NetWitness® Platform XDR

Version 12.1.0.0

Release Notes

NETWITNESS

Platform XDR

Contact Information

NetWitness Community at https://community.netwitness.com contains a knowledge base that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

Trademarks

RSA and other trademarks are trademarks of RSA Security LLC or its affiliates ("RSA"). For a list of RSA trademarks, go to https://www.rsa.com/en-us/company/rsa-trademarks. Other trademarks are trademarks of their respective owners.

License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability.

This software is subject to change without notice and should not be construed as a commitment by RSA.

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

RSA believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

THE INFORMATION IN THIS PUBLICATION IS PROVIDED "AS IS." RSA MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WITH RESPECT TO THE INFORMATION IN THIS PUBLICATION, AND SPECIFICALLY DISCLAIMS IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

What's New

The NetWitness 12.1.0.0 release provides new features and enhancements for every role in the Security Operations Center.

Upgrade Paths

The following upgrade paths are supported for NetWitness 12.1.0.0

- NetWitness 11.6.0.0 to 12.1.0.0
- NetWitness 11.6.0.1 to 12.1.0.0
- NetWitness 11.6.1.0 to 12.1.0.0
- NetWitness 11.6.1.1 to 12.1.0.0
- NetWitness 11.6.1.2 to 12.1.0.0
- NetWitness 11.6.1.3 to 12.1.0.0
- NetWitness 11.6.1.4 to 12.1.0.0
- NetWitness 11.7.0.0 to 12.1.0.0
- NetWitness 11.7.0.1 to 12.1.0.0
- NetWitness 11.7.0.2 to 12.1.0.0
- NetWitness 11.7.1.0 to 12.1.0.0
- NetWitness 11.7.1.1 to 12.1.0.0
- NetWitness 12.0.0.0 to 12.1.0.0
- NetWitness 11.7.1.2 to 12.1.0.0

For more information on upgrading to 12.1.0.0, see *Upgrade Guide for NetWitness 12.1.0.0*

Warning: Before upgrading the UEBA host to 12.1.0.0, you must perform the backup of your Elasticsearch data such as Users, Entities, Alerts, and Indicators to retain them post upgrade. For more information, see *NetWitness UEBA Configuration Guide for 12.1.0.0*.

Security Fixes

For more information on Security Fixes, see https://community.netwitness.com/t5/netwitness-platform-advisories/ct-p/netwitness-advisories#security.

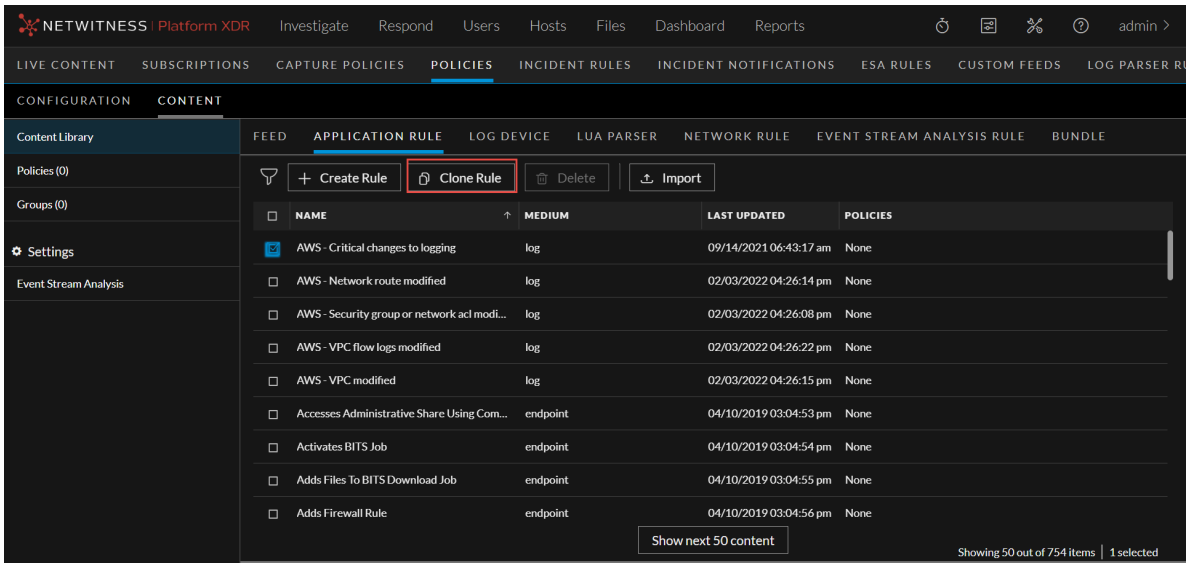
Product Version Life Cycle for NetWitness Platform

See for Product Version Life Cycle for NetWitness Platform a list of versions that reach End of Primary Support (EOPS).

Enhancements

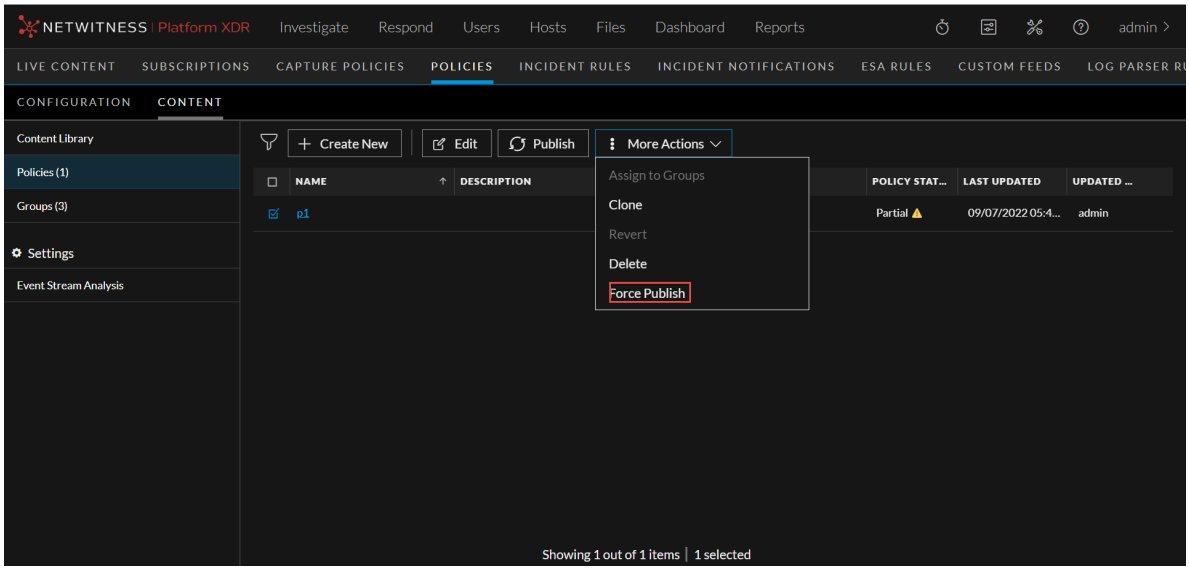
The following sections are a complete list and description of enhancements to specific capabilities:

- Policy-based Centralized Content Management
- Respond
- User Interface
- Endpoint Investigation
- Concentrator, Decoder, and Log Decoder Services



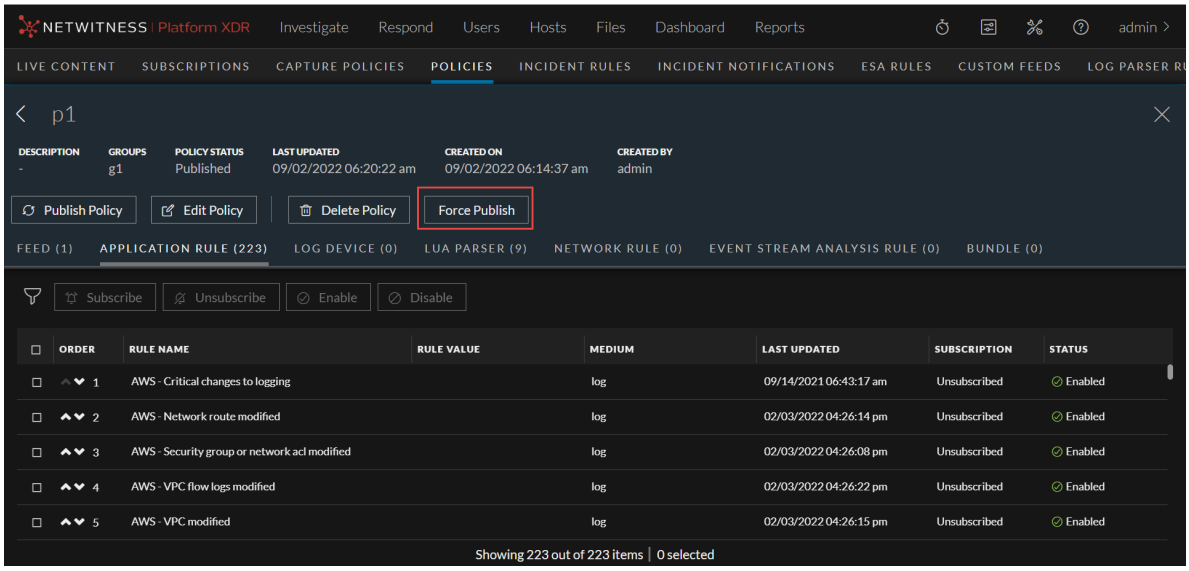
To locate the documents that are referred to in this section, see https://community.netwitness.com/t5/netwitness-platform-online/netwitness-platform-all-documents/ta-p/676246.

The Product Documentation section has links to the documentation for this release.

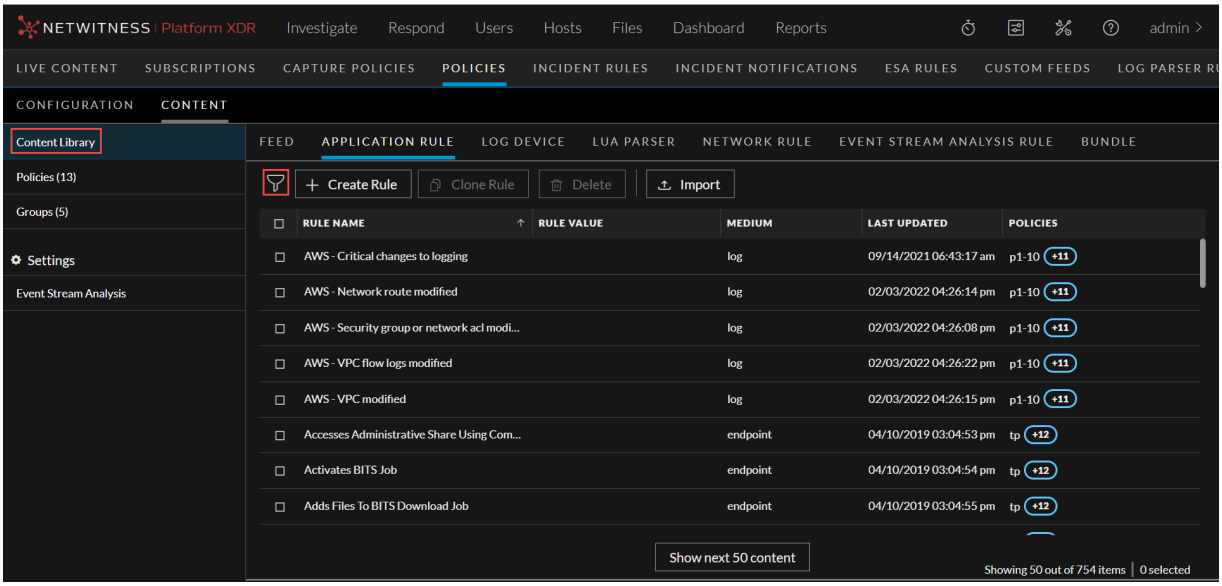


Policy-based Centralized Content Management

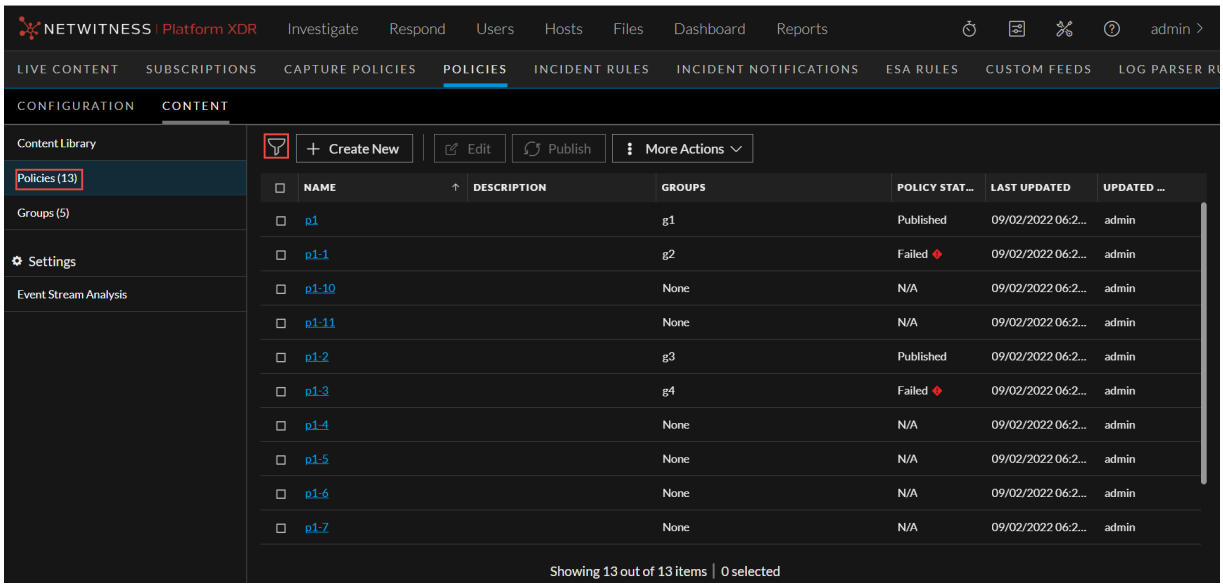
The following enhancements are made for Policy-based Centralized Content Management in 12.1.0.0 version.

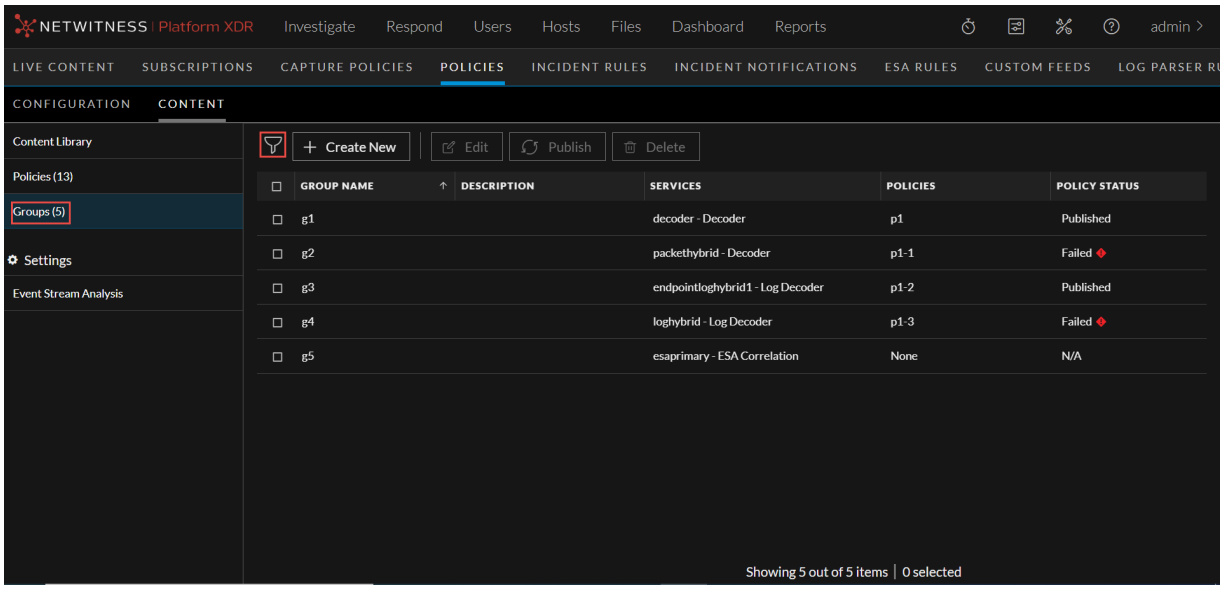


- Administrators can create and upload content to the Content Library easily by:
  - Importing log parsers as a zip file instead of converting to ".envision" format.
  - Cloning existing Application Rules and Network Rules.



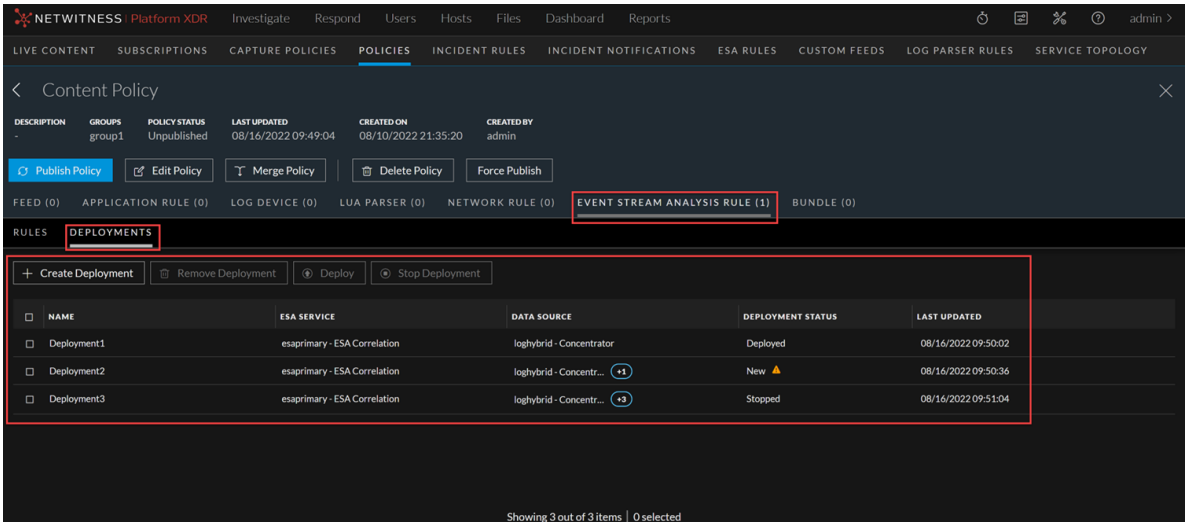
- Administrators can switch services between legacy Content Management UI and the new Centralized Content Management via Groups and Policies using the "toggle" feature. This can prevent content being mistakenly added or modified outside of a Policy, causing an out-of-sync issue.
  - Each service can be toggled to work either with individual "Service or Config" interface or with Content Policies.
  - Toggling on Content Policy for a service will restrict the legacy UI to "read only" mode.
- Administrators can now force publish all the content of a policy in two ways:
  - **Policy Listing** > **More Actions** > **Force Publish**

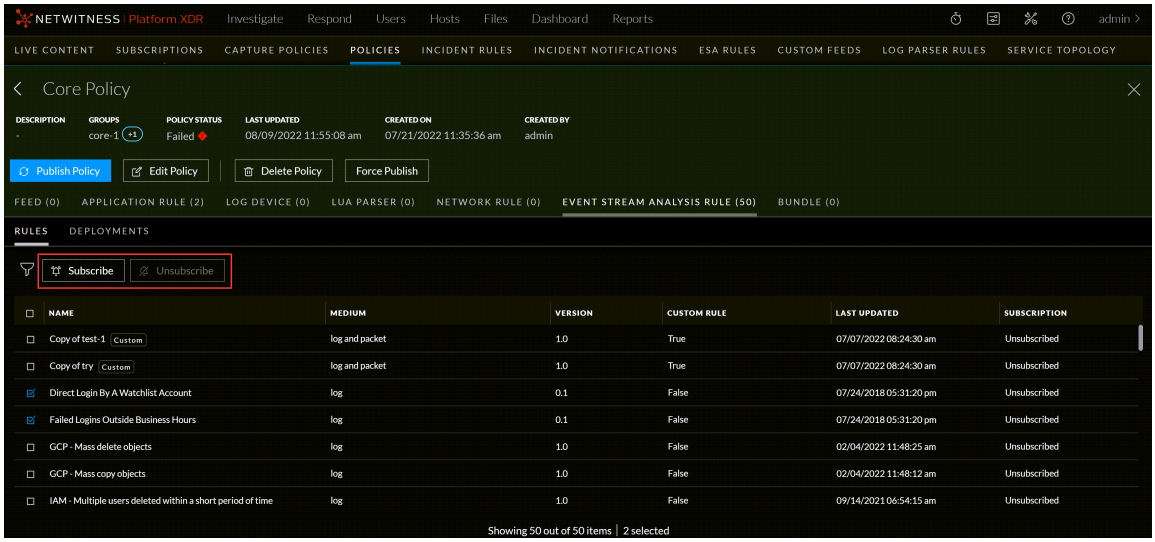




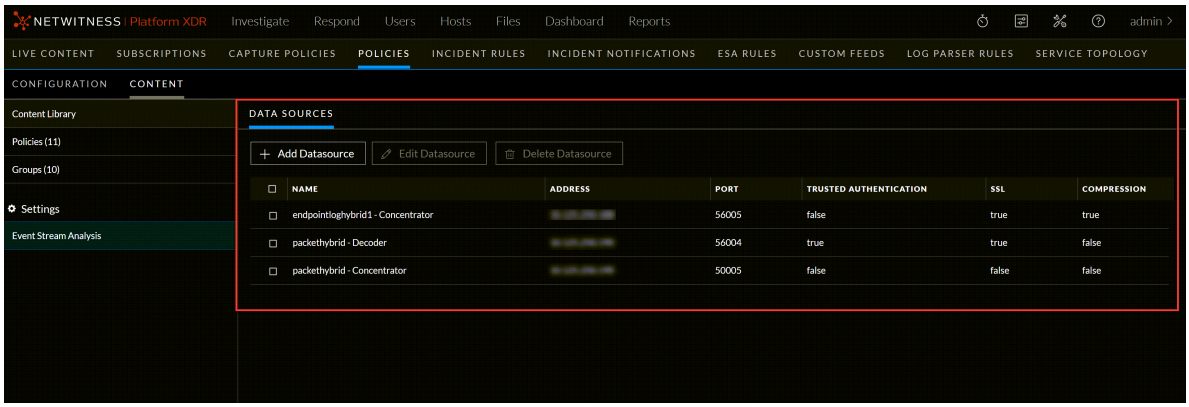
- **Policy Details** > **Force Publish**

- Administrators can easily find content, policies or groups of interest by using the "Filtering" capability of the UI in **Content Library**, **Policy Listing** page, **Policy Details** page, and **Group Listing** page.





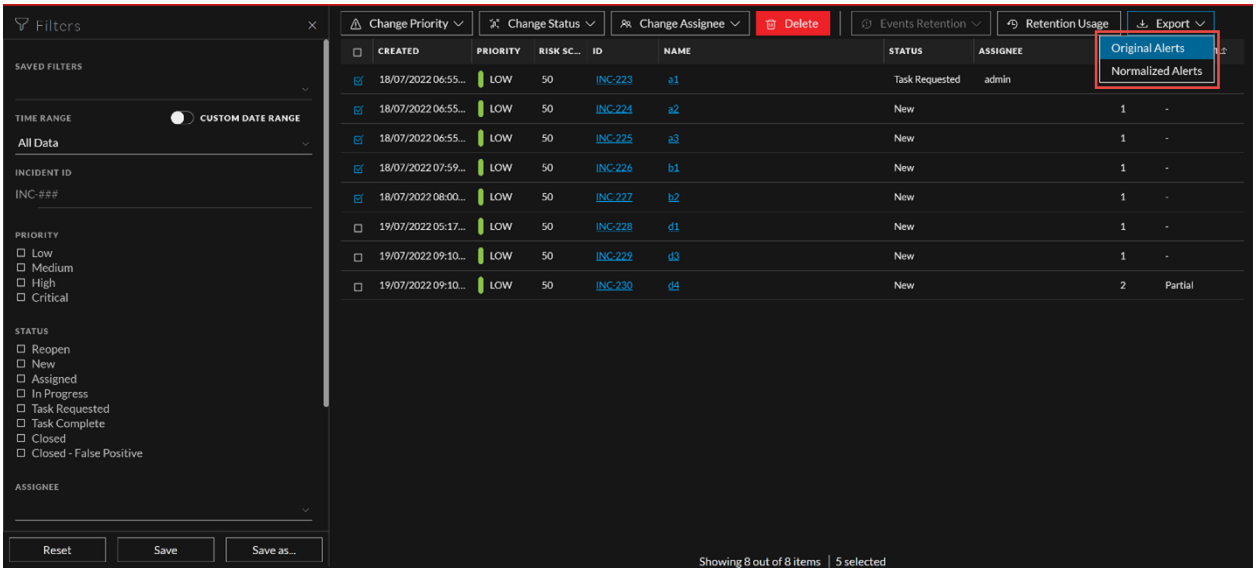
- Administrators can receive meta key and operator suggestions while creating application and network rule conditions. This eases the creation of error-free rules. Administrators can also opt for 'Advanced mode' to create complex queries.
- Addressed an issue where the Content Policy UI was not usable without an active connection to Live.
  - Administrators can now create, modify and publish policies and manage custom content in the Content Library even without an internet connection.
  - An Internet connection is still required in order to synchronize Live content with the Content Library.
- Administrators can now manage ESA contents from the **(Configure)** > **Policies** page:



- Manage ESA content and handle multiple deployments seamlessly using Policy.

- One-click management of subscriptions and automatic updates for ESA content.
  - Toggle the **Subscribe** button to enable automatic updates of ESA content.

- Seamlessly view ESA Live content along with your own custom content.
- Add and manage ESA Correlation servers as part of groups.
- Manage all the data sources for the ESA Correlation servers from the **Settings** > **Event Stream Analysis** > **Data Sources** page seamlessly.



For more information, see *Policy-based Centralized Content Management* topic in the Live Services Management Guide.

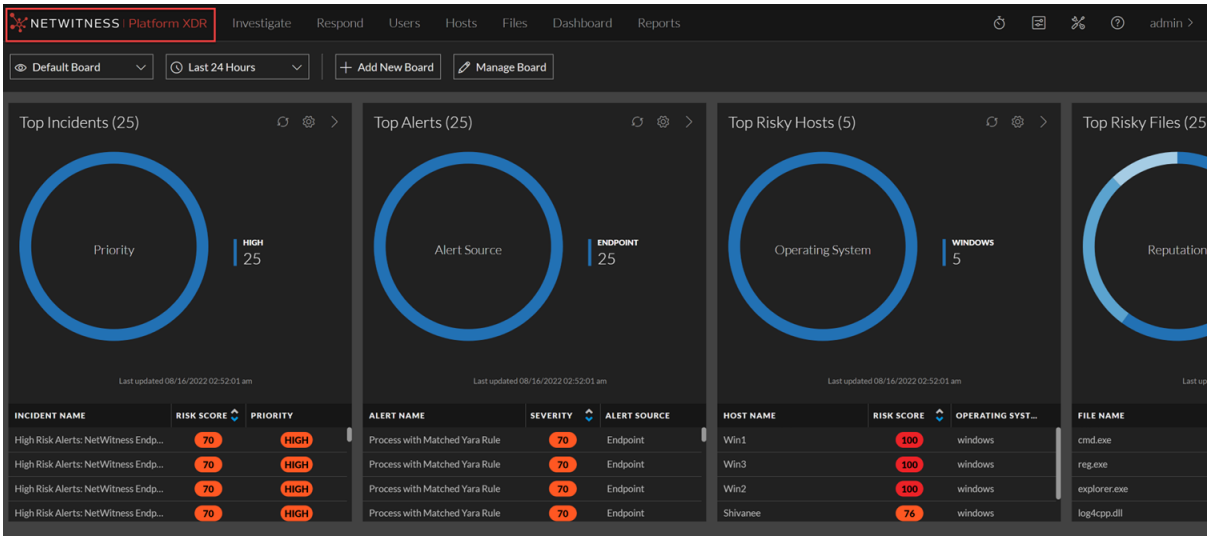
Respond

The Respond view is enhanced to help analysts export and store the Incidents with Alerts and Events in JSON format for offline investigation.

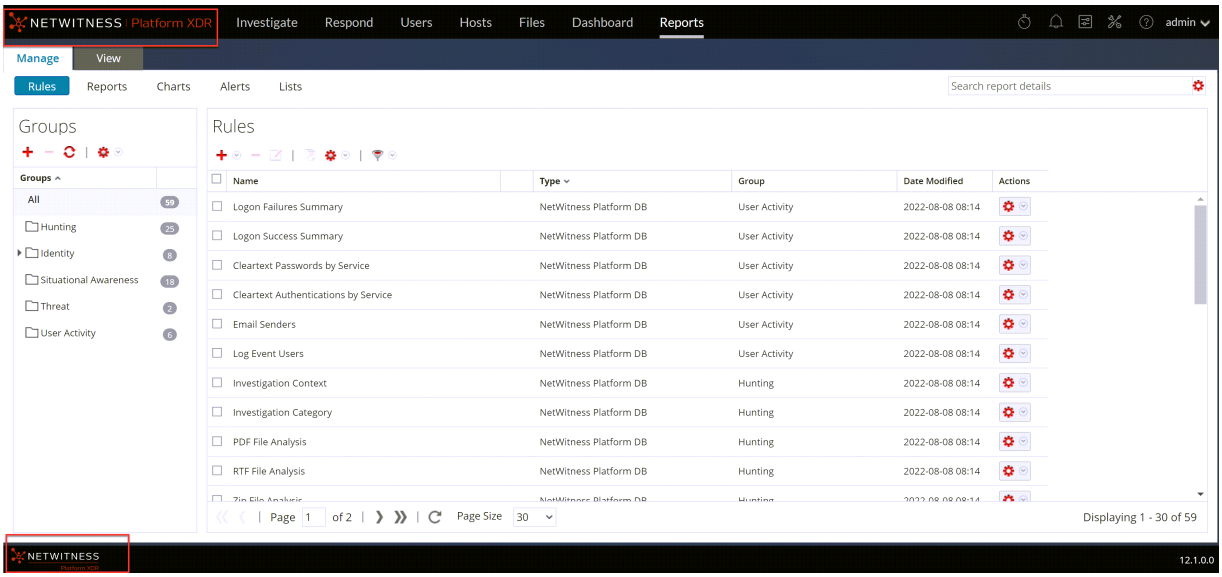
Incidents List View Enhancements

The new **Export** drop-down is added to allow analysts export and download the data such as fields or attributes associated with Alerts and Events of the selected Incidents.

You can export data of a maximum of ten incidents at a time. Once the data download is in progress, you can select a different set of ten incidents and export their data simultaneously. You can repeat this action until the condition **max-user-tasks**, which is the maximum limit set for exporting the incidents data in the **Respond** service under **rsa.respond.incident.exports** is met.



For more information, see *Escalate or Remediate the Incident* topic in the NetWitness Respond User Guide.



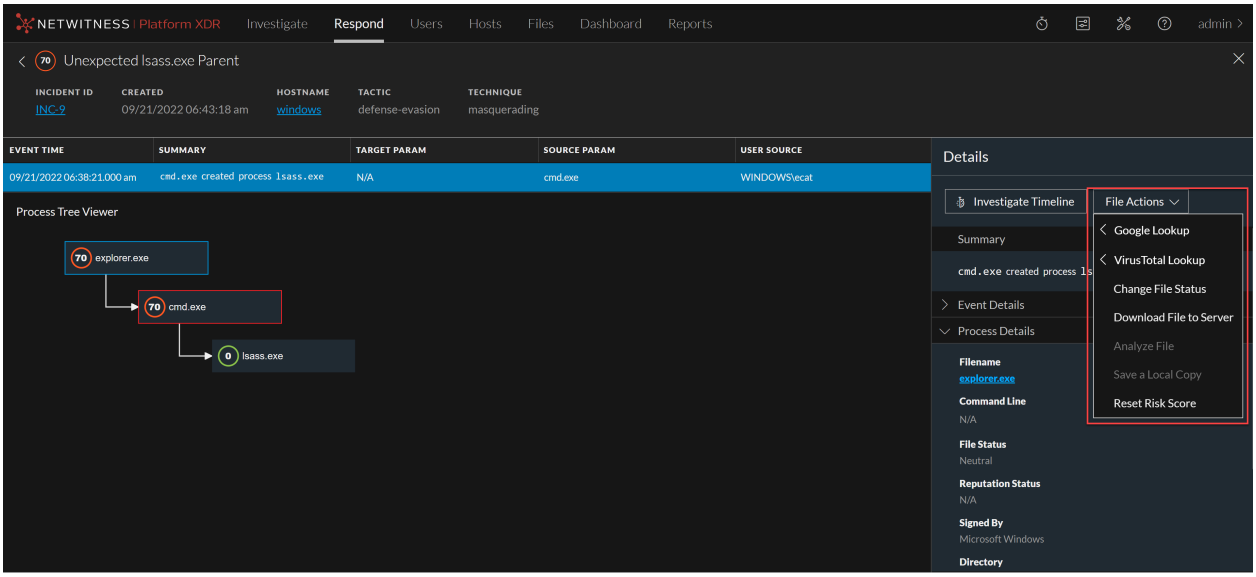
User Interface

The following section describes the new enhancements for the NetWitness user interface:

NetWitness User Interface Enhancements

- The 12.1.0.0 release includes the new NetWitness corporate logo. You can view the new logo in NetWitness Platform XDR, which updates the identity of NetWitness as a trusted brand.
- As part of the repositioning, we are renaming our product as NetWitness Platform XDR. This change aims to simplify communications and improve our customers' understanding of how each product secures and protects within the NetWitness portfolio.

Endpoint Investigation



Initiate YARA Scans at the Endpoint Agent Level

Analysts can initiate YARA scans at the endpoint agent level by selecting one or multiple endpoint agents.

For more information, see the NetWitness Endpoint User Guide.

Enhanced Process Tree View for Endpoint Alerts on Respond

The Process Tree view on the **Respond** > **Alerts** > **Endpoint Alerts** > **Alert details** page is enhanced with the new **File Actions** tab next to **Investigate Timeline**. With this enhancement, analysts can quickly save a local copy of the selected file, download it to the server, or block it.

For more information, see the NetWitness Endpoint User Guide.

Concentrator, Decoder, and Log Decoder Services

Log Parsing:

- Several new Format Types are added to DataType and VARTYPE elements for log parsing.
  - Format type **duration** can parse duration values in seconds using dateTime format specifiers.
  - Format type **convert** can perform several common conversion tasks as follows:
    - Format type convert **Domain** can normalize web domains which appear in "(3)www(7)example (3)com" formats to produce "www.example.com".
    - Format type convert **Bytes** can convert integer values between Bytes, KB, MB and GB.
- Static Value Mapping capability is added to DataType and VARTYPE to allow event categorization and similar use cases.

For more information on VARTYPE, see https://community.netwitness.com/t5/netwitness-knowledge-base/netwitness-11-x-type-and-pattern-validation-for-variables/ta-p/684779.

For more information on defining Log Parsing, see the Log Parser Customization Guide.

Fixed Issues

This section lists issues fixed after the last major release. For additional information on fixed issues, see the Fixed Version column in the NetWitness® Platform Known Issues list (https://community.netwitness.com/t5/netwitness-platform-known-issues/netwitness-platform-known-issues/ta-p/571872) on NetWitness Community Portal.

Administration Fixes

Tracking Number	Description
ASOC-113915, 115997	NetWitness users fail to handle lengthy passwords because no maximum password length is set in the password field; this may lead to DoS attack.

Core Services (Broker, Concentrator, Decoder, Archiver) Fixes

Tracking Number	Description
ASOC- 115917, 115916	NetWitness Core Services such as Log Decoder, Concentrator, and Archiver fail to handle lengthy passwords because no maximum password length is set in the password field; this may lead to DoS attack.

Log Decoder Fixes

Tracking Number	Description
ASOC- 111391	NwLogDecoder service is frequently receiving error messages in **/var/log/messages** because the message **Upload** is unable to recognize parameters such as **finalCount.**

End of Life Functionality

The following link provides information on end of life functionality, features and hardware in NetWitness 12.1.0.0 or later releases.

End of Life Functionality and Features in 12.1.0.0 or Later Releases (https://community.netwitness.com/t5/product-life-cycle/product-version-life-cycle-for-rsa-netwitness-platform/ta-p/569875)

Product Documentation

The following documentation is provided with this release.

Documentation	Location URL
NetWitness Platform Master Table of Contents	https://community.netwitness.com/t5/netwitness-platform-online/tkb-p/netwitness-online-documentation
NetWitness Platform 12.1.0.0 Product Documentation	https://community.netwitness.com/t5/netwitness-platform-online/tkb-p/netwitness-online-documentation

Feedback on Product Documentation

You can send an email to nwdocsfeedback@netwitness.com to provide feedback on NetWitness Platform documentation.

Getting Help with NetWitness Platform

Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Create a Post** fields in NetWitness Community portal to find specific information here: https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Contact NetWitness Support

If you contact NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

NetWitness Community Portal	https://community.netwitness.com In the main menu, click **Support > Case Portal > View My Cases**.
International Contacts (How to Contact NetWitness Support)	https://community.netwitness.com/t5/support/ct-p/support
Community	https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
NW Update	https://update.netwitness.com/
LiveUI	https://live.netwitness.com/

Build Numbers

The following table lists the build numbers for various components of NetWitness 12.1.0.0

Component	Version Number
NetWitness Admin Server	rsa-nw-admin-server-12.1.0.0-220830025952.5.8f53425.el7.centos.noarch.rpm
NetWitness Appliance	rsa-nw-appliance-12.1.0.0-12595.5.9deae1986.el7.x86_64.rpm

Upgrade Overview

NetWitness 12.1.0.0 provides enhancements and fixes for all products in NetWitness Platform. The instructions in this guide apply to both physical and virtual hosts (including AWS, Azure Public Cloud, and Google Cloud Platform) unless stated to the contrary.

In 12.1.0.0, NetWitness has several new features in the user interface.

Warning: Before upgrading the UEBA host to 12.1, you must perform the backup of your Elasticsearch data such as Users, Entities, Alerts, and Indicators to retain them post upgrade. For more information, see Upgrade Preparation Tasks.

Upgrade Paths

The following upgrade paths are supported for NetWitness 12.1.0.0:

- NetWitness 11.6.0.0 to 12.1.0.0
- NetWitness 11.6.0.1 to 12.1.0.0
- NetWitness 11.6.1.0 to 12.1.0.0
- NetWitness 11.6.1.1 to 12.1.0.0
- NetWitness 11.6.1.2 to 12.1.0.0
- NetWitness 11.6.1.3 to 12.1.0.0
- NetWitness 11.6.1.4 to 12.1.0.0
- NetWitness 11.7.0.0 to 12.1.0.0
- NetWitness 11.7.0.1 to 12.1.0.0
- NetWitness 11.7.0.2 to 12.1.0.0
- NetWitness 11.7.1.0 to 12.1.0.0
- NetWitness 11.7.1.1 to 12.1.0.0
- NetWitness 11.7.1.2 to 12.1.0.0
- NetWitness 12.0.0.0 to 12.1.0.0

This guide applies to both physical and virtual hosts (including AWS and Azure Public Cloud).

Running in Mixed Mode

Running in mixed mode occurs when some services are upgraded to the latest version and some services are on older versions. See "Running in Mixed Mode" in the *NetWitness Platform Hosts and Services Getting Started Guide* for further information.

Note: If you are running Endpoint Log Hybrid in mixed mode, make sure Endpoint Broker is on the same version as one of the Endpoint Servers.

Upgrade Considerations for ESA Hosts

Mixed mode is not supported for ESA hosts in NetWitness version 11.5 and later.

IMPORTANT: The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

Upgrade Considerations for STIX Custom Feeds

The custom feeds created before version 12.1.0.0 are processed automatically. On upgrade, the data sources created for ADHOC, REST and TAXII server and the feeds are pulled automatically. See "Create a STIX Custom Feed" in the *NetWitness Platform Live Service Management Guide* and "Configure STIX as a Data Source" in the *NetWitness Platform Context Hub Configuration Guide* for further information.

Upgrade or install Legacy Windows Log Collection

Refer to the Legacy Windows Log Collection Guide for NetWitness.

Note: After you update or install Legacy Windows Log Collection, reboot the system to ensure that Log Collection functions correctly.

Feedback on Product Documentation

You can send an email to nwdocsfeedback@netwitness.com to provide feedback on NetWitness documentation.

Getting Help with NetWitness Platform

Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Create a Post** fields in NetWitness Community portal to find specific information here: https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the guides.
- See https://community.netwitness.com/t5/product-life-cycle/product-version-life-cycle-for-rsa-netwitness-platform/ta-p/569875 for information related to the End of Life (EOL) of appliances and the products.
- See also https://community.netwitness.com/t5/netwitness-community-blog/bg-p/netwitness-blog.
- If you need further assistance, contact NetWitness Support.

Contact NetWitness Support

If you contact NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

NetWitness Community Portal	https://community.netwitness.com In the main menu, click **Support > Case Portal > View My Cases**.
International Contacts (How to Contact NetWitness Support)	https://community.netwitness.com/t5/support/ct-p/support
Community	https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
NW Update	https://update.netwitness.com
LiveUI	https://live.netwitness.com

Pre Upgrade Checks

You must run the pre-upgrade checks before you upgrade to NetWitness 12.1.0.0 to identify any issues that may result in upgrade failure.

To run the pre-upgrade checks, perform the following:

1. Log in to Admin console.
2. Run the following command:
   `nw-precheck-tool upgrade-checklist`

   The pre-upgrade checks verifies the following:

Upgrade Checklist

- **Security Client File Check** - Ensures `security-client-amqp.yml` file is not present.
- **Node-0 NW Service-id Status** - Ensures all the service-id is intact with all the different services in Node 0.
- **Broker Service Trustpeer Symlink** - Ensures Broker symlink file `(/etc/netwitness/ng/broker/trustpeers/)` is not broken.
- **Node-0 NW Services Status** - Checks the status of all the services in Node 0.
- **Yum External Repo Check** - Ensures external repos are not available and not enabled.
- **Node-0 RPM DB Index Check** - Checks if the RPM DB is corrupted or not.
- **Salt Master Communication** - Verifies the salt communication from Node 0 to all the Nodes.
- **Node-0 Certificates Check** - Checks if any certificates are missing, expired, or invalid issuer type.
- **Mongo Authentication** - Validates the `deploy_admin` credentials fetched from `security-cli-client` using Mongo client.
- **Rabbitmq Authentication** - Validates the `deploy_admin` credentials fetched from `security-cli-client` using RabbitMQ.
- **(Component Hosts) Node X NW Service Status** - Verifies the status of services (Active or In Active) on all the Node X.
- **(Component Hosts) Node X Certificates Check** - Checks the certificate expiry, missing, corrupted, and issuer mismatch in all categories of Node X.

- **Nodes CPU-Memory Info** - Provides CPU and Memory details of all the nodes along with the real-time available memory.
- **(Admin Server) Node 0 File System Utilization** - Verifies the disk partition utilization of `/var/netwitness/mongo`, `/var/netwitness`, and `root` on Node 0.
- **(Component Hosts) Node X File System Utilization** - Verifies the disk partition utilization of `/var/netwitness/mongo`, `/var/netwitness`, and `root` for ESA Primary and Endpoint Log Hybrid services on Node X.
- **Mongo File (ESAPrimary)** - Checks the ESA Primary node in the system or stack and verifies the permission mode of Mongo file.
- **Orchestration Server Normal Mode** - Checks if the orchestration service is running in normal or safe mode.
- **(Admin Server) Node 0 Init status** - Checks if there are any issues that might fail init process.
- **Fips Mode Check** - Checks to ensure that the Fips mode is disabled (set to false) before and after upgrade.
- **Node-X RPM DB Index Check** - Checks for the status of RPM DB on Node-X to make sure it is not corrupted.
- **Node-Z Yum Proxy Check** - Checks for the existence of yum.conf file and availability of proxy within the file on Node -Z.
- **Node-X Yum Proxy Check** - Checks for the existence of yum.conf file and availability of proxy within the file on Node -X.
- **Host Info Check Probe** - Checks if the required fields of information of all the hosts in the system (Host IP, Hostname, Installed Services, and Raw Version) are available.
- **Node-Z Cipher Check Probe** - Checks if the required ciphers are available in the location `/etc/rabbitmq/rabbitmq.config` on Node-0.
- **Node-X Cipher Check Probe** - Checks if the required ciphers are available in the location `/etc/rabbitmq/rabbitmq.config` on all Node-X.
- **Node-X Hardware Version Check Probe** - Checks for the hardware version of all reachable Node-X.
- **Node-Z Hardware Version Check Probe** - Checks for the hardware version of the Admin server.

Network Checklist

- **(Admin Server) Node 0 closed ports** - Checks if the service ports required for NetWitness services are open and listening on Node 0.
- **(Component Hosts) Node X closed ports** - Checks if the service ports required for NetWitness services are open and listening on Node X.

Certificate Checklist

- **Node 0 Service Certificates** - Checks the validity of service certificates in the location `/etc/pki/nw/service/` on Node-0.
- **Node X Service Certificates** - Checks the validity of service certificates in the location `/etc/pki/nw/service/` on Node-X.
- **Node Certificates on Node-0** - Checks the validity of node certificates in the location `/etc/pki/nw/service` on Node-0.
- **Root CA Certificates** - Checks the validity of Root CA certificates in the location `/etc/pki/nw/ca`.

Upgrade Preparation Tasks

Complete the following tasks to prepare for the upgrade to NetWitness 12.1.0.0

Warning: The Dell S4 and S4s appliances reached the End of Life (EOL) in June 2021. We recommend that you discontinue installation or upgrade activities on these and upgrade to new hardware. For more information on End of Life hardware support, see https://community.netwitness.com/t5/product-life-cycle/product-version-life-cycle-for-rsa-netwitnessplatform/ta-p/569875.

Task 1. (Optional) Remove Legacy Package Repositories

Perform this task to free up space by removing unused repositories from previous releases from your system.

1. Determine the version of the oldest NetWitness Platform host in your environment by reviewing the host list in the Admin user interface, or by running the following command on the NW Server:
   `upgrade-cli-client --list`
2. You can safely remove all legacy package repository folders located at `/var/netwitness/common/repo/<version>` on the NW Server for all versions prior the baseline major release version of the oldest active host in the environment.
   - If the oldest host version is 11.7.x.x, you can safely remove 11.0.x.x, 11.1.x.x, 11.2.x.x, 11.3.x.x, 11.4.x.x, 11.5.x.x, and 11.6.x.x repository folders. However, do not remove repository versions greater than or equal to 11.7.0.0.
   - If the oldest host version is 11.3.x.x, you can safely remove 11.0.x.x, 11.1.x.x, and 11.2.x.x repository folders. However, do not remove repository versions greater than or equal to 11.3.0.0.

Task 2. Backup and Remove the Rotated RabbitMQ Logs

Before upgrading from 11.6.x or 11.7.x to 12.1.0.0, you must remove the old RabbitMQ logs and free up the space in /var/log mount disk. Follow the below procedure to free up the space in /var/log mount disk.

1. Backup the rotated RabbitMQ logs into var/netwitness directory. Do the following.

   ```
   mkdir /var/netwitness/rabbitmq_logsbkp
   scp -r /var/log/rabbitmq/ /var/netwitness/rabbitmq_logsbkp
   ```

2. Remove the rotated RabbitMQ logs from /var/log/rabbitmq pre-upgrade. Do the following.

   ```
   cd /var/log/rabbitmq
   rm -f rabbit\@<sa-uuid>.log.*
   rm -f rabbit\@<sa-uuid>_upgrade.log.*
   rm -f *.gz
   rm -f rabbit@<sa-uuid>.log-*
   ```

Note:
- This procedure must be performed only once before upgrading to 12.1.0.0 Post-upgrade, the RabbitMQ service automatically handles the log rotation.
- The command `rm -f rabbit\@<sa-uuid>.log.*` is used to clean up the old uncompressed logs such as log.1, log.2, and log.3.
- The command `rm -f rabbit\@<sa-uuid>_upgrade.log.*` is used to clean up the old uncompressed upgrade logs.
- The command `rm -f *.gz` is used to clean up the old compressed logs.
- The command `rm -f rabbit@<sa-uuid>.log-*` is used to clean up the old uncompressed logs rotated with logrotate.

Task 3. Uninstall the Security Analytics l10n language pack

Before you upgrade from 11.6.x.x to 11.7.x.x or 12.1.0.0 version, you must uninstall the Security Analytics l10n language pack.

Task 4. Preparing ESA Deployments for Migration to 12.1.0.0

Before upgrading to 12.1.0.0, NetWitness recommends that all the ESA deployments maintain an error-free state and remove any unused ESA deployments, as ESA deployments will be migrated to policies and groups after upgrading to 12.1.0.0.

Note: Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. The deployments will not be accessible until the corresponding Correlation servers are upgraded. This action will not affect the events and alerts processing by correlation servers.

IMPORTANT: If there is any need to import ESA Rules and Enrichments. NetWitness recommends importing those missing rules and enrichments before the upgrade.

The pre-upgrade and post-upgrade states of deployments are represented in the following table.

SINo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No

Healthy deployment contains no errors, and the required resources such as ESA Server, Data source, and ESA rule are added.

Note: NetWitness recommends that all the deployments maintain an error-free state and also remove any unnecessary or unused ESA deployments.

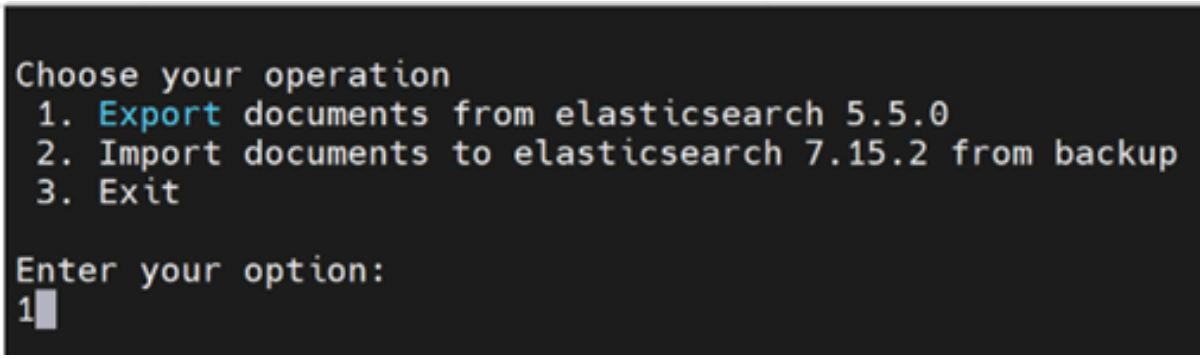
Task 5. Backup Elasticsearch Data (Users, Entities, Alerts, and Indicators)

Before upgrading the UEBA host to 12.1.0.0, you must perform the backup of your Elasticsearch data such as Users, Entities, Alerts, and Indicators (using the Elasticsearch migration tool) to retain them post upgrade.

Prerequisites

Make sure the following prerequisites are met before you perform data backup:

- The current Elasticsearch version must be 5.5.0.
- Presidio rpms version must be less than or equal to 12.0.0.0.
- `ueba_es_migration_tool.zip` file must be downloaded.



Note: ueba_es_migration_tool allows you to migrate presidio Elasticsearch data from Elasticsearch version 5.5.0 to 7.15.2 while upgrading the UEBA host to 12.1.0.0 from 12.0.0.0 and older versions. This tool contains `elk-migration-script.sh` script file and `presidio-elk-migration-1.0.0.jar` file and it can be downloaded from https://community.netwitness.com/t5/netwitness-platform-downloads/ueba-elasticsearch-migration-tool/ta-p/687496.

To backup the Elasticsearch data:

1. Select the available directory and unzip the `ueba_es_migration_tool.zip` file.
2. Go to `cd ueba_es_migration_tool`. Run the following command.

   ```
   sh elk-migration-script.sh
   ```

   The Elasticsearch migration tool guide is displayed.

3. Select **Export documents from elasticsearch 5.5.0** and enter **yes** when prompted to stop the airflow scheduler.

Note: When you enter **yes**, the airflow scheduler stops consuming the fresh incoming data such as Users, Entities, and Alerts. This avoids data loss during the export process.

4. In the next step, select **Fresh Export** to export the existing data.

```
Export documents from elasticsearch 5.5.0
 1. Fresh Export
 2. Resume Export
 3. Main menu
 4. Exit

Enter your option:
1

Destination dir path:
/root/elasticsearh_export_backup
Please wait processing your export request...

+----------------------------------------+----------+-------+----------+
| Index                                  | Exported | Total | Took     |

+----------------------------------------+----------+-------+----------+

Total: 184081, Exported: 184081, Dropped: 0, Started: 2022-08-16 05:35:10, Ends: 2022-08-16 05:35:19, Took: 8790 ms.
[root@ueba ueba_es_migration_tool]#
```

Note:
- If the Export operation fails due to some technical issue, select **Resume Export** once the issue is resolved, to resume the Export operation.
- Go to `<backup_directory_path>/log/log/es-migration-export.log` if you want to view the log for the succeeded or failed processes.

Task 6 (Optional). Disable STIG-based FIPS Kernel Controls

If you enabled STIG-based FIPS Kernel controls, you must disable them before initiating the NetWitness Platform upgrade process to avoid boot errors. To disable STIG-based FIPS Kernel controls, run the following commands:

```
manage-stig-controls --disable-control-groups 3 --host-all
```

```
grub2-mkconfig -o /boot/grub2/grub.cfg
```

After you upgrade NetWitness Platform, ensure that you enable STIG-based FIPS Kernel controls.

Note: STIG-based FIPS Kernel controls which require modifications to kernel boot options are not enabled by NetWitness out-of-the-box.

Task 7 (Optional). Verify Connection for Live Server

Go to `admin/system/live services` and do a test connection to verify if you are able to connect to the live server as this is essential for the source-server from 12.x and above. This is an optional step and applicable only for customers who have configured live.

Upgrade Options

Upgrade the systems in your environment in the following order:

1. NW Server hosts
2. Analyst UI hosts
3. ESA Primary hosts
4. ESA Secondary hosts
5. The rest of your component hosts

Note: NW Server, Analyst UI, and ESA Primary and Secondary hosts must all be upgraded on the same day. The rest of your component hosts can be upgraded on the same day or later.

For information about all the host types in NetWitness, see the *Host and Services Getting Started Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. For more information, see "**Task 4. Preparing ESA Deployments for Migration to the 12.1 Version**" in topic Upgrade Preparation Tasks.

Important Notes - Read This First

Synchronize Time on Component Hosts with NW Server Host

Before upgrading your hosts, make sure that the time on each host is synchronized with the time on the NetWitness Server.
To synchronize the time, do one of the following:

- Configure the NTP Server. For more information, see"Configure NTP Servers" in the *System Configuration Guide*.
- Perform the following steps on each host:
  a. SSH to the Admin Server host.
  b. Run the following commands.

```
salt \* service.stop ntpd
salt \* cmd.run 'ntpdate nw-node-zero'
salt \* service.start ntpd
```

Mixed Mode Unsupported for ESA Hosts

Mixed mode is not supported for ESA hosts in NetWitness Platform version. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

Respond Server Service Not Enabled Until NW Server and Primary ESA Host Upgraded to 12.1.0.0

After upgrading the primary NW Server (including the Respond Server service), the Respond Server service is not automatically re-enabled until after the Primary ESA host is also upgraded to 12.1.0.0 The Respond post-upgrade tasks only apply after the Respond Server service is upgraded and is in the enabled state.

Deploy_Admin Password Guidelines

In NetWitness Platform version 11.6 or Later, deployment account password (only on node-zero) must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.

If `deploy_admin` password is changed on Primary NW Server, it must be changed in the Warm Standby Server if it exists

Removal of DNSMasq in 12.1 Version

After upgrading to 12.1 version, the package, service, and the configuration files associated with DNSMasq are removed. However, this will not impact the system.

Additional Post Upgrade Steps for 12.1.0.0 Version with Legacy Windows Log Collector

For 12.1.0.0 version with Legacy Windows Log Collector, you should perform few additional post upgrade tasks. Refer to Legacy Windows Log Collection section in Post Upgrade Tasks for these additional post upgrade tasks.

Upgrade Options

You can choose one of the following upgrade methods based on your Internet connectivity. They are listed in the order recommended by NetWitness.

- Option 1: User Interface Method with Connectivity to the Internet
- Option 2: User Interface with No Connectivity to the Internet
- Option 3: Command Line Interface (CLI) with No Connectivity to the Internet
- Option 4 (Optional): Pre-Stage Upgrade Repo

The following rules apply when you are upgrading hosts for all of these upgrade methods:

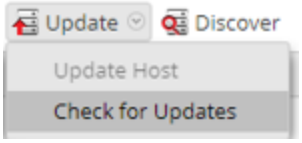
- You must upgrade the NW Server host first.
- You can only apply a version that is compatible with the existing host version.

- The NW Server, ESA primary, ESA secondary, and Analyst UI hosts must all be on the same NetWitness Platform version.
- Add Warm Standby (if exists) to the list of hosts and it must be on same version as NetWitness Platform.

Option 1: User Interface Method with Connectivity to the Internet

You can use this method if the NW Server host is connected to Live Services and if you are able to obtain the package.

Prerequisites



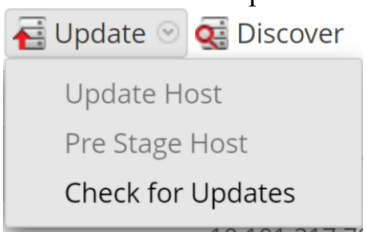
Make sure that:

1. The **Automatically download information about new upgrades every day** option is selected and is applied in **(Admin) > System > Updates**.
2. Updates are available. Go to **(Admin) > Hosts > Update > Check for Updates** to check for updates. The Host view displays the **Update Available** status.
3. 12.1.0.0 is available in the **Update Version** column.

Procedure

If you are upgrading from 11.6.x.x and 11.7.0.x to 12.1.0.0, follow the steps below:

1. Go to **(Admin) > Hosts**.
2. Select the NW Server (`nw-server`) host.
3. Check for the latest updates.



4. Update Available is displayed in the **Status** column if you have a version update in your Local Update Repository for the selected host.
5. Select **12.1.0.0** from the **Update Version** column. If you:
   - Want to view a dialog with the major features in the upgrade and information on the updates, click the information icon ( ) to the right of the upgrade version number.
   - Cannot find the version you want, select **Update > Check for Updates** to check the repository for any available updates. If an update is available, the message "New updates are available" is displayed and the **Status** column updates automatically to show Update Available. By default, only supported updates for the selected host are displayed.
6. Click **Update** > **Update Host** from the toolbar.

7. Click **Begin Update**.
8. Click **Reboot Host**.
9. Repeat steps 6 to 8 for other hosts.

Note: You can select multiple hosts to upgrade at the same time only after updating and rebooting the NW Server host. All ESA, Endpoint, and Malware Analysis hosts should be upgraded to the same version as that of the NW Server host.

If you are upgrading from 11.7.1.0 and 11.7.1.1 to 12.1.0.0, follow the steps below:

1. Go to  **(Admin) > Hosts**.
2. Select the NW Server (`nw-server`) host.
3. Check for the latest updates.

4. Update Available is displayed in the **Status** column if you have a version update in your Local Update Repository for the selected host.
5. Select **12.1.0.0** from the **Update Version** column. If you:
   - Want to view a dialog with the major features in the upgrade and information on the updates, click the information icon ( ) to the right of the upgrade version number.
   - Cannot find the version you want, select **Update > Check for Updates** to check the repository for any available updates. If an update is available, the message "New updates are available" is displayed and the **Status** column updates automatically to show Update Available. By default, only supported updates for the selected host are displayed.
6. Click **Update** > **Update Host** from the toolbar.
7. Click **Begin Update**.
8. Click **Reboot Host**.
9. Repeat steps 6 to 8 for other hosts.

Note: You can select multiple hosts to upgrade at the same time only after updating and rebooting the NW Server host. All ESA, Endpoint, and Malware Analysis hosts should be upgraded to the same version as that of the NW Server host.

Option 2: User Interface with No Connectivity to the Internet

Task 1. Populate Staging Folder (`/var/lib/netwitness/common/update-stage/`) with Version Upgrade Files

1. Download the upgrade package `netwitness-12.1.0.0.zip` from NetWitness Community (https://community.netwitness.com/) > **Downloads** > **NetWitness Platform** > **Version 12.1** to a local directory:
2. SSH to the NW Server host.
3. Copy `netwitness-12.1.0.0.zip` from the local directory to the `/var/lib/netwitness/common/update-stage/` staging folder.
   For example:

```
sudo cp /tmp/netwitness-12.1.0.0.zip /var/lib/netwitness/common/update-stage/
```

If you are logged as a root user you can ignore sudo in the command, for example,

```
cp /tmp/netwitness-12.1.0.0.zip /var/lib/netwitness/common/update-stage/
```

Note: NetWitness Platform unzips the file automatically.

Task 2. Apply Upgrades from the Staging Area to Each Host

Caution: You must upgrade the NW Server host before upgrading any non-NW Server host.

1. Log in to NetWitness.
2. Go to  **(Admin) > Hosts**.

   Note: If you are already on the  **(Admin) > Hosts** page and the **Check for Updates** option (**Update** > **Check for Updates**) is grayed out, refresh the page from the browser to check for the updates.
3. Check for updates and wait for the upgrade packages to be copied, validated, and ready to be initialized.

   "Ready to initialize packages" is displayed if:

   - NetWitness Platform can access the upgrade package.
   - The package is complete and has no errors.

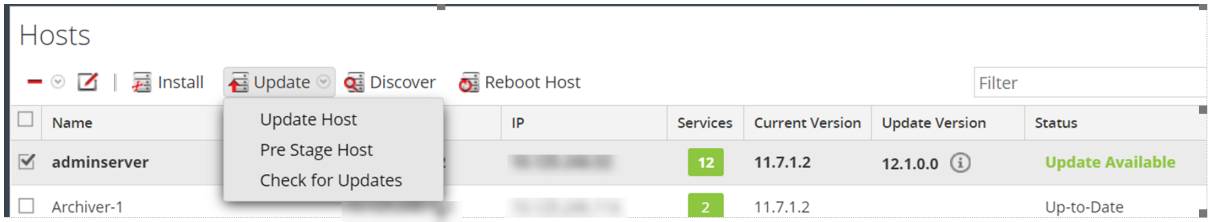
   Refer to Troubleshooting Version Installations and Updates for instructions on how to troubleshoot errors (for example, "Error deploying version <version-number>" and "Missing the following update package(s)," are displayed in the **Initiate Update Package for RSA NetWitness Platform** dialog.)
4. Click **Initialize Update**.

It takes some time to initialize the packages because the files are large and need to be unzipped. The time varies depending on how the host is configured.
After the initialization is successful, the **Status** column displays Update Available and you complete the rest of the steps in this procedure to finish the upgrade of the host.

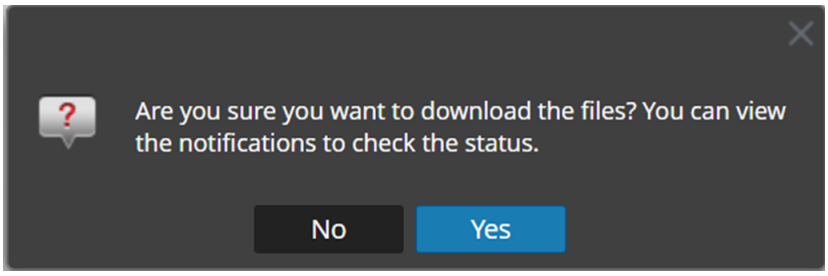
5. Click **Update** > **Update Hosts** from the toolbar.

6. Click **Begin Update** from the Update Available dialog.
   After the host is upgraded, it prompts you to reboot the host.
7. Click **Reboot Host** from the toolbar.

Option 3: Command Line Interface (CLI) with No Connectivity to the Internet



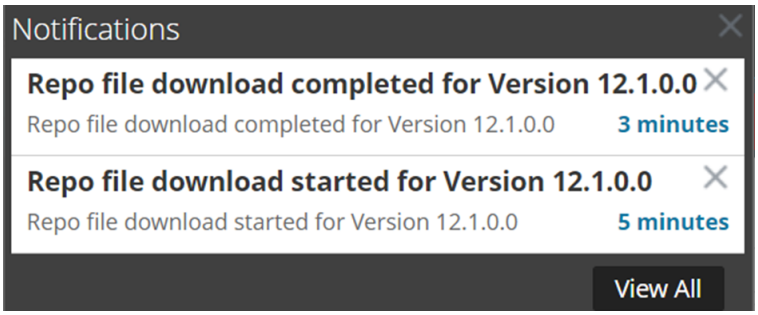
Follow the instructions in Appendix A. Offline Method (No Connectivity to Live Services) - Command Line Interface.



Option 4 (Optional): Pre-Stage Upgrade Repo

You can pre-stage the upgrade repository by downloading the required packages (.zip) without affecting the system. This minimizes the upgrade downtime and ensures the upgrade is completed within the planned time.

Procedure



1. Go to  **(Admin) > Hosts**.
2. Click **Update > Check for Updates** from the toolbar.
   All possible update versions will be displayed in the Versions drop-down list.
3. Click **Update** > **Pre Stage Host** and select the version in the update version column.
   A confirmation message for downloading the files is displayed.

4. Click **Yes** to download the upgrade packages to the repo.
5. Verify the status of the download in the notifications tray as shown below.

   The **Pre Stage Host** and **Upgrade Host** will be disabled until pre stage is completed.

Note: The current version and the update version in the UI will be the same during the pre stage as it is not the actual update. This is because only the repo files are downloaded and no actual upgrade is done. The version will change only after upgrade.

6. If the download is successful, **Check for Updates** again to start the initialization.
7. Click **Initialize Update**.

   The initialization of the package will take some time as the files are large and will need to be unzipped.

IMPORTANT: Pre Stage Repo preparation steps from 1 to 4 can be performed at any time. However, from steps 5 to 8 the upgrade process begins and you must NOT reboot the host or restart the jetty server during this time as it will corrupt the .ZIP files.

8. Check the status of initialization in the notifications tray.
9. After the initialization is completed successfully, click **Update** > **Update Host**.

After the host is updated, you will be prompted to reboot the host.

10. Set up the host and reboot the host.

Post Upgrade Tasks

After you upgrade to 12.1.0.0, NetWitness has several new features in the user interface. Complete the tasks that apply to the hosts in your environment.

- General
- Event Stream Analysis (ESA)
- Investigate
- Respond
- Reference Log Decoder
- Legacy Windows Log Collector
- User Entity Behavior Analytics

General

(Conditional) Configure NAT-Based IP Addresses

If you have a host, such as a VLC, that requires a NAT-based IP address in order to connect to the NW Server host, you must update the host configuration with the following steps.

1. Log in to the host that requires the use of NAT IP addresses, using the console or SSH.
2. Run the following command:
   `nw-manage --enable-nat-usage`
3. To set the NAT address for the NW Server:
   a. Log into the NW Server using the console or SSH.
   b. Run the following command:
   `nw-manage -update-host --host-id <UUID of NW Server> --ipv4-public <NAT IP of NW Server>`

   Note: You can find the UUID and view the current NAT IP address of the host by running `nw-manage --list-hosts`.

(Conditional - For Warm-Standby Hosts Only) Register the Secondary IP Address of Warm-Standby Hosts

The Warm-Standby server must be upgraded to 12.1.0.0 before completing the following steps.

1. Log in to the NW Server using the console or SSH.

2. Run the following command:
   `nw-manage --add-nws-secondary-ip --ipv4 <ip address of Warm/Standby Server>`

   Note: If the Warm-Standby server requires a NAT-based IP address (IPv4-public) for any host to access it during failover, the NAT IP address must also be registered by running the following command: `nw-manage --add-nws-secondary-ip --ipv4 <NAT-based IP address of Warm Standby Server>`

3. Verify the correct Warm Standby host IP address value by running the following command:
   `nw-manage --get-nws-secondary-ip`

Review Contents of /etc/hosts.user for Obsolete Host Entries

After upgrading the NW Server host or a component host, review the contents of the `/etc/hosts.user` file for any obsolete host entries. The `/etc/hosts.user` file contains system and user-generated entries that are not managed by NetWitness Platform. However, entries from `/etc/hosts.user` are merged with NetWitness Platform-generated host mappings to create and update `/etc/hosts`. To avoid conflicts with NetWitness Platform-generated mappings, and to avoid generating connectivity errors resulting from an IP address change, NetWitness recommends that you remove any entries in `/etc/hosts.user` that include a non-loopback IP address of a NetWitness Platform host.

After updating `/etc/hosts.user`, you must refresh the system by running the following command:
`nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>`

Jetty Configuration

For Jetty Configuration and related information, see **Manage Custom Host Entries** topic in the *System Maintenance Guide*.

Make Sure Services Have Restarted and Are Capturing and Aggregating Data

Make sure that services have restarted and are capturing data (this depends on whether or not you have auto-start enabled).

If required, restart data capture and aggregation for the following services:

- Decoder
- Log Decoder
- Broker
- Concentrator
- Archiver

Start Network Capture

1. In the NetWitness Platform menu, go to  (Admin) > **Services**.
   The Services view is displayed.

2. Select each **Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

Start Log Capture

1. In the NetWitness Platform menu, go to  (Admin) > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

Start Aggregation

1. In the NetWitness Platform menu, go to  (Admin) > **Services**.
   The Services view is displayed.
2. For each **Concentrator**, **Broker**, and **Archiver** service:
   a. Select the service.
   b. Under  (actions), select **View** > **Config**.
   c. In the toolbar, click 

3. Event Stream Analysis (ESA)

Note: Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.6 and later. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

There are no required post-upgrade tasks for ESA. For ESA troubleshooting, see ESA Troubleshooting Information.

If you want to add support for Endpoint, UEBA, and Live content rules, you must update the `multi-valued` and `single-valued` parameter meta keys on the ESA Correlation service to include all the required meta keys. It is not necessary to make these adjustments during the upgrade; you can make the adjustments later at a convenient time. For detailed information and instructions, see "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*

Event Stream Analysis (ESA)

After upgrading to the 12.1 version, all the ESA deployments will be migrated to (**CONFIGURE**) > **Policies** page. Each deployment will be converted into a policy and group and will be available to manage only after the upgrade of the Correlation servers to the 12.1 version. Verify if all the ESA deployments are in a healthy state. For more information, see "View a Deployment" topic in the *Live Services Management Guide*.

Note: Analysts must have appropriate permissions to view the ESA rules under (**CONFIGURE**) > **ESA Rules** and (**CONFIGURE**) > **Policies** pages. For more information, see the **Source-server** section in the "Role Permissions" topic in the *System Security and User Management Guide*.

The pre-upgrade and post-upgrade states of deployments are represented in the following table.

SINo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No

(Optional) Using the **Merge Policy** button, you can merge a policy having ESA content with a policy with no ESA content. For more information, see "Merge Policy with ESA Content" topic in the *Live Services Management Guide*.

Investigate

(Conditional - For Custom Roles Only) Adjust investigate-server Permissions for Custom User Roles

After upgrading to Version 12.1.0.0, the built-in user roles for analysts (and others) using Investigate have the `investigate-server.event.filter` permission enabled, but the upgrade process does not enable the permission for custom user roles. Users who are assigned a custom user role that does not have this permission enabled cannot see the Filter Events panel, a new panel in 12.1.0.0 where they can drill into metadata.

Note: The built-in user roles for analysts using Investigate have three additional permissions added in Version 11.4 enabled, but the upgrade process does not enable the permissions for custom user roles. Users who are assigned a custom user role that does not have these permissions cannot see the Navigate view and Legacy Events view in the Investigate menu. The three permissions that need to be enabled for custom user roles are:
`investigate-server.columngroup.read`, `investigate-server.metagroup.read`, and `investigate-server.profile.read`

To enable the permissions for a user role:

1. Go to  (Admin) > **Security** and click the **Roles** tab.
2. Select the custom user role that needs to be edited and click  (edit icon).
3. In the Edit Role dialog, ensure that these four permissions are enabled:
   `investigate-server.event.filter`
   `investigate-server.columngroup.read`
   `investigate-server.metagroup.read`
   `investigate-server.profile.read`
4. Click **Save** to save your changes. When analysts with the custom user role log in to the NetWitness Platform, the changes are in effect.

Respond

The Primary ESA server must be upgraded to 12.1.0.0 before you can complete these tasks.

Note: After upgrading the primary NW Server (including the Respond Server service), the Respond Server service is not automatically re-enabled until after the Primary ESA host is also upgraded to 12.1.0.0 The Respond post-upgrade tasks only apply after the Respond Server service is upgraded and is in the enabled state.

(Conditional) Restore Any Respond Service Custom Keys in the Aggregation Rule Schema

Note: If you did not manually customize the incident aggregation rule schema, you can skip this task.

If you added custom keys in the `var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` file for use in the `groupBy` clause for 12.1.0.0, modify the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` file and add the custom keys from the automatic backup file.

The backup file is located in `/var/lib/netwitness/respond-server/data` and it is in the following format:
`aggregation_rule_schema.json.bak-<time of the backup>`

Reference Log Decoder

For full functionality, make sure your reference Log Decoder is at 11.6 or later. If you never set up a reference Log Decoder, there is no need to take action. For details, see the *Log Parser Customization Guide*.

Legacy Windows Log Collector

Update the Legacy Windows Log Collector UUID

After upgrading to 12.1.0.0, for each Legacy Windows Log Collector configured in your environment, run the following command on the NW Server:

```
wlc-cli-client --update-to-uuid --host <WLC host address>
```

Refresh Legacy Windows Log Collector Certificates with Updated SA Certificates

Post Upgrade Steps:

1. Execute the following command in SA:
   a. `wlc-cli-client --host-display-name` **`hostDisplayName`** `--service-display-name` **`serviceDisplayName`** `--host` **`WLChostIPAddress`** `--port 50101 --use-ssl false`

      Enter following information:

      i. **Legacy Windows Log Collector REST Username and Legacy Windows Log Collector REST Password**: Enter the admin credentials for the Legacy Windows Log Collector.

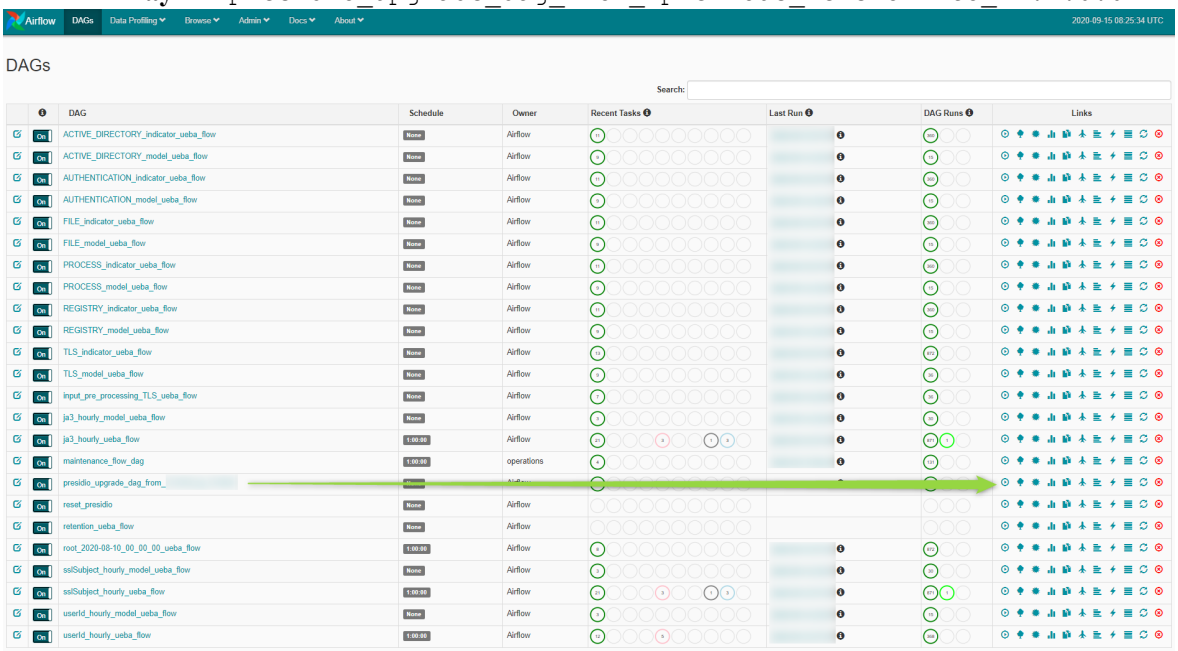
      ii. **Security Server Username and Security Server Password**: Enter admin credentials for NetWitness.
2. Restart the system.

User Entity Behavior Analytics

IMPORTANT: Before the upgrade, if you encountered and resolved the task failure issues, then after the upgrade, you must replace the `authentication.json` file before you run the post-upgrade tasks. The task failure issues in Airflow and their solutions are described in the 'Troubleshooting' topic of the *UEBA Configuration Guide*.

IMPORTANT: Every UEBA deployment when upgraded requires additional steps to complete the upgrade process. When you upgrade from 11.6.x to 11.6.x.x, you must follow UEBA instructions in the Upgrade Guide for 11.6.x.x, before you upgrade to 11.7.x.

Note: When you upgrade to 12.1.0.0 from 11.6.x.x, you don't need to rerun the UEBA system for the last 28 days, if you don't update the current processing schemas. When you upgrade to 12.1.0.0 from a version prior to 11.7.x, the UEBA system runs a rerun automatically.



1. Update the UEBA configuration using the following command from the UEBA machine.
   ```
   source /etc/sysconfig/airflow

   source $AIRFLOW_VENV/bin/activate

   OWB_ALLOW_NON_FIPS=on python
   /var/netwitness/presidio/airflow/venv/lib/python2.7/site-packages/presidio_
   workflows-1.0-py2.7.egg/presidio/resources/rerun_ueba_server_config.py
   ```
2. (Optional) Update the UEBA processing schema, if needed.

   NetWitness recommends that the UEBA start date is set to 28 days earlier than the current date. For UEBA systems that intend to process TLS data, you must make sure that the start date is set to no later than 14 days earlier than the current date.

   For more information, see the "reset-presidio script" section in the *UEBA Configuration Guide*.
3. Run the airflow upgrade DAG.
   - Go to Airflow main page `https://<UEBA-host-name>/admin`
   - Enter the admin username and password.
   - Click the **Play** in `presidio_upgrade_dag_from_<previous_version> to_12.1.0.0`.

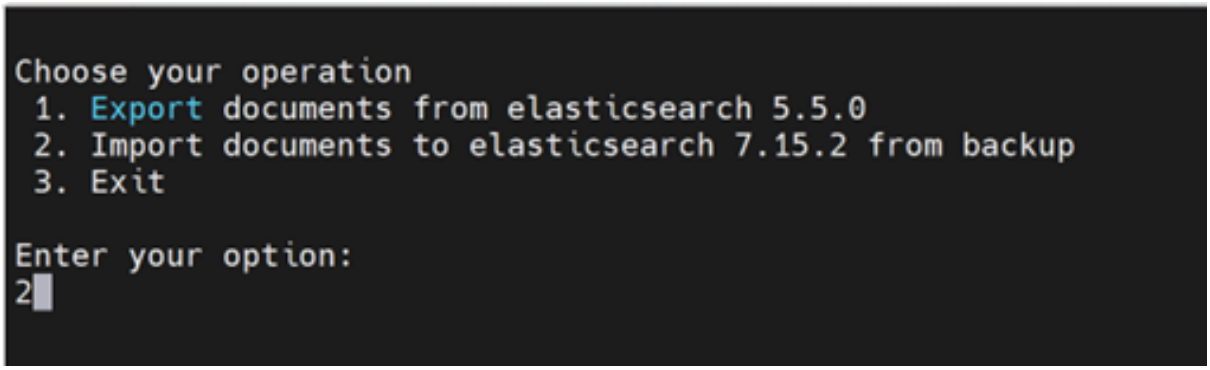
   Note: A light green circle will appear next to the upgrade DAG row during the upgrade. If the upgrade process is completed successfully the light green circle changes to green. If the upgrade process fails, the light green circle changes to red.
4. Set the appropriate "Boot Jar Pools" slots:
   - **Physical Appliance**: Update the `spring_boot_jar_pool` slot value be 18.
   - **Virtual Appliance**: Update the `spring_boot_jar_pool` slot value to 22.
     To update the **Spring Boot Jar Pools** slots, go to the Airflow main page, tap the **Admin** tab at the top bar and tap **Pools**.

a. To access the Airflow UI, go to `https://<UEBA_host>/admin` and enter the credentials.
User: admin
Password: The environment deploy admin password.

b. Click on the pencil mark of the Pools to update the slot values.

5. Edit the `spring_boot_jar_pool` and update the slots amount to 22.

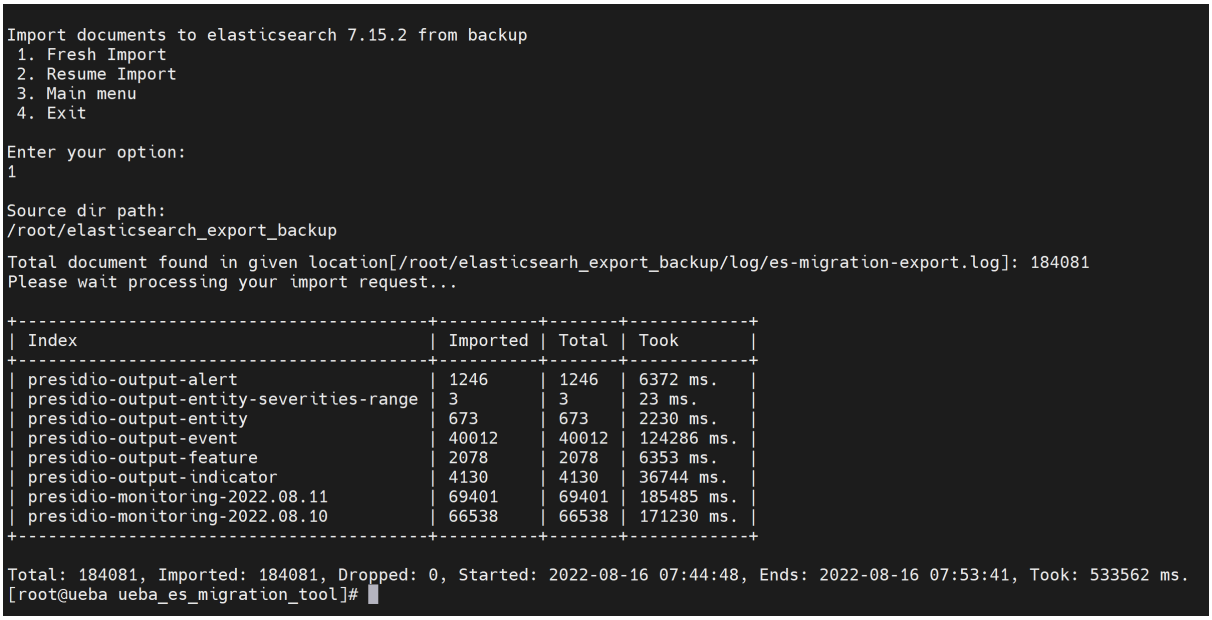
6. Import the Elasticsearch presidio data after upgrading the UEBA host to 12.1.0.0. Make sure the following prerequisites are met before you import the Elasticsearch presidio data:



- Elasticsearch version must be upgraded to 7.15.2 from 5.5.0.
- UEBA host must be upgraded to 12.1.0.0
- UEBA rpm version must be 12.1.0.0.
- Elasticsearch data in 12.0.0.0 or older versions must be exported and stored in the Elasticsearch data backup folder located in the `/root/` directory.

To import the Elasticsearch data:

a. Go to `cd ueba_es_migration_tool`. Run the following command.



```
sh elk-migration-script.sh
```

The Elasticsearch migration tool guide is displayed.

b. Select **Import documents to elasticsearch 7.15.2 from backup**.

c. In the next step, select **Fresh Import** to import the backup data.

d. Restart the Presidio UI service once the Import operation is completed. Run the following command.

```
systemctl restart presidio-ui
```

e. Go to the NetWitness Platform XDR **Users** tab and verify if all the Elasticsearch data is imported.

Note:
- Go to `<backup_directory_path>/log/log/es-migration-import.log` if you want to view the log for any exceptions.
- If the Import operation fails due to some technical issue, select **Resume Import** once the issue is resolved, to resume the Import operation.

Endpoint Upgrade Tasks

Install the 12.1.0.0 Relay Server

If you have configured Relay Server, perform the following:

1. You must upgrade the Relay Server to 12.1.0.0 by downloading the Relay Server installer from the upgraded Endpoint Server. For more information see "(Optional) Installing and Configuring Relay Server" section in the *Endpoint Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. Restart the Endpoint Server using the command:

   ```
   systemctl restart rsa-nw-endpoint-server
   ```

Upgrade Endpoint Agents

See "Upgrade Agents" in the *Endpoint Agent Installation Guide for NetWitness Platform 12.1* for instructions on how to upgrade agents.

Start Using New Features

There are many exciting new features that you can enable after you have upgraded to 12.1. The following is a list of the new features for each area of NetWitness. For a detailed description of the new features in this release, see the *Release Notes for NetWitness Platform 12.1*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

- Policy-based Centralized Content Management
- Endpoint Investigation
- Respond

Policy-based Centralized Content Management

- Create and upload content to the Content Library easily.
- Switch services between legacy Content Management UI and the new Centralized Content Management via Groups and Policies using the "toggle" feature.
- Force publish all the content of a policy using the **Force Publish** button available in **Policy Listing** and **Policy Details** page.
- Easily find content, policies or groups of interest by using the "Filtering" capability of the UI in **Content Library**, **Policy Listing** page, **Policy Details** page, and **Group Listing** page.
- Receive meta key and operator suggestions while creating application and network rule conditions.
- Create, modify and publish policies and manage custom content in the Content Library even without an internet connection.
- Manage ESA content and handle multiple deployments seamlessly using Policy.
- One-click management of subscriptions and automatic updates for ESA content.
- Seamlessly view ESA Live content along with your own custom content.
- Add and manage ESA Correlation servers as part of groups.
- Manage all the data sources for the ESA Correlation servers from the **Settings** > **Event Stream Analysis** > **Data Sources** page seamlessly.

Endpoint Investigation

- Initiate YARA scans at the Endpoint agent level by selecting one or multiple Endpoint agents.
- Use the **File Actions** tab in the **Respond** > **Alerts** > **Endpoint Alerts** > **Alert details** page to save a local copy of the selected file, download it to the server, or block it.

Respond

- Export Incident Data using **Export** drop-down.

Appendix A. Offline Method (No Connectivity to Live Services) - CLI

You can use this method if the NW Server host is not connected to Live Services.

Prerequisites

Make sure that you have downloaded the `netwitness-12.1.0.0.zip` file from NetWitness Community (https://community.netwitness.com/) > **Products > NetWitness Platform** > **Downloads** > **Version 12.1** > **Full Product Downloads** to a local directory:

Procedure

You must perform the upgrade steps for NW Server hosts and for component servers.

Note: If you copy and paste the commands from PDF to Linux SSH terminal, the characters do not work. It is recommended to type the commands.

1. Stage the 12.1.0.0 files to prepare them for the upgrade.
   - Log into the NW Server as `root` and create the following directory:
     `/tmp/upgrade/12.1.0.0`
     and then copy the package zip files to the `/root` directory of the NW Server and extract the package files from `/root` to the appropriate directories using the following command: `unzip netwitness-12.1.0.0.zip -d /tmp/upgrade/12.1.0.0`

   Note: If you copied the .zip file to the created staging directory to unzip, make sure that you delete the initial .zip file that you copied to the staging location after you extract it.
2. Initialize the upgrade, using the following command:
   `upgrade-cli-client --init --version 12.1.0.0 --stage-dir /tmp/upgrade`
3. Upgrade the NW Server host, using the following command:
   `upgrade-cli-client --upgrade --host-key <ID / display name / (hostname/ IP address)> --version 12.1.0.0`
4. When the NW Server host upgrade is successful, reboot the host from NetWitness Platform user interface in the Hosts view.
5. Repeat steps 3 and 4 for other component hosts.

Note: You can check versions of all the hosts, using the command `upgrade-cli-client --list` on the NW Server host. If you want to view the help content of `upgrade-cli-client`, use the command `upgrade-cli-client --help`.

Note: If the following error is displayed during the upgrade process:
`2017-11-02 20:13:26.580 ERROR 7994 — [ 127.0.0.1:5671] o.s.a.r.c.CachingConnectionFactory : Channel shutdown: connection error; protocol method: #method<connection.close>(reply-code=320, reply-text=CONNECTION_FORCED - broker forced connection closure with reason 'shutdown', class-id=0, method-id=0)`
the service pack will install correctly. No action is required. If you encounter additional errors when updating a host to a new version, contact Customer Support for assistance.

External Repo Instructions for CLI upgrade

1. Stage the 12.1.0.0 files to prepare them for the upgrade.
2. Log into the NW Server as `root` and create the following directory: `/tmp/upgrade/12.1.0.0` and then copy the package zip files to the `/root` directory of the NW Server and extract the package files from `/root` to the appropriate directories using the following command: `unzip netwitness-12.1.0.0.zip -d /tmp/upgrade/12.1.0.0`

   Note: If you copied the .zip file to the created staging directory to unzip, make sure that you delete the initial .zip file that you copied to the staging location after you extract it.
3. Initialize the upgrade, using the following command:
   `upgrade-cli-client --init --version 12.1.0.0 --stage-dir /tmp/upgrade`
4. Upgrade the NW Server host using the following command:
   `upgrade-cli-client --upgrade --host-key <ID / display name / (hostname/ IP address)> --version 12.1.0.0`
5. When the NW Server host upgrade is successful, reboot the host from NetWitness UI.
6. Repeat steps 3 and 4 for other component hosts.

Note: You can check versions of all the hosts, using the command `upgrade-cli-client --list` on the NW Server host. If you want to view the help content of `upgrade-cli-client`, use the command `upgrade-cli-client --help`.

Note: If the following error displays during the upgrade process:
`2017-11-02 20:13:26.580 ERROR 7994 — [ 127.0.0.1:5671] o.s.a.r.c.CachingConnectionFactory : Channel shutdown: connection error; protocol method: #method<connection.close>(reply-code=320, reply-text=CONNECTION_FORCED - broker forced connection closure with reason 'shutdown', class-id=0, method-id=0)`
the service pack will install correctly. No action is required. If you encounter additional errors when updating a host to a new version, contact Customer Support for assistance.

Appendix B. Set Up External Repo

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. (Conditional) Complete this step if you have an external repo and you want to override it.
   - Case 1: You bootstrapped the host from an external repo and you want to upgrade using a local repo on the Admin Server.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.
        `https://nw-node-zero/nwrpmrepo`
     c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool.
   - Case 2: You bootstrapped the host from local repo on the Admin server (NW Server host) and you want to use an external repo for the upgrade.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.
        `https://<webserver-ip>/<alias-for-repo>`
     c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool. The instructions are in "Appendix A. Offline Method (No Connectivity to Live Services) - Command Line Interface" in the *Upgrade Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. Set up the external repo.
   a. Log in to the web server host.
   b. Create directory to host the NW repository (`netwitness-12.1.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, /var/netwitness is the web-root, run the following command string.
      `mkdir -p /var/netwitness/<your-zip-file-repo>`
   c. Create the 12.1.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
      `mkdir -p /var/netwitness/<your-zip-file-repo>/12.1.0.0`
   d. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/12.1.0.0`
      `mkdir -p /var/netwitness/<your-zip-file-repo>/12.1.0.0/OS`
      `mkdir -p /var/netwitness/<your-zip-file-repo>/12.1.0.0/RSA`

e. Unzip the `netwitness-12.1.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/12.1.0.0` directory.
`unzip netwitness-12.1.0.0.zip -d /var/netwitness/<your-zip-file-repo>/12.1.0.0`

Unzipping `netwitness-12.1.0.0.zip` results in two zip files (`OS-12.1.0.0.zip` and `RSA-12.1.0.0.zip`)
and some other files.

f. Unzip the:
`OS-12.1.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/12.1.0.0/OS` directory.
`unzip /var/netwitness/<your-zip-file-repo>/12.1.0.0/OS-12.1.0.0.zip -d /var/netwitness/<your-zip-file-repo>/12.1.0.0/OS`

The external url for the repo is `http://<web server IP address>/<your-zip-file-repo>`.

g. Unzip the:
`RSA-12.1.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/12.1.0.0/RSA` directory.
`unzip /var/netwitness/<your-zip-file-repo>/12.1.0.0/RSA-12.1.0.0.zip -d /var/netwitness/<your-zip-file-repo>/12.1.0.0/RSA`

h. (Conditional - For Azure) Follow these steps for Azure update.

i. `mkdir -p /var/netwitness/<your-zip-file-repo>/12.1.0.0/OS/other`

ii. `unzip nw-azure-12.1-extras.zip -d /var/netwitness/<your-zip-file-repo>/12.1.0.0/OS/other`

iii. `cd /var/netwitness/<your-zip-file-repo>/12.1.0.0/OS`

iv. `createrepo`

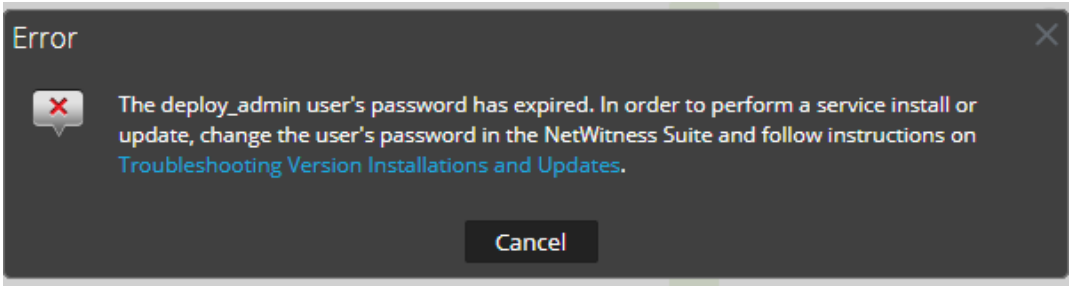
i. Use the `http://<web server IP address>/<your-zip-file-repo>` in response to **Enter the base URL of the external update repositories** prompt from NW 12.1.0.0 Setup program (`nwsetup-tui`) prompt.

Appendix C. Troubleshooting Version Installations and Upgrades

This section describes the error messages displayed in the Hosts view when it encounters problems updating host versions and installing services on hosts in the Hosts view. If you cannot resolve an update or installation issue using the following troubleshooting solutions, contact Customer Support.

Troubleshooting instructions for the following errors that may occur during the upgrade are described in this section.

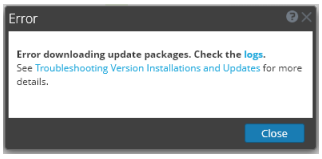
- deploy_admin Password Expired Error
- Downloading Error
- Error Deploying Version <version-number> Missing Update Packages
- Upgrade Failed Error
- External Repo Update Error
- Host Update Failed Error
- Missing Update Packages Error
- OpenSSL 1.1.x Error
- Patch Update to Non-NW Server Error
- Reboot Host After Update from Command Line Error
- Reporting Engine Restarts After Upgrade



Troubleshooting instructions are also provided for errors for the following hosts and services that may occur during or after an upgrade.

- Log Collector Service
- NW Server
- Orchestration
- Reporting Engine
- Event Stream Analysis
- Legacy Windows Log Collector

Problem	Unable to boot the appliance after upgrading
Wokaround	1. Manually modify the GRUB boot line to `FIPS=0` to get it to boot. 2. From here, disable FIPS using the following command: `manage-stig-controls --disable-control-groups 3 --host-all`

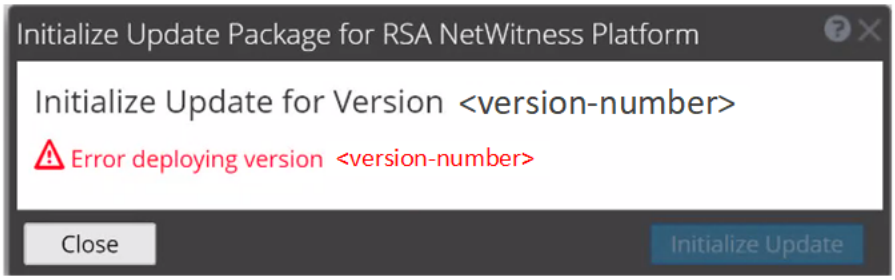


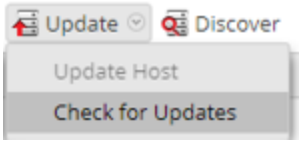
3. Verify the line `FIPS=1` is removed from `/boot/grub2/grub.cfg`
   - If not, run the following command:
     `grub2-mkconfig -o /boot/grub2/grub.cfg`
4. Reboot.
5. Run the following command to enable FIPS:
   `manage-stig-controls --enable-control-groups 3 --host-all`
6. Reboot again.

deploy_admin User Password Has Expired Error

Error Message	
Cause	The `deploy_admin` user password has expired.

Solution	Reset your `deploy_admin` password password.
	1. On the NW Server host only, run the following command.
	`nw-manage --update-deploy-admin-pw`
	`Please enter the new deploy_admin account password: <new-deploy-admin-password>`
	`Please confirm the new deploy_admin account password: <new-deploy-admin-password>`
	2. Review the output of the `nw-manage --update-deploy-admin-pw` command to verify the `deploy_admin` password was successfully updated on all hosts. If an NW host is down or fails for any reason as displayed by the output of the `nw-manage --update-deploy-admin-pw` command, run `nw-manage --sync-deploy-admin-pw --host-key <host-identifier>` to synchronize the password between the NW Server and the host that failed once the communication failure is resolved.
	3. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt.





Downloading Error

Error Message	
Problem	When you select an update version and click **Update** >**Update Host**, the download starts but fails to complete.
Cause	Version download files can be large and take a long time to download. If there are communication issues during the download it will fail.
Solution	1. Try to update again. 2. If it fails again with the same error, try to update using the offline methods as described in "Offline Method from Hosts View" or "Offline Method Using Command Line Interface" in the *Upgrade Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues. 3. If you are still not able to update, contact Customer Support.

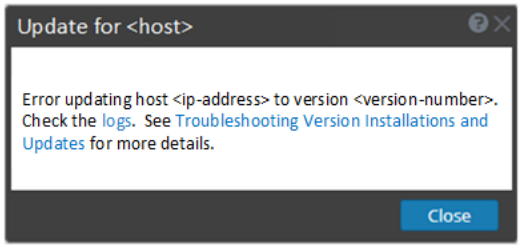
Error Message	If you are upgrading from NetWitness Platform 11.x.x.x to 11.6.x.x or later, offline UI upgrade fails with the Download error message.

Solution	1. In the Command Line Interface (CLI):
	a. SSH to NW Server.
	b. Run the following command:
	`upgrade-cli-client --upgrade --host-key <ID, IP address, hostname or display name of host> --version <version number>`
	`For example:`
	`upgrade-cli-client --upgrade --host-key <ID, IP address, hostname or display name of host> --version 11.6.0.0`
	2. After the NW Server is successfully updated, log in to the NW Server user interface and go to **(Admin) > Hosts**, where you are prompted to reboot the host.
	3. Click **Reboot Host** from the toolbar.
	You can upgrade all the other hosts directly from the user interface:
	1. Click **Begin Update** from the Update Available dialog.
	After the host is upgraded, it prompts you to reboot the host.
	2. Click **Reboot Host** from the toolbar.

Error Deploying Version <version-number> Missing Update Packages

Error Message	
Problem	Error deploying version <version-number> is displayed in the **Initialize Update Package for NetWitness Platform** dialog after you click on **Initialize Update** if the update package is corrupted.
Solution	1. Click **Close** to close the dialog. 2. Remove the version folder from staging folder. 3. Make sure that the salt-master service is running. 4. Recopy the update package zip file to the staging folder. 5. In the Hosts view toolbar, select Check for Updates again.  6. Click **Initialize Update**. 7. Click **Update** > **Update Hosts** from the toolbar. 8. Click **Begin Update** from the **Update Available** dialog. After the host is updated, it prompts you to reboot the host. 9. Click **Reboot** from the toolbar.

Upgrade Failed Error



Error Message	Received an error in the error log similar to the following when trying to update to version 11.6 or later: `FATAL: Chef::Exceptions::Package: yum_package[rsa-protobufs-rt] (rsa-audit::packages line 11) had an error: Chef::Exceptions::Package: No version specified, and no candidate version available for rsa-protobufs-rt`
Cause	Custom builds/rpms installed for certain components installed on hosts, such as in the case of installing Hotfixes.

Solution	To resolve the issue, follow the below steps.
	1. SSH to Admin Server.
	2. Locate the component descriptor file by running the following command.
	`cd /etc/netwitness/component-descriptor/`
	3. Open the component descriptor file by running the following command.
	`vi nw-component-descriptor. json`
	4. Search for "packages" section for the component you have custom build/rpm. For example, below shown is the package details for "concentrator" host that has custom build/rpm.
	`"concentrator": {`
	`"cookbook_name": "rsa-concentrator",`
	`"service_names": ["rsa-nw-concentrator"],`
	`"family": "launch",`
	`"default_port": xxxx, "description": "Concentrator",`
	`"packages":[{ "name": "rsa-nw-concentrator",`
	`"version" : "11.6.0.0-2003001075220.5.cecf24b.e.17.centos"`
	`},`
	5. Delete the complete version details including (,) character in the packages section. For example, it should look like as shown below after you delete the version details.
	`"packages": [{`
	`"name": "rsa-nw-concentrator"`
	`},`
	Note: You must delete the version details for all the host that has custom builds/rpms in the component descriptor of the admin server.
	6. Run the upgrade process again.

External Repo Update Error

Error Message	Received an error similar to the following error when trying to update to a new version from the : `.Repository 'nw-rsa-base': Error parsing config: Error parsing "baseurl = 'https://nw-node-zero/nwrpmrepo /<version-number>/RSA'": URL must be http, ftp, file or https not ""`
Cause	There is an error the path you specified.
Solution	Make sure that: • the URL does exist on the NW Server host. • you used the correct path and remove any spaces from it.

Host Update Failed Error

Error Message	
Problem	When you select an update version and click **Update** > **Update Host**, the download process is successful, but the update process fails.

Solution	1. Try to apply the version update to the host again.
	Often this is all you need to do.
	2. If you still cannot apply the new version update:
	Monitor the following logs on NW Server as it progresses (for example, run the `tail -f` command from the command line):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error appears in one or more of these logs.
	3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support.

Missing Update Packages Error

Error Message	**Initialize Update for Version xx.x.x.x** Missing the following update package(s) Download Packages from NetWitness Link
Problem	Missing the following update package(s) is displayed in the **Initialize Update Package for NetWitness Platform** dialog when you are updating a host from the **Hosts** view offline and there are packages missing in the staging folder.
Solution	1. Click Download Packages from NetWitness Community in the **Initialize Update Package for NetWitness Platform** dialog. The NetWitness Community page that contains the update files for the selected version is displayed. 2. Select the missing packages from the staging folder. The **Initialize Update Package for NetWitness Platform** dialog is displayed telling

	you that it is ready to initialize the update packages.

OpenSSL 1.1.x

Error Message	The following example illustrates an ssh error that can occur when the ssh client is run from a host with OpenSSL 1.1.x installed: `$ ssh root@10.1.2.3` **`ssh_dispatch_run_fatal: Connection to 10.1.2.3 port 22: message authentication code incorrect`**

Problem	Advanced users who want to ssh to a NetWitness Platform host from a client that is using OpenSSL 1.1.x encounter this error because of incompatibility between CENTOS 7.x and OpenSSL 1.1.x. For example:
	`$ rpm -q openssl`
	`openssl-1.1.1-8.el8.x86_64`

Solution	Specify the compatible cipher list on the command line. For example:
	`$ ssh -oCiphers=aes128-ctr,aes192-ctr,aes256-ctr root@10.1.2.3`
	`I've read & consent to terms in IS user agreement.`
	`root@10.1.2.3's password:`
	`Last login: Mon Oct 21 19:03:23 2019`

Patch Update to Non-NW Server Error

Error Message	The `/var/log/netwitness/orchestration-server/orchestration-server.log` has an error similar to the following error: **`API|Failure /rsa/orchestration/task/update-config-management [counter=10 reason=IllegalArgumentException::Version '11.x.x.n' is not supported`**
Problem	After you update the NW Server host to a version, you must update all non-NW Server hosts to the same version. For example, if you update the NW Server from 11.4.0.0 to 11.6.0.0 or later, the only update path for the non-NW Server hosts is the same version (that is, 11.6.0.0). If you try to update any non-NW Server host to a different version (for example, from 11.4.0.0 to an 11.4.x.x) you will get this error.
Solution	You have two options: • Update the non-NW Server host to 11.6.0.0 or later, or • Do not update the non-NW Server host (keep it at its current version)

Reboot Host After Update from Command Line Error

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline.

Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Reporting Engine Restarts After Upgrade

Problem	In some cases, after you upgrade to 11.6 or later from versions of 11.x, such as 11.4, the Reporting Engine service attempts to restart continuously without success.
Cause	The database files for live charts, alert status, or report status may not be loaded successfully as the files may be corrupted.
Solution	To resolve the issue, do the following: 1. Check which database files are corrupted: Navigate to the file located at `/var/netwitness/reserver/rsa/soc/reporting-engine/logs/reporting-engine.log` and check the following blocks: • If the live charts db file is corrupted, the following logs are displayed: Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception: org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196] at org.h2.message.DbException.getJdbcSQLException(DbException.java:345) at org.h2.message.DbException.get(DbException.java:168) org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'chartSummaryDAOImpl': Invocation of init method failed; nested exception is com.rsa.soc.re.exception.ReportingException: java.sql.SQLException: Connections could not be acquired from the underlying database! • If the alert status db file is corrupted, the following logs are displayed: Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception: org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196] at org.h2.message.DbException.getJdbcSQLException(DbException.java:345) at org.h2.message.DbException.get(DbException.java:168) org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertStatusHandler': Unsatisfied dependency expressed through field 'alertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertExecutionStatsDAOImpl': Unsatisfied dependency expressed through field 'persistedAlertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'persistedAlertExecutionStatsDAOImpl' • If the report status db file is corrupted, the following logs are displayed: `org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196]` 2. To resolve the live charts database file corruption, perform the following steps:

	a. Stop the Reporting Engine service. b. Move the `livechart.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/livecharts` folder to a temporary location. c. Restart the Reporting Engine service. **Note:** Some live charts data may be lost on performing the above steps. To resolve the alert status or report status database file corruption, perform the following steps: a. Stop the Reporting Engine service. b. Replace the corrupted db file with the latest `alertstatusmanager.mv.db` or `reportstatusmanager.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/archives` folder. c. Restart the Reporting Engine service. For more information, see the Knowledge Base article Reporting Engine restarts After upgrade to NetWitness Platform 11.4.

Problem	After you upgrade to version 11.6 or later, the Reporting Engine service does not restart.
Cause	The Reporting Engine service may not start due to any of the following reasons. - workspace.xml not updated. - Time is not converted properly in livechart h2 database. - JCR (Jackrabbit repository) is corrupted with primary key violation.

Solution	To resolve the issue, run the Reporting Engine Migration Recovery tool (`rsa-nw-re-migration-recovery.sh`) on the Admin Server where the Reporting Engine service is installed.
	Note: You can find the Reporting Engine Migration Recovery tool in the below location.
	`/opt/rsa/soc/reporting-engine-<version number>-<Tag>/nwtools`
	For example:
	`/opt/rsa/soc/reporting-engine-11.6.0.0-<Tag>/nwtools`
	1. SSH to Admin Server.
	2. Untar the RE (Reporting Engine) tool, run the following command.
	`tar -xvf rsa-nw-re-recovery-tool-bundle.tar`
	3. (Optional) If you want to untar the RE tool file in some other directory, you can create a directory and untar the RE tool. Run the following commands.
	`mkdir <NAME OF THE DIRECTORY>`
	`tar -xvf rsa-nw-re-recovery-tool-bundle.tar --directory <PATH OF THE DIRECTORY>`
	4. Run the script, run the following command.
	`./<PATH OF THE DIRECTORY>/rsa-nw-re-recovery-tool.sh`

	For more information, see the Knowledge Base article **Reporting Engine Migration Recovery Tool**.

Log Collector Service (`nwlogcollector`)

Log Collector installation logs posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness and configure the Lockbox as described in the "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	Decoder tries to start capture events but fails. `Aug 27 01:44:41 nwdecoder NwDecoder[8052]: [Decoder] [failure] The PF_RING driver is not installed.`

Solution	To resolve the issue, do the following steps,
	1. SSH to the Decoder host.
	2. Run the following commands.
	`yum reinstall pfring*`
	`systemctl restart nwdecoder`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 11.4.x.x or 11.5.x.x. to 11.6.0.0 or later.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Problem	When you install and orchestrate a fresh 12.1 core Node-X to the Admin server (Node-0) upgraded from 12.0 or older versions to 12.1, the core services such as Concentrator, Log Decoder, Log Collector, Archiver, Decoder, Appliance, Workbench, Warehouse Connector, and Broker appear inactive under the **Services** column in the **Admin** > **Hosts** view. As a result, you cannot access the core services in the UI. This is not applicable if you are orchestrating a fresh 12.1 core Node-X to the fresh-Installed 12.1 Admin Server (not upgraded from 12.0 or older versions to 12.1).
Cause	The 12.1 core Node-X uses a dedicated SA-server certificate instead of the common Node-0 node certificate under its trustpeers if it is orchestrated directly to an upgraded 12.1 Admin Server host.

Solution	1. Before you bootstrap and orchestrate the 12.1 core Node-X host, run the following commands.
	`mkdir -p /etc/netwitness/platform`
	`touch /etc/netwitness/platform/nw-upgrade-mode`
	2. Perform this workaround only if you skip the above workaround (Workaround 1). Run the following commands after you bootstrap and orchestrate the 12.1 core Node-X host.
	`touch /etc/netwitness/platform/nw-upgrade-mode`
	`nw-manage --refresh-host --host-key <core-node-x-salt-minion-uuid>`
	`systemctl restart <core-service-name>`
	Note:
	- Refer the file `/etc/salt/minion` to find `<core-node-x-salt-minion-uuid>`.

	- You must enter the core service name such as **nwarchiver** (Archiver), **nwdecoder** (Decoder), **nwlogcollector** (Log Collector), **nwappliance** (Appliance), **nwconcentrator** (Concentrator), **nwlogdecoder** (Log Decoder), **nwbroker** (Broker), **nwworkbench** (Workbench), and **nwwarehouseconnector** (Warehouse Connector) in `<core-service-name>`.

Reporting Engine Service

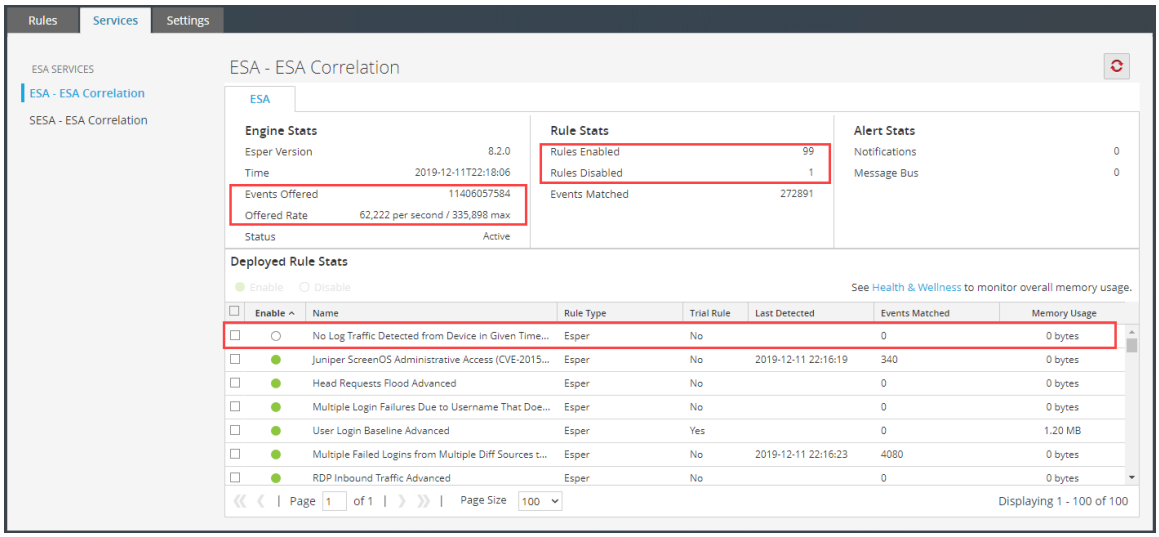
Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

Error Message	`<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [ ><existing-GB ] is less than the required space [ <required-GB> ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space.

Event Stream Analysis

Problem	After upgrading to version 11.6 or later, the ESA correlation server does not aggregate events from the configured data sources.
Error Message	`Invalid username or password at com.rsa.netwitness.streams.base.RecordSourceSubscription.run (RecordSourceSubscription.java:173)`
Solution	To resolve the issue, do the following steps. In the NetWitness user interface, 1. Go to **(Configure) > ESA Rules**. **ESA Rules** panel is displayed with **Rules** tab open. 2. In the Rules tab options panel, under Deployments, select a deployment. 3. In the **Data Sources** section, select the data source and click in the toolbar. 4. In the **Edit Service** dialog, type the password for that data source. 5. Click the **Test Connection** button to make sure that it can communicate with the ESA service and then click **OK**. **Note:** Do the above procedure for all the configured data sources. 6. After you finish making changes to the deployment, click **Deploy Now** to redeploy the ESA rule deployment.

Legacy Windows Log Collector



Problem	• Legacy Windows Log Collector appears as inactive post upgrade of SA to 12.1.0.0 version and Legacy Windows Log Collector to 11.6.x or 11.7.x versions. • Legacy Windows Log Collector appears as inactive when the stack is upgraded to 12.1.0.0.
Cause	Certificate update in the SA node.
Solution	Refer Legacy Windows Log Collector section in the Post Update Tasks.

ESA Troubleshooting Information

ESA Rules are Not Creating Alerts

If you are not seeing any alerts, check the status of the ESA rule deployments.

1. Go to  **(Configure) > ESA Rules > Services** tab.
   The Services view is displayed, which shows the status of your ESA services and deployments.
2. In the options panel on the left, select an ESA service.
3. For each service listed, look at the deployment tabs in the panel on the right. Each tab represents a separate ESA rule deployment.
4. For each ESA rule deployment:
   a. In the **Engine Stats** section, look at the **Events Offered** and the **Offered Rate**. They confirm that the data is being aggregated and analyzed properly. If you see 0 for Events Offered, nothing is coming in for the deploymIent.
   b. In the **Rule Stats** section, look at the **Rules Enabled** and **Rules Disabled**. If there are any disabled rules, look in the **Deployed Rule Stats** section below to view the details of the disabled rules. Disabled rules show a white circle. Enabled rules show a green circle.

5. If you notice any disabled rules that should be enabled:

   a. Go to **(Configure) > ESA Rules > Rules** tab and redeploy the ESA rule deployments that contain disabled rules.

   b. Go back to the **Services** tab and check to see if the rules are still disabled. If the rules are still disabled, check the ESA Correlation service log files, which are located at `/var/log/netwitness/correlation-server/correlation-server.log`.

Note: To avoid unnecessary processing overhead, the Ignore Case option has been removed from the ESA Rule Builder - Build a Statement dialog for meta keys that do not contain text data values. During the upgrade to 11.4 or later, NetWitness Platform does not modify existing rules for the Ignore Case option. If an existing Rule Builder rule has the Ignore Case option selected for a meta key that no longer has the option available, an error occurs if you try to edit the statement and try to save it again without clearing the checkbox.

Endpoint, UEBA, and Live Content Rules are Not Working

To support Endpoint and UEBA content as well as changes to ESA rules from Live, a data change from single-value (string) to multi-value (string array) is required for several meta keys within the ESA Correlation service. In NetWitness Platform 11.4 or later, ESA automatically adjusts the operator in the rule statement when there is a change from string to string array, but you still may need to make manual adjustments to adjust for the string array changes.

To change the string type meta keys to string array type meta keys manually in 11.4 or later, see "Configure Meta Keys as Arrays in ESA Correlation Rule Values" in the *ESA Configuration Guide*.

To use the latest Endpoint, UEBA, and Live content rules, the following default **multi-valued** meta keys are required on the ESA Correlation service in NetWitness Platform version 11.4 or later:

```
action , alert , alert.id , alias.host , alias.ip , alias.ipv6 , analysis.file
, analysis.service , analysis.session , boc , browserprint , cert.thumbprint ,
checksum , checksum.all , checksum.dst , checksum.src , client.all , content ,
context , context.all , context.dst , context.src , dir.path , dir.path.dst ,
dir.path.src , directory , directory.all , directory.dst , directory.src ,
email , email.dst , email.src , eoc , feed.category , feed.desc , feed.name ,
file.cat , file.cat.dst , file.cat.src , filename.dst , filename.src , filter
, function , host.all , host.dst , host.orig , host.src , host.state ,
inv.category , inv.context , ioc , ip.orig , ipv6.orig , netname , OS , param
, param.dst , param.src , registry.key , registry.value , risk , risk.info ,
risk.suspicious , risk.warning , threat.category , threat.desc , threat.source
, user.agent , username
```

The following default **single-valued** meta keys are also required on the ESA Correlation service in NetWitness Platform 11.4 or later:

```
accesses , context.target , file.attributes , logon.type.desc , packets
```

To update your meta keys, see "Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules" in the *ESA Configuration Guide*.

If you used any meta keys in the ESA rule notification templates from the Required String Array or String Meta Keys list, update the templates with the meta key changes. See "Configure Global Notification Templates" in the *System Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: Advanced EPL rules may get disabled and are not automatically updated so they must be fixed manually.

For additional troubleshooting information, see “Troubleshoot ESA” in the *Alerting with ESA Correlation Rules User Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Example ESA Correlation Server Warning Message for Missing Meta Keys

If you see a warning message in the ESA Correlation server error logs that means there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, the new Endpoint, UEBA, and Live content rules will not work. Completing the "Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules" procedure in the *ESA Configuration Guide* should fix the issue.

Multi-Valued Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[alert, alert_id,
browserprint, cert_thumbprint, checksum, checksum_all, checksum_dst, checksum_
src, client_all, content, context, context_all, context_dst, context_src, dir_
path, dir_path_dst, dir_path_src, directory, directory_all, directory_dst,
directory_src, email_dst, email_src, feed_category, feed_desc, feed_name,
file_cat, file_cat_dst, file_cat_src, filename_dst, filename_src, filter,
function, host_all, host_dst, host_orig, host_src, host_state, ip_orig, ipv6_
orig, OS, param, param_dst, param_src, registry_key, registry_value, risk,
risk_info, risk_suspicious, risk_warning, threat_category, threat_desc,
threat_source, user_agent] are still MISSING from multi-valued
```

Single Value Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[accesses, context_target,
file_attributes, logon_type_desc, packets] are still MISSING from single-
valued
```

The Basics

This guide describes the basic requirements of a NetWitness deployment and outlines optional scenarios to address the needs of your enterprise. Even in small networks, planning can ensure that all goes smoothly when you are ready to bring the hosts online.

Note: This document refers to several additional documents available on NetWitness Community Link. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

There are many factors you must consider before you deploy NetWitness. The following items are just some of these factors. You need to estimate growth and storage requirements when you consider these factors:

- The size of your enterprise (that is, the number of locations and people that will use NetWitness)
- The volume of network data and logs you need to process
- The performance each NetWitness user role needs to do their jobs effectively.
- The prevention of downtime (that is, how to avoid a single point of failure).
- The environment in which you plan to run NetWitness
  - RSA Physical Hosts (software running on hardware supplied by RSA)
  - Software Only provided by RSA:
    - On-Premises (On-Prem) Virtual Hosts
      See the *NetWitness Virtual Host Installation Guide* for detailed instructions on how to deploy on-prem virtual hosts.
    - VCloud:
      - Amazon Web Services (AWS)
        See the *NetWitness AWS Installation Guide* for detailed instructions on how to deploy virtual hosts in AWS.
      - Azure
        See the *NetWitness Azure Installation Guide* for detailed instructions on how to deploy virtual hosts in Azure.
      - Google Cloud Platform (GCP)
        See the *NetWitnessGoogle Cloud Platform Installation Guide* for detailed instructions on how to deploy virtual hosts in Google Cloud.

Basic Deployment

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

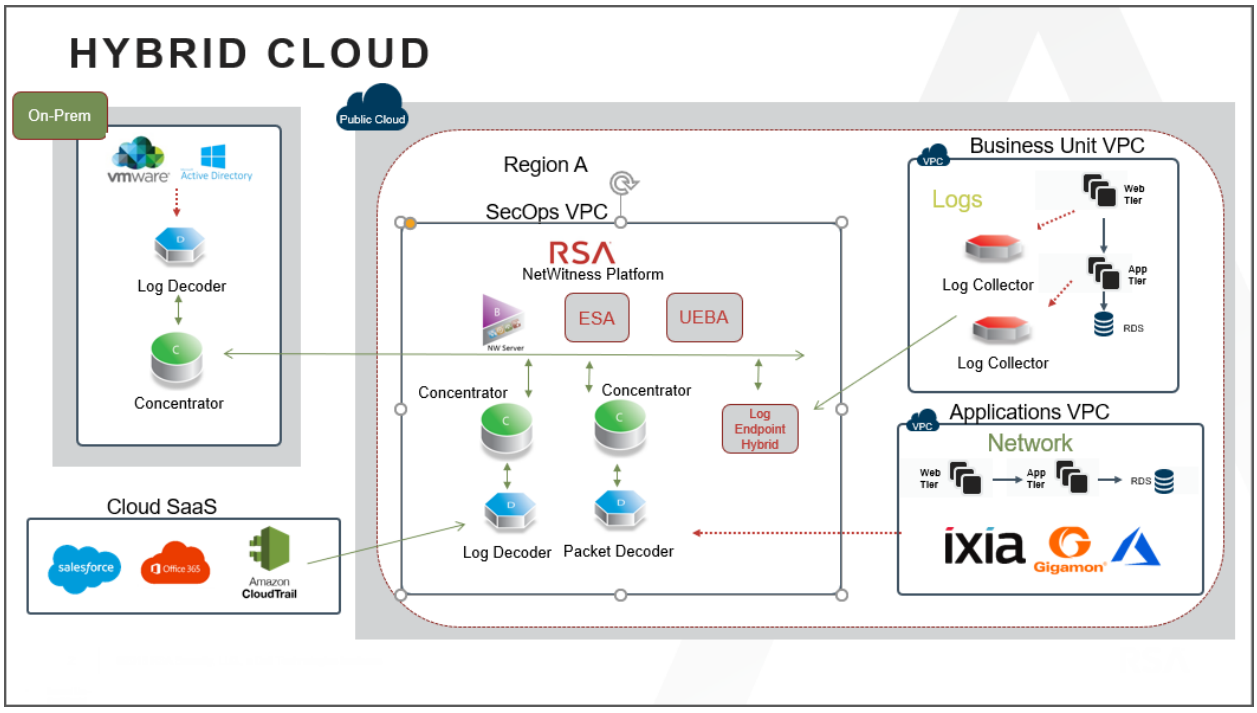
- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When ready to begin deployment, the general sequence is:

- For RSA Physical Hosts:
  1. Install physical hosts and connect to the network as described in the NetWitness Hardware Setup Guides and the *NetWitness Physical Host Installation Guide*.
  2. Set up licensing for NetWitness as described in the *NetWitness Licensing Guide*.
  3. Configure individual physical hosts and services as described in *NetWitness Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.
- For On-Prem virtual hosts, follow the instructions in the *NetWitness Virtual Host Setup Guide*.
- For AWS, follow the instructions in the *NetWitness AWS Installation Guide*.
- For Azure, follow the instructions in the *NetWitness Azure Installation Guide*.
- For Google Cloud, follow the instructions in the *NetWitnessGoogle Cloud Platform Installation Guide*.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *NetWitness Host and Services Getting Started Guide*.



NetWitness High-Level Deployment Diagrams

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log, and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

Deployment Optional Setup Procedures

You can deploy NetWitness with the following options.

Analyst User Interface
Group Aggregation
New Health and Wellness Search
Hybrid Categories on Series 6 (R640) Hardware
NW Server Deployment on ESA Hardware
Second Endpoint Server
Warm Standby NW Server

Analyst User Interface

The Analyst User Interface (UI) gives you access to a subset of features in the NetWitness Platform UI that you can set up in individual locations when you deploy NetWitness Platform in multiple locations. It is designed to reduce latency and improve the performance that can occur when accessing all functionality from the Primary User Interface on the NW Server Host (Primary UI).

You can have can have multiple Analyst UI instances provisioned in the same manner as the other NW component hosts.

Features and Limitations

Each Analyst UI host:

- Can be deployed to specific organizational groups. For example: the Americas, EMEA, APAC, Tier 1 Analysts, Tier 3 Analysts.
- If Analyst UI hosts are deployed regionally, you have the capability of querying those regional brokers directly (less latency), instead of than having to route through the Primary UI.
- Helps distribute load off the Primary UI.
- Has its own Reporting Engine (RE).
- If it becomes unavailable for any planned or unplanned reason, it will not affect the Primary UI or any other Analyst UI instances.
- Provides the same pre-query filter verification, Data Privacy protection, and RBAC functionality as the Primary UI.
- Points back to the primary NW Server for authentication and configuration.
- Does not have access to any administrative functions. All administration functions take place on the Primary UI.
- Does not allow you to create or manage Content (that is, ESA rules, app rules, feeds). All Content creation and management takes place on the Primary UI.

Use Case

Large environments that include Geo distribution with a single data center and multiple NW Servers require Analyst UI instances in all their NetWitness locations or managed entities.

For example, if an Analyst UI is deployed for the EMEA SOC team, analysts can query their EMEA NetWitness Platform hosts directly. If the EMEA team has Broker hosts and Concentrator hosts within the region, the Analyst UI can connect and query them instead of connecting back to Primary user Interface (Primary UI).

Deployment

You must install the **Analyst UI** service category on a dedicated host and you install it in the same manner as any component service category on a host.

See the "Task 2 - Install 11.7 on Other Component Hosts" in the NetWitness Platform Installation Guides for instructions on how to install any component service. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

After you provision the Analyst UI host (that is after you run the nwsetup-tui for the component host designated for the Analyst UI), complete the following steps to install the Analyst UI service category on the provisioned host.

1. Log in to **NetWitness** and go to  (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

2. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

3. Select that host in the **Hosts** view (for example, **Analyst UI**) and click 

   .
   The **Install Services** dialog is displayed.

4. Select **Analyst UI** in **Category** and click **Install**.

5. Configure NetWitness Platform for each Analyst UI instance.Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

   a. Make sure that each Analyst UI instance is connected to the correct local Reporting Engine and has the appropriate Investigation parameters set. The *Getting Started Guide for NetWitness Platform* describes the default Analyst UI Dashboard and how you manage dashboards.

   Note: You must add data sources to each Reporting Engine instance to execute Reports and Charts on an Analyst UI. See "Configure the Data Sources" in the*Reporting Engine Configuration Guide for NetWitness Platform* for instructions.

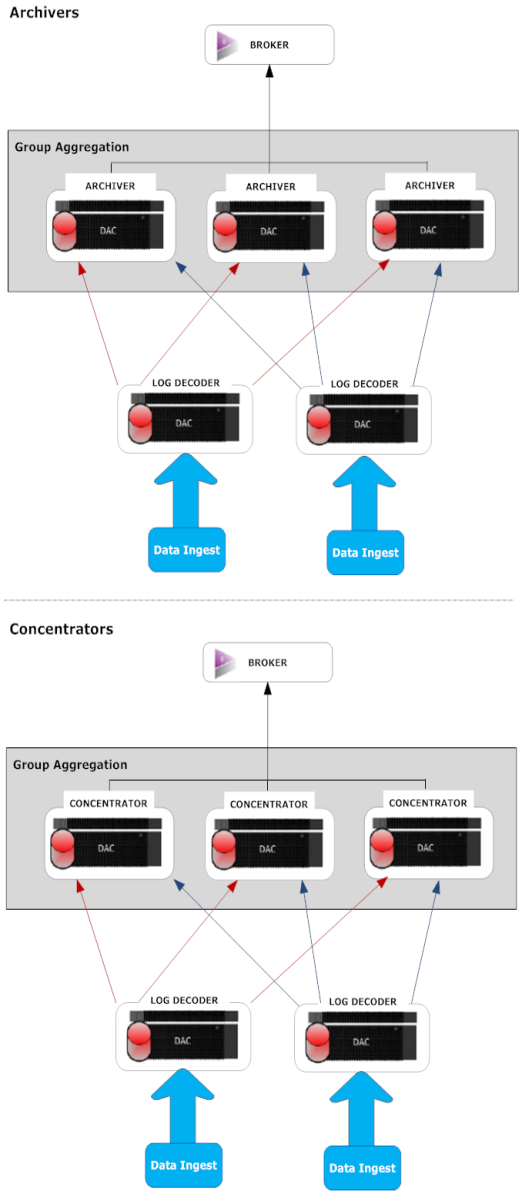
b. Configure whether to normalize alerts for any Respond Server (NW Server or Analyst UI) by enabling or disabling alert normalization. "Configure Analyst UI for Respond Server Alert Normalization" in the *NetWitness Respond Configuration Guide for NetWitness Platform* tells you how to configure Respond Server alert normalization for the Analyst UI.

Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

RSA Group Aggregation Deployment Recommendations



RSA recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

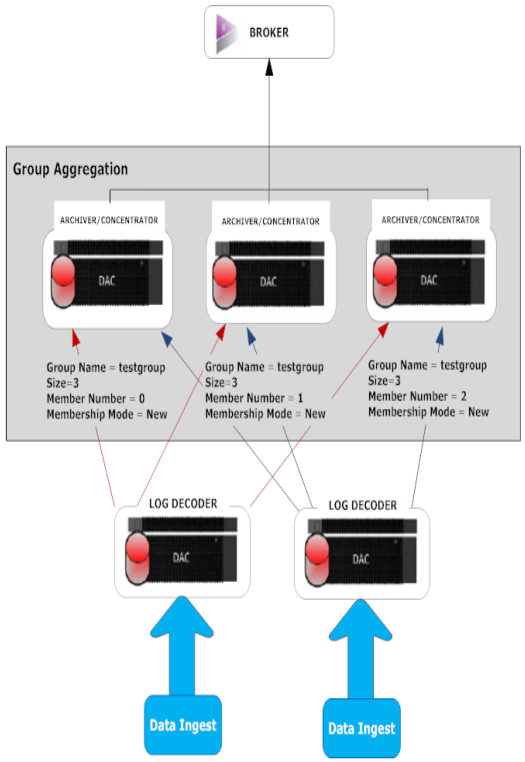
Advantages of Using Group Aggregation

- Increases the speed of NetWitness queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.

You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated sessions between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter set to 10,000, the services would divide the session between themselves as illustrated in the following table.



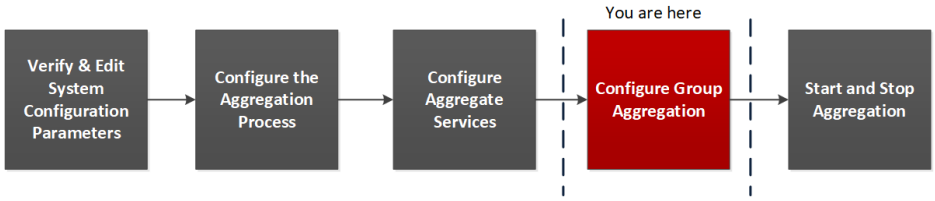
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name.
Size	It determines the number of Archiver or Concentrator services in the aggregation group.
Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: • **New**: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. • **Replace**: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from.

Note: The Membership Mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.

Complete the following steps to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.

2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

   a. Go to **(Admin) > Services**.

   b. Select the Archiver or Concentrator service, and select > **View** > **Config**.

   The Service Config view of the Archiver or Concentrator is displayed.

   c. In the **Aggregate Services** section, select **Log Decoder**.

   d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

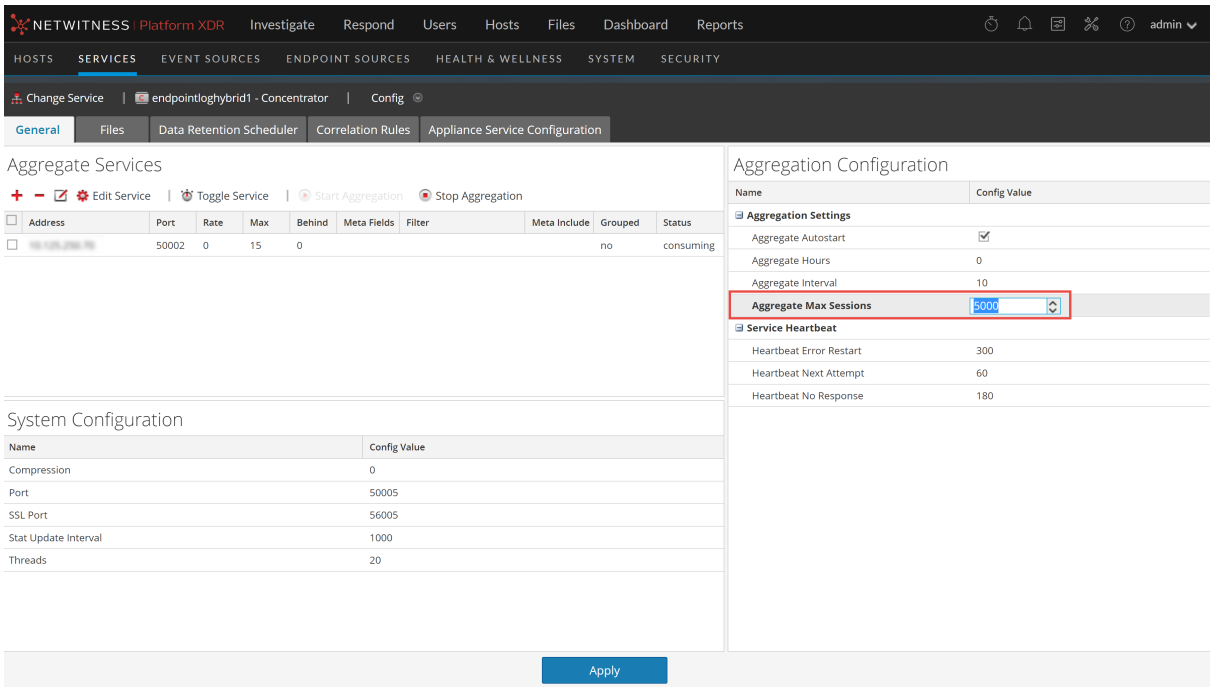
   e. Click .

   The **Edit Aggregate Service** dialog is displayed.

   f. Click Group Aggregation.

   The **Edit Group Aggregation** dialog is displayed.

   g. Select the **Enabled** checkbox and set the following parameters:



- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

i. In the Service Config view, click **Apply**.

j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.

New Health and Wellness

New Health and Wellness is an advanced monitoring and alerting system that provides insights on the operational state of the host and services in your deployment, and helps identify potential issues.

System Requirements

The following tables list the memory, disk, and CPU recommended for the New Health and Wellness based on the size of the deployment.

Note: The recommended values might differ when you install and try the new features and enhancements.

Caution: If the New Health and Wellness node is on a different subnet, you must open the respective NetWitness Platform hosts port. For more information, see "New Health and Wellness on Different Subnet" section in the Network Architecture and Ports.

Standalone Virtual Host

Minimum memory for a standalone virtual host is 16 GB.

Each NetWitness platform host writes 150 MB of New Health and Wellness metrics data into Elasticsearch data per day. For example, if you have 45 NetWitness Platform hosts then 6.6 GB of metrics data is written to Elasticsearch per day.

CPU	Memory
4 cores	16 GB

Physical Host

Deployment Size	Memory	CPU	DISK per day
Small (~5-10 hosts / 20-40 services)	16 GB	15%	1.5 GB
Medium (~150-200 hosts / 300- 400 services)	18 GB	15%	29 GB
Large (~250-300 hosts / 500-600 services)	22 GB	15%	44 GB

Based on the resources available, you can deploy the 11.7 New Health and Wellness feature on any one of the following, listed in the order of preferred deployment method with most preferred first:

- Standalone virtual host (Most preferred recommendation to ensure no performance impact on any other functionality of deployed nodes)

- Physical host:
  - Broker
  - Admin Server
  - ESA

Installing New Health and Wellness enables all hosts in your deployment to start sending metrics to monitor New Health and Wellness. After you deploy New Health and Wellness , see the "Monitor New Health and Wellness " topic in the *System Maintenance Guide* for instructions on how to configure and use this feature.

Please direct any New Health and Wellness feedback to nw.health.wellness.feedback@netwitness.com.

After you provision the New Health and Wellness host, complete the following steps to install the **New Health and Wellness** service category on the provisioned host.

1. Log in to NetWitness and go to  (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   Note: If you are not installing New Health and Wellness on a standalone virtual host ignore step 2.

2. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.
3. Select that host on which New Health and Wellness should be installed in the **Hosts** view (for example, **New Health and Wellness**) and click 

.

The **Install Services** dialog is displayed.

4. Select **New Health and Wellness** in **Category** and click **Install**.
5. Refresh all hosts to write to elastic search.
   a. SSH to the NW Server host.
   b. Run the following commands.
      `nw-manage --refresh-host --host-all`
      This may take few minutes for the changes to take effect based on the number of hosts in your deployment.

Note: (For Standalone Virtual host only) After you review your initial datastore configuration, you may determine that you need to add a new volume. For information on adding a new volume see “Add New Volume and Extend Existing File Systems” topic in the *Virtual Host Installation Guide*.

Note: After you have installed New Health and Wellness, for some reason, if you want to uninstall New Health and Wellness, you must refer to "Uninstall New Health and Wellness" in the *Upgrade guide*.

Hybrid Categories on Series 6 (R640) Hardware

You can install Hybrid Categories such as Log Hybrid and Network (Packet) Hybrid service categories on a Series 6 (R640) Physical host. This gives you the ability to attach multiple PowerVault external storage devices to the Series 6 (R640) Physical host.

NW Server Deployment on ESA Hardware

You now have the option to deploy the NW Server host on Series 6 Analytics hardware. The Series 6 Analytics Hardware has more memory and storage capacity than the standard Core appliance on which NW Server has typically been deployed. This results in better overall responsiveness and larger retention capacity for Report Engine.

Note: You can install the NW Server on ESA hardware, but you cannot co-locate any ESA services (categories) with the NW Server on this hardware.

Second Endpoint Server

Complete the following procedure to deploy a second Endpoint Server.

1. Set up a new host in NetWitness Platform.
   - For a physical host, complete steps 1 to 16 in "Install NetWitness Platform" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.7*.
   - For a virtual host, complete steps 1 to 6 in "Step 4. Install NetWitness Platform" in the *Virtual Host Installation Guide for NetWitness Platform 11.7*.

     Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. SSH to the host that you set up in step 1.
3. Submit the following command string.
   ```
   mkdir -p /etc/pki/nw/nwe-ca
   ```

   Note: You do not need to modify permissions.
4. Copy the following two files from the previously deployed endpoint server to the new/second endpoint server:
   ```
   /etc/pki/nw/nwe-ca/nwerootca-cert.pem
   /etc/pki/nw/nwe-ca/nwerootca-key.pem
   ```
5. nstall Endpoint on the host.
   a. Log in to NetWitness Platform and go to  (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the Hosts view grayed out in the background.

      Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the new host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the **Hosts** view.

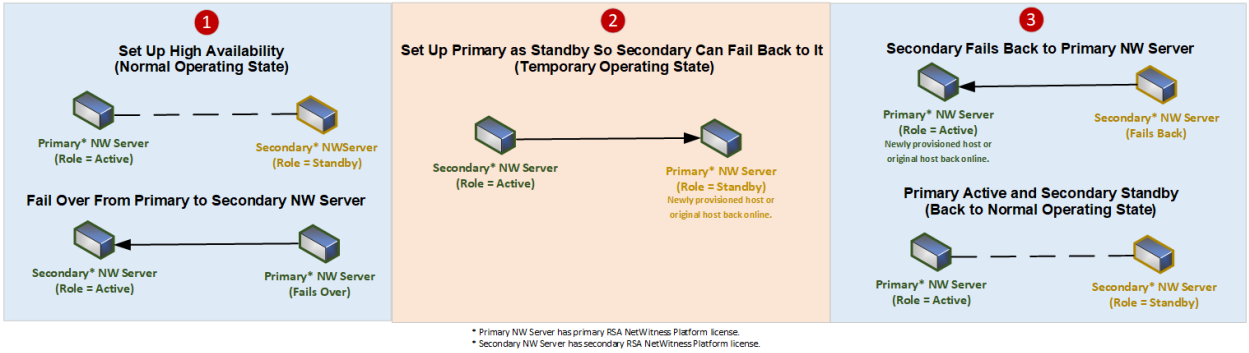
   c. Select that host in the Hosts view (for example, Endpoint Server II) and click 

.
   The **Install Services** dialog is displayed.

   d. Select **Endpoint** in **Host Type** and click **Install**.

Warm Standby NW Server Host

The Warm Standby NW Server duplicates the critical components and configurations of your active NW Server host to increase reliability.



A secondary NW Server remains in the standby role and, when configured, receives backups of the primary NW Server in the active role at regular intervals. If the primary NW Server fails (goes offline), the fail-over procedure must be executed allowing the secondary NW Server to assume the active role.

In version 11.5 and later, we support a secondary NW Server that has a different IP address from the primary NW Server. Having the same IP address for both the primary NW Server and secondary NW Server is no longer necessary.

When you set up a secondary NW Server as a Warm Standby, a failure or scheduled switch from the primary NW Server to the secondary NW Server is referred to as a fail-over. You fail back to return to the normal operating state (that is, primary NW Server in the active role and the secondary NW Server in the standby role).

The following diagram illustrates the fail-over and fail-back process.

1. Set up secondary NW Server as standby (initial setup). This is the normal operating state.
2. The primary NW Server fails over to the secondary NW Server. After the fail-over, get the primary NW Server back online and set it up in the standby role. This is a temporary operating state.
3. Fail the secondary NW Server back to the primary. The primary NW Server is back to the active role and secondary is back to the standby role. This is the normal operating state.

Note: When you set up the secondary NW Server, follow the same administrative procedures, for example, for upgrade and maintenance, as the procedures for the primary active NW Server.

Procedures

Complete the following task to set up a secondary NW Server in the standby role for fail-over:

- Set up a secondary NW Server in the standby role.

Complete the following tasks when required to maintain high availability:

- Fail over the primary NW Server to secondary NW Server.
- Fail back the secondary NW Server to primary NW Server.

Planned Fail-Over Scenario

This scenario occurs when you schedule a fail over (see **Planned Fail-Over** under step 3 in the Fail Over primary NW Server to Secondary NW Server procedure). You should not need do anything after the fail-over completes.

Required Fail-Over Scenario without Hardware Replacement

This scenario occurs when the primary NW Server fails (see *Required Fail-Over* under step 3 in the Fail Over Primary NW Server to Secondary NW Server topic), but you are able to recover it easily without re-imaging (for example, the active NW Server has corrupt or insufficient RAM). You do not need to run the `nwsetup-tui` and you do not need to contact NetWitness Customer Support to reestablish correct licensing when:

1. The active (primary NW Server) fails over to the Standby (secondary NW Server) and that secondary host temporarily assumes the role of the active NW Server.
2. You fix the problem with the primary NW Server (for example, install new RAM) and fail back to it from the secondary host.

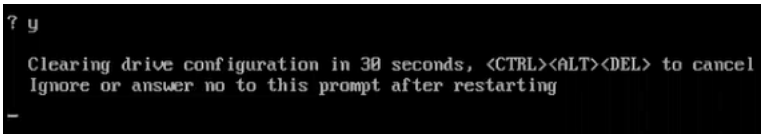
Required Fail-Over Scenario with Hardware Replacement

This scenario occurs when the active NW Server completely fails and the hardware requires replacement, for example you receive a Return Merchandise Authorization (RMA). You need to run reconfigure the host with the `nwsetup-tui` and contact NetWitness Customer Support to reestablish licensing. If you choose to rebuild the replacement host as a temporary standby (for example, until your scheduled fail-back occurs), you must answer "**Yes**" to the **Standby Host Recovery Mode** `nw-setup-tui` prompt when configuring this temporary standby for failing back (see step 4 in the Set Up Secondary NW Server in Standby Role procedure for the context of this prompt).

Set Up Secondary NW Server in Standby Role

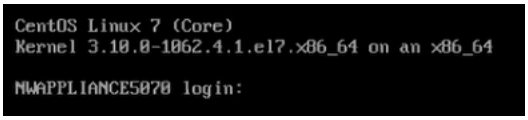
1. Before you install a secondary NW Server host for the standby role, make sure that:
   a. The primary NW Server is running 11.7.
   b. All component hosts are running 11.7
      If you are:
      - Installing NetWitness Platform 11.7, follow the instructions in the *NetWitness Platform Physical Host Installation Guide for Version 11.7*.
      - Updating from 11.x to 11.7, follow the instructions in *NetWitness Platform Update Guide for Version 11.x to 11.7*.
        Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. Create a base image on the secondary NW Server:
   a. Attach media (ISO) to the host.
      See the *NetWitness Platform Build Stick Instructions* for more information.
      - Physical media - use the ISO to create bootable flash drive media the **Etcher®** or another suitable imaging tool etch an Linux file system on the USB drive. See the *NetWitnessBuild Stick Instructions* for information on how to create a build stick from the ISO. Etcher is available at: https://etcher.io.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO file.
   b. Log in to the host and reboot it.

```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```



c. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After some system checks during booting, the following **Welcome to NetWitness Platform 11.7** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.

d. Select **Install NetWitness Platform 11.7** (default selection) and press **Enter**.
The Installation program runs and stops at the **Enter (y/Y) to clear drives** prompt that asks you to format the drives.

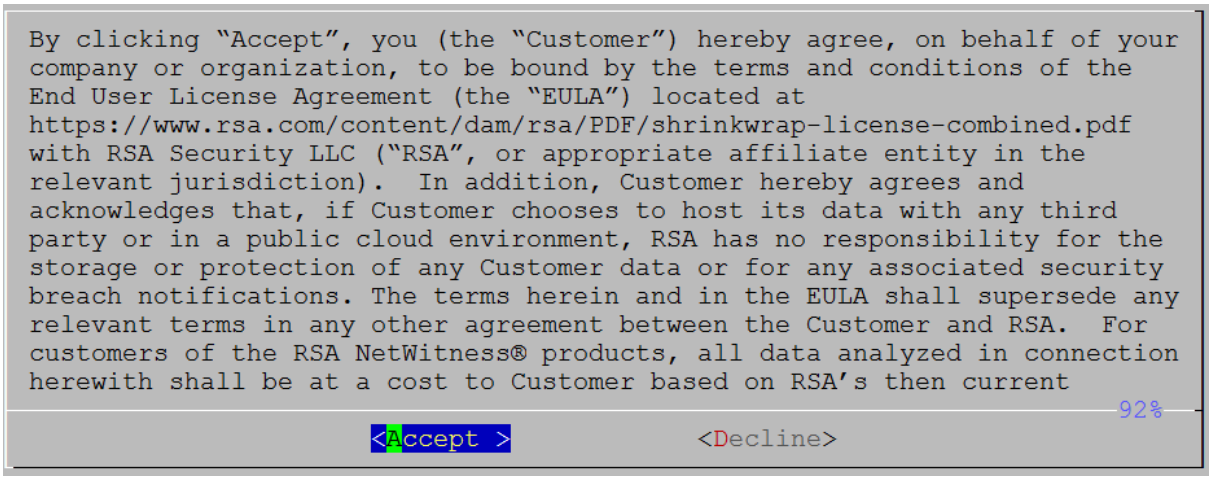


Caution: You must respond y or Y to this prompt even if the host does not have an internal RAID configuration or the installation will fail.

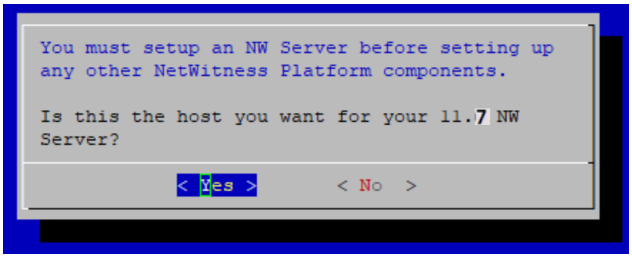
e. Type **Y** to continue.
The default action is No, so if you ignore the prompt and it will select No in 30 seconds and will not clear the drives. The **Press enter to reboot** prompt is displayed.

The system displays the all installation tasks it is performing. This can take a minute or so.After it completes the tasks, the installation program reboots the host.

Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).



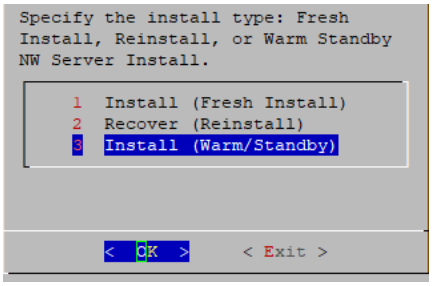
f. Log in to the host with the `root` credentials.



2. Run the `nwsetup-tui` command.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) During the Setup program, when you are prompted for the network configuration of the host, be sure to specify the same network configuration that was used for the original installation of 11.x on this host (it must be exactly the same).

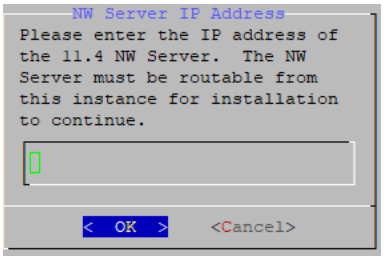
This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.



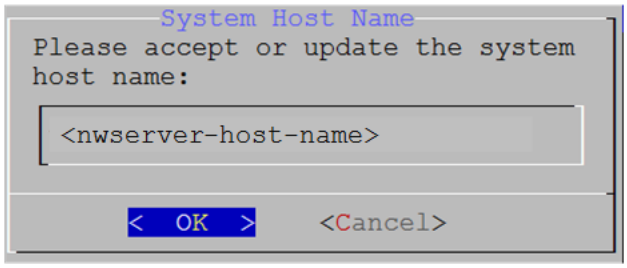
3. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.7 NW Server** prompt is displayed.

   Your response to this prompt identifies a host as either the primary or secondary during a fresh install (and the selected response stays constant regardless of the current or future role, that is active or standby of the host).

4. Tab to **Yes** and press **Enter**.
   The **Install or Recover** prompt is displayed.



5. Tab to **3 Install (Warm Standby)** and press **Enter**.
   The Standby Host Recovery Mode prompt is displayed.



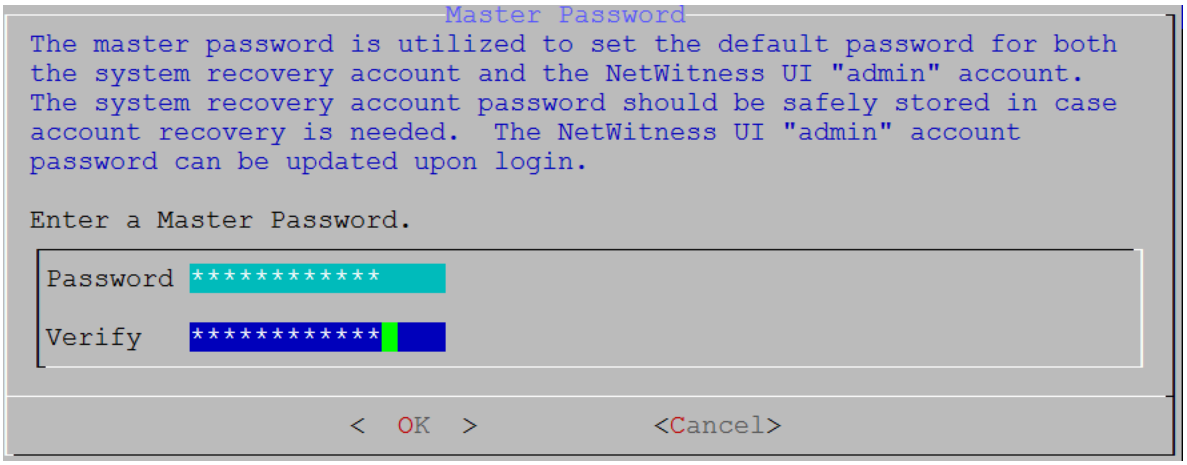
6. Tab to:

   - **No** and press **Enter** to set up a secondary NW Server with the standby role (most common scenario).
   - **Yes** and press **Enter** to set up a host that was previously used as a primary NW Server with the standby role so you can execute a fail-over and fail-back (less common scenario).

     The NW Active Server IP Address prompt is displayed.

7. Type the IP Address of the NW Server in the active role, tab to **OK**, and press **Enter**.
   The **Host Name** prompt is displayed

Caution: If you include "." in a host name, the host name must also include a valid domain name.



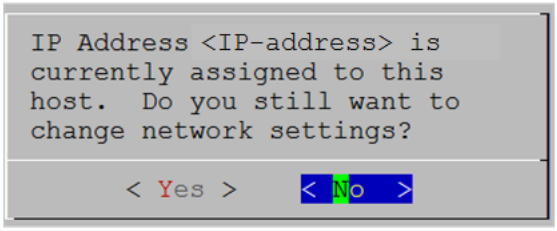
8. Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.
   The **Master Password** prompt is displayed.

   Note: You must use the same Master and Deploy Admin credentials fot the Warm Standby NW Server Host that you used for the Active NW Server Host.

   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols: **! @ # % ^ +**
   - Lowercase Characters: **a-z**
   - Uppercase Characters: **A-Z**

   No ambiguous characters are supported for Master Password and Deployment Password. For example: space { } [ ] ( ) / \ ' " ` ~ ; : .< > -



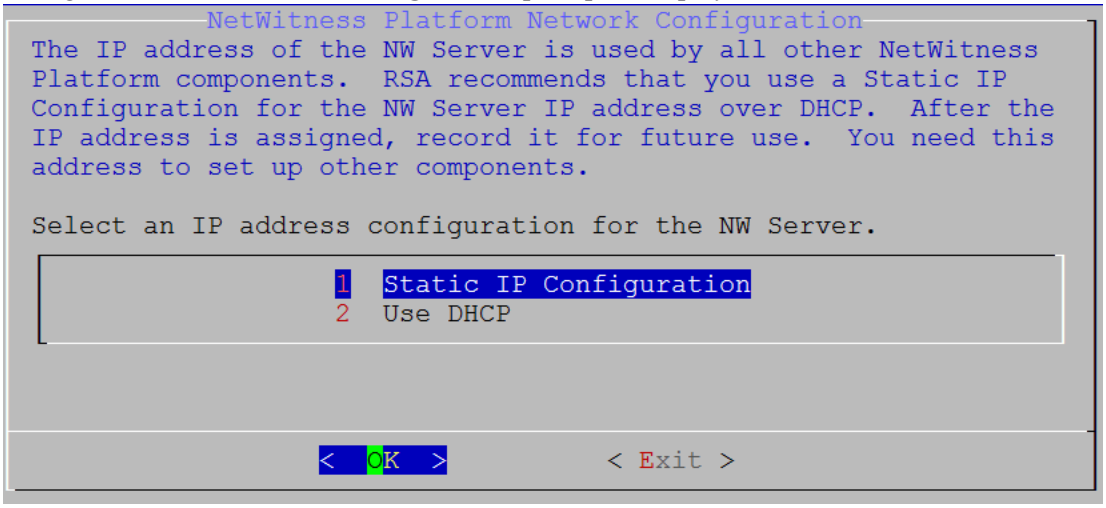
9. Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.
   The **Deployment Password** prompt is displayed.

10. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. One of the following conditional prompts is displayed.

    - If the Setup program finds a valid IP Address for this host, the following prompt is displayed.

      Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.

    - If you are using an SSH connection, the following warning is displayed.



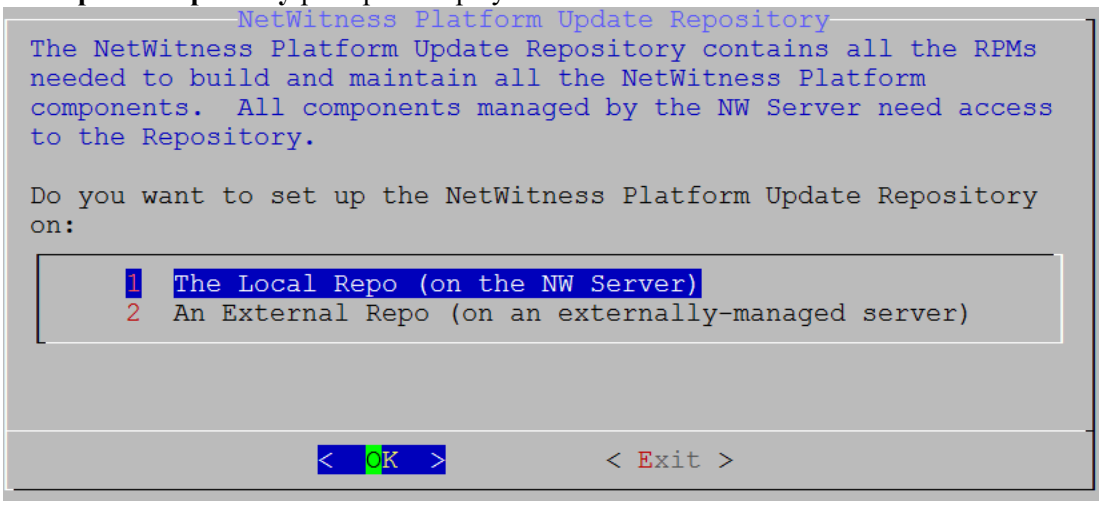
> **Note:** If you connect directly from the host console, the following warning will not be displayed.

      Press **Enter** to close warning prompt.

    - If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 12 to and complete the installation.

    - If the Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

11. Tab to **OK** and press **Enter** to use **Static IP**.
    If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
    The **Network Configuration** prompt is displayed.

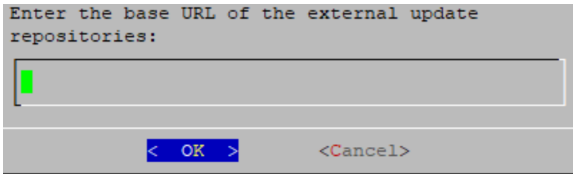


12. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
    The following **Static IP Configuration** prompt is displayed.

13. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

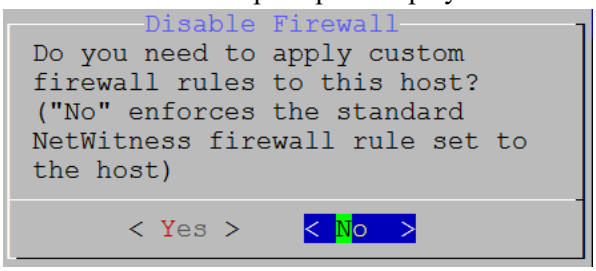
    The **Update Repository** prompt is displayed.



14. Press **Enter** to choose the **Local Repo** on the NW Server.
    If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**.

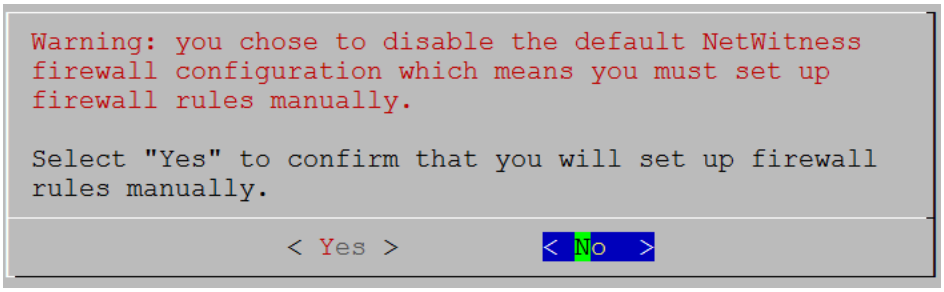
    - If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 11.7
    - .0.0. If the program cannot find the attached media, you receive the following prompt.

- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to NetWitness updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in the *Physical Host Installation Guide* for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



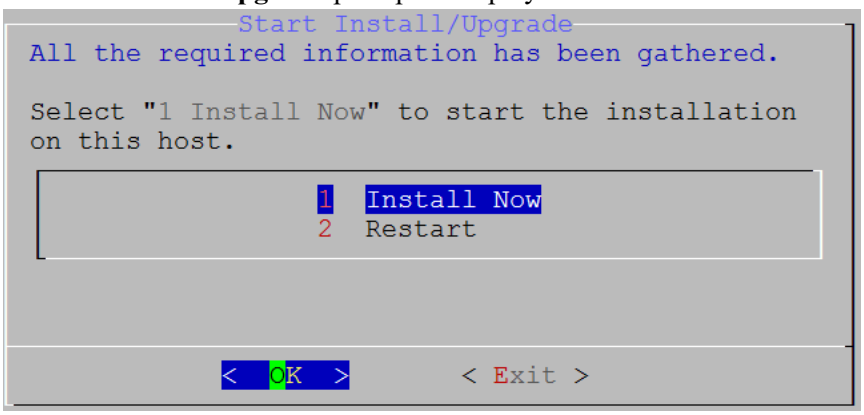
Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in the *NetWitness Platform Hosts and Services Getting Started Guide* for instructions.



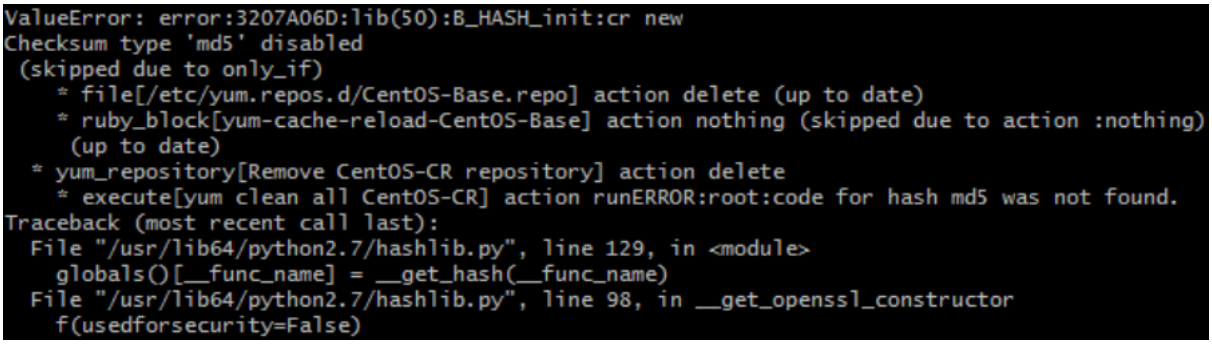
Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

The Disable firewall prompt is displayed.



15. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.



The **Start Install/Upgrade** prompt is displayed.

16. Press **Enter** to install 11.7 on the NW Server.
    When **Installation complete** is displayed, you have installed the 11.7 NW Server on this host.

> **Note:** Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

17. License the secondary NW Server.

    a. Log in to the secondary NW Server User Interface, click  (Admin) > **System** > **Info**, and note the **License Server ID** under **Version Information**.

    b. SSH to the primary NW Server.

    c. Edit the `/opt/netwitness/flexnetls/local-configuration.yaml` file and add the `back up hostid` (that is, the **License Server ID**).
    This is an example of the section of the `local-configuration.yaml` file before you add the **License Server ID**.

```
# Hostid of the backup server, if in fail over configuration.
#backup-hostid:
```

    This is an example of the section of the `local-configuration.yaml` file after you add the MAC address (for example, `000c2918c80d`) of the Warm Standby NW Server Host.

```
# Hostid of the backup server, if in fail over configuration.
backup-hostid: "000c2918c80d"
```

d. Restart the fneserver service.
```
systemctl restart flexnetls-RSALM
```

e. (Conditional) If your NetWitness Platform deployment is prohibited from accessing the Internet (Air Gap), you must:

i. Download the capability request from NetWitness Platform User Interface.

ii. Upload the request to FNO.

iii. Upload the response from FNO to the NetWitness Platform User Interface.

18. Schedule the backup of the primary NW Server and the copying of this backed-up data to the secondary NW Server.

a. SSH to the primary NW Server.

b. Submit the following commands.
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync -d -i <warm-standby-admin-server-ip>
```

Note: If the Warm Standby server becomes active, and if it will be accessed by any NW host with a NAT IP address, the NAT IP address must be added to the command:
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync -d -i <warm-standby-admin-server-ip>-p<warm-standby-NAT-admin-server-ip>
```

This backs up the primary NW Server data and copies the backup archive file to the secondary NW Server daily for future fail-over use. It also schedules the backup and copy to execute on a daily basis. You can display help for the `schedule-standby-admin-data-sync` script with the following command string.
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync --help
```
This returns the following help to which you can refer to customize the host data backup (such as backup frequency).
```
Schedule Data Synch between AdminServer and Standby AdminServer
Script also executes a synchronization each time.
Usage:
schedule-standby-admin-data-sync command [options]
```

```
Commands:

-h, --help                  Display Help
-d, --daily                 Schedule daily data
                            synchronization
-w, --weekly                Schedule weekly data
                            synchronization
-c, --custom <crontab       Schedule custom data
formatted>                  synchronization
                            i.e. to schedule for
                            midnight on 1st and
                            10th of the month:
                            '0 0 1,10 * *'
-i, --standby-ip <IP        (required) IP
address>                    address of standby
                            NW Server
-p, --standy-ip-public <NAT (optional) NAT-based
IP address>                 IP address of
                            standby NW Server
-v, --verbose               Enable verbose
                            output
```

Fail Over Primary NW Server to Secondary NW Server with Same IP Address

Initially, the primary NW Server fails over to the secondary NW Server. When the primary NW Server is back up, the secondary NW Server fails over to the primary NW Server, and that is referred to as a fail-back. When it is possible for the secondary NW Server to have the same IP address as the primary NW Server after failover, complete the following procedure to fail over from the primary NW Server to the secondary NW Server.

1. SSH to the secondary NW Server.

IMPORTANT: If you have installed New Health & Wellness on Admin Server, perform the following:
- Install New Health & Wellness on Standby NW server.
- Back up the Search category (New Health and Wellness) from Primary NW server to standby NW server using the NRT:

```
nw-recovery-tool --export --dump-directory <Backup_directory_path> --category Search
```

You must manually copy files from Primary NW server to Standby NW server after running the above command.

2. Run the `nw-failover` script with the `--make-active` argument:
   ```
   nw-failover --make-active
   ```
3. Complete the following steps for planned and required fail-over.
   a. SSH to the primary NW Server.
   b. Run the fail-over script with the `--make-standby` argument to assign the standby role to the primary NW Server:
      ```
      nw-failover --make-standby
      ```
   c. Shut down the primary NW Server.

   Note: If you have a catastrophic failure, you may need to provision a new host or re-image the primary NW Server and complete the Set Up secondary NW Server in Standby Role procedure for this host to create a new primary NW Server, so that you can fail back to it.
4. Validate that the component hosts have connected to the new active NW Server by running the following command on the new active NW Server:
   ```
   nw-manage --check-hosts-status
   ```

   Note: Do not continue to the next step until all component hosts have successfully connected to the new active NW Server. Rerun `nw-manage --check-hosts-status` as needed to continue verification.
5. Follow the IP address change procedures for the now-active NW Server in "Change Host Network Configuration" in the *System Maintenance Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: If the primary NW Server is going to remain online, you must update its IP address so that it no longer conflicts with the Warm Standby NW Server IP address when it is changed. Follow the IP address change procedures for the now-active NW Server in "Change Host Network Configuration" in the *System Maintenance Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

6. Shut down the primary NW Server, or reboot the primary NW Server and set it up as the new secondary NW Server by completing the steps in Set Up Secondary NW Server in Standby Role for this host to create a new primary NW Server, so that you can fail back to this host.

IMPORTANT: After successful fail over to Standby NW server, restore the Search category (New Health & Wellness) using NRT:
`nw-recovery-tool --import --dump-directory <Backup_directory_path> --category Search`

Fail Over Primary NW Server to Secondary NW Server with Different IP Address

If your secondary NW Server will maintain a different IP address from your primary NW Server after a fail-over event, for example, if the secondary NW Server is located in a different data center from the primary NW Server, follow these steps to fail over from the primary NW Server to the secondary NW Server.

1. SSH to the secondary NW Server.

IMPORTANT: If you have installed New Health & Wellness on Admin Server, perform the following:
- Install New Health & Wellness on Standby NW server.
- Back up the Search category (New Health and Wellness) from Primary NW server to standby NW server using the NRT:
`nw-recovery-tool --export --dump-directory <Backup_directory_path> --category Search`
You must manually copy files from Primary NW server to Standby NW server after running the above command.

2. Run the failover script:
   `nw-failover --make-active`
3. Complete the following steps for planned and required fail-over.
   a. SSH to the primary NW Server.
   b. Run the fail-over script with the `--make-standby` argument to assign the standby role to the primary NW Server:
      `nw-failover --make-standby`
   c. Shut down the primary NW Server.

      Note: If you have a catastrophic failure, you may need to provision a new host or re-image the primary NW Server and complete the Set Up secondary NW Server in Standby Role procedure for this host to create a new primary NW Server, so that you can fail back to it.

4. If you are running in a mixed-version environment, log in to each component host that is still on a version prior to 11.7 and execute the following:
   - `netconfig --update-dns --dns <active-nw-server-ip-address>`
   - `sed -Ei 's/^master:.*/master: <active-nw-server-ip-address>/g' /etc/salt/minion`
   - `systemctl restart salt-minion`

   Note: If you have a component host that uses a NAT IP address to reach the NW Server, substitute the `<NAT-IP-address>` for the `<active-nw-server-ip-address>` in both bullet items above.

5. Shut down the primary NW Server, or reboot the primary NW Server and set it up as the new secondary NW Server by completing the steps in Set Up Secondary NW Server in Standby Role for this host to create a new primary NW Server, so that you can fail back to this host.

IMPORTANT: After successful fail over to Standby NW server, restore the Search category (New Health & Wellness) using NRT:
`nw-recovery-tool --import --dump-directory <Backup_directory_path> --category Search`

Note: If the secondary NW Server had any custom certificates, you must re-apply them after failover. For information about how to re-apply custom certificates, see "(Optional) Use a Custom Server Certificate" in the *System Security and User Management Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: After upgrading the NW Server host or a component host to 11.7 or later version, review the contents of the `/etc/hosts.user` file for any obsolete host entries. The `/etc/hosts.user` file contains system and user-generated entries that are not managed by NetWitness Platform. However, entries from `/etc/hosts.user` are merged with NetWitness Platform-generated host mappings to create and update `/etc/hosts`. To avoid conflicts with NetWitness Platform-generated mappings, and to avoid generating connectivity errors resulting from an IP address change, RSA recommends that you remove any entries in `/etc/hosts.user` that include a non-loopback IP address of a NetWitness Platform host. After updating `/etc/hosts.user`, you must refresh the system by running the following command:
`nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>`

Note: While changing a host's IP address or during failover, component hosts can become disconnected from NW Server hosts. Follow these steps to reconnect a host system to its NW Server system.
1. Log in to the component host using SSH or the console.
2. Run the command `nw-manage --override-nws-ip --ipv4 <current IP address of the NW Server.`
When this command completes, the component host is reconnected to the NW Server at the specified IP address.

Follow the steps in the sections that apply to your environment.

- SSO
- Reporting Engine
- UCF
- PAM
- ECAT
- RSA NetWitness Orchestrator (By Demisto)
- Audit Logging
- Health and Wellness
- Malware Analysis
- Windows Legacy Collection

SSO

Update Configuration for Single Sign-On

Note: You must disable SSO configurations ONLY when NW Server IP is changed.

When the host network is configured with a new IP address, the SSO configurations also must be updated.

To do this:

1. Disable the SSO configuration using `nw-shell` after failover from new IP.
   To resolve this issue you must disable SSO manually, using the following commands:
   a. SSH to `admin server node`.
   b. Connect to `nw-shell`.
   c. Connect to admin server service using the `connect --service admin-server` command.
   d. Log in to admin server using the `login` command.
   e. Enter the admin username and password.
   f. Execute the following commands:
      - `cd /rsa/security/authentication/web/saml/sso-enabled`
      - `set false`
      - `logout`
      - `exit`

- `systemctl restart rsa-nw-admin-server`

2. Change the host IP address to the new IP.
3. Generate the new metadata and reupload it in ADFS. For more information, see the "Configure SAML 2.0 provider settings for portals" topic in the Microsoft documentation.

For more information, see the "Troubleshooting" topic in the *System Security and User Management Guide.*

Reporting Engine

Update Configuration for Reporting Engine

Note: You must update the Reporting Engine configurations ONLY when NW Server IP is changed.

When the host network is configured with a new IP address, you must update and verify the Reporting Engin configurations. The hostname for NetWitness configurations under the Output Actions must be updated with the new IP.

To manually configure the new IP, perform the following steps:

1. Log in to NetWitness Platform.
2. Navigate to  (Admin) > **Services > Reporting Engine > View > Config**.
3. Click the **Output Actions** tab.

4. Add the new IP address in the **Hostname** field.
5. Click **Apply**.

UCF

To enable UCF to communicate with NetWitness Platform:

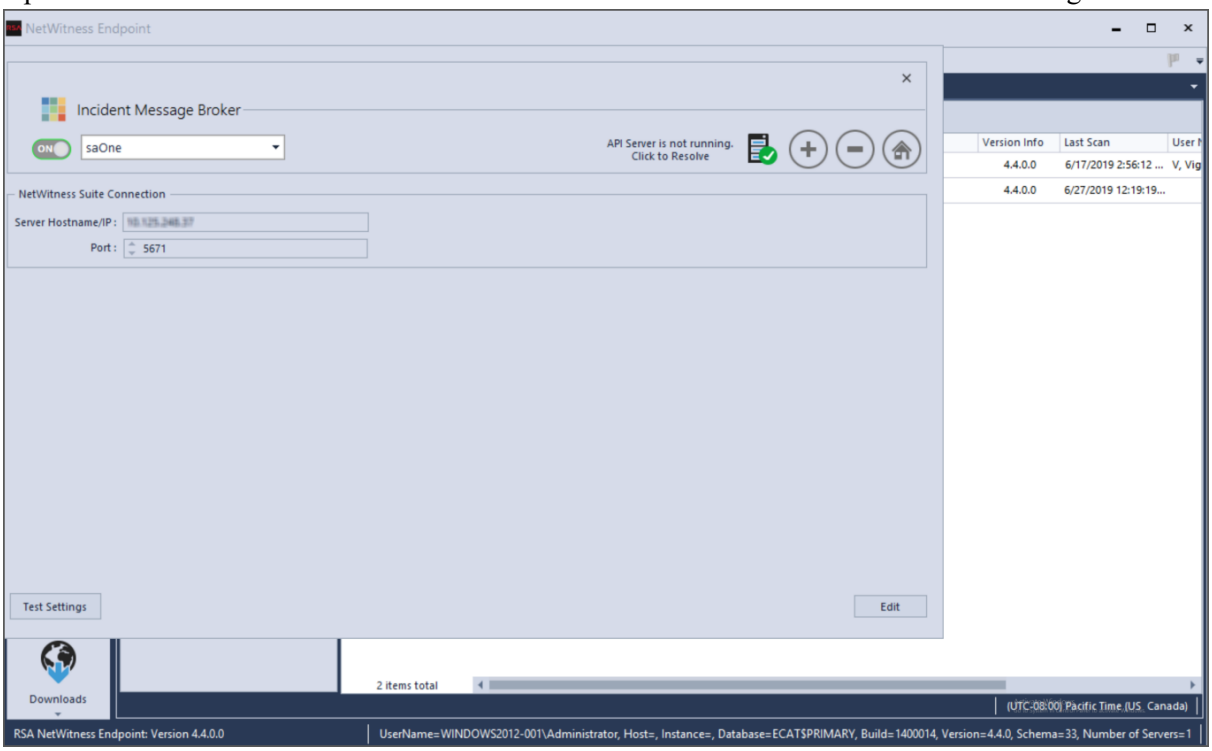
1. On the UCF server, execute the `runConnectionManager.bat` file (the same file that is used for adding connection details).
2. Select **Option #2, Edit endpoints**.
3. Select the NW Server connection from the options that are displayed.
4. When you are prompted for Host Address (the old IP address is shown in parentheses) enter the new IP address.

   Note: Do not change any other setting.

PAM

If you have PAM configured, after the failover, you must configure the system again using the instructions in the "Configure PAM Login Capability" topic in the *System Security and User Management Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

ECAT

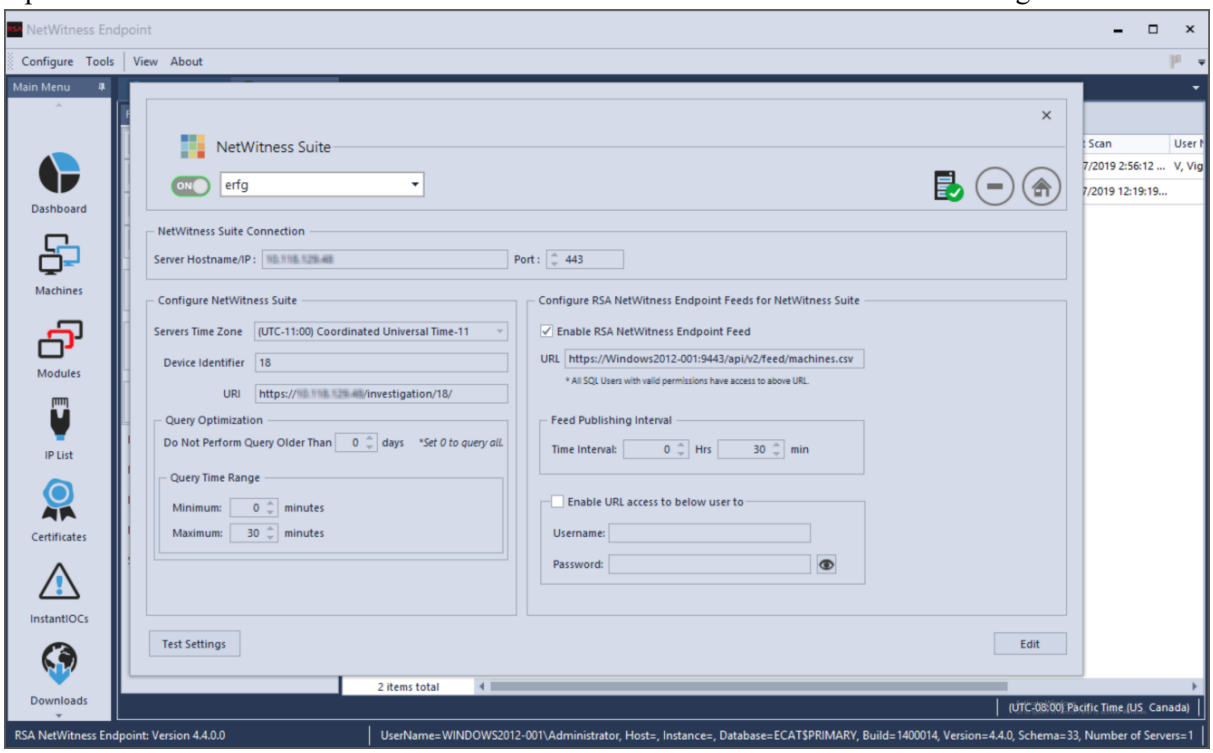


Update the following services:

- Incident Message Broker
- NetWitness Suite
- Syslog Server Settings

Incident Message Broker

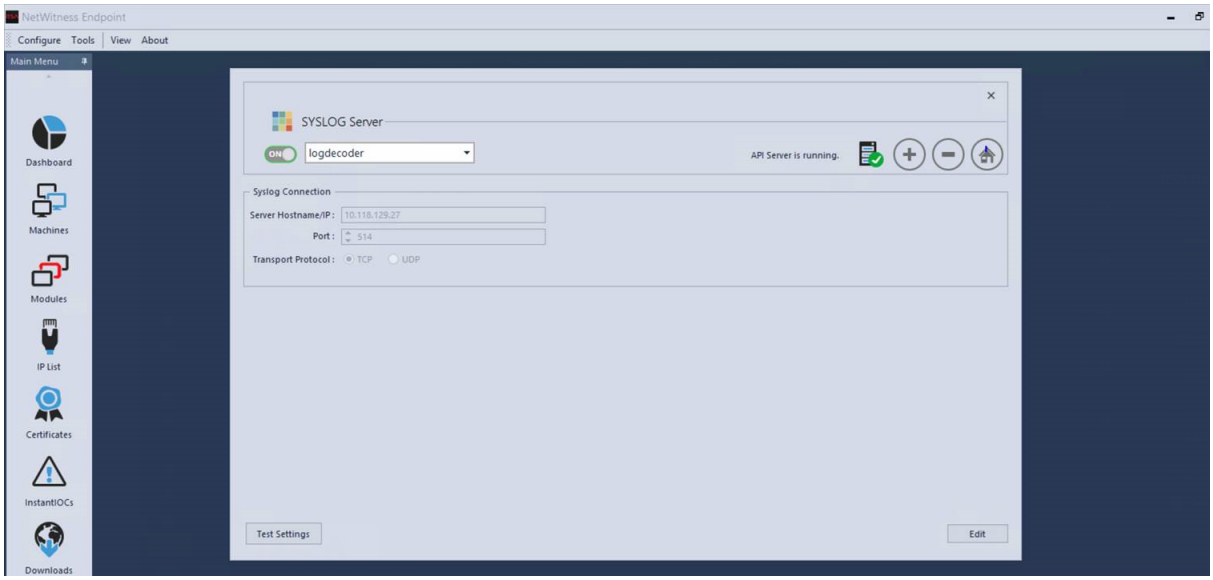
1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Monitoring and External Components Configuration** > **Incident Message Broker**.



2. Update the server Hostname and IP Address to the current active server and test the settings.

NetWitness Suite

1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Monitoring and External Components Configuration** > **Netwitness Suite**.

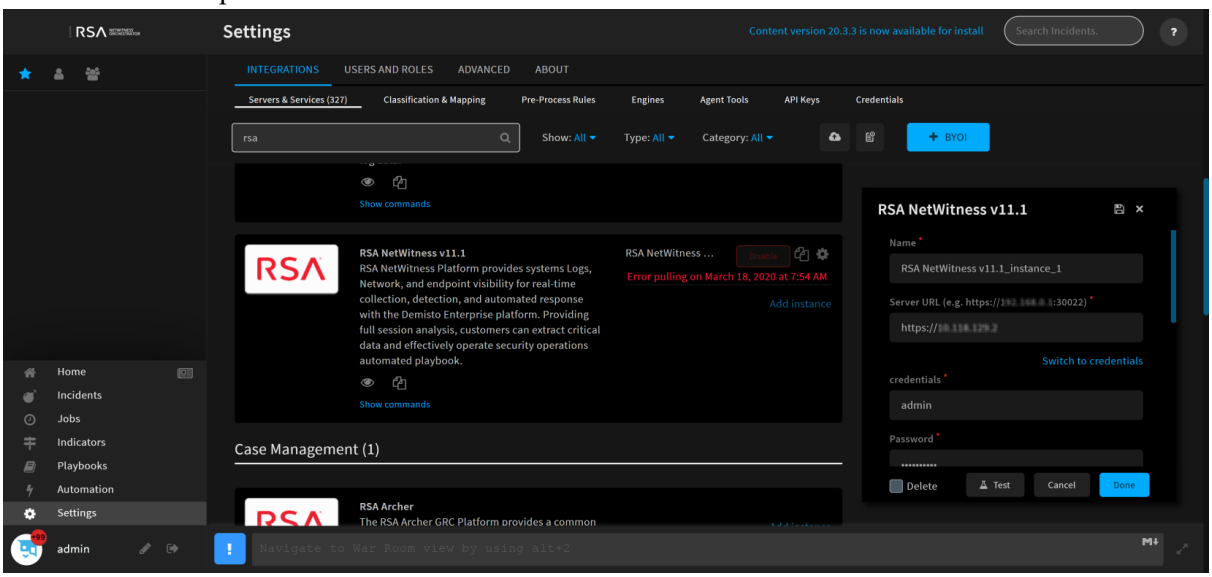


2. Update the server Hostname and IP address to the current active server and test settings.

Syslog Server Settings

If you are forwarding syslog messages to a NetWitness Platform Log Decoder, update the syslog server settings to point to the new IP address of the Log Decoder host.

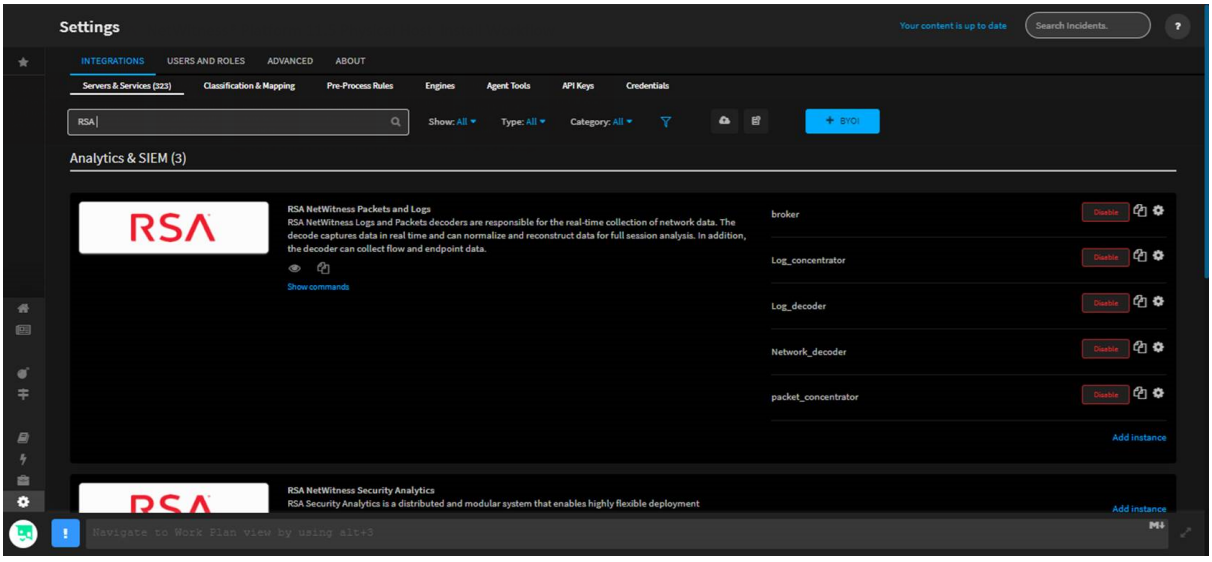
1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Syslog Server**.



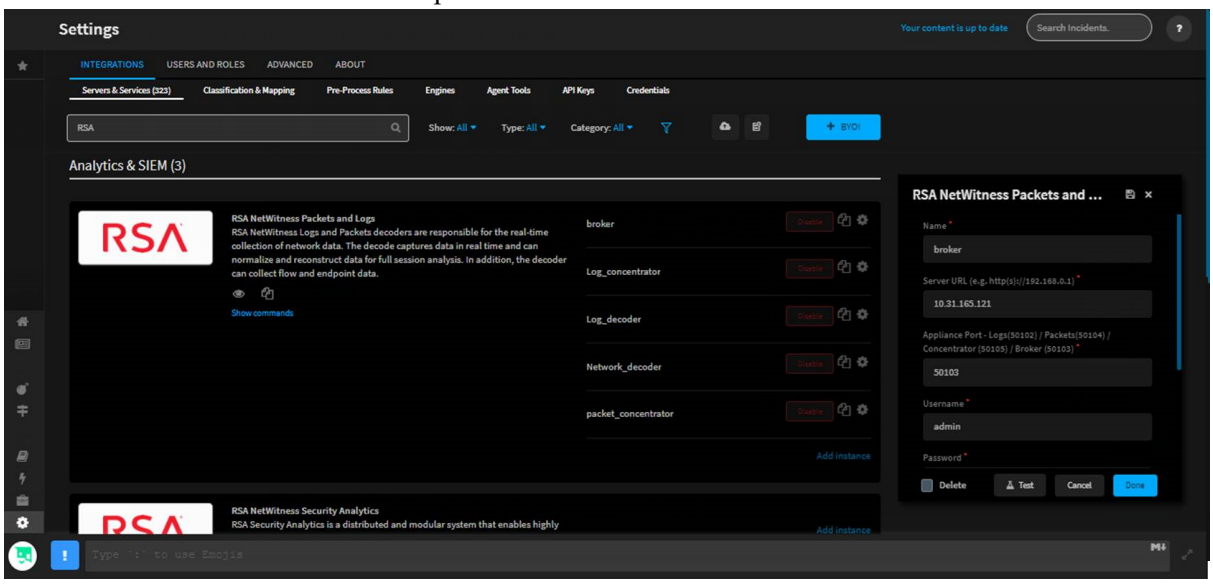
2. Select **logdecoder**, and in **Server Hostname/IP**, enter the new IP address of the Log Decoder host.

RSA NetWitness Orchestrator (By Demisto)

Update the Current Active NW Server to Fetch Respond Incidents and Alerts



1. Log in to Orchestrator and go to **Settings** > **server&services**.
2. Edit the RSA NetWitness V11.1 instance by updating the server URL to the current active NW Server to fetch respond incidents and alerts.



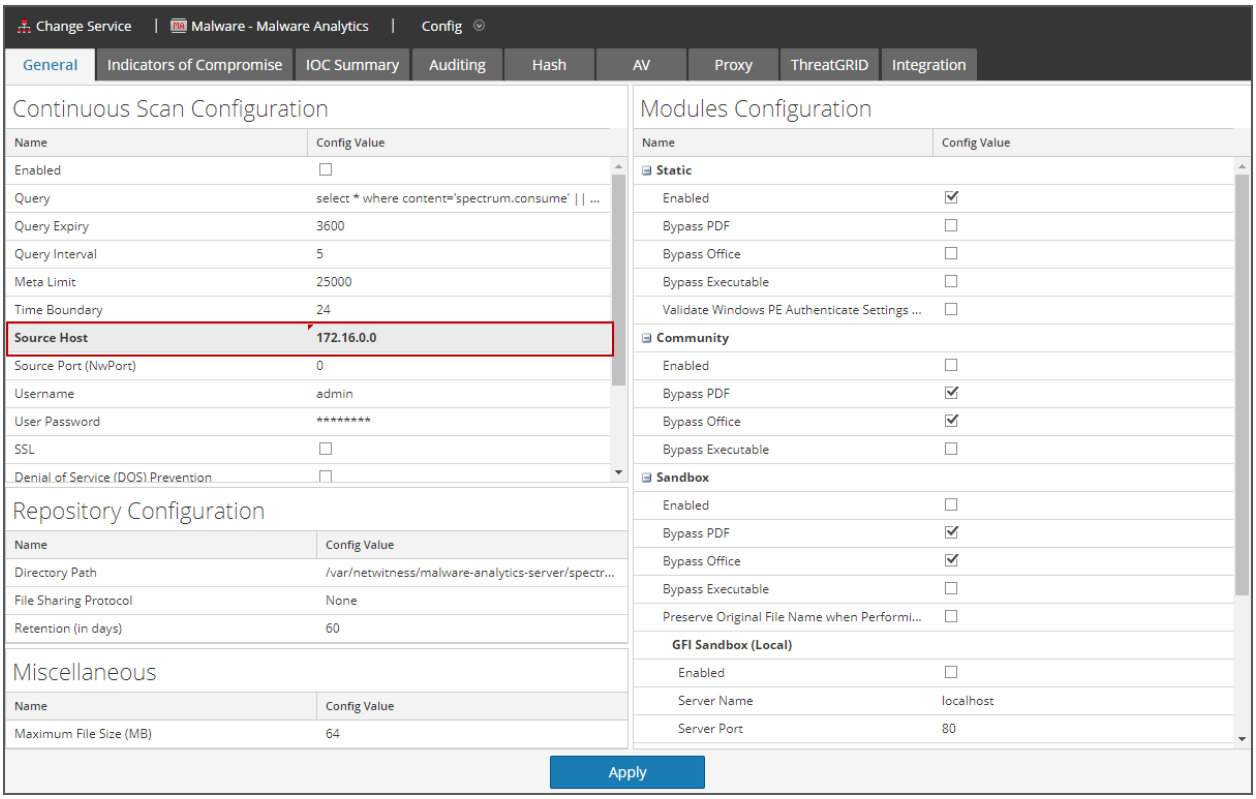
Update Component Hosts Acting as Data Sources

If you change the IP address of a component host, for example, a Concentrator, Network or Log Decoder, or Broker, that is acting as data source to the Orchestrator, update the following settings to point to the new IP address of the host.

1. Log in to Orchestrator and go to **Settings** > **server&services** and select the component host.

2. Enter the new IP address of the component host in **Server URL** and click **Done**.

Audit Logging



If you have changed the IP address of the NW Server, you must reconfigure audit logging. For instructions, see "Configure Global Audit Logging" in the *System Configuration Guide*.

Health and Wellness

If you have any Health and Wellness rules that contain IP addresses that have been changed, you must update those rules with the new IP addresses. For information about managing Health and Wellness rules, see "Monitor Health and Wellness using NetWitness Platform UI" in the *System Maintenance Guide*.

Malware Analysis

Source host IP address changes are not updated in the NetWitness user interface for Malware Analysis continuous scan configurations. You must manually update this configuration in the Malware Analysis Config view > **General** > **Continuous Scan Configuration** and update the source host IP address to the new host IP address.

Windows Legacy Collection

On occasion, you may need to change the IP address of your Windows Legacy Collector. You may also need to edit any Destination Groups that you have configured.

Change WLC IP Address

The following procedure describes how to change the IP address for your system.

1. Log onto the Windows Legacy Collector system and manually change the IP address on the system.
2. In the UI, confirm that the Log Collector service corresponding to the WLC system shows up in error (Red). It might take some time for it to reflect the changed status.
3. On the NetWitness Server, use the **nw-manage** utility to view the host information for the WLC using the following command:

   ```
   nw-manage --list-hosts
   ```

   Sample output from running the command is shown here:

   ```
   {
   "id" : "fdb8150c-e040-459e-8cc5-3c60ec2c65ae",
   "displayName" : "WLC-HOST-104",
   "hostname" : "10.101.216.102",
   "ipv4" : "10.101.216.102",
   "ipv4Public" : null
   } ]
   ```

   You use the value of **"id"** from your output in the following step.

4. Use the **nw-manage** utility to change the IP address of the WLC. For the **host-id** argument, use the value for the **"id"** that you noted from step 3. For the **ipv4** value, use the new IP Address to which you are changing.

   ```
   nw-manage --update-host --host-id "fdb8150c-e040-459e-8cc5-3c60ec2c65ae" --ipv4 10.101.216.105
   ```

5. After you see the message that the previous command ran successfully, go to the NetWitness Server UI and verify that the WLC service is running without any errors.

Edit Destination Groups For Log Collectors and VLCs

The Windows Legacy Collector is often configured with Destination Groups to forward events to Log Collectors or Virtual Log Collectors. If the IP address of any such Destination LC or VLC is changed, the Windows Legacy Collector can no longer forward events. To remediate this, you must edit the Destination groups for the WLC, making sure to select the new LC or VLC IP Address.

Note: If you added any content to the `/etc/hosts` file on the primary server, the contents of that file are available under `/var/netwitness/standby-data/unmanaged/etc` on the failover server. You can manually copy those files to the `/etc/hosts` file on the failover server after the failover is complete.

Fail Back Secondary NW Server to Primary NW Server

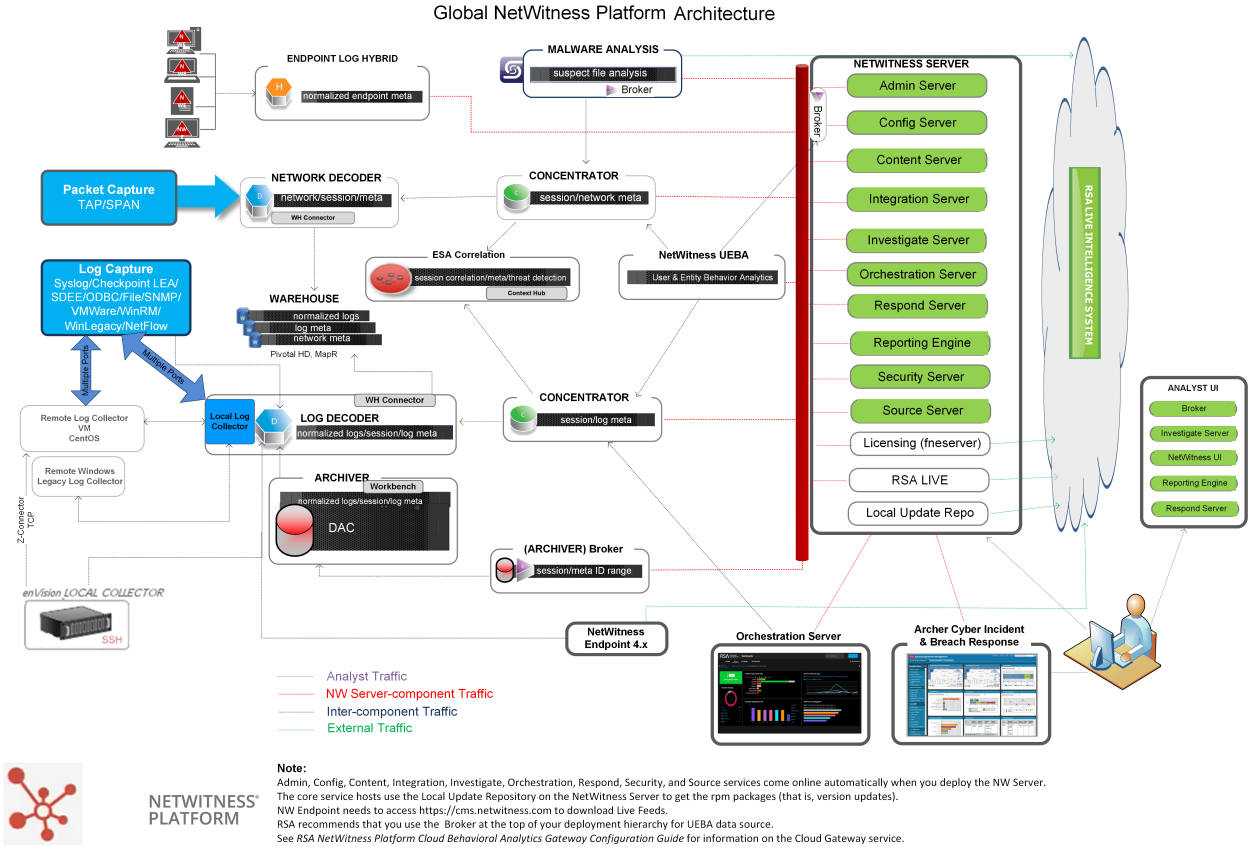
After a fail-over from the primary NW Server to the secondary NW Server, you need to fail back to your original setup of the primary NW Server in the active role and the secondary NW Server in the standby role.

Essentially, you follow the same steps described under Fail Over Primary NW Server to Secondary NW Server to fail back to your original setup (that is primary NW Server-active and secondary NW Server-standby). The difference is that you now need to fail over from the secondary NW Server to the primary NW Server.

Note: The secondary SA becomes active in case of a fail over. You should re-run the `schedule-standby-admin-data-sync` from the secondary SA before failing back to the primary SA.

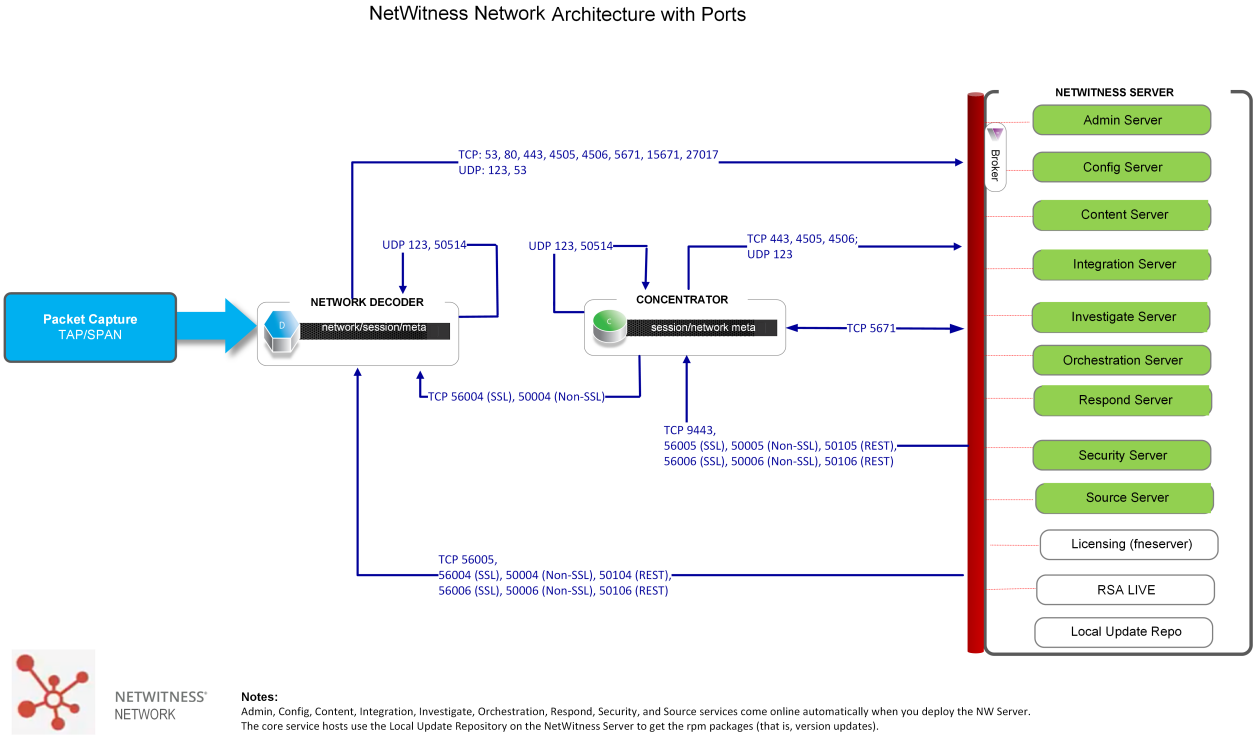
IMPORTANT: When you install and orchestrate a fresh 12.1 core Node-X to the Admin server (Node-0) upgraded from 12.0 or older versions to 12.1, the core services such as Concentrator, Log Decoder, Log Collector, Archiver, Decoder, Appliance, Workbench, Warehouse Connector, and Broker appear inactive under the **Services** column in the **Admin** > **Hosts** view. As a result, you cannot access the core services in the UI. This is not applicable if you are orchestrating a fresh 12.1 core Node-X to the fresh-Installed 12.1 Admin Server (not upgraded from 12.0 or older versions to 12.1). For more information, refer **Orchestration**topic in **Appendix C. Troubleshooting Version Installations and Upgrades** section in the *NetWitness 12.1 Upgrade Guide*.

Network Architecture and Ports



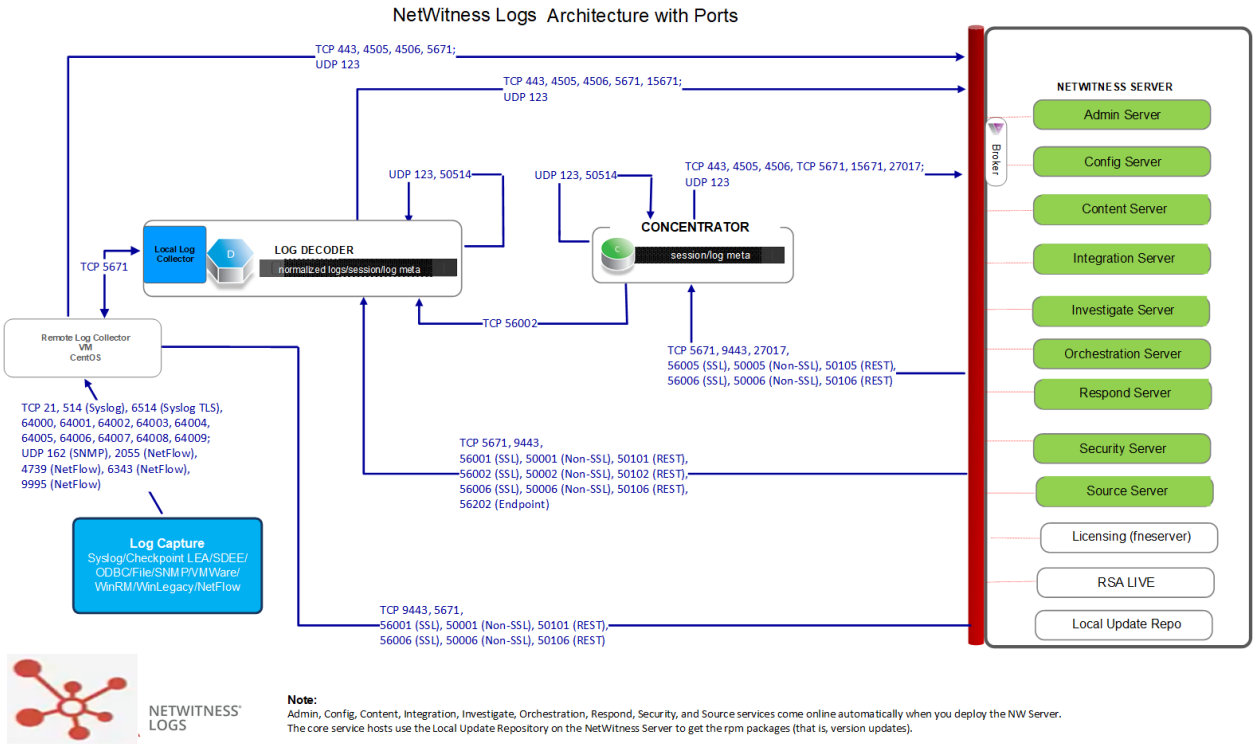
Refer to the following diagrams and port tables to ensure that all the relevant ports are opened for components in your NetWitness deployment to communicate with each other.

See NetWitness Endpoint Architecture at the end of this topic for individual Endpoint Architectural diagrams.



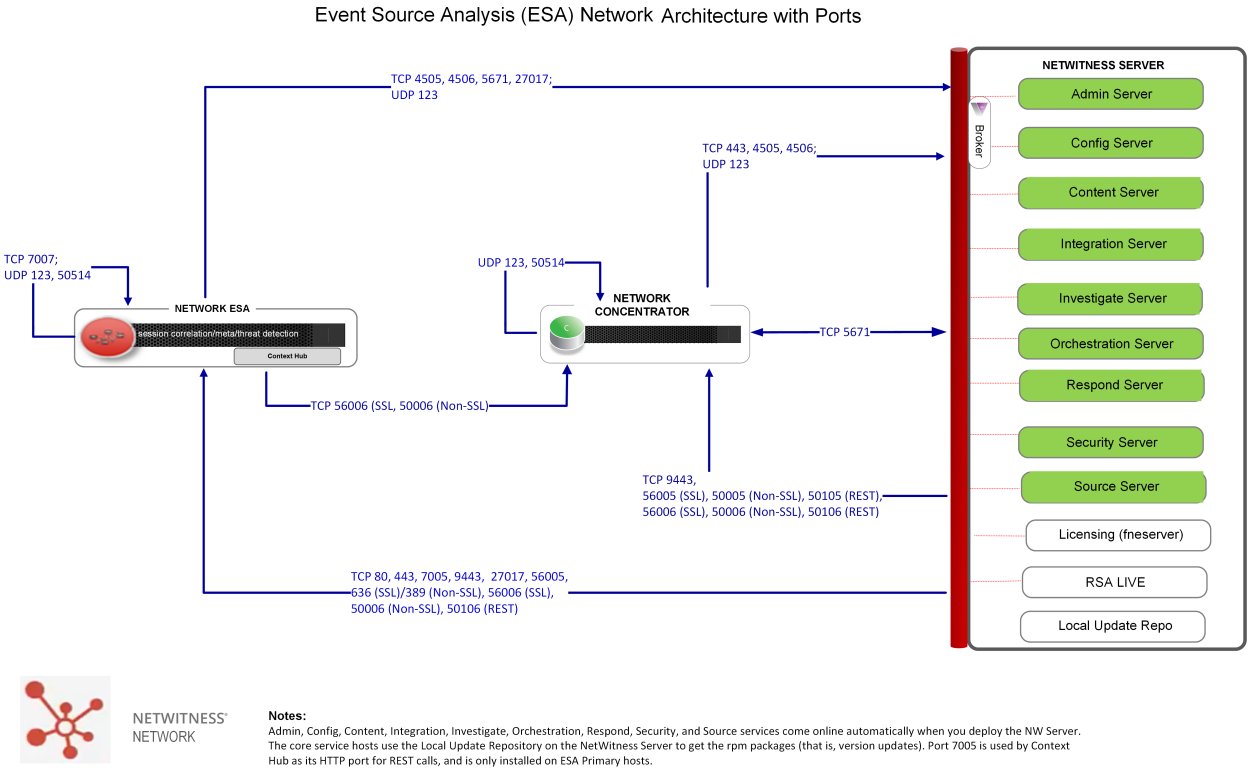
NetWitness Network Architecture Diagram

The following diagram illustrates the NetWitness network architecture including all of its component products.



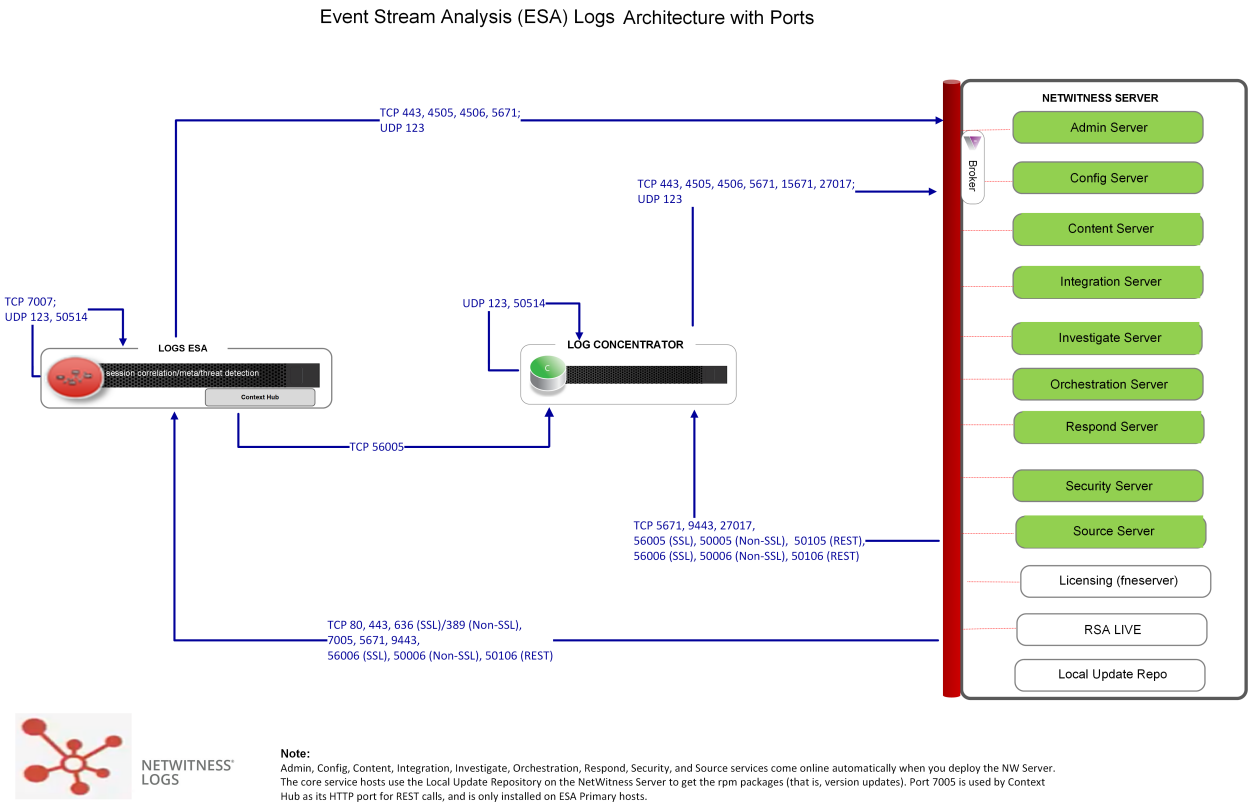
Note: NetWitness core hosts must be able to communicate with the NetWitness Server (Primary Server in a multiple server deployment) through UDP port 123 for Network Time Protocol (NTP) time synchronization.

NetWitness Network (Packets) Architecture Diagram with Ports



NetWitness Logs Architecture Diagram with Ports

Note:
Admin, Config, Content, Integration, Investigate, Orchestration, Respond, Security, and Source services come online automatically when you deploy the NW Server.
The core service hosts use the Local Update Repository on the NetWitness Server to get the rpm packages (that is, version updates).



Event Stream Analysis Network (Packets) Architecture Diagram with Ports

The following diagram illustrates the Event Stream Analysis network architecture with packet capture.

Event Stream Analysis (Logs) Architecture Diagram with Ports

The following diagram illustrates the Event Stream Analysis network architecture with log collection.

NetWitness Firewall Requirements Summary

The following table lists all the ports that need to be open in your firewall by host.

Note: The "NW Server" host ports apply to both the Primary and Warm Standby NW Server. Synchronization between the Primary and Warm Stanby is done through TCP Port 22.

Source Host	Destination Host	Ports
NW Server	ESA Primary	**TCP:** 22, 5671, 7005 **UDP:**123
NW Server	ESA	**TCP:** 22, 5671 **UDP**: 123
NW Server	Network Decoder	**TCP:** 22, 5671, 50004 (Non-SSL), 50006 (Non-SSL), 50104 (REST), 50106 (REST), 56004 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Broker	**TCP:** 5671, 50003 (Non-SSL), 50006 (Non-SSL), 50103 (REST), 50106 (REST) 56003 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Concentrator (Network & Logs)	**TCP:** 22, 5671, 50005 (Non-SSL), 50006 (Non-SSL), 50105 (REST), 50106 (REST), 56005 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Network Hybrid	**TCP:** 22, 5671, 50004 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50104 (REST), 50105 (REST), 50106 (REST), 56004 (SSL), 56005 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Log Decoder	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Log Hybrid	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56005 (SSL), 56006 (SSL) **UDP:** 123

Source Host	Destination Host	Ports
NW Server	Log Hybrid - Retention	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Endpoint Log Hybrid	**TCP:** 22, 5671, 7050, 7054, 50001 (Non-SSL), 50002 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56005 (SSL), 56006 (SSL), 56202 (Endpoint) **UDP:** 123
NW Server	VLC	**TCP:** 22, 5671, 50001 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50106 (REST), 56001 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Archiver	**TCP:** 22, 514, 5671, 6514, 50006(Non-SSL), 50007 (Non-SSL), 50008 (Non-SSL), 50106 (REST), 50107 (REST), 50108 (REST), 56006 (SSL), 56007 (SSL), 56008 (SSL) **UDP:** 123, 514
NW Server	Malware	**TCP:** 22, 5671, 5432, 50003 (Non-SSL), 50006 (Non-SSL), 50103 (REST), 50106 (REST), 56003 (SSL), 56006 (SSL), 60007 **UDP:** 123
NW Server	UEBA	**TCP:** 22, 15671, 5671, 443 **UDP:** 123

Comprehensive List of NetWitness Host, Service, and iDRAC Ports

Note: For ports used in event collection through the NetWitness Logs, see the *Log Collection Configuration Guide for RSA NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

This section contains the port specifications for the following hosts:

NW Server Host	iDRAC Ports
Analyst UI Host	Log Collector Host
Archiver Host	Log Decoder Host
Broker Host	Log Hybrid Host
Concentrator Host	Log Hybrid - Retention
Endpoint Log Hybrid Host	Malware Host
Endpoint Relay Server	Network Decoder Host
Event Stream Analysis Host	Network Hybrid Host
New Health & Wellness	UEBA Host

NW Server Host (Primary and Warm Standby NW Server Host)

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	NW Server	TCP 443, 80	nginx - NetWitness UI
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
Admin Workstation	NW Server	TCP 22	SSH Primary to Standby NW Server synchronization port.
NW Hosts	NW Server	TCP 444	Node-infra-server check
NW Hosts	NW Server	TCP 53 UDP 53	DNS
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 443	RSA Update Repository
NW Hosts	NW Server	TCP 5671	RabbitMQ-amqp
NW Hosts	NW Server	UDP 123	NTP
NW Hosts	NW Server	TCP 27017	MongoDB
NW Server	cms.netwitness.com	TCP 443	Live Content Management System (CMS) Library
NW Server	download.rsasecurity.com	TCP 443	RSA Licensing
NW Server	rsasecurity.subscribenet.com	TCP 443	RSA Licensing
NW Server	update.netwitness.com	TCP 443	Netwitness Software Updates
NW Server	NFS Server	TCP 111, 2049, UDP 111, 2049	iDRAC Installations
NW Server	NW Hosts	UDP 123	NTP
NW Server	NW Endpoint	TCP 443, 9443	For NW Endpoint 4.x integrations
NW Hosts	NW Server	TCP 444	nw-node-infra service failover check

Analyst UI Host

Source Host	Destination Host	Destination Ports	Comments
Analyst UI	NW Server	TCP 7006	The Content Server is listening on this port.
Analyst UI	NW Server	TCP 7009	The Admin Server is listening on this port.
Analyst UI	NW Server	TCP 7012	The Integration Server is listening on this port.
Analyst UI	NW Server	TCP 7015	The Source Server is listening on this port.
Analyst UI	NW Server	TCP 7016	The License Server is listening on this port.
NW Hosts	Analyst UI	TCP 5671	RabbitMQ-amqp
Analyst UI	NW Server	UDP 123	NTP
Analyst UI	NW Server	TCP 444	nw-node-infra service failover check

Archiver Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Archiver	TCP 15671	RabbitMQ Management UI
Archiver	NW Server	TCP 15671	RabbitMQ Management UI
Archiver	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Archiver	TCP 22	SSH
NW Server	Archiver	TCP 50008 (Non-SSL), 56008 (SSL), 50108 (REST)	Archiver Application Ports
NW Server	Archiver	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Archiver	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
NW Server	Archiver	TCP 50007 (Non-SSL), 56007 (SSL), 50107 (REST)	Workbench Application Ports
Archiver	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Archiver	NW Server	TCP 444	nw-node-infra service failover check

Broker Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Broker	TCP 15671	RabbitMQ Management UI
Broker	Concentrator	TCP 50005 (Non-SSL), 56005	Concentrator Application Port
Broker	NW Server	TCP 15671	RabbitMQ Management UI
Broker	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Broker	TCP 22	SSH
NW Server	Broker	TCP 50003 (Non-SSL), 56003 (SSL), 50103 (REST)	Broker Application Ports
NW Server	Broker	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Broker	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Broker	NW Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Endpoint Broker	NW Server	TCP 443	RSA Update Repository
Broker	NW Server	TCP 444	nw-node-infra service failover check

Concentrator Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Concentrator	TCP 15671	RabbitMQ Management UI
Concentrator	Log Decoder	TCP 50002 (Non-SSL), 56002 (SSL)	Log Decoder Application Port
Concentrator	Network Decoder	TCP 56004, 50004 (Non-SSL)	Network Application Port
Concentrator	NW Server	TCP 15671	RabbitMQ Management UI
Concentrator	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Concentrator	TCP 22	SSH
NW Server	Concentrator	TCP 50005 (Non-SSL), 56005 (SSL), 50105 (REST)	Concentrator Application Ports
Malware	Concentrator	TCP TCP 50005 (Non-SSL), 56005 (SSL)	Malware
NW Server	Concentrator	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Concentrator	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Concentrator	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Concentrator	NW Server	TCP 444	nw-node-infra service failover check

Endpoint Log Hybrid

Source Host	Destination Host	Destination Ports	Comments
Endpoint Agent	Endpoint Log Hybrid	TCP 443 UDP 444	NGINX HTTPS NGINX UDP. If UDP port 444 is not acceptable in your environment, see How to Change UDP Port for Endpoint Log Hybrid.
Endpoint Agent	Log Decoder or Virtual Log Collector	TCP 514 (Syslog) UDP 514 (Syslog) TLS 6514	Windows Log Collection
Endpoint Log Hybrid	Log Decoder (External)	TCP 50102 (REST) 56202 (Protobuf SSL) 50202 (Protobuf)	To forward meta to an external Log Decoder
Endpoint Log Hybrid	NW Server	TCP 443	RSA Update Repository
NW Server	Endpoint Log Hybrid	TCP 7050	UI web traffic
Endpoint Log Hybrid	NW Server	TCP 5671	Message Bus
Endpoint Log Hybrid	NW Server	TCP 27017	MongoDB
NW Server	Endpoint Log Hybrid	TCP 7054	UI web traffic
NW Server	NFS Server	TCP 111, 2049 UDP 111, 2049	iDRAC Installations
NW Server	Endpoint Log Hybrid	TCP 50001 (Non-SSL), 56001 (SSL), 50101(REST)	Log Collector application ports
NW Server	Endpoint Log Hybrid	TCP 50002 (Non-SSL), 56002 (SSL), 56202 (Endpoint), 50102 (REST)	Log Decoder application ports
Admin Workstation	Endpoint Log Hybrid	TCP 15671	RabbitMQ Management UI

Source Host	Destination Host	Destination Ports	Comments
Endpoint Log Hybrid	NW Server	TCP 15671	RabbitMQ Management UI
Endpoint Log Hybrid	NW Server	TCP 444	nw-node-infra service failover check

Endpoint Relay Server

Source Host	Destination Host	Destination Ports	Comments
Endpoint Agent	Relay Server	TCP 443	To forward host data to the Relay Server
Endpoint Log Hybrid	Relay Server	TCP 443	Pull host data from the Relay Server

Event Stream Analysis (ESA) Host

Note: The ports in this table are for the ESA Primary an ESA Secondary hosts. The Content Hub, Correlation and ESA Analytics services are co-located on the ESA Primary host. The Correlation and ESA Analytics services are co-located on the ESA Secondary host.

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	ESA	TCP 15671	RabbitMQ Management UI
ESA Primary and Secondary	NW Server	TCP 15671	RabbitMQ Management UI
ESA Primary and Secondary	NW Server	TCP 443	RSA Update Repository
Admin Workstation	ESA	TCP 22	SSH
NW Server, ESA Secondary	ESA Primary	TCP 27017	MongoDB
NW Server	ESA Primary	TCP 7005	Context Hub Launch Port - (ESA Primary)
NW Server	ESA	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
ESA Primary and Secondary	cms.netwitness.com	TCP 443	Live
ESA Primary and Secondary	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
ESA Primary and Secondary	Active Directory	636 (SSL)/389 (Non-SSL)	
NW Server	ESA	80 (HTTP)/ 443 (HTTPS)(REST)	
ESA Primary	Archer	443 (SSL)/80 (Non-SSL)	
ESA Primary	ESA Primary	TCP 7007	Launch Port
ESA Primary and Secondary	NW Server	TCP 444	nw-node-infra service failover check

New Health and Wellness

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	New Health and Wellness	TCP 22	SSH
Admin Workstation	New Health and Wellness	TCP 5601	Kibana UI
NW Hosts	New Health and Wellness	TCP 9200	Elasticsearch REST API Port
NW Server	New Health and Wellness	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
NW Server	New Health and Wellness	TCP 15671	RabbitMQ Management UI
NW Server	New Health and Wellness	TCP 7018	Metrics Server Launch Port
NW Server	New Health and Wellness	TCP 7020	Node Infra Server Launch Port

New Health and Wellness on Different Subnet

If the New Health and Wellness is on a different subnet, you must open the respective NetWitness Platform hosts port.

Example:
New Health and Wellness is on subnet A: 10.10.1.0/24 and LogHybrid host is on subnet B: 10.10.2.0/24. In this case, you must open ports for Log Decoder, Log Collector, Concentrator on Metrics Server (New Health and Wellness host) to allow ports in the firewall for communication.

Source Host	Destination Host	Destination Ports	Comments
New Health and Wellness	Log Decoder	50002(Non-SSL),56002 (SSL)	Log Decoder Application Ports
New Health and Wellness	Log Collector	50001(Non-SSL),56001 (SSL)	Log Collector Application Ports
New Health and Wellness	Concentrator	50005(Non-SSL)/56005 (SSL)	Concentrator Application Ports

iDRAC Ports

Port	Function	Comments
22*	SSH	Default, configurable port through which iDRAC listens for connections
443*	HTTP	Default, configurable port through which iDRAC listens for connections
5900*	Virtual Console keyboard and mouse redirection, Virtual Media, Virtual Folders, and Remote File Share.	Default, configurable port through which iDRAC listens for connections
111, 2049	TCP	NetWitness Platform hosts to NFS Server
111, 2049	UDP	NetWitness Platform hosts to NFS Server

Log Collector Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Log Collector	TCP 15671	RabbitMQ Management UI
Log Collector	NW Server	TCP 15671	RabbitMQ Management UI
Log Collector	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Log Collector	TCP 22	SSH
Log Collector	Log Event Sources	See *Log Collection Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.	
Log Event Sources	Log Collector	TCP 514 (Syslog) UDP 162 (SNMP), 514 (Syslog), 2055 (NetFlow), 4739 (NetFlow), 6343 (NetFlow), 9995 (NetFlow)"	Log Collection Ports
Log Event Sources	Log Collector	TCP 21, 64000, 64001, 64002, 64003, 64004, 64005, 64006, 64007, 64008,64009	Log Collection FTP/S Ports
NW Server	Log Collector	TCP 50001 (Non-SSL), 56001 (SSL), 50101 (REST)	Log Collector Application Ports
NW Server	Log Collector	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Log Collector	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Log Collector	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC installations
Log Collector	Virtual Log Collector	TCP 5671	In Pull Mode
Virtual Log Collector	Log Collector	TCP 5671	In Push Mode
Log Collector	NW Server	TCP 444	nw-node-infra service failover check

Log Decoder Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Log Decoder	TCP 15671	RabbitMQ Management UI

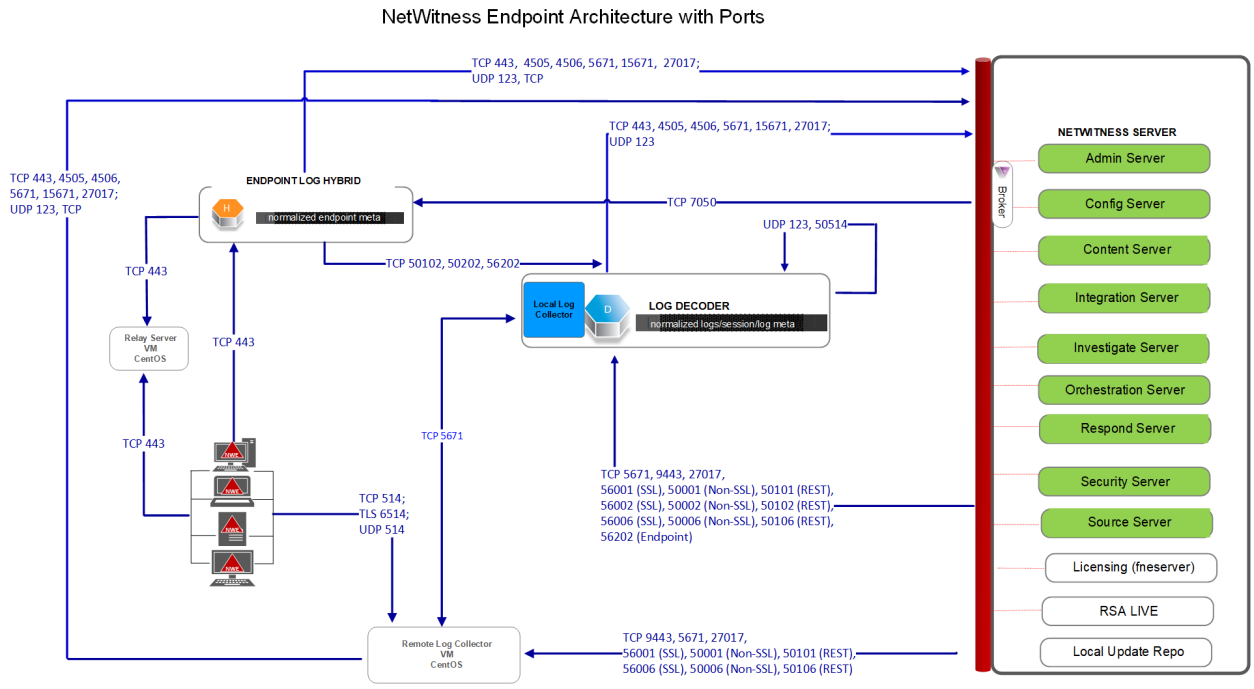
NetWitness Endpoint Architecture



NetWitness Endpoint Architecture

NetWitness Endpoint 4.4 Integration with NetWitness Platform

NetWitness Endpoint Architecture with Ports

For more information on the services running on Endpoint Log Hybrid, see *RSA NetWitness Endpoint Configuration Guide*.

How to Change UDP Port for Endpoint Log Hybrid

The following steps tell you how to change the Endpoint Log Hybrid default UDP port 444 if it is not acceptable in your environment. 555 is the example this procedures uses as a replacement for 444 UDP port.
There are two tasks you need to o change the Endpoint Log Hybrid default UDP port 444:

Task 1 - Tell All Agents to Use a New UDP Port

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

Note: If you did not select the custom firewall rules option when you ran the nwsetup-tui, NetWitness platform overwrites the firewall rules are overwritten after a period of time. Please refer to the following Knowledge Base Article 00036446 (https://community.netwitness.com/t5/netwitness-knowledge-base/how-to-add-custom-firewall-rules-after-nwsetup-tui-has-completed/ta-p/5900) if this is the case.

Task 1 - Tell All Agents to Use a New UDP Port

Complete the following steps to update the UDP port in the default Enterprise Data Replication (EDR) policy, and all other policies you have, to tell all agents to use a new UDP port.

1. In the **NetWitness** menu, select  (Admin) > **Endpoint Sources** > **Policies**.
   The **Policies** view is displayed.
2. Select the **Default EDR Policy** and click **Edit** from the toolbar.
3. roll down to find the **UDP PORT** and change the value (for example, change from **444** to **555**).
4. Click **Publish Policy** at the bottom of the view.

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

SSH to each Endpoint Log Hybrid host in your environment with `admin` credentials and make the following updates.

1. Update the `iptables` rules to allow `555` in place of `444`.
   a. Replace `444` with `555` in the following file.
      ```
      vi /etc/sysconfig/iptables
      ```
   b. Restart `iptables` with the following command string.
      ```
      systemctl restart iptables
      ```
   c. Verify the change with the following command string.
      ```
      iptables -L -n
      ```
      The following is an example of what is displayed for a correct change.
      ```
      ACCEPT udp -- 0.0.0.0/0 0.0.0.0/0 udp multiport dports 555 /*
      EndpointNginxPort */ ctstate NEW
      ```
2. Update the SELinux policy. 555 is a privileged port, so you must update SELinux policy to allow this port.
   a. Run the following command string.
      ```
      semanage port -a -t http_port_t -p udp 555
      ```
      If you received any python errors or warnings, ignored them.
   b. Verify the change with the following command string.
      ```
      semanage port -l | grep http_port_t
      ```
      The following is an example of what is displayed for a correct change.
      ```
      http_port_t udp 555, 444
      ```
   c. (Optional) Remove `444`.
3. Update nginx config.
   a. Edit the following file.
      ```
      vi /etc/nginx/nginx.conf
      ```
   b. Search for the following string.
      ```
      listen 444 udp;
      ```
   c. Replace `444` with `555`.

d. Restart nginx with the following command string.
```
systemctl restart nginx
```

4. Verify that agents are communicating over the new port.

a. Run the following command string.
```
tcpdump -i eth0 port 555
```

b. Wait for 30 seconds because the port sends out a beacon every 30 seconds. If t everything is working correctly, information similar to the following will be displayed.
```
09:20:12.571316 IP 10.40.15.103.60807 > EPS1.rsa.lab.emc.com.dsf: UDP,
length 20
09:20:12.572433 IP EPS1.rsa.lab.emc.com.dsf > 10.40.15.103.60807: UDP,
length 1
```
Both lines must be returned. One is the size request (`20` bytes) and the other is the response size (`1` byte).

Site Requirements and Safety

Make sure that you read this topic thoroughly and observe all warnings and precautions prior to installing or maintaining your NetWitness devices.

Intended Application Uses

This product was evaluated as Information Technology Equipment (ITE) that may be installed in offices, schools, computer rooms, and similar indoor commercial type locations. This device is not intended for any connection to an outdoor type cable.

Service

There are no user-serviceable components inside of this device. Please contact Customer Care in the event of a malfunction. In a fault condition, high temperatures may arise inside the system causing an alarm signal. In the event of the alarm signal, immediately disconnect the device from the power source and contact Customer Care. Further operation of the device will be unsafe and may cause personal injury or property damage.

Safety Information

Site Selection

The system is designed to operate in a typical office environment. Choose a site that is:

- Clean, dry, and free of airborne particles (other than normal room dust).
- Well-ventilated and away from sources of heat, including direct sunlight and radiators.
- Away from sources of vibration or physical shock.
- Isolated from strong electromagnetic fields produced by electrical devices.
- In regions that are susceptible to electrical storms, we recommend you plug your system into a surge suppressor.
- Provided with a properly grounded wall outlet.
- Provided with sufficient space to access the power supply cords, because they serve as the product′s main power disconnect.

Equipment Handling Practices

Reduce the risk of personal injury or equipment damage by:

- Conforming to local occupational health and safety requirements when moving and lifting equipment.
- Using mechanical assistance or other suitable assistance when moving and lifting equipment.

- Reducing the weight for easier handling by removing any easily detachable components.

Power and Electrical Warnings

Caution: The power button, indicated by the standby power marking, DOES NOT completely turn off the system AC power; 5V standby power is active whenever the system is plugged in. To remove power from system, you must unplug the AC power cord(s) from the wall outlet.

- Do not attempt to modify or use an AC power cord if it is not the exact type required. A separate AC cord is required for each system power supply.
- This product contains no user-serviceable parts. Do not open the system.
- When replacing a hot-plug power supply, unplug the power cord to the power supply being replaced before removing it from the server.

Rack Mount Warnings

- The equipment rack must be anchored to an unmovable support to prevent it from tipping when a server or piece of equipment is extended from it. The equipment rack must be installed according to the rack manufacturer's instructions.
- Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.
- Extend only one piece of equipment from the rack at a time.
- To avoid risk of potential electric shock, a proper safety ground must be implemented for the rack and each piece of equipment installed in it.

Cooling and Air Flow

Installation of the equipment should be such that the amount of air flow required for safe operation of the equipment is not compromised.

Hosts and Services Basics

This guide gives administrators the standard procedures for adding and configuring hosts and services in NetWitness. After introducing you to the basic purpose of hosts and services and how they function within the NetWitness network, this guide covers:

- Tasks you must complete to set up hosts and services in your network
- Additional procedures that you complete based on the long-term and daily, operational needs of your enterprise
- Reference topics that describe the user interface

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

What Is a Host?

A host is the machine on which a service runs and can be a physical or virtual machine. See the "NetWitness Detailed Host Deployment Diagram" in the *NetWitness Deployment Guide* for an illustration of how hosts are deployed.

What Is a Category?

A category assigns a service or services to a host when you install a host from the Hosts view. You choose a host **Category** in the **Install Services** dialog which is displayed when you select a host in the Hosts view and click 

. The following table lists each category and the services it installs. See the "NetWitness Detailed Host Deployment Diagram" in the *NetWitness Deployment Guide* for an illustration of how hosts are deployed.

Category	Services Installed
Analyst UI	Investigate Server, Broker, NetWitness UI, Reporting Engine, Respond Server
Archiver	Workbench and Archiver
Broker	Broker
Concentrator	Concentrator
Endpoint	Endpoint Server
Endpoint Broker	Endpoint Broker Server
Endpoint Log Hybrid	Log Collector, Log Decoder, Endpoint Server, and Concentrator
ESA Primary	Contexthub Server and ESA Correlation

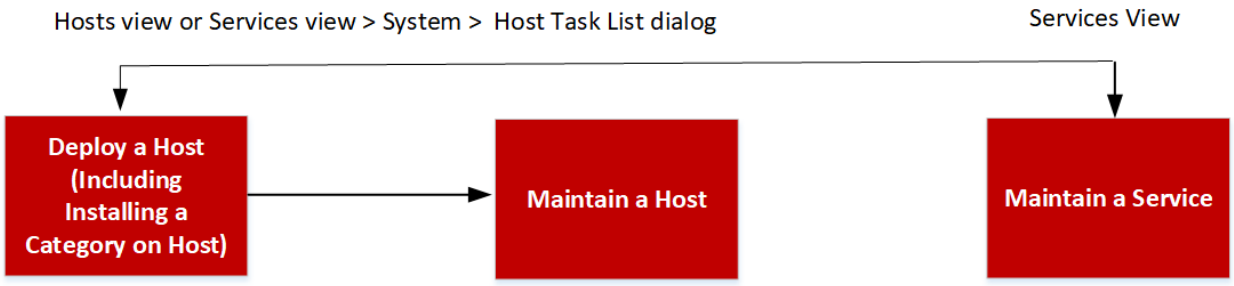
Category	Services Installed
ESA Secondary	ESA Correlation
Log Collector	Log Collector
Log Decoder	Log Collector and Log Decoder
Log Hybrid	Log Collector, Log Decoder, and Concentrator
Log Hybrid - Retention	Log Collector and Log Decoder (deployed on NetWitness Series 6 Hybrid hardware with Log Hybrid-Retention Optimization)
Malware Analysis	Malware Analysis and Broker
Network Decoder	Decoder (Packets)
Network Hybrid	Concentrator and Network Decoder
New Health and Wellness	Metrics Server
UEBA	UEBA
Warehouse Connector	Warehouse Connector

What Is a Service?

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host.

You must configure the following Core services first:

- Network Decoder
- Concentrator
- Broker
- Log Decoder



All the services are listed below and each service except the Log Collector has its own guide or shares a guide in the *Host and Services Configuration Guides* section of the NetWitness documentation page on NetWitness Community at https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation. The Log Collector has its own set of configuration guides to handle the configuration for all the supported event collection protocols. For Log Collector information, see *Log Collection Guides*.

You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data. For information about ports and a comprehensive list of ports for all services, see "Network Architecture and Ports" in the *Deployment Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

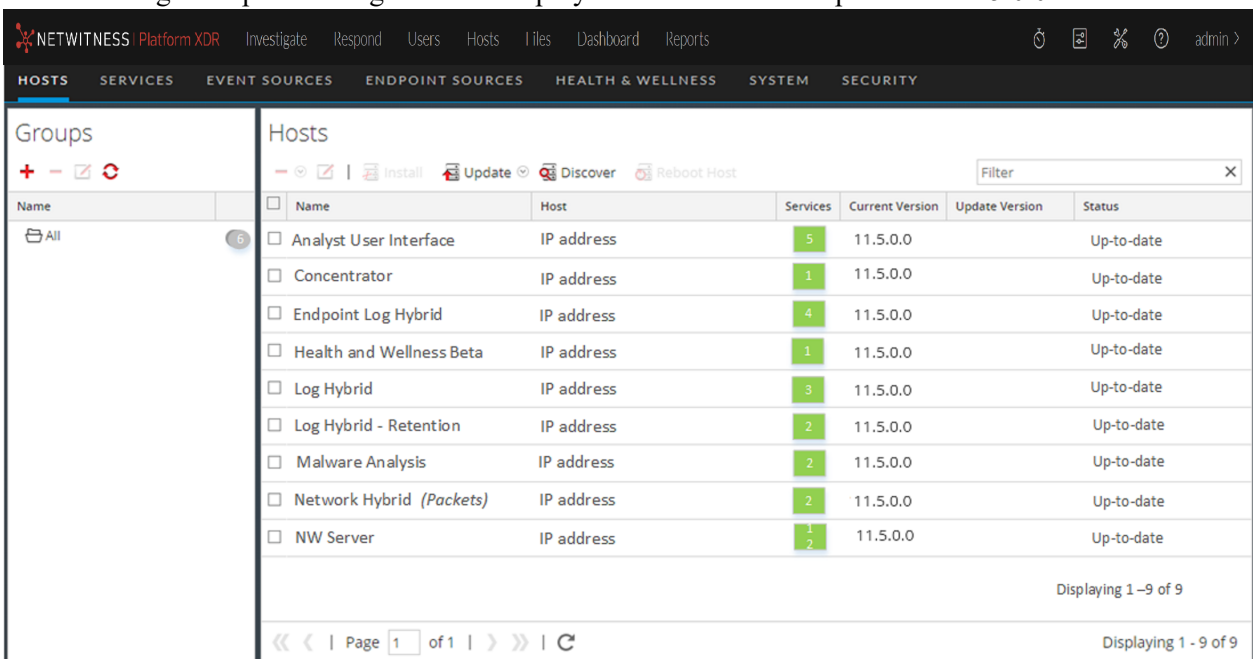
Setting Up a Host

You use the Hosts view to add a host to NetWitness. See Step 1. Deploy a Host for detailed instructions.

Maintaining Hosts

You use the main Hosts view (**(Admin) > Hosts**) to add, edit, delete, and perform other maintenance tasks for the hosts in your deployment. You use the Host Task List dialog to perform tasks relating to a host and its communications with the network. See Hosts and Services Maintenance Procedures for detailed instructions.

After initial implementation of NetWitness, the major task you perform from the Hosts view is updating your NetWitness deployment to a new version.



Update Version Naming Convention

You use the Hosts view to apply the latest version updates from your Hosts and Services Maintenance Procedures. You must understand the update version naming convention to know which version you want to apply to the host. The naming convention is ***major-release.minor-release.service-pack.patch***. For example, if you choose 11.6.1.2, you apply the following version to the host.

- 11 = major release
- 6 = minor release
- 1 = service pack
- 2 = patch

NetWitness supports multiple versions in your deployment. For more information, see Running in Mixed Mode. The NetWitness Server (NW Server Host) is updated first and all other hosts must have the same or earlier version as the NW Server Host.

The following example is a single version deployment with all hosts updated to 11.5.0.0.

Maintaining Services

You use the Services view (**(Admin) > Services**) to add, edit, delete, monitor, and perform other maintenance tasks for the services in your deployment. See Hosts and Services Procedures for detailed instructions.

Services Implemented with the NetWitness Server

The services in the following list are implemented when you deploy the NW Server to support:

- The expansion of physical and virtual deployment platforms and improvements to host and service maintenance.
- Content, Investigate, Respond, and Source functionality.

Caution: You do not need to configure these services to deploy NetWitness. recommends that you monitor the operating status of these services using Health-and-Wellness. Do not attempt to modify the parameters in the Explore view without contacting Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897).

Service	Purpose
Admin	The Administration (Admin) Server is the back-end service for administrative tasks in the NetWitness User Interface (UI). It abstracts authentication, global preferences management, and authorization support for the UI. The Admin server requires the Config server and the Security server to be online to perform its role.
Config	The Configuration (Config) Server stores and manages configuration sets. A configuration set is any logical configuration group that is managed independently. The Config server facilitates the sharing of properties among services, provides configuration backup and restore facilities, and tracks changes to properties.
Content	The Content server manages the NetWitness provided and user-created parser rules. For more information on parser management, search for "parsers" in NetWitness Community.
Integration	The Integration Server manages interactions with external systems. The service handles the following outbound or inbound channels. • REST API Gateway - gateway to external REST clients that assigns calls to the NetWitness Application Programming Interface (API). • Notifications Dispatcher - centralized dispatcher for all outbound notifications originating in the NetWitness deployment.
Investigate	The Investigate server supports Investigate and Malware Analysis functionality. For more information see the *NetWitness Investigate User Guide*.
Orchestration	The Orchestration server provisions, installs, and configures all services in your NetWitness deployment.
Respond	The Respond server supports Respond functionality. For more information see the *NetWitness Respond Configuration Guide*.

Service	Purpose
Security	The NetWitness Security Server (**Security server**) manages the security infrastructure of a NetWitness deployment. It handles the following security-related concerns. • Users and the authentication accounts • Role Based Access Control (RBAC) • Deployment PKI infrastructure A NetWitness deployment has users with authentication accounts. Independent of how you verify the identity of the analyst (for example, Active Directory), NetWitness must maintain the user state, which is not provided by all authentication providers (for example, last login time, failed login attempts, and roles). The concept of a user is separate from the identify associated with the user and the **Security server** maintains these as separate User and Account entities. In addition to the out-of-the-box local NetWitness accounts available to all NetWitness deployments, the server supports external authentication providers. The **Security server** also implements RBAC by managing Role and Permission entities. Permissions can be assigned to roles and roles to users. Together these enable a flexible authorization policy for the deployment. The server also manages generation of cryptographically secure tokens that encode the applicable authorization for a user. These tokens form the basis for deployment-wide authorization.
Source	The Source server is reserved for future use and will provide a centralized location to configure sources (for example, Endpoints and Log Sources).

Running in Mixed Mode

Mixed mode occurs when some services are updated to the latest version and some are still on older versions. This happens when you update the hosts in your deployment to the latest version in phases (or stagger the update).

Functionality Gaps Encountered During in Staggered Updates

If you stagger the update, you:

- May not have all the features operational until you update your entire deployment.
- Will not have service administrative features available until you update all the hosts in your deployment.
- May be without data capture for a period of time.

Examples of Staggered Updates

In the following examples, all the hosts are on 11.4.0.0 and you want to stagger the host updates to version 11.4.1.0.

Example 1. Multiple Network Decoders and Concentrators, Alternative 1

In this example, the 11.4.0.0 deployment includes one NW Server host, two Network Decoder hosts, two Concentrator hosts, one Archiver host, one Broker host, one Event Stream Analysis host, one Endpoint Log Hybrid host, and one Malware Analysis host.

You must complete Session 1 first and update the hosts in the order listed.

NetWitness recommends that you update the Sessions 2 and 3 hosts in the order listed.

Session 1: Update Essential Hosts

1. Update the NetWitness Server host.
2. Update the Event Stream Analysis host.
3. Update the Endpoint Log Hybrid host.
4. Update the Malware Analysis host.
5. Update the Broker host.

Session 2: Update Other Hosts

1. Update the two Network Decoder hosts.
2. Update the two Concentrator hosts and the Archiver host.

Session 3: Update Other Hosts

1. Update all other hosts.

Example 2. Multiple Network Decoders and Concentrators, Alternative 2

In this example, the 11.4.0.0 deployment includes one NW Server host, two Network Decoder hosts, two Concentrator hosts, one Broker host, one Event Stream Analysis host, one Endpoint Log Hybrid host and one Malware Analysis host.

You must complete Session 1 first and update the hosts in the order listed.

NetWitness recommends that you update the Sessions 2 and 3 hosts in the order listed.

Session 1: Update Essential Hosts

1. Update the NetWitness Server host.
2. Update the Event Stream Analysis host.
3. Update the Endpoint Log Hybrid host.
4. Update the Malware Analysis host.
5. Update the Broker host.

Session 2: Update Other Hosts

1. Update one Network Decoder host and one Concentrator host.

Note: It does not matter which of the Network Decoder hosts or which of the Concentrator hosts you update first.

Time elapses during which NetWitness processes a significant amount of data.

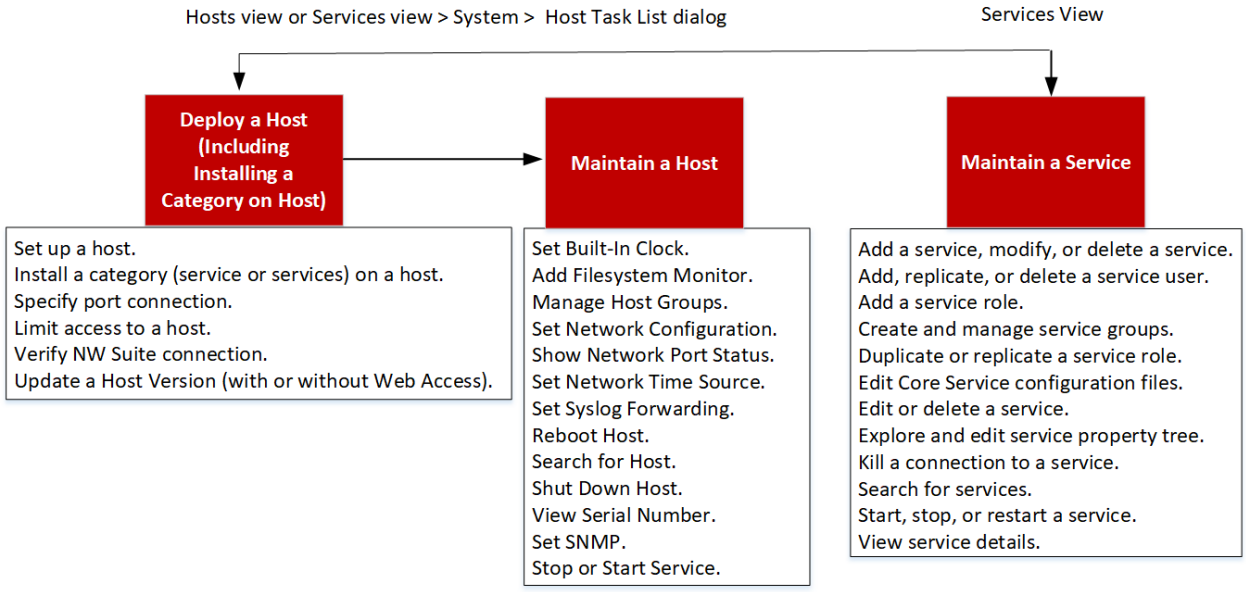
Session 3: Update Other Hosts

1. Update the second Network Decoder host and the second Concentrator host.
2. Update all Log Decoder hosts before you update Virtual Log Collectors.
3. Update all other hosts.

Example 3. Multiple Regions

In this example, the 11.4.0.0 deployment includes one NW Server host, one Event Stream Analysis host, one Endpoint Log Hybrid host, one Malware Analysis host. Additionally, there are two sites, each with two Network Decoders, two Concentrators, and one Broker, for a total of four Network Decoder hosts, four Concentrator hosts, and two Broker hosts.

Session 1: Update Essential Hosts and Site 1



1. Update the NW Server host.
2. Update the Event Stream Analysis host.
3. Update the Endpoint Log Hybrid host.
4. Update the Malware Analysis host.
5. Update one Broker host, two Network Decoder hosts, and two Concentrator hosts.

Session 2: Update Other Hosts and Site 2

1. Update the second Broker host.
2. Update the two remaining Network Decoder hosts.
3. Update the two remaining Concentrator hosts.
4. Update all the other hosts.

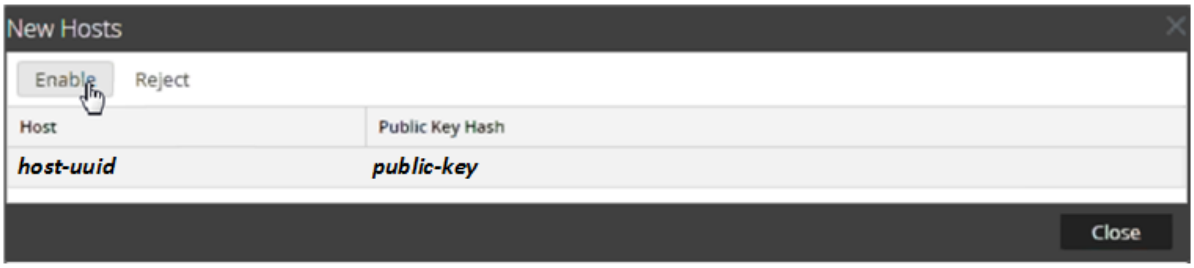
Hosts and Services Set Up Procedures

Every service requires a host. After you set up a host, you can assign services to and from this host to other hosts in your NetWitness deployment. This topic contains information about basic procedures. For additional procedures, see Hosts and Services Maintenance Procedures.

High-Level Task	Description
Set Up a Host	Complete the following tasks in the order shown to set up a host. Step 1. Deploy a Host Step 2. Install a Service on a Host Step 3. Review SSL Ports for Trusted Connections Step 4. Manage Access to a Service

Step 1. Deploy a Host

Caution: If you include "." in a host name, the host name must also include a valid domain name.



1. Deploy a host.

   You can deploy a physical host (NetWitness Appliance), virtual host on-prem, a virtual in AWS, a virtual host in Azure, or a virtual host on Google Cloud Platform. See the following guides for instructions on how to deploy hosts.

   - *Physical Host Installation Guide*
   - *Virtual Host Installation Guide*
   - *AWS Installation Guide*

- *Azure Installation Guide*
- *GCP Installation Guide*

2. Go to  **(Admin) > Hosts**.
   The New Hosts dialog is displayed with the hosts that you deployed.
3. Select the hosts that you want to enable.
   The Enable menu option becomes active.
4. Click **Enable**.

5. Select the host you enabled.
   The host is displayed in the Hosts view. At this point, you can install a service on the host.

Step 2. Install a Service on a Host

Perform the following steps to install a service on a host.

1. In NetWitness, go to  **(Admin) > Hosts**.
   The Hosts view is displayed.
2. Select the host on which you want to install the service (for example, **Event Stream Analysis**).
3. Click  in the toolbar.
   The Install Services dialog is displayed.
4. Select a service from the **Category** drop-down list (for example, **ESA Primary**).
5. Click  in the Install Services dialog.

6. A pop-up listing all the services already installed on this host is displayed. If there are no services installed, this pop-up will not be displayed.
7. Click **Yes** to install the new service.

Step 3. Review SSL Ports for Trusted Connections

To support trusted connections each core service has two ports, an unencrypted non-SSL port and an encrypted SSL port. Trusted connections require the encrypted SSL port.

Encrypted SSL Ports

By default, trusted connections are established with two settings:

- SSL is enabled.
- Core service is connected to an encrypted SSL port.

Each NetWitness Core service has two ports:

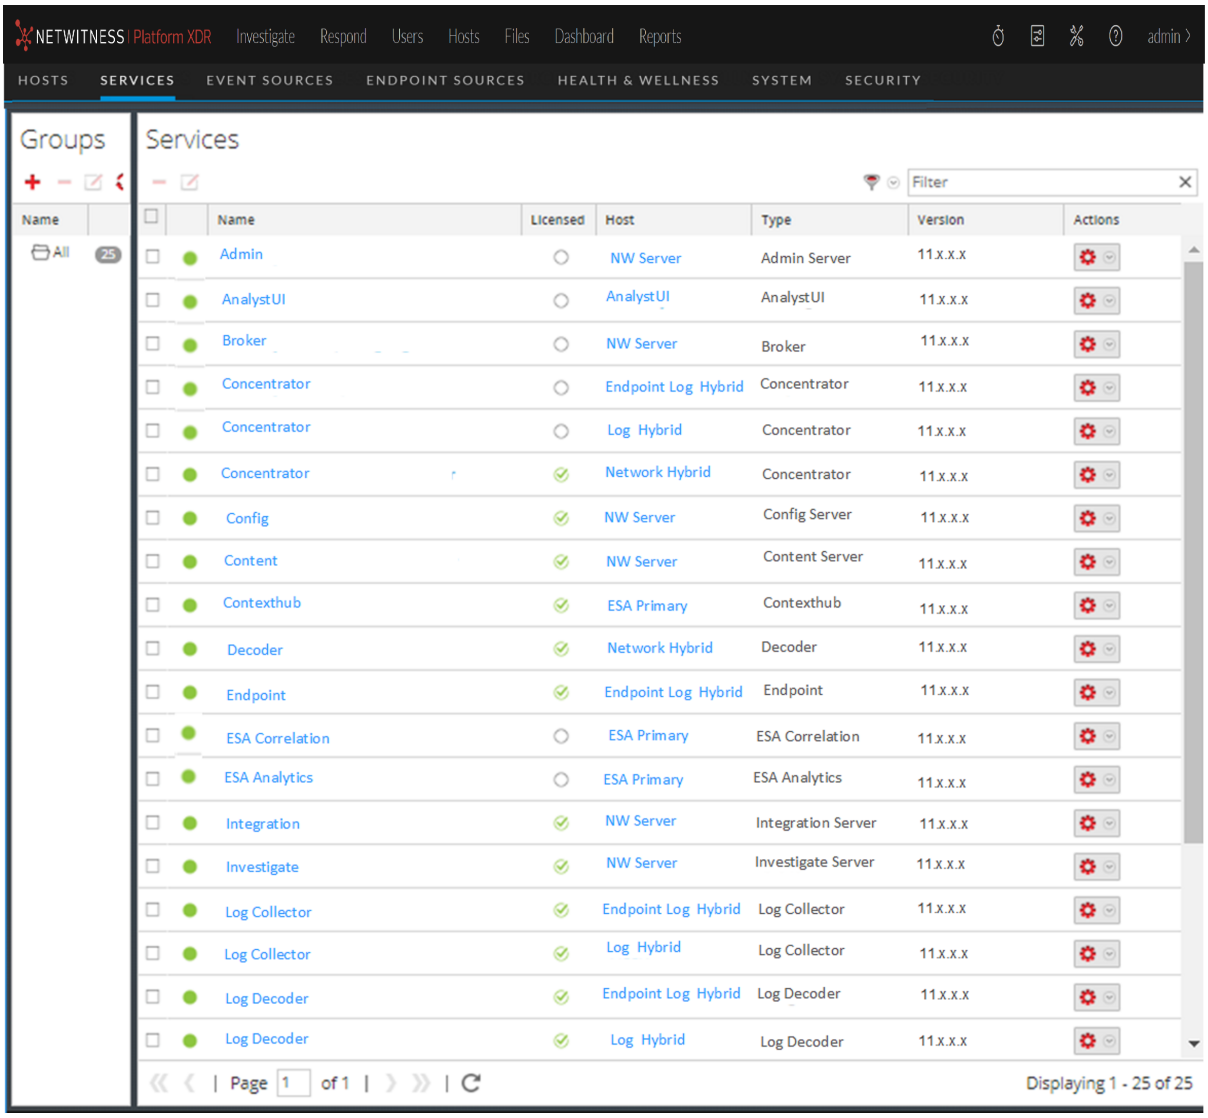
- Unencrypted non-SSL port
  Example: Archiver 50008
- Encrypted SSL port
  Example: Archiver 56008

The SSL port is the non-SSL port + 6000.

For information about ports and a comprehensive list of ports for all services, see "Network Architecture and Ports" in the *Deployment Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

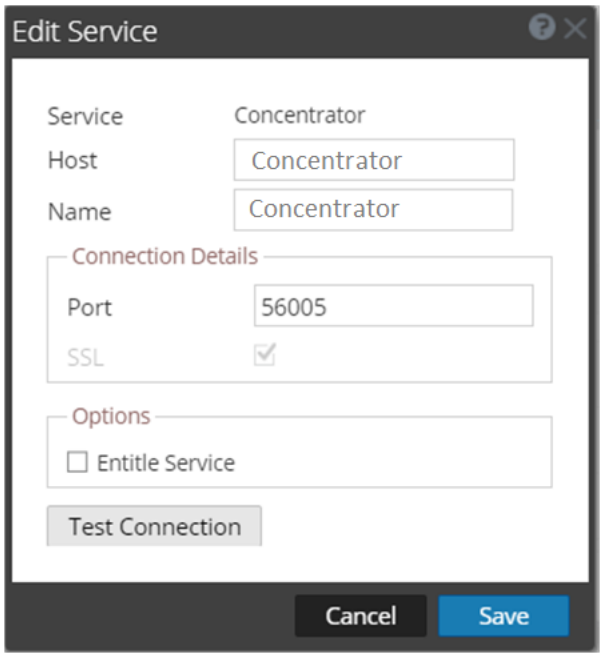
Step 4. Manage Access to a Service

In a trusted connection, a service explicitly trusts the NW Server to manage and authenticate users. With this trust, services in  **(Admin) > Services** no longer require credentials to be defined for every NetWitness Core service. Instead, users who have been authenticated by the server can access the service without entering another password.



Test a Trusted Connection

Prerequisites



1. The administrator must assign a role to the user.
   For more information, see "Add a User and Assign a Role" in the *System Security and User Management Guide*.
2. The user must:
   - Log in to NetWitness for the server to authenticate the user.
   - Have access to the service.

Procedure

1. In NetWitness, go to  **(Admin) > Services**.
   The Services view is displayed.

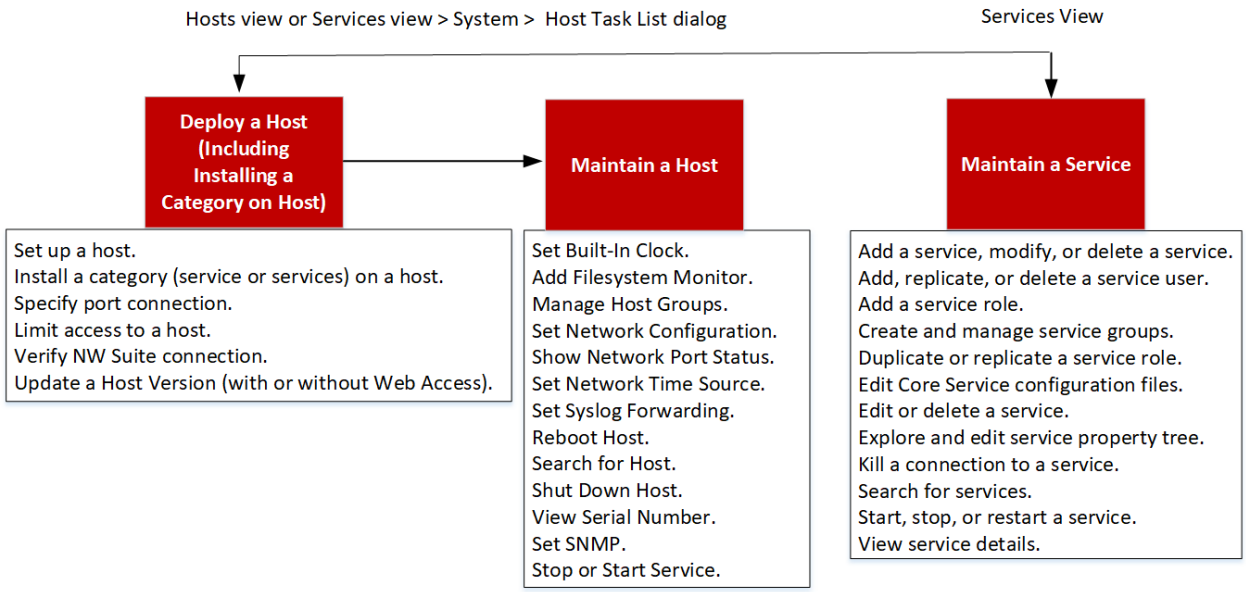
Displaying 1 - 25 of 25

2. Select the checkbox of the service (for example, a Concentrator) to test and click .
   The **Edit Service** dialog is displayed.

Note: The Options box will only display if the selected service is not licensed. A licensed service is denoted by a  in the Services view.

3. Remove the username to test the connection without credentials.
4. Click **Test Connection**.



The message `Test connection successful` confirms the trusted connection is established. The previously authenticated user can access the service without typing a username and password on the service.

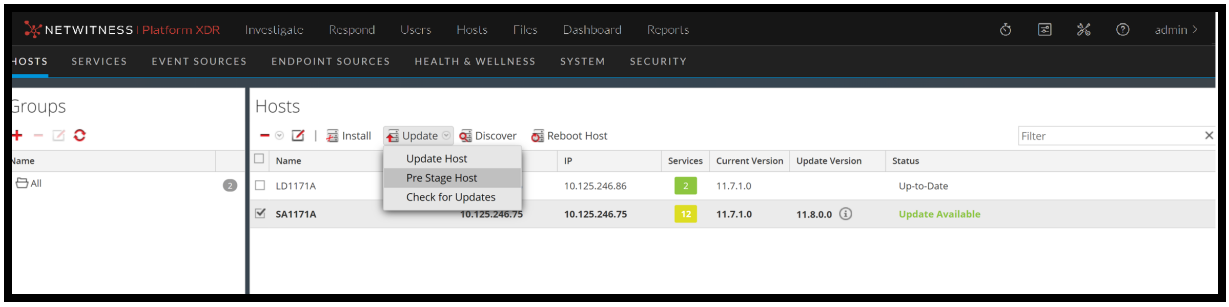
5. Click **Save**.

Hosts and Services Maintenance Procedures

Every service requires a host. After you set up a host, you can assign services to and from this host to other hosts in your NetWitness deployment.

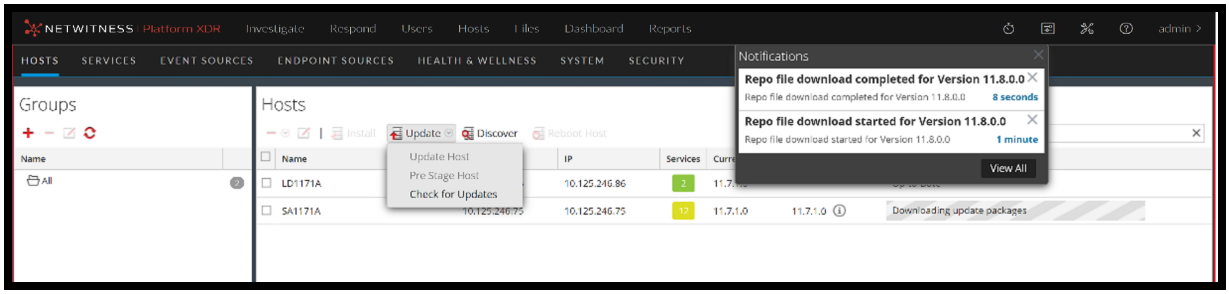
High-Level Task	Description
Maintain a Host - Basics	The following maintenance tasks are shown in alphabetical order. • Apply Version Upgrades to a Host • Create and Manage Host Groups • Search for Hosts • Set Network Time Source • Show Network Port Status • Show Serial Number • Shut Down Host • Stop and Start a Service on a Host

High-Level Task	Description
Maintain a Host from the Host Task List Dialog	You use the Host Task List dialog to manage tasks that relate to a host and its communications with the network. Several service and host configuration options are available for Core hosts. • Execute a Task From the Host Task List • Add and Delete a Filesystem Monitor • Reboot a Host • Set Host Built-In Clock • Set Network Time Source • Set SNMP • Set Syslog Forwarding • Show Network Port Status • Show Serial Number • Shut Down Host • Stop and Start a Service on a Host
Maintain a Service	The following procedures describe how to maintain services. • Add, Replicate, or Delete a Service User • Add a User Role to a Service • Change a Service User Password • Create and Manage Service Groups • Duplicate or Replicate a Service Role • Edit Core Service Configuration Files • Edit or Delete a Service • Explore and Edit Service Property Tree • Terminate a Connection to a Service • Search for Services • Start, Stop, or Restart a Service • View Topology Details • Services System View • Centralized Service Configuration via Policy



Apply Version Upgrades to a Host

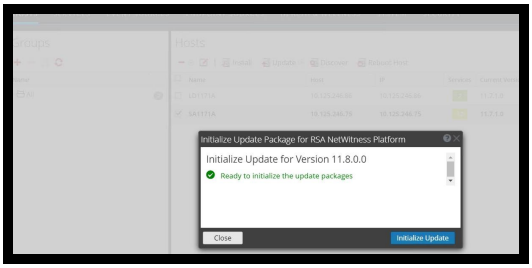
Upgrade guides are available for all supported versions of NetWitness. Refer to the upgrade guide for the latest version in the *Install and Upgrade* section of the NetWitness documentation page on NetWitness Link.



Pre-Stage Host

Note: The **Pre Stage Host** option is enabled for upgrade on the Admin Server. This option will be available after you upgrade to 11.7.1 and can be used to upgrade to versions later than 11.7.1.

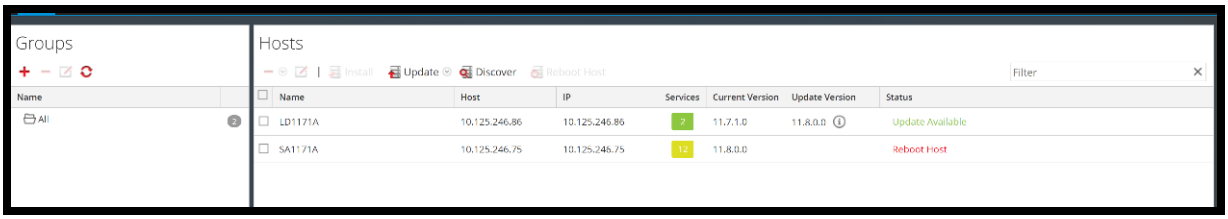
1. Go to  > Hosts.
2. Click **Update** > **Check for Updates**.
   All possible update versions will displayed in the Versions drop-down list.
3. Click **Update** > **Pre Stage Host** and select the version in the update version column.
   A confirmation message for downloading the files is displayed.



4. Click **Yes** to download the upgrade packages to the repo.
5. Verify the status of the download in the notifications tray as shown below.
   The **Pre Stage Host** and **Upgrade Host** will be disabled until pre stage is completed.

Note: The current version and the update version in the UI will be the same during the pre stage as it is not the actual update. This is because only the repo files are downloaded and no actual upgrade is done. The version will change only after upgrade.

6. If the download is successful, **Check for Updates** again to start the initialization.



7. Click on **Initialize Update**.
   The initialization of the package will take some time as the files are large and will need to be unzipped.

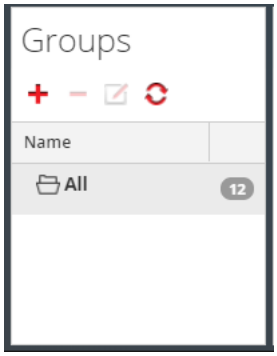
IMPORTANT: Pre Stage Repo preparation steps from 1 to 4 can be performed at any time. However, from steps 5 to 8 the upgrade process begins and you must NOT reboot the host or restart the jetty server during this time as it will corrupt the .ZIP files.

8. Check the status of initialization in the notifications tray.

9. After the initialization is completed successfully, click **Update** > **Update Host.**
   After the host is updated, you will be prompted to reboot the host.

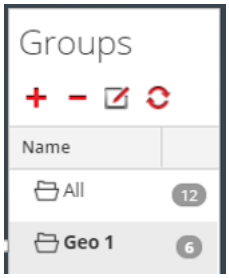
10. Set up the host and reboot the host.

Create and Manage Host Groups



The Hosts view provides options for creating and managing groups of hosts. The Groups panel toolbar includes options for creating, editing, and deleting host groups. Once groups are created, you can drag individual hosts from the Hosts panel into a group.

Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A host may belong to more than one group. Here are some examples of possible groupings:



- Group different categories to make it easier to configure and monitor all Brokers, Network Decoders, or Concentrators.
- Group hosts that are part of the same data flow; for example, a Broker, and all associated Concentrators and Network Decoders.
- Group hosts according to their geographic region and location within the region. If a major power outage occurs in a location, potentially affected hosts are easily identifiable.

Create a Group

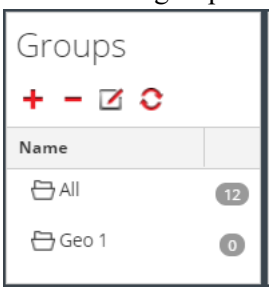
1. Select **(Admin) > Hosts**.
   The Hosts view is displayed.
2. In the **Groups** panel toolbar, click +.
   A field for the new group opens with a blinking cursor.

3. Type the name of the new group in the field (for example, `Geo 1`) and press **Enter**.
   The group is created as a folder in the tree. The number next to the group indicates the number of hosts in that group.

Change the Name of a Group

1. In the Hosts view **Groups** panel, double-click the group name, or select the group and click .
   The name field opens with a blinking cursor.
2. Type the new name of the group and press **Enter**.
   The name field closes and the new group name is displayed in the tree.

Add a Host to a Group



In the Hosts view **Hosts** panel, select a host and drag the host to a group folder in the Groups panel. The host is added to the group.

View the Hosts in a Group

To view the hosts in a group, click the group in the **Groups** panel.
The Hosts panel lists the hosts in that group.

Remove a Host from a Group

1. In the Hosts view **Groups** panel, select the group that contains the host that you want to remove. The hosts in that group appear in the Hosts panel.
2. In the **Hosts** panel, select one or more hosts that you want to remove from the group, and in the toolbar, select − > **Remove from Group**.
   The selected hosts are removed from the group, but are not removed from the NetWitness user interface. The number of hosts in the group, which is listed near the group name, decreases by the number of hosts removed from the group. The `All` group contains the hosts that were removed from the group.
   In the following example, the host group called `Geo 1` does not contain any hosts, because all the hosts in that group are removed.

Delete a Group

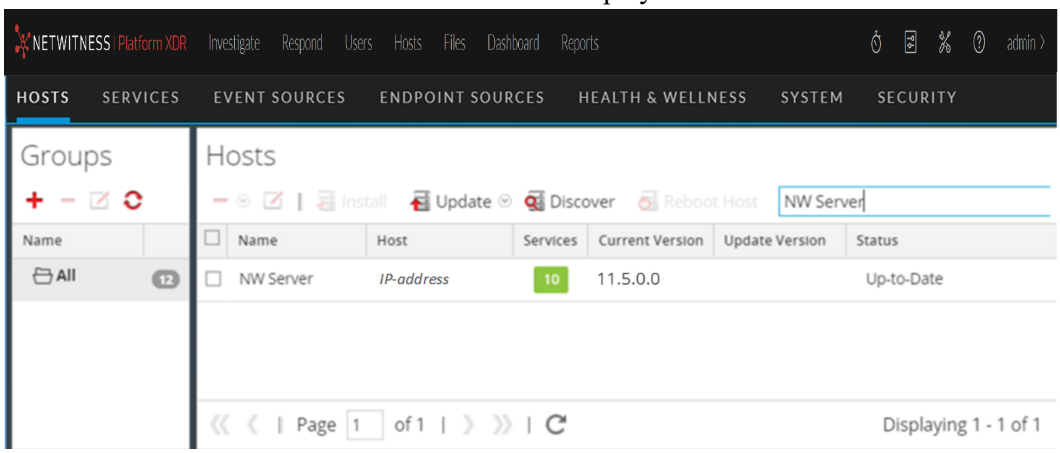
1. In the Hosts view **Groups** panel, select the group that you want to delete.
2. Click −.
   The selected group is removed from the Groups panel. The hosts that were in the group are not removed from the NetWitness user interface. The `All` group contains the hosts from the deleted group.

Search for Hosts

You can search for hosts from a list of hosts in the Hosts view. The Hosts view enables you quickly filter the list of hosts by Name and Host. It is possible to have numerous NetWitness hosts in use for various purposes. Instead of scrolling through the host list, you can quickly filter the host list to locate the hosts that you want to administer.

In the Services view, you can search for a service and quickly find the host that runs that service.

Search for a Host

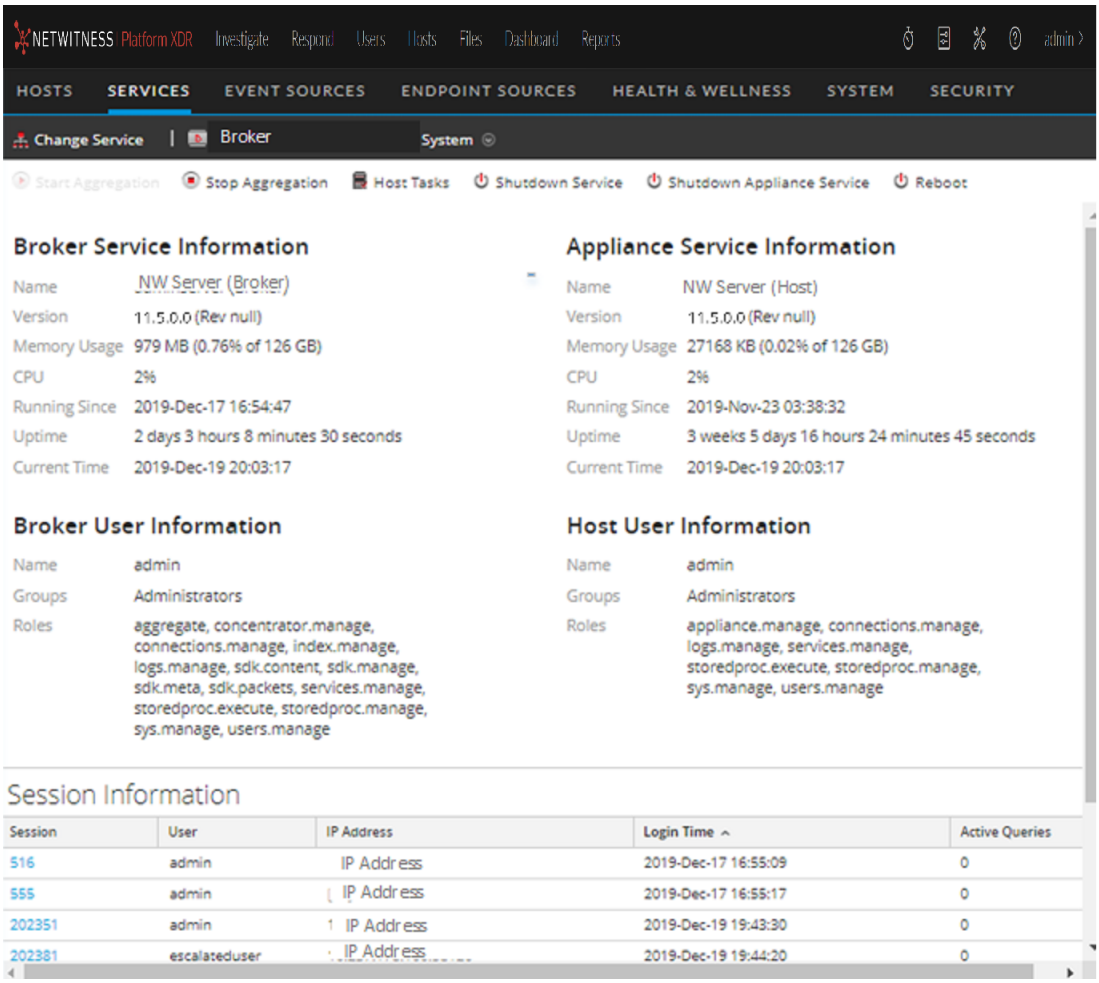


1. Select **(Admin) > Hosts**.
2. In the **Hosts** panel toolbar, type a host **Name** or **Hostname** in the **Filter** field.

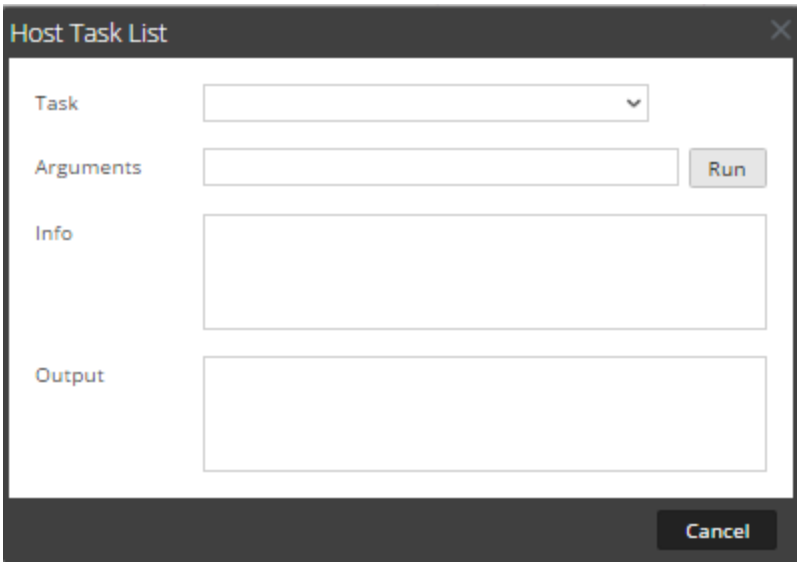
   The Hosts panel lists the hosts that match the names entered in the Filter field.

Find the Host that Runs a Service

1. Select **(Admin) > Services**.
2. In the **Services** view, select a service. The associated host is listed in the Host column for that service.
3. To administer the host in the Hosts view, click the link in the **Host** column for that service. The host associated with the selected service is displayed in the Hosts view.



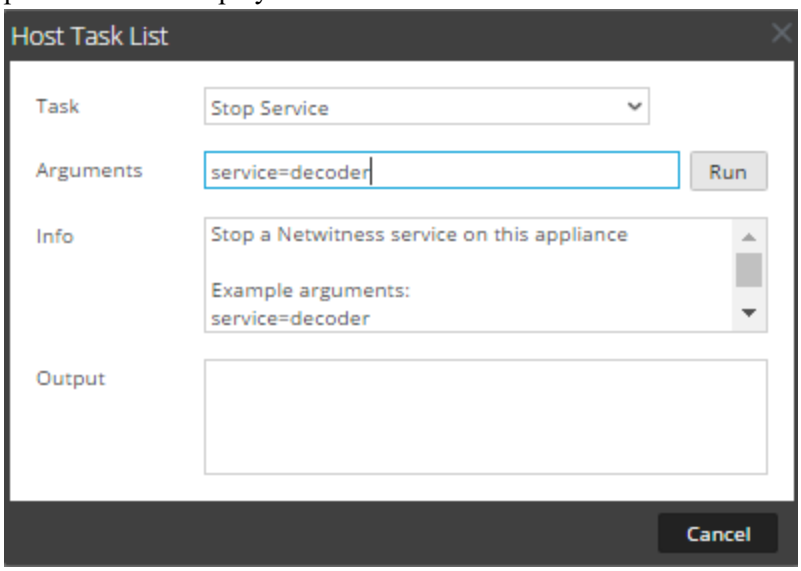
Execute a Task From the Host Task List



1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.

   Note: The Admin, Config, Orchestration, Security, Investigate, and Respond services do have access to the System view. They only have access to the Explore view.

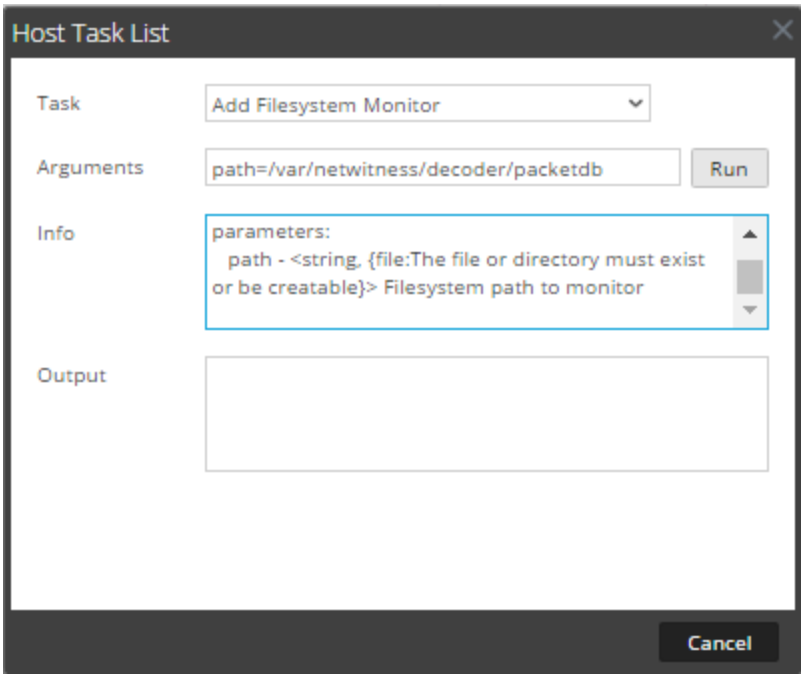
   The System view for the service is displayed below.



3. In the **Services System** view toolbar, click Host Tasks.

4. In the **Host Task List** dialog, click in the **Task** field to display a drop-down list of tasks that run on a host.

5. Select a task (for example, click **Stop Service**).
The task is displayed in the Task field. Task description, example arguments, security roles, and parameters are displayed in the Info area.

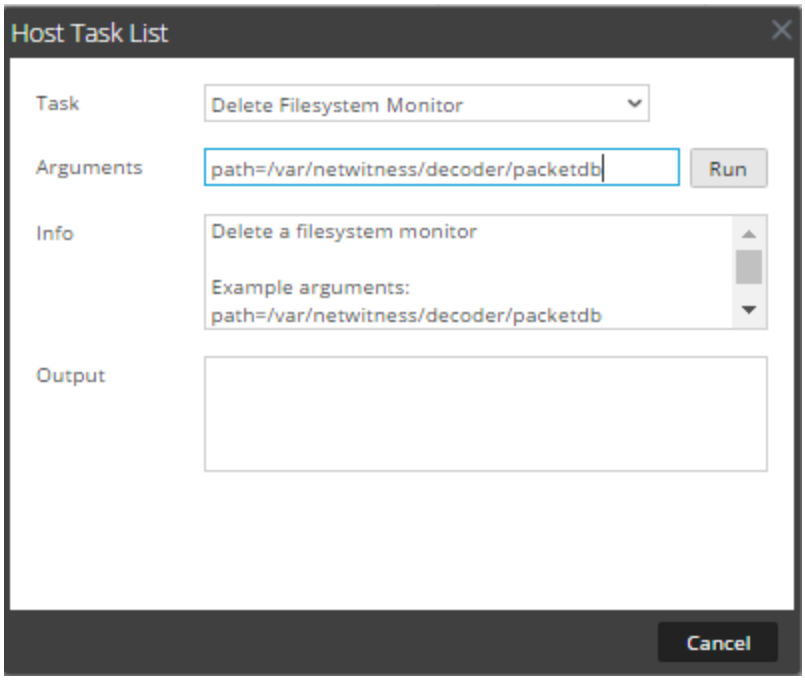


6. Type arguments if necessary and click **Run**.
The command executes and the result is displayed in the Output section.

Add and Delete a Filesystem Monitor

When you want a service to monitor traffic on a specific file system, you can select the service and then specify the path. NetWitness Platform adds a filesystem monitor. Once a file system monitor is added to a service, the service continues to monitor traffic on that path until the file system monitor is deleted.

Configure the Filesystem Monitor



1. Select  **(Admin) > Services**.
2. In the **Services** list, select a service and click  **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Add Filesystem Monitor**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.
5. To identify the file system to monitor, type the path in the **Arguments** field. For example:
   `path=/var/netwitness/decoder/packetdb`

6. Click **Run**.
   The result is displayed in the Output area. The service begins to monitor the file system and continues to monitor it until you delete the filesystem monitor.

Delete a Filesystem Monitor

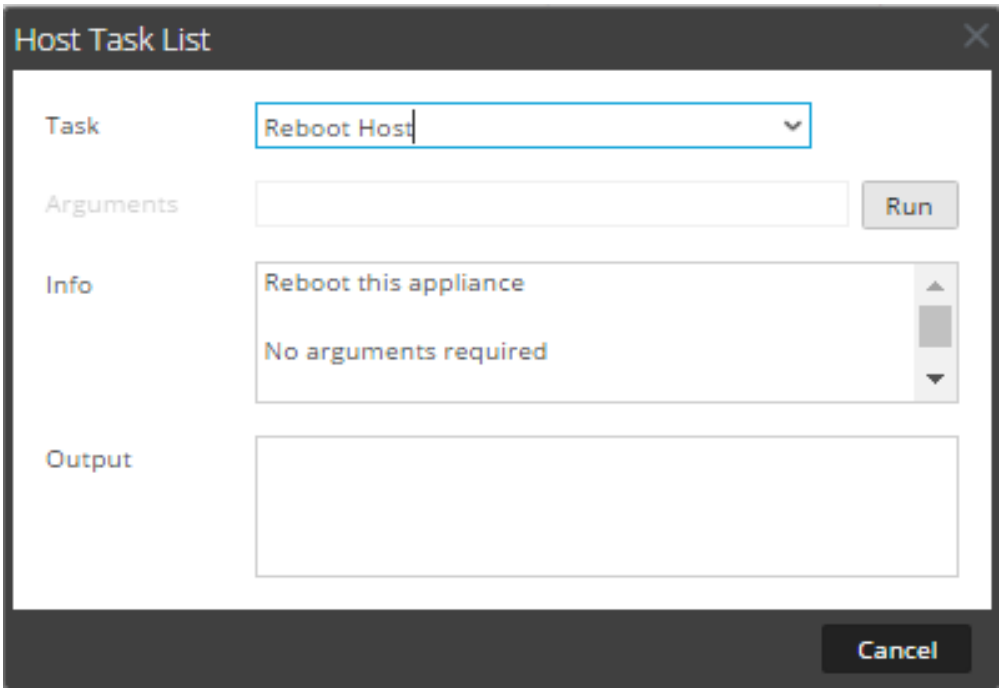
1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Delete Filesystem Monitor**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.
5. To identify the filesystem to stop monitoring, type the path in the **Arguments** field. For example:
   `path=/var/netwitness/decoder/packetdb`

6. Click **Run**.
   The result is displayed in the Output area. The service stops monitoring the file system.

Reboot a Host

Under certain conditions, you must reboot a host; for example, after installing a software upgrade. This procedure uses a Host Task List message to shut down and restart a host.

NetWitness Platform also offers other options for shutting down a host:



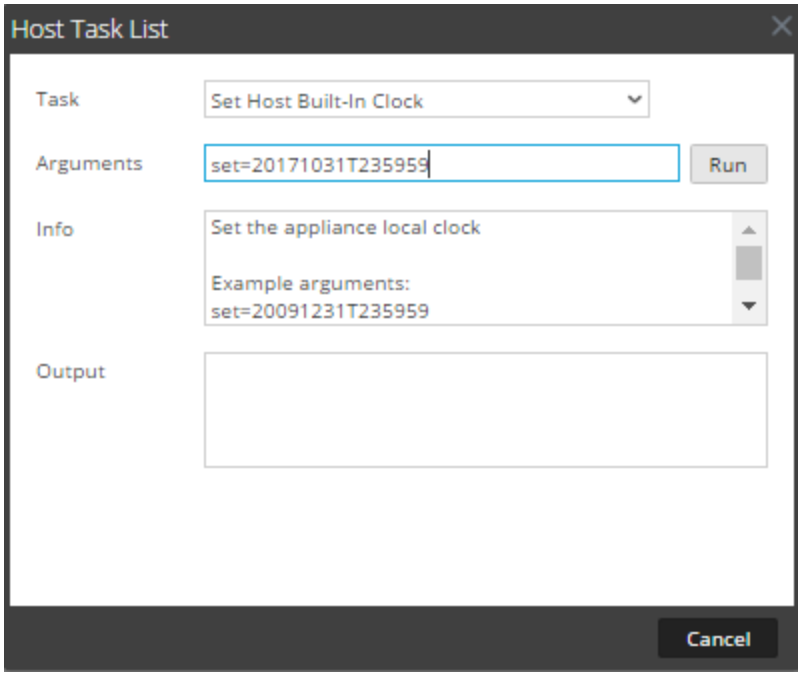
- To shut down and restart a host through an attached service, go to the Hosts view from a service in the Services view (see Search for Hosts) and then follow the Shut Down and Restart a Host from the Hosts View procedure below.
- To shut down the physical host without restarting, see Shut Down Host.

Shut Down and Restart a Host from the Hosts View

1. Select **(Admin) > Hosts**.
2. In the **Hosts** panel, select a host.
3. Select Reboot Host from the toolbar.

Shut Down and Restart a Host from the Host Task List

1. Select **(Admin) > Services**.
2. In the **Services** panel, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Reboot Host** in the **Task** field.
   No arguments are required.



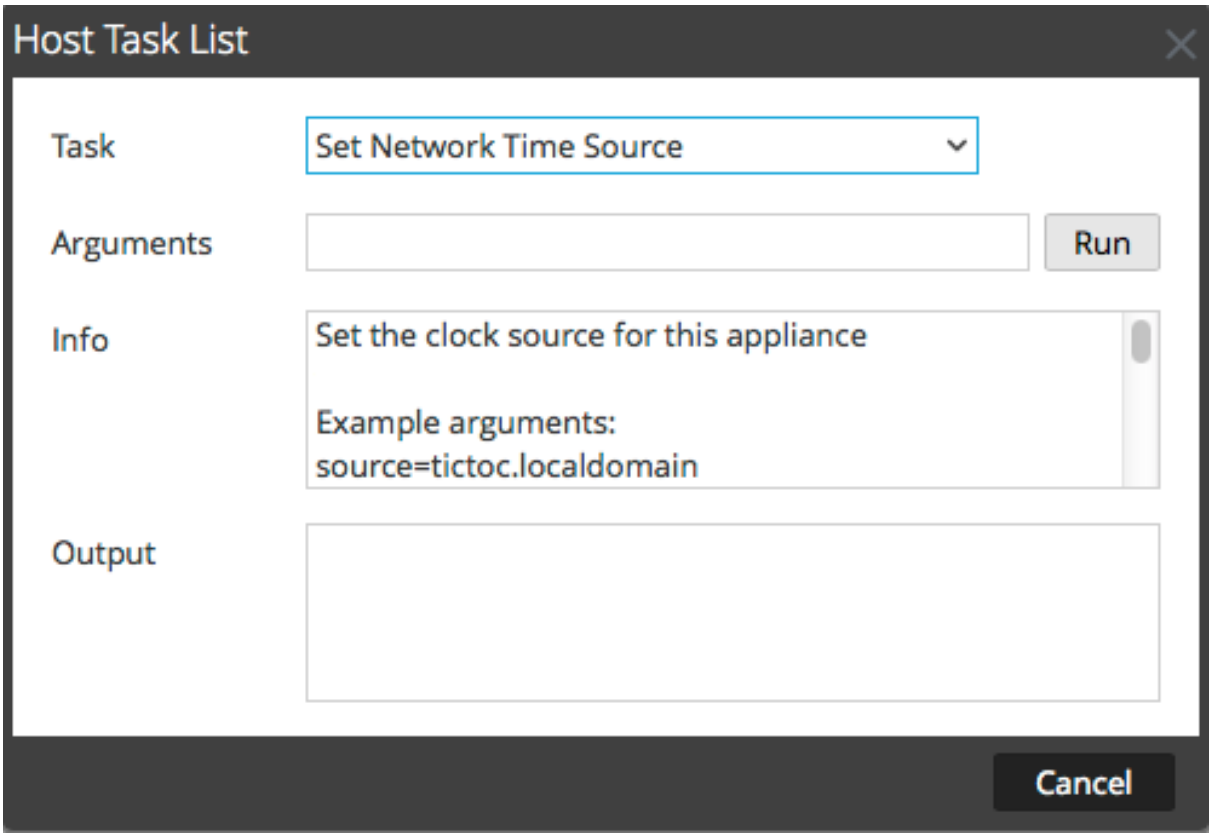
5. Click **Run**.
   The host is rebooted and the result is displayed in the Output area.

Set Host Built-In Clock

After a shutdown or battery failure, it may be necessary to set the local clock on a host. The Set Host Built-In Clock task resets the clock time.

Set the Time on the Local Clock

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Set Host Built-In Clock**.
   Help for the task is displayed in the Info area.
5. Enter the date and time arguments in the **Arguments** field.
   For example, to specify October 31, 2017 at 11:59:59 PM, type:
   `set=20171031T235959`



6. Click **Run**.
   The clock is set to the specified time and a message is displayed in the Output area.

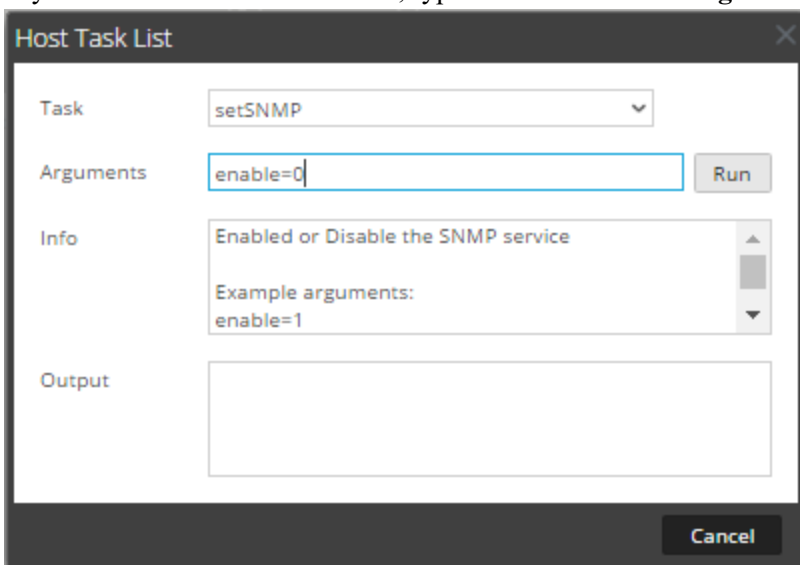
Set Network Time Source

When setting the clock source for a host, set the hostname or address of an Network Time Protocol (NTP) server to be the network clock source for the host. If the host is using a local clock source, you must specify **local** here to allow **Set the Local Clock Source** to be effective.

Specify the Network Clock Source

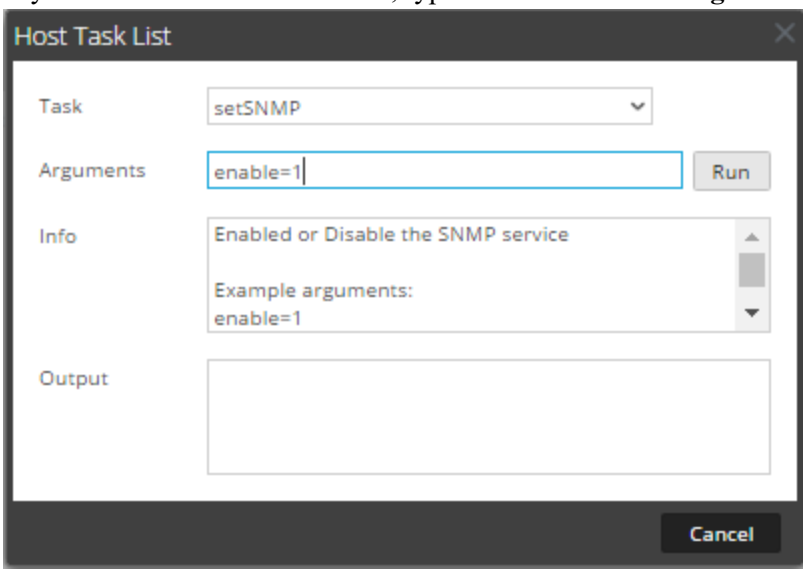
1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Set Network Time Source**.

5. Do one of the following:
   - Type the hostname or address of the NTP server to serve as the clock source for this host; for example: **`source=tictoc.localdomain`**
   - If you want to use the host clock as a clock source, type: **`source=local`**
6. Click **Run**.
   The clock source is set and a message is displayed in the Output area.



Note: If you specified a NTP clock source of **local**, the host clock serves as the clock source and the time is configured using Set Host Built-In Clock.

Set SNMP



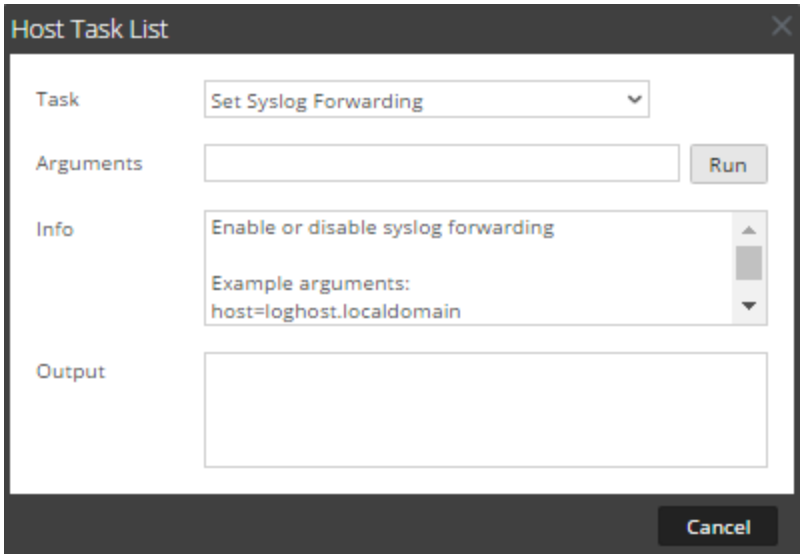
The Set SNMP task in the Host Task List enables or disables the SNMP service on a host. For a host to receive SNMP notifications, enable the SNMP service. If you are not using SNMP for NetWitness notifications, it is not necessary to enable the service.

Toggle SNMP Service on the Host

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System view** toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **setSNMP**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.
5. Do one of the following:
   - If you want to disable the service, type **`enable=0`** in the **Arguments** field.

- If you want to enable the service, type **`enable=1`** in the **Arguments** field.

6. Click **Run**.
   The result is displayed in the Output area.



Set Syslog Forwarding

You can configure Syslog forwarding to forward the operating system logs of your NetWitness Hosts to a remote syslog server. You can use the Set Syslog Forwarding task in the Host Task List to enable or disable syslog forwarding.

Set Up and Start Syslog Forwarding

1. Select  **(Admin) > Services**.
2. In the **Services** list, select a service and click  **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.

4. In the **Host Task List**, select **Set Syslog Forwarding**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.

5. In the **Arguments** field, do any one of the following.

   - To enable syslog forwarding, specify any one of the following formats:
     `host=<loghost>.<localdomain>` (for example, `host=syslogserver.local`).

     `host=<loghost>.<localdomain>:<port>` (for example, `host=syslogserver.local:514`).

     `host=<IP>` (for example, `host=10.31.244.244`).

     `host=<IP>:<port>` (for example, `host=10.31.244.244:514`).

     The following table lists the parameters used to enable syslog forwarding.

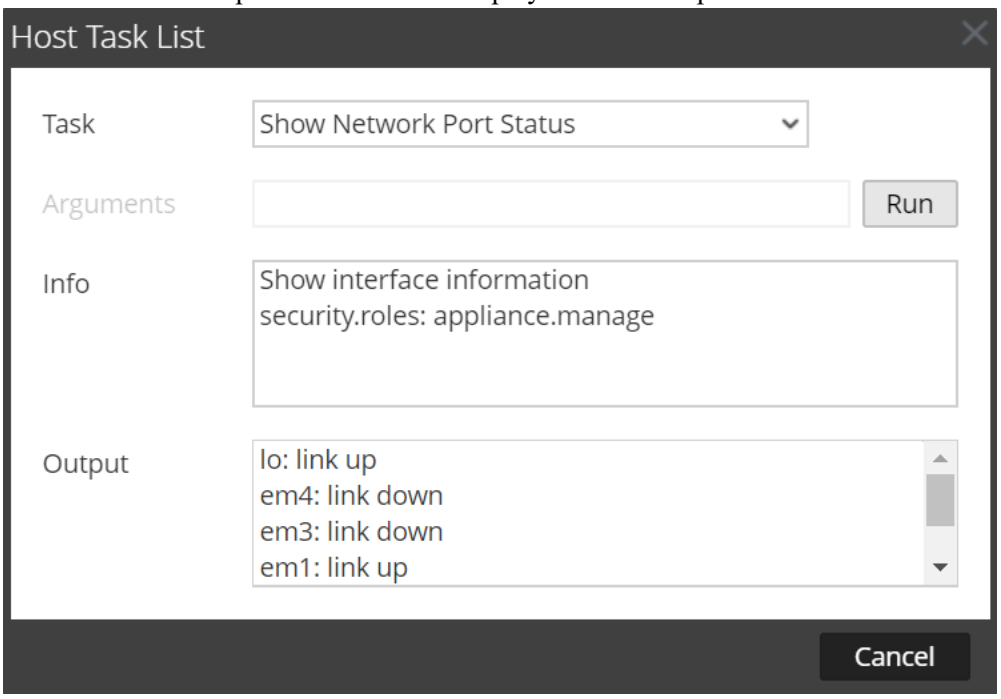
Parameter	Description
`loghost`	The host name of the remote syslog server.
`localdomain`	The domain of the remote syslog server.
`port`	IP address of the remote syslog server.
`IP`	The port number on which the remote syslog server receives a syslog messages.

   - To disable syslog forwarding, type **`host=disable`**.

6. Click **Run**.
   The result is displayed in the Output area.

Once syslog forwarding is enabled or disabled, the `/etc/rsyslog.conf` file is updated automatically to enable or disable syslog forwarding to the remote syslog destination and the syslog service is restarted.

If you enable syslog forwarding, the logs from the configured service are forwarded to the defined syslog server and continues forwarding until disabled.



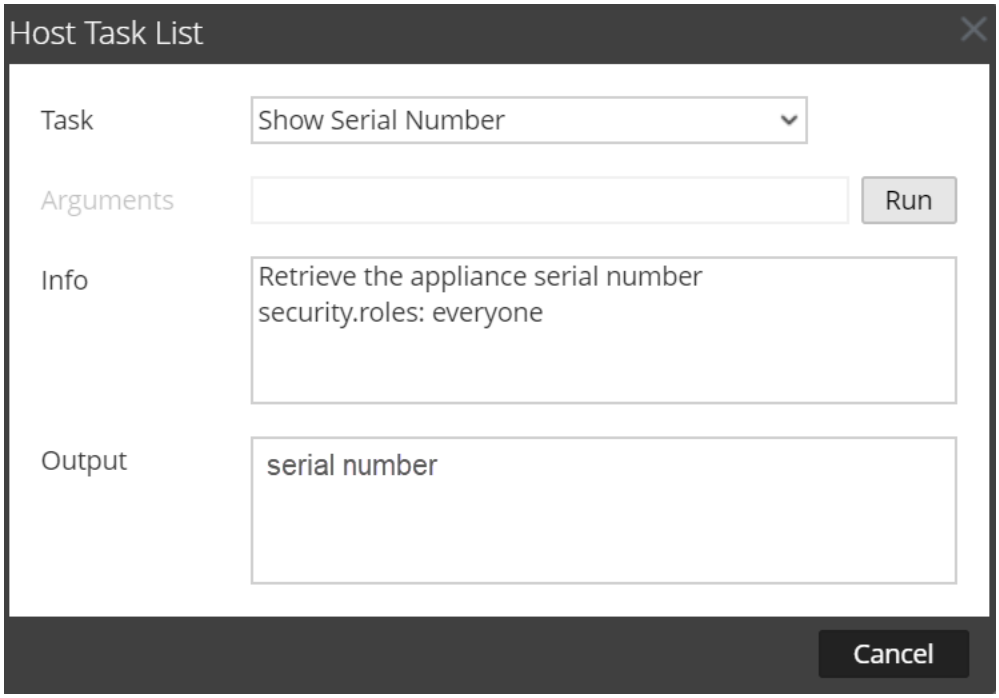
Note: You can now log in to the remote syslog server and verify if the messages are being received from the NetWitness services configured for syslog forwarding.

Show Network Port Status

The Show Network Port Status task in the Host Task List gives you the status of all configured ports on the host.

Display the Network Port Status

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and **> View> System**.
   The System view for the selected service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, click **Show Network Port Status**.
   The task is displayed in the Task field, and information about the task is displayed in the Info area.
5. No arguments are required for this task. Click **Run**.
   The status for each port on the host is displayed in the Output area.



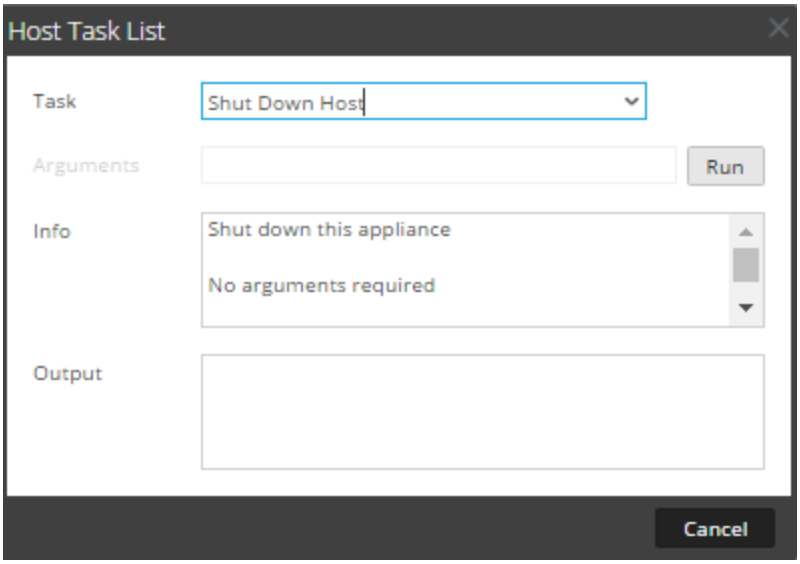
Show Serial Number

The Show Serial Number task in the Host Task List displays the serial number of a host.

Show the Serial Number

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View> System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Show Serial Number**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.
5. No arguments are required for this task. Click **Run**.
   The serial number of the selected host is displayed in the Output area.

Shut Down Host



Under certain circumstances (for example, a hardware upgrade or an extended power outage that exceeds backup power capacity), it may be necessary to shut down a physical host. When you shut down a host, all services running on the host are stopped and the physical host turns off.

The physical host does not restart automatically. Use the power switch to restart the host. Once the physical host restarts, the host and services are configured to restart automatically.

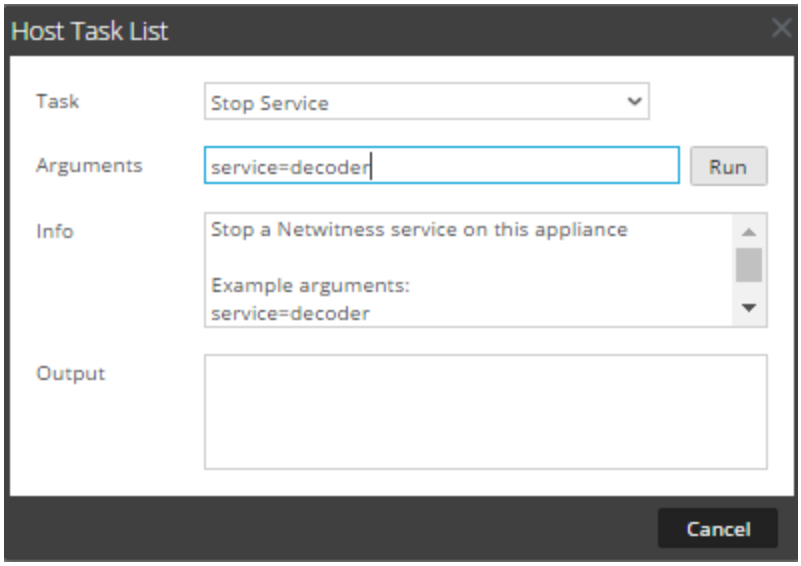
See Reboot a Host for how to start and stop a host without shutting down the host.

Shut Down the Host

1. In the **Host Task List**, select **Shut Down Host**.

2. To execute the task, click **Run**.
   The host shuts down, and the host turns off.

Stop and Start a Service on a Host



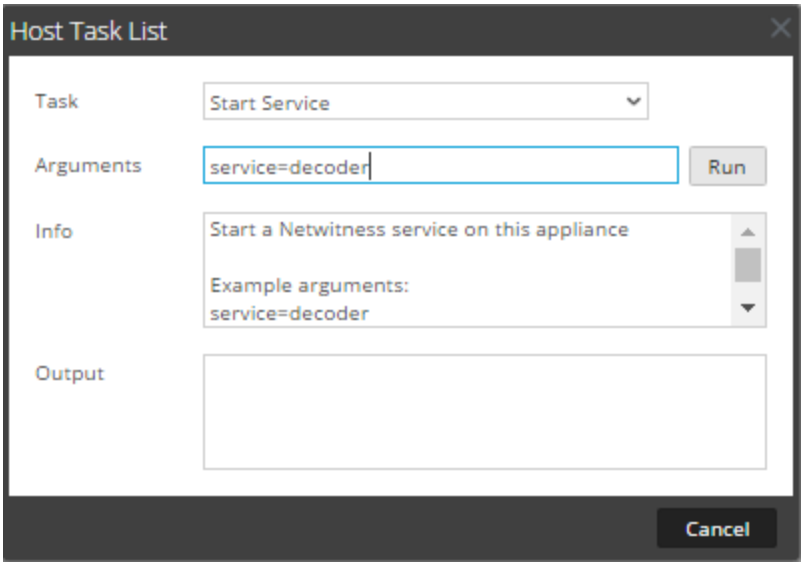
The Host Task List has two options for stopping and starting a service on a host. When you stop a service using the **Stop Service** message, all processes of the service are stopped and users connecting to the service are disconnected. Unless there is a problem with the service, it restarts automatically. This is the same as the **Shutdown Service** option in the Services System view.

If a service does not restart automatically after being stopped, you can restart it manually using the **Start Service** message.

Stop a Service on a Host

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View> System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Stop Service**.
   The task is displayed in the Task field, and information about the task is displayed in the Info area.

5. Specify the service (`decoder`, `concentrator`, `broker`, `logdecoder`, `logcollector`) to stop in the **Arguments** field; for example, **`service=decoder`**.



6. To execute the task, click **Run**.
   The service stops and the status is displayed in the Output area. All processes of the service are stopped and users connecting to the service are disconnected. Unless there is a problem with the service, it restarts automatically.

Start a Service on a Host

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View> System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Start Service**.
   The task is displayed in the Task field, and information about the task is displayed in the Info area.

5. Specify the service (`decoder`, `concentrator`, `broker`, `logdecoder`, `logcollector`) to stop in the **Arguments** field; for example, **`service=decoder`**.

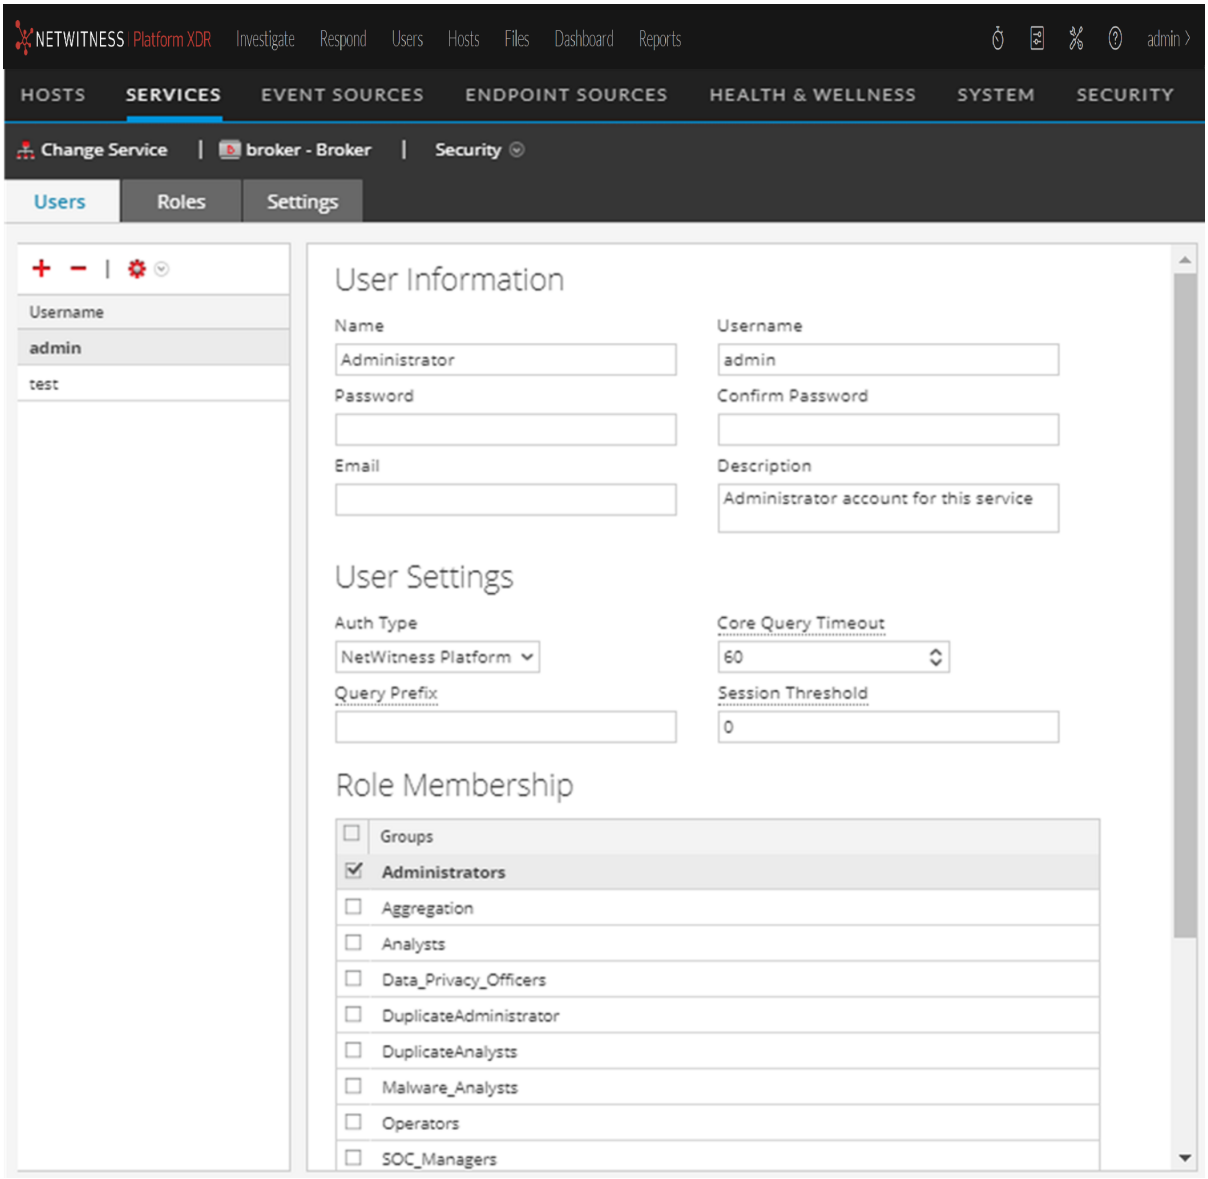
6. To execute the task, click **Run**.
   The service starts and the status is displayed on the Output area.

Add, Replicate, or Delete a Service User

You must add a user to a service for:

- Aggregation
- Accessing the service with the:
  - Thick client
  - REST API

Note: This topic does not apply to users who access services through the user interface on NetWitness Server. You must add those users to the system, not a service. For details, see the "Set Up a User" in *System Security and User Management Guide*.



For each service user, you can:

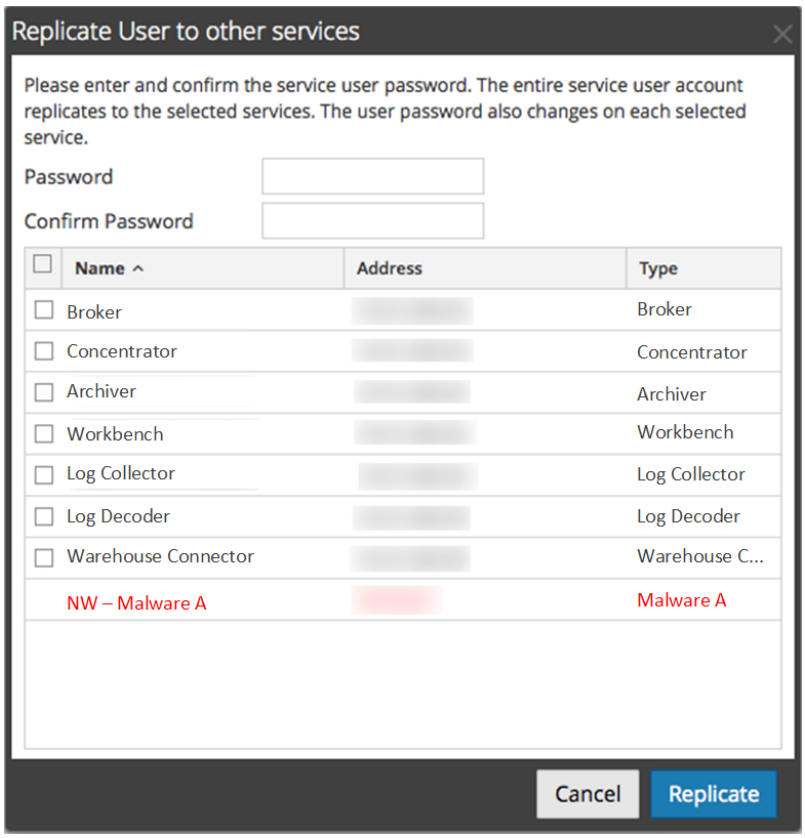
- Configure user authentication and query handling properties for the service
- Make the user a member of a role, which has a set of permissions the user receives
- Replicate the user account to other services
- Change the service user password on selected services

Change a Service User Password provides instructions for changing the service user password across services.

To navigate to the Services Security view:

1. In NetWitness, go to **(Admin) > Services**.
2. Select a service, then click **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.

Add a Service User



1. On the **Users** tab, click .
2. Type the user name to access the service, then press **Enter**.
   The User Information section displays the user name and the rest of the fields are available for editing.

3. Type the password for logging on to the service in the **Password** and **Confirm Password** fields.
4. (Optional) Provide additional information:
   - **Name** for logging on to NetWitness
   - **Email** address
   - **Description** of the user
5. In the User Settings section, select the following information:
   - **Authentication Type**
     - If NetWitness authenticates the user, select **NetWitness**.
     - If Active Directory or PAM is configured on NetWitness Server to authenticate the user, select **External**.
   - **Core Query Timeout** is the maximum number of minutes a user can run a query on the service. This field applies to NetWitness 10.5 and later service versions and does not appear for 10.4 and earlier versions.
6. (Optional) Specify additional query criteria:
   - **Query Prefix** filters queries. Type a prefix to restrict results the user sees.
   - **Session Threshold** controls how the service scans meta values to determine session counts. Any meta value with a session count that is above the threshold stops its determination of the true session count.
7. In the **Role Membership** section, select each role to assign to the user. When a user is a member of a role on a service, the user has the permissions assigned to the role.
8. To activate the new service user, click **Apply**.

Replicate a User to Other Services

Note: The **admin** user cannot be replicated to other services.

1. In the Users tab, select a user and click  **> Replicate**.
   The Replicate Users to Other Services dialog is displayed.

2. Enter and confirm the password.
3. Select each service to which you are replicating the user.
4. Click **Replicate**.

Delete a Service User

1. On the **Users** tab, select the **Username** and click −.
   NetWitness requests confirmation that you want to delete the selected user.
2. To confirm, click **Yes**.

