Contact Information

NetWitness Community at https://community.netwitness.com contains a knowledge base that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

Trademarks

RSA and other trademarks are trademarks of RSA Security LLC or its affiliates ("RSA"). For a list of RSA trademarks, go to https://www.rsa.com/en-us/company/rsa-trademarks. Other trademarks are trademarks of their respective owners.

License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability.

This software is subject to change without notice and should not be construed as a commitment by RSA.

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

RSA believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

THE INFORMATION IN THIS PUBLICATION IS PROVIDED "AS IS." RSA MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WITH RESPECT TO THE INFORMATION IN THIS PUBLICATION, AND SPECIFICALLY DISCLAIMS IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

Miscellaneous

This product, this software, the associated documentations as well as the contents are subject to NetWitness' standard Terms and Conditions in effect as of the issuance date of this documentation and which can be found at https://www.netwitness.com/standard-form-agreements/.

What's New in 12.3.1.0 Release

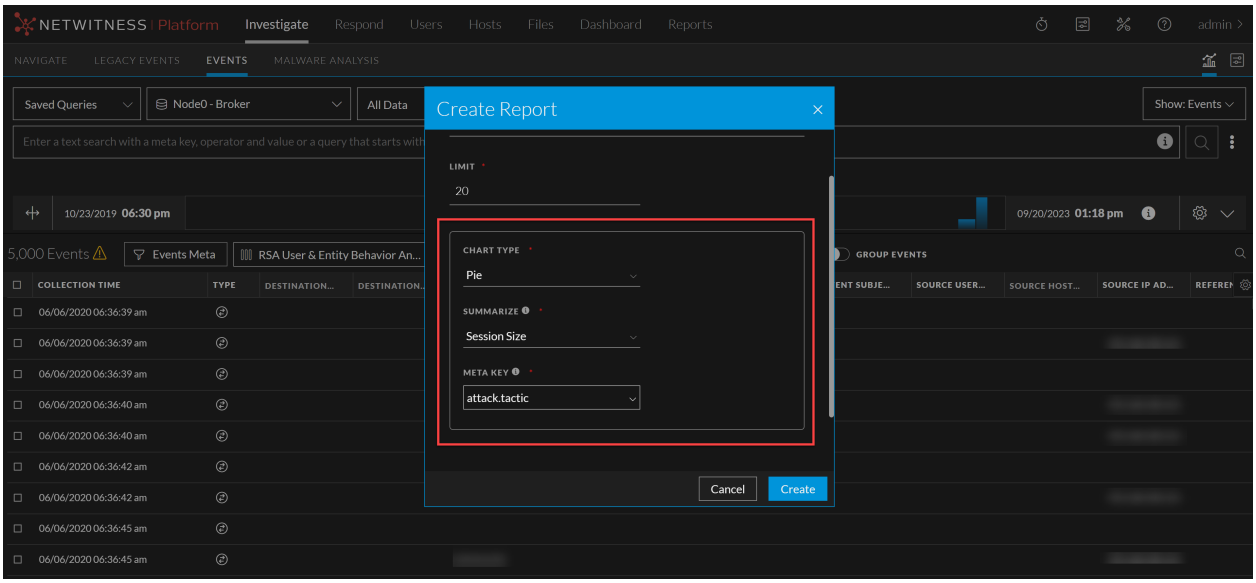
The NetWitness 12.3.1.0 Release Notes describe new features, enhancements, security fixes, upgrade paths, fixed issues, known issues, end-of-life functionality, build numbers, and self-help resources.

Enhancements

The following sections are a complete list and description of enhancements to specific components:

- Investigate
- Respond
- Insight
- User and Entity Behavior Analytics
- Endpoint
- Policy-based Centralized Content Management (CCM)
- Concentrator, Decoder, and Log Collector Services
- Log Integrations
- Upgrade
- Security
- User Interface

To locate the documents that are referred to in this section, see https://community.netwitness.com/t5/netwitness-platform-online/netwitness-platform-all-documents/ta-p/676246.

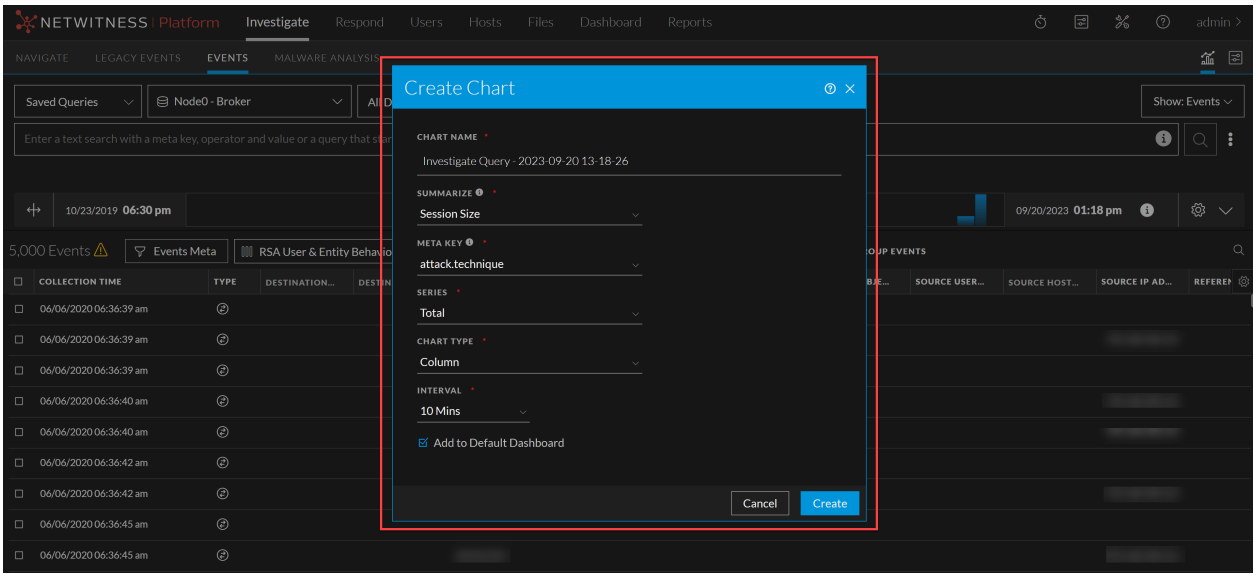


The Product Documentation section has links to the documentation for this release.

Investigate

The following section describes the new enhancements for the Investigate component:

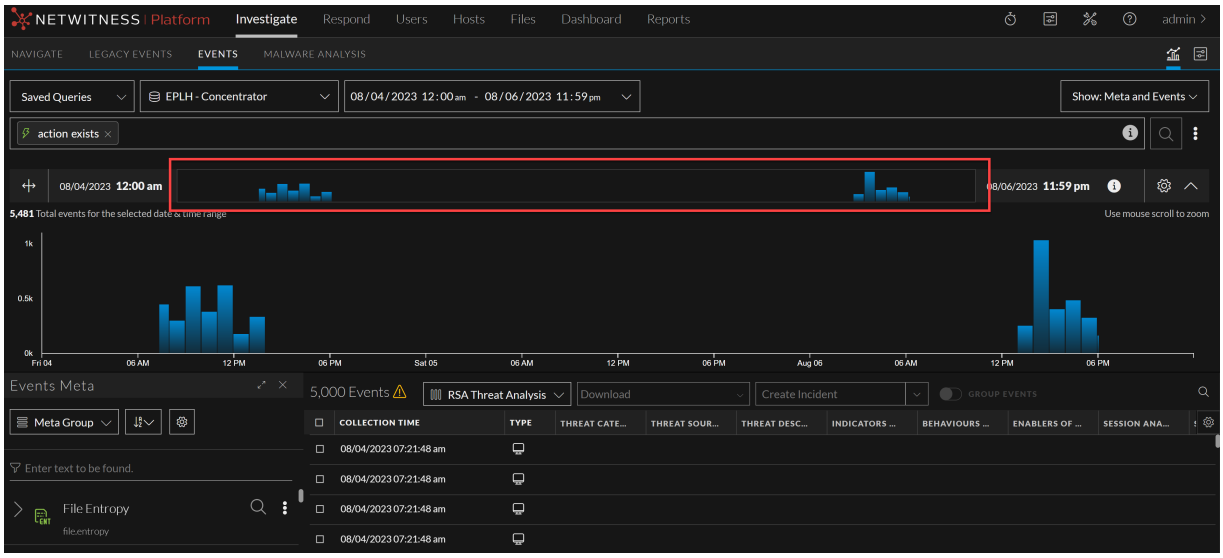
Generate Charts from Events View



Administrators and analysts can now generate Adhoc and Schedule charts from the **Investigate** > **Events** page. With this enhancement, administrators and analysts can create various types of charts based on **Event Count**, **Session Size**, **Packet Count**, and **Meta Key**. These charts offer a more in-depth understanding of events and make it easier for analysts to investigate efficiently. Additionally, analysts can share these visualizations with others in various formats like PDF and CSV files, facilitating seamless collaboration and communication.

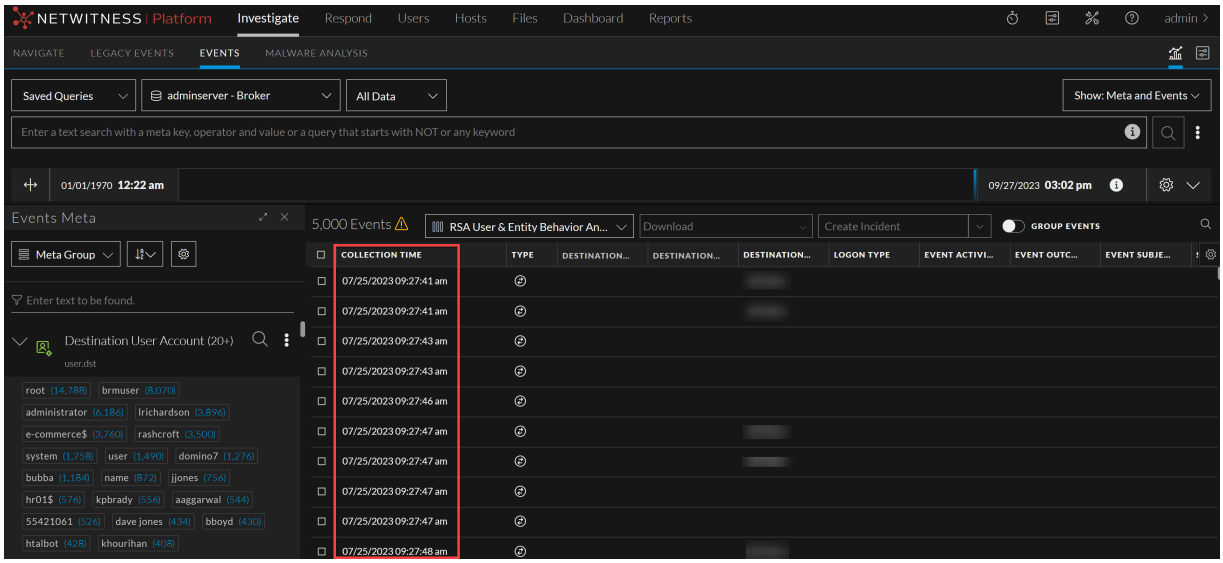
For more information, see **Generate Reports from Events View** topic in the *NetWitness Investigate User Guide*.

Create Real-time Charts from Events View



Administrators and analysts can now create real-time charts based on data from the **Investigate** > **Events** page. This feature provides a dynamic way to visualize your data and gain valuable insights as the data is continuously updated based on the configured time interval. This feature enables administrators and analysts to create a variety of chart types based on **Event Count**, **Session Size**, **Packet Count**, and **Meta Key**. It provides an all-in-one solution for tracking trends for analysts. Additionally, analysts can add these real-time charts to their **Default Dashboard**, allowing them to track critical data seamlessly within the organization.

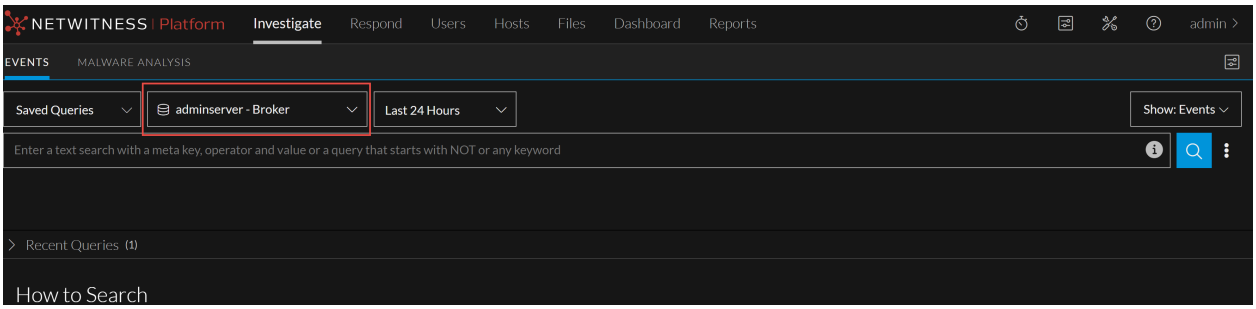
For more information, see **Generate Reports from Events View** topic in the *NetWitness Investigate User Guide*.



Events View UI Improvements

- The **Events** small timeline view has been improved with the addition of a border, making it easier for analysts to differentiate between the small and large timelines. This enhancement eliminates any confusion when using the zoom feature on the timeline and provides a clear view of the presented data.

For more information, see **Timeline** topic in the *NetWitness Investigate User Guide*.



- When viewing session reconstructions in the **Events** view, the left click function is disabled for the time and event time in the **Collection Time** column of the events table to prevent accidental alterations, resulting in a smoother and more efficient workflow.

Load Service Hierarchy Faster on Events View

The **Investigate** > **Events** page may take longer than expected to load if the list of services to load has Core hosts that are switched off adversely. In such scenarios, NetWitness Platform users can customize the hierarchy-call-time-out parameter in the **Admin** > **Services** > **Investigate Server** > **Explore** view. This customization will allow the Services to load quickly before the request is timed out. The default value is 5 seconds.

Note: The duration it takes for NetWitness Platform to load Services is the result of the total time it takes to communicate with all services present in a deployment. This load time may vary due to several factors, such as inaccessible services, stale connections, or incorrect host connection status in the cache due to a host being improperly switched off

For more information, see **Edit Service Hierarchy Timeout Settings** topic in the *Hosts and Services Getting Started Guide*.

For information on the recommended procedures for shutting down hosts, please see Delay in Loading NetWitness Investigate > Events Page in NetWitness 11.7 and later.

Respond

The following sections describes the new enhancements for the Respond component:

Support for Custom Aggregation Rule Schema Configuration

A new `custom_aggregation_rule_schema.json` file is created in this release. This feature allows administrators to manage all the custom meta fields without modifying the Out-of-the-Box (OOTB) configuration. It enables administrators to add, edit, and delete alert fields to the requirements. It also ensures a seamless upgrade experience.

To simplify customization and avoid modifying the default configuration, administrators can use the `custom_aggregation_rule_schema.json` file for smoother management and the migration a seamless transition. Importing incident rules is also more convenient, and backward compatibility is maintained automatically.

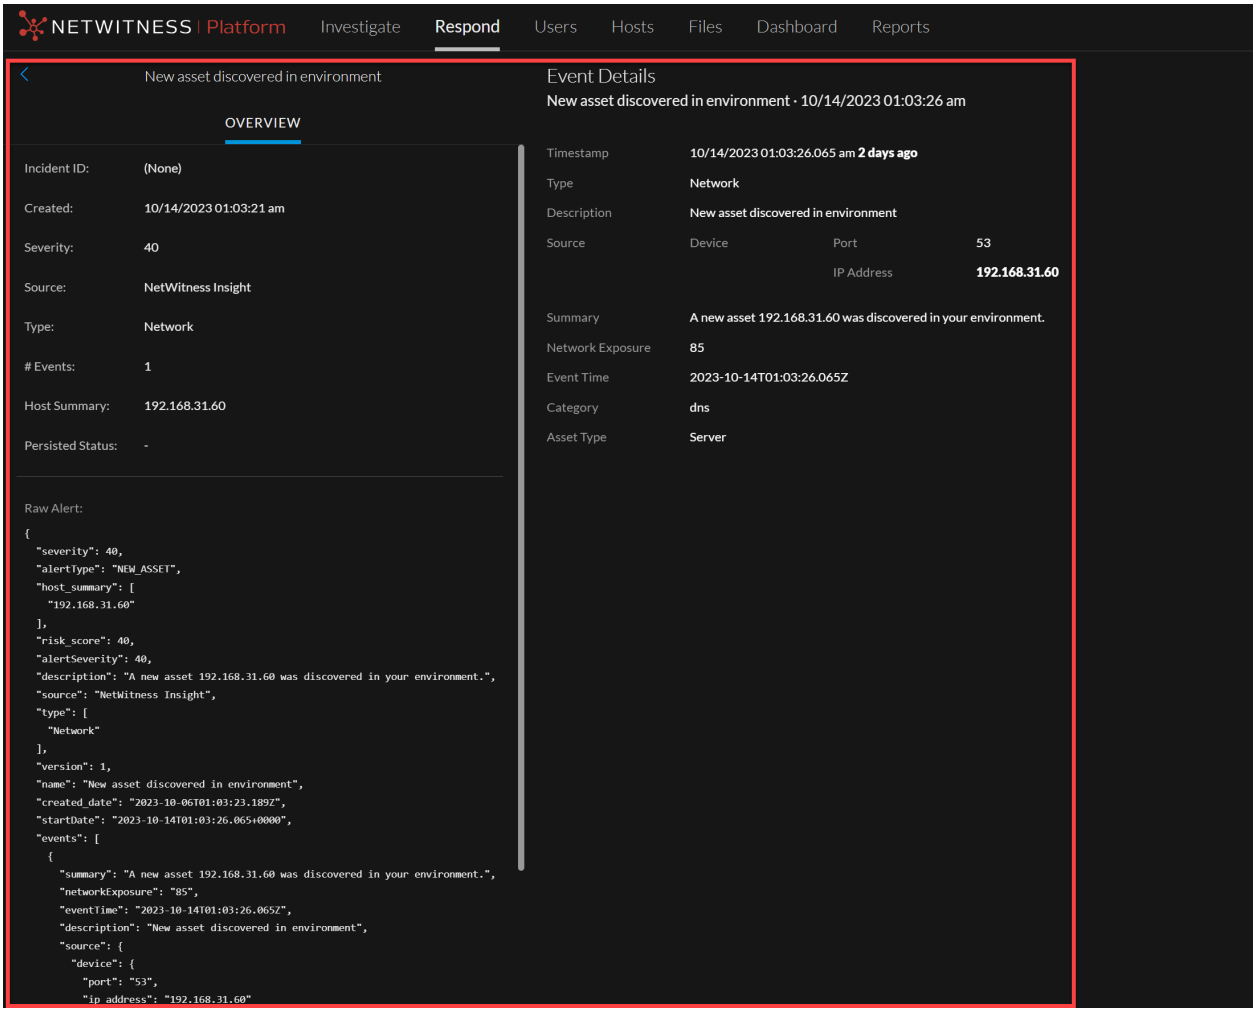
For more information, see **Configuring NetWitness Respond** topic in the *NetWitness Respond Configuration Guide*.

Enhanced Source Display in NetWitness Respond

Enhanced NetWitness Respond to list available services based on NetWitness orchestrated services. This can avoid confusion caused by outdated or nonexistent services and ensure that users only see the relevant services.

If a service is removed, it will be marked as decommissioned in the UI instead of immediately being removed from the source list. This approach prevents disruptions in source availability for ongoing activities while creating visibility into service's status.

For more information, see **Reviewing Alerts** topic in the *NetWitness Respond User Guide*.

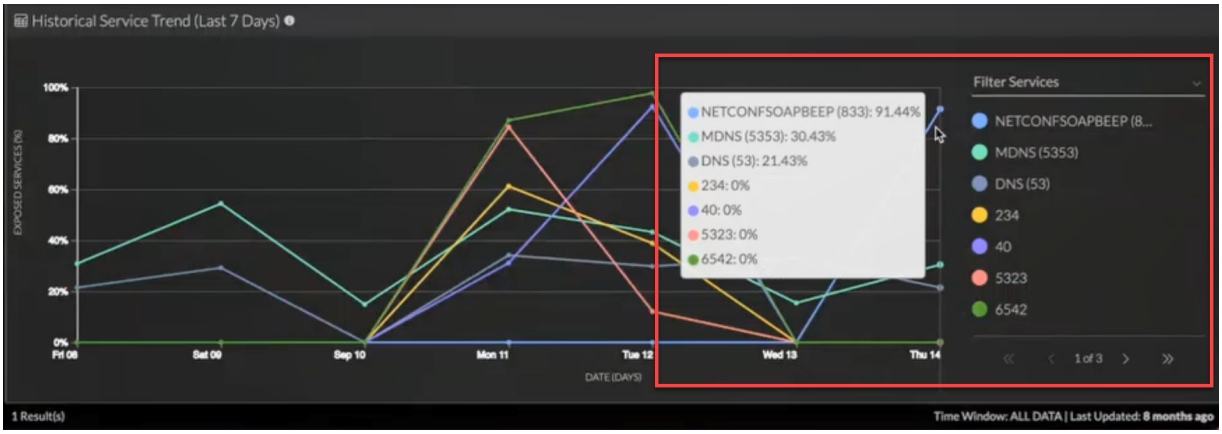


Insight

The following section describes the new enhancements for the NetWitness Insight:

Detect New Assets in Insight (BETA)

NetWitness Insight introduces a new alert named **New asset discovered in environment**. This alert is generated on the **Respond** > **Alerts** page whenever a new asset **Server** type is detected in the environment for the first time or if an existing asset has not been observed by NetWitness Insight for the last 30 days. This alert is generated for assets identified as server by NetWitness Insight. This feature enhances visibility and provides analysts with an improved understanding of the assets present in the environment, enabling them to better protect them from any potential attacks.



This feature is currently available in BETA mode and is disabled by default. Please contact NetWitness Customer Support team to enable the feature.

Historical Service Trend Chart Improvements

The following improvements are made to Historical Service Trend chart in 12.3.1.0 version:

- Added a new Service filter feature that allows you to filter services using a searchable drop-down menu. Analysts can now filter services by multiple values simultaneously, making it easier to compare services and discover insights.
- Improved pagination functionality now allows analysts to navigate between the first and last pages seamlessly.
- Services in the chart legend are sorted from highest to lowest enterprise traffic using the latest date data. When services have the same percentage value, they are sorted alphabetically.

For more information, see the **NetWitness Insight** section in the *NetWitness Documentation Portal*.

Email Notification on Exceeding Daily License Usage

NetWitness Insight customers exceeding the daily license usage limit three or more times within the last 14 days will receive an email notification.

User and Entity Behavior Analytics

The following section describes the new enhancements for UEBA component:

Support for Citrix NetScaler and Palo Alto Networks VPN Devices

NetWitness UEBA has added support for the Citrix NetScaler and Palo Alto Networks VPN devices. With this enhancement, UEBA can now process Citrix NetScaler and Palo Alto Networks VPN logs, which helps you gather and analyze user activity information.

For more information, see the **UEBA Supported Sources by Schema** section in the *UEBA Configuration Guide*.

UEBA Performance Improvements

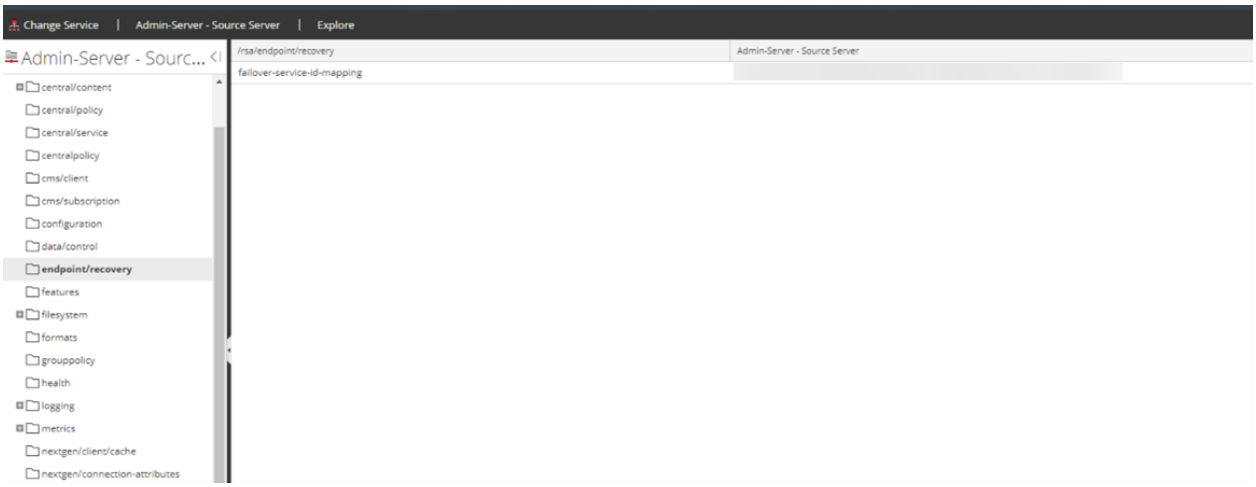
- Optimized the database for inserting and querying data, resulting in faster query response times.
- The modeling process for network data has been improved by excluding randomized JA3 entities, resulting in improvements in the overall performance.
- Optimized the modeling process to generate and update multiple models in parallel.
- Airflow retention DAGs processing times have been reduced due to faster cleanup of outdated data.

For more information on the supported scale, see the **Learning Period Per Scale for 12.3 and 12.3.1** topic in the *UEBA Configuration Guide*.

Endpoint

The following section describes the new enhancements for Endpoint component:

Supported Operating System Enhancements



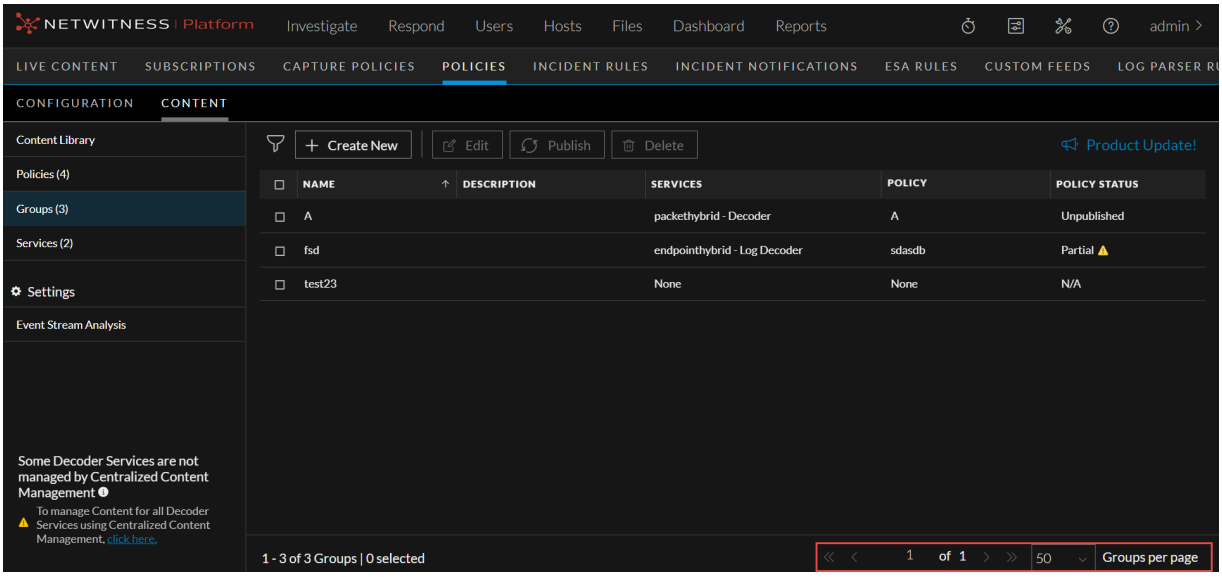
Administrators have the option to deploy Endpoint agents on the following versions of Linux and Mac Operating System:

- **Red Hat Enterprise Linux 9.x**
- **Alma Linux 9.0**
- **Oracle Linux 8.8**
- **SUSE Linux Enterprise Server 12 SP1** and **15 SP4**
- **macOS Sonoma (14)**

For more information, see **Introduction to Endpoint Agent Installation** topic in the *NetWitness Endpoint Agent Installation Guide*.

Source Server Explore View Enhancements

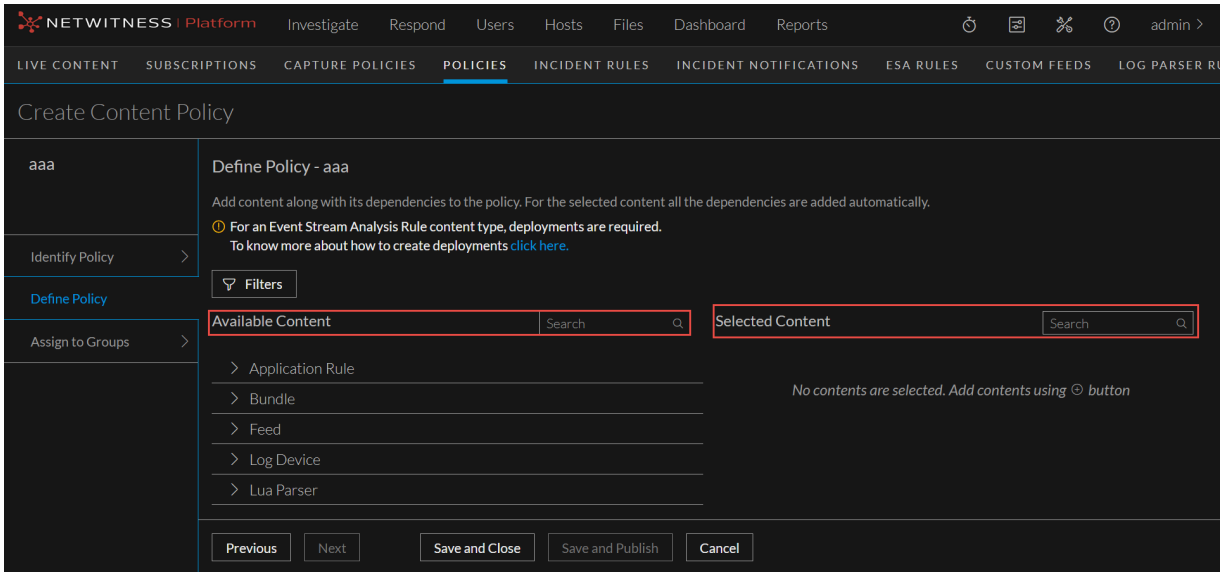
The Source server **Explore** view (**Admin** > **Services** > **View** > **Explore**) is enhanced with **endpoint/recovery** configuration option to help administrators configure Endpoint recovery in case of any disaster.



For more information, see **High Availability (Endpoint Recovery)** topic in the NetWitness Endpoint User Guide.

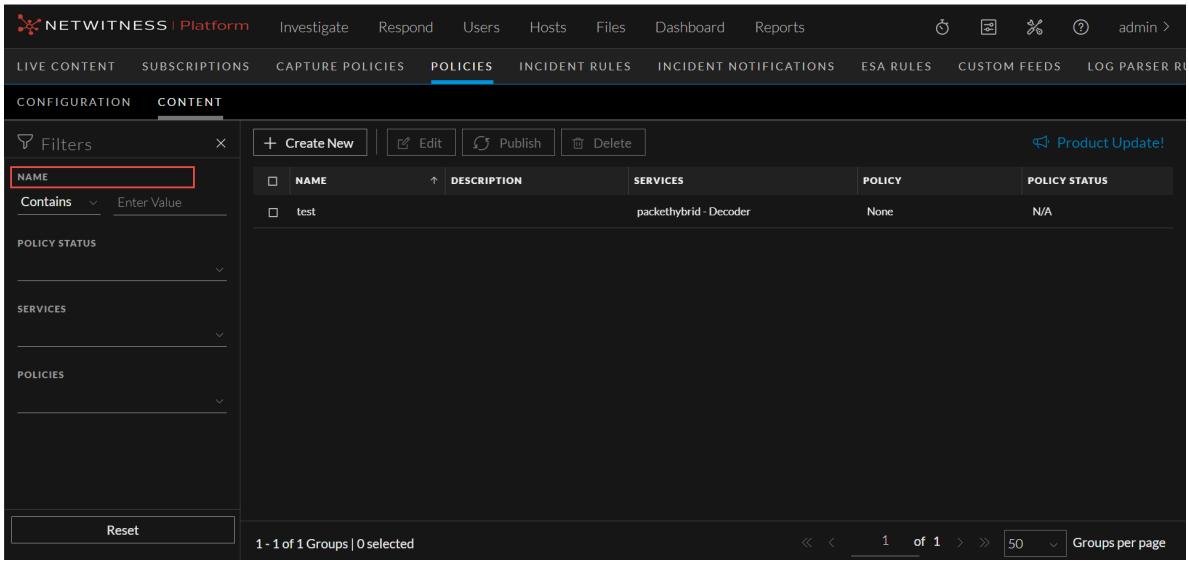
Policy-based Centralized Content Management (CCM)

The following enhancements are made to Policy-based Centralized Content Management in 12.3.1.0 version:



- Pagination is added in the **Content Library**, **Groups Listing** and **Policy Listing** pages which enables you to navigate through the list. By default, 50 rows are displayed per page. However, NetWitness allows you to modify the number of rows displayed per page.

  For more information, see the **View a Group**, **View Application Rule Details** and **View a Policy** topics in the *Policy-based Centralized Content Management Guide*.



- Administrators can directly update any content, that are part of Policies, in the Content Library. The changes will be reflected in the Services once the Policy is republished.

- The search experience for selected content during Policy creation is improved. A **Search** box is added under the **Selected Content** in the **Define Policy** screen. You can search the selected content by typing the initial content text in the **Search** box.

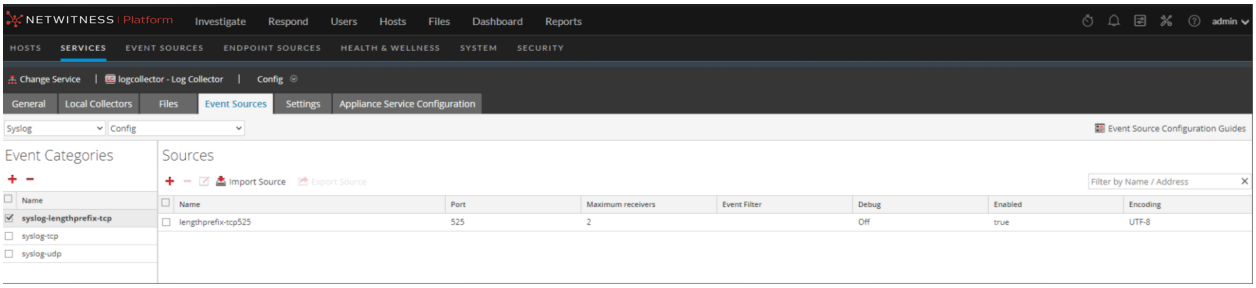
For more information, see the **Create and Publish Policies** topic in the *Policy-based Centralized Content Management Guide*.

- UI Improvements:
  - In the **Filters** panel of **Policy Listing**, **Groups Listing** and **Services Listing** pages, the respective parameters 'Policy Name', 'Group Name' and 'Service Name' is changed to 'Name'.

For more information, see the **View a Policy**, **View a Group** and **View a Service** topics in the *Policy-based Centralized Content Management Guide*.

Concentrator, Decoder, and Log Collector Services

The following section describes the new enhancements for the Decoder and Log Collector components:



HTTP2 Improvements

Created additional meta keys for more visibility. Also enhanced this feature to avoid any duplicate metas generated for **HTTP2** sessions.

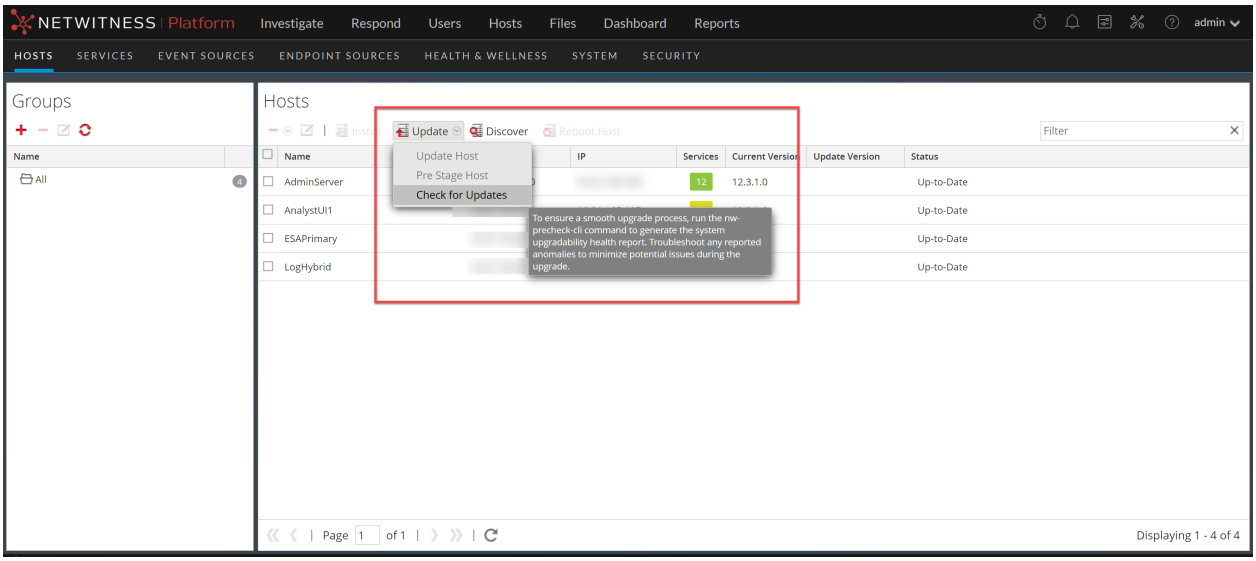
For more information, see **Visibility into HTTP/2 Sessions** topic in the NetWitness Decoder Configuration Guide.

Support for Syslog Length Prefixed Logs

Introduced a new event category called **syslog-length-prefix** under the **Syslog Collection** in the Log Collector to provide support for syslog length prefixed logs during syslog collection.

For more information, see **Configure Syslog Event Sources** topic in the Log Collection Guide.

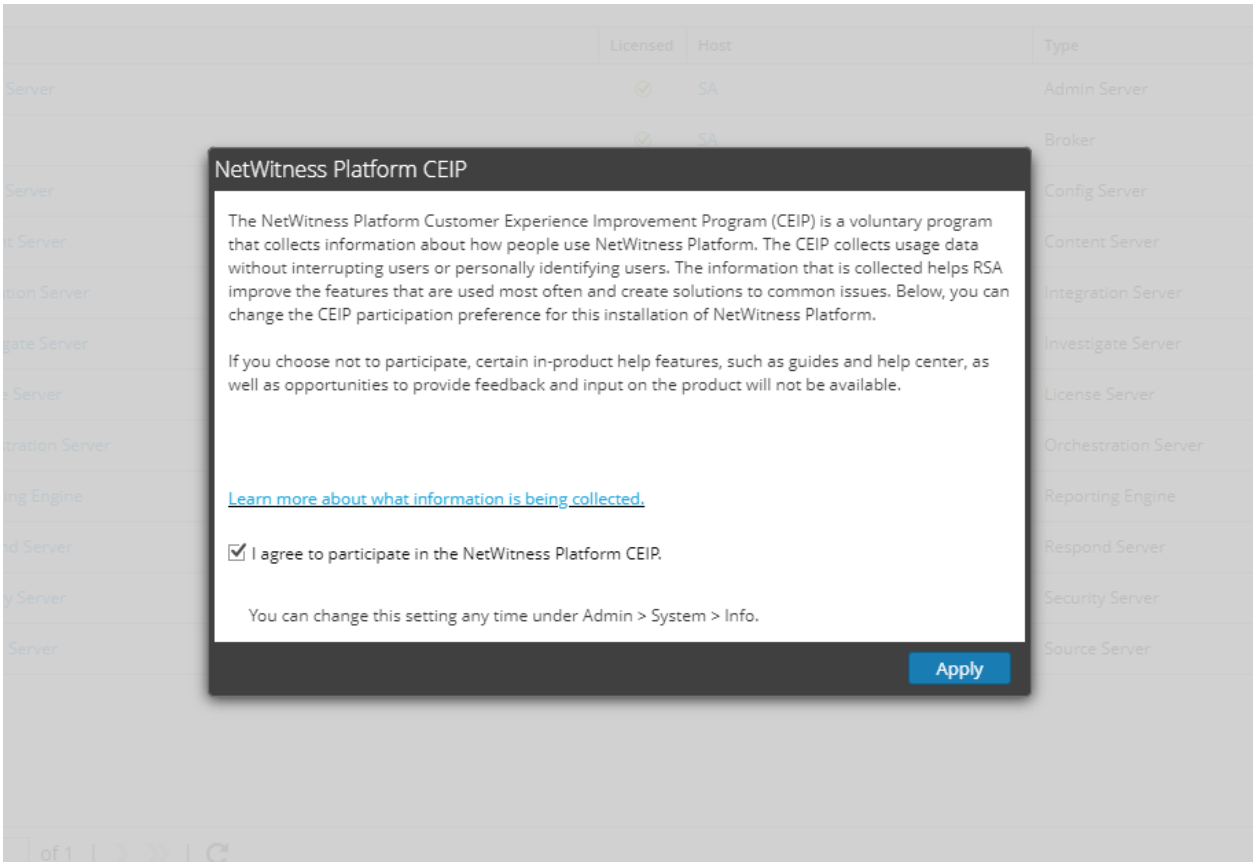
Log Integrations



NetWitness Platform supports the integration of the following event sources to collect and parse logs. Unless specified, these services are supported on NetWitness Platform 11.7.0.0 or later.

- Google Cloud Platform (Support for VPC Flow Logs, Google Kubernetes Engine (GKE) Logs, Cloud Storage Logs, and Audit Logs)
- Kaspersky Anti-Virus (Support to export events in CEF format)
- Microsoft Exchange Server (Support for MS Exchange Server 2019)
- Universal REST API (Support for Sailpoint IIQ)
- Radware DDOS
- S3 Universal Connector (Support for Amazon CloudFront).

For more information on integrating the parser services, see NetWitness Platform Integrations Guide.



Upgrade

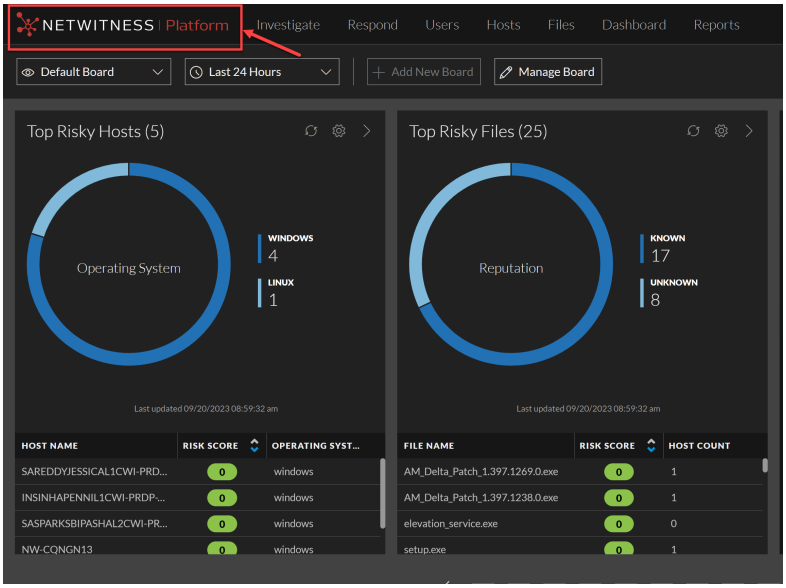
Administrators can now run the *nw-precheck-cli* command on the **Hosts** page to generate the system upgradability health report. The report helps administrators to troubleshoot any anomalies and minimize upgrade failures. The tool-tip message appears when you hover over the **Update Host** and **Check for Update** drop-down menu.

Customer Experience Improvement Program (CEIP)

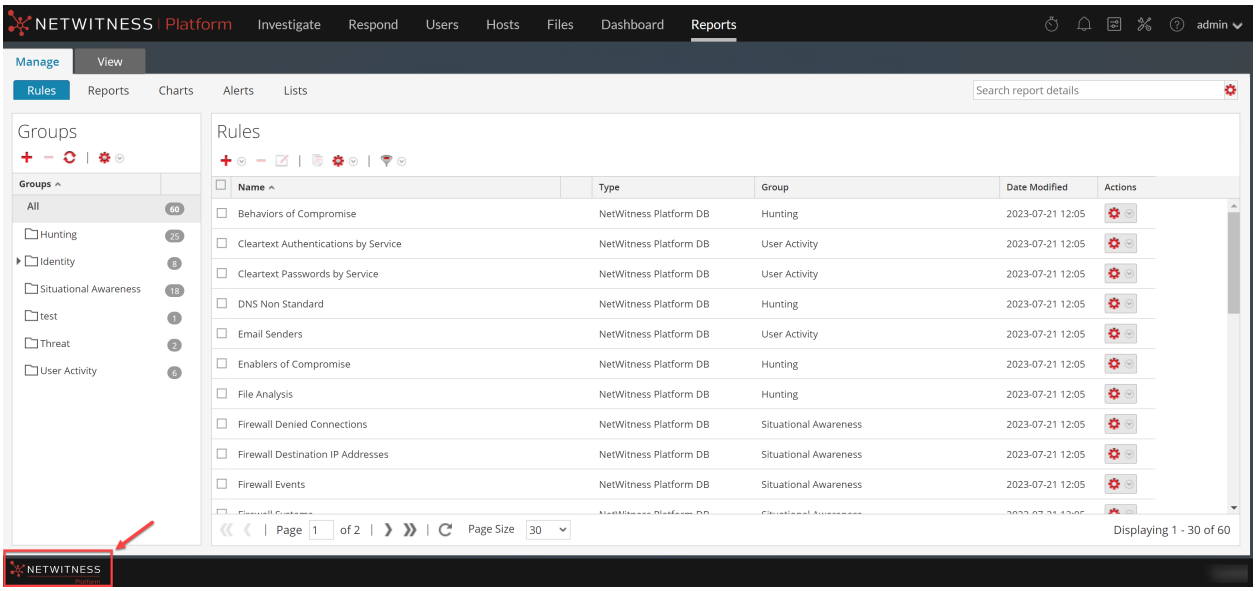
NetWitness now displays a NetWitness Platform CEIP dialog to all users (with *Manage Live Setting* and *config-server manage configuration* permissions) who previously have not enabled the CEIP program and upgrading to a major or minor platform version. For example, in NetWitness Platform version 12.3.1.0, the major version is represented by 12 while the minor version is represented by 3.

For more information, see "**Configure the Customer Experience Improvement Program**" in the System Configuration Guide.

Security



To further improve security, all NetWitness services and scripts will utilize trusted certificate-based authentication or deploy admin password for the RabbitMQ account. Additionally, the guest user account password is set to random value to restrict full Administrator Access to only authorized users on the host.



User Interface

The following section describes the new enhancements for the NetWitness user interface:

NetWitness Product Name Change

NetWitness shortened the product name to "NetWitness Platform". This change aims to streamline and align our branding with our overall product strategy.

Security Fixes

For more information on Security Fixes, see https://community.netwitness.com/t5/netwitness-platform-advisories/ct-p/netwitness-advisories#security.

Upgrade Paths

The following upgrade paths are supported for NetWitness 12.3.1.0

- NetWitness 12.3.0.0 to 12.3.1.0
- NetWitness 12.2.0.1 to 12.3.1.0
- NetWitness 12.2.0.0 to 12.3.1.0
- NetWitness 12.1.1.0 to 12.3.1.0
- NetWitness 12.1.0.1 to 12.3.1.0
- NetWitness 12.1.0.0 to 12.3.1.0
- NetWitness 12.0.0.0 to 12.3.1.0
- NetWitness 11.7.3.0 to 12.3.1.0
- NetWitness 11.7.2.0 to 12.3.1.0
- NetWitness 11.7.1.2 to 12.3.1.0
- NetWitness 11.7.1.1 to 12.3.1.0
- NetWitness 11.7.1.0 to 12.3.1.0

- NetWitness 11.7.0.2 to 12.3.1.0
- NetWitness 11.7.0.1 to 12.3.1.0
- NetWitness 11.7.0.0 to 12.3.1.0

For more information on upgrading to 12.3.1.0, see Upgrade Guide for NetWitness 12.3.1.0

Warning: Before upgrading the UEBA host to 12.3.1.0, you must perform the backup of your Elasticsearch data such as Users, Entities, Alerts, and Indicators to retain them post upgrade. For more information, see NetWitness UEBA Configuration Guide *for 12.3.1.0*.

Product Version Life Cycle for NetWitness Platform

See for Product Version Life Cycle for NetWitness Platform a list of versions that reach End of Primary Support (EOPS).

What's New in Previous Releases (11.7 to 12.3.0.0)

The section provides new features and enhancements for all supported previous releases.

For more information, see https://community.netwitness.com/t5/netwitness-platform-online/what-s-new-in-previous-releases-11-7-to-12-1-1/ta-p/695650.

Fixed Issues in 12.3.1.0 Release

This section lists issues fixed in 12.3.1.0 version.

Reporting Engine Fixes

Tracking Number	Description
ASOC-134996	A generic error message is displayed on the **Investigate** > **Events** page when creating or scheduling a report using an existing report name.
ASOC-134996	A generic error message is displayed on the **Investigate** > **Events** page when creating or scheduling a report before configuring the data source in the Reporting Engine.
ASOC-135074	Use of future dates in the Custom date range option for creating Adhoc reports on the **Investigate** > **Events** page will result in incorrect date ranges in the output report.

UEBA Fixes

Tracking Number	Description
ASOC-138953	Increased JA3 entities due to implementing JA3 randomization in applications such as Chrome caused DAGs delay on the UEBA server.
ASOC-134234	Red banner errors are displayed on the **Users** page after the UEBA host upgrade due to a communication delay between the UEBA server and the Presidio UI service.
ASOC-133835	Due to a delayed response from the UEBA server, a warning is displayed that the airflow scheduler is not running.

Investigate Fixes

Tracking Number	Description
ASOC-134482	Using the Enter key executes the selected query in Advance mode.
ASOC-135146	After selecting “=“ or “!=“ operator from the dropdown list, the cursor does not move to the end of the query. Also, the user cannot move the cursor to the end of the query.

Tracking Number	Description
ASOC-133508	In the **Advanced Mode** query bar, the selected saved query is not loaded into the query bar and applied to the executed query.
ASOC-134481	In the **Advanced Mode** query bar, the query is not executed when a service is updated to Decoder/Log Decoder due to unindexed keys.
ASOC-135221	In the **Advanced Mode** query bar, the most recently executed query is not auto-populated in the Pre-Query Conditions field while saving a query.

Policy-based Centralized Content Management (CCM) Fixes

Tracking Number	Description
ASOC-132699	When there are no 12.0+ Decoder services in environment, the wrong message 'All Decoder Services are managed by Centralized Content Management' is displayed on the UI. When the user tries to toggle the global toggle button, nothing happens. In 12.3.1 version, the default message displayed on the UI is corrected and the global toggle is disabled.

Endpoint Fixes

Tracking Number	Description
ASOC-139505	In the Remote Shell REGISTRY command, the help description does not include text for Add and Delete.
ASOC-138832	Oracle Linux agent crashes and restarts multiple times while running the build.
ASOC-135126	When the user chooses a combination of RAR and Managed host for multi-host selection and initiates an MFT, the RAR agent is successfully processed, even if MFT is not supported for the RAR agent.

Known Issues in 12.3.1.0 Release

Issues that remain unresolved in this release are documented in the NetWitness® Platform Known Issues list on the NetWitness community portal: https://community.netwitness.com/t5/netwitness-platform-known-issues/netwitness-platform-known-issues/ta-p/571872

Build Numbers for 12.3.1.0 Components

The following table lists the build numbers for various components of NetWitness 12.3.1.0

Component	Version Number
NetWitness Admin Server	rsa-nw-admin-server-12.3.1.0-230919024439.5.e292fb4.el7.centos.noarch.rpm
NetWitness Appliance	rsa-nw-appliance-12.3.1.0-12803.5.ec02638bf.el7.x86_64.rpm
NetWitness Appliance Nonfips	rsa-nw-appliance-nonfips-12.3.1.0-12803.5.ec02638bf.el7.x86_64.rpm
NetWitness Archiver	rsa-nw-archiver-12.3.1.0-12803.5.ec02638bf.el7.x86_64.rpm
NetWitness Audit Plugin	rsa-audit-plugins-12.3.1.0-4879.5.27cbe8684.el7.noarch.rpm
NetWitness Audit RT	rsa-audit-rt-12.3.1.0-4879.5.27cbe8684.el7.x86_64.rpm
NetWitness Bootstrap	rsa-nw-bootstrap-12.3.1.0-2309110733.5.6b3ecc7.el7.noarch.rpm
NetWitness Broker	rsa-nw-broker-12.3.1.0-12803.5.ec02638bf.el7.x86_64.rpm
NetWitness Broker Nonfips	rsa-nw-broker-nonfips-12.3.1.0-12803.5.ec02638bf.el7.x86_64.rpm
NetWitness Carlos RT	rsa-carlos-rt-12.3.1.0-2776.5.70a4315a5.el7.x86_64.rpm
NetWitness Cloud	rsa-nw-cloud-12.3.1.0-12803.5.ec02638bf.el7.x86_64.rpm
NetWitness Cloud Connector Server	rsa-nw-cloud-connector-server-12.3.1.0-230801022105.5.f9f1ba5.el7.centos.noarch.rpm
NetWitness Cloud Link Server	rsa-nw-cloud-link-server-12.3.1.0-230920034218.5.dafde51.el7.centos.noarch.rpm
NetWitness Collectd	rsa-collectd-12.3.1.0-4879.5.27cbe8684.el7.x86_64.rpm
NetWitness Collectd SMS	rsa-collectd-sms-12.3.1.0-4879.5.27cbe8684.el7.x86_64.rpm
NetWitness Component Descriptor	rsa-nw-component-descriptor-12.3.1.0-2310251852.5.caa8590.el7.noarch.rpm
NetWitness Concentrator	rsa-nw-concentrator-12.3.1.0-12803.5.ec02638bf.el7.x86_64.rpm
NetWitness Concentrator Nonfips	rsa-nw-concentrator-nonfips-12.3.1.0-12803.5.ec02638bf.el7.x86_64.rpm
NetWitness Config Management	rsa-nw-config-management-12.3.1.0-2309251119.5.0ad12af.el7.noarch.rpm
NetWitness Config Server	rsa-nw-config-server-12.3.1.0-230921055632.5.677c966.el7.centos.noarch.rpm
NetWitness Console	rsa-nw-console-12.3.1.0-12803.5.ec02638bf.el7.x86_64.rpm
NetWitness Content Server	rsa-nw-content-server-12.3.1.0-230919120434.5.f742e79.el7.centos.noarch.rpm
NetWitness ContextHub Server	rsa-nw-contexthub-server-12.3.1.0-230828015528.5.cae1ecb.el7.centos.noarch.rpm

NetWitness Correlation Server (ESA)	rsa-nw-correlation-server-12.3.1.0-230928073152.5.86ac93a.el7.centos.noarch.rpm
NetWitness Dashboard Content	rsa-nw-dashboard-content-20230710024254-5.noarch.rpm

Getting Help with NetWitness Platform

Product Documentation

The following documentation is provided with this release.

Documentation	Location URL
NetWitness Platform Master Table of Contents	https://community.netwitness.com/t5/netwitness-platform-online/tkb-p/netwitness-online-documentation
NetWitness Platform 12.3.1.0 Product Documentation	https://community.netwitness.com/t5/netwitness-platform-online/tkb-p/netwitness-online-documentation
NetWitness Platform 12.3.1.0 Upgrade Guide	https://community.netwitness.com/t5/netwitness-platform-online/upgrade-guide-for-12-2/ta-p/696583

Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Create a Post** fields in NetWitness Community portal to find specific information here: https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Contact NetWitness Support

If you contact NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

NetWitness Community Portal	https://community.netwitness.com In the main menu, click **Support > Case Portal > View My Cases**.
International Contacts (How to Contact NetWitness Support)	https://community.netwitness.com/t5/support/ct-p/support
Community	https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
NW Update	https://update.netwitness.com/
LiveUI	https://live.netwitness.com

NetWitness Educational Services

Sign up for access to NetWitness courses and additional resources on the NetWitness Educational Services and Training.

NetWitness Education Portal	https://netwitness.sabacloud.com/Saba/Web_spf/NA10P2PRD088/guestapp/home;spf-url=guest%2Fguestlearningcatalog
NetWitness Educational Services Course Catalog	https://community.netwitness.com/t5/netwitness-education-courses/tkb-p/netwitness-training
NetWitness Educational Services Training Schedule	https://community.netwitness.com/t5/netwitness-education-blog/netwitness-instructor-led-training-schedule/ba-p/655826
NetWitness Educational Services Support Contact	education.support@netwitness.com

Feedback on Product Documentation

You can send an email to feedbacknwdocs@netwitness.com to provide feedback on NetWitness Platform documentation.

Upgrade NetWitness Platform

This document provides information about the benefits and process of upgrading NetWitness Platform to 12.3.1.0. Ensure you go through the pre-requisites and pre-upgrade tasks before you upgrade NetWitness Platform. You can upgrade NetWitness Platform using four different options depending upon your Internet connectivity. After upgrading, you should also perform certain post upgrade tasks and post upgrade sanity checks listed in this guide to complete the upgrade process successfully. The instructions in this document apply to both physical and virtual hosts (including AWS, Azure Public Cloud, and Google Cloud Platform) unless stated to the contrary.

Warning: Before upgrading the UEBA host from 12.0 and older versions to 12.3.1.0, you must perform the backup of your Elasticsearch data such as Users, Entities, Alerts, and Indicators to retain them post upgrade. For more information, see Prepare to Upgrade NetWitness Platform. This action is not required if you are upgrading the UEBA host from 12.1 to 12.3.1.0.

Note: NetWitness Platform now supports installing multiple servers of UEBA in your environment. For more information, see **Configure Multiple UEBA Servers** topic in the *NetWitness UEBA Configuration Guide*.

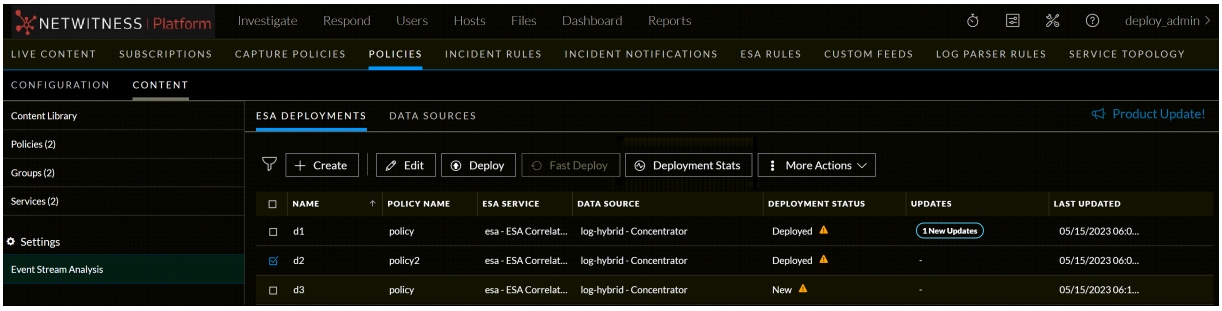
Upgrade Paths Supported for 12.3.1.0

The following upgrade paths are supported for NetWitness 12.3.1.0:

- NetWitness 12.3.0.0 to 12.3.1.0
- NetWitness 12.2.0.1 to 12.3.1.0
- NetWitness 12.2.0.0 to 12.3.1.0
- NetWitness 12.1.1.0 to 12.3.1.0
- NetWitness 12.1.0.1 to 12.3.1.0
- NetWitness 12.1.0.0 to 12.3.1.0
- NetWitness 12.0.0.0 to 12.3.1.0
- NetWitness 11.7.3.0 to 12.3.1.0
- NetWitness 11.7.2.0 to 12.3.1.0
- NetWitness 11.7.1.2 to 12.3.1.0
- NetWitness 11.7.1.1 to 12.3.1.0
- NetWitness 11.7.1.0 to 12.3.1.0
- NetWitness 11.7.0.2 to 12.3.1.0
- NetWitness 11.7.0.1 to 12.3.1.0
- NetWitness 11.7.0.0 to 12.3.1.0

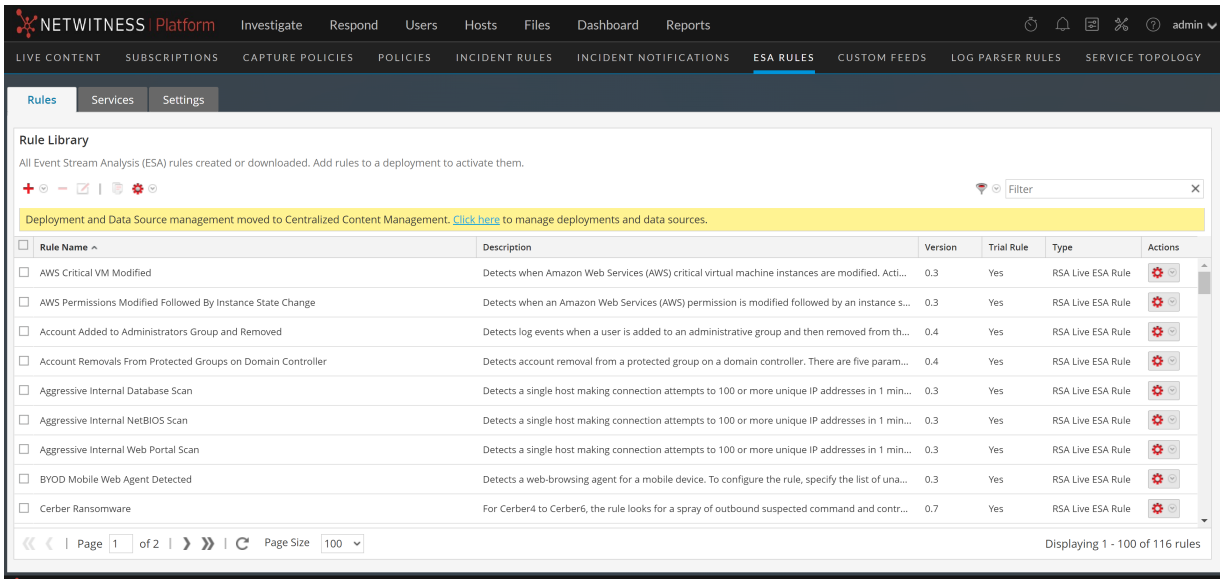
Running in Mixed Mode Environment

NetWitness Platform supports mixed mode during upgrade. Mixed mode occurs when some services are upgraded to the latest version and some services are still on the older versions.



For more information, see **Running in Mixed Mode** in the *NetWitness Hosts and Services Getting Started Guide*.

Note:
- If it takes a longer duration for upgrading all the hosts in your environment, contact NetWitness support to avoid encountering any issues.
- If you are running Endpoint Log Hybrid in mixed mode, make sure Endpoint Broker is on the same version as one of the Endpoint Servers.
- Mixed mode is not supported for ESA hosts in NetWitness Platform.



Upgrade Considerations for ESA Hosts

IMPORTANT: The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

- In 12.1 and later versions, you can only manage the ESA deployments and Data Sources through **Centralized Content Management**. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** page to manage the ESA deployments and Data Sources. Refer the following figure.

- After upgrading to 12.1 and later versions, you can only manage the ESA Rules in the **ESA Rules** page. Refer the following figure.

- After upgrading to the 12.3.1.0 version, all the ESA deployments will be migrated to (**CONFIGURE**) > **Policies** page. Each deployment will be converted into a policy and group and will be available to manage only after the upgrade of the Correlation servers to the 12.3.1.x version. Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. The deployments will not be accessible until the corresponding Correlation servers are upgraded. However, the correlation servers will still continue to process the Alerts and Events.
- You must upgrade the ESA hosts immediately after upgrading the Admin Server.

  For more information on **Centralized Content Management** and managing the deployments, see Centralized Content Management Guide for NetWitness.

Upgrade or Install Windows Legacy Collection

Refer to Windows Legacy Collection Guide for NetWitness for NetWitness Legacy Windows Collection Upgrade & Installation Instructions.

Note: After you upgrade or install Windows Legacy Collection, reboot the system to ensure that Log Collection functions correctly.

Run Pre-Upgrade Checks

You must run the pre-upgrade checks before you upgrade to NetWitness Platform 12.3.1.0 to identify any issues that may result in upgrade failure.

To run the pre-upgrade checks:

1. SSH to Admin Server.
2. Using the Upgrade Precheck tool, run the following commands:
   - `nw-precheck-tool upgrade-checklist`: This command allows the Upgrade Precheck tool to perform sanity checks for the list of probes in the Upgrade Checklist.
   - `nw-precheck-tool network-checklist`: This command allows the Upgrade Precheck tool to perform sanity checks for the list of probes in the Network Checklist.
   - `nw-precheck-tool cert-checklist`: This command allows the Upgrade Precheck tool to perform sanity checks for the list of probes in the Certificate Checklist.

Upgrade Checklist

The Upgrade Precheck tool performs the sanity checks for the following list of probes in the upgrade checklist:

- **Security Client File Check**: Ensures `security-client-amqp.yml` file is not present.
- **Node-0 NW Service-id Status Check**: Ensures all the service-id is intact with all the different services in Node 0.
- **Broker Service Trustpeer Symlink File Check**: Ensures Broker Service Trustpeer Symlink file `(/etc/netwitness/ng/broker/trustpeers/)` is not broken.
- **Node-0 NW Services Status Check**: Checks the status of all the services in Node 0.
- **Yum External Repo Check**: Ensures external repos are not available and not enabled.
- **Node-0 RPM DB Index Check**: Checks if the RPM DB is corrupted or not.
- **Salt Master Communication Check**: Verifies the salt communication from Node 0 to all the Nodes.
- **Node-0 Certificates Check**: Checks if any certificates are missing, expired, or invalid issuer type.
- **Mongo Authentication**: Validates the `deploy_admin` credentials fetched from `security-cli-client` using Mongo client.
- **Rabbitmq Authentication**: Validates the `deploy_admin` credentials fetched from `security-cli-client` using RabbitMQ.

- **(Component Hosts) Node X NW Service Status Check**: Verifies the status of services (Active or Inactive) on all the Node X.
- **(Component Hosts) Node X Certificates Check**: Checks the certificate expiry, missing, corrupted, and issuer mismatch in all the categories of Node X.
- **Provide Nodes CPU-Memory Info**: Provides CPU and Memory details of all the nodes along with the real-time available memory.
- **(Admin Server) Node 0 File System Utilization Check**: Verifies the disk partition utilization of `/var/netwitness/mongo`, `/var/netwitness`, and `root` on Node 0.
- **(Component Hosts) Node X File System Utilization Check**: Verifies the disk partition utilization of `/var/netwitness/mongo`, `/var/netwitness`, and `root` for ESA Primary and Endpoint Log Hybrid services on Node X.
- **Mongo File (ESAPrimary) Permission Mode Check**: Checks the ESA Primary node in the system or stack and verifies the permission mode of Mongo file.
- **Orchestration Server Normal Mode Check**: Checks if the orchestration service is running in normal or safe mode.
- **(Admin Server) Node 0 Init status Check**: Checks if there are any issues that might fail init process.
- **Fips Mode Check**: Checks to ensure that the Fips mode is disabled (set to false) before and after upgrade.
- **Node-X RPM DB Index Check**: Checks for the status of RPM DB on Node-X to make sure it is not corrupted.
- **Node-Z Yum Proxy Check**: Checks for the existence of yum.conf file and availability of proxy within the file on Node -Z.
- **Node-X Yum Proxy Check**: Checks for the existence of yum.conf file and availability of proxy within the file on Node -X.
- **Host Info Check Probe**: Checks if the required fields of information of all the hosts in the system (Host IP, Hostname, Installed Services, and Raw Version) are available.
- **Node-Z Cipher Check Probe**: Checks if the required ciphers are available in the location `/etc/rabbitmq/rabbitmq.config` on Node-0.
- **Node-X Cipher Check Probe**: Checks if the required ciphers are available in the location `/etc/rabbitmq/rabbitmq.config` on all Node-X.
- **Node-X Hardware Version Check Probe**: Checks for the hardware version of all reachable Node-X.
- **Node-Z Hardware Version Check Probe**: Checks for the hardware version of the Admin server.
- **PuppetCA Certificates Check Probe**: Checks if the stale puppet CA certificates are present in the location `/etc/pki/nw/trust/truststore.pem`.
- **AdminCertCheck Probe**: Verifies if the admin-certs across all the nodes are the same as the admin-certs on the Admin Server.
- **NTP Probe**: Checks all the nodes to ensure they are in sync with the NTP server.

- **StaleCerts Check Probe**: Checks the mongo and warns if there are any unused stale certificates in it.
- **NodeCertIDCheck Probe**: Checks the subject field of the node-cert and ensures that it is the same as the node-ID of the host.
- **Deploy Admin password expiry check Probe**: Verifies if the deploy_admin password is expired on Node-0.

Network Checklist

The Upgrade Precheck tool performs the sanity checks for the following list of probes in the network checklist:

- **(Admin Server) Node 0 closed ports Check**: Checks if the service ports required for NetWitness services are open and listening on Node 0.
- **(Component Hosts) Node X closed ports Check**: Checks if the service ports required for NetWitness services are open and listening on Node X.

Certificate Checklist

The Upgrade Precheck tool performs the sanity checks for the following list of probes in the Certificate checklist:

- **Node 0 Service Certificates Validity Check**: Checks the validity of service certificates in the location `/etc/pki/nw/service/` on Node-0.
- **Node X Service Certificates Validity Check**: Checks the validity of service certificates in the location `/etc/pki/nw/service/` on Node-X.
- **Node Certificates Validity Check on Node-0**: Checks the validity of node certificates in the location `/etc/pki/nw/service` on Node-0.
- **Root CA Certificates Validity Check**: Checks the validity of Root CA certificates in the location `/etc/pki/nw/ca`.

Prepare to Upgrade NetWitness Platform

Complete the following tasks to prepare for the upgrade to NetWitness Platform 12.3.1.0.

Warning: The Dell S4 and S4s appliances reached the End of Life (EOL) in June 2021. We recommend that you discontinue installation or upgrade activities on these and upgrade to new hardware.
For more information on End of Life hardware support, see https://community.netwitness.com/t5/product-life-cycle/product-version-life-cycle-for-rsa-netwitnessplatform/ta-p/569875.

Task 1 (Optional). Remove Legacy Package Repositories

You can free up the disk space by removing obsolete repositories from previous releases.

To remove the obsolete repositories:

1. Determine the version of the oldest NetWitness Platform host in your environment by using the NetWitness Repo tool. Do the following:

- SSH to the Admin Server as a `root` user.
- Run the following command.

  ```
  nw-repo-tool --list-obsolete
  ```

  After running this command, you will get a list of all the obsolete repositories.

2. Run the following command to remove all the obsolete repositories.

   ```
   nw-repo-tool --purge-obsolete
   ```

Note: Alternatively, you can safely remove all legacy package repository folders located at `/var/netwitness/common/repo/<version>` on the NW Server for all versions prior to the baseline major release version of the oldest active host in the environment. If the oldest host version is 11.7.x.x, you can safely remove 11.0.x.x, 11.1.x.x, 11.2.x.x, 11.3.x.x, 11.4.x.x, 11.5.x.x, and 11.6.x.x repository folders. **However, do not remove repository versions greater than or equal to 11.7.0.0.**

Task 2. Backup and Remove the Rotated RabbitMQ Logs

Before upgrading from 11.7.x to 12.3.1.0, you must remove the old RabbitMQ logs and free up the space in /var/log mount disk. Follow the below procedure to free up the space in /var/log mount disk.

1. Backup the rotated RabbitMQ logs into var/netwitness directory. Do the following.

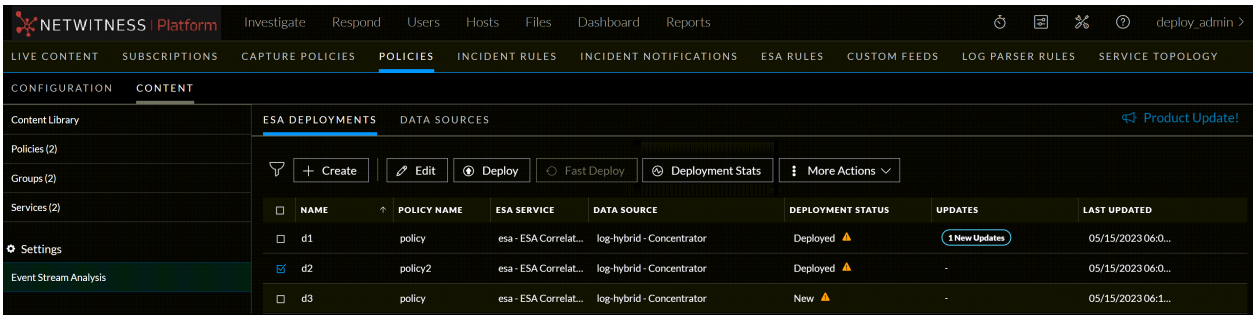
   ```
   mkdir /var/netwitness/rabbitmq_logsbkp
   ```

   ```
   scp -r /var/log/rabbitmq/ /var/netwitness/rabbitmq_logsbkp
   ```

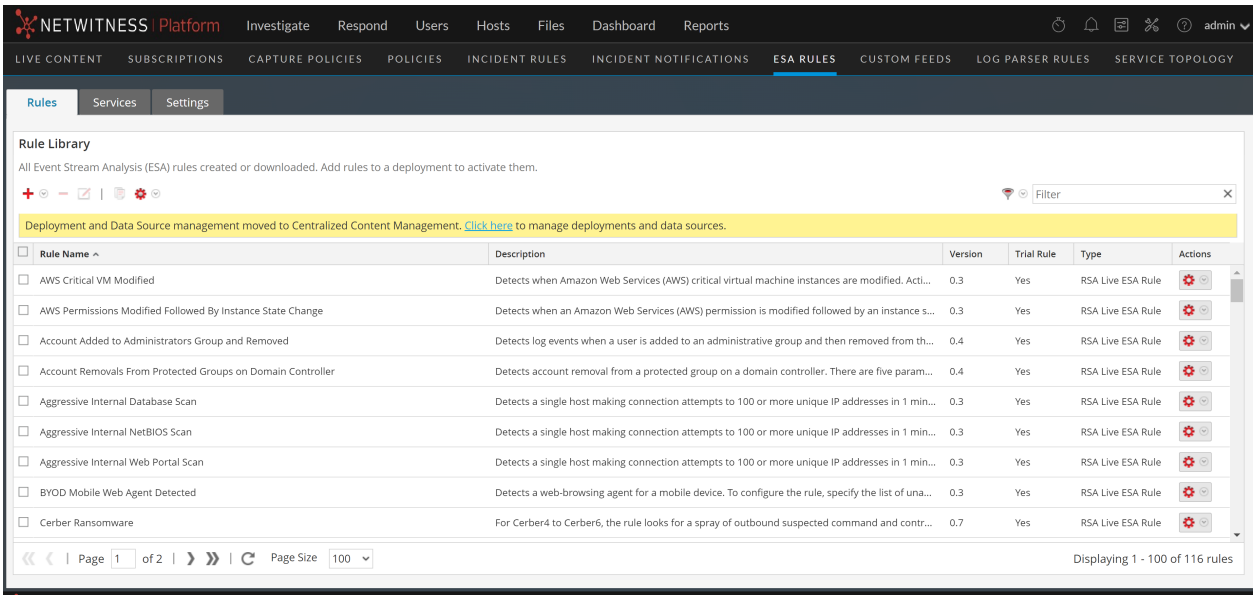
2. Remove the rotated RabbitMQ logs from /var/log/rabbitmq pre-upgrade. Do the following.

   ```
   cd /var/log/rabbitmq
   ```

```
rm -f rabbit\@<sa-uuid>.log.*
rm -f rabbit\@<sa-uuid>_upgrade.log.*
rm -f *.gz
rm -f rabbit@<sa-uuid>.log-*
```



Note:
- This procedure must be performed only once before upgrading to 12.3.1.0. Post-upgrade, the RabbitMQ service automatically handles the log rotation.
- The command `rm -f rabbit\@<sa-uuid>.log.*` is used to clean up the old uncompressed logs such as log.1, log.2, and log.3.
- The command `rm -f rabbit\@<sa-uuid>_upgrade.log.*` is used to clean up the old uncompressed upgrade logs.
- The command `rm -f *.gz` is used to clean up the old compressed logs.
- The command `rm -f rabbit@<sa-uuid>.log-*` is used to clean up the old uncompressed logs rotated with logrotate.



Task 3. Prepare ESA Deployments for Migration to 12.3.1.0

Before upgrading to 12.3.1.0, NetWitness recommends that all the ESA deployments maintain an error-free state. You must remove any unused ESA deployments, as ESA deployments will be migrated to policies and groups after upgrading to 12.3.1.0. Each deployment will be converted into a policy and group and will be available to manage only after the upgrade of the Correlation servers to the 12.3.1.x version.

Manage ESA Deployments and Data Sources

In 12.1 and later versions, you can only manage the ESA deployments and Data Sources through **Centralized Content Management**. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** page to manage the ESA deployments and Data Sources. You can only manage the ESA Rules in the **ESA Rules** page. Refer the following figures.

Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. The deployments will not be accessible until the corresponding Correlation servers are upgraded. However, the correlation servers will still continue to process the Alerts and Events. You must upgrade the ESA hosts immediately after upgrading the Admin Server.

For more information on **Centralized Content Management** and managing the deployments, see Centralized Content Management Guide for NetWitness.

IMPORTANT: If there is any need to import ESA Rules and enrichments, NetWitness recommends importing those missing rules and enrichments before the upgrade.

The pre-upgrade and post-upgrade states of deployments are represented in the following table.

SINo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No

Healthy deployment contains no errors, and the required resources such as ESA Server, Data source, and ESA rules are added.

Note: NetWitness recommends that all the deployments maintain an error-free state. You must remove any unnecessary or unused ESA deployments.

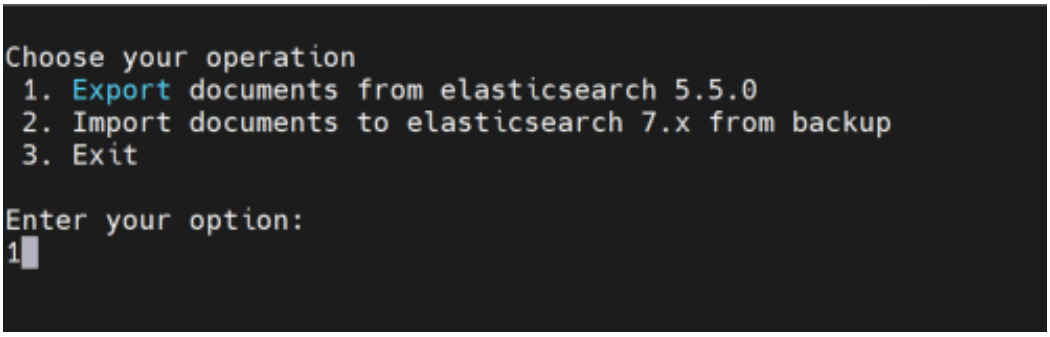
Task 4. Backup Elasticsearch Data (Users, Entities, Alerts, and Indicators)

Before upgrading the UEBA host from 12.0.0.0 and older versions to 12.3.1.0, you must perform the backup of your Elasticsearch data such as Users, Entities, Alerts, and Indicators (using the Elasticsearch migration tool) to retain them post upgrade.

Before you begin

Make sure the following prerequisites are met:

- The current Elasticsearch version must be 5.5.0.
- Presidio rpms version must be less than or equal to 12.0.0.0.
- `ueba_es_migration_tool.zip` file must be downloaded.



> **Note: ueba_es_migration_tool** allows you to migrate presidio Elasticsearch data from Elasticsearch version 5.5.0 to 7.17.6 while upgrading the UEBA host to 12.3.1.0 from 12.0.0.0 and older versions. This tool contains `elk-migration-script.sh` script file and `presidio-elk-migration-1.0.0.jar` file and it can be downloaded from https://community.netwitness.com/t5/rsa-netwitness-platform-staged/ueba-elasticsearch-migration-tool-fof-nw-12-2/ta-p/696519.

To backup the Elasticsearch data:

1. Select the available directory and unzip the `ueba_es_migration_tool.zip` file.
2. Go to `cd ueba_es_migration_tool`. Run the following command.

   ```
   sh elk-migration-script.sh
   ```

   The Elasticsearch migration tool guide is displayed.

3. Select **Export documents from elasticsearch 5.5.0** and enter **yes** when prompted to stop the airflow scheduler.

   > **Note:** When you enter **yes**, the airflow scheduler stops consuming the fresh incoming data such as Users, Entities, and Alerts. This avoids data loss during the export process.

4. In the next step, select **Fresh Export** to export the existing data.

```
Export documents from elasticsearch 5.5.0
 1. Fresh Export
 2. Resume Export
 3. Main menu
 4. Exit

Enter your option:
1

Destination dir path:
/root/elasticsearch_export_backup
Please wait processing your export request...

[root@ueba ~]#
```

Note:
- If the Export operation fails due to some technical issue, select **Resume Export** once the issue is resolved, to resume the Export operation.
- Go to `<backup_directory_path>/log/log/es-migration-export.log` if you want to view the log for the succeeded or failed processes.

Task 5 (Optional). Disable STIG-based FIPS Kernel Controls

If you enabled STIG-based FIPS Kernel controls, you must disable them before initiating the NetWitness Platform upgrade process to avoid boot errors. To disable STIG-based FIPS Kernel controls, run the following commands:

```
manage-stig-controls --disable-control-groups 3 --host-all
```

```
grub2-mkconfig -o /boot/grub2/grub.cfg
```

After you upgrade NetWitness Platform, ensure that you enable STIG-based FIPS Kernel controls.

Note: STIG-based FIPS Kernel controls which require modifications to kernel boot options are not enabled by NetWitness out-of-the-box.

Task 6 (Optional). Verify Connection for Live Server

Go to `admin/system/live services` and do a test connection to verify if you are able to connect to the live server as this is essential for the source-server from 12.x and above. This is an optional step and applicable only for customers who have configured live.

Task 7. Synchronize Time on Component Hosts with NW Server Host

Before you upgrade hosts, make sure that the time on each host is synchronized with the time on the NetWitness Server.

To synchronize the time, do one of the following:

1. Configure the NTP Server.

For more information, see **Configure NTP Servers** in the System Configuration Guide.

2. Perform the following steps:

a. SSH to the Admin Server host.

b. Run the following commands.

```
salt \* service.stop ntpd
salt \* cmd.run 'ntpdate nw-node-zero'
salt \* service.start ntpd
```

Perform Upgrade Tasks

Upgrade the systems in your environment in the following order:

1. NW Server hosts
2. Analyst UI hosts
3. ESA Primary hosts
4. ESA Secondary hosts
5. Standalone Broker hosts
6. Concentrator hosts
7. Archiver hosts
8. Packet Decoder hosts
9. Log Decoder hosts
10. Log Collector / VLC hosts
11. The rest of your component hosts

Note: NW Server, Analyst UI, and ESA Primary and Secondary hosts must all be upgraded on the same day. The rest of your component hosts can be upgraded on the same day or later.

For information about all the host types in NetWitness, see the *NetWitness Hosts and Services Getting Started Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. For more information, see "**Task 3. Prepare ESA Deployments for Migration to 12.3.1.0**" in the topic Prepare to Upgrade NetWitness Platform.

IMPORTANT: Mixed mode is not supported for ESA hosts in NetWitness Platform. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

IMPORTANT: After upgrading the primary NW Server (including the Respond Server service), the Respond Server service is not automatically re-enabled until after the Primary ESA host is also upgraded to same version. The Respond post-upgrade tasks only apply after the Respond Server service is upgraded and is in the enabled state.

IMPORTANT: In NetWitness Platform version 11.6 or Later, deployment account password (only on node-zero) must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, it must be changed in the Warm Standby Server if it exists.

Note: For 12.3.1.0 version with Legacy Windows Log Collector, you should perform few additional post upgrade tasks. Refer to Legacy Windows Log Collection section in Perform Post Upgrade Tasks for these additional post upgrade tasks.

Select Upgrade Options

You can select one of the following upgrade options based on your Internet connectivity. They are listed in the order recommended by NetWitness Platform.

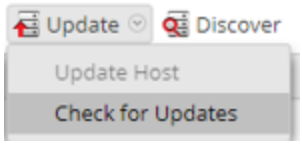
- Option 1: Upgrade NetWitness Platform using Live Services
- Option 2: Upgrade NetWitness Platform Offline
- Option 3: Upgrade NetWitness Platform using CLI (Offline)
- Option 4 (Optional): Pre-Stage Upgrade Repository by Downloading Packages

The following rules apply when you are upgrading hosts using any of the 4 upgrade methods:

- You must upgrade the NW Server host first.
- You can only apply a version that is compatible with the existing host version.
- The NW Server, ESA primary, ESA secondary, and Analyst UI hosts must all be on the same NetWitness Platform version.

Option 1: Upgrade NetWitness Platform using Live Services

You can use this method if the NW Server host is connected to Live Services and if you are able to obtain the package.



Prerequisites

1. The **Automatically download information about new upgrades every day** option is selected and is applied in **(Admin) > System > Updates**.
2. Updates are available. Go to **(Admin) > Hosts > Update > Check for Updates** to check for updates. The Host view displays the **Update Available** status.
3. 12.3.1.0 is available in the **Update Version** column.

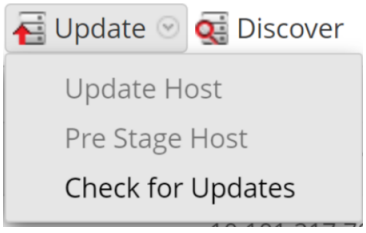
To upgrade from 11.7.0.x, 11.7.1.0, 11.7.1.1, 11.7.1.2, 11.7.2.0, 11.7.3.0, 12.0.0.0, 12.1.0.0, 12.1.0.1, 12.1.1.0, 12.2.0.0, 12.2.0.1, and 12.3 to 12.3.1.0:

1. Go to **(Admin) > Hosts**.
2. Select the NW Server (`nw-server`) host.

3. Check for the latest updates.

Update Available is displayed in the **Status** column if you have a version update in your Local Update Repository for the selected host.

4. Select **12.3.1.0** from the **Update Version** column.



Note:
- If you want to view a dialog with the major features in the upgrade and information on the updates, click the information icon ( ) to the right of the upgrade version number.

- If you cannot find the version you want, select **Update > Check for Updates** to check the repository for any available updates. If an update is available, the message "New updates are available" is displayed and the **Status** column updates automatically to show Update Available. By default, only supported updates for the selected host are displayed.

5. Click **Update** > **Update Host** from the toolbar.
6. Click **Begin Update**.
7. Click **Reboot Host**.
8. Repeat steps 5 to 7 for other hosts.

Note: You can select multiple hosts to upgrade at the same time only after updating and rebooting the NW Server host. All ESA, Endpoint, and Malware Analysis hosts should be upgraded to the same version as that of the NW Server host.

Note: In 11.7.1.0 or later versions, you can pre-stage the upgrade repository using the **Pre Stage Host** feature. Refer the following figure. For more information, see Option 4 (Optional): Pre-Stage Upgrade Repository by Downloading Packages.

Option 2: Upgrade NetWitness Platform Offline

You can manually upgrade NetWitness Platform by performing the following tasks.

Task 1. Populate Staging Folder (`/var/netwitness/common/update-stage/`) with Version Upgrade Files. Do the following.

1. Download the upgrade package `netwitness-12.3.1.0.zip` from NetWitness Community (https://community.netwitness.com/) > **Downloads** > **NetWitness Platform** > **Version 12.3.1.0** to a local directory:
   - If you are upgrading from 11.7.0.x, 11.7.1.0, 11.7.1.1, 11.7.1.2, 11.7.2.0, 11.7.3.0, 12.0.0.0, 12.1.0.0, 12.1.0.1, 12.1.1.0, 12.2.0.0, or 12.2.0.1, download `netwitness-12.3.0.0.zip` and `netwitness-12.3.1.0.zip`.
   - If you are upgrading from 12.3.0.0, download `netwitness-12.3.1.0.zip`
2. SSH to the NW Server host.
3. Upload `netwitness-12.3.0.0.zip` and `netwitness-12.3.1.0.zip` (if upgrading from 11.7.0.x, 11.7.1.0, 11.7.1.1, 11.7.1.2, 11.7.2.0, 11.7.3.0, 12.0.0.0, 12.1.0.0, 12.1.0.1, 12.1.1.0, 12.2.0.0, or 12.2.0.1) to `/var/netwitness/common/update-stage/` on the NW Server Host. For example:

   ```
   mv /var/netwitness/tmp/netwitness-12.3.0.0.zip
   /var/netwitness/common/update-stage/
   ```

   ```
   mv /var/netwitness/tmp/netwitness-12.3.1.0.zip
   /var/netwitness/common/update-stage/
   ```

4. Upload `netwitness-12.3.1.0.zip` (if upgrading from 12.3.0.0) to `/var/netwitness/common/update-stage/` on the NW Server Host.
   For example:

   ```
   mv /var/netwitness/tmp/netwitness-12.3.1.0.zip
   /var/netwitness/common/update-stage/
   ```

Note: NetWitness Platform unzips the file automatically.

Task 2. Apply Upgrades from the Staging Area to Each Host. Do the following.

Caution: You must upgrade the NW Server host before upgrading any non-NW Server host.

Note: Optionally, you can follow the instructions provided in the Option 4 (Optional): Pre-Stage Upgrade Repository by Downloading Packages if you are upgrading from 11.7.1.0, 11.7.1.1, 11.7.1.2, 11.7.2.0, and 11.7.3.0 to 12.3.1.0.

1. Log in to NetWitness.
2. Go to  **(Admin) > Hosts**.

   Note: If you are already on the  **(Admin) > Hosts** page and the **Check for Updates** option (**Update** > **Check for Updates**) is grayed out, refresh the page from the browser to check for the updates.

3. Check for updates and wait for the upgrade packages to be copied, validated, and ready to be initialized.

   "Ready to initialize packages" is displayed if:

   - NetWitness Platform can access the upgrade package.
   - The package is complete and has no errors.

   Refer to Troubleshooting Version Installations and Updates for instructions on how to troubleshoot errors (for example, "Error deploying version <version-number>" and "Missing the following update package(s)," are displayed in the **Initiate Update Package for RSA NetWitness Platform** dialog.)

4. Click **Initialize Update**.

   It takes some time to initialize the packages because the files are large and need to be unzipped. The time varies depending on how the host is configured.
   After the initialization is successful, the **Status** column displays Update Available.

5. Click **Update** > **Update Hosts** from the toolbar.

6. Click **Begin Update** from the **Update Available** dialog.
   After the host is upgraded, it prompts you to reboot the host.

7. Click **Reboot Host** from the toolbar.

Option 3: Upgrade NetWitness Platform using CLI (Offline)

You can use this option if the NW Server host is not connected to Live Services.

Before you begin

Make sure that you have downloaded the following file from NetWitness Community (https://community.netwitness.com/) > **Products > NetWitness Platform** > **Downloads** to a local directory:

- If you are upgrading from 11.7.0.x, 11.7.1.0, 11.7.1.1, 11.7.1.2, 11.7.2.0, 11.7.3.0, 12.0.0.0, 12.1.0.0, 12.1.0.1, 12.1.1.0, 12.2.0.0, and 12.2.0.1 to 12.3.1.0, download:
  `netwitness-12.3.0.0.zip`

  `netwitness-12.3.1.0.zip`
- If you are upgrading from 12.3.0.0 to 12.3.1.0, download:

  `netwitness-12.3.1.0.zip`
- If you are using external repository, you can update the external repository with the latest upgrade content. For more information, see External Repo Instructions for CLI upgrade.

To upgrade NW Server Hosts and component servers:

Note: If you copy and paste the commands from PDF to Linux SSH terminal, the characters do not work. However, you can copy the commands from the HTML page https://community.netwitness.com/t5/netwitness-platform-online/upgrade-tasks-for-12-1-1/ta-p/695018#Option3 and paste them to Linux SSH terminal.

1. Stage the 12.3.1.0 files to prepare them for the upgrade. Consider the following scenarios.

- **If you are upgrading from 11.7.0.x, 11.7.1.0, 11.7.1.1, 11.7.1.2, 11.7.2.0, 11.7.3.0, 12.0.0.0, 12.1.0.0, 12.1.0.1, 12.1.1.0, 12.2.0.0, and 12.2.0.1**, you must stage 12.3.0.0 and 12.3.1.0. Log into the NW Server as `root` and create the following directory:
  - **Option 1 (Manual)** : Log into the NetWitness Server and create the following directories:
    `/var/netwitness/tmp/upgrade/12.3.0.0/`
    `/var/netwitness/tmp/upgrade/12.3.1.0/`
    Then copy the package zip file to the `/var/netwitness/tmp/` directory of the NW Server and extract the package files from `/var/netwitness/tmp/` to the appropriate directory using the following commands:
    ```
    unzip netwitness-12.3.0.0.zip -d /var/netwitness/tmp/upgrade/12.3.0.0/
    unzip netwitness-12.3.1.0.zip -d /var/netwitness/tmp/upgrade/12.3.1.0/
    ```
    Make sure you remove the update zip file from the staging directory after it is extracted.
  - **Option 2 (Automated)** : Log into the NetWitness Server and create the following directory:
    `/var/netwitness/tmp/upgrade/`
    Then copy the NetWitness 12.3.0.0 and 12.3.1.0 package zip files to the `/var/netwitness/tmp/` directory on the NetWitness Server.
    After this, run the below command to extract, validate, and initialize the 12.3.1.0 zip files:
    ```
    [root@SA ~]# upgrade-cli-client --init --stage-dir /var/netwitness
    /tmp/upgrade --download-path /var/netwitness/tmp/ --version 12.3.1.0
    ```
    Once the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed** is displayed in the console of the admin server, only then the initialization process will begin.

Note: If you do not receive the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed**, run the previous command again.

IMPORTANT: After staging 12.3.1.0 (using the Option 2), if the initialization fails, run the command `upgrade-cli-client --init --version 12.3.1.0 --stage-dir /var/netwitness/tmp/upgrade`. If the initialization succeeds, ignore the step 2 Initialize the upgrade below and proceed with the further steps 3-6.

- **If you are upgrading from 12.3.0.0**, you only need to stage 12.3.1.0.
  - **Option 1 (Manual)** : Log into the NetWitness Server and create the following directory:

    `/var/netwitness/tmp/upgrade/12.3.1.0/`
    Then copy the package zip file to the `/var/netwitness/tmp/` directory of the NW Server and extract the package files from `/var/netwitness/tmp/` to the appropriate directory using the following command:

    ```
    unzip netwitness-12.3.1.0.zip -d /var/netwitness/tmp/upgrade/12.3.1.0
    ```
    Make sure you remove the update zip file from the staging directory after it is extracted.

- **Option 2 (Automated)** : Log into the NetWitness Server and create the following directory:
  `/var/netwitness/tmp/upgrade/`
  Then copy the NetWitness 12.3.1.0 package zip files to the `/var/netwitness/tmp/` directory on the NetWitness Server.
  After this, run the below command to extract, validate, and initialize the 12.3.1.0 zip files:
  ```
  [root@SA ~]# upgrade-cli-client --init --stage-dir /var/netwitness
  /tmp/upgrade --download-path /var/netwitness/tmp/ --version 12.3.1.0
  ```
  Once the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed** is displayed in the console of the admin server, only then the initialization process will begin.

Note: If you do not receive the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed**, run the previous command again.

IMPORTANT: After staging 12.3.1.0 (using the Option 2), if the initialization fails, run the command `upgrade-cli-client --init --version 12.3.1.0 --stage-dir /var/netwitness/tmp/upgrade`. If the initialization succeeds, ignore the step 2 Initialize the upgrade below and proceed with the further steps 3-6.

2. Initialize the upgrade using the following command:
   ```
   upgrade-cli-client --init --version 12.3.1.0 --stage-dir
   /var/netwitness/tmp/upgrade
   ```
3. Upgrade the NW Server host, using the following command:
   ```
   upgrade-cli-client --upgrade --version 12.3.1.0 --host-key <ID / display
   name / (hostname/ IP address)>
   ```
4. When the NW Server host upgrade is successful, reboot the host from NetWitness Platform user interface in the Hosts view.
5. (Conditional) If Warm Standby Server is deployed, repeat steps 1 to 4 on the Warm Standby Server host.
6. Repeat steps 3 and 4 for each component host, changing the IP address to the component host which is being upgraded.