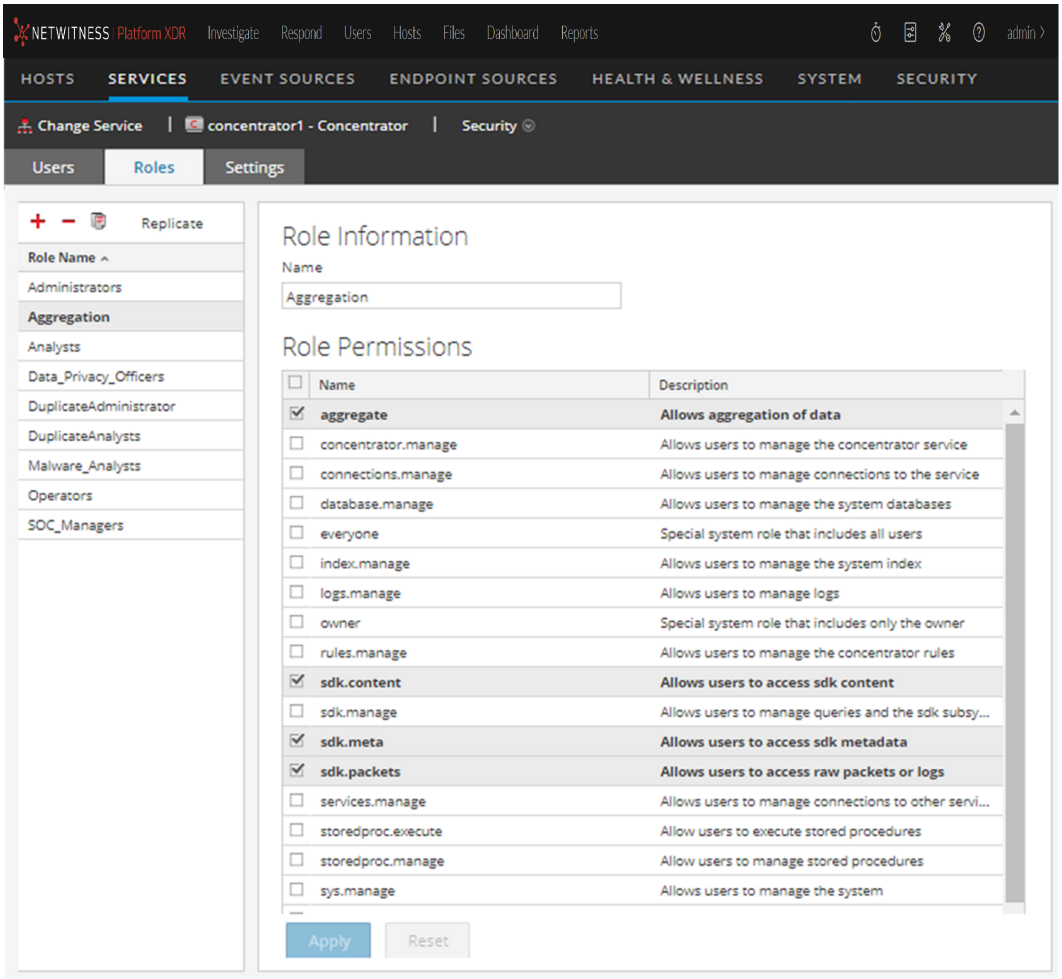
Add a User Role to a Service

There are pre-configured roles in NetWitness that are installed on the server and on each service. You can also add custom roles. The following table lists the pre-configured user roles and their permissions.

Role	Permission
Administrators	Full system access
Operators	Access to configurations but not to metadata and session content
Analysts	Access to metadata and session content but not to configurations

Role	Permission
SOC_Managers	Same access as Analysts and additional permissions to handle incidents
Malware_ Analysts	Access to malware events and to metadata and session content
Data_Privacy_ Officers	Access to metadata and session content and configuration options that manage obfuscation and viewing of sensitive data within the system (see *Data Privacy Management Guide*).

You must add a service role when you have added a:



- **Service** user or users that requires a new set of permissions.
- **Custom role on NetWitness Server** because trusted connections require that the same custom role exists both on the server and on each service the custom role will access. The names must be identical. For example, if you add a Junior Analysts role on the server then you must add a Junior Analysts role on each service the role will access. For more information, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

There is also a pre-configured **Aggregation** service role. Services Security View - Aggregation Role and Services Security View - Service User Roles and Permissions provide additional information.

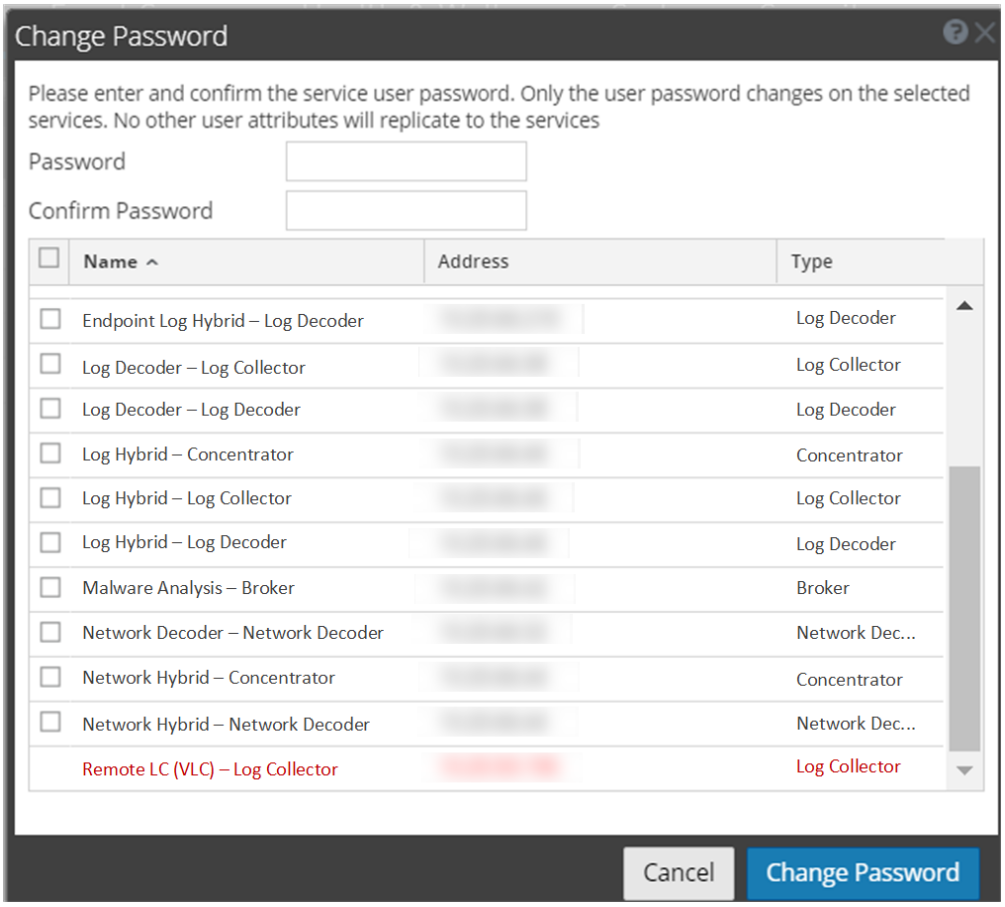
To add a service user role and assign permissions to it:

1. In NetWitness, go to  **(Admin) > Services**.
2. Select a service, then  **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.

3. Select the **Roles** tab and click .
   The Services Security view is displayed and five pre-configured roles are already listed.

4. Click , type the **Role Name** and press **Enter**.
   The Role Name is displayed above a list of **Role Permissions**.
5. Select each permission the role will have on the service.
6. Click **Apply**.

You can add service users to the role in the **Users** tab.



Change a Service User Password

This procedure allows administrators to change the password of a service user and replicate the new password to all Core services with that user account defined. It replicates only the password change to the Core services selected and does not replicate the entire user account. Administrators can also change the password of the **admin** account on the Core services.

Note: The Change Password option does not apply to external users.

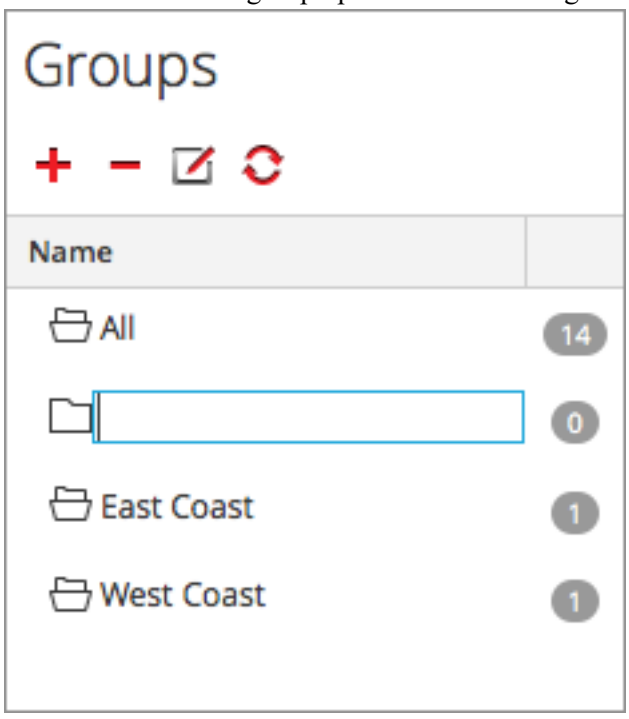
To change the password of a service user:

1. In NetWitness, go to **(Admin) > Services**.
   The Admin Services view is displayed.
2. Select a service, then click **> View > Security**.
   The Security view for the selected services is displayed.
3. In the **Users** tab, select a user and select **Change Password** from .
   The **Change Password** dialog is displayed.

4. Type a new password for the user and confirm the password.
5. Select the services where you want the user password to change.
6. Click **Change Password**.
   The status of the password change on the selected services is displayed.

IMPORTANT: If you change the admin password on a NetWitness service that is used as a Reporting Engine data source, you must remove and then re-add the service as a data source. For details, see "Configure the Data Sources" topic in the *Reporting Engine Configuration Guide for RSA NetWitness Platform 11.x Guide*.

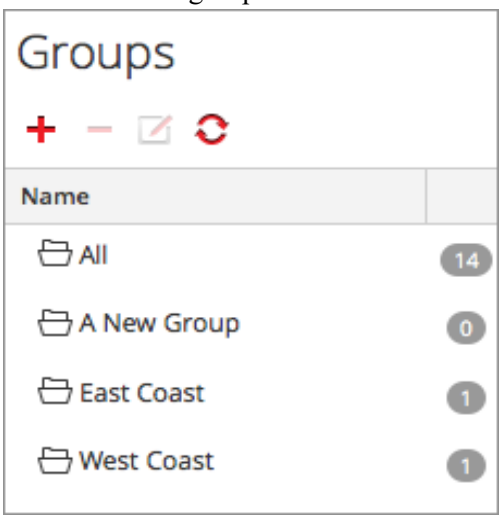
Create and Manage Service Groups



The Admin Services view provides options to create and manage groups of services. The Services list toolbar includes options to create, edit, and delete service groups. Once groups are created, you can drag individual services from the Services panel into a group.

Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A service may belong to more than one group. Here are some examples of possible groupings.

- Group different service types to make it easier to configure and monitor all Brokers, Network Decoders, or Concentrators.
- Group services that are part of the same data flow; for example, a Broker, and all associated Concentrators and Network Decoders.
- Group services according to their geographic region and location within the region. If a major power outage occurs in a location, potentially affected services are easily identifiable.



Create a Group

1. In NetWitness, go to  **(Admin) > Services**.
   The Admin Services view is displayed.
2. In the **Groups** panel toolbar, click .
   A field for the new group opens with a blinking cursor.

3. Type the name of the new group in the field (for example, **`A New Group`**) and press **Enter**.
   The group is created as a folder in the tree. The number next to the group indicates the number of

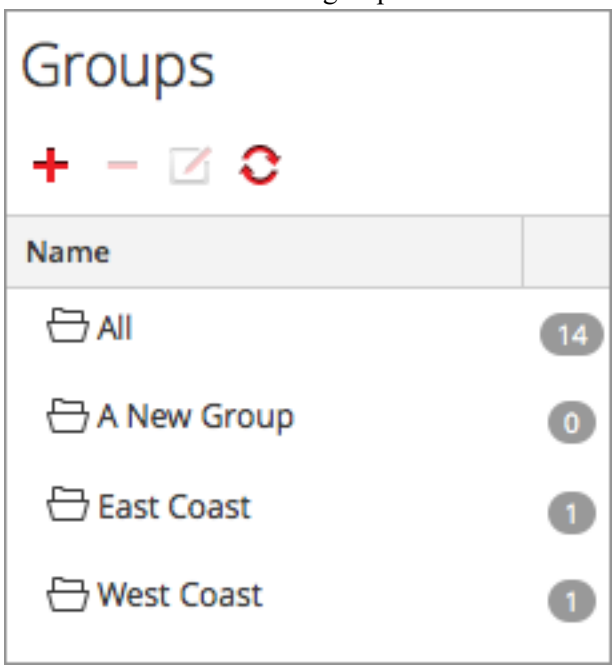
services in that group.

Change the Name of a Group

1. In the Services view **Groups** panel, double-click the group name or select the group and click . The name field opens with a blinking cursor.
2. Type the new name of the group and press **Enter**.
   The name field closes and the new group name is displayed in the tree.

Add a Service to a Group

In the Services view **Services** panel, select a service and drag the service to a group folder in the groups panel.
The service is added to the group.



View the Services in a Group

To view the services in a group, click the group in the **Groups** panel.

The Services panel lists the services in that group.

Remove a Service from a Group

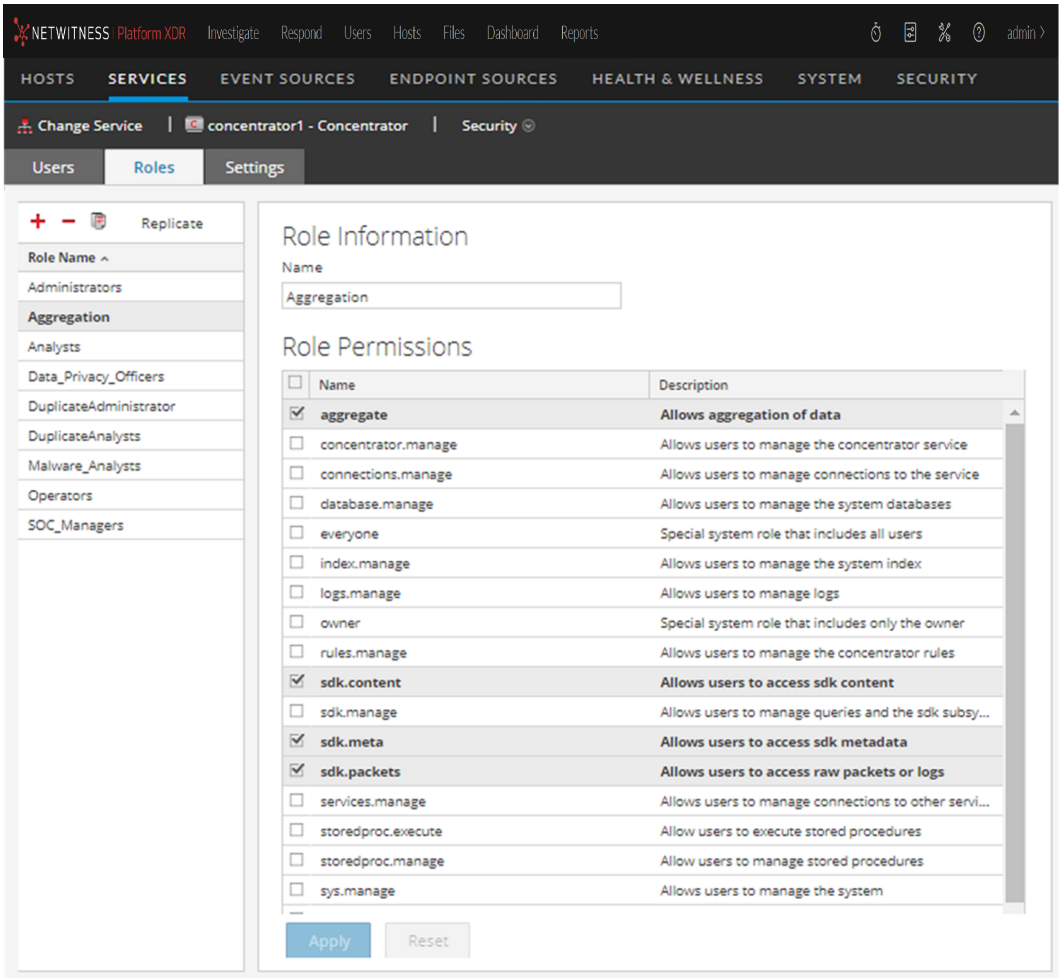
1. In the Services view **Groups** panel, select the group that contains the service that you want to remove. The services in that group appear in the Services panel.
2. In the **Services** panel, select one or more services that you want to remove from the group, and in the toolbar, select − > **Remove from Group**.
   The selected services are removed from the group, but are not removed from the NetWitness user interface. The number of services in the group, which is listed near the group name, decreases by the number of services removed from the group. The **All** group contains the services that are removed from the group.
   In the following example, the service group called **A New Group** does not contain any services, because the service in that group is removed.

Delete a Group

1. In the Services view **Groups** panel, select the group that you want to delete.
2. Click −.
   The selected group is removed from the Groups panel. The services that were in the group are not removed from the NetWitness user interface. The **All** group contains the services from the deleted group.

Duplicate or Replicate a Service Role

An efficient way to add a new service role is to duplicate a similar role, save it with a new name and revise the permissions that are already assigned. For example, you could duplicate the Analysts role. Then, save it as `JuniorAnalysts` and modify the permissions.



The quick way to add an existing role to other services is to replicate the role. For example, you could replicate the `JuniorAnalysts` role that exists on a Broker to a Concentrator and Log Decoder.

To navigate to the Services Security view:

1. In NetWitness, go to **(Admin) > Services**.
2. Select a service, then click **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.
3. Select the **Roles** tab.

Duplicate a Service Role

1. In the **Roles** tab, select the role you want to duplicate.

2. Click **> Duplicate Role.**
3. Type a new name and click **Apply**.

4. Select the new role.
5. In the **Role Permissions** section, select or deselect permissions to modify what the new role can do.

Replicate a Role

1. In the **Roles** tab, select the role you want to replicate and click **Replicate**.
2. In the **Replicate Role to Other Services** dialog, select each service on which to add the role.
3. Click **Replicate**.

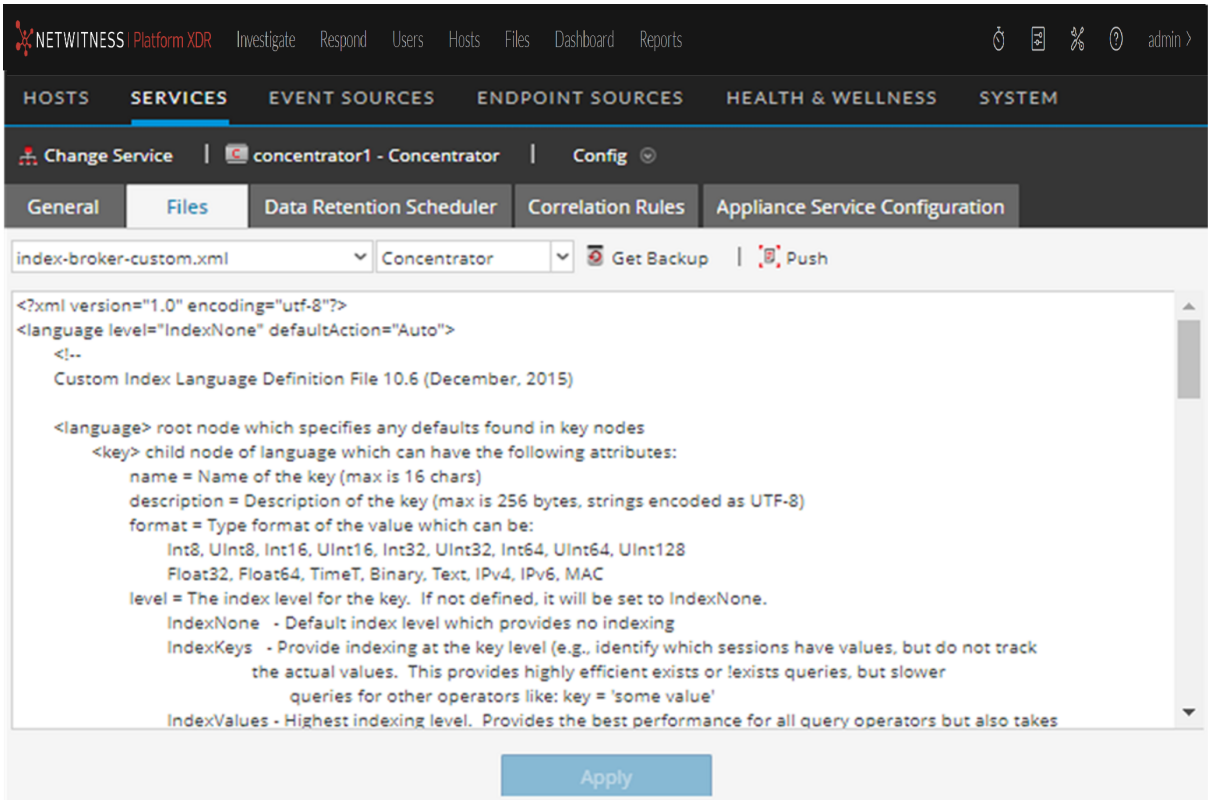
Edit Core Service Configuration Files

The service configuration files for Network Decoder, Log Decoder, Broker, Concentrator, Archiver, and Workbench services are editable as text files. In the Services Config view > Files tab, you can:

- View and edit a service configuration file that the NetWitness system is currently using.
- Retrieve and restore the latest backup of the file you are editing.
- Push the open file to other services.
- Save changes made to a file.

The files available to edit vary depending upon the type of service being configured. The files that are common to all Core services are the:

- The NetWitness file (`netwitness`). This is preconfigured and does not require editing.
- The service index file (`index-<service>`). This is preconfigured and may require editing.
  See Edit a Service Index File for more information.
- The scheduler file (`scheduler`). The scheduler service is optional and requires editing.
  See Configure the Task Scheduler for more information.
- The crash reporter file (`crashreporter`). The crash reporter service is optional and requires editing.
  See Enable the Crash Reporter Service for more information.
- The feed definitions file (`feed-definitions`). This file is optional and may require editing.
  See "Feed Definitions File" in the *Decoder Configuration Guide* for more information.



In addition, the Network Decoder has files that configure parsers, feed definitions, and a wireless LAN adapter. There is also the table mapping file provided by NetWitness, `table-map.xml`, which is an important part of the Log Decoder.

Note: The default values in these configuration files are good for the most common situations, however some editing is necessary for optional services, such as the crash reporter or scheduler. Only administrators with a good understanding of the networks and the factors that affect the way services collect and parse data should make changes to these files in the Files tab.

Edit a Service Configuration File

To edit a file:

1. In NetWitness, go to **(Admin) > Services**.
2. In the Services list, select a service.
3. Select **> View > Config**.
   The Service Config view is displayed with the General tab open.
4. Click the **Files** tab.
   cThe selected service, such as Concentrator, appears in the drop-down list on the right.
5. (Optional) To edit a file for the host instead of the service, select **Host** in the drop-down list.
6. Choose a file from the **Please Select A File To Edit** drop-down list.
   The file content is displayed in edit mode.

7. Edit the file and click **Apply**.

The current file is overwritten and a backup file is created. The changes go into effect after the service is restarted.

Revert to a Backup Version of a Service Configuration File

After you make changes to a configuration file, save the file, and restart the service, a backup file is available.

To revert to a backup of a configuration file:

1. Select a configuration file by completing steps 1-6 of Edit a Service Configuration File.
2. Click .
   The backup file opens in the text editor.
3. To revert to the backup version, click **Save**.

The changes go into effect after the service is restarted.

Push a Configuration File to Other Services

Once you have edited a service configuration file, you can push the same configuration to other services of the same type.

1. Select a configuration file by completing steps 1-6 of Edit a Service Configuration File.
2. Click .
   The Select Services dialog is displayed.
3. Select each service to push the configuration file on it. Each service must be the same type as the one you selected in the Services view.

   Caution: If you decide not to push the configuration file, click **Cancel**.
4. To push the configuration file to all selected services, click **OK**.

The configuration file is pushed to all selected services.

Edit a Service Index File

This topic provides important information and guidelines for configuring service custom index files, which are editable in the Service Config view > Files tab.

The index file, along with other configuration files, controls operation of each core service. Accessing the index file through the Service Config view in NetWitness opens the file in a text editor, where you can edit the file.

Note: Only administrators with a thorough and comprehensive understanding of Core service configuration are qualified to make changes to an index file, which is one of the central configuration files for the appliance service. Changes made should be consistent across all Core services. Invalid entries or a misconfigured file can prevent the system from starting and can require the assistance of NetWitness Support to bring the system back into a working state.

These are the index files:

- `index-broker.xml`, and `index-brokereustom.xml`
- `index-concentrator.xml`, and `index-concentrator-custom.xml`
- `index-decoder.xml`, and `index-decodereustom.xml`
- `index-logdecoder.xml`, and `index-logdecodereustom.xml`

- index-archiver.xml, and index-archiver-custom.xml
- index-workbench.xml, and index-workbench-custom.xml

Index and Custom Index Files

All customer-specific index changes are made in index-<service>-custom.xml. This file overrides any settings in index-<service>.xml, which is solely controlled by NetWitness.

The custom index file, index-<service>-custom.xml, allows creation of custom definitions or overrides of your own language keys that are not overwritten during the upgrade process.

- Keys that are defined in index-<service>-custom.xml replace the definitions found in index-<service>.xml.
- Keys that are added to index-<service>eustom.xml and not found in index-<service>.xml are added to the language as a new key.

Some common applications for editing the index file are:

- To add new custom meta keys to add new fields to the NetWitness user interface.
- To configure protected meta keys as part of a data privacy solution as described in the *Data Privacy Management Guide*.
- To adjust the NetWitness Core database query performance as described in the *NetWitness Core Database Tuning Guide*.

Caution: Never set the index level to IndexKeys or IndexValues on a Network Decoder if you have a Concentrator or Archiver aggregating from the Network Decoder. The index partition size is too small to support any indexing beyond the default time meta key.

Configure the Task Scheduler

Scheduler File

You can edit the scheduler file that in the Service Config view > Files tab. This file configures the built-in task scheduler for a service. The task scheduler can automatically send messages at predefined intervals or specific times of the day.

Scheduler Task Syntax

A task line in the scheduler file consists of the following syntax, where <Value> has no spaces:

```
<ParamName>=<Value>
```

If <Value> has any spaces, this is the syntax:

```
<ParamName>="<Value>"
```

In each task line, these guidelines apply:

- Parameter `time` or one of the interval parameters (`seconds`, `minutes` or `hours`) is required.
- Escape special characters with a `\` (backslash).

Task Line Parameters

The following task line parameters are accepted by the scheduler.

Syntax	Description
daysOfWeek: <string, optional, {enum-any:sun|mon|tue|wed|thu|fri|sat|all}>	The days of week to execute a task. The default value is all.
deleteOnFinish: <bool, optional>	Delete the task when it has successfully finished.
hours: <uint32, optional, {range:1 to 8760}>	The number of hours between executions.
logOutput: <string, optional>	Output the response to log using the specified module name.
minutes: <uint32, optional, {range:1 to 525948}>	The number of minutes between executions.
msg: <string>	The message to send the node.
params: <string, optional>	The parameters for the message.
pathname: <string>	The path of the node that receives the message.
seconds: <uint32, optional, {range:1 to 31556926}>	The number of seconds between executions.
time: <string>	The time of execution in HH::MM:SS format (local time of this server).
timesToRun: <uint32, optional>	How many times to run because service start, **0** = unlimited (default).

Messages

The following are the message strings to use in the Task Scheduler `msg` parameter.

Message	Description
addInter	Add a task to run at a defined interval. For example, this message runs the `/index save` command every 6 hours: `addInter hours=6 pathname=/index msg=save`

Message	Description
addMil	Add a task to run at a specific time of day or even day(s) of the week. For example, this message runs the `/index save` command at 1 AM every business day: `addMil time= 01:00:00 pathname=/index msg=save daysOfWeek=mon,tue,wed,thu,fri`
delSched	Deletes an existing scheduled task. The `id` parameter of the task must be retrieved from the print message.
print	Prints all scheduled tasks.
replace	Assign all scheduled tasks in one message, deleting any existing tasks.
save	Save node.

Sample Task Line

The following example task line in the `scheduler` file downloads the feeds package file (`feeds.zip`) to the selected Network Decoder every 120 minutes from the feeds host server:

```
minutes=120 pathname=/parsers msg=feed params="type\=wget
file\=http://feedshost/nwlive/feeds.zip"
```

Enable the Crash Reporter Service

The Crash Reporter is an optional service for NetWitness services. When activated for any of the Core services, the Crash Reporter automatically generates a package of information to be used for diagnosing and solving the problem that resulted in the service failure. The package is automatically sent to NetWitness for analysis. The results are forwarded to NetWitness Support for any further action.

The information package sent to NetWitness does not contain captured data. This information package consists of the following information:

- Stack trace
- Logs
- Configuration settings
- Software version
- CPU information
- Installed RPMs
- Disk geometry

The Crash Reporter crash analysis can be activated for any Core product.

The `crashreporter.cfg` File

One of the files available for editing in the Service Config view > Files tab is `crashreporter.cfg`, the Crash Reporter Client Server configuration file.

This file is used by the script that checks, updates, and builds crash reports on the host. The list of products to monitor can include Network Decoders, Concentrators, Brokers, and hosts.

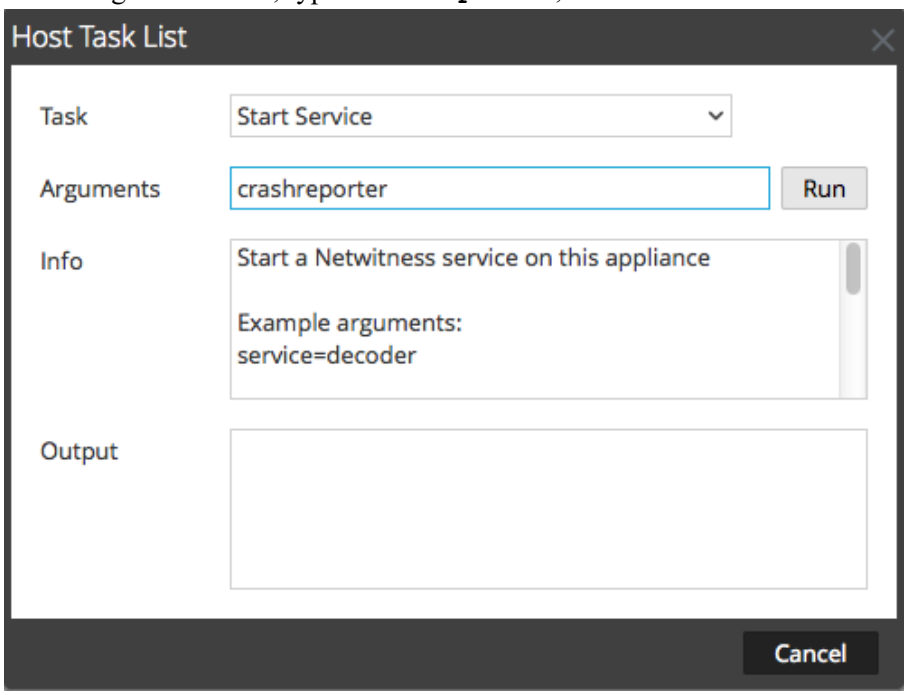
This table lists the settings for the `crashreporter.cfg` file.

Setting	Description
`applicationlist=decoder, concentrator, host`	Define the list of products to monitor.
`sitedir=/var/crashreporter`	Location of the site directory for the report.
`webdir=/usr/share/crashreporter/Web`	Location of the web directory.
`devdir=/var/crashreporter/Dev`	Location of the development directory.
`datadir=/var/crashreporter/data`	Location of the directory storing data files.
`perldir=/usr/share/crashreporter/perl`	Location of the Perl files.
`bindir=/usr/share/crashreporter/bin`	Location of the binary executables.
`libdir=/usr/share/crashreporter/lib`	Location of the binary libraries.
`cfgdir=/etc/crashreporter`	Location of the configuration files.
`logdir=/var/log/crashreporter`	Location of the log files.
`scriptdir=/usr/share/crashreporter/scripts`	Location of the directory containing scripts.
`workdir=/var/crashreporter/work`	Location of the process work directory.
`sqldir=/var/crashreporter/sql`	Location where created SQL files are placed.
`reportdir=/var/crashreporter/reports`	Location where temporary reports are created.
`packagedir=/var/crashreporter/packages`	Location of the created package files.
`gdbconfig=/etc/crashreporter/crashreporter.gdb`	Location of the `gdb` configuration file.
`corewaittime=30`	Define the number of seconds to wait after finding a core to determine if the core is still being written.
`cyclewaittime=10`	Define the number of minutes to wait between search cycles

Setting	Description
`deletecores=1`	Specify if the Core files should be deleted after report. 0 = No 1 = Yes **Note:** Until the Core file is deleted, it is reported each time crashreporter is restarted.
`deletereportdir=1`	Specify if the report directory should be deleted after the report. Useful to view ore reports on box. 0 = No 1 = Yes **Note:** If not deleted, the directory will be included in each subsequent package.
`debug=1`	Specify whether debugging messages are turned on or off in the `crashreporter` logging output. 0 = No 1 = Yes
`posturl=https://www.netwitnesslive.com/crash...ter/submit.php`	Define the webserver post URL.
`postpackages=0`	Specify if the packages should be posted to the webserver. 0 = No 1 = Yes
`deletepackages=1`	Specify if packages should be deleted after they are posted to webserver. 0 = No 1 = Yes

Configure the Crash Reporter Service

To configure the Crash Reporter service:



1. Select **(Admin) > Services**.
2. Select a service and click **> View > Config**.
3. Select the **Files** tab.
4. Edit `crashreporter.cfg`.

5. Click **Save**.
6. To display the Service System view, select **Config > System**.
7. To restart the service, click Shutdown Service.
   The service shuts down and restarts.

Start and Stop the Crash Reporter Service

To start the Crash Reporter Service:

1. Select **(Admin) > Services**.
2. Select a service and click **> View > System**.
3. In the toolbar, click Host Tasks.
   The Host Task List is displayed.
4. In the Task drop-down list, select **Start Service**.
5. In the Arguments field, type **`crashreporter`**, then click **Run**.

The Crash Reporter service is activated and remains active until you stop it.

To stop the Crash Reporter service, select **Stop Service** from the Task drop-down list.

Maintain the Table Map Files

The table mapping file provided by NetWitness, `table-map.xml`, is a very important part of the Log Decoder. It is a meta definition file which also maps the keys used in a log parser to the keys in the `metadb`.

Note: Do not edit the `table-map.xml` file. If you want to make changes to the table-map, make them in the `table-map-custom.xml` file. The latest `table-map.xml` file is available on Live Services, which NetWitness updates as required. If you make changes to the `table-map.xml` file, they can be overwritten during a content or service upgrade.

The table map and custom table map files have two purposes:

- To translate the variables used in the Log Parsers to NetWitness meta key names
- To tell the system which keys to move onto the Concentrator.

For example, look at the out-of-the-box Palo Alto log parser, and examine one of its meta keys: `stransaddr`. This key represents the source translated address. If we look in the `table-map.xml`file we can see that this variable is listed as `Transient`:

```
<mapping envisionName="stransaddr" nwName="stransaddr" flags="Transient"
format="Text" />
```

Because this variable is listed as, `Transient`, it never moved to the Concentrator. In fact, if you look at all the metadata that we parse from that log in the Concentrator, it is not listed as an available key.

Assume we change the value in the `table-map-custom.xml`file to the following:

```
<mapping envisionName="stransaddr" nwName="stransaddr" flags="None"
format="Text" />
```

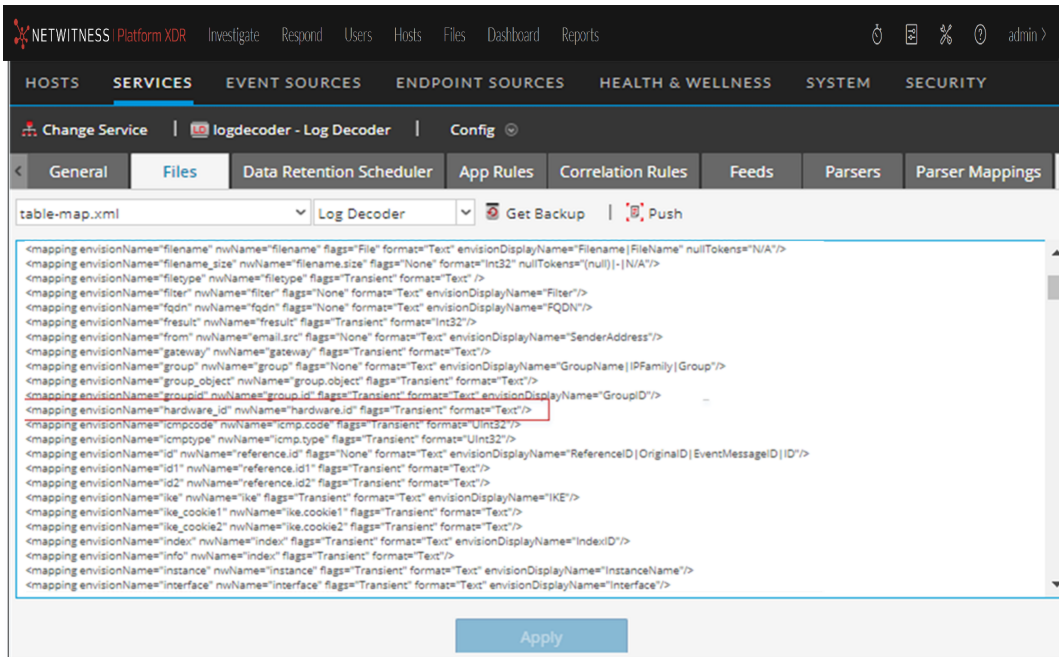
In this case, the key-value pair would get copied to the Concentrator, and from there you can choose whether or not to index it.

In the`table-map.xml`file, some meta keys are set to `Transient` and some are set to `None`. To store and index a specific meta key, the key must be set to `None`. To make changes to the mapping, you need to create a copy of the file named `table-map-custom.xml` on the Log Decoder and set the meta keys to `None`.

For meta key indexing:

- When a key is marked as `None` in the `table-map.xml` file in the Log Decoder, it is indexed.
- When a key is marked as `Transient` in the `table-map.xml` file in the Log Decoder, it is not indexed. To index the key, copy the entry to the `table-map-custom.xml` file and change the keyword `flags="Transient"` to `flags="None"`.
- If a key does not exist in the `table-map.xml`file, add an entry to the `table-map-custom.xml`file in the Log Decoder.

IMPORTANT: Do not update the **`table-map.xml`** file because an upgrade can overwrite it. Add all of the changes that you want to make to the **`table-map-custom.xml`**file.



Prerequisites

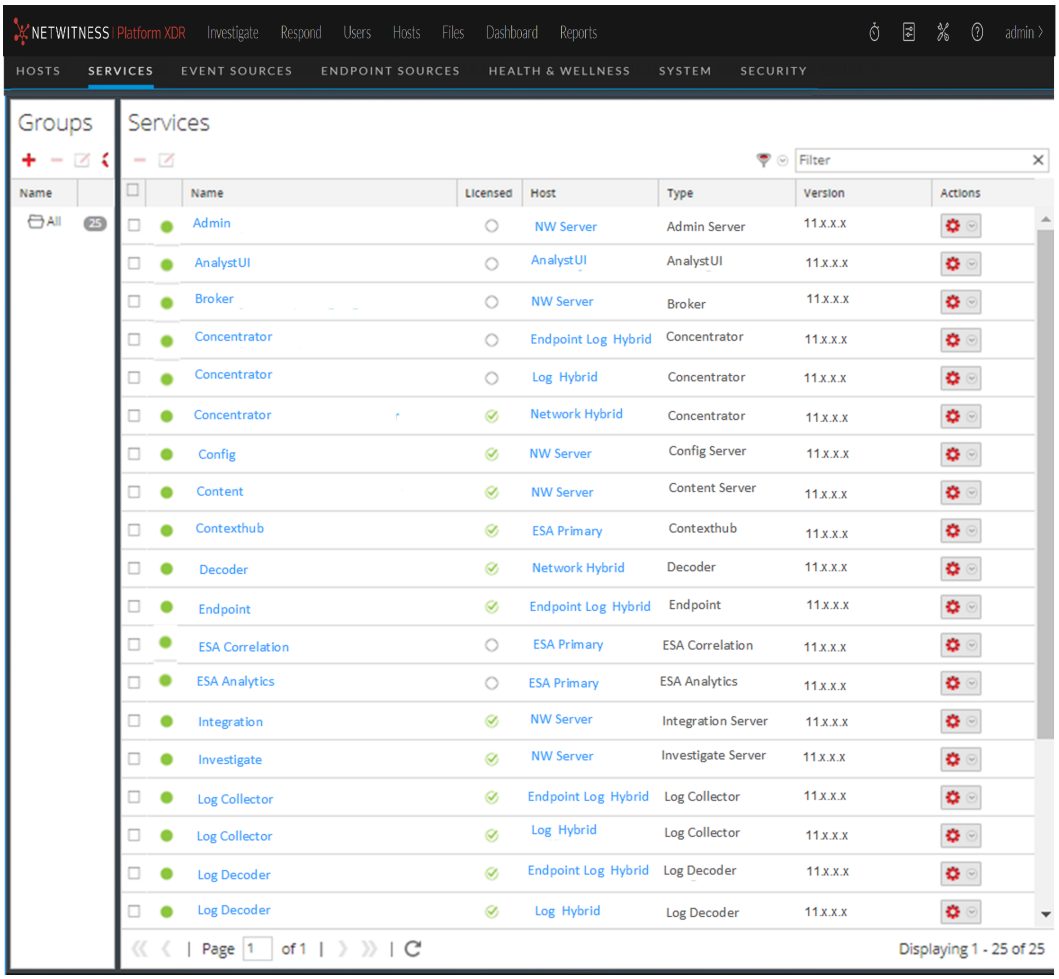
If you do not have a `table-map-custom.xml` file on the Log Decoder, create a copy of `table-map.xml` and rename it to `table-map-custom.xml`.

To verify and update the table mapping file:

1. Go to  **(Admin) > Services**.
2. In the Services list, select a Log Decoder and click  **> View > Config**.

3. Click the **Files** tab and select the **table-map.xml** file.

4. Verify that the `flags` keywords are set correctly to either `Transient` or `None`.
5. If you need to change an entry, do not change the `table-map.xml` file. Instead, copy the entry, select the `table-map-custom.xml` file, find the entry in the `table-map-custom.xml` file and change the `flags` keyword from `Transient` to `None`.
   For example, the following entry for the `hardware.id` meta key in the `table-map.xml` file is not indexed and the `flags` keyword shows as `Transient`:
   `<mapping envisionName="hardware_id" nwName="hardware.id"`
   `flags="Transient"``/>`
   To index the `hardware.id` meta key, change the flags keyword from `Transient` to `None` in the `table-map-custom.xml` file:
   `<mapping envisionName="hardware_id" nwName="hardware.id"` **`flags="None"`**`/>`
6. If an entry does not exist in the `table-map.xml` file, add an entry to the `table-map-custom.xml` file.
7. After making your changes to the `table-map-custom.xml` file, click **Apply**.

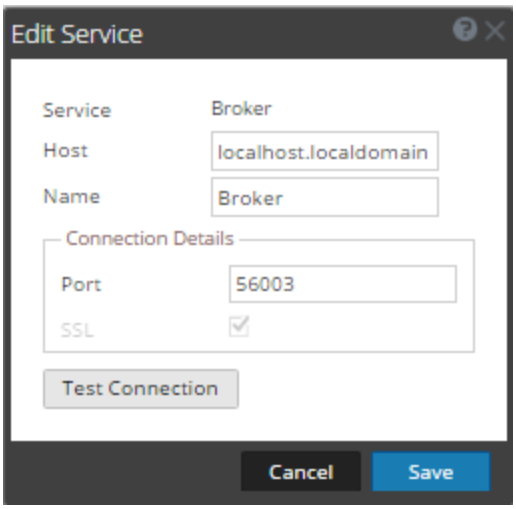


Caution: Before changing the table mapping files, carefully consider the effect of changing the index from `Transient` to `None` because it can impact the available storage and performance of the Log Decoder. For this reason, only certain meta keys are indexed out-of-the-box. Use the `table-map-custom.xml` file for different use cases.

Edit or Delete a Service

You can edit service settings, such as changing the host name or port number, or deleting a service that you no longer need.

Each of the following procedures starts in the Services view.



To navigate to the Services view, in NetWitness, go to **(Admin) > Services**.

Edit a Service

1. In the Services view, select a service and either click or > **Edit**.

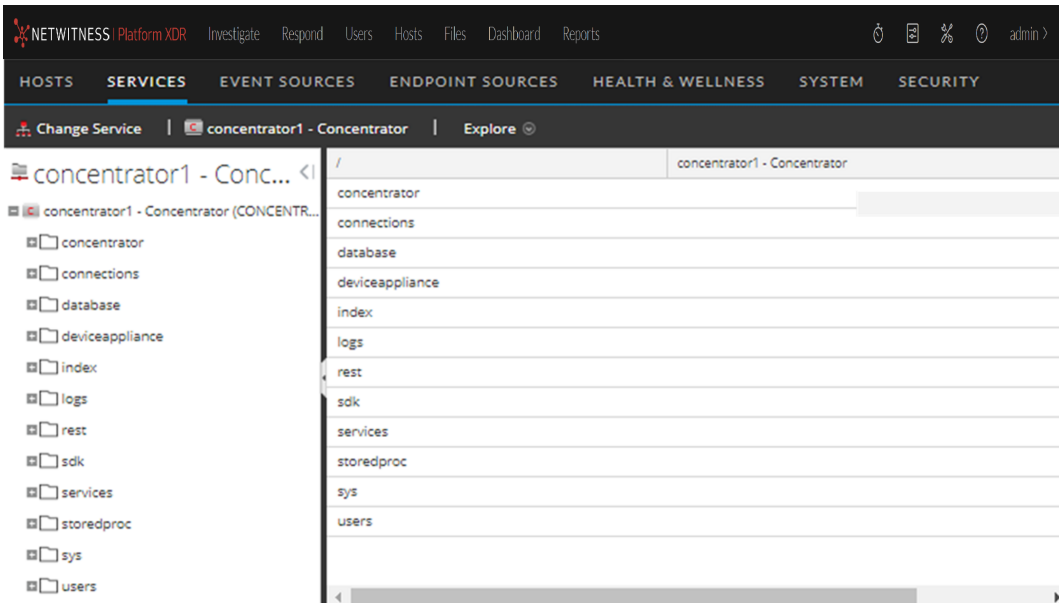
   The **Edit Service** dialog is displayed. It shows only the fields that apply to the selected service.

2. Edit the service details by changing any of the following fields:
   - **Name**
   - **Port** - Each Core service has two ports, SSL and non-SSL.
   - **SSL** - For trusted connections, you must use SSL.
   - **Username** and **Password** - Use these credentials to test the connection to a service.
     a. If you use a trusted connection, delete the username.
     If you do not use a trusted connection, type a username and password.
     b. Click **Test Connection**.
3. Click **Save**.

Delete a Service

1. In the Services view, select one or more services and either click − or > **Delete**.
2. A dialog requests confirmation. To delete the service, click **Yes**.

The deleted service is no longer available to the NetWitness modules.



Explore and Edit Service Property Tree

You have advanced access and control of service functionality in the Services Explore view, which consists of two parts. The Node list displays service functionality in a tree structure of folders. The Monitor panel displays properties of the folder or file selected in the Nodes list.

Each of the following procedures starts in the Explore view.

To navigate to the Explore view:

1. In NetWitness, go to **(Admin) > Services**.
2. Select a service, then select **> View > Explore**.
   The Explore view is displayed. The Node list is on the left and the Monitor panel is on the right.

Display or Edit a Service Property

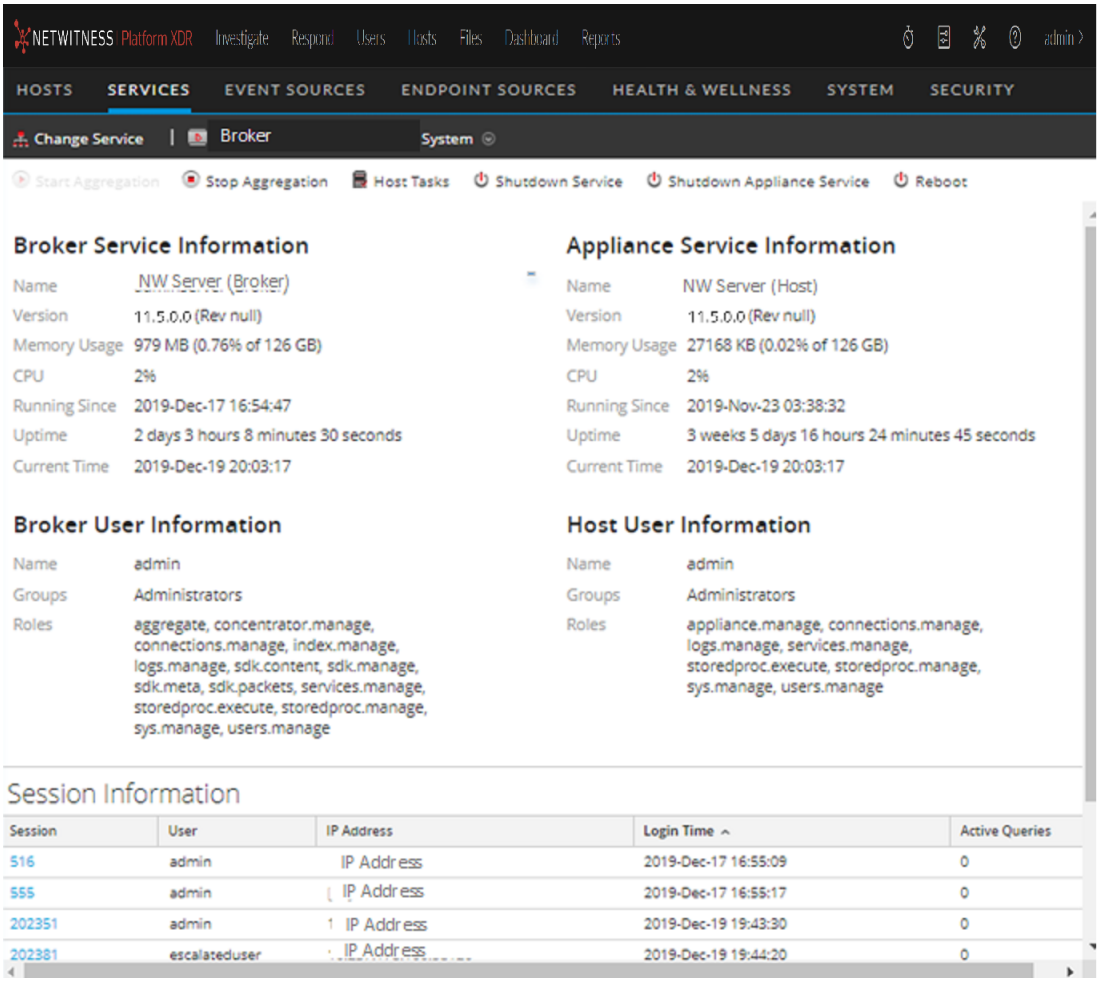
To display a service property:

1. Right-click a file in the Node list or Monitor panel.
2. Click **Properties**.

To edit the value of a service property:

1. In the **Monitor** panel, select an editable property value.
2. Type a new value.

Send a Message to a Node



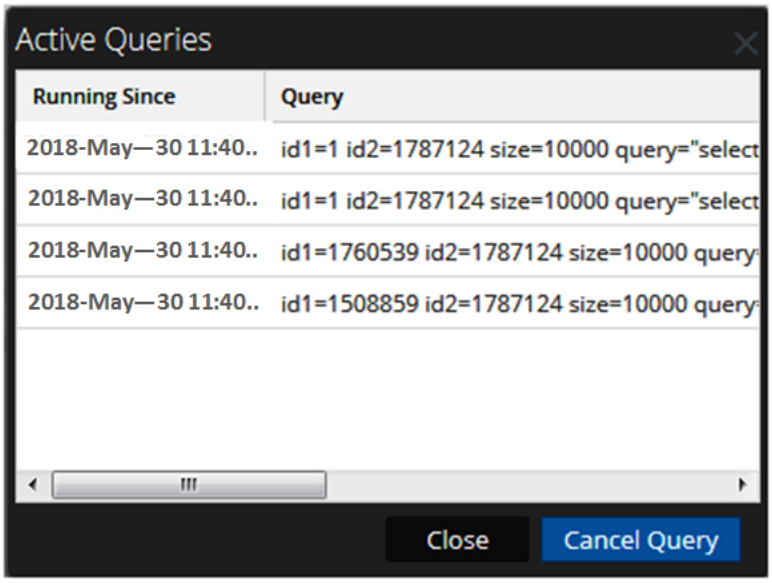
1. In the Properties dialog, select a message type from the drop-down list. Options vary according to the file selected in the Node list.
   A description of the selected message type is displayed in the **Message Help** field.
2. (Optional) If the message requires them, type the **Parameters**.
3. Click **Send**.
   The value or format is displayed in the Response Output field.

Terminate a Connection to a Service

You can view sessions that are running on a service in the Service System view. From within the list of sessions, you can terminate the session and the active queries in a session.

Terminate a Session on a Service

1. In NetWitness, go to **(Admin) > Services**.
   The Admin Services view is displayed.
2. Select a service, and select **> View > System**.
   The Services System view is displayed.



3. In the **Session Information** list at the bottom, click a session number from the Session column.
   The confirmation dialog is displayed.
4. Click **Yes**.

Terminate an Active Query in a Session

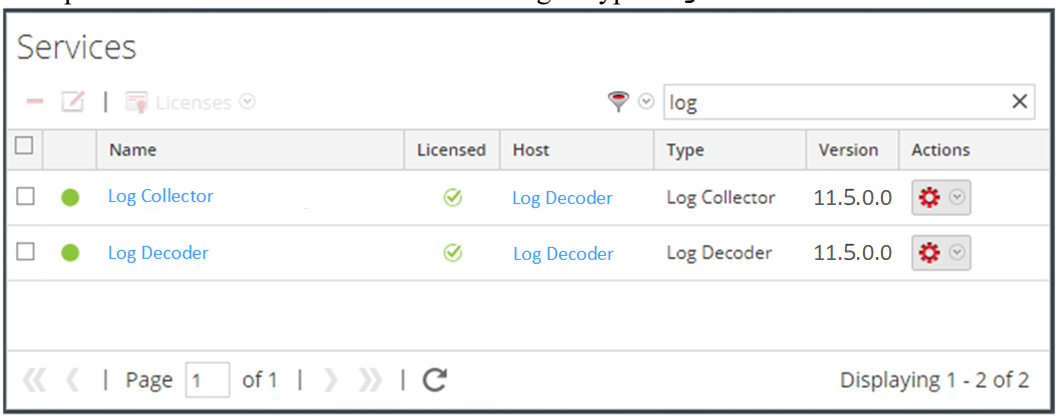
1. Scroll down to the **Sessions** list.
2. In the **Active Queries** column, click a non-zero count of active queries for a session. You cannot click on it if there are 0 active queries.

   The Active Queries dialog is displayed.

3. Select a query and click **Cancel Query**.

   The query stops and the Active Queries column is updated.

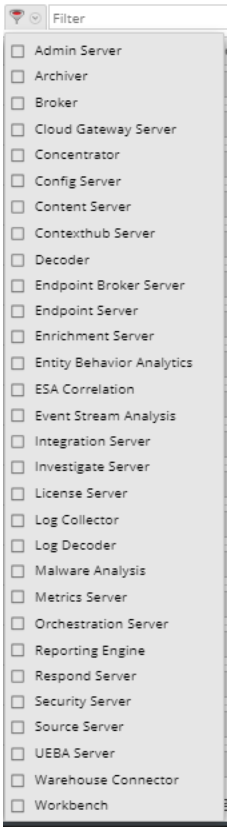
Search for Services



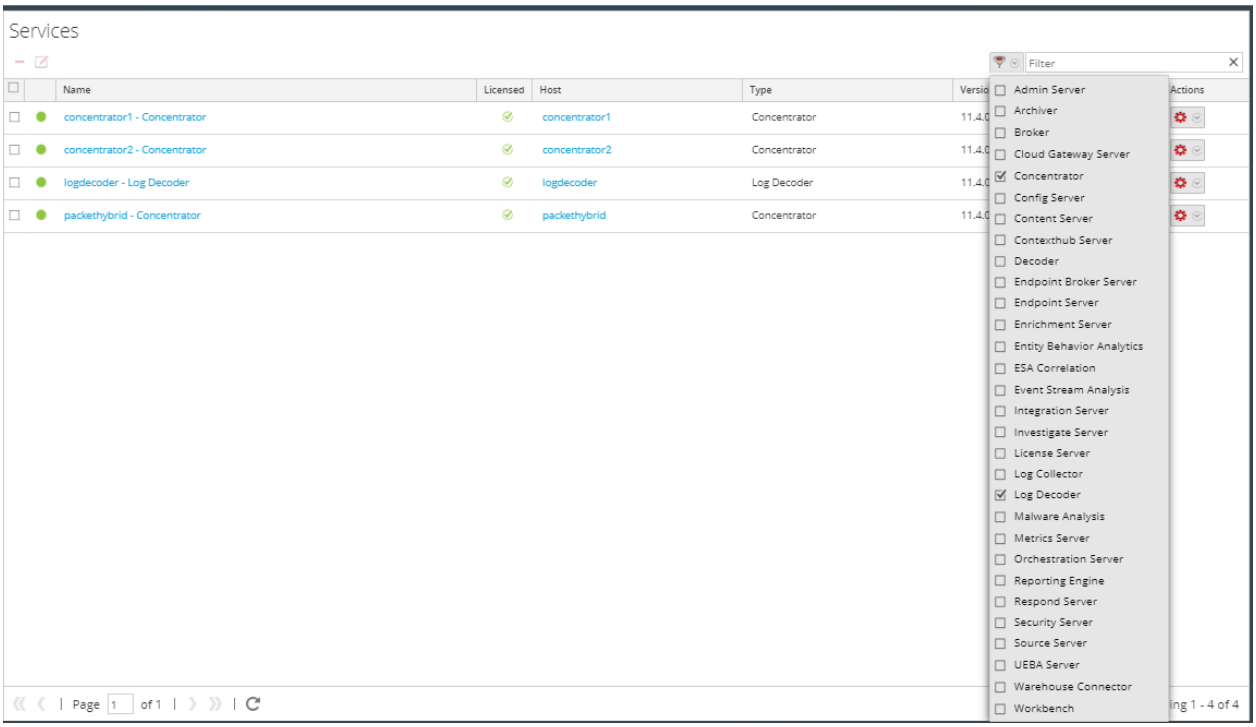
You can search for services from the list of services in the Services view. The Services view enables you to quickly filter the list of services by Name, Host, and Service Type. You can use the Filter drop-down menu and the Filter field separately or at the same time to filter the Services view.

Search for a Service

1. In NetWitness, go to  **(Admin) > Services**.
2. In the **Services** list toolbar, type a service **Name**, **Host**, or service **Type** in the **Filter** field.



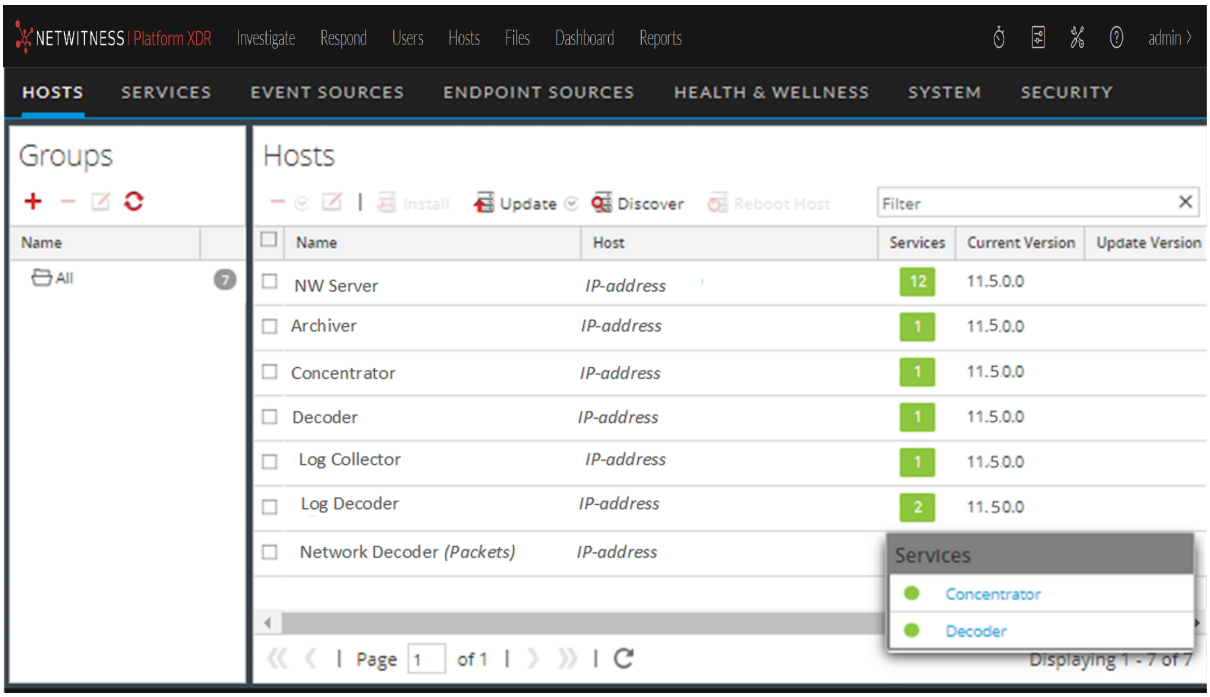
The Services panel lists the services that match the names entered in the Filter field. The following example shows the search results after starting to type **log** in the filter field.



Filter Services by Type

1. In NetWitness, go to **(Admin) > Services**.
2. In the Services view, click and select the service types that you want to appear in the Services view.

The selected service types appear in the Services view. The following example shows the Services view filtered for Concentrator and Log Decoder.



Find the Services on a Host

In addition to being able to locate the services for a host in the Services view, you can also quickly find the services that run on a host in the Hosts view.

1. In NetWitness, go to **(Admin) > Hosts**.
2. In the Hosts view, select a host and click the box that contains a number (the number of services) in the **Services** column.

   A list of the services on the selected host is displayed.

   In the following example, a list of two services on the selected host are listed after clicking the box containing the number 2.

3. You can click the service links to view the services in the Services view.

Start, Stop, or Restart a Service

These procedures apply to Core services only.

Each of the following procedures starts in the Services view. In NetWitness, go to **(Admin) > Services**.

Start a Service

1. Select a service and click > **Start**.

Stop a Service

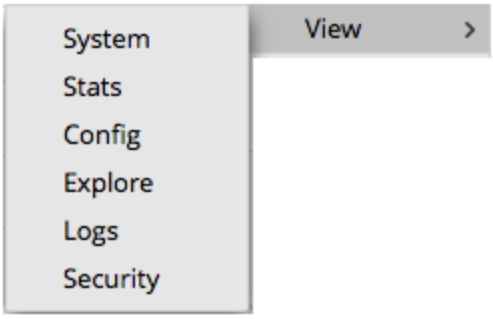
When you stop a service, all of its processes stop and active users are disconnected from it.

To stop a service:

1. Select a service and click > **Stop**.
2. A dialog requests confirmation. To stop the service, click **Yes**.

Restart a Service

Occasionally, you have to restart a service for changes to take effect. When you change a parameter that requires a restart, NetWitness displays a message.



To restart a service:

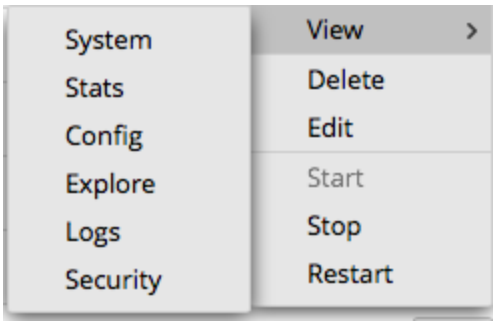
1. Select a service and click > **Restart**.
2. A dialog requests confirmation. To stop the service, click **Yes**.

The service stops, then restarts automatically.

View Service Details

You can view and edit information about services using options in the View menu for a service.

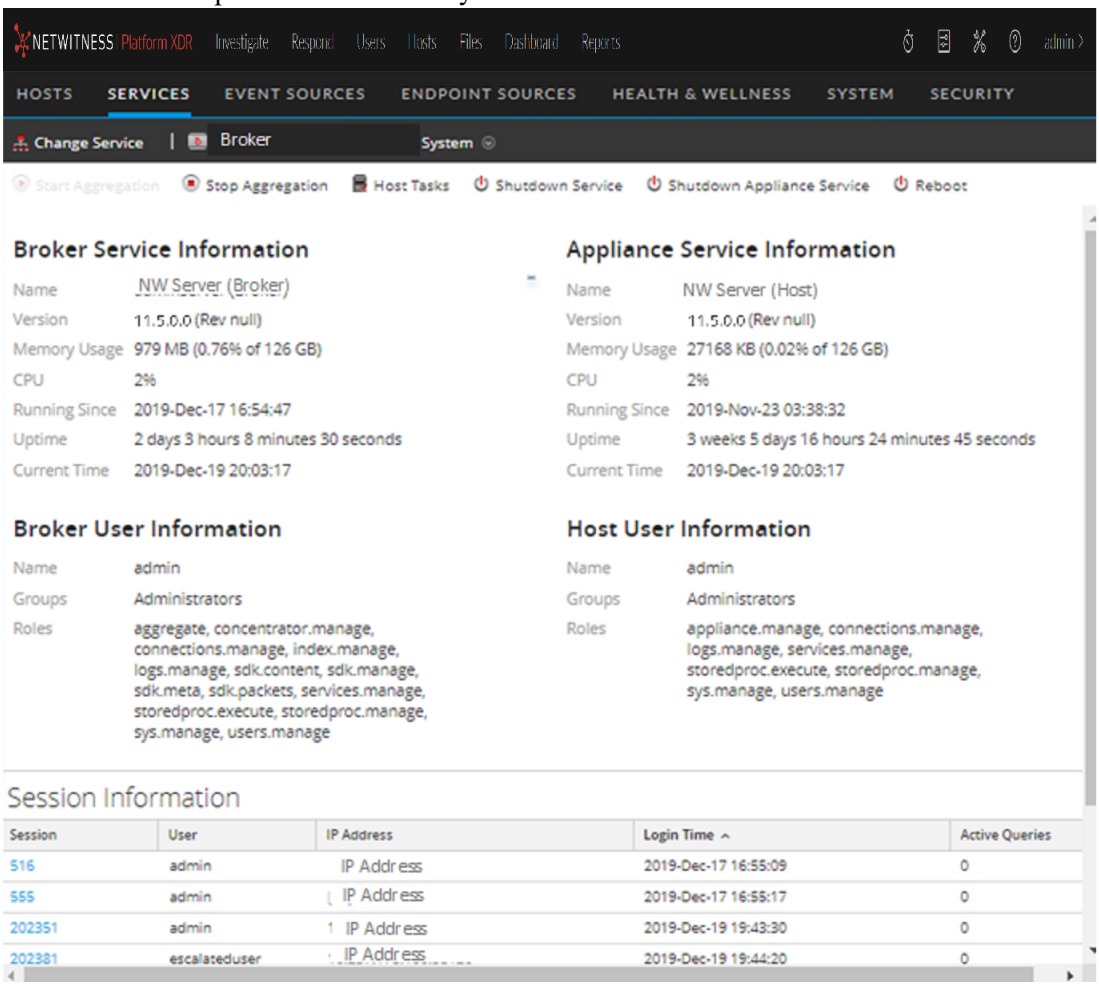
Purpose of Each Service View



Each view displays a functional piece of a service and is described in detail in its own section:

- Services System View shows a summary of service, appliance service, service user, host user, and session information.
- Services Stats View provides a way to monitor service operations and status.
- Services Config View is for configuring all aspects of a service.
- Services Explore View is for viewing and editing host and service configurations.
- System Logging Panel shows service logs that you can search.
- Services Security View is a way to add NetWitness Platform Core user accounts for aggregation, thick client users, and REST API users.

Access a Service View

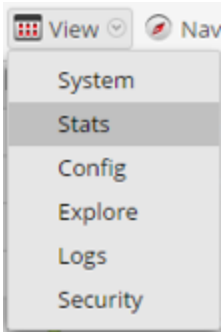


To access a view for a service:

1. In NetWitness, go to **(Admin) > Services**.
2. Select a service and click > **View**.
   The View menu is displayed.

3. From the options on the left, select a view.

   Below is an example of the Services System view for a Broker.



4. Use the toolbar to navigate:

   a. Click **Change Service** to select another service.
      The Administrate Service dialog is displayed.

   b. Select the checkbox to the left of the service that you want.

c. Select the view that you want for the service you selected in the View drop-down list.

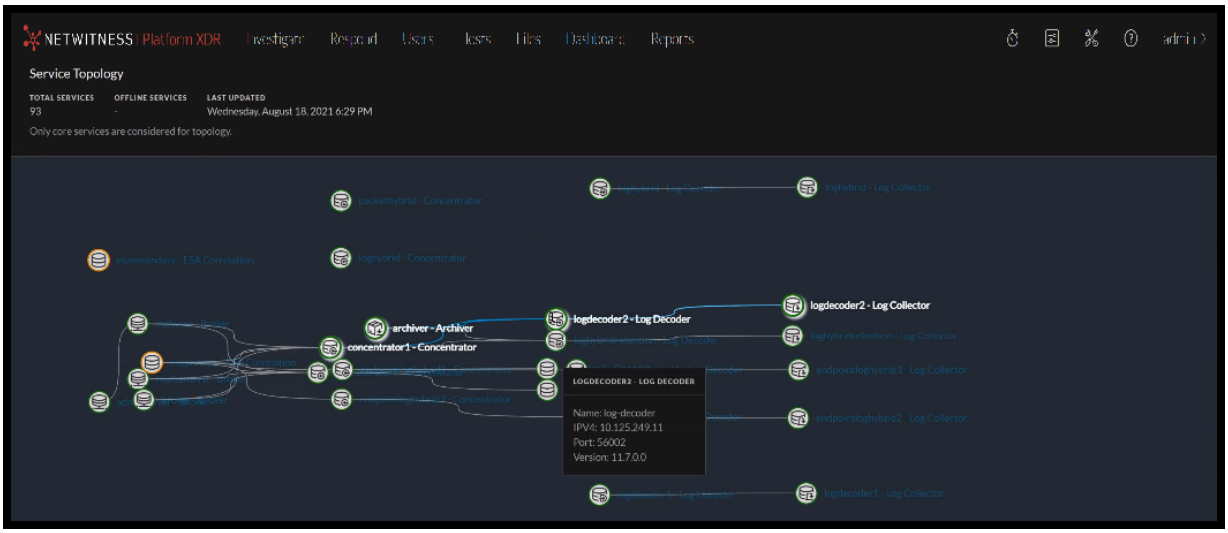
The new view (for example, Stats) is displayed for the service you selected.

View Topology Details

Note: This feature is supported in 11.7 and later.

Note: To view the **Service Topology Tab**, you must ensure this feature is enabled under **Admin Server** > **Explorer** > **Feature**> **service-topology-feature**.

Administrators and analysts can view all the NetWitness core services in a hierarchical layout depicting the collection and aggregation of the services in your deployment. This visualization displays the topology for Broker, Concentrator, Log Decoder, Packet Decoder, Hybrids, ESA and Log Collector and provides insights on which:



- Broker aggregates from the Concentrators.
- Concentrator aggregates from the Log Decoders.
- Log Decoder receives data from the Log Collectors.
- Log Collector sending data to other Log Collectors and vice-veNetWitness and the direction of the data flow.

Note: Services such as Reporting Engine, Malware Analysis, UEBA, Endpoint Server, Cloud Link Service, and Warehouse connector are not supported.

The topology is automatically refreshed once in 3 hours. You can click on any node to view the details.

To view the Topology:

1. Click > **Service Topology.**
2. Do one of the following:
   - Scroll horizontally to view the complete topology.
   - Click **Search** and enter the service name to locate a specific service. The specific service will be highlighted in blue color in the hierarchical layout.
3. Click on the node to view the details.
   For more information, see Services Topology View topic.

Centralized Service Configuration via Policy

Note: The information in this section applies to NetWitness Platform Version 11.7 and Later.

Centralized Service Configuration allows you to manage the configuration of services in your environment efficiently. The Decoder, Concentrator, and Log Decoder deployed in your environment may be large in number and geographically distributed. Managing common configurations across the services can be time consuming. With Centralized Service Configuration, you can centrally create a policy of common configuration settings and apply the policy to a set of groups.

Groups

A group is a set of services based on the service type Decoder, Concentrator, and Log Decoder. You can create a group and assign policy to it based on your requirement. For example, group all the 10G Decoder services or group services within a geographical area. For more information on creating groups, see Creating Groups and Policies.

Policies

A Policy is a set of service configurations that you can apply to a set of groups. This allows you to efficiently manage the service settings. Once you create a customized policy, you can assign it to a group.

Benefits of Centralized Service Configuration

- Apply customized settings in one step to any number of services
- Centrally restart all services within a group (when needed) to apply changes
- Indicates when an action is required, such as service restart, failed publication, or Out of Compliance services
- Clone policy to quickly create similar policies with minor changes

- Quickly revert changes to a policy in case of issues
- Groups of the same service type can be created based on similar hardware profiles or other criteria
- Add configuration items to policies in order to customize settings. Any settings which are not in the policy will be left as default
- (For version 11.7.1 and Later) Reconfigure 10G Network Decoders from the Policy UI. Administrators can quickly create 10G policies for each Decoder group based on the hardware profile
- (For version 11.7.1 and Later) Clone policy from an existing service, to save policy transition time for existing users

Creating Groups and Policies

Create a Group

You can create a group with one or more services and assign one policy to it. Atleast one service is required to publish a group.

To create a group:

1. Go to  (**CONFIGURE**) > **Policies**.
2. In the left panel, click **Groups**.
3. In the tool bar, click .
4. In the New Group panel, do the following:
   - Enter the name of the group.
   - Enter a description for the group.
   - Select the type of service for the group.
5. Click **Next**.
6. In the Define Group, click  to assign services to the group.

Note: A service is disabled if it is assigned to another group.

7. Click **Next**.
8. In the Assign Policies, click  to assign one policy to a group. Make sure that the policy and group is of same service type.
9. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.

     The Publish and Restart Services dialog is displayed only if some settings require a service restart for the changes to take effect. In the Publish and Restart Services dialog, do any one of the following:

- To publish and restart the services immediately, click **Publish & Restart**.
- To publish and restart the services later, click **Publish & Restart Later**. In this case you must restart the services manually.
- To cancel the restart dialog, click **Cancel**.

The settings that do not require restart will be applied immediately.

- Click **Save and Close** to save the settings.

Create a Policy

You can create a policy and assign it to one or more groups.

To create a policy:

1. Go to **(CONFIGURE)** > **Policies**.
2. Click **Policies**.
   The available policies are displayed.
3. Click + Create New to add a new policy.
4. In the New Policy panel, do the following:
   - Select the policy type from the drop-down list.
   - Enter a unique policy name.
   - Enter a description for the policy.
   - Select the service type for the policy from the drop-down list.
   - (For version 11.7.1 and Later) Select the service from which you want to clone the settings.
5. Click **Next**.
6. Do any one of the following:
   - Customize the settings for the policy based on your requirement, for example, in the Database setting, click and change the Policy value to sha256 or change the byte range to 10 MB.

     Note: (For version 11.7.1 and Later) If you have preferred to clone from existing service, the setting values are populated automatically from the selected service on customize settings section. You can also add or modify the settings based on your requirement.
   - (For version 11.7.1 and Later) To configure 10g Settings:
     - Click **10g Settings**.
     - Select the Decoder service to fetch the settings.
     - Click **Done**.
7. In the Group List, click to assign groups to the policy. The policy and group should be of same service type.

Note: A group is disabled if another policy of the same type is already assigned to this group.

8. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.

     The Publish and Restart Services dialog is displayed only if some settings require a service restart for the changes to take effect. In the Publish and Restart Services dialog, do any one of the following:

     - To publish and restart the services immediately, click **Publish & Restart Now**.
     - To publish and restart the services later, click **Publish & Restart Later**. In this case you must restart the services manually.
     - To cancel the restart dialog, click **Cancel**.

     The settings that do not require restart will be applied immediately.
   - Click **Save and Close** to save and return to the Policies view.

Managing Groups and Policies

View a Group

To view properties of the selected group:

1. Go to (**CONFIGURE**) > **Policies**.
2. Click **Groups**. The available groups are displayed.
3. Click a row to view details about the selected group in the right panel.

Delete a group

You can delete one or more groups. Once a group is deleted, the services and policies in the group will no longer displays the deleted group details.

To delete a group:

1. Go to (**CONFIGURE**) > **Policies**.
2. Click **Groups**. The available groups are displayed.
3. Select one or more groups and click **Delete**.

The confirmation message is displayed.

Edit a Group

You can edit the properties of the group at any point in time. The service type cannot be edited. The status of the updated group is unpublished if you change the service or policies in a group. If you just change the group name and description the status remains published (if it is already published).

To edit a group:

1. Go to  (**CONFIGURE**) > **Policies**.
2. Click **Groups**. The available groups are displayed.
3. Select a group and click **Edit**.

Note: You cannot edit the service type.

4. Make the required changes in the group.
5. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.
     The policy will be listed under the published category.
   - Click **Save and Close** to save the settings and return to the Groups view.

Filter Groups

The Filters Panel allows you to filter the list of displayed groups, based on the service type:

- Decoder
- Log Decoder
- Concentrator

Additionally, you can filter based on publication status or service status:

- **Published**: Groups that are published.
- **Unpublished**: Groups that are saved but not published.
- **Failed**: Groups that are failed to publish.
- **N/A**: Groups for which publication status is not applicable.
- **Service Require Restart**: The services associated with the group that require restart.

The Filters panel can be hidden or displayed:

- To display if hidden, click  in the toolbar.
- To hide, click  at the top-right of the panel.

Delete a Policy

To delete a policy:

1. Go to  (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Select one or more policies and in the **More Actions** drop-down list in the tool bar, click **Delete**.

The delete dialog is displayed.

Note: The services associated with this policy still require a restart if the restart is pending.

4. Click **Delete** to permanently delete the selected policies.

The deletion will take effect immediately.

Revert a Policy

You can revert a policy to the previously published version for a maximum of 5 times. Once a policy is reverted you cannot get back to the newer version and you must publish a policy.

Note: The revert is disabled if there is no previously published version.

To revert a policy:

1. Go to  (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Select a policy and in the **More Actions** drop-down list in the tool bar, click **Revert**.
   All changes made to policy will be discarded and reverted to the previously published version. You must publish the policy once it is reverted.

Note: If there are any missing settings in the previously published version, then a default value is set for those settings.

Clone a Policy

You can clone only one policy at a time. Once cloned, all the settings from the old policy is copied to the new policy.

To clone a policy:

1. Go to  (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Select a policy to clone and in the More actions drop-down list in the tool bar, click **Clone**.

The policy is cloned successfully.

Edit a Policy

You can edit the settings of the policies. The service type and policy type cannot be edited. Once the policy is edited the changes in the policy is reflected upon saving the policy. The updated settings are applied to the service if published.

After saving and before publishing the publication status of the changed policy is set to Unpublished if any settings is changed.

To edit a policy:

1. Go to  (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.

3. Select a policy and click **Edit**.
4. Make the required changes in policy.

Note: You cannot edit service type and policy type.

5. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.
     The policy will be listed under the published category.
   - Click **Save and Close** to save the settings and return to the Policies view.

View a Policy

To view a policy:

1. Go to  (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Click a row to view details about the selected policy in the right panel.

Filter Policies

The Filters Panel allows you to filter the list of displayed policies, based on the policy status and service type:

- **Published**: Policies that are published.
- **Unpublished**: Policies that are saved but not published.
- **Failed**: Policies that are failed to publish.
- **N/A**: Policies for which publication status is not applicable.

The Filters panel can be hidden or displayed:

- To display if hidden, click  in the toolbar.
- To hide, click  at the top-right of the panel.

Hosts and Services Views References

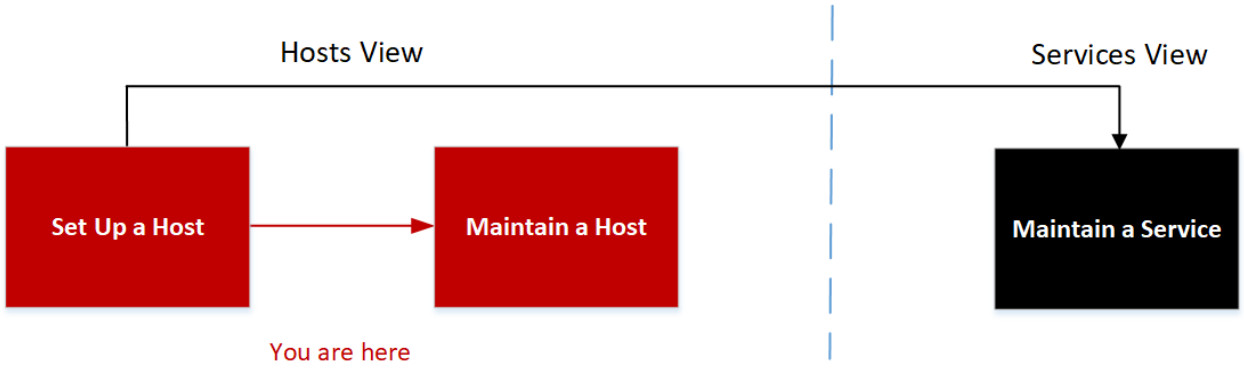
This topic is a reference for features in the NetWitness Admin user interface.

The Admin module pulls NetWitness Admin activities into a single view to monitor and manage hosts (appliances), services, tasks, and security.

Topics

- Hosts View
- Services View
- Services Config View
- Services Explore View
- Services Logs View
- Services Security View
- Services Stats View
- Services System View

Hosts View



You set up and maintain the physical or virtual machine on which NetWitness services run in the Hosts view.

IMPORTANT: For help with resolving errors you receive during version installation and update, see Troubleshooting Version Installations and Updates .

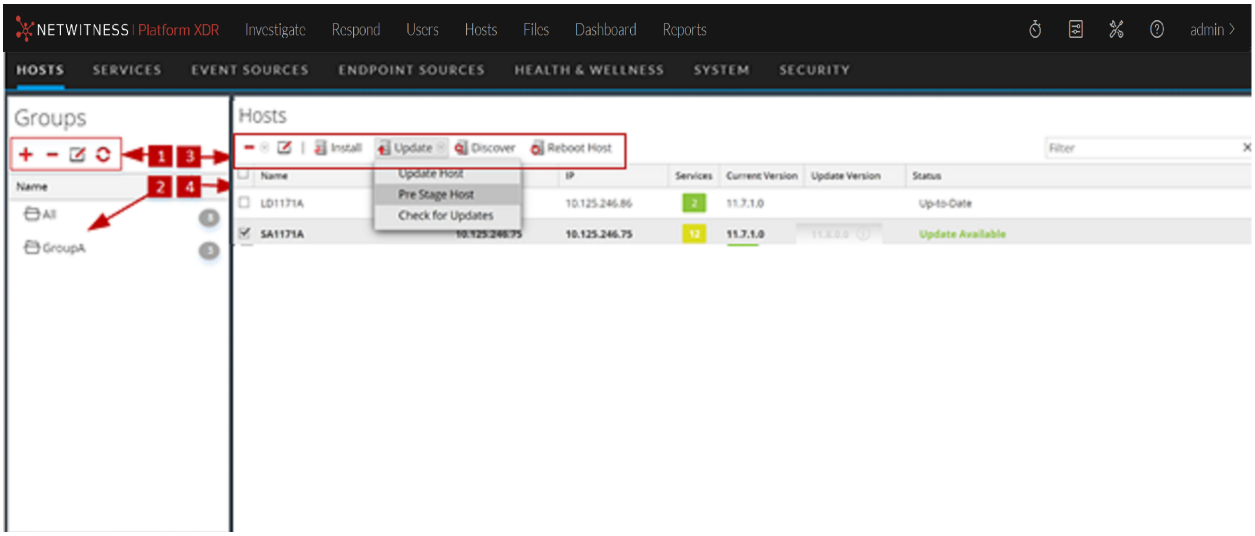
A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host. You must configure the Core services first. You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data.

Workflow

This workflow shows the procedures you complete to set up a host, maintain a host, and update the host with new NetWitness versions. Setting up a host is the first task in this workflow.The hosts with Core services are set up out-of-the-box. After that, you can set up additional hosts to enhance your NetWitness deployment. The other two tasks, maintaining a host and updating versions for a host, are performed when required and do not have a specific order of completion.

What do you want to do?

User Role	I want to...	Documentation
Administrator	set up a host.*	Setting Up a Host
Administrator	maintain a host.*	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services
Administrator	apply version updates to a host.*	Apply Version Upgrades to a Host



* You can perform these tasks in the current view.

Quick Look

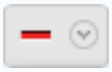
This is an example of the Hosts view.

1 Groups Panel Toolbar - Provides options to work with host groups in the list.
2 Groups Panel - Lists all host groups currently in your deployment.
3 Hosts List Toolbar - Provides options to work with the Hosts list.
4 Hosts List - Lists all hosts currently in your deployment.

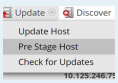
Groups Panel Toolbar

Feature	Description
+	Displays a new row in the Groups panel in which you enter the name of a new group.
−	Asks for confirmation that you want to delete the group. You can confirm or cancel the deletion.
✎	Opens the field for renaming the selected preexisting group. You can also double click on the group name in the Groups panel to rename the group. Changes take effect immediately.
↻	Refreshes the Groups panel to reflect the changes and goes back to the All group view. Changes take effect immediately.

Groups Panel



The Groups panel provides a logical way to organize hosts, such as by function, geography, or project. Once hosts are grouped, it is easier to perform operations on multiple hosts by interacting with each host in a group rather than individual hosts from an non-grouped list. You can drag a host from the Hosts list to add it to a group. A host may belong to more than one group.



Note: In NetWitness Live, groups can subscribe to resources while individual hosts cannot.

Column Title	Description
Name	The host groups are displayed in the Groups panel. The number next to each group name displays the number of hosts that added to the group.

Hosts List Toolbar

The Hosts list toolbar contains the tools that you use to maintain the hosts in your NetWitness deployment.

Feature	Description
	This drop-down list displays two options. • **Remove Host**: Deletes the selected host from both the host group and the Hosts list altogether. All related services will be removed as well. • **Remove From Group**: Removes the selected host from the host group. The Host will still be available in the Hosts list. Changes take effect immediately.
	Opens the Edit Host dialog in which you edit a host or service identification and basic communication settings. See Step 1. Deploy a Host for more information.
	Opens the Install Services dialog from which you can install a service on a deployed host. See Step 2. Install a Service on a Host for more information.

Feature	Description
	This drop-down list displays three options. • **Update Host**: Updates the selected hosts with the version you select in the Update Version column. • **Pre-Stage Host:** Pre-stage the upgrade repository by downloading the required packages without affecting the system. • **Check for Updates**: Checks the Local Update Repo for the latest updates available from NetWitness. Changes take effect immediately. See Apply Version Upgrades to a Host for more information.
	Most of the time, the Discovery function completes automatically and you do not need to click . For a fresh installation, click Discover to access the Provision dialog box so you can complete the provisioning phase. After the provisioning phase, NetWitness automatically discovers services running on the host and you do not need to click Discover.
	Restarts the host immediately.
	Entering a Name or Host here filters the list. This field allows you to quickly find a particular host.

Hosts List

Column	Description
☐	Select the host by clicking the corresponding checkbox in this column. To select all of the hosts, select the checkbox in the header.
Name	Displays the name of the host that was given when the host was installed. This column is organized in alphabetical order by default. Click the Name column title to view in reverse alphabetical order.
Host	Displays the IP address of each host.
Services	Displays the number of services added to the host.
Current Version	Displays the version that the host is currently on.
Update Version	Displays a drop-down list of versions that the user can upgrade to. See Apply Version Upgrades to a Host for more information.

Column	Description
Status	Displays whether or not the host is upgraded to the most current version. If the host is on the most current version, then the Status displays "Up-to-Date".

Services View

You set up and maintain the NetWitness services in the Services view. In the Services view, you can:

- Quickly search for and locate a specific service or type of service, such as Log Decoder or Warehouse Connector.
- Use shortcuts to get to administration tasks.
- Add, edit, and remove services.
- Sort services by name and host.
- Filter services by type, name, and host.
- Start, stop, and restart services.

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host. You must configure the following Core services first.

Services	Notes
NW Server

2 Groups Panel - Lists all service groups currently in your deployment.
3 Services List Toolbar - Provides options to work with the Services list.
4 Services List - Lists all services currently in your deployment.

Groups Panel Toolbar

Feature	Description
	Displays a new row in the Groups panel in which you enter the name of a new group.
	Asks for confirmation that you want to delete the group. You can confirm or cancel the deletion.
	Opens the field for renaming the selected preexisting group. You can also double click on the group name in the Groups panel to rename the group. Changes take effect immediately.
	Refreshes the Groups panel to reflect the changes and goes back to the All group view. Changes take effect immediately.

Groups Panel

The Groups panel provides a logical way to manage groups of services, such as by function, geography, or project. After you create a group, you can drag individual services from the Services panel into the group. A service may belong to more than one group.

Column Title	Description
Name	The service groups are displayed in the Groups panel. The number next to each group name displays the number of hosts that added to the group.

Services List Toolbar

This topic introduces the options in Services list toolbar to add, remove, edit, and get a license for services. You can also filter the services listed in the Services list.

To access the Admin Services view, in NetWitness, go to  **(Admin) > Services.** The Services list toolbar is at the top of the Services list in the Services view.

Feature	Description
	Adds a service for your deployment of NetWitness to manage. See Step 2. Install a Service on a Host.
	Deletes a service from your deployment of NetWitness. See Edit or Delete a Service.

Feature	Description
	Edits service identification and basic communication settings.
	Filters the services listed in Services view. In the Filter drop-down list, you can filter the services by one or more selected service types. In the Filter field, you can filter the services by Name and Host. You can use the Filter drop-down list and the Filter field at the same time to filter the services listed in the Services view.

Services List

Column	Description
	Select the service by clicking the corresponding checkbox in this column. To select all of the services, select the checkbox in the header.
Online/Offline Indicator	Displays  if the service is online. Displays  if the service is offline.
Name	Displays the name of the service that was given when the service was installed. This column is organized in alphabetical order by default. Click the Name column title to view in reverse alphabetical order.
Licensed	Displays  if the service is licensed. Displays  if the service is not licensed. If one or more services are not licensed, a red banner will appear at the top of the screen that will prompt you to fix this. 
Host	Displays the host name that the service belongs to.
Type	Displays the service type.
Version	Displays the version that the service is currently on.
Actions	Use drop-down list to: • Navigate to the different service views (System, Stats, Config, Explore, Logs, Security) See View Topology Details for more information. • Delete, edit, start, stop, and restart a service. See Start, Stop, or Restart a Service for more information.

Quick Look

The following list describes the features of the Add Service or Edit Service dialogs.

Field or Option	Description
Service	Displays the service type. You can add the following services: Archiver, Broker, Concentrator, Network Decoder, Event Stream Analysis, Incident Management, IPDB Extractor, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Warehouse Connector, and Workbench.
Host	Specifies the host on which the service resides.
Name	Specifies the name used to identify the service, for example, **Broker**. An understandable naming convention can make administrative tasks easier. Some administrators find it convenient to use the hostname or IP address (specified in the **Host** field) for the **Name** as well.
Port	Specifies the port used to communicate with this service. The default port, based on the selected service type in the **Service** field, is autofilled here. If you select **SSL** below, this port becomes an SSL port. If you do not select **SSL**, it becomes a non-SSL port. You can customize this port by opening a firewall for the port that you add. For information about ports, see "Network Architecture and Ports" in the *Deployment Guide*.
SSL	Indicates that NetWitness uses SSL for communications with this service.
Username	Specifies the username used to log in to this service. The default username is `admin`.
Password	Specifies the password used to log in to this service. The default password is `netwitness`.
Test Connection	Tests the connection of a service that you are adding.
Cancel	Closes the Add Service or Edit Service dialog. If you do not save the service before closing the dialog, the service is not added or edited.

Field or Option	Description
Save	Adds a new service or saves changes to existing service.

Services Config View

The Services Config view is one of the views available from the **(Admin) > Services >** . It provides a user interface for configuring all aspects of a Core service or NetWitness service.

The configuration options in the Services Config view are organized as tabs, with each tab providing a view of a set of related parameters. Unlike the Services Explore view, which offers direct access to all configuration files for a service, these tabs present the most commonly modified parameters of service configuration in a user-friendly view.

Due to configuration requirements for different services; each type of service has variations in available tabs and configuration parameters in this view. Individual topics describe configuration parameters that are specific to a host (Brokers, Concentrators, Network Decoders, Log Decoders, and Archivers) or service (for example, Reporting Engine, IPDB Extractor, Log Collector, and Warehouse Connector).

Workflow

What do you want to do?

User Role	I want to...	Documentation

Services Config View - Appliance Service Configuration Tab

The Appliance Service Configuration tab appears in the Services Config view for the Archiver, Broker, Concentrator, IPDB Extractor, Network Decoder, Log Collector, and Log Decoder services.

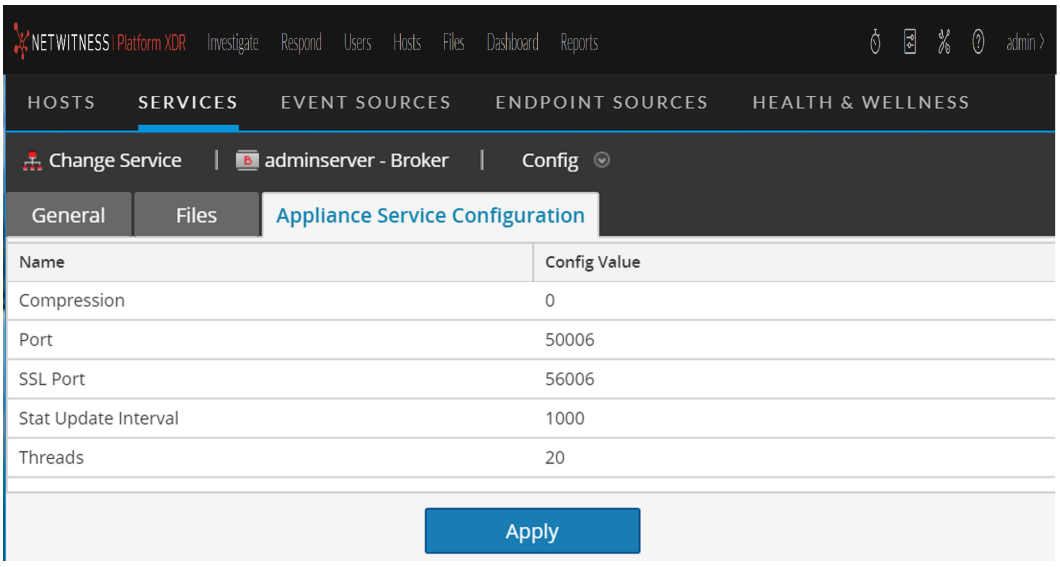
This topic lists and describes the available configuration parameters for the NetWitness Core Appliance service. The NetWitness Core Appliance service provides hardware monitoring on legacy NetWitness hardware.

Workflow

What do you want to do?

User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.*	Maintaining Services
Administrator	view or modify appliance service parameters.*	See "Services Config View - Appliance Service Configuration Tab" in the *Hosts and Services Getting Started Guide for Version 10.x*and prior.

User Role	I want to...	Documentation
Administrator	specify how long to retain database records.	See "Configure Data Retention" in the *Data Privacy Management Guide*. For information about the Data Retention tab for Archiver, see "Data Retention Tab - Archiver" in the *Archiver Configuration Guide*.
Administrator	edit `.xml` and `.lua` files.	Edit Core Service Configuration Files



* You can perform these tasks in the current view.

Related Topics

Quick Look

This is an example of the Appliance Service Configuration tab for a Broker.

The following list describes the configuration values for this tab.

Name	Description of Configuration Value	When Changes Take Effect
Compression	Compresses a message when it reaches the positive number (in bytes) that you specify.	The next time you connect to this service.
Port	Unencrypted listening port. **0** indicates that the port is disabled.	Upon restart of the service.
SSL FIPS Mode	One of the parameters you need to enable or disable Federal Information Processing Standards (FIPS). For detailed instructions, see "Activate or Deactivate FIPS" in the *System Maintenance Guide*.	Upon restart of the service.
SSL Port	SSL (Secure Sockets Layer) listening port. **0** indicates that the port is disabled. SSL is the standard security technology for establishing an encrypted link between a web server and a browser. This link ensures that all data passed between the web server and browsers remain private and integral.	Upon restart of the service.
Stat Update Interval	How often (in milliseconds) the system updates statistic nodes for monitoring Health and Wellness.	Immediately.
Threads	Threads in thread pool required to used to handle requests. The `Threads` parameter works with the `Polling Interval` parameter for event and log threads.	Immediately.

Services Config View - Data Retention Scheduler Tab

The Data Retention Scheduler tab appears in the Services Config view for the Network Decoder, Log Decoder, and Concentrator.

In the Data Retention Scheduler tab, you can define the criteria for removing database records from primary storage on Network Decoder, Log Decoder, and Concentrator services, and schedule the timing for checking the threshold.

Note: If additional customization is necessary, use the Scheduler under the Files tab in the Services Config view. For example, if you have storage available to save the RAW data versus the metadata, use `Capacity` as the threshold and to set different thresholds per database (metadata versus packet).

Workflow

Quick Look

The following figure illustrates the parameters in the Data Retention Scheduler tab for a Concentrator.

The Data Retention Scheduler tab has sections to specify Threshold settings and Run settings. The following table lists the parameters supported for data retention configuration.

Parameter	Description
Threshold	The threshold is based on the age of the data, the amount of time the data was stored or the date on which the data was stored. The date is from the database file, not from the actual session time. • **Duration**: The duration of time that data can be stored before removal. Specifies the number of days (365 maximum), hours (24 maximum), and minutes (60 maximum) that have elapsed since the time stamp on the data. • **Date**: The removal of data based on the date of the timestamp. Specifies the monthly date and time in the and fields.
Run	The schedule for running the job that checks rollover criteria. • **Interval**: Schedule the database check to occur at a regular interval. Specifies the hours and minutes between the scheduled checks. • **Date and Time**: Schedule the database check to occur at a regular day and time. Specifies the day from the drop-down list and the system clock time in `hh:mm:ss` format. Possible values for day are `Everyday`, `Weekdays`, `Weekends`, and `Custom`, where `Custom` allows you to select one or more specific days of the week.

Parameter	Description
Apply	Overwrites any previous schedule for this service and applies the new settings immediately. **Caution:** After you apply these settings, when the threshold is met the system deletes the old data from the database and you can no longer access it.
Reset	Resets the schedule to the last applied state.

Services Config View - Files Tab

The Files tab appears in the Services Config view for Archivers, Brokers, Concentrators, Log Decoders, and Network Decoders.

In the Files tab, you can edit service configuration files as text files. The files you can edit vary depending upon the type of service you are configuring. The following files are common to all Core services.

- The NetWitness file (`netwitness`)
- The service index file (`index-<service>`)
- The scheduler file (`scheduler`)
- The crash reporter file (`crashreporter`)
- The feed definitions file (`feed-definitions`)

In addition, the Decoder has files that configure parsers, feed definitions, and a wireless LAN adapter.

Note: The default values in the configuration files cover most common situations. You may need to edit configuration parameters and values for optional services, such as the crash reporter or scheduler. Do not change these values in the Files tab unless you understand networks and the factors that affect the way services collect and parse data.

More detail on the service configuration parameters is available in the Service Configuration Settings.

Workflow

Quick Look

This is an example of the Files tab.

Files Tab Toolbar

The Files tab has a toolbar and an edit window. This is an example of the toolbar.

These are the features of the Files tab toolbar.

Feature	Description
File drop-down list	Displays a list of files that the system is currently using. When you select a file, the text of the file is displayed in the text edit window. In the text window, you can edit the file and save the changes, or create alternate files to use.
Service / Host drop-down list	Displays the service type and host. You can open a file from either the service or the host for editing.
Get Backup	Retrieves the latest backup of the current file, which can prove useful when you have made changes and want to go back to the previous version of the file. The backup does not replace the current file unless you click **Save**.
Push	Displays a dialog in which you can select services of the same type and push the currently viewed file to the services.
Apply	Overwrites the current file and creates a backup file.

Services Explore View

You can use the NetWitness Services Explore view (**(Admin) > Services**, **> View > Explore**) to display and edit both host and service configurations.

The Services Explore view offers advanced access and control of all NetWitness hosts and services. All services expose their functionality through a treelike series of nodes, similar to the Windows Explorer view of a Windows file system. Here you can:

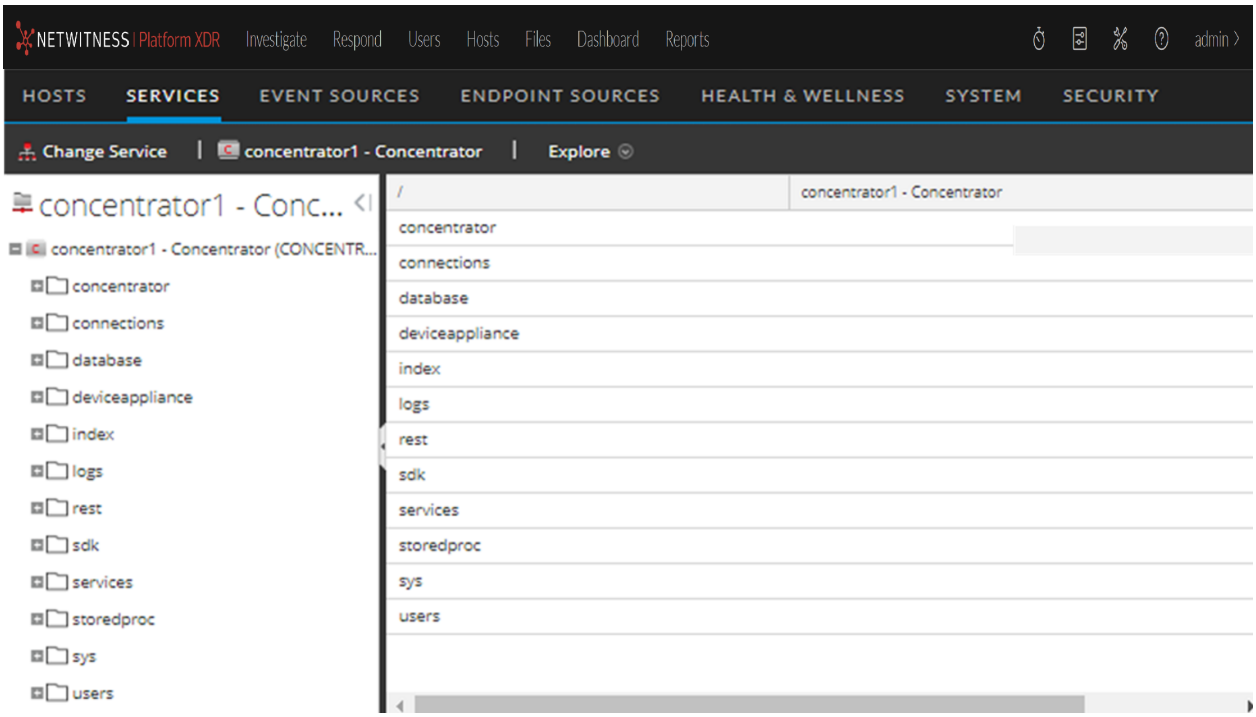
- View a directory tree showing common files for all selected services.
- Navigate down through the directory to a file.
- Open the same file for each service, and display the contents side by side.
- Select an entry in the file and edit the value.
- Apply a property value from one service to other services.

The Services Explore view can also display a Properties dialog, a simple interface for viewing properties of any node in the system and sending messages to the node.

Caution: A good understanding of the nodes and parameters is required when editing in this view. Incorrect settings can cause performance problems.

Workflow

What do you want to do?



User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services
Administrator	view and edit host and service configurations.*	Explore and Edit Service Property Tree

* You can perform these tasks in the current view.

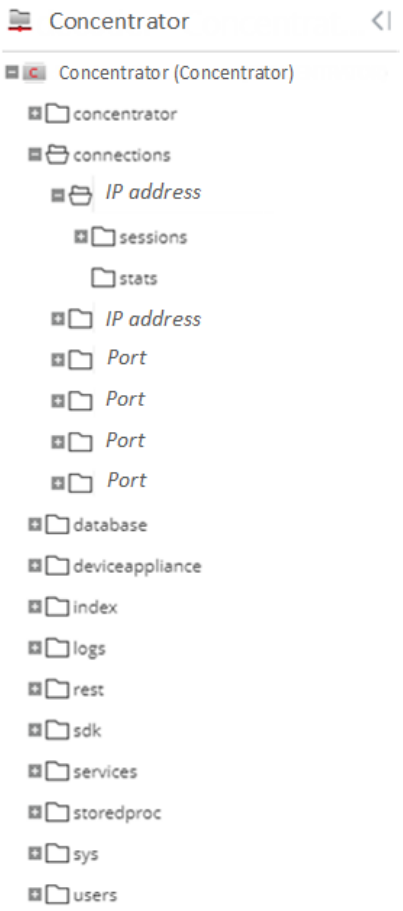
Quick Look



The Services Explore View has two main panels:

- The Node list
- The Monitor panel

You can right-click on a file to access the Properties for the file. See Services Explore View - Properties Dialog for more information.

The Node List

The Node list displays the services as a tree-like series of nodes and folders. The levels in the Node list expand and collapse to display the full hierarchy.

Each root folder is named based on the functionality it exposes. For instance, the `/connections` folder shows all connected IP addresses. Underneath each IP address or port in the list are two folders, `sessions` and `stats`.

- The `sessions` folder displays all authenticated user sessions originating from the IP/Port.
- The `stats` folder displays values, such as the number of messages sent or received, bytes sent or received, and other values set by the service. These are not editable.

Selecting any folder in the tree view displays its children in the Monitor panel. Every node in the tree is actively monitored, so when a statistic or configuration node changes value, it is immediately reflected in the tree and Monitor panel.

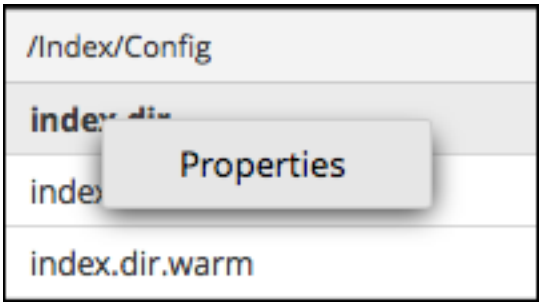
The Monitor Panel

The Monitor panel displays properties and values for a selected node (such as `index`) and a child folder (such as `config`). There are two ways to edit values:

- Click the value and type a new value
- Send a `set` message in the Properties dialog

/index/config	Concentrator
index.dir	/var/netwitness/concentrator/index=2.89 TB
index.dir.cold	
index.dir.warm	
index.slices.open	42
page.compression	huffhybrid
reindex.enable	true
save.session.count	auto

Topics



- View Topology Details

Services Explore View - Properties Dialog

You can use the Services Explore view > Properties dialog to perform the following tasks.

- Send messages to a system node
- Retrieve values for a property for multiple services
- Set values for a property for multiple services

Right-click any file in the Node list or Monitor panel to display the Properties context menu.

When you select `Properties` from the Node list or Monitor panel context menu, the Properties dialog opens below the Monitor panel. All nodes have support help that contains the following information.

- A description of the node
- The list of supported messages with a corresponding description
- Security roles needed to access the messages

The available messages vary according to the service and root folder. Many of these messages are also accessible as options with a NetWitness dashboard or view.

Workflow

What do you want to do?

* You can perform these tasks in the current view.

Related Topics

- Services Explore View

The following example shows the Properties dialog with information in Message Help displayed.

The Properties dialog has the following features.

Feature	Description
Message drop-down list	Lists all available messages for the current node. Select a message from this drop-down list to send to the node.
Parameters input field	Type the message parameters in this field.
Send	Sends the message to the selected node.
Message Help	Displays help text for the current message.
Response Output	Displays the response to a message or output from a message.

Services Logs View

The Services Logs view provides the ability to view and search the logs for a specific service. The Services Logs view is identical to the System Logging panel (**(Admin) > System tab > System Logging**) with two exceptions:

- The Services Logs view has an additional filter to select messages for the service or host.
- The System Logging panel has an additional tab for Settings.

For a complete description of NetWitness logging features in the System Logging panel, see "Monitor Health and Wellness of NetWitness Platform" in the *System Maintenance Guide*.

Historical tab	This is a searchable view of the service log. For more information, see "System Logging - Historical Tab" in the *System Maintenance Guide*.

Services Security View

In NetWitness, each service has a separate configuration of users, roles, and role permissions, which are managed in the Services Security view.

To access service information and perform service operations through NetWitness, a user must belong to a role that has permissions on that service. For NetWitness version 10.4 or later Core services that utilize trusted connections, it is no longer necessary to create NetWitness Core user accounts for users that log on through the web client. You only need to create NetWitness Core user accounts for aggregation, thick client users, and REST API users.

Note: Only the default admin user in NetWitness is created by default on all services. As a prerequisite to managing service security, the default admin user account must be present in the Admin Services view. For every other user, you must configure access to each particular service through NetWitness.

Workflow

What do you want to do?

User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services
Administrator	manage configuration of users, roles, and role permissions.*	See the *System Security and User Management Guide*.

Quick Look

The Services Security view has three tabs: Users, Roles, and Settings.

Roles and Service Access

Primary considerations in configuring service security are defining the roles and assigning users to the roles. The Service Security view separates these two functions into the Users tab and the Roles tab.

- In the Users tab, you can add a user, edit user settings, change the user password, and edit the role membership of the user for a selected service. Although you select a single service in the Services Security view, you can apply the settings for one service to other services.
- In the Roles tab, you can create roles and assign permissions to the roles for a selected service.

Topics

- Services Security View - Users Tab
- Services Security View - Roles Tab

Services Security View - Users Tab

In the Services Security view Users tab, you can configure the following for a service:

- Add user accounts.
- Change service user passwords.
- Configure user authentication properties and query handling properties for the service.
- Specify the user role membership, which specifies the roles that the user belongs to on the selected service.

Note: For version 10.4 or later NetWitness Core services that utilize trusted connections, it is no longer necessary to create NetWitness Core user accounts for users that log on through the web client. You only need to create NetWitness Core user accounts for aggregation, thick client users, and REST API users.

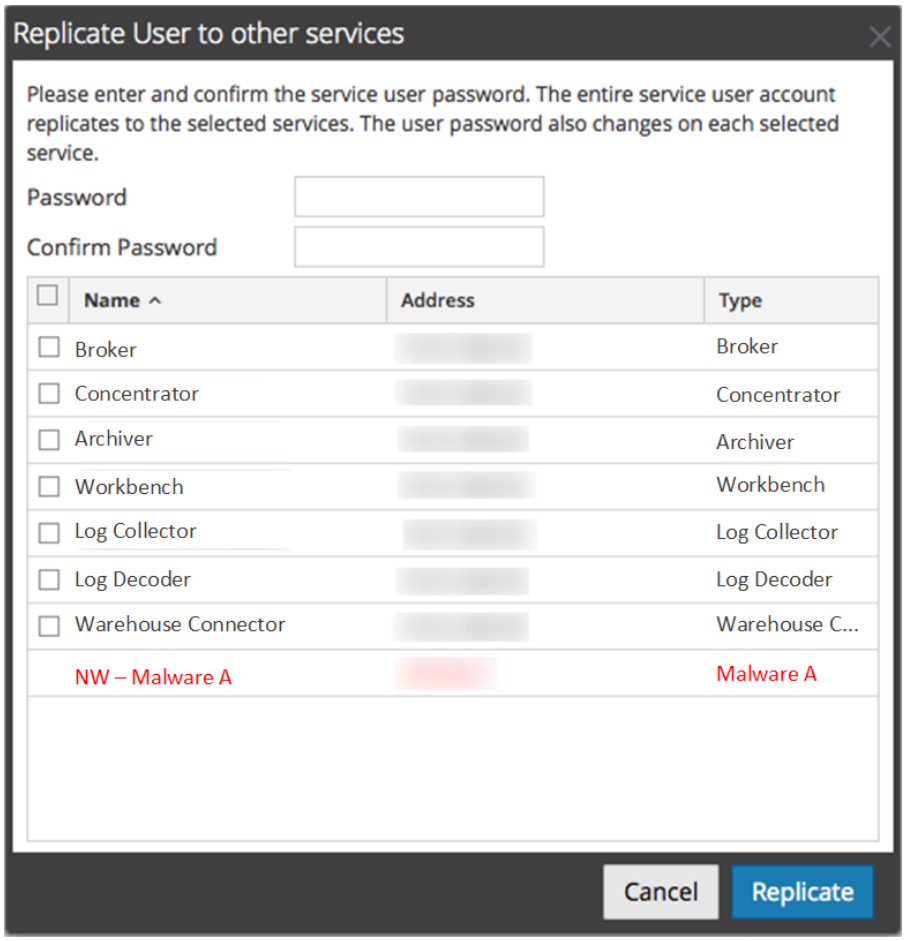
- Services Security View

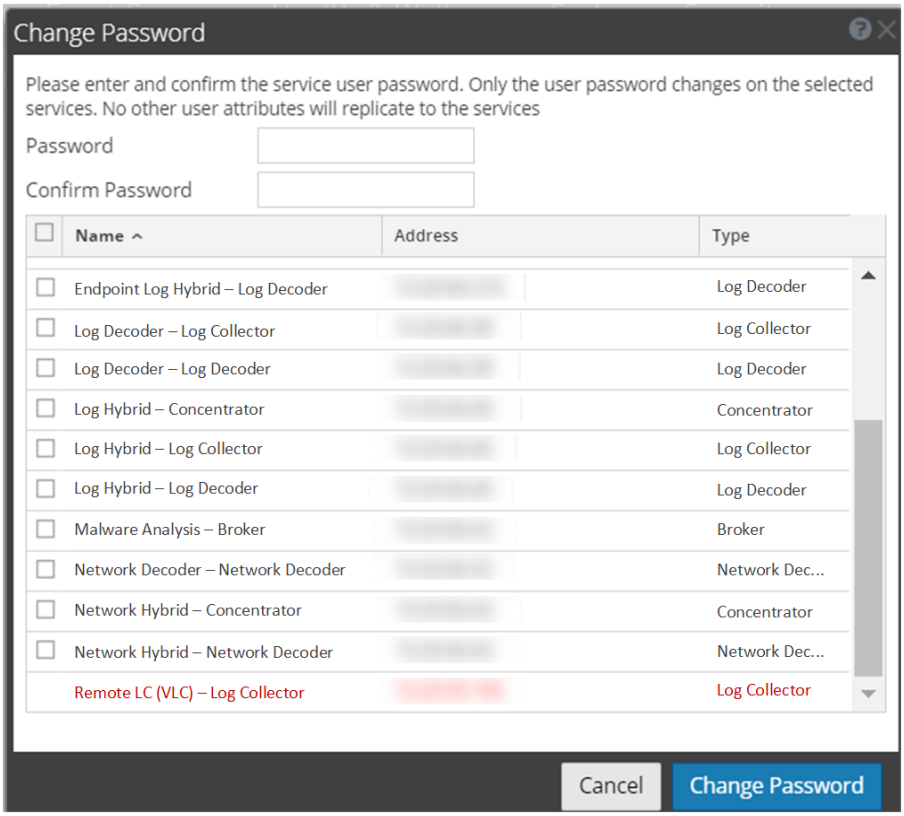
Quick Look

The Users tab has a User List panel on the left. Selecting a username from the panel makes the User Definition panel on the right available.



User List Panel

The User List panel has the following features.



Feature	Description
+	Adds a new user to the current service.
−	Deletes the selected users from the service.

Feature	Description
	Performs one of the following actions on the selected service user account: • **Replicate:** Replicates the entire service user account to selected services. • **Change Password:** Changes the password of a service user and replicates the new password to Core services with that user account defined. The Change Password option replicates only the password change to the Core services selected and does not replicate the entire user account.
Username	The usernames for all user accounts that access the service. The username must be one used to log on to NetWitness.

The following figure shows the "Replicate User to other services" dialog.

The following figure shows the **Change Password** dialog.

User Definition Panel

The User Definition panel has three sections:

- User Information identifies the user as created in the Admin Services Security view.
- User Settings define parameters that apply to this user's access to the service.
- Role Membership defines user roles to which the user belongs.

There are two buttons at the bottom of the panel:

- The **Apply** button saves the changes made in the User Definition panel, and they become effective immediately.
- If you have not saved changes in the User Definition panel, the **Reset** button resets all fields and settings to their values before editing.

User Information

The User Information section has the following features.

Field	Description
Name	The name of the user.
Username	The username that this user enters to log in to the service. This is the NetWitness username generated when the administrator added the user and the associated credentials in the Admin Services Security view.

Field	Description
Password (and **Confirm Password**)	The password that the user enters to log on to the service. This is the NetWitness password generated when the administrator added the user and the associated credentials in the **Administration Security** view. The NetWitness account password and the service password must match in order to allow the user to connect to the service through NetWitness.
Email	(Optional) The user's email address.
Description	(Optional) A general description field to describe this user.

User Settings

The User Settings section has the following features.

Field	Description
Auth Type	The authentication scheme for this user. The product line supports internal and external authentication. • **NetWitness Platform** specifies internal authentication, and is enabled by default. In this mode, all users must authenticate with the user account and passwords that are generated when the administrator uses the NetWitness Admin Services Security view to create the user and their associated credentials. • **External** specifies that authentication is enabled through the host interface with PAM (Pluggable Authentication Modules). For more information, see "Configure PAM Login Capability" in the *System Security and User Management Guide*.
Core Query Timeout	**Note:** This field was previously known as "SA Core Query Timeout" and does not appear for 10.4 and earlier service versions. NetWitness version 10.4 and earlier services use "Query Level" instead. Specifies the maximum number of minutes a user can run a query on the service. If this value is set to **0**, the query timeout is not enforced for the user on the service.
Query Prefix	(Optional) Restricts query results seen by the user by appending the query syntax to every query. For example, adding the query prefix `email != 'ceo@company.com'` prevents those email results from showing up in the sessions.
Session Threshold	(Optional) Controls the behavior of the application when scanning meta values to determine session counts. If any meta value has a session count that is above the set threshold, the determination of the true session count stops when the threshold is reached. If a threshold is set for a session, the Navigate view (INVESTIGATE > Navigate) shows that the threshold was reached and the percentage of query time used to reach the threshold.

Role Membership

The Role Membership section shows a list of all roles. The checkbox next to a role is selected for the roles that a user is a member of for the selected service.

Services Security View - Roles Tab

The Services Security view Roles tab enables you to create roles and assign permissions. Each role can have different permissions for different services. For example, the Analysts role can have different role permissions based on the selected service.

Before you can add users to roles, you need to define user roles, usually by function, and assign permissions to the roles.

Procedures related to this tab are described in Add a User Role to a Service.

Workflow

What do you want to do?

User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services

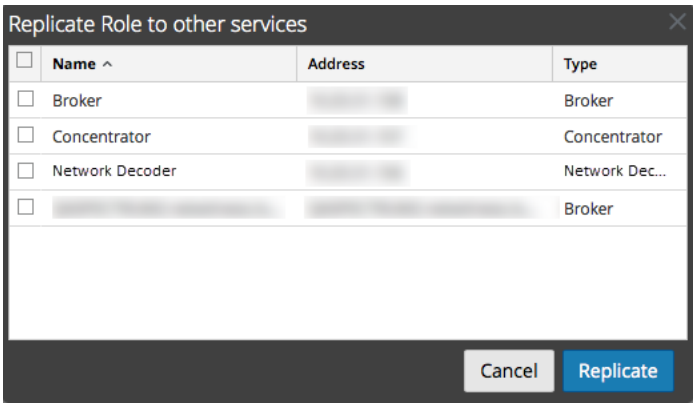
Quick Look

The Roles tab has a **Role Name** panel on the left. Selecting a role name shows the **Role Information** panel for the selected role on the right.



Role Name Panel

The **Role Name** panel has the following features.

Feature	Description
	Adds a new group to the current service.
	Deletes the selected group from the current service.
	Copies a role and its assigned permissions to a new role. The name of the new role must be unique. For example, you can copy the `Analysts` role and create another role with a new name, such as `Analyst_Managers`.

Feature	Description
Replicate	Pushes a role and its assigned permissions to other services. After you select a role and click **Replicate**, the Replicate Role to other services dialog is displayed. In the dialog, you can select the services where you want to replicate the role.

The following figure shows the Replicate Role to other services dialog.

Role Information and Permissions Panel

The Role Information and Permissions panel defines role permissions.

There are two buttons:

- The **Apply** button saves the changes made in the Role Permissions panel and they become effective immediately.
- If you have not saved changes in the Role Permissions panel, the **Reset** button resets all fields and settings to their values before editing.

Topics

Service User Roles

NetWitness has the following pre-configured service user roles.

Role	Assigned Permissions	Personnel/Account
Administrators	All permissions	NetWitness System Administrator

Aggregation	`aggregate`
	`sdk.content`
	`sdk.meta`
	`sdk.packets`
		You can use this role to create an Aggregation account.
		This role provides the minimum permissions necessary to perform aggregation of data. It is only available on NetWitness version 10.5 and later services.

Analysts, Malware_ Analysts, and SOC_ Managers	`sdk.meta`
	`sdk.content`
	`sdk.packets`
	`storedproc.execute`
		Users can use specific applications, run queries and view content for purposes of analysis.

Data_Privacy_ Officers	`sys.manage`
	`users.manage`
	`sdk.meta`
	`sdk.content`
	`sdk.packets`
	`sdk.manage`
	`logs.manage`
	`database.manage`
	`index.manage`
	`dpo.manage`
		Data Privacy Officer
		Data Privacy Officers have the `dpo.manage` permission on Network Decoders and Log Decoders.

Operators	`sys.manage`
	`services.manage`
	`connections.manage`
	`users.manage`
	`logs.manage`
	`parsers.manage`
	`rules.manage`
	`database.manage`
	`index.manage`
	`sdk.manage`
	`decoder.manage`
	`archiver.manage`
	`concentrator.manage`
	`storedproc.manage`
		Operators are responsible for the daily operation of the services.

Service User Permissions

There are many permissions that you can assign a service role in NetWitness. Users can have different permissions on each service, depending on their role assignments and the permissions selected for each role. This table describes the permissions that you can assign to a role.

Permission	Definition
sys.manage	Allows the user to edit the service configuration settings.
services.manage	Allows the user to manage connections to other services.
connections.manage	Allows the user to manage connections to the service.
users.manage	Allows the user to create individual users and user roles and specify user permissions.
aggregate	Allows the user to perform aggregation of data.
sdk.meta	Allows the user to run queries in the Investigation and Reporting applications and to view the metadata returned by the query.
sdk.content	Allows the user to access raw packets and logs from any client application (Investigations and Reporting).
sdk.packets	Allows users to access raw packets and logs from any client application.
appliance.manage	Allows the user to manage the appliance (host) tasks. This permission is required by the Appliance service.
decoder. manage	Allows the user to edit the configuration settings for the Network Decoder service.
concentrator.manage	Allows the user to edit the configuration settings for the Concentrator/Broker service.
logs.manage	Allows the user to view the service logs and edit the logging configuration settings for the specified service.
parsers.manage	Allows the user to manage all attributes under the parsers node.
rules.manage	Allows the user to add and delete all rules.
database.manage	Allows the user to set database locations, sizes, and the various configuration settings for the session, meta and/or packet/log databases.
index.manage	Allows the user to manage all index-related attributes.
sdk.manage	Allows the user to view and set all SDK configuration items.
storedproc.execute	Allows the user to execute a Lua stored procedure.
storedproc.manage	Allows the user to manage Lua stored procedures.
archiver.manage	Allows the user to modify the Archiver configuration.

Permission	Definition
dpo.manage	Allows the user to manage the transform configuration and the applicable keys.

Services Security View - Aggregation Role

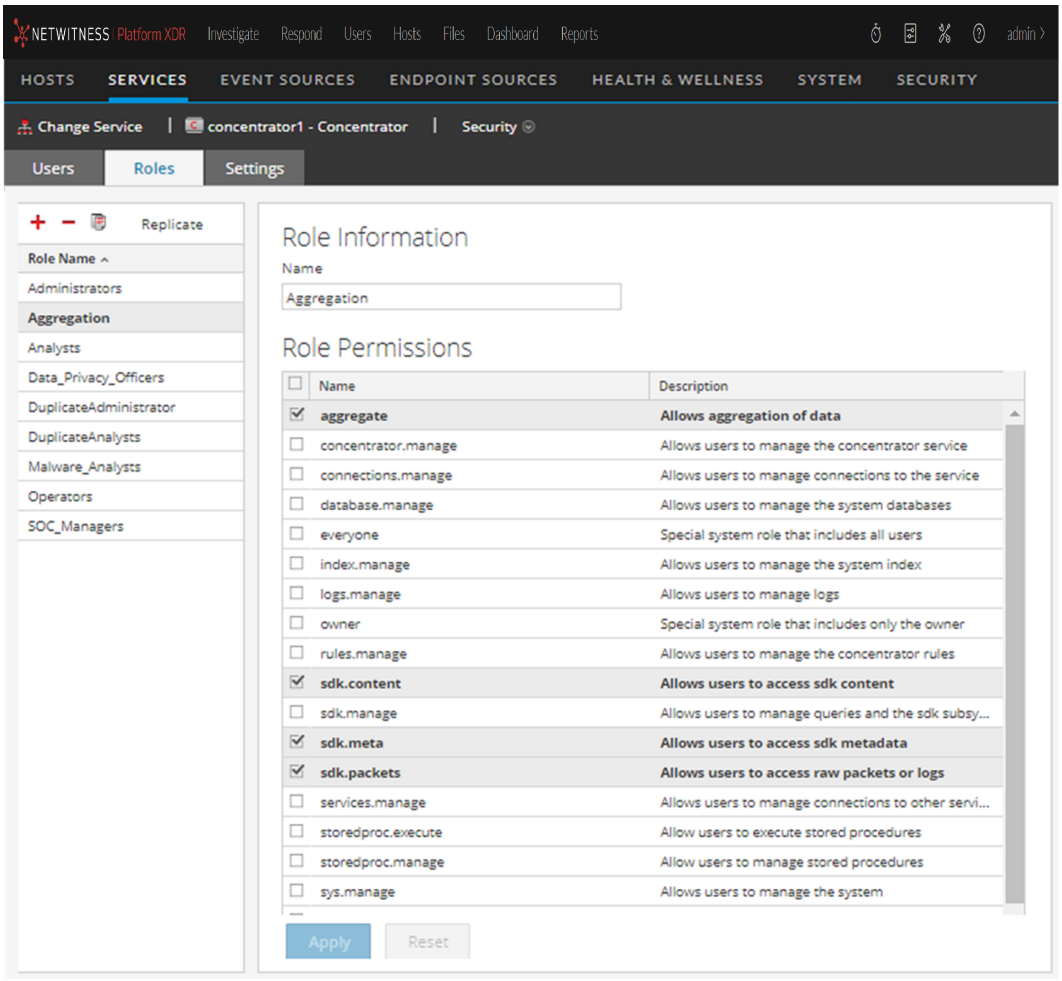
This topic describes the Aggregation role and permissions that allow service users to perform aggregation.

Related Topics

- Services Security View - Service User Roles and Permissions
- Services Security View - Roles Tab

The Aggregation role is a service user role intended only for aggregation of data. It has the minimum role permissions required to do aggregation:

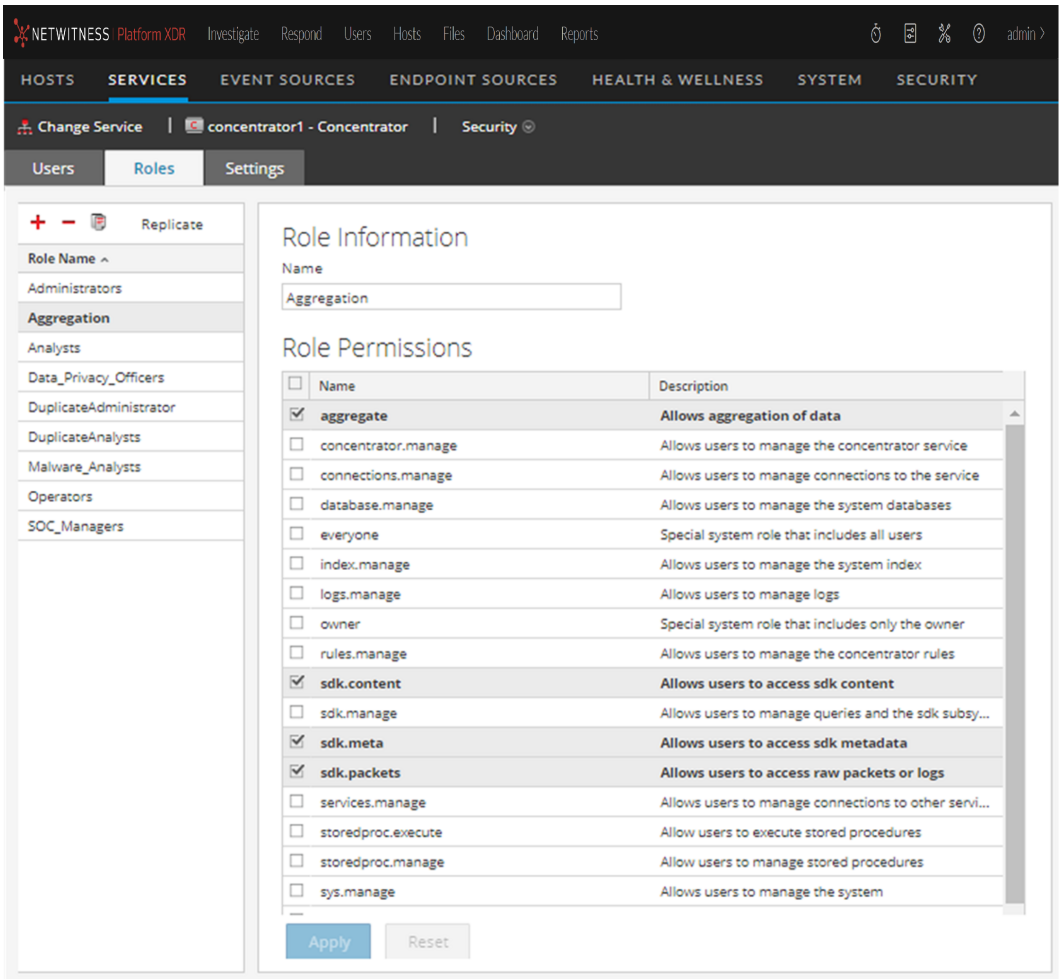
- aggregate
- sdk.meta
- sdk.packets
- sdk.content



The Aggregation role is available only on NetWitness version 10.5 and later services and it can be used for an aggregation account. Members of this role or service users with these permissions can perform aggregation on Network Decoders, Concentrators, Archivers, and Brokers. The aggregate permission allows service users to perform aggregation of sessions and metadata along with raw packets and logs.

You can still use the decoder.manage, concentrator.manage, and archiver.manage permissions, but the Aggregation role permissions allow aggregation only and prevent the other available operations.

You access the service roles from the **(Admin) > Services** (select a service) > > **View** > **Security** > **Roles** tab.



Procedures related to roles are described in Hosts and Services Maintenance Procedures. Services Security View - Service User Roles and Permissions provides detailed information on the pre-configured roles.

The following figure shows the permissions in the Aggregation role.

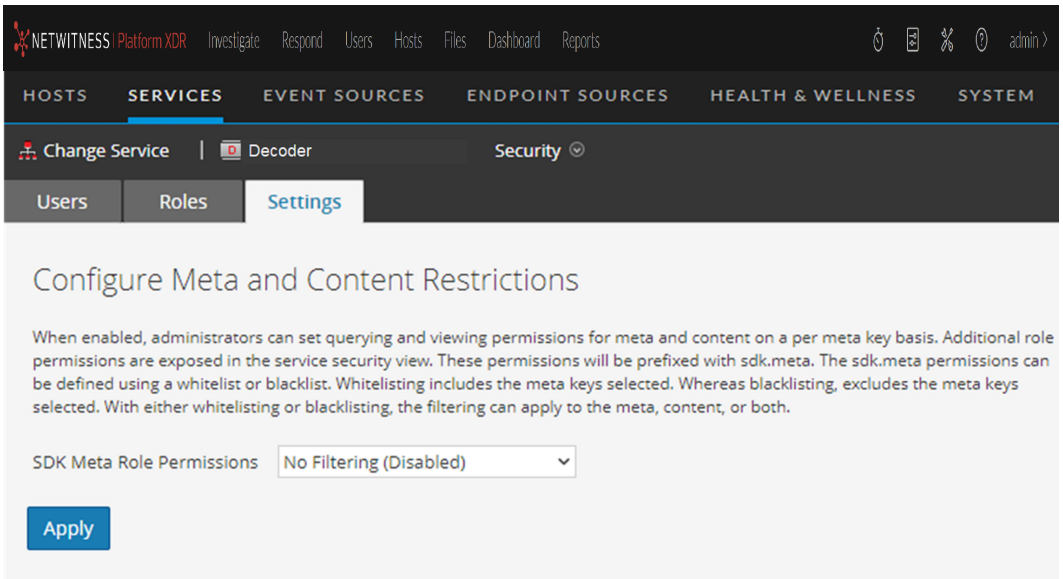
Services Security View - Settings Tab

In the Services Security view Settings tab, Administrators can enable and configure system roles that define permissions on a per meta key basis for individual Brokers, Concentrators, Network Decoders, and Log Decoders. Configuring this feature adds configurable meta keys to the Services Security view > Roles tab so that individual meta keys can be applied to specific roles on a specific service. The following figure illustrates this.

This configuration is generally part of a data privacy plan implemented to ensure that specific types of content consumed or aggregated by a service are kept secure by limiting visibility of the metadata and content to privileged users. See the *Data Privacy Management Guide* for more information.

Workflow

What do you want to do?



User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services
Administrator	enable and configure system roles that define permissions on a per meta key basis for individual Brokers, Concentrators, Network Decoders, and Log Decoders.*	See the *System Security and User Management Guide* for more information.

* You can perform these tasks in the current view.

Related Topics

Quick Look

The Settings tab includes two features.

Feature	Description
SDK Meta Role Permissions field	Provides option for disabling or configuring meta key and content restrictions. The filtering options are described.
Apply button	Applies the selected configuration immediately. If not disabled, the meta keys are added to the Roles tab so they can be applied to specific roles.

SDK Meta Role Permissions Options

The following table lists the filtering options available in the SDK Meta Role Permissions selection list, and the numeric values used to disable (0) and the types of filtering (1 through 6).

Note: There is no need to know the numeric value unless configuring metadata and content visibility manually in the `system.roles` node.

`system.roles` Node Value	Settings Tab Option	Description
0	No Filtering (Disabled)	System roles that define permissions on a per meta key basis are disabled.
1	Whitelist metadata and content	Metadata and content for the specified SDK meta roles are white listed, or visible to users assigned the system role.
2	Whitelist only metadata	Metadata for the specified SDK meta roles is white listed, or visible to users assigned the system role.
3	Whitelist only content	Content for the specified SDK meta roles is white listed, or visible to users assigned the system role.
4	Blacklist metadata and content	Metadata and content for the specified SDK meta roles are black listed, or not visible to users assigned the system role.
5	Blacklist only metadata	Metadata for the specified SDK meta roles is black listed, or not visible to users assigned the system role.
6	Blacklist only content	Content for the specified SDK meta roles is black listed, or not visible to users assigned the system role.

Services Stats View

The Services Stats view provides a way to monitor the status and operations of a service. This view displays key statistics, service system information, and host system information for a service. In addition, more than 80 statistics are available for viewing as gauges and in timeline charts. In historical timeline charts, only statistics for session size, sessions, and packets are viewable.

Workflow

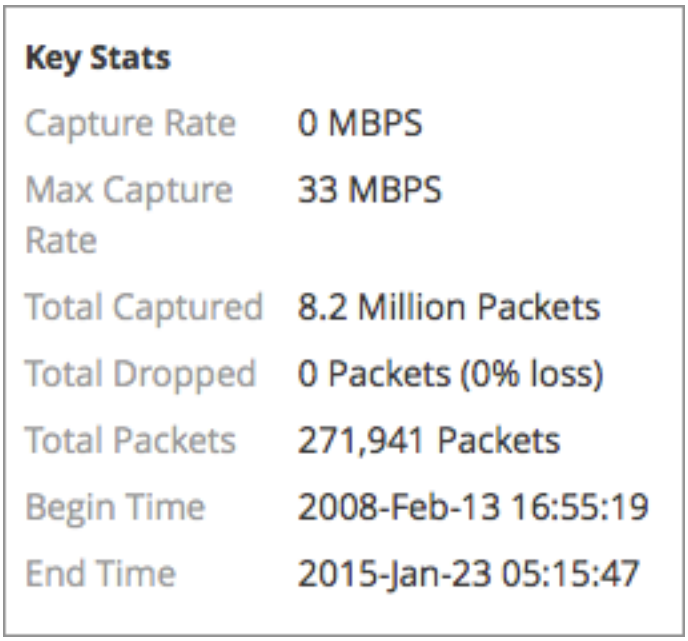
Quick Look

The following figure shows an example of the Services Stats view for a Network Decoder.

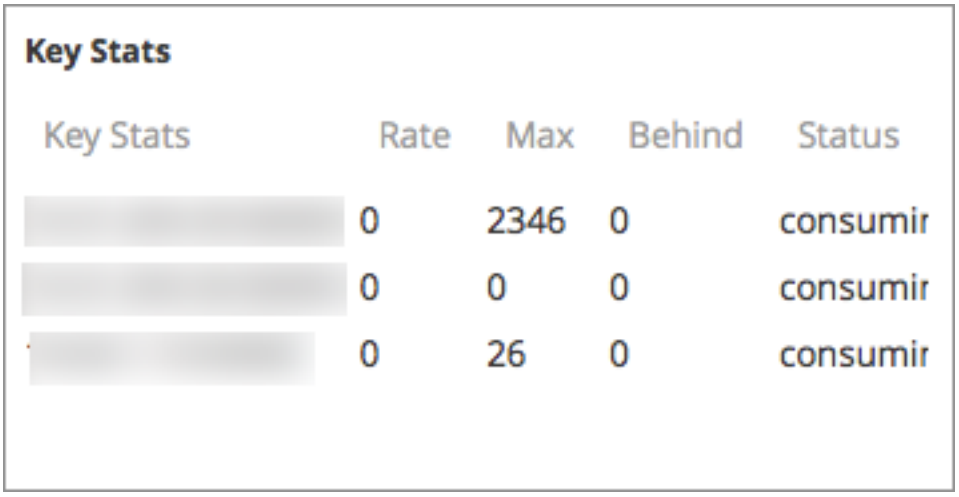
Although different statistics are available for different types of services, certain sections are common to the Services Stats view for any Core service:

- Summary Stats
- Gauges
- Timeline Charts
- Historical Timeline Charts
- Chart Stats Tray



Summary Stats Section

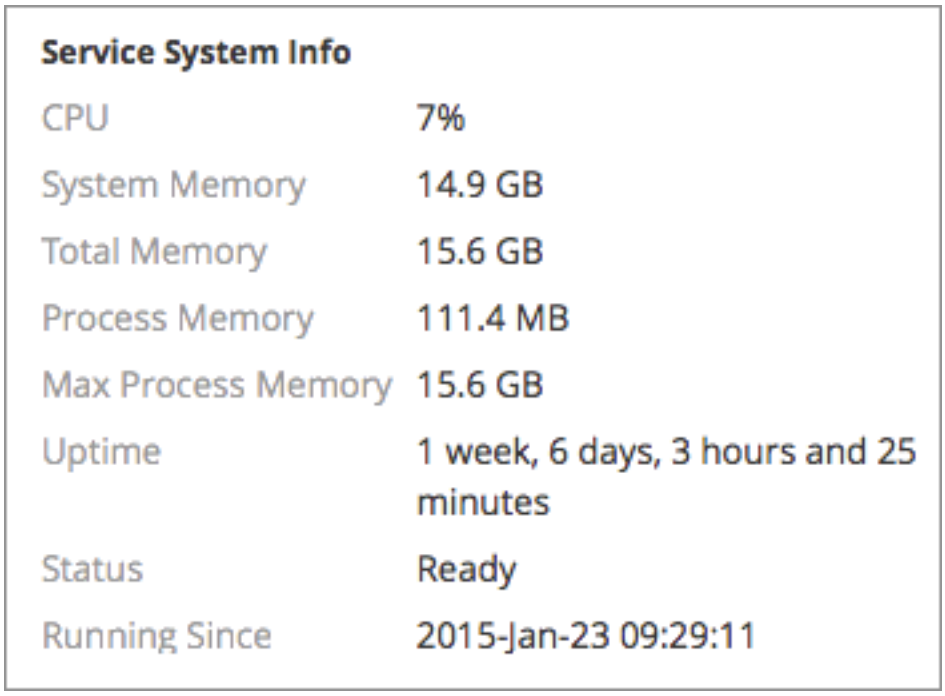
The Summary Stats section is at the top of the default view and has no editable fields. There are five panels in the Summary Stats section: Key Stats, Service System Info, Host System Info, Logical Drives, and Physical Drives. The **Key Stats** panel displays different statistics for different types of services. The remaining four panels in the Summary Stats section are the same for all types of services.



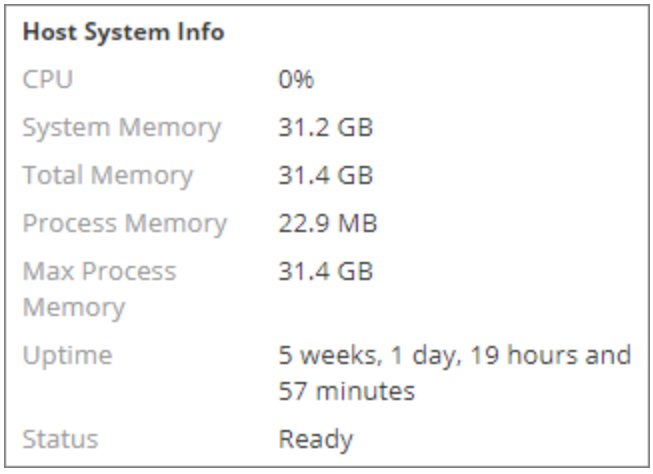
Key Stats

The Key Stats panel displays different statistics for different types of services.

- For a **Network Decoder** or **Log Decoder**, key statistics include capture statistics, such as capture rate, total packets or logs captured, total packets or logs dropped, the data capture begin time and end time.

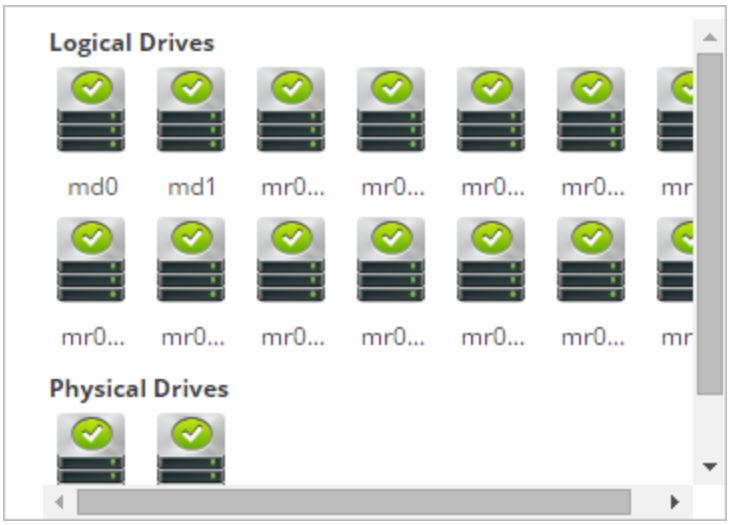


- A **Broker** or **Concentrator** aggregates data from multiple services. Therefore, the key statistics for all aggregate services are presented in a list. The columns in the list provide the service name, the capture rate, the maximum capture rate, the number of sessions behind (that need to be aggregated), and the service status.



Service System Info

The Service System Info panel includes the percentage of CPU used by the service, the memory usage statistics (system, total, process, and maximum process), service uptime, status, running since time, and the current time.



Host System Info

The Host System Info panel includes the percentage of CPU used by the host, the memory usage statistics (system, total, process, and maximum process), host uptime, status, running since time, and the current time.

Logical Drives and Physical Drives

The Logical Drives panel and Physical Drives panel are shown with an icon for the drive name and state. Drive types are used in the names and the drive status options are listed below.

Drive Types and Status

Drive Type	Description	Comments	Status Options
`sd`	SCSI block device	Directly connected SAS, SATA MegaRAID volumes.	Green: OK Red: FAIL
`ld`	MegaRAID Logical Volume	Defined in BIOS or with MegaCLI tool.	Green: OK Yellow: DEGRADED/BUILDING Red: FAIL
`pd`	MegaRAID Physical Disks	Not directly exposed to Linux.	Green: OK Red: FAIL
`md`	Linux software RAID Volume		Green: OK Yellow: DEGRADED/BUILDING Red: FAIL

Gauges

The Gauges section in the Services Stats view presents statistics in the form of analog gauges. See Services Stats View - Gauges for details on configuring gauges.

Timeline Charts

Timeline charts display the selected statistics in a running timeline with focus on the current time. This is the same for all types of services, and only the display name of the timeline is editable. See Services Stats View - Timeline Charts for details on configuring timelines.

Historical Timeline Charts

Historical timeline charts display statistics for session size, sessions, and packets in a historical timeline. This is the same for all types of services. Only the display name, begin date, and end date. See Services Stats View - Timeline Charts for details on configuring timelines.

Note: Historical timeline charts is being deprecated for Log Collector, Virtual Log Collector (VLC) and Windows Legacy Collector services.

Chart Stats Tray

The Chart Stats Tray lists all available statistics for the selected service type. Different services have different statistics to monitor. See Services Stats View - Chart Stats Tray for a detailed description.

Topics

- Services Stats View - Chart Stats Tray
- Services Stats View - Gauges

Quick Look

The following example shows the Services Stats view for a Network Decoder. The Chart Stats Tray is collapsed.

To view the Chart Stats Tray, click on the  to expand the Chart Stats Tray.

The Chart Stats Tray has different statistics for different types of services. In the example above, 132 statistics are available for the Network Decoder. The following table describes features of the Chart Stats Tray.

Feature	Description
	Click to expand the panel horizontally.
	Click to collapse the panel horizontally.
Search	Type a search term in the field and press **RETURN**. Statistics that match are displayed with the matching word highlighted.
	Click to go to the first page.
	Click to go to the previous page.
Page 1 of 11	Type a page number in the Page field.
	Click to go to the next page.
	Click to go to the last page.

Feature	Description
	Click to refresh the view.
Stats 1 - 12 of 132	Displays the range of statistics being displayed. The total number statistics varies by service type.

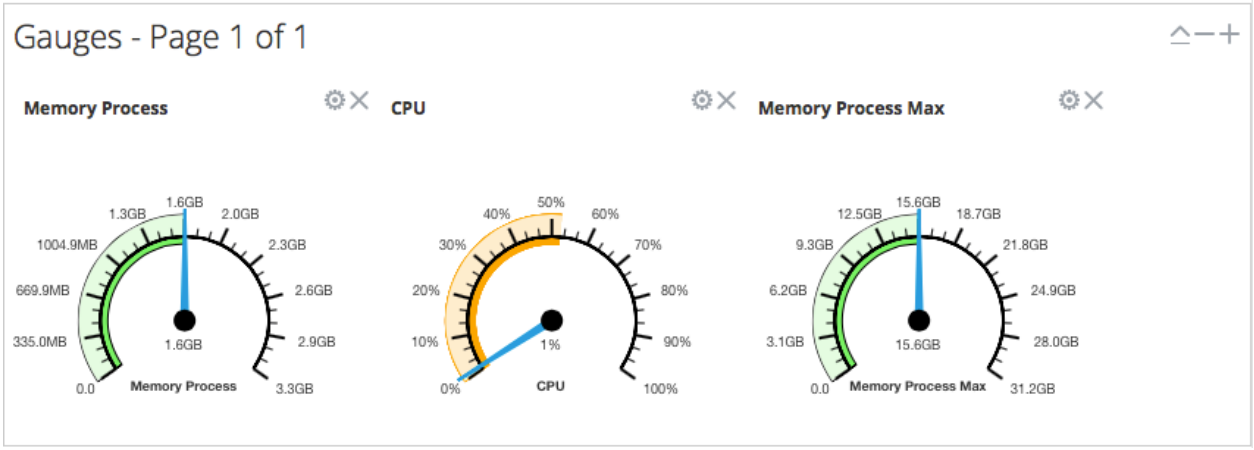
Services Stats View - Gauges

The Gauges section of the Services Stats view presents statistics in the form of an analog gauge. You can drag any statistic available in the Chart Stats Tray to the Gauges section. The properties of each individual gauge are editable; all gauges have an editable title and some have additional editable properties.

Workflow

What do you want to do?

User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services
Administrator	view statistics in the form of an analog gauge.*	See the *System Maintenance Guide*.



* You can perform these tasks in the current view.

Quick Look

The following figure shows the default gauges in the Services Stats view for a Log Decoder.

The default gauges show these statistics:

- Process memory use
- CPU use
- Maximum process memory use

The controls in the Gauges title bar and in each gauge are the standard dashlet controls. Dashlets are the parts that make up a dashboard.

- In the Gauges title bar (from left to right), you can collapse/expand, delete a page, add a page, page backward, and page forward.
- In each gauge, you can edit properties ( ) and delete ( ) the gauge.

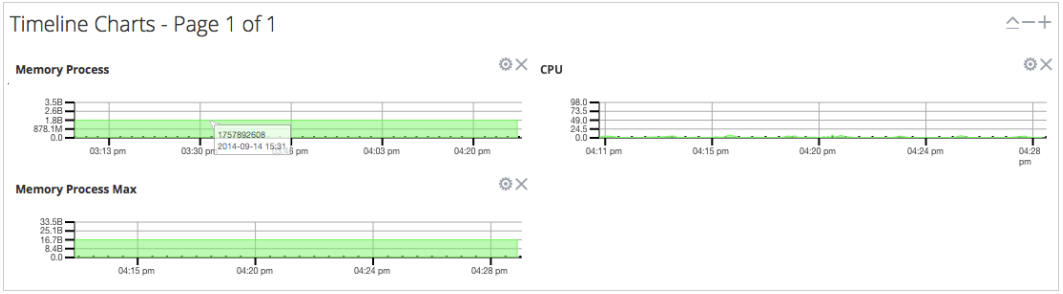
Services Stats View - Timeline Charts

The Services Stats view Timeline Charts sections display statistics in a running timeline. The Services Stats view includes two types of timelines: current time and historical. You can drag any statistic available in the Chart Stats Tray to the Timeline Charts section or Historical Timeline Charts section. Only statistics for session size, sessions, and packets are viewable in historical timeline charts. The properties of an individual timeline chart are editable; all timeline charts have an editable title and some have additional editable properties.

Workflow

What do you want to do?

User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services
Administrator	view statistics in the form of a current or historical timeline.*	See the *System Maintenance Guide*.



* You can perform these tasks in the current view.

Quick Look

The following figure is an example of a current timeline showing the value and timestamp of a data point.

The following figure is an example of a historical timeline chart.

The default current timeline charts show these statistics:

- Memory Process
- CPU
- Memory Process Max

The historical time charts show these statistics:

- Sessions
- Packets
- Session Size

The controls in the Timeline Charts title bar and in each timeline are the standard dashlet controls. The Historical Timeline Charts title bar and timelines have the same controls.

- In the Timeline Charts title bar (from left to right), you can collapse/expand, delete a page, add a page, page backward, and page forward.
- In each timeline, you can edit Properties ( ) and delete ( ) the timeline.
- Hovering over a data point in the chart, displays the value and timestamp for the selected point.

Services System View

This topic introduces features in the Services System view using Decoders (Network Decoder and Log Decoder) as an example. See the appropriate configuration guides for other services (for example, the *NetWitness Broker and Concentrator Configuration Guide*) for details on their respective **(Admin) > Services > System** views.

A Log Decoder is a special type of Decoder, and is configured and managed in a similar way to a Network Decoder. Therefore, most of the information in this section refers to both types of Decoders. Differences for Log Decoders are noted. For more information on Decoders, see the *Decoder Configuration Guide*.

Workflow

What do you want to do?

User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services
Administrator	view system and session information about a service.*	See the *System Maintenance Guide*.

Quick Look

The following figure shows an example of the Services System view for a Network Decoder.

The following figure shows the Services System view for a Log Decoder.

Services Info Toolbar

The following toolbars show the options specific to Log Decoders (top) and Network Decoders (bottom).

In addition to the common options in the Services System view toolbar, you can start and stop capture of packets or logs. The upload file options are different for the standard Network Decoder (packet capture file) and the Log Decoder (log file).

Action	Description
Upload Packet Capture File	Displays a dialog that provides a way to select a packet capture (`.pcap`) file for upload to the selected Network Decoder. For more information, see "Upload Packet Capture File" in the *Decoder Configuration Guide*. **Note:** This option does not apply to Log Decoders.
Upload Log File	Displays a dialog that provides a way to select a log (`.log`) file for upload to the selected Log Decoder. For more information, see "Upload Log File to a Log Decoder" in the *Decoder Configuration Guide*.
Start/Stop Capture	Starts packet capture on the selected Decoder. When packet capture is in progress, the option in the toolbar changes to Stop Capture, and the option to upload a file is unavailable.

Quick Look

The table below describes the Host Task List dialog features.

Field	Description
Task	An entry field in which you type or select a message for a Core host. When you click in this field a drop-down list of available host tasks is displayed.
Arguments	An entry field in which you enter the arguments, if any, for the message.
Run	Executes the task and arguments in the entry fields.
Info	Information about the message purpose and syntax.
Output	The output or result of an executed task.
Cancel	Closes the Host Task list dialog.

Host Task Selection List

These tasks are displayed as a drop-down list in the Task field. The available options are regulated by the security role required to execute the option.

Task	Description
Add Filesystem Monitor	Starts monitoring the storage services attached to the specified filesystem. See Add and Delete a Filesystem Monitor.

Task	Description
Delete Filesystem Monitor	Stops monitoring the storage services attached to the specified filesystem. See Add and Delete a Filesystem Monitor.
Reboot Host	Shuts down and restarts the host. See Reboot a Host.
Set Host Built-in Clock	Sets the local host clock. See Set Host Built-In Clock.
Set Host Hostname	This method of changing the hostname is deprecated in NetWitness 10.6. To edit a hostname, see Edit or Delete a Service.
Set Network Time Source	Sets the clock source for this host. See Set Network Time Source.
Set Syslog Forwarding	Enables or disables syslog forwarding from a remote server to the selected service. See Set Syslog Forwarding.
Show Network Port Status	Shows the network interface information for a host. See Show Network Port Status.
Show Serial Number	Gets the host serial number. See Show Serial Number.
Shut Down Host	Shuts down the physical host and the host remains off. See Shut Down Host.
Start Service	Starts a service on this host. See Stop and Start a Service on a Host.
Stop Service	Stops a service on this host. See Stop and Start a Service on a Host.
setSNMP	Enables or disables the SNMP service on a host. See Set SNMP.

Service Configuration Settings

This topic introduces the available service configuration settings for NetWitness Core services.

NetWitness Core services include Brokers, Concentrators, Network Decoders, Log Decoders, and Archivers. The service configuration parameters listed below constitute all viewable and configurable parameters. Some parameters are configurable in various parts of the NetWitness user interface while other parameters are viewable or configurable only on the Services Explore view.

Aggregation Configuration Parameters

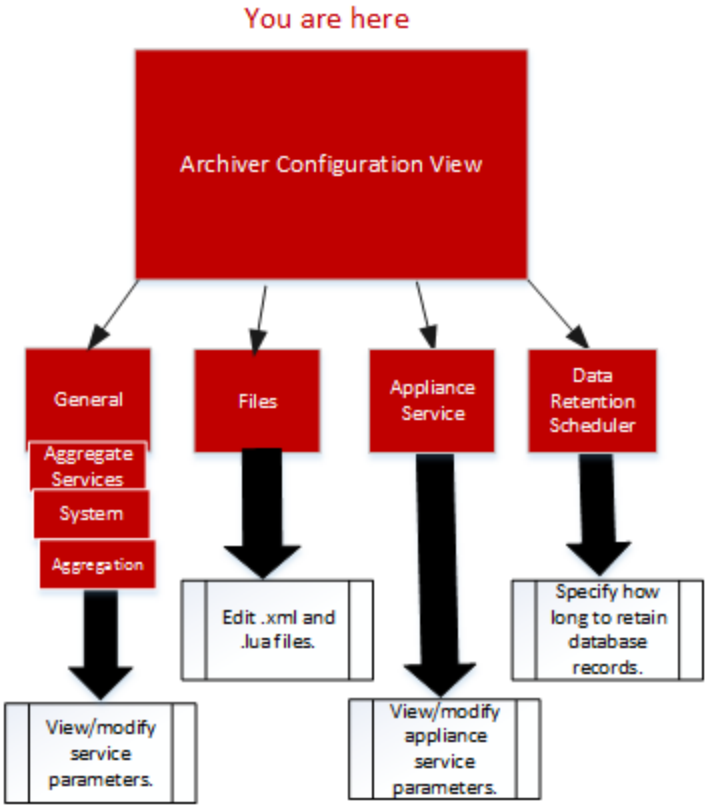
This table lists and describes the available configuration parameters that are common to services that perform aggregation, such as Concentrators and Archivers.

Configuration Path	/concentrator/config or /archiver/config
aggregate.autostart	Automatically restarts aggregation after a service restart, if enabled. Change takes effect immediately.
aggregate.buffer.size	Displays the size of the buffer (default unit is KB) used per round of aggregation. Larger buffers may improve aggregation performance but could impact query performance. Change takes effect after aggregation restart.
aggregate.crc	If enabled, all aggregation streams will be CRC validated. Change takes effect immediately.
aggregate.hours	Displays the maximum number of hours behind a service will be allowed to start aggregation. Change takes effect immediately.
aggregate.interval	Lists the minimum number of milliseconds before another round of aggregation is requested. Change takes effect immediately.
aggregate.meta.page.factor	Lists the allocated number meta pages per session used for aggregation. Change takes effect on service restart.
aggregate.meta.perpage	Lists the allocated number of meta stored on one page of data. Change takes effect on service restart.
aggregate.precache	Determines if the concentrator will precache the next round of aggregation for upstream services. Can improve aggregation performance but could impact query performance. Change takes effect immediately.
aggregate.sessions.max	Lists the number of sessions to aggregate on each round. Change takes effect after aggregation restart.
aggregate.sessions.perpage	Lists the number of sessions stored on one page of data. Change takes effect on service restart.

Configuration Path	/concentrator/config or /archiver/config
aggregate.time.window	Displays the maximum +/- time window, in seconds, that all services must be inside before another round of aggregation is requested. Zero turns off time window. Change takes effect immediately.
consume.mode	Determines if the concentrator can only aggregate locally or over a network, based on licensing restrictions. Change takes effect on service restart.
export.enabled	Allows export of session data, if enabled. Change takes effect on service restart.
export.expire.minutes	Lists the number of minutes before export cache files are expired and flushed. Change takes effect immediately.
export.format	Determines the file format used during data export. Change takes effect on service restart.
export.local.path	Displays the local location to cache exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.meta.fields	Determines which meta fields are exported. Comma-separated list of fields. * means all fields. * and field list means all fields except the listed fields. Just the field list means only those fields are included. Change takes effect immediately.
export.remote.path	Displays the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.rollup	Determines the rollup interval for export files. Change takes effect on service restart.
export.session.max	Displays the maximum sessions per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.size.max	Displays the maximum bytes per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.usage.max	Displays the maximum percentage of cache space used before stopping aggregation. Zero is no limit. Change takes effect immediately.
heartbeat.error	Lists the number of seconds to wait after a service error before attempting a service reconnect. Change takes effect immediately.
heartbeat.interval	Lists the number of milliseconds between heartbeat service checks. Change takes effect immediately.

Configuration Path	/concentrator/config or /archiver/config
heartbeat.next.attempt	Lists the number of seconds to wait before attempting a service reconnect. Change takes effect immediately.
heartbeat.no.response	Lists the number of seconds to wait before taking unresponsive service offline. Change takes effect immediately.

Appliance Service Configuration Parameters



The NetWitness Core Appliance service provides hardware monitoring on legacy NetWitness hardware. The list describes the Appliance Configuration parameters.

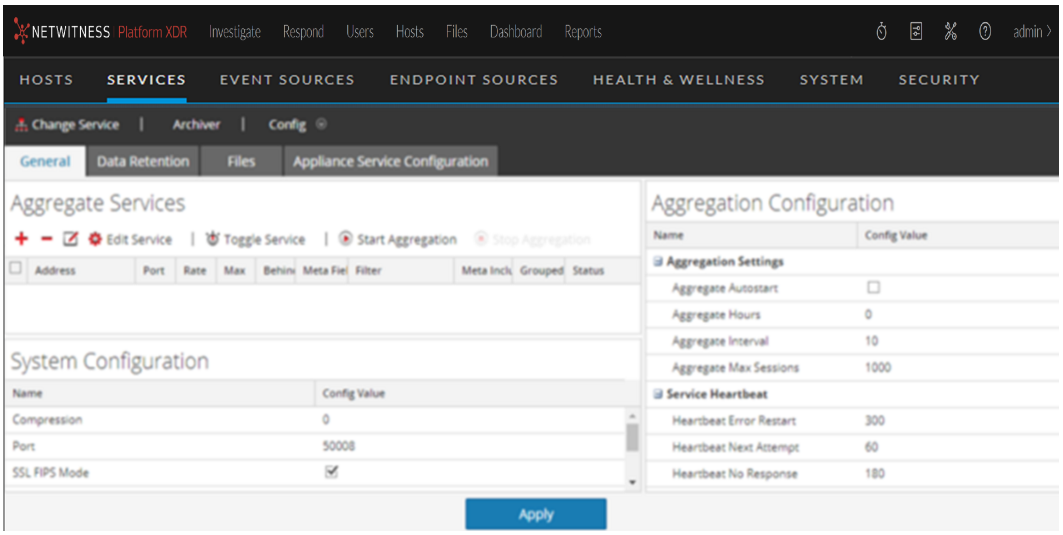
Appliance Parameter Field	Description
Logs	/logs/config refer to Core Service Logging Configuration Parameters
REST	/rest/config refer to REST Interface Configuration Parameters
Services	/services/<service name>/config refer to Core Service-to-Service Configuration Parameters
System	/sys/config refer to Core Service System Configuration Parameters

Archiver Service Configuration View

This topic lists and describes the available configuration settings for NetWitness Archivers.

Workflow

Role	I want to ...
Administrator	Configure Meta Filters for Aggregation. Refer to "(Optional) Configure Meta Filters for Aggregation" in the *NetWitness Archiver Configuration Guide* for instructions.
Administrator	Configure Group Aggregation. Refer to "Configure Group Aggregation" in the *NetWitness Deployment Guide* for instructions.



Quick Look

To access the Services Config view:

1. In **NetWitness**, select  **(Admin) > Services**.
   The Admin Services view is displayed.

2. Select an Archiver service and select  **>View > Config**.
   Services Config view for the Archiver service is displayed.

This is an example of the Services Config view for an Archiver.

Broker Service Configuration Parameters

The following list describes the Broker configuration parameters.

Broker Parameter Field	Description
Broker	`/broker/config` refer to Aggregation Configuration Parameters
`aggregate.interval.behind`	Minimum number of milliseconds before another round of aggregation is requested when the broker is behind. Change takes effect immediately.
Database	`/database/config` refer to "Database Configuration Nodes" in the *NetWitness Core Services Database Tuning Guide*.
Index	`/index/config`
`index.dir`	The directory where the broker device mapping files are stored. Change takes effect on service restart.
`language.filename`	The index language specification (XML) that is loaded on startup. Change requires service restart.
Logs	`/logs/config` refer to Core Service Logging Configuration Parameters
REST	`/rest/config` refer to REST Interface Configuration Parameters
SDK	`/sdk/config` refer to "SDK Configuration Nodes" in the *NetWitness Core Services Database Tuning Guide* and NetWitness Platform Core Service system.roles Modes
Services	`/services/<service name>/config` refer to Core Service-to-Service Configuration Parameters

Broker Parameter Field	Description
System	`/sys/config` refer to Core Service System Configuration Parameters

Concentrator Service Configuration Parameters

The following list describes the Concentrator configuration parameters.

Concentrator Parameter Field	Description
Concentrator	`/concentrator/config` refer to Aggregation Configuration Parameters
Database	`/database/config` refer to "Database Configuration Nodes" in the *NetWitness Core Database Tuning Guide*.
Index	`/index/config` refer to "Index Configuration Nodes" in the *NetWitness Core Database Tuning Guide*.
Logs	`/logs/config` refer to Core Service Logging Configuration Parameters
REST	`/rest/config` refer to REST Interface Configuration Parameters
SDK	`/sdk/config` refer to "SDK Configuration Nodes" in the *NetWitness Core Database Tuning Guide*and NetWitness Platform Core Service system.roles Modes
Services	`/services/<service name>/config` refer to Core Service-to-Service Configuration Parameters
System	`/sys/config` refer to Core Service System Configuration Parameters

Core Service Logging Configuration Parameters

The following table describes the logging configuration parameters for all NetWitness Core services. Logging configuration is the same for all Core services.

Logs Configuration Folder	/logs/config
`log.dir`	Displays the directory where the log database is stored. Optional assigned max size (=#) is in MBs. Change takes effect on service restart.
`log.levels`	Controls what types of log messages are stored (comma separated). Module specific settings are defined like this: `<Module>=[debug|info|audit|warning|failure|all|none]`. Change takes effect immediately.

Logs Configuration Folder	/logs/config
log.snmp.agent	Sets a remote SNMP Trap Receiving agent.
snmp.trap.version	Sets the SNMP version (2c or 3) to be used for gets and traps.
snmpv3.engine.boots	Displays the SNMPv3 engine boots count. This field auto-increments on startup and should not normally need to be set by the user.
snmpv3.engine.id	Sets the SNMPv3 engine ID, which is 10-64 hexadecimal digit number optionally preceded by 0x. You can add suffix values at the end of the engine ID for each of the SA Core services running on the same host. For example, if the generated Engine ID for the SA Core host is 0x1234512345, you can set the Engine ID for the Decoder service as 0x123451234501 and set 0x123451234504 for the Appliance service.
snmpv3.trap.auth.local.key	Sets the SNMPv3 Trap Authentication Local Key, which is a 16 or 20 hexadecimal digit number (depending on which authentication protocol is used) preceded by 0x. For MD5, the key is 16 hexadecimal digits, while SHA uses 20 hexadecimal digits. You can use any desired algorithm to generate the local keys. It is recommended that a generation method involving randomness be used as opposed to selecting key values manually.
snmpv3.trap.auth.protocol	Displays the SNMPv3 Trap Authentication Protocol (none, MD5 or SHA).
snmpv3.trap.priv.local.key	Sets the SNMPv3 Trap Privacy Local Key, which is a 16 hexadecimal digit number preceded by 0x.
snmpv3.trap.priv.protocol	Displays the SNMPv3 Trap Privacy Protocol (none or AES).
snmpv3.trap.security.level	Displays the SNMPv3 Trap Security Level, which indicates whether authentication and privacy are used or not. Possible values are noAuthNoPriv, authNoPriv, or authPriv.
snmpv3.trap.security.name	Sets the SNMPv3 Trap Security Name used during SNMPv3 trap authentication.
syslog.size.max	Displays the maximum size of a log sent to syslog (some syslog daemons have issues with very large messages). Zero means no limit. Change takes effect immediately.

Core Service-to-Service Configuration Parameters

This topic lists and describes the configuration parameters that control how a Core service connects to another Core service. For example, when a Concentrator connects to a Network Decoder, the connection parameters are controlled by these settings.

Whenever a Core service establishes a connection to another Core service, the service that acts as the **client** creates a new sub-folder in the `/services` folder of the configuration tree. The name of the sub-folder corresponds to the name of the service and has the form `host:port`. For example, the service connection folder for a Concentrator connection to a Network Decoder could be `/services/reston-va-decoder:50004`. Inside each service connection folder, there is a `config` sub-folder that holds configurable parameters.

The following list describes the Service Configuration parameters:

Services	/services/host:port/config
allow.nonssl.to.ssl	Allows a non-SSL connection to connect to a SSL service, when set to true. Otherwise, if `false`, non-secure to secure connections will be denied. Change takes effect immediately.
compression	Displays a config node that determines if data is compressed before sending. A positive value determines the number of bytes that need to be sent before it will be compressed. Zero means no compression.
crc.checksum	Displays a config node that determines if data streams are validated with a CRC checksum. A positive value determines the number of bytes that need to be sent before it will be CRC validated. Zero means no CRC validation.
ssl	Displays a config node that enables or disables SSL encryption on the connection.

Core Service System Configuration Parameters

The following list describes the System configuration parameters that are common to all NetWitness Core services.

System Configuration Folder	/sys/config
compression	Displays the minimum amount of bytes before a message is compressed, when set to a positive value. Zero means no compression for any message. Change takes effect on subsequent connections.
crc.checksum	Displays the minimum bytes before a message is sent over the network with a CRC checksum (to be validated by the client), when set to a positive value. Zero means no CRC checksum validation with any message. Change takes effect on subsequent connections.
drives	Displays drives to monitor for usage stats. Change takes effect on service restart.
port	Displays the port this service will listen on. Change takes effect on service restart.
scheduler	Displays the folder for scheduled tasks.

System Configuration Folder	/sys/config
service.name.override	Displays an optional service name used by upstream services for aggregation in lieu of hostname.
ssl	Encrypts all traffic using SSL, if enabled. Change takes effect on service restart.
stat.compression	Compresses stats as they are written to the database, if enabled. Change takes effect on service restart.
stat.dir	Displays the directory where the historical stats database is stored (separate multiple dirs with semicolon). Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
stat.exclude	Lists stat pathnames to be excluded from the stat database. The following wildcards are permitted: ? match any single character * match zero or more characters to delimiter / ** match zero or more characters including delimiter. Change takes effect immediately.
stat.interval	Determines how often (in milliseconds) statistic nodes are updated in the system. Change takes effect immediately.
threads	Lists the number of threads in the thread pool to handle incoming requests. Change takes effect immediately.

Decoder Configuration Parameters

The following list describes the configuration parameters that are identical on both Network Decoder and Log Decoder services.

Configuration Path	<service>/config
aggregate.buffer.size	Displays the size of the buffer (default unit is KB) used per round of aggregation. Larger buffers may improve aggregation performance but could impact capture performance. Change takes effect after capture restart.
aggregate.precache	Determines if the decoder will pre-cache the next round of aggregation for upstream services. Can improve aggregation performance but could impact capture performance. Change takes effect immediately.
assembler.pool.ratio	Displays the percentage of pool pages that assembler manages and uses for the assembly process. Change takes effect on service restart.

Configuration Path	<service>/config
assembler.session.flush	Flushes sessions either when they are complete, or when they are parsed. Change takes effect on service restart.
assembler.session.pool	Lists the number of entries in the session pool. Change takes effect on service restart.
assembler.size.max	Lists the maximum size that a session will obtain. A setting of 0 removes the session size limit. Change takes effect immediately.
assembler.size.min	Lists the minimum size that a session must be before persisting. Change takes effect immediately.
assembler.timeout.packet	Lists the number of seconds before packets are timed out. Change takes effect immediately.
assembler.timeout.session	Lists the number of seconds before sessions are timed out. Change takes effect immediately.
assembler.voting.weights	Displays the weights used to determine which session stream is marked client and server. Change takes effect immediately.
capture.autostart	Determines if capture begins automatically when the service starts. Change takes effect on service restart.
capture.buffer.size	Displays capture memory buffer allocation size (default unit is MB). Change takes effect on service restart.
capture.device.params	Displays capture service specific parameters. Change takes effect on service restart. The parameters understood by this field are specific to the currently selected capture device. If any of the parameters are not recognized by the current capture device, they are ignored. On Log Decoders, there is only the Log Events capture device. It accepts some optional parameters. • use-envision-time: If this is set to 1, the time metadata for each event will be imported from the Log Collector stream. If this is 0 or not set, the imported event time will be stored in the event.time meta. • port: This parameter can be set to a numeric value to override the default syslog port listener, 514.
capture.selected	Displays current capture service and interface. Change takes effect immediately.
export.expire.minutes	Lists the number of minutes before export cache files are expired and flushed. Change takes effect immediately.
export.packet.enabled	Allows export of packet data, if enabled. Change takes effect on service restart.

Configuration Path	<service>/config
export.packet.local.path	Displays the local location to cache packet exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.packet.max	Displays the maximum packets per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.packet.remote.path	Lists the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.packet.size.max	Displays the packet maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.rollup	Determines the rollup interval for export files. Change takes effect on service restart.
export.session.enabled	Allows export of session data, if enabled. Change takes effect on service restart.
export.session.format	Determines the file format used during session export. Change takes effect on service restart.
export.session.local.path	Displays the local location to cache session exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.session.max	Displays the maximum sessions per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.session.meta.fields	Determines which meta fields are exported. Comma-separated list of fields. * means all fields. * plus field list means all fields BUT listed fields. Just field list means only those fields are included. Change takes effect immediately.
export.session.remote.path	Displays the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.session.size.max	Lists the session maximum bytes per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.usage.max	Lists the session maximum bytes per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
parse.threads	Lists the number of parse threads to use for session parsing. Zero means let server decide. Change takes effect on service restart.

Configuration Path	<service>/config
pool.packet.page.size	Displays the size of a packet page (default is KB). Change takes effect on service restart.
pool.packet.pages	Lists the number of packet pages decoder will allocate and use. Change takes effect on service restart.
pool.session.page.size	Displays the size of a session page (default is KB). Change takes effect on service restart.
pool.session.pages	Lists the number of session pages decoder will allocate and use. Change takes effect on service restart.

Network Decoder Service Configuration Parameters

This topic lists and describes the available configuration parameters for NetWitness Network Decoders.

Decoder Parameter Field	Description
Decoder	/decoder/config refer to Decoder Configuration Parameters.
Database	/database/config refer to "Database Configuration Nodes" in the *NetWitness Core Database Tuning Guide*.
Index	/index/config refer to "Index Configuration Nodes" in the *NetWitness Core Database Tuning Guide*.
Logs	/logs/config refer to Core Service Logging Configuration Parameters.
REST	/rest/config refer to REST Interface Configuration Parameters.
SDK	/sdk/config refer to "SDK Configuration Nodes" in the *NetWitness Core Database Tuning Guide* and NetWitness Platform Core Service system.roles Modes.
System	/sys/config refer to Core Service System Configuration Parameters.

Log Decoder Service Configuration Parameters

This topic lists and describes the available configuration parameters for Log Decoder configuration settings.

Log Decoder Setting Field	Description
Database	/database/config refer to "Database Configuration Nodes" in the *NetWitness Core Database Tuning Guide*.

Log Decoder Setting Field	Description
Decoder	`/decoder/config` refer to Decoder Configuration Parameters.
Index	`/index/config` refer to "Index Configuration Nodes" in the *NetWitness Core Database Tuning Guide.*
Logs	`/logs/config` refer to Core Service Logging Configuration Parameters.
REST	`/rest/config` refer to REST Interface Configuration Parameters.
SDK	`/sdk/config` refer to "SDK Configuration Nodes" in the *NetWitness Core Database Tuning Guide*and NetWitness Platform Core Service system.roles Modes.
System	`/sys/config` refer to Core Service System Configuration Parameters.

Log Tokenizer Configuration Settings

The Log Decoder has a set of configuration items that control how the automatic log tokenizer creates meta items from unparsed logs. The log tokenizer is implemented as a set of built-in parsers that each scan for a subset of recognizable tokens. The functionality of each of these native parsers is shown in the table below. These word items form a full-text index when they are fed to the indexing engine on the Concentrator and Archiver. By manipulating the parsers.disabled configuration entry, you can control which Log Tokenizers are enabled.

Parser Name	Description	Configuration Parameters
Log Tokens	Scans for runs of consecutive characters to produce 'word' meta items.	`token.device.types`, `token.char.classes`, `token.max.length`, `token.min.length`, `token.unicode`
IPSCAN	Scans for text that appears to be an IPv4 address to produce `ip.addr` meta items.	`token.device.types`
IPV6SCAN	Scans for text that appears to be an IPv6 address to produce `ipv6` meta items.	`token.device.types`
URLSCAN	Scans for text that appears to be a URL to produce `alias.host`, `filename`, `username`, and `password` meta items.	`token.device.types`
DOMAINSCAN	Scans for text that appears to be a domain name to produce `alias.host`, `tld`, `cctld`, and `sld` meta items.	`token.device.types`

Parser Name	Description	Configuration Parameters
EMAILSCAN	Scans for text that appears to be an email address to produce `email` and `username` meta items.	`token.device.types`
SYSLOGTIMESTAMPSCAN	Scans for text that appears to be syslog-format timestamps. Syslog is missing the year and time zone. When such text is located, it is normalized into UTC time to create `event.time` meta items.	`token.device.types`
INTERNETTIMESTAMPSCAN	Scans for text that appears to be RFC 3339-format timestamps to create `event.time` meta items.	`token.device.types`

Log Tokenizer Configuration Parameters.

Log Decoder Parser Setting Field	Description
`token.device.types`	The set of device types that will be scanned for raw text tokens. By default, this is set to `unknown`, which means only logs that were not parsed will be scanned for raw text. You can add additional log types here to enrich parsed logs with text token information. If this field is empty, then log tokenization is disabled.
`token.char.classes`	This field controls the type of tokens that are generated. It can be any combination of the values `alpha`, `digit`, `space`, and `punct`. The default value is `alpha`. • `alpha`: Tokens may contain alphabetic characters • `digit`: Tokens may contain numbers • `space`: Tokens may contain spaces and tabs • `punct`: Tokens may contain punctuation marks
`token.max.length`	This field puts a limit on the length of the tokens. The default value is **5** characters. The maximum length setting allows the Log Decoder to limit the space needed to store the word metadata. Using longer tokens requires more meta database space, but may provide slightly faster raw text searches. Using shorter tokens causes the text query resolver to have to perform more reads from the raw logs during searches, but it has the effect of using much less space in the metadb and index.
`token.min.length`	This is the minimum length of a searchable text token. The minimum token length will correspond to the minimum number of characters a user may type into the search box in order to locate results. The recommended value is the default, **3**.

Log Decoder Parser Setting Field	Description
token.unicode	This boolean setting controls whether unicode classification rules are applied when classifying characters according to the token.char.classes setting. When this is set to true, each log is treated as a sequence of UTF-8 encoded code points and then classification is performed after the UTF-8 decoding is performed. When this is set to false, each log is treated as ASCII characters and only ASCII character classification is done. Unicode character classification requires more CPU resources on the Log Decoder. If you do not need non-English text indexing, you can disable this setting to reduce CPU utilization on the Log Decoder. The default is enabled.

REST Interface Configuration Parameters

The following list describes the available configuration parameters for the REST interface built in to all NetWitness Core Services.

REST Configuration Path	/rest/config
cache.dir	Displays the host directory to use for temporarily creating and storing files. Change takes effect on service restart.
cache.size	Displays the total maximum size (default unit is MB) of all files in the cache directory before the oldest are deleted. Change takes effect on service restart.
enabled	Switches to enable or disable REST services, **1** is on, **0** is off. Change takes effect on service restart.
port	Displays the port the REST service will listen on. Change takes effect on service restart.
ssl	Encrypts all REST traffic using SSL, if enabled. The default system means use setting from /sys/config/ssl. Change takes effect on service restart.

NetWitness Platform Core Service system.roles Modes

All NetWitness Platform Core services offer role-based authorization modes. This topic describes the modes that are available, and how they are configured within every service.

The configuration node /sdk/config/system.roles sets querying and viewing permissions for metadata and content on a per key basis. This parameter supports the data privacy management function and when enabled using one of the non-zero values helps a data privacy officer to control access to specific meta keys and content. This parameter is configurable in the NetWitness Platform user interface (see "Data Privacy Tab" in the *Data Privacy Management Guide* for details). When the value is edited, change takes effect immediately.

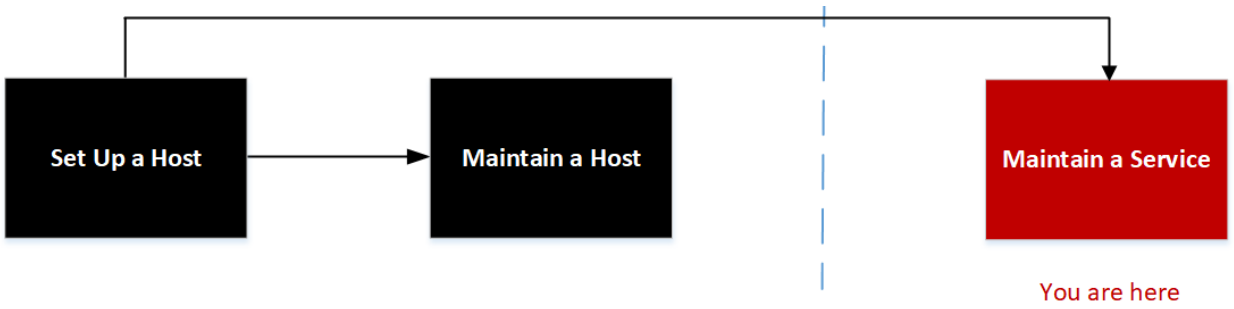
Zero means that service permissions based on SDK meta keys are disabled.

- 0 - disabled

When one of the non-zero values is specified, the data privacy officer can select a meta key to whitelist or blacklist the display of the associated metadata, content, or both, for a specific user role on a service.

- 1 - whitelist meta and content filtered
- 2 - whitelist meta filtered
- 3 - whitelist content filtered
- 4 - blacklist meta and content filtered
- 5 - blacklist meta filtered
- 6 - blacklist content filtered

Centralized Service Configuration via Policy Settings



This topic introduces the available centralized service configuration settings for Concentrators, Decoders and Log Decoders services.

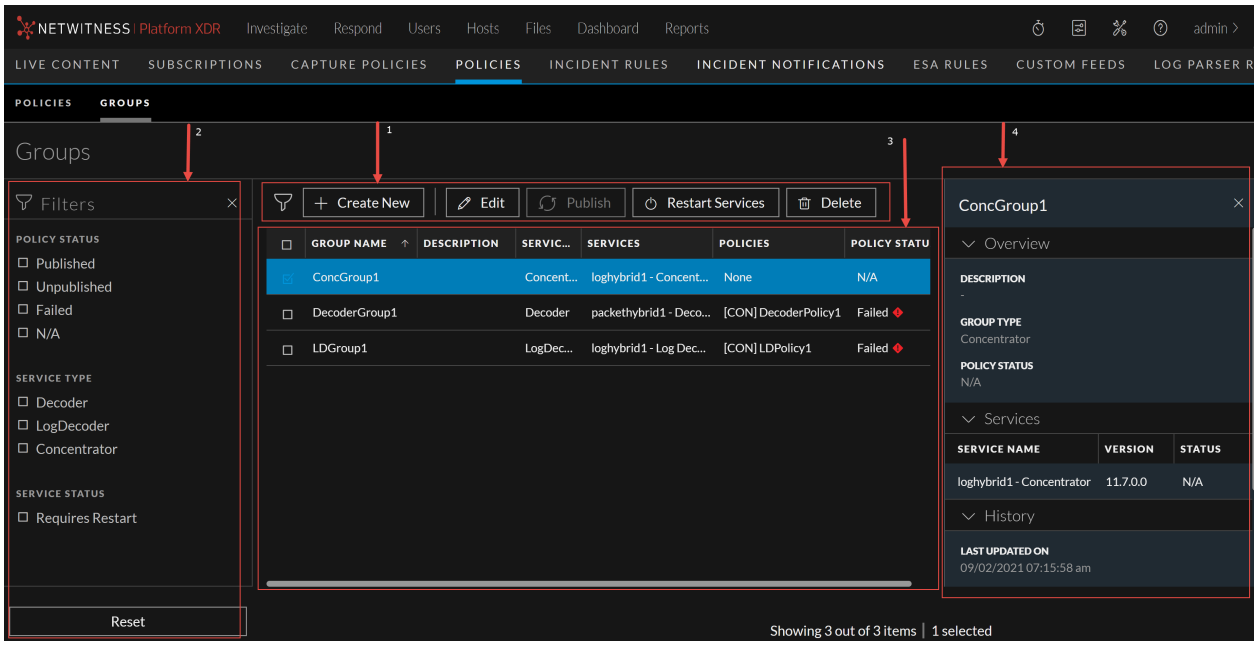
Centralized Service Configuration – Groups Tab

Note: The information in this topic applies to NetWitness Platform Version 11.7 and Later.

The  (**Configure**) > **Policies** view contains two tabs: **Groups** and **Policies**.

Workflow

What do you want to do?



User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services
Administrator	Centrally Create and Maintain Service Groups.*	Hosts and Services Maintenance Procedures

* You can perform these tasks in the current view.

Related Topics:

- Hosts and Services Set Up Procedures
- Hosts and Services Maintenance Procedures

Quick Look

Below is an example of the **Groups** tab:

The following table describes the Groups tab.

1	**Toolbar**
	• **Create New**- Lets you create a new group. For more information, see "Create a Group" in the Centralized Service Configuration via Policy.
	• **Edit** – Lets you edit the group. For more information, see "Managing Policies and Groups" in the Centralized Service Configuration via Policy.
	• **Publish** – Publishes selected groups.
	• **Restart Services** – Restarts the service associated with the selected group. This option is disable if:
	  ◦ There are no services in the group.
	  ◦ No service restart is required.
	• **Delete**- Deletes the selected groups.

2 **Filter Pane**

- **Filters**: You can filter groups based on Policy Type and Policy Status, Service Type and Service Status.

  To hide, click the  icon at the top-right of the panel. To display if hidden, click the  icon in the toolbar.

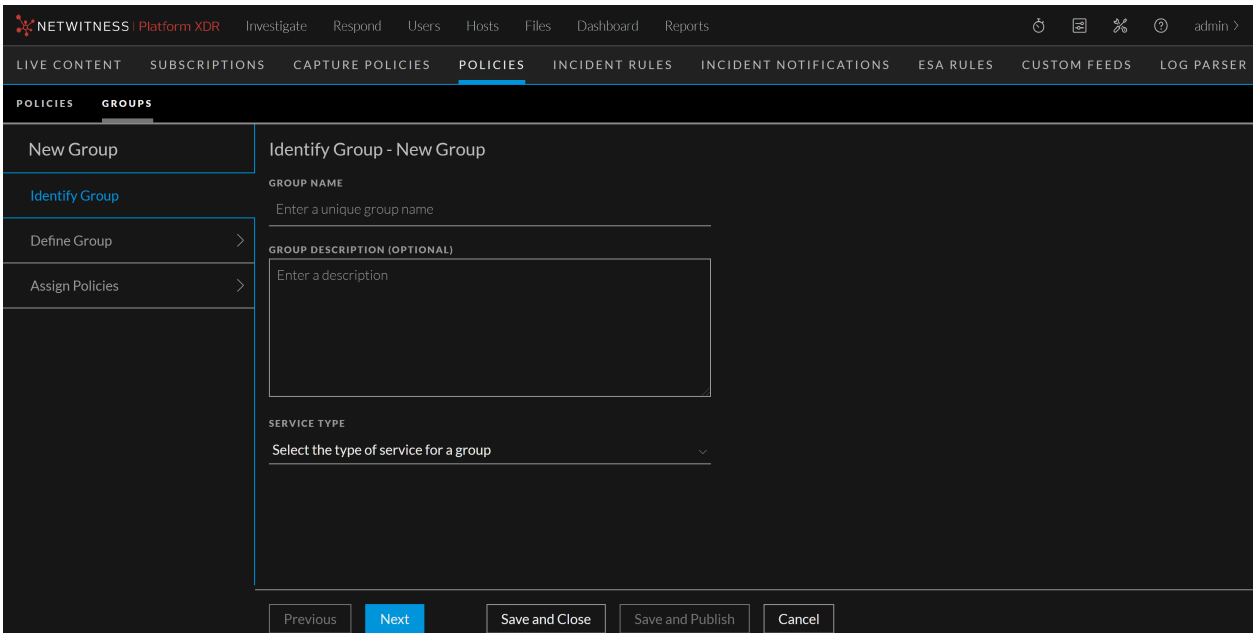
- **Reset**: Removes the currently applied filter criteria.

For more information, see "Filter Groups" in the Centralized Service Configuration via Policy.

3 **Group List Pane**

- **Group Name** – Name of the group.
- **Description** – Description of the group.
- **Service Type** – Displays the service type to which the group is applied.
- **Services** – Displays the service to the which the group is applied.
- **Policies** – Displays the policy to which the group is applied.
- **Policy Status** – Status of the policy. The values are: Published, Unpublished, Failed, N/A.

You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.



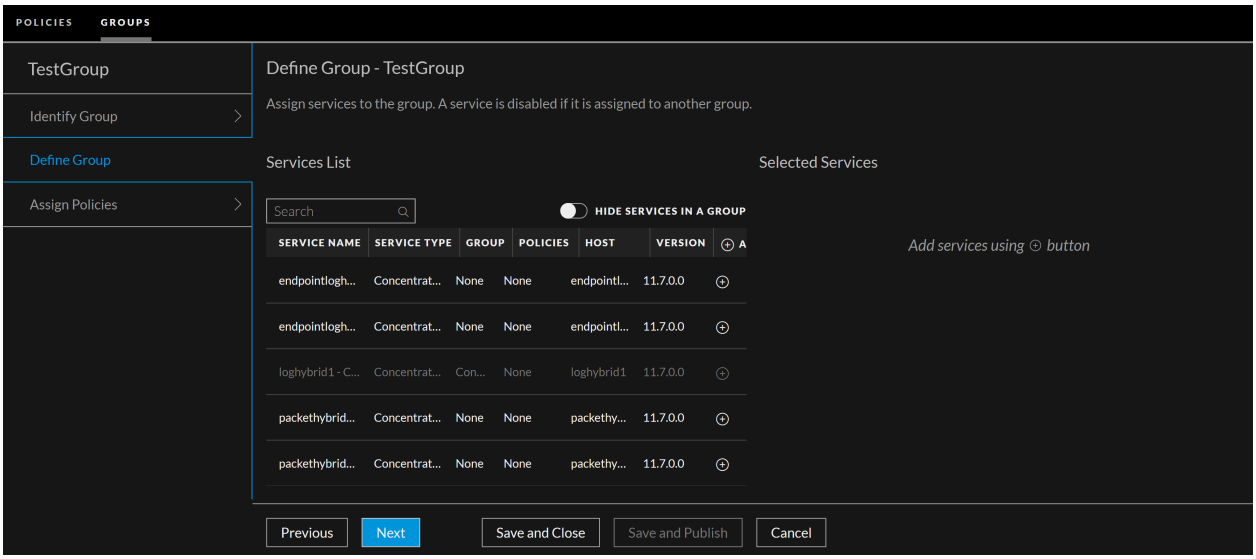
4 **Groups Details Panel**

Displays the properties of the selected group.

Note: Click the row to view the Properties panel for a group.

Create Group Dialog

Below is an example of the Create Group dialog.

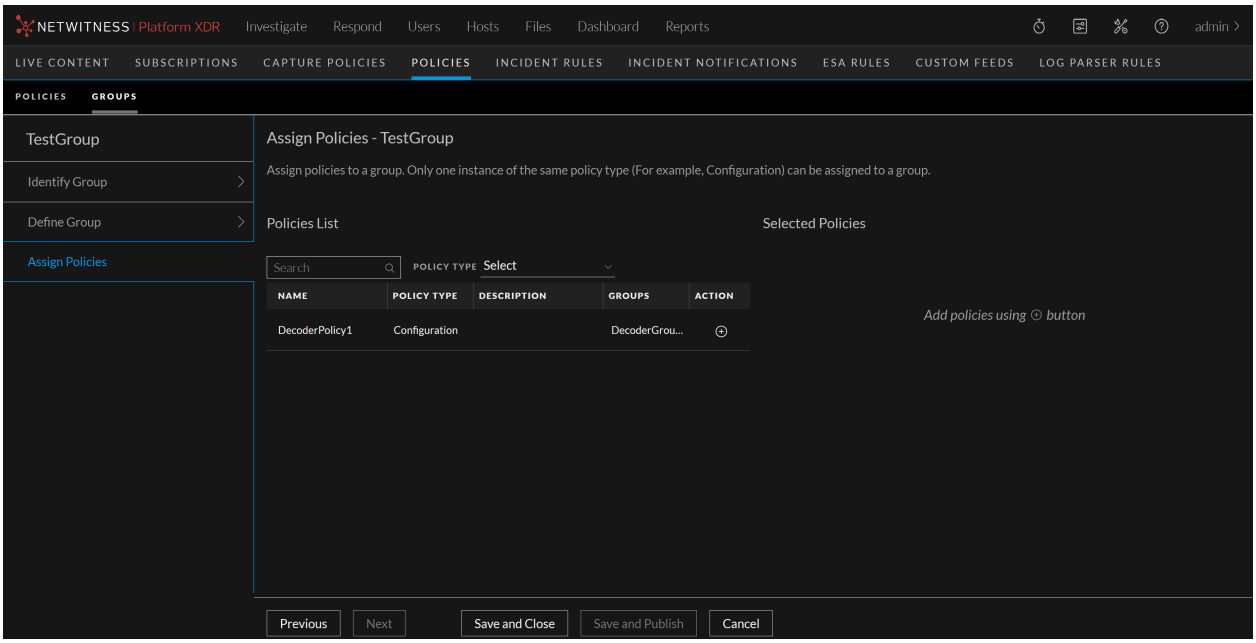


The table describes the information and options in the Create Group dialog.

Field	Description
Group Name	Name of the group. The name should be unique.
Group Description (Optional)	Description of the group. Description should not exceed 8000 characters.
Service Type	Select the type of service for a group. Available options are Log Decoder, Decoder, and Concentrator.
Save and Close	Saves the settings and closes the Create Group dialog.

Define Group Dialog

Below is an example of the define group dialog.



The table describes the information and options in the Define Group dialog.

Field	Description
Service List	Displays the list of services associated with the selected service type. The following describes services list: • **Service name** – Name of the service. • **Service type** – Displays the service type of the service. • **Group** – Name of the group. • **Policies** – Displays the policies associated with the service. • **Host** – Host name of the service. • **Version** – Service version. • **All** – Lets you to add services to the group. You can either click  to add all services or click  to add specific service.

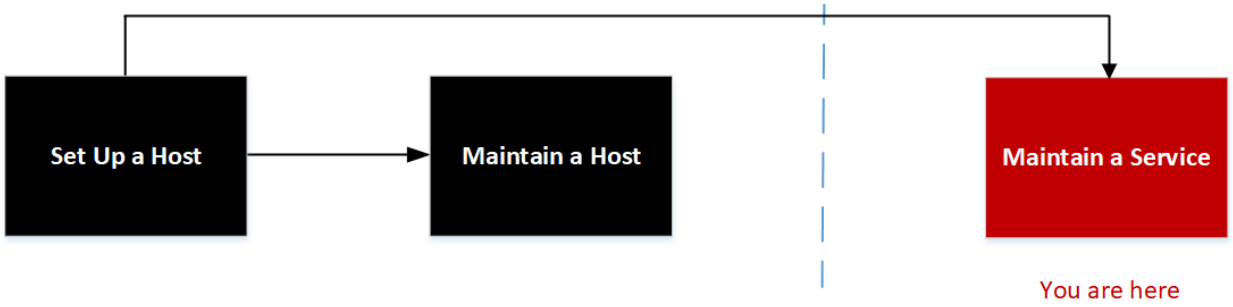
Field	Description
Hide Services in a Group	Displays the services that is not assigned to any group. By default, this option is disabled.
Selected Services	Displays the list of selected services for the group.
Save and Close	Saves the setting and closes the Define Group dialog.
Save and Publish	Saves and publishes the created group. **Note:** This option is disabled if you have not: - Assigned services - Assigned policies

Assign Policy Dailog

Below is an example of Assign Policy dialog.

The following table describes assign policy dialog:

Field	Description
Policies List	Displays the list of policies associated with the group. The following describes policies list: • **Name** – Name of the policy. • **Policy Type** – Displays the policy type. • **Description** – Description of the policy. • **Groups** – Groups associated with the policy. • **Action** - Click  to add policies to the group.
Policy Type	Select the policy type from the drop-down list.
Selected Policies	Displays the list of selected policies for the group.
Save and Close	Saves the settings and closes the Create Group dialog.



Field	Description
Save and Publish	Saves and publishes the created group. **Note:** This option is disabled if you have not: - Assigned services. - Assigned policies.

Centralized Service Configuration – Policies Tab

Note: The information in this topic applies to NetWitness Platform Version 11.7 and Later.

The  (**Configure**) > **Policies** view contains two tabs: **Groups** and **Policies**.

Workflow

User Role	I want to...	Documentation
Administrator	Centrally Create and Maintain Service Policy.*	Hosts and Services Maintenance Procedures

* You can perform these tasks in the current view.

Quick Look

Below is an example of the **Policies** tab:

1 **Toolbar**

- **Create New**- Lets you create a new policy. For more information, see "Create a Policy" in the Centralized Service Configuration via Policy.
- **Edit** – Lets you edit the policy. For more information, see "Managing Policies and Groups" in the Centralized Service Configuration via Policy.
- **Publish** – Publishes the selected policy or policies.
- **More Actions**
  - **Assign to Group** -Lets you assign policy to a group.
  - **Clone** – Lets you clone a policy.
  - **Revert** – Lets you revert to previous policy settings. By default, the revert value is set to 5. You can customize the revert value in Explorer view.
  - **Delete** - Deletes the selected policy or policies permanently.

2 **Filter Pane**

- **Filters**: You can filter policies based on Policy Type and Policy Status and Service Type.

  To hide, click the  icon at the top-right of the panel. To display if hidden, click the  icon in the toolbar.

- **Reset**: Removes the currently applied filter criteria.

For more information, see "Filter Policies" in the Centralized Service Configuration via Policy.

3 **Policy List Pane**
Name – Name of the policy.

• **Description** – Description of the policy.

• **Category** – Type of policies applied.

• **Service Type** – Displays the service type to which the policy is applied.

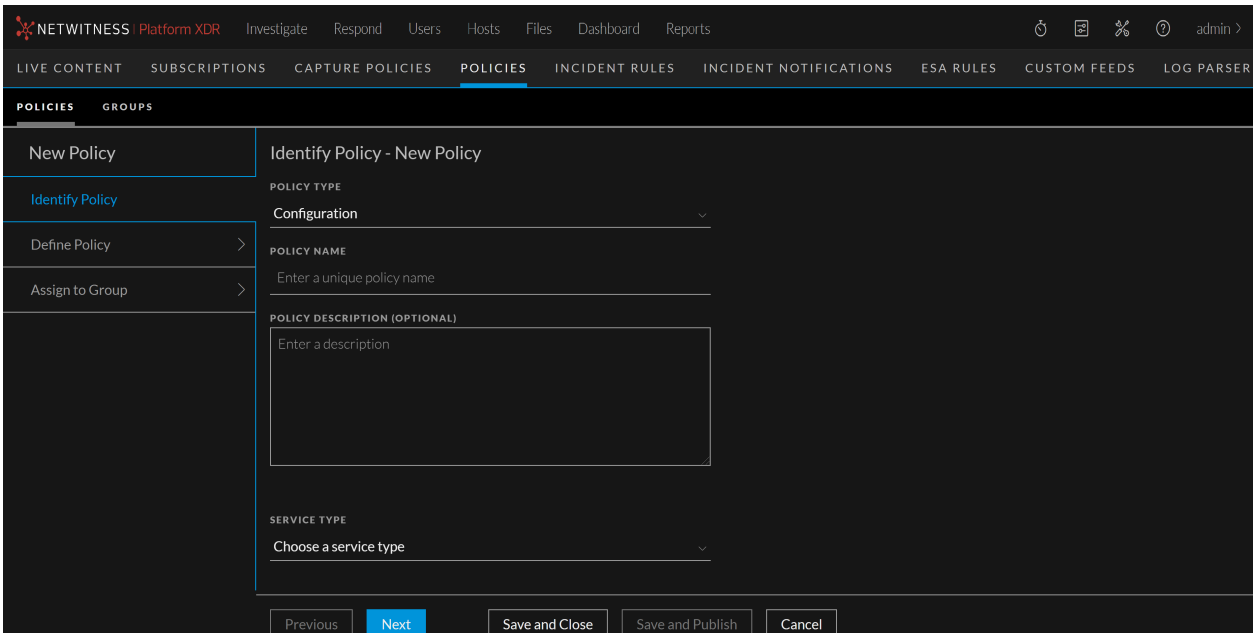
• **Groups** - Lists the group to which this policy is applied.

• **Policy Status** – Status of the policy. The values are: Published, Unpublished, Failed, N/A.

• **Last Updated** – Displays the time when the policy is updated.

• **Updated By** – The user who updated the policy.

You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.



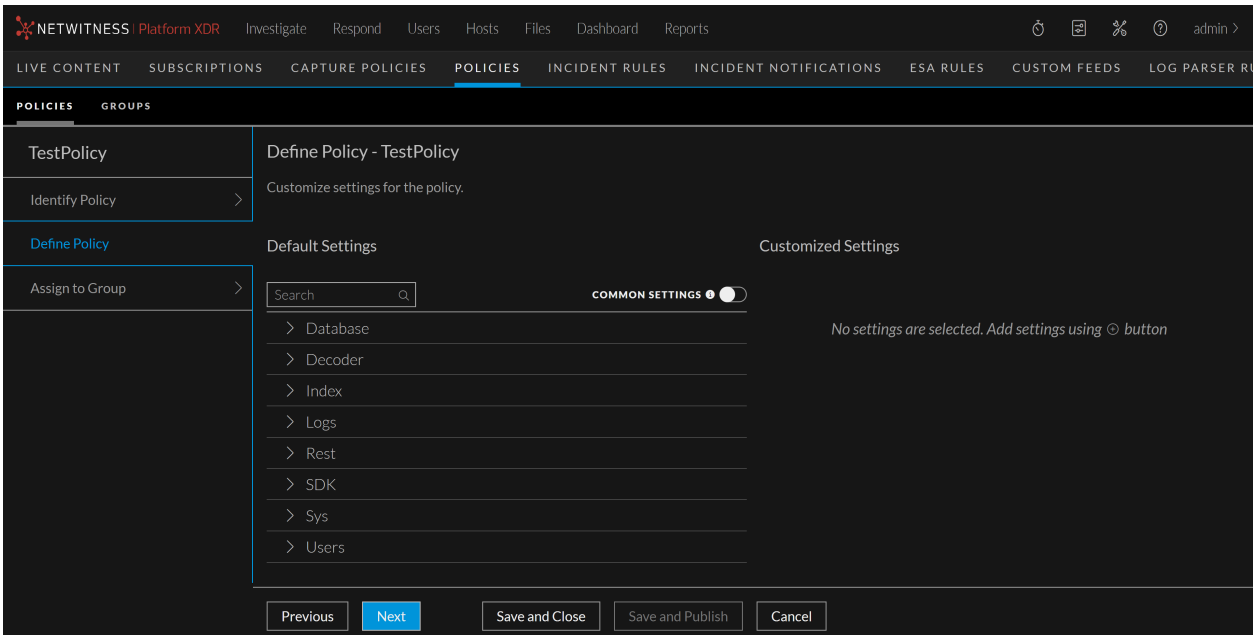
4 **Policy Details Pane**

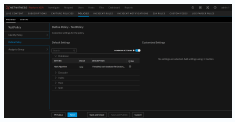
Displays the properties of the selected policy.

Note: Click the row to view the Properties panel for a policy.

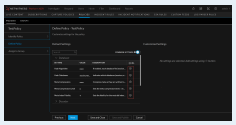
Create Policy

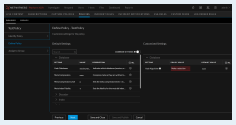
Below is an example of the Create Policy dialog.





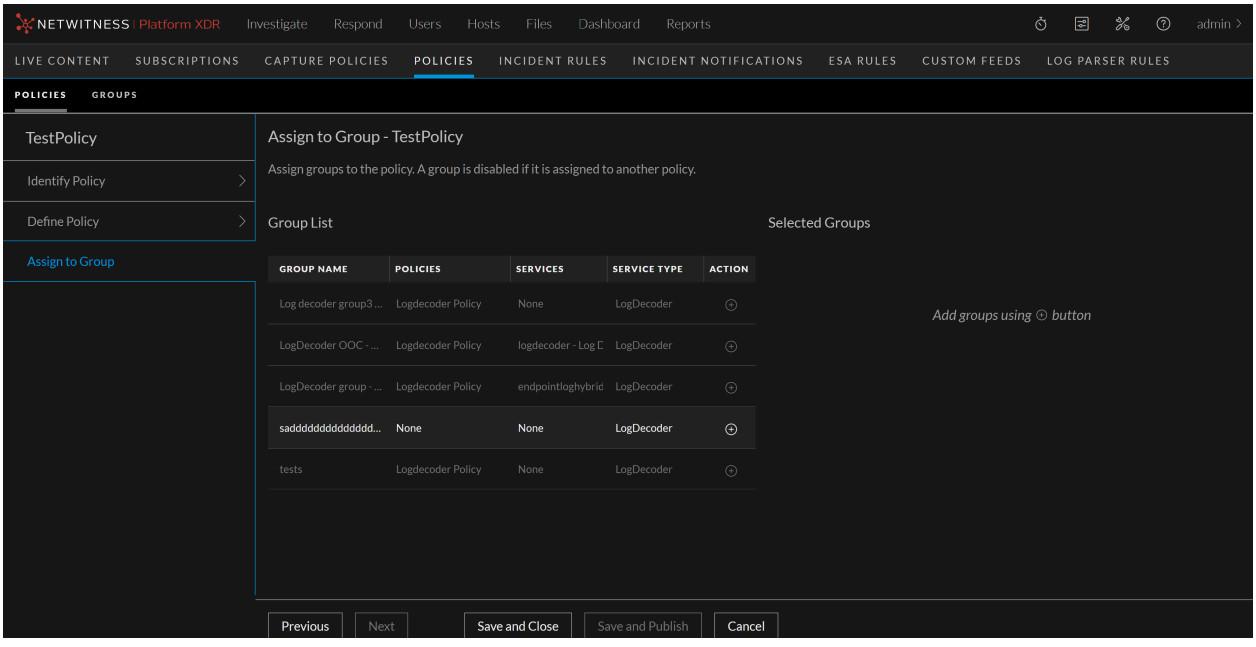
The table describes the information and options in the Create Policy dialog.





Field	Description
Policy Type	Displays the policy type.
Policy Name	Name of the policy. The name should be unique.
Policy Description (Optional)	Description of the policy. Description should not exceed 8000 characters.
Service Type	Displays the type of the service. Available options are Log Decoder, Decoder, and Concentrator.

Field	Description
(For version 11.7.1 and Later) Clone from Existing Service (Optional)	Displays the list of services based on the service type to clone those settings.
Save and Close	Saves the settings and closes the Create Policy dialog.



Define Policy Settings

Field	Description
Default Settings	Displays the settings of the service based on the category, for example, Database, Decoder and so on. Click  to expand the setting category.  The following describes Default settings: • **Setting**- Name of the setting. • **Value**- The settings value. • **Description**- Description of the setting. • **All** – Lets you to select the settings for customization. You can either click  to customize all the settings value or click  on a specific setting
Common Settings	Displays the common settings of the service. By default, it is disabled.
(For version 11.7.1 and Later) 10g Settings	Fetches the 10g settings.

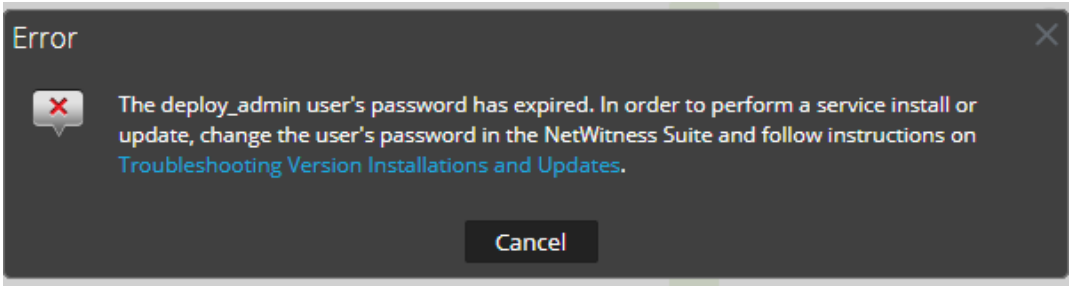
Field	Description
Customized Settings	Lists the selected settings for customization. Click ⊕ to add the setting.  Update the value based on your requirement. 

Assign to Group

Field	Description
Group List	Displays the list of group associated with the policy. A group is disabled if it is already assigned to another policy. • Group Name • Policies • Services • Service Type • Action
Selected Group	Lists the selected groups. Click  to add groups.
Save and Close	Saves the settings and closes the Assign to Group dialog.
Save and Publish	Saves and publishes the created policy. **Note:** This option is disabled if: - Policy settings are not customized. - Policy is not assigned to groups.

Troubleshooting Version Installations and Updates

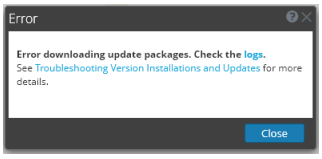
This section describes the error messages displayed in the Hosts view when it encounters problems updating host versions and installing services on hosts in the Hosts view. If you cannot resolve an update or installation issue using the following troubleshooting solutions, contact Customer Support.



Troubleshooting instructions for the following errors that may occur during the upgrade are described in this section.

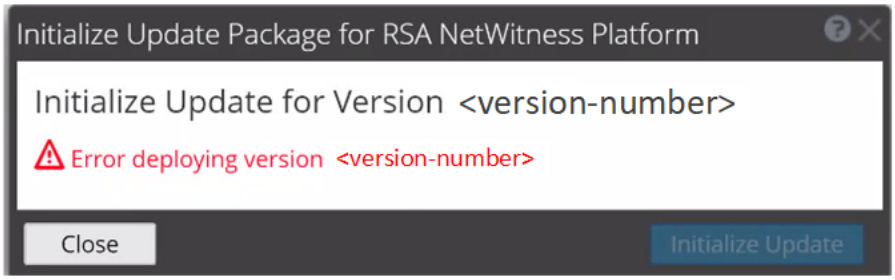
- deploy_admin Password Expired Error
- Downloading Error
- Error Deploying Version <version-number> Missing Update Packages
- Upgrade Failed Error
- External Repo Update Error
- Host Installation Failed Error
- Host Update Failed Error
- Missing Update Packages Error
- OpenSSL 1.1.x Error
- Patch Update to Non-NW Server Error
- Reboot Host After Update from Command Line Error
- Reporting Engine Restarts After Upgrade

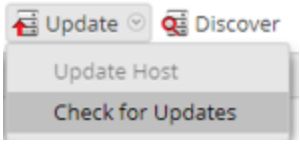
Troubleshooting instructions are also provided for errors for the following hosts and services that may occur during or after an upgrade.



- Log Collector Service
- NW Server
- Orchestration
- Reporting Engine
- Event Stream Analysis

deploy_admin User Password Has Expired Error





Error Message	
Cause	The `deploy_admin` user password has expired.

Solution	Reset your `deploy_admin` password password.
	1. On the NW Server host only, run the following command.
	`nw-manage --update-deploy-admin-pw`
	`Please enter the new deploy_admin account password: <new-deploy-admin-password>`
	`Please confirm the new deploy_admin account password: <new-deploy-admin-password>`
	2. Review the output of the `nw-manage --update-deploy-admin-pw` command to verify the `deploy_admin` password was successfully updated on all hosts. If an NW host is down or fails for any reason as displayed by the output of the `nw-manage --update-deploy-admin-pw` command, run `nw-manage --sync-deploy-admin-pw --host-key <host-identifier>` to synchronize the password between the NW Server and the host that failed once the communication failure is resolved.
	3. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt.

Downloading Error

Error Message	
Problem	When you select an update version and click **Update** >**Update Host**, the download starts but fails to complete.
Cause	Version download files can be large and take a long time to download. If there are communication issues during the download it will fail.
Solution	1. Try to update again. 2. If it fails again with the same error, try to update using the offline methods as described in "Offline Method from Hosts View" or "Offline Method Using Command Line Interface" in the *Upgrade Guide for NetWitness Platform 11.6*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues. 3. If you are still not able to update, contact Customer Support.

Error Deploying Version <version-number> Missing Update Packages

Error Message	
Problem	Error deploying version <version-number> is displayed in the **Initialize Update Package for RSA NetWitness Platform** dialog after you click on **Initialize Update** if the update package is corrupted.
Solution	1. Click **Close** to close the dialog. 2. Remove the version folder from staging folder. 3. Make sure that the salt-master service is running. 4. Recopy the update package zip file to the staging folder. 5. In the Hosts view toolbar, select Check for Updates again.  6. Click **Initialize Update**. 7. Click **Update** > **Update Hosts** from the toolbar. 8. Click **Begin Update** from the **Update Available** dialog. After the host is updated, it prompts you to reboot the host. 9. Click **Reboot** from the toolbar.

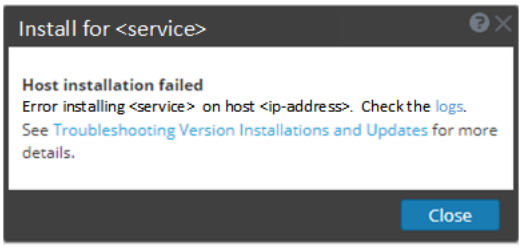
Upgrade Failed Error

Error Message	While updating/installing a device to version 11.2 or above, the following error can occur and be found in /var/log/netwitness/config-management/chef-solo.log: [2019-04-16T20:55:32+00:00] ERROR: Running exception handlers [2019-04-16T20:55:32+00:00] ERROR: Exception handlers complete [2019-04-16T20:55:32+00:00] FATAL: Stacktrace dumped to /var/lib/netwitness/config-management/cache/chef-stacktrace.out [2019-04-16T20:55:32+00:00] FATAL: Please provide the contents of the stacktrace.out file if you file a bug report [2019-04-16T20:55:32+00:00] ERROR: ruby_block[resolve ips] (nw-dns-client::config line 69) had an error: Resolv::ResolvError: no address for 889e5752-6ae3-4286-33f4ccbc [2019-04-16T20:55:32+00:00] FATAL: Chef::Exceptions::ChildConvergeError: Chef run process exited unsuccessfully (exit code 1)

Cause	The reason can be because the target host is unable to communicate to the Admin Server on port 53 as it is attempting to use the dnsmasq service on the Admin Server to resolve, in this case, 889e5752-6ae3-4286-a944-c182 33f4ccbc. This is the salt minion id of the admin server. You can see this by running "cat /etc/salt/minion" on the Admin Server to compare. Example output:
	`[root@S5-NWAdmin ~]# cat /etc/salt/minion`
	`master: localhost`
	`hash_type: sha256`
	`log_level: info`
	`id: 889e5752-6ae3-4286-a944-c18233f4ccbc`

Solution	If possible, configure any firewalls between the target host and the Admin Server host to be able to communicate on port 53. If this is not possible, the workaround is to include the minion id in the /etc/host file on the component hosts and starting in the 11.4 release, modify the chef recipe not to overwrite this workaround.
Workaround	Refer to Install/Upgrade fails in RSA NetWitness Platform because Resolv::ResolvError: no address for a particular host KB Article.

Error Message	Received an error in the error log similar to the following when trying to update to version 11.6 : `FATAL: Chef::Exceptions::Package: yum_package[rsa-protobufs-rt] (rsa-audit::packages line 11) had an error: Chef::Exceptions::Package: No version specified, and no candidate version available for rsa-protobufs-rt`
Cause	Custom builds/rpms installed for certain components installed on hosts, such as in the case of installing Hotfixes.

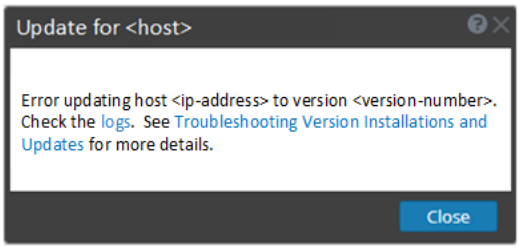


Solution	To resolve the issue, follow the below steps.
	1. SSH to Admin Server.
	2. Locate the component descriptor file by running the following command.
	`cd /etc/netwitness/component-descriptor/`
	3. Open the component descriptor file by running the following command.
	`vi nw-component-descriptor. json`
	4. Search for “packages” section for the component you have custom build/rpm. For example, below shown is the package details for “concentrator” host that has custom build/rpm.
	`“concentrator”: {`
	`“cookbook_name”: “rsa-concentrator”,`
	`“service_names”: [“rsa-nw-concentrator”],`
	`“family”: “launch”,`
	`“default_port”: xxxx, “description”: “Concentrator”,`
	`“packages”:[{ “name”: “rsa-nw-concentrator”,`
	`“version” : “11.6.0.0-2003001075220.5.cecf24b.e.17.centos”`
	`},`
	5. Delete the complete version details including (,) character in the packages section. For

	example, it should look like as shown below after you delete the version details.
	`"packages": [{`
	`"name": "rsa-nw-concentrator"`
	`},`
	Note: You must delete the version details for all the host that has custom builds/rpms in the component descriptor of the admin server.
	6. Run the upgrade process again.

External Repo Update Error

Error Message	Received an error similar to the following error when trying to update to a new version from the : `.Repository 'nw-rsa-base': Error parsing config: Error parsing "baseurl = 'https://nw-node-zero/nwrpmrepo /<version-number>/RSA'": URL must be http, ftp, file or https not ""`
Cause	There is an error the path you specified.
Solution	Make sure that: • the URL does exist on the NW Server host. • you used the correct path and remove any spaces from it.



Host Installation Failed Error

Error Message	
Problem	When you select a host and click **Install** the install service process fails.

Solution	1. Try to install the service again.
	Often this is all you need to do.
	2. If you still cannot install the service:
	a. Monitor the following logs on NW Server as it progresses (for example, submit the `tail -f` command string from the command line'):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`

	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error appears in one or more of these logs.
	b. Try to resolve the issue and reinstall the service.
	• Cause 1 - Entered the wrong `deploy_admin` password in the nwsetup-tui.
	Solution - Reset your `deploy_admin` password password.
	1. On the NW Server host and all other hosts on 11.x, run the following command.
	`/opt/rsa/saTools/bin/set-deploy-admin-password`
	2. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt.
	• Cause 2 -The `deploy_admin` password has expired.
	Solution - Reset your `deploy_admin` password password.
	1. On the NW Server host and all other hosts on 11.x, run the following command.
	`/opt/rsa/saTools/bin/set-deploy-admin-password`
	2. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt.
	3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support.

Host Update Failed Error

Error Message	
Problem	When you select an update version and click **Update** > **Update Host**, the download process is successful, but the update process fails.
Solution	1. Try to apply the version update to the host again. Often this is all you need to do. 2. If you still cannot apply the new version update:

a. Monitor the following logs on NW Server as it progresses (for example, run the `tail -f` command from the command line):
`/var/netwitness/uax/logs/sa.log`
`/var/log/netwitness/orchestration-server/orchestration-server.log`
`/var/log/netwitness/deployment-upgrade/chef-solo.log`
`/var/log/netwitness/config-management/chef-solo.log`
`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
The error appears in one or more of these logs.

b. Try to resolve the issue and reapply the version update.

- Cause 1 - `deploy_admin` password has expired.
  Solution - Reset your `deploy_admin` password .
  Complete the following steps to resolve Cause 1.

  1. In the NetWitness Suite menu, select  **(Admin) > Security > Users** tab.
  2. Select the `deploy_admin` and click **Reset Password**.
  3. (Conitional) If NetWitness Suite does not allow you to expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps.
     a. Reset `deploy_admin` to use a new password.
     b. On all non-NW Server hosts on 11.x , run the following command using the matching `deploy_admin` password from NW Server host.
     `/opt/rsa/saTools/bin/set-deploy-admin-password`

- Cause 2 -The `deploy_admin` password was changed on NW Server host but not changed on non-NW Server hosts.
  Complete the following step to resolve Cause 2.

  - On all non-NW Server hosts on 11.x , run the following command using the matching `deploy_admin` password from NW Server host.
  `/opt/rsa/saTools/bin/set-deploy-admin-password`

3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support.

Missing Update Packages Error

Error Message	**Initialize Update for Version xx.x.x.x** Missing the following update package(s) Download Packages from RSA Link

Problem	Missing the following update package(s) is displayed in the **Initialize Update Package for RSA NetWitness Platform** dialog when you are updating a host from the **Hosts** view offline and there are packages missing in the staging folder.
Solution	1. Click Download Packages from RSA Link in the **Initialize Update Package for RSA NetWitness Platform** dialog. The NetWitness Community page that contains the update files for the selected version is displayed. 2. Select the missing packages from the staging folder. The **Initialize Update Package for RSA NetWitness Platform** dialog is displayed telling you that it is ready to initialize the update packages.

OpenSSL 1.1.x

Error Message	The following example illustrates an ssh error that can occur when the ssh client is run from a host with OpenSSL 1.1.x installed: `$ ssh root@10.1.2.3` **`ssh_dispatch_run_fatal: Connection to 10.1.2.3 port 22: message authentication code incorrect`**

Problem	Advanced users who want to ssh to a NetWitness Platform host from a client that is using OpenSSL 1.1.x encounter this error because of incompatibility between CENTOS 7.x and OpenSSL 1.1.x. For example:
	`$ rpm -q openssl`
	`openssl-1.1.1-8.el8.x86_64`

Solution	Specify the compatible cipher list on the command line. For example:
	`$ ssh -oCiphers=aes128-ctr,aes192-ctr,aes256-ctr root@10.1.2.3`
	`I've read & consent to terms in IS user agreement.`
	`root@10.1.2.3's password:`
	`Last login: Mon Oct 21 19:03:23 2019`

Patch Update to Non-NW Server Error

Error Message	The `/var/log/netwitness/orchestration-server/orchestration-server.log` has an error similar to the following error: **`API|Failure /rsa/orchestration/task/update-config-management [counter=10 reason=IllegalArgumentException::Version '11.x.x.n' is not supported`**
Problem	After you update the NW Server host to a version, you must update all non-NW Server hosts to the same version. For example, if you update the NW Server from 11.4.0.0 to 11.6.0.0 , the only update path for the non-NW Server hosts is the same version (that is, 11.6.0.0). If you try to update any non-NW Server host to a different version (for example, from 11.4.0.0 to an 11.4.x.x) you will get this error.
Solution	You have two options:

	• Update the non-NW Server host to 11.6.0.0, or • Do not update the non-NW Server host (keep it at its current version)

Reboot Host After Update from Command Line Error

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Reporting Engine Restarts After Upgrade

Problem	In some cases, after you upgrade to 11.6 from versions of 11.x, such as 11.4, the Reporting Engine service attempts to restart continuously without success.
Cause	The database files for live charts, alert status, or report status may not be loaded successfully as the files may be corrupted.
Solution	To resolve the issue, do the following: 1. Check which database files are corrupted: Navigate to the file located at `/var/netwitness/reserver/rsa/soc/reporting-engine/logs/reporting-engine.log` and check the following blocks: • If the live charts db file is corrupted, the following logs are displayed: Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception: org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196] at org.h2.message.DbException.getJdbcSQLException(DbException.java:345) at org.h2.message.DbException.get(DbException.java:168) org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'chartSummaryDAOImpl': Invocation of init method failed; nested exception is com.rsa.soc.re.exception.ReportingException: java.sql.SQLException: Connections could not be acquired from the underlying database! • If the alert status db file is corrupted, the following logs are displayed:

Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception:

org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196]

at org.h2.message.DbException.getJdbcSQLException(DbException.java:345)

at org.h2.message.DbException.get(DbException.java:168)

org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertStatusHandler': Unsatisfied dependency expressed through field 'alertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertExecutionStatsDAOImpl': Unsatisfied dependency expressed through field 'persistedAlertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'persistedAlertExecutionStatsDAOImpl'

- If the report status db file is corrupted, the following logs are displayed:

```
org.h2.jdbc.JdbcSQLException: File corrupted while reading
record: null. Possible solution: use the recovery tool
[90030-196]
```

2. To resolve the live charts database file corruption, perform the following steps:
   a. Stop the Reporting Engine service.
   b. Move the `livechart.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/livecharts` folder to a temporary location.
   c. Restart the Reporting Engine service.

   Note: Some live charts data may be lost on performing the above steps.

   To resolve the alert status or report status database file corruption, perform the following steps:

   a. Stop the Reporting Engine service.
   b. Replace the corrupted db file with the latest `alertstatusmanager.mv.db` or `reportstatusmanager.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/archives` folder.
   c. Restart the Reporting Engine service.

   For more information, see the Knowledge Base article Reporting Engine restarts After upgrade to RSA NetWitness Platform 11.4.

Problem	After you upgrade to version 11.6, the Reporting Engine service does not restart.
Cause	The Reporting Engine service may not start due to any of the following reasons. - workspace.xml not updated. - Time is not converted properly in livechart h2 database. - JCR (Jackrabbit repository) is corrupted with primary key violation.
Solution	To resolve the issue, run the Reporting Engine Migration Recovery tool (`rsa-nw-re-migration-recovery.sh`) on the Admin Server where the Reporting Engine service is installed.

	Note: You can find the Reporting Engine Migration Recovery tool in the below location.
	`/opt/rsa/soc/reporting-engine-11.6.0.0-<Tag>/nwtools`
	1. SSH to Admin Server.
	2. Untar the RE (Reporting Engine) tool, run the following command.
	`tar -xvf rsa-nw-re-recovery-tool-bundle.tar`
	3. (Optional) If you want to untar the RE tool file in some other directory, you can create a directory and untar the RE tool. Run the following commands.
	`mkdir <NAME OF THE DIRECTORY>`
	`tar -xvf rsa-nw-re-recovery-tool-bundle.tar --directory <PATH OF THE DIRECTORY>`
	4. Run the script, run the following command.
	`./<PATH OF THE DIRECTORY>/rsa-nw-re-recovery-tool.sh`
	For more information, see the Knowledge Base article **Reporting Engine Migration Recovery Tool**.

Log Collector Service (`nwlogcollector`)

Log Collector installation logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness and configure the Lockbox as described in the "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	Decoder tries to start capture events but fails. `Aug 27 01:44:41 nwdecoder NwDecoder[8052]: [Decoder] [failure] The PF_RING driver is not installed.`

Solution	To resolve the issue, do the following steps,
	1. SSH to the Decoder host.
	2. Run the following commands.
	`yum reinstall pfring*`
	`systemctl restart nwdecoder`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 11.4.x.x or 11.5.x.x. to 11.6.0.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

Error Message	`<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [ ><existing-GB ] is less than the required space [ <required-GB> ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space.

Event Stream Analysis

Problem	After upgrading to version 11.6, the ESA correlation server does not aggregate events from the configured data sources.
Error Message	`Invalid username or password at com.rsa.netwitness.streams.base.RecordSourceSubscription.run (RecordSourceSubscription.java:173)`
Solution	To resolve the issue, do the following steps. In the NetWitness user interface,

1. Go to  **(Configure) > ESA Rules**.
   ESA Rules panel is displayed with **Rules** tab open.
2. In the Rules tab options panel, under Deployments, select a deployment.
3. In the **Data Sources** section, select the data source and click  in the toolbar.
4. In the **Edit Service** dialog, type the password for that data source.
5. Click the **Test Connection** button to make sure that it can communicate with the ESA service and then click **OK**.

Note: Do the above procedure for all the configured data sources.

6. After you finish making changes to the deployment, click **Deploy Now** to redeploy the ESA rule deployment.

Broker and Concentrator Basics

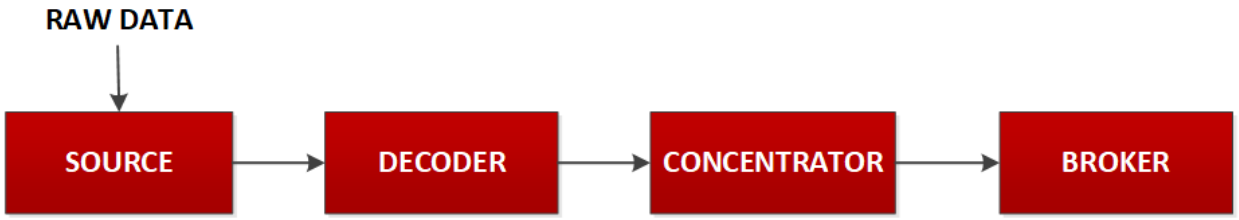
Concentrators and Brokers aggregate data captured or aggregated by other services unlike Decoders, which capture data.

NetWitness supports the following Broker and Concentrator services:

- Brokers - aggregate data across entire infrastructure from configured Concentrators. You can have multiple concentrators aggregating into one broker. You can also have multiple brokers aggregating into a single broker.
- Concentrators - aggregates and analyzes data across multiple capture locations from decoders, indexes and directs queries.

You can configure various Brokers and Concentrators together under a Broker. Brokers are able to pull in data quickly from the Concentrators because they acquire index information only. This configuration is done using the NetWitness user interface. Most of the configuration is performed in the Administration Services view (**(Admin) > Services**).

You can also configure the aggregate services and perform the whole aggregation process using the Services view. This helps setup aggregation autostart, timing and performance parameters, maximum number of open meta and session files. In addition to this, you can also time the attempts to restart, reconnect, or take a non-responsive aggregate service offline. Configuring Aggregate services includes managing Concentrators and Decoders as aggregate services. You can also limit the data being consumed from an aggregate service using meta fields and filters. The aggregation tasks are performed in the General tab of Administration Services view (**(Admin) > Services**).



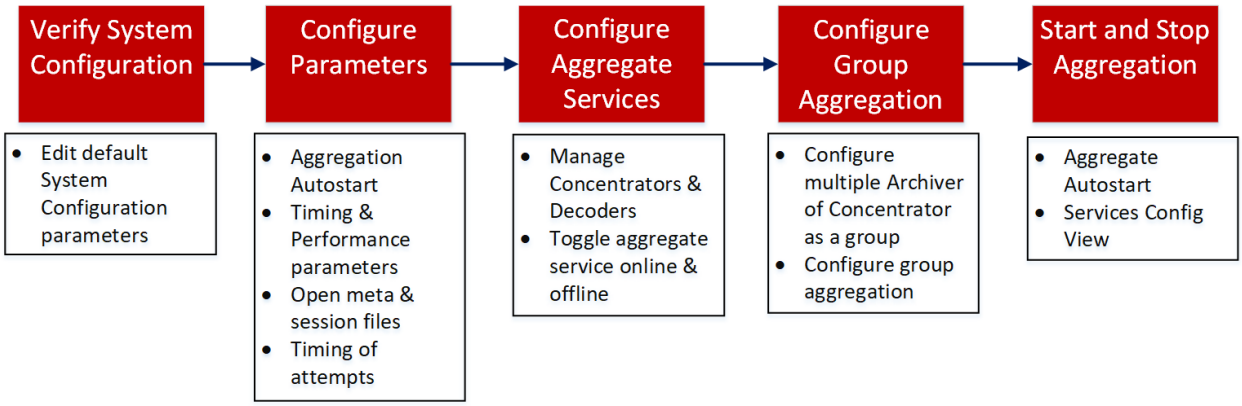
Overview of Broker and Concentrator

Brokers and Concentrators work in conjunction with Decoders and Log Decoders in the NetWitness Platform network. Unlike the two types of Decoders, which capture packets and logs, Concentrators and Brokers aggregate the data captured or aggregated by other services. Brokers aggregate data from configured Concentrators; Concentrators aggregate data from Decoders. A complete overview of the NetWitness Platform is provided in the *NetWitness Platform Getting Started Guide*.

Note: Go to the Master Table of Contents in NetWitness community portal to find and view referenced documents.

As raw data is entered in the system from the source for analysis, it has to be collected and parsed. This raw data is collected, parsed, and stored using a Decoder. The packet data is then indexed, stored, and parsed by the Concentrator. Parsed packet data is also provided as an endpoint for queries. Eventually, the Broker routes queries across multiple Decoder and Concentrator appliances. Here is how information flows to a Concentrator and Broker.

In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

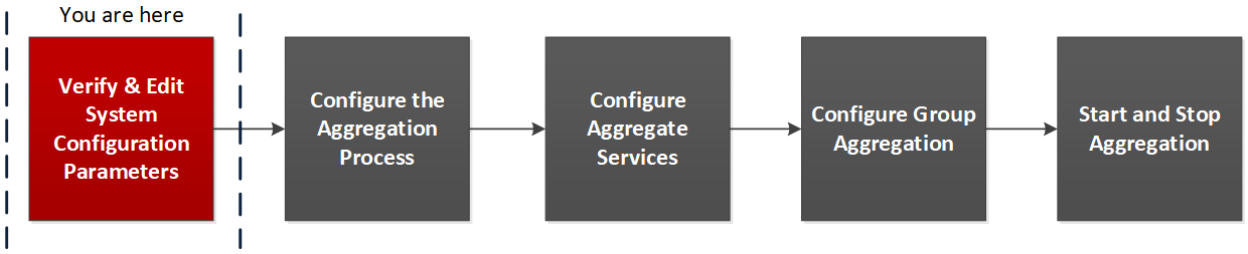


- Concentrator: is required for any large environment to store the Meta data that is generated by the parsers and feeds being triggered by packets and logs ingested into the decoders.
- Broker: The Broker service is similar to the Concentrator service except that it indexes the collected information. It performs virtual mapping of indices on all connected concentrators. Due to the less internal processing performed, the response time is fast. To allow investigation, multiple brokers and/or concentrators report data into a broker.

Broker and Concentrator Configuration

Setting up a Broker or Concentrator involves configuring the basic system parameters, the aggregate services, and the aggregation process between a Broker or Concentrator and the aggregate services.

These are the required configuration steps for a new Broker or Concentrator, and also for changing the configuration of an existing Broker. Perform the steps in the section in the sequence they are given.



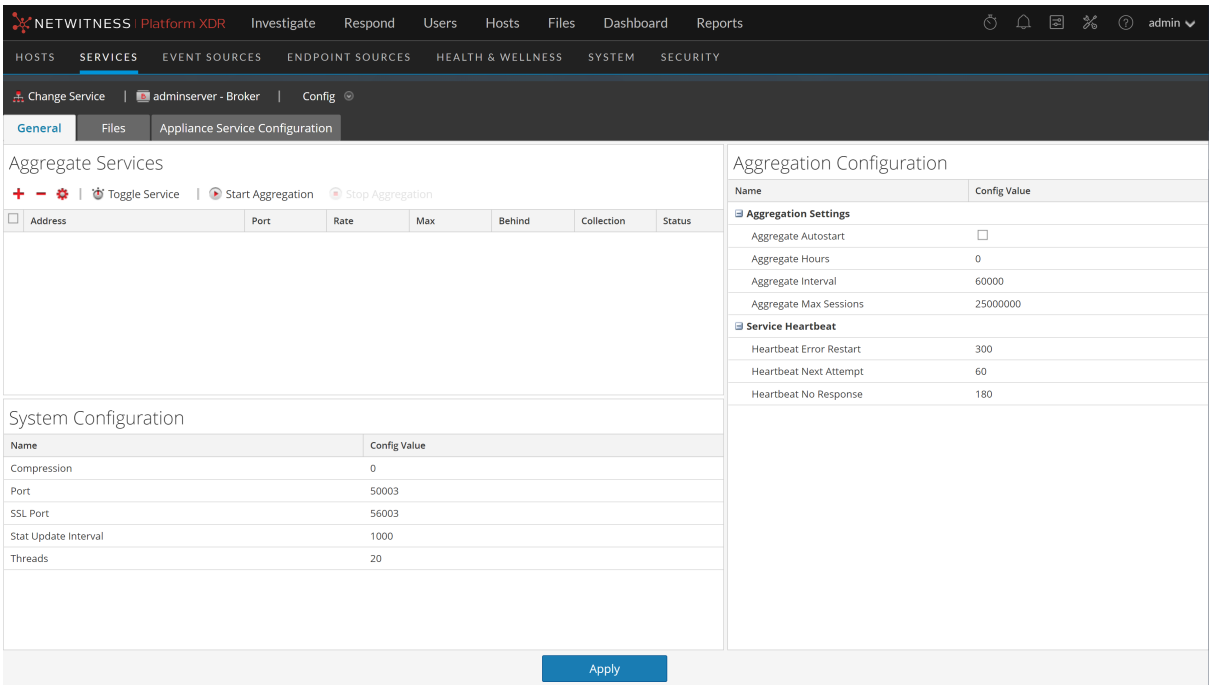
Basic Configuration Checklist

The following checklist provides the sequence for tasks that are required to configure a Broker or Concentrator that has been added to NetWitness in accordance with the *Hosts and Services Guide*.

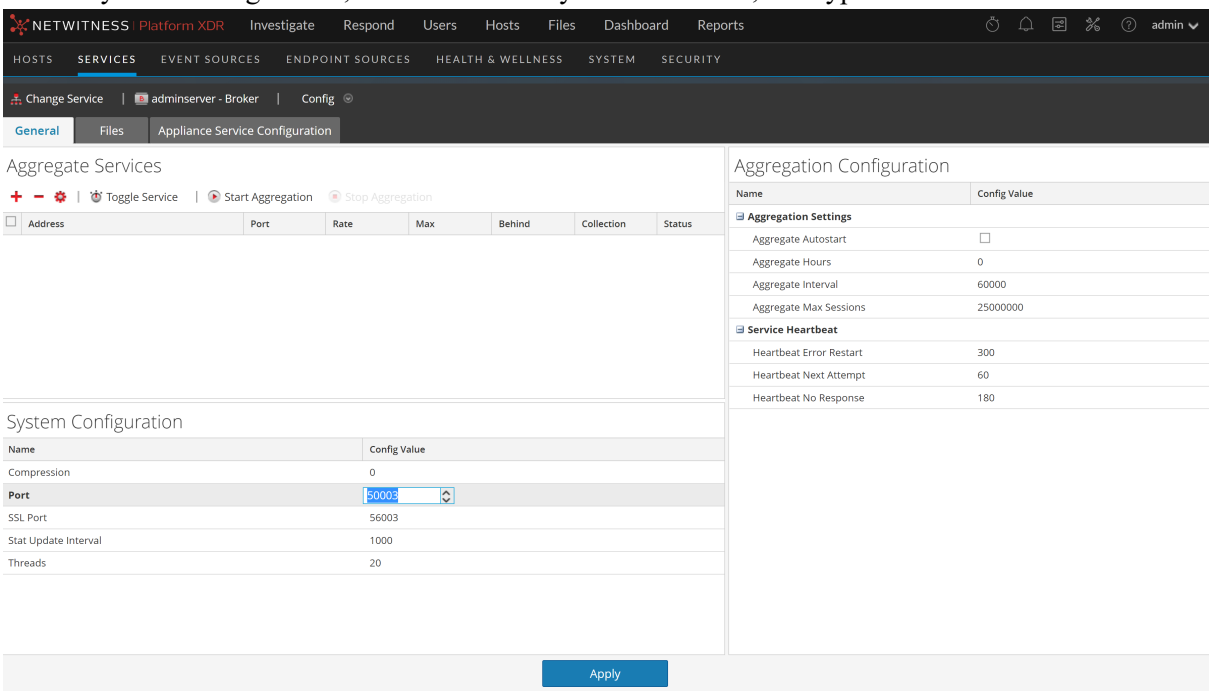
Configuration Step	Description
Step 1 - Verify System Configuration	Verify system configuration default values for the host and service are appropriate as described in Step 1. Verify Service System Configuration
Step 2 - Configure Parameters	Configure parameters that govern the overall aggregation process as described in Step 2. Configure the Aggregation Process
Step 3 - Configure Aggregate Services	Configure aggregate services as described in Step 3. Configure Aggregate Services
Step 4 - Configure Group Aggregation	(Optional) Configure group aggregation as described in Step 4. (Optional) Configuring Group Aggregation
Step 5 - Start and Stop Aggregation	Start and stop aggregation as described in Step 5. Start and Stop Aggregation

Step 1. Verify Service System Configuration

When a service is first added to NetWitness, default values for the system configuration parameters are in effect. You can edit these values to tune performance.



In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

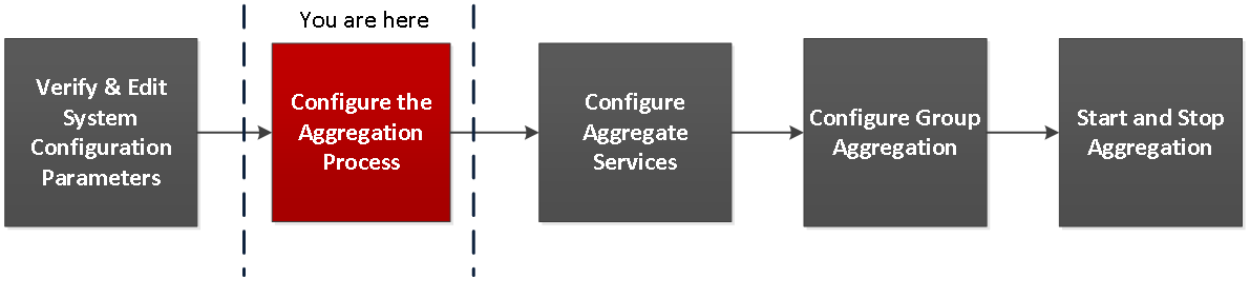


To edit system configuration parameters for a Broker or Concentrator:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select **> View > Config**.

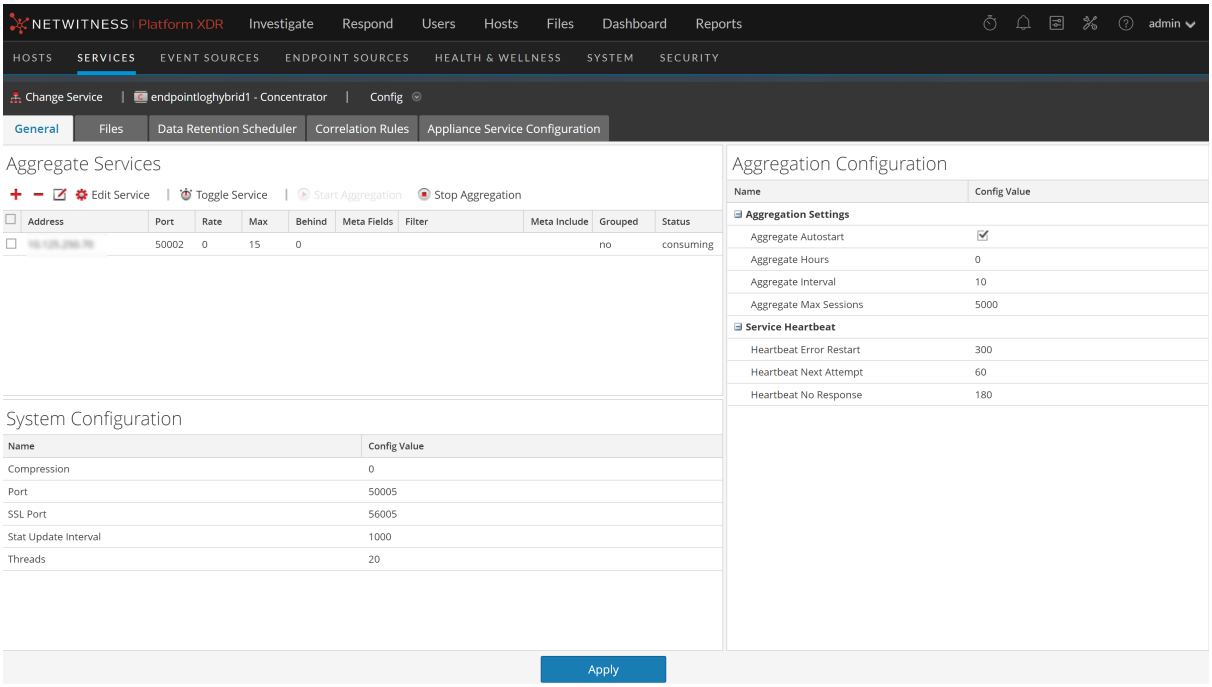
   The Services Config view for the selected service is displayed.

3. Under System Configuration, click a field that you want to edit, and type a new value.



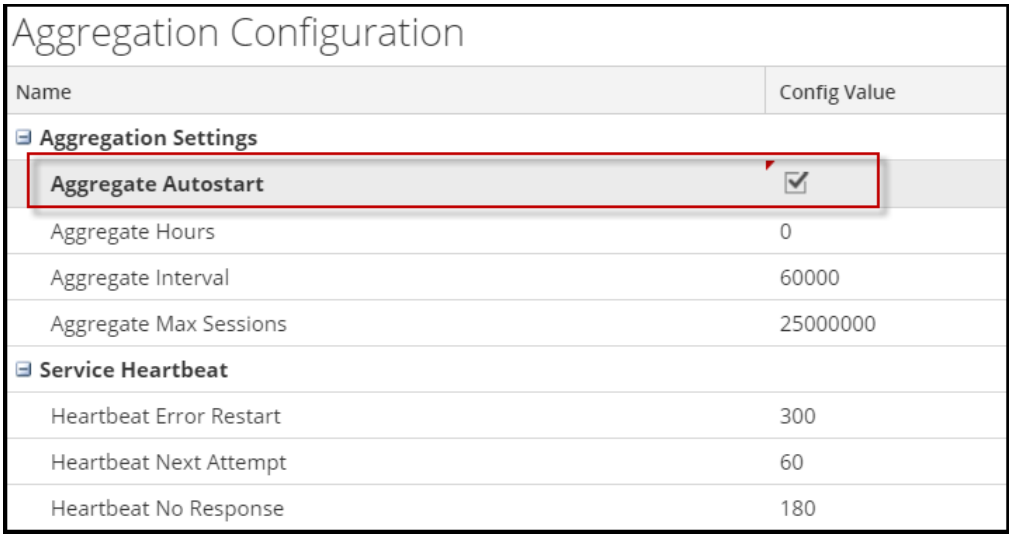
4. When finished editing, click **Apply**.

Step 2. Configure the Aggregation Process



Configuring the aggregation process for a Broker or Concentrator includes setting:

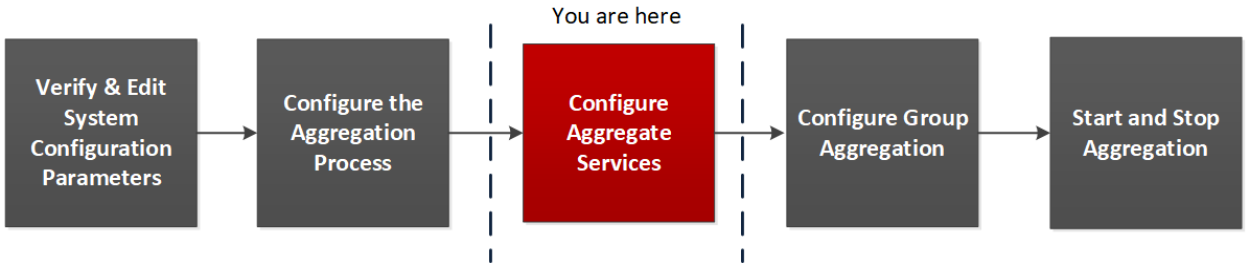
- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- Maximum number of open meta and session files
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service



To configure the aggregation process on a Broker or Concentrator:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select  **> View > Config**.
   The Services Config view, which includes the Aggregation Configuration section, is displayed.

3. (Optional) Select **Aggregate Autostart** to enable automatic start of aggregation when a service is online.

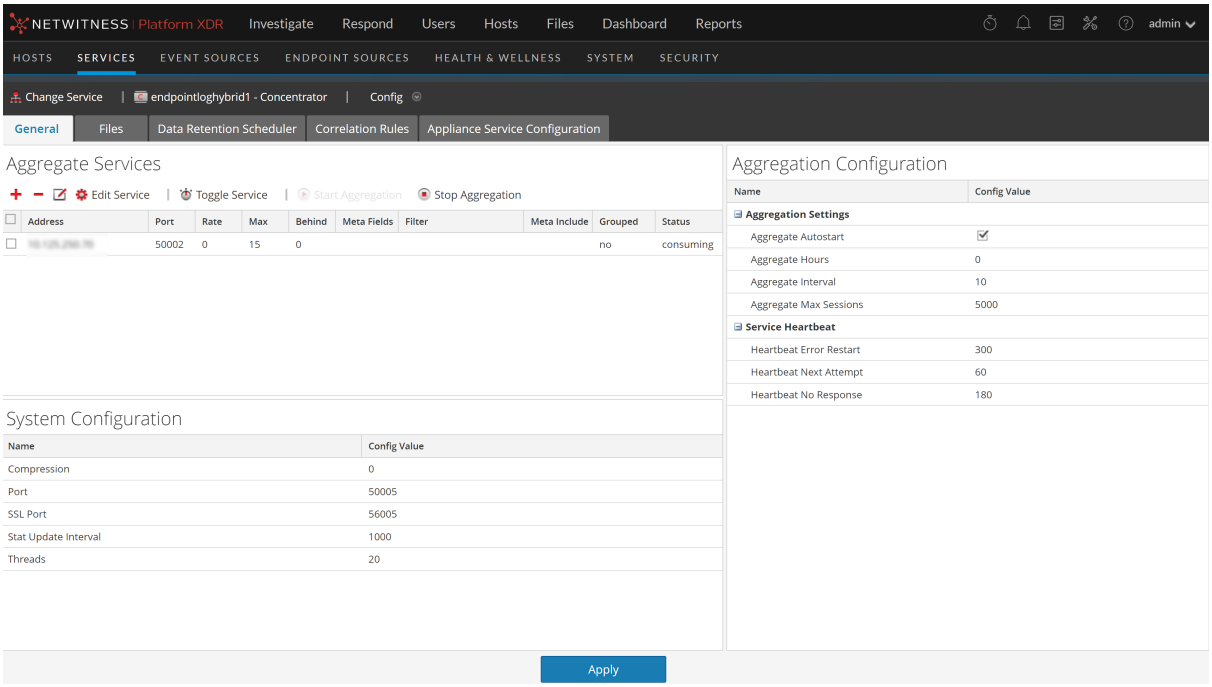


4. (Optional) Edit any of the aggregation settings: the hours back to begin aggregation, the milliseconds between rounds of aggregation, and maximum number of sessions per aggregation round.
5. (Optional) Edit any of the Service Heartbeat settings, which specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.
6. When finished editing the settings, click **Apply**.
   The settings become effective immediately.

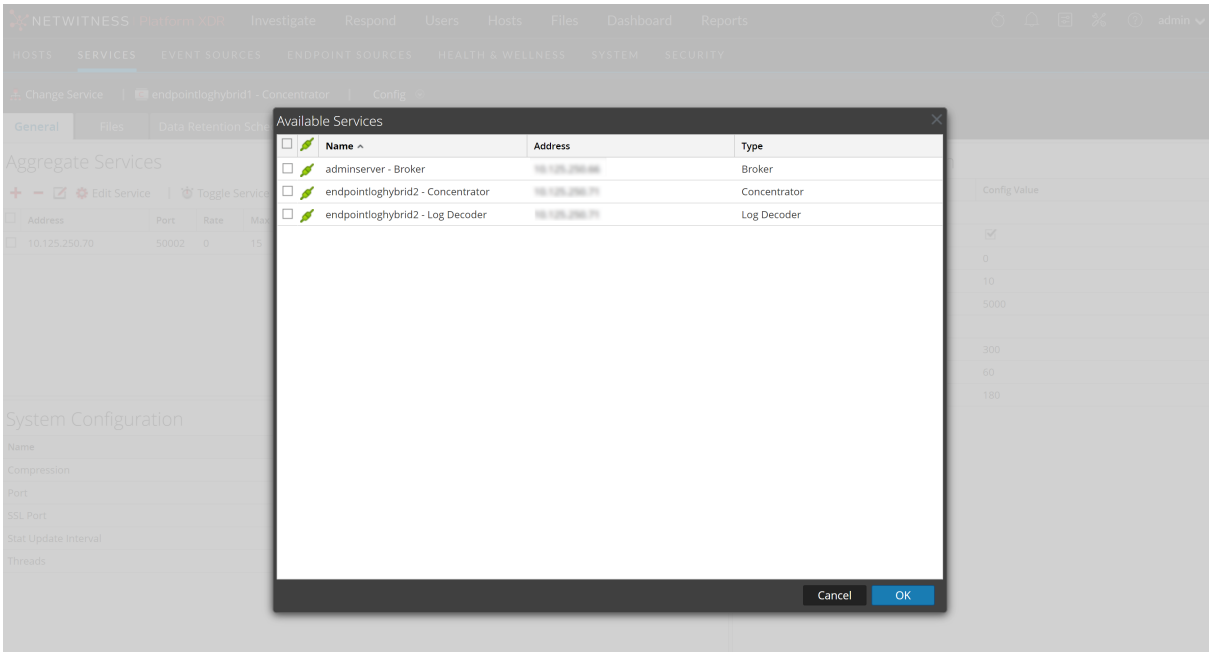
Step 3. Configure Aggregate Services

This topic introduces basic tasks related to data aggregation on Brokers and Concentrators. For information on the optional setup of group aggregation, see Step 4. (Optional) Configuring Group Aggregation.

Configuring the aggregate services (whose data is consumed and aggregated) includes:



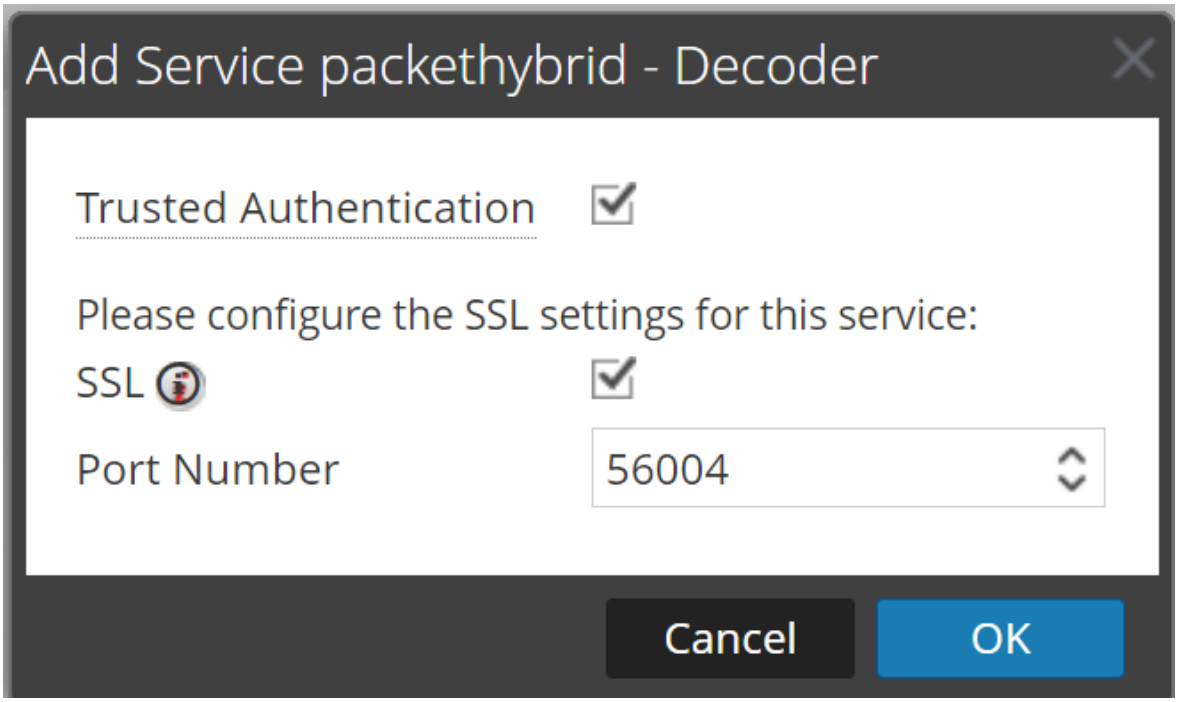
- Adding, editing, and deleting Concentrators and Decoders as aggregate services
- Toggling an aggregate service online and offline



To configure aggregate services to a Broker or Concentrator:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select  **> View > Config**.

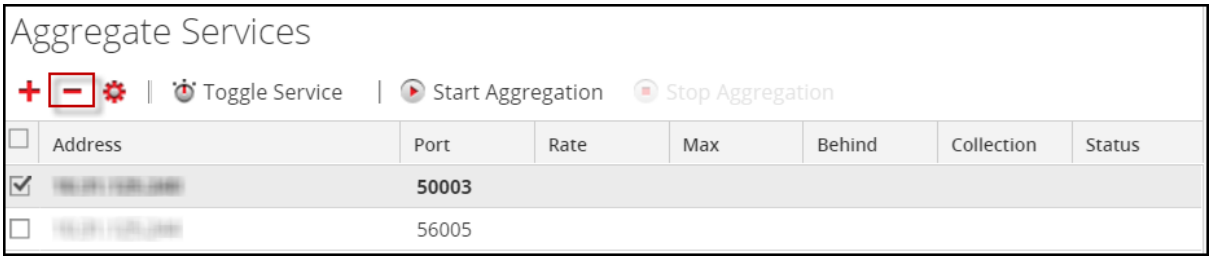
   The Services Config view for the selected service is displayed.



3. Click  in the **Aggregate Services** toolbar.
   The Available Services dialog is displayed.

4. Select one or more services to be added and click **OK**.
5. Use one of the following ways to add a service for aggregation:
   - Use Password-Based Authentication. Enter the Administrator username and password. Click **OK**.

- Select **Trusted Authentication**. Click **OK**.



The added services are listed in the Aggregate Services list.

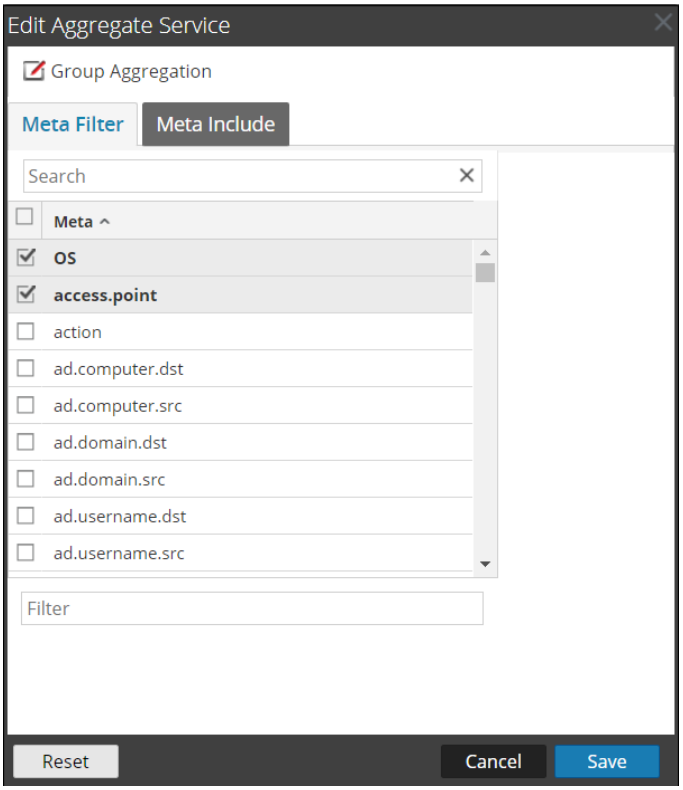
6. To save the changes, click **Apply**.

To remove aggregate services from a Broker or Concentrator:

Note: This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline.

1. In the **Aggregate Services** list, select one or more services.
2. Click − in the toolbar.

The service is removed from Aggregate Services list.



3. To save the change, click **Apply**.

To edit aggregate services on a Concentrator:

Note: This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline. You can edit only one service at a time.

You can limit the data being consumed from an aggregate service using meta fields and filters.

1. Click **Change Service** to change the service to Concentrator.
2. In the **Aggregate Services** list, select one or more services.
3. Click in the toolbar. Enter the authentication information in the pop up dialog box.
   - If the service was added on a different instance of NetWitness, you must add it to this instance of NetWitness in order to edit. A warning dialog allows you to add the service. If you click **Yes**, the Add Service dialog is displayed.
   - If the service is online, a dialog notifies that the service must be offline and requests confirmation that you want to continue. If you click **Yes**, NetWitness takes the service offline and the Edit Aggregate Service dialog is displayed.
   - If the service is offline, the Edit Aggregate Service dialog is displayed with the editable properties for an aggregate service on a Concentrator.
4. Click a type of metadata in the **Meta Include** tab to select the type of metadata for the Concentrator to consume from this service. Click **Save**.

5. To specify a rule to filter data that the Concentrator consumes from this service, compose a rule in the **Meta Filter** tab. Click **Save**.
6. Click **Close**.

   The Edit Aggregate Service dialog closes and the changes are shown in the Aggregate Services list. In this example, two meta were selected on the Meta Include tab. When you click the information icon in the Meta Include field, it shows the selections.
7. To save the changes, click **Apply**.

Toggle a Service

When data aggregation starts, Brokers and Concentrators consume data from aggregate services that are online. When first added to a Broker or Concentrator, aggregate services are offline.

To toggle a service between online and offline:

1. Select a service in the **Aggregate Services** list.
2. Click 

.

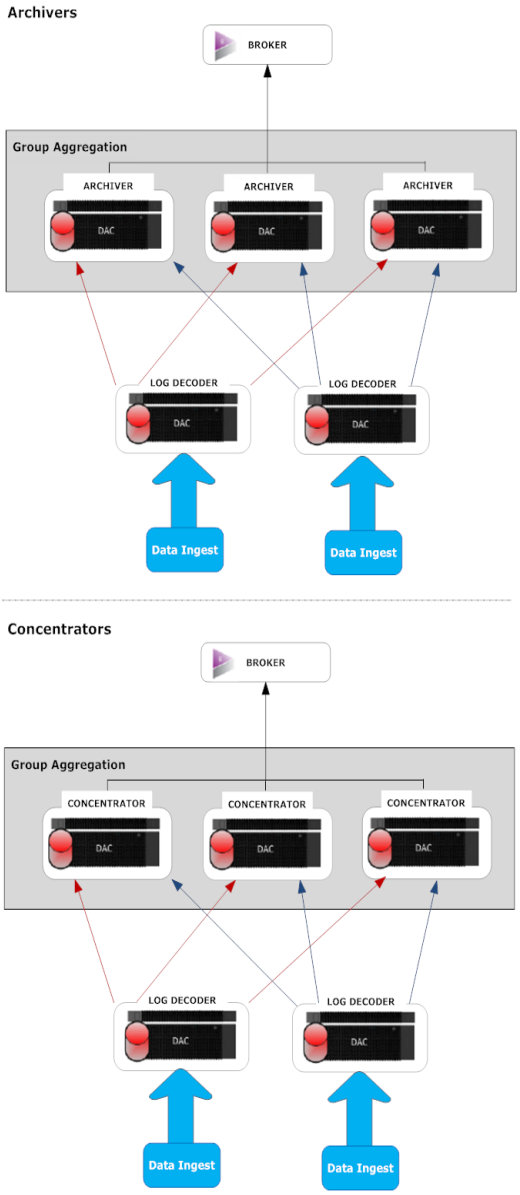
   The status is changed.

Step 4. (Optional) Configuring Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

RSA Group Aggregation Deployment Recommendations



RSA recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

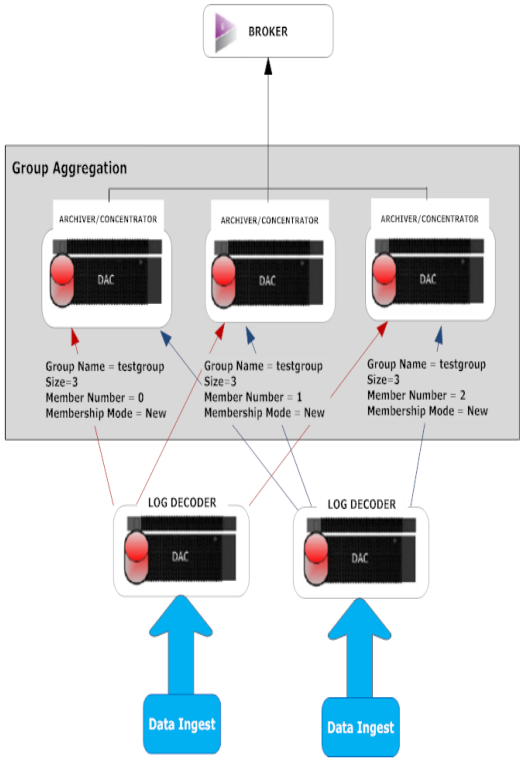
Advantages of Using Group Aggregation

- Increases the speed of NetWitness queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.

You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated sessions between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter set to 10,000, the services would divide the session between themselves as illustrated in the following table.



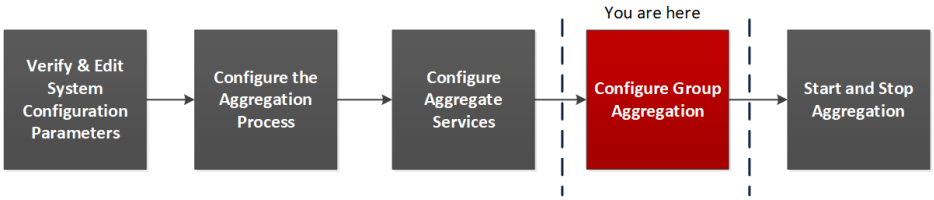
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name.
Size	It determines the number of Archiver or Concentrator services in the aggregation group.
Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: • **New**: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. • **Replace**: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from.

Note: The Membership Mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.

Complete the following steps to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.

2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

   a. Go to **(Admin) > Services**.

   b. Select the Archiver or Concentrator service, and select > **View** > **Config**.

   The Service Config view of the Archiver or Concentrator is displayed.

   c. In the **Aggregate Services** section, select **Log Decoder**.

   d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

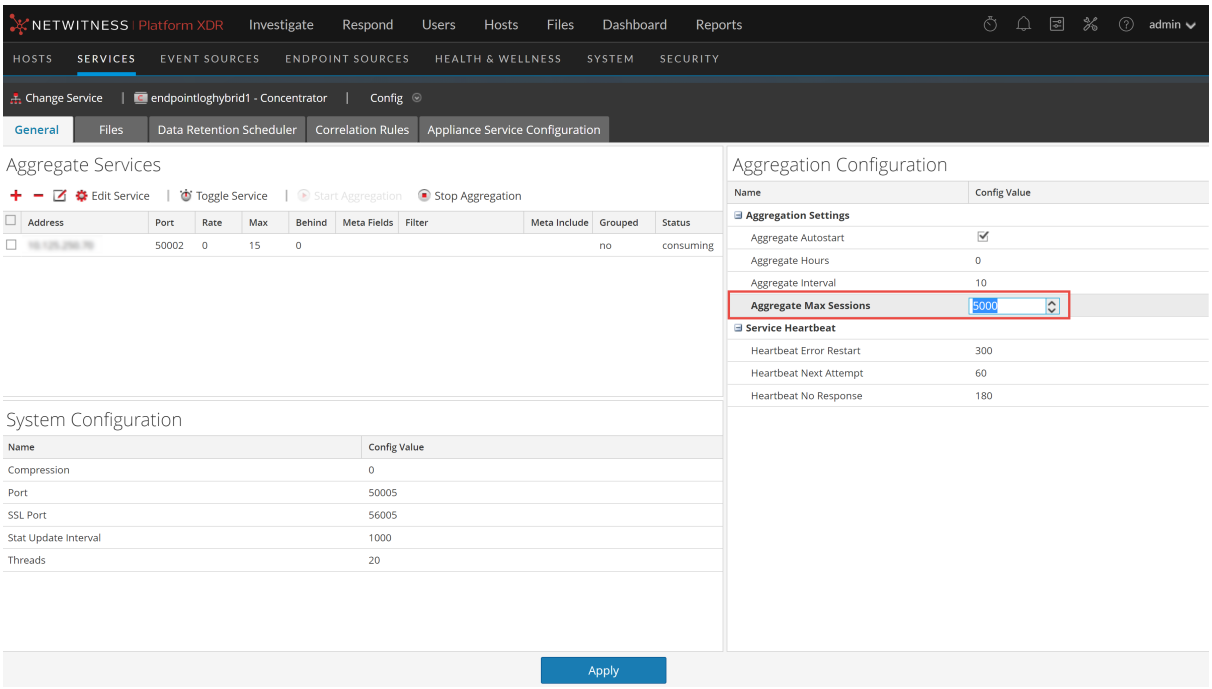
   e. Click .

   The **Edit Aggregate Service** dialog is displayed.

   f. Click Group Aggregation.

   The **Edit Group Aggregation** dialog is displayed.

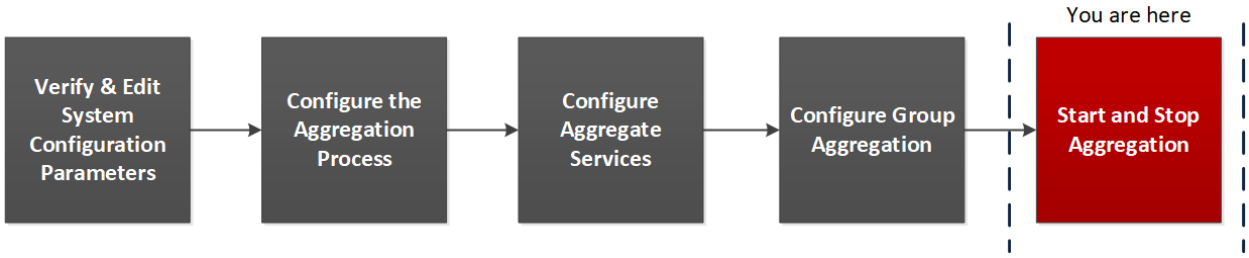
   g. Select the **Enabled** checkbox and set the following parameters:



- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

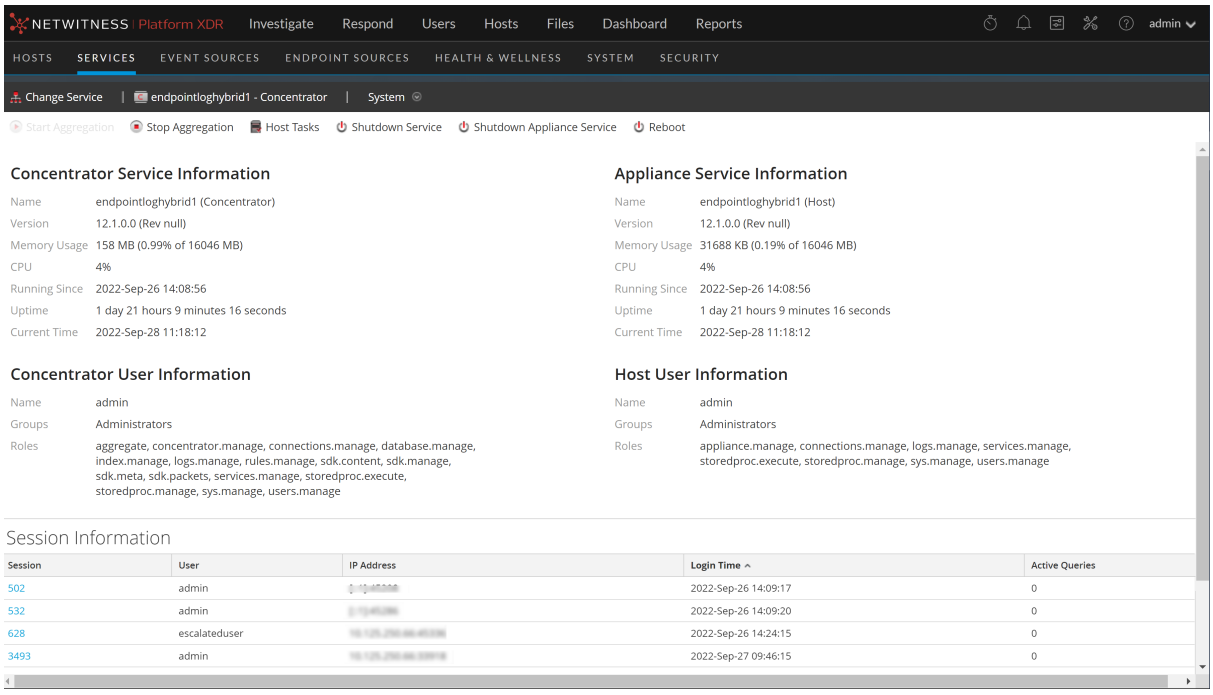
i. In the Service Config view, click **Apply**.



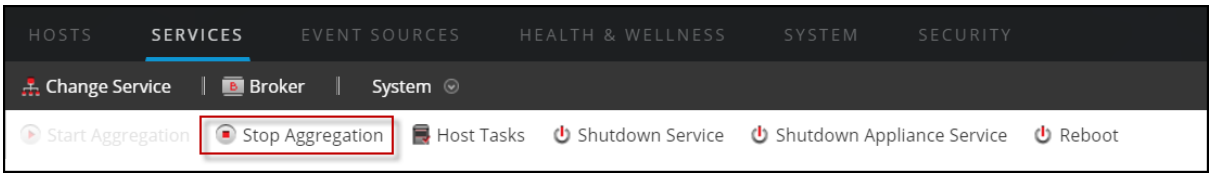
j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.

Step 5. Start and Stop Aggregation



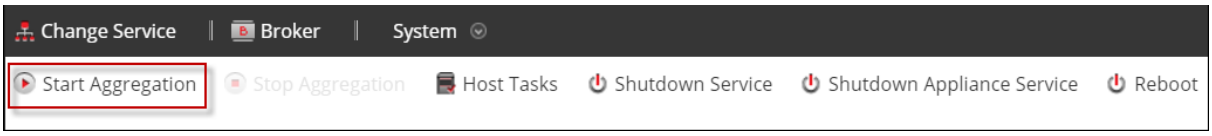
When a Broker or Concentrator starts up, it automatically begins aggregating data if Aggregate Autostart is enabled. When autostart is not enabled, you can start and stop data aggregation manually.



Note: The Aggregate Configuration Settings (in the Services Config View - Broker or Concentrator General Tab) determine whether Aggregate autostart is enabled, as well as the size of a round of aggregation and time between rounds.

To start and stop data aggregation in the services system view:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select > **View** > **System.**



3. To stop a Broker or Concentrator that is capturing data, click **Stop Aggregation** in the toolbar. The service stops aggregating data and the **Stop Aggregation** option in the toolbar is unavailable. The **Start Aggregation** option becomes active.

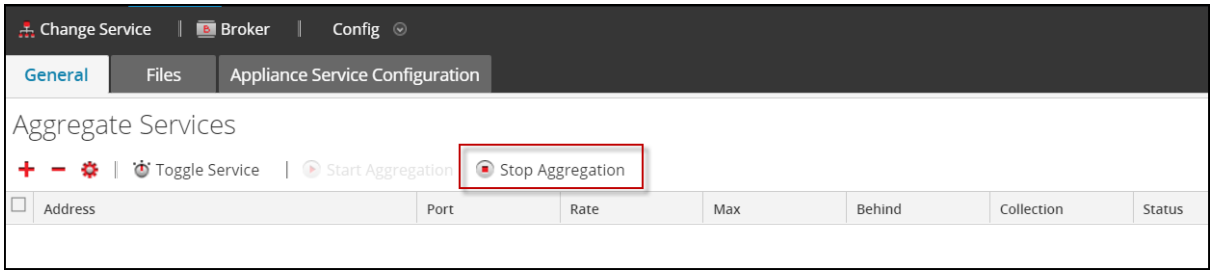
4. If you want the service to start aggregating data again, click **Start Aggregation**.

   You can now investigate the captured data in the Investigation module.

To start and stop aggregation in the services config view:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select > **View** > **Config**.

   The Services Config view, which includes the Aggregate Services section, is displayed.



3. To start aggregation on the selected Broker or Concentrator, click Start Aggregation in the **Aggregate Services** toolbar.

   When aggregation starts, the status of all online aggregate services changes to **consuming**. The Start Aggregation button is disabled and the Stop Aggregation button is enabled.

4. To stop aggregation, click  in the **Aggregate Services** toolbar.

   When aggregation stops, the status of all consuming aggregate services changes to **online**. The Stop Aggregation button is unavailable and the Start Aggregation button is available.

Broker and Concentrator Configuration References

You can configure Brokers and Concentrators using the NetWitness user interface.

In addition to the views described here, you can view the complete service nodes in a tree form in the Services Explore view, see the "Services Explore View" topic in the *Hosts and Services Getting Started Guide*.

Services Config View - Broker or Concentrator General Tab

The General tab for a Broker or Concentrator in the Services Config helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between a Broker or Concentrator and the aggregate service.

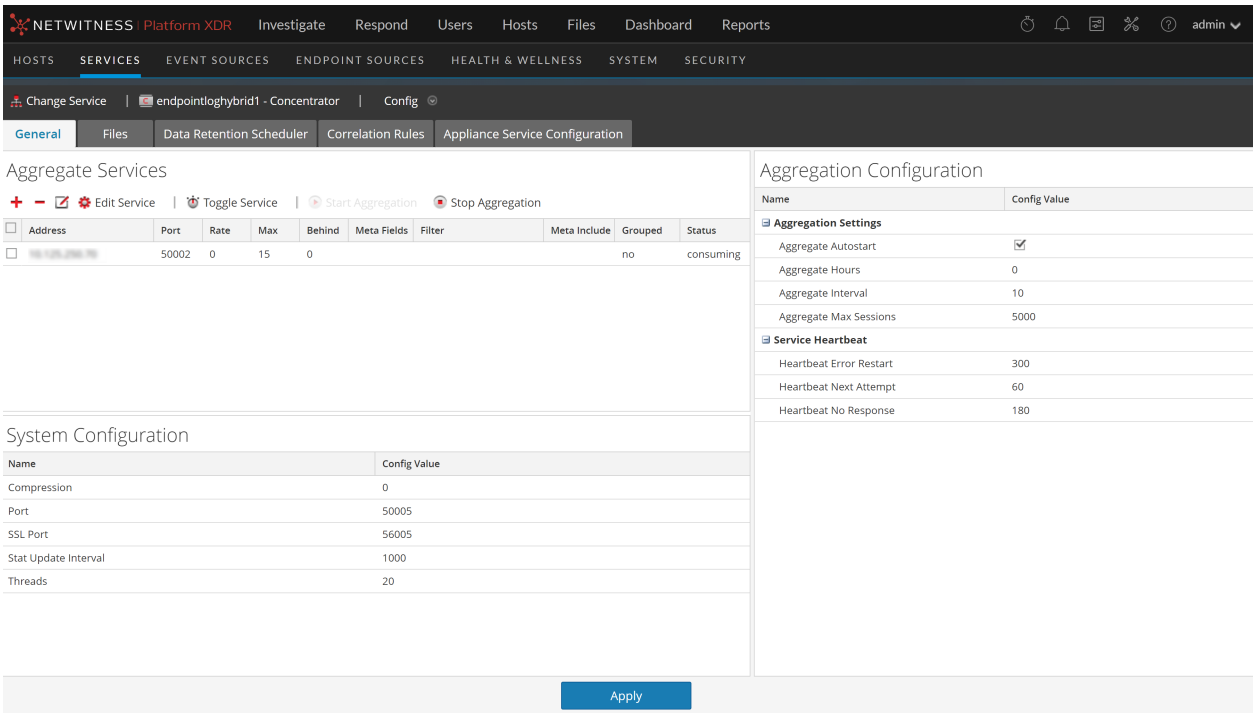
Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Concentrators and Brokers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

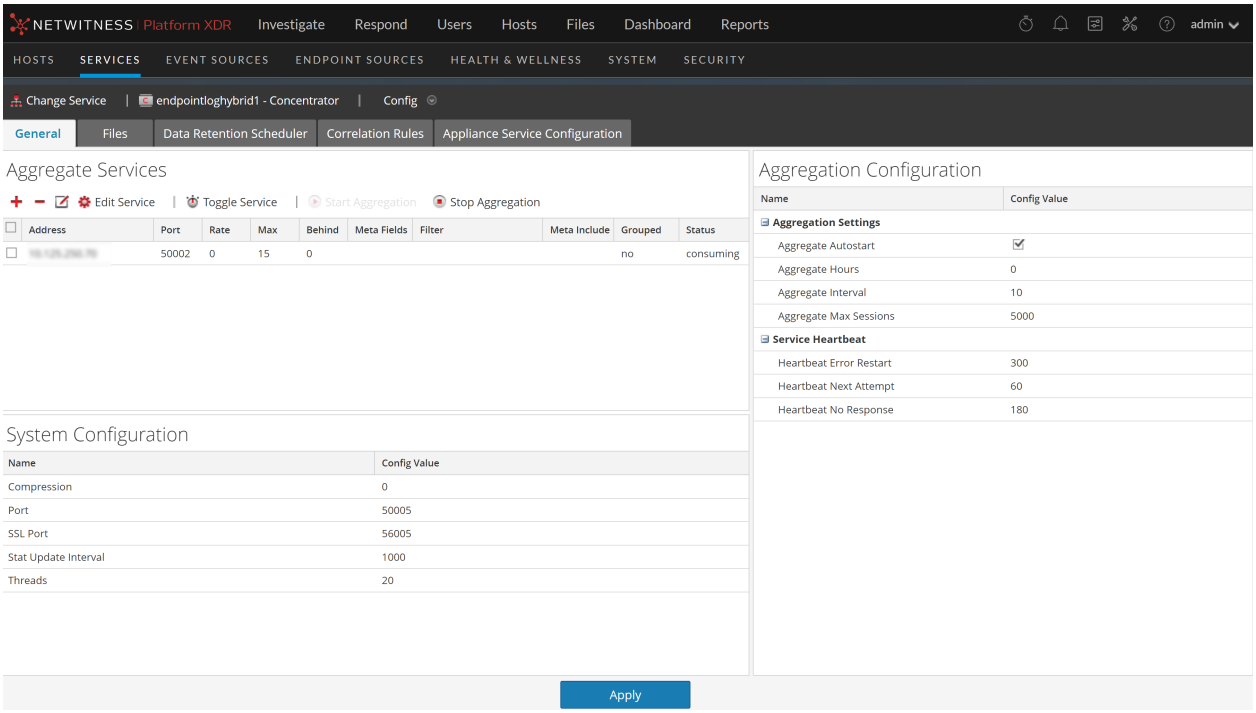
- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

What do you want to do?



Role	I want to...	Refer to...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Aggregate Services Section
Administrator	Manage System Configuration	System Configuration Section

Related Topics

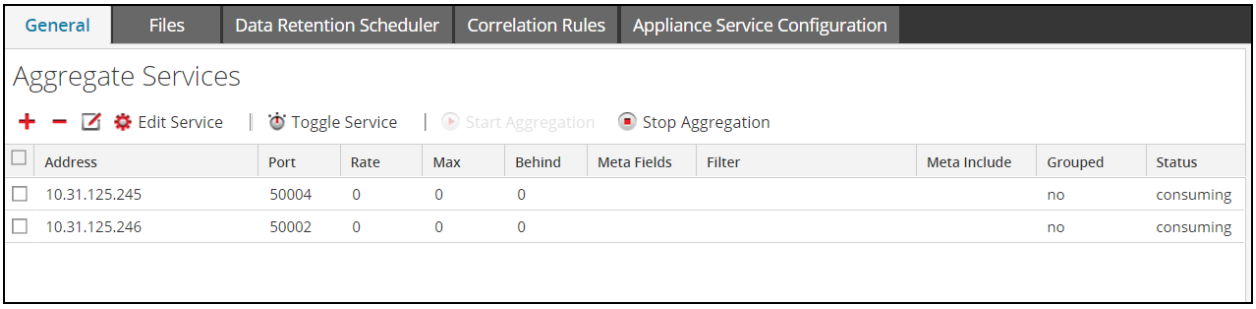


- Broker and Concentrator Basics
- Broker and Concentrator Configuration

General tab

This is an example of the General tab for a Concentrator.

This is an example of the General tab for a Broker.



These are the three major sections in the General tab for Brokers and Concentrators:

- Aggregate Services
- System Configuration

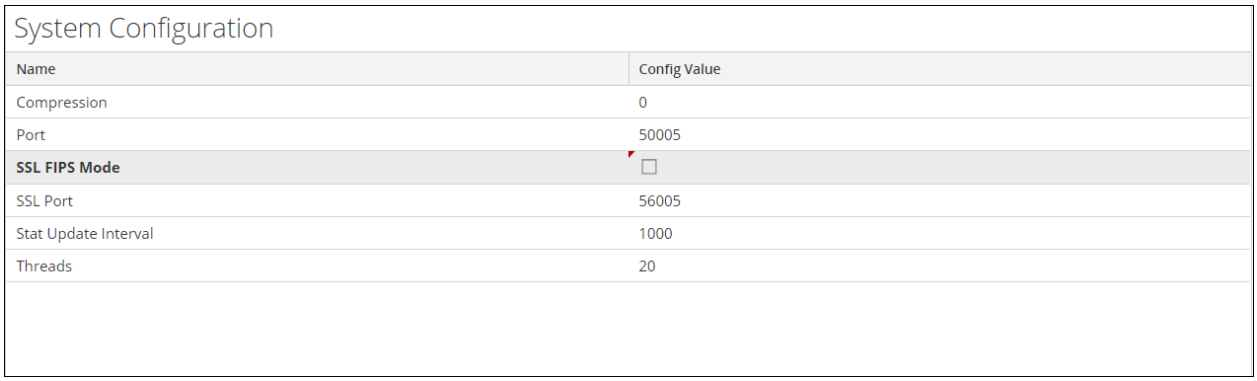
- Aggregation Configuration

Aggregate Services Section

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service. This is an example of the Aggregate Services section for a Concentrator.

The Aggregate Services section toolbar offers these options.

Option	Description
	Opens a dialog in which you can add a Concentrator, Decoder, or Log Decoder as an aggregate service.
	Removes the selected aggregate service.
	For Concentrators only, opens a dialog to edit **Meta Fields** and **Filter** values for the Concentrator.
	Enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Broker or Concentrator.
	When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service.
	When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.
	Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation.



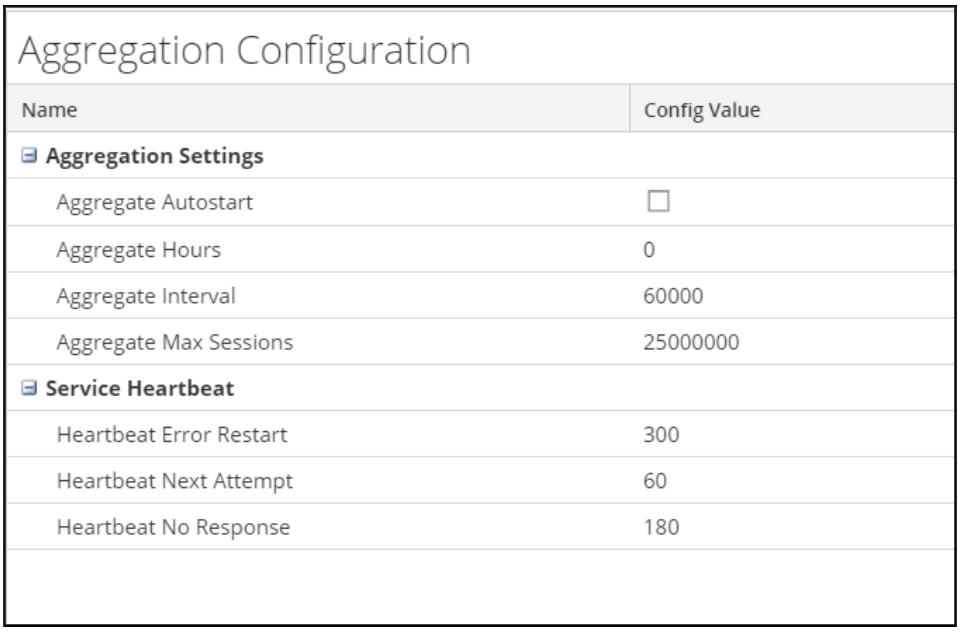
The Aggregate Services section list has these columns.

Column	Description
Address	Lists the address of the service.

Column	Description
Port	Lists the port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
Rate	Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**.
Max	Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture.
Behind	Lists the number of sessions on the service that need to be aggregated.
Collection	For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section.
Meta Fields	For Concentrators only, lists the types of metadata being consumed by the aggregate service.
Filter	For Concentrators only, a rule expression (as used in a 'where' clause) can be used to filter the results. You must add a meta key along with an operator and a value, for example `ip.src !=127.0.0.1 && word exists`
Meta Include	For Concentrators only, lists the number of types of meta included in the aggregate service.
Grouped	Whether or not the aggregate service is part of a group.
Status	Lists the current status of the service: • online = available to provide data for consumption by the Broker or Concentrator • offline = not available to provide data for consumption by the Broker or Concentrator • consuming = providing data for consumption by the Broker or Concentrator

System Configuration Section

The System Configuration section manages service configuration for a service. When a service is first added, default values are in effect. You can edit these values to tune performance.



The System Configuration section has these parameters.

Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
Port	The port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
SSL FIPS Mode	When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
SSL Port	Indicates the SSL port.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**. A change takes effect on service restart.

Aggregation Configuration Section

The Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

Caution: Do not change any of these settings unless guided by the Developers or the Customer Support team. Contact the Customer Support for any questions before editing any of these settings.

The following table describes the aggregation settings

Setting	Description
Aggregate Autostart	Option to start aggregation automatically each time the Broker or Concentrator is started. Checked means yes, unchecked means no. This change takes effect immediately.
Aggregate Hours	The number of hours back for each service that the Concentrator or Broker attempts to recover at the beginning of aggregation. This change takes effect immediately. • If the value is set to 0, aggregation for each service starts where it last left off, no matter the number of hours behind. • If the value is any positive integer, the Concentrator or Broker only consumes sessions less than that number of hours back. For example, if a service's most current session is +10 hours from the last session, this is what happens with two different Aggregate Hours values: • With a value of 12, the Concentrator or Broker starts consuming where it left off. • With a value of 4, all sessions between 5 and 10 hours back are skipped and the Concentrator or Broker starts consuming the session that started 4 hours back.
Aggregate Interval	The number of milliseconds between rounds of service aggregation. All services managed by the Broker or Concentrator request additional rounds of session and metadata to be aggregated. If a Broker or Concentrator is still consuming the previous round of data, it cannot request more until it finishes. Change takes effect immediately.
Aggregate Max Sessions	The maximum number of sessions that the Broker or Concentrator requests in a given round of data aggregation. Change takes effect after restart.

Service Heartbeat

In communicating with each aggregate service, Brokers and Concentrators monitor the heartbeat of the service. These parameters specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.

Setting	Description
Heartbeat Error Restart	After a heartbeat error is detected on an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting a service reconnect.
Heartbeat Next Attempt	After a failed attempt to reconnect to an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting another service reconnect. Change takes effect immediately.
Heartbeat No Response	After failing to reconnect to an unresponsive service, specifies the number of seconds for the Broker or Concentrator to wait before taking the unresponsive service offline. Change takes effect immediately.

When editing parameters in the General tab, you must click **Apply** to save changes.

Services System View - Broker or Concentrator

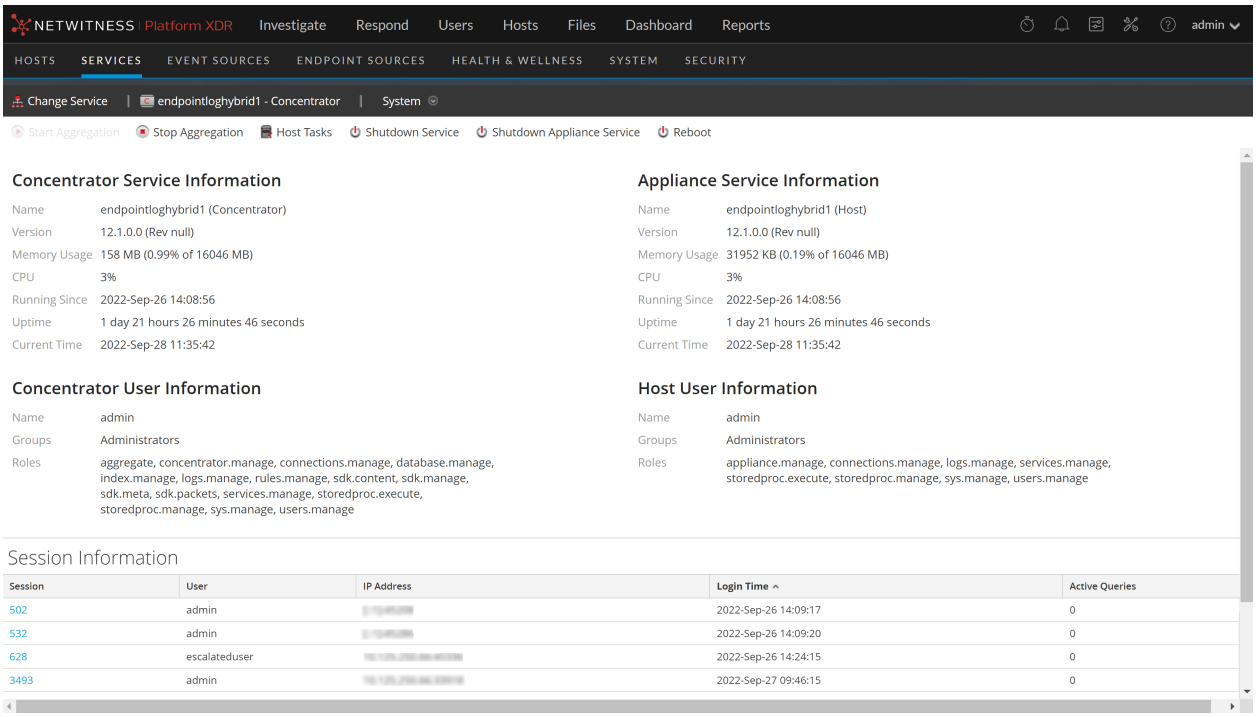
The Services System view displays information specific to specific to Brokers and Concentrators.

While information displayed in this view is the same for all types of Core services, several options in the toolbar are relevant only for Brokers and Concentrators.

What do you want to do?

Role	I want to...	Refer to...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Services System View - Broker or Concentrator
Administrator	Manage System Configuration	Services System View - Broker or Concentrator

Related Topics



- Broker and Concentrator Basics

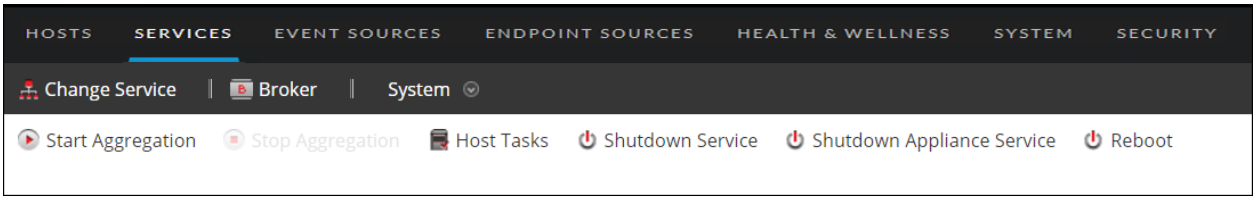
Services System View



You can access this view by doing the following:

1. Go to  **(Admin)** > **Services.**
2. Select a Concentrator or Broker, and select  > **View** > **System**.

   The System view for the selected Concentrator or Broker is displayed.

The following figure is an example of the toolbar for a Broker or Concentrator.

Host Tasks, Shutdown Service, Shutdown Appliance Service or (Shutdown Appliance), and Reboot are common to all services and are described in the "Services System view" topic in the *Host and Services Getting Started Guide*.

This table describes toolbar options that apply only to a Concentrator or Broker. Both buttons are unavailable until aggregator services are configured and consuming data.

Action	Description
Start Aggregation	Starts aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Start Aggregation button is available only when aggregator services are configured and consuming data.
Stop Aggregation	Stops aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Stop Aggregation button is available only when aggregation is occurring.

How Context Hub Works

Context Hub service provides enrichment lookup capability in the Respond and Investigate views. An Administrator can configure the Context Hub service and the data sources to enable an Analyst to perform the context lookup for the required data sources.

By default, the Context Hub service supports enrichment lookups for meta types such as IP address, User, Domain, MAC address, File Name, File Hash, and Host.

The following data sources are supported by NetWitness and provide enriched data when configured.

Lists- Provides contextual information from a list of blacklists, whitelists, or watchlists.

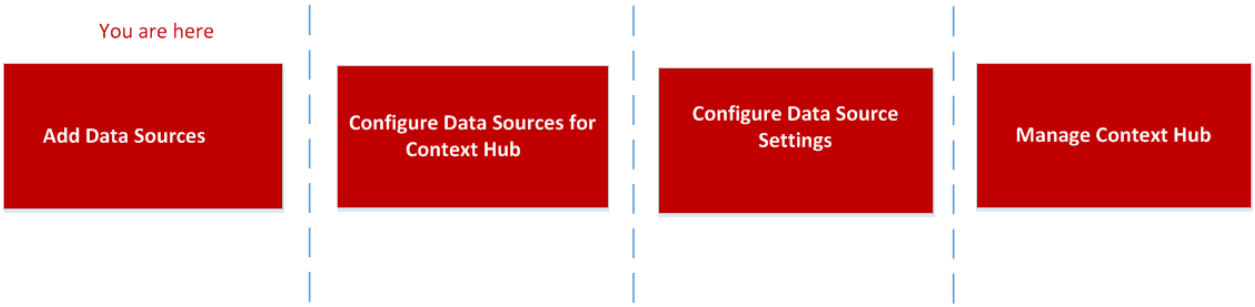
RSA Archer- Provides Criticality information of a device or specific asset based on the IP or Host which needs constant monitoring.

Active Directory - Provides contextual information of a user to help determine if the user is suspicious or not.

RSA NetWitness Endpoint - Provides context information for endpoint module and machine indicators and to help determine if any of the Endpoint devices are compromised.

Respond- Provides contextual information of a specific meta available in respond and enables analyst to respond faster based on context data.

File Reputation Server - Provides contextual information for reputation status of files.



STIX - Provides contextual information on IP address, email address, domain, filename, URL, and file hash from STIX sources.

REST API - Provides contextual information for any accessible web service with an exposed REST API.

Overview of Context Hub Configuration

The Administrator needs to perform each step in the proper sequence to configure the services to perform the context lookup effectively. In the **(Admin) > Services**. Services Config view of Context Hub service, an administrator can configure data sources for Context Hub Service. The administrator can also configure Context Lookups for custom meta keys, if required and also import lists or export lists.

The workflow below describes how the Context Hub service can be configured:

Context Hub service is pre-installed on primary ESA host, and automatically added to the NetWitness.

Note: You can have only one Context Hub service instance enabled in your NetWitness deployment. If there are multiple ESA service in NetWitness, you must choose the appropriate ESA host for Context Hub. A minimum of 8GB space is required to configure Context Hub on ESA host.

Configure Lists as a Data Source

Lists as a Data Source use the Context Hub service to fetch contextual information for meta types that support context lookup. You can create one or more lists and add relevant list values to the list. Make sure that you create meaningful lists such as blacklisted IPs, whitelisted IPs, and so on. The lists can contain supported entities such as IP address, MAC address, User name, Host name, Domain name, File name or File hash. You can import a single-column list or a multi-column list from the Data Source tab. Additionally, all feeds (except STIX feeds) that are created are converted to lists and displayed on the context lookup. If Context Hub is not configured or the service is down, then the feeds will be made available whenever Context Hub is up and running. For more information on creating feeds, see the *Live Services Management Guide*.

Note: When you create a feed, a list is automatically generated with the same name as the feed. If the list name already exists, then the name of the new list is suffixed with the number '2". For example if the existing feed name is test1.csv, then the new list will be named as test2.csv.

List values are in CSV format available in an external location and can be accessed through the following two methods:

- **Local File Store**: You can share a file from a local location.
- **HTTP(S)**: You can share a file using a web server location.

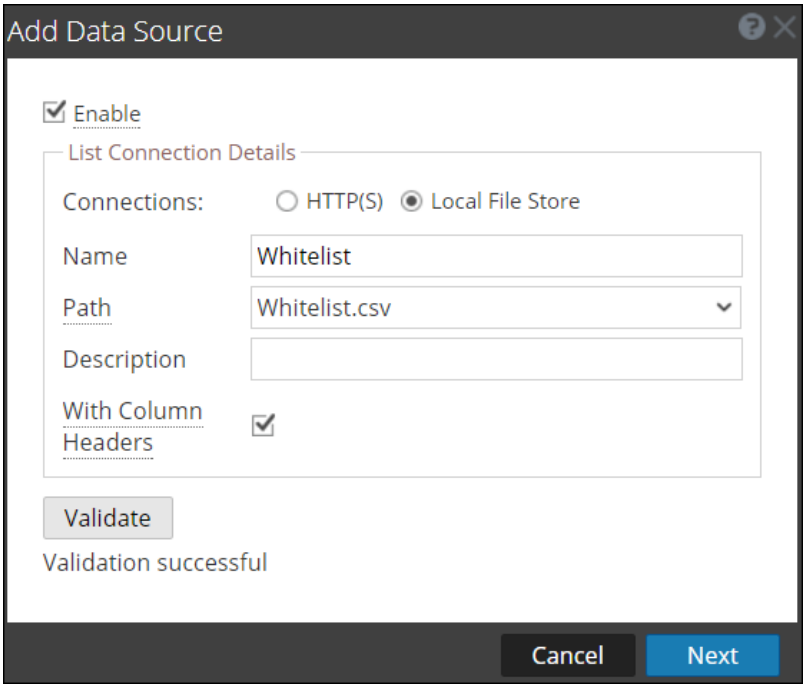
Note: You can also set up recurring job to fetch data on regular intervals by using the Prefetch settings while configuring meta mapping.

Prerequisites

Before you configure Lists data source, ensure that:

- User should have admin permissions.
- Context Hub service is available in  **(Admin) > Services** view of NetWitness.
- If you are using Local File Store or HTTP(S) server, the path mentioned should contain the CSV file In case of remote Local File Store, the file must be mounted or placed on the local drive location `/var/lib/netwitness/contexthub-server/data`.
- The NetWitness user must have read permission to access the file.

Caution: If you are creating a Context Hub list for use as an enrichment source in ESA, the list name cannot include any spaces or special characters, or start with a number. If you do not follow this naming convention, when you attempt to add the list as an enrichment source in ESA, an error message will be displayed and you will not be allowed to add the list.

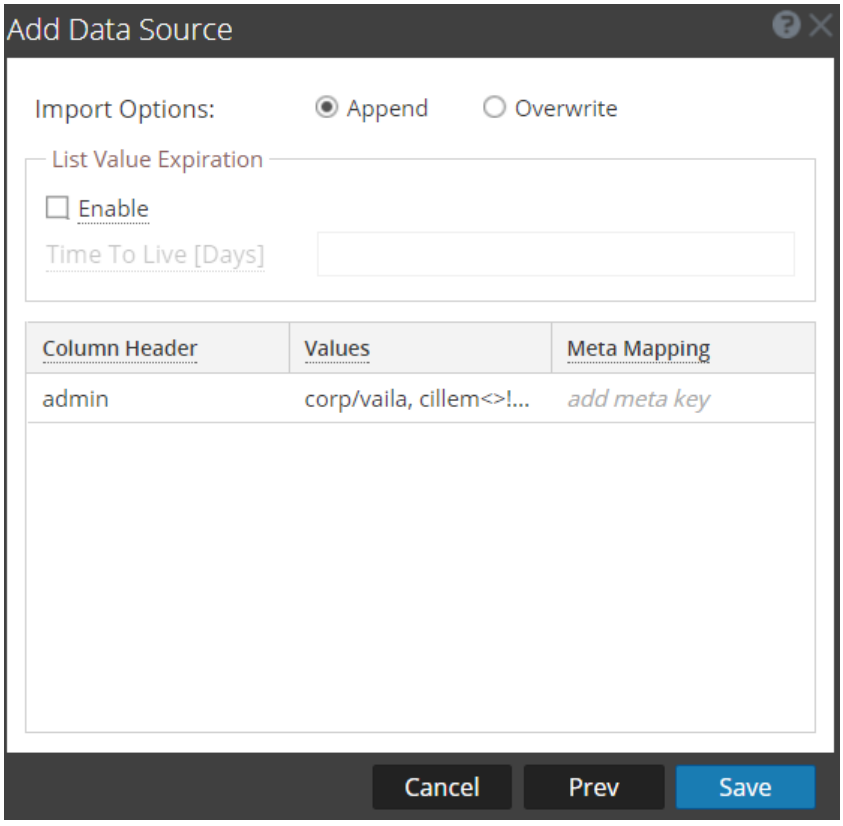


Add List data source using Local File Store

To add a List as a data source:

1. Go to **(Admin) > Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click > **LIST**.
   The **Add Data Source** dialog is displayed.
4. By default, the **Enable** checkbox is selected. If this option is unchecked, the Next button is disabled, you cannot add the data source, view the list in the list tab and view the contextual information.
5. By default, the Context Highlighting checkbox is enabled. This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub.

Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.



6. Select the **Local File Store** Connection Type.

7. Provide the following database connection details. Enter the following fields for Local File Store Connection Type:
   - **Name:** Provide a name for the list data source.
   - **Path:** This field displays all the data files available in the data folder `/var/lib/netwitness/contexthub-server/data`, where context hub service is running. Select the file name from the drop-down.
     A maximum of 32 columns of CSV file are supported that adhere to the RFC1480 standards.
   - (Optional) **Description**: Add a description for the selected file.
   - **With Column Headers**: Select this option to consider the first row as column headers from the CSV file. If you don't select this option, you need to enter the column headers in the next screen.
8. Click **Validate**.

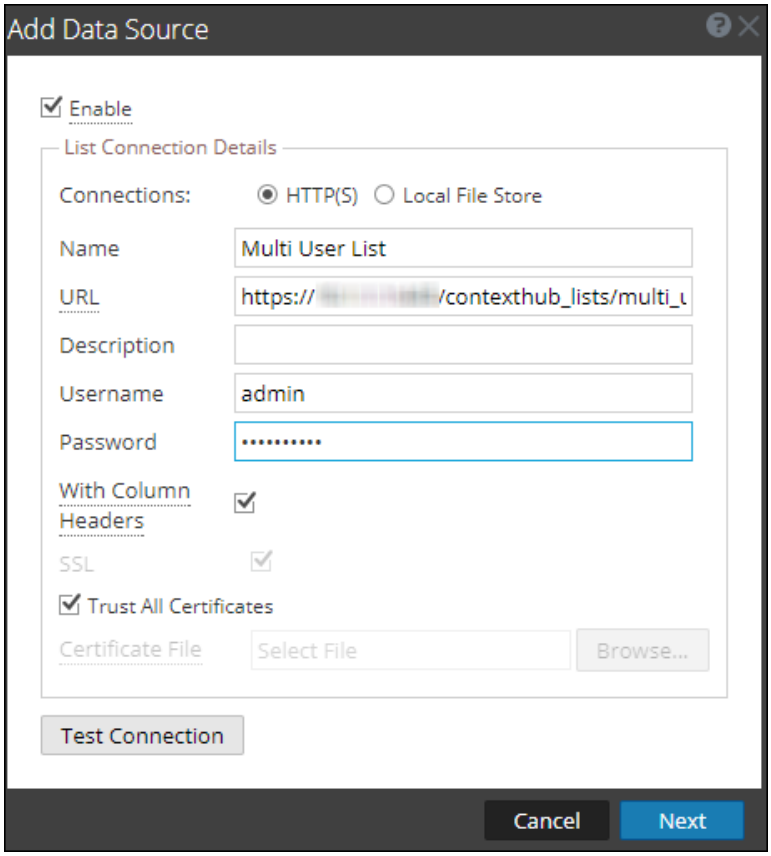
   If the validation fails, you cannot add the data source.
9. Click **Next**.

   The next dialog is displayed.

10. Select any one of the following options:
    - **Append** - Select this option to add the imported values to an existing list.
    - **Overwrite** - Select this option to replace the values in an existing list with the imported values.
11. In the **List Value Expiration** section, the **Enable** option is unchecked, by default. If you want to store the looked up list values in the cache for a specified number of days then select the **Enable**

checkbox and enter the number of days in the **Time to Live (days)** field for the list values to be retained.

12. In the next screen, map at least one meta key with one or more meta types by mapping a column header with a meta. The description for each field is as follows:
    - **Column Header**: Display headers of the CSV file which must be mapped to a meta type.
    - **Meta Mapping**: Maps a column header field to a meta type.
    - **Values**: Displays the first three values from the imported list.
13. Click **Save**.



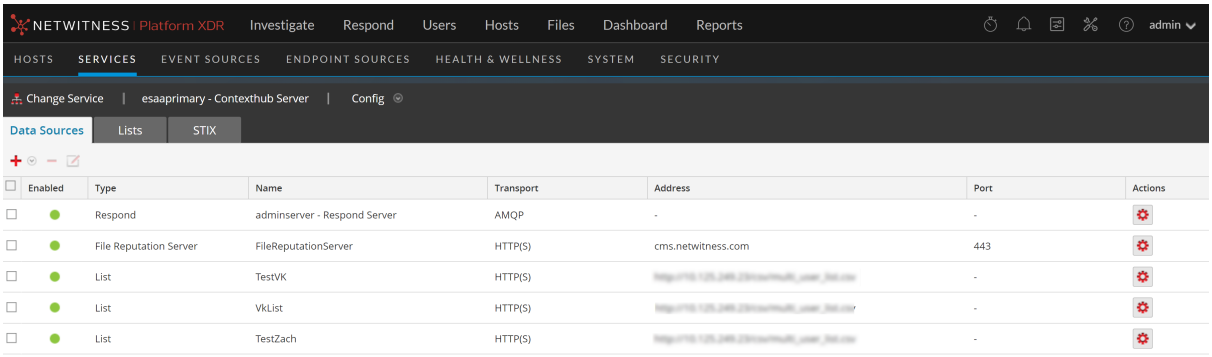
Add List data source using HTTP(S)

To add List as a data source:

1. Select  **(Admin) > Services**.
   The services view is displayed.
2. Select the Context Hub service and click  > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click  > **LIST**.
   The **Add Data Source** dialog is displayed.
4. By default, the **Enable** checkbox is selected. If this option is unchecked, the Next button is disabled, you cannot add the data source, view the list in the list tab and view the contextual information.
5. By default, the Context Highlighting checkbox is enabled. This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

6. Select the HTTP(S) Connection Type.



- Enter the following fields for HTTP(S) Connection Type:
  - **Name:** Provide a name for the list data source.
  - **URL**: Enter the path of the CSV file available on the HTTP(S) location along with the host name or IP address of the remote machine where the list is stored. The URL must be of the format: `https://<Hostname or IP-address of the HTTP(S)server>:<Port on which the HTTP(S) server is hosted>/<Absolute path of CSV file>`. For example, `https://10.1.1.1:443/contexthub_lists/multi_user_list.csv`
  - (Optional) **Description**: Add a description for the selected file.
  - (Optional) **Username:** Enter the username to connect to the HTTP(S) server requires basic authentication.
  - (Optional) **Password:** Enter the password to connect to the HTTP(S) server requires basic authentication.
  - **With Column Headers**: Select this option if you want to import a CSV file with headers. If this option is selected and you import the CSV without headers, the first row will be considered as a header which can be edited.
  - **SSL:** If you enter a URL with HTTPS in this field, then this is selected automatically. If you enter a URL with HTTP, then this checkbox is unselected.

- **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid .cer or .crt format HTTP (S)server certificate for the connection to be successful.

7. Click **Test Connection** to test the connection between Context Hub and the data source.
8. Click **Save** to save the settings.

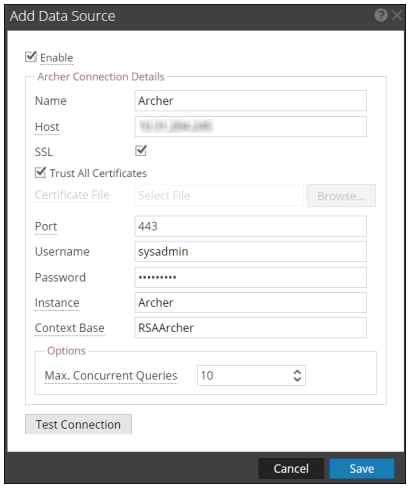
   List is added as a data source for the configured Context Hub and is displayed in the **Data Sources** tab.

Next Steps

- Add, edit, or remove values from a specific list.
- Configure the data source settings to determine the data source fields to be displayed in the Context panel. For instructions, see Configure Context Hub Data Source Settings .
- Import and export a list. For more information, see Import or Export Lists for Context Hub.
- View the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA NetWitness Respond User Guide* and *RSA NetWitness Investigate User Guide*.

Configure Archer as Data Source

You can configure Archer as a data source for Context Hub and use the Context Hub service to fetch contextual information from Archer. Use the procedures in this topic to add Archer as a data source for Context Hub service and configure the settings (if required) for Archer.



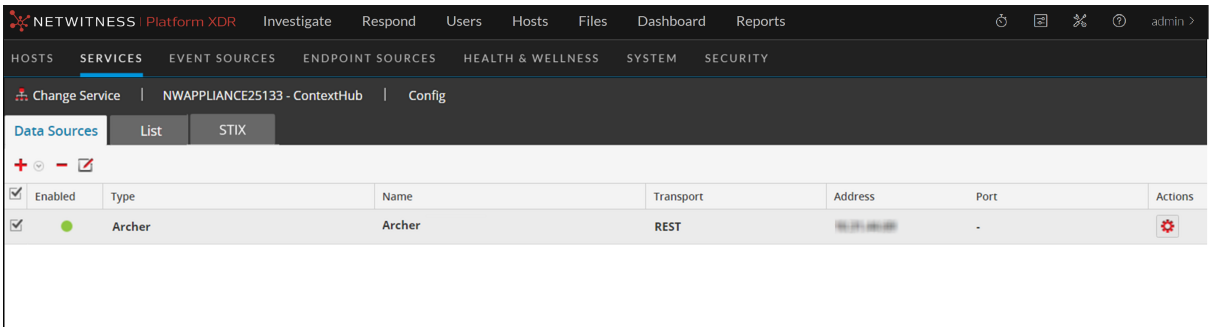
Prerequisites

Before you configure Archer data source, ensure that:

- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- Archer is installed with Licensed Devices application.

To add Archer as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service, and click > **View** > **Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, click > **RSA Archer**.
   The **Add Data Source** dialog is displayed.



4. Provide the following information:
   - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
   - **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

- Enter the following fields:
  - **Name**: Enter a name for Archer data source.
  - **Host**: Enter the hostname or IP address where Archer server is installed.
  - **SSL**: By default this option is selected and enables SSL communication to Archer .
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid Archer server certificate for the connection to be successful.
  - **Port**: The default port is 443.
  - **Username**: Enter the Archer Server username.
  - **Password**: Enter the Archer Server password.
  - **Instance**: Enter the Instance name from which you want to extract data. An RSA Archer instance is a single set up that includes unique content in a database, the connection to the database, the interface, and log-in. You might have individual instances for each office location or region or for development, test, and production environments. The Instance Database stores the RSA Archer content for a specific instance.
  - **Context Base**: Enter the virtual directory name where the files are stored. For example, rsaarcher located at the RSA Archer web address https://archer.company.com/**rsaarcher**/default.aspx. If the files are stored in the IIS default web address https://archer.company.com/default.aspx, then this field must be empty.
  - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the Archer data source.
6. Click **Save**.

   Archer is added as a data source for Context Hub and is displayed in the **Data Sources** tab.

After adding the data source, you can configure data source settings. For instructions, see Configure Context Hub Data Source Settings . And View the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, see the *NetWitness Respond User Guide* and *Investigate User Guide*.

Configure Archer Data Source

After you have configured the required data sources you can customize the settings for the data sources based on your requirement.

To access and configure settings:

1. Go to **(Admin) > Services**.

   The services view is displayed.

2. In the Services panel, select the Context Hub service and click > **View** > **Config**.

   The Services Config view of Context Hub is displayed.

3. Select the data source for which you want to configure the settings and click in the Actions column.

   The following screenshot is an example of the Configure RSA Archer dialog:

4. In the **Settings** tab. Configure the following fields:

Field	Description
Enable	This option is enabled by default (checked) and can be used to enable or disable the response from the selected data source.
Cache Settings	Any lookup from Context Hub can be stored in the Context Hub cache for a configured time. Response to any subsequent matching request will be fetched from the Context Hub cache. Use this section to define the following cache settings for query lookup: • **Cache Enabled**: By default, this checkbox is selected and the query response is cached. • **Cache Expiration (Minutes)**: The maximum time the query lookup is retained in cache. The default time is 30 minutes and maximum is 7200 minutes that you can configure.

5. Click **Cache Settings**. Configure the following fields.

Field	Description
Export Attributes Configuration	In **Settings**, **Export Attributes Configuration**, click **Export** to export the Archer Attributes Configuration. These are the attributes visible in Context Lookup while viewing Archer details for a IP, Host, or Mac. A JSON configuration file gets downloaded and the order of the attributes in sync with the listing in the context panel is maintained in the JSON file.
Import Attributes Configuration	If you want to update or edit the configuration settings, in **Settings**, **Import Attributes Configuration**, click **Browse**. Select the JSON file containing the configuration attributes. The attributes appear in the Context Lookup panel when a user views the context, in the order which they were imported. **Note:** You can backup the previous attributes before importing any changes made to existing attributes.
Data Prefetch Settings	In **Settings**, **Data Prefetch Settings** helps prefetch the data. Configure the **Schedule Recurrence** to provide data faster when you hover over the intended entity in Respond.
Schedule Recurrence	In the **Recur Every** field, enter a value or use the drop-down to configure the recurrence for prefetch. The default time duration can be selected from the drop-down list for configuring the duration of recurrence. Available values are minutes, hours, days, or weeks.

6. Click any one of the following options:

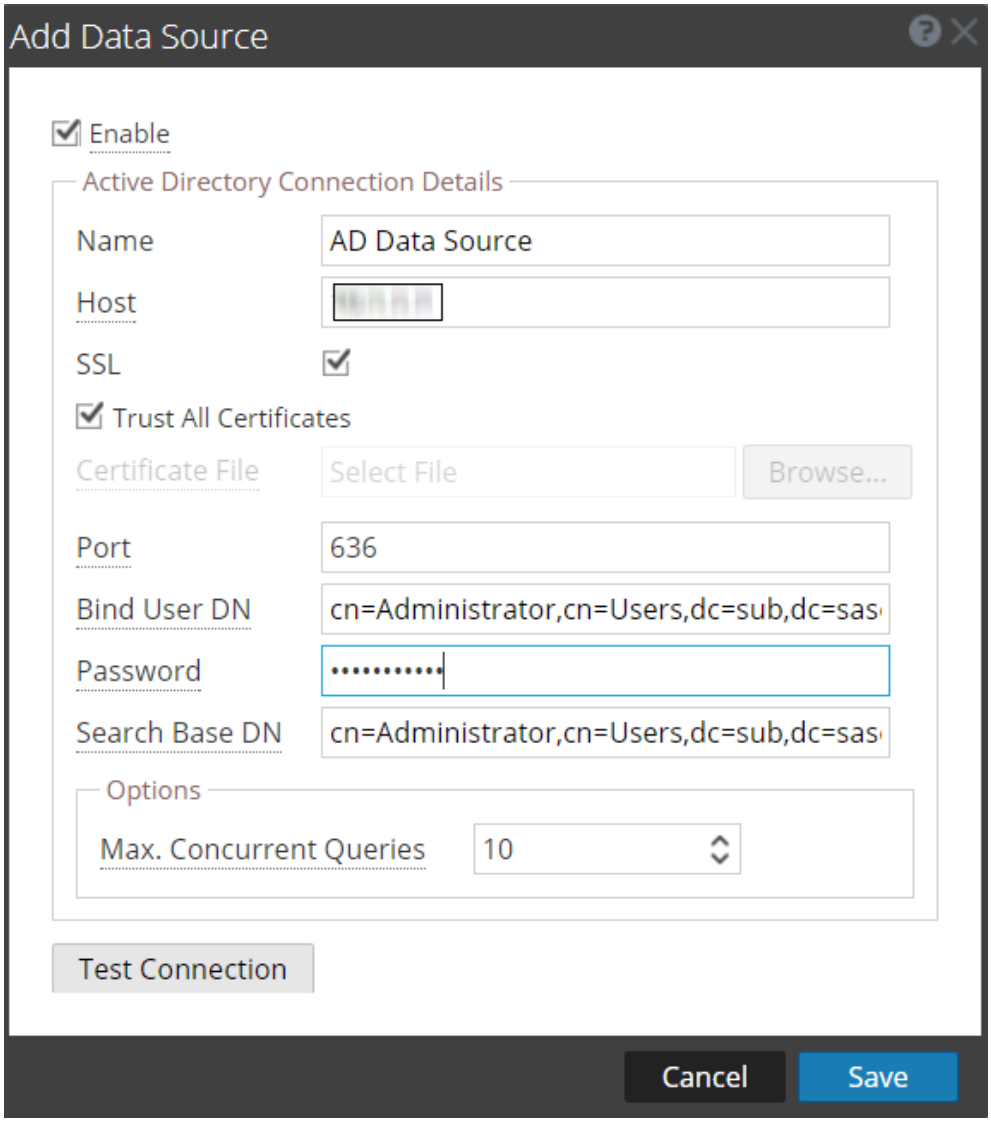
- **Cancel** - select this option to cancel the changes.
- **Save** - select this option to save the changes.
- **Save and Close** - select this option to save and close the dialog.

Note: After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to  **(Admin) > Services**> **View** > **Explore** view. Make sure you restart the Context Hub service if you make any configuration changes in the Explore view.

Configure Active Directory as a Data Source

You can configure Active Directory (AD) as a data source for Context Hub using LDAP and use the Context Hub service to fetch contextual information from AD. Use the procedures in this topic to add AD as a data source for Context Hub service and configure the settings(if required) for AD.

Prerequisites



Before you configure Active Directory data source, ensure that:

- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- AD is available and is running on Windows versions 2003, 2008, and 2012 are supported.

To add AD as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The services view is displayed.
2. Select the Context Hub service and click **> View> Config**.
   The Services Config View of Context Hub is displayed.

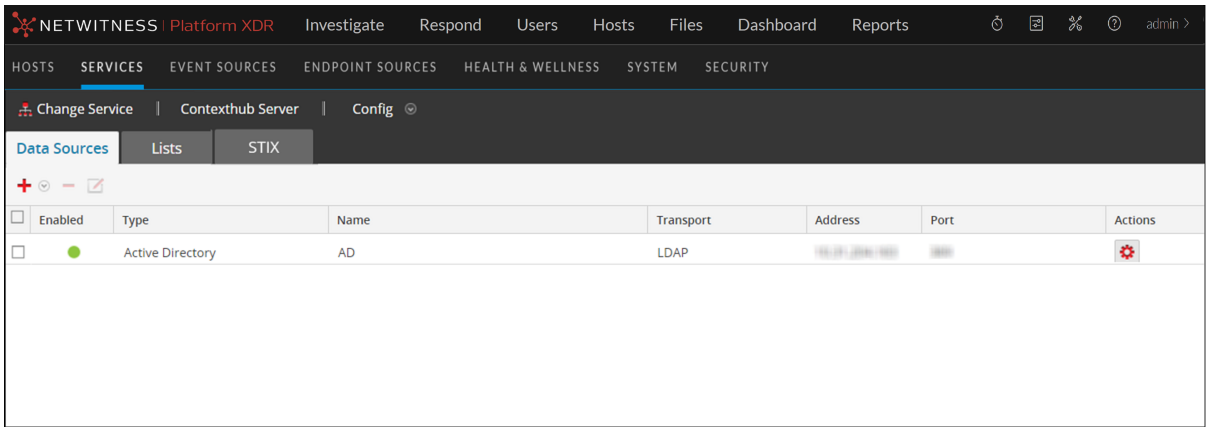
3. In the **Data Sources** tab, click + **> Active Directory**.
   The **Add Data Source** dialog is displayed.