Note: You can check versions of all the hosts, using the command `upgrade-cli-client --list` on the NW Server host. If you want to view the help content of `upgrade-cli-client`, use the command `upgrade-cli-client --help`.

Note: If the following error is displayed during the upgrade process:
```
2017-11-02 20:13:26.580 ERROR 7994 — [ 127.0.0.1:5671]
o.s.a.r.c.CachingConnectionFactory : Channel shutdown: connection error;
protocol method: #method<connection.close>(reply-code=320, reply-
text=CONNECTION_FORCED - broker forced connection closure with reason
'shutdown', class-id=0, method-id=0),
```
the service pack will install correctly. No action is required. If you encounter additional errors when updating a host to a new version, contact Customer Support for assistance.

External Repo Instructions for CLI upgrade

For information about setting up an external repository, see **Appendix A. Set Up External Repo** in the *12.3Upgrade Guide for NetWitness Platform*. The following instructions assume that you already have an external repository set up. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

1. Stage the 12.3.1.0 files to prepare them for the upgrade. Consider the following scenarios.

   - **If you are upgrading from 11.7.0.x, 11.7.1.0, 11.7.1.1, 11.7.1.2, 11.7.2.0, 11.7.3.0, 12.0.0.0, 12.1.0.0, 12.1.0.1, 12.1.1.0, 12.2.0.0, and 12.2.0.1**, you must stage 12.3.0.0 and 12.3.1.0. Log into the NW Server as `root` and create the following directory:
     - **Option 1 (Manual)** : Log into the NetWitness Server and create the following directories:
       `/var/netwitness/tmp/upgrade/12.3.0.0/`
       `/var/netwitness/tmp/upgrade/12.3.1.0/`
       Then copy the package zip file to the `/var/netwitness/tmp/` directory of the NW Server and extract the package files from `/var/netwitness/tmp/` to the appropriate directory using the following commands:
       ```
       unzip netwitness-12.3.0.0.zip -d /var/netwitness/tmp/upgrade/12.3.0.0/
       unzip netwitness-12.3.1.0.zip -d /var/netwitness/tmp/upgrade/12.3.1.0/
       ```
       Make sure you remove the update zip file from the staging directory after it is extracted.
     - **Option 2 (Automated)** : Log into the NetWitness Server and create the following directory:
       `/var/netwitness/tmp/upgrade/`
       Then copy the NetWitness 12.3.0.0 and 12.3.1.0 package zip files to the `/var/netwitness/tmp/` directory on the NetWitness Server.
       After this, run the below command to extract, validate, and initialize the 12.3.1.0 zip files:
       ```
       [root@SA ~]# upgrade-cli-client --init --stage-dir /var/netwitness
       /tmp/upgrade --download-path /var/netwitness/tmp/ --version 12.3.1.0
       ```
       Once the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed** is displayed in the console of the admin server, only then the initialization process will begin.

   Note: If you do not receive the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed**, run the previous command again.

   IMPORTANT: After staging 12.3.1.0 (using the Option 2), if the initialization fails, run the command `upgrade-cli-client --init --version 12.3.1.0 --stage-dir /var/netwitness/tmp/upgrade`. If the initialization succeeds, ignore the step 2 Initialize the upgrade below and proceed with the further steps 3-6.

   - **If you are upgrading from 12.3.0.0**, you only need to stage 12.3.1.0.
     - **Option 1 (Manual)** : Log into the NetWitness Server and create the following directory:
       `/var/netwitness/tmp/upgrade/12.3.1.0/`
       Then copy the package zip file to the `/var/netwitness/tmp/` directory of the NW Server and extract the package files from `/var/netwitness/tmp/` to the appropriate directory using the following command:
       ```
       unzip netwitness-12.3.1.0.zip -d /var/netwitness/tmp/upgrade/12.3.1.0
       ```
       Make sure you remove the update zip file from the staging directory after it is extracted.

- **Option 2 (Automated)** : Log into the NetWitness Server and create the following directory:
  `/var/netwitness/tmp/upgrade/`
  Then copy the NetWitness 12.3.1.0 package zip files to the `/var/netwitness/tmp/` directory on the NetWitness Server.
  After this, run the below command to extract, validate, and initialize the 12.3.1.0 zip files:
  ```
  [root@SA ~]# upgrade-cli-client --init --stage-dir /var/netwitness
  /tmp/upgrade --download-path /var/netwitness/tmp/ --version 12.3.1.0
  ```
  Once the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed** is displayed in the console of the admin server, only then the initialization process will begin.

Note: If you do not receive the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed**, run the previous command again.

IMPORTANT: After staging 12.3.1.0 (using the Option 2), if the initialization fails, run the command `upgrade-cli-client --init --version 12.3.1.0 --stage-dir /var/netwitness/tmp/upgrade`. If the initialization succeeds, ignore the step 2 Initialize the upgrade below and proceed with the further steps 3-6.

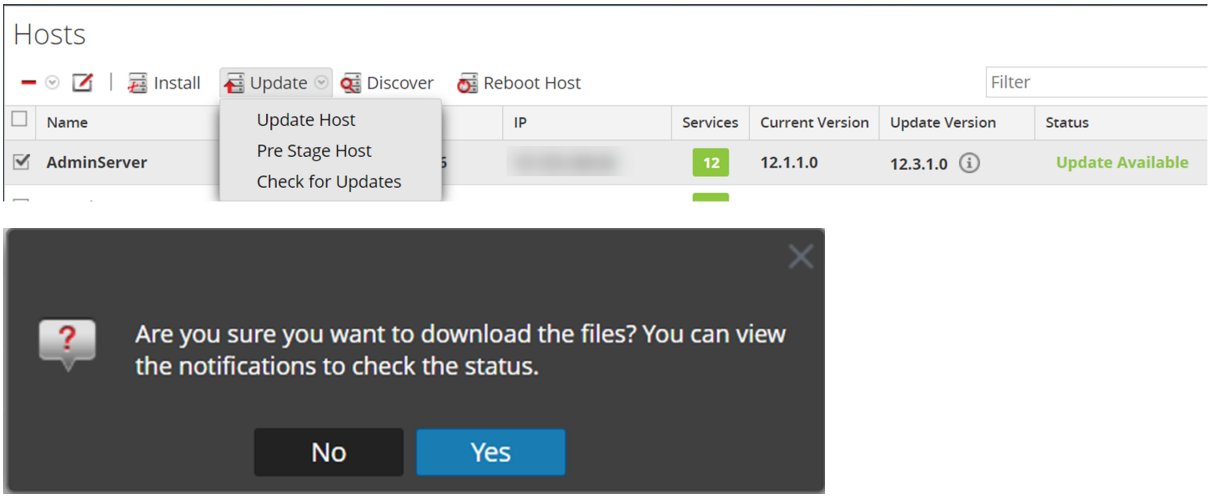
2. Initialize the upgrade using the following command:
   ```
   upgrade-cli-client --init --version 12.3.1.0 --stage-dir
   /var/netwitness/tmp/upgrade
   ```
3. Upgrade the NW Server host, using the following command:
   ```
   upgrade-cli-client --upgrade --version 12.3.1.0 --host-key <ID / display
   name / (hostname/ IP address)>
   ```
4. When the NW Server host upgrade is successful, reboot the host from NetWitness Platform user interface in the Hosts view.
5. (Conditional) If Warm Standby Server is deployed, repeat steps 1 to 4 on the Warm Standby Server host.
6. Repeat steps 3 and 4 for each component host, changing the IP address to the component host which is being upgraded.

Note: You can check versions of all the hosts, using the command `upgrade-cli-client --list` on the NW Server host. If you want to view the help content of `upgrade-cli-client`, use the command `upgrade-cli-client --help`.

Note: If the following error is displayed during the upgrade process:
```
2017-11-02 20:13:26.580 ERROR 7994 — [ 127.0.0.1:5671]
o.s.a.r.c.CachingConnectionFactory : Channel shutdown: connection error;
protocol method: #method<connection.close>(reply-code=320, reply-
text=CONNECTION_FORCED - broker forced connection closure with reason
'shutdown', class-id=0, method-id=0),
```
the service pack will install correctly. No action is required. If you encounter additional errors when updating a host to a new version, contact Customer Support for assistance.

Option 4 (Optional): Pre-Stage Upgrade Repository by Downloading Packages

You can pre-stage the upgrade repository by downloading the required packages (.zip) without affecting the system. This minimizes the upgrade downtime and ensures the upgrade is completed within the planned time.



Note: Pre Stage Host feature is supported from version 11.7.1.0 or later.

To pre-stage the upgrade repository and update the hosts:

1. Go to  **(Admin) > Hosts**.
2. Click **Update > Check for Updates** from the toolbar.

   All possible update versions will be displayed in the Versions drop-down list.
3. Click **Update** > **Pre Stage Host** and select the version in the update version column.

   A confirmation message for downloading the files is displayed.

4. Click **Yes** to download the upgrade packages to the repo.
5. Verify the status of the download in the notifications tray as shown below.

   The **Pre Stage Host** and **Upgrade Host** will be disabled until pre stage is completed.

Note: The current version and the update version in the UI will be the same during the pre stage as it is not the actual update. This is because only the repo files are downloaded and no actual upgrade is done. The version will change only after upgrade.

6. If the download is successful, **Check for Updates** again to start the initialization.
7. Click **Initialize Update**.

   The initialization of the package will take some time as the files are large and will need to be unzipped.

IMPORTANT: Pre Stage Repo preparation steps from 1 to 4 can be performed at any time. However, from steps 5 to 8 the upgrade process begins and you must NOT reboot the host or restart the jetty server during this time as it will corrupt the .ZIP files.

8. Check the status of initialization in the notifications tray.
9. After the initialization is completed successfully, click **Update** > **Update Host**.

   After the host is updated, you will be prompted to reboot the host.
10. Set up the host and reboot the host.

Perform Post Upgrade Tasks

This topic lists the tasks you must perform after upgrading NetWitness Platform. Complete the tasks that apply to the hosts in your environment.

- General
- Event Stream Analysis (ESA)
- Respond
- User Entity Behavior Analytics
- Legacy Windows Log Collector

General

You must configure Jetty, restore the core services contents, and also start Network capture, Log capture, and aggregation after upgrading NetWitness Platform.

Configure Jetty

For Jetty Configuration and related information, see **Manage Custom Host Entries** topic in the System Maintenance Guide.

Make Sure Services Have Restarted and Are Capturing and Aggregating Data

Make sure that services have restarted and are capturing data (this depends on whether or not you have auto-start enabled).

If required, restart data capture and aggregation for the following services:

- Decoder
- Log Decoder
- Broker
- Concentrator
- Archiver

To Start Network Capture:

1. In the NetWitness Platform menu, go to  (Admin) > **Services**.
   The **Services** view is displayed.
2. Select each **Decoder** service.

3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

To Start Log Capture:

1. In the NetWitness Platform menu, go to  (Admin) > **Services**.
   The **Services** view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

To Start Aggregation:

1. In the NetWitness Platform menu, go to  (Admin) > **Services**.
   The **Services** view is displayed.
2. For each **Concentrator**, **Broker**, and **Archiver** service:
   a. Select the service.
   b. Under  (actions), select **View** > **Config**.
   c. In the toolbar, click 

3. For Event Stream Analysis (ESA):

   Note: Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.6 and later. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

   There are no required post-upgrade tasks for ESA. For ESA troubleshooting, see ESA Troubleshooting Information.

   If you want to add support for Endpoint, UEBA, and Live content rules, you must update the `multi-valued` and `single-valued` parameter meta keys on the ESA Correlation service to include all the required meta keys. It is not necessary to make these adjustments during the upgrade; you can make the adjustments later at a convenient time. For detailed information and instructions, see **Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys** in the ESA Configuration Guide.

Restore the Core Services Contents

Once you upgrade to 12.3.1.0, the Core services Contents such as Configuration files (.cfg), Feeds, Parsers, and Log Devices are copied to the **.tar** location of the respective components such as Decoder, Log Hybrid, Network Hybrid, and Log Decoder.

The following table lists the Core Services Contents paths and the **.tar** location of the respective components where the Core Services Contents are copied.

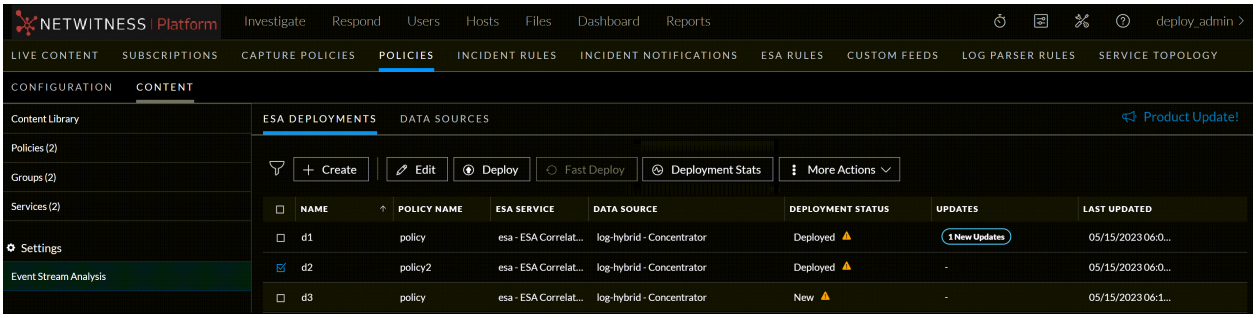
Core Services Contents Paths	Components	.tar location of the Components
/etc/netwitness/ng/feeds (Feeds)	Decoder	/var/netwitness/decoder/decoder_backupcontent_ccm.tar
/etc/netwitness/ng/parsers (Parsers)	Log Hybrid	/var/netwitness/logdecoder/logdecoder_backupcontent_ccm.tar
/etc/netwitness/ng/envision/etc/devices (Log Devices)	Network Hybrid	/var/netwitness/decoder/decoder_backupcontent_ccm.tar
/etc/netwitness/ng/NwDecoder.cfg (Configuration files (.cfg))	Log Decoder	/var/netwitness/logdecoder/logdecoder_backupcontent_ccm.tar

By default, CCM option is disabled. After upgrading to 12.3.1.0, if you enable CCM and encounter the loss of the Core Services Contents, you can use the backup tar files to recover the lost data. For more information, see https://community.netwitness.com/t5/netwitness-knowledge-base/automatic-backup-of-core-service-content-after-upgrading-core/ta-p/694527.

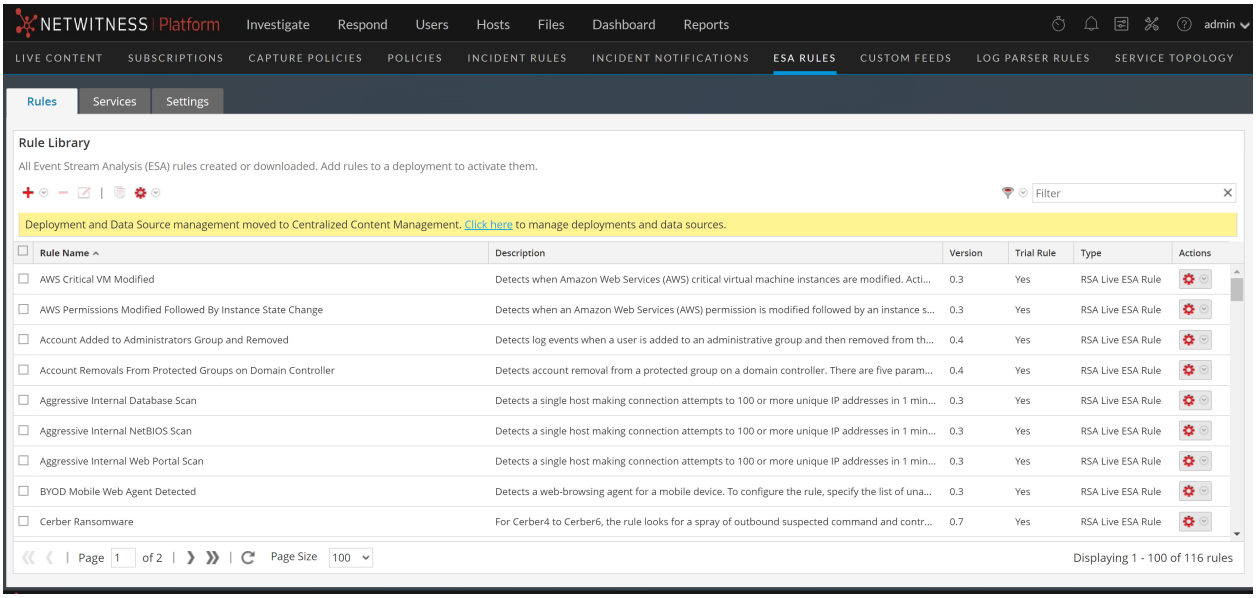
Event Stream Analysis (ESA)

After upgrading to the 12.3.1.0 version, all the ESA deployments will be migrated to (**CONFIGURE**) > **Policies** page. Each deployment will be converted into a policy and group and will be available to manage only after the upgrade of the Correlation servers to the 12.3.1.x version. Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. The deployments will not be accessible until the corresponding Correlation servers are upgraded. However, the correlation servers will still continue to process the Alerts and Events. Verify if all the ESA deployments are in a healthy state. For more information, see **View a Deployment** topic in the *Live Services Management Guide*.

Note: Analysts must have appropriate permissions to view the ESA rules under (**CONFIGURE**) > **ESA Rules** and (**CONFIGURE**) > **Policies** pages. For more information, see the **Source-server** section in the **Role Permissions** topic in the *System Security and User Management Guide*.



The pre-upgrade and post-upgrade states of deployments are represented in the following table.



SINo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No

(Optional) Using the **Merge Policy** button, you can merge a policy having ESA content with a policy with no ESA content. For more information, see **Merge Policy with ESA Content** topic in the *Live Services Management Guide*.

Manage ESA Deployments and Data Sources

In 12.1 and later versions, you can only manage the ESA deployments and Data Sources through **Centralized Content Management**. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** page to manage the ESA deployments and Data Sources. You can only manage the ESA Rules in the **ESA Rules** page. Refer the following figures.

You must upgrade the ESA hosts immediately after upgrading the Admin Server.

For more information on **Centralized Content Management** and managing the deployments, see Centralized Content Management Guide for NetWitness.

Respond

The Primary ESA server must be upgraded to 12.3.1.0 before you can complete the following task.

Note: After upgrading the primary NW Server (including the Respond Server service), the Respond Server service is not automatically re-enabled until after the Primary ESA host is also upgraded to 12.3.1.0. The Respond post-upgrade tasks only apply after the Respond Server service is upgraded and is in the enabled state.

(Conditional) Restore Any Respond Service Custom Keys in the custom_normalize_alerts.js and support new datasource

Note: If you did not manually customize the custom_normalize_alerts.js, you can skip this task. We attempt to automatically migrate the custom keys. However in case of failures, use this step to verify the custom data's integrity.

If you added custom keys in the `/var/netwitness/respond-server/scripts/custom_normalize_alerts.js` file for use in custom normailization, modify the `/var/netwitness/respond-server/scripts/custom_normalize_alerts.js` file and add the custom normalized keys from the automatic backup file. The backup file is located in `/var/netwitness/respond-server/scripts` and it is in the following format:

`custom_normalize_alerts.js.bak-<time of the backup>`

In case of automatic update of the script fails, add support for Netwitness Core and NetWitness Insight by updating the `custom_normalize_alerts.js` file manually to support these new sources in respond.

User Entity Behavior Analytics

Complete the following tasks after upgrading UEBA to 12.3.1.0.

IMPORTANT: Before the upgrade, if you encountered and resolved the task failure issues, then after the upgrade, you must replace the `authentication.json` file before you run the post-upgrade tasks. The task failure issues in Airflow and their solutions are described in the 'Troubleshooting' topic of the *UEBA Configuration Guide*.

IMPORTANT: Every UEBA deployment when upgraded requires additional steps to complete the upgrade process. When you upgrade from 11.6.x to 11.6.x.x, you must follow UEBA instructions in the Upgrade Guide for 11.6.x.x, before you upgrade to 11.7.x.

1. Update the UEBA configuration using the following command from the UEBA machine.
   ```
   source /etc/sysconfig/airflow

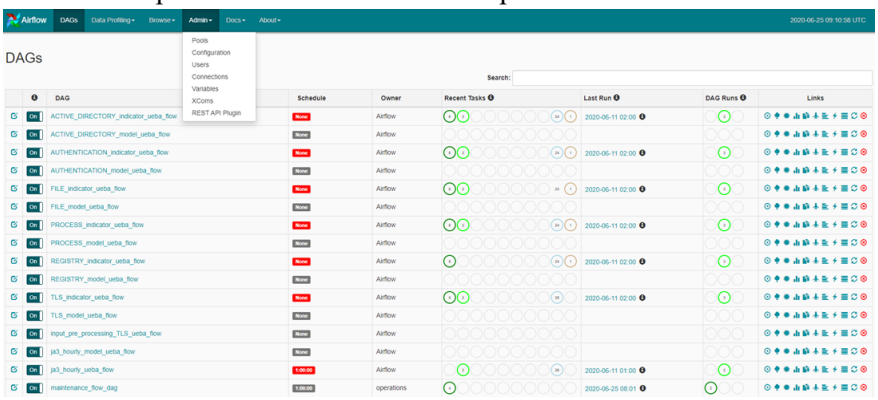
   source $AIRFLOW_VENV/bin/activate

   OWB_ALLOW_NON_FIPS=on python
   /var/netwitness/presidio/airflow/venv/lib/python2.7/site-packages/presidio_
   workflows-1.0-py2.7.egg/presidio/resources/rerun_ueba_server_config.py
   ```
2. (Optional) Update the UEBA processing schema, if needed.

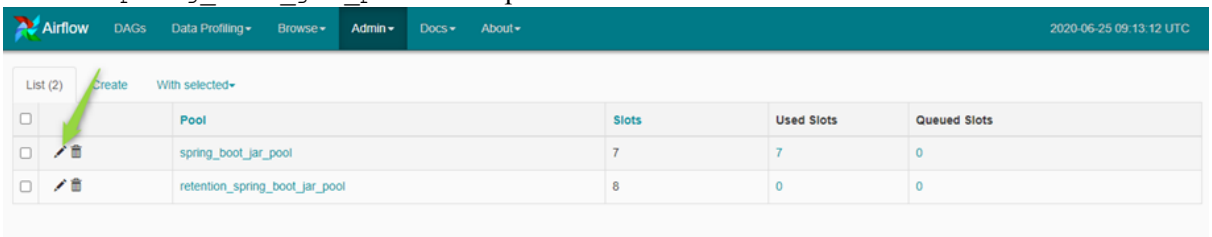
   NetWitness recommends that the UEBA start date is set to 28 days earlier than the current date. For UEBA systems that intend to process TLS data, you must make sure that the start date is set to no later than 14 days earlier than the current date.

For more information, see the "reset-presidio script" section in the *UEBA Configuration Guide*.

3. Run the airflow upgrade DAG.
   - Go to Airflow main page `https://<UEBA-host-name>/admin`
   - Enter the admin username and password.
   - Click the **Play** in `presidio_upgrade_dag_from_<previous_version> to_12.3.1.0`.



> **Note:** A light green circle will appear next to the upgrade DAG row during the upgrade. If the upgrade process is completed successfully the light green circle changes to green. If the upgrade process fails, the light green circle changes to red.



4. Set the appropriate "Boot Jar Pools" slots:
   - **Physical Appliance**: Update the `spring_boot_jar_pool` slot value be 18.
   - **Virtual Appliance**: Update the `spring_boot_jar_pool` slot value to 22.
     To update the **Spring Boot Jar Pools** slots, go to the Airflow main page, tap the **Admin** tab at the top bar and tap **Pools**.

   a. To access the Airflow UI, go to `https://<UEBA_host>/admin` and enter the credentials.
      User: admin
      Password: The environment deploy admin password.

b. Click on the pencil mark of the Pools to update the slot values.

5. Edit the `spring_boot_jar_pool` and update the slots amount to 22.

6. Import the Elasticsearch presidio data after upgrading the UEBA host from 12.0.0.0 or older versions to 12.3.1.0. Make sure the following prerequisites are met before you import the Elasticsearch presidio data:

   - Elasticsearch version must be upgraded to 7.15.2 from 5.5.0.
   - UEBA host must be upgraded to 12.3.1.0
   - UEBA rpm version must be 12.3.1.0.
   - Elasticsearch data in 12.0.0.0 or older versions must be exported and stored in the Elasticsearch data backup folder located in the `/root/` directory.

   ### To import the Elasticsearch data:

   a. Go to `cd ueba_es_migration_tool`. Run the following command.

   ```
   sh elk-migration-script.sh
   ```

   The Elasticsearch migration tool guide is displayed.

b. Select **Import documents to elasticsearch 7.15.2 from backup**.

c. In the next step, select **Fresh Import** to import the backup data.

```
Import documents to elasticsearch 7.15.2 from backup
 1. Fresh Import
 2. Resume Import
 3. Main menu
 4. Exit

Enter your option:
1

Source dir path:
/root/elasticsearch_export_backup

Total document found in given location[/root/elasticsearh_export_backup/log/es-migration-export.log]: 184081
Please wait processing your import request...

+----------------------------------------+----------+-------+------------+

| presidio-monitoring-2022.08.10         | 66538    | 66538 | 171230 ms. |
+----------------------------------------+----------+-------+------------+

Total: 184081, Imported: 184081, Dropped: 0, Started: 2022-08-16 07:44:48, Ends: 2022-08-16 07:53:41, Took: 533562 ms.
[root@ueba ueba_es_migration_tool]#
```

d. Restart the Presidio UI service once the Import operation is completed. Run the following command.

```
systemctl restart presidio-ui
```

e. Go to the NetWitness Platform **Users** tab and verify if all the Elasticsearch data is imported.

> **Note:**
> - Go to `<backup_directory_path>/log/log/es-migration-import.log` if you want to view the log for any exceptions.
> - If the Import operation fails due to some technical issue, select **Resume Import** once the issue is resolved, to resume the Import operation.

Legacy Windows Log Collector

Update the Legacy Windows Log Collector UUID

After upgrading to 12.3.1.0, for each Legacy Windows Log Collector configured in your environment, run the following command on the NW Server:

```
wlc-cli-client --update-to-uuid --host <WLC host address>
```

Refresh Legacy Windows Log Collector Certificates with Updated SA Certificates

Post Upgrade Steps:

1. Execute the following command in SA:

   a. `wlc-cli-client --host-display-name` **`hostDisplayName`** `--service-display-name` **`serviceDisplayName`** `--host` **`WLChostIPAddress`** `--port 50101 --use-ssl false`

      Enter following information:

      i. **Legacy Windows Log Collector REST Username and Legacy Windows Log Collector REST Password**: Enter the admin credentials for the Legacy Windows Log Collector.

      ii. **Security Server Username and Security Server Password**: Enter admin credentials for NetWitness.

2. Restart the system.

Perform Sanity Checks After Upgrade

You must perform the following sanity checks after upgrading to NetWitness 12.3.1.0.

1. Go to (Admin) > **Services** view to verify that all the services are active (appearing in green) after upgrade.
2. Verify that the services are upgraded to match the host version. The service version in (Admin) > **Services** view must match the host version in (Admin) > **Hosts** view after upgrade.
3. In the (Admin) > **Services** view, do the following.
   - Select a Log Collector service and go to (actions) > **View** > **System** view to verify if the required logs collection is started. You should click the Collection drop-down option and go to the right collection protocol to check if the logs collection is started. If the required collection is not started, select Start next to the required collection protocol from the list to start the collection.
   - Select a Log Decoder service and go to (actions) > **View** > **System** view to verify if the Log Decoder is capturing the logs properly.
   - Select a Packet Decoder service and go to (actions) > **View** > **Config** view to check if the capture interface is configured under **Decoder Configuration** section. If the capture interface is not configured, you must select the required capture interface from the drop-down list to configure it. If the capture interface is already configured, go to the (actions) > **View** > **System** view of the Packet Decoder and check if the capture is started. If the capture is not started, click Start Capture to start the packet capture.
4. Go to (Admin) > **Services** > Select a Log Decoder or Packet Decoder service > (actions) > **View** > **Stats** > **General** view to analyze the current capture rate.
5. Verify that the Concentrators, Archivers, and Brokers are aggregating the data. Make sure that you can investigate from each Concentrator, Archiver, and Broker to validate that it is operational.
6. Go to **Respond** > **Alerts** view to verify if the alerts are triggering from different sources.
7. Go to (Admin) > **Health & Wellness** > **Alarms** view and verify if the SMS server is up and running.
8. Go to (Admin) > **Event Sources** > **Monitoring Policies** view and verify if the policies configured before upgrade are appearing.
9. Go to (Admin) > **Health & Wellness** > **New Health & Wellness** > **Pivot to Dashboard** > **Elastic** > **Dashboard** view and ensure the following.
   - The visualizations you created before upgrade still exist.

- The metric server is up and running.
- Alerts are generated properly for the monitors you have configured before upgrade.

Perform Endpoint Upgrade Tasks

You must perform Endpoint upgrade tasks as part of the upgrade process. Do the following.

Install the 12.3.1.0 or Later Relay Server

If you have configured Relay Server, perform the following:

1. Upgrade the Relay Server to 12.3.1.0 or later by downloading the Relay Server installer from the upgraded Endpoint Server. For more information see **(Optional) Installing and Configuring Relay Server** section in the Endpoint Configuration Guide. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. Restart the Endpoint Server using the following command.

   ```
   systemctl restart rsa-nw-endpoint-server
   ```

   Note: You must keep the security patches up to date on the Relay Server.

Upgrade Endpoint Agents

See **Upgrade Agents** in the Endpoint Agent Installation Guide for NetWitness Platform for instructions on how to upgrade the agents.

Use New Features in NetWitness Platform

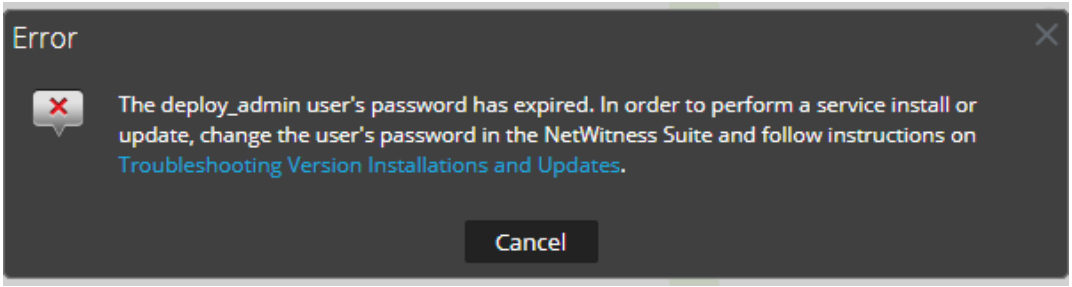
There are many exciting new features that you can enable after you have upgraded to 12.3.1.0. For a detailed description of the new features in this release, see the *Release Notes for NetWitness Platform 12.3.1.0*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues. For more information on the new features released in the previous releases, see https://community.netwitness.com/t5/netwitness-platform-online/what-s-new-in-previous-releases-11-x-to-12-x/ta-p/695650.

Troubleshoot Upgrade Issues

This section describes the error messages displayed in the Hosts view when it encounters problems updating host versions and installing services on hosts in the Hosts view. If you cannot resolve an upgrade or installation issue using the following troubleshooting solutions, contact Customer Support.

Troubleshooting instructions for the following errors that may occur during the upgrade are described in this section.

- deploy_admin Password Expired Error
- Downloading Error
- Error Deploying Version <version-number> Missing Update Packages
- Upgrade Failed Error
- External Repo Update Error
- Host Update Failed Error
- Missing Update Packages Error
- OpenSSL 1.1.x Error
- Patch Update to Non-NW Server Error
- Reboot Host After Update from Command Line Error
- Reporting Engine Restarts After Upgrade



Troubleshooting instructions are also provided for errors for the following hosts and services that may occur during or after an upgrade.

- Log Collector Service
- NW Server
- Orchestration
- Reporting Engine
- Event Stream Analysis
- Legacy Windows Log Collector
- User Entity Behavior Analytics

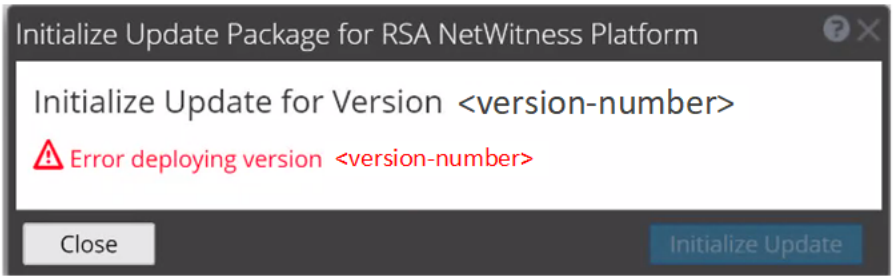
Problem	Unable to boot the appliance after upgrading
Wokaround	1. Manually modify the GRUB boot line to `FIPS=0` to get it to boot. 2. From here, disable FIPS using the following command: `manage-stig-controls --disable-control-groups 3 --host-all` 3. Verify the line `FIPS=1` is removed from `/boot/grub2/grub.cfg`

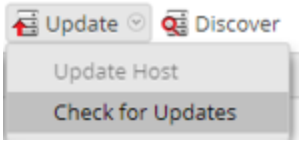
	• If not, run the following command:
	`grub2-mkconfig -o /boot/grub2/grub.cfg`
	4. Reboot.
	5. Run the following command to enable FIPS:
	`manage-stig-controls --enable-control-groups 3 --host-all`
	6. Reboot again.

deploy_admin User Password Has Expired Error

Error Message	
Cause	The `deploy_admin` user password has expired.

Solution	Reset your `deploy_admin` password password. Do the following.
	1. On the NW Server host only, run the following command.
	`nw-manage --update-deploy-admin-pw`
	`Please enter the new deploy_admin account password: <new-deploy-admin-password>`
	`Please confirm the new deploy_admin account password: <new-deploy-admin-password>`
	2. Review the output of the `nw-manage --update-deploy-admin-pw` command to verify the `deploy_admin` password was successfully updated on all hosts. If an NW host is down or fails for any reason as displayed by the output of the `nw-manage --update-deploy-admin-pw` command, run `nw-manage --sync-deploy-admin-pw --host-key <host-identifier>` to synchronize the password between the NW Server and the host that failed once the communication failure is resolved.
	3. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt.





Downloading Error

Error Message	
Problem	When you select an update version and click **Update** >**Update Host**, the download starts but fails to complete.
Cause	Version download files can be large and take a long time to download. If there are communication issues during the download it will fail.
Solution	1. Try to update again. 2. If it fails again with the same error, try to update using the offline methods as described in "Offline Method from Hosts View" or "Offline Method Using Command Line Interface" in the *Upgrade Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues. 3. If you are still not able to update, contact Customer Support.

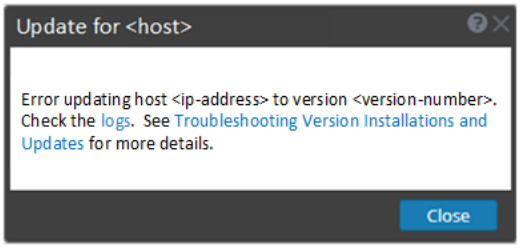
Error Message	If you are upgrading from NetWitness Platform 11.x.x.x to 11.6.x.x or later, offline UI upgrade fails with the Download error message.

Solution	1. In the Command Line Interface (CLI), do the following:
	a. SSH to NW Server.
	b. Run the following command:
	`upgrade-cli-client --upgrade --host-key <ID, IP address, hostname or display name of host> --version <version number>`
	`For example:`
	`upgrade-cli-client --upgrade --host-key <ID, IP address, hostname or display name of host> --version 11.6.0.0`
	2. After the NW Server is successfully updated, log in to the NW Server user interface and go to  **(Admin) > Hosts**, where you are prompted to reboot the host.
	3. Click **Reboot Host** from the toolbar.
	To upgrade all the other hosts directly from the user interface:
	1. Click **Begin Update** from the **Update Available** dialog.
	After the host is upgraded, it prompts you to reboot the host.
	2. Click **Reboot Host** from the toolbar.

Error Deploying Version <version-number> Missing Update Packages

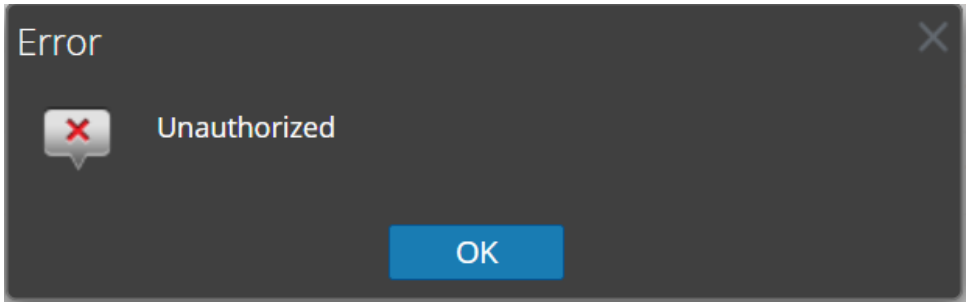
Error Message	
Problem	Error deploying version <version-number> is displayed in the **Initialize Update Package for NetWitness Platform** dialog after you click on **Initialize Update** if the update package is corrupted.
Solution	1. Click **Close** to close the dialog. 2. Remove the version folder from staging folder. 3. Make sure that the salt-master service is running. 4. Recopy the update package zip file to the staging folder. 5. In the **Hosts** view toolbar, select **Check for Updates** again.  6. Click **Initialize Update**. 7. Click **Update** > **Update Hosts** from the toolbar. 8. Click **Begin Update** from the **Update Available** dialog. After the host is updated, it prompts you to reboot the host. 9. Click **Reboot** from the toolbar.

Upgrade Failed Error



Error Message	You will receive an error in the error log similar to the following while trying to update to version 11.6 or later: `FATAL: Chef::Exceptions::Package: yum_package[rsa-protobufs-rt] (rsa-audit::packages line 11) had an error: Chef::Exceptions::Package: No version specified, and no candidate version available for rsa-protobufs-rt`
Cause	Custom builds/rpms installed for certain components installed on hosts, such as in the case of installing Hotfixes.

Solution	**To resolve the issue:**
	1. SSH to Admin Server.
	2. Locate the component descriptor file by running the following command.
	`cd /etc/netwitness/component-descriptor/`
	3. Open the component descriptor file by running the following command.
	`vi nw-component-descriptor. json`
	4. Search for "packages" section for the component you have custom build/rpm. For example, below shown is the package details for "concentrator" host that has custom build/rpm.
	`"concentrator": {`
	`"cookbook_name": "rsa-concentrator",`
	`"service_names": ["rsa-nw-concentrator"],`
	`"family": "launch",`
	`"default_port": xxxx, "description": "Concentrator",`
	`"packages":[{ "name": "rsa-nw-concentrator",`
	`"version" : "11.6.0.0-2003001075220.5.cecf24b.e.17.centos"`
	`},`
	5. Delete the complete version details including (,) character in the packages section. For example, it should look like as shown below after you delete the version details.
	`"packages": [{`
	`"name": "rsa-nw-concentrator"`
	`},`
	Note: You must delete the version details for all the host that has custom builds/rpms in the component descriptor of the admin server.
	6. Run the upgrade process again.



External Repo Update Error

Error Message	You will receive an error similar to the following error while trying to update to a new version from the : `.Repository 'nw-rsa-base': Error parsing config: Error parsing "baseurl = 'https://nw-node-zero/nwrpmrepo /<version-number>/RSA'": URL must be http, ftp, file or https not ""`
Cause	Incorrect path specified.
Solution	Make sure that: • the URL does exist on the NW Server host. • you used the correct path and remove any spaces from it.

Host Update Failed Error

Error Message	
Problem	When you select an update version and click **Update** > **Update Host**, the download process is successful, but the update process fails.

Solution	1. Try to apply the version update to the host again.
	Often this is all you need to do.
	2. If you still cannot apply the new version update:
	Monitor the following logs on NW Server as it progresses (for example, run the `tail -f` command from the command line):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error appears in one or more of these logs.
	3. If you still cannot apply the update, gather the logs from **step 2** above and contact Customer Support.

Error Message	
Problem	When you select an update version and click **Update** > **Check for Updates**, the **Unauthorized** error message is displayed. As a result, the connection to the live service fails.
Solution	1. Make sure the Live test connection passes. 2. Update https://update.netwitness.com/RSA-netwitness in **(Admin)** > **System** > **Updates**.

	3. SSH to the Admin Server and backup `/etc/default/jetty`.
	4. Update the following entry at the end of the JAVA_OPTIONS in the `/etc/default/jetty`.
	`JAVA_OPTIONS="${JAVA_OPTIONS} -Drsa.nw.legacy.web.server.system.update.repo.url=https://update.netwitness.com/RSA-netwitness/ -Drsa.nw.legacy.system.update.auth.url=https://update.netwitness.com/authenticate "`
	5. Restart the jetty service. Run the following command.
	`service jetty restart`

Missing Update Packages Error

Error Message	**Initialize Update for Version xx.x.x.x** Missing the following update package(s) Download Packages from NetWitness Link
Problem	Missing the following update package(s) is displayed in the **Initialize Update Package for NetWitness Platform** dialog when you are updating a host from the **Hosts** view offline and there are packages missing in the staging folder.
Solution	1. Click Download Packages from NetWitness Community in the **Initialize Update Package for NetWitness Platform** dialog. The NetWitness Community page that contains the update files for the selected version is displayed. 2. Select the missing packages from the staging folder. The **Initialize Update Package for NetWitness Platform** dialog is displayed telling you that it is ready to initialize the update packages.

OpenSSL 1.1.x

Error Message	The following example illustrates an ssh error that can occurs when the ssh client is run from a host with OpenSSL 1.1.x installed: `$ ssh root@10.1.2.3` **`ssh_dispatch_run_fatal: Connection to 10.1.2.3 port 22: message authentication code incorrect`**

Problem	Advanced users who want to ssh to a NetWitness Platform host from a client that is using OpenSSL 1.1.x encounter this error because of incompatibility between CENTOS 7.x and OpenSSL 1.1.x. For example:
	`$ rpm -q openssl`
	`openssl-1.1.1-8.el8.x86_64`

Solution	Specify the compatible cipher list on the command line. For example: `$ ssh -oCiphers=aes128-ctr,aes192-ctr,aes256-ctr root@10.1.2.3`

	I've read & consent to terms in IS user agreement. root@10.1.2.3's password: Last login: Mon Oct 21 19:03:23 2019

Patch Update to Non-NW Server Error

Error Message	The `/var/log/netwitness/orchestration-server/orchestration-server.log` has an error similar to the following error: **`API|Failure /rsa/orchestration/task/update-config-management [counter=10 reason=IllegalArgumentException::Version '11.x.x.n' is not supported`**
Problem	After you update the NW Server host to a version, you must update all non-NW Server hosts to the same version. For example, if you update the NW Server from 11.4.0.0 to 11.6.0.0 or later, the only update path for the non-NW Server hosts is the same version (that is, 11.6.0.0). If you try to update any non-NW Server host to a different version (for example, from 11.4.0.0 to an 11.4.x.x) you will get this error.
Solution	Do any of the following: • Update the non-NW Server host to 11.6.0.0 or later, or • Do not update the non-NW Server host (keep it at its current version)

Reboot Host After Update from Command Line Error

Error Message	You will receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	The above error occurs when you use CLI to reboot the host. You must use the User Interface to reboot the host.
Solution	Reboot the host in the **Host** View in the User Interface.

Reporting Engine Restarts After Upgrade

Problem	In some cases, after you upgrade to 11.6 or later from versions of 11.x, such as 11.4, the Reporting Engine service attempts to restart continuously without success.
Cause	The database files for live charts, alert status, or report status may not be loaded successfully as the files may be corrupted.
Solution	**To resolve the issue:** 1. Check which database files are corrupted: Navigate to the file located at

`/var/netwitness/reserver/rsa/soc/reporting-engine/logs/reporting-engine.log` and check the following blocks:

- If the live charts db file is corrupted, the following logs are displayed:

```
Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception:

org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196]

    at org.h2.message.DbException.getJdbcSQLException(DbException.java:345)

    at org.h2.message.DbException.get(DbException.java:168)

org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'chartSummaryDAOImpl': Invocation of init method failed; nested exception is com.rsa.soc.re.exception.ReportingException: java.sql.SQLException: Connections could not be acquired from the underlying database!
```

- If the alert status db file is corrupted, the following logs are displayed:

```
Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception:

org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196]

    at org.h2.message.DbException.getJdbcSQLException(DbException.java:345)

    at org.h2.message.DbException.get(DbException.java:168)

org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertStatusHandler': Unsatisfied dependency expressed through field 'alertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertExecutionStatsDAOImpl': Unsatisfied dependency expressed through field 'persistedAlertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'persistedAlertExecutionStatsDAOImpl'
```

- If the report status db file is corrupted, the following logs are displayed:

```
org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196]
```

2. To resolve the live charts database file corruption, do the following:
   a. Stop the Reporting Engine service.
   b. Move the `livechart.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/livecharts` folder to a temporary location.
   c. Restart the Reporting Engine service.

   Note: Some live charts data may be lost on performing the above steps.

3. To resolve the alert status or report status database file corruption, perform the following steps:
   a. Stop the Reporting Engine service.
   b. Replace the corrupted db file with the latest `alertstatusmanager.mv.db` or `reportstatusmanager.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/archives` folder.

	c. Restart the Reporting Engine service. For more information, see the Knowledge Base article Reporting Engine restarts After upgrade to NetWitness Platform 11.4.

Problem	After you upgrade to version 11.6 or later, the Reporting Engine service does not restart.
Cause	The Reporting Engine service may not start due to any of the following reasons. - workspace.xml not updated. - Time is not converted properly in livechart h2 database. - JCR (Jackrabbit repository) is corrupted with primary key violation.

Solution	To resolve the issue, run the Reporting Engine Migration Recovery tool (`rsa-nw-re-migration-recovery.sh`) on the Admin Server where the Reporting Engine service is installed.
	Note: You can find the Reporting Engine Migration Recovery tool in the below location.
	`/opt/rsa/soc/reporting-engine-<version number>-<Tag>/nwtools`
	For example:
	`/opt/rsa/soc/reporting-engine-11.6.0.0-<Tag>/nwtools`
	1. SSH to Admin Server.
	2. Untar the RE (Reporting Engine) tool, run the following command.
	`tar -xvf rsa-nw-re-recovery-tool-bundle.tar`
	3. (Optional) If you want to untar the RE tool file in some other directory, you can create a directory and untar the RE tool. Run the following commands.
	`mkdir <NAME OF THE DIRECTORY>`
	`tar -xvf rsa-nw-re-recovery-tool-bundle.tar --directory <PATH OF THE DIRECTORY>`
	4. Run the script, run the following command.
	`./<PATH OF THE DIRECTORY>/rsa-nw-re-recovery-tool.sh`
	For more information, see the Knowledge Base article **Reporting Engine Migration Recovery Tool**.

Log Collector Service (`nwlogcollector`)

Log Collector installation logs posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the **Reset the Stable System Value**

	topic under **Configure Lockbox Security Settings** topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness and configure the Lockbox as described in the **Configure Lockbox Security Settings** topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness and reset the stable system value password for the Lockbox as described in the **Reset the Stable System Value** topic under **Configure Lockbox Security Settings** topic in the *Log Collection Configuration Guide*.

Error Message	Decoder tries to start capture events but fails. `Aug 27 01:44:41 nwdecoder NwDecoder[8052]: [Decoder] [failure] The PF_RING driver is not installed.`

Solution	**To resolve the issue:**
	1. SSH to the Decoder host.
	2. Run the following commands.
	`yum reinstall pfring*`
	`systemctl restart nwdecoder`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you will notice one of the following: • Audit logs are not getting forwarded to the configured Global Audit Setup. • The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 11.4.x.x or 11.5.x.x. to 11.6.0.0 or later.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Problem	When you install and orchestrate a fresh 12.3.1.0 core Node-X to the Admin server (Node-0) upgraded from 12.0 or older versions to 12.3.1.0, the core services such as Concentrator, Log Decoder, Log Collector, Archiver, Decoder, Appliance, Workbench, Warehouse Connector, and Broker appear inactive under the **Services** column in the **Admin** > **Hosts** view. As a result, you cannot access the core services in the UI. This is not applicable if you are orchestrating a fresh 12.3.1.0 core Node-X to the fresh-Installed 12.3.1.0 Admin Server (not upgraded from 12.0 or older versions to 12.3.1.0).
Cause	The 12.3.1.0 core Node-X uses a dedicated SA-server certificate instead of the common Node-0 node certificate under its trustpeers if it is orchestrated directly to an upgraded 12.3.1.0 Admin Server host.

Solution	1. Before you bootstrap and orchestrate the 12.3.1.0 core Node-X host, run the following commands.
	`mkdir -p /etc/netwitness/platform`
	`touch /etc/netwitness/platform/nw-upgrade-mode`
	2. Perform this workaround only if you skip the above workaround (Workaround 1). Run the following commands after you bootstrap and orchestrate the 12.3.1.0 core Node-X host.
	`touch /etc/netwitness/platform/nw-upgrade-mode`
	`nw-manage --refresh-host --host-key <core-node-x-salt-minion-uuid>`
	`systemctl restart <core-service-name>`
	Note:
	- Refer the file `/etc/salt/minion` to find `<core-node-x-salt-minion-uuid>`.

	- You must enter the core service name such as **nwarchiver** (Archiver), **nwdecoder** (Decoder), **nwlogcollector** (Log Collector), **nwappliance** (Appliance), **nwconcentrator** (Concentrator), **nwlogdecoder** (Log Decoder), **nwbroker** (Broker), **nwworkbench** (Workbench), and **nwwarehouseconnector** (Warehouse Connector) in `<core-service-name>`.

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

Error Message	`<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [ ><existing-GB ] is less than the required space [ <required-GB> ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the **Add Additional Space for Large Reports** topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space.

Event Stream Analysis

Problem	After upgrading to version 12.3.1.0 or later, the ESA correlation server does not aggregate events from the configured data sources.
Error Message	`Invalid username or password at com.rsa.netwitness.streams.base.RecordSourceSubscription.run (RecordSourceSubscription.java:173)`
Solution	**To resolve the issue:** In the NetWitness user interface, 1. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** > **Data Sources**. The **Data Sources** panel is displayed. 2. Select the data source and click **Edit Datasource** in the toolbar. The **Edit Datasource** dialog is displayed. 3. In the **Edit Datasource** dialog, do one of the following: • Select **Trusted Authentication**. • Select **Use Credentials** and enter the Username and Password. 4. Click **Test Connection** to make sure that it can communicate with the ESA service and then click **OK**. **Note:** Do the above procedure for all the configured data sources.

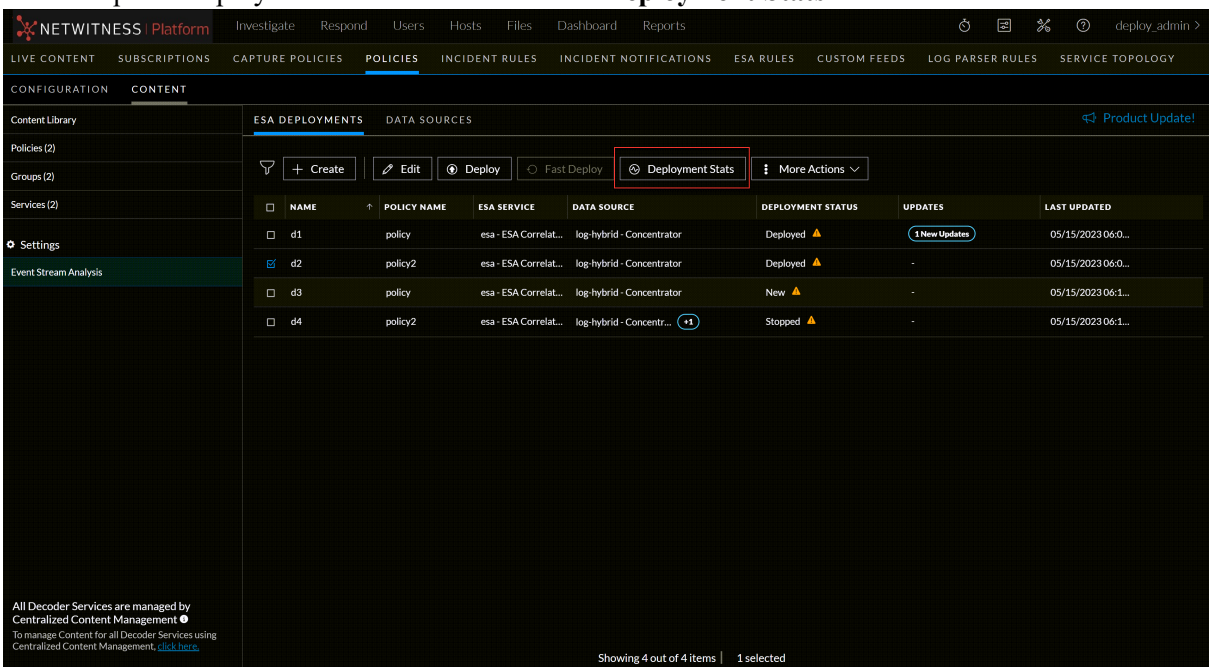
	5. Deploy all the deployments associated with the edited data sources in the **Data Sources** panel after you finish making changes to the data sources.

Legacy Windows Log Collector

Problem	• Legacy Windows Log Collector appears as inactive post upgrade of SA to 12.3.1.0 version and Legacy Windows Log Collector to 11.6.x or 11.7.x versions. • Legacy Windows Log Collector appears as inactive when the stack is upgraded to 12.3.1.0.
Cause	Certificate update in the SA node.
Solution	Refer Legacy Windows Log Collector section in the Perform Post Upgrade Tasks.

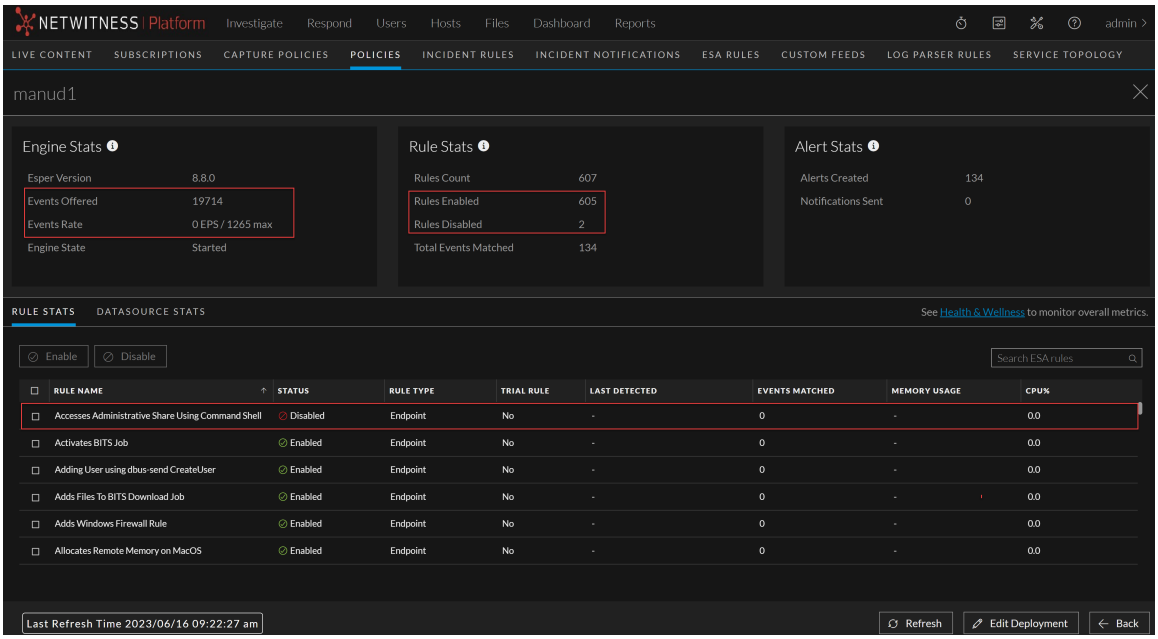
User Entity Behavior Analytics

Problem	The Context Hub Server **Config** page (**(Admin)** > **Services** > **select the ContextHub Server** > **View** > **Config**) keeps loading post upgrade, if the RSA Endpoint (ECAT Data Sources) is not removed from the Context Hub Server before upgrading from 11.7 and older versions to 12.0, 12.1, or 12.1.x.x versions.
Cause	In 12.0 and later versions, the ECAT Integration such as the RSA Endpoint (ECAT Data Sources) in the ContextHub Server is not supported by NetWitness Platform.



Solution	Do the following to access the Context Hub Server **Config** page.
	1. SSH to the Admin Server.
	2. Log in to the MongoDB.
	3. Go to the ContextHub collection and search for the **RSA Endpoint** document.
	4. Delete the entry **RSA Endpoint** from the Admin Server Mongo.
	5. Restart the Mongo. Run the following command.
	`service mongo restart`
	6. Restart the Context Hub service. Run the following command.
	`service rsa-nw-contexthub-server restart`
	The **Config** page is loaded properly.
	Note: You must restart the Context Hub service from the ESA box.

ESA Troubleshooting Information



ESA Rules are Not Creating Alerts

If you are not seeing any alerts, check the status of the ESA rule deployments.

1. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** > **ESA Deployments**. The **ESA Deployment** panel is displayed.
2. Select required deployment from the list and click **Deployment Stats** tab.

3. Deployment Stats page is displayed, which shows the status of your ESA services and deployments.
4. For each ESA rule deployment:
   a. In the **Engine Stats** section, look at the **Events Offered** and the **Offered Rate**. They confirm that the data is being aggregated and analyzed properly. If you see 0 for Events Offered, nothing is coming in for the deployment.
   b. In the **Rule Stats** section, look at the **Rules Enabled** and **Rules Disabled**. If there are any disabled rules, look in the **Deployed Rule Stats** section below to view the details of the disabled rules. Disabled rules show a white circle. Enabled rules show a green circle.

5. If you notice any disabled rules that should be enabled:

   a. Go to  **(Configure) > ESA Rules > Rules** tab and redeploy the ESA rule deployments that contain disabled rules.

   b. Go back to the **Services** tab and check to see if the rules are still disabled. If the rules are still disabled, check the ESA Correlation service log files, which are located at `/var/log/netwitness/correlation-server/correlation-server.log`.

Note: To avoid unnecessary processing overhead, the Ignore Case option has been removed from the ESA Rule Builder - Build a Statement dialog for meta keys that do not contain text data values. During the upgrade to 11.4 or later, NetWitness Platform does not modify existing rules for the Ignore Case option. If an existing Rule Builder rule has the Ignore Case option selected for a meta key that no longer has the option available, an error occurs if you try to edit the statement and try to save it again without clearing the checkbox.

Example ESA Correlation Server Warning Message for Missing Meta Keys

If you see a warning message in the ESA Correlation server error logs that means there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, the new Endpoint, UEBA, and Live content rules will not work. Completing the **Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules** procedure in the *ESA Configuration Guide* should fix the issue.

Multi-Valued Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[alert, alert_id,
browserprint, cert_thumbprint, checksum, checksum_all, checksum_dst, checksum_
src, client_all, content, context, context_all, context_dst, context_src, dir_
path, dir_path_dst, dir_path_src, directory, directory_all, directory_dst,
directory_src, email_dst, email_src, feed_category, feed_desc, feed_name,
file_cat, file_cat_dst, file_cat_src, filename_dst, filename_src, filter,
function, host_all, host_dst, host_orig, host_src, host_state, ip_orig, ipv6_
orig, OS, param, param_dst, param_src, registry_key, registry_value, risk,
risk_info, risk_suspicious, risk_warning, threat_category, threat_desc,
threat_source, user_agent] are still MISSING from multi-valued
```

Single Value Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[accesses, context_target,
file_attributes, logon_type_desc, packets] are still MISSING from single-
valued
```

Use NetWitness Community Portal for Assistance

You can use NetWitness Community Portal to search for specific documents, find information related to End of Life of appliances, and read blogs.

Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Create a Post** fields in NetWitness Community portal to find specific information here: https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Contact NetWitness Support

If you contact NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

NetWitness Community Portal	https://community.netwitness.com In the main menu, click **Support > Case Portal > View My Cases**.
International Contacts (How to Contact NetWitness Support)	https://community.netwitness.com/t5/support/ct-p/support
Community	https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
NW Update	https://update.netwitness.com

What is NetWitness Endpoint?

NetWitness Endpoint is an endpoint detection and response tool that continuously monitors the behavior of all endpoints in the network to provide deep visibility and analysis of executables and processes. It helps to detect new, unknown, and targeted attacks, highlights suspicious activity for investigation, exposes anomalous behaviors, and determines the scope of compromise to help analysts respond to advanced threats faster.

About this Guide

This guide provides end-to-end instructions to configure NetWitness Endpoint and to use Endpoint features.

NetWitness Platform Documentation in NetWitness Community Portal

NetWitness Platform product documentation is organized along functional lines. If you are looking for a specific guide or version, go to the a.

Use these links to view the NetWitness Platform 12.x documentation. Both links provide the same documentation, in these two formats:

- HTML Guides include the latest information for currently supported 12.x versions: NetWitness Platform 12.x Documentation.
- PDF Guides provide the information for a specific version: NetWitness Platform 12.3.1 PDFs.

Use these links to access documentation that is not related to a particular version of the software:

- Hardware setup guides: https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation
- Documentation for RSA Content such as feeds, parsers, application rules, and reports: https://community.netwitness.com/t5/netwitness-platform-threat/tkb-p/netwitness-threat-intelligence.

Getting Started

The following tasks can be performed in any sequence.

Description	References
	

Description	References
View information about product updates, improvements, and known issues.	*Release Notes*
Understand NetWitness Endpoint.	"Getting Started with NetWitness Platform" and "Investigate" in the *NetWitness Platform Getting Started Guide*

Setup and Installation

Fresh Installation

The following tasks must be performed in the sequence listed.

Description	References
	
Obtain a license for Endpoint Log Hybrid.	Licensing Management Guide
Review the supported hardware.	"Supported Hardware" in the *Physical Host Installation Guide*
Review the Endpoint architecture; plan your deployment based on the number of endpoints, distribution, and location of these endpoints; and choose one of the following deployments: • Single Endpoint server • Multiple Endpoint server	"NetWitness Endpoint Architecture" in the *Deployment Guide*
Configure the ports on your firewall.	"Network Architecture and Ports" in the *Deployment Guide*
Install NetWitness Server and other components. For a single Endpoint server deployment, you need to install - NetWitness Server, Endpoint Log Hybrid, and ESA. For a multiple Endpoint server, in addition to the above components, you need to install - Additional Endpoint Log Hybrid, NetWitness Broker along with Endpoint Broker installed on it.	- *Physical Host Installation Guide* for instructions on how to set up physical hosts - *Virtual Host Installation Guide* for instructions on how to set up virtual hosts

Description	References
Install Endpoint Log Hybrid.	"RSA NetWitness Endpoint" in the *Physical Host Installation Guide*
Review the services installed.	*Hosts and Services Getting Started Guide*
Note: Review the default policies and modify them accordingly. Install Endpoint agent on hosts.	"Endpoint Sources" topic in the *Endpoint Configuration Guide* *NetWitness Endpoint Agent Installation Guide*

Upgrade

The following tasks must be performed in the sequence listed.

Description	References
	
Install the 12.3.1.0 Relay Server	"Install the 12.3.1.0 Relay Server" in the Upgrade Guide
Upgrade Endpoint Agents	"Upgrade Agents" in the *Endpoint Agent Installation Guide*

Configuration

The following tasks can be performed in any sequence.

Description	References
	
Understand NetWitness Endpoint and high-level tasks required for configuration.	"NetWitness Endpoint Overview and Endpoint Server Configuration" in the *Endpoint Configuration Guide*
Review Groups and Policies for agents.	"Endpoint Sources" topic in the *Endpoint Configuration Guide*

Description	References
Set up the RSA Live account and verify if the ESA content and Application Rules for Endpoint are available. **Note:** The file reputation service is automatically enabled on RSA Live.	*Live Services Management Guide*
Create role-based access control (RBAC).	"Role Permissions" in the System Security and User Management Guide

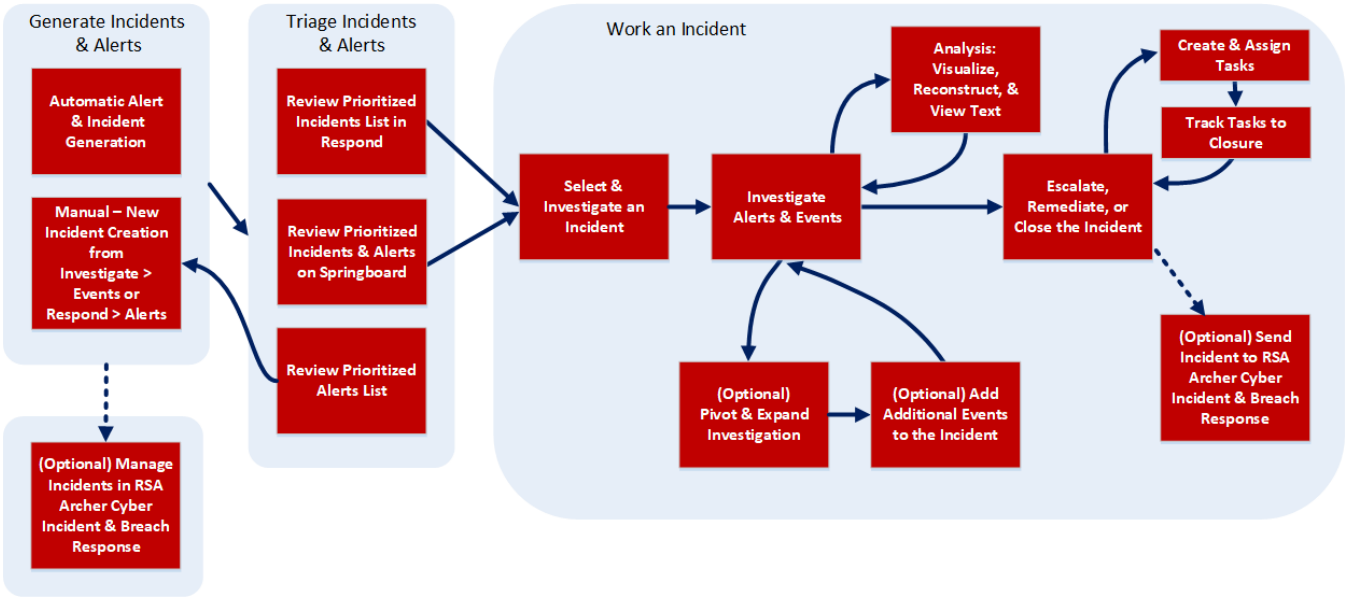
NetWitness Respond Process

NetWitness Respond collects alerts from multiple sources and provides the ability to group them logically and start an Incident Respond workflow to investigate and remediate the security issues raised. NetWitness Respond enables you to configure rules that automatically aggregate alerts into incidents. Alerts are normalized by the system to a common format to provide users with a consistent view for the rule criteria regardless of the data source. You can build query criteria based on the alert data with the ability to query on fields that are common as well as specific to data sources.

The rule engine allows you to group similar alerts together into an incident so that the investigation and remediation workflow can be shared across a set of similar alerts. You can create rules that can group alerts into incidents depending on a common value they share for one or two attributes (for example, source hostname) or if they are reported within a limited time window (for example, alerts that are within four hours of each other).

If an alert matches a rule, an incident is created using the criteria. As new alerts are ingested, if an existing incident was already created that matched those criteria, and that incident is not "in progress" yet, the new alerts continue to be added to the same incident. If there is no existing incident for the grouped value (for example, the specific hostname) or the time window, a new incident is created and the alert is added to it.

You can have multiple incident rules. The rules can either group alerts into incidents or suppress alerts from being matched by any rule. The rules are ranked top-to-bottom and only the first rule to match an incoming alert is used to include that alert in an incident. The incidents provide a context for the alerts, provide tools to record the investigation status, and track the progress of associated tasks.



The stages in the NetWitness Respond process are:

- **Generate Incidents & Alerts**
  - Automatic Alert & Incident Generation
  - Manual - New Incident Creation from Investigate > Events or Respond > Alerts
  - (Optional) Manage Incidents in Archer Cyber Incident and Breach Response (If you manage incidents in Archer instead of in NetWitness Respond, the process ends here.)
- **Triage Incidents & Alerts**
  - Review Prioritized Incident List in Respond
  - Review Prioritized Incidents & Alerts on Springboard
  - Review Prioritized Alerts List
- **Work an Incident**
  - Select & Investigate Incident
  - Investigate Alerts & Events
    - Analysis: Visualize, Reconstruct, and View Text
    - (Optional) Pivot & Expand Investigation
    - (Optional) Add Additional Events to Incident

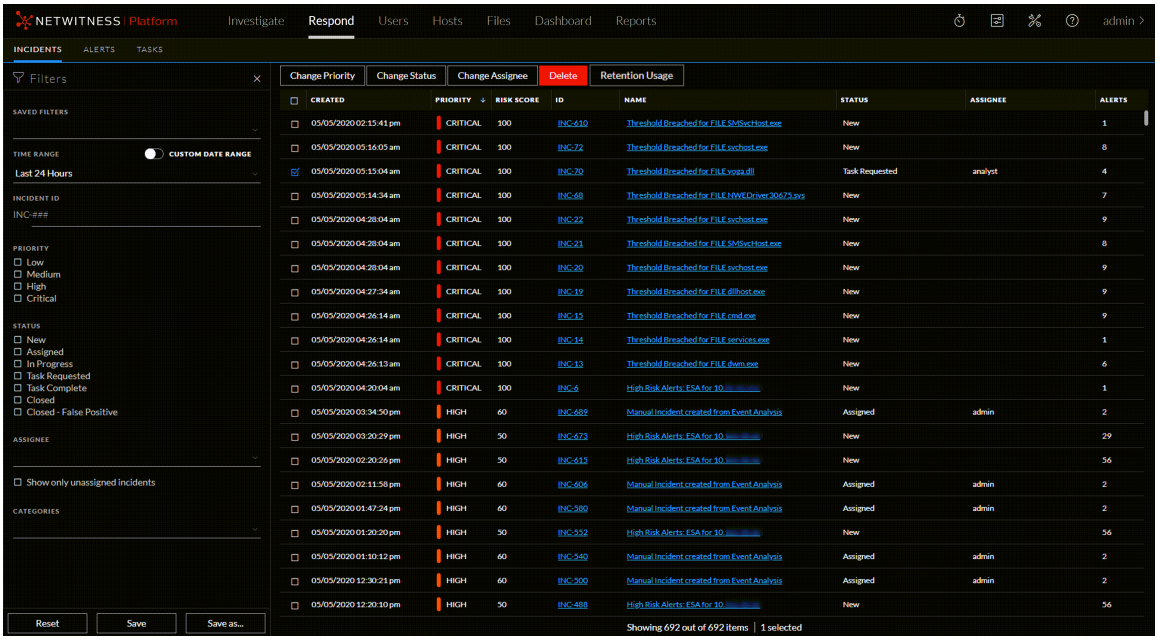
- Escalate, Remediate, or Close the Incident
  - Create & Assign Tasks
  - Track Tasks to Closure
  - (Optional) Send Incidents to Archer Cyber Incident & Breach Response. (In NetWitness version 11.2 and later, if Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response.)

NetWitness Respond Workflow

The following figure shows the high-level NetWitness Respond workflow process.

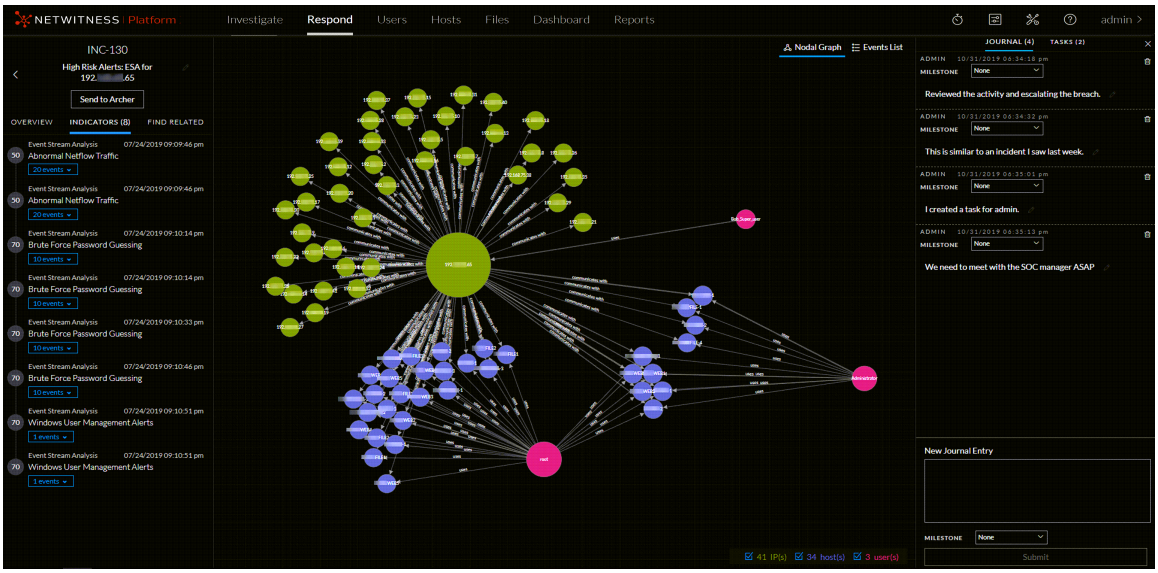
Responding to Incidents

An *Incident* is a logically grouped set of alerts created automatically by the Incident Aggregation Engine and grouped by a specific criteria. An incident, available in the Respond view, allows an Analyst to triage, investigate, and remediate these groups of alerts. Incidents can be moved between users, notated, and explored using a nodal graph. Incidents allow users to ensure that they understand the full scope of an attack or event in their NetWitness system and then take action.



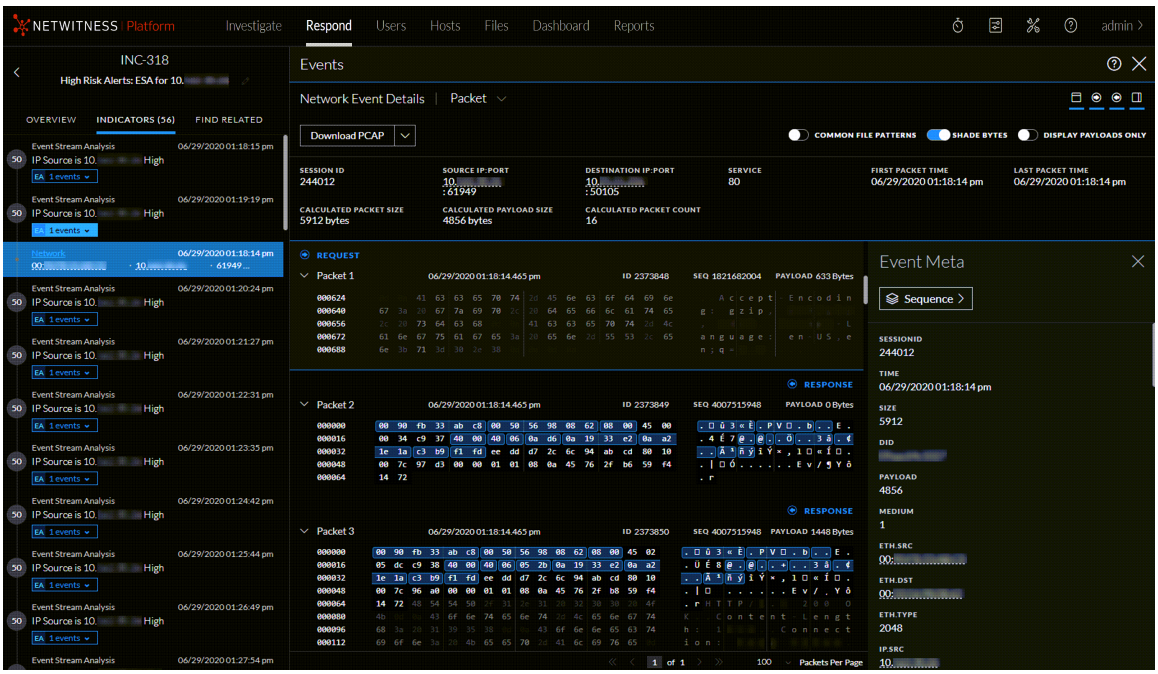
The **Respond** view is designed to help you quickly identify the ongoing issues in your network and work with other Analysts to quickly solve the issues.

The Respond view presents Incident Responders with a queue of incidents in severity order. When you take an incident from the queue, you receive relevant supporting data to help you investigate the incident. This enables you to determine the incident scope so you can escalate or remediate it as appropriate.

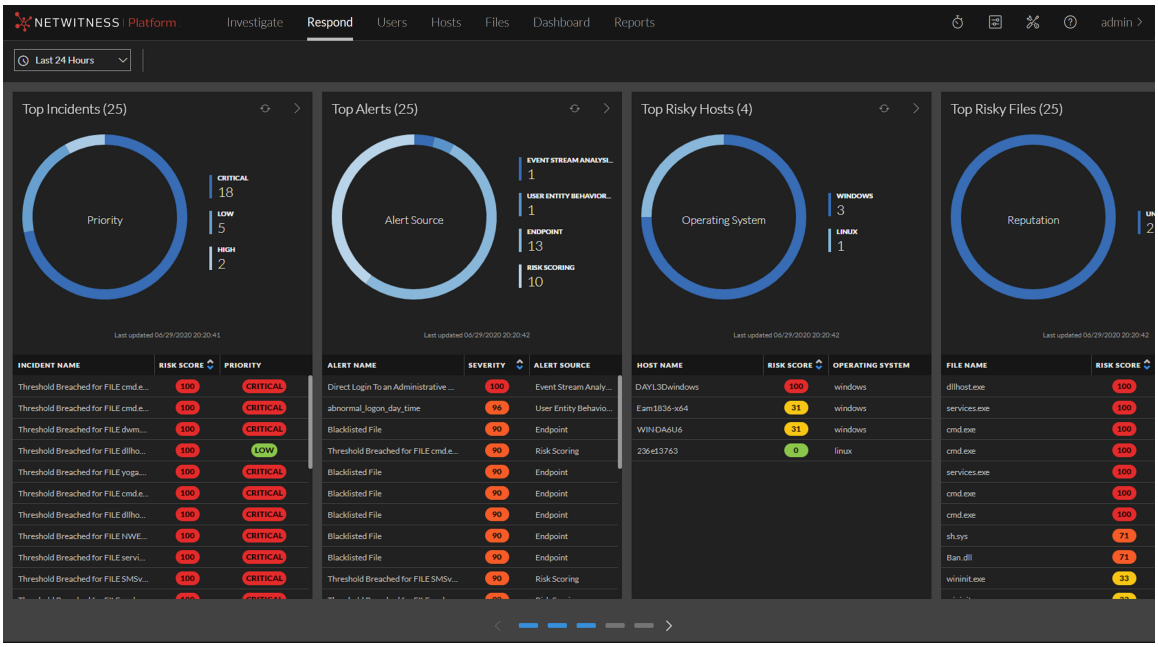


Within the Respond view, you can see Incidents, Alerts, and Tasks:

- **Incidents**: Enables you to respond to and manage incidents from start to finish.
- **Alerts**: Enables you to manage alerts from all sources received by NetWitness and create incidents from selected alerts.
- **Tasks**: Enables you to view and manage the complete list of tasks created for all incidents.



If you navigate to Respond > Incidents, you can see the Incidents List view and from there you can access the Incident Details view for a selected incident. These are the main views that you use to respond to incidents. The following figure shows the list of prioritized incidents in the **Incidents List** view.



The next figure shows an example of details available in the **Incident Details** view.

The Respond view is designed to make it easy to evaluate incidents, contextualize that data, collaborate with other analysts, and pivot to a deep-dive investigation as needed. The following figure shows an example of an event analysis in the Incident Details view.

In NetWitness Version 11.4 and later, alerts and incidents are also displayed in the Springboard by default. Springboard is a landing page for analysts showing them all risks detected by the platform in a single place. For more information on the Springboard, see "Managing the Springboard" in the *NetWitness Platform Getting Started Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Respond Persist Data

The primary objective of this feature is to enable you to investigate events for a longer period of time. When investigating a set of alerts or events, it is important to have the assurance that the underlying data (raw and meta) will be available for both the length of time it takes to run the analysis, and for historical look up. From NetWitness Platform Version 11.6, you can persist events that are associated with particular incidents, thereby enabling you to view the incident in the future, regardless of its age. You can also add a new journal entry in the **JOURNAL** tab for the persisted events for future reference. The event data will always be available for viewing and reconstruction as long as the event is persisted, enabling you to easily refer back to details, even if the original event has rolled over from the NetWitness database.

Once you persist an event, the data is copied from the NetWitness database into a long term storage cache within the data source. You can persist or suspend persist events per incident or per alert within an incident or a specific event in an alert that belongs to an incident. The roll over in the NetWitness database does not impact the events that are already saved in the long term cache.

You can:

- You can persist or suspend persist events per incident or per alert within an incident or a specific event in an alert that belongs to an incident.
- Perform complete event reconstruction for persisted events even after the session is rolled over from the NetWitness database.

- Filter incidents which has persisted events.
- Suspend persist of all events associated with an incident, even if only a few events persisted in it.
- Remove all associated persisted events by deleting an alert or incident.

This topic contains the following basic Respond Persist Data procedures:

- Customizing Respond Persist Data
- Working with Incident Filters
- Persist and Suspend Persist Events
- Change Event Retention

Customizing Respond Persist Data

The persisted events are saved in the directory `/var/netwitness/pin-<servicetype>`, by default. You can manually change the event storage location from the default directory to any other directory, as per the requirement. You can increase the storage space as per your requirement by performing an Network File System (NFS) mount. For more information on how to perform an NFS mount, see Configure the Destination Using NFS.

To customize the persist directory:

1. Go to **Admin** >**Services**.
The **Services** page appears.

2. From the **Filter** pull down menu, select the concentrator and the log decoder services.
The concentrator and log decoder are listed in the **Services** page.

3. Go to **Actions** > **View** > **Explore**.
The **Explore** page appears.

4. Go to **sdk** > **config** .

The **Configuration** page appears.

The following table provides information on the default values for each parameter that are configured in the **Configuration** page.

S.No	Parameter	Default Value
1.	Long Term Cache Behavior (pin.cache.behavior)	fail-on-new
2.	Long Term Cache Directory (pin.cache.dir)	/var/netwitness/pin-<serviceType>***
3.	Long Term Cache Size (pin.cache.size)	10 GB

2. [Optional]*** In the **Long Term Cache Directory (pin.cache.dir)**, enter the path of the custom directory where you want to save the persisted events, if you do not want to use the default location. The default path is `/var/netwitness/pin-S<serviceType>`.

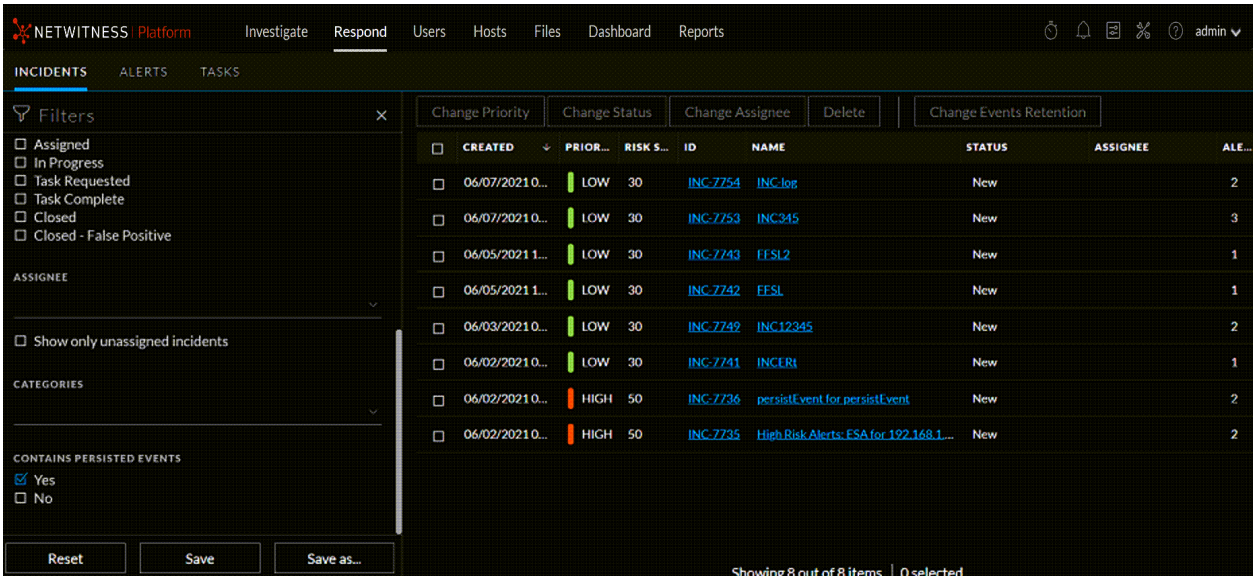
Note: When you install NetWitness Platform for the first time or upgrade to the 11.6 version, the directories are pre-configured with default values.

Working with Incident Filters

You can filter incidents based on the persisted events.

To filter incidents:

1. Go to **Respond** > **INCIDENTS**.



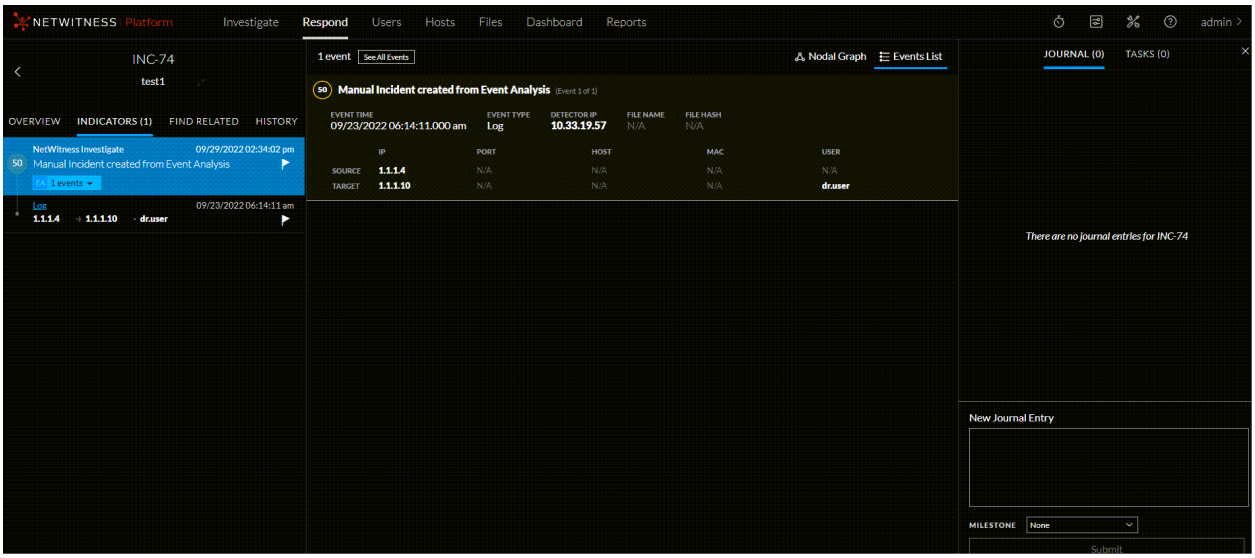
The **INCIDENT** page appears.

2. In the **FILTERS** tab, the **CONTAINS PERSISTED EVENTS** menu provides the filters to view incidents based on the persisted events.

a. Select **Yes** to view the incidents that contain persisted events.

b. Select **No** to view the incidents that do not contain persisted events.

For more information on working with filters, see Filter the Incident List.



Persist and Suspend Persist Events

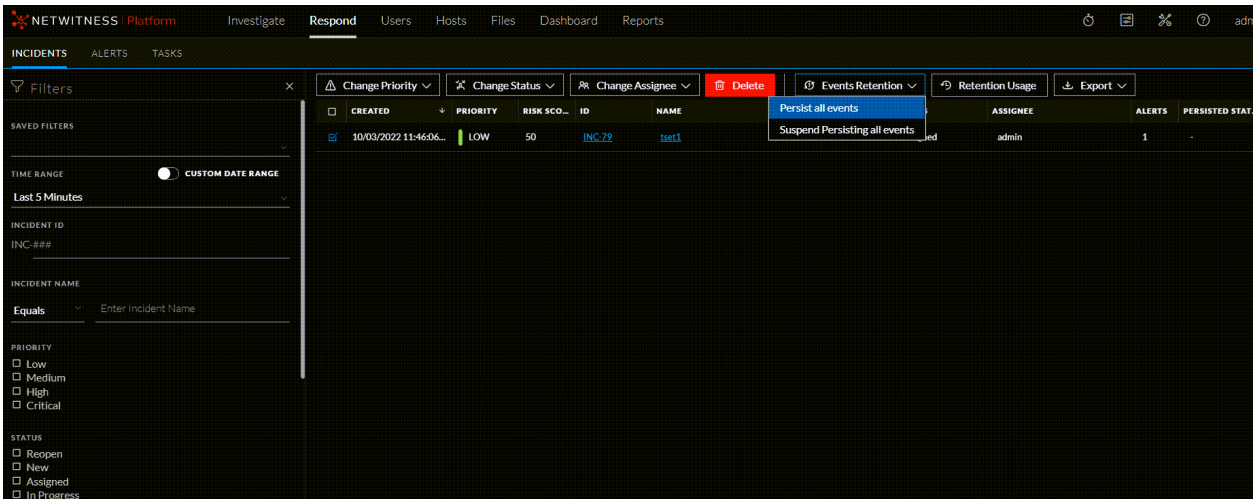
Persist an event to retain the event and thereby, copy the event data from the regular database into a long-term storage cache within the NetWitness source. Suspend persist the event to delete the event in the long-term storage cache.

- To persist an event, click the flag listed under each of the event. The selected flag is highlighted, and the message Event Persisted successfully appears.
- To suspend persist event, click a highlighted flag (persisted event) once again. The selected flag is no longer highlighted, and the message Suspended Event Persist successfully appears.
- To persist all events in an alert, click the flag at the alert level. The selected flag is highlighted along with all the flags associated with events of the alert.

- To suspend persist all events in an alert, click the flag at the alert level. The selected flag is highlighted along with all the flags associated with events of the alert.

Change Event Retention

Incidents can contain multiple persisted events, for which analysis has been completed. They can be suspended from persisting at a time using this feature.



Note: A maximum of 1 incident can be persisted or suspend persisted at a time in the source NetWitness database. If you try to change event retention for more than 1 incidents, an error message will be displayed. This limitation is introduced to optimize and extract the best performance for this feature. This limit cannot be changed.

To change event retention:

1. Go to **Respond** > **INCIDENTS**.
   All the incidents are listed in the **INCIDENTS** page.
2. Click the selection check-box to select the incident.
3. Click **Change Events Retention** > **Persist all events** or **Suspend Persist all events**.
   The **Confirm change in Retention** window appears.
4. Click **OK**.
   The events in the selected incident are either persisted or suspended from persisting.

Note: You cannot change the event retention for incidents that are in **New** or **Closed** state.

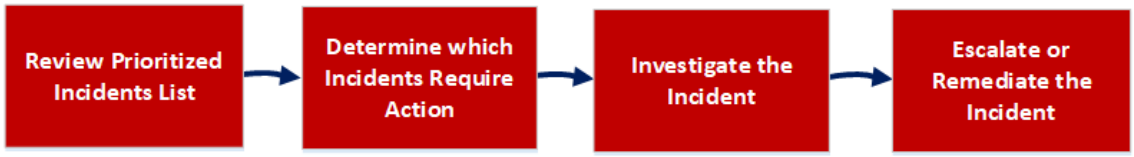
Note: Suspending persist of events in an incident from NetWitness will delete it from the long term cache of the source only. This may not be reversible if the original event data has rolled out in the source database. The events will be deleted permanently.

When you delete incidents or alerts, or suspend persist all the events in an incident, the action will always be successful. However, there are chances for the back-end function to fail due to, but not limited to the following reasons:

- Decoder/Concentrator outage
- Network disruption
- Service Outage

A data retention job is scheduled to run on a daily basis to clean up the events that failed from being deleted. To access the data retention job settings, see To change event retention:

The following table provides information on the parameters that are configured to run the job, which are enabled by default:



Parameter	Default Setting
`failure-count`	5
`persisted-events-retention-job-enabled`	true - default false.
`persisted-alerts-retention-period`	90 Days

Everyday at a preset time, the data retention job is executed. The default `failure-count` is set to 5 days. If the data retention job is unable to suspend persist an event from the back-end after 5 days, it deletes the event from the repository.

Note: The retention period of risk score context is the same as the retention period of alerts. For example, if the retention period for alerts is set to 90 days, then the retention period of risk score context is also set to 90 days automatically.

Responding to Incidents Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in the Respond view.

First, you review the list of prioritized incidents, which shows basic information about each incident, and determine which incidents require action. You can click a link in an incident to get a clearer picture of the incident with supporting details in the Incident Details view. From there, you can further investigate the incident. You can then determine how to respond to the incident, by escalating or remediating it.

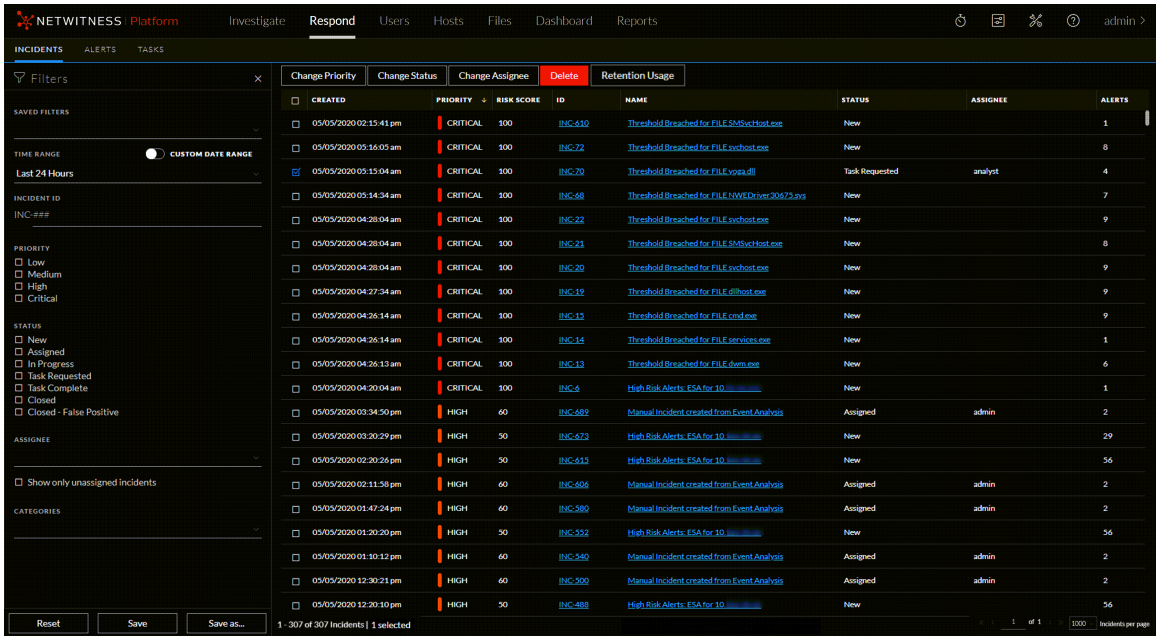
These are the basic steps for responding to an incident:

1. Review Prioritized Incident List
2. Determine which Incidents Require Action
3. Investigate the Incident
4. Escalate or Remediate the Incident

Review Prioritized Incident List

In the Respond view, you can view the list of prioritized incidents. The incident list shows both active and closed incidents.