You need to configure the Active Directory schema to replicate the following attributes to view the data in the Respond page:

- Employee ID
- Department
- Company
- Title
- Postal Code

All the other attributes replicate automatically.

4. Provide the following database connection details:



- By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
- Enter the following fields.
  - **Name:** Enter a name for the AD data source.
  - **Host:** Enter the host name or IP address of the AD.
  - **SSL:** By default this will be checked with 636 port number which will connect to the data source using Secure Sockets Layer (SSL) connection.
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid .cer or .crt format Active Directory server certificate for the connection to be successful. If you add multiple AD data sources with ssl, you should configure all the data sources with either a valid certificate or a Trust All Certificates.
  - **Port:** The default port is 636 with SSL and 389 without SSL.
    If you want to fetch data from multi-domains you can configure a single data source with the Global catalog port (3269 with SSL or 3268 without SSL).

    Alternately, for multi-domain, you can configure a single data source for each domain with the default port (389 with SSL or 636 without SSL).

    Multi-forest is a collection of multi-domains. If you want to fetch data from multi-forest you need to configure each forest with the Global catalog port (3269 with SSL or 3268 without SSL).
  - **Password:** Enter password of the user DN used to bind with AD.
  - **Bind User DN:** The distinguished name of the user that will authenticate to the search directory. For example, cn=Administrator,cn=Users,dc=sub,dc=saserver,dc=local.
  - **Search Base DN:** The base distinguished name, or base DN, identifies the entry in the directory from which searches are initiated; the base DN is often referred to as the search base. For example, dc=sub,dc=saserver,dc=local.

5. Click **Test Connection** to test the connection between Context Hub and the data source.
6. Click **Save**.
   AD is added as a data source for the configured Context Hub. The added AD data source is displayed

in the **Data Sources** tab.

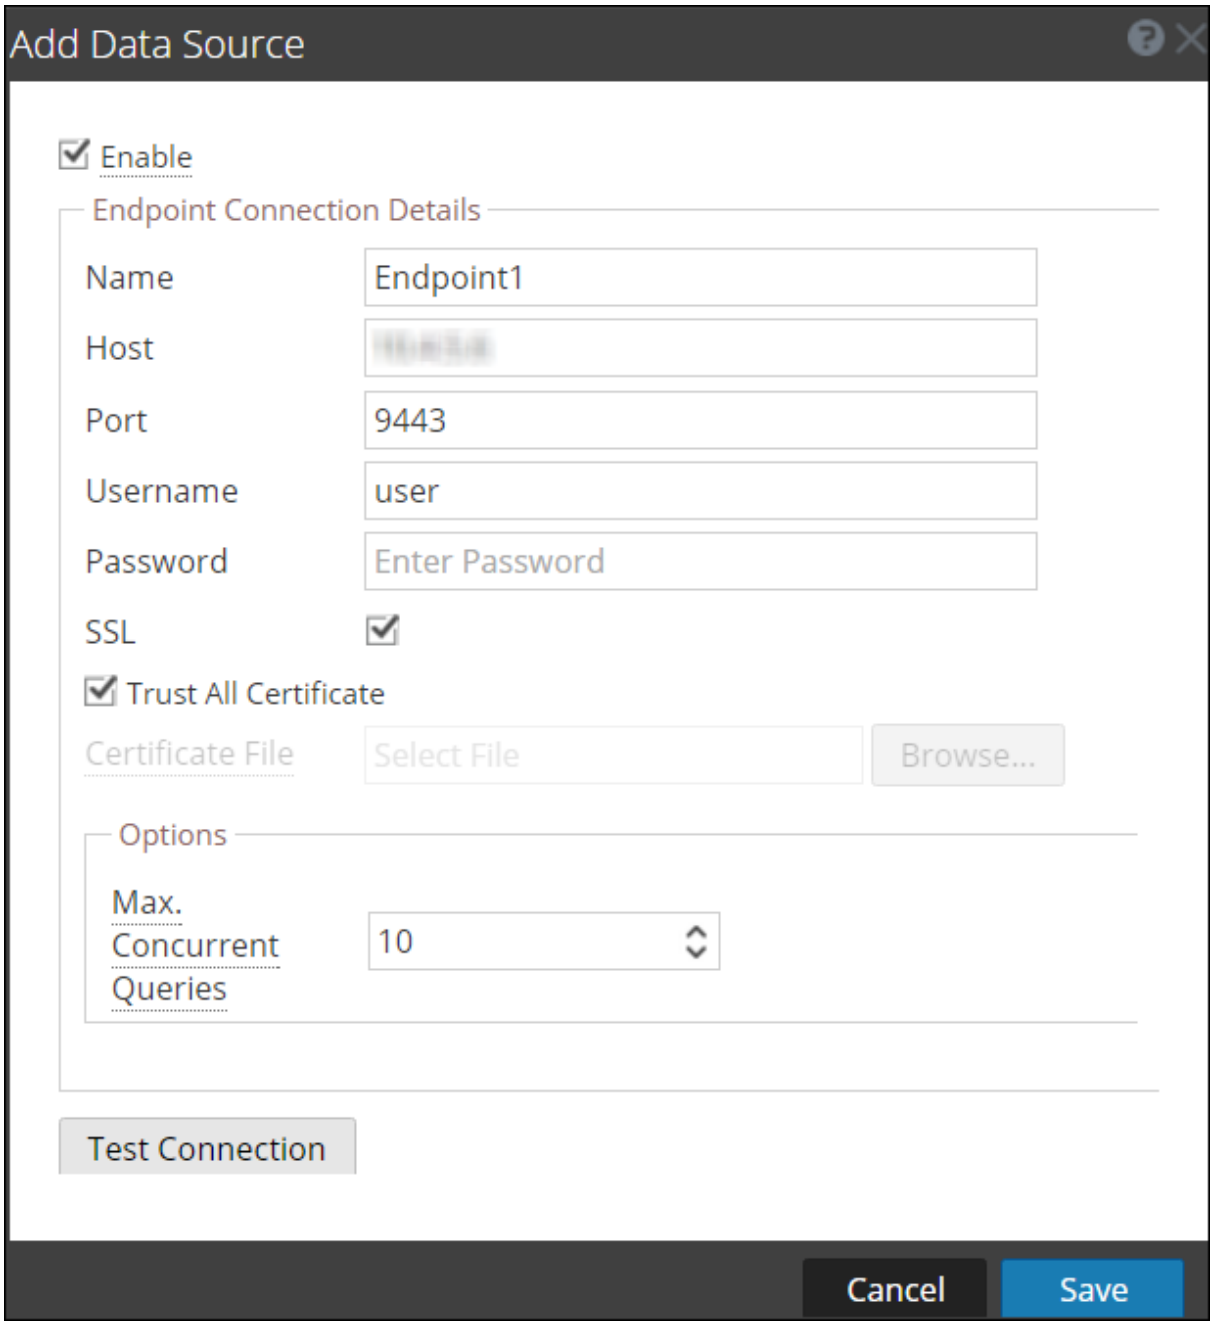
After adding the data source, you can configure the data source settings. For instructions, see Configure Context Hub Data Source Settings .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, see the **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

Configure NetWitness Endpoint as a Data Source

You can configure NetWitness Endpoint as a data source for Context Hub and use the Context Hub server to fetch contextual information from NetWitness Endpoint. Use the procedures in this topic to add NetWitness Endpoint as a data source for Context Hub service and configure the settings (if required) for NetWitness Endpoint.



Prerequisites

Before you configure NetWitness Endpoint data source, ensure that:

- Context Hub service is available in  **(Admin) > Services**.view of NetWitness.
- NetWitness Endpoint (v4.1.1 to 4.3.0.5) is installed and configured.
  For more information on how to install, configure and for detailed information on NetWitness Endpoint, see the NetWitness Endpoint documents available at NetWitness Community.

To add NetWitness Endpoint as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service, and click > **View** > **Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, click > **RSA Endpoint**.
   The **Add Data Source** dialog is displayed.

4. Provide the following information:

   - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
   - **Context Highlighting** – This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

   Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

   - Enter the following fields:
     - **Name**: Enter a name for NetWitness Endpoint data source.
     - **Host**: Enter the hostname or IP address where NetWitness Endpoint API server is installed.
     - **Port**: The default port is 9443.
     - **SSL**: Select SSL if you want NetWitness to communicate with the host using SSL. This is enabled by default.
     - **Username**: Enter the NetWitness Endpoint API Server username.
     - **Password**: Enter the NetWitness Endpoint API Server password.
     - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid server generated or CA certificate to authenticate the connection with the supported formats of .cer or .crt of Base64 [PEM] encoded or DER encoded.
     - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the NetWitness Endpoint.

6. Click **Save**.
   NetWitness Endpoint is added as a data source for Context Hub and is displayed in the **Data Sources** tab.

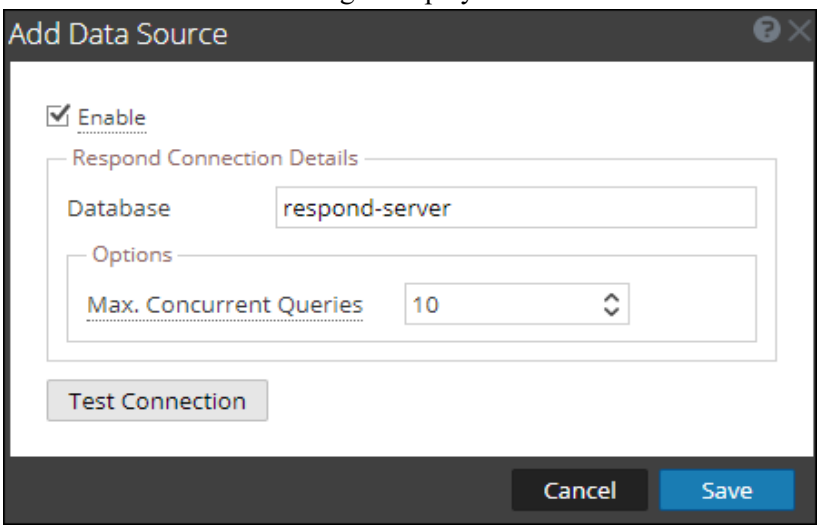
Next steps

After adding the data source, you can configure the settings. For more information, see Configure Context Hub Data Source Settings .

Also you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA NetWitness Respond User Guide* and the *RSA NetWitness Investigate User Guide*

Configure Respond as a Data Source

You can configure Respond as a data source for Context Hub and use the Context Hub service to fetch contextual information from Respond service. If Respond service is already configured, the configuration details are pre-populated while adding Respond as a data source. Use the procedures in this topic to add Respond as a data source for Context Hub service and configure the settings.



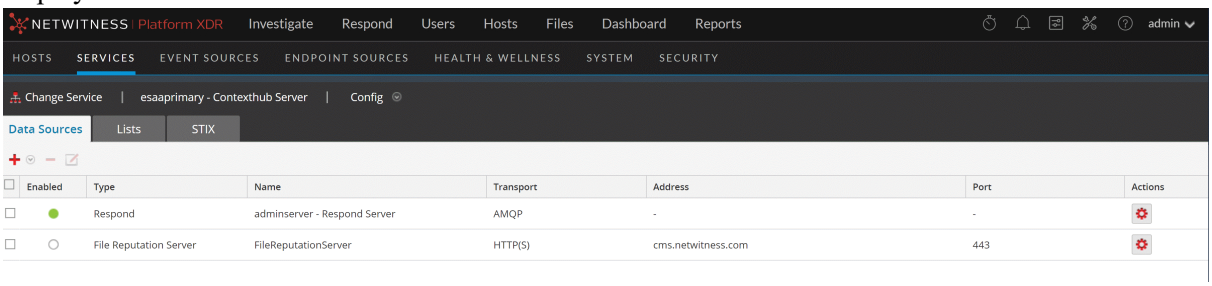
Prerequisites

Before you configure Respond data source, ensure that:

- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- Respond service is available.

To add Respond as a data source for Context Hub:

1. Go to **(Admin) Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click > **Respond**.
   The **Add Data Source** dialog is displayed.



The required fields to configure the Respond data source are automatically updated.

You can enable or disable Context Highlighting. This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

> **Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

4. Click **Test Connection** to test the connection between Context Hub and the data source.
5. Click **Save**.
   Respond is added as a data source for the configured Context Hub. The added Respond data source is displayed in the **Data Sources** tab.

After adding the data source, you can configure the settings. For more information, see Configure Context Hub Data Source Settings .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA NetWitness Respond User Guide* and the *RSA NetWitness Investigate User Guide*.

Configure File Reputation Server as a Data Source

File Reputation Server provides analysts the opportunity to view reputation status of files. By default, File Reputation is enabled in Additional Live Services section.

If Context Hub service is configured, File Reputation Server is automatically added as data source for Context Hub.

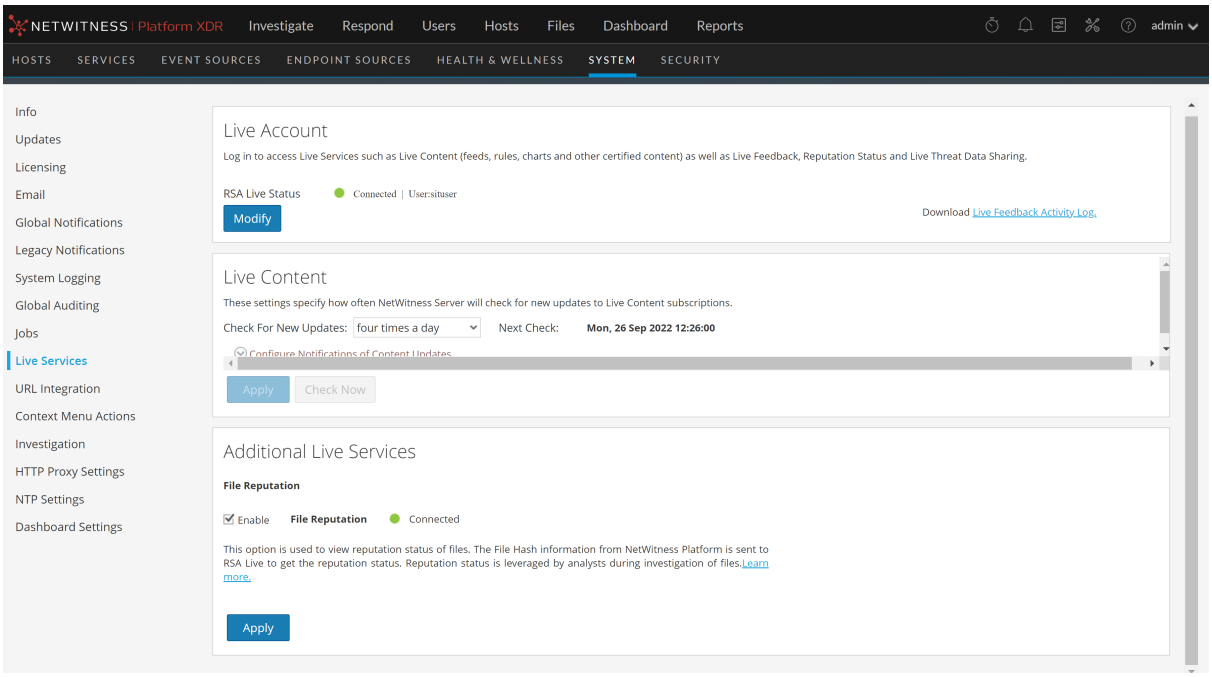
Prerequisites

Ensure the followings:

- Context Hub is enabled and the service is available in  **(Admin) > Services** view of NetWitness.
- RSA Live Account is available.

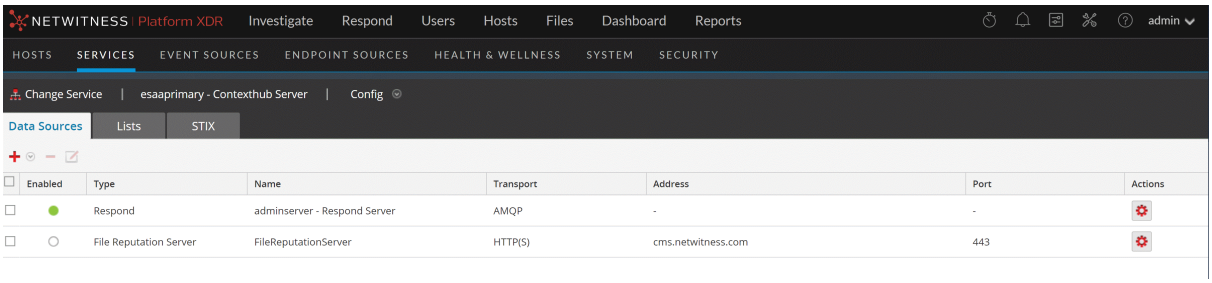
Note: To create a Live Account, see the **Step 1. Create Live Account** topic in the *Live Services Management Guide*.

By default, **File Reputation** is enabled in **Additional Live Services** section. Before setting up File Reputation data source, make sure that you have signed in to your Live account with your Live Account Credentials and Context Hub is enabled. File Reputation is automatically added as a data source for context hub.



For information about configuring Live Account and Live Services, see the **Configure Live Services Settings** topic in the *System Configuration Guide*.

For information about configuring Context Hub service, see the **Step 1. Add the Context Hub Service** topic in the *Context Hub Configuration Guide*.



Enable or Disable File Reputation Data Source

To enable or disable File Reputation data source for Context Hub:

1. Go to  **(Admin) > System**.
2. In the left navigation pane, select **Live Services**.
3. In the **Additional Live Services** section, enable **File Reputation**.

4. Click **Apply**.
   File Reputation Server data source is enabled for Context Hub service.
5. To verify, go to the **Data Sources** tab and view the available sources.
   File Reputation source must be added to the list of available sources and the **Enabled** field must be a solid green circle ( ).

6. To disable File Reputation data source, disable **File Reputation** in Additional Live Services panel and click **Apply**.

   File Reputation data source is disabled for Context Hub service.

Edit File Reputation Server Data Source Settings

To edit File Reputation Server data source for Context Hub:

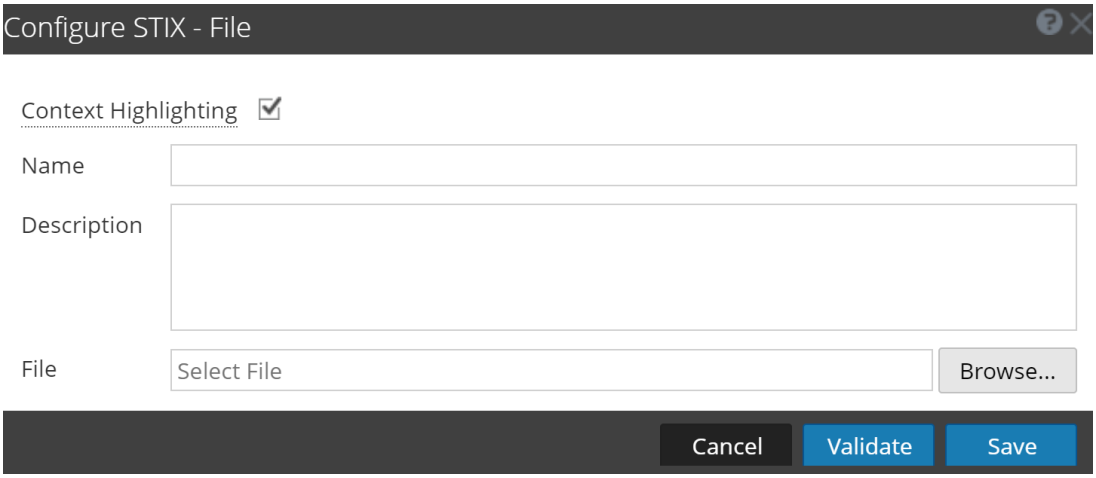
1. Select **(Admin) > Services**.
   The Services view is displayed.

2. In the **Services** panel, select the Context Hub service, and **> View > Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, select the File Reputation Server source and click .
   The **Edit Data Source** dialog is displayed.

4. Edit the required fields:

Field	Description
Context Highlighting	This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled. **Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.
Max. Concurrent Queries	You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 25.

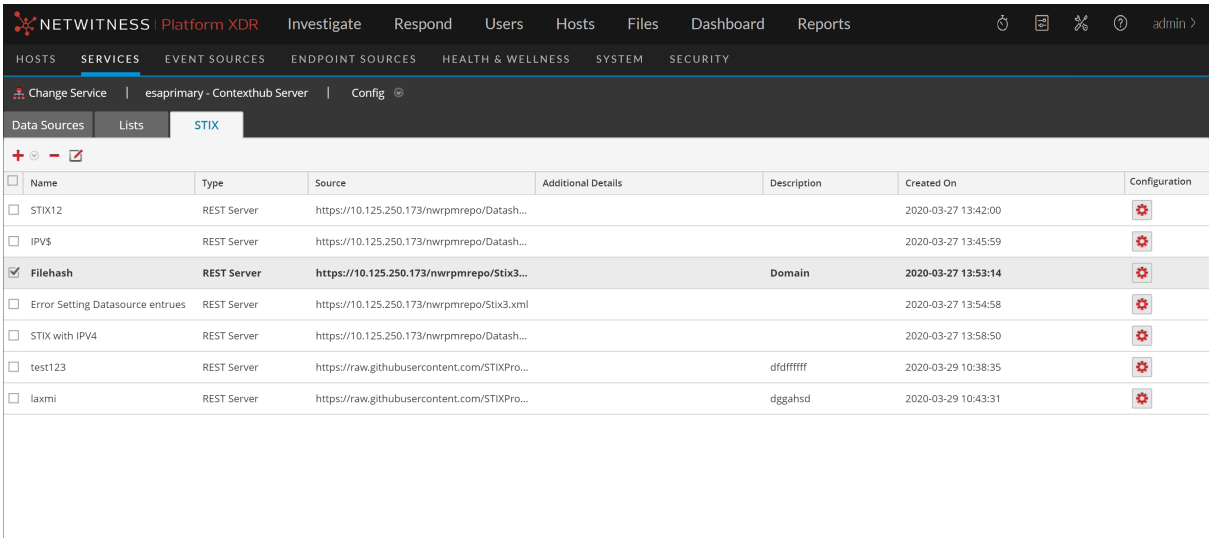
5. To edit the Proxy settings, see **the HTTP Proxy Settings Panel** topic in the *System Configuration Guide*.
6. Click **Test Connection** to test the connection between Context Hub and the data source.
7. Click **Save** to save the settings.



Configure STIX as a Data Source

You can configure Structured Threat Information eXpression (STIX) as a data source for Context Hub and use the Context Hub service to fetch contextual threat intelligence information from a STIX source.

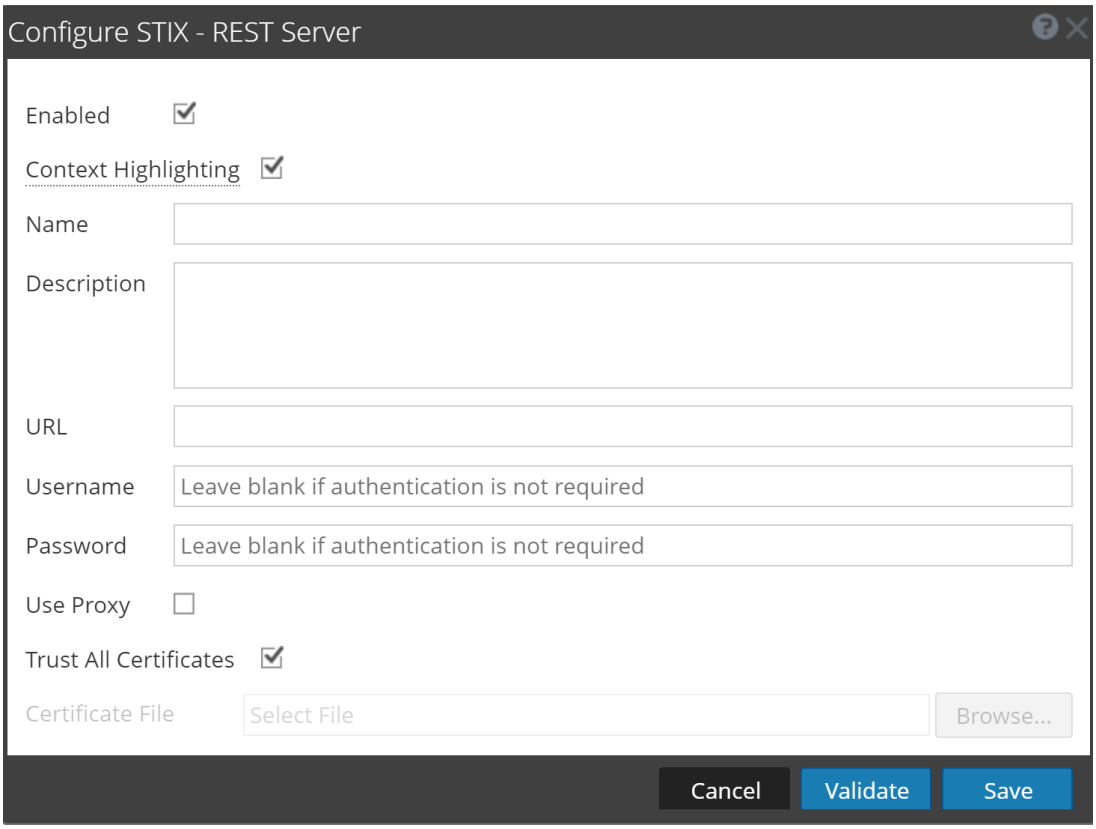
Configure STIX File



To add STIX as a data source for Context Hub:

1. Go to **(Admin) > Services** .
   The Services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services config view of Context Hub is displayed.
3. Click the **STIX** tab, and click .
4. Select **File** as data source.

4. Provide the following details:
   a. **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.
   b. **Name**: Provide a name for the STIX file data source.
   c. **Description**: Provide description of the data source.
   d. **File**: Browse for the file you want to add as a data source.
5. Click **Validate** to verify the format of the file.



6. Click **Save** to configure the data source.
   The File is added as a data source for the configured Context Hub and is displayed in the **STIX** tab.

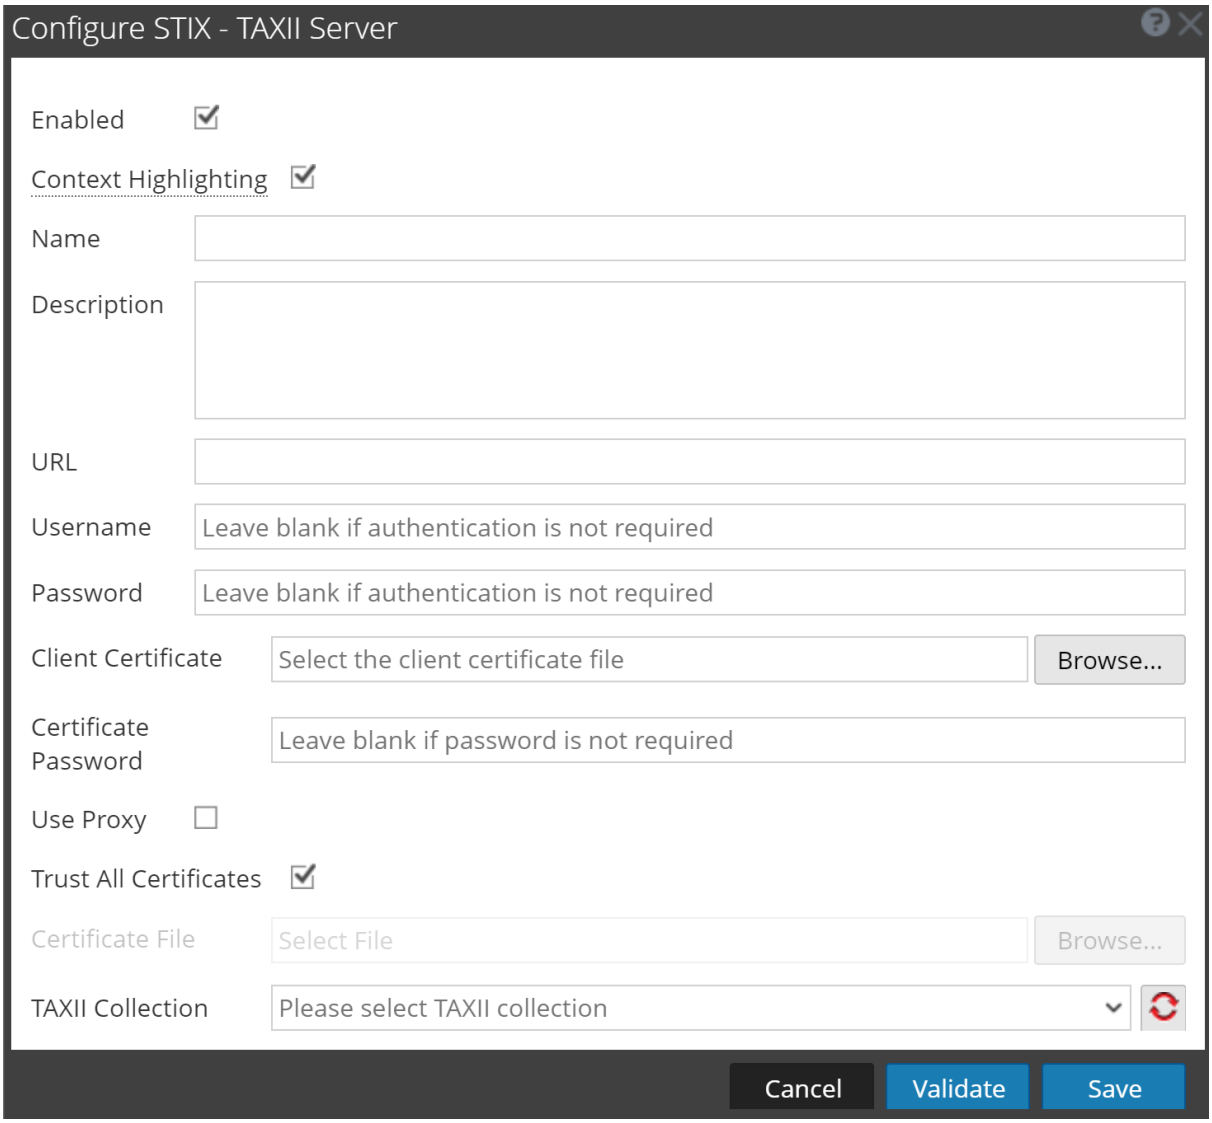
Configure REST Server

To add REST as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services config view of Context Hub is displayed.
3. Click the **STIX** tab, and click .
4. Select **REST Server** as data source.

4. Provide the following details:
   a. **Enabled**: Select this checkbox to enable the connection.
   b. **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.
   c. **Name**: Provide a name for the REST Server data source.
   d. **Description**: Provide a description for the data source.
   e. **URL**: Specify the URL to the STIX file to be hosted on the server.
   f. (Optional) **Username**: Enter the username for the REST server.
   g. (Optional) **Password**: Enter the password for the REST server.
   h. **Use Proxy**: Select this checkbox to use proxy.
   i. (Optional) **Trust All Certificates**: Select this checkbox if you want to trust all certificates and do not have a custom certificate.
   j. (Optional) **Certificate File**: Browse for the certificate file if you have not selected the Trust All certificates checkbox.
5. Click **Validate** to verify the connection parameters to the REST Server.

6. Click **Save** to configure the data source.
   The REST Server is added as a data source for the configured Context Hub and is displayed in the **STIX** tab.



After adding the data source, you can configure additional settings. For more information, see Configure Context Hub Data Source Settings .

Configure TAXII Server

To add TAXII Server as a data source for Context Hub:

1. Go to  **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service and click  > **View** > **Config**.
   The Services config view of Context Hub is displayed.
3. Click the **STIX** tab, and click .

4. Select **TAXII Server** as data source.

5. Provide the following details:
   a. **Enabled**: Select this checkbox to enable the connection.
   b. **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.
   c. **Name**: Provide a name for the TAXII Server data source.
   d. **Description**: Provide a description for the data source.
   e. **URL**: Specify the discovery URL to the TAXII Server.
   f. (Optional) **Username**: Enter the username for the TAXII server.
   g. (Optional) **Password**: Enter the password for the TAXII server.

h. (Optional) **Client Certificate**: Browse to upload a pkcs12 format client certificate available on your local system.

i. (Optional) **Certificate Password**: Enter the password to the certificate, if it is password-protected.

j. (Optional) **User Proxy**: Select this checkbox to use proxy.

k. (Optional) **Trust All Certificates**: Select this checkbox if yoenabu want to trust all certificates and do not have a custom certificate.

l. (Optional) **Certificate File**: Browse for the certificate file if you have not selected the Trust All certificates checkbox.

m. **TAXII Collection**: Select the TAXII Collection name from the drop-down to automatically download the collection.

6. (Optional) Click  to manually retrieve the list of collections available in the TAXII server , if the collections are not downloaded automatically.
7. Click **Validate** to verify the connection parameters to the TAXII Server.
8. Click **Save** to configure the data source.
   The TAXII Server is added as a data source and is displayed in the **STIX** tab.

After adding the data source, you can configure additional settings. For more information, see Configure Context Hub Data Source Settings .

Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

Configure REST API as a Data Source

You can configure REST API as a data source for Context Hub which allows analysts to use the Context Hub during an investigation to fetch contextual information from any accessible web service with an exposed REST API. Use the procedures in this topic to add REST API as a data source for Context Hub service and configure the settings (if required) for REST API. The maximum number of REST APIs supported by default is ten.

Prerequisites

Before you configure REST API data source, ensure that:

• Context Hub service is available in  (Admin) > **Services** view of NetWitness Platform.

• Third-party REST API web server is reachable.

To add REST API as a data source for Context Hub:

1. Go to (**Admin**) > **Services**.
   The Services view is displayed.

2. Select the Context Hub service and click  > **View** > **Config**.
   The Services Config view is displayed.

3. In the **Data Sources** tab, click  > **REST API**.
   The Add Data Source dialog is displayed.

4. Provide the following information:
   - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
   - Enter the following fields.
     a. **Name** - Enter a name for the REST API data source.
     b. **URL** - Specify the REST API URL with the query parameters.
     The following table lists some examples of URL and associated parameters:

URL	Parameters
https://www.virustotal.com/vtapi/v2/file/report?apikey=<API Key>&resource=$metaValue	• **API key** – Specify your API key • **$metaValue** - You must specify the Test meta value in step 7 to test the REST API connection. For example, C5D0065B594A4775E26FA9875B21189F

URL	Parameters
https://www.virustotal.com/vtapi/v2/url/report?apikey= 1bfdf66f3b0f1875381830ec933f7151f5b48c1cbaa54ac625f2d5a74312e9a2&resource=$metaValue	• **API key** – Specify your API key • **$metaValue** - You must specify the Test meta value in step 7 to test the REST API connection. For example, textspeier.de

c. **Description** – Enter the description of the REST API data source.

d. **User name**: Enter the username of the REST API if it needs to be authenticated.

e. **Password**: Enter the password of the RSET API if it needs to be authenticated.

f. **Response Type**: Select the REST API response type. Possible values are:

- HTML
- JSON

g. **Test Meta value**: Enter the meta value to test the REST API connection.

Note:
- The meta value you specify will be replaced with `$metavalue` in the URL mentioned in step 2 for test connection.
- During context lookup, the `$metavalue` variable is replaced with meta value in the REST API call.

h. **SSL** - Enables SSL communication to REST API. By default, this option is selected.

i. (Optional) **Trust All Certificates**: Select this checkbox if you want to trust all certificates and do not have a custom certificate. By default, this option is enabled.

j. (Optional) **Certificate File**: Browse for the certificate file if you have not selected the Trust All certificates checkbox.

5. Click **Test Connection** to test the connection between Context Hub and the REST API data source.
6. Click **Next**.
7. In the **Response Preview** section, you can view the live response for the REST API configured, using the test meta value as a placeholder.
8. In the **Meta Mapping** section, select one or more meta type supported by the REST API to view context lookup (for meta values) in the Respond and Investigation views.
9. In the **Field Mapping** section, you can add friendly display name for the response field for which you want to perform context lookup. Do the following:

a. Click .

b. In the **Field** drop-down, enter the path for which you want to add a friendly name. As you type the path, the auto-suggest function looks for the matches in the JSON path returned in the response preview. You can also add the path that is not available in the response preview but available for other meta values.

c. **Value (from Preview)** field is filled automatically when you select the path.

d. In the **Display Name** field, enter the friendly name.

> **Note:** After configuration, only the fields that are mapped with friendly names are displayed during context lookup. If you do not map any fields, all fields in the JSON will be available during context lookup.

10. Click **Save** to configure the data source.

> **Note:** After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to  (**ADMIN**) > **Services**> **View** > **Explore** view.

Edit REST API Data Source

To edit REST API data source for Context Hub:

1. Go to  (**Admin**) > **Services**.
2. Select the Context Hub service and click  > **View** > **Config**.
3. In the Data Sources tab, click  > **REST API**.
4. Edit the required fields.
5. Click **Test Connection** to test the connection between Context Hub and the data source.
6. In the **Meta and Field Mapping** and **Cache settings**, edit the required fields.
7. Click **Save** to save the settings.

Delete REST API Data Source

To edit REST API data source for Context Hub:

1. Go to  (**Admin**) > **Services**.
2. Select the Context Hub service and click  > **View** > **Config**.
3. In the **Data Sources** tab, select the data source you want to delete.
4. Click .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

Configure Context Hub Data Source Settings

After you have configured the required data sources you can customize the settings for the data sources based on your requirement.

To access and configure settings:

1. Go to **(Admin) > Services**.

   The services view is displayed.

2. In the Services panel, select the Context Hub service and click > **View** > **Config**.

   The Services Config view of Context Hub is displayed.

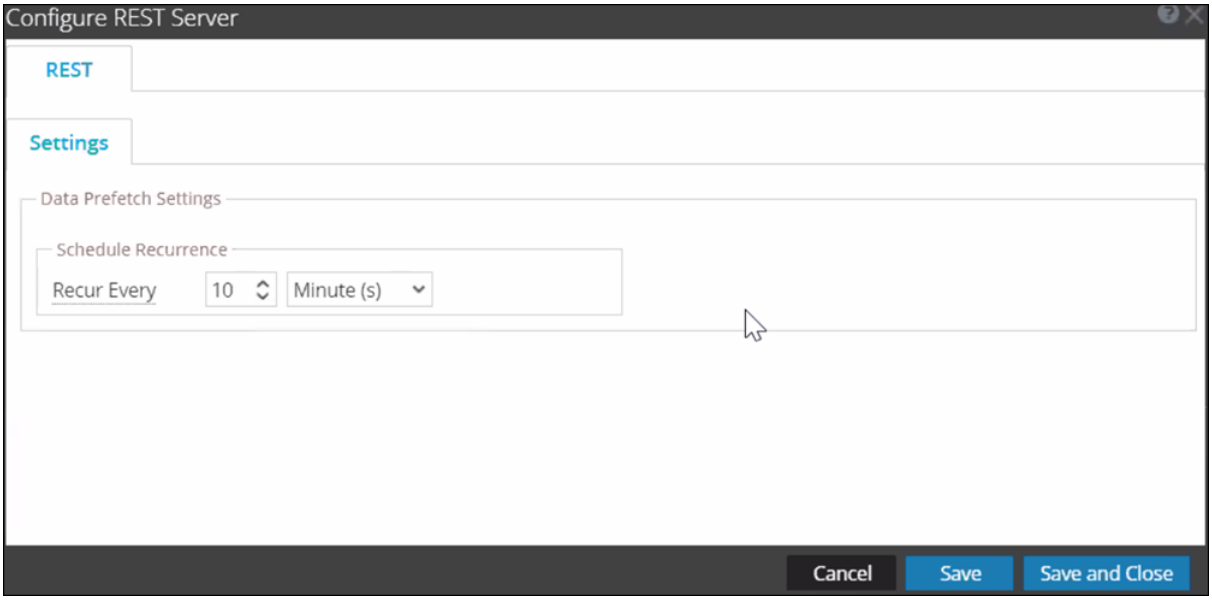
3. Select the data source for which you want to configure the settings and click in the Actions column.

   The following screenshot is an example of the NetWitness Endpoint settings dialog:

The following screenshot is an example of the REST API settings dialog:

4. Configure the following fields:

Field	Description
Enable	This option is enabled by default (checked) and can be used to enable or disable the response from the selected data source.

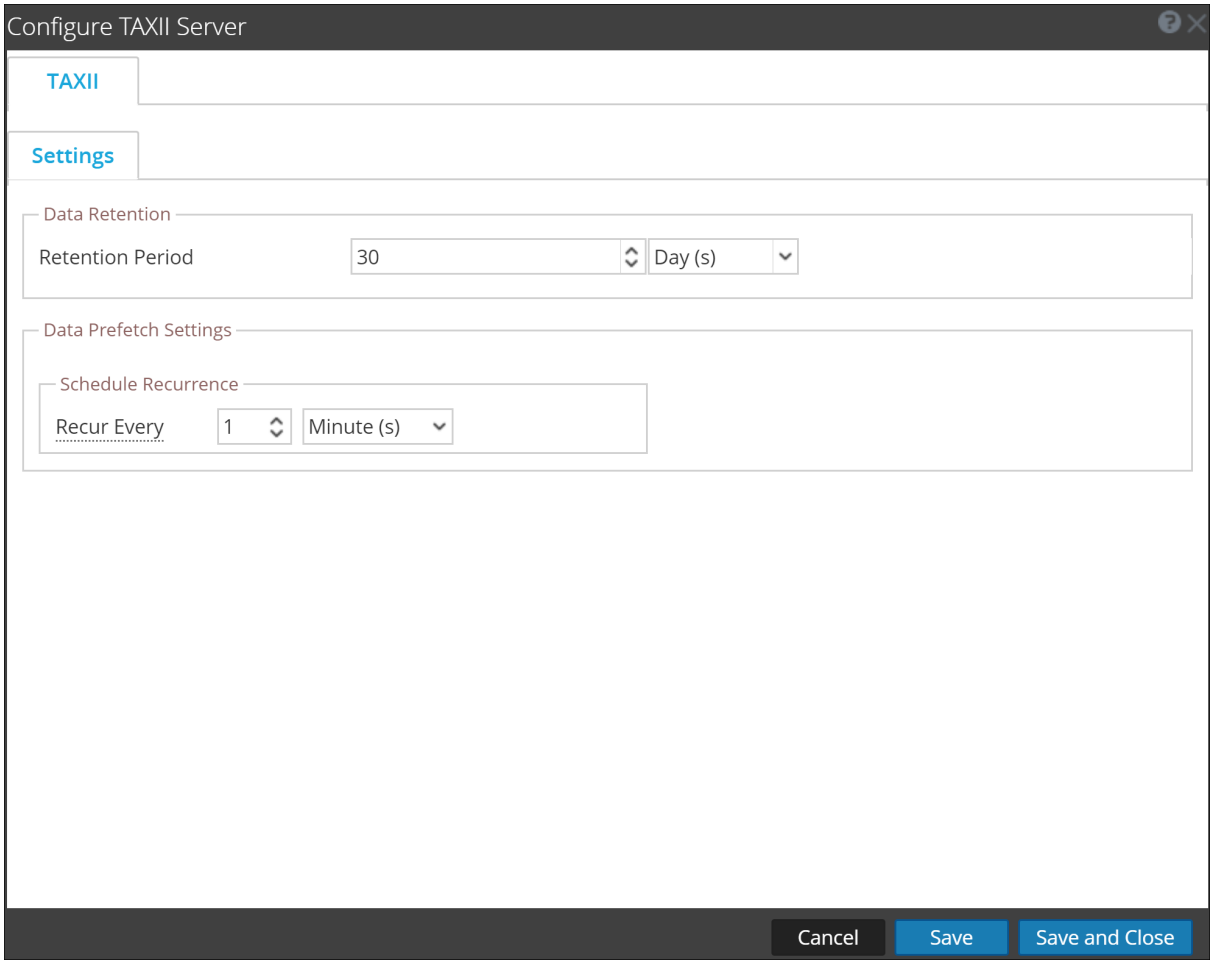


Field	Description
Cache Settings	Any lookup from Context Hub can be stored in the Context Hub cache for a configured time. Response to any subsequent matching request will be fetched from the Context Hub cache. Use this section to define the following cache settings for query lookup: • **Cache Enabled**: By default, this checkbox is selected and the query response is cached. • **Cache Expiration (Minutes)**: The maximum time the query lookup is retained in cache. The default time is 30 minutes and maximum is 7200 minutes that you can configure.
List value Expiration	**Enable**: Select Enable to define the number of days the list values must be available. By default, this option is disabled and the values are retained. **Time to Live (Days)**: Enter the number of days you want to the list values to be retained.
Meta Mapping	Any list stored in Context Hub should be made available for a lookup. The lookup in Context Hub is performed based on meta type or entities. Examples IP, HOST, MAC ADDRESS, DOMAIN, FILE_NAME, FILE_HASH, USER. **Meta Type**: Entities available in Context Hub. **Context Hub Fields**: Column headers from CSV file you have added when creating a list.
Meta and Field Mapping	**Response Preview**: You can view the live response for the REST API configured, using the test meta value as a placeholder. **Copy**: Copies the response preview. **Meta Mapping**: Any REST API stored in Context Hub should be made available for a lookup. The lookup in Context Hub is performed based on meta type or entities selected. Examples IP, HOST, MAC ADDRESS, DOMAIN, FILE_NAME, FILE_HASH, USER. **Meta Type**: Entities available in Context Hub. **Field Mapping**: Add friendly display name for the response field which is displayed during the context lookup.  - Add a field mapping. - Delete a field mapping. **Field**- Enter the path for which you want to add a friendly name. **Value (from Preview)**- The value is filled automatically based on the path. **Display Name**- Enter friendly name.
Minimum IIOC Score	The minimum IIOC score to be considered for fetching contextual information of NetWitness Endpoint modules.

Field	Description
Query Last (Days)	The duration (in days) for which the Context Data must be queried.
Limit	The maximum number of records to be displayed when Context Lookup is performed.
Recur Every	Configure recurring schedule to fetch and store contextual data for the required intervals.

5. Click any one of the following options:
   - **Cancel** - select this option to cancel the changes.
   - **Save** - select this option to save the changes.
   - **Save and Close** - select this option to save and close the dialog.

To access and configure settings for STIX data sources



1. Go to **(Admin) > Services** and select Context Hub service.
2. Click > **View** > **Config** > **STIX** tab.
3. Select the data source for which you want to configure the settings and click in the Configurations column.
   a. For REST Server, the following fields are displayed.

Configure the following fields for REST Server.

Field	Description
Recur Every	Specify the time frequency in minutes, hours, days or weeks to retrieve the content from the data source.

b. For TAXII Server, the following fields are displayed.

Configure the following fields for TAXII Server.

Field	Description
Retention Period	Specify the number of days the content retrieved from the taxi data source must be retained before it is automatically deleted.
Recur Every	Specify the time frequency in minutes, hours, days or weeks to retrieve the content from the data source .

Based on the data source you select, the Response Groups differ. The following table describes the response groups for every data source.

Data Source (Connection)	Response Supported Groups	Field Settings
List	List	Meta Mapping Meta Type Context Hub Fields Settings Data Prefetch Settings Schedule Recurrence List Value Expiration Cache Settings Cache Enabled Cache Expiration (Minutes) [Min is 30 minutes Max is 7200 minutes]
Archer	Archer	Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Export Attributes Configuration Export Attributes Data Prefetch Settings Schedule Recurrence
Active Directory	Users	Meta Mapping Meta Type Context Hub Fields Settings Data Prefetch Settings Schedule Recurrence List Value Expiration Cache Settings Cache Enabled Cache Expiration (Minutes)[Min is 30 minutes Max is 7200 minutes]

Data Source (Connection)	Response Supported Groups	Field Settings
NetWitness Endpoint	IOC Machines Modules	Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Context Panel Settings Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Context Panel Settings Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Minimum IIOC Score Context Panel Settings
Respond	Alerts Incidents	Context Panel Settings Data Prefetch Settings Query Last [Days Cache Settings Cache Enabled Cache Expiration (Minutes)
File Reputation Server	File Reputation Server	Cache Settings Cache Enabled Cache Expiration (Minutes)
TI	Displays information for STIX data sources.	IP address, email address, domain, filename, URL's, and file hash. **Note:** The context lookup for email address and URL will be displayed only if these metas are mapped. To map the metas, navigate to (Configure) > **System** > **Investigation** > **Context Lookup**.

Data Source (Connection)	Response Supported Groups	Field Settings
REST API	REST API	• Meta and Field Mapping • Meta Type • Field • Value (from Preview) • Display Name • Cache Settings • Cache Enabled • Cache Expiration (Minutes)

Note: After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to **(Admin) > Services**> **View** > **Explore** view. Make sure you restart the Context Hub service if you make any configuration changes in the Explore view.

Import or Export Lists for Context Hub

As an administrator you can import or export a list that is configured in the Context Hub service which can be used by an analyst. The file to be imported or exported is a CSV file and you can add multiple lists as Data Sources.

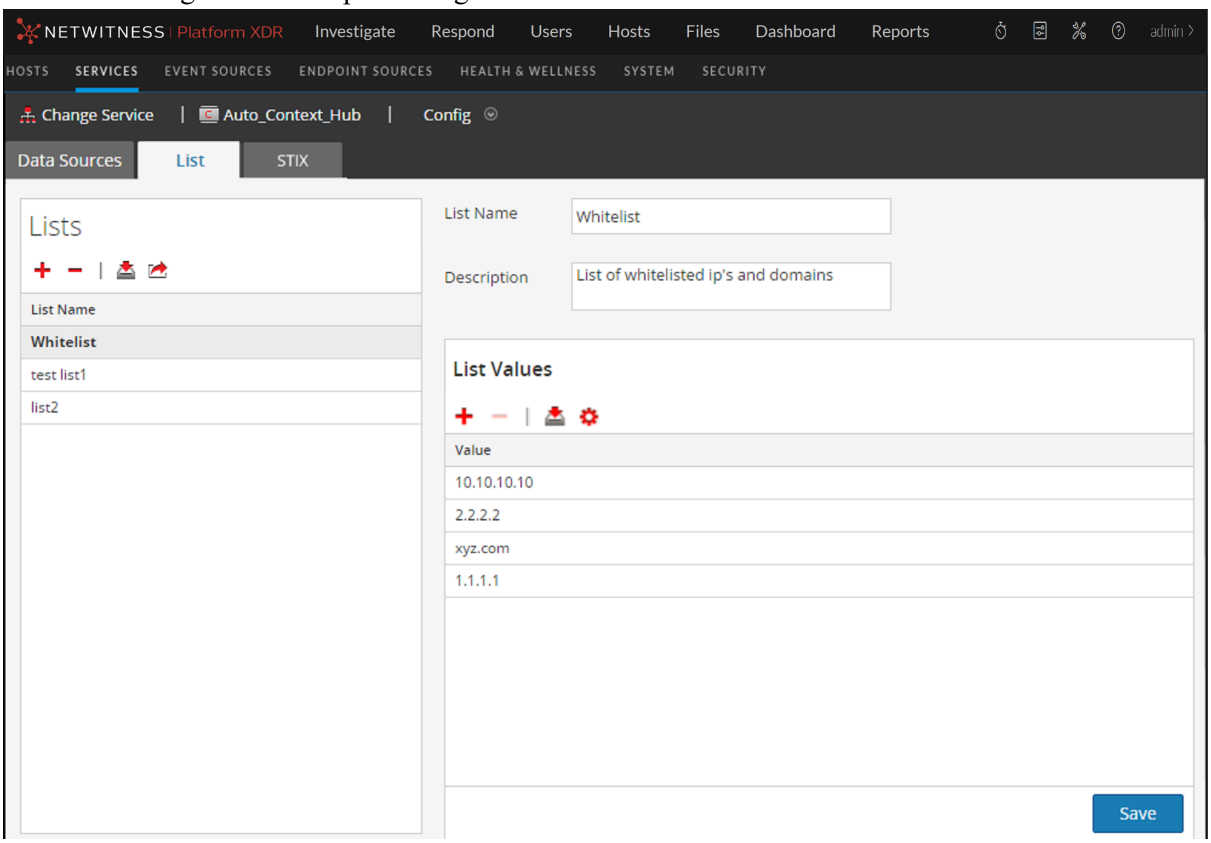
Prerequisites

Ensure that Context Hub is enabled and the service is available in **(Admin) > Services** view of NetWitness.

Import a List

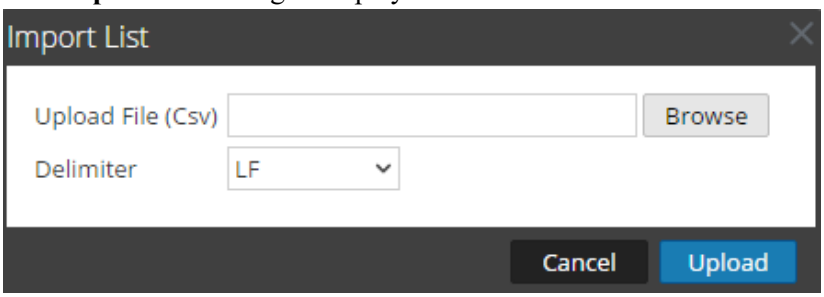
After you have imported a list, you can perform the following tasks:

- Import values to an existing list
- Add row to a list
- Edit a list name and description
- Edit a value from a list
- Delete a list
- Delete row from a list



Note: You have to make the same changes to the relevant .CSV file, so that the changes get reflected the next time the schedule recurs. Otherwise, when you import values into an existing single-column or multi-column list, the data is overwritten from the source file when the schedule recurs. In case of a custom feed list, if the feed is edited or deleted, the corresponding Context Hub list also gets edited or deleted.

Import Single-Column List



To import a list:

1. Select **(Admin) > Services**.
   The services view is displayed.
2. In the **Services** panel, select the Context Hub service and click > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.

The below image is an example of single-column list.

4. Click  on the **Lists** panel.
   The **Import List** dialog is displayed.

5. In the **Import List** dialog, complete the following steps:
   a. In the **Upload File (.CSV)** field, browse and select the `CSV` file.
   b. In the **Delimiter** field, select the delimiter to separate the values in a list from the options—**Comma**, **CR** (Carriage Return), and **LF** (Line Feed).
6. Click **Upload** to upload the CSV file to Context Hub.

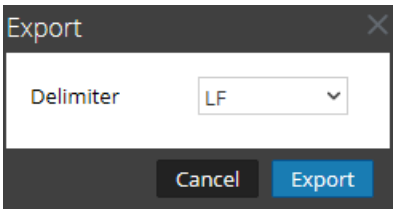
These lists are considered as data sources for retrieving contextual information. But you can append to an existing multi-column list. The data will be appended only if the number of columns match.

Note: You cannot create a new multi column list by directly importing a CSV file. However, all the feeds that are converted into multi-colum lists will be displayed in the List tab. For information on how to import multi-column list, see Configure Lists as a Data Source

Import Values to an existing List

When you are importing into existing multi- column list the data is overwritten from the source file when the schedule recurs.

To import values to a list:



1. Go to  **(Admin) > Services**.
   The services view is displayed.
2. Service and click  > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.
4. In the Lists panel, select a list for which you want to import the values.
5. Click  on the **List Values** panel.
   The **Import List** dialog is displayed.
6. In the **Import List** dialog, complete the following steps:
   a. In the **Upload File (Csv)** field, browse and select the `CSV` file.
   b. In the **Delimiter** field, select the delimiter to separate the values in a list from the options—**Comma**, **CR**(Carriage Return), and **LF**(Line Feed).
7. Click **Upload** to upload the CSV file to NetWitness.

The list values are imported to the selected list. These lists are considered as data sources for retrieving contextual information. But you can append an existing multi column list. The data will be appended only if the number of column match.

Export List for Context Hub

To export a list:

1. On the **Lists** tab of the Services Config view of the Context Hub service, click  .
   The **Export** dialog is displayed.

2. In the **Delimiter** field, select the delimiter to separate the values in an exported list from the drop-down [**Comma**, **CR** (Carriage Return), and **LF** (Line Feed)].
3. Click **Export**.

In case of a single-column list, you can select the delimiter. And, in case of a multi-column list, the list is exported as CSV file to the local machine.

Note: When a custom feed is converted into a Context Hub list, you must map at least one meta key with one or more entity mapping for a column header with a meta. However, if you want to add or edit more entities you can do so by clicking ⚙.

Configure Meta Type Mapping for Context Hub

As an administrator you manage the mapping of Context Hub meta types with NetWitness meta keys.

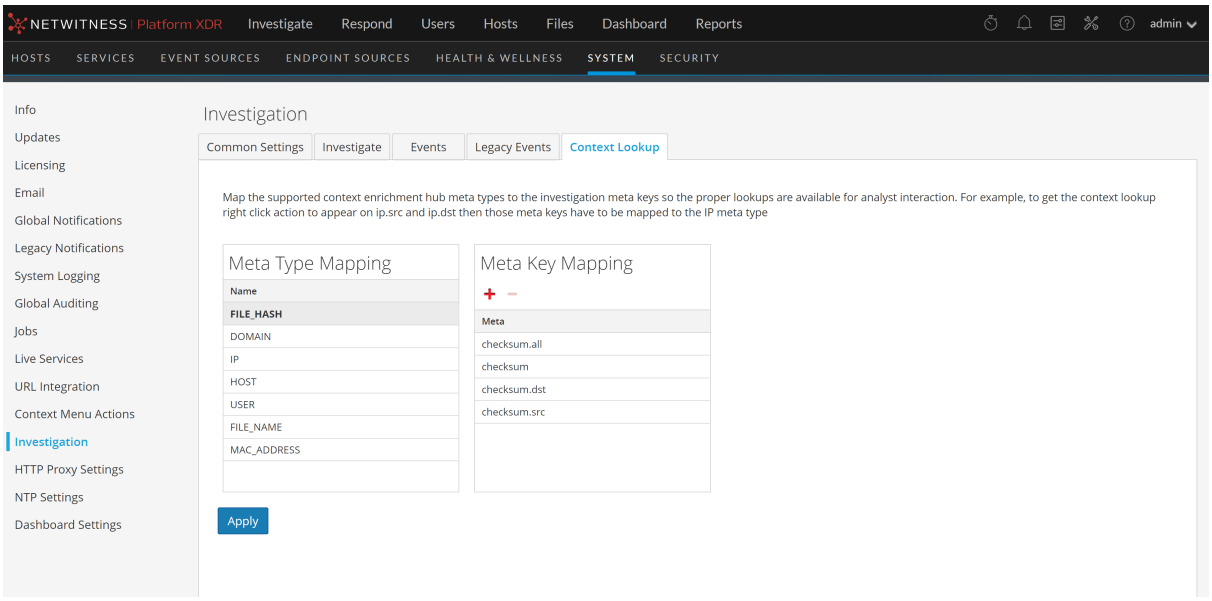
The Context Hub service provides context lookup for meta values in the Respond and Investigation views. These meta values are grouped into meta types based on the category they belong to. For example, meta keys of NetWitness Respond and Investigation like `ip.src` and `ip.dst`are grouped into the meta type `IP` in Context Hub. The meta type `IP` is in turn mapped to metas like `alert.events.source.device.ip_address` and `alert.events.destination.device.ip_address` in the Respond database.

In the  (Admin) **> System > Investigation** view, the Context Lookup tab enables the administrator to configure the NetWitness meta keys and meta type mapping. The administrator can add or remove meta keys to the list of meta types supported by Context Hub.

The Context Hub service is pre-configured with default meta type and meta key mapping, which is expected to work with most deployments, unless there are some custom mappings created for your specific deployment.

Note: You cannot add a new Meta Type.

The default mapping is given below:



Meta Type Name	Meta Keys
IP	device.ip, ip.dst, ip.src, ip.addr, paddr, ip.all, alias.ip
USER	user.all, user.src, user.dst, username
DOMAIN	domain.src, domain.all, domain.dst
MAC_ADDRESS	eth.dst, eth.src, eth.all
FILE_NAME	filename, filename.all, filename.src, filename.dst, sourcefile
FILE_HASH	checksum.all, checksum, checksum.dst, checksum.src
HOST	device.host, alias.host, host.all

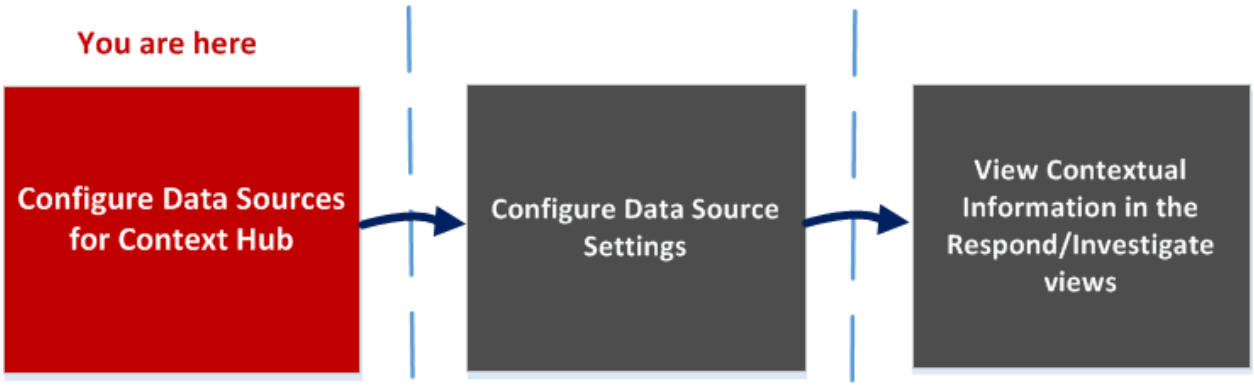
Procedure

To manage Investigation meta keys mapping:

1. Go to  **(Admin) > System**.
2. In the options panel, select **Investigation**.

   The Investigation Configuration panel is displayed.
3. Select the **Context Lookup** tab.

4. Select a meta type to view the default meta keys that are mapped with this meta type.
5. To add a meta key, click + and enter the meta key.
6. To remove a meta key, select the meta key and click −.
7. To save the changes, click **Apply**.
8. In order to add a new meta, they need to be included in the Concentrator's custom index file. For example, if you want to add a meta "**fqdn**" then you need to add an new entry: **<key name="fqdn" description="Fully Qualified Domain Name="IndexValues" form-at="Text" valueMax="100" />** in the index file. For more information on how to include a new meta in the index file, see Index Customization topic in the *Core Database Tuning Guide*. After you add the new meta, you can view the contextual information on clicking the Pivot to investigate option in the Respond view.



In case a new meta key is added, the Context Lookup menu option is enabled for the meta values under that meta key. For more information, see the "Investigation Configuration Panel" topic in the *System Configuration Guide*

Context Hub Data Sources Tab

In the **Data Sources** tab, you can configure one or more data sources for Context Hub service. Navigate to **(Admin) > Services** > Select Context Hub service > **View** > **Config** > **Data Sources** tab.

Workflow

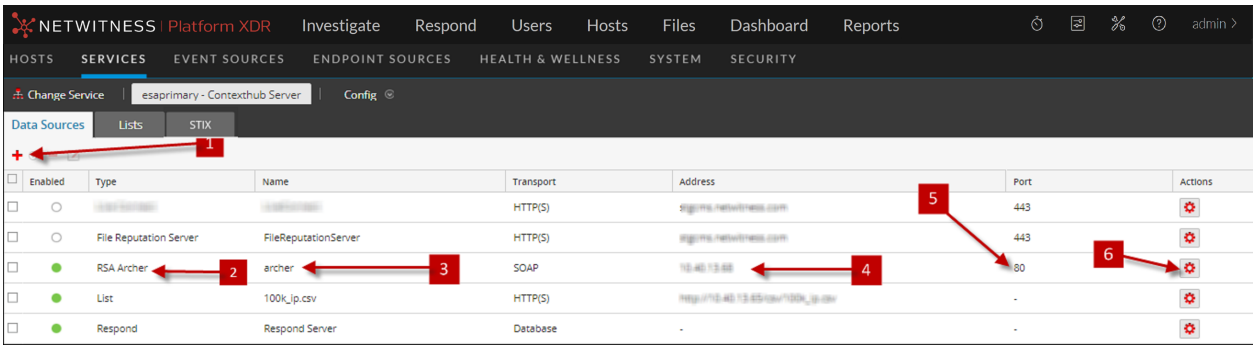
This workflow shows the procedure to configure data sources for Context Hub service to view contextual information in the Respond / Investigate views.

- The first task is to add a data source
- The second task is to configure data sources settings to enhance your deployment. This task is optional as the settings for each data source is already configured with default values for optimal performance.
- And the third task is to view and analyze the contextual information in the Context Summary panel of the Respond or Investigate views.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Data Sources for Context Hub*	Configure Lists as a Data Source Configure Archer as Data Source Configure Active Directory as a Data Source Configure NetWitness Endpoint as a Data Source Configure REST API as a Data Source Configure File Reputation Server as a Data Source Configure STIX as a Data Source
Administrator	Configure Hub Data Settings*	Configure Context Hub Data Source Settings

Role	I want to ...	Show me how
Analyst	View Contextual Information in Respond View	See the *NetWitness Respond User Guide*.
Analyst	Add, create and delete list from the Respond or Investigate View	See the *NetWitness Respond User Guide*. See the *Investigate User Guide*.
Analyst	Add or delete an entry from an existing list	See the *NetWitness Respond User Guide*.



*You can complete this task here (that is in the Context Hub Data Sources Tab.)

Quick Look

The following example illustrates how to add a data source for Context Hub service.

1 Click + to display the **Add Data Source** dialog.
2 Displays the type of Data Source.
3 Name that identifies the Data Source.
4 The IP address or hostname of the data source.
5 The connection port for the data source.

6 Opens the **Configure Settings** dialog. You can view and edit the settings to be displayed on the Context Summary panel in the Respond or Investigate views.

7 Click **Test Connection** to verify that the host is connected to the Context Hub service.

Toolbar

The following table describes the toolbar actions.

Feature	Description
	Opens the Add Data Source dialog so that you can add a data source. You can add only one data source of each type. Except in case of Lists and Active Directory data sources which can be added in multiples. For detailed instructions to add a data source, see Configure Lists as a Data Source.
	Delete a data source. If you delete a data source, Context Hub does not consider the deleted service as a data source. All contextual information fetched previously will not be available.
	Opens the Edit Data Source dialog.
	Opens the Configure Settings dialog. You can view and edit the settings for the data sources. For description of each field in Configure Responses dialog, see Configure Context Hub Data Source Settings .

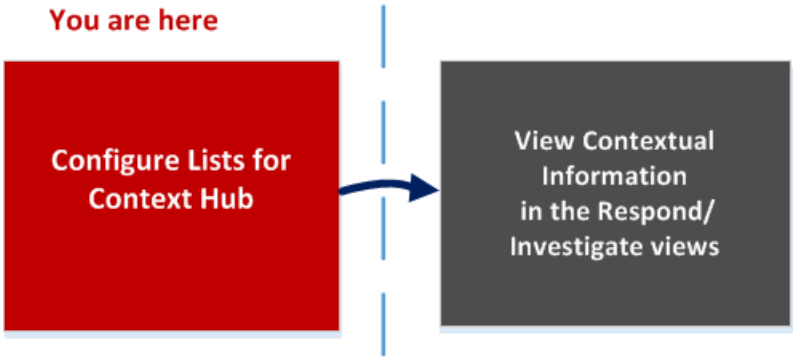
Data Source Configurations

The following table describes the listed configurations.

Feature	Description
Enabled	Indicates whether the data source is enabled or disabled. A solid colored green circle indicates that data source is enabled (). An blank white circle indicates that data source is disabled.
Type	The type of data source. For example, Lists, Archer, Active Directory, Endpoint, Respond, REST API or File Reputation server.
Name	The unique name to identify the data source. For example, Respond.
Address	The IP address or hostname of the data source.
Port	The connection port for the data source and vary based on the data source being added. For example, for Endpoint the port is 9443, for Lists the port is 80 and so on.

Context Hub Lists Tab

In the **Lists** tab, you can create and configure lists for Context Hub. Navigate to **(Admin) > Services** > Select Context Hub service > **View** > **Config** > **Lists** tab.



The Lists tab of the Context Hub service allows you to create one or more lists and add relevant list values to the list. These lists are automatically considered as data sources for the Context Hub service.

These lists may be populated with items either by importing external or custom feed CSV files or by adding meta values by using the option Add/Remove from List in Investigation and Respond views.

Note: You can also create lists and add list values from Respond and Investigation views. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

Workflow

This workflow shows the procedure to configure lists for Context Hub service and to view contextual information in the Respond and Investigate views.

Creating one or more list is the first task in this workflow. The lists can contain supported metas such as an IP address, User, Host, Domain, MAC address, File Name or File Hash. The next task is to analyze or use the list data to view contextual data in Respond and Investigate views.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure List Data Source for Context Hub*	Configure Lists as a Data Source
Administrator/ Analyst	View Contextual Information in Respond View	See the *NetWitness Respond User Guide*.

Role	I want to ...	Show me how
Administrator/ Analyst	"Manage Lists and List Values in Investigation	See the *Investigate User Guide*.
Administrator/ Analyst	Create a list	See the *NetWitness Respond User Guide* and *Investigate User Guide*
Administrator/ Analyst	Update a list	See the *NetWitness Respond User Guide* and *Investigate User Guide*
Administrator/ Analyst	Delete list	See the *NetWitness Respond User Guide* and *Investigate User Guide*
Administrator/ Analyst	Import a list	Import or Export Lists for Context Hub
Administrator/ Analyst	Export list	Import or Export Lists for Context Hub

*You can complete this task here (that is in the Context Hub Lists Tab).

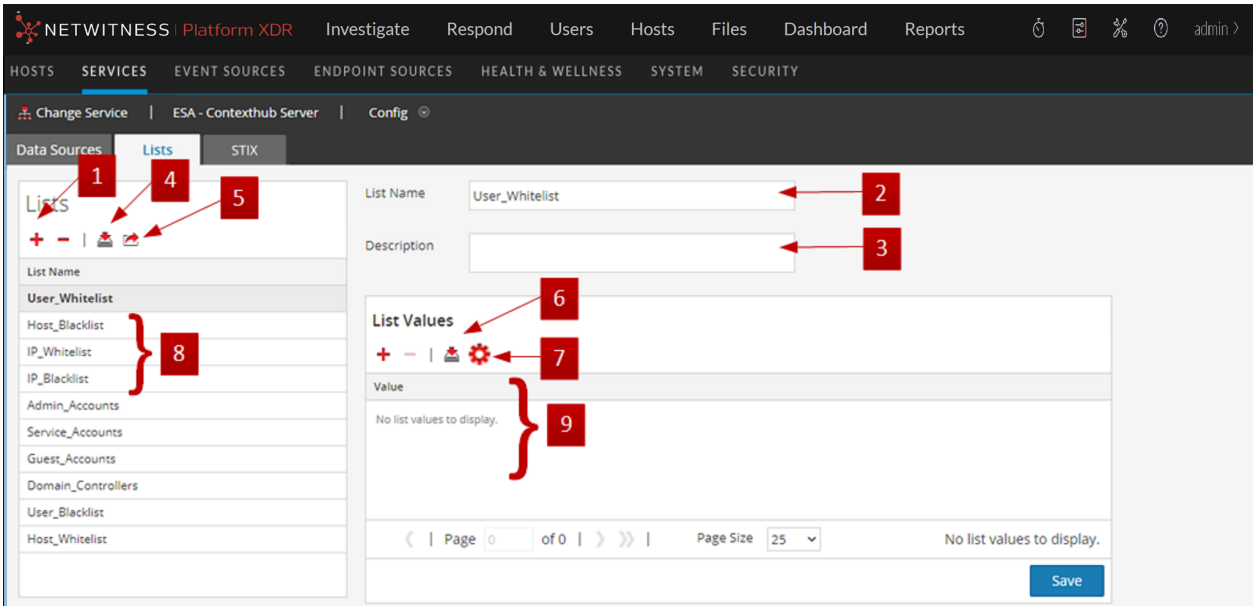
Quick Look

The following example illustrates how to add lists for Context Hub service.

The List tab consists of the **Lists** panel and **List Values** panel. The **Lists** panel has a toolbar with options to add, delete, import, and export lists. The entries under **List Name** are lists that are added or imported for the Context Hub service.



By default, 10 empty single-column lists are available in NetWitness11.1. These lists are empty and you need to add information to these lists. The out of the box 10 list names are used in ESA rules, for more information on ESA rules, see the *Alerting with ESA Correlation Rules User Guide*. For users upgrading from previous versions, they will be able to view these new lists in addition to their previously created lists. The lists available by default are:

- Admin_Accounts
- Guest_Accounts
- Service_Accounts
- User_Blacklist
- User_Whitelist
- Host_Whitelist

- Domain_Controllers
- IP_Blacklist
- IP_Whitelist
- Host_Blacklist

Note: If a list with the same name already exists prior to updating to or installing NetWitness12.1.0.0, then that list will be retained. Either rename that list before updating to 11.1 or update the contents in such a way that it can be used in ESA rules.

The lists are available in ESA rules tab in CONFIGURE > ESA Rules > Settings > Enrichment Sources. For more information on ESA rules, see the *Alerting with ESA Correlation Rules User Guide for Version 11.1*.
The **List Values** panel has a toolbar with options to add, delete, and import list values to the selected list. The entries under **Value** identify each list entry included in the list.

1	Click + to add a new list.
2	Name that identifies the list.
3	Description of the list.
4	Click to import list(s) to Context Hub.
5	Click to export a list to the local machine.
6	Click to import list values to selected list.
7	Click to add or edit entity mapping.

8	Displays the custom list(s) that are added to Context Hub.
9	Displays the list values that are added to the selected list.

Toolbar

The following table describes the toolbar actions.

Feature	Description
	Add a new list. For more information, see Configure Lists as a Data Source.
	Delete a list. If you delete a list from Context Hub, the list is no longer considered as a data source for retrieving contextual information.
	Import lists to Context Hub. For more information, see Import or Export Lists for Context Hub.
	Export a list to the local machine. For more information, see Import or Export Lists for Context Hub.

Note: You can select multiple lists at a time. Do one of the following:
1. Select a list, press and hold Ctrl key, and click the lists to be selected.
2. Select a list, press and hold Shift Key, and use arrow keys to select other lists.

List View Options

The following table describes the Lists configurations.

Feature	Description
List Name	Unique name to identify the list.
Description	Description of the list.
Save	Saves the changes made to the list.

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

Context Hub STIX Tab

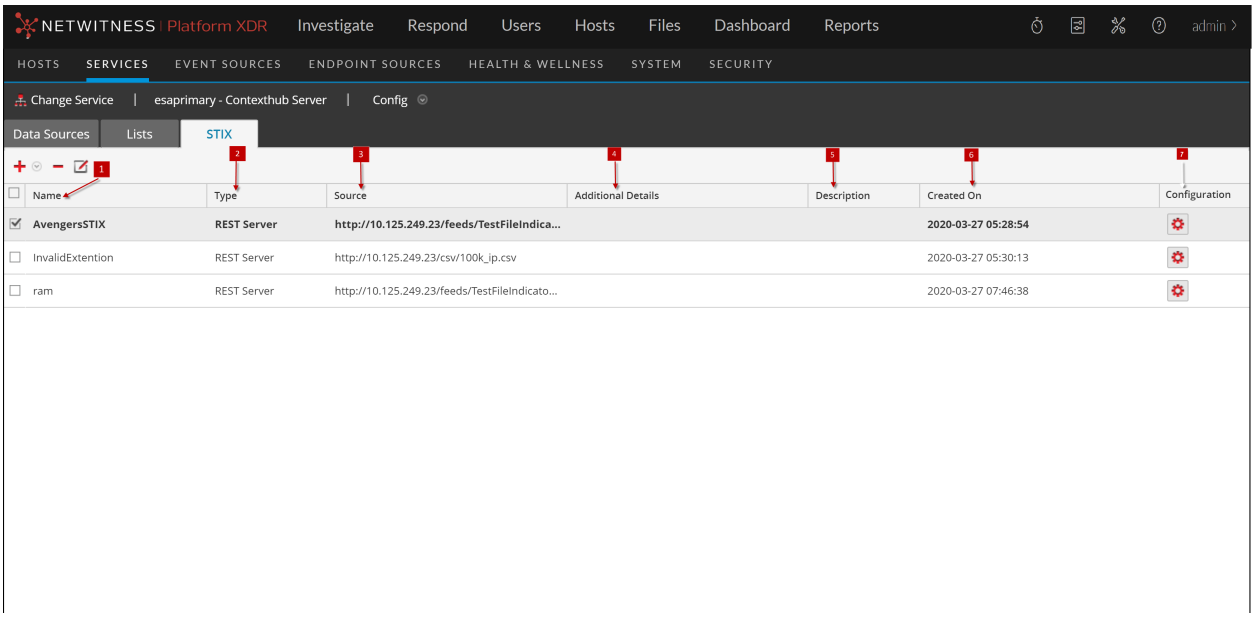
In the **STIX** tab, you can create and configure Structured Threat Information eXpression (STIX) data source for Context Hub. Navigate to  **(Admin) > Services**> Select Context Hub service > **View** > **Config** > **STIX** tab.

The STIX tab of the Context Hub service allows you to create one or more STIX, REST URLs, or TAXII data sources and edit them whenever required. When STIX is configured, Context Hub service automatically considers it as a data source.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure STIX Data Source for Context Hub*	Configure STIX as a Data Source
Administrator/ Analyst	View Contextual Information in Respond View	See the *NetWitness Respond User Guide*.

*You can complete this task here (that is in the Context Hub Lists Tab).



Related Topics

- Configure STIX as a Data Source

Quick Look

The following example illustrates how to add STIX to Context Hub service.

The STIX tab consists of add, delete and edit data sources options.

1	Name that identifies the added STIX source.
2	Type of data source - REST server, STIX or TAXII server.
3	The path of the source from which the STIX files are obtained.
4	Additional details related to the data source being added.
5	Description of the data source.
6	Date when the data source was created.
7	Click to edit the selected data source and configure advanced settings.

Toolbar

The following table describes the toolbar actions.

Feature	Description
+	Add a new data source such as File, REST Server, or TAXII Server. For more information, see Configure STIX as a Data Source .
−	Delete the selected data source.
✎	Edit the selected data source.

The following table describes the all the data source server configuration options.

Field	Description
Common Configuration Options	

Field	Description
Enabled	Select this checkbox to enable the configuration.
Name	Provide a name to the data source you want to add.
Description	Description of the data source.
Cancel	Click to revert the data source addition.
Validate	Click to verify the URL path to the Server.
Save	Click to save the configuration and add the required server as a data source.
REST Server Configuration Options	
URL	URL of the REST server.
Username (Optional)	Provide the username of the REST server if it needs to be authenticated.
Password (Optional)	Provide the password of REST server if it needs to be authenticated.
Trust All Certificates	Select this checkbox to trust all certificates.
Certificate File	Click browse to navigate to the location of the certificate file.
TAXII Server Configuration Options	
URL	URL of the TAXII server.
Username (Optional)	Provide the username of TAXII server if it needs to be authenticated.
Password (Optional)	Provide the password of REST server if it needs to be authenticated.
Client Certificate	Browse to upload a pkcs12 format client certificate available on your local system.
Certificate Password	Enter the password to the certificate, if it is password-protected.
UserProxy	Select this checkbox to enable proxy.
Trust All Certificates	Select this checkbox to trust all certificates.
Certificate File	Browse and select the certificate file.
TAXII Collections	Select the TAXII Collection name from the drop-down to automatically download the collection.
	Click to manually retrieve the list of available TAXII Servers, if the collections are not downloaded automatically.

Field	Description
STIX File Configuration Options	
File	Browse and select the STIX file.

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

Troubleshooting

This topic provides information about possible issues that NetWitness users may encounter when setting up their ContextHub service in NetWitness.

Problem	Solutions
Prefetch for list fails if the list is created in append mode.	**Details:** The following error message is displayed in logs indicating that, entries in list exceeds the max allowed. `Error setting data source entries com.rsa.asoc.contexthub.exception.ContextHubException: total.entries.exceed.max` Also, Health & Wellness sets the stat - `Contexthub.Datasource.Health.Data-Sources-Health` to `Unhealthy` and displays the names of the lists for which prefetch has failed. For example, number of entries in the list are 50001 and number of records in the CSV file are 50001 (user did not change the csv since last prefetch.). Upper limit on number of entries in list is 100,000. Now on prefetch, Context Hub will try to append 50001 entries to the list but since 50001 + 50001 > 100,000, prefetch fails. **Solutions:** You should add only those entries in the .csv file which they wish to append to the existing .csv file. If, you do not want to append any entries to the list then perform one of the options, as applicable: • If you created the list with headers: remove all rows from the csv except the header. • If you created list without headers: you should have 0 rows in csv.
The Respond service is not able to send incidents to Archer with third party signed certificates.	As a workaround, you need to run a command to add a PEM certificate to the Respond trust store Run the following command on the Respond host: `security-cli-client --add-trusts -s respond-server -x <pem_certfilename> -u <username> -k <password>` Where: • `<pem_certfilename>` is the name of the certificate file. • `<username>` and `<password>` are your NetWitness administrator credentials.
SSL handshake with Archer certificate fails while adding it as a data source.	Use an archer generated certificate with the Trust All Certificates option configured.

Problem	Solutions
Pivot to Investigate option on the Respond page does not navigate to the correct link.	When you stop and restart the RabbitMQ server, the Pivot to Investigate option available on the respond screen is not visible. And the context panel for Pivot to Investigate reopens the same page. You need to restart the jetty service on the NetWitness Server, login to the NetWitness Server Host and enter the service jetty restart command.
When you import a list with missing quotes such as "172.16.0.0, the list is saved without any data to display.	This is because of the Apache bug (CSV-141), which does not parse CSV files with incorrect formats. To fix, import a list with correct quotes to avoid displaying an empty file. For example, “172.16.0.0”, “host.mycompany.com” and so on.
Increasing the limit settings for Alerts and Incidents leads to lookup error.	By default, the limit settings to view number of Alerts and Incidents is set to 50. If the limit is increased, the looked-up meta for alerts and incidents may lead to lookup error. This happens due to an internal database restriction. Make sure to keep the limit for viewing number of Alerts and Incidents to 50 or less.
Multiple incident and alert tabs are displayed while editing advanced configuration of Respond datasource.	You must delete duplicate entries in the Context Hub MongoDB and restart the MongoDB Context Hub Server. Perform the following: 1. Log in to control MongoDB on Admin Server. 2. Go to contexthub-server > ds_meta collection. **Note:** Make a note of '_id' value of duplicate entries for the incident and alerts documents that you want to delete. 3. In the ds_meta collection, delete 1 Incident and 1 Alert document. Once the duplicate entries are deleted only 1 Incident and 1 Alert type document will be available in the ds_meta collection. 4. Log in to application MongoDB on ESA Primary. 5. Go to contexthub-server, locate and delete the below collections: • ds_entries*_*<id-of-incident-doc-deleted-in-step 3> • ds_entries*_*<id-of-alert-doc-deleted-in-step 3> 6. Under bookmark_store collection, locate and delete documents with id same as _id of Incident and Alert from ds_meta collection. 7. Restart Context Hub Server.

Data Privacy Overview

This topic introduces the concept and implementation considerations for a data privacy officer or administrator who is managing exposure of privacy-sensitive data in NetWitness. In addition, information about recommended use cases is included.

Note: A data privacy plan touches on most components of NetWitness. The person who configures data privacy needs to understand NetWitness network components, configuration of NetWitness hosts and services as described in the *Host and Services Getting Started Guide*, and the types of information that need to be protected.

Regulatory mandates in some locations, for example the European Union (EU), require that information systems have a means of protecting privacy-sensitive data. Any data that could directly or indirectly identify "Who did what when?" may be considered privacy-sensitive data. A few examples are user names, email addresses, and host names. NetWitness provides a range of controls that customers can leverage to protect privacy-sensitive data. These controls can be used in a variety of combinations to protect privacy-sensitive data, without significantly reducing analytical capability.

A user role for a Data Privacy Officer (DPO) supports the management of privacy-sensitive data. The DPO can configure NetWitness to limit exposure of metadata and raw content (packets and logs) using a combination of techniques. The methods available to protect data in NetWitness include:

- Data Obfuscation
- Data Retention Enforcement
- Audit Logging

Data Obfuscation

NetWitness has configurable options for data obfuscation. Data privacy officers and administrators can specify which meta keys in their environment are privacy-sensitive and limit where the meta values and raw data for those keys are displayed in the NetWitness network. In place of the original values, NetWitness can provide obfuscated representations to enable investigation and analytics. In addition, DPOs and administrators can prevent persistence of privacy-sensitive meta values and raw logs or packets.

Three methods work together to implement data obfuscation:

- Obfuscation of meta values for privacy-sensitive meta keys with an optional salt. Meta keys configured as protected are represented by obfuscated values at the time of creation on a Decoder or Log Decoder; the obfuscated values are hashed and considered to be impossible to read. To implement, you must configure the Decoder and Log Decoder hash algorithm and salt, and configure privacy-sensitive language keys as protected on all Core services.
- Role-based access (RBAC) to the raw logs or packets and the privacy-sensitive meta values. The DPO can use roles with granular permission capabilities to restrict what an analyst versus a data privacy officer is able to view during configuration, analysis, and investigation. The *System Security and User Management Guide* provides in-depth coverage of the RBAC implementation in NetWitness. To implement, you must configure metadata and content visibility per role on individual Brokers, Concentrators, Decoders, Log Decoders, and Archivers.

- Preventing persistence of privacy-sensitive meta values and raw logs or packets. To implement, you must configure meta keys on parsers for individual Decoders and Log Decoders as transient.

Data Retention Enforcement

NetWitness can ensure that data is retained only as long as necessary or as specified. An administrator can configure data retention using age and time thresholds on a per-service basis. Schedulers running on each service automatically delete data meeting those thresholds. Once the data is deleted, it is no longer available through user interfaces, queries, or application programming interface (API) calls. Some of the NetWitness components also support purging of data through overwrites.

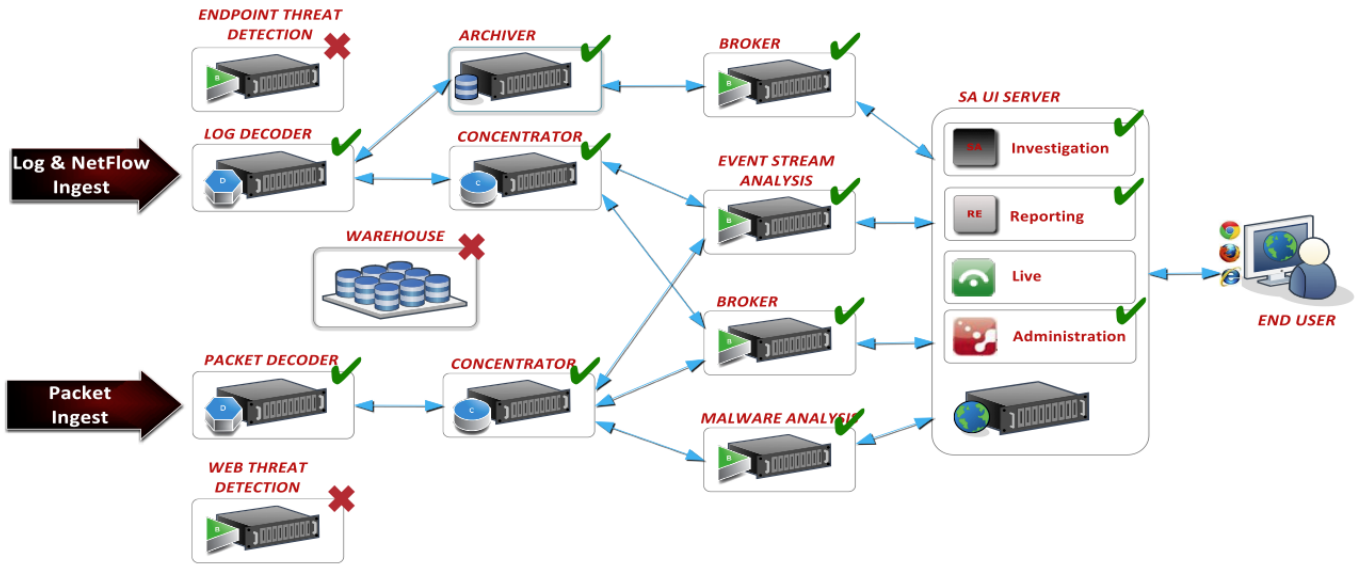
An administrator can manage data retention in several ways:

- Configure how long data persists in storage on the system.
- For Core services, strategically remove privacy-sensitive data that may have been written by configuring automatic removal of data of a specific age.
- Configure NetWitness so that original data is not sent or saved to the other components. If privacy-sensitive data makes its way into another database on the Reporting Engine, Malware Analysis, and NetWitness Servers, data retention can be managed there as well. This configuration for Event Stream Analysis is managed in the Services Explorer view.

Note: If a situation arises where the DPO decides that already collected data is privacy-sensitive after the system is functional, the administrator can manually overwrite the data from databases or files where the data is saved.

Audit Logging

Administrators can leverage audit logs that NetWitness creates using the Global Audit Logging feature. The audit logging feature generates audit log entries about many activities, and the following are examples of log entries that are relevant to data privacy:



- Modifications to permissions and users assigned to roles.
- Failed and successful attempts to log on to NetWitness and log off.
- Data deletion.
- Data exports and downloads.
- Navigation by users to user interfaces and queries that users performed.
- Attempts (successful or not) to view or modify privacy-sensitive data, including an identification of the user who made the attempts.

All audit log entries are part of a standard audit trail for NetWitness. Administrators can configure NetWitness to forward audit logs to a designated destination, including third-party systems to provide additional filtering and reporting capabilities. For more information on Global Audit Logging, see "Configure Global Audit Logging" in the *System Configuration Guide*.

Components Covered by the Data Privacy Feature

The figure below identifies the NetWitness components covered by the Version 11.x data privacy feature with a green check mark. Components marked with an X are not supported by data privacy functions. The *NetWitness Getting Started Guide* provides a functional description of NetWitness components.

Note: NetWitness data privacy features are not supported for Warehouse and protected metadata can make it to Warehouse through Warehouse Connector, unless explicitly configured to be filtered out using Warehouse Connector Meta Filters. If protected metadata makes it to Warehouse, users having direct access to Warehouse can query such data. Data privacy officers need to prevent that through administrative, technical, and procedural controls outside of NetWitness.

Data Privacy Feature Implementation by Component

The following table identifies which data privacy features are supported for each NetWitness component. For each component, a check mark indicates if the component supports data obfuscation, data retention enforcement, data overwriting, and audit logging.

Component	Data Obfuscation	Data Retention Enforcement	Data Overwriting	Audit Logging
Ingestion				
Decoder	✓	✓	✓	✓
Log Decoder	✓	✓	✓	✓
Meta Aggregation				
Concentrator	✓	✓	✓	✓

Component	Data Obfuscation	Data Retention Enforcement	Data Overwriting	Audit Logging
Broker	n/a	✓ (stored in DPO cache only)[1]		✓
Real-Time Analysis				
Investigate	✓	✓ (stored in DPO cache only)[2]		✓
Event Stream Analysis	✓			✓
Malware Analysis	✓	✓		✓
Respond	✓	✓		✓
Reporting				
Reporting Engine	✓	✓		✓
Long-Term Analytics				
Archiver	✓	✓	✓(uncompressed)[3]	✓
Warehouse				

Notes:
1 - Brokers can cache data and this needs to be cleared by configuring an independent rollover and other removal of cache as required. The administrator can configure cache rollover for a Broker using the Scheduler in the Services Config view Files tab.
2 - Investigate and the NetWitness Server cache data, and this is cleared automatically every 24 hours.
3 - The overwriting procedure described in Configure Data Retention applies to uncompressed data.

Component-Specific Configuration Guidelines

NetWitness components and modules that obtain access to privacy-sensitive metadata and their obfuscated counterparts are Investigate, Event Stream Analysis (ESA), Malware Analysis, Respond, and Reports. They get access to data based on the permissions defined for the role to which the user belongs. The Administrator or DPO configures each Decoder or Log Decoder to identify meta keys that are flagged for obfuscation.

These components have additional guidelines to ensure that they function as expected with a data privacy scheme:

- **Event Stream Analysis**. When ESA receives privacy-sensitive data from NetWitness core, ESA passes on only the obfuscated version of the data. ESA does not store or show protected data. There are some additional guidelines for configuring advanced EPL rules and enrichment sources as well as information on how to remove sensitive data globally from all alerts (see "How ESA Handles Sensitive Data" in the *Alerting with ESA Correlation Rules User Guide*).

- **Malware Analysis**. Malware Analysis references certain meta keys during scoring, including `alias.host`, `client`, and others. To ensure no loss of analytical functionality Malware Analysis should be configured as a trusted client; that is, configured to connect to the NetWitness Core infrastructure with an account equivalent to a user in DPO role. Otherwise, if meta keys referenced by Malware Analysis do get tagged for obfuscation and are not accessible to Malware Analysis, some of the Indicators of Compromise (IOCs) may be rendered ineffective.
- **Respond Server service.** The Respond Server service uses a data privacy mapping file to display obfuscated data in alerts.(see "Obfuscate Private Data" in the *NetWitness Respond User Guide*) and has a configurable data retention period for alerts (see "Set a Retention Period for Alerts and Incidents" in the *NetWitness Respond User Guide*).
- **Reports.** In Reporting Engine, each Core service is added as two separate data sources, using the two separate service accounts; one data source has a service account representing the Data Privacy Officer role and the other data source has a service account representing a non-Data Privacy Officer role. "Configure Data Privacy for Reporting Engine" in the *Reporting Engine Configuration Guide* provides procedures to configure data privacy for Reporting Engine.

Recommended Configurations

This topic describes the recommended data privacy implementation for NetWitness and several additional use cases for managing exposure of privacy-sensitive data in NetWitness. Administrators can set up the NetWitness hosts and services to meet data privacy requirements for their environment. This section provides recommended configurations for data privacy and data retention.

Recommended Data Privacy Configuration

The recommended configuration to obtain the best analytical value with data obfuscation enabled is to define privacy-sensitive metadata and keep both original and obfuscated (hash) values of privacy-sensitive data on disk for Decoders, Log Decoders, Concentrators, and Brokers.

The assumption is that only a handful of metadata (approximately 10 meta keys) will be classified as protected and a FIPS 140-compliant algorithm for hashing will be used along with a salt to make reverse engineering the original value difficult. The recommended solution is SHA-256 with a salt length of at least 16 characters and up to 60 characters.

Note: By default, hash values are stored in binary format for faster response times and because it requires less storage space in the database when compared to saving them in string format. The recommended storage method is text/string.

Brokers and Investigate may have original and obfuscated data in cache due to data privacy officers using Investigate to confirm the original value to which the obfuscated value maps during investigations. Downstream services can also limit the use of the original sensitive values to in-memory processing so that data does not persist on disk in those downstream systems; this holds true for ESA and Malware Analysis.

The recommended solution to delete data when ready is the built-in and automatic data retention enforcement, which deletes data at a certain threshold. You can use this method for the following components: Decoder, Log Decoder, Log Collector, Archiver, Malware Analysis, NetWitness Respond, and Reporting Engine. You can manually configure Event Stream Analysis to support similar automatic data retention enforcement.

To manage cache storage, the NetWitness Server clears cache related to investigations of events every 24 hours. The Broker can also be configured to execute a periodic removal of locally stored cache.

Options for Data Retention Configurations

NetWitness provides alternative controls that the administrator can apply to enforce stronger restrictions on privacy-sensitive data storage when data obfuscation is enabled.

Data Storage With Data Retention Options in Effect

The following table summarizes where data is stored in the default configuration with no data privacy as well as for each data retention alternative. A checkmark indicates that privacy-sensitive data is saved on the component; a blank indicates that no privacy-sensitive data is stored on the component.

Component	Default Configuration	Data Storage Options		
	Original Data Stored	Original Data and Hash Stored (recommended)	Only Hash Stored	No Data Stored (all metadata is transient)
Ingestion				
Decoder	✓	✓		
Log Decoder	✓	✓		
Meta Aggregation				
Concentrator	✓	✓		
Broker	✓ (Cache only)	✓ (Cache only)		
Real-Time Analysis				
Investigate	✓	✓ (Cache only)		
Event Stream Analysis	✓			
Malware Analysis	✓			
Respond	✓			
Reporting				
Reporting Engine	✓	✓ (Optional)		
Long-Term Analytics				
Archiver	✓ (Optional)	✓ (Optional)		
Warehouse	✓ (Optional)	✓ (Optional)		
Content				
Live	n/a	n/a	n/a	n/a
Fraud Analysis				
RSA Fraud and Risk Intelligence Suite	n/a	n/a	n/a	n/a

Component	Default Configuration	Data Storage Options		
	Original Data Stored	Original Data and Hash Stored (recommended)	Only Hash Stored	No Data Stored (all metadata is transient)
End Point Protection				
NetWitness Endpoint	n/a	n/a	n/a	n/a

Notes:
Cache Only means that sensitive data is in the Broker or NetWitness Server cache. Configure Data Retention provides details about automated and manual clearing of cache.
Optional means that sensitive data storage does occur, but can be limited by optional configurations. For example, to limit where sensitive data is stored, do not enable DPO access for Reporting and do not aggregate original protected data into the Archiver.

Option 1: No Original Data Saved to Disk, Only Hash Stored

Administrators can eliminate the persistence of sensitive data to disk and store only an obfuscated value if the risk of exposure is too great. In this scenario, metadata generated during parsing on the Decoders and Log Decoders is used only in memory and not written to disk. Administrators can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that sensitive metadata is not written to disk. Downstream services do not see original values and must use obfuscated values to conduct investigation and analytics.

To configure this data privacy scheme, data obfuscation must be enabled with hash values configured. You can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that original values are not written to disk.

- Original values identified as sensitive are extracted from the raw data during parsing on the Decoder and Log Decoder and are accessible to the system during parsing (parsers, rules, feeds).
- The Decoder does not save the original values for meta keys identified as sensitive, storing only the hash of original values along with other non-sensitive metadata related to the event.

A side effect of these options is some loss in analytical capability, but you can configure these to suit the needs of your environment.

- By configuring all sensitive data as Transient, sensitive values are not persisted to disk, and the analytic capabilities using the original value are available at parse time only (parsers, rules, feeds).
- Event stream analysis (ESA) and Malware Analysis systems must rely only on the obfuscated meta values when doing their correlation and scoring respectively.
- Reporting Engine is limited to pulling reports using the non-sensitive and obfuscated values.

- The data privacy officer cannot view the original value, but can use the configured hash and salt to determine if an obfuscated value represents a specific known original value.

Option 2: No Original or Obfuscated Values Stored: Not Recommended

Administrators can eliminate the persistence of the original value to disk entirely if the risk of exposure is too great. As in Option 1, in this scenario, metadata generated during parsing on the Decoders and Log Decoders is used only in memory and not written to disk. Administrators can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that sensitive metadata is not written to disk. Downstream services do not see original values and have no obfuscated values to conduct investigation and analytics.

To configure this data privacy scheme, configure individual meta keys on a Decoder or Log Decoder as transient to ensure that original values are not written to disk.

- Original values identified as sensitive are extracted from the raw data during parsing on the Decoder and Log Decoder and are accessible to the system during parsing (parsers, rules, feeds).
- The Decoder does not save not save the original values for meta keys identified as sensitive, storing only non-sensitive metadata related to the event.

A side effect of these options is significant loss in analytical capability, but you can configure these to suit the needs of your environment.

- By configuring all sensitive data as Transient, sensitive values are not persisted to disk, and the analytic capabilities using the original value are available at parse time only (parsers, rules, feeds). See Configure Data Retention.
- All downstream components have no visibility in the original values, obfuscated or otherwise.
- The data privacy officer has no visibility into the original value obfuscated or otherwise.

Optional Data Overwriting Options

Several options for overwriting data are available, and you should thoroughly understand each one before implementing data overwriting.

Option 1: Limit Disk Space for Continuous Overwriting of Older Data

If the desired data retention period to store the data, and therefore the amount of storage required for that data, is known, the size of the underlying hardware or the partition can be limited to that size. By reducing the hard drive storage or the partition size, the amount of free space available that has to be filled before new data overwrites it would also be limited. The newly ingested data continually overwrites the older data. Either solution must be done at deployment time to be effective.

Side effects of this option are:

- The removal of some disks will limit the number of resources available to distribute the I/O, causing some degradation in performance.

- The smaller partition size may cause some degradation in performance, but would alleviate some of the performance impact of removing disks.

Option 2: Use Tiered Storage to Overwrite Data on a Scheduled Basis

If overwriting of data is required on a scheduled automatic basis, you can configure the Decoders and Concentrators to use tiered storage. The tiered storage configuration provides a mechanism for invoking a script after a database file has been removed from the application but prior to its removal from the file system. If necessary, instead of moving the file to the second tier, or cold storage, (the intended function in a tiered storage use case), the script can use a utility like the CentOS `shred` utility to overwrite the file. This tool is less effective when the database is stored in a journaling file system like XFS, in which the Core database resides, and on a RAID logical drive like the ones with which the Core hosts connect.

Most other NetWitness components do not have this option; their data is stored in a database that does not support the tiered storage mechanism. The only other component that could use this overwrite method is the Reporting Engine since it saves reports and alerts as individual files. However, the Reporting Engine charts are stored in a database so they would be immune to this technique.

Option 3: Purge Data Using String and Pattern Redaction Option

Data purging provides a mechanism to strategically overwrite a specific subset of data from the system in case any sensitive data has been persisted either on purpose or by accident. The NetWitness `wipe` utility allows for unique patterns to be written over the data in the meta and packet databases for Core services, which may contain RAW packets or logs for existing sessions, based on a session identifier. All Core components have the capability to overwrite a subset of data that has been found by executing a query string, including regex patterns. The session identifiers resulting from the query are fed into the NetWitness `wipe` utility.

Note: This option is not available if the data in the Core database has been compressed (as typically done in Archiver deployments).

In most NetWitness components the database in use does not provide a built-in redaction or secure deletion mechanism. The Malware Analysis component can overwrite the data object in the database with the value `private` instead of deleting it during the data retention management process, but this is not meant to be a secure deletion mechanism.

Caution: Using this method on a large number of sessions has two drawbacks: it can be time-consuming and impact performance.

See Purge Data Using String and Pattern Redaction Option for procedure.

Limitations to Data Overwriting

There are limitations to the overwriting techniques described as Option 2 and 3. To perform the overwrite of the data in the disk sectors, the above options for overwriting and the overwrite command line tool provided as an alternative method (`shred`, a function of CentOS) make assumptions about the disk layout. NetWitness hosts use SSD drives and RAID configurations for performance and reliability reasons, and these inhibit the functionality of the overwrite techniques. If overwrite techniques alter SSD drives and RAID configurations in an attempt to increase security, there will inevitably be an associated performance cost reflected in ingest rates, query speeds, and potentially other areas. The command line tools available for overwrite are recommended only for special use cases when it is necessary to redact specific data. The tools are not for use in a real-time continuous method because of the potential performance cost that will be incurred.

Quick Start Procedures

This section provides end-to-end instructions for preparing to configure data privacy features, then completing the configuration of the recommended data privacy solution.

- Prepare to Configure Data Privacy
- Configure the Recommended Data Privacy Solution

Prepare to Configure Data Privacy

This topic provides general guidelines for planning and configuring data privacy policies in the NetWitness network. Before beginning configuration, you must understand the data that needs to be protected on your network and develop a plan. You will need to:

1. Identify the meta keys that hold privacy-sensitive data and need to be protected. This decision is based on requirements specific to your site.
2. Decide which users need access to privacy-sensitive metadata and raw content. The first decision is whether to separate the DPO and administrator roles for your site by configuring a custom administrators system role on Decoder and Log Decoders and removing the `dpo.manage` permission. By default, administrators have all permissions including the ability to configure the salted hash transform used to obfuscate data; some sites may want to reserve this access for data privacy officers. "Service User Roles and Permissions" in the *Hosts and Services Getting Started Guide* has more details on exactly what permissions each role has and the purpose of the permissions.
3. Plan the configuration changes you need to make in your NetWitness deployment to support adequate data privacy.
4. Assess how your configuration may impact out-of-the-box and custom content. For example, by default content available through Live for Reporting Engine is not geared toward obfuscated meta values.

In a single deployment, certain data-privacy configurations in the Core services must be the same. The following table lists these settings and uses a checkmark to identify the services for which the configuration must be the same. In the heading, the following abbreviations are used: D = Decoder, LD = Log Decoder, A = Archiver, C = Concentrator, and B = Broker.

	Configuration must be the same for these services:				
Setting	**D**	**LD**	**A**	**C**	**B**
Hash algorithm and salt for privacy-sensitive data	✓	✓			
Language key data privacy attributes in the custom index file (includes configuring keys as protected)	✓	✓	✓	✓	✓
Transient meta keys (not persisted on disk) per service and parser	✓	✓			
Meta data and raw content visibility per system user group. (The meta keys must exist in the custom index file.)	✓	✓	✓	✓	✓
User who has the `Aggregation` service user role assigned is added.*	✓	✓	✓		

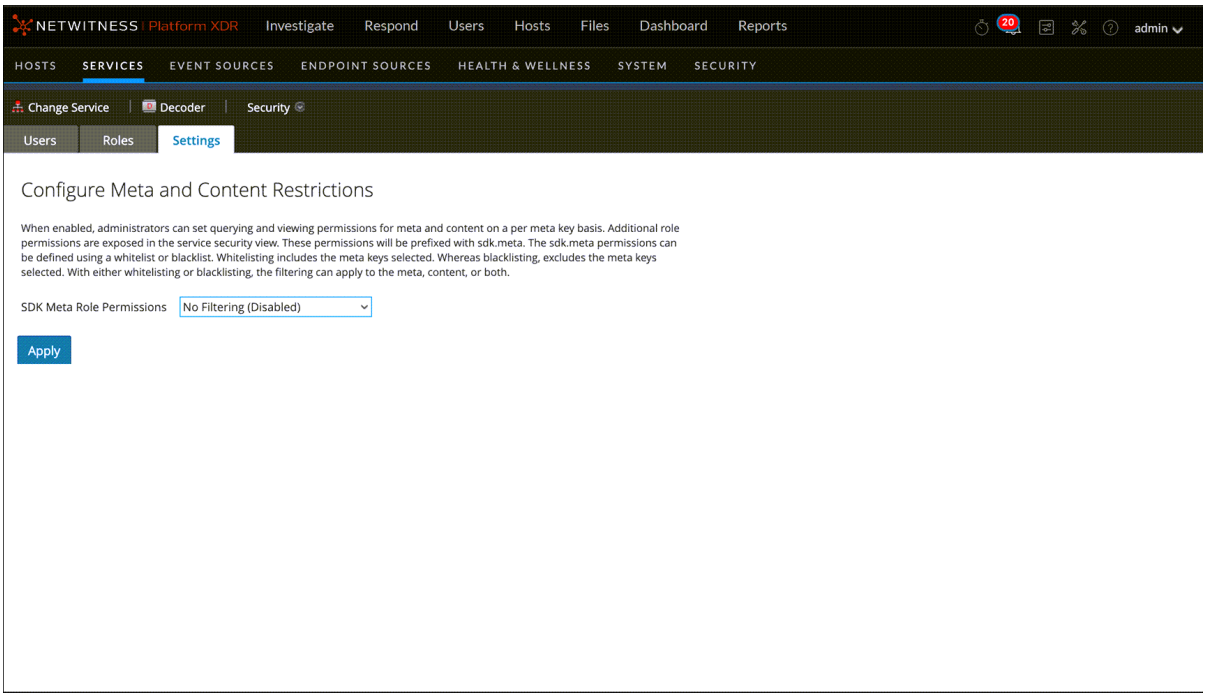
* When trying to access data on an aggregate service, the Log Collector or Broker requests authentication. When prompted to enter user name and password, you must authenticate as a user who is assigned the `Aggregation` service role. "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide* provides detailed information about this role. Follow the instructions in "Add, Replicate or Delete a Service User" in the *Hosts and Services Getting Started Guide* to create a user and assign the new user the Aggregation service user role.

Configure the Recommended Data Privacy Solution

This topic tells administrators and data privacy officers how to configure the recommended data privacy solution in a NetWitness network. These are the basic steps to follow to configure the NetWitness system to identify sensitive data and determine who can see the sensitive data. The recommended configuration generates obfuscated values of certain original meta keys and then persists both the original and obfuscated data so that it is available to users assigned privileged role access.

This configuration has several parts:

1. Create two users with different levels of permissions. One user (the data privacy officer) can view all metadata and another user (an analyst) is restricted from seeing certain metadata and content with associated metadata.
2. Set up two transforms using a salt and hash to create an obfuscated version of original `username` and `ip.src` meta keys.
3. Configure data retention on the Decoder and Concentrator services.

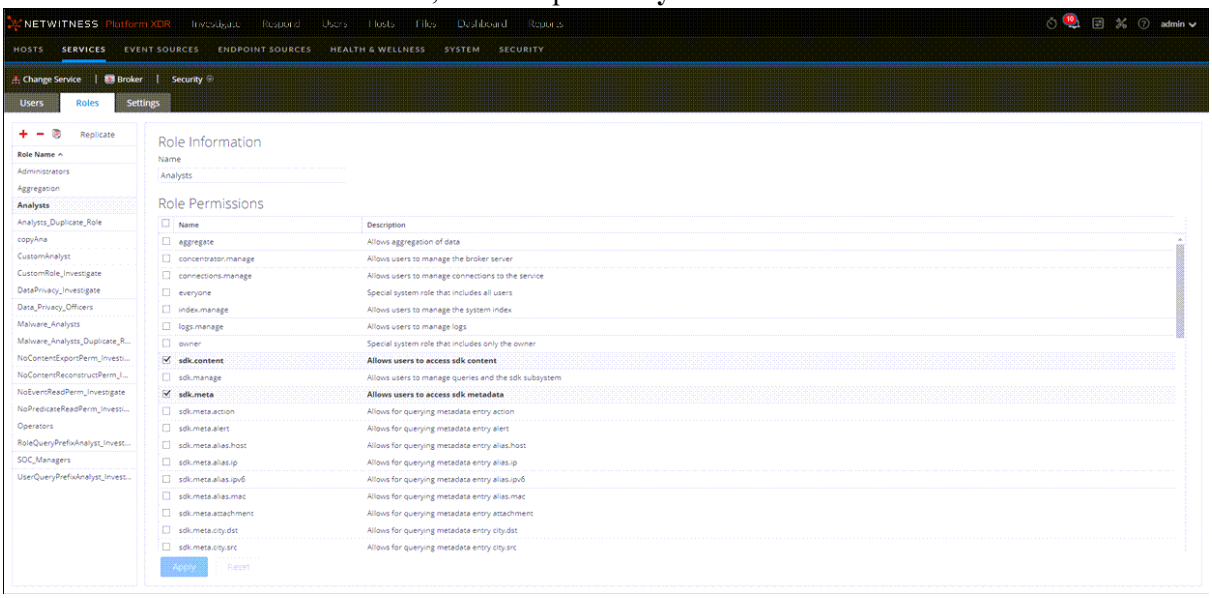


Note: The following conditions are required in order to complete this procedure:
-The Concentrator and Decoder must be added to the NetWitness Server using trusted connections.
-The NW Server version must be 11.x or later.
-The Core services must be 11.x or later.
-Aggregation must use Aggregators accounts on all Core services.

Configure Metadata and Content Restrictions on Brokers, Concentrators, and Decoders

Note: In version 11.6, if these 12 metas namely `'sessionid','nwe.callback_id', 'medium','session.split','ip.dst','ip.src','ipv6.src','ipv6.dst','tcp.dstport','tcp.srcport','udp.dstport', and 'udp.srcport'` are restricted then the group events option will be disabled.

To restrict the metadata and raw content that users can view, you must enable SDK system roles to allow more granular controls by configuring metadata and content restrictions on each service in the Services Security view.



1. Go to  **(Admin)** > **Services**, select a service and then select  **> View > Security**.
2. Click the **Settings** tab.

3. In the **SDK Meta Role Permissions** field, select **Blacklist meta and content**. Click **Apply**.

   This allows the administrator to blacklist individual meta keys so that only the data privacy officer can see the meta keys and content. New roles per meta key are added to the Roles tab.

4. Click the **Roles** tab and select a role, for example **Analysts**.

5. In the **Roles** tab,

   a. Select the meta keys that you do not want analysts to see, for example, select `sdk.meta.username` and `sdk.meta.ip.src`.
   This restricts the analyst from seeing the privacy-sensitive meta keys `username` and `ip.src` as well as any content for any session that contains that metadata within it.

b. Ensure that `sdk.packets` is selected.
   If it is de-selected, analysts lose the ability to bulk export raw packets and logs. In NetWitness Platform 11.0 and later, RBAC just works for packets. Sessions that are restricted are just skipped during pcap generation in Investigate. Sessions that are allowed have packets returned. For more information on RBAC, see the *System Security and User Management Guide*.

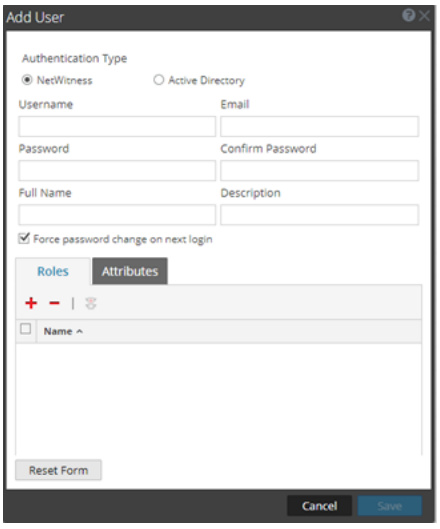
c. Click **Apply**.

6. In the Roles tab, ensure that the `Data_Privacy_Officers` role has no `sdk.meta.values` selected. Click **Apply**.

   A DPO can view any metadata and any session.

   In the Roles tab, ensure that the `Aggregation` role has the following permissions: select `aggregate`, `sdk.content`, `sdk.meta`, and `sdk.packets`.

Add Data Privacy Officer and Analyst Accounts on the NetWitness Server



You must add two new user accounts in NetWitness at the system level to depict a privileged data privacy officer and a typical analyst. If the environment is configured using the default trusted connections, you do not need to create the new user accounts on the Core services (Brokers, Concentrators, and Decoders). When a user is created in the NetWitness Server, that user can log on to the services.

Note: The role name is required to exist on both the server and the services, and the role name for all must be identical. If you create a new custom role on the NetWitness Server, make sure to add it to all Core services as well.

1. Create a new user account for the data privacy officer:

   a. Go to **(Admin)** > **Security**, select the **Users** tab. In the **Users** tab toolbar, click .

   The Add User dialog is displayed.

   b. Create the new account with the following credentials.

Username = <new user name for logon, for example, DPOadmin>
Email = <new user's email, for example, DPOadmin@rsa.com>
Password = <new user's password for logging on, for example, RSAprivacy1!@>
Full Name = <new user's full name, for example, DPO Administrator>

c. Click the Roles tab, , and select the `Data_Privacy_Officers` role for the new user.

d. Select **Save**.

2. Create a new user account for the analyst with limited privileges:

a. In the **Services Security** view, select the **Users** tab. In the **Users** tab toolbar, click .

The Add User dialog is displayed.

b. Create the new account with the following credentials:

Username = <new user name for logon, for example, NonprivAnalyst>
Email = <new user's email, for example, NonprivAnalyst@rsa.com>
Password = <new user's password for logging on, for example, RSAprivacy2!@>
Full Name = <new user's full name, for example, Nonprivileged Analyst>

c. Click the Roles tab, , and select the `Analysts` role for the new user.

d. Select **Save**.

Configure Obfuscated Data on Decoders and Concentrators

This procedure creates the obfuscated values to provide to users who do not have access to the original values.

1. Configure a salt so that the obfuscated value becomes unique. Different companies may have analysts of the same first name and potentially the same login username, and using a salt limits the possibility of someone outside your organization determining your obfuscation mechanism. In this example, you use a simple salt and SHA-256, but the salt is configurable and the hash algorithm can be changed. For additional information, see Configure Data Obfuscation.

a. To define the salt and hash algorithm, go to  **(Admin) > Services**.

b. Select a Decoder in the **Admin Services** view and select  > **View > Config**.

c. Click the **Data Privacy** tab, and select hash algorithm (SHA-256). In the Salt field, type a hash, for example, **rsasecurity**, and click **Apply**.

2. Define the transforms, including the hash format, between the original meta key and obfuscated meta key on the Decoder. The default hash format is binary, but the recommended configuration calls for using the text/string format.

a. While still in the Services Config view, click the **Files** tab, and in the drop-down menu select **index-decoder-custom.xml.** (You can apply this same configuration to the Log Decoder in the `index-logdecoder-custom.xml` file.)

b. Enter the following lines in the available input area:

```
<?xml version="1.0" encoding="utf-8"?>
<language level="IndexNone" defaultAction="Auto">
<key name="username" description="Username" format="Text"
protected="true"><transform destination="username.hash"/></key>
<key name="username.hash" description="Username Hash"
format="Text"/>
<key name="ip.src" description="Source IP Address" format="IPv4"
protected="true"><transform destination="ip.src.hash"/></key>
<key name="ip.src.hash" description="Source IP Address Hash"
format="Text"/>
</language>
```

c. To restart the Decoder service, go to **(Admin)** > **Services**, find the Decoder service you want to restart, and select > **Restart**.
The service should automatically restart.

3. Define the meta keys on the Concentrator in the `index-concentrator-custom.xml` file:

a. Go to **(Admin)** > **Services**, select a Concentrator in the **Admin Services** view, and select > **View > Config**.

b. Click the **Files** tab, and in the drop-down menu select **index-concentrator-custom.xml**

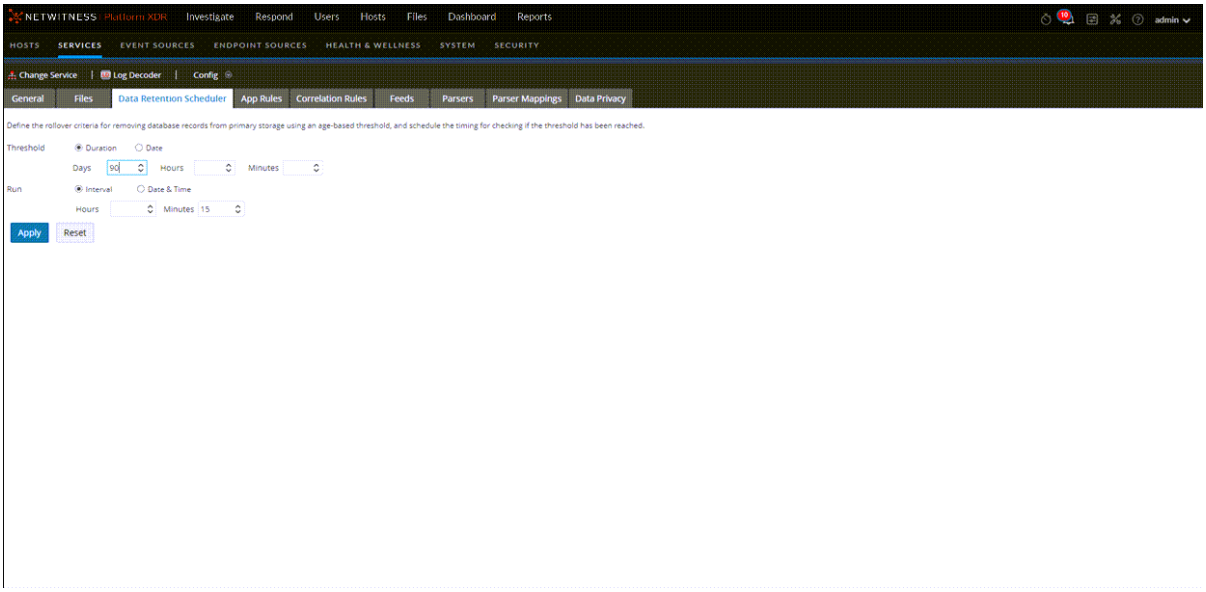
c. Enter the following lines in the available input area:

```
<?xml version="1.0" encoding="utf-8"?>
<language level="IndexValues" defaultAction="Auto">
<key name="username" description="Username" format="Text"
level="IndexValues" protected="true"/>
<key name="username.hash" description="Username Hash"
format="Text" level="IndexValues" token="true"/>
<key name="ip.src" description="Source IP Address" format="IPv4"
level="IndexValues" protected="true"/>
<key name="ip.src.hash" description="Source IP Address Hash"
format="Text" level="IndexValues" token="true"/>
</language>
```

d. To restart the Concentrator service, go to **(Admin)** > **Services**, find the concentrator service you want to restart, and select > **Restart**.
The service should automatically restart.

Configure Data Retention on Concentrators and Decoders

Data retention configuration ensures that the data residing in the NetWitness Core components is deleted after a certain time. Configuring data retention on Concentrators and Decoders is not required for all environments, but it may be necessary to be in compliance with applicable laws and regulations. It is important to evaluate an appropriate retention period for your environment. The Data Retention Scheduler settings that you set apply to ALL data on a Concentrator or Decoder.



In the following example, NetWitness is configured to execute a check every 15 minutes to determine if the duration threshold has been met. If the threshold is met, NetWitness deletes data older than 90 days in the relevant databases.

Caution: The 90 day retention period is just an example. Adjust your rollover criteria depending on the location of the data and the applicable laws. In a strict data privacy environment, such as in Europe where laws require that Personally Identifiable Information (PII) not be saved or removed frequently, you may need to adjust the time.

This procedure is optional. If you do not set a time retention limit, the system automatically deletes the oldest data when the hard drive space is full.

(Optional) For each Concentrator and Decoder:

1. Navigate to the **Services Config** view **> Data Retention Scheduler** tab.

2. Define the data retention period. For example, set the **Threshold** to **Duration**, and type **90** in the **Days** field.
3. Define how often the scheduler checks to see if the threshold has been met. For example, set the runtime to **Interval** and select **15** in the **Minutes** field.
4. To save the configuration, click **Apply**.

Validate Data Privacy Protection

At this point, users have been added with roles that have permissions around specific types of metadata. The next step is to make sure the restricted user (the analyst) cannot view what the unrestricted user (the DPO) can. Also you need to ensure that the data retention configuration is limiting how long data is kept on the systems.

1. View role-based obfuscation in action:
   a. Log on as the unrestricted user (DPOadmin) and make sure this user can see all the data including the protected sensitive data `username` and `ip.src` along with any session that contains that metadata.
   b. Log off and the back on as the DPO user.

c. For each Decoder and Log Decoder, import a PCAP or logfile into the Services System view. Go to  **(Admin)** > Services, click a service, and use the **Upload Packet Capture File** option to upload a PCAP file that contains `username` and `ip.src` metadata.

d. When the import is complete, go to **Investigate > Navigate**, select the Concentrator connected to the Decoder to which the data was just imported.

e. Scroll down to make sure the `username` and `ip.src` meta keys and corresponding values are visible.

f. Click one of the green numbers next to a `username` or `ip.src` value and verify that the session loads in the Events view.

g. Make a note of the session ID to check when logging on as the restricted user.

h. Log off and log on as the restricted user (NonprivAnalyst).

i. Repeat steps c through f to verify that the user cannot see any `username` or `ip.src` metadata or sessions with that metadata including the one previously mentioned.

j. To jump to a specific session in the **Navigate** view, in the **Actions** menu, select **Go to Event** and enter the session ID.

2. Validate that the data retained in the database falls within the retention time configured in the Data Retention Scheduler.

a. Log off and log on as the unrestricted user (DPOadmin).

b. On the Concentrator, navigate to the **Services > Explore** view.

c. In the node tree, select the **database** node and then **stats**.

d. Observe the `meta.oldest.file.time` value and verify that this is not older then the threshold put on the data retention scheduler.

e. Change the service to the Decoder and repeat steps b through d, check for `stats meta.oldest.file.time` and `packet.oldest.file.time`.

In-Depth Procedures

This topic is a collection of procedures that a Data Privacy Officer uses to implement a data privacy plan for the NetWitness network. These procedures are part of an overall configuration, and are performed as needed to implement the data privacy plan and manage the flow of information in the network.

- Configure Data Obfuscation
- Configure Data Retention
- Configure User Accounts for Use in Data Privacy

Configure Data Obfuscation

This topic provides the procedures for configuring data obfuscation in NetWitness. In a single deployment, all Core service configurations for a data privacy solution must be the same; be sure to use the same hash and salt across all Decoders and Log Decoders.

Note: In order for data obfuscation to work, user accounts need to be configured as described in Configure User Accounts for Use in Data Privacy.

Configure the Decoder Hash Algorithm and Salt

Value hashing accomplished as part of the data privacy solution occurs at the time of meta key creation on the Decoder and Log Decoder. Both services have default settings for use with all meta keys whose values are transformed without a specified hash algorithm type or salt value. The initial NetWitness values for defaults are: hash algorithm (SHA-256) and salt (none).

Note: The SHA-1 algorithm and it is not available.

If you want to change the default settings, you can edit them in the Services Config view > Data Privacy tab or in the following nodes in the NetWitness Services Explorer view:

- `/decoder/parsers/transforms/default.type`

  The algorithm to use for any keys with a transform defined that does not specify `type`. The supported algorithms are: `duplicate` and `sha-256`.

- `/decoder/parsers/transforms/default.salt`

  The salt value prepended to any value that is hashed (`sha-256`). This value is optional, an empty salt is valid and produces an unsalted hash. The salt is not defined by default so that you can create a unique salt for your environment. In general, the longer and more complex the salt, the better the security. A salt of up to 60 characters can be used without any major impact. A salt of at least 16 characters is recommended.

To edit the default hash algorithm and salt

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Decoder or Log Decoder service, and select  **> View > Config > Data Privacy**.

3. In the **Configure Hash Algorithm and Salt** section, select a **Hash Algorithm** to use for any meta keys with a defined transform that does not specify type: `sha-256`. (A second algorithm, `duplicate`, is available for administrators to use in validating that expected hashing behavior is occurring in the network.)
4. (Optional) In the **Salt** field, enter a salt value to be prepended to any value that is hashed. This value is optional, an empty salt is valid and produces an unsalted hash. The salt is not defined by default so that you can create a unique salt for your environment. In general, the longer and more complex the salt, the better the security. Best practices for security purposes dictate a salt value that is no less than 100 bits or 16 characters in length. If a unique salt is required for each individual meta key, that needs to be configured in the index file as shown in example 3 below.
5. Click **Apply**.

   The new settings become effective immediately.

Configure Language Keys

The NetWitness Core Language has several language key attributes to facilitate data privacy. You can edit these attributes in the custom index file for each Decoder or Log Decoder. The custom index file (for example, `index-decoder-custom.xml`) is editable in the Services Configuration view > Files tab. After making changes in the index file, like the ones shown in the examples below, a service restart in a specific sequence is required.

Based on the data privacy requirements for your site, configure individual meta keys to be protected using the following `key` attributes:

- `protected`

  This attribute specifies that NetWitness should consider the values as protected and tightly control any release of the value. When propagating the protected attribute, NetWitness ensures that any downstream trusted system treats the values accordingly. Add this attribute to all services that create the protected values (that is, Decoder or Log Decoder) and any services that will provide trusted access (software development kit (SDK) query/values, aggregation) outside of Core services. The exception to this rule is that a Broker with no index file specified does not need to have the attribute added.

- `token`

  This attribute specifies that values for this key are stand-ins for another value and may not be visually interesting. The `token` attribute is informational, primarily for UI elements to display the value in a more useful or visually pleasing format.

- `transform`

  This child element of `key` indicates that any values for a given meta key should be transformed and the resulting value persisted in another meta key. The `transform` element is only required on Decoders and Log Decoders and is informational if specified on any other Core services. The `transform` element has the following attributes and children:

Name	Type	Description	Optional or Required
`destination`	attribute	Specifies the key name where the transformed value will be persisted.	required
`type`	attribute	The transform algorithm to apply. If not specified, the value of `/decoder/parsers/transforms/default.type` is used.	optional
`param`	child-element	A name/value pair, where each `param` element has a required attribute `name` and the child text is the value. The only supported `param` is used to specify a meta key-specific `salt` value. If not specified, the following value is used: `/decoder/parsers/transforms/default.salt`	optional

Example 1

On a Decoder or Log Decoder, mark `username` as protected and hash all values into `username.hash` with the default algorithm and salt:

```
<key name="username" description="Username" format="Text" protected="true">
<transform destination="username.hash"/></key>
```

Example 2

On a Concentrator, mark `username` as protected and `username.hash` as token:

```
<?xml version="1.0" encoding="utf-8"?> <language level="IndexNone"
defaultAction="Auto">
<key description="Username" format="Text" level="IndexValues" name="username"
protected="true"/>
<key description="Username Hash" format="Binary" level="IndexValues"
name="username.hash"
token="true"/> </language>
```

Example 3

On a Decoder or Log Decoder, mark `username` as protected and hash all values into `username.bin` with the specified algorithm and salt:

```
<key name="username" description="Username" format="Text" protected="true">
<transform destination="username.bin" type="sha-256">
param name="salt">0000</param> </transform></key>
```

Configure Metadata and Content Visibility Per User Role on Core Services

On individual Broker, Concentrator, Decoder, Log Decoder, and Archiver services being viewed in the Services Security view  **(Admin) > Services > Security**), administrators can configure the visibility of metadata and content based on the user group or role assigned to a user. This is called the SDK meta roles capability, and it is enabled by default. Administrators who want to configure metadata and content visibility per user must not disable the `sdk.content` permission (in the Roles tab). If the `sdk.content` permission has been disabled in the Roles tab, packets and raw logs are not visible to `system.roles` node. The `system.roles` node handles the filtering using the method configured in the Settings tab.

With `sdk.content` capability enabled, the next step is to select the method of filtering metadata and content in the Settings tab. Selecting a blacklist or whitelist option makes additional permissions for specific meta keys available in the Roles tab. The result is that administrators can choose a user role, such as analyst, in the Roles tab and select specific meta keys (and content) to be blacklisted or whitelisted for that user group. The permissions apply to any user in the user group.

For the Events view to display events correctly, the `sdk.meta.medium` meta key must be enabled to display values in the Type column (one of the default columns in the Events list). In addition, any meta keys used in a Query Prefix under User Settings in the Users tab or a PreQuery configured for Investigate must be enabled  **(Admin) > Security > Users** or  **(Admin) > Security > Roles**). If the meta key is not enabled for the user group, the column will not be displayed in the Events list.

Note: In the Version 11.4 and later Events panel, events are listed even when the user does not have permission to view the event reconstruction. In addition, the download options may still be available when a user does not have permission to view the event reconstruction. In these cases the user is allowed to download the events, but the output is an empty file because restricted permissions are enforced during the download.

The following table lists the options for filtering in the Settings tab and the numeric values used to disable (0) and the types of filtering (1 through 6). There is no need to know the numeric value unless configuring metadata and content visibility manually in the `system.roles` node.

system.roles Node Value	Settings Tab Option	Event Metadata	Original Event
0	**No Filtering.** System roles that define permissions on a per meta key basis are disabled.	Visible	Visible
1	**Whitelist meta and content.** By default no meta keys and no packets are visible. Selecting individual SDK meta roles per user group allows users to see metadata and packets for that SDK meta role.	Not Visible-Select to Show	Not Visible-Select to Show
2	**Whitelist only meta.** By default packets are shown, but no metadata is visible. Selecting individual SDK meta roles per user group allows users to see metadata for that SDK meta role.	Not Visible-Select to Show	Visible
3	**Whitelist only content.** By default metadata is visible, but no packets are visible. Selecting individual SDK meta roles per user group allows users to see packets for that SDK meta role.	Visible	Not Visible-Select to Show
4	**Blacklist meta and content.** By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing metadata and packets for that SDK meta role.	Visible-Select to Hide	Visible-Select to Hide
5	**Blacklist only meta.** By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing metadata for that SDK meta role.	Visible-Select to Hide	Visible
6	**Blacklist only content.** By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing packets for that SDK meta role.	Visible	Visible-Select to Hide

Three factors determine what a user sees:

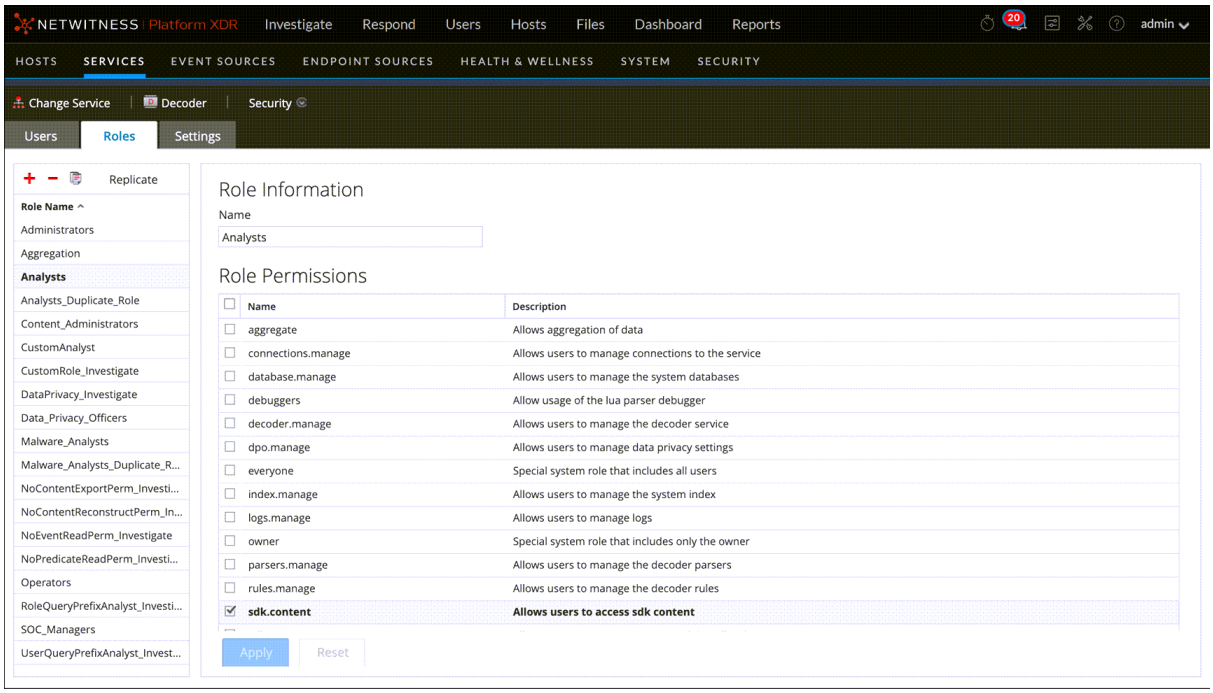
- The SDK meta role setting (blacklist or whitelist).
- The restricted meta keys configured for the group to which the user belongs.

- The meta keys in the session being analyzed. These include meta keys specified in a query prefix for a user at the service level, and for roles and users at the system level.

Caution: Be aware that with blacklisting, implicit trust is granted for all except the configured metadata. For a Decoder to have RBAC enabled and use implicit trust, it must only use a blacklist system setting; a whitelist setting will result in some issues with meta keys that are not explicitly enabled and therefore not visible. It is impossible to grant implicit trust under whitelist rules because the universe of meta keys cannot be known. If you want to use whitelisting, a workaround is to turn RBAC off for the Decoder and disable any user accounts from connecting directly to the Decoder if they should use RBAC.

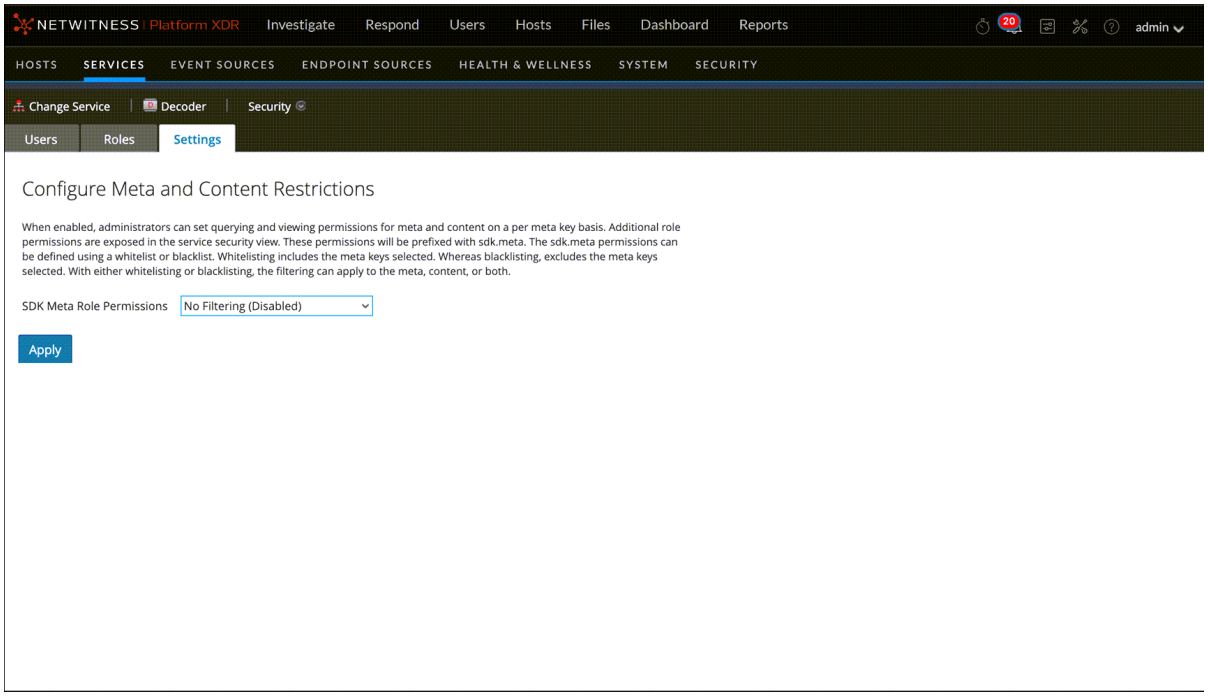
Here is an example of how the SDK meta role configuration meshes with a Group that has restricted meta keys.

Configuration:



- The SDK meta role setting is **Blacklist meta and content**. With this option implemented, all metadata and all content (packets and logs) are visible by default.
- The administrator has restricted meta keys configured for the Analysts group to prevent viewing of sensitive data (for example, `username`).
- The packets and logs for any session that includes the `username` meta key are not visible to an analyst.

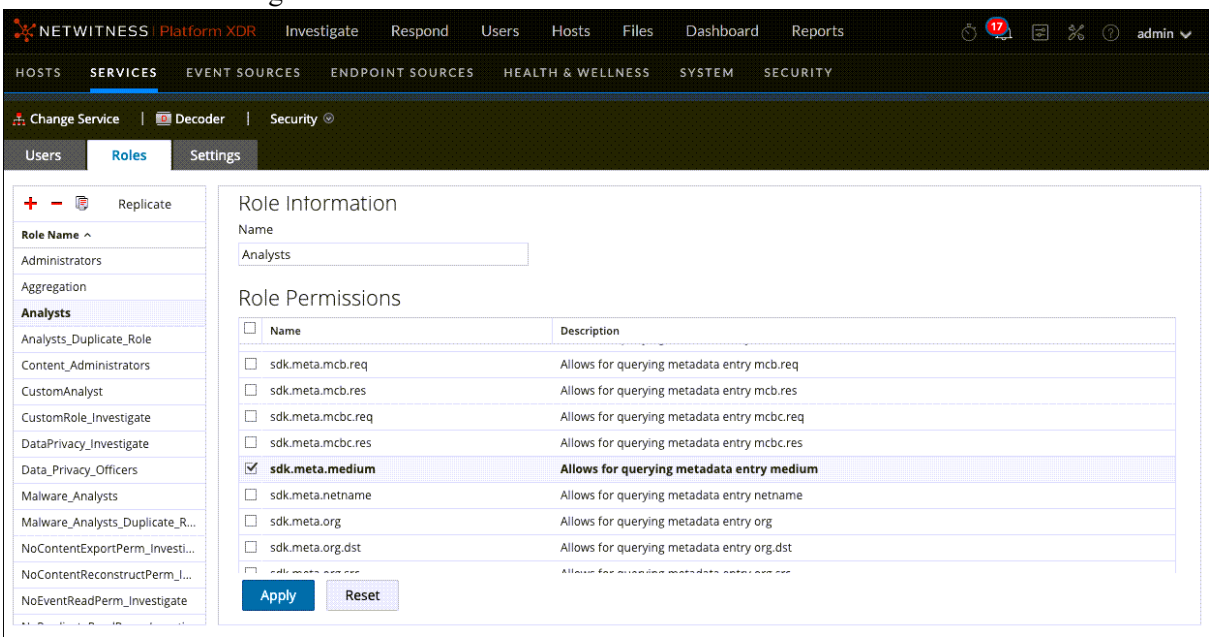
Result: Now a user who is a member of the Analyst Group investigates a session. Depending on the content of the session, the results are different:



- Session 1 includes the following meta keys: `ip`, `eth`, `host`, and `file` The session does not include `username` so all packets and logs in the session are displayed.
- Session 2 includes the following meta keys, `ip`, `time`, `size`, `file`, and `username`, Because the session includes `username` , no packets or logs from the session are displayed for the analyst.

To configure metadata and content restrictions for a Decoder or Log Decoder:

1. Go to  **(Admin)** > **Services**.
2. In the **Services** view, select a Broker, Concentrator, Decoder, Log Decoder, or Archiver service and select  **> View > Security**. Click the **Roles** tab, select a role, and verify that the `sdk.content` permission is enabled.



3. Click the **Settings** tab.

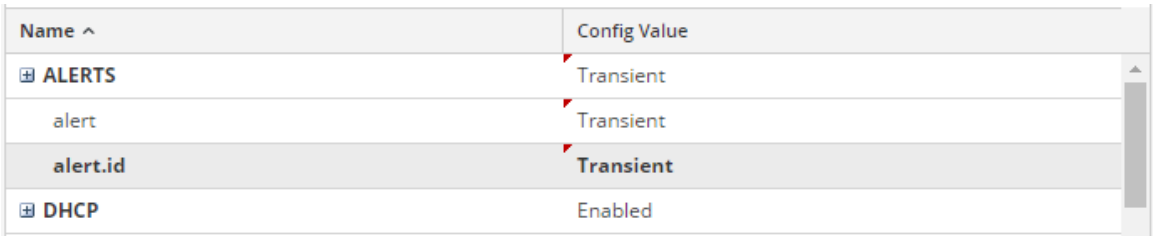
4. Select one of the filtering methods (blacklist or whitelist) and content types (meta and content, meta only, or content only), and click **Apply**.
5. Click the **Roles** tab and a role for which you want to allow content (whitelist) or block content (blacklist) as specified in the SDK Meta Role Permissions setting.

The Role Permissions for the selected role are displayed, and the SDK Meta Role Permissions are available for selection, for example, `sdk.meta.medium`. If you selected one of the whitelist options in the SDK Role Permissions setting, you must assign each SDK meta role to make the selected content visible to users assigned that SDK meta role. The `sdk.meta.medium` permission must be enabled in order for the Type column to be displayed in the Investigate > Events view. If you selected one of the blacklist options in the SDK Role Permissions setting, selected content will be hidden from users assigned that SDK meta role.

6. Select the SDK meta role permissions for users assigned this role. Click **Apply**.

The settings become effective immediately and apply to new packets and logs processed by the Decoder or Log Decoder.

Configure Meta Keys Not Written to Disk Per Parser on a Decoder



On a Decoder and Log Decoder, a Data Privacy Officer can configure individual meta keys that are not written to disk. To do so, the DPO specifies the meta keys as transient in the index and the parser configuration.

Note: The same capability was previously available on Log Decoders, and was configured when setting up parsers by modifying the table-map.xml file. Now it is integrated in the Services Config view.

To configure selected meta keys on individual parsers that will not written to disk:

1. Go to **(Admin)** > **Services**.
2. In the **Services** view, select a Decoder or Log Decoder service and select **> View > Config**.
3. In the **Parsers Configuration** section of the **General** tab, select a parser and then select **Transient** in the **Config Value** drop-down list. Access the list by clicking on the configuration value (Enabled, Disabled, or Transient).

The configuration change is marked by a red triangle.

4. Click **Apply**.

   The change is effective immediately. The parser configured as Transient will no longer store meta keys to disk.

Configure Data Retention

A NetWitness user with the role of Administrator can configure NetWitness to ensure that sensitive data has been removed after a specific retention period, regardless of system ingest rate. For instance, the policy might be to keep packets (both raw data and metadata) for no more than 24 hours, and to keep some logs (both raw data and metadata) for up to seven days. If sensitive data makes its way into another database on the Reporting Engine, Malware Analysis, Event Stream Analysis, and NetWitness Servers, data retention can be managed there as well. The administrator needs to set up each service individually across all NetWitness components (except Event Stream Analysis) based on policy and data privacy laws.

Sensitive data may also be in cache.

- Brokers can cache data and this needs to be cleared by configuring an independent rollover and other removal of cache as required. The administrator can configure cache rollover for a Broker by editing the `Scheduler` file in the Services Config view Files tab.
- Investigate and the NetWitness Server cache data, and this is cleared automatically every 24 hours.
- If the Data Privacy Officer (DPO) exports data, that is the same as saving data on the NetWitness Server in the jobs queue. To clear this data, the administrator or DPO should clean up the jobs queue on a regular basis.

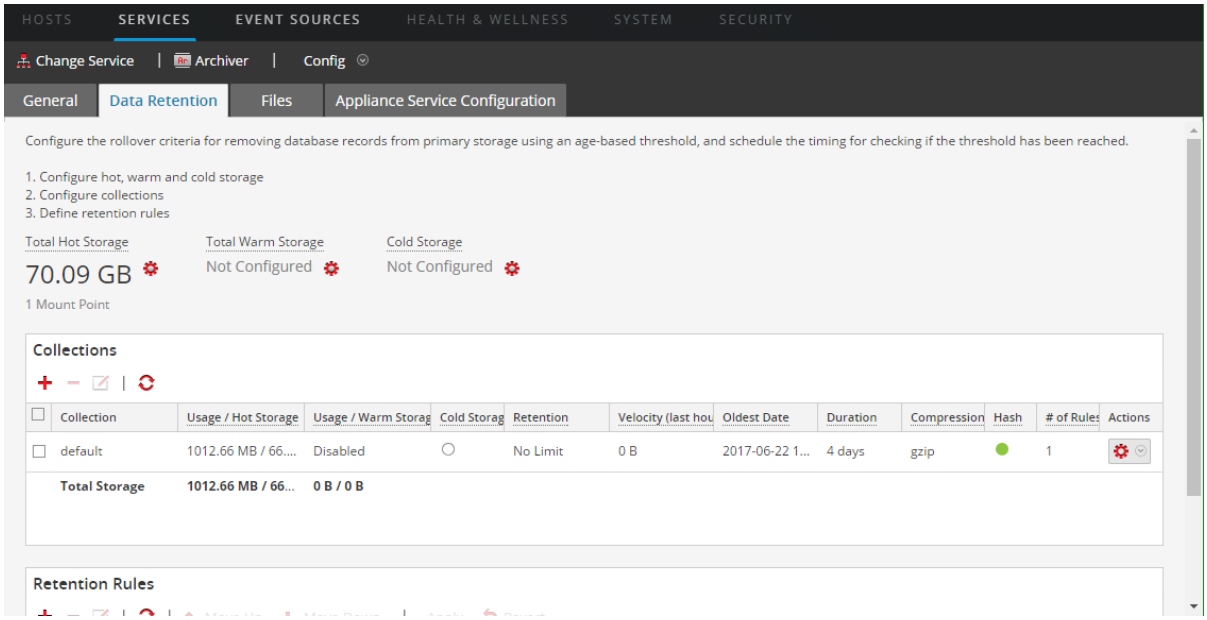
Data Retention

You can schedule a recurring job for Decoder, Log Decoder, and Concentrator services in NetWitness to check if data is ready to be removed. The Data Retention Scheduler provides a means to configure basic scheduling (see below), and advanced Scheduler settings are also available by editing the `Scheduler` file in the Services Config view Files tab or the node in the Explorer view.

The Archiver has flexible data storage and retention options. You can place different types of log data into individual collections and manage them separately. These collections enable you to specify how much of the total storage space to use and how many days to store the logs in the collection. You can also determine whether to delete the log data or to move it to offline cold storage after it reaches the maximum specified storage space for the collection.

For example, you can put sensitive information in a collection and configure a limitation on how long to keep it, such as 30 days. To delete the data after 30 days, you would not enable warm or cold storage for that collection.

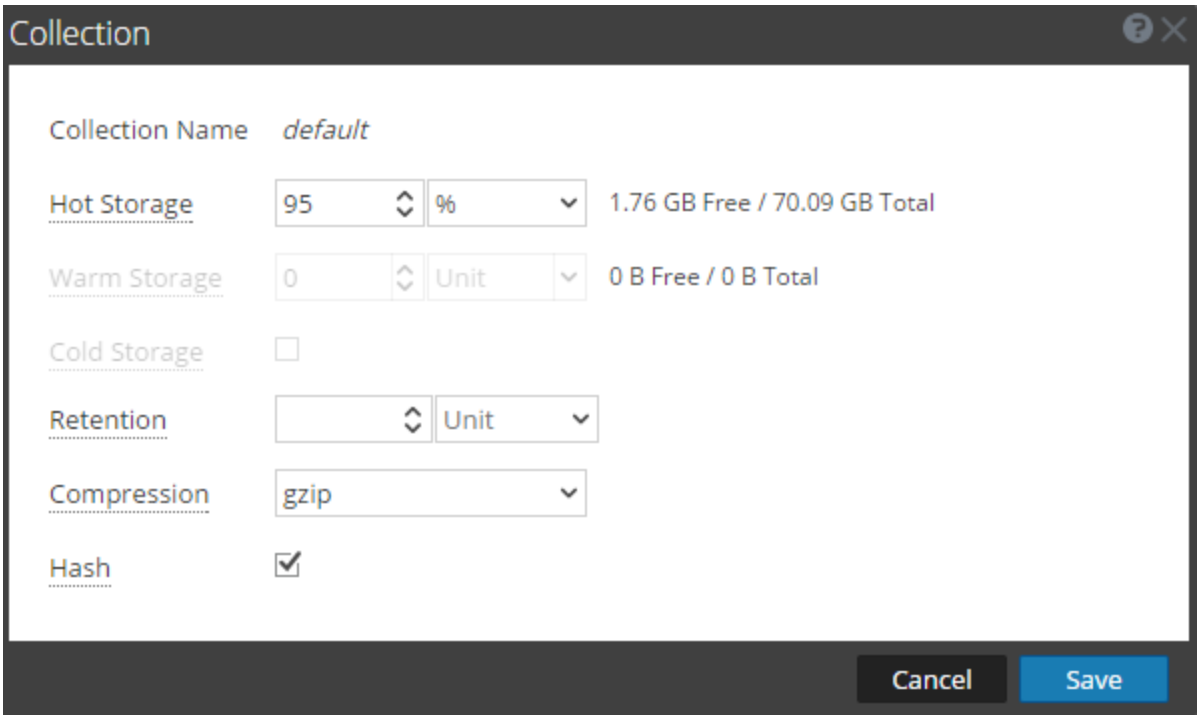
Deleting versus Retaining Log Data



Administrators can configure hot, warm, and cold tiered storage on an Archiver. Cold storage contains the oldest log data that is either required for the operation of the business or mandated by regulatory requirements. When a collection reaches its retention limits for hot and warm storage, NetWitness deletes the log data from hot or warm storage. With cold storage configured, a copy goes into cold storage before the logs are deleted from hot or warm storage. You can choose whether to enable cold storage for each log storage collection. NetWitness does not manage cold storage.

Enable or Disable Cold Storage in a Log Storage Collection

When log data in a collection reaches its retention limits for hot and warm storage, you can delete it or move it to offline (cold) storage.



To enable or disable cold storage in a log retention storage collection on an Archiver:

1. Go to **(Admin)** > **Services**.
2. Select the Archiver service and select **> View > Config**.
3. Click the **Data Retention** tab.

4. In the **Collections** section of the Data Retention tab, select a collection and click .

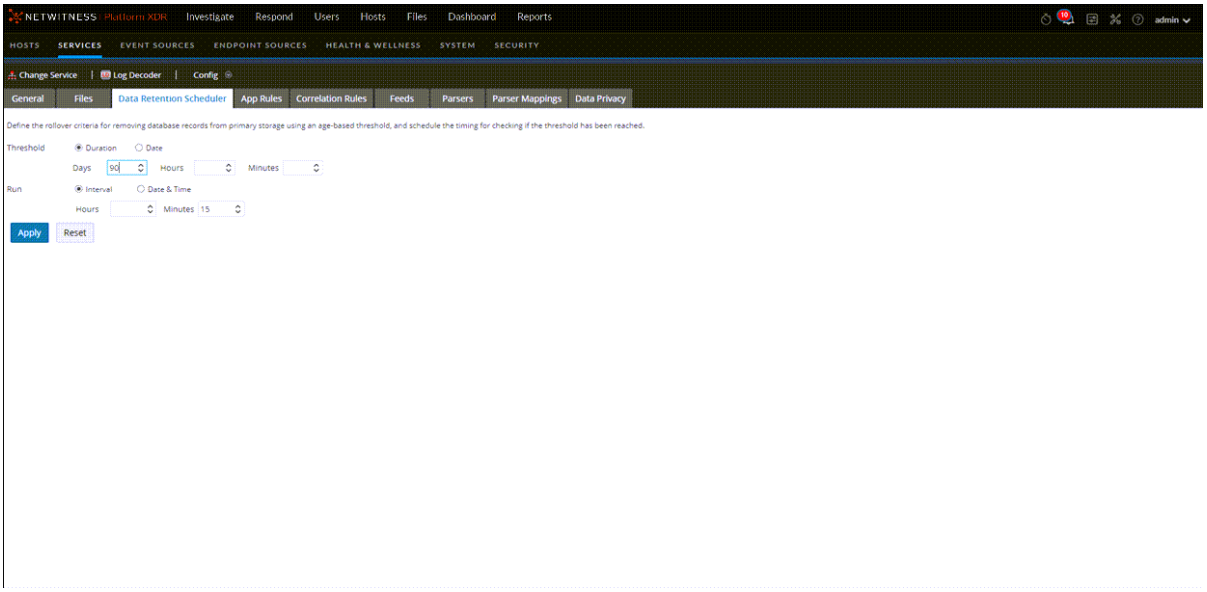
   The Collection dialog is displayed.

Note: If the maximum storage size of the collection does not allow full data retention for the retention period specified, NetWitness deletes the data or it goes to warm or cold storage if specified in the collection.

5. Enable or disable cold storage:
   - To delete log data when the collection reaches its specified retention limits, clear the **Cold Storage** checkbox.
   - To move log data to offline storage when the collection reaches its specified retention limits, select the **Cold Storage** checkbox.
6. Click **Save**.

Configure Log Retention and Storage on an Archiver

To configure log retention and storage on an Archiver, see "Configure Archiver Storage and Log Retention" in the *Archiver Configuration Guide*.



Schedule a Recurring Job to Check Data Retention Thresholds

The data retention scheduler configuration ensures that the data residing in the Decoder, Log Decoder, and Concentrator components is deleted after a certain time. For example, data retention on a Decoder might be configured to execute a check every 15 minutes to determine if the specified duration threshold has been met. If the threshold is met, NetWitness deletes data older then 4 hours in the relevant databases.

Caution: The schedule overwrites any previous schedule and becomes effective immediately. If the retention period is decreased, the data exceeding this retention period is removed.

For a Decoder, Log Decoder, or Concentrator:

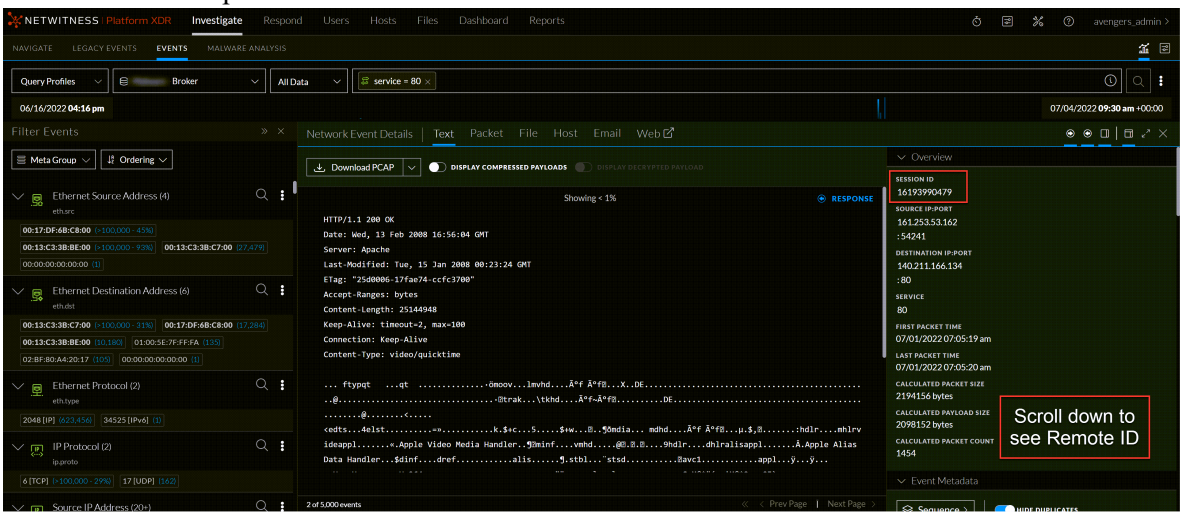
1. Go to **(Admin)** > **Services**.
2. In the **Services** view, select a Decoder, Log Decoder, or Concentrator service and select **> View > Config**.
3. Click the **Data Retention Scheduler** tab.

4. Set the threshold based on the duration of time the data has been stored or the date on which the data was stored. Do one of the following:
   a. To define the duration of time that data can be stored before removal, select **Duration**, and then specify the number of days (365 maximum), hours (24 maximum), and minutes (60 maximum) that have elapsed since the time stamp on the data.
   b. To define the removal of data based on the date of the timestamp, select **Date**, and then specify the monthly date and time in the Calendar and Time fields.
5. Do one of the following to configure the **schedule for checking rollover criteria**:
   a. If you want to set a regular interval at which the scheduled database check occurs, select **Interval** and specify the **Hours** and **Minutes** between the scheduled checks.
   b. If you want to set a regular date and time at which the scheduled database check occurs, select **Date and Time** and specify the system clock time in `hh:mm:ss` format for the rollover.
      - To specify the day, select **Every Day**, **Weekdays,** or **Weekends**. The Scheduler defaults to **Every Day**.
      - To specify a different set of days of the week, select **Custom** and click on each day on which the database check occurs.

      Caution: The schedule overwrites any previous schedule and becomes effective immediately. If the retention period is decreased, the data exceeding this retention period

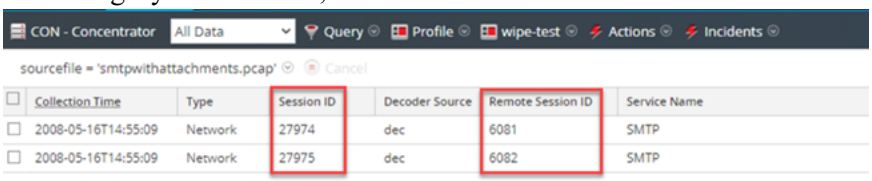
is removed.

6. Click **Apply** to complete the configuration.



Purge Data Using String and Pattern Redaction Option

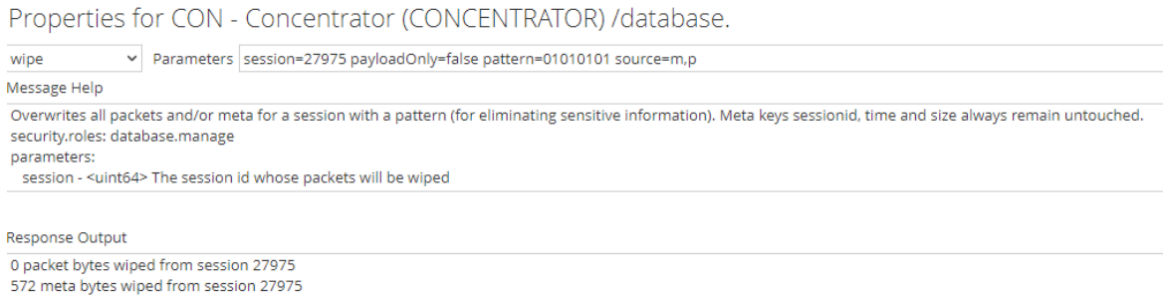
If you have data where you do not want it to be (for example, you have classified data in your unclassified Network Decoder), purging data using string and pattern redaction is the fastest way to wipe data. It is ideal for smaller amounts of data. This method requires that you identify the data to be purged by using a query in either the Investigate view, the REST API interface, or the NwConsole. Using the Investigate view requires additional steps to clear user interface cache on the admin server. This procedure includes the extra steps needed when you find the data to be purged using the Investigate view.



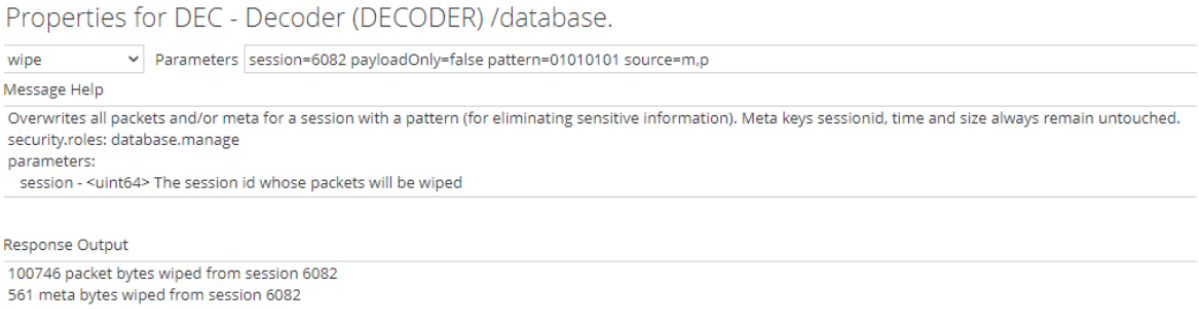
Note: If a large amount of data needs to be purged, it is best to start with the data on the storage component. Refer to Optional Data Overwriting Options for additional information.

To purge the data:

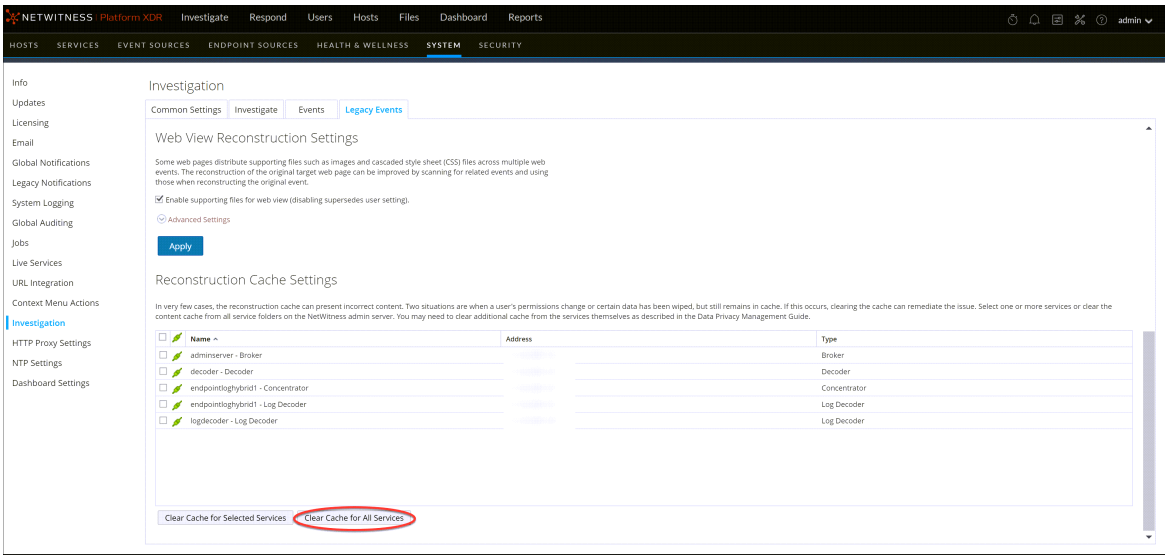
1. Go to **Investigate** > **Events** or **Investigate** > **Legacy Events** and find the events that you want to purge. In the Events view you can see the session ID in the Overview panel. You need to scroll down in the Event Meta panel to see the remote ID.



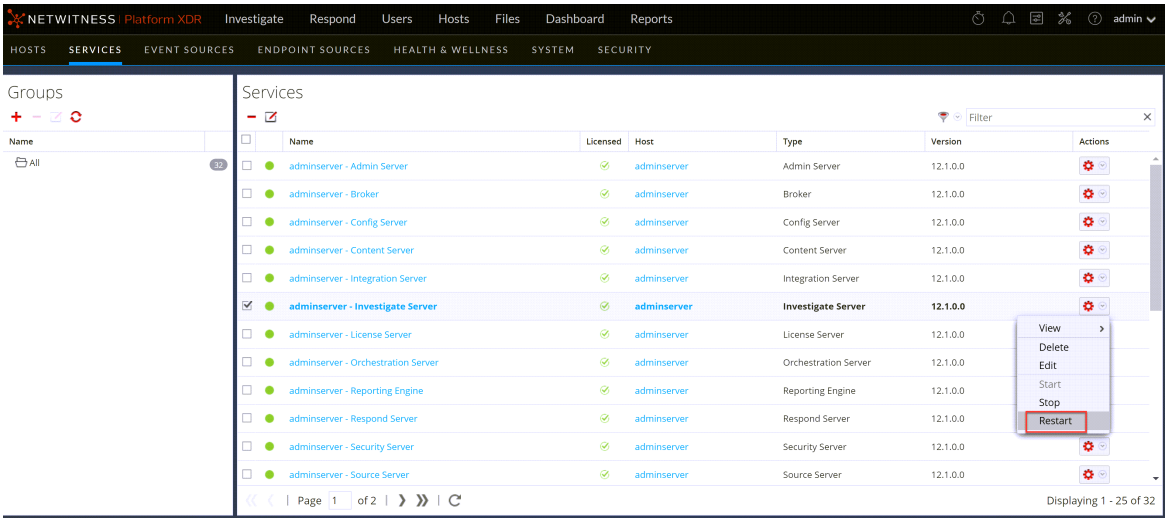
In the Legacy Events view, both IDs are visible in the Events list.



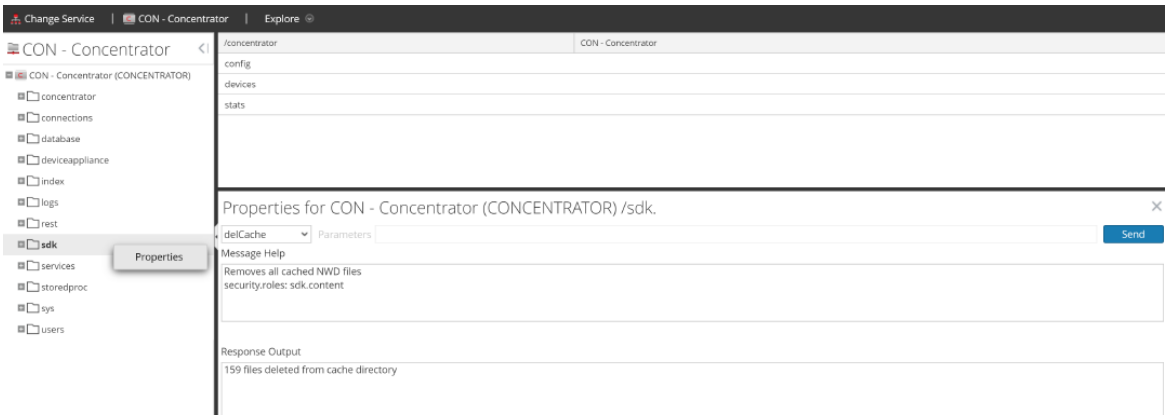
2. Make a note of the session ID and the remote ID of each event to be deleted. In the example above, the session IDs are 27974 and 27975. The remote IDs are 6081 and 6082.



3. Starting with the Concentrator, view the service using the REST API. Refer to the *RESTful API User Guide* for instructions. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
   In the REST API, enter the `wipe` command with the following parameters:
   - **`session=<uint64>`**: The session ID whose packets will be wiped.
   - **`payloadOnly=<bool, optional>`**: If `payloadOnly` is `true`, only the packet payload will be overwritten. The default value is `true`.
   - **`pattern=<string, optional>`**: The pattern uses all zeros by default. If you use a string as your pattern, it will not overwrite any meta values that are not a string type. Therefore, it is best to keep the pattern as a numerical value.
   - **`metaList=<string, optional>`**: Comma-separated list of metadata to wipe. The default (empty) is all metadata.
   - **`source=<string, optional, {enum-any:m|p}>`**: The types of data to wipe: metadata, packets, or both. The default is packets only. The best option here is to wipe both metadata and packets `(m,p)`.



4. For each Network Decoder and Log Decoder in the path of the query, use the `wipe` command and the remote session IDs to overwrite the raw sessions on disk.



5. To ensure that the indexed meta values that were stored on the Concentrator index are removed, rebuild the index. This can take a long time but is necessary because the `wipe` command does not remove any data from the Concentrator index. Refer to the *Core Database Tuning Guide* for instructions.
6. (Optional) If the data was discovered using the Investigate view, additional steps are necessary:
   a. To clear the query path to prevent an analyst from bringing up an old copy of the session, go to: **(Admin)** > **System** > **Investigation** > **Legacy Events** and click **Clear Cache for All Services**.

b. To clear the cache for a reconstruction in the Events view, restart the Investigate service.

c. To clear the cache for the Concentrator and Network Decoder, go to  **(Admin)** > **Services** > **Concentrator** > right-click **sdk** > **Properties** and  **(Admin)** > **Services** > **Decoder** > right-click **sdk** > **Properties** and execute the `delCache` command. The figure below shows this path for the Concentrator.

An analyst attempting to view the same session in Investigate will see that the raw data is unavailable for viewing and the metadata has been overwritten.

Configure User Accounts for Use in Data Privacy

This topic provides the procedures for configuring user accounts that work with data obfuscation in NetWitness. In order for data obfuscation to work, accounts and permissions for several types of users must be configured.

- Customize the default Administrators system role in NetWitness to remove permissions that should be available only to the Data Privacy Officer.
- Add two new user accounts at the system level to depict a data privacy officer and a typical analyst.
- Add a user account at the service level with the aggregation role so that Decoders and Log Decoders can aggregate data to a Concentrator or Broker.
- On the Reporting Engine, configure two separate service accounts. One service account for general purpose reporting that does not include any sensitive data and the other account for privileged users with access to all data including sensitive data. This procedure is described in "Configure Data Source Permissions" in the *Reporting Engine Configuration Guide*.

Customize the Default Administrators User Role at the Service Level

To separate the data privacy officer and administrator functions on each Decoder and Log Decoder, you need to remove the `dpo.manage` permission from a clone of the Administrators role.

1. Go to  **(Admin)** > **Services**, select a Decoder or Log Decoder, then select  **> View > Security**.
2. In the **Services Security** view, click the **Roles** tab, select **Administrators** and click .
   In the **Enter Role Name** dialog, enter a new role name such as Non_DPO_Administrators and click **Save**.
3. Select the new role.

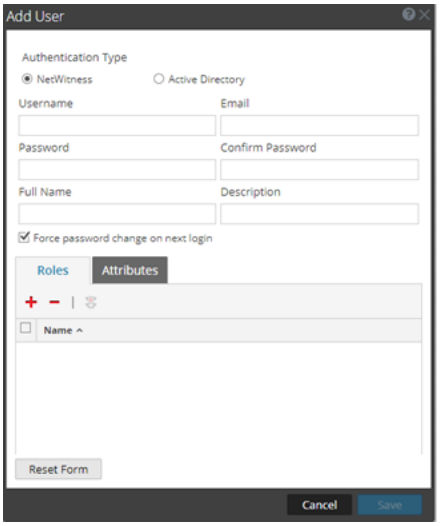
   The Role Information is displayed for editing.
4. Clear the box next to **dpo.manage** so that it is no longer checked and click **Apply**.

   The permission to manage data privacy configuration is removed for the new role.
5. In the **Users** tab, select each user who has the **Administrators** role, and change their role to the cloned role.
6. Validate that the users with the modified Administrators role can login as with admin privileges.
7. Validate that the users with the modified Administrators role cannot configure metadata and content restrictions in the Settings tab.

Add a User Account with the Aggregation User Role at the Service Level

To ensure that Decoders and Log Decoders can aggregate data to a Concentrator or Broker:

1. **Go to** **(Admin) > Services, select a Decoder or Log Decoder, then select** **> View > Security.**
2. In the **Users** tab, add a user with the `Aggregation` role and click **Apply**.



Note: "Aggregation Role" in the *Hosts and Services Getting Started Guide* provides details about the application of this user role.

Add Data Privacy Officer and Analyst Accounts on the NetWitness Server

You need to add two new user accounts in NetWitness at the system level to depict a privileged data privacy officer and a typical analyst. If the environment is configured using the default trusted connections, you do not need to create the new user accounts on the Core services (Brokers, Concentrators, and Decoders). When a user is created in the NetWitness Server, that user can log on to the services.

Note: The role name is required to exist on both the server and the services, and the role name for all places must be identical. If you create a new custom role on the NetWitness Server, make sure to add it to all Core services as well.

1. Create a new user account for the data privacy officer:
   a. **Go to** **(Admin) > Security,** select the **Users tab** and click **.**
   The Add User dialog is displayed.

   b. Create the new account with the following credentials.

   Username = <new user name for logon, for example, DPOadmin>
   Email = <new user's email, for example, DPOadmin@rsa.com>
   Password = <new user's password for logging on, for example, RSAprivacy!@>
   Full Name = <new user's full name, for example, DPO Administrator>

c. Click the **Roles** tab, , and select the `Data_Privacy_Officers` role for the new user.

d. Select **Save**.

2. Create a new user account for the analyst with limited privileges:

a. In the  **(Admin) > Security** view, click the **Users** tab. In the **Users** tab toolbar, click .

The Add User dialog is displayed.

b. Create the new account with the following credentials:

Username = <new user name for logon, for example, NonprivAnalyst>
Email = <new user's email, for example, NonprivAnalyst@rsa.com>
Password = <new user's password for logging on, for example, RSAprivacy!@>
Full Name = <new user's full name, for example, Nonprivileged Analyst>

c. Click the **Roles** tab, , and select the `Analysts` role for the new user.

d. Select **Save**.

Data Privacy References

The following reference materials are available for management of data privacy and data retention. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

- See "Data Privacy Tab" in the *Decoder and Log Decoder Configuration Guide.*
- See "Data Retention Tab - Archiver" in the *Archiver Configuration Guide.*
- See "Data Retention Scheduler Tab"in the *Hosts and Services Getting Started Guide.*

NetWitness Core Database Introduction

This topic provides an overview of the NetWitness Platform Core database. The NetWitness Platform Core services contain a proprietary database developed specifically for use within the NetWitness Platform products. It bears little resemblance to traditional relational databases, and is not based on any off-the-shelf database technology. As such, many users find that there is a steep learning curve to understanding how the Core database works, and how to make best use of it. The purpose of this guide is to help NetWitness Platform users understand the database and use it to its fullest potential.

As a System Administrator, you can use this information to help plan your NetWitness Platform deployment, and to tune it for best performance. As an Analyst, you can use this guide to structure your analysis in ways that will return reports faster. As a Content Developer, you can use this guide to help write content that will be processed efficiently by the database system.

NetWitness Platform Products Covered by this Guide

This guide covers the capabilities of NetWitness Platform. The following NetWitness Platform components contain the Core database:

- Concentrator
- Archiver
- Decoder
- Log Decoder
- Workbench

Frequently Used Terms

Definitions for terms that are used throughout this document are presented here. The terms are listed in the order in which they enter the NetWitness Platform system:

- **Packet DB** : The packet database contains the raw captured data. On a Decoder, the packet database contains packets as captured from the network. Log Decoders use the packet database to store raw logs. The raw data stored in the packet database is accessible by a Packet ID, however, this ID is typically never visible to the end user.
- **Packet ID** : A number used to uniquely identify a packet or log in a packet database.
- **Meta DB** : The meta database contains items of information that are extracted by a Decoder or Log Decoder from the raw data stream. Parsers, rules, or feeds can generate meta items.
- **Meta ID** : A number used to uniquely identify a meta item in the meta database.
- **Meta Key** : A name used to classify the type of each meta item. Common meta keys include ip.src, time, or service.
- **Meta Value** : Each meta item contains a value. The value is what each parser, feed, or rule generates.

- **Session DB** : The session database contains information that ties the packet and meta items together into sessions.
- **Session** : On a packet Decoder, a session represents a single logical network stream. For example, a TCP/IP connection is one session. On a Log Decoder, each log event is one session. Each session contains the references to all the Packet IDs and Meta IDs that refer to the session.
- **Session ID** : A number used to uniquely identify sessions in the Session DB.
- **Index** : The index is a collection of files that provides a way to look up Session IDs using Meta Values.
- **Core Database** : This refers to the combination of the Packet, Meta, Session, and Index.

For syntax definitions, this document uses EBNF grammar definitions.

NetWitness Core Database History

NetWitness developed the Core database for use in packet capture systems. Early in the history of NetWitness, developers identified that existing database technologies would not be able to keep up with the high ingest rate inherent in full packet capture. Contemporary database technologies were not anywhere close to being able to keep up with capturing the number of sessions received every second, much less sorting every packet. Likewise, the volume of data meant that packet storage would need to be discarded and reused just as quickly as it was consumed. This was also a weakness of databases at the time. Thus, NetWitness created a database consisting of the packet, session, and meta databases.

In order to provide the analytical capabilities of NetWitness Investigator, a meta index was added to the NetWitness database. The index shared the same design goals as the original databases. It was designed to sustain a very high insert rate into a high number of very large indices.

The index has evolved considerably over the years. Early versions of the index were only capable of providing summary estimates about how many unique meta values were present in the meta database. Other versions have had great challenges in meeting acceptable query performance. For example, NetWitness 9.0 more frequently measured report times in minutes rather than seconds. The current version of the index is derived from the NetWitness 9.0 index, but has evolved considerably in order to meet performance expectations and to add new features.

Core Database Strengths and Weaknesses

Strengths:

- High sustained insert rates, without needing down time for bulk inserts.
- Decent query performance simultaneous with high insert rates.
- Automatic cleanup and rollover of old data with minimal fragmentation.
- Extremely high number of meta value indices: more than 100 enabled by default on a Concentrator.
- Ability to scale to Petabyte database sizes and Terabyte index sizes within a single node.

- Using meta key-value pairs, it is very flexible for storing arbitrary meta items within a session. Thus a session can be used to represent nearly any kind of data record.

Weaknesses:

- The query functionality is limited and low level.
- The packet, meta, and session DB schema is fixed, and all customization is done through custom meta keys and values.
- The database provides no transaction atomicity guarantees as you might expect to find in a SQL database.

Basic Database Configuration

This topic covers basic database configuration settings of NetWitness Core services. For information on how to configure the Core services by editing configuration files, see "Service Configuration Settings" in the *Host and Services Getting Started Guide* .

This document assumes that the reader has some familiarity with adjusting the configuration of a NetWitness Core service. To use this document, you should be familiar with one of the mechanisms for modifying the configuration tree of Core services. Examples of such mechanisms include the Explorer view of the Administration pages within the NetWitness Platform user interface, or the REST interface accessible on each service through a web browser.

Find Help within the Core Service

Each configuration item within a Core service has a built-in help description of what the item does. You can view this help information by hovering your mouse over the configuration item in the Explorer view. Each configuration item also indicates whether it can be changed without restarting or if a restart of the service is needed for the change to take effect.

Developers using the REST API can retrieve the help text for each configuration item by sending the `help` message to the configuration node path.

Packet, Meta, and Session Storage

Each of the packet, meta, and session databases are configured through the `/database/config` folder on each NetWitness Core service. Each database has a configurable parameter to specify where the Core service stores data. Packet, meta, and session databases follow a predictable pattern for all of their configuration entries. Configuration items for the packet database start with the prefix `packet` , meta database configuration starts with the prefix `meta` , and the session database configuration items start with the prefix `session` .

Index Storage

The index configuration is stored in the `/index/config` folder on each Core service.

Topics

- Tiered Database Storage
- Manifests

Tiered Database Storage

This topic describes tiered database storage and provides recommendations for Hot, Warm, and Cold tier storage.

Starting with version 10.4, the Archiver service has the capability to be configured to use tiered storage. The concept of tiered storage is to put the most recent data on a Hot tier, which is the fastest storage available on the Archiver.

All services use the Hot tier by default.

The next tier is known as Warm and is typically cheaper and slower storage, such as a network-attached storage (NAS). The Warm tier contains older data; how old depends upon how much storage is allocated on the Hot tier and the average ingest rate. When the Hot tier reaches max utilization, the natural progression is to move the oldest data from the Hot tier to the Warm tier. When configured correctly, this happens automatically and is invisible to the end user. Queries and data access happen automatically no matter what tier (Hot or Warm) the data resides on. However, there can be a performance impact when accessing data on the Warm tier as compared to the Hot tier, because access times on the Warm tier are typically slower.

In addition to Hot and Warm, there is also a Cold tier. The Cold tier is only used as a staging area for offline backup. NetWitness Core services do not access data on the Cold tier. NetWitness Core services move the oldest data to the Cold tier and consider it abandoned (the service no longer accesses the data). This data can then be backed up to long-term storage like tape for possible restoration months or even years later, depending on requirements. The backing up and subsequent removal of data on the Cold tier must be handled outside of NetWitness Core services via scripts or other processes.

If the Cold tier becomes full because external processes are not removing data in a timely manner, this causes the NetWitness Core service to eventually stop the ingestion of new data until the problem is corrected.

When moving data to the Cold tier, NetWitness recommends that the directory remain on the same mount point as where it is being moved from. Therefore, if the files are coming from the Warm tier, it is far better for performance reasons to set the Cold tier directory on the same file system. The reason for this is that the service attempts to simply move the file and directory to the Cold tier, which is a nearly instantaneous operation on the same file system. If the move fails, the fallback is to copy the data to the Cold tier, which takes more processing time and causes additional I/O contention on the tier from which it is being copied.

Archiver

The tiers of storage capabilities are used by the Archiver. You can configure Archiver to only use Hot storage (the default), Hot and Warm, or all three (Hot, Warm and Cold). All services must use Hot, you cannot configure a service to only use Warm. Data flows from Hot to Warm and finally to Cold. You can also skip Warm and go from Hot to Cold. If Cold (offline) storage is not configured, the oldest data is deleted on the last configured tier, which has been the standard operating procedure.

The typical Archiver deployment sets all the databases to unlimited size (packet.dir, meta.dir, session.dir, index.dir, and optionally the Warm tier variants), which means that the size specifier is left off or set to zero. This lets the databases and index grow unbounded. Instead of each database managing their own size and rolling out only when each individual database exceeds their configured size, Archiver rolls out everything together using the `/index sizeRoll` command. This enables the databases and index to roll out in unison. For more information on sizeRoll, see "Asynchronous Rollover" in Rollover .

Archiver is typically configured to place the index, session, meta, and packet (log) DB on the same volume, instead of multiple volumes like a Concentrator or Decoder. Although this can potentially cause more I/O contention when concurrent reads happen across multiple databases, it also maximizes overall retention. Because all databases are on the same volume, they are configured to roll out together, which minimizes orphaning of data. Decoder and Concentrator are configured for maximum I/O speed, but can suffer from estimates on the proper volume sizing.

For example, if the session DB is too large, it may have enough storage for six months of retention, whereas the meta DB and index only have retention for four months. Because the session, meta DB, and index are intricately tied together, the shortest retention period for all three define the overall retention period (in this case, four months). Retention of individual databases is mostly affected by factors beyond our control, such as traffic captured, meta generated (parsers, feeds, rules) and filtering. The databases are easily resized by a simple configuration change, but this usually also involves changes at the hardware and file system level to adjust partitions, which complicates dynamic resizing. Archiver avoids these problems by using a single volume for everything, with the trade-off of somewhat slower I/O speed.

Manifests

This topic describes manifest files and provides an example manifest for a meta DB file. It also describes manifest searching and provides an example manifest search.

Manifest files are created with every session, meta, and packet (log) DB file and index slice directory. A manifest file is a file that describes several key pieces of information about the data to which it refers. Manifest files are written as a JSON record. Manifest files travel with the data they represent from tier to tier. If the data they represent is deleted, the manifest file is also deleted, except in the following special case. If the service has `/database/config/manifest.dir` configured to a valid directory, at the point when the manifest data is deleted, a copy of the manifest file is placed into the directory pointed at by `manifest.dir` (the directory is created if it does not exist). This enables a NetWitness Platform feature called historical manifest searching.

The intention of this process is to keep historical manifest files for years, in one location for offline querying. As you might imagine from a service running for many years, this can potentially generate hundreds of thousands of files. This should not be a concern however, as the service automatically compresses files into a single archive in order to save space when they grow too numerous. Manifest files are very small and compress well.

Example manifest (`meta-000000023.nwmdb.manifest`) for a meta DB file:

```
{
    "filename" : "meta-000000023.nwmdb",
    "size" : 185153768,
    "fileTime" : 1403903940,
    "id1" : 150814110,
    "id2" : 159341086,
    "session1" : 4023382,
    "session2" : 4250442,
    "time1" : 1403903879,
    "time2" : 1404739851
}
```

```
filename  = The filename for the db file the manifest represents
size      = The size in bytes of the db file
fileTime  = The time the file was created
id1       = The starting id in the file (for this example, the starting meta
ID)
id2       = The last id in the file (for this example, the last meta ID)
session1  = The starting session ID of the first meta in the file
session2  = The last session ID of the last meta in the file
time1     = The POSIX time of the first "time" meta found in the file
time2     = The POSIX time of the last "time" meta found in the file
```

In this example manifest, the most important fields are `fileTime` , `time1` and `time2` . All three fields are written in POSIX time. `time1` and `time2` are the starting and stopping times of the meta recorded in the meta DB file `meta-000000023.nwmdb` . In particular, `fileTime` is always the time in which the file was created (not last modified). `time1` and `time2` are representative of the min and max range of the parsed data within the meta DB file. When doing historical searches by time, `time1` and `time2` are preferred over `fileTime` , when they are present. Manifest files for the other databases and index contain some different fields, but all have enough information to perform time based queries.

Search Historical Manifests

When manifests are collected in the directory pointed to by `manifest.dir` , it is assumed that the data they refer to was copied to the Cold tier and eventually backed up to offline storage. Because the historical manifests are still accessible by the service, this allows time-based queries to be performed on offline data, in order to determine what data needs to be restored for a given time range.

You can search manifests using the `/database manifest` command:

```
manifest: If a manifest directory is defined, it will allow operations on the
manifest files (such as a time based query) for database files in cold
storage.
security.roles: database.manage
parameters:
   op - <string, optional, {enum-one:query|compress}> The operation to perform
(defaults to query)
   time1 - <date-time, optional> The beginning time (UTC) for matching offline
database files
   time2 - <date-time, optional> The ending time (UTC) for matching offline
```

```
database files
   timeFormat - <string, optional, {enum-one:posix|simple}> Specify the time
format that is returned (posix, simple), default is posix
```

Example search:

```
/database manifest time1="2014-04-20 11:00:00" time2="2014-04-11
11:20:00" timeFormat=simple
```

The search returns all manifests that match the query:

```
[ filename=meta-000001691.nwmdb size=4843826176 fileTime="2014-Apr-20
11:06:34" id1=301555027452 id2=301733101896 session1=15352020201
session2=15361024200 time1="2014-Apr-20 11:05:34" time2="2014-Apr-20 11:16:34"
compression=gzip ]
[ filename=session-000001865.nwsdb size=268439552 fileTime="2014-Apr-20
11:06:35" id1=14674145801 id2=14682041000 metaId1=288217522208
metaId2=288370660984 packetId1=11733872441 packetId2=11741745303 ]
[ filename=session-000001866.nwsdb size=268439552 fileTime="2014-Apr-20
11:18:31" id1=14682041001 id2=14689936200 metaId1=288370660985
metaId2=288520616949 packetId1=11741745304 packetId2=11749618589 ]
```

The returned results can be used to correlate which files should be restored from backup for the given time range. For versions 10.4 and later, a service called Workbench can be used to take the restored files and provide a query interface over the restored data using one or more collections.

Setup of the Workbench service is beyond the scope of this document. For more information, see "Configure Data Backup and Restore" in the *Archiver Configuration Guide* .

Advanced Database Configuration

This topic explains the advanced configuration options of the NetWitness Core database.

The configuration options of the NetWitness Core database may change from one release to the next. However, many of the configuration items do not change frequently and are documented here. This is not an exhaustive list, since new features are added in every release, and they may require new configuration items. For the most up-to-date documentation, refer to the built-in help functionality of the NetWitness Core service.

- Snort Rules and Configuration

Database Configuration Nodes

This topic describes database configuration nodes. The following database configuration nodes are some of the advanced database configuration items of the NetWitness Core database that do not change frequently.

packet.dir,meta.dir,session.dir

This is the primary configuration entry for each database (also known as the Hot tier). It controls where in the file system the respective databases are stored. This configuration entry understands a complex syntax for specifying many directories as storage locations.

Configuration syntax:

```
config-value = directory, { ";" , directory } ;
directory    = path, [ ( "=" | "==" ) , size ] ;
path         = ? linux filesystem path ? ;
size         = number size_unit ;
size_unit    = "t" | "TB" | "g" | "GB" | "m" | "MB" ;
number       = ? decimal number ? ;
```

Example:

```
/var/lib/netwitness/decoder/packetdb=10
t;/var/lib/netwitness/decoder0/packetdb=20.5 t
```

The size values are optional. If set, they indicate the maximum total size of files stored there before databases roll over. If the size is not present, the database does not automatically roll over, but its size can be managed using other mechanisms.

The use of = or == is significant. The default behavior of the databases is to automatically create directories specified when the Core service starts. However, this behavior can be overridden by using the == syntax. If == is used, the service does not create any directories. If the directories do not exist when the service starts, the service does not successfully start processing. This gives the service resilience against file systems that are missing or unmounted when the host boots.

If you modify the size of a directory in use, the size takes effect immediately, as long as it is larger. If the size is smaller, it is ignored if it is more than 10 percent smaller than the existing size. This prevents an accidental mistype that causes a enormous loss of data. For example, if the packet database was configured for `12 TB` and someone mistyped it as `12 GB`, the database would end up deleting over 11 TBs of data in order to shrink it down to just 12 GB. Instead, the database ignores the `12 GB` setting and logs a warning, so that the error can be caught quickly. Of course, if the size specified is actually correct and more than a 10 percent difference from the existing size, the only recourse for it to take effect is to restart the service. When it starts back up, it assumes the size is correct and adjusts the database to the new size by rolling out the oldest data until the new size is reached. If you actually do want to adjust the size downward and by more than 10 percent without restarting the service, you need to modify the size multiple times, each time adjusting it by less than 10 percent. Watch the service logs to know when the database has adjusted to the new size, as it only adjusts the total database size when the latest file being written has been closed.

If new directories get added or deleted (semicolon separated), they do not take effect until the service restarts.

packet.dir.warm, meta.dir.warm, session.dir.warm

These settings are optional and are used for Warm tier storage on an Archiver. By default, they are blank and unused. If configured, they follow the same format and behavior as `packet.dir`, `meta.dir`, and `session.dir` (see _ `packet.dir`, `meta.dir`, and `session.dir` _ above). When configured, the oldest file on the Hot tier moves to the Warm tier when no available space remains in the Hot tier.

packet.dir.cold, meta.dir.cold, session.dir.cold

These settings are optional and are used to move files from either a Hot or Warm tier storage system to the Cold tier directory specified. Specifically, this setting is nothing more than a directory, there are no size specifiers. However, the defined path name has a few special format specifiers that you can use to name the directory with the date of the data in it.

```
%y   = The year of the data being moved to the cold tier
%m   = The month of the data being moved to the cold tier
```

```
%d   = The day of the data being moved to the cold tier
%h   = The hour of the data being moved to the cold tier
%##r = A block of time within a day. So %12r would create two blocks, 00 and
01\. 00 for all data in the AM, 01 for all PM data
```

Example setting:

```
packet.dir.cold = /var/lib/netwitness/archiver/database1/alldata/cold-
storage-%y-%m-%d-%8r
```

For the setting above, if a log database file was about to be moved to cold storage and it was created on `2014-03-02 15:00:00` , it would be moved to the following directory on the Cold tier:

```
/var/lib/netwitness/archiver/database1/alldata/cold-storage-2014-03-02-01
```

The last number `01` needs some explanation. The `%8r` specifier breaks the hours of the day into 24 / 8 = 3 parts. The first eight hours of the day would be block `00` , so 12 a.m. to 8 a.m. The next eight hours are from 8 a.m. to 4 p.m. and are assigned block `01` . Since the data being moved to cold storage was created at 3 p.m., it falls into block `01` . The `%r` format specifier is useful for backing up files with a granularity somewhere between a day `%d` and a single hour `%h` . The Cold storage directory is created on demand and is defined by the data being moved when the format specifiers are used.

The ability to add a date to the path of the data is just a convenience added for backup and restore. It is a way of tagging the data with a date in the path.

packet.file.size , meta.file.size , session.file.size

This controls the size of the files created with each database. It is normally not necessary to change these values as the default values typically work well. This setting takes effect immediately for subsequent files.

packet.files , meta.files , session.files

This setting controls the number of files held open by the database. You can increase this value to improve performance: however, the operating system has an overall limit on the number of files that service can keep open. If this limit is exceeded, an error is reported and the service does not function. This setting takes effect immediately.

In versions 10.6 and later, the default value for packet.files, meta.files, and session.files is `auto` and the service manages the number of open files based on this criteria:

1. Number of collections
2. Amount of system memory

When set to `auto` , the number is dynamic and you can view it in the logs when it changes. NetWitness recommends that you leave this value as `auto` and do not change it to a specific number.

packet.free.space.min , meta.free.space.min , session.free.space.min

This setting provides a safety limit on the minimum free space that exists on the paths specified by the packet.dir, meta.dir, and session.dir directories, respectively. This setting is used to prevent the service from running out of space in the event that other programs have filled up the space that should be dedicated to each of the databases. This setting takes effect immediately.

packet.index.fidelity , meta.index.fidelity

This setting controls how frequently packet ID locations and meta ID locations are indexed. This setting can be increased to reduce the amount of space needed by each packet or meta nwindex file, but increasing the setting reduces the speed at which individual packets or meta items can be located. This setting takes effect immediately.

The session database does not have a fidelity setting because it does not generate index files.

packet.integrity.flush , meta.integrity.flush , session.integrity.flush

This setting controls whether the database forces a sync operation on the file system when it is finished writing a file. The default value is `sync` , which means when a file is closed there will be a significant delay while the data writes to non-volatile storage. It may be necessary to set this to `normal` in order to achieve higher sustained write rates, especially on a Decoder. This setting takes effect on the next file created. Therefore, it is expected that at least one more sync will happen if the value was just changed to `normal` .

If packet drops are occurring and packet.integrity.flush is set to `sync` , set it to `normal` and monitor. Keep the session and meta flush settings on `sync` . If packet drops are still problematic, then set all three to `normal` and monitor.

packet.write.block.size , meta.write.block.size , session.write.block.size

The block size represents how much data is allocated at a time within each database file. Larger block sizes can provide higher throughput and compression ratios, and can improve the rate at which items can be retrieved from the database sequentially. However, larger block sizes have a detrimental impact on random read speed for compressed packet and meta items. This setting takes effect immediately.

packet.compression , meta.compression

These parameters control whether the databases compress data. Compression reduces the amount of storage needed by each database, but it can have a major detrimental impact on the speed at which items are written to the database, and the speed at which items are retrieved from the database. Changes take effect immediately on the next file creation. Make a note that you can not compress the `pcapng` packet db format.

As of version 10.4, the valid values for this parameter are `gzip` , `bzip2` , `lzma` , or `none` . `gzip` is the preferred algorithm when compression is used, because it provides a good balance between performance and space savings. Both `bzip2` and `lzma` can achieve better space savings, but the tradeoff in speed is substantial and likely should only be considered for low ingest speeds and when storage space is at a premium.

packet.compression.level , meta.compression.level

You can use these settings to further refine how the compression algorithms behave. They have no effect when compression is disabled. The valid values are between 0–9\. The default value of zero means let the software pick the best setting for speed and compression. The values between 1 and 9 are used as a sliding scale between performance (1) and compression (9). The value of 9 typically gives you the best compression for a given algorithm, but the worst performance. Somewhere in the middle is usually the best setting, which is what zero picks.

hash.algorithm

This setting controls how the database files are hashed. The default value is `none` , so no hashing is performed. The valid values are `none` , `sha256` , `sha1` , or `md5` . Database files can be hashed to provide evidence that they have not been tampered with since they were closed. Hashing is time intensive and affects ingest performance when enabled. This change takes effect immediately.

hash.databases

This setting controls which databases are hashed. Valid values are `session` , `meta` , and `packet` and are comma separated when hashing multiple databases. This change takes effect immediately.

hash.dir

This setting is normally empty, which means the hash file is created in the same directory as the database file that was hashed. If this setting is defined, the hash file is written to the directory specified instead. This could be some form of write-once storage for resilience against hash tampering.

Hash files are small XML files containing the hex encoded hash along with metadata about the database file that was hashed.

Index Configuration Nodes

This topic describes index configuration nodes. The following index configuration nodes are some of the advanced database configuration items of the NetWitness Core database that do not change frequently.

index.dir

The index.dir setting controls where the files used by the index are stored. This setting supports the same syntax as the packet.dir , meta.dir , and session.dir settings.

index.dir.warm

The Warm tier storage for index slices. This setting supports the same syntax as packet.dir.warm , meta.dir.warm , and ession.dir.warm .

index.dir.cold

The Cold tier storage for index slices. This setting supports the same syntax as packet.dir.cold , meta.dir.cold , and session.dir.cold .

index.slices.open

This setting controls the number of index slices held open by the index. Index slices are opened automatically as needed by queries. When queries complete, the index engine may hold the slices open so that subsequent queries execute faster. The most recently created slices are the slices that will be held open, since they are mostly likely to be used by queries.

If queries against the index require the index to open slices, then they will execute slower than if the slices were already open. Therefore, this parameter should be tuned such that most queries executed against the index will work on open slices. However, each open index slice consumes some resources, such as file handles and memory. If there are too many index slices open, the overall performance of the service can suffer.

You should set this parameter so that the open index slices will cover most of the time ranges that most queries will need. For example, if most queries are over the past two weeks, and there are index slices created every 8 hours, then there are 14 days x 3 slices per day, or 42 slices created over the past two weeks. Thus, you could set index.slices.open to 42 so that only slices that are likely to be used are held open.

If this parameter is set to 0, then all slices are held open until the next index save. In this scenario, the only thing limiting the number of slices open in the process is the number of slices in the index.

page.compression

Deprecated. Versions of the NetWitness Core index between 9.8 and 10.2 supported two different index compression algorithms, and you can choose between them using this setting. As of 10.3, the only recommended value is the default of huffhybrid .

save.session.count

This setting controls how often the index is automatically saved when new sessions are inserted. If the value of save.session.count is greater than 0, any time more than save.session.count sessions are added to the index, the index automatically saves itself. If the save.session.count is set to 0, this feature is disabled and the index will not automatically save itself when new sessions are added to the index.

`save.session.count` can be used to implement an automatic save pattern that is based on the volume of data that enters the index. This is useful because it allows a lightly loaded system to generate save points less often.

For more information on the topic of index saves, see the section in this guide on Optimization Techniques .

reindex.enable

This setting controls the operation of the background reindexer .

SDK Configuration Nodes

This topic describes the SDK configuration nodes that affect the database. There are some additional configuration items in each Core service that affect the database, but do not actually affect how the database stores or retrieves data. These settings exist in the `/sdk/config` folder.

max.concurrent.queries

This setting controls how many query operations are allowed on the database simultaneously. Allowing more simultaneous query operations can improve overall responsiveness for more users, but if the query load of the Core service is very I/O bound, having a high max.concurrent.queries value can have a detrimental effect. The recommended value is near the number of cores on the system, including hyper threading. Thus, for an appliance with 16 cores, the value should be somewhere close to 32\. Subtract a few for aggregation threads and general system response threads. Subtract a few more if this is a hybrid system (for example, both a Decoder and Concentrator running on the same appliance). There is no magic number, but somewhere between 16 and 32 should work well.

max.pending.queries

This setting controls the backlog size for the query engine of the database. Larger values allow the database to queue more operations for execution. A queued query does not make progress on its execution, so it may be more useful to make the system produce errors when the queue is full, rather than allowing the queue to grow very large. However, on a system that is primarily performing batch operations such as reports, there may be no detrimental effect to having a large queue.

cache.window.minutes

This setting controls a feature of the query engine that is intended to improve query responsiveness when there are a large number of simultaneous users. For more information on cache window, see Optimization Techniques .

max.where.clause.cache

The where clause cache controls how much memory can be consumed by query operations that need to produce a large temporary data set to evaluate sorting or counting. If the where clause cache size is overflowed, the query still works, but it is much slower. If the where clause cache is too large, it is possible for queries to allocate so much memory that the service would be forced into swap or run out of memory. Thus, this value multiplied by the max.concurrent.queries should always be much less than the size of physical RAM. This setting understands sizes in the form of a number followed by a unit, for example `1.5 GB`.

max.unique.values

The maximum unique values limits how much memory can be consumed by the SDK Values function. SDK Values produces a sorted list of unique values. In order to produce accurate results, it may need to merge together large numbers of unique values from many slices. This merged set of values must be held in memory, so this parameter exists to put a limit on how much memory the merged value set can consume. The default value will limit memory usage to approximately 1/10th of total RAM.

query.level.1.minutes, query.level.2.minutes, query.level.3.minutes

These settings are available in 10.4 and earlier versions.

In versions 10.4 and earlier, the Core database supports three query priority levels. Each user is assigned to one of the priority levels. Therefore, there are up to three groups of users that can be defined for the purposes of performance tuning. These settings control how long each user level is allowed to execute the queries. For example, lower privileged users may have a lower value so that they are not able to use all the resources of the Core service with long-running queries.

query.timeout

This setting is available in 10.5 and later versions.

Query levels have been replaced in versions 10.5 and later with per user account query timeouts. For trusted connections, these timeouts are configured on the NetWitness Platform server. For accounts on Core services, there is a new config node under each account called `query.timeout`, which is the maximum amount of time in minutes that each query can run. Setting this value to zero means no query timeout will be enforced by the Core service.

max.where.clause.sessions

This setting will be deprecated in a future release. Use `max.query.memory` to limit overall query memory usage.

This setting imposes a limit on how many sessions can be scanned by a single query. For example, if a user selects all meta from the database, the database stops processing results once the number of sessions read for the query reaches this configuration value. The value of 0 disables this limit.

The number of sessions needed to fully process a query is equal to the number of sessions that match the WHERE clause of the query, assuming that all terms in the where clause have a suitable index. If there are terms in the where clause that are not indexed, the database has to read more sessions and meta, and reaches this limit sooner.

max.query.groups

This setting will be deprecated in a future release. Use `max.query.memory` to limit overall query memory usage.

This setting imposes a limit on the number of unique groups collected in a single query. For example, if a query has a group by clause with multiple metas that have high unique value counts, the amount of memory needed for that query could easily outpace the amount of RAM available on the server. Thus, this limit exists to prevent out-of-memory conditions from happening.

Setting a value of 0 disables this limit.

packet.read.throttle

This is a decoder-only setting that affects the access to the packets database. When packet.read.throttle is set to a value greater than 0, the decoder attempts to throttle packet reads when it detects packet contention on the packet database. Higher numbers provide more throttling. Changes takes effect immediately.

cache.dir , cache.size

All NetWitness Platform Core services maintain a small file cache of raw content extracted from the device. These parameters control the location (cache.dir) and size (cache.size) of this cache.

pin.cache.dir , pin.cache.size

All NetWitness Platform Core services provide a separate file cache of raw content that is marked (or pinned) for long-term retention. These parameters control the location (pin.cache.dir) and size (pin.cache.size) of this cache. You can configure the maximum size of the pinned cache at `/sdk/config/pin.cache.size`. The default size is zero that prevents pinning of new sessions once storage decreases below 100 MB. If you configure it with a non-zero value, then it will reduce the cached files when the total size exceeds the configured size by deleting the oldest pinned sessions.

parallel.values

This setting is available in 10.5 and later versions.

This setting allows SDK-values operations to be executed in parallel. If this is set to 0, it will disable parallel execution. If it is set to a value greater than 0, it represents the number of threads created when each SDK-values operation is executed. The maximum value is the number of logical CPUs available when the process started.

Setting a higher value for parallel.values is useful when there are small numbers of simultaneous users, since it will allow for more complex Investigations to be executed more quickly. If there are many simultaneous users, it is better to use a low value here, since there will be many independent SDK-values operations executed simultaneously.

parallel.query

This setting is available in 10.5 and later versions.

This configuration is similar to the parallel.values setting in that the maximum value is the number of logical CPUs. Setting parallel.query to a specific value should take into account the number of simultaneous users to maximize CPU utilization without consistently exceeding available resources.

Setting a higher value for parallel.query is useful when there are small numbers of simultaneous users and queries, since it will allow more complex queries to be executed more quickly. If there are many simultaneous users and queries, it is better to use a low value, since there will be many independent SDK-query operations executed simultaneously.

Query operations are limited by the meta database read rate, so setting parallel.query to a value higher than 4 is unlikely to produce dramatically better results than the default value of 0\. The best number to use for parallel.query will depend on the type of storage attached. Experiment with different values of parallel.query to determine the best results for your storage system.

Per-User Configuration Nodes

This topic describes the per-user configuration nodes. There are settings that influence the actions users are allowed to perform on the database. These settings are stored in the configuration tree at `/users/accounts/<username>/config` , where `<username>` is the name of the user to which the settings apply.

query.prefix

A query prefix applies a filter to every query operation that the user performs. This is implemented by taking the `query.prefix` values and appending it the the where clause of each query using the logical && (and) operator. For more information on Where Clauses, see Queries .

query.level

This setting is available in 10.4 and earlier versions.

The query.level setting assigns the query level that the users have for every query they perform. These influence whether their queries are limited by the query.level.1.minutes, query.level.2.minutes, or query.level.3.minutes.

query.timeout

This setting is available in 10.5 and later versions.

The query.timeout setting assigns the maximum amount of time in minutes that a user can run each query. For trusted connections, these timeouts are configured on the NetWitness Platform server. For accounts on Core services, this setting is stored in the configuration tree at `/users/accounts/<username>/config` , where `<username>` is the name of the user to which the setting applies. When this value is set to zero, the Core service does not enforce the query timeout.

session.threshold

The session.threshold setting assigns a maximum session threshold for the user. If set, this threshold value is assigned to all values calls that the user performs. A detailed discussion of both the values call and thresholds is covered in this guide.

Scheduler

This topic provides a brief introduction to the scheduler and explains how to schedule commands. All NetWitness Core services come with a built-in scheduler found under `/sys/config/scheduler`. To use the scheduler, you add the command you want to run periodically using one of two messages:

`/sys/config/scheduler addInter` - Add a command to run at the specified interval (every N hours, minutes or seconds)

or

`/sys/config/scheduler addMil` - Add a command to run at the specified time of day or even specific days of the week

Example

For example, suppose that you have a use case to delete all packet data that is greater than seven days old. Since you cannot configure the packet.dir setting to rollout data based on a time interval, you need to schedule the `/database timeRoll` command to run every so often. For this example, create a timeRoll to run every 20 minutes:

```
addIter minutes=20 pathname=/database msg=timeRoll params="type=packet days=7"
```

This command adds a scheduled task (it is persisted between restarts of the service) to run every 20 minutes, on the `/database` node, and ages out all packet data older than seven days. The `params` parameter is used to pass all the parameters to the command specified (in this case `timeRoll`). Notice how it quotes all the embedded parameters (`type` and `days`) so they are not interpreted as parameters to be passed to the outer `addIter` command. If the parameters inside `params` need to use quotes, you must escape the inner quotes with a backslash. You can rewrite it with embedded quotes, which does not alter the command in any way:

```
addIter minutes="20" pathname="/database" msg="timeRoll"
params="type=\"packet\" days=\"7\""
```

This command works identically to the original, but demonstrates how to escape complicated parameter passing. Additional useful scheduler commands are:

`/sys/config/scheduler print` - Print all scheduled commands (you can also see them by doing an `ls` on the scheduler node).

`/sys/config/scheduler delSched` - Delete a scheduled command by passing in the identifier shown in the `print` (or `ls`) command.

This is a brief introduction to the scheduler. For more information on command parameters, send the `help` message to the scheduler node and pass in the command name via the `msg` parameter. For more information, see the "Services Explore View" topic in the *Host and Services Getting Started Guide* .

Rollover

This topic describes the two rollover mechanisms. The database operates as a first-in, first-out (FIFO) queue. New data is always appended to the database, and the oldest data is automatically removed as needed. Data that is in the middle of the database is immutable, meaning it cannot be modified.

There are two mechanisms to for rollover: synchronous and asynchronous.

Synchronous Rollover

Synchronous rollover refers to rollover settings that are applied in response to a write operation on the database. That means data is removed from the database in direct response to the need to write new data. Synchronous rollover is configured by setting size values on the configuration for `packet.dir` , `meta.dir` , `session.dir` , and `index.dir` .

Synchronous rollover on the packet, meta, and session databases can occur within any write operation. Synchronous rollover on the index occurs when the index is saved.

Asynchronous Rollover

Asynchronous rollover refers to database file removal that occurs when an explicit rollover command is issued to the database. Most commonly this type of rollover is scheduled to run periodically using the built-in scheduler of the Core service. The user can also explicitly request it.

The asynchronous rollover command is the `sizeRoll` message present on the `/index` and `/database` nodes of the configuration tree. The message on the `/database` node does size rollover on packet, meta, and session databases only, while the message on the `/index` node can do simultaneous rollover on both the index and the packet, meta, and session databases.

The `sizeRoll` command has the following parameter syntax:

```
size-roll-params    = {type-param, space}, (max-size-param | min-free-param |
max-percent-param), {max-size-warm-param, space}
type-param          = "type=", {type-flag} , { ",", type-flag } ;
type-flag           = "packet" | "meta" | "session" ;
max-size-param      = "maxSize=", number, {space}, unit ;
max-percent-param   = "maxPercent=", number, {space}, unit ;
min-free-param      = "minFree=", number, {space}, unit ;
max-size-warm-param = "maxSizeWarm=", number, {space}, unit ;
unit                = "t" | "TB" | "g" | "GB" | "m" | "MB" ;
```

```
number              = ? decimal number ? ;
percentage          = ? number between 0 and 100 ? ;
```

The `type` parameter controls the databases to consider for removing the oldest data based on total size or space remaining. If type is not specified on the `/index` sizeRoll, only the index is considered for rollover operations.

The `maxSize` parameter sets a current maximum size of the database or index. If the database is larger than this size, oldest data is deleted first (or moved to the Warm or Cold tier, depending on the configuration) until total size is less than `maxSize` . The `sizeRoll` operation determines which data is oldest out of all the databases and the index based on session IDs. Sessions or index entries with lowest session IDs are deleted first, possibly including removing meta and packet databases that are orphaned by removing entries from the session database. The index data is rolled out if the sessions that it refers to are removed.

The `maxSizeWarm` parameter sets a current maximum size on the *Warm* tier, but otherwise behaves identically to the `maxSize` parameter. When data is rolled out on the Warm tier, it is moved to the Cold tier (if configured) or deleted.

The `maxPercent` parameter sets a maximum percentage of all the volumes of all databases passed in `type` parameter combined. When exceeded, oldest data is deleted first until total size is less than maxPercent of total volumes.

The `minFree` parameter sets a minimum allowed free space on the volumes before oldest data is deleted.

Each call to the sizeRoll operation provides a single pass through the database to delete files. When the operation completes, the current size utilization of the database will have met the criteria specified by the `maxSize` , `maxPercent` , or `minFree` parameters and the optional `maxSizeWarm` . Therefore, this operation can be scheduled periodically to ensure that the database can continue to operate uninterrupted.

Example

The following example shows a typical sizeRoll scheduler entry for an Archiver:

```
pathname=/index minutes=5 msg=sizeRoll params="type=meta,session,packet
maxSize=25TB maxSizeWarm=150TB"
```

This scheduler entry specifies that every five minutes the database ensures that the max size of the meta, session, packet, and index does not exceed 25 terabytes on the Hot tier and does not exceed 150 terabytes on the Warm tier.

Snort Rules and Configuration

Snort® rules and configuration are added to the parsers/snort directory for Investigator and Decoder. Decoder supports the payload detection capabilities of Snort rules. The rules files must have the extension `.rules` and the configuration files must have the extension `.conf` . The Decoder implementation of Snort rules is centered on using the content strings defined in a Snort rule as a token. Once a token is matched, the rule header and additional rule options can be evaluated. Currently, rules that do not define any content (via `content` or `uricontent` rule options) are not supported.

Configuration

The configuration files are loaded prior to loading rules.

Variable Definitions	Description
`ipvar`	The full language for defining IP Address variables is supported, including lists, CIDR, and negation.
`portvar`	The full language for defining IP Address variables is supported, including lists, ranges, and negation.
`var`	Not supported; use `ipvar` or `portvar` .

Action Definitions	Description
`ruletype`	The definition of additional `ruletype` s is supported. However, only rules that have a base rule type of **alert** are supported.

General Configuration	Description
`nopcre`	This configuration option disables all rules with **pcres**.

Meta key usage

Starting with the 11.3 release, an attempt has been made to align better the Snort parser's meta key usage with that of other parsers. As of the 11.3 release, the default mode operation continues to write to the legacy key set (consistent with previous releases). To use the aligned key set, set the `udm` option to `true` for the Snort parser in the `parser.options` configuration node. Refer to the **General options** section, below, for a description of how the two modes differ.

Rules

- Any rule that does not properly parse is ignored.
- Any valid Snort rule should successfully parse; however,there are rule options that are not supported by Decoder that are not fully parsed.

Snort rules are parsed and loaded when PCS is loaded (any import/capture in Investigator, initial capture start and parser reload in Decoder).

Section	Description
Header	The header conditions are evaluated when a rule receives the first token callback for a stream. The header is evaluated once per stream, and prevents any further consideration of a rule against a specific stream if the conditions are not met.
Actions	The specified action or a rule must be defined (either one of the native Snort actions or defined in the configuration using the `ruletype` statement) for the rule to be considered valid. Decoder only utilizes rules with alert actions.
Protocols	Decoder supports the current Snort protocol keywords (`tcp` , `udp` , `icmp` , `ip`).
IP Addresses	The full language for defining IP addresses is supported, including lists, CIDR, and negation.
Port Numbers	The full language for defining port numbers is supported, including lists, ranges and negation.
Direction Operator	The directional operator supports the from-to (`->`) and bidirectional (`<>`) values. The to-from (`<-`) value is invalid and will cause the rule to fail to load.

General options

Snort rule general options can result in different meta keys being written depending on whether the Snort parser is in legacy mode or not.

Aligned key mode:

Option	Description
`msg`	If the rule matches, the `msg` value is added as `sig.name` meta.
`sid`	If the rule matches, the `sig.id` value is added as meta.
`classtype`	If the rule matches, the `classtype` name is added as `threat.cat` meta.

Option	Description
`priority`	If the rule matches and it has a `priority` option, it is used for the value of the `risk.num` meta.

Legacy key mode:

Option	Description
`msg`	If the rule matches, the `msg` value is added as `risk.info` , `risk.warning` , or `risk.suspicious` meta, depending on rule priority.
`sid`	If the rule matches, the `sid` value is added as meta.
`classtype`	If the rule matches, the `classtype` name is added as `threat.cat` meta.
`priority`	If the rule matches and it has a `priority` option, it is used to determine the type of risk meta associated with the `msg` value.

Payload options

Decoder supports the following payload rule options:

Option	Description
`content`	The `content` option creates a token for Decoder to match. Only tokens of three or more bytes are accepted. It is also important to note that Decoder differs from Snort in that rules are evaluated across the payload of the reconstructed stream and not just a single packet. This can result in differences in rules matches between Snort and Decoder, especially when considering positional options.
`nocase`	Currently not supported. This option is ignored and case-sensitive matching is used.
`depth`	This option is applied to the distance of the token from the beginning of the stream. If the token position is greater than this value, it is not a match.
`offset`	This option is applied to the distance of the token from the beginning of the stream. If the token position is less than this value, it is not a match.
`distance`	This option is applied to the distance of the token from the end of the previous token match. If the relative token position is less than this value, it is not a match.
`within`	This option is applied to the distance of the token from the end of the previous token match. If the relative token position is greater than this value, it is not a match.

Option	Description
`http_uri`	Any token that hits is verified to fall within an `http_uri` as indicated by the HTTP parser. No URI normalization is applied.
`uricontent`	There is no URI normalization applied. Otherwise, this is equivalent to the content option with the `http_uri` modifier.
`pcre`	Currently, PCREs are only applied to URIs and must specify the U option.

Non-payload options

Option	Description
`flow`	Verifies that the rule is only applied to the client or server stream.
`to_client`	Limits the rule to only matching on a stream that Decoder has defined as Server.
`from_server`	Synonym for `to_client` .
`from_client`	Limits the rule to only matching on a stream that Decoder has defined as Client.
`flowbits`	Maintains state per session and are reset at the end of each session.
`set`	When the rule matches, the specified flowbit is set.
`unset`	When the rule matches, the specified flowbit is cleared.
`toggle`	When the rule matches, the specified flowbit is flipped.
`isset`	When the rule is evaluated, the specified flowbit state must be set for the rule to match.
`isnotset`	When the rule is evaluated, the specified flowbit state must not be set for the rule to match.
`noalert`	Prevents the rule from generating meta data if it matches.

Queries

This topic covers the database query syntax. There are three main mechanisms for performing queries in the database, the `query` , `values` , and `msearch` calls on the `/sdk` folder on each Core service.

The `query` call returns meta items from the meta database, possibly using the index for fast retrieval.

The `values` call returns groups of unique meta values sorted by some criteria. It is optimized to return a subset of the unique values sorted by an aggregate function such as count.

The `msearch` call takes text search terms as it's input, and returns matching sessions that match the search terms. It can search within indexes, meta, raw packets, or raw logs.

`query` Syntax

The `query` message has the following syntax:

```
query-params     = size-param, space, query-param, {space, start-meta-param},
{space, end-meta-param}, {space, search-param} ;
size-param       = "size=", ? integer between 0 and 1,677,721 ? ;
query-param      = "query=", query-string ;
start-meta-param = "id1=", metaid ;
end-meta-param   = "id2=", metaid ;
search-param     = "search=", search-string ;
metaid           = ? any meta ID from the meta database ? ;
```

The `id1` , `id2` , and `size` parameters form a paging mechanism for returning a large number of results from the database. Their usage mostly benefits developers who are writing applications directly against the NetWitness Core database. Normally, results are returned in the order of oldest to newest data (higher meta IDs are always more recent). In order to return results from most recent to oldest, reverse the IDs such that `id1` is larger than `id2` . This has a slight performance penalty, because the where clause must be completely evaluated before processing in reverse order can begin.

When size is left off or set to zero, the system streams back all results without paging. For the RESTful interface, this results in the full response to be returned with chunked-encoding. The native protocol returns the results over multiple messages.

The `query` parameter is a `query` command string with its own NetWitness-specific syntax:

```
query-string      = select-clause {, where-clause} {, group-by-clause {,
order-by-clause } } ;
select-clause     = "select ",  ( "*" | meta-or-aggregate {, meta-or-
aggregate} ) ;
```

```
where-clause      = " where ",  { where-criteria } ;
meta-or-entity    = (meta_key | entity) ;
meta-or-aggregate = meta-or-entity | aggregate_func, "(", meta-or-entity, ")"
;
aggregate_func    = "sum" | "count" | "min" | "max" | "avg" | "distinct" |
"first" | "last" | "len" | "avglen" | "countdistinct" ;
group-by-clause   = " group by ", meta-key-list
meta-key-list     = meta-or-entity {, meta-key-list}
order-by-clause   = " order by ", order-by-column
order-by-column   = meta-or-aggregate { "asc" | "desc" } {, order-by-column}
```

The `select` clause allows you to specify either `*` to return all the meta in all the sessions that match the where clause, or a set of meta field names and aggregate functions to select a subset of the meta with each session.

The `select` clause may contain entity names in the place of meta key names. If an entity name is in the select clause, meta items returned by the query will have their key name set to the entity name, rather than their actual meta key name stored in the session. Thus, the names of the meta items returned in the query will match the names of the metas in the select clause. For example, if there is an entity `ip` that consists of `ip.dst` and `ip.src` , then a query containing `select ip` will only return `ip` fields, with nothing to distiguish `ip.dst` meta items from `ip.src` meta items in the result set.

The `select` clause may contain renamed meta key names. Any fields appearing in the result set as a result of a renamed key in the `select` clause will be returned with the meta key name matching the name used in the `select` clause. For example, if the key `port_src` is used to rename `tcp.srcport` , then a query containing `select port_src` will only return `port_src` fields, even if the underlying meta had type `tcp.srcport` .

Note: Usage of renamed meta key pairs in the `select` clause cannot be combined with fixed-size result paging for a query. Doing so causes discrepancies in the results returned to Brokers. The reason for the discrepancies is that Concentrators cannot return only one of the key values of a renamed meta key pair and still preserve the correctness of the result set for the requested size. Hence, the Concentrator omits renamed meta key pair results to preserve the correctness of the result set, which causes the Broker to pull the result from the next Concentrator and advance the IDs that are returned.

Example: `select ip.proto,ipv6.proto` cannot be combined with `size=10` (a paging query) `size=10 flags=0 threshold=0 query="select time,ip.src,ip.dst, ip.proto,ipv6.proto,eth.type,size,payload,lifetime,client,did`

The aggregate functions have the following effect on the query result set.

Function	Result
`sum`	Add all meta values together; only works on numbers
`count`	The total number of meta fields that would have been returned

Function	Result
min	The minimum value seen
max	The maximum value seen
avg	The average value for the number
distinct	Returns a list of all unique values seen
countdistinct	Returns the number of unique values seen. countdistinct is equivalent to the number of metas that would have been returned by the distinct function.
first	Returns the first value seen
last	Returns the last value seen
len	Converts all field values to a UInt32 length instead of returning the actual value. This length is the number of bytes to store the actual value, not the length of the structure stored in the meta database. For example, the word "NetWitness" returns a length of 10. All IPv4 fields, like ip.src , return 4 bytes.
avglen	Returns a single value which is the average value returned from the len function. The result is always a float64 value.

where Clauses

The where clause is a filter specification that allows you to select sessions out of the collection by using the index.

Syntax:

```
where-criteria    = criteria-or-group, { space, logical-op, space, criteria-
or-group } ;
criteria-or-group = criteria | group ;
criteria          = (meta-key | entity), ( unary-op | binary-op meta-value-
ranges ) ;
group             = ["~"], "(" where-clause ")" ;
logical-op        = "&&" | "||" ;
unary-op          = "exists" | "!exists" ;
binary-op         = "=" | "!=" | "<" | ">" | ">=" | "<=" | "begins" |
"contains" | "ends" | "regex" ;
meta-value-ranges = meta-value-range, { ",", meta-value-range } ;
meta-value-range  = (meta-value | "l" ), [ "-", ( meta-value | "u" ) ] ;
```

```
meta-value          = number | quoted-value | ip-address | mac-address |
relative-time ;
number              = ? any numeric value ? | ( '"' text '"' )
quoted-value        = ( '"' text '"' ) | ( '"' date-time '"' ) ;
relative-time       = "rtp(" , time-boundary , "," ,  positive-integer , time-
unit, ")" ;
time-boundary       = "earliest" | "latest" | "now" ;
positive-integer    = ? any non-negative integral number ?
time-unit           = "s" | "m" | "h" ;
```

When specifying rule criteria, the `meta-value` part of the clause is expected to match the type of the meta specified by the `meta-key` . For example, if the key is `ip.src` the `meta-value` should be an IPv4 address. Entity names are allowed in any location where a meta-key name is required.

Queries using a `meta-key` name will match meta items corresponding both to the `meta-key` name as well as to the names of any "renames" specified for the key. See "Key Renaming" under the Index Customization topic for details on key renaming.

Query Operators

The following table describes the function of each operator.

Operator	Function
=	Match sessions containing the meta value exactly. If a range of values is specified, any of the values is considered a match.
!=	Matches all sessions that would not match the same clause as if it were written with the = operator.
<	For numeric values, matches sessions containing meta with the numeric value less than the right side. If the right side is a range, the first value in the range is considered. If multiple ranges are specified, the behavior is undefined. For text metas, a lexicographical comparison is performed.
<=	Same behavior as < , but sessions containing meta that equals the value exactly are also considered matches.
>	Similar to the < operator, but matches sessions where the numeric value is greater than the right side. If the right side is a range, the last value in the range is considered for the comparison.
>=	Same behavior as > , but sessions containing meta that equals the value exactly are also considered matches.
begins	Matches sessions that contain text meta value that starts with the same characters as the right side.

Operator	Function
`ends`	Matches sessions that contain text meta that ends with the same characters as the right side.
`contains`	Matches sessions that contain text meta that contains the substring given on the right side.
`regex`	Matches sessions that contain text meta that matches the regex given on the right side. The regex parsing is handled by boost::regex.
`exists`	Matches sessions that contain any meta value with the given meta key.
`!exists`	Matches sessions that do not contain any meta value with the given meta key.
`length`	Matches sessions that contain text meta values of a certain length. The expression on the right side must be a non-negative number.

Text Values

The system expects quoted text values. Unless it can be parsed as a time (see below), a quoted value is interpreted as text.

> It is also important to quote any text value that may contain – so that it is not interpreted as a range.

For text values, the backslash character `\` is used as an escape value. This character is used when you need to search for a value containing quote characters. If you need to search for a backslash character, then the backslash itself must be escaped, as `\\` . Note that if you are wrapping the query parameters within another language, such as the parameter fields of the REST interface, you may need to add additional escape levels as required by whatever API or interface you are using to interact with the core service.

IP Addresses

IP addresses can be expressed using standard text representations for IPv4 and IPv6 addresses. In addition, the query can use CIDR notation to express a range of addresses. If CIDR notation is used, it is expanded to the equivalent value range.

MAC Addresses

A MAC address can be specified using standard MAC address notation: `aa:bb:cc:dd:ee:ff`

Numeric Values

In a where clause, you can specify numeric search values. Numbers should not be surrounded by quotes.

Bucketed Numeric Indexes

Meta keys indexed with bucketing can be used like any other numeric search value. Under most situations such searches will return sessions that have a meta value that exactly matches the requested search criteria.

Special behavior is invoked for queries that select only `sessionid` , for example a query of the form `select sessionid where size = 2048` . Selecting `sessionid` explicitly bypasses all meta database read operations, and only returns index information. If selecting `sessionid` only, and if the numeric value specified is exactly equal to one of the bucket values, then the system will return all sessions that match somewhere in the bucket, rather than an exact match. For example, the search term `size = 2048` will match all sessions in the 2 KB bucket, which is the range from 2048 to 3171 bytes. However, if the search values does not match a bucket values, then the system will return only matches for the exact byte value. For example, the search term `size = 2049` will only match sessions with a size meta value exactly 2049. In this mode of operation, specifying a non-bucket value in a where clause is slower than searching within a bucket value. The 'where' clause parameter to the `values` API also invokes this optimization.

Using bucketed values in other forms of `query` does not invoke special behavior. The same is true for the `msearch` API. For those APIs, the use of a bucketed index in the where clause is evaluated accurately, without special meaning applied to bucket values. To search within an entire bucket using these APIs, specify the bucket range explicitly. For example `size=2048-3171` .

More information on how to tell if an index is bucketing is in the topic Index Customization .

Numeric Value Aliases

For numeric values, aliases specified in the index can be used in a query as a quoted string in place of where a literal numeric value would be used; e.g.,

```
select * where service = "NFS"
```

Numeric value aliases can be used anywhere a numeric literal might be used: as a single value, as the beginning or end of a range, or in a comma-delimited list of values (and/or ranges).

Refer to the topic Index Customization for details of how value aliases can be specified in the index.

Date and Time Expressions

In NetWitness Platform, dates are represented using Unix epoch time, which is the number of seconds since Jan 1, 1970 UTC. In queries, you can express the time as this number of seconds, or you can use the string representation. The string representation for the date and time is `"YYYY-mmm-DD HH:MM:SS"` . A three-letter abbreviation represents the month. You can also express the Month as a two-digit number, 01-12.

Time values must be quoted.

All times specified in queries are expected to be in UTC.

Relative Time Points

Relative time points allow a where clause to reference a value at some fixed offset relative to the earliest or latest time metas seen in the collection. It can also be used to reference a point in time relative the the current time.

A relative time point expression has the syntax `rtp(boundary, duration)` .

The boundary is either `earliest` , `latest` , or `now` .

The duration is an expression of hours, minutes, or seconds. For example, `24h` , `60m` , or `60s` . When the boundary is `earliest` , the duration represents the amount of time **after** the earliest time present in the collection. If the boundary is `latest` , the duration represents the amount of time **before** the earliest time present in the collection. If the boundary is `now` , the duration represents the amount **before** the current time.

When the boundary is `now` , the system clock of the Core service host is used to determine what time it is.

Boundary can be represented as 0 seconds if you wish to specify the relative time point with no duration offset. This is most useful in the case of the `now` boundary, since it is possible that the highest, latest, time observed in the collection may be much earlier than the current time.

Relative time points can only be used in SDK operations, where there is a collection from which to get the boundaries for earliest and latest time metas.

Relative time points only work on indexed meta types. The default indexed meta types are `time` and `event.time` .

Examples:

```
Last 90m of collection time:
time = rtp(latest, 90m) - u

First 2 days of event time:
event.time = l - rtp(earliest, 48h)

Events added in the last hour:
time = rtp(now, 60m) - rtp(now,0s)
```

Special Range Values

Ranges are normally expressed with the syntax * `smallest` * - * `largest` *, but there are some special placeholder values you can use in range expressions. You can use the letter `l` to represent the lower-bound of the all meta values as the start of the range, and `u` to represent the upper bound. The bounds are determined by looking at the smallest or largest meta value found in the index out of all the meta values that have already entered the index.

If you use the `l` or `u` tag, it should be unquoted.

For example, the expression `time = "2014-may-20 11:57:00" - u` would match all time from that 2014-may-20 11:57:00 to the most recent time found in the collection.

Notice that it is easy to confuse a range expression with a text string. Make sure that text values that contain − are quoted, and that hyphens within range expressions are not within quoted text.

`group by` Clause (since 10.5)

The query API has the ability to generate aggregate groups from the results of a query call. This is done using a `group by` clause on the query. When `group by` is specified, the result set for the query is subdivided into groups. Each group of results is uniquely identified by the meta values indicated in the group by clause.

For example, consider the query `select count(ip.dst)` . This query returns a count of all ip.dst metas in the database. However, if you add a `group by` clause, like this: `select count(ip.dst) group by ip.src` , the query returns a count of the ip.dst metas found for each unique ip.src.

As of version 10.5, you can utilize up to 6 meta fields in a `group by` clause.

The `group by` clause shares some of the same functionality as the `values` call, but it offers significantly more advanced groups at the expense of longer query times. Producing the results of a grouped query involves reading the meta from the meta database for all sessions that match the `where` clause, while a values call can produce its aggregates by reading the index only.

The contents of each group returned by the query are defined by the `select` clause. The `select` clause can contain any of the aggregate functions or meta fields selected. If multiple aggregates are selected, the result of the aggregate function is defined for each group. If nonaggregate fields are selected, the meta fields are returned in batches for each group.

The result set of a `group by` query is encoded with the following rules:

1. All meta items associated with a group are delivered with the same group number.
2. The first meta items returned to the group identify the group key. For example, if the `group by` clause specifies `group by ip.src` , then the first meta item of each group will be an `ip.src` .
3. The normal, nonaggregate meta items are returned after the `group key` , but they all will have the same group number as the group key metas.
4. The aggregate result meta fields for each group are returned next.
5. All fields within a group are returned together. Different group results will not be interleaved.

If one of the `group by` meta items is missing from one of the sessions matched by the `where` clause, that meta field is treated as a NULL for the purposes of that group. When the results for that group are returned, the NULL-valued parts of the group key will be omitted from the group's results, since the database has no concept of NULL.

The semantics of a `group by` query differ from a SQL-like database in terms of what meta fields are returned. SQL databases require you to select the `group by` columns explicitly in the `select` clause if you want them to be returned in the result set. The NetWitness Core database always implicitly returns the group columns first.

A query with a `group by` clause honors the result set `size` parameter if one is provided. However, due to the nature of the grouping, it puts an additional burden on the caller to page and reform groups if a fixed-size result set is requested. For this reason, you should not specify an explicit result size when making a `group by` call. By not specifying an explicit size, the entire result set will be delivered as partial results.

`group by` clauses allow results to be grouped by an entity definition.

The following table describes the database honors configuration parameters that limit I/O or memory impact of a group by query.

Parameter	Function
/sdk/config/max.query.groups	This is the limit on how many groups can be held in memory to calculate aggregates. This parameter allows you to limit the overall memory usage of the query.
/sdk/config/max.where.clause.sessions	This is the limit on how many sessions from the where clause can be processed in a query. This parameter allows you to set a limit on the number of sessions that have to be read from the meta and session databases to resolve a query.

order by Clause (since 10.5)

An order by clause can be added to a query that contains a group by clause. The order by clause causes the set of grouped results to be returned in sorted order.

An order by consists of a set of items to sort by in ascending or descending order. Sorting can be performed on any data field that will be returned in the result set. This includes meta specified by the select clause, aggregate function results specified by the select clause, or group by meta fields.

The order by clause can sort over many columns. There is no limit on the number of order by columns allowed in the query; but a practical limit exists in that each of the order by columns must refer to something returned by the select clause or group by clause. The multiple column sort is imposed lexicographically, meaning that if two groups have equal values for the first column, then they are sorted by the second columns. If they are equal in the second column, they are sorted by the third column, and so on for however many order by columns are provided. Groups that do not contain any of the metas referenced by the order by clause are sorted first in the result set in the case of an ascending sort, and last in the case of a descending sort.

The NetWitness Core database is unique in that the groups of results returned by a query may each have many values for a selection. For example, it is possible to select all meta items that match a meta type and organize them into groups, and it is possible to use the distinct() function to return groups of distinct meta values. If an order by clause references one of the fields in the group that has multiple values, the sorting order is applied as follows:

1. Within each group, the fields with multiple matching values are ordered by the ordering clause
2. All the groups are sorted by comparing the first occurrence of the ordered field found within each group

The order by clause is only available in queries that have a group by clause, since groups are required to organize the meta fields into distinct records. If you wish to sort an arbitrary query as if there were no grouping applied, use group by sessionid . This ensures that results are returned in groups of distinct sessions or events.

group by clauses are naturally returned in ascending group key order; but, an order by clause can be used to return groups in a different order.

If an order by column does not specify asc or desc , the default ordering is ascending.

Examples:

```
select countdistinct(ip.dst) GROUP BY ip.src ORDER BY countdistinct(ip.dst)
select countdistinct(ip.dst) GROUP BY ip.src ORDER BY countdistinct(ip.dst)
desc
select countdistinct(ip.dst),sum(size) GROUP BY ip.src ORDER BY sum(size)
desc, countdistinct(ip.dst)
select sum(size) GROUP BY ip.src, ip.dst ORDER BY ip.dst desc
select user.dst,time GROUP BY sessionid ORDER BY user.dst
select * GROUP BY sessionid ORDER BY time
```

`search` parameter

The `query` API supports a `search` parameter to perform free text searching. The syntax of the search parameter is identical to the search parameter utilized by the `msearch` API call. Refer to the `msearch` documentation for a description of the search field syntax.

The `search` parameter acts as an extension of the `where` clause in the `query` parameter. This means that the `query` and `search` parameters work together. Use the `query` parameter to specify the `select` clause, the `group by` clause, or the `order by` clause. Any `where` clause criteria specified in the `query` parameter are combined with the search filter as if they were joined with an `AND` operation.

Searches through the `query` API are always done against indexed meta, in case-insensitive mode. It has the same behavior as specifying flags `si,sm,ci` to the `msearch` API.

`values` call

The index provides a low-level `values` function to access the unique meta values that have been stored in the index. This function allows developers to perform more advanced operations on groups of unique meta values.

The `values` call parameter syntax:

```
values-params          = field-name-param, space, where-param, space, size-
param, {space, flags-param} {space, start-meta-param}, {space, end-meta-
param}, {space, threshold-param}, {space, aggregate-func-param}, {space,
aggregate-field-param}, {space, min-param}, {space, max-param}, {space,
search-param} ;
field-name-param       = "fieldName=", (meta-key | entity) ;
where-param            = "where=", where-clause ;
```

```
size-param            = "size=", ? integer between 1 and 1,677,721 ? ;
start-meta-param      = ? same as query message ?
end-meta-param        = ? same as query message ?
flags-param           = "flags=", {values-flag, {"," values-flag} } ;
values-flag           = "sessions" | "size" | "packets" | "sort-total" |
"sort-value" | "order-ascending" | "order-descending" ;
threshold-flag        = "threshold=", ? non-negative integer ? ;
aggregate-func-param  = "aggregateFunction=", { aggregate-func-flag } ;
aggregate-func-flag   = "count" | "sum" ;
aggregate-field-param = "aggregateFieldName=", ( meta-key | entity ) ;
min-param             = "min=", meta-value ;
max-param             = "max=", meta-value ;
search-param          = "search=", search-string ;
```

The `values` call provides the function of returning a set of unique meta values for a given meta key. For each unique value, the `values` call can provide an aggregate total count. The function used to generate the total is controlled by the flags parameter.

Parameters

The following table describes the function of each parameter.

Parameter	Function
`fieldName`	This is the meta key name for which you retrieve unique values. For example, if `fieldName` is `ip.src` , this function returns the unique source IP values in the collection. Entities can be used for the field name, in which case the result is defined as the combined set of field values for all the referenced meta keys. If the `fieldName` refers to a key with rename references, the result is defined as the combined set of field values for the given meta key name plus all of the references' meta keys.
`where`	This is a `where` clause which filters the set of sessions for which the unique values are returned. For example, if the `fieldName` is `ip.src` , and the `where` clause is `ip.src = 192.168.0.0/16` , only values in the range of `192.168.0.0` to `192.168.255.255` are returned. For information on the `where` clause syntax, see *Where Clauses* .
`size`	The size of the set of unique values to return. This function is optimized to return a small subset of the possible unique values in the database.

Parameter	Function
id1 , id2	These optional parameters limit the scope of the search for unique values to a specific region of the meta database and the index. Setting the id1 and id2 parameters to a limited range of the meta database is very important to running searches quickly on large collections.
flags	Flags control how the values are sorted and totaled. Flags are described in the following Values Flags section.
threshold	Setting the threshold parameter allows the values call to short-cut collection of the total associated with each value once the threshold is reached. By providing a threshold, the caller can reduce the amount of index and meta items that must be retrieved from the database. If the threshold parameter is omitted or set to 0, this optimization is not used.
aggregateFunction	Optional parameter used to change the default behavior from counting sessions, packets, or size to counting or summing the numeric field defined by aggregateFieldName . Both parameters must be specified when either is defined. Pass either sum or count to specify which behavior to perform.
aggregateFieldName	The meta field on which to perform the aggregateFunction . Both aggregateFunction and aggregateFieldName parameters must be specified when the aggregate flag is set. Performing a values call using one of the aggregate functions can be significantly slower than a values call that collects totals of sessions, packets, or size. The reason for this is that each session that matches the where clause must be retrieved from the meta database. This scan causes a large portion of the query to be I/O bound on the meta DB volumes. The time taken to run an aggregate values call is linearly proportional to the number of sessions that match the where clause.
min , max	The minimum and maximum value that should be returned from the call. These parameters are used to iterate (or page) over an extremely large number of values, typically more values than could be returned from a single call. Primarily used in conjuction with the flags sort-value, sort-ascending such that the highest value returned would be used in a subsequent call as the min parameter value. The values are exclusive. If min="rsa" was specified and rsa was a valid value, rsa would not be returned; instead, the next highest value would be returned.
search	Text search pattern to be used to further refine the where parameter

values Flags

The flags parameter controls how the values call operates. There are three groups of flags that correspond to the different modes of operation as shown in the following table.

Flag	Description
sessions , size , packets	The values call allows you to specify one of these flags to determine how the total for each value is calculated. If the flag is sessions , the values call returns a count of sessions that contain each value. If the flag is size , the values call totals the size of all sessions that contain each unique value, and reports the total size for each unique value. If the flag is packets , the values call totals the number of packets in all sessions that contain each unique value, and then reports that total for each unique value.
sort-total , sort-value	These flags control how results are sorted. If the flag is sort-total , the result set is sorted in order of the totals collected. If the flag is sort-value , the results are returned in order of the sorting order of the values.
order-ascending , order-descending	These flags control the sort order of the result set. For example, if sorting by total in descending order, the values with the greatest total are returned first.
suggest	Enables suggestion mode for the values API. All other flags are ignored if this flag is set
database-scan	Make the values call bypass the index and instead collect unique values as if where traversing the meta database. This mode is slow on most cases, but it can be fast if the where clause matches very few sessions.
ignore-cache , clear-cache	These flags control result set caching on the set of values returned by this call. Normally these should not be used.

values Call Example

The values call is used extensively by the Navigation view in NetWitness Platform. The default view generates calls that look like this:

```
/sdk/values id1=198564099173 id2=1542925695937 size=20 flags=sessions,sort-total,order-descending threshold=100000 fieldName=ip.src where="time=\"2014-May-20 13:12:00\"-\"2014-May-21 13:11:59\""
```

In this example, the Navigation view requests unique values for ip.src . It requests unique values of ip.src in the time range given. It asks for the count of sessions that match each ip.src , and the results are the top 20 ip.src values when sorted by the number total count of sessions in descending order. In addition, the Navigation view has a meta ID range in order to provide an optimization hint to the query engine.

Values call and bucketing mode

When a values call is executed with a `fieldName` parameter that specifies a bucketed indexed meta, the system will only return the bucket values present within the rest of the criteria. This has the side effect of producing counts and totals that represent all sessions within each returned bucket. This is useful because it summarizes size meta into groups that represent human-readable ranges like 1 MB, 2 MB, and so one.

When the number of sessions scanned by the values call drops below 1000 sessions, the values call operates in meta-scanning mode, and at that point it returns exact values for numeric value indexes, regardless of the bucketing setting on the index.

Suggestion Mode

The `values` call has an additional execution mode that is used to provide suggested search values. In this mode of operation, the `values` call only identifies unique values stored with the given meta key name. It provides these results within milliseconds. To achieve this it does not provide any session counts, it will not utilize any other sort flags. The suggestion mode does utilize the `where` parameter to refine suggestions, but it only utilizes the time range clause if provided. Other portions of the `where` clause are not utilized to refine suggestion.

Suggestion mode is enabled by setting the `suggest` flag in the `flags` parameter.

Suggestion mode gives special meaning to the `min` parameter. The `min` parameter can contain the starting point for the suggested values. The return values of `suggest` mode will only include values that start with the text provided in the `min` parameter.

`search` parameter

The `values` API supports a `search` parameter to perform free text searching. The syntax of the search parameter is identical to the search parameter utilized by the `msearch` API call. Refer to the `msearch` documentation for a description of the search field syntax.

The `search` parameter acts as an extension of the `where` parameter. This means that the `where` and `search` parameters work together. Any `where` parameter specified is combined with the search filter as if they were joined with an `AND` operation.

Searches through the `values` API are always done against indexed meta, in case-insensitive mode.

The `values` API only operates on index entries for most requests, in order to provide fast totals over a large numbers of events. When the search parameter operates over in-exact indexes, such as N-Gram indexes, it may include sessions with near matches instead of narrowing the search to exact matches.

`msearch` Call

The index provides a low-level `msearch` function to perform text searches against all meta types. This type of search does not require users to define their queries in terms of known meta types. Instead, it searches all parts of the database for matches. `msearch` is used by the Events view text search. See the "Filter and Search Results in the Events View" topic in the *Investigation and Malware Analysis Guide* for detail on the accepted search forms and examples.

`msearch` parameters:

```
msearch-params  = search-param, {space, where-param}, {space, limit-param},
{space, size-param}, {space, flags-param};
search-param    = "search=", ? free-form search string ? ;
where-param     = "where=", ? optional where clause ? ;
limit-param     = "limit=", ? optional session scan limit ? ;
size-param     = "size=", ? optional result count limit ? ;
flags           = "flags=", {msearch-flag, {"," msearch-flag} };
msearch-flag    = "sp" | "sm" | "si" | "ci" | "regex" ;
```

The `msearch` algorithm works as follows:

1. A set of sessions is identified from the index by finding the intersection of three sets:
   - (Set 1) All sessions in the database
   - (Set 2) Sessions that match the `where` clause parameter
   - (Set 3) If the `si` flag is specified, sessions that indexed values that match the search string parameter.
2. If the search specifies the `sm` parameter, all meta items from the set of sessions identified in step 1 are read and scanned to see if they match the search string parameter. The meta items will be read from the service nearest to the point where the search was executed. For example, if the search is performed on a Broker, the meta items may be read from the Concentrator nearest to the broker, but if the search is performed on an Archiver the meta items will be read from the Archiver itself.
3. If the search specifies the `sp` parameter, all raw packet or log entries from the set of sessions identified in step 1 are read and scanned to see if they match the search string parameter. The packets will be read from the service nearest to the point where the search was executed. For example, if the search is performed on a Concentrator, the packet data will be read from the Decoder, but if the search is performed on an Archiver, the packet data will be read from the Archiver itself.
4. Matches from step 2 and step 3 are returned as they are found, up to the point where the `limit` parameter is reached or the `size` count is reached, whichever occurs first. The `limit` parameter specifies the maximum number of sessions for which meta and packet data will be scanned. If `limit` is not specified, the entire set of sessions determined in step 1 is scanned. The `size` parameter specifies the maximum number of results that will be returned. In practice, the `size` parameter acts more as a suggestion. It is possible that slightly more results than specified will be returned, but fewer results will never be returned. If the `size` parameter is not specified, all results matching the search will be returned.

`msearch` Flags

Flag	Description
`sp`	Scans raw packet data
`sm`	Scans all meta data
`si`	Does index lookups for all search parameters before scanning meta
`ci`	Performs a case insensitive search. Returned results are case-preserving.
`regex`	Treats the search parameter as a regular expression. Only a single regular expression can be specified, but the regular expression may be arbitrarily complex.

`msearch` Index Search Mode

Using the index search mode, specified by using the `si` flag, causes results to be returned significantly faster than any other mode. The main limitation of this mode is that it only returns matches on text terms that match value-indexed meta values.

- The `si` parameter must be combined with the `sm` flag. The `si` parameter implies the search only matches indexed meta.
- The `si` parameter can be used with regex searches, however only text indexed values will match. IP addresses and numbers will not match the regex.

Text Search Syntax

The search parameter given to `msearch` is composed of 1 or more words, separated by whitespace. For example, searching for `foo` returns sessions that contain the word foo.

If multiple terms are provided for the search, they are implicitly considered to be an AND operation. For example, searching for `foo bar` returns sessions that contain both foo AND bar. Sessions that contain only foo or only bar are filtered out. If you want to search for sessions containing any of two or more terms, you must explicitly separate the terms with the word OR. For example, searching for `foo OR bar` returns sessions that contain either foo or bar.

Search Syntax And Index Modes

The searches given to the `msearch` command are interpreted according to the index level on all the indexes. `msearch` works on the value-indexed keys in the index. Search terms provided to `msearch` will find values that are an exact match to values that were indexed.

As of version 11.1, there are new index modes available that allow `msearch` to locate text that is not an exact match to the search input. `msearch` supports wildcard searches on the word meta index, if the word meta index has the ngram option enabled. For details on the ngram option, see the topic Index Customization.

The wildcard search allows the use of the `*` and `?` characters as wildcards in search terms. The `*` can stand for 0 or more characters, while the `?` may stand for any single character. To search for those characters in an N-gram enabled index, you may escape them with a backslash character.

If the word index has the 'edge' N-gram option enabled, then it can be used to locate searches that end in a wildcard. This means it is only useful for finding text that begins with a known prefix.

If the word index has the 'all' N-gram option enabled, then wildcards may appear anywhere in the search term.

This table summarizes the relationship between word index level, and the types of searches that `msearch` will locate.

Search input	Non-indexed	IndexValues	IndexValues with Edge N-grams	IndexValues with All N-grams
"foo"	no match	"foo"	words starting with "foo"	words containing "foo"
"foo*"	no match	literal "foo*"	words starting with "foo"	words starting with "foo"
"*foo"	no match	literal "*foo"	no match	words ending with "foo"
"*foo*"	no match	literal "*foo*"	words staring with foo	words containing "foo"
"foo*"	no match	literal "foo*"	literal "foo*"	literal "foo*"

`msearch` Tips

- Always use the `where` clause to specify a time range for the search.
- To search for IP address ranges, specify them in the `where` clause.
- Use the `limit` parameter when not using the index search mode. Without it, there will be an extremely large amount of data read by the meta and packet databases.

Stored Procedures

The `query` and `values` calls provide more low-level search functionality. For more advanced use cases, server-side stored procedures exist.

Use of Quotes in Query Syntax

The query parser does not care whether you use single or double quotes within a query statement. A single- or double-quoted value is treated as text meta.

The query parser attempts to make sense of whatever you put in the statement. It is not very strict about what it will accept.

For example:

`reference.id=4752`

This clause identifies sessions that have a `reference.id` meta value that has a *numeric* value of 4752.

`reference.id='4752'` or `reference.id="4752"`

This clause identifies sessions that have a `reference.id` meta value that has a *string* value of `4752` .

However, the query engine implicitly compares numbers and strings that look like numbers as equal when the values are semantically the same. So it works with either syntax.

For most efficient performance, however, it is always a good idea to construct the queries such that the query syntax matches the data types generated by the parser.

For example, if the parser is creating `reference.id` as a numeric data type (such as `uint32` or `uint64`), then use the numeric syntax.

If the parser is creating `reference.id` as a text data type, then use the string syntax.

`hierarch` Call

The `hierarch` call returns information about the hierarchy of devices attached to the collection represented in this database.

A hierarchy consists of this device, plus any devices that this device is connected to. For each device, the contents of the `/sys/stats` folder is returned. This information includes the device name, it's UUID, and it's version information.

The hierarchy command returns it's information as a MessagePack object, which may be translated into different representations depending on what API you are using to access the Core service. For example, using the REST API it is translated to a JSON object.

For devices that connect to upstream devices, such as a Broker or Concentrator, the hierarchy message will contain a `devices` member. The `devices` member is an array that holds the contents of the `hierarch` message as executed on each upstream device. In this way, the `hierarch` message forms a hierarchical directory of all services that the device connects to, both directly and indirectly.

Index Customization

This topic describes how to use the custom index file to customize the index. Each NetWitness NextGen service is installed with a default index configuration that is intended to cover the index needs for most users of the product. However, it is possible to index new meta keys in order to use the index with custom content that generated custom meta.

Index Configuration File Locations

The index customization is accomplished by making changes to the custom index file. The location of this file is **/etc/netwitness/ng/index-<servicename>-custom.xml** , where **<servicename>** corresponds to the name of the product that you are customizing. For example, the Concentrator custom index file is /etc/netwitness/ng/index-concentrator-custom.xml.

Concentrator products also include a file that describes the default index configuration: **/etc/netwitness/ng/index-concentrator.xml** . This file is useful as a template to show how the custom index file is formatted.

If you make customizations to the index in the custom index file, those customizations override any conflict with the default index configuration.

You can make changes to the custom index file while the service is running. When the service receives an index save command, the changes to the custom index file are read and applied to the index.

Changes to the index can only be applied to new incoming data. Data cannot be retroactively reindexed with a new custom index configuration, except by Rebuilding the Index .

Index configuration entries

The custom index file is an XML document. The root element of this document is the `language` element, and inside there are elements for each meta key to describe each custom index. Each element of the custom index configuration looks like this:

```
<key name="did" description="Decoder Source" level="IndexValues" format="Text"
valueMax="100"  />
```

Definitions for each attribute in this element:

Attribute	Description
name	The name of the meta key that will be indexed
description	A human-readable description for the meta type
level	The type of index that will be created for this meta key
valueMax	The maximum unique values that will be stored for this key per slice
format	The format of the data held by all meta items with this meta key name

Attribute	Description
bucket	Enable size bucketing
ngrams	Enable ngram generation
threshold	Threshold for approximate value merging on ngram indexes
defaultAction	Default Navigate view action for this key: Open, Closed, Auto, Hidden

The next few sections examine these parameters in greater detail.

Meta names

The meta name used by the index refers to the meta key name present within every meta item in the meta database. These meta names are generated by the Decoders when parsing. Parsers can choose to generate meta with any meta key name. Therefore, the custom index allows you to choose which of the meta items generated by the Decoder are indexed.

Meta key names can be 16 characters long, and contain only letters or the '.' character.

Data Types

When the Decoder generates meta items, it assigns a data type. Each parser can choose the data type of the meta it generates. However, there are recommended and standard data types for each of the default meta keys. For example, ip.src and ip.dst are stored as the IPv4 meta type, and alias.host is stored as the Text meta type. Each parser must agree on the data format for each meta key generated by the Decoder.

When adding a custom index to the Concentrator, the data type of the custom index must match the format of the data generated by the Decoder. If the types do not match, the Concentrator attempts to convert the meta generated into the type specified for the custom index. However, these conversions sometimes fail, and the resulting index can produce undefined results.

Likewise, when many Decoders and Concentrators work together as part of a NetWitness installation, they must all agree on the types for each meta key. Conflicts of meta types between NetWitness NextGen services can lead to undefined behavior.

The following table shows the metadata types supported by the NetWitness NextGen services.

Type	Size in bytes	Description
Int8	1	Signed 8-bit integer
UInt8	1	Unsigned 8-bit integer
Int16	2	Signed 16-bit integer
UInt16	2	Unsigned 16-bit integer
Int32	4	Signed 32-bit integer
UInt32	4	Unsigned 32-bit integer
Int64	8	Signed 64-bit integer

Type	Size in bytes	Description
UInt64	8	Unsigned 64-bit integer
UInt128	16	Unsigned 128-bit integer
Float32	4	32-bit floating point number, single precision
Float64	8	64-bit floating point number, double precision
TimeT	8	Unix epoc timestamp
Binary	1-255	Arbitrary binary data
Text	1-255	UTF-8 Encoded text data
IPv4	4	IPv4 address bytes
IPv6	16	IPv6 address bytes
MAC	6	MAC Address bytes

When defining a custom index, it is important to use the best data type for the meta. For example, never store IP addresses as Text, since the Text representation takes more bytes than the IPv4 representation.

Index Levels

There are three levels, or types, of indexing: IndexNone, IndexKeys, and IndexValues.

IndexNone

This type of custom index is not really an index at all. Custom index entries with the IndexNone level exist only to define and document the meta key. IndexNone entries can be used in custom Decoder indices to enforce a specific data type for a meta key across all the parsers on a Decoder.

IndexKeys

This type of custom index indicates that the index only keeps track of sessions that contain meta items with this meta key name. However, it does not index any unique values in the meta database for the meta key.

Key-level indices take much less storage space, memory, and CPU time to manage, but they require a lot more work from the query engine when you perform query or values operations using them.

If used in a where clause, a meta key indexed at the key level can only be used to resolve operations such as exists or !exists.

IndexValues

This type of custom index keeps sessions that contain each individual unique value for the meta key. This type of index is also known as a "full index".

This type of index is needed for efficient processing of most where clauses, and for use of this meta key as the fieldName parameter of a values call.

Value Max

Value max is a parameter that can have a very significant impact on the accuracy and performance of a Value-level index.

As a Decoder parses packets or logs, it is allowed to create meta of any type with any value. Usually, these meta items are created from data copied directly out of the packet or log. Therefore, anyone can create unique meta values in response to nearly any event.

The performance of the index is directly dependent on the number of unique values it has found for each meta key. As the number of unique values increases, the rate at which new meta is indexed can decrease, and the speed with which queries are completed decreases. Since any person can influence the creation of unique meta values, it is possible for any person to affect the performance of the index.

The value max parameter limits the number of unique values that can enter the index. Therefore, a malicious user cannot flood the system with a large number of unique values in an attempt to make the NetWitness system not work.

It is important to set a value max on any meta key that may have its value influenced directly by incoming packets or logs.

The value max applies only to values added since the last index save operation.

The limit for how high value max can be set varies from version to version and on the amount of RAM available to the NetWitness NextGen service. As of 10.3, the recommended ceiling for value max is 5,000,000 for any meta key. If there are a lot of custom indices, then the value max may have to be lower.

maxLength

The max length parameter is used exclusively on the `word` meta type. The meaning of the `maxLength` parameter depends on whether the index is storing N-grams, as indicated by the `ngrams` parameter. The default and recommended value for `maxLength` is 5.

Max Length without N-Grams

If N-Gram support is turned off, then the `maxLength` parameter indicates that search terms need to be truncated so that they will match truncated values in the index and meta database. If this is the case, the `maxLength`**must** be less than or equal to the corresponding setting for **/decoder/parsers/config/token.max.length** on the Log Decoder service that is generating `word` token metas. The index will use the `maxLength` to properly interpret search terms fed into the `msearch` SDK function.

Max Length with N-Grams

If N-Gram support is turned on, by setting `ngrams="Edge"` or `ngrams="All"` , then the maxLength parameter controls the maximum length of N-Grams extracted from the meta item. In this scenario, the maxLength does not have to match the length of `word` meta items generated on the Log Decoder.

minLength

The minimum length parameter is used exclusively on the `word` meta type. It only has an effect when N-grams are generated. It indicates the smallest length N-gram that will be extracted from the `word` meta items. The default and recommended minimum N-Gram length is 3, which means that searches against the `word` index must have at least 3 characters.

ngrams

The `ngrams` parameter is used exclusively on the `word` meta type. N-gram indexes extract information that allow for fast lookup of searches that only match part of the word. For example they allow for finding 'ball' inside the word 'basketball'. If set to the value of `all` , then the index will create entries for all N-grams within the word meta values. The minimum value of N is specified by `minLength` , and the maximum value of N is specified by `maxLength` .

The `ngrams` parameter also supports the value `edge` , which indicates the index will only store N-grams that appear at the beginning of a word. Edge N-grams are useful for type-ahead search matching, and take less space than storing all N-grams. However they are not useful to locate matches inside the word or at the end of the word.

The `ngrams` parameter supports the `` `allvalue` `` value for the text format meta keys. It means that the index for a meta key will store `` `all` `` N-grams within the meta values and also `` `IndexValues` `` limited by ValueMax.

This index type enhances the search capability on overflowed index values due to Value Max limits. The N-grams index provides the ability to search any meta value and the Values index provides the ability to retrieve top N available values.

The `` `minLength` `` parameter specifies the minimum value of N, the `` `maxLength` `` parameter specifies the maximum value of N, and the `` `ValueMax` `` parameter specifies maximum unique values. The following are some guidelines to follow while using these parameters:

- It is recommended to set `minLength=3` and `maxLength=3` for compact index storage of N-grams and also use ValueMax to limit value index storage. When compared to Text format keys indexed by IndexValues and ValueMax=0 (unlimited) this N-gram index configuration provides better search functionality with compact index storage and memory usage.
- The `contains` operation in queries runs faster for meta keys indexed with this Ngram index type when compared to IndexValues.
- As the index type uses both N-grams and IndexValues for the same meta key, it increases the index memory and the index storage usage for the meta key and eventually reduces index retention. Hence it is recommended to choose this index type `only` for desired meta keys to consider storage and index retention.
- When you switch to this N-gram type and if the new behavior is required on the whole index, you must perform a re-index.

N-gram indexing has a major impact on the functionality of the text indexes. Using the N-gram settings of 'all' or 'allvalue' N-grams with maxLength 3, a meta key index will consume approximately 2 times more space than if N-grams were not enabled.

Note: Note: When you switch from ngrams 'allvalue' or 'all' to IndexValues, then you may need to consider re-index as index slices created before the configuration change would be ngram indexes and the values call would return ngrams.

N-gram indexing has a major impact on the functionality of the text indexes. Using the N-gram settings of `all` N-grams with maxLength 3, a meta key index will consume approximately 2 times more space than if N-grams were not enabled.

In the default index configuration, only the `word` meta key has N-gram indexing enabled. This meta key is used to index text tokens extracted from unparsed logs on the Log Decoder.

The N-gram index mode supports a 'threshold' tunable parameter that controls the precision of the index. The threshold is used to merge similar index values together depending on how closely the set of indexed sessions matches. Values greater than 0 and less than or equal to 1.0 are accepted. A value of 1.0 means that the index will only merge values if they were found in the same set of sessions. Higher values mean that the index will merge fewer values, at the expense of requiring more time to create the index during aggregation. Lower values mean the index will merge more values together, at the expense of longer search execution time due to more database access. The threshold parameter does **not** affect search accuracy.

Numeric Bucketing

Indexes on meta formats that are unsigned integers, specifically UInt32 and UInt64, can make use of size bucketing to improve performance.

Size bucketing rounds down the size values in the index to their nearest traditional byte unit of information. Enabling this option on a numeric index reduces the number of unique values to track in the index, which improves aggregation and query performance.

The bucketing option is enabled by the boolean parameter `bucket` on the key element. `bucket` may have the value `0` , for off or `1` for on. The default is `0` .

Examples of bucket number values:

Raw Value	Value Stored in Index	Explanation
0 - 1,023	0 - 1,023	Values 0-1023 are stored unmodified
1,024 - 1,048,575	1 KB, 2 KB, 3 KB ... 1,023 KB	Values under 1 MB are stored in 1 KB buckets
1,048,576 - 1,073,741,823	1 MB, 2 MB, 3 MB ... 1,023 MB	Values under 1 GB are stored in 1 MB buckets
1,073,741,824 - 1,099,511,627,775	1 GB, 2 GB, 3 GB ... 1,023 GB	Values under 1 TB are stored in 1 GB buckets

Key Value Aliases

Value aliases can be specified for keys. Value aliases are text representations that correspond to specific values for a key. These text representations may be easier to remember and more convenient to display. Aliases can be used in the rule/query language (see Queries) and are accessible via the SDK.

Value aliases are specified using the `aliases` and `alias` elements:

```
<key description="Service Type" format="UInt32" level="IndexValues"
```

```
name="service" valueMax="75" defaultAction="Open">
        <aliases>
                <alias format="$alias" value="0">OTHER</alias>
                <alias format="$alias" value="20">FTPD</alias>
                <alias format="$alias" value="21">FTP</alias>
                <alias format="$alias" value="22">SSH</alias>
                <alias format="$alias" value="23">TELNET</alias>
                <alias format="$alias" value="25">SMTP</alias>
                ⋮
        </aliases>
</key>
```

Key Renaming

The index language supports the concept of key renaming. This feature is used to provide backwards compatibility for new key names to deprecate and replace old key names. A renaming is achieved by adding `rename` elements to the key. This has the effect of indicating the parent key renames the key in the rename element. For example, the key definition below defines a new key named `port_src` that renames the key `tcp.srcport` .

```
<key name="port_src" description="Source Port" format="UInt16"
level="IndexValues">
        <rename name="tcp.srcport"/>
</key>
```

The rename element indicates to the database that uses of the parent key, in this case `port_src` , will include both meta items with type port_src and meta items with type tcp.srcport. Thus, new meta items can be added to the database and queried using `port_src` , and such queries will return information that was previously stored in tcp.srcport as well.

The rename element accepts a single attribute, `name` , that refers to a previously defined key.

Keys referred by rename elements must have the same type as the parent key.

Keys referred by rename elements must have the same index level as the parent key.

If a key is redefined in a custom index file, and the redefined key contains rename elements, then those rename elements replace any previously defined rename elements.

Note: Usage of renamed meta key pairs in the `select` clause cannot be combined with fixed-size result paging for a query. For more information, see the Queries topic.

Entities

The index configuration is used to define entities. Entities provide a convenient way to work with several meta keys at the same time. An entity definition is an alias that groups together the results from other meta keys. You can use an entity definition anywhere you would use a normal meta name. The primary use for entities is to organize similar meta types into a single, easier to use, meta type. For example, the default NextGen database language includes distinct meta types for IP source and IP destination. You could define an entity that represents the combined set of all IP sources and destinations using an `entity` element:

```
<entity name="ip.all" description="any ip entity">
       <keyref name="ip.src"/>
       <keyref name="ip.dst"/>
</entity>
```

The `entity` element accepts the following attributes:

Name	Description
name	(Required) The name of the entity
description	(Optional) A description of the entity
defaultAction	(Optional) Navigate view action for this entity: Open, Closed, Auto, Hidden

Entity definitions create new entries in the NextGen service language. Since they are returned in the SDK `language` call, they can be used by older client applications that are not directly aware of the concept of entities.

Each entity definition must contain one or more `keyref` elements. The keyref element only allows a single `name` attribute that must refer to a real meta `key` element defined somewhere else in the device's language. The `keyref` is also allowed to refer to meta types defined in the default language.

Meta entities can be utilized in application rules, but are not supported in network rules as meta available is too limited.

Entity Definition Rules

- All the keys referenced by an entity must have the same data type
- All the keys referenced by an entity must have the same index level
- An entity name cannot conflict with any existing meta type
- Keyrefs must refer to meta key names that are defined earlier in the index configuration

Entities in Brokers

Brokers will inherit entity definitions from up-stream devices, in the same way that meta key definitions are inherited. If the upstream devices attached to the broker do not all have the same set of entities defined, the Broker will log a warning. All upstream devices should have the same entity configuration. A broker operating with mismatched entity definitions may produce undefined behavior.

Rebuilding the Index

Under normal operation, changes made to the index configuration for a service are only applied to new data that enters the collection. Rebuilding the index over all the data in the collection is a time-consuming process because it requires all of the meta database storage to be read from disk.

In version 11.0 and later, it is possible to rebuild the index while the service is online. Version 11.0 services rebuild indexes in the background whenever the service detects that part of the session and meta databases is unindexed.

Activating the Background Reindexer

The background reindexer is activated whenever the service starts. During startup, the indexer checks for gaps between sessions that are indexed and sessions that are present in the session and meta database. If any gaps are found, the background reindexer begins reindexing the session and meta database on the service.

Examples of events that may activate the background reindexer:

1. A power failure or crash occurred, rendering the last slice of the index corrupt. The corrupt data is deleted at startup, leaving a gap in the index.
2. Index data is forcibly deleted, either by doing an index reset or deleting files from the filesystem.

Controlling the Background Reindexer

The operation of the background indexer is controlled by the configuration node `/index/config/reindex.enable`. If `reindex.enable` is set to true, the next time the service starts the reindexer will operate. If `reindex.enable` is set to false, the reindexer will not start the next time the service starts, but will continue to operate until the service is restarted.

Background Reindexing Algorithm

The operation of the background indexer is as follows:

1. The index examines the ranges of sessions that are present in the index and compares them to the ranges of sessions that have valid meta data. Any discrepancies between the two are considered gaps.
2. The gaps in the index are subdivided into slices based on the current value of `/index/config/save.session.count`.
3. For each slice that is missing, a temporary index is created in one of the directories specified by `/index/config/index.dir`. The slices are reindexed in reverse numerical order. Thus, the most recently collected sessions are indexed first.
4. Once the slice is completely reindexed, it is moved into its valid location in the online index. If the reindexed slice belongs on the warm tier, it is moved to the warm tier.
5. The newly indexed data appears as part of the collection.

Background indexer status

The stat node `/index/stats/updater.state` indicates the current state of the background reindexer. This node will say `running`, `not running`, or `failed`. If the status is `failed`, check the service log for more diagnostic information.

Effects on Aggregation

Services that perform aggregation utilize the index to keep track of sessions that have already been aggregated. If the index does not have enough information to begin aggregation, aggregation will be offline until enough slices have been reindexed. During this time the aggregation status for the upstream device will indicate that it is waiting on aggregation.

Forcing A Reindex

To force the index on a service to be rebuilt:

1. Ensure that `/index/config/reindex.enable` is true.
2. Reset the index by using the `reset` message on the service. For example: `/concentrator/reset index=1` will restart the service and delete all the index files.
3. Wait for the service to restart. Background reindexing will start.
4. The most recently collected data will be available for queries as soon as the index slice representing those sessions has been reindexed.

Optimization Techniques

This topic describes optimization techniques for the NetWitness Core database. The NetWitness Core database is set up to work with a wide variety of work loads by default. However, like any database technology, its performance can be very sensitive to both the nature of the data being ingested, and the nature of the searches that the user performs against the database.

Thresholds

Thresholds are a useful optimization that can have a dramatic effect on how fast results are returned to the NetWitness Platform Navigate view. Thresholds are applied to the `values` call. For more information about the `values` call, see Queries .

The threshold defines a limit to how much of the database is retrieved from disk in order to produce a count. For most queries, the number of sessions that match the `where` clause is very large. For example, selecting all the log events for just one hour running at 30,000 events per second matches 108,000,000 sessions.

NetWitness introduced the threshold feature based on the observation that most cases where a count of sessions is required do not have to have results that are accurate down to the very last session. For example, when looking at the top 20 IP addresses present over the past hour, it is not very important if the report indicates that an IP value matched 10,000,000 or 10,000,001 sessions exactly. The estimate is good enough. In these scenarios, we can make an estimate for the value of the count returned when our count exceeds the threshold parameter. When the threshold is reached, the remaining count is estimated, and the results are sorted based on the estimated counts, if necessary.

Complex `where` Clauses

The amount of time it takes for the NetWitness Core database to produce a result is dependent on the complexity of the query. Queries that align directly with the indexes present on the meta can be resolved quickly, but it is very easy to write queries that cannot be resolved quickly. Sometimes, queries that cannot be returned quickly can be processed by the Core database and the index differently to produce much more satisfying results for the customer.

It is useful to know the relative *cost* of each part of the `where` clause. A clause with a high cost takes longer to execute. In the following table, the query operations are ordered in terms of their relative cost, from lowest to highest.

Operation	Cost
exists, !exists	Constant
= , !=	Logarithmic in terms of the number of unique values for the meta key, linear in terms of the number of unique elements that match a range expression
< , > , <= , >=	Logarithmic in terms of unique value lookup, but more likely to be linear since the expression matches a large range of values
`begins` , `ends` , `contains`	Linear in terms of the number of unique values for the meta key

Operation	Cost
regex	Linear in terms of the number of unique values for the meta key with a high per-value cost

AND and OR

When constructing a where clause, keep in mind that constructing many terms using the AND operator can have a beneficial affect on the performance of a query. Any time that multiple criteria can be used to filter down the set of sessions matching the where clause, there is less work for the query to do. Likewise, each OR clause creates a larger set of sessions to process for each query.

As a general rule of thumb, the more AND clauses in the query, the faster it completes, but the more OR clauses in the query, the slower it completes.

Use Case: Match a Large Subnet

It is common for users to construct queries that attempt to include or exclude a large subnet. This type of query is common because the users are trying to include or exclude some large portion of their internal network from their investigation.

Starting with NetWitness 11.4, all /8, /16, and /24 IPv4 subnets get their own index entries. So, no special action is needed to help optimize these queries.

For versions of NetWitness 11.3 and earlier, it is slower for the query engine to resolve this query using the ip.src or ip.dst indices alone. The issue arises from the fact that a where clause such as this:

```
ip.src = 10.0.0.0/23
```

Actually must be interpreted as:

```
ip.src = 10.0.0.0 || ip.src = 10.0.0.1 || ip.src = 10.0.0.2 || ... || ip.src =
10.0.1.255
```

Thus, the index could have to create a where clause with 512 terms.

The solution to this problem is to use the Decoder to tag common networks of interest using application rules. For example, you could create meta items with an application rule that looks like this:

```
name=internal rule="ip.src = 10.0.0.0/23" order=3 alert=network
```

This rule creates meta items in the meta key network with the value internal for any IP address in the 10.0.0.0/23 network.

The where clause could be expressed as:

```
network = "internal"
```

Assuming there is a value-level index on the network meta data, the index does not have to expand this query into anything more complex, and the sessions matching the desired subnet are matched very quickly.

Use Case: Substring Matching

Using the operators `begins` , `ends` , `contains` , and `regex` in a `where` clause can be very slow if there are a large number of unique values for the meta key. Each of these operators is evaluated independently against each unique value. For example, if the operator is `regex` , the `regex` must be run independently against each unique value.

To work around this, the most effective strategy is to reorganize the meta items such that the user does not have to use a substring match.

For example, consider if the users are attempting to find the host name within a URL somewhere in the session. The users might write a `where` clause such as:

```
url contains 'www.rsa.com'
```

In this scenario, it is likely that the `url` meta key contains one unique value for every session that was captured by the Decoder, and therefore has a huge number of unique values. In this case, the contains operation is slow.

The best approach is to identify the part of meta data they are attempting to match, and move the matching into the content parser.

For example, if there is meta data being generated for each URL, a parser could also break down the URL into its constituent components. For example, if the Decoder generates URL meta data with the value `http://www.rsa.com/netwitness` , it could also generate `alias.host` meta data with the value `www.rsa.com` . Queries could be performed using:

```
alias.host = 'www.rsa.com'
```

Since the substring operator is no longer needed, the query is much faster.

Index Saves

The Core index is subdivided by save points, also known as slices. When the index is saved, all the data in the index is flushed to disk, and that portion of the index is marked as read-only. Saves serve two functions:

- Each save point represents a place where the index could be recovered in the case of a power failure.
- Periodically saving can ensure that the portion of the index that is actively being updated does not grow larger than RAM.

Save points have the effect of partitioning the index into independent, non-overlapping segments. When a query must cross over multiple save points, it must re-execute parts of the query and merge the results together. This ultimately makes the query take longer to complete.

By default, for installations of versions 10.5 and later, a save is performed on the Core index every time 600,000,000 sessions are added to the database. This interval is set by the index configuration parameter `save.session.count` . For more information, see Index Configuration Nodes .

Older versions of NetWitness Platform, or systems that have been upgraded from versions prior to 10.5, use a time-based save schedule that saves the index every 8 hours. You can see the current save interval by using the scheduler editor in the NetWitness Admin UI for the service. The default entry looks like this:

```
hours=8 pathname=/index msg=save
```

By adjusting the interval, you can control how often saves are created.

Affects of Increasing the Save Interval

By increasing the save interval, save points are created less frequently, and therefore fewer save points exist. This has a positive effect on query performance, because it becomes less likely that queries traverse slices, and when slices do have to be traversed, there are not as many to traverse.

There are downsides to increasing the save interval though. First, the Concentrator is more likely to hit the `valueMax` limit set on any of the indices. Second, the recovery time in the event of a forced shutdown or power failure is increased. And third, the aggregation rate may suffer if the index slice grows too large to fit in memory.

Affects of Decreasing the Save Interval

By decreasing the save interval, it is possible to avoid hitting the `valueMax` limits while maintaining a full value index for meta data that contains a large number of unique values. Decreasing the save interval does have a detrimental impact on query performance, since more slices are created.

Working with `valueMax`

The `valueMax` limitation can be frustrating to customers who want to index all possible unique meta. Unfortunately that is not possible in the general case. Meta keys exist that can have arbitrary random data from anywhere on the Internet, and all unique values cannot be indexed.

However, it is possible to work around some of the limitations of `valueMax` by using key level indices instead of value indices. Key level indices are not influenced by `valueMax` .

It is possible to use the Navigate view on a meta key indexed at the key level. The database uses value level indices in the `where` clause where possible, but meta database scanning is used to resolve unique values for the `values` call. This approach works well when the `where` clause provides an effective filter to limit search scope to a small number of sessions, perhaps less than 10,000 sessions.

In cases where the `valueMax` is reached, the users can perform a database scan on their queries to ensure no relevant values were dropped. This feature is accessible in the Investigator 9.8 client via the right-click menu on the Navigation view. Although the meta database scan takes a long time, it reassures the customer that they are not missing anything in their reports.

Parallelize Workloads

When the customer is using a lot of reports, ensure that they are making full use of the parallel executing options within Reporting Engine. Likewise, ensure that the number of `max.concurrent.queries` is appropriate for the hardware.

The NetWitness Platform Navigate view has the ability to run the components of its output in parallel, which can have a significant impact on the perceived performance of the NetWitness Core service.

Index Rebuild

In rare cases, a Core service might benefit from an index rebuild. Examples:

- The NetWitness Core service has index slices created by a very old version of the product and has not rolled out any data in more than six months.
- The index was configured incorrectly, and the customer wants to re-index all meta with a new index configuration.
- The traffic load into the Core service was very light, and the save interval was large, causing more slices than needed to be generated.

In these cases, an index rebuild may provide performance improvements. To do so, you must send the message `reset` with the parameter `index=1` to the `/decoder` folder on a Decoder, the `/concentrator` folder on a Concentrator, or the `/archiver` folder on an Archiver.

Be aware that a full reindex takes days to complete on a fully loaded Concentrator, and possibly weeks on a full Archiver.

Scaling Retention

There are several ways to improve the retention of the NetWitness Core database. Retention refers to the period of time that is covered by data stored in the database.

The first step in analyzing retention is to determine which part of the database is the limiting factor in terms of retention. The packet, meta, and session databases provide the `packet.oldest.file.time` , `meta.oldest.file.time` , and `session.oldest.file.time` stats in the `/database/stats` folder to show the age of the oldest file in the database. The index provides the `/index/stats/time.begin` stat to show the oldest session time stored in the index.

Increasing Packet and Meta Retention

The primary mechanism for increasing retention on these databases is adding more storage. If adding more storage to the NetWitness Core service is not possible, then it may be necessary to use the compression options on the packet and meta database to reduce the amount of data each database writes.

If meta retention is a concern, you may want to remove unneeded content from the Decoder generating meta. Many parsers generate meta that the customer does not need to store long term.

Increasing Index Retention

Usually the index has longer retention than the databases, but with a complex custom index the index retention may be shorter. Usually the easiest course of action is to remove unneeded value-level indices from the custom config, or perhaps override some of the default value-level indices with key-level indices.

It is also possible to scale the index by adding additional index storage. However, the index storage should be extended using solid-state drives only.

Scaling Horizontally

Starting in version 10.3, Concentrators and Archivers have the ability to be clustered using group aggregation. Group aggregation allows a single Decoder to feed sessions to multiple Concentrators or Archivers in a load-balanced manner. Group aggregation enables the query and aggregation workload to be split among an arbitrarily large pool of hardware.

For more information, see the "Group Aggregation" topic in the *Deployment Guide* .

Grouping Workloads

The NetWitness Core database works much better when all the users of the system are working within the same region of the database. Since the database is fed data from the Decoder with a first-in-first-out scheme, data in the database typically is clustered together according to the time it was captured and stored. Therefore, the database works better when all users are working on the same time period of data.

It is not always possible for all users to be working on the same time period simultaneously. The NetWitness Core database can handle that use case, but it is slow to do so because it must alternate between having different periods of time in RAM. It is not possible to have all of the time periods in RAM at the same time. Typically less than 1 percent of the database and less than 10 percent of the index fits in RAM.

To make NetWitness Platform work for the customer, it is important to get the customer to organize their users into groups that tend to work on the same time ranges. For example, users who do daily monitoring over the most recent data may be one user group. Perhaps there is another user group that does queries further back in time as part of an investigation. And perhaps another set of users do reports over large periods of time. Attempting to serve all the groups from a single database can lead to frustration and long wait times for results to be produced. However, if the different use cases can be spread to different Concentrator hardware, the perceived performance can be much better. In this case, it may be beneficial to utilize more Concentrator services with less RAM and CPU power rather than a single large and expensive Concentrator intended to meet all needs.

Cache Window

Consider this sequence of events:

1. At 9:00 a.m., user "kevin" logs in to a Concentrator and requests a report on the last one hour of collection time.
2. The Concentrator retrieves reports for the time range 8:00 a.m. to 9:00 a.m.
3. At 9:02 a.m., user "scott" logs in to the same Concentrator and also requests a report on the last one hour of collection time.
4. The Concentrator retrieves reports for the time range 8:02 a.m. to 9:02 a.m.

Notice that even though both users were looking at time ranges that were close together, the work done by the Concentrator to produce reports for Kevin could not be re-sent to Scott, since the time ranges are slightly different. The Concentrator had to re-calculate most of the reports for Scott.

The setting `cache.window.minutes` on the `/sdk` node allows you to optimize this situation. When a user logs in, the point in time representing the most recent data for the collection only moves forward in increments of the the number of minutes in this setting.

For example, assume the `/sdk/config/cache.window.minutes` is 10\. Re-evaluating the above action changes the sequence of events.

1. At 9:00 a.m., user "kevin" logs in to a Concentrator and requests a report on the last one hour of collection time.
2. The Concentrator retrieves reports for the time range 8:00 a.m. to 9:00 a.m.
3. At 9:02 a.m., user "scott" logs in to the same Concentrator and also requests a report on the last one hour of collection time.
4. The Concentrator retrieves reports for the time range 8:00 a.m. to 9:00 a.m.
5. At 9:10 a.m., user "scott" re-loads the reports for the last one hour of collection time.
6. The Concentrator retrieves reports for the time range 8:10 a.m. to 9:10 a.m.

The report returned in step 3 falls in the cache window, so it is returned instantaneously. This gives Scott the impression that the Concentrator is very fast.

Thus, larger `cache.window` settings improve perceived performance, at the cost of introducing small delays until the latest data is available to search.

Time Limits

When a query is running on the NetWitness Core database for a very long time, the Core service dedicates more and more CPU time and RAM to that query in order to get it to complete faster. This can have a detrimental impact on other queries and aggregation. In order to prevent lower privileged users from using more than their share of the Core service resources, it is a good idea to put time limits on the queries run by normal users.

Query Priority

Some calls in `/sdk` support a `queryPriority` parameter. This parameter is used when the query execution pool is full and other queries are waiting to be executed. Those waiting queries are executed as resources become available and in the order of their priority. The `queryPriority` parameter uses the same scale as the Linux `nice` command. When the `queryPriority` parameter is passed to a query on a downstream device (ie. Broker, Concentrator), it is passed along with other parameters to the upstream devices (ie. Decoder, Log Decoder).

If this parameter is not passed, the calls will default to the current user's `query.priority` setting. See Per-User Configuration Nodes .

This parameter can be used on the following calls: `language` , `msearch` , `packets` , `query` , `timeline` and `values` .

All queries and rule conditions in NetWitness Core services must follow these guidelines:

All string literals, value aliases, and time stamps must be quoted. Do not quote numbers, MAC, or IP addresses.

- `extension = 'torrent'`
- `time='2015-jan-01 00:00:00'`
- `service=80`
- `ip.src = 192.168.0.1`

The space on the right and the left of an operator is optional. For example, you can use `service=80` or `service = 80`.

Rule Examples

The following table shows examples of rule conditions. You can use rule conditions for log retention collections in an Archiver and for application, network, and correlation rules on a Decoder, Log Decoder, or Concentrator. Rule conditions are also used in all `WHERE` clauses in all Core database queries.

For detailed information on rule syntax in NetWitness Platform, see **WHERE Clauses** in the Queries .

Rule Name	Condition
ComplianceDevices	`device.group='PCI Devices' || device.group='HIPPA Devices'`
HighValueWindows	`device.group='Windows Compliance'`
MediumValueWindows	`device.type='winevent_nic' && msg.id='security_4624_security'`
LowValueWinLogs	`device.type='winevent_nic' && msg.id='security_4648_security'`
LowValueProxyLogs	`device.class='proxy' && msg.id='antivirus_license_expired'`
GeneralWindows	`device.type='winevent_nic'`

Correcting invalid rules

Since version 11.0, NetWitness Platform has been using a parser for rules and queries that strictly defines valid syntax. When a Core service encounters invalid syntax, it writes a warning in the NetWitness Platform logs indicating the error.

NetWitness Platform 11.0 and later do not support parsing of legacy syntax rules (as Security Analytics 10.6 did).

After you update to NetWitness Platform 11.0 (or later), rules with invalid syntax are highlighted in the user interface. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. See "Fix Rules with Invalid Syntax" in the *Decoder and Log Decoder Configuration Guide* .

The `/decoder/config/rules/rule.errors` and `/concentrator/config/rules/rule.errors` stats, introduced in 10.6, contain the count of rules with errors. If `rule.errors` is nonzero, NetWitness Platform generates a Health and Wellness alert to indicate that you need to fix the rules.

Valid Syntax with the Modern Parser

- All text types must quote literal values. Example: `username = 'user1'`
- Quotes can use single or double quotes; but they must match. (You cannot start with a single quote and finish with a double quote.)
- If the literal value has a quote, you can escape it (using a backslash) or use a different starting quote character. Both of the following examples are valid: `username = "User's"`, `username = 'User\'s'`

The following are valid syntax rules using the modern parser:

- To use a backslash in a literal string, escape it using an extra backslash: `\\`
- All time types should use quotes for dates in this form: `time = 'YYYY-MM-DD HH:MM:SS'`
- All time types that are the number of seconds since EPOCH (Jan 1, 1970), should not be quoted. Example: `time = 1448034064`
- **Everything** else is unquoted: IP addresses, MAC addresses, numerics, and so on. Example: `service = 80 && ip.src = 192.168.1.1/16`

Appendix A: Statistics

This topic describes statistics used to monitor system operation. The Core services provide a very large number of statistics for monitoring the operation of the system. Some of them are useful for monitoring performance, while some of them exist for monitoring the operation of the system or for debugging purposes.

Statistics in /database/stats

The following table shows the meaning of the statistics in **/database/stats** .

Statistic	Meaning
`meta.bytes` , `packet.bytes` , `session.bytes`	The total size of data (in bytes) stored in each database
`meta.first.id` , `packet.first.id` , `session.first.id`	The first meta ID, packet ID, and session ID, respectively, stored in the database
`meta.last.id` , `packet.last.id` , `session.last.id`	The last meta ID, packet ID, and session ID, respectively, stored in the database
`meta.oldest.file.time` , `packet.oldest.file.time` , `session.oldest.file.time`	The creation date of the oldest file in each database
`meta.rate` , `packet.rate` , `session.rate`	The count of the number of meta, packet, and session objects added to each database over the last second
`meta.total` , `packet.total` , `session.total`	The total number of meta, packet, and session objects within each database
`meta.volume.bytes` , `packet.volume.bytes` , `session.volume.bytes`	The approximate total volume size (in bytes) for all directories used by each database
`meta.free.space` , `packet.free.space` , `session.free.space`	The approximate total unused space (in bytes) across all directories used by each database

Statistics in /index/stats

The following table shows the meaning of the statistics in **/index/stats** .

Statistic	Meaning
`checkpoint.page` , `checkpoint.summary`	The last objects stored the last time an index save was created (debugging)

Statistic	Meaning
index.bytes	An approximate measure of how much disk space is required by index files
index.last.load.time	The timestamp when the current index configuration was loaded from the index configuration files
memory.used	An approximate measure of how much memory is occupied by the index
page.first.id, summary.first.id	The first page and summary object stored in the index (debugging)
page.last.id, summary.last.id	The last page and summary object stored in the index (debugging)
page.total, summary.total	Number of pages and summaries in the index (debugging)
session.first.id	The ID of the first session indexed
session.last.id	The ID of the last session indexed
sessions.since.save	The number of sessions currently held by the current index slice
values.added	The number of unique values added to the current index slice
slices.total	The number of slices in the index
time.begin	The oldest time meta indexed
time.end	The most recent time meta indexed
updater.state	The status of background reindexer

Statistics in /sdk/stats

The following table shows the meaning of the statistics in **/sdk/stats**

Statistic	Meaning
cache.window.time.begin	The beginning of the current time enforced by cache.window.minutes
cache.window.time.end	The end of the current time enforced by cache.window.minutes
queries.active	The number of queries currently executing in the index
queries.queued	The number of queries waiting for execution
values.calls	The number of calls made to the "values" function since the process was started

Statistic	Meaning
values.calls.cached	The number of calls made to the "values" function that were resolved by the values call result cache

Per-query Statistics

SDK operations, such as query and values, provide information about their execution status in /sdk/config/stats/queries/<handleid> , where <handleid> is a unique identifier for the query operation.

The following table shows the meaning of per-query statistics.

Statistic	Meaning
channel.path	This stat provides a link to the connection channel over which the operation is communicating. This channel is used to communicate results back to the client.
query.type	The type of operation being performed, such as queries or values
query	The complete set of parameters given to the query
query.progress	The percentage of the query execution that has completed
query.status	A message describing what stage of the query execution is currently occurring
running.since	The time at which the query began execution
user	The user name that executed the query

Appendix B: Index Inspect

The NetWitness Core database index has a built-in debugging feature called `inspect` that provides detailed information about the composition of its indexes. The index inspect feature is located at `/index/inspect` in every Core service configuration tree. Services that do not actually have an index, like Broker, do not have the `/index/inspect` feature.

Parameters

Options

Type: String This parameter may be set to the value `all-slices` to collect inspect information about every slice in the index. If it is not set, information on the current, most recently created slice is returned.

Collecting information on all slices may take a very long time to complete if there are many index slices.

Response

Inspect returns many rows of key value pairs that represent the state of the index.

Slice Summary

The first row returned for every slice is a summary with the following values.

`session1`	The first session ID indexed in the slice
`session2`	The last session ID indexed in the slice
`meta1`	The first meta ID in the first session indexed in the slice
`meta2`	The last meta ID in the last session indexed in the slice

Per-Index Summary

There will be per-index summary rows returned for each index. Only value-level indexes are reported.

`key`	The meta key name for the index
`pathname`	The path on disk to this index
`values`	The number of unique values stored in this index
`summaries`	The number of summary entries occupied by this index in the summary.db file
`pages`	The number of page entries occupied by this index in the page.db file
`sessions`	The number of sessions that had a value that was inserted into this index
`size`	The cumulative "size" meta values for all sessions that inserted a value into this index

`packets`	The cumulative count of packets for all sessions that inserted a value into this index
`summary1`	The first summary ID used by this index
`summary2`	The last summary ID used by this index
`session1`	The first session ID referenced by this index
`session2`	The last session ID referenced by this index

Slice Summary Footer

The last row in each inspect report contains cumulative statistics for all the indexes in the slice.

`totalKeys`	The number of indexed meta types
`totalValues`	The number of unique values tracked by all indices in this slice
`totalMemory`	An approximate total of the memory needed to open this index slice

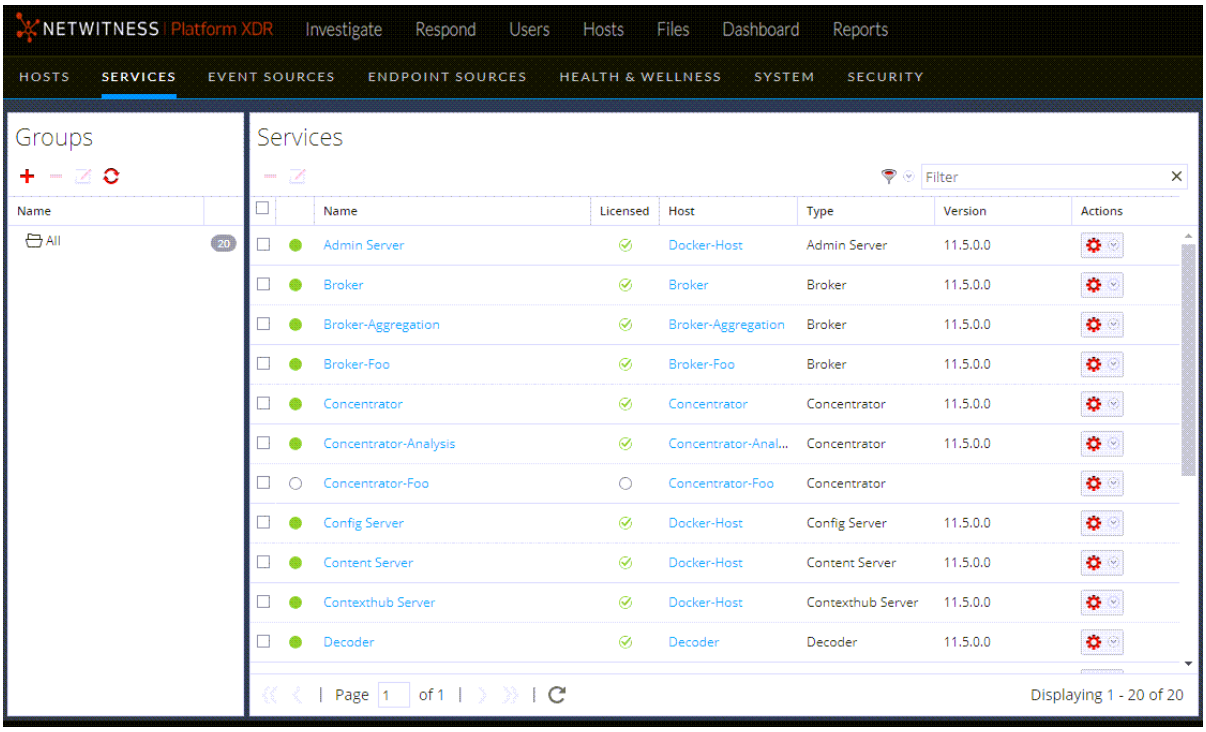
Decoder and Log Decoder Quick Setup

A basic NetWitness network includes at minimum Brokers, Concentrators, and Decoders. Brokers aggregate data from Concentrators, and Concentrators consume data from at least one Network Decoder or Log Decoder. The basic network may include both types of Decoders. Network Decoders are usually referred to as Decoders, and they capture network data in packet form. Log Decoders capture log data as events.

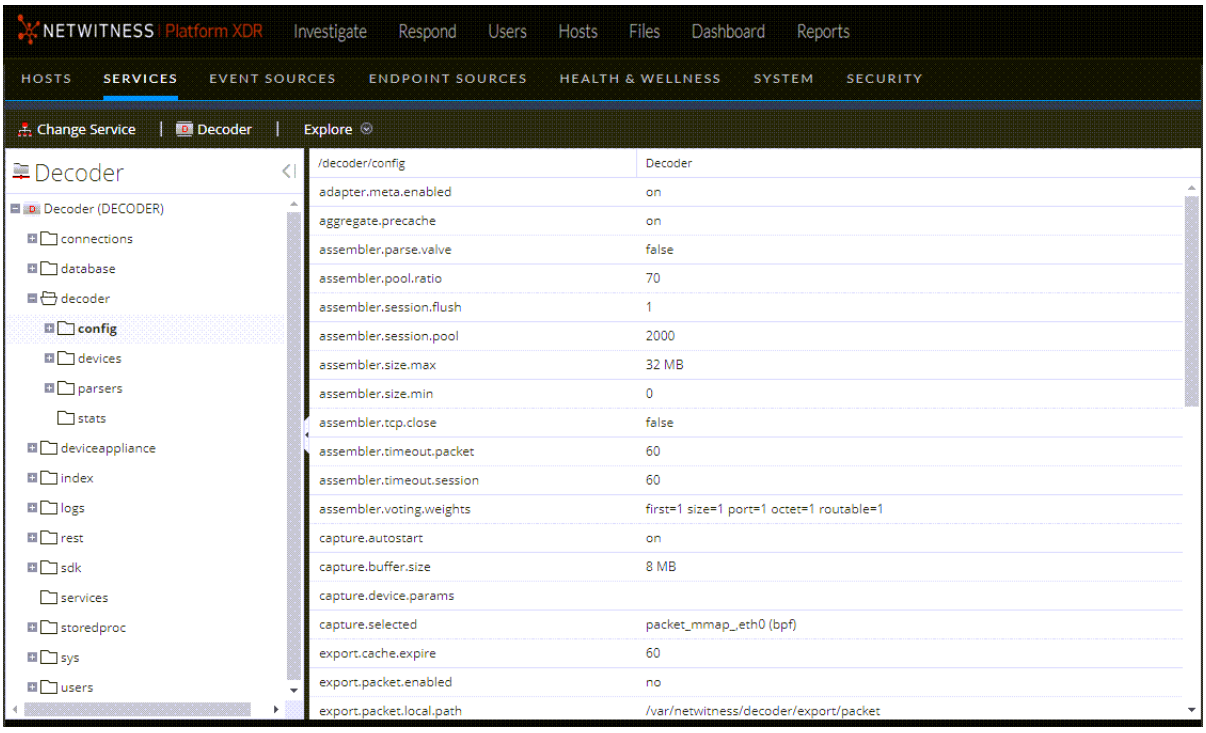
Adding a Decoder makes it visible and available for use with NetWitness Administration, Live Services, and Investigate. To add a service in NetWitness, you select the service type, provide service connection information, and validate that the service can be reached. The *Hosts and Services Getting Started Guide* provides the information you need to understand and install all NetWitness services.

After the services are added, you need to configure each service. This is the preferred order for configuring your system:



1. Decoders
2. Log Decoders
3. Concentrators (refer to the *Broker and Concentrator Configuration Guide*)
4. Brokers (refer to the *Broker and Concentrator Configuration Guide*)

Note: A Log Decoder is a special type of Decoder, which is configured and managed in a similar way to a Decoder. Most of the information in this guide refers to both types of Decoders. "Decoder" refers to both types of Decoders. Information that applies exclusively to Network Decoders or Log Decoders is clearly identified.

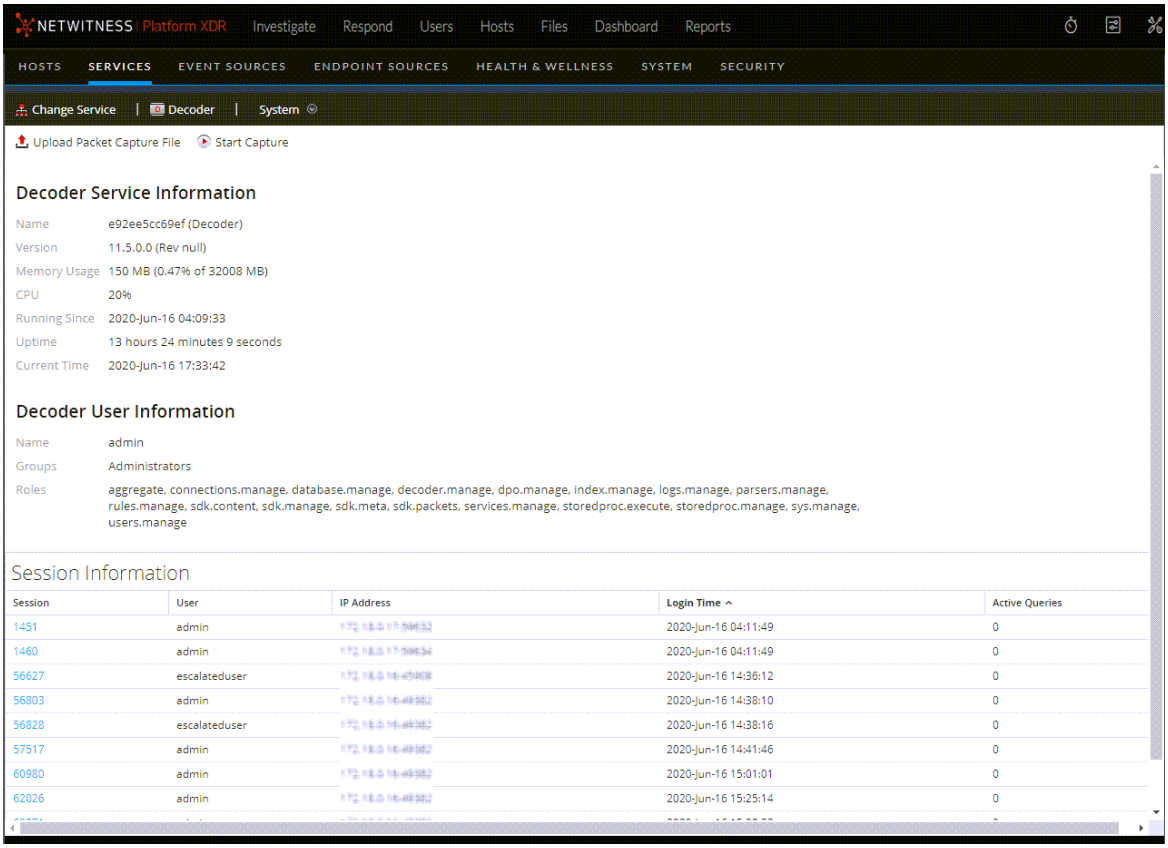


Basic configuration of the Decoder involves selecting a network adapter interface and starting data capture.

In addition, you can configure each Decoder to control the type of traffic captured using rules, feeds, and parsers. Advanced configuration tasks enable additional features that are relevant to specific applications. For example, configure a 10G Decoder, create custom meta keys, or decrypt incoming packets.

The easiest way to configure all of the required Decoder and Log Decoder settings is to use the options in the NetWitness user interface. For the most part, configuration is performed in the Administration Services view ( (Admin) > Services).

Administrators who feel comfortable working outside of the user interface can configure the basic parameters as well as advanced settings by editing database nodes in the Decoder node tree using the Services Explore view.



Perform Initial Quick Setup

This procedure accomplishes the initial, basic configuration of a Decoder, and starts data capture. When the basic setup is complete, the Decoder begins capturing data for the Concentrator to consume.

To configure a Decoder and start capturing data:

1. Assign a network interface for capturing data. For details, see "Select a Network Adapter" in Configure Capture Settings.
2. Do one of the following:
   a. To start capture, select the Decoder and  **> View > System**. In the toolbar click .

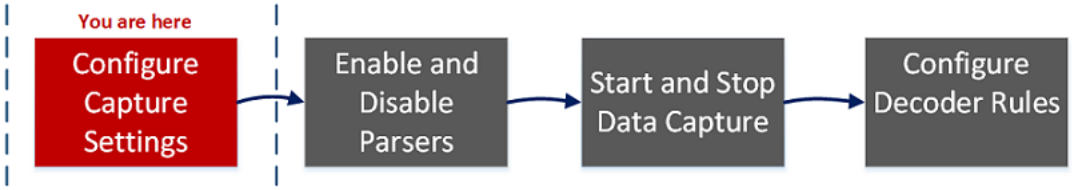
   b. To enable Capture Autostart, see "Configure a Decoder to Begin Capturing Data Automatically" in Configure Capture Settings.
   The Decoder begins capturing data for consumption by a Concentrator. For additional configuration options, refer to Configure Common Settings on a Decoder Configure Common Settings on a Decoder and or Decoder and Log Decoder Additional Procedures

Configure Common Settings on a Decoder

This section introduces commonly used configuration settings on a Decoder with procedures and background information. After you have completed Decoder and Log Decoder Quick Setup, you can refine your configuration by using parsers, feeds, and rules to limit the captured data.

Note: A Log Decoder is a special type of Decoder, which is configured and managed in a similar way to a Decoder. Most of the information in this guide refers to both types of Decoders. "Decoder" refers to both types of Decoders. Information that applies exclusively to Network Decoders or Log Decoders is clearly identified.

The following workflow illustrates commonly used settings and breaks the configuration process into four steps.



Configuration Step	Description
Configure Capture Settings	When initially setting up the Decoder, configuring the network adapter interface is required. Additional optional capture settings are available; one that is frequently used is Capture Autostart.
Enable and Disable Parsers and Log Parsers	View the parsers that have been downloaded and deployed from Live, and manage which ones are enabled or disabled.
Start and Stop Data Capture	When a Decoder starts up, it automatically begins aggregating data if Capture Autostart is enabled. When autostart is not enabled, you can start and stop data capture manually.

Configuration Step	Description
Configure Decoder Rules	Capture rules can add alerts or contextual information to sessions or logs. They can also define which data a Decoder or Log Decoder filters out. By default, no capture rules are defined when you first configure NetWitness. Unless rules are specified and the rules are valid, the packets are not filtered. You can deploy the latest rules from Live as described in the *Live Services Management Guide*. You can define capture rules at any time, and you can fix rules that use invalid syntax (Fix Rules with Invalid Syntax).

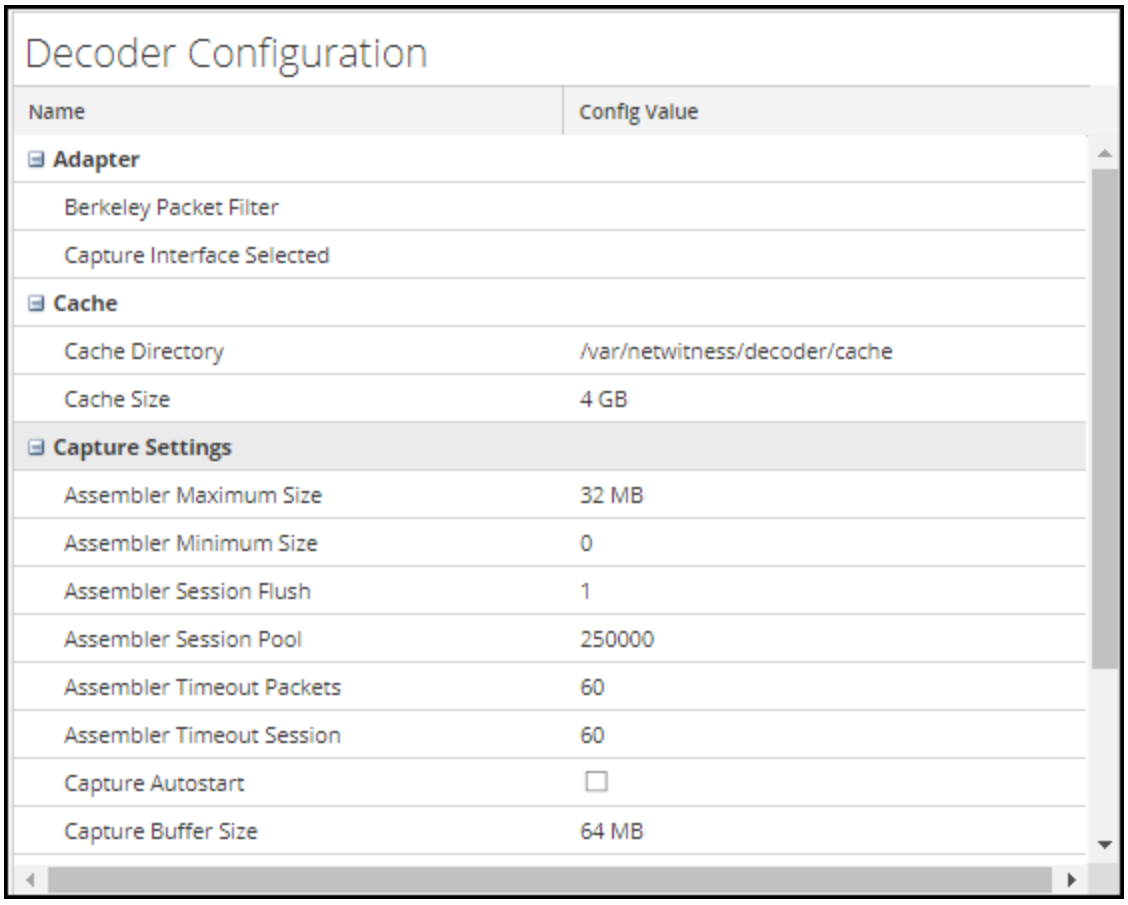
Configure Capture Settings

When initially setting up the Decoder, configuring the network adapter interface is required. Additional optional capture settings are available; two that are frequently used are the Berkeley Packet Filter, and Capture Autostart.

Besides the basic network adapter interface setup, you may decide to use one of the special-purpose configurations described in (Optional) Preserve VLAN Tags When Using the Packet MMAP Capture Interface or (Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces

The rest of the capture settings have default values chosen to be effective in most cases (see a detailed list in Services Config View - General Tab). You can adjust these in some circumstances, for example, if Customer Support advises a change. You can edit the capture settings at any time.

Select a Network Adapter

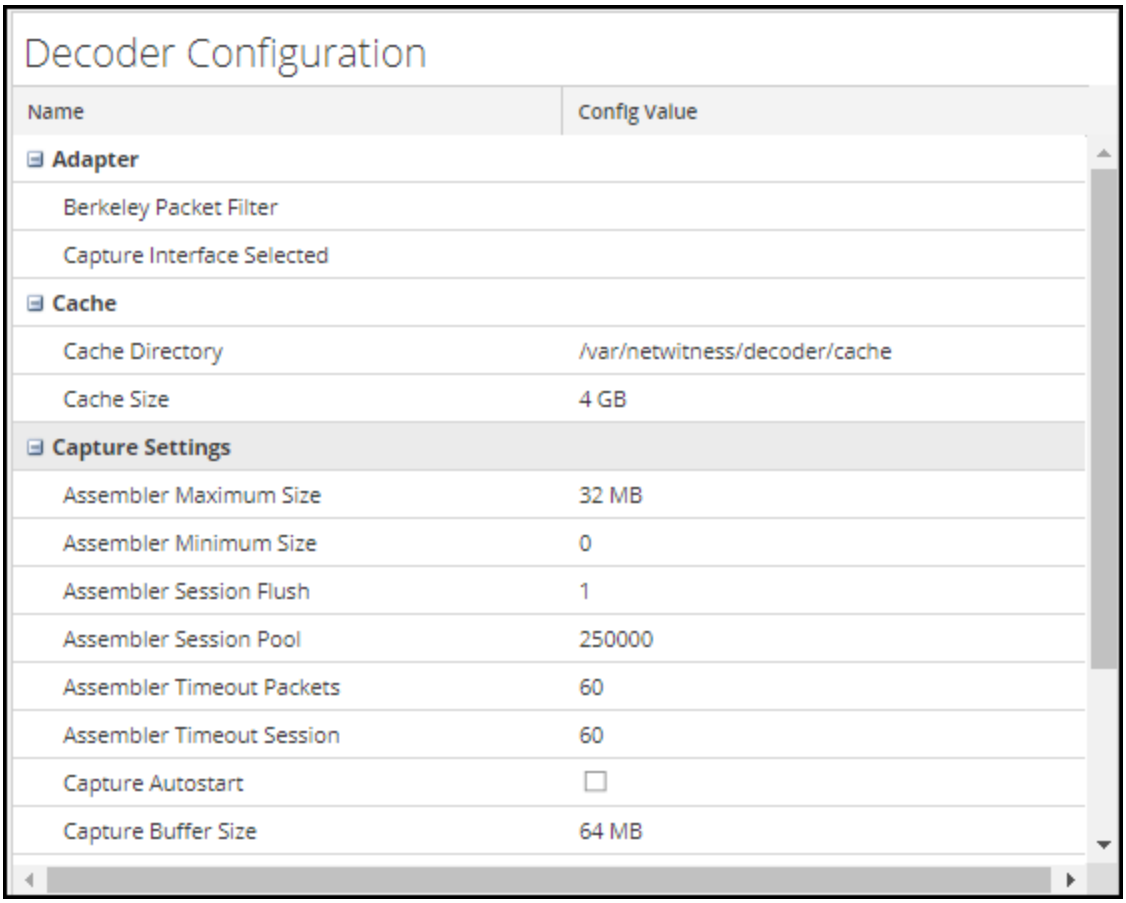


The table below describes the Network Adapter settings for a Decoder. The system administrator sets the default network adapters when the Decoder is installed. Consult your System Administrator for more information.

Adapter Parameter	Description
Berkeley Packet Filter	Berkeley Packet Filters (BPF) are applied to the packet stream before the packets are copied to the Decoder adapter for analysis. This allows unwanted traffic to be efficiently discarded. However, any packets discarded are not accounted for in any Decoder statistics (capture rate, packets dropped, and packets filtered and total packets).

Adapter Parameter	Description
Capture Interface Selected	Select an adapter through which the Decoder captures packets. For the lower speed internal capture interface, use the `packet_mmap_,7,eth1` adapter, which corresponds to the monitor port located on the motherboard. There are six additional capture ports: • `packet_mmap_,1,lo (bpf)` • `packet_mmap_,2,eth2 (bpf)` • `packet_mmap_,3,eth3 (bpf)` • `packet_mmap_,4,eth4 (bpf)` • `packet_mmap_,5,eth5 (bpf)` • `packet_mmap_,8,ALL (bpf)` There are three wireless capture services available: • `packet_netmon_ (Microsoft Netmon)` • `packet_mac80211_ (Linux mac80211)` • `packet_airport_ (Mac OS X AirPort)`
Capture Interface Selected for Log Decoder	The following capture service is available: • `log_events,Log Events`

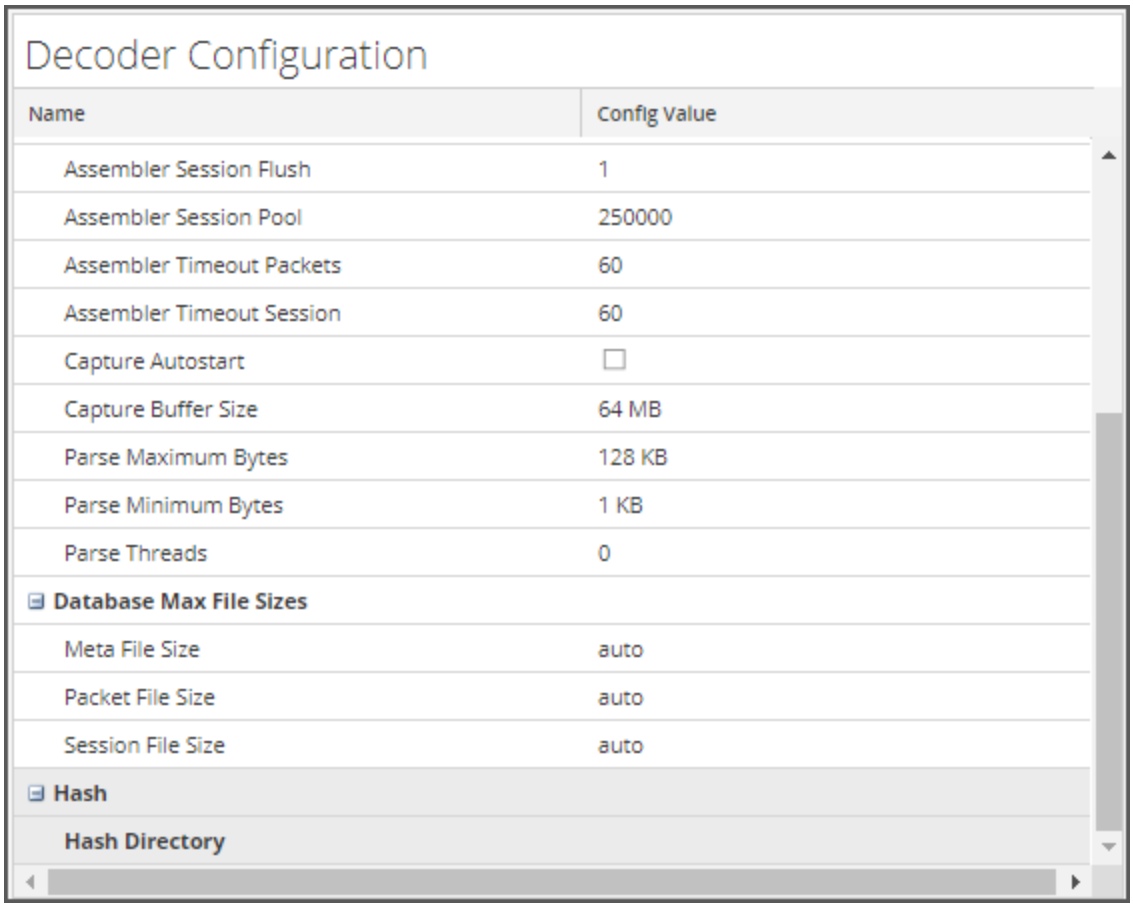
To configure the network adapter on a Decoder:



1. Go to  (Admin) **> Services**.
2. In the **Administration Services view**, select the Decoder and  **> View > Config.**
   The Services Config view is displayed with the General tab open.

3. In the **Capture Interface Selected** field, select the network adapter that best suits the Decoder.
4. To save the changes, click **Apply.**
5. If necessary to put the changes into effect, navigate back up to the **Administration Services view**, select the Decoder, and select > **Restart**.

Configure a Decoder to Begin Capturing Data Automatically



1. Go to (Admin) **> Services**.
2. In the **Administration Services view**, select the Decoder and **> View > Config.**
   The Services Config view is displayed with the General tab open.

3. Under **Capture Settings**, select the **Capture Autostart** checkbox.
4. To save the changes, click **Apply.**
5. If necessary to put the changes into effect, navigate back up to the **Administration Services view**, select the Decoder, and select > **Restart**.

Configure Optional Capture Settings

1. Go to (Admin) > **Services**.
2. In the **Administration Services view**, select the Decoder and > **View** > **Config**.
   The Services Config view is displayed with the General tab open.

3. If you want to apply a system-level filter to the packet stream before the packets are copied to the Decoder adapter for analysis, configure the Berkeley Packet Filter as described in (Optional) Configure System-Level (BPF) Packet Filtering.
4. In the **Capture Settings** sections, review the default values. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change. See Services Config View - General Tab for an explanation of these settings.
5. In the **Database Max File Sizes** section, review the default values. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change. See Services Config View - General Tab for an explanation of these settings.
6. In the **Hash** section, define a directory for hash files if you are using this feature. See Services Config View - General Tab for an explanation of these settings.

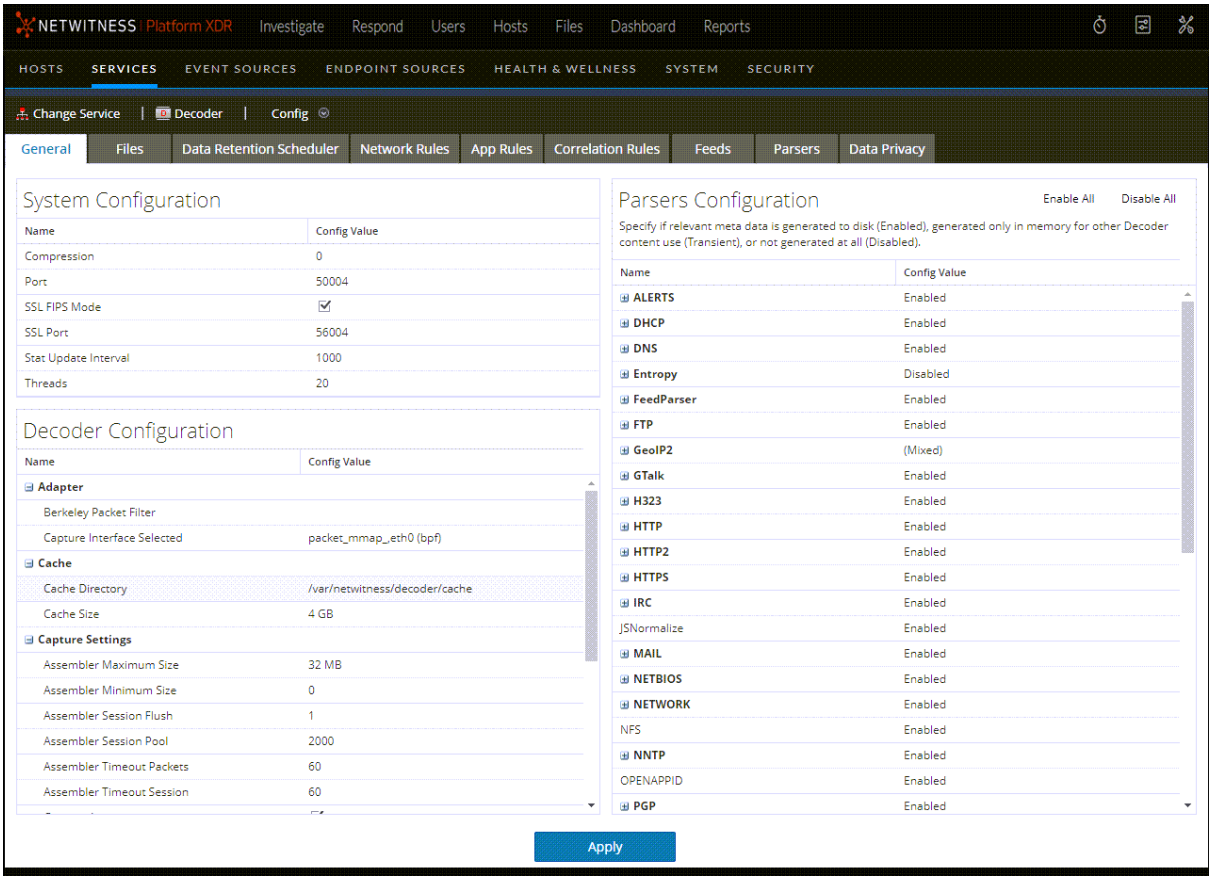
(Optional) Configure System-Level (BPF) Packet Filtering

You can use Berkeley Packet Filters to control which packets and logs are processed by a Decoder.

Berkeley Packet Filters (BPF) are applied to the packet stream before the packets are copied to the Decoder adapter for analysis. This allows unwanted traffic to be efficiently discarded. These discarded packets are not accounted for in any Decoder statistics (capture rate, packets dropped, and packets filtered and total packets).

The Decoder also supports system-level packet filtering defined using `tcpdump/libpcap` syntax. Specifying a `Libpcap` filter can efficiently reduce packet volume based on Layer 2 - Layer 4 attributes. A `Libpcap` filter is appropriate for use when a Decoder is receiving a traffic volume that is placing a load against the physical resources of the platform. In this scenario, the Decoder may consistently drop packets and have a large number of capture pages available(`/decoder/stats/capture.pagefree` is high).
The following is an example of a `libpcap` filter to keep only packets that do not have both source and destination addresses in the 10.21.0.0/16 subnet.

```
not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)
```



For a full reference of the `Libpcap` filter syntax, see the main pages for:

- tcpdump (http://www.tcpdump.org/tcpdump_man.html).
- pcap-filter (http://www.unix.com/man-page/FreeBSD/7/pcap-filter/).

To add a system-level Berkeley Packet Filter:

1. Go to  (Admin) **> Services.**

2. In the Administration Services view, select a Decoder service and  **> View > Config.**
   The Services Config view is displayed with the General tab open.

3. In the **Decoder Configuration Section**, under **Adapter**, click in the field next to **Berkeley Packet Filter**.
4. Type only one filter in the field. If you want to filter multiple items, join multiple expressions using `and`. Several examples are provided below.
   The user interface validates input at the time you enter your filter string.
5. To save the filter, click **Apply**.
   If the syntax is correct, a confirmation message is displayed.
   If the syntax is incorrect, a **Packet filter is not valid** message is displayed and a corresponding log message will follow in the log messages on the Decoder:
   ```
   164474800 2020-May-01 19:03:08 warning Decoder Failed to parse filter 'example_badrule': syntax error
   ```
6. To activate the filter, you must stop and start capture on the Decoder:
   a. Change the **Config** view to the **System** view.
   b. Click **Stop Capture**.
   c. Click **Start Capture**.
      The active filter will be displayed in the Decoder logs.

Examples

These are several filter examples:

- Drop packets to or from any address in the 10.21.0.0/16 subnet:
  `not (net 10.21.0.0/16)`
- Drop packets that have both source and destination addresses in the 10.21.0.0/16 subnet:
  `not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)`
- Drop packets that are from 10.21.1.2 or are headed to 10.21.1.3.
  `not (src host 10.21.1.2 or dst host 10.21.1.3)`
- Combine both IP and HOST:
  `not (host 192.168.1.10) and not (host api.wxbug.net)`
- Drop all port 53 traffic, both TCP & UDP:
  `not (port 53)`
- Drop only UDP port 53 traffic:
  `not (udp port 53)`
- Drop all IP protocol 50 (IPSEC) traffic:
  `not (ip proto 50)`
- Drop all traffic on TCP ports 133 through 135.
  `not (tcp portrange 133-135)`

The following filters combine some of the above to demonstrate how to put multiple directives into one filter:

- Drop any port 53(DNS) traffic sourced from 10.21.1.2 or destined to 10.21.1.3.
  `not (port 53) and not (src host 10.21.1.2 or dst host 10.21.1.3)`
- Drop any traffic using IP proto 50 or port 53 or any traffic from net 10.21.0.0/16 destined to net 10.21.0.0/16
  `not (ip proto 50 or port 53) or not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)`

Caution: The use of parentheses can have a large and potentially disruptive effect on the use of Packet Filters. As a best practice, keep "not" operations outside of parentheses and always test your rules before deploying them. Failure to properly format your rules (despite input validation) can cause a packet filter to drop ALL traffic or behave in other unexpected ways. This is due to the way packet `Libpcap` filters work and is not the result of any logic within NetWitness software.

Testing

BPF filters can and should be tested using either `tcpdump` or `windump` to ensure that they will provide the expected behavior before implementing them. This example shows a test of a filter using windump:

```
windump -nni 2 not (port 53 or port 443) or not (ip proto 50)
```

Conversions

If for the sake of performance, you have decided that an existing network rule filter would be better running as a System-Level Packet Filter, you can convert it. There are a few things to remember when doing conversions.

- `&&` becomes `and`
- `alias.ip` becomes `host` if a single host or `net` if a network.
- `ip.src` becomes `src host` if a single host or `src net` if a network.
- `ip.dst` becomes `dst host` if a single host or `dst net` if a network.
- Use CIDR notation when listing a network (that is, 10.10.10.0/24).
- `||` becomes `or`
- `!` becomes `not`
- Multiple rules must be joined with `and`.

The manual for TCPDump also gives examples of filters and strings that can be used: http://www.tcpdump.org/tcpdump_man.html

Additionally, the following site provides an excellent reference for BPF-style packet filters: http://biot.com/capstats/bpf.html

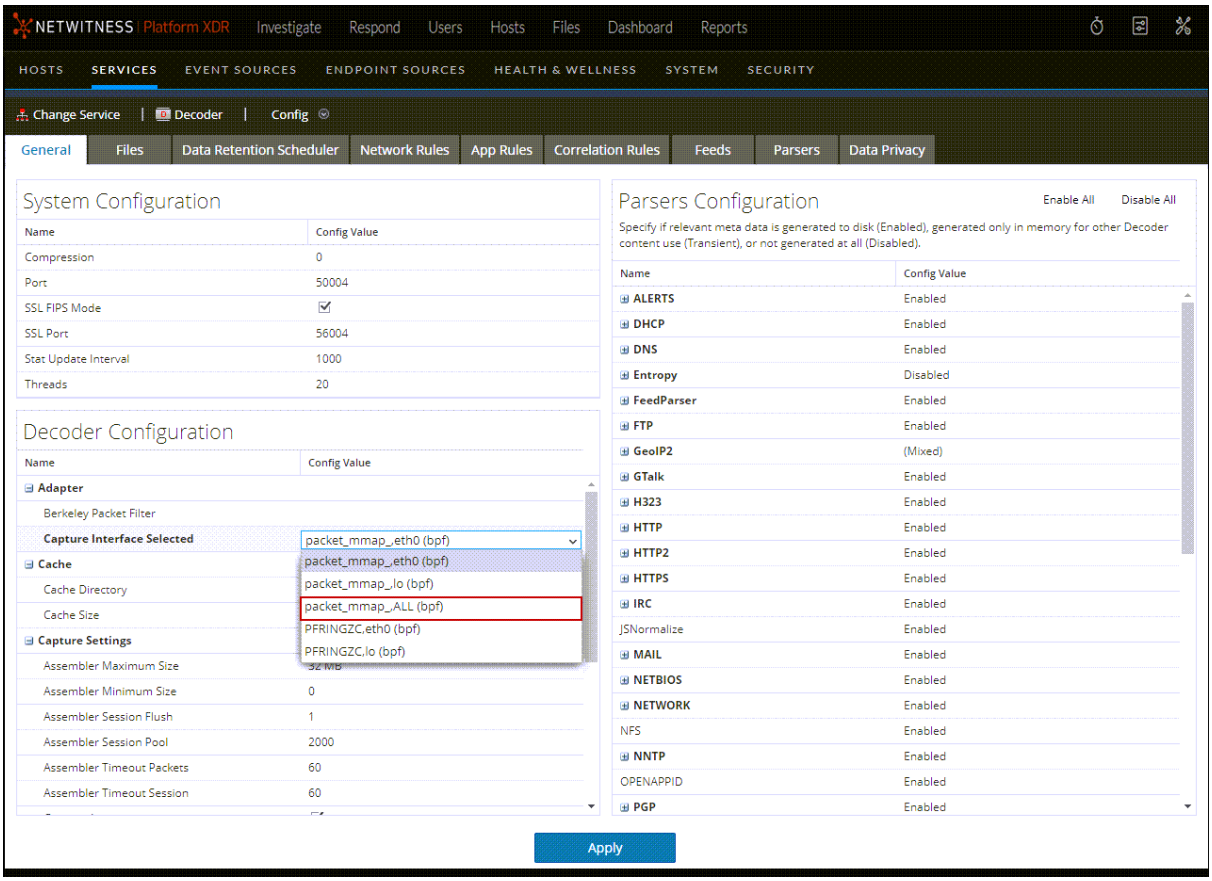
Caution: If you are capturing `vlan` tagged packets, above standard bpf filter may not work. For example, if you use `not (udp port 123)` to filter `vlan` tagged NTP traffic on udp port 123, it will not work. This is because the bpf filter machinery is simple and does not account for protocols not referenced in the rule. So the OS executing the bpf filter will look for the `udp port` values at the byte offset they would occur in a standard Ethernet/udp packet; but the optional `vlan` tag fields in the Ethernet header pushes those values by 4 bytes, thus the bpf filter rule will fail. To fix it, you need to change the bpf filter to: `not (vlan and udp port 123)`.

(Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces

The `packet_mmap_,ALL` adapter is capable of capturing across all types of network interfaces at the same time. For example, this can include things like physical network interfaces over different media types and tunnel interfaces.

The default behavior of the `ALL` adapter is to capture from all interfaces from the system, except for the hard-coded defaults of `lo`, `eth0`, and `em1`.

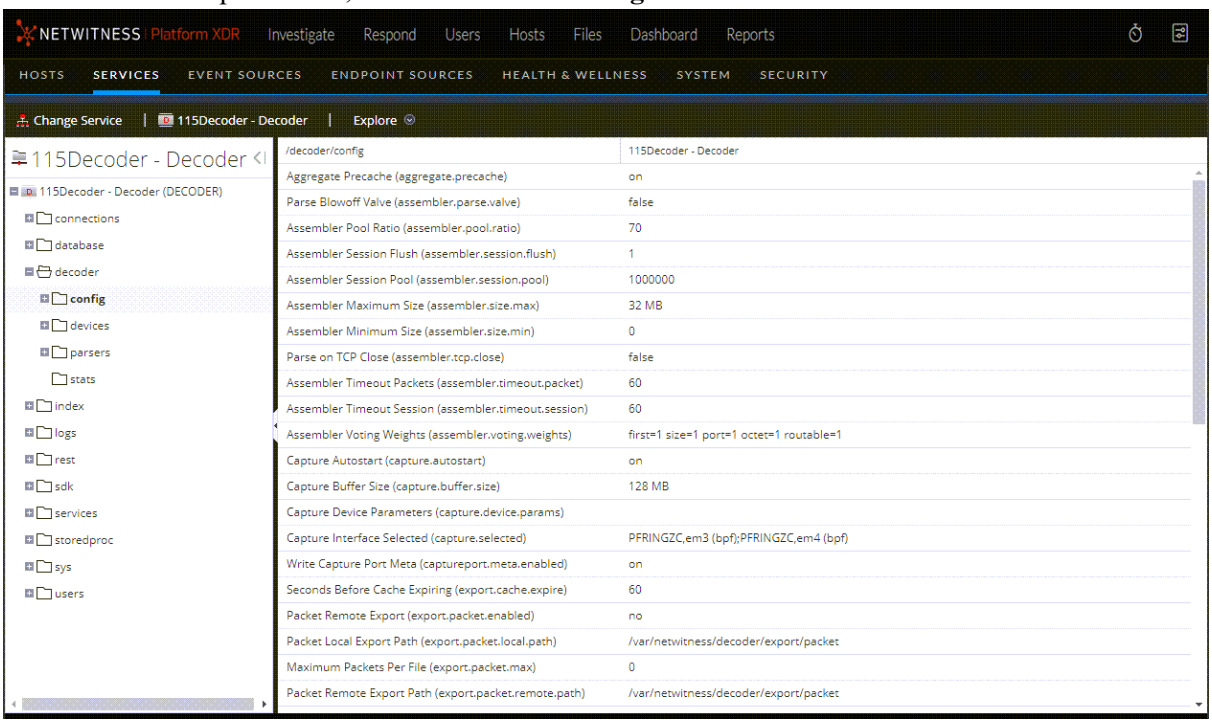
You can select any subset of the capture interfaces by editing the Decoder configuration node `/decoder/config/capture.device.params` to include an `interfaces=` parameter. The `interfaces` parameter contains a comma-separate list of interfaces that are used for capture. Instead of using all interfaces for capture, only the specified interfaces are used.



For example, if you want to force capture on interfaces `em1`, `em2`, and `em4`, and ignore `em3`, you can select the `packet_mmap_,ALL` adapter, and then add this line to `capture.device.params`: `interfaces=em1,em2,em4`

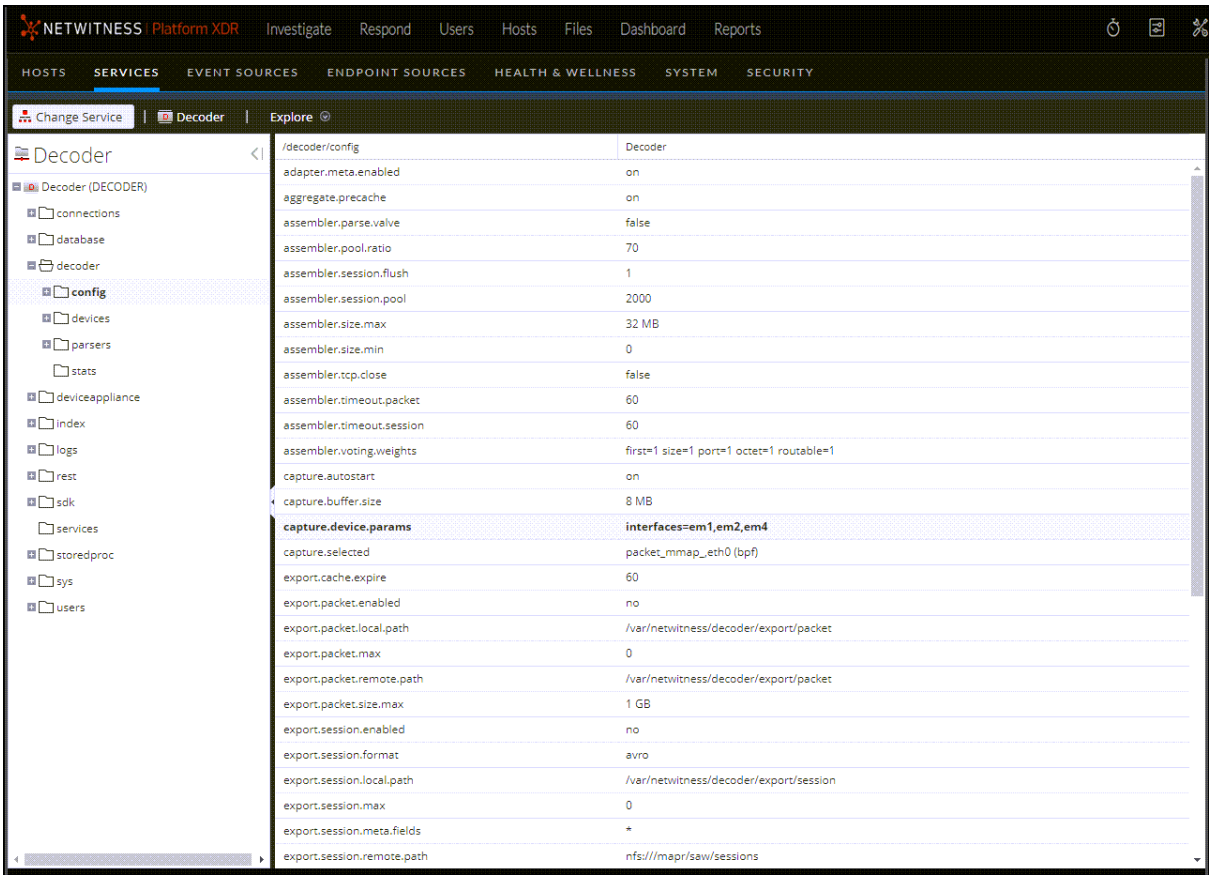
Note: Decoder automatically performs decapsulation of Virtual Extensible LAN (VXLAN) protocol from network traffic on UDP-4789 so that parsing can take place on the decapsulated Ethernet frames. During the decapsulation, the VXLAN ID is extracted and stored in the VXLAN meta key. By default, the VXLAN ID extraction is enabled. To disable, navigate to the `VlanGre` parser in the Parser Configuration settings. Click the drop-down list for `vlan` in the **Config Value** column and select **Disabled**. Each parser is configurable in the Services Config View - General Tab. The Parser Configuration panel provides a way to enable or disable parsers to use on Decoders in addition to limiting the metadata that the parser creates.

Note: Using the `interfaces` parameter to select `eth0`, `lo`, or `em1` overrides the default behavior, which is to drop traffic from those ports.



To configure the `packet_mmap_,ALL` adapter to capture from specific interfaces instead of all interfaces:

1. Go to (Admin) > **Services**, select the Decoder service and > **View > Config.**
2. In the **Services Config view**, set **Capture Interface Selected** to `packet_mmap_,ALL` adapter.



3. Click **Apply**, and then restart the Decoder service.

4. Go to (Admin) > **Services**, select the Decoder service, and click > **Config** > **Explore**.
5. In the Services Explore view, select **decoder** > **config**.

6. Click in the values column next to `capture.device.params`, type **`interfaces=em1,em2,em4`**, and press **Enter**.

The change goes into effect immediately; only traffic on `em1`, `em2`, and `em4` interfaces is captured.

(Optional) Configure Meta-Only Decoders

You can configure Decoders so that packets and logs can be processed, and then dropped before they are written to disk. This is called a Meta-Only Decoder, which uses the Meta-Only license, and can save storage space (however, analysts cannot reconstruct events in Investigate if you use this option). The configuration option `/decoder/config/packet.write.disabled` controls this feature. If this option is set to `true`, all packets are dropped after parsing, so they are never written to the database. This applies to both Log and Network Decoders. The ingested logs and packets flow through the system normally so that parsing and other operations are not impacted. The default setting is `false`, which preserves the normal behavior of writing packets to disk.

Note: You must purchase the Meta-Only license before you can realize the full benefit of using this option. For information about purchasing licenses, see the *Licensing Management Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

To configure a Meta-Only Decoder where packets and logs are parsed and not written to disk:

1. Go to  (Admin) > **Services** and select a Decoder.
2. Click  > **View** > **Explore**, and in the left panel, expand **decoder** and click **config**.
3. In the right pane, go to `packet.write.disabled`, and change the value from `false` to `true`.

Note: You can make this configuration update while capture is running, but the update does not take affect until capture is restarted.

For an example of how to use the Meta-Only license to apply centrally-managed capture policies across your Network Decoders, see (Optional) Configure Selective Network Data Collection

(Optional) Configure Selective Network Data Collection

Selective network data collection gives administrators the ability to apply centrally managed capture policies across their Network Decoders. This results in better use of service resources, including hard drive space, which leads to more predictable costs and lessens the burden of managing multiple services. Administrators can determine which traffic is stored and how it is stored by using policies. Each policy contains a list of supported base protocols and definitions for handling any other protocols that are detected.

Note: Administrators can use this feature to create policies for metadata-only while using the cost-effective Meta-Only license, without having to pay for additional storage or throughput licensing. To use this license, work with your NetWitness Customer Support Representative to purchase the license, and then enable the functionality as described in (Optional) Configure Meta-Only Decoders.

The administrator can choose to deploy predefined policies that capture:

- All base and other protocols (Full Capture - All Protocols)
- Only metadata on all base and other protocols (Capture Meta Only - All Protocols)
- Only metadata on all base protocols and drop all other protocols (Capture Meta on Base Protocols, Drop all other protocols)
- All base protocols and only metadata on all other protocols (Full Capture on Base Protocols, Meta only on all other protocols)

The predefined policies are not configurable. The only way you can edit predefined policies is by assigning services (such as Decoders) to deploy them.

Administrators can create custom policies to give further control over the deployment. A base set of protocols are available for alterations by the administrator, allowing you to choose what level of capture you prefer on a per-protocol basis. If you are only making slight changes, a good start for customization is to clone one of the predefined polices and alter it. These centrally-managed policies are then applied to services (Network Decoders) to allow handling multiple use cases across your environment.

Here are some example use cases and how an administrator would deploy these.

Use Case 1: Predefined Policy for Internal Assets

To gain further visibility into internal lateral traffic going East-West through the environment, a Network Decoder is deployed in the interior of the network to capture this traffic. Applying full packet capture for this segment may generate too much data to manage at a reasonable cost point. Instead, the predefined "Capture Meta Only – All Protocols" policy can be applied to achieve the same parsing and detection while only saving the metadata, limiting the amount of storage required of the solution. In this situation, the only steps you must complete is to choose the predefined policy, edit it, and then enable it by assigning it to the appropriate internal services (Decoders). For an example of how to set up this policy, see Use Predefined Policies.

Use Case 2: Custom Policy for DMZ Assets

To protect the public-facing web servers, a Network Decoder is deployed into the demilitarized zone (DMZ). The network communications between these web servers and other network devices are a subset of the base protocols. To make sure you can harvest forensic evidence for any communications related to these high-value assets, you would want to do full packet capture on HTTP, SMTP, FTP, and DNS protocols. You still want visibility into any other traffic these servers are engaged in, so you would prefer metadata generated for all other protocols. The suggested steps to create this custom policy would have you choose the predefined policy "Full Capture on Base Protocols, Meta only on all other protocols" and then clone it to adjust it to the protocols aligned with the DMZ scenario. During the clone process, the name and description can be updated to identify the new purpose of the policy. The define policy step allows all the base protocol rules inside the policy except HTTP, SMTP, FTP, and DNS to be altered from "Collect All" to "Collect Meta Only" to achieve the desired policy. The last steps are assigning the policy to the appropriate DMZ services (Decoders). For an example of how to set up this policy, see Create New Policies from Predefined Ones.

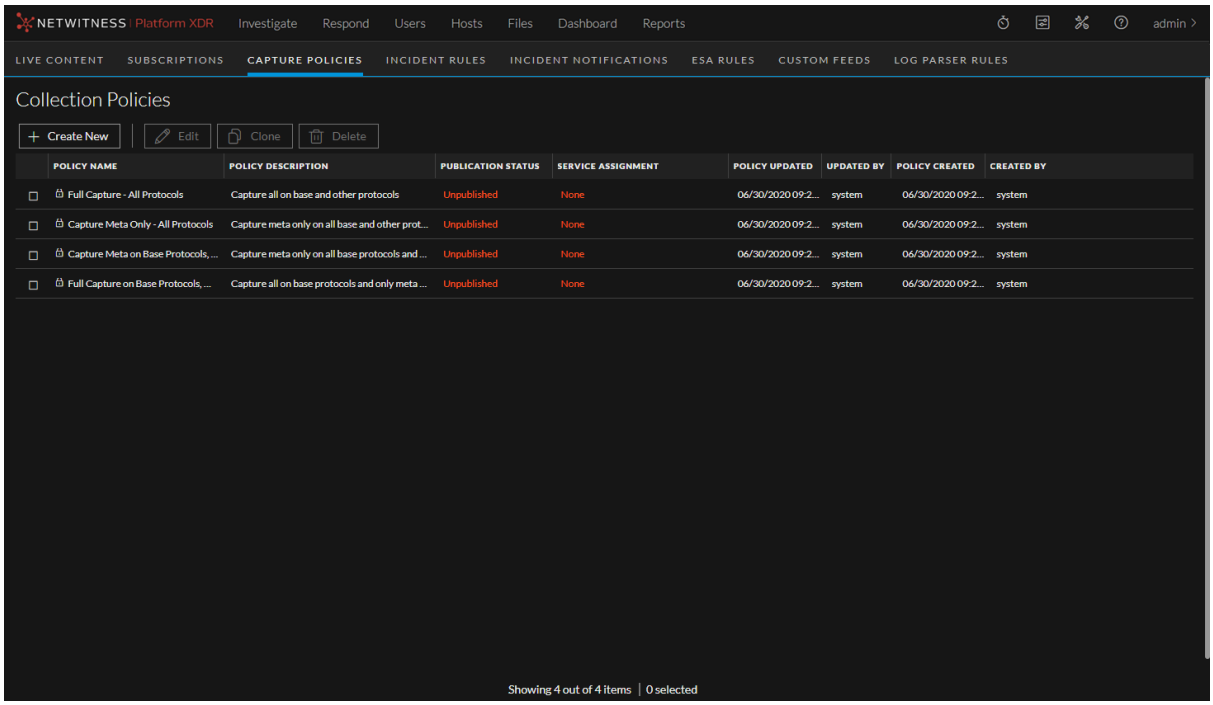
Note: When a Decoder is being managed by a selective collection policy, it is possible that the Decoder specifications in the policy could be overwritten if the Decoder configuration is edited outside of the policy. To try and avoid this situation, the following warning message is displayed at the top of the Parsers section of the Decoder Configuration page: `This Decoder is being managed by the following capture policy: <policy-name>. Some parsers are required by the capture policy, and changes made here may overwrite that policy. Review of the capture policy is recommended.`
Another warning message is displayed at the top of the Application Rule section: `This Decoder is being managed by the following capture policy: <policy-name>. Some application rules are required by the capture policy, and changes made here may overwrite that policy. Review of the capture policy is recommended.`

The following sections describe configuring and using selective network data collection.

- Use Predefined Policies
- Create New Policies from Predefined Ones
- Create Custom Policies
- Unpublish Policies
- Delete Policies
- Supported Protocols for Selective Network Data Collection

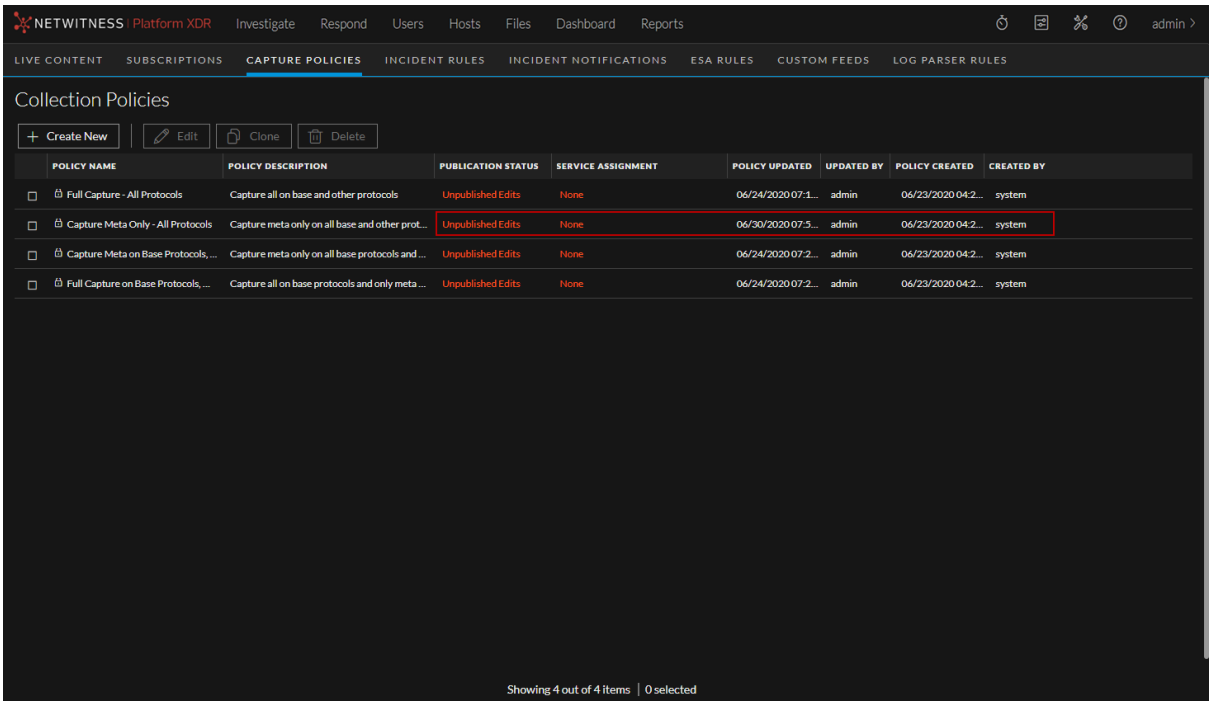
For detailed information about the Selective Collection user interface, see:

- Services Config View - Capture Policies Tab
- Services Config View - Edit Capture Policies Wizard



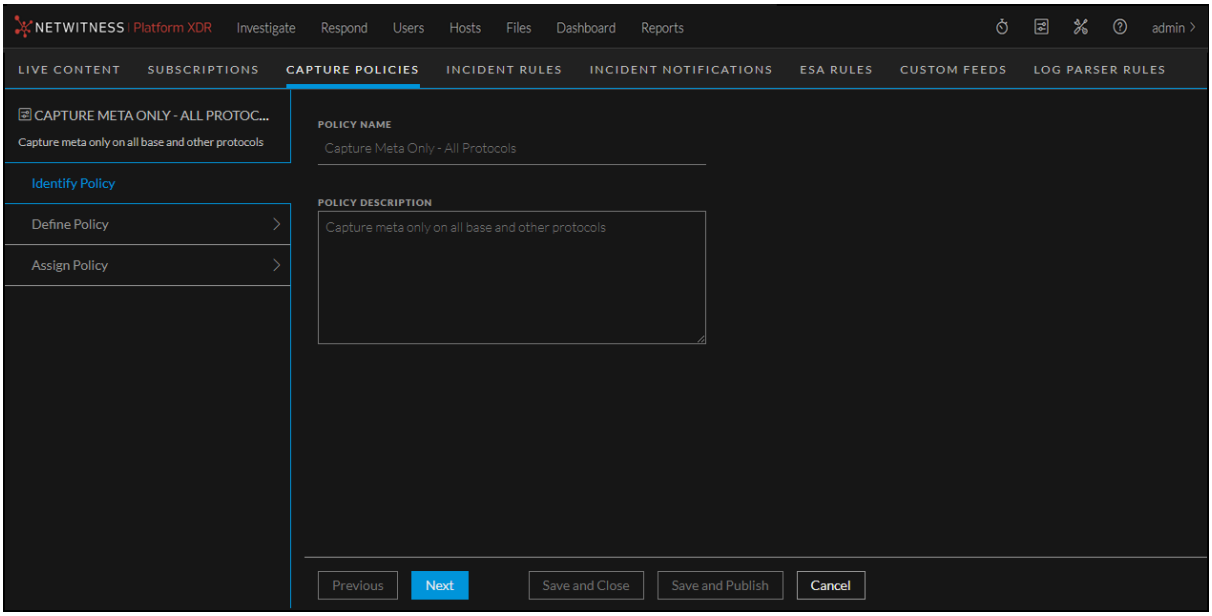
Use Predefined Policies

This procedure describes how to use the predefined policies. You can use this procedure to configure a policy for internal assets. For example, as described in Use Case 1: Predefined Policy for Internal Assets , to gain further visibility into internal lateral traffic going East-West through the environment, you could deploy a Network Decoder in the interior of your network to capture the traffic. Applying full packet capture for this segment may generate too much data to manage at a reasonable cost point. Instead, use the predefined "Capture Meta Only – All Protocols" policy to achieve the same parsing and detection while only saving the metadata, limiting the amount of storage required for this solution.

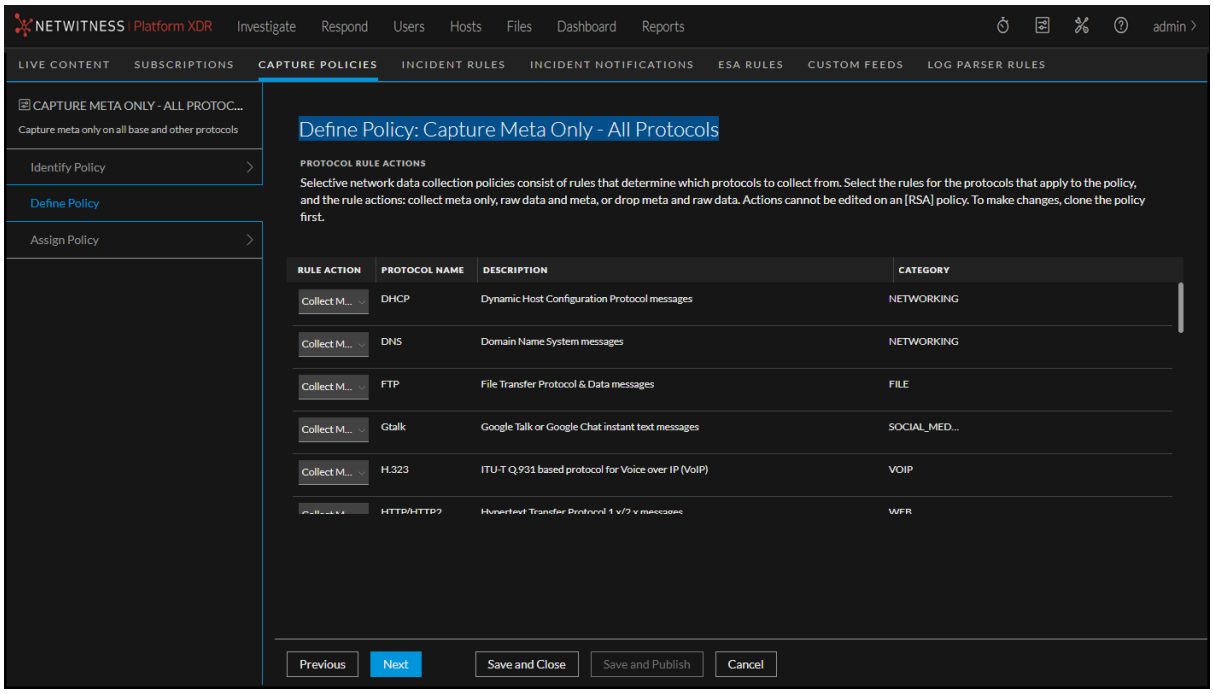


In this situation, the only steps you must complete is to select the "Capture Meta Only – All Protocols" predefined policy to edit it, enable it by assigning it to the appropriate Decoders, and then publish the policy to start collecting the data.

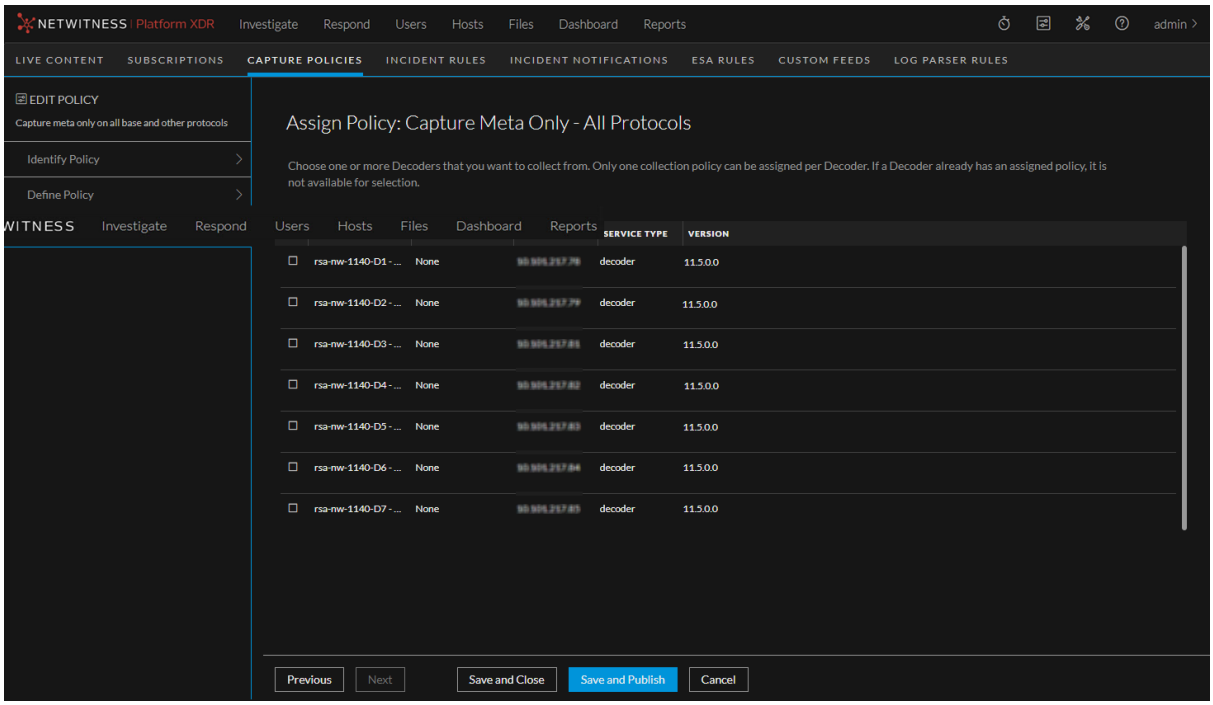
To work with a predefined policy:



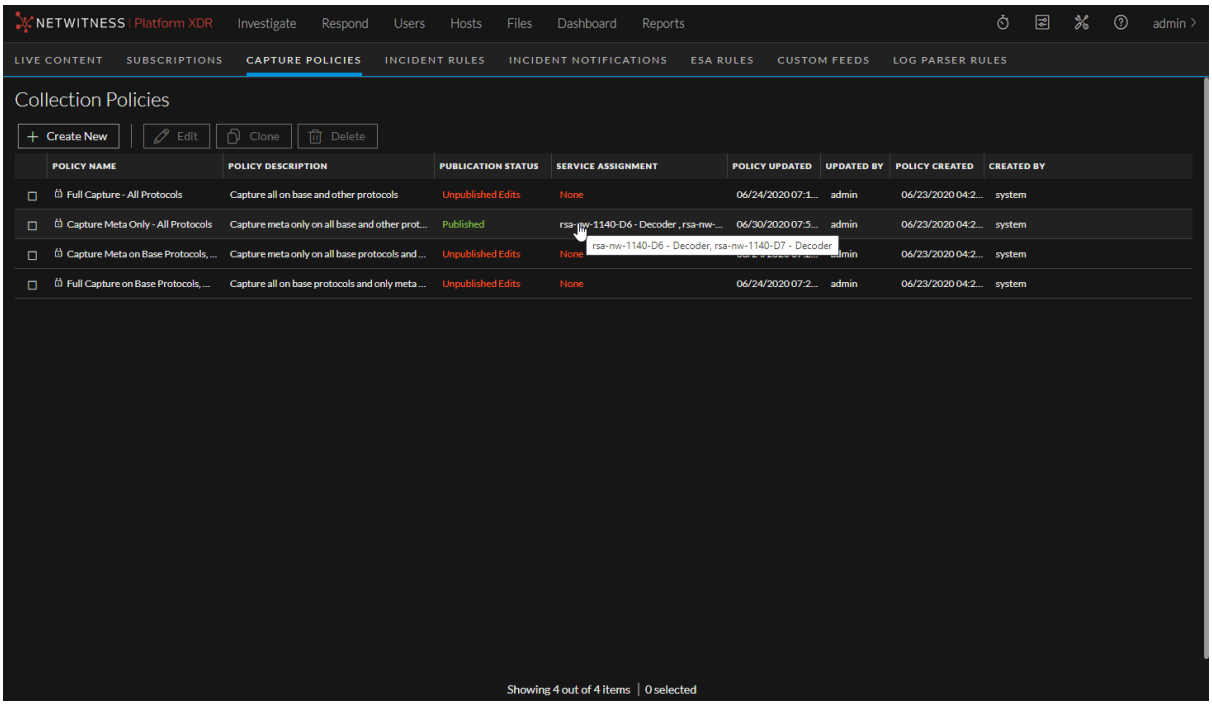
1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.



Notice that the PUBLICATION STATUS column lists each of the predefined policies with the status of **Unpublished**. The only way to edit a predefined policy is to assign Decoders to apply the policy. If changes are made to the Decoder assignments but are not published, the status changes to **Unpublished Edits**, the date the change was made is displayed in the POLICY UPDATED column, and the user name of the person who made the change is displayed in the UPDATED BY column. In predefined policies, the CREATED BY field is always **system**.
The following figure shows the statuses of the policies.



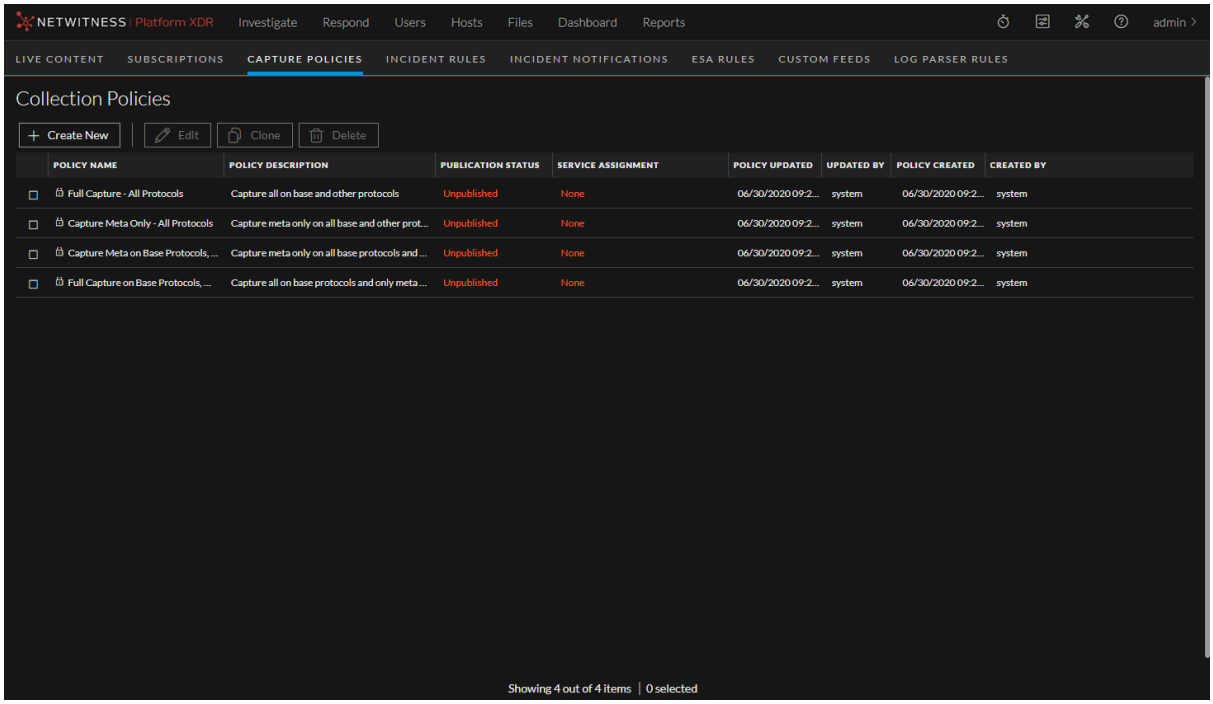
2. Select **Capture Meta Only - All Protocols**, and then click **Edit**.
The editing view is displayed with the **Identify Policy** option active.



3. Because this is a predefined policy, you cannot change the policy name or description. Click **Next**.
The Define Policy: Capture Meta Only - All Protocols page is displayed.

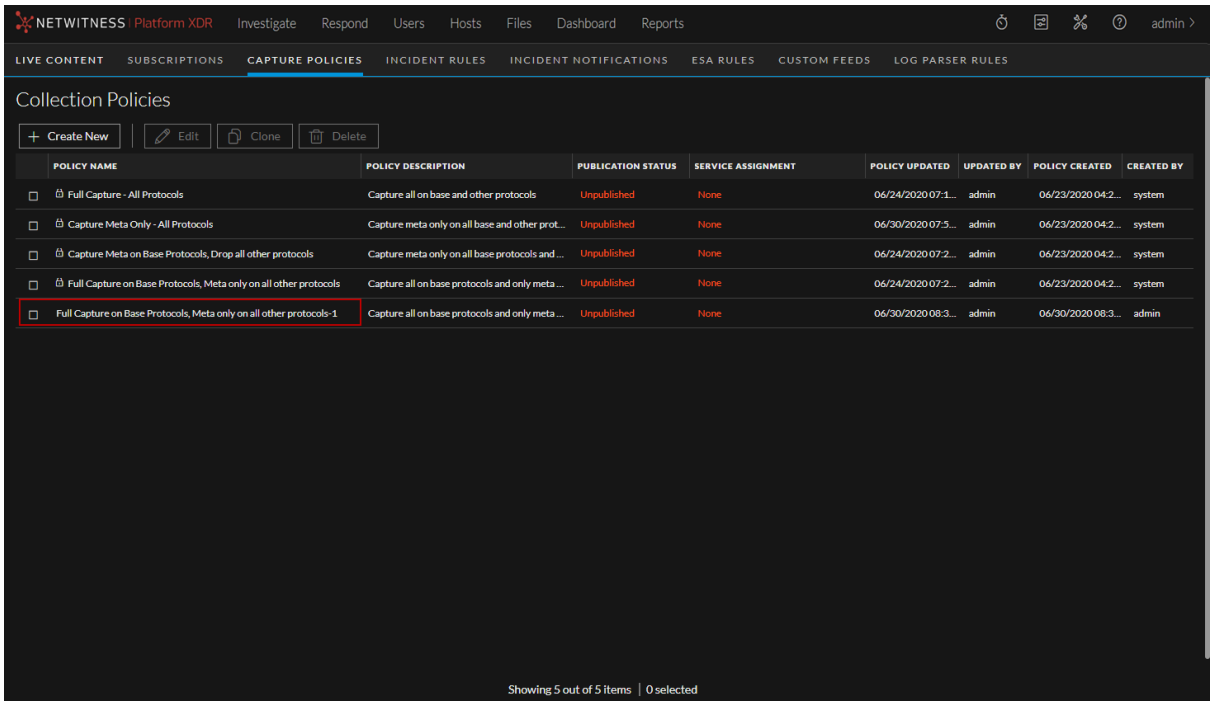
4. Because this is a predefined policy, you cannot edit this page. Review the rules on this page to understand the actions that will be enabled when you publish this policy. Click **Next**.
   The Assign Policy page is displayed.

5. Select the Decoders that you want to collect from, and then click **Save and Publish**.
   The publication status moves to **Updating**. It changes to **Published** when the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as **Published**, so even if not all of the Decoders are available (and the publication status is not **Published**), data will begin to be collected on the Decoders that are available. When the status moves to **Published**, all the services are displayed in the Service Assignment column. You can hover over the names of the Decoders to see their full names, as shown in the following figure.



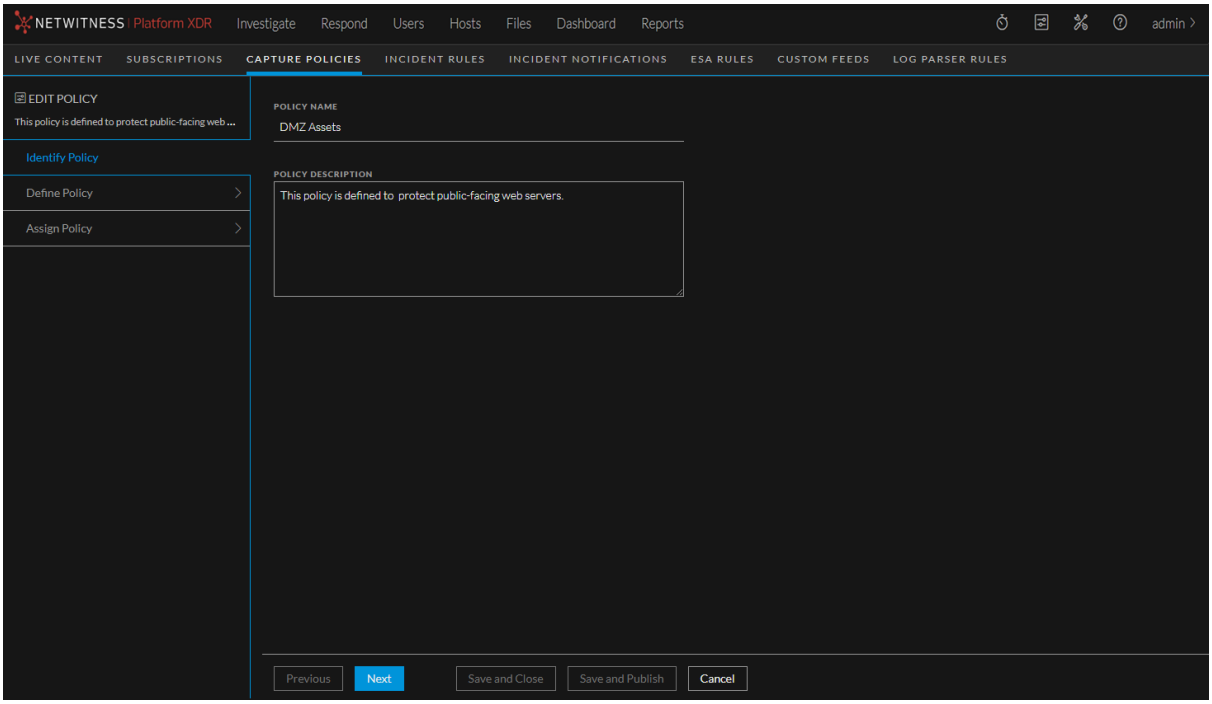
Create New Policies from Predefined Ones

This procedure describes the steps for creating a new policy from a predefined one, and provides an example of how you might use this policy.



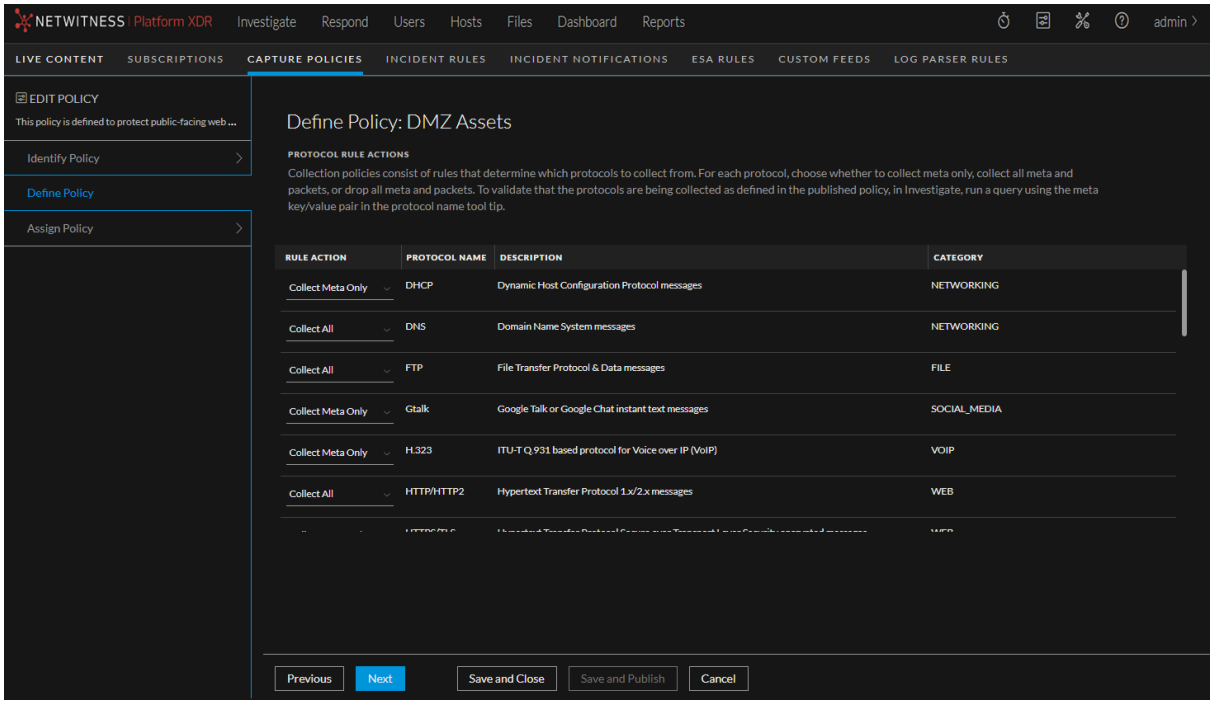
For example, as described in Use Case 2: Custom Policy for DMZ Assets, suppose a Network Decoder has been deployed into the demilitarized zone (DMZ) to protect public-facing web servers. The network communications between these web servers and other network devices are a subset of the base protocols. To make sure they can harvest forensic evidence for any communications related to these high value assets, you would want to get full packet capture on HTTP, SMTP, FTP, and DNS protocols. To provide visibility into any other traffic these servers are engaged in, you would want to generate metadata for all other protocols.

To configure a policy that would achieve the results described here, you would select the predefined policy "Full Capture on Base Protocols, Meta only on all other protocols," clone it, and then edit it to align the protocols with the DMZ scenario. During the clone process, you can update the name and description to identify the new purpose of the policy. In the step where you define the policy, you can change all the base protocol rules inside the policy (except HTTP, SMTP, FTP, and DNS) from "Collect All" to "Collect Meta Only" to achieve the desired results. The last steps assign the policy to the appropriate DMZ Decoders.

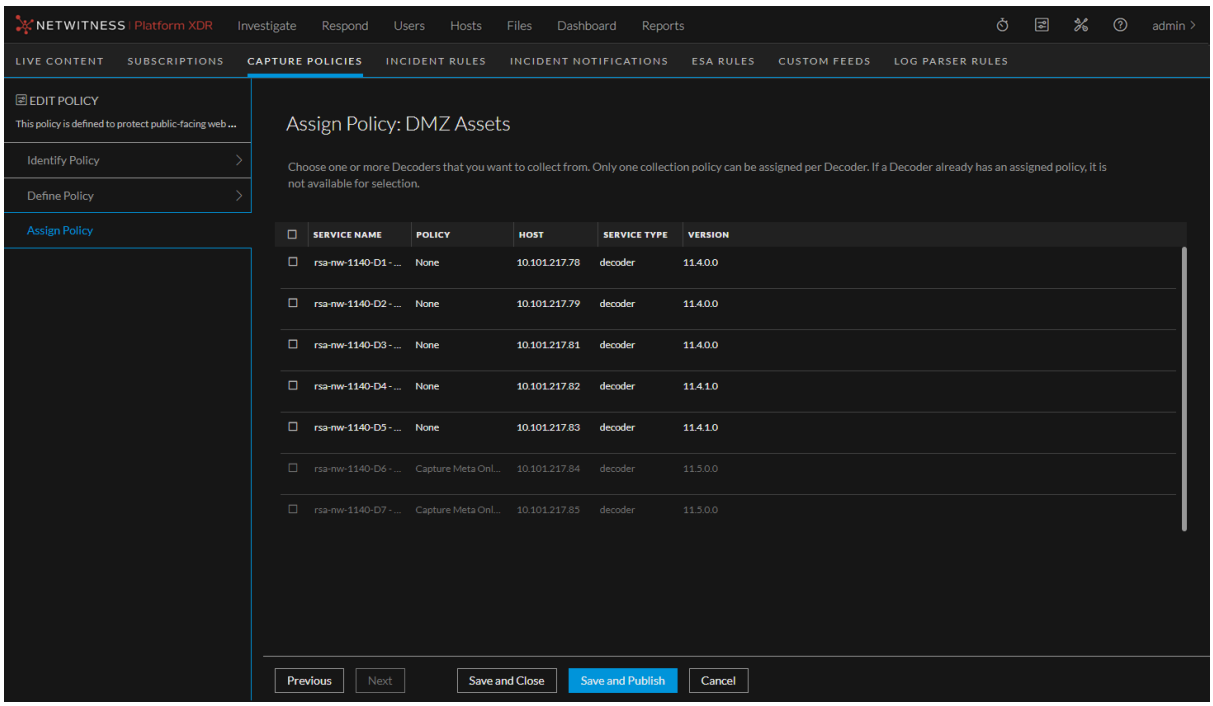


1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.

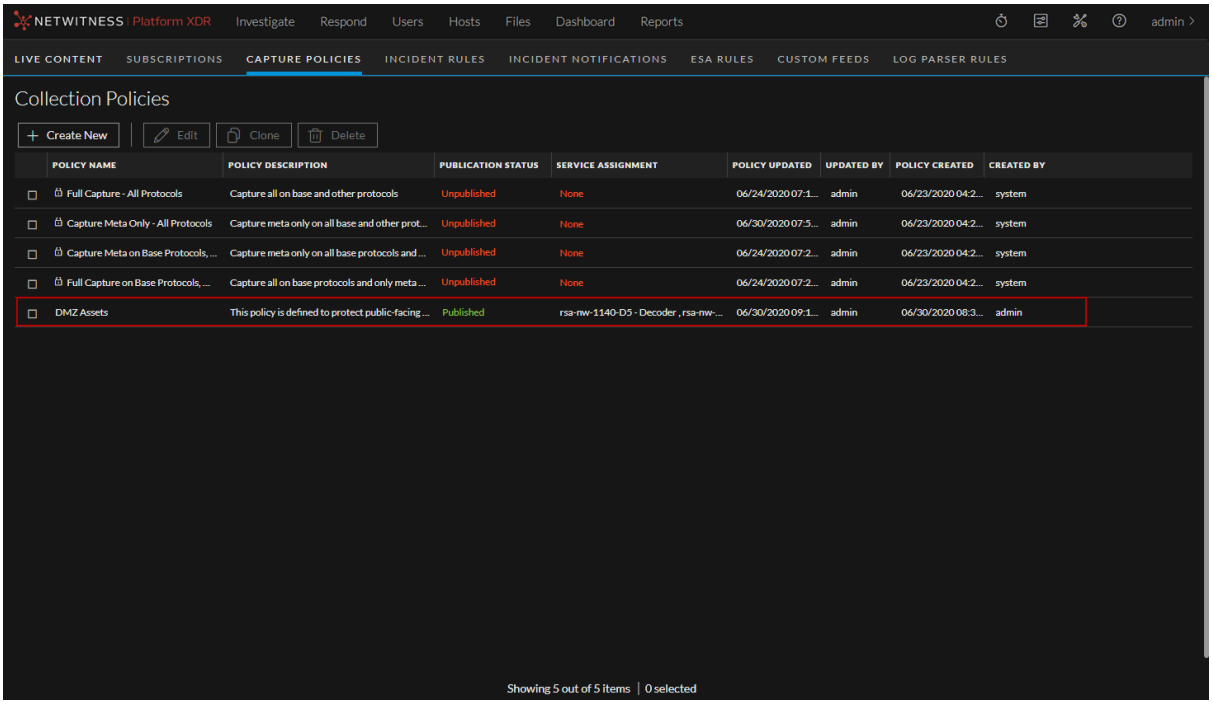
2. Select **Full Capture on Base Protocols, Meta only on all other protocols** and then click **Clone**. The Collection Policies view is displayed with the cloned policy at the bottom of the list, identified by appending -1 to the policy name.



3. Select the cloned policy and click **Edit**.
   The editing view is displayed with the **Identify Policy** option active.
   In this example, we are naming this policy "DMZ Assets" and providing the description "This policy is defined to protect public-facing web servers."

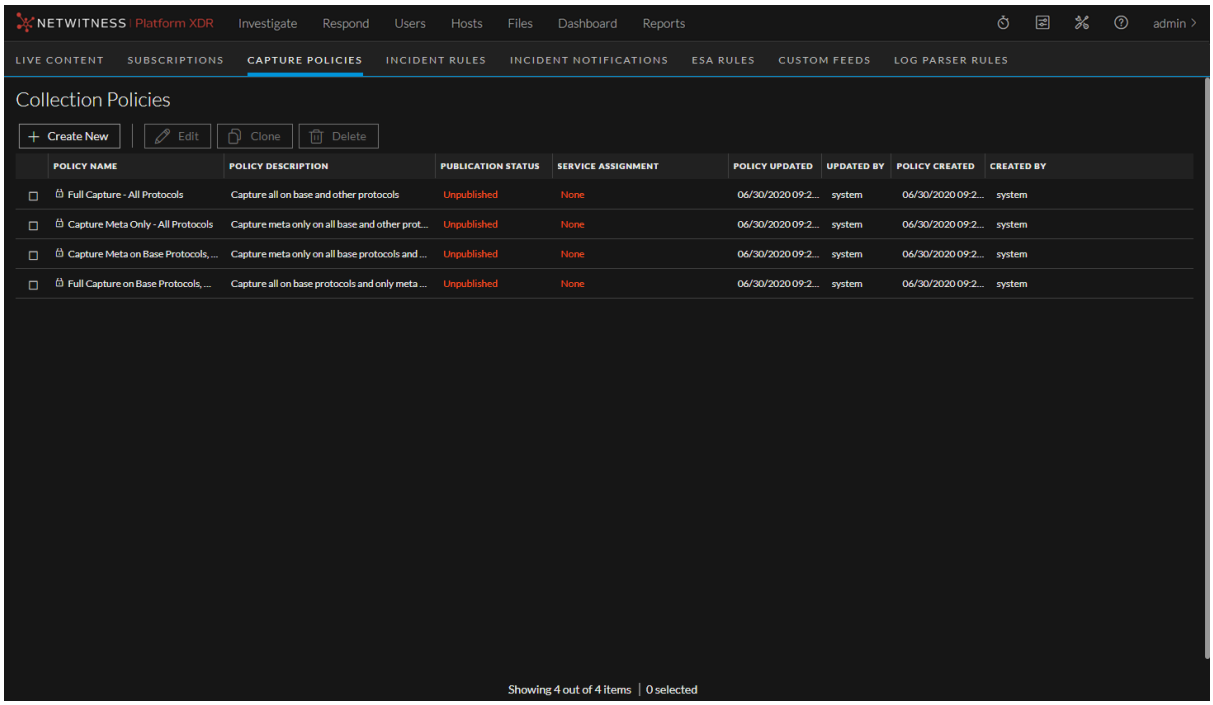


4. Click **Next**. The Define Policy view is displayed, with a list of rules you can use to define the policy. You can select the following options for rule actions:
   - **Collect Meta Only**: Collect metadata
   - **Drop All**: Drop metadata and network packets
   - **Collect All**: Collect metadata and network packets

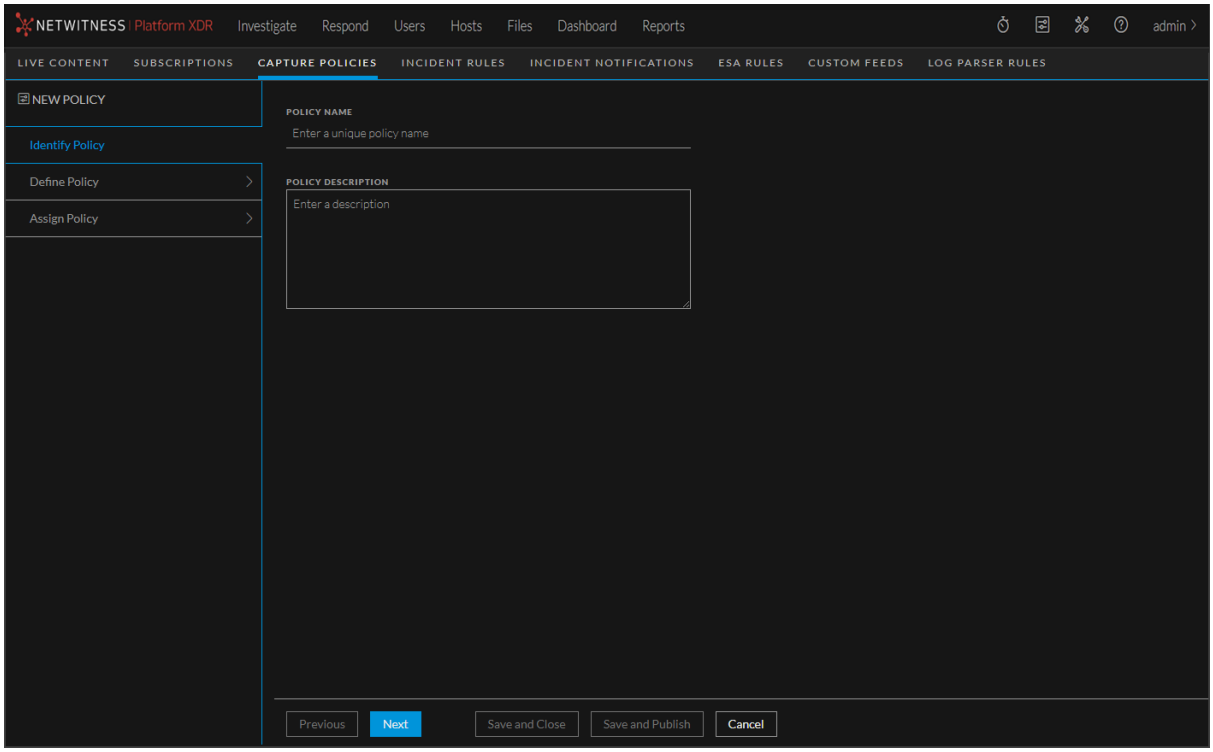


To collect the targeted data for the DMZ Assets policy, we are going to change all the base protocol rules inside the policy (except HTTP, SMTP, FTP, and DNS) from **Collect All** to **Collect Meta Only**, as shown below.

5. Click **Next**.
   The Assign Policy page is displayed.

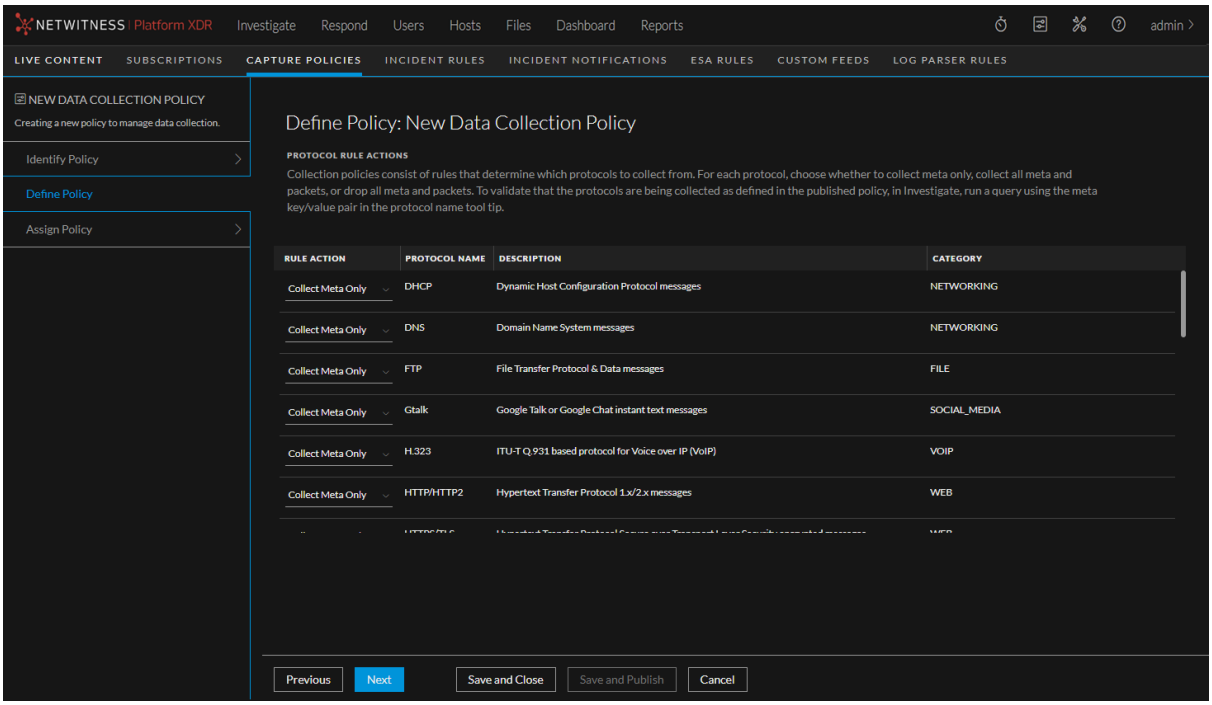


6. A Decoder can only be assigned to one policy. Decoders that are not available are greyed-out, because they are already assigned to other policies. Select the Decoders to collect the targeted data, and then click **Save and Publish**. The publication status moves to **Updating**. It changes to **Published** when the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as **Published**, so even if not all of the Decoders are available (and the publication status is not **Published**), data will begin to be collected on the Decoders that are available.
   Your new policy is displayed in the Collection Polices view, with the services displayed in the Service Assignment column.



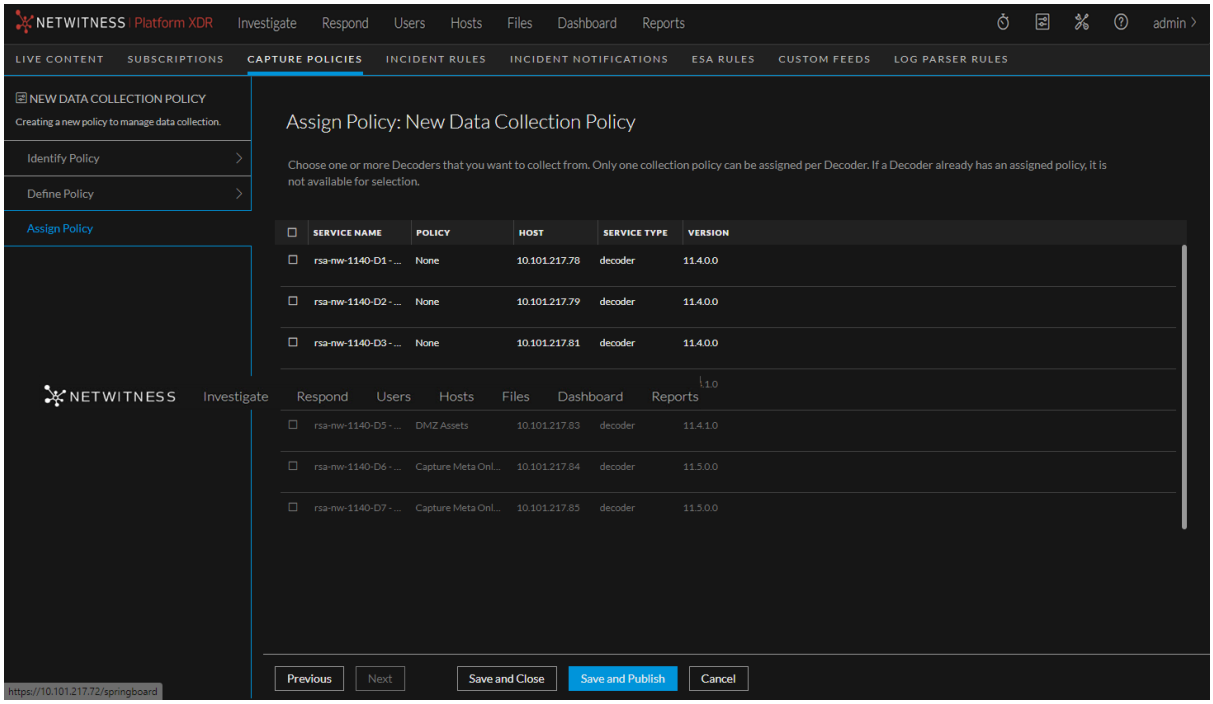
Create Custom Policies

You can create a custom Selective Network Decoder policy, where you can select specific protocols on which to collect data, as well as the rules that apply to them.

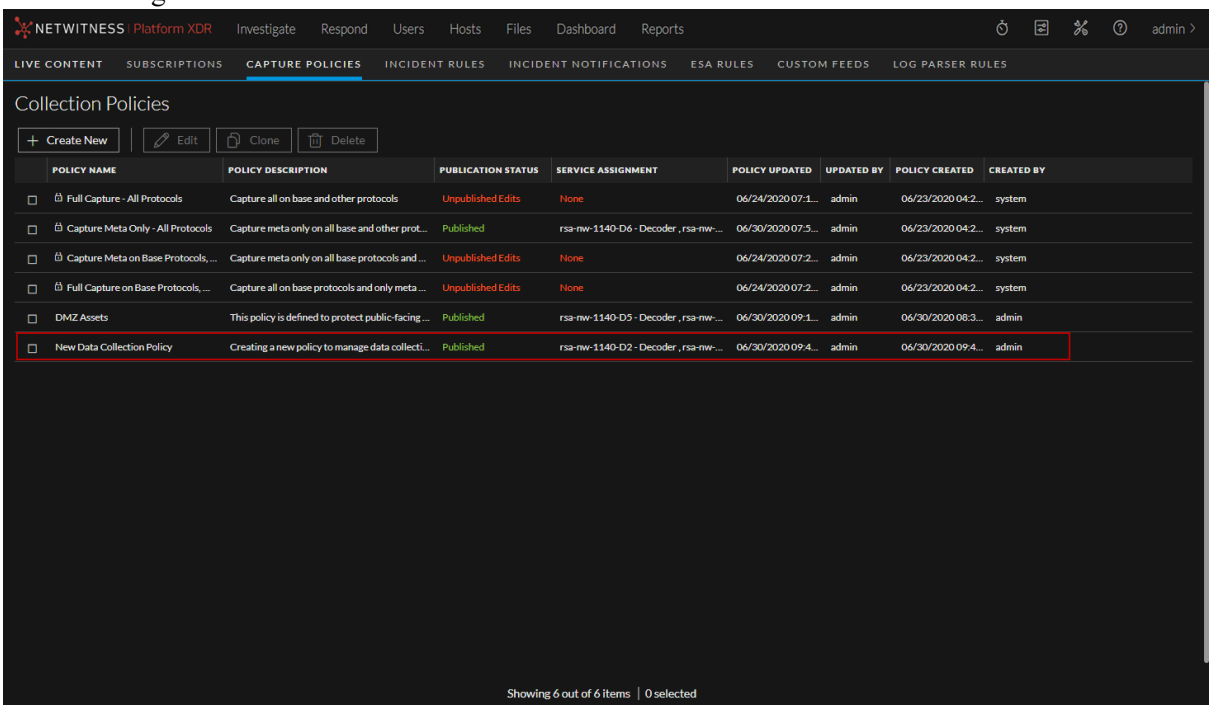


1. In the NetWitness user interface, go to  (Configure) and select the **CAPTURE POLICIES** tab.

2. Click **Create New**.
   The editing view is displayed with the **Identify Policy** option active.



3. Enter a name and description for your policy, and then click **Next**.
   The Define Policy view is displayed.

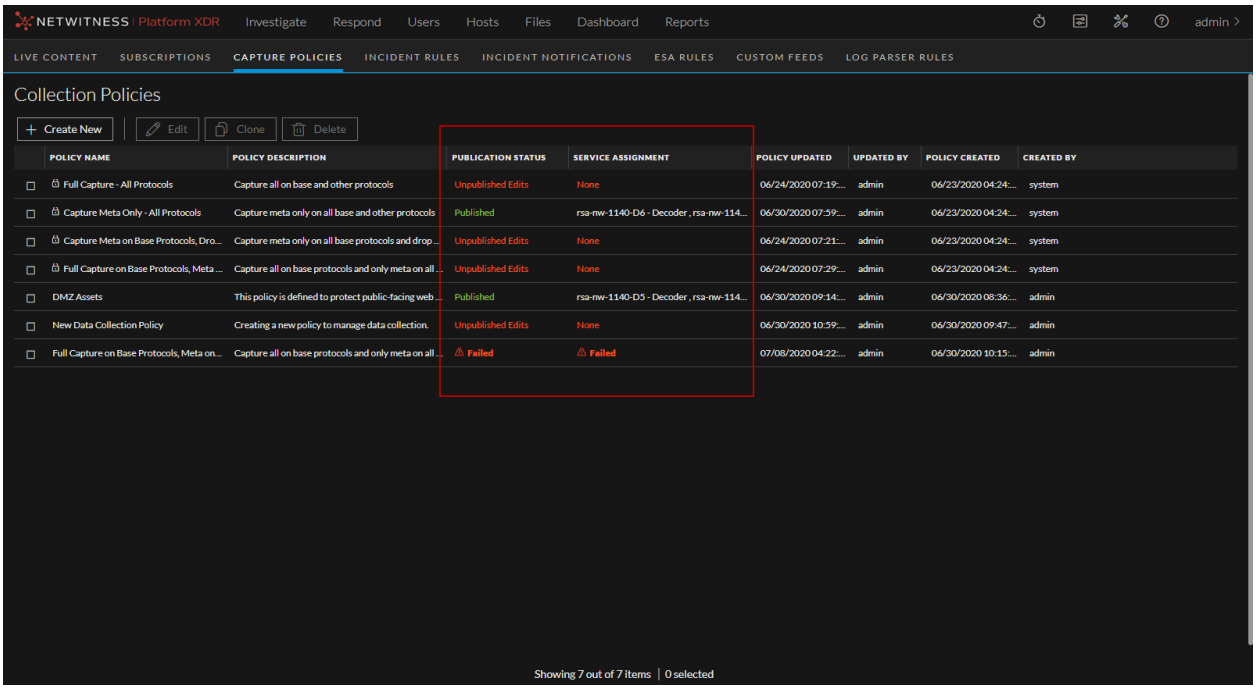


4. Define the actions for each of the protocols. The options for **RULE ACTION** are:
   - **Collect Meta Only**: Collect metadata
   - **Drop All**: Drop metadata and network packets
   - **Collect All**: Collect metadata and network packets

5. Click **Next**.
   The Assign Policy view is displayed.

6. A Decoder can only be assigned to one policy. Decoders that are not available are greyed-out, because they are already assigned to other policies. Select the Decoders to collect the targeted data, and then click **Save and Publish**. The publication status moves to **Updating**. It changes to **Published** when the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as **Published**, so even if not all of the Decoders are available (and the publication status is not **Published**), data will begin to be collected on the Decoders that are available.

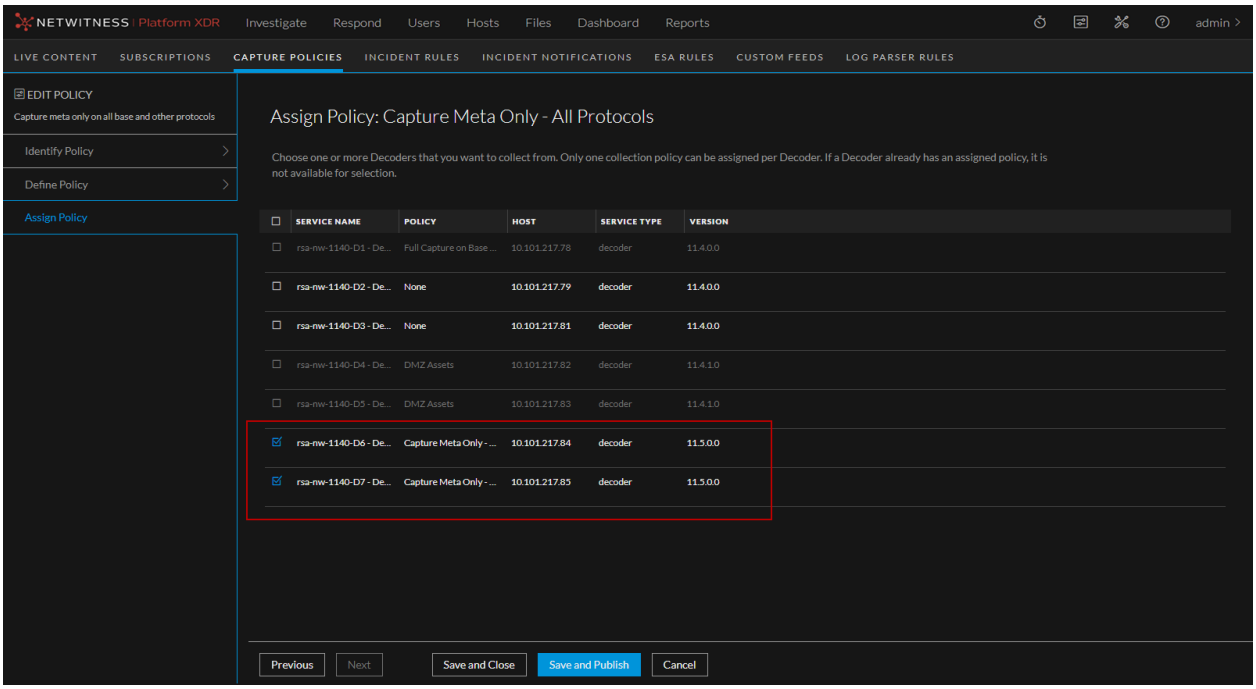
Your new policy is displayed in the Collection Polices view, with the services displayed in the Service Assignment column.



Verify Published Policies

When a policy has been published, the policy is applied to the Decoders that were designated in the policy assignment step. The Decoders that are assigned to the policy start collecting the data defined in the policy. There are a few ways to validate the policy is functioning as expected.

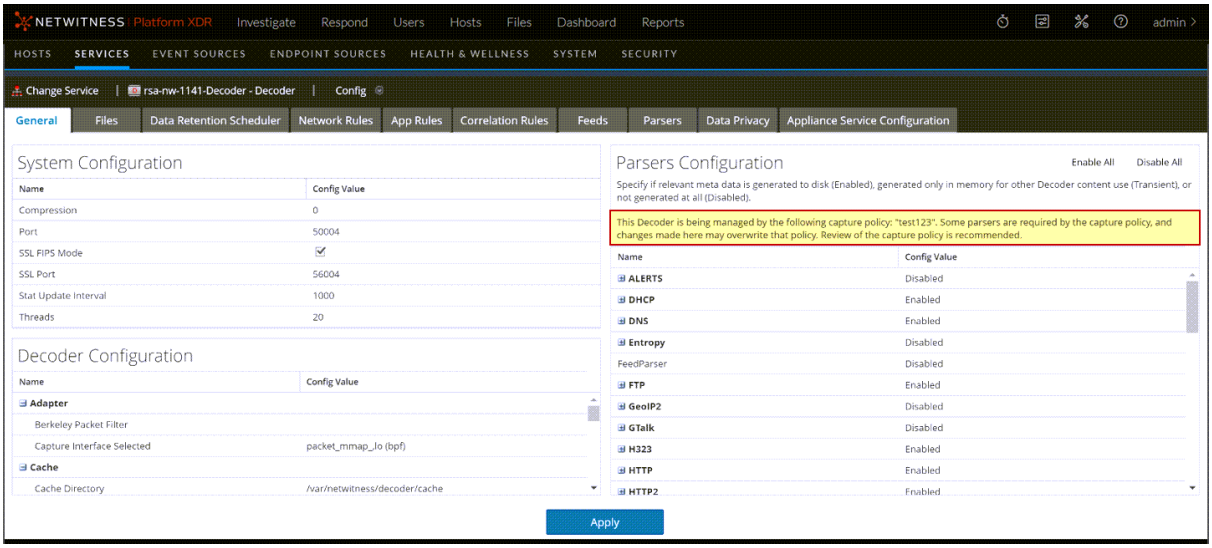
View Publication Status



Publication status is indicated in the Capture Polices view in the PUBLICATION STATUS column. You can also see which Decoders are assigned to the policy in the SERVICE ASSIGNMENT COLUMN.

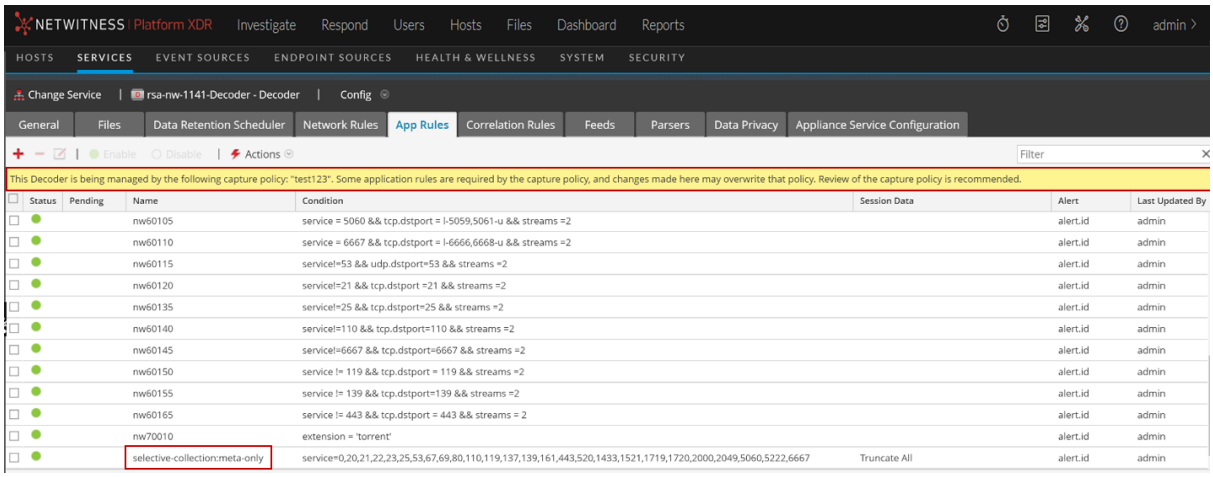
The publication statuses are:

- **Unpublished** - the rule actions of the policy have been defined and Decoders may have been assigned to the policy, but the policy has not been deployed to any Decoders.
- **Unpublished Edits** - policies that have been updated but are not deployed to Decoders. Clicking **Save and Close** after making edits keeps them from automatically being published, allowing the administrator to wait until a specific outage window to publish them. This would display as **Unpublished** (for policies not previously published to Decoders) or **Unpublished Edits** (for policies that have been previously published to Decoders, but the updates have not been deployed to Decoders).
- **Published** - the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as Published, so even if not all of the Decoders are available (and the publication status is not Published), data will begin to be collected on the Decoders that are available.
- **Failed** - policies that failed to execute, for example, if a Decoder is offline or a system is down.



You can also select a published policy, and then click **Edit** to verify the Decoders that are assigned to the policy.

Verify Policies in Admin > Services

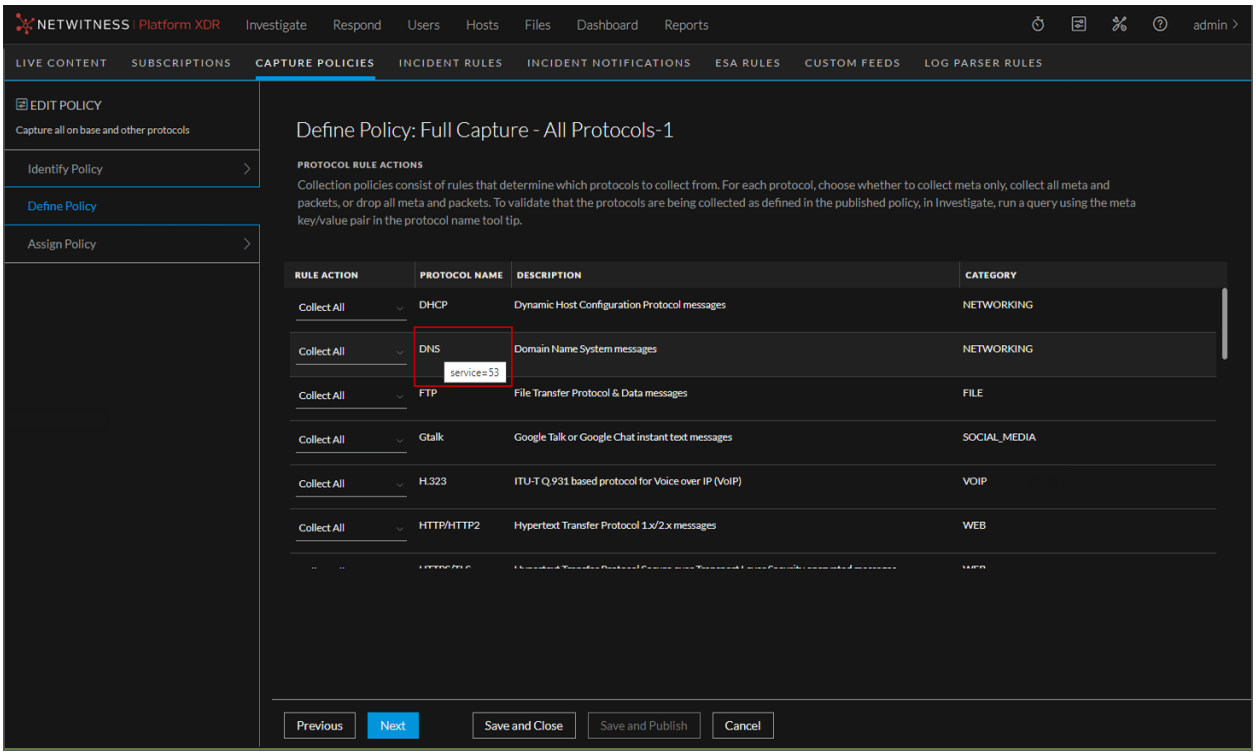


1. As an administrator, log in to the NetWitness user interface to view the Decoders that have been assigned to the policy.

2. Go to  (Admin) > **Services** > **<decoder name>** >  **(Actions)** > **View** > **Config**. On the General tab, in the right panel, there is a list of parsers that are installed on the Decoder by default. If a policy is administering this Decoder and requires any of those parsers to function, a message is displayed as shown below.

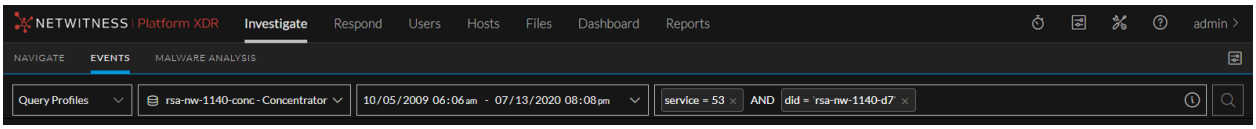
3. On the **App Rules** tab, a similar message indicates that some of the rules are required for the policy to function. You can search for "selective collection" to find the specific rules required, as the rule names contain that information.

> **Note:** In Investigate, you must have the **Alert** session option selected for the selective collection policy to be displayed.



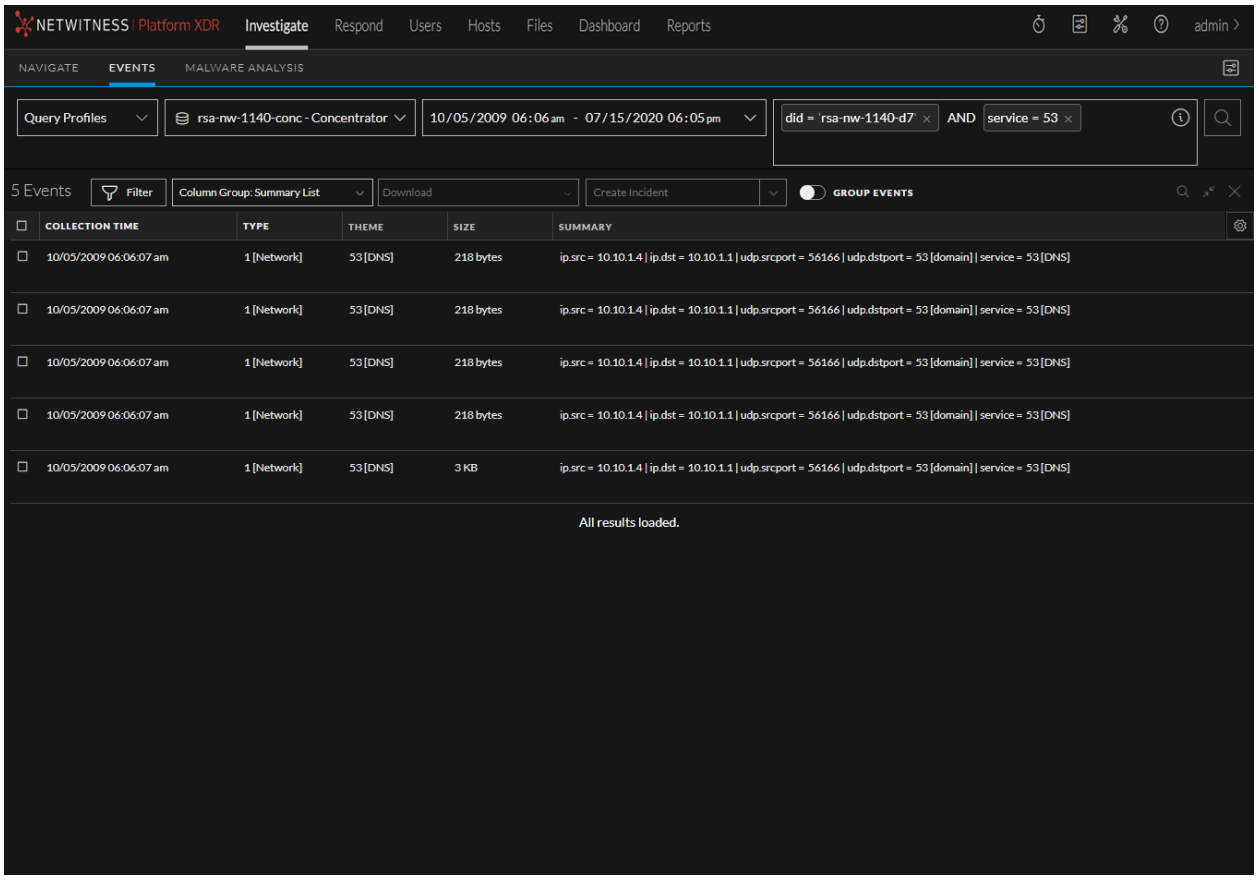
By default, the selective collection rules are added to the bottom of the rule set when the policy is applied. However, an administrator can directly affect the policy by altering the selective policy rules or by moving conflicting rules (rules with the same services) above the selective collection rules. In both cases, those changes take effect when they are saved locally on the individual Decoders, until the next time the policy is published from the central configuration page, when that policy will override changes made individually on the Decoders.

> **Note:** There currently is no feedback in the centralized configuration page denoting that the configuration related to the policy has been altered locally on the Decoders. To avoid this situation, manage all the policy rules from the centralized configuration page. If that is not possible, as additional application rules outside of collection policies may be required, follow standard security practices, including separation of duties, to limit people who need access to alter application rules and general parsers.

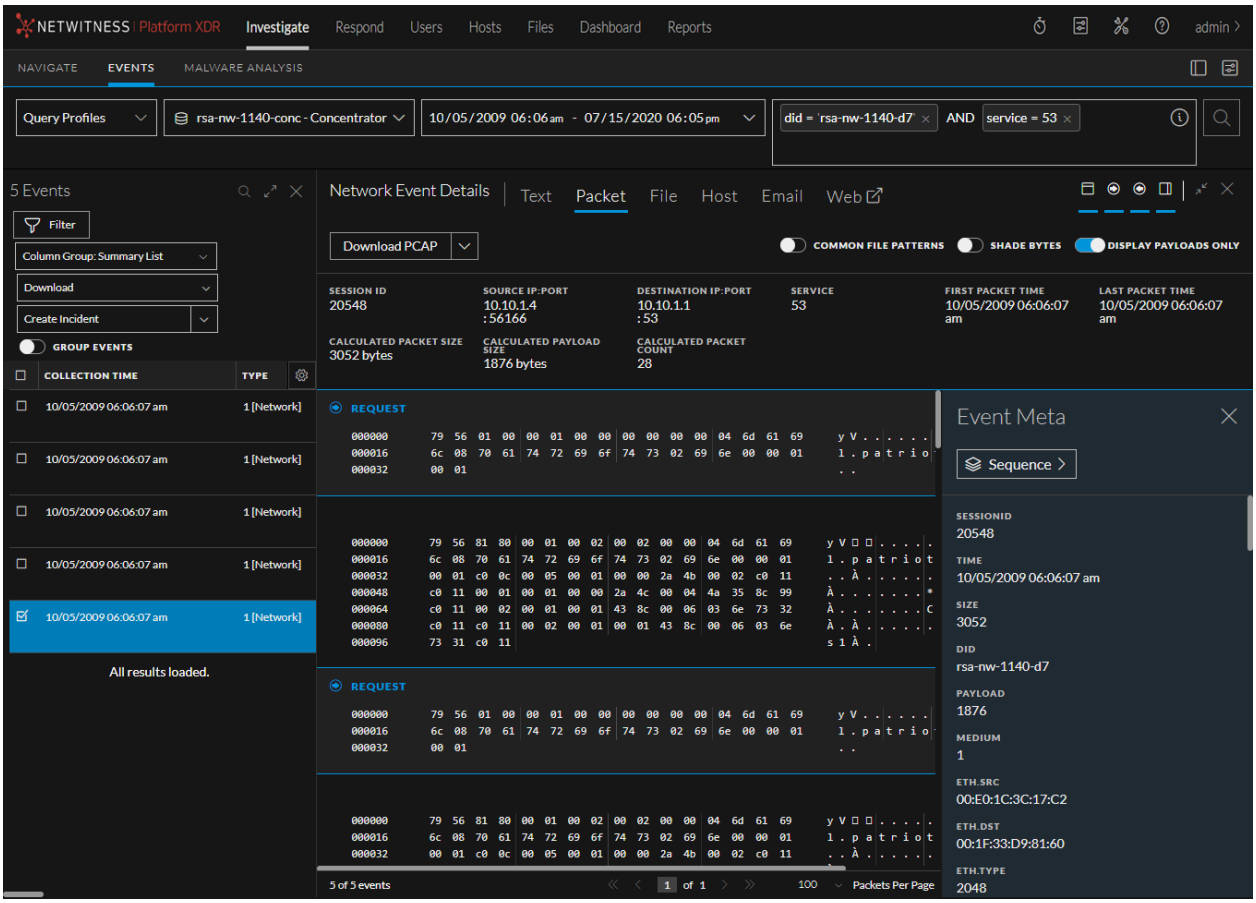


Verify Policies in the Investigate View

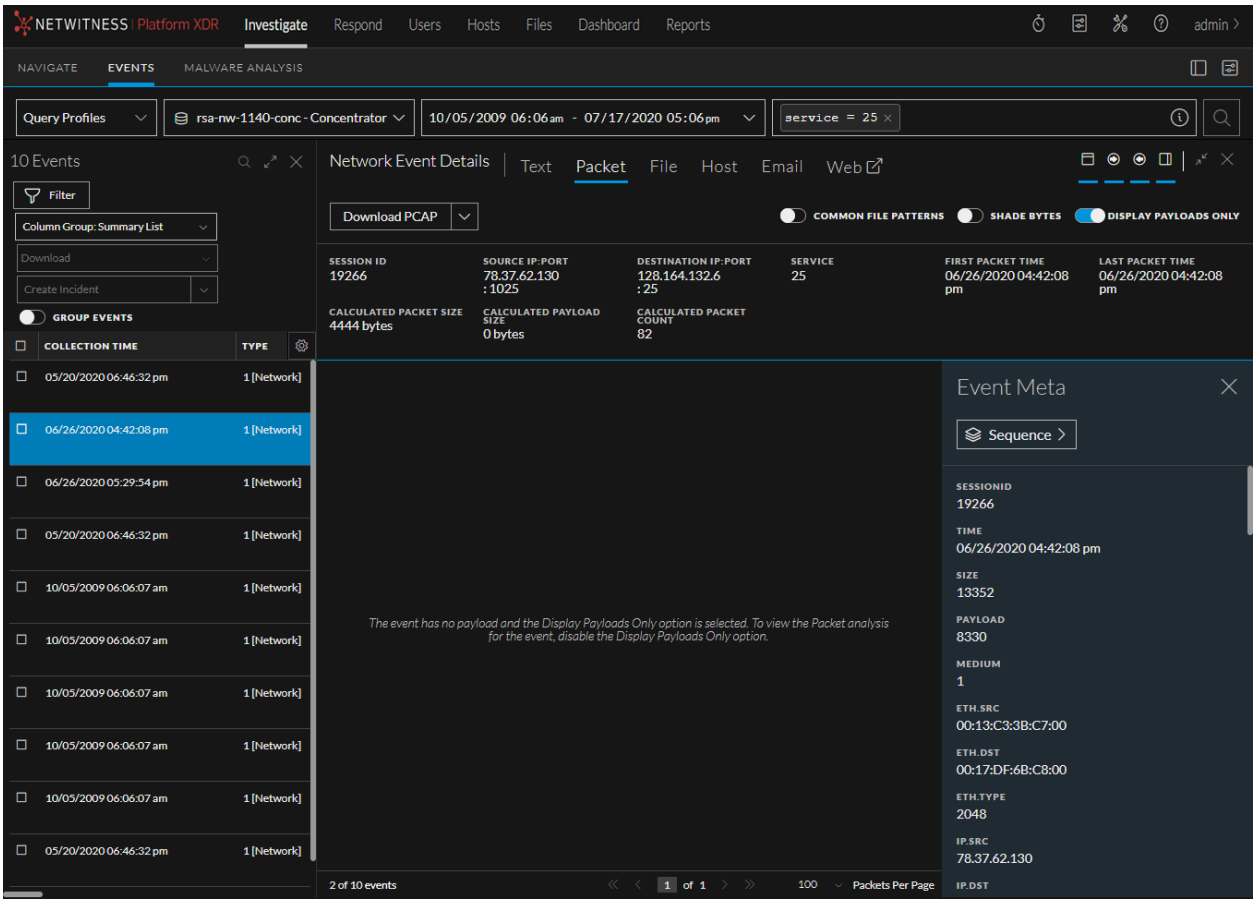
You can further verify that the policy is working as expected (the protocols are being collected as published) in the Investigate view. In the centralized configuration page for selective collection, the administrator can get a translation of what the query parameter would be for each individual protocol when viewing the rules inside the policy.



For example, in  (Configure) > **Capture Policies** > **<select a policy>** > **Edit** > **Define Policy**, if you hover over the DNS protocol name, `service=53` is displayed.

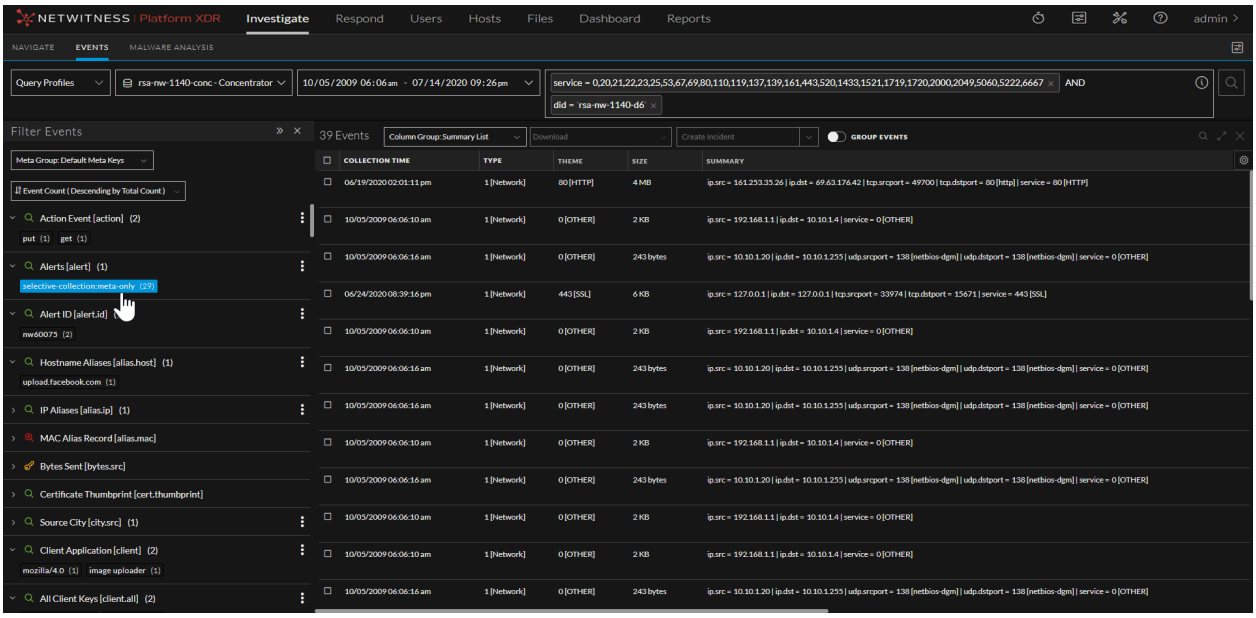


To determine if the appropriate action has been taken for DNS traffic, in **Investigate** > **Events** you can add the query parameter (for example, `service=53`) as a filter in the query bar and run the query against the Broker or Concentrator the Network Decoder is associated with for the time the policy has been active on the Network Decoder. To make sure you are only seeing the traffic from the Decoders that you want, you can add the Decoder Source, or `did` meta key as another filter in the query bar.



After running the query, if there are any related results, those events are displayed in the table (unless you applied an action to drop them).

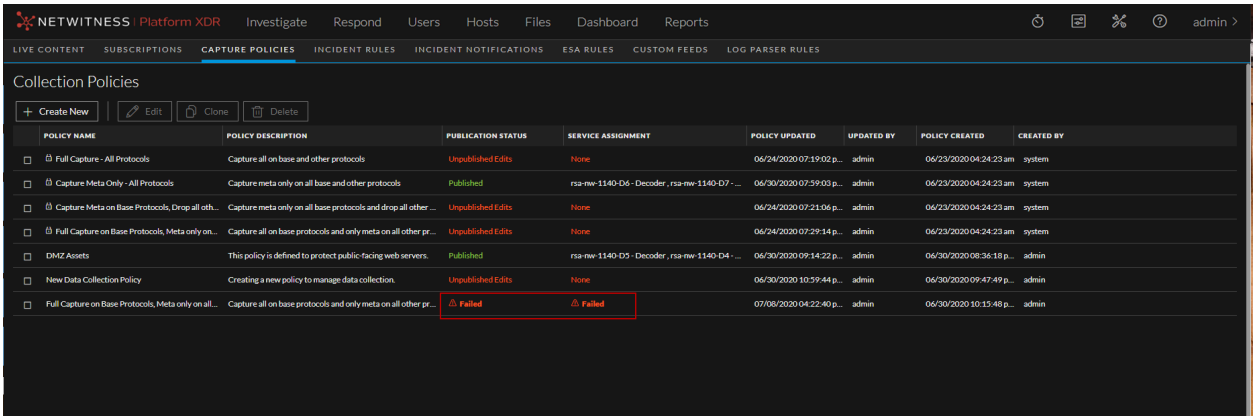
If you chose the action to `collect all` you can click on one of the events and review the metadata and the payload information for that packet session.



If you chose the action to `collect meta only`, you can click on one of the events and review the metadata, however, a message would be displayed instead of the packet payloads, as shown in the following figure.

To expedite this process, you can also take the application rules from one of the Network Decoders the policy is applied to and use it as the filter in the **Investigate** > **Events** query bar.

The following figure shows an entire `collect meta only` configuration by using the application rule shown here, created on the Decoder (in Verify Policies in Admin > Services):
`(service=0,20,21,22,23,25,53,67,69,80,110,119,137,139,161,443,520,1433,1521,1719,1720,2000,2049,5060,5222,6667) truncate`:



Note: If the findings do not align with what is expected from the policy, make sure that there are not other rules on the individual Decoders that might be conflicting with the selective collection policy rules. In addition, make sure when checking in Investigate that you are looking at only the traffic associated with the Decoders related to the policy.

Troubleshooting Policy Deployments That Fail

Policy deployment can fail for the following reasons:

- A Decoder service assigned to the policy is not running
- A Decoder host system is down when you try to deploy the policy

When a policy deployment fails, the Failed icon is displayed in the PUBLICATION STATUS and SERVICE ASSIGNMENT columns as shown in the following figure.

Use the following options to research publication failures:

Check the status of the Decoders

Check to see if the Decoder system is down, or if the Decoder service has stopped capturing data.

1. Select the policy, click **Edit**, and go to the Assign Policy page to determine which Decoders are assigned to the policy,
2. Go to  (Admin) > **Services**, select the Decoder, click  > **View** > **System** to investigate the status of the Decoder.

Review the content-server.log file

You can review the content in this file to troubleshoot errors. This file is located in the following directory on the NW Server host:

```
/var/log/netwitness/content-server/content-server.log
```

The following example shows a content-server log snippet that is displayed when publishing a policy fails:

```
2020-07-08 16:22:45,287 [ nioEventLoopGroup-2-2]
INFO     DataAccess|Finished publishing policy 'Full Capture on Base
Protocols, Meta only on all other protocols-1' outcome:FAILED
```

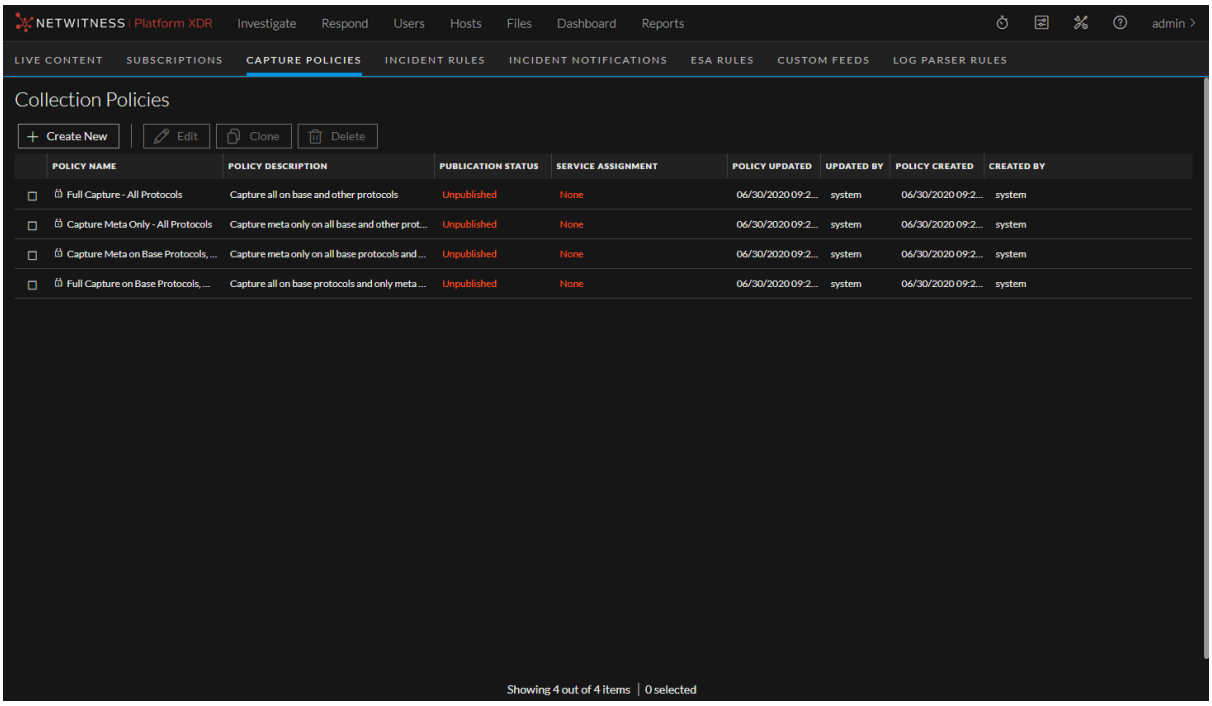
This is an example of a content server log snippet for successfully publishing a policy:

```
2020-06-23 17:40:50,373 [ nioEventLoopGroup-2-7]
INFO     DataAccess|Finished publishing policy 'Policy 1' outcome:SUCCESS
```

Review `/var/log/messages` on Decoder Systems

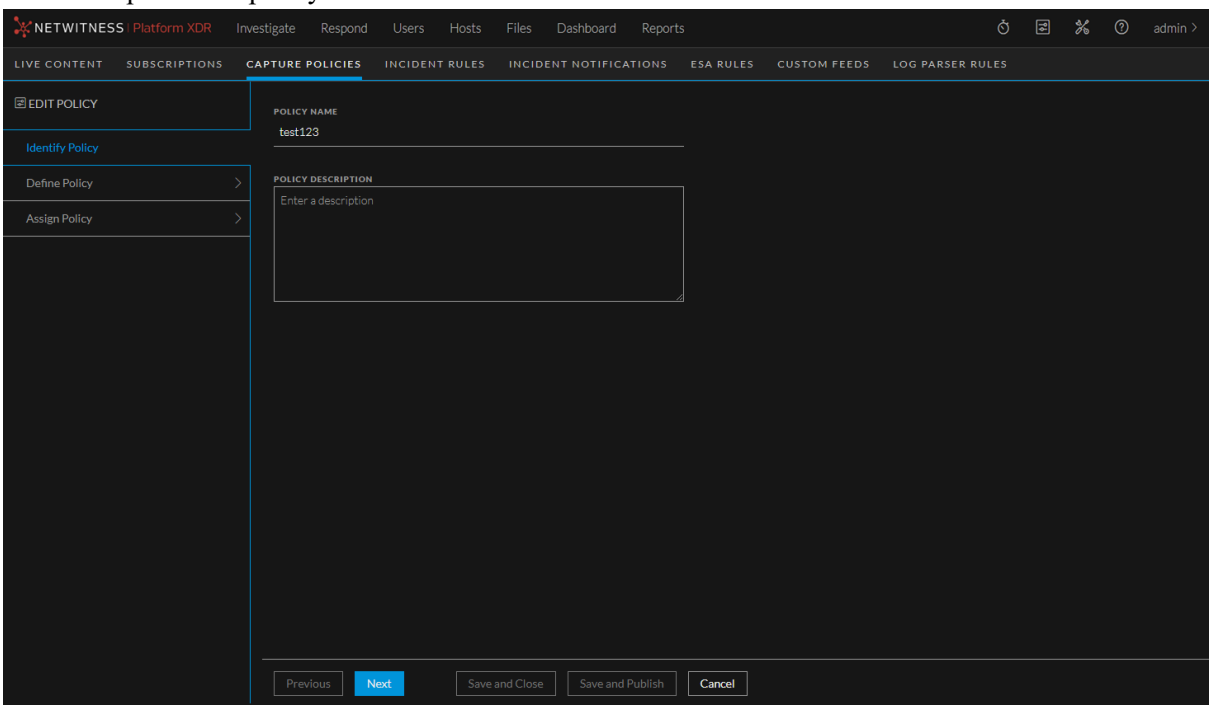
You can view publication status in `/var/log/messages` on a Decoder system.

The following is an example of successful publication in `/var/log/messages`:



```
Jun 15 18:35:17 rsa-nw-1141-Decoder-1 NwDecoder[8260]: [Rules] [audit] User
admin (session 26182, 10.237.169.43:55380) has added application rule
'selective-collection:meta-only' at position 38
```

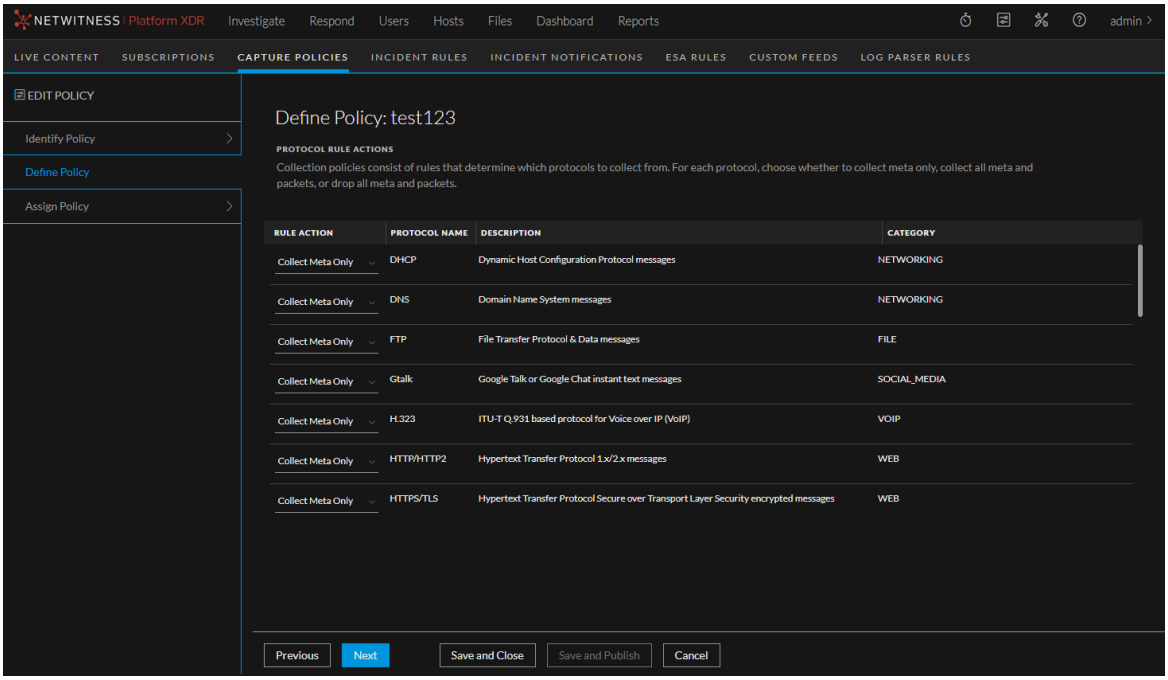
Unpublish Policies



You can unpublish a policy by unassigning the Network Decoders from the policy, which preserves the policy but makes it inactive so that the data it defines is not being collected. You can then change or remove a portion of policy, or remove the entire policy from the Decoders to which they are assigned.

To unpublish a policy:

1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.



2. Select the published policy and click **Edit**.

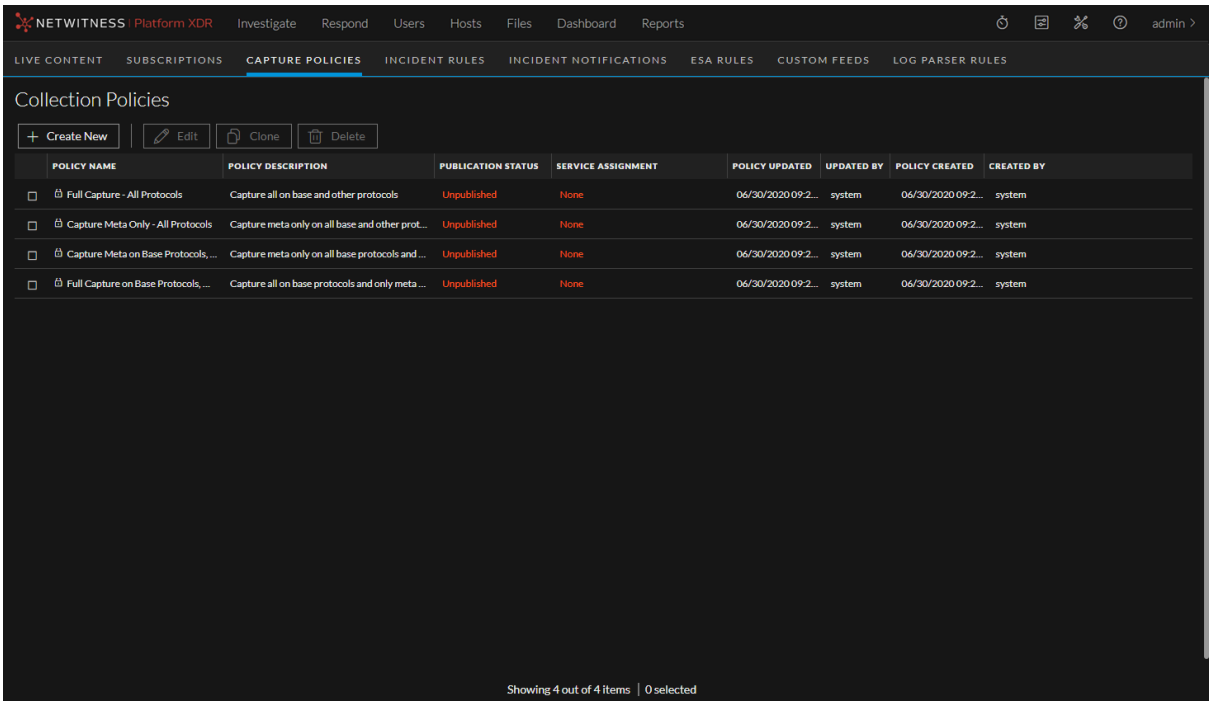
   a. To change the name or description of the policy, update the policy name or description in the Identify Policy view.

b. To change the protocols that are collected, click **Next** and then edit the rule actions in the Define Policy view.

c. To unassign or reassign Decoders to this policy, click **Next**.

- To fully unpublish this policy, deselect all the Decoders and then click **Save and Publish**.
- To change the Decoders that are assigned to this policy, select or deselect the Decoders as needed and then click **Save and Publish.**

When the changes to the policy status have been completed and the Decoders updated, the policy status is displayed in green text as **Published** on the Collection Policies tab. If you unassigned all the Decoders without assigning any new ones, the publication status is **Unpublished Edits**.



Delete Policies

You can only delete customized policies. Predefined policies can be unpublished, but cannot be deleted. You can only delete one policy at a time. When you delete a policy, any Decoders that were assigned to the policy immediately stop applying the rules in the policy.

For information about how to unpublish a policy, see Unpublish Policies.

To delete a policy:

1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.

2. Select a customized policy and click **Delete**.
   The policy is removed from the system.

Caution: If you delete a policy that is published to Decoders, a warning is displayed. If you click **Accept** in the warning, that policy is removed from the Decoders, the collection status is changed, and the policy is deleted.

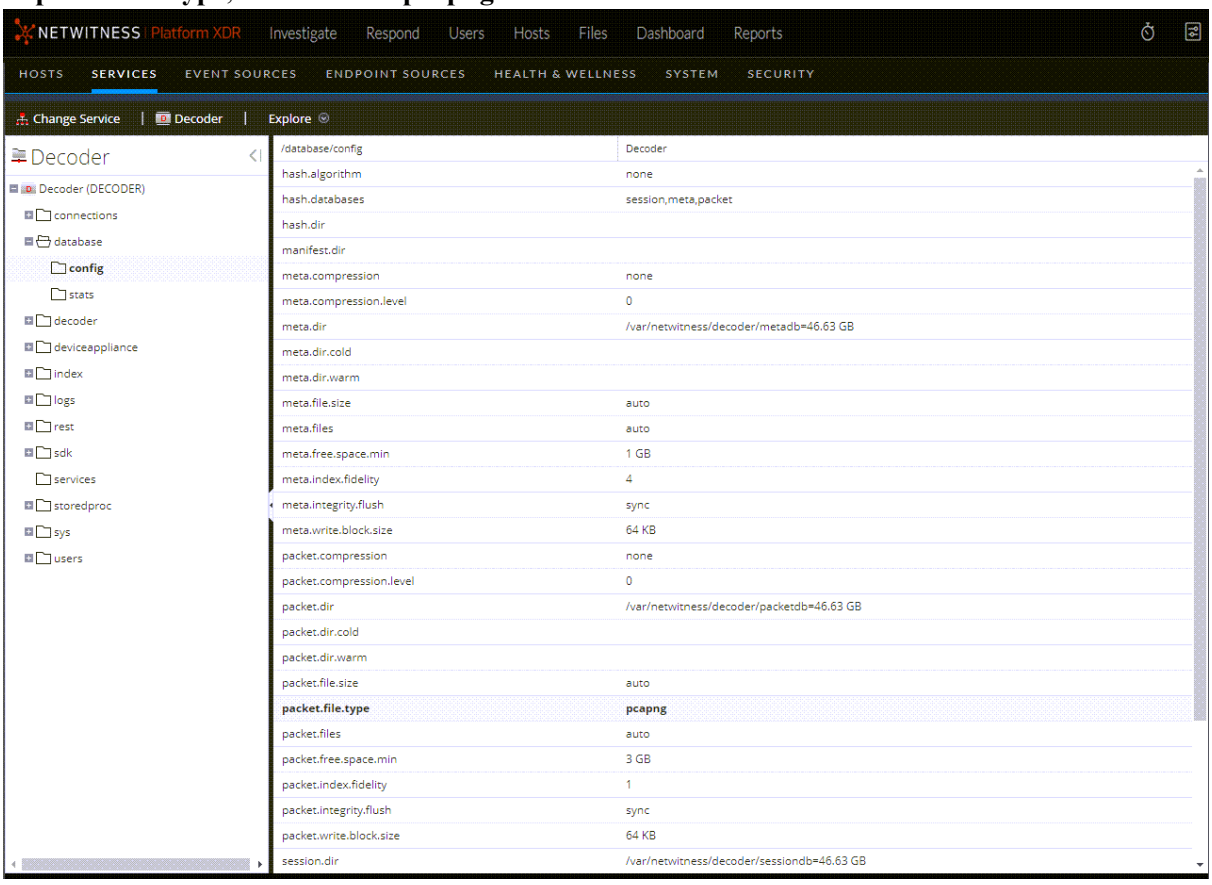
Supported Protocols for Selective Network Data Collection

The protocols in this list are supported for selective network data collection. These protocols have descriptive tool tips in the user interface. You can choose how to handle each of these protocols individually by dropping, capturing metadata only, or capturing all data related to them. There is also an additional rule for each policy that handles all other unidentified protocols not included in this list. The policies apply the collect or drop actions based on protocol characteristics, regardless of the port that they are captured on.

Category	Protocol	Description
Database	TNS	Transparent Network Substrate Oracle database networking protocol messages
	TDS	Tabular Data Stream for SQL server communications
Email	SMTP	Simple Mail Transport Protocol messages

Category	Protocol	Description
	POP3	Post Office Protocol v3 messages (Email clients use to retrieve mail from server)
File	SMB	Server Message Block (or CIFS) network communication protocol file sharing communications
	NFS	Network File System protocol messages
	FTP	File Transfer Protocol messages
	TFTP	Trivial File Transfer Protocol messages
Networking	SNMP	Simple Network Management Protocol messages
	DNS	Domain Name System messages
	DHCP	Dynamic Host Configuration Protocol messages
	NETBIOS	Network Basic Input/Output System networking protocol messages
Remote Access	SSH	Secure Shell secure remote connections
	TELNET	Teletype network remote interface protocol messages
	SCCP	Cisco Skinny Client Control Protocol terminal control protocol messages
Routing	RIP	Routing Information Protocol distance-vector routing protocol messages
Social Media	GTalk	Google Talk or Google Chat instant text messages
	IRC	Internet Relay Chat protocol text messages
	NNTP	Network News Transfer Protocol for Usenet news articles
VoIP	RTP	Real-time Transport Protocol audio and video streaming protocol messages
	SIP	Session Initiation Protocol text-based messaging application control protocol messages
	H323	ITU-T Q.931 based protocol for Voice over IP (VoIP)
Web	HTTP/HTTP2	HyperText Transfer Protocol 1.x/2.x messages
	HTTPS/TLS	HyperText Transfer Protocol Secure over Transport Layer Security or Secure Sockets Layer encrypted messages

Note: When selective network data collection is set up to collect metadata only for the HTTPS/TLS protocol, it truncates the traffic after the SSL/TLS handshake to ensure that all the certificates and other details are retained for analysis purposes while the encrypted packet payloads are dropped.



(Optional) Configure a Decoder to Write Standard pcap-formatted Files

To provide a more open database format, the Network Decoder can write standard pcap-formatted files. You can enable pcapng-formatted database files with the configuration node:
`/database/config/packet.file.type = 'pcapng' or 'netwitness'`

Note: This capability is enabled by default if you install 11.2 or later. If you upgrade from a previous version to 11.2, you must enable pcapng-formatted database files manually, which can result in an approximate 4% decrease in disk space (as the pcapng files require more space than the NetWitness nwdb files).

To enable writing standard pcap-formatted files:

1. Go to (Admin) > **Services**, select a Network Decoder service, and then select > **View** > **Explore**.
2. Go to **database** > **config**.
3. In **packet.file.type**, the default is **pcapng**.

4. To change the packet file type to NetWitness formatting, type **netwitness** and press **Enter**. This change will take effect immediately on the next packet file that is created.

Note: In the pcapng database file format, the data is in clear text, and is not obfuscated by our proprietary format, which can improve security.

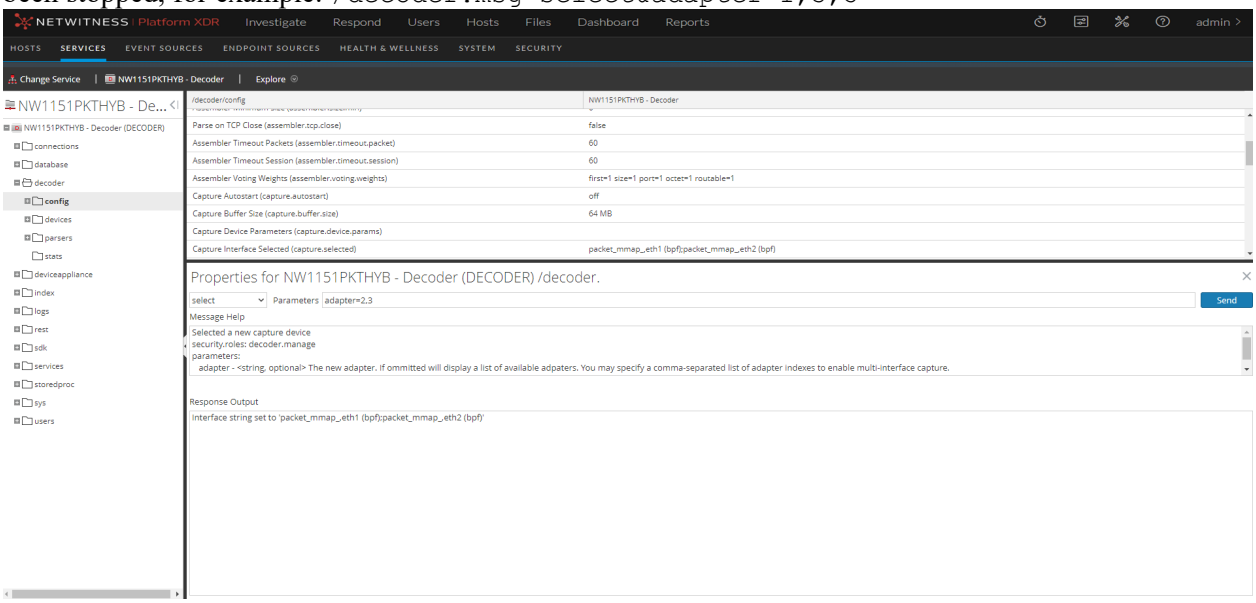
Caution: Please do not touch any files in the packet database directories! You must not read or edit any `pcapng` file in the packet database directories, as they are always in use while Decoder is running. Decoder always expects full and exclusive access to those files, and other processes reading those files prevent normal Decoder operation. The proper way to access the `pcapng` files is to set up a cold storage directory. This allows Decoder to copy `pcapng` files to the cold storage directory before deletion. At that point, you are responsible for managing the `pcapng` files, including making sure that the cold storage volume never fills up. Keep in mind that copying the `pcapng` files to cold storage requires a non-trivial amount of I/O and could interfere with packet capture. Cold storage for `pcapng` is not supported at 10G speeds.

(Optional) Multiple Adapter Packet Capture

Beginning with 11.5, the Network Decoder can capture from multiple interfaces simultaneously. This functionality allows Network Decoders to capture from multiple physical Network Interface Cards (NICs), or multiple ports on multiple interfaces, while leveraging the same network rules, application rules, and parsers for each NIC. The benefit of capturing from multiple physical NICs is that this method multi-threads the capture process for each adapter interface, which also multi-threads network rule evaluation.

For example, prior to 11.5, defining `capture.selected=PFRINGZC, em3` along with `capture.device.params=device=zc:em3,zc:em4` allocated a single thread for the Network Decoder to capture any traffic that came into either `em3` or `em4` interfaces. This also meant that all network rules were evaluated in a single thread.

However, in 11.5, configuring `capture.selected=PFRINGZC,em3; PFRINGZC,em4` allocates two threads for the Network Decoder to capture the traffic collected on either `em3` or `em4`, which provides more resources to the capture pipeline.



In this topic, the term "adapter" refers to a capture device within the Decoder. An adapter's name consists of the device (for example, the software API that the Decoder uses to interact with an adapter), and an interface (the physical device). A device can have multiple interfaces, and an interface can be compatible with multiple devices.

Configure Multiple Adapter Packet Capture

Note: Changes to capture device configuration do not take effect until service restart.

You can define multiple adapter packet capture for Decoders in the config setting `/decoder/config/capture.selected`. It accepts a semi-colon separated list of adapters, for example: `bpf,en5 (bpf);null_device,Null Capture`. This setting can be edited while capture is running, however, the changes do not take effect until the service has been restarted.

You can use the `/decoder?msg=select` command to select one or more adapters after capture has been stopped, for example: `/decoder?msg=select&adapter=1,3,5`

Note: As of 11.5, this configuration is not yet available in the `decoder` > `config` page. Use the `decoder` > `explore` page or the REST API. You can the Explore view by selecting a Decoder in the user interface and going to  (actions)> **View** > **Explore**. You can access the REST API by opening a browser and specifying the IP address of the host, for example, `https://<decoder-ip-address>:50106`.

Per Interface Configuration

The `/device/config/device.capture.params` configuration is a global configuration setting, and is applied to every interface when capture is started.

There is also a configuration setting for individual interfaces, which is `/decoder/devices/<devicename>/<interfacename>/config`. Currently, the only option available in this configuration setting is `capture.params`. Any value in this setting will override the global configuration setting.

Stat Nodes

As with configuration, there are per-interface stats and aggregate stats (similar to the global configuration). When there is a single device configured, these stat nodes function as in previous versions. When there is more than one device configured, the stat settings `/decoder/stats/capture.device` and `/decoder/stats/capture.selected` read `multi`.

Per-Interface Stats

The stats for each interface can be found in:
`/decoder/devices/<devicename>/<interfacename>/stats`

The captured stats are:

- capture.avg.size
- capture.dropped
- capture.filtered
- capture.header.bytes
- capture.kept
- capture.payload.bytes
- capture.received
- capture.total.bytes
- pool.packet.captured

Aggregate Stats

The capture stats under /decoder/stats represent an aggregate of the individual interface stats.

In the following table, for example, capture.avg.size is the maximum average size among all the interfaces, where capture.dropped is the total captures that were dropped for all the interfaces.

capture.rate	SUM
capture.avg.size	MAX
capture.dropped	SUM
capture.filtered	SUM
capture.header.bytes	SUM
capture.kept	SUM
capture.payload.bytes	SUM
capture.received	SUM
capture.total.bytes	SUM
pool.packet.captured	MIN

Pool Stats

All the network packet and session pool pages are tracked in /decoder/stats/pool/.

The stats under /decoder/stats/pool represents the total number of capture pages configured in Decoder. These include packet pool and session pool pages.

capture.port Meta Key

Each session is given a capture.port meta key which identifies the adapter from which the packets in the session were captured. This meta key can optionally be turned off with the /decoder/config/captureport.meta.enabled option. This meta key is on by default for Network Decoders, and is off by default for Log Decoders.

IMPORTANT: The `capture.port` meta key does not work with the `packet_mmap_,ALL` adapter. You must specify individual ports while using `capture.port`. The `packet_mmap_,ALL` adapter is capable of capturing across all types of network interfaces at the same time. For more information, see (Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces.

Note: If you turn the `capture.port` meta key off, you must perform a capture restart for the change to take affect since this is a configuration change.

Special Devices

The nwimport device is for handling PCAP imports while simultaneously capturing network data. For more information on PCAP imports, see Upload a Packet Capture File.

`nwimport`: This device is not selectable but does have stat and config nodes. The config node for `nwimport` is ignored.

`Packet arrived out of order` Message

This message means that the Decoder is seeing old packets. This can be a side-effect of running import while capture is running. This message is usually suppressed at the beginning of import and then unsuppressed at the end. However, packets can still be in the state of being processed even after the upload of the imported file has completed. This means that this warning can be unsuppressed before the processing of the imported packets is completed, which results in displaying this message.

For information about updating Decoder configurations, see the *RESTful API User Guide for NetWitness Platform*. For information about stopping and restarting capture, see Configure Capture Settings. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Multi-Assembler Modes

The process that reassembles captured packets into streams is known as the Assembler. You can customize the Assembler operation to suit the packet capture configuration. It works in two modes (`on` and `off`) that are configured using the `/decoder/config/assembler.threading.enabled` variable. The value of `assembler.threading.enabled` only takes effect if multi-adapter packet capture is enabled.

Note: If you change the value of `assembler.threading.enabled`, you must perform a capture restart.

OFF Mode: If assembler threading is `off`, then one Assembler is used to assemble all packets captured from all interfaces. Packets from a stream may appear on any capture interface and the single assembler will put them back together.

- Assembler threading must be `off` to allow assembler to reconstruct streams that are capture across multiple capture interfaces.
- When assembler threading is `off`, the single Assembler instance may limit the maximum packet rate that the Decoder can process.

ON Mode: If assembler threading is `on`, there will be a separate Assembler for each capture interface. Each Assembler will only reassemble the packets it receives from it's capture interface.

- This mode of operation enables higher throughput because each Assembler instance operates on a dedicated processor.
- Each logical stream of packets must be ingested by one interface only. For example, the streams on each capture interface could come from different networks.

For compatibility with previous releases, the Multi Assembler mode is `off` by default.

When importing packets, the imported packets are fed to one of the existing assemblers, or the single Assembler instance when Assembler threading is `off`. Importing packets does not create a separate Assembler process.

(Optional) Internet Content Adaptation Protocol Capture

Internet Content Adaptation Protocol (ICAP) is a service protocol that encapsulates HTTP messages into ICAP Messages and forwards them to an ICAP server for processing.

NwDecoder supports capturing ICAP Messages and converting the HTTP requests and responses into packets. The capture device is named `icap`, `ICAP Server`, and can be used simultaneously with other capture devices (i.e., packet capture).

ICAP Capture Options

The capture options are specified on Decoder in the configuration node `/decoder/config/capture.params`

You must restart the capture before any changes take effect.

- `reqmod=<bool>` - By default, the Decoder will process both `REQMOD` and `RESPMOD` messages. Since the `RESPMOD` contains both the request and response, it may be advantageous for Decoder to ignore `REQMOD` messages and only process `RESPMOD`. If you set the `reqmod=false`, the Decoder will generate a request packet and response packets from a single `RESPMOD` message. The default behavior is equivalent to `reqmod=true`

- `client_ip=<string>` - You can configure some ICAP Clients to include the originating IP address in the ICAP headers. The name of the header with this information can vary, so you can use this setting to specify the name of the client IP header. For example, `client_ip=X-Client-IP` would configure the Decoder to extract the IP from the `X-Client-IP` header. Ignoring this setting will disable searching for the header.

(Optional) Data Plane Development Kit Packet Capture

The NetWitness Decoder supports capturing packets through the Data Plane Development Kit, also known as DPDK. DPDK is a set of libraries and drivers that support applications that work on directly on packets. DPDK's web site, www.dpdk.org, provides more information.

Advantages

The Decoder can use the DPDK to ingest packets from Ethernet interfaces. It is an alternative to existing packet capture options built into the Decoder. DPDK offers these advantages:

- It is entirely open source, with no binary-only driver components, unlike PF_RING.
- It is directly supported by multiple vendors, including our main vendor, Intel.
- Since the kernel-level interface is in the mainline Linux kernel, there are no separate driver packages to compile and distribute.
- DPDK devices are completely separate from the Linux network stack, which avoids unintentional interaction between Linux networking and packet capture.
- DPDK is capable of capturing at greater than 10G, unlike the `packet_mmap`.

How it Works

DPDK completely detaches the Ethernet interface from the Linux kernel. It does this by doing the following:

- It uses a Linux User I/O driver mechanism to expose the raw PCI-Express device to normal Linux programs. This means that it can take the raw memory space mapped to the PCI device and expose it, so that a normal Linux program can directly manipulate the hardware. There are a couple of drivers built into the Linux mainline kernel that can accomplish this. Decoder is designed to use `vfio_pci_generic`.

  Note: Only one driver can be attached to an Ethernet interface at a time. When `vfio_pci_generic` is attached to an interface, the Linux network driver for that interface is detached.

- The DPDK provides its own user-space implementation of the hardware drivers for a wide variety of Ethernet cards. When a DPDK application like Decoder is loaded, it can attach directly to the PCI device and manipulate it using DPDK-specific library functions. When a device is attached to DPDK, the Decoder can see it and automatically sets the device up with the DPDK Capture Device option.

Migrate PF_RING Devices to DPDK

For configurations using multiple adapter packet capture (available in 11.5 and later), you must use the manual procedure outlined in Manually Move a Capture Interface to DPDK . For example, the migration (`dpdk migrate`) does not support a Decoder when capture is configured with: `capture.interface=PFRINGZC,em3; PFRINGZC,em4;packet_mmap,em2`.

For configurations prior to 11.5, the procedure that uses the devices parameter to capture from multiple `PF_RING`-supported interfaces (for example, `ixgbe` and `i40e`) will be converted to using DPDK, along with the multiple adapter packet capture, so that one capture thread is used per interface.

For example, the migration will work if configured as follows:

- For multi-interface capture: `capture.interface=PFRINGZC,em3` along with `capture.device.params=device=zc:em3,zc:em4`
- For single interface capture: `capture.interface=PFRINGZC,em3`

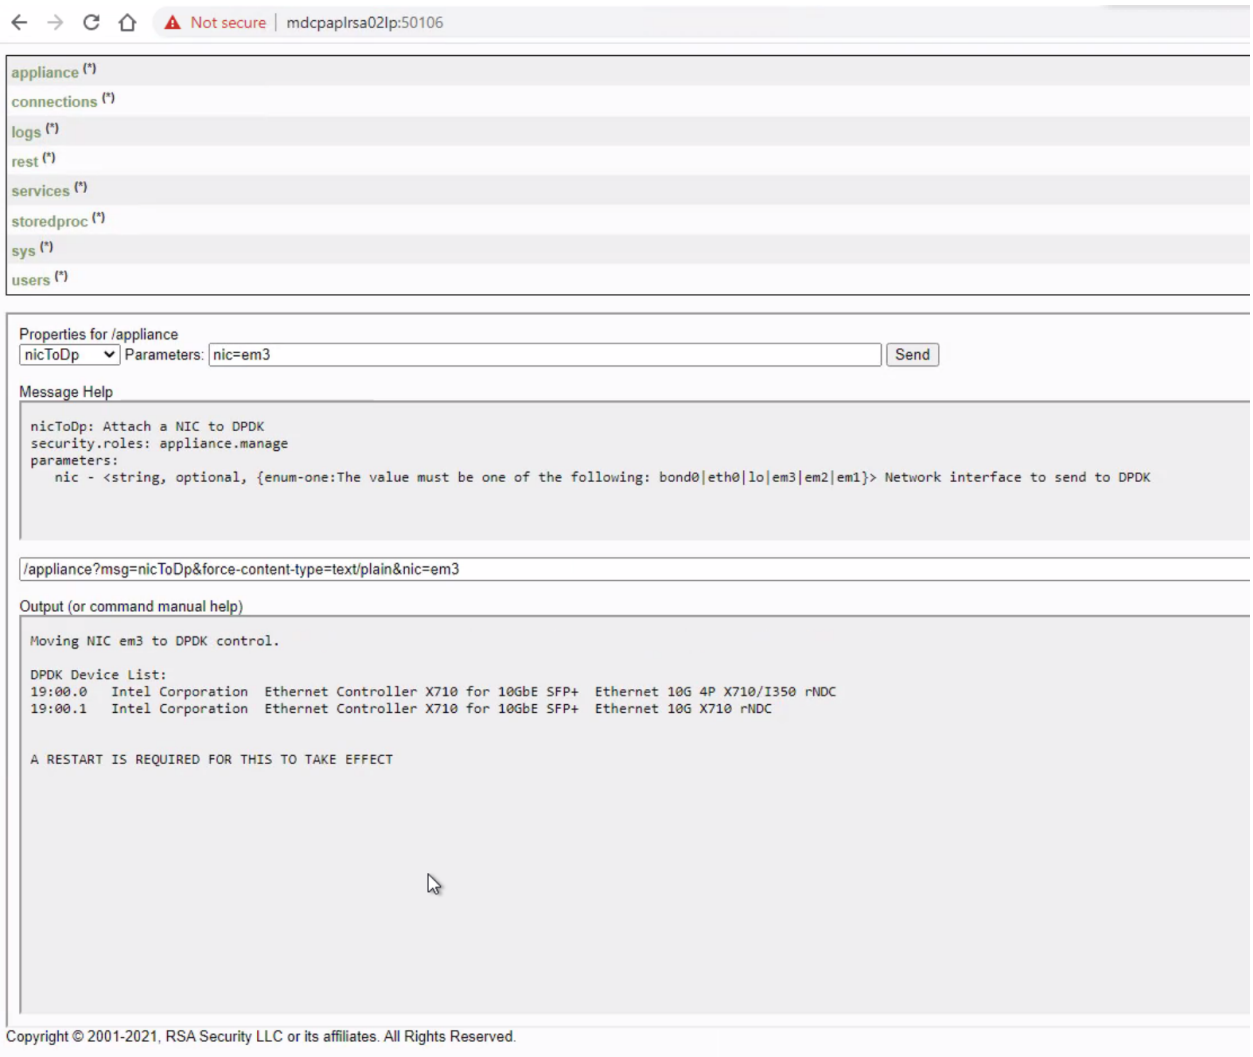
Note: `dpdk migrate` only functions with `PFRINGZC`, not `mmap` interfaces.

If you are using `PF_RING` to capture packets on your Decoder, you can use the Decoder's `dpdk migrate` command to migrate your existing PF_RING capture devices to DPDK. This command uses your currently-selected capture device configuration to determine which network interfaces are moved to DPDK control.

1. Go to  (Admin) > Services and select a Decoder.
2. Click  > **View** > **Explore**, right-click **decoder** and select **Properties**.
3. From the command drop-down list, select the `dpdk` command, type the parameter `migrate`, and click **Send**.

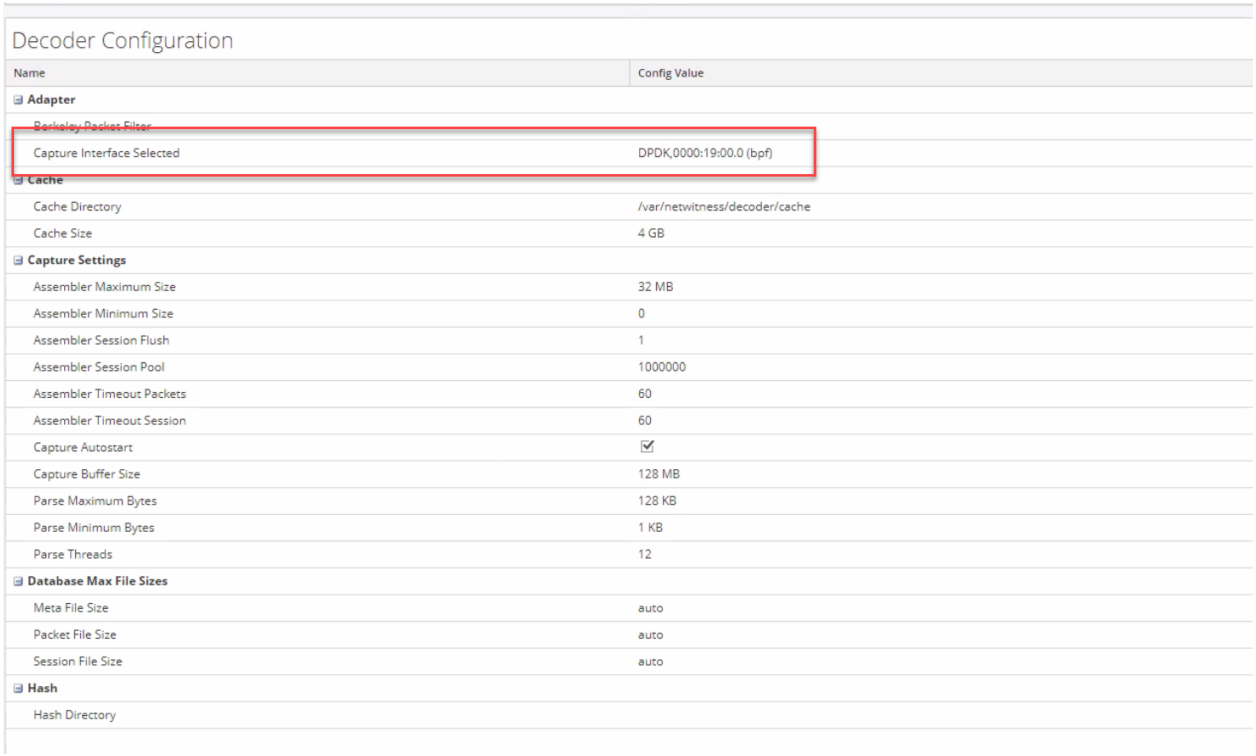
4. In the command output window, the changes that will be made on the Decoder to perform the migration are displayed. If everything looks correct for the migration, add the parameter `commit=1` to the command after `migrate` to actually make the changes on the Decoder.

1. At the reboot prompt, reboot the host to make the driver loading changes.
2. (Optional) Run the `/decoder/devices/<devicename>/msg=prune` command to remove configuration options for devices and interfaces that no longer exist after the migration.



> **Note:** The `prune` command removes only the undetected interface folders. Also, it ignores the `interfaces`, `stats`, `nwimport`, and `flow_events` folders available in `/decoder/devices/`.

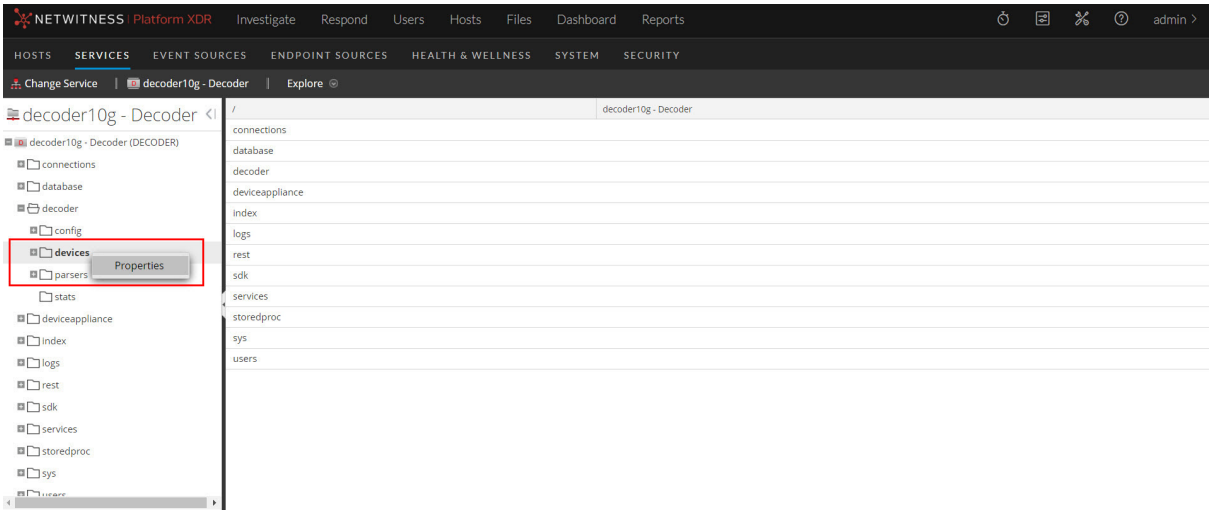
Manually Move a Capture Interface to DPDK



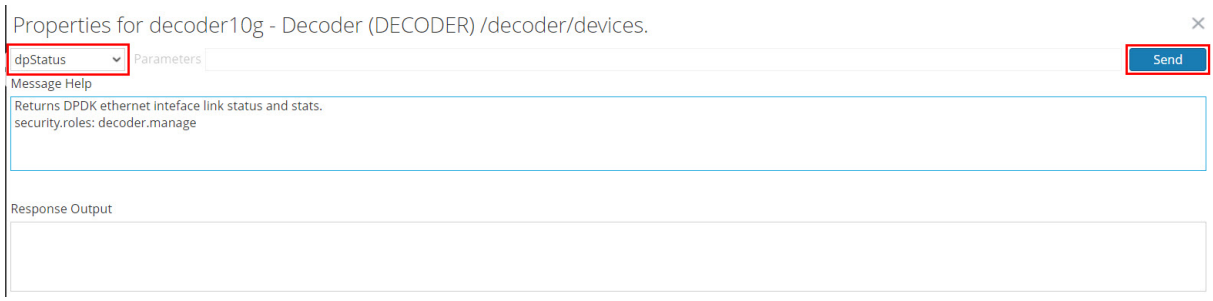
1. Run the new host service command `/appliance/nicToDp`, that converts a named network interface and sends it to DPDK.
   For example, if you provide `nicToDp` an interface name like `p1p1` it detaches it and sets it up for DPDK to use. It does the following:
   a. Identifies the PCI address of the named interface.

   > **Note:** From this point on, the Ethernet interface is identified by its PCI address alone, which is a physical characteristic based on where the Ethernet interface is installed in the computer.

   b. Creates configuration files that describe which PCI addresses DPDK is allowed to use.
   c. Sets up a systemd unit that binds the configured PCI addresses to DPDK instead of to the default Linux drivers on the next system reboot. The following figure shows a successful command.

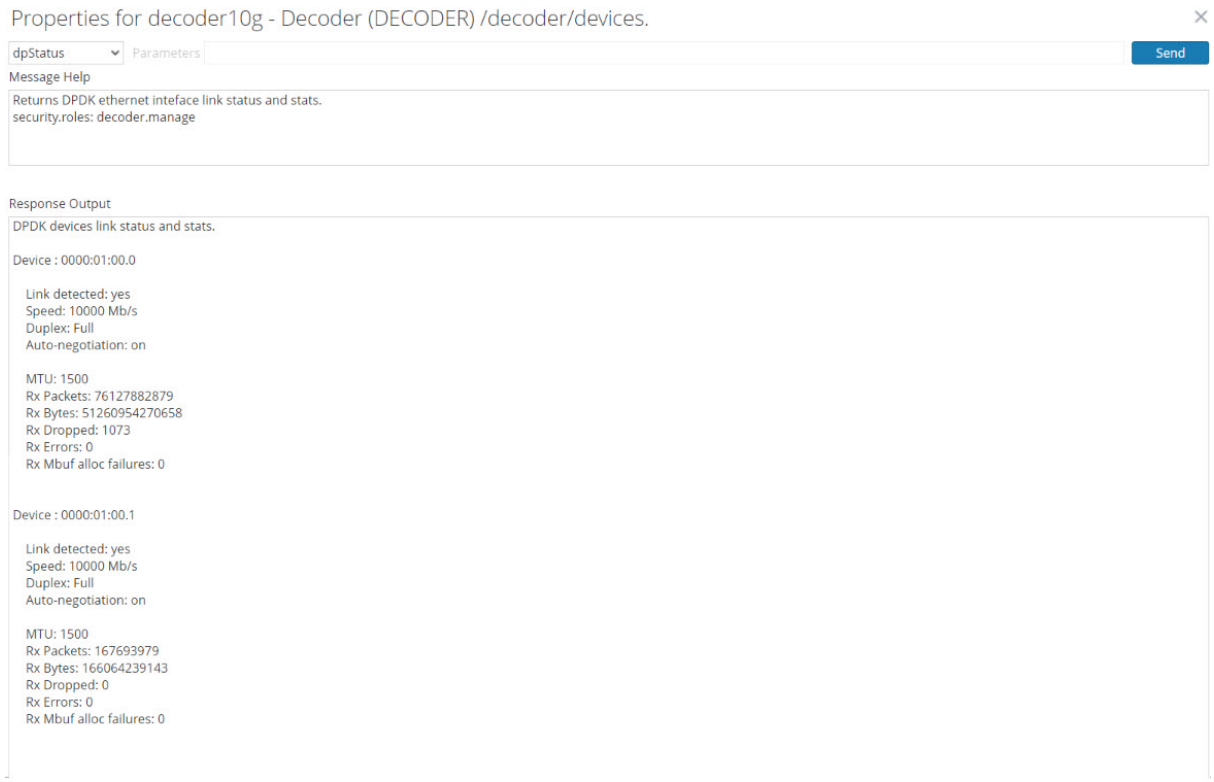


2. Reboot the Decoder host. The reboot accomplishes the following:
   a. Ensures that live capture on the interfaces stops before the network driver is unloaded.
   b. Binds the `vfio_pci_generic` driver to the configured interfaces.
   c. Pre-allocates some Huge Page memory for each interface, as required by the DPDK libraries.
3. After the reboot, the Decoder does not start capturing, since the network interface it had been using to capture has been moved to DPDK. Change the Decoder's capture configuration to select the DPDK device that is now available. For information about how to change the capture configuration, see Configure Capture Settings.
4. Restart the service. The following figure shows the Decoder configuration after a restart.



Check the device status and stats of DPDK interfaces

When you capture using DPDK interfaces, the link status and stats of the DPDK can be obtained using the command `/decoder/devices dpStatus`. The traditional commands like `ethtool` or `ifconfig`, which are used for other capture interfaces, will not fetch the link status and stats of DPDK devices.



1. Go to (Admin) > **Services**.
2. In the Administration Services view, select the Decoder and **View > Explore**.
3. Navigate to **decoder > devices**, right click on **devices** and select **Properties**.

4. Select **dpStatus** from the drop-down and click **Send**.

The link status and stats of DPDK devices are displayed in the **Response Output** section.

Check link status and stats from NwConsole

Run `/decoder/devices dpStatus` on NwConsole. Sample output when capture is in **Start** state:

```
[localhost:56004] /> send /decoder/devices dpStatus
DPDK devices link status and stats.

Device : 0000:01:00.0

    Link detected: yes
    Speed: 10000 Mb/s
    Duplex: Full
    Auto-negotiation: on

    MTU: 1500
    Rx Packets: 416843663
    Rx Bytes: 281110914127
    Rx Dropped: 314
    Rx Errors: 0
    Rx Mbuf alloc failures: 0

Device : 0000:01:00.1

    Link detected: yes
    Speed: 10000 Mb/s
    Duplex: Full
    Auto-negotiation: on

    MTU: 1500
    Rx Packets: 597764
    Rx Bytes: 373053232
    Rx Dropped: 0
    Rx Errors: 0
    Rx Mbuf alloc failures: 0
```

Sample ouput when the capture is in **Stop** state:

```
Device : 0000:01:00.0
Link detected: no
Device : 0000:01:00.1
Link detected: no
```

Utilizing Receive Side Scaling with DPDK

Receive Side Scaling (RSS) efficiently distributes the network receive processing across multiple CPUs in a multi-processor system. RSS ensures that the processing associated with a given connection stays on the assigned CPU.

IMPORTANT: Receive Side Scaling is supported on DPDK devices using the ixgbe or i40e device drivers only.

Advantages

When RSS is enabled, the DPDK capture devices split the incoming packet stream into multiple queues providing following benefits:

- Each queue is processed with a dedicated capture worker thread. As there are more threads processing the capture work, it allows more CPU time available for Berkeley Packet Filters (BPF) rule and network rule evaluation.

- Each capture worker thread can feed multiple assemble worker threads simultaneously which allows more CPU time available for assembly.
- Each CPU thread processes only a fraction of the packet stream. However, the total number of packets processed from all queues working in parallel increases the overall output (packets processed per second) of Decoder.

Configuring Receive Side Scaling

To enable RSS in a DPDK controlled NIC, set the `/decoder/devices/DPDK/(PCI_ID)/config/rss` value to a value greater than `1`. The typical values of RSS must be a small power of 2, for example, `4` or `8`. This value determines the number of CPU threads to be allotted for packet processing during the next capture. Similarly, if assembler threading is enabled, a matching number of assembler threads will be created to process the packets on each incoming queue.

For example, the following sample configuration will utilize a total of eight threads (four capture threads + four assembler threads) for multi-adapter packet capture with DPDK and multi-assembler threading turned on. This is the maximum recommended value for an eight core Decoder CPU.

`assembler.threading.enabled` set to `on` or `true`

```
/decoder/devices/DPDK/0000:01:00.1/config/rss=2
/decoder/devices/DPDK/0000:01:00.0/config/rss=2
```

To minimize packet drops, it is recommended that you keep the total number of capture and assembler threads less than the number of cores per CPU.

How it Works

When RSS is enabled, Decoder utilizes the RSS hardware acceleration on the capture NIC to apply a symmetric RSS hash function. The hash function sends packets from both directions of a given stream to the same queue. It enables the packets received on that queue to be processed by a dedicated assembler thread. This eliminates the need for Decoder to merge streams from different RSS queues and reassemble the streams. Hence, it is recommended that you enable multi-threaded assembly when using RSS. To enable, set `/decoder/config/assembler.threading.enabled` to `true` or `on`.

Configure the Decoder Capture Failover in Load Balance Deployments

The DPDK capture in the decoder service provides the ability for load balancers to failover and avoid data loss when decoder capture is off or when the service is shut down due to maintenance activity. When the decoder capture is stopped, the DPDK capture interface link status is down. This provides the ability for the traffic ingestion physical load balancers (for example, Keysight Ixia, Gigamon) which monitor interface links to switch to a different decoder and avoid data loss.

Configuration Failover on DPDK Capture Interfaces

Refer to the (Optional) Data Plane Development Kit Packet Capture *topic for instructions to configure DPDK capture on the decoder*.

- You can migrate existing PF_RING devices to DPDK

  (Or)

- Manually move capture interfaces to DPDK

Disable Wake On LAN (WOL) in BIOS settings

Some load balancers monitor interface link status through NIC link lights. You must disable WOL as the interface will not be down if WOL is enabled. To disable WOL in the BIOS, follow the BIOS instructions.

Example: f2 -> Device Settings -> "Integrated NIC 1" (capture interfaces) -> "NIC Configuration" -> "Wake on LAN" = Disabled

Note: When you restart the device and if capture does not auto-start, the lights on the capture interface are on. But if you turn on capture and turn it off again the lights will be off.

(Optional) Remove DPDK on Capture Interfaces

In case you need to revert DPDK on capture interfaces you can use the Appliance service `dpToNic` command.

- If you run this command without arguments, it lists the ethernet devices controlled by DPDK.
  - **Example:** /appliance dpToNic

    DPDK Device List:

    82:00.1 Intel Corporation 82599ES 10-Gigabit SFI/SFP+ Network Connection Ethernet Server Adapter X520-2
- If you specify an ethernet interface using the 'eth' parameter, it removes the interface from DPDK so that when the system reboots it will be treated as a normal Linux network interface.
  - Example: /appliance dpToNic eth=82:00.1

    Detaching PCI Device 82:00.1 from DPDK.

    DPDK Device List: A RESTART IS REQUIRED FOR THIS TO TAKE EFFECT

Validate Link Status

- On Capture Start
  - During the decoder capture start, the service logs DPDK interface link status
    - [DPDK] eth dev 0000:05:00.0 link is up
  - On the upstream traffic ingest Load Balancer, the link status would be detected.
    - If it is a Linux-based device, you can use the ethtool <interface name> command to check link status
- On Capture Stop
  - During the decoder capture stop, the service logs that capture is stopped on DPDK interfaces
    - [Thread] Stopped thread: Capture Work (DPDK, 0000:05:00.0) id: 31214
  - On the upstream traffic ingest Load Balancer, the link status would not be detected.
    - If it is a Linux-based device, you can use the ethtool <interface name> command to check link status.

DPDK Interface Configuration and Statistics

- The `dpdk-devbind --status` command displays the status of DPDK and other known network interfaces. It displays the PCI domain, bus, slot, and function, along with a text description of the device.
  - Example: `dpdk-devbind --status`
    - 0000:01:00.0 '82599ES 10-Gigabit SFI/SFP+ Network Connection 10fb' drv=vfio-pci unused=ixgbe_zc
    - 0000:01:00.1 '82599ES 10-Gigabit SFI/SFP+ Network Connection 10fb' drv=vfio-pci unused=ixgbe_zc
- The default MTU is 2048. If you need to adjust the MTU for capture, add the `snaplen` parameter to `/decoder/config/capture.device.params` .
- VLAN offload is disabled.
- The DPDK interface capture stats are updated under /decoder/devices/dpdk/
  - Example: /decoder/devices/DPDK/0000:01:00.1/stats/
    - Received packets (Rx packets) - capture.received
    - Received bytes (Rx bytes) - capture.total.bytes
    - Received dropped (Rx dropped) - capture.dropped

For information on checking device status and stats of DPDK interfaces, refer to Check the device status and stats of DPDK interfaces

(Optional) Preserve VLAN Tags When Using the Packet MMAP Capture Interface

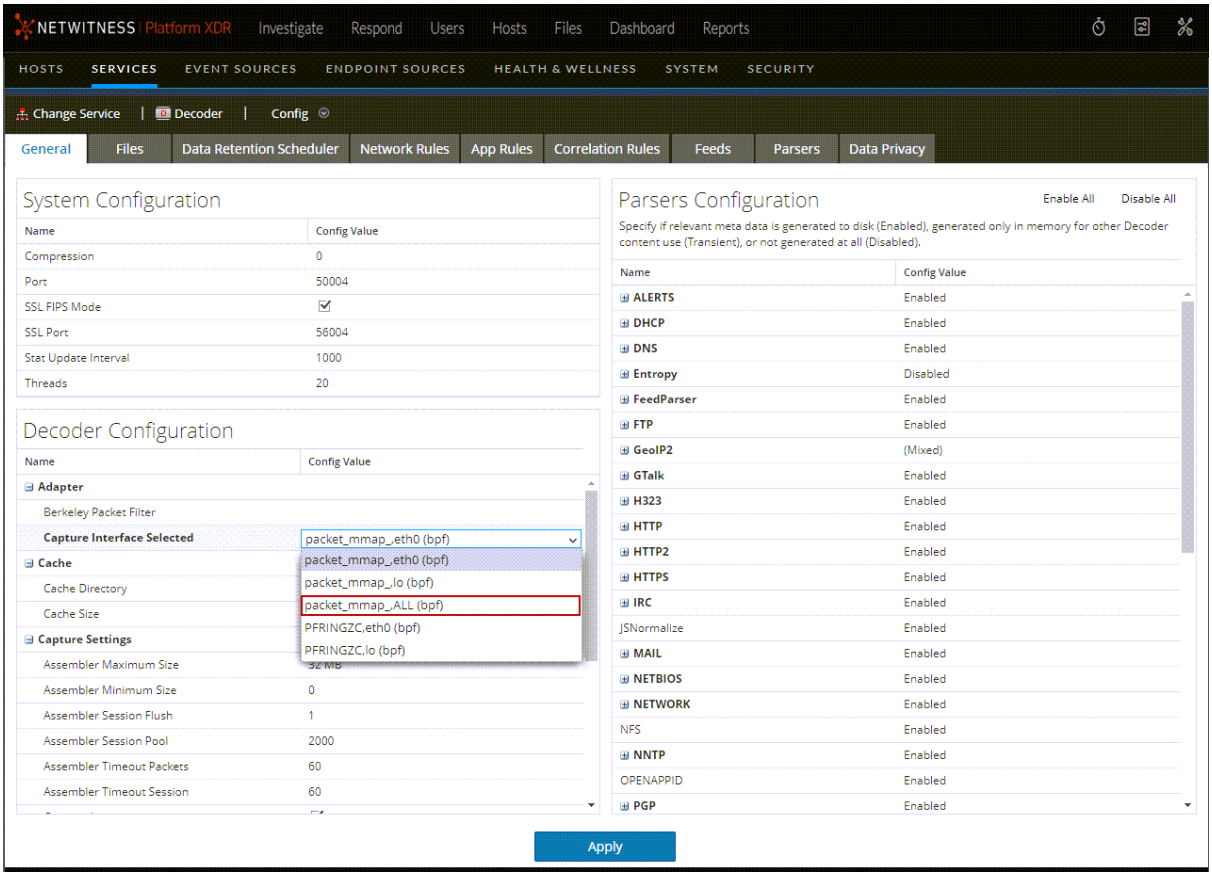
When capturing traffic containing VLAN tags, you may need to configure the Packet MMAP capture interface to preserve the VLAN tags in the packets (VLAN fixup). By default, the network capture hardware removes the tags. Performing this procedure preserves the tags in the packets, and the tag values are parsed into VLAN meta data for further analysis.

There are two mechanisms for enabling the VLAN fixup.

- Option 1: Set `vlan-fix=true` within `capture.device.params`. This option performs the VLAN fixup on all traffic entering the Decoder. This option is appropriate in most cases, since it is assumed that all the traffic will be VLAN tagged.This mechanism works on either single-interface mode, or on all-interfaces mode. This option overrides the VLAN fixup settings on individual interfaces; even interfaces that are not configured to do VLAN fixup will have the feature enabled.
- Option 2: Use the `interfaces` parameter within `capture.device.params` on a per-device basis. The `interfaces` parameter accepts a comma-separated list of interface names on which to capture packets. By adding `:vlan` to an interface name, you can enable the VLAN fixup on individual

interfaces. If the interface does not have the `:vlan` suffix added, then it will not perform the VLAN fixup.

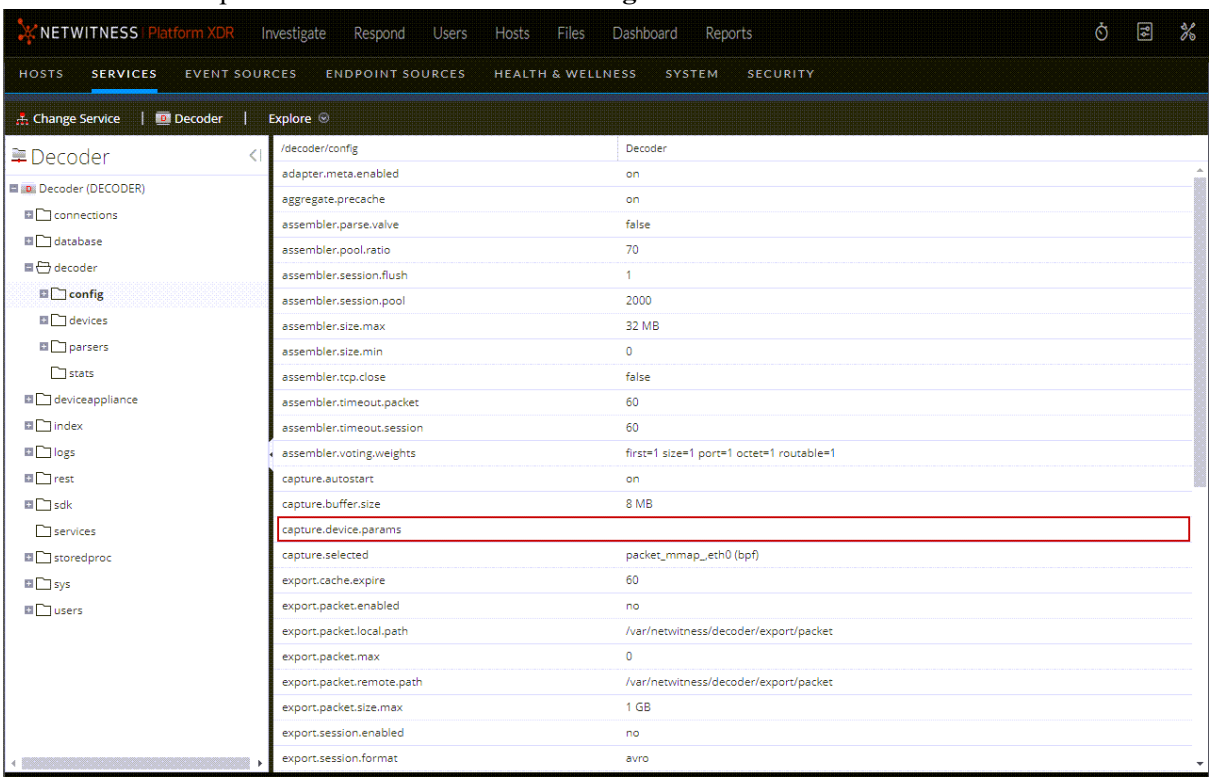
After editing this parameter, you must restart capture on the Decoder in order for changes to `capture.device.params` to take effect.



These are `vlan` examples of both options. If you need to pass multiple settings for `capture.device.params`, use the following synax. Notice that quotes are needed to delineate whitespace. For more information about how to use quotes for whitespace, see the "Connecting to a Service" topic in the *NwConsole User Guide for NetWitness Platform*.
`name1="value1" name2="value2"`.

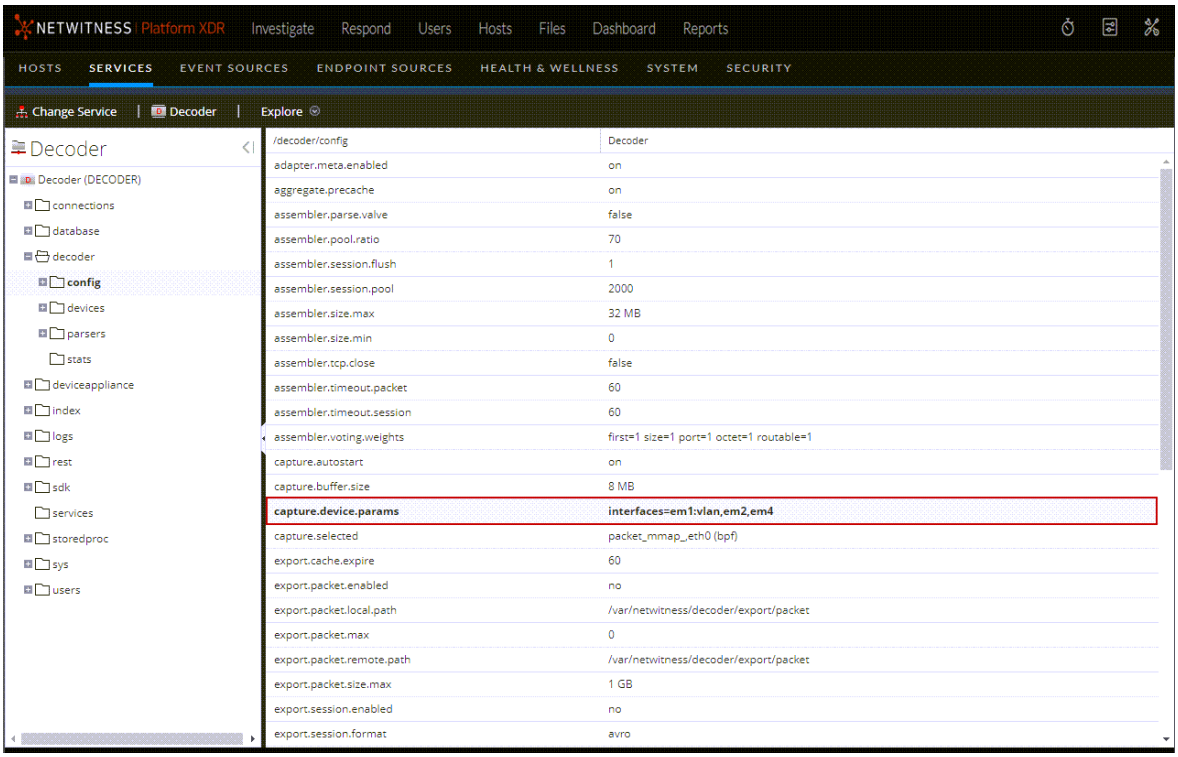
Parameter	Value	Effect
`capture.device.params`	`vlan-fix=true`	VLAN fixup always performed on all interfaces. The default value is `vlan-fix=false`.
`capture.device.params`	`interfaces=eth0:vlan,eth1`	VLAN fixup performed on traffic capture on `eth0` interface only
`capture.device.params`	`interfaces=eth0:vlan,eth1 vlan-fix=true`	VLAN fixup always performed because the `vlan-fix` setting overrides the interfaces setting.

To configure the `packet_mmap_` adapter to preserve the VLAN tags in packets:



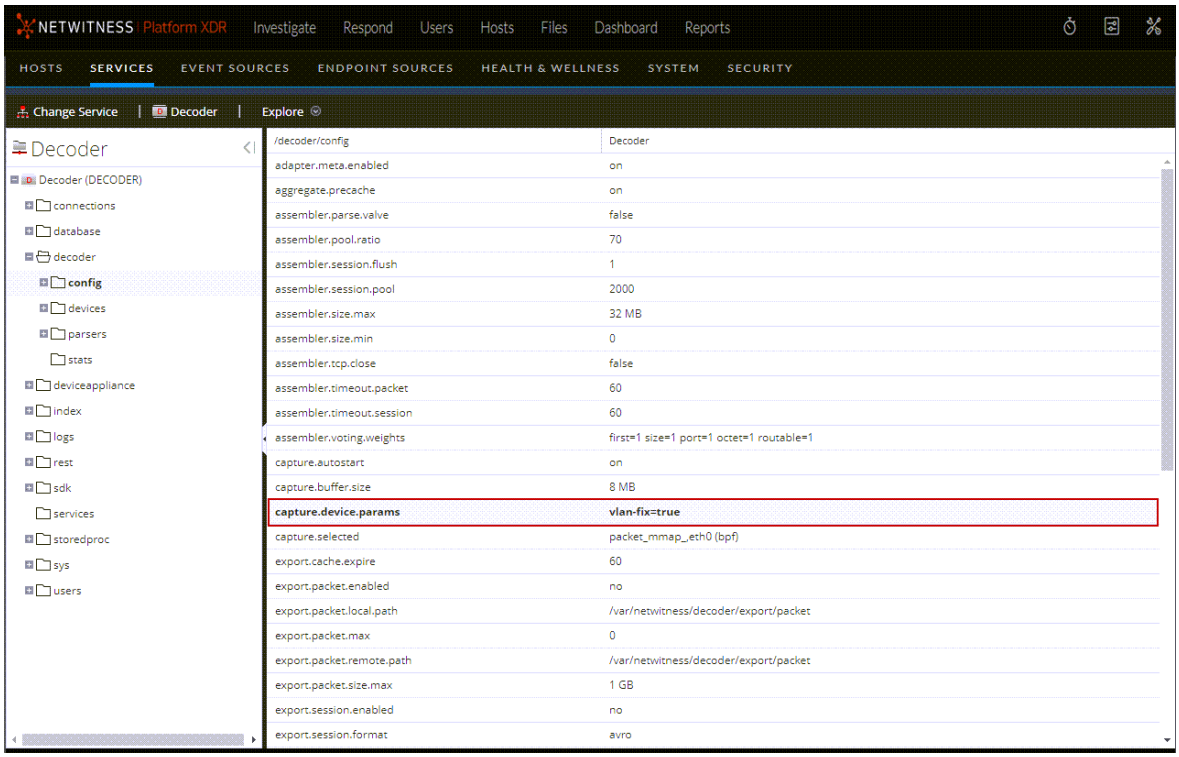
1. Go to  (Admin) , select the Decoder service and  **> View > Config.**

2. In the **Decoder Configuration** panel, set **Capture Interface Selected** to the `packet_mmap_,ALL` adapter.



3. To go to the **Explore** view, click **Config** in the toolbar and select **Explore** in the drop-down list.

4. In the Services Explore view select **decoder** > **config**.



5. Click in the values column next to `capture.device.params`, and do one of the following:

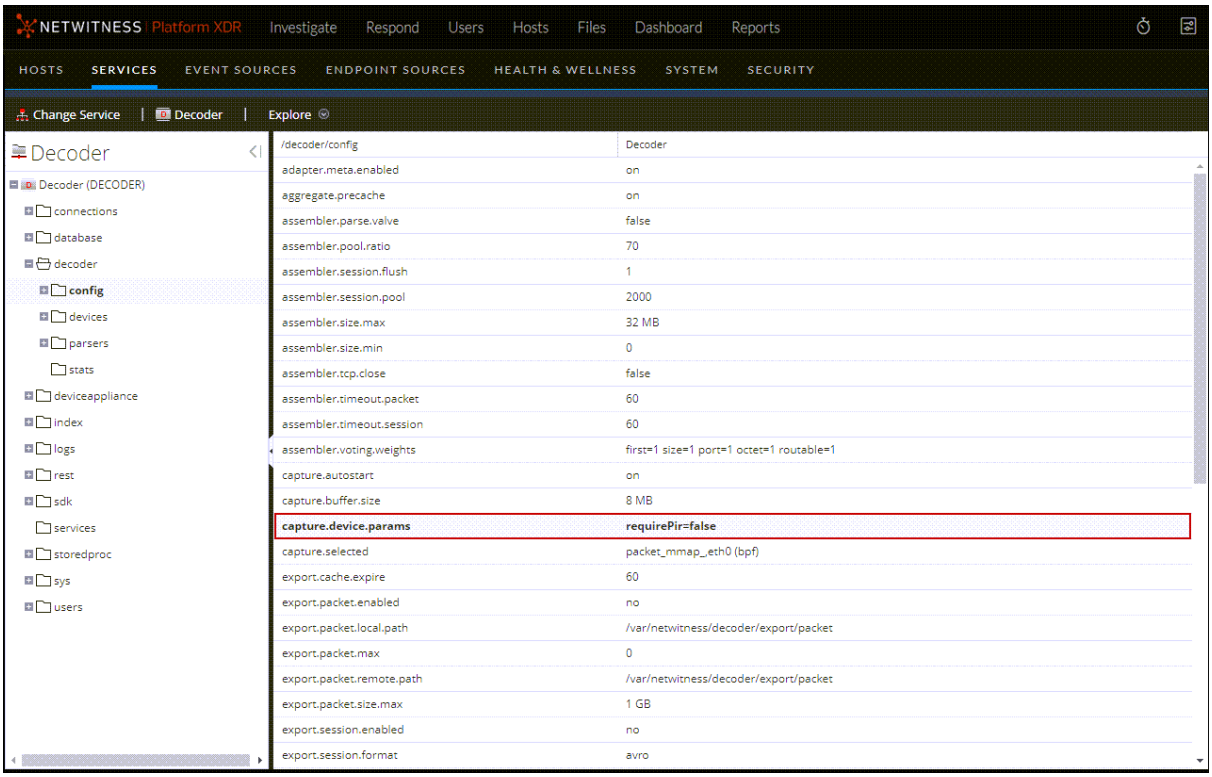
   - To preserve VLAN tags on an interface in the interfaces list, add **`:vlan`** after the interface name and press **Enter**.
     For example, this specifies that VLAN tags are preserved on `em1`, but not on `em2` and `em4`:
     `interfaces=em1:vlan,em2,em4`

The change goes into effect after restarting capture; only traffic on `em1` has the VLAN tags preserved.

- To preserve VLAN tags on all interfaces, enter the following and press **Enter**:
  `vlan-fix=true`

VLAN tags are preserved on all capture interfaces.

6. Select Start Capture (Start Capture). The change takes affect after capture is restarted.



(Optional) Process Raw Syslog Data without Priority Field

You have the option to process raw syslog data that does not contain a valid priority (`PRI`) field.

To configure a Log Decoder to process syslog without a Priority field:

1. Go to (Admin) > **Services**, select the Log Decoder service and > **View > System**.
2. Select Stop Capture (Stop Capture).
3. From the drop-down menu, where System is shown, select **Explore**.
4. Select **decoder** > **config**.
5. In the `capture.device.params` field, add the following text, and then click **Enter** to save the changes:

   `requirePri=false`

6. From the drop-down menu, where Explore is shown, select **System**.
7. Select Start Capture (Start Capture). The change takes affect after capture is restarted.

(Optional) Configure Decoder to Support OpenAppID

The NetWitness Decoder can identify applications using the OpenAppID detectors. OpenAppID from Cisco is an application-layer network security plug-in for Snort (an open source network intrusion detection system). It is a set of open source Lua libraries (detectors) that identifies applications in the network traffic.

When Network Decoder detects an application with an OpenAppID detector, the `appid` meta is created. The value of the `appid` meta helps in identifying the application as it is the application's entry in the `appMapping.data` file. The `appMapping.data` file is part of the OpenAppID distribution and contains metadata of the application detectors.

Note: By default, all detectors are disabled to avoid any negative impact on the performance.

To configure the OpenAppID detectors:

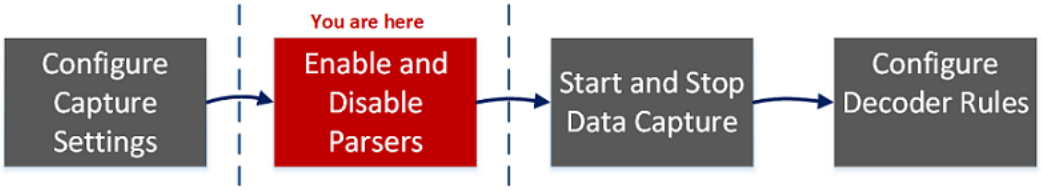
IMPORTANT: Ensure that you enable only the required OpenAppID detectors. Enabling all the OpenAppID detectors can reduce the performance. Before you enable any detector, understand your application detection requirements and enable only the specific detectors. For example, enabling the `service_*` detector or any other detector that attempts to match short generic patterns can cause severe impact on the performance.

1. Download the OpenAppID source package (`snort-openappid.tar.gz`) from the Snort Downloads (https://www.snort.org/downloads) page.
2. Upload the OpenAppID source package to the network decoder (`http://<networkdecoder>:50104/decoder/parsers/upload`), which can be accessed using the REST interface.
   Once uploaded, decoder will extract the package to an appropriate folder. The default folder is `/etc/netwitness/ng/odp`.
3. To enable detectors, modify the `/decoder/parsers/config/openappid.enabled` file with a combination of detector filenames or wildcards, separated by commas. For example, `client_*, payload_slashdot.lua, payload_reddit.lua`.
   The following table describes the detector group filenames and their functions. You can extract the complete set of detectors from the OpenAppID source package (`snort-openappid.tar.gz`) or it can be viewed on the Decoder file system at `/etc/netwitness/ng/odp/lua`.

Detector Group Filename	Description
`client_*`	Detectors for client applications (for example, Facebook, MacAppStore).
`content_group*`	Detectors for a specific type of network attribute such as protocol, port, or service (for example, port_services which contains many services identified by their common ports).
`payload_*`	Detectors for the host based traffic (for example, Hulu, Reddit).
`service_*`	Detectors for service applications (for example, Minecraft, VNC).
`ssl_host_group_*`	Detectors for SSL hosts logically grouped together (for example, 334 which contains many ecommerce websites).

4. Ensure that you specify the detector filenames correctly. If you specify an incorrect filename, the detector will not load. The following table lists some good and bad file naming conventions and their status on subsequent loading.

Detector Group Filename	Status
`client_9P.lua`	loaded
`client_9p.lua`	not loaded (Linux only)
`client_9P`	not loaded
`client_9P*`	loaded
`client_`	loaded



Detector Group Filename	Status
9P.*	
lient_ 9P.lua	not loaded
lient_ 9P.*	not loaded
*lient_ 9P.lua	loaded

5. Once the required detectors are enabled, reload the parser to load the detectors. The following example message will confirm that the detectors and enabled successfully.
```
2020-May-14 17:03:37 [OpenAppID] 59 detectors loaded out of 59
```

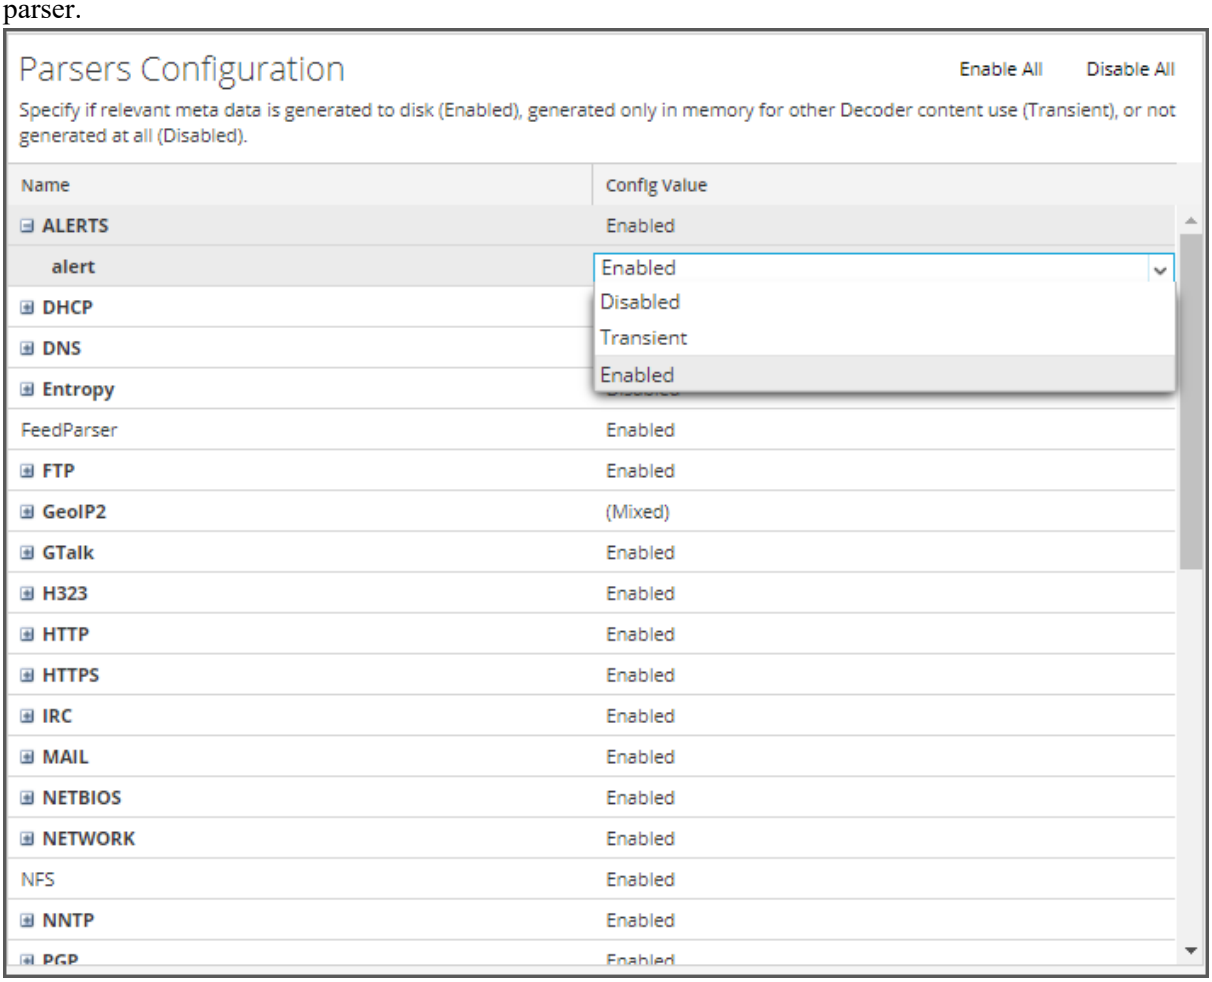
Enable and Disable Parsers and Log Parsers

Administrators can see which parsers have been downloaded from Live and deployed on a Decoder or Log Decoder, see which of these have been enabled, and enable or disable parsers and log parsers.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup.

You should only download and deploy the parsers you need for the following reasons:

- There is an impact on performance as you increase the number of deployed parsers.
- The more parsers you deploy, the more meta data created, which impacts data retention.
- Not having extra (unnecessary) log parsers deployed reduces the potential for mis-identification of messages.



The Parsers Configuration panel provides a way to select parsers to use on the Decoder. Within some parsers, you can also configure the metadata that the parser creates. These are the options in the Parsers Configuration panel.

Option	Description
Enable All **Disable All**	These options provide a way to quickly select either all parsers or no parsers.
Name	The names of parsers available to the Decoder. A plus sign indicates that the metadata generated by the parser is configurable. Clicking the plus sign displays the metadata that the parser can create.
Config Value	A drop-down list changes the setting for the parser or metadata to **Enabled**, **Disabled**, or **Transient**. • When **Enabled**, the Decoder is using the parser to filter traffic. • When **Transient**, the Decoder is using the parser to filter traffic, and the generated metadata is not stored on disk. The transient metadata is available in memory to additional content (that is, parsers, feeds, and application rules) on that Decoder. This helps administrators to protect certain data and is usually done as part of a data privacy plan (see the *Data Privacy Management Guide*). • When **Disabled**, the Decoder is not using the parser. If the generated metadata for the parser is configurable, clicking the plus sign to expand the parser displays configurable meta keys and the same drop-down list selects the meta key the parser will create.

Note: For a Log Decoder, you must have previously deployed log parsers from Live. See the **Find and Deploy Live Resources** topic in the *Live Services Management* Guide for details. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

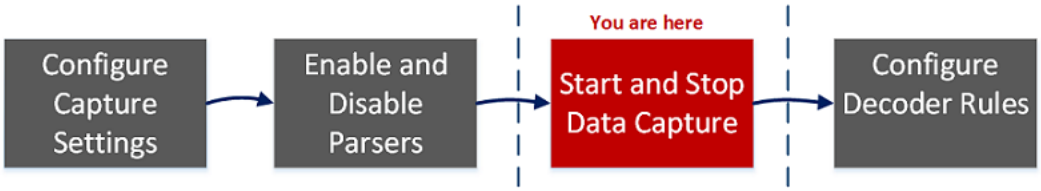
To enable or disable a parser, or to view the status for each parser:

1. Go to (Admin) > **Services**.
2. In the **Administration Services view**, select a Log Decoder or a Decoder, and **>View** > **Config**.
3. In the **Parsers Configuration** panel, look for the Decoder parser or the Log Decoder event source parser.

4. In the **Config Value** column, note the current status for your parser.

   You can update the status of any individual parser by selecting its **Config Value** and selecting **Disabled**, **Transient**, or **Enabled** from the drop-down menu. Alternatively, you can select **Enable All** or **Disable All** to update the status for all of your log parsers at once.

5. Click **Apply**.



When you click **Apply**, note that all parsers are reloaded into NetWitness. The status for each parser is updated, based on your selections.

Start and Stop Data Capture

When a Decoder starts up, it automatically begins aggregating data if **Capture Autostart** is enabled. When autostart is not enabled, you can start and stop data capture manually.

Note: The Capture Configuration Settings in the Service Config view for a Decoder determine whether Capture Autostart is enabled.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup. You may want to stop and start capture at other times, for example, before you shut down the service.

To start and stop capture:

1. Go to (Admin) > **Services**.
2. Select a Decoder or Log Decoder service, and select **> View > System**.
3. In the toolbar, click **Start Capture**.

   If the service is a Decoder, it begins capturing packets. If the service is a Log Decoder, it begins capturing logs.

   When packet or log capture is in progress, the option in the toolbar changes to **Stop Capture**, and the option to upload a file is unavailable.
4. Whenever you want to discontinue traffic capture on a Decoder, click **Stop Capture**.

   Packet or log capture ceases, and the option to upload a file to the service is again available.

Note: When you stop the Log Decoder service while capture is running, all events currently in Log Decoder memory will be processed and persisted. Should an issue arise where it is necessary to quickly shutdown the service, use the Services Explore view to stop capture (`/decoder stop`), passing the parameters `flush=false` before stopping the Log Decoder service. For further information, see the "Services Explore View" in the *Host and Services Getting Started Guide*.

Configure Decoder Rules

This topic provides procedures for creating and managing rules for Decoder or Log Decoder traffic capture in the **Services Config view** > **Rules** tabs . Services Config View - Rules Tabs provides details about the Rules tab options.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup.

Capture rules can add alerts or contextual information to sessions or logs. They can also define which data is filtered out by a Decoder or Log Decoder. Rules are created for specific metadata patterns, which result in predefined actions when matches are found. For example, to keep all traffic that fits certain criteria, but discard all other traffic, you can create a rule to perform the necessary actions. When applied, rules affect both packet capture file importing, as well as live network capture.

Rule and Query Guidelines provides guidelines that all queries and rule conditions in NetWitness Core Services must follow.

By default, no rules are defined when you first install NetWitness. Until rules are specified, the packets are not filtered. You can deploy the latest rules from Live. You can define three types of rules: Network Rules, Application Rules, and Correlation Rules.

- Network rules are applied at the packet level and are made up of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied to the Decoder. Rules can be applied to multiple layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules are only available on Network Decoders.
- Application rules are applied at the session level. If the first rule listed is not a match, the Decoder then attempts to match the next rule listed, until a match is found.
- Correlation rules are applied over a configurable sliding time window. When a match is found, the service creates a new super session that identifies other sessions that match the rule, then creates a session list for analysis.

The two most common uses of rules are:

- To alert, and thereby create a custom alert meta value, when certain conditions are found.
- To filter out certain types of traffic that do not add value to the analysis of the data.

Groups of capture rules form rule sets, which you can import and export. This feature enables use of multiple rule sets for various scenarios. You can import the exported rule set, in the form of an .nwr file, to other NetWitness services, simplifying the deployment and configuration of multiple services.

Rule Processing

These are the principles governing capture rule processing:

- Multiple rules can be applied to the Decoder.
- Capture rules are executed one after the other, in sequence.
- Rule processing stops when all rules are processed or after a rule configured to stop rule processing is matched.
- A default rule can be used to either include or exclude all traffic not otherwise selected by a rule. A default rule, if used, must always be placed at the bottom of the rule list. Otherwise, rule processing stops as soon as the default rule is evaluated since, by definition, all traffic is selected by the default rule.
- When rule processing stops, the session is saved using the configured session options and debug options.

Rule and Query Guidelines

All queries and rule conditions in NetWitness Core services must follow these guidelines:

All string literals and time stamps must be quoted. Do not quote numbers, MAC, or IP addresses.

- `extension = 'torrent'`
- `time='2015-jan-01 00:00:00'`
- `service=80`
- `ip.src = 192.168.0.1`

Note: The space on the right and the left of an operator is optional. For example, you can type a rule as `service=80` or `service = 80` .

Rule Examples

The following table shows examples of rule conditions. You can use rule conditions for log retention collections in an Archiver and for application, network, and correlation rules on a Decoder, Log Decoder, or Concentrator. Rule conditions are also used in all `WHERE` clauses in all Core database queries.

For detailed information on rule syntax in NetWitness, see "`WHERE` Clauses" in the "Queries" section of the *Core Database Tuning Guide* .

Rule Name	Condition
ComplianceDevices	`device.group='PCI Devices' || device.group='HIPPA Devices'`
HighValueWindows	`device.group='Windows Compliance'`
MediumValueWindows	`device.type='winevent_nic' && msg.id='security_4624_security'`

Rule Name	Condition
LowValueWinLogs	`device.type='winevent_nic' && msg.id='security_4648_security'`
LowValueProxyLogs	`device.class='proxy' && msg.id='antivirus_license_expired'`
GeneralWindows	`device.type='winevent_nic'`

Invalid Rules

NetWitness uses a rule parser that strictly defines valid syntax for rules and queries. When a Core service encounters invalid syntax, it writes a warning in the NetWitness logs indicating the error.

Note: NetWitness 11.x does not support parsing of legacy syntax rules (as version 10.6 did). After you update to NetWitness 11.x, rules with invalid syntax are highlighted in the user interface, and no rules will be applied until the invalid rules are corrected. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. See Fix Rules with Invalid Syntax.

The `/decoder/config/rules/rule.errors` and `/concentrator/config/rules/rule.errors` stats, contain the count of rules with errors. If `rule.errors` is nonzero, NetWitness generates a Health and Wellness alert to indicate that you need to fix the rules.

General Syntax Guidelines

- All text values must quote literal values. Example: `user = 'user1'`
- Quotes can use single or double quotes; but they must match. (You cannot start with a single quote and finish with a double quote.)
- If the literal value has a quote, you can escape it using double quotes. Example: `user = "User's"`

The following are valid syntax rules:

- All time values should use quotes for dates in this form: `time = 'YYYY-MM-DD HH:MM:SS'`
- All time values that are the number of seconds since EPOCH (Jan 1, 1970), should not be quoted. Example: `time = 1448034064`
- Everything else is unquoted: IP addresses, MAC addresses, numerics, and so on. Example: `service = 80 && ip.src = 192.168.1.1/16`

Capture Rule Syntax

Capture rules compare fields to values or to other fields. This is an example of a simple expression with a meta key on the left side of the operator and a value on the right side.

```
ip.dst=192.168.1.1
```

The syntax allows a meta key on the right side of the operator in Decoders and Log Decoders for application and network rules. Meta key comparison does not apply in the `where` clause in queries. This is an example of a simple expression with a meta key on the left side of the operator and a meta key on the right side.

```
ip.src=ip.dst
```

Rules that include a meta key comparison support renamed meta keys; if a rule queries a meta key that has been renamed, the rule is parsed for the renamed meta key. For example, if the meta key `ip_dst` is used in a rule, it is transparently mapped to the renamed meta key: `ip.dst`. Existing rules that include original keys will trigger alerts that include data for the renamed meta key.

This is an example of a rule that finds packets having the same `ip.src` address and `ip.dst` address on a Decoder, and generates an alert on the Concentrator.

```
alert=ioc name=testRule8 rule="ip.src=ip.dst" order=38
```

This rule would generate an error because `eth.src` and `ip.src` are incompatible formats.

```
rule="eth.src=ip.src" name="testRule99" alert=ioc
```

Values can be expressed as discrete values, a range of values, an upper or lower bound, or a combination of these three. You can create a greater than or less than comparison, and test equality or inequality against a range of values or an upper/lower bound.

`key 0-5` (a range of values)

`key = 0-u` is the same as `key >= 0` (upper bound, greater than or equal to)

The following table summarizes the operators on meta keys.

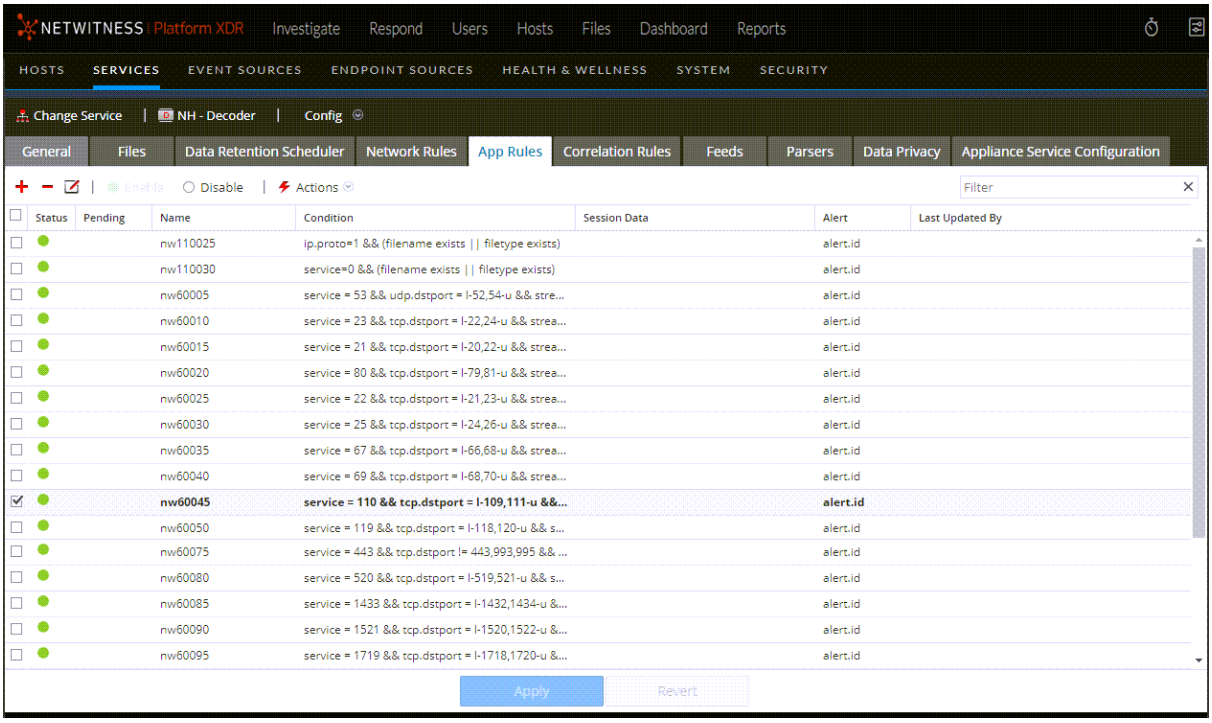
Left Operand Format	Operator	Right Operand Format	Description
any	=	compatible with left operand	Equality operator. You can use values or meta keys on the right side of the equality operator.
any	!=	compatible with left operand	Inequality operator. You can use values or meta keys on the right side of the inequality operator.
any	<	compatible with left operand	Less than operator. You can use values or meta keys on the right side of this operator.

Left Operand Format	Operator	Right Operand Format	Description
any	`<=`	compatible with left operand	Less than or equal to operator. You can use values or meta keys on the right side of this operator.
any	`>`	compatible with left operand	Greater than operator. You can use values or meta keys on the right side of this operator.
any	`>=`	compatible with left operand	Greater than or equal to operator. You can use values or meta keys on the right side of this operator.
text	`contains`	text	Find values that contain the right operand. You can use meta keys or values on the right side of this operator.
text	`begins`	text	Find values that begin with the right operand. You can use meta keys or values on the right side of this operator.
text	`ends`	text	Find values that end with the right operand. You can use meta keys or values on the right side of this operator.
text	`length`	integer	Find strings of a certain length. You can use meta keys or values on the right side of this operator.
any	`count`	integer	Find values with a specific number of occurrences within the session. You can use meta keys or values on the right side of this operator.
any	`ucount` and `unique`	integer	Finds a number of uniquely occurring values. You can use meta keys or values on the right side of this operator. For example, if the results include instances of a meta key with five unique values and three of the same value, the `ucount` is six.
N/A	`exists`	any	Finds any values for the meta key. You can use meta keys or values on the right side of this operator.
N/A	`!exists`	any	Finds any sessions in which the meta key does not occur. You can use meta keys or values on the right side of this operator.
text	`regex`	text	Finds values matching a regular expression. You can use values on the right side of this operator.

The following table summarizes other syntax elements used in rules.

Syntax element	Description
*	Default rule. By using an asterisk (*) as the sole character in a rule, that rule will select all traffic.
u	Upper bound of a range of times, IP addresses, or numeric formats. For example, to select all TCP ports above 40000, the syntax would be: `tcp.port = 40000-u`
l	Lower bound of a range of times, IP addresses, or numeric values. For example, to select all TCP ports below 40000, the syntax would be: `tcp.port = l-40000`
- (dash)	Denotes a range. This is only applicable to time values, IP or MAC addresses, or numeric values. Separate the lower and upper bounds of the range with a dash (-) character. For example, to select TCP ports between 25 and 443, the syntax would be: `tcp.port = 25-443`
, (comma)	Denotes a list of ranges or values or meta keys. Single values may be used as well as any combination of ranges and upper or lower bounds. Single meta keys may be used in a list. Meta keys and literal values cannot both appear on the right-hand side of an operator. For example, the following is valid syntax: `tcp.port = 1-10,25,110,143-225,40000-u`
( )	Grouping operator. An expression can be enclosed in parentheses to create a new logical expression. For example, the following would select traffic on port 80 to/from 192.168.1.1 OR traffic on port 443 to/from 10.10.10.1: `(alias.ip=192.168.1.1 && tcp.port=80) || (alias.ip=10.10.10.1 && tcp.port=443)`
~	Logical NOT operator, a negation of an expression.
&&	Logical AND operator, a conjunction of two expressions.
||	Logical OR operator, a disjunction of two expressions.

Configure Capture Rules



The Decoder and Log Decoder rules are editable in the Services Config view. While each type of rule (network, application, and correlation) has its own tab; the functions are similar for all types of rules. You can:

- Add, edit, and delete rules
- Enable and disable rules
- Change the execution sequence of rules
- Import rules from a file
- Export rules to a file

- Push rules to another service
- Revert or apply rule changes
- Restore one of the last ten rule configurations from a snapshot

To configure rules in the Rules tabs

1. Go to (Admin) > **Services**.
2. In the **Services** view, select a Decoder service and > **View** > **Config**.
3. In the **Services Config** view, select one of the Rules tabs: Network Rules, App Rules, or Correlation Rules.
   The rules list for the selected rule type is displayed.

Each type of rule has a list with slightly different columns and different parameters. Several basic guidelines apply to all rule management activities:

- The rules are executed in the sequence they are displayed in the list. To change the execution sequence of rules, drag and drop rules to the appropriate location in the list or use the context menu options to arrange the rules in the list.
- To select a single row, click the row.
- To select a group of adjacent rows, click the first, then shift-click the row at the end of the group.
- To select multiple non-adjacent rows, click the first, then control-click the others.
- When editing rules in the Rules tab, you must apply the configuration changes in order to activate.
- Until changes are applied, you can discard edits to the list and revert to the unedited rules.

- Once rules are applied, you can recover the last ten rules configurations using the **History** option in the **Actions** menu.

To add a rule in any Rules tab, do one of the following:

- Click  .
- Right-click a rule, and select **Insert Above** or **Insert Below** from the context menu.
  The Rule Editor dialog for that type of rule is displayed.

To remove a rule:

1. From any Rules tab, select the rules to remove from the rules list.
2. Click .
   The selected rules are removed from the list, but still exist on the service.

To edit a rule

1. From any Rules tab, select the rule to edit.
2. Click  or double-click the rule row.
   The Rule Editor dialog for that type of rule is displayed.

To disable a rule:

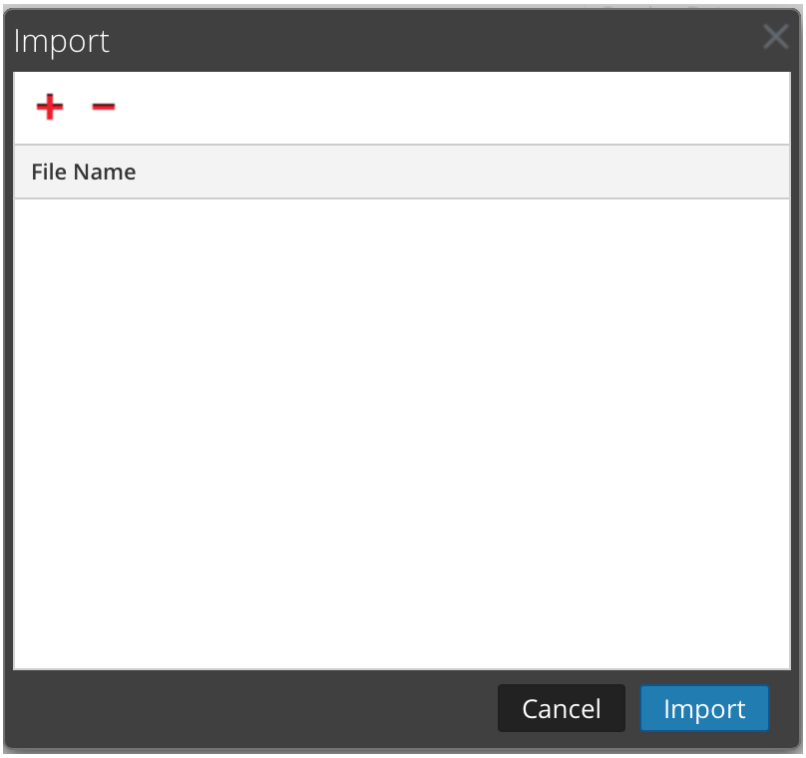
1. From any Rules tab, select the rules to disable.
2. Click 

   .
   The status changes to disabled in the rules list, but the rule is still enabled on the service.

To enable a rule:

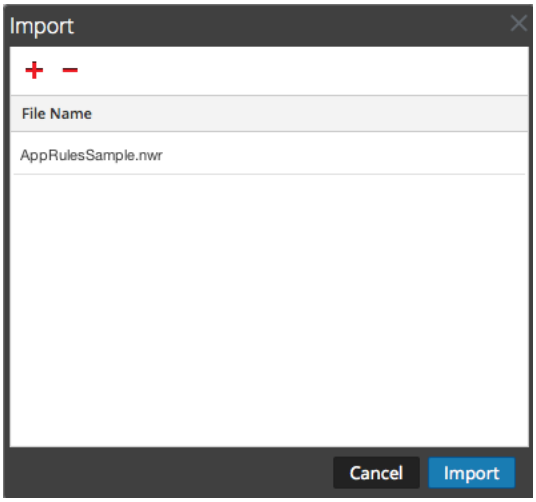
1. From any Rules tab, select the rules to enable.
2. Click 

   .
   The status changes to enabled in the rules list, but the rule is still disabled on the service.



Import Rules from a File and Export Rules

You can import network, application, and correlation rules to a Decoder from a file that contains rules of the same type. After the rules are imported, you can edit and manage them as you would any other rules.



When you attempt to import a group of rules, NetWitness Administration checks the type of rules imported. If you are successful, a message displays the number of rules imported. If the rule type differs from the active tab type, the rules are not imported. You must re-import the rules under the correct tab or select another file to import.

To import rules to a service:

1. From any Rules tab, select Actions > Import .
   The Import dialog is displayed.

2. Click + .
   A view of the directory structure is displayed.
3. Choose one or more NetWitness rules (.nwr) files to import, and click **Open**.
   The file is added to the list in the Import dialog.

4. Click **Import**.
   The rules are imported into the user interface. Imported rules have a red corner in each edited column.
5. Edit or reorder the rules if needed.
6. To save the rules to the service, click **Apply**.
   The rules for the service are updated with the changes.

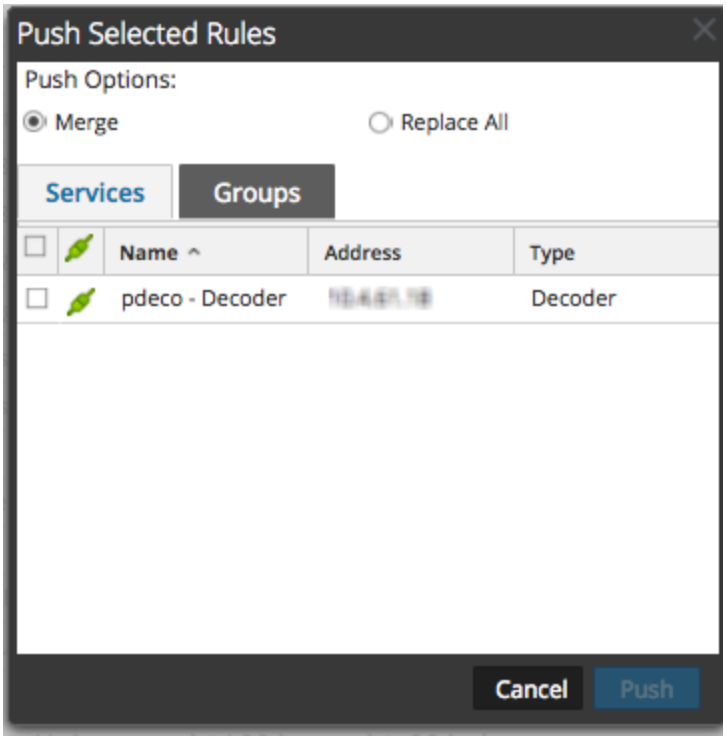
To export a rule to a file:

1. To export a subset of the rules, select the rules to be exported.
2. Do one of the following:
   - In the toolbar, select 

 > Export > Selection. (**Export > All** exports all rules in the rules list even if you have a subset selected for export.)
   - Right-click the selected rules and select **Export Selection**.

     A prompt for the filename is displayed.
3. Enter the filename and click **Export**.
   The .**nwr** file is downloaded.

Push Rules to Other Services

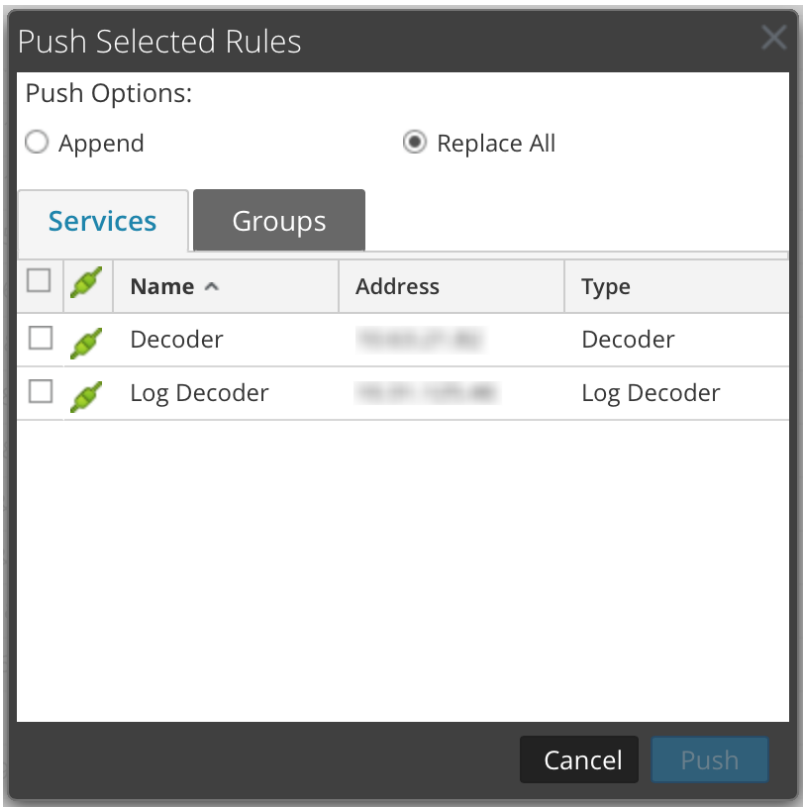


You can apply (push) rules or selected rules to other services (Decoders or Log Decoders) or service groups. When you push all rules to other services, all rules on the target services are removed and replaced with all of the rules on the source service.

To push selected rules from this Decoder to other Decoders:

1. From any Rules tab, select the rules that you want to push to another Decoder.
2. Do one of the following:
   - Select 

 > Push > Selection.



- Right-click the selected rules and select **Push Selected Rules**.
  The Push Selected Rules dialog is displayed.

3. Select a Push Option:
   - Select **Replace All** to delete all rules on the target services and replace them with the selected rules. This is the default selection.
   - Select **Merge** to merge the selected rules with the existing rules on the target services.
4. On the **Services** tab, select the target services to receive the pushed rules, or select the groups of services from the **Groups** tab.
5. Click **Push**.
   The rules are pushed to the selected services and become effective immediately.

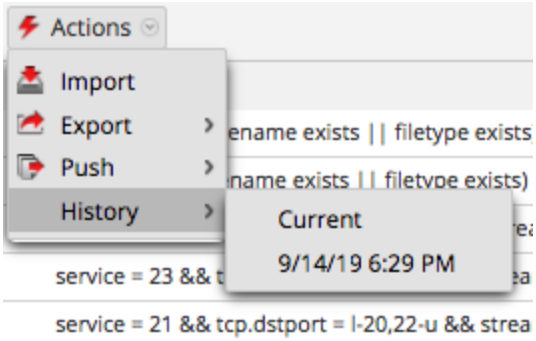
To push all rules from this Decoder to other Decoders:

1. From any Rules tab, select Actions **> Push > All**.
   (**Push > All** pushes all rules in the rules list even if you have a subset selected to push.) The Push Selected Rules dialog is displayed.

2. On the **Services** tab, select the target services to receive the pushed rules, or select the groups of services from the **Groups** tab.
3. Click **Push**.
   All rules from the target services are deleted and replaced with all of the rules from source service. The rules become effective immediately.

Change Execution Order of Rules

Capture rules are applied in the order they are displayed in the rules list. To reorder rules, use either of these methods:



- Drag and drop the rules in the appropriate location in the rules list.
- Right-click a rule to display the context menu, and use the **Cut** and **Paste** options.

Restore a Rule Snapshot from History

NetWitness keeps the last ten snapshots of rules applied to a service.

To restore a rules snapshot from history:

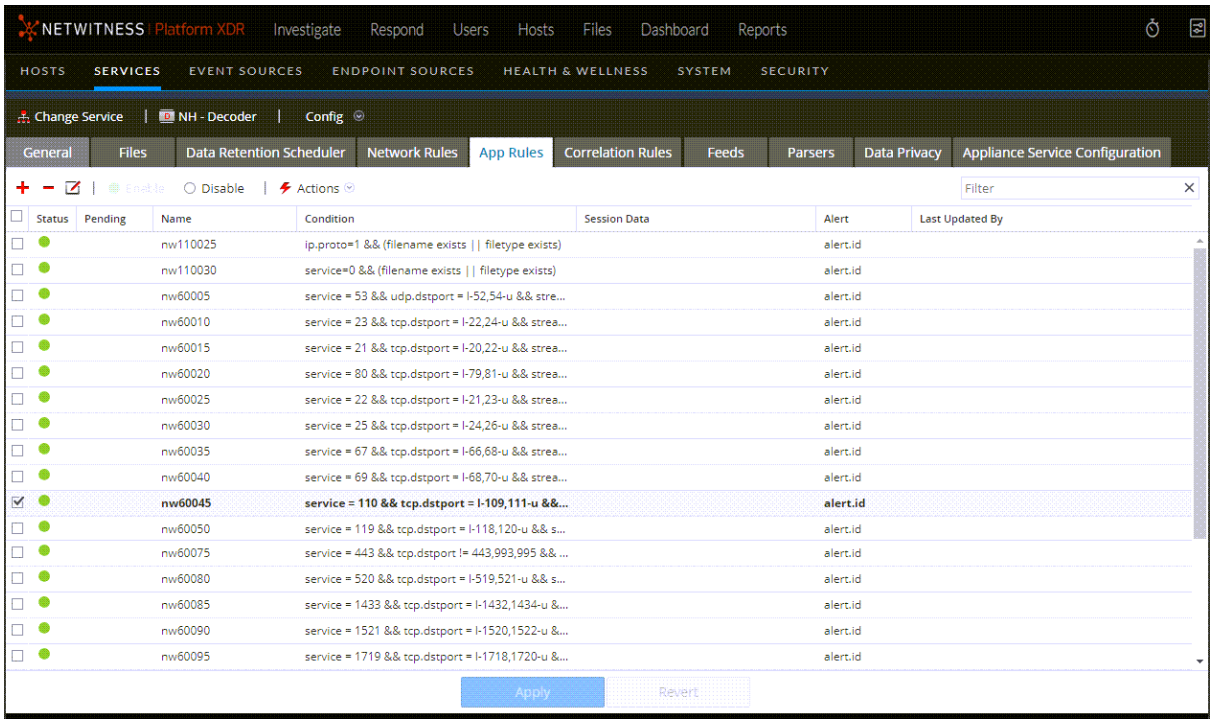
1. Select Actions > **History**.
   A submenu of snapshots is displayed.

2. Select the snapshot time from the submenu.
   The rules from the snapshot are loaded into the rules list, replacing the current set. But the current set is still in use on the service.
3. To apply the rules to the service, click **Apply**.
   The rules are applied to the service.

Configure Application Rules

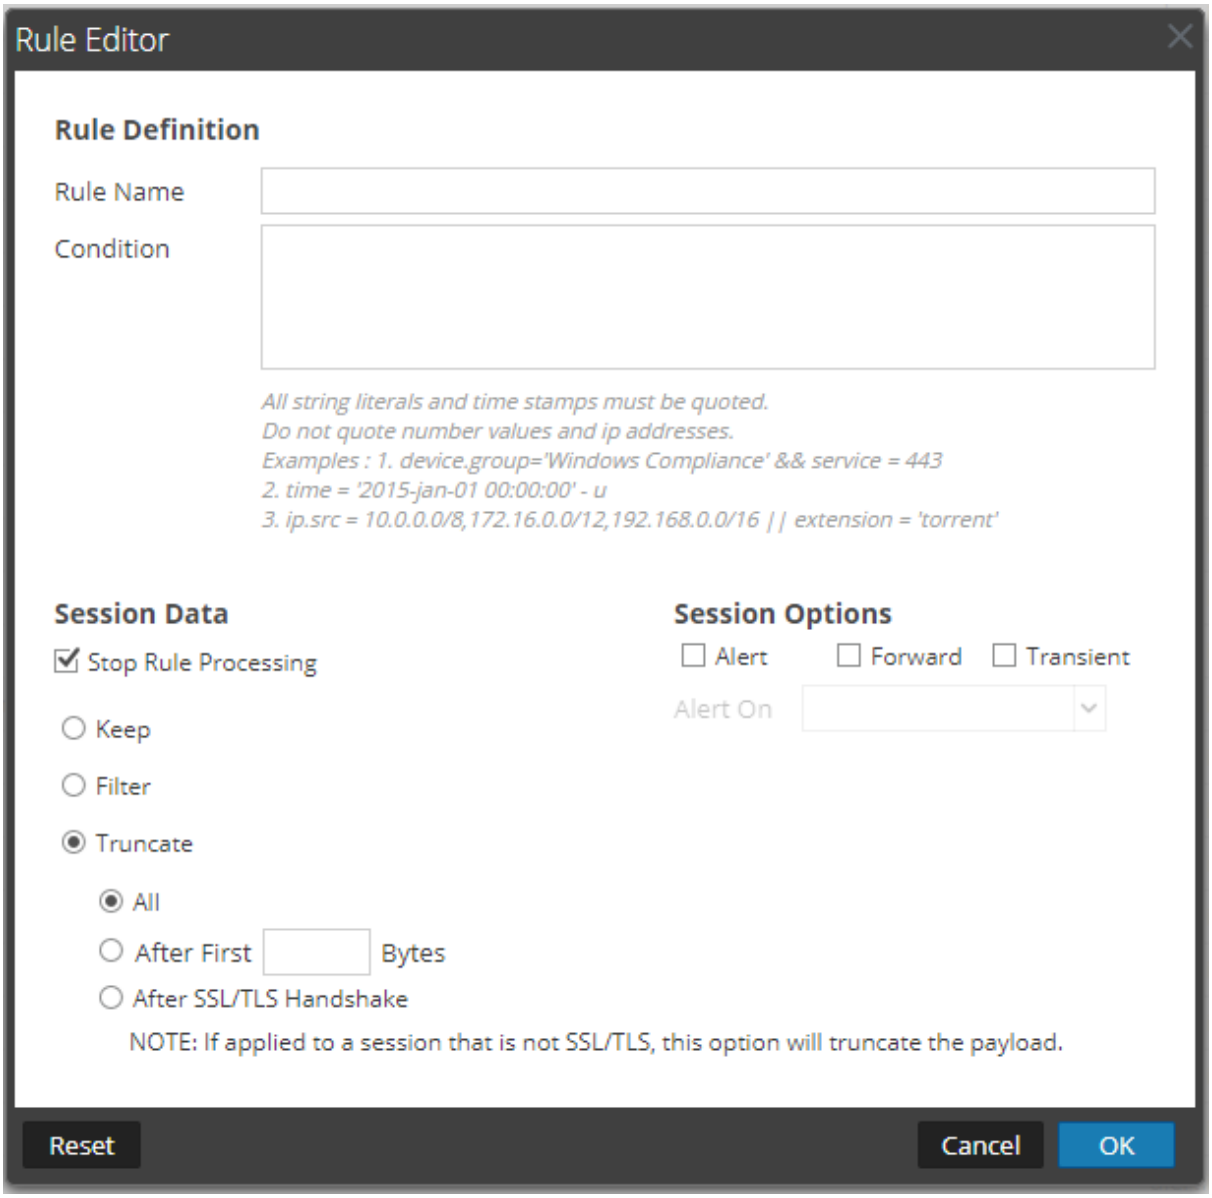
Application layer rules are applied at the session level. The following are sample application rules.

To truncate packets carried via Server Message Block protocol (SMB), create a rule as follows:



- Rule Name: Truncate SMB
- Condition: `service=139`
- Rule Action: Truncate All

To retain email to and from a specific e-mail address, create a rule as follows:



- Rule Name: Retain Email Tom Jones
- Condition: `email='Tom.Jones@TheShop.com'`
- Rule Action: Keep

To add or edit an application rule:

1. Go to (Admin) > **Services**.
2. Select a Decoder or Log Decoder service and > **View** > **Config**.
   The Systems Config view for the selected service is displayed.
3. Select the **App Rules** tab.

4. Do one of the following:
   - If adding a new rule, click  .
   - If editing a rule, select the rule from the rules list and click .
5. The Rule Editor Dialog is displayed with application rule parameters.

   a. In the **Rule Name** field, type a name for the rule. For example, for a rule that truncates all SMB, type **Truncate SMB**.
   b. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, NetWitness displays syntax errors and warnings. For example, to truncate all SMB, type **service=139**.

All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.

c. If you want rule evaluation to end with this rule, check the **Stop Rule Processing** checkbox.

d. In the **Session Data** section, choose one of the following actions to apply when a matching packet is found:

- **Keep**: The packet payload and associated meta are saved when they match the rule.
- **Filter**: The packet is not saved when it matches the rule.
- **Truncate**: Select a truncate option to execute when a packet matches the rule. The example uses the **All** option.
- **Truncate All** to save the packet headers and associated metadata, and do not save the packet payload.
- **Truncate After First <n> Bytes** to save the packet headers and associated metadata, and do not save the packet payload after the specified first <n> bytes, where <n> is a number of bytes.
- **Truncate SSL/TLS Handshake** to truncates the payload for all sessions except in the case of an SSL/TLS session, where the SSL exchange is preserved, but the rest of the payload is not saved. This option is for use with SSL parsers.

e. In the **Session Options** section, do any of the following:

- **To generate a custom alert** when a session metadata matches the rule, enable the Alert flag and select the name of the alert meta from the **Alert On** drop-down list.
- **To perform syslog forwarding** when the log matches the rule, enable the **Forward** flag. Make sure that:
  - You have enabled both the Alert and Forward flags to carry out syslog forwarding.
  - The name of the rule mentioned in the Rule Editor dialog matches the syslog forwarding destination name specified in the Log Decoder > View > Explore > `/decoder/config/logs.forwarding.destination` parameter
- **To prevent the alert metadata that is created from being written to the disk**, enable the **Transient** flag.

6. To save the rule and add it to the grid, click **OK**.

   The rule is added at the end of the grid or inserted where you specified in the context menu. The plus sign is displayed in the **Pending** column.

7. Check that the rule is in the correct execution sequence with other rules in the grid. If necessary, move the rule.

8. To apply the updated rule set to the Decoder or Log Decoder, click **Apply**.

NetWitness saves a snapshot of the currently applied rules, then applies the updated set to the Decoder and removes the pending indicator from the rules that were pending.

Monitor Application Rules

The Decoder and Log Decoder keep track of how many times each application rule matches a session. These stats can be viewed by connecting to the Decoder or Log Decoder Explore view and viewing the properties on the `/decoder/config/rules/application` folder. Then, send the command "`statdump`" to that folder. The output of this message is a listing of the number of times each application rule is hit. The listing is ordered in the same order as the contents of the rule definitions in the `/decoder/config/rules/application` folder. For example, on a system with three application rules:

```
0001: hits=6543 loaded=true
0002: hits=9294 loaded=true
0003: hits=43 loaded=true
```

The hit counters for the application rules are reset whenever the parsers are reloaded.

Configure Correlation Rules

Basic Correlation Rules are applied at the session level and alert the user to specific activities that may be occurring in their environment. NetWitness applies correlation rules over a configurable sliding time window. When the conditions are met, alert metadata is created for this activity and there is a visible indicator of the suspicious activity.

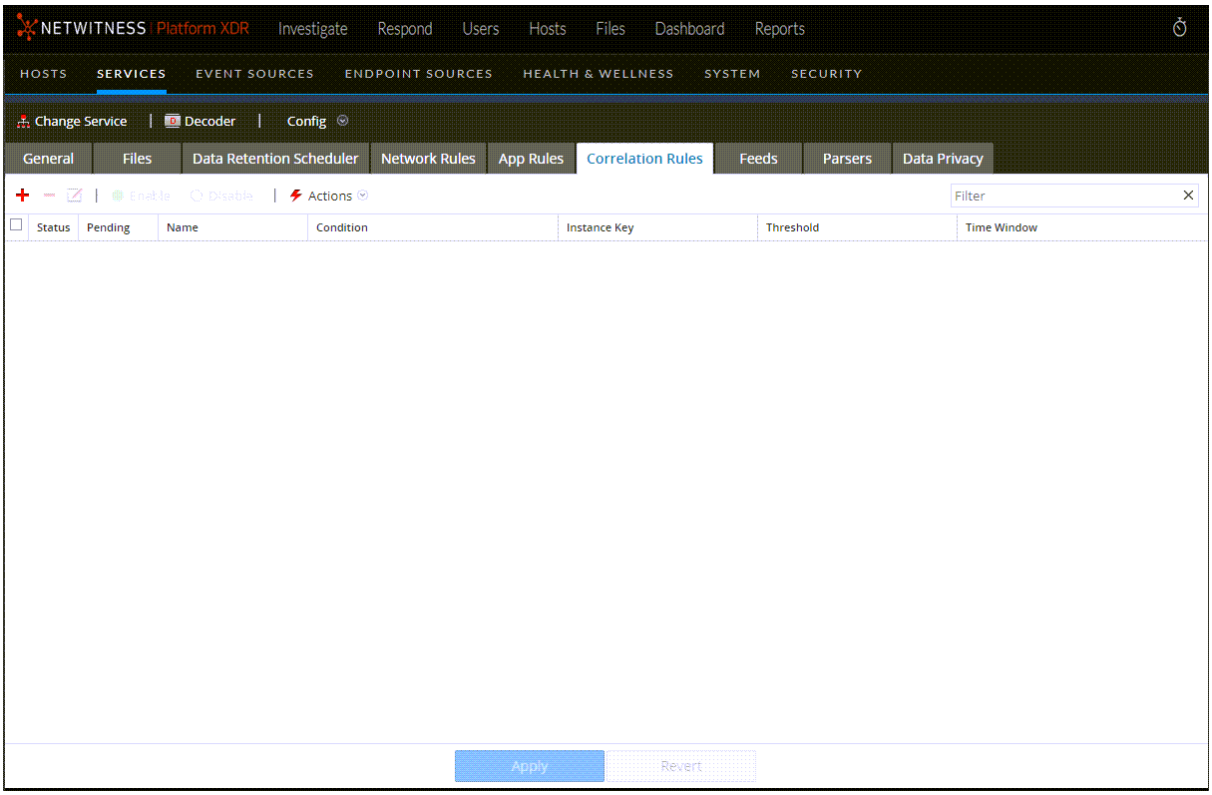
The following are sample correlation rules illustrating two use cases and the syntax.

Objective: In sessions where `port.dst` exists, if there is any combination of ip.src and ip.dst where the count of unique instances of `port.dst > 5` within one minute, then alert. To achieve this objective, create a rule as follows:

- Rule Name: IPv6 Vertical TCP Port Scan 5
- Rule: `port.dst exists`
- Instance Key: `ip.src,ip.dst`
- Threshold: `u_count(port.dst)>5`
- Time Window: 1 min

Objective: In sessions where `action==login` and `error==fail`, if there is any combination of `ip.src` and `ip.dst` that appears in more than 10 sessions within five minutes, then alert. To achieve this objective, create a rule as follows:

- Rule Name: IPv4 Potential Brute Force 10
- Rule: action=`'login' && error='fail'`
- Instance Key: `ip.src,ip.dst`
- Threshold: `count()>10`
- Time window: 5 mins

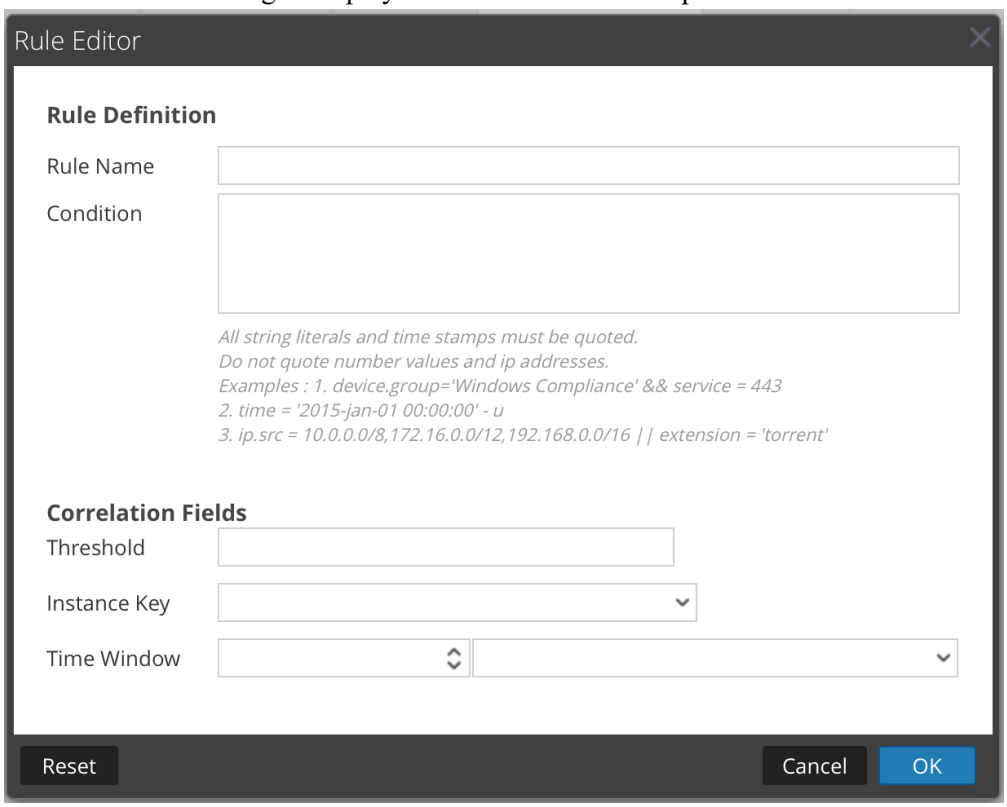


Both sample rules have the same instance key: `ip.src` and `ip.dst`. Because we are looking for unique combinations of `ip.src` and `ip.dst` that match the correlation condition, **`ip.src`** and **`ip.dst`** are **primary keys**.
Threshold can include an **associated key** that identifies the meta type that we are counting to determine if the condition is satisfied. In the first example, the associated key specified in Threshold is `port.dst`. We are counting unique instances of `port.dst` for every `ip.src/ip.dst` pair. In the second example, the associated key is not specified in the Threshold because it is merely a count of sessions. It is helpful to think of this scenario as counting unique session IDs and the associated meta is implicitly session.id. We are counting unique `session.id` for every `ip.src/ip.dst` pair.

Invalid use case: In sessions where (rule), if there is any combination of `ip.src` and `ip.dst` that have a unique count of `ipv6.dst > 5` within (time window), then alert. This case does not work because the associated key `ipv6.dst` is an IPv6 meta type. IPv4 and IPv6 meta types are not permitted to be used as associated keys.

To add or edit a correlation rule

1. Go to  (Admin) > **Services**, select a service, and click  > **View** > **Config**.
   The Service Config view for the selected service is displayed.



2. Select the **Correlation Rules** tab.

3. In the **Correlation Rules** tab, do one of the following:

   - If adding a new rule, click .

- If editing a rule, select the rule from the rules grid and click .
  The Rule Editor dialog is displayed with correlation rule parameters.

4. In the **Rule Name** field, type a name for the rule. For example, to create the sample rule, **IPv6 Vertical TCP Port Scan 5**.
5. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, syntax errors and warnings are displayed by NetWitness. For example, to create the sample rule, type **tcp.dstport exists**. When this condition is matched, the session data action is performed.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
6. In the **Threshold** field, use one of the threshold parameters to specify the minimum number of occurrences required to create a correlation session and an associated key if required. The associated key cannot be an IPv4 or IPv6 meta type.
   - `u_count(associated_key)` = the count of unique values of the specified key
   - `sum(associated_key)` = the values of the specified key
   - `count` = number of sessions (no associated key is specified)
7. In the **Instance Key** field, select the target indicator to base the event upon. This can be a single key or a compound key (two primary keys, separated by a comma).

8. In the **Time Window**, set the duration during which the threshold must be reached to create a correlation session.
9. To save the rule and add it to the grid, click **OK**.
   The rule is added at the end of the grid or inserted where you specified in the context menu. The plus sign is displayed in the **Pending** column.
10. Check that the rule is in the correct execution sequence with other rules in the grid. If necessary, move the rule.
11. To apply the updated rule set to the service, click **Apply**.
    NetWitness saves a snapshot of the currently applied rules, then applies the updated set to the Decoder or Log Decoder.

Configure Network Rules

Network rules are applied at the packet level on a Decoder and are made up of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied at the packet level to a Decoder. Network rules can apply to multiple network layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules do not apply to Log Decoders, they apply only to Network Decoders.

You can create and manage network rules in the Services Config view > Network Rules tab.

Note: Because network rules are applied on the packet level, you must specify both the source and destination meta keys in the rule condition. This is because the packet flow can occur on both sides at the packet level, while the directions are still not determined. For example, if you want to filter traffic on port 553 and port 55553, the condition should be written as follows:
`port.src=553 || port.dst=553 || port.src=55553 || port.dst=55553`
You must also specify both the source and destination meta keys in the conditions for `ip.src` and `ip.dst`. Specifying only source or destination in the condition will not work as expected.

Supported Meta Keys in Network Rule Conditions

The following table describes the meta keys that NetWitness supports for use in network rule conditions.

Meta Key	Description
`eth.addr`	Ethernet source or destination address. Commonly known as the MAC address.
`eth.dst`	Destination Ethernet address. This is the same as the Ethernet address field except that it selects only packets where the destination address matches the selected value (s).
`eth.src`	Same as Ethernet destination except that it focuses on the source address.
`eth.type`	Ethernet frame type.
`hdlc.type`	Frame type of the HDLC frame.
`alias.ip`	IPv4 source or destination address in standard form. IP addresses can be entered in CIDR notation for subnets.
`ip.dst`	Destination IPv4 address in standard form. IP addresses can be entered in CIDR notation for subnets.
`ip.proto`	IPv4 protocol field.
`ip.src`	Source IPv4 address in standard form. IP addresses can be entered in CIDR notation for subnets.
`alias.ipv6`	IPv6 source or destination address in hex format. Generally IPv6 addresses are written as eight groups of four hex digits, thus expressing the entire 128 bit address length. Supports notation to represent multiple blocks of 0000 in an address. Does not support CIDR notation.

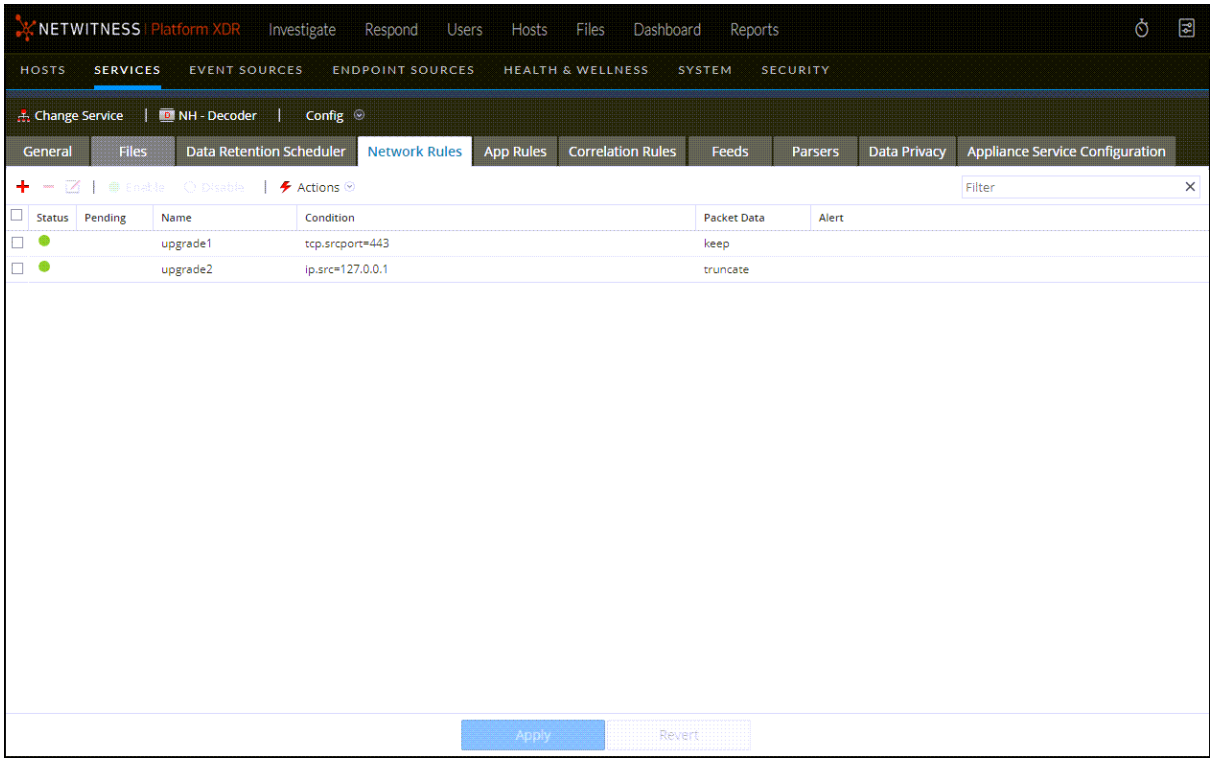
Meta Key	Description
ipv6.dst	Destination IPv6 address in hex format.
ip.proto	IPv6 protocol field. This maps to the Next Header field in the IPv6 header and uses the same values as the IPv4 protocol field.
ipv6.src	Source IPv6 address in hex format.
port.dst	Destination TCP port.
tcp.port	TCP source or destination port.
port.src	Source TCP port.
port.dst	Destination UDP port.
udp.port	UDP source or destination port.
port.src	Source UDP port.

The following are sample network rules.

To truncate all SSL from the source port, create a rule as follows:

- Rule Name: Truncate SSL
- Condition: `port.src=443`
- Rule Action: Truncate

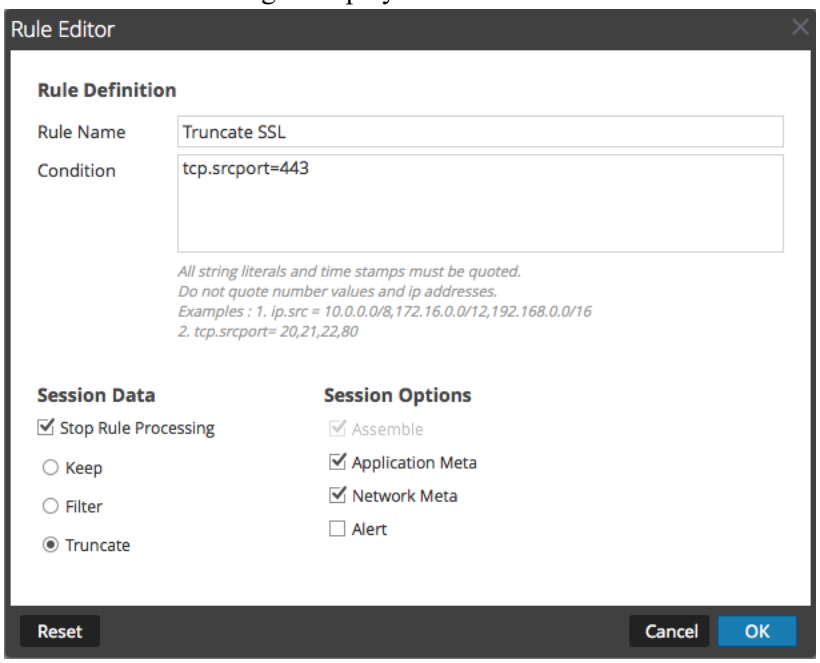
To filter subnet traffic, create a rule as follows:



- Rule Name: Subnet Filter
- Condition: `alias.ip=192.168.2.0/24`
- Rule Action: Filter

Meta entities, which provide a way to work with several meta keys at the same time, can be used in application rules, but are not supported in network rules as the metadata available are too limited. For more information on meta entities, see the *Core Database Tuning Guide*.

To add or edit a network rule:



1. Go to  (Admin) > **Services**, select a Decoder service, and  **> View > Config**.
   The Services Config view for the selected service is displayed.

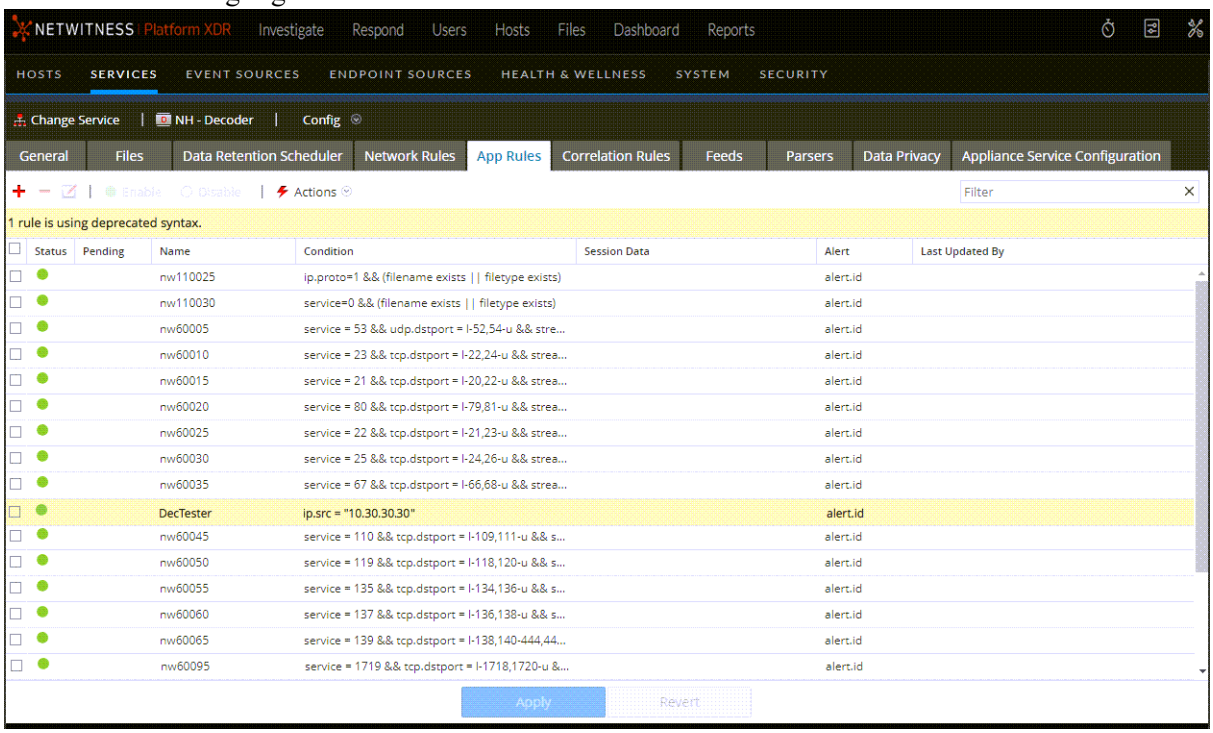
2. Select the **Network Rules tab**.
   The Network Rules tab is displayed.

3. In the **Network Rules** tab, do one of the following:

   - If adding a new rule, click .
   - If editing a rule, select the rule from the rules list and click .
     The Rule Editor dialog is displayed.

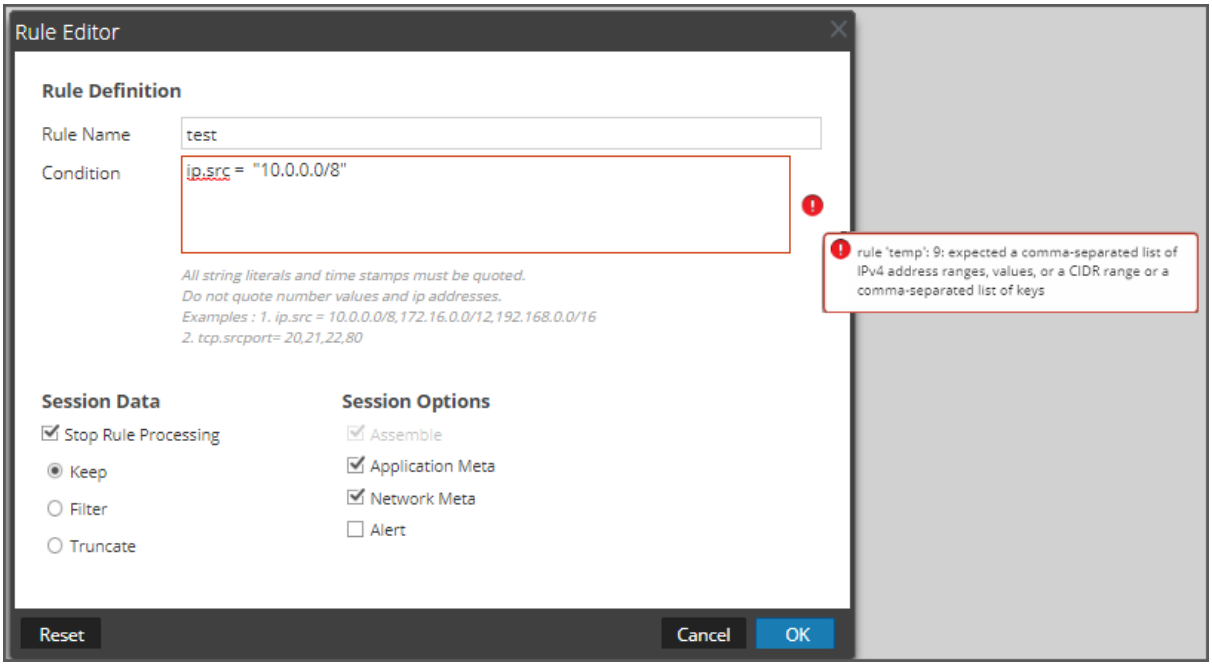
4. In the **Rule Name** field, provide a name for the rule. For example, for a rule that truncates all SSL from the source port, type **SSL Truncate**.
5. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta values from the window actions. As you build the rule definition, NetWitness displays syntax errors and warnings. For example, to truncate all SSL from the source port, **`tcp.srcport=443`**.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details. Supported Meta Keys in Network Rule Conditions describes the meta keys that NetWitness supports for use in network rule conditions.
6. If you want rule evaluation to end with this rule, select the **Stop Rule Processing** checkbox.
7. In the **Session Data** section, choose one of the following actions to apply when a matching packet is found:
   - **Keep**: The packet payload and associated metadata are saved when they match the rule.
   - **Filter**: The packet is not saved when it matches the rule.
   - **Truncate**: The packet payload is not saved when it matches the rule, but packet headers and associated metadata are retained.

8. In the **Session Options** section, select all options that apply of these four.
   - **Assemble**: The assembler assembles the packet chain when it matches the rule.
   - **Network Meta:** The packet generates network metadata when it matches the rule.
   - **Application Meta**: The packet generates application metadata when it matches the rule.
   - **Alert**: The packet generates a custom alert when metadata matches the rule.



9. To save the rule and add it to the rules list, click **OK**.
   The rule is added at the end of the list or inserted where you specified in the context menu.
10. Check that the rule is in the correct execution sequence with other rules in the list. If necessary, move the rule.
11. To apply the updated rule set to the Decoder, click **Apply**.
    NetWitness saves a snapshot of the currently applied rules, then applies the updated set to the Decoder and removes the pending indicator from the rules that were pending.

Fix Rules with Invalid Syntax



After an update to NetWitness 11.x, the user interface highlights any rules with invalid syntax. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. Configure Decoder Rules provides guidelines that all queries and rule conditions in NetWitness must follow.

To correct rules with invalid syntax:

1. Go to (Admin) > **Services**.
2. In the **Services** view, select a Decoder and **> View > Config**.
3. In the **Services Config** view, select one of the Rules tabs: Network Rules, App Rules, or Correlation Rules.
   The Rules tab for the selected rule type shows the number of rules using invalid syntax and the invalid rules are highlighted.

4. Select an invalid rule and click .
   The Rules Editor shows additional information for the invalid rule.

5. In the **Condition** field, correct the rule syntax.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
   For example, if the invalid rule condition is `ip.src="10.30.30.30"`, correct the syntax by removing the quotes: `ip.src=10.30.30.30`
6. Do one of the following:
   - To correct the rule individually, click **Save**.
     The corrected rule is applied independently to the Decoder. The corrected rule appears on the Rules tab without highlights.
   - To correct the rule and apply the rule to the Decoder later with other rules, click **OK**.
     The corrected rule appears on the Rules tab without highlights. The rule is not applied to the Decoder.

Decoder Commands for Managing Rules

In the NetWitness Core database, the Rules tree holds the main functionality related to managing rules for all Core services that have rules: Concentrators, Decoders, Log Decoders, and Archivers. Although you can manage rules in the NetWitness user interface, advanced users may prefer to manage rules using a command line to add, merge, replace, delete, and validate rules on a service. This section provides a brief overview of the commands and their usage. These are the available commands:

- `add` - Adds a single rule at the specified position.
- `clear` - Deletes all existing rules in the current node on the service. For example, using the command in `/decoder/config/rules/application` node deletes all existing application rules on the Decoder.
- `delete` - Deletes one or more rules at a specified position and count.
- `merge` - Merges a pushed rule set with an existing rule set. Existing rules that match the incoming rules (by name or rule) are replaced; otherwise, rules are inserted by the position indicated as described in merge Command.
- `replace` - Deletes all existing rules and replaces them with the incoming rule set.
- `validate` - Validates the syntax of a rule, but does not validate the meta keys.

add Command

The `add` command adds the rule to the existing rule set. Formatting is important because the API uses double quotes in the rule language and also uses double quotes as parameters to all NetWitness APIs. Therefore, you must escape any double quotes in the rule itself by preceding it with a backslash (\) character. This is the syntax of the command:

```
add rule=<string> name=<string> alert=<string, optional> atPos=<uint32, optional>
```

- `rule` is the rule to add. Be sure to place double quotes around any rules with white space and to escape any double quotes that are part of the rule with a backslash.
- `name` is the name of the rule.
- `alert` is the alert for the rule (if any).
- `atPos` is the position at which the rule should be added (1 based). Zero is the top of the list and any number larger than the current size of the list is appended to the list.

This is an example of command to add a rule using NwConsole

```
send /decoder/config/rules/application add rule="ip.src exists" order=1 alert=ioc name=testrule
```

For example, take the following rule:

```
alias.host = "myPC" && country.src="china","russian federation"
```

To add this as a rule, you would need to send the parameters as follows:

```
rule="alias.host = \"myPC\" && country.src=\"china\",\"russian federation\"" name=myRule filter
```

Notice how all the double quotes had to be escaped inside the rule parameter. A simple trick to make this more readable is to use single quotes inside the rule. Single and double quotes are interchangeable in the rule and query language, but not in parameters for the API (only double quotes are supported there). Therefore, this is more readable:

```
rule="alias.host = 'myPC' && country.src='china','russian federation'"
name=myRule filter
```

merge Command

The `merge` command is used to merge an incoming list of rules with the existing rules on the service. This is how it works:

- It finds existing rules that match via the name OR via a matching rule, updates the existing rule name, and keeps the same position.
- It inserts new rules into the rule list based on the NUMBER position. If the number is zero, it goes to the top of the list.
- It processes the rules in the order received so if you have two rules numbered zero, the second rule is processed after the first and claims the top spot. All existing rules are pushed down two places. Any numbers higher than existing rule positions are appended after the last existing rule and numbered in sequence.
- Any non-numbered rule is appended after the last existing rule and numbered in sequence.

This is the syntax of the merge command:

```
merge --file-data=<string> --file-format<string>
```

- `file-data` is the full path and name of the rules file to merge.
- `file-format` is the format of the rules file. Valid values are `params-list`, `string, params`, `binary`, and `params-binary`.

Methods of Sending a List of Rules to a Service

There are two ways to send a list of rules. You can send them as a `.nwr` (NetWitness Rule) file or as a numbered set of parameters, each number indicates the position to insert the rule at as well as the encoded rule. If you want to see the current list of rules on a service, you need to run the `ls` command on the rule category (for instance, application rules on a Decoder are found in `/decoder/config/rules/application`).

This is an example of commands to list the existing rules using NwConsole:

```
login <hostname>:50004 <username> <password>
cd /decoder/config/rules/application
ls
```

This is another example to list existing rules in NwConsole:

```
send /decoder/config/rules/application ls
```

This is an example of the command to point to network rules in the RESTful port, which supports a basic `admin HTML` app.

```
http[s]://<decoder>:50104/decoder/config/rules/network
```

Send a NetWitness Rule File

Let's start with an example `nwr` file, each rule must be on a separate line:

```
rule="ip.src=192.168.0.1" name=first keep
rule="ip.src=192.168.1.1" name=second alert=ioc
rule="ip.src=192.168.2.1" name=third filter
```

To push and merge rules using NwConsole, use the following commands:

```
login <hostname>:50004 <username> <password>
send /decoder/config/rules/application merge --file-data=/root/App_
Rules.nwr --file-format=params-list
```

To replace the existing rules with the rules in the file, instead of using the `merge` command, use the `replace` command.

```
send /decoder/config/rules/application replace --file-
data=<pathname> --file-format=params-list
```

To merge the rules in an `nwr` file using the RESTful port, you can use a `curl` command that pushes the rules:

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-
stream" --data-binary @<pathname> -X POST
"http://<hostname>:50104/decoder/config/rules/application?msg=merge"
```

The examples are pushing application rules. To push network rules, send the rules to `/decoder/config/rules/network`. For correlation rules, send the rules to `/decoder/config/rules/correlation`.

Send Numbered Parameters

The other way to send a list of rules is to send them as numbered parameters. The difficulty with this method is remembering to escape the quotes within each numbered rule. Though it is only a problem if you are trying to do it by hand. For instance, to send the same rules above as parameters via NwConsole, use the following command:

```
send /decoder/config/rules/application merge
1="rule=\"ip.src=192.168.0.1\" name=first keep"
2="rule=\"ip.src=192.168.1.1\" name=second alert=ioc"
3="rule=\"ip.src=192.168.2.1\" name=third filter"
```

This command is hard to read because you have to escape the inner quotes with a backslash (\). Otherwise, these two commands accomplish the same thing. Merging or adding three rules in positions 1, 2 and 3. If you think the above was hard to read, this is what the equivalent `curl` command looks like:

```
curl -u "<username>:<password>"
"http://<hostname>:50104/decoder/config/rules/application?msg=merge&1=rule%3D
%22ip.src%3D192.168.0.1%22%20name%3Dfirst%20keep&2=rule%3D%22ip.src%3D192.168
.1.1%22%20name%3Dsecond%20alert%3Dioc&3=rule%3D%22ip.src%3D192.168.2.1%22%20n
ame%3Dthird%20filter"
```

For more details on how to escape double quotes inside parameters, see add Command.

Ordering Rules When Pushing

Pushed rules are ordered in one of two ways. When passing as parameters, the number of each parameter determines the insertion order. If it is not actually a number, `merge` checks for an `order` parameter within the rule itself and uses that value if found.

Note: Using `order` is the only way to set the order with a `.nwr` file. If neither a number nor an `order` parameter is found, there are no guarantees of the insertion order.

Example

A Decoder has the following application rules installed; notice the numbering is ALWAYS consecutive and starts at 1:

```
0001 : rule="ip.src = 192.168.0.1 || ip.dst = 192.168.0.1 || alias.host = 'My-PC'" name=first keep
0002 : rule="ip.src=192.168.1.1" name=second alert=ioc
0003 : rule="ip.src=192.168.2.1" name=third filter
```

And you want to merge the following four rules:

```
rule="ip.src=192.168.3.1" name=third keep
rule="ip.dst=192.168.4.1" name=NewRule filter order=0
rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=append
rule="service=80,443" name=web filter order=3
```

Use any method to push your rules and this is what you end up with:

```
0001 : rule="ip.dst=192.168.4.1" name=NewRule filter order=1
0002 : rule="ip.src = 192.168.0.1 || ip.dst = 192.168.0.1 || alias.host = 'My-PC'" name=first keep order=2
0003 : rule="service=80,443" name=web filter order=3
0004 : rule="ip.src=192.168.1.1" name=second alert=ioc order=4
0005 : rule="ip.src=192.168.3.1" name=third keep order=5
0006 : rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=6
```

Are there any surprises here? This is how each rule was processed.

```
1. rule="ip.src=192.168.3.1" name=third keep
```

This rule had the same name as an existing rule on the Decoder (third). So the rule updated the existing rule, `changing _filter_ to _keep_`.

```
2. rule="ip.dst=192.168.4.1" name=NewRule filter order=0
```

This rule is new and had `order=0` in it, which means insert at the very top.

```
3. rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=append
```

This rule had a non-number `append` for `order`, therefore, it went to the end of the list. You can accomplish the same thing by giving a very large number, like `999999`.

```
4. rule="service=80,443" name=web filter order=3
```

This rule is last but has `order=3`, therefore, if it does not match an existing rule by name or the text of the rule itself, it should be placed in position 3. And there it is, the third rule in the list. Any rules that follow were pushed further down.

replace Command

The `replace` command removes all existing rules and replaces them with the incoming rule list. Refer to merge Command for details on how to format the incoming rule list and how ordering works.

This is an example of the `replace` command using a NetWitness Rule File :

```
send /decoder/config/rules/application replace --file-data=/root/Decoder-AppRules.nwr --file-format=string
```

This is an example of the `replace` command using Numbered Parameters :

```
send /decoder/config/rules/application replace 1="rule=\"ip.src exists\" name=\"test rule\" order=1 alert=ioc"
```

clear Command

The `clear` command removes all existing rules on the service. This is an example of the command:

```
send /decoder/config/rules/application clear
```

delete Command

The `delete` command deletes one or more rules on the service.

```
delete atPos <uint32> count <uint32, optional>
```

- `atPos` deletes the rule at the given position. Rules are numbered starting with 1 and go in sequential order.
- `count` deletes one or more rules starting `atPos`. This is an optional parameter defining the number of rules to delete starting `atPos`. The default value is 1.

This example of the command deletes four rules beginning at position 0003:

```
send /decoder/config/rules/application delete atPos=0003 count=4
```

validate Command

The `validate` command takes the provided rule and verifies that it parses correctly. Keep in mind that this command cannot verify whether language keys and entities are valid.

```
validate rule <string>
```

`rule` - is the name of the rule to validate. Make sure to place double quotes around any rules with white space.

Configure Parsers and Feeds

Parsers and feeds are responsible for analyzing the packets and logs when captured or imported in Decoders. Most commonly, they are used for static metadata extraction and service identification. The flexible definition allows custom extension of the core defined services to provide extra service type identification and metadata extraction. This is important due to the volume of custom applications that are used on networks.

See the following sections for details about configuring parsers and feeds.

- Configure Parsers
- Configure Feeds

Configure Parsers

NetWitness has a set of native parsers that are defined by the system, and also provides the option to add additional parsers. Each parser is configurable in the Services Config View - General Tab. The Parser Configuration panel provides a way to enable or disable parsers to use on Decoders in addition to limiting the metadata that the parser creates.

There are also several types of custom configurable parsers:

- GeoIP2 – This parser associates IP addresses with geographical locations. For new installations and upgrades, the GeoIP2 parser is enabled by default. For more information on these parsers, see GeoIP2 Parsers.
- Search – This parser is user-configured to generate metadata by scanning for pre-defined keywords and regular expressions.
- FLEXPARSE (deprecated) – This is a generic parser definition language for extending the existing application protocol support of the Decoder. By default this parser is disabled (see Enable or Disable Lua and Flex Parsing Systems).
- Lua – This parser is defined using the Lua scripting language for extending the existing application protocol support of the Decoder.
- Log – This application parser supports the Log Decoder and is configured to generate metadata by scanning log files.
- Snort® – This parser supports the payload detection capabilities of Snort IDS rules. Snort rules and configuration are added to the `parsers/snort` directory for Investigation and Decoder (see Decoder Snort Detection).

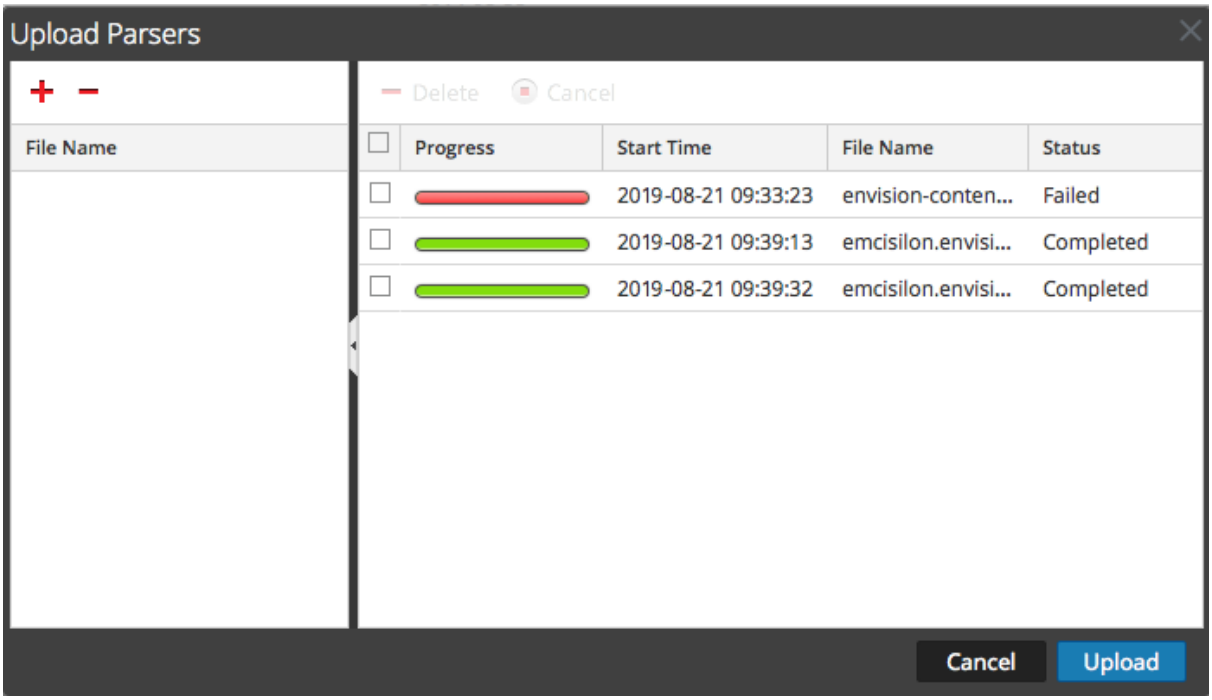
In the Services Config view > Parsers tab, you can view deployed parsers on a Decoder, upload parsers, and delete deployed parsers. The user interface includes an Indicator if the parser originated from Live Services, installed through NetWitness, or uploaded manually. Parsers can be added and removed while a Decoder is running without affecting capture.

Note: To pass options to parsers, you must first give the name of the parser and then the options to be passed in this format:
`<ParserName>="<ParserOptions>"<Whitespace><ParserName2>="<Parser2Options>"`
Each `ParserName=Value` option must be separated by whitespace. Normally, the `Value` must have double quotes around it. The `Value` itself can sometimes list multiple `Option=Value` pairs, each separated by whitespace, and if those values have whitespace, they must be in escaped double quotes. To escape a quote, place a backslash before it: `\"`.
This is an example of defining options for Parser1, Parser2, and Parser3:

```
Parser1="Option1=\"Option1 Value With Space\" Option2=Option2ValueNoSpace"
Parser2="Option1=Value" Parser3="op1=val1 op2=val2 op3=\"another value\""
```

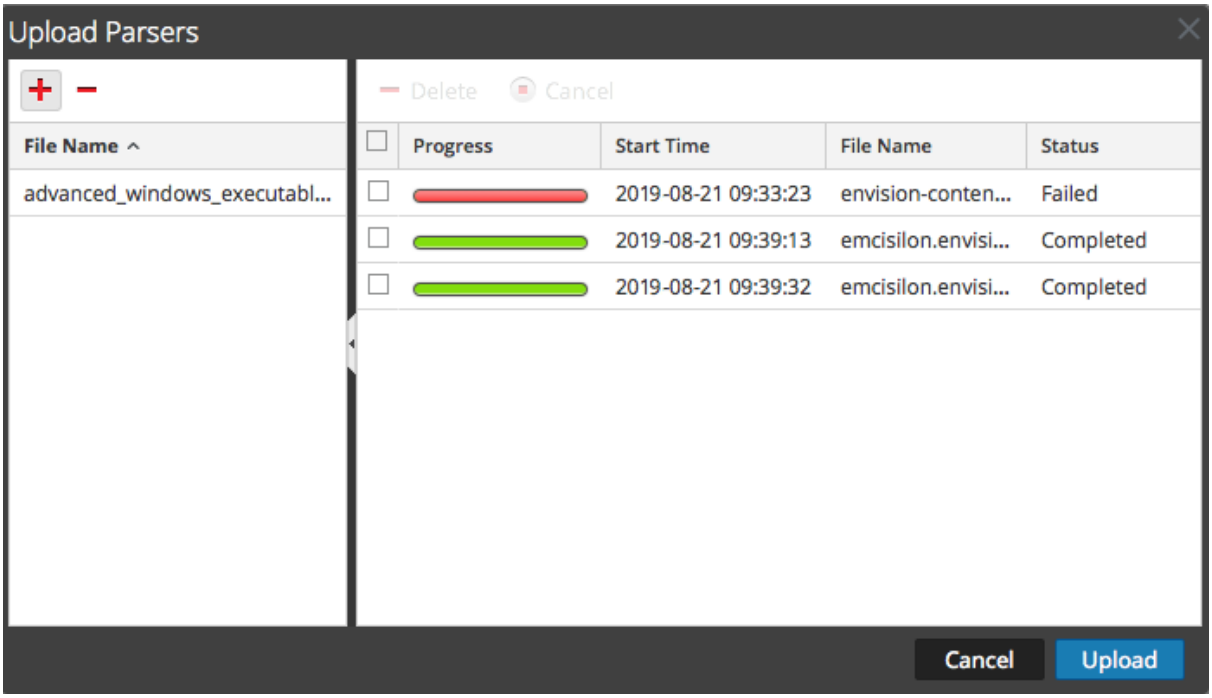
In addition, you can download parsers using NetWitness Live Services.

Upload and Delete Custom Parsers



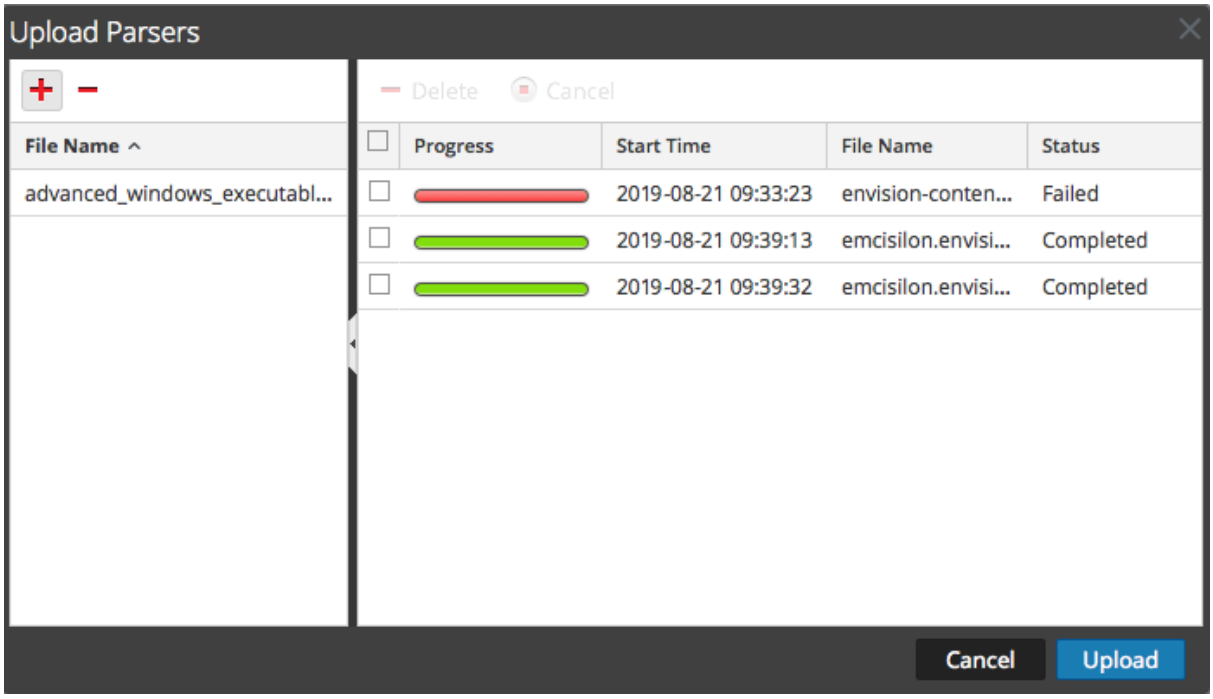
NetWitness has the ability to upload parsers from your local system and delete these parsers.

Upload Parsers to a Decoder or Log Decoder



The Upload option in the Service Config view > Parsers tab displays the Upload Parsers dialog, in which you can manage the uploading of parsers to a Decoder or Log Decoder. In the File list, you prepare a list of parsers for uploading. You can add files from a directory structure, and delete files from the list if you decide that you don't want to upload a particular file. When the list is ready, clicking Upload starts the upload process.

1. Go to  (Admin) > **Services**, select a service, and click  **> View > Config.**
   The Config view for the selected service is displayed.
2. Click the **Parsers** tab.



3. Click Upload.
   The Upload Parsers dialog is displayed.

4. Click .
   A file selection dialog is displayed.
5. Select the **.flex**, **.parser**, and **.lua** files to be updated, and click **Open**.
   The dialog closes, and the selected files are displayed in the File list.

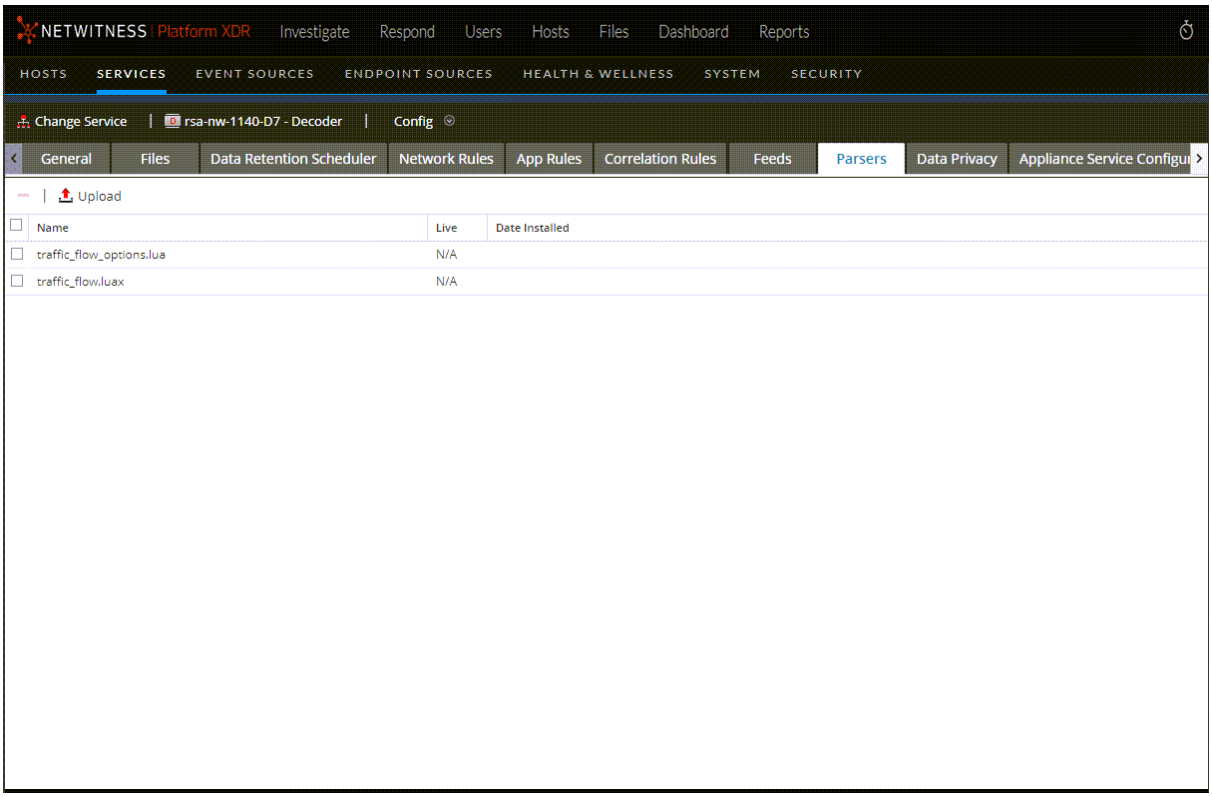
6. Click **Upload**.
   The Upload Job grid shows the progress of the upload jobs with each job representing a file being uploaded.

7. Use any of the Upload grid tools to manage the upload of selected jobs: pause and resume, cancel, and delete.
   Once a job is complete, it is deployed on the Decoder and listed with the deployed parsers in Parsers tab.

Manage Upload Jobs

You can use any of the Upload grid tools to manage the upload of selected jobs: pause, resume, cancel, and delete.

- To cancel uploading a set of parsers while the upload is in queue or progress, click Cancel.
- To pause uploading a set of parsers, if the upload is not yet complete, click Pause.
- To resume uploading a set of parsers after a pause, click Resume.
- To delete an upload job, click .



Delete Deployed Parsers

The Delete option in the Service Config view > Parsers tab provides a way to delete deployed parsers from a Decoder or Log Decoder. Parsers can be added and removed while a Decoder is running without affecting capture.

Note: Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

To delete a parser from a Decoder:

1. Go to (Admin) > **Services**, select a Decoder, and > **View** > **Config.**
   The Services Config view for the selected service is displayed.
2. Click the **Parsers** tab.

3. In the **Parsers** tab, select one or more parsers to delete.
4. Click −.
   A dialog requests confirmation that you want to delete the parsers.
5. If you want to delete the parsers, click **Yes**.
   The parsers are removed from the Decoder immediately.

Enable and Configure the Entropy Parser

Beginning with NetWitness 11.0, the administrator can configure a Decoder to use a NetWitness native parser, known as the Entropy parser. When the Entropy parser is enabled, analysts have visibility into channels that are trying to blend in with other traffic, but do not follow normal protocol behavior. This helps to identify channels that do not conform to the normal environment traffic baseline, and may be worthy of investigation.

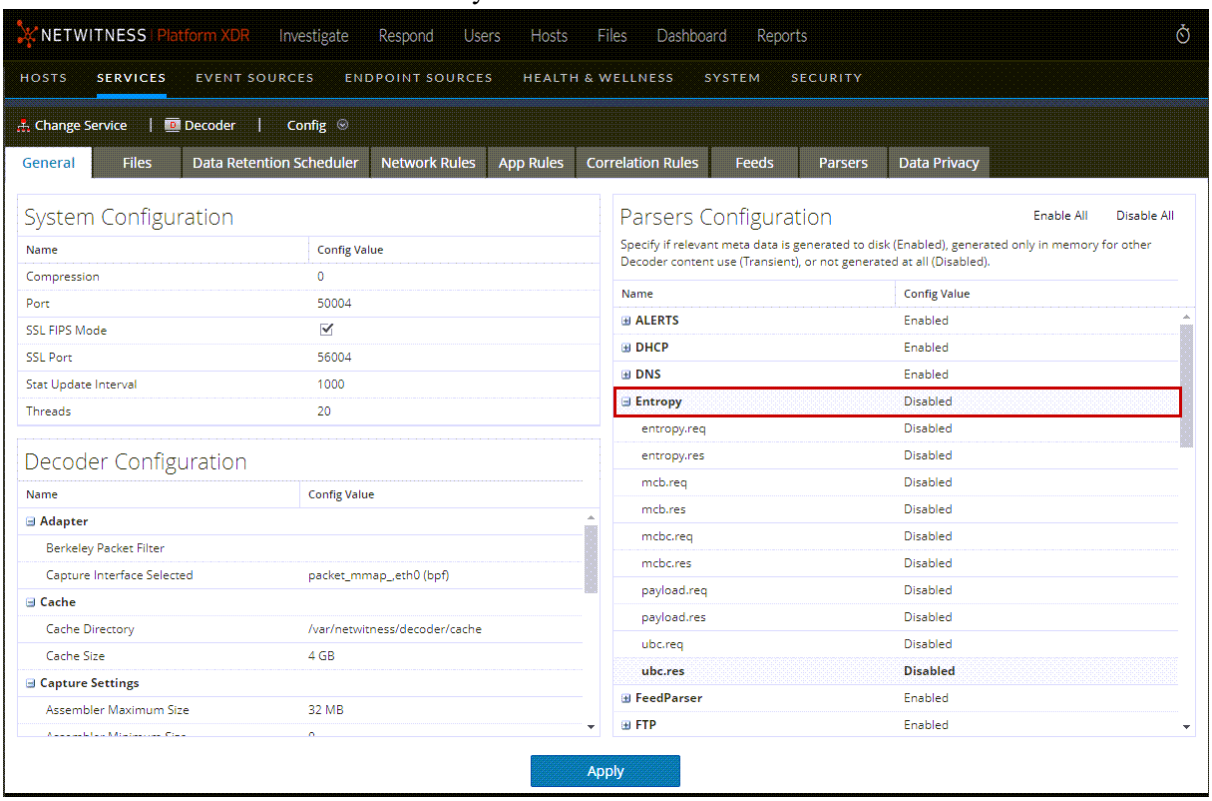
The parser creates meta keys, based on statistics collected by the native NetWitness parser, that help to identify behavior of any channel that is getting lots of network traffic. When the parser is first enabled, the analyst needs to become familiar with overall behavior for the different channels seen in a captured session to understand the frequency of bytes and the normal client and server payload. Once the normal behavior is known, analysts can use the meta keys to find behavior that does not match the expected.

By default, the Entropy parser generates 10 additional meta keys that do not add significantly to the load on a Decoder, and are useful for this specialized case. The parser is disabled by default.

Enable indexing if you have interest in exploring interesting sessions based on payload byte analysis of the packets. By default, to make indexing easier, the normal `Float32` value for `entropy.req` and `entropy.res` is multiplied by 10k and stored in a `UInt16` (thus giving four digits of precision, 0 to 10,000).

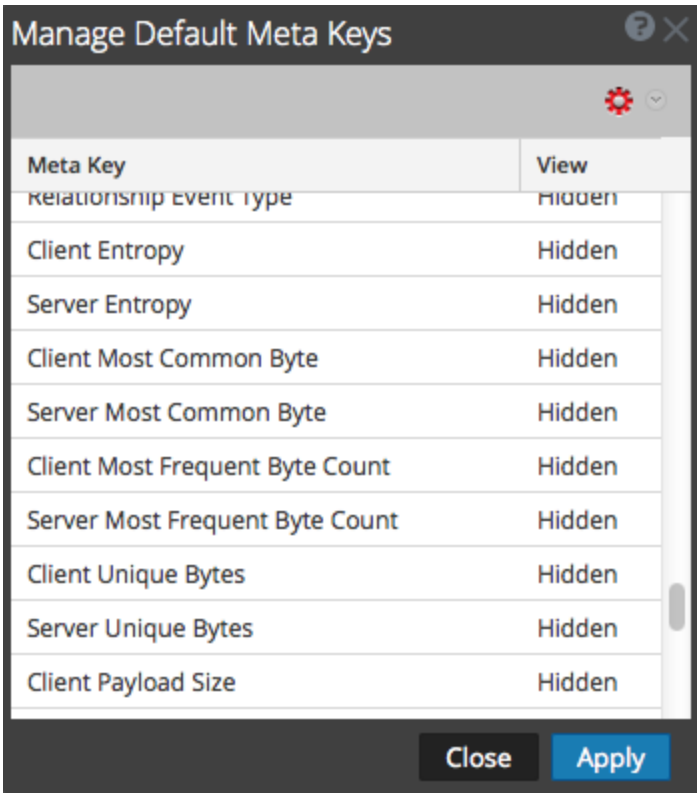
However, if you define the `entropy.*` fields in the Decoder language to be `Float32`, the Decoder will store it as a float with a range of 0.0 to 1.0. Take care to change the language everywhere if you decide to keep it as a `Float32`.

NetWitness does not recommend indexing as a `Float32` because of the high unique counts due to minute changes in precision.



These are the new meta keys generated by the Entropy parser by default:

- `entropy.req` and `entropy.res`: These meta keys capture entropy using the Shannon entropy equation, which has a floating point value as a result. The floating point value of 0 to 1.000 is multiplied by 10000 and written in NetWitness as `UInt 16`, an unsigned integer of 0 through 10000. .
- `mcb.req` and `mcb.res`: The most common byte is simply which byte for each side (0 thru 255) was seen the most.
- `mcbc.req` and `mcbc.res`: The most common byte count is the number of times the most common byte (above) was seen in the session streams.
- `ubc.req` and `ubc.res`: - Unique byte count is the number of unique bytes seen in each stream. 256 would mean all byte values of 0 thru 255 were seen at least once.



To enable and configure the Entropy parser on a Decoder:

1. Go to  (Admin) > **Services**, select a Decoder service and click  **View > Config**.
   The Services Config view for the selected Decoder is displayed.
2. The Entropy parser is disabled by default. Click the drop-down list for **Entropy** in the **Config Value** column, and select **Enabled**. If you want to disable some of the meta keys, click the drop-down list

and select **Disabled** next to the meta key.

3. Click **Apply**.
   The Entropy parser is enabled and begins creating the new meta keys as configured in the Concentrator custom index file.
4. In the Service Config view select the Concentrator that is aggregating traffic from this Decoder. Select **View > Files** and open the Custom Index file for the Concentrator. Look for the Entropy parser meta keys to see if they are included and uncommented.
   By default the keys are commented out and therefore not enabled. To enable that part of the language the administrator needs to copy that part of index file into the `index-concentrator-custom.xml` and uncomment the `key description` line for each meta key. An example of the custom index file with the Entropy parser keys and instructions is shown below in Entropy Parser Configuration in the Concentrator Custom Index File.
5. With the Entropy meta keys enabled, they are available to analysts in Investigate, but hidden by default. To make the meta keys visible in the Investigate Values view, edit the default meta keys in the Default Meta Keys dialog so that they are open instead of hidden. You can manage these meta key the same way you manage other meta keys.

Entropy Parser Configuration in the Concentrator Custom Index File

The following is an excerpt of the Concentrator Index file lines that the administrator must copy to the custom index file. The comments provide guidance on configuring the parser.

```
<!-- This section is commented out because it's only used by the Entropy
parser which is disabled by default. To enable this part of the language, copy
to index-concentrator-custom.xml and uncomment the keys. HOWEVER, take note
that depending on how the Entropy parser is configured, the entropy.req and
entropy.res format might be a Float32 instead of a UInt16. So make sure to
change to the correct type if necessary.-->

<!-- Entropy parser meta - enable indexing if you have interest in exploring
this for interesting sessions based on payload byte analysis of the packets.
By default, to make indexing easier, the normal Float32 value for entropy.req
and entropy.res is multiplied by 10k and stored in a UInt16 (thus giving 4
digits of precision, 0 to 10,000). However, if you define the entropy.* fields
in the Decoder language to be Float32, it will store it as a float with a
range of 0.0 to 1.0. Take care to change the language everywhere if you decide
to keep it as a Float32. We do not recommend indexing as a Float32 because of
the high unique counts due to minute changes in precision. -->

<!--

<key description="Entropy Request (Client)" format="UInt16" level="IndexNone"
name="entropy.req" valueMax="10001"/>

<key description="Entropy Response (Server)" format="UInt16" level="IndexNone"
name="entropy.res" valueMax="10001"/>

-->
```

```
<!-- The most common byte is simply which byte for each side (0 thru 255) was
seen the most -->

<!--

<key description="Most Common Byte Request" format="UInt8" level="IndexNone"

<key description="Unique Byte Count Response" format="UInt16"
level="IndexNone" name="ubc.res"/>

-->

<!-- The payload size metrics are the payload sizes of each session side at
the time of parsing. However, in order to keep indexing from having high
unique counts (bad for performance), the two payload size metas below are
indexed in buckets. -->

<!--

<key description="Payload Size Request" format="UInt32" level="IndexNone"
bucket="true" name="payload.req" valueMax="500000"/>

<key description="Payload Size Response" format="UInt32" level="IndexNone"
bucket="true" name="payload.res" valueMax="500000"/>

-->
```

Flex Parsers

There are two kinds of Flex parsers:

- **Service identification based solely on port.** These are parsers that use only the source or destination ports to identify the session application type (service). These are the most basic and easiest to define.
- **Service identification based on a found token(s).** These parsers use tokens to identify the service type. This is also an easy way to expand which service types are identified. These are important when identifying non-internet standard applications. These parsers require that the protocol has a definable token that can uniquely identify the service type.

Five common parser operations are:

- Match Port and Identify Immediately
- Match Port and Delay Identification
- Match Token and Identify Immediately
- Match Multiple Tokens
- Match Token and Create Metadata

Detailed language information and samples are provided in this topic. This topic describes the XML schema used to define a FlexParse file. The SML node, attribute, and values referenced in descriptive text are **bold**. The root node of every file must be the **parsers** node. Under that node there can be any number of parser nodes. Each parser node defines a single parser. A parser node can have an optional **declaration** node and any number of **match** nodes.

Topics

- Arithmetic Functions
- Common Parser Operations
- General Functions
- Logging Functions
- Nodes
- Payload Functions
- Regex
- String Functions

Arithmetic Functions

This topic defines language for the flex parser arithmetic functions.

This topic defines language for the flex parser arithmetic functions. All numbers are 64-bit unsigned values and subject to both underflow and overflow, depending on the operation.

Language Definition

The following table provides language definitions.

Node Name	Attribute Name	Description
`and`		Performs bitwise AND between two numbers.
	`name`	Variable to AND result into.
	`value`	Number to AND into result.
`or`		Performs bitwise OR between two numbers.
	`name`	Variable to OR result into.
	`value`	Number to OR into result.
`increment`		Performs ADDITION of two numbers.
	`name`	Variable containing the initial value AND to receive ADDITION results.
	`value`	Number to ADD to initial value.
`decrement`		Performs SUBTRACTION of two numbers.
	`name`	Variable containing initial value AND to receive SUBTRACTION results.
	`value`	Number to SUBTRACT from initial value.
`divide`		Performs DIVISION of two numbers.
	`name`	Variable containing the initial value AND to receive DIVISION results.
	`value`	Number by which to divide the initial value. Division by zero generates an error and stops any further processing of the current session by this parser.
`modulo`		Performs MODULO of two numbers.
	`name`	Variable containing the initial value AND to receive MODULO results.

Node Name	Attribute Name	Description
	value	Number by which to divide the initial value. Division by zero generates an error and stops any further processing of the current session by this parser.
multiply		Performs MULTIPLICATION of two numbers.
	name	Variable containing the initial value AND to receive MULTIPLICATION results.
	value	Number by which to MULTIPLY the initial value.
shiftleft		Performs a binary shift left.
	name	Variable containing the initial value AND to receive shift results.
	value	Number of bits to shift by.
shiftright		Performs a binary shift right.
	name	Variable containing the inital value AND to receive shift results.
	value	Number of bits to shift by.

Common Parser Operations

This topic provides some examples of common parser operations.

This topic includes five common parser operations.

Match Port and Identify Immediately

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="parsers.xsd">
          <parser name="CustApp" desc="Acme Custom App" service="45324">
               <declaration>
                    <port name="port" value="45324" />
               <declaration>
               </match name="port">
                    <identify />
               </match>
          </parser>
</parsers>
```

Match Port and Delay Identification

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="MSRPC" desc="Microsoft RPC protocol" service=135">
          <declaration>
               <port name="port" value="135" />
               <number name="state" scope="session" />
               <session name="end" value="end" />
          </declaration>
          <match name="port">
               <assign name="state" value="1" />
          </match>
          <match name="end">
               <if name="state" equal="1" />
                    <identify />
               </if>
          </match>
     </parser>
```

```
</parsers>
```

Match Token and Identify Immediately

```
<?xml version="1.0" encoding="utf-8?>
<parsers
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="RDP" desc="Remote Desktop Protocol" service="3389">
          <declaration>
               <token name="signature" value="Cookie: mstshash=" />
          </declaration>
          <match name="signature">
               <identify />
          </match>
     </parser>
</parsers>
```

Match Multiple Tokens

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="MyServiceMultiToken" desc="Multiple Tokens" service="333">
          <declaration>
               <number name="state" scope="stream" />
               <token name="user" value="USER " />
               <token name="pass" value="PASS " />
               <session name="session" value="end" />
          </declaration>
          <match name="user">
               <or name="state" value="1" />
          </match>
          <match name="pass">
               <or name="state" value="2" />
          </match>
          <match name="session">
               <if name="state" equal="3">
                    <identify />
               </if>
          </match>
```

```
     </parser>
</parsers>
```

Match Token and Create Metadata

```
<?xml version="1.0" encoding="utf-8"?>
<parsers xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="SHELL" desc="Command Shell Identification">
          <declaration>
               <token name="cmd.exe" value=" (C) Copyright 1985-2001 Microsoft
               Corp" options="linestart" />
               <meta name="client" key="client" format="Text" />
          </declaration>
          <match name="cmd.exe"
               <register  name="client" value="MS Command Shell" />
          </match>
     </parser>
</parsers>
```

General Functions

This topic defines language for the flex parser general functions.

General Functions Language Definition

Node Name	Attribute Name	Description
apptype		Gets the currently defined service type for the current session.
	name	A number variable to receive the current service type.
identify		Marks the session with the parser's service type if the service type has not already been identified.
assign		Assigns a value to a variable.
	name	The unique identifier assigned to the item in the declaration section.
	value	Optional. If specified, the action defined in the match is only applied when the declaration matches the given value.
getmeta		Retrieves the value of meta that generated a callback. This function will return empty results (0, zero length string) if called when there was no meta callback.
	name	The variable to receive the value of the meta key that generated the callback.
gettoken		Returns the current matched token.
	name	A string variable to receive the current matched token. If there is no current token, the variable is assigned an empty string.
end		This terminates the execution of the current **match** section.
if		Compares two values. If the comparison is true, executes any sub-actions. Comparisons can be **number** or **string** types, as long as both values are the same type.
	name	The unique variable identifier assigned to the item in the **declaration** section.
	equal notequal less lessequal greater greaterequal and or	The operation value to compare. If true, any sub-actions are executed.
register		Adds metadata to the session.

Node Name	Attribute Name	Description
	name	The unique identifier of a meta variable to be created, as defined in the **declaration** section.
	value	The value of the metadata to be created.
while		Compares two values and executes any sub-actions if the comparison is true. Comparisons can be **number** or **string** types, as long as both values are the same type.
	name	The unique variable identifier assigned to the item in the declaration section.
	equal notequal less lessequal greater greaterequal and or	Specifies the operation value to compare. If true, any sub-action is executed. The **and** and **or** attributes signify bitwise operations and can only be applied to **number** variables.
call		Executes the specified **match** element. This can be any match element defined in the same flex parser regardless of how it was declared.
	value	The name of the match element, or a string variable containing the name of a match element. • If the match element name is specified, the parser will not load if the named matched element doesn't exist. • If a string variable is specified, the **call** element will execute any child elements that it may have if the string value resolves to a match element after executing the named match element. • If no **match** element can be found matching the string value, no action is taken.

Logging Functions

This topic defines language for the flex parser logging functions.

Logging functions provide a means for a flex parser to write to the system log. Logging functions can be extremely useful when creating a new flex parser, but should be kept to an absolute minimum when a flex parser is deployed to a production system.

Language Definition

Node Name	Attribute Name	Description
`failure`		Logs a message to the system log with the log level **Failure.**
	`value`	A string to include as the log message.
`warning`		Logs a message to the system log with the log level **Warning.**
	`value`	A string to include as the log message.
`info`		Logs a message to the system log with the log level **Info**.
	`value`	A string to include as the log message.
`debug`		Logs a message to the system log with the log level **Debug.**
	`value`	A string to include as the log message.

Nodes

This topic defines language for the flex parser nodes.

Nodes Language Definition

Node Name	Attribute Name	Description
`parsers`		The root node in each definition file.
	`xmins:xsi`	Defines the namespace to use for the schema inclusion. This attribute is not required; however, language definition is not possible without it. This node must have the following value: http://www.w3.org/2001/XMLSchema-instance
	`xsi:noNamespaceSchemaLocation`	Defines the XSD schema validation file used to validate the language definition. This attribute is not required; however, language definition is not possible without it. This node must have the following value: parsers.xsd
`parser`		The node that defines a single parser definition. This node must be directly under the `parsers` node. There can be more than one per file.
	`name`	The name that uniquely identifies the parser. This name should be short and succinct. This is used by the system to allow enabling and disabling. It should contain only the letters [a-z] and [A-Z].
	`desc`	Provides a friendly description of what the parser does.
	`service`	The unique number assigned to the session when identified.
`declaration`		Delineates the definition. Each of these definitions can have an associated `match` entry.

Node Name	Attribute Name	Description
token		Specifies a definition for identifying a token somewhere in the session protocol. This defines a match callback when the specified tokens are encountered in a session payload. The read position is set to the byte immediately following the matched token.
	name	This is a unique identifier for the declaration.
	value	This is the exact token value to be identified.
	options	Options specify that the token should start on a new line or at an end of a line (linestart or linestop).
meta-callback		Registers a callback for the flex parser whenever meta of a specific format is created. This can be further qualified to generate callbacks only for sessions that have been identified as a specific apptype (for example, 80 for HTTP).
	name	Name of the match element to be executed when a callback occurs. (String)
	key	Name of the meta key that generates callbacks. (String)
	format	The data type of the meta key that will generate the meta.
	apptype	The meta callback is only generated if the session being parsed has been identified with the specified apptype. (Unsigned Integer, Optional)
number		Defines a numeric variable that can be referenced elsewhere within the parser definition. All numeric values are 64-bit unsigned values.
	name	This is a unique identifier for the declaration.

Node Name	Attribute Name	Description
	`scope` (optional)	Specifies when to reset the variable. This can either be for each side of a two-sided session or only after a new session is detected. The possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
`string`		Defines a numeric variable that can be referenced elsewhere within the parser definition.
	`name`	This is a unique identifier for the declaration.
	`scope` (optional)	Specifies when to reset the variable. This can either be for each side of a two-sided session or only after a new session is detected. The possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
port		Defines a **match** callback when a session is encountered using the specified port. The **read** position is set to the first byte of the first stream (client) in the session.
	`name`	This is a unique identifier for the declaration.
	`value`	This is the port number to identify.
`session`		Defines a `match` callback for session begin/end events. These events only occur if a token for the parser is encountered in the session.
	`name`	This is a unique identifier for the declaration.
	`value`	Specifies that processing takes place at the beginning of a new session or at the end of a session (`begin` or `end`).
`stream`		Defines a `match` callback for stream begin/end events. These events only occur if a token for the parser is encountered in the stream.
	`name`	This is a unique identifier for the declaration

Node Name	Attribute Name	Description
	`value`	Specifies that processing takes place at the beginning or at the end of a stream (`begin` or `end`).
`function`		Defines a `match` section that can be used as a generic function. No callbacks are associated with this declaration.
	`name`	This is a unique identifier for the declaration.
`meta`		Defines the type of data that the parser will create.
	`key`	Specifies the key name. The key needs to be 1-16 bytes in size.
	`format`	Specifies the variant type (for example, **`Text`**, **`IPv4`**, **`UInt32`**). Refer to the SDK documentation for a full list.
`pattern`		Defines a regular expression variable for use by the `regex` function
	`name`	This is a unique identifier for the declaration.
	`scope` (optional)	Specifies when to reset the variable. This can be for each side of a two-sided session or only after a new session is detected. Possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
	`value` (optional)	Specifies a regular expression to assign to the pattern variable. This attribute is only valid when the **`scope attribute`** is set to `constant`.
`match`		The possible entries for taking an action once a match criterion has been found for a declaration. These nodes can be nested to provide deeper logic. There are several categories of execution elements (functions) that can appear as children of a match element: • General • Arithmetic • String • Payload

Payload Functions

This topic defines language for the flex parser payload functions.

These functions operate on a `read` position, set at the beginning of a `match` element.

Language Definition

Node Name	Attribute Name	Description
`find`		Searches the stream payload starting at the read position for a provided string value. If the value is found, the offset from the read position is returned. Any child elements will then execute. If not found, any child elements will not execute.
	`name`	A `number` variable to receive the offset from the `read` position where the match begins.
	`value`	A string to find.
	`length` (optional)	A limit to the length of the payload to be searched. If a limit is not provided, the remainder of the payload is searched. It is recommended to always use the smallest value possible here in order to reduce the effect on performance.
`install-decoder`		To enable tokens to match on payload data that may be fragmented or otherwise encoded. A scan decoder can be installed to preprocess a section of the payload before it is scanned for tokens. An example would be an HTTP response that uses the chunked transfer encoding with gzip content encoding. By parsing the HTTP header, the necessary type, offset, and length parameters can all be set, after which the HTTP response payload would appear to the token scanning as if neither encoding had been applied. However, this incurs significant overhead.
	`type`	The type of decoder to install. Valid options are: gzip, deflate, chunked, chunked-gzip, chunked-deflate.
	`offset`	Offset from the current read position to begin decoding.
	`length`	The maximum payload length to decode.
`isdecoding`		Tests whether an installed decoder is currently active. If so, any children of this function will execute. This function has no parameters.

Node Name	Attribute Name	Description
`move`		Moves the `read` position forward in the current stream by a specified number of bytes. If there is sufficient data in the stream, the `read` position is updated and any child elements will then execute. If not found, the `read` position remains unchanged and any child elements will not execute.
	`value`	The number of bytes to move the `read` position.
	`direction` (optional)	The direction to move the current read position. Can be `forward` (default) or **`reverse.`**
`packetid`		Returns the id of the packet for the current read position. It is possible for the result to be 0, which indicates that the packet id could not be determined.
	`name`	A number variable to receive the current packet id.
`payload-position`		Returns the current read position. This is a zero based index into the stream payload.
	`name`	A number variable to receive the current read position.
`read`		Reads a specified number of bytes starting at the `read` position into a variable. If there is sufficient data in the stream, the `read` position is updated, the data read assigned, and any child elements will then execute. If not found, the `read` position remains unchanged and any child elements will not execute.
	`name`	The name of a `string` or `number` variable to receive stream data. If a `number` variable is provided, the bytes read are interpreted as a single unsigned numeric value.
	`length`	The number of bytes to read from a stream.
	`endianess` (optional)	The byte ordering to use when reading into a number variable. Can be `big` (default) or `little`. The attribute is invalid when reading into a `string` variable.

Regex

This topic defines language for the flex parser regex node.

Regex searches the stream payload starting at the `read` position for matches to a provided regular expression. If matches are found, the offset from the `read` position and, optionally the matched string, is returned. Any child elements execute. If no matches are found, child elements do not execute.

Language Definition

Attribute Name	Description
`name`	A `number` variable to receive the offset from the `read` position where the match begins.
`value`	A regular expression to find.
`length` (optional)	A limit to the length of the payload to be searched. If a limit is not provided, the remainder of the payload is searched. It is recommended to always use the smallest value possible here in order to reduce the effect on performance.
`found` (optional)	The name of a `string` variable to receive a matched string.

String Functions

This topic provides language definitions for the flex parser string functions.

String Functions Language Definition

Node Name	Attribute Name	Description
`append`		Attaches a number or string to the end of a `string` variable.
	`name`	The unique identifier of a string variable to which the specified value is to be attached.
	`value`	A number or string to attach.
`find`		Searches a string for a provided string value. If it is found, the position is returned and any child elements will execute. Otherwise, child elements will not execute.
	`name`	A `number` variable to receive the zero-based position, where the provided value string was found in the **in** string.
	`value`	A string to find.
	`in`	A string to search.
	`length` (optional)	A limit to the length of the **in** string to be searched. If a limit is not provided, all of **in** will be searched.
`length`		Assigns the length of a string to a `number` variable.
	`name`	A `number` variable to receive the length of the specified string.
	`value`	A string value whose length is to be determined.
`regex`		Searches a string for matches to the provided regular expression. If a match is found, the position and, optionally, the matching string is returned. Any child elements will then execute. If not found, any child elements will not execute. Regular expression operations can adversely affect system performance.
	`name`	A number variable to receive the zero-based position, where the provided regular expression matched in the in string.
	`value`	A regular expression to be searched for.

Node Name	Attribute Name	Description
	in	A string to search.
	length (optional)	A limit to the length of the in string to be searched. If a limit is not provided, all of **in** will be searched.
	found (optional)	The name of a string variable to receive the matched string.
substring		At least one of the optional attributes from and length must be specified.
	name	The unique identifier of a string variable to receive the extracted value.
	value	A string value from which to extract a substring.
	from (optional)	The zero-based position from which to begin the substring. If not specified, it defaults to zero.
	length (optional)	The number of characters to extract. If not specified, it defaults to the remaining length of the string.
tolower		Converts a string to all lowercase letters.
	name	The name of a string variable to process.
toupper		Converts a string to all uppercase letters.
	name	The name of a string variable to process.
urldecode		Decodes a string containing url-encoded characters.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.
base64decode		Decodes a base-64 encoded string.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.
uudecode		Decode a uuencoded string.
	name	A string variable to receive the decoded string.
	value	A uuencoded string. The header and trailing lines should not be included.
quotedprintabledecode		Decode a Quoted-printable encoded string.
	name	A string variable to receive the decoded string.
	value	A quoted-printable encoded string.

Node Name	Attribute Name	Description
convert-ebcdic		Convert an EBCDIC string to its ASCII equivalent.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.

GeoIP2 Parsers

This topic describes the GeoIP2 parser for Decoders. This parser converts IP addresses into geographic locations, such as the country name and city where the IP address is typically found.

Note: In version 11.3 and later, the native GeoIP2 parser replaces the GeoIP parser (which has been permanently removed). The GeoIP2 parser provides the same basic functionality as the GeoIP parser as well as many enhancements. For example, it converts IP addresses into geographic locations, provides the latest Maxmind GeoIP package, and supports IPv6 addresses as well as IPv4.

Available in NetWitness version 11.2 or later, the GeoIP2 Parser is enabled by default for upgrades and new installations. The GeoIP2 parser provides the latest Maxmind GeoIP package and supports IPv6 addresses as well as IPv4.

To edit the GeoIP2 parser configuration:

1. Go to  (Admin) > **Services**.
2. In the **Administration services** view, select a Log Decoder or a Decoder.
3. Click the settings icon () and select **View** > **Config**. In the Parsers Configuration panel, select **GeoIP2** to view and update configuration options.
4. Define the IP addresses to lookup. The GeoIP2 parser enables the following IP addresses by default: `ip.src`, `ip.dst`, `ipv6.src`, and `ipv6.dst`. You can update options by using `parsers.options` to remove or add new IP addresses. For example, you can edit `parsers.options` and pass a comma-separated list of IP addresses to use as follows:
   `GeoIP2="ipaddr=ip.src,ip.dst,ipv6.src,ipv6.dst,alias.ip"`
   This adds a new IP address to lookup called `ip.addr`. However, since `alias.ip` does not end in `.src` or `.dst`, the parser will elect to place the GeoIP2 metadata generated in meta keys without a `.src` or `.dst` suffix. So, you would see country, city, and so on, after the `alias.ip` metadata.
5. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

Note: The list you pass for `alias.ip` replaces the default list. So, if you pass `alias.ip=ip.src`, it generates only GeoIP2 metadata for `ip.src`, and generates no metadata for other IP addresses.

Note: `parsers.options` is used for passing options to multiple parsers. So if you add GeoIP2 to it, you should not delete any other options being passed to other parsers (like Entropy).

The following table provides the full list of metadata that the GeoIP2 parser can potentially generate and indicates which metadata is or is not enabled by default:

Enabled by Default	Not Enabled
country, country.src, country.dst	latdec, latdec.src, latdec.dst
	longdec, longdec.src, longdec.dst
domain, domain.src, domain.dst	isp, isp.src, isp.dst
org, org.src, org.dst	city, city.src, city.dst

You can enable the other metadata using the standard parser configurations.

Note: By disabling some metadata by default, the GeoIP2 parser does not work the same as the GeoIP parser (which did not, by default, disable any metadata it generated). If you need any of the disabled metadata, you need to enable them (once only) for each Decoder, after upgrading to 11.2 or later. Keep in mind that the `isp` and `org` meta keys usually produce an equivalent value to `domain`.

Lua Parsers

There are a number of Lua parsers available from Live. See NetWitness Content for:

- A complete list of these parsers
- Their interdependencies
- The Flex parsers that are subsumed by each Lua parser

Five common parser operations are:

- Match Port and Identify Immediately
- Match Port and Delay Identification
- Match Token and Identify Immediately
- Match Multiple Tokens
- Match Token and Create Metadata

HTTP Parsers

The HTTP parser is a native parser that is used for Decoders to parse both requests and responses in HTTP messages. In version 11.4 and later, the HTTP parser provides a decompression option.

The decompression option mimics the decompression option in the Lua HTTP parser and is controlled by the `'decompression'` option for the HTTP parser. Parser options are set in the `/decoder/parsers/config/parsers.options` configuration node. To set an option on the HTTP parser, you append an `HTTP=""` clause to the `parsers.options` field so that HTTP can understand the `'decompression'` option.

For example, you could add `HTTP="decompression=true"` to the parser option list to enable decompression of all HTTP compressed bodies.

You can use the following values in the `'decompression'` field.

Value	Description	Example Entry in parsers.options
`true`	Decompress all bodies	`HTTP="decompress=true"`
`false`	Do not decompress. This is the default.	`HTTP="decompress=false"`
`1`	Decompress `application/*` content	`HTTP="decompress=1"`
`2`	Decompress `audio/*` content	`HTTP="decompress=2"`
`4`	Decompress `font/*` content	`HTTP="decompress=4"`
`8`	Decompress `image/*` content	`HTTP="decompress=8"`
`16`	Decompress `message/*` content	`HTTP="decompress=16"`
`32`	Decompress `model/*` content	`HTTP="decompress=32"`
`64`	Decompress `text/*` content	`HTTP="decompress=64"`
`128`	Decompress `video/*` content	`HTTP="decompress=128"`

The numeric values can be combined by addition to search for multiple types of content. For example, if you want to decompress application and text content, use `1 + 64 = 65`, which becomes `HTTP="decompress=65"`.

To set the decompression option:

1. Go to  (Admin) > **Services** and select a Decoder, and in the actions menu (), select **View** > **Explore**.
2. Expland **decoder** > **parser**s and select **config**.
3. In **parsers.options**, append `HTTP="decompress=<option from table>"`.

4. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

Visibility into HTTP/2 Sessions

You can search for metadata items derived from headers in the HTTP/2 stream to gain visibility into HTTP/2 sessions.

To turn on header parsing for HTTP/2 sessions:

1. Go to **ADMIN** > **Services** and select a Decoder, and in the actions menu (), select **View** > **Explore**.
2. Expland **decoder** > **parser**s and select **config**.
3. In **parsers.options**, append `HTTP2="headers=true"`.
4. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

Decoder Snort Detection

Snort is a free and open-source intrusion prevention system that uses a rule-based language to detect malicious network traffic. The NetWitness Platform Decoder offers compatibility with Snort detection rules, sometimes referred to as Snort signatures. NetWitness supports importing existing Snort rules into the Decoder, extending the known threats that can be detected. There are many sources for Snort rules, as it is an open source solution. In most cases, the behavior of Snort rules in the Decoder is the same as the rules in other network analysis tools. However, the Decoder does not have coverage for all Snort rule options. The topics in this section highlight NetWitness Platform Decoder-specific details of how to set up Snort parsers, how Snort rules are handled, and explain cases where Decoder might differ in behavior from Snort.

Using Snort Rules in Decoders

The Snort Detection engine is implemented as a built-in native parser in Decoders. The parser's identifier is `Snort`, and can be found in the Decoder Parsers Configuration page along with the other native parsers enabled by default. The Snort parser reads files from the directory `/etc/netwitness/ng/parsers/snort`. All files in this directory are read during the Decoder service restart. Files that end in the extension `.conf` are treated as configuration files. The format for configuration files matches the configuration file format for Snort, although not all configuration directives are supported. Further details are in Configuration Directives . Files that end in the extension `.rules` are treated as Snort rules files. A rules file can contain one or more rules, and the Snort directory can contain more than one rules file. The rule file format is the same as for Snort itself. The Snort rule files can be loaded into the Decoder by any of the following methods:

1. The Decoder service starts.
2. The `reload` message is sent to the `/decoder/parsers` folder. This allows for rules to be reloaded while capture is running.

However, note the following:

- Any rule that does not properly parse is ignored.
- Any valid Snort rule should successfully parse; however, there are rule options that are not supported by Decoders which are not fully parsed. For more information, see Snort Parser Capabilities .

Note: NetWitness recommends that the maximum number of Snort rules in use per Decoder is 1,000.

Initial Decoder Snort Configuration

Follow these steps to set up an initial configuration of Snort on a Decoder.

1. Edit the `snort.conf` file in the `/etc/netwitness/ng/parsers/snort` directory, and configure it according to the instructions in Configuration Directives , which describes the details of the variables inside the configuration file. If the variables `HOME_NET, EXTERNAL_NET` and `HTTP_PORTS` are not defined, they default to the value of `any`.
   A sample `snort.conf` file is shown below, but depending on where the Decoder is placed in the network, and which threats need to be captured, you might need to alter the configuration.
   For example, you can be more specific about the internal subnets by defining `ipvar HOME_NET [192.168.0.0/16, 10.0.0.0/8, 172.16.0.0/12]`. However, if the Decoder is capturing

traffic on a DMZ, those subnets might not be accurate.
Also, if `HOME_NET` has been defined, and the `EXTERNAL_NET` has also been narrowed down to `ipvar EXTERNAL_NET !$HOME_NET`, then you may miss lateral movement traffic (for example, `192.168/16` to `192.168/16`) within your environment. In general we suggest you align this configuration file with how you configure the `traffic_flow` configuration for the corresponding Traffic Flow Lua parser.

An example `snort.conf` file that is a good starting point:

```
#Configure the network addresses you are protecting
ipvar HOME_NET any
#Configure the network addresses external to your environment
ipvar EXTERNAL_NET any
#Configure any specific network ports
portvar HTTP_PORTS any
```

2. Generate or upload a Snort rules file into the same directory (`/etc/netwitness/ng/parsers/snort`). Read the Snort documentation at https://www.snort.org/#documents for details on how to construct rules. There are many free community-generated Snort rules available as well, that can be uploaded from https://www.snort.org/downloads/#rule-downloads. Several other sites publish Snort signatures as responses to new threats that are found. The basic rule structure and supported sections are mentioned in Rule Sections.

   Note: Only the Snort V2.x rules are supported. There are some rule options that are not supported, which are described in Snort Parser Capabilities .

3. Make sure the Snort configuration and rules files do not cause any errors when initialized by the Decoder by running the service restart command on the Decoder.
   The reload will check in the Snort rules without restarting, but does not log any messages about whether there are any issues with the rules or configuration.

   a. In the NetWitness user interface, go to  (Admin) > **Services** > **Decoder** >  > **View** > **System**.

   b. Select **Shutdown Service** and confirm. (The Decoder will automatically restart.)

   c. Go to > **Services** > **Decoder** >  > **View** > **Logs**.

   d. Search for Snort to validate that the rules files loaded.
      The log will indicate if the rules files are loaded completely (`full`), partially (`partial`), or if any rules railed to load (`failed`).
      The following are example log entries, using `mysnort.rules`, with two fully supported rules in the file. If any of the rules are marked partial or failure, examine the rules to determine why the load was not successful.

```
Loaded mysnort.rules, full 2, partial 0, failures 0
Loaded 2 snort rules, 2 small tokens, 0 with pcres, 0 partial, 0
unsupported
```

      When you search for Snort, you can find details on configuration variables and warning messages

if they are not defined. The following is an example log entry for a `snort.conf` file that is not fully populated with the minimal IP and port variables.

```
Undefined snort ip variables (will default to any): EXTERNAL_NET, HOME_
NET
Undefined snort port variables (will default to any): HTTPS_PORTS
```

e. Alternatively, you can perform the service restart and review of the logs from the Decoder console:

```
systemctl restart nwdecoder
tail -f /var/log/messages | grep -i snort
```

4. Import or capture network traffic that is known to trigger the Snort rules to validate they are functioning.
5. Validate that the Snort rules are getting triggered by the network traffic or by sample uploaded PCAPs. The Snort statistics can be used to track which rules have been evaluated, compared to generated metadata. For more information, see Rule Statistics . The default metadata generated by Snort rules are: `sig.id`, `sig.name`, `threat.category`, `threat.source`, and `risk.num`. The mapping of Snort rule information to NetWitness Platform metadata, and how to change it, is described in Snort Parser Output.

Snort Parser Output

When a Snort rule matches a session, it produces meta items. The meta items generated may change depending on the configuration of the Snort parser. Snort parser meta key usage has been updated with a new option for the Snort parser. The option, `Snort="udm=true"` (set to true by default), uses the Aligned Unified Data Model (UDM) key set. For information about UDM, see https://community.netwitness.com/t5/netwitness-platform-unified-data/introduction-to-the-rsa-netwitness-platform-unified-data-model/ta-p/565620. By default, the Aligned UDM key set is used.

Note: To pass options to parsers, you must first give the name of the parser and then the options to be passed in this format:
`<ParserName>="<ParserOptions>"<Whitespace><ParserName2>="<Parser2Options>"`
Each `ParserName=Value` option must be separated by whitespace. Normally, the `Value` must have double quotes around it. The `Value` itself can sometimes list multiple `Option=Value` pairs, each separated by whitespace, and if those values have whitespace, they must be in escaped double quotes. To escape a quote, place a backslash before it: `\"`.
This is an example of defining options for Parser1, Parser2, and Parser3:

```
Parser1="Option1=\"Option1 Value With Space\" Option2=Option2ValueNoSpace"
Parser2="Option1=Value" Parser3="op1=val1 op2=val2 op3=\"another value\""
```

The following keys are generated in the Aligned Unified Data Mode:

- `sig.id` with the value of the rule's `sid` field
- `threat.category` with the value of the rule's `classtype` field
- `sig.name` with the value of the rule's `msg` field
- `risk.num` with the value of the rule's priority

The following keys are generated in Legacy Key Mode:

- `alert.id` with the value of rule's `sid` field
- `threat.category` with the value of the rule's `classtype` field
- `risk.info`, `risk.suspicious`, or `risk.warning` depending on the priority of the rule. The value of the risk meta is the rule's `msg` field.

If you want to use the legacy key set which contains keys that are consistent with previous releases for Snort parser meta keys, follow these steps.

1. In the NetWitness User Interface, go to **ADMIN** > **Services**.
2. Select a Decoder and then click ⚙ > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.
4. In the right panel, in `parser.options`, add `Snort="udm=false"`.

Rule Statistics

The Snort parser maintains counters to monitor the activity of each rule. These counters can be retrieved using the running `snrtStat` on the Decoder's `/decoder/parsers` node, which can be accessed through the NwConsole utility or the REST interface. The statistics reported for each rule are:

- `evaluations`: This counts the number of times the rule was evaluated. A rule can be evaluated once for each stream in a session. Typically a rule will only match one side of a session, and will be evaluated, at most, once. The `content` strings determine if a rule will be evaluated in a session. A `content` pattern must match somewhere in the session in order for it to be evaluated.
- `hits`: This counts the number of times a rule matched and the corresponding alert meta item was created.

To review the Snort statistics when using the Decoder console:

1. Log in to the console locally or remotely
2. Type the command `NwConsole`
3. Log in to `localhost:50004 <admin> <netwitness>` (change login credentials accordingly)
4. Enter `/decoder/parsers snrtStat`

The output is a JSON structure listing the number of evaluations and hits performed, along with the options evaluated, for each Snort ID.

Configuration Directives

Decoder supports a limited number of configuration directives.

Variable Definitions

Decoder supports definitions of variables that hold the value of IP ranges using `ipvar` or Port ranges using `portvar`. For example, Snort rules usually make use of `HOME_NET, EXTERNAL_NET` and `HTTP_PORTS` variables. These have to be defined in your configuration file. If they are undefined, they default to the special value `any`.

ruletype

The definition of additional rule types is supported. However, only rules that have a base rule type of `alert` are supported. Rule type definitions follow the same definition format as Snort configuration.

Other Configuration Entries

config detection: debug

Adding this configuration line turns on debug messages that are generated as the rule is being processed. These debug messages are generally emitted only emitted when a rule matches a session by one of the content patterns, but then fails to match other options within the rule. This is useful for debugging complex filters in Snort rules, to determine why they may not be matching as expected.

config nopcre

Adding this configuration line turns off the PCRE (regular expression) capability.

config classification

Classification configuration influences how meta is generated when a rule matches a session. Meta output from Snort rule matches is described in Snort Parser Output.

Snort Parser Capabilities

The general format of a Snort rule is that it contains a rule header and rule options. The rule header consists of the rule action, protocol type, source-destination criteria (IP addresses, ports), and the direction of traffic. The rule options consist of the message (`msg`) which describe what the rule has detected, the references related to the threat or where the rule was generated, the classification of the rule, the unique signature (`rule`) identifier, and a long list of attributes (for example, `flow`, `content`, `pcre`) to define how the traffic is identified. The specific details on which header and rule options are supported are outlined in the remainder of this section.

Rule Sections

Section	Description
Header	The header conditions are evaluated when a rule receives the first token callback for a stream. The header is evaluated once per stream, and prevents any further consideration of a rule against a specific stream if the conditions are not met.
Actions	The specified action or a rule must be defined (either one of the native Snort actions, or defined in the configuration using the `ruletype` statement) for the rule to be considered valid. The Decoder only uses rules with alert actions.
Protocols	The Decoder supports the current Snort protocol keywords (`tcp`, `udp`, `icmp`, `ip`).
IP Addresses	The full language for defining IP addresses is supported, including lists, CIDR, and negation.
Port Numbers	The full language for defining port numbers is supported, including lists, ranges and negation.

Section	Description
Direction Operator	The directional operator supports the from-to (‘->’) and bidirectional (‘<>’) values. The to-from (‘<-’) value is invalid and causes the rule to fail to load.

Content

The Snort `content` statement makes up the bulk of the Snort pattern detection capability. For best performance, Decoder strives to map `content` patterns to the Token Parser used by most NetWitness parsers. Therefore, the `content` strings are the main mechanism to activate the rule matching engine on a session for a particular rule. If the rule does not have any content patterns, it is effectively unsupported. The Snort parser allows for very short strings patterns in content, but be aware that a rule that contains only very short content may have to be evaluated for every session, which will make the Snort Engine run much more slowly.

The Snort parser supports most forms of `content` statements, including the following modifiers. All modifiers effect the last `content` pattern declared in the rule.

Option	Description
`nocase`	Case-insensitive pattern matching is used.
`offset`	This option is applied to the distance of the token from the beginning of the packet. If the number of bytes between the offset point and the start of the token is **less** than this value, it is not a match.
`depth`	This option is applied to the distance of the token from the current offset position, or the beginning of the packet if no offset is set. If the number of bytes between the 'offset' point and the beginning of the token is **greater** than this value, it is not a match.
`distance`	This option is applied to the distance of the token from the current Detection Offset End (DOE) point. If the number of bytes between the current token and the DOE is **less** than this value, the token is not a match.
`within`	This option is applied to the distance of the token from the current Detection Offset End (DOE) point. If the number of bytes between the current token and the DOE is **greater** than this value, the token is not a match.

These content modifiers are supported if the Snort parser is used in conjuction with AppHTTP native parser:

Option	Description
`http_client_body`	The token must appear in the body of an HTTP request.
`http_cookie`	The token must appear in an HTTP cookie header.
`http_header`	The token must appear any where in in an HTTP request or response header.

Option	Description
`http_method`	The token must appear in the HTTP method field. The detection engine does not currently restrict the method tokens, such as `GET` or `POST`, to the HTTP method field, so these matches will work even if `AppHTTP` is turned off.
`http_uri`	The token must appear in the **normalized** HTTP header. Non-normalized header matches are not supported.

Further detail on the HTTP related modifiers is described below in HTTP Parsing.

Flow

The flow directive verifies that the rule is only applied to the client or server stream. It supports the following options.

Option	Description
`to_client`	Limits the rule to only matching on a stream that a Decoder has defined as Server.
`from_server`	Synonym for `to_client`.
`from_client`	Limits the rule to only matching on a stream that a Decoder has defined as Client.