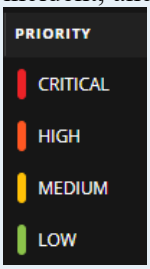
This topic contains the following basic incident list procedures:



- View the Incidents List
- Filter the Incident List
- Remove My Filters from the Incidents List View
- Save the Current Incidents Filter
- Update a Saved Incidents Filter
- Delete a Saved Incidents Filter
- View My Incidents
- Find an Incident
- Sort the Incidents List
- View Unassigned Incidents

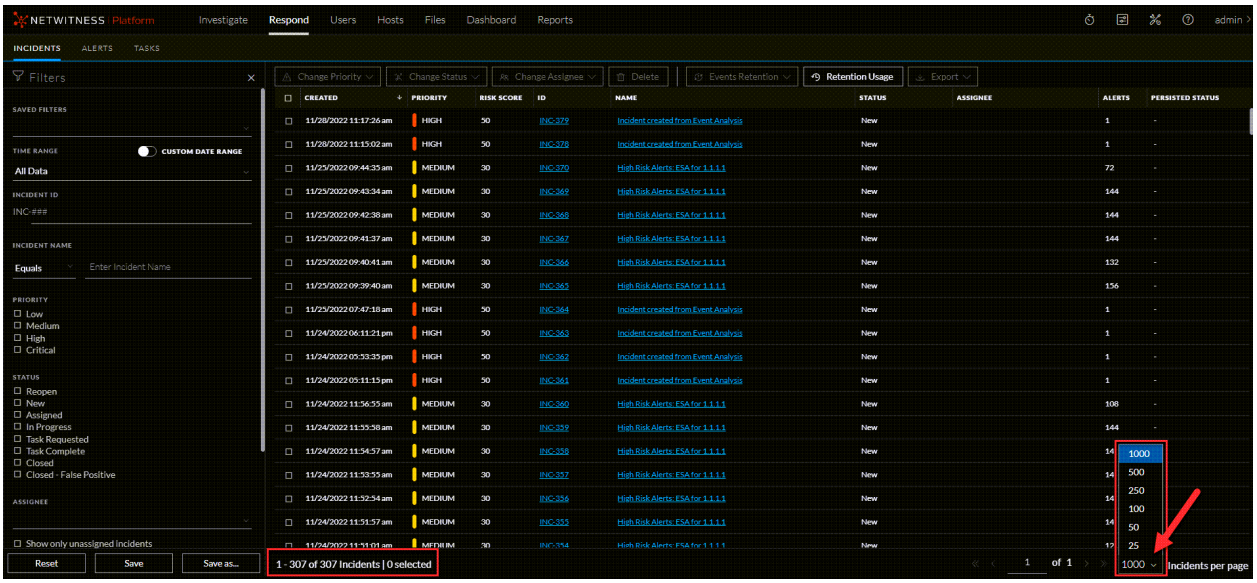
- Assign Incidents to Myself
- Unassign an Incident

View the Incidents List



After logging in to NetWitness, most Incident Responders see the Respond view, which is set as the default view. If you have a different initial view, you can navigate to the Respond view.

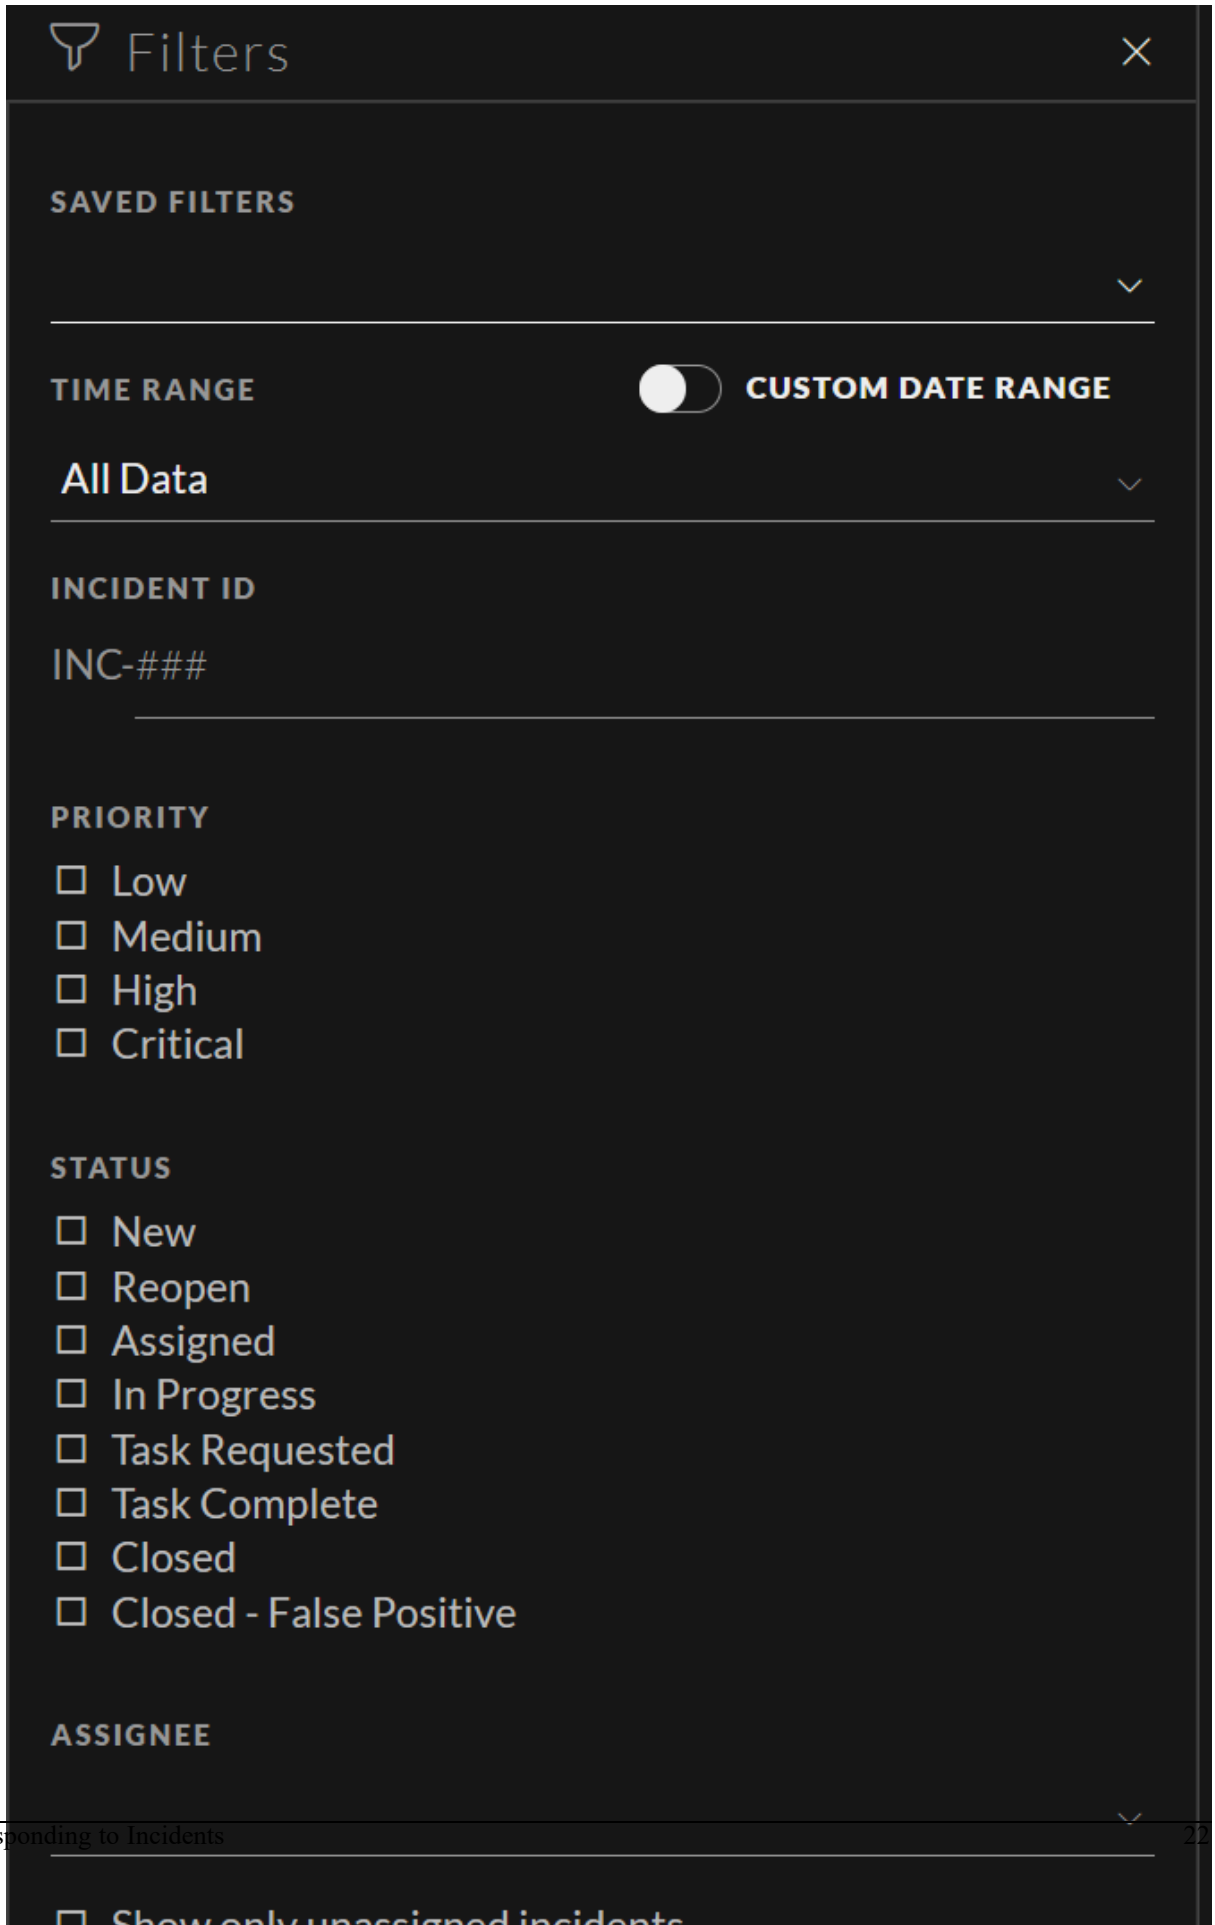
1. Log in to NetWitness.
   The Respond view shows the list of incidents, also referred to as the Incident List view.



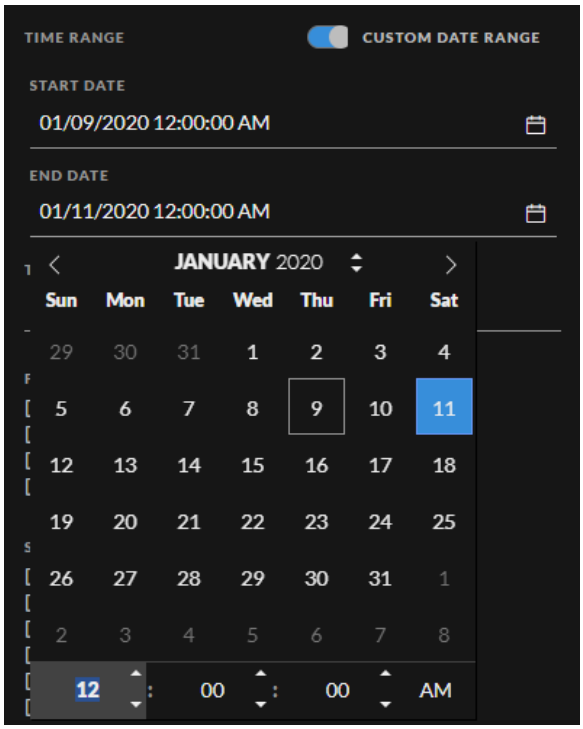
2. If you do not see the incidents list in the Respond view, go to **Respond > Incidents**.
3. Scroll through the incidents list, which shows basic information about each incident as described in the following table.

Column	Description
Created	Shows the creation date of the incident.

Column	Description
Priority	Shows the incident priority. Priority can be Critical, High, Medium, or Low. The Priority is color coded, where red indicates a **Critical** incident, orange represents a **High** risk incident, yellow indicates a **Medium** risk incident, and green represents a **Low** risk incident. For example: 
Risk Score	Shows the incident risk score. The risk score indicates the risk of the incident as calculated using an algorithm and is between 0-100. 100 is the highest risk score.
ID	Shows the automatically created incident number. Each incident is assigned a unique number that you can use to track the incident.
Name	Shows the incident name. The incident name is derived from the rule used to trigger the incident. Click the link to go to the Incident Details view for the selected incident.
Status	Shows the incident status. The status can be: **Reopen**, **New**, **Assigned**, **In Progress**, **Task Requested**, **Task Complete**, **Closed**, and **Closed - False Positive**.
Assignee	Shows the team member currently assigned to the incident.
Alerts	Shows the number of alerts associated with the incident. An incident may include many alerts. A large number of alerts might mean that you are experiencing a large-scale attack.



At the bottom of the list, you can see the number of incidents on the current page, the total number of incidents, and the number selected. For example: **1 - 500 of 2400 Incidents | 0 selected**. The maximum number of incidents that you can view at one time is 1,000. You can also change the maximum number of incidents per page by selecting from the drop-down at the bottom right corner.

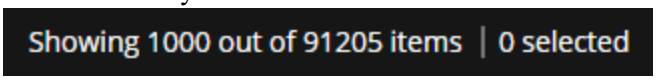


Filter the Incident List

The number of incidents in the Incidents List view can be very large, making it difficult to locate particular incidents. The Filter enables you to specify those incidents that you would like to view. You can also choose the timeframe when those incidents occurred. For example, you may want to view all of the new critical incidents created within the last hour.

1. Verify that the Filters panel appears to the left of the incidents list. If you do not see the Filters panel, in the Incident List view toolbar, click , which opens the Filters panel.

Filters
SAVED FILTERS
TIME RANGE
CUSTOM DATE RANGE
All Data
INCIDENT ID
INC-###
PRIORITY
Low
Medium
High
Critical
STATUS
New
Reopen
Assigned
In Progress
Task Requested
Task Complete
Closed
Closed - False Positive
ASSIGNEE



2. In the Filters panel, select one or more options to filter the incidents list:
   - **Time Range**: You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the incidents. For example, if you select Last Hour, you can see incidents that were created within the last 60 minutes.
   - **Custom Date Range**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar.

   - **Incident ID**: Type the number of the incident that you would like to locate. For example, for INC-1050, type only the number "1050" to view the incident.
   - **Priority**: Select the priorities that you would like to view.
   - **Status**: Select one or more incident statuses. For example, select Closed - False Positive to view only false positive incidents, which were initially identified as suspicious, but then they were later found to be safe.
   - **Assignee**: Select the assignee or assignees of the incidents that you would like to view. For example, if you only want to view the incidents assigned to Cale or Stanley, select Cale and Stanley from the Assignee drop-down list. If you want to view incidents regardless of the assignee, do not make a selection under Assignee.
     (Available in version 11.1 and later) To view only unassigned incidents, select **Show only unassigned incidents**.
   - **Categories**: Select one or more categories from the drop-down list. For example, if you only want to view incidents classified with the Backdoor or Privilege abuse categories, select Backdoor and Privilege abuse.

- **Sent to Archer**: (In version 11.2 and later, if Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and this option will be available in NetWitness Respond.) To view incidents that were sent to Archer, select **Yes**. For incidents that were not sent to Archer, select **No**.
- **CONTAINS PERSISTED EVENTS**: Select a filter to view incidents based on the persisted events.

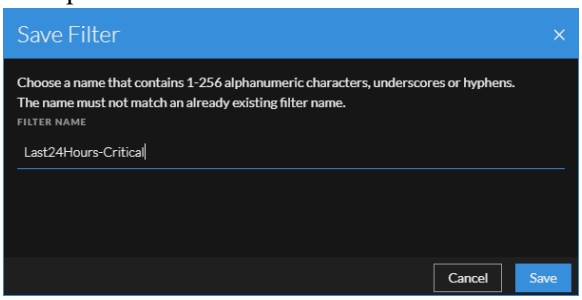
The incidents list shows a list of incidents that meet your selection criteria. You can see the number of incidents in your filtered list at the bottom of the incident list.

3. If you want to close the Filters panel, click . Your filters remain in place until you remove them.

Remove My Filters from the Incidents List View

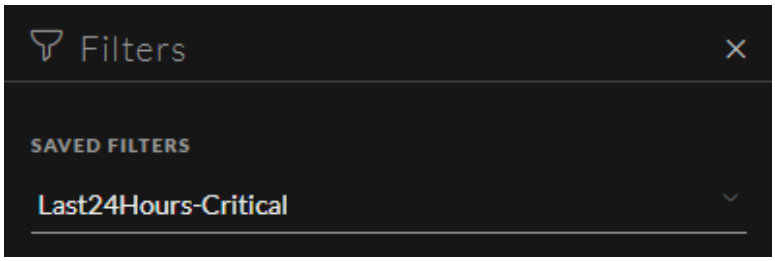
NetWitness remembers your filter selections in the Incidents List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of incidents that you expect to see or you want to view all of the incidents in your incident list, you can reset your filters.

1. In the Incident List view toolbar, click .
   The Filters panel appears to the left of the incidents list.
2. At the bottom of the Filters panel, click **Reset**.



Save the Current Incidents Filter

Note: This option is available in NetWitness Platform Version 11.5 and later.



Saved filters provide a way for analysts to save and quickly apply specific filter conditions to the list of incidents. You can also use these filters to customize the Springboard landing page. For example, you may want to create a filter to show only critical incidents over the last 24 hours.

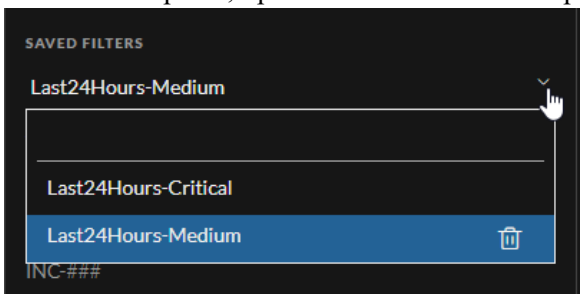
Saved filters are global. You can save a filter for other analysts to use and you can use any saved filter.

1. In the Filters panel, select one or more options to filter the incidents list. For example, in the Time Range field, select Last 24 Hours, and for Priority, select Critical.
2. Click **Save As** and in the **Save Filter** dialog, enter a unique name for the filter and save it, for example Last24Hours-Critical.

The filter is added to the **Saved Filters** list.

Update a Saved Incidents Filter

Note: This option is available in NetWitness Platform Version 11.5 and later.



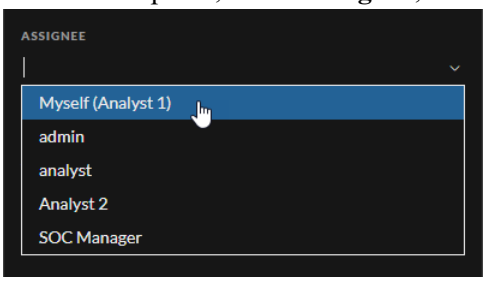
1. In the Filters panel **Saved Filters** drop-down list, select a saved filter.
2. Update your filter selections and click **Save**.

Delete a Saved Incidents Filter

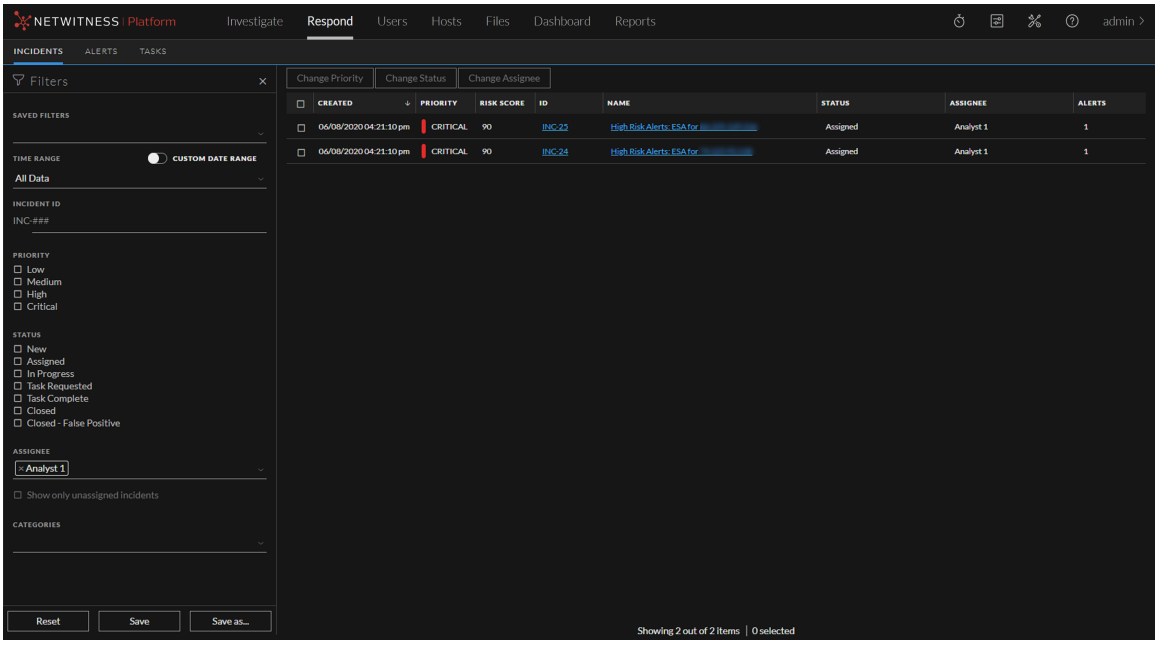
Note: This option is available in NetWitness Platform Version 11.5 and later.

When a saved filter is no longer required, you can remove it from the saved filters list. Filters used in the Springboard cannot be deleted.

1. In the Filters panel, open the **Saved Filters** drop-down list.



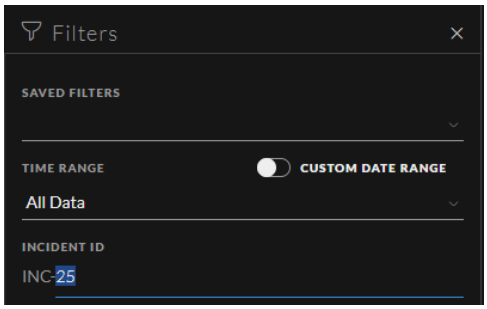
2. Next to the filter name, click  to delete it.



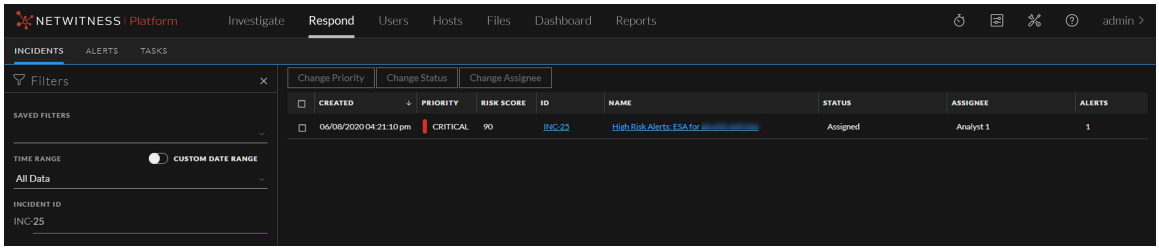
View My Incidents

You can view your incidents by filtering the incidents by your username.

1. If you cannot see the Filter panel, in the Incidents List view toolbar, click .
2. In the Filter panel, under **Assignee**, select **Myself (your full name)** from the drop-down list.



The incidents list shows the incidents that are assigned to you.



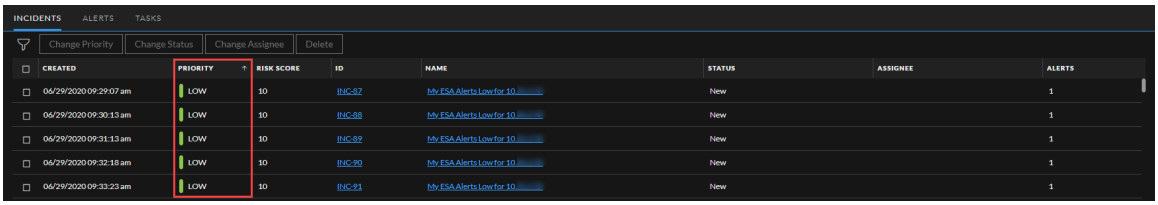
Find an Incident

If you know the Incident ID, you can quickly locate an incident using the Filter. For example, you may want to locate a specific incident out of thousands of incidents.

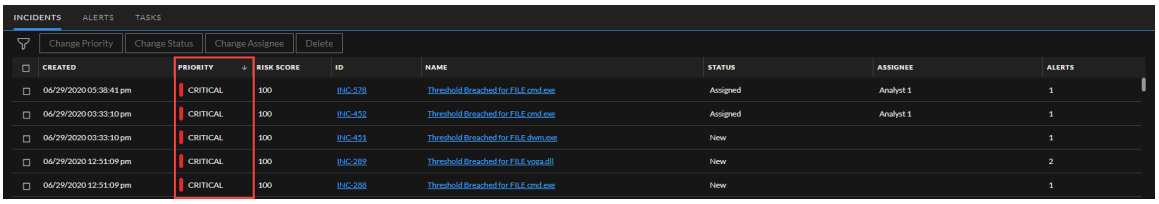
1. Go to **Respond > Incidents**.
   The Filters panel is located to the left of the incidents list. If you do not see the Filters panel, in the Incident Lists view toolbar, click , which opens the Filters panel.

2. In the **INCIDENT ID** field, type the Incident ID for an incident that you would like to locate, for example, type **25** for INC-25.
   The specified incident appears in your incident list. If you do not see any results, try resetting your filters.

Sort the Incidents List



The default sort for the incidents list is by Created date in descending order (newest on the top).

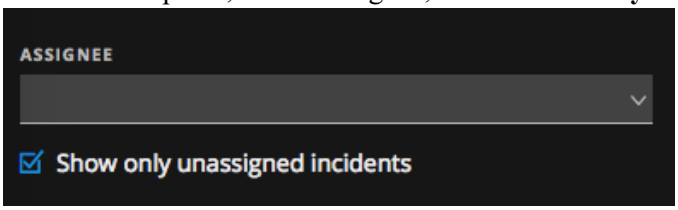


You can change the sort order of the incidents list by clicking a column header in the list.

For example, to prioritize the incidents, you can sort your view by clicking the Priority column header.

The following figure shows the incidents list sorted by Priority in ascending order (lowest priority on top).

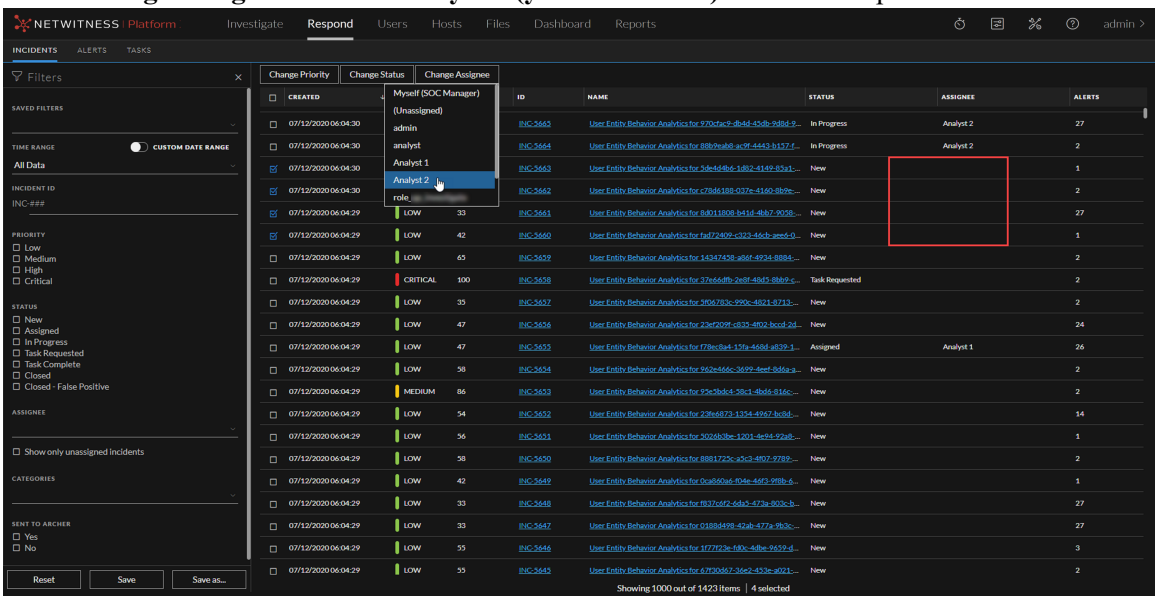
To sort by Priority in descending order (highest priority on top), click the Priority column header again. The highest priority incidents are at the top as shown in the following figure.



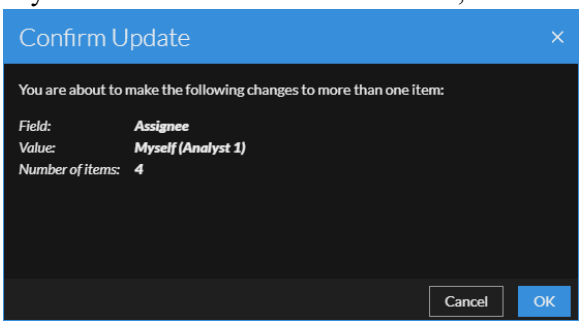
View Unassigned Incidents

Note: This option is available in NetWitness Platform Version 11.1 and later.

You can view unassigned incidents using the Filter.

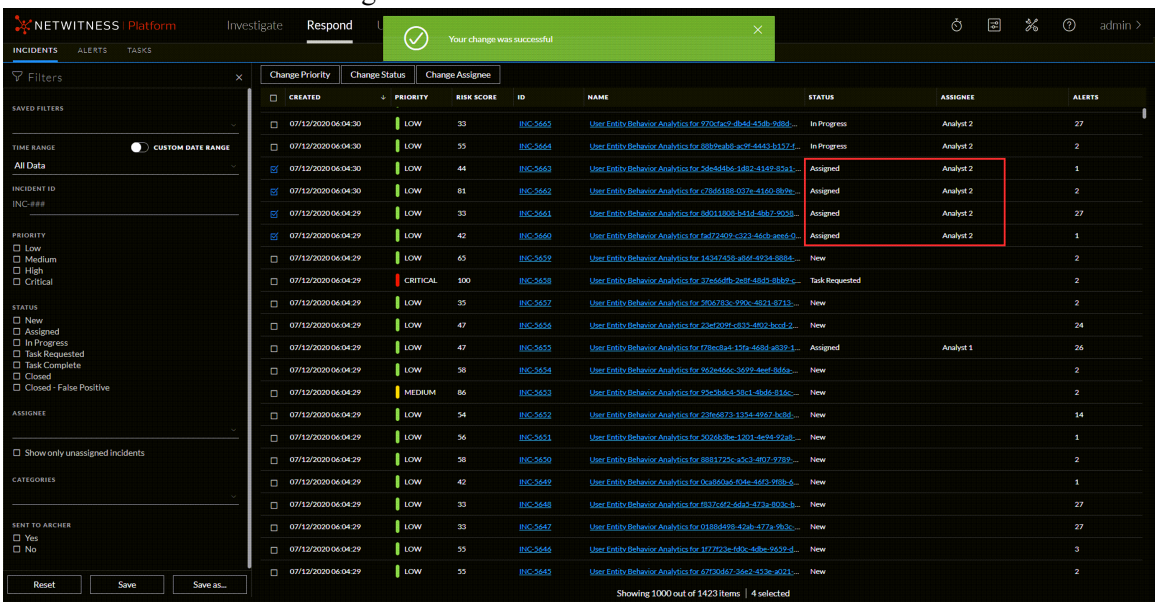


1. If you cannot see the Filter panel, in the Incident List view toolbar, click .
2. In the Filters panel, under Assignee, select **Show only unassigned incidents**.

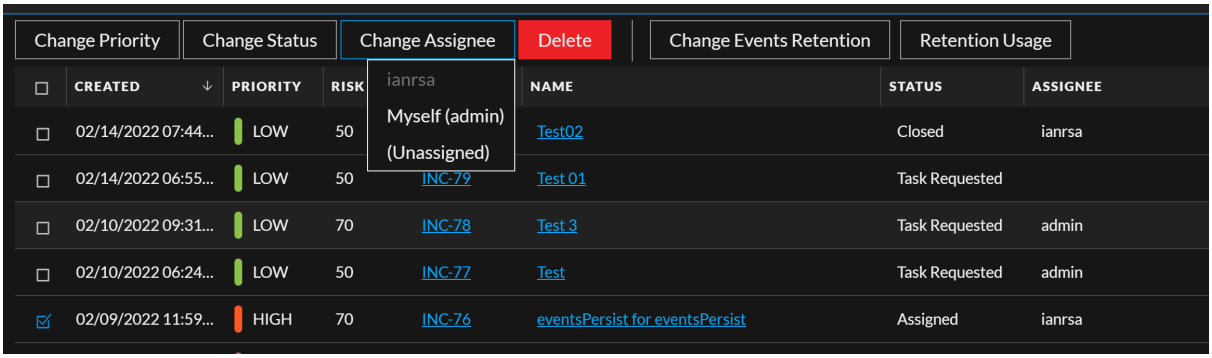


The incidents list is filtered to show unassigned incidents.

Assign Incidents to Myself

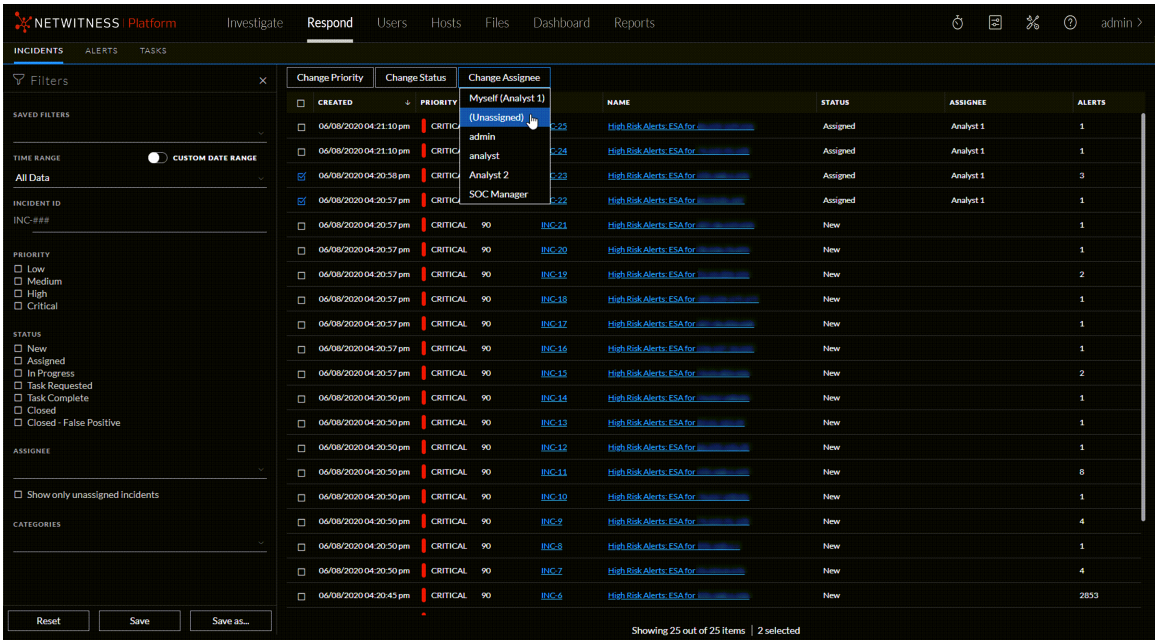


1. In the Incident List view, select one or more incidents that you want to assign to yourself.
2. Click **Change Assignee** and select **Myself (your full name)** from the drop-down list.

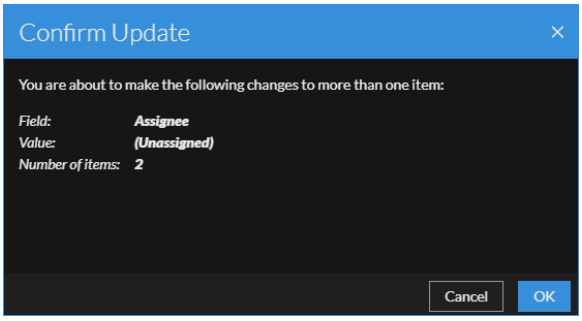


3. If you selected more than one incident, in the Confirm Update dialog, click **OK**.

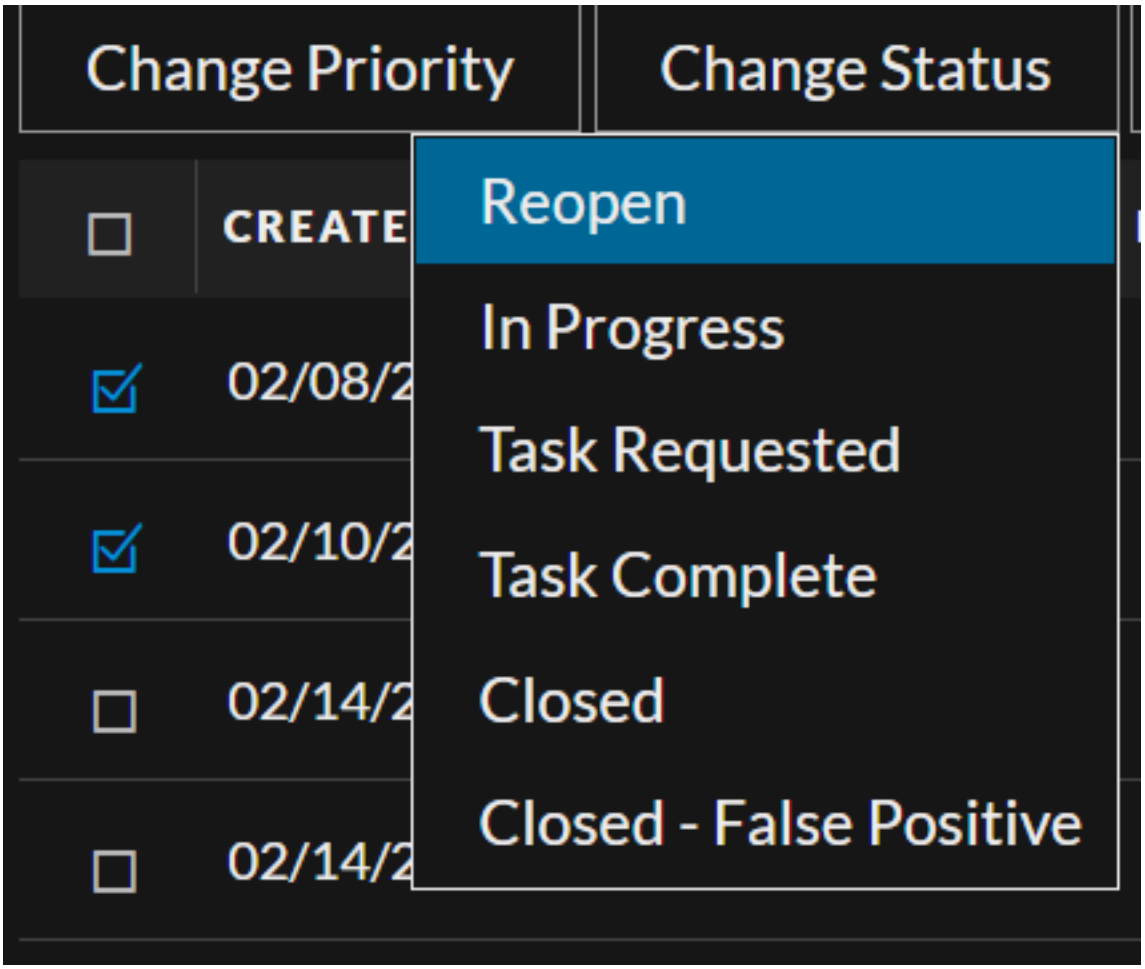
You can see a successful change notification.



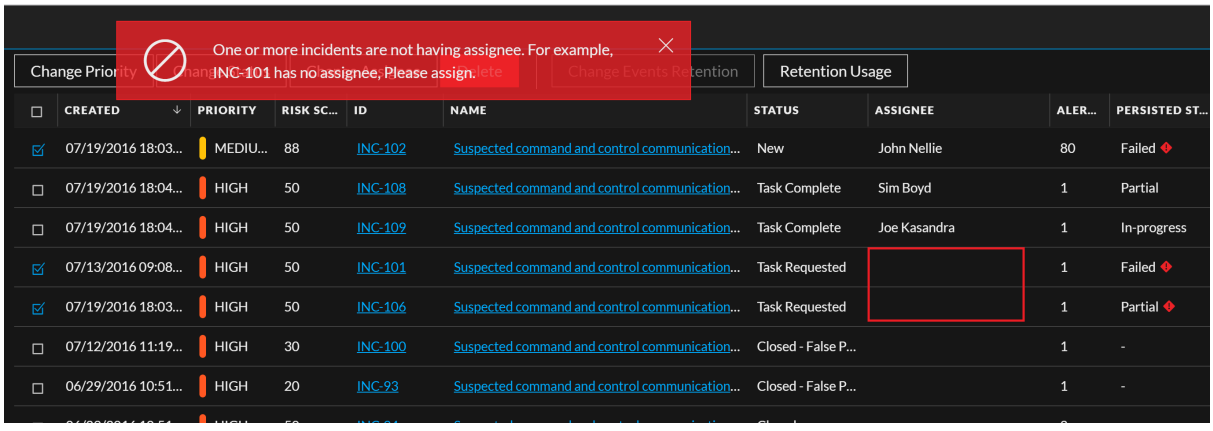
Note: On selecting any particular incident, current assignee name is grayed out under **Change Assignee** drop-down list. This is not applicable in case multiple incidents are selected. Refer the following figure.



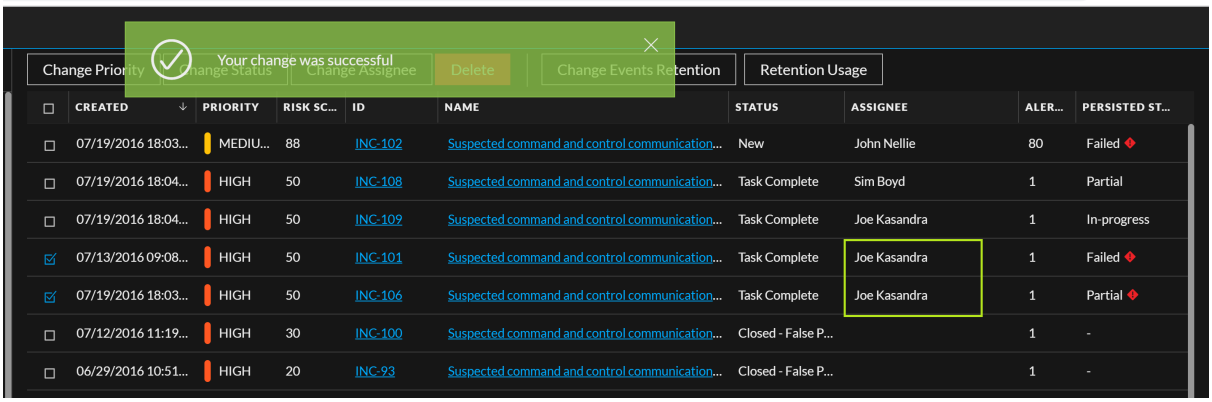
Unassign an Incident



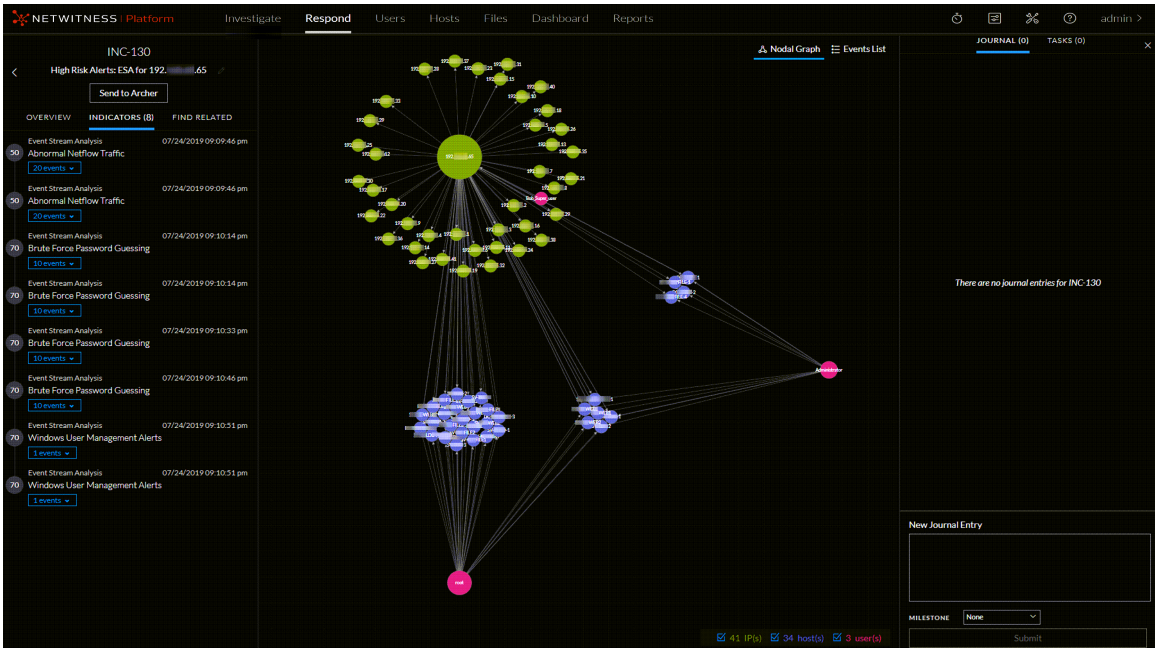
1. In the Incident List view, select one or more incidents that you want to unassign.
2. Click **Change Assignee** and select **(Unassigned)** from the drop-down list.



3. If you selected more than one incident, in the Confirm Update dialog, click **OK**.



4. Verify that the Status is still correct and make changes as required. To change the status, select one or more incidents, click **Change Status**, and select a new status.



Note: You must assign the incidents to change their status. If you try to change the incident status without assigning the incident, the error message **One or more incidents are not having assignee. For example, INC-x has no assignee, Please assign.** is displayed. Refer the following figures.

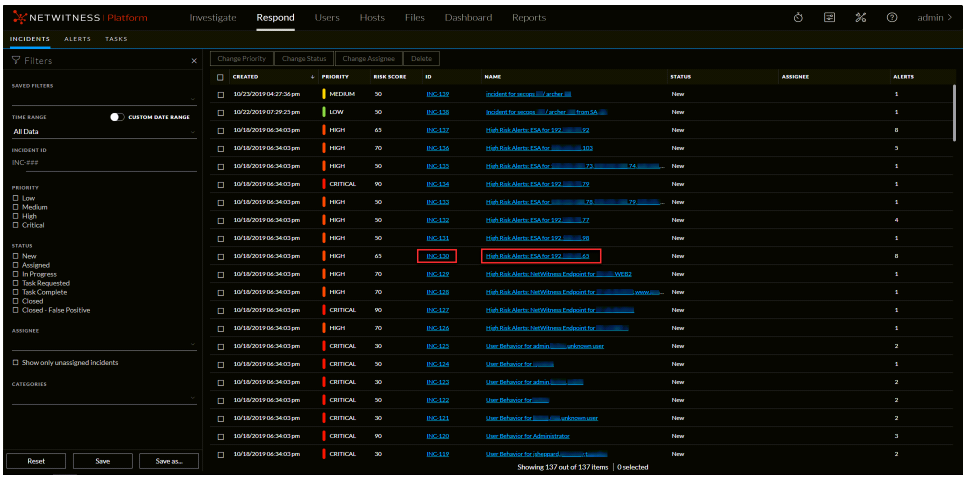
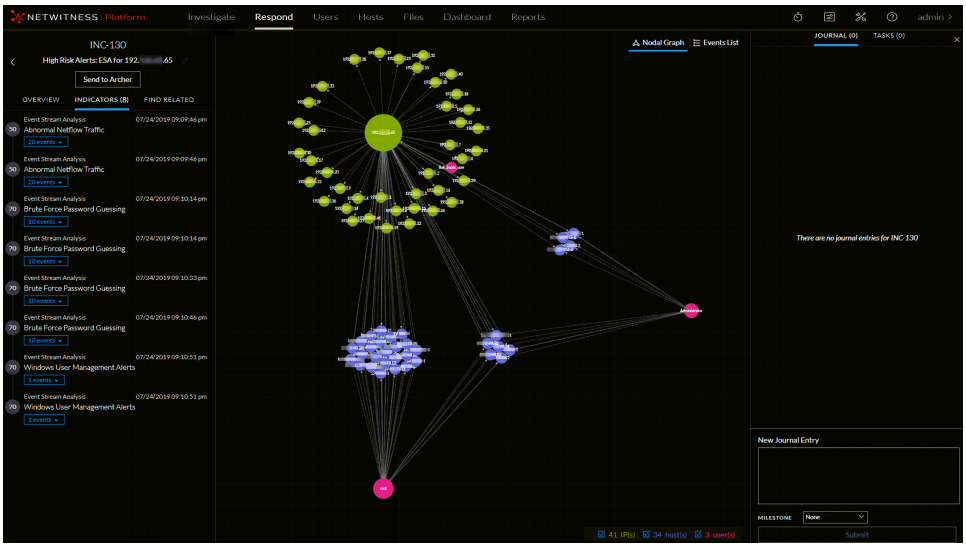
Determine which Incidents Require Action

Once you get the general information about the incident from the Incident List view, you can go to the Incident Details view for more information to determine the action required.



You can perform the following procedures in the Incident Details view to determine the action required on an incident:

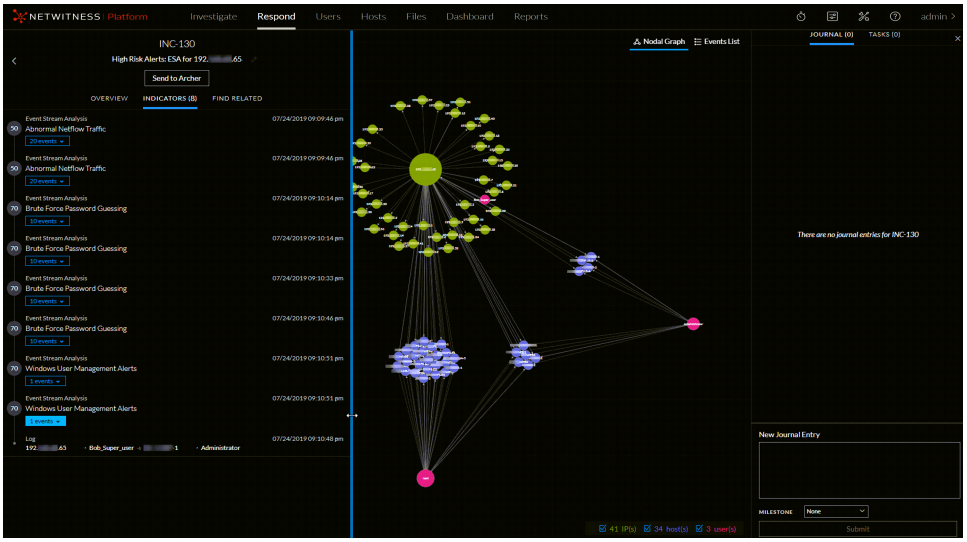


- View Incident Details
- View Basic Summary Information about the Incident
- View the Indicators and Enrichments
- View and Study the Events
- View C2 Enrichment Information for Suspected C&C Incidents
- View and Study the Entities Involved in the Events on the Nodal Graph
- Nodal Graph Behaviors and Characteristics
- Select Node Types to View on the Nodal Graph
- Filter the Data in the Incident Details View
- View the Tasks Associated with an Incident
- View Incident Notes
- Find Related Indicators
- Add Related Indicators to the Incident

View Incident Details

To view details for an incident, in the Incidents List view, choose an incident to view and then click the link in the **ID** or **NAME** column for that incident.

The Incident Details view for the selected incident appears with the Indicators panel, Nodal Graph, and Journal in view.



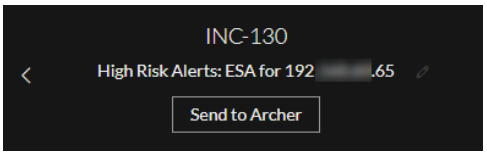
The Incident Details view has the following panels:

- **Overview**: The incident Overview panel contains high-level summary information about the incident, such as the score, priority, alerts, and status. You have the option to send the incident to Archer and change the incident Priority, Status, and Assignee.
- **Indicators**: The Indicators panel contains a chronological listing of indicators. *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert. This listing helps you to connect indicators and

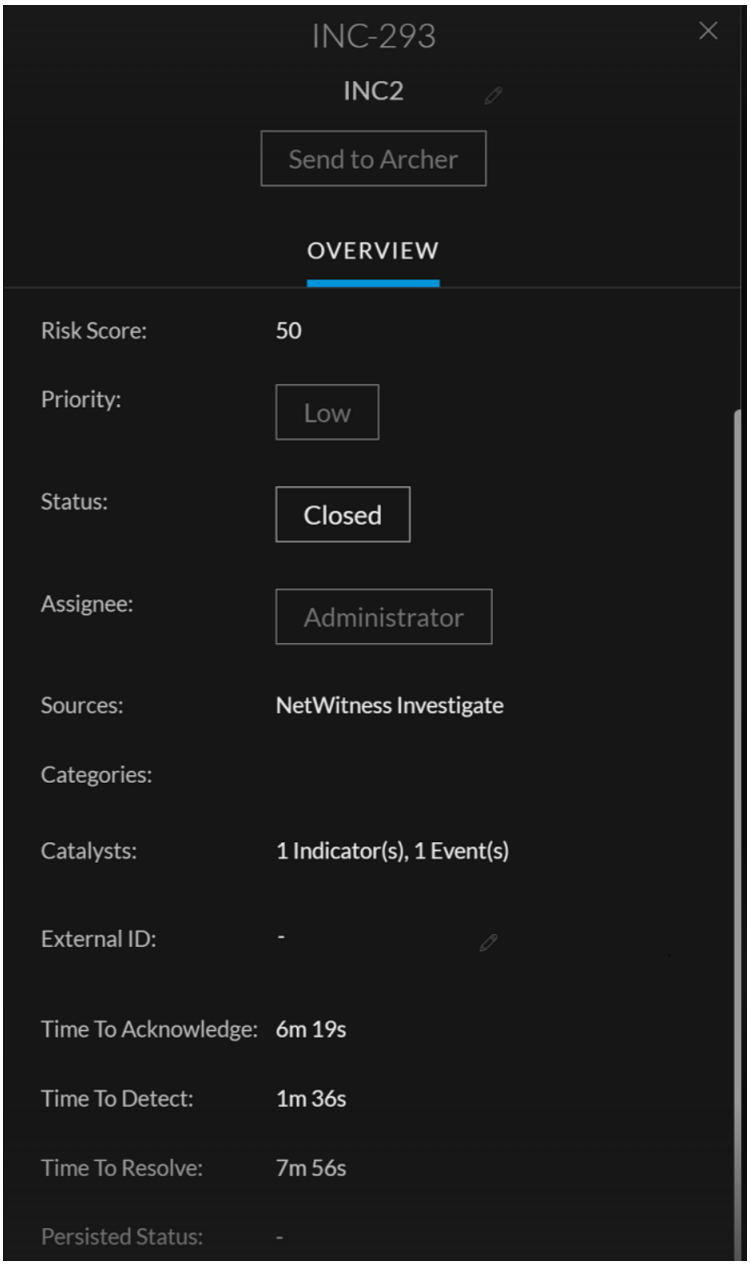
notable data. For example, an IP address connected to a command and communication ESA alert might also have triggered a NetWitness Endpoint alert or other suspicious activities.

- **Related Indicators**: The Related Indicators panel enables you to search the NetWitness alerts database to find alerts that are related to this incident. You can also add related alerts that you find to the incident.
- **History**: The History panel allows you to view the different actions performed by the user on an incident. Events such as Incident Assignee change, Incident Status change, Incident Priority change, and Incident creation are recorded in this panel.
- **Nodal Graph**: The nodal graph is an interactive graph that shows the relationship between the entities involved in the incident. An *Entity* is represented by an IP address, MAC address, user, host, domain, file name, or file hash.
- **Events List**: The Events List, also known as the Events table, lists the events associated with the incident. It also shows event source and destination information along with additional information depending on the event type. You can click the top of an event in the list to view the detailed data for that event.
- **Journal**: The Journal panel enables you to access the Journal for the selected incident, which allows you to communicate and collaborate with other analysts. You can post notes to a journal, add Investigation Milestone tags (Reconnaissance, Delivery, Exploitation, Installation, Command and Control, Action on Objective, Containment, Eradication, and Closure), and view the history of activity on your incident.
- **Tasks**: The Tasks panel shows all of the tasks that have been created for the incident. You can also create additional tasks from here.

To view more information in the left-side panel without scrolling, you can hover over the right edge and drag the line to resize the panel as shown in the following figure:

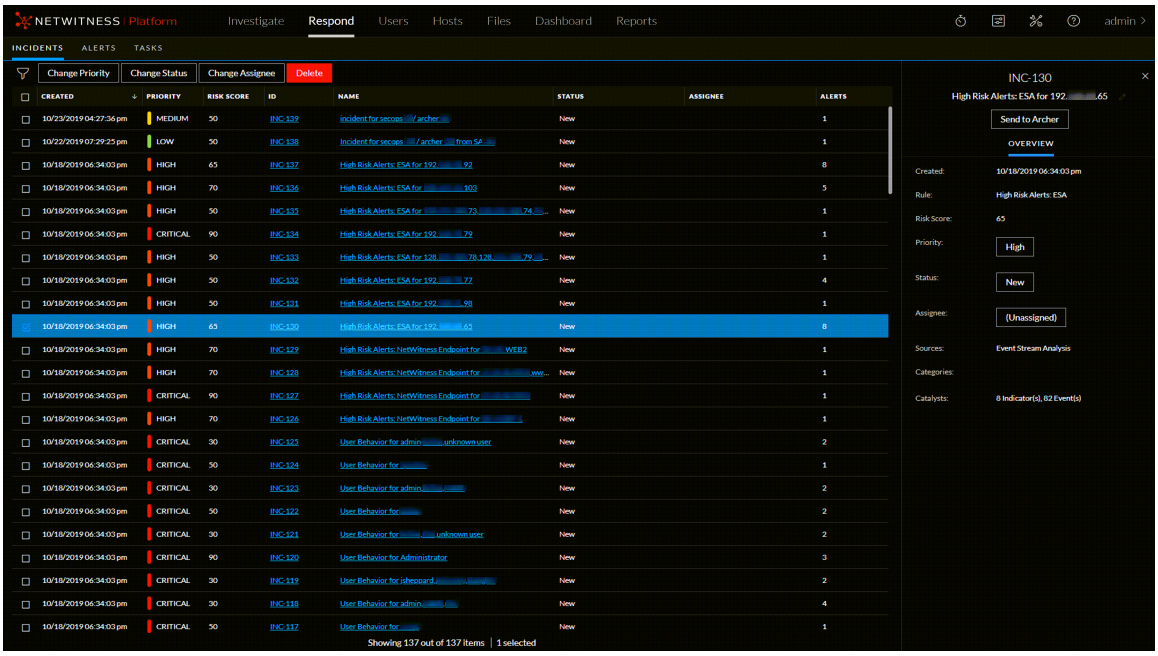


View Basic Summary Information about the Incident



You can view basic summary information about an incident in the Overview panel.

Above the Overview panel, you can see the following information:

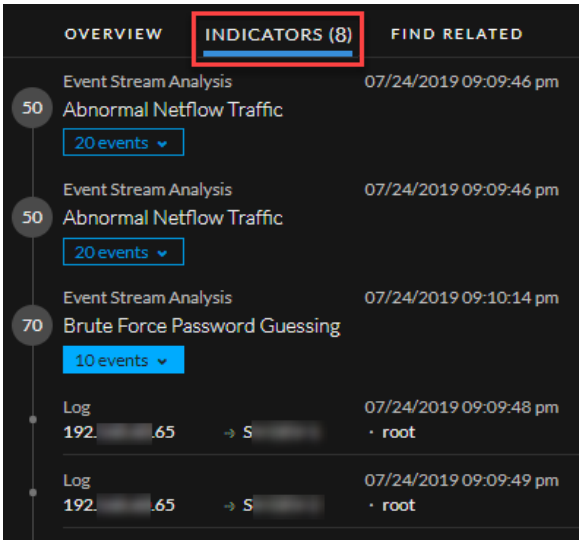


- **Incident ID**: This is an automatically created unique ID assigned to the incident.
- **Name**: The incident name is derived from the rule used to trigger the incident.
- **Send to Archer / Sent to Archer**: (In version 11.2 and later, if Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and this option is available in NetWitness Respond.) This shows whether an incident has been sent to Archer Cyber Incident & Breach Response. An incident sent to Archer shows as Sent to Archer. An incident that has not been sent to Archer shows as Send to Archer. You can click the Send to Archer button to send the incident to Archer Cyber Incident & Breach Response.

To view the Overview panel from the Incident Details view, select **Overview** in the left panel.

To view the Overview panel from the Incidents List view, click a row in the incident list. The Overview panel appears on the right.

The Overview panel contains basic summary information about the selected incident:



- **Created**: Shows the creation date and time of the incident.
- **Rule / By**: Shows the name of the rule that created the incident or the name of the person who created the incident.
- **Risk Score**: Shows a value between 0 and 100 that indicates the risk of the incident as calculated by an algorithm. 100 is the highest risk score.
- **Priority**: Shows the incident priority. Priority can be Critical, High, Medium or Low.
- **Status**: Shows the incident status. The status can be Reopen, New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed - False Positive. After you create a task, the status changes to Task Requested.
- **Assignee**: Shows the team member currently assigned to the incident.
- **Sources**: Indicates the data sources used to locate the suspicious activity.
- **Categories**: Shows the categories of the incident events.
- **Catalysts**: Shows the count of indicators that gave rise to the incident.
- **External ID**: Allows storing the Incident ID referrals from a different platform such as Archer.
- **Time to Acknowledge**: Shows the time taken to assign an Incident after creating it.
- **Time to Detect**: Shows the time taken for completing the task after the Incident is assigned.
- **Time to Resolve**: Shows the time taken for closing the task after the Incident is created.
- **Persisted Status**: Shows the persist status of the Incident. The status can be Complete, Partial, or None (-).

View the Indicators and Enrichments

Note: *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert.

You can find indicators, events, and enrichments on the Indicators panel. The Indicators panel is a chronological listing of indicators that helps you to find enrichments and events related to the triggering indicator. For example, an indicator might be a Command and Control alert, a NetWitness Endpoint alert, a Suspicious Domain (C2) alert, or an alert from an Event Stream Analysis (ESA) rule. The Indicators panel helps you to aggregate and order these indicators (alerts) from different systems so that you can see how they are related and also help you develop a timeline of a given attack.

To view the Indicators panel, in the left panel of the Incident Details view, select **Indicators**.

Indicators are alerts, such as an ESA alert or a NetWitness Endpoint alert. This listing helps you to connect indicators and notable data. For example, indicators can show the data found by your rules. In the Indicators panel, the risk score for an indicator is shown within a solid-colored circle.

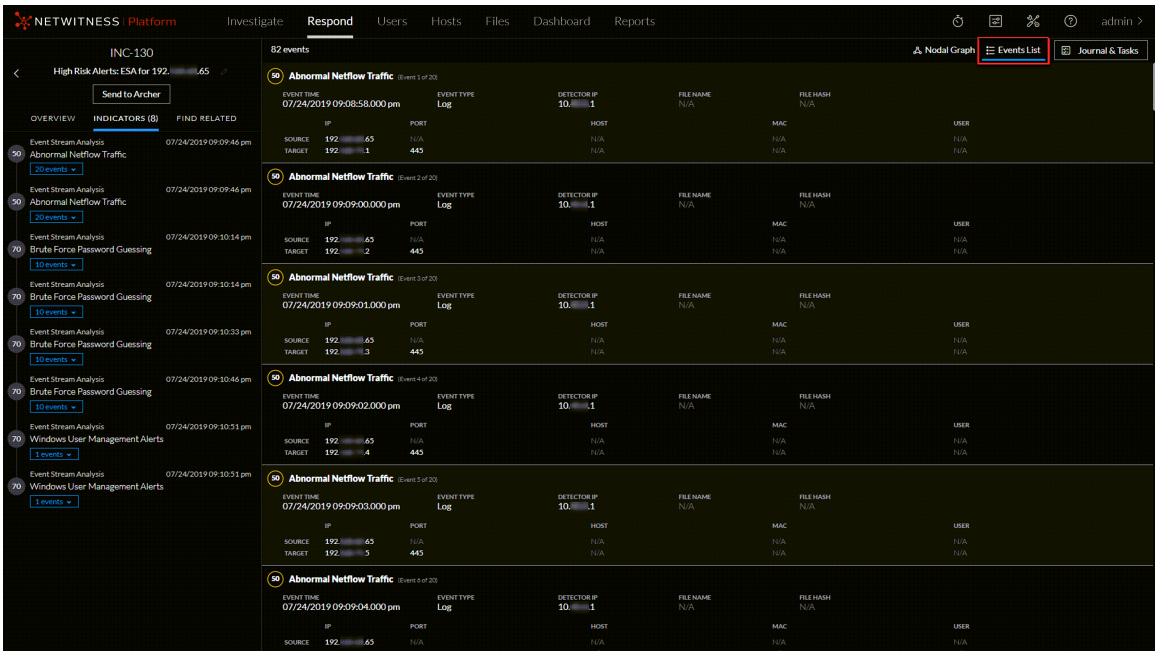
Data source information is shown below the names of the indicators. You can also see the creation date and time of the indicator and the number of events in the indicator. When data is available, you can see the number of enrichments. You can click the event and enrichment buttons to view the details.

Note: The maximum number of indicators (alerts) displayed in the Indicators panel is 1,000.

View and Study the Events

You can view and study the events associated with the incident from the Events List. It shows information about the events, such as event time, source IP, destination IP, detector IP, source user, destination user, and file information about the events. The amount of information listed depends on the event type.

There are two types of events:



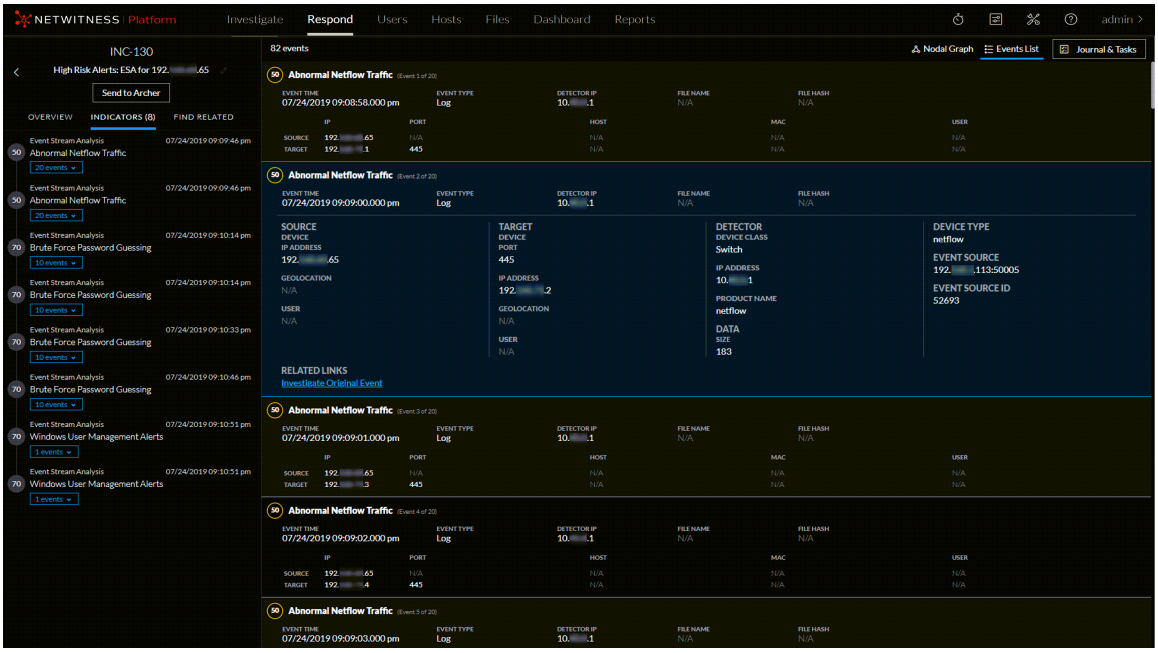
- A transaction between two machines (a Source and a Destination)
- An anomaly detected on a single machine (a Detector)

Some events will only have a Detector. For example, NetWitness Endpoint finds malware on your machine. Other events will have a Source and Destination. For example, packet data shows communication between your machine and a Command and Control (C2) domain.

You can drill further into an event to get detailed data about the event.

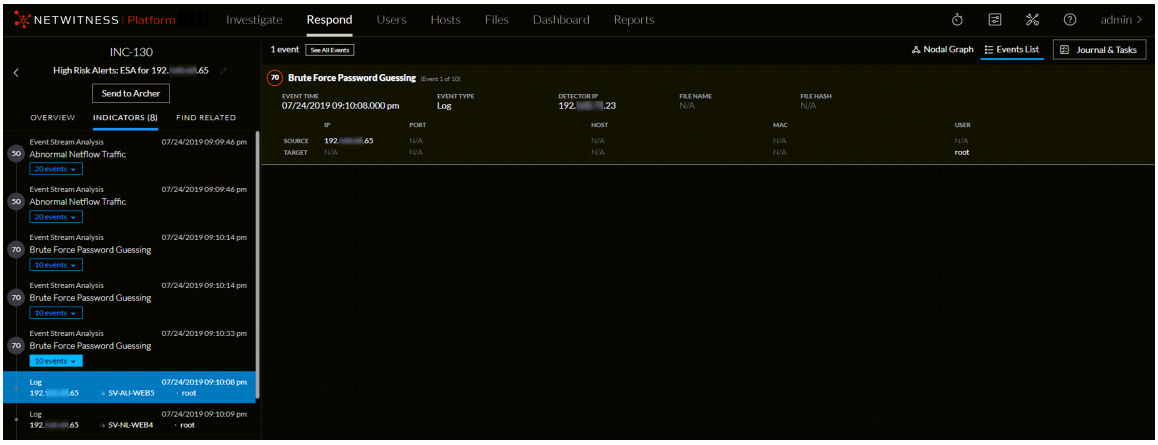
To view and study the events:

1. To view the Events List, in the Incident Details view toolbar, click Events List.



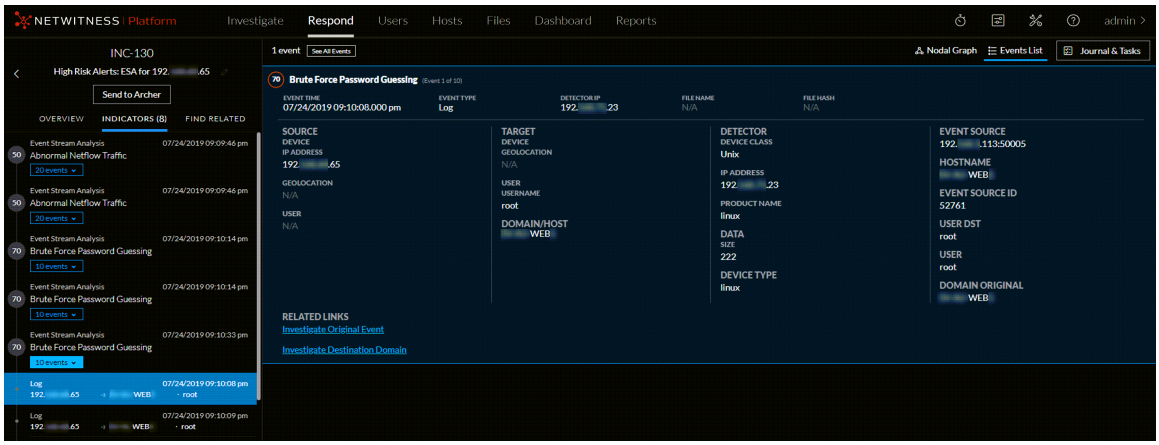
Note: The EVENT TIME displayed on this screen is the same as the COLLECTION TIME from the investigation page.

The Events List shows different information about each event depending on the event type. The maximum number of events displayed in the Events List is 1,000.



The following table lists typical event information. For details specific to endpoint events, see Events List.

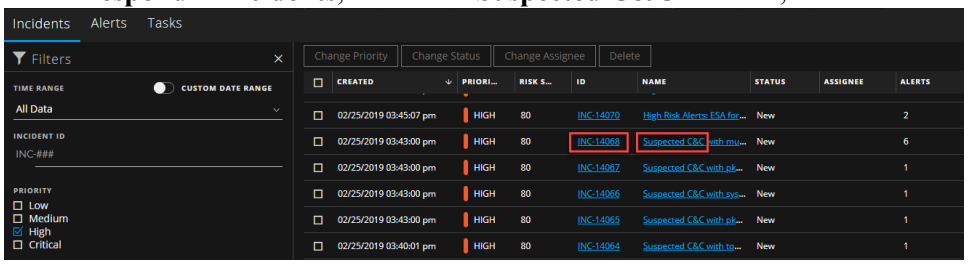
Field	Description
EVENT TIME	Shows the time the event occurred.
EVENT TYPE	Shows the type of alert, such as Log and Network.
DETECTOR IP	Shows the IP address of the machine where an anomaly was detected.
FILE NAME	Shows the file name if a file is involved with the event.
FILE HASH	Shows a hash of the file contents.
SOURCE IP	Shows the source IP address if there was a transaction between two machines.
SOURCE PORT	Shows the source port of the transaction. The source and destination ports can be on the same IP address.
SOURCE HOST	Shows the destination host where the event took place.
SOURCE MAC	Shows the MAC address of the source machine.
SOURCE USER	Shows the user of the source machine.
TARGET IP	Shows the destination IP address if there was a transaction between two machines
TARGET PORT	Shows the destination port of the transaction. The source and destination ports can be on the same IP address.
TARGET HOST	Shows the host name of the destination machine.
TARGET MAC	Shows the MAC address of the destination machine.
TARGET USER	Shows the user of the destination machine.



2. Click the top of an event in the Events List to view the event details.
   This example shows the event details for a selected event in the list.

3. To view the events for a specific indicator (alert), go to the Indicators panel on the left and click the indicator to view the events for that indicator in the Events List on the right.
   This example shows one event for a selected indicator.

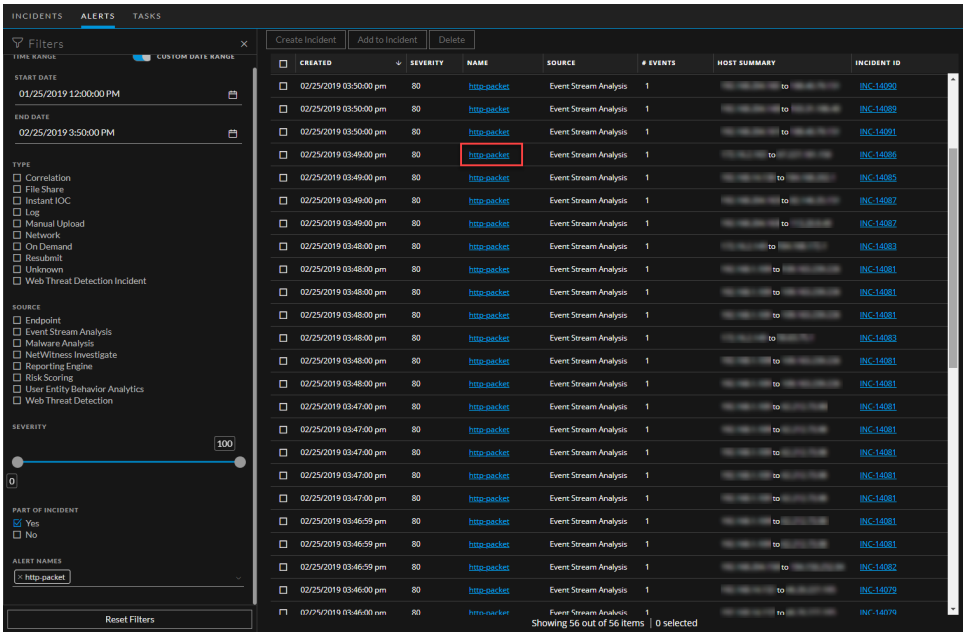
4. To view event details for a specific indicator event, select an event in the Indicators panel. Click the top of the event to view the details.
   The following example shows information for the selected event.



If you have additional Investigate-server permissions, you can also access event analysis details for events. See View Event Analysis Details for Indicators. If you have the UEBA_Analysts role, you can access UEBA details for indicators. See View User Entity Behavior Analytics for Indicators.

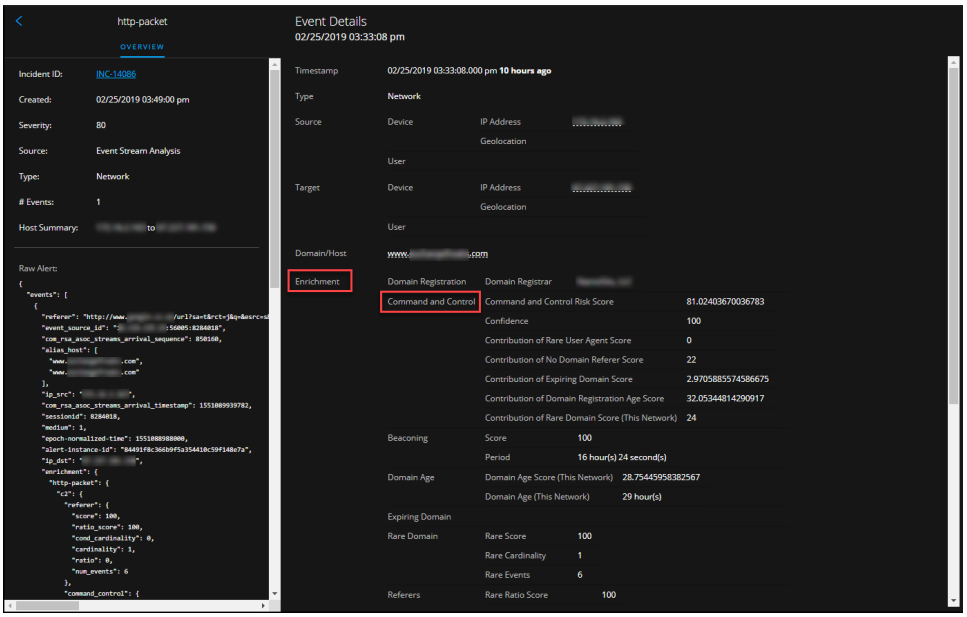
View C2 Enrichment Information for Suspected C&C Incidents

Note: This procedure applies only to incidents from ESA Analytics in NetWitness Version 11.3 and 11.4. The Event Stream Analytics Server (ESA Analytics) service, which is used for Automated Threat Detection, is end of life (EOL) and not supported in NetWitness Platform Version 11.5 and later.



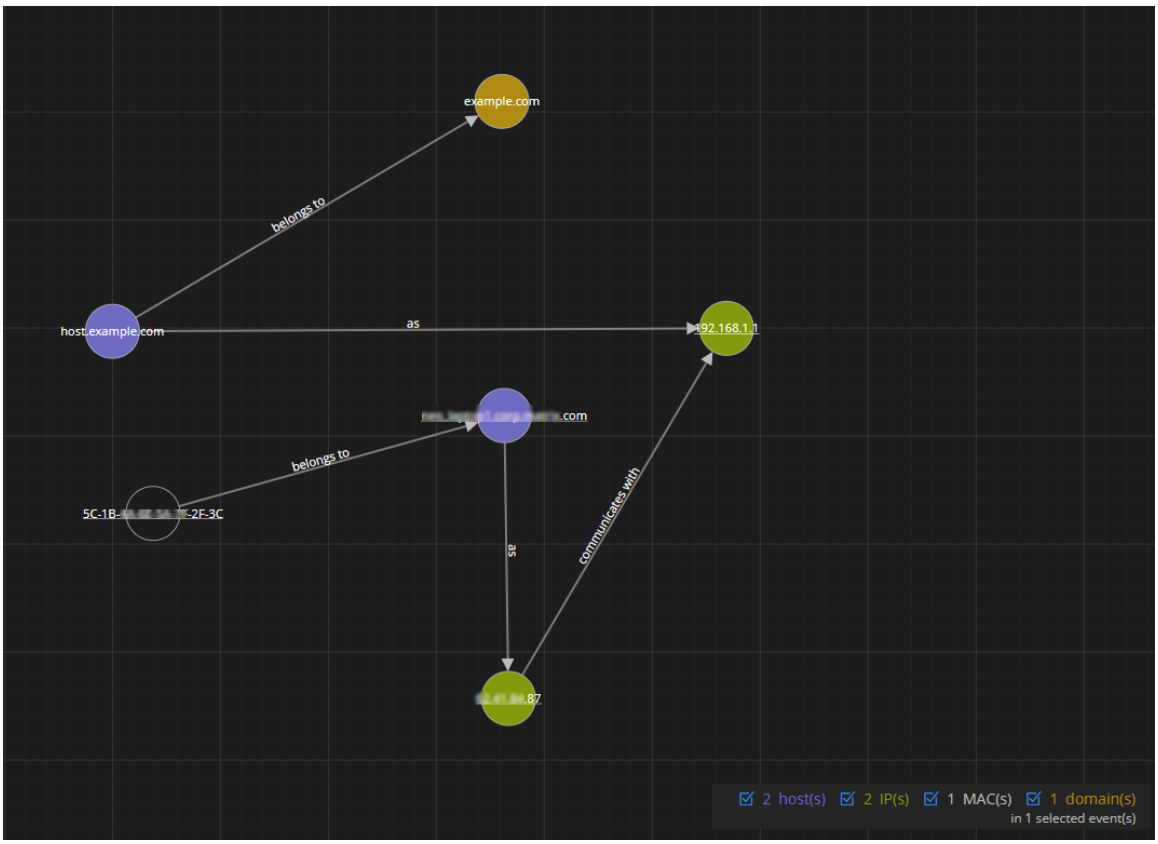
The Events List in version 11.3 and later does not show the Command and Control (C2) enrichment information for HTTP packet alerts in Suspected C&C incidents. However, you can view the C2 enrichment information in the Alert Details view.

1. Go to **Respond > Incidents**, look for a **Suspected C&C** incident, and note the incident ID.



2. Go to **Respond > Alerts** and in the Filters panel, select the following to locate an alert in the Alerts list with the incident ID noted above:
   a. In the **Part of Incident** section, select **Yes**.
   b. In **Alert Names** section, select **http-packet**.

If you are still not able to locate an alert in the Alerts list with the incident ID noted above, try filtering your alerts list more using the time range of the incident.



3. In the Alerts list, click the **http-packet** link in the **NAME** field of the alert associated with the incident ID.
The Event Details view shows the C2 enrichment information.

View and Study the Entities Involved in the Events on the Nodal Graph

An *Entity* is either an IP address, MAC address, user, host, domain, file name, or file hash. The nodal graph is an interactive graph that you can move around to get a better understanding of how the entities involved in the events relate to each other. The nodal graphs look different depending on the type of event, the number of machines involved, whether the machines are associated with users, and if there are files associated with the event.

The following figure shows an example nodal graph with six nodes.

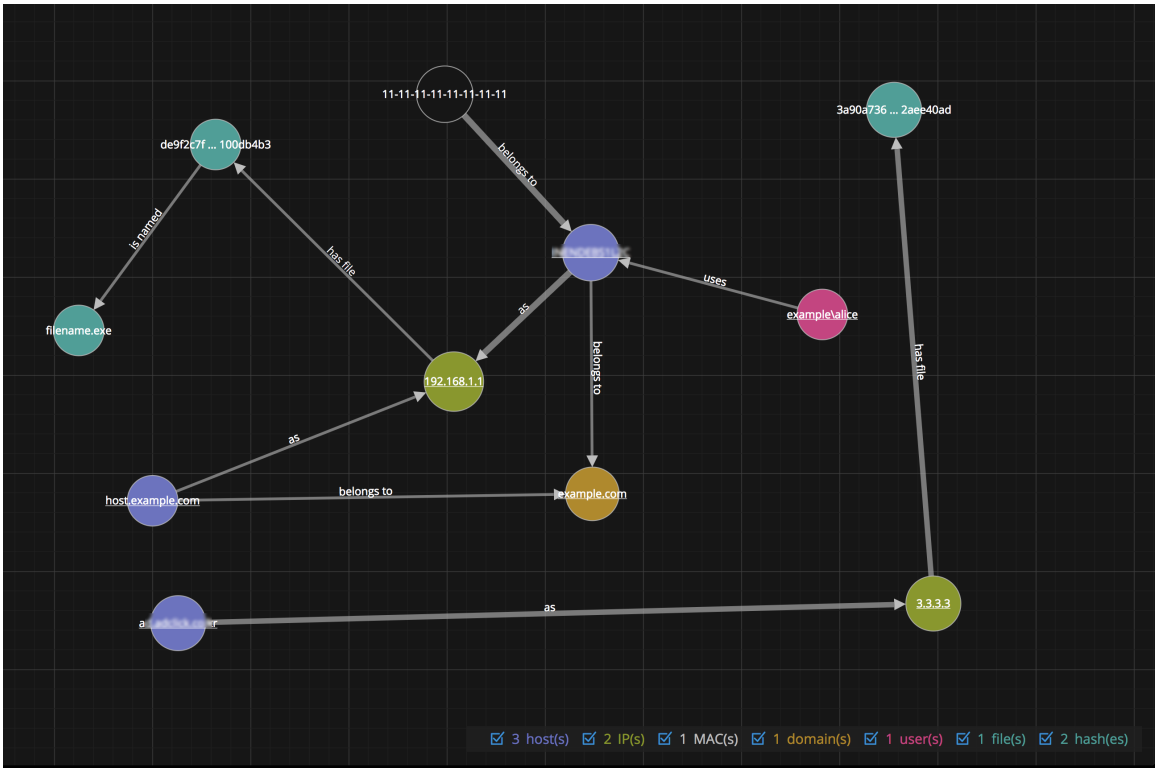
If you look closely at the nodal graph, you can see circles that represent nodes. A nodal graph can contain one or more of the following types of nodes:

- **IP address** (If the event is a detected anomaly, you can see a Detector IP. If the event is a transaction, you can see a Destination IP and a Source IP.)
- **MAC address** (You may see a MAC address for each type of IP address.)
- **User** (If the machine is associated with a user, you can see a user node.)
- **Host**
- **Domain**

- **Filename** (If the event involves files, you can see a filename.)
- **File Hash** (If the event involves files, you may see a file hash.)

In NetWitness 11.3 events, nodes for source filename and file hash are supported, but nodes for target filename and file hash are not supported. In NetWitness 11.4 and later events, nodes for both source and target filenames as well as file hashes are supported.

The legend at the bottom of the nodal graph shows the number of nodes of each type and the color coding of the nodes.

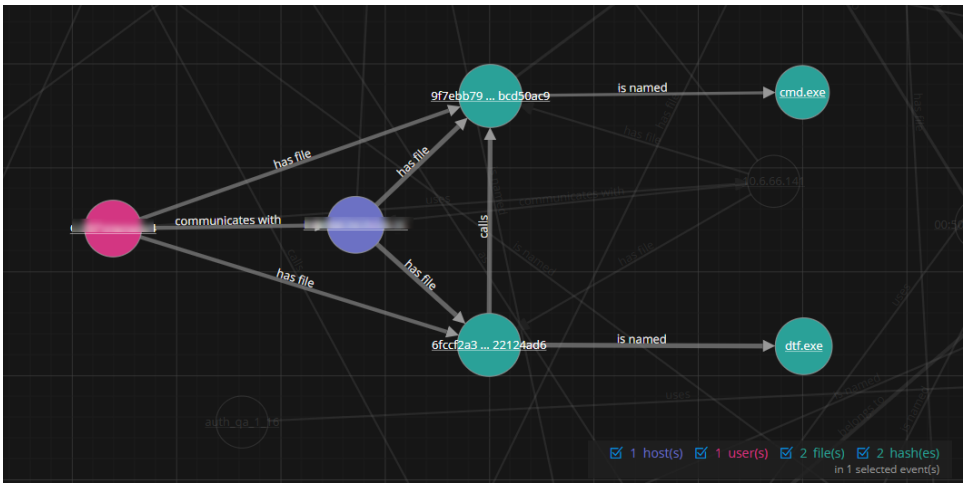


You can click and drag any node to reposition it.

The arrows between the nodes provide additional information about the entity relationships:

- **Communicates with**: An arrow between a Source machine node (IP address or MAC address) and a Destination machine node labeled with "communicates with" shows the direction of the communication.
- **Has file**: An arrow between a machine node (IP address, MAC address, or Host) and a file hash node labeled with "has file" indicates that the IP address has that file.
- **Uses**: An arrow between a User node and a machine node (IP address, MAC address, or Host) labeled with "uses" shows the machine that the user was using during the event.
- **Calls**: (This arrow is available in NetWitness Platform 11.4 and later.) An arrow between two file hash (checksum) nodes labeled with "calls" indicates the direction of the interaction between the associated files. The source file hash "calls" the target (destination) file hash, which indicates that the source file associated with the source file hash is performing an action on the target file associated with the target file hash.
- **As**: (This relationship type represents attributes of the connected node.) An arrow between nodes labeled with "as" provides additional information about the IP address that the arrow points to. In the above example, there is an arrow from the host node circle that points to an IP address node that is labeled with "as". This indicates that the name on the host node circle is the hostname of that IP address and is not a different entity.
- **Is named**: (This relationship type represents attributes of the connected node.) An arrow from a File Hash node to a File Name node labeled with "is named" indicates that the file hash corresponds to a file with that name.
- **Belongs to**: (This relationship type represents attributes of the connected node.) An arrow between two nodes labeled with "belongs to" indicates that they pertain to the same node. For example, an arrow between a MAC address and a Host labeled with "belongs to" indicates that it is the MAC address for the host.

Larger line size arrows indicate more communication between the nodes. Larger nodes (circles) indicate more activity than smaller nodes. The larger nodes are the most common entities mentioned in the events.



The following nodal graph example has 11 nodes.

In this example, notice that there are two IP nodes. They both have hashed files, but they do not communicate with each other. The IP address at the top (192.168.1.1) represents one machine with two hostnames (host.example.com is one of them) in the example.com domain. The MAC address of the machine is 11-11-11-11-11-11-11-11-11-11 and Alice uses it.

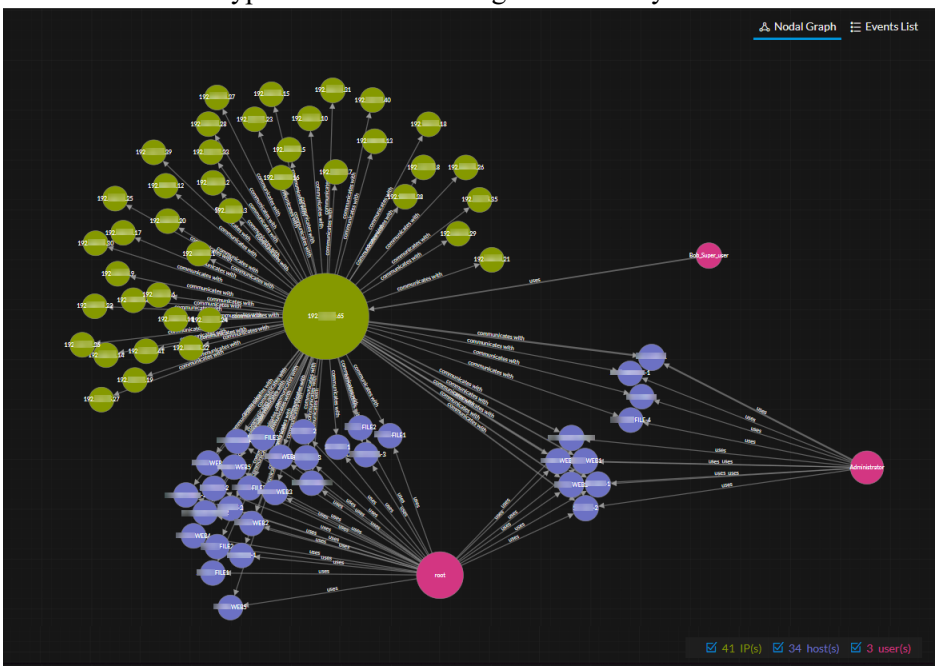
Note: The following example applies to NetWitness Platform 11.4 and later.

In the following nodal graph example, you can see the interaction between source and target (destination) files. There are six nodes in the selected event.

In this example, the user communicates with a host that has `dtf.eve` and `cmd.exe` files. The `dtf.exe` file on the host "calls" (in this case, launches) the `cmd.exe` file, which is suspected to be malicious activity. Notice that the "calls" arrow appears between the source and target file hashes, which are associated with the files.

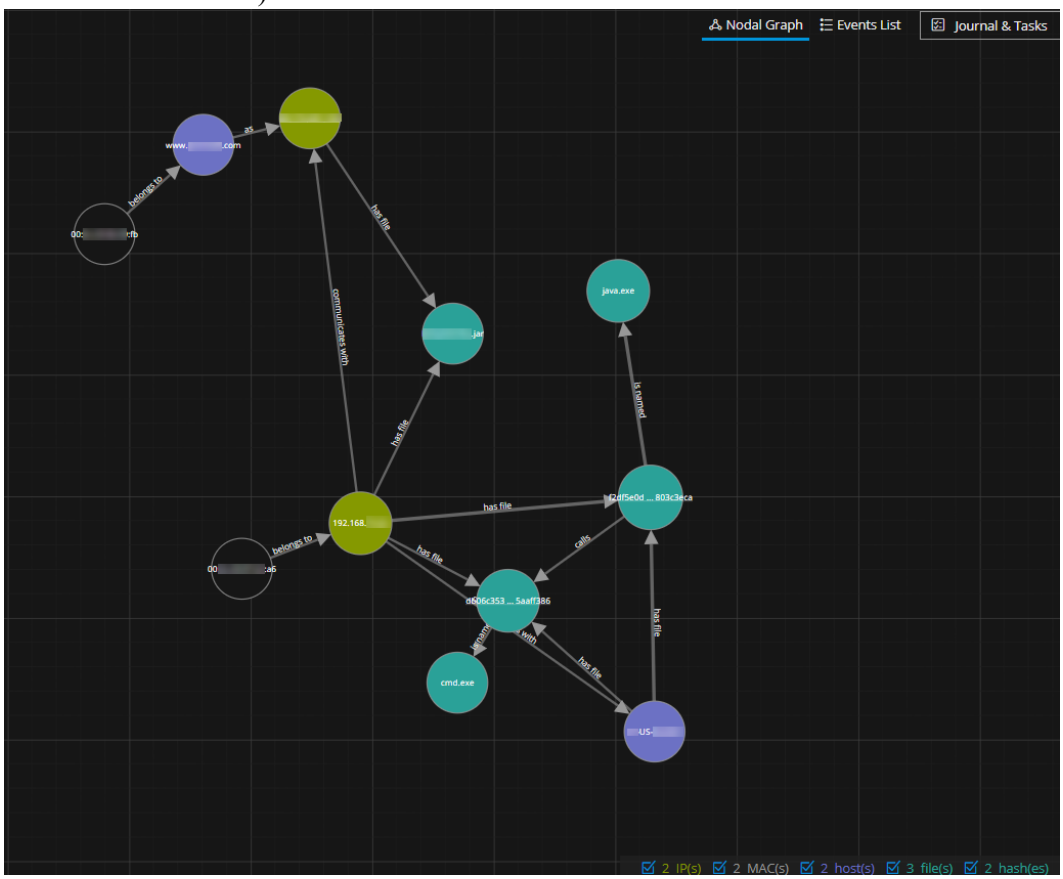
Nodal Graph Behaviors and Characteristics

Note: These nodal graph behaviors and characteristics are available in NetWitness Platform Version 11.4 and later.



The nodal graph makes it easier for an analyst to get an initial understanding of an incident with minimal effort.