Fast Pattern

The Snort parser uses `content` tagged with `fast_pattern` to indicate tokens that should always be used as tokens in the Decoder's token scanner. Decoder supports the `fast_pattern` and `fast_pattern:only` directives, but it does not support the `fast_pattern:offset,length` directive.

PCRE

The Snort parser implements `pcre` regex matching using the same libpcre library as other tools. It supports most of the flags documented for the `pcre` tag, with a few minor exceptions as described later in this document.

HTTP Parsing

The Snort parser relies on the native HTTP parser to notify it when HTTP is being parsed. The HTTP parser feeds information to the Snort engine to let it know which regions of the session should be used to evaluate the `http content` flags. The `pcre` implementation has option flags analogous to the `http content` options, and these are supported as well. If the native HTTP parser is disabled, then these features are also disabled in the Snort parser.

File Data

The Snort parser supports the `file_data` tag for HTTP response bodies only. This functionality relies on the native HTTP parser being enabled. If the Native HTTP parser has the decompression feature turned on, the Snort parser also uses decompressed responses to implement rule matching inside of `file_data` regions. You can enable the HTTP decompression feature by adding the token `HTTP="decompress=true"` to the configuration field `/decoder/config/parsers.options`.

The Decoder has a Javascript normalization parser that functions similarly to the `normalize_javascript` feature in Snort's HTTP preprocessor. It also affects data presented to Snort rules using `file_data`. To enable the Javascript normalization parser, add the token `JSNormalize="unescape=true"` to the configuration field `/decoder/config/parsers.options`.

The Snort parser emulates the `file_data` behavior in the same way as Snort. Directives that appear after `file_data` are implicitly evaluated whenever a content match is found inside of a `file_data` region. Because of this, `file_data` has side effects on other statements that appear after it in a rule.

Binary (byte) Directives

The Snort parser supports the `byte_test`, `byte_extract` and `byte_jump` directives.

The detection engine supports most options on these directives:

- The options for extracting the value, such as the offset, the little endian / big endian options, and relative options are supported. The relative flag causes the extraction of the byte value to occur relative to the DOE (Detection Offset End) pointer.
- `byte_jump` and `byte_extract` support the `align` and `multiplier` options to manipulate the extracted value.

The '`byte_extract` directive stores values in variable names that can be used to substitute a number into a few specific locations elsewhere in the rule. These locations are supported:

- The `value` field in a subsequent `byte_test`
- The value of a `within` statement on a subsequent content pattern
- The value of a `distance` statement on a subsequent content declaration.

The `byte_jump` option explicitly moves the DOE (Detection Offset End) pointer for use by subsequent directives, like `byte_test`, content marked with distance or within, or PCRE patterns marked as relative.

There are some less common byte operations that are not supported:

- The byte options do not support the `string` option for converting text into a binary value
- The byte options do not support the `bitmask` option.
- The byte options do not support the `dce` option.

Default option / fallback

When the Snort parser encounters rule options it does not yet support, it skips those options and assumes they did not prevent the rule from matching. In such cases it relies on the implementation of options it does support, such as the content or pcre statements, to determine if the rule matches. This behavior means that the Snort parser is more likely to fail in the `false-positive` direction rather than the `false-negative` direction when using features that Decoder does not yet support.

Packet Scanning/Scoping

Depending on how the rule is formed, it may be intended to match content entirely within single packets, or it may be intended to match data that spans multiple packets. The Snort parser attempts to handle both cases. Rule statements that are implicitly packet-scoped may be evaluated for every packet available in a session at parse time, and the Snort parser correctly scopes such rules so they only match if the elements of the rule match in a single packet. Conversely, if the rule uses a feature that implies reassembly and reconstruction, such as `file_data`, the Snort parser will allow the rule to be evaluated for the reconstructed portion of the stream that the rule references. This allows the Snort parser to emulate the various buffers that the Snort product provides.

Known Limitations for Snort Parser

Decoder Token Match Limits

The Snort Parser is activated by token scanning in Decoder, and therefore is subject to the same limitations on matches as all Decoder parsers. Configuration items such as `parse.bytes.min`, `parse.bytes.max`, timeouts, and size limits all apply to the Snort parser. The Decoder configuration guide describes these parameters in great detail. The Snort parser is implemented on top of reassembled sessions only so that features that require an assembled session can be supported.

Flow Bits

Flow bit directives, which start with the keyword `flowbits`, are currently mostly ignored by the Snort detection engine. Statements in rules that test flow bits currently always pass. However, the detection engine will honor flowbit directives that specify `noalert`. Rules marked as `noalert` never generate meta, even if they match.

DCE Preprocessor

The Snort parser does not currently implement any DCE preprocessors, so any features that rely on the DCE preprocessor are not implemented.

Thresholds and Filters

The Snort parser implements the `threshold` filters option only. It does not yet implement the `detection_filter` filter.

Raw Byte Scanning

The Snort parser does not currently allow rules to individually bypass the normalization or decoding using tags like `rawbytes`.

IPv6

The Snort rule parser does not currently allow rules to utilize IPv6 addresses as part of their header.

Note: Only the Snort V2.x rules are supported.

Performance Considerations

The performance of the Snort parser is dependent entirely on the rules that are being evaluated. Therefore it will vary greatly from one installation to another.

Content Tokens

Content tokens form the main entry point into the Snort engine. Hence they are the main factor affecting rules performance. The more times that a content string is found in the packet stream, the more work the Snort parser performs, and the more CPU time it uses. Therefore, it's important to use content tokens that are long, unique, and unlikely to appear in random data. Short tokens will spuriously activate the Snort parser, wasting CPU time.

Negation

Statements like `content` and `pcre` support negation, meaning they only allow the rule to match if a content string is not found or if a regex doesn't match. These are usually detrimental to performance because they still tend to contain strings that will activate rule evaluation, yet will often fail since they are intended to filter out patterns. For example, a negated `pcre` search still has to be evaluated if it is negated, and if it is used to filter out common text. it will produce lots of CPU activity on traffic that does not actually match the Snort rule.

Search Parser

The Search Parser is a custom parser used to generate metadata by scanning for predefined keywords and regular expressions. The parser searches the payload of a reconstructed session for string matches and can execute a regular expression search. You can configure the parser by editing the **search.ini** file.

Caution: The search parser can have a significant impact on system performance. It is important that both the search mechanism and the data to which it is applied to be well understood before creating new search definitions and enabling the search parser.

The search definition is used across all protocols. There are three basic search methods:

- Keyword: Search a stream for a specific set of words
- Pattern: Search a stream for a regular expression match
- Keyword + Pattern: Search a stream for a regular expression if it contains any of a given set of keywords.

Search Methods

The Search parser uses three basic search methods:

- Keyword: Search a stream for a specific set of words.
- Pattern: Search a stream for a regular expression match.
- Keyword+Pattern: Search a stream for a regular expression if it contains any of a given set of key words.

Syntax

```
Maxrecon=<max_size>Maxsearch=<max_ssearch_length>MatchLimit=<max_matches_per_
stream
Search Name
Services=<service_id_list>Keywords=<keyword_list>|Pattern=<expression>Case=0|1
Proximity=<number_of_bytes>Recon=0|1
Raw=0|1
```

Parameters

Parameters used in this command:

Parameter	Description
`autocheck`	Automatically fixes all problems without prompting
`header Only`	Check/display the header of each file

Parameter	Description
chatty	Displays a hex dump of every object in the file (huge amount of data)
dump#-#	Indicates a zero-based object or range of objects in the file to output in hex to the console

Example

Following is an example of the command:

To check all NetWitness database files located in the Collection named Default. If any problems are found, the command will describe the problem and ask if you would like to fix it.

```
dbcheck C:\Documents and Settings\User\My Documents\NetWitness\
Investigations\Default\*.nw*
```

Wireless LAN Configuration

One of the files available for editing in the Services Config view > Files tab is **wlan-config.xml**, the wireless LAN configuration file.

It controls the 802.11 parsers. Its chief purpose is to control decryption of raw 802.11 frames captured by the Decoder. This file is optional. If decryption of 802.11 traffic is not desired, there is no need to create the file.

There are five link-level parsers related to wireless LAN packet capture:

- IEEE 802.11 parser (data frames and beacons only)
- Radiotap w/ 802.11 header
- Absolute Value Systems (AVS) w/ 802.11 header
- Prism II w/ 802.11 header
- CACE's "Per Packet Information" (PPI) w/ 802.11 header

The 802.11 wireless parsers introduced in 9.8 all share a single configuration file. This wlan-config.xml file is used to define any wireless access points the user may have in the network, and its primary purpose is to control decryption. The BSSID of the access point and the SSID that it's authoritative for is added to this file as well as all of the active default keys used by the access point.

Troubleshooting Parsers

This topic provides guidance for troubleshooting issues related to parsers.

Lua Parser Errors

Lua parsers occasionally generate errors. If a parser enters a state where it generates multiple errors, these errors can hinder performance. Beginning with 11.4, a new option is available for Lua parsers that instructs the Decoder to automatically disable the parser after a configurable number of errors.

The value is set on the `/decoder/parsers/config/parsers.options` configuration node as shown in the following example:

```
Entropy="log2=true" GeoIP2="ipaddr=ip.src,ip.dst,ipv6.src,ipv6.dst" error_
parser="errorMax=5" addy_parser="errorMax=10"
```

This configuration node enables you to set options for different parsers. In this example, the Lua parser `error_parser` is configured with a maximum error count of 5, and the `addy_parser` to 10. The `errorMax` setting has a valid range of values from 0 (meaning the feature is disabled) to 65,535, and takes effect when parsers are loaded or reloaded.

To disable a Lua parser after a defined number of errors:

1. Go to **ADMIN** > **Services**, select a Decoder and then select  > **View** > **Explore**.
2. In the left panel, expand **decoder** > **parsers**, and select **config**.
3. In **parsers.options**, add the following command, where `<any_parser>` is the Lua parser for which you want to limit errors, and `<n>` is the number of errors to which the parser is limited:
   `<any_parser>="errorMax=<n>"`

4. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

Results of Automatically Disabling a Parser

When a parser is automatically disabled, a log message is generated (per parser thread) and states that the parser has been disabled, as shown in the following example:

```
(W) 2019-Apr-25 16:25:33 [Parse] Lua parser 'error_parser' has been disabled
because it exceeded the configured error threshold (5)
```

If detailed statistics for parsers are enabled, the text of the last error is populated in the parser's detailed statistics under `/decoder/parsers/definitions/<parser-name>`. Also, a new attribute has been added to the XML returned by the `/decoder/parsers?msg=schema` call. When the parser is in an error state, the attribute `error` is set to `1` and the `enabled` attribute is set to `0`. When the parser is reset, the values are reset to `0` and `1` respectively.

Resetting the Parser

If a parser is disabled because it has exceeded the error threshold, it can be reset by reloading the parser. This causes the statistics to reset so that if the faulty parser is still in place, it will function again until the error threshold is met.

Configure Feeds

NetWitness uses feeds to create metadata based on externally defined metadata values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created. This data could identify and classify malicious IPs or incorporate additional information such as department and location based on internal network assignments. Some examples of feeds include threat feeds to identify BOTNets, DHCP mappings, or even Active Directory (AD) information such as physical location or logical department.

You can use the Live module in NetWitness to obtain feeds from outside sources. "Live Content in NetWitness" in the *Live Services Management Guide* provides an overview of the Live content management tool.

Within the NetWitness user interface, you can view the list of currently deployed feeds, along with an indicator if a feed that originated from Live was installed through NetWitness or manually. Feeds can be added, removed, and updated while a Decoder is running without affecting capture.

Custom Feed Definition File Structure

The NetWitness Custom Feed wizard allows creation and deployment of custom Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides users through the process to create both on-demand and recurring feeds, it is helpful to understand the form and content of a feed file when you create a feed.

Before you create or modify custom feeds, keys, or data types, ensure that you have a good understanding of the relationship between keys and datatypes in databases. It is important that any custom keys that you create match the corresponding datatypes. If your feed utilizes a custom meta key, you must define that key's data type in `index-decoder-custom.xml`. This is to ensure that the key data is generated with correct data format.

Also, to enable investigation on the custom meta key, you must define its index on the concentrator, using the `index-concentrator-custom.xml` file. For more information on how to write the `index-decoder-custom.xml` or `index-concentrator-custom.xml` file, see the topic "Index Customization" in the *Core Database Tuning Guide for RSA NetWitness Platform*.

Feed filenames in RSA NetWitness are in the form `<filename>.feed`. To create a feed, NetWitness requires a feed data file in `.csv` or `.xml` format and a feed definition file in `.xml` format, which describes the structure of a feed data file. The Custom Feed wizard can create the feed definition file based on a feed data file, or based on a feed data file and the corresponding feed definition file.

The files that you use to create an on-demand feed must be stored on your local file system. The files used to create a recurring feed must be stored at an accessible URL, whence NetWitness can fetch the most current version of the file for each recurrence. After a NetWitness feed is created, you can download the feed to your local file system, edit the feed files, and then edit the NetWitness feed to use the updated feed files.

Sample Feed Definition File

This is an example of a feed definition file named `dynamic_dns.xml`, which NetWitness creates based on your entries in the Custom Feed wizard. It defines the structure of the feed data file named `dynamic_dns.csv`.

Note: The feed file path should be `.csv` regardless of the Feed Type (Default or STIX).

```
<?xml version="1.0" encoding="utf-8"?>
 <FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">

   <FlatFileFeed name="Dynamic DNS Domain Feed"
   path="dynamic_dns.csv"
   separator=","
   comment="#"
   version="1">

   <MetaCallback
   name="alias.host"
   valuetype="Text"
   apptype="0"
   truncdomain="true"/>

   <LanguageKeys>
            <LanguageKey name="threat.source" valuetype="Text" />
            <LanguageKey name="threat.category" valuetype="Text" />
            <LanguageKey name="threat.desc" valuetype="Text" />
```

```
    </LanguageKeys>

    <Fields>
    <Field index="1" type="index" key="alias.host" />
    <Field index="4" type="value" key="threat.desc" />
    <Field index="2" type="value" key="threat.source" />
    <Field index="3" type="value" key="threat.category" />
    </Fields>
    </FlatFileFeed>

  </FDF>
```

Define Multiple Values in a Single Field

The information in this section applies to NetWitness version 11.3.1 and later.

Custom feeds support multiple values in a single field. This allows feeds to generate multiple values of the same meta.

For example:

```
<Fields>

     <Field index="1" type="index" key="lc.cid" />

     <Field index="2" type="value" key="user" separator=";" openchar="("
     closechar=")"/>

</Fields>
```

The second field is defined to accept multiple values in the corresponding CSV file. The following is an example of the defined values:

```
clc1,(bob;tom;sam) clc12,susan clc123,doris
```

This definition means that when we see the `lc.id` with a value of `cic1`, three `username` meta values are generated with the values of `bob`, `tom` and `sam`.

The separator in the field definition for a multi-value field **must** be different than the separator for the feed file itself. Escaping the separator character in field values is **not** supported.

Feed Definition Equivalents for Custom Feed Wizard Parameters

The NetWitness Custom Feed wizard provides options to define the structure of the data feed file. These correspond directly to attributes in the feed definition (`.xml`) file.

NetWitness Parameter	Feed Definition File Equivalent
(Define Feed Tab) Feed Type	Select: **Default** - to define a feed based on a `.csv` formatted feed data file. **STIX** - to define a feed based on STIX formatted `.xml` file.
(Define Feed Tab) Feed Task Type	Select: **Adhoc** - to create an on-demand feed. **Recurring** - to update the `.csv` or `.xml` file persistently and store it in a location accessible by NetWitness, so NetWitness downloads a file at regular intervals and pushes it to the downstream devices.

NetWitness Parameter	Feed Definition File Equivalent
(Define Feed tab) **Name**	The custom feed name in the feed data file. It corresponds to the `flatfeedfile name` attribute in the feed definition file. For example, Dynamic DNS Test Feed. **Note:** You can use special characters to define the name of the custom feed.
(Define Feed tab) **File**/ **Browse**	This is the name of the feed data file. It corresponds to the `flatfeedfile path` attribute in the feed definition file. For example, `dynamic_dns.csv`.
(Advanced Options tab) **XML Feed File**	The name of the feed definition file. For example, `dynamic_dns.xml`.
(Advanced Options tab) **Separator**	The separator character used to separate attributes in the feed data file. It corresponds to the `flatfeedfile separator` in the feed definition file. For example, a comma.
(Advanced Options tab) **Comment**	The character used to identify a comment in the feed data file. It corresponds to the `flatfeedfile comment` attribute in the feed definition file. For example, `#`.
(Define Columns tab, Define Index) **Type**	The type of lookup value in the index position of the feed data file. **IP** means that each row in the feed data file contains an IP address in the lookup value position. The IP value is in dotted-decimal format (for example, 10.5.187.42). **IP Range** means that each row in the feed data file contains a range of IP addresses in the lookup value position. The IP range is in CIDR format (for example, 192.168.2.0/24). **Non IP** means that the each row in the feed data file contains a metadata value other than IP address in the lookup value position. The Service Type and Truncate Domain, and Callback Keys fields become active for a Non IP index.
(Define Columns tab, Define Index) **CIDR**	Specifies that the IP value in the lookup position is in CIDR format. The **CIDR** attribute sets the IP address format in the field to Classless Inter-Domain Routing (CIDR) notation.
(Define Columns tab, Define Index) **Service Type**	For a Non IP index, the integer service type to filter meta lookups. It corresponds to the `MetaCallback apptype` attribute in the feed definition file. A value of 0 indicates no filtering by service type.
(Define Columns tab, Define Index) **Truncate Domain**	For a Non IP index, for meta values that contain domain names (for example, hostnames), the system can strip off the host specific element in the data. Truncate Domain corresponds to the `MetaCallback truncdomain` attribute. If the value is `www.example.com`, it is truncated to `example.com`. A value of **False** selects no truncation, and **True** selects truncation.

NetWitness Parameter	Feed Definition File Equivalent
(Define Columns tab, Define Index) **Callback Keys**	For a Non IP index, the available meta keys to match on instead of ip.src/ip.dst (the defaults for IP index type) are selectable from the drop-down list. The Callback Key corresponds to the `MetaCallback name` attribute, and the index column of the csv file must contain data that can match the chosen meta key. For example, if the `user` meta key is chosen, the index column of the `.csv` file needs to be populated with users to be matched.
(Define Columns tab, Define Index) **Index Column**	Identifies the column in the feed data file that provides the lookup value for the row. Each position in each row of the feed data file is identified by a **Field index** attribute in the feed definition file. A field with an index of **1** is the first entry in a row, the second field has an index of **2**, the third field has an index of **3**, and so on.
(DEFINE VALUES) **Key**	The name of the `LanguageKey`, as defined in the feed definition file, for which meta is created from this row of the feed data file. It corresponds to the `Field key` attribute in the feed definition file. A key applies only to a field whose type is set to `value`. In the feed definition file, there is a list of `LanguageKeys` from `index.xml`, or a summary name if Source Name and Destination Name are used. For example, `reputation` is a summary name for `reputation.src` and `reputation.dst`. This value is referenced by the Field key attribute.

Sample Files for a MetaCallback Feed Using CIDR Index Range for IPv4 and IPv6

These sample files demonstrate how to use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using MetaCallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a `.csv` file and an `.xml` file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

`.csv file:`

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

`.xml file:`

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
      <MetaCallback name="DstIP" valuetype="IPv4" apptype="0"
truncdomain="false">
            <Meta name="ip.dst"/>
      </MetaCallback>
      <LanguageKeys>
            <LanguageKey name="alert" valuetype="Text" />
      </LanguageKeys>
```

```
      <Fields>
            <Field index="1" type="index" range="cidr"/>
            <Field index="2" type="value" key="alert" />
      </Fields>
</FlatFileFeed>
</FDF>
```

Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with `range="cidr"`. Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Feed Definitions File

This topic introduces the feed definitions file, which is available for editing in the Services Config view > Files tab. One of the files available for editing in the Services Config view > Files tab is **`feed-definitions.xml`**, the feed definitions file.

You can define feeds in the `feed-definitions.xml` file. The Decoder uses an XML schema to define feed messages when it creates a binary .feed file from the feeds defined here.

For details on the feed definition language, refer to Custom Feed Definition File Structure

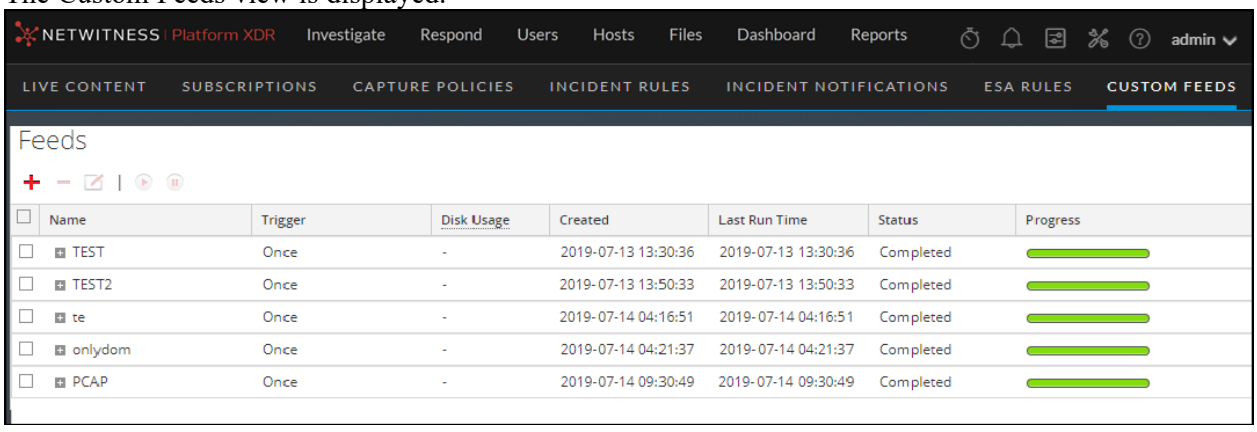
Create a Custom Feed

You can create a custom feed using the Custom Feed wizard. To complete this procedure, you need a feed data file in `.csv` or `.xml` format. If you also have an associated feed definition file in `.xml` format, which describes the structure of the feed data file, you can use the feed definition file to create a feed. The Custom Feed wizard can create the feed based on a feed data file, or based on a feed data file and corresponding feed definition file.

Before you create or modify custom feeds, keys, or data types, ensure that you have a good understanding of the relationship between keys and datatypes in databases. It is important that any custom keys that you create match the corresponding datatypes. If your feed utilizes a custom meta key, you must define that key's data type in `index-decoder-custom.xml`. This is to ensure that the key data is generated with correct data format.

Also, to enable investigation on the custom meta key, you must define its index on the concentrator, using the `index-concentrator-custom.xml` file. For more information on how to write the `index-decoder-custom.xml` or `index-concentrator-custom.xml` file, see the topic "Index Customization" in the *Core Database Tuning Guide for RSA NetWitness Platform*.

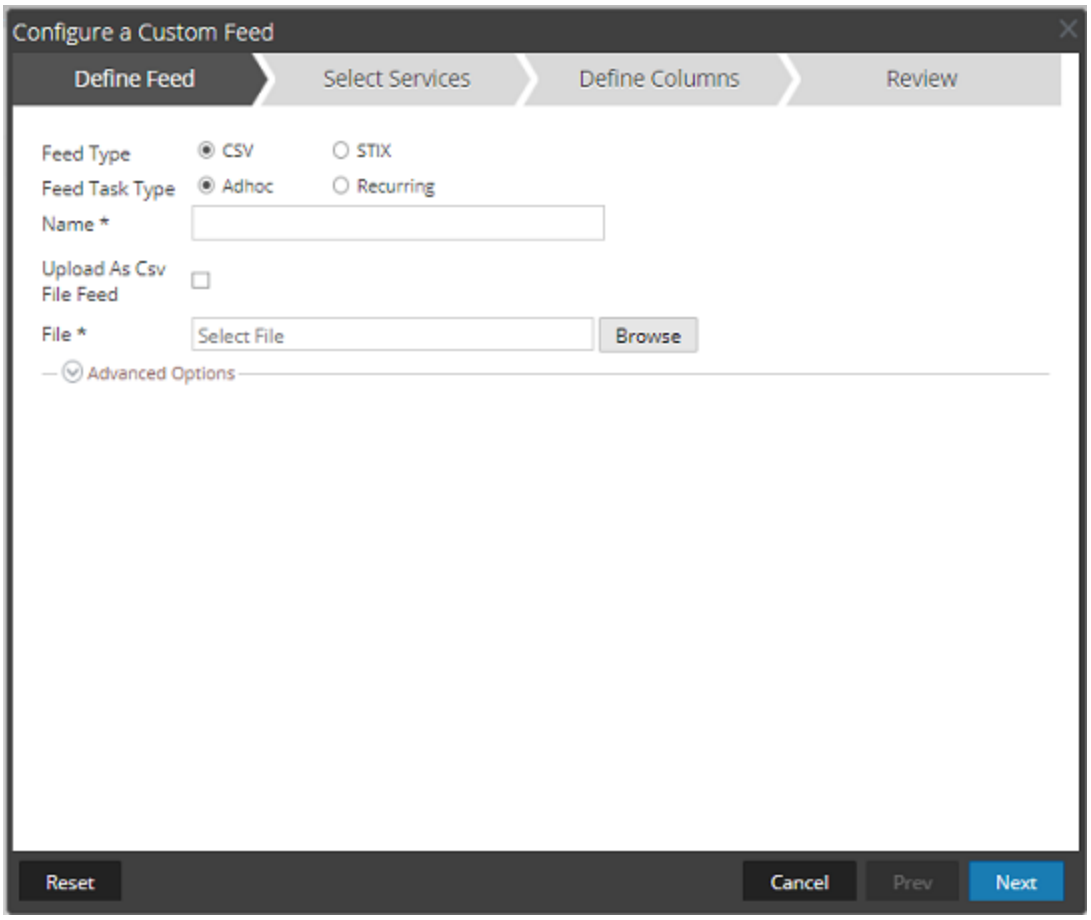
Note: For information about STIX and creating a STIX custom feed, see "Create a STIX Custom Feed" in the *Decoder and Log Decoder Configuration Guide*.



The feed data file and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

Note: When you create a source and destination-based feed on a Log Decoder, it only populates the source meta key. You cannot use a range-based or CIDR feed. You must list every single IP address. To resolve this issue, create two different feeds using IP addresses and you can use CIDR in these feeds.

To create a custom feed:

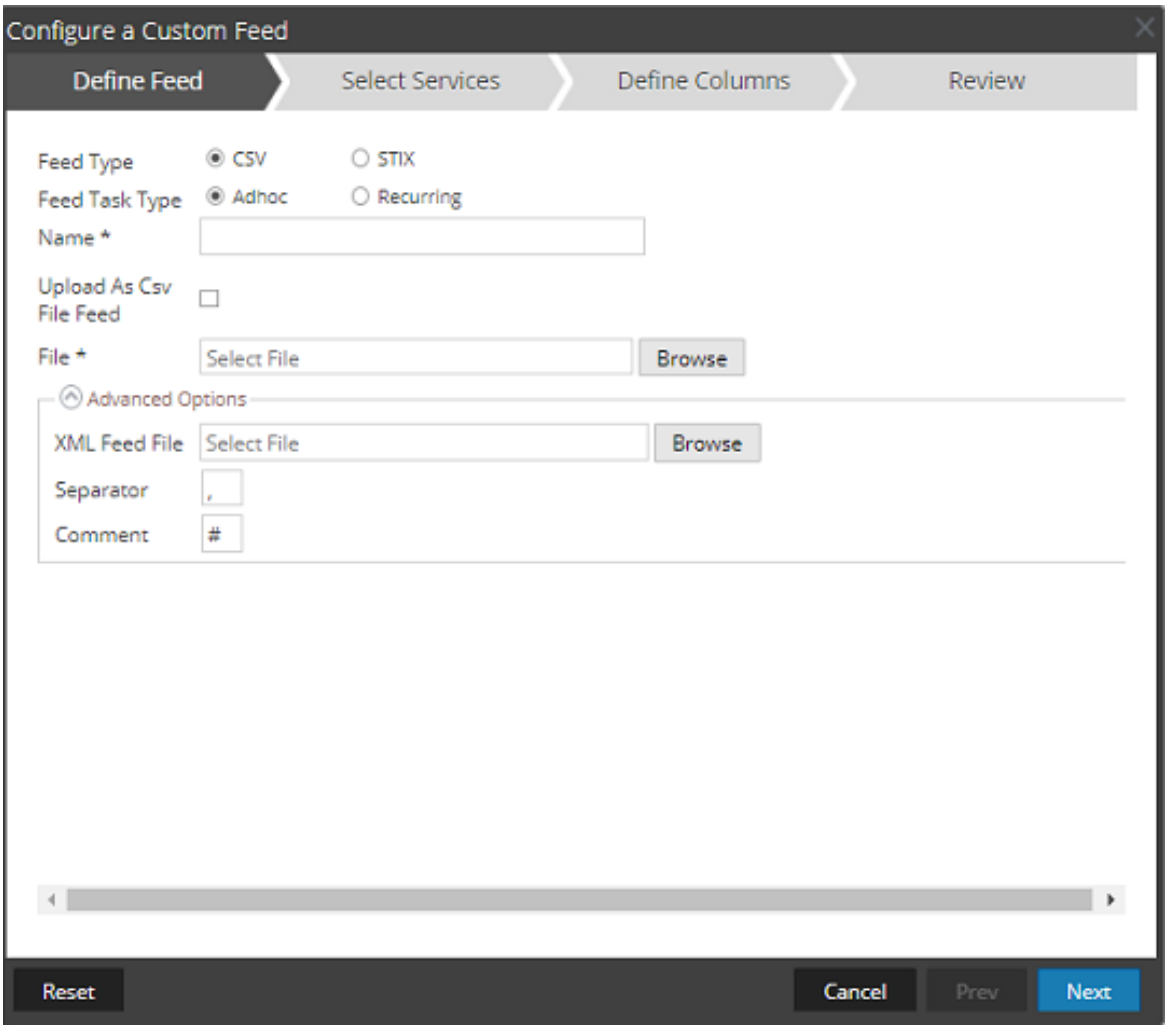


1. Go to **Configure > Custom Feeds.**

   The Custom Feeds view is displayed.

2. In the **Feeds** panel, click + > **Custom Feed** > **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.



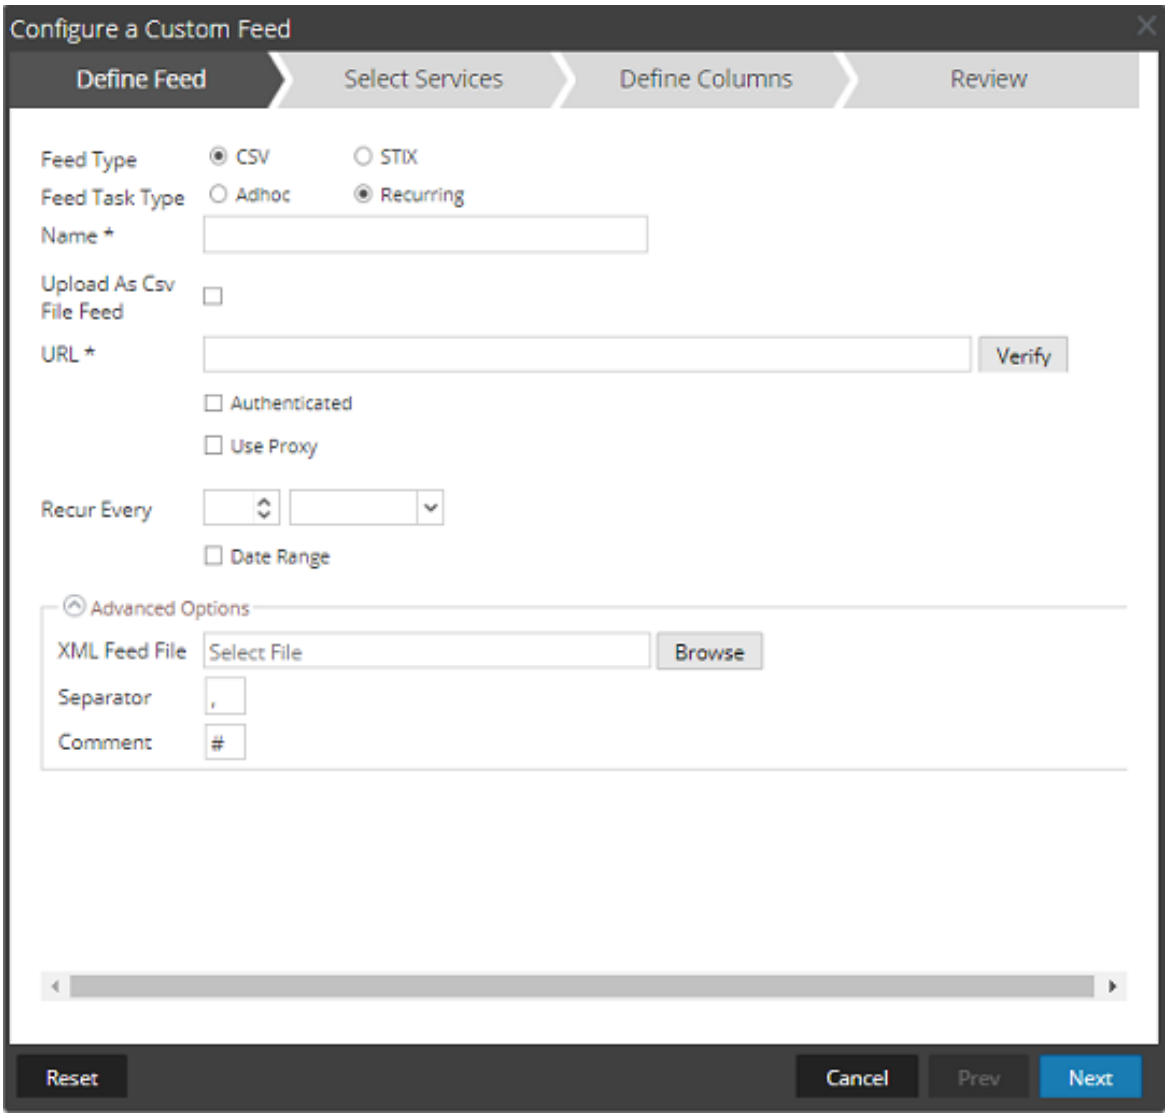
3. Select the Feed Type: **CSV** or **STIX**.
4. To define a feed based on a `.csv` formatted feed data file, select **CSV** (which is the default) in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on a CsvFileFeed file, select the **Upload as Csv File Feed** checkbox, type the feed **Name**, select a .csv content file from the local file system, and click **Next**. If you do not select the checkbox, the .csv file will be a FlatFileFeed file.

      Note: When you select the Upload as Csv File Feed checkbox, the XML feed options under Advanced are unavailable.

   b. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      Note: Ensure that the Upload as Csv File Feed checkbox is deselected.

      The Advanced Options are displayed:



c. Select an XML feed file from the local file system, choose the separator (default is comma), specify the comment characters used in the feed data file (default is #), and click **Next**.
The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.

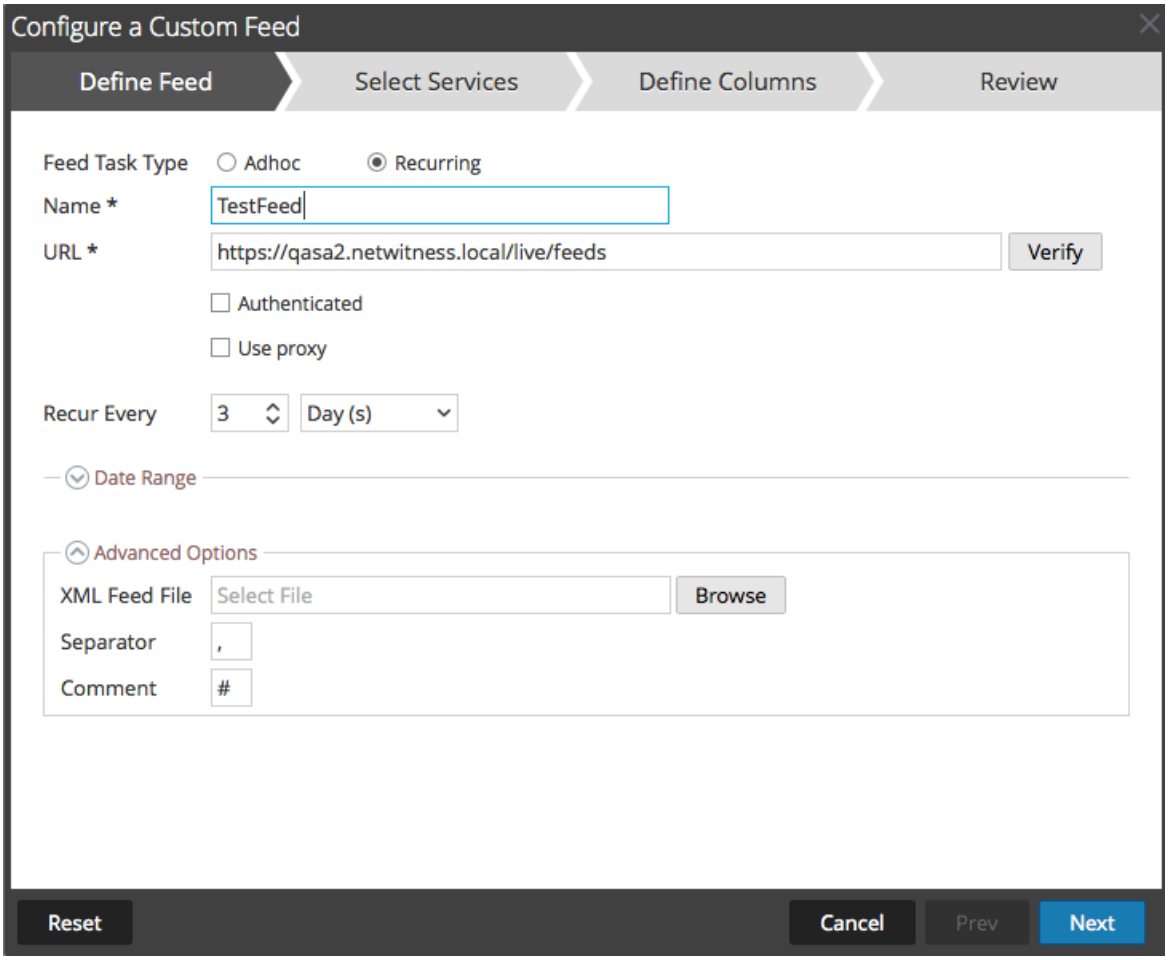
6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range:

   a. In the Define Feed form, select **Recurring** in the **Feed Task Type** field.

      The Define Feed form includes the fields for a recurring feed.

b. In the **URL** field, enter the URL where the feed data file is located, for example, `http://<hostname>/<feeddatafile>.csv`, and click **Verify**. NetWitness verifies the location where the file is stored in order to enable checking for the latest file automatically before each recurrence.

c. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.
NetWitness provides your user name and password for authentication to the URL.

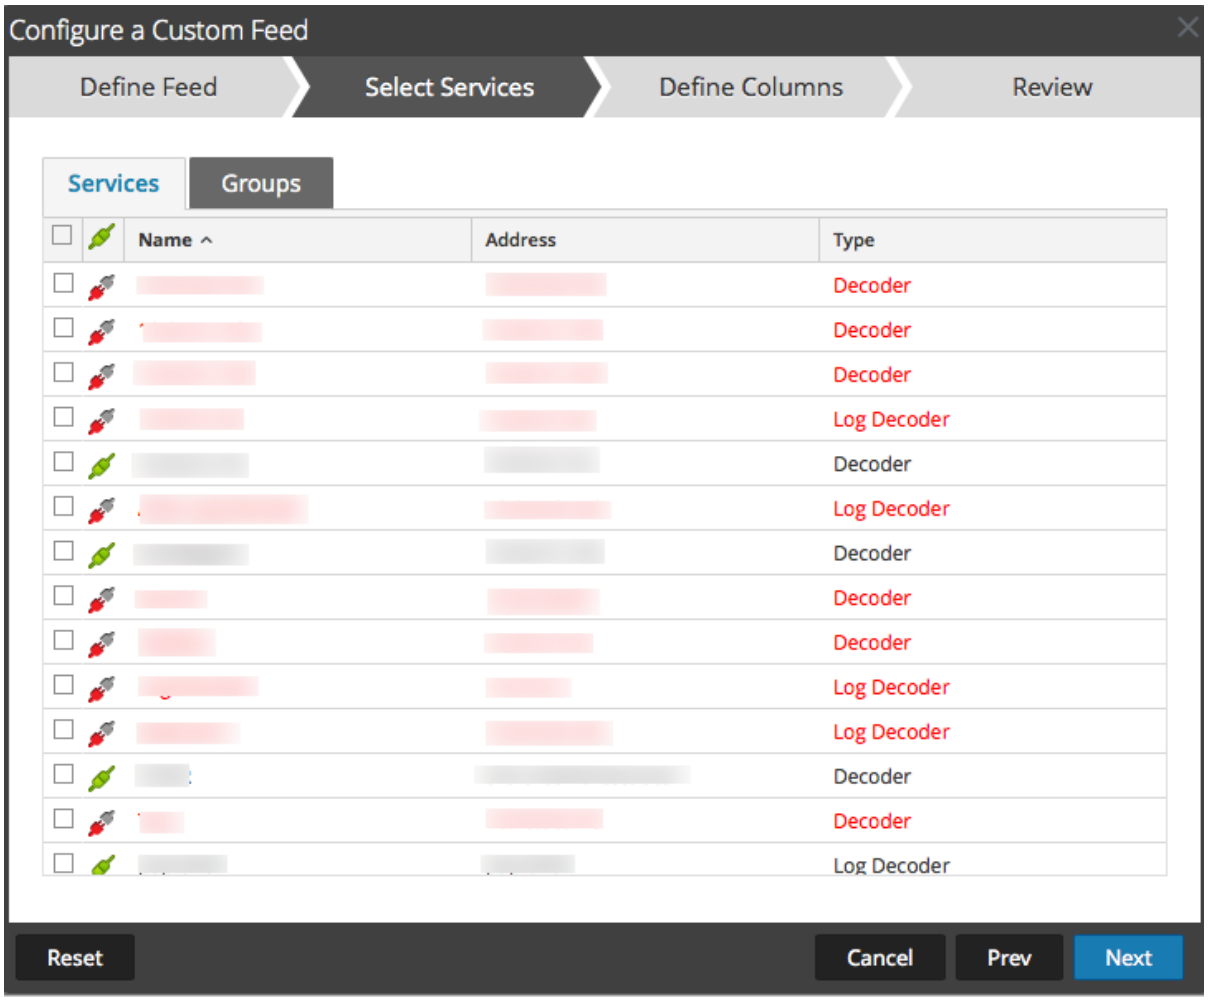


d. If you want the NetWitness server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see "Configure Proxy for NetWitness" in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not set.

e. To define the interval for recurrence, do one of the following:

- Specify the number of minutes, hours, or days between recurrences of the feed.

- Specify recurrence every week, and select the days of the week.

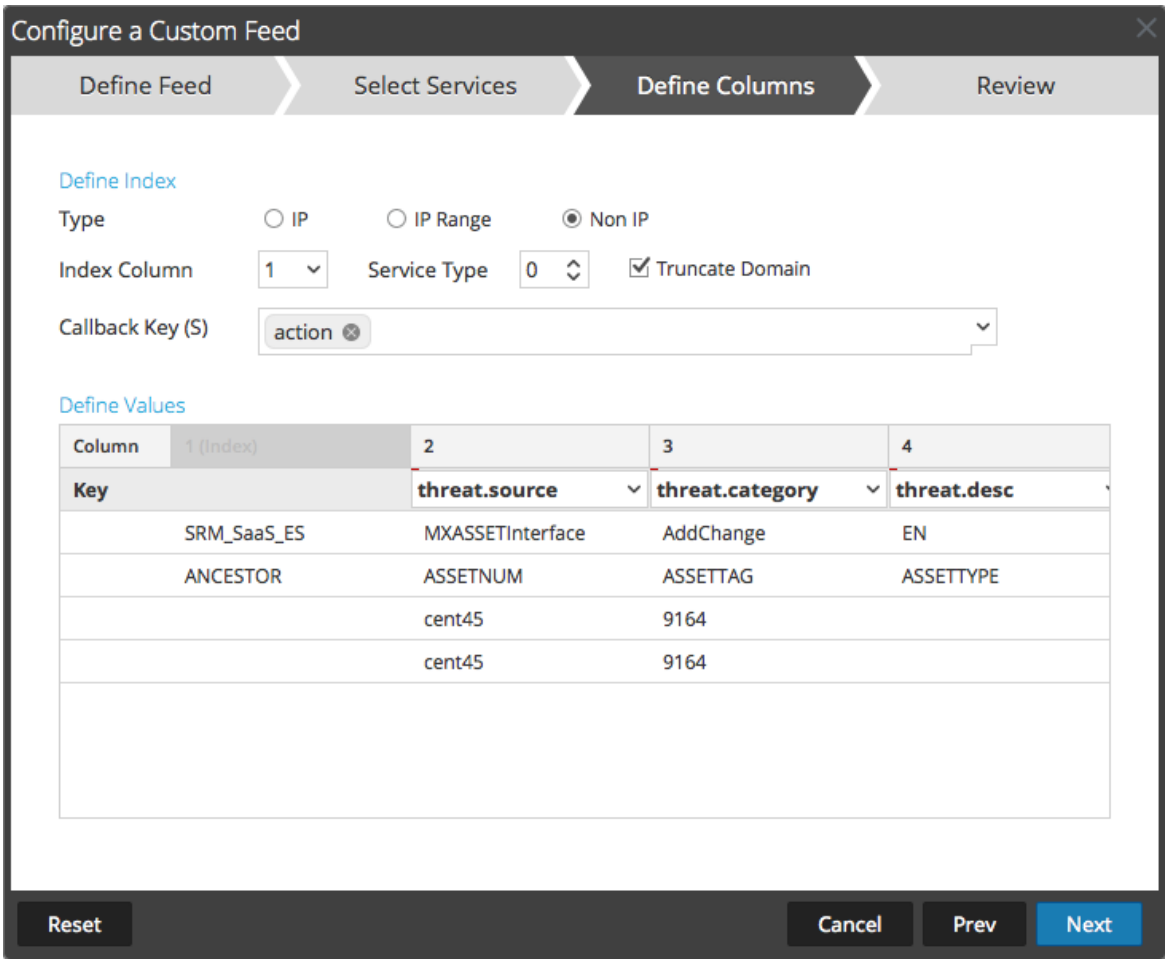


f. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

7. (Conditional) If you want to define a feed based on an XML feed file:

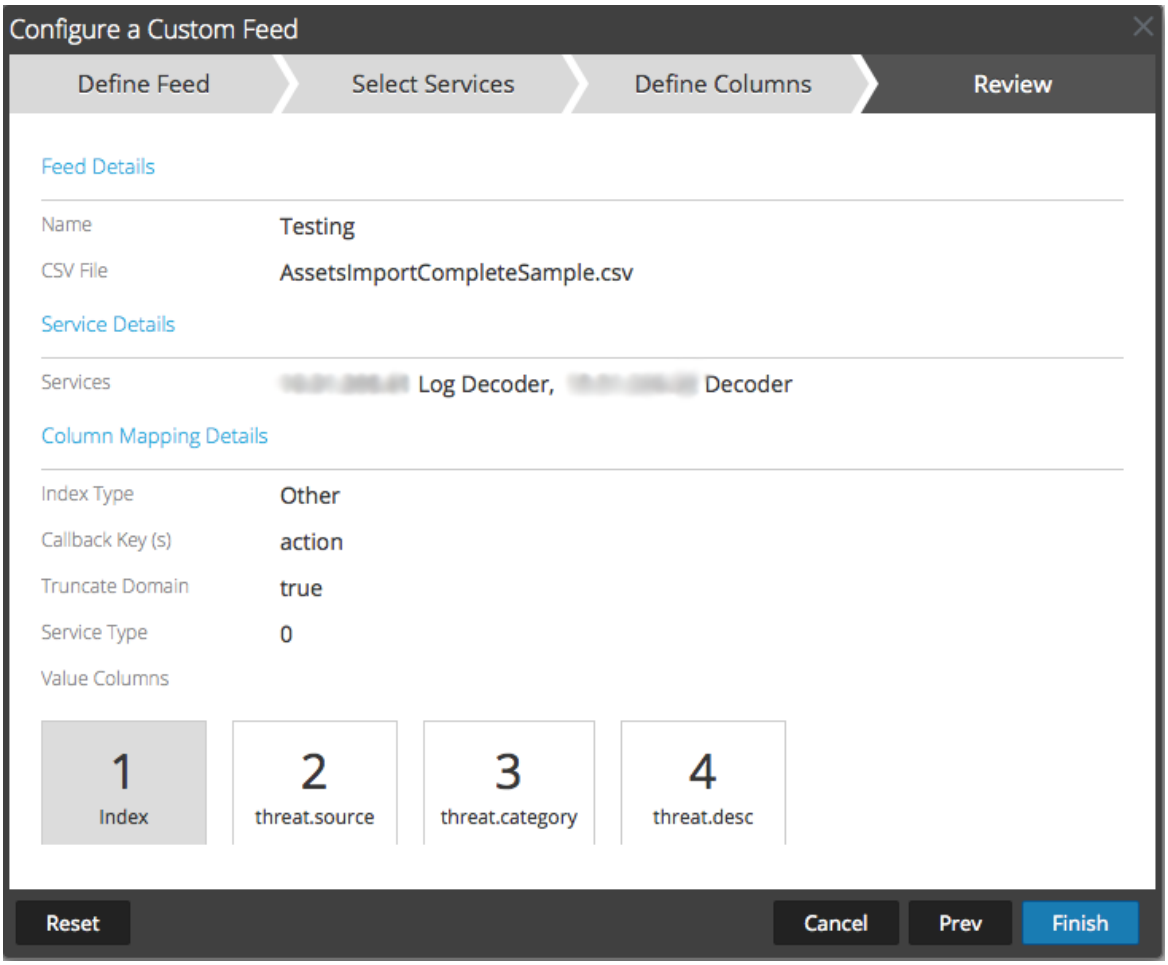
   a. Type the feed **Name**, select **Advanced Options**. The Advanced Options fields are displayed.

   b. Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #) and click **Next**. The Select Services form is displayed.

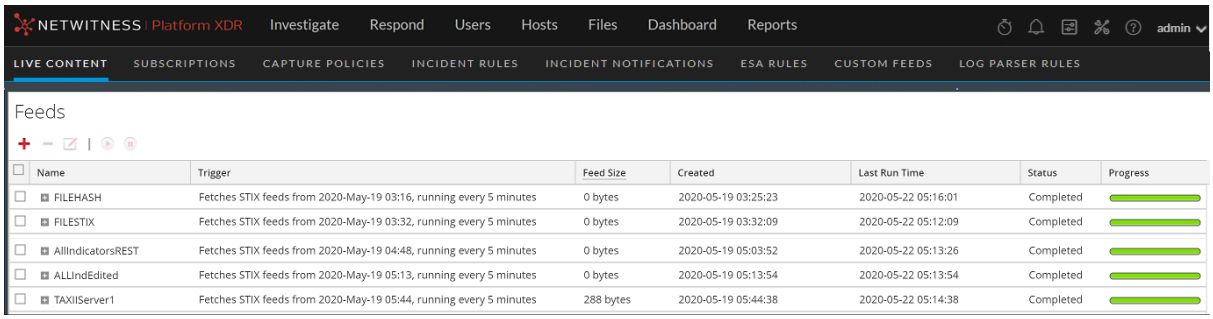


8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**
   b. Click the **Groups** tab and select a group. Click **Next**.

      The Define Columns form is displayed.
9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.



d. Select the language key to apply to the data in each column from the drop-down list. The meta keys displayed in the drop-down list is based on the meta keys available for the service define values. You can also add other meta keys based on advanced expertise.



e. Click **Next**.

The Review form is displayed.

10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Create a STIX Custom Feed

Structured Threat Information Expression (STIX™) is a structured language for describing cyber threat information so it can be shared, stored, and analyzed in a consistent manner. For more information about STIX, see https://stixproject.github.io/.

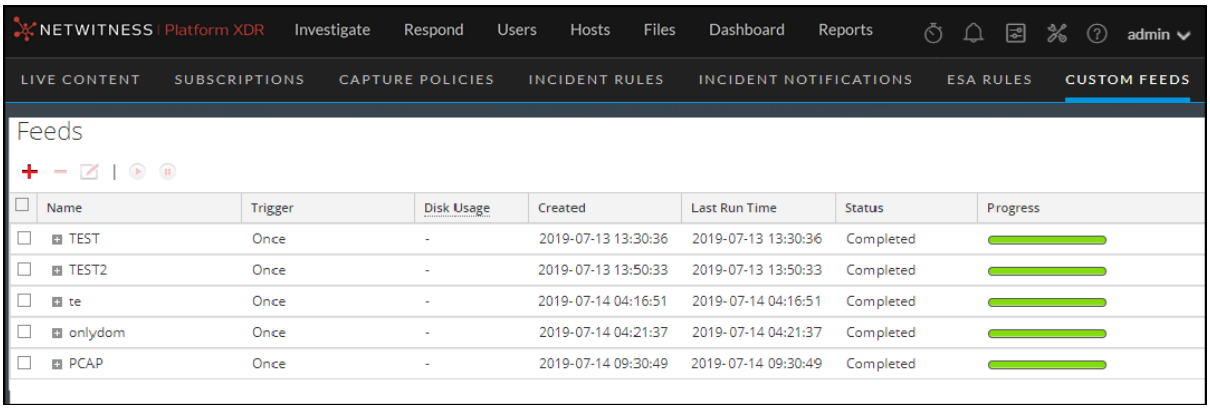
You can create a custom feed using a STIX-formatted feed data file (`.xml`) in RSA NetWitness. NetWitness supports Structured Threat Information Expression (STIX) 1.0, 1.1 and 1.2 versions only.

Caution: If a STIX recurring feed is configured and you update Security Analytics from 10.6.x to NetWitness 11.x, you must re-configure the STIX recurring feed.

In NetWitness, STIX feeds of type Indicator or Observable that contain properties such as the IP addresses, File hashes, Domain names, URIs and Email addresses are supported. The property values in the Equals operator are supported. Attributes such as Type and Title are also read from the STIX. A STIX file with a single STIX_Package is supported.

TAXII (Trusted Automated eXchange of Indicator Information) is the main transport mechanism for cyber threat information represented in STIX. Using the TAXII services, organizations can share cyber threat information in a secure and automated manner.

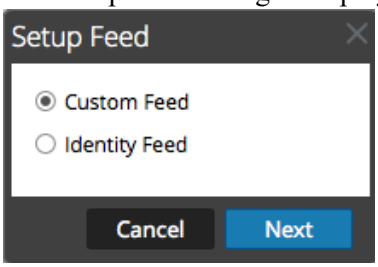
The STIX and TAXII communities work closely together to ensure that they continue to provide a full stack for sharing threat intelligence.



Apart from the TAXII server, STIX data can also reside on a REST server and you can fetch the STIX file from the REST server by providing the URL of the REST server. For example, `http://stixrestserver.internal.com`.

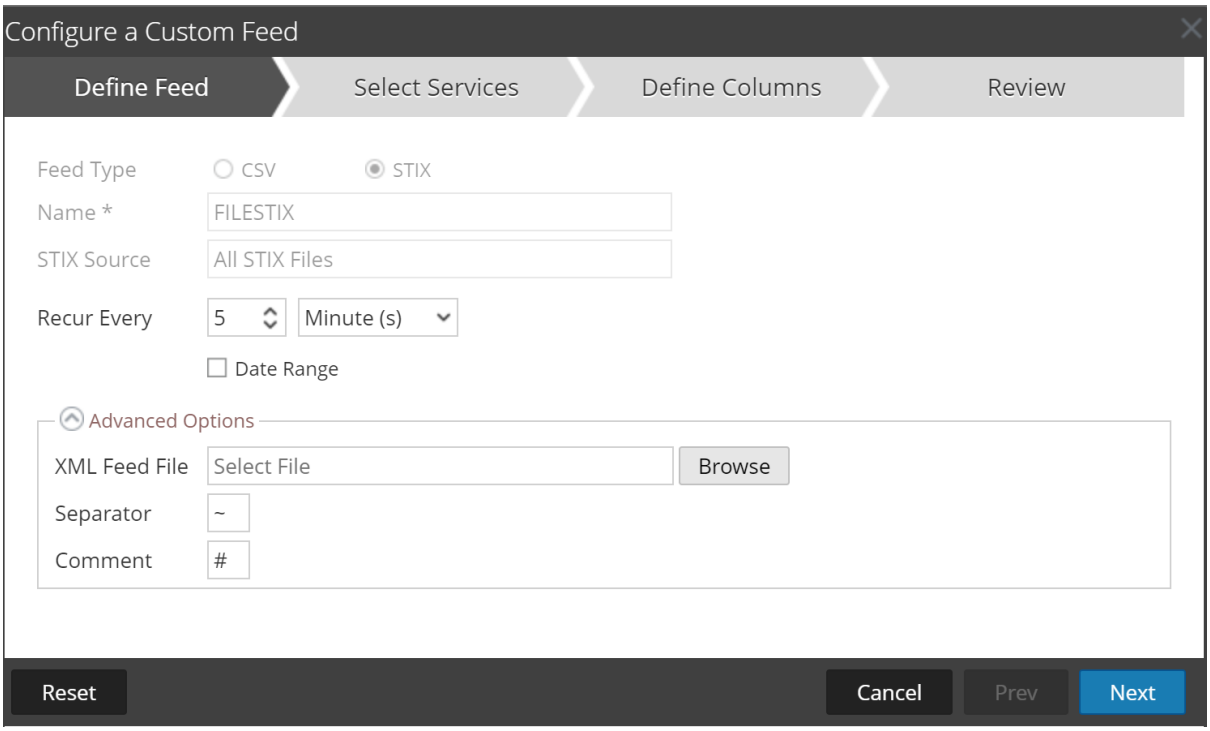
The STIX feed data file and optionally the feed definition file, both in `.xml` format must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

To create a STIX custom feed:



1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



2. In the toolbar, click .

The Setup Feed dialog is displayed.

3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed dialog open.

4. Enter the following details:

   a. **Feed Type**: Select **STIX**, to define a feed based on a STIX formatted `.xml` file.

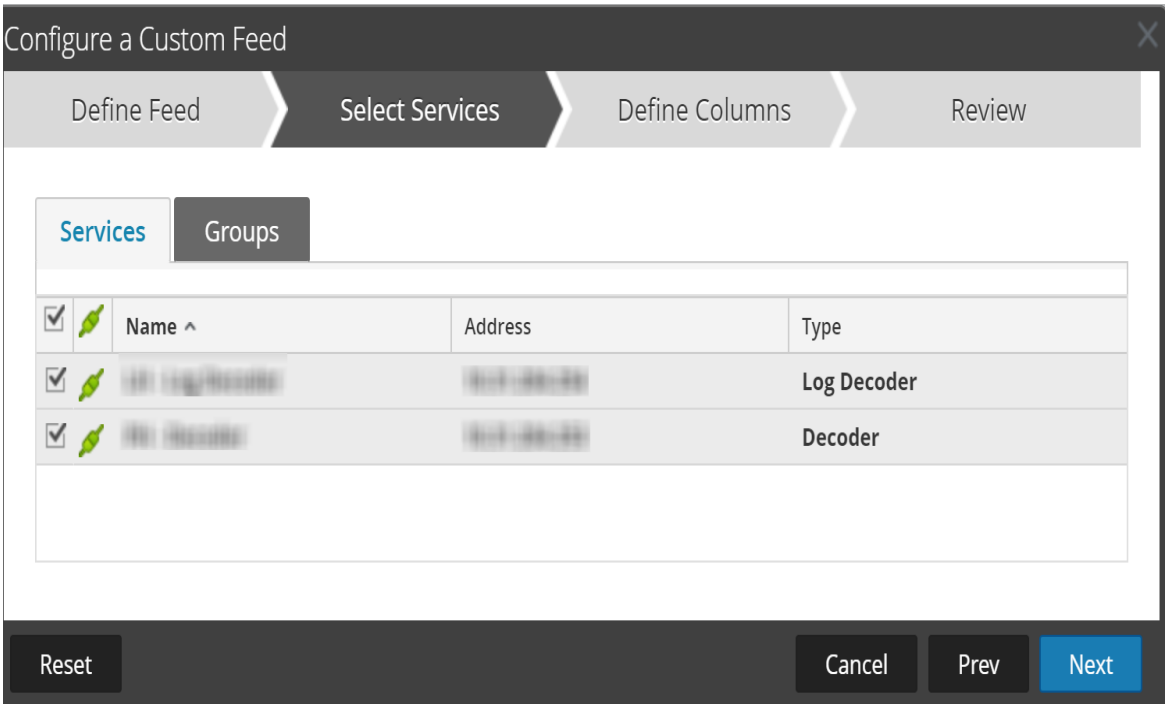
   b. **Name**: type the feed name, to define a feed based on STIX formatted `.xml` file.

   c. **STIX Source**:Select a STIX data source from the drop-down which is added in Context Hub.

   d. **Recur Every**: Specify a recurring feed task that executes repeatedly at specified intervals.

   Note: NetWitness verifies the connection to the server, so that NetWitness can check for the latest file automatically before each recurrence.

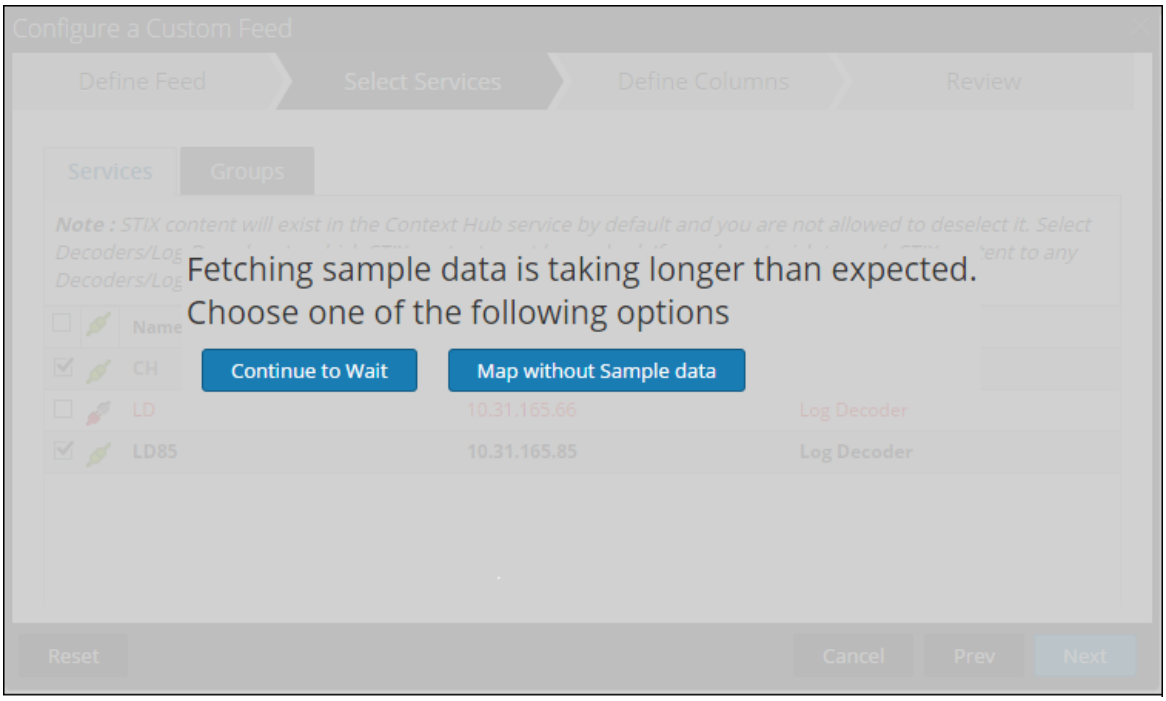
   e. **Date Range**: Select the checkbox and specify the date range for the feed task to recur.



5. (Optional) Select **Advanced Options**,to define a feed based on an XML feed file.

   a. **XML Feed file**: Browse and select an XML feed file from the local file system.

   b. **Separator**: Choose a separator (default is comma).



c. **Comment**: Specify the comment characters used in the feed data file (default is #).

6. Click **Next**.
7. The Select Services dialog is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.

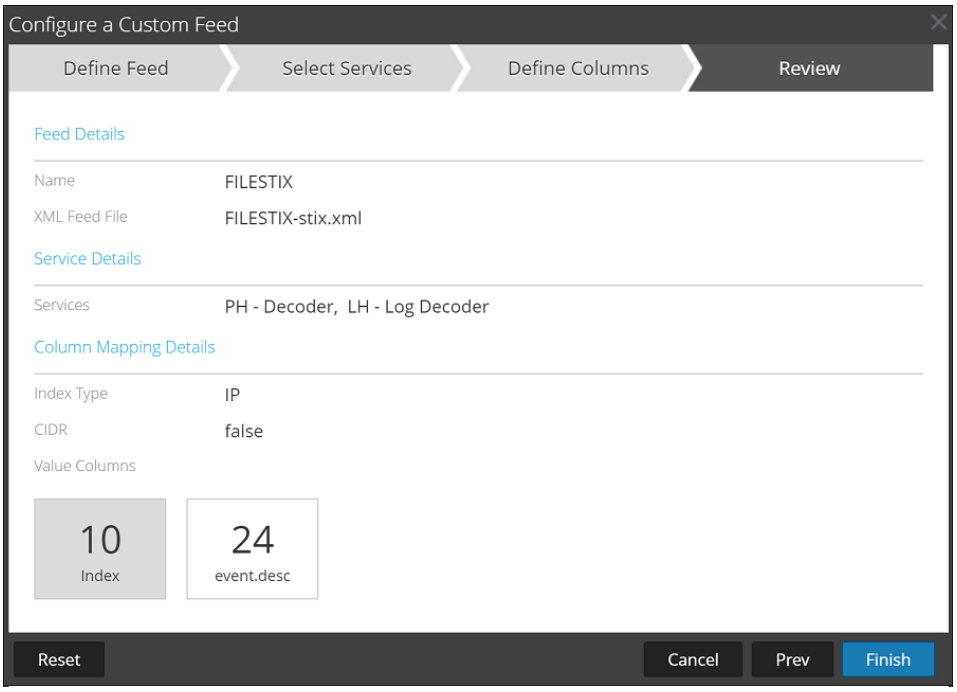
8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**.
   b. In case of STIX feed, Context Hub will be selected by default and you are not allowed to deselect it. In addition, you can select one or more Decoders and Log Decoders and click **Next** or Click the **Groups** tab and select a group. Click **Next**.

      If the data from the STIX server is large, the following message is displayed:

- If you click **Continue to Wait**, it continues to wait till the sample data is fetched or timeout (10 minutes) whichever is sooner. In case of timeout no sample data is retrieved even after 10 minutes.
- If you click **Map Without Sample data**, the mapping column is displayed without any sample data.

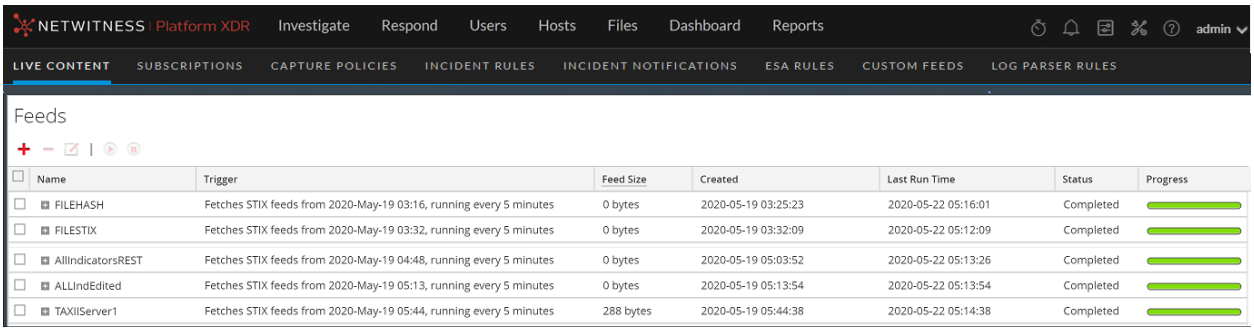
The Define Columns dialog is displayed.

9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Optional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. (Optional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.



Note:
- If the **Index Type** is Non IP, you can select multiple index columns in the **Index Column(S)**. The values from all the selected columns are merged in the first index column that you selected and the merged values are pushed to the Log Decoder for parsing. For example, in the **Index Column(S)** if you select 2,4,7 as index columns the values from the 2,4 and 7 columns are merged in the column 2 and the values are pushed to Log Decoder for parsing.
- Indexing cannot be done for the columns such as Indicator Title, Indicator Description, Observable Title, Observable Description, as the look up cannot be performed for those columns.

d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.



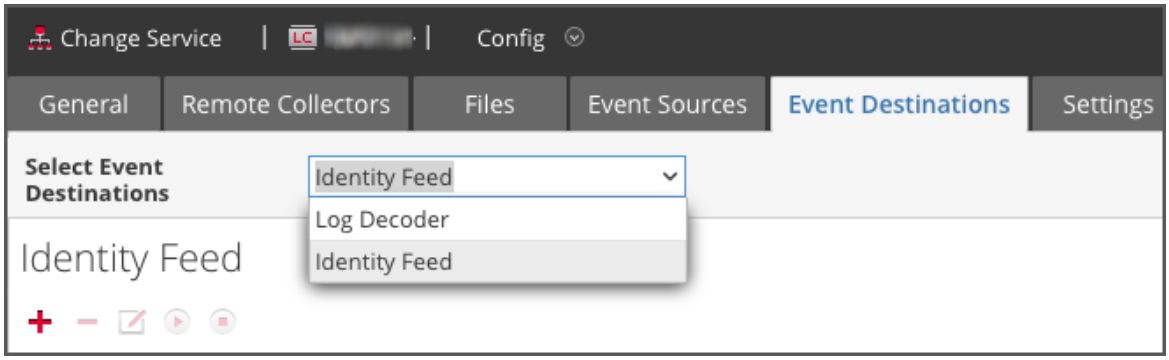
e. Click **Next**.

   The Review dialog is displayed.

10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next dialog (if not viewing the last form).
    - Click **Prev** to display the previous dialog (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.

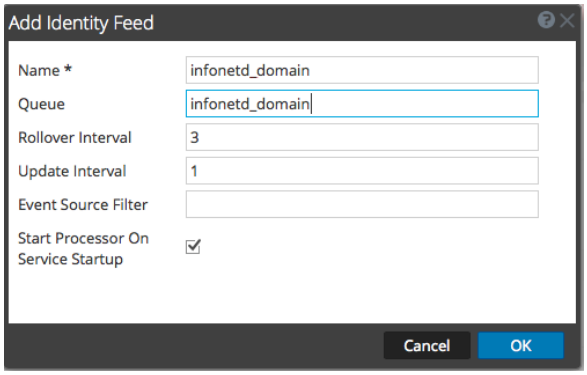
Upon successful creation of the feed definition file, the Create Feed wizard closes, the feed and corresponding token file are listed in the Feed grid, and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Note: Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy due to low memory. For more information on how to troubleshoot `OutOfMemoryError` on `Contexthub` Server, refer to "Troubleshooting" in the *Live Services Management Guide*.



Create an Identity Feed

You can create an Identity feed and populate it to selected Decoders and Log Decoders. In order to create an identity feed, you need to have:



- A Log Collector service with an Identity Feed Event Processor
- A Log Collector service with Windows Collection configured and enabled

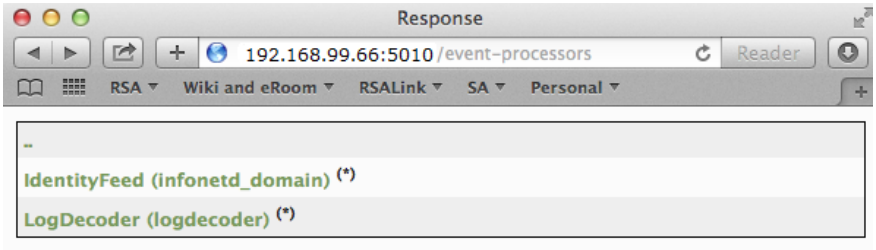
To create an identity feed:

1. Add a destination for the feed.
   a. Go to **(Admin) > Services** and in the **Services**.
   b. In the list of services, select a **Log Collector** service, and select **View > Config**.
   c. Select the **Event Destinations** tab.
   d. In the Select **Event Destinations** field, select **Identity Feed**.

   e. Click and enter a unique name for the feed.
   The Queue name identifies the feed within the Log Collector. Use the name of the feed for the Queue.

   f. Click **OK**.
2. Test generation of messages.

a. Have users log into Windows boxes on the domain to generate the appropriate log messages on the domain controllers for testing.

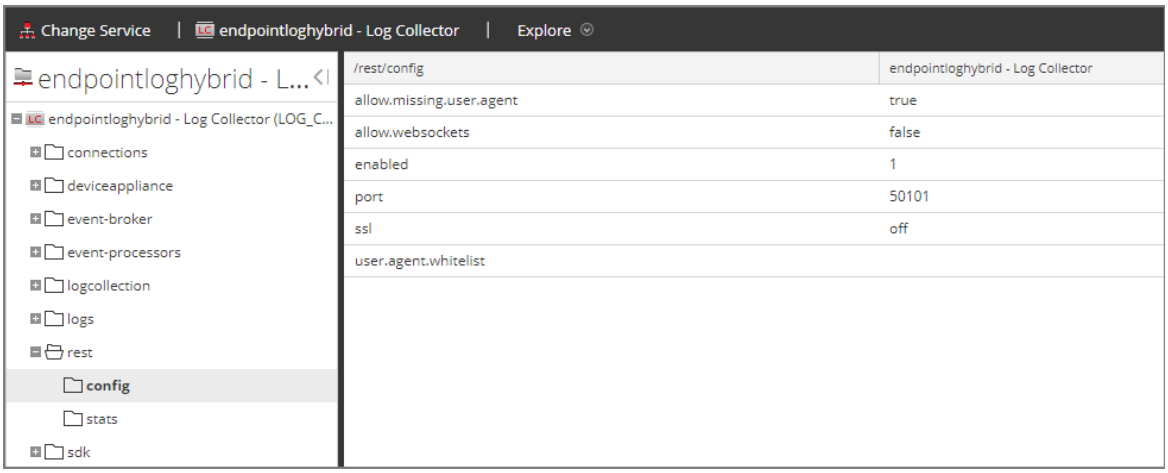


b. Verify that data is written to the feed files. SSH to the Log Decoder/Collector or Virtual Log Collector being configured. Navigate to `/var/netwitness/logcollector/runtime/identity-feed` and verify that the `Identity_deploy` files are getting populated with data.

c. Open up a web browser (Non-Internet Explorer browsers preferred) and log in to the REST interface of the Log Collector. Use administrative credentials when logging in. For example, if the IP address of your Log Collector is 192.168.99.66, the URL would be:

- SSL not enabled: **http://192.168.99.66:50101/event-processors**
- SSL enabled: **https://192.168.99.66:50101/event-processors**

The browser screen should look like this:

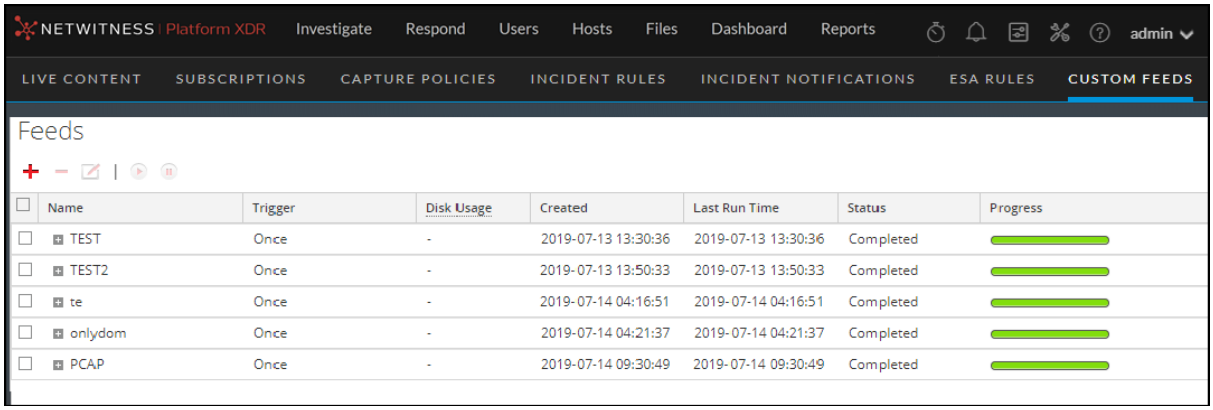


The screen contains the name of the identity feed you created earlier (`infonetd_domain`, in this example).

For the identity feed to function correctly, port 50101 must be active on the Log Collector, and you must determine whether SSL encryption is active.

d. Go to **(Admin) > Services > *<Log Collector being setup>*** **> View > Explore**.

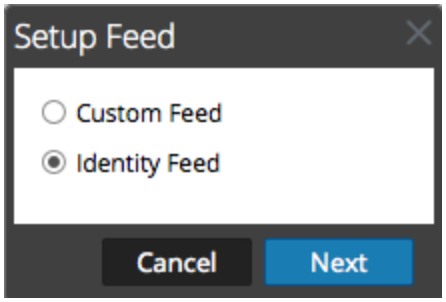
e. In the left pane, expand **rest > config**.



For REST to be active, **enabled** must be set to **1**.

f. Note the value for **ssl**. If SSL should be enabled for your environment, this must be set to **on**.

> **Note:** If you changed the setting for either the **enabled** or **ssl** option you must restart the Log Collector service before moving forward.

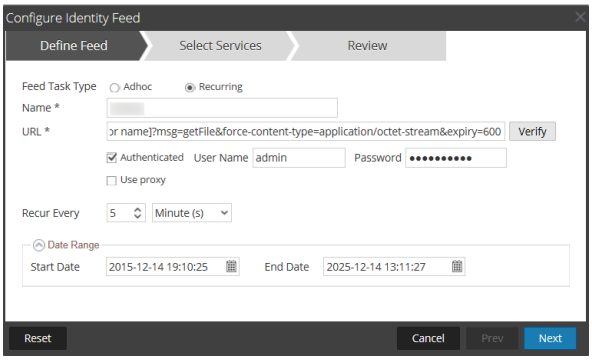


3. Go to **(Configure) > Custom Feeds**.

The Feeds dialog is displayed.

4. In the toolbar, click .

The Setup Feed dialog is displayed.



5. Make sure **Identity Feed** is selected and click **Next**.

The Configure Identity Feed panel opens with the **Define Feed** tab displayed.

6. (Conditional) You can create an on-demand or recurring feed.

   - To define an on-demand Identity feed task that executes once, select **Adhoc** in the **Feed Task Type** field, type the feed **Name**, and browse for and open the feed.
   - To define a recurring Identity Feed task that executes on a recurring basis, select **Recurring** in the **Feed Task Type** field.

     The **Define Feed** dialog includes the fields for a recurring feed.

Note: NetWitness verifies the location where the file is stored, so that NetWitness can check for the latest file automatically before each recurrence.

7. Enter a value and verify the URL field.

   a. In the **URL** field, enter the URL where the feed data file is located. This is the REST API interface that was setup earlier. Make sure you have the following information to construct the URL:

      - The IP address of the Log Collector being used to construct the Identity Feed file.
      - The identity queue name, as set in step 2c.
      - Whether or not SSL is enabled on the Log Collector REST port, as set in step 2f.

      You can construct this value as follows:

      - SSL enabled: `https://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`
      - SSL not enabled: `http://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`

      So, using the example from earlier, the complete value that you would enter into this field is as follows:

      ```
      http://192.168.99.66:50101/event-processors/infonetd_
      domain?msg=getFile&force-content-type=application/octet-
      stream&expiry=600?msg=getFile&force-content-type=application/octet-
      stream&expiry=600
      ```

b. For the URL verification to work correctly, it is important that the NetWitness UI server can access the Log Collector's REST API port (50101). This can be tested by going to the NetWitness UI server via SSH. Once there, run the following command:

- SSL enabled: `curl -vk https://<ip of log collector>:50101`
- SSL not enabled: `curl -v http://<ip of log collector>:50101`

If the `curl` command does not connect then there may be a network firewall or routing issue between the NetWitness UI server and the Log Collector.

Example of a bad connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... No route to host
* couldn't connect to host
* Closing connection #0
curl: (7) couldn't connect to host
```

Example of a good connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... connected
* Connected to 192.168.99.66 (192.168.99.66) port 50105 (#0)
> GET / HTTP/1.1
> User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu) libcurl/7.19.7
NSS/3.19.1 Basic ECC zlib/1.2.3 libidn/1.18 libssh2/1.4.2
> Host: 192.168.99.66:50105
> Accept: */*
>
< HTTP/1.1 401 Unauthorized
< Content-Length: 71
< Connection: Keep-Alive
< Pragma: no-cache
< Expires: -1
< Cache-Control: no-cache, no-store, must-revalidate
< WWW-Authenticate: Basic realm="NetWitness"
< Content-Type: text/xml; charset=utf-8
<

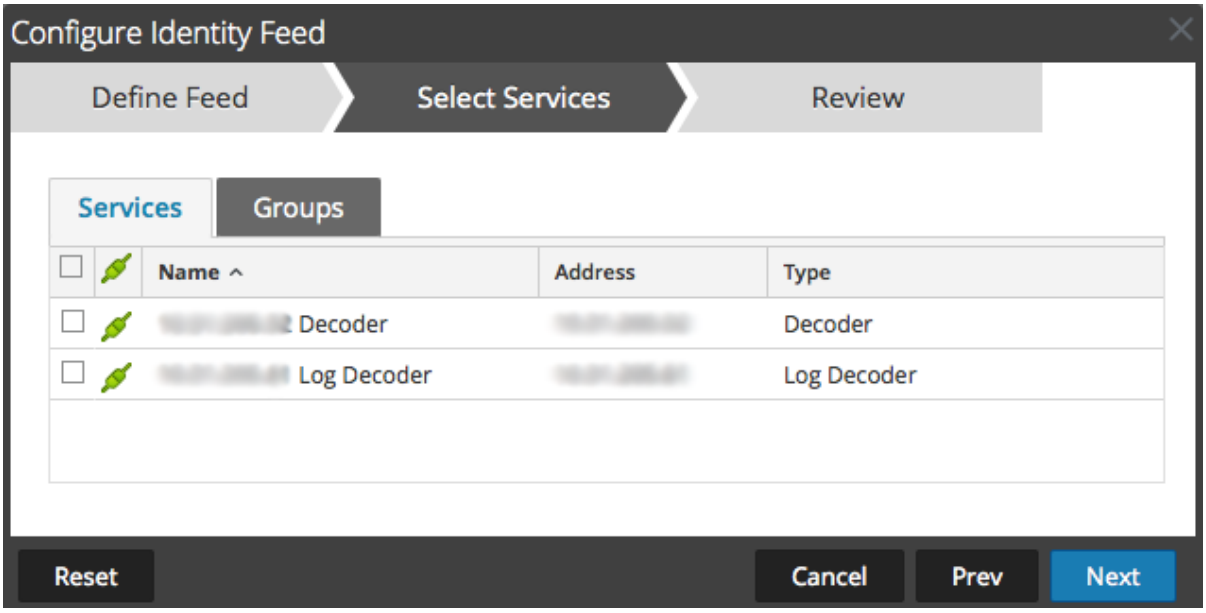
<?xml version="1.0" encoding="utf-8"?>
<error>401 Unauthorized</error>
* Connection #0 to host 192.168.99.66 left intact
* Closing connection #0
```

8. The REST API requires a username and password when attempting to pull the `identity_deploy.csv` file from the Log Collector. This can be any username and password that is available on the service itself. For more information, see the "Services Security View" topic in the *Hosts and Services Guide*.

   To see which accounts are available, go to  **(Admin) > Services > <log collector being setup> > Actions > View > Security**.

   Under the Users table, you see all the users that can be used in this step. It is suggested that a separate user account is created specifically for this setup, and is used nowhere else in the environment, for added security. For details, see "Add a User and Assign a Role" in the *System Security and User Management Guide*. (Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.)

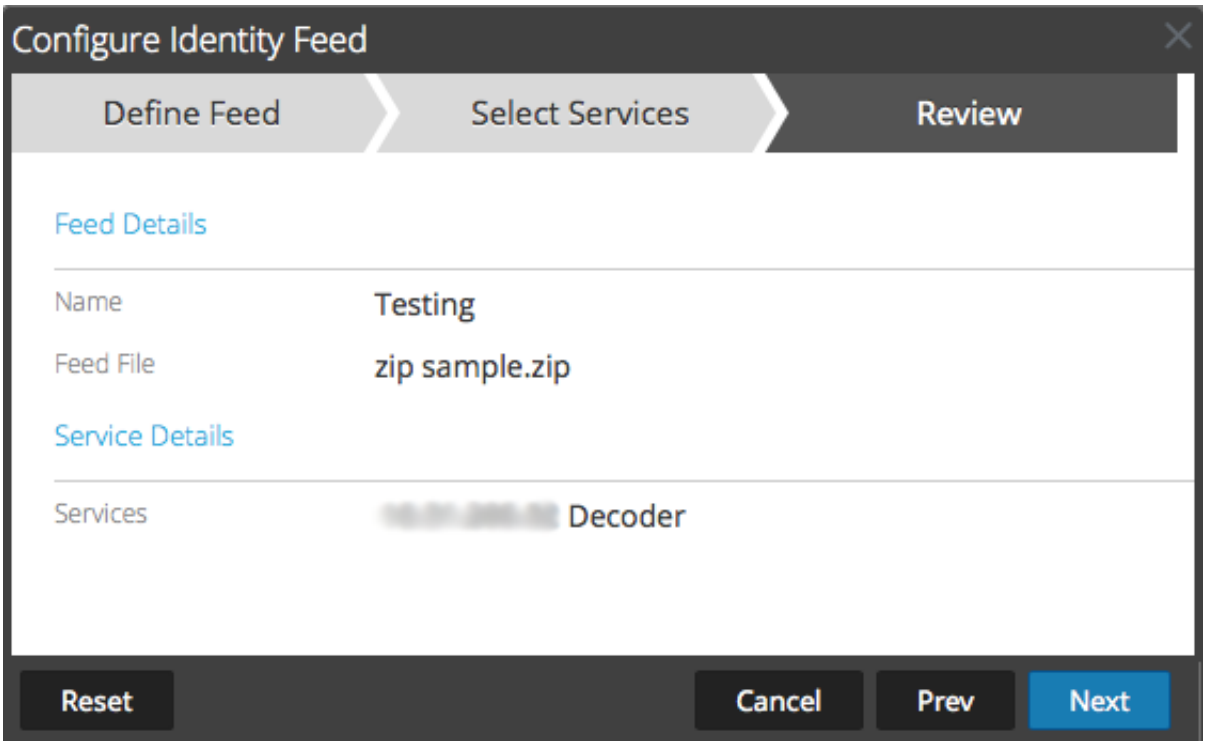
9. To define the recurrence interval, do one of the following:



- Specify the number of minutes, hours, or days between recurrences of the feed.
- Enter the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

10. If using SSL encryption, you need to install the REST API SSL certificate for the Log Collector into the NetWitness UI server. For more information, see Import the SSL Certificate.

    If, after importing the SSL certificate, the verification of the URL still fails, see Cannot Verify Identity Feed URL.



11. Click **Verify** to verify your identity feed configuration before you proceed to the Select Services dialog.
12. Click **Next**.

    The Select Services dialog is displayed.

13. To identify services on which to deploy the feed, select one or more Decoders and Log Decoders and click **Next**.
14. Click the **Groups** tab, select a group, and click **Next**.

    The Review dialog is displayed.

Note: If a group of devices with Decoders and Log Decoders is used to create recurring or custom feeds and this group is deleted, you can edit the feed and add a new group to the feed.

15. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
16. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Import the SSL Certificate

If SSL is configured on the Identity feed's Log Collector, follow these steps to import the Log Collector's SSL certificate into the NetWitness UI server key store. If this certificate is not imported, the NetWitness UI server will be unable to pull the Identify feed file from the Log Collector.

1. To pull the SSL certificate off the Log Collector, SSH into the NetWitness UI server and run the following command:

   ```
   echo -n | openssl s_client -connect <HOST>:<PORT> | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/<SERVERNAME>.cert
   ```

   This command saves the SSL certificate to `/tmp/<SERVERNAME>.cert`. For example:

   ```
   echo -n | openssl s_client -connect 192.168.99.66:50101 | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/logcollector.cert
   ```

2. To import the SSL certificate into the NetWitness UI server, SSH into the UI server and run the following command:

   ```
   keytool -importcert -alias <name an alias for the cert> -file <the cert file pathname> -keystore /etc/pki/java/cacerts
   ```

   For example:

   ```
   keytool -importcert -alias logcollector01 -file /tmp/logcollector.cert -keystore /etc/pki/java/cacerts
   ```

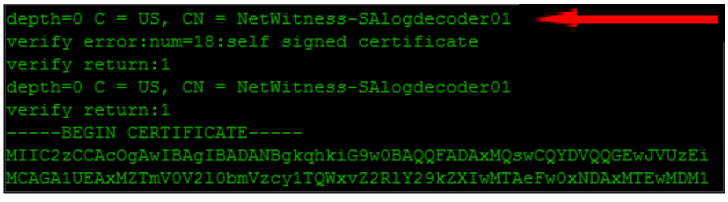
3. The system requests a password. Enter the password for the keystore on the NetWitness UI server, not for the jetty keystore. The default password is **changeit**.

4. Restart **jettysrv** to allow jetty to read the new certificate in the store.

Cannot Verify Identity Feed URL

If the Identity feed URL cannot be verified, and you are using SSL, make sure you followed the steps in Import the SSL Certificate.

If there are issues, it is possible that the internal name of the certificate does not match the hostname of the Log Collector. The following procedure checks this.



1. SSH to the NetWitness UI server.
2. Run the following command to output the CN name of the SSL cert:

   ```
   echo -n | openssl s_client -connect <log decoder>:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

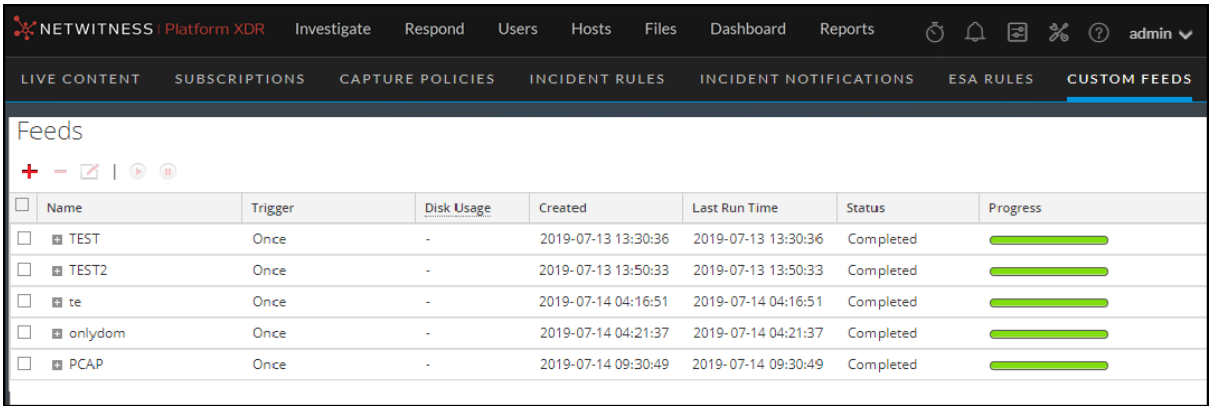
   For example:

   ```
   echo -n | openssl s_client -connect salogdecoder01:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

3. Retrieve the CN name of the SSL certificate.

4. Edit the `/etc/hosts` file and add the IP address and CN name to the file.

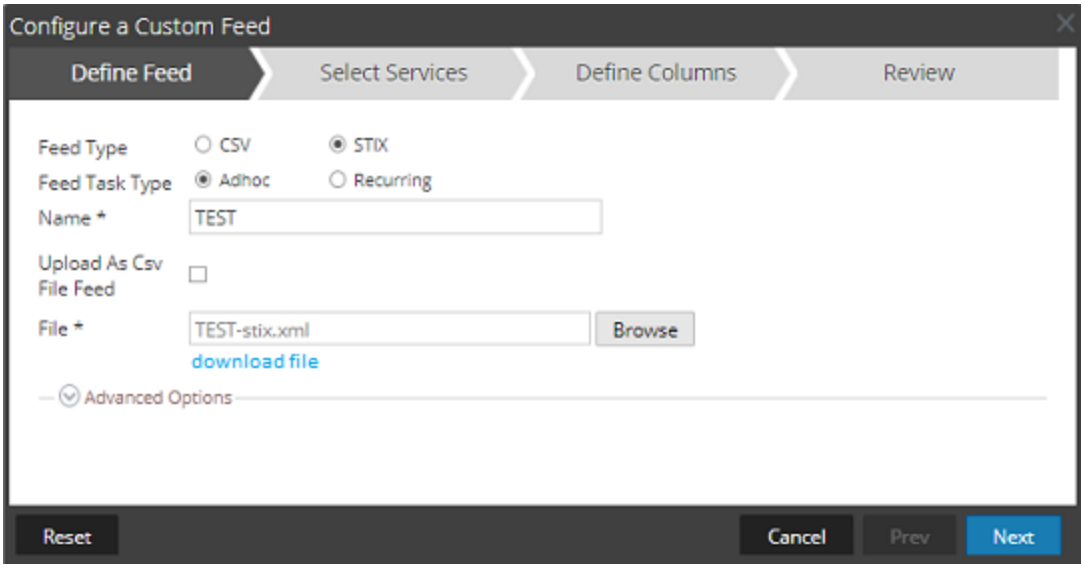
5. Restart the network service on the appliance.
6. Confirm that the name placed in the **/etc/hosts** file is used instead of the FQDN or IP address in the Identity feed URL.
7. Re-verify the Identity feed URL.



Edit, Upload, or Remove a Feed

You can upload a feed, edit an existing feed, or remove a feed.

To edit an existing feed:



1. Go to (Configure) > **Custom Feeds**.

   The Feeds view is displayed.

2. In the toolbar, select a feed and click .

   The Configure Custom Feed or Configure Identity Feed panel opens in the Custom Feed wizard.

3. If you want to edit the feed file:

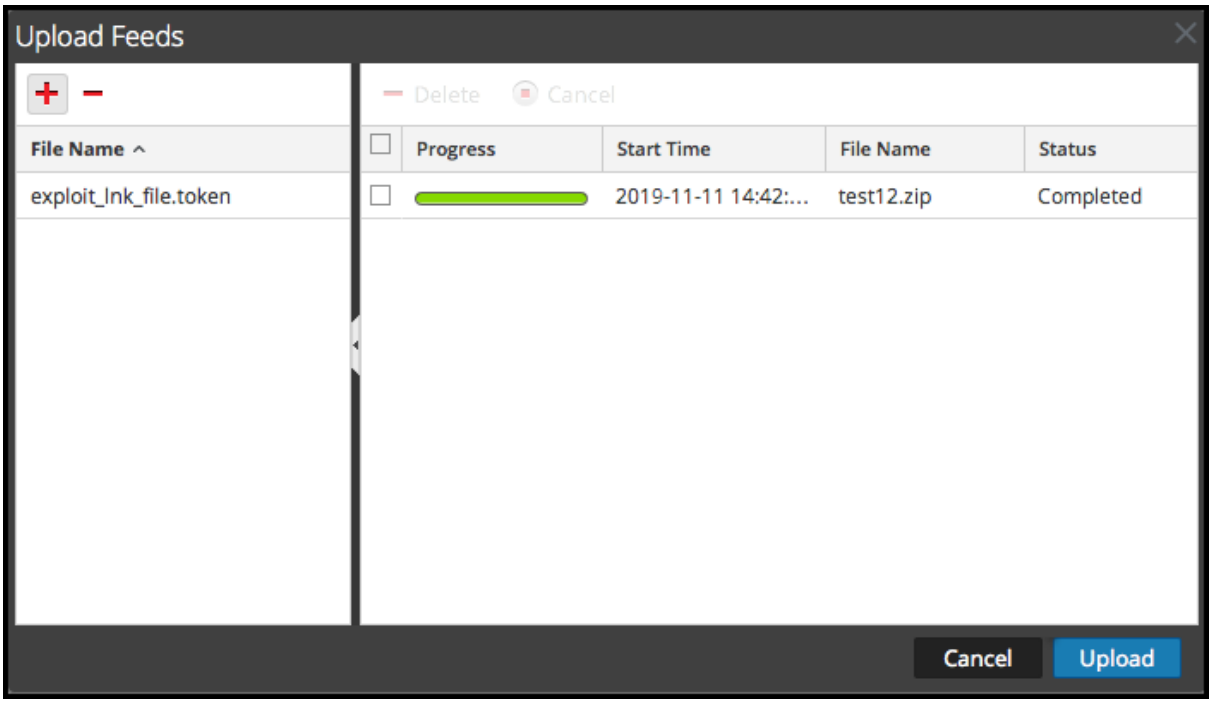
   a. Click **download file**.

      For an Identity feed, the .zip file is downloaded. For a custom feed, the .csv or .xml file is downloaded to your local file system. For a STIX feed, the .xml file is downloaded to your local file system.

b. Edit and save the file.

c. In the **Define Feed** tab, browse for and open the edited file.

4. Edit any other parameters in the **Define Feed** tab, **Select Services** tab, and **Define Columns** tab that apply to the type of feed.
5. Anytime before you click **Finish**, you can:
   - Click **Cancel** to close the wizard without saving your changes.
   - Click **Reset** to clear the data in the wizard.
   - Click **Next** to display the next form (if not viewing the last form).
   - Click **Prev** to display the previous form (if not viewing the first form).
6. In the **Review** tab, review the feed information, and if correct, click **Finish**.



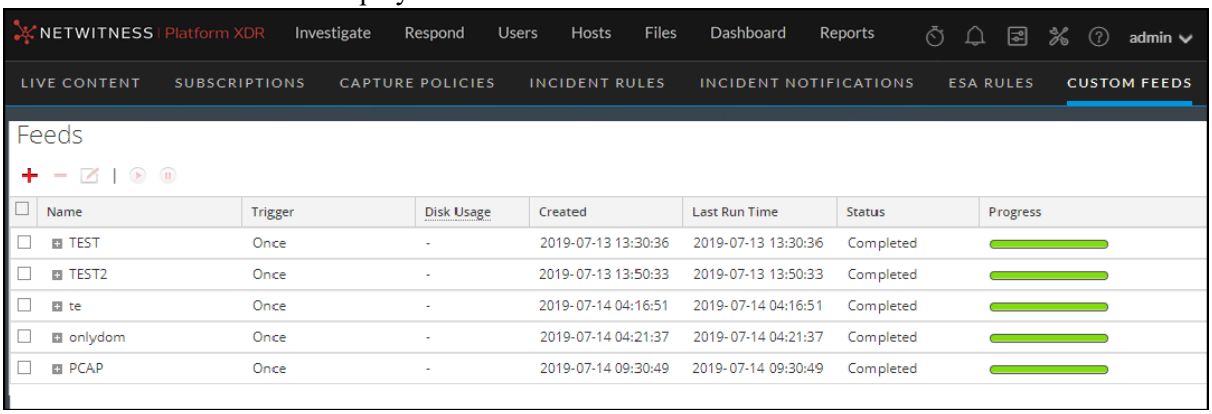
The feed is recreated with the updated file and new feed specifications. The feed is added to the Feeds list and progress bar tracks completion. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file is listed in the Feeds list. You can expand or collapse the entry to see how many services are included, and which services are successful.

To upload a feed to a Decoder or Log Decoder:

1. Go to  (Admin) > **Services**.
2. Select a Decoder or Log Decoder service and click  **> View > Config**.

   The Services Config view is displayed with the General tab open.
3. Select the **Feeds** tab.
4. In the Feeds tab toolbar, click .

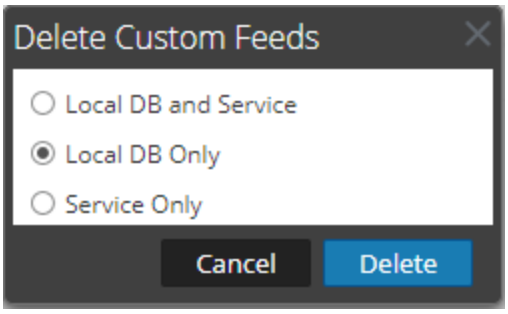
   The Upload Feeds dialog is displayed.



5. In the **File** grid, click + and select a feed file. Supported files are *.feed, *.token, and *.filter.
6. Select the feed file from the **File** list and click **Upload**.

   The Upload Job list is updated to show the progress and status of the uploaded feed.

To remove a feed:



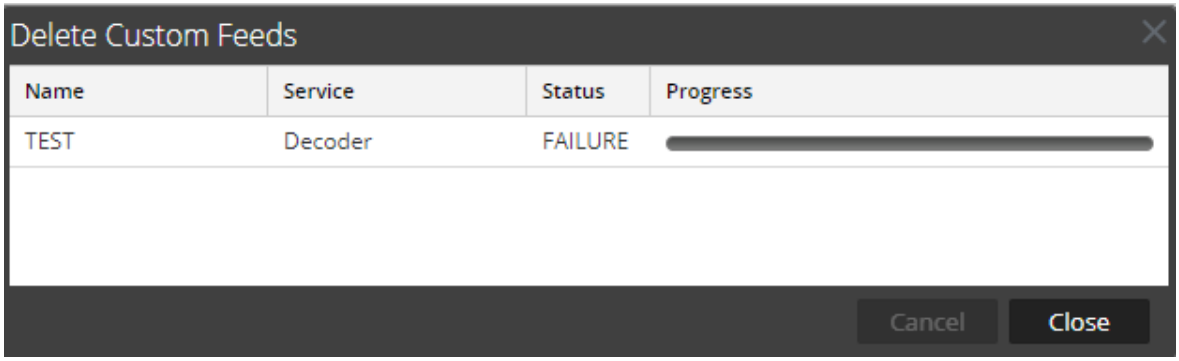
1. Go to (Configure) > **Custom Feeds**.

   The Custom Feeds view is displayed.

2. In the toolbar, select a feed and click − .

   The Delete Custom Feeds dialog is displayed.

You can select one of the following options to delete the feed:



- If you choose to delete the feed from **Local DB and Service**, the feed is deleted from both the service and the local NetWitness box. The deleted feed will no longer be seen on the NetWitness user interface.
- If you choose to delete the feed from **Local DB Only**, the feed is deleted from the local NetWitness box. The deleted feed will not be seen on the NetWitness user interface; however, the last deployed version of the feeds will be present on the service. The undeployed feeds will be deleted forever.
- If you choose to delete the feed from **Service Only**, the feed is deleted from the service. The deleted feed will appear on the NetWitness user interface and can be deployed again.

3. Select where you want to delete the feed and click **Delete**.

   A warning dialog is displayed.

4. Click **yes** to confirm that you want to delete the feed from the select areas.

   - If you chose to delete the feed from the **Local DB Only**, the feed is deleted.
   - If you chose to delete the feed from the **Local DB and Service** or **Service Only**, the Delete Custom Feeds view is displayed showing the progress of the deletion on the service.

Create Custom Meta Keys Using a Custom Feed

This topic provides information on how to add custom meta keys using a custom feed in the Log Decoder, and highlights the configuration changes to reflect the custom meta keys in the Concentrator, ESA, Archiver, Warehouse Connector, and Reporting Engine schema. You can create custom meta keys to retrieve data, to investigate and analyze the logs and packets. Custom meta keys enable you to add an enrichment context for the log and packet data.

Here is an example of creating a custom meta key in the Log Decoder. In this scenario, an organization wants to track the location of an asset such as a printer. So, a custom meta key **source location** is introduced, which indicates the location of the asset, for example Printer1, which is located in the 'Fifth Floor A wing'.

Note: Custom meta keys can be created in the Decoder as well. Select the `index-decoder-custom.xml` file when you create a custom meta key in the Decoder.

Add a Custom Meta Key in the Log Decoder

To add custom meta keys using custom feed:

1. Go to  (Admin) > **Services** .
2. Select a Log Decoder service and click  > **View** > **Config** > **Files** tab > **index-logdecoder-custom.xml.**

```
<Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location" level="IndexNone"
name="location.src" format="Text"/>
 </Language>
 name = Name of the key (max is 16 chars)
```

3. Restart the Log Decoder service. In the Services view, click  > **Restart**.

Note: Following are the NetWitness reserved keywords. Do not use these keywords as custom meta keys as it can cause display error in the NetWitness user interface due to CSS conflicts referencing to the same keywords.

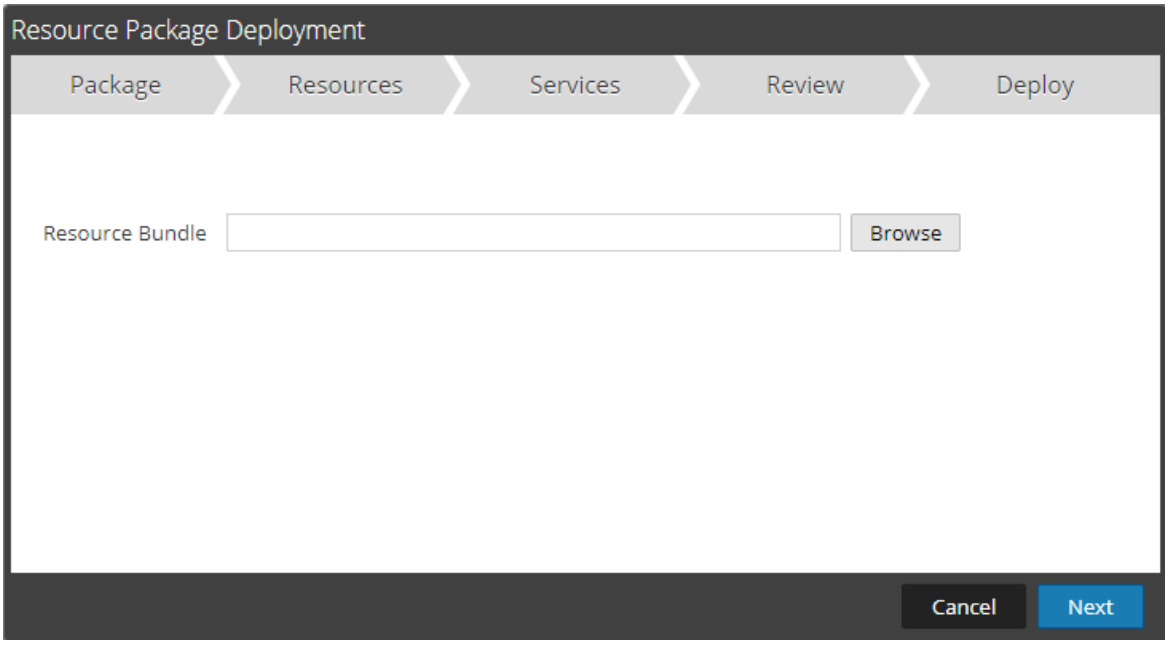
Deploy a Log Decoder Feed in Live

To deploy the feed in the live environment:

1. Go to  (Configure) > **Live Content**
2. Select a group of resources, or a previously created resource package. To select a resource or group of resources:
   a. In the **Live Search View,** browse Live resources (for example, search for the **Log Collector** resource Type).
   b. In the **Matching Resources** panel, select **Show Results > Grid**.

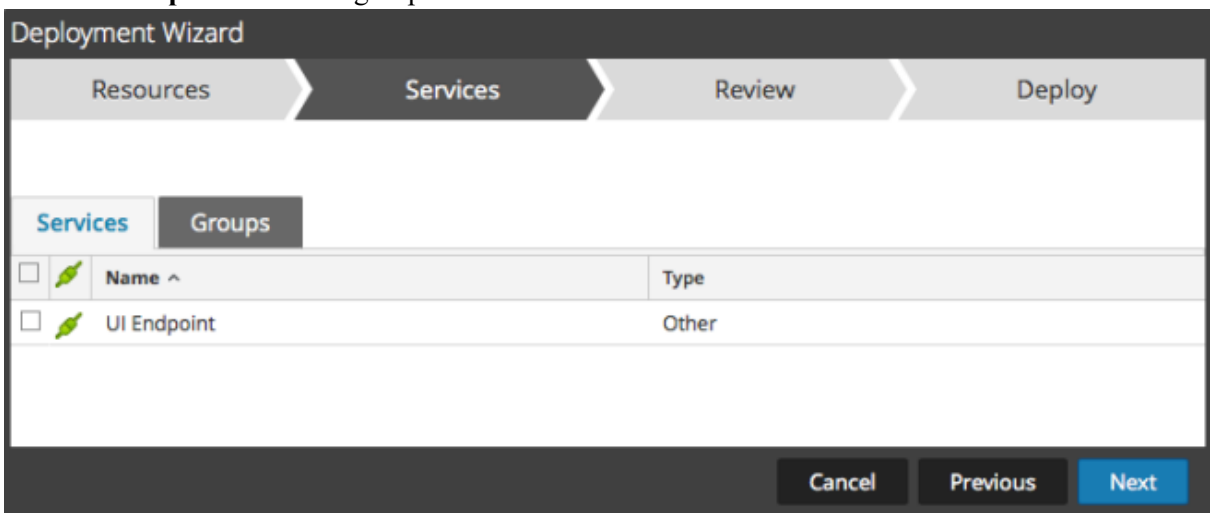


c. Select the checkbox to the left of the resources that you want to deploy.

d. In the Matching Resources toolbar, click Deploy.

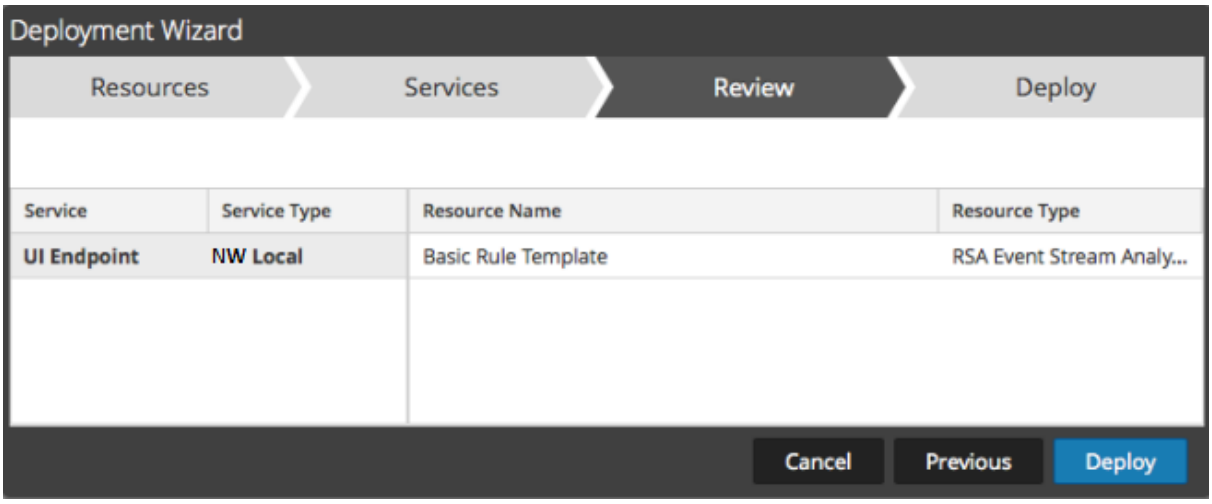
3. To select a resource package to deploy:

a. In the **Live Search** view **- Matching Resources** toolbar, select **Package** > **Deploy** :
The Package page of the Resource Package Deployment wizard is displayed.



b. Click **Browse** and select a package from your network.

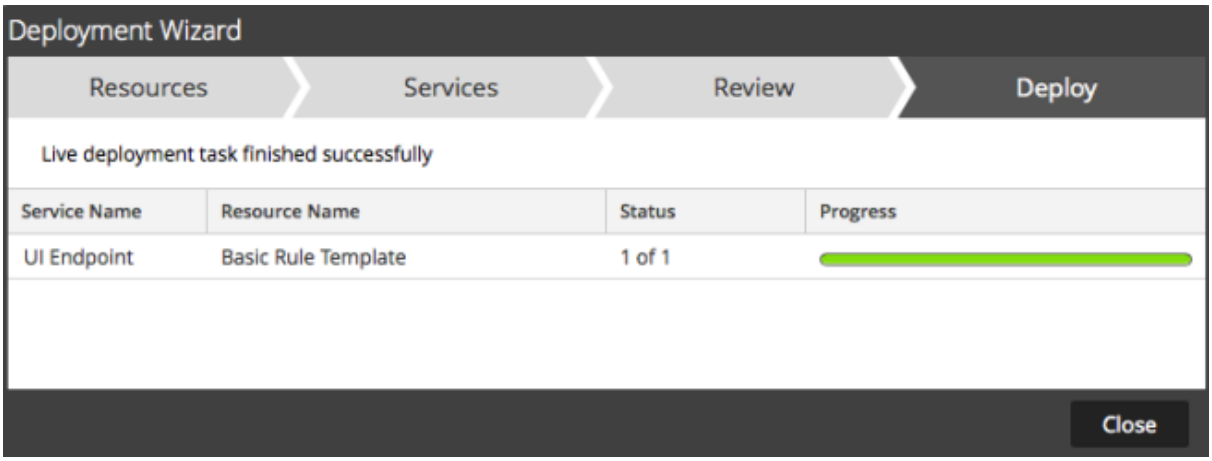
c. Click **Open.**
At this point, whether you are deploying a package or a group of resources, the Deployment Wizard opens, and the Resources page is displayed.



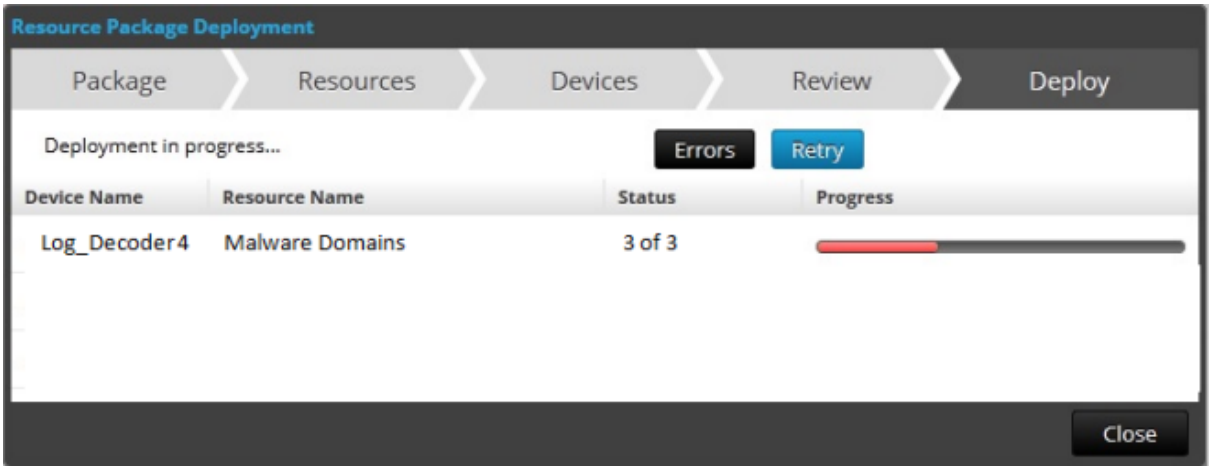
3. Click **Next**.
The **Services** page is displayed. It has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the (Admin) > Services view. The columns are a subset of the columns available in the Services view.

Note: The Live server is "smart" about deploying resources to Services. For example, it does not deploy resources that have a Medium of packets to any Log Decoders. This means that only applicable content resources are deployed to each Service.

4. Select the services to which you want to deploy the content. You can select any combination of services and service groups.
Use the **Services** tab to select individual services, list of services and service groups that are configured in the Admin Services view.
Use the **Groups** tab to select groups of services.



5. Click **Next**.
The **Review** page is displayed.



Make sure that you have selected correct resources and the services to which you want to deploy them.

6. Click **Deploy**.
   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.

If you try to deploy resources and services that are not compatible, NetWitness displays the Errors and Retry buttons, which you click to review the errors and retry the deployment.

7. Click **Close**.

> **Note:** The Source IP should be indexed by selecting the type as 'IP' as the ip.src. and ip.dst are in IPv4 format.

In this scenario, a custom meta key location.src (location source) is added by indexing the hostname (alias.host). In this example, the printer hostname are populated in meta key 'alias.host'. Select **alias.host** as callback key, and index type as 'Non IP' in the Feed Wizard as shown below. In the Define Values section, select the custom meta key from the drop down menu.

Add the Custom Meta Key Entry in the Concentrator Custom Index file

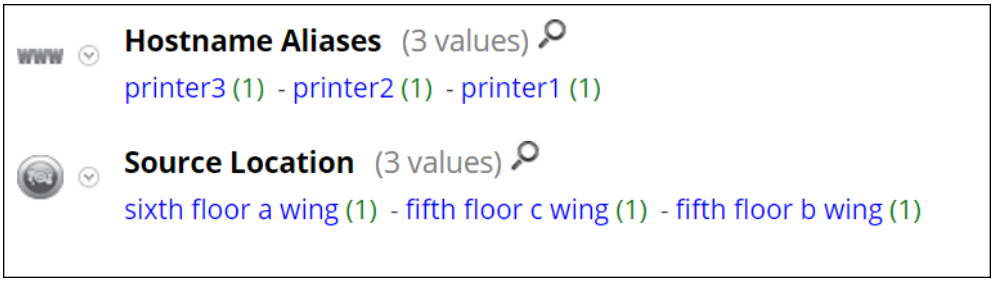
To add the custom meta key entry in the Concentrator custom index file:

1. Go to  (Admin) > **Services** > **Concentrator**.
2. Click  > **View** > **Config** > **Files** tab > **index-concentrator-custom.xml.**
3. Add the custom meta key entry in the Concentrator index file.

```
 <Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
   <!-- Reserved Meta key for Feed -->
   <Key description="Source Location"  level="IndexValues"
name="location.src" format="Text"  valueMax="10000"
defaultAction="Open"/>
  </Language>
```

4. To restart the Concentrator service, in the Services view, click  > **Restart**.

> **Note:** In case of the Broker, the Broker derives its index from the Concentrator from which it aggregates. So you do not need to create custom meta in the Broker. If you have not indexed the meta key in the Concentrator, the Broker does not display the meta key in Investigate.



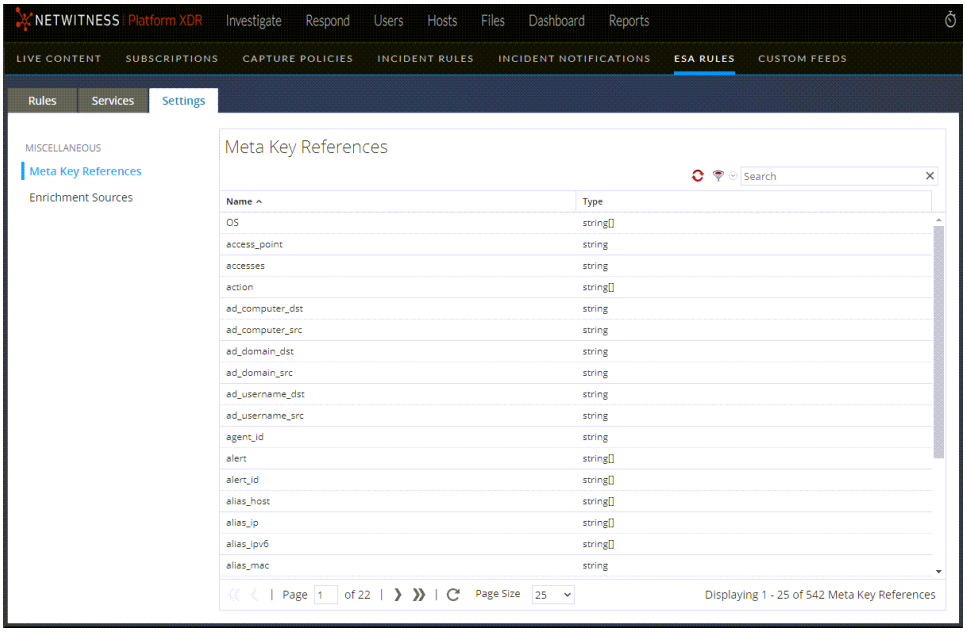
Investigate a Custom Meta Key

> **Note:** You have to log out and log back in to the NetWitness User Interface in order to view the custom meta key in Investigate.

To investigate a custom meta key:

1. Go to **Investigate**.
   The Investigate dialog, which provides services, is displayed.

2. Select a Concentrator service, and click **Navigate**.



Additional Procedures

The following procedures must be executed if you have Warehouse Connector, Archiver, Reporting Engine, and ESA configured.

Verify the Custom Meta Keys on ESA

After you add custom meta keys on the Concentrator, you can verify that your meta keys are updated on ESA.

1. Go to (Configure) > **ESA RULES** > **Settings** tab.

2. In the Meta Key References, click the Meta Re-Sync (Refresh) icon ( ).

3. Verify that the custom meta keys appear on ESA. If you do not see the meta keys, you may need to restart the Concentrator.

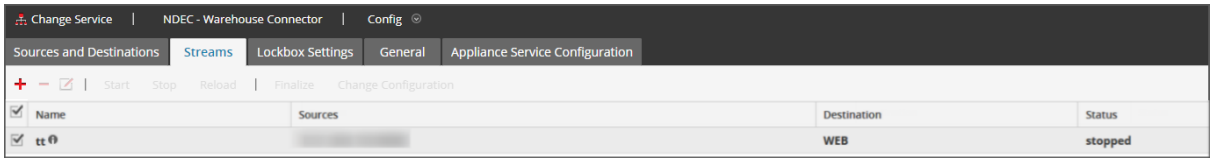
Update the Schema in Archiver

If you want to configure the Archiver, using the new custom meta keys, you need to update the Archiver schema in the Reporting Engine. To update the Archiver schema in Reporting Engine:

1. Go to **(Admin)** > **Services** > **Archiver**.
2. Select > **View** > **Config** > **Files** > **index-archiver-custom.xml**.
3. Add the custom meta key entry in the Archiver index file.

```
<Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location" level="IndexValues"
name="location.src" format="Text"
  valueMax="10000" defaultAction="Open"/>
 </Language>
```

4. To restart the Archiver service, click > **Restart.**
   The Archiver schema is updated with the custom meta key.



Update the Schema in Warehouse Connector

If you want to configure the Warehouse Connector with custom metadata and use it in a Warehouse Connector report then you need to update the Warehouse Connector schema in the Reporting Engine.

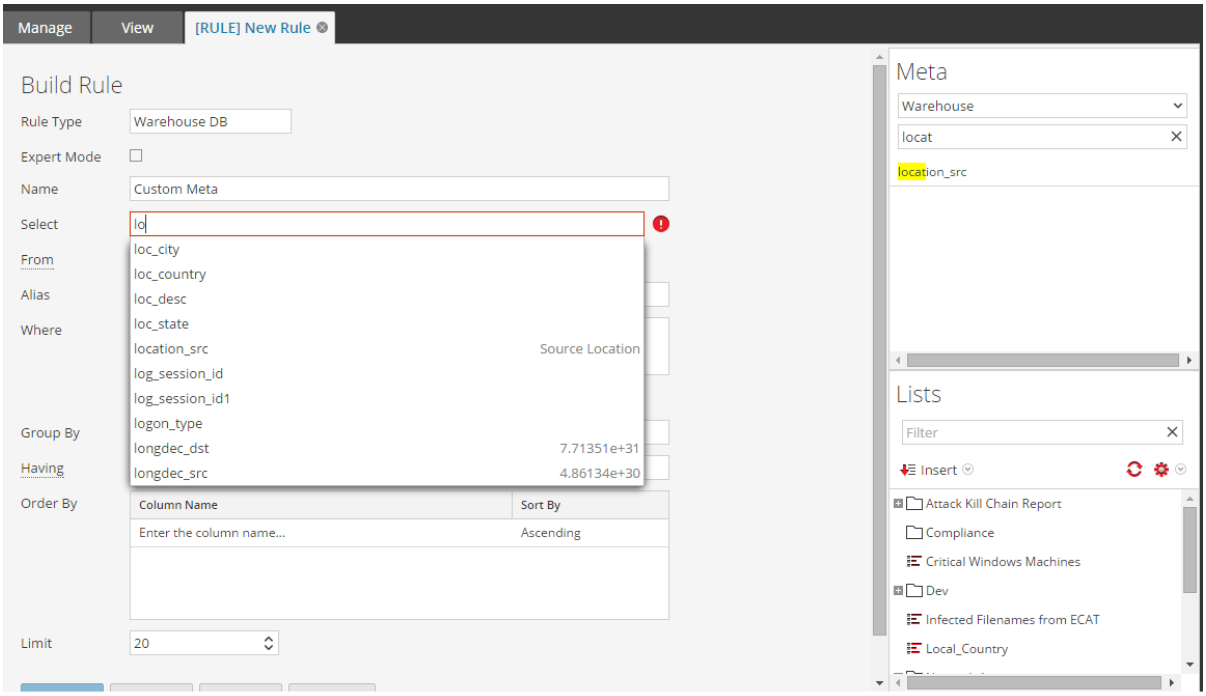
If the Log Decoder or Decoder, where the custom meta key is added, is one of the sources in the Warehouse Connector stream, you need to update the schema in the Warehouse Connector.

To update the Warehouse Connector schema in the Reporting Engine:

1. Go to (Admin) > **Services** > **Warehouse Connector**.
2. Click > **View** > **Config**.
   The Services Config view of Warehouse Connector is displayed.
3. Click the **Streams** tab.
4. Select the stream and then click **Reload**.
   The Warehouse Connector pulls the schema from the downstream devices (Log Decoder/Decoder).

For more information on streams, see "Configure Streams" in the *Warehouse Connector Configuration Guide*.

Update the Schema in Reporting Engine



To update the schema in Reporting Engine:

1. Go to **(Admin)** > **Services** > **Reporting Engine.**
2. Click > **Restart.**

Note: Restart the Reporting Engine or wait for thirty minutes for the schema to be updated.

To view the custom meta key:

1. Navigate to **Monitor** > **Reports** > **Rules**.
2. In the toolbar, click .
3. Select **Warehouse DB**.
4. In the **Build Rule** tab, search for the custom meta from the right panel.
   The custom meta key is displayed.

or Decoder and Log Decoder Additional Procedures

This topic explains the additional procedures an administrator could choose to follow which are not essential for the configuration of the Decoder or Log Decoder.

Topics

- Configure High Speed Packet Capture Capability (Version 11.6 and Later)
- Configure a Log Decoder to Accept Protobuf
- Configure Session Split Timeouts
- Configure Syslog Forwarding to Destination
- Configure Transaction Handling on a Decoder
- Configure Data Export
- Decrypt Incoming Packets (TLS 1.2)
- Decrypt Incoming Packets TLS 1.3
- Edit Decoder System Configuration
- Enable CPU Usage Statistics for Installed Content
- Enable Parser Mappings
- Enable or Disable Lua and Flex Parsing Systems
- Map IP Address to Service Type for Log Parsing
- Map an IP Address to a Time Zone
- Obtain Log Files from a Pre-11.0 Log Decoder
- Upload a Log File to a Log Decoder
- Upload a Packet Capture File
- Troubleshooting Packet Drops (11.x and above)

Configure High Speed Packet Capture Capability (Version 11.6 and Later)

This topic guides administrators on how to tune a Network Decoder specifically for high speed packet capture using NetWitness 11.6. This applies when capturing packets on 10G, 40G, or higher speed interface cards.

IMPORTANT: Packet capture at high speeds requires careful configuration and pushes the Decoder hardware to its limits, so you must read this entire topic while implementing a high speed capture solution.

NetWitness provides support for high-speed collection on the Decoder. You can capture network packet data from higher speed networks and optimize your Network Decoder to capture network traffic up to 40 Gbit/s. These network capture speeds can be easily achieved on a Decoder but make a note that not all NetWitness Platform features operate at these rates. The actual throughput of Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and deep packet inspection. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.
- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Enhancements that facilitate capture in these high speed environments include the following:

- Utilization of the DPDK capture drivers to leverage the commodity 10G and 40G Intel NIC cards for high-speed capture environments. For more information on how to configure DPDK, see (Optional) Data Plane Development Kit Packet Capture.
- Introduction of `assembler.parse.valve` configuration, which automatically disables application parsers when certain thresholds are exceeded, to limit risk of packet loss. When the application parsers are disabled, network layer parsers are still active. When stats fall below exceeded thresholds, application parsers are automatically re-enabled.
- Utilization of Berkeley Packet Filters (BPF) in 10G environments. For more information, see (Optional) Configure System-Level (BPF) Packet Filtering in Configure Capture Settings.
- Decoder will utilize the symmetric RSS to distribute capture loads among multiple CPU cores. For more information see, "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture
- Decoder will distribute the session reassembly work among multiple CPU cores as well, provided that the packets fed into each assembly are naturally segregated using the RSS features or as a result of being captured on different physical interfaces.

Note: Beginning with 11.5, the Network Decoder can capture from multiple interfaces simultaneously. This functionality allows Network Decoders to capture from multiple physical Network Interface Cards (NICs) while leveraging the same network rules, application rules, and parsers for each NIC. You can use this feature in all capture environments. For more information, see (Optional) Multiple Adapter Packet Capture.

Note: Enabling intra-session for HTTP pipelining is not supported when capturing at 10G rates on a single Decoder as the HTTP_Lua parser required to function can cause dropped packets at that rate of ingest. In this case, the load should be spread across multiple Concentrator-Decoder pairs.

Hardware Prerequisites

- A Series 5 or Series 6 Decoder
- An Intel 82599-based ethernet card, such as the Intel x520 or an Intel i40e-based card like the Intel XL710. All NetWitness-provided 10G cards meet this requirement such as the following:
  - All SMC-10GE cards provided by NetWitness.
  - A Dell Network Daughter Card using an Intel controller to provide 10G network interfaces. This is included in all Series 5 hardware.
- Sufficiently large and fast storage to meet the capture requirement of packets in case you set up in a mode other than meta-only. Storage considerations are covered later in this topic.
- If the Decoder will reassemble and handle high numbers of sessions, for example 30000 sessions per second or more, then at least two physical storage volumes are required. This will allow one volume to be used for writing session data while the other to read session data and deliver it for down-stream analytics.
- Each Network Decoder configured with a minimum of 2 DACs or SAN connectivity when set up in mode other than meta-only.

Software Prerequisites

NetWitness Platform 11.6 or later.

Decoder Installation

Perform the following steps to install the Decoder.

Install the Decoder Service on Host that Will Perform the Capture

The Network Decoder service package contains the necessary software components to utilize the features described in the document. The Network Decoder service package and all other required packages are installed during the Decoder installation.

Select the Capture Interfaces and Assign Interfaces to DPDK

You must choose the physical network connections that will be used for packet ingest. The physical interface type will depend on the type of network traffic sent to the Decoder. The interface you select must match the physical characteristics of the Decoder feed (or network link) used to receive packets. For example, if you want to capture at 40G speeds on a cable, then you need a 40G interface capable of attaching to that cable.

For information on how to assign interfaces to DPDK, see (Optional) Data Plane Development Kit Packet Capture.

Verify the Decoder Packages Installation

Perform the following steps to verify the Decoder package installation:

- After you configure the interfaces to use with DPDK, ensure that you reboot the Decoder host.
- After the reboot, ensure that the DPDK interfaces appear in the Decoder's capture adapter list.

Select the Decoder Operating Mode

You can configure Decoder to handle any type of capture scenario that ranges from a very deep application-level inspection to very fast and simple network connection tracking. The Decoder includes the following three built-in templates that serve as a starting point for configuring your capture needs:

1. **Normal**: It is the default Decoder mode with no defined resource allocation and all tunable parameters set to default. It can be a good option if your capture rate is less than 5 Gbit/s or if you want to run a large amount of deep inspection content such as application parsers, feeds, OpenAppID detectors, complex Snort rules, and so on. For more information, see Configure the Decoder for Normal Mode (Default Mode).
2. **10G**: This mode is available in NetWitness 10.4 and later. You can use this mode if your capture rate is under 10 Gbit/s. This mode assumes that most of the packets are retained and saved in the packet database. Make a note that not all parsers can run at 10 Gbit/s speeds as some parsers are too complex for high speeds. For more information, see Configure the Decoder for 10G Mode.
3. **NDR**: This mode is to capture beyond the 10 Gbit/s speeds, but below 40Gb/sec. Make a note of the following points while using this mode:
   a. By default, this mode assumes that packets are not retained as the rate at which this mode consumes storage is significantly high.
   b. By default, the ingested packets are dropped. You must insert the network rules before the drop statement to pick portions of the network stream and keep the incoming packet feed for further analysis.
   c. Make a note that at higher speeds only a limited amount of deep packet inspection content can be used.
   d. Ensure that you enable the multi-thread assembly while using this mode.

   For more information, see Configure the Decoder for NDR Mode.

Configure the Decoder for Normal Mode (Default Mode)

By default, the Decoder runs in the normal mode and requires no additional configuration. The default normal mode captures up to 5Gb/sec with large amounts of deep packet inspection while storing network sessions.

Configure the Decoder for 10G Mode

The instructions in this section are to configure the Decoder for capture speeds up to 10Gb/sec with medium amounts of deep packet inspection while storing network sessions.

To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=10g`
   Ensure that the correct parameter is displayed in the output.
2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters can be `op=10g update=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=10g`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

      ```
      1: packet_mmap_,eth0
      2: DPDK,0000:41:00.0
      3: DPDK,0000:41:00.1
      ```

   c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.
   d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.
6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:
   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.

- You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.

7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.
8. The following configuration parameters are deprecated and no longer necessary.
   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory
   - Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

Note: An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping the unwanted traffic as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
   The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

IMPORTANT: Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

Storage Considerations

Packet Retention Requires Extremely High Sustained Throughput

When capturing at 10G line rates, the storage system holding the packet and meta databases must be capable of sustained write throughput of 1400 MBytes/s. Make a note that many SANs are not capable of achieving these speeds.

Using SAN and Other Storage Configurations

The Decoder allows any storage configuration that can meet the sustained throughput requirement. The standard 8 Gbit FC link to a SAN is not sufficient to store packet data at 10G; in order to use a SAN it may be required to perform aggregation across multiple targets using a software-RAID Scheme. Thus environments using SAN are required to configure connectivity to the SAN using multiple FCs.

Optimize Read/Write Operations When Adding New Storage

A 10G Decoder is optimized to stagger read and write operations across multiple volumes so that the current file being written is on a different volume from the next file that will be written. This allows maximum throughput on the raid volume when reading data from the last file being written while writing the current file on a different volume. However, if volumes are added after a Decoder has been in use, the ability to stagger is limited because one or more volumes are already full so the new volume is the only place new files can be written.

To remedy this situation, an administrator can run a `stagger` command on an existing NetWitness database (packet, log, meta, or session), that has at least two volumes, to stagger the files across all volumes in the most optimal read/write pattern. The major use case is when new storage is added to an existing Decoder and you want to stagger the volumes before restarting capture.

The configuration nodes for this command are the session, meta, and packet databases. Each of these lives under `/database/config`, which is usually a root node. The config nodes for a Decoder are:

- `/database/config/packet.dir`
- `/database/config/meta.dir`
- `/database/config/session.dir`

The *NetWitness Platform Core Database Tuning Guide* has information on how those configurations are formatted.

The `stagger` command is typically only useful for a 10G Decoder and usually just for the packet database. Maximum performance is achieved for storing and retrieving packets when multiple volumes are present. In this scenario, the Decoder always fills the volume with the most free space. When the volumes are roughly the same size, this results in a staggered write pattern, which allows maximum throughput for reading and writing across all volumes. However, this only naturally occurs when multiple packet storage volumes are present at the time the Decoder is first deployed.

A typical use case is adding more storage to an existing Decoder to increase retention. However, when adding storage to an deployment that has already filled the existing volumes with stored packets, the Decoder will naturally fill the new storage with packets before rolling out any packets on the existing storage. This results in a suboptimal read/write pattern because most reads will occur on the same volume that is currently being written to. In a 10G deployment, reads are blocked from the volume when writes are occurring. This does not stop ALL reads on that volume, because the file is buffered in memory before being written, but it does result in suboptimal read performance.

With the `stagger` command, you can add more storage and then have the service naturally stagger the files across ALL volumes (existing and new) so that read performance is optimized.

Caution: This command should only be performed after the storage is mounted and the Decoder configured to use it (for example, after adding the mount point(s) to `packet.dir`).

The downside to this command is it can take some time to stagger and the Decoder should not be capturing during the stagger operation.

Recommended workflow:

1. Add all storage and configure mount points.
2. Add new storage mount points to `packet.dir` (or `session.dir`/`meta.dir`) and restart service (very important!).
3. Ensure capture is stopped.
4. Run the stagger operation. You must not terminate the connection that initiated the stagger operation until the operation is complete. If you run stagger from NwConsole, run the `timeout 0` command before sending the `stagger` command. This will prevent the normal 30 second command timeout.
5. Start capture after the `stagger` command finishes.

The following are the parameters for the stagger command:

- `type` - The database that will be staggered (session, meta, or packet). Typically only the packet database is useful for staggering, but it is possible to do the session or meta database when multiple volumes are present for those databases. Since the session and meta databases write far less data than the packet database, typically staggering those databases results in less noticeable performance gains.
- `dryRun` - If `true` (the default), will only return a description of the operations that would be performed. If `false`, then the files will actually be moved to an optimal read/write pattern. You MUST pass false to actually stagger the files.

Example usage from NwConsole:

```
login <decoder>:50004 <username> <password>
timeout 0
send /database stagger type=packet dryRun=false
```

Note: If you run this command using the RESTful API, pass the additional parameter `expiry=0` to prevent a timeout from the service. You will also need to ensure the HTTP client does not disconnect before the operation completes.

Parsing and Content Considerations

Parsing raw packets at high speeds presents unique challenges. Given the high session and packet rates, parsing efficiency is paramount. A single parser that is inefficient (spends too long examining packets) can slow the whole system down to the point where packets are dropped at the card.

For initial 10G testing, start with only native parsers (except SMB/WebMail). Use the native parsers to establish baseline performance and with little to no packet drops. Do not download any Live content until this has been done and the system is proven to capture without issue at high speeds.

After the system has been operational and running smoothly, Live content should be added very slowly, especially the parsers.

Best Practices

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss. One caveat is that if you are updating a current 10G deployment but not adding any additional traffic. For example, a current Decoder capturing off a 10G card at 2G sustained should see no difference in performance, unless part of the update also entails adding additional traffic for capture.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- Although lesser performance impacts, feeds should also be reviewed and added in a phased approach to help measure performance impacts.
- Application Rules also tend to have little observable impact, though again, it is best not to add a large number of rules at once without measuring the performance impact.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Also, making the recommended configuration changes outlined in the Configuration section will help minimize potential issues.

Use Case 1: 10G Mode - Egress, Deep Packet Inspection

In this setup the goal is to ingest at 10G sustained line rates, perform Deep Packet Inspection (DPI), store metadata, and store raw packets for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- MA content (7 Lua parsers, 1 feed, 1 application rule)
- 4 feeds (alert ids info, nwmalwaredomains, warning, and suspicious)
- 41 application rules
- DNS_verbose_lua (disable DNS)
- fingerprint_javascript_lua
- fingerprint_pdf_lua
- fingerprint_rar_lua
- fingerprint_rtf_lua
- MAIL_lua (disable MAIL)
- SNMP_lua (disable SNMP)
- spectrum_lua
- SSH_lua (disable SSH)
- TLS_lua
- windows_command_shell
- windows_executable

Not Tested

- SMB_lua, native SMB disabled by default
- html_threat

Other

- HTTP_lua reduces the capture rate from >9G to <7G. At just under 5G this parser can be used in place of the native without dropping (in addition to the list above).
- xor_executable pushes parse CPU to 100% and the system can drop significantly due to parse backup.

Aggregation Adjustments Based on Tested Live Content

A 10G Decoder can serve aggregation to a single Concentrator while running at 10G speeds. Deployments using Malware Analysis, Event Stream Analysis, Warehouse Connector, and Reporting Engine are expected to impact performance and can lead to packet loss.

For the tested scenario, the Concentrator aggregates between 45 and 70k sessions per second. The 10G Decoder captures between 40 and 50k sessions per second. With the content identified above, this is about 1.5 to 2 million meta per second. Due to the high volume of session rates, the following configuration changes are recommended:

- Nice aggregation on the Concentrator limits the performance impact on the 10G Decoder. The following command turns on nice aggregation.
  `/concentrator/config/aggregate.nice = true`
- Due to the high volume of sessions on the Concentrator, you may consider activating parallel values mode on the Concentrator by setting `/sdk/config/parallel.values` to `16`. This improves Investigation performance when the number of sessions per second is greater than 30,000.
- If multiple aggregation streams are necessary, aggregating from the Concentrator instead has less impact on the Decoder.
- Further review for content and parsing is required for deployments where you want to use other NetWitness components (Warehouse Connector, Malware Analysis, ESA, and Reporting Engine).

Configure the Decoder for NDR Mode

The instructions in this section are to configure the Decoder for capture speeds more than 10Gb/sec but less than 40Gb/sec with small amounts of DPI while storing only metadata.

To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=ndr`
   Ensure that the correct parameter is displayed in the output.
2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters will be `op=ndrupdate=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=ndr`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

```
1: packet_mmap_,eth0
2: DPDK,0000:41:00.0
3: DPDK,0000:41:00.1
```

c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.

d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.

6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:

- When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
- Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
- Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
- The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
- When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
- The assembler session pool should be large enough that it is not forcing sessions.
- You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.

7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.

8. The following configuration parameters are deprecated and no longer necessary.

- The `core= parameter` in `capture.device.params`
- Any configuration files under `/etc/pf_ring` directory
- Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

Note: An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping traffic that you don't need to retain as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
   The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

   IMPORTANT: Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
   Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

   For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

Storage Considerations

NDR Mode Assumes No Packet Retention

The base or default configuration for NDR mode starts with all packet writes disabled. So, in this scenario the storage throughput requirements are relatively less. If you choose to turn on packet retention, be aware that it is relatively easy to overwhelm the I/O throughput of most storage solutions with a 40G network feed.

Parsing and Content Considerations

Parsing at Speeds Greater than 10G

As network ingest speeds increase, less CPU time is available to examine each packet or each session. It means that only limited amount of parsing can be performed. Fortunately, you only need to account for the amount of traffic that enters Decoder's parsing sub-system. For example, if you are ingesting 40 Gbit/s but filter out 30 Gbit/s of traffic, you only need to allow 10 Gbit/s of traffic to move through the parsers. At raw 40 Gbit/s speeds, only the "well-behaved" content works. The "well-behaved" content can defined as:

- Content that only activate when a large, uncommon search token is registered. It includes the Snort rules with a large, uncommon "fast-pattern" content field. For more information on fast-pattern and Snort rules, see Decoder Snort Detection.
- Content that generates a finite number of metas per session.
- Parsers that do not activate on session begin/end events.

The overall maximum throughput of the reassembly and parsing systems on Decoder is about 100,000 sessions (or streams) per second. However, in practical terms, very few downstream analytical or database services can handle such activity. If you find that your session rate is too high, or that your down-stream services cannot handle how many sessions the Decoder is generating, consider filtering out lower value traffic as it is ingested.

Best Practices

The NDR mode has a network rule configured to drop all incoming traffic by default. In general, when capturing above 10Gb/sec, you must limit the amount of traffic analyzed using DPI. These use cases in this document are example guidelines that do not guarantee the actual throughput of the Decoder. As mentioned previously in this document, the actual throughput of the Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and DPI. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.
- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Use Case 1: NDR Mode - Egress, General Purpose

Generate NetFlow Style Meta Only + Small Subset of Snort Rules + All Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- The **`NETWORK`** native parsers
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.

- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Use Case 2: NDR Mode - Egress, Data Exfiltration

Generate NetFlow Style Meta Only + Exfiltration Focused Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- Native parsers - HTTP, HTTPS(SSL), SMTP, DNS, FTP, SFTP/SSH, and VNC
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Use Case 3: NDR Mode - Lateral Movement

Generate NetFlow Style Meta Only + Small Subset of Snort Rules + Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- Native parsers - Kerberos, SMB, VNC, and SFTP/SSH
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Disable the Snort rule related to SMB traffic (for example, `M.HackTool.SMB.Impacket-Obfuscation.[Service Names]`). It is recommended because large regex parameters can cause Snort parser to utilize more than 50% CPU.
- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Configure High Speed Packet Capture Capability (Version 11.6 and Later)

This topic guides administrators on how to tune a Network Decoder specifically for high speed packet capture using NetWitness 11.6. This applies when capturing packets on 10G, 40G, or higher speed interface cards.

IMPORTANT: Packet capture at high speeds requires careful configuration and pushes the Decoder hardware to its limits, so you must read this entire topic while implementing a high speed capture solution.

NetWitness provides support for high-speed collection on the Decoder. You can capture network packet data from higher speed networks and optimize your Network Decoder to capture network traffic up to 40 Gbit/s. These network capture speeds can be easily achieved on a Decoder but make a note that not all NetWitness Platform features operate at these rates. The actual throughput of Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and deep packet inspection. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.
- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Enhancements that facilitate capture in these high speed environments include the following:

- Utilization of the DPDK capture drivers to leverage the commodity 10G and 40G Intel NIC cards for high-speed capture environments. For more information on how to configure DPDK, see (Optional) Data Plane Development Kit Packet Capture.
- Introduction of `assembler.parse.valve` configuration, which automatically disables application parsers when certain thresholds are exceeded, to limit risk of packet loss. When the application parsers are disabled, network layer parsers are still active. When stats fall below exceeded thresholds, application parsers are automatically re-enabled.

- Utilization of Berkeley Packet Filters (BPF) in 10G environments. For more information, see (Optional) Configure System-Level (BPF) Packet Filtering in Configure Capture Settings.
- Decoder will utilize the symmetric RSS to distribute capture loads among multiple CPU cores. For more information see, "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture
- Decoder will distribute the session reassembly work among multiple CPU cores as well, provided that the packets fed into each assembly are naturally segregated using the RSS features or as a result of being captured on different physical interfaces.

Note: Beginning with 11.5, the Network Decoder can capture from multiple interfaces simultaneously. This functionality allows Network Decoders to capture from multiple physical Network Interface Cards (NICs) while leveraging the same network rules, application rules, and parsers for each NIC. You can use this feature in all capture environments. For more information, see (Optional) Multiple Adapter Packet Capture.

Note: Enabling intra-session for HTTP pipelining is not supported when capturing at 10G rates on a single Decoder as the HTTP_Lua parser required to function can cause dropped packets at that rate of ingest. In this case, the load should be spread across multiple Concentrator-Decoder pairs.

Hardware Prerequisites

- A Series 5 or Series 6 Decoder
- An Intel 82599-based ethernet card, such as the Intel x520 or an Intel i40e-based card like the Intel XL710. All NetWitness-provided 10G cards meet this requirement such as the following:
  - All SMC-10GE cards provided by NetWitness.
  - A Dell Network Daughter Card using an Intel controller to provide 10G network interfaces. This is included in all Series 5 hardware.
- Sufficiently large and fast storage to meet the capture requirement of packets in case you set up in a mode other than meta-only. Storage considerations are covered later in this topic.
- If the Decoder will reassemble and handle high numbers of sessions, for example 30000 sessions per second or more, then at least two physical storage volumes are required. This will allow one volume to be used for writing session data while the other to read session data and deliver it for down-stream analytics.
- Each Network Decoder configured with a minimum of 2 DACs or SAN connectivity when set up in mode other than meta-only.

Software Prerequisites

NetWitness Platform 11.6 or later.

Decoder Installation

Perform the following steps to install the Decoder.

Install the Decoder Service on Host that Will Perform the Capture

The Network Decoder service package contains the necessary software components to utilize the features described in the document. The Network Decoder service package and all other required packages are installed during the Decoder installation.

Select the Capture Interfaces and Assign Interfaces to DPDK

You must choose the physical network connections that will be used for packet ingest. The physical interface type will depend on the type of network traffic sent to the Decoder. The interface you select must match the physical characteristics of the Decoder feed (or network link) used to receive packets. For example, if you want to capture at 40G speeds on a cable, then you need a 40G interface capable of attaching to that cable.

For information on how to assign interfaces to DPDK, see (Optional) Data Plane Development Kit Packet Capture.

Verify the Decoder Packages Installation

Perform the following steps to verify the Decoder package installation:

- After you configure the interfaces to use with DPDK, ensure that you reboot the Decoder host.
- After the reboot, ensure that the DPDK interfaces appear in the Decoder's capture adapter list.

Select the Decoder Operating Mode

You can configure Decoder to handle any type of capture scenario that ranges from a very deep application-level inspection to very fast and simple network connection tracking. The Decoder includes the following three built-in templates that serve as a starting point for configuring your capture needs:

1. **Normal**: It is the default Decoder mode with no defined resource allocation and all tunable parameters set to default. It can be a good option if your capture rate is less than 5 Gbit/s or if you want to run a large amount of deep inspection content such as application parsers, feeds, OpenAppID detectors, complex Snort rules, and so on. For more information, see Configure the Decoder for Normal Mode (Default Mode).
2. **10G**: This mode is available in NetWitness 10.4 and later. You can use this mode if your capture rate is under 10 Gbit/s. This mode assumes that most of the packets are retained and saved in the packet database. Make a note that not all parsers can run at 10 Gbit/s speeds as some parsers are too complex for high speeds. For more information, see Configure the Decoder for 10G Mode.
3. **NDR**: This mode is to capture beyond the 10 Gbit/s speeds, but below 40Gb/sec. Make a note of the following points while using this mode:
    a. By default, this mode assumes that packets are not retained as the rate at which this mode consumes storage is significantly high.
    b. By default, the ingested packets are dropped. You must insert the network rules before the drop statement to pick portions of the network stream and keep the incoming packet feed for further analysis.

c. Make a note that at higher speeds only a limited amount of deep packet inspection content can be used.

d. Ensure that you enable the multi-thread assembly while using this mode.

For more information, see Configure the Decoder for NDR Mode.

Configure the Decoder for Normal Mode (Default Mode)

By default, the Decoder runs in the normal mode and requires no additional configuration. The default normal mode captures up to 5Gb/sec with large amounts of deep packet inspection while storing network sessions.

Configure the Decoder for 10G Mode

The instructions in this section are to configure the Decoder for capture speeds up to 10Gb/sec with medium amounts of deep packet inspection while storing network sessions.

To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=10g`
   Ensure that the correct parameter is displayed in the output.
2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters can be `op=10g update=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=10g`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

      ```
      1: packet_mmap_,eth0
      2: DPDK,0000:41:00.0
      3: DPDK,0000:41:00.1
      ```

   c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.
   d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.

6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:
   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.
   - You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.
7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.
8. The following configuration parameters are deprecated and no longer necessary.
   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory
   - Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

   Note: An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping the unwanted traffic as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be

handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

IMPORTANT: Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

Storage Considerations

Packet Retention Requires Extremely High Sustained Throughput

When capturing at 10G line rates, the storage system holding the packet and meta databases must be capable of sustained write throughput of 1400 MBytes/s. Make a note that many SANs are not capable of achieving these speeds.

Using SAN and Other Storage Configurations

The Decoder allows any storage configuration that can meet the sustained throughput requirement. The standard 8 Gbit FC link to a SAN is not sufficient to store packet data at 10G; in order to use a SAN it may be required to perform aggregation across multiple targets using a software-RAID Scheme. Thus environments using SAN are required to configure connectivity to the SAN using multiple FCs.

Optimize Read/Write Operations When Adding New Storage

A 10G Decoder is optimized to stagger read and write operations across multiple volumes so that the current file being written is on a different volume from the next file that will be written. This allows maximum throughput on the raid volume when reading data from the last file being written while writing the current file on a different volume. However, if volumes are added after a Decoder has been in use, the ability to stagger is limited because one or more volumes are already full so the new volume is the only place new files can be written.

To remedy this situation, an administrator can run a `stagger` command on an existing NetWitness database (packet, log, meta, or session), that has at least two volumes, to stagger the files across all volumes in the most optimal read/write pattern. The major use case is when new storage is added to an existing Decoder and you want to stagger the volumes before restarting capture.

The configuration nodes for this command are the session, meta, and packet databases. Each of these lives under `/database/config`, which is usually a root node. The config nodes for a Decoder are:

- `/database/config/packet.dir`
- `/database/config/meta.dir`
- `/database/config/session.dir`

The *NetWitness Platform Core Database Tuning Guide* has information on how those configurations are formatted.

The `stagger` command is typically only useful for a 10G Decoder and usually just for the packet database. Maximum performance is achieved for storing and retrieving packets when multiple volumes are present. In this scenario, the Decoder always fills the volume with the most free space. When the volumes are roughly the same size, this results in a staggered write pattern, which allows maximum throughput for reading and writing across all volumes. However, this only naturally occurs when multiple packet storage volumes are present at the time the Decoder is first deployed.

A typical use case is adding more storage to an existing Decoder to increase retention. However, when adding storage to an deployment that has already filled the existing volumes with stored packets, the Decoder will naturally fill the new storage with packets before rolling out any packets on the existing storage. This results in a suboptimal read/write pattern because most reads will occur on the same volume that is currently being written to. In a 10G deployment, reads are blocked from the volume when writes are occurring. This does not stop ALL reads on that volume, because the file is buffered in memory before being written, but it does result in suboptimal read performance.

With the `stagger` command, you can add more storage and then have the service naturally stagger the files across ALL volumes (existing and new) so that read performance is optimized.

Caution: This command should only be performed after the storage is mounted and the Decoder configured to use it (for example, after adding the mount point(s) to `packet.dir`).

The downside to this command is it can take some time to stagger and the Decoder should not be capturing during the stagger operation.

Recommended workflow:

1. Add all storage and configure mount points.
2. Add new storage mount points to `packet.dir` (or `session.dir`/`meta.dir`) and restart service (very important!).
3. Ensure capture is stopped.
4. Run the stagger operation. You must not terminate the connection that initiated the stagger operation until the operation is complete. If you run stagger from NwConsole, run the `timeout 0` command before sending the `stagger` command. This will prevent the normal 30 second command timeout.
5. Start capture after the `stagger` command finishes.

The following are the parameters for the stagger command:

- `type` - The database that will be staggered (session, meta, or packet). Typically only the packet database is useful for staggering, but it is possible to do the session or meta database when multiple volumes are present for those databases. Since the session and meta databases write far less data than the packet database, typically staggering those databases results in less noticeable performance gains.

- `dryRun` - If `true` (the default), will only return a description of the operations that would be performed. If `false`, then the files will actually be moved to an optimal read/write pattern. You MUST pass false to actually stagger the files.

Example usage from NwConsole:

```
login <decoder>:50004 <username> <password>
timeout 0
send /database stagger type=packet dryRun=false
```

Note: If you run this command using the RESTful API, pass the additional parameter `expiry=0` to prevent a timeout from the service. You will also need to ensure the HTTP client does not disconnect before the operation completes.

Parsing and Content Considerations

Parsing raw packets at high speeds presents unique challenges. Given the high session and packet rates, parsing efficiency is paramount. A single parser that is inefficient (spends too long examining packets) can slow the whole system down to the point where packets are dropped at the card.

For initial 10G testing, start with only native parsers (except SMB/WebMail). Use the native parsers to establish baseline performance and with little to no packet drops. Do not download any Live content until this has been done and the system is proven to capture without issue at high speeds.

After the system has been operational and running smoothly, Live content should be added very slowly, especially the parsers.

Best Practices

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss. One caveat is that if you are updating a current 10G deployment but not adding any additional traffic. For example, a current Decoder capturing off a 10G card at 2G sustained should see no difference in performance, unless part of the update also entails adding additional traffic for capture.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- Although lesser performance impacts, feeds should also be reviewed and added in a phased approach to help measure performance impacts.

- Application Rules also tend to have little observable impact, though again, it is best not to add a large number of rules at once without measuring the performance impact.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Also, making the recommended configuration changes outlined in the Configuration section will help minimize potential issues.

Use Case 1: 10G Mode - Egress, Deep Packet Inspection

In this setup the goal is to ingest at 10G sustained line rates, perform Deep Packet Inspection (DPI), store metadata, and store raw packets for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- MA content (7 Lua parsers, 1 feed, 1 application rule)
- 4 feeds (alert ids info, nwmalwaredomains, warning, and suspicious)
- 41 application rules
- DNS_verbose_lua (disable DNS)
- fingerprint_javascript_lua
- fingerprint_pdf_lua
- fingerprint_rar_lua
- fingerprint_rtf_lua
- MAIL_lua (disable MAIL)
- SNMP_lua (disable SNMP)
- spectrum_lua
- SSH_lua (disable SSH)
- TLS_lua
- windows_command_shell
- windows_executable

Not Tested

- SMB_lua, native SMB disabled by default
- html_threat

Other

- HTTP_lua reduces the capture rate from >9G to <7G. At just under 5G this parser can be used in place of the native without dropping (in addition to the list above).
- xor_executable pushes parse CPU to 100% and the system can drop significantly due to parse backup.

Aggregation Adjustments Based on Tested Live Content

A 10G Decoder can serve aggregation to a single Concentrator while running at 10G speeds. Deployments using Malware Analysis, Event Stream Analysis, Warehouse Connector, and Reporting Engine are expected to impact performance and can lead to packet loss.

For the tested scenario, the Concentrator aggregates between 45 and 70k sessions per second. The 10G Decoder captures between 40 and 50k sessions per second. With the content identified above, this is about 1.5 to 2 million meta per second. Due to the high volume of session rates, the following configuration changes are recommended:

- Nice aggregation on the Concentrator limits the performance impact on the 10G Decoder. The following command turns on nice aggregation.
  `/concentrator/config/aggregate.nice = true`
- Due to the high volume of sessions on the Concentrator, you may consider activating parallel values mode on the Concentrator by setting `/sdk/config/parallel.values` to `16`. This improves Investigation performance when the number of sessions per second is greater than 30,000.
- If multiple aggregation streams are necessary, aggregating from the Concentrator instead has less impact on the Decoder.
- Further review for content and parsing is required for deployments where you want to use other NetWitness components (Warehouse Connector, Malware Analysis, ESA, and Reporting Engine).

Configure the Decoder for NDR Mode

The instructions in this section are to configure the Decoder for capture speeds more than 10Gb/sec but less than 40Gb/sec with small amounts of DPI while storing only metadata.

To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=ndr`
   Ensure that the correct parameter is displayed in the output.

2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters will be `op=ndrupdate=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=ndr`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

      ```
      1: packet_mmap_,eth0
      2: DPDK,0000:41:00.0
      3: DPDK,0000:41:00.1
      ```

   c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.
   d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.
6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:
   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.
   - You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.

7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.
8. The following configuration parameters are deprecated and no longer necessary.
   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory
   - Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

   Note: An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping traffic that you don't need to retain as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
   The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

   IMPORTANT: Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
   Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

   For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

Storage Considerations

NDR Mode Assumes No Packet Retention

The base or default configuration for NDR mode starts with all packet writes disabled. So, in this scenario the storage throughput requirements are relatively less. If you choose to turn on packet retention, be aware that it is relatively easy to overwhelm the I/O throughput of most storage solutions with a 40G network feed.

Parsing and Content Considerations

Parsing at Speeds Greater than 10G

As network ingest speeds increase, less CPU time is available to examine each packet or each session. It means that only limited amount of parsing can be performed. Fortunately, you only need to account for the amount of traffic that enters Decoder's parsing sub-system. For example, if you are ingesting 40 Gbit/s but filter out 30 Gbit/s of traffic, you only need to allow 10 Gbit/s of traffic to move through the parsers. At raw 40 Gbit/s speeds, only the "well-behaved" content works. The "well-behaved" content can defined as:

- Content that only activate when a large, uncommon search token is registered. It includes the Snort rules with a large, uncommon "fast-pattern" content field. For more information on fast-pattern and Snort rules, see Decoder Snort Detection.
- Content that generates a finite number of metas per session.
- Parsers that do not activate on session begin/end events.

The overall maximum throughput of the reassembly and parsing systems on Decoder is about 100,000 sessions (or streams) per second. However, in practical terms, very few downstream analytical or database services can handle such activity. If you find that your session rate is too high, or that your down-stream services cannot handle how many sessions the Decoder is generating, consider filtering out lower value traffic as it is ingested.

Best Practices

The NDR mode has a network rule configured to drop all incoming traffic by default. In general, when capturing above 10Gb/sec, you must limit the amount of traffic analyzed using DPI. These use cases in this document are example guidelines that do not guarantee the actual throughput of the Decoder. As mentioned previously in this document, the actual throughput of the Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and DPI. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of

the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.

- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Use Case 1: NDR Mode - Egress, General Purpose

Generate NetFlow Style Meta Only + Small Subset of Snort Rules + All Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- The **`NETWORK`** native parsers
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Use Case 2: NDR Mode - Egress, Data Exfiltration

Generate NetFlow Style Meta Only + Exfiltration Focused Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- Native parsers - HTTP, HTTPS(SSL), SMTP, DNS, FTP, SFTP/SSH, and VNC
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Use Case 3: NDR Mode - Lateral Movement

Generate NetFlow Style Meta Only + Small Subset of Snort Rules + Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

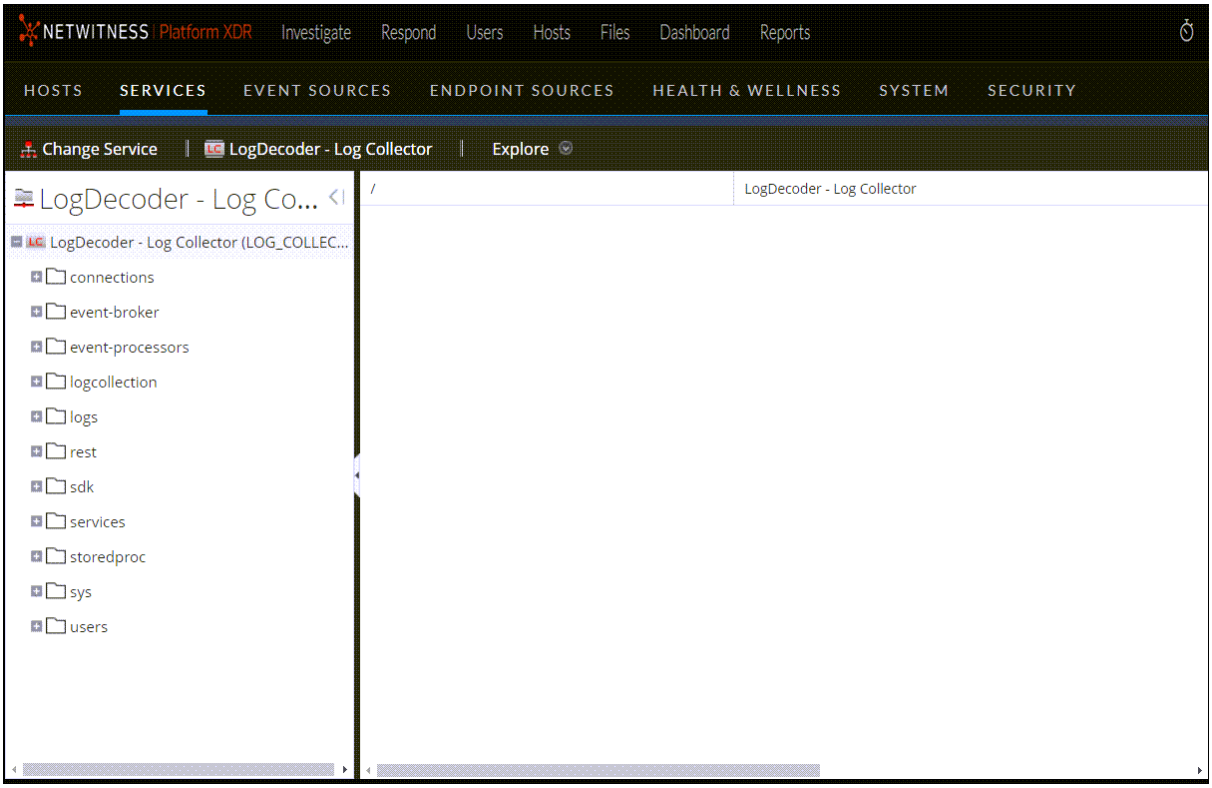
- Native parsers - Kerberos, SMB, VNC, and SFTP/SSH
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

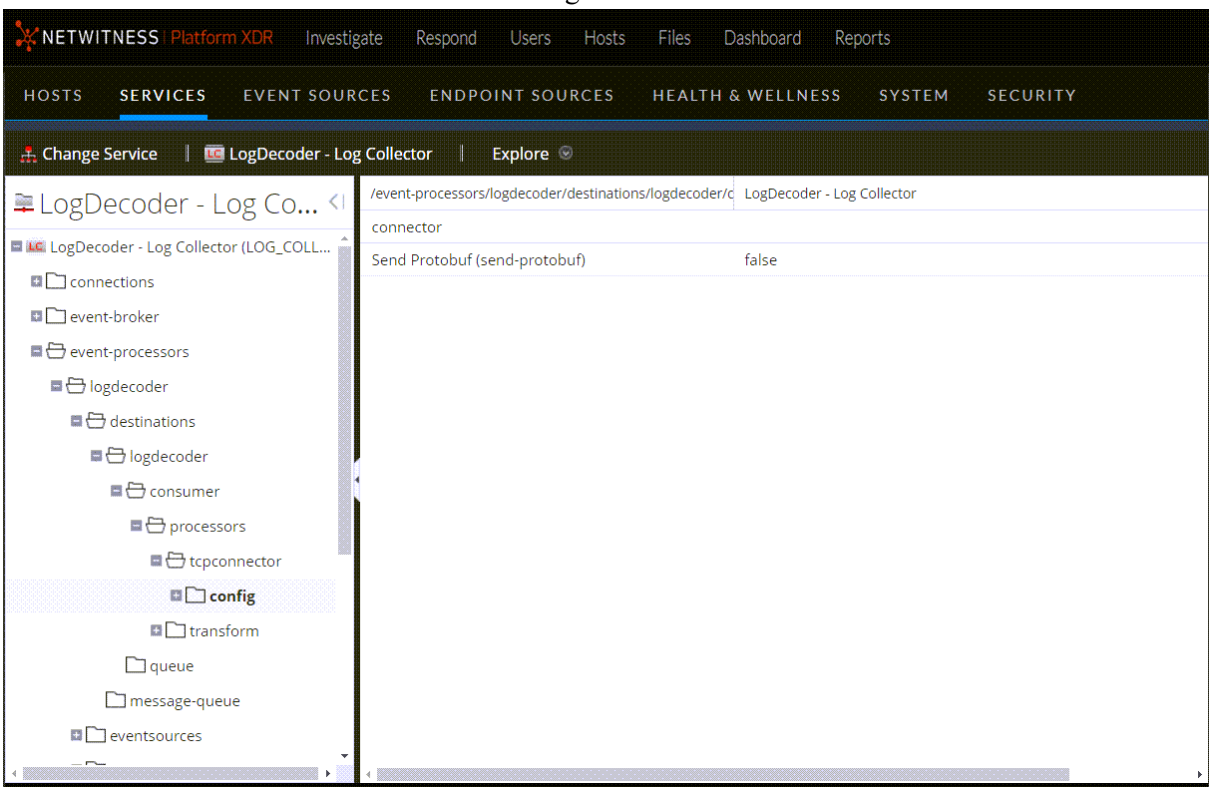
The following considerations are recommended while running the Decoder in the NDR mode:



- Disable the Snort rule related to SMB traffic (for example, `M.HackTool.SMB.Impacket-Obfuscation.[Service Names]`). It is recommended because large regex parameters can cause Snort parser to utilize more than 50% CPU.
- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Configure a Log Decoder to Accept Protobuf

There are occasions when you want to analyze log files that are in protobuf (Protocol Buffer) format. You can configure a Log Decoder with a Log Collector service to accept logs in protobuf (Protocol Buffer) format.



To import a log file to a Log Decoder:

1. Go to **(Admin) > Services**.
2. Select a Log Decoder with a Log Collector service in the **Service** list, and select **> View > Explore**.
   The Explore view for the Log Decoder -Log Collector is displayed.

3. Navigate to **`event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config`**

Your screen should look similar to the following.

4. For the **send-protobuf** field, select **false**, and change the value to **true.**
5. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config/connector/channel/tcp` and change the **port** value to **50202**.
6. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config/connector/event` and change the following parameters:
   - Clear the **delimiter** field
   - Change **format** to **%text%**

Configure Session Split Timeouts

The default behavior of the Decoder is to automatically end sessions that exceed a configured size or have been inactive for a period of time. When the session is ended due to timeout, any subsequent packets received in that session appear to be stored in a new session. You can mitigate the effect of session splitting due to long periods of inactivity between packets using this procedure.

When a Decoder session exceeds a configured size (32MB by default, the `/decoder/config/assembler.size.max`) or has been inactive for a period of time, the session is split. NetWitness has the previous packet and the next packet and can propagate session state from the initial session fragment to the subsequent session fragment.

Each session fragment is annotated (`session.split` meta) such that it can be identified and associated with other fragments from the actual network session. Directionality as determined by the initial session reduces the occurrence of fragments having reversed directionality.

If there is a gap in time between packets large enough that there are no longer any packets for the session in memory, the session is removed from the Decoder. If a subsequent packet shows up after this occurs, a new session is created with no context to the preceding session. The issue is the inability to continue a session when we encounter a gap between packets of a session that is larger than the packets we are buffering (based upon available memory and timeout configurations). Once the last packet of a session is removed from memory, the session is also removed, and with it the necessary context for ensuring consistent directionality.

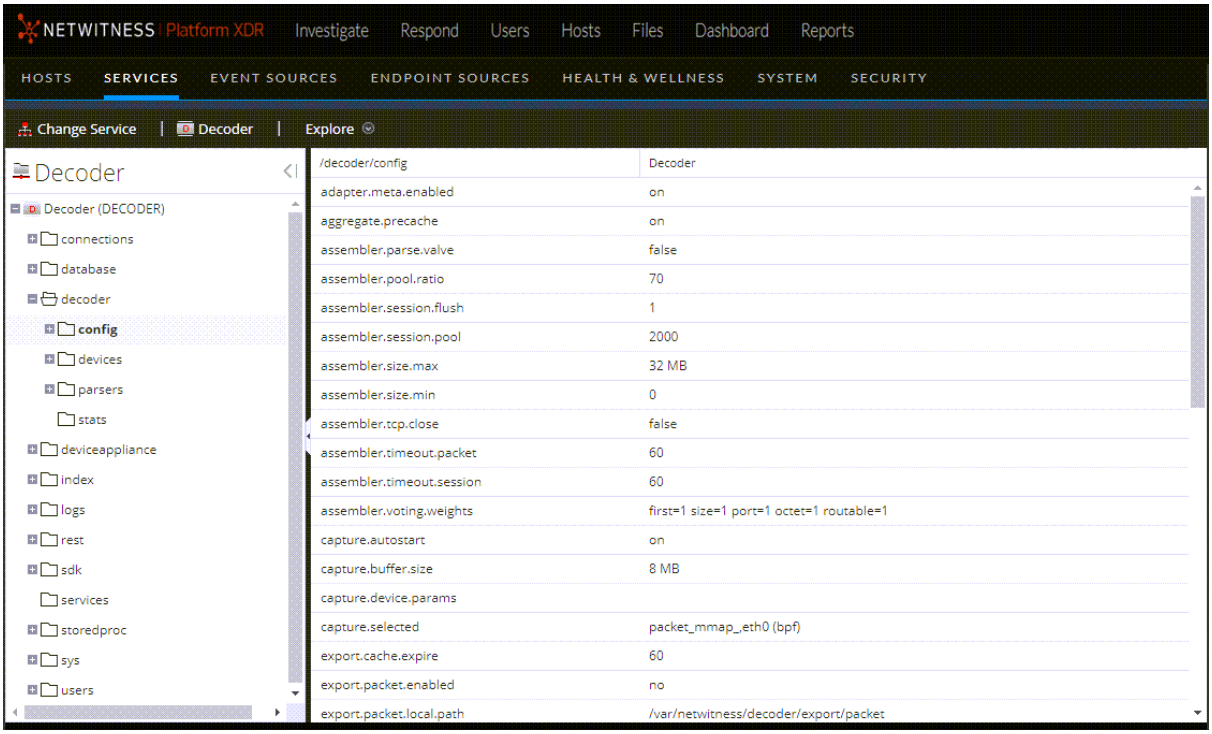
There are two timeout settings in a Network Decoder, `/decoder/config/assember.timeout.session` and `assembler.timeout.packet`. Both default to 60 seconds. The setting `assembler.timeout.session` controls how long a session lives in Assembler without receiving another packet. The setting `assembler.timeout.packet` controls how long a session waits before getting parsed. If the session is kicked out of Assembler before this timeout, then it automatically goes to parsing.

The session timeout is the number of seconds since the last packet was added to that session. Therefore, this timeout resets on every packet added to that session. The packet timeout is the number of seconds since the very first packet for that session was added (in other words, the packet that created the session). This is never reset and once the timeout expires, the session is parsed.

The important point is a session can be parsed but still remain in Assembler. A session in Assembler can still have packets added to it, even if it has already been parsed. Packets added after the session is parsed will never be seen by parsers, but they will be attached to the session and can be viewed by a subsequent `/sdk content` or `/sdk packets` call.

After a session is parsed, the session AND its metadata are written to disk. At this point, they can be aggregated and "seen" by `sdk` commands. Packets are written in order of capture and are not reordered by what session they belong to. Nor are they necessarily written when the session and meta data are written.

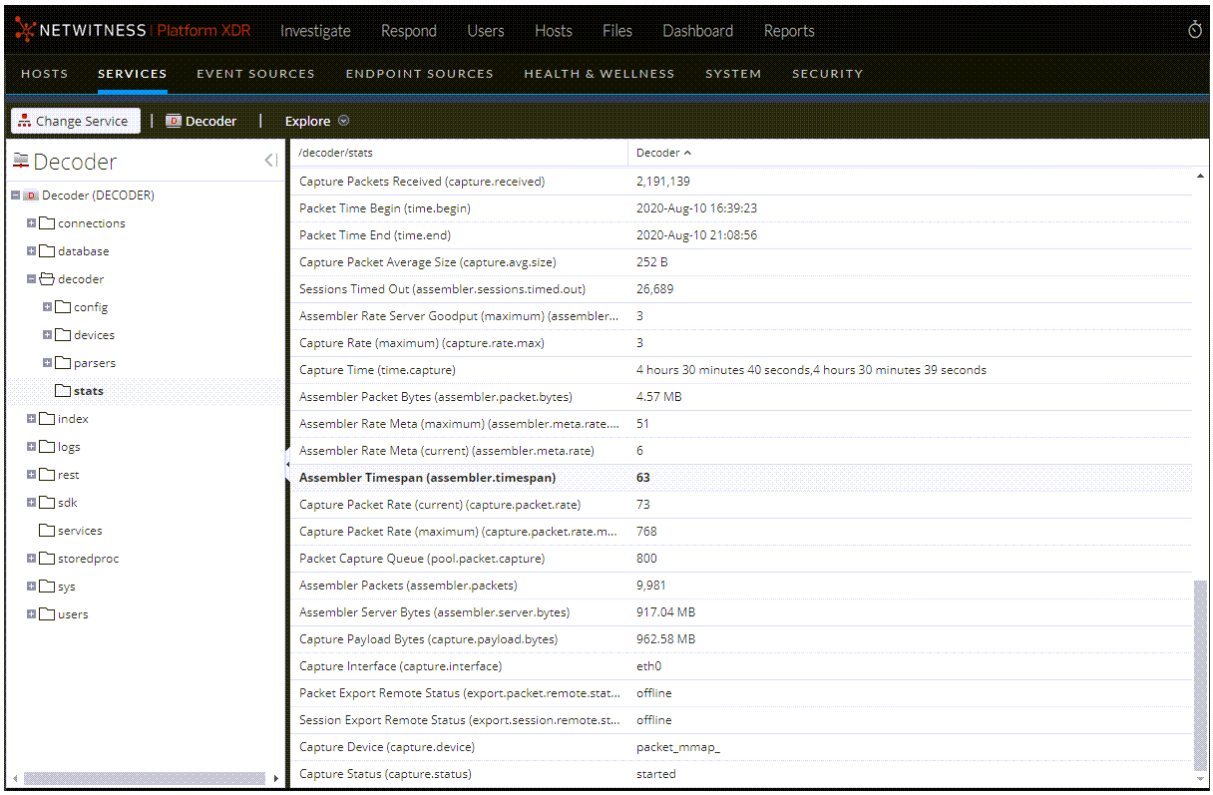
You can disable both timeout nodes, `/decoder/config/assembler.timeout.session` and `assembler.timeout.packet`, by setting them to zero in the Services Explore view.



If both timeouts are disabled, the sessions are still split due to time or size expiration. However, the Decoder keeps track of the network stream for as long as it has sufficient memory. Thus, when more packets arrive on the same network stream, the Decoder adds `split` meta items to the subsequent sessions. Using a combination of the `split` metadata and the stream key, it is possible to reconstruct the network stream from the multiple sessions.

The length of time for which sessions are tracked is limited by the number of session pool entries available on the Decoder, and therefore the actual time window varies according to the rate at which new sessions are added. If new sessions are added at a high rate, the size of the time window decreases. The size of the pool is set using the configuration entry `/decoder/config/assembler.session.pool`, which sets the maximum number of sessions that will be tracked at a time.

The `/decoder/stats/assembler.timespan` statistic allows you to see when the Decoder is no longer tracking session splits because the ingest rate is too high and the Decoder does not have enough memory to track. This statistic shows the number of seconds tracked within the session table, which is the effective time window in which the Decoder can link together sessions. Under normal operation this statistic matches the value of `/decoder/config/assembler.timeout.session`, but when running in Time Split mode, the `/decoder/stats/assembler.timespan` statistic grows or shrinks depending on the ingest rate.



To configure Time Split mode, set the following configuration parameters and restart the Decoder:

1. In the (Admin) > **Services** view, select the Decoder service and **> View > Explore.**
2. In the Services Explore view select **decoder** > **config**.

3. Click in the **Value** column next to the parameter and set these two parameters :
   `/decoder/config/assembler.session.flush = 0`
   `/decoder/config/assembler.timeout.session = 0`
4. To see when the Decoder is no longer tracking session splits because the ingest rate is too high and the Decoder does not have enough memory to track, view the `/decoder/stats/assembler.timespan` statistic, in the Services Explore view select **decoder** >

stats.

Configure Syslog Forwarding to Destination

In addition to collecting Syslog messages, you can configure the Log Decoder to forward Syslog messages to another Syslog receiver.

Note: No configuration is necessary to collect Syslog messages on the Log Decoder.

NetWitness forwards Syslog messages after it has parsed the messages and before it writes the messages to the Log Decoder.

Note: You must configure Syslog Forwarding using the steps defined in this topic using the **Explore** view.

The Log Decoder must be in the **Started** state before you can configure Syslog Forwarding. To configure Syslog Forwarding:

1. Configure Log Decoder application layer rules (Application rules) to tag Syslog messages with metadata that instructs NetWitness to forward the messages:

   a. In the **Services** view, select a Log Decoder, and in the Actions column, select > **View** > **Explore**.

   b. Go to the **/decoder/config/rules/application** node, right-click **application,** and click **Properties**.

   c. In the **Properties** view, specify the **add** command with the following parameters:

   `rule=<query> name=<name>`

   Example 1: `rule=* name=receiver1`

   Example 2: `rule="device.type='winevent_nic'" name=receiver`)

   d. Click **Send**.

NetWitnesscreates the `name=receiver1 rule=* order=<n>` rule. NetWitness inserts the order number (for example, `order=49`) based on when you set up the rule.

e. Go to the `/decoder/config/rules/application` node and click the `name=receiver1 rule=* order=49` rule.

f. Add **alert forward** parameters to the rule parameters.

```
rule=* name=receiver1 order=49 alert forward
```

or

```
rule=* name=receiver1 forward
```

All other rule parameters have the same meaning as they do in other application rules.

The following Application rule example selects all logs with the * rule. It creates a transient alert meta with the value "receiver1" and tags the entire log for forwarding it to the syslog forwarding destination. You can define as many different forwarding rules as you need with the same name or unique names.

2. Define Syslog forwarding destinations and enable forwarding.

a. In the **Services** view, select a Log Decoder, and  **> View > Explore**.

b. Syslog forwarding destinations are defined in the configuration node.

```
/decoder/config/logs.forwarding.destination
```

This configuration node contains one or more name/value pairs. The name corresponds to the name parameter in the application rule that you used to tag logs with forwarding meta. The value is a colon-separated triple of transport, host, and port followed by an optional formatting parameter.

```
name=(udp|tcp|tls):host:port[:(retainsource|rfc3164)]
```

The first parameter indicates the transport protocol and must be one of udp, tcp, or tls. Specifying udp will forward logs via RFC 3164 / RFC 5426 UDP syslog protocol. Specifying tcp will forward logs via a TCP connection with RFC 6587 framing. Specifying tls will forward logs in accordance with RFC 5425.

The host is an IPv4 address, IPv6 address, or host name.

The port is the port to which the logs are sent. This is typically port 514 for UDP syslog, and 6514 for TLS connections. There is no standard port assignment for syslog over TCP.

Optionally, `retainsource` or `rfc3164` can be specified at the and of the destination string to indicate that additional formatting and information should be included with each log forwarded. Specifying `retainsource` will include z-connector headers at the beginning of the log based and will be populated by the `time`, `device.(ip|ipv6|host)`, and `lc.cid` meta and is best used for forwarding to other log decoders. The `rfc3164` option will prepend a valid RFC3164 header to all events forwarded constructed of the `syslog.pri`, `time`, and `device.(ip|ipv6|host)` meta. In both cases, the original log text is unmodified.

Example forwarding destination:

```
gears=tls:gears.netwitness.local:6514
```

Example forwarding over tcp to blackout on port 514 with z-connector headers:

```
fwdrule=tcp:blackout.netwitness.local:514:retainsource
```

In the `/decoder/config/logs.forwarding.destination` parameter, specify the destination. For example:

TLS Connections: `receiver1=tls:receiver1.netwitness.local:6514`

UDP Connections: `receiver1=udp:receiver1.netwitness.local:514`

TCP Connections: `receiver1=tcp:receiver1.netwitness.local:514`

Note:
You can configure:
- Multiple rules to forward logs to the same destination.
- Multiple rules to forward logs to multiple destination.

For TLS connections, the certificate of the forwarding destination must be validated. The certificate authority that signed the destination's certificate must be present in the Log Decoder's CA trust store and the certificate must reside on the destination or Syslog receiver. Refer to "Configure Certificates" in the *Log Collection Configuration Guide* for information about manipulating the Log Decoder's CA trust store. (Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.)

c. In the `/decoder/config/logs.forwarding.enabled` parameter, specify **true**.

Configure Transaction Handling on a Decoder

Administrators can configure a Decoder to subdivide incoming sessions into smaller transaction sessions when using Lua parsers designed to create transactions. The feature allows analysts to perform analytics on the split sessions in downstream services such as Investigate.

Caution: Use caution when enabling this feature when you are above the standard ingest rate supported by the Network Decoder as it may start to cause backups with aggregation and dropped packets.

Transaction Handling

The Decoder service configuration node has a new parameter for configuration of transaction handling: `/decoder/parsers/config/parser.transaction.mode`. This node controls the behavior of the Decoder when a parser defines a transaction within a network session.

The values for `parser.transaction.mode` correspond to the operating modes:

- `off` (transactions off)
- `meta` (transactions represented as meta items)
- `split` (transactions split sessions)

Transactions Off

When transactions mode is off, any application-level transactions created by parsers are ignored, and nothing is stored in the collection to represent the transaction.

Transactions Represented as Meta Items

In this mode of operation, when a parser generates an application-level transaction, a new meta item of type `{{trans}}` is added to the session in which the transaction occurred. The `{{trans}}` meta item contains a list of other meta items that constitute the transaction.

Transactions Split Sessions

In this mode of operation, when a parser generates an application-level transaction, the session is split. The session splitting is accomplished by:

1. A new session item is created.
2. Network meta items are copied from the parsed session into the new session.
3. Meta items marked in the transaction are moved from the original session to the new session.

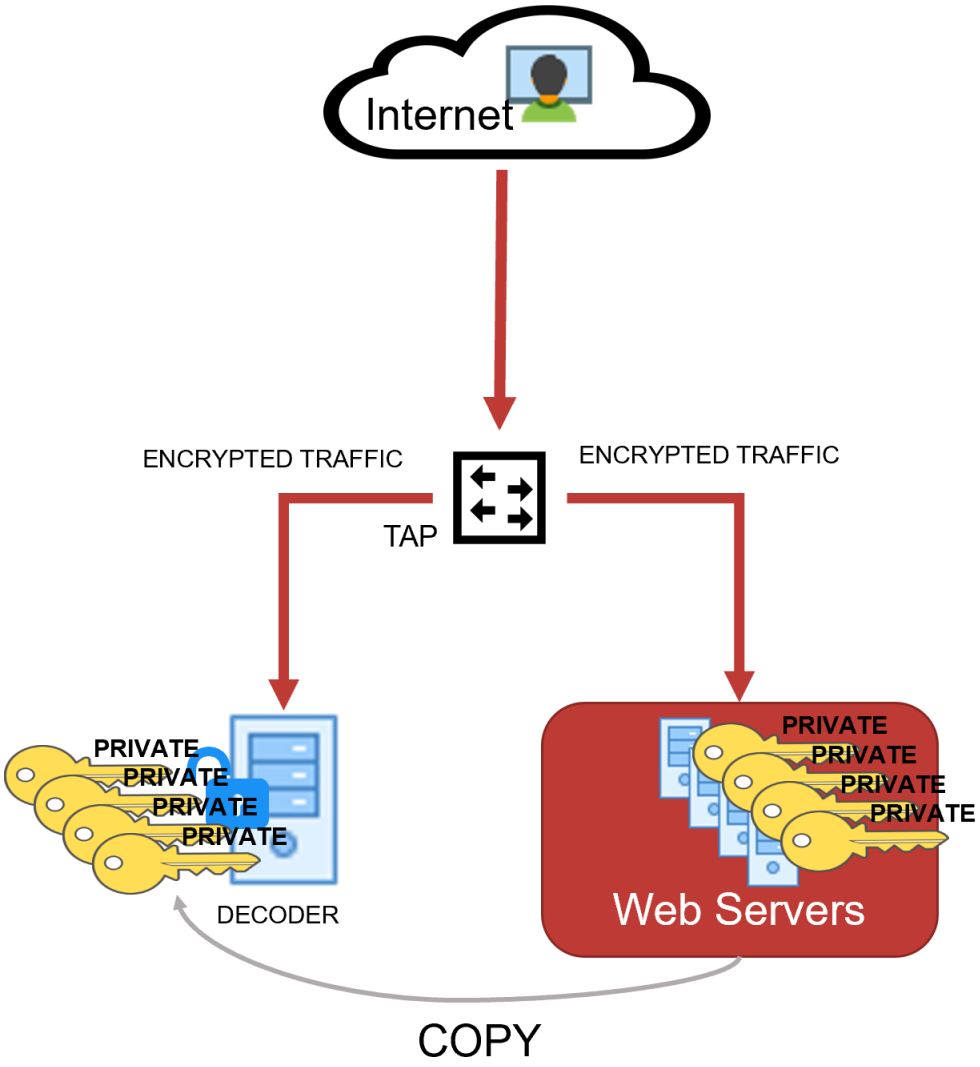
The following meta items are duplicated into the split session from the session that was parsed:

- `time`
- `medium`
- `eth.src`
- `eth.dst`
- `eth.type`
- `ip.proto`
- `ip.src`
- `ip.dst`
- `ipv6.src`
- `ipv6.dst`
- `ip.proto`
- `port.src`
- `port.dst`
- `tcp.flags`
- `udp.srcport`
- `udp.dstport`
- `service`
- `udp.srcport`
- `udp.srcport`
- `tls.premaster`

Configure Data Export

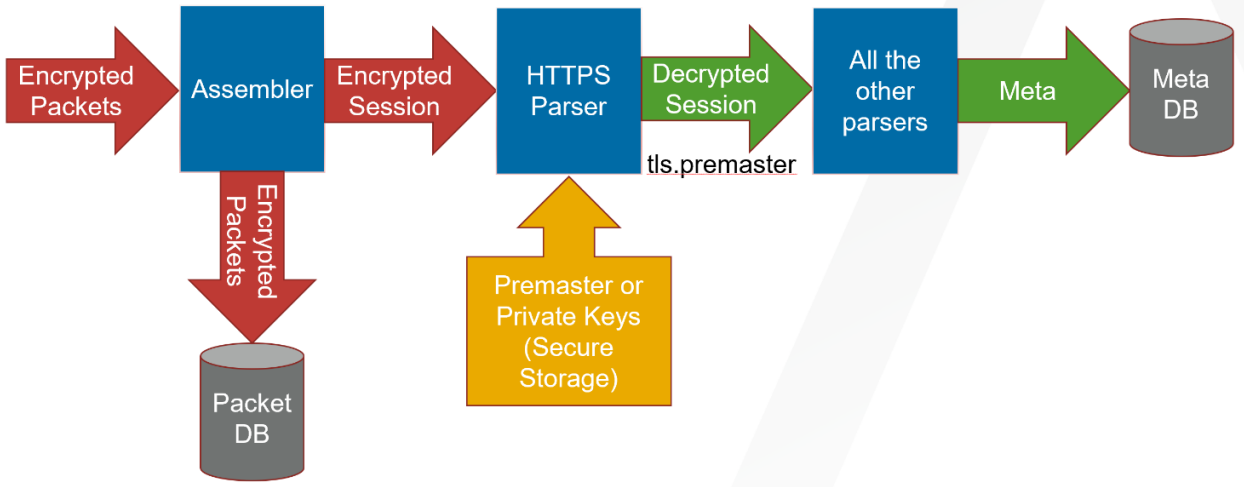
This exports meta data and raw logs from the Decoder or Log Decoder and converts it to Logstash JSON object. To enable data export you must configure the export connector through Logstash.

To configure the data export:



1. Go to  **(Admin) > Services** and select a Decoder or Log Decoder.
2. Select  **> View > Config**.
3. In the Configuration view, select the **Data Export** tab.
4. In the Data Export list, click the name of the host.

The Event Source tab is displayed with export connector typespec selected.



For more information on configuring export connector, see Configure Logstash Event Sources in NetWitness.

Decrypt Incoming Packets (TLS 1.2)

Administrators can configure a Network Decoder to decrypt incoming network packets. This capability is currently supported with encrypted communications to managed servers using TLS 1.2 or earlier and certain cipher suites, which are described in Supported Cipher Suites . The following figure illustrates the supported configuration of a Network Decoder deployed as a passive network device where it captures network traffic for managed servers. The Network Decoder is able to decrypt the traffic by using private keys uploaded to it from the managed servers .

As the network traffic is collected and passed through the system, the encrypted packets are stored as captured even if the system has been able to decrypt them. As the Decoder parses the encrypted traffic, it uses any private keys that have been uploaded, and determines if the network traffic can be decrypted. If the Decoder is able to decrypt the traffic, it generates an additional meta key, defined as `tls.premaster`, which contains the decryption key for that particular session. Whether the traffic is decrypted or not, the metadata `service` is tagged as 443 or SSL/TLS traffic, as the Decoder is port agnostic, even though it is marked with the default port number. The following figure shows the basic progression through the NetWitness platform as the packets are being decrypted and the session metadata is generated.

Follow the steps below to configure the Network Decoder to natively decrypt this network traffic.

- Step 1: Validate That The Network Decoder Captures Encrypted Traffic
- Step 2: Obtain Private Keys from Managed Servers
- Step 3: Validate That The Private Key Cipher Suite is Supported
- Step 4: Confirm HTTPS Parser is Enabled on Decoders
- Step 5: Upload the Supported Private Keys to Decoders
- Step 6: Reload HTTPS Parser on Decoders
- Step 7: View Decrypted Sessions

Note: Currently, you cannot review the decypted payloads directly in the in the user interface. However, you can review them using the RESTful API interface and the NwConsole. However, the Decoders being able to decrypt traffic enables them to detect and generate potentially malicious communications that would otherwise not be detected.

See Troubleshooting for resolving any issues you might encounter while performing these steps.

Step 1: Validate That The Network Decoder Captures Encrypted Traffic

First, make sure the Decoder is actually capturing the SSL/TLS traffic from the managed servers that you want to use to gain visibility into the encrypted sessions. You can do this by searching in the Investigate views (Navigate or Events) using the IP addresses of the servers as the destination IP addresses, and the service as SSL/TLS.

For example, if you are searching for HTTPS traffic to 192.168.1.2 and 192.168.1.3, you can run the following query:

```
service = 443 && ip.dst = 192.168.1.2, 192.168.1.3
```

Conduct this search on the Concentrator that aggregates metadata from the Decoder that is expected to capture this network segment, or on a Broker that may have access to all collected metadata.

(Version 11.6 or later) In case of simultaneous ingestion of the encrypted and decrypted traffic streams in the Decoder, ensure that multi-thread assembly is enabled. This is to prevent mixing of packets from different sessions by single thread assembly. For more information, see the following topics:

- Perform Simultaneous Ingestion of the Encrypted and Decrypted Traffic Streams to Decoder
- (Optional) Multiple Adapter Packet Capture

Step 2: Obtain Private Keys from Managed Servers

Private keys are the asymmetric keys generated by services that accept TLS traffic. They are normally stored in PEM files. These keys are used during the TLS handshake to encrypt the premaster symmetric key that is used for the rest of the payload encryption.

Note: The method to export private keys from web servers (from which to decrypt traffic) varies depending on the product. Refer to the product documentation for instructions for exporting private keys.

Extracting Certificates for the Decoder SSL Decryption

Extracting the proper key materials from popular servers is required to leverage the Decoder built-in decryption capability. The following are a few examples to extract private keys and certificates from popular servers like Apache, Microsoft IIS, and Exchange.

Note: These procedures can also be used as references to extract keys from other servers as well.

Extract private key from Apache

The private key file location would be referenced in the main Apache configuration file, which is `httpd.conf` or `apache2.conf`. The config directive `SSLCertificateKeyFile` will specify the path on your server where private keys are stored.

If Apache is using OpenSSL default certificates and keys, then locate private keys (which are usually saved to the folder /usr/local/ssl by default). You can run the command openssl version –a to find OPENSSLDIR where your server is saving the keys.

If the private key is password protected, then it can be extracted using the below command with the password.

```
openssl rsa -in yourcertificate.pem -out serverkey.pem
```

Validate the located private key using the following command.

```
openssl rsa -in serverkey.pem -check -noout
```

Extract Private Key and Certificate from Windows Servers

Windows servers provide the interface to extract certificates and private keys in PKCS12 format files (.pfx format). It is recommended to use password protection while exporting private keys.

After exporting keys to the pfx file, you can use the OpenSSL tool to extract private keys as PEM files and upload them to Decoder.

Step 2 (a): Extract PKCS12 file from Internet Information Services (IIS)

There are multiple ways to extract certificates from IIS and the following are few examples.

Using IIS Manager App

- Open Internet Information Services Manager App.
- Under IIS > Navigate to Select Certificates > Select Features view > Select the required web or application server certificate.
- Right-click the certificate and select the Export option. In the export wizard, select the file path to save the pfx file (PKCS12 format)
- Example: C:\ServerCerts\servercrt.pfx.
- Enter the password and confirm the password in the export.
- This would create password protected pfx file which contains a private key and associated certificate.

Using Microsoft Management Console (MMC)

- Open Microsoft Management Console (MMC).
- In the Console Root expand Certificates (Local Computer).
- If the Certificates folder is not available then navigate to File > Add Snap In > Add Certificates.
- Locate your server certificate, it is located in the Web Server or Personal sub-folders.
- Right-click the certificate, identified by the Common Name, select Export, and follow the wizard. Use password to protect the pfx file.
- This would create password protected pfx file which contains a private key and associated certificate.

Step 2 (b): Extract PKCS12 file from Exchange Servers

Refer the Export a Certificate from an Exchange Server document for information on how to extract the pfx file from the Exchange server.

Step 2 (c): Extract Private Key From a pfx File Using OpenSSL

OpenSSL tool provides API to export keys in PEM format.

1. Extract private key in PEM format, at the openssl prompt use the password to decrypt the pfx file.
   ```
   openssl pkcs12 -in servercrt.pfx -nocerts -nodes -out serverkey.pem
   ```
2. Validate the private key generated
   ```
   openssl rsa -in serverkey.pem -check -noout
   ```
3. Extract cert in PEM format to validate compatibility with private key
   ```
   openssl pkcs12 -in servercrt.pfx -nokeys -out serverkey.crt
   ```
4. Validate private key and certificate modulus. The modulus should be the same for both the private key and its certificate.
   ```
   openssl rsa -noout -modulus -in serverkey.pem
   openssl x509 -noout -modulus -in serverkey.crt
   ```

Recommendations

Once private keys are extracted from servers and imported to Decoder, it is recommended to secure or delete the extracted PEM file of the private key (serverkey.pem) generated by the above OpenSSL commands.

Step 3: Validate That The Private Key Cipher Suite is Supported

As a passive collection device, the Network Decoder can only decrypt ciphers that use the RSA key exchange. The list of supported keys, and whether the keys are FIPS compliant, are listed in Supported Cipher Suites and Unsupported Cipher Suites . If you are expecting to decrypt less-secure channels of communication, you might need to disable FIPS. However, this is a system change to the entire Decoder, not just the parsing of captured traffic, so take caution before disabling FIPS. If you require more-secure cipher suites for the managed server communications, search for "SSL decrypt" in our third party partner integrations section at NetWitness Community (https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions).

Note: If FIPS is enabled, the list of ciphers for decryption is restricted to only those that are FIPS-compliant.

Supported Cipher Suites

The following table lists which cipher-suites are supported using private keys.

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_RSA_WITH_AES_256_GCM_SHA384	AES256-GCM-SHA384	[0x9d]	TLSv1.2	Kx=RSA	Compliant
TLS_RSA_WITH_AES_256_CBC_SHA256	AES256-SHA256	[0x3d]	TLSv1.2	Kx=RSA	Compliant

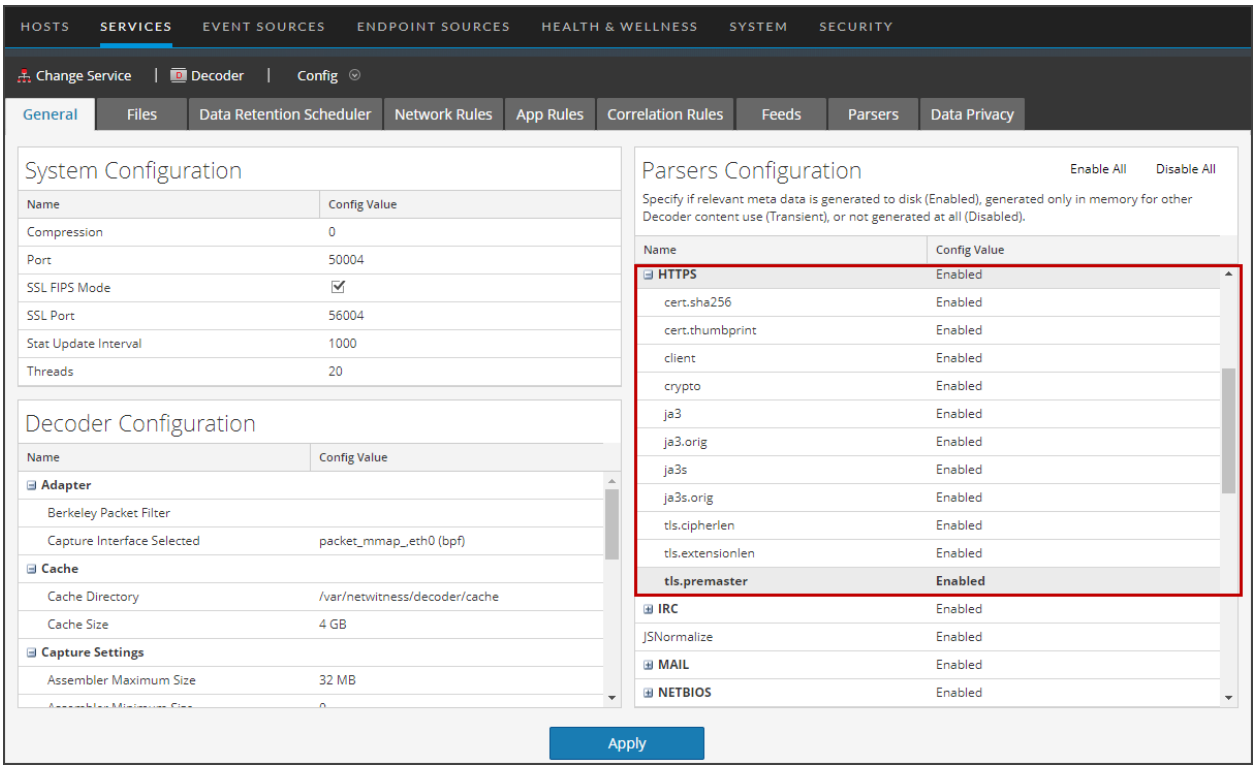
Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_RSA_WITH_AES_256_CBC_SHA	AES256-SHA	[0x35]	SSLv3	Kx=RSA	Compliant
TLS_RSA_WITH_CAMELLIA_256_CBC_SHA	CAMELLIA256-SHA	[0x84]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_3DES_EDE_CBC_SHA	DES-CBC3-SHA	[0x0a]	SSLv3	Kx=RSA	Compliant
TLS_RSA_WITH_AES_128_GCM_SHA256	AES128-GCM-SHA256	[0x9c]	TLSv1.2	Kx=RSA	Compliant
TLS_RSA_WITH_AES_128_CBC_SHA256	AES128-SHA256	[0x3c]	TLSv1.2	Kx=RSA	Compliant
TLS_RSA_WITH_AES_128_CBC_SHA	AES128-SHA	[0x2f]	SSLv3	Kx=RSA	Compliant
TLS_RSA_WITH_SEED_CBC_SHA	SEED-SHA	[0x96]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_CAMELLIA_128_CBC_SHA	CAMELLIA128-SHA	[0x41]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_IDEA_CBC_SHA	IDEA-CBC-SHA	[0x07]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_RC4_128_SHA	RC4-SHA	[0x05]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_DES_CBC_SHA	DES-CBC-SHA	[0x09]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_EXPORT_WITH_DES40_CBC_SHA	EXP-DES-CBC-SHA	[0x08]	SSLv3	Kx=DES	Non-Compliant

Unsupported Cipher Suites

The following table lists which cipher-suites are not supported using private keys.

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384	ECDHE-RSA-AES256-GCM-SHA384	[0xc030]	TLSv1.2	Kx=ECDH	Compliant
TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384	ECDHE-ECDSA-AES256-GCM-SHA384	[0xc02c]	TLSv1.2	Kx=ECDH	Compliant
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384	ECDHE-RSA-AES256-SHA384	[0xc028]	TLSv1.2	Kx=ECDH	Compliant

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384	ECDHE-ECDSA-AES256-SHA384	[0xc024]	TLSv1.2	Kx=ECDH	Compliant
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA	ECDHE-RSA-AES256-SHA	[0xc014]	SSLv3	Kx=ECDH	Compliant
TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA	ECDHE-ECDSA-AES256-SHA	[0xc00a]	SSLv3	Kx=ECDH	Compliant
TLS_DHE_DSS_WITH_AES_256_GCM_SHA384	DHE-DSS-AES256-GCM-SHA384	[0xa3]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_RSA_WITH_AES_256_GCM_SHA384	DHE-RSA-AES256-GCM-SHA384	[0x9f]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_RSA_WITH_AES_256_CBC_SHA256	DHE-RSA-AES256-SHA256	[0x6b]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_DSS_WITH_AES_256_CBC_SHA256	DHE-DSS-AES256-SHA256	[0x6a]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_RSA_WITH_AES_256_CBC_SHA	DHE-RSA-AES256-SHA	[0x39]	SSLv3	Kx=DH	Compliant
TLS_DHE_DSS_WITH_AES_256_CBC_SHA	DHE-DSS-AES256-SHA	[0x38]	SSLv3	Kx=DH	Compliant
TLS_DHE_RSA_WITH_CAMELLIA_256_CBC_SHA	DHE-RSA-CAMELLIA256-SHA	[0x88]	SSLv3	Kx=DH	Non-Compliant
TLS_DHE_DSS_WITH_CAMELLIA_256_CBC_SHA	DHE-DSS-CAMELLIA256-SHA	[0x87]	SSLv3	Kx=DH	Non-Compliant
TLS_ECDH_RSA_WITH_AES_256_GCM_SHA384	ECDH-RSA-AES256-GCM-SHA384	[0xc032]	SSLv3	Kx=ECDH/RSA	Compliant
TLS_ECDH_ECDSA_WITH_AES_256_GCM_SHA384	ECDH-ECDSA-AES256-GCM-SHA384	[0xc02e]	TLSv1.2	Kx=ECDH/ECDSA	Compliant
TLS_ECDH_RSA_WITH_AES_256_CBC_SHA384	ECDH-RSA-AES256-SHA384	[0xc02a]	TLSv1.2	Kx=ECDH/RSA	Compliant
TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA384	ECDH-ECDSA-AES256-SHA384	[0xc026]	TLSv1.2	Kx=ECDH/ECDSA	Compliant
TLS_ECDH_RSA_WITH_AES_256_CBC_SHA	ECDH-RSA-AES256-SHA	[0xc00f]	SSLv3	Kx=ECDH/RSA	Compliant
TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA	ECDH-ECDSA-AES256-SHA	[0xc005]	SSLv3	Kx=ECDH/ECDSA	Compliant



Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_ECDHE_RSA_WITH_3DES_EDE_CBC_SHA	ECDHE-RSA-DES-CBC3-SHA	[0xc012]	SSLv3	Kx=ECDH	Compliant
TLS_ECDHE_ECDSA_WITH_3DES_EDE_CBC_SHA	ECDHE-ECDSA-DES-CBC3-SHA	[0xc008]	SSLv3	Kx=ECDH	Compliant
TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA	EDH-RSA-DES-CBC3-SHA	[0x16]	SSLv3	Kx=DH	Compliant
TLS_DHE_DSS_WITH_3DES_EDE_CBC_SHA	EDH-DSS-DES-CBC3-SHA	[0x13]	SSLv3	Kx=DH	Compliant
TLS_ECDH_RSA_WITH_3DES_EDE_CBC_SHA	ECDH-RSA-DES-CBC3-SHA	[0xc00d]	SSLv3	Kx=ECDH/RSA	Compliant

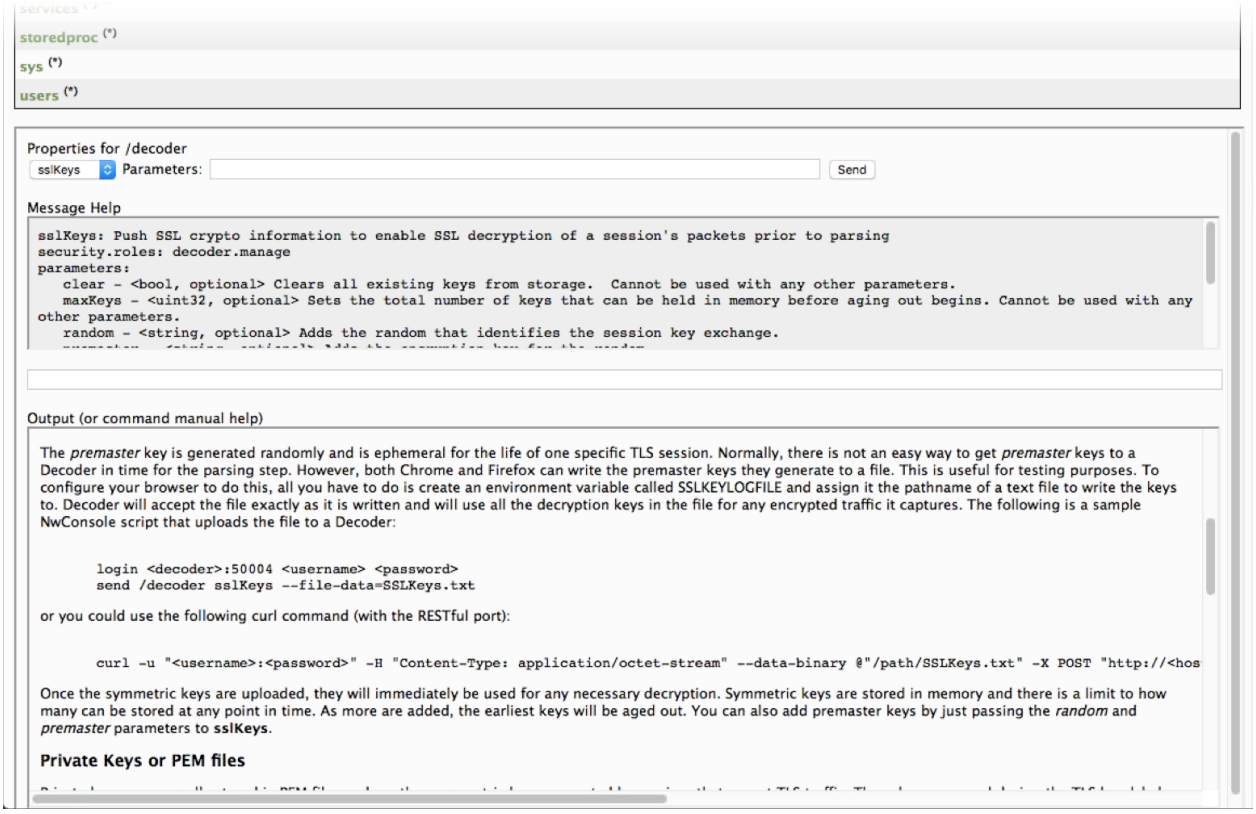
TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256	ECDHE-ECDSA-AES128-GCM-SHA256	[0xc02b]	TLSv1.2	Kx=ECDH	Compliant
TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256	ECDHE-RSA-AES128-SHA256	[0xc027]	TLSv1.2	Kx=ECDH	Compliant
TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256	ECDHE-ECDSA-AES128-SHA256	[0xc023]	TLSv1.2	Kx=ECDH	Compliant
TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA	ECDHE-RSA-AES128-SHA	[0xc013]	SSLv3	Kx=ECDH	Compliant
TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA	ECDHE-ECDSA-AES128-SHA	[0xc009]	SSLv3	Kx=ECDH	Compliant
TLS_DHE_DSS_WITH_AES_128_GCM_SHA256	DHE-DSS-AES128-GCM-SHA256	[0xa2]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_RSA_WITH_AES_128_GCM_SHA256	DHE-RSA-AES128-GCM-SHA256	[0x9e]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_RSA_WITH_AES_128_CBC_SHA256	DHE-RSA-AES128-SHA256	[0x67]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_DSS_WITH_AES_128_CBC_SHA256	DHE-DSS-AES128-SHA256	[0x40]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_RSA_WITH_AES_128_CBC_SHA	DHE-RSA-AES128-SHA	[0x33]	SSLv3	Kx=DH	Compliant

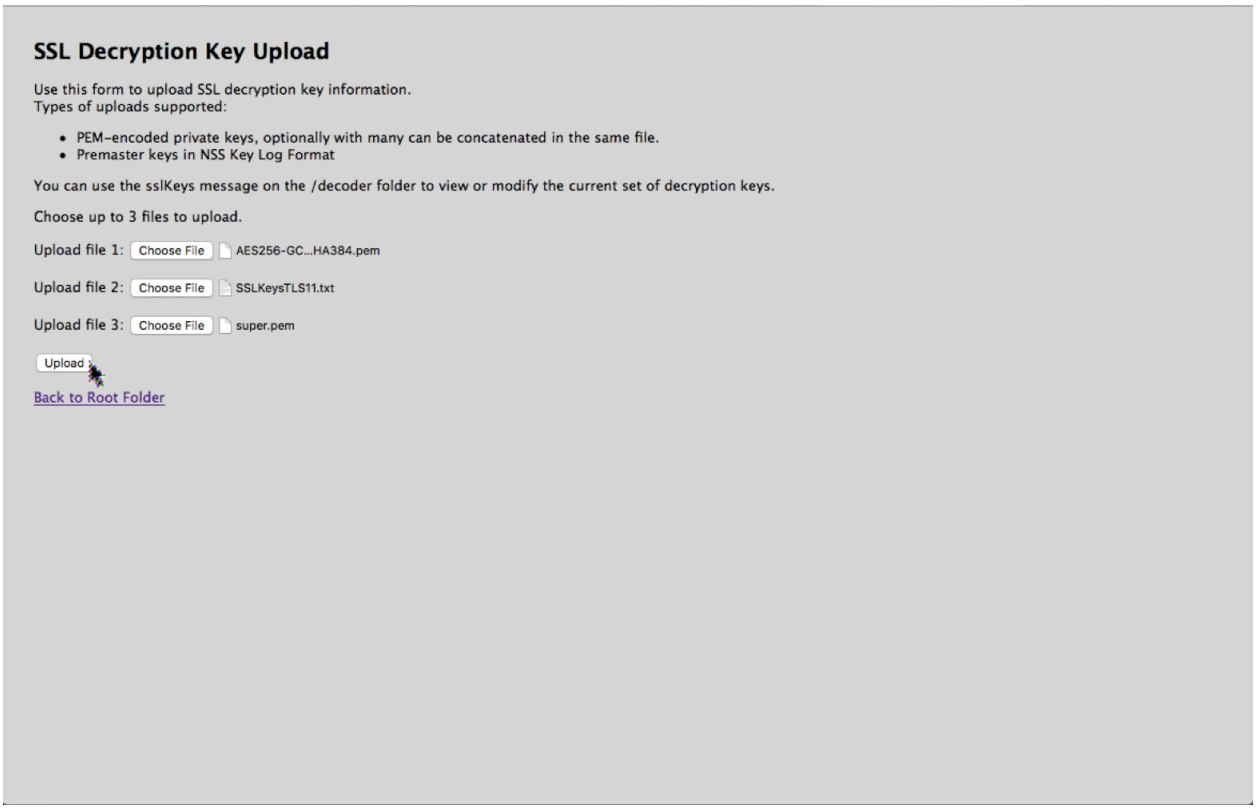
Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_DHE_DSS_WITH_AES_128_CBC_SHA	DHE-DSS-AES128-SHA	[0x32]	SSLv3	Kx=DH	Compliant
TLS_DHE_RSA_WITH_SEED_CBC_SHA	DHE-RSA-SEED-SHA	[0x9a]	SSLv3	Kx=DH	Non-Compliant
TLS_DHE_DSS_WITH_SEED_CBC_SHA	DHE-DSS-SEED-SHA	[0x99]	SSLv3	Kx=DH	Non-Compliant
TLS_DHE_RSA_WITH_CAMELLIA_128_CBC_SHA	DHE-RSA-CAMELLIA128-SHA	[0x45]	SSLv3	Kx=DH	Non-Compliant
TLS_DHE_DSS_WITH_CAMELLIA_128_CBC_SHA	DHE-DSS-CAMELLIA128-SHA	[0x44]	SSLv3	Kx=DH	Non-Compliant
TLS_ECDH_RSA_WITH_AES_128_GCM_SHA256	ECDH-RSA-AES128-GCM-SHA256	[0xc031]	TLSv1.2	Kx=ECDH/RSA	Compliant
TLS_ECDH_ECDSA_WITH_AES_128_GCM_SHA256	ECDH-ECDSA-AES128-GCM-SHA256	[0xc02d]	TLSv1.2	Kx=ECDH/ECDSA	Compliant
TLS_ECDH_RSA_WITH_AES_128_CBC_SHA256	ECDH-RSA-AES128-SHA256	[0xc029]	TLSv1.2	Kx=ECDH/RSA	Compliant
TLS_ECDH_ECDSA_WITH_AES_128_CBC_SHA256	ECDH-ECDSA-AES128-SHA256	[0xc025]	TLSv1.2	Kx=ECDH/ECDSA	Compliant
TLS_ECDH_RSA_WITH_AES_128_CBC_SHA	ECDH-RSA-AES128-SHA	[0xc00e]	SSLv3	Kx=ECDH/RSA	Compliant
TLS_ECDH_ECDSA_WITH_AES_128_CBC_SHA	ECDH-ECDSA-AES128-SHA	[0xc004]	SSLv3	Kx=ECDH/ECDSA	Compliant
TLS_ECDHE_RSA_WITH_RC4_128_SHA	ECDHE-RSA-RC4-SHA	[0xc011]	SSLv3	Kx=ECDH	Non-Compliant
TLS_ECDHE_ECDSA_WITH_RC4_128_SHA	ECDHE-ECDSA-RC4-SHA	[0xc007]	SSLv3	Kx=ECDH	Non-Compliant
TLS_ECDH_RSA_WITH_RC4_128_SHA	ECDH-RSA-RC4-SHA	[0xc00c]	SSLv3	Kx=ECDH/RSA	Non-Compliant
TLS_ECDH_ECDSA_WITH_RC4_128_SHA	ECDH-ECDSA-RC4-SHA	[0xc002]	SSLv3	Kx=ECDH/ECDSA	Non-Compliant
TLS_DHE_RSA_WITH_DES_CBC_SHA	EDH-RSA-DES-CBC-SHA	[0x15]	SSLv3	Kx=RSA	Non-Compliant
TLS_DHE_DSS_WITH_DES_CBC_SHA	EDH-DSS-DES-CBC-SHA	[0x12]	SSLv3	Kx=DSS	Non-Compliant
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA	EXP-EDH-RSA-DES-CBC-SHA	[0x14]	SSLv3	Kx=DSS	Non-Compliant

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_DHE_DSS_EXPORT_WITH_DES40_CBC_SHA	EXP-EDH-DSS-DES-CBC-SHA	[0x11]	SSLv3	Kx=DSS	Non-Compliant

Step 4: Confirm HTTPS Parser is Enabled on Decoders



The decryption process requires the native HTTPS parser to be enabled to examine the TLS handshake and to compare the uploaded encryption keys to determine if they decrypt the traffic. This can be validated in (Admin) > **Services** > **Decoder** > **Config** > Parsers Configuration panel as shown in the following figure.

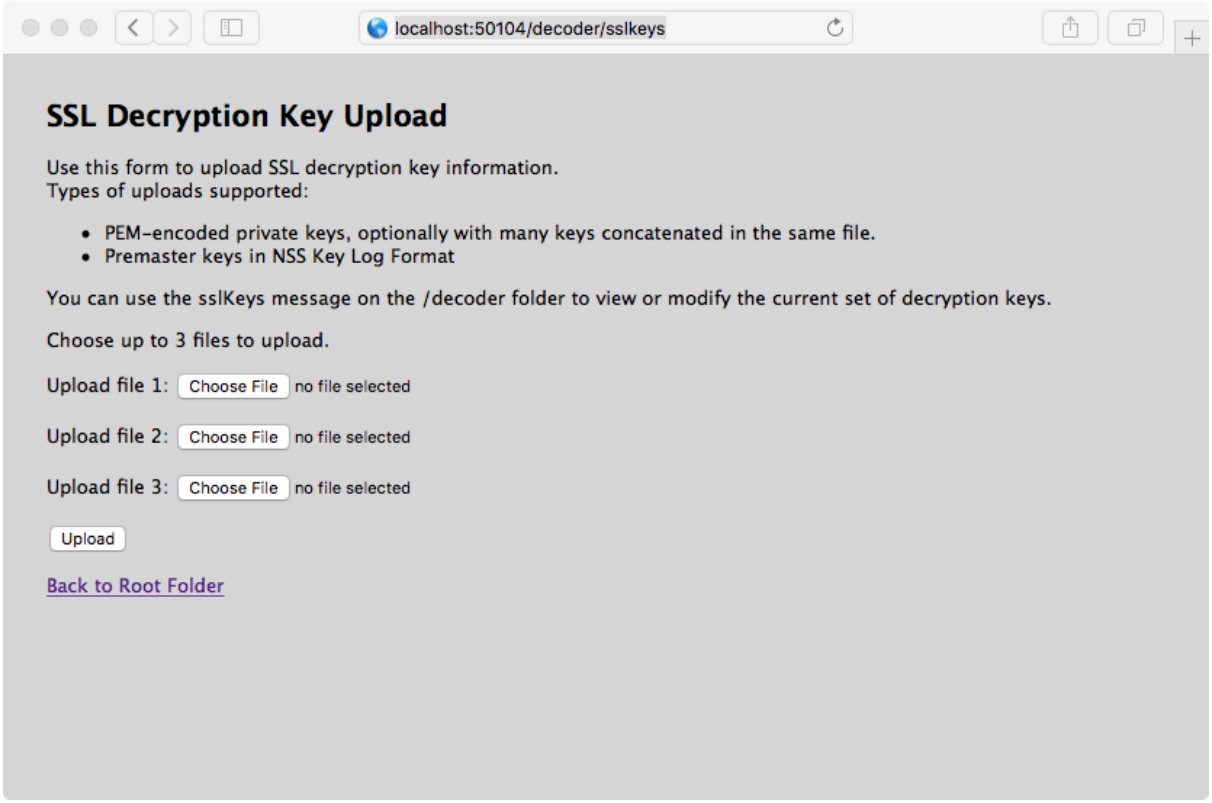


Step 5: Upload the Supported Private Keys to Decoders

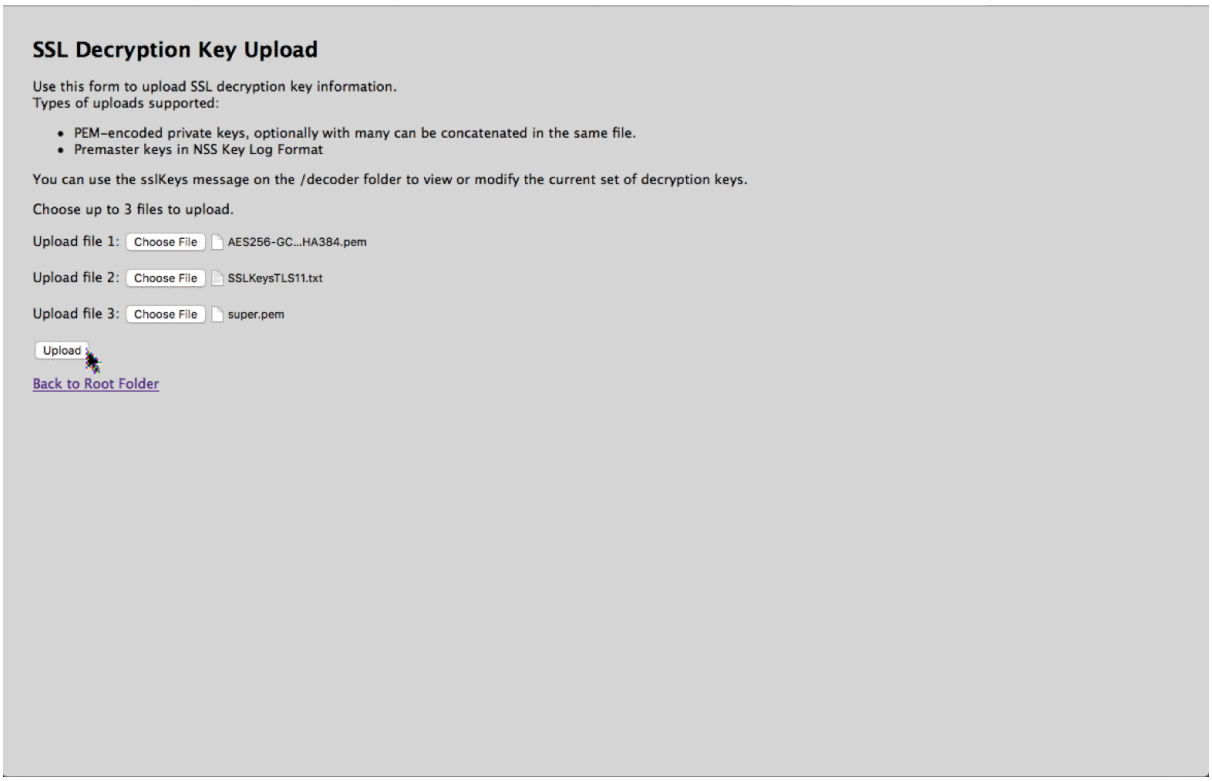
The `sslKeys` command provides a way to upload premaster or private keys to the Decoder, so that captured encrypted packets that match the keys can be decrypted before parsing. Administrators configure the Decoder by entering the `sslKeys` command using the NwConsole command line interface or the Decoder RESTful interface. After upload, you must issue a parser reload command so that the newly installed key becomes visible to the HTTPS parser. Now, all TLS handshakes that use that private key will be able to be decrypted by the Decoder.

For information about how to use the NwConsole command line interface, see the *NwConsole User Guide for NetWitness Platform*. For information about how to use the RESTful interface, see the *RESTful API User Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

The RESTful interface form at the path `/decoder/sslkeys` allows uploading a single PEM-encoded private key, a single file containing multiple private keys concatenated together, or a single file of multiple premaster keys.



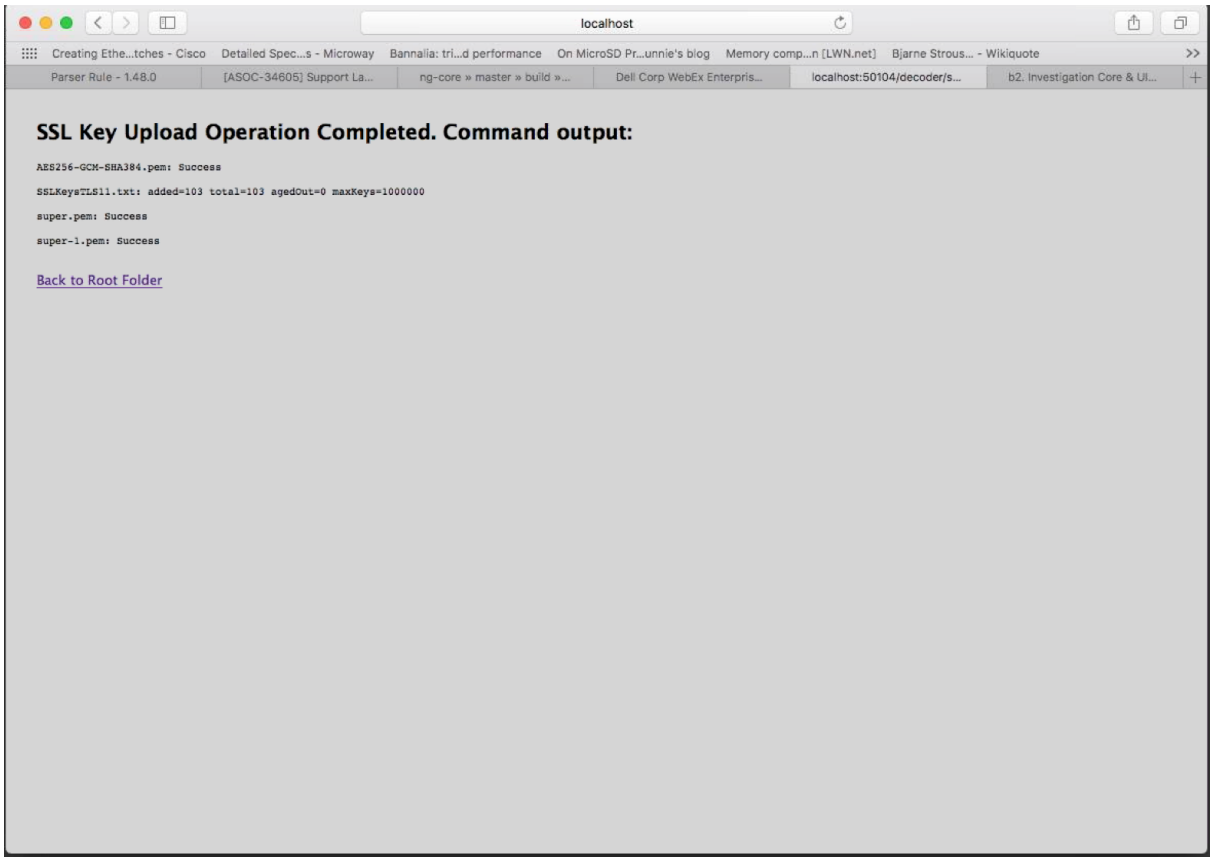
Upload Multiple Premaster and Private Keys



Note: As of 11.5, uploading premaster keys is not officially supported yet for real-time capture, but can be used to validate that decryption is functioning properly on the Decoder.

You can use the RESTful interface form to facilitate uploading of multiple keys, both premaster and private at the same time.

1. Open the RESTful API in your browser and navigate to this path on the Decoder that you want to configure: `/decoder/sslkeys`.



2. Next to **Upload File 1**, click **Choose File** and locate the premaster key file or PEM file that you want to upload on your local file system.
3. (Optional) Repeat for **Upload File 2** and **Upload File 3**.

4. Click **Upload**.

   The files are uploaded to the Decoder and results are displayed in the form.

Parameters for Managing Keys

The `sslKeys` command has several parameters for managing premaster and private keys. This is the full list of parameters:

Parameter	Description
`clear`	Removes all premaster keys from memory. Does not delete any PEM files installed on the system.
`maxKeys`	Changes the maximum number of premaster keys that are stored in memory.
`listPems`	Returns a list of all installed private key PEM files.
`deletePem`	Deletes the named PEM file from the file system. You can pass this parameter more than once to remove multiple files.
`random`	The random hash used to identify the premaster key.
`premaster`	The premaster key that will be installed for the previous `random` parameter. They must show up in pairs and `random` must be first.

Return Values

Most `sslKeys` commands return name/value pairs of statistics about the premaster keys in memory. The statistics are listed in the following table.

Name	Description
`added`	The number of premaster keys just added during this command.
`total`	The total number of premaster keys loaded in memory.
`agedOut`	The total number of premaster keys that were removed during this command; this is not a lifetime stat.
`maxKeys`	The current maximum allowed premaster keys

Encryption Keys

The `sslKeys` command accepts two types of encryption keys:

- Premaster key: the symmetric key used in the TLS payload stream for encryption and decryption.
- Private key: the asymmetric private key used during the TLS handshake that encrypts the premaster.

Premaster Key

The premaster key is generated randomly and is ephemeral for the life of one specific TLS session. Normally, there is not a good way to get premaster keys to a Decoder in time for the parsing step. However, both Chrome and Firefox can write the premaster keys they generate to a file. This is useful for testing purposes. To configure your browser to do this, create an environment variable called `SSLKEYLOGFILE` and assign it the pathname of a file to which the keys will be written. The Decoder will accept the file exactly as written and will use all the decryption keys in the file for any encrypted traffic it captures.

This is a sample NwConsole script that uploads the file to a Decoder:

```
login <decoder>:50004 <username> <password>
send /decoder sslKeys --file-data=SSLKeys.txt
```

This is an example using a curl command (with the RESTful port) to upload the file to a Decoder:

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/SSLKeys.txt" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys"
```

After the symmetric keys are uploaded, they will immediately be used for any necessary decryption. Symmetric keys are stored in memory and there is a limit to how many can be stored at any point in time. As more keys are added, the earliest keys will be aged out. You can also add premaster keys by just passing the `random` and `premaster` parameters to `sslKeys`.

Private Keys or PEM Files

Private keys are normally stored in PEM files and are the asymmetric keys generated by services that accept TLS traffic. These keys are used during the TLS handshake to encrypt the premaster symmetric key that will be used for the rest of the payload encryption.

For example, if you have a web server whose traffic you want visibility into, you need to upload the private key it uses to encrypt traffic. You only need to do this once, as it is stored permanently (or until removed by a delete command). Private keys are automatically encrypted before storing to protect them. After upload, you must issue a parser reload command so that the newly installed key becomes visible to the HTTPS parser. Now, all TLS handshakes that use that private key will be able to be decrypted by the Decoder.

Note: Not all ciphers suites use a "known" private key (for example, Ephemeral Diffie Hellman). Encrypted traffic with those ciphers cannot be decrypted unless the premaster key is uploaded to the Decoder before the session is parsed.

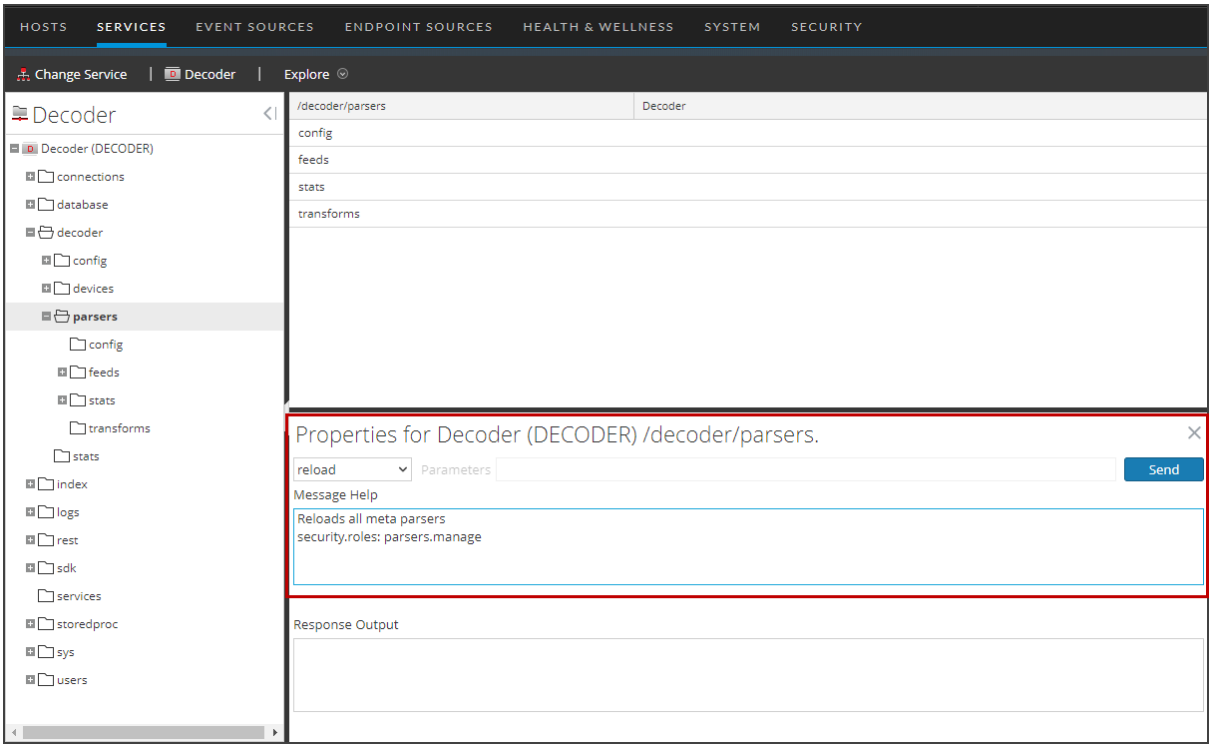
These are some sample commands that upload a PEM file to be used for decryption.

Using NwConsole:

```
send /decoder sslKeys pemFilename=MyKey.pem --file-data=/path/MyKey.pem
```

Using the RESTful interface (you must provide the `pemFilename` parameter in the URL):

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/MyKey.pem" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys&pemFilename=MyKey.pem"
```



Step 6: Reload HTTPS Parser on Decoders

After uploading the private keys, you must issue a parser reload command so that the newly-installed key becomes visible to the HTTPS parser. All TLS handshakes that use that private key are now able to be decrypted by the Decoder.

To issue a parser reload command:

1. Go to  (Admin) > **Services** and select the Decoder.
2. Click  > **View** > **Explore** > **decoder**, right-click **parsers** and select **Properties**.

3. In the Properties for Decoder (DECODER) /decoder/parsers pane, select reload from the drop-down menu and click **Send**.

Step 7: View Decrypted Sessions

All storage of the packets is still encrypted, so when you search for any decrypted traffic, your query should still focus on `service=443` or HTTPS (HTTP over SSL/TLS). If any packets were able to be decrypted, `tls.premaster` metadata is associated with the session that has the premaster key required for decrypting that session. The session will also have crypto metadata denoting the cipher suite, with crypto formated as `tls.premaster`.

Viewing Unencrypted Traffic

If packets are decrypted during the parse stage, encrypted packets are written to disk, and the matching premaster key used for decrypting is written to the `tls.premaster` meta key, analysts can view the unencrypted packets using the `tls.premaster` meta key.

One Decoder API that you can use to see the unencrypted packets is the `/sdk/content` RESTful service. You need to know the Session ID of the encrypted packets and the `flags` parameter masked to the value 128 (or 0x80 in hex). Point your browser to the Decoder RESTful interface and type in the following command, substituting the actual Session ID for `<id>`:

`http://<decoder>:50104/sdk/content?session=<id>&flags=128&render=text`

The Decoder returns a simple web page showing the packets after they are decrypted.

If you want to see what the packets look like encrypted, type in one of the following commands, substituting the Session ID for <id>:

`http://<decoder>:50104/sdk/content&session=<id>&render=text`

`http://<decoder>:50104/sdk/content&session=<id>&flags&render=text`

For more information on the `/sdk/content` service, see the manual page for `/sdk content`.

Alternatively, you can use the NetWitness Investigator thick client to decrypt and display the network sessions, as it can communicate to a Concentrator or have PCAPs and private keys loaded locally.

If you are not able to view the encrypted sessions, check Troubleshooting. However, if you are able to see the `tls.premaster` metadata, that confirms that the Decoder is able to see inside the encrypted session, which enables parsers to see the unencrypted packet payload and create metadata accordingly. For these decrypted sessions, look for additional metadata around usernames, passwords, or HTTP body content that would be obfuscated when encrypted, which would result in metadata not being generated.

Troubleshooting

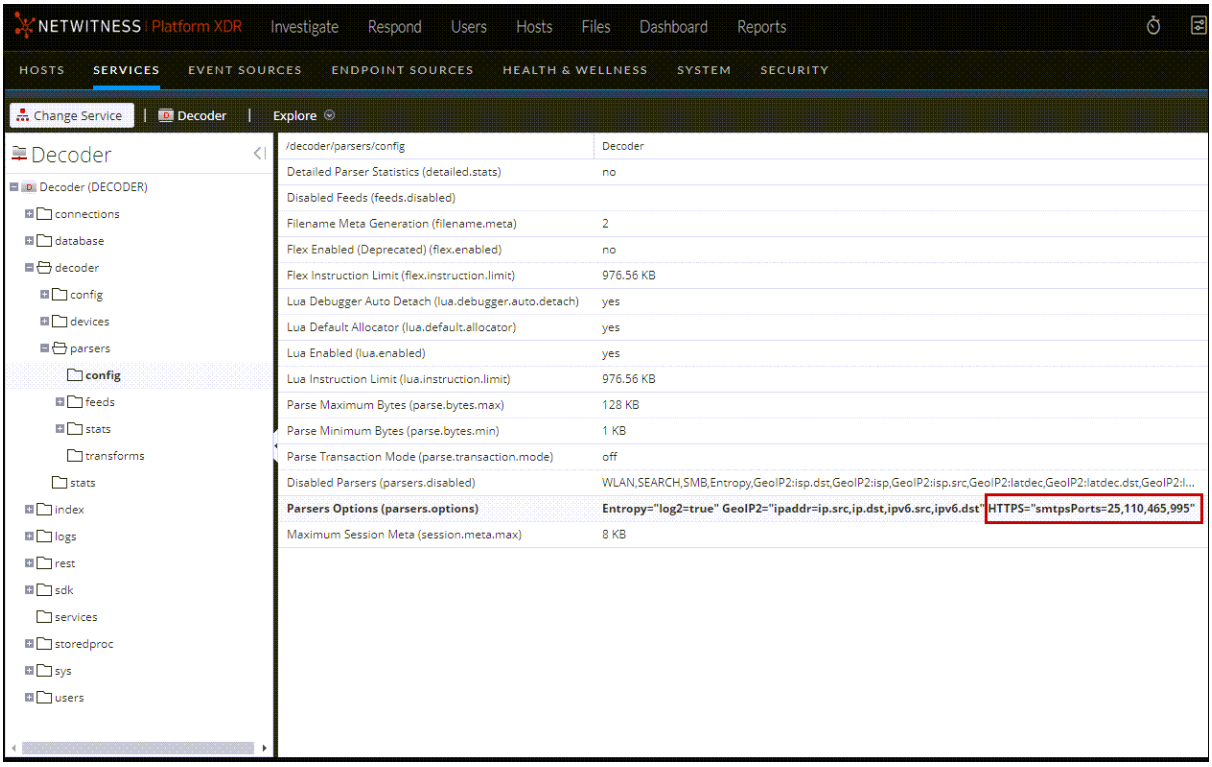
If you are still not able to decrypt or view the decrypted payloads after attempting the steps above, try these steps.

1. Validate that your private key is using an acceptable cipher-suite.
2. Make sure your Network Decoder is capturing the traffic matching the server for which you have the private key. To check, you can upload the private key and PCAP into Wireshark and see if it is able to decrypt it.

Decryption of Secure SMTP

In version 11.3, NetWitness supports opportunistic SSL/TLS decryption, which addresses RFC 3207 (https://tools.ietf.org/html/rfc3207). You can add an HTTPS parser option that provides a .csv list of destination ports of the session where the STARTTLS command will be searched, with at least one encryption key that has been uploaded. This enables the STARTTLS functionality.

Note: The .csv list must include all the destination ports of a session. If a destination port is not in the list, the search for STARTTLS will not be started.



The STARTTLS search is limited to the first 1024 bytes of the session's payload, to prevent performance degradation. If STARTTLS is found, the parser uses the next client packet with payload as the start of a TLS negotiation.

To add an HTTPS parser option for secure SMTP decryption:

1. In the NetWitness User Interface, go to **(Admin)** > **Services**.
2. Select a Log Decoder service and click > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.
4. In **parsers.options**, enter an HTTPS parser option in the following format that provides a .csv list of the destination ports of the session where the STARTTLS command is searched:

   `HTTPS="smtpsPorts=<port#1,port#2,port#n>"`

The following image shows an example of an HTTPS parser option for secure SMTP decryption.

Performance Considerations

Decrypting packets in real time requires extra work in the parsing stage. Before implementing this feature, plan carefully to ensure the incoming traffic bandwidth does not overwhelm the available compute power. You may need more Decoders to decrypt traffic than you would need if not decrypting.

Packets captured on a Decoder normally have a timeout of ~60 seconds in the assembly stage before they are sent to the parsing step. If the Decoder is under memory pressure due to very high bandwidth, the lifetime of the packets in Assembler may be shortened. To alleviate this situation, you can configure a longer timeout value and increase the amount of memory available to hold packets in Assembly. Also, in order to perform decryption of the packets, the Decoder must receive the decryption key before the parsing stage.

Note: Currently, only TLS 1.2 and earlier protocols can be decrypted

With no feeds loaded, the following parsers enabled, and 50% of the sessions being decrypted, a Decoder can process traffic at 3 Gbps .

Parser Name	Description
SYSTEM	Session Details
NETWORK	Network Layer
ALERTS	Alerts
GeoIP	Geographic data based on ip.src and ip.dst
GeoIP2	Geographic data by default based on IPv4 (`ip.src`, `ip.dst`) and IPv6 (`ipv6.src`, `ipv6.dst`) meta keys
HTTP	Hyper Text Transport Protocol (HTTP)
HTTP_Lua	Hyper Text Transport Protocol (HTTP) Lua
FTP	File Transfer Protocol (FTP)
TELNET	TELNET Protocol
SMTP	Simple Mail Transport Protocol (SMTP)
POP3	Post Office Protocol (POP3)
NNTP	Network News Transport Protocol (NNTP)
DNS	Domain Name Service (DNS)
HTTPS	Secure Socket Layer (SSL) Protocol
MAIL	Standard E-Mail Format (RFC822)
VCARD	Extracts VCARD fullname and email information
PGP	Identifies PGP blocks within network traffic
SMIME	Identifies SMIME blocks within network traffic
SSH	Secure Shell (SSH)
TFTP	Trivial File Transfer Protocol (TFTP)
DHCP	Dynamic Host Configuration Protocol (DHCP and BOOTP)
NETBIOS	Extracts NETBIOS computer name information.
SNMP	Simple Network Management Protocol (SNMP)
NFS	Network File System (NFS) protocol
RIP	Routing Information Protocol (RIP).
TDS	MSSQL and Sybase database protocol (TDS)

Parser Name	Description
TNS	Oracle database protocol (TNS)
IRC	Internet Relay Chat (IRC) protocol
RTP	Real Time Protocol (RTP) for audio/video
SIP	Session Initiation Protocol (SIP)
H323	H.323 Teleconferencing protocol
SCCP	Cisco Skinny Client Control Protocol
GTalk	Google Talk (GTalk)
VlanGre	Vlan ID and GRE/EtherIP tunnel addresses
BITTORRENT	BitTorrent File Sharing Protocol
FIX	Financial Information eXchange Protocol
GNUTELLA	Gnutella file sharing protocol
IMAP	Internet Message Access Protocol
MSRPC	Microsoft Remote Procedure Call protocol
RDP	Remote Desktop Protocol
SHELL	Command Shell Identification
TLSv1	TLSv1
SearchEngines	A parser that extracts search terms
FeedParser	External Feed Parser

TLS Certificate Hashing

The Network Decoder can produce hashes of certificates that are seen in the packet stream. These hashes are the SHA-1 value of any DER-encoded certificate encountered during a TLS handshake. The hashes produced can be used to compare network traffic with hashes from public SSL blacklists, such as the one from sslbl.abuse.ch.

The TLS Certificate hashing feature is disabled by default. To enable TLS Certificate hashing:

1. Go to  **(Admin)** > **Services**, select a Network Decoder service and  > **View > Explore.**
2. Select **decoder** > **parsers** > **config**.
3. In the values column next to `parsers.options`, type `HTTPS="cert.sha1=true"`.
   When this option is enabled, the SHA-1 is stored as a text value in the `cert.thumbprint` meta key.

4. The change takes effect on parser reload. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**

The SHA-256 hash of the certificate can be enabled by adding the parser option:

```
HTTPS="cert.sha256=true"
```

to a Network Decoder's `/decoder/parsers/config/parsers.options` configuration.

When this option is enabled, SHA-256 is stored as a text value in the meta keys:

```
cert.sha256
cert.thumbprint
```

JA3 and JA3S TLS Fingerprints

The Network Decoder can produce the JA3 value of TLS clients and the JA3S value of TLS servers that are observed in a Network session. The values that are produced conform to the values generated by the open source JA3 tools (https://github.com/salesforce/ja3). The JA3 features are disabled by default.

To enable JA3 features:

1. In the NetWitness Platform User Interface, go to  **(Admin)** > **Services**.
2. Select a Decoder service and click  > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.
4. In **parsers.options**, add `HTTPS="ja3=true ja3s=true"`.
5. In the left panel, right click on **parsers** and select **properties**.
6. In the right panel, in the lower pane, set the value in the first drop down to **Reload**.
7. Click **Send**.

JA3 and JA3S can be enabled independently using these options. When enabled, the JA3 is stored as a text value in the meta key `ja3`. The JA3S is stored as a text value in the meta key `ja3s`.

Additional meta keys are activated using a mechanism similar to the JA3S and JA3S meta items. For example, `ja3.orig` is enabled by adding `ja3.orig=true` to the HTTPS parser options. This is also true for `ja3s.orig`, `tls.extensionlen`, and `tls.cipherlen`.

`ja3.orig`, `tls.extensionlen`, and `tls.cipherlen` are only created if JA3 is enabled.

`ja3s.orig` is only created if JA3S is enabled.

Perform Simultaneous Ingestion of the Encrypted and Decrypted Traffic Streams to Decoder

In previous versions, ingesting encrypted and decrypted traffic streams of the same session to a Decoder causes packets from both the sessions to mix on the Decoder as reassembly is performed by the same thread. It cause session parsing and content extraction inaccuracies.

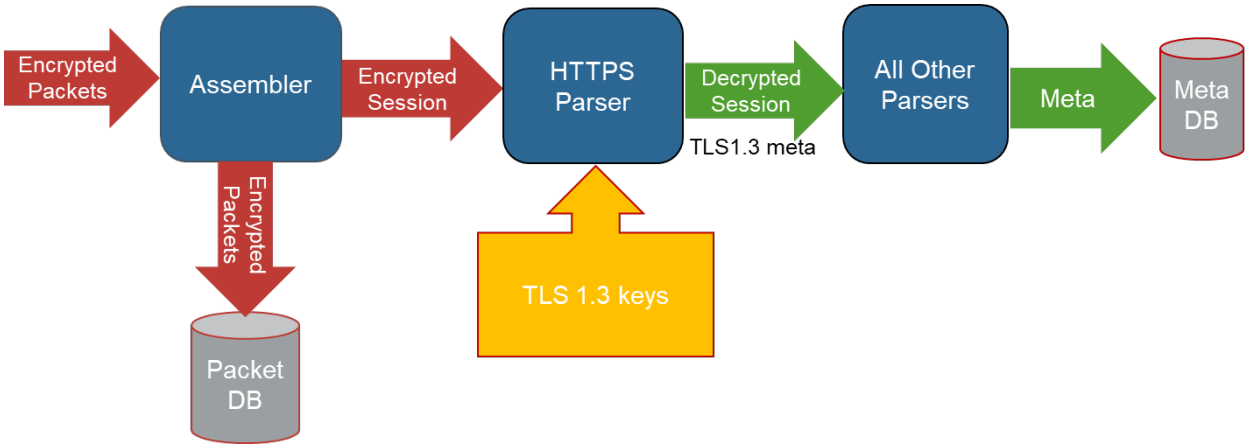
In NetWitness 11.6, using multi-adapter capture and multi-thread assembler features, you can configure the Decoder to receive encrypted and decrypted streams on separate adapters. The multi-thread assembler feature allows decoder to assemble packets from its corresponding capture work thread. It keeps the packets from encrypted and decrypted sessions separate during assembly and avoid inaccuracies in session parsing and content extraction.

To configure the Decoder for the simultaneous ingestion of the encrypted and decrypted traffic streams:

1. Configure Decoder to capture from multiple adapters simultaneously, see (Optional) Multiple Adapter Packet Capture.
2. Set `/decoder/config/assembler.threading.enabled=on` to enable multi-thread assembler.
3. Restart the Decoder service.

Community ID

The Network Decoder generates Community ID flow hash values that are compatible with the Community ID specification defined by `https://github.com/corelight/community-id-spec`.



The Community ID is written to a text-formatted meta key named `community`.

The Community ID is generated on sessions containing TCP over IPv4, TCP over IPv6, UDP over IPV4, and UDP over IPV6.

Decrypt Incoming Packets TLS 1.3

Administrators can configure a `nonfips` Network Decoder to decrypt incoming TLS 1.3 network packets. This capability is currently supported with encrypted communications to managed servers using TLS 1.3 or earlier.

For TLS 1.2 and earlier protocols refer Decrypt Incoming Packets (TLS 1.2)

As the network traffic is collected and passed through the system, the encrypted packets are stored as captured even if the system can decrypt them. As the Decoder parses the encrypted traffic, it uses TLS 1.3 keys that have been pushed or uploaded, and determines if the network traffic can be decrypted. If the Decoder is able to decrypt the traffic, it generates an additional meta keys, defined as `tls.client.hdshk, tls.server.hdshk, tls.client.app, tls.server.app, tls.client.early` which contains the decryption keys for that particular session. Whether the traffic is decrypted or not, the metadata service is tagged as 443 or SSL/TLS traffic, as the Decoder is port agnostic, even though it is marked with the default port number.

Non-FIPS Builds

Network Decoder TLS 1.3 decryption is supported ONLY through special `nonfips` rpm builds which run in NON FIPS mode. The `nonfips` builds use crypto library which has pending FIPS certification in NIST, hence they are labeled as `nonfips`. If you are restricted to run only FIPS in your environment then TLS 1.3 decryption feature is not supported.

The following nonfips builds for components Decoder, Appliance , Concentrator and Broker are required to be installed, as they provide dependencies and support to TLS 1.3 decryption in session parsing and during content reconstruction.

Decoder (rsa-nw-decoder-nonfips rpm)	Decrypt on Session Parsing and Content Reconstruction
Concentrator (rsa-nw-concentrator-nonfips rpm)	Decrypt on Content Reconstruction

Broker (rsa-nw-broker-nonfips rpm)	Decrypt on Content Reconstruction
Appliance (rsa-nw-appliance-nonfips rpm)	Installs dependencies and scripts for TLS 1.3 Decryption

Install or update Non-FIPS builds

The `rsa-nw-appliance` rpm now includes a script `nw-nonfips-override-generator.sh` to generate `nonfips` override descriptors. It will be installed at the path: `/usr/local/sbin/nw-nonfips-override-generator.sh`

The script automates the descriptor override generation steps highlighted in the wiki **Hotfixes with Descriptor Overrides**.

PR: https://github.rsa.lab.emc.com/asoc/ng-core/pull/2933

(Option 1) Instructions to install nonfips rpms during an upgrade

Step 1: Upgrade Node-Zero

- Follow upgrade instructions for node-zero from UI or command line, this would install the latest repo under `/var/netwitness/common/repo/`

Step 2: Before upgrading other Node-X hosts with core services, run the script on Node-Zero.

- `/usr/local/sbin/nw-nonfips-override-generator.sh`
  - This would invoke script in default mode which uses latest installed version ex: 12.0.0.0 and repo /var/netwitness/common/repo/12.0.0.0/RSA .
  - The script generates and validates nonfips descriptor override files.

Step 3: Refresh Node-Zero to apply applicable nonfips rpms (broker, appliance) using the command:

- `nw-manage --refresh-host --host-key <node-zero-ip-address>`
- Reboot Node-Zero

Step 4: Upgrade each Node-X

- (Option 1) : Upgrade Node-X via Command line
  - Start upgrade host Node-X with the following command from Node-Zero.
    - Example: upgrade-cli-client –-upgrade --host-key <Host UUID or IP address> --version 12.0.0.0
  - Reboot the Node-X
- (Option 2): Upgrade Node-X from UI:
  - Continue upgrading from UI and follow instructions to upgrade the remaining hosts.
- If applicable, all the hosts would have the nonfips rpms (decoder, concentrator, broker, appliance) installed.

(Option 2) Instructions to install nonfips rpms after upgrade

After upgrading Node-Zero and all other Node-X hosts, and if you wish to install nonfips rpms at later then following are instructions:

- Step 1: Run the script on Node-Zero
  - `/usr/local/sbin/nw-nonfips-override-generator.sh`
    - This would invoke script in default mode which uses latest installed version ex: 12.0.0.0 and repo /var/netwitness/common/repo/12.0.0.0/RSA .
    - The script generates and validates nonfips descriptor override files.
- Step 2: Command line update:
  - Refresh all the hosts (including Node-Zero) to apply applicable nonfips rpms (decoder, concentrator, broker, appliance).
    - nw-manage --refresh-host --host-all
    - Reboot all the hosts.

Note: The `/usr/local/sbin/nw-nonfips-override-generator.sh` script would generate logs while running the commands, and also update `/var/log/messages` using the logger command.

TLS 1.3 Keys and Cipher suites

According to RFC 8446 the TLS 1.3 protocol doesn't support Private key based decryption and it only support a set of ephemeral symmetric keys also called as key secrets for the life of one specific TLS 1.3 session. The TLS 1.3 session also encrypts handshake, all the TLS records after Server Hello are encrypted , and at each stage a corresponding key is used for the encryption ex: client handshake, server handshake, client application and server application etc.. . So in order for decrypting a TLS 1.3 session all the required session keys `tls.client.hdshk, tls.server.hdshk, tls.client.app, tls.server.app, tls.client.early`(optional) are needed to be available.

Cipher Suites

TLS 1.3 protocol recommends to support only strong and advanced Cipher suites. The Network Decoder supports all the advertised cipher suites from RFC-8446, however on integration with Thirdparty key forwarder the supported cipher suites might be limited to list supported by Thirdparty server. Example only GCM ciphers are supported etc..

The following is list of cipher suited supported in Network Decoder

- TLS_AES_128_GCM_SHA256
- TLS_AES_256_GCM_SHA384
- TLS_CHACHA20_POLY1305_SHA256
- TLS_AES_128_CCM_SHA256
- TLS_AES_128_CCM_8_SHA256

Steps to configure Network Decoder to decrypt TLS 1.3 traffic

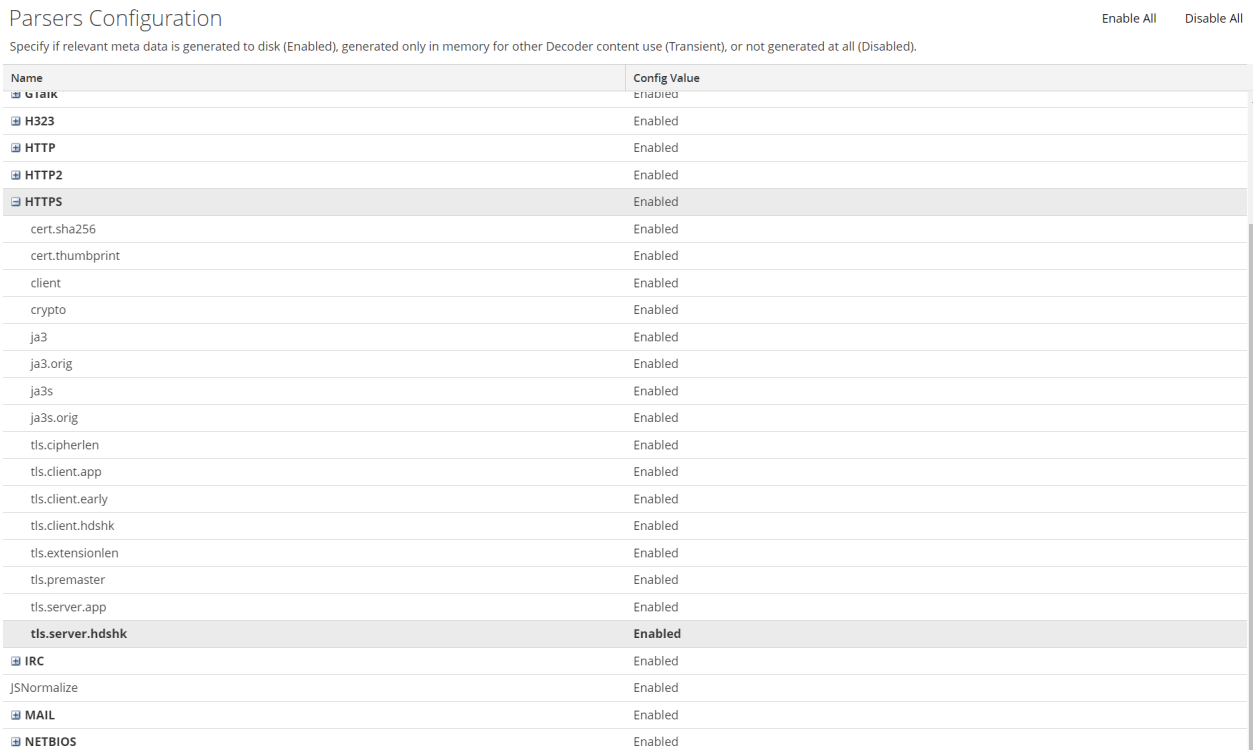
- Step 1: Validate that the Network Decoder Captures Encrypted TLS 1.3 Traffic
- Step 2: Confirm HTTPS Parser is Enabled on Decoders
- Step 3: Integrate Network Decoder to receive keys from Thirdparty TLS 1.3 key forwarder
- Step 4: (Optional) Upload TLS 1.3 keys to validate Decryption
- Step 5: Validate TLS 1.3 keys are received on Decoder
- Step 6: View Decrypted Sessions

Step 1: Validate that the Network Decoder Captures Encrypted TLS 1.3 Traffic

First, make sure the Decoder is actually capturing the SSL/TLS traffic from the managed servers that you want to use to gain visibility into the encrypted sessions. You can do this by searching in the Investigate views (Navigate or Events) using the IP addresses of the servers as the destination IP addresses, and the service as SSL/TLS.

For example, if you are searching for HTTPS traffic to 192.168.1.2 and 192.168.1.3, you can run the following query:

```
service = 443 && ip.dst = 192.168.1.2, 192.168.1.3
```



Conduct this search on the Concentrator that aggregates metadata from the Decoder that is expected to capture this network segment, or on a Broker that may have access to all collected metadata.

(Version 11.6 or later) In case of simultaneous ingestion of the encrypted and decrypted traffic streams in the Decoder, ensure that multi-thread assembly is enabled. This is to prevent mixing of packets from different sessions by single thread assembly. For more information, see the following topics:

- Perform Simultaneous Ingestion of the Encrypted and Decrypted Traffic Streams to Decoder
- (Optional) Multiple Adapter Packet Capture

Step 2: Confirm HTTPS Parser is Enabled on Decoders

The decryption process requires the native HTTPS parser to be enabled to examine the TLS handshake and to compare the uploaded encryption keys to determine if they decrypt the traffic. This can be validated in **Admin > Services > Decoder > Config** > Parsers Configuration panel as shown in the following figure.

If TLS_Lua parser is enabled then meta version: TLS 1.3 is registered for TLS 1.3 encrypted traffic.

Step 3: Integrate Network Decoder to receive keys from Thirdparty TLS 1.3 key forwarder

TLS 1.3 protocol only support ephemeral keys which are unique per session and Network Decoder need to receive those keys in time for parsing step.

Network Decoder provides `sslKeys` API which can receive the keys forwarded or injected to Decoder on RESTful interface.

A Thirdparty TLS 1.3 key forwarder which acts as Man-In-The-Middle (MITM) gateway for TLS 1.3 may intercept SSL handshake and forward the TLS 1.3 keys to Network Decoder.

Example: F5 BIG-IP Local Traffic Manager.

Option 1: Configure F5 BIG-IP Local Traffic Manager (LTM)

If you are using BIG-IP LTM in your environment for application traffic management, load balancing etc.. and if you would like to decrypt and analyze TLS 1.3 traffic handled by BIG-IP LTM, then refer the following section to Configure F5 BIG-IP LTM and forward keys to Network Decoder.

Refer F5 BIG IP - Netwitness Perfect Forward Secrecy Inspection Visibility for more information.

Option 2: Using sslKeys API

If you are using other Man-In-The-Middle (MITM) gateway which can intercept TLS 1.3 handshake and forward the keys, then you can refer the following information and parameters to send keys to `sslKeys` API on Network Decoder.

The `sslKeys` API is used to push SSL crypto information to enable SSL decryption of a session's packets prior to parsing.

Parameters for Managing Keys

The `sslKeys` command has several parameters for managing premaster and private keys. This is the full list of parameters:

Parameter	Description
clear	Removes all premaster and TLS 1.3 keys from memory. Will not delete any PEM files installed on the system.
maxKeys	Changes the maximum number of premaster and TLS 1.3 keys that will be stored in memory.
counts	Returns key counts for sslKeys. Cannot be used with any other parameters.
listPems	Returns a list of all installed private key PEM files.
deletePem	Deletes the named PEM file from the file system. You can pass this parameter more than once to remove multiple files.
random	The random hash used to identify the premaster key or TLS 1.3 keys.
premaster	The premaster key that will be installed for the previous random parameter. They must show up in pairs and random must be first.
CETS	The TLS 1.3 client early traffic secret key that will be installed for the previous random parameter. It must show up with random parameter.
CHTS	The TLS 1.3 client handshake traffic secret key that will be installed for the previous random parameter. It must show up with random parameter.
SHTS	The TLS 1.3 server handshake traffic secret key that will be installed for the previous random parameter. It must show up with random parameter.
CTS0	The TLS 1.3 client traffic secret 0 key (application) that will be installed for the previous random parameter. It must show up with random parameter.
STS0	The TLS 1.3 server traffic secret 0 key (application) that will be installed for the previous random parameter. It must show up with random parameter.

Usage:

The Client random and TLS 1.3 keys can be passed as parameters to `sslKeys`, ex:

- Using Native port 56004:
  - `/decoder sslKeys random=`<value> `CETS=`<value> `CHTS=`<value> `SHTS=`<value> `CTS0=`<value> `STS0=`<value>
- Using RESTful port 50104:
  - `/decoder?msg=sslKeys&random=`<value>`&CETS=`<value>`&CHTS=`<value>`&SHTS=`<value>`&CTS0=`<value>`&STS0=`<value>
- Replace <value> with base64 encoded TLS 1.3 key value in the above cases.

Note: For most of the sessions the CETS (CLIENT_EARLY_TRAFFIC_SECRET) key may not be generated or used by TLS clients and it is normal. However, if the other keys (handshake and application keys) are not generated and not available then TLS 1.3 decryption will NOT be successful.

Return Values

Most commands return name/value pairs of statistics about the premaster and TLS 1.3 keys in memory. The statistics are listed in the following table.

Parameter	Description
added	The number of premaster and TLS 1.3 keys just added during this command.
total	The total number of premaster and TLS 1.3 keys loaded in memory.
agedOut	The total number of premaster and TLS 1.3 keys that were removed during this command (this is not a lifetime stat).
maxKeys	The current maximum allowed premaster and TLS 1.3 keys.
premaster	The total number of premaster keys loaded in memory.
tls13	The total number of TLS 1.3 keys loaded in memory.

Step 4: (Optional) Upload TLS 1.3 keys to validate Decryption

Note: Uploading TLS 1.3 keys is not supported for real-time capture, but can be used to validate that decryption is functioning properly on the Decoder.

The `sslKeys` command provides a way to upload TLS 1.3 keys to the Decoder, so that captured encrypted packets that match the keys can be decrypted before parsing. Administrators configure the Decoder by entering the `sslKeys` command using the NwConsole command line interface or the Decoder RESTful interface. Now, all TLS handshakes that use the TLS 1.3 keys and will be able to be decrypted by the Decoder.

For information about how to use the NwConsole command line interface, see the *NwConsole User Guide for NetWitness Platform*. For information about how to use the RESTful interface, see the *RESTful API User Guide for NetWitness Platform*. Go to the *Master Table of Contents* to find all NetWitness Platform 11.x documents.

You can use the RESTful interface form to facilitate uploading of multiple keys, both premaster and private at the same time.

1. Open the RESTful API in your browser and navigate to this path on the Decoder that you want to configure:

   `/decoder/sslkeys`.

2. Click **Choose File** Next to **Upload File 1**, and locate the TLS 1.3 keys file that you want to upload on your local file system.
3. Click **Upload**. The files are uploaded to the Decoder and results are displayed in the form.

TLS 1.3 Keys

Similar to `premaster` key, capturing TLS 1.3 keys and uploading to Decoder in time for parsing is not an easy way. However, well known browsers like Chrome , Firefox and IE can write the TLS 1.3 keys they generate to a file and this is useful for testing purposes. To configure your browser to do this, create an environment variable called SSLKEYLOGFILE and set with a pathname to text file to write the keys. Decoder will accept the file exactly as it is written and will use all the decryption keys in the file for any encrypted traffic it captures.

The following is a sample NwConsole script that uploads the file to a Decoder:

```
login <decoder>:50004 <username> <password>
send /decoder sslKeys --file-data=SSLKeys.txt
```

Optionally the parameters can be passed in as list in the upload file, ex:

```
send /decoder sslKeys --file-data=SSLKeys.txt --file-format=params-list
```

or you could use the following curl command (with the RESTful port):

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/SSLKeys.txt" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys"
```

Once the symmetric keys are uploaded, they will immediately be used for any necessary decryption. Symmetric keys are stored in memory and there is a limit to how many can be stored at any point in time. As more are added, the earliest keys will be aged out. You can also add available TLS 1.3 keys by just passing the `random`, `CETS` , `CHTS` , `SHTS` , `CTS0` and `STS0` parameters to `sslKeys`.

Note: For most of the sessions the CLIENT_EARLY_TRAFFIC_SECRET key may not be generated or used by TLS clients and it is normal. However, if handshake and application keys are not generated and not available then TLS 1.3 decryption wouldn't be successful.

Step 5: Validate TLS 1.3 keys are received on Decoder

It is advised to validate if Decoder is receiving keys to Decrypt TLS 1.3 sessions. As Decryption wouldn’t be successful if the keys are not available.

The following are few ways:

1. Decoder generates the following TLS 1.3 meta per session

`tls.client.hdshk`, `tls.server.hdshk`, `tls.client.app`, `tls.server.app`, and `tls.client.early`

2. The `sslKeys` API provides an option to display current key stats using counts=true .

Example: `/decoder sslKeys counts=true`

```
premasterKeys: 478
tls13Keys: 341
total: 819
maxKeys: 1000000
```

Step 6: View Decrypted Sessions

All storage of the packets is still encrypted, so when you search for any decrypted traffic, your query should still focus on `service=443` or HTTPS (HTTP over SSL/TLS). If any packets were able to be decrypted, the `tls.client.hdshk`, `tls.server.hdshk`, `tls.client.app`, `tls.server.app`, and `tls.client.early` metadata is associated with the session that has the TLS 1.3 keys required for decrypting that session. The session will also have crypto metadata denoting the cipher suite.

Viewing Unencrypted Traffic

If packets are decrypted during the parse stage, encrypted packets are written to disk, and the matching TLS 1.3 keys used for decrypting is written to the TLS 1.3 meta, analysts can view the unencrypted packets using the TLS 1.3 meta keys.

Option 1 : Using Event Analysis UI

Starting 12.0 the Event Analysis View support Displaying Decrypted and Encrypted Payloads of TLS sessions when TLS keys meta are registered.

Option 2 : Using RESTful API on Decoder service

The Decoder API that you can use to see the unencrypted packets is the `/sdk/content` RESTful service. You need to know the Session ID of the encrypted packets and the `flags` parameter masked to the value 128 (or 0x80 in hex). Point your browser to the Decoder RESTful interface and type in the following command, substituting the actual Session ID for `<id>`:

`http://<decoder>:50104/sdk/content?session=<id>&flags=128&render=text`

The Decoder returns a simple web page showing the packets after they are decrypted.

If you want to see what the packets look like encrypted, type in one of the following commands, substituting the Session ID for <id>:

`http://<decoder>:50104/sdk/content&session=<id>&render=text`

`http://<decoder>:50104/sdk/content&session=<id>&flags&render=text`

For more information on the `/sdk/content` service, see the manual page for `/sdk content`.

If you are not able to view the encrypted sessions, check Troubleshooting. However, if you are able to see the TLS 1.3 metadata, that confirms that the Decoder is able to see inside the encrypted session, which enables parsers to see the unencrypted packet payload and create metadata accordingly. For these decrypted sessions, look for additional metadata around usernames, passwords, or HTTP body content that would be obfuscated when encrypted, which would result in metadata not being generated.

Troubleshooting

If you are still not able to decrypt or view the decrypted payloads after attempting the steps above, try these steps.

1. Validate if Decoder is receiving TLS 1.3 keys. Refer #Step 5 listed above.
2. Validate that your TLS 1.3 session key is using an acceptable cipher-suite.
3. Make sure your Network Decoder is capturing the traffic matching the server for which you have the TLS 1.3 keys. To check, you can upload the TLS 1.3 keys and PCAP into Wireshark and see if it is able to decrypt it.

Additional Features

The following features which are supported in TLS 1.2 are also supported in TLS 1.3 decryption.

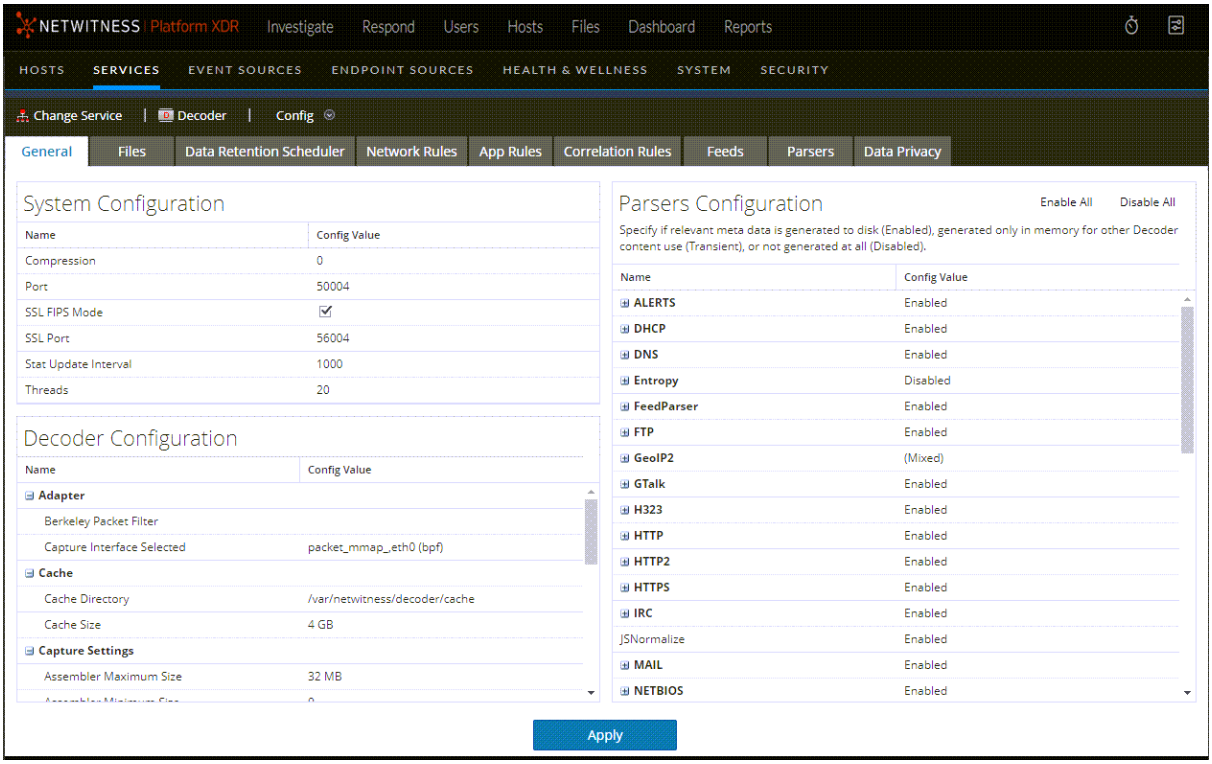
1. TLS Certificate Hashing
2. JA3 and JA3S TLS Fingerprints
3. Performance Considerations

For more details refer Decrypt Incoming Packets (TLS 1.2)

Edit Decoder System Configuration

When a service is first added to NetWitness, default values for the system configuration parameters are in effect. In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance. You do not need to edit these setting unless an NetWitness Customer Support technician advises you to change them.

System Configuration



Name	Config Value
Compression	0
Port	50004
SSL FIPS Mode	☐
SSL Port	56004
Stat Update Interval	1000
Threads	20

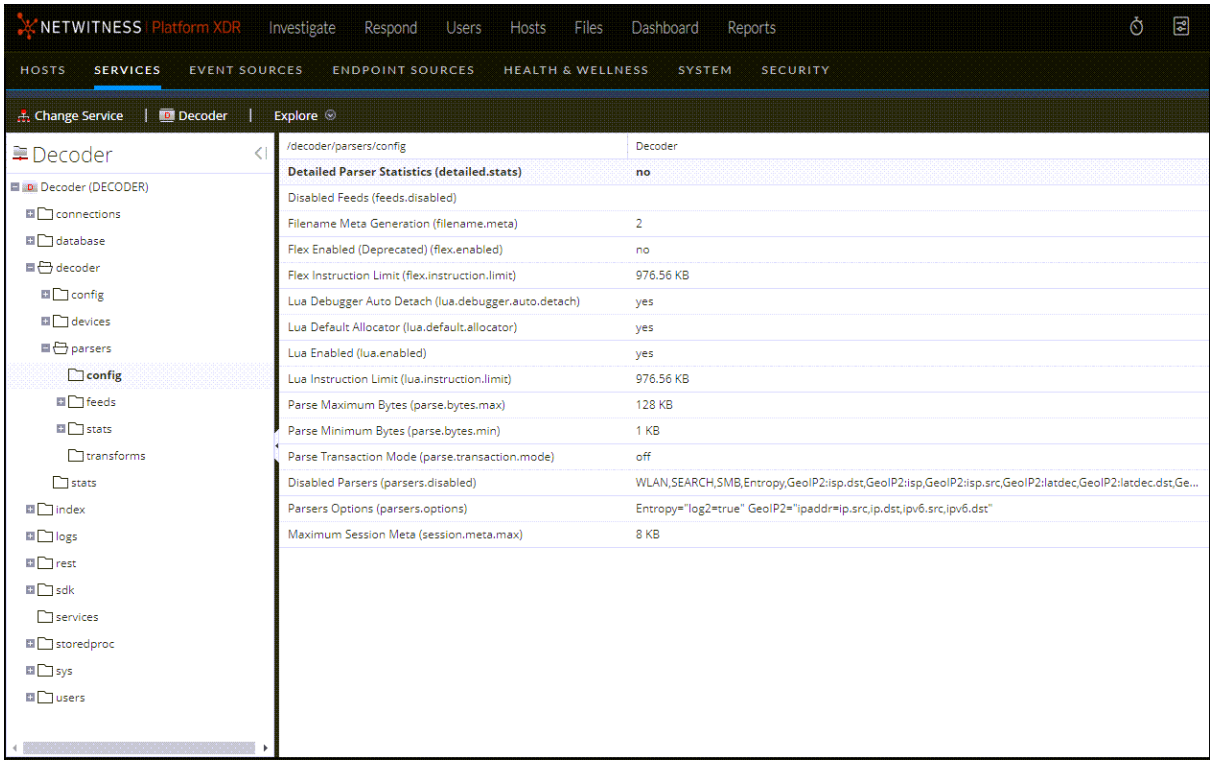
One parameter that you may want to change for your environment is the SSL setting, which by default is not enabled. When enabled, the security of data transmission is managed by encrypting information and providing authentication with SSL certificates.

To edit system configuration parameters for a Decoder or Log Decoder:

1. Go to  **(Admin) > Services**.

2. Select a Decoder or Log Decoder service, and select  **> View > Config**.
   The Services Config view for the service is displayed with the General tab open.

3. Under **System Configuration**, click in a field that you want to edit **(Compression**, **Port**, **SSL FIPS Mode**, **SSL Port**, **Stat Update Intervals**, or **Threads**). Type a new value.
4. When finished editing, click **Apply.**
   The settings become effective immediately.



Enable CPU Usage Statistics for Installed Content

The Decoder provides CPU utilization statistics for all installed content, which you can use to reveal how much CPU time is used by parsers, feeds, application rules, and lexical scanning. The statistics are visible as Stat nodes in the service tree from the Explore view when `/decoder/parsers/config/detailed.stats` is enabled and the Decoder is capturing the stats.

Each piece of content is accounted as a single percentage value (0-100) regardless of the number of parse threads running. The percentage represents an average of the CPU utilization for the content across all threads.

To enable usage statistics monitoring:

1. In the NetWitness User Interface, go to **(Admin)** > **Services**.
2. Select a Decoder service and click > **View** > **Explore**.
   The Explore view for the Decoder is displayed.
3. Open `/decoder/parsers/config/` and in the right pane, select the `detailed.stats` parameter.

4. Change the value to **yes**. If the Decoder is not capturing data, start capture.
   When you open the Decoder Stats node in the Explore view, the new statistic is visible.

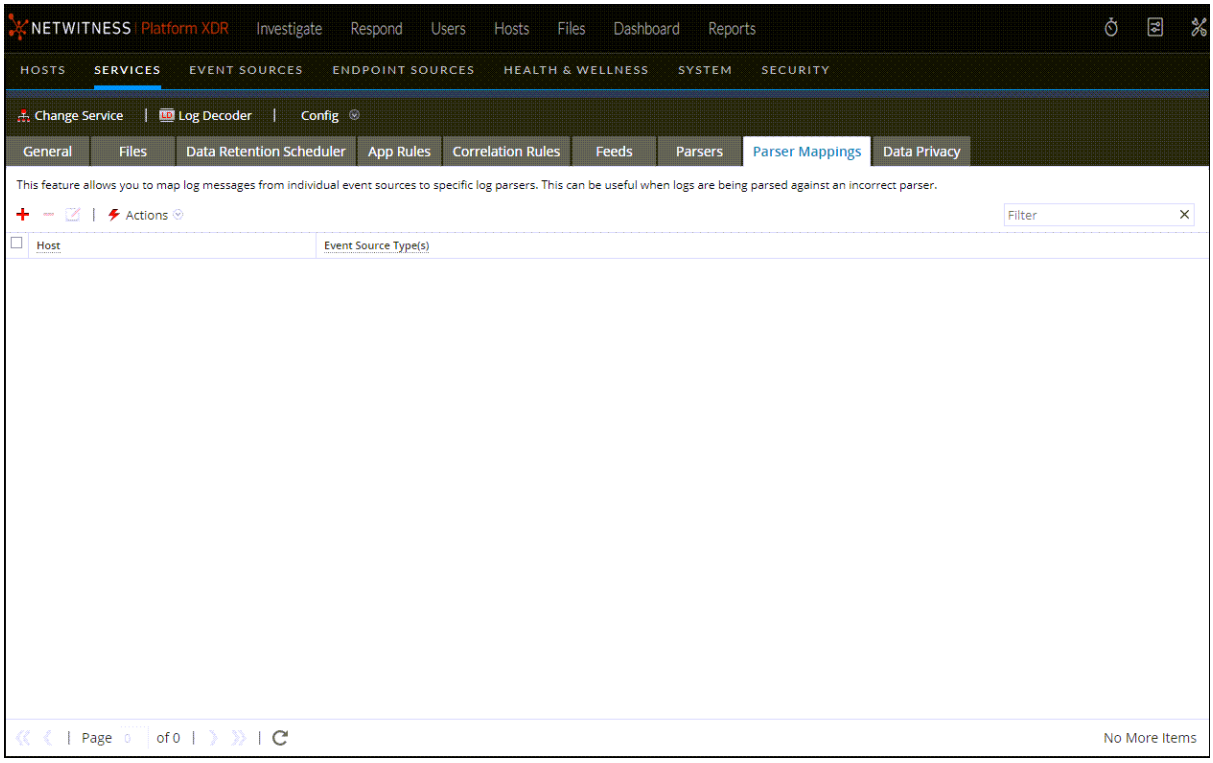
Enable Parser Mappings

This topic tells administrators how to enable event source mapping on a Log Decoder.

The Log Collector discovers the event source type on a per-message basis. If the correct parser is not identified for the event source, a small percentage of logs may be misidentified. The misclassified messages do not populate event source rules and alerts, and the reports do not have the correct data. If there are multiple event source types associated with an IP address, it makes it difficult for the parsers to identify the exact event source from which the logs are generated.

If you map an IP address to its event source type, the Log Decoder can identify the event source from which the log is generated. When messages are delivered to the Log Decoder from a mapped event source, only the assigned parsers are queried to find event matches.

You can assign event source types to IPV4, IPV6, or the hostname value of the event source. You can also assign multiple event source types to a single IP address. You can also use the Log Collector ID when different event source types with the same IP address are sent to different Log Collectors.



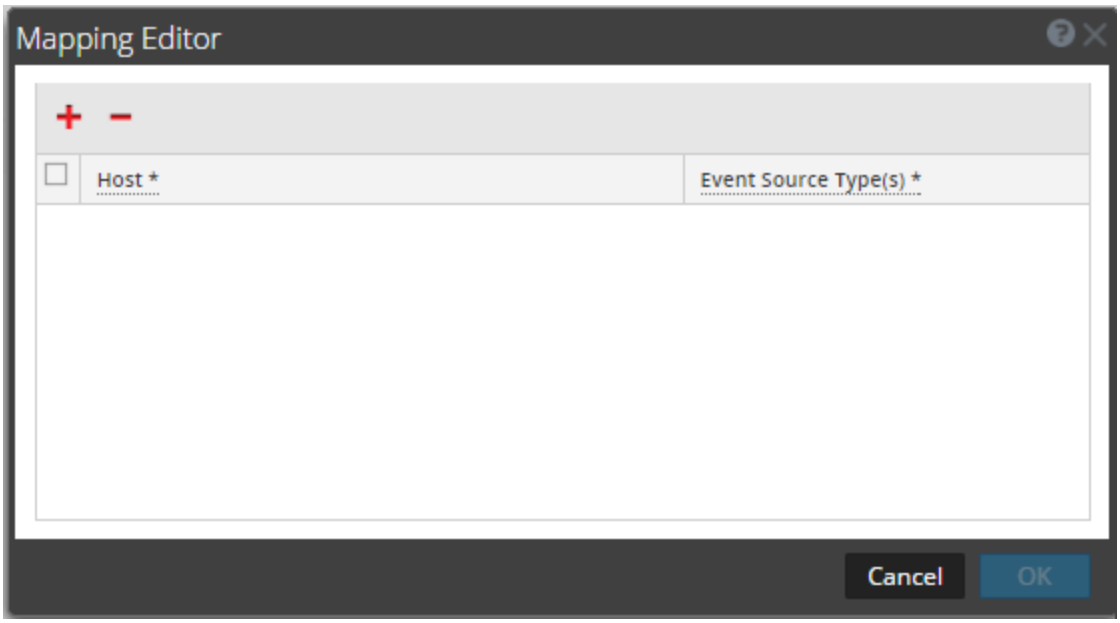
Note: You can also enable parser mapping functions by navigating to  (Admin) **> Event Sources > Discovery.**

Enable IP Address to Event Source Mapping

To enable an IP address to event source mapping:

1. Go to  **(Admin) > Services** and select a Log Decoder.
2. Select  **> View > Config**.
3. In the Configuration page, select the **Parser Mappings** tab.

The Parser Mappings tab is displayed in the Services Config view.



Update IP to Event Source Mapping

To update an IP to event source mapping:

1. Go to (Admin) > **Services**.
2. Select a **Log Decoder**, and in the **Actions** column, select > **View** > **Config**.

   The Services Config view is displayed.
3. Select the **Parsers Mapping** tab.
4. Click .

   The Mapping Editor is displayed.

5. Any of the following mappings can be defined:
   - **One Host and One Event Source Type**

     In the **Host** field, enter the hostname.

     For example: `10.0.0.1`
   - In the **Event Sources(**s) field, enter the event source type.

     For example: `apache`
   - **One Host and One or More Event Source Types**

     In the **Host** field, enter the hostname.

     For example: `10.0.0.1`
   - In the **Event Source(s)** field, enter the event source type.

     For example: `apache,sap,aix`
   - **One Host, One Log Collector, and One Event Source Type**

     In the **Host** field, enter the hostname and Log Collector ID.

     For example: `10.0.0.1,LC-1`
   - In the **Event Source(s)** field, enter the event source type.

     For example: `apache`
   - **One Host, One Log Collector ID, and One or More Event Source Types**

     In the **Host** field, enter the hostname and Log Collector ID.

     For example: `10.0.0.1,LC-1`
   - In the **Event Source(s)** field, enter the event source type.

     For example: `apache,sap,aix`

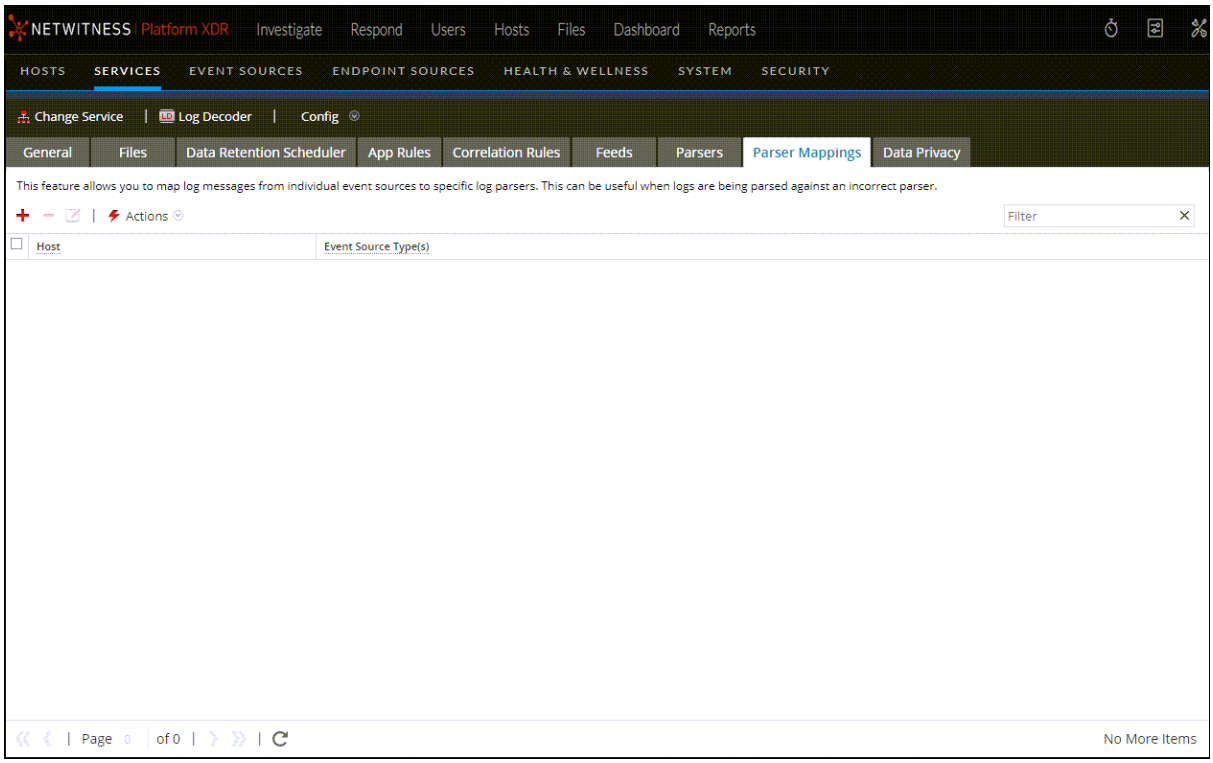
Note: The event source types are processed in the order you enter the parsers and if one or more parsers matches a log, the first parser in the list is queried. The Host/IP can be IPv4, IPv6, or Hostname.

6. Click **OK**.

   The Parser Mapping is added.

7. To cancel the parser mappings selection, click **Cancel**.

Read IP to Event Source Type Mappings



To read an IP to event source type mappings:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Services Config view is displayed.

3. Select the **Parsers Mapping** tab.

   The mappings are displayed.

Edit IP to Event Source Type Mappings

To edit IP to event source type mappings:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mapping you want to edit.

   Note: You can only edit one mapping at a time.
5. Click .
6. In the **Event Source(s)** field, modify the event source(s).

   Note: The host is not editable and the field is disabled.
7. Click **OK** to accept the edited Event Source.
8. To cancel the changes, click **Cancel**.

Delete IP to Event Source Type Mappings

To delete IP to event source type mappings:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mapping you want to delete.
5. Click .

   The mapping is deleted and the grid is refreshed.
6. To cancel the changes, click **Cancel**.

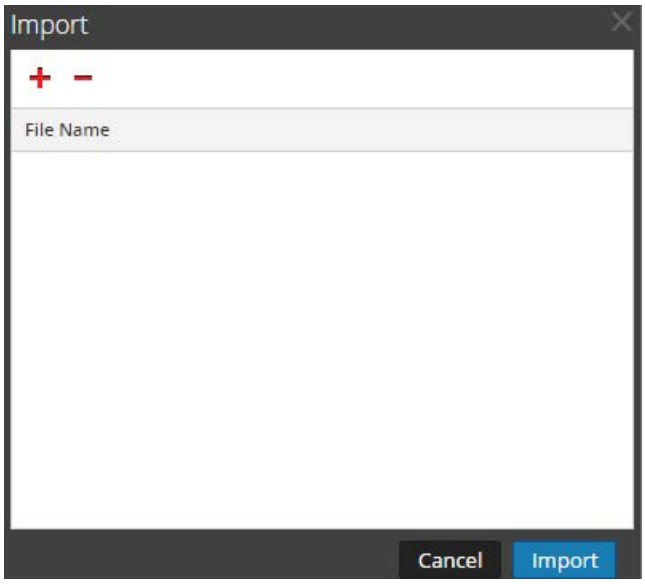
Sort the Hostname or Event Source Type

To sort the hostname or event source type:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. To sort a column, click in the column header.

Event Source Types are applied for your selected IP address. Logs are parsed against the parsers in the order they are listed.



Import IP to Event Source Mapping Entries

To import IP to event source mapping entries:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select **Actions > Import**.

   The Import dialog is displayed.

5. Click .
6. Select the file you want to import and click **OK**.
7. To load the parser, click **Import**.

Note: You can only import one .csv file at a time.

Export IP to Event Source Mapping Entries

To export IP to event source mapping entries:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mappings you want to export.

5. Select **Actions > Export > Selection**.

   The Export Selection dialog is displayed.

6. Enter the file name and click **Export**.

Search IP to Event Source Mapping Entries

To search IP to event source mapping entries:

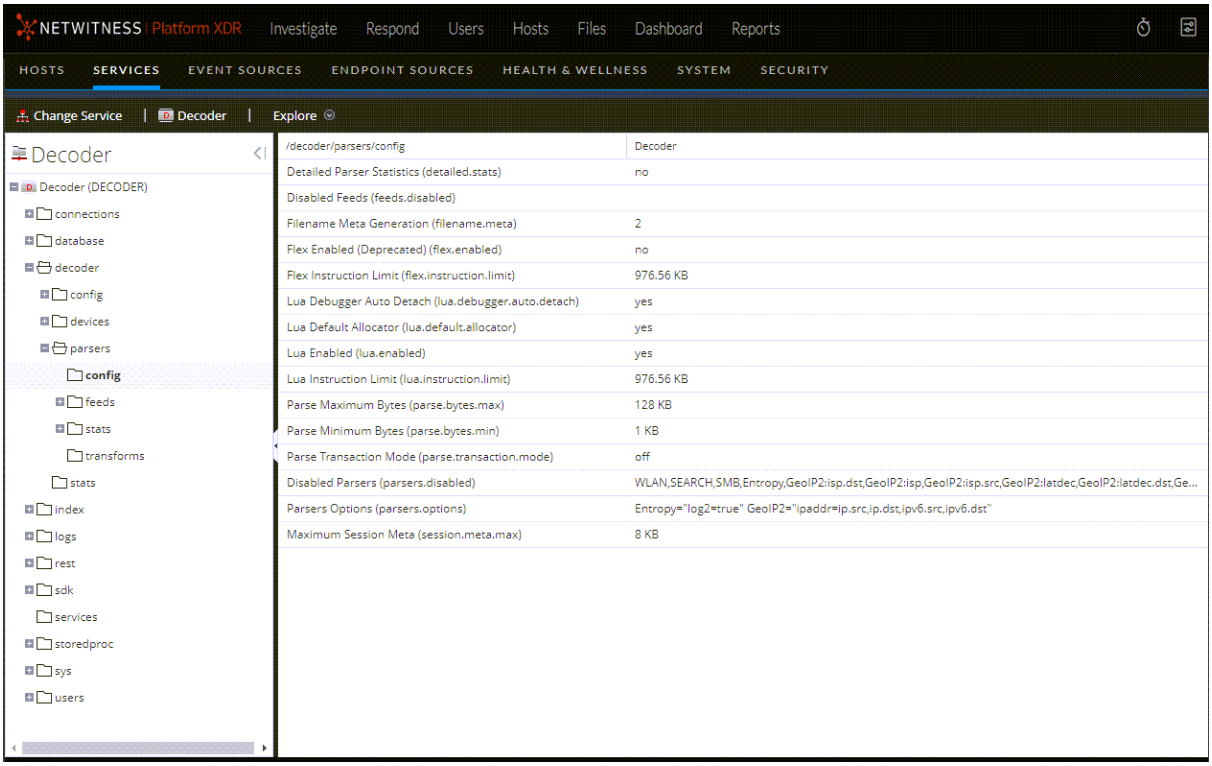
1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. In the Parsers Mappings toolbar, enter the Host or Event Source in the **Filter** field.
5. Click **Enter**.

The Hosts or Event Sources that match the names entered in the **Filter** field are displayed.

Enable or Disable Lua and Flex Parsing Systems

This topic tells administrators how to enable or disable Lua and Flex parsing systems on a Decoder or Log Decoder. Flex parsers are deprecated and disabled by default.



The settings to enable or disable Lua and Flex parsing systems are configured correctly by default and you do not typically have to change them. However, you may need to adjust these settings at the request of NetWitness Customer Care or for troubleshooting purposes.

In addition to configuring individual parsers, you can enable and disable all Lua parsing as well as all Flex parsing in the Services Explore view. You enable and disable the Lua parsing and Flex parsing systems settings separately, but they work in the same way.

- If you **disable** the Lua or Flex parsing system, the corresponding parsing system is disabled and no parsers are loaded.
- If you **enable** the Lua or Flex parsing system, the corresponding parsing system is enabled and individual parsers are enabled and disabled following the current individual configurations.

To enable or disable Lua and Flex parsing systems on a Decoder or Log Decoder:

1. Go to **(Admin) > Services.**
2. Select a Decoder or Log Decoder and **> View > Explore.**
   The Services Explore view for the selected service is displayed.
3. In the Node list, navigate to and select **`/decoder/parsers/config`**.

4. In the values panel:
   - To enable the Lua parsing system, in the value field for `lua.enabled`, type **yes**.
   - To disable the Lua parsing system, in the value field for `lua.enabled`, type **no**.
   - To enable the Flex parsing system, in the value field for `flex.enabled`, type **yes**.
   - To disable the Flex parsing system, in the value field for `flex.enabled`, type **no**.

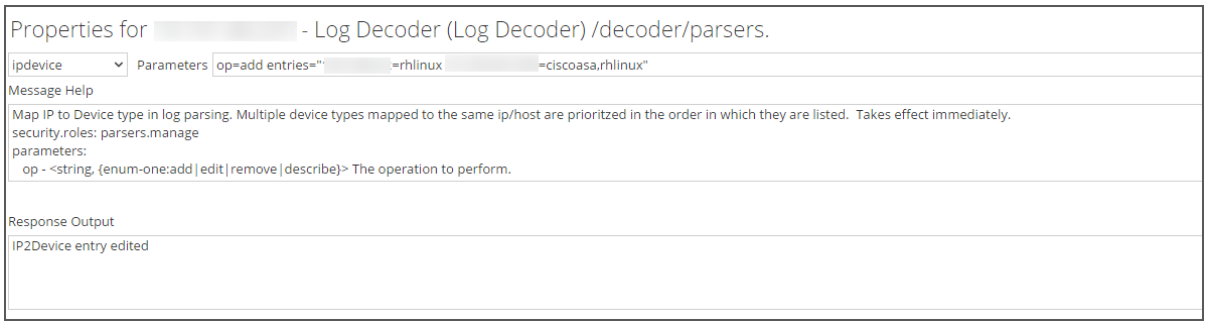
Map IP Address to Service Type for Log Parsing

This topic describes the procedure to map an IP address to a service type for log parsing.

The Log Collector discovers event source type on a per-message basis. If the correct parser is not used for the specific event source, the messages that are common between event source types are misclassified. The misidentified messages will not populate service rules and alerts, and the reports will not have proper information. Also, if there are multiple services associated with an IP address, it can be difficult for the parsers to identify the exact service from which the log is generated.

If you map an IP address to its services, the Log Decoder can identify the service from which the log is generated. When messages come into the log decoder from a mapped service, the assigned parsers are loaded to find event matches.

You can assign service types to IPV4, IPV6 or hostname value of the event source. You can also assign multiple service types to a single IP address. You can also use the CollectorID when different service types with the same IP address are sent to different collectors.



Map an IP Address to a Service Type

To map an IP address to a service type, do the following:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select  **> View > Explore**.
3. Go to **/decoder/parsers** node, right-click **parsers**, and select **Properties**.
4. In the **Properties** view, specify the **ipdevice** command with the following parameters:

   `op=add/remove entries="`***`ipaddress`***`=`***`service`***`"`

   for example, `op=add entries="10.100.201.300=ciscoasa"`
5. Click **Send**.

IPdevice Command

In the `ipdevice` command, three operations are available:

- `add`: This operation adds or updates entries in the ipdevice map. Multiple space delimited address/type pairs may be specified.

  `op=add entries="`***`address`***`=`***`service type`***`"`

- `remove`: This operation removes entries from the ipdevice map. Multiple space delimited address/type pairs may be specified.

  `op=remove entries="`***`address`***`"`

- `describe`: This operation returns the values currently in the ipdevice map.

Map an IP Address to a Time Zone

This topic discusses NetWitness support for Event Time.

Often times logs do not fully specify timestamps and may be missing time zone information. To properly normalize such timestamps to UTC, the Log Decoder provides the ability to associate devices from a specific address (IPv4 or IPv6) or hostname to a time zone or a fixed offset.

Timestamp consideration for log files:

- Some logs are in UTC format.
- Some logs that are not in UTC include a timezone offset value to adjust the time accordingly.
- For logs that use local time, with no offset provided, you can create a source mapping to manually adjust times for logs from that event source.

Three time zone formats are currently accepted and are shown in the following examples:

- Olson format: `America/Anguilla`
- POSIX format: `AST2:45ADT0:45,M4.1.6/1:45,M10.5.6/2:45`
- Offset by Minutes format: `= -500`

NetWitness maps the device address (IPv4 or IPv6) or hostname to a specific time zone or offset. Event time meta that is parsed from a log that is from a mapped address and does not include an offset or time zone as part of the timestamp is adjusted to UTC according to the mapping.

To map an IP address to a time zone, do the following:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.
4. In the **Properties** view, specify the `iptmzone` command with the following parameters:

   `op=add entries="`***`ipaddress`***`=`***`timezone`***`"`

   for example: `op=add entries="10.10.10.10=Africa/Addis Ababa"`
5. Click **Send**.

tzinfo Command

You can view the strings that can be used to specify the time zone by using the `tzinfo` command.

To view the time zone strings, do the following:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.

4. In the **Properties** view, specify the `tzinfo` command with the following parameters:

   `op=tznames`

5. Click **Send**.

The list of time zone strings is returned in the **Response Output** text box.

iptmzone Command

In the `iptmzone` command, three operations are available:

- `add`: This operation adds or updates entries in the iptmzone map. Multiple space delimited address/type pairs may be specified.

  `op=add entries="address=time zone"`

- `remove`: This operation removes entries in the iptmzone map. Multiple space delimited address/type pairs may be specified.

  `op=remove entries="address"`

- `describe`: This operation returns the values currently in the iptmzone map.

Examples

The following examples provide instances for mapping IP addresses to time zones:

- If you want to map two different entries with different IPV4 values and time zone, enter the following parameter in the **iptmzone** command and click **Send**

  `op=add entries="10.10.10.10=America/Anguilla 10.10.10.11=Pacific/Rarotonga"`

- If you want to remove an entry for a single IPV4 value and time zone, enter the following parameter in the **iptmzone** command and click **Send**.

  `op=remove entries="10.5.245.9"`

- If you want to create a single entry for an IPV6 value and time zone, enter the following parameter in the **iptmzone** command and click **Send**.

  `op=add entries="2001:DB8:85A3::8A2E:370:7334=America/Anguilla"`

- If you want to create a single entry to map an IPV4, IPV6, or hostname with the Minute Offset, Olson, or POSIX format, enter the following string in the **iptmzone** command and click **Send**.

  ```
  op=add entries="10.168.0.2=America/Anguilla
  2001:DB8:85A3::8A2E:370:7334=0500 nwappliance21=EST5EDT,M3.2.0/2,M11.1.0"
  ```

Change the Date format

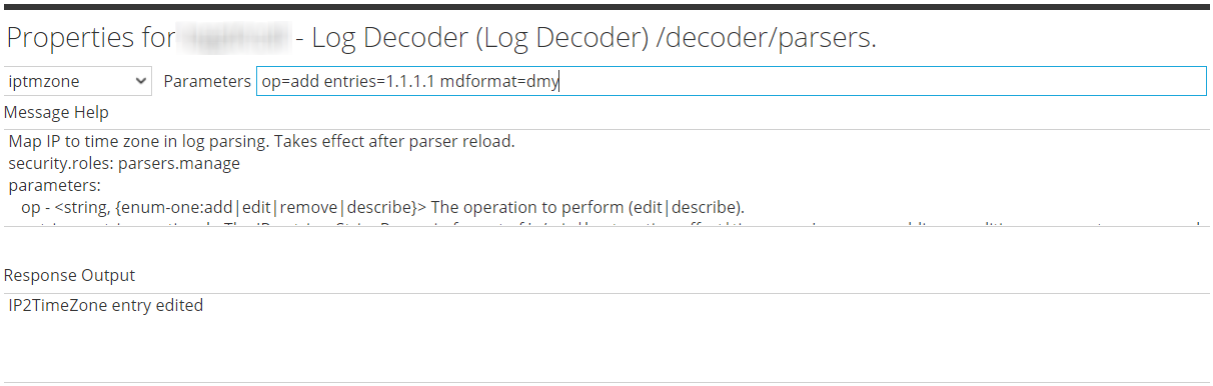
The Log Decoder parsing engine uses the `event.time` meta key to keep track of the time an event occurs for incoming log messages. You can use the `mdformat` for the **iptmzone** command to change the date format. The Log Decoder currently has the ability to change the dates in the logs to have the following format:

```
mdy or dmy (month/day/year or day/month/year)
```

Notes:

- Event time metadata in a parser does not account for `dmy` and `mdy`.
- Currently, there is no functionality to detect this scenario and adjust parsing automatically.

To change the date format, do the following:



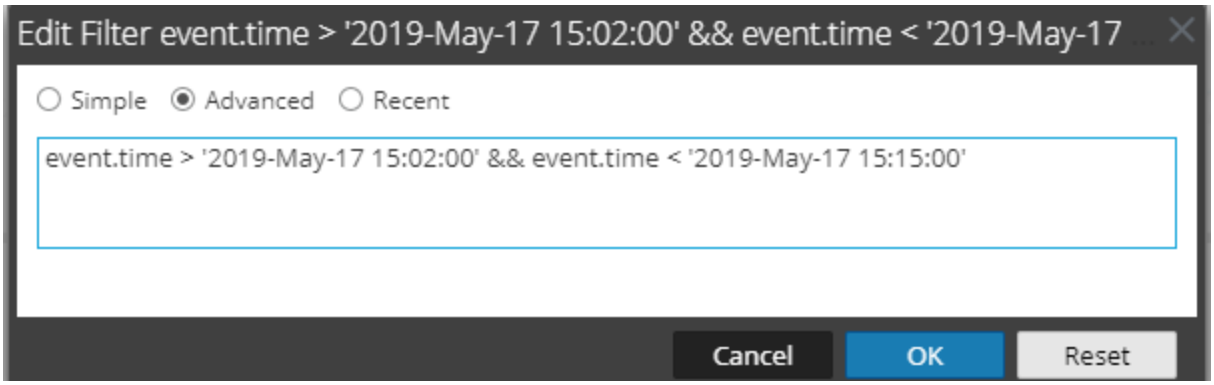
1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select; **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.
4. In the **Properties** view, select **iptmzone** from the drop-down list, and specify the command with the following parameters:

   `op=add entries="<ipaddress>" mdformat=[dmy | mdy | none]`

   for example: `op=add entries="1.1.1.1" mdformat=dmy`

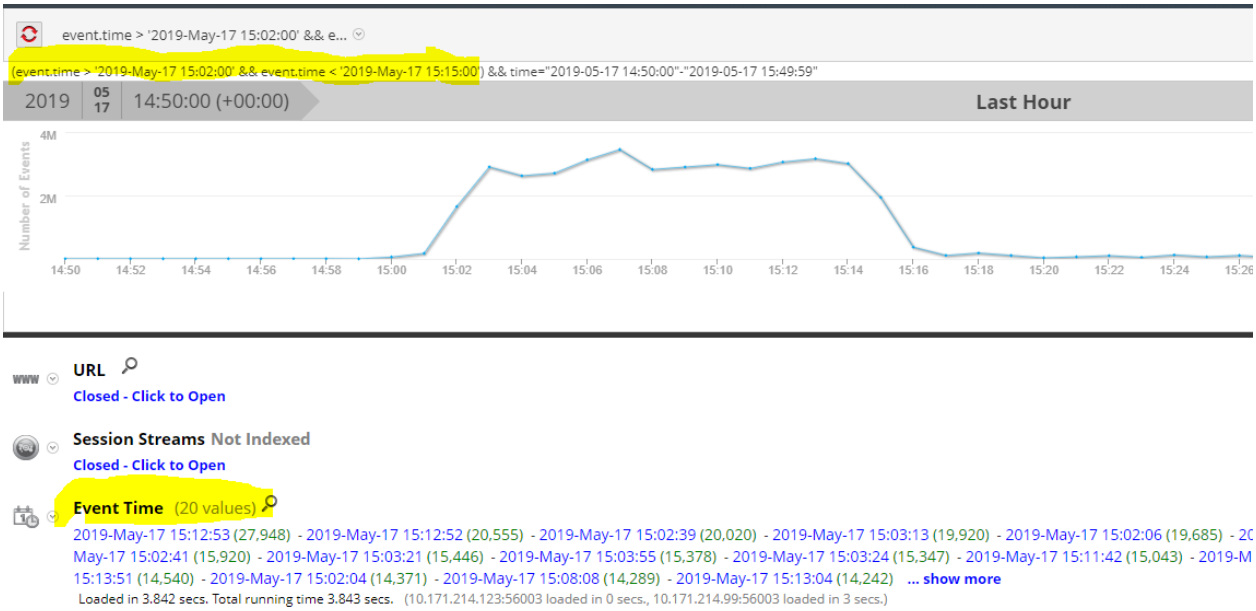
   Where:

   - `ipaddress` is the Device IP address, and
   - `mdformat` can be **dmy**, **mdy**, or **none**.



5. Click **Send**.

NetWitness maps the IP address along with the date format in the Log Decoder. Event time meta items are updated according to their respective mappings.



Event Time Filter Example

If you want to see logs that have an event time between 3:02 PM and 3:15 PM on May 17, 2019, create the following filter:

Note: The query builder may tell you "invalid expression," but that is a validation error in the User Interface. The query works because even though this is a text (string) search, the system actually compares the ASCII values. So, for example the expression **A < B** would be true.

Below is a sample of the event meta values returned from the query:

Missing Year Support

If there is no year associated with a format string, the parser attempts to populate the year heuristically. In most cases, the value is populated based on the current year. The current year is assigned as the message year (UTC), as per the clock on the Log Decoder.

The following are the various other scenarios:

1. Latent log during transition to new year.
2. Logs from forward time zones (or skewed clocks) just before new year transition.
3. Latent logs received where a leap day cannot be successfully assigned to an appropriate leap year.

Latent log during transition to new year

If the day is more than 31 days into the future, the year is decremented.

For example,

The message date is Dec-31. The current date is 2018-Jan-1. The temporary assigned date, 2018-Dec-31, will be more than 31 days into the future.

This will cause the year component to be decremented to 2017, resulting in a reasonable message time.

Logs from forward time zones (or skewed clocks) just before new year transition

If the day is more than 334 days into the past, the year is incremented.

For example,

The message date is Jan-1. The current date is 2017-Dec-31. The temporary assigned date, 2017-Jan-1, will be more than 334 days into the past.

This will cause the year component to be incremented to 2018, resulting in a reasonable message time.

Latent logs received where a leap day cannot be successfully assigned to an appropriate leap year

If the day (Feb 29) is invalid (say, the assigned year is NOT a leap year), the relative position to the current time cannot be calculated. To do this, the year is decremented in an attempt get a valid time stamp.

Because the position of the leap day relative to the transition to the new year, along with the expectation that no logs would be received this far into the future, we do not ever make an attempt to increment the year to produce a valid time stamp.

After the year is decremented, the same logic is then followed (refer to statement 1 and 2). If the result is still an invalid day. The parser throws and a valid message time cannot be parsed.

Limitations

Note: Currently, there is no mechanism to assign a year to the import of logs.

As this pertains to leap days, if you find the correct leap year, an inconsistent data would result. For example, if a set of messages is two years old and during a leap year, only a single day would remain which is accurate. Because of the heuristic described above, the remaining set of messages would have time stamps one year too.

For data consistency, usually you cannot find valid leap years beyond 1 month and less than 11 months.

Examples

The following examples provide instances for logs with year and logs without year:

- If the log is with year, event time is generated as below:

```
%emcavamar: 1704^^2017-04-07^^07:50:02^^1^^<event-source NodeID="avamar"
ProgramName="com.avamar"/>^^1270626^^SYSTEM^^ERROR^^OK^^MCS:DPN_
Proxy^^Internal server error^
<MESSAGE
     id1="1:01"
     id2="1"
     eventcategory="1605020000"
     functions="&lt;@msg:*PARMVAL($MSG)&gt;&lt;@event_time:*EVNTTIME
     ($MSG,'%W-%G-%F %H:%U:%O',fld2,fld3)&gt;"
     content="&lt;fld1&gt;^^&lt;fld2&gt;^^&lt;fld3&gt;^^&lt;fld4&gt;^^
     &lt;&lt;event-source NodeID=&quot;&lt;hostname&gt;&quot;
     ProgramName=&quot;&lt;fld8&gt;&quot;/&gt;^^&lt;fld9&gt;^^&lt;cate
     gory&gt;^^&lt;severity&gt;^^&lt;event_
     type&gt;^^&lt;agent&gt;^^&lt;event_description&gt;" />
```

- If the log is without year, event time is still generated, The current year is assigned as the message year (UTC), as per the clock on the Log Decoder.

```
%emcavamar: 1704^^04-07^^07:50:02^^1^^<event-source NodeID="avamar"
ProgramName="com.avamar"/>^^1270626^^SYSTEM^^ERROR^^OK^^MCS:DPN_

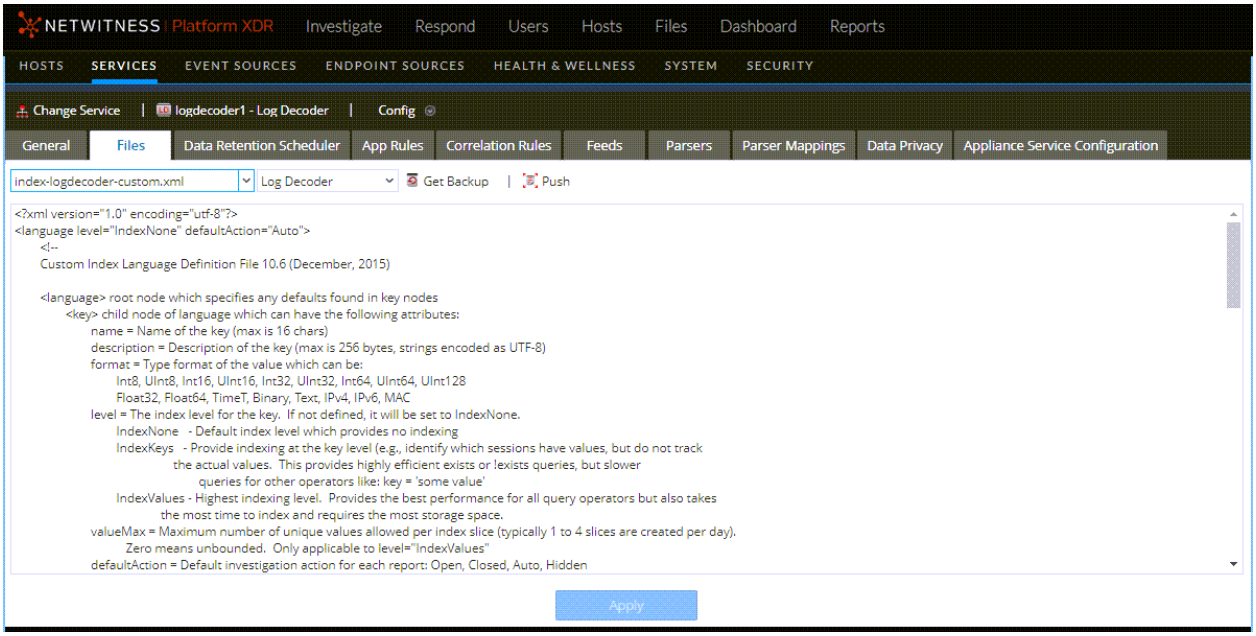
```

Obtain Log Files from a Pre-11.0 Log Decoder

NetWitness 11.0. added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available.

To enable logs preview for a pre-11.0 Log Decoder, follow these steps on the Log Decoder:

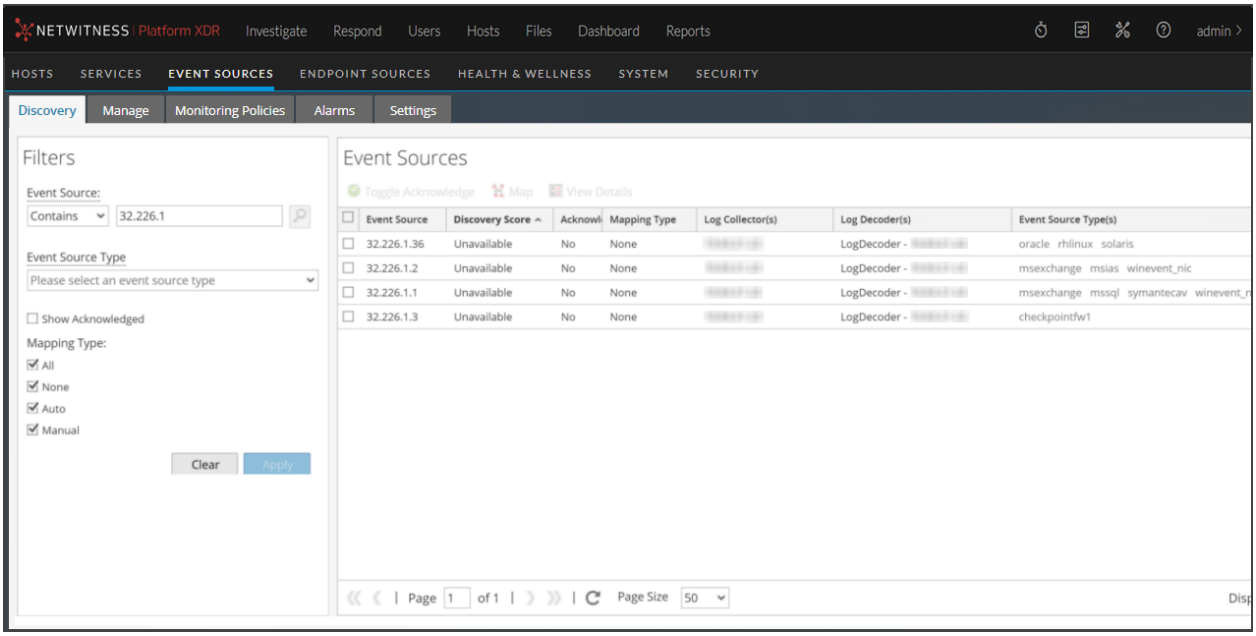
1. Go to (Admin) > **Services** > select a **Log Decoder**, then select > **View** > **Config**.
2. Click the **Files** tab and select **index-logdecoder-custom.xml** from the drop-down menu.
3. Add the following three lines at the end of the file (before the closing language tag):



```
<key description="Device IP" level="IndexValues" name="device.ip" format="IPv4"
valueMax="100000" defaultAction="Open"/>
<key description="Device IPv6" level="IndexValues" name="device.ipv6" format="IPv6"
valueMax="100000" defaultAction="Open"/>
<key description="Device Host" level="IndexValues" name="device.host" format="Text"
valueMax="100000" defaultAction="Open"/>
```

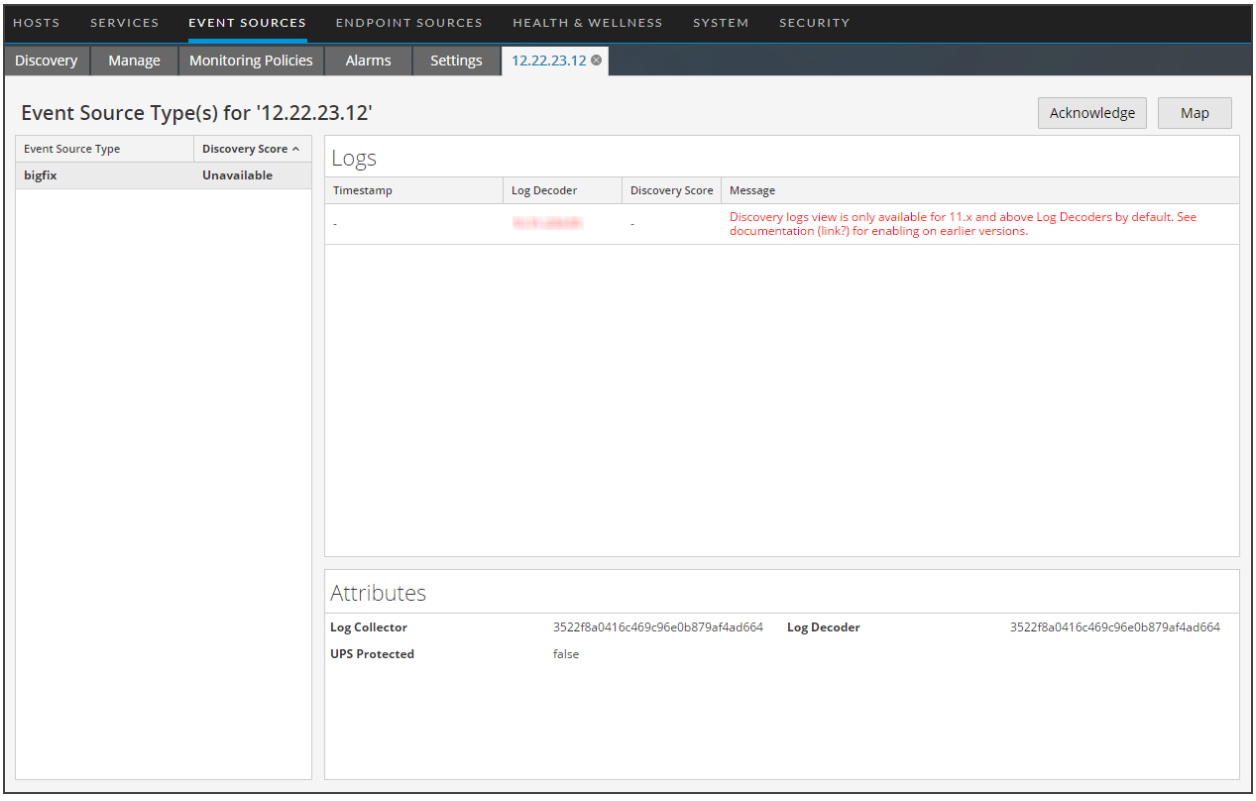
4. Click **Apply**.
5. Restart the Log Decoder service as follows.

   Select Log Decoder service > **Explore** > **decoder** > **Properties** > **reset**. You select **reset** from a drop down menu.



Click **Send** after you select reset.

This is an example of the **index-logdecoder-custom.xml** file.



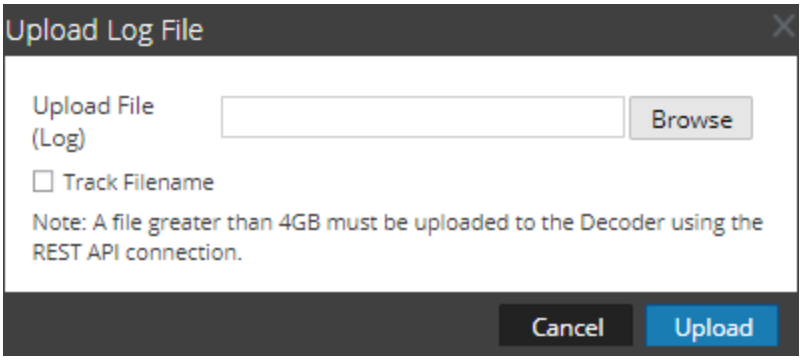
Note: Discovery Scores are only available for 11.x and above Log Decoders. Discovery Scores for pre-11.x Log Decoders are displayed as Unavailable.

The following example shows the Discovery Score as **Unavailable** in the **Details** view for a pre-11.0 Log Decoder.

Note: Device logs are only available for 11.x and above Log Decoders.