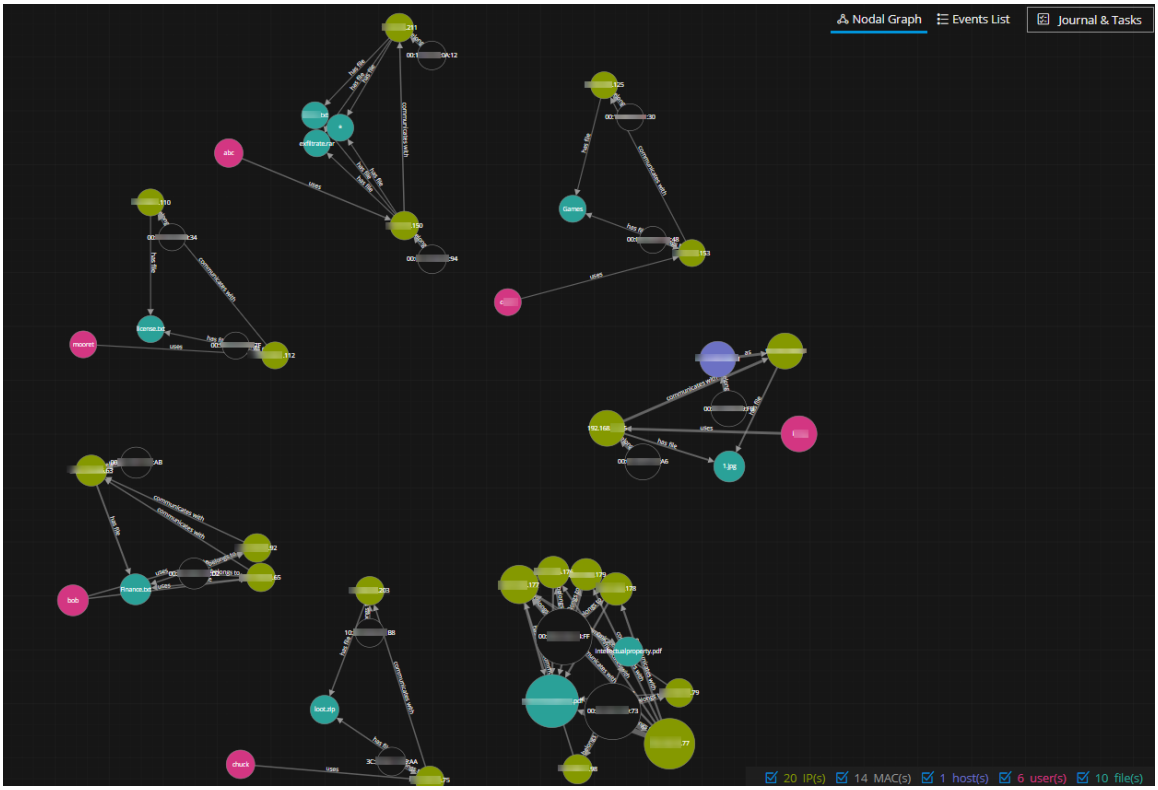
The nodal graph provides the following benefits to an analyst when responding to an incident:



- The nodal graph helps determine scope, commonalities, and outliers in a given dataset, which can be useful context for an analyst.
- In many cases, the initial nodal graph layout presents valuable insight without any interaction from the analyst.
- In cases where the initial layout does not give enough clarity or when an analyst wants to view things differently, a few nodal mouse-drag position adjustments can provide a much faster method of exposing insightful relationships and clusters.

The following behaviors and characteristics are now part of the graph:

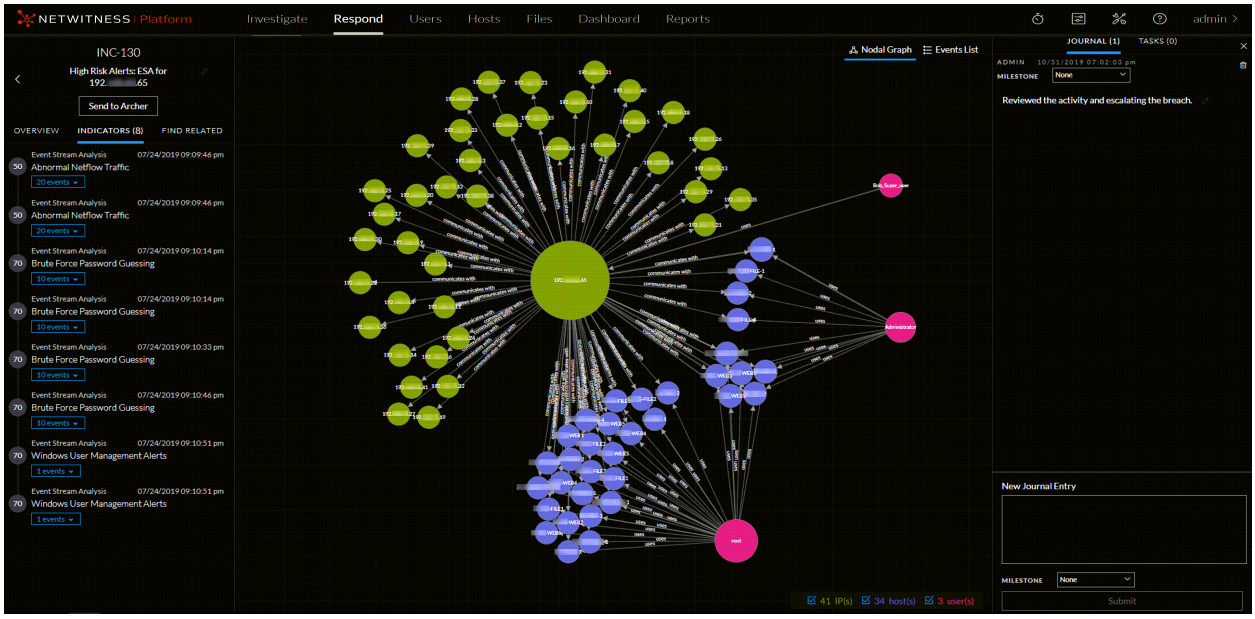
- Entities of similar types tend to cluster together visually.



- Attributes and actions are better differentiated. Arrows that represent attributes ("as", "is named", "belongs to", and "has file") tend to be shorter than those representing actions ("call" and "communicates with").

- Leaf nodes, which are nodes that only have a single relationship to a single entity, tend to stay closer together.

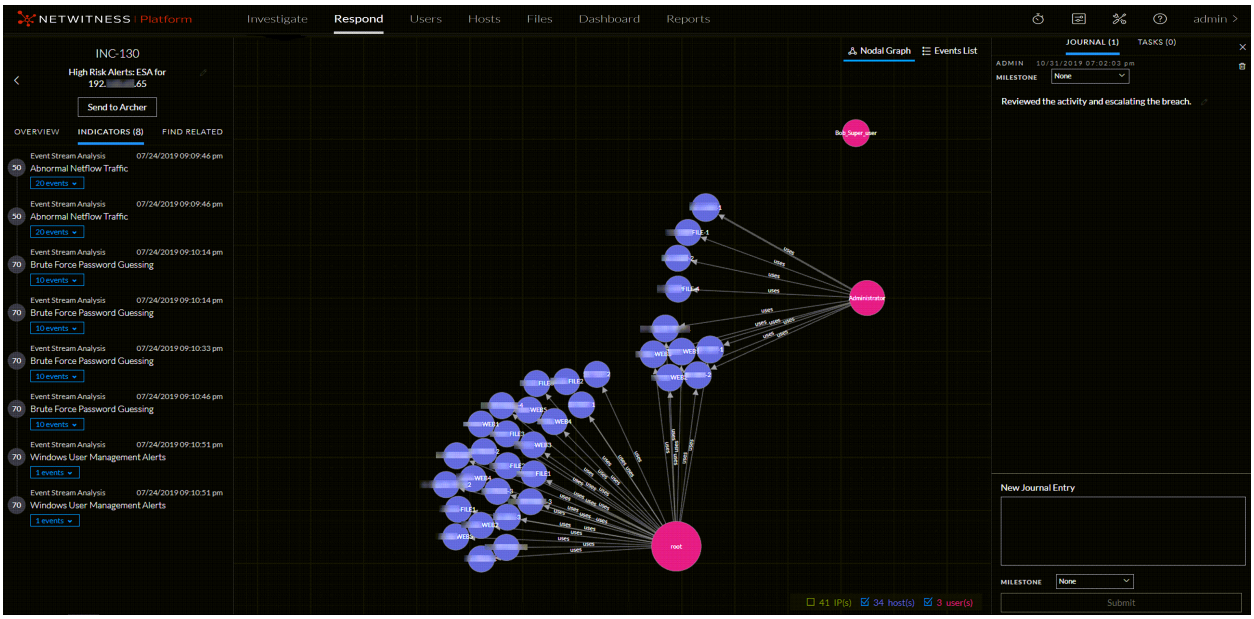
- Disjointed graphs, such as clusters of entities and relationships that do not have connections with one another, are forced apart.



Dragged nodes are pinned in place. Double-click a node to unpin it and allow the forces to apply again to the node.

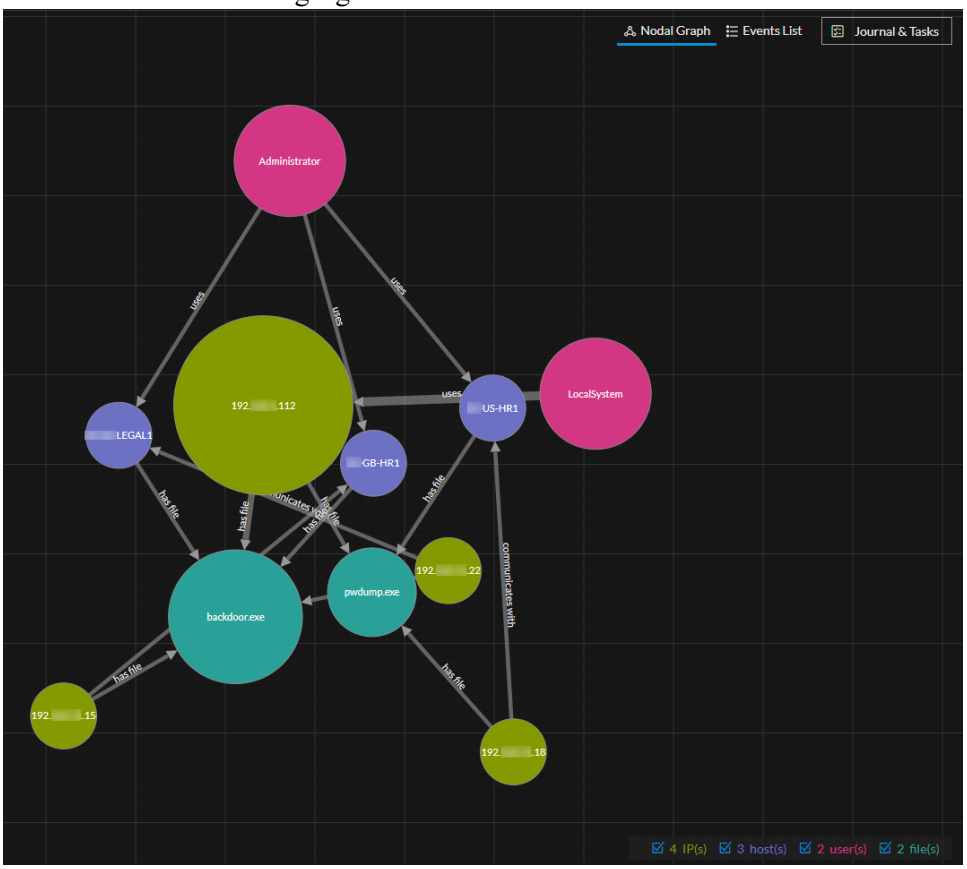
Select Node Types to View on the Nodal Graph

Note: This option is available in NetWitness Platform Version 11.2 and later.



In the Incident Details view nodal graph, you can hide node types to further study the interactions between the entities on the nodal graph.

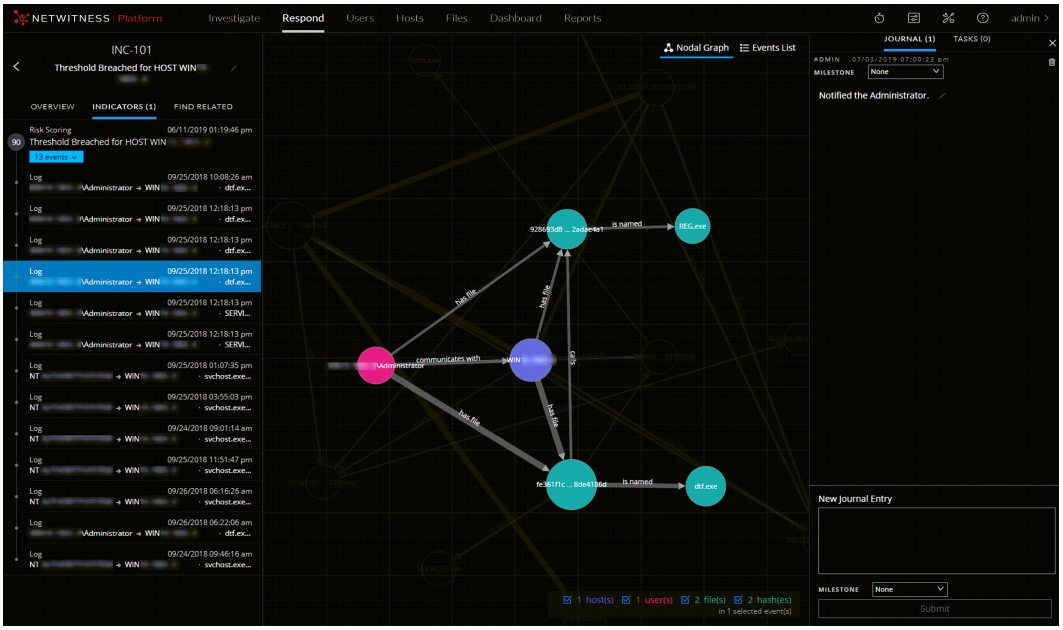
1. Go to **Respond > Incidents**.
2. In the Incidents List view, choose an incident to view and then click the link in the **ID** or **NAME** column for that incident.
   The Incident Details view for the selected incident appears with the Nodal Graph in view. The legend below the nodal graph has all of the entity node types selected by default.
   If you do not see the nodal graph, click Nodal Graph.



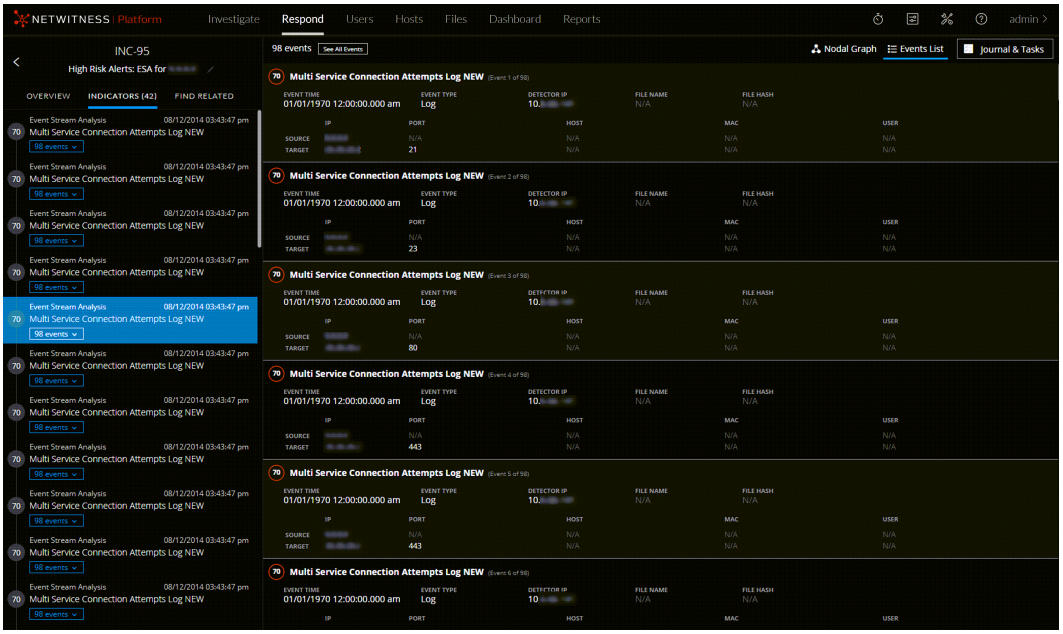
3. To hide node types, in the legend, clear the checkbox for the node types that you would like to hide in the nodal graph.

   The following example shows the IP address node type cleared and the IP address nodes are now hidden.

4. To include (unhide) node types, select the checkbox for the node types that you would like to appear in the nodal graph.
   Hiding node types can be especially helpful if the nodal diagram has overlapping entity relationships as shown in the following figure.



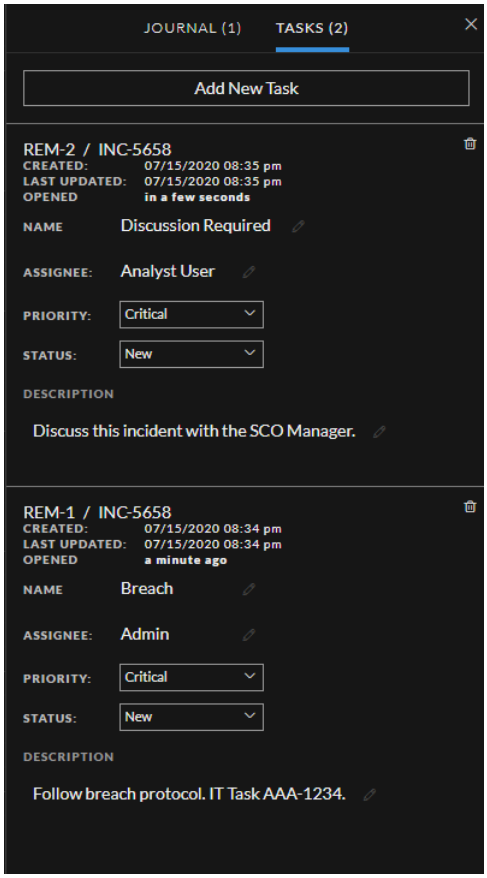
After hiding the IP node types, you can get a better understanding of what is happening with the remaining nodes.



Filter the Data in the Incident Details View

You can click indicators in the Indicators panel to filter what you can see in the Nodal Graph and the Events List.

If you select an indicator to filter the nodal graph, data that is not part of your selection is dimmed, but it is still in view as shown in the following figure.

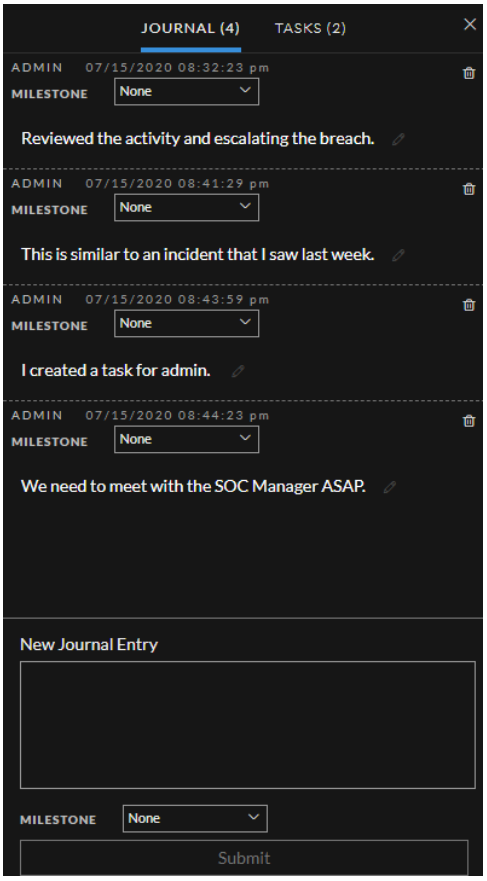


If you select an indicator to filter the Events List, only the events for that indicator are shown in the list. The following figure shows an indicator selected that contains ninety-eight events. The filtered Events List shows those ninety-eight events.

View the Tasks Associated with an Incident

Threat responders and other analysts can create tasks for an incident and track those tasks to completion. This can be very helpful, for example, when you require actions on incidents from teams outside of your security operations. You can view the tasks associated with an incident in the Incident Details view.

1. Go to **Respond > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident.
3. In the Journal on the right side of the Incident Details view, click the **TASKS** tab.
   If you cannot see the Journal, click **Journal & Tasks** and then click the **TASKS** tab.
   The Tasks panel shows all of the tasks for the incident.

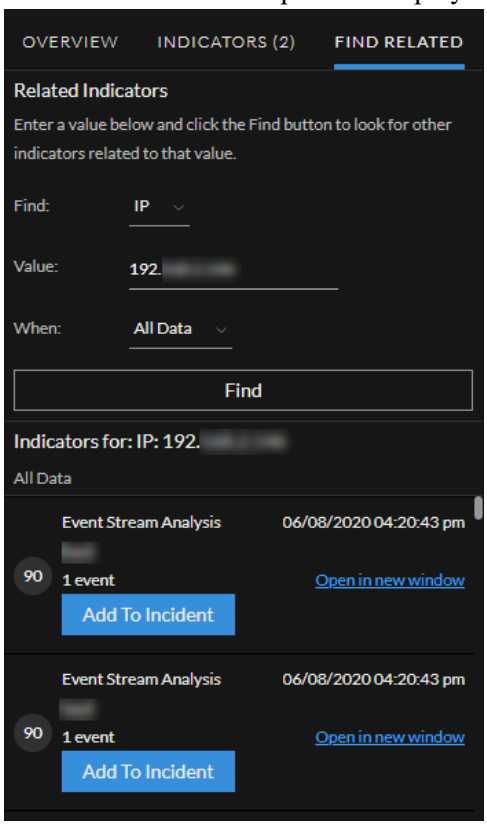


For more information about tasks, see Tasks List View, View All Incident Tasks, and Create a Task.

View Incident Notes

The incident Journal enables you to view the history of activity on your incident. You can view journal entries from other analysts and also communicate and collaborate with them.

1. Go to **Respond > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident.
   The Journal on the right side of the Incident Details view shows all of the journal entries for the incident.
   If you cannot see the Journal, in the toolbar, click **Journal & Tasks**.

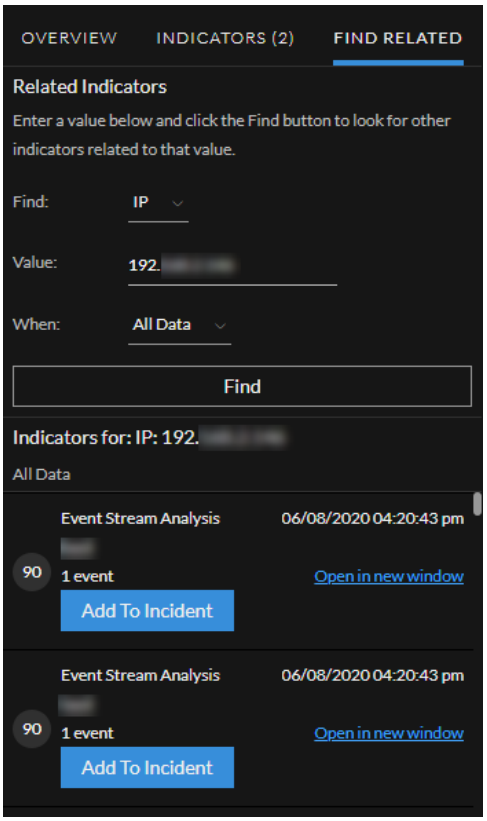


Find Related Indicators

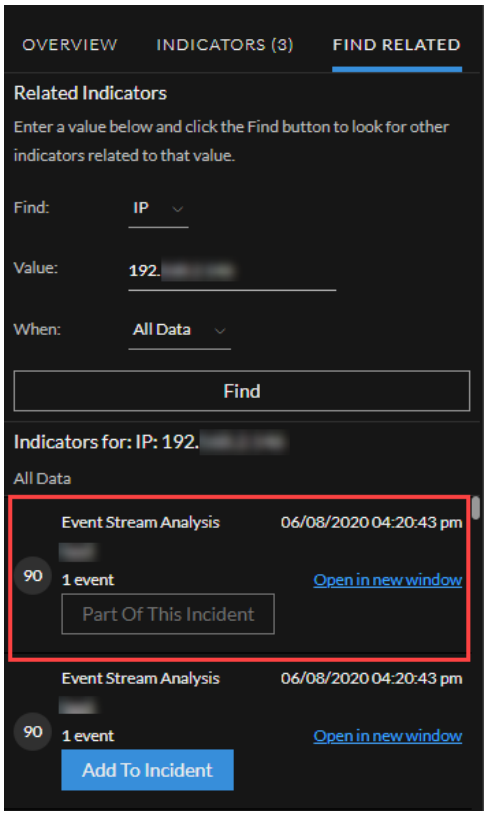
Related Indicators are alerts that were not originally part of the selected incident, but they are related in some way to the incident. The relationship may or may not be obvious. For example, related indicators can involve one or more entities from the incident, but they can also be related due to some intelligence outside of NetWitness.

In the Incident Details view Related Indicators panel, you can search for an entity (such as IP, MAC, Host, Domain, User, Filename, or Hash) in other alerts outside of the current incident.

1. Go to **Respond > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident.
3. In the left panel of the Incident Details view, click the **FIND RELATED** tab.
   The Related Indicators panel is displayed.



4. In the **Find** field, select the entity type to search, such as IP.
5. In the **Value** field, type a value for the entity, such as a specific IP address.
6. In the **When** field, select the time period to search, such as the Last 24 Hours.
7. Click **Find**.
   A list of related indicators (alerts) appear below the **Find** button in the **Indicators for** section. If an alert is not part of another incident, you can click the **Add to Incident** button to add the related indicator (alert) to the current incident. See Add Related Indicators to the Incident below.



Add Related Indicators to the Incident

You can add related indicators (alerts) to the current incident from Related Indicators panel. An indicator that is already part of an incident cannot be part of another incident. In the search results, if an alert is not already part of an incident, it has an **Add to Incident** button.

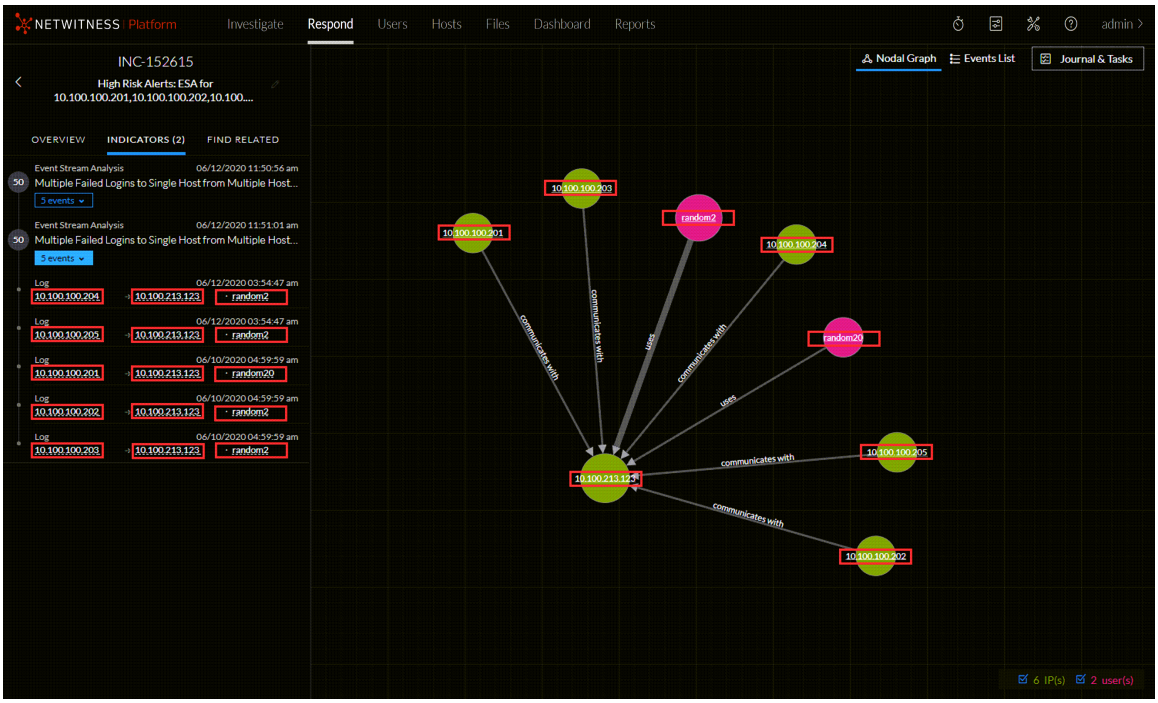
1. In the Related Indicators panel, do a search to find related indicators. See Find Related Indicators above.

2. Review the alerts in the search results. The **Indicators for** section (below the Find button) lists the related indicators (alerts).
3. To inspect the details of an alert before adding it as a related indicator to the incident, you can click the **Open in New Window** link to view the alert details for that indicator.
4. For each alert that you want to add to the current incident as a related indicator, click the **Add to Incident** button.
   The button in the Related Indicators panel now shows **Part of This Incident**.

The selected related indicator adds to the Indicators panel. The Indicators tab now shows the additional indicator.

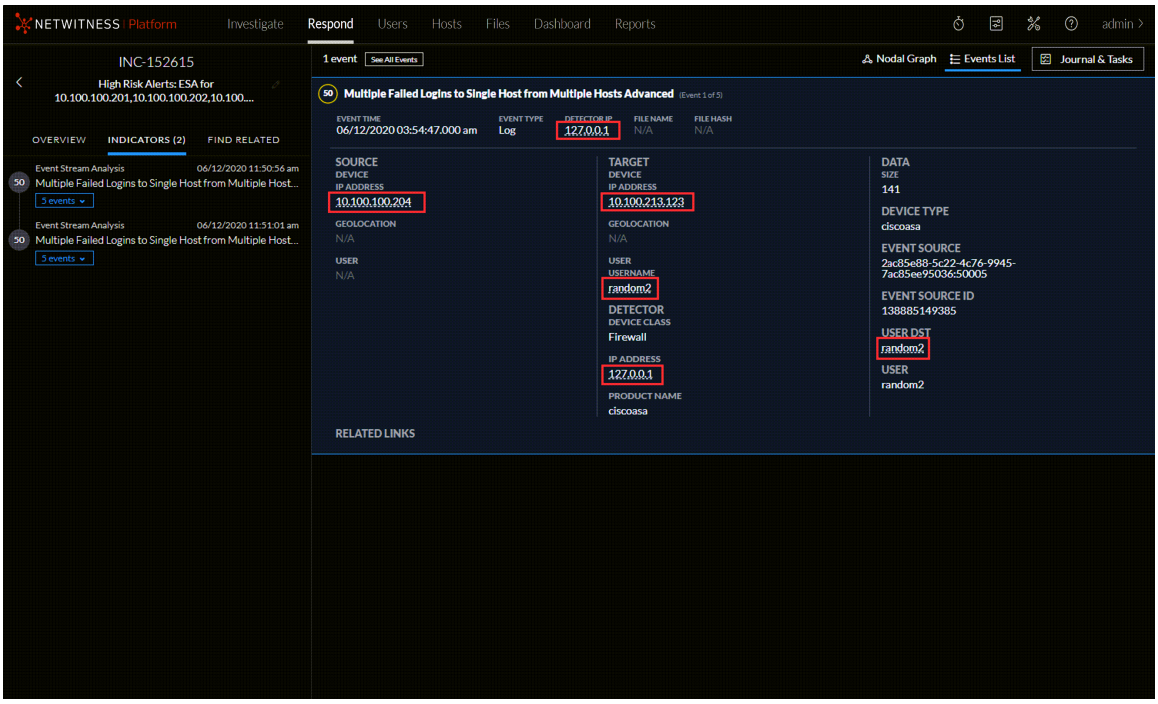
Investigate the Incident

To further investigate an incident within the Incident Details view, you can find links that take you to additional contextual information about the incident when it is available. This additional context can help you understand additional technical context and business context about a specific entity in the incident. It can also provide additional information that you may want to research to ensure that you understand the full scope of the incident.



You can perform the following procedures to further investigate an incident:

- View Contextual Information
- Add an Entity to a Whitelist
- Create a List
- View the Reputation Status of a File Hash
- Pivot to the Investigate > Events View
- Pivot to the Hosts or Files View
- Pivot to NetWitness Endpoint Thick Client
- Pivot to Archer
- View Event Analysis Details for Indicators
- View User Entity Behavior Analytics for Indicators
- Document Steps Taken Outside of NetWitness
  - View the Journal Entries for an Incident
  - Add a Note
  - Delete a Note

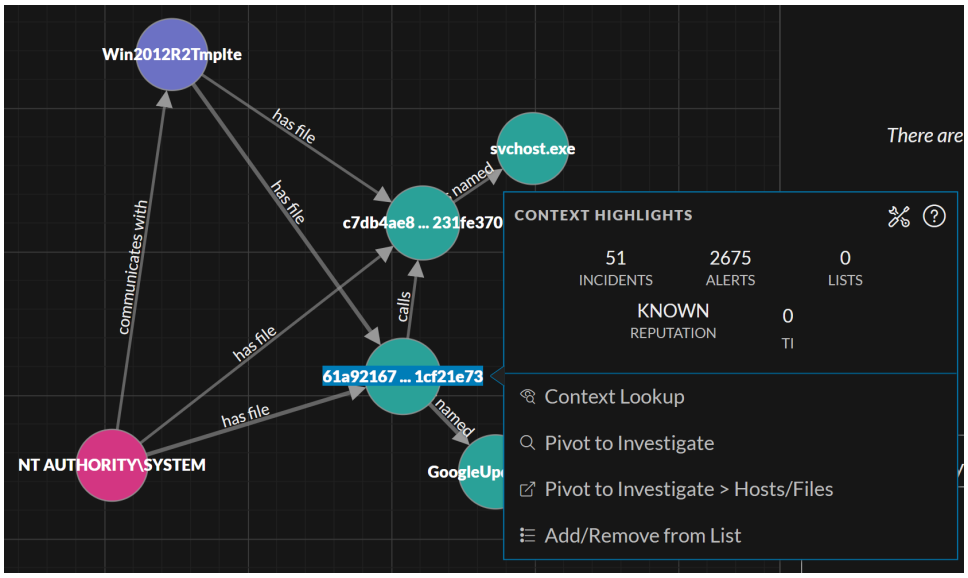


View Contextual Information

In the Indicators panel, Events List, or the Nodal Graph, you can view the underlined entities. If an entity is underlined, NetWitness is populating information about that entity type in the Context Hub. There may be additional information available about that entity in the Context Hub.

The following figure shows underlined entities in the Indicators panel and the Nodal Graph.

The following figure shows underlined entities in the Events list details.



The Context Hub is preconfigured with meta fields mapped to the entities. NetWitness Respond and NetWitness Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Settings for a Data Source" in the *Context Hub Configuration Guide*.

Caution: For the Context Lookup to work correctly in the Respond and Investigate views, NetWitness recommends that when mapping meta keys in the **Admin > System > Investigation > Context Lookup** tab, you add only meta keys to the Meta Key Mappings, not fields in the MongoDB. For example, ip.address is a meta key and ip_address is not a meta key (it is a field in the MongoDB).

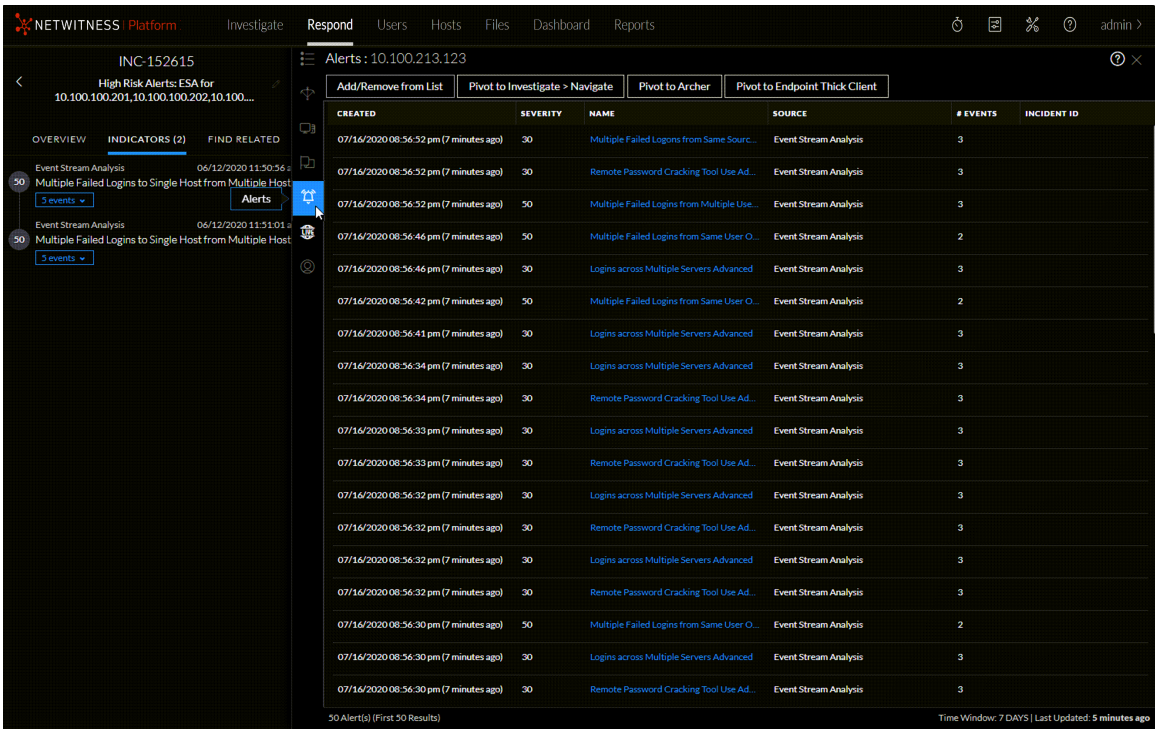
Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Respond** view to view context lookup for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

To view contextual information:

1. In the Indicators panel, Events List, or the Nodal Graph, left or right-click an underlined entity.
   A context tooltip appears with a quick summary of the type of context data that is available for the selected entity.

The information in the **Context Highlights** section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, Endpoint//, Criticality, Asset Risk, Reputation, and Threat Intelligence (TI). Depending on your data, you may be able to click these items for more information.

The above example shows 0 related incidents, 6800 alerts, 0 lists for the selected host, 0 incidents for TI, and no information available for Endpoint, Live Connect, Criticality, and Asset Risk.



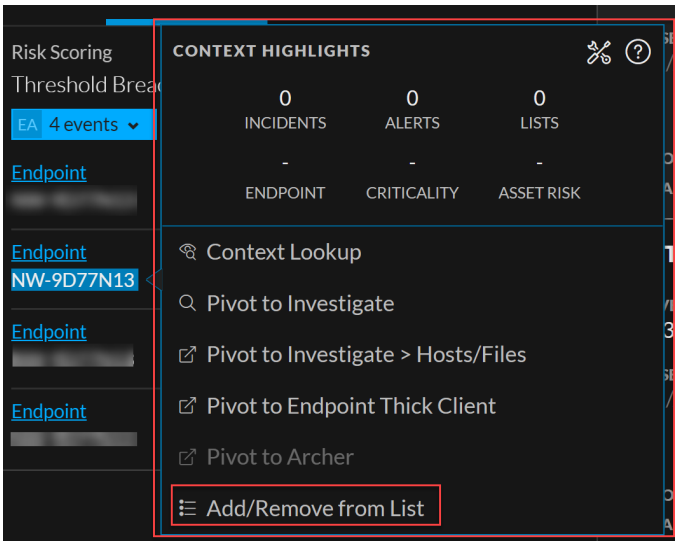
TI information comes from the STIX data source configured in Context Hub. For more information, see the *Context Hub Configuration Guide*.

The **Actions** section lists the available actions. In the above example, the Add/Remove from List, Pivot to Investigate > Navigate, Pivot to Investigate > Hosts/Files and Pivot to Endpoint Thick Client options are available.

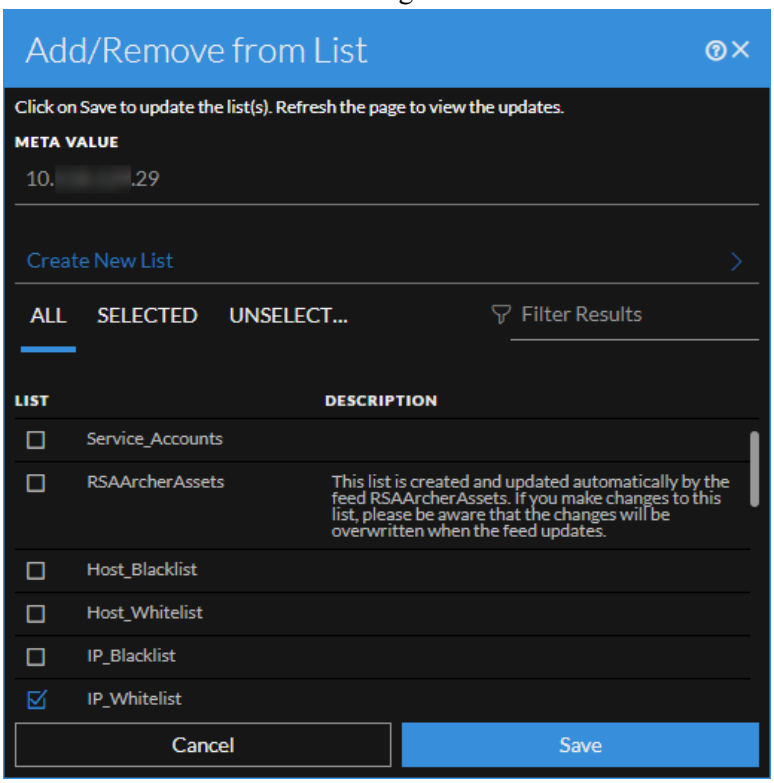
Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer data source is not responding. Check that the Archer configuration is enabled and configured properly.

For more information, see Pivot to the Investigate > Events View, Pivot to Archer, Pivot to NetWitness Endpoint Thick Client, Pivot to the Hosts or Files View, and Add an Entity to a Whitelist.

2. To see more details about the selected entity, click the **View Context** button.
   The Context Lookup panel opens and shows all of the information related to the entity.
   The following example shows contextual information for a selected host. It lists all of the incidents that mention that host.



To understand the different views within the Context Hub Lookup panel, see Context Lookup Panel - Respond View.

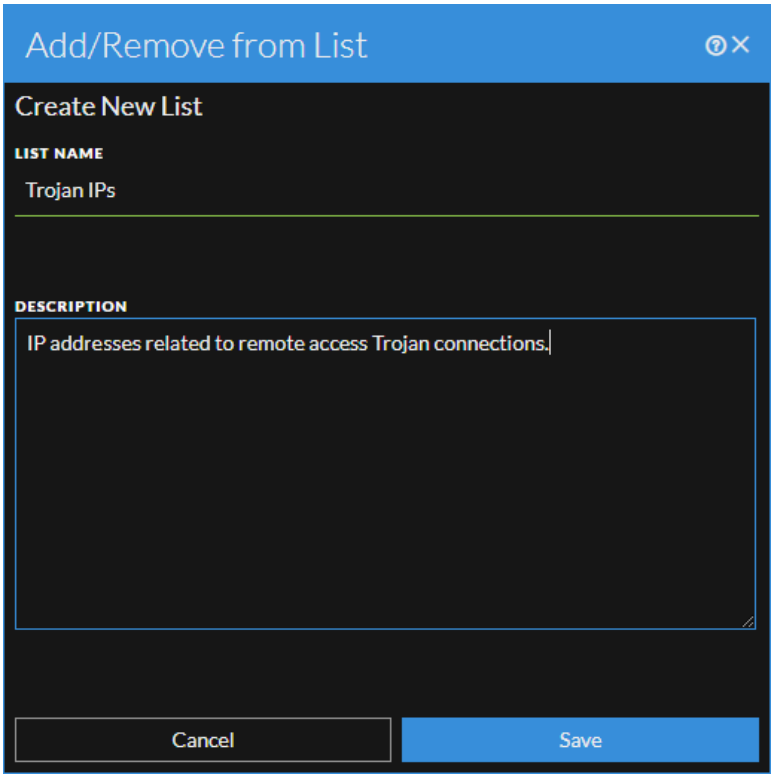


Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Indicators panel, Events List, or the Nodal Graph, left or right-click the underlined entity that you would like to add to a Context Hub list.
   A context tooltip appears showing the available actions.

2. In the **ACTIONS** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove from List dialog shows the available lists.



3. Select one or more lists and click **Save**.
   The entity appears on the selected lists.
   Add/Remove from List Dialog provides additional information.

Create a List

You can create lists in Context Hub from the Respond view. In addition to using lists to whitelist and blacklist entities, you can use lists to monitor entities for abnormal behavior. For example, to improve the visibility of a suspicious IP address and Domain under investigation, you may want to include them in two separate lists. One list could be for domains suspected of being related to command and control connections, and another list could be for IP addresses related to remote access Trojan connections. You can then identify indicators of compromise using these lists.

To create a list in Context Hub:

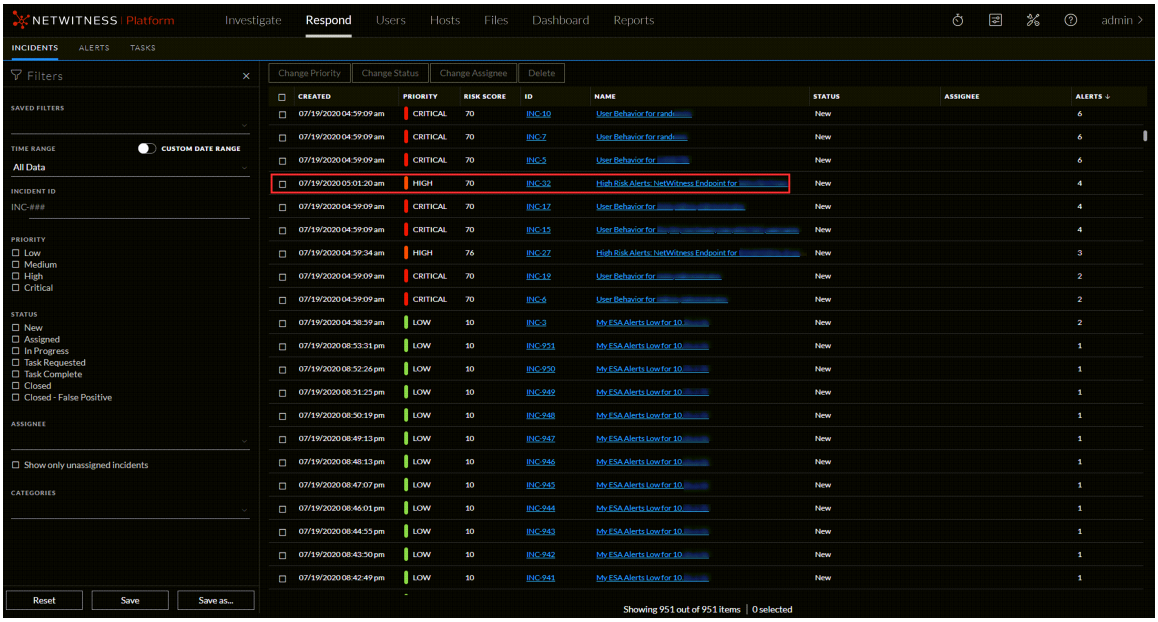
1. In the Indicators panel, Events List, or the Nodal Graph, left or right-click the underlined entity that you would like to add to a Context Hub list.
   A context tooltip opens showing the available actions.
2. In the **Actions** section of the tooltip, click **Add/Remove from List**.
3. In the Add/Remove from List dialog, click **Create New List**.

4. Type a unique **List Name** for the list. The list name is not case sensitive.
5. (Optional) Type a **Description** for the list.
   Analysts with the appropriate permissions can also export lists in CSV format to send to other analysts for further tracking and analysis. The *Context Hub Configuration Guide* provides additional information.

View the Reputation Status of a File Hash

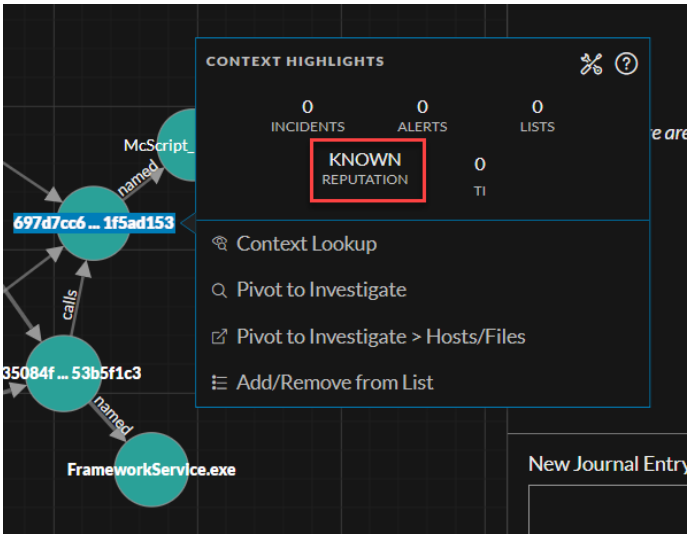
The File Reputation service available on RSA Live checks the reputation of every file hash against an extensive database of known file hashes updated in real-time. The file reputation is displayed in the Investigate and Respond views. In the View Context lookup, if the reputation status changes, Context Hub notifies the change in reputation status to all Endpoint servers. Information about the file hash such as any suspicious or malicious activity on the file is populated from Context Hub. There may be additional information available about that entity in the Context Hub.

The following table describes the file hash reputations.



Reputation	Description
Malicious	File hash is labeled as malicious.
Suspicious	File hash is suspected to be malicious.
Unknown	File hash is not known.
Known	File hash information is known to the file reputation service and does not have any previous bad record.
Known Good	File hash information is known good, such as files signed by Microsoft or NetWitness.
Invalid	File hash format is invalid.

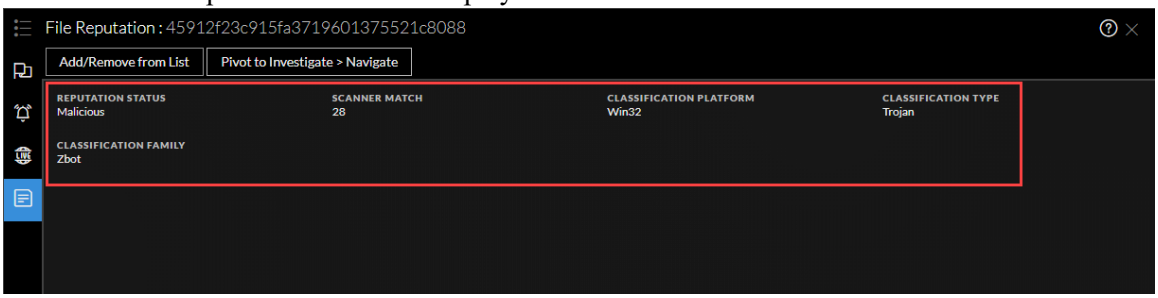
Note: A reputation status is visible for a file hash entity only and File Reputation service supports a maximum of 10 million files for a reputation of file hash.



The suspicious or malicious files are available for further analysis in the **Investigate > Navigate** view and **Investigate > Events** view. For more information on the file reputation service, see the *Live Services Management Guide* and the *NetWitness Endpoint User Guide*.

To view the reputation of a file hash:

1. Go to **Respond > Incidents**.
2. In the Incidents List view, choose an incident to view and then click the link in the **ID** or **Name** column for that incident.



3. In the Incident Details view, left or right click the file hash entity.
   The context tooltip displays the reputation status of the selected file hash entity.

4. Click **Reputation** to view the reputation status information.

5. Click the **File Reputation** icon  to view further details.
   The details for reputation status are displayed.

Pivot to the Investigate > Events View

For a more thorough investigation of the incident, you can access the **Investigate** > **Events**.

1. In the Indicators panel, Events List, or the Nodal Graph, left or right click any underlined entity to access a context tooltip.
2. In the context tooltip panel, select **Pivot to Investigate**.
   The Events view opens, which enables you to perform a deep dive investigation.

For more information, see the *NetWitness Investigate User Guide*. For troubleshooting information with the Investigate > Events link see the *Alerting with ESA Correlation Rules User Guide*.

Pivot to the Hosts or Files View

For a more thorough investigation about specific Hosts and Files, you can access the Hosts and Files views.

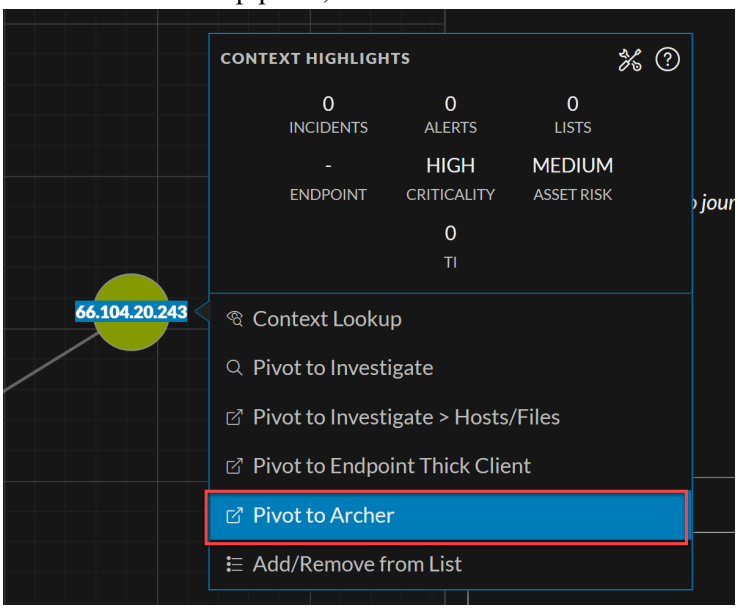
1. In the Indicators panel, Events List, or the Nodal Graph, hover over any entity to access a context tooltip.
2. In the context tooltip panel, select **Pivot to Investigate > Hosts/Files**.
   If you hover over a host or IP or MAC address entity and click **Pivot to Investigate > Hosts/Files**, it displays the Hosts view with a specific host listed.
   If you hover over a filename or file hash entity and click **Pivot to Investigate > Hosts/Files** it displays the Files view with a specific file listed.

Note: By default, the search for entities is on the previously selected Endpoint Server. However, you can select a different Endpoint Server to fetch the information or data.

For more information, see the *NetWitness Investigate User Guide*.

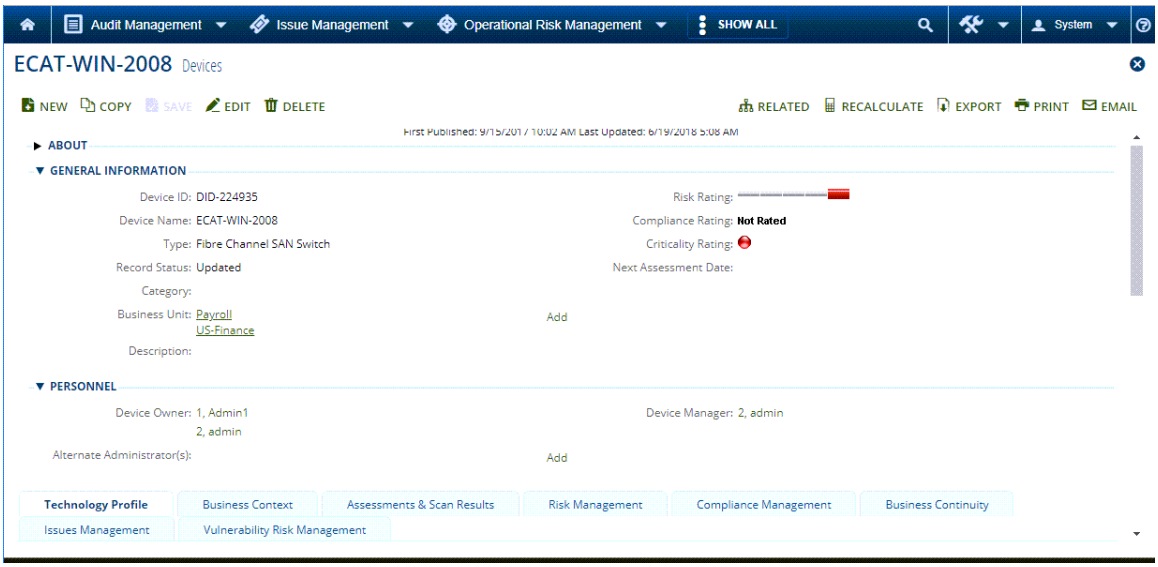
Pivot to NetWitness Endpoint Thick Client

If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.



1. In the Indicators panel, Events List, or the Nodal Graph, hover over any underlined entity to access a context tooltip.
2. In the context tooltip panel, select **Pivot to Endpoint Thick Client**.
   The NetWitness Endpoint thick client application opens outside of your web browser.

For more information on the thick client, see the *NetWitness Endpoint User Guide*.



Pivot to Archer

For viewing more details about the device in Archer Cyber Incident & Breach Response, you can pivot to the device details page. This information is displayed only for IP address, host, and Mac address.

1. In the Indicators panel, Events List, or the Nodal Graph, left or right click any underlined entity (IP address, host, and Mac address) to access a context tooltip.
2. In the context tooltip panel, select **Pivot to Archer**.

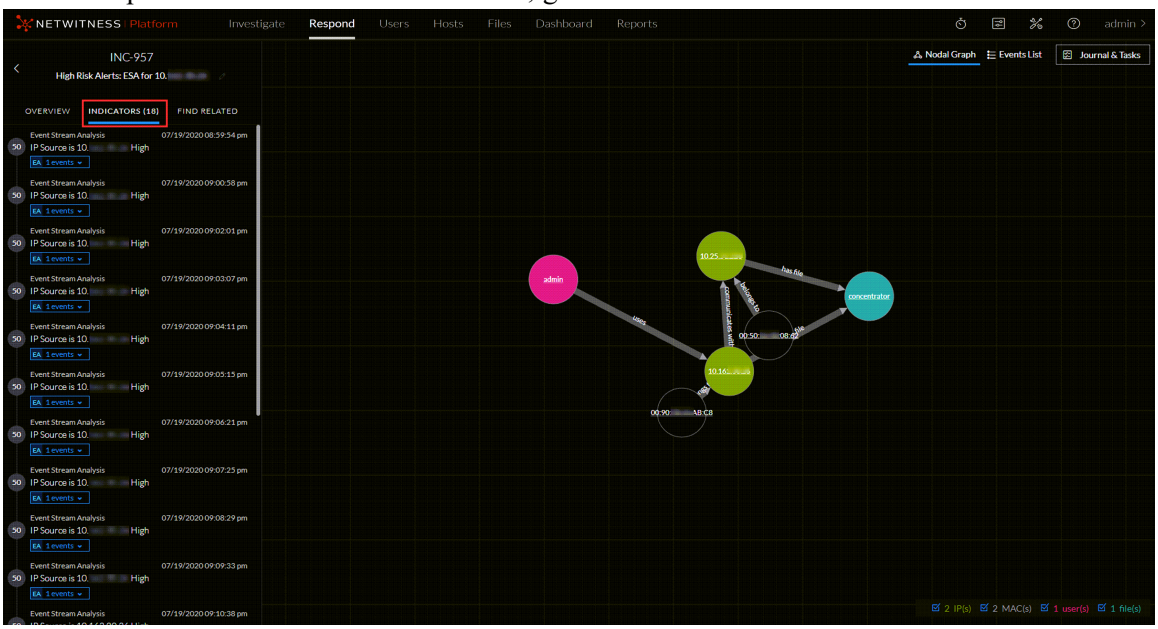
3. The device details page in **Archer Cyber Incident & Breach Response** opens if you are logged in to the application, otherwise the login screen is displayed.

Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the Archer configuration is enabled and configured properly.

For more information, see the *NetWitness Archer Integration Guide*.

View Event Analysis Details for Indicators

In the Incident Details view Indicators panel, you can drill deeper into the events associated with the listed indicators to get a better understanding of the events. In the Events panel, you can view raw events and metadata with interactive features that enhance your ability to find meaningful patterns in the data. You can examine network, log, and endpoint events in the Events panel. The Events panel in the Respond view shows the Events view from Investigate for specific indicator events. For detailed information about the Events view, see the *NetWitness Investigate User Guide*.

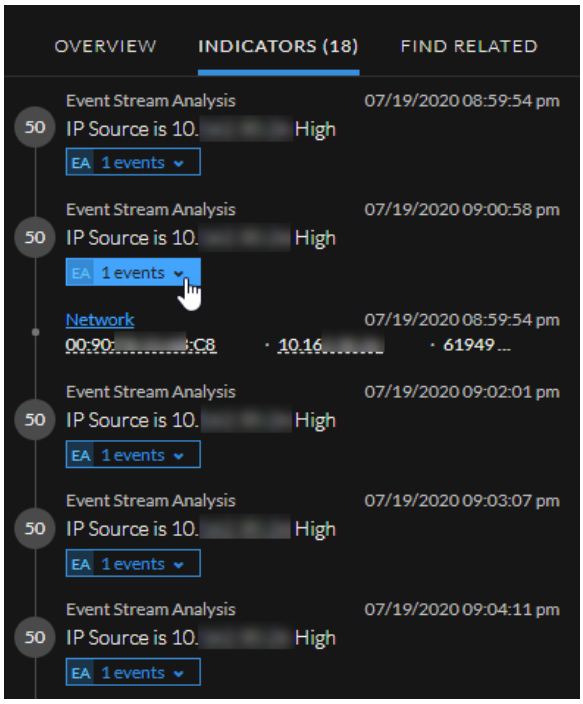


Note: You must have the following Investigate-server permissions to view the Events panel in the Respond view:
`event.read`
`content.reconstruct`
`content.export`
The Events view requires all Core services to be on NetWitness Platform 11.4 or later.

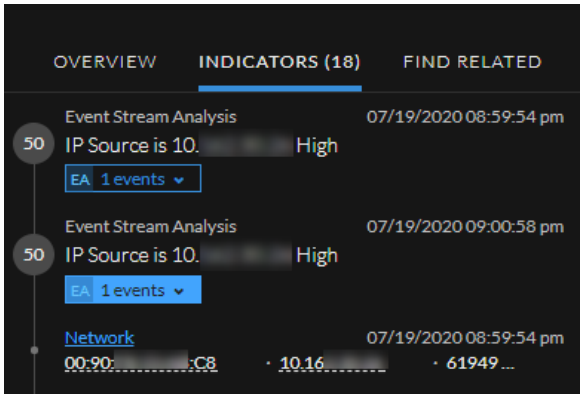
Migration Considerations

Migrated incidents from NetWitness versions before 11.2 will not show the Events panel in the Respond Incident Details view Indicators panel. Likewise, if you use alerts that were migrated from versions before 11.2 to create incidents in 11.5, you will also not be able to view the Events panel in the Respond view for those incidents.

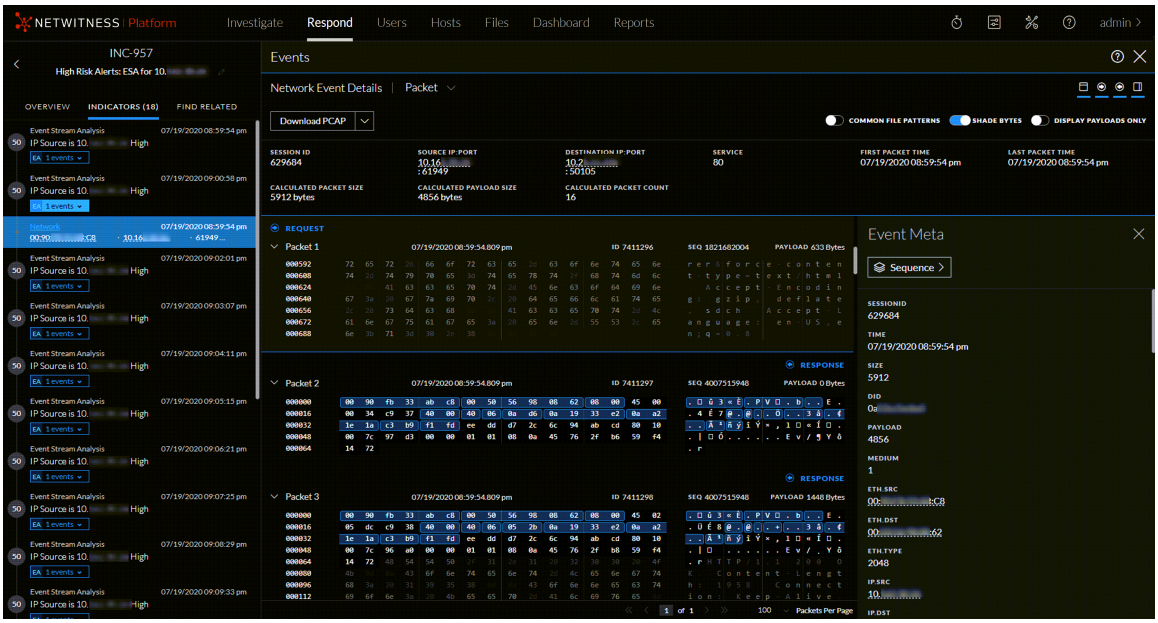
To access event analysis details for an event in the Indicators panel:



1. Go to **Respond > Incidents**.
2. In the Incidents List view, choose an incident to view and then click the link in the **ID** or **NAME** column for that incident.
   The Incident Details view is displayed.
3. In the left panel of the Incident Details view, go to the **Indicators** tab.



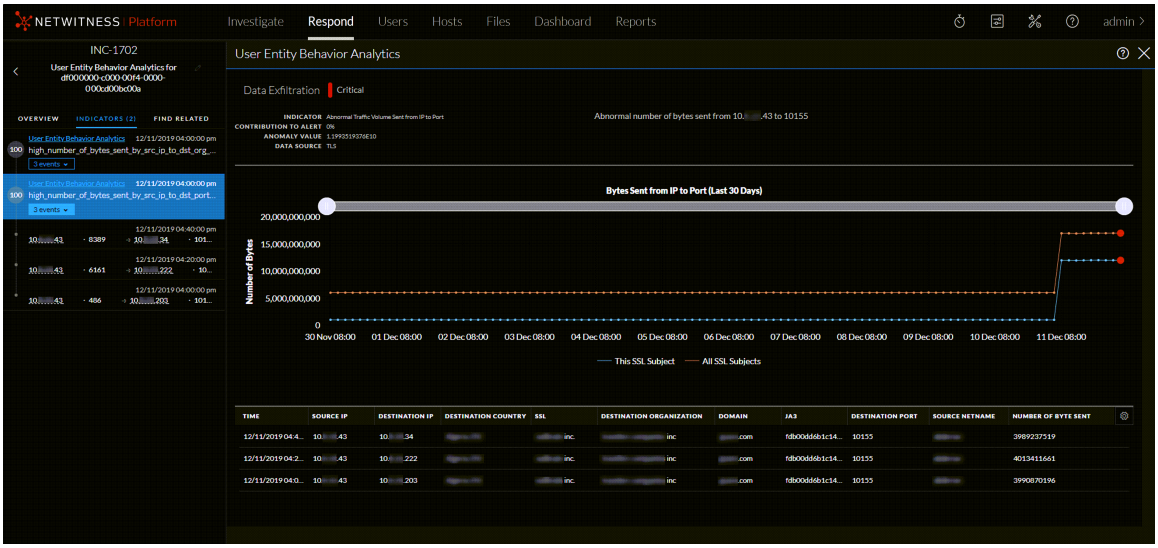
Data source information is shown above the names of the indicators. You can also see the creation date and time as well as the number of events in the indicator. If event analysis (EA) information is available, you can see an **EA** icon in front of the event count as shown in the following figure.



4. Click an event count with an **EA** icon to view additional event information.

5. Click an event type hyperlink within the event to open the Events panel. In the following example, the event type is Network.

The Events panel shows event details for the event, such as packet analysis details. The information available can vary based on the event type.

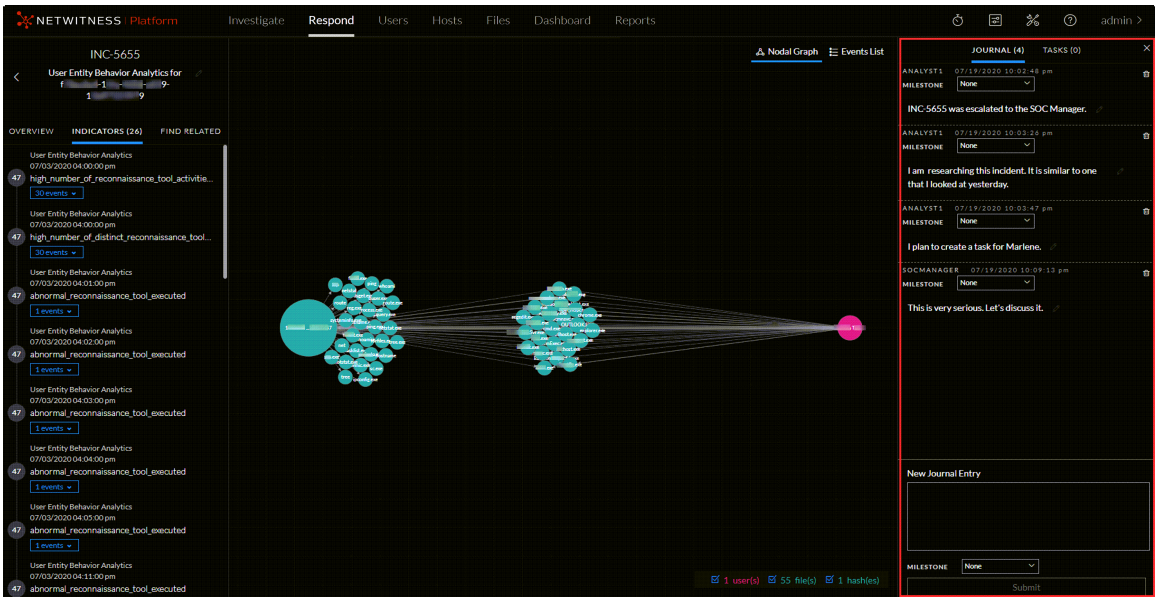


For detailed information about the Events view, see the *NetWitness Investigate User Guide*.

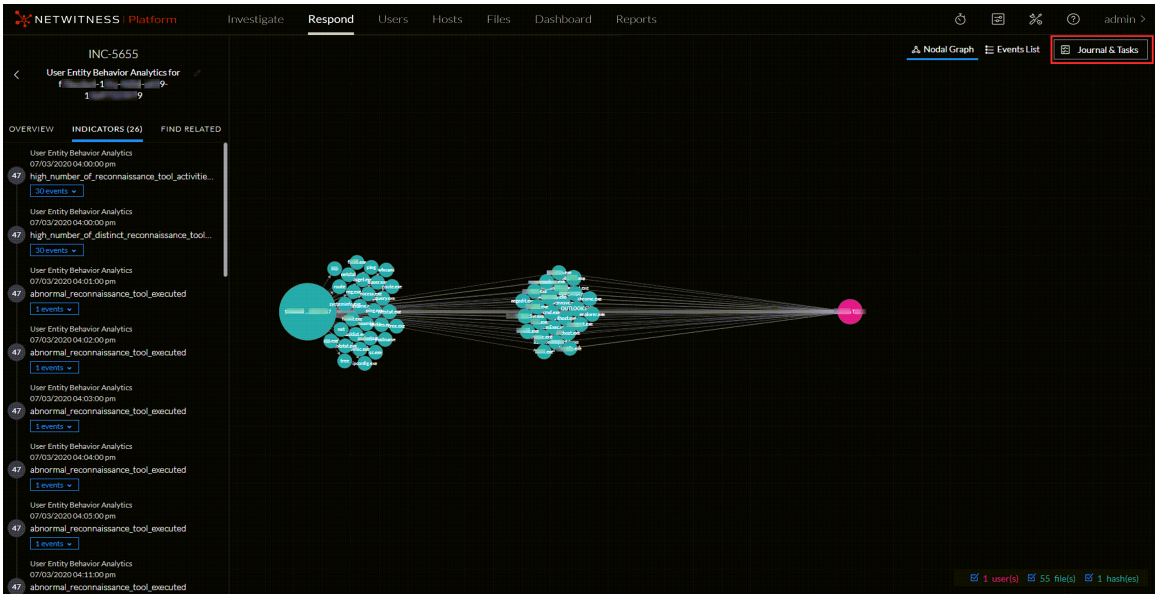
Note: If you want to send the Events URL link to another analyst, you can copy the event type hyperlink, for example Network.

View User Entity Behavior Analytics for Indicators

NetWitness UEBA (User and Entity Behavior Analytics) is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all users and entities in your network environment. You can access UEBA from the Respond Incident Details view Indicators panel. Indicators with a **User Entity Behavior Analytics** hyperlink have additional UEBA information available. For detailed information about UEBA, see the *NetWitness UEBA User Guide*.

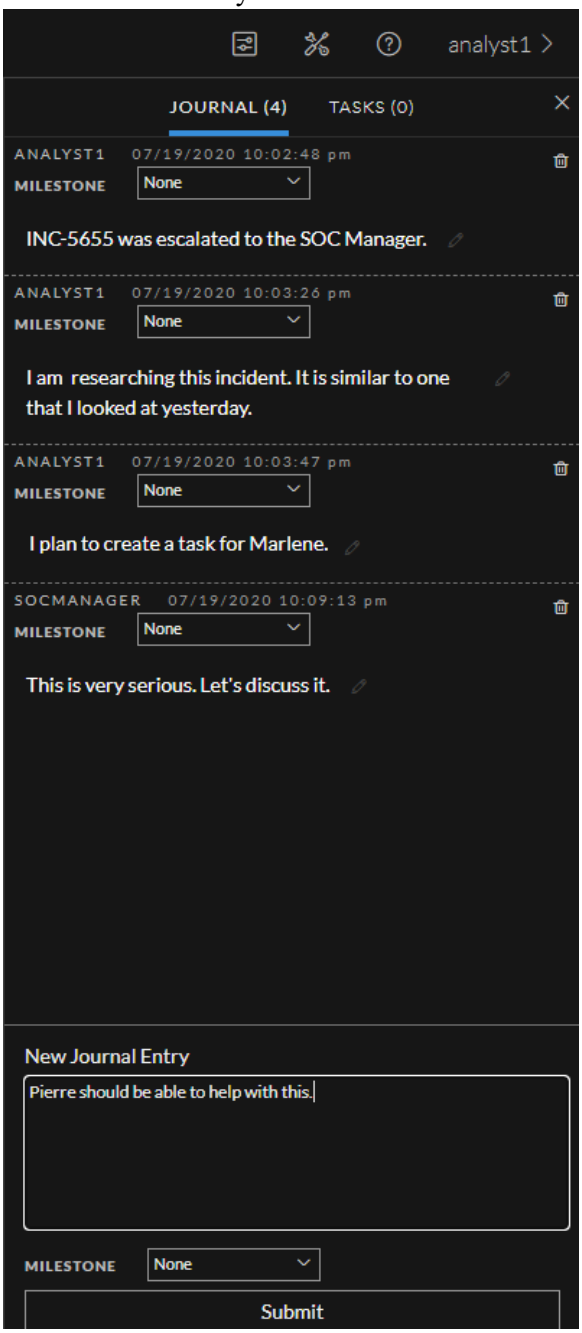


Document Steps Taken Outside of NetWitness



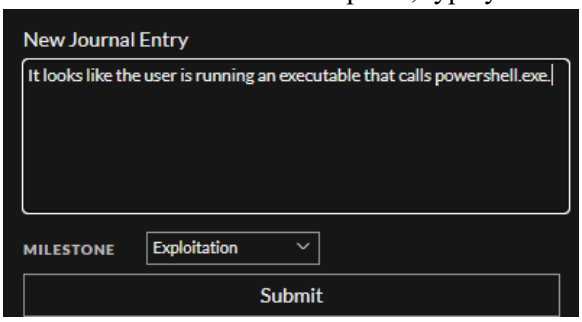
The journal shows notes added by analysts and it enables you to collaborate with your peers. You can post notes to a journal, add Investigation Milestone tags (Reconnaissance, Delivery, Exploitation, Installation, Command and Control, Action on Objective, Containment, Eradication, and Closure), and view the history of activity on your incident.

View the Journal Entries for an Incident



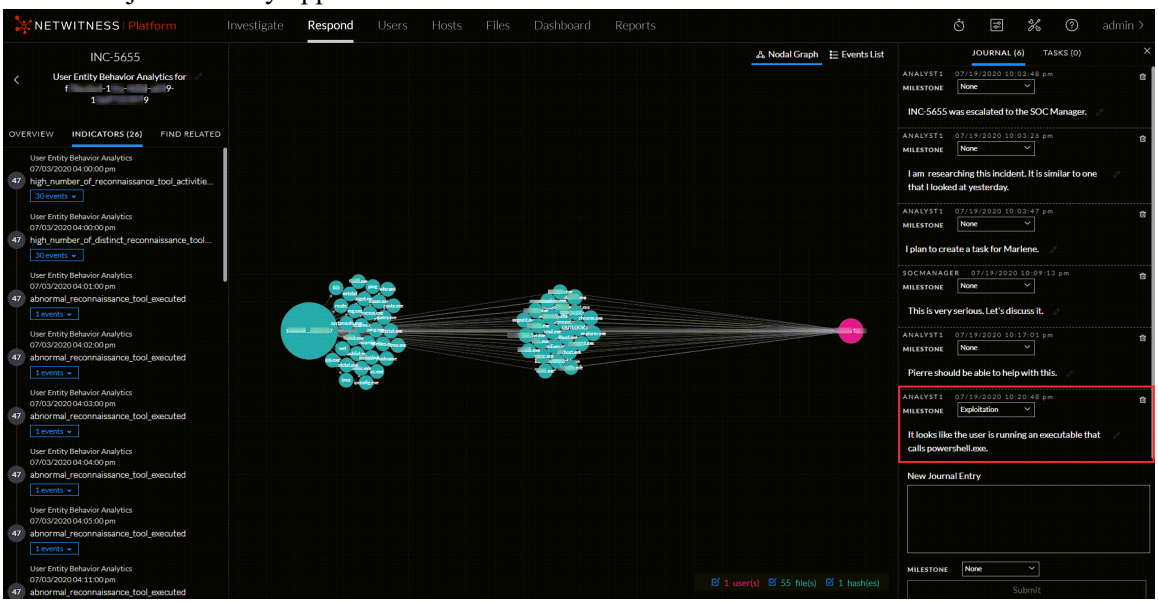
The Journal is on the right side of the Incident Details view.

If you do not see the Journal, in the toolbar, click **Journal & Tasks**.



The Journal shows the history of activity on an incident. For each journal entry, you can see the author and time of the entry.

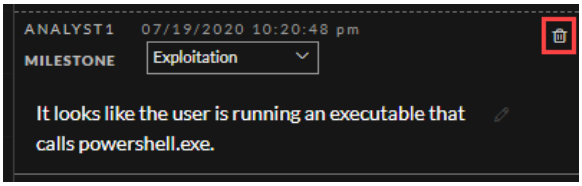
Add a Note



Typically, you will want to add a note to allow another analyst to understand the incident, or add a note for posterity so that your investigative steps are documented.

1. At the bottom of the Journal panel, type your note in the **New Journal Entry** box.

2. (Optional) Select an Investigation Milestone from the drop-down list (Reconnaissance, Delivery, Exploitation, Installation, Command and Control, Action On Objective, Containment, Eradication, and Closure).

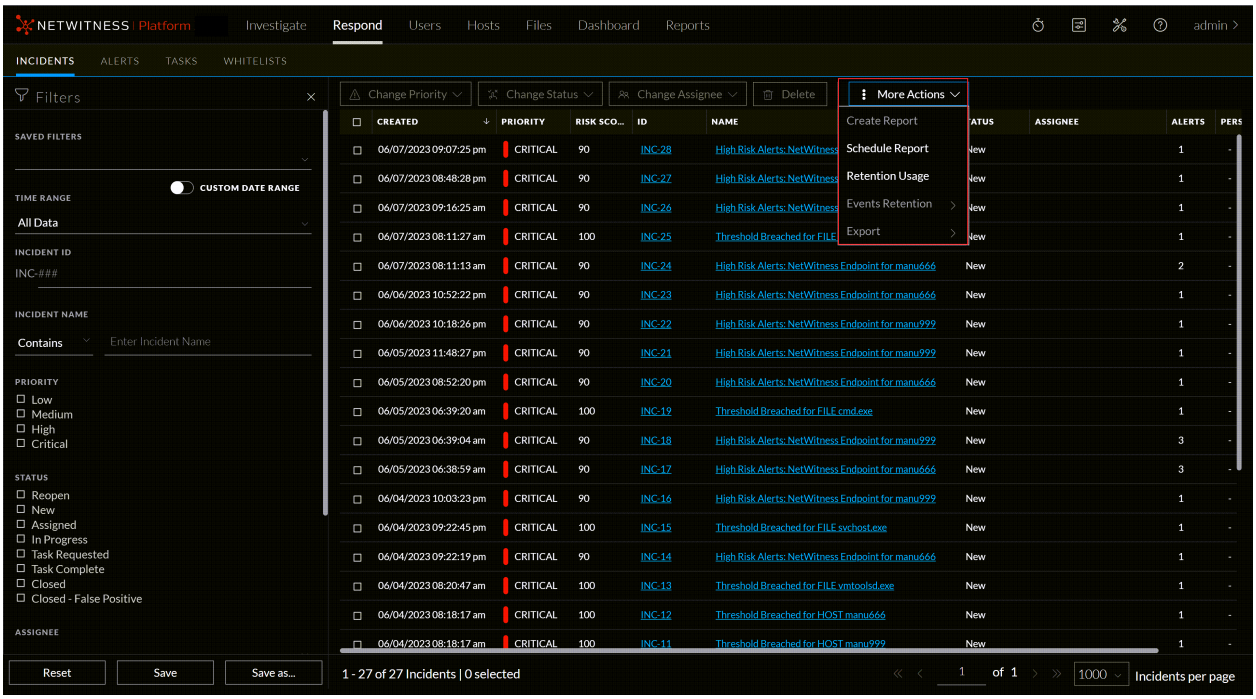


3. After you finish your note, click, **Submit**.
   Your new journal entry appears in the Journal.

Delete a Note

1. In the Journal panel, locate the journal entry that you would like to delete.

2. Click the trash can (delete) icon  next to the journal entry.



3. In the confirmation dialog that appears, click **OK** to confirm that you want to delete the journal entry. This action cannot be reversed.

Generate Reports from Respond View

From NetWitness Platform 12.3 or later, Users can directly create or schedule a report from the Respond view. You can create a simple ad-hoc report or complex report and configure its execution properties by scheduling a report. You can generate a report to capture details related to past, current, or predicted resource needs and schedule different time ranges to execute the same report. For example, depending on your requirement, you can schedule a report to run hourly, daily, weekly, or monthly.

Note:
- If the administrator has not configured the time zone, the reports follow the UTC time zone by default.
- If the administrator configures the time zone under the User Preferences panel, the report follows the administrator's configured time zone. For more information, see Setting User Preferences in the *NetWitness Getting Started Guide*.
- A generated output report can contain up to 100 results in tabular format.

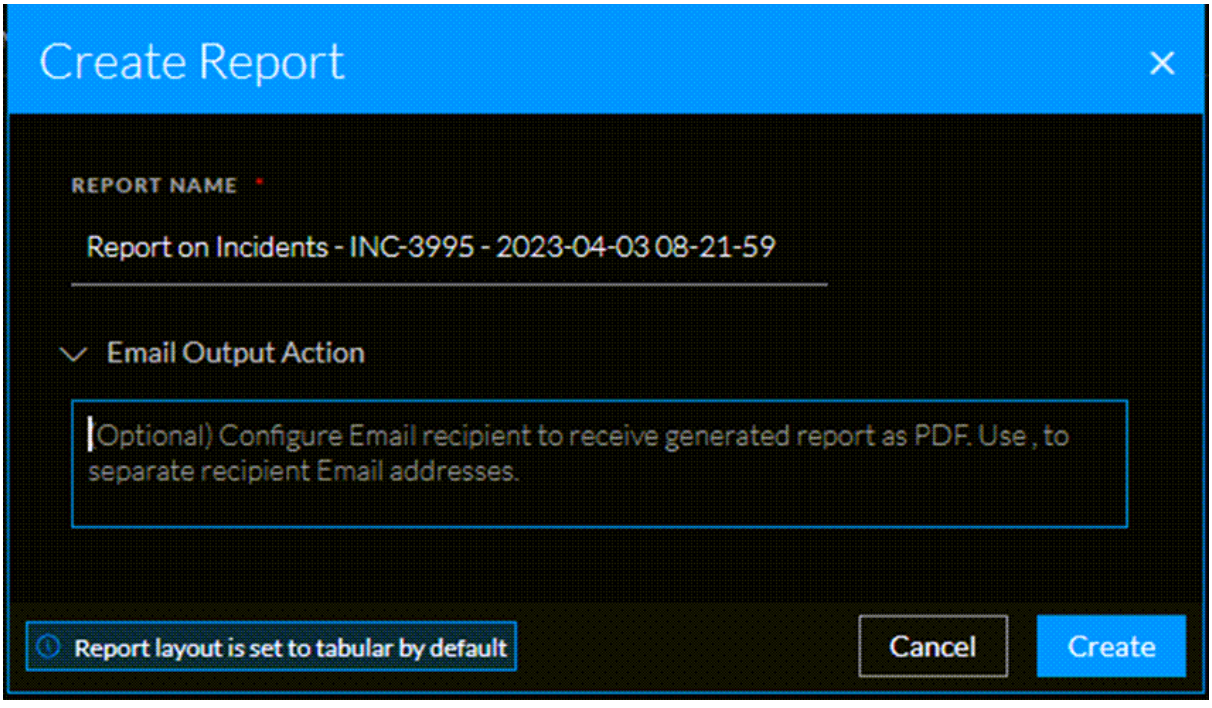
IMPORTANT: The minimum permissions for the users required to create/schedule reports in Respond View:
- Must enable Define rule, Access configure, and Define report in the report permission section.
- Must enable alert.manage, incident.manage, alert.read, incident.read in the respond-server permission section.

- Create a Report.
- Schedule a Report.

Create a Report

The Create Report dialog enables you to create a report instantly. To create a report, you must select the incidents or alerts via their checkboxes.

Note: The report will only include data from the selected records on the screen.



To create a Report

1. Log in to the NetWitness Platform.
2. Go to **Respond** > **Incidents**.

   IMPORTANT: You can create reports from the Incidents and Alerts pages separately as per your requirements. For generating reports from the Alerts page, Go to **Respond** > **Alerts**
3. Apply the required filters on the incident or alert page, select the desired records, and create a report for selected Incidents or Alerts.

   Note:
   - Once - Once the Incident or Alerts are displayed, you can sort them by ascending or descending order, and the report will be generated for the selected records.
   - To generate the reports, users must select one or more incidents or alerts.
4. Click **More Actions** > **Create Report**.

   The **Create Report** dialog is displayed.

5. The default report name with a time stamp will be displayed initially. For example, **Report on Incident - 2023-02-25 10-16-09**.

   Note:
   • You can customize the report name as per the requirement, and the name must be unique to create a report.
   • The report name must not have special characters such as / \ : * ? ” < > |.

IMPORTANT: Ensure that the SMTP mail server is configured in order to send reports to users.

6. (Optional) Click **Email Output Action** and enter the email address to which the generated report needs to be sent.

   You can enter multiple comma-separated valid email IDs. For example, **email1@example.com**,**email2@example.com**,**email3@example.com**.

7. Click **Create**.

   The success message is displayed on the screen.

Note: The time required for reports to be generated may vary based on the amount of data. Please wait for the requested report to be created.

8. To view the report, do one of the following:

   - On the success message banner, click the hyperlink **click here** to directly open the report in the reports tab.
   - Go to **Reports** > **Manage** > **Reports** > **View All Reports**.

Note:
• You can download the report in a PDF or CSV file format for future and offline needs.
• When the report is generated, it is attached as a PDF to the email and sent to all users configured during the report creation process.

Schedule a Report

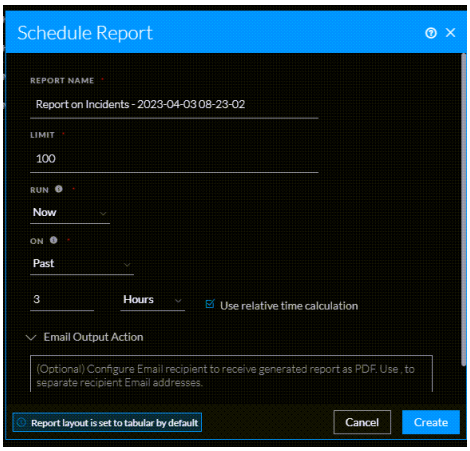
The Schedule Report dialog enables you to create a schedule for the report. Reports can be scheduled later (required time-line), hourly, daily, weekly, or monthly. In order to schedule a report at a specific time or on a daily, weekly, or monthly basis, you must configure the scheduling options on the Schedule tab.

Note: The report will only include data from the selected time interval. You can change the interval starting with the next recurrence.

To create a Schedule Report

1. Log in to the NetWitness Platform.
2. Go to **Respond** > **Incidents**.

   IMPORTANT: You can create reports from the Incidents and Alerts pages separately as per your requirements. For generating reports from the Alerts page, Go to **Respond** > **Alerts**



3. Apply the required filters on the incident or alert page, select the desired records, and create a report for selected Incidents or Alerts.

   All filters applied on the filters panel will be included in the reporting rule to create your report.

   Note: Once the events are displayed, you can sort the events by ascending or descending order, and the report will be generated based on the limit configured.

4. Click **More Actions** > **Schedule Report**.

   The **Schedule Report** dialog is displayed.

5. The default report name with a time stamp will be displayed initially. For example, **Report on Incident - 2023-04-25 10-18-26**.

6. Specify the following parameters to configure the Schedule.

   Depending on the type of run schedule, select one of the following:

Field	Description
Run	Time interval to use for running the scheduled job: • **Now**: If you select a Now. The system will instantly generate reports with the filters applied from the filters panel. • **Later**: If you select a **Later** run schedule, you must provide a value for the day and time in the respective field provided. • **Hourly**: If you select an **Hourly** run schedule, you must specify the minutes in the **At** Minute field. For example, if you schedule the report for 50 minutes, for every 50th minute, the report will be prepared. **Note:** A maximum of only 59 minutes can be selected. • **Daily**: If you select a **Daily** run schedule, you must enter a value in the **At** field. For example, if you schedule the report at 04:25, the report will be prepared at 04:25 AM every day. • **Weekly**: If you select a **Weekly** run schedule, you must enter a value in the **At** field and select the weekdays. **Note:** The report runs on the day of the week that the schedule begins. For example, if you schedule the report to first run on Monday, the report runs on Monday every week. • **Monthly**: If you select a **Monthly** run schedule, you must provide a value for the day and **At** field. For example, select 25 for the 25th day of the month. The report will be prepared on the 25th month of every month. **Note:** During the monthly report generation process, a message will appear if the day is greater than 28. This will notify the user that the report will be scheduled for the month containing that day.

Field	Description

ON	• **Past**: If you select the **Past** option, you can schedule the report based on **Hours**, **Days**, **Weeks**, **Months**, and **Years**. For example, if you want to schedule the report to start three days before the current date, do the following actions:
	  • Select **Past** in the **ON** field.
	  • Enter **3** in the field and select **Days** from the drop-down list.
	  This field appears only if you select **Later** in the **Run** field.
	  Note:
	  • This field appears if you select Later, Hourly, Daily, Weekly, and Monthly in the Run field.
	  • For Hourly, the maximum value allowed is 168 (24 hours x 7 days) which is counted as total hours.
	• **Range(specific)**: If you select Range(specific) option, you must provide the **From** and **To** values.
	  For example, if you want to schedule the report for a specific date and time range from 02/01/2023 12:00:00 AM to 02/15/2023 12:00:00 AM. The report runs for the data on the specified period.
	  Note: This field appears only if you select Later in the Run field.
	• **Range(generic)**: If you select **Range(generic)** option, you must provide the **From** and **To** values.
	  For example, if you want to schedule the report daily for a time range, from 04:00 to 10:00. The report runs for the data on the specified period.
	  Note: This field appears only if you select Later, Daily, Weekly, and Monthly in the Run field.

Field	Description
	Note: While scheduling a report, if you select the **Past** option or **Range(specific)/Range (generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.
Use relative time calculation	• By default, the **Use relative time calculation** option is enabled, and it uses the relative time duration to schedule a report. For example, if you schedule a report to run over the past 3 hours for the relative time, the time is exactly 3 hours from when the report is run. If the current time is 6:30 P.M., the events that occurred in the past 60 minutes or between 3:30 P.M. and 6:30 P.M. today. • You can deselect the option and schedule a report. For example, if you schedule a report to run over the past 3 hours, it will take the past 3 hours, excluding the minutes. If the current time is 6:30 P.M., the events occurred between 3 P.M. and 6 P.M. today.

IMPORTANT: Ensure that the SMTP mail server is configured in order to send reports to users.

7. (Optional) Click **Email Output Action** and enter the email address to which the generated report needs to be sent.

   You can enter multiple comma-separated valid email IDs. For example, **email1@example.com**,**email2@example.com**,**email3@example.com**.

8. Click **Create**.

   The success message is displayed on the screen.

   Note: The time required for reports to be generated may vary based on the amount of data. Please wait for the requested report to be created.

9. To view the report, do one of the following:

- On the success message banner, click the hyperlink **click here** to navigate to the reports tab and open the generated report.
- Go to **Reports** > **Manage** > **Reports** > **View All Reports**.

Note:
• You can download the report in a PDF or CSV file format for future and offline needs.
• When the report is generated, it is attached as a PDF to the email and sent to all users configured during the report creation process.

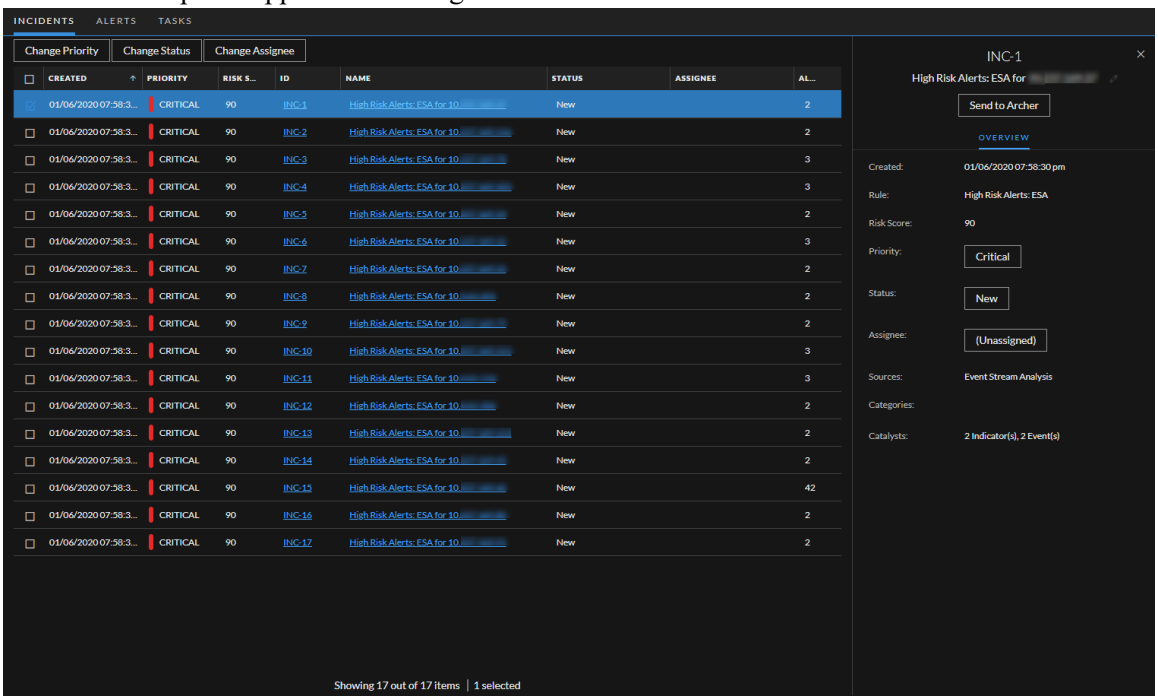
Escalate or Remediate the Incident

You may want to escalate an incident, assign incidents to another Analyst, or change the status and priority of an incident as you gather more information about it. This is useful if, for example, you upgrade the priority of an incident from high to critical after determining that the incident is a major breach. You may also want to send the incident to Archer Cyber Incident & Breach Response for additional analysis and action.

You can perform the following procedures to escalate or remediate an incident:

- Send an Incident to Archer
- View All Incidents Sent to Archer
- Update an Incident
- Change Incident Status
- Change Events Retention
- Obtain Retention Usage Details
- Export Incident Data
- Change Incident Priority
- Assign Incidents to Other Analysts
- Rename an Incident
- View All Incident Tasks
- Filter the Tasks List
- Remove My Filters from the Tasks List
- Create a Task
- Find a Task
- Modify a Task
- Delete a Task
- Close an Incident

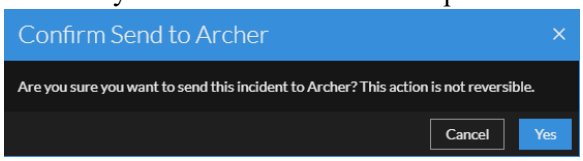
Send an Incident to Archer



Note: This option is available in NetWitness Version 11.2 and later. If Archer is configured as a data source in Context Hub, you can send incidents to Archer and you can see the Send to Archer option and Sent to Archer Status in NetWitness Respond.

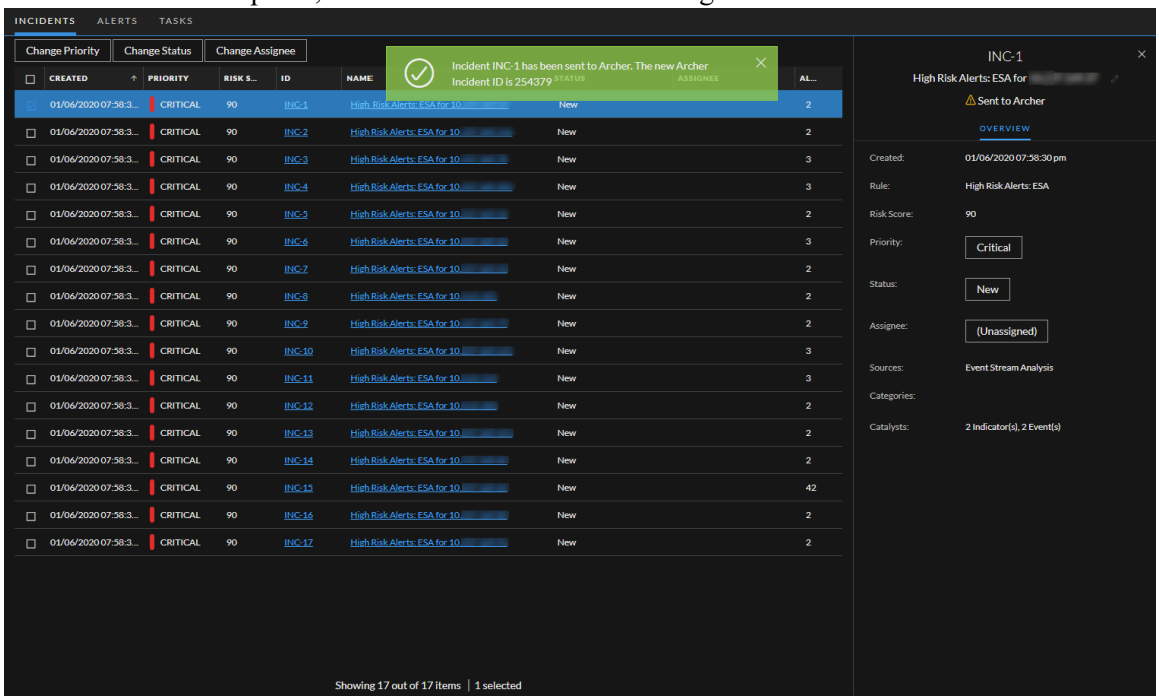
When you send an incident to Archer, a Sent to Archer notification appears within the incident. When configured, the NetWitness Platform can start additional business processes in Archer Cyber Incident & Breach Response. You can view all of the incidents that were sent to Archer Cyber Incident & Breach Response using the filter in the Incident Lists view.

You send an incident to Archer by clicking the Send to Archer button in the Overview panel in the Incident Lists view or the Incident Details view.



Caution: The **Send to Archer** action is not reversible.

1. Go to **Respond > Incidents**.
2. From the Incidents List view, click the incident that you want to send to Archer Cyber Incident & Breach Response.
   The Overview panel appears on the right.

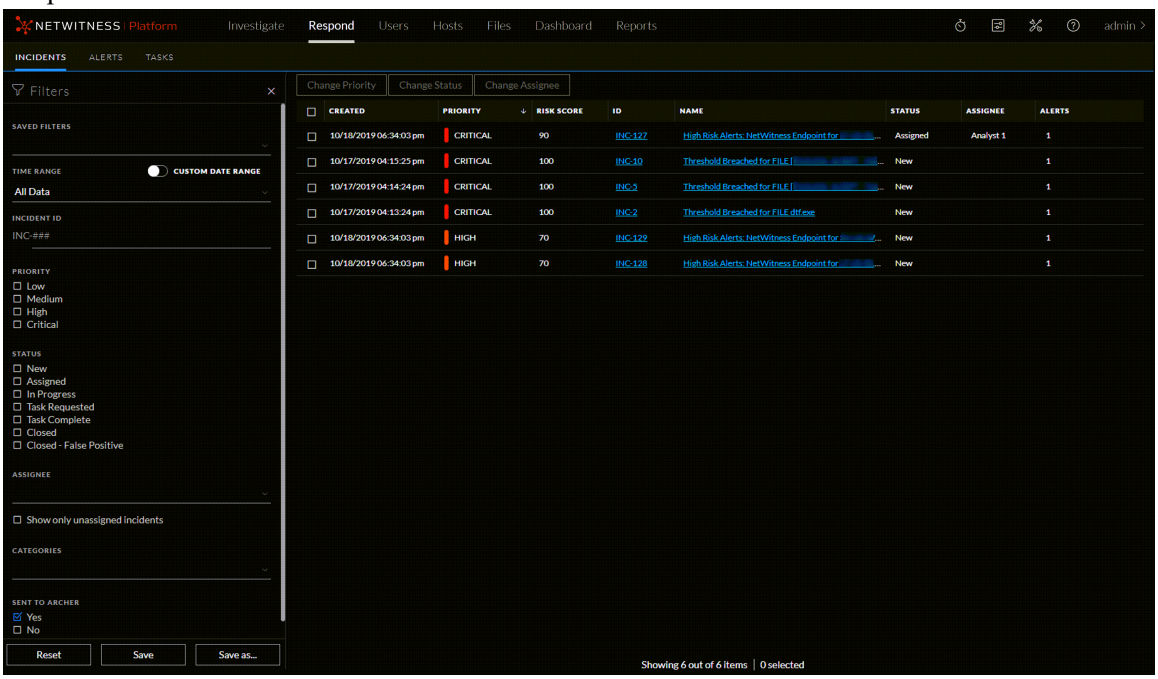


3. In the Overview panel, click **Send to Archer**.

4. Read the **Confirm Send to Archer** dialog and then click **Yes** to confirm sending the incident to Archer Cyber Incident & Breach Response. This action is not reversible.

You will receive a confirmation that the incident was sent to Archer along with an Archer incident ID. In the Overview panel, the Send to Archer button changes to Sent to Archer.

In the Incident Details view (click the link in the ID or NAME field of the incident sent to Archer) you can see the Sent to Archer notification above the Overview and Indicators panels. If you open the Journal, you can see a system journal entry that shows that the incident was sent to Archer and it now has an Archer ID number.



View All Incidents Sent to Archer

Note: This option is available in NetWitness Version 11.2 and later. If Archer is configured as a data source in Context Hub, you can send incidents to Archer and you will be able to see the Sent to Archer option and Sent to Archer Status in NetWitness Respond.

You can view incidents sent to Archer Cyber Incident & Breach Response using the Filter.

1. Go to **Respond > Incidents**. The Incidents List is displayed.
2. If you cannot see the Filters panel, in the Incident List view toolbar, click .
3. In the Filters panel, under **Sent To Archer**, select **Yes**.
   The incidents list will be filtered to show incidents that were sent to Archer Cyber Incident & Breach

Response.

Update an Incident

You can update an incident from several places. You can change the priority, status, or assignee from the Incident List view and the Incident Details view. For example, if you are an Analyst, you may want to assign yourself a case from the Incident List view if you see that it is related to another case you are working on. If you are an SOC Manager or an Administrator, you may want to view unassigned incidents from the Incident List view and assign the incidents as they come in. SOC Managers and Administrators can do bulk updates of the priority, status, or assignee instead of updating them one incident at a time.

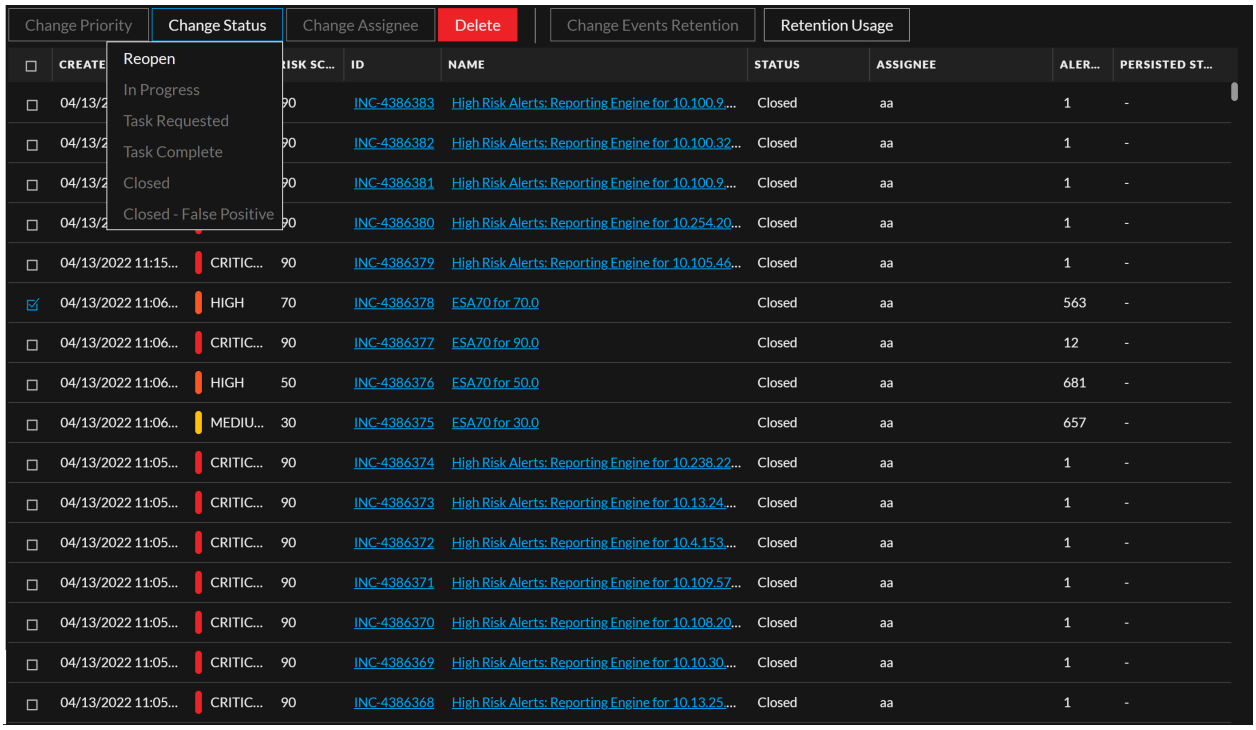
From the Details view, you might want to change the status to In Progress once you begin working on an incident, and then update it to Closed or Closed - False Positive after you resolve the issue. Or you might change the priority of the incident to Medium or High as you determine the details of the case.

Change Incident Status

When an incident first appears in the incident list, it has an initial status of New. You can update the status as you complete your work on the incident. The following statuses are available:

- Reopen
- In Progress
- Task Requested
- Task Complete

- Closed
- Closed - False Positive



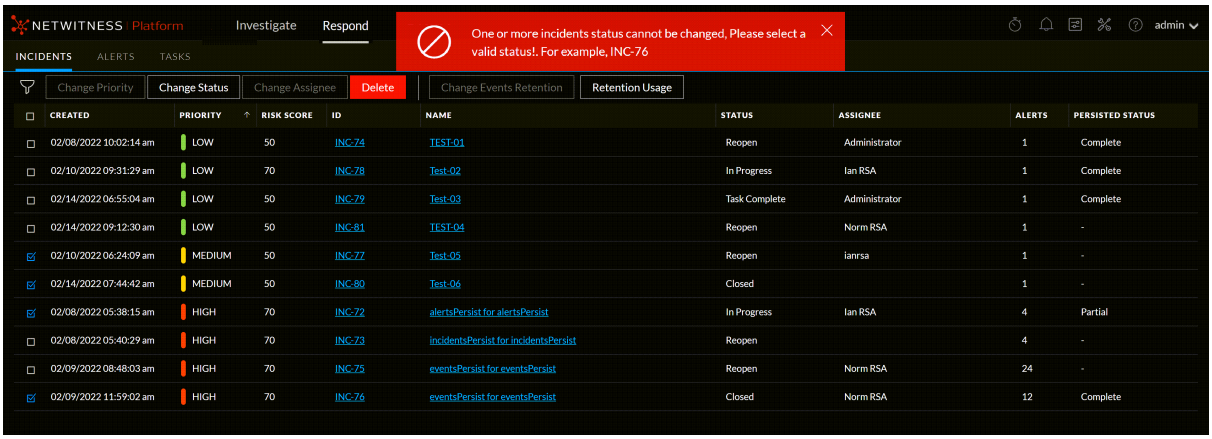
> **Note:** New and Assigned statuses under the Change Status drop-down list are removed in the version 12.0 and later.

Status Change Workflow

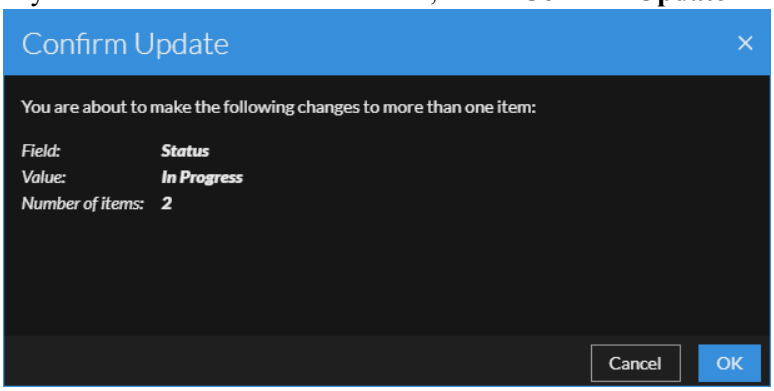
The table below lists all the statuses and provides information about specific Status Change Workflow.

Status	New	Reopen	Assigned	In Progress	Task Requested	Task Complete	Closed / Closed - False Positive
New	No	No	Yes	Yes	No	No	Yes
Reopen	No	No	Yes	Yes	No	No	Yes
Assigned	No	No	No	Yes	No	No	Yes
In Progress	No	No	No	No	Yes	Yes	Yes
Task Requested	No	No	No	Yes	No	Yes	Yes
Task Complete	No	No	No	Yes	Yes	No	Yes
Closed / Closed - False Positive	No	Yes	No	No	No	No	No

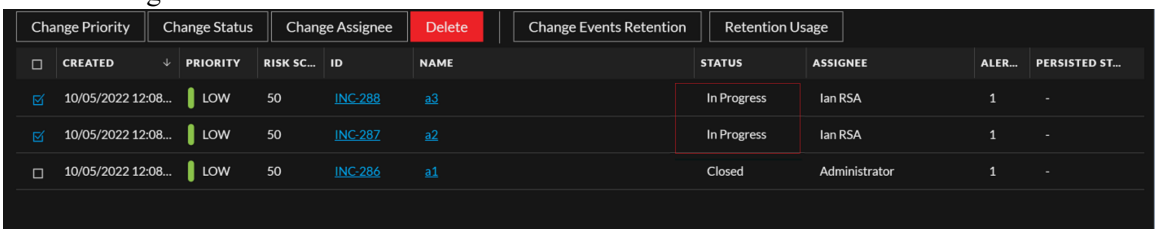
> **Note:** When you select an incident and click Change Status, all the invalid statuses are grayed out under the Change Status drop-down list. This is not applicable for multi-select of incidents. Refer the following figure.



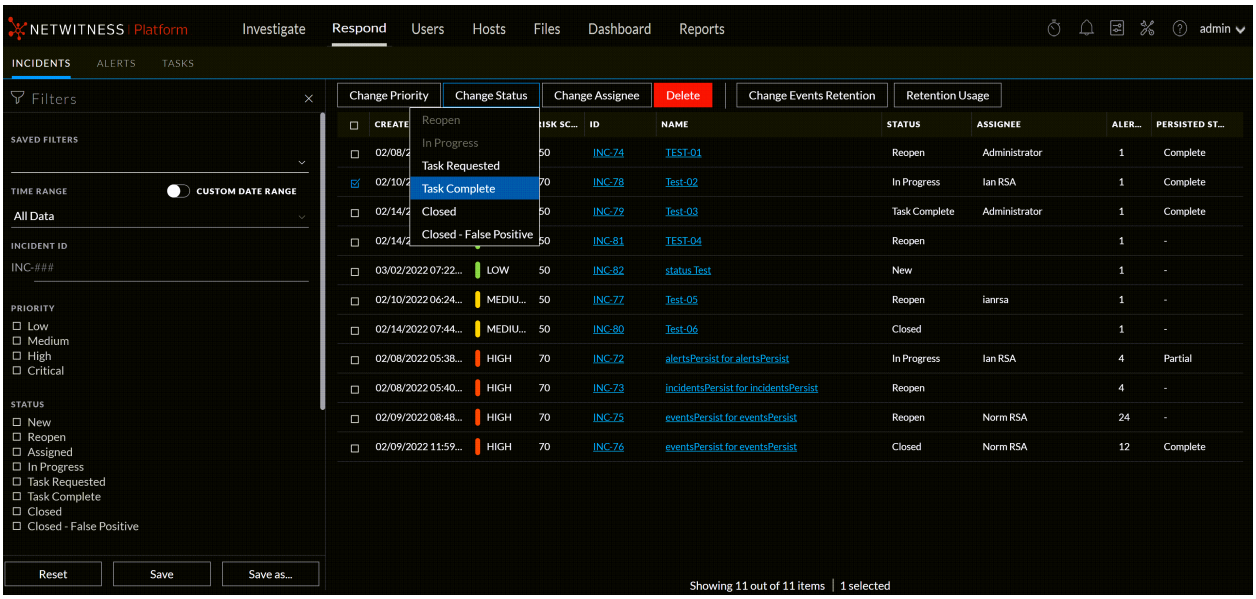
To update the status of multiple incidents:



1. In the Incidents List view, select one or more incidents that you would like to change. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Status** and select a status from the drop-down list. In this example, the current status is Assigned, but the Assignee would like to change it to In Progress for the selected incidents.

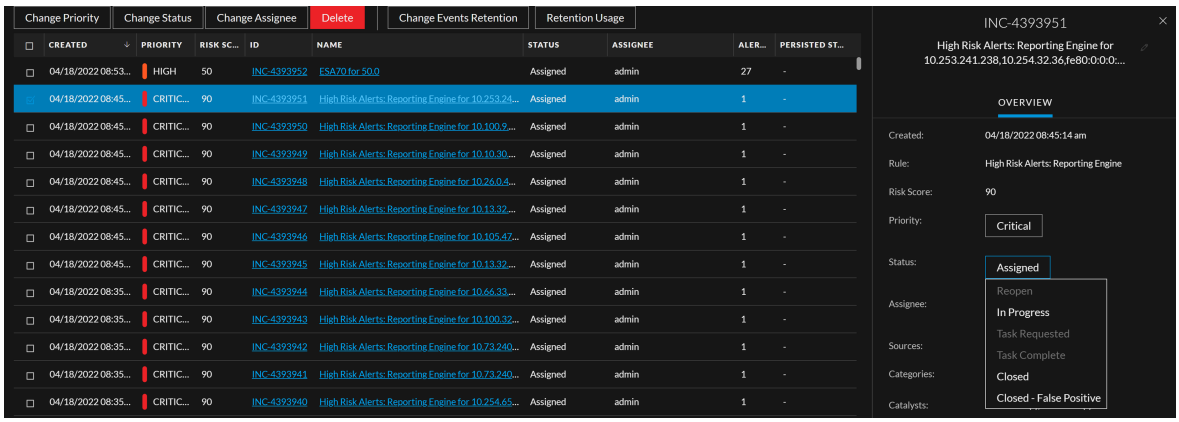


Note: The incident status can be changed to **Reopen** only if the current status of the incident is **Closed** or **Closed - False Positive**. This is also applicable when multiple incidents are selected. Even if one of the multiple incidents selected has the status other than **Closed or Closed - False Positive**, the error message **One or more incidents status cannot be changed, Please select a valid status!. For example, INC-x** is displayed. Refer the following figure.

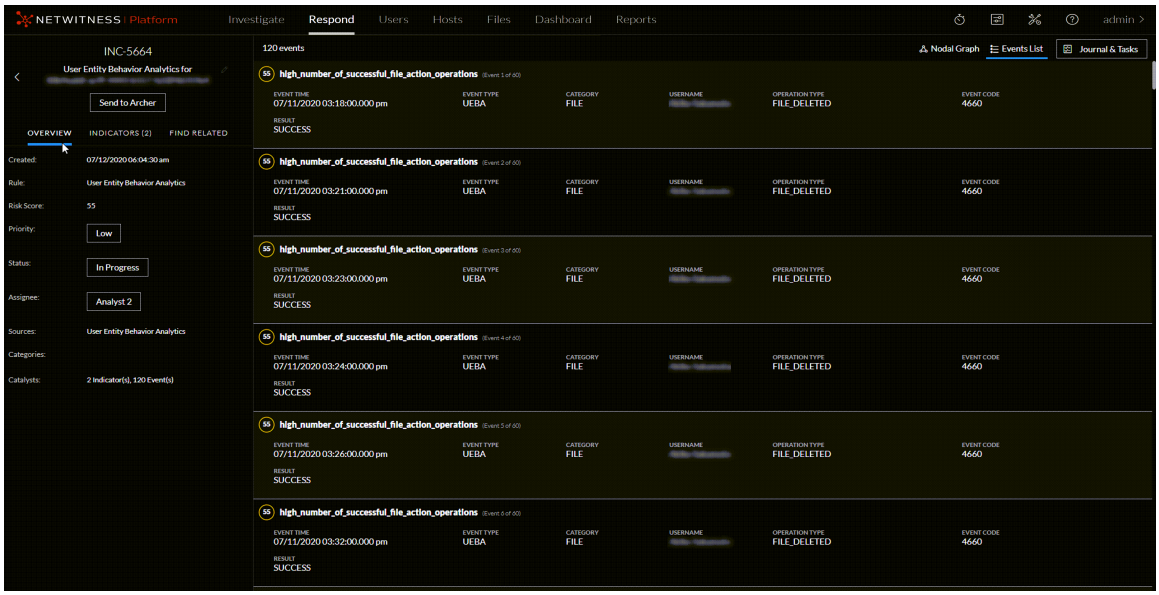


3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.

You can see a successful change notification. In this example, the status of the updated incidents now show In Progress.

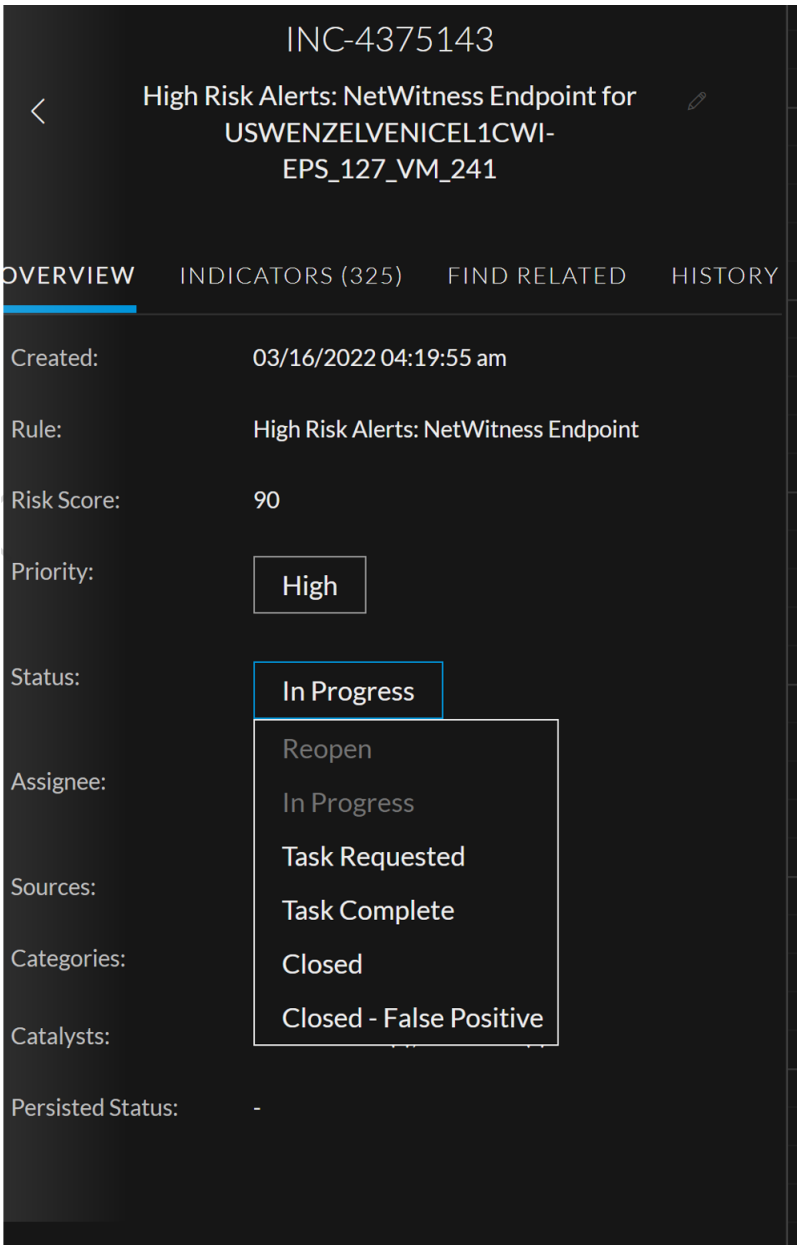


Note: If you select any incident and click **Change Status**, the current status of the incident is grayed out in the drop-down list. This is not applicable if you select multiple incidents. Refer the following figure.

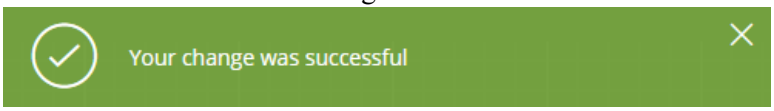


To change the status of a single incident from the Overview panel:

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click the row of an incident that needs a status update.



- From the Incident Details view, click the **OVERVIEW** tab.



In the Overview panel, the Status button shows the current status of the incident.

2. Click the **Status** button and select a status from the drop-down list.

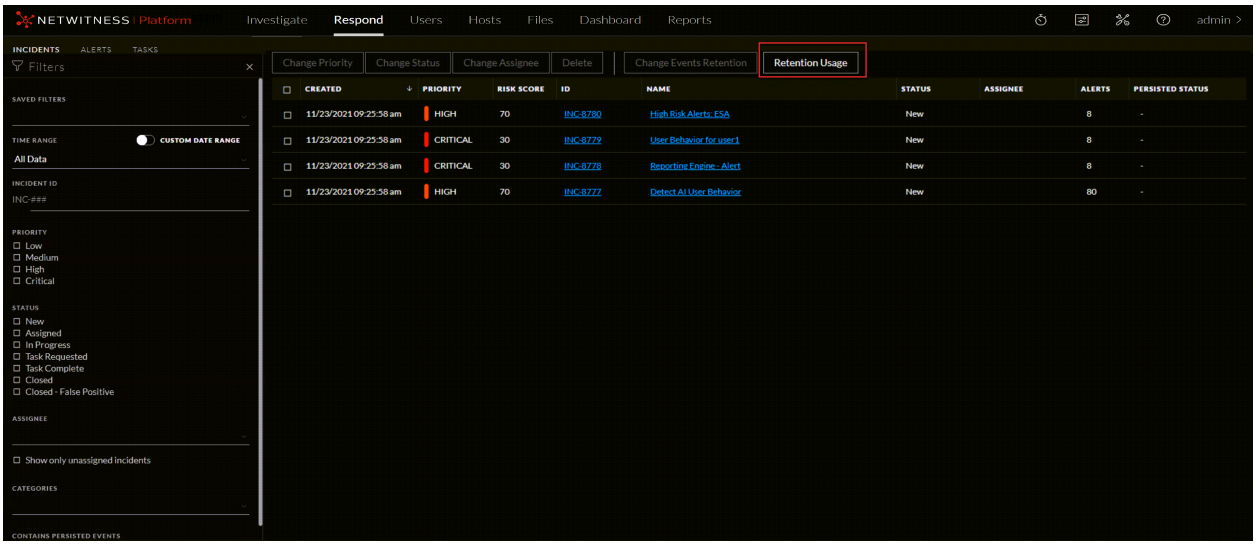
You can see a successful change notification.

Note: The incident status can be changed to **Reopen** only if the current status of the incident is **Closed** or **Closed - False Positive**.

Change Events Retention

Events retention enables you to persist events that are associated with particular incidents, thereby enabling you to view the incident related events in the future, regardless of its age. The event data will always be available for viewing and reconstruction as long as the event is persisted, enabling you to easily refer back to details, even if the original event has rolled over from the NetWitness database. You can perform the following functions:

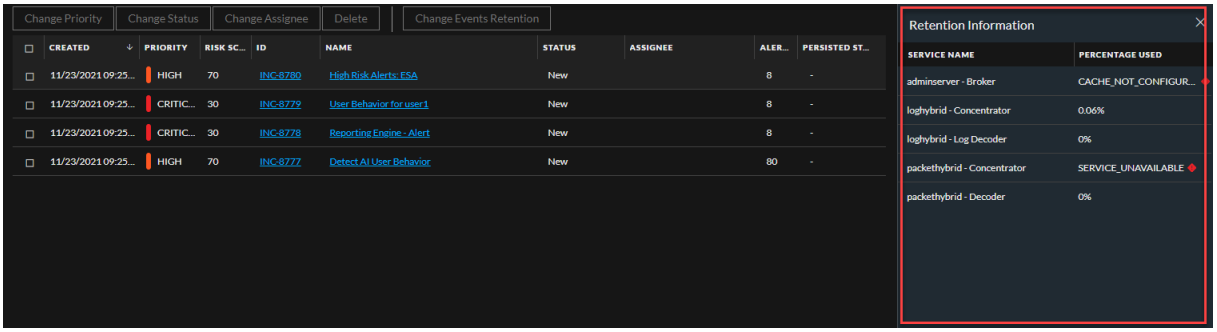
- Persist all events
- Suspend persisting all events



To change event retention:

1. Select the incidents for which you want to change the event retention plan.
2. Select **Persist all events** from the **Change Events Retention** tab to persist all the events that are associated with the selected incidents.
   a. The confirmation message appears. Click **OK** to persist all events.
   Persisting all events in an incident in NetWitness will save the events data in the long term cache of the source.
3. Select **Suspend Persisting all events** from the **Change Events Retention** tab to stop persisting the events that are associated with the selected incidents.
   a. The confirmation message appears. Click OK to suspend persist all events.
   Suspending persist of events in an incident from NetWitness will delete it from the long term cache of the source only. This may not be reversible if the original event data has rolled out in the source database.

Note: You cannot change the event retention for incidents that are in **New** or **Closed** state.



Obtain Retention Usage Details

The Retention Usage tab allows an analyst to fetch all the persisted data disc usage stats of all the configured services and the percentage used by the pinned cache directories. This will enable the analyst to determine if the disk is running out of space and if additional space needs to be added or suspend persist on the existing events in an incident.

After the analyst clicks on the Retention Usage tab, a Retention Information panel is displayed with the following status:

- Percentage of the disk used when data is persisted
- Cache directory is configured or not. In case it is not configured it is explicitly indicated.
- List of all the status of a configured service. In case the service is not available it is explicitly indicated.

Note: In case the disk space exceeds the usage, a warning message displayed. The service threshold can be configured by navigating to **Respond** > **Services** > **respond/core/properties** > **warning-threshold field**.

Export Incident Data

NetWitness Platform enables the analysts to export and store the Incidents with Alerts and Events in JSON format for offline investigation. The **Export** drop-down allows you to export and download the data (such as fields or attributes) associated with Alerts and Events of the selected Incidents. The data can only be downloaded in JSON format.

Schema Files for Incident Export

NetWitness Platform provides Schema files (Default and Custom) located at `/var/netwitness/respond-server/export-schema` to allow you to export only a subset of attributes among the many list of attributes available in Mongo DB for Incidents and Alerts. Default schema files cannot be modified, but the Custom schema files can be modified to add the attributes as required. For more information, see Schema Files for Incidents and Schema Files for Alerts.

Schema Files for Incidents

The Incident Schema files contain various fields or attributes associated with an Incident. Based on the requirement, you can modify these Schema files and download additional fields. The Schema files are categorized into two types:

- **Default Incident Schema File** (**default_incident_export.json**): This file contains a default list of attributes associated with the Incidents (in Mongo DB) that are used to export. This pre-populated out-of-the-box file provided by NetWitness Platform must not be modified.
- **Custom Incident Schema File** (**custom_incident_export.json**): This is an empty file provided by NetWitness Platform to allow users to download the attributes unavailable in the **Default Incident Schema File**, but listed in the **incident** collection in Mongo DB.

To download the required attributes using Custom Incident Schema File:

1. Edit the `custom_incident_export.json` file located at `/var/netwitness/respond-server/export-schema` to add the required attributes.
2. Restart the **Respond** Service.
3. Export the Incidents data from UI.

> **Note:** The attributes downloaded using the **Custom Incident Schema File** include the attributes already listed in the **Default Incident Schema File** and the newly added attributes.

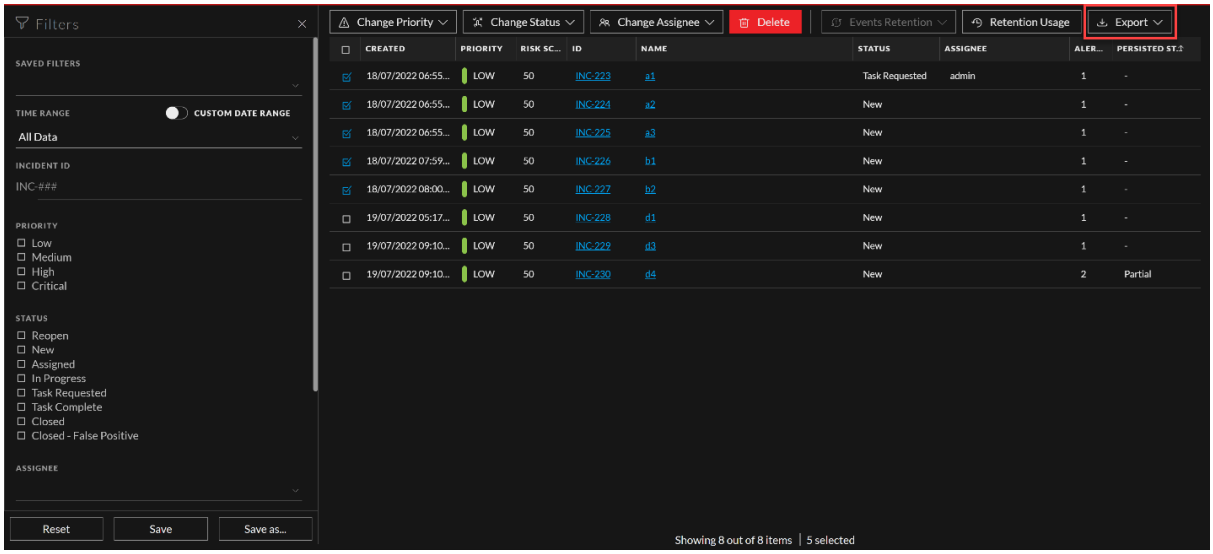
Schema Files for Alerts

NetWitness Platform allows you to download various fields or attributes associated with the Original and Normalized alerts.

Original Alerts

The alerts triggered and received through different sources such as Endpoint, User Entity Behavior Analytics (UEBA), Event Stream Analysis (ESA), Malware Analysis, NetWitness Investigate, Reporting Engine, Risk Scoring, Web Threat Detection, and NetWitness UEBA (Cloud) are Original Alerts.

Normalized Alerts



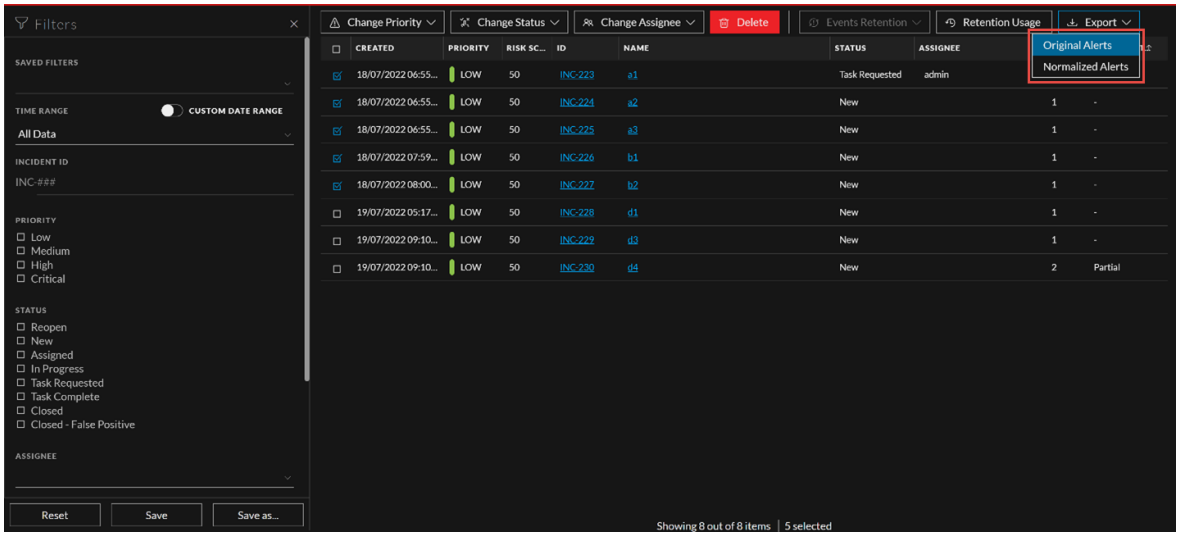
The structure or pattern of the Original Alerts varies based on the source from which the alerts are triggered. These alerts are normalized and standardized in the **Respond** service to unify their structure.

Based on the attributes (associated with the Original and Normalized Alerts) downloaded, the Alerts Schema files are categorized into:

- **Default Original Alerts Schema File** (**default_alert_original_export.json**): This file contains a default list of attributes associated with the Original Alerts (in Mongo DB) that are used to export. This pre-populated out-of-the-box file provided by NetWitness Platform must not be modified.
- **Custom Original Alerts Schema File** (**custom_alert_original_export.json**): This is an empty file provided by NetWitness Platform to allow you to download the attributes unavailable in the **Default Original Alerts Schema File**, but listed in the **originalAlert** (**alert** > **originalAlert**) collection in Mongo DB.
- **Default Normalized Alerts Schema File** (**default_alert_normalized_export.json**): This file contains a default list of attributes associated with the Normalized Alerts (in Mongo DB) that are used to export. This pre-populated out-of-the-box file provided by NetWitness Platform must not be modified.
- **Custom Normalized Alerts Schema File** (**custom_alert_normalized_export.json**): This is an empty file provided by NetWitness Platform to allow you to download the attributes unavailable in the **Default Normalized Alerts Schema File**, but listed in the **alert** (**alert** > **alert**) collection in Mongo DB.

To export the Incident data:

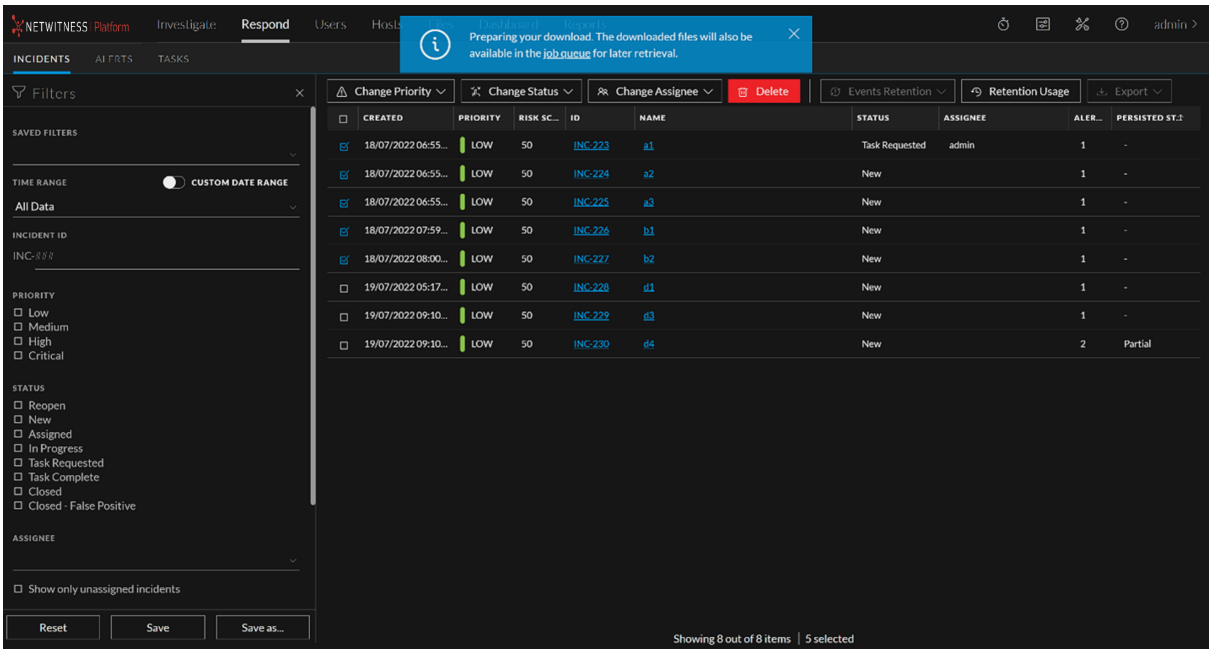
1. Go to **Respond** > **Incidents**.
2. In the Incidents List view, select one or more incident and click the **Export** drop-down.



IMPORTANT: To access the **Export** drop-down, you must have access to escalate or remediate the incident.

Note: The **Export** drop-down is enabled only in the following scenarios:
- When an incident is selected in the Incidents List view.
- When the different set of incidents are selected in the Incidents List view after incident data export.
- When you select the same set of incidents again in the Incidents List view to export the data.

Note:
- You must refresh the page to select the same set of incidents again in the Incidents List view to export the data.
- You can export data of a maximum of ten incidents at a time. Once the data download is in progress, you can select a different set of incidents (ten incidents) and export their data simultaneously. You can repeat this action until the condition **max-user-tasks** (a maximum limit set for exporting the incidents data in the **Respond** service under **rsa.respond.incident.exports**) is met.



3. Select one of the following options in the **Export** drop-down list to download the files.

   - **Original Alerts**: Select this option to download the attributes associated with the Original Alerts. For more information, see Original Alerts.
   - **Normalized Alerts**: Select this option to download the attributes associated with the Normalized Alerts. For more information, see Normalized Alerts.

   Once the file download is initiated, a notification message is displayed.

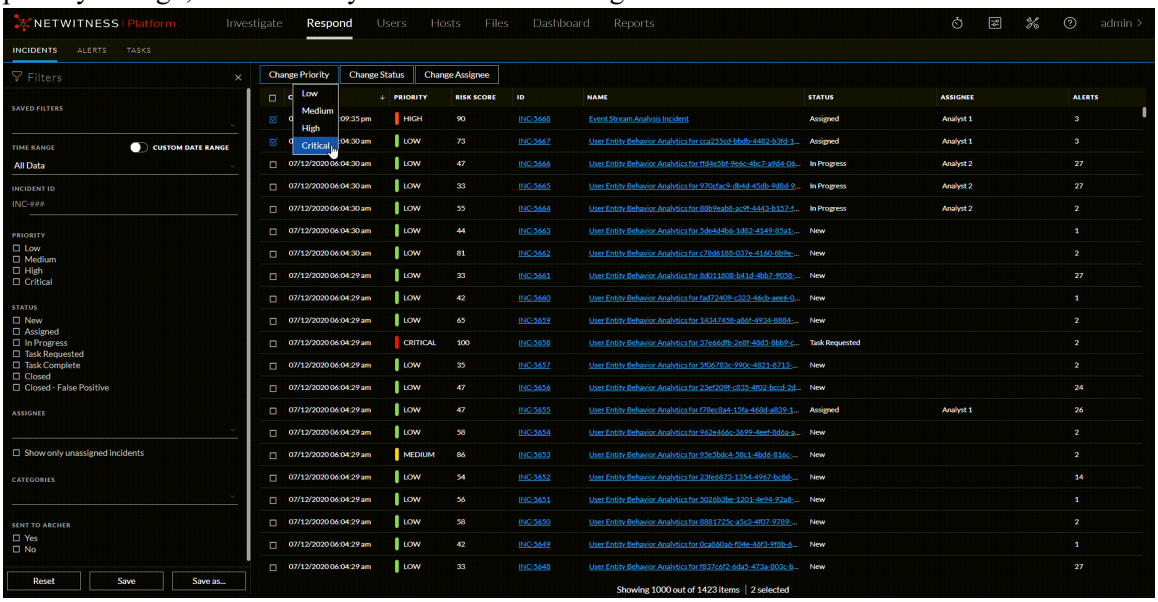
4. Click the **job queue** link.

The **Jobs** page is displayed.

5. Select the file and click **Download** under the **Action** column once the download status is displayed as **Completed** under the **Status** column.

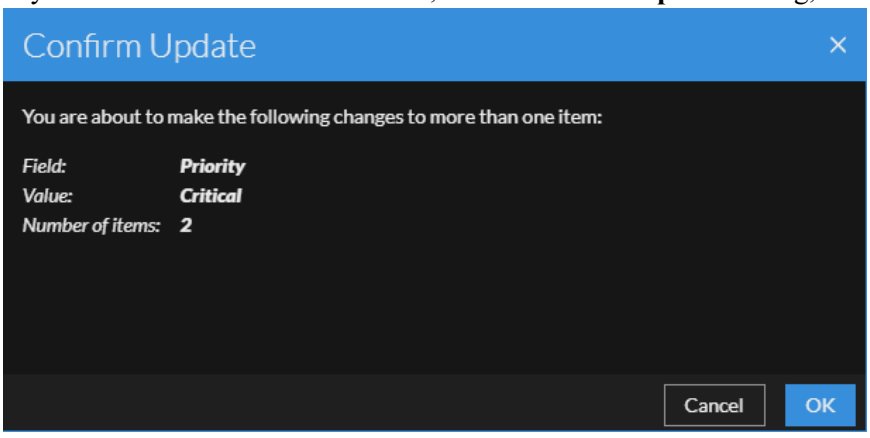
Change Incident Priority

The incident list is sorted by Priority by default. You can update the priority as you study the details of the case. The following priorities are available:



- Critical
- High

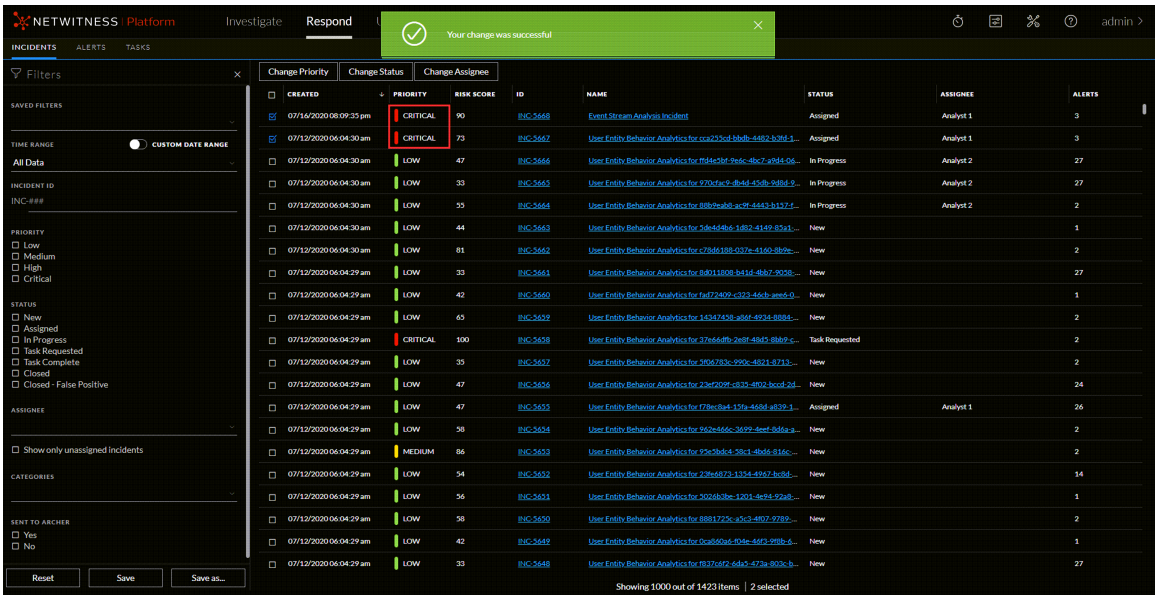
- Medium
- Low



Note: You cannot change the priority of a closed incident.

To update the priority of multiple incidents:

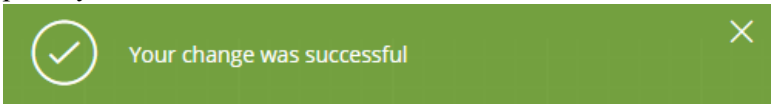
1. In the Incidents List view, select one or more incidents that you would like to change. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Priority** and select a priority from the drop-down list. In this example, the current priority is High, but the Analyst would like to change it to Critical for the selected incidents.



3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.

You can see a successful change notification. In this example, the status of the updated incidents now

show Critical.

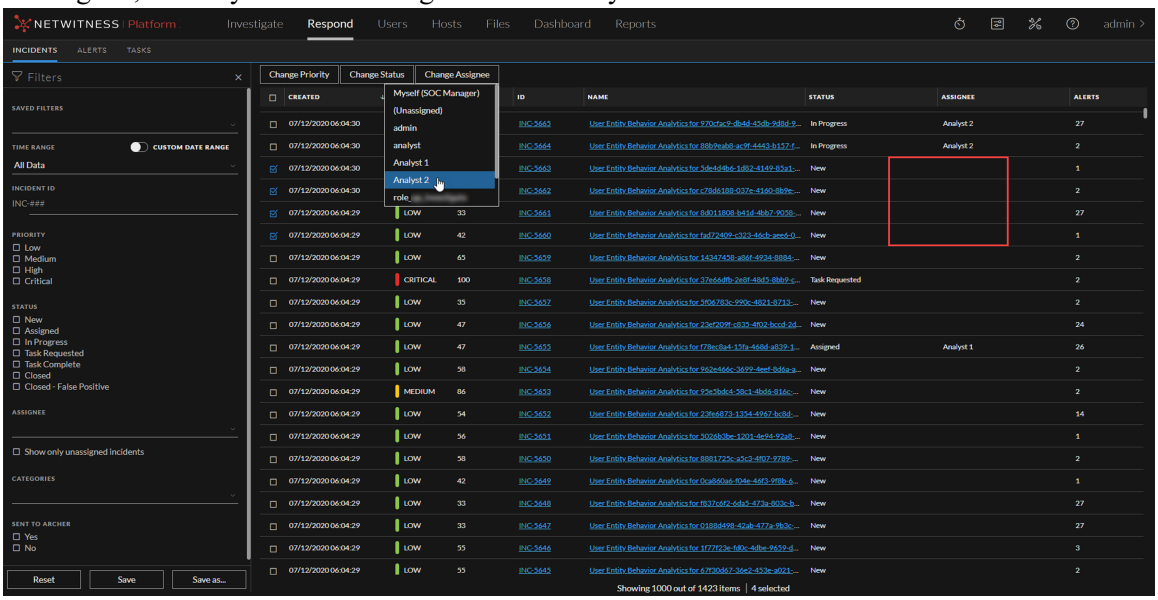


To change the priority of a single incident from the Overview panel

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click the row of an incident that needs a priority update.
   - From the Incident Details view, click the **Overview** tab in the left panel.
     In the Overview panel, the Priority button shows the current priority of the incident.
2. Click the **Priority** button and select a status from the drop-down list.

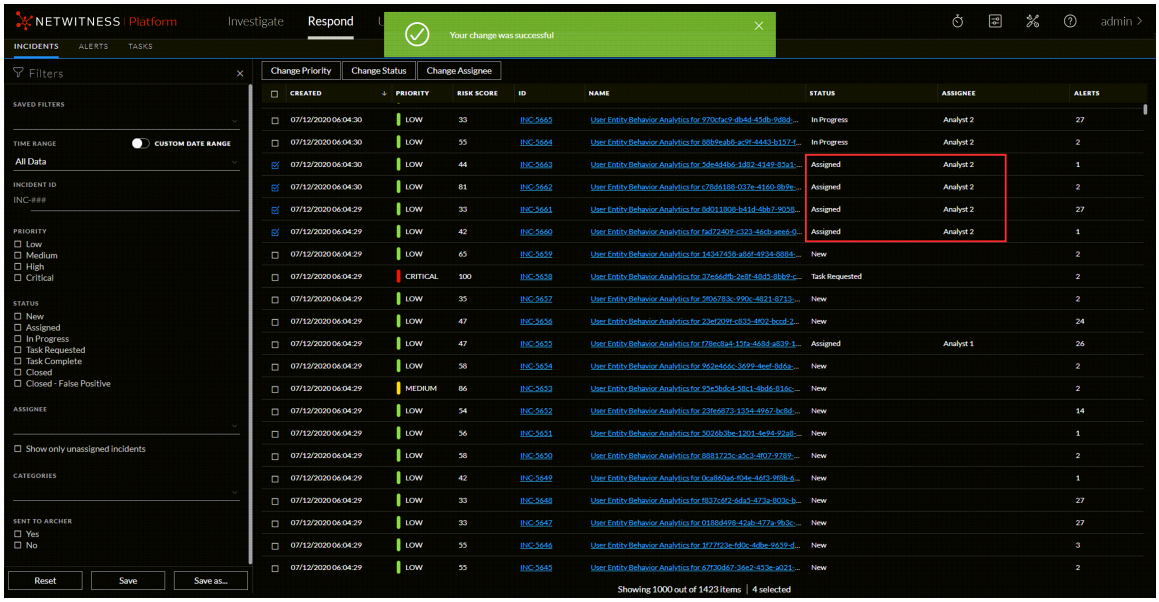
You can see a successful change notification. The Priority button changes to show the new incident priority.

Note: Current priority is grayed out under **Priority** drop-down list. You will not be able to select the grayed out priority.



Assign Incidents to Other Analysts

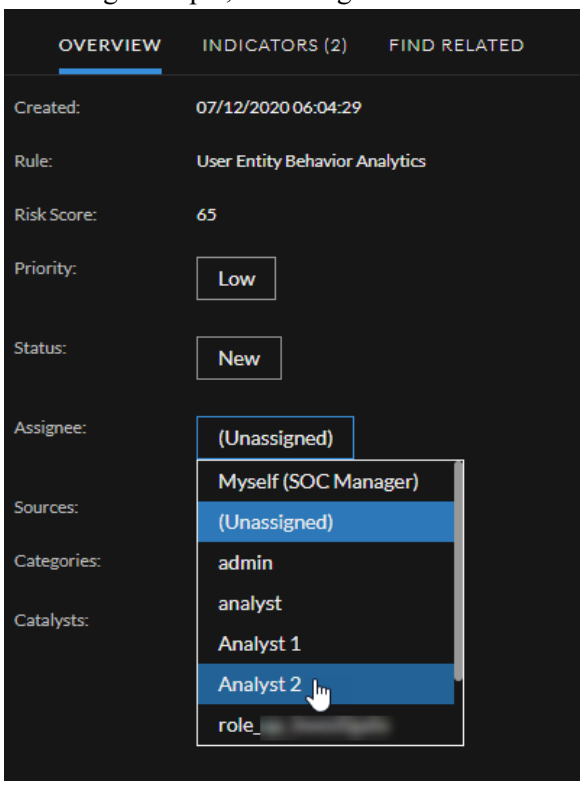
You can assign incidents to other Analysts in the same way as you assign incidents to yourself. SOC Managers and Administrators can assign multiple incidents to a user at the same time.



Note: You cannot change the assignee of a closed incident.

To assign multiple incidents to a user:

1. In the Incidents List view, select the incidents that you would like to assign to a user. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Assignee** and select a user from the drop-down list. In this example, the incidents are unassigned, but they should be assigned to an Analyst.



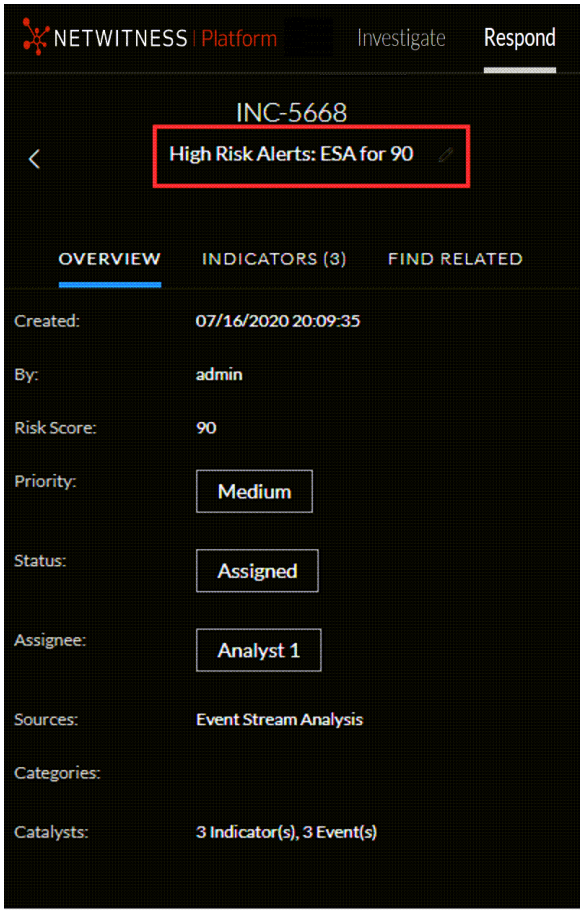
3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.
   You can see a successful change notification. The assignee changes to the selected user.

To assign a user to an incident from the Overview panel:

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click the row of an incident that you would like to assign to a user.
   - From the Incident Details view, click the **Overview** tab in the left panel.
     In the Overview panel, the Assignee button shows the current assignee of the incident. In the

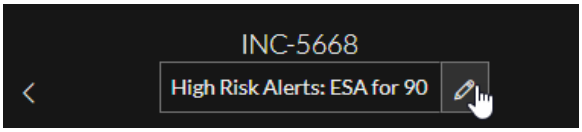
following example, the Assignee button has a current status of Unassigned.

2. Click the **Assignee** button and select a user from the drop-down list.
   You can see a successful change notification. The Assignee button changes to show the assigned user.



Note: Current assignee name is grayed out under **Assignee** drop-down list. You will not be able to select the grayed out user.

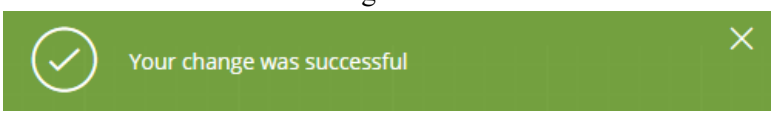
Rename an Incident



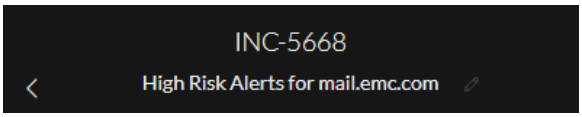
You can rename an incident from the Overview panel in the Incidents List view and the Incident Details view. For example, you may want to rename an incident to provide clarification about the issue, especially if multiple incidents have the same name.

1. Go to **Respond > Incidents**.
2. To open the Overview panel, do one of the following:
   - From the Incidents List view, click the row of an incident that needs a name change.
     The Overview panel opens.

- From the Incident Details view, click the **OVERVIEW** tab in the left panel.
  In the header above the Overview panel, you can see the incident ID and the incident name.

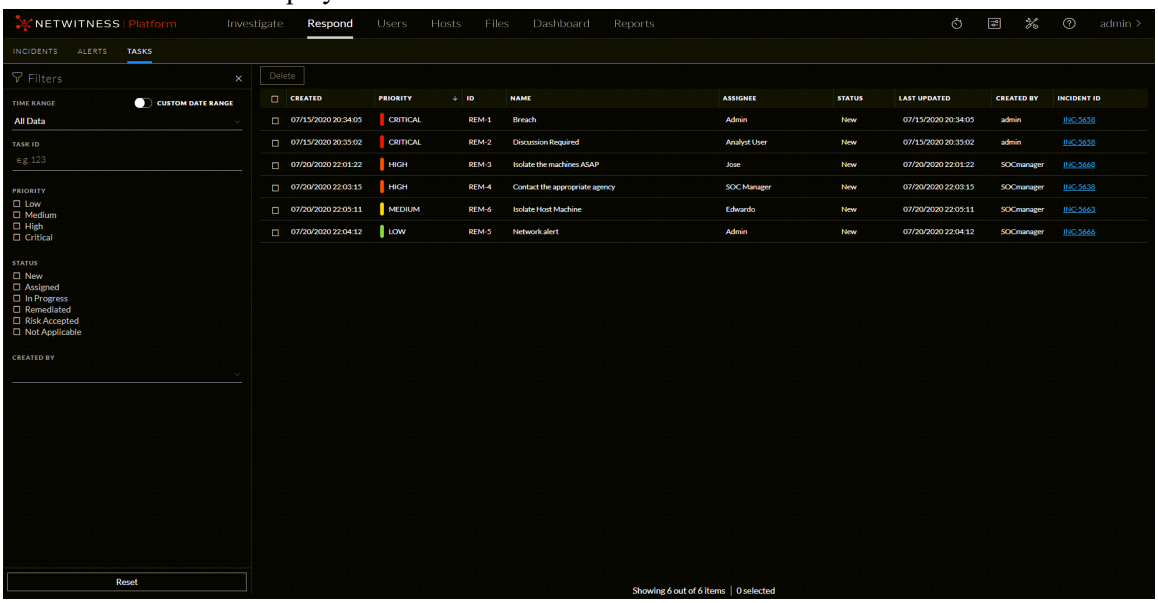


3. Click the incident name in the header to open a text editor.



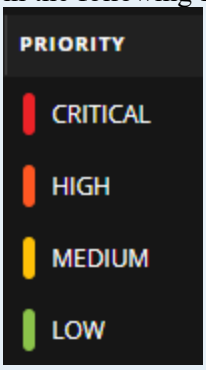
4. Type a new name for the incident in the text editor and click the check mark to confirm the change.

For example, you can change "High Risk Alerts: ESA for 90.0" to "High Risk Alerts for mail.emc.com" for more clarification.
You can see a successful change notification.



The incident name field shows the new name.

View All Incident Tasks

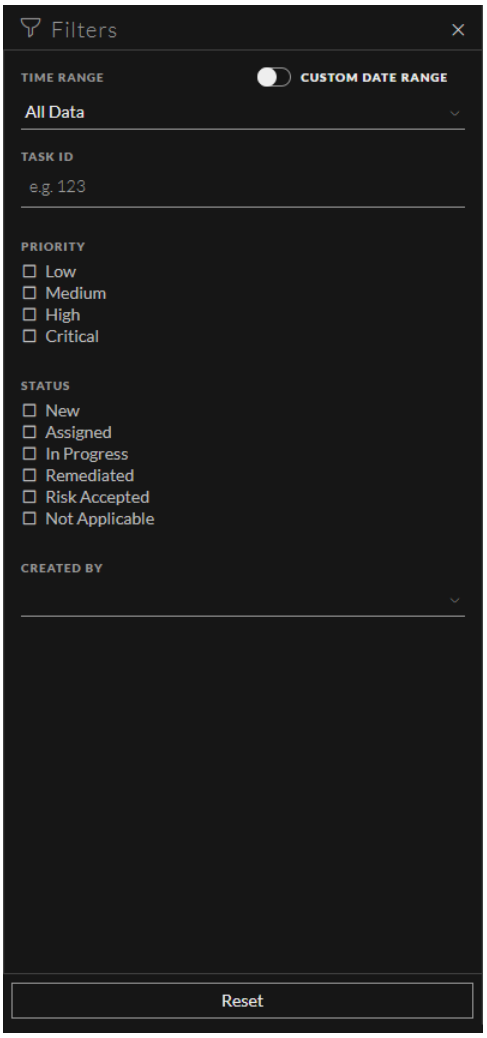


When additional work is required for an incident, you can create tasks for the incident and track the progress on those tasks. This is helpful, for example, when the work being done is outside security operations or you make a request for a computer reimage. In the Tasks List view, you can manage and track the tasks to closure.

1. Go to **Respond > Tasks**.
   The Tasks List view displays a list of all incident tasks.

2. Scroll through the tasks list, which shows basic information about each task as described in the following table.

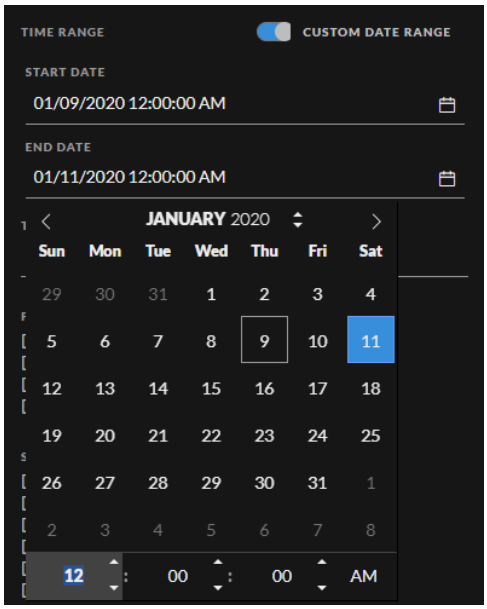
Column	Description
Created	Displays the date when the task was created.



Column	Description
Priority	Displays the priority assigned to the task. The priority can be any of the following: Critical, High, Medium, or Low. The Priority is also color coded, where red indicates **Critical**, orange represents **High** risk, yellow indicates **Medium** risk, and green represents **Low** risk as shown in the following figure: 
ID	Displays the task ID.
Name	Displays the task name.
Assignee	Displays the name of the user assigned to the task.
Status	Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
Last Updated	Displays the date and time when the task was last updated.
Created By	Displays the user who created the task.
Incident ID	Displays the incident ID for which the task was created. Click the ID to display the details of the incident.

At the bottom of the list, you can see the number of tasks on the current page, the total number of tasks, and the number of tasks selected. For example: **Showing 6 out of 6 items | 2 selected**.

Filter the Tasks List



The number of tasks in the Tasks List can be very large, making it difficult to locate particular tasks. The Filter enables you to specify those tasks that you would like to view, such as tasks created within the last 7 days. You can also search for a specific task.

1. Go to **Respond > Tasks**.
   The Filters panel appears to the left of the Tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.

2. In the Filters panel, select one or more options to filter the incidents list:
   - **Time Range**: You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the tasks. For example, if you select Last Hour, you can see tasks that were created within the last 60 minutes.
   - **Custom Date Range**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of CUSTOM DATE RANGE to view the Start

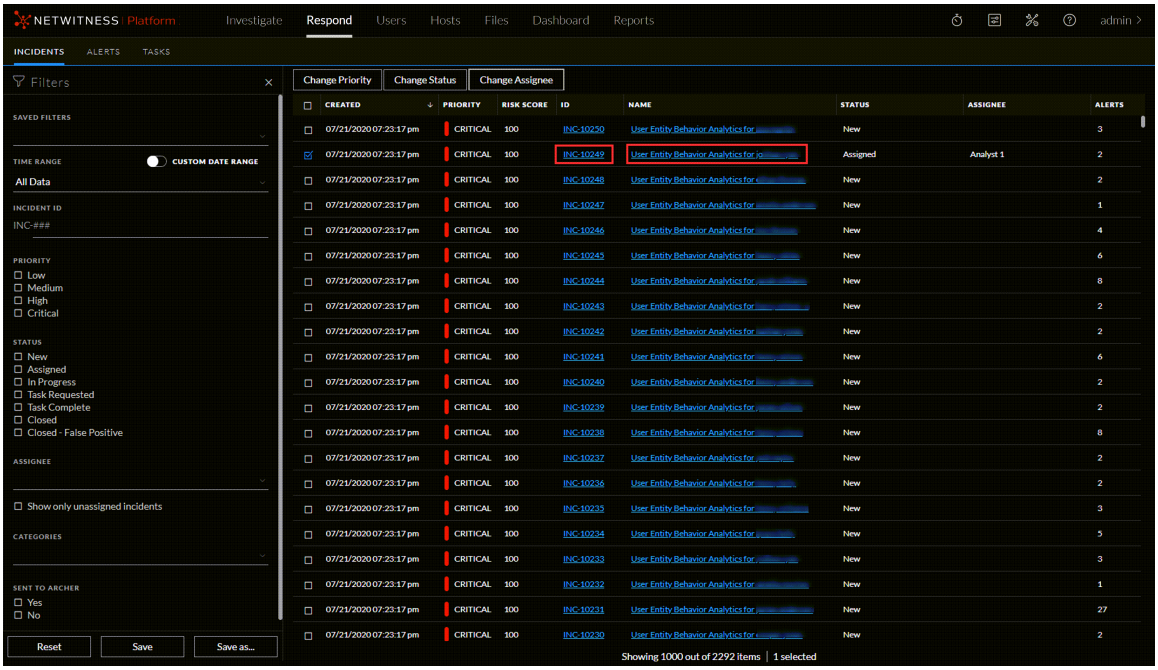
Date and End Date fields. Select the dates and times from the calendar.

- **Task ID**: Type the Task ID for a task that you would like to locate, for example REM-123.
- **Priority**: Select the priorities that you would like to view.
- **Status**: Select one or more incident statuses. For example, select Remediated to view completed remediation tasks.
- **Created By**: Select the user who created the tasks that you would like to view. For example, if you only want to view the tasks created by Edwardo, select Edwardo from the CREATED BY drop-down list. If you want to view tasks regardless of the person who created the task, do not make a selection under CREATED BY.

The Tasks List shows a list of tasks that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the tasks list.
For example: **Showing 6 out of 6 items**

3. If you want to close the Filters panel, click **X**. Your filters remain in place until you remove them.

Remove My Filters from the Tasks List

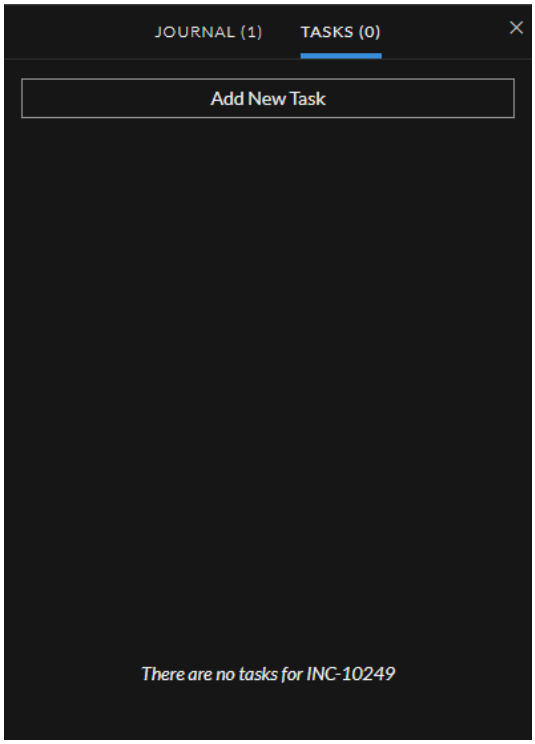


NetWitness remembers your filter selections in the Tasks List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of tasks that you expect to see or you want to view all of the tasks in your tasks list, you can reset your filters.

1. Go to **Respond > Tasks**.
   The Filters panel appears to the left of the tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.
2. At the bottom of the Filters panel, click **Reset Filters**.

Create a Task

After you investigate an incident and know more about it, you can create a task, assign it to a user, and track it to closure. You create tasks from the Incident Details view.

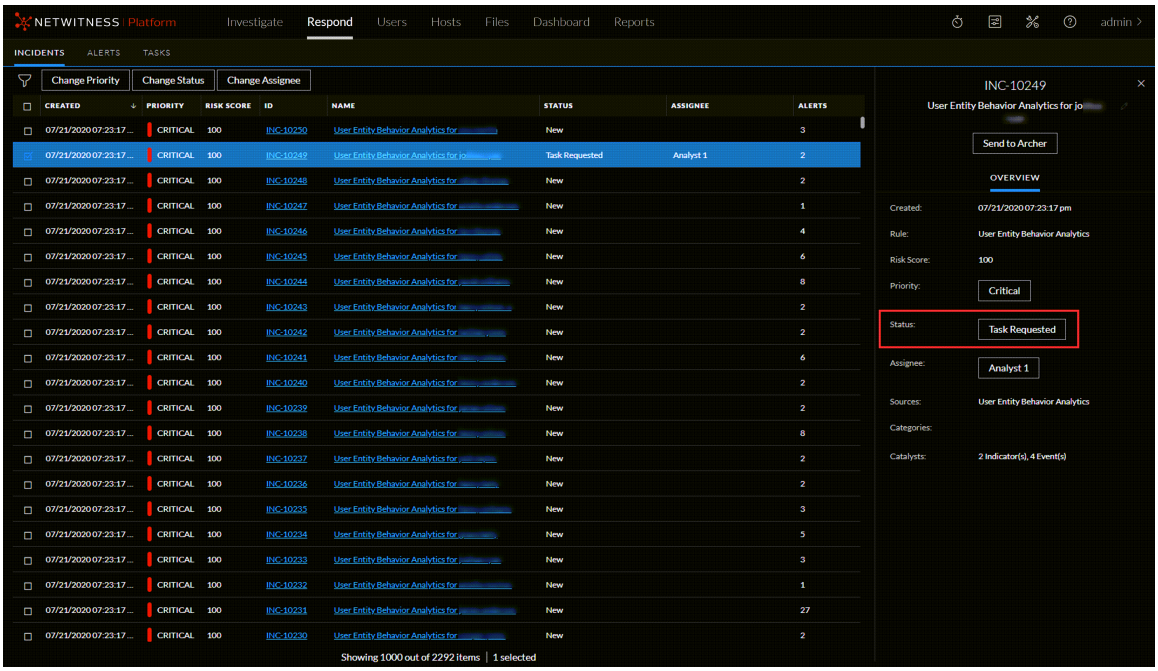


1. Go to **Respond > Incidents**.
   The Incidents List view displays a list of all of the incidents.
2. Locate the incident that needs a task and click the link in the **ID** or **Name** field.

3. In the Journal panel on the right side of the Incident Details view, click the **Tasks** tab.
   If you do not see the Journal panel, click **Journal & Tasks** and then click the **Tasks** tab.

4. In the Tasks panel, click **Add New Task**.

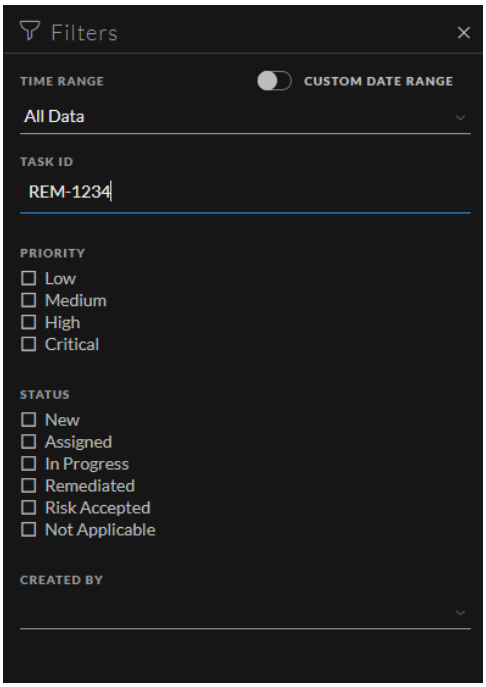
   You can see the new task fields.



If the incident is in a closed state (Closed or Closed - False Positive), the Add New Task button is disabled.

5. Provide the following information:
   - **Name** - Name of the task. For example: Re-image the machine.
   - **Description** - (Optional) Type information that describes the task. You may want to include any applicable reference numbers.
   - **Assignee** - (Optional) Type the username of the user to whom the task is to be assigned.
   - **Priority** - Click the priority button and select a priority for the tasks from the drop-down list: Low, Medium, High, or Critical.
6. Click **Save**.
   You can see a confirmation that your change was successful. The incident status changes to **Task Requested**. (You may need to refresh the Incident Details view to see the changes.) The task appears in the Tasks panel for this incident.

   In the Incidents List view, the incident status also changes to Task Requested.



The task also appears in the Tasks list (Respond > Tasks), which shows a list of all incident tasks.

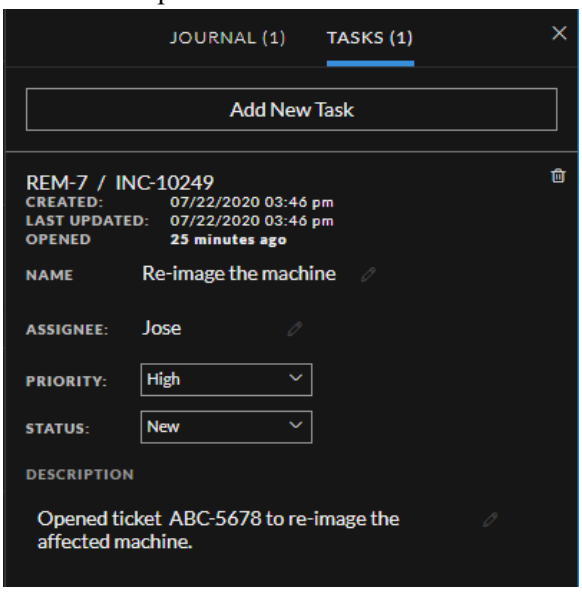
Note: If you do not see the status change, you may need to refresh your internet browser.

Find a Task

If you know the Task ID, you can quickly locate a task using the Filter. For example, you may want to locate a specific task out of thousands of tasks.

1. Go to **Respond > Tasks**.
   The Filters panel appears to the left of the Tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.

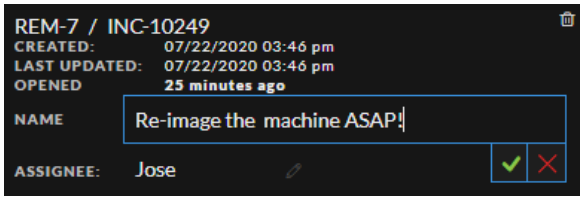
2. In the **Task ID** field, type the Task ID for a task that you would like to locate, for example REM-1234.
   The specified task appears in your task list. If you do not see any results, try resetting your filters.



Modify a Task

You can modify a task from within an incident and from the Tasks list. For example, you may want to show the status of the task as In Progress and add some additional information to the task. If the task is in a closed state (Not Applicable, Risk Accepted, or Remediated), you cannot modify the Priority or Assignee.

To modify a Task from within an incident:



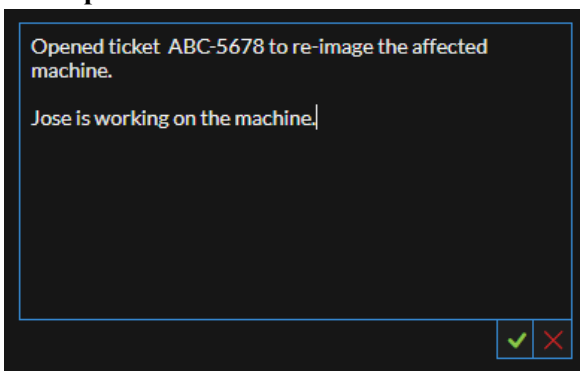
1. Go to **Respond > Incidents**.
   The Incidents List view displays a list of all incidents.
2. Locate the incident that needs a task update and click the link in the **ID** or **Name** field.
3. In the Journal panel on the right side of the Incident Details view, click the **Tasks** tab.
   If you do not see the Journal panel, click **Journal & Tasks** and then click the **Tasks** tab.
   In the Tasks panel, a pencil icon indicates a text field that you can change. A button indicates that

there is a drop-down list to make a selection.

4. You can modify any of the following fields:

- **Name** - Click the current task name to open a text editor.

  Click the check mark to confirm the change. For example, you can change "Re-image the machine" to "Re-image the machine ASAP!"

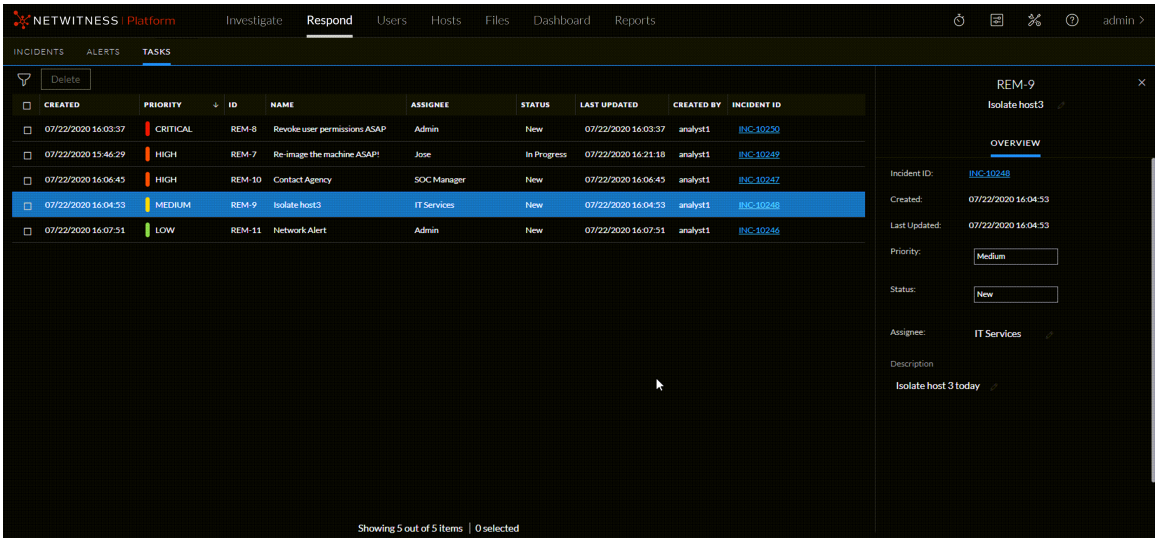


- **Assignee** - Click (Unassigned) or the name of the previous assignee to open a text editor. Type the username of the user to whom the task is to be assigned.
  Click the check mark to confirm the change.

- **Priority** - Click the Priority button and select a priority for the task from the drop-down list: Low, Medium, High, or Critical.

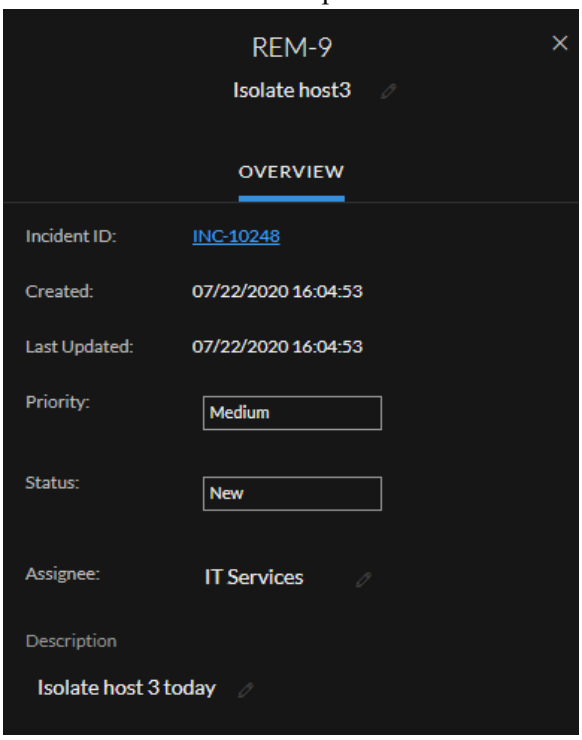
- **Status** - Click the Status button and select a status for the task from the drop-down list: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. For example, you can change the status to In Progress.

- **Description** - Click the text underneath the description to open a text editor.



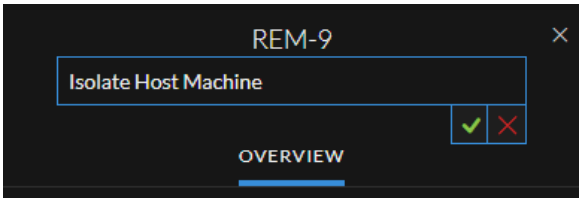
Modify the text and click the check mark to confirm the change.

For each change that you make, you can see a confirmation that your change was successful.



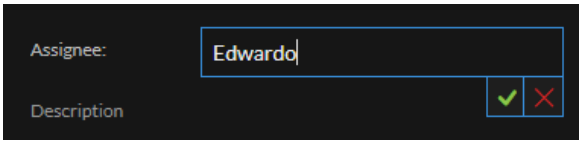
To modify a Task from the Tasks list:

1. Go to **Respond > Tasks**.
   The Tasks List view displays a list of all incident tasks.
2. In the Tasks list, click the task that you want to update.
   The Task Overview panel appears to the right of the tasks list.



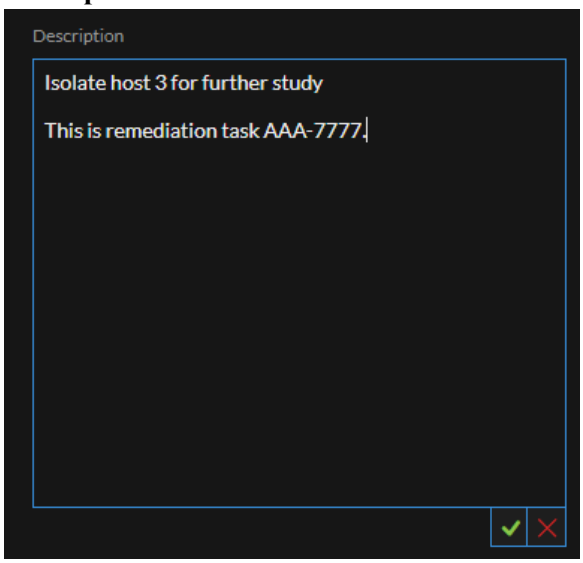
In the Task Overview panel, a pencil icon indicates a text field that you can change. A button

indicates that there is a drop-down list to make a selection.



3. You can modify any of the following fields:

- **<Task Name>** - At the top of the Task Overview panel, below the Task ID, click the current task name to open a text editor.



Click the check mark to confirm the change. For example, you can change Isolate Host to Isolate Host Machine.

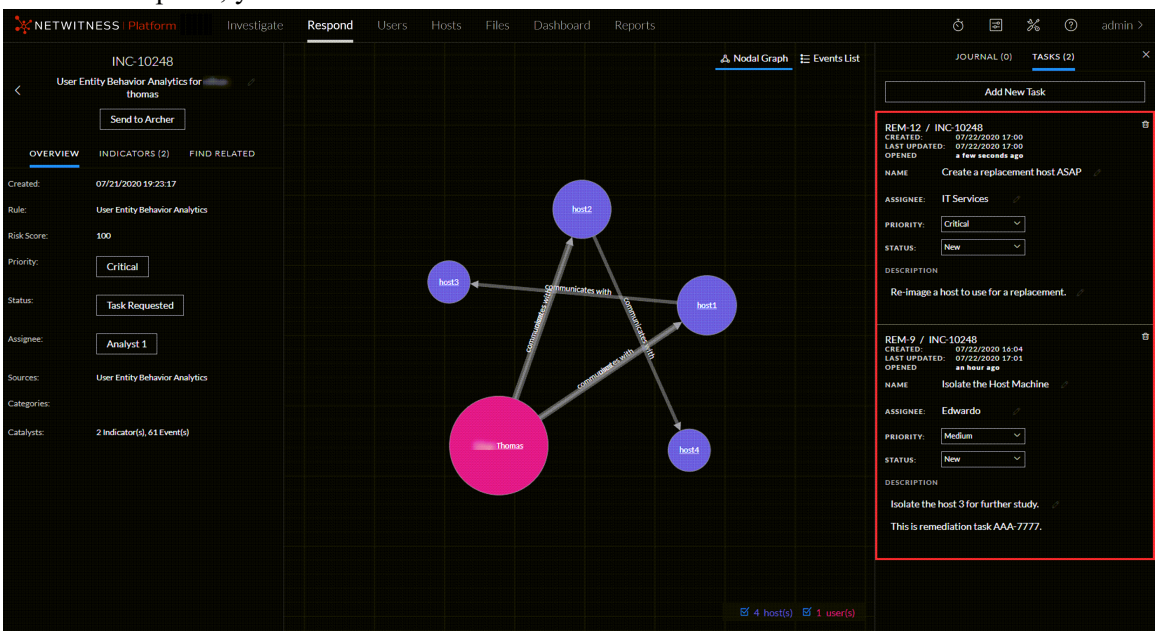
- **Priority** - Click the Priority button and select a priority for the task from the drop-down list: Low, Medium, High, or Critical.
- **Status** - Click the Status button and select a status for the task from the drop-down list: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
- **Assignee** - Click (Unassigned) or the name of the previous assignee to open a text editor. Type the username of the user to whom the task is to be assigned.

Click the check mark to confirm the change.

- **Description** - Click the text underneath the description to open a text editor.

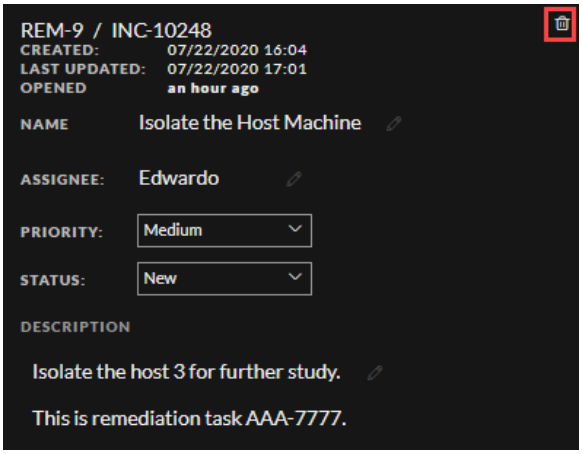
  Modify the text and click the check mark to confirm the change.

For each change that you make, you can see a confirmation that your change was successful.



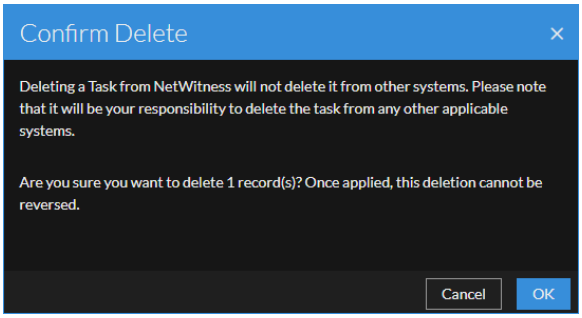
Delete a Task

You can delete a task, if, for example, you created it in error or you find that it is not needed. You can delete a task from within an incident and also from the Tasks List view. In the Tasks List view, you can delete multiple tasks at the same time.



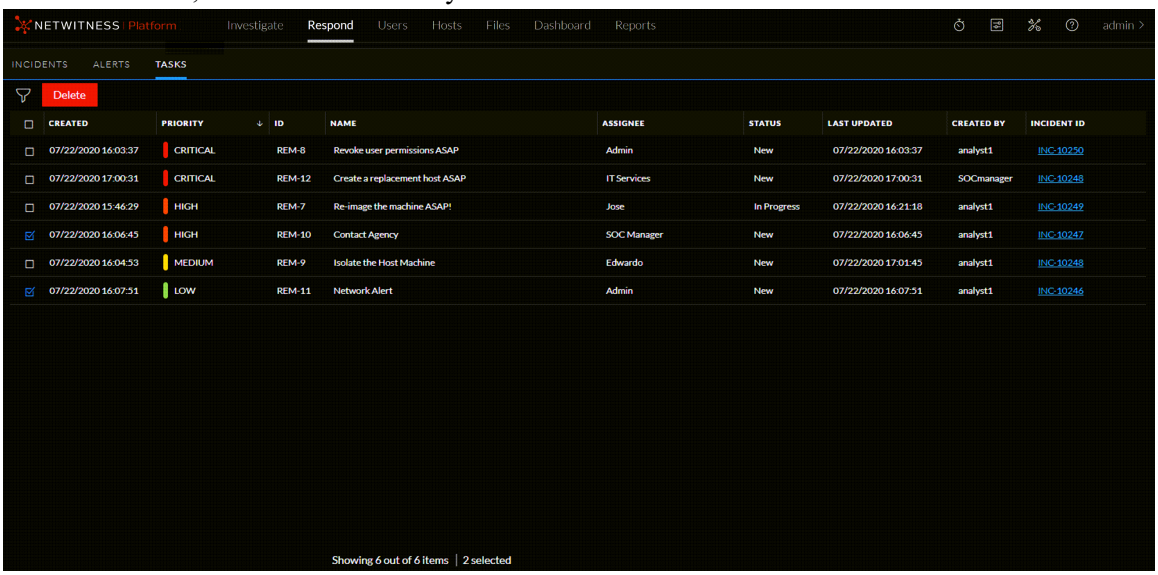
To Delete a Task from within an incident:

1. Go to **Respond > Incidents**.
   The Incidents List view displays a list of all incidents.
2. Locate the incident that needs a task update and click the link in the **ID** or **Name** field.
3. In the Journal panel on the right side of the Incident Details view, click the **Tasks** tab.
   If you do not see the Journal panel, click **Journal & Tasks** and then click the **Tasks** tab.

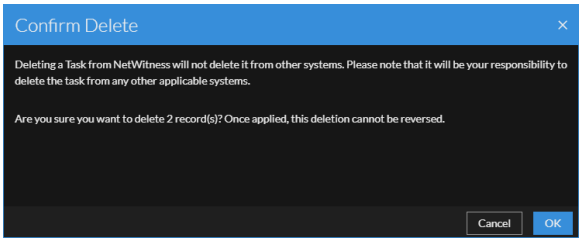


In the Tasks panel, you can see the tasks created for the incident.

4. Click  to the right of the task that you want to delete.



5. Confirm that you want to delete the task and click **OK**.



The task is deleted from NetWitness. Deleting tasks from NetWitness does not delete them from other systems.

To Delete Tasks from the Tasks List:

1. Go to **Respond > Tasks**.
   The Tasks List view displays a list of all incident tasks.
2. In the Tasks list, select the tasks that you want to delete and click **Delete**.

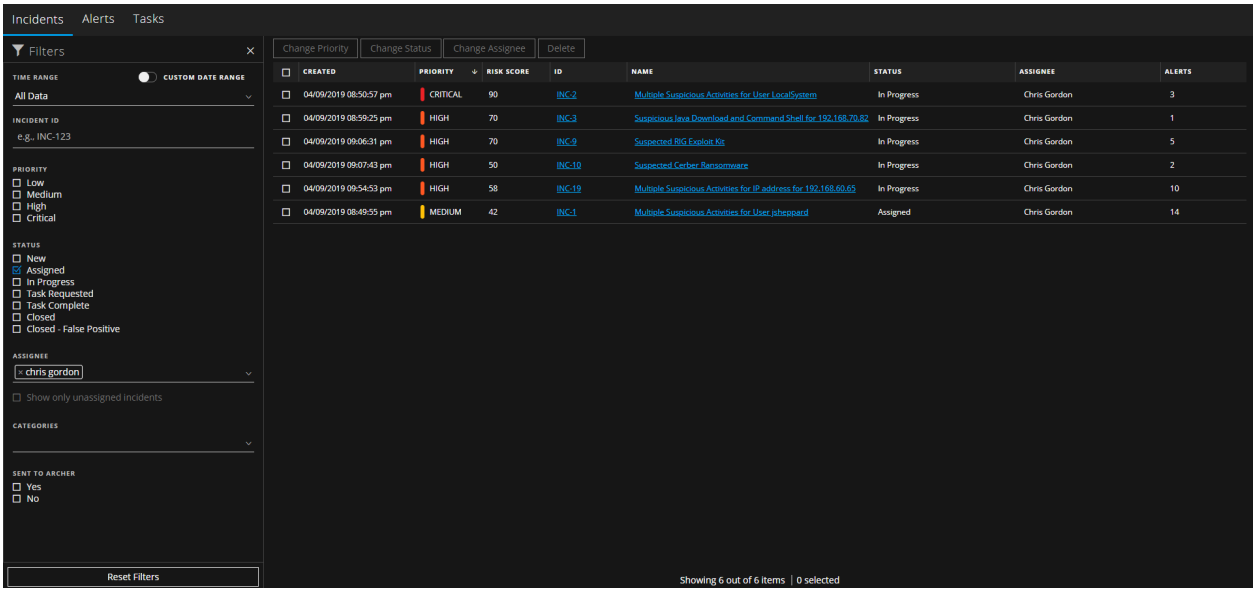
3. Confirm that you want to delete the tasks and click **OK**.

   The tasks are deleted from NetWitness. Deleting tasks from NetWitness does not delete them from other systems.