The following example shows the message that is displayed in the Logs panel for a pre-11.0 Log Decoder.

Upload a Log File to a Log Decoder



There are occasions when you want to analyze a log file that is not available on the service you are using. You can upload a log file captured on another service to NetWitness. Log filenames are of the type **.log**.

When a log file is uploaded to a Log Decoder, the Log Decoder analyzes and generates meta for each log it contains. These logs are added to the already decoded logs on the Log Decoder and are available for analysis. NetWitness includes a filename tracking option that makes searching for a particular set of logs easier. When the log file is uploaded with file tracking, the Log Decoder adds meta to each log based on the uploaded filename. You can then filter sessions for analysis using that meta.

The option to upload a log file is dimmed when other Log Decoder operations prevent an upload from occurring, for example, when the Log Decoder is capturing logs.

To import a log file to a Log Decoder:

1. Go to  **(Admin)** **Services**.
2. Select a Log Decoder in the **Service** grid, and select  **> View > System**.
   The Services System view for the Log Decoder is displayed.
3. In the toolbar, click **Upload Log File**.

4. To choose a log file, click **Browse**.
   A directory view is displayed.
5. Select the log file that you want to upload.
   The filename is displayed in the **Upload File** field.
6. If you want the Log Decoder to add meta to the logs based on the filename, click the checkbox next to **Track Filename**.
7. To upload the file, click **Upload**.
   The selected file is uploaded and a status message indicates that the file is uploaded. The log file is available for analysis.

Upload a Packet Capture File

There are occasions when you want to analyze a packet capture file that is not available on the service you are using. You can upload a file captured on another service to NetWitness. Supported packet capture file types are `pcap` and `pcap.gz`.

When a packet capture file is uploaded to a Decoder, the Decoder creates sessions from the packet capture file packets. These sessions are added to the already decoded sessions on the Decoder and are available for analysis. NetWitness includes a filename tracking option that makes searching for a particular set of sessions easier. When the packet capture file is uploaded with file tracking, the Decoder adds meta to the sessions based on the uploaded filename. You can then filter sessions for analysis using that meta.

The option to upload a packet capture file is dimmed when other Decoder operations prevent an upload from occurring; for example, when the Decoder is capturing packets.

To select and upload a packet capture file:

1. Go to **(Admin)** > **Services**.

   The Administration Services view is displayed.

2. Select the Decoder name, and **> View > System**.

   The Services System view for the Decoder is displayed.

3. In the toolbar, click **Upload Packet Capture File**.

   The **Upload Packet Capture File dialog** is displayed.

4. To choose a capture file, click **Select**.

   A directory view is displayed.

5. Browse the directory and select the packet capture file that you want to upload.

   The filename is displayed in the **Upload File (pcap, pcap.gz)** field.

6. If you want the Decoder to add meta to the sessions based on the filename, click the checkbox next to **Track Filename**.

7. To upload the file, click **Upload**.

   A progress bar shows upload progress.

Upload time varies depending on the size of the file. When the file upload is complete, a status message is displayed. The file is now available for investigation.

Simultaneous Import and Capture

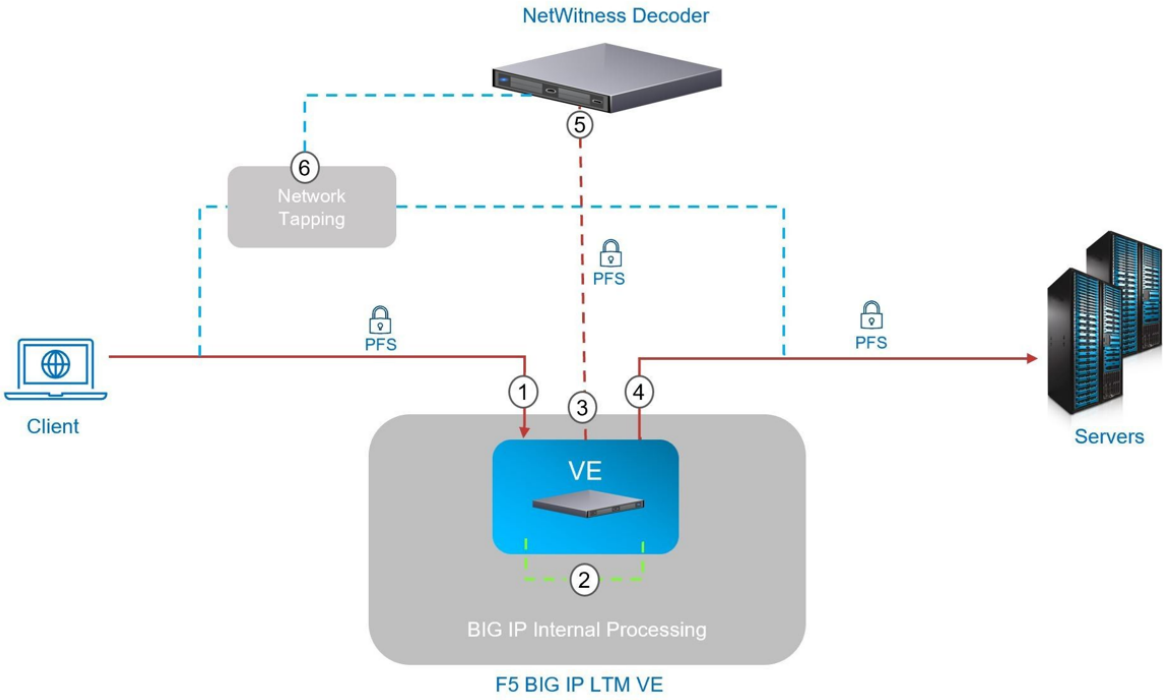
You can import or upload PCAPs while the capture is running using RESTful API. Make a note of the following points before you start importing during capture:

- The source file metadata is not created for imported PCAPs when the capture is running. If capture is stopped, the source file metadata is created as in older versions.
- The NWD files can be imported, but not while the capture is running. If you attempt to import an NWD file while the capture is running, the Decoder returns an error. An active import will block starting/stopping of import and capture.
- The file tracking meta is not created during the simultaneous import and capture.

F5 BIG IP - NetWitness Perfect Forward Secrecy Inspection Visibility

This topic discusses Perfect Forward Secrecy (PFS) Inspection Visibility with F5 BIG-IP Local Traffic Manager (LTM) and NetWitness Decoder integration.

NetWitness Decoder allows administrators to receive session keys from PFS sessions and decrypt each session traffic. It can receive session keys through its RESTful port, the PFS encrypted traffic through its capture interface, and supports the traffic decryption for inspection.



This solution utilizes functionality in iRule to extract session keys and deliver them to NetWitness Decoder via a sideband connection.

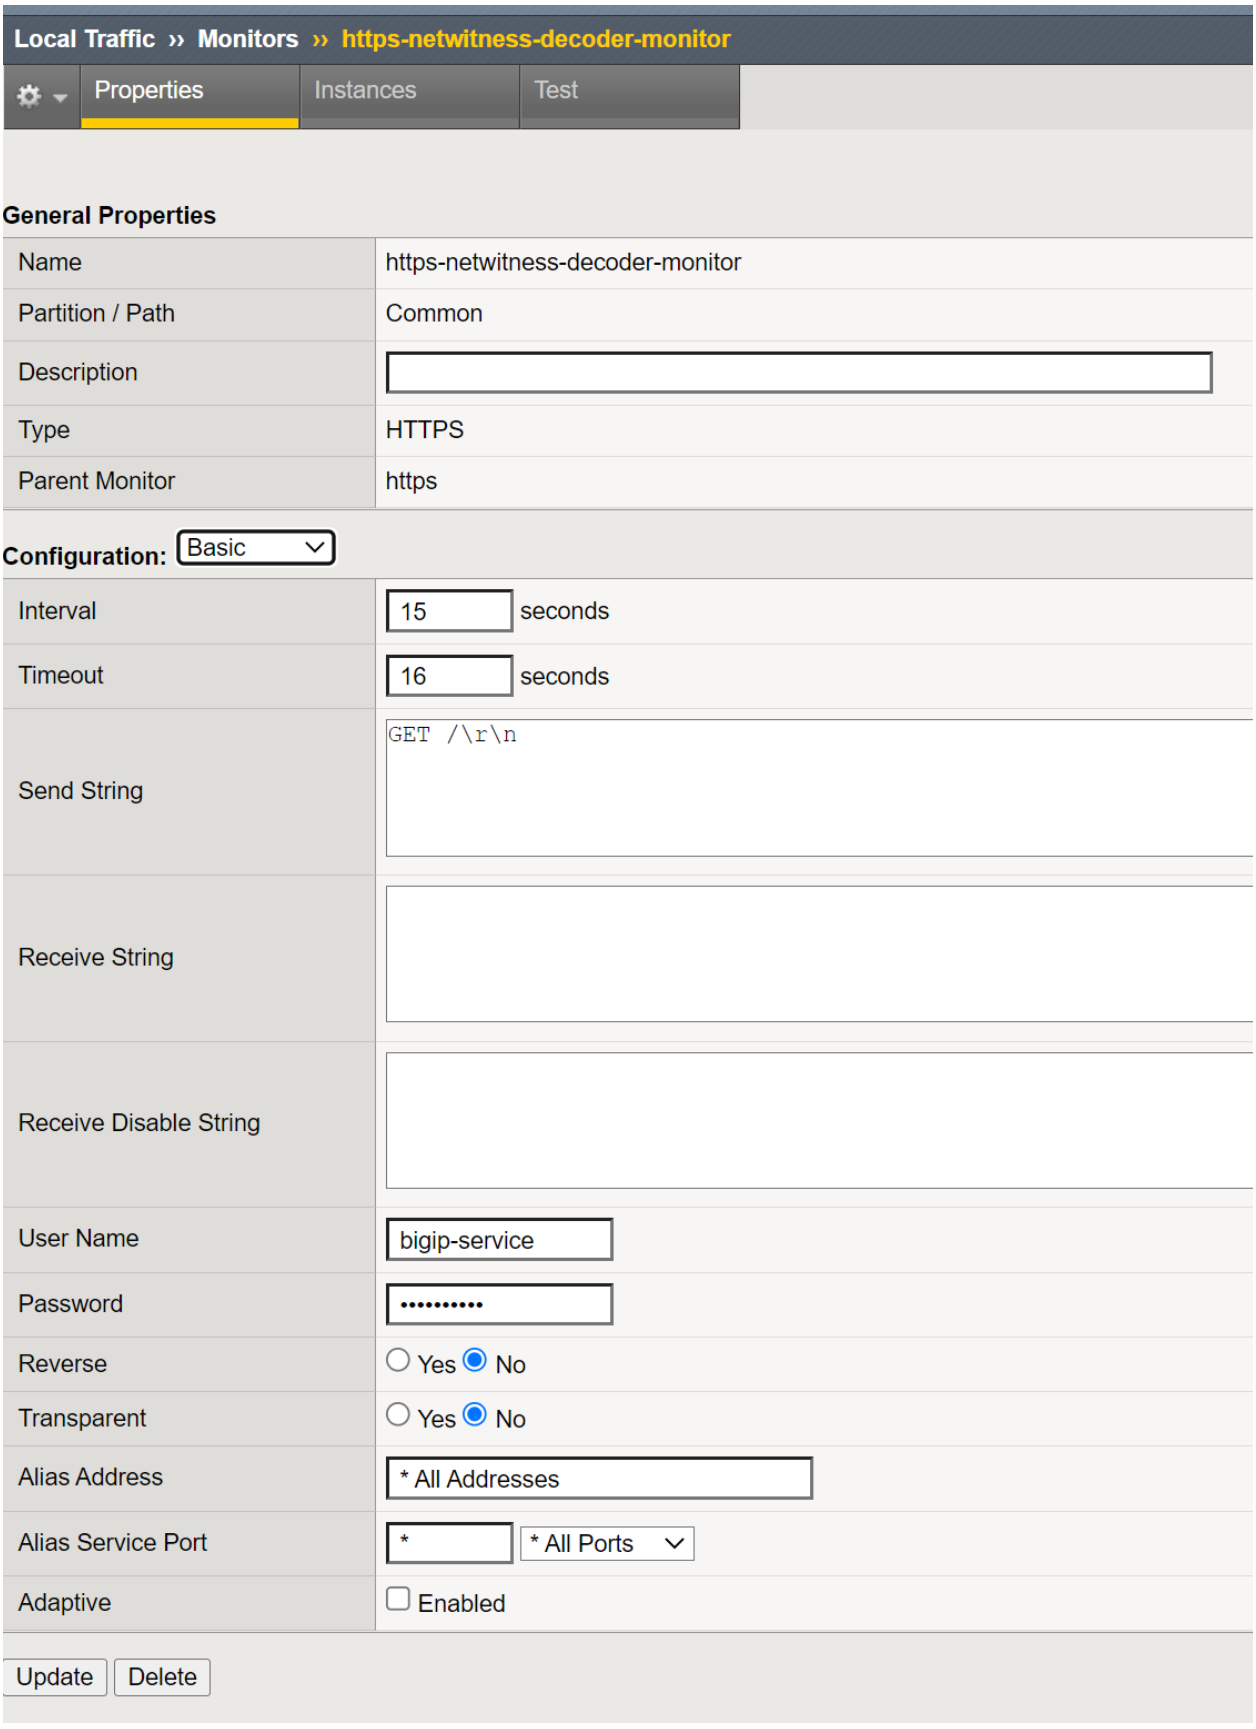
Prerequisites

A few prerequisites need to be considered in your environment for the integration of BIG-IP LTM and NetWitness Decoder.

- Deploy and Configure BIG IP LTM External Virtual Server (version 15.1.5 and above)
  - Configure Client SSL Profile with TLS 1.3 enabled.
  - Configure Server SSL Profile with TLS 1.3 enabled.
- Deploy and Configure NetWitness Decoder NON-FIPS (version 12.0 and above)
  - Install Decoder `nonfips` builds which support TLS 1.3 decryption.
  - Allow NetWitness Decoder RESTful port (default 50104) in your Network Firewall to receive keys from BIG-IP LTM.
    - NetWitness Decoder receives keys via HTTPS on RESTful port.
  - Create an Administrator account on the Decoder Device with role permissions `security.roles: decoder.manage` to forward TLS keys to Decoder.
    - Example name: bigip-service
  - Consider deploying NetWitness Decoder close to BIG-IP LTM so that it's feasible to mirror the encrypted traffic via TAP or Switch and avoid Network Latency in receiving TLS keys.

Deployment

1. A client connects to BIG-IP LTM using TLS with PFS cipher. The External Virtual Server has `clientssl` profile to decrypt traffic for inspection.
2. While inspecting the traffic an `iRule` on External Virtual Server collects the session keys and makes a `sideband` connection to Internal Virtual Server with the NetWitness Decoder as a `pool member`. The Internal Virtual Server has a `serverssl` profile to ensure traffic between BIG-IP LTM and NetWitness Decoder is protected since session keys are forwarded.
3. The Internal Virtual Server has a `HTTP profile` applied to manage the key transfer via HTTPS between BIG-IP LTM and NetWitness Decoder. `Oneconnect` profile is utilized and session keys will be sent on existing connections if available to reduce the connection setup overhead with NetWitness Decoder.
4. The External Virtual Server also has a `serverssl` profile to re-encrypt the traffic back to server pool.
5. The NetWitness Decoder receives the TLS keys from BIG-IP LTM on its RESTful port and decrypts the traffic ingested.
6. The Payload is not sent from BIG-IP LTM to NetWitness Decoder, this is received either from port mirroring configurations or a Network TAP infrastructure as shown above.



BIG-IP LTM Configurations

The BIG-IP configuration objects required include the following:

- HTTPS Monitor for monitoring NetWitness Decoder Node and Pool status (e.g online, offline etc…)
- Node and Pool objects for NetWitness Decoder.
- HTTP profile for managing key transfer to NetWitness Decoder via HTTPS.
- Server SSL profile for HTTPS sideband connection to NetWitness Decoder.
- Internal Virtual Server for receiving session keys and sideband communication with NetWitness Decoder.
- iRule: for session keys copying and sideband communication with Internal Virtual Server.

HTTPS Monitor

- Configure HTTPS monitor for NetWitness Decoder.
- Set the User Name and Password of the Administrator account created on Decoder device for BIG-IP transactions. Example Configuration using bigip-service account.

Delete

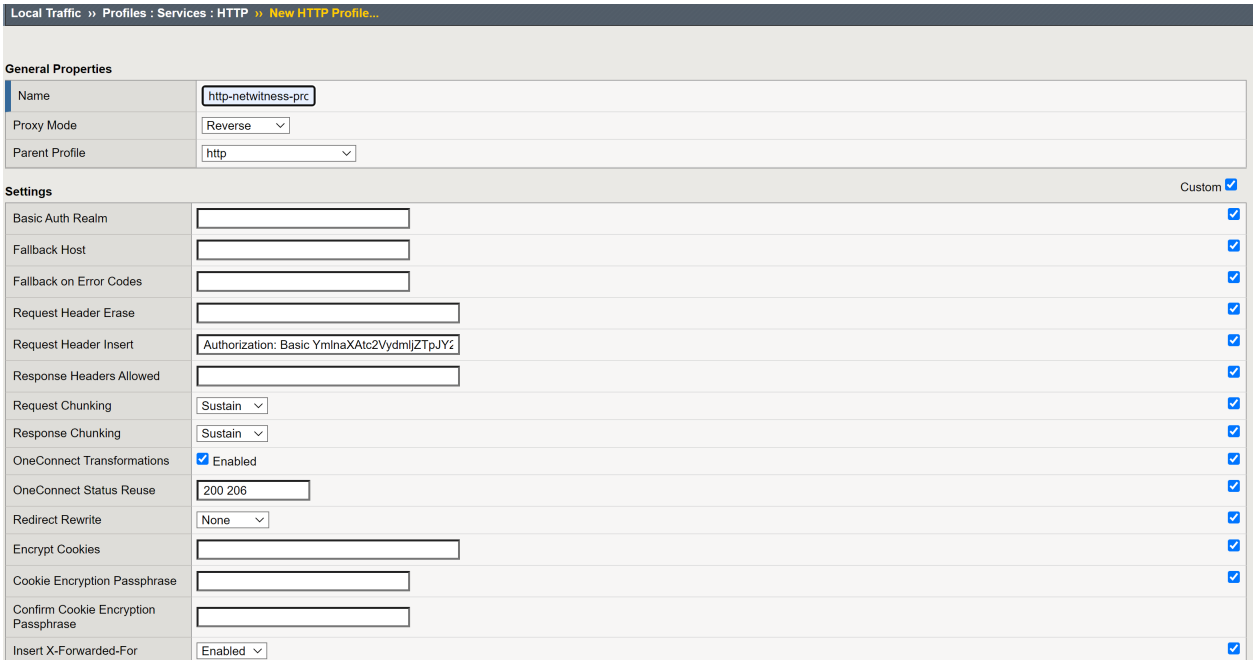
```
ltm monitor https /Common/https-netwitness-decoder-monitor
{
adaptive disabled
defaults-from /Common/https
destination *.50104
interval 15
ip-dscp 0
password <encrypted-bigip-service-account-password>
recv none
recv-disable none
send "GET /\r\n"
ssl-profile /Common/serverssl-secure
time-until-up 0
timeout 16
username bigip-service
}
```

Pool & Node

Configure Pool and Node objects.

- Select **Health Monitors** `https-NetWitness-decoder-monitor`
- Add **New Node** with the following:
  - Set **Node Name** example: `node-NetWitness-decoder`
  - **Address**: <Decoder IP Address >, **Service Port**: 50104 HTTPS and then click **Add**.
- Click **Finished** to create Pool with a Node.

```
ltm pool /Common/pool-netwitness-decoder-https {
members {
/Common/node-netwitness-decoder:50104 {
address 10.10.10.140
}
}
monitor /Common/https-netwitness-decoder-monitor
}
```



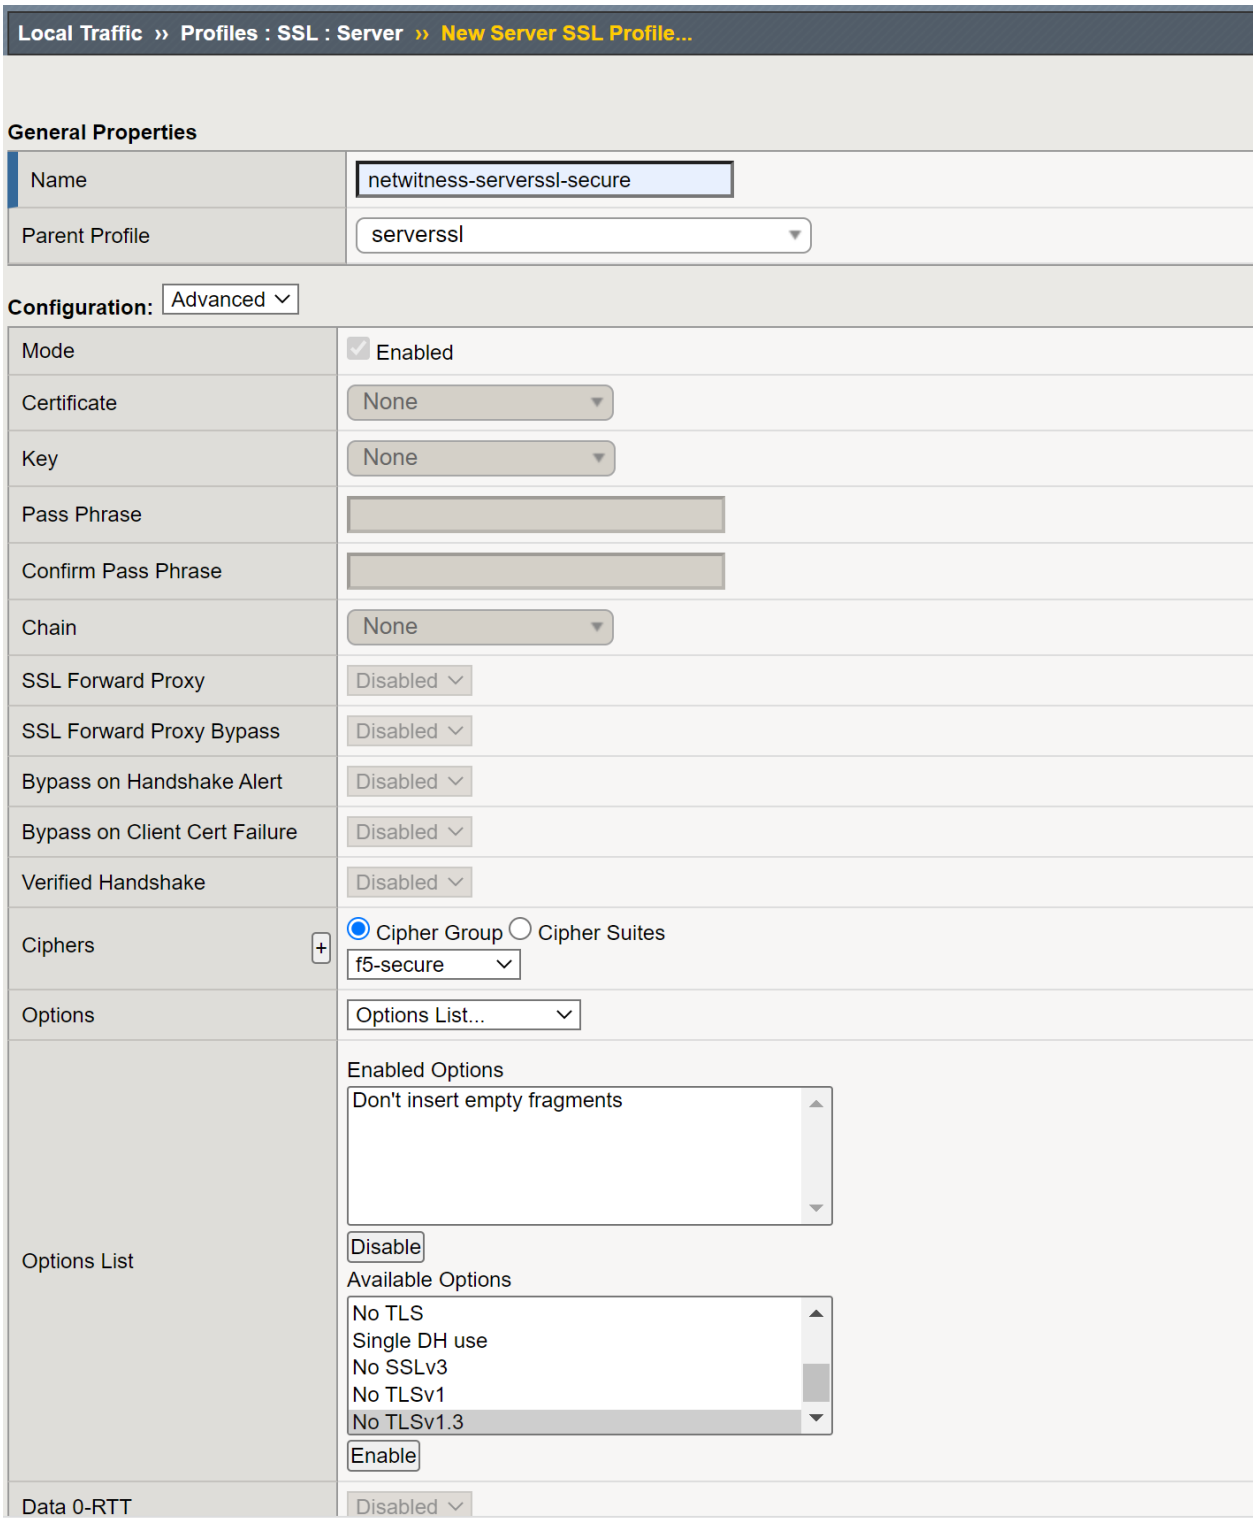
HTTP Profile

- Configure HTTP Profile **Name** `http-NetWitness-profile` to authenticate NetWitness Decoder device and send TLS keys.
- Set **Parent Profile** as **http**
- Check the **Custom** check box to edit the Settings.
- Set **Request Header Insert** field with basic Authorization header string
  - `"Authorization: Basic <Base64 encoded stirng (username:password)>"`
  - Example: `"Authorization: Basic YmlnaXAtc2VydmljZTpJY2FuU2VleW91QDEyMyE="`

- Where
  - username - Administrator account on Decoder device (example: bigip-service)
  - password - The account password

- Set **Insert X-Forwarded-For** as **Enabled** , this would add X-Forwarded-For header with the original Client IP of the session.

Rest of the other configurations can remain as default values.



```
ltm profile http /Common/http-NetWitness-profile {
accept-xff disabled
app-service none
basic-auth-realm none
defaults-from /Common/http
encrypt-cookies none
enforcement {

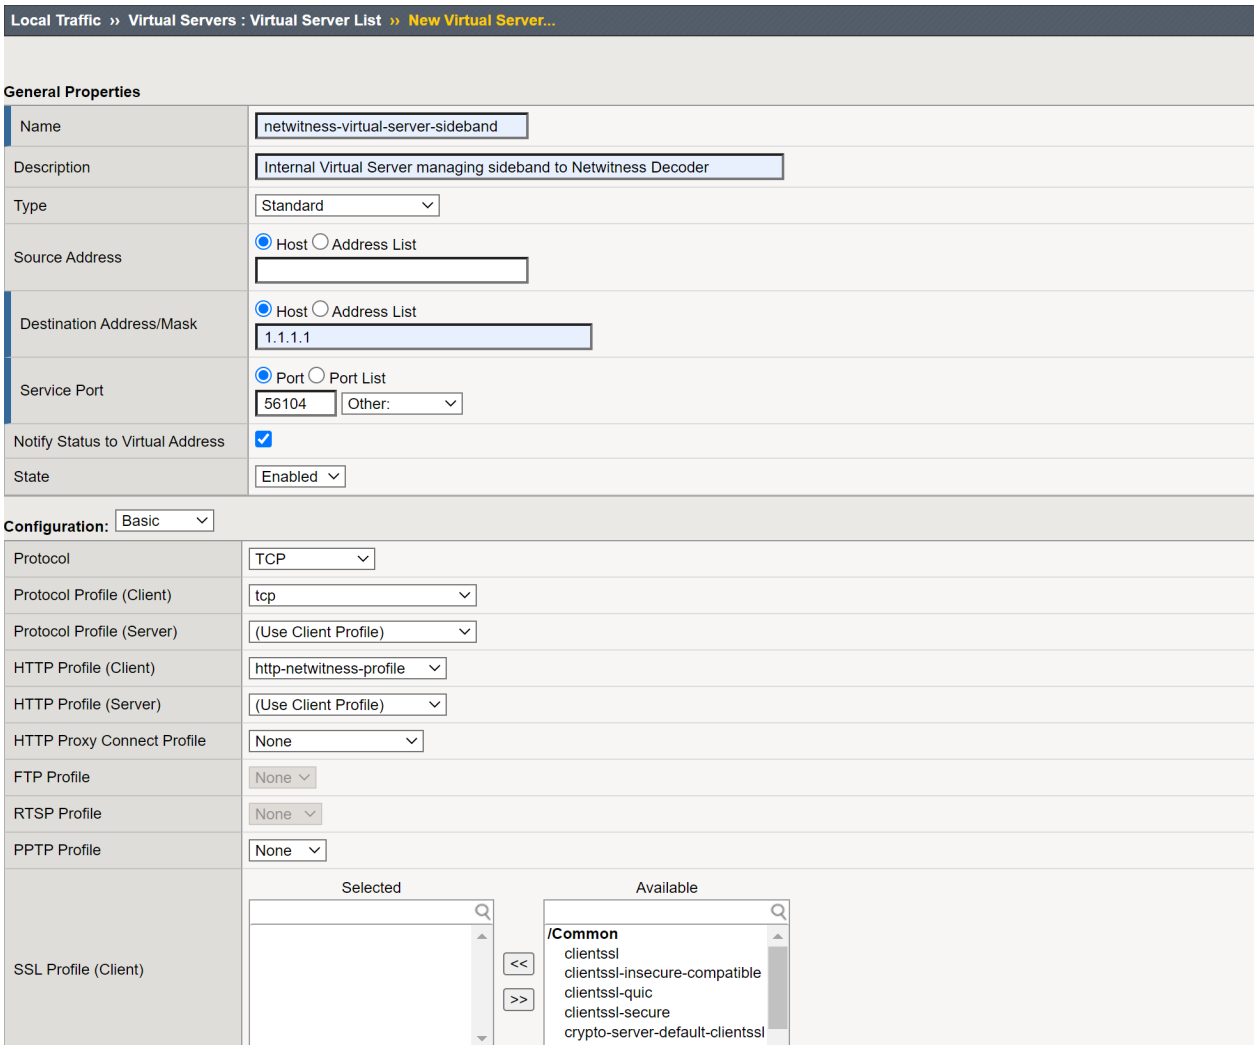
via-response preserve
xff-alternative-names none
}
```

Server SSL Profile

1. Set server-ssl profile **Name** `NetWitness-serverssl-secure`
2. Select **Advanced** from **Configuration**.
3. Set **f5-secure** from **Ciphers > Cipher Group**.
4. (Optional) **Disable** `no-TLS1.3` in options which enables TLS 1.3 between BIG-IP and NetWitness Decoder.
5. Click **Update** to create `server-ssl` profile.



```
ltm profile server-ssl /Common/NetWitness-serverssl-secure {
app-service none
cipher-group /Common/f5-secure
ciphers none
```

```
defaults-from /Common/serverssl
options { no-ssl }
renegotiation disabled
}
```

Internal Virtual Server

1. Create an Internal Virtual server to manage sideband connection to NetWitness Decoder and forward keys.
2. Set **Name** as `NetWitness-virtual-server-sideband` and add **Description** for virtual server.
3. Let the Source Address be blank, and it would default to 0.0.0.0.
4. Set **Destination Address/Mask** to 1.1.1.1; this is a non-routable IP address and is used internally.
5. Set **Service Port** to 56104 , a virtual non-routable port used internally.
6. Select **HTTP Profile (Client)** `http-NetWitness-profile` that was created earlier. By default, Server inherit Client profile.
7. Select **SSL Profile (Server)** `NetWitness-serverssl-secure` which was created earlier. This would be used by the Pool `pool-NetWitness-decoder-https` when connecting to NetWitness Decoder.
8. Select **Source Address Translation** Auto-Map.
9. Select **OneConnect Profile** oneconnect.
10. Select **Default Pool** `pool-NetWitness-decoder-https` which was created earlier.
11. Click **Finished** to create Internal Virtual Server.

```
ltm virtual /Common/NetWitness-virtual-server-sideband {
description "Internal Virtual Server managing sideband to NetWitness
Decoder"
destination /Common/1.1.1.1:56104
ip-protocol tcp
mask 255.255.255.255
pool /Common/pool-NetWitness-decoder-https
profiles {
/Common/http-NetWitness-profile { }
/Common/NetWitness-serverssl-secure {
context serverside
}
/Common/oneconnect { }
/Common/tcp { }
}
```

```
serverssl-use-sni disabled
source 0.0.0.0/0
source-address-translation {
type automap
}
translate-address enabled
translate-port enabled
}
```

iRule Session keys copying and Sideband communication

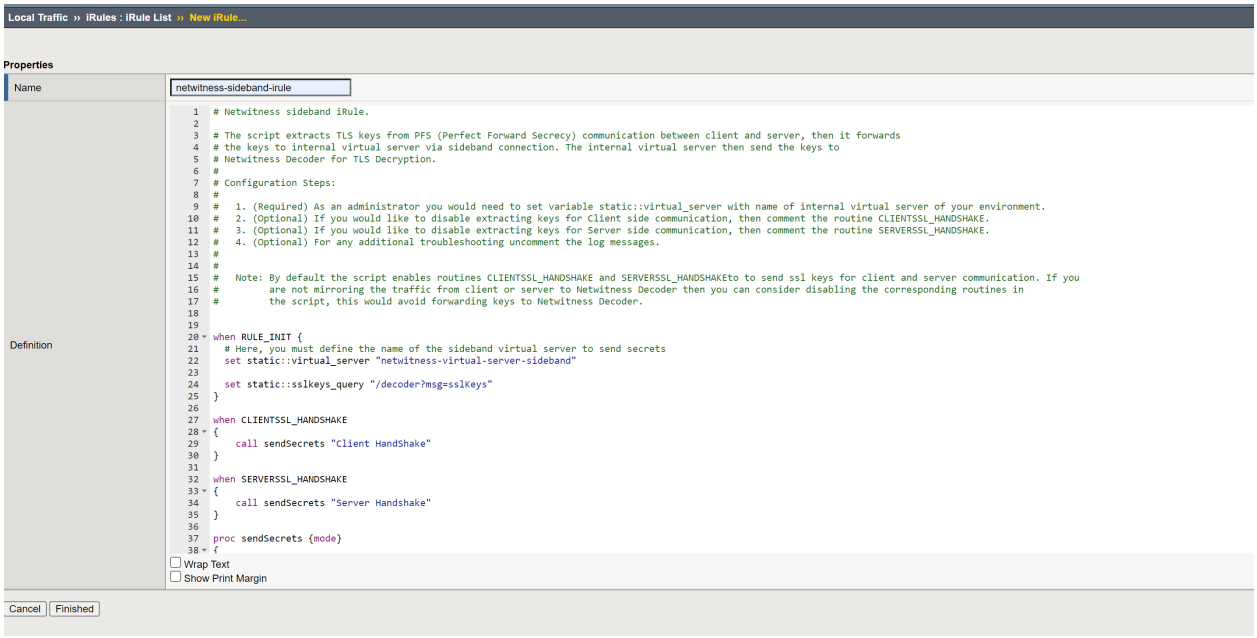
Configuration

1. Configure and add the following `netwitness-sideband-irule` **iRule** in your **External Virtual Server**, as an Administrator
2. Set **variable** `static::virtual_server` in `RULE_INIT` with name of **Internal Virtual Server** of your environment.
   - Example `set static::virtual_server "NetWitness-virtual-server-sideband"`
3. (Optional) If you would like to disable extracting keys for Client side communication, then comment the routine CLIENTSSL_HANDSHAKE.
4. (Optional) If you would like to disable extracting keys for Server side communication, then comment the routine SERVERSSL_HANDSHAKE.
5. (Optional) For any additional troubleshooting uncomment the log messages.

iRule `NetWitness-sideband-irule`

```
# NetWitness sideband iRule.

# The script extracts TLS keys from PFS (Perfect Forward Secrecy) communication between client and server, then it forwards
# the keys to internal virtual server via sideband connection. The internal virtual server then send the keys to
# NetWitness Decoder for TLS Decryption.
#
# Configuration Steps:
#
#   1. (Required) As an administrator you would need to set variable static::virtual_server with name of internal virtual server of your environment.
#   2. (Optional) If you would like to disable extracting keys for Client side communication, then comment the routine CLIENTSSL_HANDSHAKE.
```



```
# 3. (Optional) If you would like to disable extracting keys for Server side communication, then comment the routine SERVERSSL_HANDSHAKE.
# 4. (Optional) For any additional troubleshooting uncomment the log messages.
#
#
# Note: By default the script enables routines CLIENTSSL_HANDSHAKE and SERVERSSL_ HANDSHAKEto to send ssl keys for client and server communication. If you
#       are not mirroring the traffic from client or server to NetWitness Decoder then you can consider disabling the corresponding routines in
#       the script, this would avoid forwarding keys to NetWitness Decoder.
when RULE_INIT {
# Here, you must define the name of the sideband virtual server to send secrets
set static::virtual_server "NetWitness-virtual-server-sideband"
set static::sslkeys_query "/decoder?msg=sslKeys"
}
when CLIENTSSL_HANDSHAKE
{
call sendSecrets "Client HandShake"
}
when SERVERSSL_HANDSHAKE
{
call sendSecrets "Server Handshake"
}
proc sendSecrets {mode}
{
if {[SSL::cipher version] == "TLSv1.3" } {
#log local0. "$mode: CLIENT_HANDSHAKE_TRAFFIC_SECRET [SSL::clientrandom] [SSL::tls13_ secret client hs]"

set conn [connect -timeout 1000 -idle 300 -status conn_status $static::virtual_server]
if { $conn_status ne "connected" }{
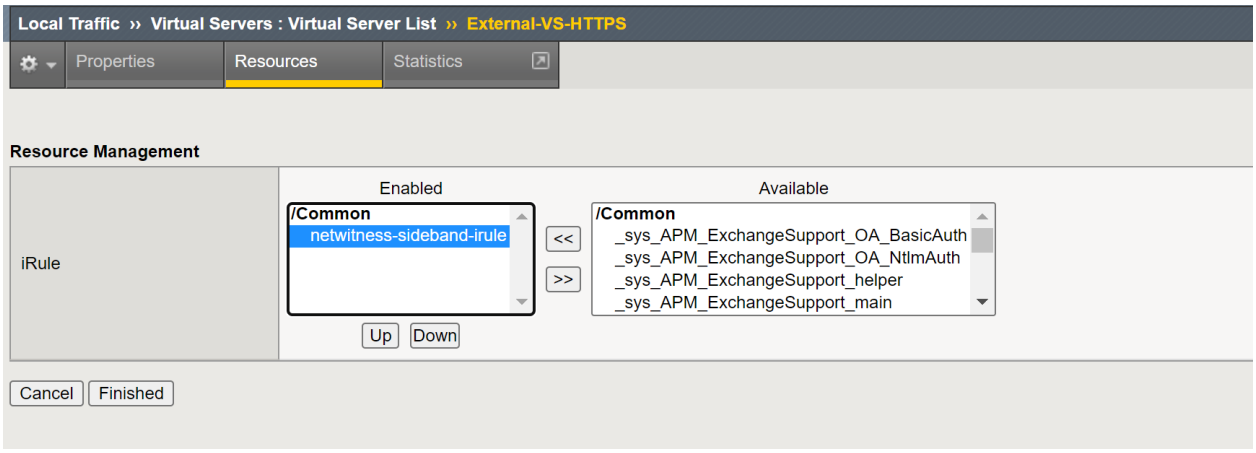
#log local0. "Failed to connect on connection re-use to virtual_server $static::virtual_server"
return
}
session add dest_addr $key "$conn" 300
```

```
}
}
#log local0. "Sending keys to virtual_server $static::virtual_server ..."
set send_bytes [send -timeout 1000 -status send_status $conn "GET $static::sslkeys_query&$secrets HTTP/1.0\r\n\r\n"]
#log local0. "Sent keys to virtual_server $static::virtual_server ..."
recv -timeout 1 $conn
}
```



Copy

1. **Create iRule** in iRule List create wizard
2. Copy the above iRule content to **Definition**
3. Click **Finished** to save iRule

Example: Add iRule to External Virtual Server

Select **iRule** `netwitness-sideband-irule` and click **Finished** to add iRule.

Troubleshooting Packet Drops (11.x and above)

Packet drops can occur if there is backup happening at Packet Pool or Session Pool on the Decoder, and eventually, Decoder runs out of free capture pages resulting in drops.

Quick configuration Checks to avoid packet drops

The Decoder would log warning messages when it encounters packet drops. These logs contain possible reasons for drops, and you can solve some of the drop symptoms through simple configuration checks.

To check and tune the configuration:

In most cases, the decoder configuration parameters would be different from the default configuration or with the hardware deployed. So, make sure to check the following and fix configuration issues.

1. When `/var/log/messages` logs show drops with reason "check capture configuration, packet sizes".
   - NwDecoder[15913]: [Packet] [warning] **Packet drops encountered, packet capture** (737626/737628): **check capture configuration, packet sizes and rates**
   - For 10G decoder run

     `/decoder reconfig op=10g update=1`

     Or

     Explore view | /decoder | properties | select reconfig | op=10g update=1 | send
   - For normal decoder run

     `/decoder reconfig update=1`

     Or

     Explore view | /decoder | properties | select reconfig | update=1 | send
   - The Decoder service needs to be restarted for changes to be effective.
   - Monitor decoder for drops
2. When `/var/log/messages` logs show drops with reason "check packet database configuration, iostats, packet and content calls"
   - NwDecoder[74030]: [Packet] [warning] **Packet drops encountered, packet write** (717957/723314): **check packet database configuration, iostats, packet and content calls**
   - Packet drops encountered (884632/884642): **check session & meta database configuration, iostats and sdk activity**.
   - For 10G decoder run
     - `/database reconfig op=10g update=1`

       Or

- Explore view | /database | properties | select reconfig | op=10g update=1 | send

- For normal decoder run
  - `/database reconfig update=1`

    Or
  - Explore view | /database | properties | select reconfig | update=1 | send
- The Decoder service needs to be restarted for changes to be effective.
- If we are still seeing drops, then a few more changes are required. There could be i/o bound waits for database writes on the Decoder.
  - Set `/database/config/packet.integrity.flush=normal`
  - Set `/database/config/session.integrity.flush=normal`
  - Set `/database/config/meta.integrity.flush=normal`
- Monitor decoder for drops.

3. As of NetWitness Platform version 11.3.1.1, `sosreport` retrieves service and database reconfig information as well as what settings were active when the `sosreport` was retrieved. This information can be used for cross-checking purposes and can be found in the `..../sos_commands/rsa_nw_rest` directory (service-reconfig, database-reconfig, ls<service>).

Information required to troubleshoot packet drops

- Monitor Packet Drops Tool Output (Highly recommended)
- This can be accessed through REST port `http://<decoder>:50104/sdk/app/packetdrops`
- By default, the tool looks for drops in last 24 hrs and also provides options to search drops based on time ranges.
- Enable detailed stats on decoder `REST /decoder/parsers/config/detailed.stats=yes`

What if the REST port is inaccessible?

- Enable detailed stats on decoder

  `/decoder/parsers/config/detailed.stats=yes`
- Wait for new drops and then collect `sosreport`. The `sosreport` on Decoder would collect few stats db files.
- These files can be copied to your local decoder `/var/netwitness/decoder/statdb` and restart Decoder.
- Access packet drops tool on your local Decoder.

How do I troubleshoot packet drops?

The packet drops tool would help narrow down the possible cause for drops. There could be various cases involved that need verification.

The following sections describe how to use the Packet drops tool and analyze its results.

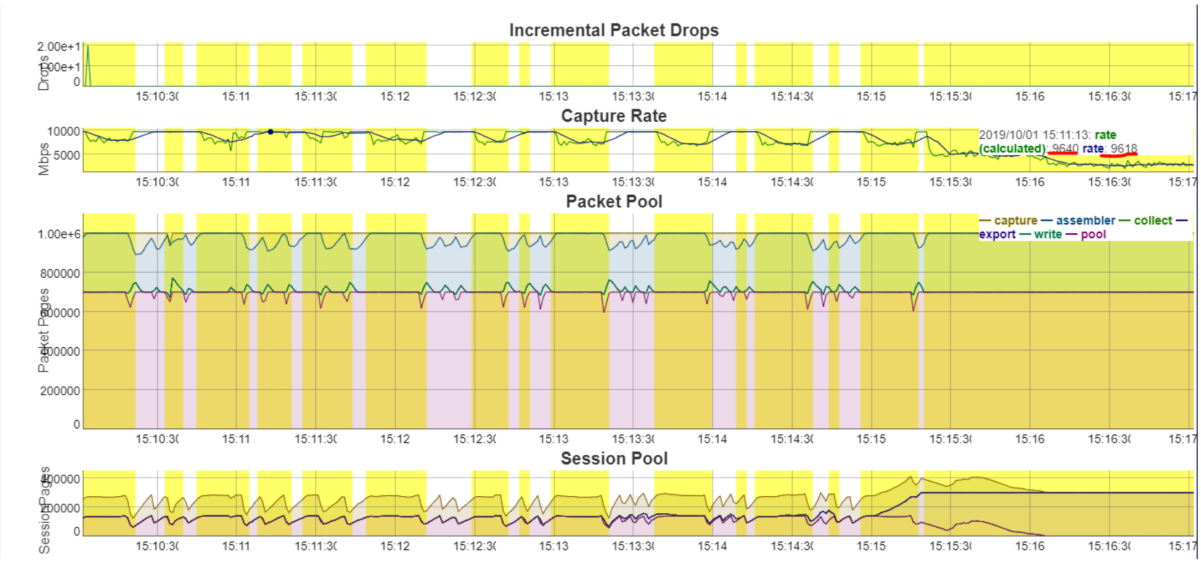
Navigate to the Packet drops tool using the REST interface

- The tool would search drop instances and list them with links.
- Start investigating the latest drop instances where the drop count is high.
- Look at other drop instances and find the pattern for drops.

Introduction to Drops tool Charts

- Incremental Packet Drops - Displays packet drops count at that instance of time
- Capture - Displays traffic ingestion rates Capture.rate in Mbps and Calculated capture rate (instantaneous rate) in Mbps.
- Packet Pool - Displays graphs for the following packet pool stats:
  - capture - /decoder/stats/pool.packet.capture → Number of free packet pages available for capture
  - assembler - /decoder/stats/pool.packet.assembler → Number of packet pages waiting to be assembled.
  - write - /decoder/stats/pool.packet.write → Number of packet pages waiting to be updated to Packet Database.
  - pool - /decoder/stats/assembler.packet.pages → Number of packet pages held in the assembler
  - export - /decoder/stats/pool.packet.export → Number of packet pages waiting to be exported
- Session Pool
  - This displays graphs for following session pool stats
  - parse - /decoder/parsers/stats/pool.session.parse → Number sessions waiting to be parsed.
  - write - /decoder/stats/pool.session.write → Number of session pages waiting to be written.
  - correlate - /decoder/stats/pool.session.correlate → Number of session pages waiting to be correlated.
  - queue.sessions.total - /decoder/parsers/stats/queue.sessions.total → The total number sessions in parse threads and queues.
  - export - /decoder/stats/pool.session.export Number of session pages waiting to be exported.

When packet drops occur, the chart shows that instance of time in yellow.



Symptoms Checklist

We recommend following the symptom checks in the order listed below, and this helps to troubleshoot all the symptoms associated with current packet drops.

Symptom 1: Higher traffic ingestion rates for the content deployed would cause packet drops

If the traffic ingestion rate -(capture) > 8 Gbps for the content (higher number of parsers) deployed on Decoder, this would cause packet drops.

ex: Below screenshot shows capture rate > 8 Gbps (9.6 Gbps)

Resolution:

Consider the following options:

- Split the traffic ingestion into multiple decoders so that the ingestion rate would be ~4-5 Gbps

  Or

- Start with baseline supported 10G content and then add parsers one by one until no drops are observed.
  - Refer Parsing and Content Considerations section on Configure High Speed Packet Capture Capability (Version 11.6 and Later)

Symptom 2: Packet Database Write backup would cause packet drops

Packet Pool Write - write (pool.packet.write), if write backup increases, then packet write delays would be causing the drops

ex: Below screenshot displays, there are many packet pages (471K) waiting on the write queue.

Decoder logs would throw warnings like the below:

- NwDecoder[74030]: [Packet] [warning] **Packet drops encountered, packet write** (717957/723314): **check packet database configuration, iostats, packet and content calls**

Top -Hp <Decoder PID> would display decoder packet write thread waiting on Disk.

iotop tool can show Disk i/o activity: rpm is available here and can be installed: `http://mirror.centos.org/centos/7/os/x86_64/Packages/iotop-0.6-4.el7.noarch.rpm`

Example iotop results where decoder packet write thread is blocked on IO 99% of decoder IO time and its throughput is just ~400KB/s

```
iotop -o -d 2
```

```
Total DISK READ :       0.00 B/s | Total DISK WRITE :     463.05 K/s
Actual DISK READ:       0.00 B/s | Actual DISK WRITE:       0.00 B/s
  TID  PRIO  USER     DISK READ  DISK WRITE  SWAPIN     IO>    COMMAND
 3373 be/4 root        0.00 B/s  431.79 K/s  0.00 % 99.99 % NwDecoder [Packet Write Wo]
 3374 be/4 root        0.00 B/s   31.26 K/s  0.00 % 99.99 % NwDecoder [Session Write W]
```

Resolution:

- Make sure database configuration tuning is applied as suggested in the section To check and tune the configuration:

- Check I/O stats on the Decoder using the command "`iostat -mNx 1`". Refer to How do you get statistics on I/O performance?
  - If % `iowait` is > 10% then decoder packet db writes have higher i/o waits
  - If % util for packetdb goes greater than 95 and wMB/s < 1000 , then Disk write throughput is low and the Disk where packetdb exists needs to be replaced.
  - If `iotop` is installed the disk io activity can be monitored through 'iotop –o –d 2'
  - For a 10G decoder we recommend packet db disk write throughput to be 1300 MB/s (~10Gbps) for better write performance.
- Lot of Content calls to extract packets or content can cause packet write issue.
  - Check drops tool logs or `/var/log/messages` or sosreport logs for SDK-Content Calls.
  - You can also use NwConsole **topQuery** command on messages logs to identify Content calls.
  - Set `/decoder/sdk/config/packet.read.throttle=100` (a higher value) so that packet write would get preference.
  - Check service invoking SDK-Content calls and reduce the content calls.
- Kernel and Driver compatibility issues
  - Check if the firmware is updated according to Kernel version. If not update firmware.

How do you get statistics on I/O performance?

1. The command you want to run for near real time statistics on I/O usage is "`iostat -N -x -m 1`". For detailed information on the output of iostat, type "`man iostat`". If the columns do not line up, you can leave off the `-N` option, but you should probably run it once so you can see what disk groups correspond to which databases.

2. In the above sample output, you can see the session and meta DBs (last two lines) are reading in about 30 MB/s combined. You can also see that `sdd` corresponds to those two databases, since the numbers combined roughly add up. The important takeaway is the last column, %util. This means: Percentage of CPU time during which I/O requests were issued to the device (bandwidth utilization for the device). Device saturation occurs when this value is close to 100%. Therefore, the disks are currently saturated with read requests and the databases are currently I/O bound. When measuring performance of the SA Core services, it's important to know if the software is I/O bound. This would be the limiting factor for increasing performance as the current hardware is running at capacity.
3. To determine which physical volume the index is on, run "`vgdisplay -v index`". In the above example, it's /dev/sde. To see a list of volumes, run "`vgdisplay -s`".
4. Run "`ls -l /dev/mapper`" to see the drive mappings.

Symptom: Session Database Write backup would cause packet drops

Session Pool Write - write (pool.session.write), if session write backup increases, then session write delays would be causing the drops

ex: Below screenshot displays there are many session pages (198K) waiting on session write queue

Decoder logs would also throw warnings like below:

- Packet drops encountered (884632/884642): **check session & meta database configuration, iostats and sdk activity**.

Top -Hp <Decoder PID> would display decoder packet write thread waiting on Disk.

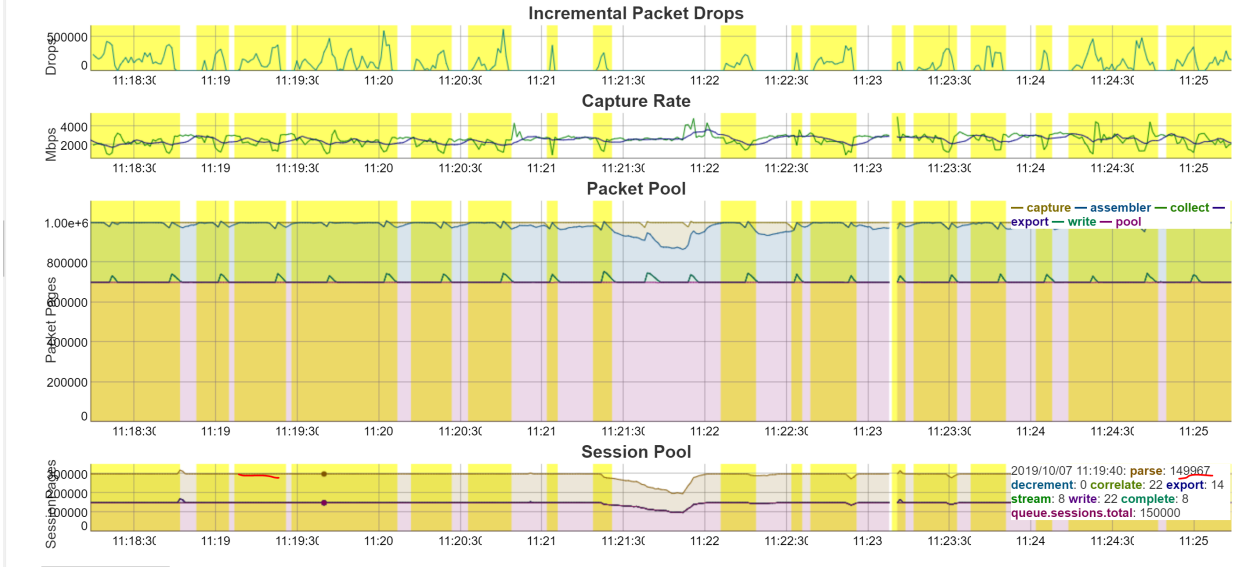
iotop tool can show Disk i/o activity: rpm is available here and can be installed: `http://mirror.centos.org/centos/7/os/x86_64/Packages/iotop-0.6-4.el7.noarch.rpm`

Example iotop results where decoder session write thread is blocked on IO 99% of decoder IO time and its throughput is just ~30KB/s

iotop –o –d 2

```
Total DISK READ :       0.00 B/s | Total DISK WRITE :     463.05 K/s
Actual DISK READ:       0.00 B/s | Actual DISK WRITE:       0.00 B/s
  TID  PRIO  USER     DISK READ  DISK WRITE  SWAPIN     IO>    COMMAND
 3373 be/4 root        0.00 B/s  431.79 K/s  0.00 % 99.99 % NwDecoder [Packet Write Wo]
 3374 be/4 root        0.00 B/s   31.26 K/s  0.00 % 99.99 % NwDecoder [Session Write W]
```

Resolution:

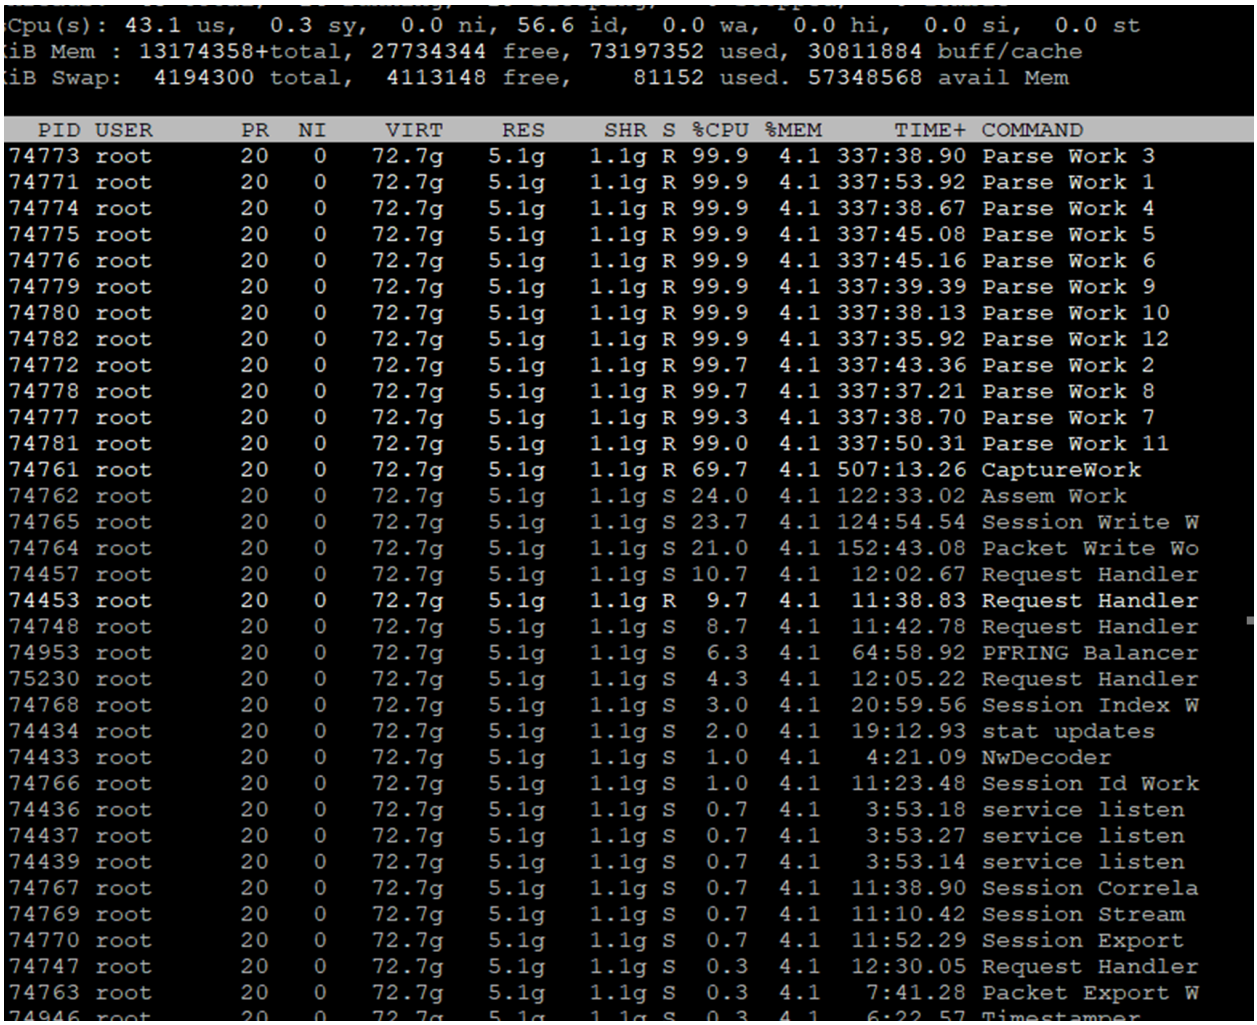


- Make sure database configuration tuning is applied as suggested in section To check and tune the configuration:
- Aggressive aggregators from Decoder
  - Check aggregators using `/decoder whoAgg` or Explore `/decoder | properties | select whoAgg | send`
  - Many aggregators with nice disabled (false) in their configuration can cause session pool backup.
    - For Archiver and Warehouse Connectors nice should be enabled (true).
    - For Concentrator nice should be disabled (false).
  - If there is one device aggregating from Decoder then it would mostly be Concentrator, don't enable nice on Concentrator.

  - If there is an Archiver or Warehouse Connector then set `aggregate.nice=true` On Warehouse Connectors and Archivers aggregating from Decoder.
- Check I/O stats on the Decoder using command "`iostat -mNx 1`". Refer to How do you get statistics on I/O performance?
  - If % `iowait` is > 10% then decoder session db and metadb writes have higher i/o waits
  - If % util for `sessiondb` or `metadb` goes greater than 95 and wMB/s < 1000 , then Disk write throughput is low and the Disk where `sessiondb` and `metadb` exists needs to be replaced.
  - If `iotop` is installed the disk io activity can be monitored through '`iotop -o -d 2`'
  - For a 10G decoder we recommend `sessiondb` and `metadb` write throughput to be 1300 MB/s (~10Gbps) for better session write performance.
- Lot of Content calls to extract meta or content can cause session write issue.
  - Check drops tool logs or `/var/log/messages` or `sosreport logs` for SDK-Content Calls
  - You can also use NwConsole **topQuery** command on messages logs to identify Content calls.
  - Set `/decoder/sdk/config/packet.read.throttle=100` (a higher value) so that packet write would get preference.
  - Check service invoking SDK-Content calls and reduce the content calls.
- Kernel and Driver compatibility issues
  - Check if the firmware is updated according to the Kernel version. If not, update firmware.

Symptom: Session Pool Parsing delays causes packet drops (Parsing issues)

Session Pool Parse - parse (pool.session.parse): If session parse backup increases, then sessions would be queued on assembler and would be causing the drops.

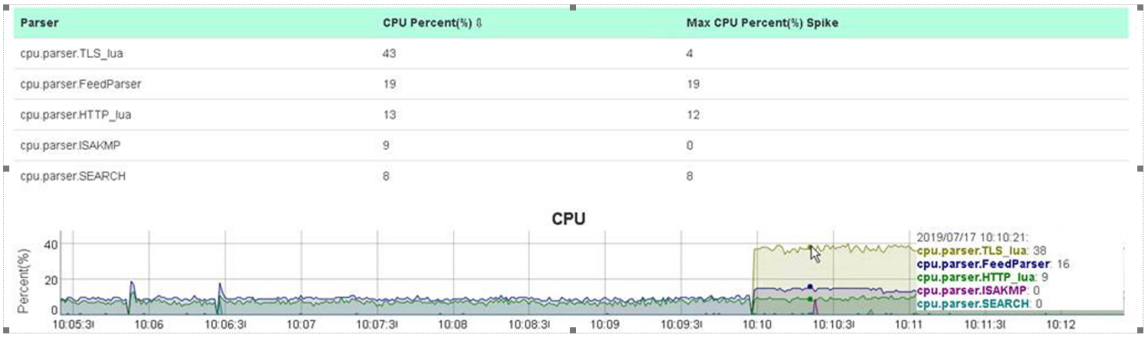


ex: Below screenshot displays there are many sessions waiting to be parsed - Session Pool | parse stat.

Decoder logs would throw warnings like the below:

NwDecoder[42946]: [Packet] [warning] Packet drops encountered, packet assemble (910178/910179): **check session pool (following log), line and session rates**

top -Hp <Decoder pid> would display decoder Parse Work (Parser Threads) are so busy with high CPU usage.



```

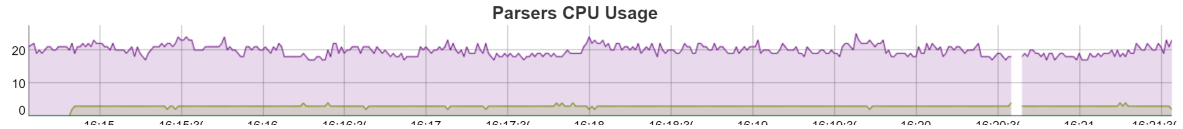
Resolution:

- Enable parser detailed stats on decoder `/decoder/parsers/config/detailed.stats=yes`, wait for new drop instance.
- Click on 

to analyse parsing activity.
- Click on Top Parsers CPU usage, this displays top 5 parsers using higher cpu usages.
  - Try to disable the parsers which are using high CPU usage and wouldn't be parsing the larger percentage of traffic and monitor decoder for drops due to parsing.
    - For ex: parser like TLS_lua , TLD_Lua has higher CPU usage than HTTP_lua (which parsers larger percent of traffic).

Parser	CPU Percent(%) ⇩	Max CPU Percent(%) Spike
cpu.parser.TLS_lua	43	4
cpu.parser.FeedParser	19	19
cpu.parser.HTTP_lua	13	12
cpu.parser.ISAKMP	9	0
cpu.parser.SEARCH	8	8

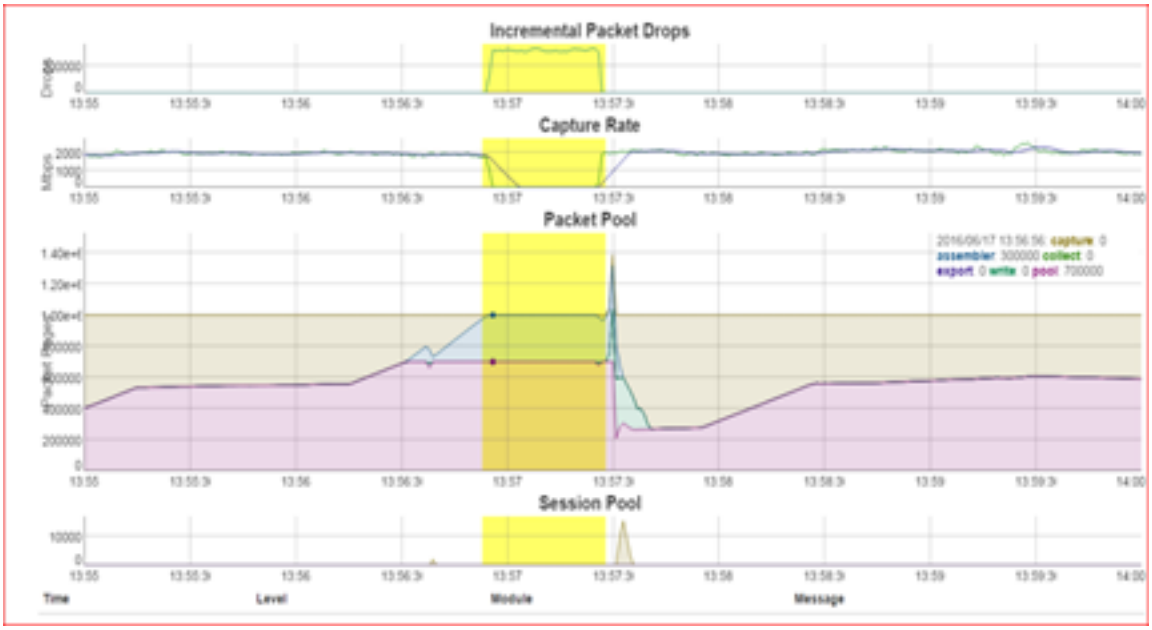
- Repeat the above step till packet drops are reduced or resolved
- Notify parser Content owner (Customer - if it is their custom content or NetWitness Content team if it is NetWitness parser) so that a fix may be provided for parser issue.



- Click Top Parsers Token Callback counts, this displays top 5 parsers having higher token callback counts during the drop window.
- Try to disable the parsers which are using high Token Callback count and wouldn't be parsing the larger percentage of traffic. Monitor decoder for drops due to parsing.

Top Parsers TokenCallback count

Parser	TokenCallbacks Count ⇩	Max TokenCallbacks Count Spike
TLS_lua	66656555	314517
HTTP_lua	14169879	151699
china_chopper	10648606	116502
rekaf	10604218	115998
Form_Data_lua	8871783	97752



- For ex: parser like TLS_lua has higher Token Callback count than HTTP_lua (which parsers larger percent of traffic)

- Click Top Parsers Meta Callback counts, this displays top 5 parsers having higher meta callback counts during drop window.
- The parsers which displays higher Token Callback count and does not generate much meta and wouldn't parse larger percent of traffic, needs to be disabled.
  - Disable such parsers and monitor Decoder.
- Click Top Parsers Memory Usage, high Lua memory usage (>1 Gb per parser) or memory spike can cause packet drops.
  - Disable Lua Parsers which are using higher memory usage > 1 Gb and monitor Decoder for drops.
- Complex App rules including "regex" or "contains" are CPU intensive
  - Check Parsers CPU Usage graph, if there is high CPU usage for cpu.app.rules stat, then check the app rules configured and tune them.

Symptom: Session Parsing stuck can cause packet drops

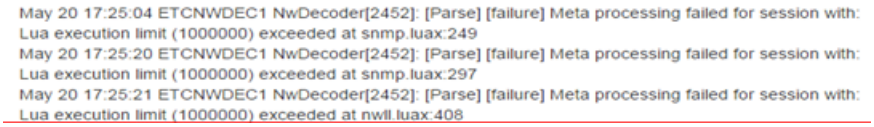
Session parsing got stuck at a parser would show symptom of graph like below where queue.sessions.total =1 on Session pool.

Decoder would log warning message like:

NwDecoder[42946]: [Packet] [warning] Packet drops encountered, packet assemble (910178/910179): **check session pool (following log), line and session rates**.

Resolution:

- Enable parser detailed stats on decoder `/decoder/parsers/config/detailed.stats=yes`, wait for new drop instance.
- Click on Analyse Parser Stats to analyse parsing activity.
- Click on Top Parsers CPU usage, this displays top 5 parsers using higher cpu usages.
  - The parser which shows CPU usage when Session Pool `queue.sessions.total =1` would be the one got stuck or looping.
  - Disable the parser and monitor for drops . Notify parser Content owner to get the fix.



Symptom: Lua Parser Warnings can cause packet drop issues

A lua parser which throws warnings and errors can affect the parse thread and its cpu cycles, hence if there is any lua parser which is throwing warnings then it needs to be fixed.

Resolution:

- Identify and disable the lua parser throwing errors or warnings and monitor decoder.
- Create a content ticket so that content owners can provide a fix or workaround.

ex: Lua Parser throwing parse failure for execution limits exceeding.

Decoder and Log Decoder References

This is a collection of references, which provide information about the user interface for Decoders and Log Decoders in NetWitness, with references to the procedures that describe the work you can do in that part of the user interface.

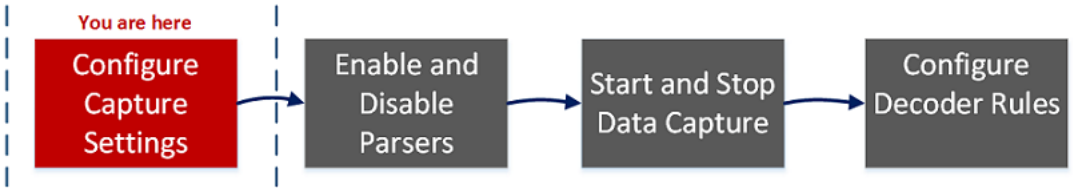
Services Config View - Capture Policies Tab

In the Capture Policies tab ((Configure) > **Capture Policies**, administrators can configure selective network data collection policies.

Selective network data collection gives administrators the ability to apply centrally managed capture policies across their Network Decoders. This results in better use of Decoder resources, including hard drive space, which leads to more predictable costs and lessens the burden of managing multiple services. You can determine which traffic is stored and how it is stored by using policies. Each policy contains a list of supported base protocols and definitions for handling any other protocols that are detected. The administrator can choose to deploy predefined policies that capture:



- All base and other protocols (Full Capture - All Protocols)
- Only metadata on all base and other protocols (Capture Meta Only - All Protocols)
- Only metadata on all base protocols and drop all other protocols (Capture Meta on Base Protocols, Drop all other protocols)
- All base protocols and only metadata on all other protocols (Full Capture on Base Protocols, Meta only on all other protocols)

The predefined policies are not configurable. The only way you can edit predefined policies is by assigning services (such as Decoders) to deploy them.

Administrators can create custom policies to give further control over the deployment. A base set of protocols is available for alterations by the administrator, allowing you to choose what level of capture you prefer on a per-protocol basis. If you are only making slight changes, a good start for customization is to clone one of the predefined polices and alter it. These centrally managed policies are then applied to services (Network Decoders) to allow handling multiple use cases across your environment.

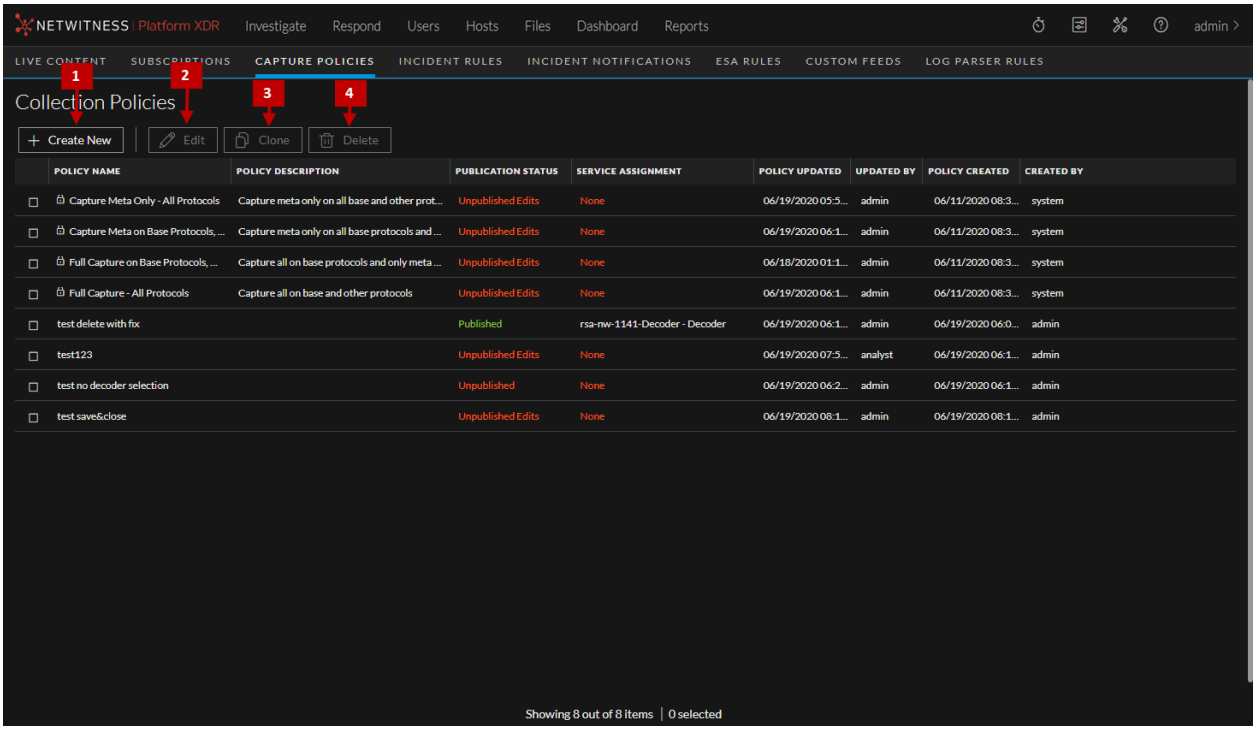
Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.

What do you want to do?

User Role	I want to...	Documentation
Administrator	use predefined selective collection policies*	(Optional) Configure Selective Network Data Collection
Administrator	create new policies from predefined ones*	(Optional) Configure Selective Network Data Collection

User Role	I want to...	Documentation
Administrator	create custom policies*	(Optional) Configure Selective Network Data Collection
Administrator	verify policies	(Optional) Configure Selective Network Data Collection
Administrator	unpublish policies*	(Optional) Configure Selective Network Data Collection
Administrator	delete policies*	(Optional) Configure Selective Network Data Collection



*You can complete these tasks here.

Related Topics

- Services Config View - Edit Capture Policies Wizard

Quick Look

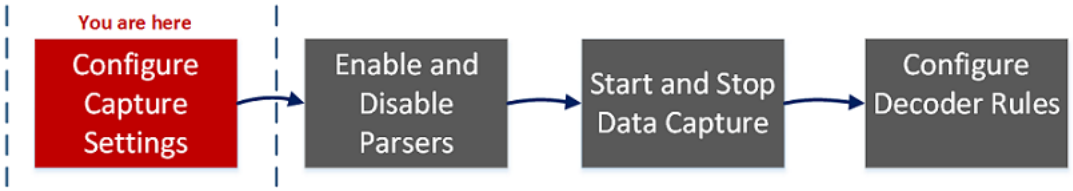
This is an example of the Capture Policies tab.

1 Create New - Provides a wizard to create a new policy.
2 Edit - Provides a wizard to edit an existing custom policy.
3 Clone - Selects an existing policy (predefined or custom) and copies it to create a new policy.
4 Delete - Removes policies.

The following table describes the contents of the Capture Policies tab.

Column	Description
Policy Name	The name of the policy (not editable for predefined policies).
Policy Description	The description of the policy (not editable for predefined policies).
Publication Status	• **Unpublished**: policies that have not been deployed to Decoders yet. • **Unpublished Edits**: policies that have been updated but are not deployed to Decoders. Clicking **Save and Close** after making edits keeps them from automatically being published, allowing the administrator to wait until a specific outage window to publish them. This would display as **Unpublished** (for policies not previously published to Decoders) or **Unpublished Edits** (for policies that have been previously published to Decoders, but the updates have not been deployed to Decoders). • **Published**: policies which have been deployed to Decoders. • **Failed**: policies that failed to execute, for example, if a Decoder is offline or a system is down. For information about how to troubleshoot failed policies, see "Troubleshooting Policy Deployments That Fail" in (Optional) Configure Selective Network Data Collection.
Service Assignment	Identity of the Decoder or service on which the policy is run.
Policy Updated	Date the policy was edited.
Updated By	Role of the person who updated the policy.
Policy Created	Date on which the policy was created.
Created By	Role of the person who created the policy.

Services Config View - Edit Capture Policies Wizard



In the Edit Policies view ((Configure) > **Capture Policies** > **Edit**, administrators can configure selective network data collection policies. The panels for creating a new policy and editing an existing policy are the same except that in the editing wizard, the definitions of the existing policy are displayed.

You can edit existing policies to customize them for your environment. A base set of protocols are available for alterations, allowing you to choose what level of capture you prefer on a per-protocol basis. If you are only making slight changes, a good start for customization is to clone one of the predefined polices and alter it.

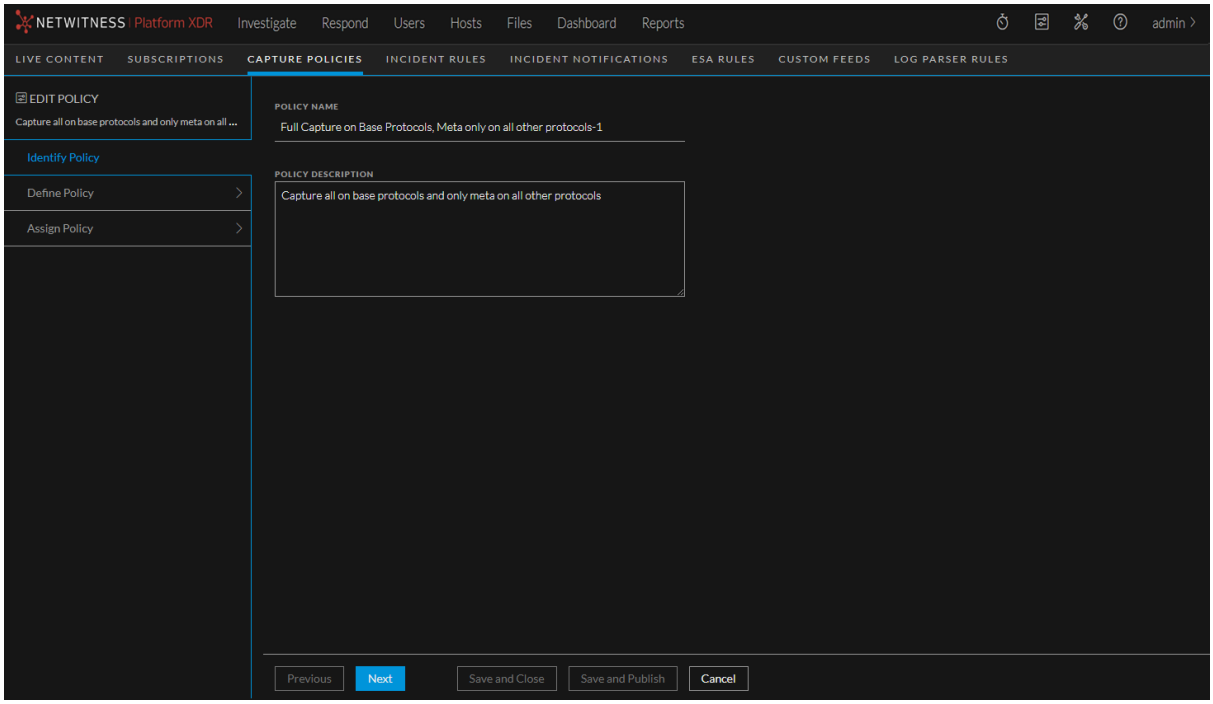
Note: A set of predefined policies are available immediately. The only way you can edit a predefined policy is by assigning Decoders to the policy to collect the targeted data.

Workflow

The following figure shows the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.

What do you want to do?

User Role	I want to...	Documentation
Administrator	create new policies from predefined ones*	(Optional) Configure Selective Network Data Collection
Administrator	create custom policies*	(Optional) Configure Selective Network Data Collection
Administrator	unpublish policies*	(Optional) Configure Selective Network Data Collection
Administrator	delete policies*	(Optional) Configure Selective Network Data Collection



*You can complete these tasks here.

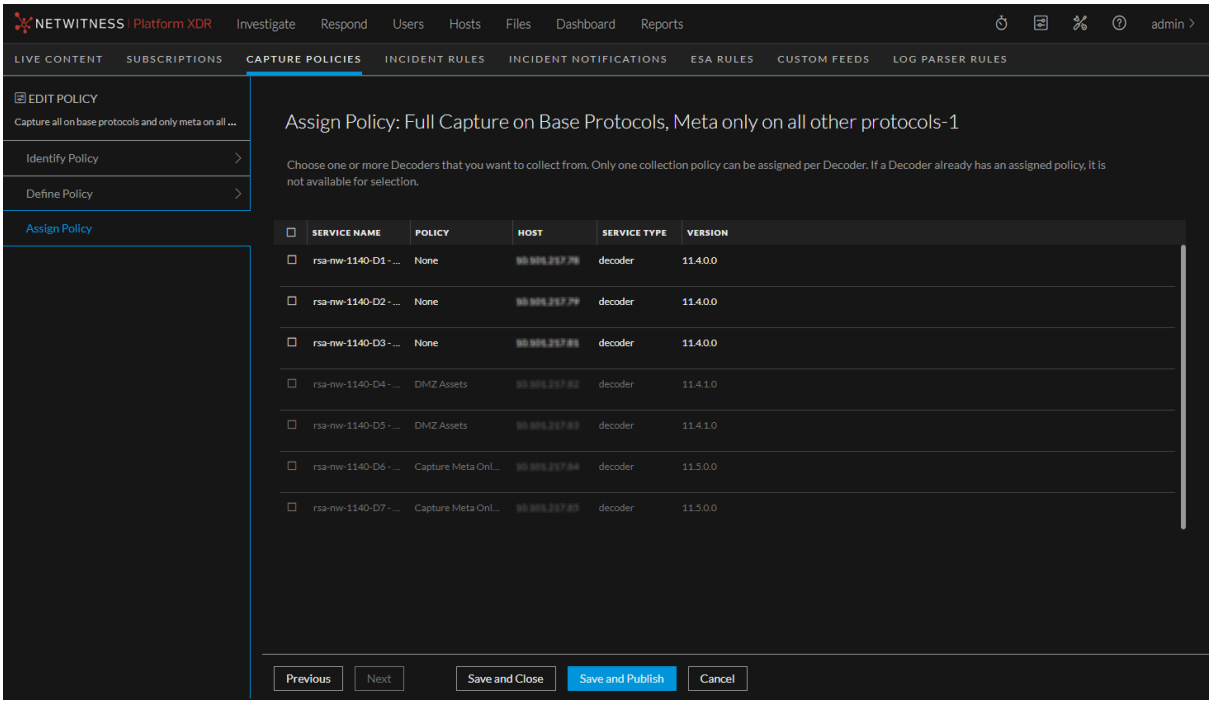
- Services Config View - Capture Policies Tab

Quick Look

1. To access the Edit Policy wizard, go to (Configure) > **Capture Policies**, select a policy, and click **Edit**.
   The Identify Policy page is displayed, where you can change the name and description of the policy.

2. To view the Define Policy page, click **Next**.



In the Define Policy page, you can define rule actions for the protocols for which you are interested in collecting data. The rule actions are:

- **Collect Meta Only**: Collect metadata
- **Drop All**: Drop metadata and network packets
- **Collect All**: Collect metadata and network packets

You can click **Save and Close** to save your policy without deploying it on Decoders.
The following table describes the actions of the buttons on this page.

Button	Description
Previous	Go to the previous page of the wizard
Next	Keep updates from the current page and go to the next page of the wizard.
Save and Close	Save the policy definitions without publishing the policy.
Save and Publish	Save the policy definitions and publish the policy to Decoders to begin data collection.
Cancel	Cancel the definitions and return to the Capture Policies tab.

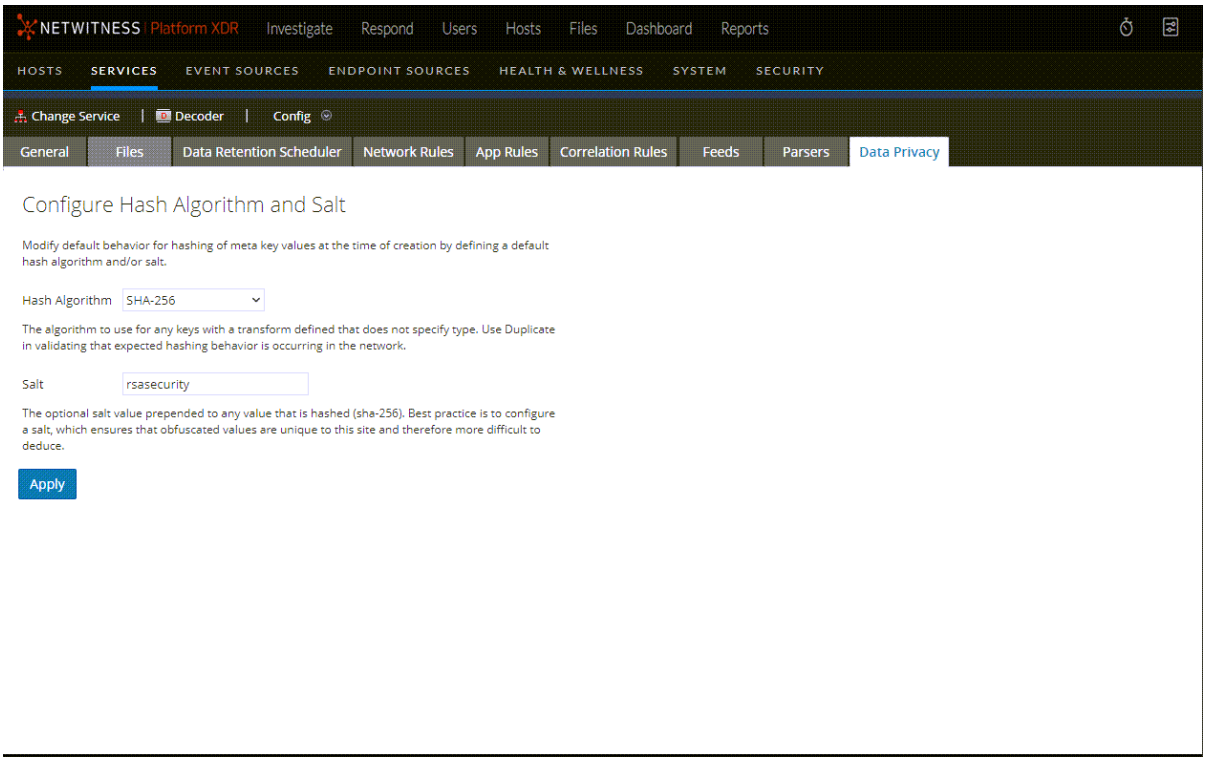
3. Click Next to go to the Assign Policy page.

This is where you assign the policy to Decoders to capture the data. The following table describes the columns in this page.

Column	Description
Service Name	The name of a service. For 11.5, Decoder is the only available service.
Policy	The policy that a Decoder is assigned to.
Host	The IP address or name of the host system for the Decoder.
Service Type	The type of service the policy is published to. For 11.5, the service type is **decoder**.
Version	The version of NetWitness Platform that is installed on the service host.

Services Config View - Data Privacy Tab

In the Data Privacy tab (**(Admin) > Services > Select a Decoder or Log Decoder >** > **Config > Data Privacy tab)**, administrators can configure data privacy parameters for certain Core services. For the Decoder and Log Decoder, you can set the default hash algorithm and salt.



What do you want to do?

User Role	I want to ...	Documentation
Administrator	configure hash algorithm and salt	"Configure the Hash Algorithm and Salt" in the *Data Privacy Management Guide.* (Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.)

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

Quick Look

The Data Privacy tab has the Configure Hash Algorithm and Salt configuration settings. The following table describes the parameters in this tab.

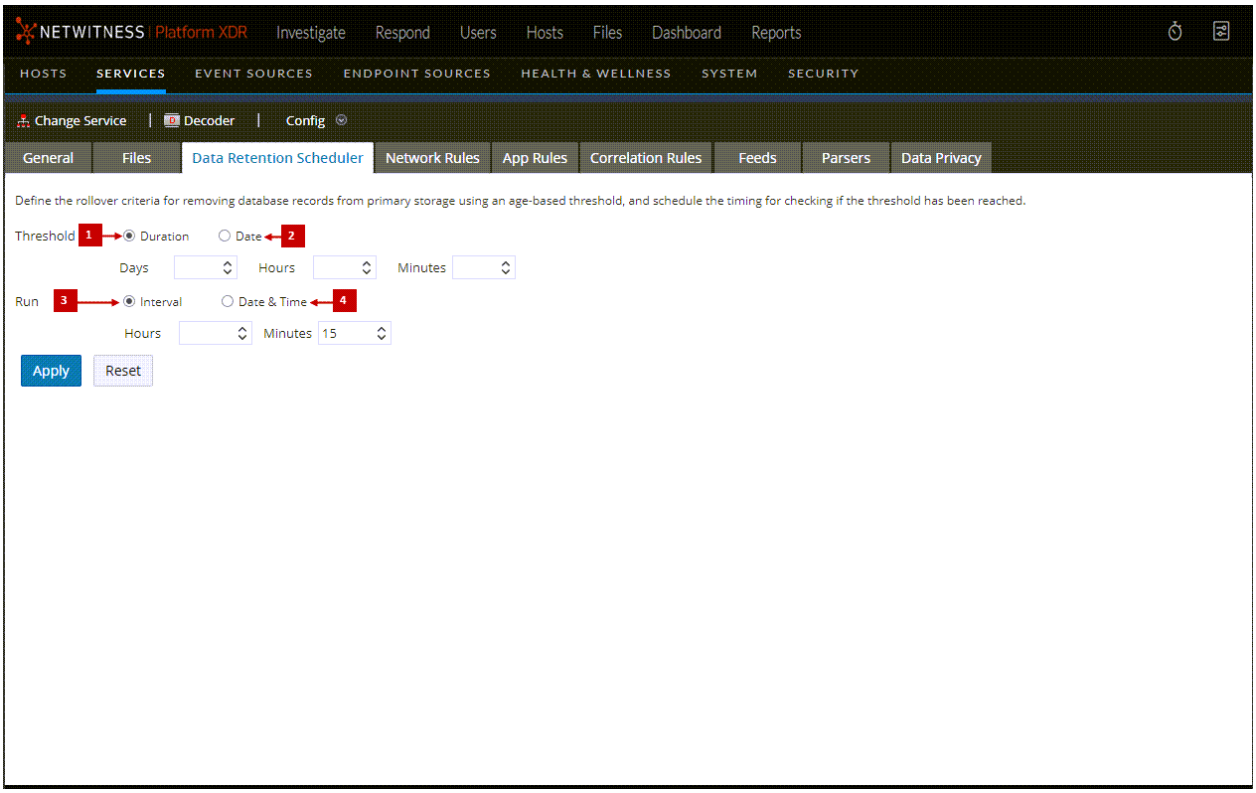
Parameter	Description
Hash Algorithm	Displays a drop-down list of hash algorithms to use for any keys with a transform that does not specify algorithm type. Possible values are SHA-256 and Duplicate. Duplicate is a special algorithm available for administrators to use when validating that expected hashing behavior is occurring in the network.
Salt	Indicates the optional salt value prepended to any value that is hashed. Best practices for security purposes dictate a salt value that is no less than 100 bits or 16 characters in length. Configuring a value ensures that obfuscated values are unique to this site and therefore more difficult to deduce. For more information on this field, see "Configure Data Obfuscation" in the *Data Privacy Management* guide.
Apply	Applies any changes.

Services Config View - Data Retention Scheduler

In the Data Retention Scheduler tab, you can set the rollover criteria for removing database records from primary storage using an age-based threshold. You can also schedule the timing to check whether the threshold is reached.

To access the Data Retention Scheduler tab, go to (Admin) > **Services** > select a **Decoder** or **Log Decoder** service and click > **View** > **Config** > **Data Retention** tab.

What do you want to do?



User Role	I want to...	Documentation
Administrator	Schedule the timing to see if the threshold is reached.	Configure Transaction Handling on a Decoder

Related Topics

- Configure Common Settings on a Decoder
- Decoder and Log Decoder Quick Setup

Quick Look

This is an example of the Data Retention Scheduler tab.

1. **Threshold Duration**: Removes database files older than the selected number of days, minutes, or hours.
2. **Threshold Date**: Removes database files older than the selected UTC date (YYYY-MM-DD-HH:MM:SS) that are not compatible with minutes, hours, or days parameters.
3. **Run Interval**: Indicates the number of hours between executions.
4. **Run Date and Time**: Defines which days of the week to execute the scheduler, as well as time of execution in HH:MM:SS format for the local time of the service.

Services Config View - Feeds Tab

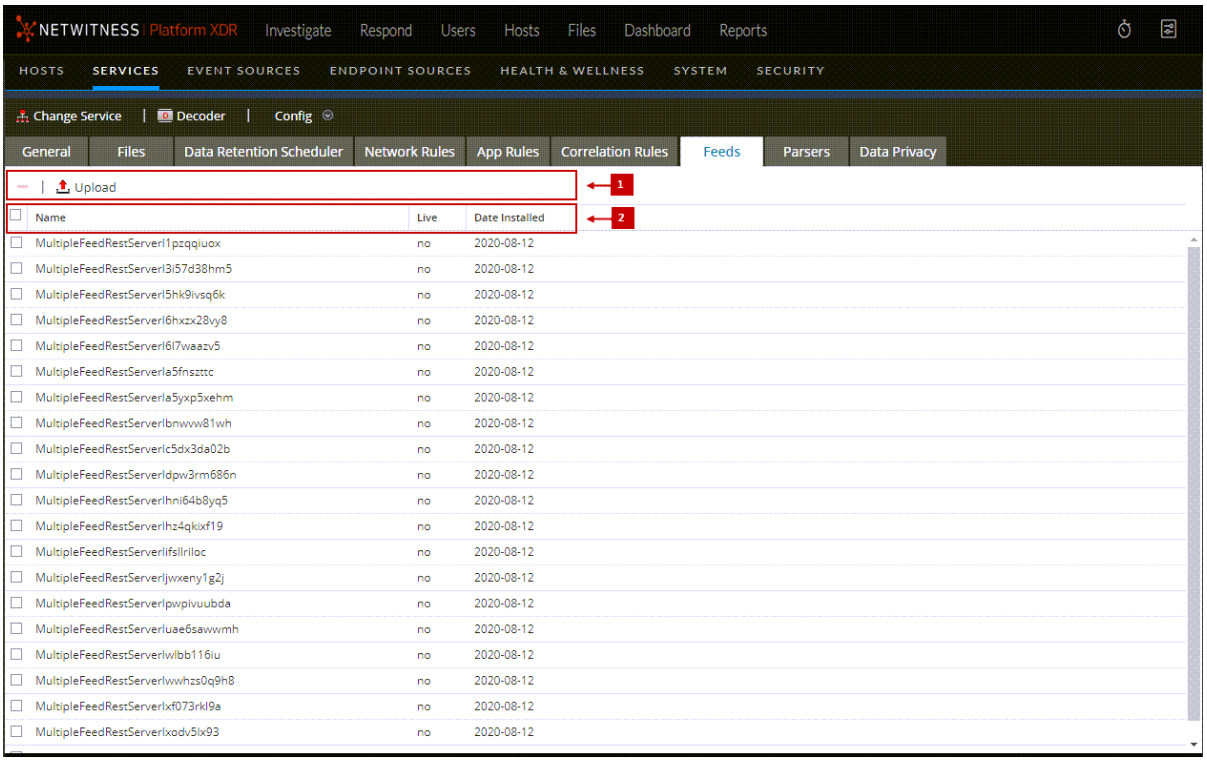
Feeds and parsers are Lua programs loaded and compiled when either processing capture files in NetWitness Investigate or capturing data with Decoders. Most commonly, they are used for static meta extraction and service identification.

Note: Pre-11.0 versions of NetWitness used FLEXPARSE programs in addition to Lua programs; Flexparsers are deprecated in NetWitness 11.0. Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

NetWitness uses feeds to create metadata based on externally defined meta values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created. This data can identify and classify malicious IPs or incorporate additional information such as department and location based on internal network assignments. Some examples of feeds include threat feeds to identify BOTNets, DHCP mappings, or even active directory information such as physical location or logical department.

Feeds can be added, removed, and updated while a Decoder is running without affecting capture. The Feeds tab (**(Admin) > Services >** select a Decoder or Log Decoder service and click **> View > Config > Feeds tab**) provides a user interface for managing feeds on Decoders.

What do you want to do?



User Role	I want to...	Documentation
Administrator	configure feeds	Configure Parsers and Feeds
Administrator	enable and disable parsers	Enable and Disable Parsers and Log Parsers

Related Topics

- Configure Common Settings on a Decoder
- Decoder and Log Decoder Quick Setup
- Upload Feeds Dialog

Quick Look

This is an example of the Feeds tab.

1 Feeds Tab Toolbar - Provides options to work with feeds in the grid
2 Feed List - Lists all feeds that are currently deployed on the Decoder

Feeds Tab Toolbar

Feature	Description
Upload	Displays the Upload Feeds dialog.
−	Deletes the selected feeds.

Feeds List

The Feeds list provides a listing of all currently deployed feeds for the Decoder.

Column	Description
Name	The name of the feed or the feed file.
Live	Indicates if the feed originated from Live. Possible values are **Yes**, **No**, or **N/A**. • **Yes** = Installed through Live • **No** = Installed through NetWitness • **N/A** = The feed has no attributes file created by NetWitness to track the installation date. The feed may have been installed manually, not through NetWitness or Live Services. Manually installed feeds still function properly.

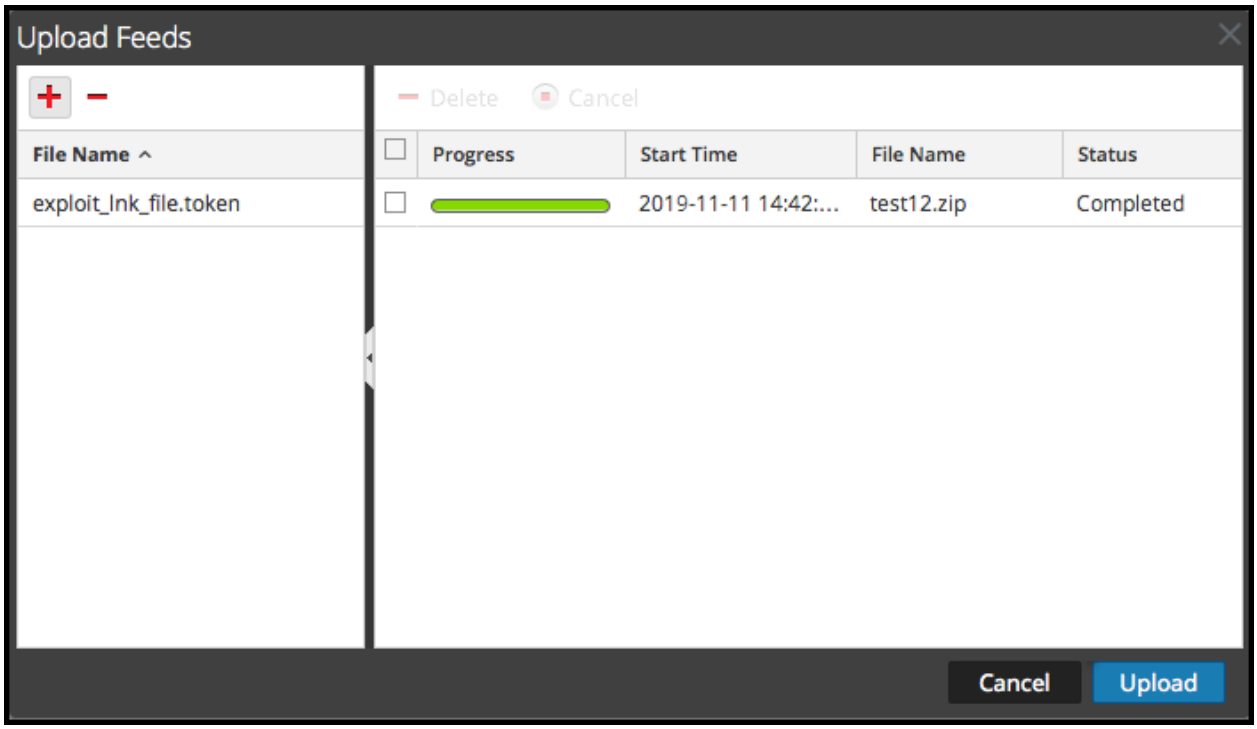
Column	Description
Date Installed	The date the feed was pushed to the service.

Upload Feeds Dialog

This topic describes the features of the Upload Feeds dialog in the Services Config view > Feeds tab.

The **Upload** option in the Services Config view > Feeds tab displays the Upload Feeds Dialog, in which you can manage the uploading of feeds to a Decoder or Log Decoder.

What do you want to do?



User Role	I want to...	Documentation
Administrator	prepare a list of feeds for upload	Edit, Upload, or Remove a Feed
Administrator	view and delete upload jobs	Edit, Upload, or Remove a Feed

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

Quick Look

This is an example of the Upload Feeds dialog.

File List

The File list is the place to prepare a list of feeds for uploading. You can add files from a directory structure, and delete files from the list if you decide that you don't want to upload a particular file. When the list is ready, clicking **Upload** starts the upload process.

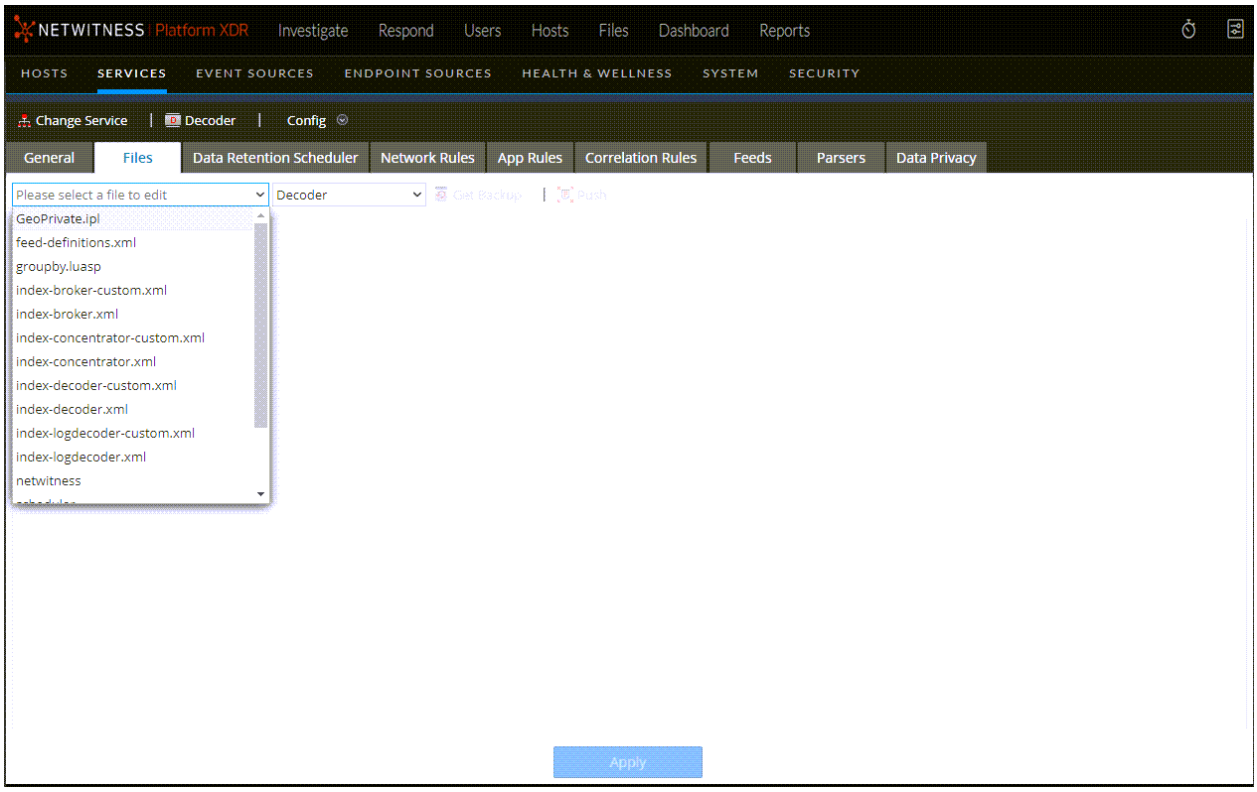
Feature	Description
	Opens a view of the directory structure where you can select files to add to the File list.
	Deletes the selected files from the File list.
File Name	Lists the feed files you have added from a file system in preparation for uploading to a Decoder. When you click **Upload**, the files listed here are uploaded.

Upload Job List

The Upload Job list provides a view of upload jobs started by clicking **Upload**.

Feature/Column	Description
Delete	Deletes an upload job.
Progress	Displays progress of an upload job.
Start Time	Displays the start time of an upload job.
File Name	Lists filename of the feed being uploaded.
Status	Displays the status of upload job.

Upload Feeds Dialog Buttons



Feature	Description
Cancel	Closes the Upload Feed dialog.
Upload	Starts uploading the feed files listed in the File list. Each feed is listed in a separate row in the Upload job list.

Services Config View - Files Tab

The Decoder and Log Decoder configuration files are visible and editable in the (Admin) > Services > Config view > Files tab. "Edit Core Services Configuration Files" in the *Hosts and Services Getting Started Guide* provides general instructions for editing files. (Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.)

Like other Core services, both the Decoder and Log Decoder have an index file, and may also have a crashreporter, netwitness, and scheduler. The Decoder and Log Decoder index files are named **`index-decoder-custom.xml`** and **`index-logdecoder-custom.xml`.**

Note: `Table-map.xml` and `table-map-custom.xml` are available only for Log Decoders with log content installed.

What do you want to do?

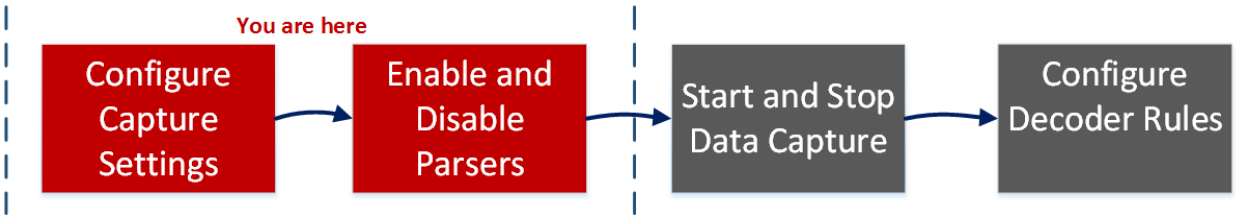
User Role	I want to...	Documentation
Administrator	obtain log files from pre-11.0 Log Decoder	Obtain Log Files from a Pre-11.0 Log Decoder

User Role	I want to...	Documentation
Administrator	edit files and parsers	• Feed Definitions File • Flex Parsers • GeoIP2 Parsers • Lua Parsers • Decoder Snort Detection • Search Parser • Wireless LAN Configuration

Related Topics

- Configure Common Settings on a Decoder
- Decoder and Log Decoder Quick Setup
- Create Custom Meta Keys Using a Custom Feed

Quick Look



Filename	Description
`GeoPrivate.ipl`	This fixed parser takes the IP addresses and converts them to geographical locations. The locations are displayed through the Google Earth display.
`feed-definitions.xml`	Used to create custom feeds, this is the XML schema used by the Decoder to define a **feed** message when it creates a **.feed** file.
`traffic_flow_options.lua`	Used to provide directionality information. Update this file with environment-specific internal and external subnets for the Lua parser to create proper directionality in metadata. The parser is described in Content for NetWitness Platform.
`search.ini`	This is the Search Parser configuration file. The Search Parser is a custom parser, used to generate metadata by scanning for pre-defined keywords and regular expressions.
`wlan-config.xml`	This is the wireless LAN configuration file (9/9/2009). This file controls the 802.11 parsers. Its chief purpose is to control decryption of raw 802.11 frames captured by the Decoder.

Services Config View - General Tab

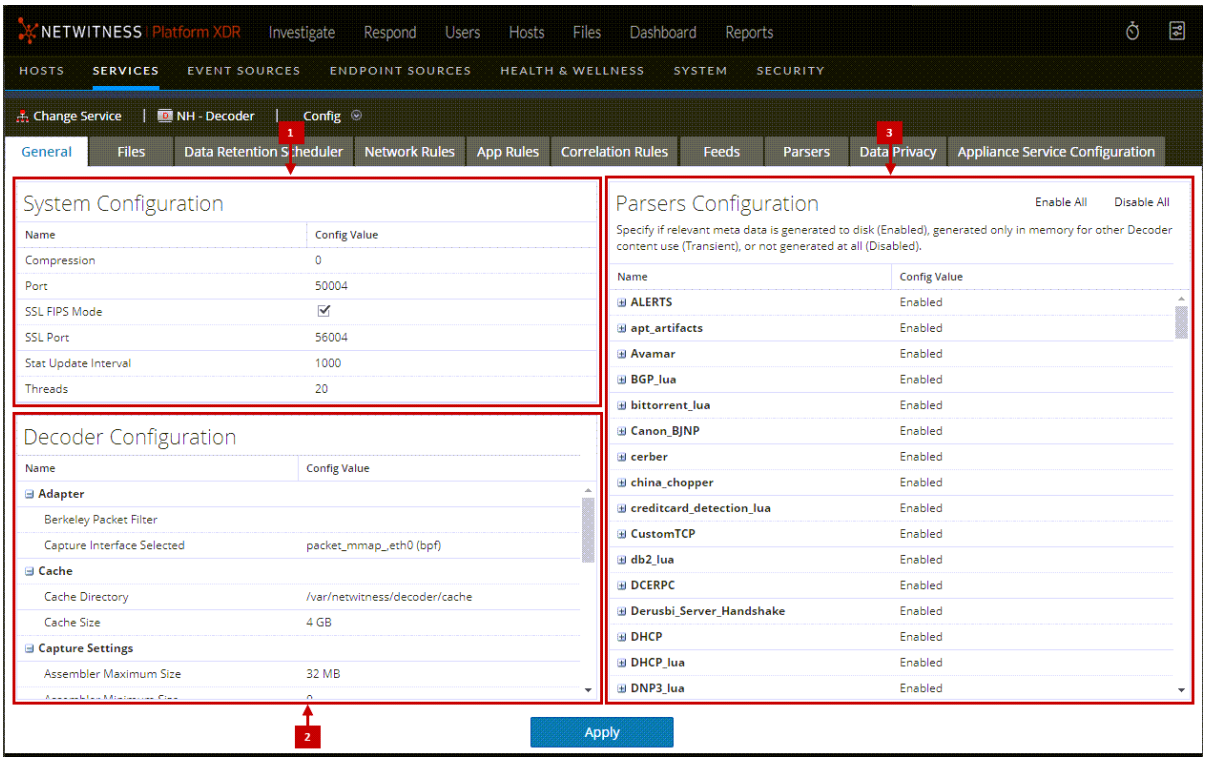
The General tab for a Decoder in the Services Config view provides a way to manage basic service configuration, configure data capture, and select the parsers that are applied to the captured data. To access the General tab, go to **Admin > Services >** select a Decoder or Log Decoder and click **> View > Config > General tab**.

Workflow

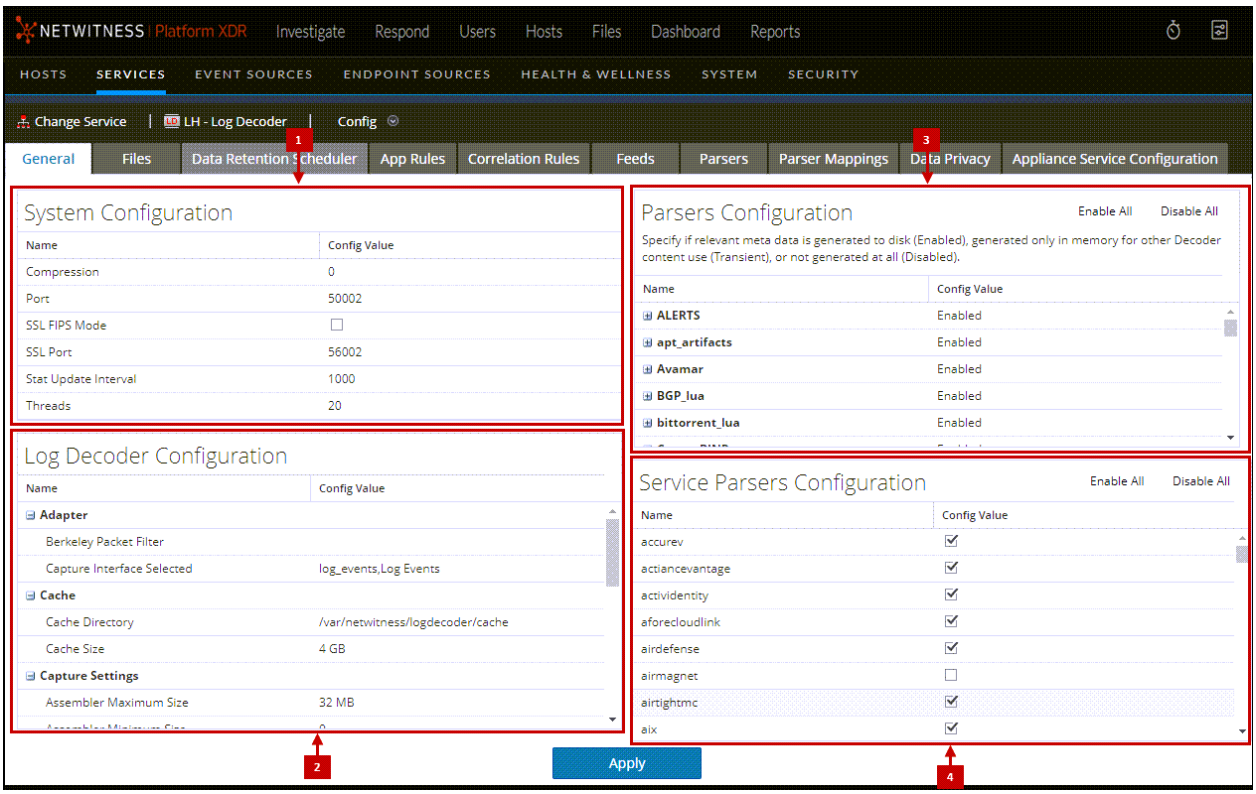
The following figure depicts common Decoder configuration tasks with the steps you can complete in this view highlighted.

What do you want to do?

User Role	I want to...	Documentation
Administrator	configure capture settings*	Configure Capture Settings
Administrator	manage parsers and log parsers*	Enable and Disable Parsers and Log Parsers
Administrator	start and stop data capture	Start and Stop Data Capture
Administrator	configure rules	Configure Decoder Rules



*You can complete these tasks here.

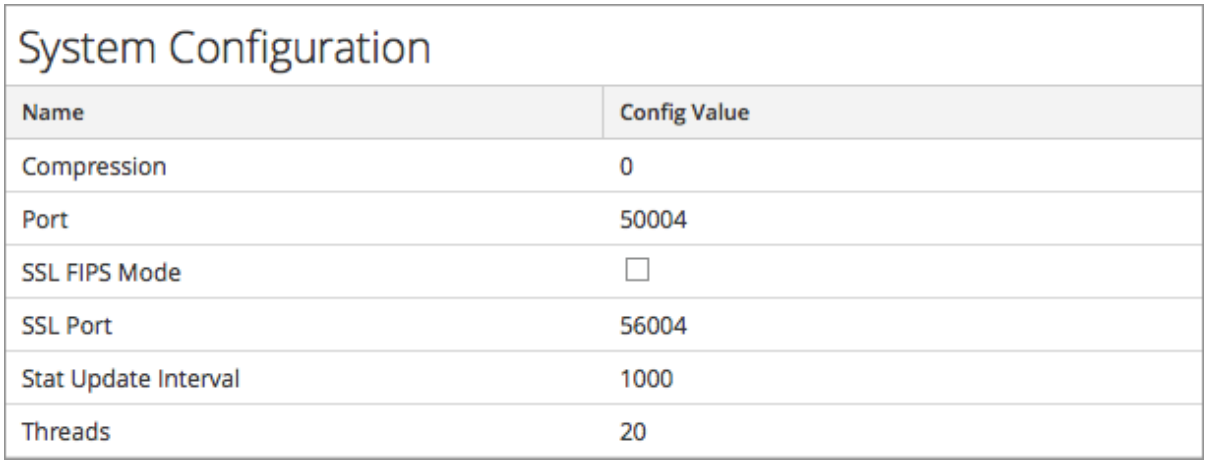


Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder
- Configure Parsers and Feeds

Quick Look

The first figure is an example of the General tab for a Decoder. The second is the General tab for a Log Decoder.



1 System Configuration - Manages service configuration for a Decoder or a Log Decoder.

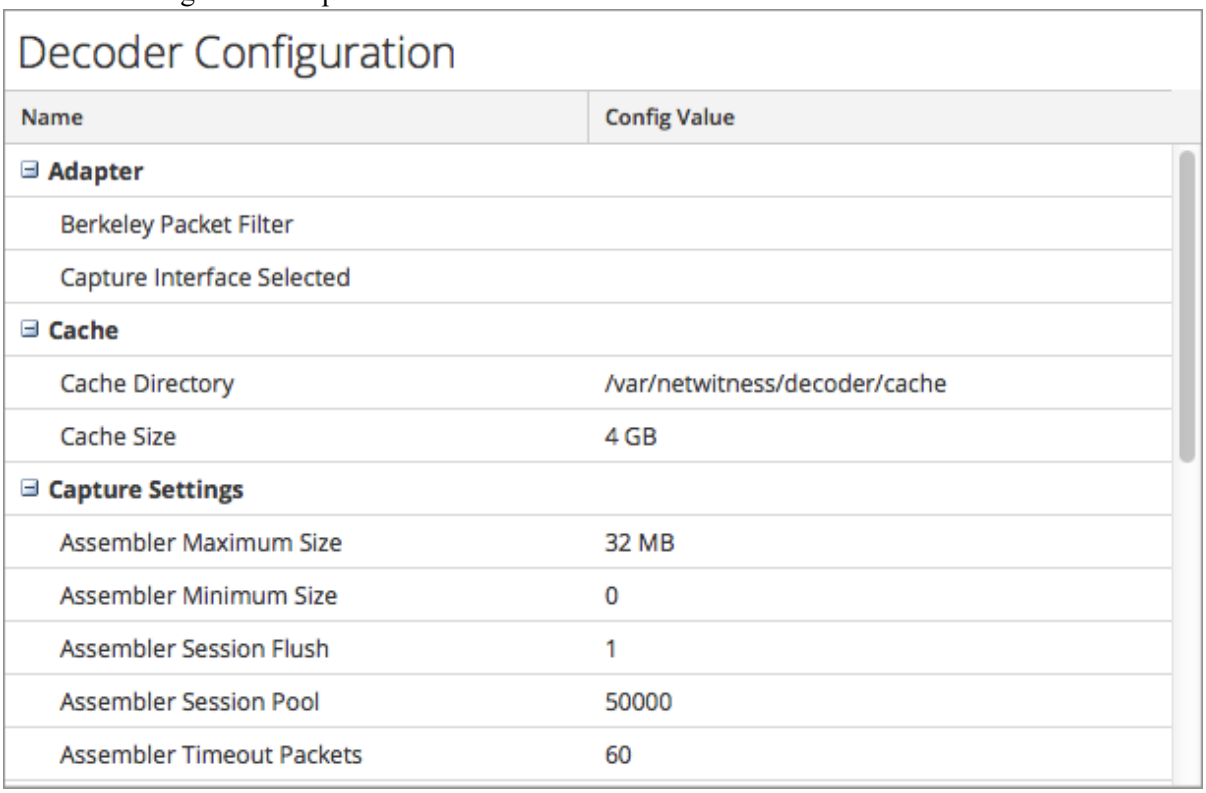
2 Decoder Configuration or Log Decoder Configuration - Lets you view and edit service configuration parameters for a Decoder or Log Decoder.

3 Parsers Configuration - Lets you select parsers to use on the Decoder or Log Decoder.
4 Service Parsers Configuration (Log Decoders only) - Lets you select service parsers to use on the Log Decoder.

System Configuration Section

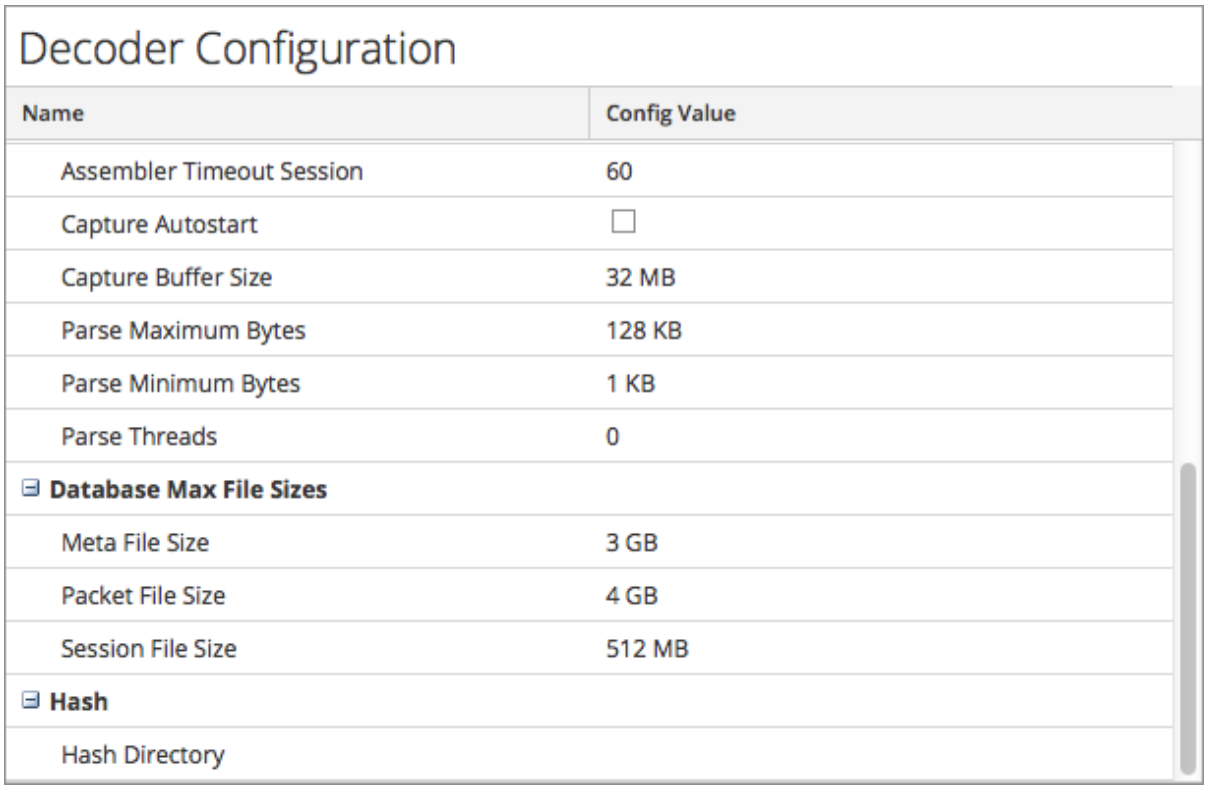
The System Configuration section manages service configuration for a Decoder. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

System Configuration



Name	Config Value
Compression	0
Port	50004
SSL FIPS Mode	☐
SSL Port	56004
Stat Update Interval	1000
Threads	20

The System Configuration section has these parameters.



Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of 0 disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
Port	Determines the port used by the service. **Note:** If you change the port number, ensure that you restart the service.
SSL FIPS mode	If enabled, all the data transferred in the network will be encrypted using SSL.
SSL Port	Indicates the port used for encrypting using SSL.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. A change takes effect on service restart.

Decoder Configuration Section

The Decoder Configuration section provides a way to view and edit service configuration parameters for a Decoder or Log Decoder. When a service is first added, default values are in effect. You can edit these values to manage traffic capture.

Scrolling to the bottom of the section reveals these additional Decoder Configuration parameters.

Adapter Section

Adapter parameters configure the network interface for capture as described in Configure Capture Settings.

Cache Section

Cache parameters configure the cache directory and size for session cache files. The following table describes the cache settings. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

Cache Parameter	Description
Cache Directory	The directory where session cache files are stored. The default value is `/var/netwitness/decoder/cache`. Change takes effect immediately.
Cache Size	The maximum size, in Megabytes (MB), that all files in the cache directory can attain before the oldest files are deleted. Once the threshold is reached, the cache size is reduced by 10%. The default value is **4 GB**. Change takes effect immediately.

Capture Settings Section

The Capture Settings section provides a way to configure operational capture settings. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

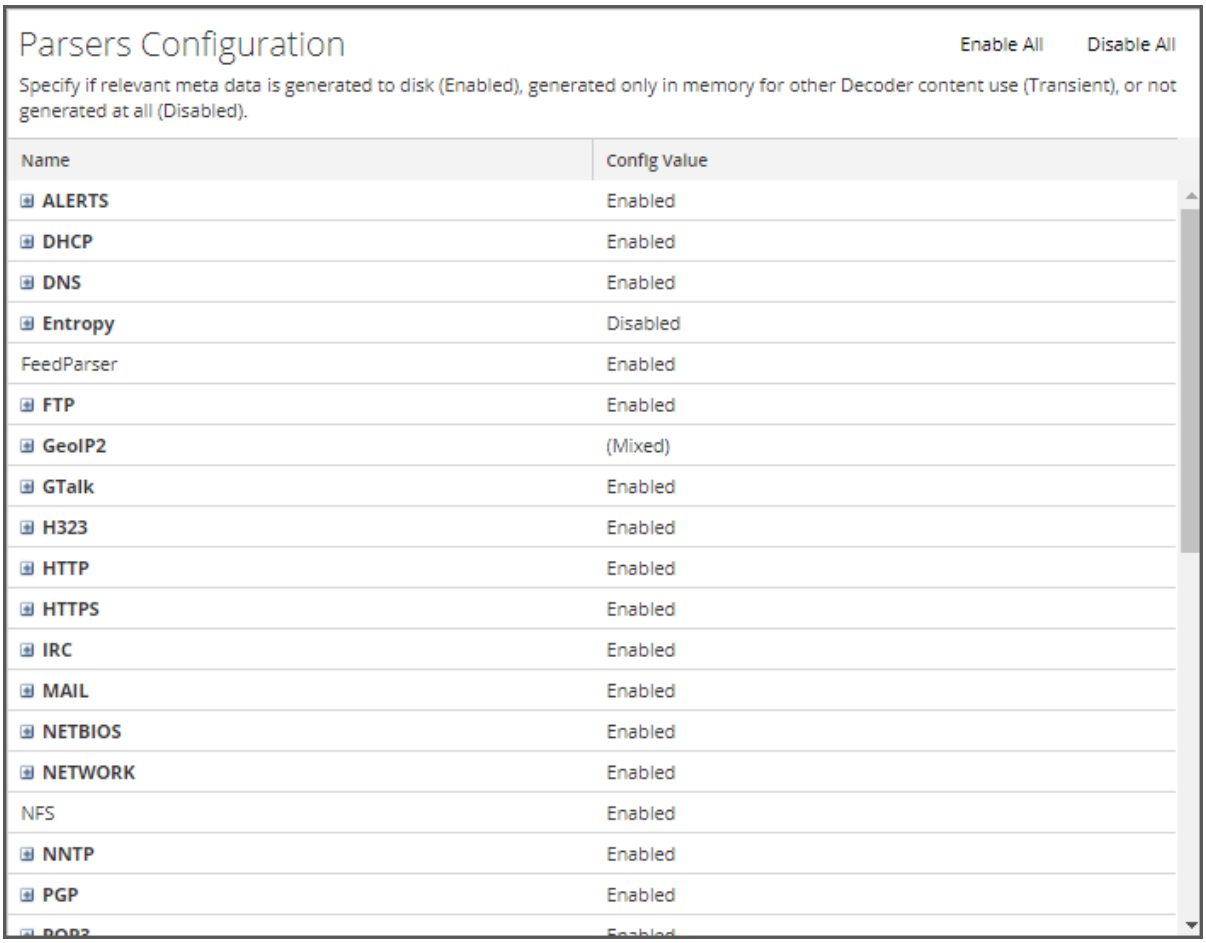
Capture Settings Parameter	Description
Assembler Maximum Size	Specifies the maximum size in bytes that a session's packet data size can attain. The default value is **32 MB**. Change takes effect immediately.
Assembler Minimum Size	Specifies the minimum size in bytes that a session must have in order to generate metadata. A value of **0** means every session has metadata generated. The default value is **0.** Change takes effect immediately.
Assembler Session Flush	Specifies whether a session is removed from the assembler when the session's last chain is removed from the assembler. The default value is **1**. • **2** = if the first packet of a session times out of assembler, the session is removed from assembler after parsing is complete. Any subsequent packets for this session create a new session in assembler. • **1** = If the last chain of a session times out of assembler, the session is removed from assembler. Any subsequent packets for this session create a new session in assembler. • **0** = If the last chain of a session times out of assembler, the session is left in assembler until it times out. Any subsequent packets for this session are filtered Change takes effect on service restart.
Assembles Session Pool	Specifies the number of entries in the session pool. The default value is **350000**. Change takes effect on service restart.
Assembler Timeout Packets	Specifies the number of seconds before a packet or chain is timed out. T default value is **60**. Change takes effect immediately.
Assembler Timeout Session	Specifies the number of seconds before a session is timed out. Default value is **60**. Change takes effect immediately.
Capture Autostart	Specifies whether capture begins automatically each time Decoder is started. When checked, the value = yes. When unchecked, the value = no. The default value is **no**. Change takes effect immediately.
Capture Buffer Size	The capture memory buffer allocation in Megabytes. Default value is **64 MB**. Change takes effect on service restart.
Parse Maximum Bytes	The maximum number of bytes to scan a stream for additional tokens. When the first token is found, the stream is scanned up to the set number of bytes, but no further. A setting of **0** removes the early termination and the full stream is scanned regardless of size. The default value is **128 KB**. Change takes effect immediately.
Parse Minimum Bytes	The minimum number of bytes to scan a stream for the first token. If no token is found within the set number of bytes, scanning is terminated. A setting of **0** removes the early termination and the full stream is scanned regardless of size. The default value is **1 KB**. Change takes effect immediately.

Capture Settings Parameter	Description
Parse Threads	The number of parse threads to use for session parsing. A value of **0** means let the server decide. The default value is **0**. Change takes effect on service restart.

Database Max File Sizes Section

The Database Max File Sizes section controls the maximum file size for various databases. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

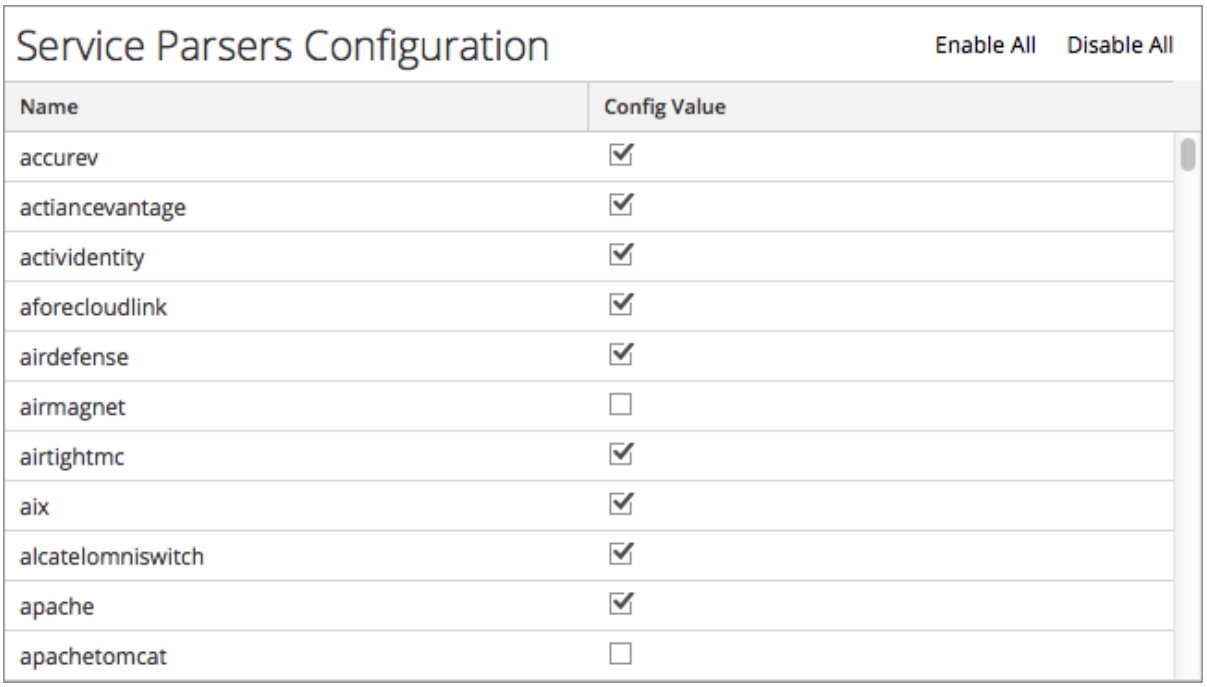
File Size Parameter	Description
Meta File Size	The maximum size of meta database files in Megabytes. The default value is **10 MB**. Change takes effect on service restart.
Packet File Size	The maximum size of packet database files in Megabytes. The default value is **10 MB**. Change takes effect on service restart.
Session File Size	The maximum size of session database files in Megabytes. The default value is **100 MB**. Change takes effect on service restart.



Hash Section

The Hash section settings control data base file hashing options. There is a small performance penalty when hashing.

Hash Parameter	Description
Hash Directory	The server directory where all hash files are written. If empty, each hash file is written to the same directory as the file being hashed. The default value is blank. Change takes effect on service restart.



Parsers Configuration Panel

The Parsers Configuration panel provides a way to select parsers to use on the Decoder. Within some parsers, you can also configure the metadata that the parser creates. See Enable and Disable Parsers and Log Parsers for detailed information and procedures.

Service Parsers Configuration Section for Log Decoder

The Service Parsers Configuration section provides a way to select Service parsers to use on the Log Decoder.

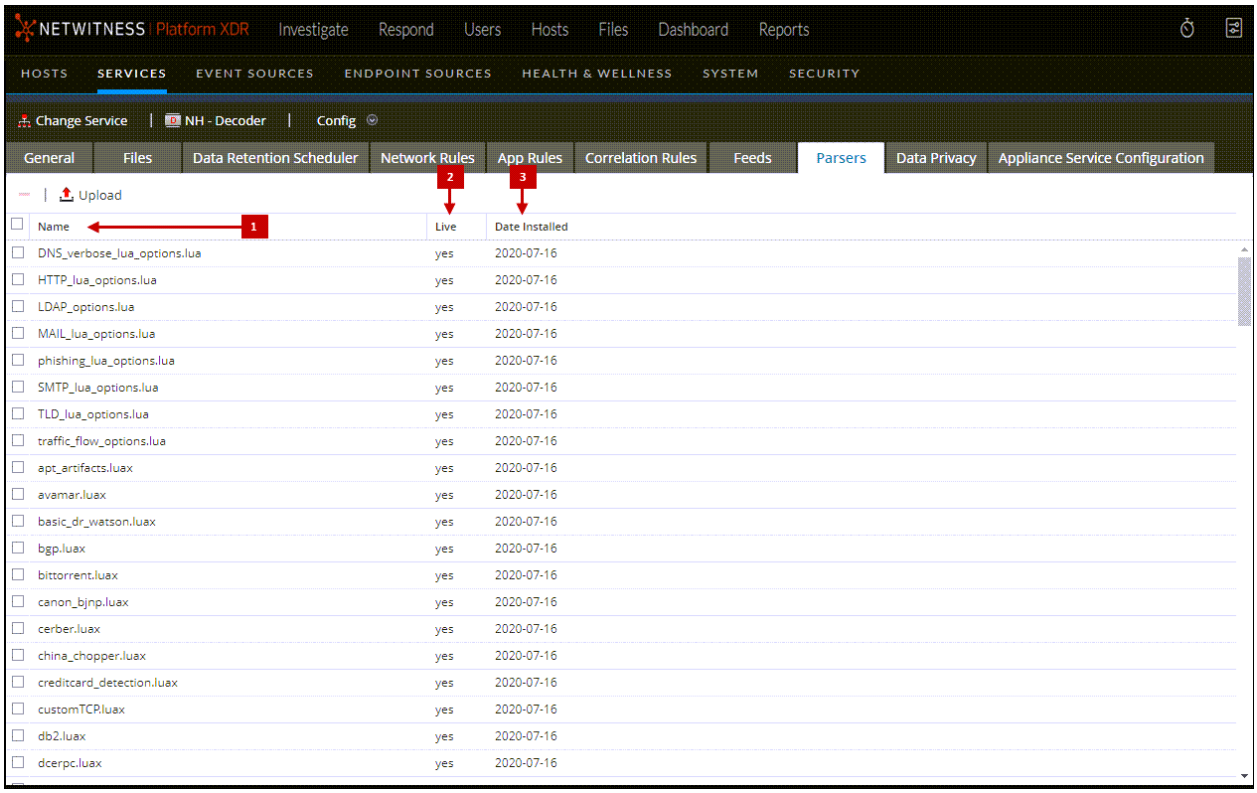
Service Parsers Configuration
Enable All
Disable All
Name
Config Value
accurev
actiancevantage
actividentity
aforecloudlink
airdefense
airmagnet
airtightmc
aix
alcatelomniswitch
apache
apachetomcat

Services Config View - Parsers Tab

In the Services Config View > Parsers tab, you can view deployed parsers on a Decoder or Log Decoder, upload parsers, and delete deployed parsers. Parsers can be added and removed while a Decoder or Log Decoder is running without affecting capture.

To access the Parsers tab, go to (Admin) > **Services** > select a **Decoder** or **Log Decoder** service and click > **View** > **Config** > **Parsers** tab.

What do you want to do?



User Role	I want to...	Documentation
Administrator	View deployed parsers.	Enable and Disable Parsers and Log Parsers
Administrator	Upload parsers to a Decoder or Log Decoder.	Enable and Disable Parsers and Log Parsers

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder
- Upload and Delete Custom Parsers

Quick Look

This is an example of the Parsers tab. The Parsers grid lists all parsers that are currently deployed on the Decoder.

1 **Name**: The name of the parser or the parser file.

2 **Live**: Indicates if the parser originated from Live. Possible values are **Yes**, **No**, or **N/A**.

- **Yes** = Installed through Live Services.
- **No** = Installed through NetWitness.
- **N/A** = The parser has no attributes file created by NetWitness to track the installation date. The parser may have been installed manually, not through NetWitness or Live Services.

3 **Date Installed**: The date the parser was pushed to the service.

Parsers Tab Toolbar

The Parsers Tab toolbar has options to work with parsers in the grid.

Feature	Description
Upload	Enables you to upload parsers to a Decoder or Log Decoder.
−	Requests confirmation that you want to delete the selected parsers. You can select **No** to cancel the deletion, or select **Yes** to delete the selected parsers.

Services Config View - Parser Mappings Tab

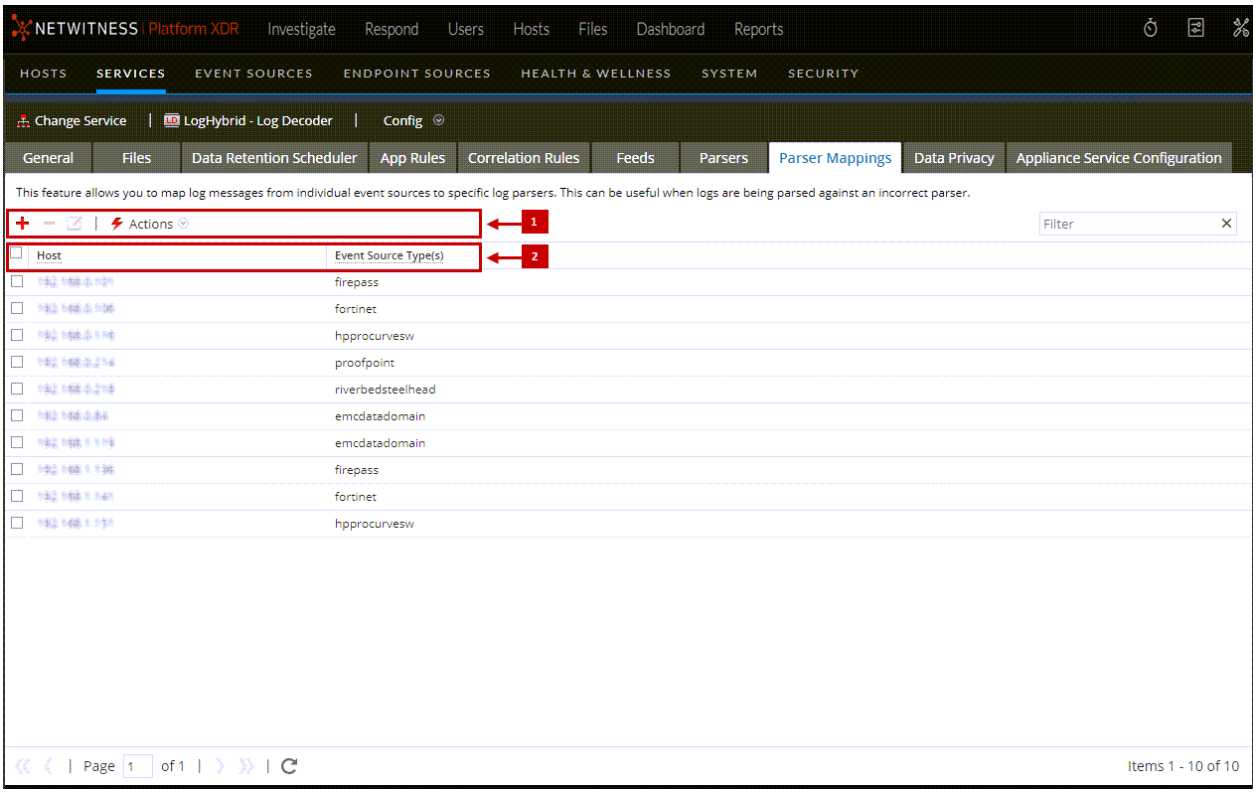
This topic provides a description of the configurable options for a Log Decoder in the Parser Mappings tab.

In the Parser Mappings Administrators can configure log parser mappings for Log Decoder services. To access the Parser Mappings tab, go to  (Admin) > **Services** > select a Log Decoder service and click  > **View** > **Config** > **Parser Mappings** tab.

Note: You can also configure log parser mappings for Log Decoder services by navigating to **Admin > Services > Event Sources > Discovery**.

This feature is intended to track a subset of event sources that is parsing against the wrong parser.

What do you want to do?



User Role	I want to...	Documentation
Administrator	Manage IPs for Event Source Mapping.	Enable Parser Mappings

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

Quick Look

This is an example of the tab.

1 Parser Mappings Toolbar - Provides options to work with parser mappings in the list
2 Parser Mappings List - Lists all parsers that are currently mapped on the Log Decoder

Parser Mappings Toolbar

The Parser Mappings toolbar has options to work with parser mappings in the grid.

Feature	Description
	Add a parser mapping.
	Delete the selected parser mapping.
	Edit a parser mapping.
	Refresh the list of parser mappings.
	Display the Actions menu. • **Import** - Import a parser mapping to a file. • **Export** - Save a parser mapping to a file.

Parser Mappings List

The Parser Mappings list displays all parsers that are currently mapped on the Log Decoder.

Parameter	Description
Host	Displays the IP address of the host.
Event Source	Displays the event sources that are parsing incorrectly.

Parser Mappings Editor Dialog

The Parser Mappings Editor dialog allows you to update an IP to event source mapping.

To access the Parser Mappings Editor dialog, in the Services Config view for a Log Decoder, select the Parser Mappings tab.

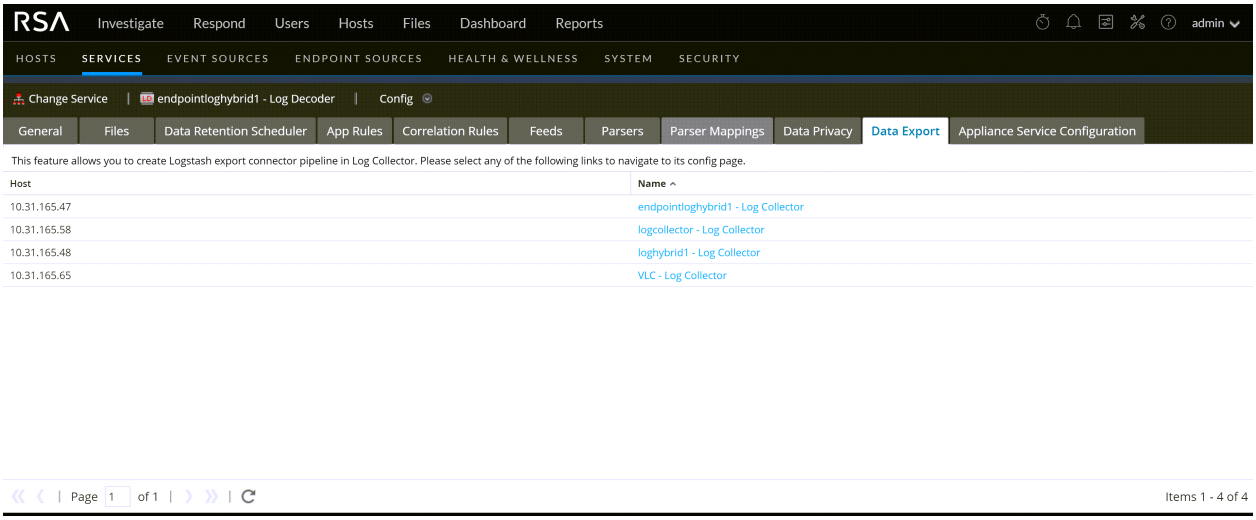
Data Export Tab

The Data Export tab (**Admin** > **Services** > select a Decoder or Log Decoder and click > **View** > **Config** > **Data Export** tab) exports meta data and raw logs from the Decoder or Log Decoder and converts it to Logstash JSON object by configuring the export connector through Logstash.

Prerequisites

Make sure you have log collector service to configure Logstash in the UI.

What do you want to do?



User Role	I want to...	Documentation
Administrator	Configure Export Connector	Configure Logstash Event Sources in NetWitness

Related Topics

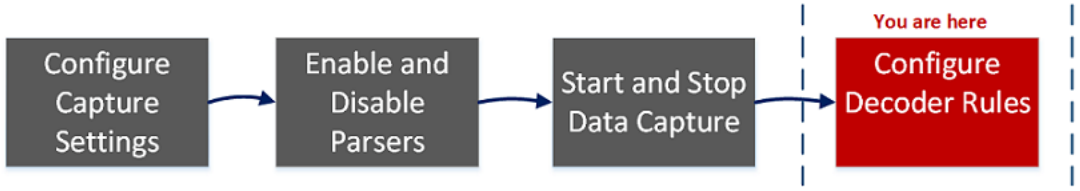
- Services Config View - Rules Tabs

Quick Look

The following figure shows an Data Export tab.

The data export list displays all the Log Collectors in your deployment.



Parameter	Description
Host	Displays the IP address of the host.
Name	Displays the name of the Log Collector.

Services Config View - Rules Tabs

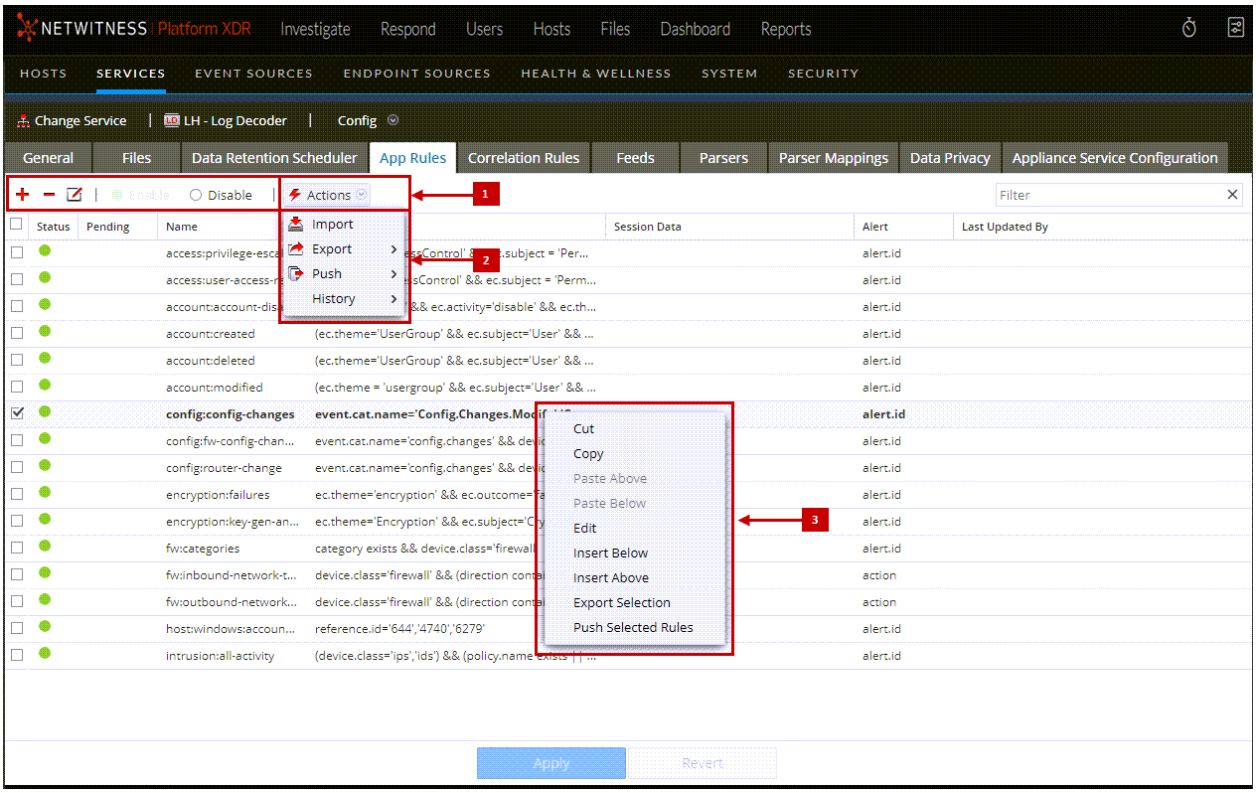
The Rules tabs in the Services Config view (**(Admin) > Services >** select a service and click **> View > Config**) enable you to define and manage capture rules. Each type of rule has a list with slightly different columns and different parameters in the Rule Editor dialog. Application and correlation rules apply to both Decoders and Log Decoders. Network rules apply only to Network Decoders.

Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.

What do you want to do?

User Role	I want to...	Documentation
Administrator	configure capture settings	Configure Capture Settings
Administrator	manage parsers and log parsers	Enable and Disable Parsers and Log Parsers
Administrator	start and stop data capture	Start and Stop Data Capture
Administrator	configure rules*	Configure Decoder Rules
Administrator	import, export, or push a rule*	Configure Decoder Rules
Administrator	enable or disable a rule*	Configure Decoder Rules
Administrator	add, edit, or delete a rule*	Configure Decoder Rules



*You can complete these tasks here.

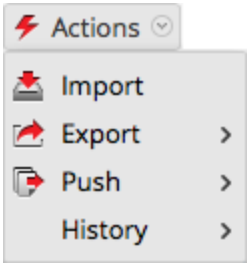
Quick Look

This is an example of the App Rules tab.

1 Rules Tab Toolbar - Provides options to work with rules in the list
2 Rules Actions Menu - Provide options to manage sets of rules
3 Rules List Context Actions - Displays the Rules List Context Menu

Rules Tab Toolbar

The toolbar is the same for all Config view > Rules tabs.



Feature	Description
Actions	Displays the **Actions** menu.
	Adds a new rule to a service.
	Deletes a rule from a service.
	Allows rule modification.
	Disables a rule (without deleting the rule).
	Enables (reactivates) a rule.

Feature	Description
Filter	The input field for a search string. NetWitness filters the rules dynamically as you type a search string. Clicking **x** clears the input field, restoring the unfiltered view.
Apply	Saves the changes made to rules and applies the configured rules to a service. Until you apply changes, it is possible to reload the rules as they were before current modifications.
Revert	Discards unsaved changes to the list and reverts to the unedited rules.

Rules Actions Menu

The Actions menu has options that help to manage sets of rules.

Option	Description
Import	Imports a set of rules into the user interface so that it can be applied to a service. You can edit the rules before applying.
Export	Saves selected rules or all rules to an .nwr file on the client machine.

Push	Allows rules to be applied to other services (Decoders or Log Decoders) or Decoders belonging to a service group. When pushing, the rules can either be merged (update existing rules and append new ones) or replaced.
	• **Push > All.** Pushes all rules to other services. All rules on the target services are removed and replaced with all of the rules on the source service.
	• **Push > Selection.** Pushes selected rules to other services. You have two options:
	  • **Replace.** Deletes all rules on the target services and replaces them with the selected rules from the source service.
	  • **Merge.** Merges the selected rules with the existing rules on the target services

History	Displays the last ten snapshots of rules applied through NetWitness. You can select and apply (restore) a snapshot to the Decoder at anytime.

Rules List Context Actions

Within a rules list, right-clicking a row displays the Rules list context menu.

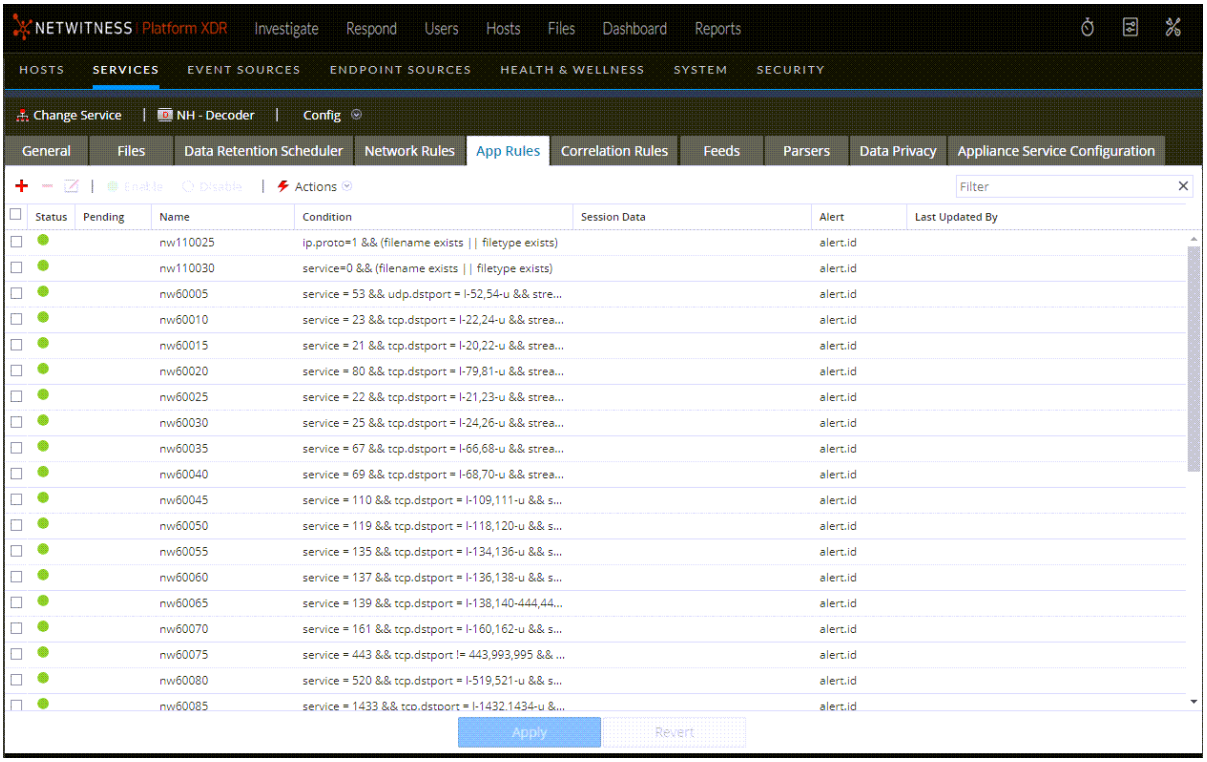
Option	Description
Cut	Deletes the current rule.

Option	Description
Copy	Copies the current rule.
Paste Above	Pastes the copied rule above the current rule.
Paste Below	Pastes the copied rule below the current rule.
Edit	Edits the current rule.
Insert Below	Inserts imported rules below the current rule.
Insert Above	Inserts imported rules above the current rule.
Export Selection	Exports the selected rules.
Push Selected Rules	Pushes the selected rules to other services.

App Rules Tab

The App Rules tab (**Admin > Services >** select a Decoder or Log Decoder and click **> View > Config > App Rules tab**) enables you to manage application rules. NetWitness applies application rules at the session level.

What do you want to do?



User Role	I want to...	Documentation
Administrator	add or edit application rules	Configure Application Rules

Related Topics

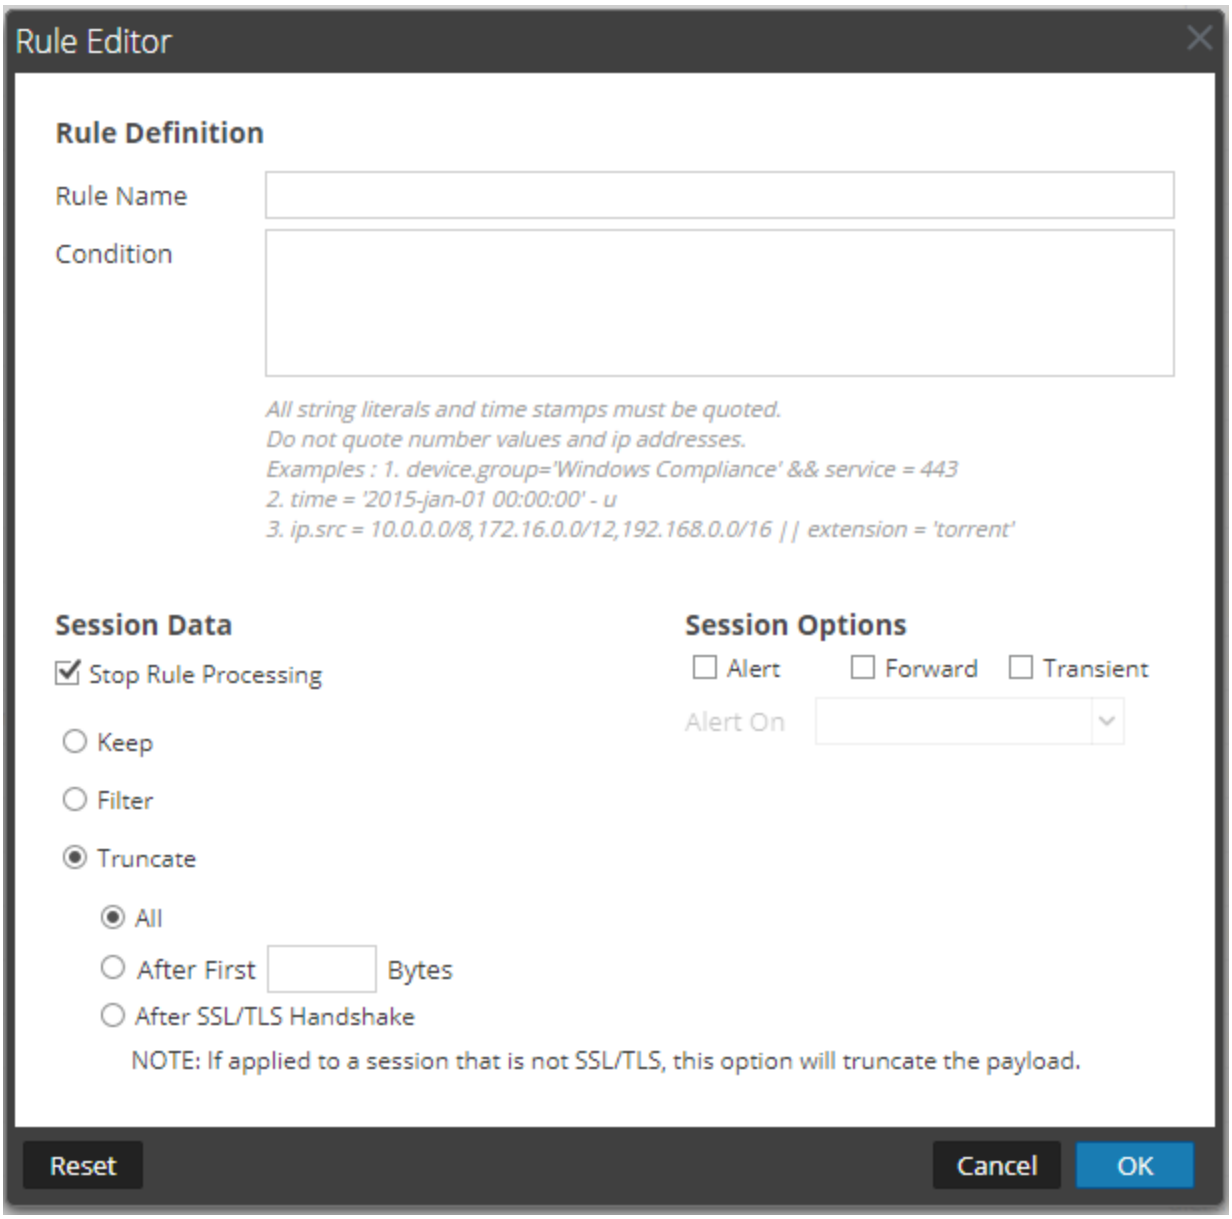
Quick Look



The following figure shows an App Rules tab and the table describes the columns.

Column	Description
Pending	This column indicates whether a rule has pending changes. Rules that are currently active on the Decoder have no indicator. If the rule is new or has been modified, the column contains . Once the rules are applied, the pending indicator is removed.
Name	This is the rule name, a descriptive identifier for the rule.
Condition	This is the definition of the condition that triggers an action when matched.
Session Data	This column displays the Session Data action taken when a packet matches the rule. Possible values are **Filter**, **Keep**, or **Truncate**.
Alert	This column displays the name of the custom alert that the Decoder generates when metadata matches the rule.
Status	This column indicates whether the rule is enabled or disabled with a circle icon. If the circle is filled green, the rule is enabled. If the circle is empty, the rule is disabled.

Rule Editor Dialog

The following figure shows the Rule Editor dialog for an application rule.

The Rule Editor dialog provides the fields and options needed to define an application rule.

Field	Description
Rule Name	The descriptive name that identifies the rule.
Condition	The definition of the condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the Intellisense window actions. As you build the rule definition, Intellisense displays syntax errors and warnings. All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.

The following table describes the Session Data actions and options.

Action	Description
Stop Rule Processing	If checked, further rule evaluation ends if the rule is matched, and the session is saved in accordance with the session action. If not checked, rule evaluation continues until all rules are evaluated.
Keep	The packet payload and associated metadata are saved when they match the rule.
Filter	The packet is not saved when it matches the rule.
Truncate	**Truncate All** – truncates all session payload bytes. The packet payload is not saved when it matches the rule, but packet headers and associated metadata are retained. This is the default truncation option. **Truncate After First <n> Bytes** – truncates the session payload bytes after the specified first <n> bytes, where <n> is an integer. The packet payload is not saved after <n> bytes when it matches the rule, but packet headers and associated metadata are retained. **Truncate SSL/TLS After Handshake** – truncates the payload for all sessions except in the case of an SSL/TLS session, where the SSL exchange is preserved, but the rest of the payload is not saved. This option is for use with SSL parsers.
Alert and **Alert On**	If **Alert** is checked, the packet generates a custom alert when metadata matches the rule. You can select the name of the alert in the **Alert On** field.
Forward	Enables the performance of syslog forwarding when the log matches the rule.
Transient	Prevents the alert metadata that is created from being written to the disk.

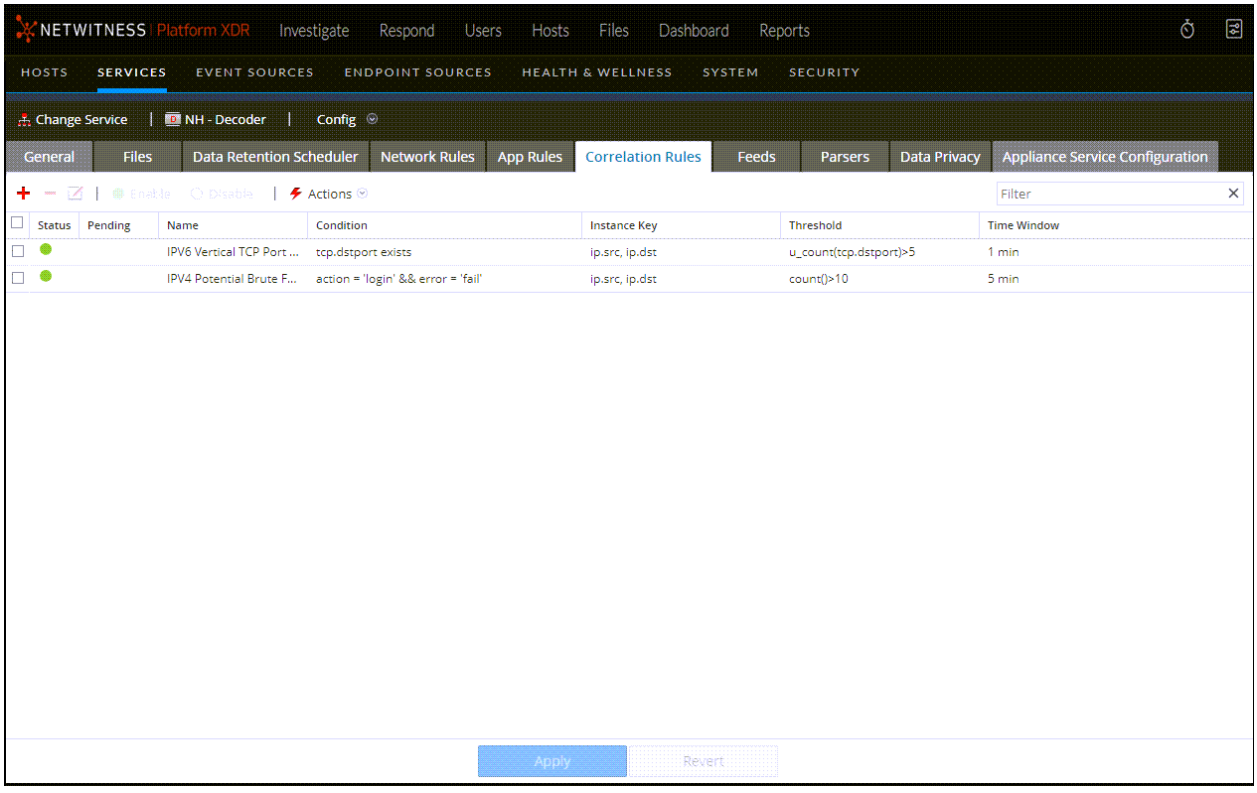
The following table describes Rule Editor dialog actions.

Action	Description
Reset	Resets the contents of the dialog to their values before editing; changes are discarded.
Cancel	Cancels any edits and closes the Rule Editor dialog.
OK	Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor dialog closes.
Save	(Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax.

Correlation Rules Tab

The Correlation Rules tab (**(Admin) >** select a service and click **> View > Config > Correlation Rules tab**) enables you to manage correlation rules. Basic correlation rules are applied at the session level and alert the user to specific activities that may be occurring in their environment. NetWitness applies correlation rules over a configurable sliding time window.

What do you want to do?



User Role	I want to...	Documentation
Administrator	add or edit a correlation rule	Configure Correlation Rules

Related Topics

Quick Look

The following figure shows the Correlation Rules tab.

The following figure shows the Rule Editor dialog for a correlation rule.

The following table describes the Correlation Rules tab columns.

Column	Description
Pending	This column indicates whether a rule has pending changes. Rules that are currently active on the Decoder have no indicator. If the rule is new or has been modified, the column contains . Once the rules are applied, the pending indicator is removed.
Name	This is the descriptive name for the rule.
Condition	This is the definition of the condition that triggers an action when matched. In conditions, all string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
Instance Key	This is the target indicator to base the event upon. It can be a single primary key, such as ip.src or a compound primary key such as `ip.src,ip.dst`.
Threshold	This is the minimum number of occurrences required to trigger a correlation session and can include a associated key that identifies the meta type that were are counting to determine if the condition is satisfied. The correlation engine cannot use IPv4 or IPv6 as an associated meta type. Use one of these three arguments: • `u_count(associated_key)` = the count of unique values of the specified key. A key is required. • `sum(associated_key)` = the values of the specified key. a key is required. • `count()` = number of sessions, no associated key used. If included, it is ignored.
Time Window	This is the duration in hours, minutes, or seconds within which the threshold must be reached to trigger a correlation session.

Column	Description
Status	This column indicates whether the rule is enabled or disabled with a circle icon. If the circle is filled green, the rule is enabled. If the circle is empty, the rule is disabled.

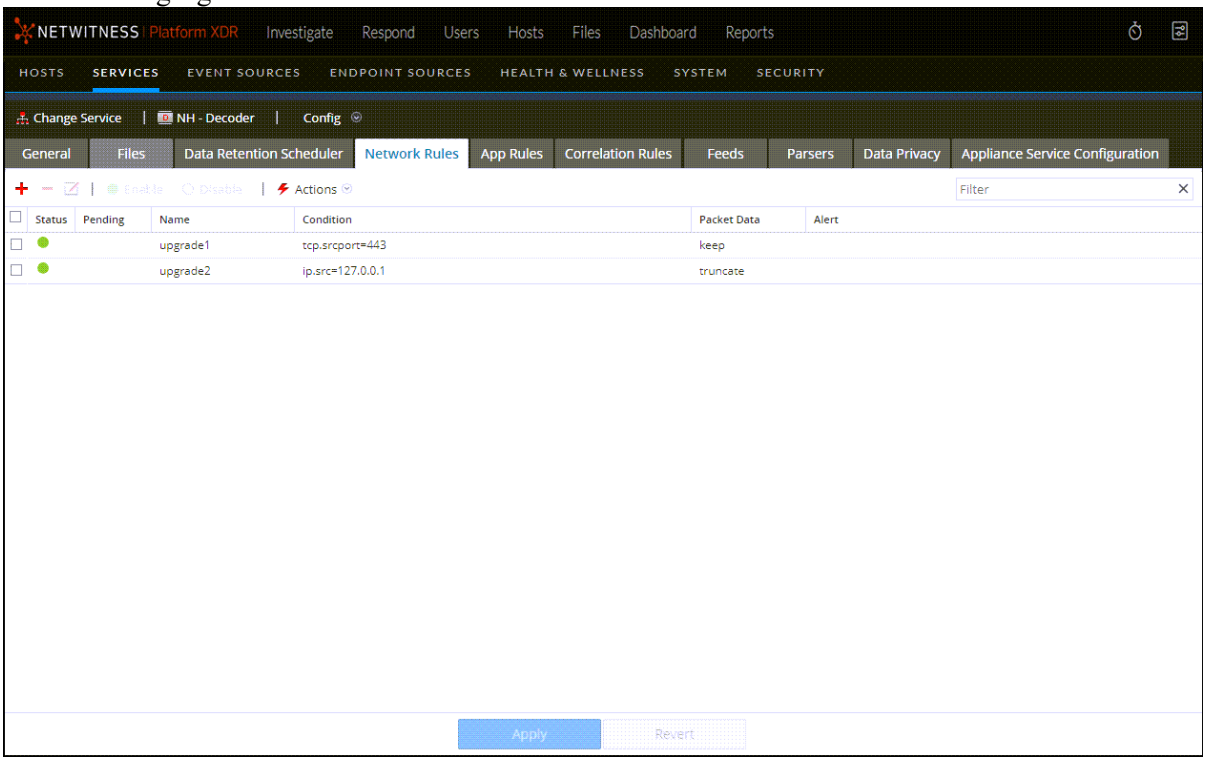
The **Rule Editor** dialog provides the fields and options needed to define a network rule. The fields correspond exactly to the grid columns.

Action	Description
Reset	Resets the contents of the dialog to their values before editing; changes are discarded.
Cancel	Cancels any edits and closes the Rule Editor Dialog.
OK	Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor Dialog closes.
Save	(Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax.

Network Rules Tab

The Network Rules tab (**(Admin) > Services >** select a Decoder and click **> View > Config > Network Rules tab**) enables you to manage network rules. NetWitness applies network rules at the packet level. Network rules consist of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied to the Decoder. Rules can be applied to multiple layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules apply only to Network Decoders.

What do you want to do?



User Role	I want to...	Documentation
Administrator	add, edit, or fix network rules	Configure Network Rules

Quick Look

The following figure shows the Network Rules tab.

The following figure shows the Rule Editor dialog for a network rule.

The following table describes the columns in the Network Rules grid.

Column	Description
Pending	This column indicates whether a rule has pending changes. Rules that are currently active on the Decoder have no indicator. If the rule is new or has been modified, the column contains . Once the rules are applied, the pending indicator is removed.
Name	This is the rule name, a descriptive identifier for the rule.
Condition	This is the definition of the condition that triggers an action when matched.
Packet Data	This column displays the Session Data action taken when a packet matches the rule. Possible values are **Filter**, **Keep**, or **Truncate**.
Alert	This column indicates whether the Decoder generates a custom alert when metadata matches the rule. Possible values are **Enabled** or **Disabled**.
Status	This column indicates whether the rule is enabled or disabled with a circle icon. If the circle is filled green, the rule is enabled. If the circle is empty, the rule is disabled.

The **Rule Editor** dialog provides the fields and options needed to define a network rule.

The following table describes the Rule Definition fields.

Field	Description
Rule Name	The descriptive name that identifies the rule.
Condition	The definition of the condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the Intellisense window actions. As you build the rule definition, Intellisense displays syntax errors and warnings. In conditions, all string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details. This section also describes the meta keys that NetWitness supports for use in network rule conditions.

The following table describes the Session Data actions.

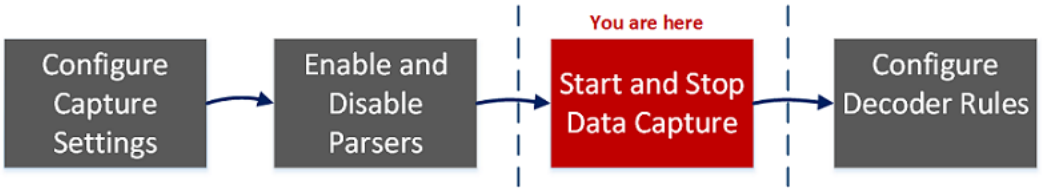
Action	Description
Stop Rule Processing	If checked, further rule evaluation ends if the rule is matched, and the session is saved as indicated. If not checked, rule evaluation continues until all rules are evaluated.
Keep	The packet payload and associated meta are saved when they match the rule.
Filter	The packet is not saved when it matches the rule.
Truncate	The packet payload is not saved when it matches the rule, but packet headers and associated meta are retained.

The following table describes the session options.

Action	Description
Assemble	If checked, the assembler assembles the packet chain when it matches the rule.
Network Meta	The packet generates network metadata when it matches the rule.
Application Meta	The packet generates application metadata when it matches the rule.
Alert	The packet generates a custom alert when metadata matches the rule.

The following table describes Rule Editor dialog actions.

Action	Description
Reset	Resets the contents of the dialog to their values before editing; changes are discarded.
Cancel	Cancels any edits and closes the Rule Editor dialog.
OK	Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor dialog closes.
Save	(Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax.



Services System View - Decoders

A Log Decoder is a special type of Decoder, and is configured and managed in a similar way to a Decoder. Therefore, most of the information in this section refers to both types of Decoders. Differences for Log Decoders are noted.

To reach the Services System view, go to **(Admin) > Services >** select a Decoder or Log Decoder > > **View** > **System**.

Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.

What do you want to do?

User Role	I want to...	Documentation
Administrator	configure capture settings	Configure Capture Settings
Administrator	manage parsers and log parsers	Enable and Disable Parsers and Log Parsers
Administrator	start and stop data capture*	Start and Stop Data Capture
Administrator	upload packet capture and log files*	Upload a Log File to a Log Decoder Upload a Packet Capture File
Administrator	reset log stats, perform host tasks, shutdown the service, shutdown the appliance service, and reboot the host*	*Hosts and Services Getting Started Guide*
Administrator	configure rules	Configure Decoder Rules

*You can complete these tasks here.

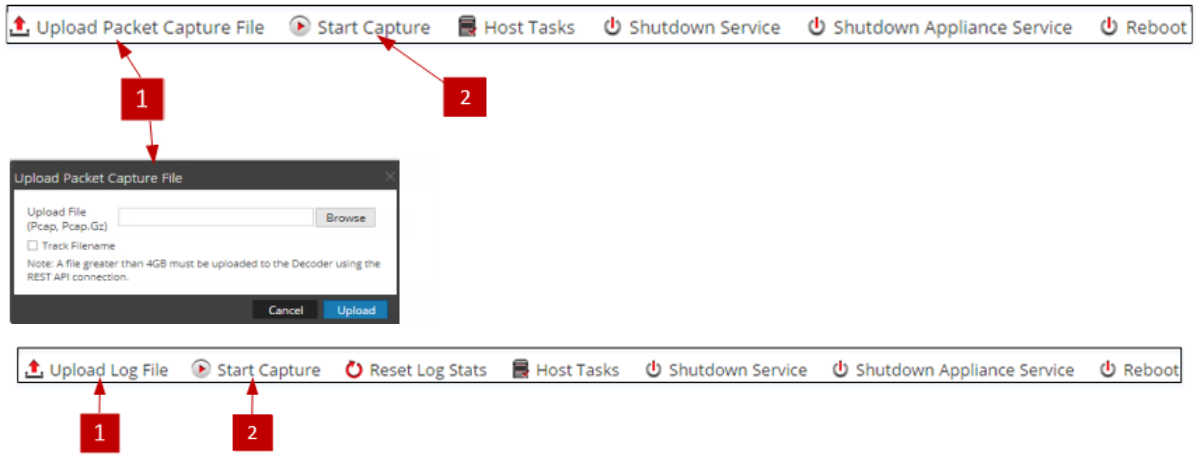
Quick Look

This is an example of the Services System view for a Decoder.



This is an example of the Services System view for a Log Decoder.

Service Info Toolbar

These two toolbars illustrate the options specific to Decoders and Log Decoders.

In addition to the common options in the Services System view toolbar, you can start and stop capture of packets or logs. The upload file options are different for the standard Decoder (packet capture file) and the Log Decoder (log file).

Action	Description
Upload Packet Capture File	Displays a dialog that provides a way to select a packet capture (.pcap) file for upload to the selected Decoder. For more information, see Upload a Packet Capture File. **Note:** This option does not apply to Log Decoders.
Upload Log File	Displays a dialog that provides a way to select a log (.log) file for upload to the selected Log Decoder. For more information, see Upload a Log File to a Log Decoder.
Start/Stop Capture	Starts packet capture on the selected Decoder. When packet capture is in progress, the option in the toolbar changes to Stop Capture, and the option to upload a file is unavailable.

Introduction to Endpoint Agent Installation

Note: The information in this guide applies to Version 11.1 and later.

Hosts can be laptops, workstations, servers, physical or virtual, where a supported operating system is installed. An Endpoint Agent can be deployed on a host with either a Windows, Mac, or Linux operating system. The installation process involves:

1. (Optional) Configuring the Relay Server

Note: You must set up the default relay server before generating the Agent packager. Whenever the Relay server configuration is modified, agent policy is updated automatically. For more information on configuring the relay server, see *Endpoint Configuration Guide*.

2. Generating an agent packager
3. Generating the agent installer

You can run the agent installer specific to your operating system to deploy agents on the hosts. The agents collect endpoint data and tracking events from these hosts. It monitors key behaviors related to process, file, registry, console, and network, and forwards them as events to the Endpoint Server over HTTPs.

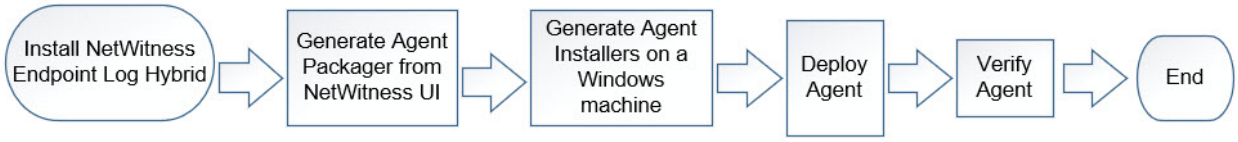
Note: The Endpoint agent can operate either in Insights or Advanced mode depending on the policy configuration. For more information, see the *NetWitness Endpoint Configuration Guide*.

Supported Operating Systems

Note: From version 12.0 and higher, NetWitness Endpoint agents run on ARM devices running on Windows 10 and 11.

Windows	**Linux** *(The agent software runs only on x86_64 architecture)*	**macOS**
Windows 11 (up to version 22H2)	CentOS 7.x and 8.x	macOS Monterey (12)
Windows 10 (32 and 64-bit) (up to version 22H2)	Red Hat Enterprise Linux 7.x and 8.x	macOS Big Sur (11)
Windows 8.1 (32 and 64-bit)	SUSE Linux Enterprise Server 12 SP3, 12 SP4, 12 SP5 and 15 SP1	macOS Catalina (10.15)
Windows 8 (32 and 64-bit)	Ubuntu 16.04 LTS, 18.04 LTS, and 20.04 LTS	macOS Mojave (10.14)
Windows 7 (32 and 64-bit)		macOS High Sierra (10.13)
Windows Server 2022 Windows Server 2022 Core		macOS Sierra (10.12)

Windows Server 2019 Windows Server 2019 Core		OS X El Capitan (10.11)
Windows Server 2016		OS X Yosemite (10.10)
Windows Server 2012 R2		OS X Mavericks (10.9)
Windows Server 2012		
Windows Server 2008 R2 (32 and 64-bit)		
Windows 10 Kiosk Mode (64-bit)		



Hardware Requirements

The following are the minimum hardware requirements to run an agent in a host (laptops, workstations, servers, physical or virtual):

- 256 MB RAM
- 300 MB disk space
- Single-core CPU

Installation Flowchart

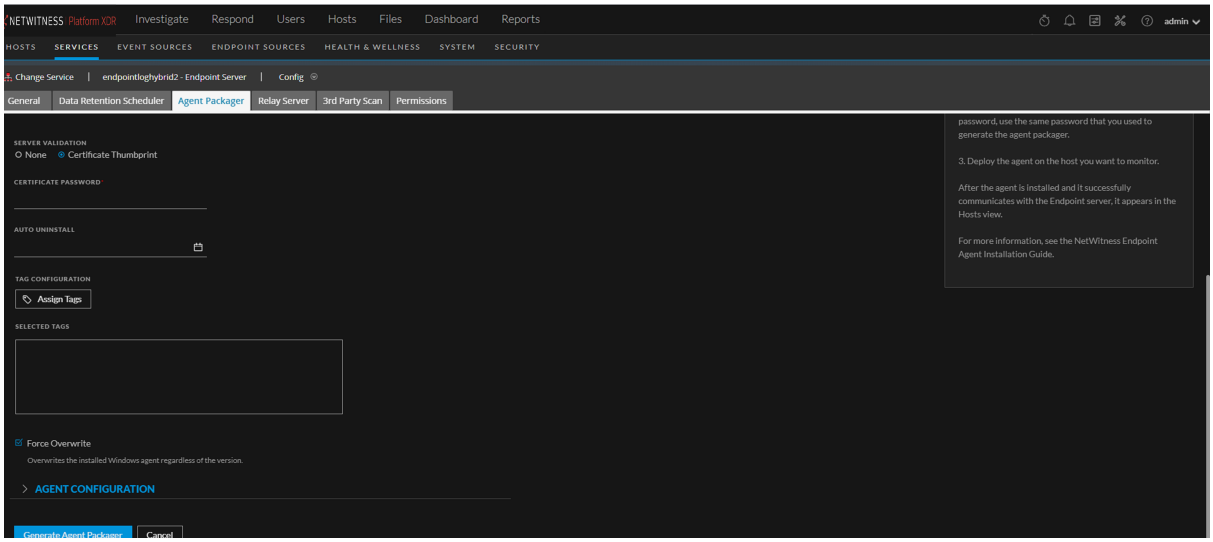
The following flowchart illustrates the Endpoint agent installation process:

Prerequisites

- Install NetWitness. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*.
- Install NetWitness Endpoint Log Hybrid. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*.
- Deploy ESA Rules from the Endpoint Rule Bundle. For more information, see *ESA Configuration Guide*.
- Configure Endpoint Metadata forwarding. For more information, see *NetWitness Endpoint Configuration Guide*.
- Review the default policies and create groups to manage your agents. For more information, see *NetWitness Endpoint Configuration Guide*.
- Configure your RSA Live account and make sure the File Reputation service is enabled. For more information, see *Live Services Management Guide*.
- To migrate an existing NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.5 and later, see https://community.netwitness.com/t5/netwitness-platform-online/migrating-netwitness-endpoint-4-4-0-x-to-netwitness-platform/ta-p/669090 to import the NetWitness Endpoint 4.4.0.x configurations (file status, certificate status and blocked hashes).

Note: If you are upgrading, make sure that you deploy the latest Endpoint application rules from RSA Live. For more information, see *Live Services Management Guide*.

Generate an Endpoint Agent Packager



To generate an agent packager to collect endpoint data from hosts:

1. Log in to NetWitness.

   Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Login screen.

2. Click  **(Admin) > Services**.

3. Select the **Endpoint Server** service and click  **> View > Config > Agent Packager** tab.
   The Agent Packager tab is displayed.

4. Enter the values in the following fields:

Field	Description
Endpoint Server	Displays all the available Endpoint servers in the deployed.
Endpoint Server Forwarder (Optional)	The optional Endpoint Server Forwarder allows you to enter an alternative Fully Qualified Domain Name (FQDN) or IP address on which the sever can be reached in the case that agents need to go through a NAT or similar in order to reach the Endpoint Server. If specified forwarder is not available, agent will eventually fall back to the packaged address.
HTTPS Port	Port number. For example, 443.
Server Validation	Determines how the agent validates the Endpoint Server certificate: • None – The agent will not validate the server certificate. • Certificate Thumbprint – default selection. The agent identifies the server by validating the thumbprint of the Root CA of the server certificate.
Certificate Password	Password used to download the packager. The same password is used while generating the agent installer. **Note:** The password must be minimum seven characters long and a combination of uppercase and lowercase letters, numbers, and special characters. For example, **Admin@123**.
Auto Uninstall	Date and time the agent automatically uninstalls. You can leave it blank if not required.
Tag Configuration	When you click **Assign Tags** under Tag Configuration, you can do any of the following: • Create new tags and assign them to the hosts. • Select already existing tags and assign them to the hosts. For more information, see Investigate Hosts.
Force Overwrite	Overwrites the installed Windows agent regardless of the version. If this option is not selected, the same installer can be run multiple times on a system, but installs the agent only once. If you enable this option, make sure that you provide the same service name and driver service name as the previously installed agent, while creating a new agent. **Note:** If you want to force overwrite with MSI, run the following command: `msiexec /fvam <msifilename.msi>` After you move an agent from one deployment to another, using Force Overwrite to change the agent incurs an 8-hour delay in communication between the agent and its Endpoint Server on the new deployment. To eliminate the delay, uninstall the agent from the old deployment, and reinstall the agent on the new deployment.

Field	Description
Agent Configuration	
Note: The following Service and Driver fields are applicable only for Windows.	
Service	
Service Name	Name of the agent service. For example, NWEAgent.
Display Name	Display name of the agent service. For example, NWE Agent.
Description	Description of the agent service. For example, NetWitness Endpoint.
Driver	
Driver Service Name	Name of the driver service. For example, NWEDriver.
Driver Display Name	Display name of the driver service. For example, NWE Driver.
Driver Description	Description of the driver service. For example, NetWitness Endpoint Driver.
Generate Agent	Generates an agent packager.

5. Click **Generate Agent**.

   This downloads an agent packager (**AgentPackager.zip**) on the host where you are accessing the NetWitness user interface.

Generate Endpoint Agent Installers

To generate endpoint agent installers to deploy on hosts:

Note: Use a Windows machine to execute the agent packager file.

1. Unzip the **AgentPackager.zip** file. It includes the following:
   - **agents** folder – Contains executables for Linux, Mac, and Windows.
   - **config** folder – Contains configuration file and the certificates required to communicate between the Endpoint Server and the agent.
   - **AgentPackager.exe** file.
2. Run the **AgentPackager.exe** file as administrator by right-clicking the file and selecting **Run as administrator**.
3. Enter the same password used while generating the agent packager and press **Enter**.
   This creates the following installers in the root folder:
   - nwe-agent-package.exe (for Windows)
   - NWE000032.msi (for Windows 32-bit)
   - NWE000064.msi (for Windows 64-bit)
   - nwe-agent.pkg (for Mac)
   - nwe-agent.x86_64.rpm (for RPM based Linux 64-bit)
   - nwe-agent.x86_64.deb (for Debian based Linux 64-bit)

   Note: The MSI files should not be renamed.

Deploy and Verify Endpoint Agents

This section provides instruction on how to deploy and verify agents.

Note: By default, the agent is installed in the Insights mode. Depending on the policy assigned, the agent can operate in Insights or Advanced mode. Make sure you review the policy before deploying the agent. For more information, see *NetWitness Endpoint Configuration Guide*.

Deploying Agents (Windows)

To deploy the agent, run the **nwe-agent-package.exe** file on the hosts you want to monitor.

Verifying Windows Agents

After deploying the Windows agents, you can verify if a Windows agent is running by using any of the following methods:

- Using the NetWitness UI

  The Hosts view contains the list of all hosts with an agent. You can look for the host name on which the agent is installed.

  Note: Click **Hosts** or press F5 to refresh the list for latest data.

- Using Task Manager

  Open Task Manager and look for service name that you configured while generating the agent packager on the host machine.

- Using Services.msc

  Open `Services.msc` in run and look for the service name that you configured while generating the agent packager on the host machine.

Deploying Agent (Linux)

To deploy the agent on the hosts you want to monitor:

RPM based Linux

Run the **nwe-agent.x86_64.rpm** (for 64-bit) file. To run the command, open Terminal on the Linux machine and run the following command as `root`:

```
rpm -iv <installer file name>.rpm
```

For example, using the default installer file name, you can enter the following command:

`rpm -iv nwe-agent.x86_64.rpm` (for x86_64 architecture)

Note: To upgrade RPM based Linux agents, run **rpm -Uvh nwe-agent.x86_64.rpm**.

Debian based Linux

Run the **nwe-agent.x86_64.deb** (for 64-bit) file. To run the command, open Terminal on the Linux machine and run the following command as `root`:

```
dpkg -i <installer file name>.deb
```

For example, using the default installer file name, you can enter the following command:

`dpkg -i nwe-agent.x86_64.deb` (for x86_64 architecture)

(Enter the administrator password when prompted.)

Note: To upgrade Debian based Linux agents, run **dpkg -i nwe-agent.x86_64.deb**.

Verifying Linux Agents

After deploying the Linux agents, you can verify if a Linux agent is running by using any of the following methods:

- Using the NetWitness UI

  The Hosts view contains the list of all hosts with an agent.

  Note: Click **Hosts** or press F5 to refresh the list for latest data.

- Using Command Line

  Run the following command to get the PID:

  ```
  pgrep nwe-agent
  ```

- To check the NetWitness Endpoint version, run the following command:

  ```
  cat /opt/rsa/nwe-agent/config/nwe-agent.config | grep version
  ```

Deploying Agent (Mac)

To deploy the agent, run the `nwe-agent.pkg` file on the hosts you want to monitor. On macOS version Catalina (10.15) and higher, you need to move the `nwe-agent.pkg` file to a folder with sufficient access privileges (e.g., `/tmp`) and install the agent from there.

Verifying Mac Agents

After deploying the Mac agents, you can verify if a Mac agent is running by using any of the following methods:

- Using the NetWitness UI

  The Hosts view contains the list of all hosts with an agent.

  Note: Click **Hosts** or press F5 to refresh the list for the latest data.

- Using Activity Monitor

  Open Activity Monitor (/Applications/Utilities/Activity Monitor.app) and look for NWEAgent.
- Using Command Line

  Run the following command to get the PID

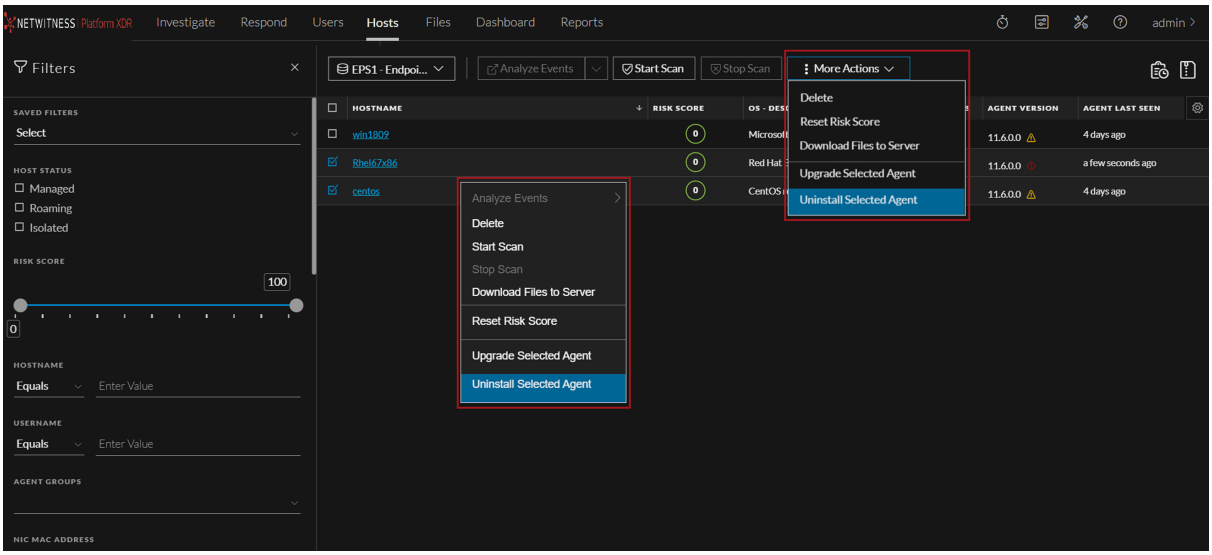
  ```
  pgrep NWEAgent
  ```
- To check the NetWitness Endpoint version, run the command:

  ```
  grep a /var/log/NWEAgent.log | grep NWEAgent | grep Version
  ```

Uninstall Agents

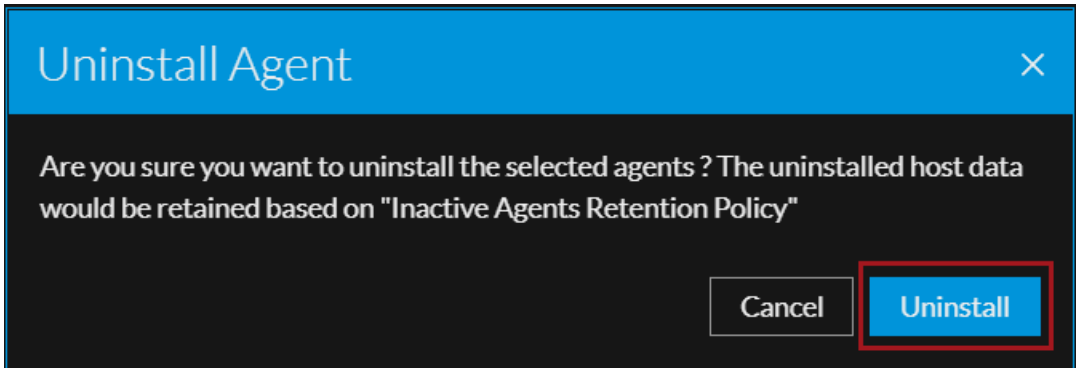
You can use one of the following methods to uninstall Endpoint agents. Select a method based on your current Endpoint agent version.

- Uninstalling Agent using UI (Supported from agent version 11.5.1 and later)
- Uninstalling Agent Manually



Uninstalling Agent using UI (Supported from agent version 11.5.1 and later)

Note: To uninstall an agent using UI, the agent must be a managed agent with version 11.5.1 or later.

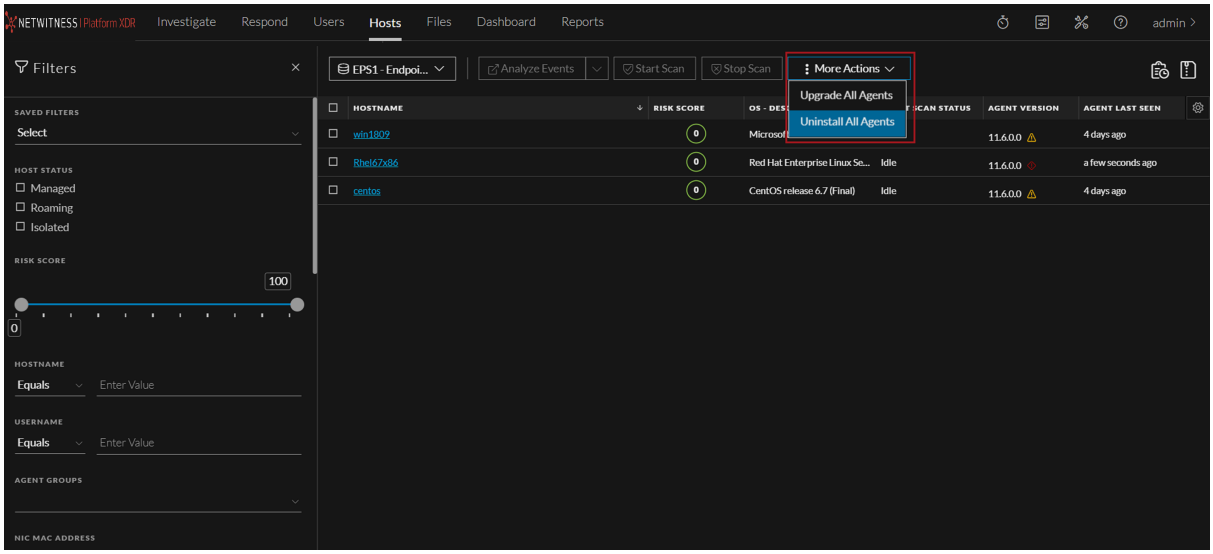


You can uninstall agent using UI by going to **Hosts** and performing one of the following options.

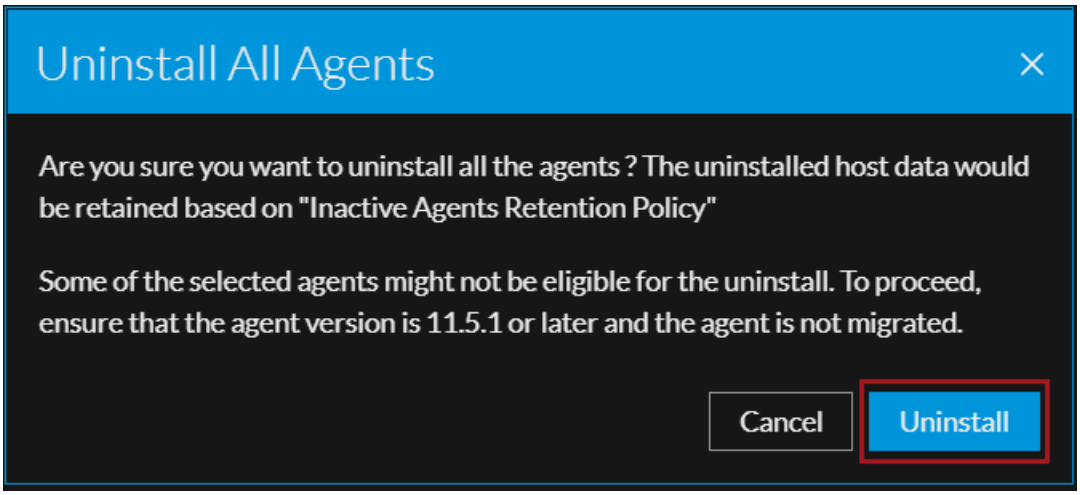
Uninstall one or more agents from Hosts view

1. Select one or more hosts from which you want to uninstall the agents.
2. Selected **More Actions > Uninstall Selected Agent** from the toolbar.

3. In the **Uninstall Agent** dialog, click **Uninstall.**



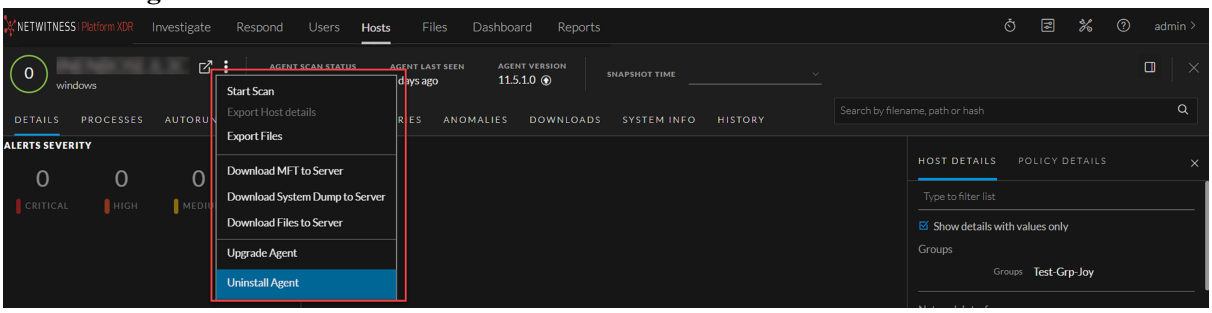
Uninstall all the agents from Hosts view



> **Note: Uninstall All Agents** via UI is also supported for Broker service.

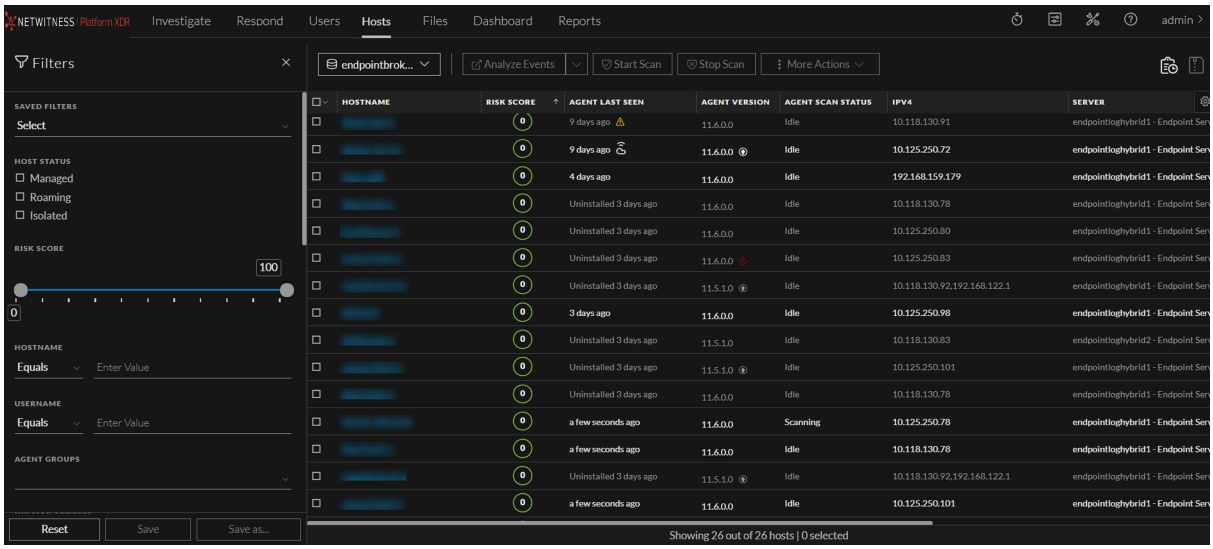
1. Select **More Actions > Uninstall All Agents** from the toolbar.

> **Note:** For the uninstall all agents option, you do not need to select the hosts. **Upgrade All Agents** / **Uninstall All Agents** are the default options on the More Actions drop-down. If you select one or more hosts, the More Actions drop-down shows Upgrade Selected Agent / Uninstall Selected Agent as the available options.



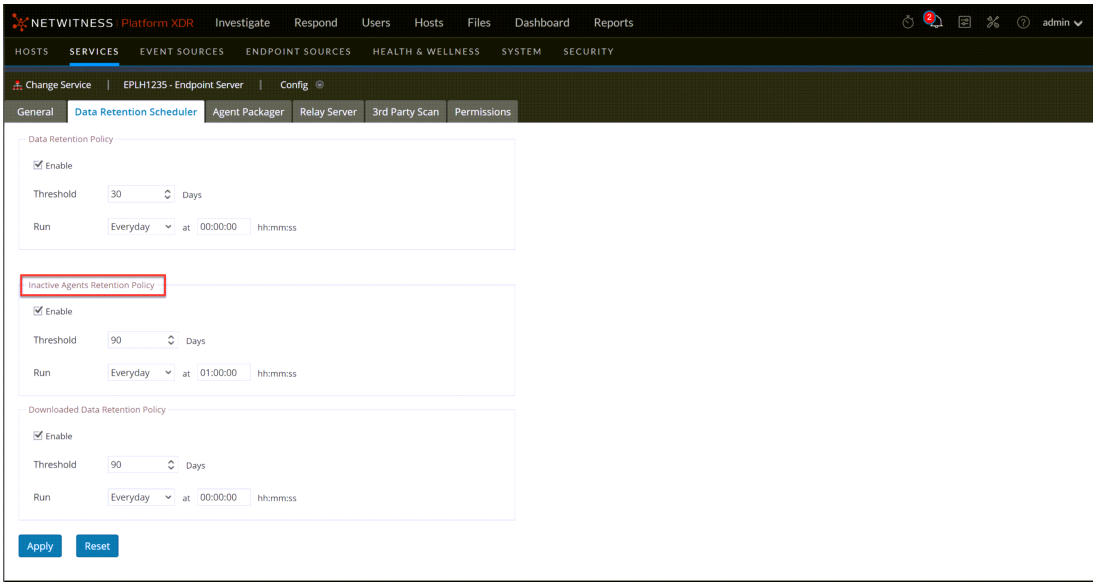
2. In the **Uninstall All Agents** dialog, click **Uninstall.**

Note: Uninstall All Agents process will require more time to complete depending upon the number of agents selected based on the filters applied.



Uninstall an agent from Host details view

1. Select the hostname to open the host details, click ⋮ (**More Actions**) beside the hostname, and select **Uninstall Agent**.



2. In the **Uninstall Agent** dialog, click **Uninstall.**

3. After the agent is uninstalled, **Agent Last Seen** is updated and the host is grayed out in the **Hosts** view.

Note: Once an agent is uninstalled, only **Delete** and **Analyze Events** actions can be performed on it.

IMPORTANT: If you are uninstalling agent using UI, the uninstalled host data would be retained based on **Inactive Agents Retention Policy.**

Uninstalling Agent Manually

Uninstalling Windows Agent

Run the following command as administrator:

```
msiexec /x{63AC4523-5F19-42F0-BC43-97C8B5373589}
```

Uninstalling Linux Agent

For RPM based Linux, run the following command as root:

```
rpm –ev nwe-agent
```

For Debian based Linux, run the following command as root:

```
dpkg -r nwe-agent
```

Uninstalling Mac Agent

Run the following commands:

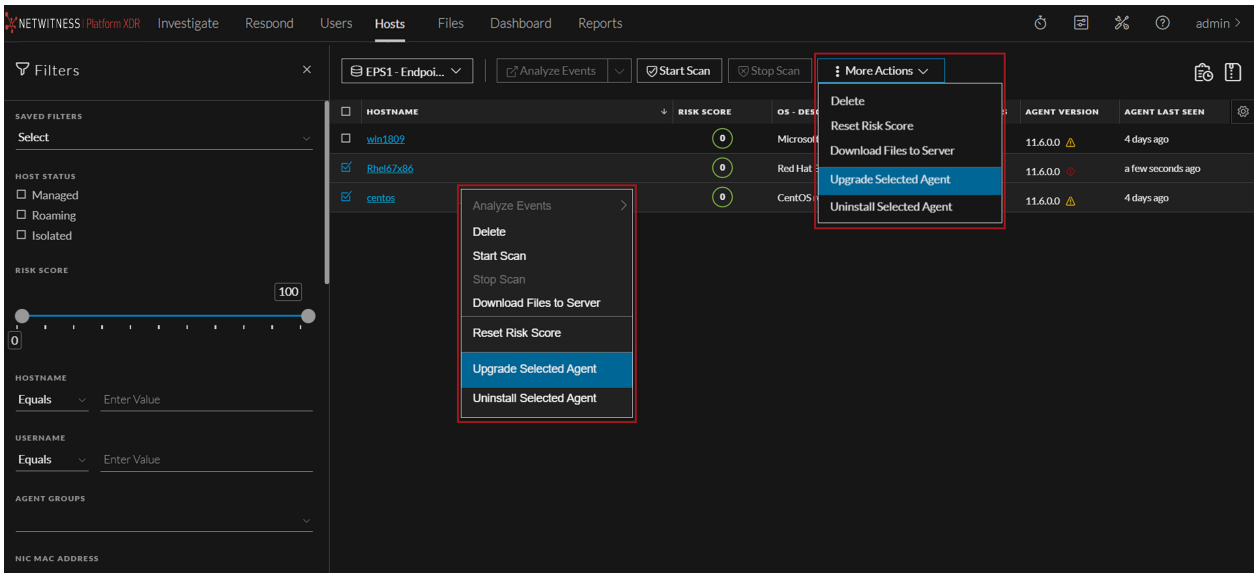
1. `sudo launchctl unload /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist`
2. `sudo rm -Rf /usr/local/nwe`
3. `sudo rm -Rf '/Library/Application Support/NWE'`
4. `sudo rm –Rf /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist`
5. `sudo pkgutil --forget com.rsa.pkg.nwe`

Upgrade Agents

You can use one of the following methods to upgrade Endpoint agents. Select a method based on your current Endpoint agent version. If you have upgraded the endpoint server recently, you must restart it to see **Upgrade Selected Agent** and **Upgrade All Agents** options on the UI.

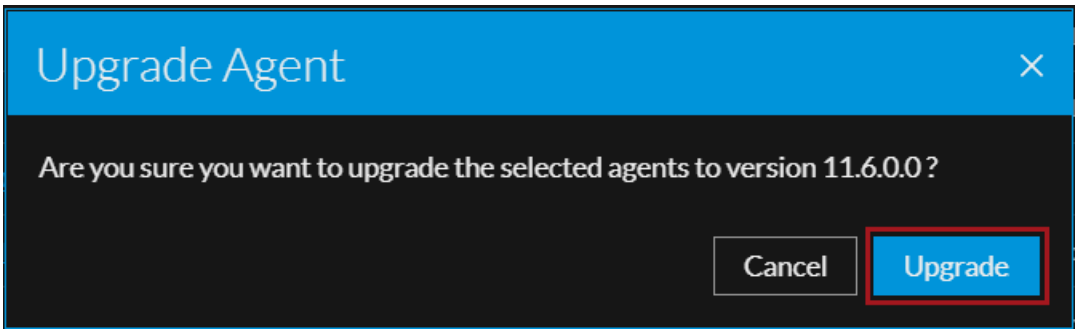
- Upgrading 11.5.1 or Later Agents Versions Using UI
- Upgrading 11.3.x or Later Agents Versions

Upgrading 11.5.1 or Later Agents Versions Using UI



Note: To upgrade agent from UI, ensure the service user account has both `endpoint-server.agentupdate.manage` and `endpoint-server.ca.manage` permissions. For more information on how to assign roles and permissions, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

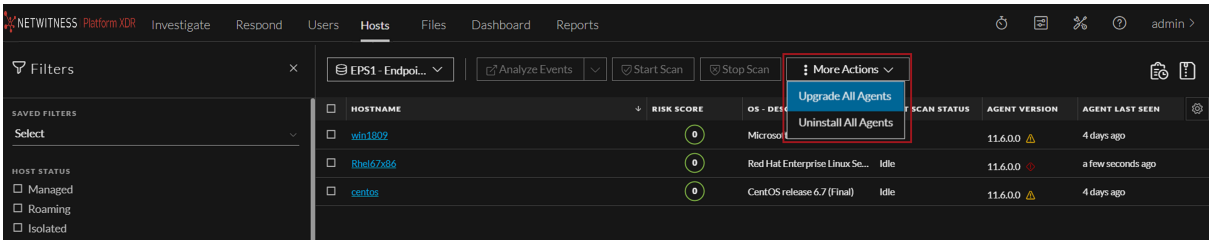
From 11.6, you can upgrade the Endpoint agents using the UI. Agent version must be 11.5.1 or later to upgrade using the UI.



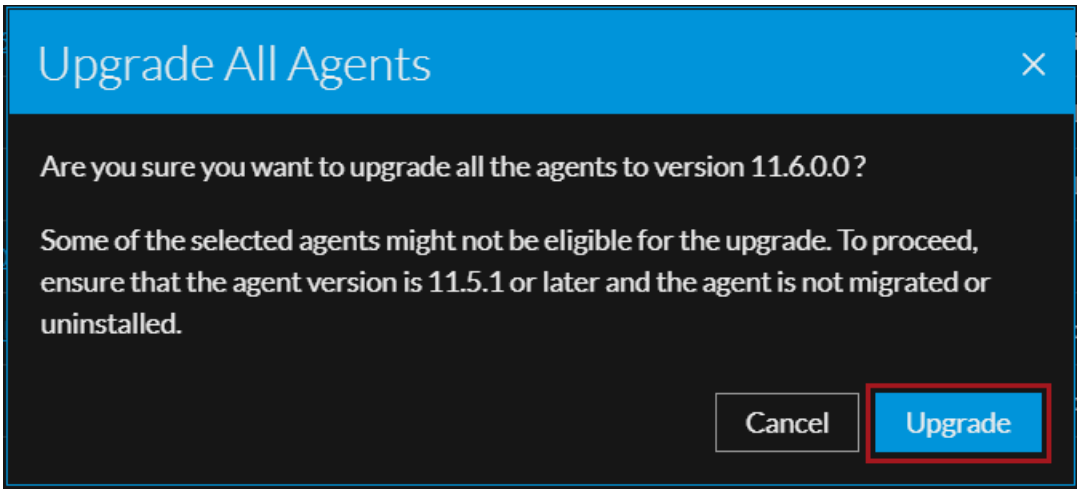
You can upgrade agents using UI by going to **Hosts** and performing one of the following options.

Upgrade one or more agents from Hosts view

1. Select one or more hosts and select **More Actions > Upgrade Selected Agent**



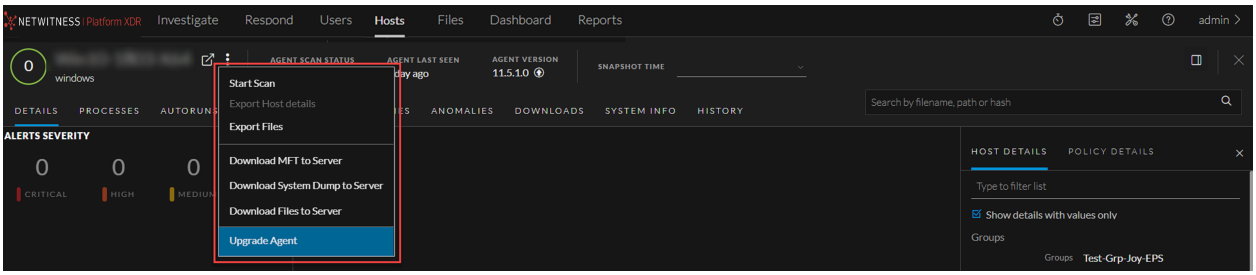
2. In the **Upgrade Agent** dialog, click **Upgrade**.



Upgrade all agents from Hosts view

1. Select **More Actions > Upgrade All Agents** from the toolbar, to perform bulk agent upgrade.

Note: For the upgrade all agents option, you do not need to select the hosts. **Upgrade All Agents** / **Uninstall All Agents** are the default options on the More Actions drop-down. When you select one or more hosts, the More Actions drop-down shows Upgrade Selected Agent / Uninstall Selected Agent as the available options.



2. In the **Upgrade All Agents** dialog, click **Upgrade**.

Note: Upgrade All Agents process will require more time to complete, depending upon the number of agents selected based on the filters applied.

Upgrade an agent from Hosts details page

Select the hostname to open the host details, click ⋮ (**More Actions**) beside the hostname, and select **Upgrade Agent**.

1. In the **Upgrade Agent** dialog, click **Upgrade**.

Note: To upgrade an agent using UI, the agent must be a managed agent with version 11.5.1 or later.

The following upgrade status icons are displayed in the **Agent Version** column.

Icons	Upgrade Status	Description
	Upgrade Available	An agent upgrade is available.
	Agent Upgrade Pending	The agent has not yet received the upgrade command.
	In Progress	The agent is being upgraded.
	Failed	Agent upgrade failed. View details in the agent history page.
No Icon	No Upgrade Available	No upgrade available for the agent. Refer to agent eligibility.

You can view the list of commands issued to the agents (by the server or actions performed by any analyst) in the Host view and Host details. By default, commands are sorted based on the command time.

To view the commands:

1. Go to **Hosts**.
2. Do any one of the following,

   - To view all commands, click . You can also filter commands.
     The Agent History view is displayed.
   - To view commands specific to a particular host:
     - Click the host for which you want to view the commands.
     - In the Host details view, click **History** tab. You can also filter commands.
       The History view is displayed.

For more information on Agent History, see the "Investigating Hosts" topic in the *NetWitness Endpoint User Guide*.

Upgrading 11.3.x or Later Agents Versions

You can upgrade the 11.3.x and later versions of Endpoint agent to 11.6 or later.

Note: In a multi-server Endpoint deployment, during an agent upgrade, make sure that the correct Endpoint server is mentioned in the respective agent policy. In case the agent uses the default policy, ensure to use the agent packager downloaded from the respective Endpoint server to which it is communicating. Using Agent packager from different Endpoint server for agent upgrade will result in migrating the agents to another Endpoint server.

Note: For a subsequent installation or upgrade, use the same service and driver service name.

To upgrade from 11.3.x and later, download the 11.6 agent packager, deploy and verify agents. For more information, see Generate an Endpoint Agent Packager and Deploy and Verify Endpoint Agents.

Upgrade from 4.4.0.9 and 4.4.1.x is supported only for version 11.3. For more information, see *NetWitness Endpoint 4.4.1.x to NetWitness Platform 11.3 Migration Guide*.

To upgrade an agent from 4.4.0.x to 11.6, uninstall the agent and perform a fresh installation.

Recommendations for Installing Agents in Virtual Desktop Infrastructure (VDI) Environment

Agent ID is generated based on various parameters, such as security identifier (SID) and SMBIOS Universal Unique Identifier (UUID). A SMBIOS UUID is a 128-bit number used to uniquely identify a host.

Note: While cloning the VDI image where an agent is already installed, the agent ID automatically changes for Windows and Mac agents if `uuid.action = keep` is not set in the .vmx file. For more information, see Configure a Virtual Machine to change the UUID.
For Linux agents, the agent ID does not change automatically on VDI clone.

When you clone a VDI image:

- If you do not change the agent ID for each VDI clone, make sure that the SMBIOS UUID remains the same.
- If you change the agent ID for each VDI clone, make sure that the SMBIOS UUID is also changed.

To avoid duplication of agent IDs, make sure that the SMBIOS UUID changes on the following VDIs:

- Citrix XenServer
- VMWare Workstation
- VMware vCloud Director

  For more information, see VMware Knowledge Base.
- vCenter hosted ESXi Server

To get the SMBIOS UUID on a Windows virtual host, execute the following command:

```
wmic csproduct get UUID
```

Troubleshooting

This section provides information about possible issues when using the NetWitness Endpoint.

Packager Issue

Issue	Failed to generate the agent installers.
Explanation	Some encryption software may create additional files that fails to generate the agent installers.
Resolution	Copy the packager to a machine that does not have antivirus or encryption software and then generate the agent installers.

Issue	Failed to generate agent installers for MAC.
Explanation	Agent packager `AgentPackager.exe` fails to generate MAC agent installer (`nwe-agent.pkg`) with the error message "Failed to generate table of content for package" or "Failed to create config file C:\AgentPackager (4)\agents\mac\Plugins\NWEInstallerPlugin.bundle\Contents\Resources\config.cfg".
Resolution	Run the `AgentPackager.exe` as administrator by right-clicking the file and selecting **Run as Administrator**.

Issue	Agent packager generates temporary agent installers for MAC.
Explanation	Agent packager `AgentPackager.exe` generates MAC agent installer as `nwe-agent_tmp.pkg` instead of `nwe-agent.pkg`.
Resolution	Run the `AgentPackager.exe` as administrator by right-clicking the file and selecting **Run as Administrator**. The MAC agent package `nwe-agent.pkg` will be generated as expected

Agent Upgrade via UI Issues

Issue	Agent upgrade not available.
Explanation	1. The agent version might not be supported for upgrade from UI. Agent version has to be 11.5.1 or later for upgrade via UI. 2. Logged in user may not have appropriate permission for upgrade from UI. 3. Agent version is up-to date.
Resolution	1. Use the manual upgrade method for upgrading the version.

	2. Use admin user which have following permissions, endpoint-server.agentupdate.manage and endpoint-server.ca.manage. 3. No upgrade required. Agent version is already up-to date and no further upgrade is available.

Issue	Agent upgrade is in Pending state.
Explanation	The hosts for which the command is shown in pending could be in offline or inactive state.
Resolution	Ensure Hosts/agents are communicating with Endpoint server directly or via Relay server for it to receive the upgrade command from server. Verify "Agent Last seen" time in Host listing page.

Issue	Agent upgrade failed.
Explanation	1. Agent upgrade fail with any of the following reasons: • Service Name or Driver name mismatch • Checksum mismatch • Installer size mismatch 2. Agent installer could not be created.
Resolution	1. Retry upgrading the agent. If it continues to fail, use the manual upgrade method. 2. Check the permissions for the user initiated the upgrade command. User can be viewed in **Host** > **Agent History** page. User should have following permissions, `endpoint-server.agentupdate.manage` and `endpoint-server.ca.manage`.

Issue	Linux agent upgrade fails with an error, sudo not found.
Resolution	Make sure that the sudo package is installed on the agent machine.

Agent Uninstall via UI Issues

Issue	Agent uninstalled failed.
Explanation	Agent uninstall fails due to several unknown reasons.
Resolution	1. Retry uninstalling the agent. 2. Use the manual uninstall method. For more information, see Uninstalling Agent Manually.

NetWitness Endpoint

Note: The information in this topic applies to NetWitness Version 11.1 and later.

About NetWitness Endpoint

NetWitness Platform provides an endpoint detection and response solution that continuously monitors the behavior of all endpoints in and outside the network to provide deep visibility and analysis of executables and processes. It helps to detect new, unknown, and targeted attacks, highlights suspicious activity for investigation, exposes anomalous behaviors, and determines the scope of compromise to help analysts respond to advanced threats faster. During investigation, the analyst can use the visual indication of threat level to assess the risk of endpoints.

As part of this solution, NetWitness introduces **Endpoint Log Hybrid** that:

- Collects and manages endpoint (host) data from Windows, Mac, and Linux hosts.
- Collect log files and Windows logs from Windows hosts.
- Generates metadata to correlate endpoint data with sessions from other events sources, such as logs and network.

Analysts can:

- Perform instant scans for detailed insights of the host behavior at any point in time.
- Analyze the scope of the attack across hosts and network through integrated metadata.
- Quickly triage and focus their investigation by managing suspect and legitimate files.
- Perform multiple checks of file legitimacy to determine if a file is malicious, including checking file certificates and hashes.
- Blacklist malicious files and then block them across all hosts in the network to prevent future execution of this file on any host.
- Download Master File Table (MFT), system dump, and process dump for forensic investigation.
- Isolate host from the network to safely investigate possible threats within the host.

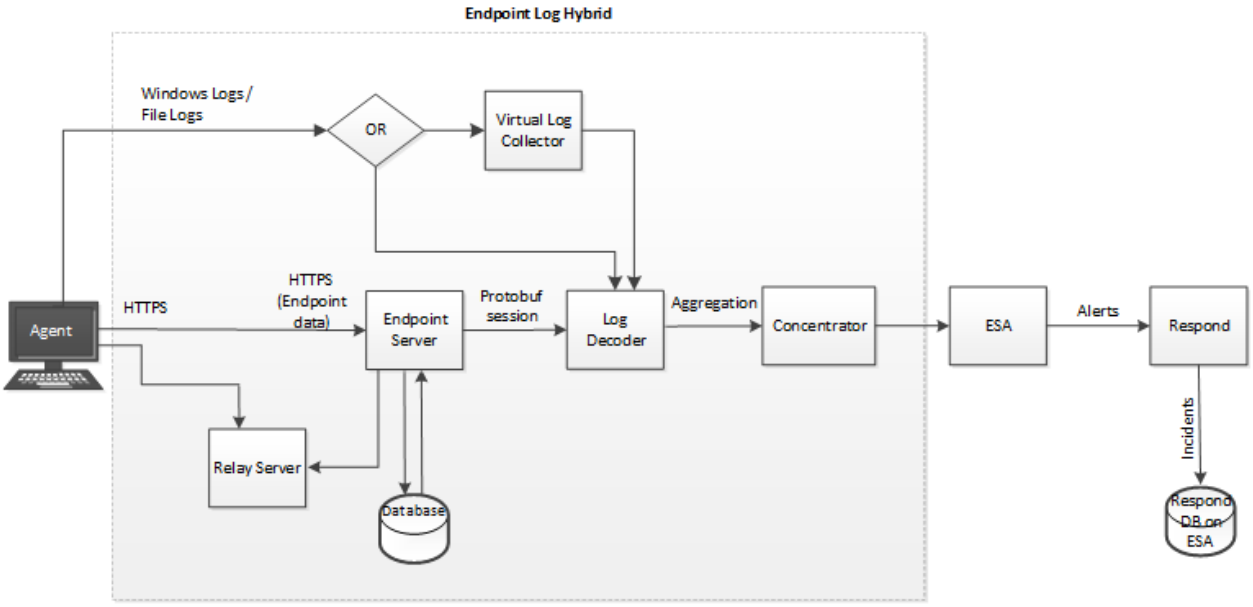
Endpoint Log Hybrid receives data from the Endpoint Agents. The following services run on the Endpoint Log Hybrid:

- **Endpoint Server**: Manages data received and stores it in a database. It parses the events, generates metadata, and forwards it to the Log Decoder through protobuf. You can deploy up to 6 Endpoint Log Hybrid hosts. For a consolidated view of all endpoint data from multiple Endpoint Log Hybrid hosts, install the Endpoint Broker. You can add only one broker in a NetWitness platform deployment which serves up to 6 Endpoint Log Hybrid hosts. Multiple Endpoint Log Hybrids are required to share certificates by copying them from the primary Endpoint Log Hybrid to the secondary Endpoint Log Hybrid using the `SCP` command.

  Note: You may need to install your Endpoint Server on separate hardware from your Log Decoder. If you are only using NW Platform for collecting and analyzing logs, you can co-locate your Endpoint Server on the same physical hardware as your Log Decoder. For more information, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness Platform*.

  If you exceed these guidelines, the amount of disk space usage and CPU might become so high as to create alarms for your Endpoint Server in Health and Wellness. If you notice this, and are running both log collection and EDR scans, you can use Throttling to control the amount of data coming into the Log Decoder.

  If that doesn't help, NetWitness recommends that you move your Endpoint Server onto separate hardware from that used by your Log Decoder.



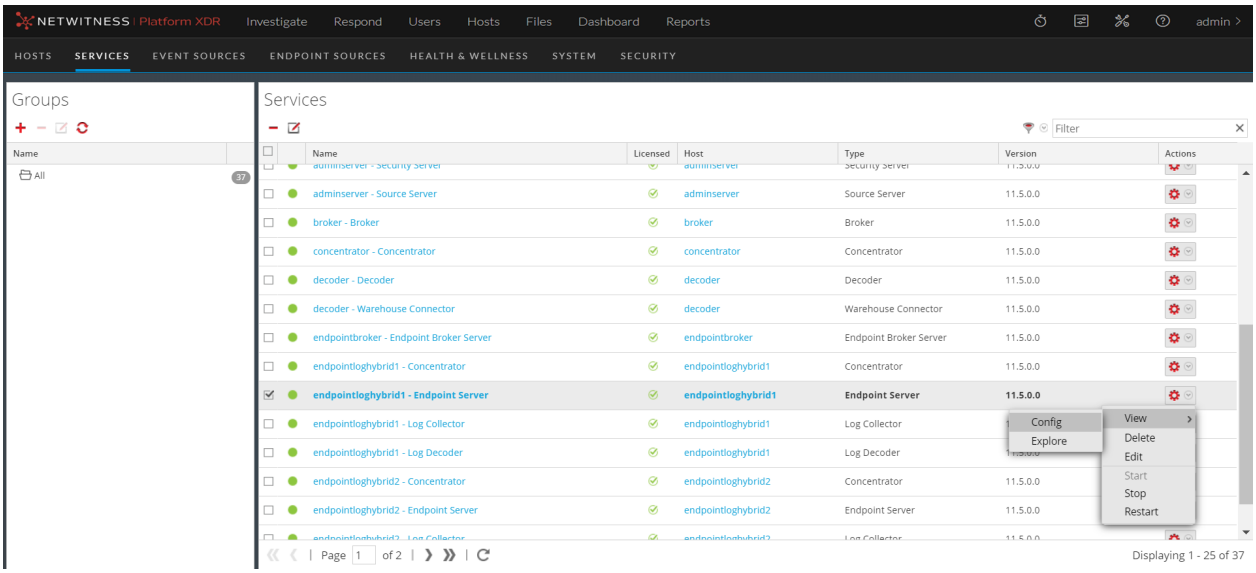
- **Log Decoder**: Captures data from the Endpoint Server and processes the metadata.
- **Concentrator**: Aggregates metadata from the Log Decoder and makes it available for all upstream components like Investigate, Reporting Engine, Respond, and Event Stream Analysis similar to NetWitness Decoder and Concentrator.
- **Log Collector**: Collects logs from all event sources that are supported for the log collection in the NetWitness Platform.

In addition to the above services, the Endpoint Log Hybrid leverages the following services:

- **Event Stream Analysis (ESA)**: Creates alerts from ESA rules for Endpoint data.
- **Endpoint Broker**: Provides a consolidated view of all Endpoint servers in a multiple Endpoint Log Hybrid deployment.

Endpoint Agent Data Flow

The following figure shows the endpoint data flow from the agent to the NetWitness:



The *Hosts and Services Getting Started Guide* provides the information you need to understand and install all the NetWitness services.

Basic configuration involves:

- Installing agents on hosts
- Deploying the ESA rules from the Endpoint Rule Bundle
- Creating groups and policies
- Configuring Endpoint metadata forwarding and retention policies
- Defining health and wellness policies to monitor Endpoint Server
- Installing and configuring Relay Server

You can configure the required settings in the NetWitness user interface under Administration Services Config view (**(Admin) > Services > Endpoint Server > Config**).

Agent Modes

Note: The information in this topic applies to NetWitness Version 11.3 and later.

In NetWitness 11.3 and later, the Endpoint agent can operate either in Insights or Advanced mode depending on the policy configuration. For more information on policy configuration, see the *NetWitness Endpoint Configuration Guide*. You can have both Insights and Advanced agents in a single deployment.

There is no license required for the Insights agent. However, you must procure a license for an Advanced agent. For more information on licensing, see the *Licensing Management Guide*.

The following table list the features supported for Insights and Advanced agents:

Feature	Insights Agent	Advanced Agent
Full System Scan	No	Yes (agent version 11.6.1 or higher)
Scan data - Processes, Autoruns, Files, Drivers, Libraries, and System Information	Yes - Windows, Mac, and Linux	Yes - Windows, Mac, and Linux
Tracking data - Process, File, Registry, Network, and Console	No	Yes - Windows and Mac Registry and Console events are applicable only for Windows.
Expanded network visibility	Yes - Windows	Yes - Windows
Anomaly detection - Image Hooks, Kernel Hooks, Registry Discrepancies, and Suspicious Threads	No	Yes - Windows
Windows log collection	Yes	Yes
File log collection	Yes - Windows	Yes - Windows
Threat detection content - ESA, Application Rules	Yes	Yes
Analysis of downloaded file	Yes	Yes
File status - Whitelist, Blacklist, Graylist, and Neutral	Yes	Yes
File remediate (Block)	No	Yes - Windows
Process visualization	No	Yes
Live connect	Yes	Yes

Feature	Insights Agent	Advanced Agent
File reputation service (Third-party lookup)	Yes	Yes
Risk score for hosts	No	Yes
MFT, process dump, and system dump download	No	Yes - Windows
Automatic file download	Yes	Yes
Automatic Memory DLL Download	No	Yes
Manual file download	No	Yes
Network isolation	No	Yes - Windows
Relay server	Yes	Yes

Endpoint Log Hybrid Configuration

This topic provides the high-level tasks required to configure the Endpoint Log Hybrid.

Tasks	Description
Install the Endpoint Log Hybrid	For a physical host: See *Install Endpoint Log Hybrid* topic under Post Installation Tasks on *Physical Host Installation Guide* For a virtual host: See *Install Endpoint Log Hybrid* topic under Step 5. Post Installation Tasks on *Virtual Host Setup Guide*.
Configure one or more Endpoint Log Hybrids	For a physical host: See *Configuring Multiple Endpoint Log Hybrids* topic under Post Installation Tasks on *Physical Host Installation Guide* For a virtual host: See *Configuring Multiple Endpoint Log Hybrids* topic under Step 5. Post Installation Tasks on *Virtual Host Setup Guide*.
Add hosts to the Endpoint Log Hybrid	For a physical host: See *Add Hosts to the Endpoint Log Hybrid* topic under Post Installation Tasks on *Physical Host Installation Guide* For a virtual host: See *Add Hosts to the Endpoint Log Hybrid* topic under Step 5. Post Installation Tasks on *Virtual Host Setup Guide*.
Deploy Application and ESA Rules	See Deploying Endpoint Application Rules and ESA Correlation Rules.

Tasks	Description
Configuring Metadata Forwarding	Similar to logs and packets, you can view Endpoint metadata in the Navigate and Events view. You can also generate reports and alerts for the Endpoint data. By default, the Endpoint Meta option is disabled. The agent must be installed with the Endpoint Meta option enabled to forward metadata.
Install Agents on Hosts	The Endpoint agent installer is generated using the Packager tab under **(Admin) > Services > Config > Endpoint Server** from the NetWitness user interface. The Packager is a zip file that contains executables and configuration files for generating agent installer for Linux, Mac, and Windows operating systems. You can install only one version of the agent on a host. If you have a previous version of an agent installed (for example, 4.4), uninstall this agent to install the 12.1.0.0 agent. After the agent is installed, it appears on the **Hosts** view. By default, the Endpoint data is posted for the first time. To collect subsequent Endpoint data, you have to either schedule a scan or perform ad hoc scan. It retrieves data, such as drivers, processes, DLLs, files (executables), services, autoruns, security information, anomalies, system configurations, and scripts found on the host. **Note:** If a Windows host has proxy setup enabled and configured, the Endpoint agent communicates to the Endpoint server through proxy. If a host has both Automatic (Auto detect and Setup Script) and Manual proxy settings enabled and configured, the order of precedence is as follows: 1. Manual proxy setup 2. Automatic proxy setup - Use setup script 3. Automatic proxy setup - Automatically detect settings

Tasks	Description
Install and Configure the Relay Server	See (Optional) Installing and Configuring Relay Server.
3rd Party Scan	Configure 3rd party scans like YARA and OPSWAT. See Configure YARA and Configure OPSWAT
Permissions	Grant or Revoke role permissions for the selected Endpoint Server. See Manage Role Permissions at Endpoint Server Level
Manage Groups and Policies	To efficiently manage and update endpoint agent configurations, you can group the agents, and manage their behavior using policies.
Enable Reputation Status	Reputation Status is enabled by default in an NetWitness Platform 11.3 and later deployment and displays information about the file. For troubleshooting, see the *Live Services Guide*.
Risk Score	Risk Score is calculated and obtained from NetWitness Respond for hosts and files. For more information, see the *NetWitness Respond Configuration Guide*.
Configuring Data Retention Policy	Define data retention policies to optimally store and manage the Endpoint data based on the age of the Endpoint data or the storage size. By default, 30 days of agent data is retained.
Managing Inactive Agents	By default, agents (including all the collected Endpoint data) that have not communicated with the Endpoint Server for 90 days will be automatically deleted.
Configure Retention Policy for Memory Dumps and MFT	Define retention policy to optimally store and manage downloaded system dump, process dump, and MFT. By default, 90 days of data is retained.
Investigate Endpoint data	You can investigate the Endpoint data in the **Hosts** and **Files** views. For more information, see the *NetWitness Endpoint User Guide*.

Deploying Endpoint Application Rules and ESA Correlation Rules

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The existing IIOCs from NetWitness Endpoint 4.4.0.x are now available as OOTB Endpoint Application rules tagged as Indicators of Compromise, Behaviors of Compromise, Enablers of Compromise, and Analysis.File. Application rules for Endpoint are automatically available on installation of NetWitness 11.3 and later.

For Endpoint risk score, every Application rule must have an ESA rule that generates alerts used for the risk score calculation. A set of OOTB ESA rules are available as Endpoint Rule Bundle. You must specify the Endpoint data sources (Concentrators) and deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the *ESA Configuration Guide*.

If the Application rule key value matches with ESA rule then an alert is triggered which is used to compute the risk score and an incident is raised when risk score exceeds the defined threshold limit.

Note: If you are upgrading from an existing Endpoint Log Hybrid to 11.3 or later, you must deploy the Application rules from RSA Live. During deployment, you must specify Endpoint Log Hybrid Log Decoder service. In case of multiple Endpoint servers, select all the Endpoint Log Hybrid Log Decoder services. For more information, see the *Live Services Management Guide*.

You can view the application rules that are deployed in  **(Admin) >Services > Endpoint Log Hybrid - Log Decoder** > **Config** > **App Rules** and application rules that were triggered in **Investigate** > **Navigate**> **Endpoint Log Hybrid - Concentrator** > **App rules**.

The Endpoint ESA rules generate alerts with the severity; Critical, High, and Medium. You can view the alerts on:

- Risk Details tab - You can view Critical, High and Medium alerts for a host or file on **Hosts** > **Risk Details** or **Files** > **Risk Details**.
- Respond view : You can view only critical and high severity alerts on **NetWitness Respond** > **Alerts**.

Custom Endpoint Rule for Risk Scoring

If you have custom IIOCs in NetWitness Endpoint 4.4.0.x, you need to create these custom Endpoint rules. Once you have created your custom Application rule, you must create the custom ESA Rule for risk score calculation and update the RiskConfig file in MongoDB.

To create a custom Endpoint rule, perform the following tasks:

1. Add a custom Application Rule: For more information on creating a custom Application Rule, see *Create an Application Rule* topic in the **Live Services Management Guide**.
2. Add a custom ESA Rule: For more information on creating a custom ESA Rule, see *Create an ESA Rule* topic in the **Live Services Management Guide**.
3. Add the rule to RiskConfig

ESA Rule Parameters

The following table describes the fields that define an ESA rule.

Fields	Description
id	The name of the ESA Rule. For example, In Encrypted Directory.
key	The metakey on which an alert would be generated. For example, alert is generated on analysis.file metakey for In Encrypted Directory rule.
value	Specify the value. The value must exactly match with the App rule name. For example, in encrypted directory.
title	The name of the alert. For example, In Encrypted Directory.
type	Specify the type of rule. For custom endpoint rule, the type must be ENDPOINT.
enabled	The status of the rule. Specify true, if the rule should be considered for risk scoring.
description	The description of the rule.
severity	The severity of the rule; critical, high or medium.

Add the rule to RiskConfig

After you create the custom Application rule and the ESA rule, you must update the RiskConfig in mongoDB.

To update the riskconfig file, perform the following:

1. SSH to Admin Server.
2. Create a JavaScript file (For example, `in-encrypteddirectory- rule.js)` with the custom ESA rule definition in the below format.

```
db.risk_rule.insertMany(
[ {
"name" : "In Encrypted Directory",
"enabled" : true,
"handler" : "Default",
"entities" : {

},
"metas" : {
"File" : [
```

```
{
"meta" : "checksum_src",
"name" : "filename_src",
"weight" : NumberInt(100)
}
],
"Host" : [
{
"meta" : "agent_id",
"name" : "alias_host",
"weight" : NumberInt(100)
}
]
},
"_class" : "com.rsa.asoc.respond.pipeline.risk.rules.AlertScoringRule"
} ]
)
```

The following table describes the fields that define a rule.

Field	Description
name	The name of the ESA rule.
enabled	The flag to enable or disable risk scoring. Specify true to enable risk scoring.
handler	The value of this should be Default.
entities	The value of this should be empty.
metas > Files > meta	The metakey for a file for which score should be calculated.
metas > Files > name	The name of the metakey of the file identity.
metas > Files > weight	By default the weight value is 100.
metas > Host > meta	The metakey for a host for which score should be calculated.
metas > Host > name >	The name of the metakey of the host identity.
metas > Host > weight	By default the weight value is 100.
_class	This is used for internal purpose, do not change.

3. Insert the new rule into the riskconfig file on mongoDB using following command:

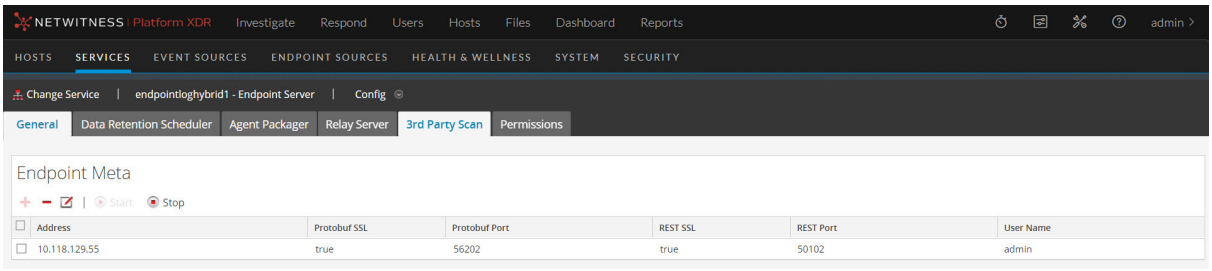
```
mongo respond-server --authenticationDatabase admin -u deploy_admin -p
<deploy_admin-user-password> in-encrypted-directory-rule.js
```

4. Confirm if ESA rule is updated successfully in the riskconfig, using following command

```
mongo respond-server --authenticationDatabase admin -u deploy_admin -p
<deploy_admin-user-password> --eval "db.risk_rule.find({ "name": /.*In
Encrypted Directory.*/i })"
```

5. Restart the Respond server for the changes to take effect.

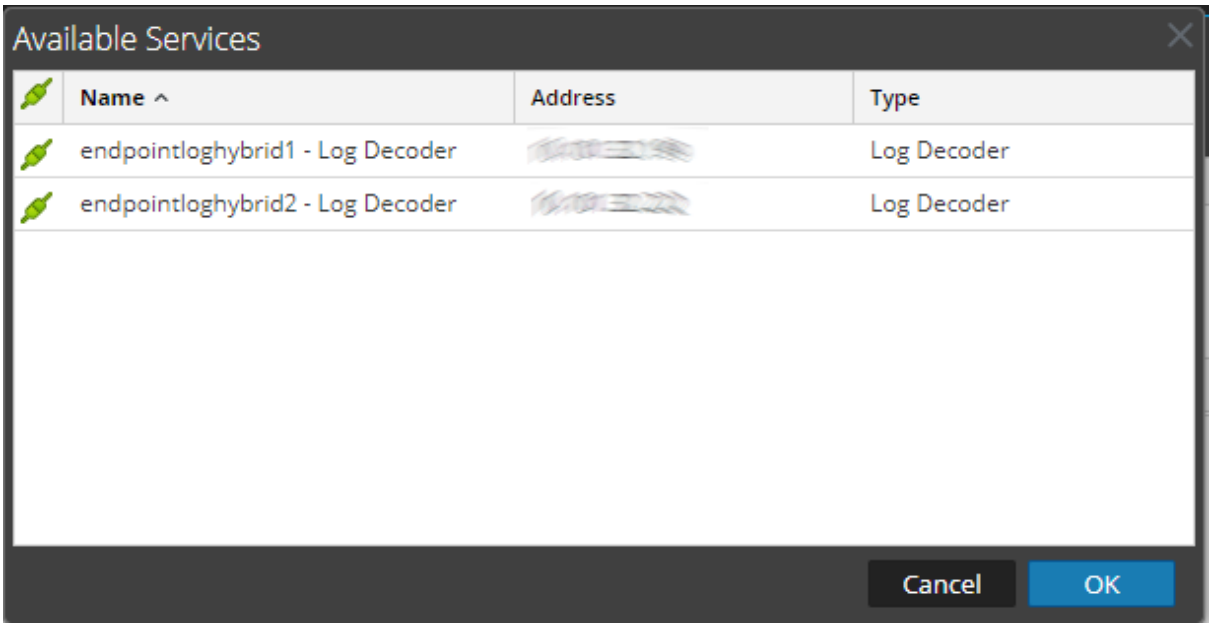
```
service rsa-nw-respond-server restart
```



After you create a custom Endpoint rule and update the risk configuration file, whenever an event is generated for the new rule (For example, In Encrypted Directory) an alert will be generated and the risk score is calculated for the host and file.

Configuring Metadata Forwarding

To view the metadata, you must enable the metadata forwarding while installing the Endpoint Log Hybrid. The Endpoint metadata is displayed in the NetWitness Investigate (**Navigate** and **Events** views) similar to Logs and Packets. For information on metadata mappings, see Endpoint Metadata Mappings.



To configure metadata forwarding:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View** > **Config**.
4. Click the **General** tab.

5. Click in the toolbar.

   The Available Services dialog is displayed.

6. Select a Log Decoder service and click **OK**.

   The Add Service dialog is displayed.

Note: You can add only one Log Decoder service.

7. Enter the administrator credentials for authentication.
8. (Optional) If you enable Raw Data, a brief summary of the session is forwarded along with the metadata.
9. (Optional) If you have enabled SSL on the REST port in the Log Decoder, select the **REST SSL** option. By default, the REST port for non-SSL is 50102.
10. Select the **Protobuf SSL** option to enable SSL on Protobuf. By default, the Protobuf port is 50202.
11. Click **Save**.

After configuring the metadata forwarding, make sure to:

- Start the capture on the Log Decoder
- Start the aggregation on the Concentrator
- Add the Log Decoder as a service in the **Concentrator**

Start Metadata Forwarding to the Log Decoder

1. In the Endpoint Meta config > General view, select the service.
2. Click Start
   The Endpoint Server starts forwarding the metadata to the Log Decoder.

Stop Metadata Forwarding to the Log Decoder

1. In the Endpoint Meta config > General view, select the service.
2. Click Stop.
   The Endpoint Server stops forwarding the metadata to the Log Decoder.

Remove Metadata Forwarding

Note: Make sure you stop the service, before removing the metadata forwarding.

1. In the Endpoint Meta config view, select the service.
2. Click −.
3. Click **Apply**.

Endpoint Metadata Mappings

You can view the default metadata mappings or modify the metadata mappings for endpoints.

JSON Schema for Metadata Mappings

All metadata mappings is configured using the JSON schema. The following is a sample JSON schema:

```
{
"metaKeyPairs" : [
     {
     "metaKeyPairsCategory" : "",
     "keyPairs" : [
          {
          "endpointJpath" : "",
          "metaName" : "",
          "type" : "",
          "enabled" : true
          },
          {
          "endpointJpath" : "",
          "metaName" : "",
          "type" : "",
          "enabled" : true
```

```
            }
        ]
        }
]
}
```

The following APIs are used to view or modify the metadata mappings:

- `get-default` - Returns the default configurations for the endpoint metadata mappings.
- `get-custom` - Returns the custom configurations for the endpoint metadata mappings.
- `set-custom` – Helps customize the endpoint metadata mappings.

View the Metadata Mappings

To view the endpoint metadata mappings:

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter the credentials.
3. Connect to the Endpoint Server using the following command:
   `connect --host <IP address> --port <number>`

Note: The default port is 7050.

4. Run the following commands:

```
cd endpoint/meta
cd get-default
invoke
```

The following screen shows the default metadata mappings:

```
    {
      "endpointJpath" : "users/sessionType",
      "metaName" : "logon_type",
      "type" : "text",
      "enabled" : true
    },
    {
      "endpointJpath" : "hostFileEntries/hosts",
      "metaName" : "dhost",
      "type" : "text",
      "enabled" : true
    },
    {
      "endpointJpath" : "securityConfigurations",
      "metaName" : "event_state",
      "type" : "text",
      "enabled" : true
    }
  ]
},
{
  "metaKeyPairsCategory" : "MACHINE_IDENTITY",
  "keyPairs" : [
    {
      "endpointJpath" : "_id",
      "metaName" : "agent.id",
      "type" : "text",
      "enabled" : true
    },
```

To disable a default metadata mapping:

Enter the same endpointJpath value and set the enabled parameter to `false`.

For example, if the endpointJpath is `Category` and enabled parameter is `true`, enter the same endpointJpath and set the enable parameter to `false`.

```
{
  "metaKeyPairsCategory" : "COMMON",
  "keyPairs" : [
    {
      "endpointJpath" : "Category",
      "metaName" : "category",
      "type" : "text",
      "enabled" : true
    },
```

Note: Do not modify the metaKeyPairsCategory in the schema; “COMMON”, “COMMON_MACHINE”, “COMMON_MACHINE_FOR_EVENTS”.

To change the metadata name or metadata type:

Enter the same endpointJpath value and specify values for the metaName and type.

Note: The metaName must exist in the table-map.xml of the Log Decoder, index-concentrator.xml or index-concentrator-custom.xml file of the Concentrator, for the metaName to appear on the Investigate view.

Add or Modify Metadata Mappings

To add or modify the metadata mappings, run the `set-custom` API. The metaKeyPairs configuration provided in the JSON file should match the JSON schema of the default configuration received through the `get-default` API.

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter the credentials.
3. Connect to the Endpoint Server using the following commands:

   ```
   connect --service endpoint-server
   ```

   Note: The default port number is 7050.

4. Run the following commands:

   ```
   cd endpoint/meta
   cd set-custom
   invoke --file <json file>
   ```

You can add new metaKeys by adding entries to the file that will be uploaded using the `set-custom` API. The following example shows how to add a new metadata mapping:

View the Custom Metadata Mappings

To view the custom metadata mappings, run the `get-custom` API, and then invoke commands.

Note: The `get-custom` API will return values only if the metadata mappings are modified using the `set-custom` API.

Endpoint Sources

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Endpoint agents deployed in your environment may be large in number and geographically distributed. To efficiently manage and update configurations automatically, agents can be organized into smaller subsets called **Groups**.

Groups

Groups can be created based on Machine OU, IP address (IPv4 and IPv6), host names, operating system type, and operating system description. You can create groups based on your requirements. For example, you can group all agents running on Windows 2016 Server and IP ranging from 10.40.10.1 to 10.40.10.200. For more information on creating groups, see Creating Groups and Policies.

Note: All agents that are not part of any group use the default policy settings.

Policies

To manage the behavior of agents in a group, you can apply a set of rules called **Policies**. The NetWitness supports three types of policies for endpoints: **Agent Endpoint**, **Agent File Logs**, and **Agent Windows Logs** policies. The following default policies are available on installation.

Note: NetWitness recommends that you review these default policies before deploying agents.

- Default Agent Endpoint (EDR) Policy
- Default Windows Log Policy
- Default File Log Policy

You can either assign the default policies to a group, modify the default policy, or create custom policies based on your organizational requirements.

Note: You cannot edit the default policy for Windows Logs nor for File Logs.

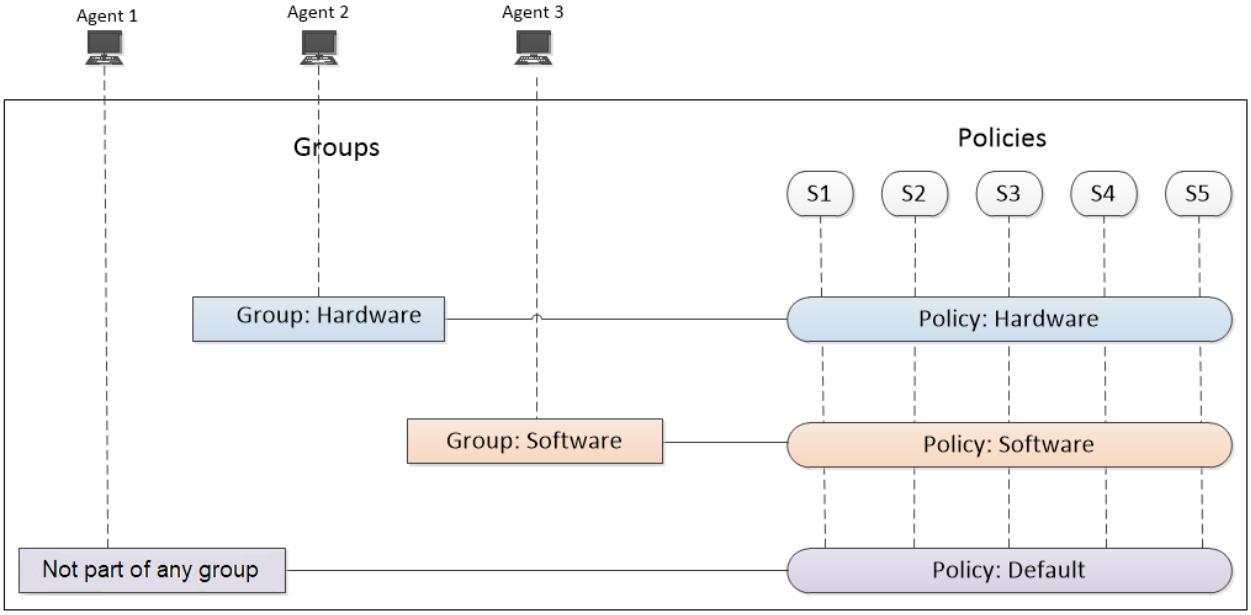
You can do the following through a policy:

- Define the agent mode - Insights or Advanced
- Configure scan schedule and settings
- Configure automatic file download
- Configure endpoint settings, such as which Endpoint server the agents should communicate, port details, and beacon intervals
- Configure response actions such as blocking
- Configure Windows and File Log collection

For example, you can create a policy to schedule scan and enable blocking. For more information on creating policies, see Create an EDR Policy, Create a File Log Policy, or Create a Windows Log Policy.

Group Ranking

When a group is created, a rank is associated with every group based on the creation order. If an agent belongs to multiple groups, to handle conflicting configurations, you can reorder the groups to change the ranking, and the policy associated with the highest ranked group takes precedence.

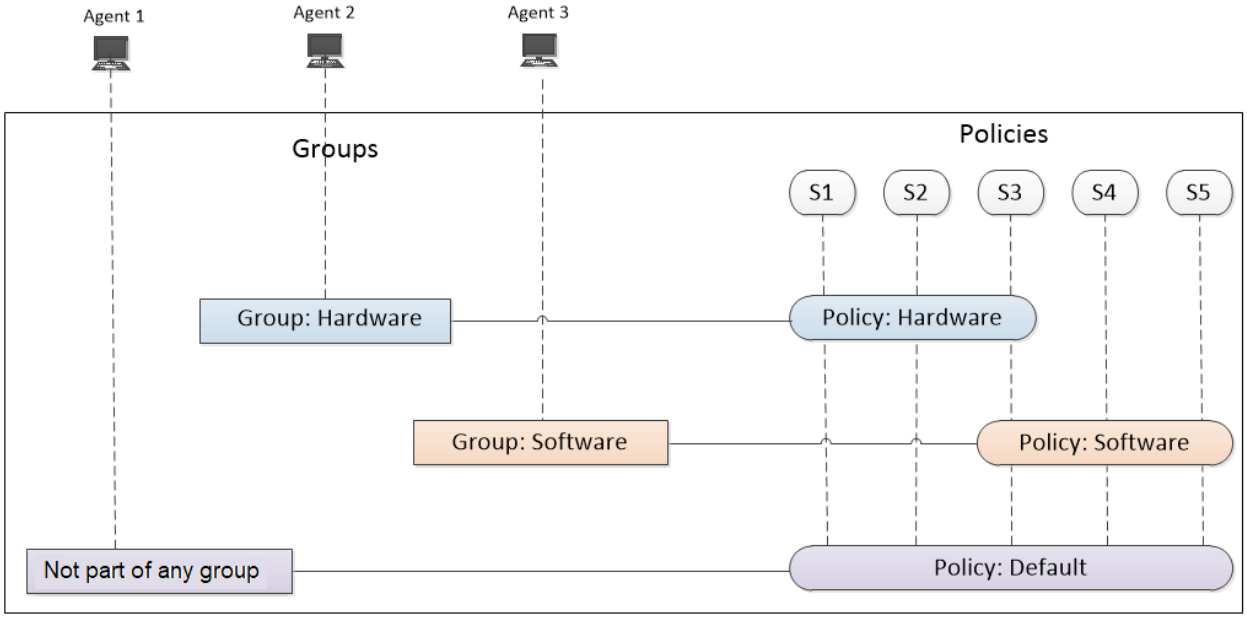


Example 1

A **Server** group contains 100 hosts with a default Agent Endpoint policy. Amongst these, if 20 hosts require further investigations, analyst can:

1. Create a temporary group with a static list of these 20 hosts.
2. Create or apply any policy to this group that will not impact any other hosts.
3. Edit the ranking for the new group, moving to the top of the Ranking list (making sure it is above the existing Server group).
4. After investigation is done, delete this group. The hosts are revalidated and assigned to the appropriate group based on the ranking.

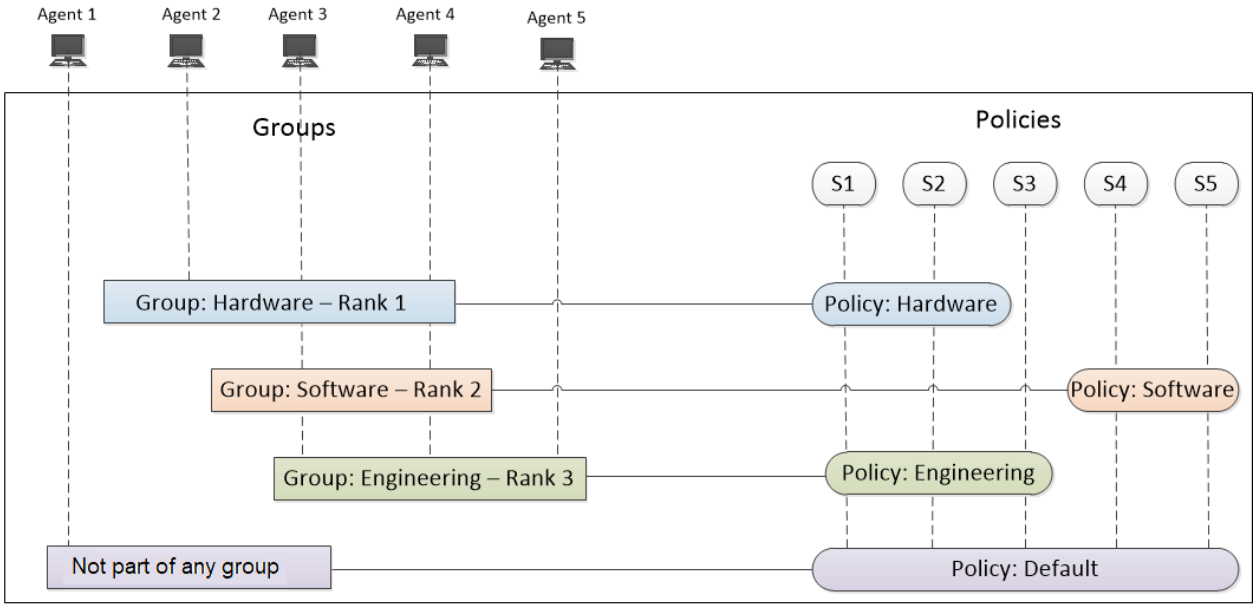
Example 2



Case 1:

* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

Each agent is a part of a unique group that is associated with a policy, where each policy has all settings S1, S2, S3, S4, and S5 defined. For example, Agent 2 is a part of the group Hardware, where all settings in the policy Hardware are applicable.



Case 2:

* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

In the policy Hardware, S4 and S5 settings are not defined, and hence the agent 2 inherits settings S4 and S5 from the default policy.

Case 3:

* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

- Agent 2 is a part of the highest ranked group Hardware, and with the policy Hardware. The agent 2 inherits settings S3, S4, and S5 from the default policy as they are not defined in the policy Hardware.

- Agent 3 is a part of Hardware, Software, and Engineering groups, and with the policy Software. The agent considers the settings S4 and S5 from the policy Software, and the remaining undefined settings are inherited as follows:
  - S1 and S2 from the policy Hardware, which is associated with the highest ranked group.
  - S3 from the policy Engineering, which is the next ranked group.
- Agent 4 is a part of Hardware, Software, and Engineering groups, and with the policy Engineering.
  - Though settings S1 and S2 are defined in policy Engineering, the agent 4 considers the settings S1 and S2 from the policy Hardware as it is associated with the highest ranked group.
  - S4 and S5 from the policy Software, which is the associated with the next highest ranked group.
  - S3 from the policy Engineering.

The following are some of the key points:

- If an agent is not assigned to any group, default policies are applied.
- A policy can be assigned to multiple groups. However, a group can only have one policy of each type (Agent Endpoint and Agent Windows Logs).
- An agent can belong to multiple groups. The policy is derived based on the ranking of the group as shown in the above example (case 3).
- If all settings are defined in a single policy, and it is the highest ranked policy for an agent, no policy settings from other ranked groups are inherited (case 1).
- If there are any undefined settings in the policy, the settings from the default policy is considered as shown in the example above (case 2 and 3).
- If an agent falls into more than one group, its complete set of policy attributes is determined as follows:
  - It takes all settings from the highest ranked policy that applies.
  - Any settings that are not set in the highest ranked policy are taken from the next highest ranked policy that applies.
  - If there are still unset attributes, they are taken from the default policy.
  - If there are any conflicts, the higher ranked policy wins.

Example 3

Assume the following:

- Agent A belongs to below two groups, **Production Servers** and **All Windows Hosts**.
- The Production Servers group has the **Schedule scan set and no blocking** policy assigned, and it has the following settings:
  - Schedule Scan : Enabled
  - Effective Date: 2019-03-08

  - Start Time: 09:00
  - Scan Frequency: Every 1 week
  - CPU Maximum: 45 %
  - Virtual Machine Maximum: 20 %
  - Blocking: Disabled
- The All Windows Hosts group has the **EDR for All Windows** policy applied, which has the following settings:
  - Scan Master Boot Record: Disabled
  - Blocking: Enabled
- The **Production Servers** group is ranked higher than the **All Windows Hosts** group for EDR policies. Keep in mind that ranking only applies to policies of the same source type: that is, all EDR policies are ranked, and all Windows Logs policies are ranked separately.

Agent A gets its final policy configuration as per the ranking of the groups (and associated policies) to which it belongs:

- The agent uses the schedule set in the **Schedule scan set and no blocking** policy.
- Scan Master Boot Record is disabled, because that is set in the **EDR for All Windows** policy.
- Blocking is disabled: since there is a conflict, the value in the higher ranked policy is used.
- All other attributes are set based on values in the Default EDR policy.
- Note that if you wanted Blocking to be enabled, you could change the group ranking so that All Windows Hosts is higher than Production Servers: in this case, Production Servers would win the conflict, and Blocking would be enabled for Agent A.

Default Agent Endpoint (EDR) Policy

When an agent is installed, it operates in an Insights mode until a policy is assigned. The following are the default EDR policy settings:

Settings	Fields	Default Value
Scan Schedule	Run Scheduled Scan	Disabled
	Effective Date	Current date
	Scan Frequency	Every week
	Start Time	09:00 (this is 9 AM)
	CPU Maximum	25%
	Virtual Machine Maximum	10%

Settings	Fields	Default Value
Agent Mode	Monitoring mode	Advanced
Scan Settings	Scan Master Boot Record	Disabled
	Auto Scan New Systems When Added	Disabled
File Download Settings	Automatic File Download	Enabled
	Automatic Memory DLL Download	Enabled
	Signature	Exclude All Signed
	File Size Limit	1 MB
Response Action Settings	Blocking	Disabled
	Network Isolation	Disabled
Endpoint Server Settings	Endpoint Server	The agent considers the default Endpoint Server that is configured during packager generation.
	Server Alias (Optional)	
	HTTPS Port	443
	HTTPS Beacon Interval	15 Minutes
	UDP Port	444
	UDP Beacon Interval	30 Seconds

Default Windows Log Policy

The following are the default Windows Log policy settings:

Settings	Fields	Default Value
Windows Log Settings	Status	Disabled
	Protocol	TLS
	Send Test Log	Disabled

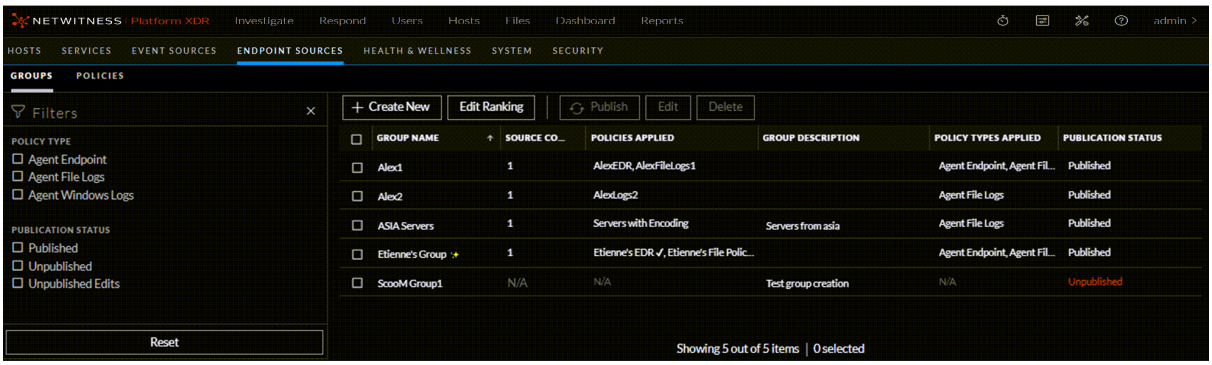
Default File Log Policy

The following are the default File Log policy settings:

Settings	Fields	Default Value
File Log Settings	Status	Disabled
	Protocol	TLS
	Send Test Log	Disabled

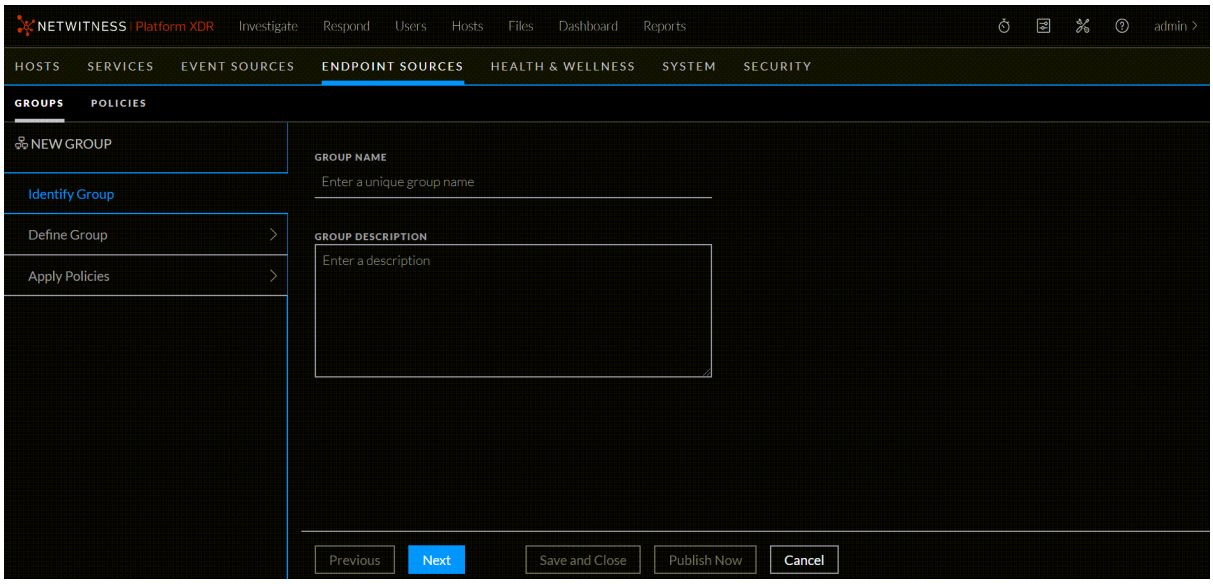
Creating Groups and Policies

Note: The information in this topic applies to NetWitness Version 11.3 and later.



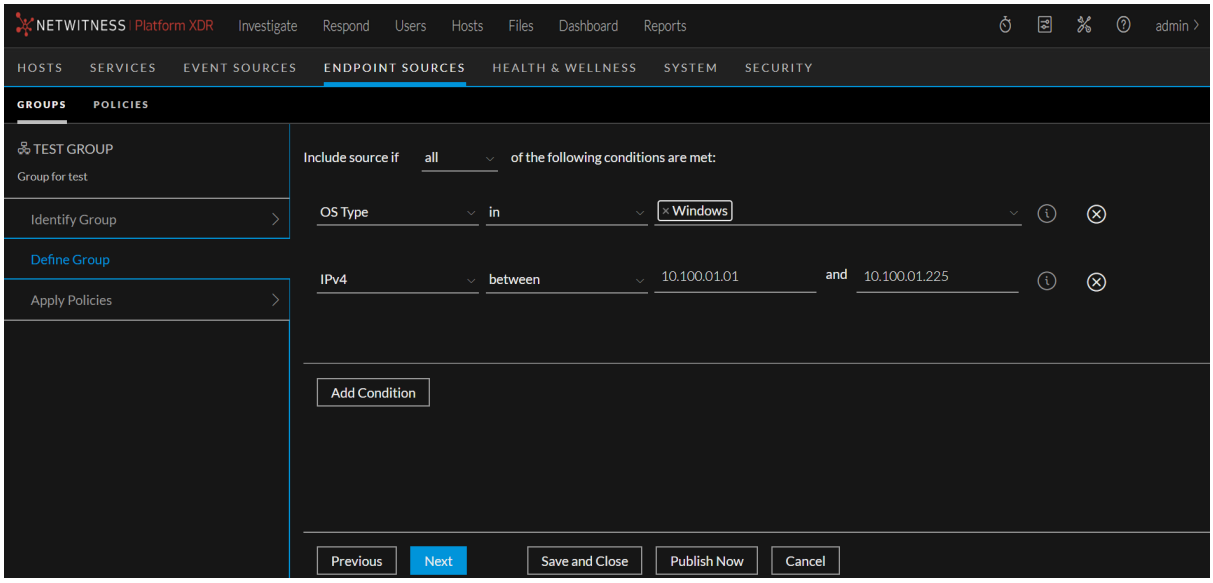
The following sections provide instructions on how to create groups and policies.

- Groups: Create a Group
- Policies:
  - Construct a Policy
  - Create an EDR Policy
  - Create a Windows Log Policy
  - Create a File Log Policy
  - Replace Windows SFTP Agents



Create a Group

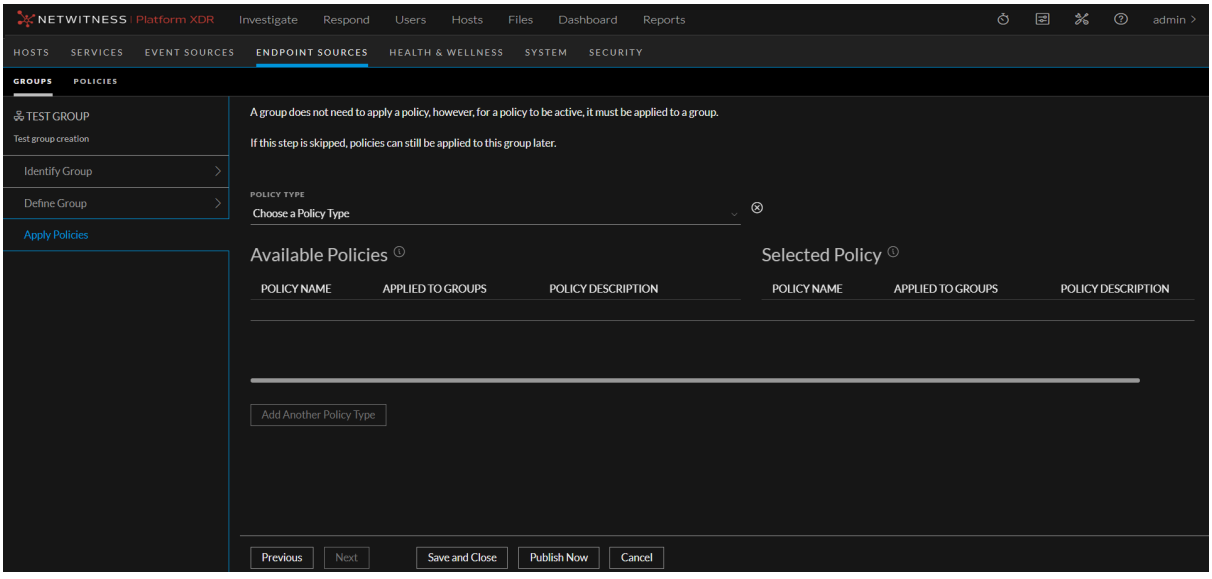
To create a group:



1. Go to **(Admin) > Endpoint Sources** view.
2. In the left panel, select the **Groups** tab.

3. In the toolbar, click **Create New**.
4. In the **New Group** panel, enter a group name and group description, and click **Next**.

5. Specify the logical statements that define the condition for an agent to be included in the group. Each logical statement consists of: parameter, operator, and values to match.



- In the **Include source if ___ of the conditions are met** field, select either **all** or **any**.
- For each logical statement, select the required options:

Item	Description
Parameter	The parameter can be OS Type, OS Description, Host Name, IPv4, IPv6, Machine OU, Tag, and Subnet. • OS Type, OS Description, Host Name: The value you enter should reference hardware or virtual machines that are running endpoint agents. • IPv4 or IPv6: Enter valid IP addresses as either ranges or as a set of IP addresses to include or exclude. • Machine OU: Enter a valid Machine OU(Organizational Unit) name. • Tag: Enter a valid tag that already exists. • Subnet: Enter a valid Subnet mask. **Note:** If you do not want to include certain IP addresses, use the **Not in** operator, and enter the IP addresses separated by a space or a comma.
Operator	The choice of values is dependent upon the parameter you chose. For example, if your parameter is OS Type, the only operator available is **in**.
Value or values to match	The value or values to match. For the OS Type parameter, you can choose one or more values from the drop-down list. For all other parameters, you can enter free-form text. **Note:** Although you can enter any text for values, the system validates your entries when you attempt to proceed to another screen, and will not allow you to proceed until values are valid.

6. Continue adding conditions until you have completely specified the new group. After you have added all conditions, click **Next** to proceed.
7. (Optional) Click **Apply Policies** and select the source type from the drop-down list.

   Policies with the selected source type are displayed below **Available Policies**.

   Select a policy by clicking . Skip this step if you want to apply a policy to the group at a later time.

Note: You can attach only one policy per source type to a group. That is, you cannot attach more than one Agent Endpoint policy to a single group, nor more than one Agent Windows Logs policy.

For more information on creating policies, see Create an EDR Policy, Create a Windows Log Policy, or Create a File Log Policy.

8. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Groups view. The publication status is displayed as **Unpublished** in the Groups view.

     Note: You can select an unpublished group and click **Publish** to publish a group.
   - Click **Publish Now** to publish the group.

Construct a Policy

When you create a policy, you should keep in mind the way groups and Agents can inherit values from other policies. The simplest way to construct a policy is to set values for all of the available settings for that policy type. If you do this, you can assign the policy to one or more groups, and all of the agents in those groups can receive the settings defined in the policy itself.

However, you do not need to set all possible available settings within a single policy. In the Group Ranking section, there are examples that show where values can come from, based on the ranking order.

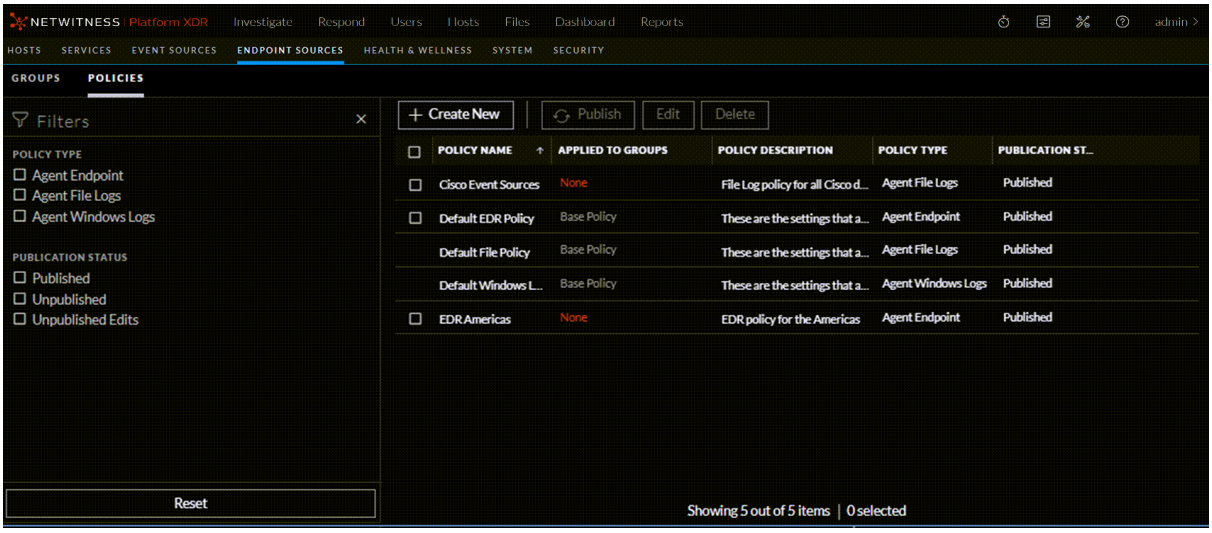
Note: Remember that a group can have no more than one of each policy type assigned to it: it can be assigned 0 or 1 Agent Endpoint, Agent File Logs, and Agent Windows Logs policies.

If an agent is only a member of one group, that agent's settings are as follows:

- If a value is set in the policy assigned to the group, that value is used.
- If a value is not set in the policy assigned to the group, the value set in the default policy is used.

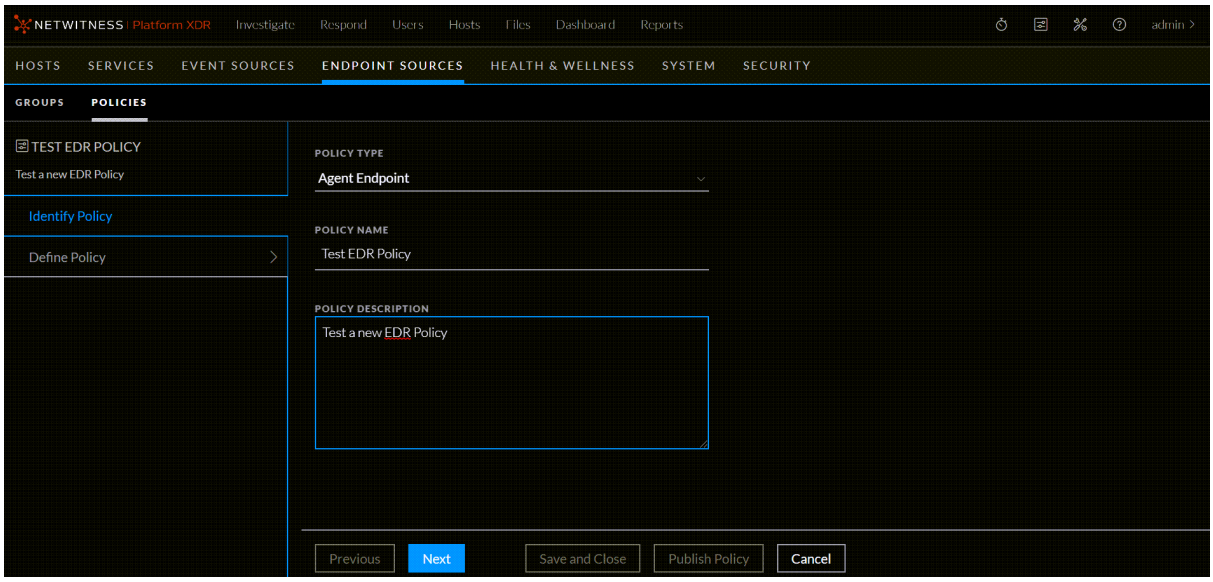
For agents that are members of multiple groups, it is a bit more complicated. For these agents, the settings are evaluated from highest priority member group (as set on the Edit Rankings page) to the lowest priority member group. If a parameter is set in a higher group, it is not overwritten, event if the same parameter is also set in a lower group. For example, assume an Agent is part of three groups:

- If a value is set in the highest ranked policy, the agent uses that value.
- If a value is not set in the highest ranked policy, but is set in the second-highest-ranked policy, the agent uses the value from the second-highest-ranked policy.
- If a value is not set in either the first- or second-highest ranked policy, but is set in the third-highest-ranked policy, the agent uses the value from the third-highest-ranked policy.
- If a value is set in the highest-ranked policy and either or both of the other policies, the value is taken from the highest-ranked policy.
- If a value is not set in any of the three policies assigned to the agent, the agent uses the value set in the default policy.



Create an EDR Policy

While creating a policy, note the following:

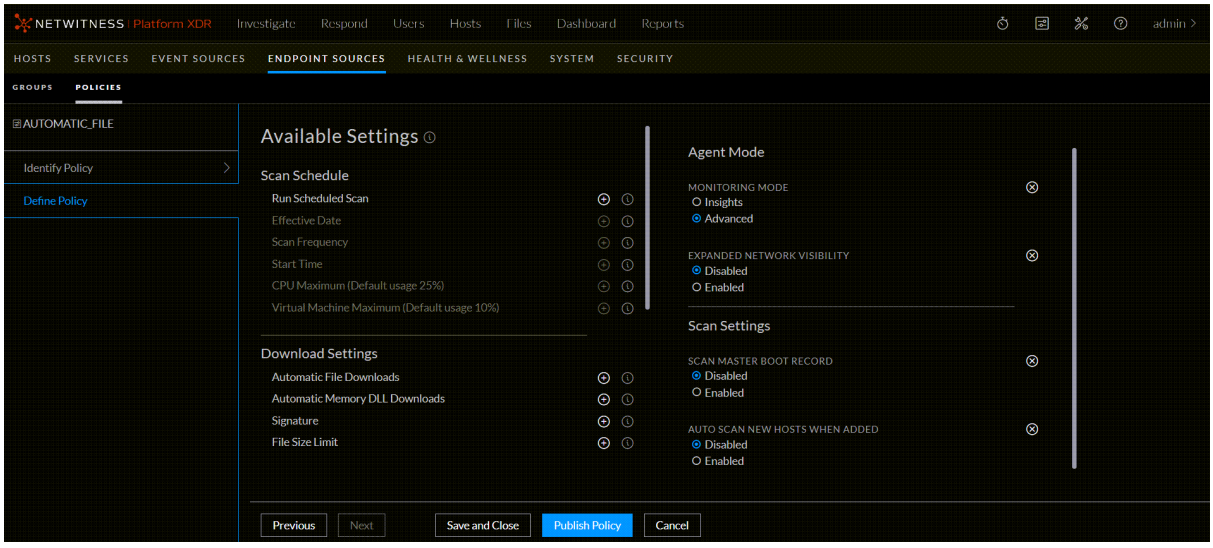


- Whenever you choose a setting, it is added to the **Selected Settings** panel.
- To clear any of your selected settings, click  to remove that setting.
- At any point in the wizard, you can choose **Save and Close**, so that you can return to complete the policy at a later time.

To create an EDR policy:

1. Go to  **(Admin) > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.

3. Click **Create New** to add a new policy.
4. In the New Policy panel, do the following:



- Select **Agent Endpoint** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.

6. Click  to select a setting from list of **Available Settings**. After you click, the specific setting is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings. For details, see Define Policy Panel for Agent Endpoint Policy.

Note: You do not need to set all possible available settings within a single policy. The complete list of settings for an agent is derived from one or more groups to which that agent belongs. This is described in more detail in Construct a Policy.

- In the Scan Schedule category, enable **Run Scheduled Scan** to configure the scan, and set any of the available parameters based on your needs. For more details, see Define Policy Panel for Agent Endpoint Policy.
- In the **Agent Mode** category, you can set the following:
  - Select the monitoring mode of the agent - Insights or Advanced.
  - Select **Expanded Network Visibility**:

    ### Prerequisite

    Note: For Expanded Network Visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide for NetWitness Platform*.

    - To enable network tracking and monitoring on Windows hosts in Insights mode.

    Note: Reports UDP connections for Windows 10 version 1803 in Insights mode.

    - To optimize the frequency of agents sending network events for both Insights and Advanced modes.
    - The endpoint agents should have the **Expanded Network Visibility** option enabled for enriched network events from NetWitness Platform packet deployment with endpoint data. In the **Events** View > **Hosts** tab, the endpoint data related to the network event selected will be automatically displayed if it exists. For more information, see "Host Information" in the *Investigate User Guide*.

    Note: For network tracking in Insights mode, verify that the Windows Management Instrumentation (WMI) service is enabled.
- In the Scan Settings category, you can enable either or both of the following actions:
  - Enable **Scan Master Boot Record** to include Master Boot Record (MBR) details in scheduled scans.
  - Enable **Auto Scan New Systems When Added** to automatically queue a scan for any host that does not have any snapshot data
- In the Download Settings category, you can set the following:
  - Enable **Automatic File Downloads** to automatically download files based on the Signature and file size. By default this option is enabled.
  - Enable **Automatic Memory DLL Downloads** to automatically download all the memory DLLs that are detected during a scan. By default this option is enabled.
  - Select the **Signature** type to limit the download of files based on the signature (not available for Linux systems).

- Specify the **File Size Limit** to limit the download of files based on the file size. The file size limit should be between 1 KB - 10 MB.

- In the Response Action Settings category you can enable or disable the following actions:
  - Enable **Blocking** to prevent the execution of a malicious file on any host.
  - Enable **Network Isolation** to provide an option to isolate a compromised host during investigation.
- In the Endpoint Server Settings, configure your server:
  - Add the Endpoint server that the agent will communicate from the drop-down list.

    Note: If you do not select an Endpoint Server, the agent uses the default Endpoint Server that is configured during packager generation.
  - (Optional) Enter an alternative hostname or IP address.
  - Enter the HTTPS port used for communication.
  - Specify the HTTPS beacon interval.
  - Enter the UDP port used for communication.
  - Specify the UDP beacon interval.
  - **Advanced Setting** - For NetWitness Support staff only.

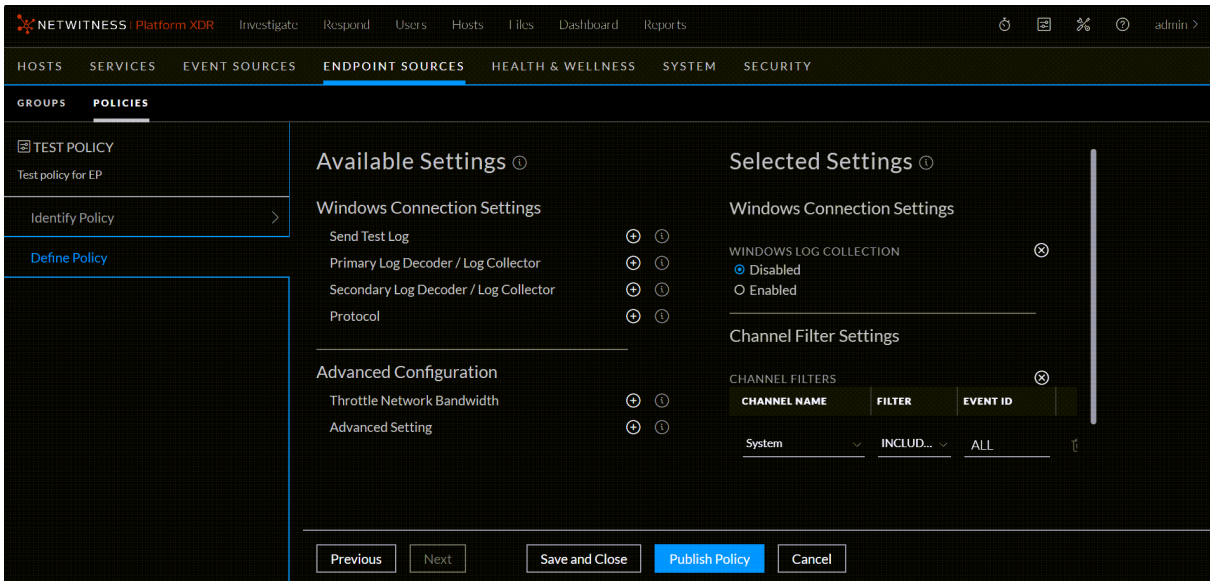
    IMPORTANT: It is strongly recommended not to use the Advanced Configuration unless advised to do so by NetWitness.

7. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
   - Click **Publish Policy** to publish the policy.

Create a Windows Log Policy

To create a Windows Log policy:

1. Go to  **(Admin) > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.
3. Click **Create New** to add a new policy.
4. In the New Policy panel, do the following:



- Select **Agent Windows Logs** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.

6. Click  to select a setting from list of **Available Settings**. After you click a setting it is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings.

Note: You do not need to set all possible available settings within a single policy. The complete list of settings for an agent is derived from one or more groups to which that agent belongs. This is described in more detail in Construct a Policy.

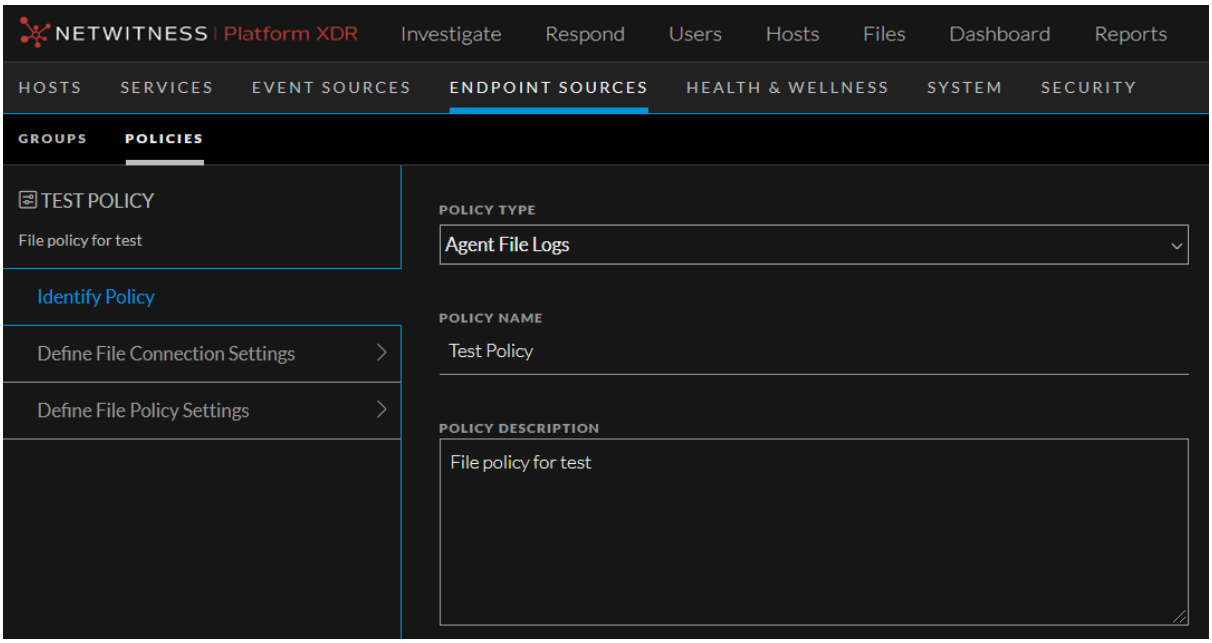
- Select **Windows Log Collection** to enable Windows Log collection. By default, this option is disabled.
- Enable **Send Test Log** to send a test log. By default, this option is disabled.
- Select **Primary Log Decoder / Log collector** to forward logs from the drop-down list.
- (Optional) Select **Secondary Log Decoder / Log collector** to forward logs from the drop-down list.

  Note: When the Endpoint Agent is configured to use the UDP protocol and the Primary Log Decoder/ Remote Log Collector is not reachable, the secondary Log Decoder or Log Collector is not functional. The logs are not forwarded to the secondary Log Decoder or Log Collector when the primary is down, thus resulting in the event loss.

- Select **Protocol** from the drop-down list. The available options are UDP, TCP, and TLS. By default, the protocol is TLS.
- Add **Channel Filters** and select the channels from which the logs are collected from the drop-down list. You can add or remove a channel filter and specify individual Event IDs.

- **Advanced Configuration**
  - **Throttle Network Bandwidth:** use this setting to limit network bandwidth that the Agent uses to connect to NetWitness. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.
    - If not set, Agent does not do any network throttling.
    - If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps.
  - **Advanced Setting** - For NetWitness Support staff only.

    IMPORTANT: It is strongly recommended not to use the Advanced Configuration unless advised to do so by NetWitness.



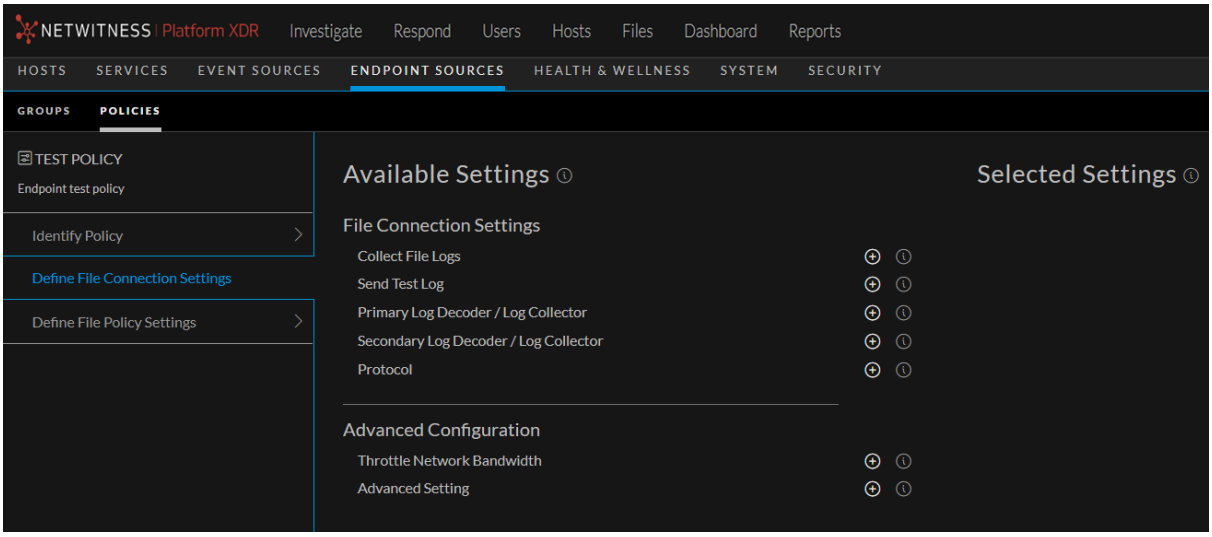
7. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
   - Click **Publish Policy** to publish the policy.

Create a File Log Policy

Note: You cannot create File Log policies while the system is in mixed mode. Until all Endpoint servers are updated to 11.4, the Agent File Logs options on the policy create, assign policy, and edit ranking pages are disabled.

To create a File Log policy:

1. Go to  **(Admin) > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.
3. Click **Create New** to add a new policy.
4. In the New Policy panel, do the following:

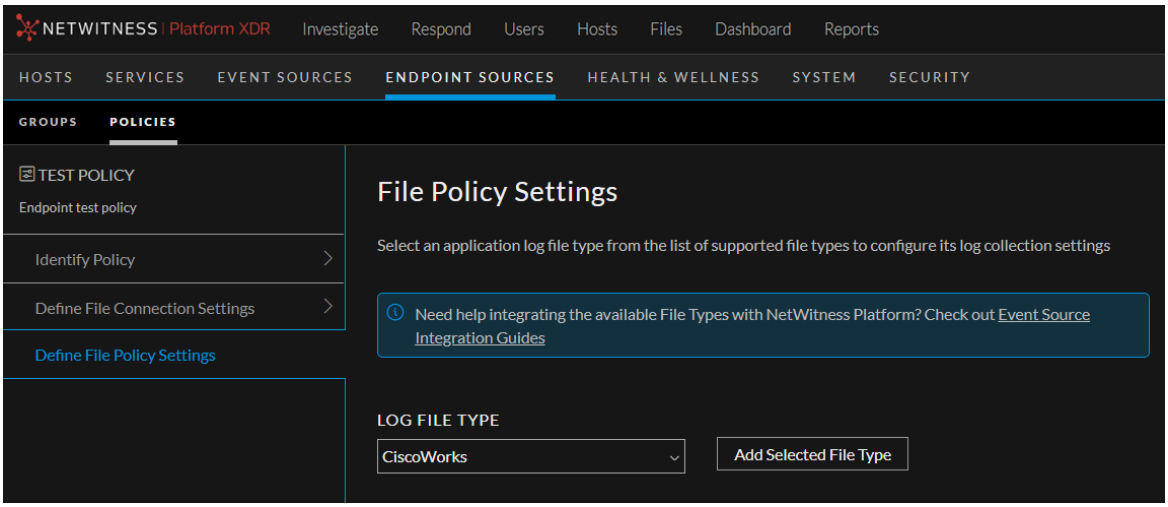


- Select **Agent File Logs** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.

6. Click  to select a setting from list of **Available Settings**. After you click a setting, the specific setting is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings.

Note: You do not need to set all possible available settings within a single policy. The complete list of settings for an agent is derived from one or more groups to which that agent belongs. This is described in more detail in Construct a Policy.



- Enable **Collect File Logs** to collect file logs on endpoints assigned to this policy. By default, this option is disabled.
- Enable **Send Test Log** to send a test log. By default, this option is disabled.
- Select **Primary Log Decoder / Log collector** to forward file logs from the drop-down list.
- (Optional) Select **Secondary Log Decoder / Log collector** to forward file logs from the drop-down list.

  Note: When the Endpoint Agent is configured to use the UDP protocol and the Primary Log Decoder/Remote Log Collector is not reachable, the secondary Log Decoder or Log Collector is not functional. The logs are not forwarded to the secondary Log Decoder or Log Collector when the primary is down, thus resulting in the event loss.

- Select **Protocol** from the drop-down list. The available options are UDP, TCP, and TLS. By default, the protocol is TCP.
- **Advanced Configuration**
  - **Throttle Network Bandwidth:** use this setting to limit network bandwidth that the Agent uses to connect to NetWitness. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.
    - If not set, Agent does not do any network throttling.
    - If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps.
  - **Advanced Setting** - For NetWitness Support staff only.

    IMPORTANT: It is strongly recommended not to use the Advanced Configuration unless advised to do so by NetWitness.

7. Click **Next**, and add the file type or types for the policy.
   a. Select a log file type from the list, then click **Add Selected File Type** to configure its log collection settings.

   For a list of currently supported event source types, see Endpoint Sources - Policies.

   b. Choose values for the available parameters.

- **Collect Logs**: Select **Enable** or **Disable**.
- **On First Connect**: Choose whether or not to collect older, historical data, or just new data. The default setting is to collect new data only.

  Note: New data is data that is collected starting from when you configure log collection for the specified event source.

- (Optional) **Log File Path**: Add a path for where the log files are stored. This is only necessary if the log files are not stored in the standard directory for the selected event source type. To add a path, click **Add Path** and enter a pathname.

  Note: This can be a Universal Naming Convention (UNC) pathname. (`\\host-name\share-name\file-path`).

  Click **Add Path** again to add another path. You can add as many paths as you like.

- **Exclusion Filters**: You can enter a newline-separated list of exclusion filters, which specify log files from which NetWitness should not be collecting data.

  Note: The filter needs to be entered as a valid regex string, or the system will not allow you to save it.

- Advanced Settings: note that most users do not need to set these parameters.
  - **Source Alias**: For most installations, this value is not needed. Use this to specify a unique event source name, in the case you have multiple event sources of the same type, for example two IBM WebSphere MQ event sources in the same NetWitness installation.
  - **File Encoding**: Select a type of file encoding. You can choose from a wide variety of encodings. The default value is **UTF-8/ASCII**.

For more details on the available parameters, see Panels for Log File Policy.

c. You can add more file types to the policy. After you have added all your file types, proceed to the next step.

8. Do one of the following:

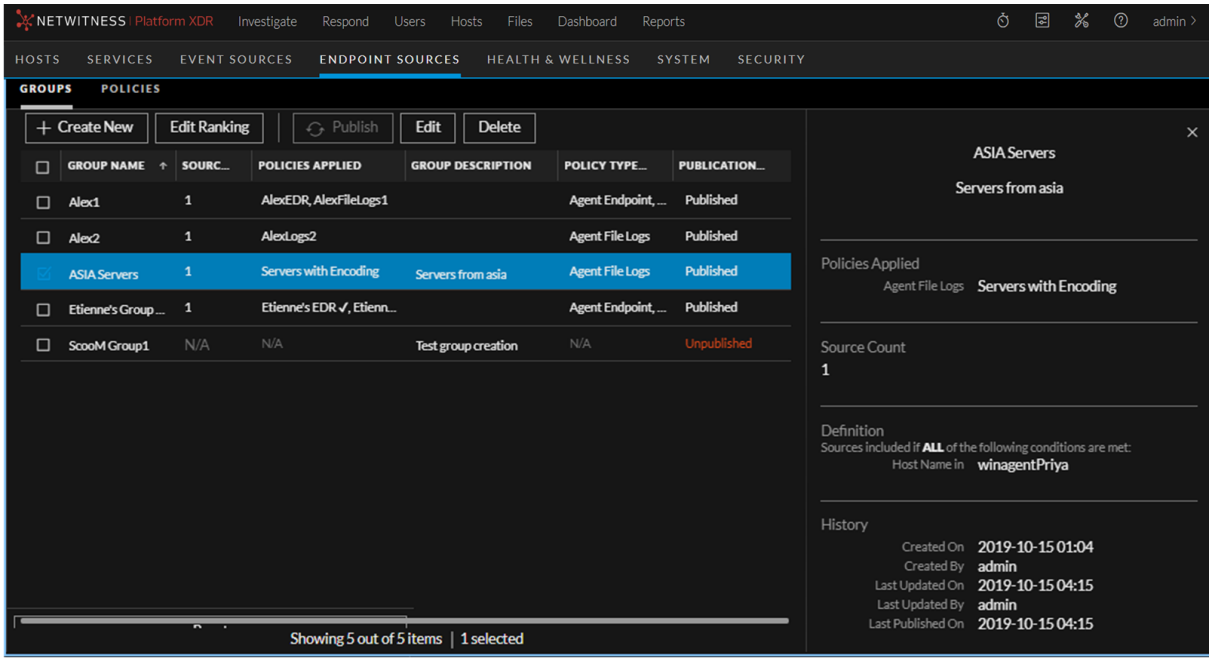
- Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
- Click **Publish Policy** to publish the policy.

Replace Windows SFTP Agents

Note that you might want to replace the SFTP Agent for Windows with the NetWitness Endpoint Agent for collection from file event sources. If so, perform the following procedure:

1. Using the File Collection Policy wizard (as described below), configure file collection for your event sources.
2. Verify that collection is working.
3. On each of your event sources, stop the SFTP service.

Managing Groups



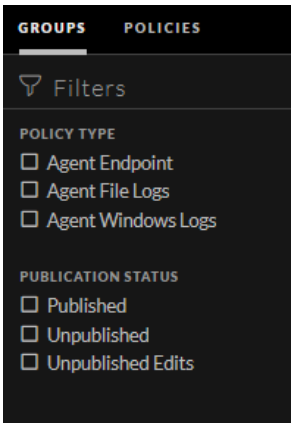
Note: The information in this topic applies to NetWitness Version 11.3 and later.

You can view group details, edit group details, filter endpoint groups, delete groups, and edit group ranking. For details on how to create groups, see Create a Group.

View Group Details

To view properties of the selected group:

1. Go to **(Admin) > Endpoint Sources**.
2. In the left panel, select the **Groups** tab. The details, such as group name, source count, policies applied, group descriptions, source type applied, and publication status are displayed. For more details on these columns, see Endpoint Sources - Groups.
3. Click the row to view the properties in the right-panel.



Filter Endpoint Groups

The Filters Panel allows you to filter the list of displayed groups, based on the one of the following source type:

- Agent Endpoint
- Agent Windows Logs

Additionally, you can sort based on publication status:

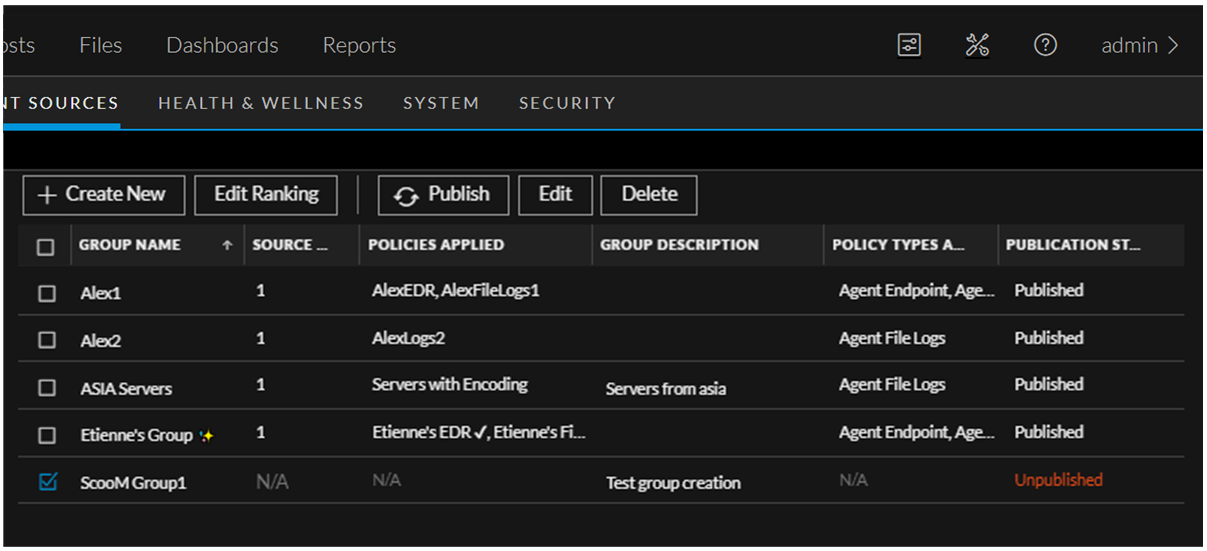
- Published - Groups that are published to use.
- Unpublished - Groups that are saved but not published.
- Unpublished Edits - Groups that are previously published and edited later and saved, but not published.

The Filters panel can be hidden or displayed:

- To hide, click the icon at the top-right of the panel.
- To display if hidden, click the icon in the toolbar.

Click **Reset Filters** to remove the currently applied filter criteria.

Edit a Group



You can edit the properties of the group at any point in time. To edit properties of a group:

1. Go to **(Admin) > Endpoint Sources**.
2. Select a group and click **Edit**.
3. Edit the group details as required.
4. Do one of the following:
   - Click **Save and Close** to save the changes and return to the Groups view. The group will be listed under the **Unpublished Edits** category.
   - Click **Publish Now** to publish the changes.

Delete a Group

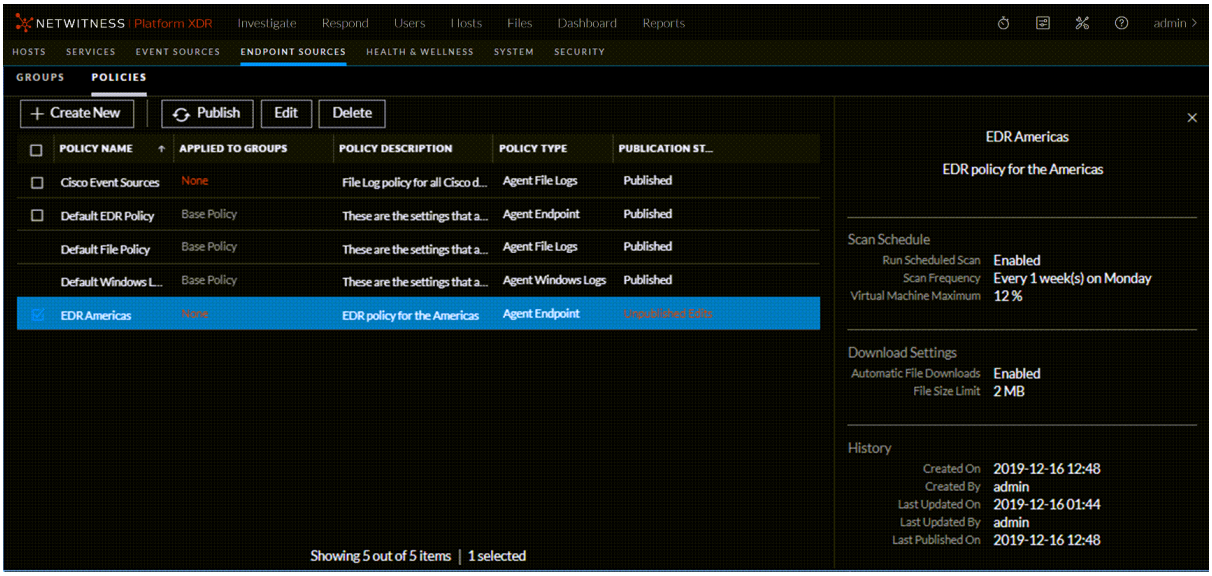
To delete a group:

1. Go to **(Admin) > Endpoint Sources**.
2. The **Groups** tab and available groups are displayed.

3. Select one or more groups and click **Delete**.
4. Click **Delete**. The confirmation message is displayed.
5. In the Delete Groups dialog, click **Delete Group(s)** to permanently delete the selected groups.

Managing Policies

Note: The information in this topic applies to NetWitness version 11.3 and later. Policies are not applicable on standalone agents.



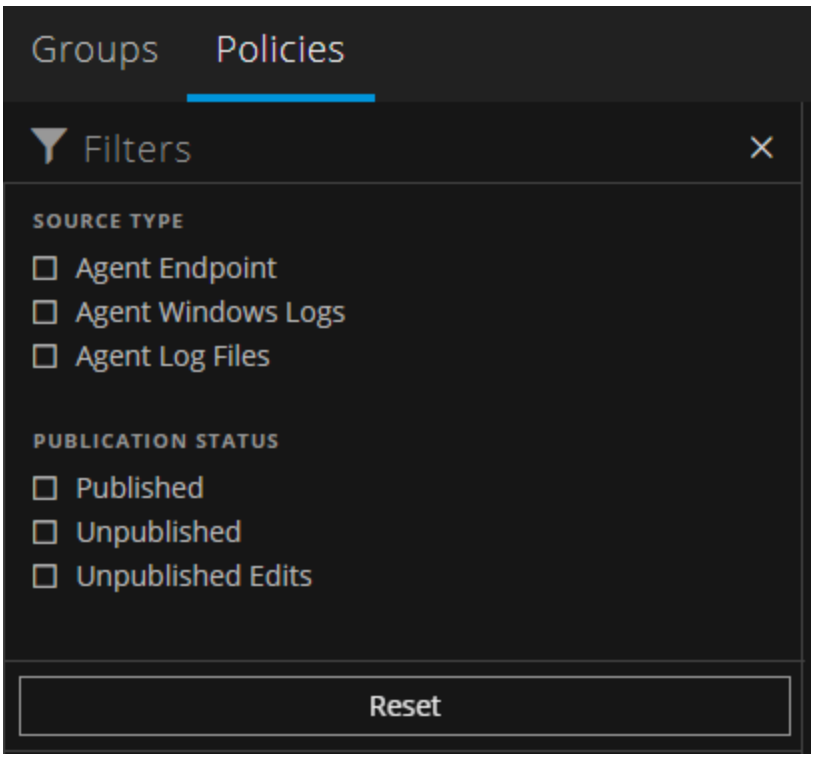
You can view, edit, filter, and delete policies, as detailed in the following sections:

- View Policy Details
- Filter Policies
- Edit a Policy
- Delete a Policy
- Conflict Resolution

View Policy Details

To view properties of the selected policy:

1. Go to **(Admin) > Endpoint Sources**.
2. In the left panel, select the **Policies** tab. The details, such as policy name, applied to groups, policy description, source type, and publication status are displayed. For more details on these columns, see Endpoint Sources - Policies.
3. Click the row to view details about selected policy in right pane.



Filter Policies

The Filters Panel allows you to filter the list of displayed policies, based on the source type. You can filter on any combination of the following:

- Agent Endpoint
- Agent File Logs
- Agent Windows Logs

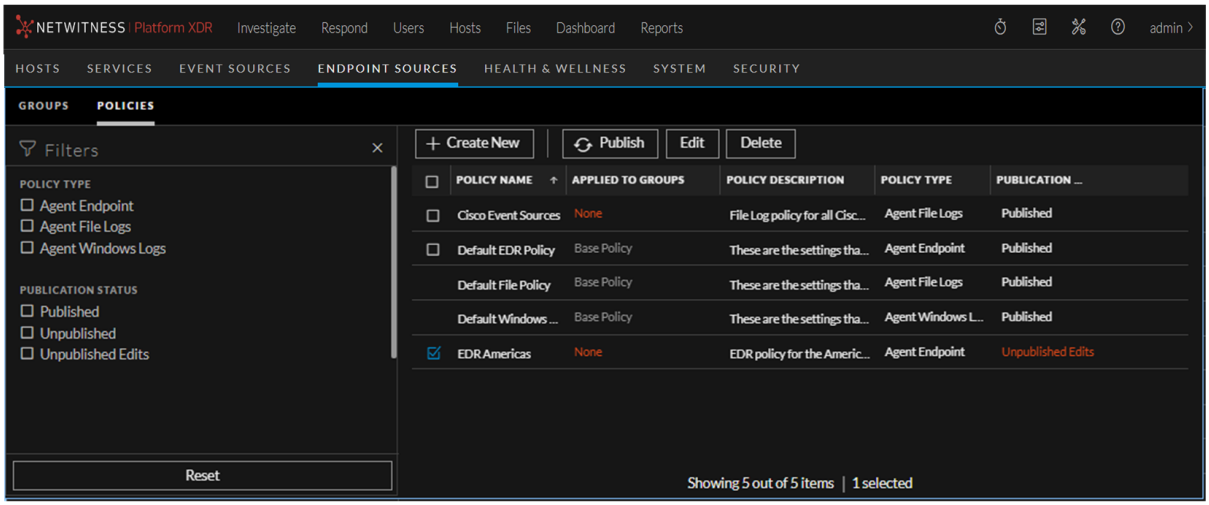
Additionally, you can filter based on publication status:

- Published: Policies that are published to use.
- Unpublished: Policies that are saved but not published.
- Unpublished Edits: Policies that are previously published and edited later and saved, but not published.

The Filters panel can be hidden or displayed:

- To hide, click the icon at the top-right of the panel.
- To display if hidden, click the icon in the toolbar.

Click **Reset Filters** to remove the currently applied filtering criteria.



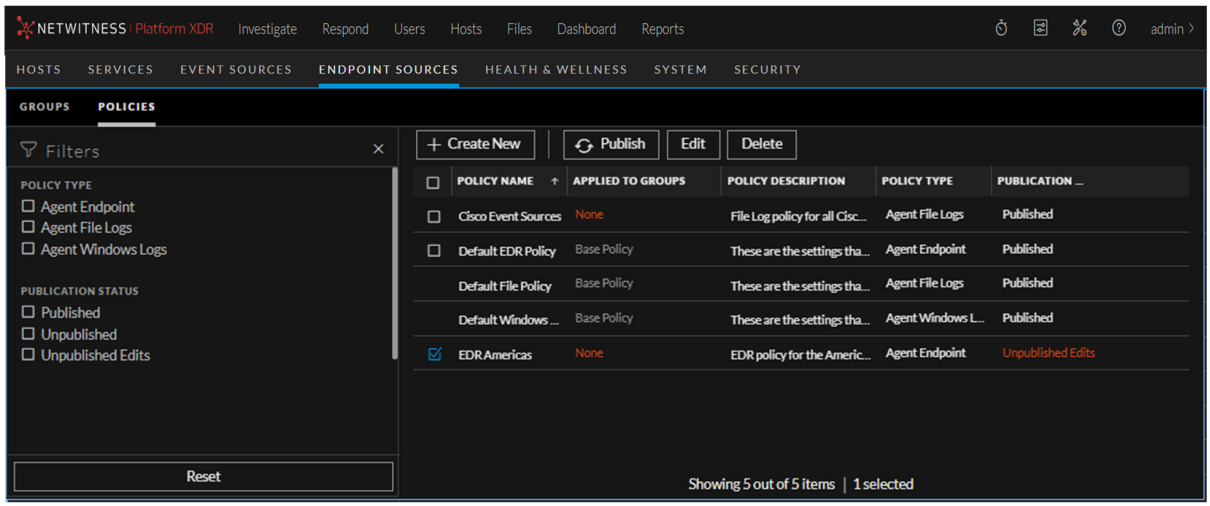
Edit a Policy

You can edit the settings of the default Agent Endpoint and custom policies. The default Agent Windows Log policy cannot be edited.

Note: For the default EDR policy, you cannot edit the source type, policy name, and policy description. However, you can edit the details in the Define Policy panel.

To edit a policy:

1. Go to **(Admin) > Endpoint Sources**, and select the **Policies** tab.
2. Select a policy and click **Edit**.



3. Edit the policy details as required.
4. Do one of the following:
   - Click **Save and Close** to save the changes and return to the Policies view. The policy will be listed under the **Unpublished Edits** category.
   - Click **Publish Policy** to publish the changes.

Delete a Policy

To delete a policy:

1. Go to **(Admin) > Endpoint Sources**.
2. Click the **Policy** tab. The available policies are displayed.

3. Select one or more policies and click **Delete**.

   The confirmation message is displayed.

4. In the Delete Policies dialog, click **Delete Policy(ies)** to permanently delete the selected policies.

Conflict Resolution

An endpoint can be in more than one group, and can thus have more than one Agent Endpoint, Agent File Logs, or Windows Logs policy applied to it. In this case, there may be conflicting settings that could be applied to the endpoint.

For example, an endpoint that is in two Groups could have two, different File Log policies applied to it. In this case, some of the settings could have conflicting values. The value that is actually applied to the endpoint is determined by the highest-ranked policy that contains a value for that setting.

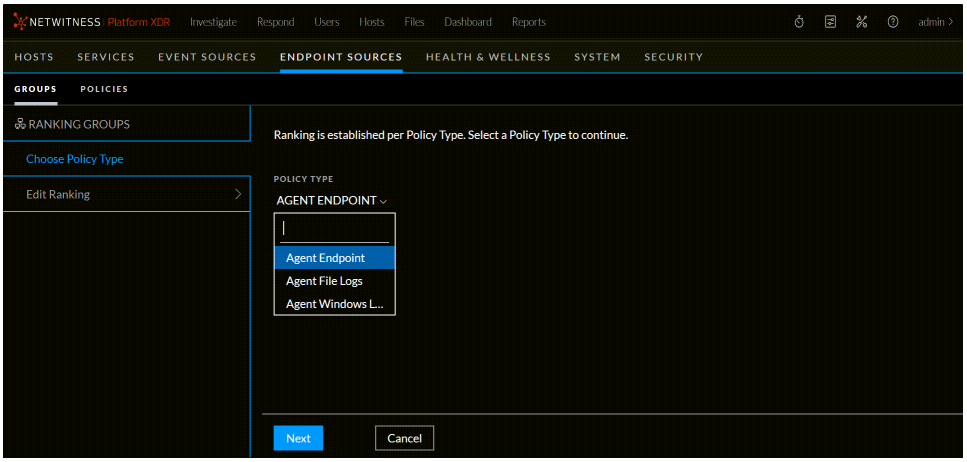
For example, assume there is an endpoint that has 2 Agent File Log policies applied to it:

- LF Policy One: Log File Type is webgateway, and **File Encoding** is set to UTF-8
- LF Policy Two: Log File Type is webgateway, and **File Encoding** is set to Local Encoding

How NetWitness assumes the webgateway logs are encoded is dependent upon which policy is ranked higher:

- If Policy One is ranked higher than Policy Two, NetWitness treats the logs as having UTF-8 encoding.
- If Policy Two is ranked higher than Policy One, NetWitness treats the logs as having Local Encoding.

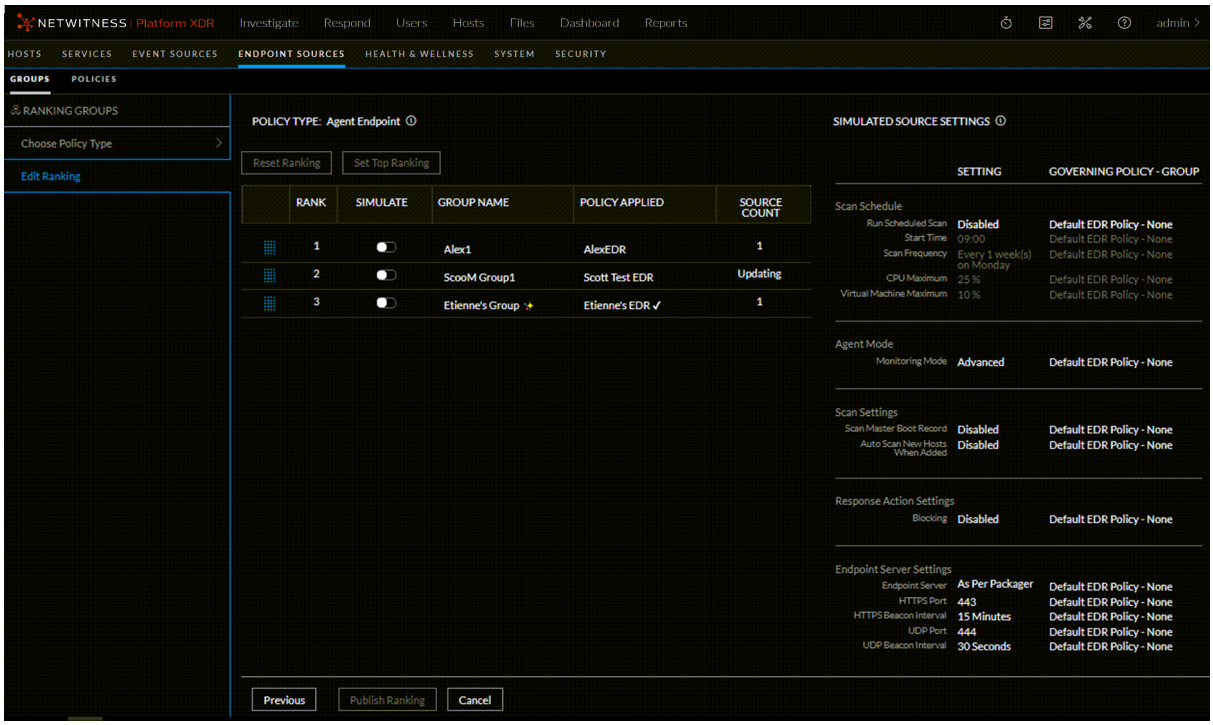
For an example using EDR policies, see Simulation Examples, which shows how you can preview the settings that would be applied before actually changing any policy rankings.



Change Policy Ordering for Groups

An endpoint agent can be included in multiple groups. And these groups can have different policies applied to them. In this case, you can edit the ordering or ranking of policies, to specify a hierarchy for your policies.

Edit Ranking



To edit the ordering or ranking of a group:

1. Go to  **(Admin) > Endpoint Sources**.
2. Select the Groups tab and click **Edit Ranking**.
3. Select one of the following source type for the drop-down list:
   - **Agent Endpoint** to rank the groups associated with Agent Endpoint type policies.
   - **Agent Windows Logs** to rank the groups associated with Agent Windows Log type policies
   - **Agent Log Files** to rank the groups associated with agents that are using File Collection.

4. Click **Next**.

   The Ranking view is displayed:

You can simulate your policy settings and how they affect the endpoints within their groups. This gives you the ability to preview how your changes to the ranking will affect the policy settings applied to each hypothetical agent.

5. You can manipulate the sliders to simulate different options. You can select the slider in the **Simulate** column for each group into which a hypothetical agent would fall, and drag it to the right to simulate turning on that policy.

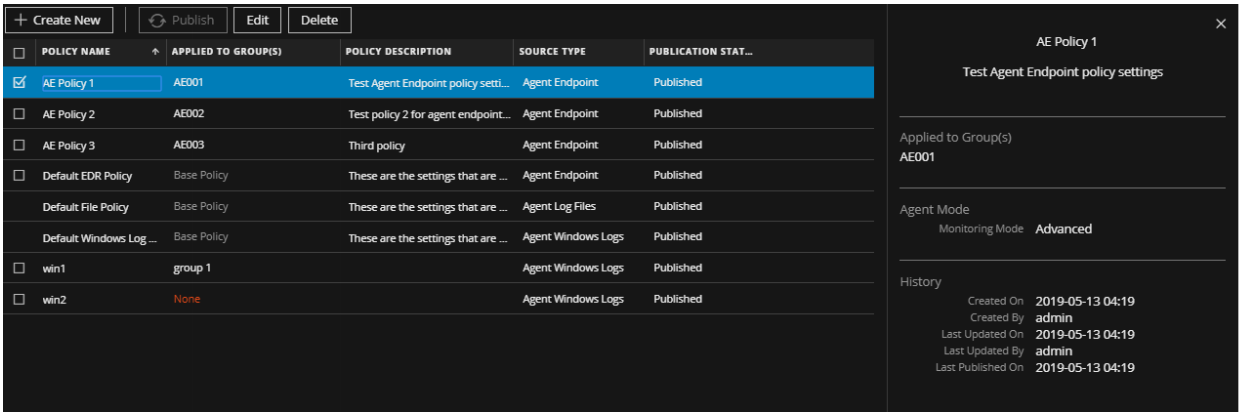
   This image shows all policies being simulated:

6. Reorder your groups as necessary.
   a. Select anywhere within a group's row.
   b. Drag the group up or down to change the priority. Priority decreases from top to bottom.
   c. Repeat moving groups until they are ordered as you prefer.

   Note: To move any group to the top, select the group and click **Set Top Ranking**.

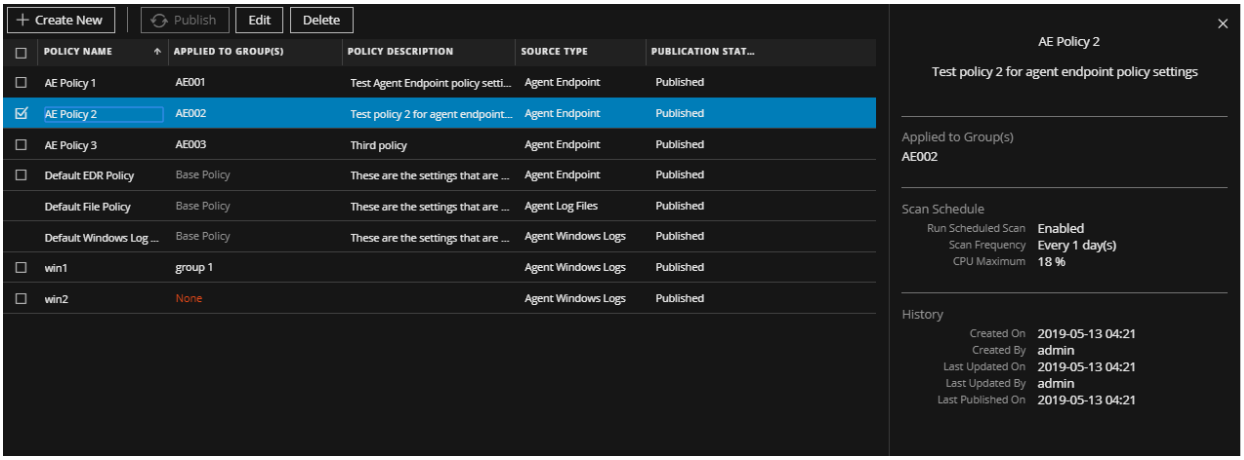
7. As you change the rankings for your groups, you can preview how the policy settings would change based on your new rankings. For example, assume each of the following scenarios:
   - If you have a hypothetical agent that belongs in group 1, simulate only group 1 to see which policies would affect that agent.
   - If you have a hypothetical agent that belongs in group 1 and group 2, simulate both group 1 and group 2 to see how policies would be applied for that agent.
8. After you have specified the optimal ranking order, you can publish the new ranking.

Simulation Examples



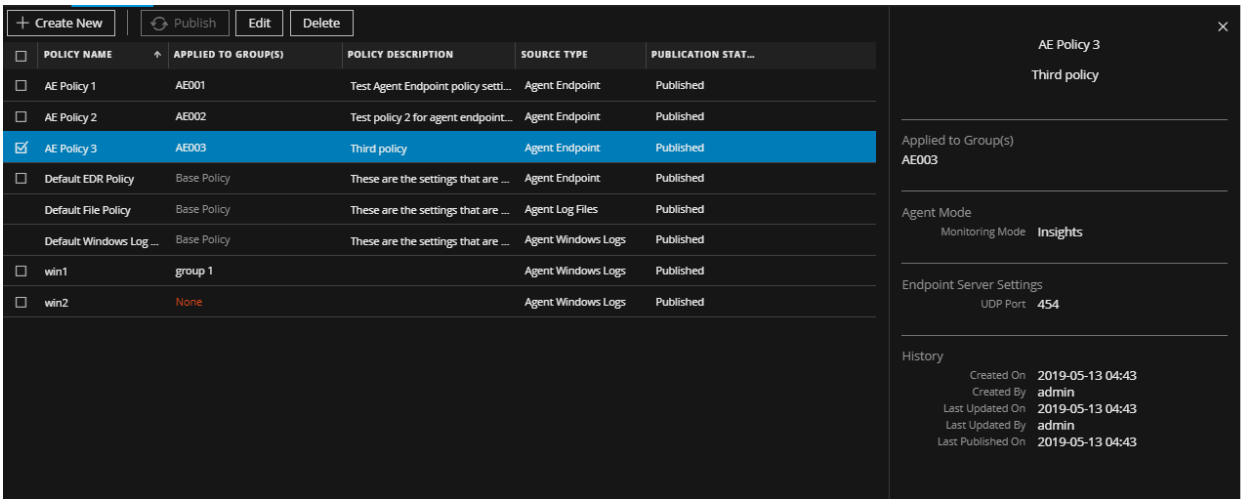
This section contains simulation examples for Agent Endpoint policies and Agent Log policies. Note that Windows policies have the same behavior as Agent Endpoint policies.

Agent Endpoint Policies Examples



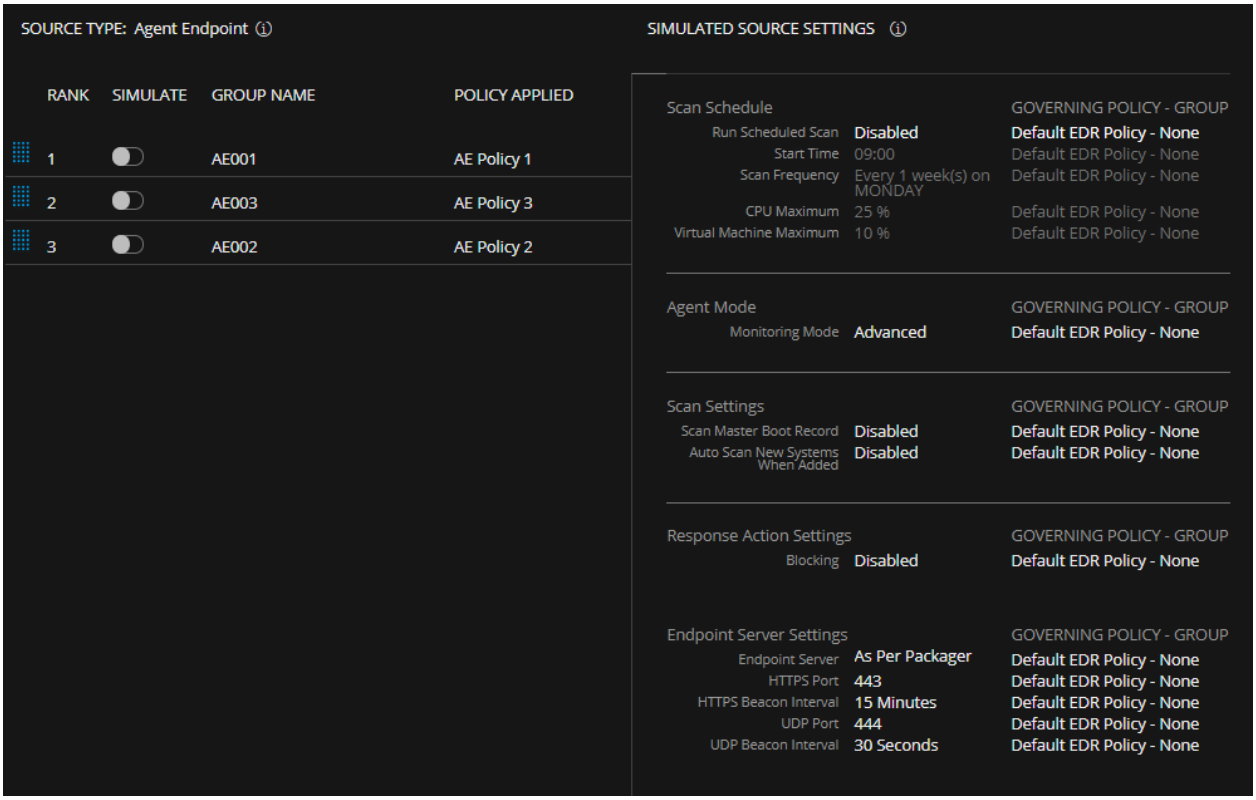
The **Simulated Source Settings** panel shows each individual policy setting, along with the governing policy for each setting.

Examine **AE Policy 1**, **AE Policy 2** and **AE Policy 3** to see which values are set in those policies.

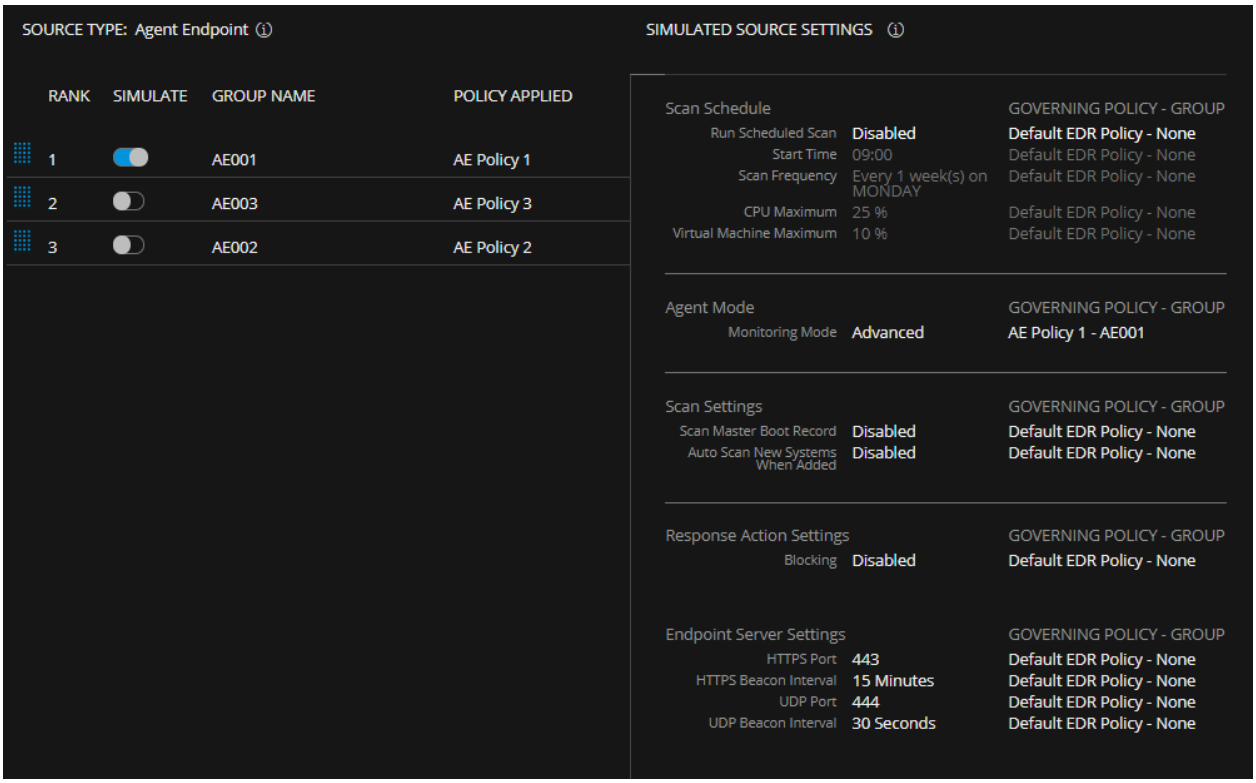


AE Policy 1 has Agent Mode set:

AE Policy 2 has a scan schedule set, as well as limiting the CPU maximum to 18%:



AE Policy 3 has Agent Mode set (to **Insights**), and sets the UDP Port to **454**:



No Settings Applied

When none of the policies are simulated, you can see that the Default EDR Policy governs all behavior.

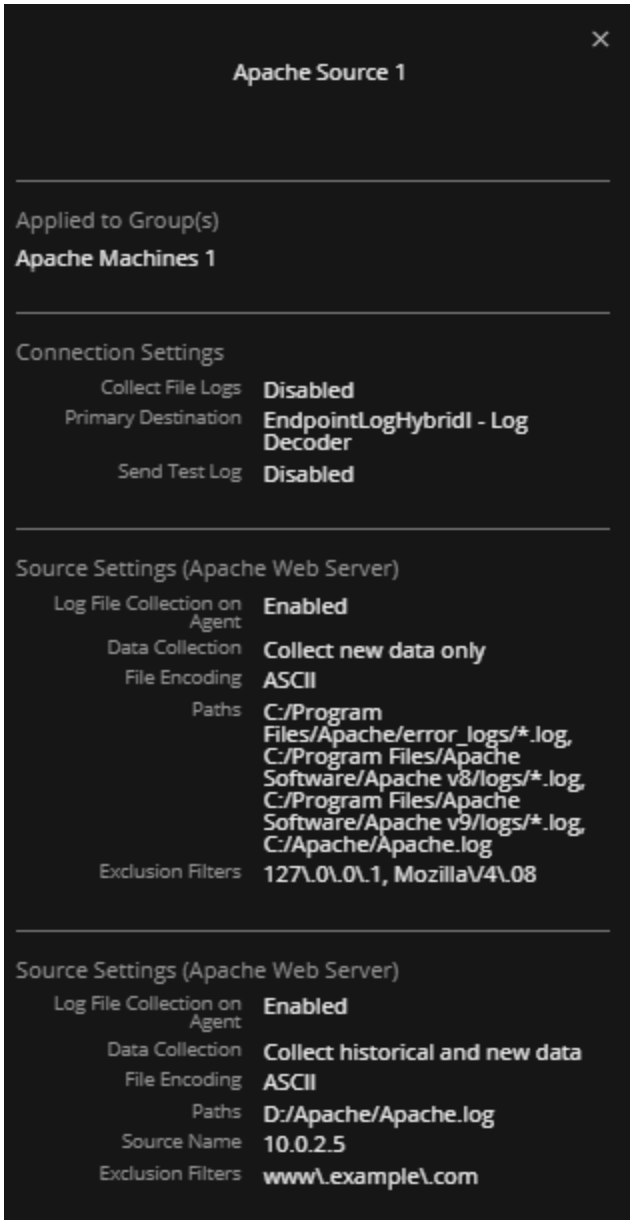
Simulate a Single Policy

When you select the AE001 Group, you can see that the values set in AE Policy 1 govern the behavior Agent Mode, as well as the Default EDR Policy being used for all unset parameters.

Simulate Multiple Policies

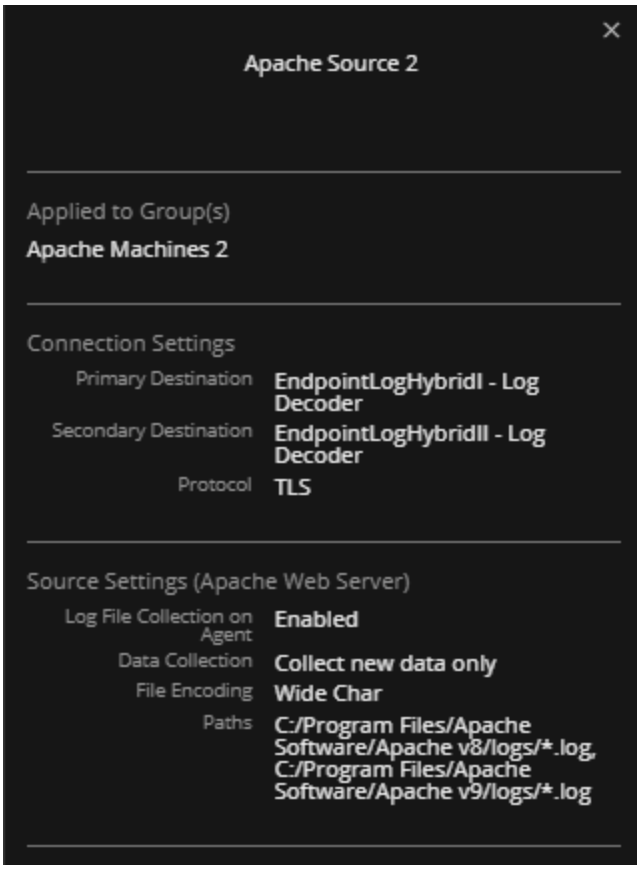
When you select multiple groups and policies, you can see the effects of each policy, based on the current ranking.

You can see that Agent Mode is set to **Insights**: this is because **AE Policy 3** is ranked above **AE Policy 1**, so the higher ranked policy's setting is used. None of the other parameters are set in more than a single policy, so for those, each policy's setting is used. Since **AE Policy 1** only has Agent Mode set—and **AE Policy 3** ranks higher and sets a different value—**AE Policy 1** does not govern any of the EDR settings. And finally, for parameters not set in any of the simulated policies, the Default EDR Policy settings are used.



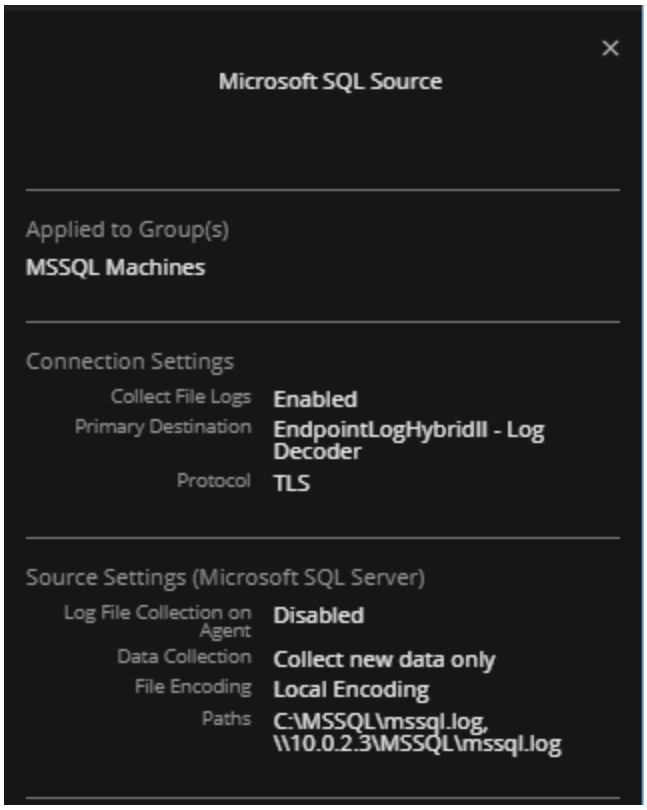
File Log Policies Simulation Example

The collection of parameter values into a complete policy works a bit differently for File Log policies than for EDR or Windows policies. To determine which values are applied from which policies, note the following:



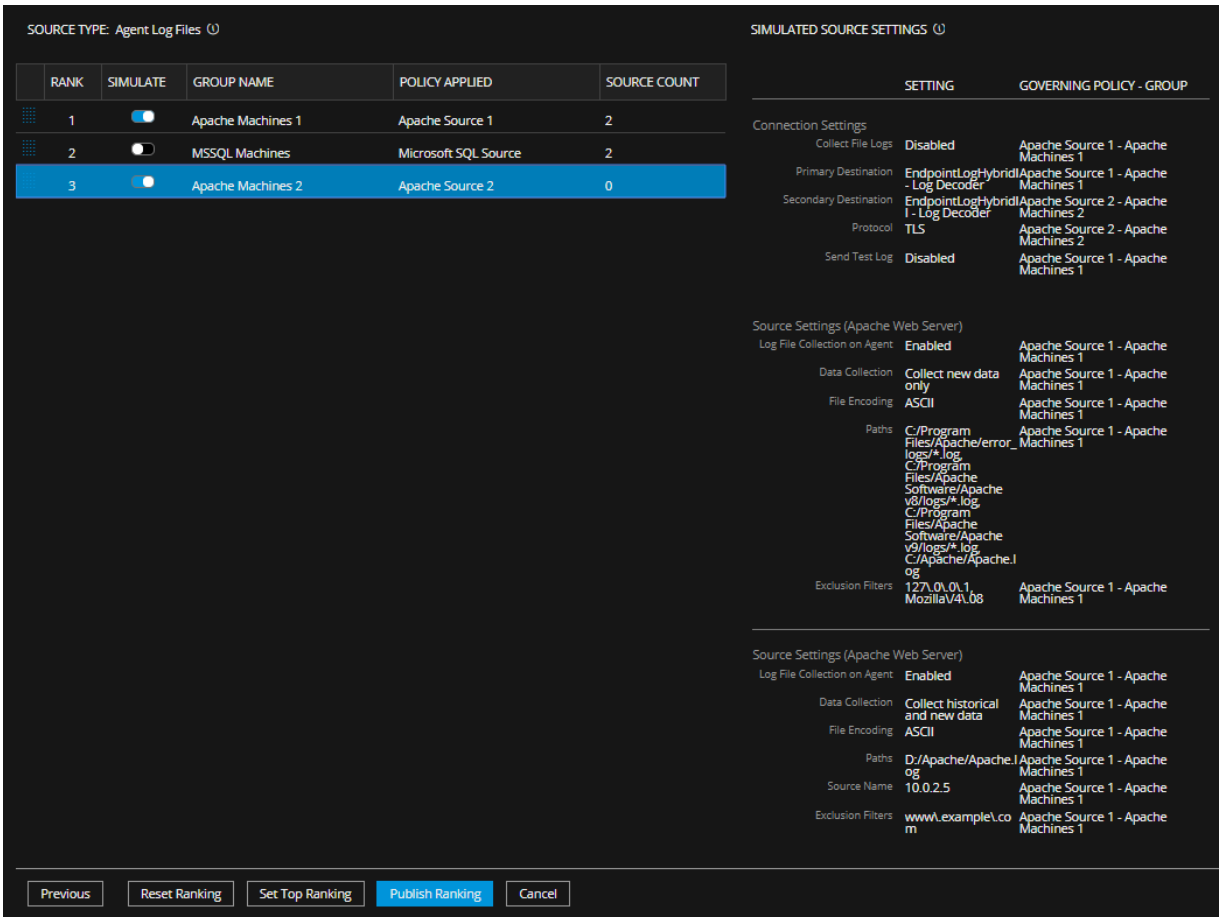
- Each event source type acts as a separate setting. That is, if a policy has values for both Apache and Access Manager, for example, each of those event source types is treated as a separate set of values.
- When an endpoint inherits values, it might not only get values from the highest ranked policy that has a value set. It might, for example, inherit Apache values from one policy, and Access Manager settings from another.
- If you consider a set of File Log policies that all include settings for the same event sources, then they behave the same as EDR and Windows policies.

Consider the following example, where there are three log file policies—two with Apache source types and one with MS SQL event source type.

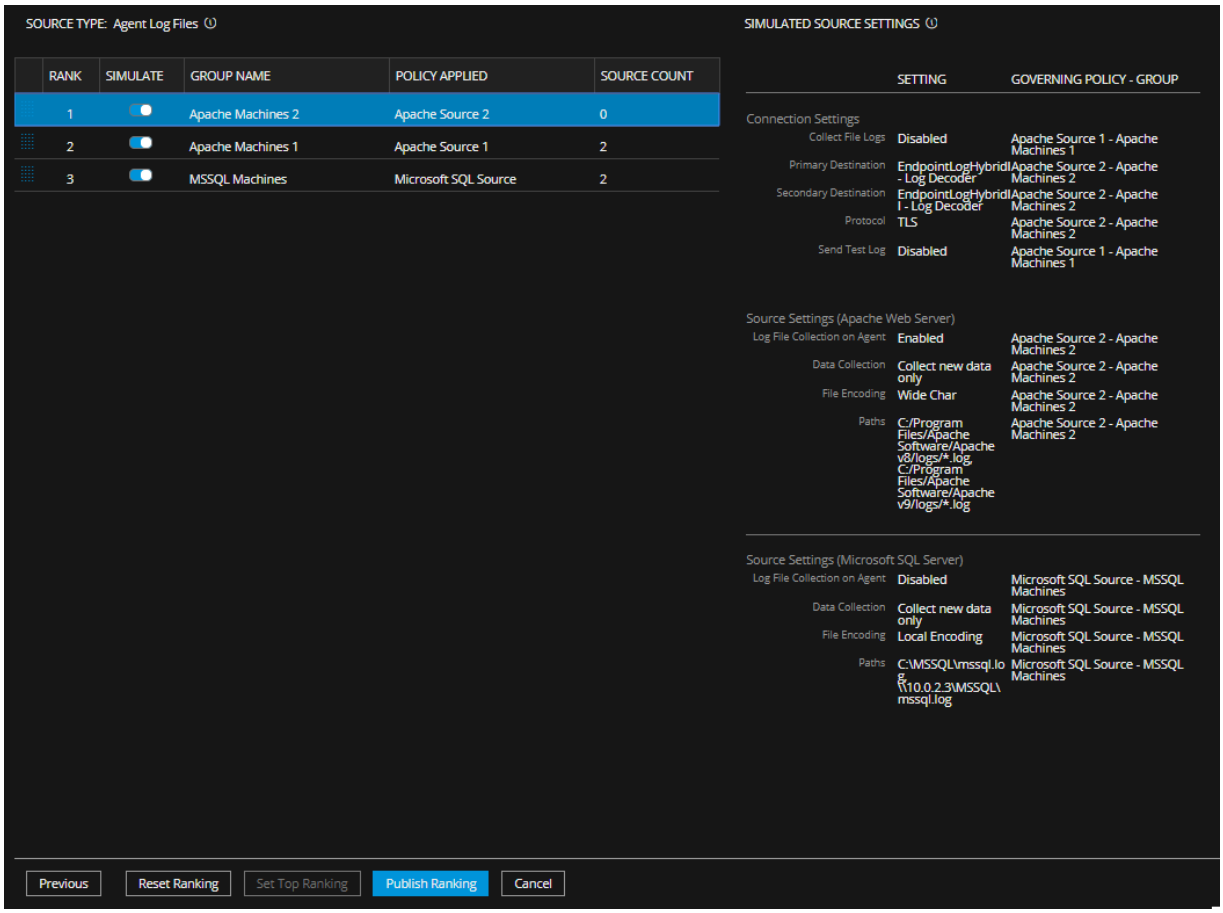


- File policy **Apache Source 1**:

- File policy **Apache Source 2**:



- File policy **Microsoft SQL Source**:



Examine two of the possible ranking orders:

- Simulate policies 1: **Apache Source 1**, 2: **Apache Source 2**. Note that in this case, the MS SQL policy is not simulated.

In this case, all Apache settings for the group are inherited from the **Apache Source 1** policy.

- Move the **Apache Source 2** policy higher than **Apache Source 1** policy, and add the **Microsoft SQL Source** policy. Simulate policies 1: **Apache Source 2**, 2: **Microsoft SQL Source**, 3: **Apache Source 1**.

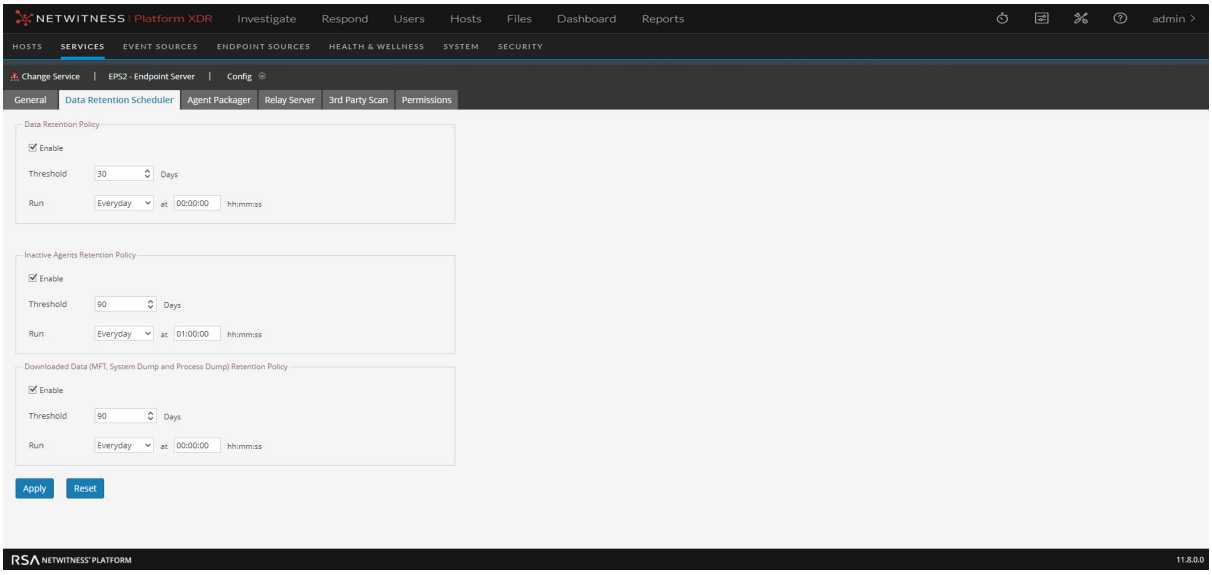
In this case, all Apache settings for the group are inherited from the **Apache Source 2** policy, and groups also get the MS SQL settings.

So, the Apache settings are inherited from the highest ranked Apache policy **only**, but the source settings as a whole are **combined** to include settings from each event source type.

The SIMULATE Slider

The slider has two positions:

- On: 
- Off: 



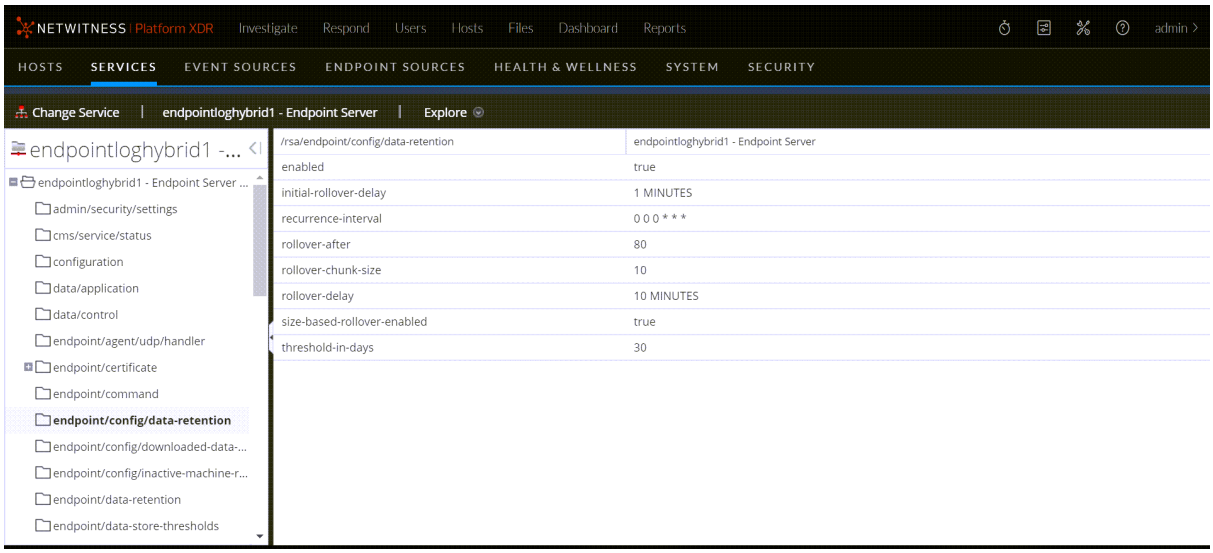
If the simulate slider is ON for a policy, that policy's values are factored into the complete set of governing settings. If the slider is OFF for a policy, the setting for that policy have no effect on the list of the governing settings.

Configuring Data Retention Policy

An administrator can configure the retention policies to retain the Endpoint data based on the age or the storage size. By default, days and size-based retention policies are enabled.

To change the configuration for age-based retention:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

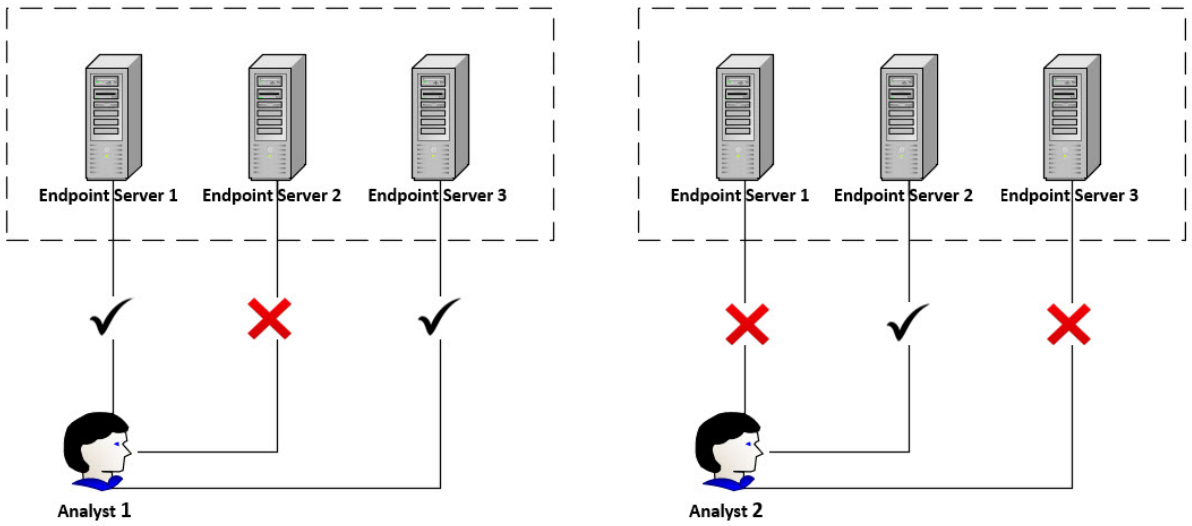


5. In the **Data Retention Policy** panel, by default, the **Threshold** is set to 30 days, and **Run** to Everyday. This means only 30 days of Endpoint data is retained and the older data is deleted from the database.
6. Click **Apply**.

To change the configuration for size-based retention:

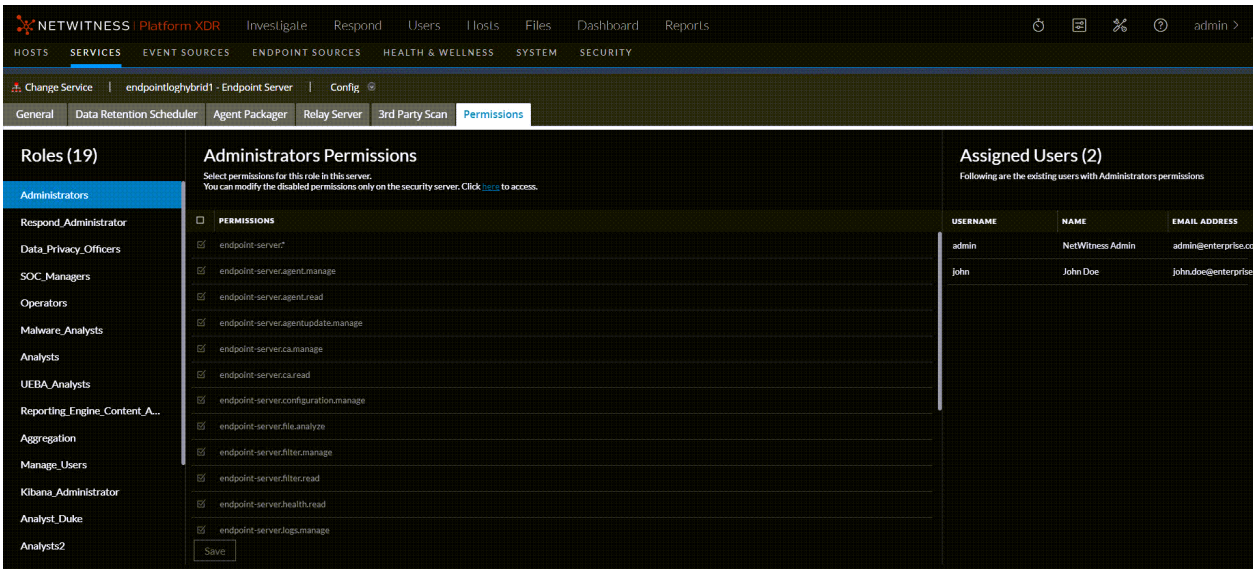
By default, for the size-based retention, the `rollover-after` value is set to 80 and `rollover-chunk-size` is set to 10. This means that when the storage size exceeds 80 percent of the space allocated for the disk partition, 10 percent of the older Endpoint data is deleted from the database. However, you can change these values as follows:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View > Explore**. The Explore view is displayed:



4. In the left panel, select **endpoint/config/data-retention**.
5. Edit the configurations based on your requirements.

Manage Role Permissions at Endpoint Server Level

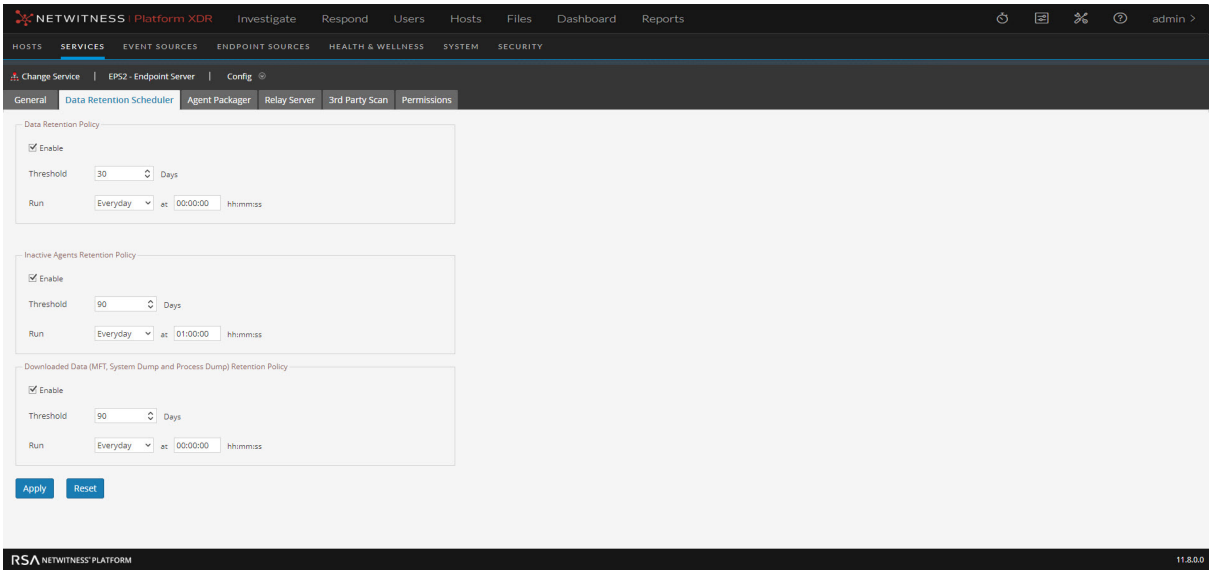


NetWitness Platform version 11.7 and later provides more flexibility for managing RBAC (Role-Based Access Control). This enhancement enables you to grant/revoke access for any role at individual endpoint server levels in an environment rather than all. On the **admin > Config** view for any endpoint server, you can navigate to the **Permissions** tab and manage a significant number of permissions for the selected endpoint server. A new permission called **endpoint-server.file.analyze** lets the user perform file analysis activities(Analyze Files, Save a Local Copy and Initiate OPSWAT Scans), allowing more flexible options to manage user permissions. Refer to Manage Users with Roles and Permissions on the *System Security and User Management Guide* for more information.

The following illustrations show how you can set permissions at the endpoint server level for an analyst.

To configure permissions at the endpoint server level:

1. Go to **(Admin) > Services**.
2. In the Services view, select the Endpoint Server service.
3. Click  and select **View > Config**.
4. Navigate to **Permissions** tab.
5. Select a role from the **Roles** pane on the left. (For more information on managing roles, refer (Optional) Add a Role and Assign Permissions in *System Security and User Management Guide*.)
6. Select the permissions from the **PERMISSIONS** section (Center pane).
7. Click **Save**. The **Assigned Users** pane on the right shows the list of users assigned with the selected role and permissions.
8. Repeat steps **5 – 7** if you want to modify permissions to any role. Make sure you save the changes before navigating out of the current role.



Note: Some of the permissions on the Permissions tab are disabled, and you can modify them only on the Security server (Admin > Security). All other permissions listed here are editable on both the Security server and the Permissions tab. For more information on managing permissions and on the NetWitness Platform, see *System Security and User Management Guide*.

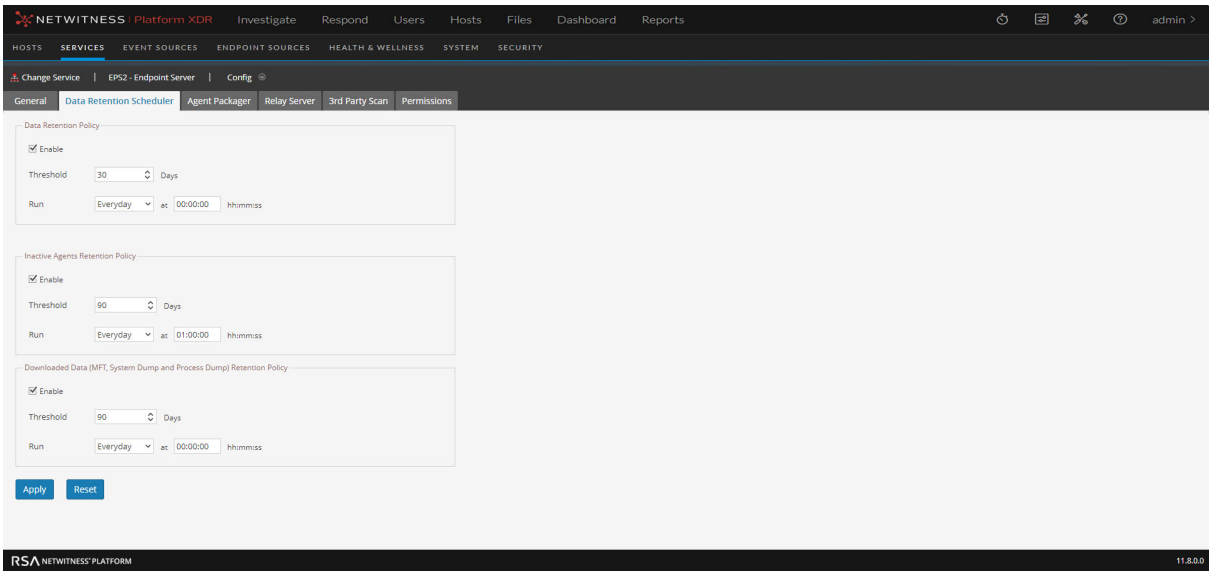
Managing Inactive Agents

An administrator can configure the inactive agent retention policy to delete data of agents that are inactive, from the Endpoint Server. On deletion, the Endpoint Server stops collecting data from these agents. By default, this option is enabled.

To configure the inactive agent retention policy:

1. Go to  **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click  and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

5. In the **Inactive Agents Retention Policy** panel, by default, the **Threshold** is set to 90 days and **Run** to Everyday. This means that the data of agents that have not communicated with the Endpoint server for 90 days is deleted from the database.
6. Click **Apply**.



Note: The Inactive Agents Retention Policy is not applicable for NetWitness Endpoint 4.4.0.2 or later agents.

Configure Retention Policy for Memory Dumps and MFT

An administrator can configure the retention policy to delete the downloaded system dump, process dump, and Master File Table (MFT) from the Endpoint server based on the number of days. By default, this option is enabled.

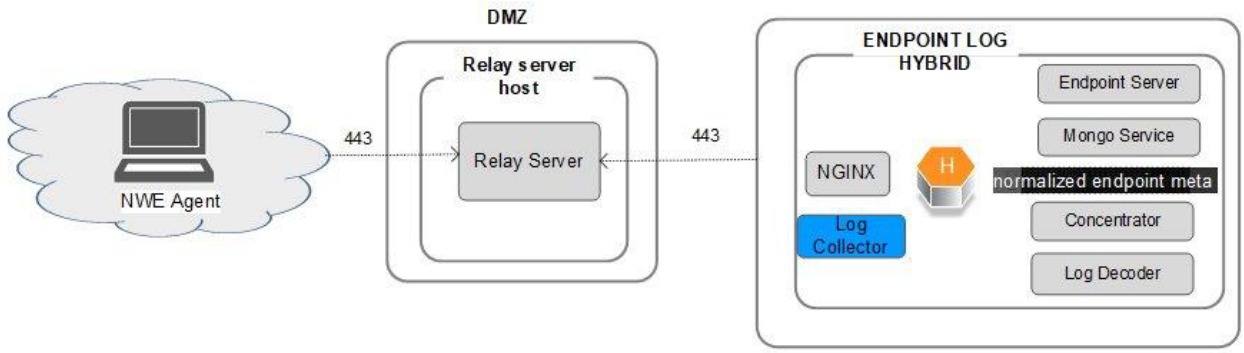
To configure the retention policy:

1. Go to  **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click  and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

5. In the **Memory Dumps and MFT Retention Policy** panel, by default, the **Threshold** is set to 90 days and **Run** to every day. This means only 90 days of data is retained and the older data is deleted from the Endpoint server.
6. Click **Apply**.

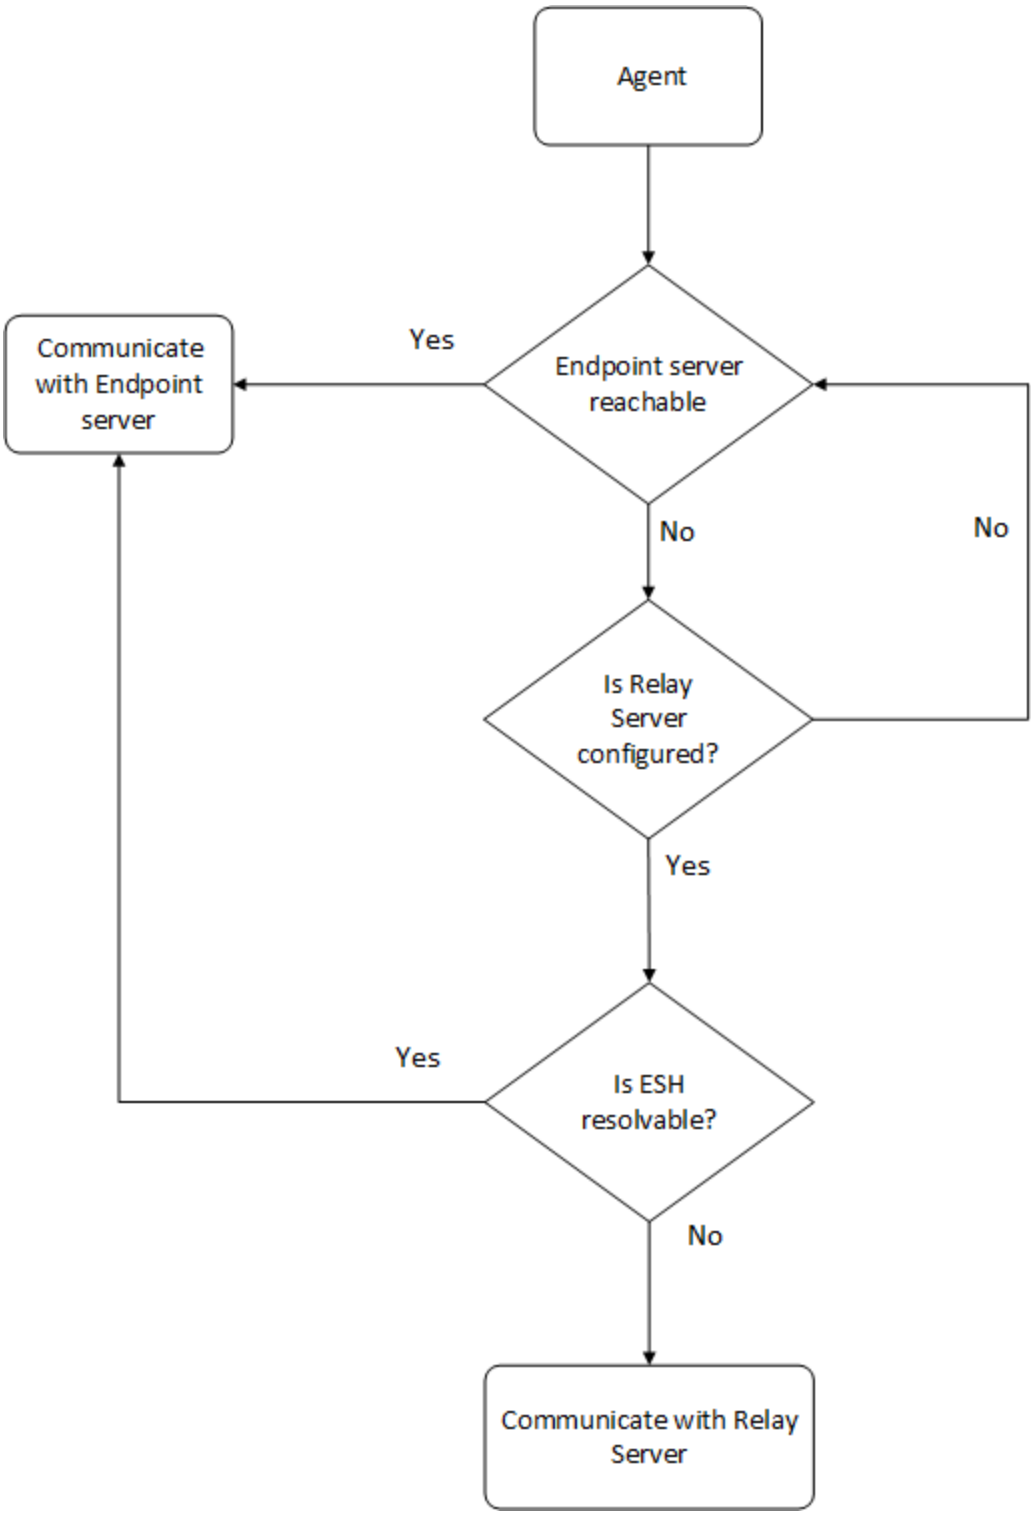
(Optional) Installing and Configuring Relay Server

Note: The information in this topic applies to NetWitness Version 11.3.1 and later.



Relay Server (referred to as RAR in NetWitness Endpoints) extends NetWitness Platform's visibility into endpoints when they are outside the corporate network. The Relay Server deployed in a cloud or DMZ relays the endpoint data between the hosts and the Endpoint Server. The hosts that are outside the corporate network send the endpoint data to the configured Relay Server and the corresponding Endpoint server pulls the data.

Note: If you have Windows hosts that are outside the corporate network, the log data is not sent to the Relay Server.



You can configure a Relay Server on the Endpoint Server Config view. Once the Relay Server is configured, the policy for the host is automatically updated and you can view the Relay Server settings on the **Host Details** view > **Policy Details** panel.

You can configure a single Relay Server with one or more Endpoint servers. In this case, the Relay Server ensures that the endpoint data reaches the Endpoint Server configured in the policy.

The following describes the architecture of the Relay Server.

The following flowchart explains how the host switches to the Relay Server.

Agent
Endpoint server reachable
Yes
Communicate with Endpoint server
No
No
Is Relay Server configured?
Yes
Yes
Is ESH resolvable?
No
Communicate with Relay Server

Installing the Relay Server

The Relay Server installer contains binaries, certificates, configuration files, and the installation script required to install the Relay Server.

IMPORTANT:
- The Relay Server version must match with the corresponding NetWitness Endpoint Server version. If you plan to upgrade a Relay Server to a newer version, first upgrade the Endpoint Server, then download the Relay Server installer, and run the installer script.
- Operating System updates and general system hardening on the Relay Server must be managed by the customer according to standard best practices. The Relay server package does not contain OS updates and the operating system will not be updated as part of the standard NetWitness update process.
- Do NOT run the nwsetup-tui script to install the Relay Server. Follow the instructions in this document only as Relay Server is an independent server and not part of NetWitness UI (Admin > Hosts).

Installation Media

The Relay Server can be installed only on a CentOS 7 or NetWitness Platform 11.4.0.0 base image which is available for download from Downloads page (https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads). Also, make sure that the Relay server host is connected to internet to download the required dependencies.
For more information on deploying Relay Server host on a:

- DMZ - see "Step 1a. Deploy the Virtual Host to create VM" in the *Virtual Host Installation Guide*.
- Cloud
  - see "Step 1. Deploy NW Server Host" in the *Azure Installation Guide*.
  - see "AWS Deployment" in the *AWS Installation Guide*.

Relay Server Host System Requirements

Agents	RAM	CPU Cores	Disk	Ideal Beacon Interval
20000	32 GB	4 cores	200GB	5 min

To install the Relay Server:

1. Log in to NetWitness Platform.
2. Click  **(Admin) > Services**.
3. Select the **Endpoint Server** service and click  > **View** > **Config** > **Relay Server** tab.
4. In the **Download Installer** section, enter the installer password and click **Download** to download the Relay Server installer file (**RelayInstaller.zip**).

5. Copy the Relay Server installer file (**RelayInstaller.zip**) to the Relay Server host.
6. Unzip the **RelayInstaller.zip** file on the Relay Server host. For example:

   ```
   /home/RelayInstaller.zip
   unzip <installer path>
   ```

7. Set up the execution permission using the following command:

   ```
   chmod +x install.sh
   ```

8. Run the installer script using the following command:

   ```
   ./install.sh
   ```

   The **All necessary RPMs will be installed without further** prompts is displayed.
9. Enter **Y** to continue the installation.

   The password prompt is displayed.
10. Enter the password.

    Note: Make sure you enter the same password you set while downloading the Relay Server installer.

    Note: In case if you are re-installing the Relay Server host. **Do you wish to update the list** prompt is displayed.
    - Enter **Y** to update the Endpoint server IPs.

    Enter the Endpoint Server IPs prompt is displayed.
11. Enter all the Endpoint server IPs you plan to configure with the Relay server with comma separated.

If the Relay Server installation is successful, you can check the status of the services:

- Check if the Relay Server is up and running:

  ```
  systemctl status rsa-nw-relay-server
  ```

- Check if Ngnix is running:

  ```
  systemctl status ngnix
  ```

You can also update Endpoint Server IPs without installing the Relay Server.

To update Endpoint Server IPs without installing the Relay Server:

1. Run the following command:

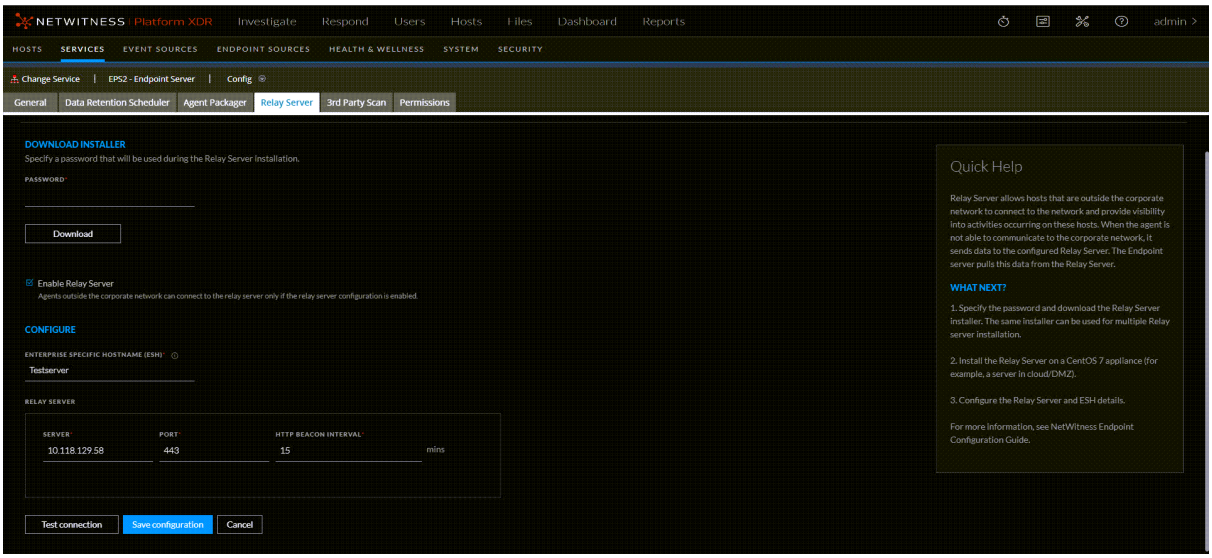
   ```
   bash /var/netwitness/relay-configure-allowed-hosts.sh
   ```

   The list of all the configured Endpoint server IPs is displayed and **Do you wish to update the list** prompt is displayed.
2. Enter **Y** to update the list of Endpoint server IPs.

   Enter the Endpoint Server IPs prompt is displayed.
3. Enter a comma-separated list of all the Endpoint Server IPs to update.

   The list of updated IPs is displayed.

Configuring the Relay Server



Make sure you have installed the Relay Server.

Note: During Relay Server host installation, firewalld is configured to allow incoming connections only on TCP ports 443 and 22.

To configure the Relay Server:

1. Log in to NetWitness Platform.
2. Click **(Admin) > Services**.
3. Select the **Endpoint Server** service and click > **View** > **Config** > **Relay Server** tab.

   The Relay Server tab is displayed.

4. Select the **Enable Relay Server** check box to enable the Relay Server configuration.

   Note: To disable the Relay Server, clear the **Enable Relay Server** check box.

   Caution: Before you disable the Relay Server configuration, if the hosts will be always roaming make sure to migrate these hosts to an alternate Endpoint server configured with a different Relay server. Else these hosts will not be able to connect back to the corporate network. When you disable the configuration, the Relay Server settings are removed from the EDR policy.

5. In the **Configure** section:

a. Enter the ESH.

IMPORTANT: This should a hostname that can only be resolved on the corporate internal DNS and not on public internet DNS (ex: 1.1.1.1 or 8.8.8.8). It is used to determine if the host running the Endpoint agent client is connected to the internal network (physically on premise or via VPN).

b. Specify the Relay **Server**, **Port** and **HTTP Beacon Interval**.

IMPORTANT: The Relay Server needs to be a hostname that can be resolved correctly on both internal DNS (with the internal IP) and public DNS (with the public IP)

6. Click **Test Connection** to check if the Relay Server is reachable.
7. Click **Save Configuration** to save the configuration.

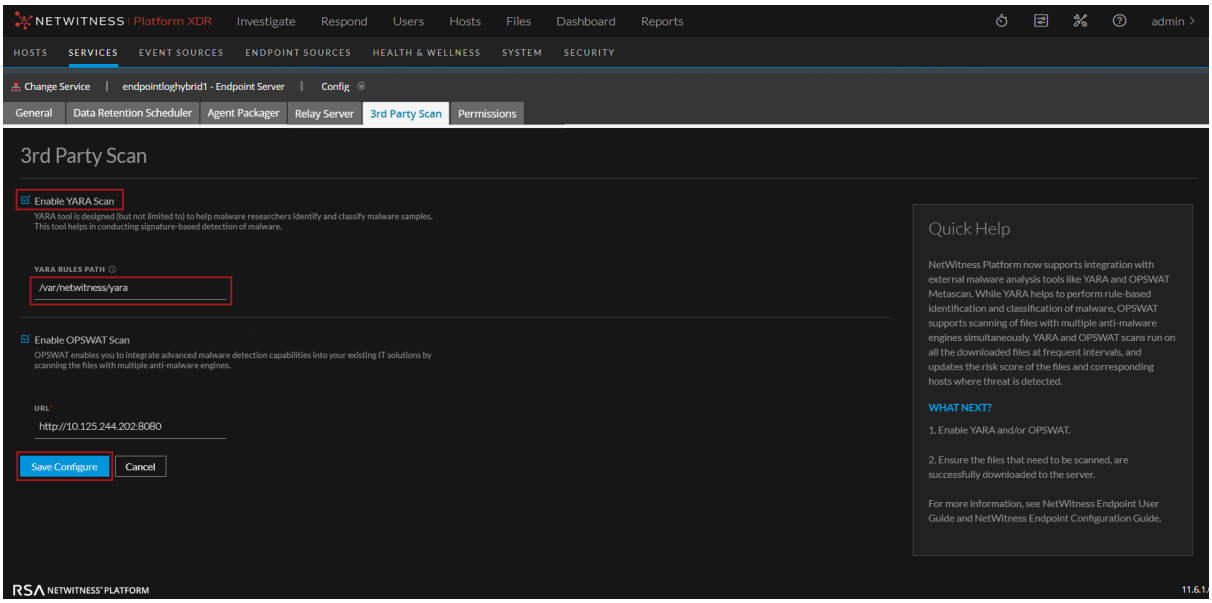
Note: Before you modify the Relay Server configuration, perform any one of the following:
- Make sure that the hosts are inside the corporate network so that the policy with the Relay Server configuration is applied.
- If hosts will always be roaming, then migrate these hosts to an alternate Endpoint server configured with a different Relay Server.

IMPORTANT: You must change the root password after you deploy the Relay Server host.

Configure YARA

YARA helps analysts in identifying and classifying malware in a simple and effective manner. By default YARA is disabled, administrators can configure and enable YARA. You are required to provide YARA rule files and specify the path where these rule files are stored. Ensure that the Endpoint server and YARA rules directory are in the same appliance.

Note: The YARA rules directory should have the permission as 'netwitness'.



Note: For new installations, YARA will be included as part of the orchestration. If you are upgrading to NetWitness Platform 11.6 or later, YARA is included automatically. In case of an upgrade, deploy the following Yara App rules from Live-

- Yara Rule Matched
- Process with Matched Yara Rule

IMPORTANT: Ensure that YARA is configured and YARA RULES PATH is same across all the Endpoint servers.

To change the configuration for YARA:

1. Go to  **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click  and select **View** > **Config**.
4. Click the **3rd Party Scan** tab.

5. Select **Enable YARA Scan.**

6. In **YARA RULES PATH**, specify the directory path where the YARA rule files are stored.

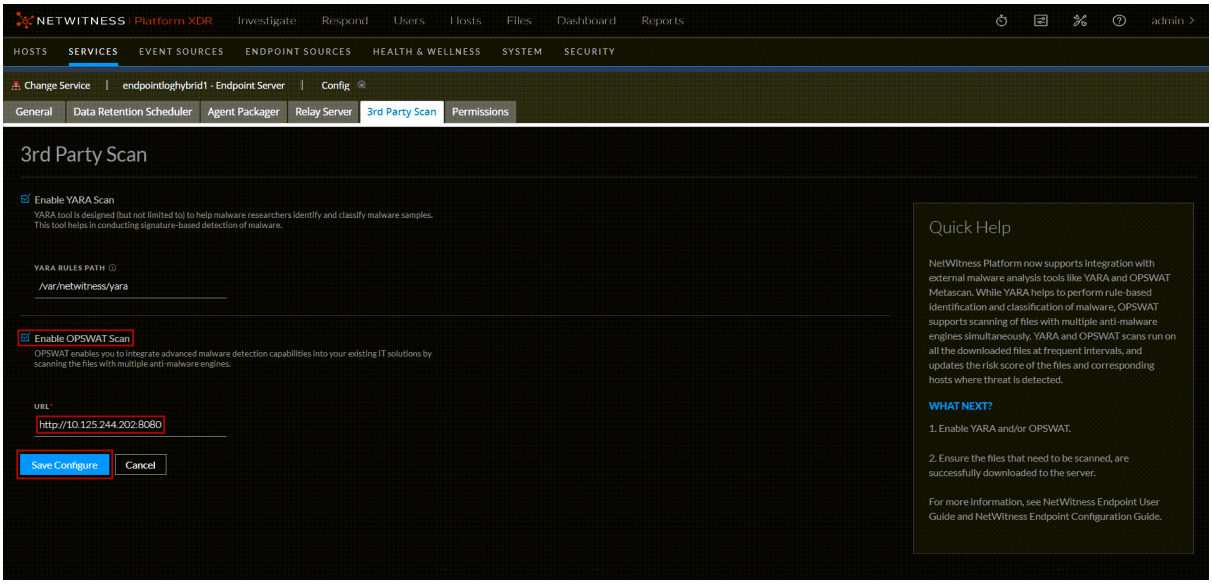
   Note: You can add any number of YARA rule files in this directory. Each rule file can have more than one rule. All downloaded files are scanned by all the YARA rule files.

7. Click **Save Configure**.

Configure OPSWAT

OPSWAT (MetaDefender Core) provides advanced malware detection capabilities by scanning files with multiple anti-malware engines simultaneously. OPSWAT is disabled by default. As an administrator, you can enable and configure OPSWAT on the endpoint servers.

Note: You need to deploy the following OPSWAT app rules from Live services to log decoder for successful configuration of OPSWAT on endpoint servers:



- opswat reported infected
- opswat reported suspicious
- process with opswat reported suspicious
- process with opswat reported infected

IMPORTANT: Ensure that OPSWAT is configured in all endpoint servers and the configuration parameters are consistent across all endpoint servers.

To enable and configure OPSWAT:

1. Go to **(Admin) > Services**.
2. In the Services view, select the Endpoint Server service.
3. Click  and select **View > Config**.
4. Click the **3rd Party Scan** tab.
5. Select **Enable OPSWAT Scan**.
6. Enter the URL.

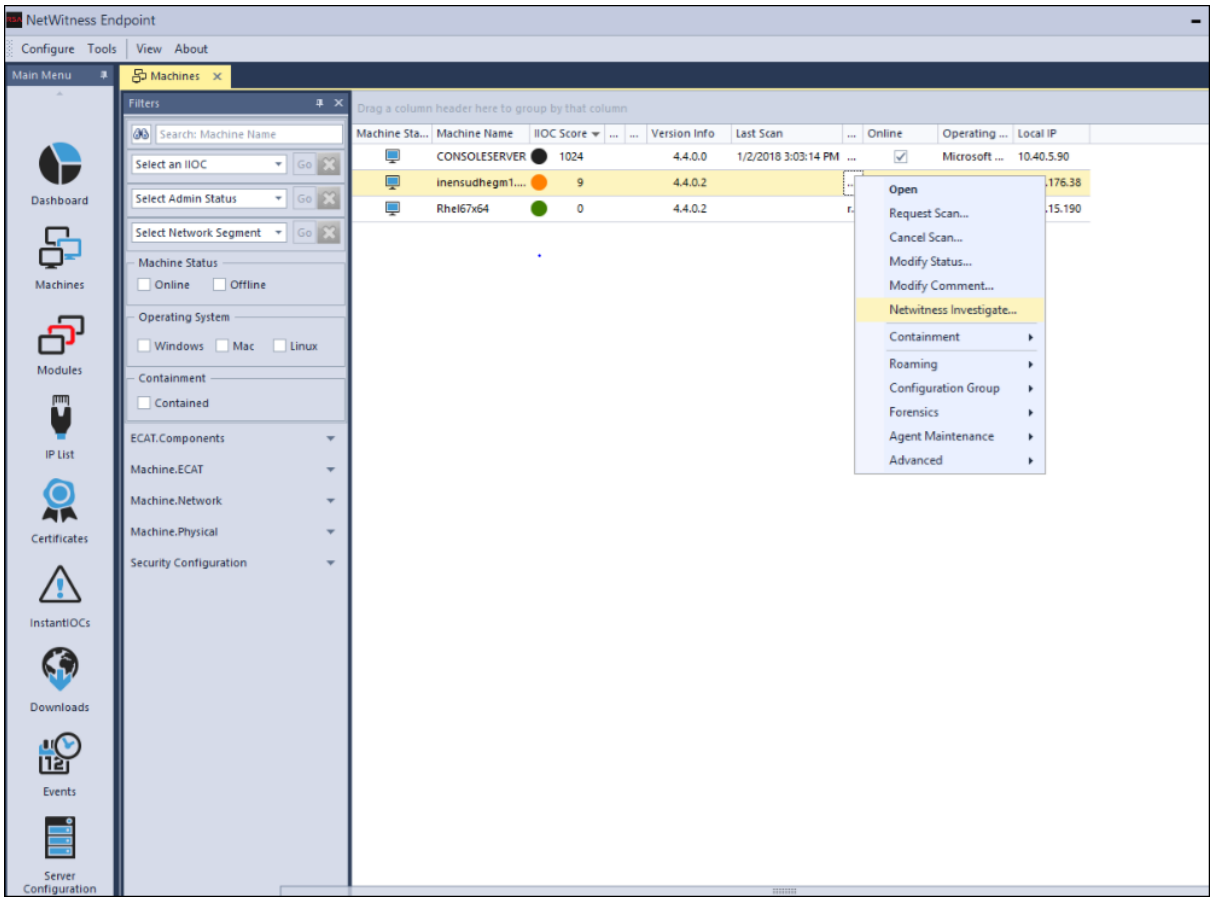
7. Click **Save Configure.**

Integrating NW Endpoint 4.4.0.2 or Later with NW Platform

You can configure the Endpoint Metadata for the NetWitness Endpoint 4.4.0.2 by integrating the Meta Integrator service in the NetWitness Endpoint 4.4.0.2 directly to a Log Decoder. You can view the Endpoint metadata in the **Investigate > Navigate** and **Events** views. This integration includes the following steps:

- Enable Metadata Forwarding
- Enable Machines to Forward Metadata

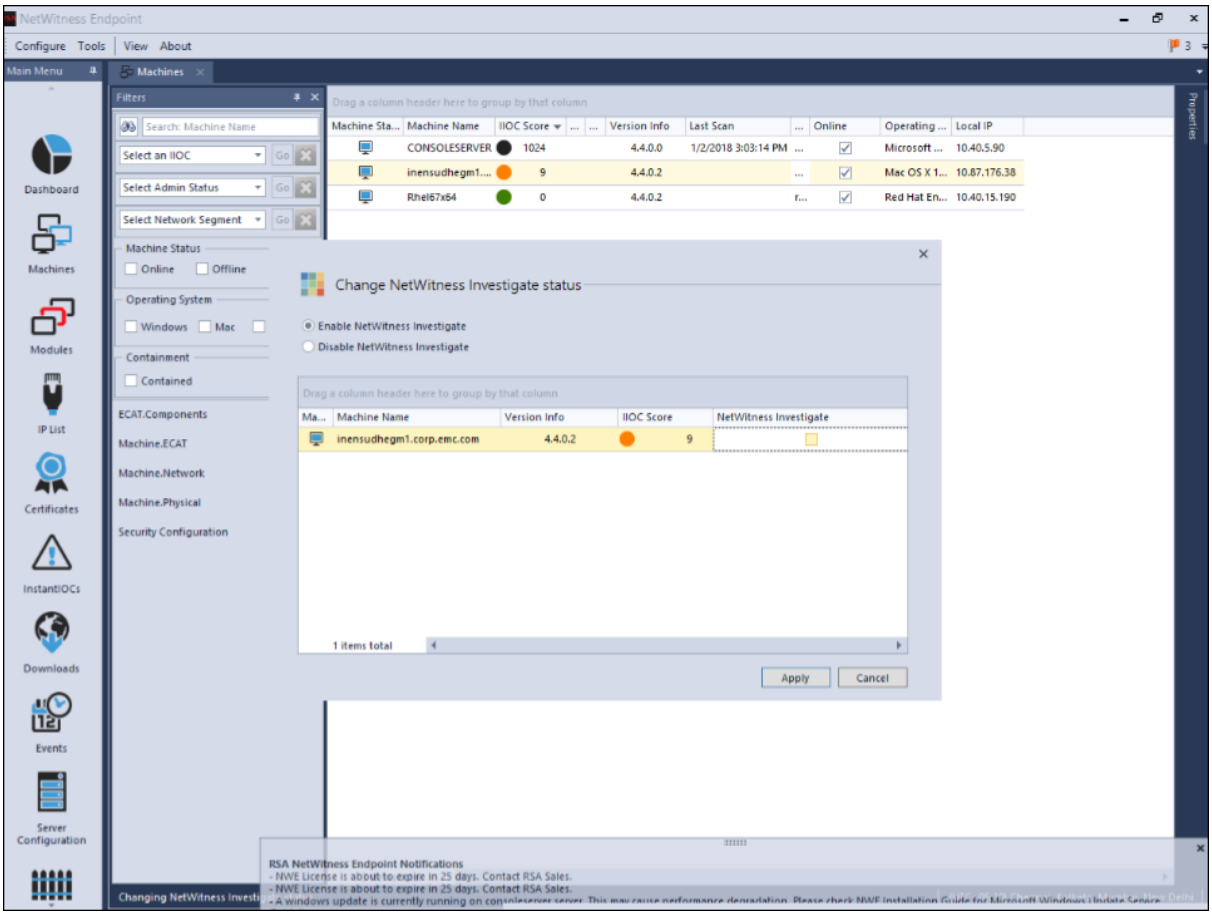
Enable Metadata Forwarding



To enable the Metadata Integrator service for the selected NetWitness Endpoint 4.4.0.2 agents, run the following command:

```
ConsoleServer.exe /nw-investigate enable
```

Enable Machines to Forward Metadata



After you enable the Metadata Forwarding using any one of the above options, perform the following to enable the machines to forward metadata to the Log Decoder.

1. Open the NetWitness Endpoint 4.4.0.2 user interface.
2. Click **Machines** from the left panel. The list of available machines are displayed.

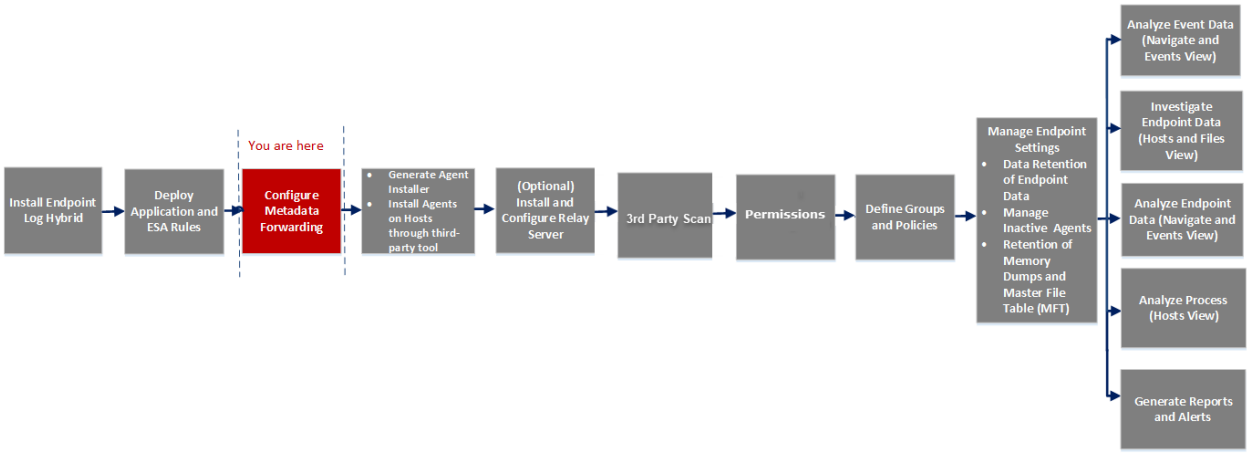
3. Select machines for which you want to forward metadata to the NetWitness Endpoint Server.
4. Right-click and select the **NetWitness Investigate** option.

   The Change NetWitness Investigate Status dialog is displayed.

5. Select the **Enable NetWitness Investigate** option.
6. Click **Apply**.
7. To verify if the **Enable NetWitness Investigate** option is enabled, repeat step 4.

Endpoint References

This section is intended to help you understand the purpose of the Services Config View for the Endpoint Server. For each configuration, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition, it includes workflow and Quick Look sections to highlight important features in the user interface.



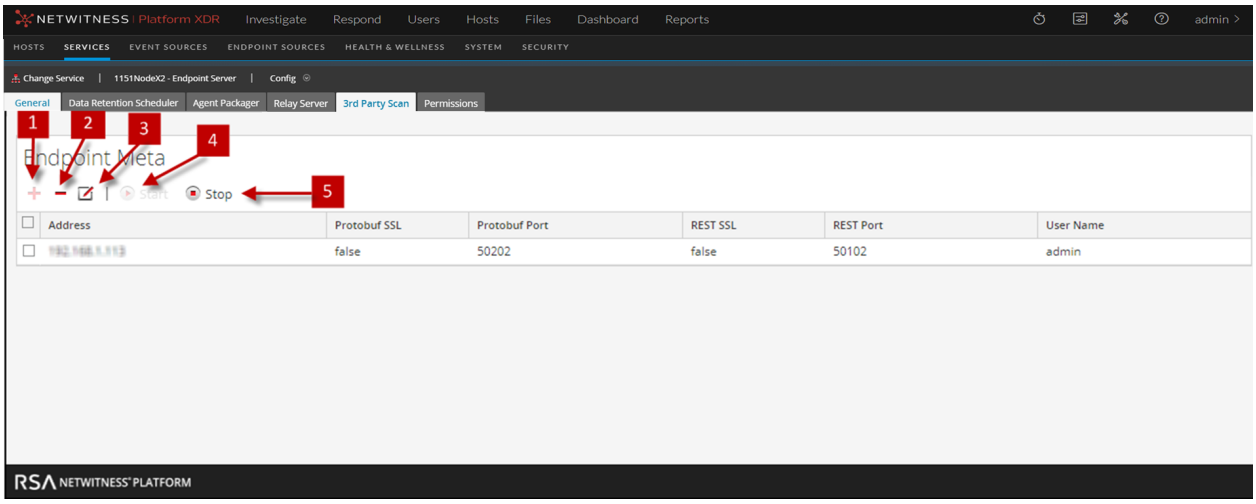
You can view the complete service nodes in tree form in the Services Explore view. For more information, see the "Services Explore View" topic in the *Hosts and Services Getting Started Guide*.

General Tab

In the **General** tab, you can configure the Endpoint metadata forwarding for multiple endpoint servers. To access this view:

1. Go to **(Admin) > Services**.
2. In the Services view, select **Endpoint Server** for which you want to configure the metadata forwarding.
3. Click and select > **View** > **Config**.
4. Click the **General** tab.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Administrator	Configure Endpoint Metadata Forwarding for the NetWitness Endpoint Agents*	Configuring Metadata Forwarding
Administrator	Configure Endpoint Metadata Forwarding for the NetWitness Endpoint 4.4.0.2 or later Agents*	Integrating NW Endpoint 4.4.0.2 or Later with NW Platform

*You can perform this task in the current view

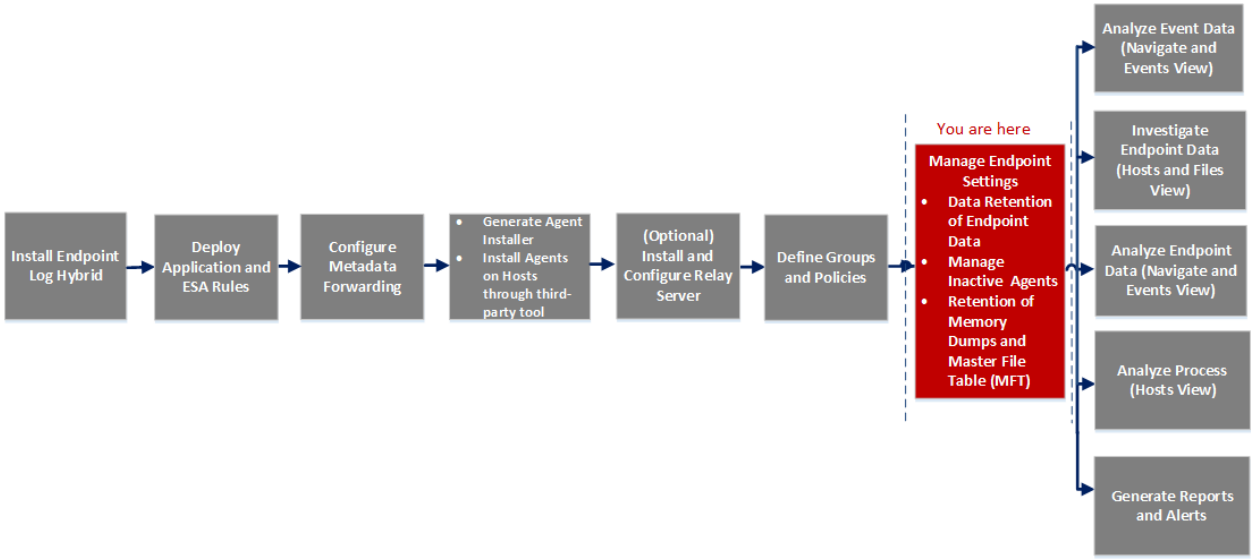
Quick Look

The following figure is an example of the General tab.

1. Click + to view the Available Services dialog.
2. Click − to delete the added service.
3. Click to edit the information for the added service.
4. Click Start to start the Endpoint metadata forwarding.
5. Click Stop to stop the Endpoint metadata forwarding.

The following table describes the fields in the General tab.

Field	Description
Address	Displays the IP address of the Log Decoder.
Protobuf SSL	Indicates if SSL is enabled on Protobuf. By default, this option is disabled.
Protobuf Port	Displays the port used for Protobuf. By default, the port is 50202.
REST SSL	Indicates if SSL is enabled on the REST port in the Log Decoder. By default, this option is disabled.
REST Port	Displays the port used for REST communication. The default value is 50102 (for non-SSL) and value 56102 (for SSL).
User Name	Displays the user name.
Raw Data	Sends a brief summary of the session along with the metadata if enabled. By default, this option is disabled.



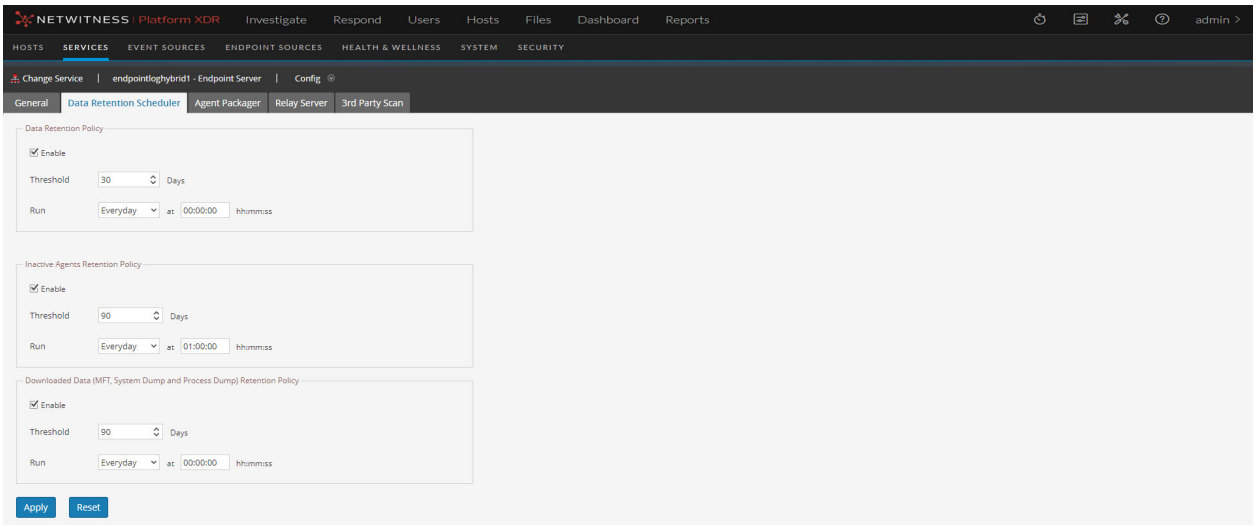
Data Retention Scheduler Tab

In the **Data Retention Scheduler** tab, you can configure data retention, inactive agents, and memory dump and MFT retention policies for multiple endpoint servers. To access this view:

1. Go to  **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click  and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

Repeat the above steps to configure data retention settings for multiple endpoint servers.

Workflow



What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Data Retention Policy*	Configuring Data Retention Policy
Administrator	Configure Inactive Agents Policy*	Managing Inactive Agents
Administrator	Configure Memory Dumps and MFT Policy*	Configure Retention Policy for Memory Dumps and MFT

*You can perform this task in the current view

Quick Look

The following figure is an example of the Data Retention Scheduler tab.

Features

The following table lists the fields for data retention policy.

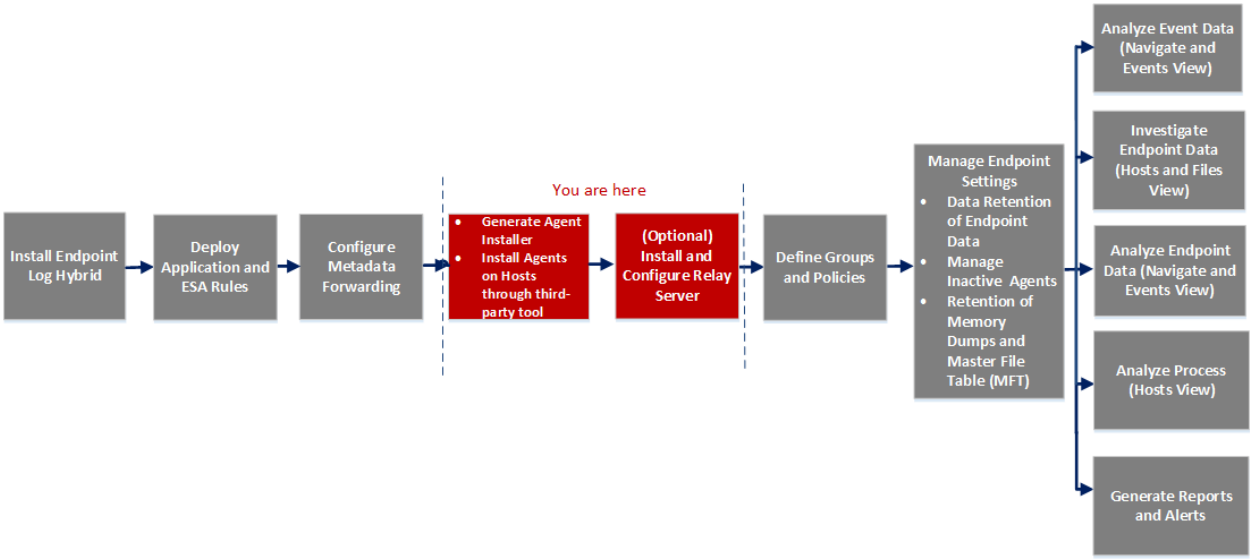
Field	Description
Enable	Enables the configuration for the data retention policy. By default, this option is enabled.
Threshold	Displays the number of days the Endpoint data is retained in the database. By default, the Threshold is set to 30 days. The data older than 30 days is deleted from the database.
Run	Displays the schedule for running the data retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job.
Apply	Overwrites any previous schedule for the data retention policy and applies the new schedule immediately.
Reset	Resets the schedule to the default settings.

The following table lists the fields for inactive agents retention policy.

Fields	Description
Enable	Enables the configuration for the inactive agents policy. By default, this option is enabled.
Threshold	Displays the number of days the inactive agents are retained in the Endpoint Server. By default, the threshold value is 90 days.

Fields	Description
Run	Displays the schedule for running the inactive agents retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job.
Apply	Overwrites any previous schedule for the inactive agents retention policy and applies the new settings immediately.
Reset	Resets the schedule to the default settings.

The following table lists the fields for memory dumps and MFT retention policy.



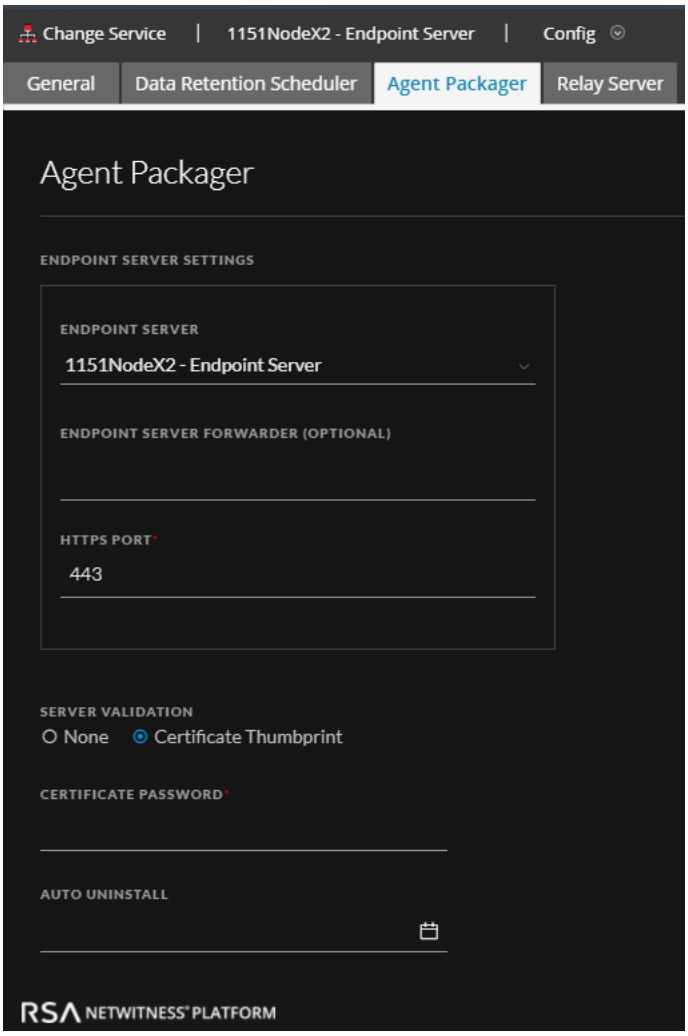
Fields	Description
Enable	Enables the configuration for the memory dumps and MFT policy. By default, this option is enabled.
Threshold	Displays the number of days the memory dumps and MFT are retained in the Endpoint Server. By default, the Threshold is set to 90 days. The data older than 90 days is deleted from the Endpoint Server.
Run	Displays the schedule for running the retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job.
Apply	Overwrites any previous schedule for the retention policy and applies the new schedule immediately.
Reset	Resets the schedule to the default settings.

Agent Packager Tab

In the **Agent Packager** tab, you can generate an agent packager and agent installer. To access this view:

1. Go to **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click and select > **View** > **Config**.
4. Click the **Packager** tab.

Workflow



What do you want to do?

User Role	I want to ...	Show me how

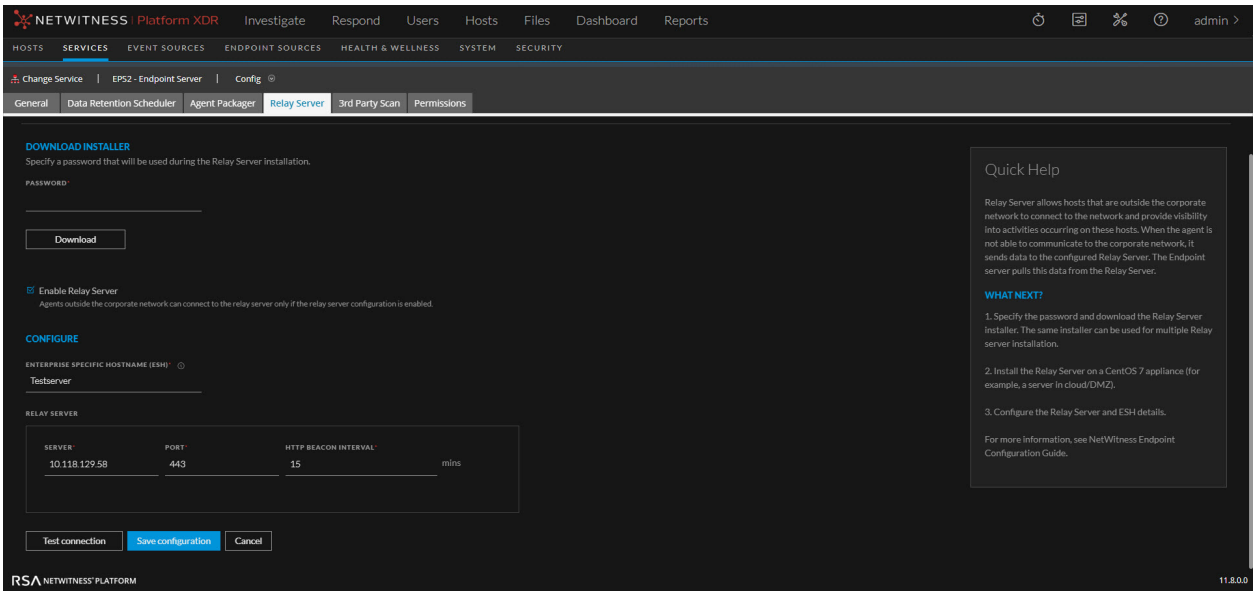
Relay Server Tab

In the **Relay Server** tab, you can download and configure Relay Server . To access this view:

1. Go to **ADMIN** > **Services**.
2. In the Services view, select **Endpoint Server**.
3. Click  and select > **View** > **Config**.
4. Click the **Relay Server** tab.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Administrator	Install Relay Server*	(Optional) Installing and Configuring Relay Server
Administrator	Configure Relay Server*	(Optional) Installing and Configuring Relay Server

* You can perform this task in the current view.

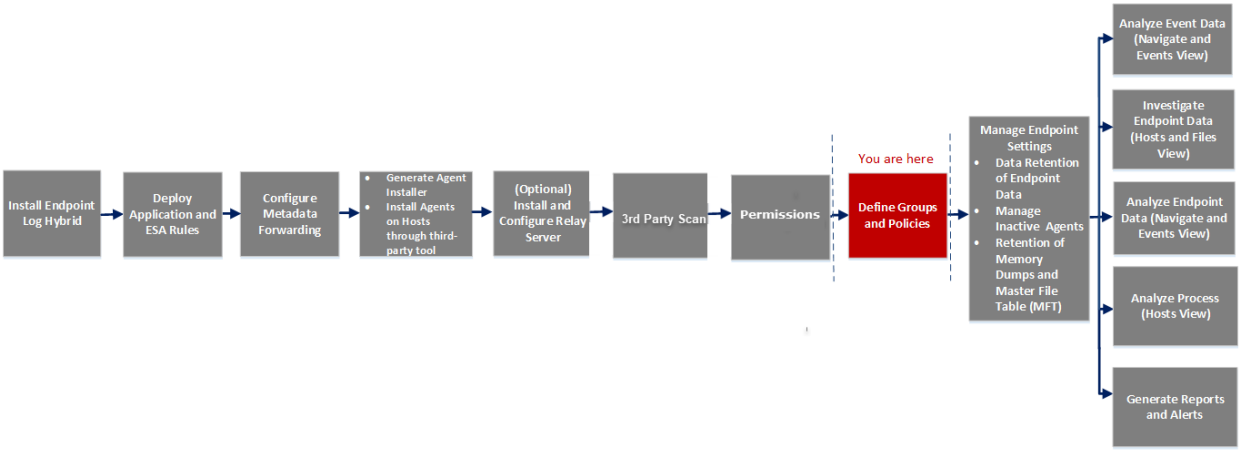
Quick Look

The following figure is an example of the Relay Server tab.

Features

The following table lists the fields for Relay Server tab.

Field	Description
Download Installer	
Password	Enter the relay server installation password. For example, netwitness. Password must be minimum of 3 characters and can contain alphanumeric and special characters. **Note:** You must provide the same password when prompted during Relay Server installation.
Download	Click to download the Relay Server installer.
Enterprise Specific Hostname (ESH)	Enter the hostname which can be resolved only within the corporate network.
Enable Relay Server	Check Enable Relay Server for Agents outside the corporate network to connect to the configured relay server. By default, this option is disabled.
Configure	
Server	Hostname or IP of the Relay Server.
Port	Port number. For example, 443.
HTTP Beacon Interval	Enter the Interval value ranges from 60 – 1440 minutes.
Test Connection	Click test connection to check if the relay server is reachable by the agents.



Field	Description
Save Configuration	Saves the relay server configuration.
Cancel	Cancel the unsaved changes.

Endpoint Sources - Groups

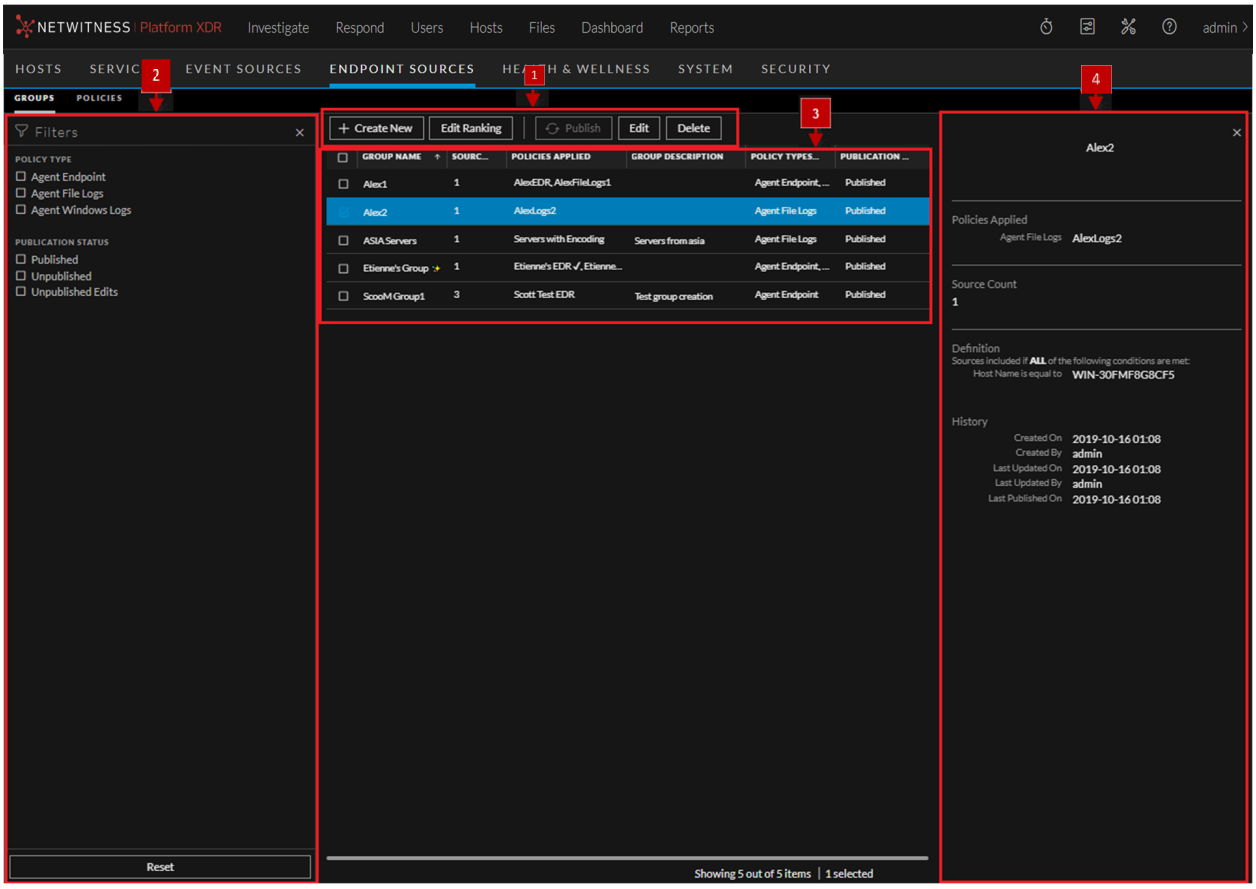
Note: The information in this topic applies to NetWitness Version 11.3 and later.

The **(Admin) > Endpoint Sources** view contains two tabs: **Groups** and **Policies**.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Administrator	create new groups*	Create a Group
Administrator	edit groups*	Edit a Group
Administrator	edit ranking*	Managing Groups
Administrator	delete groups*	Delete a Group
Administrator	view default policies	Default Agent Endpoint (EDR) Policy
Administrator	create an EDR policy	Create an EDR Policy
Administrator	create a Windows Log policy	Create a Windows Log Policy
Administrator	edit policies	Edit a Policy
Administrator	delete policies	Delete a Policy



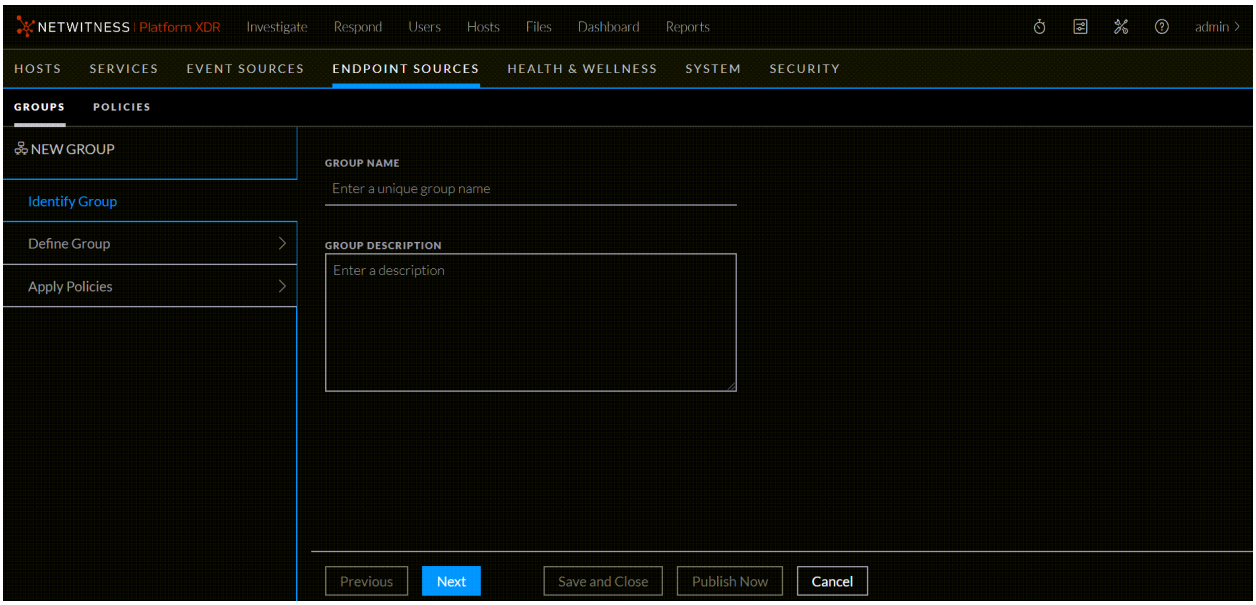
*You can perform this task in the current view.

Related Topics

- Endpoint Sources
- Managing Policies

Quick Look

Below is an example of the Groups tab:

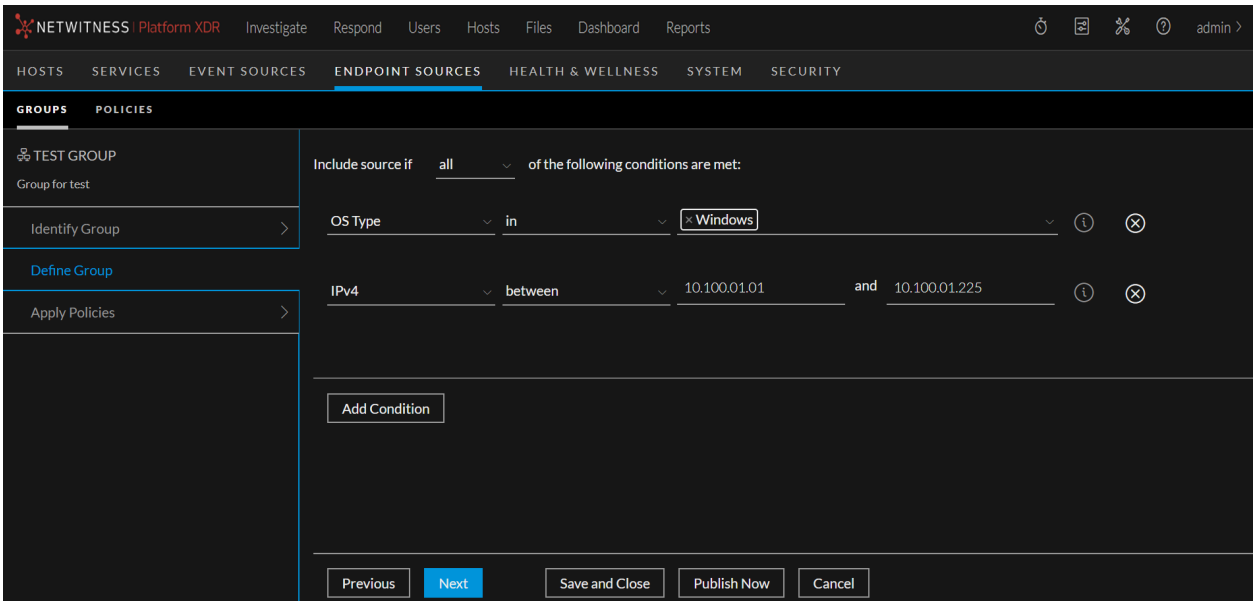


1 **Toolbar**

- **Create New**: Lets you create a new group. For more information, see Create a Group
- **Edit Ranking**: Lets you edit the ranking of groups. For more information, see Managing Groups
- **Publish**: Publishes the selected group or groups.
- **Edit**: Lets you edit the details of an existing group. For more information, see Edit a Group.
- **Delete**: Deletes the selected group or groups permanently. For more information, see Delete a Group.

2	**Filter Pane** • **Filters**: You can filter groups based on Policy Type and Publication Status. To hide, click the  icon at the top-right of the panel. To display if hidden, click the  icon in the toolbar. • **Reset**: Removes the currently applied filter criteria. For more information, see Filter Endpoint Groups.
3	**Groups List Pane** • **Group name**: Name of the group. • **Source Count**: Number of hosts that are currently members of the group. • **Policies applied**: Lists the policies applied to this group. • **Group description**: Description of the group. • **Policy Types Applied:** Type of policies applied to the group: Agent Endpoint, Agent File Logs, Agent Windows Logs, or any combination of these. • **Publication Status**: Status of the group - Published or Unpublished. You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.
4	**Group Details Pane** Displays the properties of the selected group. **Note:** Click the row to view the Properties panel for a group.

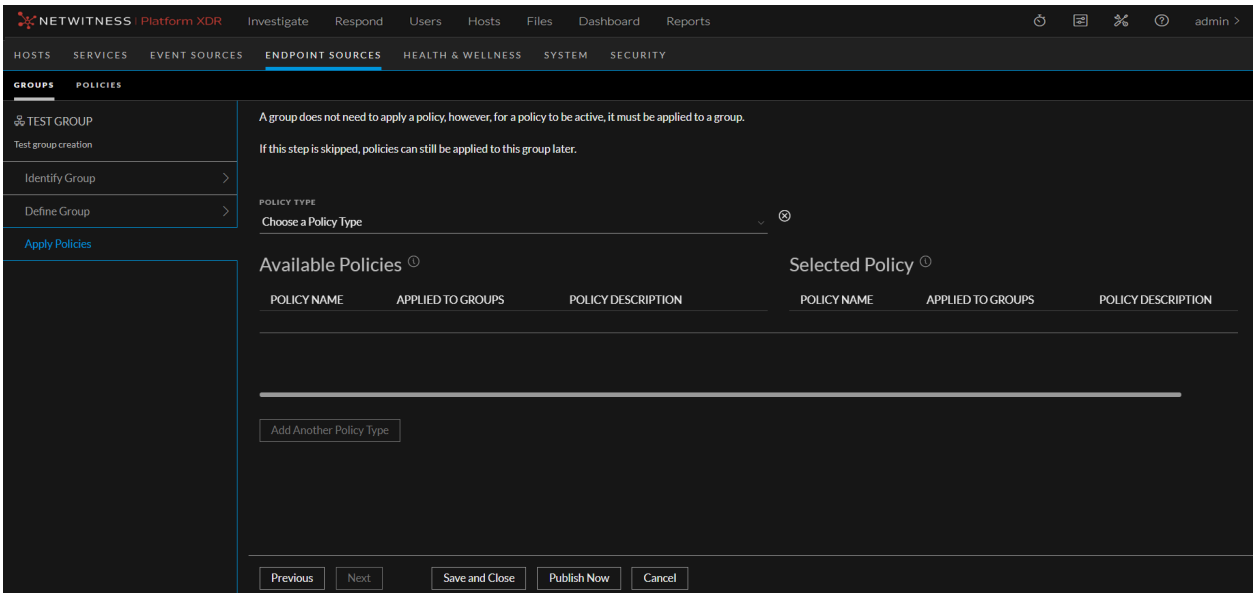
Create Group



Below is an example of the Create Group dialog. The table describes the information and options in the Create Group dialog.

Field	Description
Group Name	Name of the group. The name should be unique.
Group Description	Description of the group and should not exceed 8000 characters.

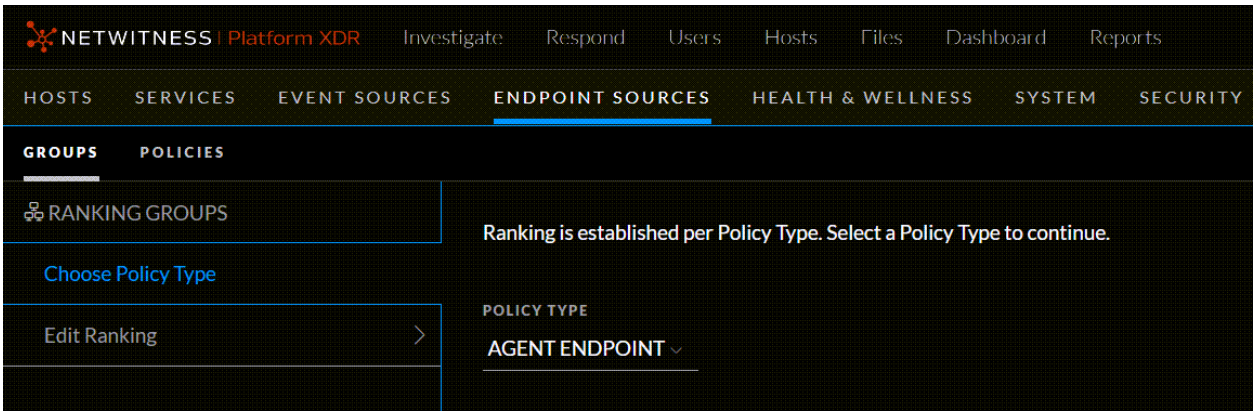
Define Group



Below is an example of Define Group panel. The table describes the information and options in the Define Group panel:

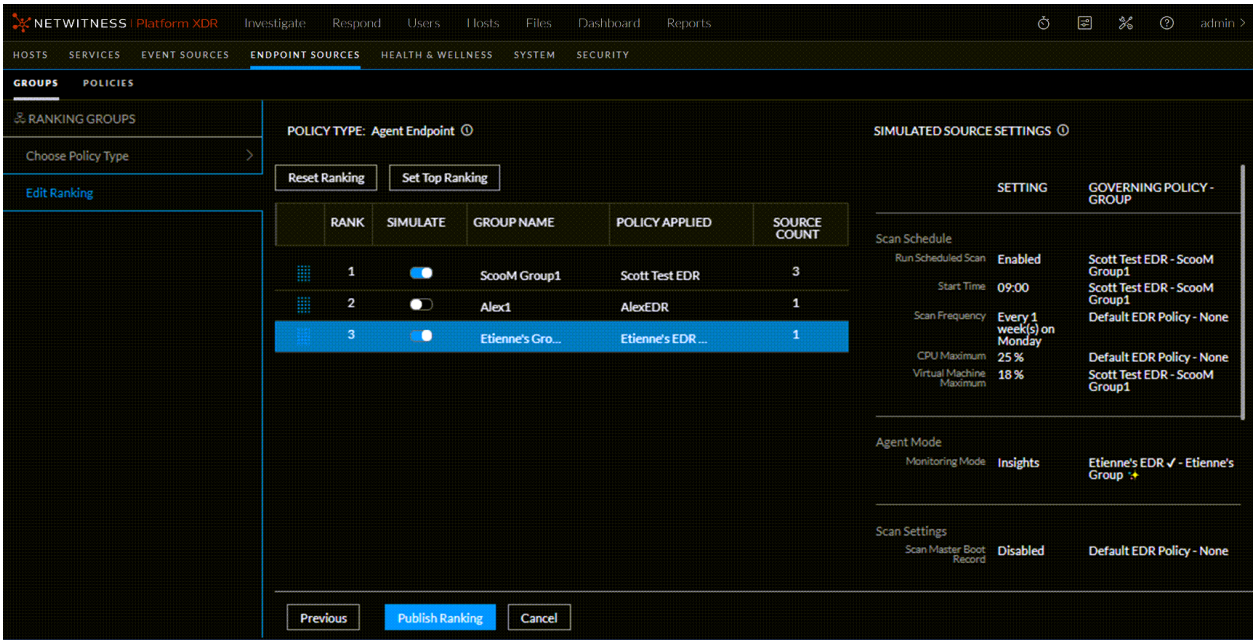
Field	Description
Include source if ...of the conditions are met	Defines the conditions for an agent to be included in the group. Available options are all or any.
Parameter	The parameter can be OS Type, OS Description, Host Name, IPv4, IPv6 or Machine OU. • OS Type - Type of operating system. Available options are: Windows, Linux, and MacOS. • OS Description - Description of the operating system. The description should not exceed 256 characters. Available operators are: is equal to, contains, start with, and ends with. For example, Microsoft Windows 10 Enterprise. • Host name - Name of the host. The host name can contain only alphanumeric characters. Available operators are: is equal to, contains, start with, ends with, and in. For example, DESKTOP-QQPDNG3. • IPv4 and IPv6 - IP address. Available operators are: between, in, not in, and between. For example, 10.40.15.220. • Machine OU - Name of the Machine OU. Available operators are: is equal to, contains. For example, OU=Win10, OU=Contractors, DC=corp, DC=com **Note:** If you do not want to include certain IP addresses, use the **Not in** operator, and enter the IP address separated by a space or a comma.
Operator	The choice of values is dependent upon the parameter you chose. For example, if your parameter is OS Type, the only operator available is **in**.
Value or values to match	The value or values to match. For the OS Type parameter, you can choose one or more values from the drop-down list. For all other parameters, you can enter free-form text. **Note:** Although you can enter any text for values, the system validates your entries when you attempt to proceed to another screen, and will not allow you to proceed until values are valid.
Add condition	Lets you add another condition.

Apply Policies



Below is an example of Apply Policies panel. The table describes the information and options in the Apply Policies panel:

Field	Description
Source Type	Defines the source type for the group. Available options are Agent Endpoint and Agent Windows Logs.
Available Policies	List the available policies associated with the source type.
Selected Policies	List the policies selected.
Add Another Source Type	Lets you add another source type.
Save and Close	Saves the settings and closes the Create Group dialog.
Publish Now	Publishes the created group.



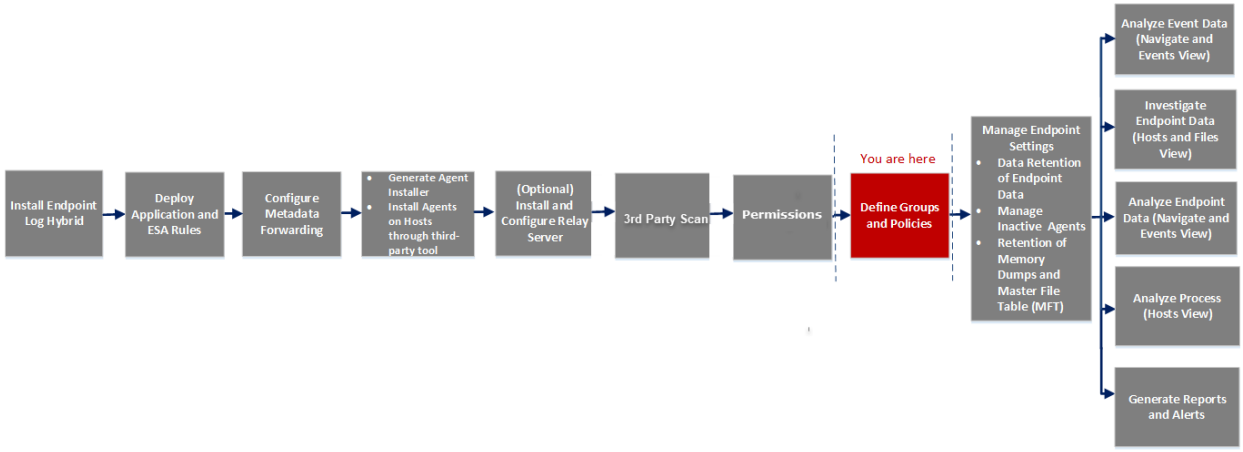
Ranking Groups

Below is an example of the Ranking Groups dialog. The table describes the information and options in the Ranking Groups dialog.

Field	Description
Source Type	Establishes ranking for the source type. Available options are Agent Endpoint and Agent Windows Logs.

Below is an example of the Edit Ranking panel.

From this panel, you can do the following:



- Drag the group up or down to change the priority. Priority decreases from top to bottom.
- Turn the Simulate slider on or off, to simulate your policy settings and how they affect the endpoints within their groups. For more details, see Simulation Examples.
- Use the available buttons to perform actions:
  - **Reset Ranking**: Resets the ranking to the original order.
  - **Set Top Ranking**: Moves the selected group to the top.
  - **Previous**: Navigates to the Choose Source Type panel.
  - **Publish Ranking**: Lets you edit the details of an existing group. For more information, see Edit a Group.
  - **Cancel**: Discards the changes and returns to the Groups tab.

Endpoint Sources - Policies

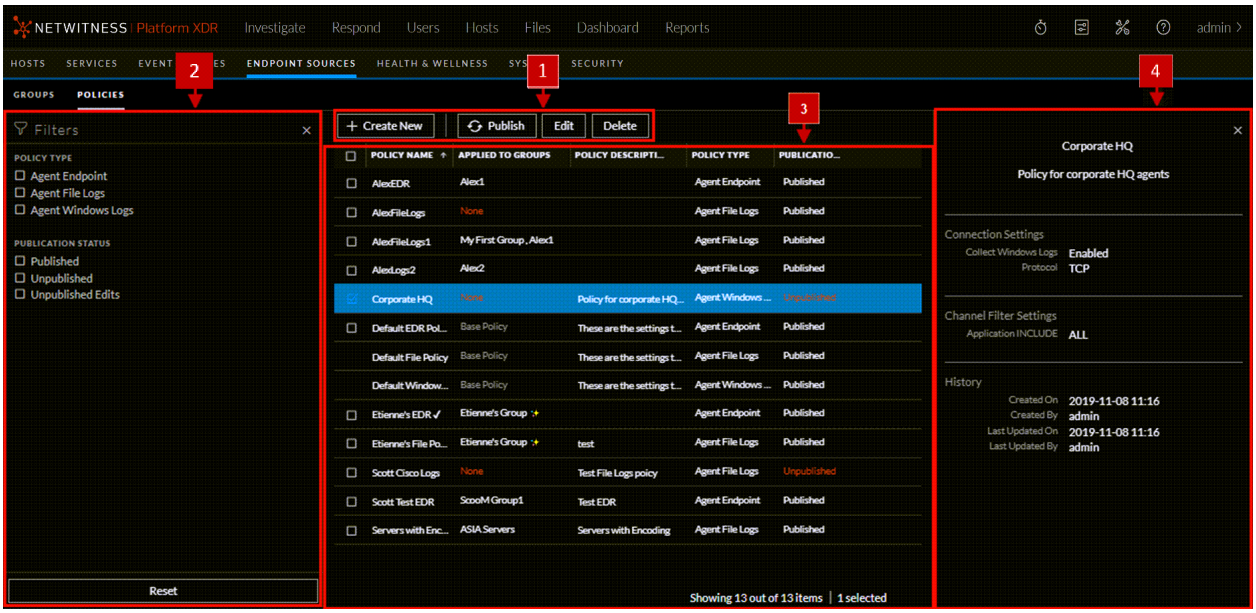
Note: The information in this topic applies to NetWitness Version 11.3 and later.

The **(Admin) > Endpoint Sources** view contains two tabs: **Groups** and **Policies**.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Administrator	create new groups	Create a Group
Administrator	edit groups	Edit a Group
Administrator	edit ranking	Managing Groups
Administrator	delete groups	Delete a Group
Administrator	view default policies*	Default Agent Endpoint (EDR) Policy
Administrator	create an EDR policy*	Create an EDR Policy
Administrator	create a Windows Log policy*	Create a Windows Log Policy
Administrator	create a File Log policy*	Create a File Log Policy
Administrator	edit policies*	Edit a Policy
Administrator	delete policies*	Delete a Policy



*You can perform this task in the current view

Related Topics

- Endpoint Sources
- Managing Groups

Quick Look

Below is an example of the Policies tab:

1 **Toolbar**

- **Create New**: Lets you create a new policy. For more information, see Managing Policies.
- **Publish**: Publishes the selected policy.
- **Edit**: Lets you edit the details of an existing policy. For more information, see Edit a Policy.
- **Delete**: Deletes the selected policies permanently. For more information, see Delete a Policy.

2 **Filter Panel**

- **Filters**: You can filter policies based on Policy Type and Publication Status.

  To hide, click the icon at the top-right of the panel. To display if hidden, click the icon in the toolbar.

- **Reset**: Removes the currently applied filter criteria.

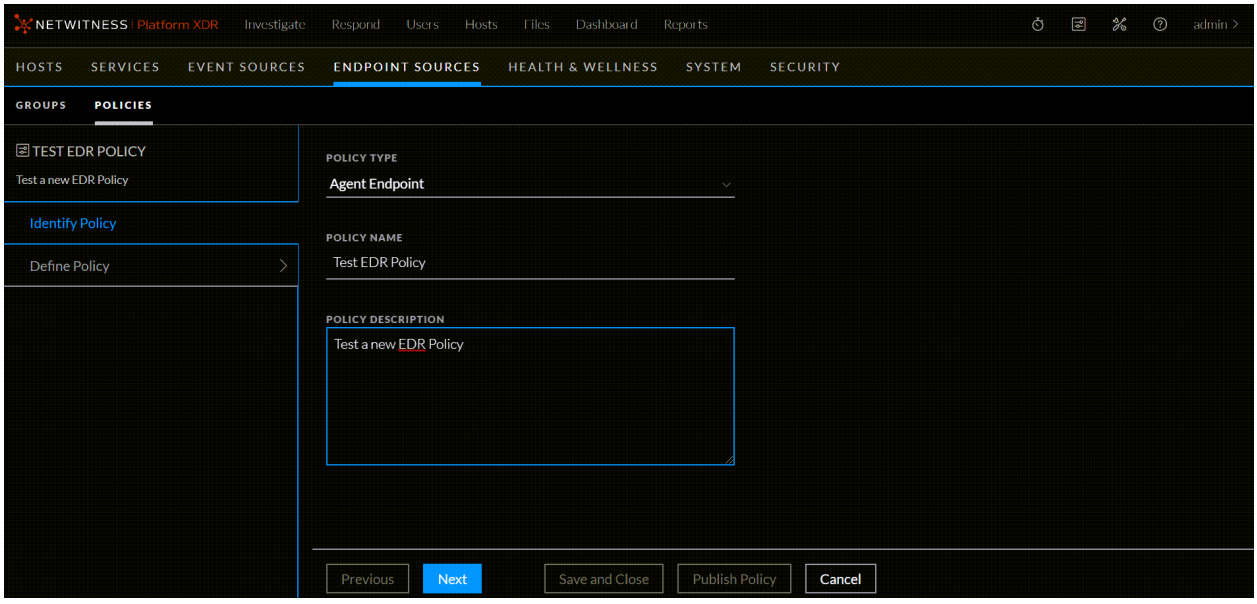
For more information, see Filter Policies.

3 **Policies List Panel**

Policy View. Displays the policy details:

- **Policy name**: Name of the policy.
- **Applied to groups**: Lists the group to which this policy is applied.
- **Policy description**: Displays the first portion of the description.
- **Policy type**: Displays the policy type: Agent Endpoint, Agent File Logs, or Agent Windows Logs.
- **Publication Status**: Status of the policy: Published or Unpublished.

You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.



4 **Policy Details Panel**

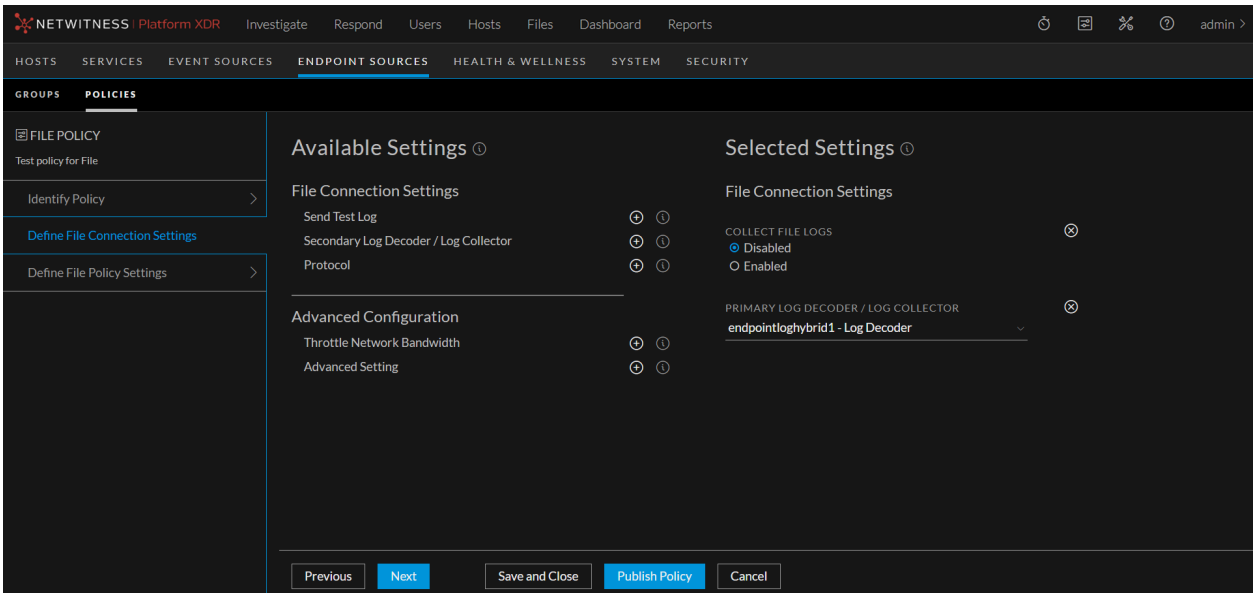
Displays the properties of the selected policy.

Note: To view the Properties panel for a policy, click the Policy Name.

Create Policy

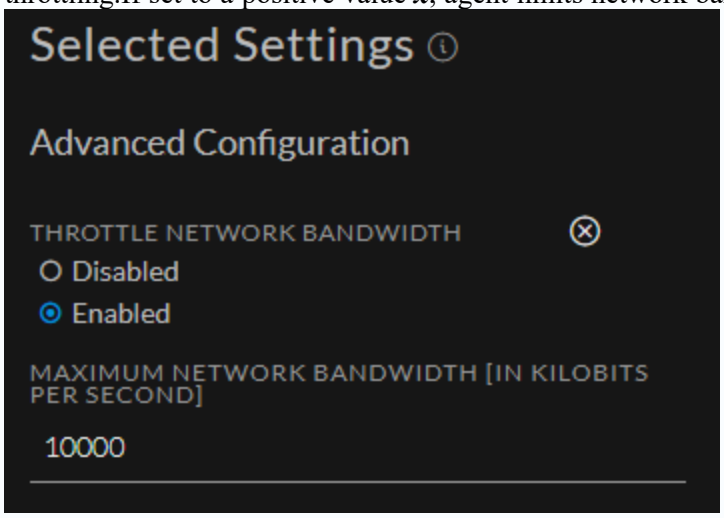
Below is an example of the Create Policy dialog. The table describes the information and options in the Create Policy dialog.

Field	Description
Policy Type	Displays the type for the policy. Available options are Agent Endpoint, Agent File Logs, and Agent Windows Logs.



Field	Description
Policy Name	Name of the policy. The name should be unique.
Policy Description	Description of the policy. Description should not exceed 8000 characters.

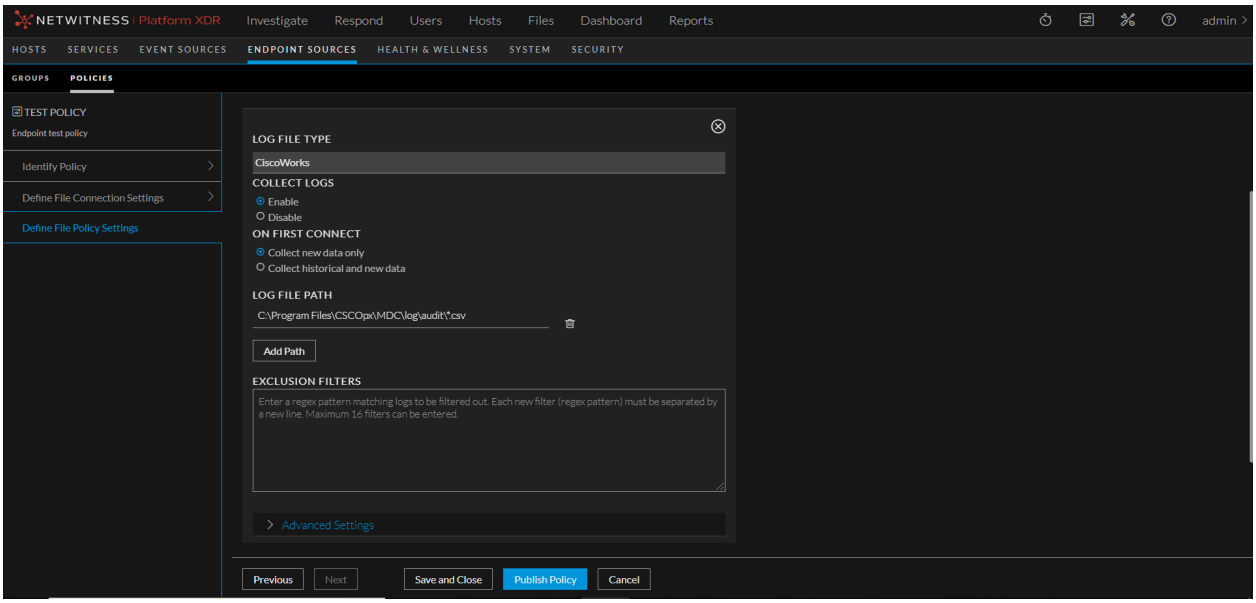
Panels for Log File Policy



There are two panels for defining the parameters for an Agent Log File Policy: **Define Connection Settings** and **Define File Policy Settings**.

Define Connection Settings

Below is an example of Define Connection Settings panel. The table describes the information and available options.



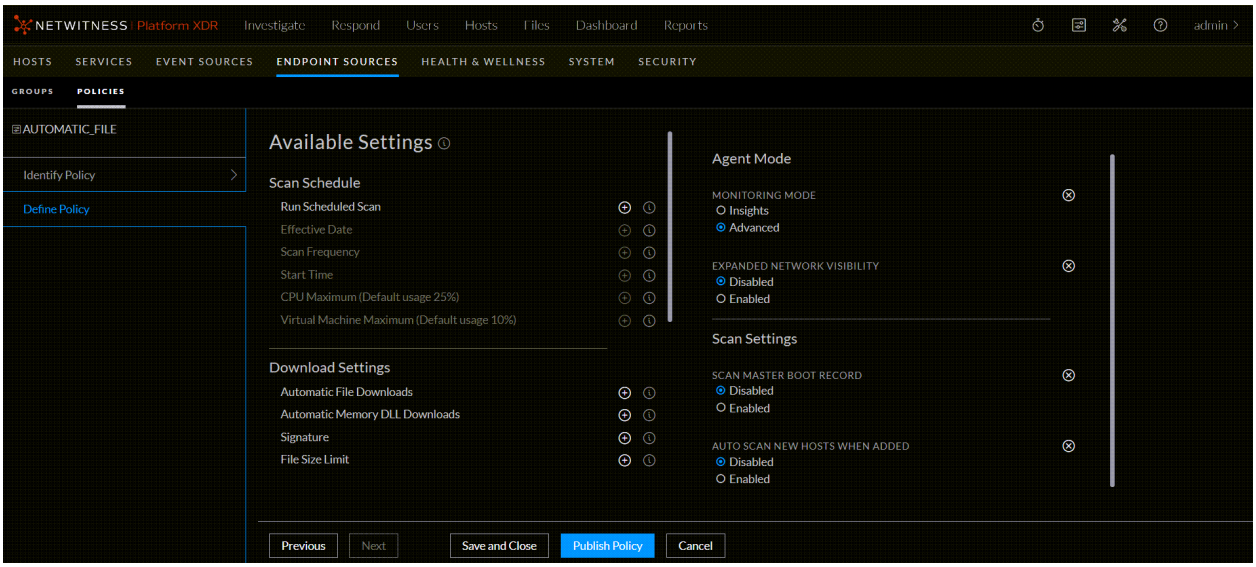
Field	Description
Collect File Logs	If enabled, the log file collection capability of the agent is activated. Logs are collected and forwarded to the NetWitness as they are generated. If disabled, no defined event source logs are collected. **Note:** This option must be enabled for any file event sources to be collected.
Send Test Log	If enabled, a sample log is sent to the configured server when the policy is loaded to test connectivity. This allows to test the configuration before standard logs are available. By default, this option is disabled.

Field	Description
Primary Log Decoder / Log Collector	The primary Log Decoder or Log Collector to which the collected file logs will be forwarded.
Secondary Log Decoder / Log Collector	If the primary Log Decoder or Log Collector is not reachable, collected file logs are forwarded to the secondary Log Decoder or Log Collector. **Note:** The NetWitness cannot detect failures when UDP protocol is used.
Protocol	Select the transport protocol that is used to forward the collected file logs to the NetWitness servers. The following options are available: • SSL: Recommended, but also the most resource-intensive option. • TCP: Sends the logs in clear text over a reliable TCP connection. May be acceptable within a corporate network. • UDP: Sends the log in clear text over a non-guaranteed UDP connection. This is the least resource intensive option. **Note:** Resource intensity is dependent upon the Log Decoder, since there is only a single connection per agent.
Advanced Configuration	
Throttle Network Bandwidth	Use this setting to limit network bandwidth that the Agent uses to connect to NetWitness. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.If not set, Agent does not do any network throttling.If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps. 

Field	Description
Advanced Setting	**Caution:** It is strongly recommended not to use this setting unless advised to do so by NetWitness.

Define File Policy Settings

Field	Description
Log File Type	From the drop-down menu, select the type of event source to be monitored. The list of available event source is based on all the event source types defined on your NetWitness. You can add event source types using the Live Services module. For details, see "Find and Deploy Live Resources" in the *Live Services Management Guide*.
Collect Logs	If enabled, log files for this file type instance are collected and forwarded to the NetWitness. File collection must be enabled on each source applying this policy for these specific logs to be collected.
On First Connect	Determines whether the NetWitness Agent collects all logs or only newly created logs located in the specified paths upon initial collection. In both cases, new logs are collected. **Note:** Historical logs cannot be collected after an agent has begun collecting logs.



Field	Description
Log File Path	One or more paths to be used by the agent to locate the log files. Represents the location of the log files to be read. **Note:** The Path value cannot end at a directory—the final portion of the path must represent a file name or set of files (using wildcard characters). You can use wildcards for both files and directories. Each source is limited to entry of 16 paths. This setting must include a path and a file spec. For example: `C:\Program Files\apache-tomcat-*\logs\*.log`. In this case, the file spec is all files with a ".log" extension in the specified path. If you cannot use wildcards to specify multiple files, you can add additional paths to accommodate the differences in path locations on a specific endpoint agent. This might be due to installation locations or version information. Only the paths with valid locations and files on the specific endpoint agent are used, and the others are ignored. For many event source types, there is a default path. If so, you only need to enter a path if the log files are not stored in the standard directory for that event source type. **Note:** This can be a standard Windows pathname (such as `C:\Program Files\Apache\error_logs\logfile.log`) or a UNC (Universal Naming Convention) pathname (`\\host-name\share-name\file-path`). For more details about UNC paths, see Endpoint Sources - Policies below.
Exclusion Filters	An optional list of regex patterns which can be used to filter out any logs that match the patterns. Each separate filter should be entered on a new line. Each source is limited to 16 exclusion filters. **Note:** Each filter needs to be entered as a valid regex string, or the system does not allow you to save it.
Advanced Settings	

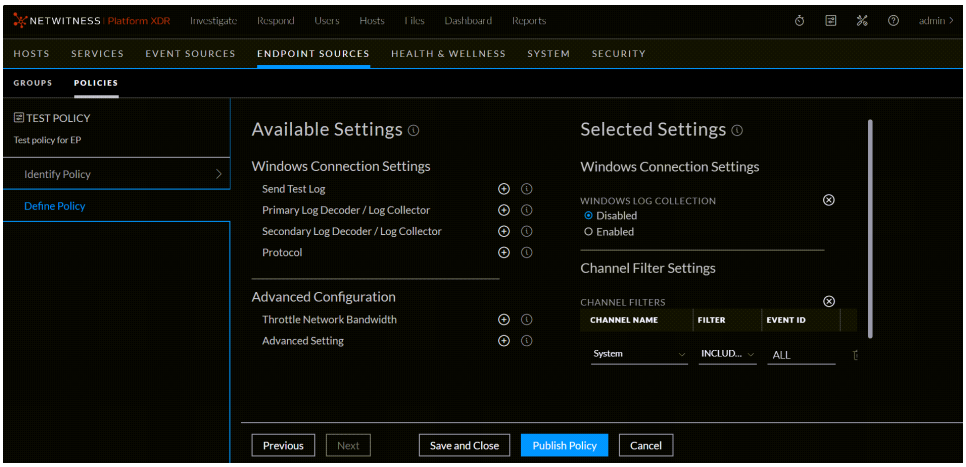
Field	Description
Source Alias	Optionally, enter a hostname, IPv4 or IPv6 address to identify individual sources. This is recommended when there are two or more sources of the same type on the same server: For example, a server that runs two instances of Apache web server. **Note:** This value only rarely needs to be entered. One example is if you have more than one Web Server, and they are running different Apache servers. Note the following: • If you enter a value for this parameter, the event source is applicable to a single Endpoint server. • This optional address or hostname is included in the meta for any logs originating from this source. This can be used by analysts to assist in identifying the source. • Set a value for this parameter if two sources of the same event source type are configured in the same policy. • This setting is not commonly needed: it is only useful if the policy is only applied to a single endpoint.
File Encoding	Specifies the type of character encoding of the log files. If **Local Encoding** is selected, the NetWitness Agent uses the default encoding of the Windows machine upon which it is running. This setting must match the encoding of the log files, or they will not be processed correctly. **Note:** UTF-8/ASCII is recommended (and the default). UTF-8 is a super-set of ASCII Note that all logs are re-encoded to UTF-8 before being sent to the NetWitness.

For a list of the currently supported types, see Currently Supported File Log Event Source Types.

Define Policy Panel for Agent Endpoint Policy

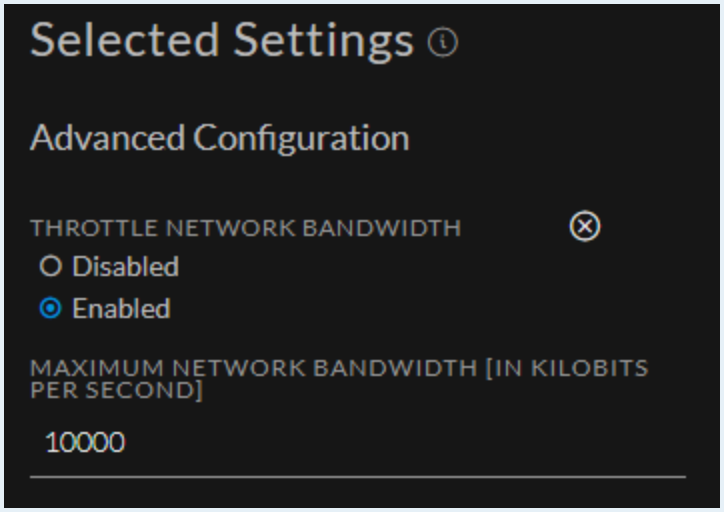
Below is an example of Define policy panel. The table describes the information and options for Agent Endpoint policy:

Settings	Description
	Scan Schedule
Run Scheduled Scan	Run a scheduled scan if you want to receive regular snapshots from a host. Scan snapshots provide detailed information about processes and files loaded on the memory. By default, this option is disabled. You can also run a manual scan from the **Hosts** view. **Note:** The following scan schedule options are available only when the scan schedule is enabled. The values entered are specific to the agent time zone.
Effective Date	Date when the policy takes effect. If you do not want this policy to take effect as soon as it is applied to a group and published, set an effective date that is in the future. By default, this is set to the current date.
Scan Frequency	Determines how often the scheduled scan runs on a host. By default, this is set to every week. Every network is different and the frequency should balance the needs of the analysts for current data, availability to review the data, and how systems deal with the load of the generated data. Select Days or Weeks: • Days: Select the number of days of the scan frequency. You can set a schedule to scan every n days, where n is 1, 2, 3, 4, 5, 6, 10, 15, or 20. For example, to scan every third day, select 3. • Weeks: Select after how many weeks the policy scan should be initiated and on which day of the week the policy scan should initiate. For example, to scan every other Wednesday, choose 2 and W.
Start Time	Time when the scheduled scan starts to run on a host. By default, this is set to 9:00. This is the local host time, meaning that scans across a global network will not run all at once. Note that the time is in 24 hour format. To set a time of 7:30 PM, select 19:30.



Settings	Description
CPU Maximum	Amount of CPU the agent can use to run scheduled scans on physical hosts. By default, the value is set at 25%. Increasing the CPU maximum increases the speed of scan snapshot retrieval. Drag the slider to specify the maximum CPU usage by the created policy. Minimum value is 5%. Use the slider to select the maximum CPU processing power to use for the scan. Note that the higher the percentage, the less CPU is available for other tasks on the host.
Virtual Machine Maximum	Amount of CPU the agent can use to run scheduled scans on virtual machines. By default, the value is set at 10%. Increasing the virtual machine maximum value increases the speed of scan snapshot retrieval. Drag the slider to specify the maximum Virtual Machine usage by the policy. Minimum value is 5%. Use the slider to select the maximum CPU processing power to use for the scan. Keep in mind that the higher the percentage, the less CPU is available for other tasks running on the virtual machine.
Agent Mode	
Monitoring mode	Allows you to specify whether an agent should operate in Insights (free) or Advanced mode (license). By default, it is set to Advanced.
(Version 11.5 and Later) Expanded Network Visibility	Enables network tracking and monitoring on Windows hosts in Insights mode. **Note:** For network tracking in Insights mode, verify that the Windows Management Instrumentation (WMI) service should be enabled. It also optimizes the frequency of agents sending network events for network packet correlation for both Insights and Advanced modes. By default, this option is disabled.
Scan Settings	
Scan Master Boot Record	Includes Master Boot Record (MBR) details in scheduled scans. By default, this option is disabled. This can help to identify when an operating system boot sequence is compromised. However, not all modifications to the MBR are malicious, as they could be made to provide encryption or enforce licensing of certain legitimate software.
Auto Scan New Systems When Added	Automatically scans when a new host is added. By default, this option is disabled. If this option is disabled, no snapshot data is displayed in the **Hosts** view until a manual or scheduled scan is run on these hosts. Existing hosts will not be affected. **Note:** Enabling this option on a new deployment when this policy is applied to a large number of hosts may result in a large number of simultaneous scans that cause performance degradation.
Download Settings	
Automatic File Download	Automatically download the files to the NetWitness Endpoint Server based on the file size and signature. If a file is present on multiple hosts or multiple Endpoint Servers, only one instance of the file is downloaded. By default this option is enabled.

Settings	Description
Automatic Memory DLL Downloads	From version 11.6.1 and higher, all memory DLLs that are detected during a scan, will be automatically downloaded regardless of the file size. This option is enabled by default.
Signature	Limits the download of files based on the signature. The options are : • Exclude All Signed - Downloads all the unsigned files to the NetWitness Endpoint Server and exclude all the signed files. • Exclude only Microsoft and Apple signed - Downloads all the unsigned files and exclude the files signed by Microsoft and Apple. • Include All- Downloads all the signed and unsigned files. **Note:** . In case of Linux, **Exclude all signed** and Exclude **Microsoft and Apple** signed options will download the files that are not part of any installed RPMs or files which are part of RPM but the hashes does not match with RPM.
File Size Limit	Limits the download of files based on the file size. The File size should be between 1 KB and 10 MB. By default, file size lesser than or equal to 1 MB are downloaded automatically.
Response Action Settings	
Blocking	Allows an analyst to prevent the execution of a malicious file on any host running an Advanced mode agent. By default, this option is disabled. File blocking will not be enforced if it is disabled by policy, which might be desirable to ensure that there are no performance side effects on systems where CPU or IO performance is critical. **Note:** Blocking is only supported on Windows agent (in Advanced mode) with NetWitness version 11.3 and later.
Network Isolation	Allows an analyst to block hosts that are compromised from connecting to the network. This controls the spread of an attack and help analyze the malware behavior after the network isolation. All attempted network connections are monitored and reported to the Endpoint Server. By default, this option is disabled. **Note:** Network isolation is only supported on Windows agent (in Advanced mode) with NetWitness version 11.4 and later.
Endpoint Server Setting	
Endpoint Server	Displays all available Endpoint servers in the deployed. **Note:** If you do not select an Endpoint Server, the agent uses the default Endpoint Server that is configured during packager generation.
Server Alias (Optional)	The optional server alias allows you to enter an alternative hostname or IP address on which the server can be reached in the case that agents need to go through a NAT or similar in order to reach the Endpoint Server.



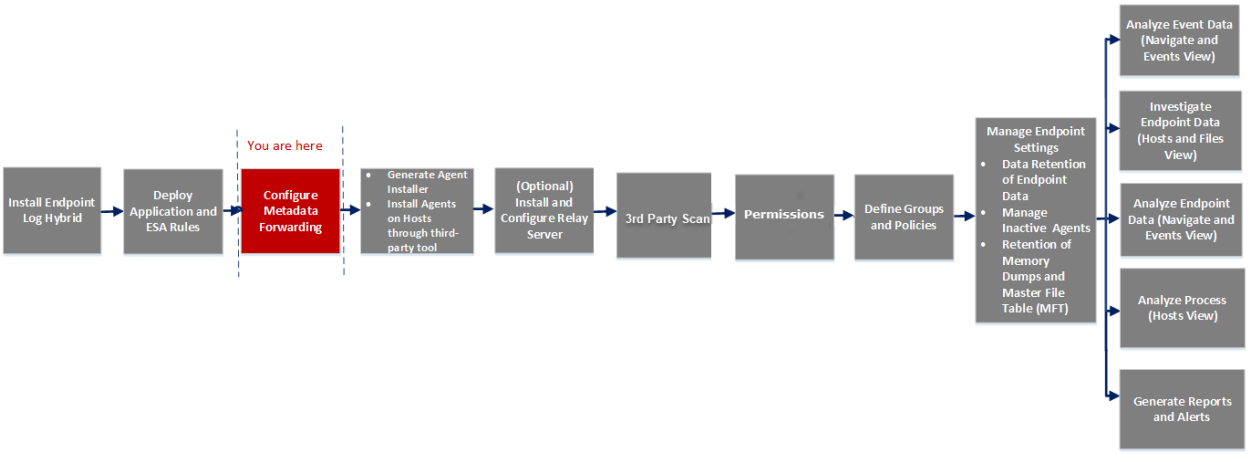
Settings	Description
HTTPS Port	Port number used for HTTPS communication. By default, the port is set to 443. If you want to change this port, make sure that it matches the server configuration. If you enter the wrong port, the agents can no longer communicate with the Endpoint server and the system will be non-functional.
HTTPS Beacon Interval	Determines how often an agent can communicate with the Endpoint server over HTTPS. By default, the value is set to 15 minutes. The default method of beaconing is UDP. Beaconing is used as a method of keep-alive to know if a host is online and to allow hosts to respond faster than the fallback HTTPS beacon time.
UDP Port	Port number used for UDP communication. By default, the port is set to 444. If you want to change this port, make sure that it matches the server configuration. Entering the wrong port results in loss of functionality and effects performance.
UDP Beacon Interval	Determines how often an agent can communicate with the Endpoint server over UDP. By default, the value is set to 30 seconds.

Define Policy Panel for Windows Logs Policy

The table describes the information and options for Agent Windows Logs policy:

Settings	Description
Windows Log Collection	If enabled, logs from the Windows hosts are collected and forwarded to the NetWitness Platform. By default, this option is disabled.
Send Test Log	If enabled, a sample log is sent to the configured server when the policy is loaded to test connectivity. This allows to test the configuration before standard logs are available. By default, this option is disabled.

Settings	Description
Primary Log Decoder / Log collector	Primary NetWitness Log Decoder or Log Collector to which the collected Windows logs are forwarded.
(Optional) Secondary Log Decoder / Log collector	If the primary Log Decoder or Log Collector is not reachable, the collected Windows logs are forwarded to the secondary Log Decoder or Log Collector. **Note:** NetWitness cannot detect failures when UDP protocol is used.
Protocol	Select whether TLS, TCP, or UDP transport protocol is used to forward the collected Windows logs to the NetWitness Platform servers. By default, the protocol is TCP.
Channel Filters	Configure which Windows Log events to collect by selecting a channel, filter condition, and the relevant event IDs. You can either select common channels, such as Security or System from the drop-down list, or create custom channels by entering the channel name. By default, all events are collected from a selected channel. To collect a subset of events from that channel replace 'ALL' with the relevant Event IDs. Select **INCLUDE** if only events with the listed Event IDs should be collected or select **EXCLUDE** to collect all events except for these events.
Advanced Configuration	
Throttle Network Bandwidth	Use this setting to limit network bandwidth that the Agent uses to connect to NetWitness. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second. • If not set, Agent does not do any network throttling. • If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps. 



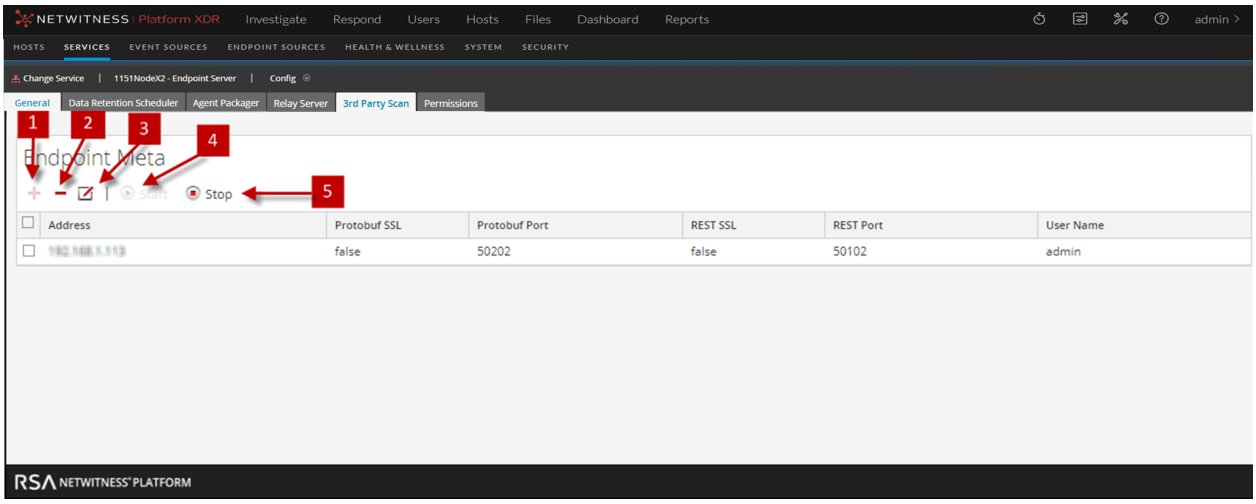
Settings	Description
Advanced Setting	**Caution:** It is strongly recommended not to use this setting unless advised to do so by NetWitness.

General Tab

In the **General** tab, you can configure the Endpoint metadata forwarding for multiple endpoint servers. To access this view:

1. Go to  **(Admin) > Services**.
2. In the Services view, select **Endpoint Server** for which you want to configure the metadata forwarding.
3. Click  and select > **View** > **Config**.
4. Click the **General** tab.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Administrator	Configure Endpoint Metadata Forwarding for the NetWitness Endpoint Agents*	Configuring Metadata Forwarding
Administrator	Configure Endpoint Metadata Forwarding for the NetWitness Endpoint 4.4.0.2 or later Agents*	Integrating NW Endpoint 4.4.0.2 or Later with NW Platform

*You can perform this task in the current view

Quick Look

The following figure is an example of the General tab.

1 Click + to view the Available Services dialog.

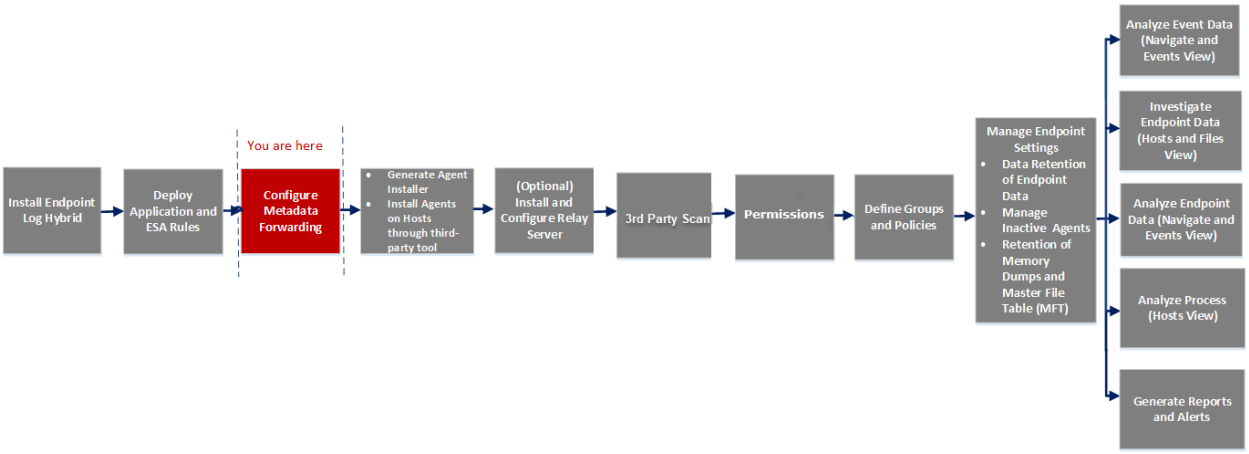
2 Click − to delete the added service.

3 Click to edit the information for the added service.

4 Click Start to start the Endpoint metadata forwarding.

5 Click Stop to stop the Endpoint metadata forwarding.

The following table describes the fields in the General tab.



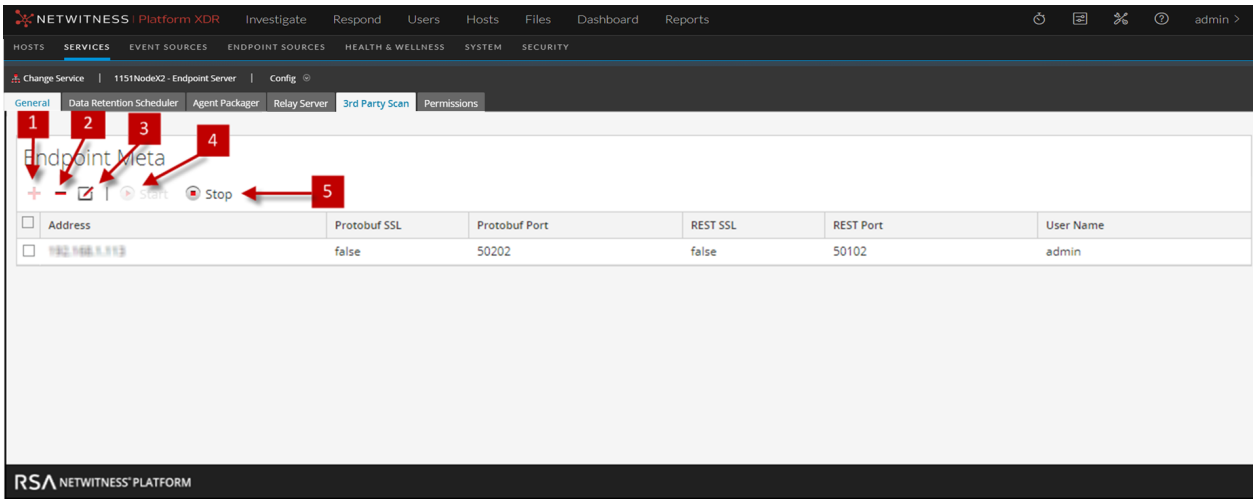
Field	Description
Address	Displays the IP address of the Log Decoder.
Protobuf SSL	Indicates if SSL is enabled on Protobuf. By default, this option is disabled.
Protobuf Port	Displays the port used for Protobuf. By default, the port is 50202.
REST SSL	Indicates if SSL is enabled on the REST port in the Log Decoder. By default, this option is disabled.
REST Port	Displays the port used for REST communication. The default value is 50102 (for non-SSL) and value 56102 (for SSL).
User Name	Displays the user name.
Raw Data	Sends a brief summary of the session along with the metadata if enabled. By default, this option is disabled.

General Tab

In the **General** tab, you can configure the Endpoint metadata forwarding for multiple endpoint servers. To access this view:

1. Go to **(Admin) > Services**.
2. In the Services view, select **Endpoint Server** for which you want to configure the metadata forwarding.
3. Click and select > **View** > **Config**.
4. Click the **General** tab.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Administrator	Configure Endpoint Metadata Forwarding for the NetWitness Endpoint Agents*	Configuring Metadata Forwarding
Administrator	Configure Endpoint Metadata Forwarding for the NetWitness Endpoint 4.4.0.2 or later Agents*	Integrating NW Endpoint 4.4.0.2 or Later with NW Platform

*You can perform this task in the current view

Quick Look

The following figure is an example of the General tab.

1 Click + to view the Available Services dialog.

2 Click − to delete the added service.

3 Click to edit the information for the added service.

4 Click Start to start the Endpoint metadata forwarding.

5 Click Stop to stop the Endpoint metadata forwarding.

The following table describes the fields in the General tab.

Field	Description
Address	Displays the IP address of the Log Decoder.
Protobuf SSL	Indicates if SSL is enabled on Protobuf. By default, this option is disabled.
Protobuf Port	Displays the port used for Protobuf. By default, the port is 50202.
REST SSL	Indicates if SSL is enabled on the REST port in the Log Decoder. By default, this option is disabled.
REST Port	Displays the port used for REST communication. The default value is 50102 (for non-SSL) and value 56102 (for SSL).
User Name	Displays the user name.
Raw Data	Sends a brief summary of the session along with the metadata if enabled. By default, this option is disabled.

Troubleshooting

This section provides information about possible issues when using NetWitness Endpoint.

Agent Communication Issues

Issue	Agent **Last Seen Time** column is not updated in the UI.
Explanation	The issue could be due to any one of the following: • Agent is inactive • Agent data is not processed if the **Endpoint.Health.Overall-Health** statistic shows **Unhealthy** due to which all the agent data including agent last seen time is not updated.
Resolution	See the resolution for these statistics in the Health and Wellness Issues section.

Issue	Agent is unable to communicate with the Endpoint Server.
Explanation	This could be due to one of the following reasons: • Agent is inactive. • Endpoint Server settings is incorrect in the agent packager or policy configuration, or not available for communication. • Endpoint Server or Nginx Server is not running . • Firewall or IP table rules are blocking the connection between the host and Endpoint Server.
Resolution	• Check if the Endpoint Server and Nginx Server are reachable. • If the Endpoint Server settings are incorrect, uninstall the agent, download the agent packager, and reinstall the agent. • Update firewall or IP table rules, if required.

Issue	Agent takes a long time to scan.
Explanation	Sometimes, the NetWitness Endpoint scan takes a long time to complete. This is because of the CPU usage by other antivirus programs (such as Windows Defender, McAfee, Norton, and so on) that may be installed on the agent machines.
Resolution	It is recommended to whitelist the `<service.exe>` (name provided in the packager, by default, the service name is `NWEAgent.exe`) file in the antivirus suite.

Issue	You want to change the responsiveness of the Agent.

Explanation	Depending on your installation, you can adjust Beaconing intervals to change how responsive your agents are.
Resolution	If resources are not a concern, you can lower the HTTPS Beacon Interval and UDP Beacon Intervals. If resources are a concern and responsiveness of the agent is not, you can increase these intervals.

Issue	Agent is unable to generate network tracking events in Insights mode.
Explanation	Verify that Windows Management Instrumentation (WMI) service is running.
Resolution	• Run `Services.msc` and look for Windows Management Instrumentation (WMI) service. • Go to properties and change the **Startup type** to Automatic.

Packager Issues

Message	`Failed to load the client certificate.`
Issue	Incorrect certificate password.
Explanation	While generating the agent installer, the certificate password does not match with the one provided while downloading the agent packager from the UI.
Resolution	Specify the correct certificate password.

Health and Wellness Issues

Endpoint Issues

Behavior	The health check of the **Endpoint.Health.Overall-Health** statistic shows **Unhealthy**.
Issue	Endpoint Server service or required resources are not available or not in a usable state. This could be due to one of the following reasons: • Unable to forward Endpoint meta data to the Log Decoder. • Endpoint Log Hybrid disk usage reaches the specified limit. • Mongo DB is down or excessive read and write errors during processing.
Resolution	• For Log Decoder issue, see Log Decoder Issues section. • For disk usage and Mongo DB issues, see Disk Usage and Mongo Issues section.

Disk Usage and Mongo Issues

Behavior	The health check of the **Data.Application.Connection-Health Application**, **Data Store Disk Usage** or **Data Persistence** for Endpoint Server shows Unhealthy.
Issue	• **Data.Application.Connection-Health Application** or **Data Persistence** shows Unhealthy, if Mongo service is down or fails due to authentication. • **Data Store Disk Usage** shows **Unhealthy**, if Endpoint Server Mongo storage size has exceeded the threshold. By default, the server automatically delete the old data when it reaches 80% of the disk space.
Resolution	• For **Data.Application.Connection-Health Application** or **Data Persistence** issue, you must check the Endpoint server logs (`/var/log/netwitness/endpoint-server/endpoint-server.log`) and Mongo logs (`/var/log/mongodb/mongod.log`), and: ◦ If the issue is due to authentication, you must reissue the certificate. For more information, see "Service Certificate Reissue" section in the *System Maintenance Guide*. ◦ If the issue is due to Mongo service is down, you must restart the Mongo. • For **Data Store Disk Usage** issue, you must increase the storage or configure data retention settings to clear the old data. For more information, see Configuring Data Retention Policy.

Log Decoder Issues

Behavior	Endpoint metadata is not available in the **Investigate > Navigate** or **Events** view.
Issue	The health check of the **Log Decoder Buffer** and **Meta Forward** shows **Unhealthy** in the Health and Wellness.
Explanation	The issue could be due to any of the following reasons: • Log Decoder capture is not started. • Concentrator aggregation is not started. • Log Decoder connection issue. • Log Decoder buffer usage is beyond the specified limit.
Resolution	Make sure that: • Capture is enabled on the Log Decoder. • Aggregation is enabled on the Concentrator. • Meta forwarding is configured properly.

	Note: Make sure **Capture Autostart** is enabled in the Service Config view for Log Decoder and **Aggregate Autostart** is enabled in the Service Config view for Concentrator.

File Log Policy Issues

Invalid Policy or Bad Connection Issues

Issue	Policies can be invalid for a variety of reasons. Some examples: • No sources found if the policy is enabled. • Invalid or missing typespec file • No destination is reachable for a file log policy event source type Additionally, if capture is stopped on the destination Log Decoder, Endpoint Agents will send an error to the Endpoint Server saying that they failed to connect. Also, if there is a lot of data to be processed for Agents collecting File data (when File Policy is enabled) , there is a possibility that Log Decoder buffer becomes full. If this happens, the Log Decoder cannot process any requests from the Agents communicating via EPS.
Explanation	The system is dynamic in nature, which means its state can change: event sources can lose their connection, typespec files can be altered or deleted, and other changes can occur that can invalidate a previously valid policy.
Resolution	To help identify the specific issue, check the log file on the Endpoint Server that reports the error: `/var/log/netwitness/endpoint-server/endpoint-server.audit.log` Relevant errors will be listed as **FileLogError** in the log file. If you experience this issue, you can do the following: 1. Try to identify and target higher-value data, thus limiting the total amount of data being processed. 2. Enable throttling in the File policy to smooth out the peaks in usage. 3. If you really do need to process more data on a regular basis, consider server-side hardware upgrades.

Reset File Collection Bookmarks

Issue	If the system is not configured correctly, NetWitness might collect logs and not be able to parse them. Or, files might get sent, but for some reason, not make it to the Log Decoder (for example if communication is via UDP and there is a network connectivity issue).

Explanation	In these and other cases, you can reprocess these "missing" log files.
	For whatever reason, you may need to reprocess logs from the beginning of the file.
Resolution	Reset bookmarks for an event source type using the procedure described here: Reset File Collection Bookmarks.

Missing Log Collectors and Event Sources in the User Interface

Issue	Some log collectors or event sources seem to be missing from the list of available items.
Explanation	The Filter drop-down menus (types, log collectors, and log decoders) only show values that are in the event sources database, rather than all possible values. For example, if you have a log collector that has not yet collected any logs, then it is missing from the list.
Resolution	Collect logs from a specific log collector and event source, and then they should appear as items in the appropriate menu.

Relay Server Issues

Test Connection Issues

Issue	Relay Server test connection failed.

Resolution	1. Check if the hostname or IP and port of the Relay Server are correct.
	2. Make sure that the hostname or IP of the Relay Server is resolvable from the Endpoint Server. Perform the following:
	a. In the Endpoint Log Hybrid console, verify if the Relay Server is reachable using the following command:
	`nc -zvw3 <relayhost> <relayport>`
	If the Relay Server is not reachable contact your Administrator.
	b. If the Relay Server is reachable, verify if the correct Relay Server installer is used by getting the Endpoint Server revision ID from the Relay Server host (`/var/log/relay-install.log`) and check the Endpoint Server RPM on Endpoint Log Hybrid using the following command:
	`rpm -qa | grep <Endpoint Server Revision ID>`
	c. Make sure if the Relay Server is installed and running.
	• Verify the Relay Server installation logs using the following command:
	`/var/log/relay-install.log`
	• Verify the status of Relay Server using the following command:
	`systemctl status rsa-nw-relay-server`

Issue	Test fails when installing relay server in cloud, using CentOS 7 configuration

Resolution	1. Check if you have entered the suggested port numbers.
	2. If you have entered any other port number than the suggested one
	3. Make sure that the hostname or IP of the Relay Server is resolvable from the Endpoint Server. Perform the following:
	a. In the Endpoint Log Hybrid console, verify if the Relay Server is reachable using the following command:
	`nc -zvw3 <relayhost> <relayport>`
	If the Relay Server is not reachable contact your Administrator.
	b. If the Relay Server is reachable, verify if the correct Relay Server installer is used by getting the Endpoint Server revision ID from the Relay Server host (`/var/log/relay-install.log`) and check the Endpoint Server RPM on Endpoint Log Hybrid using the following command:
	`rpm -qa | grep <Endpoint Server Revision ID>`
	c. Make sure if the Relay Server is installed and running.
	• Verify the Relay Server installation logs using the following command: `/var/log/relay-install.log`
	• Verify the status of Relay Server using the following command: `systemctl status rsa-nw-relay-server`

Issue	Relay Server installer generation fails with an error message ‘Unable to download the installer. Retry after sometime’.
Explanation	Dependencies of the Relay Server are not resolved or downloaded completely.
Resolution	You must retry the download after 5-10 minutes. If the download still fails even after all dependencies are downloaded in the Endpoint Server, contact the NetWitness Customer Support. **Note:** You can check ‘Finished downloading all Relay Server dependencies’ message in the Endpoint Server logs at `/var/log/netwitness/endpoint-server/endpoint-server.log`, to see if the dependencies are downloaded. If the download fails due to yum related issues, then you must clean yum repo using the command `yum clean all` and restart the Endpoint Server.

Installation Issues

Issue	Relay Server installation fails due to missing or corrupted dependencies.
Resolution	Re-download the installer dependencies, perform the following:

	1. Go to **(Admin) > Endpoint Server** service > select > **View** > **Explore**. 2. In the Endpoint server configuration, make sure **endpoint.relay.installer.download-on-restart** boolean is set to true (by default it is true). 3. Restart the Endpoint server using the following command: `systemctl restart rsa-nw-endpoint-server` Fresh dependencies will be downloaded to the local directory in the Endpoint Server. This may take few minutes. 4. Download the Relay Installer. 5. Run the Relay Server Installation Script. For more information, see (Optional) Installing and Configuring Relay Server.

YARA Issues

Issue	Failure in saving YARA configuration.
Explanation	The rule-folder path is under some Linux user home-directory such as /root or /home/user1.
Resolution	Choose other paths such as /var or /tmp etc. or change the owner of the directory to 'netwitness' user.

OPSWAT Issues

Files can not be scheduled for scan

Issue	Some files cannot be scheduled for the scan. See Endpoint Configuration Guide > Troubleshooting
Explanation	The issue could be due to any one of the following: 1. One of the endpoint servers is either down or not responsive. 2. OPSWAT is not configured in one or more of the endpoint servers.
Resolution	1. Ensure all the endpoint servers are up and running. 2. Ensure OPSWAT is configured in all the endpoint servers.

OPSWAT not configured on all endpoint servers

Issue	OPSWAT is not configured on appropriate Endpoint servers.
Explanation	The issue could be due to any one of the following:

Resolution	1. OPSWAT is not configured in any of the endpoint servers. 2. One or more endpoint servers are down.
	1. Ensure OPSWAT is configured in all the endpoint servers. 2. Ensure all the endpoint servers are functioning.

OPSWAT scan results not getting updated

Issue	OPSWAT scan is scheduled successfully, but no results are getting updated.
Explanation	The issue could be due to any one of the following: 1. Either you have selected unsupported file extensions, or some files are larger than the configured file size limit. 2. OPSWAT server is either down or not responsive.
Resolution	1. Ensure only the files with supported extensions are selected, and file size has not exceeded the configured maximum file size. 2. Contact OPSWAT support for additional information.

Appendices

Reset File Collection Bookmarks

In cases where issues have caused logs to be lost, or not correctly sent to the Log Decoder, you can resend messages in log files by resetting the bookmarks for those log files.

Note: For security reasons, NetWitness does not allow resetting bookmarks from the agents. Rather, you must do so from an Endpoint Server.

The following procedure describes how to reset bookmarks for file collection logs.

Note: Currently, you can reset bookmarks for all sources or just one specific source, by providing a list in a JSON file.

Construct a JSON File to Identify Agents and Event Source Types for Reset

First, you need to construct a JSON file using the following structure:

```
{

     "agentIds": [],
     "sourceType" : ""

}
```

where:

- `agentIds`: a list of the IDs for one or more Endpoint Agents: these are the individual agents on which the source log files reside.
- `sourceType`: this is a list of the file event source type or types for which you want the log file bookmarks to be reset.

For details on finding agent IDs and source types, see How to Find Agent IDs and Source Types below.

For example, the following source code snippet could be used to delete bookmarks for **all** sources on 3 agents:

```
{

     "agentIds": ["43F27B6E-A02D-955A-9607-2DFC5D17B6E7",
        88AD4B2C-192B-B50E-A125-C05B801301AA"
        "3899038D-8F42-BC93-5BA7-ECBFC309D6A3"],
     "sourceType": "ALL"

}
```

Similarly, the following source code snippet could be used to delete bookmarks for **apache** sources on 3 agents:

```
{
```

```
    "agentIds": ["43F27B6E-A02D-955A-9607-2DFC5D17B6E7",
       88AD4B2C-192B-B50E-A125-C05B801301AA"
       "3899038D-8F42-BC93-5BA7-ECBFC309D6A3"],
    "sourceType": "apache"

}
```

Reset Bookmarks

Perform the following steps to reset the bookmarks that you specified in a JSON-formatted file:

1. SSH to the NetWitness Admin Server.
2. Run `nw-shell` command. for details about using the NetWitness shell, see the *Shell User Guide*, available in NetWitness Link.
3. After nw-shell starts, connect to an Endpoint Server service, using the following command:

   `connect --service endpoint-server.`*`serviceID`*

   where *serviceID* is identifier for the Endpoint Server that hosts the agents you are changing. See How to Find Endpoint Service IDs for details on how to retrieve the service ID.
4. Change to the directory where the reset command resides:

   `cd endpoint/command/reset-bookmark`
5. Login with an administrator account.
   a. Type the login command:

      `login`

   b. Enter the user name for your admin account.

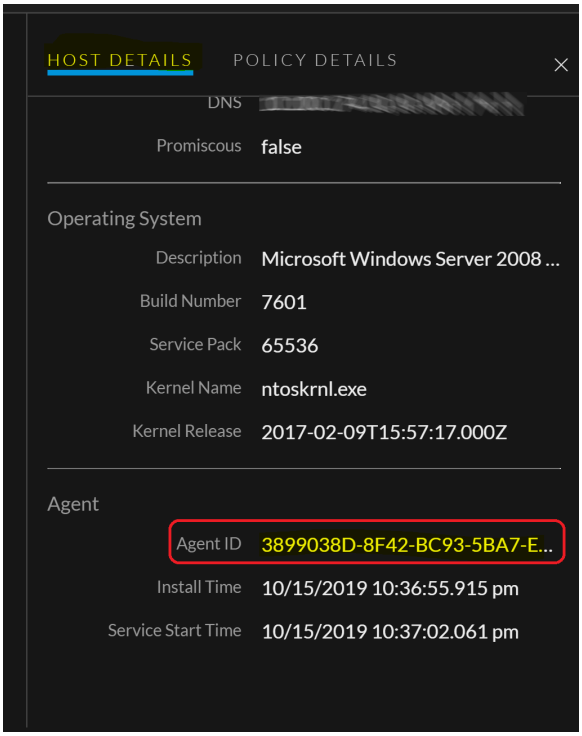
   c. Enter the password for your admin account.
6. Run the reset command: you need to provide the JSON path and filename that you created earlier.

   `invoke --file <path and filename for JSON>`

   For example:

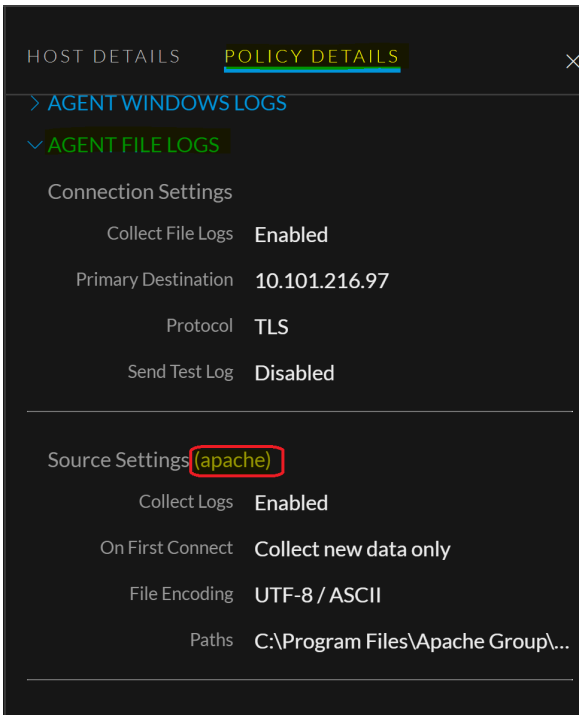
   `invoke --file /tmp/test.json`

The bookmarks for each log file identified in your JSON file are reset. The following image shows an example NetWitness Shell session:



```
[root@SA ~]# nw-shell

RSA Netwitness Shell. Version: 5.15.0-SNAPSHOT



offline » connect --service endpoint-server.38909c2f-7a9b-415a-b567-f49a19cf250e
INFO: Connected to endpoint-server (38909c2f-7a9b-415a-b567-f49a19cf250e)
endpoint-server:Folder:/rsa » cd endpoint/command/reset-bookmark
endpoint-server:Method:/rsa/endpoint/command/reset-bookmark » login
user: admin
password: **********
admin@endpoint-server:Method:/rsa/endpoint/command/reset-bookmark » invoke --file /tmp/test.json
```

How to Find Agent IDs and Source Types

To find the Agent IDs for agents, go to **Hosts** > ***<select an Agent>***, then click the **Host Details** panel, and scroll down to the **Agent** section, where the Agent ID is shown:

To find the source types, go to **Hosts** > ***<select an Agent>***, then click the **Policy Details** panel, expand Agent File Logs, view the Source Settings for the source type name to use:

How to Find Endpoint Service IDs

You can retrieve the service ID for an Endpoint Server by using SSH to connect to it.

To retrieve the service ID for an Endpoint Server:

1. SSH to the NetWitness Endpoint Server for which you need to retrieve the ID. The IP address is available under  **(Admin) > Hosts**. The IP address for each host is listed in the **Host** column of the table.
2. View the file that contains the ID by running the following command:

   ```
   cat /etc/netwitness/endpoint-server/service-id
   ```

   It returns the Endpoint Server ID, for example:

   ```
   38909c2f-7a9b-415a-b567-f49a19cf250e
   ```

Currently Supported File Log Event Source Types

The following event source types are currently supported:

Apache Tomcat	Apache Web Server	CA Siteminder
CiscoWorks	CiscoWorks	Citrix XenMobile Device Manager
Courion Password Courier	EMC NetWorker	EMC Symmetrix

Specify UNC (Universal Naming Convention) Paths

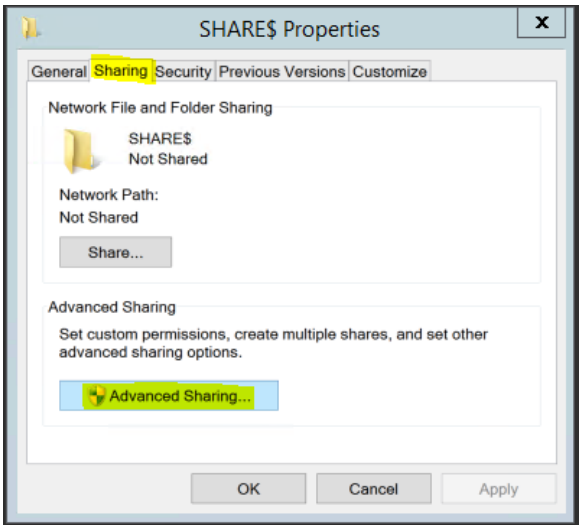
During configuration of a Log File Policy, you can specify the log file path. You can set one or more paths to be used by the agent to locate the log files. The path can be a standard Windows pathname (such as `C:\Program Files\Apache\error_logs\logfile.log`) or a UNC (Universal Naming Convention) pathname (`\\host-name\share-name\file-path`). This topic describes how to specify a UNC path.

Secure the UNC Path Location

When you use a UNC path to collect log data on a remote system, make sure that you secure the UNC path location. One solution that works with minimal risk in a Windows domain environment is to do the following:

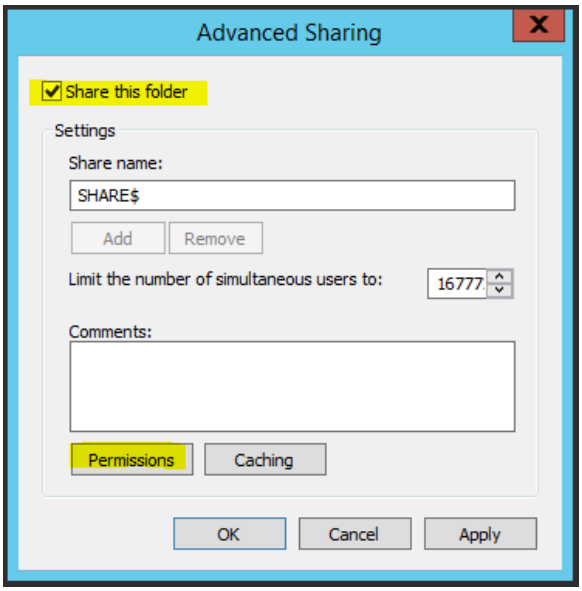
1. Create a share on the directory on the computer where the log data exists in isolation.
2. Name the share to something like **LOGDATA$** for example. (Shares can be hidden from curious browsers by adding a "$" to the end of the share name).
3. Remove all the default share permissions except local admin so it can be changed.
4. Add a share permission for the agent computer system. This allows any user on the agent system to access the shared location. On the agent system collecting the remote log data, nothing else should be required to properly collect the log data from the UNC path.

Note: You may not be able to view the UNC directory contents from file explorer. Seek advice from your IT or security group for additional guidence to setting up and securing a UNC directory share.



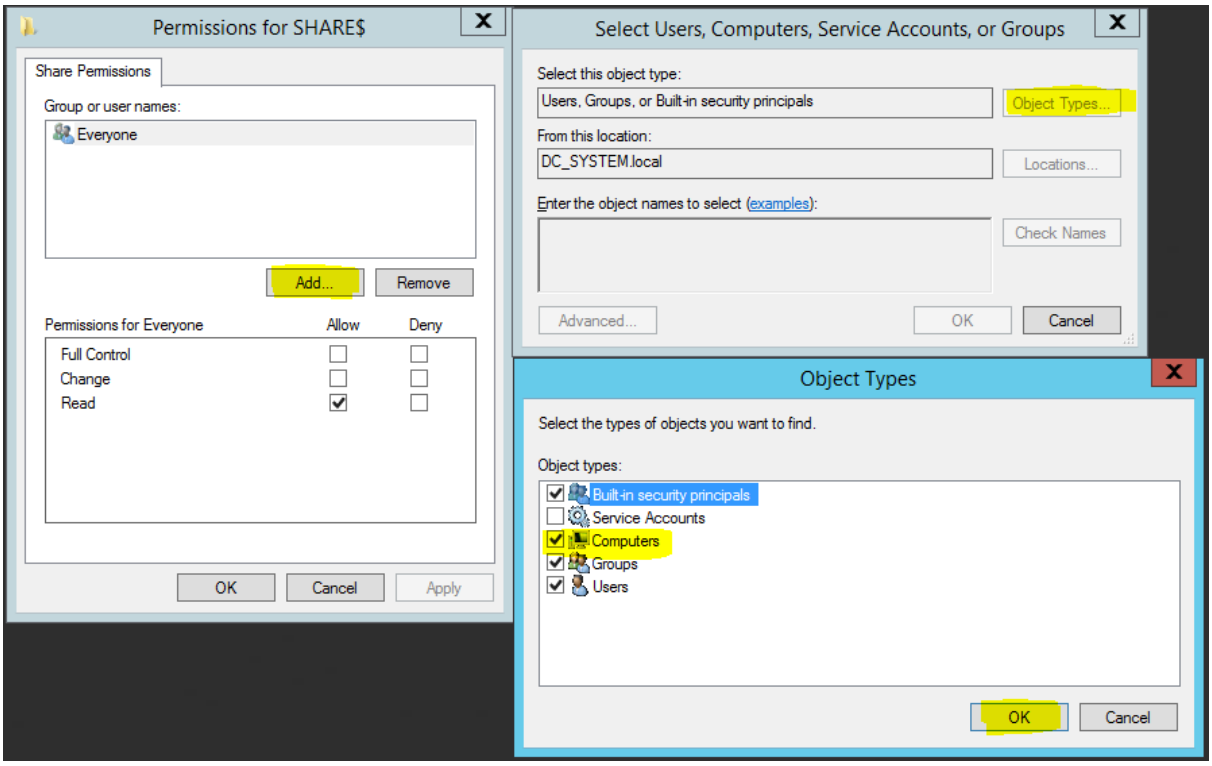
The following procedures describe how to:

- Share a folder between machines in a domain, and
- Share a folder between machines in a Workgroup

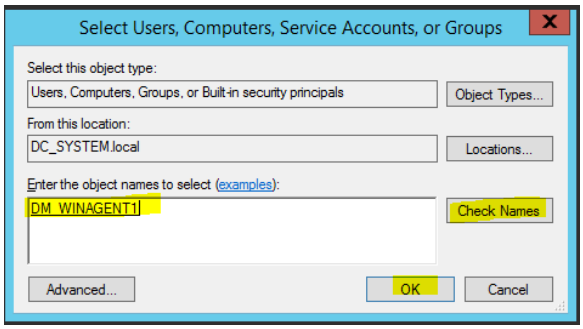


Share a folder between machines in a domain

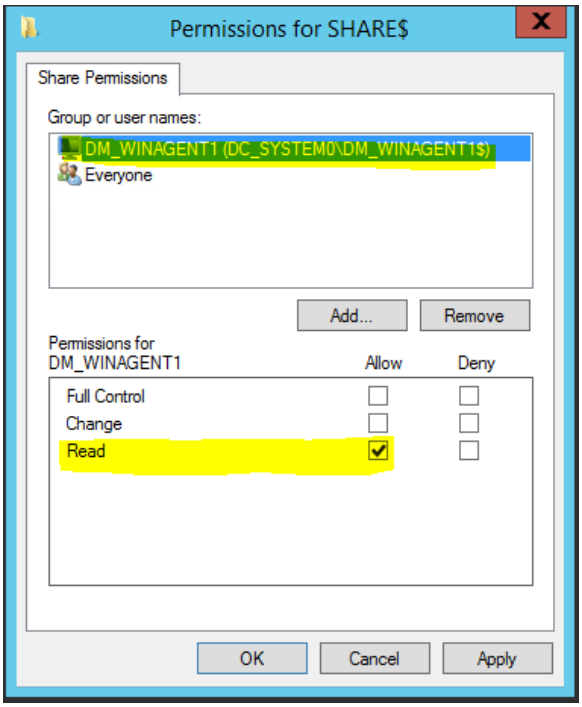
This procedure describes how to share a folder between Windows machines that are both in the same domain.



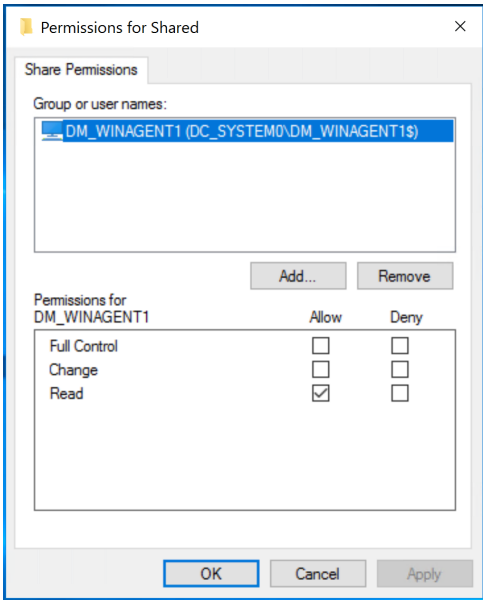
1. Log on to a Domain member machine that contains the logs folder you want to collect using an agent.
2. Right click on the folder you want to share with the agent to collect logs from, and click **Properties**: **SHARE$** in this example.



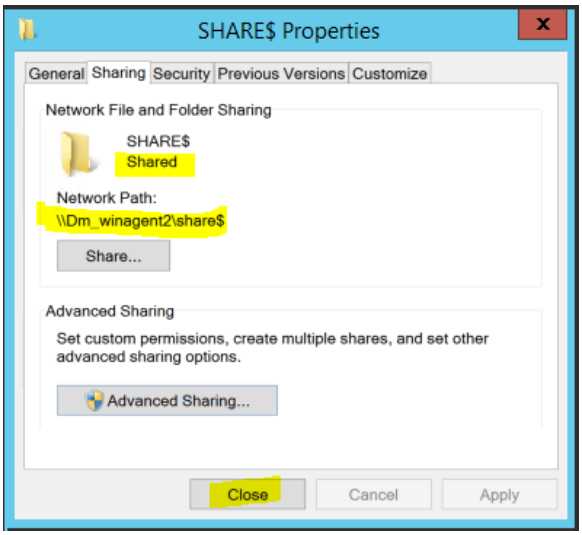
3. Click Advanced Sharing, select Share this folder, and then click Permissions.



4. Click **Add**, and then on the next window click **Object Types**, check **Computers**, hit **OK**.

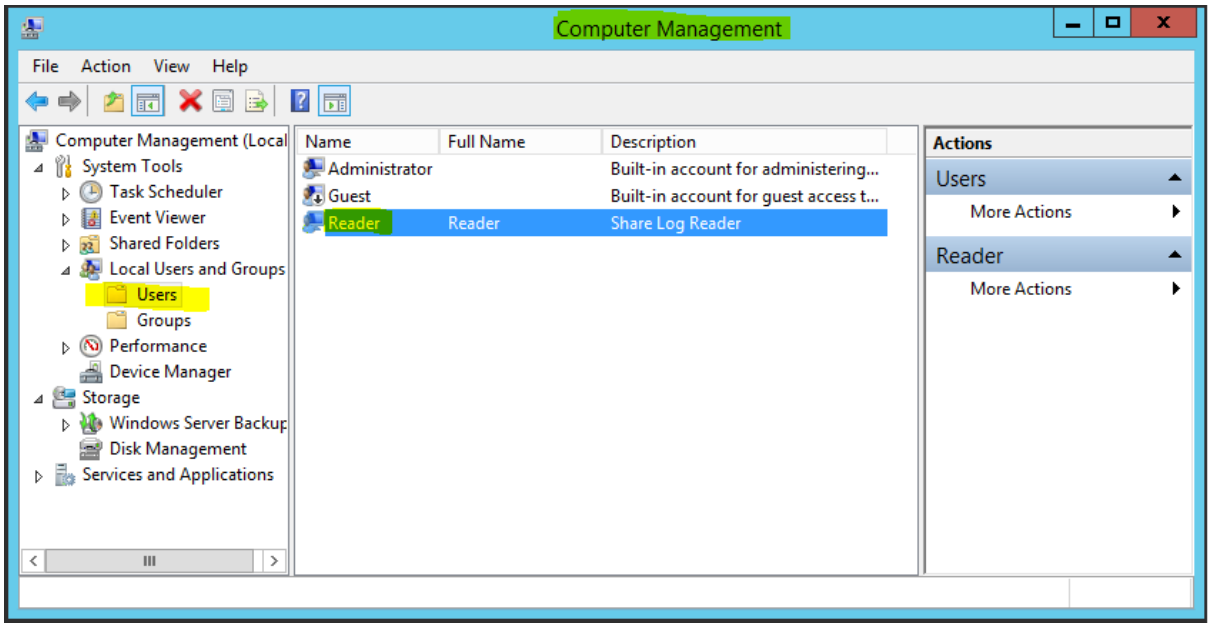


5. Search for the Agent computer name as shown below and click **OK**.

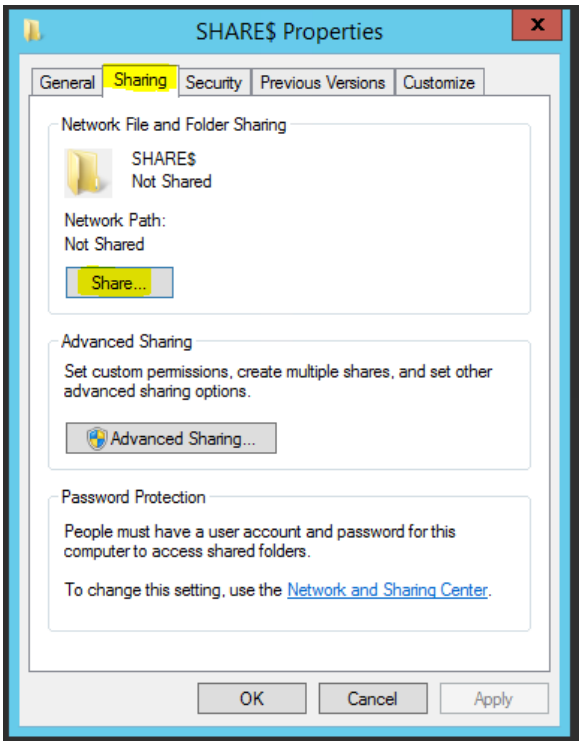


6. In the Permissions screen, provide **Read** permission to the agent, click **Apply**, and then click **OK**.

7. Remove **Everyone** from the Share Permissions list.

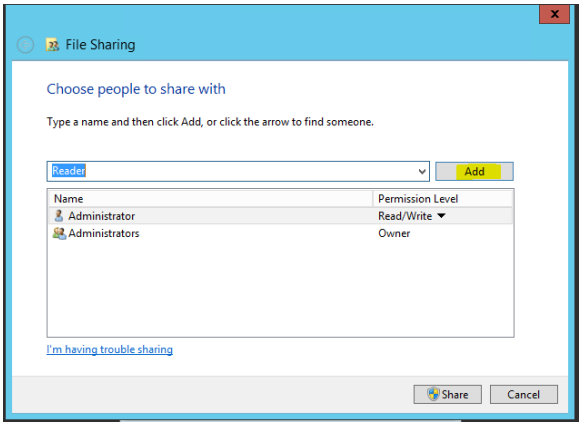


8. Verify that now the **SHARE$** folder status is correct, and note the network path so that you can enter it later, when you configure the policy that will use this shared folder.

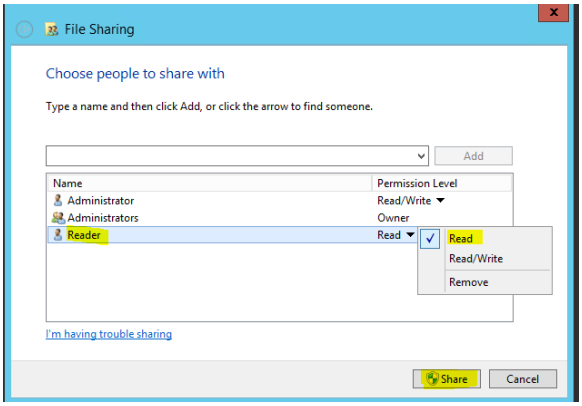


Share a folder between machines in a Workgroup

This procedure describes how to share a folder between Windows machines that are both in the same Workgroup.



1. Log on to a workgroup machine that contains the logs folder you want to collect using an agent.
2. Create a non-admin user for log collection: **Reader** in this example.



3. Right click on the folder you want to share with the agent to collect logs from, and click **Properties**: **SHARE$** in this example.
4. Click the **Sharing** tab, then click **Share**.

5. Choose the newly-created user and click **Add**.

6. Select the **Read** permission and click **Share**.

7. Log onto the Agent to add credentials, so that the system can read logs from the shared folder.
   a. Download the `psexec` tool from the Microsoft web site.
   b. Run the following command:

      ```
      psexec -i -s cmd.exe
      ```

      A new command window opens, running as **system**.
   c. In the command window, run the following command to cache credentials for the newly-created user to access logs on shared folder from a workgroup machine:

      ```
      net use \\hostname of machine with logs\Share$
      ```

      For example:

      ```
      net use \\WGWINAGENT2\Share$
      ```
   d. Provide the username and password for the non-admin user created earlier (in step 2).

This command adds credentials to read logs from the shared folder on the workgroup machine.

NetWitness Endpoint Integration

NetWitness customers who are using NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later can integrate into NetWitness 11.x in several different ways.

Note: In Version 11.2 and later, the following components are rebranded:
- NetWitness Suite to NetWitness Platform
- Packet Decoder to Network Decoder

Integration Options

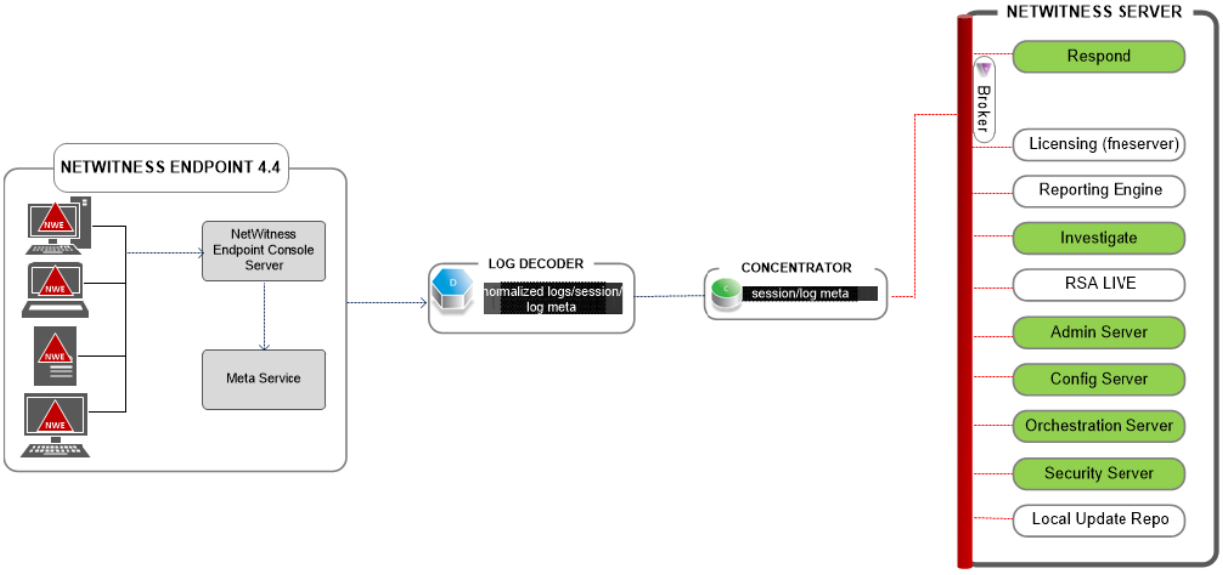
Integration Methods

The following are the NetWitness Endpoint integration methods:

- Configure Endpoint Alerts through Respond
- Configure Contextual Data from Endpoint through Recurring Feed
- Configure Endpoint Alerts through Syslog into a Log Decoder
- Configuring Meta Integrator service in the NetWitness Endpoint 4.4.0.2 or later directly to a Log Decoder

Endpoint alerts into NetWitness Respond. This integration provides the capability for forwarding Endpoint alerts to Respond.

Contextual data from Endpoint through a NetWitness Live recurring feed. This integration can enrich the session displayed in NetWitness Investigation with contextual information; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data.



NetWitness Endpoint alerts through Syslog (CEF) into NetWitness Log Decoders. This integration provides the capability to forward Endpoint events through Syslog and to correlate the events with other log or packet metadata in the NetWitness ecosystem.

(For Version 11.1 and later) **NetWitness Endpoint directly to a Log Decoder.** This integration lets you view the Endpoint metadata in the **Investigate > Navigate** and **Event Analysis** view similar to Logs and Packets.

Note: For information on NetWitness Endpoint 4.4.0.x integration with NetWitness, see *NetWitness Endpoint Configuration Guide*.

NetWitness Endpoint Metadata Integration

The NetWitness Platform provides seamless integration allowing Endpoint metadata to be included into the NetWitness work flow. This lets analyst to investigate an incident and respond using packet, log, and endpoint metadata. The endpoint metadata provides further indicators and context related to a host, user, process, or file. It also provides tracking data that provide data of what has transpired with a host, user, process, or file.

Built-in NetWitness Endpoint Lookup

With the NetWitness Endpoint user interface (UI) installed on the same machine where the analyst is using a browser to access NetWitness, the built-in NetWitness Endpoint Lookup from NetWitness Investigation and NetWitness Respond provides right-click access to the NetWitness Endpoint console server for the following meta keys: IP address (ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip), host (alias-host, domain.dst), client, and file-hash. These are described in the "Launch an External Lookup of a Meta Key" topic in *Investigation and Malware Analysis User Guide* and the "View Alerts" topic in *NetWitness Respond User Guide*.

NetWitness configuration is not required for endpoint lookup when you are using one of the built-in parsers, NetWitness Endpoint or CEF, and you have not customized the default meta keys used when loading metadata in Investigation. For more information, see "Manage and Apply Default Meta Keys in an Investigation" topic in the *Investigation and Malware Analysis User Guide*.

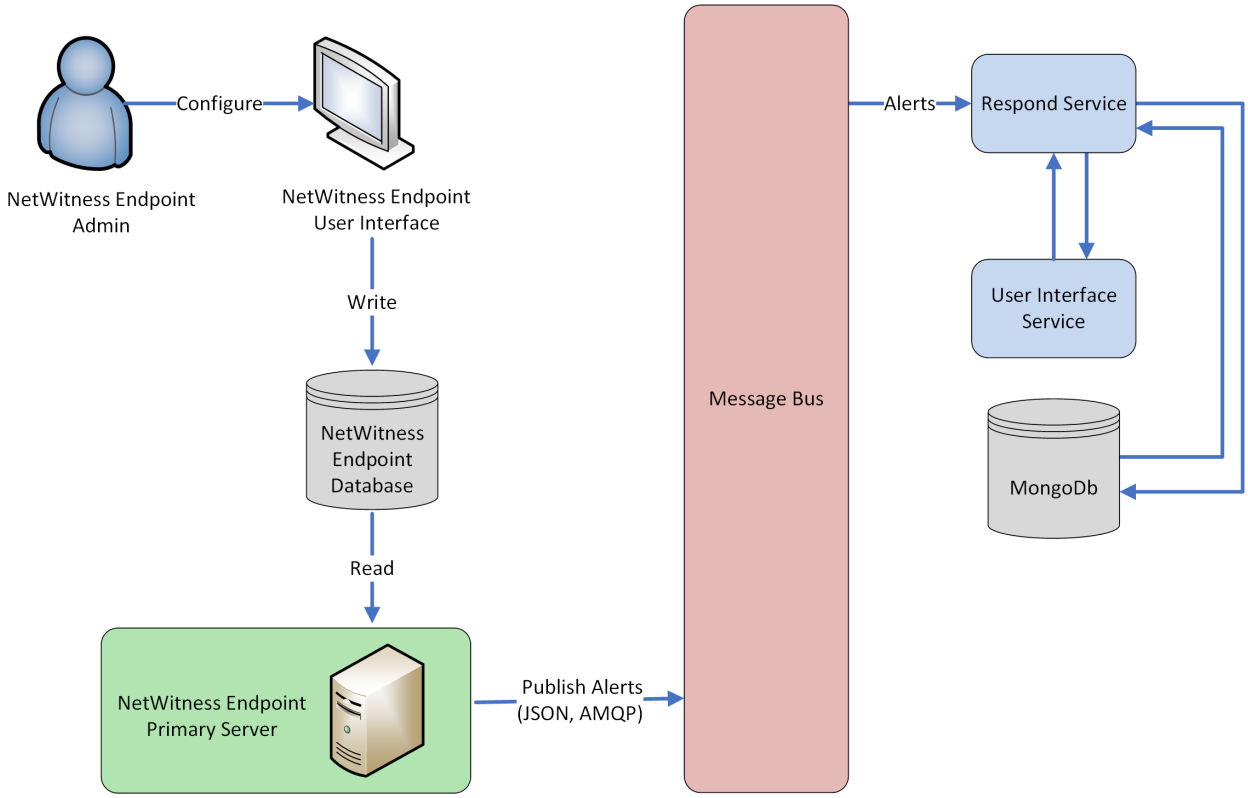
Note: The exception occurs if you customize NetWitness by editing the display setting for the default meta keys in Investigation, add meta keys to the table-map-custom.xml file, or customize NetWitness Endpoint feeds. Some configuration is required to add the custom meta keys to the context menu NetWitness Endpoint Lookup in the  **(Admin)** > System view as described in the "Add Custom Context Menu Actions" topic in the *System Configuration Guide*.

NetWitness Endpoint Alerts and Indicators of Compromise

NetWitness Endpoint IIOC (Instant Indicator of Compromise) is a database query that NetWitness Endpoint runs on collected NetWitness Endpoint scan data to determine the presence of potential malware on scanned hosts. NetWitness Endpoint 4.1.2 or later ships with IOCs that users can enable and mark as alertable. NetWitness Endpoint runs IOC queries regularly on new scan data, which is collected and stored in the database. If the IOC query is satisfied, this indicates a potential indicator of compromise, and the event can be reported to a user or sent to an external system as an alert.

Possible types of alerts are:

- Machine alert: This alert indicates that the machine in question is suspicious.
- Module alert: This alert indicates that a module, such as a file, a DLL, or an executable, is suspicious. It contains details about the module in question.
- Event alert: This alert represents any other suspicious activity detected by NetWitness Endpoint that does not fall into the above categories.



Each of these alert types can be sent to NetWitness.

Configure NetWitness Endpoint Alerts to Respond

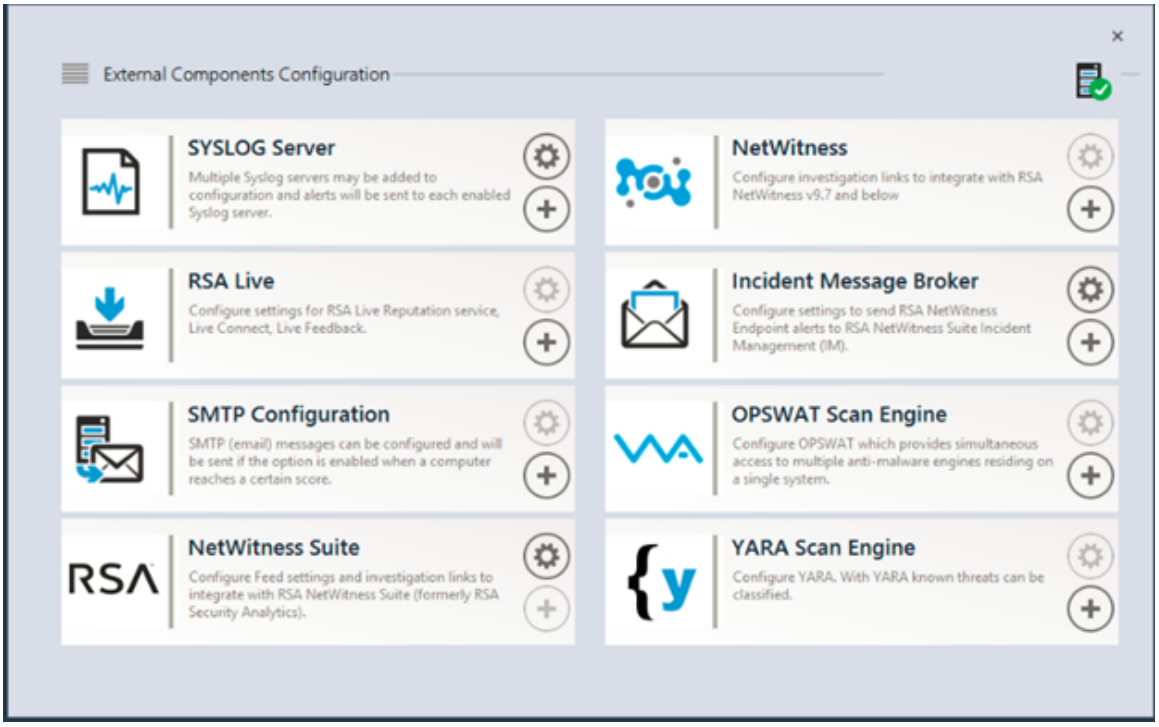
This procedure is required to integrate NetWitness Endpoint with NetWitness so that the NetWitness Endpoint alerts are picked up by the Respond component of NetWitness and displayed in the **Respond > Alerts** view.

Note: NetWitness supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later for NetWitness Respond integration. For more information, see the "NetWitness Suite Integration" topic in the *NetWitness Endpoint User Guide*.

The diagram below represents the flow of NetWitness Endpoint alerts to the Respond Incident List view of NetWitness and its display in the **Respond > Alerts** view.

Prerequisites

Ensure that you have the following:



- The Respond service is installed and running on NetWitness.
- NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later is installed and running.

Configure NetWitness Endpoint to Forward NetWitness Endpoint Alerts

To configure NetWitness Endpoint to send alerts to Respond to the NetWitness user interface:

1. In the NetWitness Endpoint user interface, click **(Configure) > Monitoring and External Components**.

   The External Components Configuration dialog is displayed.

2. From the components listed, select **Incident Message Broker** and click + to add a new IM broker.
3. Enter the following fields:
   a. **Instance Name**: Enter a unique name to identify the IM broker.
   b. **Server Hostname/IP address**: Enter the Host DNS or IP address of the IM broker (NetWitness Server).
   c. **Port number**: The default port is 5671.
4. Click **Save**.
5. Navigate to the **ConsoleServer.exe.config** file in **C:\Program Files\RSA\ECAT\Server**.
6. Modify the virtual host configurations in the file as follows:
   `<add key="IMVirtualHost" value="/rsa/system" />`

Note: In NetWitness 11.0 and 11.1, the virtual host is "/rsa/system". For version 10.6.x and below, the virtual host is "/rsa/sa".

7. Restart the API Server and Console Server.
8. To set up SSL for Respond Alerts, perform the following steps on the NetWitness Endpoint primary console server to set the SSL communications:
   a. Export the NetWitness Endpoint CA certificate to .CER format (Base-64 encoded X.509) from the personal certificate store of the local computer (without selecting the private key).
   b. Generate a client certificate for NetWitness Endpoint using the NetWitness Endpoint CA certificate. (You MUST set the CN name to ecat. Run cmd.exe console with Administrator rights.)

      ```
      makecert -pe -n "CN=ecat" -len 2048 -ss my -sr LocalMachine -a sha1 -sky
      exchange -eku 1.3.6.1.5.5.7.3.2 -in "NweCA" -is MY -ir LocalMachine -sp
      "Microsoft RSA SChannel Cryptographic Provider" -cy end -sy 12
      c:\client.cer
      ```

      Note: In the previous code sample, if you upgraded to version 4.3 (or later) from a previous version and did not generate new certificates, you should substitute `"EcatCA"` for `"NweCA"`. Or, if your current operating system has PowerShell version 5.1 or later, you can use the following code sample:

      ```
      PS C:\> New-SelfSignedCertificate -KeyExportPolicy Exportable -Subject
      "CN=ecat" -KeyAlgorithm RSA -KeyLength 2048 -CertStoreLocation
      "cert:\LocalMachine\My" -HashAlgorithm SHA256 -KeySpec KeyExchange -
      TextExtension @("2.5.29.37={text}1.3.6.1.5.5.7.3.2,1.3.6.1.5.5.7.3.1") -
      Provider "Microsoft RSA SChannel Cryptographic Provider" -KeyUsage
      DigitalSignature, KeyEncipherment, KeyAgreement -Signer (Get-ChildItem -
      Path Cert:\LocalMachine\My\ -DnsName NweCA)-NotAfter (Get-Date).AddYears
      (5); Export-Certificate –Cert (Get-ChildItem –Path
      Cert:\LocalMachine\My\ -DnsName ecat) –FilePath C:\Client.cer
      ```

   c. Make a note of the thumbprint of the client certificate generated in step b. Enter the thumbprint value of the client certificate in the IMBrokerClientCertificateThumbprint section of the ConsoleServer.Exe.Config file as shown.

      ```
      <add key="IMBrokerClientCertificateThumbprint"
      value="896df0efacf0c976d955d5300ba0073383c83abc"/>
      ```

9. On the NetWitness Server, copy the NetWitness Endpoint CA certificate file in .CER format into the import folder:

   `/etc/pki/nw/trust/import`

10. Issue the following command to initiate the necessary Chef run:
    `orchestration-cli-client --update-admin-node`
    This appends all of those certificates into the truststore.
11. Restart the RabbitMQ server:
    `systemctl restart rabbitmq-server`
    The NetWitness Endpoint account should automatically be available on RabbitMQ.
12. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NetWitness Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Troubleshooting

This section suggests how to resolve problems you may encounter when you configure NetWitness Endpoint alerts to Respond.

Known Issues	Solutions
Orchestration fails on admin node.	You must copy and paste the content of NweCA or EcatCA certificate in `/etc/rabbitmq/ssl/truststore.pem` and restart the Rabbitmq service.

Configure Contextual Data from NetWitness Endpoint Through Recurring Feed

You can configure NetWitness Endpoint data in NetWitness to provide contextual data from NetWitness Endpoint to Decoder and Log Decoder sessions. This configuration adds contextual meta values in addition to the instant IOC alerts that can be used to build correlations to other metadata in the NetWitness ecosystem.

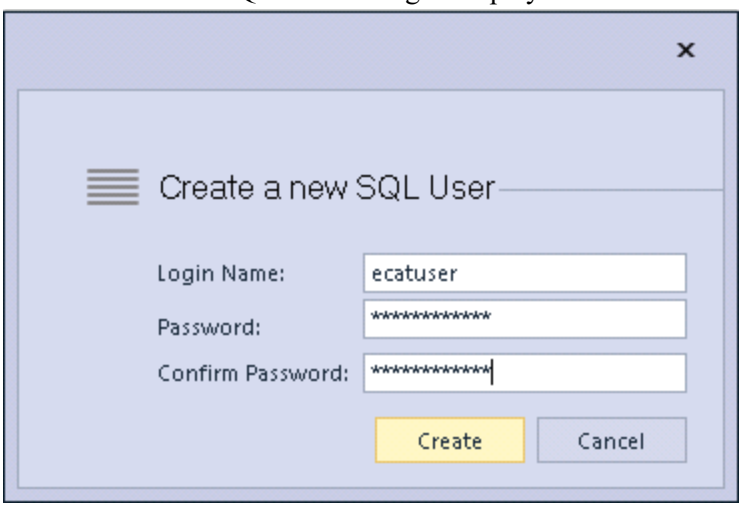
Administrators can configure NetWitness to consume system scan contextual data from NetWitness Endpoint through a NetWitness Live recurring feed. This integration can enrich the session from a Decoder or Log Decoder with contextual information displayed in NetWitness Investigation; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data into sessions from a Decoder or Log Decoder.

Note: Although this feature is targeted for customers with a Network Decoder, a recurring feed can also be implemented in Log Decoders.

Caution: In an environment with many NetWitness Endpoint hosts, using recurring feed may result in decreased performance on the NetWitness ingest devices (Decoder and Log Decoder).

Prerequisites

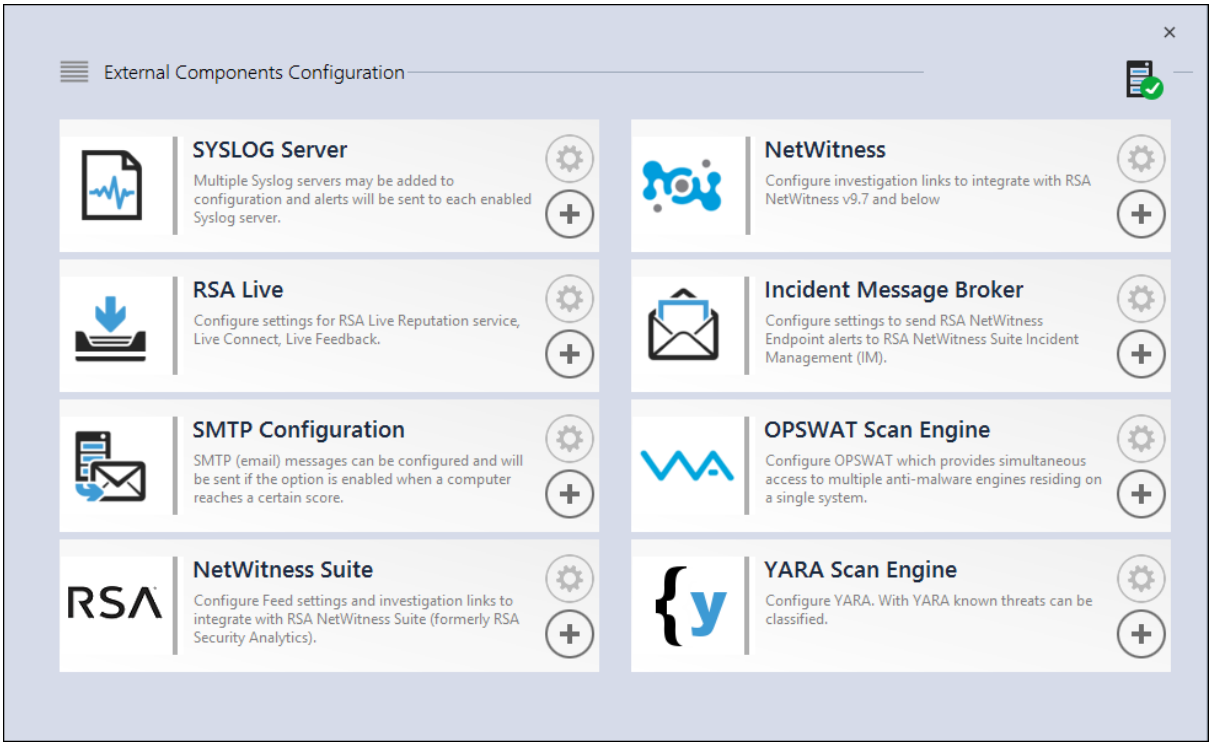
- Version 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later NetWitness Endpoint Console server and NetWitness Server Version 10.4 and above installed.
- Version 11.0 or 11.1 NetWitness Decoder and Concentrator connected to the NetWitness Server in the network.



To Configure Contextual Data from NetWitness Endpoint Through Recurring Feed, perform the following:

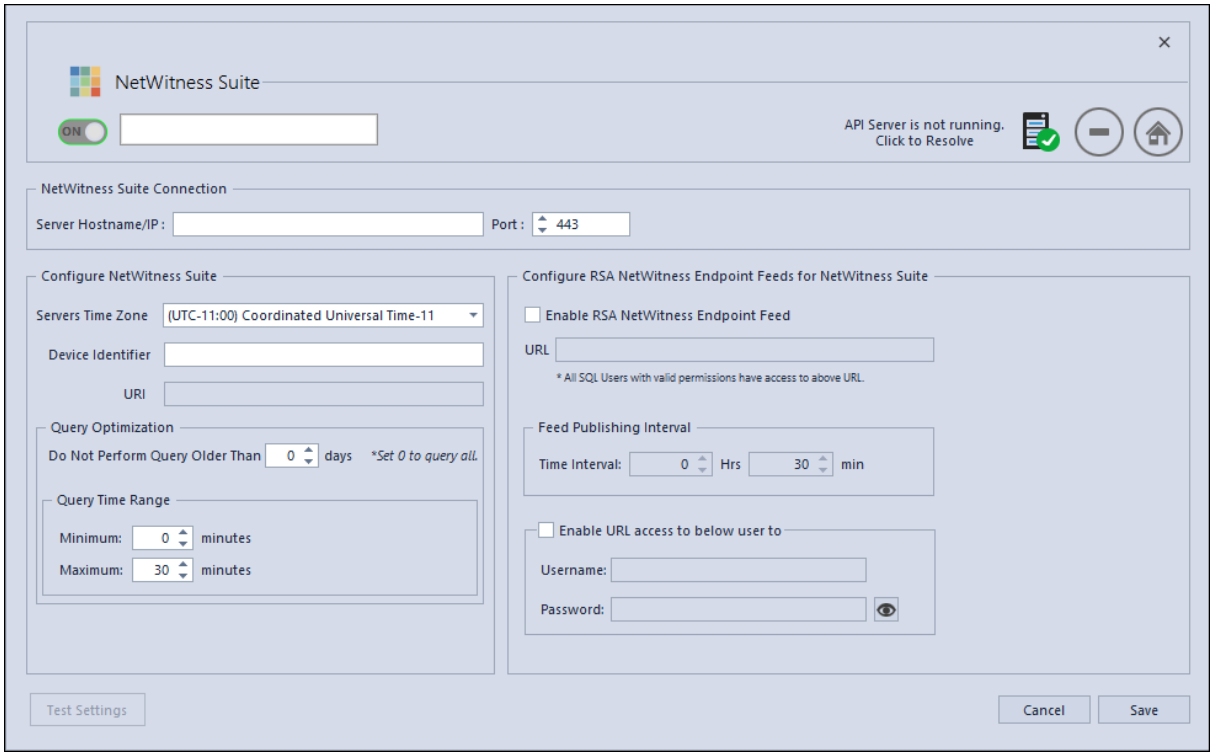
1. Enable the NetWitness Endpoint Feed for NetWitness in the NetWitness Endpoint User Interface.
2. Export the NetWitness Endpoint CA Certificate from the NetWitness Endpoint Console server and Import it into NetWitness trust store.
3. Configure the NetWitness Concentrator service to define which meta keys are indexed.
4. Create a recurring feed in NetWitness Live.

Enable the NetWitness Endpoint Feed for NetWitness



1. In the NetWitness Endpoint user interface, create SQL user in NetWitness Endpoint:
   a. Open the NetWitness Endpoint user interface and log on using the proper credentials.
   b. From the menu bar, select  **(Configure) > Manage Users and Roles**, right-click in the pane, and select **create sql user**.

The Create a new SQL User dialog is displayed.



c. Enter the **Login Name** and **Password** and click **Create**.

2. From the menu bar, select **(Configure) > Monitoring and External Components**.
   The External Components Configuration dialog is displayed.

3. In NetWitness, click +.
   The NetWitness dialog is displayed.

4. In the **NetWitness** panel, in **On**, enter the name to identify the NetWitness component.
5. In the **NetWitness Connection** panel, perform the following.
   a. In the **Server Hostname/IP** field, enter the host name or IP address of the NetWitness Server.
   b. In the **Port** field, enter the port number. By default port number is 443.
6. In the **Configure NetWitness** panel, perform the following:
   a. In the **Servers Time Zone** field, select the time zone for the component from the drop-down list.
   b. In the **Device Identifier** field, enter the NetWitness concentrator device ID.

   Note: You can find the Device Identifier in NetWitness when you look up a Concentrator or Broker in **Investigation > Navigate > <*Concentrator or Broker Name*>**. The Device Identifier is the number in the URL after "investigation." For example, in the URL `https://<IP address>investigation/319/navigate/values`, the Device Identifier is **319**.

   The **URI** field is populated when you click **Save**.
7. In the **Query Optimization** panel, in the **Do Not Perform Query Older Than** field, enter the number of days to limit the query period. Enter **0** if you want to discard this feature.

8. In the **Query Time Range** panel, perform the following:
   a. In the **Minimum** field, enter the number of minutes for the minimum query time range. This value is used to automatically increase the time range submitted to NetWitness. This ensures that a query returns a positive response if the NetWitness Endpoint Agent's reported time is slightly different than NetWitness Endpoint's time.
   b. In the **Maximum** field, enter the number of minutes to limit the time range. This value is used to automatically limit the time range submitted to NetWitness, so that a query does not overload the NetWitness Server.
9. In the **Configure NetWitness Endpoint Feeds for NetWitness** panel, perform the following:
   a. Select **Enable NetWitness Endpoint Feed**.
   b. In the **URL** field, enter the SQL **Username** and **Password** (configured in step 1) to access the location of the feed.
   The **URL** field is populated when you click **Save**.
   c. Enter the time interval for the frequency at which feeds are published.
10. In the **Feed Publishing Interval** panel, in the **Time Interval** field, select the time interval in **hrs** and **mins** for the frequency at which feeds are published.
11. In the **Enable URL access to below user to** panel, enter the **Username** and **Password** of the NetWitness Endpoint user.
12. Click **Save**.
    A feed is created.

Export the NetWitness Endpoint SSL Certificate

Note: This procedure works only for NetWitness 10.5 and above because Java 8 support was added for 10.5. If you are using an earlier version of NetWitness, refer to the applicable version of this guide.

To export the NetWitness Endpoint CA certificate from the NetWitness Endpoint Console server and copy it to the NetWitness host:

1. Log on to the NetWitness Endpoint Console.
2. Open **MMC**.
3. Add a certificate snap-in for **Computer account**.
4. Export the certificate named **`NweCA`** (in NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh install) or **`EcatCA`** (in NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5).
   a. Export without a private key.
   b. Export in DER encoded binary X.509 (`.CER`) format.
   c. Name it **`NweCA.cer`** (in NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh install) or **`EcatCA.cer`** (in NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5).

5. Copy the NetWitness Endpoint CA certificate to the NetWitness host:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5 or 4.4 fresh installation:
     `scp NweCA.cer root@<sa-machine>:.`
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5:
     `scp EcatCA.cer root@<sa-machine>:.`
6. To import the NetWitness Endpoint Endpoint CA certificate into the NetWitness Trusted store, navigate to java directory. Enter the following commands:
   - For NetWitness Endpoint fresh installation:
     `keytool -import -v -trustcacerts -alias nweca -file ~/NweCA.cer -keystore /etc/pki/java/cacerts -storepass changeit`
   - For NetWitness Endpoint upgraded from previous version:
     `keytool -import -v -trustcacerts -alias ecatca -file ~/EcatCA.cer -keystore /etc/pki/java/cacerts -storepass changeit`

   When prompted for certificate update confirmation, enter **Yes**.
7. Create a file `jetty.user` in the `/etc/default` directory and add the following text.
   `JAVA_OPTIONS="${JAVA_OPTIONS} -Djdk.security.allowNonCaAnchor=true"`
8. On the NetWitness host, do one of the following:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh installation, edit**`/etc/hosts.user`** to map the IP address of the NetWitness Endpoint Console server to the name **NweServerCertificate** by adding the following line to the file:

     `<ip-address-ecat-cs> NweServerCertificate`
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, edit **`/etc/hosts.user`** to map the IP address of the upgraded NetWitness Endpoint Console server to the name **`ecatserverexported`** by adding the following line to the file:

     `<ip-address-ecat-cs> ecatserverexported`
9. SSH to ADMIN Server and run the following command.
   `nw-manage --refresh-host --host-all`
10. To restart NetWitness, enter the following command:
    service jetty restart

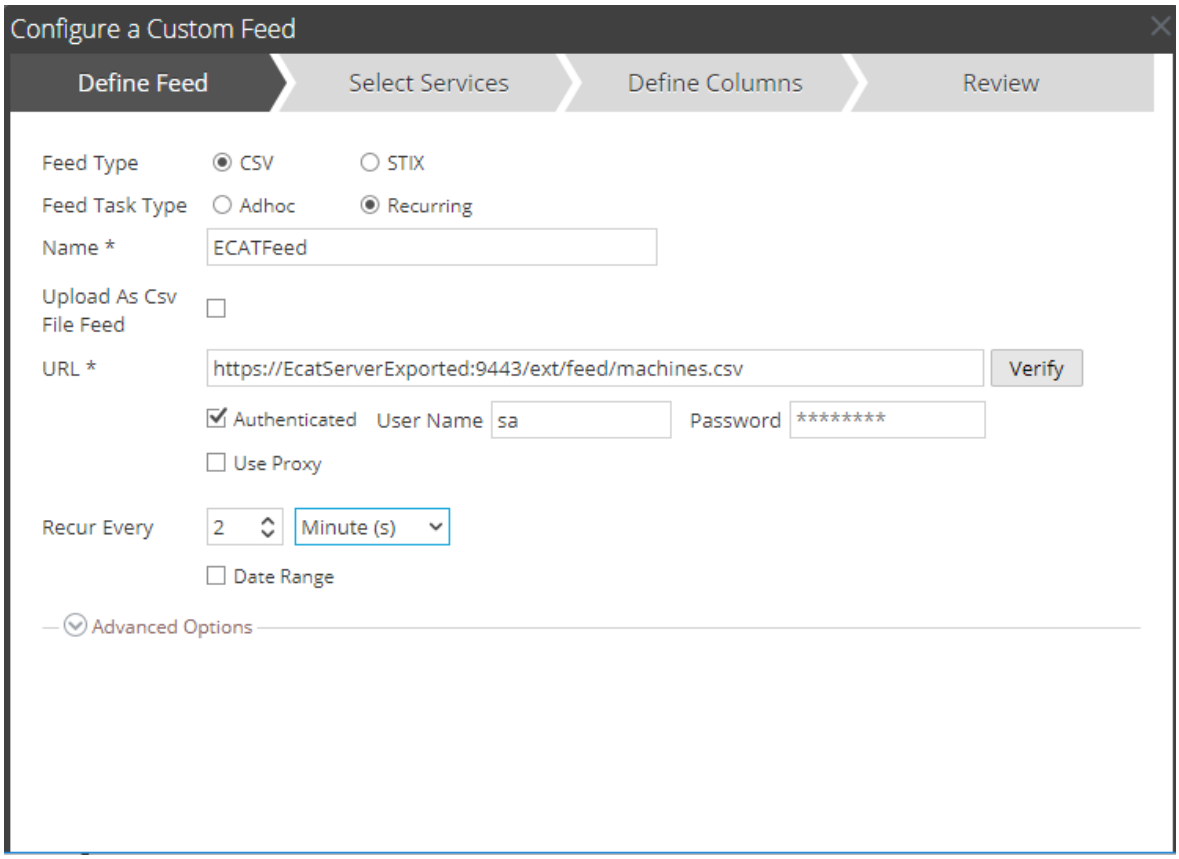
Configure the NetWitness Concentrator Service

1. Log on to NetWitness and go to  **(Admin) > Services**.
2. Select a **Concentrator** from the list and select **View > Config.**
3. Select the **Files** tab, and from the **Files to Edit** drop-down menu, select **index-concentrator-custom.xml**.
4. Add the following NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them. The following lines are examples; make sure the values match your configuration and the column names you included in

the feed definition, where:
description is the name of the meta key you want to display in NetWitness Investigation.
level is "IndexValues"
name matches the column name of the CSV file that NetWitness uses while defining the recurring feed (see the table in *Configure the Recuring Custom Feed Task in NetWitness* below).

```
<key description="Gateway" format="Text" level="IndexValues" name="gateway"
valueMax="250000" defaultAction="Open"/>
<key description="Risk Number" format="Float64" level="IndexValues"
name="risk.num" valueMax="250000" defaultAction="Open"/>
<key description="Strans Addr" format="Text" level="IndexValues"
name="stransaddr" valueMax="250000" defaultAction="Open"/>
<key description="Domain" format="Text" level="IndexValues" name="domain"
valueMax="250000" defaultAction="Open"/>
<key description="User Account" format="Text" level="IndexValues"
name="username" valueMax="250000" defaultAction="Open"/>
<key description="Ecat Connectiontime" format="Text" level="IndexValues"
name="ecat.ctime" valueMax="250000" defaultAction="Open"/>
<key description="Ecat Scantime" format="Text" level="IndexValues"
name="ecat.stime" valueMax="250000" defaultAction="Open"/>
```

5. Restart the Concentrator to activate the custom key updates.

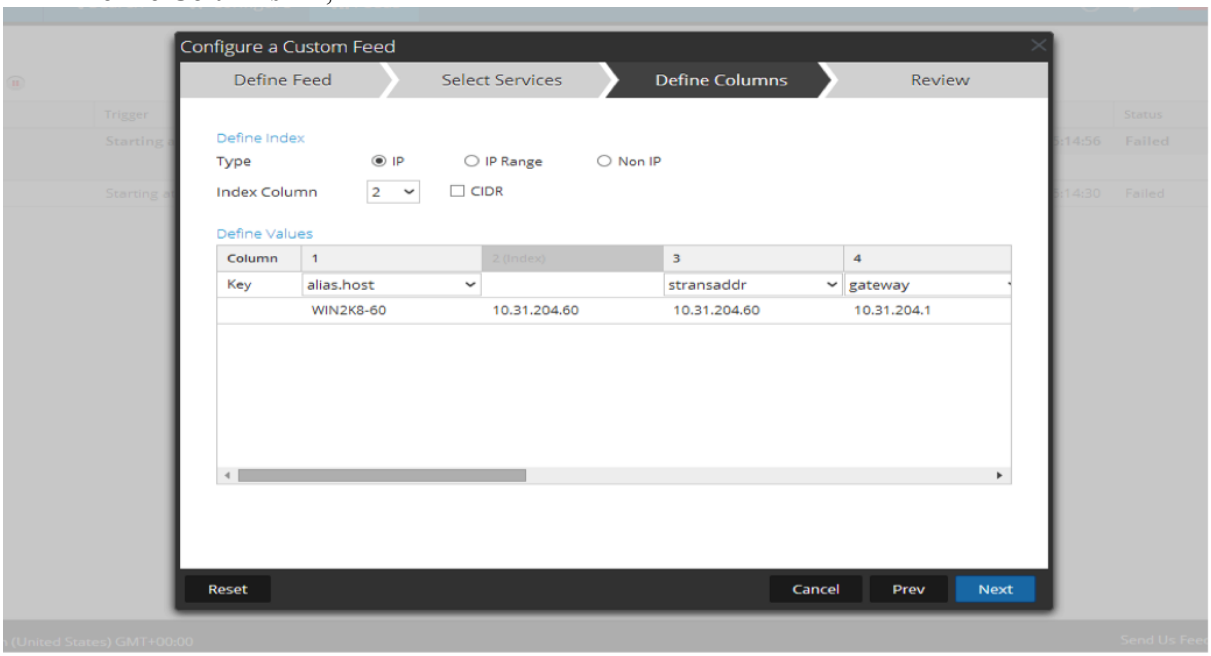


Configure the Recurring Custom Feed Task in NetWitness

1. Log on to NetWitness and go to  **(Configure) > Custom Feeds**.
   The Feeds view is displayed.
2. In the toolbar, click .
   The Setup Feed dialog is displayed.
3. In the Setup Feed dialog, select **Custom Feed** and click **Next**.
   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.
4. In the **Define Feed**, perform the following:
   a. In the **Feed Type** field, select **CSV**.
   b. In the **Feed Task Type** field, select **Recurring**.
   c. In the **Name** field, enter the name of the feed. For example, EndpointFeed.
   d. Enable the **Upload As Csv File Feed** checkbox to upload the feed as a CSV file.
   e. In the **URL** field, enter the URL with the hostname of the Windows server on which NetWitness Endpoint is installed:
      - For NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh installation, use the URL **`https://NweServerCertificate:9443/api/v2/feed/machines.csv`**.
      - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, use the URL **`https://ecatserverexported:9443/api/v2/feed/machines.csv`**.

f. Enable the **Authenticated**checkbox and enter the username and password as noted in *Enable the ECAT Feed* above.

g. Click **Verify** to check if NetWitness can reach the web resource.

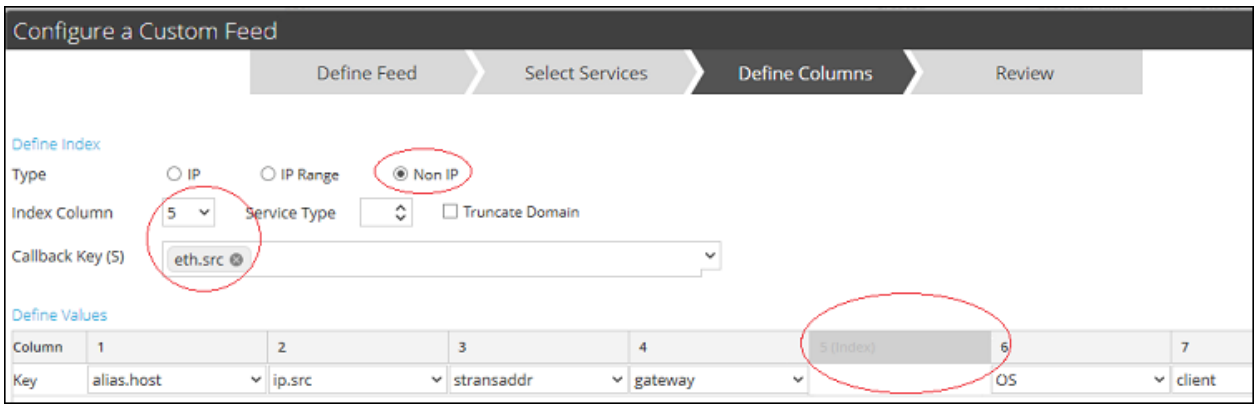


.

h. Define the schedule and click **Next**

5. In the **Select Services** tab, select the Decoder or groups to consume the feed. Click **Next**.

6. In the **Define Columns** tab, enter the column names as shown in the table below and save the feed.



The following table shows the columns in the CSV file for the NetWitness Endpoint feed.

Column	Name	Description	Column Name in NetWitness (Meta Key Name)
1	MachineName	Host name of the Windows agent	alias.host
2	LocalIp	IPv4 address	IP type (indexed column)
3	RemoteIp	Far end IP as seen by the router	stransaddr
4	GatewayIp	IP of the gateway	gateway
5	MacAddress	MAC address	eth.src
6	OperatingSystem	Operating system used by the Windows Agent	OS
7	AgentID	Agent ID of the host (unique ID assigned to the agent)	client
8	ConnectionUTCTime	Last time when the agent connected to NetWitness Endpoint server	ecat.ctime
9	Source Domain	Domain	domain.src
10	ScanUTC time	Last time when the agent was scanned	ecat.stime

Column	Name	Description	Column Name in NetWitness (Meta Key Name)
11	UserName	Username of the client machine	username
12	Machine Score	Score of the agent indicating the suspicious level	risk.num

Note: In the table, the recommended index setting is LocalIp. However, if the LocalIp for NetWitness Endpoint Agent PC is allocated by a DHCP Server and the DHCP lease has expired, and if the IP is then re-allocated to another PC, the metadata created by the feed will be incorrect. To avoid this risk, use the machine name or the Mac address instead of the localIP address as the Feed's index. For example, to use a Mac address, you could enter the values as shown in the following figure.

Result

When viewing feed data in NetWitness, upon a match of the indexed value (ip.src), meta data is populated in Investigation, Reporting, and Alerting Interfaces.

Configure Endpoint Alerts Through Syslog into a Log Decoder

You can configure the use of NetWitness Endpoint data in NetWitness to provide NetWitness Endpoint alerts through Syslog into Log Decoder sessions. This generates metadata that is used by NetWitness Investigation, Alerts, and Reporting Engine.

For NetWitness networks that are consuming logs, this integration of NetWitness Endpoint with NetWitness pushes NetWitness Endpoint events to the Log Decoder through common event format (CEF) syslog messages and generates metadata that is used by NetWitness Investigation, Alerts, and Reporting Engine. The use case for this integration is SIEM Integration to allow centralized event management, correlation of NetWitness Endpoint events with other Log Decoder data, NetWitness reporting on NetWitness Endpoint events, and NetWitness alerting of NetWitness Endpoint events.

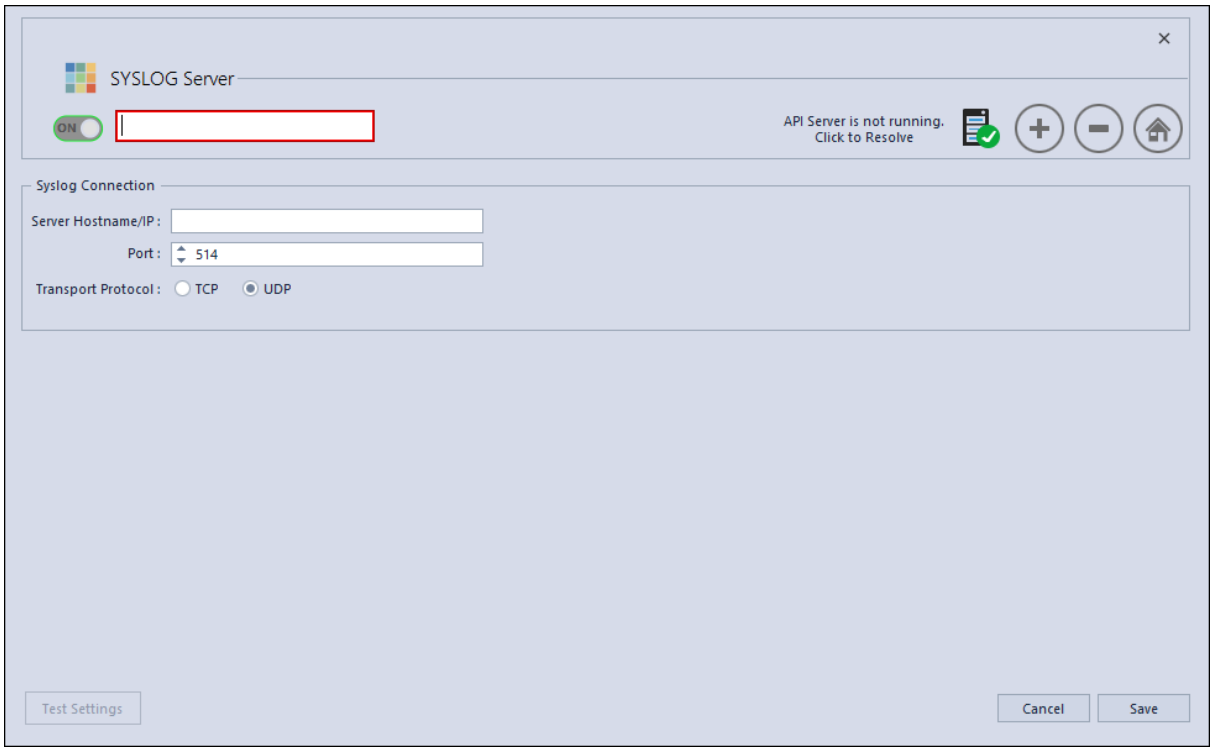
Prerequisites

The following are required for this integration:

- Version 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later NetWitness Endpoint UI.
- NetWitness Server Version 11.1 is installed.
- Version 10.4 or later NetWitness Log Decoder and Concentrator connected to the NetWitness Server in the network.
- Port UDP- 514 or TCP - 1514 open from NetWitness Endpoint server to Log Decoder in the firewall.

Procedure

1. Deploy the required parser (CEF or rsaecat) to the Log Decoder as described in the "Manage Live Resources" topic in *Live Services Management*. After you deploy the parser, make sure the parser is enabled. For more information, see "Services Config View - General Tab" in the *Malware Analysis Configuration Guide*.

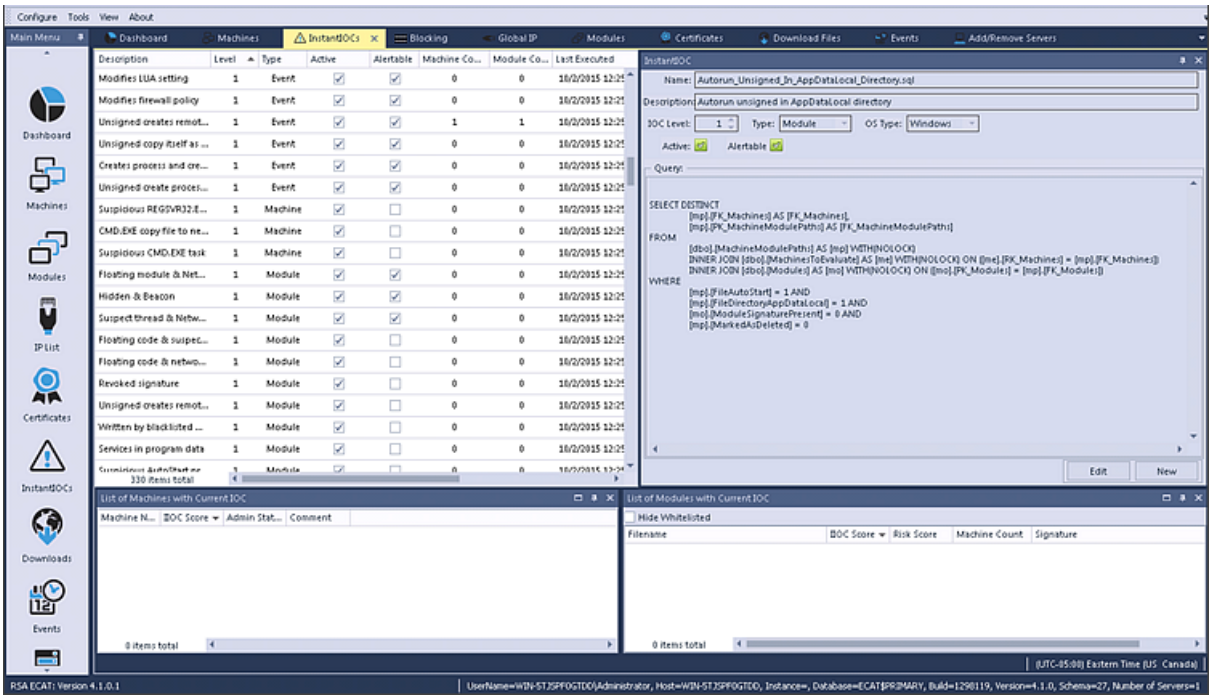


Note: Use only one of these parsers. When the CEF parser is deployed, it supersedes the NetWitness Endpoint parser, and all CEF messages into NetWitness are processed by the CEF parser. Enabling both parsers is an unnecessary burden on performance.

2. Configure NetWitness Endpoint to send syslog output to NetWitness and generate NetWitness Endpoint alerts to the Log Decoder.
3. (Optional) Edit the table mapping in `table-map-custom.xml` and the `index-concentrator-custom.xml` to add fields based on user preferences for metadata to be mapped to NetWitness.

Configure NetWitness Endpoint to Send Syslog Output to NetWitness

To add the Log Decoder as a Syslog external component and generate NetWitness Endpoint alerts to the Log Decoder:



1. Open the NetWitness Endpoint user interface and log on using the proper credentials.
2. From the menu bar, select **(Configure) > Monitoring and External Components**.
   The External Components Configuration dialog is displayed.
3. In **SYSLOG Server**, click .
   The SYSLOG Server dialog is displayed.

4. In the **NetWitness** panel, in **On**, enter the descriptive name for the Log Decoder.
5. In the **Syslog Connection** panel, perform the following to enable Syslog messaging:

   Server Hostname/IP = The hostname DNS or IP address of the NetWitness Log Decoder
   Port = 514
   Transport Protocol = Select **UDP** or **TCP** as appropriate for your Syslog server for the transport protocol.

6. Click **Save**.
7. Open the **InstantIOCs** window in the NetWitness Endpoint UI and, in the **Alertable** column, click to enable each IIOC for which you want alerts sent to the Log Decoder.

When the instant IOCs are triggered, Syslog alerts from the NetWitness Endpoint server are sent to the Log Decoder. Log Decoder alerts are then aggregated to the Concentrator. These events are injected into the Concentrator as metadata.

Edit the Table Mapping in table-map-custom.xml

In the default NetWitness table-map.xml provided by NetWitness, the meta keys in the `table-map.xml` file are set to `Transient`. In order to view the meta keys in Investigation, the keys must be set to `None`. To make changes to the mapping, you must add the entries to the `table-map-custom.xml` on the Log Decoder.

This is the list of meta keys in `table-map.xml`.

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
agentid	client	No
CEF Header Hostname Field	alias.host	No
CEF Header Product Version	version	No
CEF Header Product Name	Product	Yes
CEF Header Severity	severity	Yes

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
CEF Header Signature ID	event.type	No
CEF Header Signature Name	event.desc	No
destinationDnsDomain	ddomain	Yes
deviceDnsDomain	domain	Yes
dhost	host.dst	No
dst	ip.dst	No
end	endtime	Yes
fileHash	checksum	No
fname	filename	No
fsize	filename.size	No
gatewayip	gateway	Yes
instantIOCLevel	threat.desc	No
instantIOCName	threat.category	No
machineOU	dn	No
machineScore	risk.num	No
md5sum	checksum	No
os	OS	No
port	ip.dstport	No
protocol	protocol	Yes
Raw Message	msg	Yes
remoteip	stransaddr	Yes
rt	alias.host	No
sha256sum	checksum	No
shost	host.src	No
smac	eth.src	No
src	ip.src	No
start	starttime	No
suser	user.dst	No
timezone	timezone	No

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
totalreceived	rbytes	Yes
totalsent	bytes.src	No
useragent	user.agent	No
userOU	org	Yes

The following seven keys are not in `table-map.xml`; to use these keys in NetWitness you need to add them to `table-map-custom.xml`, and set the flags to `None`.

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
moduleScore	cs.modulescore	Yes
moduleSignature	cs.modulesign	Yes
Target module	cs.targetmodule	Yes
YARA result	cs.yararesult	Yes
Source module	cs.sourcemodule	Yes
OPSWATResult	cs.opswatresult	Yes
ReputationResult	cs.represult	Yes

Here are the entries to be added to the `table-map-custom.xml` if required.

```
<mapping envisionName="cs_represult" nwName="cs.represult" flags="None"
envisionDisplayName="ReputationResult"/>
 <mapping envisionName="cs_modulescore" nwName="cs.modulescore" format="Int32"
flags="None" envisionDisplayName="ModuleScore"/>
 <mapping envisionName="cs_modulesign" nwName="cs.modulesign" flags="None"
envisionDisplayName="ModuleSignature"/>
 <mapping envisionName="cs_opswatresult" nwName="cs.opswatresult" flags="None"
envisionDisplayName="OpswatResult"/>
 <mapping envisionName="cs_sourcemodule" nwName="cs.sourcemodule" flags="None"
envisionDisplayName="SourceModule"/>
 <mapping envisionName="cs_targetmodule" nwName="cs.targetmodule" flags="None"
envisionDisplayName="TargetModule"/>
 <mapping envisionName="cs_yararesult" nwName="cs.yararesult" flags="None"
envisionDisplayName="YaraResult"/>
```

Note: Restart the Log Decoder or reload the log parsers for the changes to take effect.

Configure the NetWitness Suite Concentrator Service

1. Log on to NetWitness and go to  **(Admin) > Services**.
    1. Select a **Concentrator** from the list and select **View > Config.**
2. Select the **Files** tab, and from the **Files to Edit** drop-down list, select **index-concentrator-custom.xml**.

3. Add the NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them.
4. Restart the Concentrator.
5. To add the Concentrator as a data source in the Reporting Engine, in the  **(Admin) > Services** view, select the **Reporting Engine** and Select **View> Config > Sources.**
   NetWitness Endpoint meta is populated in Reporting Engine, and you can run reports by selecting the appropriate meta keys.

Example

Note: The following lines are examples; make sure the values match your configuration and the column names you included in the feed definition, where:
description is the name of the meta key you want to display in NetWitness Investigation.
level is "IndexValues"
name is the NetWitness Endpoint meta key name from the table below

```
<language>
<key description="Product" format="Text" level="IndexValues" name="product"
valueMax="250000" defaultAction="Open"/>
 <key description="Severity" format="Text" level="IndexValues" name="severity"