Close an Incident

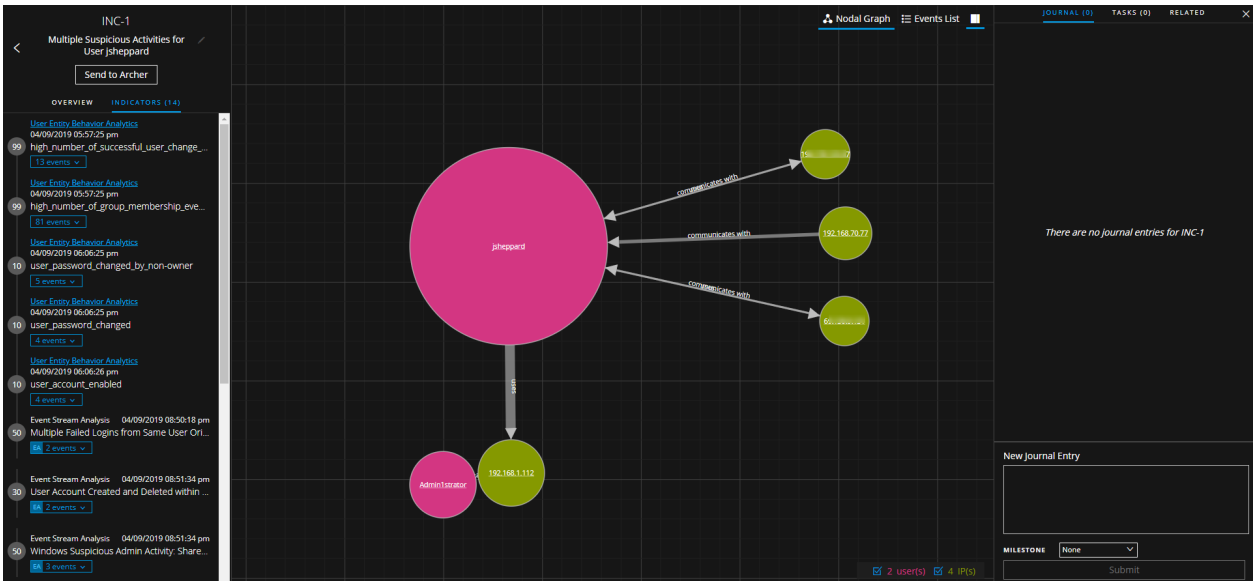
When you have arrived at a solution after investigating an incident and remediating it, you close the incident.

1. Go to **Respond > Incidents**.
2. In the Incident List view, select the incident that you want to close and click **Change Status**.
3. Select **Closed** from the drop-down list.
   You can see a successful change notification. The incident is now closed. You cannot change the priority or assignee of a closed incident.



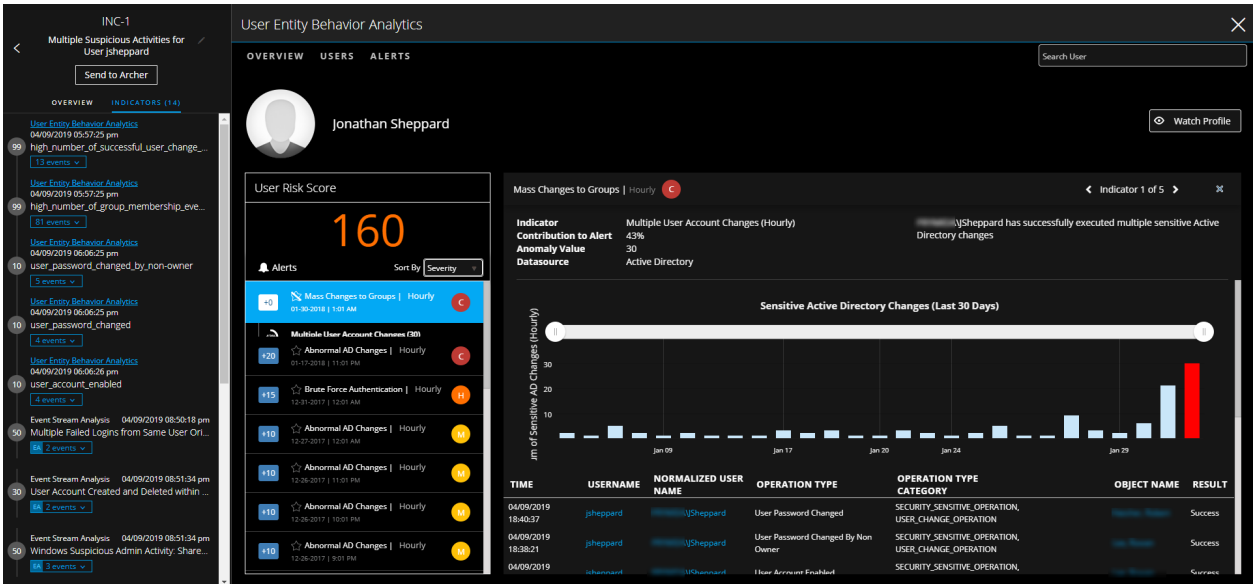
Note: You can also close an incident in the Overview panel. You can close multiple incidents at the same time in the Incident List view. Change Incident Status provides additional details.

Incident Response Use Case Examples

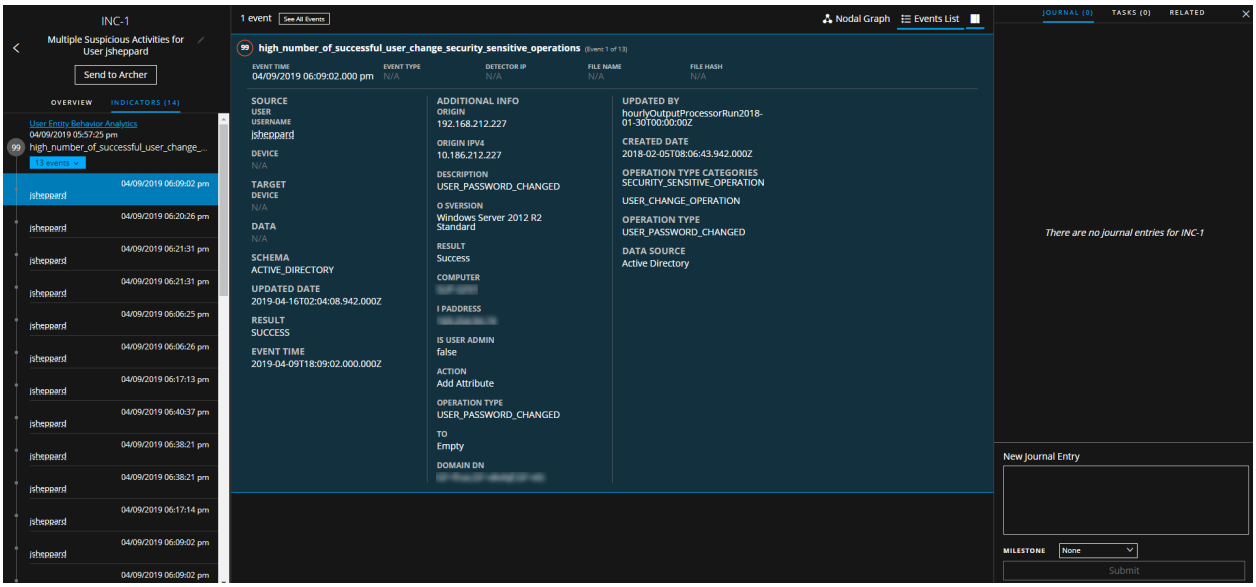


The following use cases provide examples of an analyst using NetWitness to quickly respond to incidents, identify threats, and take action to reduce or eliminate the ability of threat actors to compromise valuable information in the corporate network.

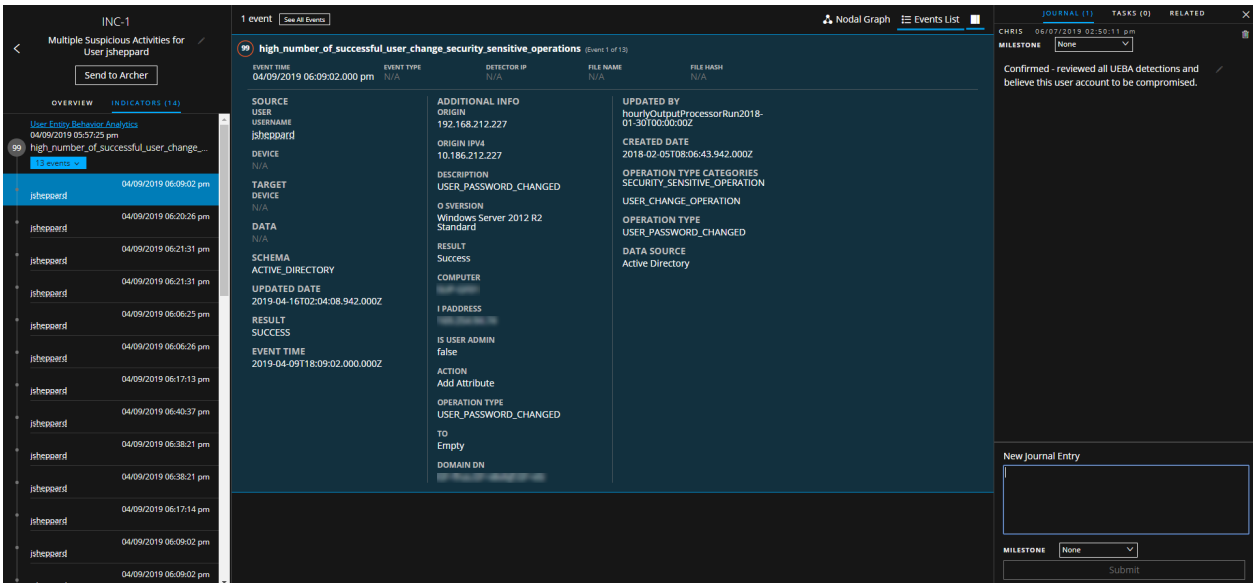
Use Case #1: UEBA Anomalous User Activity



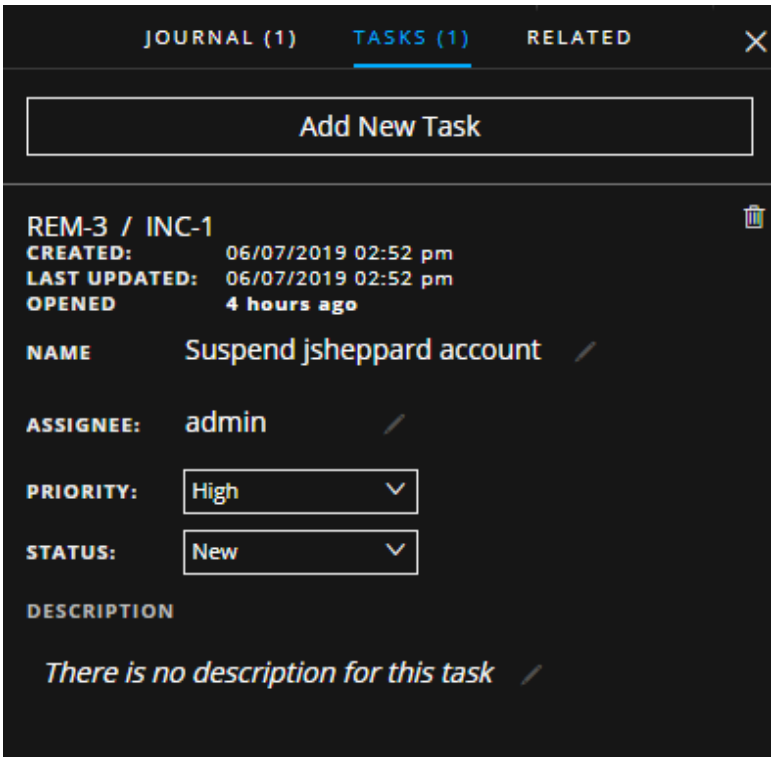
An analyst named Chris logs in, goes to the Incidents List view, and uses the filters on the left-hand side to look at all of the incidents assigned to her. In the list, she notices an incident that she has not yet reviewed (status is Assigned) and opens the incident.



In the Incident Details view, the analyst sees a timeline of contributing events (Indicators panel) on the left, a visualization of the entities involved in the middle, and additional panels on the right where she can keep track of notes and tasks during her review.

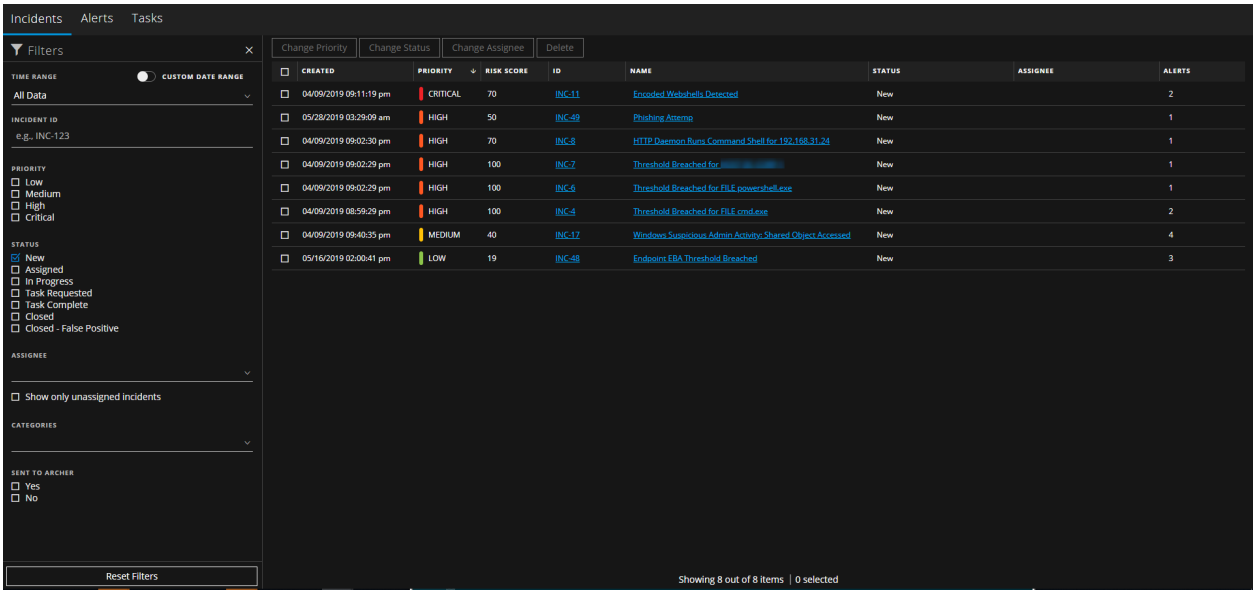


Chris uses the Indicators panel to get finer detail on the events that lead to this incident being created. Clicking the "User Entity Behavior Analytics" link in the Indicators panel exposes the analysis that was done and the anomaly that was detected on the user account "Jonathan Sheppard (jsheppard)." The User Entity Behavior Analytics panel below shows an overall risk score of 160, details the Windows events that contributed to the severity, and shows the actual anomaly in user account changes attributed to this user. She can explore the data in as much depth as required to help validate and understand the alert.

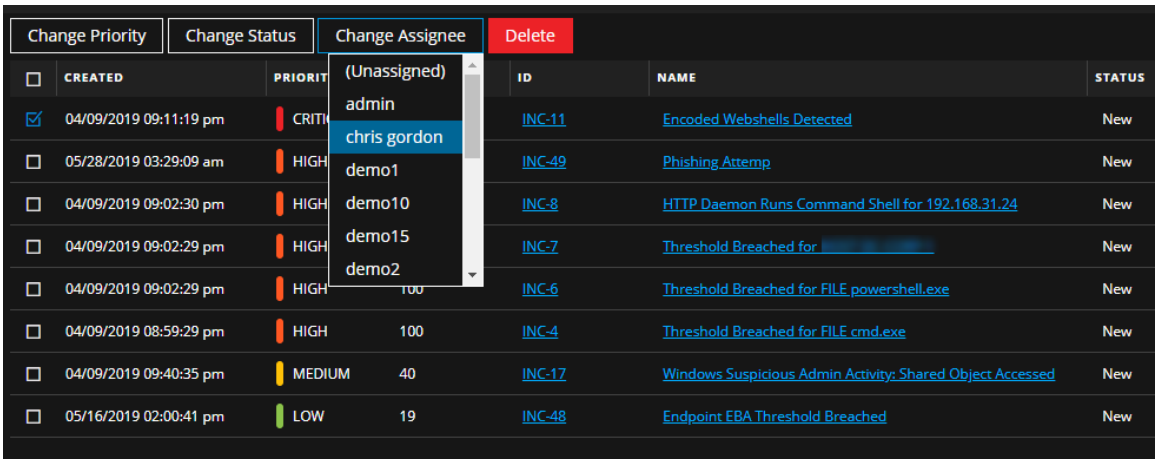


In the Events List, Chris can even inspect the details of the individual log events involved.

During her review and investigation, she can update the incident with her notes, as well as create and assign tasks for herself or other analysts.

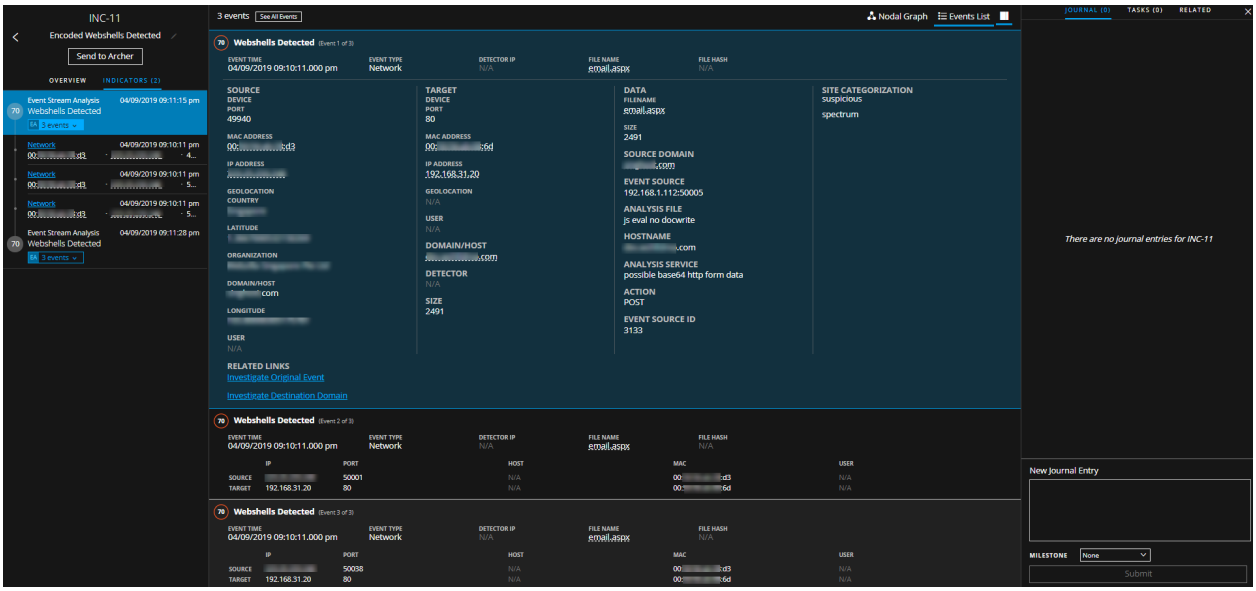


To remediate the incident, Chris opens a task for the administrator (admin) to suspend the jsheppard account.

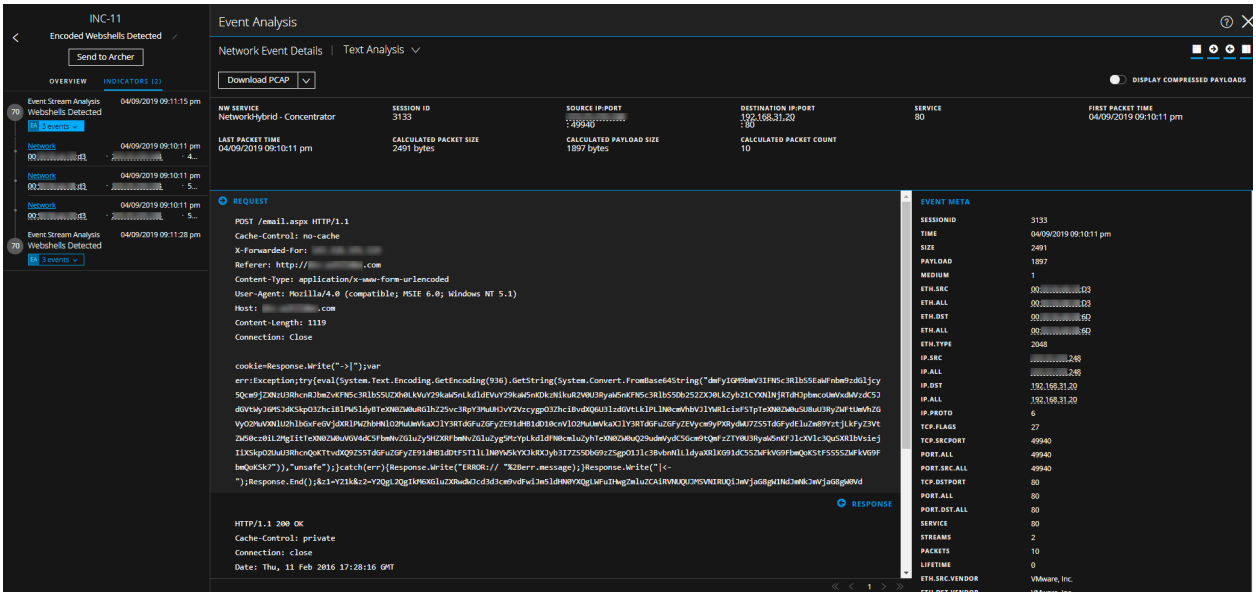


Use Case #2: Encoded Webshells Detected

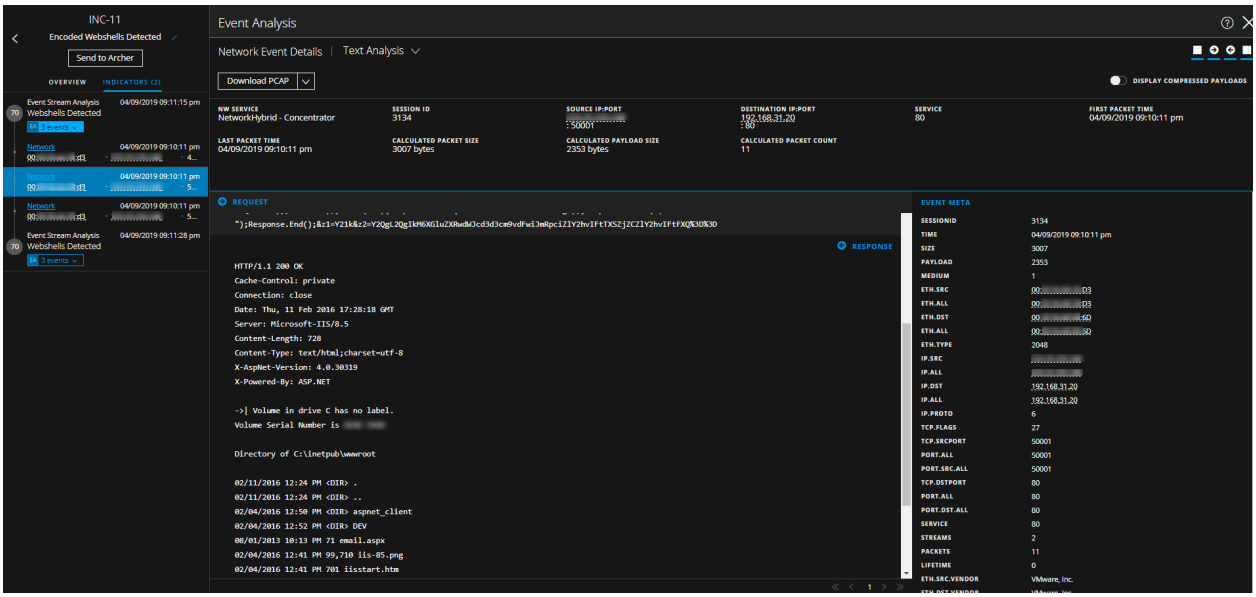
Analyst Chris logs in, looks at all of the new incidents that have not yet been assigned to anyone, and notices a highly critical incident "Encoded Webshells Detected."



Chris decides to assign this incident to herself and investigate it.

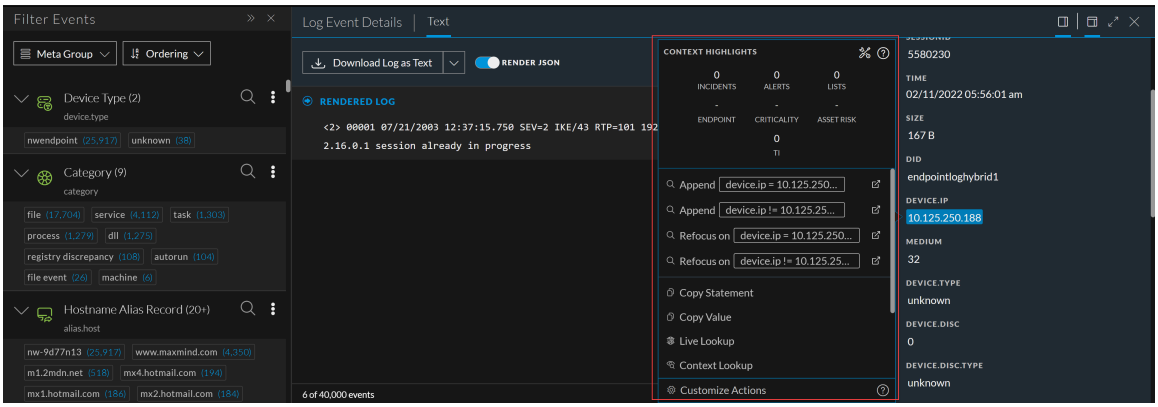


At first glance using the visual summary, Chris can see a couple of specific Event Stream Analysis alerts that kicked off this incident, and the entities associated with the alerts. She sees that a public IP address (xxx.xx.xxx.248) has been detected as interacting with a webshell on the internal web server 192.168.31.20. It looks like the suspicious request was made to the file `email.aspx`. She dives in to investigate.

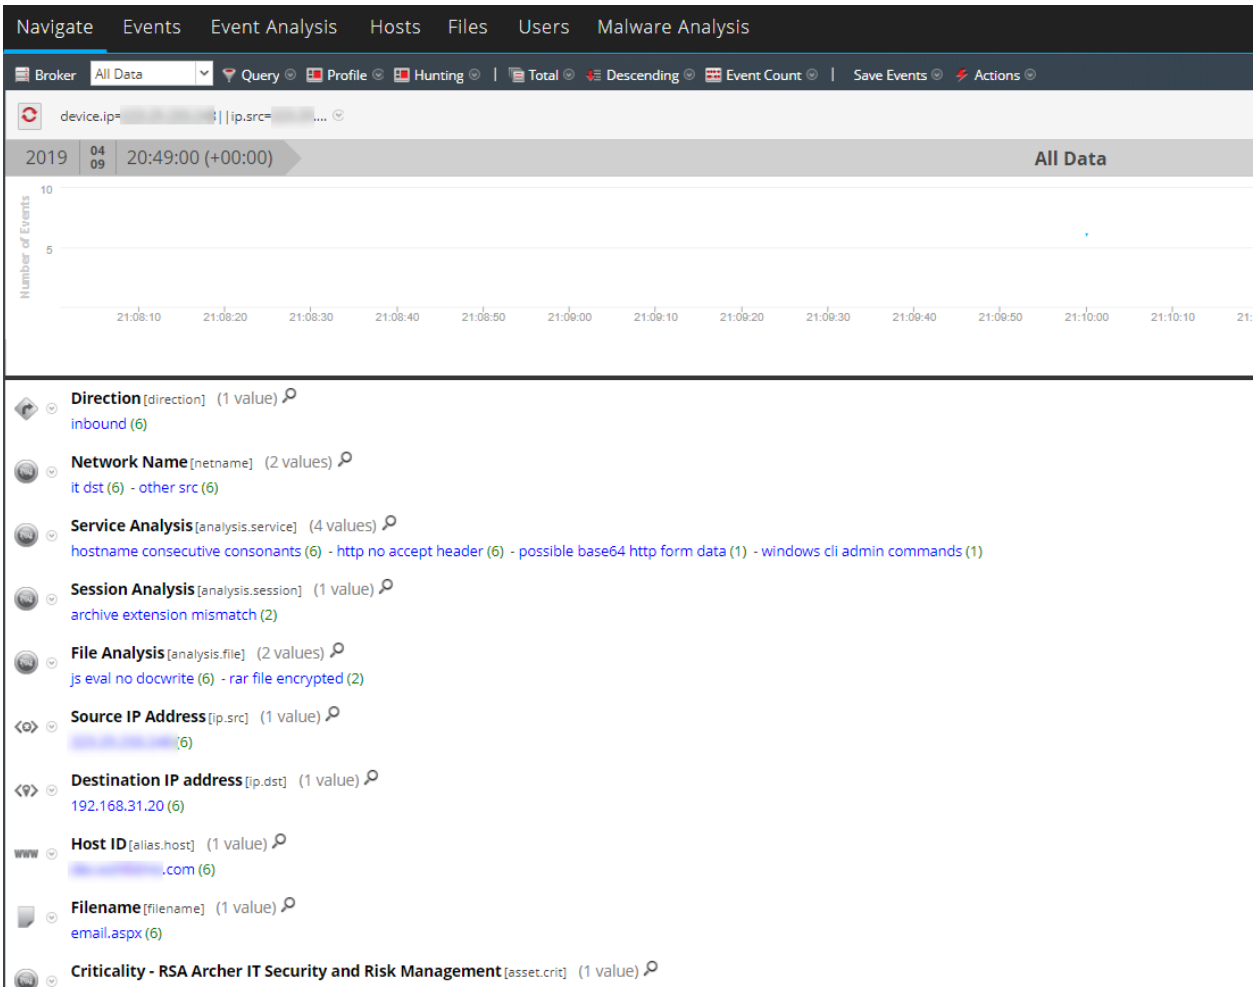


By drilling into the indicator (alert) on the left-hand side, Chris can view the entire list of events associated with the incident and all of the metadata generated by the system, including details about the connections between the external and internal host. She notices that the type of data in this case is "Network," meaning that these events were generated by the full packet capture component of NetWitness.

While the metadata associated with these events does look suspicious to Chris, she wants to investigate even deeper to see what is going on. To do this she can drill into the raw packet reconstruction of the HTTP sessions simply by clicking the "Network" link in the Indicators panel on the left-hand side.



From this deep dive, Chris can examine the raw payload of the suspicious connections and can easily see the strange nature of this request. In the request payload she can see a strange looking request, but most alarmingly, once she scrolls down to the response portion she can see the information that her web server is sending back out to the suspect external IP address.



Chris sees what looks to be a directory listing in the packet data, which is not something she would expect from normal web site communications. With this information, she confirms that this is indeed a malicious webshell that has been installed on the internal web server.

From here, Chris can take a number of actions. She can journal her confirmation, assign a task to another user to handle the incident from there, or she can expand her investigation to look for any other activity that has been associated with the malicious external IP address. Chris does this by left or right click the IP address to open a context tooltip and pivoting into Investigate.

This pivot brings Chris into another part of the NetWitness interface where she can perform free-form search and analysis outside of the incident.

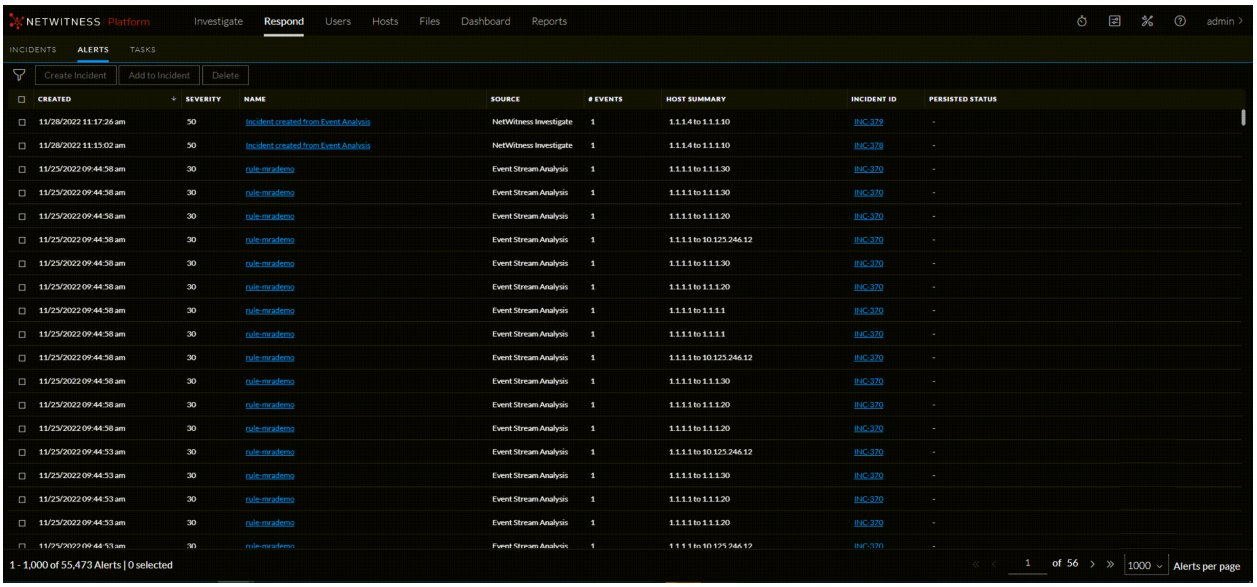
In this case she did not uncover anything other than the same network events that were part of the original incident, which is a good step in validating the isolated scope of the incident. If, however, she were to find other interesting events across any log, network, or endpoint data in the system, she could easily add those events into the incident to keep track.

Reviewing Alerts

NetWitness enables you to view a consolidated list of threat alerts generated from multiple sources in one location. You can find these alerts in the Respond > Alerts view. The source of the alerts can be ESA correlation rules, NetWitness Endpoint, NetWitness UEBA (Cloud), Malware Analysis, Reporting Engine, Risk Scoring, as well as many others. You can see the source of the alerts, the alert severity, and additional alert details.

Note: ESA correlation rule alerts can ONLY be found in the Respond > Alerts view.

To better manage a large number of alerts, you have the ability to filter the alerts list based on criteria that you specify, such as severity, time range, and alert source. For example, you may want to filter the alerts to only show those alerts with a severity between 90 and 100 that are not already part of an incident. You can then select a group of alerts to create an incident or add to an existing incident.



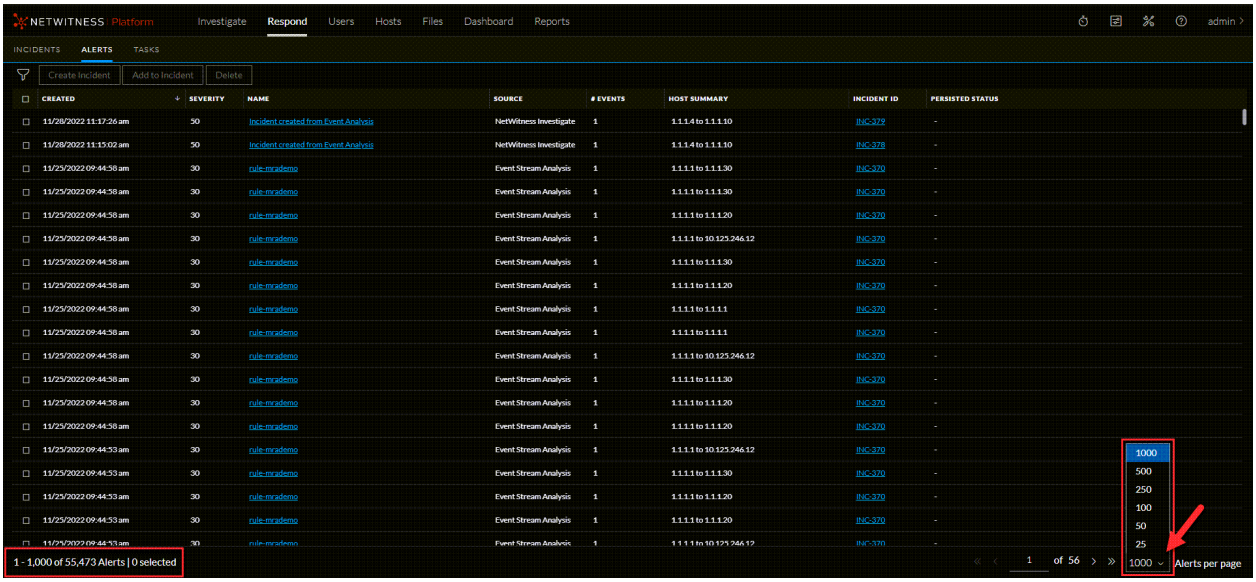
You can perform the following procedures to review and manage alerts:

- View Alerts
- Filter the Alerts List
- Remove My Filters from the Alerts List
- Save the Current Alerts Filter
- Update a Saved Alerts Filter
- Delete a Saved Alerts Filter
- View Alert Summary Information
- View Event Details for an Alert
- Investigate Events
- Create an Incident Manually
- Add Alerts to an Incident
- Delete Alerts

View Alerts

In the Alerts List view, you can browse through various alerts from multiple sources, filter them, and group them to create incidents. This procedure shows you how to access the alerts list.

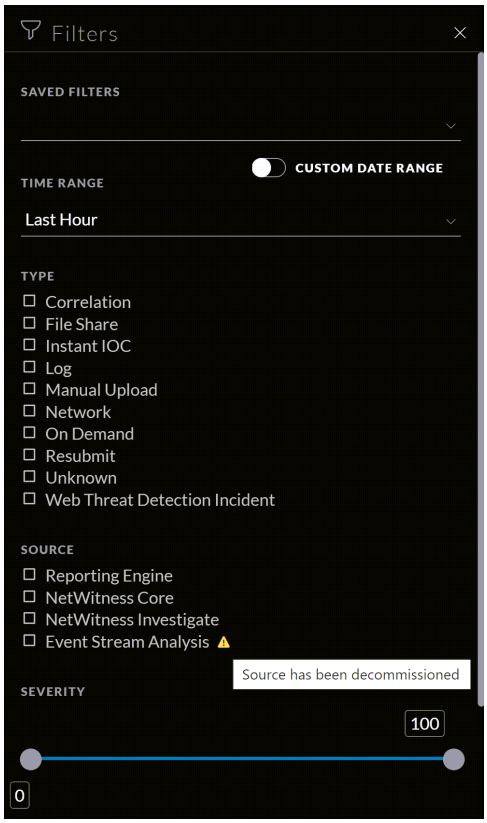
1. Go to **Respond > Alerts**.
   The Alerts List view displays a list of all NetWitness alerts.



2. Scroll through the alerts list, which shows basic information about each alert as described in the following table.

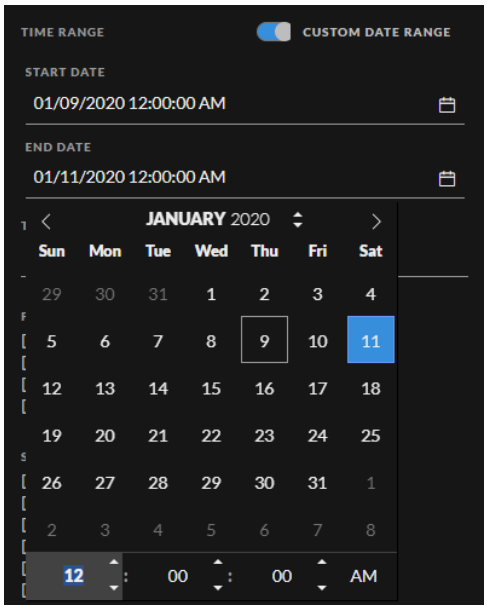
Column	Description
Created	Displays the date and time when the alert was recorded in the source system.
Severity	Displays the level of severity of the alert. The values are from 1 through 100.
Name	Displays a basic description of the alert.
Source	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, ESA correlation rules, Reporting Engine, Risk Scoring, and many others. **Note:** - From 12.3.1 and later, the alert source filter panel displays only the sources installed in your instance of NetWitness and won't display all possible sources. If a user deletes a host / service on their NetWitness Instance, any source associated with that host / service will be marked as decommissioned. For Ex. ESA Primary is deleted in the hosts page, the ESA source will be marked as decommissioned, the source decommissioned message (**source has been decommissioned**) is displayed in the alert source filter panel.
# Events	Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky.

Column	Description
Host Summary	Displays details of the host like the host name from where the alert was triggered. The details may include information about the source and destination hosts in an Alert. Some alerts may describe events across more than one host .
Incident ID	Shows the Incident ID of the alert. If there is no incident ID, the alert does not belong to any incident and you can create an incident to include this alert or the alert can be added to an existing incident.



At the bottom of the list, you can see the number of alerts on the current page and the total number of alerts. For example: **1 - 500 of 2400 Alerts | 0 selected**. The maximum number of alerts that you can view at one time is 1,000. You can also change the maximum number of alerts per page by selecting from the drop-down at the bottom right corner.

Filter the Alerts List



The number of alerts in the Alerts List can be very large, making it difficult to locate particular alerts. The Filter enables you to view the alerts you want to see, for example, alerts from a particular source, alerts of a particular severity, alerts that are not part of an incident, and so on.

1. Go to **Respond > Alerts**.
   The Filters panel appears to the left of the Alerts list. If you do not see the Filters panel, in the Alerts List view toolbar, click , which opens the Filters panel.

2. In the Filters panel, select one or more options to filter the alerts list:
   - **Time Range**: You can select a specific time period from the Time Range drop-down list. The time range is based on the date that the alerts were received. For example, if you select Last Hour, you can see alerts that were received within the last 60 minutes.
   - **Custom Date Range**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and

End Date fields. Select the dates and times from the calendar.

- **Type**: Select the type of events in the alert to view, for example, logs, network sessions, and so on. In NetWitness Platform 11.3 and later, if one of the events in an alert has a device_type of `nwendpoint`, Endpoint is included in the Type field.
- **Source**: Displays only the alert sources which are installed. Select one or more sources to view alerts triggered by the selected sources. For example, to view NetWitness Endpoint alerts only, select Endpoint as the source. Netwitness Core is available from 12.3 and later version. For more information, see the *NetWitness Respond Configuration Guide*.
- **Severity**: Select the the level of severity of the alerts to view. The values are from 1 through 100. For example, to concentrate on the highest severity alerts first, you may want to view only those alerts with a severity from 90 to 100.
- **Part of Incident**: To view only alerts that are not part of an incident, select **No**. To view only alerts that are part of an incident, select **Yes**. For example, when you are ready to create an incident from a group of alerts, you can select No to view only those alerts that are not currently part of an incident.
- **Alert Names**: Select the name of the alert to view. You can use this filter to search for all alerts generated by a specific rule, for example, Direct Login to an Administrative Account.

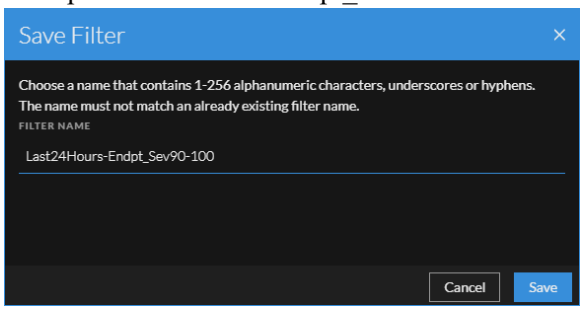
The Alerts List shows a list of alerts that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the alerts list.
For example: **Showing 30 out of 30 items**

3. If you want to close the Filters panel, click **X**. Your filters remain in place until you remove them.

Remove My Filters from the Alerts List

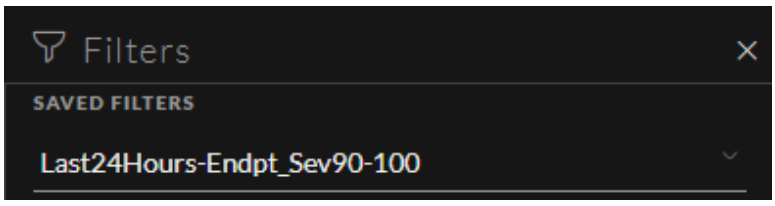
NetWitness remembers your filter selections in the Alerts List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of alerts that you expect to see or you want to view all of the alerts in your alerts list, you can reset your filters.

1. Go to **Respond > Alerts**.
   The Filters panel appears to the left of the alerts list. If you do not see the Filters panel, in the Alerts List view toolbar, click , which opens the Filters panel.
2. At the bottom of the Filters panel, click **Reset Filters**.



Save the Current Alerts Filter

Note: This option is available in NetWitness Platform Version 11.5 and later.



Saved filters provide a way for analysts to save and quickly apply specific filter conditions to the list of alerts. You can also use these filters to customize the Springboard landing page. For example, you may want to create a filter to show only alerts from a specific source and severity level over the last 24 hours. (This option is available in NetWitness Platform 11.5 and later.)

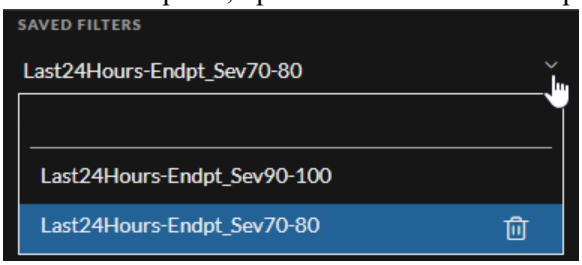
Saved filters are global. You can save a filter for other analysts to use and you can use any saved filter.

1. In the Filters panel, select one or more options to filter the incidents list. For example, in the Time Range field select Last 24 Hours, in the Source field select Endpoint, and for Severity, select the 90 to 100 range.
2. Click **Save As** and in the **Save Filter** dialog, enter a unique name for the filter and save it, for example Last24Hours-Endpt_Sev90-100.

The filter is added to the **Saved Filters** list.

Update a Saved Alerts Filter

Note: This option is available in NetWitness Platform Version 11.5 and later.



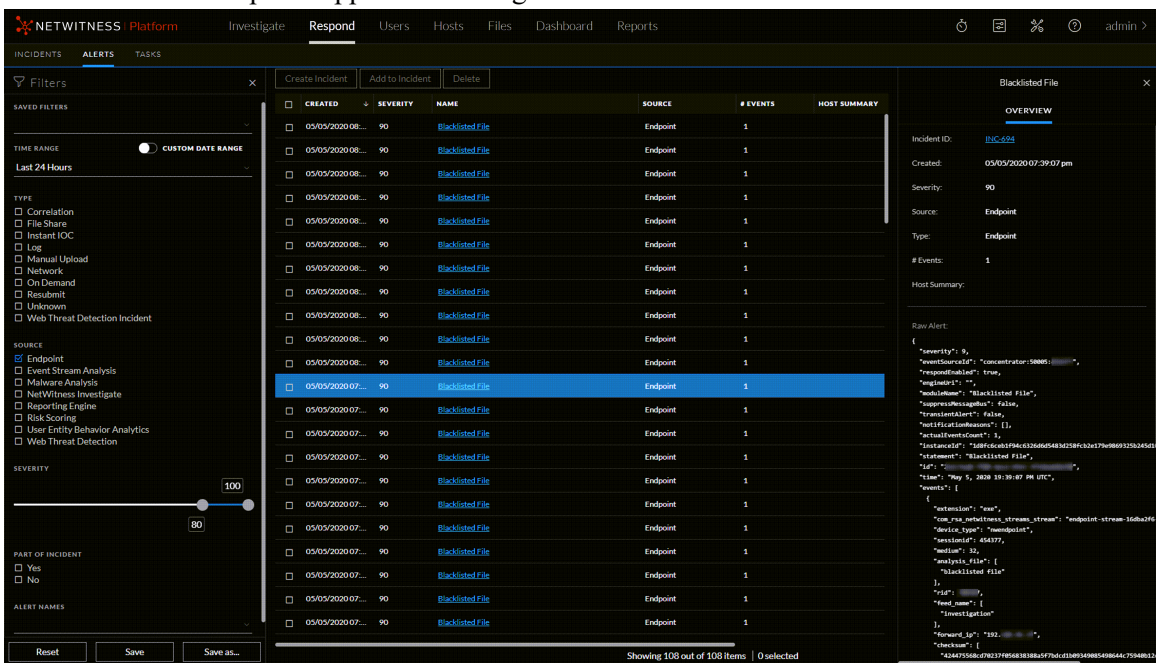
1. In the Filters panel **Saved Filters** drop-down list, select a saved filter.
2. Update your filter selections and click **Save**.

Delete a Saved Alerts Filter

Note: This option is available in NetWitness Platform Version 11.5 and later.

When a saved filter is no longer required, you can remove it from the saved filters list. Filters used in the Springboard cannot be deleted.

1. In the Filters panel, open the **Saved Filters** drop-down list.

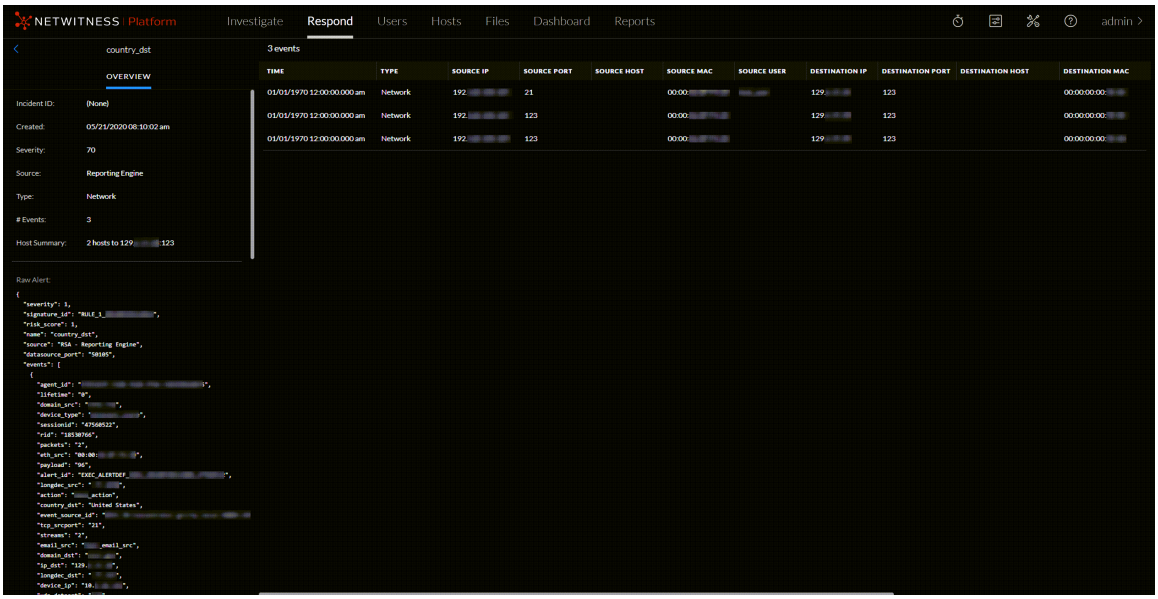


2. Next to the filter name, click  to delete it.

View Alert Summary Information

In addition to viewing basic information about an alert, you can also view raw alert metadata in the Overview panel.

1. In the Alerts list, click the alert that you want to view.
   The Alert Overview panel appears to the right of the Alerts list.



2. In the Overview panel Raw Alert section, you can scroll to view the raw alert metadata.

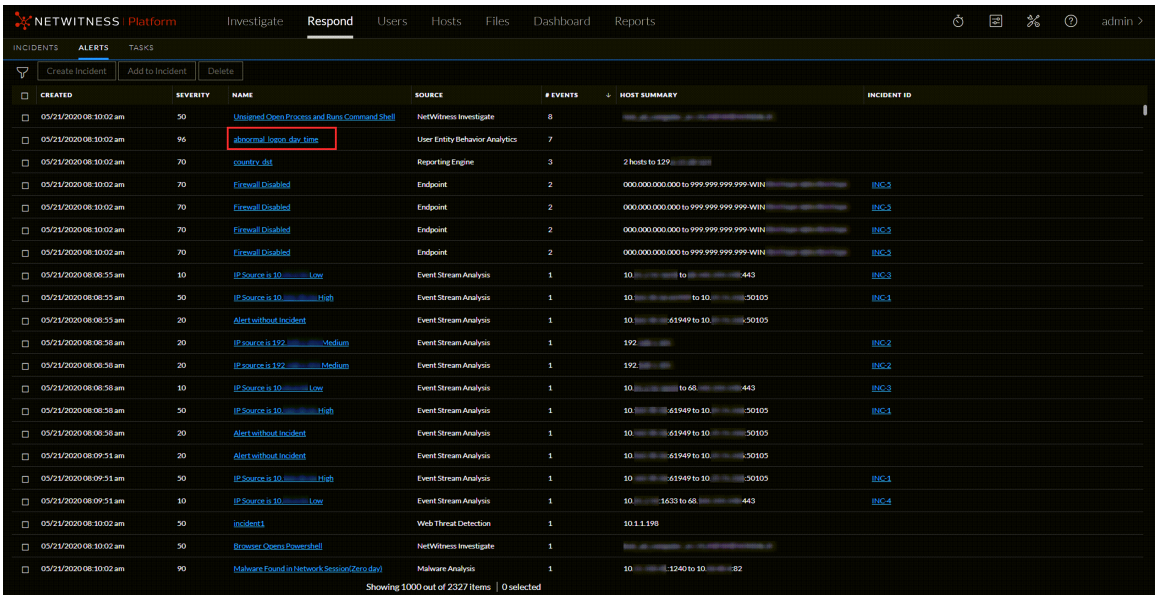
View Event Details for an Alert

After you review the general information about the alert in the Alerts List view, you can go to the Alert Details view for more detailed information to determine the action required. An alert contains one or more events. In the Alert Details view, you can drill down into an alert to get additional event details and further investigate the alert. The following figure shows an example of the Alert Details view.

The Overview panel on the left has the same information for an alert as the Overview panel in the Alerts List view.

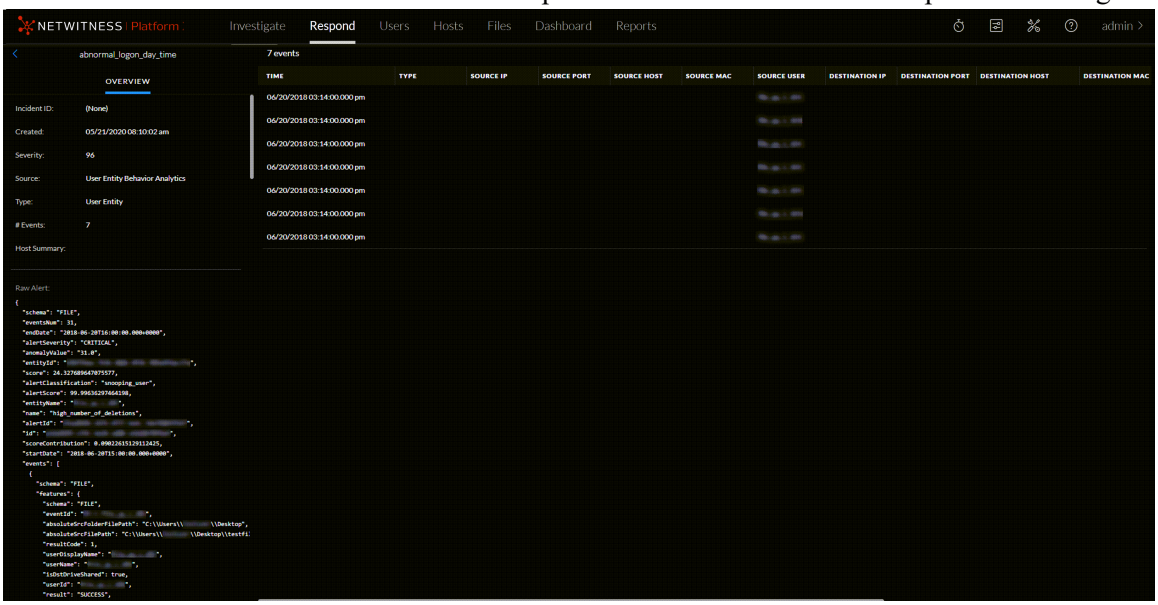
The Events panel on the right shows information about the events in the alert, such as event time, source IP, destination IP, detector IP, source user, destination user, and file information about the events. The amount of information listed depends on the event type.

There are two types of events:



- A transaction between two machines (a Source and a Destination)
- An anomaly detected on a single machine (a Detector)

Some events will only have a Detector. For example, NetWitness Endpoint finds malware on your machine. Other events will have a Source and Destination. For example, packet data shows communication between your machine and a Command and Control (C2) domain.

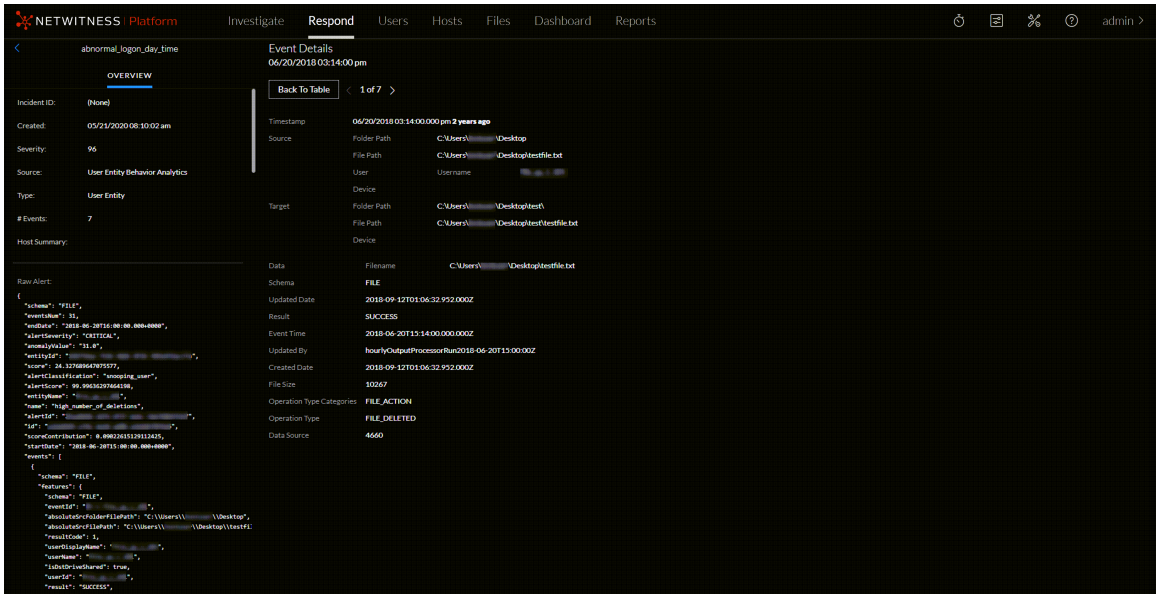


You can drill further into an event to get detailed data about the event.

To View the Event Details for an Alert:

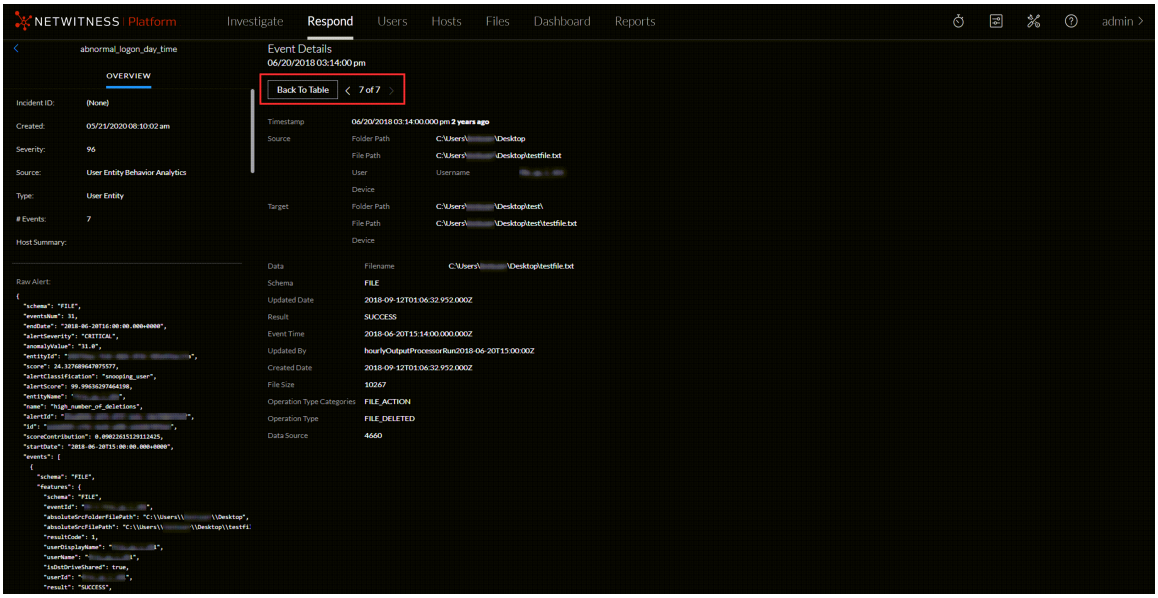
1. To view event details for an alert, in the Alerts List view, choose an alert to view and then click the link in the **Name** column for that alert.

The Alerts Details view shows the Overview panel on the left and the Events panel on the right.



The Events panel shows a list of events with information about each event. The following table shows some of the columns that can appear in the Events List (Events Table).

Column	Description
Time	Shows the time the event occurred.
Type	Shows the type of alert, such as Log and Network.
Source IP	Shows the source IP address if there was a transaction between two machines.
Destination IP	Shows the destination IP address if there was a transaction between two machines

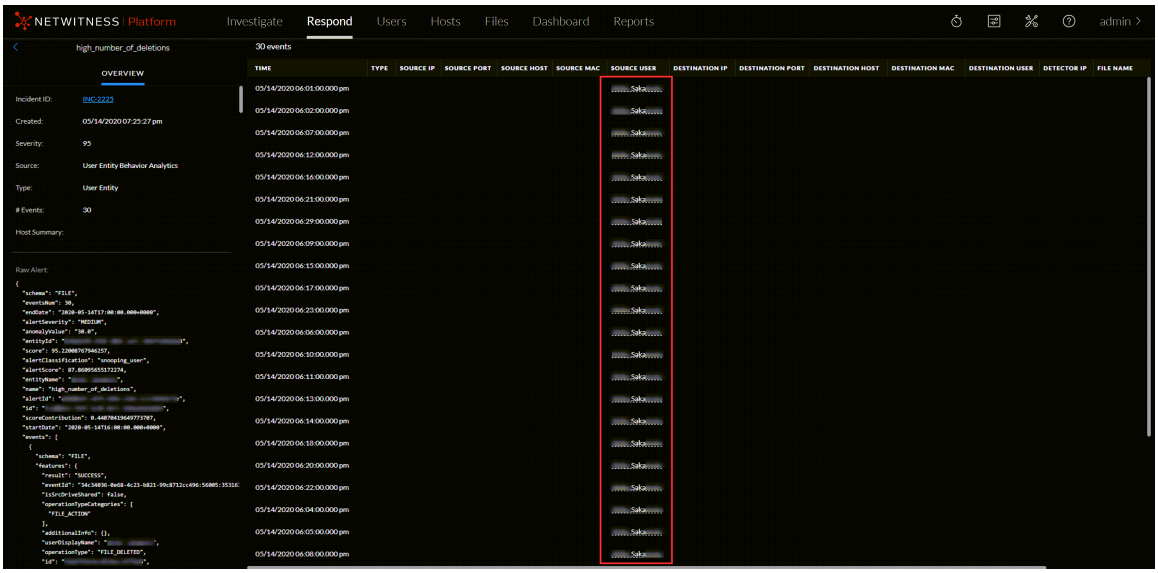


Column	Description
Detector IP	Shows the IP address of the machine where an anomaly was detected.
Source User	Shows the user of the source machine.
Destination User	Shows the user of the destination machine.
File Name	Shows the file name if a file is involved with the event.
File Hash	Shows a hash of the file contents.

If there is only one event in the list, you see only the event details for that event instead of a list.

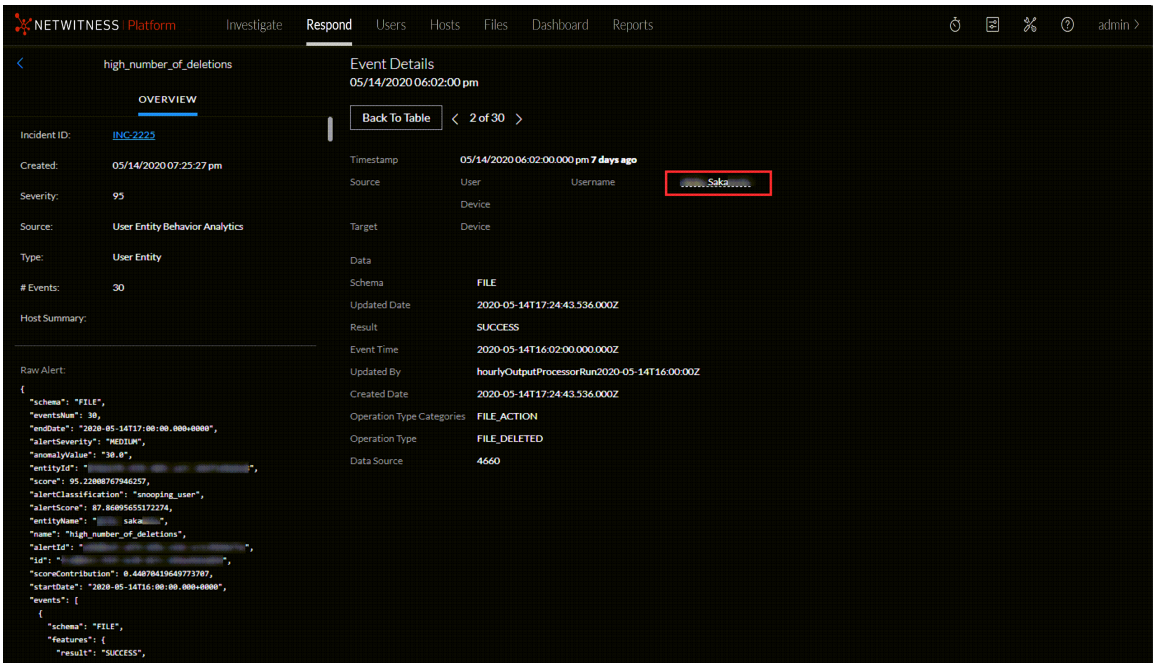
2. Click an event in the Events list to view the Event details.
   This example shows the event details for the first event in the list.

3. Use the page navigation to the right of the Back To Table button to view other events. This example shows the event details for the last event in the list.



See Alert Details Panel for detailed information about the event data listed in the Alert Details panel.

Investigate Events

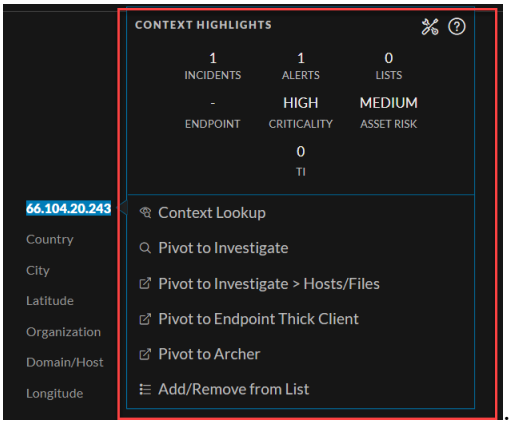


To further investigate the events, you can find links that take you to additional contextual information. From there, you have options available depending on your selection.

View Contextual Information

In the Alert Details view, you can see underlined entities in the Events panel. An underlined entity is considered an entity in the Context Hub and has additional contextual information available. The following figure shows underlined entities in the Events list.

The following figure shows an underlined entity in the Event Details.



The Context Hub is preconfigured with meta fields mapped to the entities. NetWitness Respond and NetWitness Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Settings for a Data Source" in the *Context Hub Configuration Guide*.

Caution: For the Context Lookup to work correctly in the Respond and Investigate views, NetWitness recommends that when mapping meta keys in the **(missing or bad snippet) > System > Investigation > Context Lookup** tab, you add only meta keys to the Meta Key Mappings, not fields in the MongoDB. For example, ip.address is a meta key and ip_address is not a meta key (it is a field in the MongoDB).

To View Contextual Information:

1. In the Alert Details view Events List or Event Details, left or right click an underlined entity.
   A context tooltip appears with a quick summary of the type of context data that is available for the selected entity.

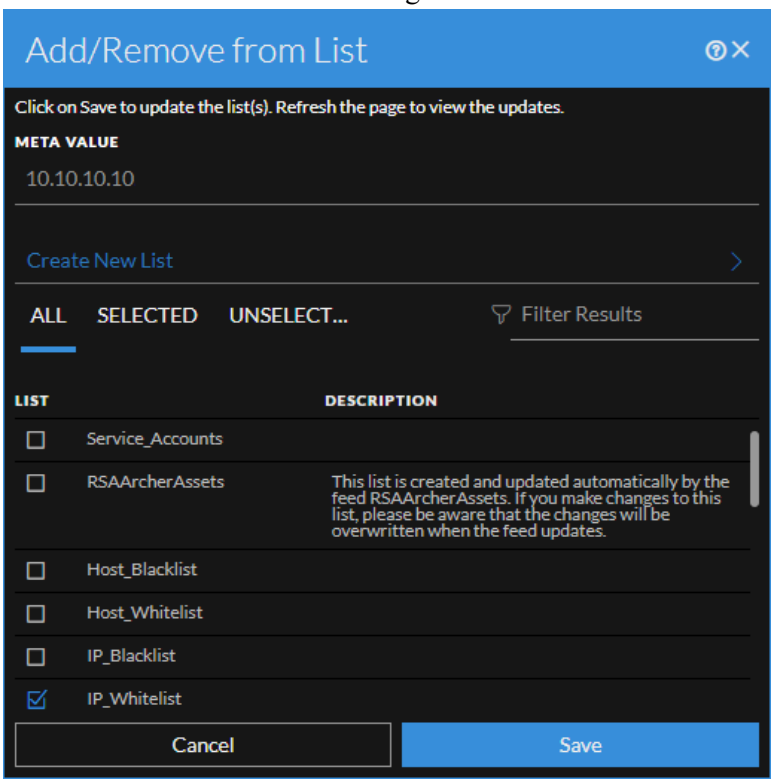
   The information in the **Context Highlights** section helps you to determine the actions that you would like to take. It shows the number of related alerts and incidents. It can show related data for Incidents, Alerts, Lists, Endpoint, Criticality, Asset Risk, Reputation, and Threat Intelligence (TI). Depending on your data, you may be able to click these numbered items for more information. The above example shows 1 related incidents, 1 related alerts, and one list associated with the selected IP address. There is no information for Endpoint, , Criticality, or Asset Risk. TI information comes from the STIX data source configured in Context Hub. For more information, see the *Context Hub Configuration Guide*.

   The other section lists the available actions. In the above example, the Add/Remove From List, Pivot to Investigate, Pivot to Investigate > Hosts/Files, Pivot to Endpoint Thick Client, and and Pivot to Archer options are available.

   Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the Archer configuration is enabled and configured properly.

   For more information, see Pivot to the Investigate > Events View, Pivot to the Hosts or Files View, Pivot to Archer, Pivot to Endpoint Thick Client, and Add an Entity to a Whitelist.

2. To see more details about the selected entity, click the **View Context** button.
   The Context panel opens and shows all of the information related to the entity.
   Context Lookup Panel - Respond View provides additional information.



Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Alert Details view Events List or Event Details, left or right click the underlined entity that you would like to add to a Context Hub list.
   A context tooltip appears showing the available actions.

2. In the **Actions** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove From List dialog shows the available lists.

3. Select one or more lists and click **Save**.
   The entity appears on the selected lists.
   Add/Remove from List Dialog provides additional information.

Create a Whitelist

You can create a whitelist in the Context Hub in the same way as you would create it in the Incident Details view, see Create a List.

Pivot to the Investigate > Events View

For a more thorough investigation of the incident, you can access the Investigate > Navigate view.

1. In the Events List or Event Details in the Alert Details view, hover over any underlined entity to access a context tooltip.
2. In the **Actions** section of the tooltip, select **Pivot to Investigate** > **Events**.
   The Navigate view opens, which enables you to perform a deeper dive investigation.

For more information, see the *NetWitness Investigate User Guide*. For troubleshooting information with the Investigate > Events link see the *Alerting with ESA Correlation Rules User Guide*.

Pivot to the Hosts or Files View

For a more thorough investigation about specific Hosts and Files, you can access the Hosts and Files views.

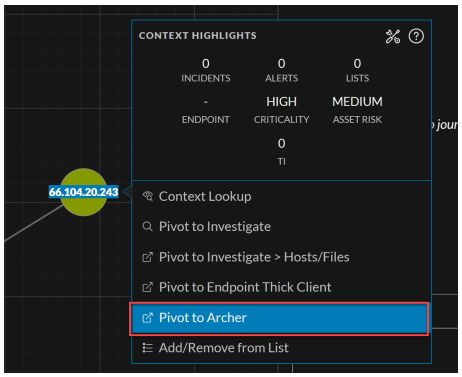
1. In the Events List or Event Details in the Alert Details view, left or right click any entity to access a context tooltip.
2. In the tooltip, select **Pivot to Investigate** > **Hosts/Files**.
   If you left or right click a host or IP or MAC address entity and click **Pivot to Investigate** > **Hosts/Files**, it displays the Hosts view with a specific host listed.
   If you left or right click a filename or file hash entity and click **Pivot to Investigate** > **Hosts/Files** it displays the Files view with a specific file listed.

Note: By default, the search for entities is on the previously selected Endpoint Server. However, you can select a different Endpoint Server to fetch the information or data.

For more information, see the *NetWitness Investigate User Guide*.

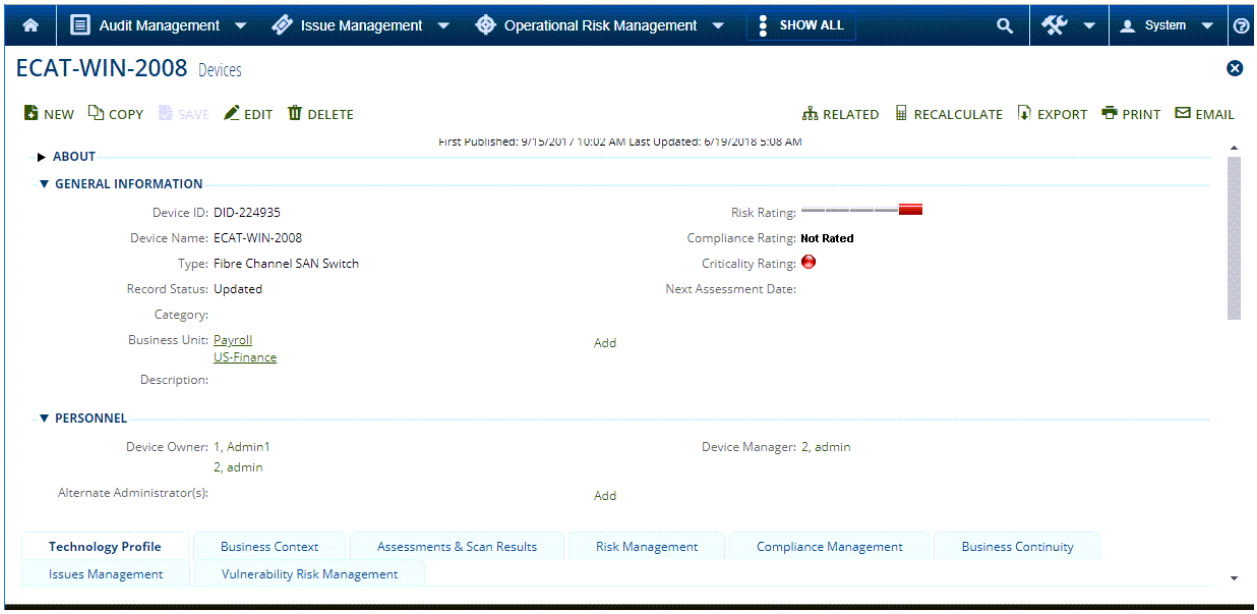
Pivot to Endpoint Thick Client

If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.



1. In the Events List or Event Details in the Alert Details view, hover over any underlined entity to access a context tooltip.
2. In the **Actions** section of the tooltip, select **Pivot to Endpoint Thick Client**.
   The NetWitness Endpoint thick client application opens outside of your web browser.

For more information on the thick client, see the *NetWitness Endpoint User Guide*.



Pivot to Archer

For viewing more details about a device in Archer Cyber Incident & Breach Response, you can pivot to the device details page. This information is displayed only for IP address, host, and Mac address.

1. In the Events List or Event Details in the Alert Details view, left or right click any underlined entity to access a context tooltip.
2. In the **Actions** section, select **Pivot to Archer**.

3. The device details page in **RSA Archer Cyber Incident & Breach Response** opens if you are logged in to the application, otherwise the login screen is displayed.

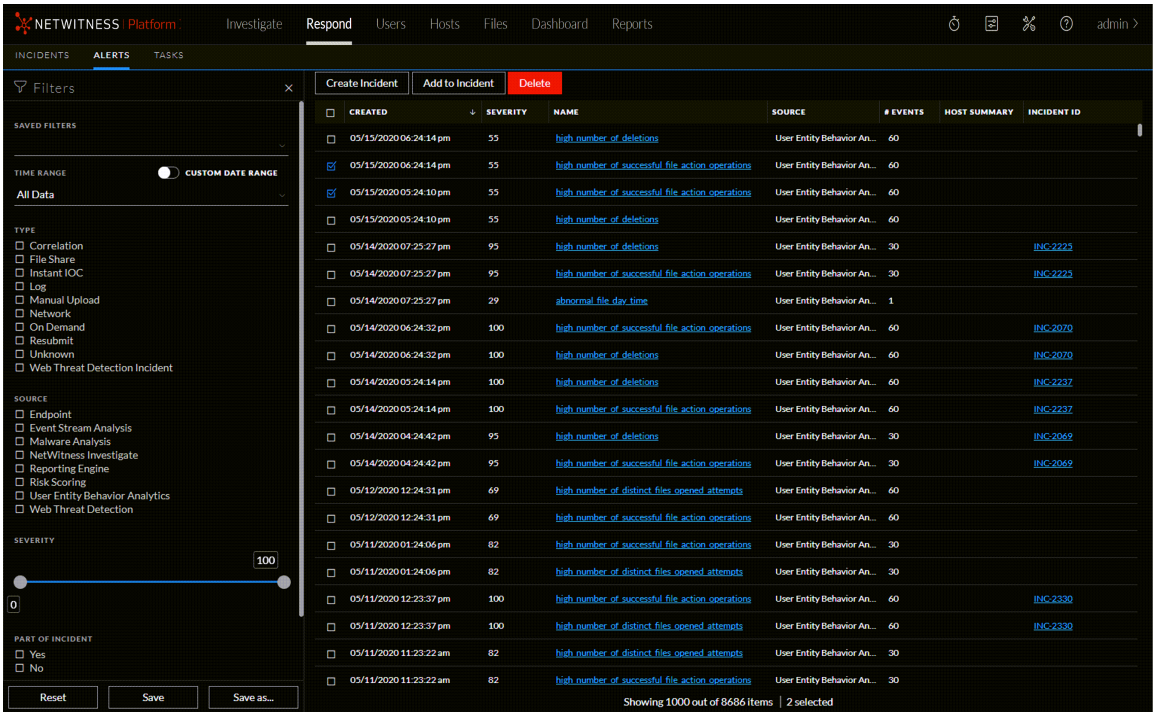
Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the Archer configuration is enabled and configured properly.

For more information, see the *NetWitness Archer Integration Guide*.

Create an Incident Manually

You can create incidents manually from alerts in the Alerts List view. The alerts that you select cannot be part of another incident.

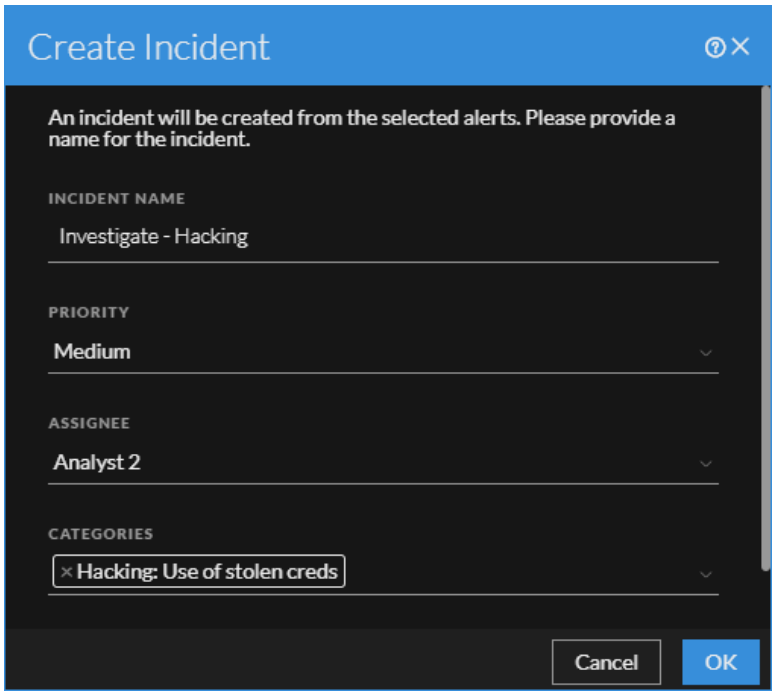
In NetWitness Version 11.2 and later, you can change the assignee, category, and priority when you create an incident manually from alerts.



In NetWitness Version 11.1, incidents created manually from alerts default to Low priority, but you can change the priority after you create it. You cannot add categories to manually created incidents in version 11.1.

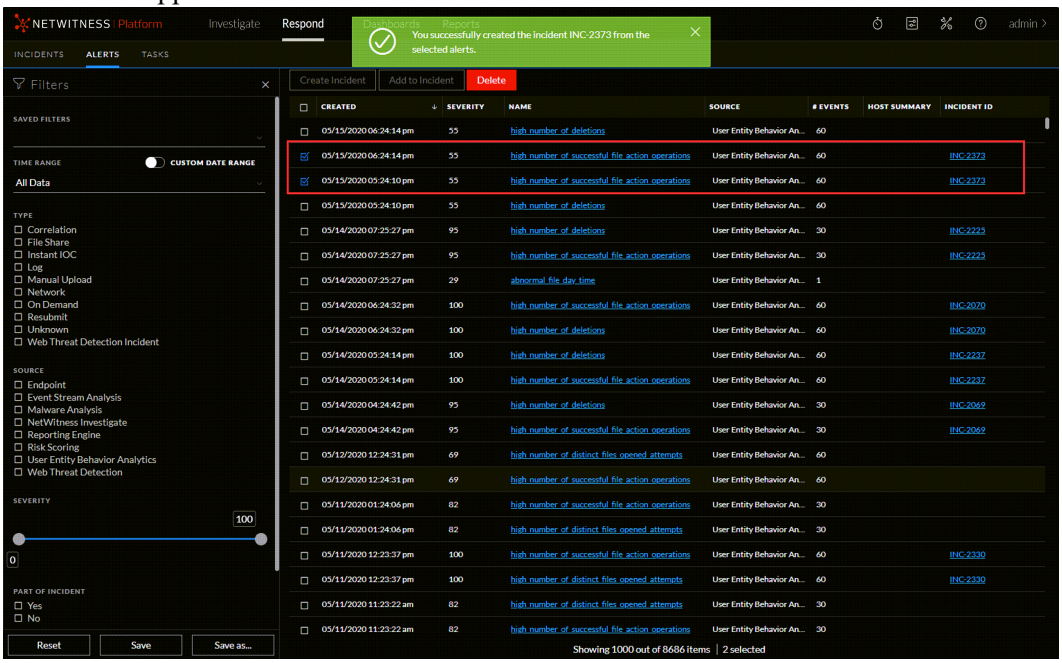
Note: Incidents can be created manually or automatically. An Alert can only be associated with one Incident. You can create incident rules to analyze the alerts collected and group them into incidents depending on which rules they match. For details, see the "Create an Incident Rule for Alerts" topic in the *NetWitness Respond Configuration Guide*.

To Create an Incident Manually:



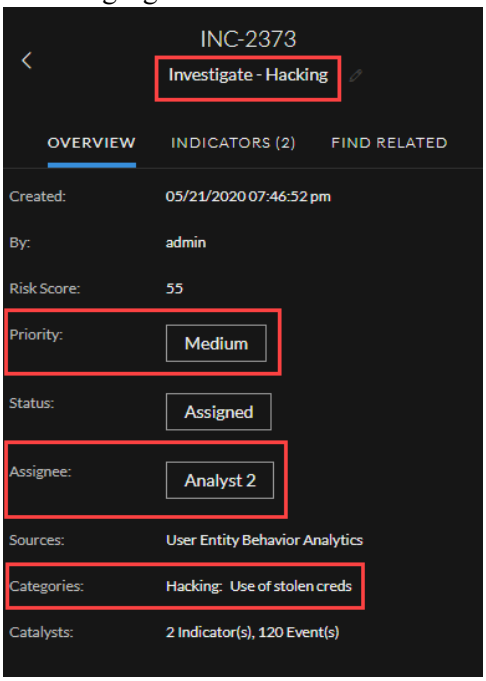
1. Go to **Respond** > **Alerts**.
2. Select one or more alerts in the Alerts List.

   Note: Selecting alerts that do not have incident IDs enable the **Create Incident** button. If the alert is already part of an incident, the button is disabled. You can filter alerts that are not part of an incident by selecting the option **Part of Incidents** as **No** in the Filters panel.



3. Click **Create Incident**.

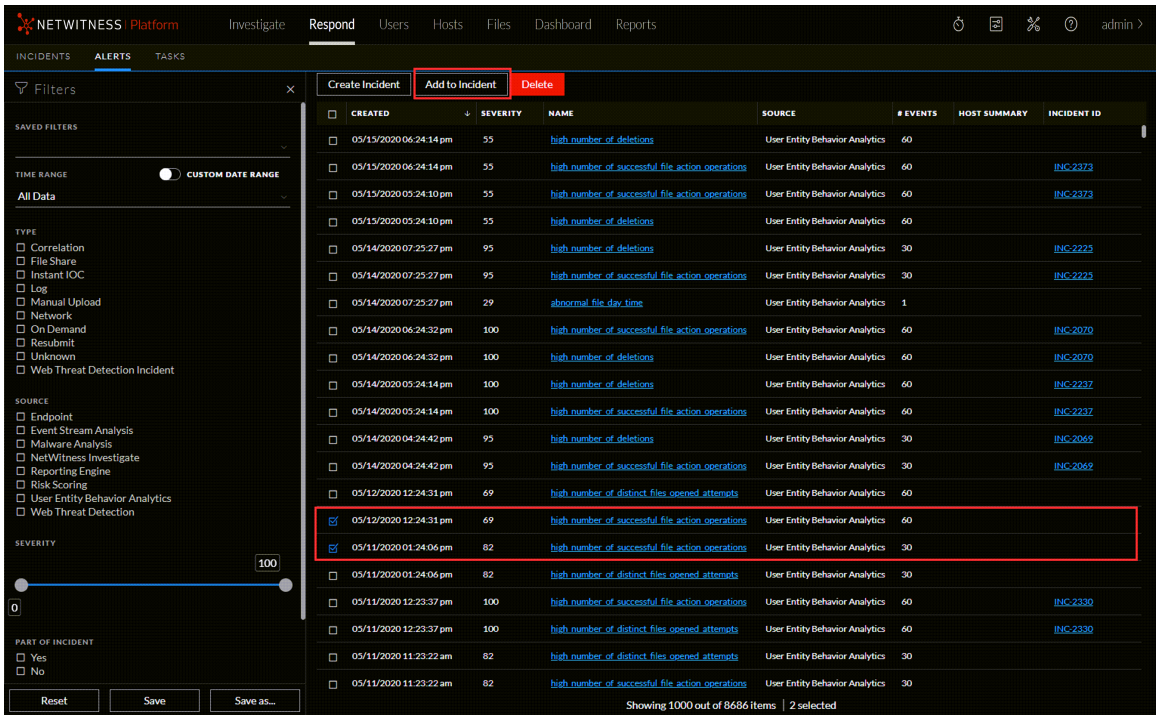
   The **Create Incident** dialog is displayed.



4. In the **Incident Name** field, type a name to identify the incident. For example, Investigate - Hacking.
5. In the **Priority** field, select a priority for the incident. The priority defaults to Low.
6. (Optional) If you are ready to assign the incident, in the **Assignee** field, select a specific user.
7. (Optional) In the **Categories** field, you can select a category to classify the incident, such as Hacking: Use of stolen creds. This is also helpful when trying to locate the incident later using the incidents filter.

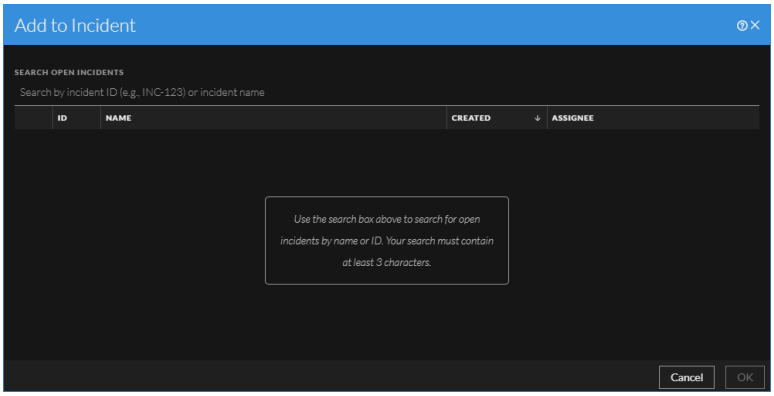
8. Click **OK**.
   You can see a confirmation message that an incident was created from the selected alerts. The new incident ID appears as a link in the INCIDENT ID column of the selected alerts.

If you click the link, it takes you to the Incident Details view for that incident, where you can update information, such as changing Priority to high or assigning the incident to another user. The following figure shows the Incident Details view Overview panel for the new incident.



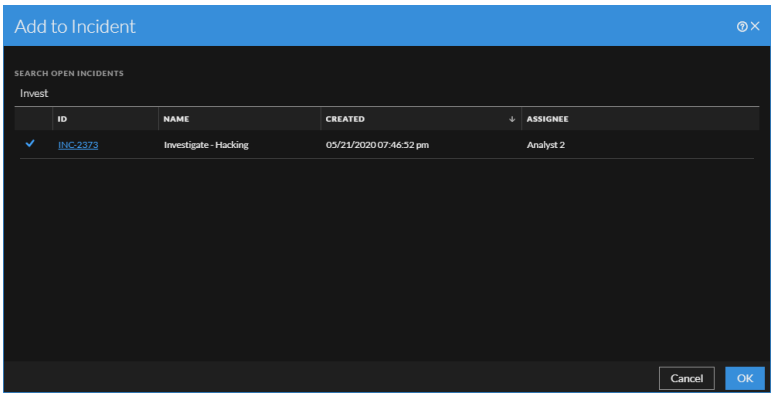
Add Alerts to an Incident

Note: This option is available in NetWitness Version 11.1 and later.

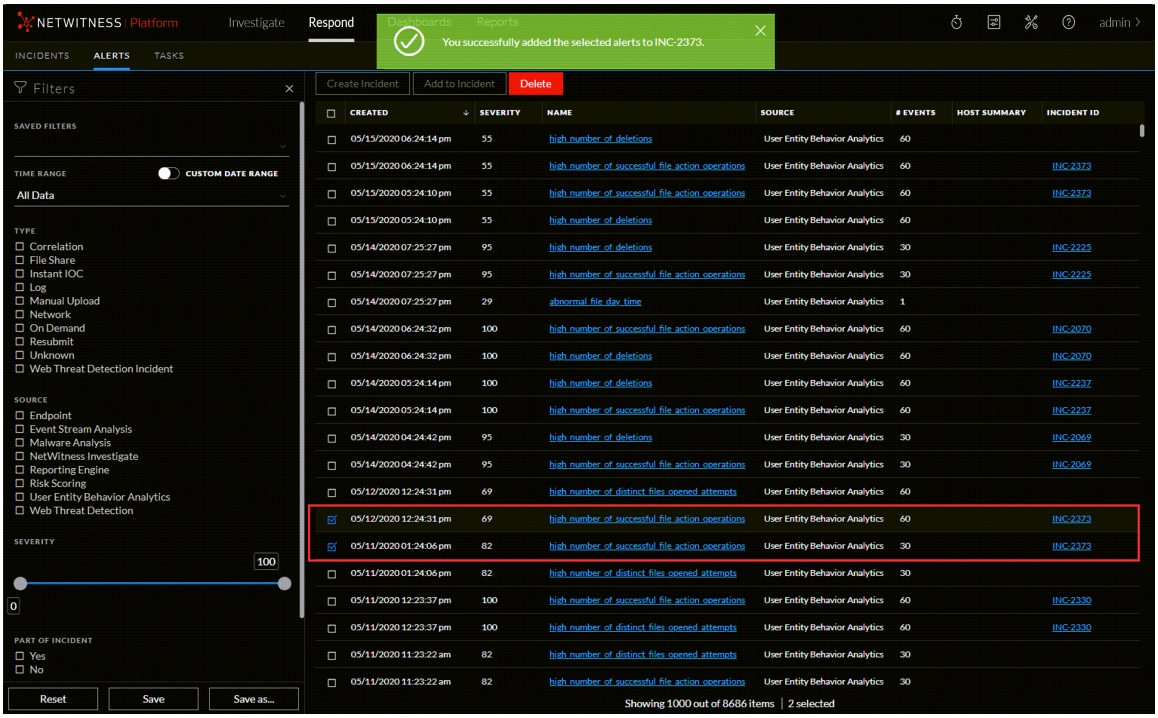


If you have alerts that fit a particular existing incident, you do not have to create a new incident. Instead, you can add alerts to that incident from the Alerts List view. The alerts that you select cannot be part of another incident.

1. Go to **Respond > Alerts**.
2. In the Alerts List, select one or more alerts that you want to add to an incident, and click **Add to Incident**.

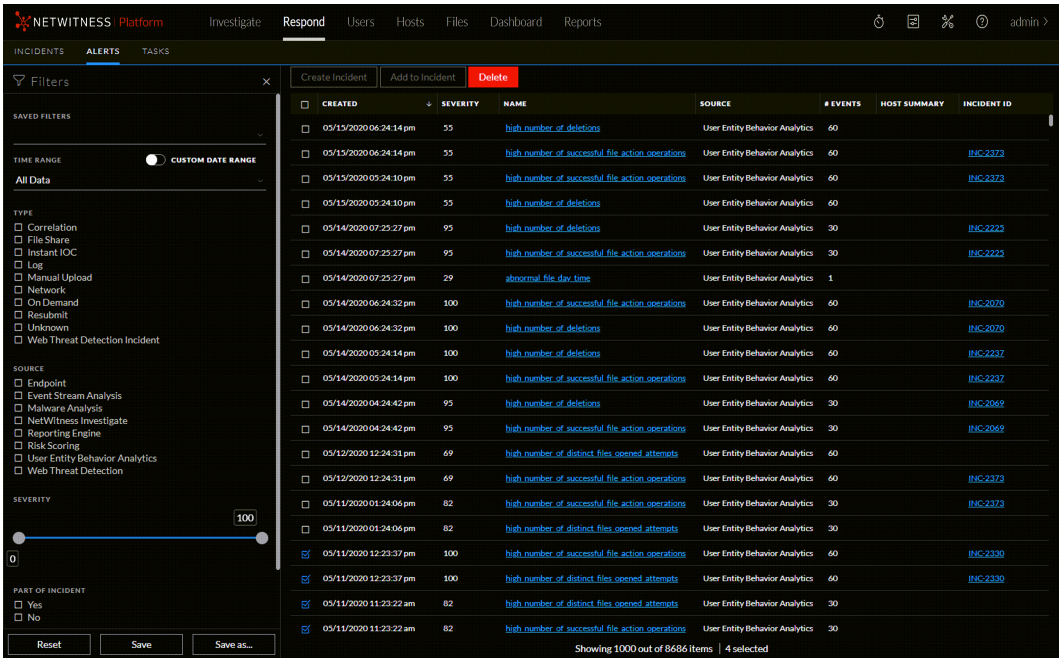


Note: Selecting alerts that do not have incident IDs enables the **Add to Incident** button. If the alert is already part of an incident, the button is disabled. You can filter alerts that are not part of an incident by selecting the option **Part of Incident** as **No** in the Filters panel.

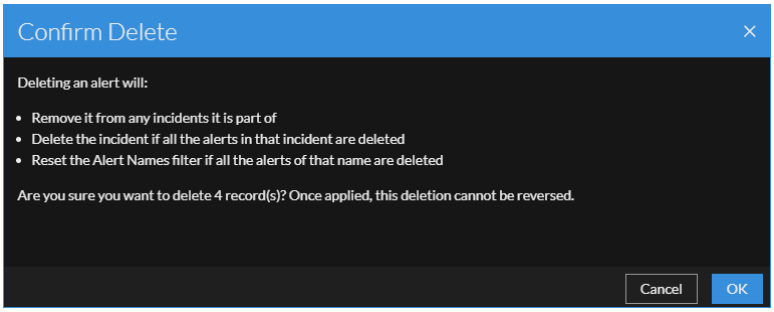


3. In the **Add to Incident** dialog, type at least three characters in the **Search** field to search for the incident by **Name** or **Incident ID**.

4. In the results list, select the incident that will receive the selected alerts and click **OK**.



The selected alert or alerts are now part of the selected incident and will have that incident ID.



Delete Alerts

Users with the appropriate permissions, such as Administrators and Data Privacy Officers, can delete alerts. This procedure is helpful when you want to remove unnecessary or non-relevant alerts. Deleting these alerts frees up disk space.

1. Go to **Respond > Alerts**.
   The Alerts List view displays a list of all NetWitness alerts.
2. In the Alerts list, select the alerts that you want to delete and click **Delete**.

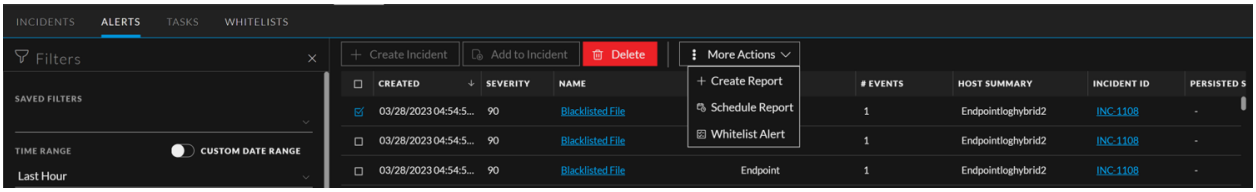
   If you do not have permission to delete alerts, you will not see the Delete button.
3. Confirm that you want to delete the alerts and click **OK**.

   The alerts are deleted from NetWitness. If a deleted alert is the only alert in an incident, the incident is also deleted. If the deleted alert is not the only alert in an incident, the incident is updated to reflect the deletion.

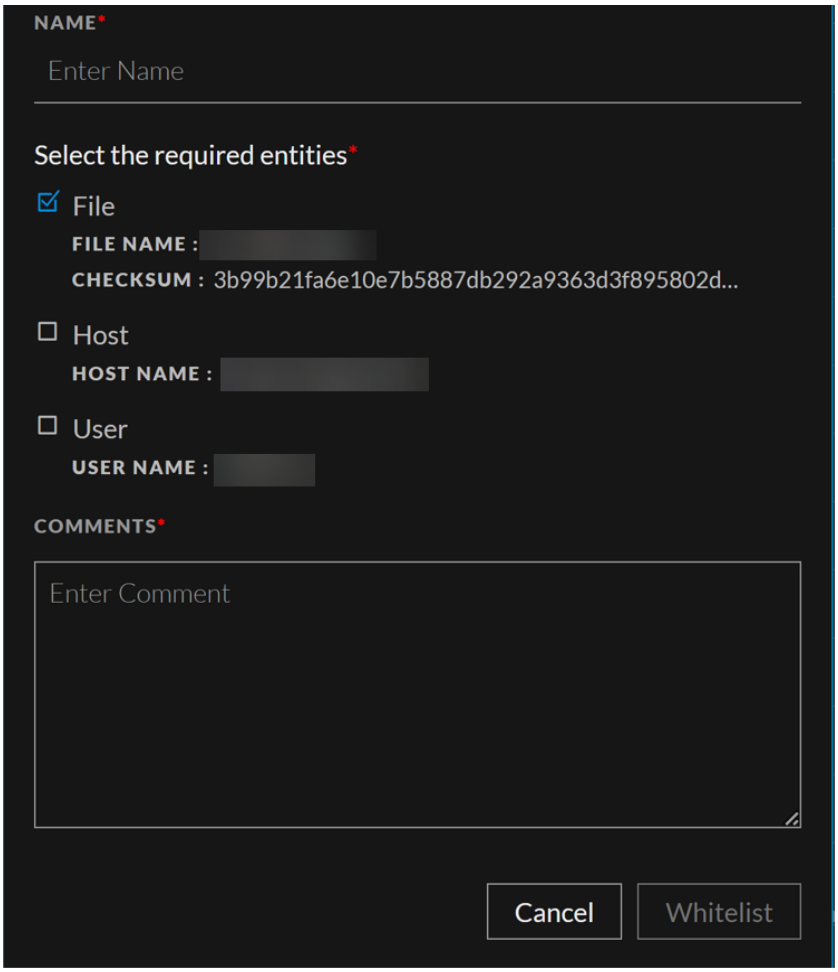
Whitelist Endpoint Alerts

The **Whitelist Alert** feature allows you to whitelist the unwanted and recurring non-suspicious Endpoint alerts triggered in the **Respond** > **Alerts** view. With this feature, you can select entities such as File, User, and Host and define the Whitelist condition to avoid triggering unwanted alerts for the required entities. Administrators can permanently delete the existing alerts matched with the Whitelist condition by enabling the Config in the **Services** > **Respond Server** > **Explore** view.

Note: By default, the Config is disabled in the **Services** > **Respond Server** > **Explore** view (the `alert-cleanup-enabled` parameter is set to **false**). To enable the config, you must set the `alert-cleanup-enabled` parameter to **true** in **Services** > **Respond Server** > **Explore** view. Refer to the following figures.



Note:
- When you enable the config, the existing alerts matched with the Whitelist condition still continue to exist over a period of time before they are permanently deleted. Once deleted, the alerts cannot be reversed to the selected entities.
- You can select only one alert at a time for whitelisting.



To whitelist an Endpoint alert

1. Go to **Respond** > **Alerts**.

   The **Alerts** view is displayed.

2. Select an alert and click **More Actions** > **Whitelist Alert**.
3. Enter the name of the Whitelist and select the required entities.

4. Specify the reason for whitelisting in the **Comments** section.
5. Click **Whitelist**.

   The **Confirm Whitelist** confirmation dialog is displayed.
6. Click **Confirm Whitelist**.

Use Case: Unwanted Endpoint Alerts Triggering in the Respond service

John, an analyst, logs in to the NetWitness Platform and clicks **Respond** > **Alerts**. While investigating the alerts in the Respond **Alerts** view, John notices that a few alerts displayed in the UI are not suspicious. Analyst selects a non-suspicious alert and clicks the **Whitelist Alert** tab under **More Actions** in the toolbar. Once the **Alert Whitelisting** confirmation window is displayed, John performs the following:

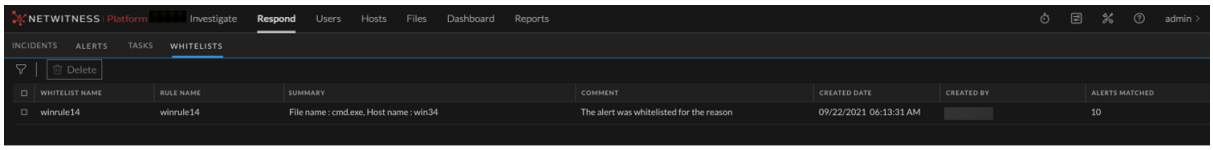
- Enters the name of the Whitelist.

- Selects the entities **File** and **Host** to stop triggering the new matching alerts for the particular file **xxxx.smp** and the host **Windows**.

- Specifies the reason for whitelisting the alert in the **Comments** section and clicks **Whitelist**.
- Once the **Confirm Whitelist** confirmation window is displayed, John clicks **Confirm Whitelist**.

After whitelisting the selected alert, John selects another non-suspicious alert in the Respond Alerts view for whitelisting. This time, John enables the config in the **Services** > **Respond Server** > **Explore** view to permanently delete the existing alerts matched with the Whitelist condition. Later, John selects the entities **User**, **Host**, and **File** in the **Alert Whitelisting** confirmation window to stop triggering the new matching alerts for the selected entities.

Note: Upon enabling the config and then whitelisting the alert for the selected entities **User**, **Host**, and **File**, John finds that the risk score of the entities **File** and **Host** is affected. This is due to the permanent deletion of the existing alerts matched with the Whitelist condition after enabling the config.



Delete the Whitelists

You can delete the Whitelists to start receiving the new matched alerts for the selected entities in the **Respond** > **Alerts** view. Once you delete the selected Whitelist, the new matching alerts are triggered only for the selected entities.

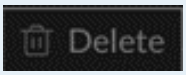
To delete the Whitelists

1. Go to **Respond** > **Whitelists**.

   The **Whitelists** view is displayed.

2. Select the Whitelist and click **Delete**.

   The confirmation window is displayed.



3. Click **Delete Whitelist**.

   The Whitelist is deleted.

Note:
- When you delete the Whitelists, only the new matching alerts are triggered. The whitelisted old alerts cannot be recovered for the selected entities.
- Analysts must have one of the following permissions to view the **Whitelists** tab in the **Respond** view:
  - **respond-server.alert.delete**
  - **respond-server.alert.read**
  - **respond-server.alert.manage**
  - **respond-server.alertrule.manage**
  - **respond-server.alertrule.read**
- Analysts must have the **respond-server.alert.read** permission to view the whitelists in **Respond** > **Whitelists** view and **respond-server.alert.manage** permission to delete the Whitelists.

Toolbar Actions

The table below lists the toolbar actions available in the Whitelists List view.

Option	Description
	Select this option and access the **Filters** panel to filter the required Whitelists.
	Select this option to delete the selected Whitelist.

Whitelists List View

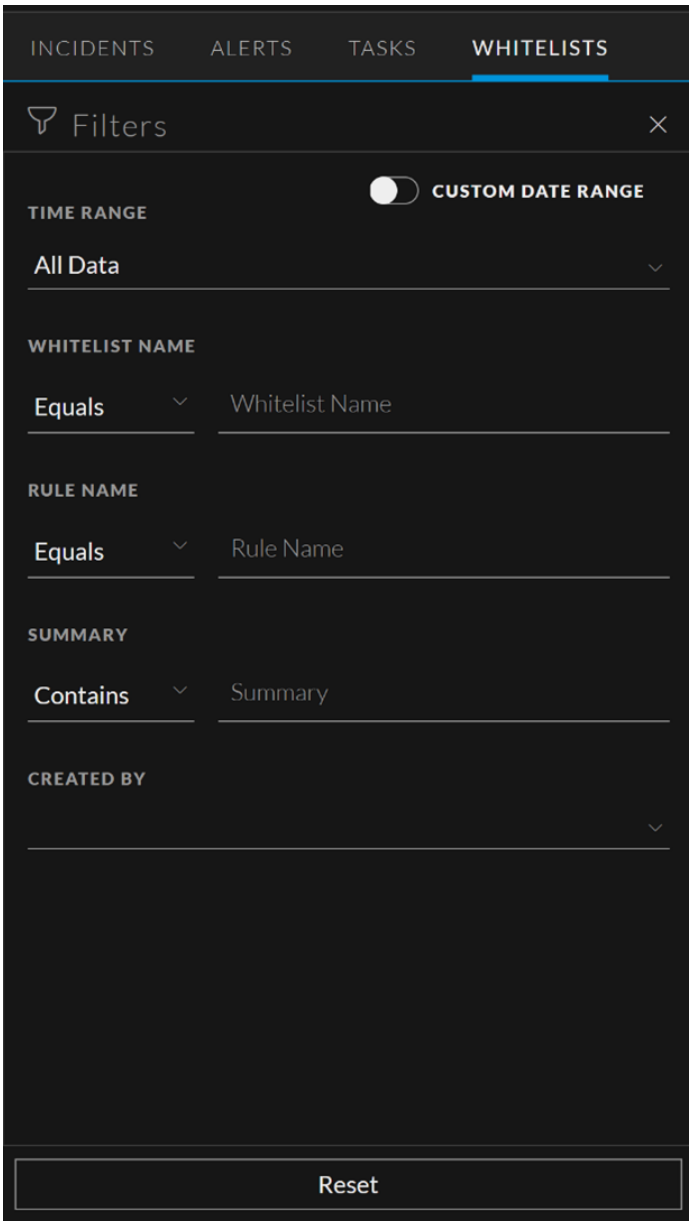
The Whitelists List view displays the list of all the Endpoint Whitelists with the Rule Name, Creation Date, and the Summary associated with the respective Whitelisted Endpoint Alerts. The view consists of a Filters panel and the Whitelists List.

Whitelists List

The Whitelists List displays all the Endpoint Whitelists in the NetWitness Platform. You can filter this list to view only the Whitelists of interest.

The following table describes the columns in the Whitelists List.

Columns	Description
Whitelist Name	Displays the name of the Whitelist you provided during the whitelisting of the selected alert.
Rule Name	Displays the rule name associated with the whitelisted alert.
Summary	Displays the details of the entities selected during the whitelisting of the selected alert. For Example: **File name: cmd.exe, Host name: win34.**
Comment	Displays the comment added during the whitelisting of the selected alert.
Created Date	Displays the Whitelist creation date and time.
Created By	Displays the name of the user who created the Whitelist.
Alerts Matched	Displays the number of new matching alerts that are not triggered for the selected entities in the **Respond** > **Alerts** view after whitelisting the selected alert.



Filters Panel

You can filter the Whitelists based on the following parameters.

- Time Range
- Whitelist Name
- Rule Name
- User who created the Whitelists
- Summary associated with the Whitelists

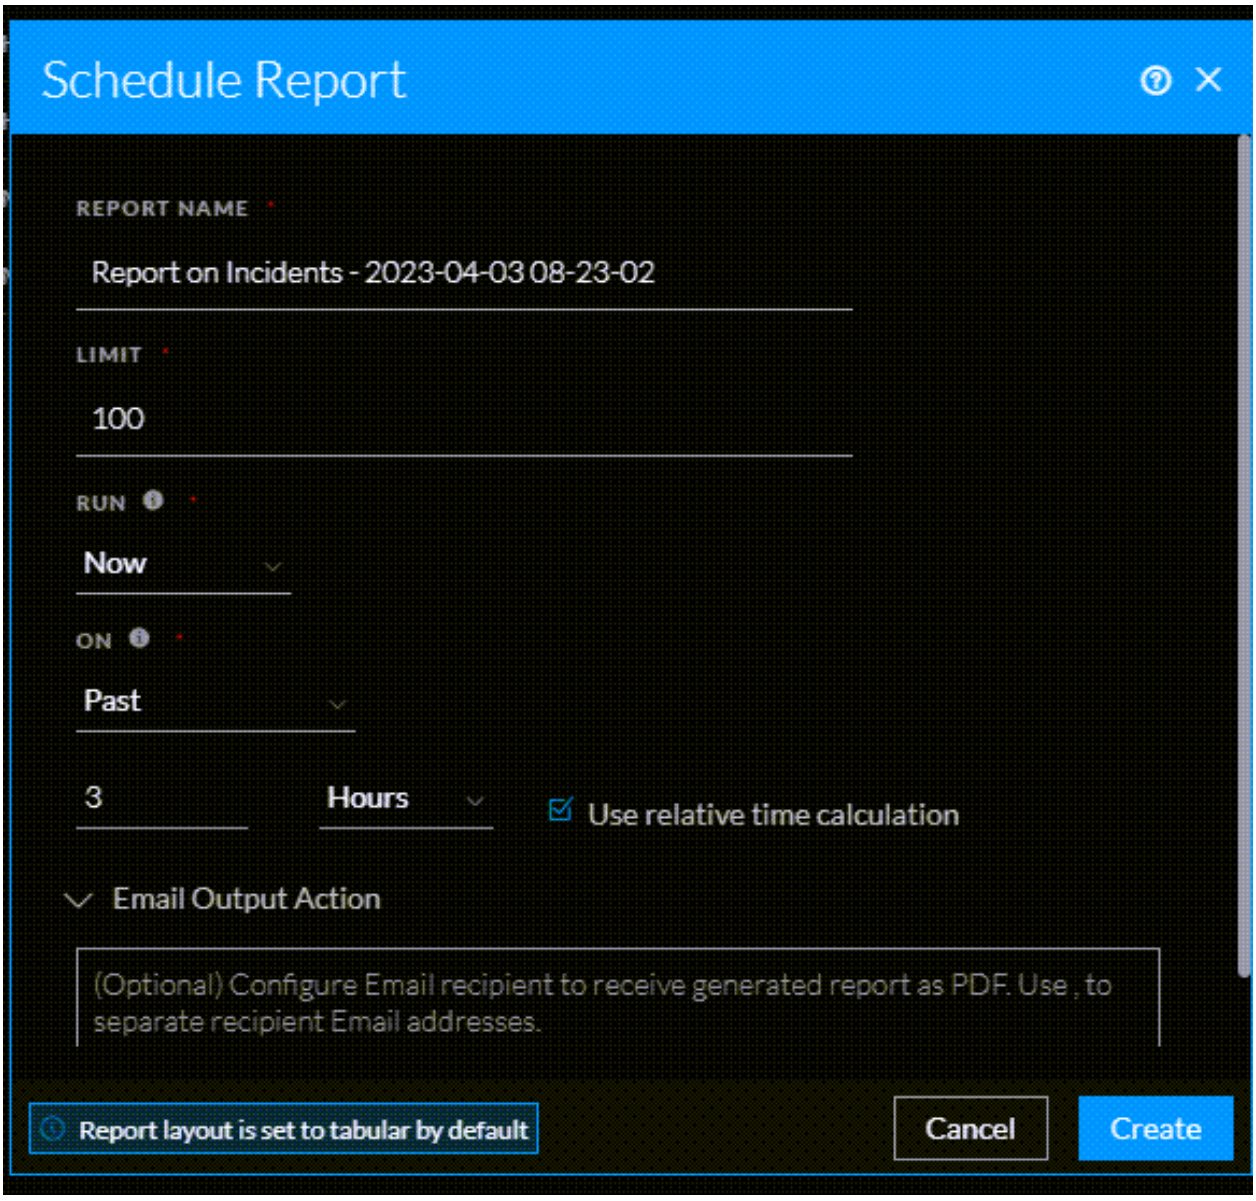
The following table lists all the fields displayed in the Whitelists List view Filters panel.

Fields	Description
Time Range	Allows you to select the required time duration and view the Whitelists created in the time duration selected. **Note:** Turn On the **Custom Date Range** Toggle to select a custom date range of your choice.
Whitelist Name	Allows you to enter the name of required Whitelist.
Rule Name	Allows you to enter the name of the rule associated with the Whitelists created.
Summary	Allows you to enter the complete value or a part of the value of the entities associated with the required Whitelist. For example: **cmd.exe** or **win34** or **analyst1**.
Created By	Allows you to filter the Whitelists on the basis of the user who created them.

Click **Reset** to remove the filters applied.

Schedule Report Dialog from Respond View

The **Schedule Report** dialog enables you to create a schedule for the report. Reports can be scheduled hourly, daily, weekly, or monthly. In order to schedule a report at a specific time or on a daily, weekly, or monthly basis, you must configure the scheduling options on the Schedule report dialog.



To access this dialog, Go to the **Respond** > **Incidents** view, add a query on the query search bar >  > **Schedule Report** from the toolbar.

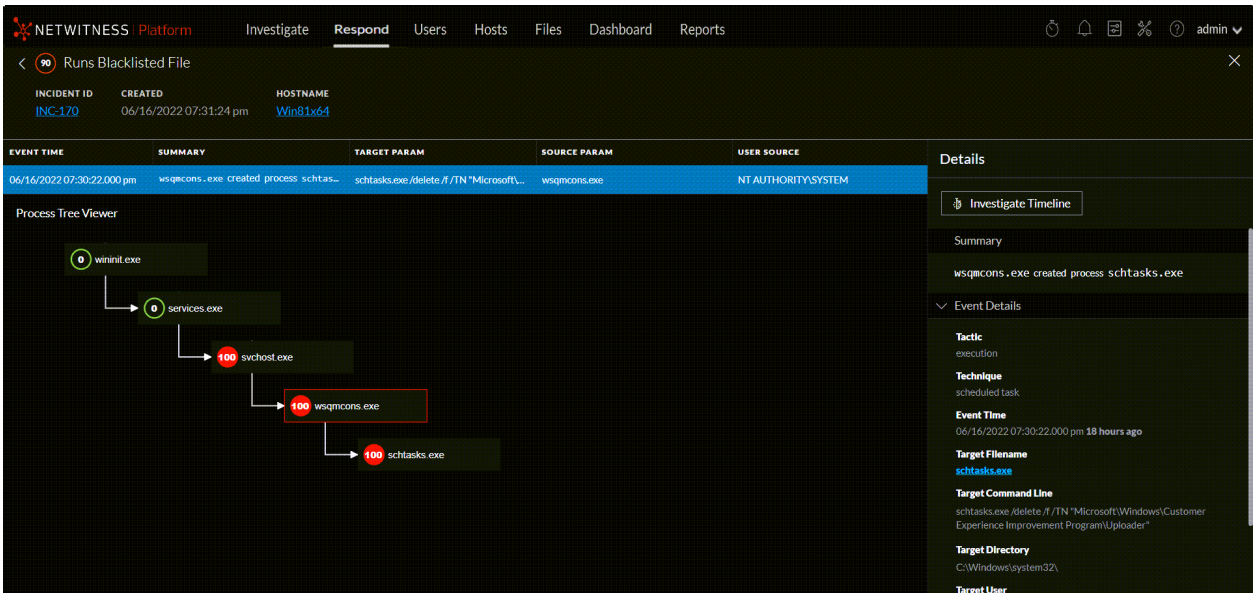
What do you want to do?

User Role	I want to ...	Show me how
Administrator / Analysts	Schedule Report	Generate Reports from Respond View

Quick Look - Schedule Report Dialog

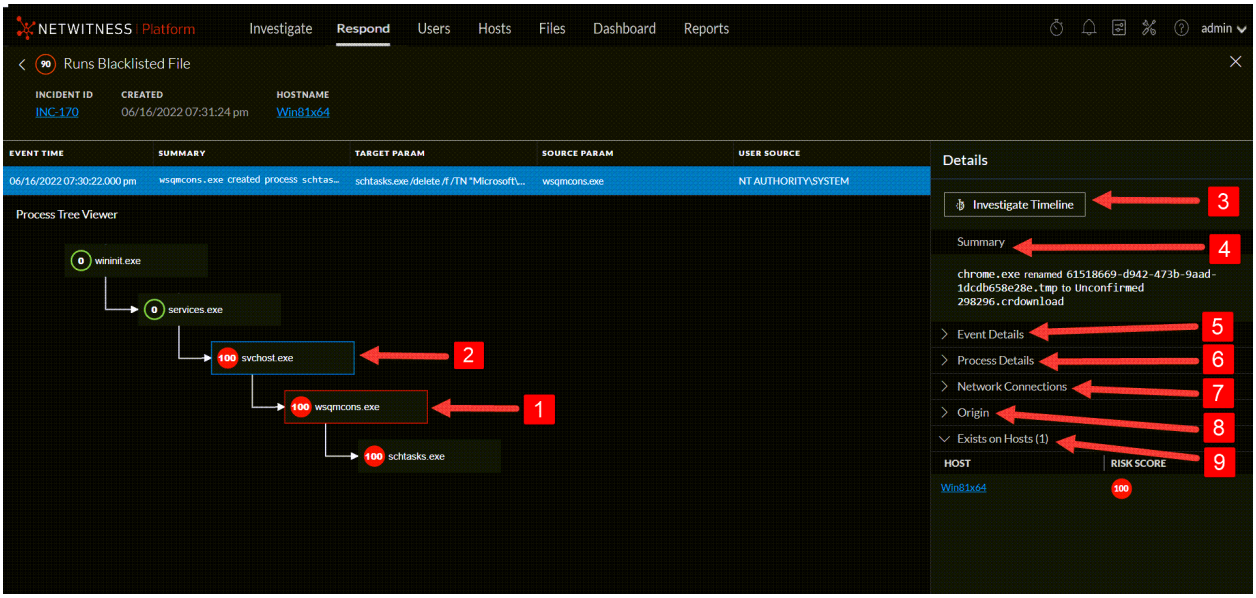
This is an example of the Schedule Report Dialog.

The following table describes the fields in the **Schedule Report Dialog** view.



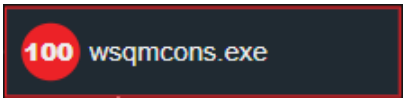
Feature	Description
Report Name	Specifies a name to identify the panel. For example, **Report on Incident - 2023-04-25 10-18-26**. You can provide a name that clearly identifies the nature of events that will be added to this report.

Feature	Description
Run	Time interval to use for running the scheduled job: • **Later**: Runs on specific date and time. • **Hourly**: Runs on a designated repeating interval. For example, if you schedule the report for 50 minutes, for every 50th minute, the report will be prepared. **Note:** A maximum of only 59 minutes can be selected. • **Daily**: Runs daily at a designated time. For example, if you schedule the report at 04:25, the report will be prepared at 04:25 AM every day. • **Monthly**: Runs on a monthly basis at a designated time and day of the month. For example, select 25 for the 25th day of the month. The report will be prepared on the 25th month of every month. **Note:** During the monthly report generation process, a message will appear if the day is greater than 28. This will notify the user that the report will be scheduled for the month containing that day.
ON	Set the frequency, duration, and time for running the report: • **Past**: You can schedule the report based on **Hours**, **Days**, **Weeks**, **Months**, and **Years**. • **Range(specific)**: You can schedule the report for a specific date and time range. **Note:** This field appears only if you select Later in the Run field. • **Range(generic)**: You can schedule the report for a generic date and time. **Note:** This field appears only if you select Later, Daily, Weekly, and Monthly in the Run field.
Use relative time calculation	The Use relative time calculation option is enabled by default, and it uses the relative time duration to schedule a report. For example, if you schedule a report to run over the past 1 hour –1h for the relative time, the time is exactly 1 hour from when the report is run. If the current time is 3 P.M., the events that occurred in the past 60 minutes or between 2 P.M. and 3 P.M. today.
Email Output Action	Specify email addresses to send the report to, separated by commas.
Create	Creates the report and closes the dialog. A message confirms that the report was scheduled successfully.
Cancel	Closes the dialog without applying changes.



Review Endpoint Alerts using Process Tree

From version 12.0.0.0 and higher, the Alert details page for Endpoint alerts will show a process tree along with the details of Summary, Event details, Process details, etc.



After you filter the Endpoint alerts in the Alerts List view, you can go to the Alert Details view for more detailed information on the Endpoint alerts, to determine the action required. An alert contains one or more events. In the Alert Details view for Endpoint alerts, you can view the alert details in the form of a process tree and additional event details, process details and much more on the right panel. The following figure shows an example of the Alert Details view for Endpoint alerts.

The process tree on the Alert Details view provides a complete picture about where the suspicious/malicious file originated including the path in the form of a process tree.

The **Details** panel on the right has more information for an alert than the Overview panel in the Alerts List view.

- The file that caused the alert is outlined in red.

- Selected file is outlined in blue.

1 - The file that caused the alert, and it is outlined in red. If you click on this file, the red outline will become blue to show it is selected.

2 - The file from which the suspicious/malicious file is originated.

3 - **Investigate Timeline** takes to the Investigate view for the selected alert.

4 - **Summary** shows a short description of the event.

5 - **Event Details** section provided a detailed information about the event that includes the Event Time, Target Filename, Tactic, Technique, Target User etc.

6 - **Process Details** section shows the Directory where the file is stored besides User name, Hash value, Risk score, Signature etc.

7 - **Network Connections** shows any network connection the selected file established since ten minutes before and till ten minutes after the alert triggered time. For example, if the alert was triggered at 16:00 hours, the network connections(if any)established by the selected file from 15:50 hours to 16:10 hours will be shown.

8 - **Origin** section shows how the selected file originated in the host.

9 - **Exists on Hosts** shows the list of hosts(with risk score) the selected file exists.

Process Details Section Values

Name	Description	Example
Tactic	Shows the tactic, as per MITRE ATT&CK frame work, this attempt falls under.	*execution*

Name	Description	Example
Technique	Shows the technique, as per MITRE ATT&CK frame work, this attempt falls under.	*masquerading*
Event Time	Shows the event occurred time.	*06/22/2022 10:14:28.000 am 8 hours ago*
Target Filename	Shows the name of file that is targeted. You can also view it in the process tree, next to the file that caused the alert.	*Unconfirmed 298296.crdownload*
Target Command Line	Shows the command line argument of the target file.	N/A
Target Directory	Shows the targeted directory.	*C:\Users\Administrator\Downloads*
Target User	Shows the user name through which the attempt was made.	*WIxxxxxx\Administrator*
Target Hash	Shows the hash value of the selected file.	*f214c48dc1daxxxx41d327c6bed1b52xxxx492573d85a305d8183eaa0222cc96*

Event Details Section Values

Value	Description	Example
File name	Shows the selected file name with extension	*iexplore.exe*
Command Line	Shows the command line name for the selected file	*IEXPLORE.EXE*
Directory	Shows the location of the selected file	*C:\Program Files\Internet Explorer*
User	Shows the user name	*WIxxxxxx\Administrator*

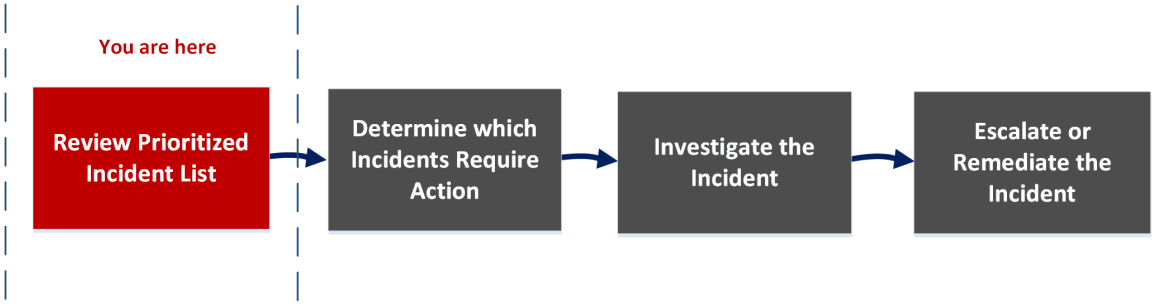
Hash	Shows the hash value of the selected file	*f214c48dc1daxxxx41d327c6bed1b52xxxx492573d85a305d8183eaa0222cc96*
Risk Score	Risk score of the selected file	*100*
Signature	Shows whether the selected file is signed or not	*microsoft,signed,valid*
Reputation Status	Shows the reputation of a file hash	*Suspicious*
File Status	Shows the file status for the selected file	*Blacklist*

Note: The process tree will be invisible if you drag it to the right end of the screen. Refresh the page to reload the process tree.

NetWitness Respond Reference Information

The Respond view user interface provides access to NetWitness Respond functions. This topic contains descriptions of the user interfaces as well as other reference information to help users understand the functions of NetWitness Respond.

Topics



- Incidents List View
- Incident Details View
- Alerts List View
- Alert Details View
- Tasks List View
- Whitelists List View
- Add/Remove from List Dialog
- Context Lookup Panel - Respond View

Incidents List View

The Incidents List view (Respond > Incidents) shows Incident Responders and other Analysts a prioritized results list of incidents created from various sources. For example, your results list could show incidents created from ESA rules or NetWitness Endpoint. From the Incidents List view, you have easy access to the information that you need to quickly triage and manage incidents through completion.

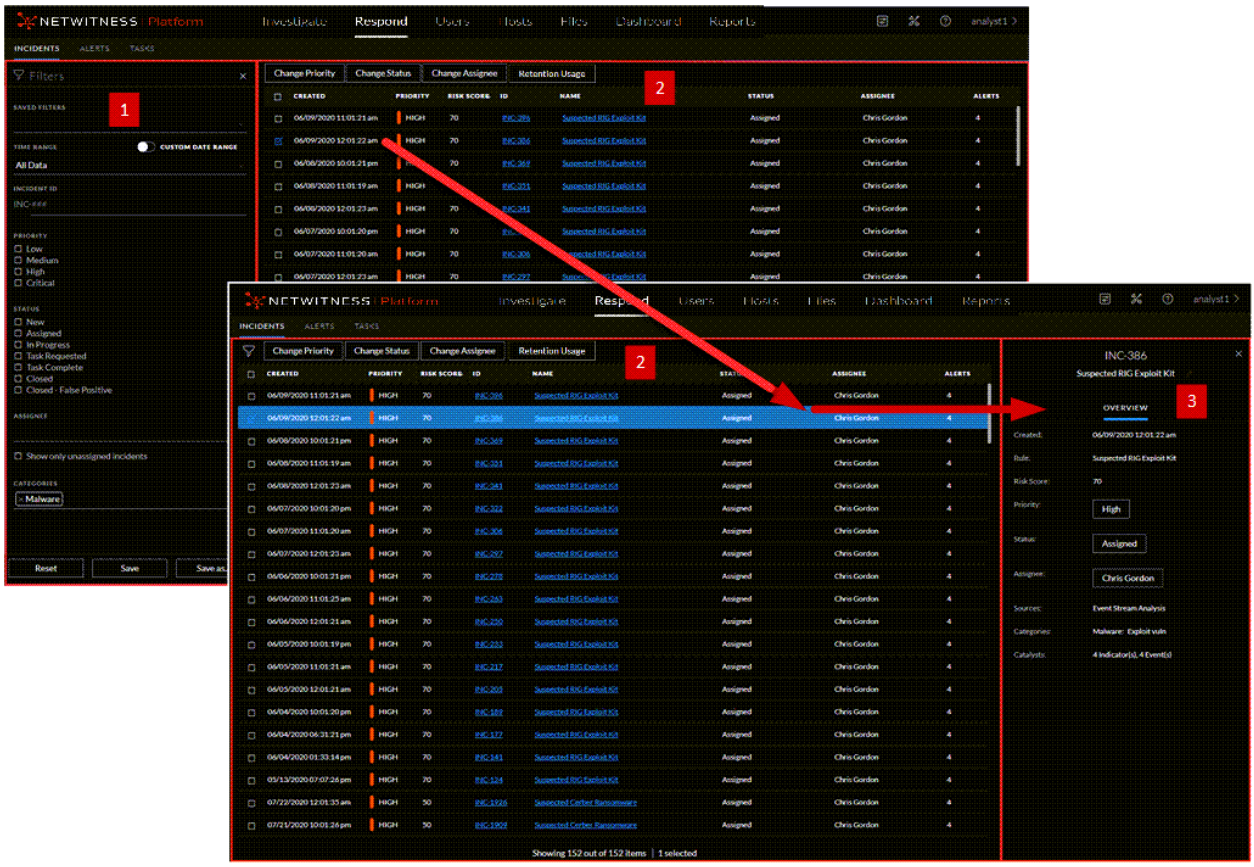
Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in NetWitness.

In the Incidents List view, you can review the list of prioritized incidents, which shows basic information about each incident. You can also change the assignee, priority, and status of the incidents. Because the results can be large in the incidents list, you have the option to filter those incidents by time range, incident ID, custom date range, priority, status, assignee, and categories.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts, and SOC Manager	View prioritized incidents*	Review Prioritized Incident List
Incident Responders, Analysts, and SOC Manager	Filter and sort the incident list*	Filter the Incident List
Incident Responders, Analysts	View my incidents*	View My Incidents
Incident Responders, Analysts	Assign incidents to myself*	Assign Incidents to Myself
Incident Responders, Analysts, and SOC Manager	Find Incidents*	Find an Incident
Incident Responders, Analysts, and SOC Manager	Send an incident to Archer Cyber Incident & Breach Response or update an incident.*	Escalate or Remediate the Incident
Incident Responders, Analysts	View incident details.	Determine which Incidents Require Action
Incident Responders, Analysts	Further Investigate an incident.	Investigate the Incident
Incident Responders, Analysts, and SOC Manager	Create a task.	Escalate or Remediate the Incident



*You can complete these tasks here (that is, in the Incidents List view).

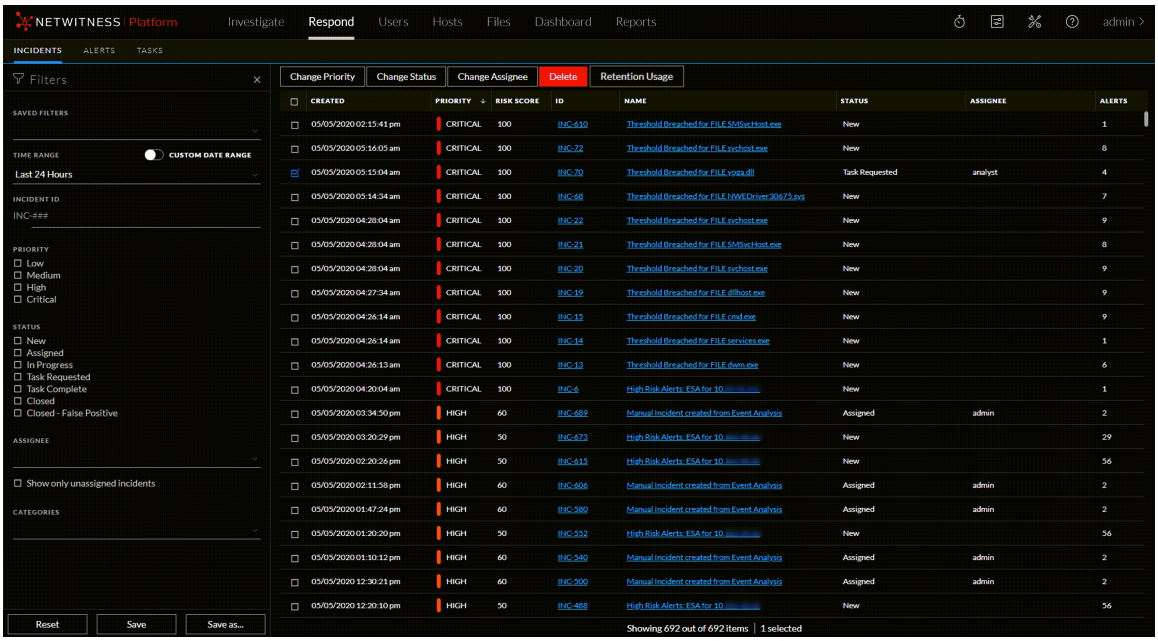
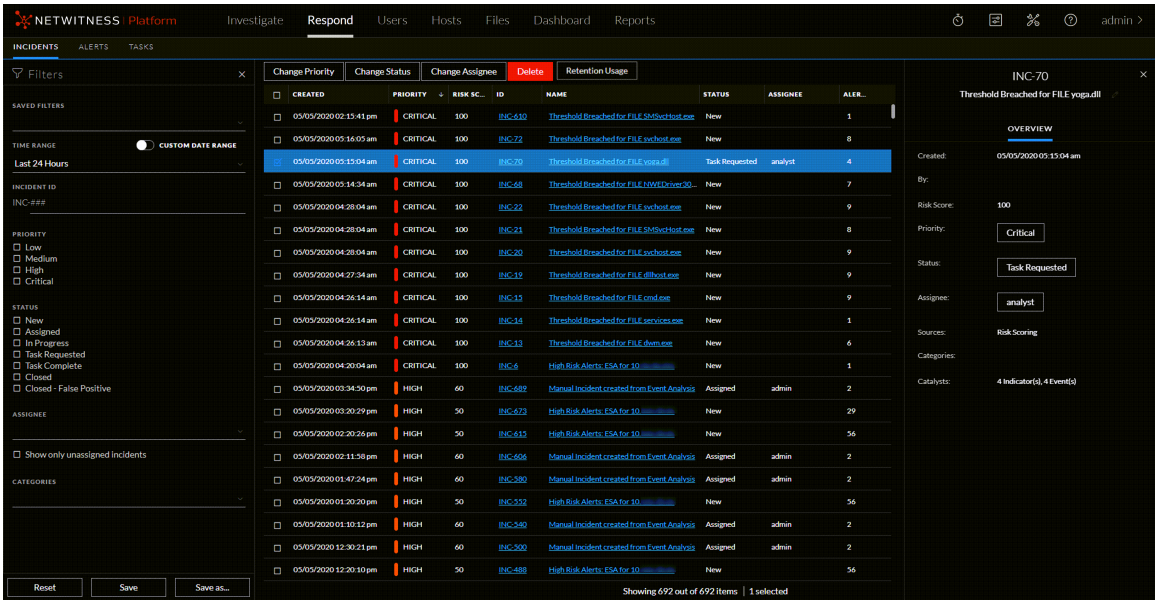
Quick Look

The following example shows the initial Incidents List view with the Filter panel. You can open the Overview panel for an incident by clicking an incident in the Incident List.



1 Filters Panel
2 Incidents List
3 Overview Panel

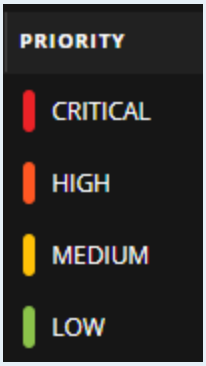
You can go directly to the Incident Details view from the Incidents List by clicking the hyperlinked ID or NAME. The Overview panel is also available in the Incident Details view. For more information about the Incidents Details view, see Incident Details View.



Incidents List View

To access the Incidents List view, go to **Respond > Incidents**. The Incidents List view displays a list of all incidents. The Incidents List view consists of a Filters panel, an Incidents List, and an Incidents Overview panel.

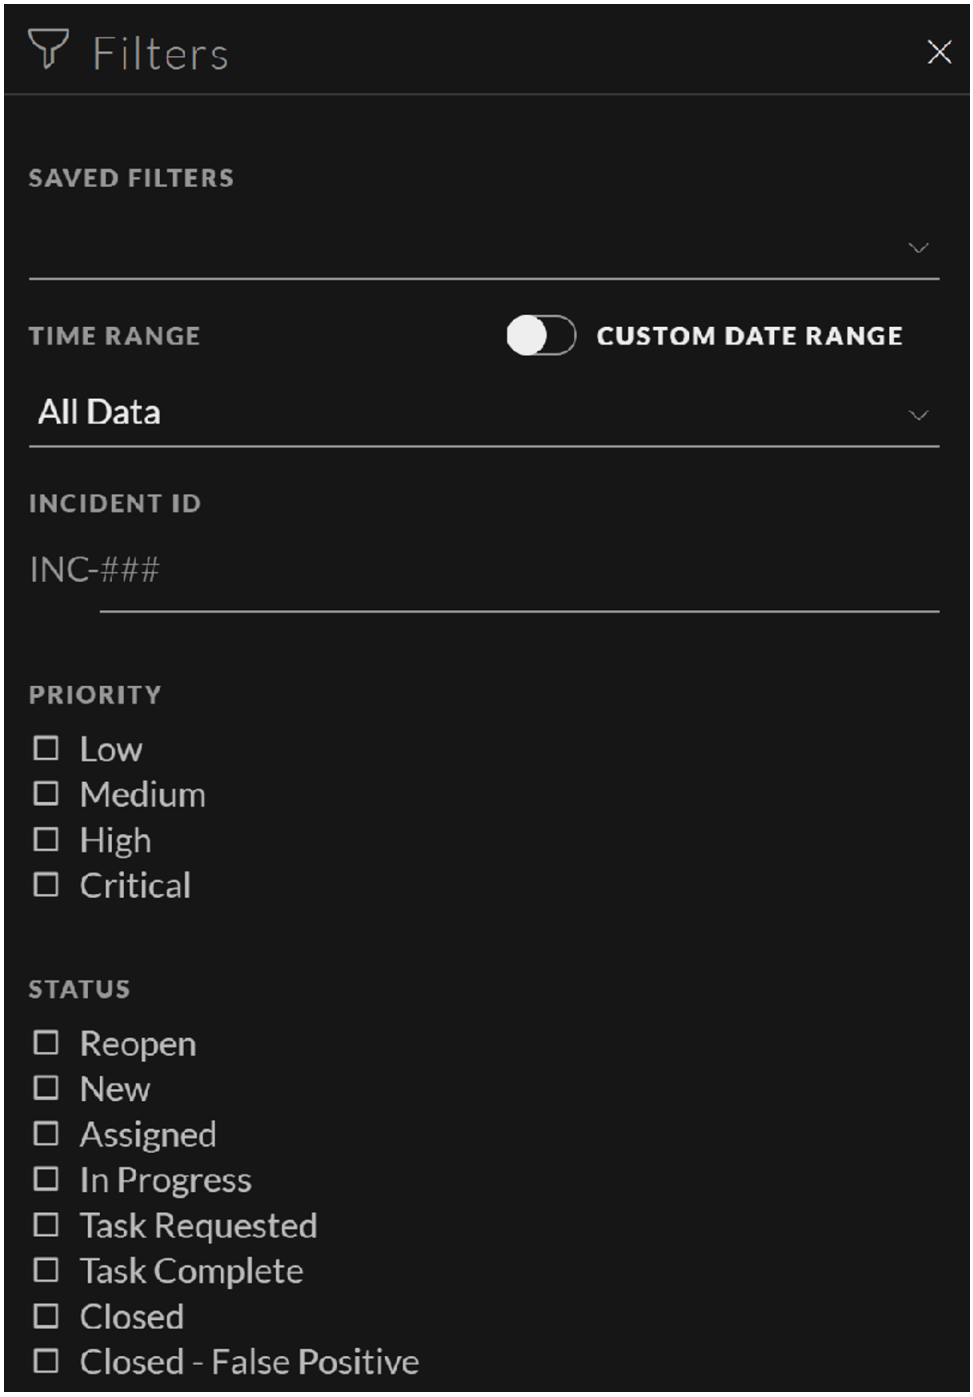
The following figure shows the Filter Panel on the left and the Incidents List on the right.



The following figure shows the incident Overview panel on the right.

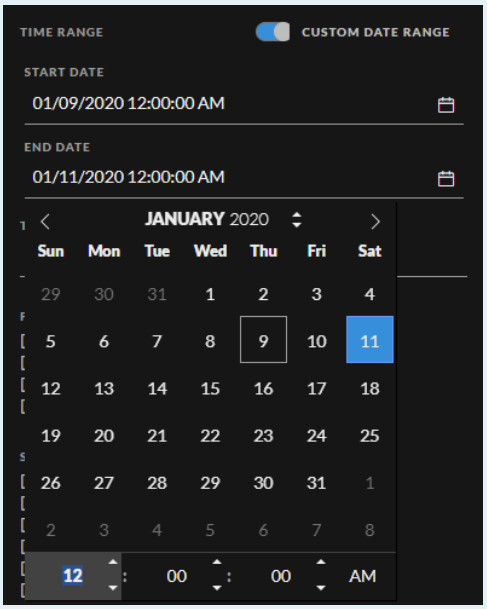
Incidents List

The Incidents List shows a list of all of the prioritized incidents. You can filter this list to show only incidents of interest.



Column	Description
Created	Shows the creation date of the incident.

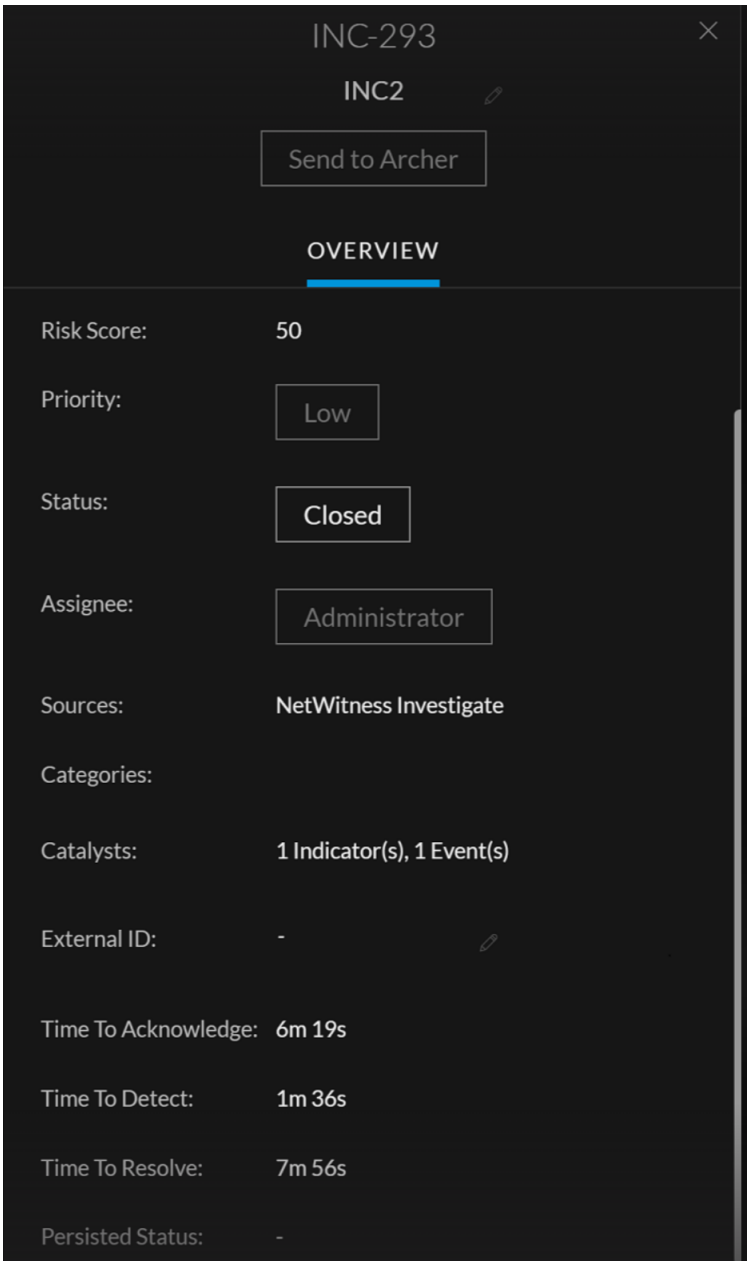
Column	Description
Priority	Shows the incident priority. Priority can be Critical, High, Medium, or Low. The Priority is color coded, where red indicates a **Critical** incident, orange represents a **High** risk incident, yellow indicates a **Medium** risk incident, and green represents a **Low** risk incident. For example: 
Risk Score	Shows the incident risk score. The risk score indicates the risk of the incident as calculated by an algorithm and is between 0-100. 100 is the highest risk score.
ID	Shows the automatically created incident number. Each incident is assigned a unique number that you can use to track the incident.
Name	Shows the incident name. The incident name is derived from the rule used to trigger the incident. Click the link to go to the Incident Details view for the selected incident.
Status	Shows the incident status. The status can be: Reopen, New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed-False Positive.
Assignee	Shows the team member currently assigned to the incident.
Alerts	Shows the number of alerts associated with the incident. An incident may include many alerts. A large number of alerts might mean that you are experiencing a large-scale attack.



At the bottom of the list, you can see the number of incidents on the current page, the total number of incidents, and the number of incidents selected. For example: **Showing 1000 out of 2517 items | 2 selected**. The maximum number of incidents that you can view at one time is 1,000.

Incident Filters Panel

The following figure shows the filters available in the Filters panel.



The Filters panel, on the left of the Incidents List view, has options that you can use to filter the incidents list. When you navigate away from the Filters panel, the Incidents List view retains your filter selections.

Option	Description
Saved Filters	You can select a saved filter to filter the incident list. Saved filters are global. You can save a filter for other analysts to use and you can use any saved filter. Saved filters are also available for use on the Springboard landing page. Filters used in the Springboard cannot be deleted. (This option is available in NetWitness Platform 11.5 and later.)
Time Range	You can select a specific time period from the Time Range drop-down list. The time range is based on the received date of the alerts. For example, if you select Last Hour, you can see alerts that were received within the last 60 minutes.
Custom Date Range	You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar. 
Incident ID	Type the number of the incident that you would like to locate. For example, for INC-1050, type only the number "1050" to view the incident.
Priority	Select the priorities that you would like to view.
Status	Select one or more incident statuses. For example, select Closed - False Positive to view only false positive incidents, which were initially identified as suspicious, but then they were later found to be safe.

Option	Description
Assignee	Select the assignee or assignees of the incidents that you would like to view. For example, if you only want to view the incidents assigned to Cale or Stanley, select Cale and Stanley from the Assignee drop-down list. If you want to view incidents regardless of the assignee, do not make a selection under Assignee. (Available in NetWitness Version 11.1 and later) To view only unassigned incidents, select **Show only unassigned incidents**.
Categories	Select one or more categories from the drop-down list. For example, if you only want to view incidents classified with the Backdoor or Privilege abuse categories, select Backdoor and Privilege abuse.
Sent to Archer	(In NetWitness Version 11.2 and later, if Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and this option will be available in NetWitness Respond.) To view incidents that were sent to Archer, select **Yes**. For incidents that were not sent to Archer, select **No**.
Reset	Removes your filter selections. If you reset filters on a saved filter, it takes you to the default empty filter.
Save	Saves the currently applied incidents filter or updates a saved filter. For a new filter, choose a unique name that contains 1-256 alphanumeric characters, underscores, or hyphens. (This option is available in NetWitness Platform 11.5 and later.)
Save As	Saves the currently applied incidents filter for future use. Choose a unique name that contains 1-256 alphanumeric characters, underscores, or hyphens. (This option is available in NetWitness Platform 11.5 and later.)

Incident Overview Panel

The Overview panel shows basic summary information about a selected incident. From the Incidents List, you can click an incident to access the Overview panel. The Overview panel in the Incident Details view contains the same information.

The following table lists the fields displayed in the Incident Overview panel.

Field	Description
<Incident ID>	Displays the Incident ID.

Field	Description
Send to Archer / Sent to Archer	(In NetWitness Version 11.2 and later, if Archer is configured as a data source in Context Hub, you can escalate incidents to Archer Cyber Incident & Breach Response and this option will be available in NetWitness Respond.) Shows whether the incident was sent to Archer Cyber Incident & Breach Response: • **Send to Archer**: The incident was not sent to Archer. You can click the **Send to Archer** button to send the incident to Archer Cyber Incident & Breach Response for additional processing. This action is not reversible.  • **Sent to Archer**: The incident was sent to Archer Cyber Incident & Breach Response for additional analysis and action. 
<Incident Name>	Displays the name of the incident. You can click the incident name to change it. For example, rules can create many incidents with the same name. You can change the incident names to be more specific.
Created	Shows the creation date and time of the incident.
Rule / By	Shows the name of the rule that created the incident or the name of the person who created the incident.
RiskScore	Shows a value between 0 and 100 that indicates the risk of the incident as calculated by an algorithm. 100 is the highest risk score.
Priority	Shows the incident priority. Priority can be Critical, High, Medium or Low. To change the priority, you can click the Priority button and select a new priority from the drop-down list.
Status	Shows the incident status. The status can be Reopen, New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed - False Positive. To change the status, you can click the Status button and select a new status from the drop-down list.
Assignee	Shows the team member currently assigned to the incident. To change the assignee you can click the Assignee button and select a new assignee from the drop-down list.

Field	Description
Sources	Displays the data sources used to locate the suspicious activity.
Categories	Displays the categories of the incident events.
Catalysts	Displays the count of indicators that gave rise to the incident.
External ID	Allows storing the Incident ID referrals from a different platform. **Note:** Click **Send to Archer** to generate the External ID. The ID generated is automatically stored as External ID.
Time to Acknowledge	Displays the time taken to assign an Incident after creating it.
Time to Detect	Displays the time taken for completing the task after the Incident is assigned.
Time to Resolve	Displays the time taken for closing the task after the Incident is created.
Persisted Status	Displays the persist status of the Incident. The status can be Complete, Partial, or None (-).

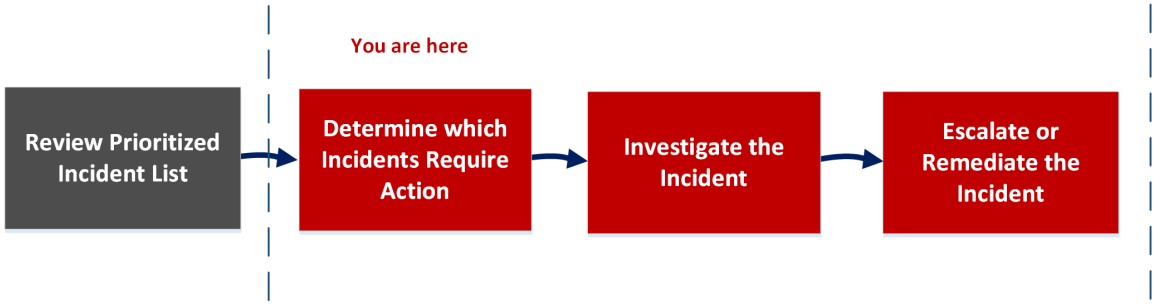
Toolbar Actions

This table lists the toolbar actions available in the Incidents List view.

Option	Description
	Enables you to open the Filters panel so that you can specify the incidents that you would like to see in the Incidents List.
	Closes the panel.
Change Priority button	Allows you to change the Priority of one or more selected incidents in the Incidents List.
Change Status button	Allows you to change the Status of one or more selected incidents.
Change Assignee button	Allows you to change the Assignee of one or more selected incidents.
Delete button	Allows you to delete the selected incidents if you have the appropriate permissions, such as an Administrator or Data Privacy Officer.

Option	Description
Retention Usage button	Allows an analyst to fetch all the stats of all the configured services and the percentage used by the pinned cache directories.

Incident Details View



In the Incident Details view (Respond > Incidents > click an ID or NAME hyperlink in the Incidents List), you can view and access extensive incident details. The Incident Details view contains multiple panels that provide the following benefits:

- **Overview**: View an incident summary and update the incident.
- **Indicators**: View the indicators (alerts) involved in the incident, the events within those alerts, and available enrichment information. You can also access Event Analysis details for some events and perform event reconnaissance.
- **Related Indicators**: View indicators (alerts) that are related to the incident and add them to the incident if they are not associated with an incident.
- **History**: View all the actions performed by the user on any incident.
- **Nodal Graph**: Visualize the size and interactions between entities (IP address, MAC address, user, host, domain, file name, or file hash).
- **Events List**: Study the events associated with the incident.
- **Journal**: Add notes and collaborate with other analysts.
- **Tasks**: Create incident tasks and track them to closure.

You can also filter the data in the Incident Details view to study indicators and entities of interest.

Workflow

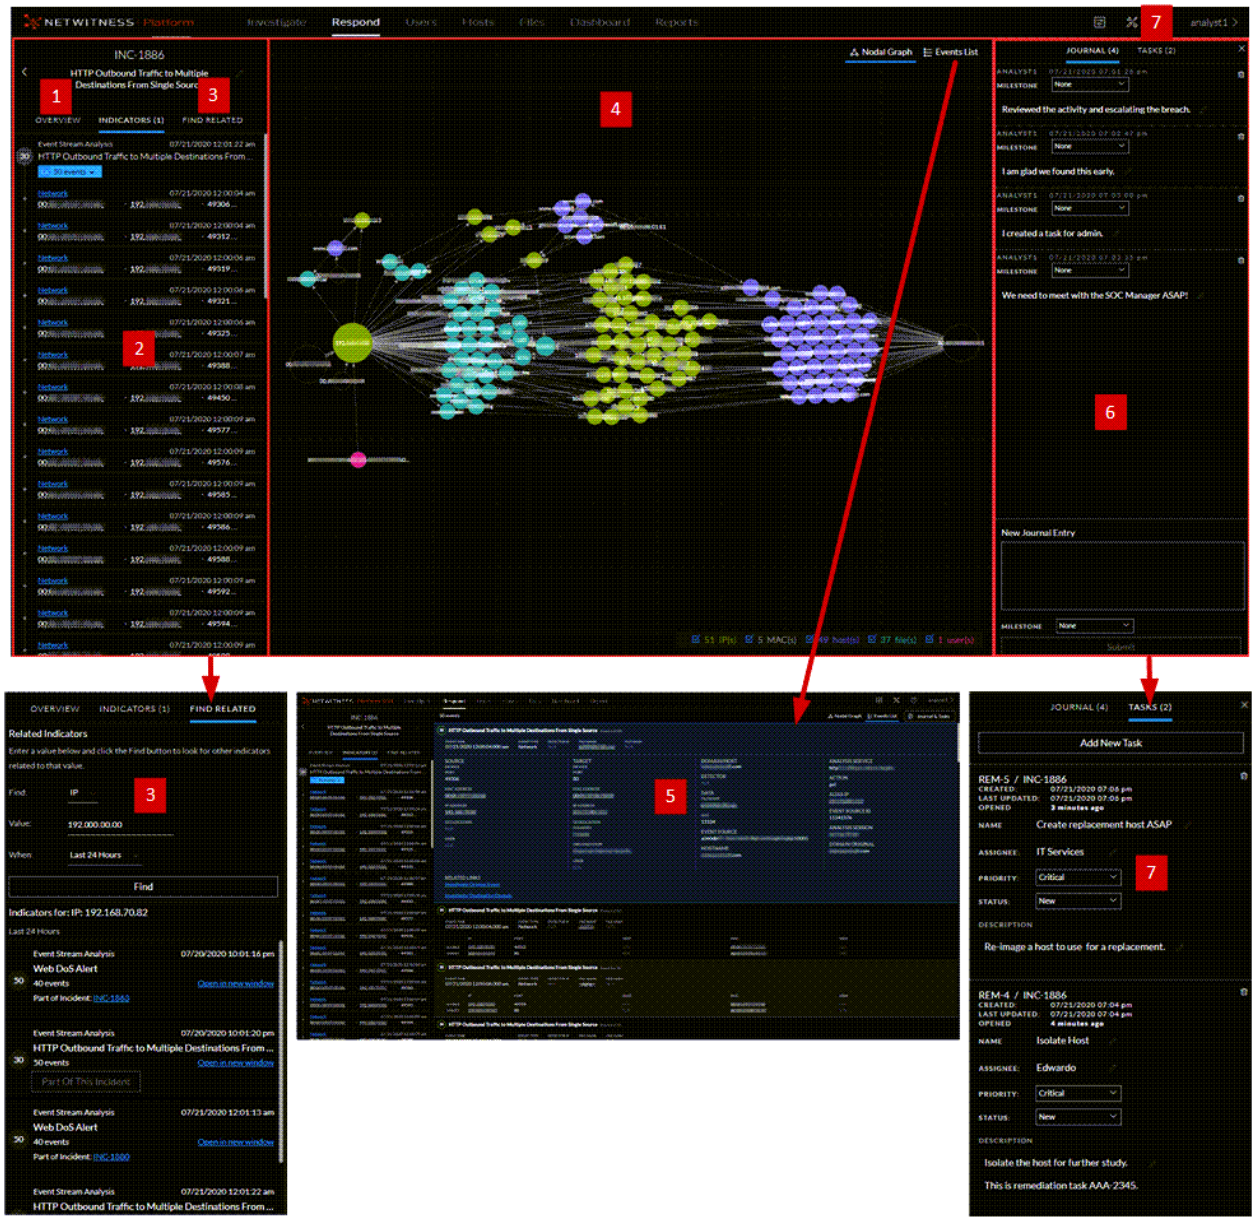
This workflow shows the high-level process that Incident Responders use to respond to incidents in NetWitness.

In the Incident Details view, you can use the extensive information provided about the incidents to determine which incidents require action. You also have the tools and information to investigate the incident, and then escalate or remediate it.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts, and SOC Manager	View prioritized incidents, filter and sort the incident list, find incidents, view my incidents, and assign incidents to myself.	Review Prioritized Incident List
Incident Responders, Analysts	View incident details.*	View Incident Details
Incident Responders, Analysts	View alerts and enrichments.*	View the Indicators and Enrichments
Incident Responders, Analysts	View events.*	View and Study the Events
Incident Responders, Analysts (Additional permissions required)	View event analysis for an event.*	View Event Analysis Details for Indicators
Incident Responders, Analysts	View a graph of the entities involved in the events.*	View and Study the Entities Involved in the Events on the Nodal Graph
Incident Responders, Analysts	Filter the incident data.*	Filter the Data in the Incident Details View
Incident Responders, Analysts	View and add incident notes.*	View Incident Notes and Document Steps Taken Outside of NetWitness
Incident Responders, Analysts	View and create tasks.*	View the Tasks Associated with an Incident and Create a Task
Incident Responders, Analysts	Add related alerts and add them to the incident.*	Find Related Indicators and Add Related Indicators to the Incident
Incident Responders, Analysts	View contextual information about an incident from Context Hub.*	View Contextual Information
Incident Responders, Analysts	Reduce false positives by adding an entity to a whitelist.*	Add an Entity to a Whitelist
Incident Responders, Analysts	Pivot to NetWitness Investigate.*	Pivot to the Investigate > Events View
Incident Responders, Analysts	Pivot to NetWitness Endpoint.*	Pivot to NetWitness Endpoint Thick Client
Incident Responders, Analysts, and SOC Manager	Send an incident to Archer Cyber Incident & Breach Response.*	Send an Incident to Archer

Role	I want to ...	Show me how
Incident Responders, Analysts	Update or close an incident.*	Update an Incident and Close an Incident
Incident Responders, Analysts, and SOC Manager	View all tasks.	Escalate or Remediate the Incident
Incident Responders, Analysts, and SOC Manager	Bulk update incidents and tasks.	Escalate or Remediate the Incident



*You can complete these tasks here (that is, in the Incident Details view).

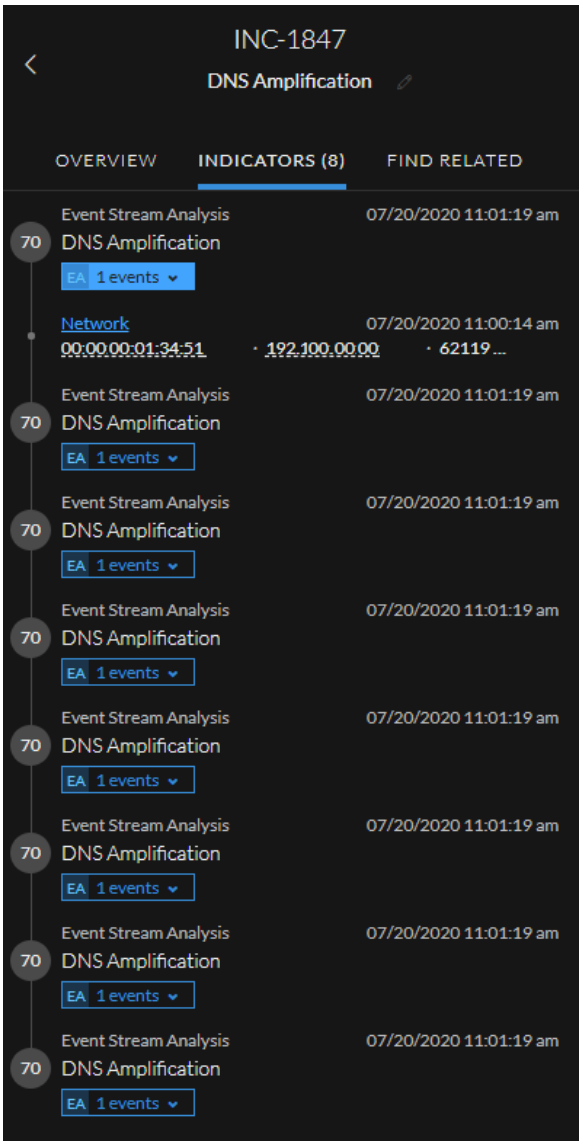
9	UEBA (Click a User Entity Behavior Analytics hyperlink in the Indicators panel to view UEBA.)
10	History Panel

Note: Your Incident Details view may not look like these diagrams because the layout changed in NetWitness 11.3.2 and later versions.
The Related tab is renamed as the Find Related tab and is located on the left-side panel.
The journal is open by default on the right-side panel. When the journal is closed, the Journal & Tasks button enables easy access to notes and tasks.

Overview Panel

The Overview panel shows basic summary information about a selected incident. It also allows you to change the incident name and update the incident priority, status, and assignee. The Overview panel in the Incidents List view contains the same information. The Incidents List view Incident Overview Panel topic provides details.



To view the Overview panel in the Incident Details view, click the **Overview** tab in the left panel.

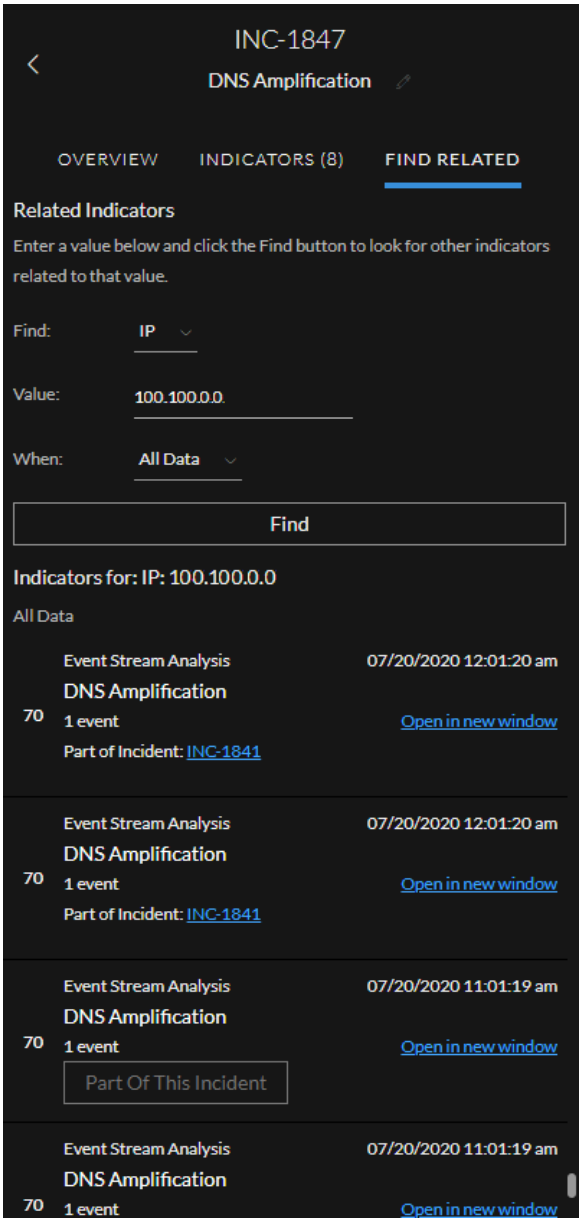
Persisted Status: -

Indicators Panel

The Indicators panel contains a chronological listing of indicators. *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert. (This is different than a timeline, which provides a visual representation of the timing of the events in the incident). This listing helps you to connect indicators and notable data. For example, an IP address connected to a command and communication ESA alert might also have triggered a NetWitness Endpoint alert or other suspicious activities.

To view the Indicators panel, in the left panel of the Incident Details view, click the **Indicators** tab.



Data source information is shown below the names of the indicators. You can also see the creation date and time of the indicator and the number of events in the indicator. In the Indicators panel, you can drill deeper into the events associated with the listed indicators to get a better understanding of the events.

Note: The maximum number of indicators (alerts) displayed in the Indicators panel is 1,000.

Related Indicators Panel

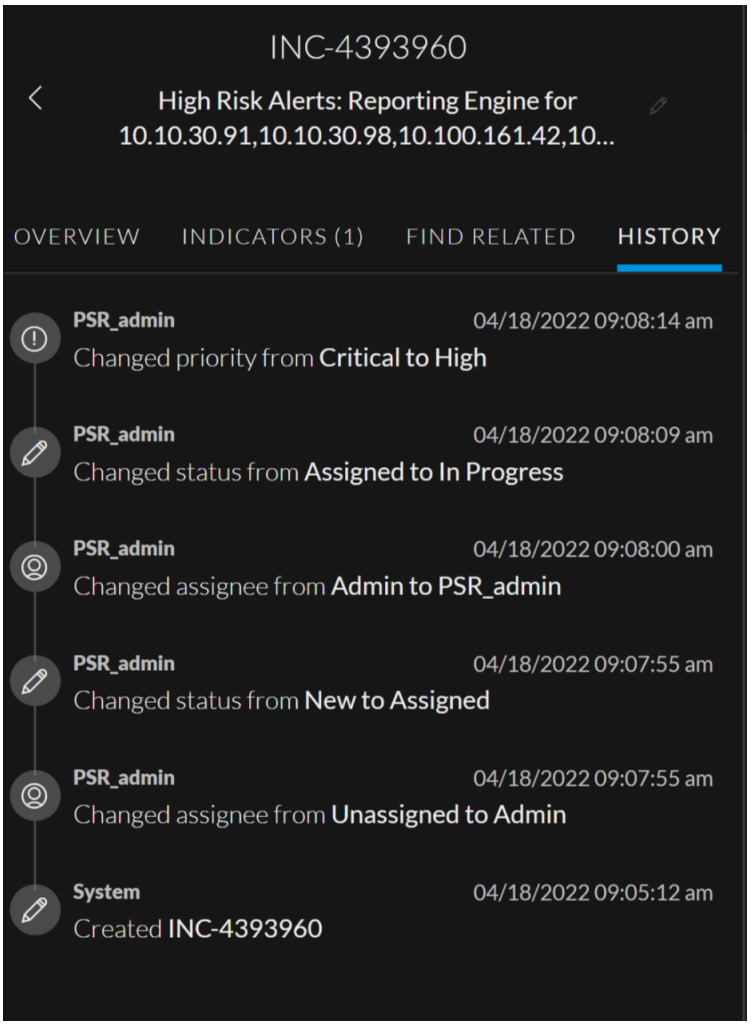
The Related Indicators panel enables you to search the NetWitness alerts database to find alerts that are related to this incident. You can add alerts that you find to the incident if they are not already associated with an incident.

To view the Related Indicators panel, in the left panel of the Incident Details view, click the **Find Related** tab.

The following table describes the fields in the search section at the top of the panel.

Field	Description
Find	Select the entity that you would like to locate in the alerts. For example, IP.
Value	Type the value of the entity. For example, type the actual IP address of the entity.
When	Select a time range to search for the alerts. For example, Last 24 hours.
Find button	Initiates the search. A list of related indicators appear below the **Find** button in the **Indicators for** section.

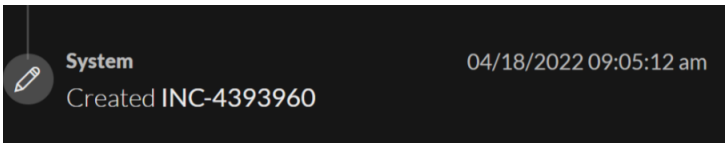
The following table describes the options in the **Indicators for** (results) section at the bottom of the panel.



Option	Description
Indicators For:	Shows the search results.
Open in new window link	Shows alert details for the indicator.
Add To Incident button	Adds the related indicator to the incident. The related indicator adds to the Indicators panel.
Part Of This Incident button	Shows that the indicator is already part of the incident.

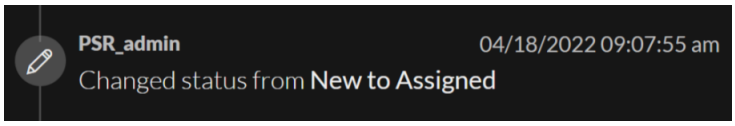
History Panel

The History panel displays every action performed by the user on an incident. The various actions performed on an incident are as shown below



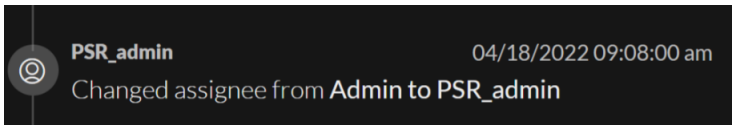
- Incident Assignee Change
- Incident Status Change
- Incident Priority Change
- Incident Creation

Every time a user performs an action on an incident, the date and time also gets recorded and is displayed in the panel. Consider the following example

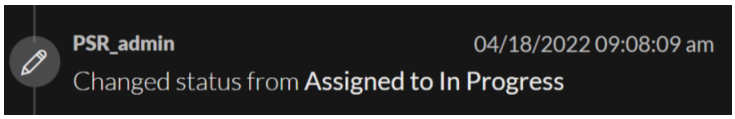


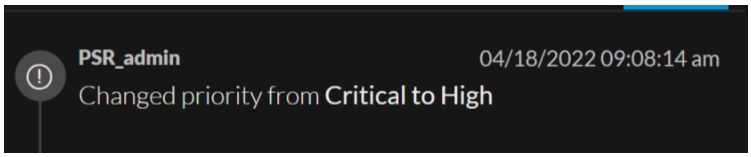
The different actions performed by the user are described below

- In this example, the Incident INC-4393960 was created by the user (System) on 18/04/2022 at 09:05:12 am.



- After the incident creation, PSR_admin assigned the incident to Admin on 18/04/2022 at 09:07:55 am. Hence, the status of the incident is changed from New to Assigned.

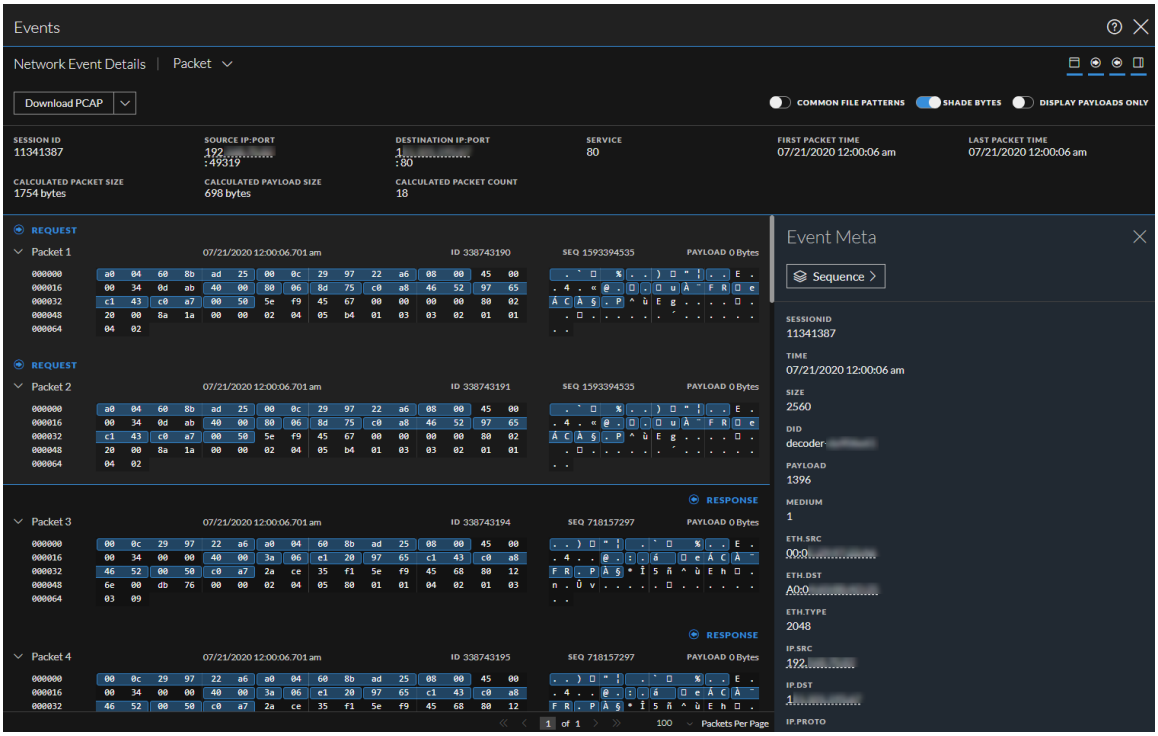




- Later, PSR_admin changed the Incident assignee from Admin to PSR_admin on 18/04/2022 at 09:08:00 am.

- After changing the assignee, PSR_admin changed the Incident status from Assigned to In Progress on 18/04/2022 at 09:08:09 am.

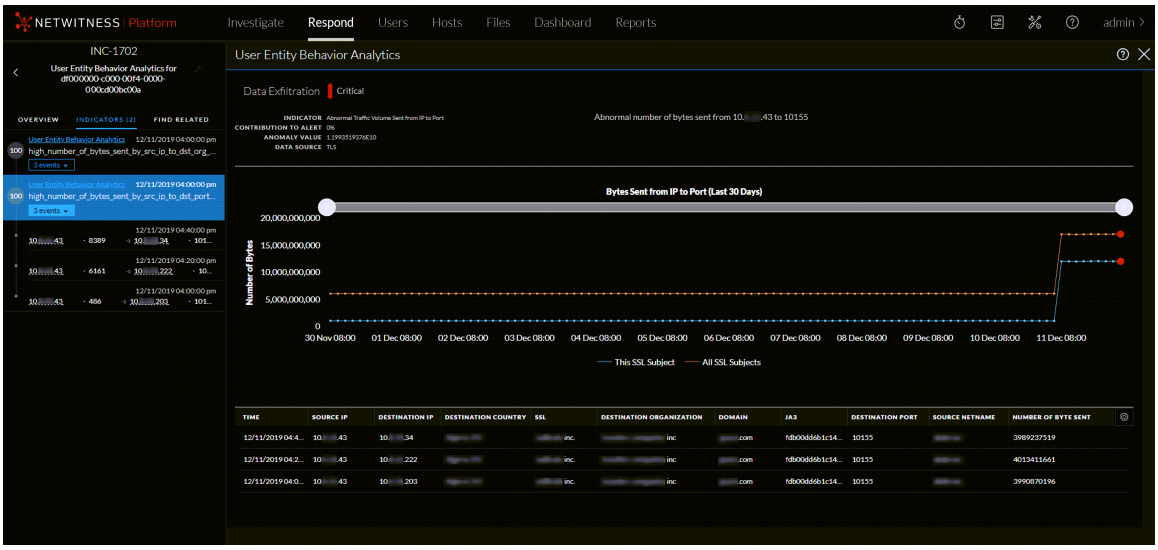
- Later, the Incident priority was changed from Critical to High on 18/04/2022 at 09:08:14 am by PSR_admin.



Events

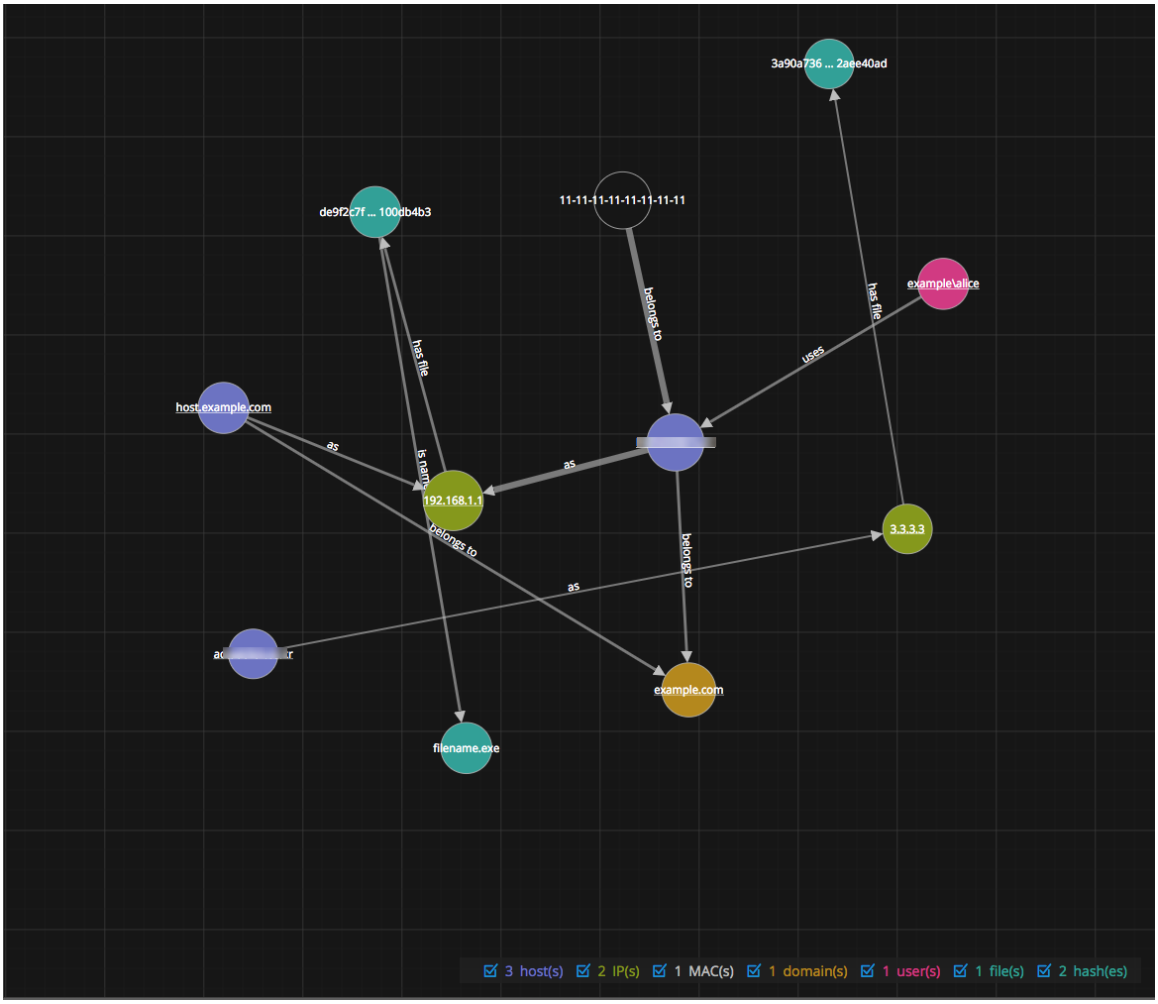
You can perform an event analysis from the Indicators panel. Event counts preceded by an **EA** (event analysis) icon have event reconnaissance information available: 

. You can select an event type hyperlink, such as Network, to access the Events panel for the selected event.

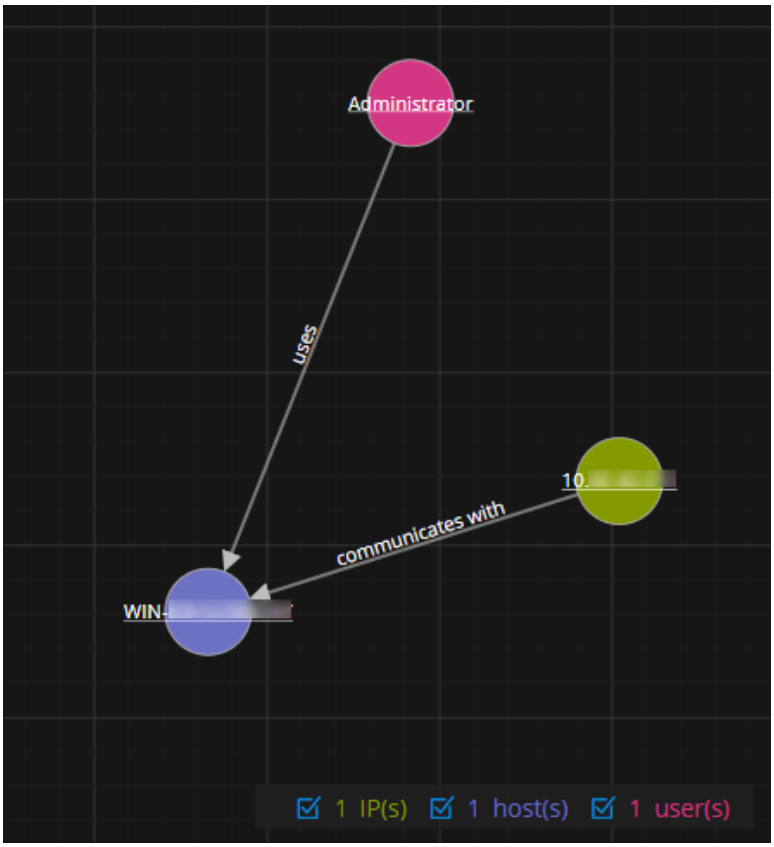


In the Events panel, you can view raw events and metadata with interactive features that enhance your ability to find meaningful patterns in the data. You can examine network, log, and endpoint events. The Events panel in the Respond view shows the Events view from Investigate for specific indicator events. For detailed information about the Events view, see the *NetWitness Investigate User Guide*.

Note: Migrated incidents from NetWitness versions before 11.2 will not show the Events panel in the Respond Incident Details view Indicators panel. Likewise, if you use alerts that were migrated from versions before 11.2 to create incidents in 11.5, you will also not be able to view the Events panel in the Respond view for those incidents.



User Entity Behavior Analytics

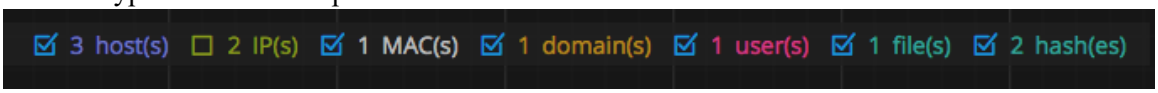


NetWitness UEBA (User and Entity Behavior Analytics) is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all users and entities in your network environment. You can access UEBA from the Respond Incident Details view Indicators panel. Indicators with a **User Entity Behavior Analytics** hyperlink have additional UEBA information available. For detailed information about UEBA, see the *NetWitness UEBA User Guide*.

Nodal Graph

The nodal graph is an interactive graph that shows the entities involved in the incident. An *Entity* is represented by an IP address, MAC address, user, host, domain, file name, or file hash.

Nodes



In the nodal graph, circles represent nodes. The following table describes the nodal graph node types.

Node	Description
IP address	If the event is a detected anomaly, you can see a Detector IP. If the event is a transaction, you can see a Destination IP and a Source IP.
MAC address	You may see a MAC address for each type of IP address.
User	If the machine is associated with a user, you can see a user node.
Host	A host can be physical equipment or a virtual machine, designated by a Fully Qualified Domain Name (FQDN) or IP address, on which any service is installed.
Domain	If a host is associated with a domain, you can see a domain node.
Filename	If the event involves files, you can see a filename.
File Hash	If the event involves files, you may see a file hash.

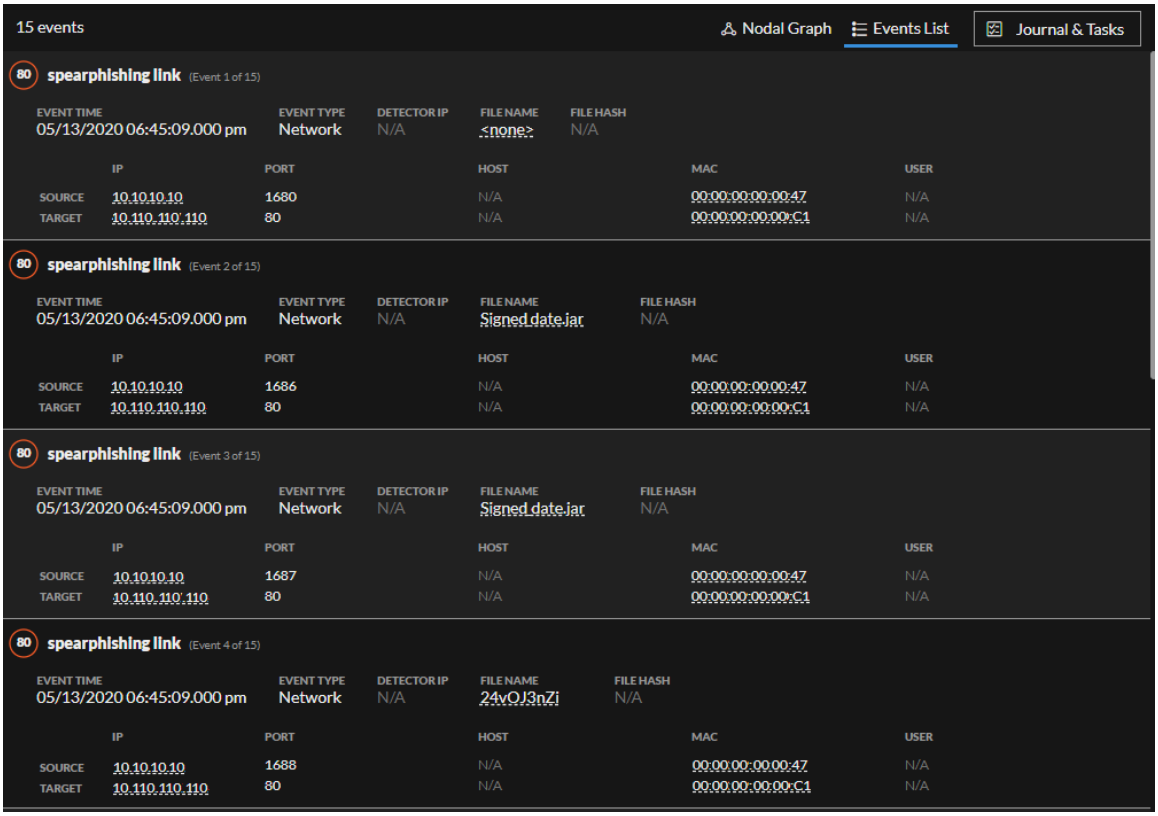
The legend at the bottom of the nodal graph shows the number of nodes of each type and the color coding of the nodes. It also helps you to locate the entities when the values, such as the IP addresses, are hashed.

You can click any node and drag it to reposition it.

In NetWitness Version 11.2 and later, you can select the node types that you want to view by clearing or selecting the checkboxes in the legend. The following figure shows an example nodal graph legend with all node types selected except IP.

Arrows

The arrows between the nodes provide additional information about the entity relationships. The following table describes the nodal graph arrow types.



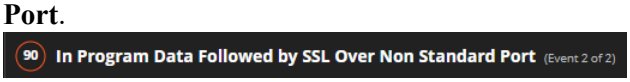
Arrow	Description
Communicates with	An arrow between a Source machine node (IP address or MAC address) and a Destination machine node labeled with "communicates with" shows the direction of the communication.
Has file	An Arrow between a machine node (IP address, MAC address, or Host) and a file hash node labeled with "has file " indicates that the IP address has that file.
Uses	An arrow between a User node and a machine node (IP address, MAC address, or Host) labeled with "uses" shows the machine that the user was using during the event.
Calls	(This arrow is available in NetWitness Platform 11.4 and later.) An arrow between two file hash (checksum) nodes labeled with "calls" indicates the direction of the interaction between the associated files. The source file hash "calls" the target (destination) file hash, which indicates that the source file associated with the source file hash is performing an action on the target file associated with the target file hash.
As	(This relationship type represents attributes of the connected node.) An arrow between nodes labeled with "as" provides additional information about the IP address that the arrow points to. For example, if there is an arrow from the host node circle that points to an IP address node that is labeled with "as", it indicates that the name on the host node circle is the hostname of that IP address and is not a different entity.
Is named	(This relationship type represents attributes of the connected node.) An arrow from a File Hash node to a File Name node labeled with "is named" indicates that the file hash corresponds to a file with that name.
Belongs to	(This relationship type represents attributes of the connected node.) An arrow between two nodes labeled with "belongs to" indicates that they pertain to the same node. For example, an arrow between a MAC address and a Host labeled with "belongs to" indicates that it is the MAC address of the host.

Larger line size arrows indicate more communication between the nodes. Larger nodes (circles) indicate more activity than smaller nodes. The larger nodes are the most common entities mentioned in the events.

Events List

The Events List shows the events associated with the incident. It shows information about the events, such as event time, source IP, destination IP, detector IP, source user, target user, and file information about the events. The amount of information listed depends on the event type. The maximum number of events displayed in the Events List is 1,000.

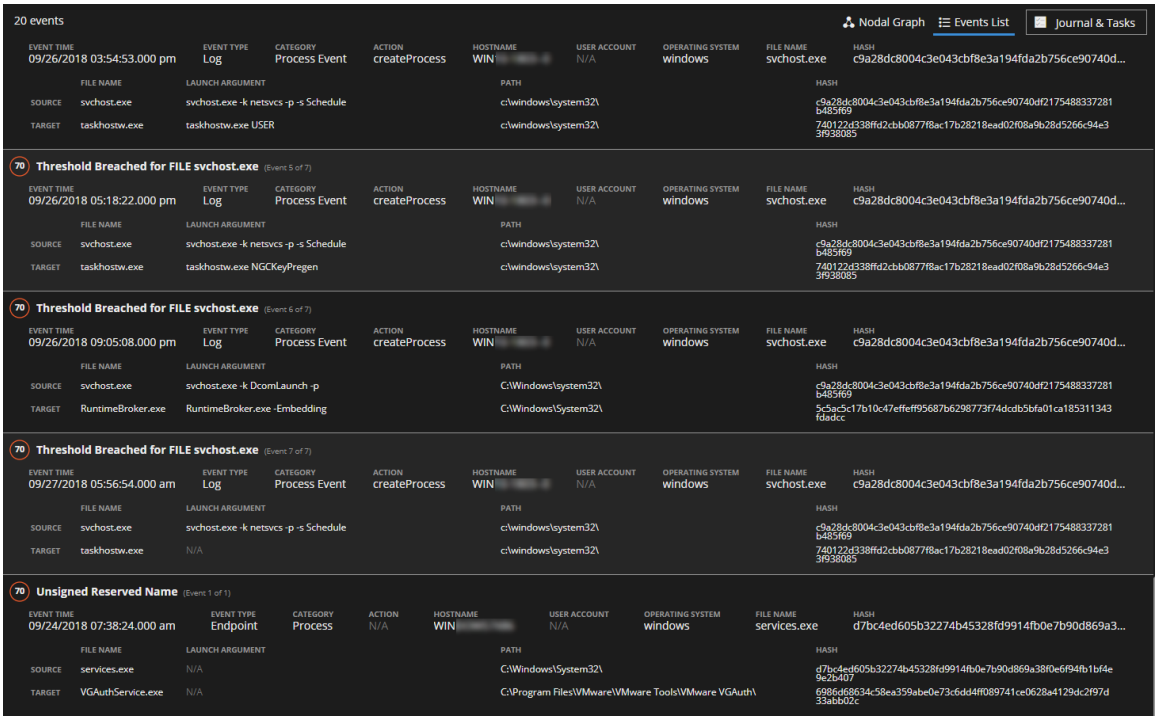
The following figure shows an Events List for network events.