 <key description="Strans Address" format="Text" level="IndexValues" name="stransaddr"
valueMax="250000" defaultAction="Open"/>
 </language>
```

Result

Analysts can:

- Create NetWitness alerts based on NetWitness Endpoint events by configuring NetWitness Endpoint events as an enrichment source.
- Create ESA rules using NetWitness Endpoint meta as described in the "Add Rules to the Rules Library" topic in the *Alerting Using ESA Guide*.
- Report on NetWitness Endpoint events using NetWitness Endpoint meta as described in the "Configure a Rule" topic in the *Reporting Guide*.
- View NetWitness Endpoint alerts in NetWitness Respond as described in the "View Alerts" topic in *NetWitness Respond User Guide*.
- View NetWitness Endpoint meta keys in Investigation along with standard NetWitness core meta keys as described in the "Conduct an Investigation" topic in *Investigation and Malware Analysis User Guide*.

What is NetWitness Endpoint?

RSA NetWitness Endpoint is an endpoint detection and response tool that continuously monitors the behavior of all endpoints in the network to provide deep visibility and analysis of executables and processes. It helps to detect new, unknown, and targeted attacks, highlights suspicious activity for investigation, exposes anomalous behaviors, and determines the scope of compromise to help analysts respond to advanced threats faster.

About this Guide

This guide provides end-to-end instructions to configure NetWitness Endpoint and to use Endpoint features.

RSA NetWitness Platform Documentation in NetWitness Community Portal

NetWitness Platform product documentation is organized along functional lines. If you are looking for a specific guide or version, go to the a.

Use these links to view the NetWitness Platform 11.x documentation. Both links provide the same documentation, in these two formats:

- HTML Guides include the latest information for currently supported 11.x versions: NetWitness Platform 11.x Documentation.
- PDF Guides provide the information for a specific version: NetWitness Platform 11.7 PDFs.

Use these links to access documentation that is not related to a particular version of the software:

- Hardware setup guides: https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation
- Documentation for RSA Content such as feeds, parsers, application rules, and reports: https://community.netwitness.com/t5/netwitness-platform-threat/tkb-p/netwitness-threat-intelligence.

Getting Started

Introduction to Endpoint Investigation

NetWitness Investigate provides data analysis capabilities in NetWitness, so that analysts can analyze packet, log, endpoint, and UEBA data, and identify possible internal or external threats to security and the IP infrastructure. This guide helps analysts perform investigations of endpoint data using NetWitness Investigate.

Note: In Version 11.1 and later, the Hosts and Files views provide a view into endpoint data. Earlier versions offer access to endpoint data using a standalone NetWitness Endpoint server.

For more information, see the *NetWitness Endpoint Quick Start Guide*, the *NetWitness Investigate Quick Start Guide*, and the *NetWitness Investigate User Guide*.

Endpoint Metadata

Endpoint metadata is generated when hosts are scanned and when there are real-time activities on the hosts. You can view the following categories of sessions when metadata forwarding is enabled:

Operating System	Scan Categories & Real-time events	Tracking Categories

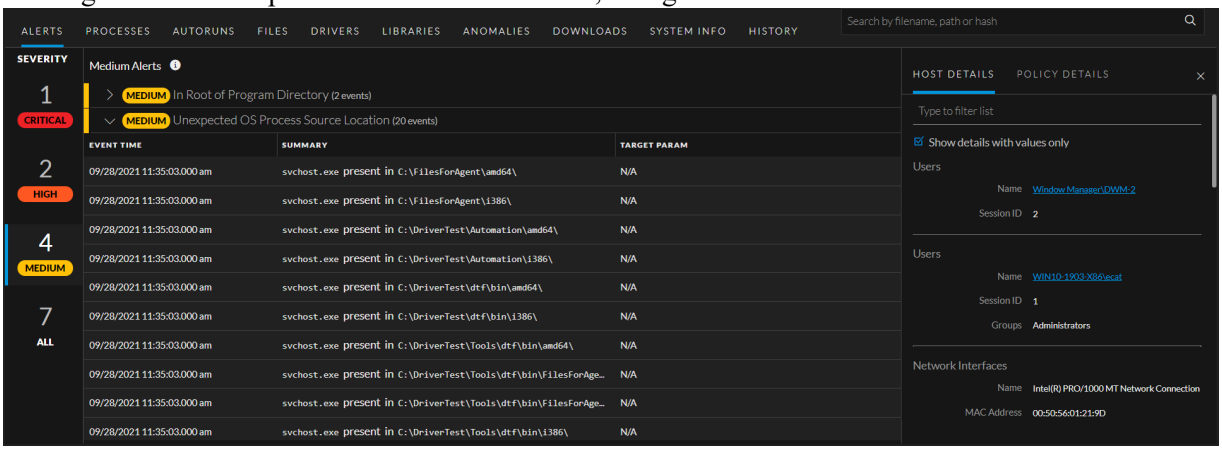
Windows	file, service, dll, process, task, autorun, machine, kernel hook, image hook, registry discrepancies, suspicious threads and removable device(USB) detection	• Process event - Reports any process related activities, such as `openprocess`, `openosprocess`, `createprocess`, `createremotethread`, `openbrowserprocess`.
		• File event - Reports any file related activities by an executable, such as `readdocument`, `writetoexecutable`, `renameexecutable`, `selfdeleteexecutable`, `openphysicaldrive`.
		• Registry event - Reports activities that result in registry creation or modification, such as `modifyservicesimagepath`, `modifyfirewallpolicy`, `createservicesimagepath`, `createsecuritycenterconfiguration`, `modifybadcertificatewarningsetting`, `Modifies Startup Folder Location`, `Modifies Winlogon Registry Settings`, `Registers Time Provider Dll`, `Registers Port Monitor Dll`, `Registers Netsh helper Dll`, `Registers AppInit Dll`, `Registers AppCert Dll`,
		• System event - Reports connection of removable devices(USB devices), IP change and boot events such as, `removableDeviceConnected`, `removableDeviceDisconnected`
		• Network event - TCP/UDP and incoming/outgoing.
		  • Reports outbound and inbound network connections on all supported Windows platforms.
		  • Reports IPv4 and IPv6 connections.
		• Console event (for Windows 8 and later) - User input that is entered into a console application, such as `cmd.exe`, `powershell.exe`, is captured and reported with the context `console.local`.
		Commands executed by `cmd.exe`, `powershell.exe` as a result of inter-process communication through anonymous pipes are captured and reported with the context `console.remote`.

Operating System	Scan Categories & Real-time events	Tracking Categories
		For example, `Get-Item -Path Registry::HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion`.
Linux	file, autrorun, loaded library, systemd, process, cron, initd, and machine	-

Mac	file, daemon, process, task, dylib, autorun, and machine	• Process event - Reports any process related activities, such as `openprocess`, `createprocess`, `openosprocess`, `openbrowserprocess`, `allocateremotememory`, `createremotethread`.
		• File event - Reports any file related activities by an executable, such as `writetoexecutable`, `renameexecutable`, `createautorun`, `deleteexecutable`, `selfdeleteexecutable`, `writetoplist`, `writetosudoers`, `createbrowserextension`.
		• Network event - TCP/UDP and incoming/outgoing.
		  • Reports outbound and inbound network connections on all supported Mac operating system.
		  • Reports IPv4 and IPv6 connections.

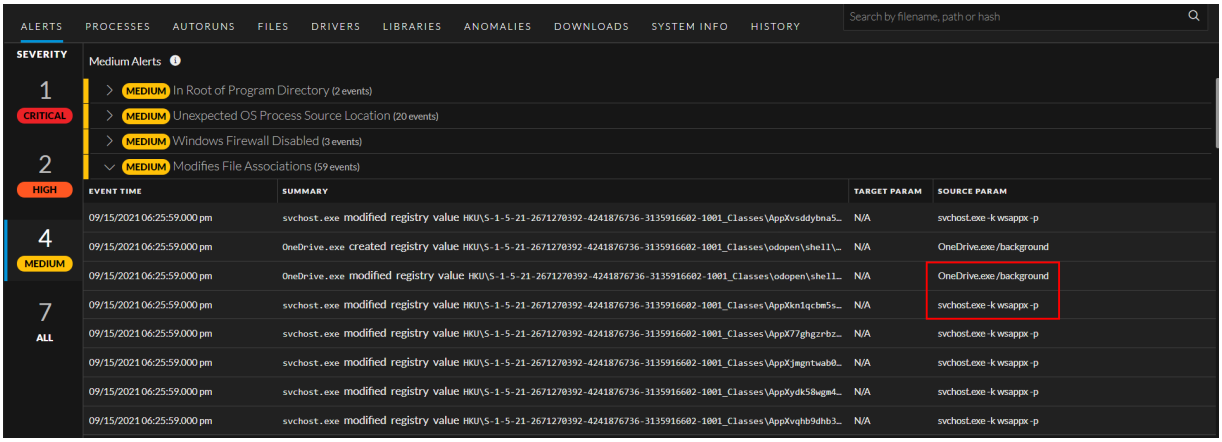
For more information on metadata, meta keys, meta values, and meta entities, see the *NetWitness Investigate User Guide*.

Risk Score



Analysts can use the risk score to begin an investigation on hosts and files. NetWitness uses a proprietary algorithm to calculate the risk scores ranging from 0 to 100. A subset of alerts associated with hosts and files contribute to the risk score calculation. Analysts can review critical and high alerts associated with a risk score to identify strong evidence of malicious activity and take required action.

Note: If you have an Insights agent, you can view the risk score for files but not for hosts. To view the risk score for hosts, upgrade to the Advanced agent. For more information, see the *NetWitness Endpoint Configuration Guide*.



The following factors contribute to the risk score:

- **Distinct Alerts.** Any host or file activities that are suspicious or malicious generate alerts. Only the distinct alerts are used for risk score calculation.
- **Severity of Alerts.** Severity of alerts, such as critical, high, and medium.

  This figure is an example of a host with 1 Critical, 2 High and 4 Medium distinct alerts.

  All the distinct alert shown in the above example can be for the same file or different files. For example, Modifies File Associations alert is triggered for files, such as `svchost.exe` and `OneDrive.exe`.

  This figure is an example of a file with the Critical alert. The file can have a same alert name being triggered by two different hosts as shown below.

The risk score is reset when you perform any of the following actions:

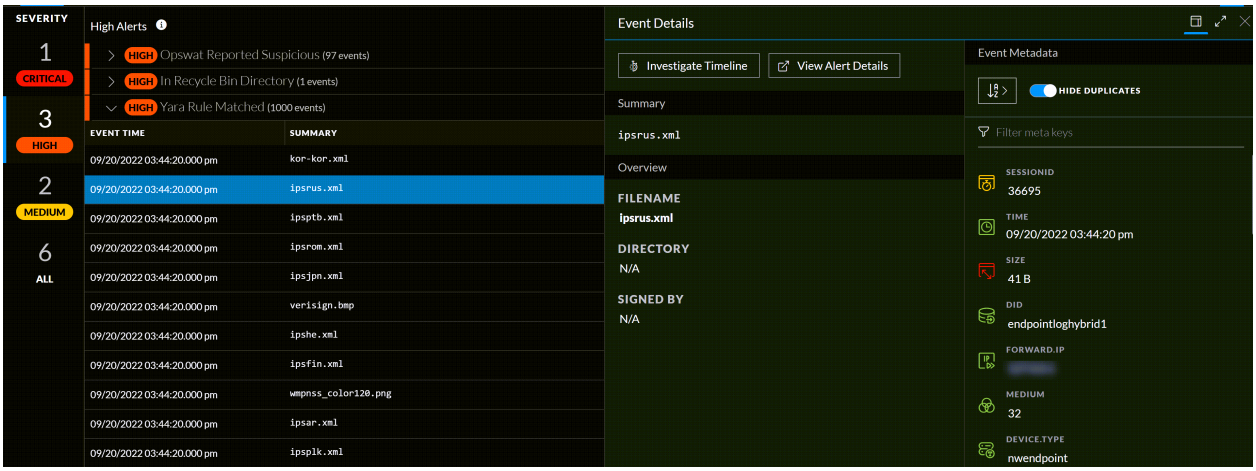
- Whitelist or blacklist a file after investigation. The risk score of a file is set to 0 on whitelisting and set to 100 on blacklisting.
- If the alerts or events triggered by the host or files on the host are false positive, you make changes to the Endpoint Application rules or ESA rules and reset the risk score.

Besides the above factors, the risk score is reset when a file no longer matches Yara rules in the subsequent scans

Note: When you whitelist a file or reset the risk score, the alerts that contributed to the risk score are not shown in the Host Details tab.

The host risk score depends on the risk score of all the files on the host. When you change the file status or reset the file risk score, the host risk score is recalculated. For example, the score for all the hosts on which a blacklisted file is present is recalculated and becomes 100. If the host is not found to be infected, you can reset the host risk score. This deletes the alerts contributed to the risk score and does not impact the global file score. For more information on changing the file status, see Changing File Status or Remediate.

Note: For the risk score calculation, the ESA Correlation server must be configured with an Endpoint Concentrator. The application rules are automatically deployed on installation. For an upgrade, you must deploy the application rules from RSA Live. For more information, see the *NetWitness Endpoint Configuration Guide*.



Note: For the accurate risk score calculation, the default multi-valued meta keys are required on the ESA Correlation service. For more information, see "Configure Meta Keys as Arrays in ESA Correlation Rule Values" section in the *ESA Configuration Guide*.

Severity of Alerts

The following table depicts the risk score range based on the associated alert severity:

Severity	Color	Risk Score Range
Critical	Red	100
High	Orange	70-99
Medium	Yellow	31-69
Low	Green	0-30

The following is an example of alerts contributing to the risk score:

In the above example, there are three distinct High alerts. For each alert type, associated events are displayed. The details of the events are displayed with the metadata information. For more information on severity alerts and metadata information, see Analyze Hosts Using the Risk Score and Analyze Files Using the Risk Score.

Global and Local Risk Score

Analysts can get better context on file activities on hosts using the global risk score and the local risk score of a file.

Global Risk Score - The global risk score is an aggregate of all suspicious and malicious activities performed by the file across all hosts. This score indicates the potential threat posed by the file across the NetWitness Platform.

Local Risk Score - The local risk score is calculated on suspicious or malicious activities performed by the file on a specific host. The local risk score is used for the host risk score calculation.

For more information on the global and local risk score, see Investigating Files and Investigating Hosts.

Automated Incident Creation Based on Risk Score

By default, a threshold is set for the risk score to control the generation of incidents and alerts in NetWitness Respond. For more information on configuring the threshold limit, see the *NetWitness Respond Configuration Guide*.

File Reputation

The File Reputation service available on RSA Live checks the reputation of every file hash against an extensive database of known file hashes updated in real-time. The file reputation is displayed on the Investigate and Respond views.

The reputations for a file hash are:

Reputation	Description
Malicious	File hash is labeled as malicious.
Suspicious	File hash is suspected to be malicious.
Unknown	File hash is not known.
Known	File hash information is known to the file reputation service and does not have any previous bad record.
Known Good	File hash information is known good, such as files signed by Microsoft or RSA.
Invalid	File hash format is invalid.

The suspicious or malicious files are available for further analysis in the **Investigate > Navigate** view and **Investigate > Events** view. For more information on the file reputation service, see the *Live Services Management Guide*.

Note: The File Reputation service supports maximum of 10 million files for a reputation of file hash.

File Status

To help analysts triage and focus on their investigation, NetWitness provides capabilities to manage suspect and legitimate files. For example, you can whitelist files that are legitimate (such as security products), or blacklist files based on known threats and investigation.

A file can be classified as follows:

- Blacklist: File that is marked suspicious, such as when ransomware is found by scan.
- Graylist: File that is marked for a later review.

- Whitelist: File that is legitimate and is not to be considered for risk scoring.
- Neutral: Default status.

For more information, see Changing File Status or Remediate.

Remediation

If a file is malicious or infected, you can block the file to prevent future execution on any host. Remediation helps to:

- Stop or reduce the spread of identified malware, such as viruses, trojans, rootkits, worms, spyware, and adware.
- Identify attempted breach points to aid in deeper analysis; all events are time-stamped allowing analysts to trace backward to identify the entry point.
- Remove unwanted software, such as adware, which can potentially mask real malware.
- Stop all actions possible by the loader.

You can block files with the following file extension: EXE, COM, SYS, DLL, SCR, OCX, BAT, PS1, VBS, VBE, and VB. For more information, see Changing File Status or Remediate.

Network Isolation

If you suspect that a host is potentially compromised with the threat still being active, you can isolate the host from the network and safely investigate possible threats within the host. By isolating the host, you can control the spread of an attack and analyze the malware behavior. When a host is isolated, only connection to the following IP addresses are allowed:

- Endpoint Server, Relay Server, DNS, DHCP, Gateways, 0.0.0.0, and 255.255.255.255.
- Other IP addresses that you include in the exclusion list.

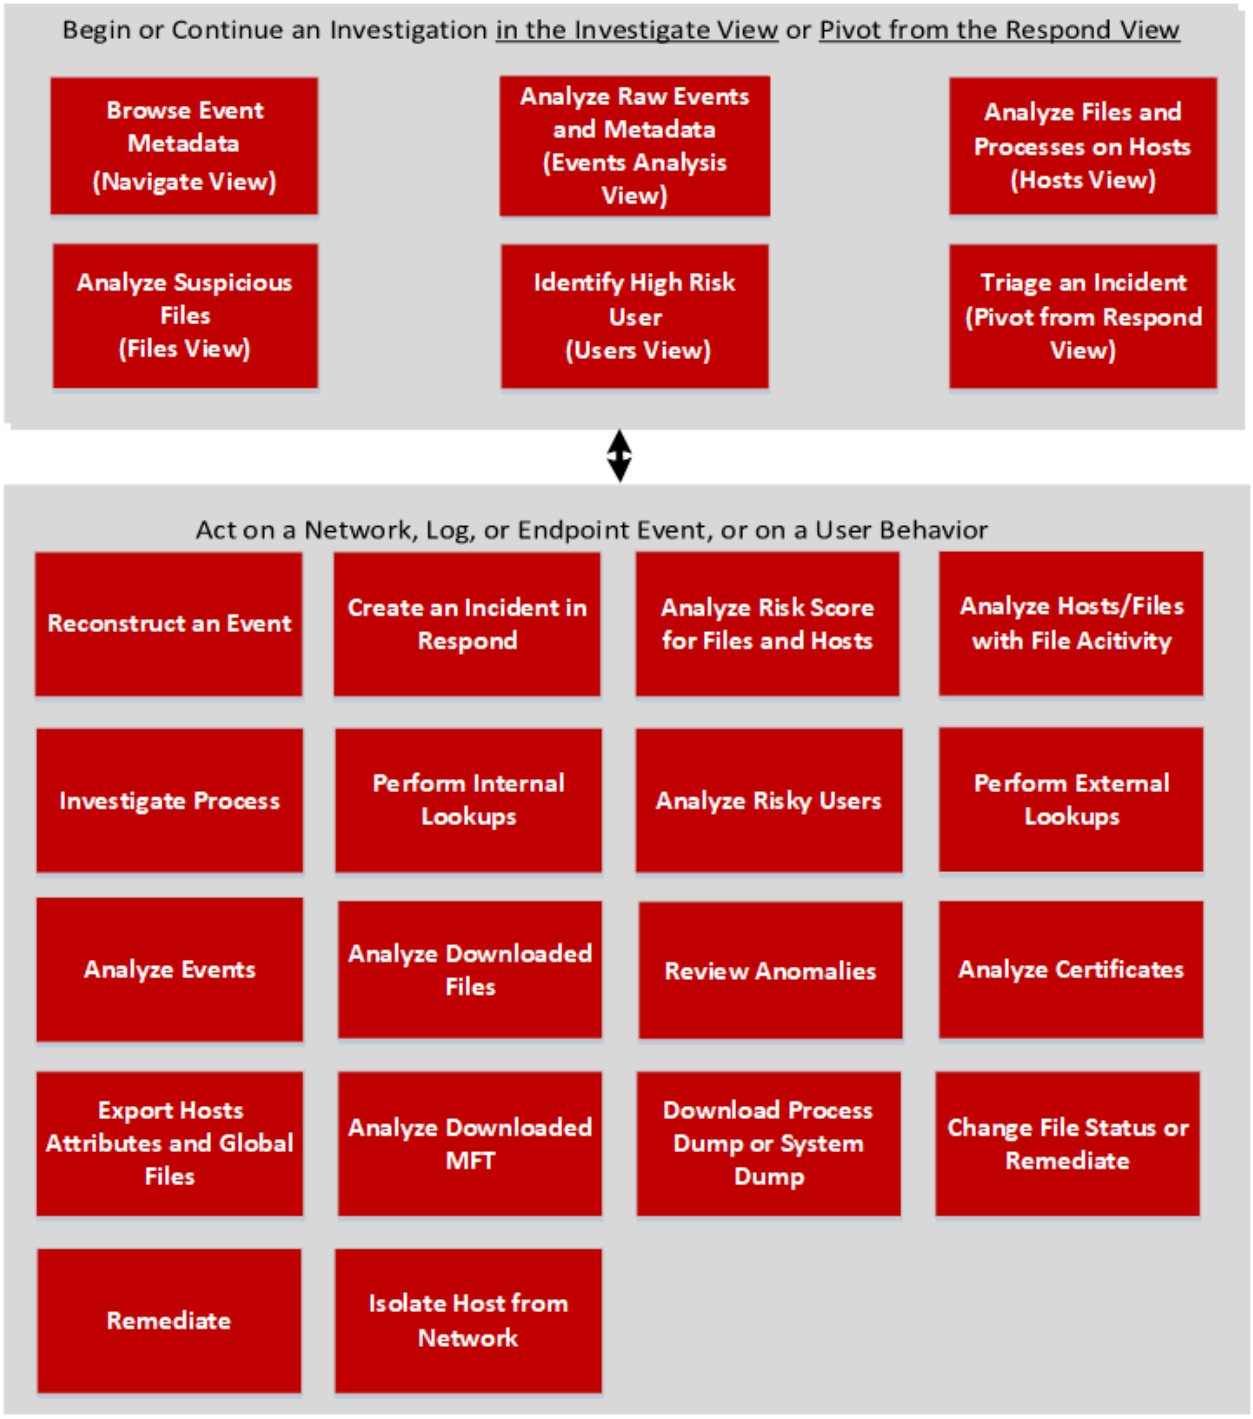
In the isolated state, all events are reported to the Endpoint Server retaining full visibility into activities on the host. You can continue investigation by requesting scans, downloading MFT, files, and so on. The following metadata is added to the network events:

- network.isolated - indicates that the host is isolated.
- network.connectallowed - indicates that the network connection is allowed as the IP address is included in the exclusion list.
- network.connectblocked - indicates that the network connection is blocked.

Note: If the agent is enabled for log or file collection, make sure that you add the Log Decoder IP addresses in the exclusion list while you isolate the host.

For more information, see Isolating Hosts from Network.

Focusing on Endpoint Analysis



This guide provides the information needed to conduct an investigation that is focused on endpoint data from configured hosts. Analysts who conduct analysis using Investigate need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in Roles and Permissions for Endpoint Analysts. For more information on roles and permissions, see the *System Security and User Management Guide*.

To hunt for information on hosts that have the agent running, begin the investigation in the Hosts view (**Hosts**). For every host, you can see processes, drivers, DLLs, files (executables), services, anomalies, and autoruns that are running, and information related to logged-in users. (See Investigating Hosts.)

You can begin the investigation on files in your deployment in the Files view (**Files**). (See Investigating Files.)

Note: To access the Hosts and Files views, you must have the `endpoint-server.filter.manage` permission.

Analysts use the Hosts and Files views to investigate or perform analysis on hosts or files using attributes such as IP address, host name, Mac address, risk score, and so on. This figure shows the high-level capabilities of an endpoint investigation. The top box are all the possible starting points, and the lower box shows the tasks that you can accomplish from different starting points.

Begin or Continue an Investigation in the Investigate View or Pivot from the Respond View

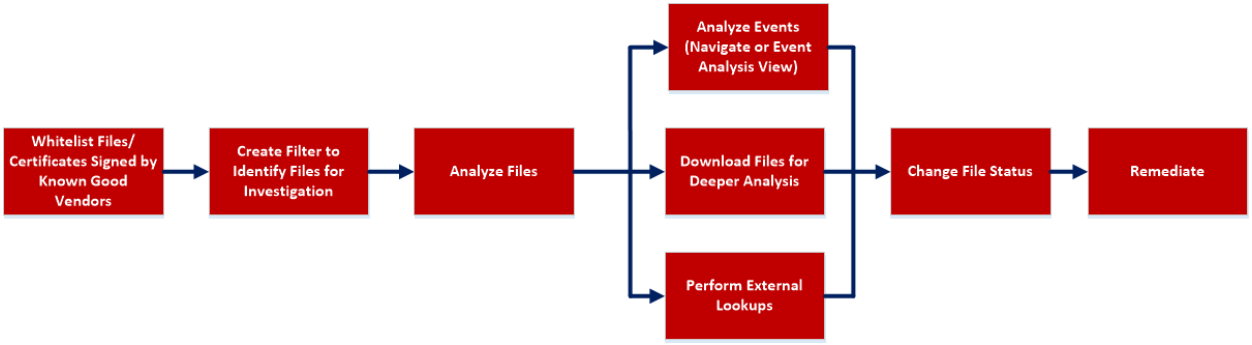
Isolate Host from Network



Investigating Files

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Files view provides a holistic view of all files in your NetWitness platform. You can apply various filters, sort, and categorize files into different status to reduce the number of files for analysis and identify suspicious or malicious files.

Best Practices

The following are some best practices and tips that may help you investigate efficiently to identify and isolate threats or attacks:

- Whitelist all files signed by RSA, Microsoft, and any other known good vendors. Use the filters to list the files and change the status of all these files to whitelist. For more information, see Filter Files and Changing File Status or Remediate.

  Note: Some Microsoft signed files are restricted from whitelisting as there is a potential risk of them being used for malicious purposes. To view the list, see Files Restricted from Whitelisting.

- Change the status of certificate and the associated files automatically. For more information, see Analyze Certificates.
- Filter to exclude whitelisted, files with valid signature, known good files based on reputation status. For more information, see Filter Files.
- Lookup Google or VirusTotal with the filename or hash to get more information about a suspected file. For more information, see Launch an External Lookup for a File.
- Analyze the files using one or more of these indicators:

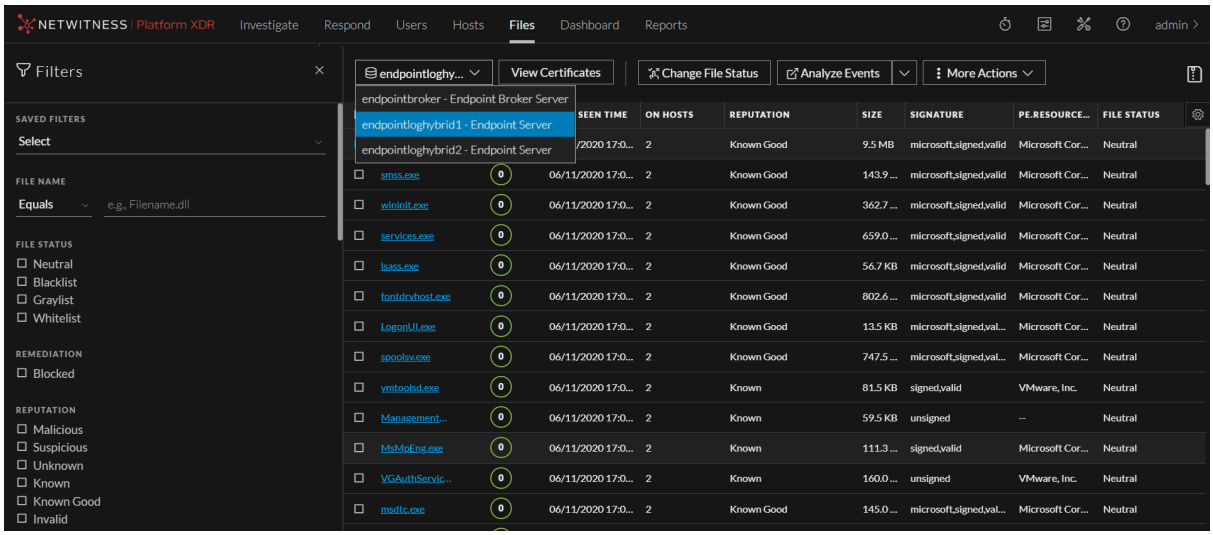
  a. Risk score - Displays the risk score for a file. Analysts can view the associated alerts and events for further investigation. For more information, see Analyze Files Using the Risk Score.

  b. On Hosts - Indicates the number of hosts on which a file exist. If a file is present on fewer hosts with a high risk score, it may require further investigation. You can also sort or filter using On Hosts column to narrow down the search during investigation. For more information, see Analyze Hosts with File Activity.

c. File status - To manage suspected and legitimate files, analysts can use the file status to manage. For more information on the various file status, see Changing File Status or Remediate.

d. Reputation status - Indicates the reputation of a file hash for analyst to narrow-down the files to investigate. For more information, see File Reputation.

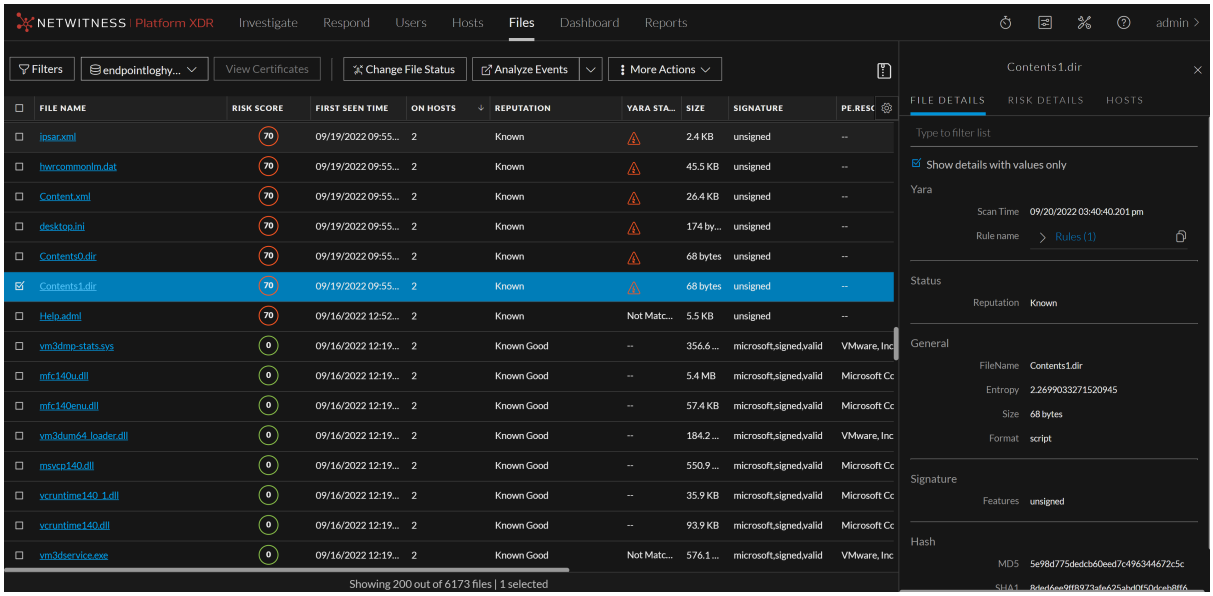
e. Signature - A valid signature on a file signed by a trusted vendor, such as Microsoft and Apple indicates that the file is not a risk. If a file is unsigned, it may be malicious, and needs investigation.



f. File name - Many trojans write random file names when dropping their payloads to prevent an easy search across the hosts in the network based on the filename. For example, if a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

- Investigate a particular file name or hash by pivoting to Navigate or Events view to view context, file activity on different hosts, and any file transfers across the network through packet data. For more information, see Analyzing Events.
- Investigate files using a rule-based detection technique. YARA helps to identify threats effectively using easy-to-create malware descriptions called YARA rules. For more information, see Analyze Files Using YARA.
- Download suspicious files to the server for deeper analysis. For more information, see Analyzing Downloaded Files.
- Change the status of the file (blacklist or graylist), and block an infected or malicious file. For more information, see Changing File Status or Remediate.

View Files



You can view all files present on a specific Endpoint server or consolidated list of all files on multiple Endpoint servers using the Endpoint Broker for analysis. To view files:

1. Go to **Files**.
2. Select one of the following:

- **Endpoint Broker Server** to view all files across all Endpoint servers.
- **Endpoint Server** to view files on a specific Endpoint server.

3. Select the file that you want to analyze.
4. Click a row to view the following details:

- **File Details** displays the file information. For more information, see Launch an External Lookup for a File.
- **Risk Details** displays the distinct alerts associated with the risk score. For more information, see Analyze Files Using the Risk Score.
- **Hosts** displays the number of hosts on which file activities are present. For more information, see Analyze Hosts with File Activity.

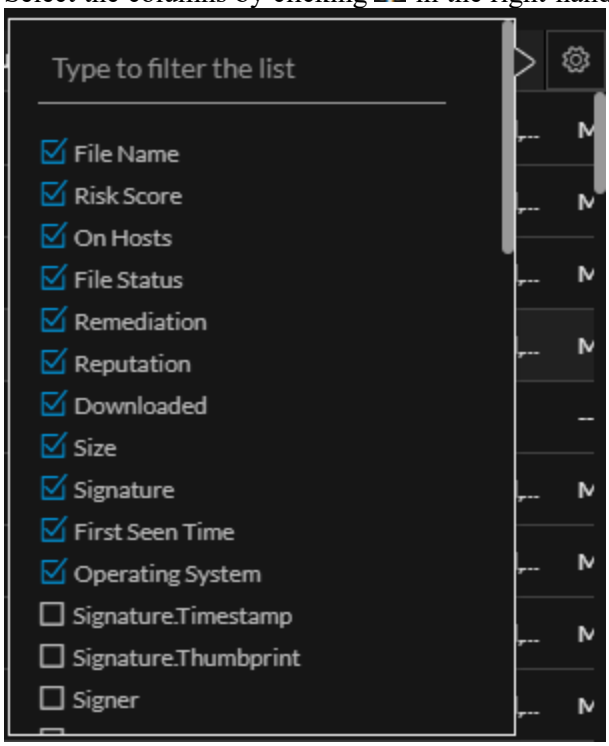
Filter Files

You can narrow down the investigation by filtering files using file name, on hosts, file status, risk score, remediation, reputation status, operating system, size, entropy, format, signature, company name, checksum (MD5 and SHA256), downloaded status, and YARA rules.

Note: While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Filename, MD5, SHA256, Operating System, First Seen Time, Format, File Status, On Host, and Reputation Status.

Select the parameters in the Filters tab. Click **Save** to save the search and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters list. To delete a filter, hover over the name and click .

Note: Special characters are not allowed in the filter name except underscore (_) and hyphen (-) while saving the filter.



For example, to filter the files based on file reputation, select the reputation status in the Filter panel.

Note: For the file size, 1 KB is calculated as 1024 bytes. For example, if the actual size of the file is 8421 bytes, the UI will display it as 8.2 KB instead of 8.22 KB. It is recommended to search using the bytes format when using the `Equals` operator.

Add and Sort Columns in the Table

By default, the Files view displays a few columns, and files are sorted based on the risk score. To add or remove columns:

1. Go to **Files**.
2. Select the columns by clicking in the right-hand corner.

3. Scroll down or enter the keyword to search and select the required columns.
4. To sort the column in ascending or descending order, click the arrow on the column header.

Analyze Files Using the Risk Score

Based on the Alert severity, the files can be analyzed using the following options:

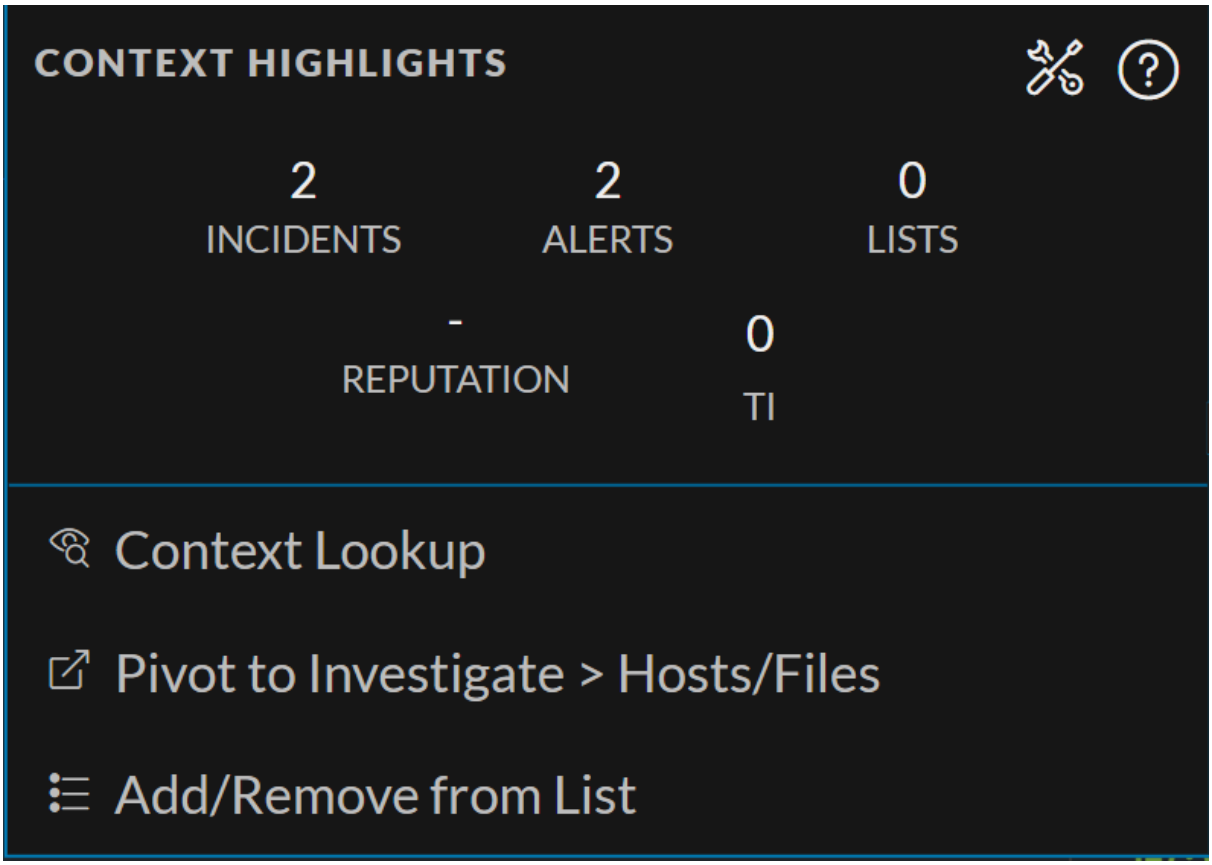
- **View Alert Details**: This option allows you to analyze the files associated with **Critical** and **High** alerts. For more information, see Investigating a Process.
- **Analyze Process Tree**: This option allows you to analyze the files associated with **Medium** alerts. For more information, see Investigating a Process.

To analyze files associated with Critical and High alerts using the risk score:

1. Go to **Files**.

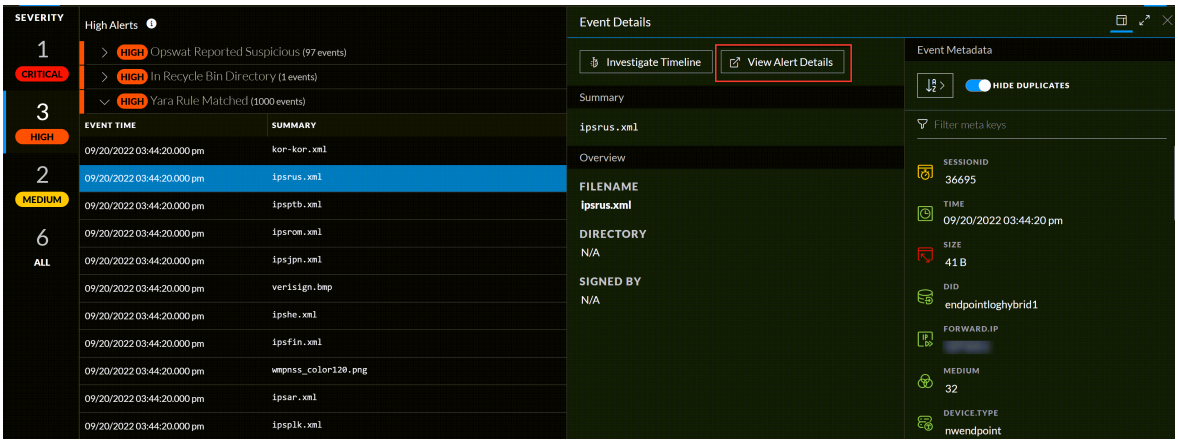
   The **Files** view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the files.
3. Select the file and do any of the following.
   - Click a row to view the risk associated with the file in the **Risk Details** panel.
   - Click the filename to view the associated alerts and events.

The **Alerts** tab is displayed.



4. In the **Alerts** > **Severity** panel, click the alert severity, such as **Critical** or **High**.
   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.

   Note: For each alert, only the latest 1000 events are displayed.



6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.

7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.
8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **View Alert Details** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.

To analyze files associated with Medium alerts using the risk score:

1. Go to **Files**.

   The **Files** view is displayed.

2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the files.

3. Select the file and do any of the following.

   - Click a row to view the risk associated with the file in the **Risk Details** panel.
   - Click the filename to view the associated alerts and events.

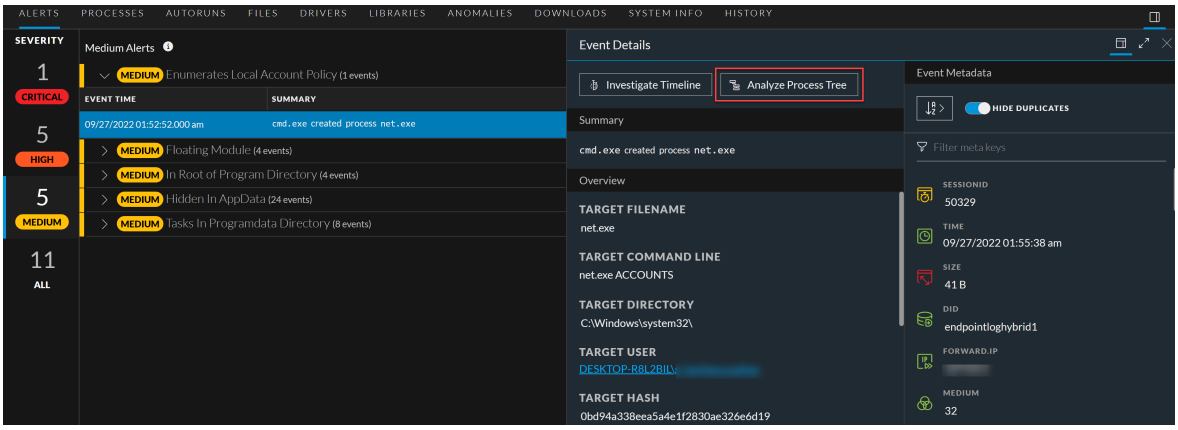
     The **Alerts** tab is displayed.

4. In the **Alerts** > **Severity** panel, click the **Medium** alert severity.
   The list of distinct alerts is displayed along with the total number of events associated with the alert.

5. Click an alert to view the associated events.

   Note: For each alert, only the latest 1000 events are displayed.

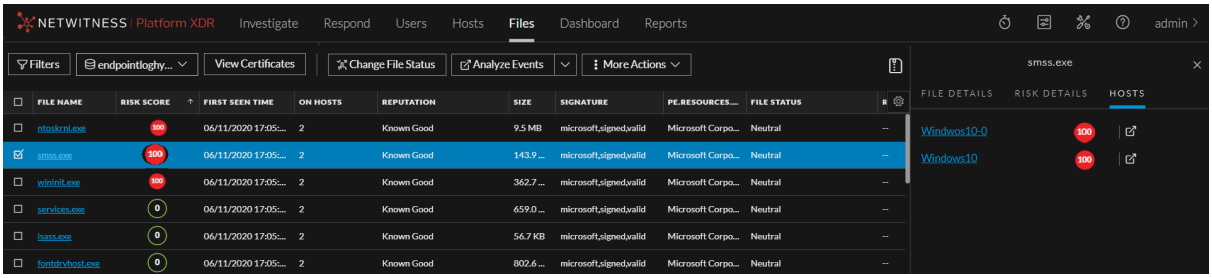
6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.



7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **Analyze Process Tree** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.



Analyze Hosts with File Activity

To view the list of hosts on which a file exist, do the following:

Note: By default, the system detects the best data source for the On Hosts aggregation. To change the data source, in the Explore view, modify the investigate service ID under `endpoint/investigate`.

1. In the **Files** tab, click the row for the file you want to analyze.
2. In the right panel, click the **Hosts** tab. The list of hosts along with the risk score are displayed.

3. Click the host name to open the host details.
4. Click  to analyze events on the host in the Events view. For more information, see Analyzing Events.

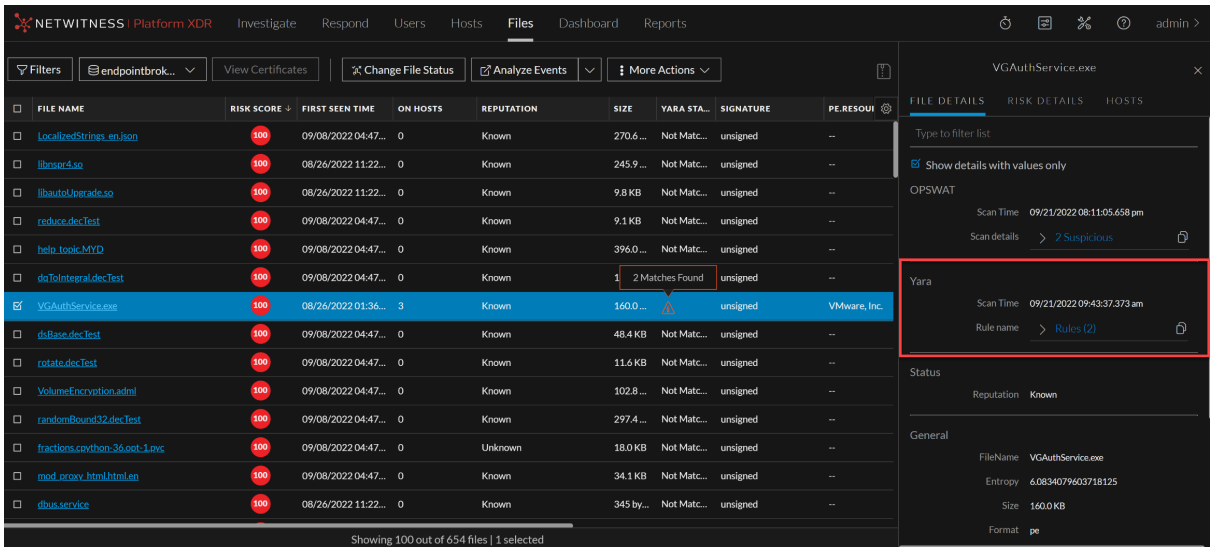
Analyze Files Using YARA

YARA helps analysts with rule-based detection capabilities in identifying and classifying malware. You can easily create malware descriptions using YARA rules. YARA scans can be performed at the Endpoint server level and Endpoint agent level.

Analyze Files at the Endpoint Server Level

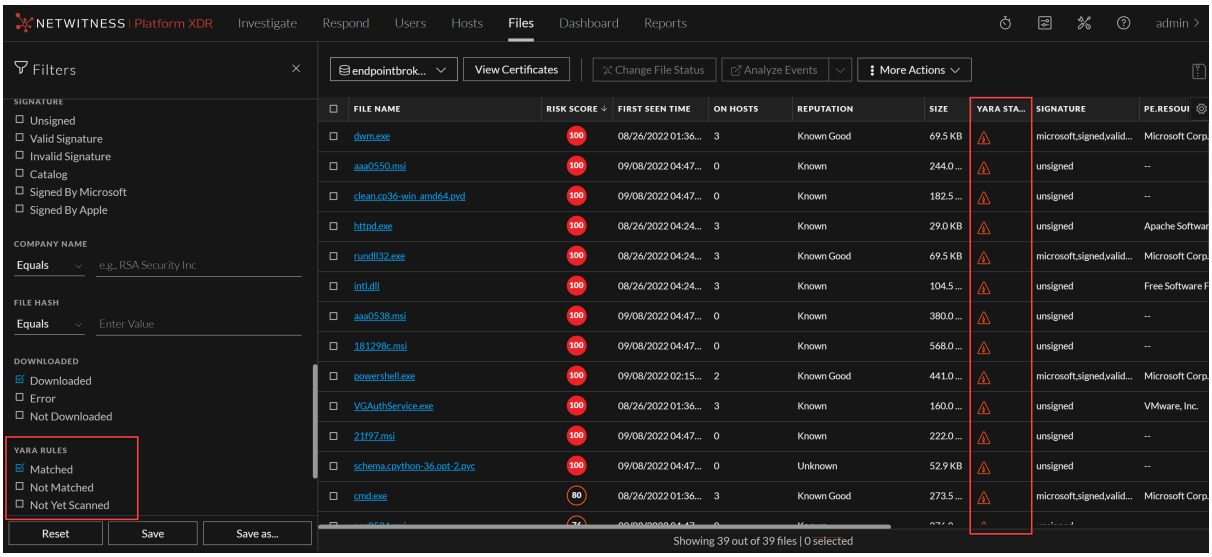
Administrators must enable and configure YARA on the Endpoint server. To learn more about enabling and configuring YARA, refer to NetWitness Endpoint Configuration Guide.

Files must be downloaded to the Endpoint server and YARA scans the downloaded files automatically. The scan results are displayed under **YARA STATUS** on the **Files** tab.



To analyze the scanned files,

1. Go to **Files**.
2. Select the Endpoint server from the server drop-down , to view files.
3. Select a file that is downloaded to the Endpoint server and do any of the following:
   - Click a row to view the YARA scan details associated with the file in the **File Details** panel.
   - If any file matches one or more YARA rules, the **File Details** panel displays the matching rule names besides scan time.
   - **YARA STATUS** field displays the status of the YARA scan. Following are the available statuses and their definitions



- **Matched** - The file matches with one or more YARA rules
- **Not Matched** - The file does not match with any of the YARA rules
- **Not Yet Scanned** - There is no scan performed for this file. Files will be scanned automatically once they have been downloaded. After the scan YARA status will be updated to either Matched or Not Matched

Note: When a file matches with a YARA rule, high severity alerts are triggered and, the file's risk score is updated. In the subsequent scans, If the same file doesn't match with a YARA rule, the risk score will be reset.

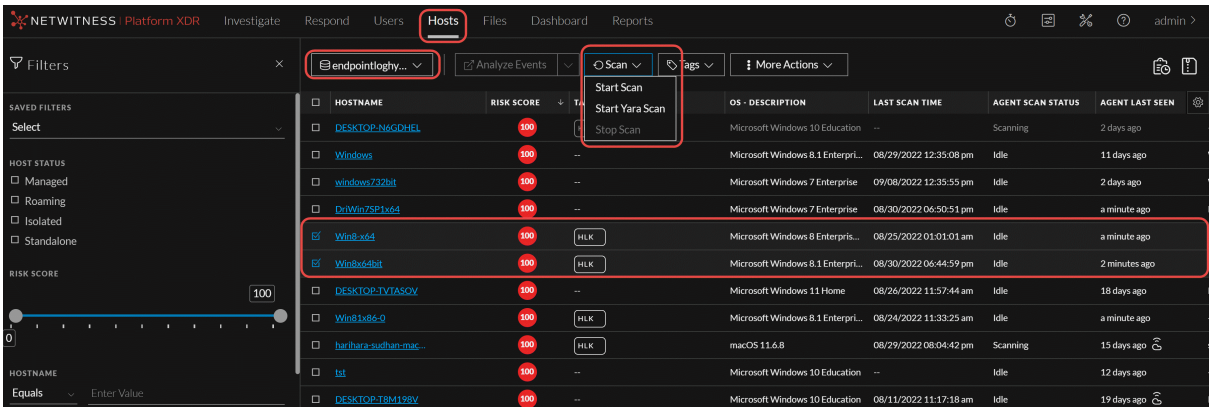
Note: If a downloaded file has an error, it will not be scanned by YARA and, the **Downloaded** column will display the file download status as **Error**.

4. On the **Filters** pane, scroll to the **YARA RULES** section. This section provides options to filter the files based on YARA scan status:
   - Select **Matched** to view the files that match YARA rules.
   - You can also view the files that do not match YARA rules or not yet scanned against YARA rules, by selecting **Not Matched** or **Not Yet Scanned** from the **YARA RULES** section.

For more information on investigating with YARA, see *NetWitness Investigate User Guide.*

Yara Scan at the Endpoint Agent Level

NetWitness Platform XDR allows you to quickly perform YARA scan at the Endpoint Agent level. A snapshot of the YARA scan shall be available on the Endpoint server with the details such as:



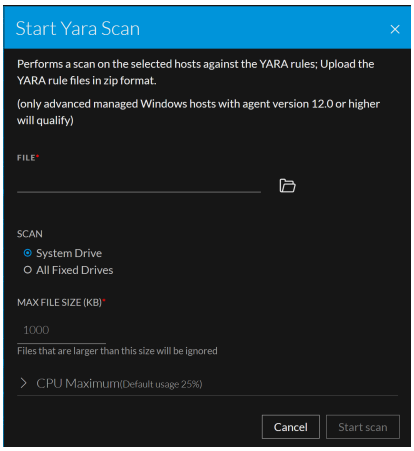
- List of files matching the YARA rules.
- List of YARA rules ran during the scan and the YARA rules status such as Loaded or Failed to load.

  Note: To perform Yara scan at the Endpoint agent level, the agent version must be higher than or equal to 12.1. This is applicable for the Advanced mode Windows Agents.

- YARA version associated with the agent.

To initiate YARA scan on the Endpoint Agent,

1. Click **Hosts**.
2. Select the Endpoint server from the server drop-down, to view hosts.
3. Select one or multiple hosts and click **Scan** > **Start Yara Scan**.



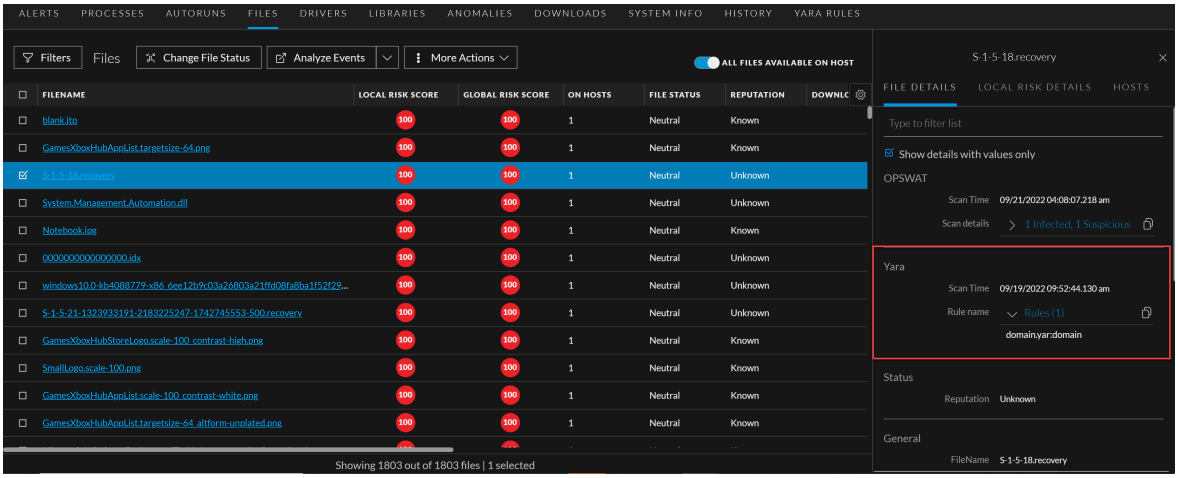
4. On **Start Yara Scan** pop-up,

   a. Click  and upload the YARA rule zip file.

   b. Select **System Drive** (Default selection) or **All Fixed Drives**.

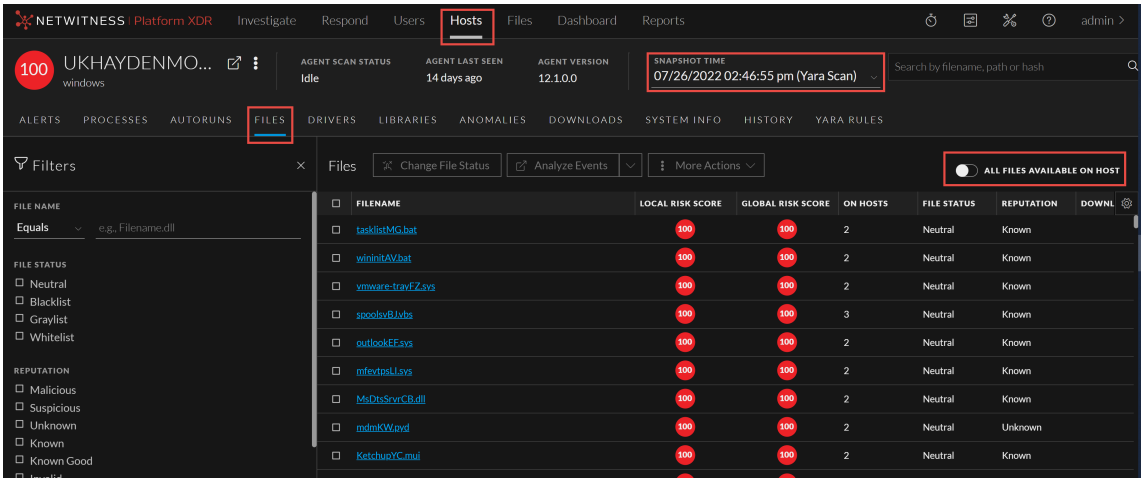
   c. Enter the Max File Size in Kilo Bites (KB).

   d. Select CPU Maximum.



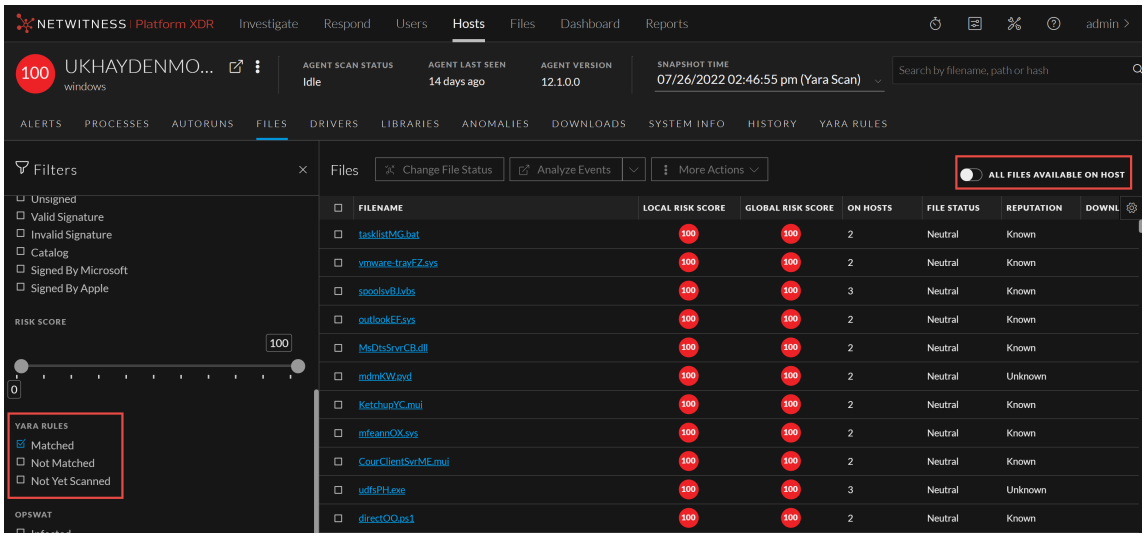
5. Click **Start scan**. See the command status In the **Host** > **History** tab.

To analyze the scanned hosts and files:

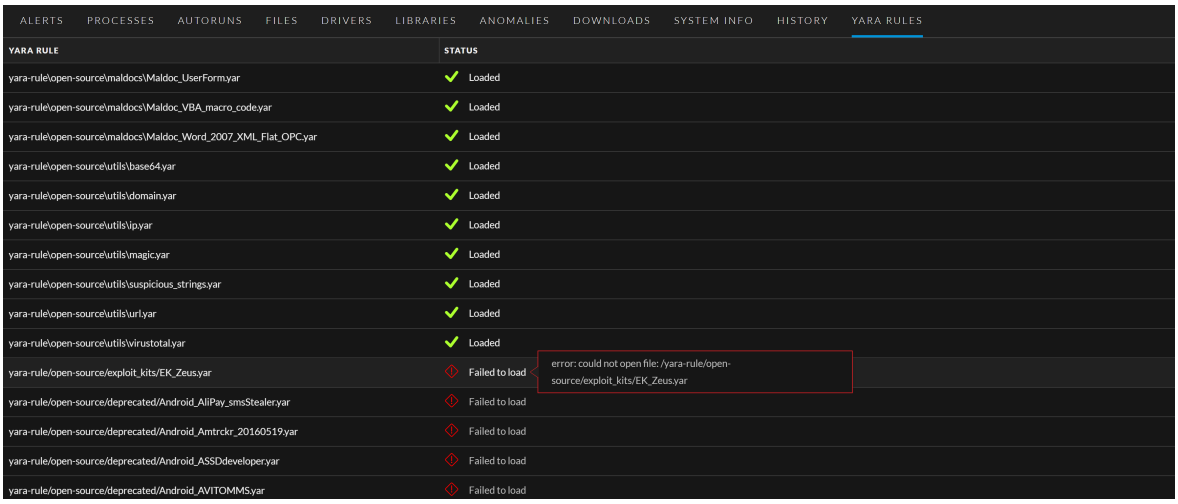


1. Log in to the NetWitness Platform XDR.
2. Click **Hosts**.
3. Select the Endpoint server from the server drop-down to view hosts.
4. Select the **Host** and **YARA Snapshot Time**, and do any of the following:
   - In the Host details view, click **Files** and select a row to view the YARA scan details associated with the file in the **File Details** panel.

If any file matches with one or more YARA rules, the **File Details** panel displays the matching rule names besides scan time.



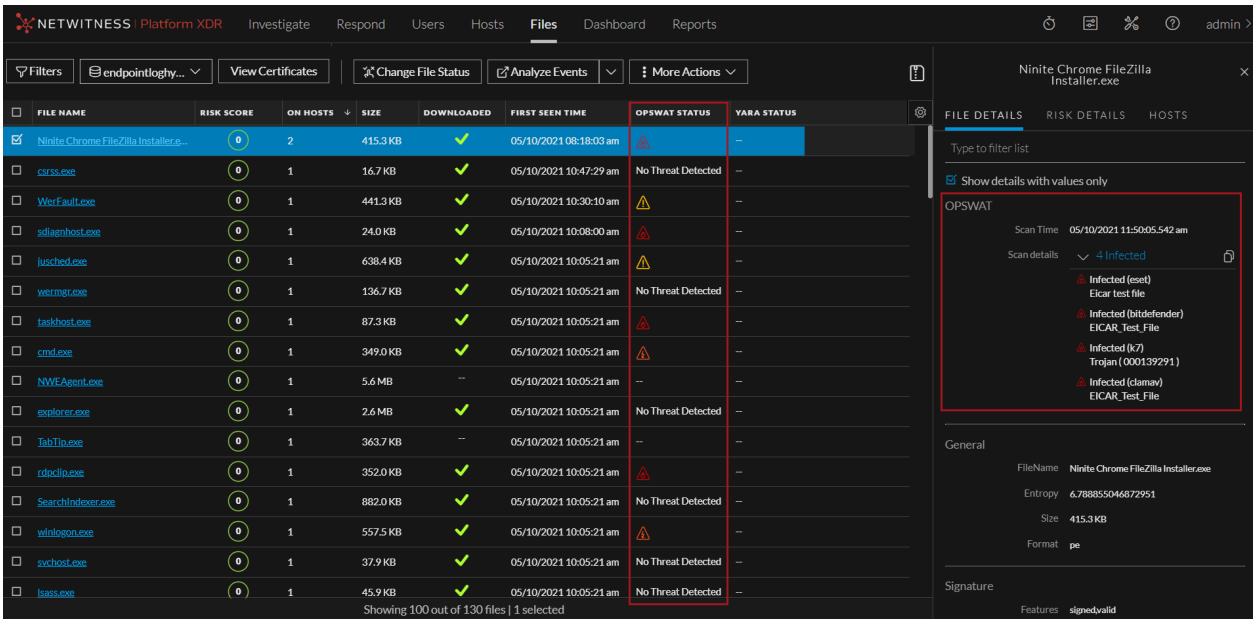
- Toggle the **All Files Available on Host** to view all the files irrespective of the snapshot selected.



Note: When a file matches with a YARA rule, high severity alerts are triggered and the file's risk score is updated.

- On the **Filters** pane, scroll to the **YARA Rules** section. This section provides options to filter the files based on YARA scan status: Select **Matched** to view the files that match YARA rules.
  - You can also view the files that do not match YARA rules or not yet scanned against YARA rules, by selecting **Not Matched** or **Not Yet Scanned** from the YARA rules section.

- In the Host details view, click the **YARA Rules** tab to know if the YARA rules used for the scan are successfully loaded or failed to load. If any of the YARA rules are failed to load, hover over  icon (Failed to load) to know the reason for failure.



- In the Host details view, click the **History** tab to view the command history.

Analyze Files Using OPSWAT

OPSWAT (MetaDefender Core) provides advanced malware detection capabilities by scanning files with multiple anti-malware engines simultaneously. Administrators need to enable and configure OPSWAT on the Endpoint server. To learn more about enabling and configuring OPSWAT, see *NetWitness Endpoint Configuration Guide*.

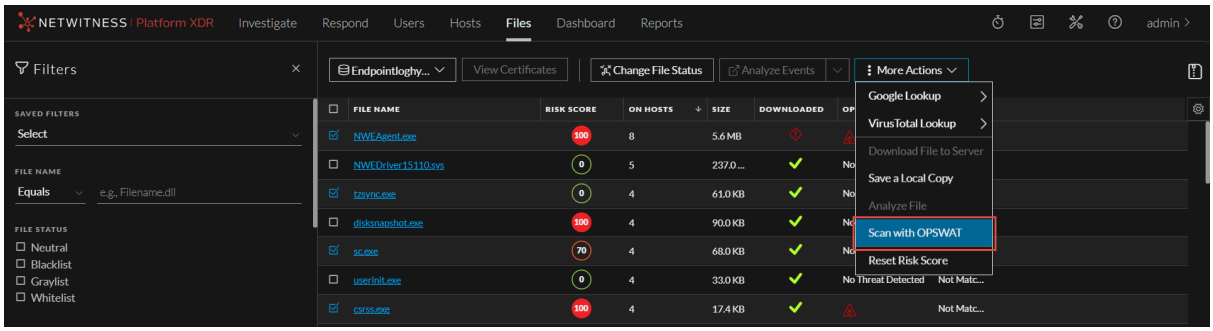
All downloaded files (executable) will automatically be sent to OPSWAT server for scanning once OPSWAT is enabled and configured on the endpoint servers.

Scan files with OPSWAT

Downloaded files are automatically sent to the OPSWAT server for scanning. However, you can also initiate the scan manually using options under the**More Actions** menu. Executable files with the following file extensions, ***pe***, ***script***, ***macro***, and ***elf*** are supported by this feature. The maximum file size limit is set to 10MB by default. You can increase or decrease it if required.

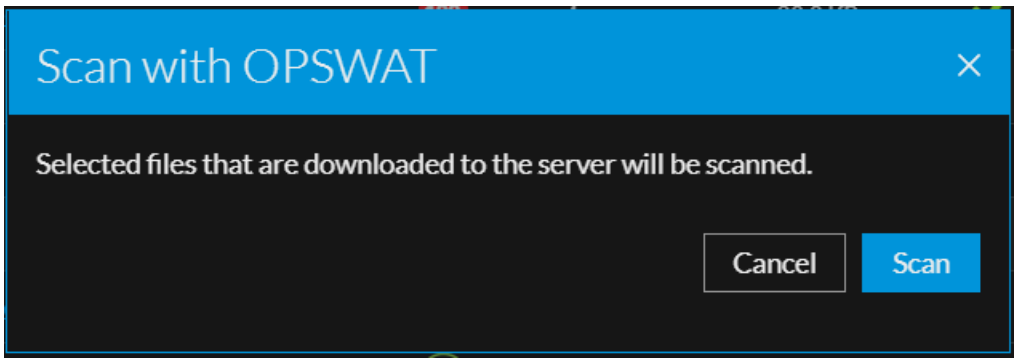
Automatic scan:

The endpoint server will automatically send all (executable) downloaded files to the OPSWAT server. The scan results will be displayed under the**OPSWAT STATUS** column on the**Files** tab.



Manual Scan:

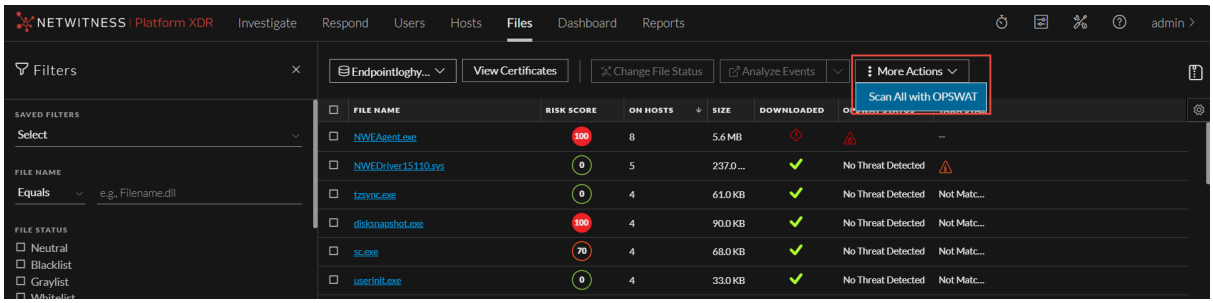
You can also manually initiate an OPSWAT scan using the options under the**More Actions** menu on the **Files** tab.



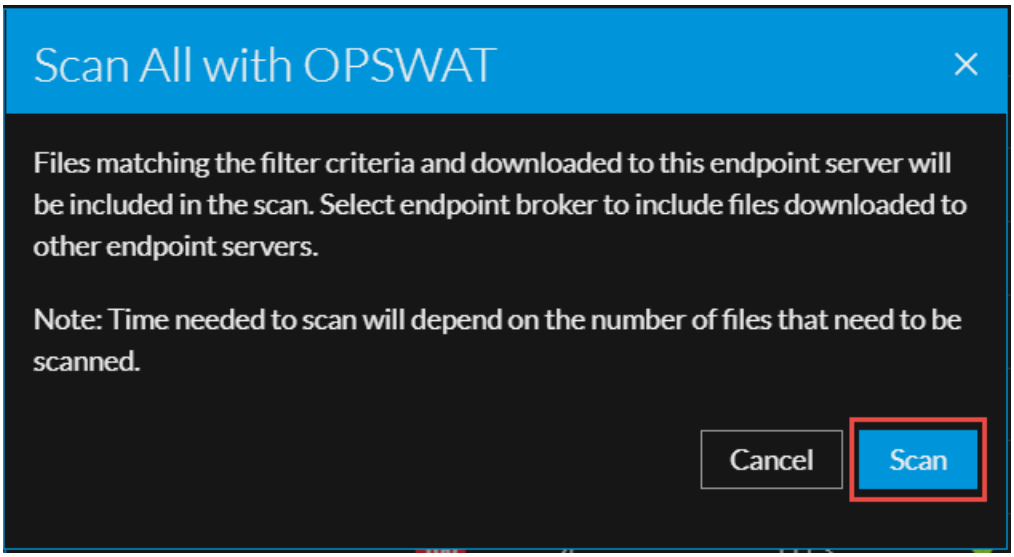
The **More Actions** menu provides the following options:

Manual Scan - Scan selected files

1. Select the files that need to be sent to the OPSWAT server for scanning.
2. Select **More Actions > Scan with OPSWAT**.



3. Click **Scan** on the confirmation pop-up.



Manual Scan - Scan all files

1. Select **More Actions > Scan All with OPSWAT**.

2. Click **Scan** on the confirmation pop-up.

View OPSWAT Scan Results

The scan results will be displayed under the**OPSWAT STATUS** column on the**Files** tab as follows:

 - File is infected

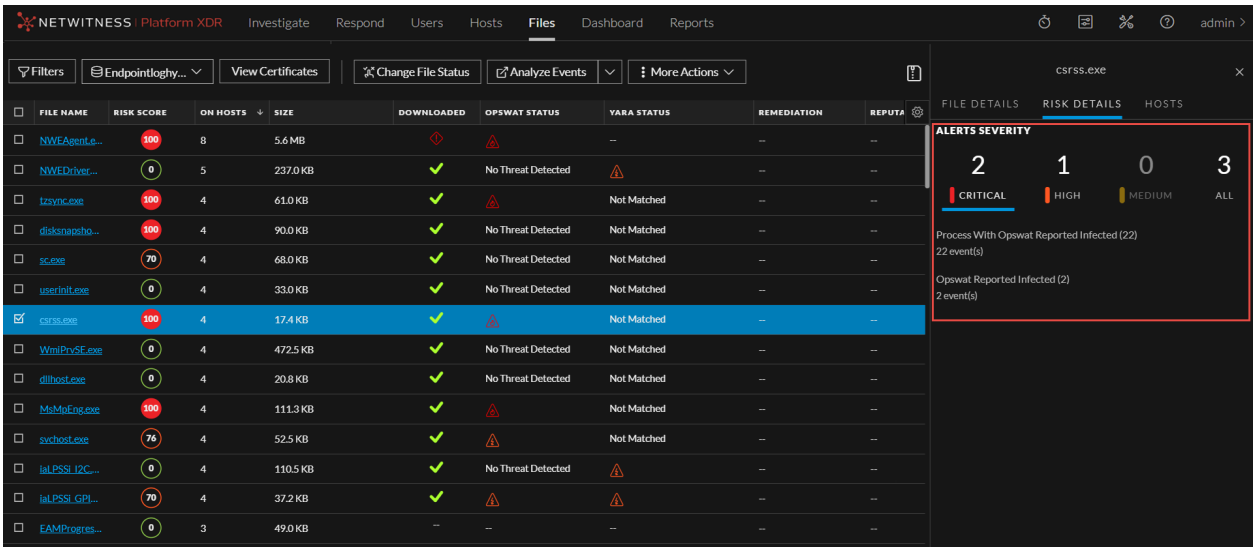
 - Suspicious file

 - Scan failed; see troubleshooting section for more information.

 - The file is clean as of the last scanned time.

 - Not yet scanned.

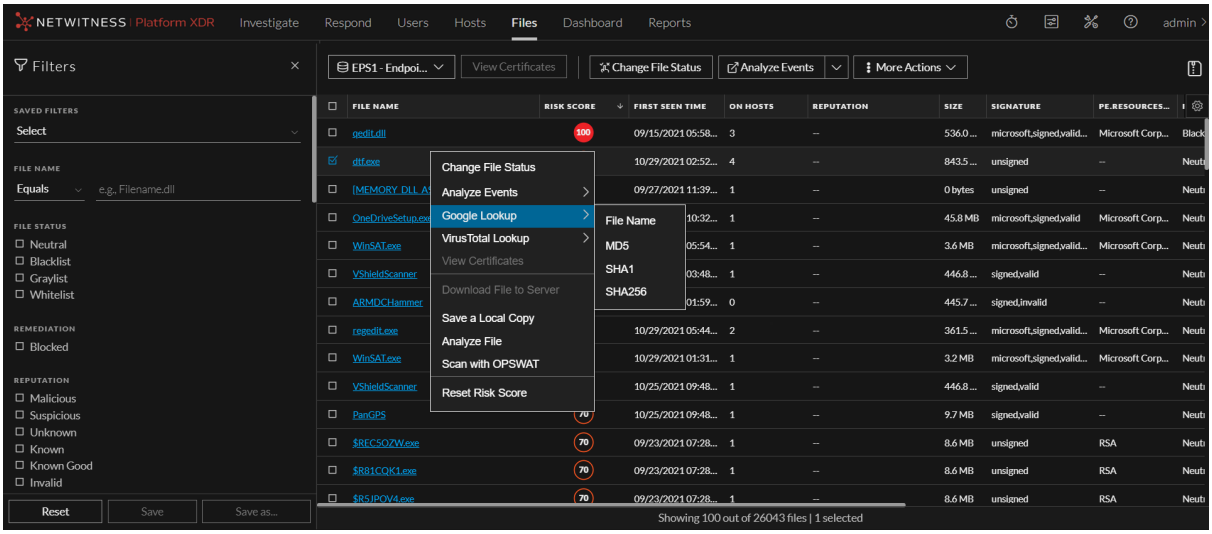
Click on a file to view scan results under the**FILE DETAILS** panel.



- **Scan Time**: States the last scanned time.
- **Scan details**: States whether a file is infected or suspicious or no threat detected, names of anti-malware engines that identified the threat.

Alerts and Impact on Risk scores

Alerts: Critical alerts will be triggered when OPSWAT finds a file as infected, and High severity alerts when a file is found suspicious.



Risk score: If a file is found infected or suspicious by OPSWAT, the risk score of that file and the corresponding host will be increased.

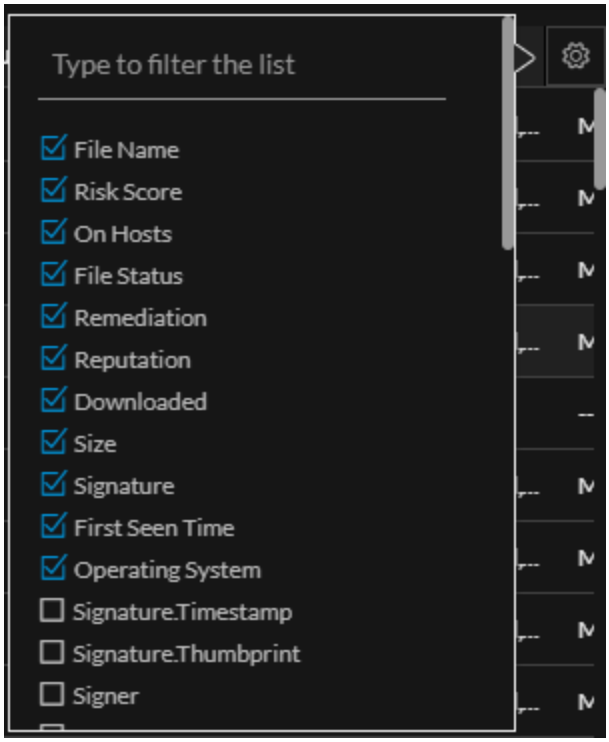
Launch an External Lookup for a File

While analyzing a file, you can search Google or VirusTotal with the filename or hash to get more information about the file. To launch the search:

1. Go to **Files**.
2. View the details of the file name and hash from the table MD5, SHA1, and SHA256 columns, or view the details in the File Details tab on the right panel.
3. Select one or more files, and right-click or in the **More Actions** drop-down list in the toolbar, do the following:

   a. Select **Google Lookup** and perform a search on the filename, MD5, SHA1, or SHA256.

   b. Select **VirusTotal Lookup** and perform a search on MD5, SHA1, or SHA256.



Note: To open files in multiple tabs, make sure you enable the pops-up in the browser.

Set Files Preference

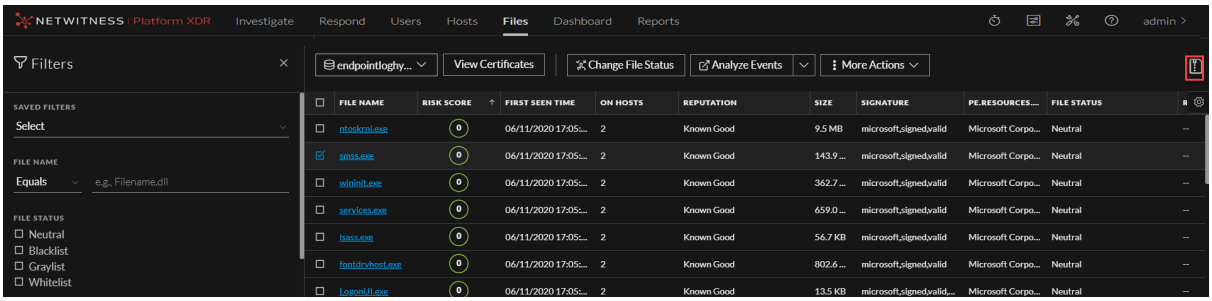
By default, the Files view displays a few columns and the files are sorted based on the risk score. If you want to view specific columns and sort data on a specific field:

1. Go to **Files**.

2. Select the columns by clicking in the right-hand corner. The following example shows the drop-down list displayed while adding columns:

3. Sort the data on the required column.

Note: The selections you make here become your default view every time you log in to the Files view.



Export Global Files

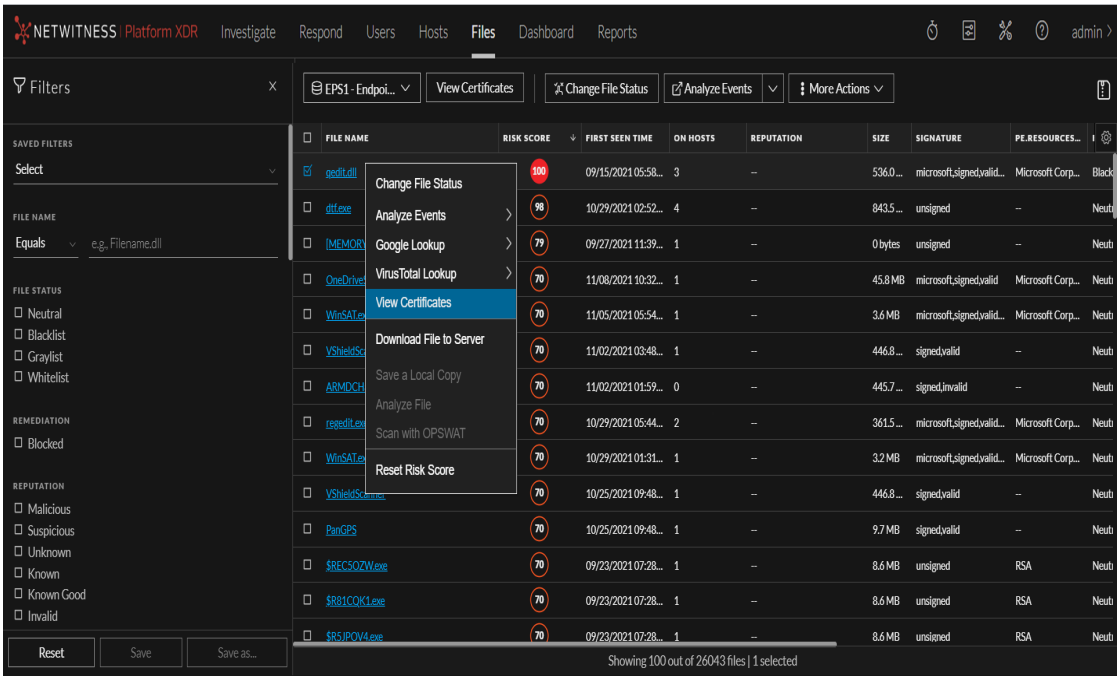
To extract the list of global files to a comma-separated values (csv) file:

Note: While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. You can export up to 100k files at a time.

1. Go to **Files**.
2. Filter the files by selecting the required filter option.
3. Add columns by clicking in the right-hand corner.

4. Click  to export the files to a csv file.

You can either save or open the CSV file.



Analyze Certificates

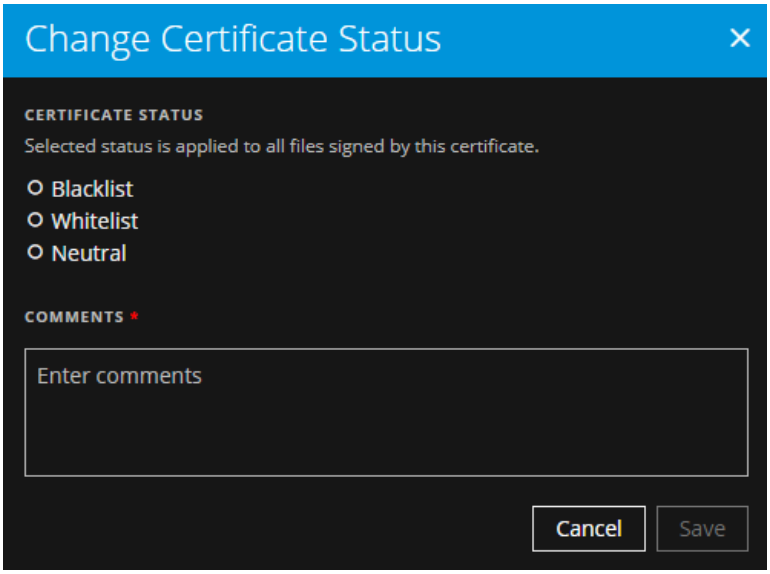
Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Certificates view provides a list of code-signing certificates reported by hosts found in your deployment and their associated properties. You can select the certificates under a specific Endpoint server.

To view the certificates in an Endpoint server:

1. Go to **Files**.
2. From the drop-down menu, select the Endpoint server to view certificates present on that server. To view a consolidated list of certificates, select the Endpoint Broker server.
3. Select a file and do one of the following:

- Right-click and select **View Certificates** from the context menu.
- Click **View Certificates** in the toolbar.



Change the Certificate Status

You can assign a Whitelist status to the certificate signed by certain trusted vendors and this status can be automatically applied to all files that is signed by this certificate. If you consider abc a trusted vendor, you can set the status for the certificates signed by abc as Whitelist.

Similarly, you can also set the certificate status as Blacklist or Neutral. If a company's certificate is stolen or compromised, you can blacklist this certificate and remediate.

To change the certificate status:

1. Select a certificate, and click **Change Certificate Status**.

2. In the Change Certificate Status dialog, select a status - Blacklist, Whitelist, or Neutral.

   Note: If you have manually updated a file status in the Files or Hosts view, changing the status in the Certificate view does not impact the file status as the manual update takes precedence. For example, if you have whitelisted the file vmci.sys that is signed by VMware, Inc. in the Files or Hosts view, and you have blacklisted VMware, Inc. in the Certificate view, the file vmci.sys remains Whitelisted though the certificate is blacklisted.

3. Add a comment and click **Save**.
4. Click **< Files** to go to the Files view.

Note: In a multi-server environment, changing the status of a certificate in one endpoint server updates the respective files in other endpoint servers. For example, if a certificate status is set to Blacklist on one endpoint server, all files signed by this certificate are set to Blacklisted on all endpoint servers.

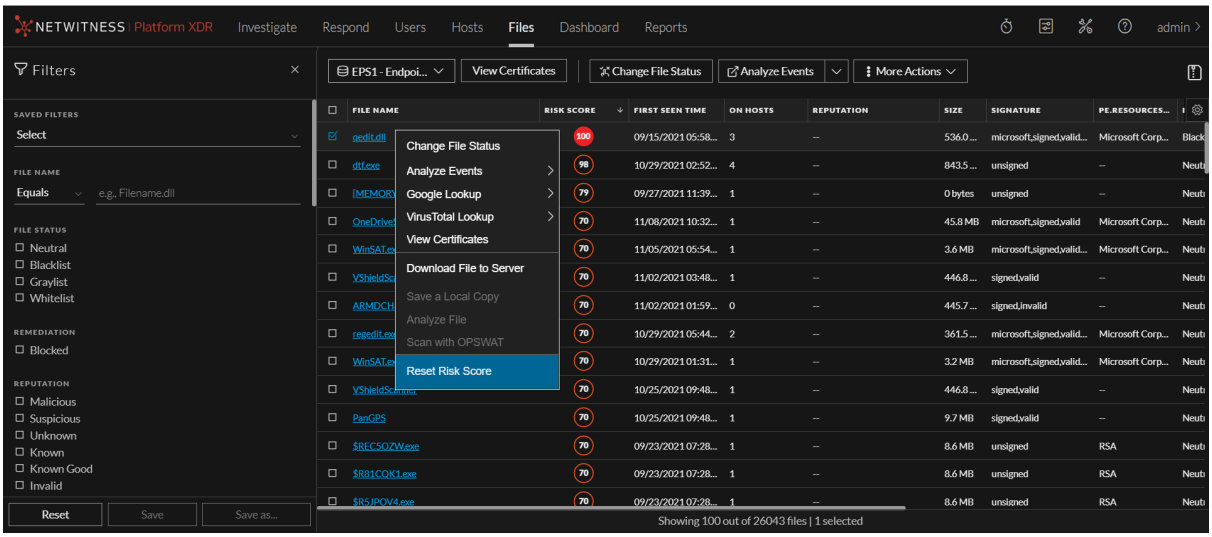
Filter Certificates

You can filter certificates on status, signature, friendly name, and thumb print.

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters list. To delete a filter, hover over the name, and click .

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Resetting Risk Score of Files



You can reset the risk score for a file in these situations:

- If the alerts or events triggered by the host or a file are considered to be false positive, you can make required changes to the Endpoint Application rules or ESA rules.
- After you take required action on a malicious file.

When you reset the risk score, the risk calculation for the file is deleted and score is set to 0. The risk score on all the hosts on which this file exists is recalculated. You can reset the risk score for a single file or multiple files.

To reset the risk score of a file:

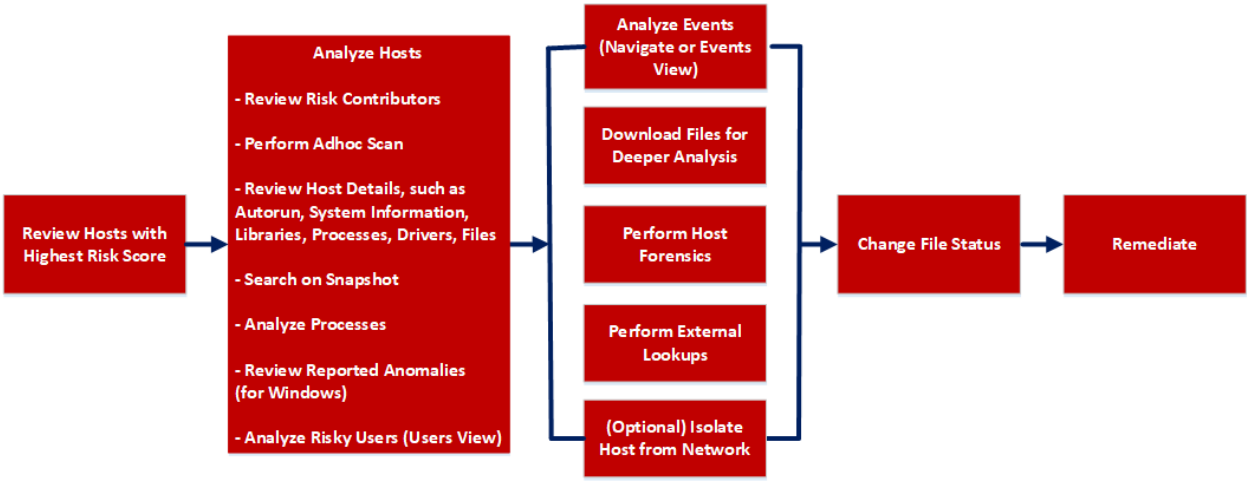
1. Go to **Files**.
2. Select the Endpoint Server or Endpoint Broker.
3. Select one or more files and do one of the following:

- Right-click and select **Reset Risk Score** from the context menu.
- Click **More Actions** > **Reset Risk Score** in the toolbar.

All the alerts associated with the score are deleted.

Note: You can select a maximum of 100 files to reset the score.

4. Refresh the page to view and confirm if the file's score is reset. This may take sometime for changes to take effect.



Investigating Hosts

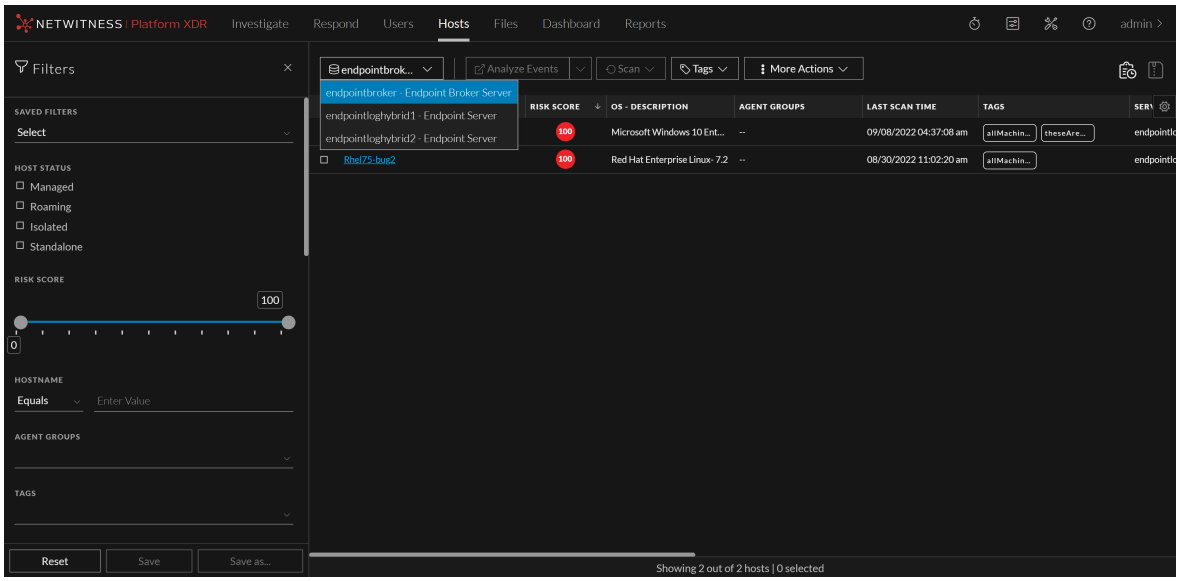
Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Hosts view allows you to investigate on a host, which includes scan details, tracking events related to alerts, anomalies, and process details.

Best Practices

The following are some best practices and tips that may help you investigate efficiently to identify and isolate threats or attacks:

- Review hosts with highest risk score and analyze the alerts contributing to the risk. Review the entities, such as file name, processes involved in the alerts. For more information, see Analyze Hosts Using the Risk Score.
- Review files or processes that created this suspected file, and check if any other files are accessed or created in the Events view. For more information, see Analyzing Events.
- Review hosts for rare files in the **On Hosts** column. If a file is present on 100 hosts, it can be legitimate. If a file is present on fewer hosts with a high risk score, it may be malicious and needs further investigation.
- Filter to exclude hosts on host status, risk score, hostname, and so on. For more information, see Filter Hosts.
- Search Google or VirusTotal with the file hash and review any reported activities. For more information, see Launch an External Lookup for a File.



- Review the processes, autoruns, files, libraries, drivers, and system information. For example,
  - Search for files in known malware locations. For example,
    - C:\Windows\.
    - C:\Users\<name>\AppData\<uncommon folder>.
    - C:\Users\<name>\AppData\Local\Temp.
    - C:\Windows\Temp\.
  - Search for a particular file name or hash and review the snapshot to check when the file was first seen.
  - Review any network connections established by the process, such as:
    - Domain or IP address.
    - Ports used (common (80 and 443) versus uncommon ports (8080 , 8888, and 3465)) and check if the ports are listening actively.
  - Check the file compile time. If the date is recent, it could be malicious.
  - Check the file creation time on the host.
- Review reported anomalies, such as suspicious threads, kernel hooks, image hooks, and registry discrepancies. For more information, see Analyze Anomalies.
- Launch Process Analysis to view the sequence of activities performed on the host by the file or process. For more information, see Analyze Processes.
- Download suspicious files to the server for deeper analysis. For more information, see Analyzing Downloaded Files.
- Download MFT, process, or system dump to the server for forensic investigation. For more information, see Performing Host Forensics.
- After investigation if a file is found to be malicious you change the status of the file (blacklist or graylist) and block infected or malicious file. For more information, see Changing File Status or Remediate.
- (Optional) If you suspect that a host is potentially compromised with the threat still being active, you can isolate the host from the network and safely investigate possible threats within the host. For more information, see Isolating Hosts from Network.

View Hosts

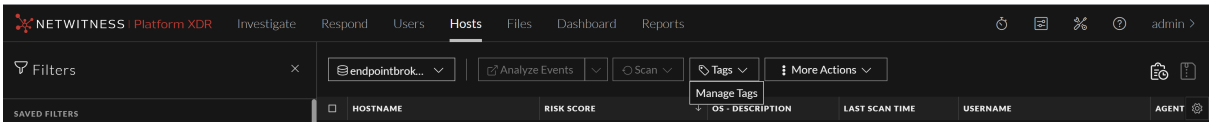
You can view all hosts present on a specific Endpoint server or consolidated list of all hosts on multiple Endpoint servers using the Endpoint Broker for analysis. By default, hosts are sorted based on the risk score. To view the hosts:

1. Go to **Hosts**.
2. Select from the following:

- **Endpoint Broker Server** to view all hosts across all Endpoint servers. When querying, the Endpoint Broker ignores Endpoint servers that are offline. If the Endpoint server is online but is not responding, the Endpoint Broker waits for 10 seconds, and ignores if it does not respond.
- **Endpoint Server** to view hosts on a specific Endpoint server.

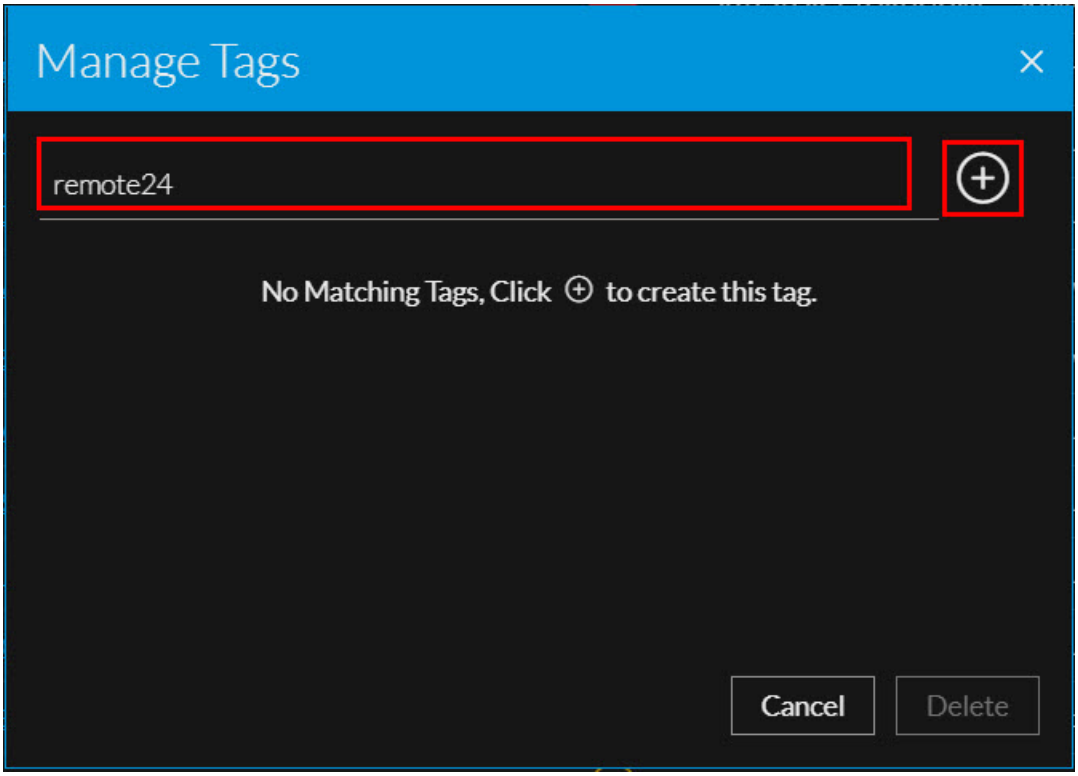
3. Select a host that you want to analyze.
4. Click a row to view the following details:
   - **Host Details** displays the host information such as Network Interfaces, operating system, hardware and others.
   - **Risk Details** displays the distinct alerts associated to the risk score and the alerts severity. Click **Critical**, **High**, **Medium**, or **All** to display all the alerts. For more information, see Analyzing Risky Users.
5. Click **Show next 100 hosts** to view other hosts.
6. Click the host name to investigate the scan results. For more information, see Analyze Host Details.

Manage Hosts Using Tags



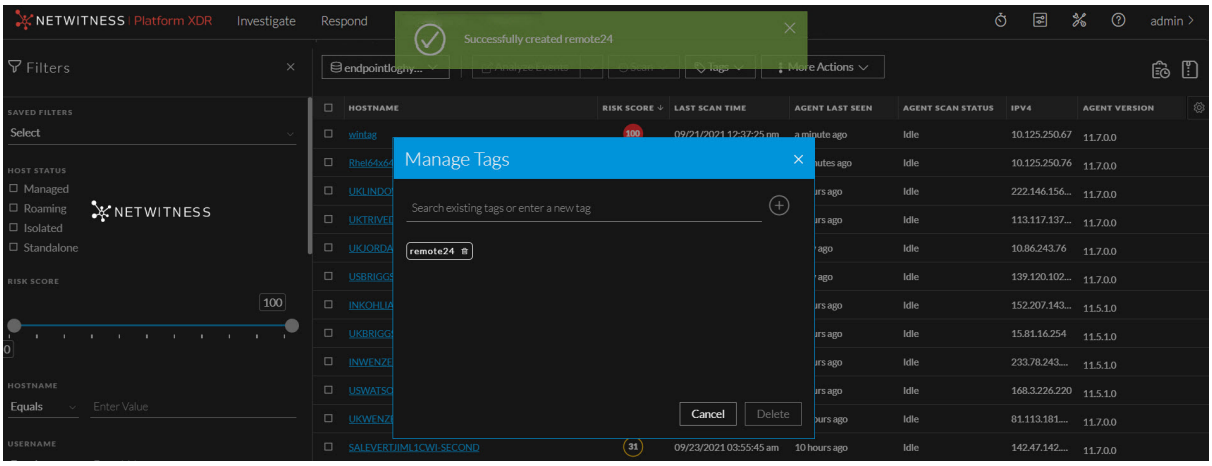
From version 11.7 and later, NetWitness Platform allows you to create Tags to manage the hosts effectively. Tags are custom texts that you can create and assign to hosts for identifying them. A tag can contain alphabets, numbers and special characters(Except \ **' , [ ] "** and **space**). You can use these tags to create host groups. You can also filter hosts by tags using the filters pane on the Hosts screen.

Manage Tags



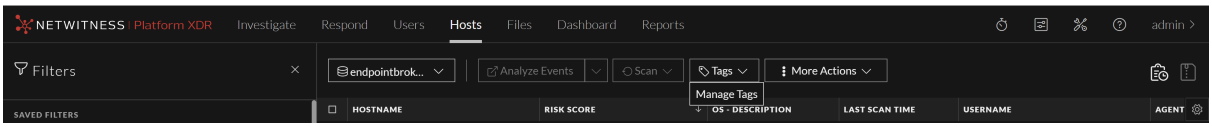
The Manage Tags option allows you to create and delete tags without selecting any hosts.

To Create Tags:

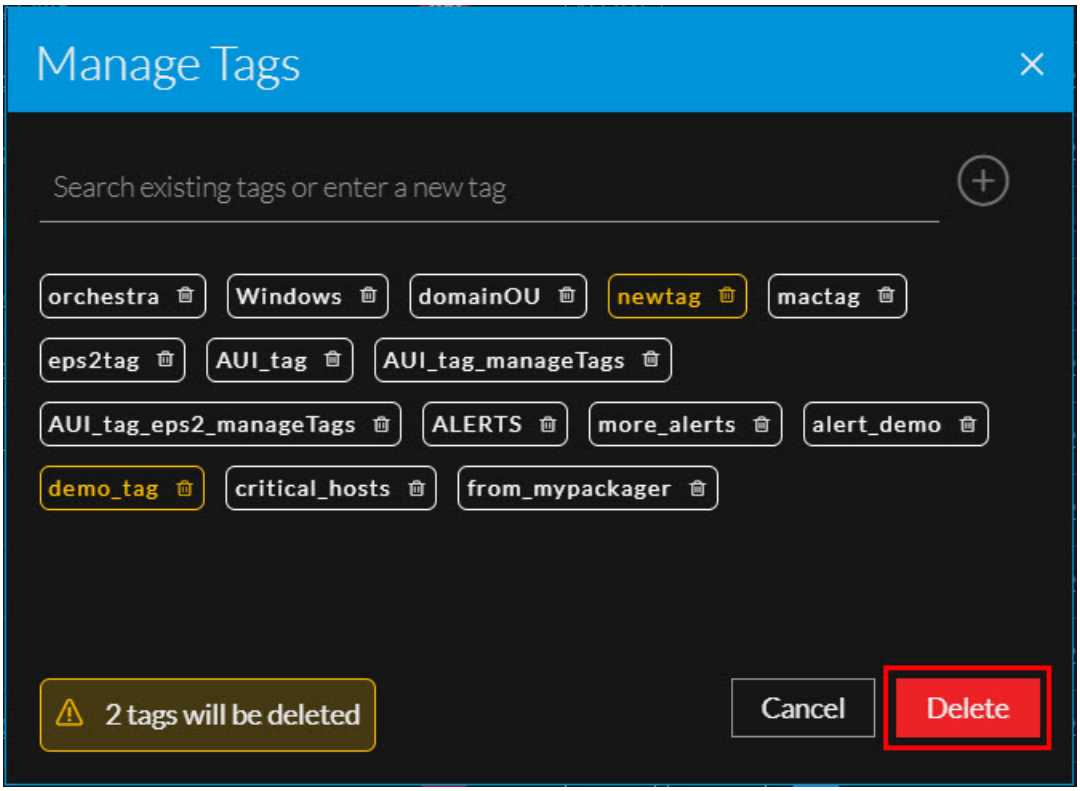


1. Click **Tags > Manage Tags** on the Hosts tab.

2. Enter a valid tag in the text field on the **Manage Tags** pop-up and click .

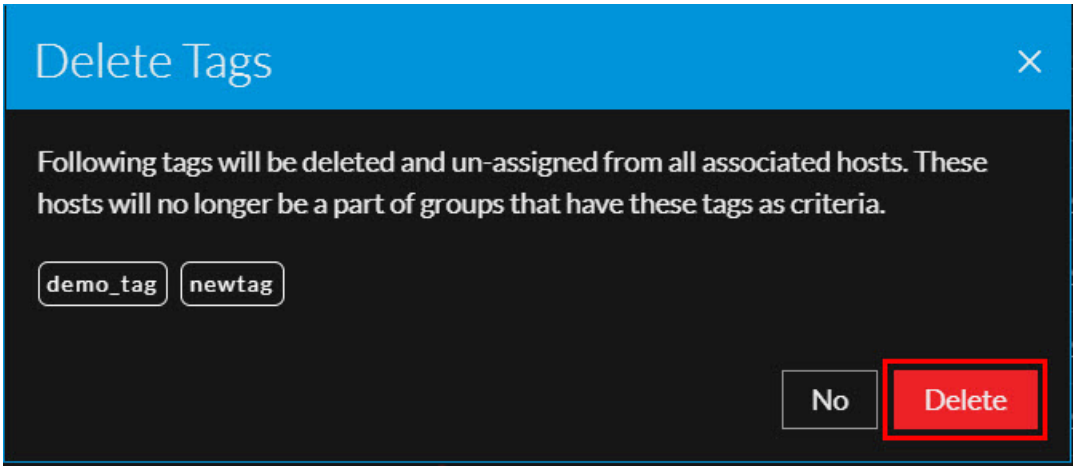


- The tag is created, and a success message will appear.



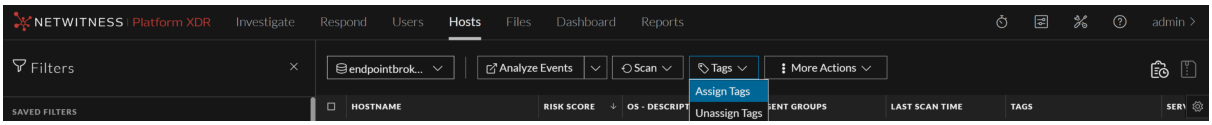
3. Repeat step 2 to create more tags.

To Delete Tags:



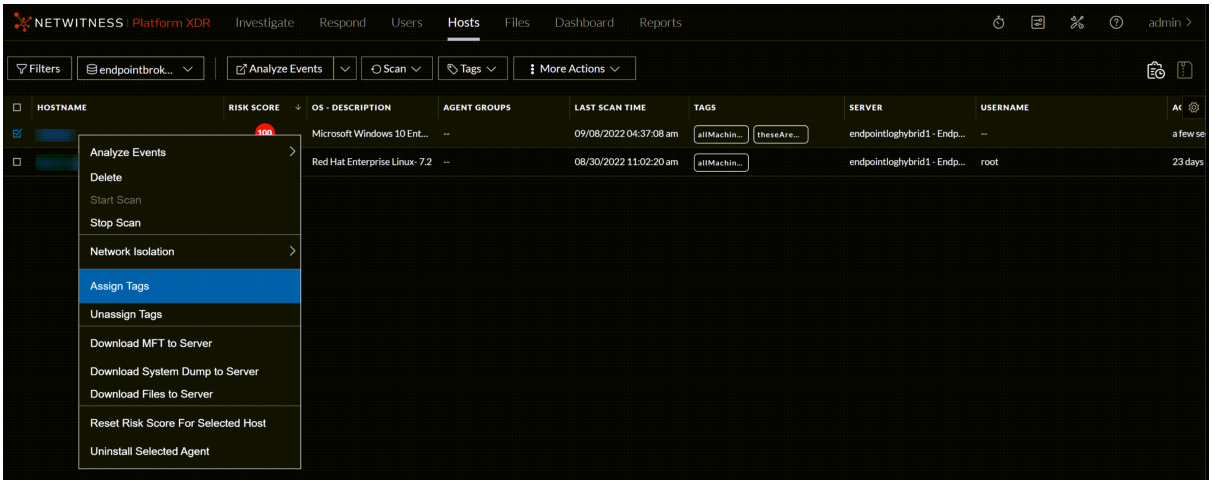
1. Click **Tags > Manage Tags** on the Hosts tab.

2. Select the tags that you want to delete and click **Delete** on the **Manage Tags** pop-up.



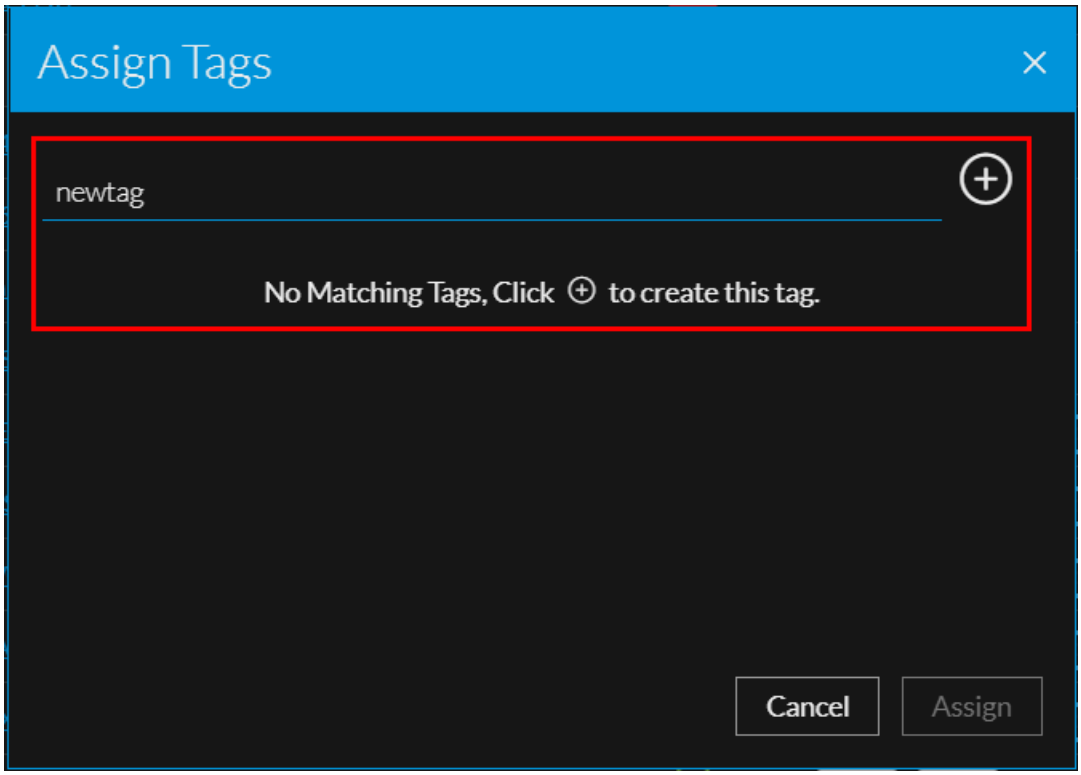
3. Click **Delete** on the **Delete Tags** confirmation pop-up.

Note: The tags you deleted will also be unassigned from all associated hosts. If the associated hosts are a part of groups created using these tags as one of the criteria, then the hosts will no longer be a part of those groups. Refer What happens next after unassigning or deleting tags from hosts? for more information.



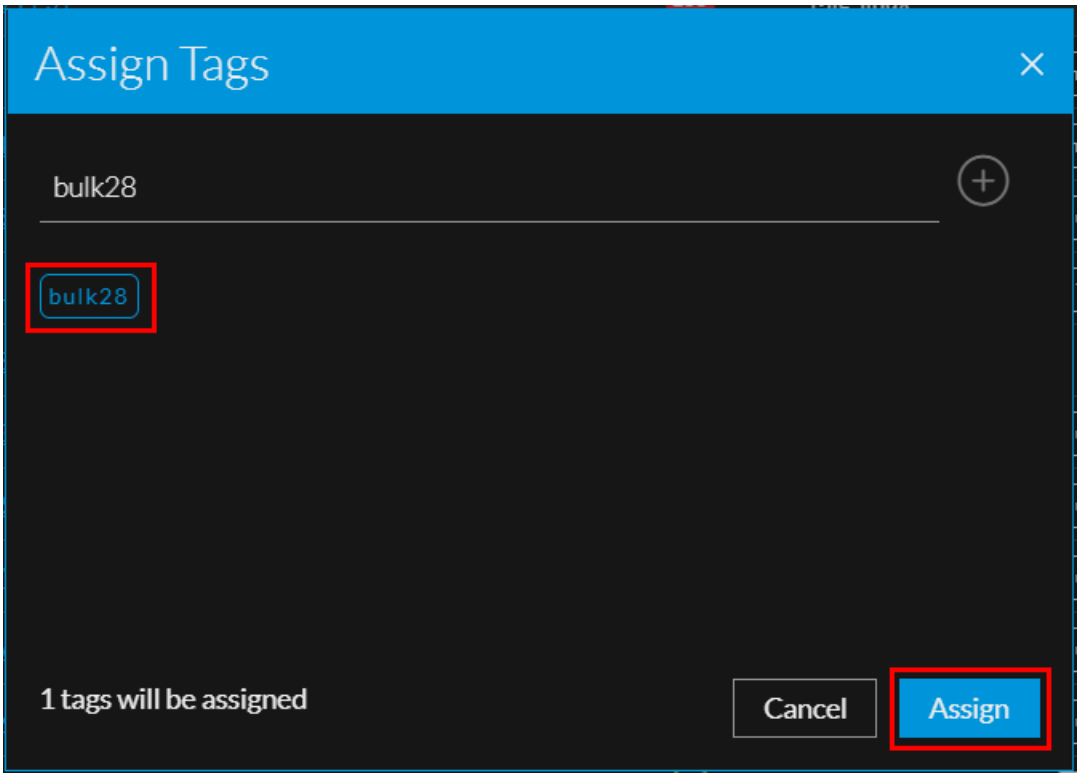
Assign tags

1. Select one or more hosts on the Hosts tab.
2. Select **Tags > Assign Tags** from the menu.



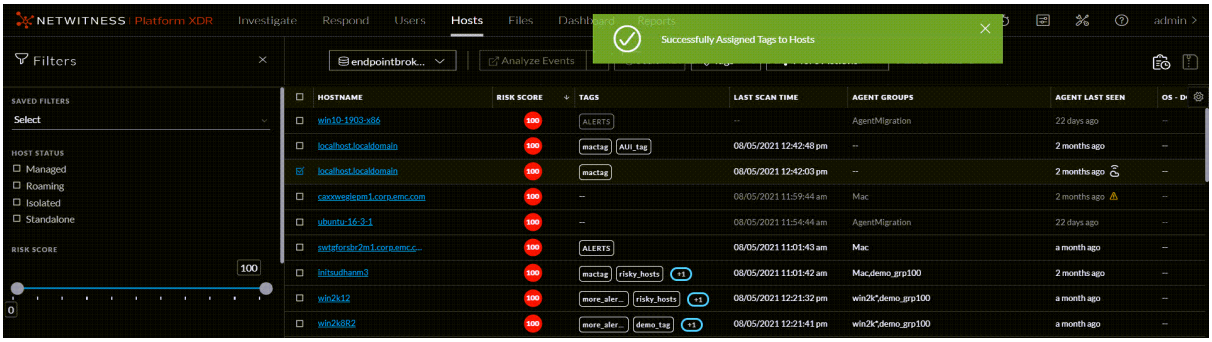
(or)

Select a host, right click and select **Assign Tags**.



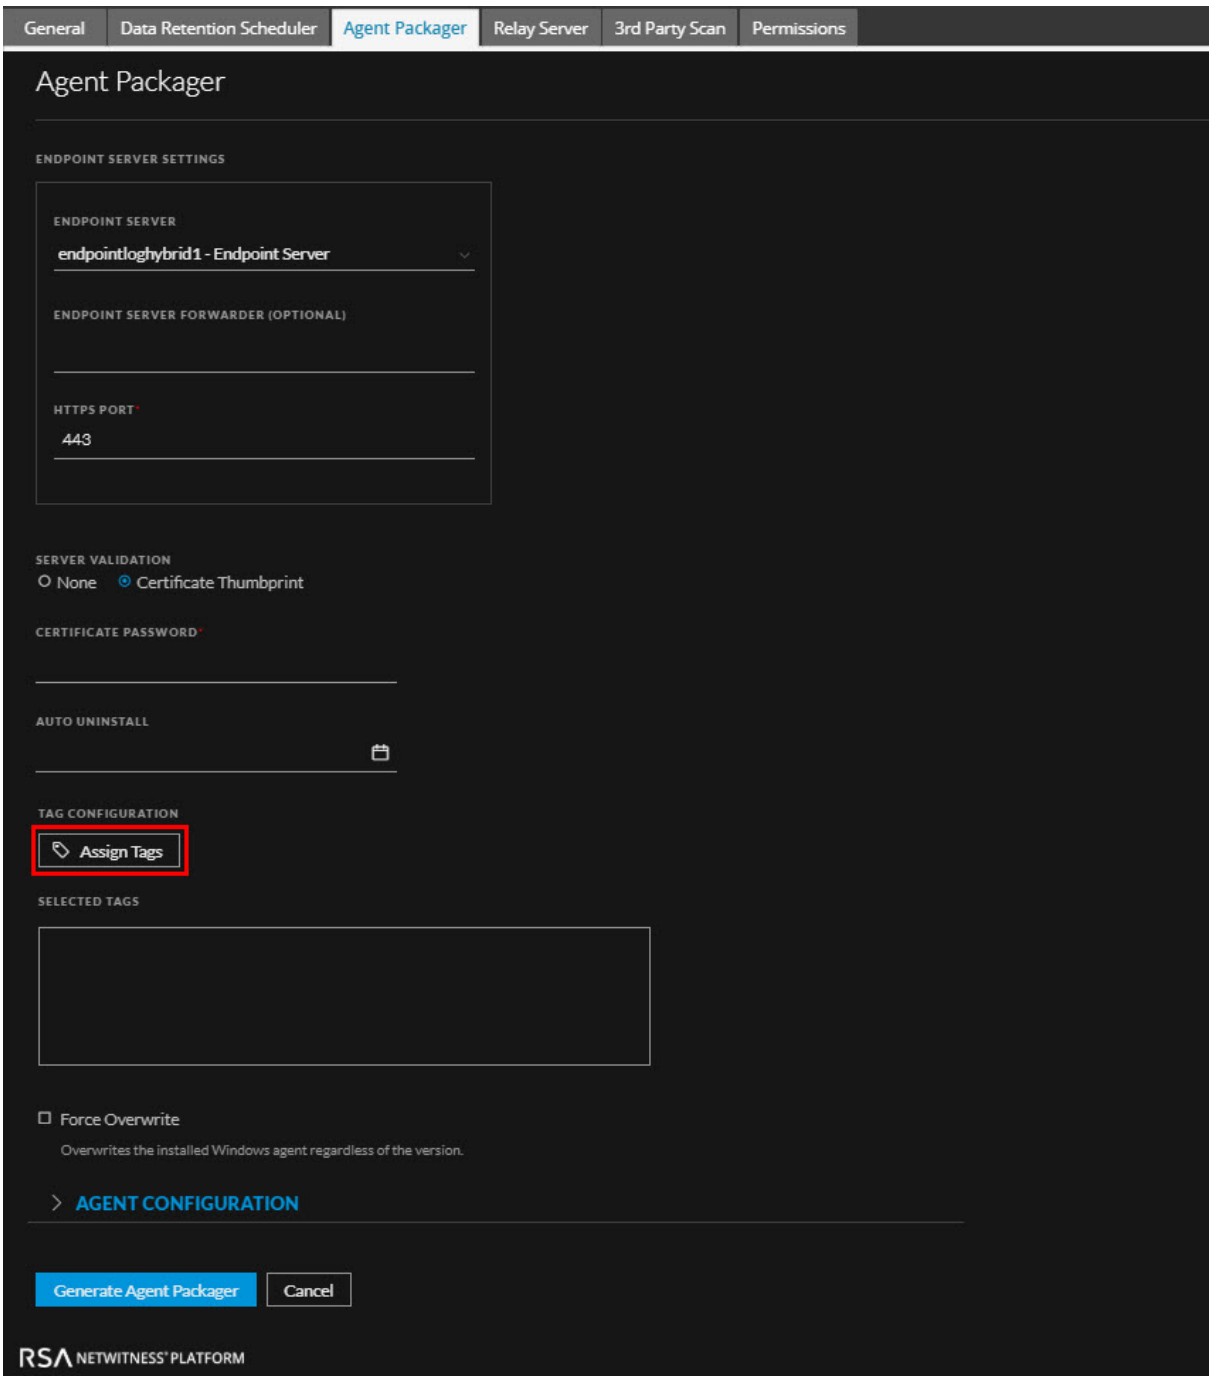
3. The Assign Tags pop-up will appear and shows all the existing tags. You can either

- Enter a valid tag and click  to create it. The newly created tag is selected by default.

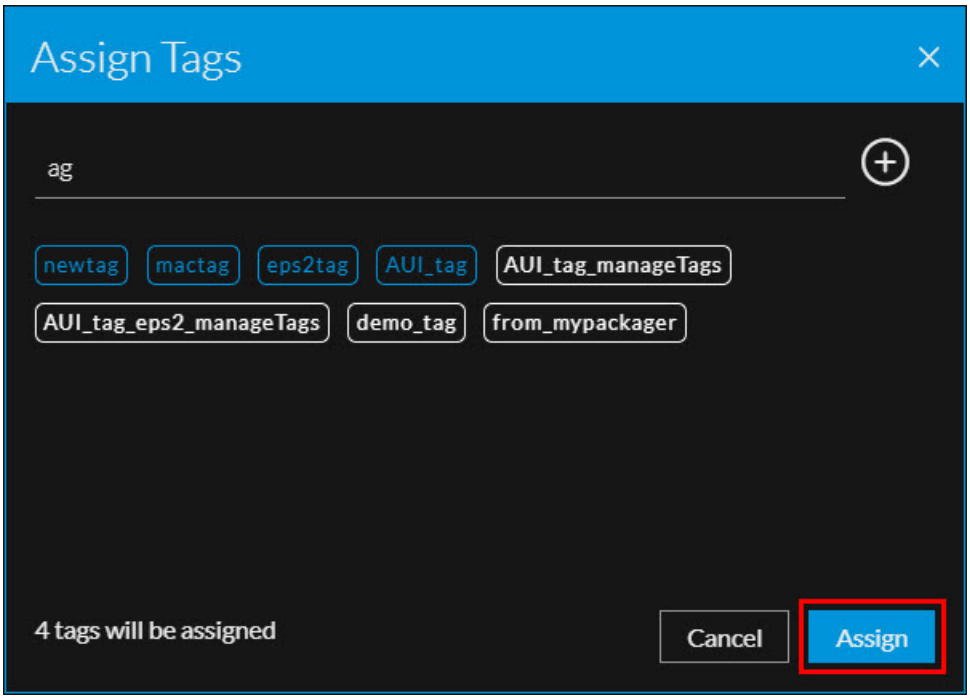


(Or)

- Search for an existing tag using the text field and select it if required.



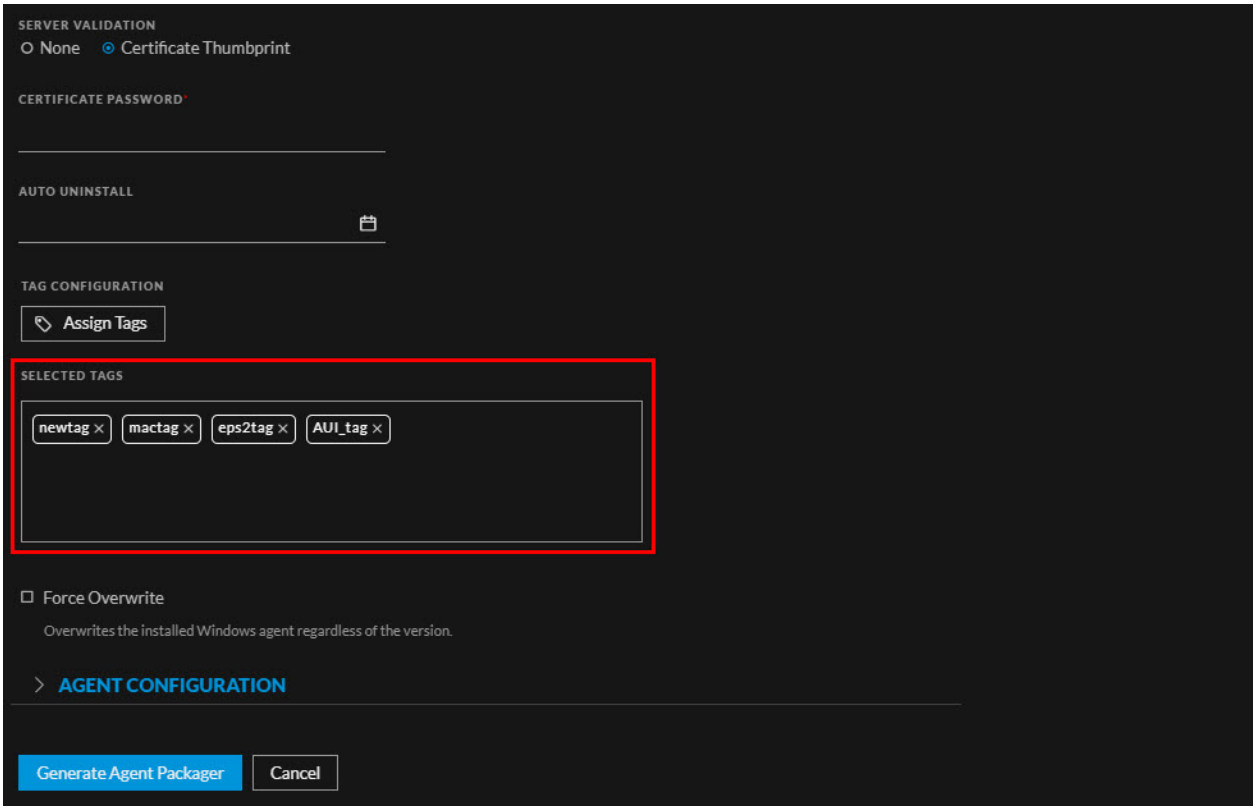
4. Click **Assign**. These tags will be assigned to the selected hosts.



Create and Assign Tags When Generating the Agent Packager

You can add tags to the hosts while installing the Endpoint agents. When generating the agent packager on the Agent Packager tab, you can either create new tags or select already existing tags. These tags will automatically be assigned to the host in which the agent will be installed.

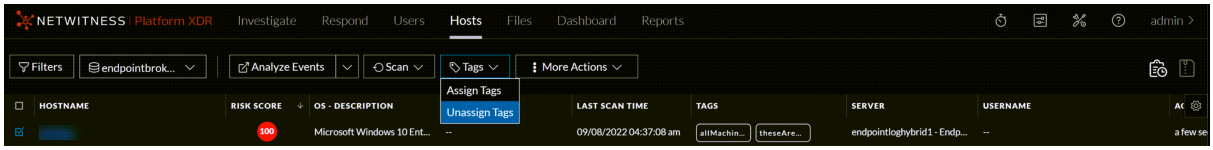
1. Click **Assign Tags** under **TAG CONFIGURATION** on the Agent Packager tab.



2. On the **Assign Tags** pop-up,
   - Search for an existing tag using the text field and click **Assign**.

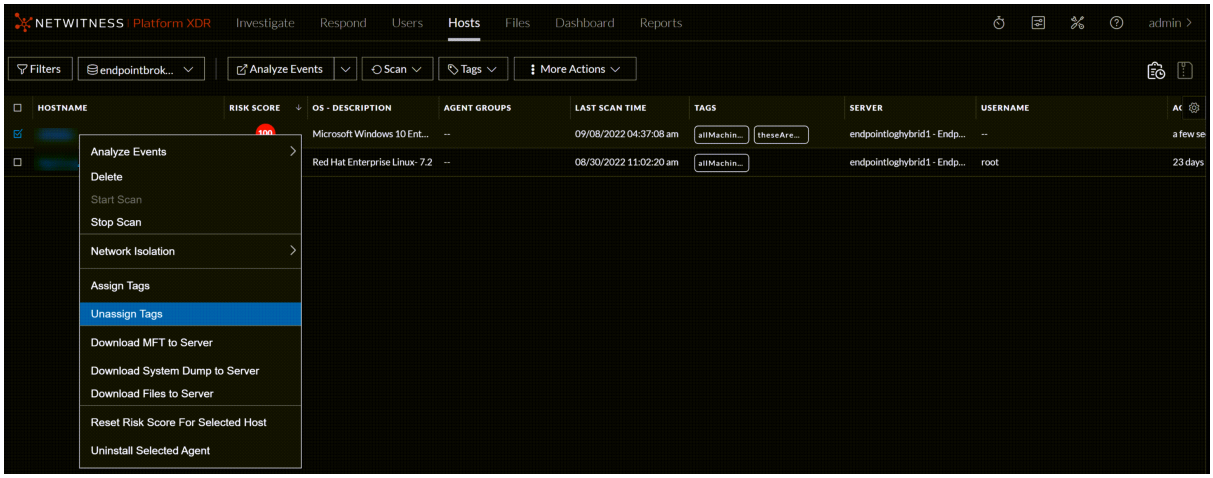
(or)

- Enter a new tag in the text field and click  to add it to the selection. Click **Assign**.



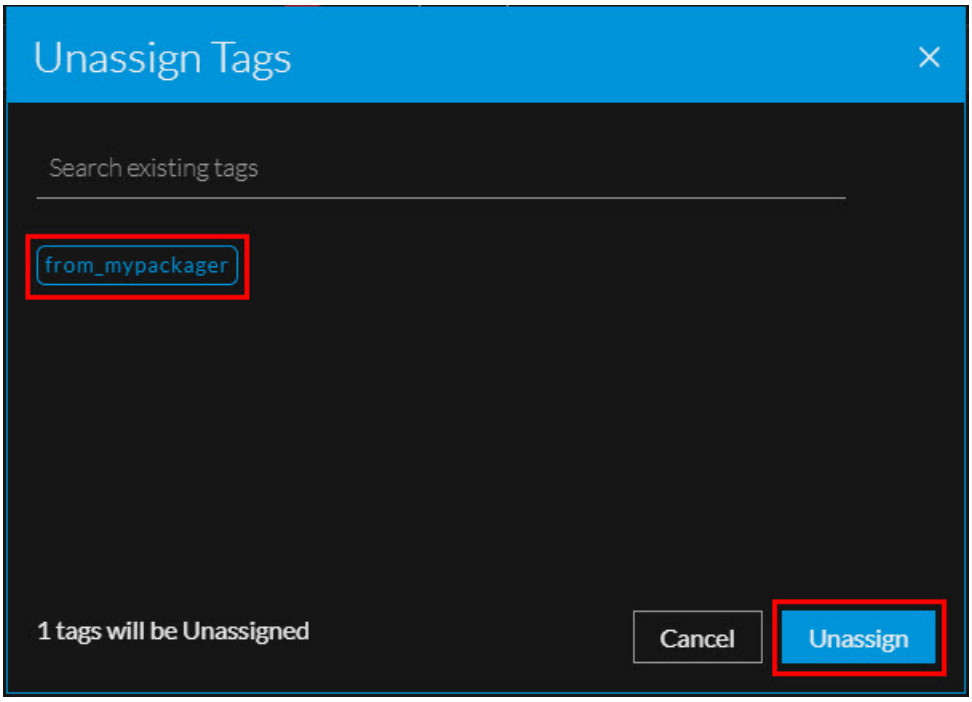
3. Assigned tags will appear under **SELECTED TAGS**.

Note: The tags added while generating the Agent Packager are applicable only to the newly installed agents and not to the manually upgraded agents.

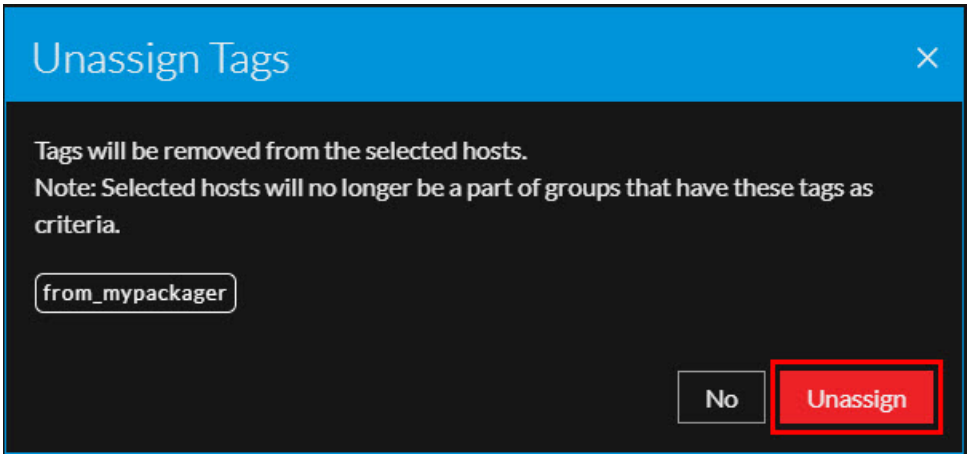


Unassign tags

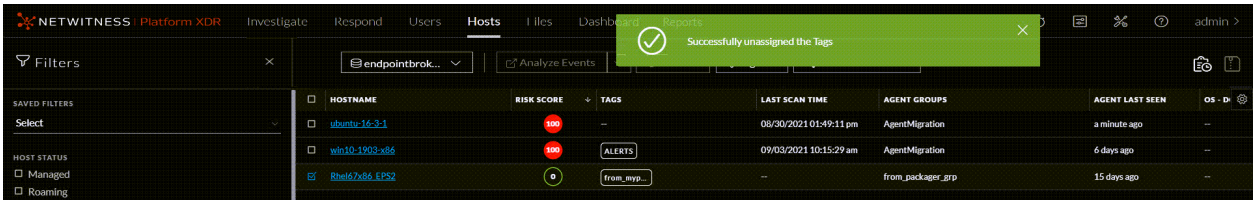
1. Select one or more hosts on the Hosts tab.
2. Select **Tags > Unassign Tags** from the menu.



(or)



Right click on a host and select **Unassign** Tags. The **Unassign Tags** pop-up will appear and shows all the tag assigned to the selected hosts.



3. Search for the tags you want to unassign, select them and click **Unassign**.

4. Click **Unassign** on the confirmation pop-up.

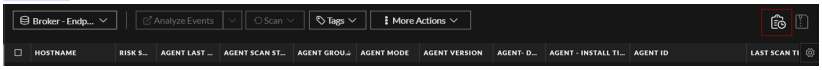
5. These tags will be Unassigned from the selected hosts.

What happens next after unassigning or deleting tags from hosts?

Unassigning/deleting tags from hosts will immediately initiate group & policy evaluation. For example, if a host is a part of the group created using only the unassigned/deleted tag as criteria, the host will no longer be a part of that group. Refer to the following scenarios to understand more.

Example Scenario 1: Assume you create a group with a couple of tags as grouping criteria, all the hosts with these tags assigned will be a part of the group. And, if you delete these two tags(or unassigning from the hosts), the hosts may no longer be a part of this group.

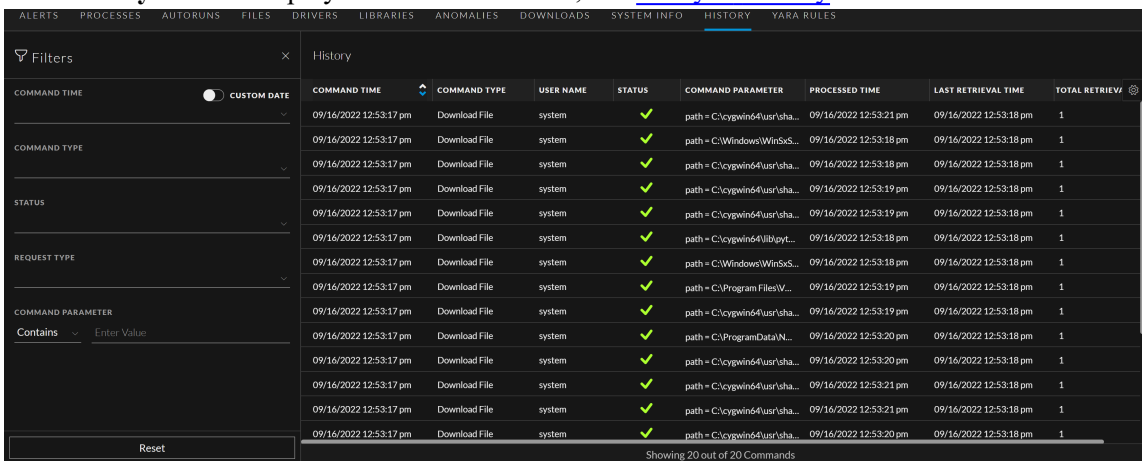
Example Scenario 2: Assume you create a group with a couple of tags and IP addresses as grouping criteria; all the hosts assigned with these tags and IP addresses will be a part of the group. And, if you delete(or unassigning from the hosts) the tags alone, the hosts may still be a part of this group as they are still grouped using the IP addresses.



View Agent History

You can view the list of commands issued to the agents (by the server or actions performed by any analyst) in the Host view and Host details. By default, commands are sorted based on the command time.

To view the commands:

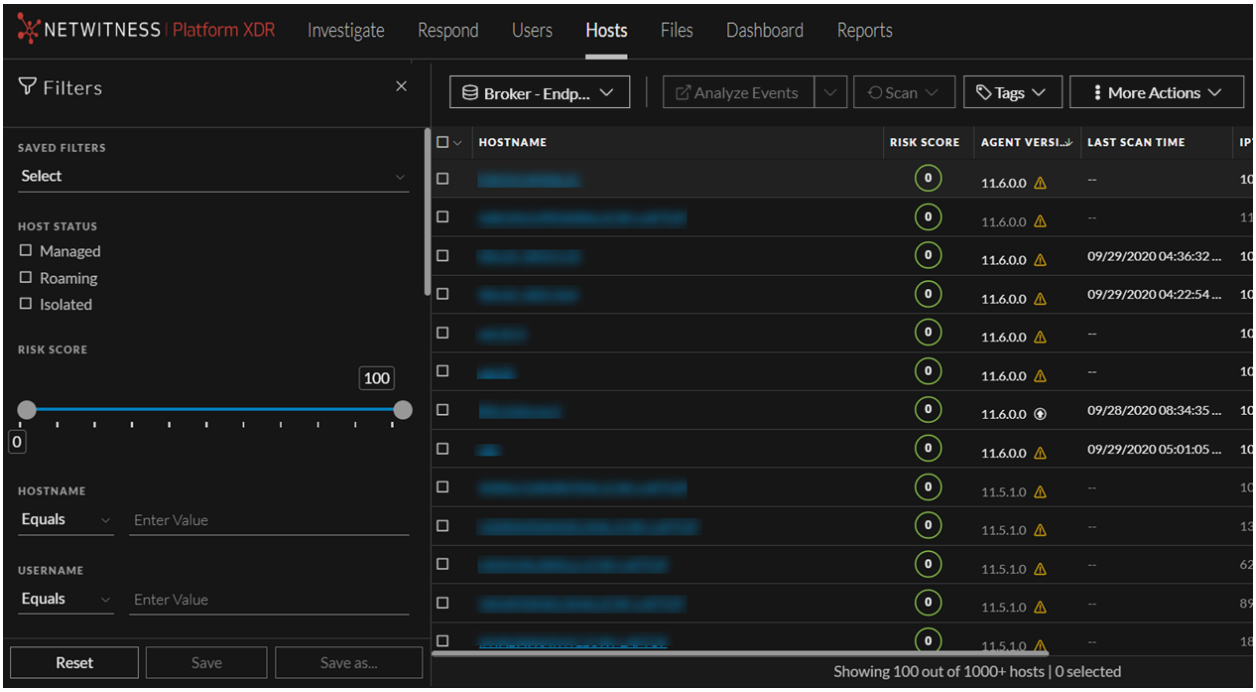


1. Go to **Hosts**.
2. Do any one of the following,

   - To view all commands, click . You can also filter commands, for more information see Filter Hosts.

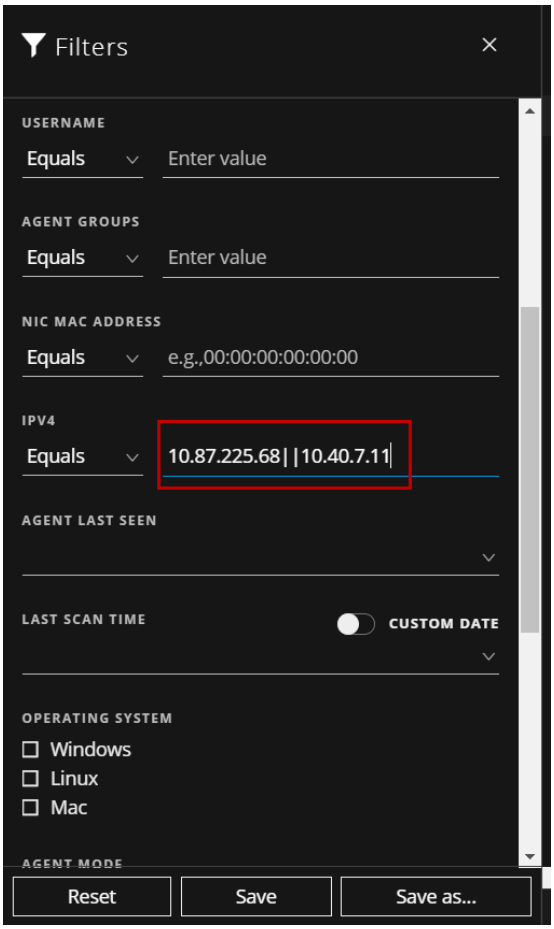
     The Agent History view is displayed. For more details, see Analyze History.

   - To view commands specific to a particular host:
     - Click the host for which you want to view the commands.
     - In the Host details view, click **History** tab. You can also filter commands, for more information see Filter Host Details.
       The **History** view is displayed. For more details, see Analyze History.



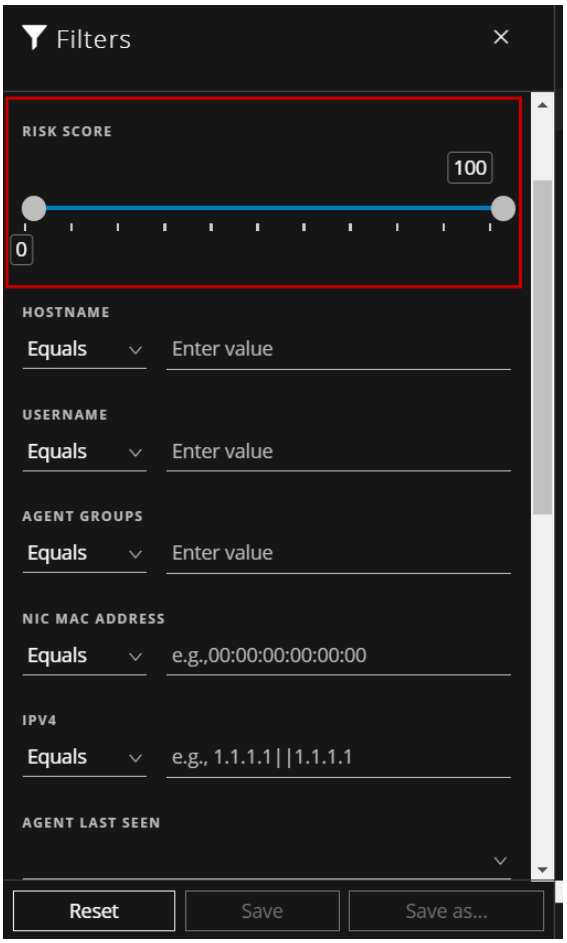
Filter Hosts

You can filter hosts on agent version, agent ID, agent mode, agent upgrade, agent last seen, last scan time, operating system, hostname, username, Mac address, risk score, IPV4, driver error code, security configurations, agent groups, and host status - managed, roaming, and isolated.



In the **Host** view > click , to filter the commands on command type, status, host name, request type, command parameter and command time. In the Command Time field, you can filter by custom date range.

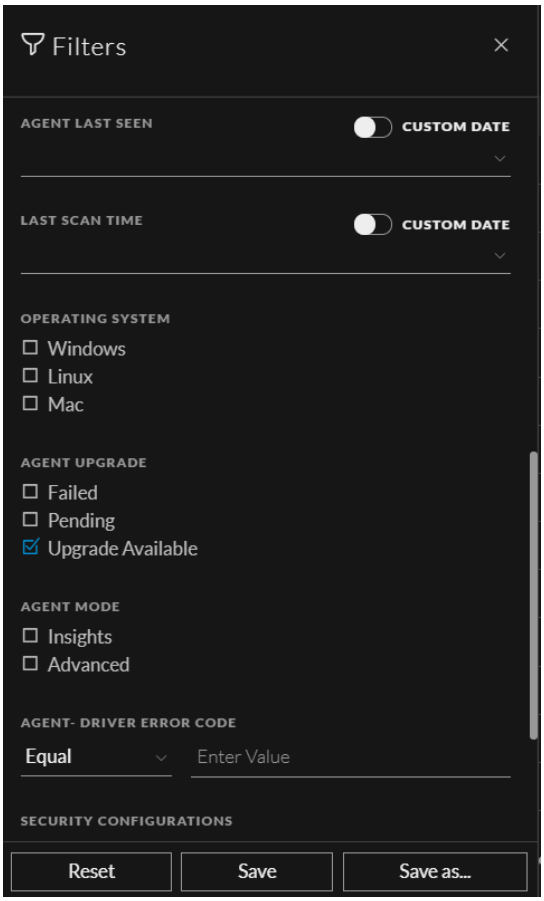
Note: While filtering on a large amount of data, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Hostname, IPv4, Operating System, Last Scan Time, and Risk Score.



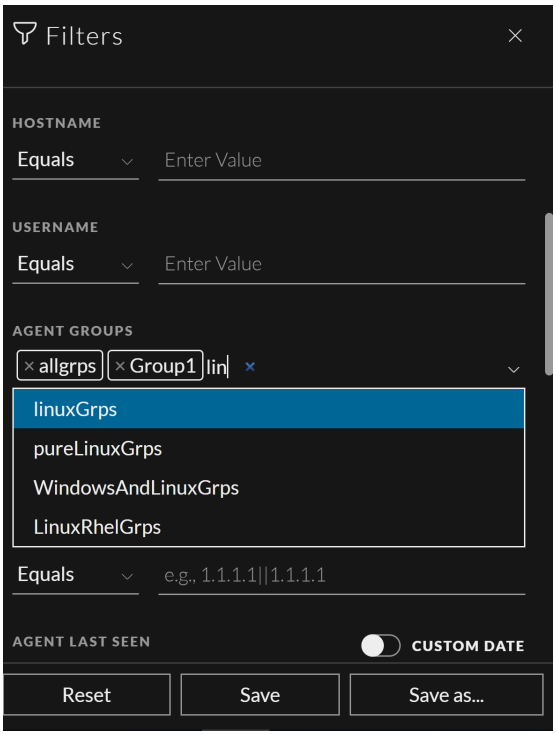
To search multiple values within a field, set the filter option to `Equals`, and use `||` as a separator.

For example, using `Equals` operator for multiple IPV4 values with a separator `||`.

To filter on the agent last seen or last scan time, select the option from the drop-down list. If you select 3 Hours ago for the Last Scan Time, the result displays hosts that were last scanned 3 hours ago or earlier.

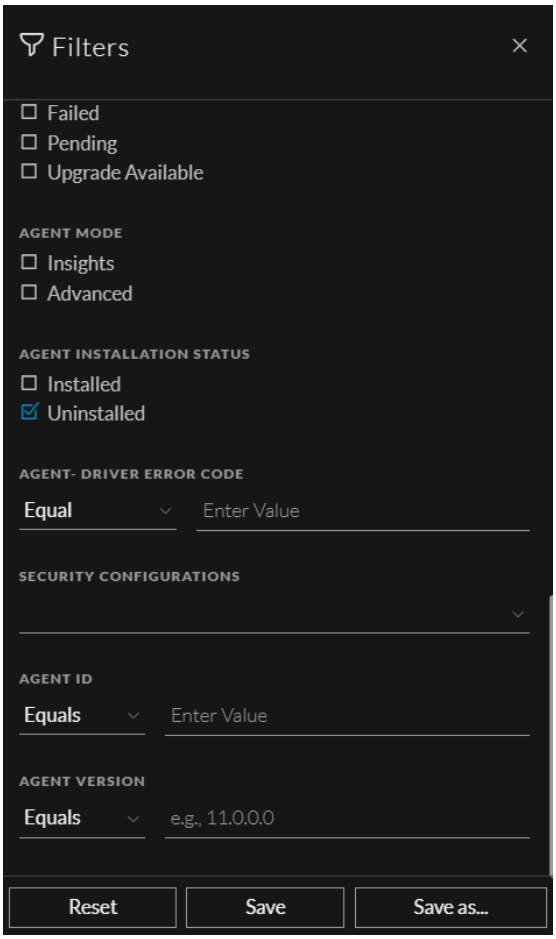


To filter on the risk score, use the slider to increase or decrease the values between 0 to 100.



Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click 🗑.

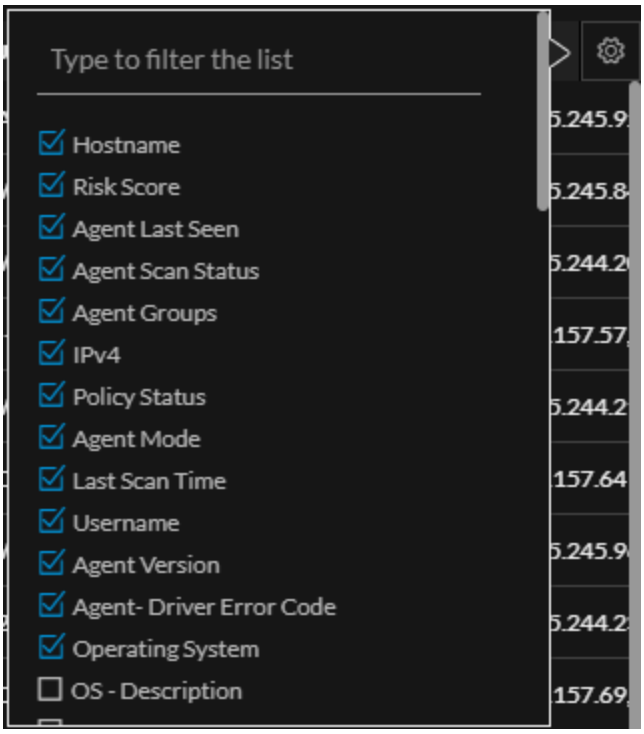
Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.



To filter the agents based on the upgrade status, select one of the upgrade statuses. For example, select the **Upgrade Available** checkbox to get the list of agents available for an upgrade.

To filter the agents based on single or multiple agent groups, select a group from the drop-down list. You can also search the name of the groups from this list.

To filter the agents based on the installation status, select one of the installation statuses. For example, select the **Uninstalled** checkbox to get the list of agents for which the uninstall is initiated or successfully completed.



You can also filter the commands on command type, status, host name, request type, command parameter and command time (In which you can filter by custom date range), by clicking .

Adding and Sorting Columns in the Table

By default, the Hosts view displays a few columns and the hosts are sorted based on the risk score. To add or remove columns:

1. Go to **Hosts**.
2. Select the columns by clicking  in the right-hand corner.

3. Scroll down or enter the keyword to search for the column.
4. Click the arrow on the column header to sort the column in ascending or descending order.

Scan Hosts

You may want to perform an on-demand scan if you want to get the latest snapshot of the host.

You can either choose to perform a quick scan or a full system scan.

Quick scan - Scans all executable files that are loaded in memory. Both Insights and Advanced agents support quick scan.

Full System Scan - Scans all fixed drives or the system drive You can perform a full system scan only on advanced agents that are in version 11.6 or later. Native executables are included in the full system scan, by default

When hosts are scanned, the Endpoint Agent retrieves the following data that can be used for investigation:

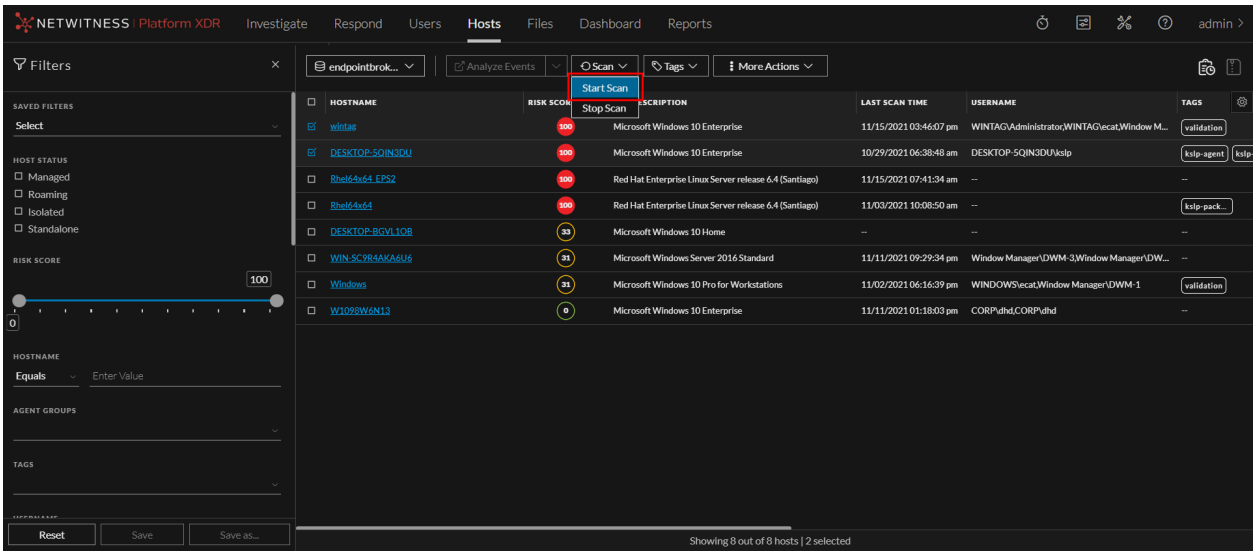
- Drivers, processes, DLLs, files (executables), services, autoruns, anomalies, host file entries, and scheduled tasks running on the host.
- System information such as network share, installed Windows patches, Windows tasks, logged-in users, bash history, and security products installed.

To perform a Quick Scan:

1. Go to **Hosts**.
2. Select one or more hosts (up to 100) at a time, and do one of the following:

- Click **Scan > Start Scan** from the menu (Or)
- Right-click and select **Start Scan** from the context menu

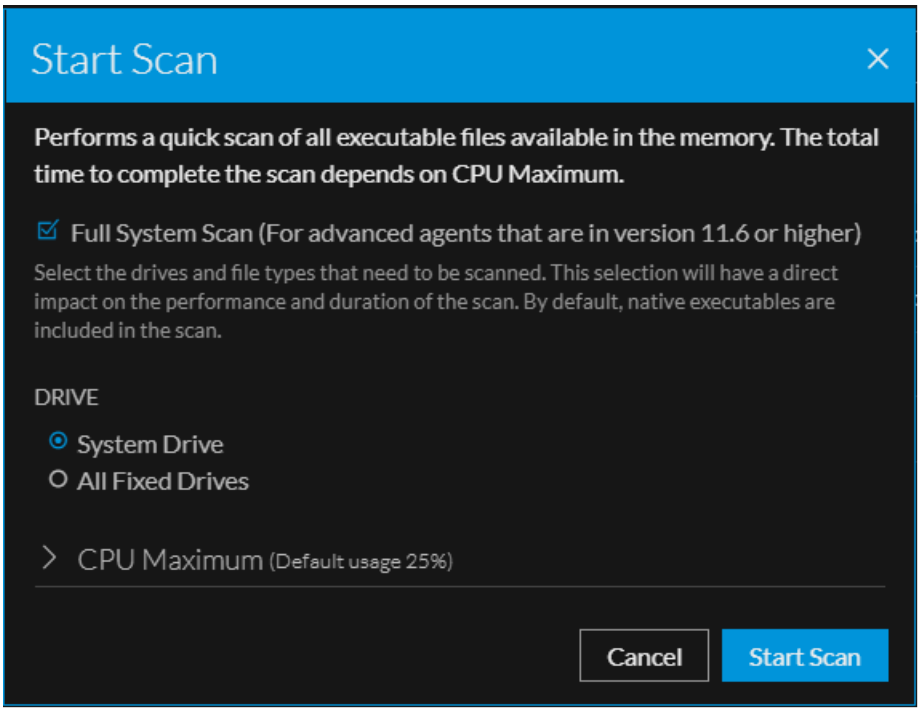
3. Click **Start Scan** on the pop-up. Quick scan is initiated for executable modules loaded in memory.



The following are the scan statuses:

Status	Description
Idle	No scan is in progress.
Scanning	Scan is in progress.
Pending	Scan request is sent to the server, and the agent will receive the request the next time it communicates with the server.
Cancel	Stop request is sent to the server, and the agent will receive the request the next time it communicates with the server.

Note: By default, the scan utilizes 25% of the CPU. You can click CPU Maximum and select a value from 5% to 100%. Increasing the CPU Maximum limit reduces the scan time but could lead to more CPU usage.



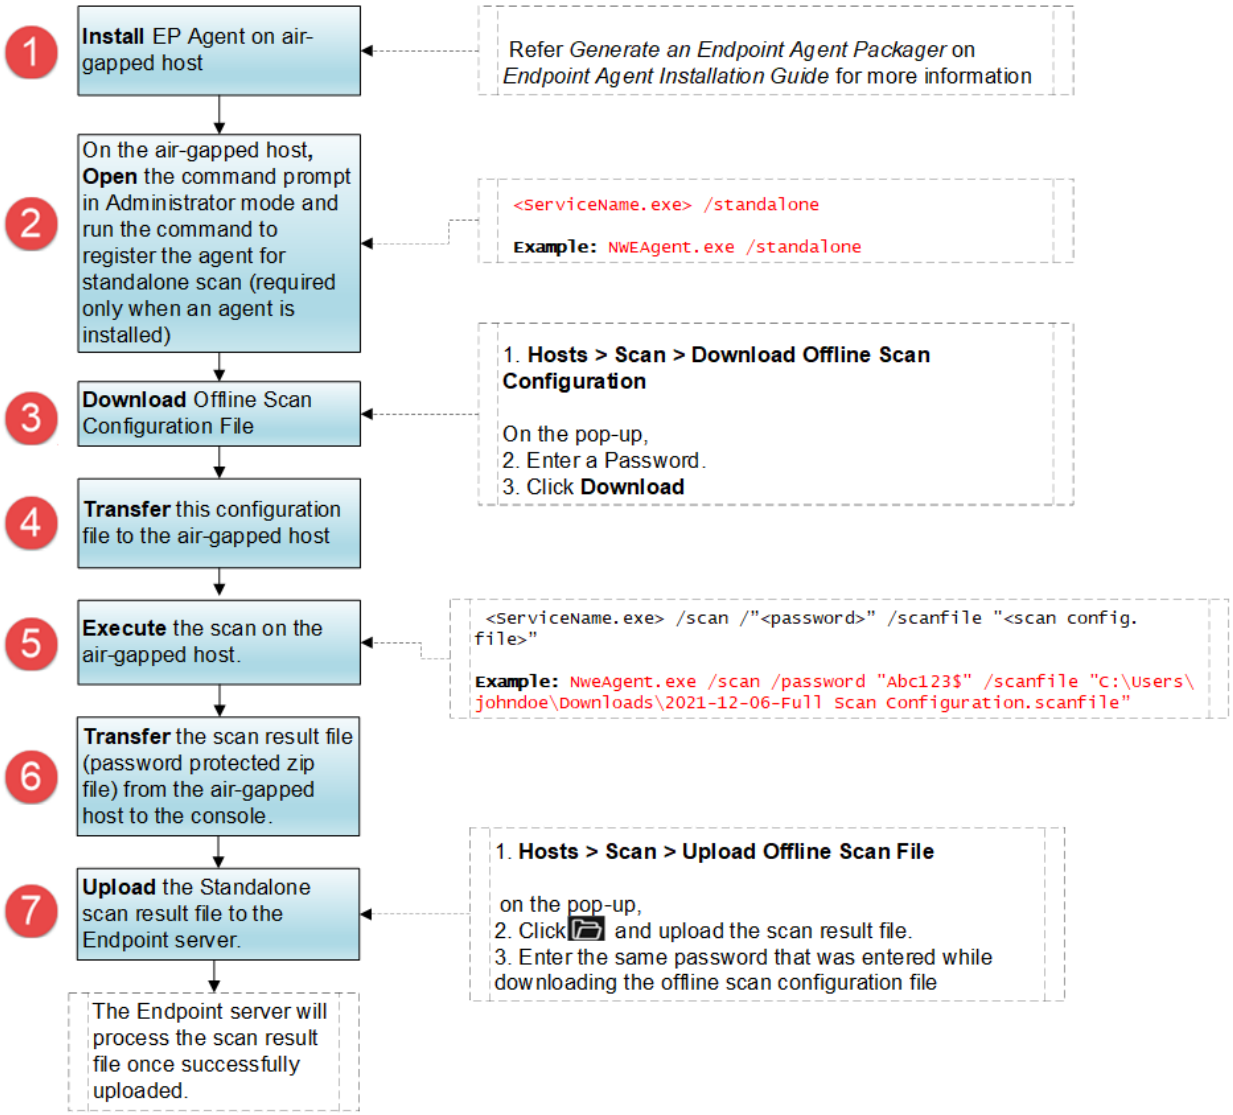
To perform a Full System Scan:

1. Go to **Hosts**.
2. Select one or more hosts (up to 100) at a time for an on-demand scan, and do one of the following:
   - Click **Scan > Start Scan** from the menu bar (Or)
   - Right-click and select **Start Scan** from the context menu

1. From the **Start Scan** pop-up, select **Full System Scan (Only on advanced agents that are 11.6 or higher.)**

2. Select **System Drive**(Default selection) or **All Fixed Drives**
3. Click **Start Scan** on the pop-up.

Note: An Endpoint server supports up to 10k Full System Scans in a rollover period.

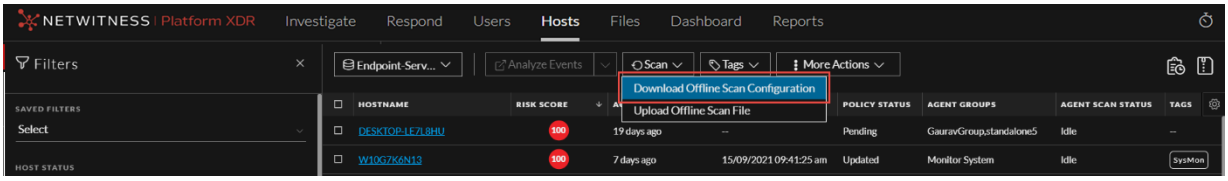


Standalone Scan on Air-gapped Windows Hosts

The Standalone scan feature allows administrators to run scans on the air-gapped Windows hosts that are disconnected from the network. Administrators can download the scan command once from UI and execute it on multiple hosts. For the best utilization of resources, we recommend running standalone scan every two weeks. Policies do not apply on air-gapped hosts, and features such as downloading MFT to the server, upgrading agents through UI, downloading a file to the server are not available for standalone agents.

The scan process involves two files:

- **Offline Scan Configuration** - Contains the configuration information needed to run the scan.
- **Scan Results File** – This contains the results of the Scan, which you can upload using the **Scan > Upload Offline Scan File** option on the **Hosts** view. This file will be imported and processed by NetWitness.

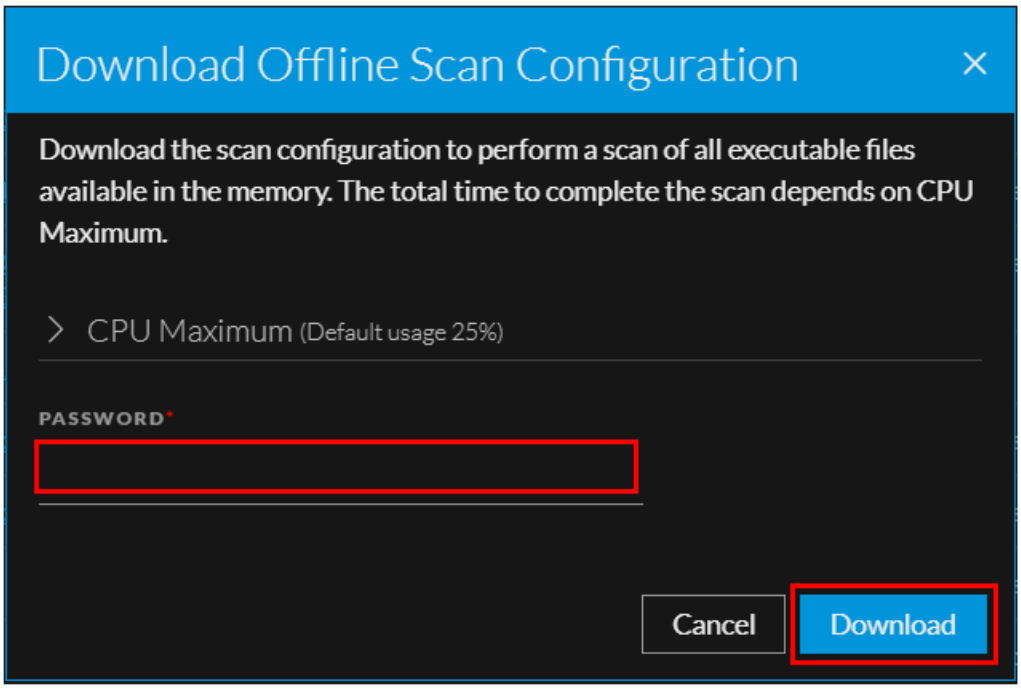


Standalone scan workflow:

Note: Both Download Offline Scan Configuration and Upload Offline Scan File options are available only on the Endpoint server view. These options can't be accessed from Broker view.

Generate the scan configuration file

1. Click **Scan > Download Offline Scan Configuration** on the Hosts screen.



On the Download Offline Scan Configuration pop-up,

2. (Optional) **Select CPU Maximum**.

3. Enter a Password. (not more than 31 characters long)

4. Click **Download**.

5. Transfer the Offline Scan Configuration file to the air-gapped host.

Install Endpoint Agent and Register for Standalone Scan

1. Install the Endpoint Agent on the air-gapped host. Refer to *Endpoint Agent Installation Guide* for more information.
2. Register the agent for standalone scan (required only when an agent is installed)
   - Open command prompt in administrator mode and execute the following command:

     `ServiceName.exe /standalone`

     Example: `NweAgent.exe /standalone`

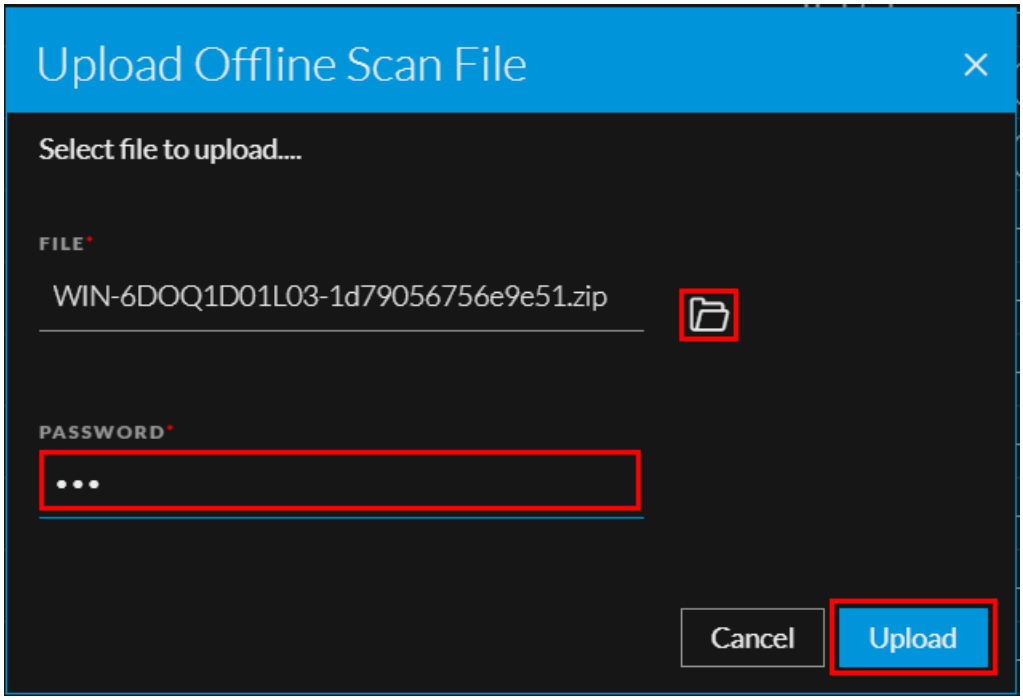
Start a Standalone scan

1. Open the command prompt in Administrator mode, on the air-gapped host.

2. Execute the scan using the following command(syntax):

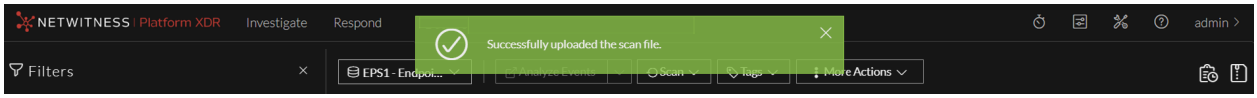
```
ServiceName.exe /scan /password ”<password>” /scanfile "<scan config. file>”
```

Example: `NweAgent.exe /scan /password "Abc123$" /scanfile "C:\Users\johndoe\Downloads\2021-12-06-Full Scan Configuration.scanfile"`



- `<password>` is the password entered while generating the Offline Scan Configuration File.

- `<scan config file>` is name of the scan configuration file with full path.



3. Wait until the scan is completed.
4. Transfer the scan result file(password protected .zip file) back to the machine to upload to the UI.

Upload the Standalone scan result file

1. Click **Scan > Upload Offline Scan File** on the Hosts screen.

2. Click  and upload the scan result file.
3. Enter the same password that was entered while downloading the offline scan configuration file.
4. The Endpoint server will process the scan result file once successfully uploaded.

Note: Standalone agents can only be upgraded manually using the Endpoint agent packager. Refer to *Generate an Endpoint Agent Packager* on *Endpoint Agent Installation Guide* for more information.

Analyze Hosts Using the Risk Score

You can investigate a host by analyzing the risk contributors such as alerts and events to look for suspicious or malicious activity.

Based on the severity of the alert triggered by the host, you can analyze the host using the following options:

- **View Alert Details**: This option allows you to analyze the host when Critical and High alerts are triggered. For more information, see Investigating a Process.
- **Analyze Process Tree**: This option allows you to analyze the host when Medium alerts are triggered. For more information, see Investigating a Process.

To analyze the hosts (which trigger Critical or High alerts) using the risk score:

1. Go to **Hosts**.

   The **Hosts** view is displayed.

2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the hosts.

3. Select the host and do any of the following.

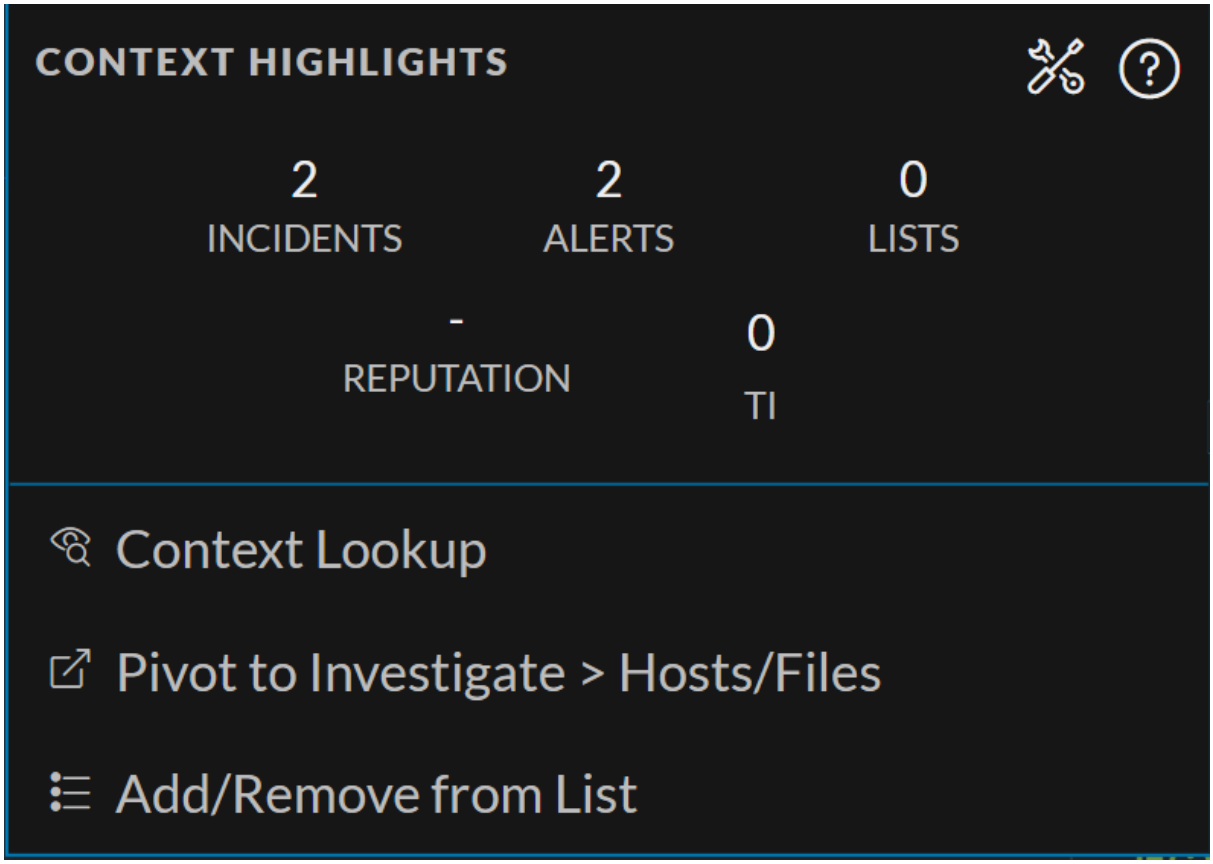
   - Click a row to view the risk associated with the host in the **Risk Details** panel.
   - Click the hostname to investigate the host.

     The **Alerts** tab is displayed.

4. In the **Alerts** > **Severity** panel, click the alert severity such as **Critical** or **High**.

   The list of distinct alerts is displayed along with the total number of events associated with the alert.

5. Click an alert to view the associated events.



Note: For each alert, only the latest 1000 events are displayed.

6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.

7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.
8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

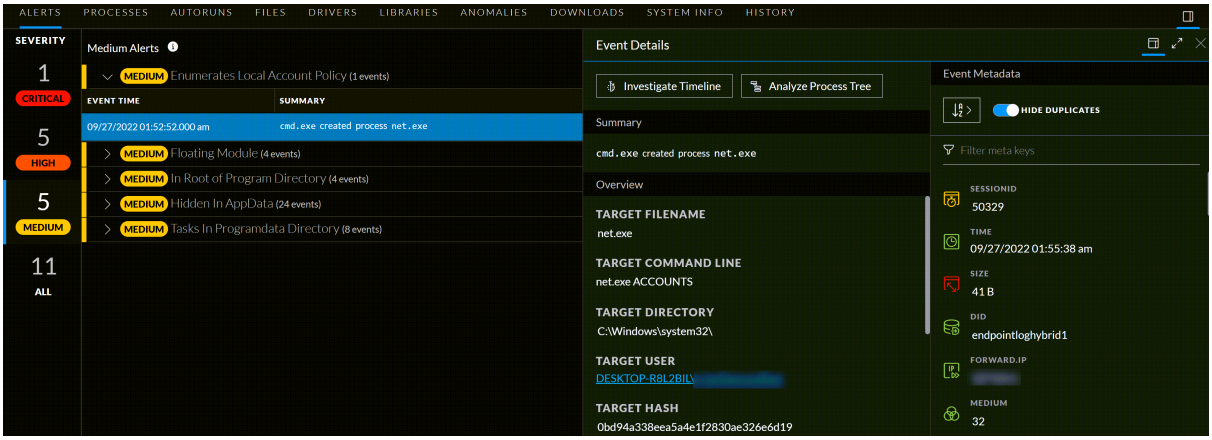
9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **View Alert Details** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.

To analyze the hosts (which trigger Medium alerts) using the risk score:

1. Go to **Hosts**.

   The **Hosts** view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the hosts.
3. Select the host and do any of the following.
   - Click a row to view the risk associated with the host in the **Risk Details** panel.
   - Click the hostname to investigate the host.

The **Alerts** tab is displayed.



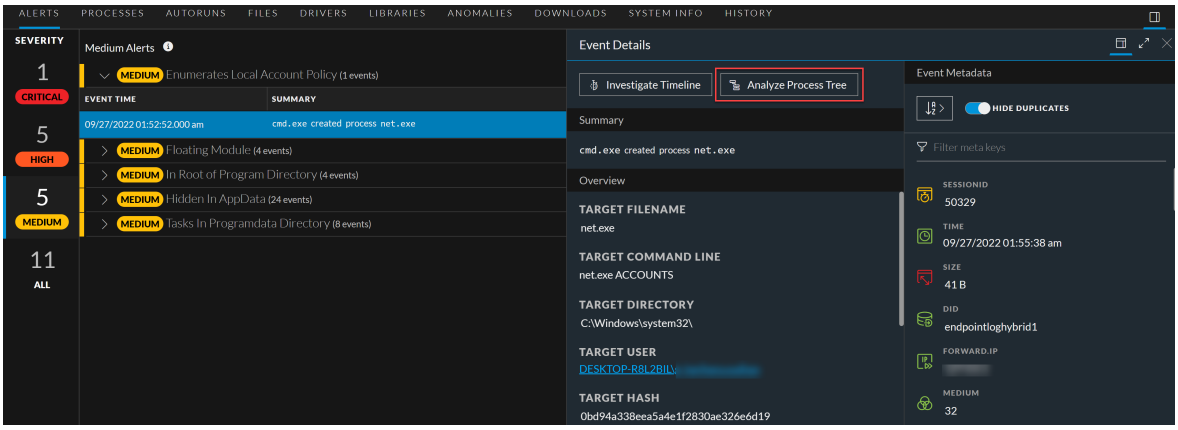
4. In the **Alerts** > **Severity** panel, click the **Medium** alert severity.

   The list of distinct alerts is displayed along with the total number of events associated with the alert.

5. Click an alert to view the associated events.

   Note: For each alert, only the latest 1000 events are displayed.

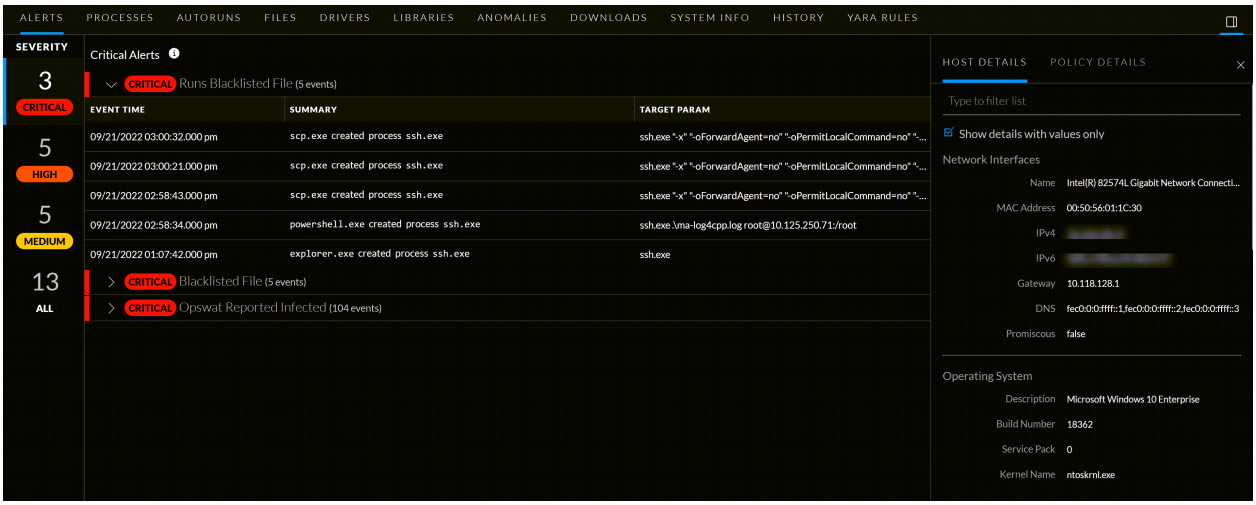
6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.



7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **Analyze Process Tree** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.



Analyze Host Details

To look for suspicious files on a host, click the host name and view the details of the host, or start an on-demand scan to get the most recent information. On the right-hand panel, you can view the following:

- **Host Details** displays the host information, such as Network interface, operating system, hardware and others.
- **Policy Details** displays the complete resolved policy settings.

For more details, see Hosts View - Details Tab.

Filter Host Details

In the Processes, Autoruns, Files, Drivers, Libraries, and Anomalies tabs, you can filter the processes or files on file status, reputation, file or process name, signature, and risk score. Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click 🗑.

In the **Host** view > **Files** tab, you can filter the files available on host, and files deleted from host. The result of files deleted from host depends on the data retention policy configured in the **Endpoint Config** view > **Data Retention Scheduler** tab. By default, data retention policy is configured for 30 days, this means only 30 days of deleted files are stored in the Endpoint server. These filter options are disabled if **All Files Available on Host** toggle is disabled.

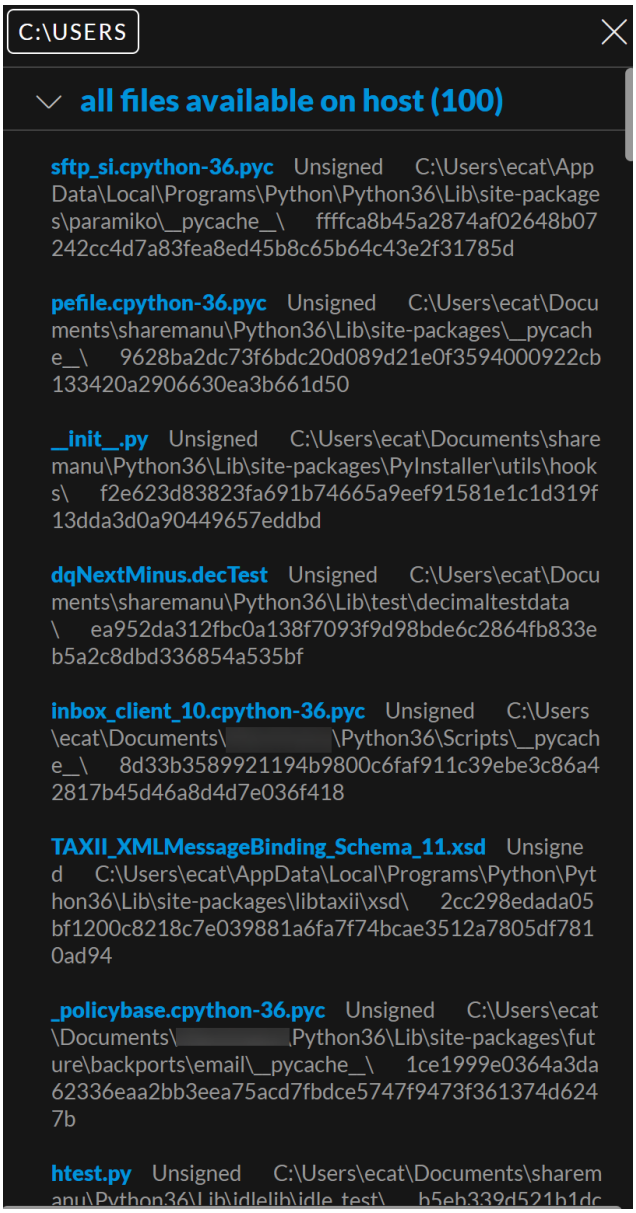
In the **Host** view > **History** tab, you can filter the commands on command type, status, host name, request type, command parameter and command time. In the Command Time field, you can filter by custom date range.

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters).The filter is added to the **Saved Filters** panel on the left. To delete a filter, hover over the filter name and click 🗑.

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Search Files on Host

To investigate a host or to check if it is infected with a known malware, you can search for occurrences of the file name, file path, or SHA-256 checksum.



Note: To search for a SHA-256 checksum, provide the entire hash string in the search box.

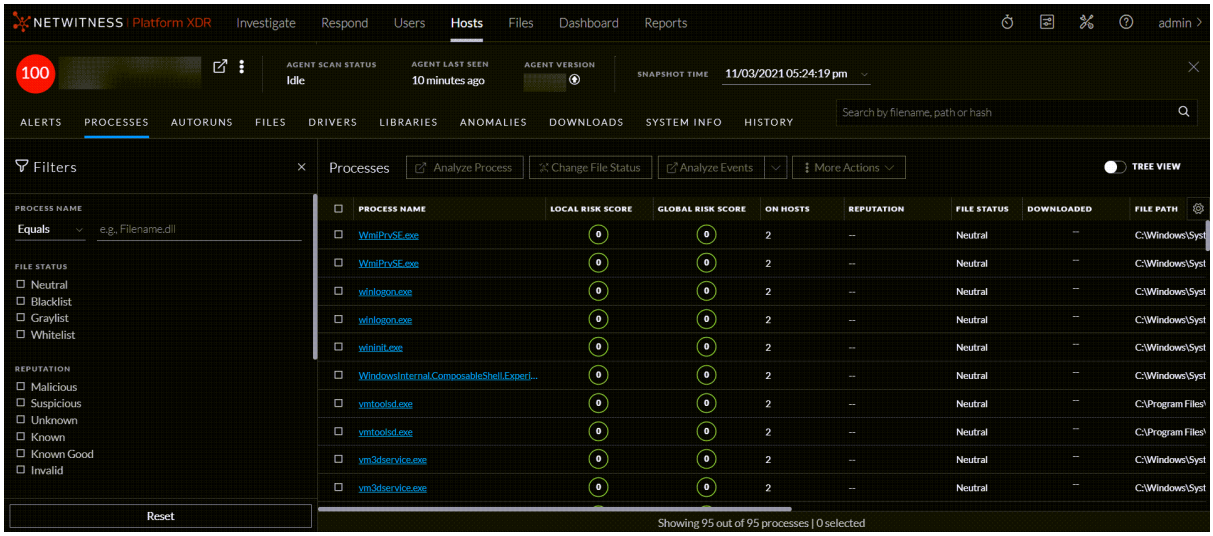
The result displays the matching files present on the host in **All Files Available on Host** category and in the respective **snapshot** category with the details, such as file name, signature information,and checksum. In addition, the **snapshot** category displays the system interaction, for example, ran as process, library, autorun, service, task, or driver. To view more details, click the **filename** or **system interaction** link.

Example, a user has clicked and executed a malicious attachment through a phishing email, and downloaded it to `C:\Users`. To investigate this file:

1. Go to **Hosts**.
2. Select the host that you want to investigate or select the Endpoint Broker server to investigate all the hosts.
3. In the **Alerts** tab, enter the file path `C:\Users` in the search box.

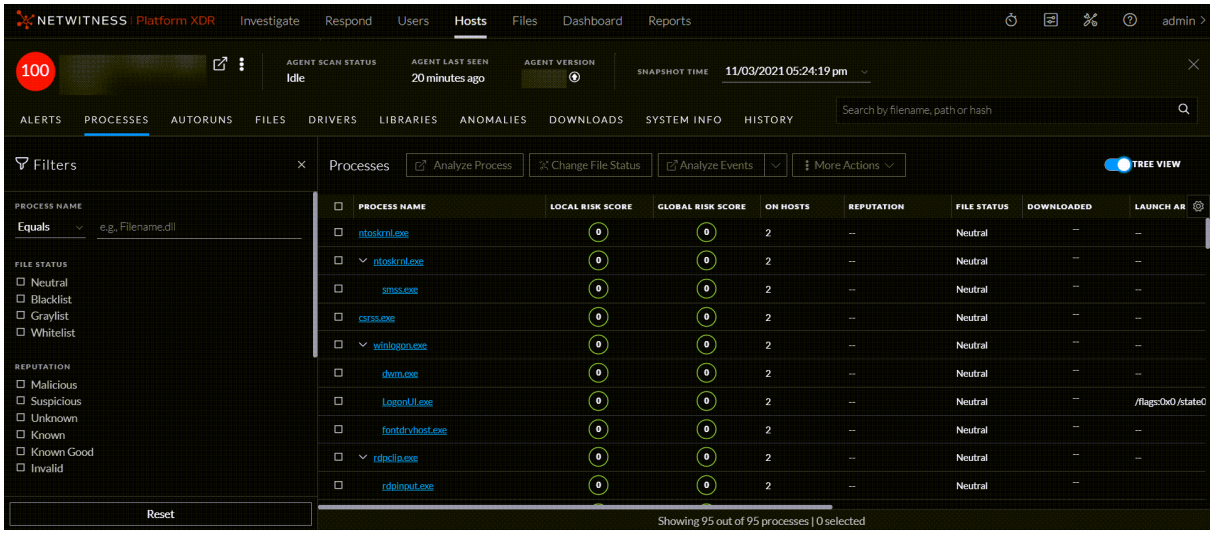
   The search displays a maximum of 100 results of the executables in this folder. In this example, there are some unsigned file that might be malicious. If the search is executed on an Endpoint Broker server, it queries all the Endpoint servers.

This file is run as a Process.



4. To view details of this file, click **Process** in the result.

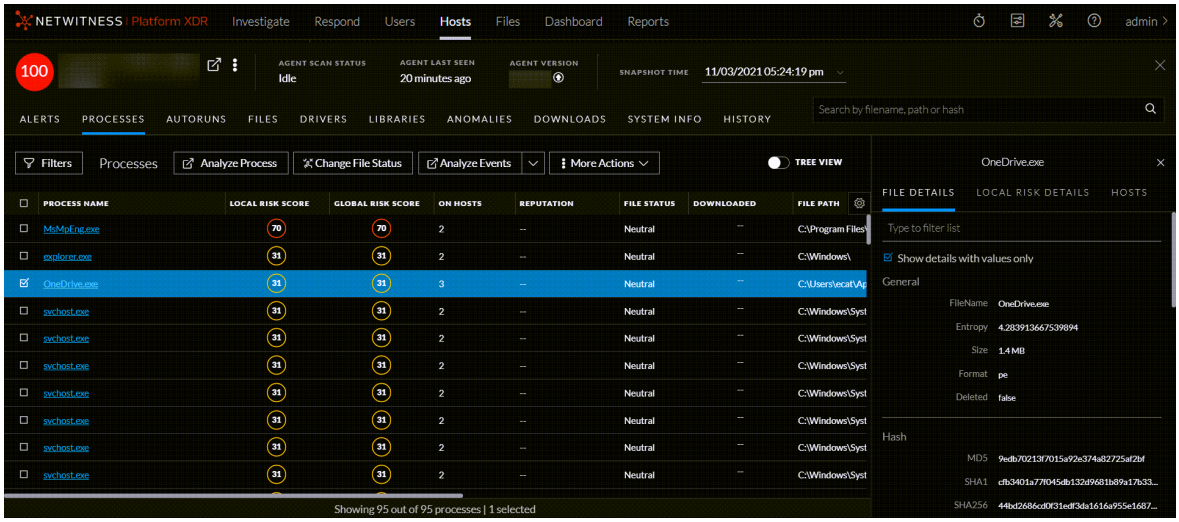
   This opens the **Process** tab where you can view the process details.



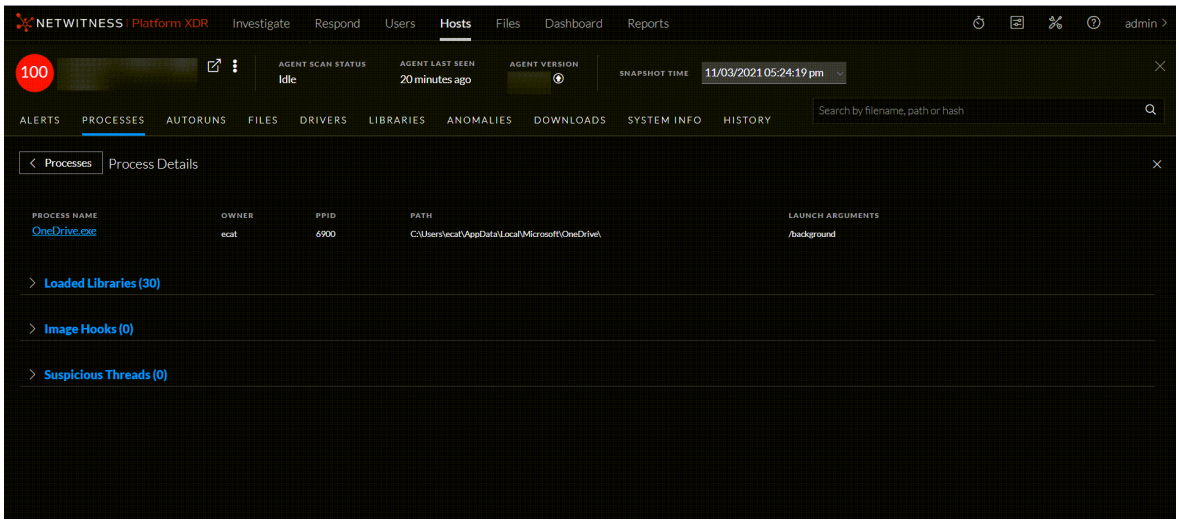
Analyze Processes

To analyze the process:

1. In the **Hosts** details, select the **Processes** tab.



To view the process tree, click the toggle switch. The following is an example of the tree view:



2. In the **Processes** Tab, do one of the following:

- Click a row to view the properties of a process in the right panel.

- Click the process name to view the process details of a specific process.

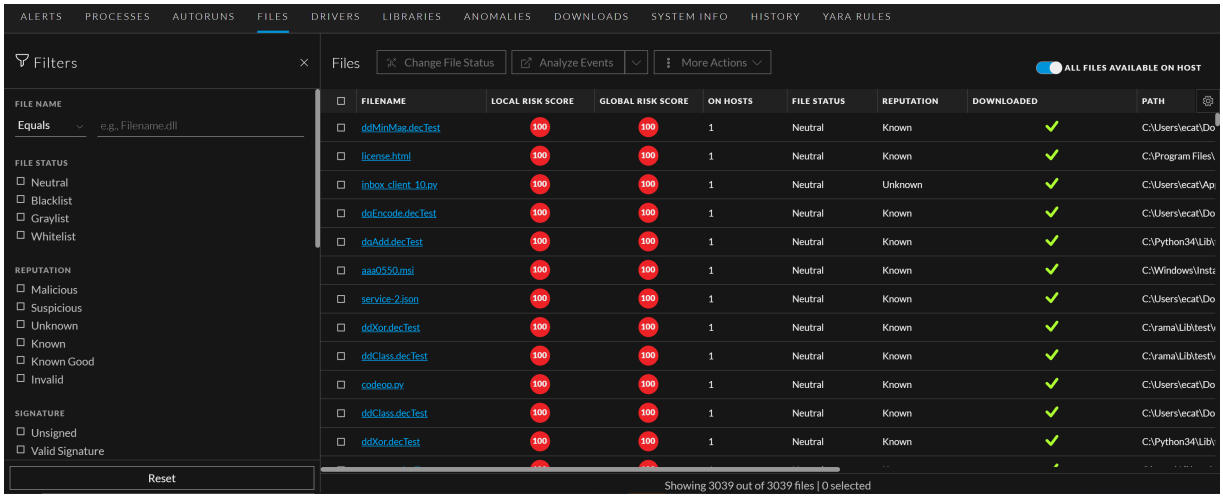
When reviewing processes, it is important to see the launch arguments. Even legitimate files can be used for malicious purposes, so it is important to view all of them to determine if there is any malicious activity.

For example,

- `rundll32.exe` is a legitimate Windows executable that is categorized as a good file. However, an adversary may use this executable to load a malicious DLL. Therefore, when viewing processes, you must view the arguments of the `rundll32.exe` file.
- `LSASS.EXE` is a child to `WININIT.EXE`. It should not have child processes. Often malware use this executable to dump passwords or mimic to hide on a system (`lass.exe`, `lssass.exe`, `lsasss.exe`, and so on).
- Most legitimate user applications like Adobe and Web browsers do not spawn child processes like `cmd.exe`. If you encounter this, investigate the processes.

You can view the sequence of activities performed on the host by the file or process using the process analysis. For more information, see Investigating a Process.

Analyze Autoruns



In the Hosts details, select the **Autoruns** tab. You can view the autoruns, services, tasks, and cron jobs that are running for the selected host.

For example, in the Services tab, you can look for the file creation time. The compile time is found within each portable executable (PE) file in the PE header. The time stamp is rarely tampered with, even though an adversary can easily change it before deploying to a victim's endpoint. This time stamp can indicate if a new file is introduced. You can compare the time stamp of the file against the created time on the system to find the difference. If a file was compiled a few days ago, but the time stamp of this file on the system shows that it was created a few years ago, it indicates that the file is tampered.

Analyze Files

To analyze the files, you can do either one of the following based on your requirement.

- In the **Hosts** view, select the **Files** tab.
  You can view the list of all files (reported as part of scan and tracking) on the host including the deleted files.

- To view the files reported as part of scan snapshot, you must disable **All Files Available On Host** toggle and select the scan time from the **Snapshot** drop-down list.

Example for analyze files, many trojans write random filenames when dropping their payloads to prevent an easy search across the endpoints in the network based on the filename. If a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

Analyze Libraries

In the Hosts details, select the **Libraries** tab. You can view the list of libraries loaded at the time of scan.

For example, a file with high entropy gets flagged as packed. A packed file means that it is compressed to reduce its size (or to obfuscate malicious strings and configuration information).

Analyze Drivers

In the Hosts details, select the **Drivers** tab. You can view the list of drivers running on the host at the time of scan.

For example, using this panel, you can check if the file is signed or unsigned. A file that is signed by a trusted vendor such as Microsoft and Apple, with the term `valid`, indicates that it is a good file.

Analyze Anomalies

Note: This tab is available only for advanced agent.

In the Hosts details, select the **Anomalies** tab. You can view the following details for the selected host:

- Image hooks - Hooks found in executable images (user-mode or kernel-mode) - IAT, EAT, Inline, exceptionHandler.
- Kernel hooks - Hooks found on kernel objects (such as Driver Object [Pointers, IRP_MJ, SSDT, IDT, and so on]). This also includes filter devices.
- Suspicious threads - Threads whose starting address points to memory DLLs or floating code. The threads could be running with either user-mode or kernel-mode privileges. These threads could run malicious code inside a trusted application to execute their own code.
- Registry discrepancies - The Windows registry is a hierarchical database that stores configuration settings and options on Microsoft Windows operating systems. It contains settings for low-level operating system components and for applications running on the platform: the kernel, device drivers, services, SAM, user interface, and third party applications all use the registry. The discrepancies between low-level parsing with Win32 registry API are reported.

Note: Anomalies is applicable only for Windows hosts.

For example, hooking is used to intercept calls in a running application and to capture information related to the API invocations. Malicious programs can implant hooks in various system applications for different purposes, such as hiding files, directories, registry entries, intercepting users keystrokes to establish a stealthy communication channel with the attacker.

Analyze System Information

In the Hosts details, select the **System Information** tab. This panel lists the agent system information. For Windows operating system, the panel displays the host file entries and network shares of that host.

For example, malware might use host file entries to block antivirus updates.

Analyze History

In the Host details, select the **History** tab. This tab lists the commands along with the respective status and additional details.

When you review the history, look for the command status and retrieval count to check if the agent retrieved the commands.

Below are some examples:

- A file download command is issued, but the file is deleted on the host. In this case status of the command is failed as the file is not downloaded.
- The retrieval count increases, but the command is not processed. This happens when an analyst requests a large number of files (For example, MFT, system dump, or process dump), and the connection breaks when the agent uploads these files.
- If the agent command is not retrieved, the agent is either offline or busy processing other commands (For example, uploading a system dump). In this case, the status of the command shows pending.

To view more details, click the **Hostname** link highlighted in blue. The Hosts details view is displayed. In the case of MFT, download file, system dump, and process dump command types, **Downloads** tab is displayed with details such as file name, type, status, size, downloaded time and SHA256 of the file, when you click on the **Hostname** link.

Export Host Details or Files to JSON File

Note: Export Host details option is disabled if there is no snapshot time.

To export host details or files to JSON file:

1. Go to **Hosts**.
2. Select the hostname to open the host details.
3. Click (**More**) beside the hostname and do any of the following:
   - To export the scan data categories for the host, select **Export Host Details**. This exports files such as:
     - allfiles.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported as part of scan and tracking.
     - fileContext.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported during the host scan.
     - machinedetails.json - This file consists of the machine details, including hardware, operating system, interfaces, and so on, along with the agent details like version, policy details.

   Note: If Endpoint Broker is selected and a host is communicated with multiple Endpoint servers, during the host details export, all files and details of the host are exported from the Endpoint server where the selected snapshot is stored.

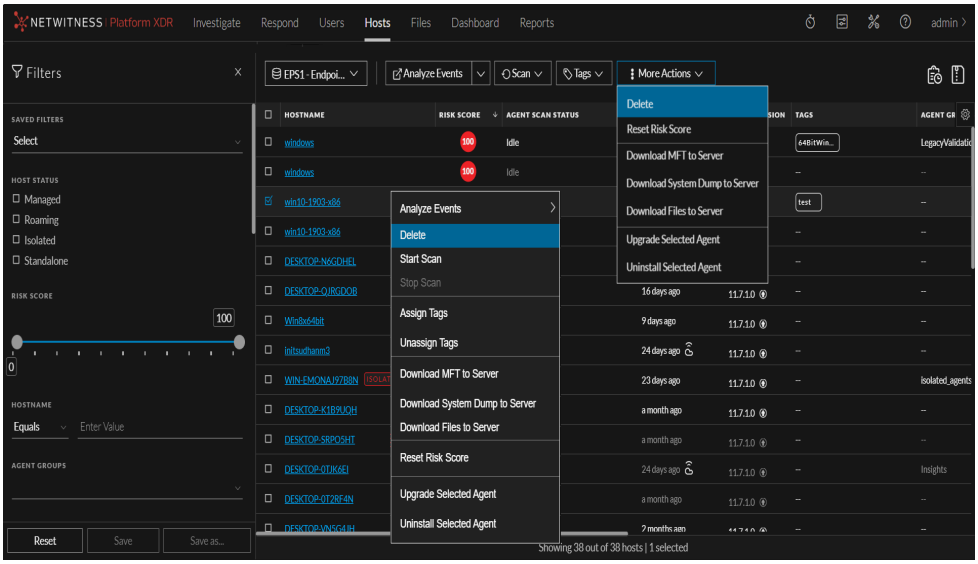
   Note: allfiles.json file is exported irrespective of the selected snapshot.

- To export all the files available on the host, select **Export Files**. This exports:
  - allfiles.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported as part of scan and tracking.

Launch an External Lookup for a File

While analyzing a file, you can search Google or VirusTotal with the filename or hash to get more information about the file. To launch the search:

1. Go to **Hosts** > **Host Details** (Autorun, Files, Drivers, Libraries, or Anomalies tab).
2. Right-click one or more files, or in the **More Actions** drop-down list in the toolbar, do the following:



- Select **Google Lookup** to perform a search on the filename, MD5, SHA1, or SHA256.
- Select **VirusTotal Lookup** to perform a search on MD5, SHA1, or SHA256.

Note: To open files in multiple tabs, make sure you enable the pops-up in the browser.

Delete a Host

If the agent is uninstalled on a host or if you no longer require the host scan data, you can manually delete this host from the Hosts view. Deleting a host deletes all scan data associated with the host. To delete hosts:

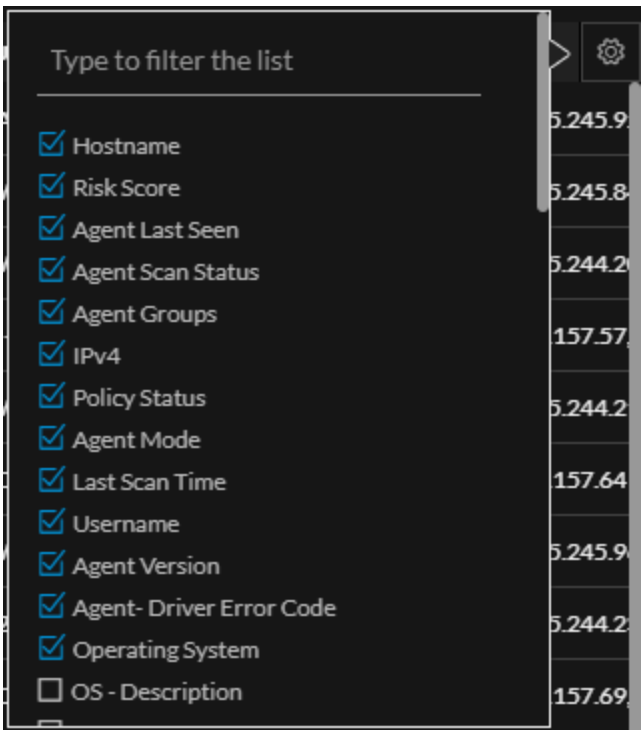
1. Go to **Hosts**.
2. Select the hosts that you want to delete from the Hosts view and do one of the following:

- Right-click and select **Delete** from the context menu.
- Click **More** drop-down list in the toolbar and select **Delete**.

Note: If you accidentally delete a host from the Hosts view, the Endpoint Server forbids all requests from this agent. The agent must be uninstalled manually from the host and reinstalled for it to appear on the Hosts view.

Deleting Hosts with Older Agent Versions

After upgrading the 11.1.x and 11.2.x agents to 11.3 or later, if you want to delete the hosts with older versions:



1. Go to **Hosts** view.
2. Filter the hosts based on the Agent version, and delete these hosts.

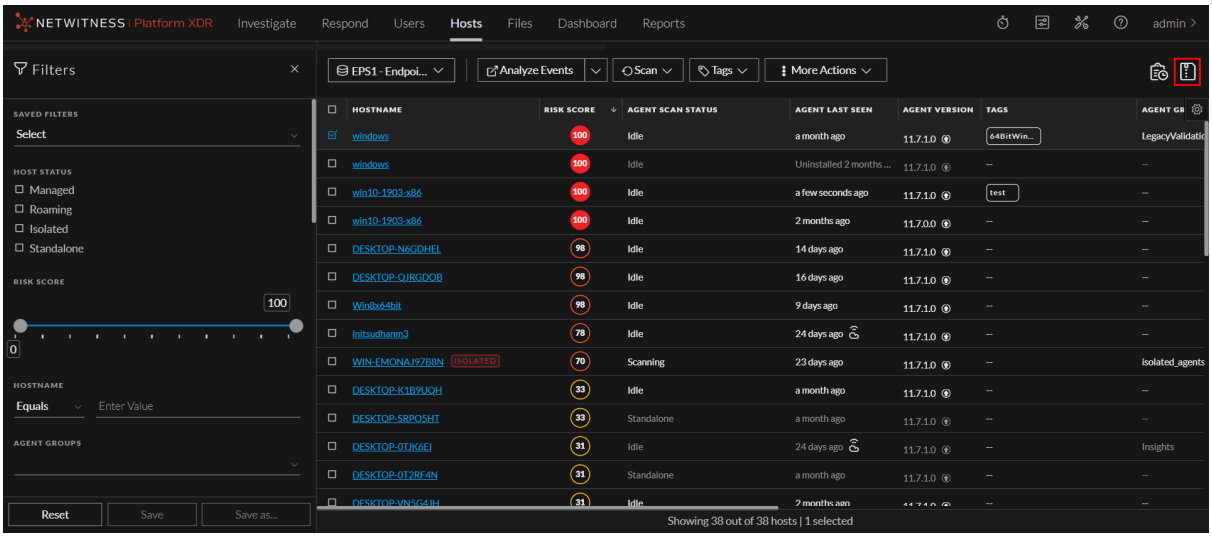
   If you do not delete, the hosts are deleted based on the Data Retention Policy settings.

Set Hosts Preference

By default, the Hosts view displays a few columns and the hosts are sorted based on the risk score. If you want to view specific columns and sort data on a specific field:

1. Go to **Hosts**.
2. Select the columns by clicking in the right-hand corner. The following example shows the drop-down list displayed while adding columns:

3. Scroll down or enter the keyword to search for the column in the displayed list.
4. Sort the data on the required column.



Note: The selections you make here become your default view every time you log in to the Hosts view.

Export Host Attributes

You can export up to 100,000 host attributes at a time. To extract the host attributes to a csv file:

1. Go to **Hosts**.
2. Filter the hosts by selecting the required filter options.
3. Add columns by clicking in the right-hand corner.

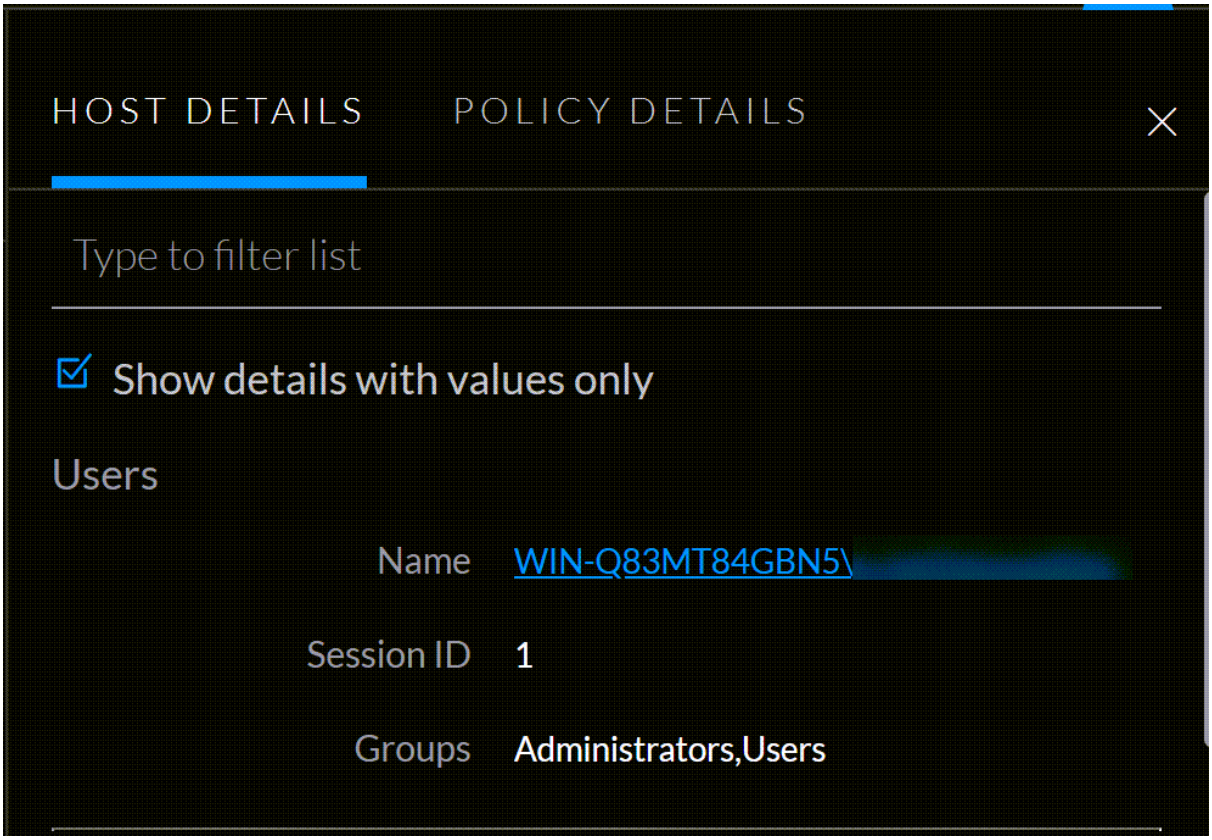
4. Click  to export the host attributes to a csv file.

You can either save or open the csv file.

Migrate Hosts

Hosts can be migrated from one Endpoint server to another using groups and policy associated with the host. If a host is migrated, the Server column shows as **Migrated**. On all the tabs within the Hosts view, the message Host is migrated to <Server-name> is displayed. You view the host details by clicking the <Server-name>. The risk score of a migrated host is displayed on all Endpoint servers where it is present.

Note: Some of the actions are disabled for the migrated host on the selected server, such as start scan, start stop, analyze events, and others. If you want to perform the required action, select the Endpoint server to which the host is migrated.



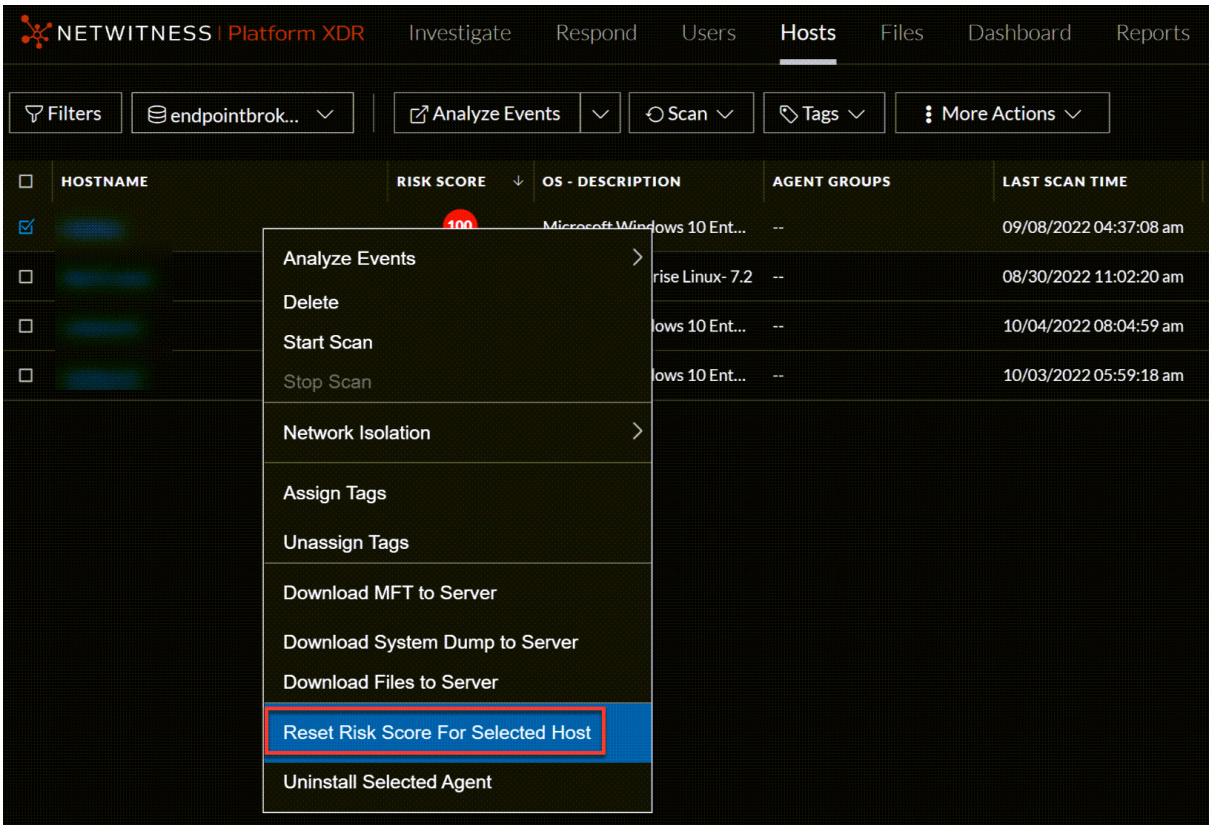
Note: To view only managed hosts, select the **Show Only Managed Agents** option in the Filters panel.

Analyzing Risky Users

If you have NetWitness UEBA installed, you can view the alerts associated with users logged in on the host. To analyze risky users:

1. Go to **Hosts**.
2. Click the host name you want to analyze.
3. In the **Host Details** panel, under the **Users** category, click the name.

This opens the **Entities** tab for investigation in a new tab.



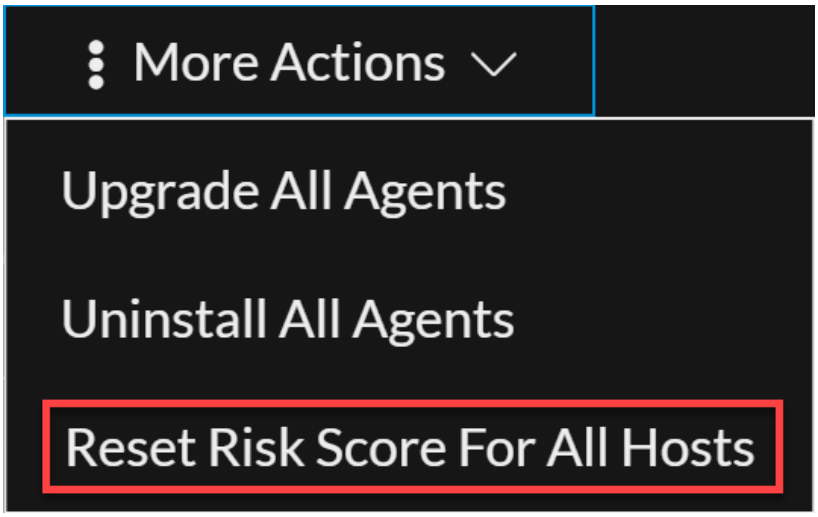
Resetting Risk Score of Hosts

You can reset the risk score for a host in these situations:

- If the alerts or events triggered by the host or files on the host are false positive, you can make changes to the Endpoint Application rules or ESA rules.
- After you take required action on the host for malicious file activities contributing to the risk score. When you reset the risk score, all the risk calculation for the host is deleted. When you reset the host's risk score, it does not change the file's risk score. You can reset the score for a single host or multiple hosts.

To reset the risk score of the selected host:

1. Go to **Hosts**.
2. Select the Endpoint Server or Endpoint Broker.
3. Select one or more hosts and do one of the following:



- Right-click and select **Reset Risk Score For Selected Host** from the context menu.
- Click **More Actions** > **Reset Risk Score For Selected Host** in the toolbar.

All the alerts associated with the score are deleted.

4. Refresh the page to view and confirm if the host's score is reset. This may take sometime for changes to take effect.

To reset the risk score of all the available hosts simultaneously:

1. Go to **Hosts**.
2. Click **More Actions** > **Reset Risk Score For All Hosts** in the toolbar.

All the alerts associated with the score are deleted.

Investigating a Process

Note: The information in this topic applies to NetWitness Version 11.3 and later.

Analysts can perform process analysis to investigate a particular process behavior to:

- Understand the entire process event chain, process parent-child relationships, and all associated events in a timeline view.
- Analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, risk score, and file path.

The Analyze Process view provides a list of processes captured on hosts in a parent-child hierarchical format over a time range. The process tree is created from the tracking event type "Process event" where the action meta key is `createProcess`. The agent reports new events for the same createProcess if the following parameters change:

- Parent process filename
- Child process filename
- Launch arguments
- User name

If the above parameters do not change, the event is reported only once every eight hours.

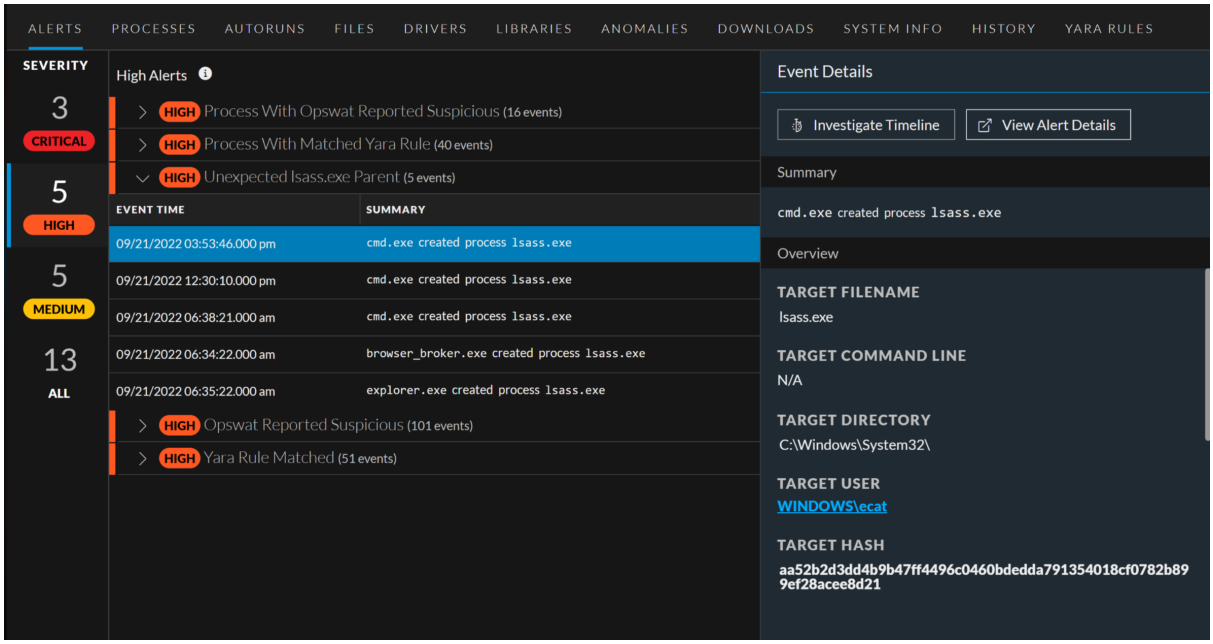
Best Practices

When reviewing a host for malicious activity, there are a few key things to review while looking for malicious processes.

- Process Name - When reviewing running processes on a host, check for the name of the program that looks suspicious. Sometimes malware uses random names, such as `wzuduje.exe`. In some cases, the names might be misleading such as `adob3.exe`, `scvhost.exe`, or `Microsoft.exe`. Being familiar with Windows processes and any type of internal tool that might be used throughout the environment, also helps you to identify potentially malicious or suspicious files.
- File Path - Similar to knowing normal and key Windows processes, knowing what path the processes originate from is a key to detect certain processes that imitate the legitimate process. For instance, if you see `svchost.exe` running on a system from `C:\Users\<username>\AppData\Roaming\adobe\` (which is a valid file path), and knowing that the legitimate Windows process originates from `C:\Windows\System32\`, you can determine that the `svchost.exe` file starting from the `C:\Users\<username>\AppData\Roaming\adobe\` directory is the suspicious one. To help determine further identification of a suspicious process, review the Autoruns tab to see if this process is running as an autorun, service, or task.
- File Signature - When a software package is created, it has a valid digital signature. The following are a few exceptions:
  - If a process that is running is not digitally signed, it does not automatically confirm that the file is malicious.

  - While files may have a valid signature, it does not mean that they are legitimate. There are instances of software identified as a Potentially Unwanted Program (PUP) or Adware, which can have a valid signing certificate.
- On Hosts - Indicates the number of hosts on which a file exist. If a file is present on fewer hosts with a high risk score, it may be malicious and needs further investigation.
- Reputation - Leveraging the reputation service is a way to find malicious processes.
- Analyze events - For further insight to a process, you can analyze console events, network events, file events, process events, and registry events.
  - Network events - Look for any suspicious domains to which the process is connecting. Sometimes malware creates legitimate connections to a known site, such as google.com, bing.com to hide its activity on the network. Look for connections to Dynamic DNS domains where a lot of known malicious activity resides. During analysis, consider uncommon processes making direct connections to an IP address or to a uncommon port number.
  - File and process events - Review process interactions that have occurred on the system with the suspected file. You can look for key events such as `writeToExecutable`, `renameExecutable`, and `createRemoteThread`, which indicate suspicious behavior.
- Leverage other methods
  - Look up with Google - You can search the file name or hash value against Google to determine if the file is malicious.
  - Look up with VirusTotal – You can search the hash value against the VirusTotal to determine if the file is malicious between multiple AV vendors.
  - Download file – Download and analyze a file to find indicators such as compile time, imported DLLs, section names, and performing string searches. Look for TLD values (.com, .net, .biz) or debug information of a compiled binary (.pdb), which can be easily changed or forged.
  - Time stamp values – Review modified, accessed, and created dates associated with the binary. Review how long a file has been residing on a host. While this value is correct most of the time, attackers can change the time stamp values of a file.

Analyze a Process

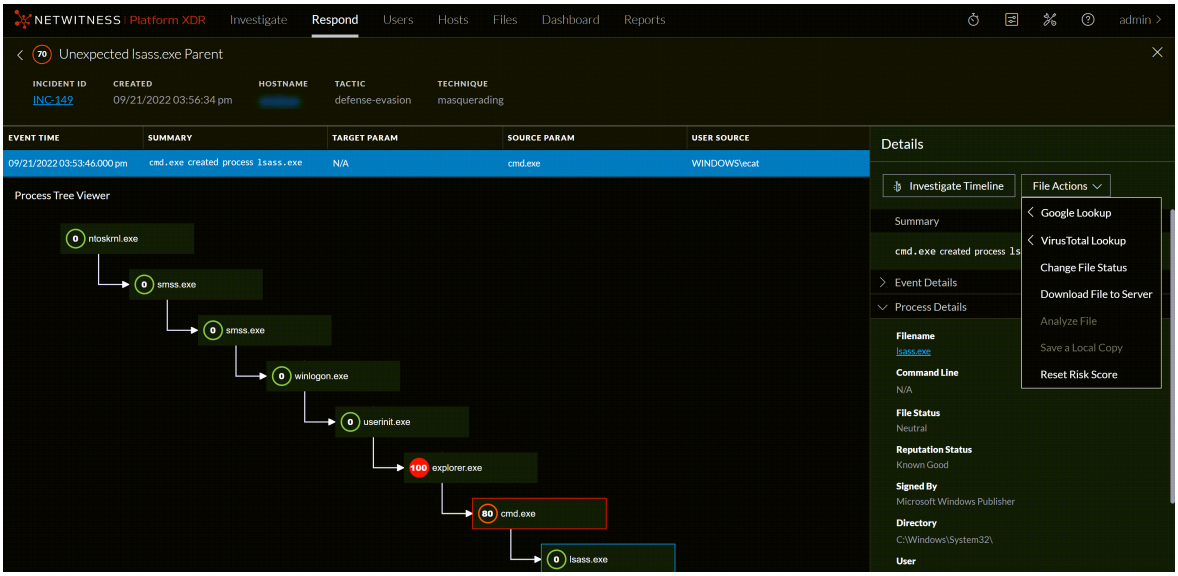


Note: Linux is not supported for analyzing a process.

Based on the Alert severity, you can analyze the processes using two different options:

- **View Alert Details**: This option allows you to analyze the processes associated with **Critical** and **High** Alerts.
- **Analyze Process Tree**: This option allows you to analyze the processes associated with **Medium** Alerts.

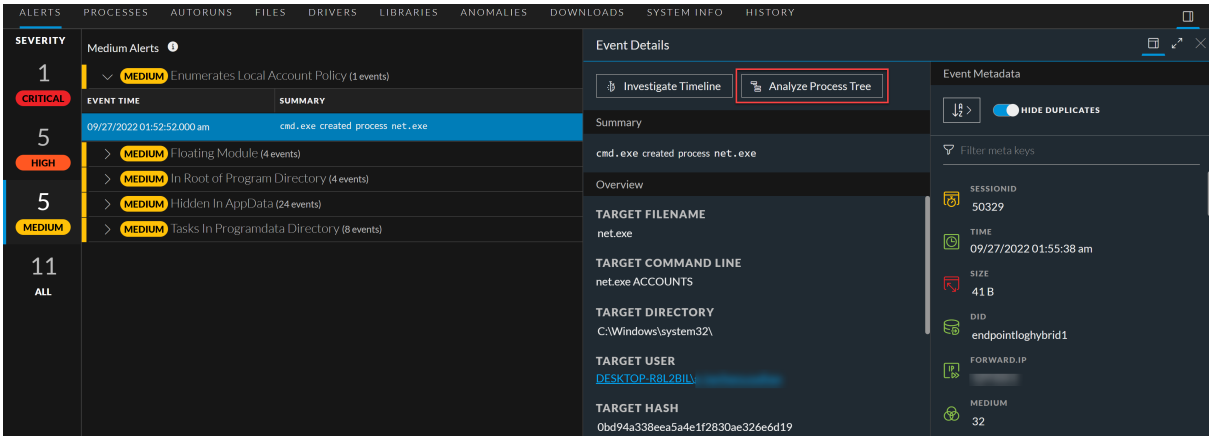
To analyze the process associated with Critical and High Alerts:



1. Go to **Hosts** and click on a host.
2. Click on an event associated with the **Critical** or **High** alert on the Host Details view. The **Event Details** panel appears.
3. Click **View Alert Details** to analyze the process activities of a file associated with the **Critical** or **High** Alerts.

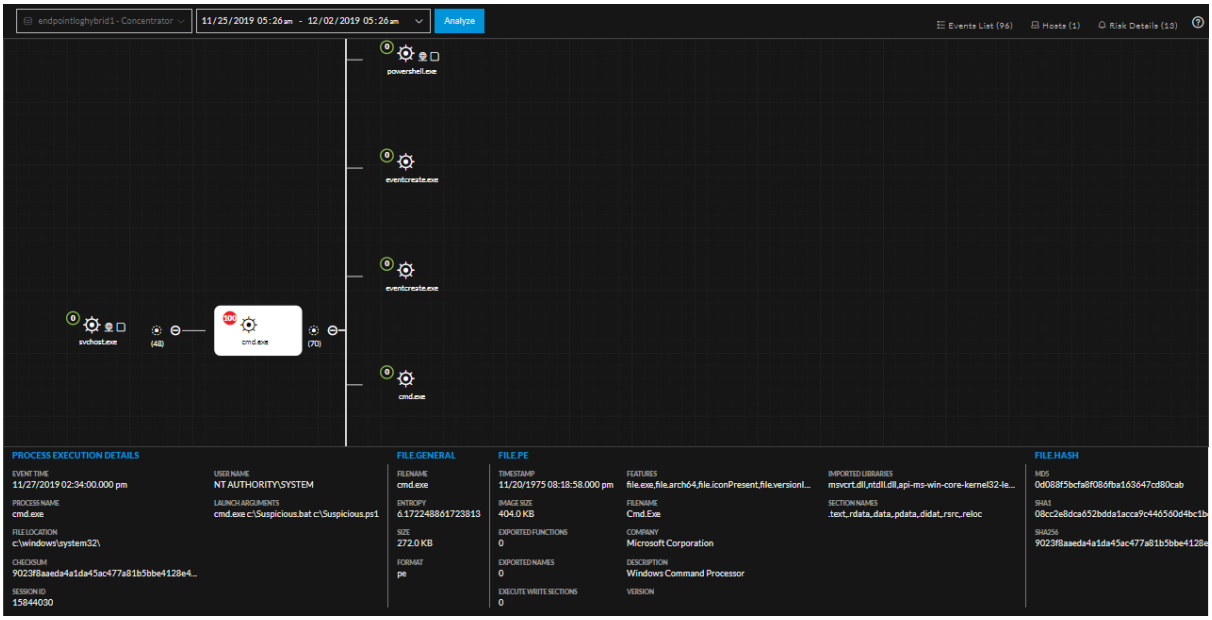
The **Process Tree Viewer** is displayed in the **Respond** service.

4. Select the process in the **Process Tree Viewer** and click **File Actions** in the **Details** panel to perform the following actions:
   - **Google Lookup**
   - **VirusTotal Lookup**
   - **Change File Status**
   - **Download File to Server**
   - **Analyze File**
   - **Save a Local Copy**



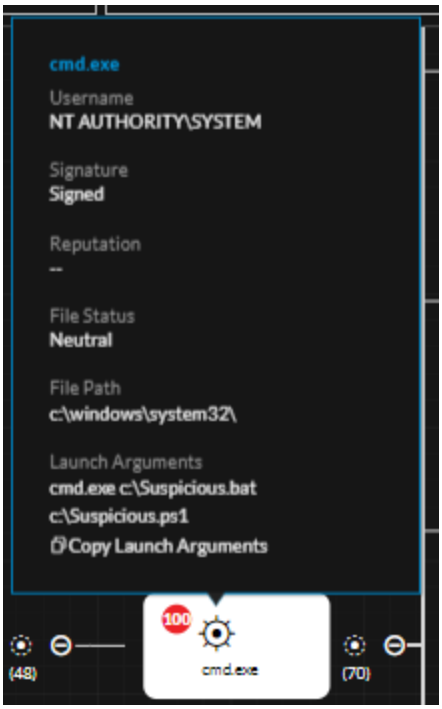
- **Reset Risk Score**

To analyze the process associated with Medium Alerts:



1. Go to **Hosts** and click on a host.
2. Click on an event associated with the **Medium** alert on the Host Details view. The **Event Details** panel appears.
3. To analyze the process activities of a file associated with the **Medium** Alerts, do one of the following:
   - In the **Event Details** panel, click **Analyze Process Tree**.
   - Select the **Processes** tab and do one of the following:
     - Right-click a process and select **Analyze Process** from the context menu.
     - Click **Analyze Process** in the toolbar.

In the following example, the file `cmd.exe` has created process `net.exe`.

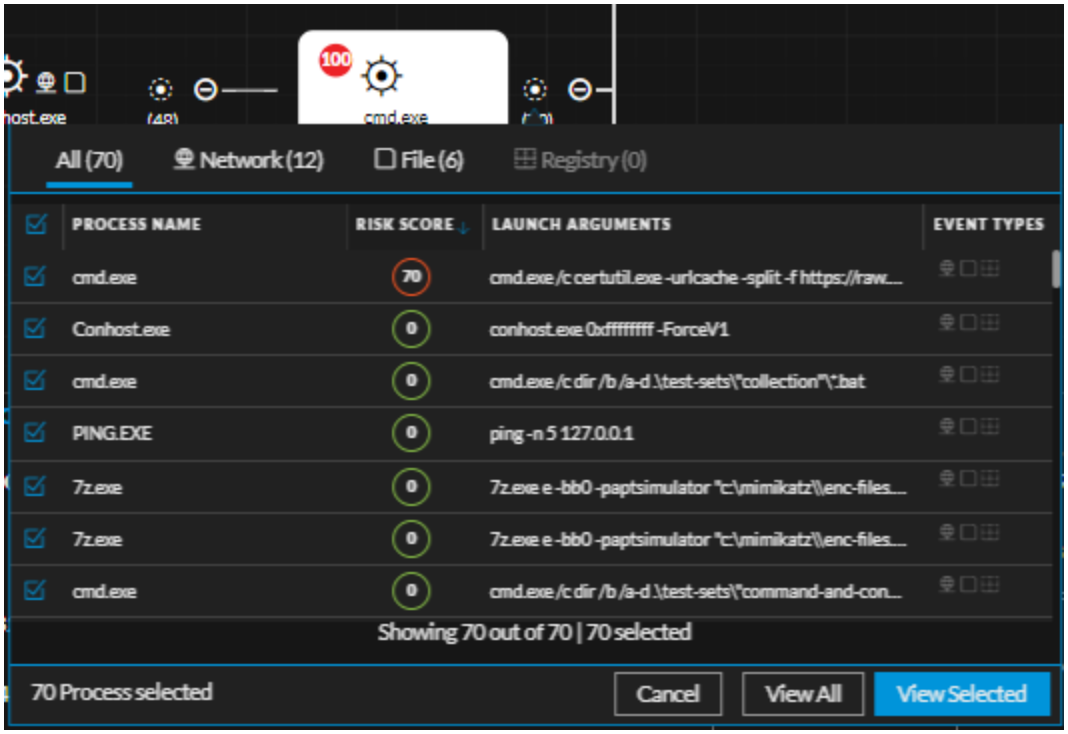


Clicking **Analyze Process** displays the process visualization. For each node, the process name, risk score, and type of activity the selected process has performed (network, file, or registry) are displayed. Optionally, you can change the time range to view data.

You can view the properties, such as process execution details, file properties of the selected process in the bottom of the view.

Note: No result is displayed in the process visualization view if there is no data for last seven days or if there is no `createprocess` event.

4. On the right side of the process visualization view:
   - Click **Events List** to view the associated events. You can also filter events based on the events category. For more information on filtering, see Analyze Events for a Process.
   - Click **Hosts** to view the hosts on which this file is present and the associated risk score. For more information, Analyze Hosts with File Activity.
   - Click **Risk Details** to view the list of distinct alerts, such as Critical, High, Medium, and All. For more information, see Analyze Hosts Using the Risk Score.
5. Hover over the process name to analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, and file path.

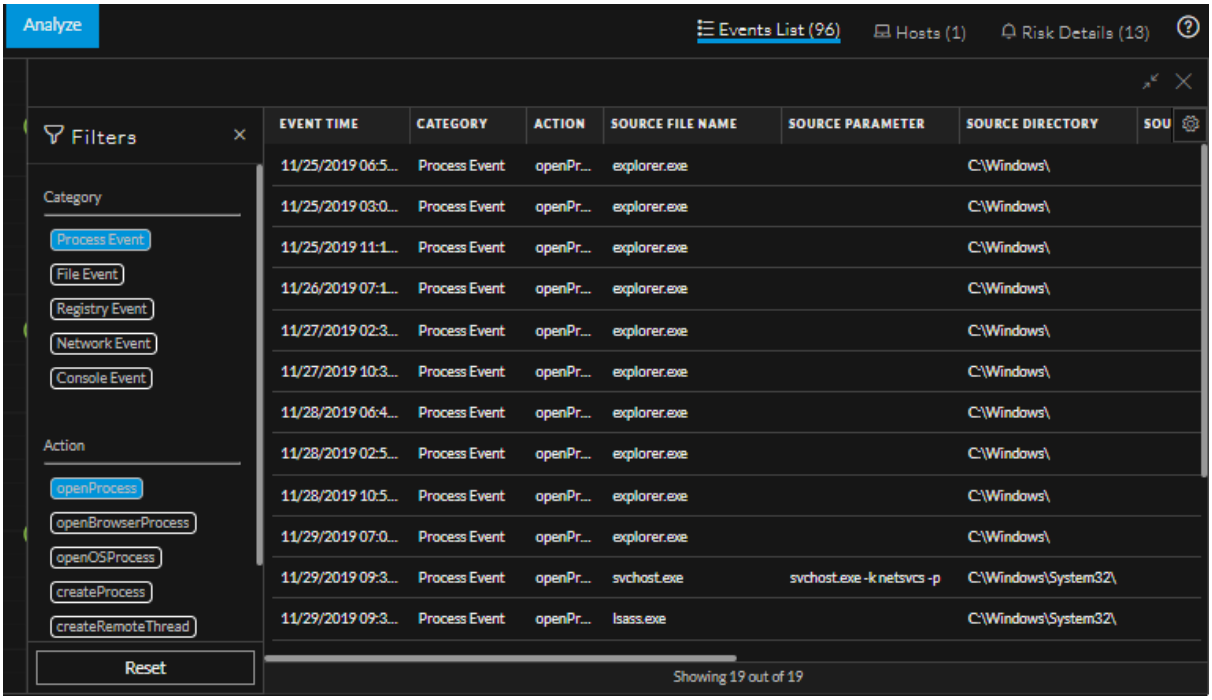


6. Click  to view the child processes. The Process selection dialog is displayed with the child processes associated with the process based on the risk score. You can filter the result on the event type by clicking icons on the top panel. When no matching event types are available, these filter options are disabled.

   Depending on the type of event, the icons are highlights in the Event Types column.

   a. Click **View All** to view all child processes or select the required processes and click **View selected**. The associated events and properties are displayed in the right panel.

b. Click  to change the process selection and click  to collapse the view.



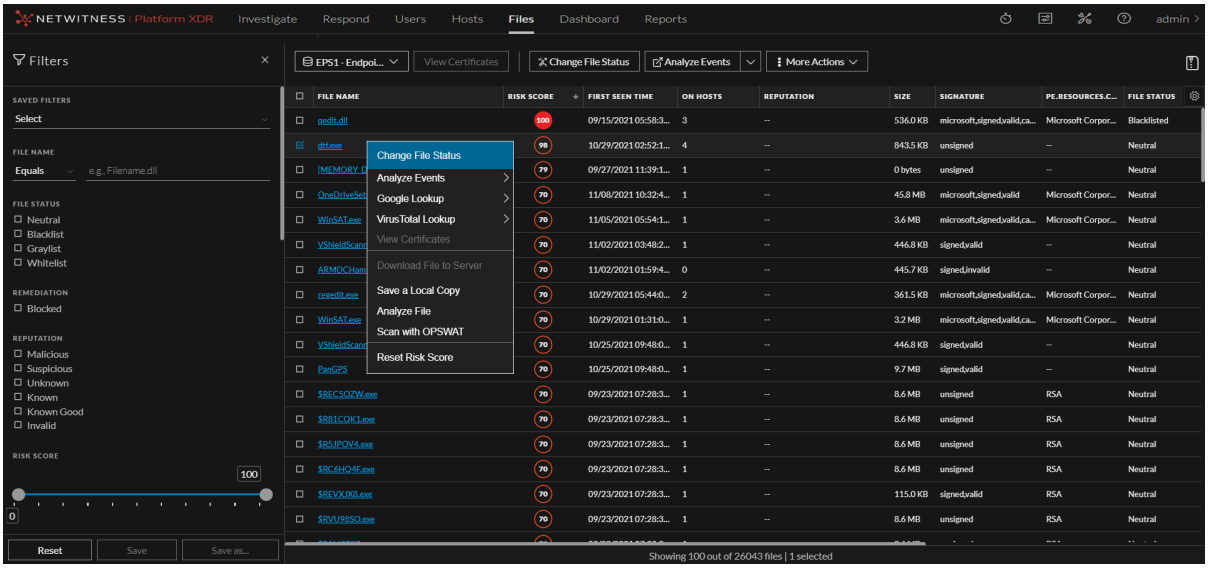
Analyze Events for a Process

To analyze events for the selected process:

1. Perform steps 1 to 3 in To analyze the process associated with Medium Alerts:.
2. In the process visualization, click the **Events** tab.
3. To narrow down the search to find any suspicious indicators, behaviors, or specific type of event, filter on a set of matched events based on a category - Process, File, Registry, Network Event, or Console Event (for Windows).

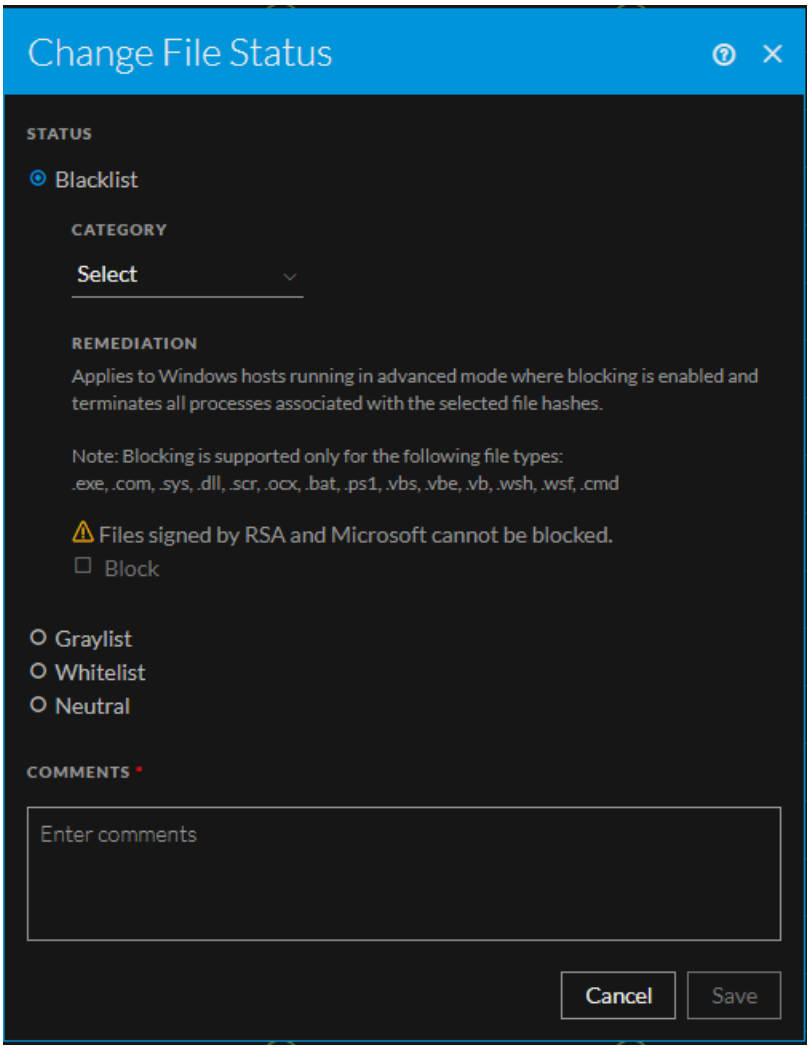
For example, to view only process events, select the **Process Event** category, and filter on action.

The result displays the sequence of activities involving this process for the selected filters.



Note: For the console events, the context for local and remote are available only if the data is sent from 11.4 or later agents.

Changing File Status or Remediate



Note: By default, the blocking option is disabled in the policy. To enable blocking, in the policy configuration, change the **Blocking** option to **Enabled** under Response Action Settings. For more information, see the *NetWitness Endpoint Configuration Guide*.

To change the status of a file:

1. Do one of the following:
   - Go to **Hosts** (Processes, Autoruns, Files, Drivers, Libraries, or Anomalies tab).
   - Go to **Files**.
2. Select one or more files and do one of the following:

   - Right-click and select **Change File Status** from the context menu.
   - Click **Change File Status** in the toolbar.
3. In the Change File Status dialog, select a status - **Blacklist**, **Whitelist**, **Graylist**, or **Neutral**.

Note: You cannot whitelist certain Microsoft files, such as `cscript.exe`, `wscript.exe`, `cmd.exe`, `bash.exe`, as there is a potential risk of them being used for malicious purposes. For more information, see Files Restricted from Whitelisting.

If you select Blacklist or Graylist, the following options are displayed:

a. **Category:** Select the appropriate category type: **Generic Malware**, **APT: Advanced Persistent Threats**, **Attacker Tool**, **Unidentified**, **Ransomware**.

Caution: Before blocking, make sure that you review the file because this may cause the system or software to be unusable.

b. **Remediate:** Select **Block** to block the file.

Note: Blocking is supported only for Windows hosts that are running in advanced mode. All PE files along with the following file extensions can be blocked.
.exe, *.com*, *.sys*, *.dll*, *.scr*, *.ocx*, *.bat*, *.ps1*, *.vbs*, *.vbe*, *.vb*, *.wsh*, *.wsf*, *.cmd*
You cannot block the following:.
- Memory DLL and floating code
- Files that are signed by Microsoft or RSA.
To delete a blocked file, users can log in to the host and execute the delete command using the elevated command prompt.

4. Add a comment and click **Save**.

You can change the status of only 100 files at a time. When the status is changed, it impacts the file status on all hosts on which the file is present. The status is sent as a session under the **File** category, and available for investigation. If the file is seen in subsequent scan or tracking, the corresponding sessions contain a meta value with the file status (except Neutral).

Import File Hashes using the Block Hash tool

The Block Hash tool allows you to import a set of file hashes which can be set to block state and change the file bias status (whitelist, blacklist, and graylist). The tool allows you to block the imported file hashes (suspicious, invalid, and malicious) and prevent them from opening or executing on the hosts. You can block up to a maximum of **50,000** file hashes using this tool.

Note: For more information on changing the file status or blocking the file, see Changing File Status or Remediate.

IMPORTANT:
- Enter only valid SHA256 hashes; otherwise, the blocking functionality might break.
- Do not block any file hashes signed by RSA, Microsoft, and Apple. It might make your Endpoints unresponsive.
- Make sure the number of hashes entered in the JSON file is less than the number of the available limit of hashes that can be blocked (the maximum limit is **50,000**).
For example: If 100 file hashes are already blocked as part of NetWitness deployment, you can only block 49,900 more file hashes using this tool.

JSON File Format

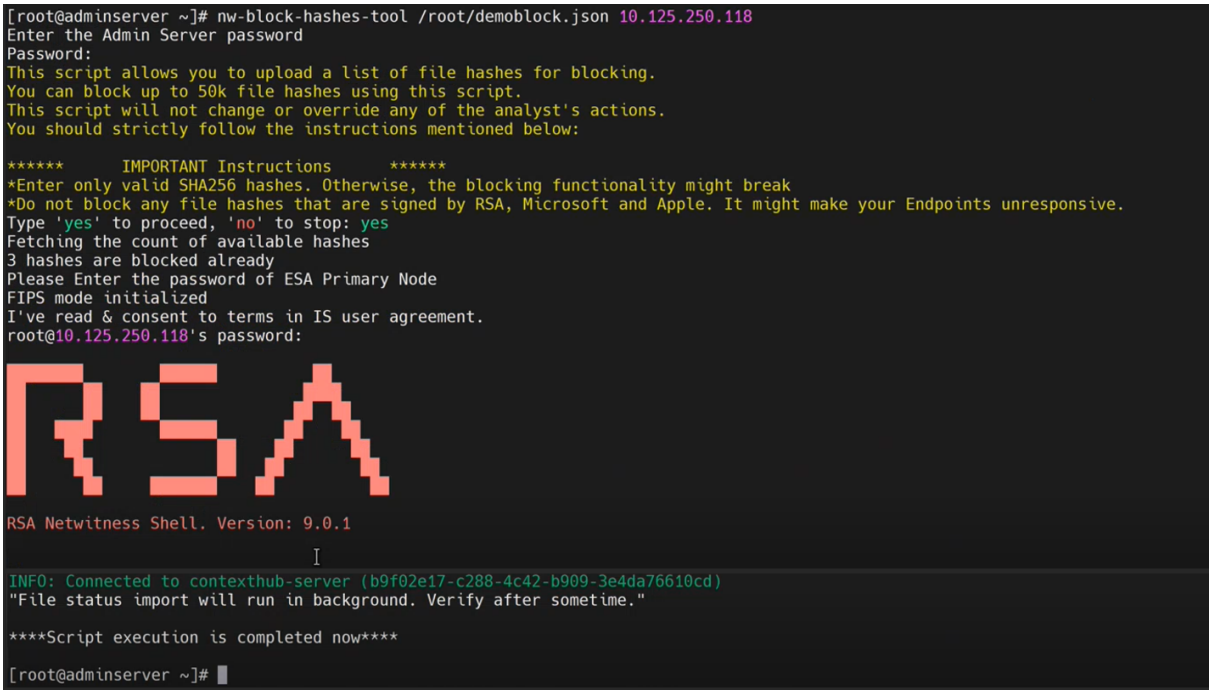
The example below describes the JSON file format for blocking and blacklisting the file hashes.

Sample demoblock.JSON:

```
[{
"checksums":
["1b30e463ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077886da2804","67fa30e4
63ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077dsbhb561","78vbba909e463ebe0
131dsdsdb66fce7d4aa43f3e1dsdsd49064d85dsdsman61n"],
"fileStatus": "Blacklist",
"comment”: "File blocking set through new tool",
"remediationAction": "Block"
}]
```

The example below describes the JSON file format only for blacklisting the file hashes.

Sample demoblock.JSON:



```
[{
"checksums":
["2b30e463ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077886da2800","97fa30e4
63ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077dsbhb500","38vbba909e463ebe0
131dsdsdb66fce7d4aa43f3e1dsdsd49064d85dsdsman68c"],
"fileStatus": "Blacklist",
"comment": "File status change set through new tool",
}]
```

To block the file hashes using the Block Hash tool:

1. SSH to node 0 and copy the JSON file (containing the file hashes to be blocked) stored in it.
2. Run the tool.

   ```
   nw-block-hashes-tool <absolute path of json residing on node 0> <ESA node
   IP/hostname>
   ```

   Note: Enter the JSON file path in `<absolute path of json residing on node 0>` and enter the ESA node IP in `<ESA node IP/hostname>`.
   For Example: `nw-block-hashes-tool /root/demoblock.json 10.125.250.118`.

3. Enter the Admin Server password.
4. Follow the instructions displayed on the screen. Enter any one of the following options when prompted.

- **yes**: Enter **yes** to proceed with the execution of the script.
- **no**: Enter **no** to stop the execution of the script.

> **Note:** At this stage, the tool validates the number of incoming file hashes through the JSON file and the number of existing file hashes already blocked in the deployment. If the total of the file hashes (incoming through JSON file and existing as blocked in the deployment) exceeds the maximum limit of **50,000**, the tool stops the execution, and it will not proceed further.

Files Restricted from Whitelisting

To view or update the files that are restricted from whitelisting, do the following:

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter your credentials.
3. Connect to the Endpoint Server using the following command:

   ```
   connect endpoint-server
   ```
4. Run the following commands to view the list of files:
   - `cd endpoint/file/status/restricted/get`
   - `invoke Whitelist`
5. Run the following commands to add files to the list:
   - `cd endpoint/file/status/restricted/get`
   - `invoke '{"id":"<filename>","restrictedStatus":["Whitelist"], "enable":true}`
6. Run the following commands to delete files from the list:
   - `cd endpoint/file/status/restricted/update`
   - `invoke '{"id":"<filename>","restrictedStatus":["Whitelist"], "enable":false}`

Analyzing Downloaded Files

To perform a deep analysis of suspicious files, you can manually or automatically download the file to the server.

Note: Saving or analyzing downloaded file works the same way irrespective of whether the file is downloaded manually or automatically.

Note: Downloaded files are stored in the Endpoint Server which may fill up the disk space. To utilize the storage efficiently without impacting the health of Endpoint Server, NetWitness recommends you to configure an external storage mount, so all the Endpoint Server can use the configured location to store the downloaded data.
By default, all files are downloaded to `/var/netwitness/endpoint-server/<files>/`. If you want to change the location, make sure that you have **endpoint-server.configuration.manage** permissions and do the following:
1. In the Explore view, go to **endpoint/download**,
2. In the base-path, provide the location of the directory.

Caution: By default, the status **File Download Disk Usage** stats in the **Health and Wellness** view shows unhealthy if the disk usage reaches 60% and the file download stops automatically when the disk usage is 70%. You can customize the warning or fatal thresholds in the  **> Services > Endpoint Server > view > Explore > rsa.endpoint.file-download-disk-thresholds.warning-percent** and **rsa.endpoint.file-download-disk-thresholds.fatal-percent** parameters respectively.

For the downloaded file, you can:

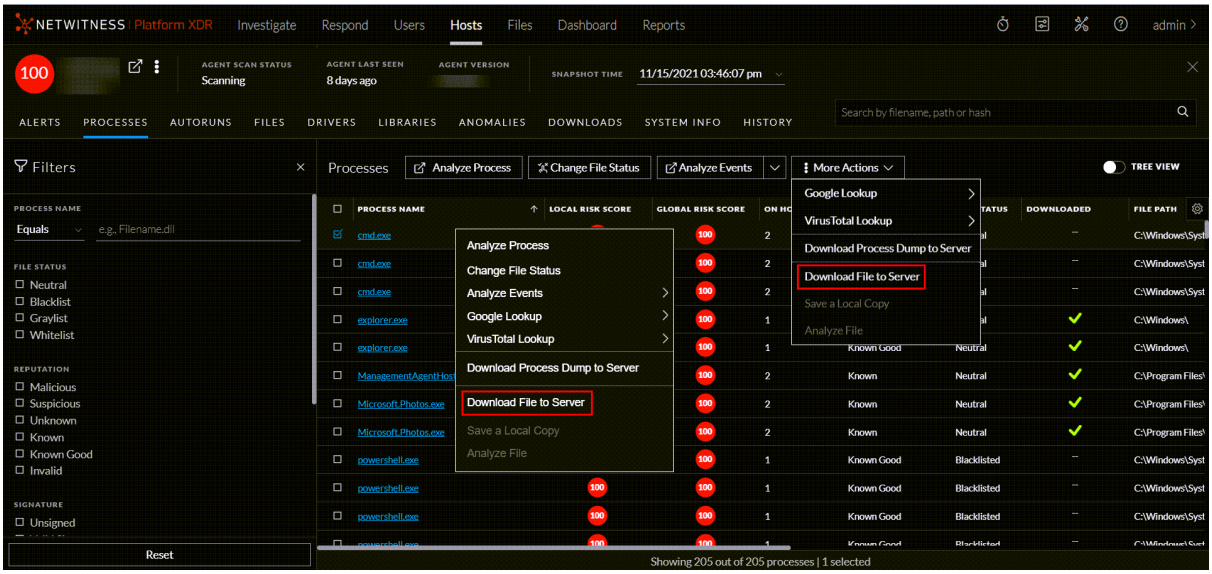
- Search for strings in the executable
- View text content for scripts
- View imported libraries and functions
- Save a local copy for further analysis

Download Files to Server

Downloading file to server is not supported for memory DLL and floating code.

Note: Downloading files may take significant time. Additional requests to the agent during download are queued and processed when the download is complete.

Automatic File Download

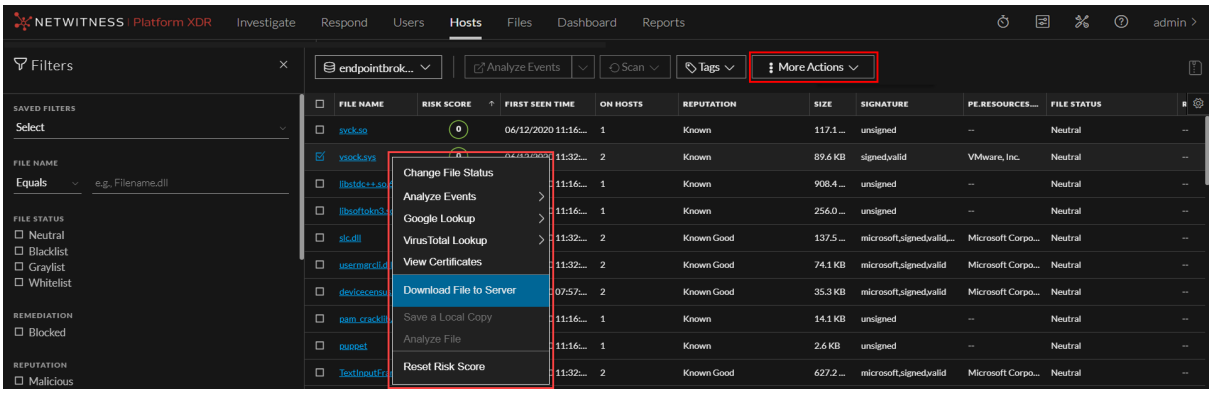


By default, the files that are unsigned and size lesser than or equal to 1 MB are downloaded automatically to the NetWitness Endpoint server. And, only single copy of each file is downloaded automatically. You can limit the volume of files to be downloaded in the  **> Endpoint Sources > Policies** tab, so the files matching certain criteria are only downloaded automatically. For more information on automatic file download settings, see "Create an EDR Policy" section in the *NetWitness Endpoint Configuration Guide*.

The status of the download is displayed in the **Files** tab > **Downloaded** column.

Manual File Download

To manually download files to the server from the Hosts view:



1. Go to **Hosts**.
2. Select the hostname to open the Host Details view.
3. In any of the Processes, Autoruns, Files, Drivers, Libraries, or Anomalies tabs, select the file, and do one of the following:

- Right-click and select **Download File to Server** from the context menu.
- Select **Download File to Server** from the **More Actions** drop-down list in the toolbar.

To download files to the server from the Files view:

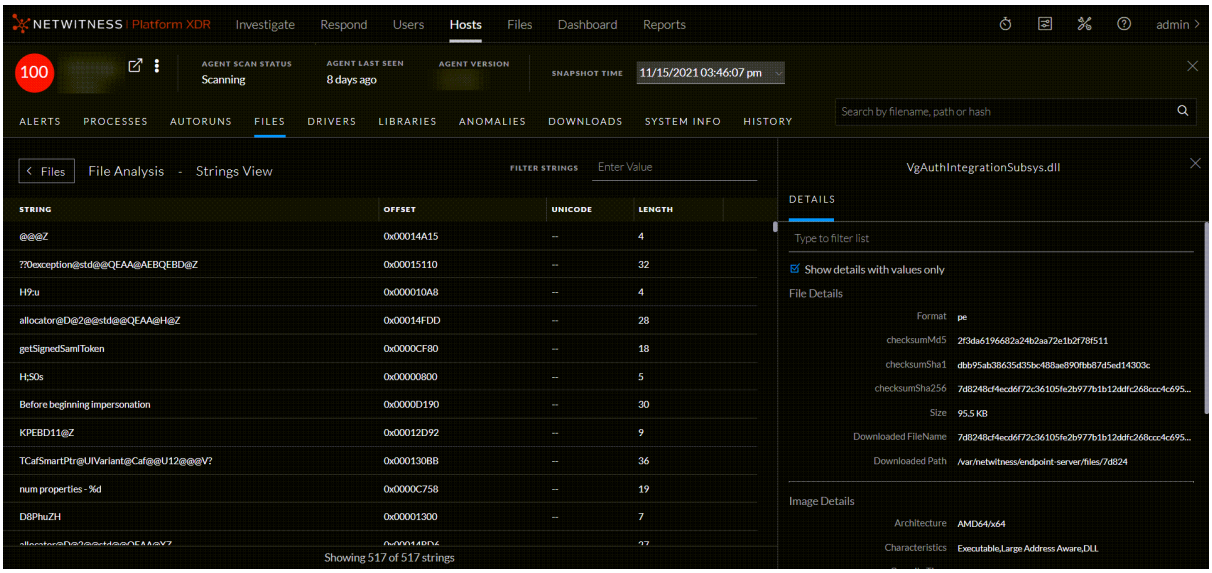
1. Go to **Files**.
2. Select the file and do one of the following:

- Right-click and select **Download File to Server** from the context menu.
- Select **Download File to Server** from the **More Actions** drop-down list in the toolbar.

The status of the download is displayed in the Downloaded column. The download statuses are Downloaded, Not downloaded, and Error.

Save Downloaded Files

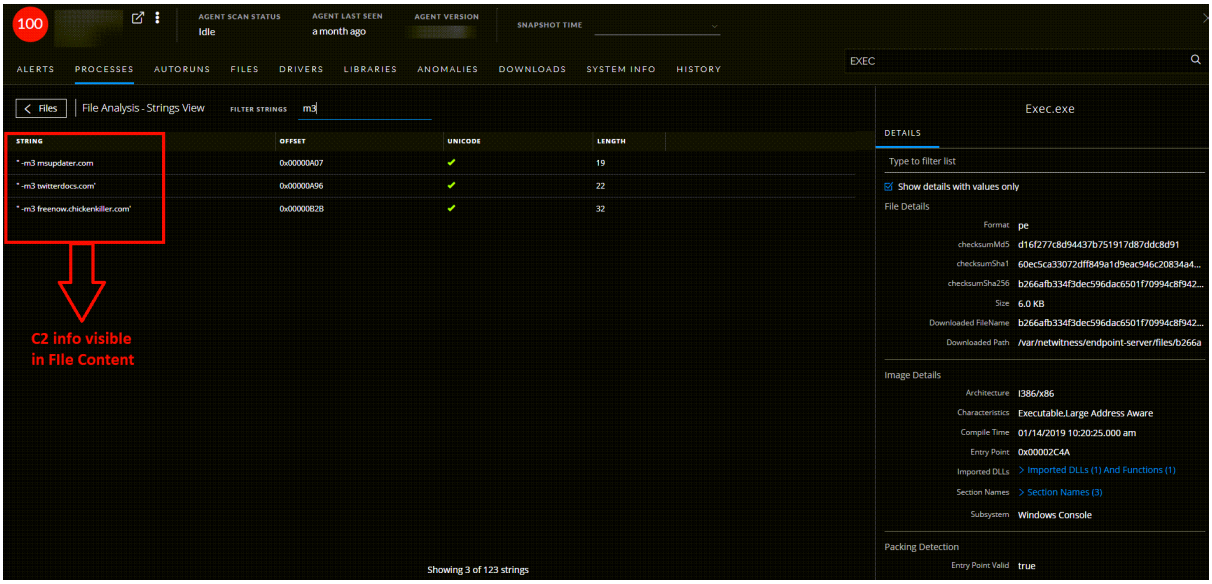
You can retrieve a downloaded file and save it to your local file system for further analysis. Downloaded files are stored in the server in the configured location. This option is enabled only if the file is downloaded to the server.



To save a file:

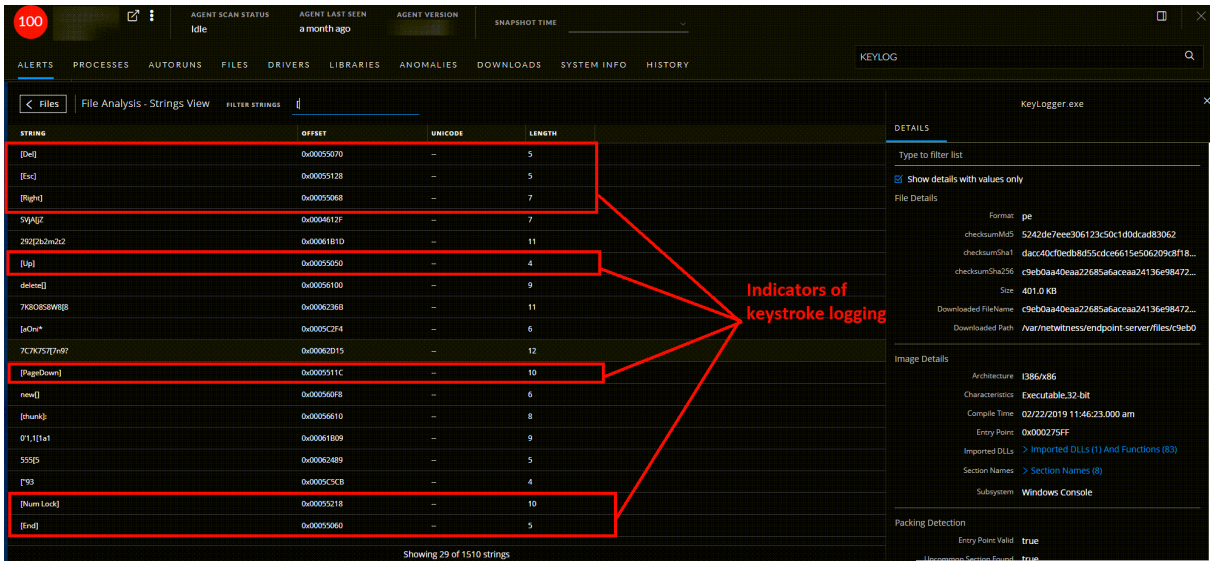
1. Go to **Hosts** or **Files** .
2. Right-click the file you want to save and select **Save a Local Copy**.
3. Browse the location and click **Save**.

Analyze Downloaded Files



You can use the **Analyze File** option to view detailed information about a downloaded file. This option is enabled only if the file is downloaded to the server. To analyze a file:

1. Go to **Hosts** or **Files**.
2. Right-click the downloaded file and select **Analyze File**. The File Analysis view opens and properties of the are is displayed in the right panel.



3. View strings in the file in the Strings view while analyzing an executable (such as `macho`, `pe`, `elf`). This view contains the string, offset in the binary, unicode, and the length of the string. You can search for or filter on a specific string value in the **Filter String** field.
4. View the text content of the file and look for any suspicious behavior in the script file.

   For example, if the file contains C2 information in the form of domain names or IP addresses, it is highly suspicious.

If you see unprintable keyboard keys listed within the file, such as: [F1], [F2]…[Page Up], [Enter], [ESC], and so on, that may be indicative of a keystroke logger.

Performing Host Forensics

Note: The information in this topic applies to NetWitness Version 11.4 and later.

You can perform the following forensic investigation on a host:

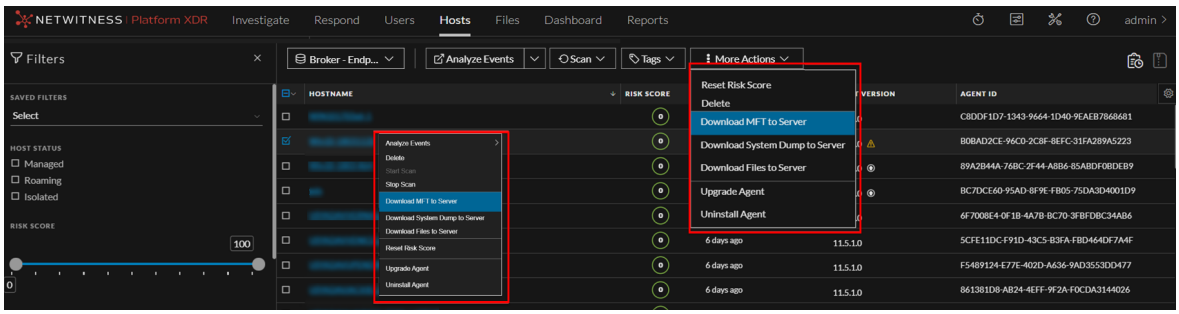
- Master File Table (MFT)
- System Dump
- Process Dump

Note: This is applicable only for Windows agent (in Advanced mode) with NetWitness Platform version 11.4. Downloading system dump files may take significant time. Additional requests to the agent during system dump download are queued and processed when the download is complete. MFT, system dump, and process dump downloads are not supported for agents communicating through Relay server.

Note: MFT, system dump, and process dump are stored in the Endpoint Server which may fill up the disk space. For large deployments, to utilize the storage efficiently without impacting the health of Endpoint Server, NetWitness recommends you to configure an external storage mount, so all the Endpoint Server can use the configured location to store the downloaded data.
By default, all files are downloaded to `/var/netwitness/endpoint-server/<file type>/`, where `<file type>` is MFT, system dump, or process dump. If you want to change the location, make sure that you have endpoint-server.configuration.manage permissions and do the following:
1. In the Explore view, go to **endpoint/download**.
2. In the base-path, provide the location of the directory.

Download Master File Table

Master File Table contains metadata of every file on the host. It keeps track of information, such as filename, size, timestamps, permissions, and location of the file on the host. It consists of two sets of timestamps - Standard Information ($SI) and File Name ($FN). Each set has the following timestamps - creation, access, update, and modification.

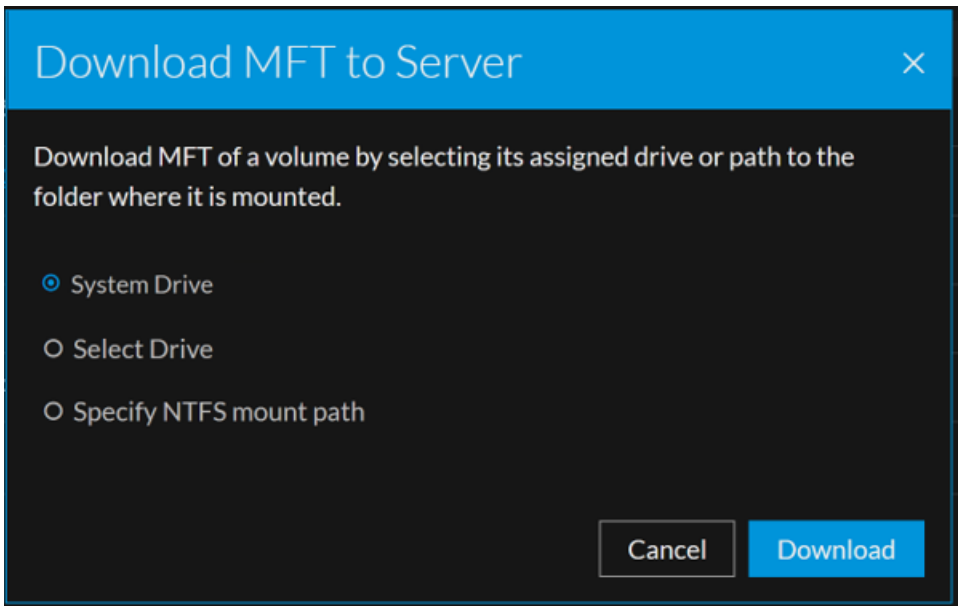


Time stomping is a technique that modifies the timestamps for a file (creation, access, update, and modification time) to mimic files that are in the same folder, making it difficult to identify suspicious files on a host. To perform forensic investigation of a suspicious file, you can download and analyze the MFT, and focus on files that are time stomped. For more information, see Analyze Downloaded MFT.

During MFT analysis, you can also search for suspicious filenames, and also files that were created before or after a known malicious event. You can also download files from the MFT viewer for further analysis.

Download MFT to Server

To download MFT to the server from the Hosts view:



1. Go to **Hosts** and do one the following:
   - Select one or more hosts and select **Download MFT to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar.

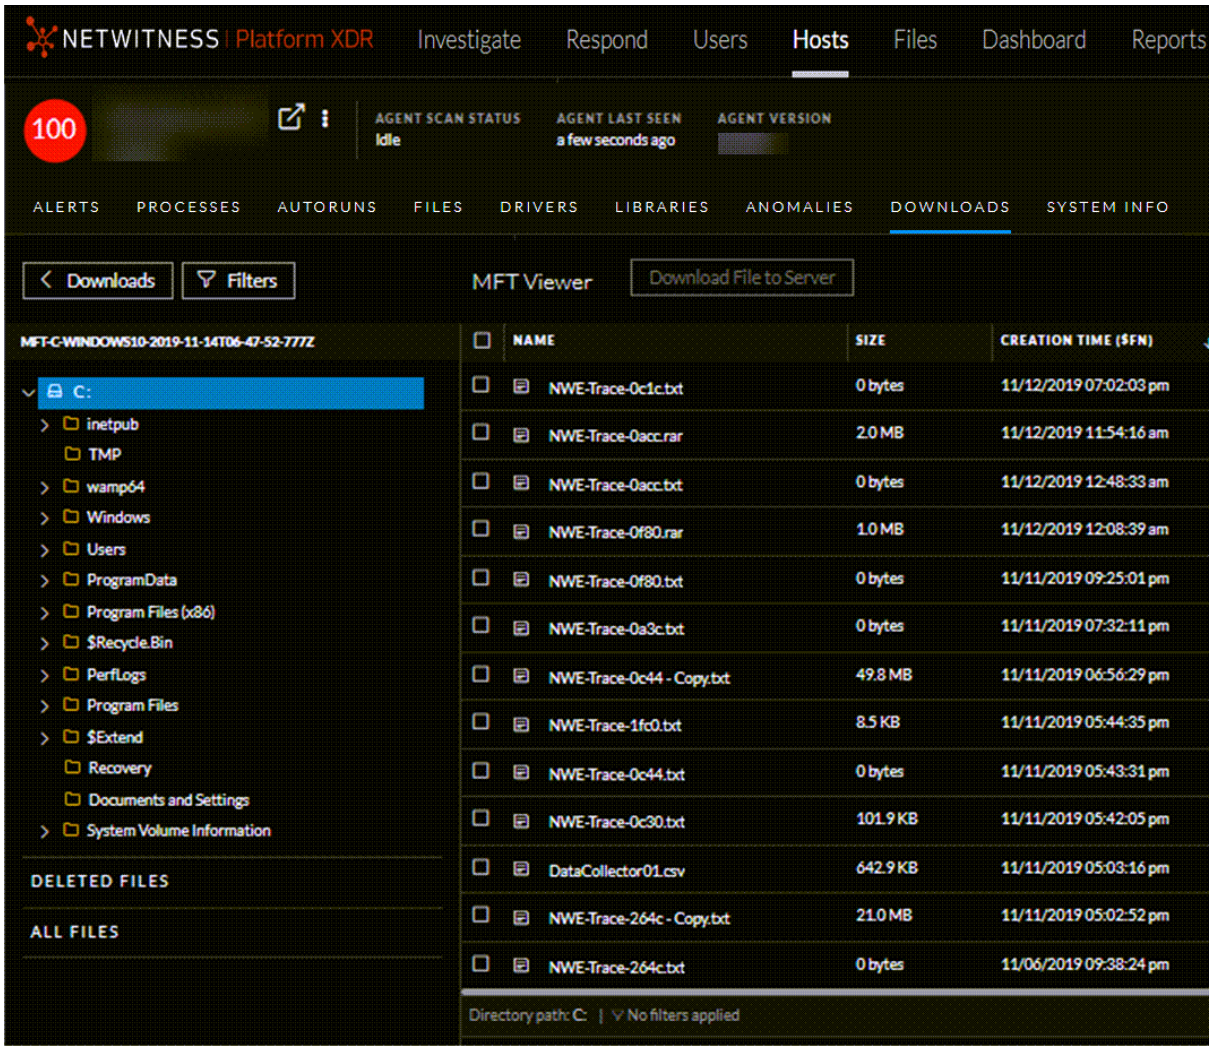
   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Download MFT to Server**.

2. In the **Download MFT to Server** dialog, select one of the following:
   - **System Drive** - to download MFT to the system drive.
   - **Select Drive** - to download MFT on assigned drive.
     You can select any drive from the **Drive** drop-down list. By default the selected drive is C.
   - **Specify NTFS mount path** - to download MFT on the path to the folder where it is mounted

   Click **Download**.

3. View details of the downloaded MFT in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

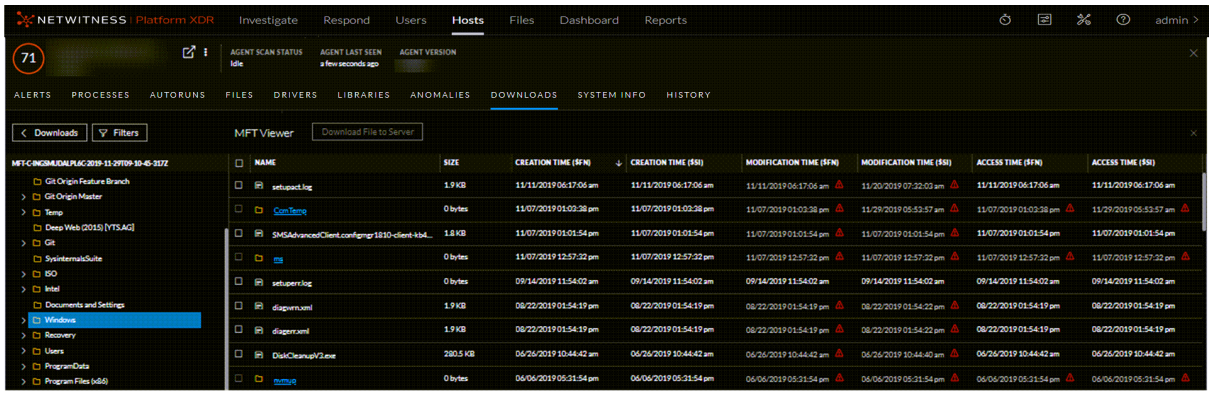
Analyze Downloaded MFT



You can use the MFT viewer to begin analysis where you can search for files based on file name, time stamps, and identify files that are timestomped.

View MFT

To view the content of the downloaded MFT:

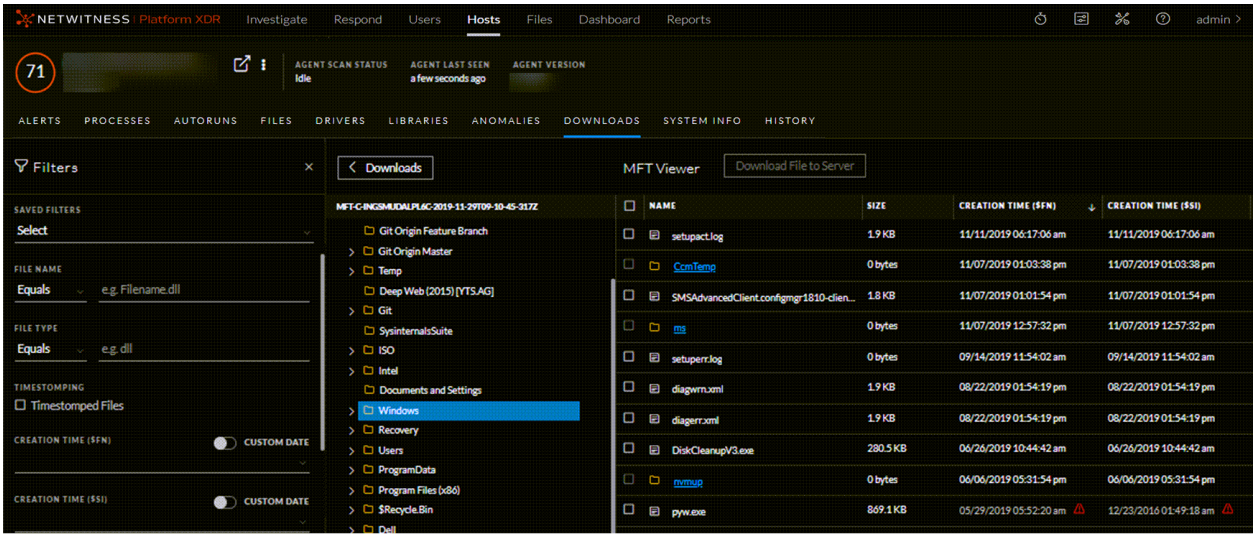


1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Click the file name. The MFT viewer is displayed.

   All available files are displayed in a tree view similar to the Windows Explorer in the All Files folder. The Deleted Files folder contains a sequential list of all deleted files.

4. Click ▶ to view the folder structure. Click the row to view the folder content.

   The details of the MFT is displayed in the table. By default, the table is sorted on the creation time ($FN). If the $SI and $FN timestamps are different, the columns are highlighted in red (⚠) indicating that it is time stomped.



5. Select one or more files and click **Download File to Server** on the toolbar to download files to the server.

> **Note:** Downloading a folder is not supported and hence the option is grayed out for folders.

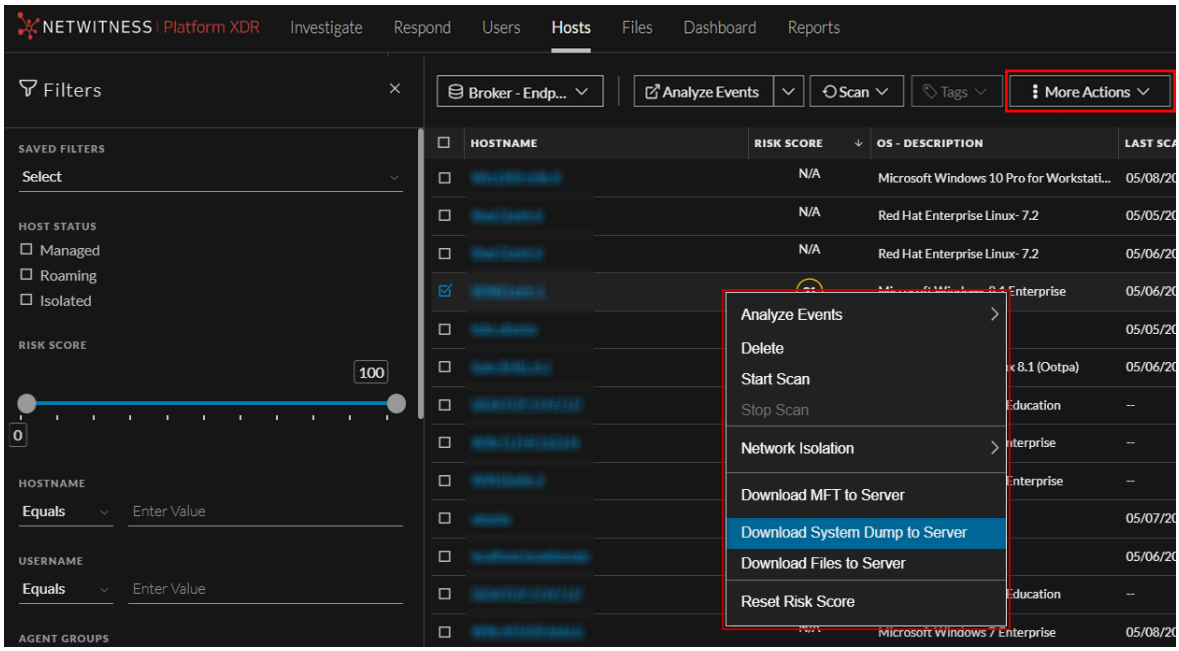
Filter MFT

You can filter files on file name, creation time ($FN), creation time ($SI), access time ($FN), access time ($SI), update time ($FN), update time ($SI), modified time ($FN), and modified time ($SI).

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click .

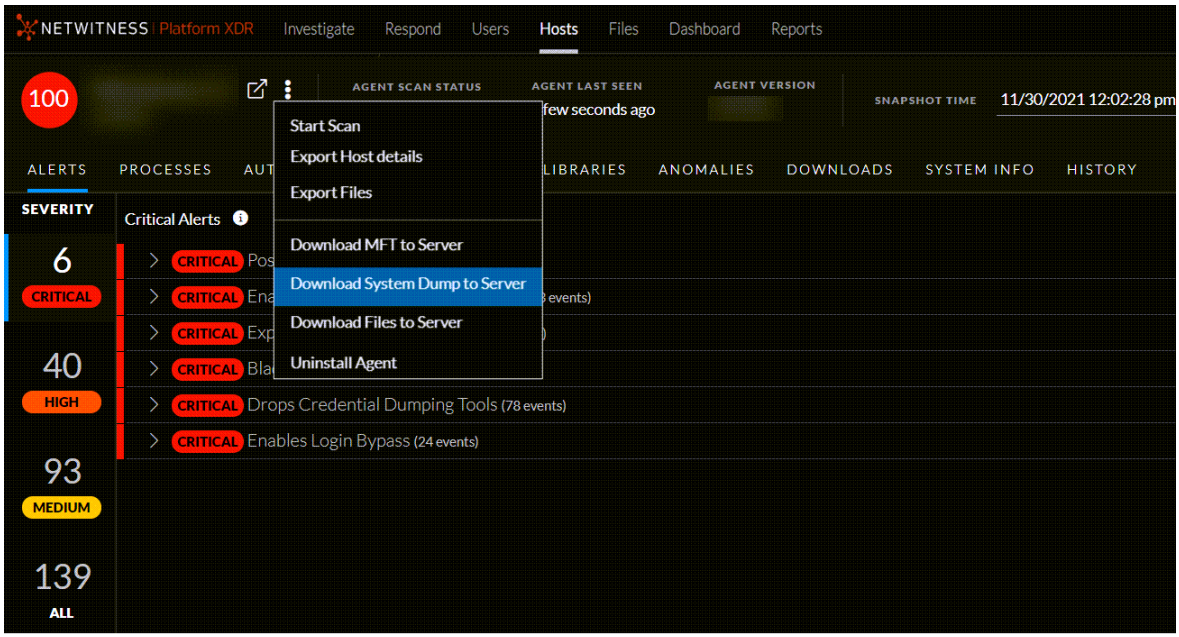
> **Note:** Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

To filter, save, and delete MFT, see Filter Downloaded Files, Save Downloaded File, and Delete Downloaded Files.



System and Process Memory Dump

To perform forensic investigation during an incident response, you can request a memory dump of a host or a process running on the host. You can analyze these dumps using third-party tools, such as Volatility, Rekall.

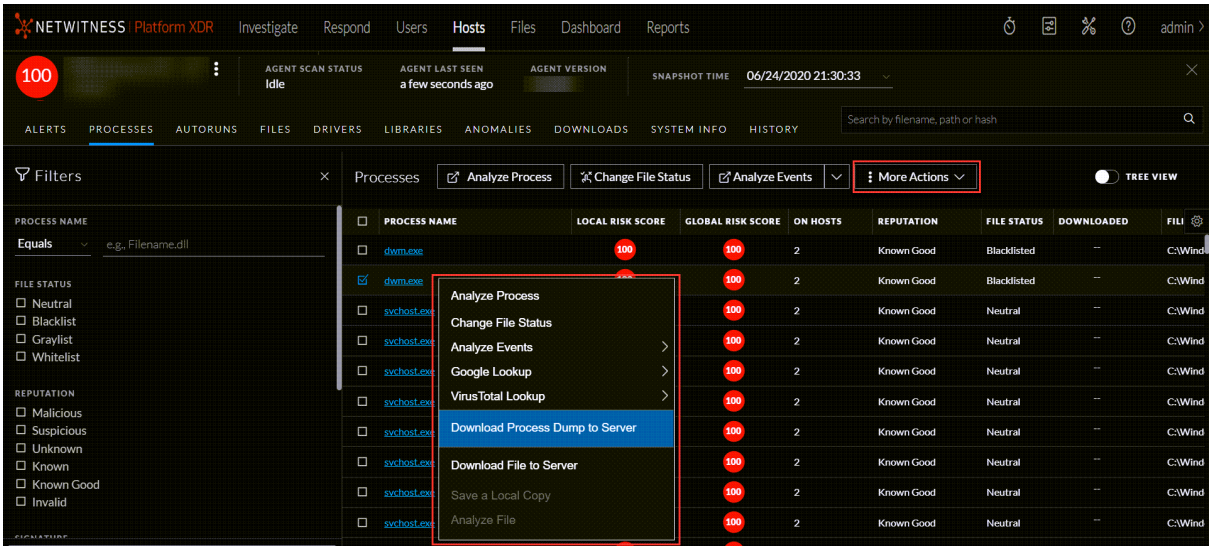


Download System Dump to Server

To download system dump to the server from the Hosts view:

1. Go to **Hosts** and do one the following:
   - Select a host and select **Download System Dump to Server** from the right-click context menu, or from the **More** drop-down list in the toolbar.

- Select the hostname to open the host details and select **Download System Dump to Server** from the **More** option besides the hostname.



2. View the details of the downloaded system dump in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

Download Process Dump to Server

To download process dump to the server:

1. Go to **Hosts**.
2. Select the hostname to open the host details.
3. In the Processes, Libraries, or Anomalies tab, select **Download Process Dump to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar.

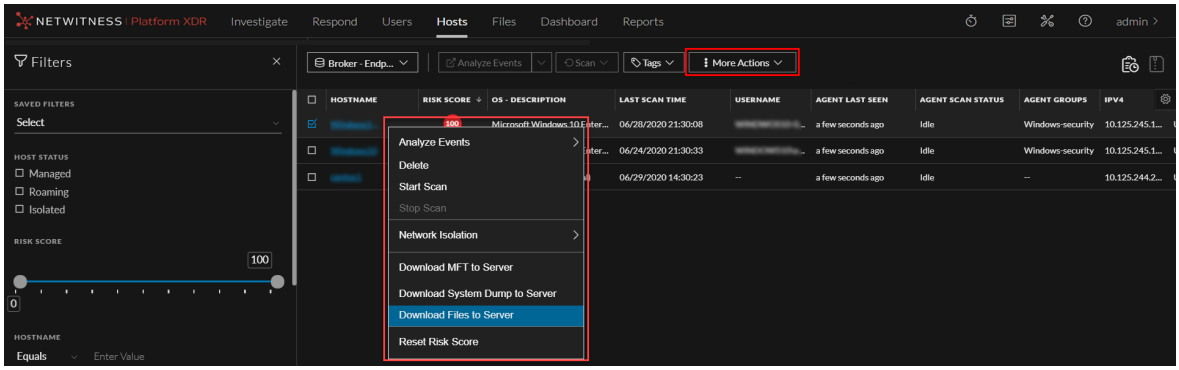
4. View the details of the download process dump in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

To filter, save, and delete system dump or process dump, see Filter Downloaded Files, Save Downloaded File, and Delete Downloaded Files.

The following are some errors you might encounter during system and process dump download:

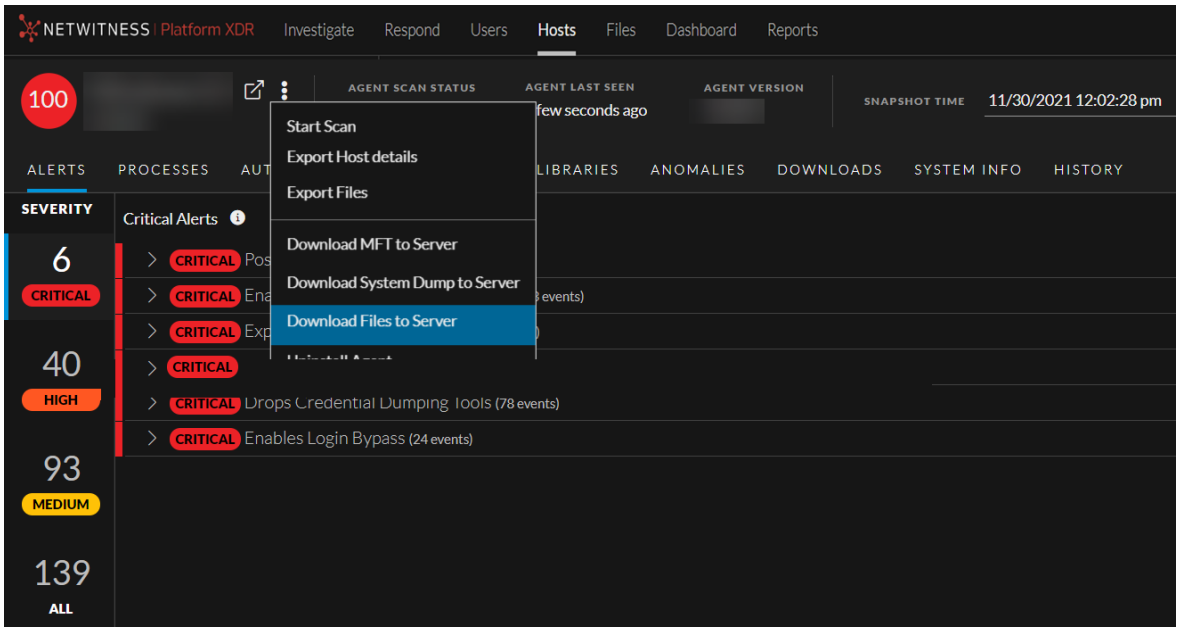
Issue	Explanation
Parameter is incorrect.	The process for which the dump is requested might be running with a different process ID.
Element not found	The process for which the dump is requested is no longer active.
java.io.IOException:Unable to unwrap data, invalid status [CLOSED]	Connection to the agent is interrupted.
java.net.SocketTimeoutException	The network is slow or the system is down.
One or more arguments are not correct	Agent might be in the Insight mode or driver is not running.

Download Files Using Full Path or Wildcard



You can manually download files that help in investigations by either providing full path of the file or using wildcard.

Note: This is applicable only for agents in Advanced mode with NetWitness Platform version 11.5 and later.



To download files to the server:

1. Go to **Hosts** and do one of the following:

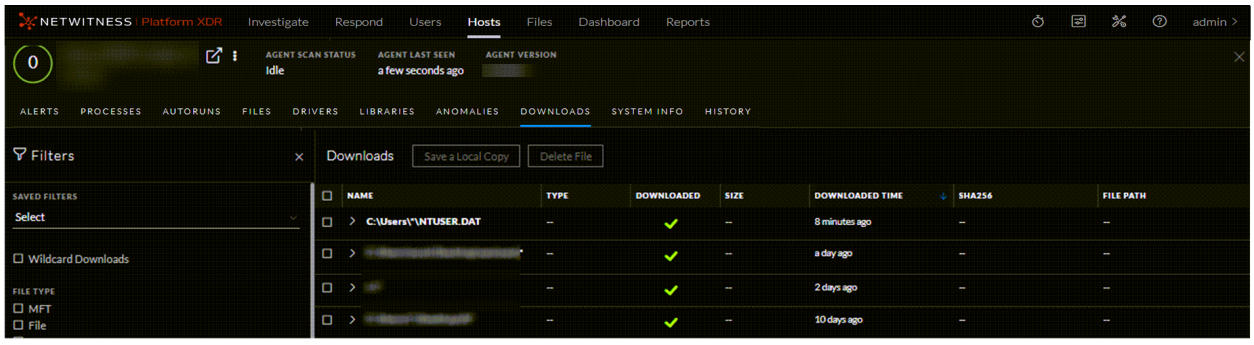
   - Select one or more hosts from the same operating system, and select **Download Files to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar. You can download files from only top 100 selected hosts at a time.

   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Download Files to Server**.

2. In the **Download Files to Server** dialog, enter the full path where the files may be present or search using wildcard. For wild card search, you can use a maximum of two `*`, one at a folder level and the other at a file level.

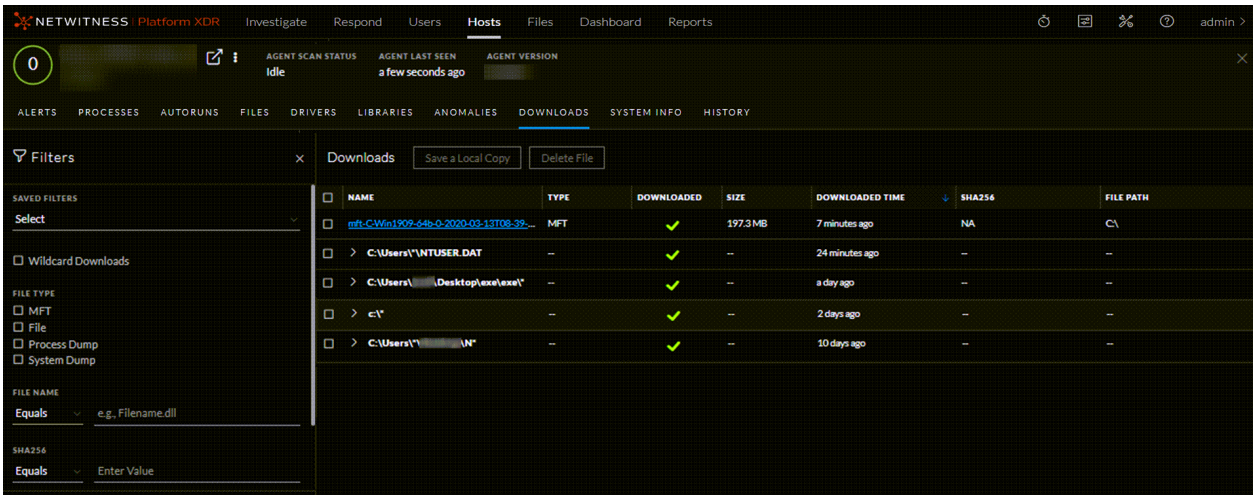
   For example, to retrieve the registry hive, you can enter the full path, `C:\Windows\System32\config\SYSTEM`.

If you want to retrieve user settings and configuration preferences for all users, download all files using the wildcard `C:\Users\*\NTUSER.DAT`.



3. For wildcard search, enter the number of files to download and size of the file. By default, the number of files is set to 10 and file size is set to 100 MB. For example, if the maximum number of files is set to 10 and file size is set to 10 MB, first 10 files within 10 MB are downloaded.

> **Note:** You can set a limit to the Maximum Number of Files field on the explore page of the Endpoint server (**> [Endpoint server] > explore > endpoint/command > max-file-count**). By default, the limit is set to 100, and you can change it to any value between 100 - 1000 in each Endpoint server. In broker view, if the Endpoint servers have different max-file-count, the lesser value will be taken as the limit.

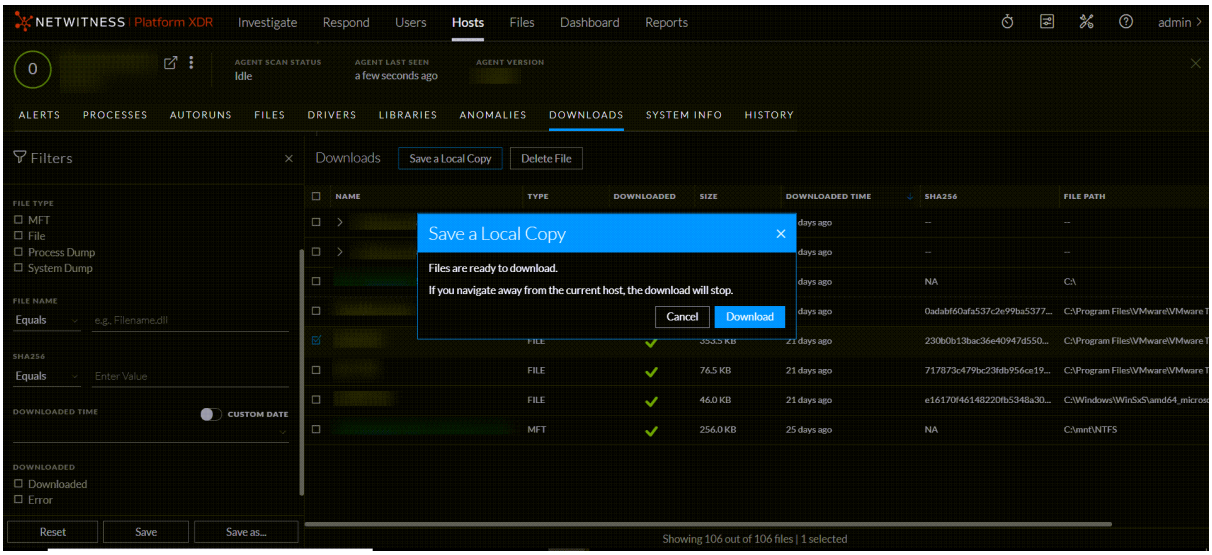


4. Click **Download**.

All files downloaded as a part of wildcard search are grouped together based on the search criteria. For example, all files downloaded using `C:\Users\*\NTUSER.DAT` are grouped, and you can click to expand and view all files under this group. You can sort the groups on the downloaded time and view the status of the download in the **Downloaded** column.

Filter Downloaded Files

You can filter the downloaded files on wildcard downloads, file type, file name, SHA256 (for files), and downloaded time. In the Downloaded Time field, you can also filter by custom date.



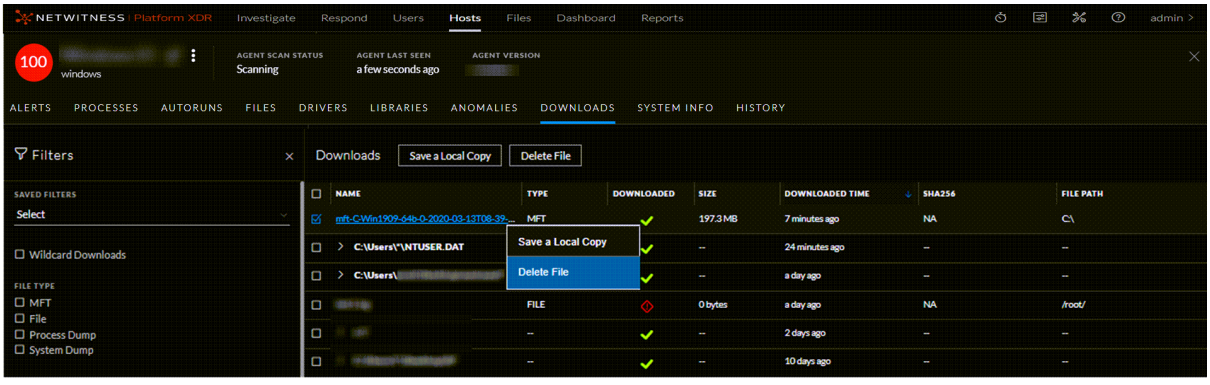
Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click .

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Save Downloaded File

You can retrieve the downloaded file and save it to your local file system for further analysis. To save the file:

1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Right-click the file you want to save and select **Save a Local Copy** from the context menu or from the toolbar.



4. In the **Save a Local Copy** dialog, click **Download**.

Note: For wildcard downloads, select a file from the group that are downloaded successfully to save a local copy. You cannot save multiple files in the group at a time or save files with errors.

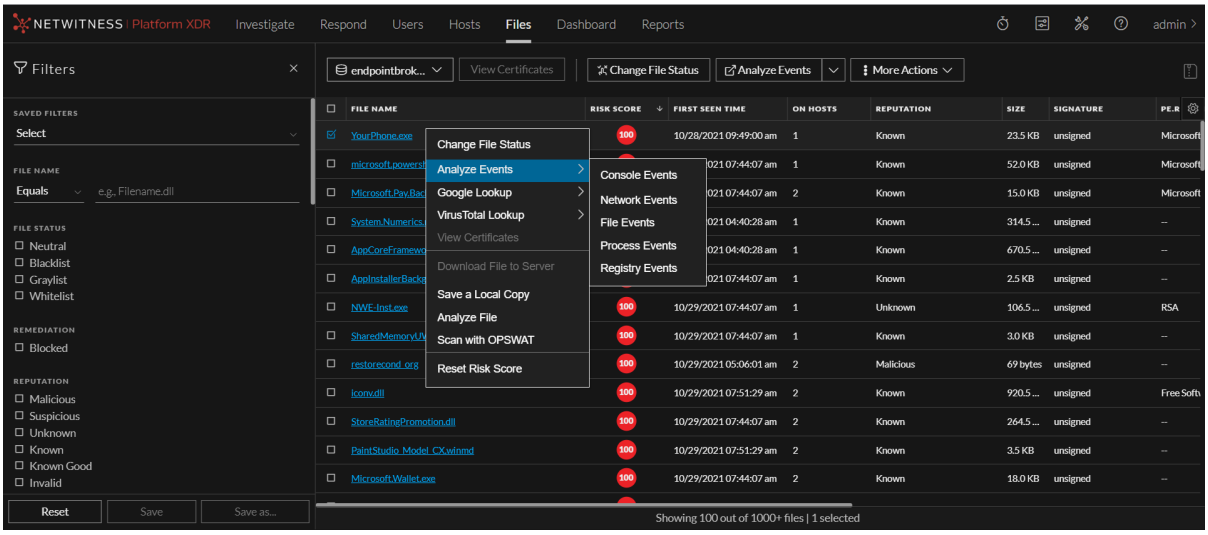
Delete Downloaded Files

If you want to delete the downloaded file from the server:

1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Right-click one or more files you want to delete, and select **Delete File** from the context menu or from the toolbar.

Note: For wildcard downloads, you can select the group to delete all files that are downloaded.

Analyzing Events



If you need to investigate a particular host, IP address, username, filename, or hash to look for related activity across a time range, you can pivot to Navigate view to get the entire context of the activity. By default, the time range is set to 7 days. You can change the time range.

Note: By default, the system detects the best data source to pivot to Navigate view. To change the data source, modify the investigate service ID under endpoint or investigate in the Explore view.

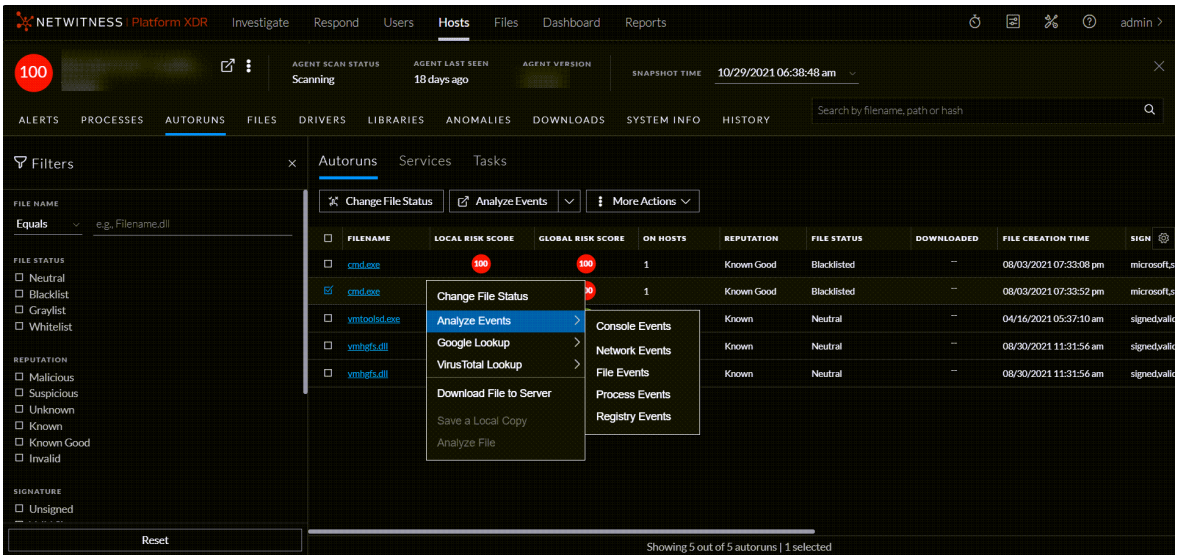
Analyze Events from Files View

To investigate a particular filename or hash (SHA256 and MD5):

1. Go to **Files**.
2. Select the file you want to analyze and do one of the following:
   - Right-click and select **Analyze Events** from the context menu.
   - Click **Analyze Events** in the toolbar.

This opens the Navigate view with data related to the file. For more information on analyzing events in the Navigate and Events views, see the *NetWitness Investigate User Guide*.

Note: If the values are not indexed, the results take time to load. For more information, see Troubleshooting NetWitness Endpoint.



Analyze Events from Hosts View

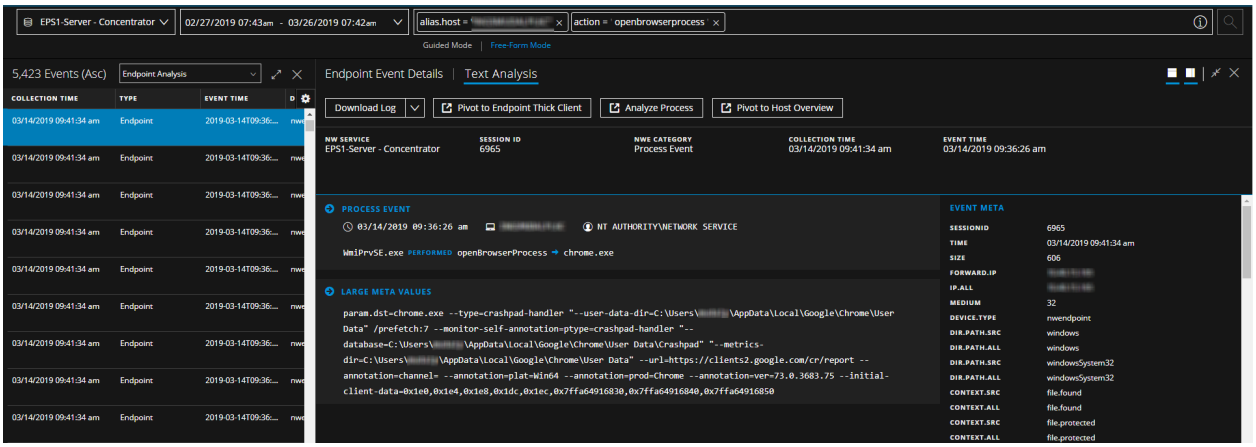
To investigate a particular host, IP address (IPV4), or username:

1. Go to **Hosts**.
2. Do one of the following:

- Right-click a host, select **Analyze Events** from the right-click context menu or in the toolbar, and select a specific event type (such as network events, file events) that you want to view.
- Select the hostname to open the host details. Right-click a file or in the toolbar, select **Analyze Events**, and select a specific event type that you want to view.

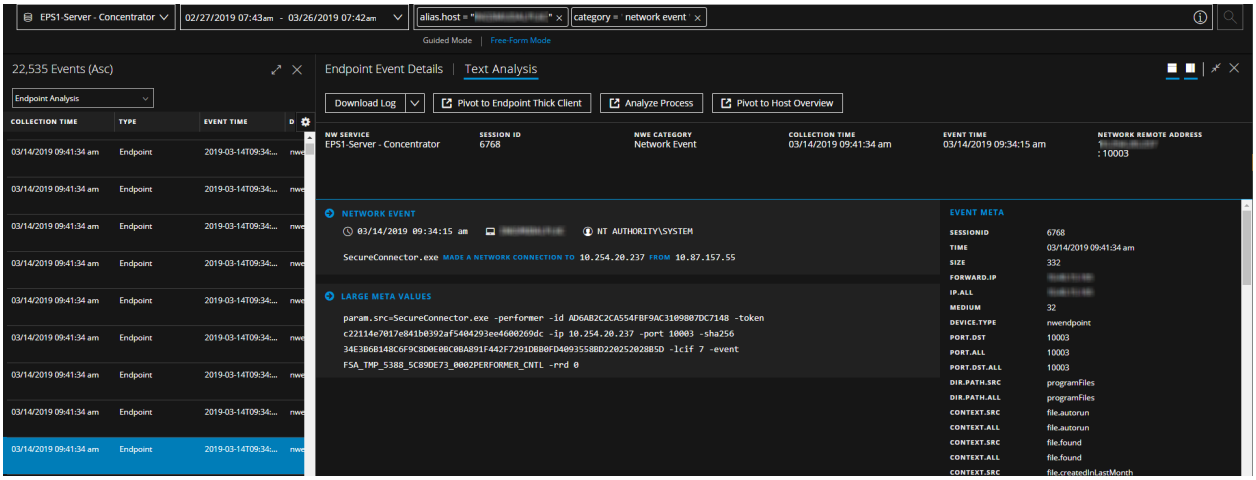
  The following figure is an example of the Autoruns tab.

  This opens the Navigate view with data related to the file.



For more information on analyzing events in the Navigate and Events views, see the *NetWitness Investigate User Guide*.

Text Analysis for an Endpoint Event

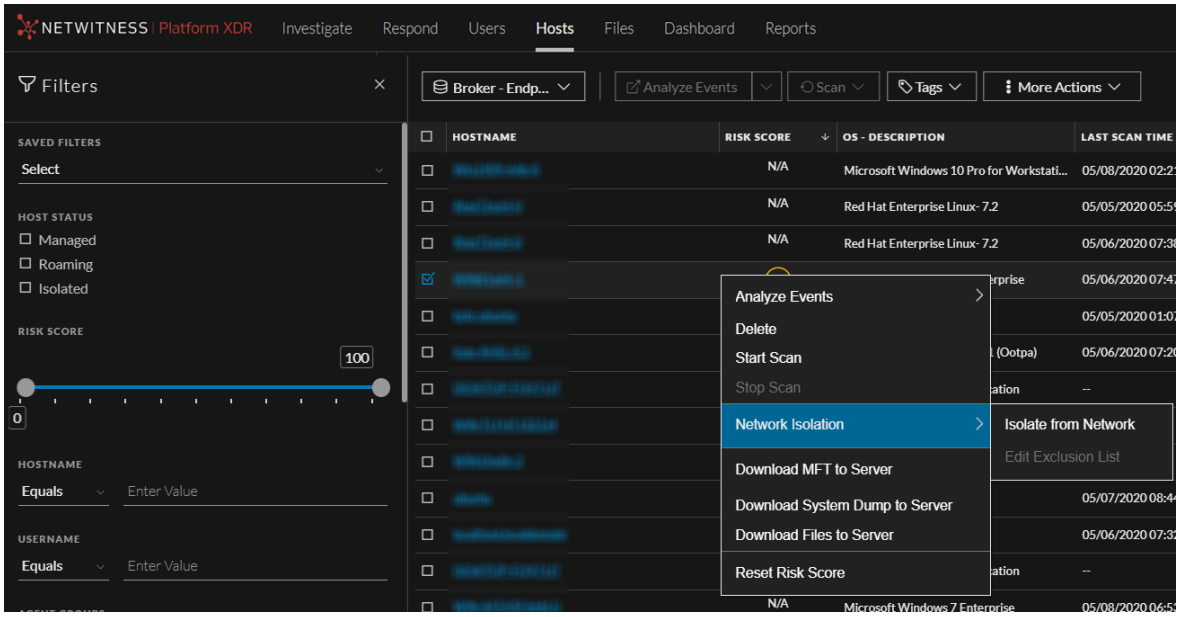


You can view all Endpoint events in their original text format in the Events view Event List panel. When you click an event in the Event list panel, the adjacent panel shows the Text Analysis. Pagination controls add flexibility when paging through the reconstructed text of an event. The Text Analysis displays the following:

- Event Header, which provides summary information about the event. (Version 11.5 and Later) The event header includes host name, process, and user name details in addition to other event details if the selected Endpoint event contains these metadata.
- Options for exporting - log, csv, xml, and json formats.
- Option to pivot to the Endpoint Thick Client to analyze the meta value.
- Option to analyze process details associated with the event.
- Option to view the host details for further analysis.

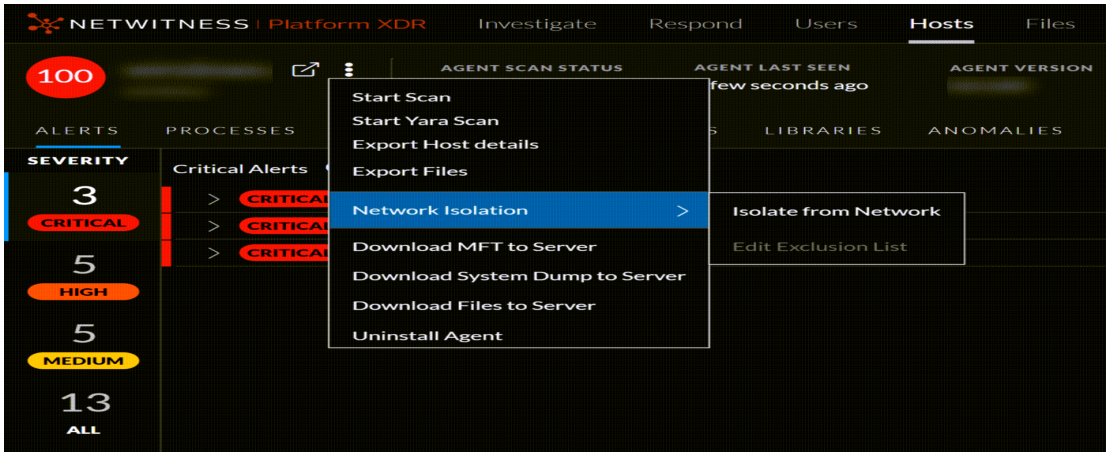
Below is an example of the Process event for Endpoint. The text in the Text Analysis panel explains that a source process `WmiPrvSE.exe` opened a browser process named `chrome.exe`. In the events, if there is a meta value that exceeds 255 characters, the value is displayed in the Large Meta Values panel.

Below is an example of the Network event:



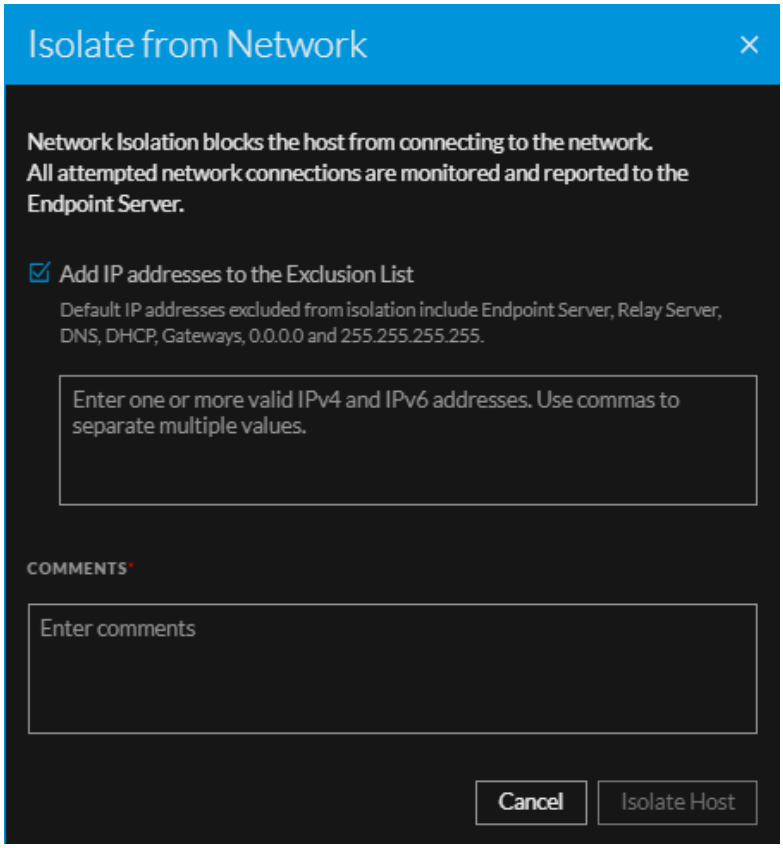
For more information on Events view, see the *NetWitness Investigate User Guide*.

Isolating Hosts from Network



Note: By default, the network isolation option is disabled in the policy, and you cannot view options mentioned in this section. To enable network isolation, in the policy configuration, select **Enabled** in the **Network Isolation** option under Response Action Settings. For more information, see the *NetWitness Endpoint Configuration Guide*.

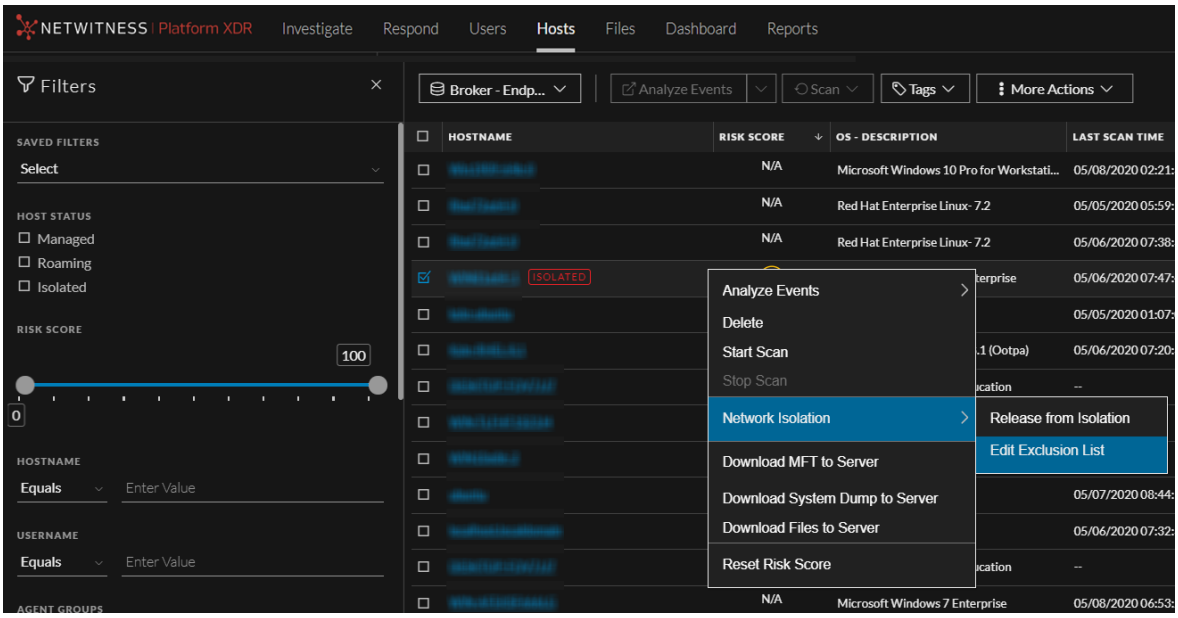
To isolate a host from the network:



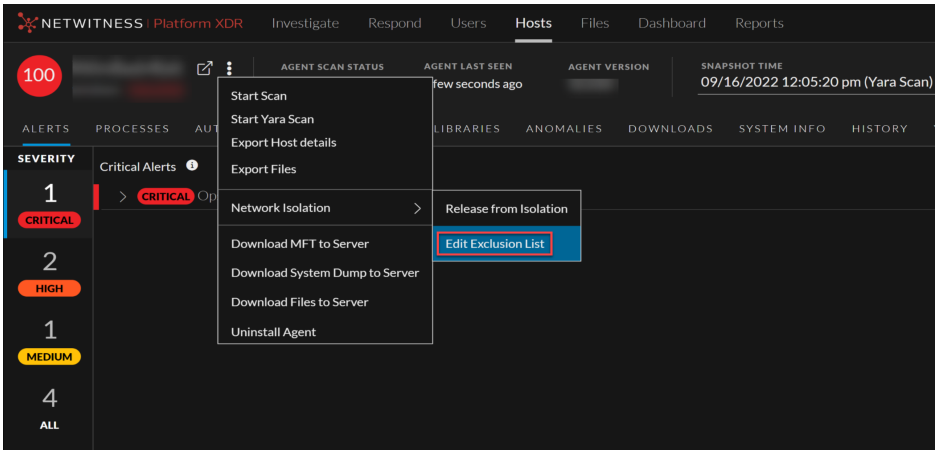
1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Isolate from Network** from the right-click context menu, or from the **More** drop-down list in the toolbar.

   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Isolate from Network**.

2. In the Isolate from Network dialog, by default, a set of IP addresses are excluded from isolation. For more information, see Network Isolation. To add IP addresses to the list, select the **Add your IPs to Exclusion List** checkbox. You can enter up to 100 IP addresses separated by comma.



3. Enter comments.
4. Click **Isolate Host**.

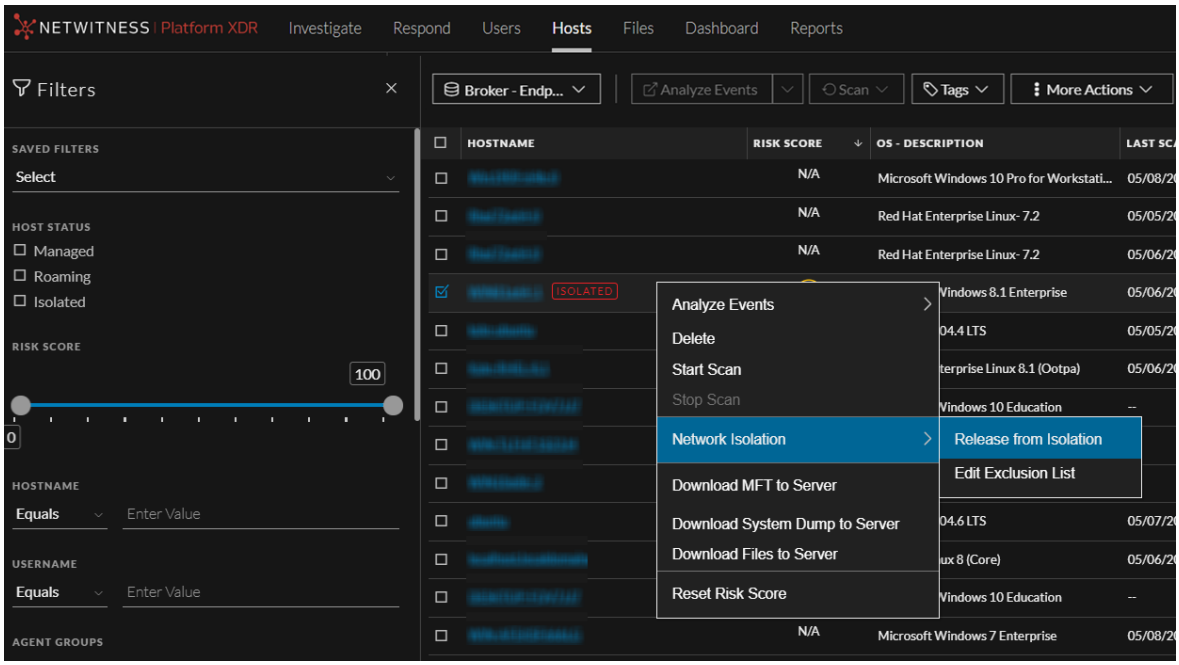


Edit Exclusion List

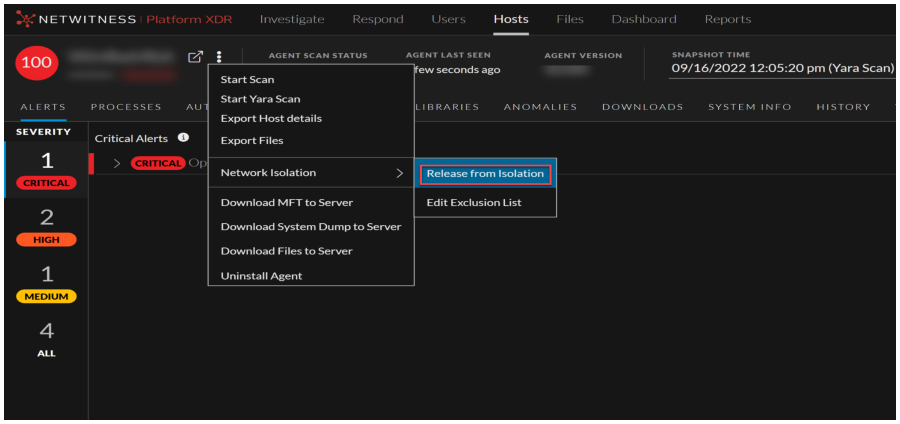
To edit the exclusion list:

1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Edit Exclusion List** from the right-click context menu, or from the **More** drop-down list in the toolbar.

- Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Edit Exclusion List**.



2. Add or modify the IP addresses in the list.
3. Enter comments and click **Save**.



Release Isolated Hosts

Releasing the isolated host restores the network connection and removes IP addresses added to the Exclusion list. To release the host from isolation:

1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Release from Isolation** from the right-click context menu, or from the **More** drop-down list in the toolbar.

- Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Release from Isolation**.

2. Enter comments and click **Release Host**.

NetWitness Endpoint with Third-Party Antivirus Products

If you want the NetWitness Endpoint agent to coexist with any of the security products, make sure to whitelist the agent. For more information, see the respective third-party product documentation.

Troubleshooting NetWitness Endpoint

This section provides information about possible issues when using NetWitness Endpoint.

General Issues

Issue	Some of the hosts or files data are not displayed when Endpoint Broker is selected for querying.
Solution	The Endpoint Broker aggregates data from all Endpoint Servers, which responds within 10 seconds. You must increase the query timeout value to see the result of Endpoint server that is online. Perform the following: 1. Go to  **(Admin) > Endpoint Broker** service. 2. Click  > **View** > **Explore**. 3. Click **endpoint/broker** node. 4. In the **query-timeout** field increase the value, for example, 30 seconds.

Issue	The Endpoint Agent is unable to communicate with the Endpoint Server. The connection may not be established due to any of the following issues: • UDP • HTTPS • Firewall

Solution	• To verify the UDP or HTTPS connection, you must verify the connection between Windows Endpoint Agent and Endpoint Server:
	1. Go to System32 folder using the following command:
	`cd C:\Windows\System32`
	2. Execute the following command:
	`<Agent Service name>.exe /testnet`
	For example, `NWEAgent.exe /testnet`
	• If the issue is with the firewall, check the incoming and outgoing firewall rules.

Issue	The Endpoint Agent is unable to communicate with the Log Decoder. The connection may not be established due to any of the following issues: • UDP • TCP • TLS

Solution	• Firewall

	• To verify the UDP, TCP, and TLS connection, you must verify the connection between Windows Endpoint Agent and the Log Decoder:
	1. Go to System32 folder using the following command:
	`cd C:\Windows\System32`
	2. Execute the following command:
	`<Agent Service name>.exe /testlognet`
	For example, `NWEAgent.exe /testlognet`
	• If the issue is with the firewall, check the incoming and outgoing firewall rules.

Multi-server Issue

Issue	Agent is not communicating with the Endpoint Server after migration.
Solution	Check the Nginx logs of the Endpoint Server to which the agent has migrated, and if the agent is communicating with error code 403, that means the certificate of the first Endpoint Server and second Endpoint Server are different. This is because during the installation of second Endpoint Server, the certificate of first Endpoint Server is not copied to the second Endpoint Server. Reinstall the second Endpoint Server by copying the certificate of first Endpoint Server, and reinstall the agent. For more information, see the *Physical Host Installation Guide*.

Hosts View Issues

Message	`An error has occurred. The Endpoint Server may be offline or inaccessible.`
Issue	When attempting to access the Hosts or Files view, the view opens with the message.
Explanation	Endpoint Server or Nginx Server is not running. Check the status of the Endpoint Server under  **(Admin) > Services** or check if the Endpoint Server host IP address is registered with the Admin Server. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*. If the service is not running, start the Endpoint Server.

Issue	Hosts view shows 'No Results Found.' error in the following scenario: • Host A belongs to Endpoint server A and does not exist in Endpoint server B. • Endpoint server B is selected in Hosts view. • In a new window/tab, open the Host details page (of Host A) • Navigate to Hosts view using **[*Host Name*] > Actions > Pivot to Investigate**

	> Hosts/Files `Endpoint server B is selected by default, and the page shows 'No results found.' error.`
Explanation	This is expected behavior. The Endpoint server that is selected first is considered to be current /active throughout the session.
Workaround	Ensure the correct Endpoint server is selected, and `Pivot to Investigate > Hosts/Files` will behave normally.

Issue	For MFT download: 1. The request fails with file not found error for drives/mount paths created on the machine after agent is installed. 2. Incorrect MFT is downloaded for the provided NTFS mount path.
Solution	Make sure that the agent version is 11.6 or later.

Files View Issues

Issue	Unable to analyze events from **Hosts** and **Files** view.
Explanation	Other than Broker or Concentrator, if any aggregation service, such as Archiver, is aggregating data from the Log Decoder that is configured for metadata forwarding from any Endpoint server, clicking **Analyze Events** from **Hosts** and **Files** view for this Endpoint server may not work. To resolve this issue: **Note:** To get the investigate-service-id: 1) Go to **(Admin) > Services > Concentrator** service. 2) Click > **View** > **Explore** tab. 3) Expand the **sys/stats** node list. 4) In the UUID filed, copy the value. 1. Go to **(Admin) > Services > Endpoint Server** service. 2. Click > **View** > **Explore** tab. 3. In the **endpoint/investigate** field, specify the **investigate-service-id**.

Policy Issue

Issue	Policy status in the Policy Details panel is not updated or shows Policy Unavailable/Permission Required.
Explanation	**Policy Unavailable** - Hosts belong to previous versions, such as NetWitness Platform 11.1 or 11.2, where a policy is not applied.

	Permission Required - If you do not have permissions, see the "Role Permissions" topic in the *System Security and User Management Guide*.

Issue	Policy Status shows error.
Explanation	Policy may have wrong configurations. Check the error description, logs in Endpoint server, and audit logs for details. Contact your system administrator with the error details.

Driver Issue

Issue	While loading the driver on the host, an error is encountered.
Explanation	Check the driver error code in the **Agent-Driver Error Code** column under **Hosts** view. Contact your system administrator with the error code.

Download Issue

Issue	Downloads (Files, MFT, System/Process dumps, etc.) fail at times.
Explanation	Downloads fail when there is not sufficient disk space on the Endpoint Server.
Workaround	Clean up some disk space and try downloading again. We recommend you keep sufficient disk space before initiating any download.

File Reputation Service Issue

Issue	When you configure RSA Live for the first time and the File Reputation service is not connected.
Solution	You must manually enable the File Reputation service. To enable the File Reputation service: 1. Go to  **(Admin) > System > Live Services**. 2. In the **Additional Live Services** section, select the enable File Reputation check box. 3. Click **Apply**.

Risk Scoring for Hosts or Files Issue

Issue	NetWitness Endpoint takes a long time to process risk scoring for Hosts or Files.

Solution	Check the backlog of alerts for risk scoring. 1. SSH to the ESA Primary appliance. 2. Execute the following command: `mongo respond-server --authenticationDatabase admin -u deploy_admin -p <deploy_admin_password> --eval 'db.staging.find({"$or":[{state:"STAGED"},{state :"WORKING"}]}).count()' --quiet` The backlog count is displayed. If the backlog count is 1 million or greater, you must disable the risk scoring and Endpoint ESA alerts. 3. To disable risk scoring: a. Go to **(Admin) > Services > Respond** service. b. Click > **View** > **Explore**. c. Expand the **respond/scheduled/jobs** node list. d. In the **risk-scoring-enabled** field, set the value to **false**. 4. To disable Endpoint ESA alerts: a. To disable NetWitness Endpoint ESA alerts generation for severity; Critical, High and Medium. i. Go to **(Configure) > ESA Rules**. The Configure view is displayed with the Rules tab open. ii. In the **Options** panel, under Deployments, select the Endpoint deployment to delete. A confirmation dialog is displayed. iii. Click **Yes**. b. To disable only Medium severity NetWitness Endpoint ESA alerts: i. Go to **(Admin) > ESA Correlation** service (on which Endpoint deployment is added). ii. Click > **View** > **Explore**. iii. Expand the **correction/alert** node list. iv. In the **transient-enabled** field, set the value to **false**.

Endpoint Broker/Server Issue

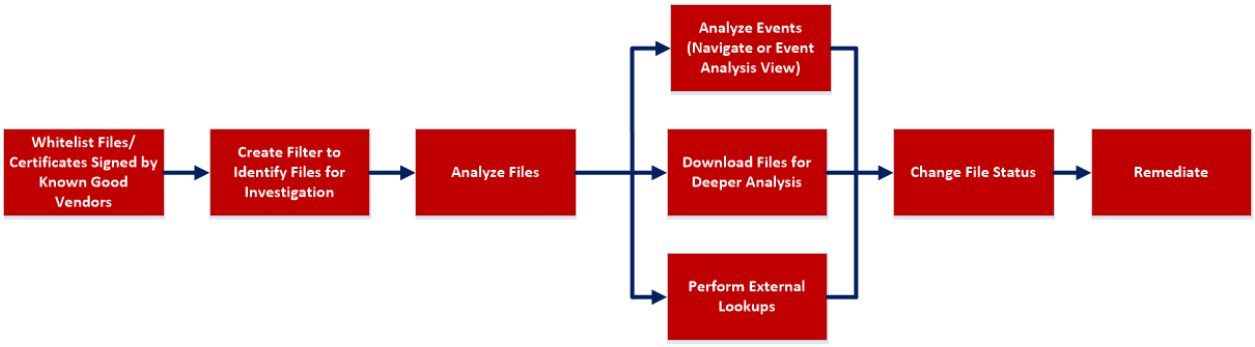
Issue	User have access to one Endpoint server and unable to access the other.
Explanation	Reach out to the administrator and check if you have access to that endpoint servers. Request for access if required.

Issue	In the Endpoint Server Broker view, the user can scan hosts that belong to a particular Endpoint server but cannot scan hosts that belong to another Endpoint server.
Explanation	User may not have access to that endpoint server. Check with the Administrator to see if the user has access.

NetWitness Endpoint Reference Materials

This section is intended to help you understand the purpose and application of NetWitness **Investigate** > **Hosts** view and **Files** view. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.

- Files View
- Hosts View
- Hosts View - Details Tab
- Hosts View - Process Tab
- Hosts View - Autoruns Tab
- Hosts View - Files Tab
- Hosts View - Drivers Tab
- Hosts View - Libraries Tab
- Hosts View - Anomalies Tab
- Hosts View - Downloads Tab
- Hosts View - System Information Tab
- Hosts View - Agent History Tab
- Hosts View - YARA Rules Tab



Files View

Note: The information in this topic applies to NetWitness Version 11.1 and later.

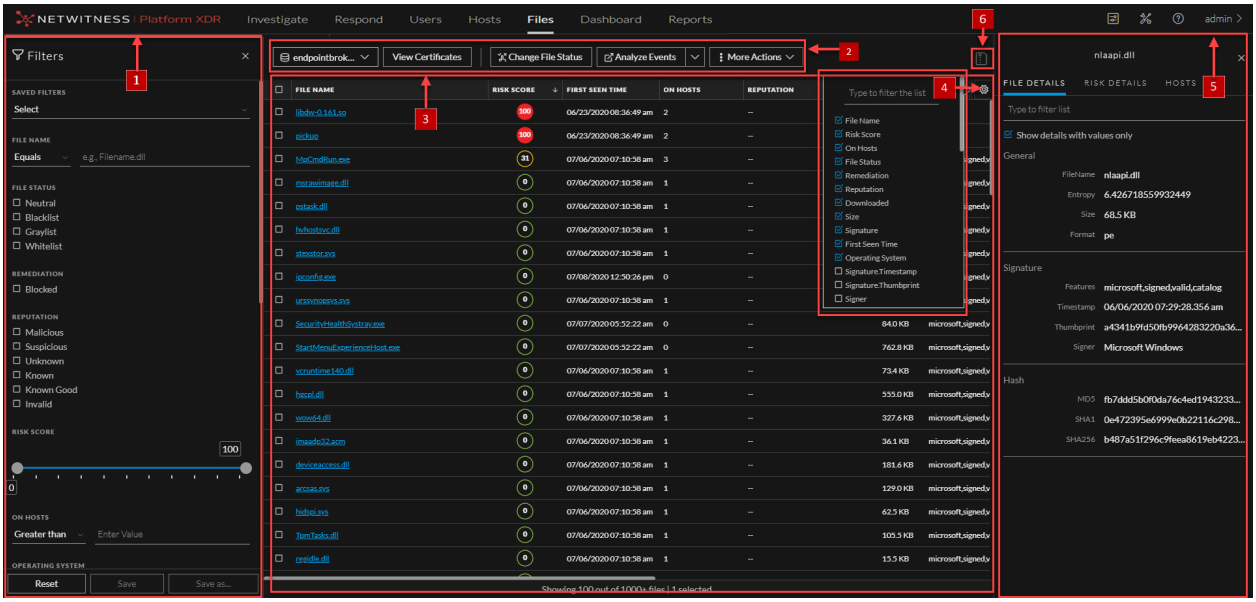
The Files view provides a holistic view of all files in your deployment. To access this view, go to **Files**. By default, the Files view displays 100 files. To display more files, click **Load More** at the bottom of the page.

You can either view files specific to an Endpoint server or view all files from multiple Endpoint servers by selecting the Endpoint Broker.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	whitelist files and certificates signed by known good vendors*	Analyze Certificates
Threat Hunter	create filter to identify files for investigation*	Filter Files
Threat Hunter	analyze files*	Investigating Files
Threat Hunter	analyze events*	Analyzing Events
Threat Hunter	download files for deeper analysis*	Analyzing Downloaded Files
Threat Hunter	perform external lookups*	Launch an External Lookup for a File
Threat Hunter	change file status or remediate*	Changing File Status or Remediate



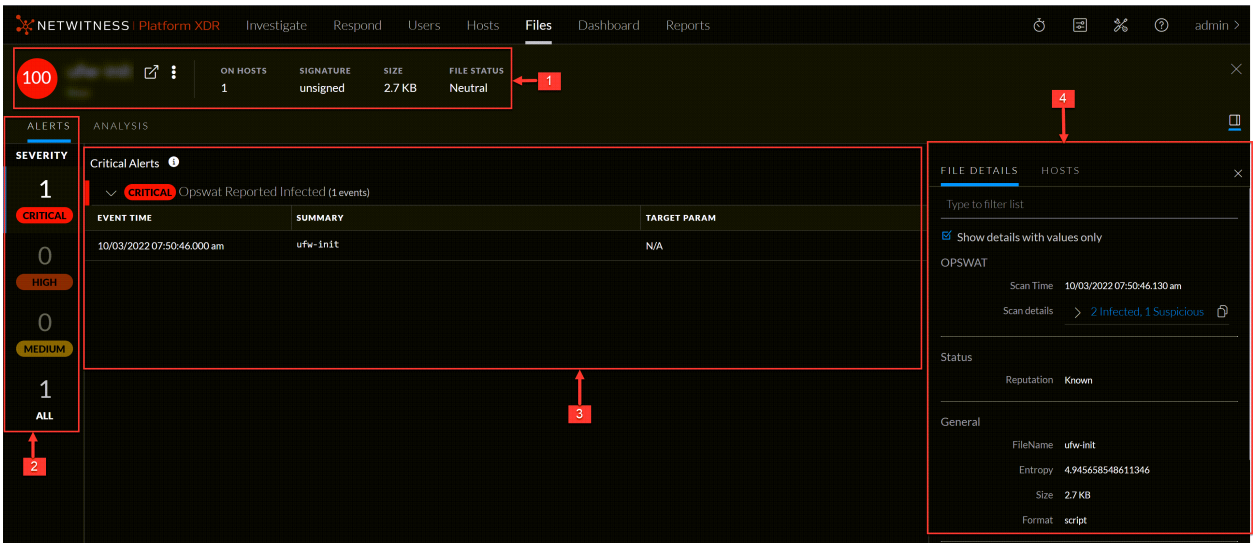
*You can perform this task in the current view

Related Topics

- Focusing on Endpoint Analysis
- Investigating Hosts
- Analyzing Downloaded Files
- Analyzing Events
- Analyze Certificates
- Changing File Status or Remediate

Quick Look

Below is an example of the Files view:

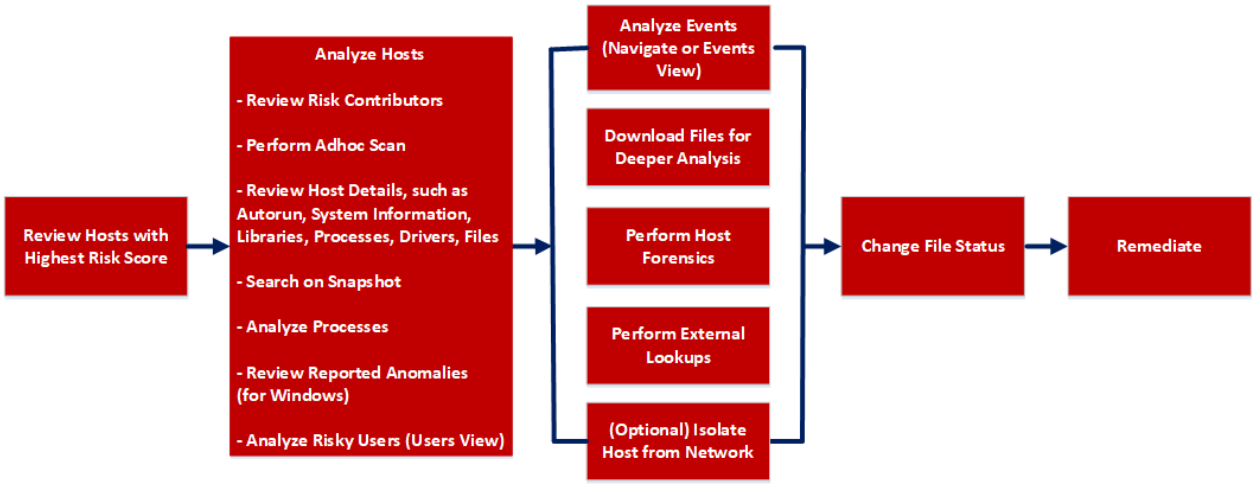


1 **Filter Files**. You can filter the files by selecting the options in the Filters panel and create filters. For more information, see Filter Files.

2	**Actions in the toolbar:** **Server drop-down list** - You can select the Endpoint server or Endpoint Broker server to view the hosts. **View Certificates** - Provides a list of code-signing certificates reported by hosts found in your deployment and their associated properties. For more information, see Analyze Certificates. **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected files to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More Actions** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. • Reset risk score. **Note:** You can perform the above actions from the right-click context menu.
3	**Sort Columns.** Lets you sort on column titles.
4	**Settings Menu.** You can set Files view preferences by selecting columns from the Settings menu. For more information, see Set Files Preference.
5	**Show/Hide File Properties Panel.** Click a row to show or hide the File Properties panel. It displays the following tabs: **File Details** - Displays the file information. **Risk details** - Displays the distinct alerts associated with the risk score. **Hosts** - Displays the top 100 hosts based on the risk score on which the file is present. For more information, see Analyze Hosts with File Activity.
6	**Export to CSV** - Extracts global files to a CSV file. For more information, see Export Global Files.

File Details View

To access this view, go to **Files**, and select a file. Below is an example of the File Details view:



1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More** - Provides options to perform external lookups. **On Hosts** - Indicates the number of hosts on which a file exist. **Signature** - Provides signatory information. **Size** - Size of the file. **File Status** - Status of the file. For example, `Neutral`.
2	**Alerts Severity** tab - Displays list of distinct alerts, such as Critical, High, Medium and All, along with the total number of events associated with the alert. **Analysis** tab - Provides detailed information about a downloaded file. For more information, see Analyzing Downloaded Files.
3	Displays events for an alert and metadata associated with a specific event.
4	**Show/Hide File Properties Panel.** Click a row to show or hide the File Properties panel. It displays the following tabs: **File Details** - Displays the file information. **Hosts** - Displays the hosts on which file activities are present. For more information, see Analyze Hosts with File Activity.

Hosts View

Note: The information in this topic applies to NetWitness Version 11.1 and later.

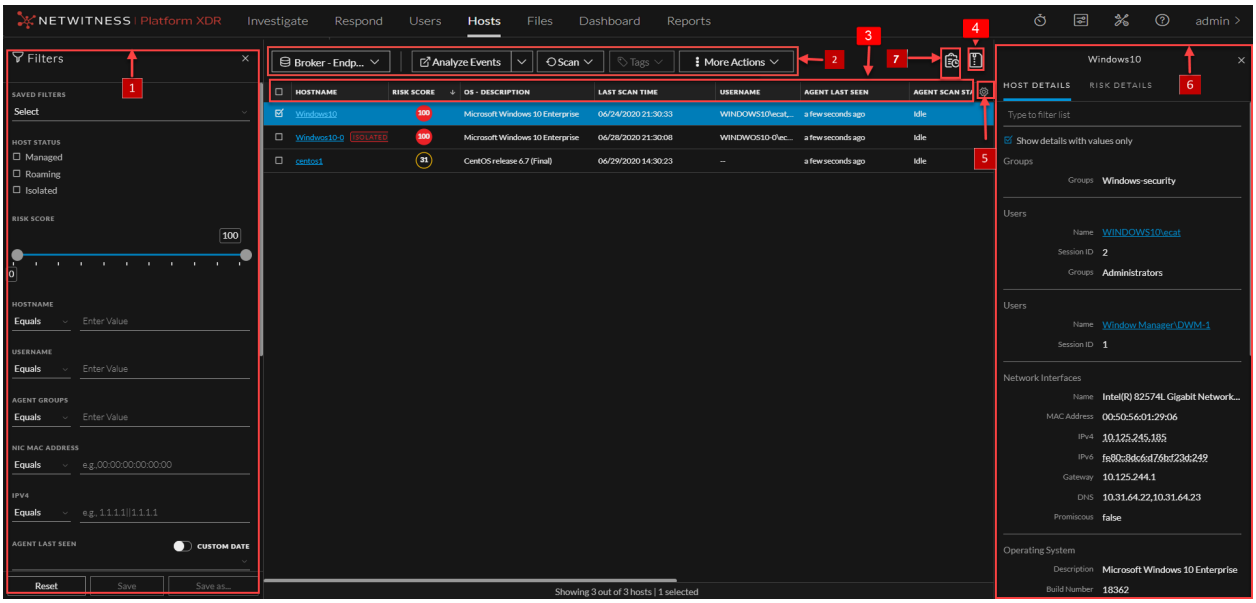
The Hosts view provides a list of all hosts with an Endpoint agent installed. To access this view, go to **Hosts**. By default, hosts are sorted based on the risk score.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	review hosts with highest risk score*	Analyze Hosts Using the Risk Score
Threat Hunter	analyze hosts*	Investigating Hosts
Threat Hunter	perform adhoc scan*	Scan Hosts
Threat Hunter	review host details*	Analyze Host Details
Threat Hunter	search on snapshot*	Search Files on Host
Threat Hunter	analyze processes*	Investigating a Process
Threat Hunter	review reported anomalies*	Analyze Anomalies

User Role	I want to ...	Show me how
Threat Hunter	analyze risky users*	Analyzing Risky Users
Threat Hunter	analyze events*	Analyzing Events
Threat Hunter	download files for deeper analysis*	Analyzing Downloaded Files
Threat Hunter	perform external lookups*	Launch an External Lookup for a File
Threat Hunter	change file status or remediate*	Changing File Status or Remediate
Threat Hunter	filter files*	Filter Host Details
Threat Hunter	isolate host from network*	Isolating Hosts from Network
Threat Hunter	download MFT*, system dump*, or process dump	Performing Host Forensics



*You can perform this task in the current view.

- Isolating Hosts from Network

Quick Look

Below is an example of the Hosts view:

1 **Filter Hosts**.You can filter the hosts by selecting the options in the Filters panel and create filters. For more information, see Filter Hosts.

2 **Actions in the toolbar:**

Server drop-down list - You can select the Endpoint server or Endpoint Broker server to view the hosts.

Analyze Events - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.

Start Scan - Starts a scan for the selected hosts.

Stop Scan - Stops a scan for the selected hosts.

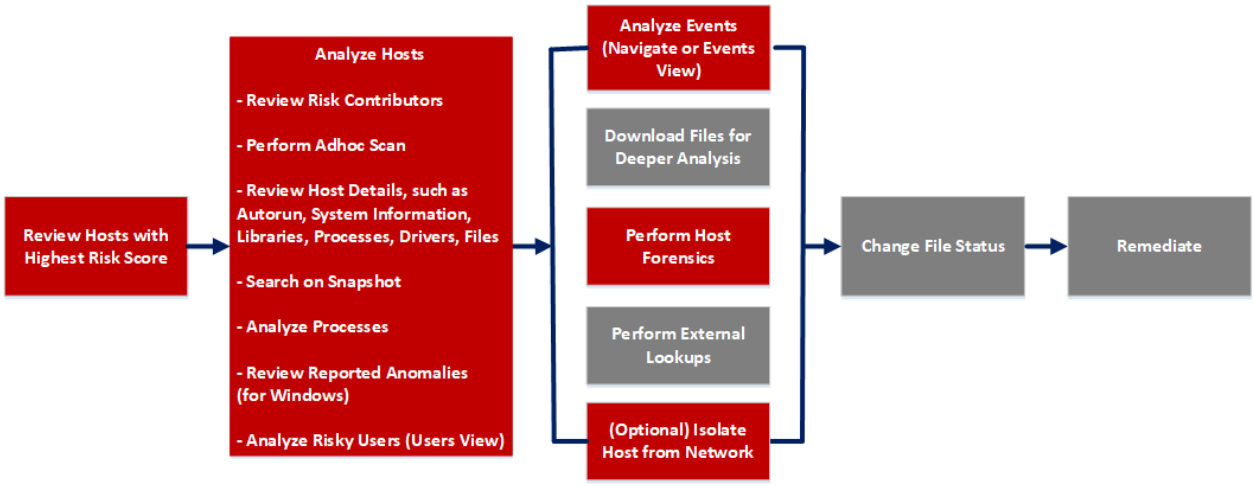
More Actions - Provides options to:

- Reset risk score.
- Delete - Lets you delete hosts manually from the user interface. After deletion, the Endpoint server does not process any request from this host. For more information, see Delete a Host.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Isolation host from the network. For more information, see Isolating Hosts from Network.

Note: You can perform the above actions from the right-click context menu.

3 **Sort Columns**. Lets you sort on column titles.

4 **Export to CSV** - Extracts host attributes to a CSV file. For more information, see Export Host Attributes.



5	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.
6	**Show/Hide Host Properties Panel.** Click a row to show or hide the Host Properties panel. It displays the following tabs: **Host details** - Displays the host information such as Network Interfaces, operating system, hardware and others. **Risk details** - Displays the distinct alerts associated with the risk score.
7	**View Agent History** - Displays the list of commands issued to the agent. For more information, see View Agent History.

Hosts View - Details Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Details tab provides details of the selected host. To access this view, go to **Hosts** view, and select a host.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	review hosts with highest risk score*	Analyze Hosts Using the Risk Score

- Isolating Hosts from Network

Quick Look

Below is an example of the Details tab:

1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts. **Agent Last Seen** - Time when the agent last communicated with the Endpoint server. **Agent Version** - Version of the agent. For example, `11.3.0.0`. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More** - Provides options to: • Start a scan for the selected hosts. For more information, see Scan Hosts. • Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes. • Isolation host from the network. For more information, see Isolating Hosts from Network. • Download MFT to the server. For more information, see Performing Host Forensics. • Download System Dump to the server. For more information, see System and Process Memory Dump. **Snapshot Time** - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.
2	Search files on host. Lets you search the files on the host (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
3	**Show/Hide Right Panel** - Displays host and policy details panel.

4 **Host Details Panel** - Displays all properties of the selected host. It is grouped as follows:

Groups - Groups on which the host is added on.

User - Information related to the user.

Network Interfaces - Network adapter information, such as Mac Address, Gateway.

Operating System - Operating system version and build information.

Agent - Agent-related information, such as agent ID, driver error code, install time, and agent mode.

Hardware - Information related to the architecture.

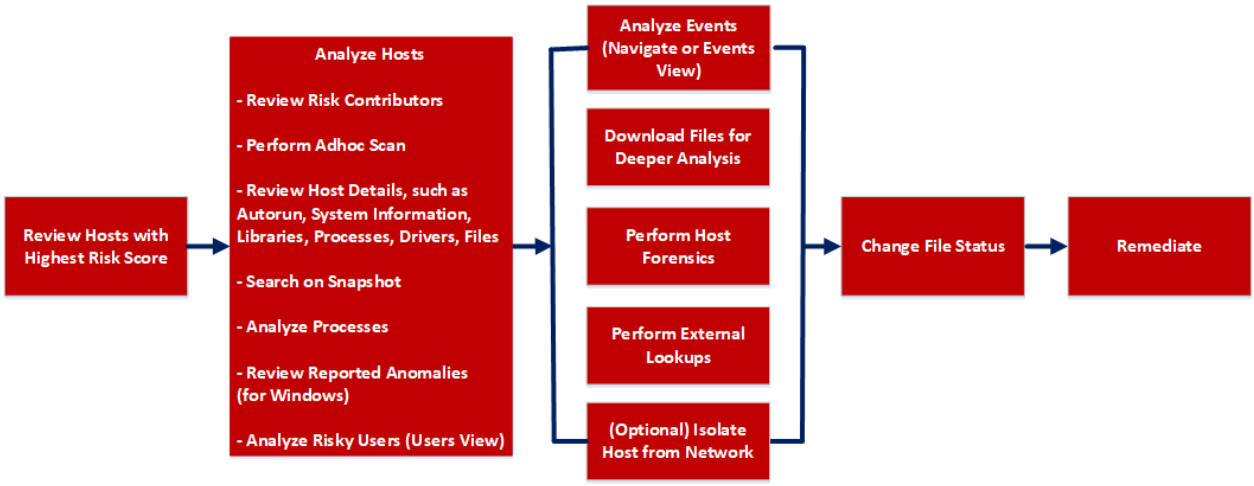
Locale - Time zone and language that is local to the host.

5 **Policy Details Panel** - Displays the following:

- Policy Status -
  - Updated - Host has the latest policy.
  - Pending - Policy is resolved but the latest policy is not updated on the host. When the host communicates with the Endpoint server next time, the latest policy is applied if there are no errors.
  - Unavailable - Hosts that belong to previous versions, such as NetWitness Platform 11.1 or 11.2, or the source server is not installed.
  - Error - Problem applying the latest policy along with the error description.
- Blocked Hashes Status -
  - Updated - Host has the latest blocked hashes.
  - Pending - Hashes are blocked but the latest hashes are not updated on the host. When the host communicates with the Endpoint server next time, the latest hashes are applied if there are no errors.
- Evaluated Time - Time when the Endpoint server evaluated the policy.
- Relay Server. Displays the Relay Server details.
  - Server - Host name or IP address of the Relay Server.
  - Port - Port number.
  - HTTP Beacon Interval - HTTP beacon interval value in minutes.
- Complete resolved policy settings. For more information, see "Managing Policies" in the *NetWitness Endpoint Configuration Guide*.

Note: The values that are not set in the policy are not displayed.

6 **Alerts Severity** - Displays list of distinct alerts, such as Critical, High, Medium and All, along with the total number of events associated with the alert.



7	Displays events for an alert and metadata associated with a specific event. For more information, see Analyze Hosts Using the Risk Score.

Hosts View - Process Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Process panel provides a list of processes running on the host. To access this tab, select a host from the **Hosts** view and click the **Process** tab.

Quick Look

Below is an example of the Process tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

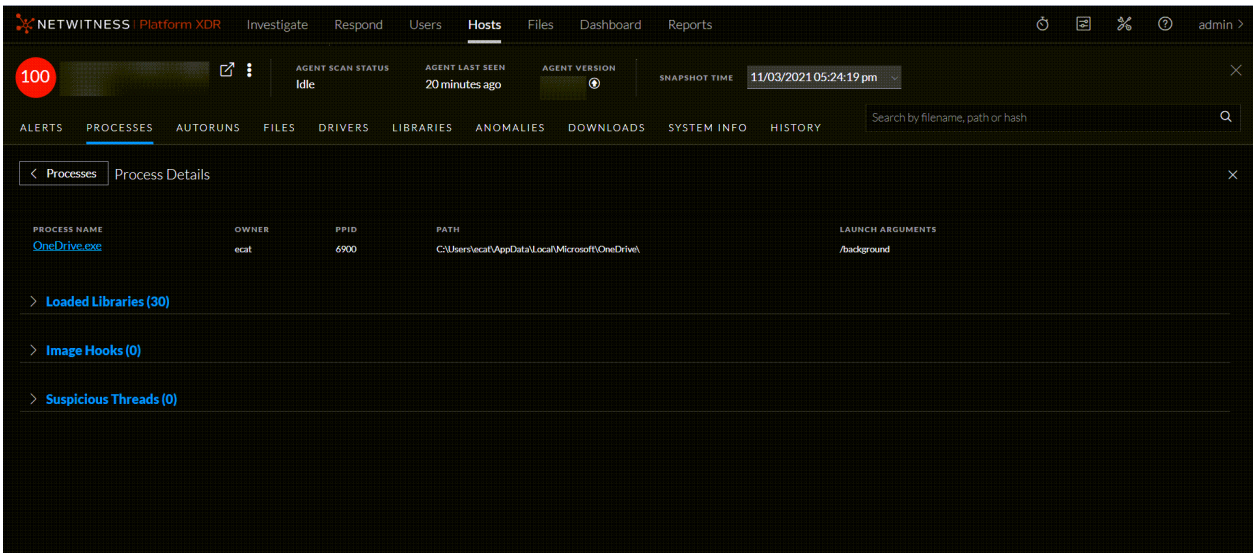
Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

More - Provides options to:



- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.

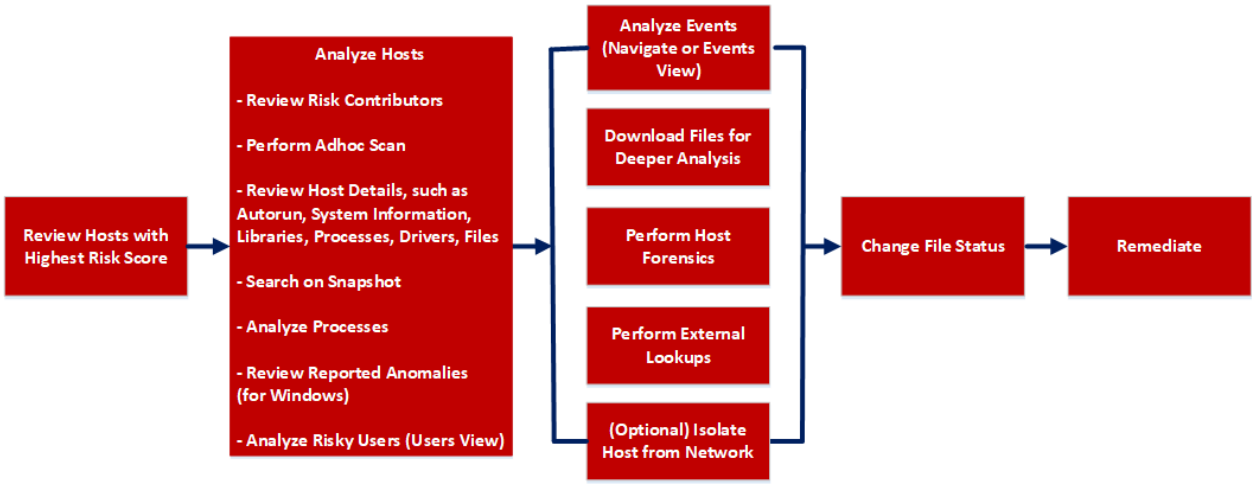
Snapshot Time - Lists scanned time stamps. To view the scan history, you select the snapshot time from the drop-down menu.

2	**Actions in the toolbar:** **Analyze Process** - Lets you perform process analysis to investigate a particular process behavior, and understand the entire process event chain, process parent-child relationships, and all associated events. For more information, see Investigating a Process. **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected file to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. • Download process dump to server. **Note:** You can perform some of the above actions from the right-click context menu.
3	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
4	**Toggle.** Lets you toggle between List view and Tree view.
5	**Process panel** - Displays process information, such as process name, local risk score, global risk score, On Hosts, reputation status, file status, and others.
6	**Show/Hide Right Panel** - Displays the following properties of a process in the right panel: • **File Details** - Displays all properties of the selected process. It is grouped as follows: **General** - General information about the file, such as file name, entropy, size, and format. **Signature** - Provides signatory information. **Hash** - Hash type of the file (MD5, SHA1, and SHA256). **Time** - Time when the file was created, modified, or accessed. **Location** - Location of the file. **Process** - Details of the process, such as image size and PID. **Image** - Image details loaded by the process. • **Local Risk Details** - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All. • **Hosts** - Displays the top 100 hosts based on the risk score on which the file is present.
7	**Filter Files**. You can filter processes by selecting the options in the Filters panel and create filters. For more information, see Filter Host Details.
8	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

Process Details

Clicking the process name displays the process details of a specific process as shown in the following figure:

Field	Description
Process Name	Name of the process. For example, `server.exe`.
PID	ID of the process. For example, `492`.
Path	Path of the file associated with the process on the disk. For example, `C:\Windows\System32`.
Launch Arguments	Command line arguments passed to the process when it is launched. For example, `-k LocalServiceNoNetwork`.



- List of loaded libraries for the selected process, such as DLLs (for Windows), Dylibs (for Mac), or .SO (for Linux).
- List of autoruns (if configured).
- List of image hooks and suspicious threads (for Windows).

Hosts View - Autoruns Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Autoruns panel provides a list of autoruns, services, tasks, and cron jobs running on the host. To access this tab, select a host from the **Hosts** view and click the **Autoruns** tab.

4	**Details Panel** - Displays the following tabs: • Image Hooks • Kernel Hooks • Suspicious Threads • Registry Discrepancies
5	**Show/Hide Right Panel** - Displays the following properties in the right panel: • **File Details** - Displays all properties of the selected process. It is grouped as follows: **General** - General information about the file, such as file name, entropy, size, and format. **Signature** - Provides signatory information. **Hash** - Hash type of the file (MD5, SHA1, and SHA256). **Time** - Time when the file was created, modified, or accessed. **Location** - Location of the file. **Image Hooks/Kernel Hooks/Suspicious Threads/Registry Discrepancies** - Details related to image hooks, kernel hooks, suspicious threads, or registry discrepancies. • **Local Risk Details** - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All. • **Hosts** - Displays the top 100 hosts based on the risk score on which the file is present.
6	Clicking a filename lets you navigate to the Files view for further analysis.
7	**Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. For more information, see Filter Host Details.

8 **Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

Image Hooks

Image hooks found in executable image are displayed in the following columns.

Columns	Description
Type	Type of the hook . Possible values are - inline, iat, eat, or exception Handler.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Signature	Provides signatory information.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Hooked Process	Process in which hooks are placed.
Hooked Filename	Name of the file that was modified by the hook.
Hooked Symbol	Symbol in which the hook is performed.

Kernel Hooks

Hooks found on kernel objects are displayed in the following columns.

Category	Description
Type	Type of kernel object which was modified. Possible values are: objectInitializer,basicObjectPointer, majorFunction, invalidObject, fastIO, notifyRoutine, attachedDevice, device, miniPort, sdt, sysEnter, or type.idt.
Driver name	Name of the driver which placed the hooks.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.

Category	Description
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Signature	Provides signatory information.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Object Function	Name of the object function hooked into.
Hooked File Name	Name of the file that was modified by the hook.

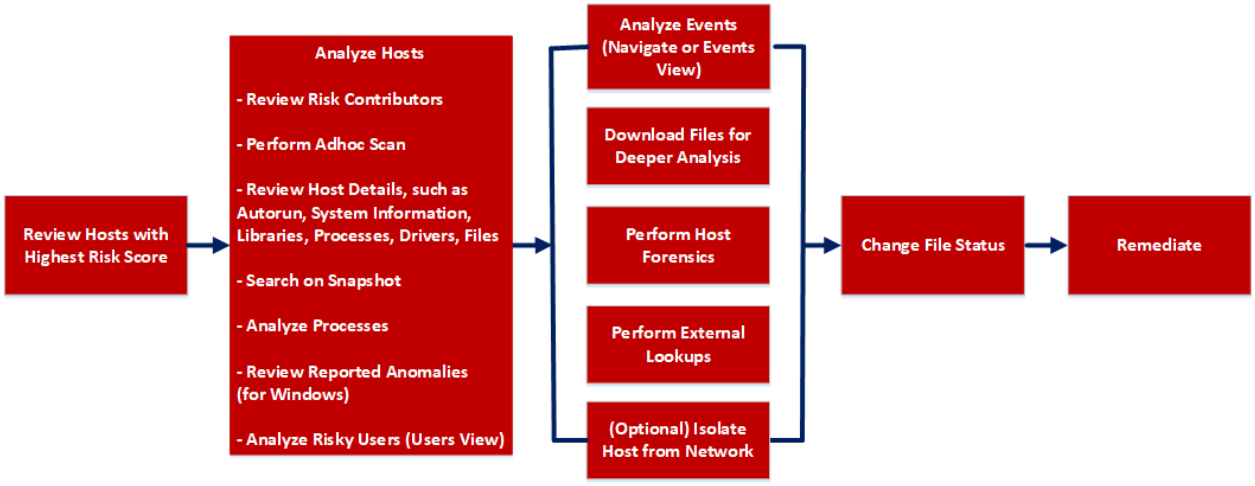
Suspicious Threads

Threads whose service table was hooked are displayed in the following columns.

Category	Description
Start Address	Start Address - Start address of the thread.
DLL Name	Name of the DLL.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Process	File name and PID of the process in which thread is running.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Signature	Provides signatory information.
Thread ID	ID of the running thread.
Thread Environment Block	Address of the thread environment block.

Registry Discrepancies

Configuration settings and options on Microsoft Windows operating systems that are stored are displayed in the following columns.



Category	Description
Hive	Name of the registry hive when possible, otherwise it displays the hive ID. Possible values are: `hkeyClassesRoot`, `hkeyCurrentUser`, `hkeyLocalMachine`, `hkeyUsers`, or `hkeyPerformanceData`.
Reason	Type of registry discrepancy. Possible values are: notFound, embeddedNull, accessDenied, parentIsHidden, or dataMismatch.
Registry Path	Registry path that is affected. The value is separated by a @ character.
Raw Type	Value type found in the low-level parsing.
Raw Data	Value data extracted from the low-level parsing.
API Type	Value type from the Win32 registry API.
API Data	Value data from the Win32 registry API.

Hosts View - Downloads Tab

Note: The information in this topic applies to NetWitness Version 11.4 and later.

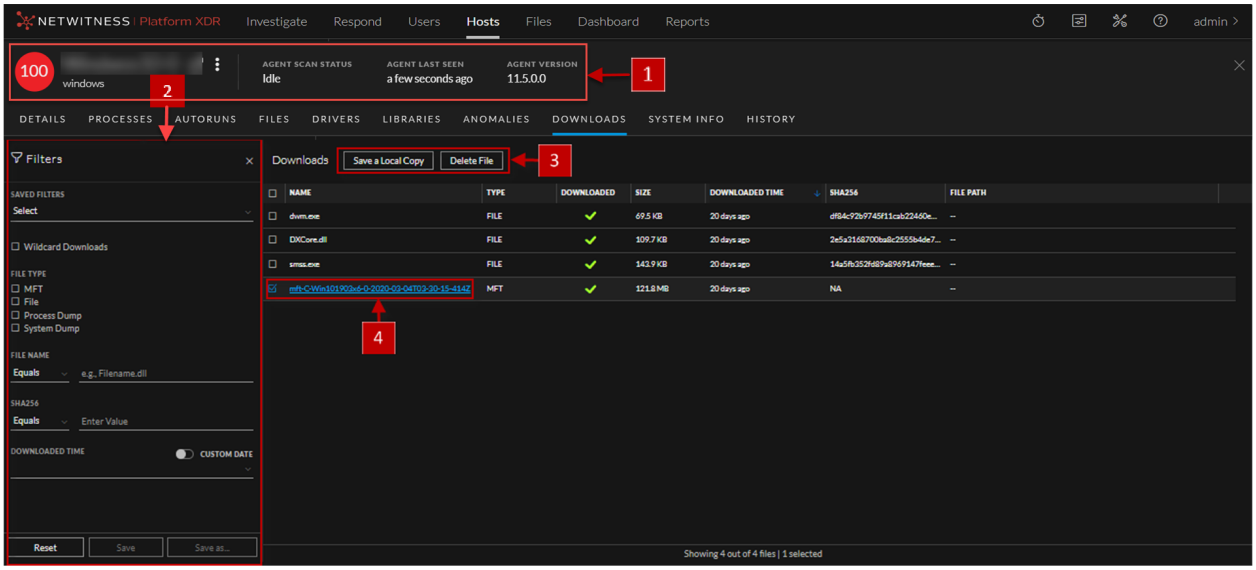
The Downloads tab provides information about all downloads (MFT, files, system dump, and process dump) performed on the host. To access this tab, select a host from the **Hosts** view and click the **Downloads** tab.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	review hosts with highest risk score	Analyze Hosts Using the Risk Score
Threat Hunter	analyze hosts	Investigating Hosts
Threat Hunter	perform adhoc scan	Scan Hosts
Threat Hunter	review host details	Analyze Host Details
Threat Hunter	search on snapshot	Search Files on Host
Threat Hunter	analyze processes	Investigating a Process
Threat Hunter	review reported anomalies	Analyze Anomalies
Threat Hunter	analyze risky users	Analyzing Risky Users
Threat Hunter	analyze events	Analyzing Events
Threat Hunter	download files for deeper analysis	Analyzing Downloaded Files
Threat Hunter	perform external lookups	Launch an External Lookup for a File
Threat Hunter	change file status or remediate	Changing File Status or Remediate
Threat Hunter	isolate host from network*	Isolating Hosts from Network
Threat Hunter	download MFT, download files, system dump, or process dump*	Performing Host Forensics

*You can perform this task in the current view.



Related Topics

- Focusing on Endpoint Analysis
- Investigating Hosts

- Performing Host Forensics
- Isolating Hosts from Network

Quick Look

Below is an example of the Downloads tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

More - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download files to the server. For more information, see Download Files Using Full Path or Wildcard.
- Download System Dump to the server. For more information, see System and Process Memory Dump.

2 **Filter Files**. You can filter downloaded files by selecting the options in the Filters panel and create filters. For more information, see Performing Host Forensics.

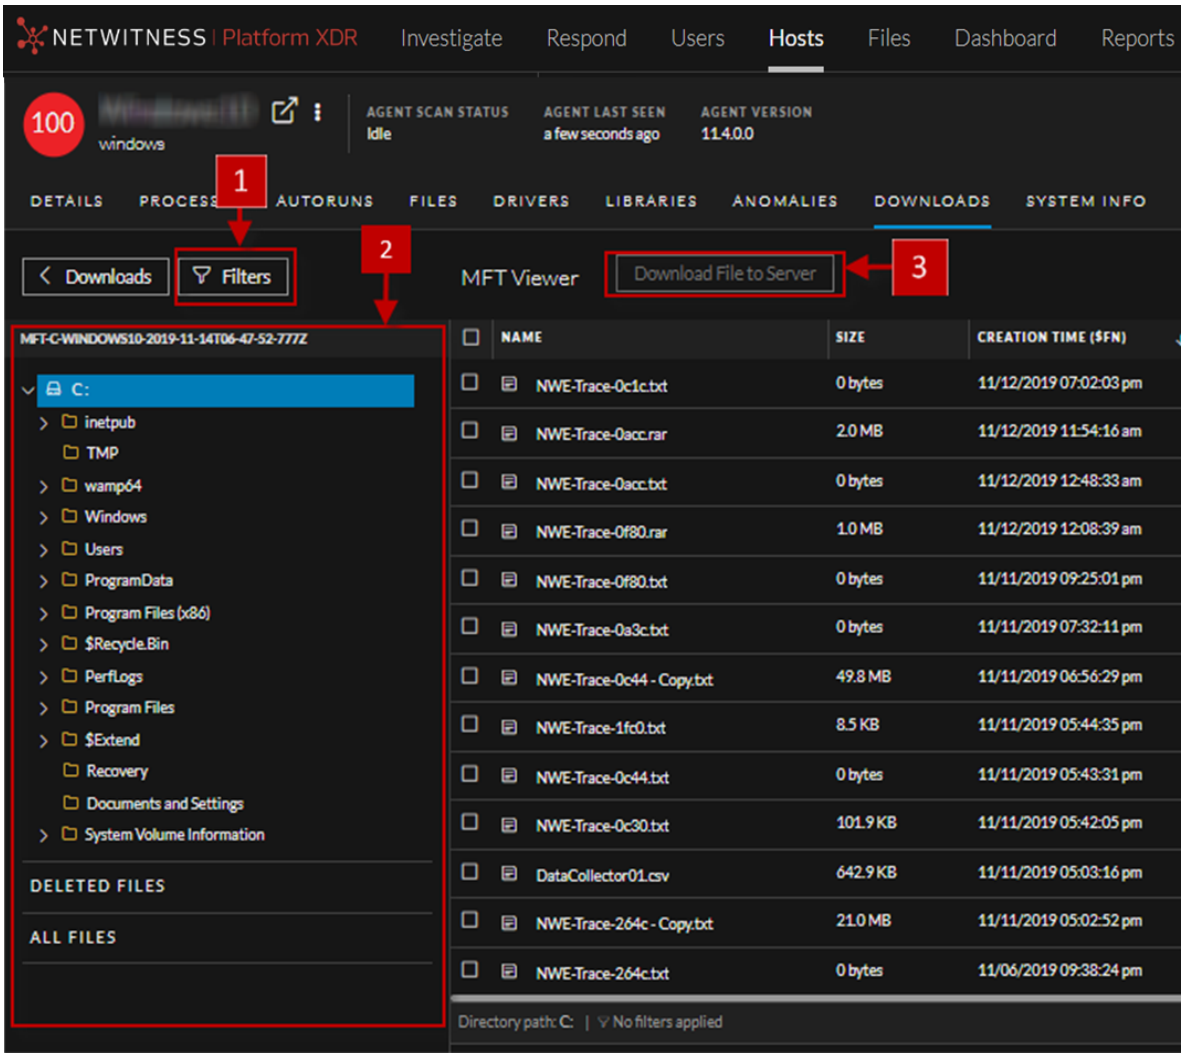
3 **Actions in the toolbar:**
Save a Local Copy - Lets you retrieve the downloaded MFT and save it to your local file system for further analysis.

Delete File - Deletes the downloaded MFT from the server.

For more information, see Performing Host Forensics.

4 **View MFT Details**. Click the filename to view the MFT details. For more information, see MFT Viewer.

The table displays the following information:



Column	Description
File Name	Name of the file that is downloaded. For example, `VGAuthService.exe`.
Type	Type of file downloaded - MFT, file, memory dump.

Column	Description
Downloaded	Status of the download:  - Download successful  - Processing the downloaded file  - Errors including download failed  - Errors downloading one or more files in the group.
Size	Size of the downloaded file.
Downloaded Time	Time when the MFT was downloaded.
SHA256	SHA256 of the file. **Note:** This is applicable only for files.

MFT Viewer

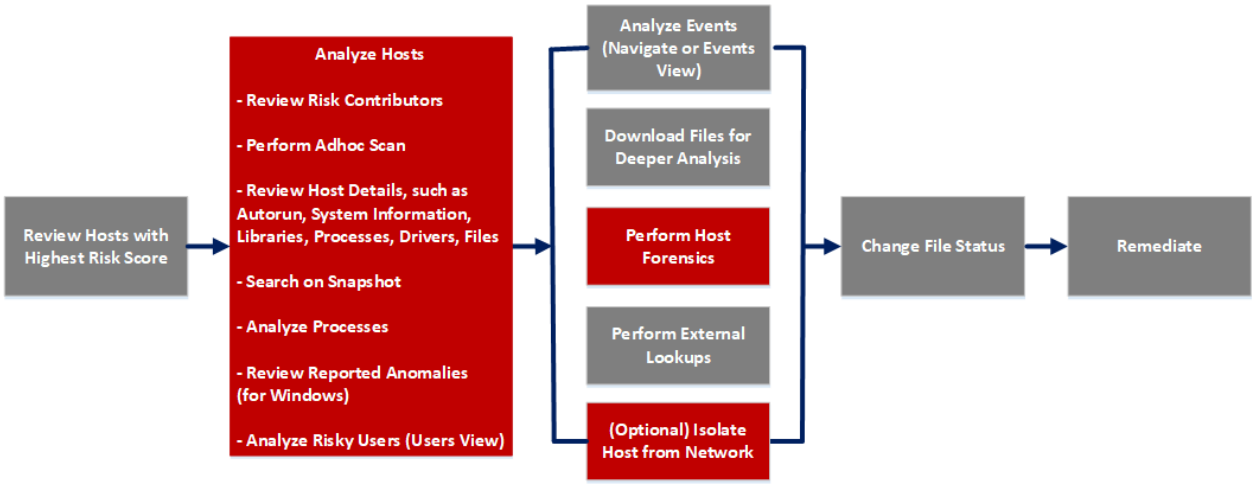
You can analyze the downloaded MFT using the MFT Viewer. For more information, see Analyze Downloaded MFT.

Below is an example of the MFT Viewer:

1. **Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. For more information, see Filter MFT.
2. **Folder Details**. Lets you view the content of the MFT.
3. **Download File to Server**. Downloads files to the server.

The table displays the following information:

Column	Description
Name	Name of the file. For example, `dtf.exe`.
Size	Size of the file.
Creation Time ($FN)	File Name ($FN) creation time.
Creation Time ($SI)	Standard Information ($SI) creation time.



Column	Description
Modification time ($FN)	$FN modified time.
Modification time ($SI)	$SI modified time.
Access time ($FN)	$FN access time.
Access time ($SI)	$SI access time.
Update time ($FN)	$FN updated time.
Update time ($SI)	$SI updated time.
Full Path	Path of the file.
Allocated Size	File size on the disk.
Archive	Indicates if a file is archived.
Compressed	Indicates if a file is compressed.
Encrypted	Indicates if a file is encrypted.
Hidden	Indicates if a file is hidden.
Directory	Indicates if it is a directory.
Extension	Type of the file. For example, exe, pdf, txt.

Hosts View - System Information Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The System Information tab lists the agent system information. To access this tab, select a host from the **Hosts** view and click the **System Information** tab.

Workflow

What do you want to do?

User Role	I want to ...	Show me how

Quick Look

Below is an example of the System Information tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

More - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.

Snapshot Time - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.

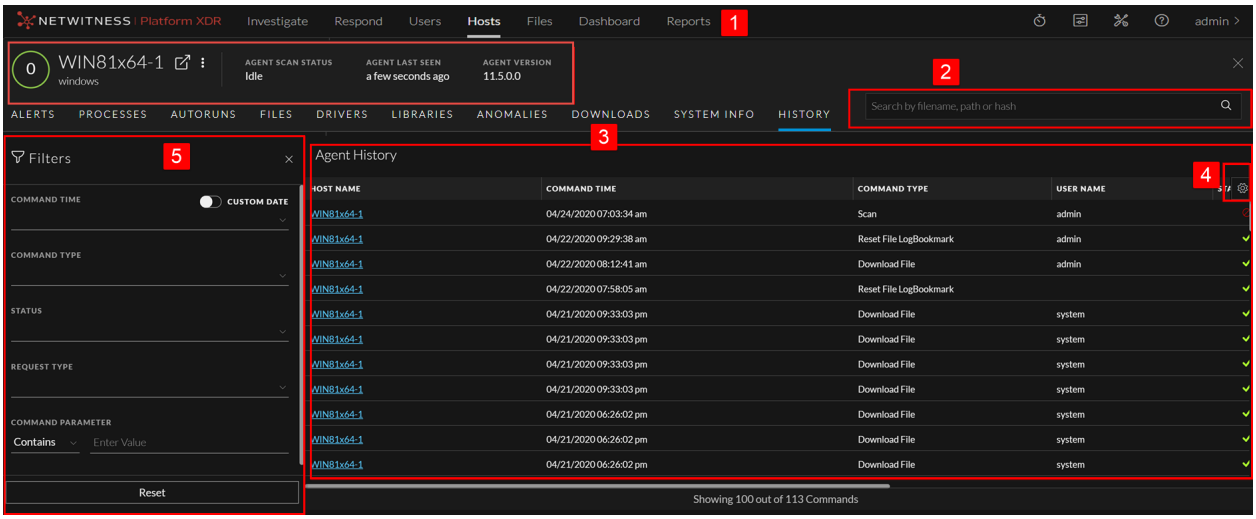
2 **Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.

3 **System Information Panel** - See System Information Panel.

System Information Panel

The System Information panel displays the following tabs:

Tabs	Description
Host File Entries	All network redirections written in the host file. For example, IP Address - `10.10.10.3` and DNS Name - `localhost,localhost.localdomain,localhost4,localhost4.localdomain4`
Network Shares	Network name of the shared resource (for Windows only). For example, Name - `Admin$`, Description - `Remote Admin`, Path - `C:\`, Permissions - `None`, Type - `disk, special`, Max Users - `4294967295`, Current Users - `0`.
Security Products	Installed security products (for Windows only). For example, Display Name - `Windows Defender`, Instance - `D68DDC3A-831F-4FAE-9E44-DA132C1ACF46`, Features - `Enabled`, Type - `antiVirus`.



Tabs	Description
Windows Patches	List of patches applied by Windows update (for Windows only). For example, `KB2959936`.
Security Configuration	Security configuration details on the host. For example, firewall disabled or enabled, smart screen filter disabled or enabled. This field is only applicable for Windows and Mac.

Hosts View - Agent History Tab

The Agent History tab lists the commands along with the respective status and additional details.

Quick Look

Below is an example of the Agent History tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

More - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.

2 **Search files on host**. Lets you search the files on the host (file name, file path, and SHA-256 checksum).

3 **Details Panel**- Displays information, such as:

- **Command Time** - Command issued time.
- **Command Type** - Type of the command (Identity, scan, stop scan, download file, MFT, process dump, system dump, start isolation, update isolation exclusion list, stop isolation, reset file logbookmark, and download multiple files, agent upgrade, and uninstall agent) issued.
- **User Name** - User who issued the command. For example, Analyst, System.
- **Status** - Status (success, pending, expired, failed, or cancelled) of the command issued.

Note: If the command's status is expired, it means that the agent is unable to process the command even after five retries.

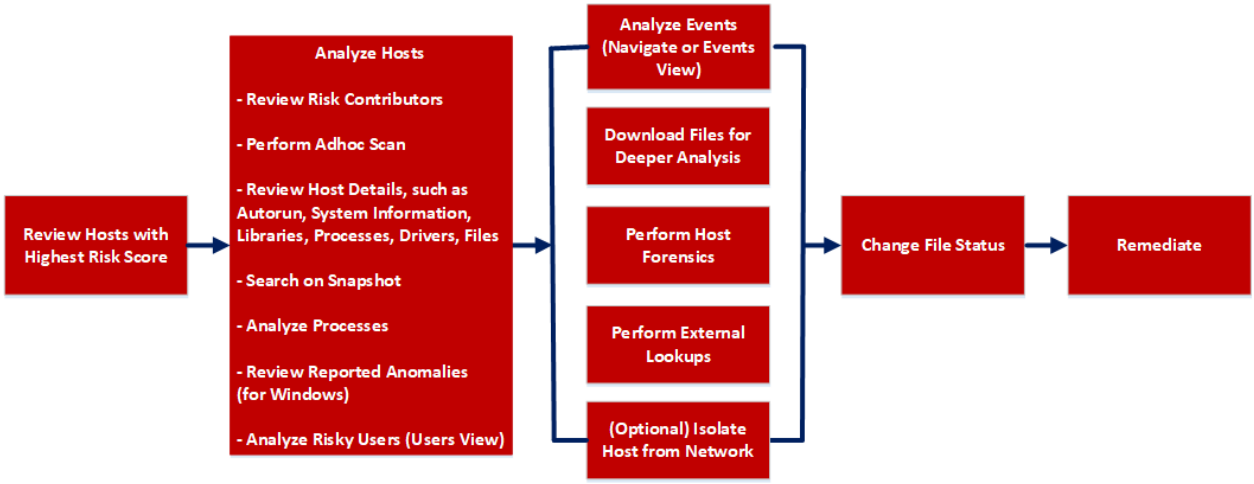
- **Command Parameter** - Parameters associated with the command. For example, Command parameter for command type Download File is `path = C:\Windows\System32\ | filename = cmd.exe | hash = 6f88fb88ffb0f1d5465c2826e5b4f523598b1b8378377c8378ffebc171bad18b`

Note: Command types such as identity, scan, stop scan, stop isolation, system dump do not contain any associated command parameters.

- **Processed Time** - Time at which the command is completed, pending, expired, failed, or cancelled.
- **Last Retrieval time** - Last time when the command is issued to the agent.
- **Total Retrieval** - The number of times the command is issued to the agent.

Note: After you upgrade to NetWitness version 11.5, the commands executed in the previous versions are displayed automatically. The fields such as last retrieval time, total retrieval, and user do not contain any values. For system generated commands, the user field value shows as system.

4 **Filter Files**. You can filter commands by selecting the options in the Filters panel. For more information, see Filter Host Details.



5 **Settings Menu.** You can set History view preferences by selecting columns from the Settings menu.

Hosts View - YARA Rules Tab

Note: The information in this topic applies to NetWitness Version 12.0 and later.

The **YARA Rules** tab lists the various YARA rules used for the scan and their status. To access this tab, select a host from the **Hosts** view and click the **YARA Rules** tab.

Workflow

Getting Started with ESA

This topic covers quick start topics for NetWitness Event Stream Analysis (ESA) to help you get started in using ESA. The following topics are designed to assist you in working with ESA Correlation Rules.

- Best Practices helps you to understand how to best set up, deploy, and create rules.
- Troubleshoot ESA helps you to troubleshoot different aspects of ESA, including rule writing and deployment.
- View Memory Metrics for Rules helps you to work with memory metrics to understand memory usage for ESA services.

In NetWitness version 11.5 and later, There are only two services that can run on an ESA host:

- **ESA Correlation (ESA Correlation rules):** Creates alerts from ESA rules.
- **Contexthub Server (Context Hub):** Runs only on an ESA primary host. Contexthub Server provides enrichment lookup capability in the Respond and Investigate views. For information, see the *Context Hub Configuration Guide*.

Note: The Event Stream Analytics Server (ESA Analytics) service is not supported in NetWitness Platform version 11.5 and later.

The first service is the ESA Correlation service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live.

In NetWitness 11.3 and later, the ESA Correlation service replaces the Event Stream Analysis service and is also known as ESA Correlation Server. The ESA Correlation service provides the same services as the Event Stream Analysis service with the added benefit of enabling you to specify different data sources for your ESA correlation rules. Like the Event Stream Analysis service, the ESA Correlation service installs on the ESA Primary and ESA Secondary host types.

The second service is the Contexthub Server service, which provides enrichment lookup capabilities in the Respond and Investigate views. It runs only on an ESA Primary host. For information, see the *Context Hub Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

IMPORTANT: The NetWitness server (Admin server), ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

How ESA Generates Alerts

The ESA Correlation service runs rules that specify criteria for problem behavior or threatening events in your network. When ESA detects a threat that matches rule criteria, it generates an alert.

To generate alerts, ESA performs the following functions:

1. Gathers data
2. Runs ESA rules against the data
3. Captures events that meet rule criteria
4. Generates alerts for those captured events

Data Source Configuration Changes

In NetWitness version 11.3 and later, the ESA Correlation service enables you to specify different data sources for different sets of rules. Instead of adding data sources, such as Concentrators, to the entire ESA Correlation service, you can specify different data sources for each ESA rule deployment. An ESA rule deployment includes an ESA Correlation service with its associated data sources and a set of ESA rules. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment. For more detailed information, see Deploy Rules to Run on ESA.

An Endpoint Risk Scoring Rules Bundle is available in NetWitness Platform

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

The ESA Correlation service can process endpoint risk scoring rules, which generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Best Practices

Best practices provide guidelines to help you write and manage rules, deploy rules, and maintain system health for your ESA services.

Understand Event Stream Analysis Rule Types

The ESA Correlation service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators. However, when working with Event Stream Analysis, you should be aware of the factors that affect resource usage in order to create effective rules.

Each event that is received by ESA is evaluated to determine if it may trigger a rule. There are three types of rules that can be deployed in order to determine what the ESA engine should do with the incoming event. Each of these rule types have different impacts on system resource utilization. All three rule types may be created via the Rule Builder, Advanced Event Processing Language (EPL) rules, or downloaded via RSA Live. The table below lists the rule type and the impact this rule may have on system resources.

Rule Type	Description
Simple Filter Rule	This rule has no correlation to other events. At ingestion time, this rule is evaluated against a set of conditions, and if those conditions are met an alert is generated. If no conditions match, the event is quickly released by the engine to free up memory usage. These rules do not take up memory since the events are not retained beyond the initial evaluation. The memory resource usage does not increase as more simple filter rules are deployed. However, if the filter condition is too generic, it is possible that this rule can generate too many alerts, which will strain the system resources for the storage and retrieval of these alerts. For example, you might write a rule to generate an alert when HTTP network activity arrives over a non-standard HTTP port.