Note: The EVENT TIME displayed on this screen is the same as the COLLECTION TIME from the investigation page.

Each event has a header row with the following information:

- **Risk score**: This is the risk score of the indicator (alert) that contains the event.
- **Title**: This is the name of the event.
- **(Event x of x)**: This indicates the number of the event out of the total number of events in the indicator.



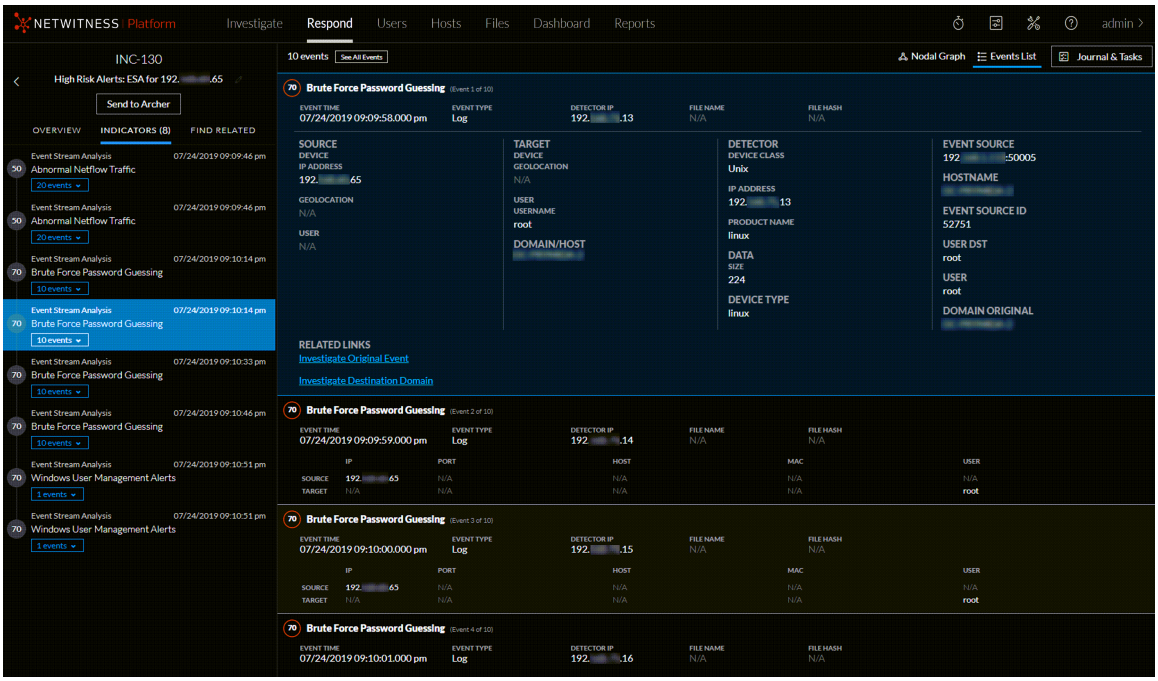
For example, the following event header shows that this event is event 2 of 2 for an indicator (alert) that has a risk score of 90. The event name is **In Program Data Followed by SSL Over Non Standard Port**.

The following table describes the fields in the Events List for network or log events.

Field	Description
EVENT TIME	Shows the time the event occurred.
EVENT TYPE	Shows the type of alert, such as Log and Network.
DETECTOR IP	Shows the IP address of the machine where an anomaly was detected
FILE NAME	Shows the file name if a file is involved with the event.
FILE HASH	Shows a hash of the file contents.
SOURCE IP	Shows the source IP address if there was a transaction between two machines.
SOURCE PORT	Shows the source port of the transaction. The source and destination ports can be on the same IP address.
SOURCE HOST	Shows the destination host where the event took place.
SOURCE MAC	Shows the MAC address of the source machine.
SOURCE USER	Shows the user of the source machine.
TARGET IP	Shows the destination IP address if there was a transaction between two machines
TARGET PORT	Shows the destination port of the transaction. The source and destination ports can be on the same IP address.
TARGET HOST	Shows the HOST name of the destination machine.
TARGET MAC	Shows the MAC address of the destination machine.
TARGET USER	Shows the user of the destination machine.

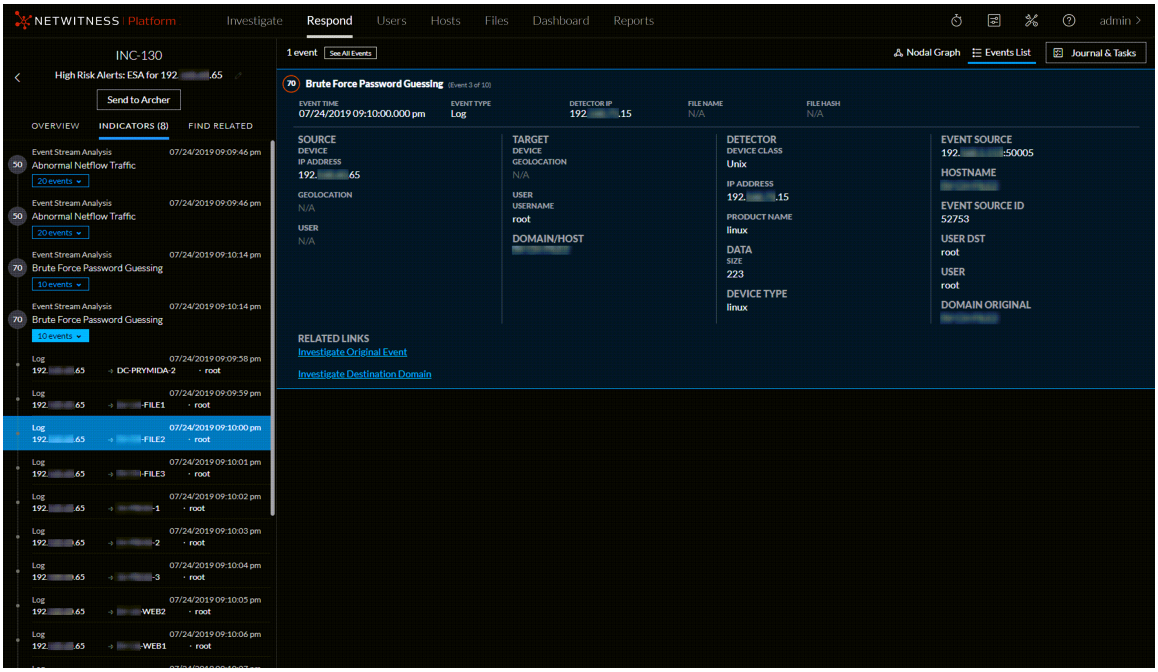
The following figure shows an Events List for NetWitness Endpoint events.

The following table describes the fields in the Events List for NetWitness Endpoint events. NetWitness Endpoint events have an `Endpoint` Event Type and an `nwendpoint` Device Type. NetWitness Endpoint events from version 4.4.x and earlier can have an Event Type that shows the origin of the event.



Field	Description
EVENT TIME	Shows the time the event occurred.
EVENT TYPE	Shows the type of alert, such as Endpoint or Log. NetWitness Endpoint events have an `Endpoint` event type. NetWitness Endpoint events from version 4.4.x and earlier can have an Event Type that shows the origin of the event.
CATEGORY	Shows the NetWitness Endpoint category.
ACTION	Shows the action that the file performed.
HOSTNAME	Shows the name of the machine that is running the agent.
USER ACCOUNT	Shows the username of the actively logged in user.
OPERATING SYSTEM	Shows the operating system of the agent.
FILE HASH	Shows the checksum of the file.

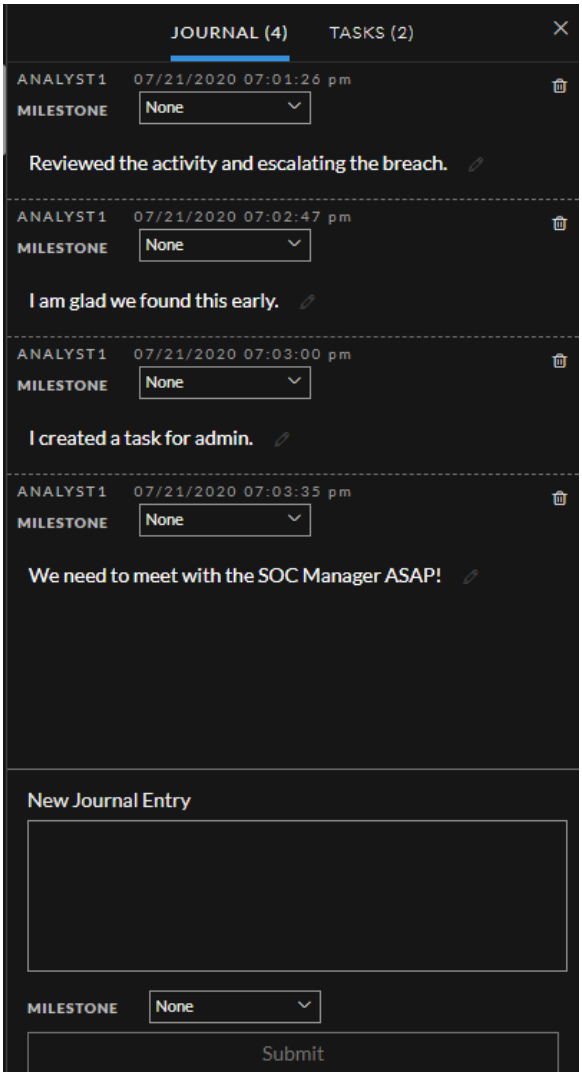
Field	Description
SOURCE FILENAME	Shows the name of the source file.
SOURCE LAUNCH ARGUMENT	Shows the command line argument for the running process.
SOURCE PATH	Shows the path of the source file.
SOURCE HASH	Shows the checksum of the source file.
SOURCE IP ADDRESS	Shows the IP address of the agent.
SOURCE PORT	Shows the source port of the connection.
TARGET FILENAME	Shows the name of the target file.
TARGET LAUNCH ARGUMENT	Shows the command line argument for the running process.
TARGET PATH	Shows the path of the target file.
TARGET HASH	Shows the checksum of the target file.
TARGET IP ADDRESS	Shows the destination IP address of this NetWitness activity.
TARGET PORT	Shows the destination port of the connection.
EVENT SOURCE	Shows the hostname or IP address along with the port of the of the Core service that holds the event information.
DEVICE TYPE	Shows the type of the device from which the data is sent or collected. For example, it shows `nwendpoint` for NetWitness Endpoint.



Event Details

To view the event details, you can click the top of an event in the Events List. The details appear below the event. Viewing inline event details enables you to keep the context of the event as it relates to the other events.

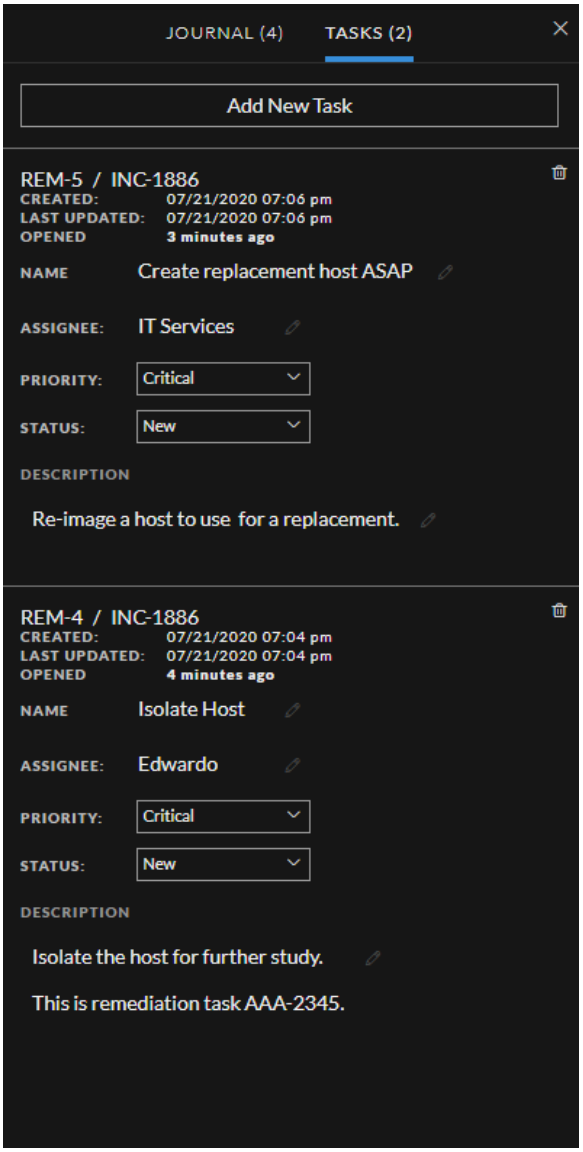
The following figure shows an indicator (alert) selected in the Indicators panel. The events for that indicator appear in the Events List on the right.



The following figure shows a specific indicator event selected in the Indicators panel. Information about the selected event appears in the Events List on the right.

Journal Panel

The incident Journal shows the history of activity on your incident.



The following table describes the New Journal Entry options.

Field	Description
New Journal Entry	Type your note in the field.
Milestone	(Optional) Select a milestone, if applicable. This field is used to track significant events for the incident.
Submit button	Click submit to add an entry to the journal. You journal entry will be visible to anyone who views the incident.

Tasks Panel

In the Tasks panel, you can manage and track the incident tasks to closure.

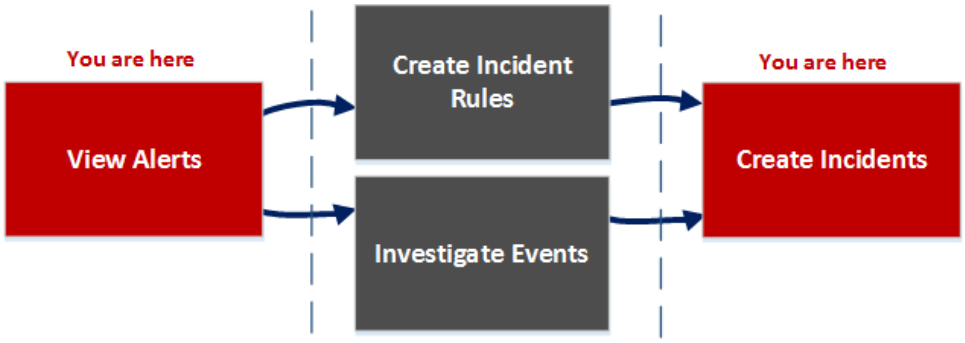
The following table describes the Task fields.

Field	Description
<Task ID / <Incident ID>	The autogenerated Task ID / The incident associated with the task.
Created	The created date of the task.
Last Updated	The date that the task was last modified.

Field	Description
Opened	The time that passed since the task was opened. For example, 3 minutes ago or 2 days ago.
Name	The name of the task. For example: Re-image the machine. You can click this field to edit it.
Assignee	The username of the user assigned to the task. You can click this field to edit it.
Priority	The priority of the task: Low, Medium, High, or Critical. You can click the priority button and select a new priority for the task from the drop-down list.
Status	The status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. You can click the status button and select a new status for the task from the drop-down list.
Description	Type information that describes the task. You may want to include any applicable reference numbers. You can click this field to edit it.

Toolbar Actions

Option	Description
	(Back to Incidents) Enables you to navigate back to the Incidents List view.
	Closes the panel.
	Deletes the entry, such as a journal entry or task.
Priority button	(In the Overview panel) Allows you to change the Priority of one or more selected incidents in the Incidents List.
Status button	(In the Overview panel) Allows you to change the Status of one or more selected incidents.
Assignee button	(In the Overview panel) Allows you to change the Assignee of one or more selected incidents.
	Enables you to view the Nodal Graph.
	Enables you to view the incident Events List. Clicking the top of an event enables you to view the event details below it.
	Enables you to view incident notes and tasks.



Option	Description
 (Journal, Tasks, and Related)	(This option is available in NetWitness Version 11.3.1 and earlier 11.x versions.) Enables you to view the Journal, Tasks, and Related Indicators panels.
	Enables you to show or hide the event header, request, response, and metadata in the Events panel in the Respond Incident Details view. For more information about event analysis, see "Events View" in the *NetWitness Investigate User Guide*.

Alerts List View

The Alerts List view (Respond > Alerts) enables you to view all of the threat alerts and indicators received by NetWitness in one location. This can include alerts received from ESA Correlation Rules, Malware Analysis, Reporting Engine, NetWitness Endpoint, as well as many others. In the Alerts List view you can browse through various alerts, filter them, and group them to create incidents.

Workflow

This workflow shows the high-level process that Analysts use to review alerts and create incidents.

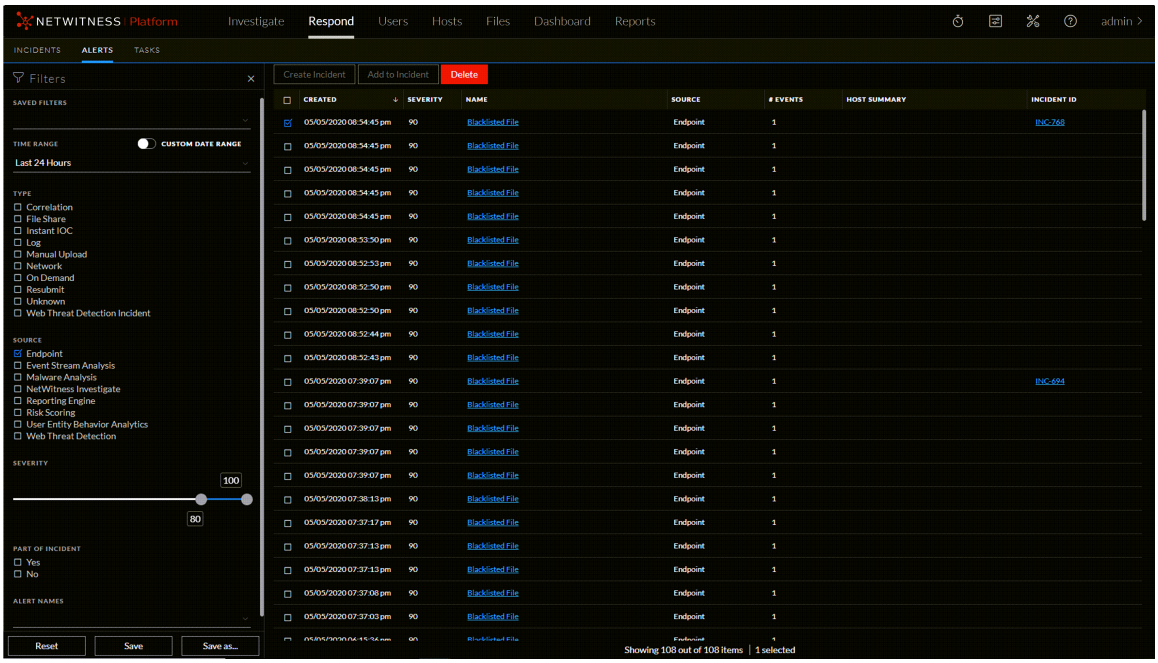
In the Alerts List view, you can review a list of alerts from all sources received by NetWitness. After that, you can investigate those alerts further and create incidents from the alerts or you can create incident rules to create incidents.

Note: You can use NetWitness Automated Threat Detection to create incidents without manually creating rules.

What do you want to do?

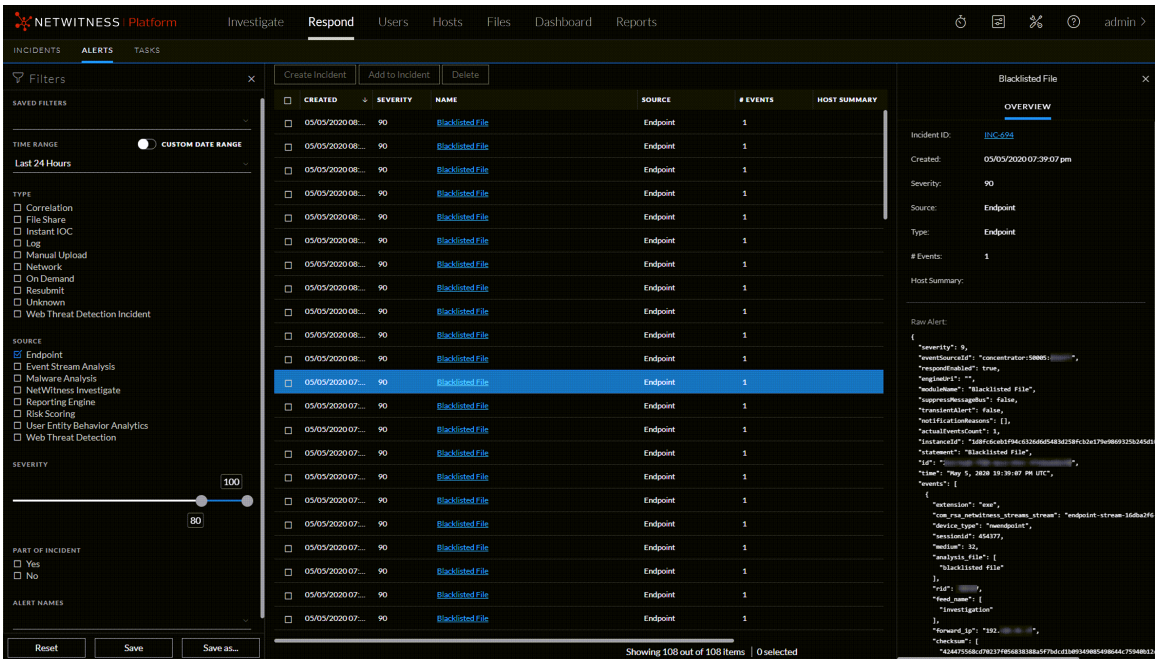
Role	I want to ...	Show me how
Incident Responders, Analysts	View all alerts in NetWitness.*	View Alerts
Incident Responders, Analysts	Filter alerts.*	Filter the Alerts List
Incident Responders, Analysts	View alert overview information and raw alert metadata.*	View Alert Summary Information
Incident Responders, Analysts	Create incidents from alerts.*	Create an Incident Manually

Role	I want to ...	Show me how
Incident Responders, Analysts	(Available in NetWitness Version 11.1 and later) Add alerts to an existing incident.*	Add Alerts to an Incident
Administrators, Data Privacy Officers	Delete alerts.*	Delete Alerts
SOC Managers, Administrators	Create incident rules.	See "Create an Incident Rule for Alerts" in the *NetWitness Respond Configuration Guide*.
Incident Responders, Analysts	Investigate the events in an alert.	View Event Details for an Alert and Investigate Events
Incident Responders, Analysts	Add related alerts to an existing incident.	Add Related Indicators to the Incident



*You can complete these tasks here (that is, in the Alerts List view).

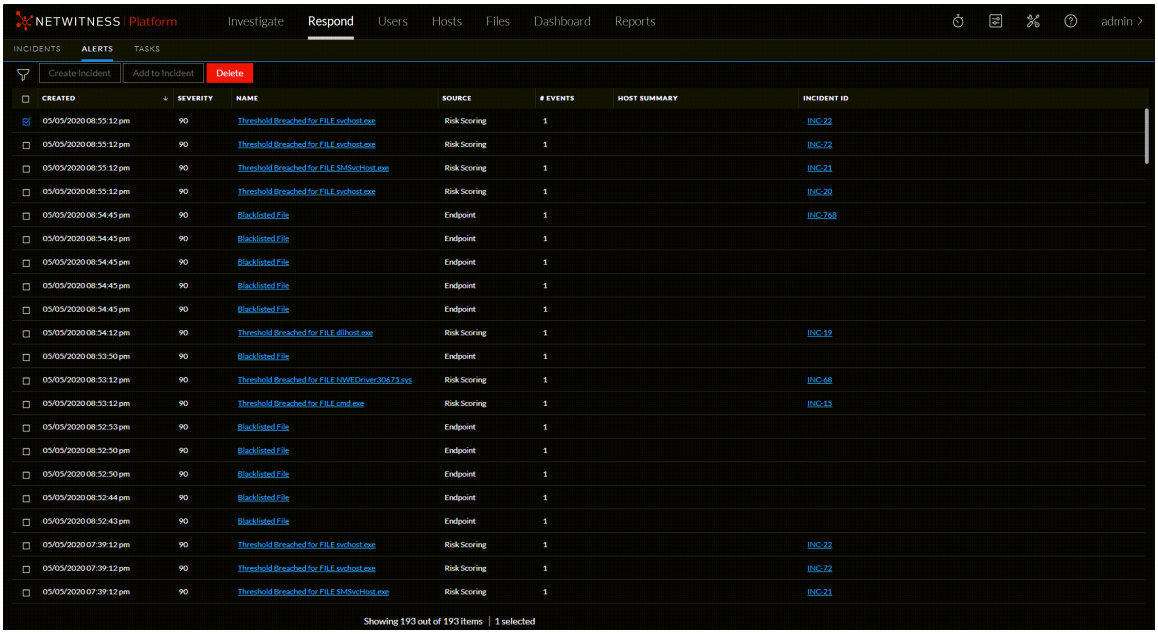
Related Topics



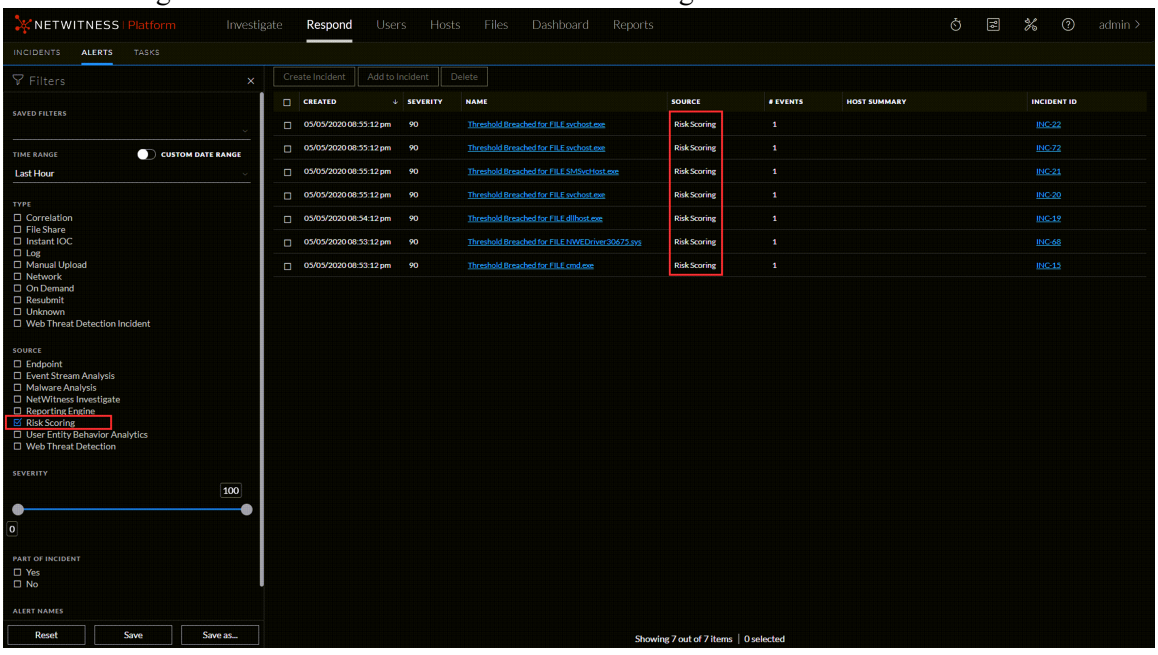
- Alert Details View
- Reviewing Alerts

Quick Look

To access the Alerts List view, go to **Respond > Alerts**. The Alerts List view displays a list of all alerts and indicators received by the Respond Server database in NetWitness. The following figure shows the Filters panel on the left.



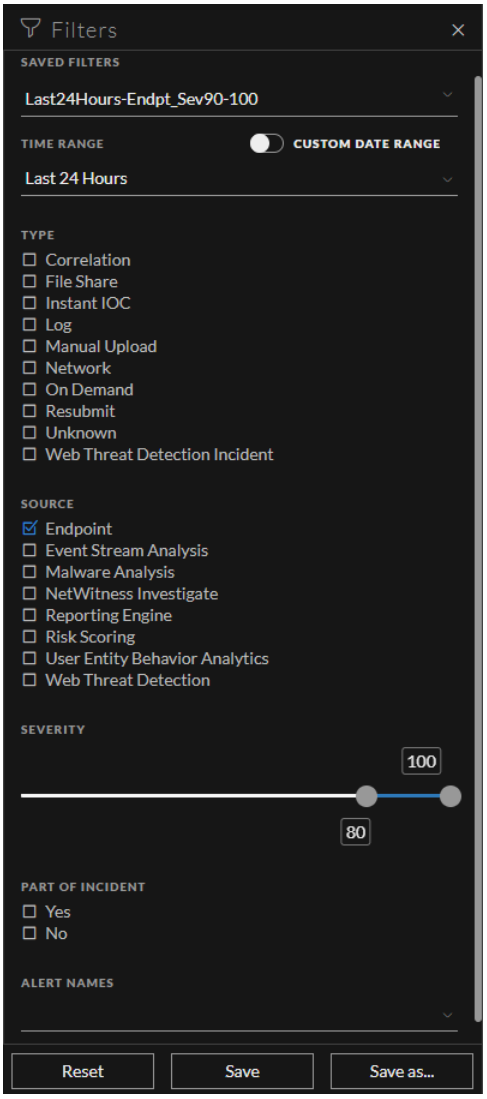
The Alerts List view consists of a Filters panel, an Alerts List, and an Alert Overview panel. You can click an alert in the Alerts list to view the Alert Overview panel on the right.



Alerts List

The Alerts List shows all of the alerts in NetWitness. You can filter this list to only show alerts of interest.

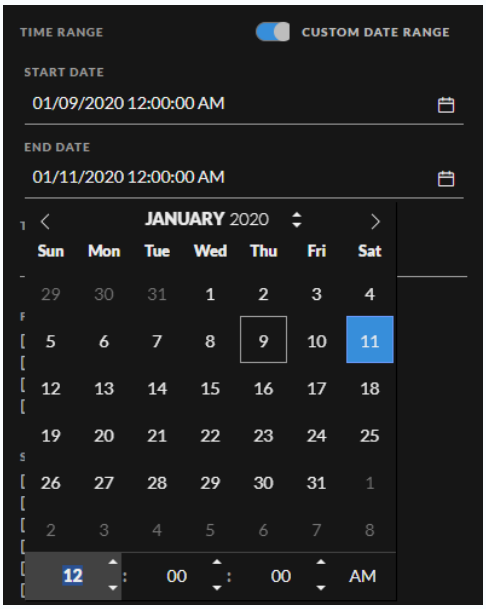
The following Alerts List view is filtered for Risk Scoring Alerts.



The following table describes the columns in the Alerts List.

Column	Description
	Enables you to select one or more alerts to delete. Users with the appropriate permissions, such as Administrators and Data Privacy Officers, can delete alerts.
Created	Displays the date and time when the alert was recorded in the source system.
Severity	Displays the level of severity of the alert. The values are from 1 through 100.
Name	Displays a basic description of the alert.
Source	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, ESA correlation rules, Reporting Engine, Risk Scoring, and many others. **Note:** - From 12.3.1 and later, the alert source filter panel displays only the sources installed in your instance of NetWitness and won't display all possible sources. If a user deletes a host / service on their NetWitness Instance, any source associated with that host / service will be marked as decommissioned. For Ex. ESA Primary is deleted in the hosts page, the ESA source will be marked as decommissioned, the source decommissioned message (**source has been decommissioned**) is displayed in the alert source filter panel.
# Events	Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky.
Host Summary	Displays details of the host like the host name from where the alert was triggered. The details may include information about the source and destination hosts in an Alert. Some alerts may describe events across more than one host .
Incident ID	Shows the Incident ID of the alert. If there is no incident ID, the alert does not belong to any incident and you can create an incident to include this alert or the alert can be added to an existing incident.

At the bottom of the list, you can see the number of alerts on the current page, the total number of alerts, and the number of alerts selected. For example: **Showing 4 out of 4 items | 1 selected**



Alert Filters Panel

The following figure shows the filters available in the Filters panel.

The Filters panel, on the left of the Alerts List view, has options that you can use to filter the alerts list. When you navigate away from the Filters panel, the Alerts List view retains your filter selections.

Option	Description
Saved Filters	You can select a saved filter to filter the alerts list. Saved filters are global. You can save a filter for other analysts to use and you can use any saved filter. Saved filters are also available for use on the Springboard landing page. Filters used in the Springboard cannot be deleted. (This option is available in NetWitness Platform 11.5 and later.)

Option	Description
Time Range	You can select a specific time period from the Time Range drop-down list. The time range is based on the received date of the alerts. For example, if you select Last Hour, you can see alerts that were received within the last 60 minutes.
Custom Date Range	You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar. 
Type	Indicates the type of events in the alert, for example, logs, network sessions, and so on.
Source	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, Event Stream Analysis (ESA Correlation Rules), Reporting Engine, Web Threat Detection, Risk Scoring, and many others. **Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint.
Severity	Displays the level of severity of the alert. The values are from 1 through 100.
Part of Incident	Categorizes alerts on whether or not they are associated with an incident. Select **Yes** to view alerts that are part of an incident. Select **No** to view alerts that are not part of an incident. For example, before you create incidents from alerts, you may want to select No to view only those alerts that are not already part of an incident.

Option	Description
Alert Names	Shows the names of the alerts being filtered. You can use this filter to search for all alerts generated by a specific rule, for example, Direct Login to an Administrative Account.
Reset	Removes your filter selections. If you reset filters on a saved filter, it takes you to the default empty filter.
Save	Saves the currently applied alerts filter or updates a saved filter. For a new filter, choose a unique name that contains 1-256 alphanumeric characters, underscores, or hyphens. (This option is available in NetWitness Platform 11.5 and later.)
Save As	Saves the currently applied alerts filter for future use. Choose a unique name that contains 1-256 alphanumeric characters, underscores, or hyphens. (This option is available in NetWitness Platform 11.5 and later.)

The Alerts List shows a list of alerts that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the alerts list. For example: **Showing 4 out of 4 items**

Alert Overview Panel

The Overview panel shows basic summary information about a selected alert and raw alert metadata. The Overview panel in the Alert Details view contains the same information, but in the Alerts Details view, you can expand the panel to view more information.

The following table lists the fields displayed in the Alert Overview panel.

Field	Description
<Alert Name>	Displays the name of the alert.
Incident ID	Displays the Incident ID associated with the alert. You can click the incident ID link to go to the Incident Details view of the associated incident. If there is no incident ID, the alert does not belong to an incident. You can create an incident for this alert or you can add it to an incident.
Created	Displays the date and time when the alert was created.
Severity	Displays the level of severity of the alert. The values are from 1 through 100.

Field	Description
Source	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, ESA correlation rules, Reporting Engine, Risk Scoring, and many others. **Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint.
Type	Indicates the type of events in the alert, for example, logs, network sessions, and so on. There can be multiple types listed. **Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint.
Server	Displays details of the UEBA Server from where the alert was triggered. For example, UEBA-2 - UEBA Server. **Note:** This option is displayed only for UEBA servers.
# Events	Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky.
Raw Alert	Shows the raw alert metadata.

Toolbar Actions

This table lists the toolbar actions available in the Alerts List view.

Option	Description
	Enables you to open the Filters panel so that you can specify the alerts that you would like to see in the Alerts List.
	Closes the panel.
Create Incident button	Enables you to create incidents from alerts. The alerts cannot be part of an incident. To get a list of alerts without incidents, you can filter the Alerts List. In thePart of Incident section, select No.

Option	Description
Add to Incident button	(This option is available in NetWitness Version 11.1 and later.) Enables you to add selected alerts to an incident. The alerts cannot be part of an incident. To get a list of alerts without incidents, you can filter the Alerts List. In the Part of Incident section, select No.
Delete button	Allows you to delete alerts.

Alert Details View

In the Alert Details view (Respond > Alerts > click on a row in the Alerts List), you can view the overview of an alert, such as the source of the alert, the number of events within the alert, Incident ID, if it is part of an incident. You can also view the raw alert that contains detailed information about the events.

Workflow

This workflow shows the high-level process that Analysts use to review alerts and create incidents.

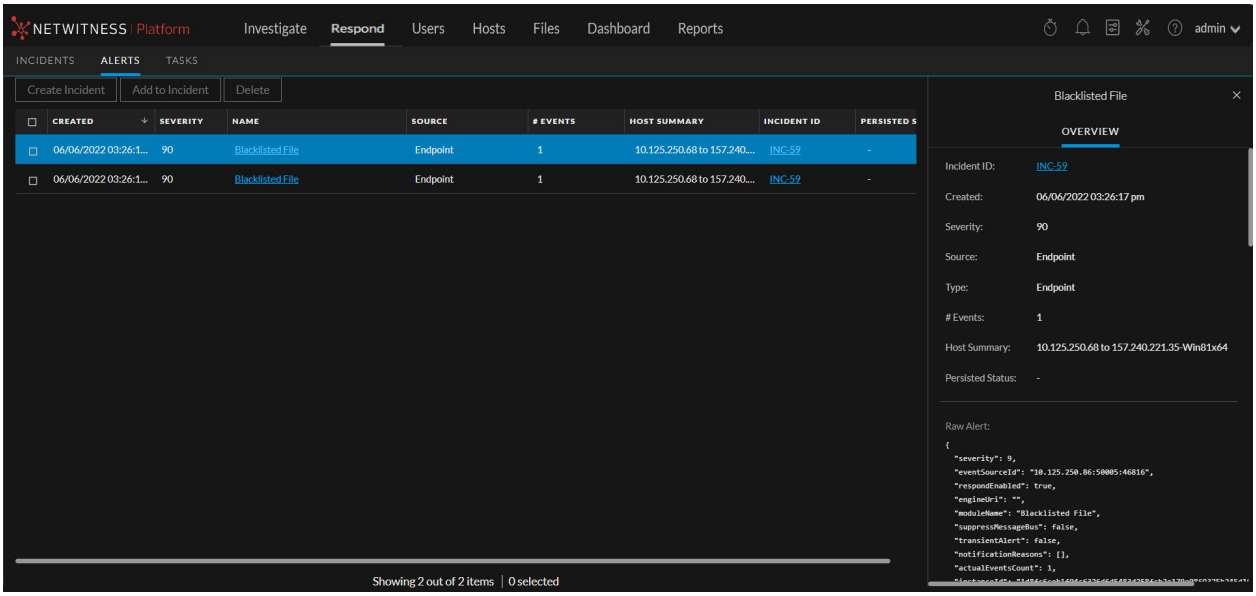
After reviewing the alerts list, you can investigate those alerts further and create incidents from the alerts, in the Alert Details view. In the Configure > Incident Rules view, you can create incident rules to create incidents.

Note: You can also use NetWitness Automated Threat Detection to create incidents without manually creating rules.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts	View all alerts in NetWitness.	View Alerts
SOC Managers, Administrators	Create incident rules.	See "Create an Incident Rule for Alerts" in the *NetWitness Respond Configuration Guide*.
Incident Responders, Analysts	View a list of events in the alert.*	View Event Details for an Alert
Incident Responders, Analysts	View event metadata for each event in the alert.*	View Event Details for an Alert

Role	I want to ...	Show me how
Incident Responders, Analysts	Further investigate the events in the alert.*	Investigate Events
Incident Responders, Analysts	Add alerts to an existing incident.	Add Alerts to an Incident Add Related Indicators to the Incident
Incident Responders, Analysts	Create incidents from alerts.	Create an Incident Manually
Data Privacy Officers, Administrators	Delete alerts.	Delete Alerts



*You can complete these tasks here (that is, in the Alerts Details view).

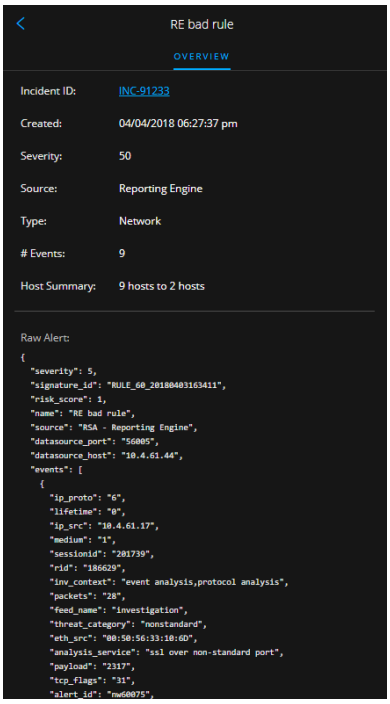
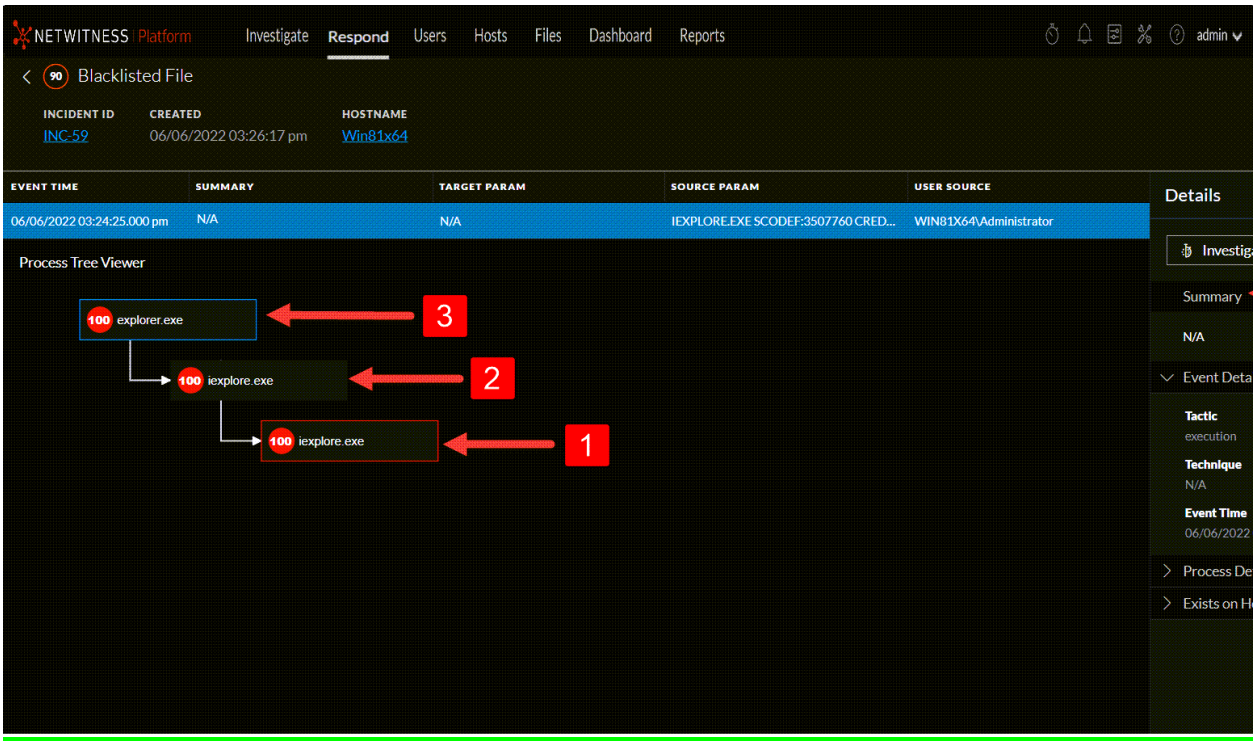
- Alerts List View
- Reviewing Alerts



Quick Look

1. To access the Alert Details view, go to **Respond > Alerts**.
2. In the Alerts list, choose an alert to view and then click the link in the Name column for that alert. The Alert Details view has an Overview panel on the right. You can resize the panels to show more information as shown in the following figure.



Overview Panel

The Overview panel shows basic summary information about a selected alert. The Overview panel on the Alerts List view contains the same information. The Alerts List view Alert Overview Panel topic provides details.

Events - Process Tree View

Click on an event name link to view the event details. The Process Tree Viewer opens and displays the process that caused the alerts and the processes it originated from.

1 -The process that caused the alert is highlighted with a red-colored outline.

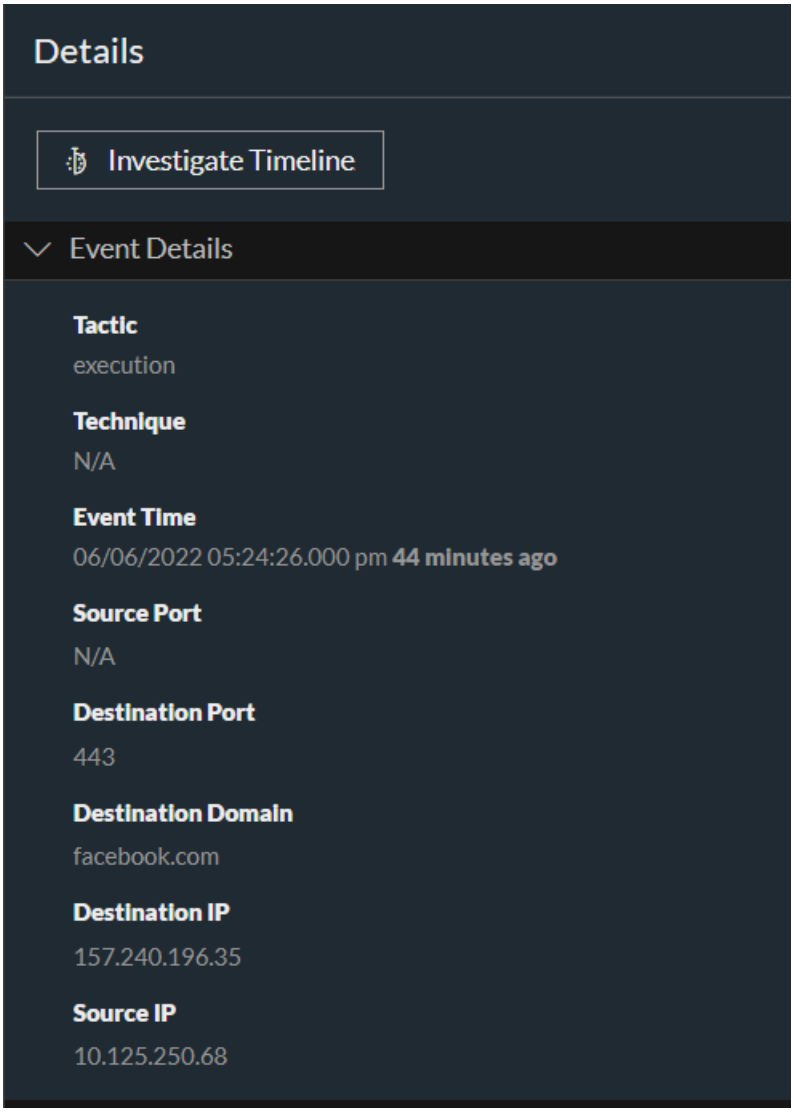
2 & 3 - The processes from which the highlighted process originated.

4 - Summary of the alert.

5 - Event Details section shows the tactics, techniques, and event time stamp.

6 - Process Details section provides detailed insights about the selected process.

7 - Shows the details of Network Connections established by the process; You can view the network connections that took place up to ten minutes before and after the alert triggered time. Network connections details are available only for the process that caused the alert.



8 - Shows the name and a link to the host where the process exists.

Events List

The Events List for a selected alert shows all of the events contained in that alert.

Event Details

The Event Details in the Events panel shows the event metadata for each event in the alert.

Event Details

The following table lists some event details section and subsections shown in the Event Details. This is not an extensive list.

Section	Subsection	Description
Summary		Shows a summary of the event.

Section	Subsection	Description
Event		Shows the destination device and user.
	Device	Shows information about the destination device. See Event Source or Destination Device Attributes below.
	User	Shows information about the user or users of the destinationSee Event Source or Destination User Attributes below.
Detector		Shows the host or software product that detected the issue. This is most relevant for malware scanners and logs.
	Device Class	Shows the device class of the product that detected the alert.
	IP Address	Shows the IP address of the product that detected the alert.
	Product Name	Shows the name of the product that detected the alert.
Domain		Shows the domain associated with the event.
Enrichment		Shows available enrichment information.
Related Links		If available, it shows a link back to the user interface (UI) of the source product.
	Type	Shows the type of event, such as investigate_original_event.
	URL	Shows the URL link back to the UI of the source product.
Size		Shows the size of the transmission or file involved.
Source		Shows the source device and user.
	Device	Shows information about the source machine. See Event Source or Destination Device Attributes below.
	User	Shows information about the user or users of the source machine. See Event Source or Destination User Attributes below.
Timestamp		Shows the time that the event occurred.
Type		Shows the type of the alert, such as log, network, correlation, Resubmit, Manual Upload, On Demand, File Share, or Instant IOC.

Event Source or Destination Device Attributes

The following table lists attributes for an event source or destination device that can be shown in the Events Details.

Name	Description
Asset Type	Displays the type of device, for example, desktop, laptop, server, network equipment, tablet, and so on.
BusinessUnit	Shows the business unit associated with the device.

Name	Description
Compliance Rating	Shows the compliance rating of the device. It can be Low, Medium, or High.
Criticality	Shows how critical the device is to the business (business criticality).
Facility	Shows the location of the device.
Geolocation	Shows the geographic location for the host. It can contain the following attibutes: city, country, latitude, longitude, organization, and domain.
IP Address	Shows the IP address of the device.
MAC Address	Shows the MAC address of the device.
Netbios Name	Shows the NetBIOS name for the device.
Port	Displays the TCP port, UDP port, or the IP Src port (the first one available) used to connect to and from the host.

Event Source or Destination User Attributes

The following table lists attributes for an an event source or destination user that can be shown in the Events Details.

Attribute Name	Description
AD Domain	Shows the Active Directory domain.
AD Username	Shows the Active Directory username.
Email Address	Shows the email address of the user.
Username	Shows a general name if you do not know the source of the username, such as UNIX or a username in a particular system.

Toolbar Actions

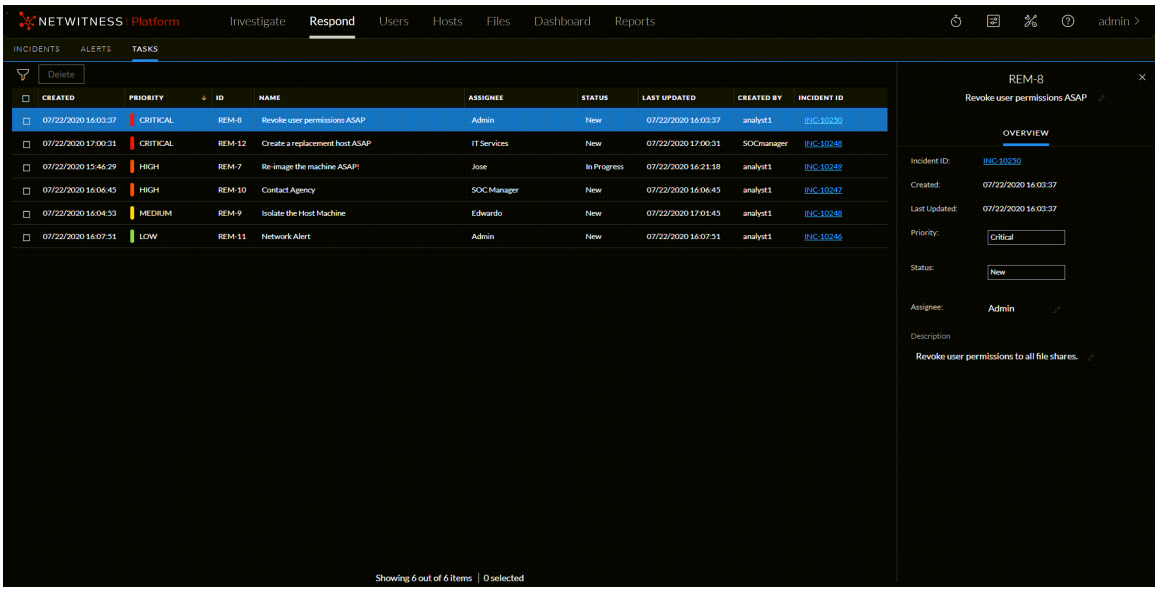
This table lists the toolbar actions available in the Alert Details view.

Option	Description
	(Back to Alerts) Enables you to navigate back to the Alerts List view.
	Click the arrows to navigate through the event meta details for each event in the alert. The numbers, such as "1 of 2" show the number of the event that you are currently viewing. Click **Back to Table** to go back to the Events List view, which is also known as the Events Table.

Tasks List View

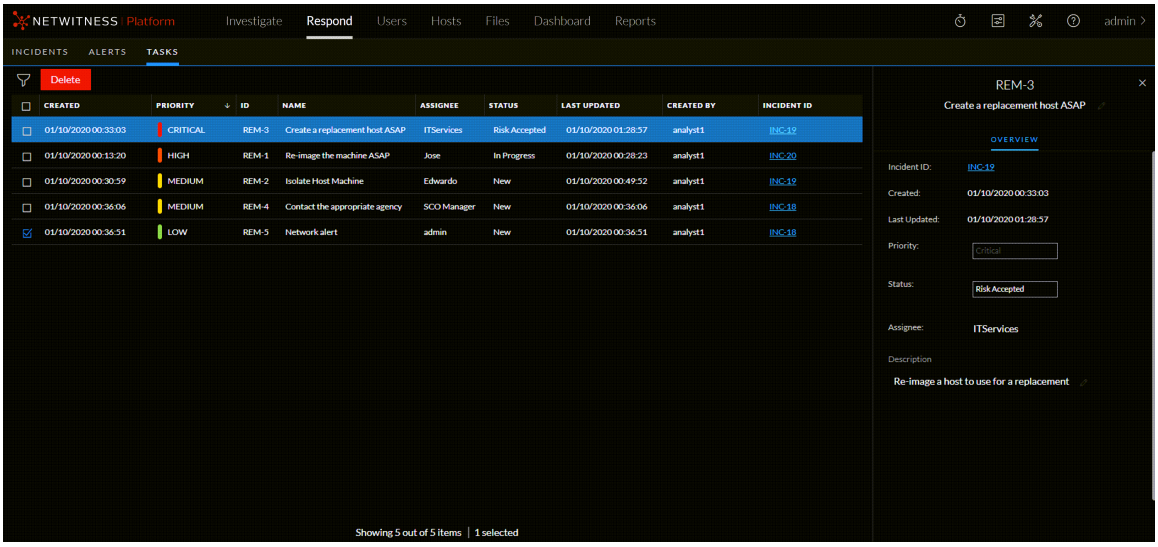
After investigating incidents, in the Tasks List view (Respond > Tasks), you can create and track incident tasks. For example, you can create remediation tasks when you require actions on incidents from teams outside of your security operations. You can reference external ticket numbers within the tasks and then track those tasks to completion. You can also modify and delete tasks as required, depending on your user permissions.

What do you want to do?



Role	I want to ...	Show me how
Incident Responders, Analysts	View tasks	View All Incident Tasks and View the Tasks Associated with an Incident
Incident Responders, Analysts	Filter tasks.	Filter the Tasks List
Incident Responders, Analysts	Create a task.	Create a Task
Incident Responders, Analysts	Find and modify tasks.	Find a Task and Modify a Task
Incident Responders, Analysts	Close a task (Change the Status to Remediated, Risk Accepted, or Not Applicable).	Modify a Task
Incident Responders, Analysts, SOC Managers	Delete a task.	Delete a Task

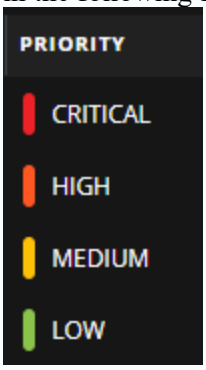
Related Topics



- Incident Details View
- Escalate or Remediate the Incident

Quick Look

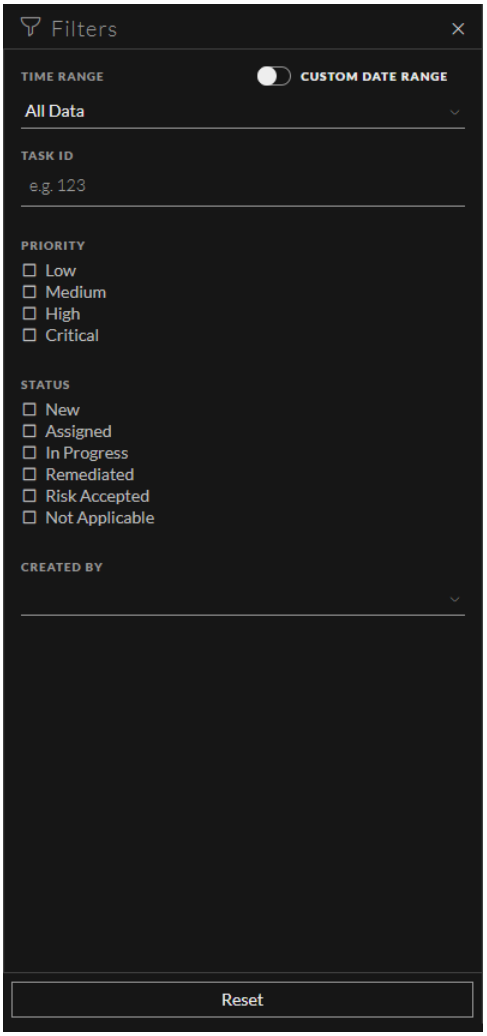
To access the Tasks List view, go to **Respond > Tasks**. The Tasks List view displays a list of all incident tasks.



The Tasks List view consists of a Filters panel, a Tasks List, and a Task Overview panel. The following figure shows the Tasks List and the Overview panel.

Tasks List

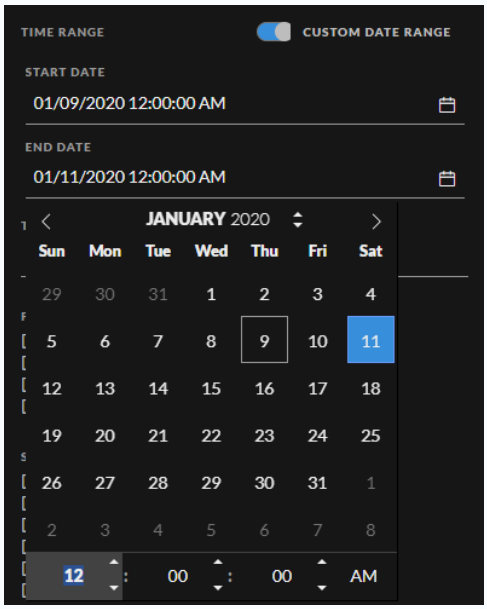
The Tasks List shows all of the incident tasks. You can filter this list to show only tasks of interest.



Column	Description
	Enables you to select one or more tasks to modify or delete. Users with the appropriate permissions can make bulk updates and delete tasks, such as SOC Managers. For example, an SOC Manager may want to assign multiple tasks to a user at the same time.
Created	Displays the date when the task was created.

Column	Description
Priority	Displays the priority assigned to the task. The priority can be any of the following: Critical, High, Medium, or Low. The Priority is also color coded, where red indicates **Critical**, orange represents **High** risk, yellow indicates **Medium** risk, and green represents **Low** risk as shown in the following figure: 
ID	Displays the task ID.
Name	Displays the task name.
Assignee	Displays the name of the user assigned to the task.
Status	Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
Last Updated	Displays the date and time when the task was last updated.
Created By	Displays the user who created the task.
Incident ID	Displays the incident ID for which the task was created. Click the ID to display the details of the incident.

At the bottom of the list, you can see the number of tasks on the current page and the total number of tasks. For example: **Showing 23 out of 23 items**

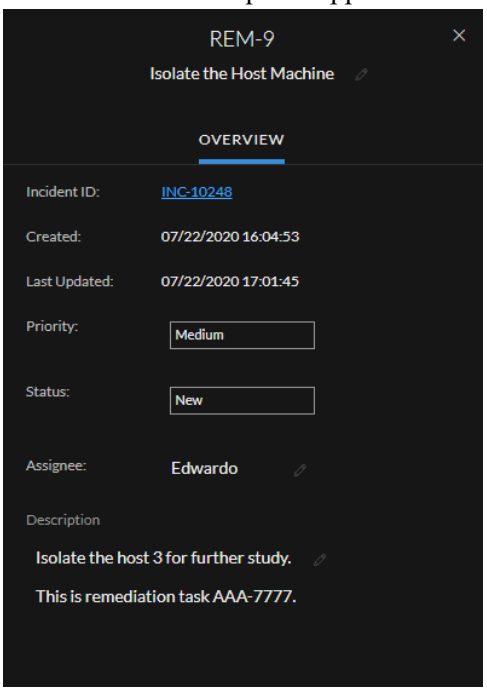


Task Filters Panel

The following figure shows the filters available in the Filters panel.

The Filters panel, on the left of the Tasks List view, has options that you can use to filter the incident tasks.

Option	Description
Time Range	You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the tasks. For example, if you select Last Hour, you can see tasks that were created within the last 60 minutes.



Option	Description
Custom Date Range	You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar. 
Task ID	You can type the Task ID for a task that you would like to locate, for example REM-123.
Priority	You can select the priorities that you would like to view. If you make one or more selections, the Tasks list shows only those tasks with the selected priorities. For example: If you select Critical, the Tasks list shows only the tasks with a priority set to Critical.
Status	You can select the statuses that you would like to view. If you make one or more selections, the Tasks list shows only those tasks with the selected statuses. For example: If you select Assigned, the Tasks panel shows only the tasks that are assigned to users.
Created By	You can select the user who created the tasks that you would like to view. For example, if you only want to view the tasks created by Edwardo, select Edwardo from the CREATED BY drop-down list. If you want to view tasks regardless of the person who created the task, do not make a selection under CREATED BY.
Reset Filters	Removes your filter selections.

The Tasks List shows a list of tasks that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the tasks list. For example: **Showing 18 out of 18 items**

Task Overview Panel

To access the Task Overview panel:

1. Go to **Respond > Tasks**.
2. In the Task list, click the task that you want to view.
   The Task Overview panel appears to the right of the Tasks list.

The following table lists the fields displayed in the Task Overview panel.

Field	Description
<Task ID>	Displays the automatically assigned task ID.
<Task Name>	Displays the task name. This is an editable field. To change the task name, you can click the current task name to open a text editor. For example, you can change a task name from "Reimage a Laptop" to "Reimage a Server".
Incident ID	Displays the Incident ID for which the task was created. Click the ID to display the details of the Incident.
Created	Displays details about the date and time when the task was created.
Last Updated	Displays the date and time when the task was last updated.
Priority	Displays the priority of the task: Low, Medium, High, or Critical. To change the priority, you can click the priority button and select a priority for the task from the drop-down list.

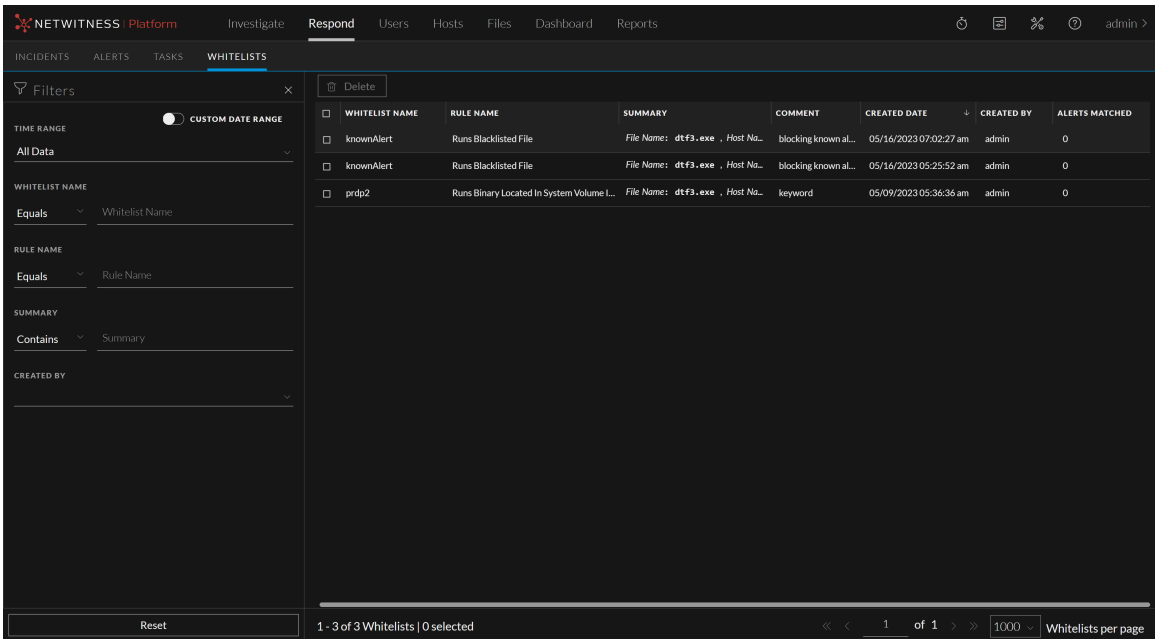
Field	Description
Status	Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. To change the status, you can click the status button and select a status for the task from the drop-down list.
Assignee	Displays the user assigned to the task. To change the user assigned to the task, you can click (Unassigned) or the name of the previous assignee to open a text editor.
Description	Shows task details. To modify the description, you can click the text underneath the description to open a text editor.

Toolbar Actions

This table lists the toolbar actions available in the Tasks List view.

Option	Description
	Enables you to open the Filters panel so that you can specify the tasks that you would like to see in the Tasks List.
	Closes the panel.
Delete button	Allows you to delete the selected tasks.

Whitelists List View



The Whitelists List view (**Respond** > **Whitelists**) enables you to view all the Endpoint Whitelists with the Rule Name, Creation Date, and the Summary associated with the respective Whitelisted Endpoint Alerts.

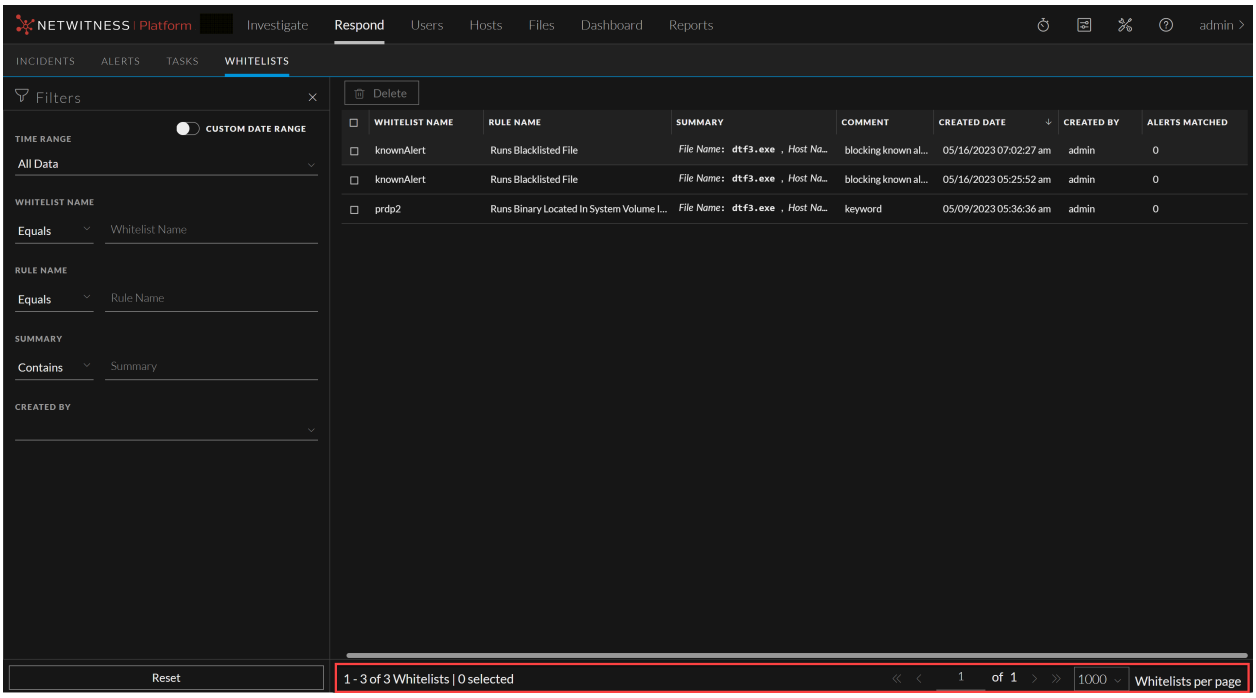
Whitelists List

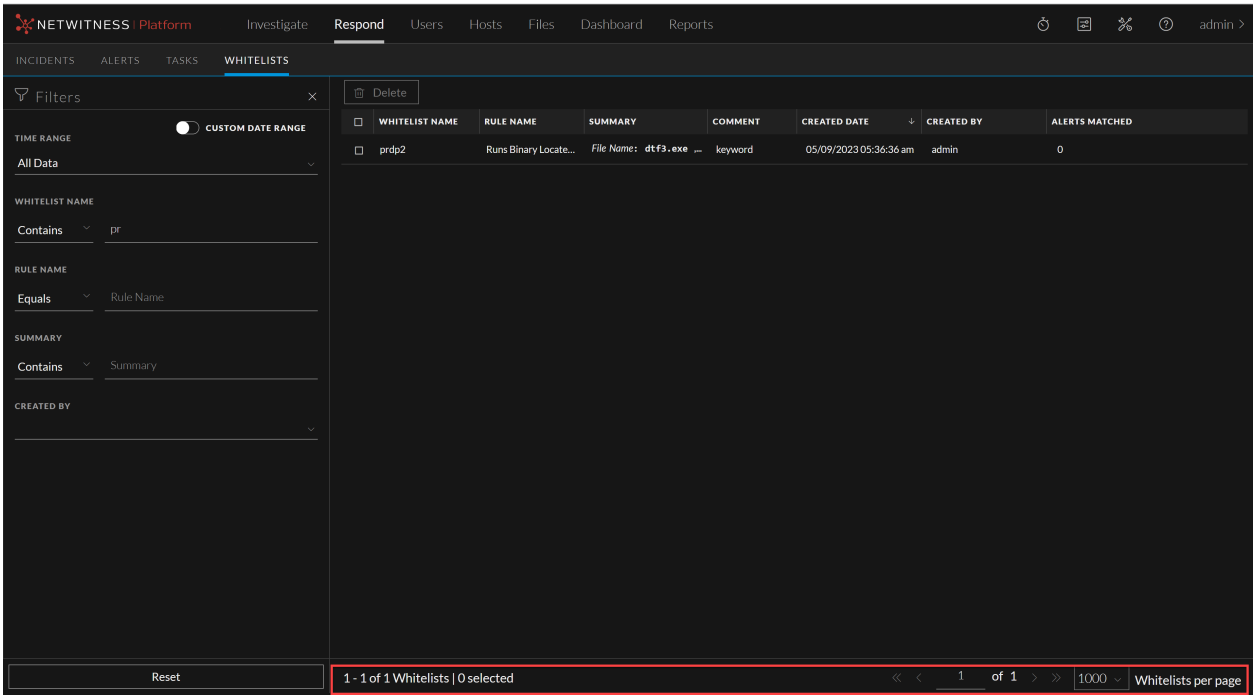
The Whitelists List displays all the Endpoint Whitelists in the NetWitness Platform. You can filter this list to view only the Whitelists of interest.

The following table describes the columns in the Whitelists List.



Columns	Description
Whitelist Name	Displays the name of the Whitelist you provided during the whitelisting of the selected alert.
Rule Name	Displays the rule name associated with the whitelisted alert.
Summary	Displays the details of the entities selected during the whitelisting of the selected alert. For Example: **File name: cmd.exe, Host name: win34.**
Comment	Displays the comment added during the whitelisting of the selected alert.
Created Date	Displays the Whitelist creation date and time.
Created By	Displays the name of the user who created the Whitelist.
Alerts Matched	Displays the number of new matching alerts that are not triggered for the selected entities in the **Respond** > **Alerts** view after whitelisting the selected alert.

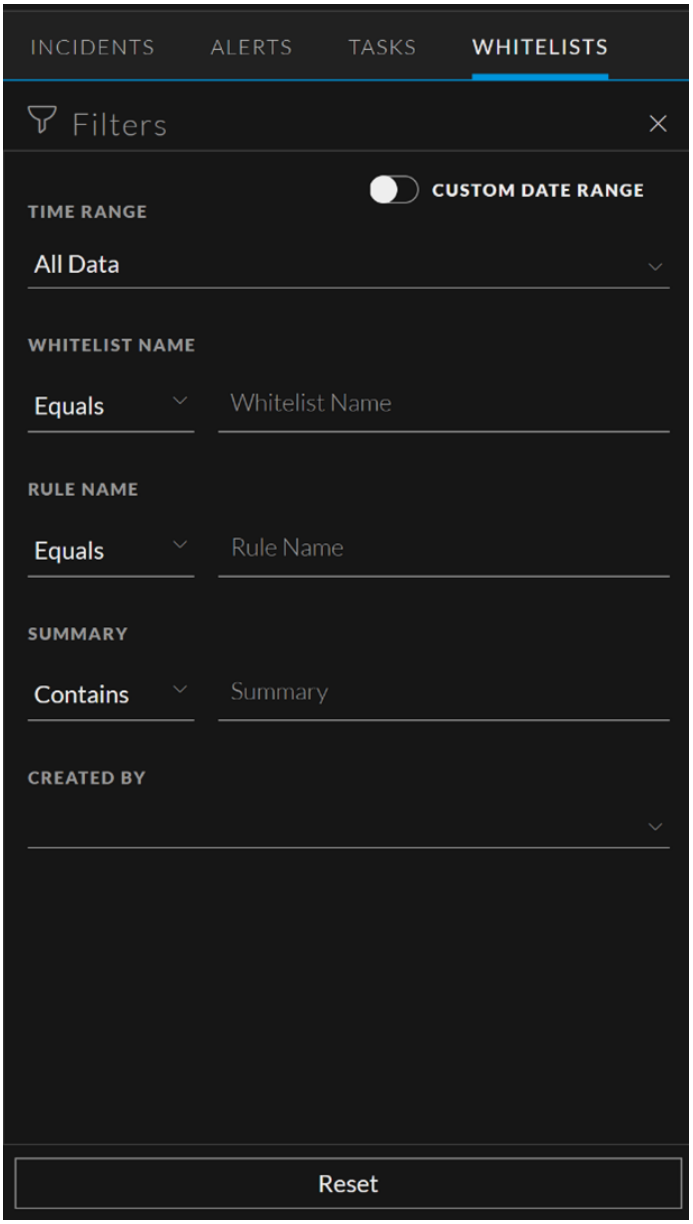
The following parameters are displayed at the bottom of the list.



- The count of the Whitelists displayed on the current page.
- The total number of Whitelists created.
- The number of Whitelists selected in the list.
- The current page number.
- Total number of pages available.
- The maximum number of Whitelists displayed in each page.

The values of the above mentioned parameters vary depending upon the filters you apply.

For example, consider the existing count of the Whitelists displayed on page **1** is **1 - 3** and the total number of Whitelists created is **3**.



After entering the Whitelist name (completely or partially) in the **Filters** panel and filtering the required Whitelist, the count of the Whitelists displayed on page **1** changes to **1 - 1** and the total number of Whitelists created is displayed as **1** since only 1 Whitelist matches the filter applied.

Whitelists Filters Panel

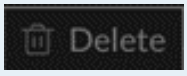
The following figure shows the filters available in the Whitelists **Filters** panel.

You can filter the Whitelists based on the following parameters.

- Time Range
- Whitelist Name
- Rule Name

- Summary associated with the Whitelists
- User who created the Whitelists

The following table lists all the fields displayed in the **Filters** panel.



Fields	Description
Time Range	Allows you to select the required time duration and view the Whitelists created in the time duration selected. **Note:** Turn On the **Custom Date Range** Toggle to select a custom date range of your choice.
Whitelist Name	Allows you to enter the name of required Whitelist.
Rule Name	Allows you to enter the name of the rule associated with the Whitelists created.
Summary	Allows you to enter the complete value or a part of the value of the entities associated with the required Whitelist. For example: **cmd.exe** or **win34** or **analyst1**.
Created By	Allows you to filter the Whitelists on the basis of the user who created them.

You can click **Reset** at the bottom of the **Filters** panel to remove the filters applied.

When you navigate away from the **Filters** panel, the Whitelists List view retains your filter selections.

Toolbar Actions

This table lists the toolbar actions available in the Whitelists List view.

Option	Description
	Select this option and access the **Filters** panel to filter the required Whitelists.
	Select this option to delete the selected Whitelist.

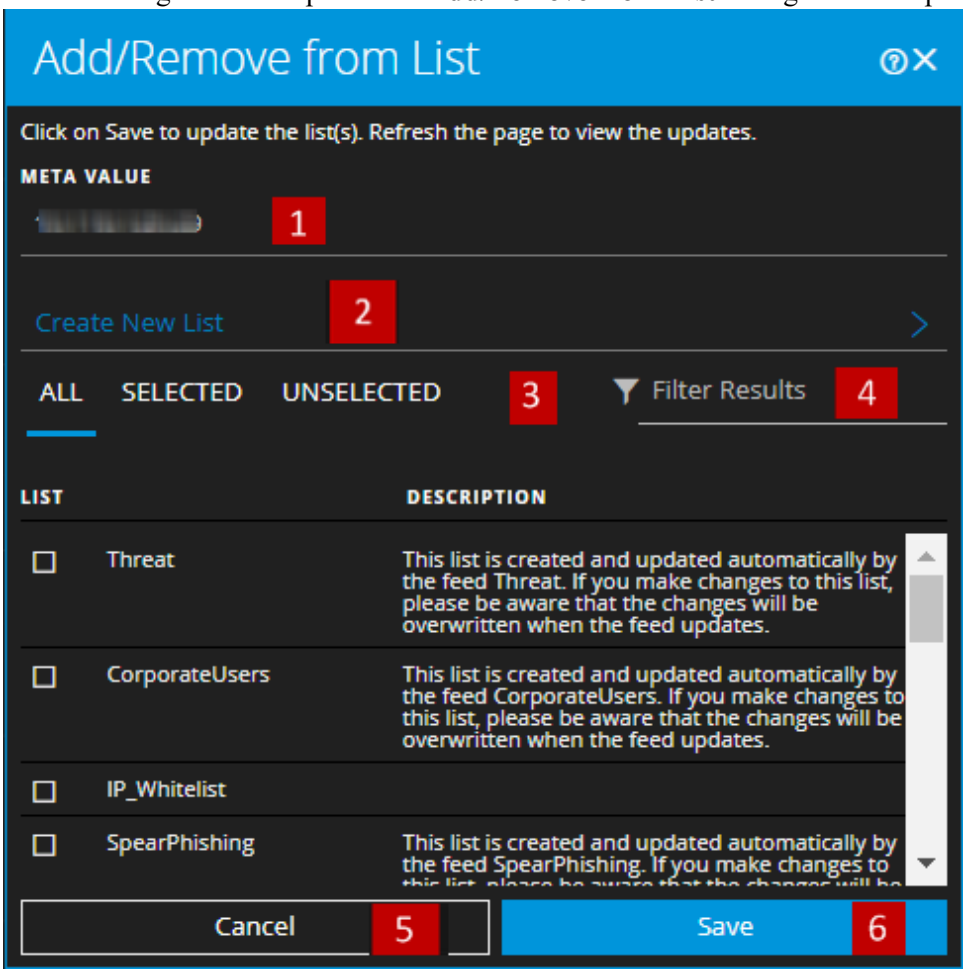
Add/Remove from List Dialog

The Add/Remove from List dialog allows you to add or remove an entity or meta value to an existing list or create a new list. For example, when you look up an IP address and you find it suspicious or interesting, you can add it to a relevant list, which has been added a data source. This improves the visibility of the suspicious IP addresses. You can also add entities or meta values to different lists. For example, you can add them to one list for suspected domains related to command and control connections and to another list for Trojan connections IP addresses related to remote access. If a list is not available, you can create a list. You can also remove the entity or meta value from a list.

Note: From the Add/Remove from List dialog, you can only add or remove entities or meta values from single column lists added as a datasource, not multi-column lists. And when you edit a list or a value in a list from the nodal view or the context lookup view, ensure to refresh the web page to view the updated data.

What do you want to do?

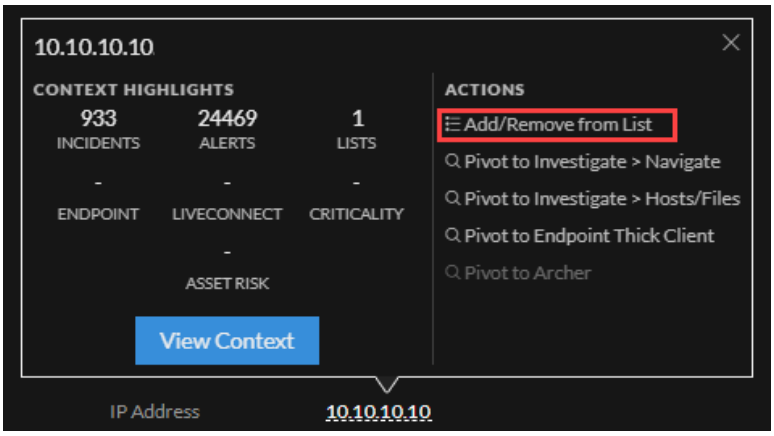
Role	I want to ...	Show me how
Incident Responders, Analysts	Add an entity to a list.	From the Incident Details view, see Add an Entity to a Whitelist. From the Alert Details view, Add an Entity to a Whitelist.
Incident Responders, Analysts	Create a whitelist, blacklist, or other list.	Create a List
Administrators	Add a Context Hub list as a data source.	See "Configure Lists as a Data Source" in the *Context Hub Configuration Guide*.
Administrators	Import or export a list for Context Hub.	See "Import or Export Lists for Context Hub" in the *Context Hub Configuration Guide*.



Related Topics

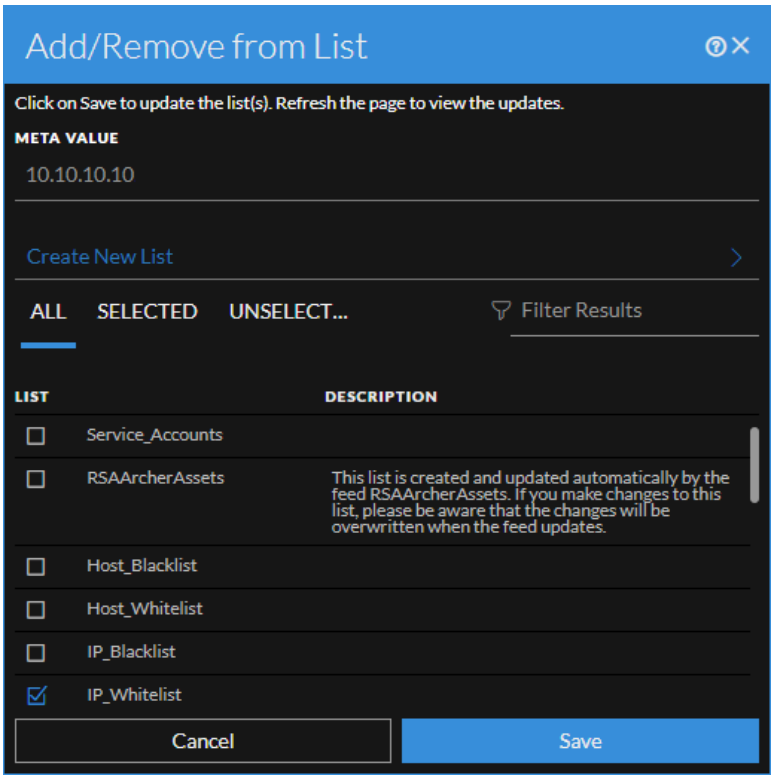
- Investigate the Incident
- Reviewing Alerts
- View Contextual Information (Incident Details view)
- View Contextual Information (Alert Details view)

Note: You cannot delete a list, but you can delete values within a list.



Quick Look

The following is an example of the **Add/Remove from List** dialog in the Respond view.



1 Entities or meta values to be added or removed.
2 Create a new list using the selected meta values.
3 Select any of the tabs: All, Selected, or Unselected.
4 Search using the list name or description.
5 Cancel the action.
6 Save to update lists or create a new list.

To access the Add/Remove from List dialog, in the Incident Details view or the Alert Details view, hover over the underlined entity that you would like to add or remove from a Context Hub list. A context tooltip appears showing the available actions.

In the Actions section of the tooltip, click Add/Remove from List. The Add/Remove From List dialog shows the available lists.

The following table shows the options in the Add/Remove from List dialog.

Option	Description
Meta Value	Displays the selected entity or meta value that needs to be added to or removed from one or more lists. You can also a create a new list using the selected value.
Create New List	When clicked, it displays a dialog to create a new list using the selected meta value.

Option	Description
All	Shows all of the available Context Hub lists. The lists that contain the selected entity or meta value are selected. Select a checkbox to add an entity or meta value to a list. Clear a checkbox to remove it from the list.
Selected	Shows only the lists that contain the selected entity or meta value. (All lists are selected.)
Unselected	Shows only the lists that do not contain the selected entity or meta value. (All lists are unselected.)
Filter Results	Enter the name or description of a specific list to search from multiple lists.
List	Displays the name of all the lists.
Description	Displays information about the selected list. The description that you provide when creating a list appears in this dialog. For example: This list contains all of the blacklisted IP addresses.
Cancel	Cancels the operation.
Save	Saves the changes.

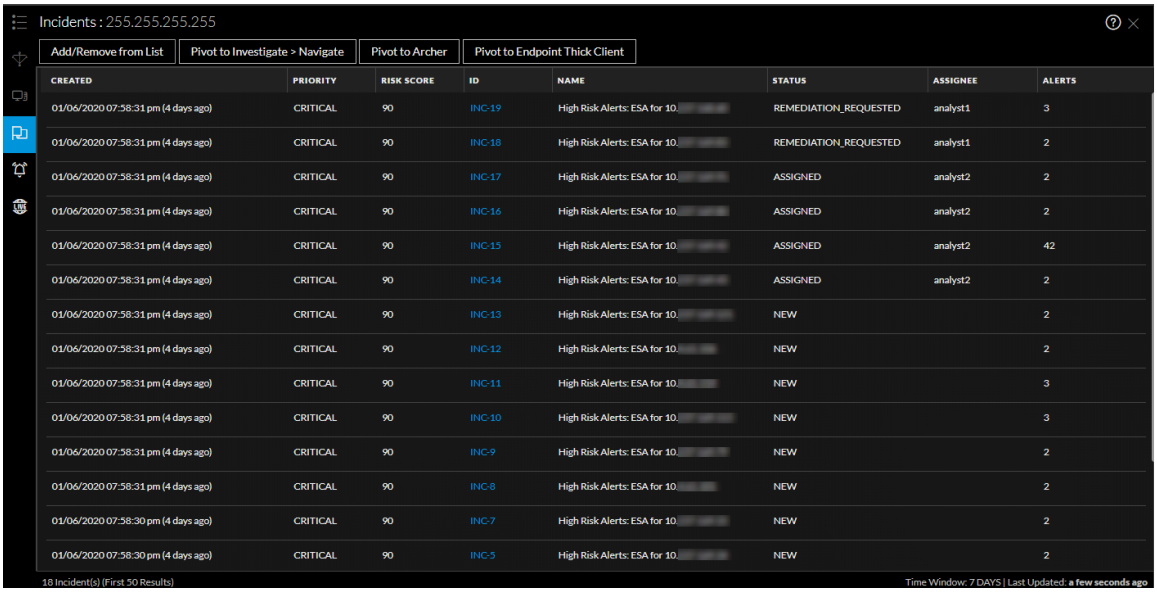
Context Lookup Panel - Respond View

The Context Hub service brings together contextual information from several data sources into the Respond view so that analysts can make better decisions during their analysis and take appropriate action. Seeing the entities, meta values, and contextual information in a single interface helps analysts to prioritize and identify areas of interest. For example, recently created incidents and alerts from the Respond view involving a given entity or meta value will be displayed when the analyst queries for additional information for that entity or meta value. The Context Lookup panel displays contextual information for the selected entities or meta values such as IP address, User, Host, Domain, File Name, or File Hash. The data available depends on the configured sources in the Context Hub.

The Context Lookup panel displays the contextual information based on the data available on the configured sources in the Context Hub.

Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Respond** view to view context lookups for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

What do you want to do?



Role	I want to ...	Show me how
Incident Responders, Analysts, Threat Hunters	Navigate to the Context Lookup panel.	From the Incident Details view, see View Contextual Information. From the Alert Details view, see View Contextual Information.
Incident Responders, Analysts, Threat Hunters	Understand the information in the Context Lookup panel for a selected entity.	See the information in this topic.
Administrator	Configure Data Sources for Context Hub.	See "Configure Data Sources for Context Hub" in the *Context Hub Configuration Guide*.
Administrator	Configure Context Hub settings.	See "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.

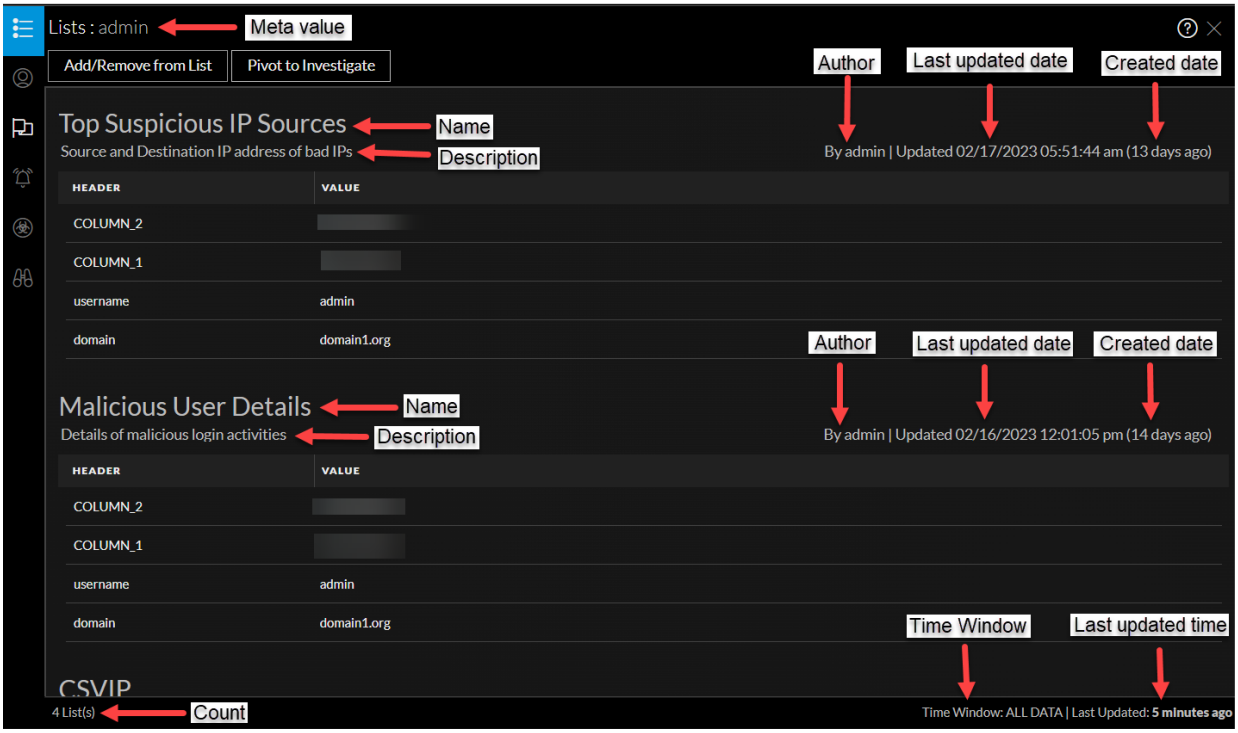
Contextual Information Displayed in the Context Lookup Panel

The contextual information or query results displayed in the Context Lookup panel depends on the selected entity and the associated data sources. The Context Lookup panel has separate tabs for each of the data sources. The tabs are: List data source, Archer, Active Directory, Endpoint, Incidents, Alerts, and REST API. The following figure shows the Context Lookup panel for a selected entity in the Incident Details view.

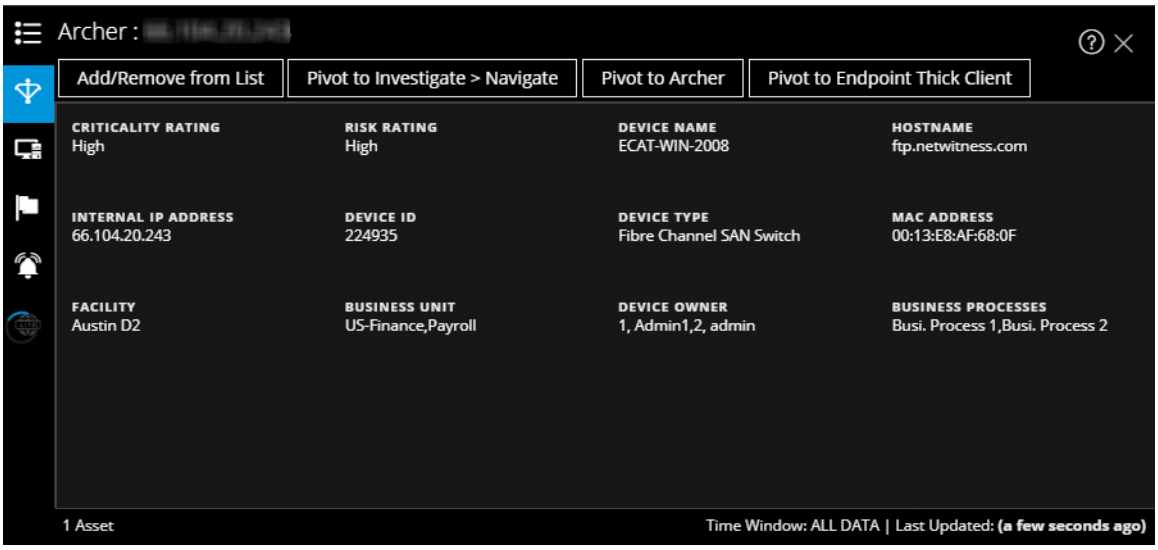


The following table describes the data available on each tab and the supported entities.

Tab	Description	Supported Entities
(Lists)	Displays all of the list data associated with the selected entity or meta value. The result is sorted by the last updated list.	All entities
(Archer)	Displays asset information along with criticality ratings using the Archer data source.	IP, Host, and Mac
(Active Directory)	Displays all user information for the selected user.	User

Tab	Description	Supported Entities
 (NetWitness Endpoint)	Displays the NetWitness Endpoint data source information for the selected entity or meta value, which includes the Machines, Modules, and IIOC levels. Modules are by highest IOC score to lowest IIOC score and IIOC levels are sorted by highest IOC levels to lowest IOC levels.	IP, MAC address, and Host
 (Incidents)	Displays the list of incidents associated with the selected entity or meta value. The result is sorted by newest incidents to oldest incidents.	All entities
 (Alerts)	Displays the list of alerts associated with the selected entity or meta value. The result is sorted by newest alerts to oldest alerts.	All entities
 (Live Connect)	Displays information related to Live Connect.	IP, Domain, and Filehash
 (File Reputation)	Displays file reputation status for Filehash entities.	Filehash entities
 TI	Displays information for STIX data sources.	IP address, email address, domain, filename, URL's, and file hash. **Note:** The context lookup for email address and URL will be displayed only if these metas are mapped. Navigate to  (Admin) > System > Investigation > Context Lookup.
 REST API	Displays the list of REST APIs (enabled in Context Hub) associated with selected the entity.	All entities

Lists Tab

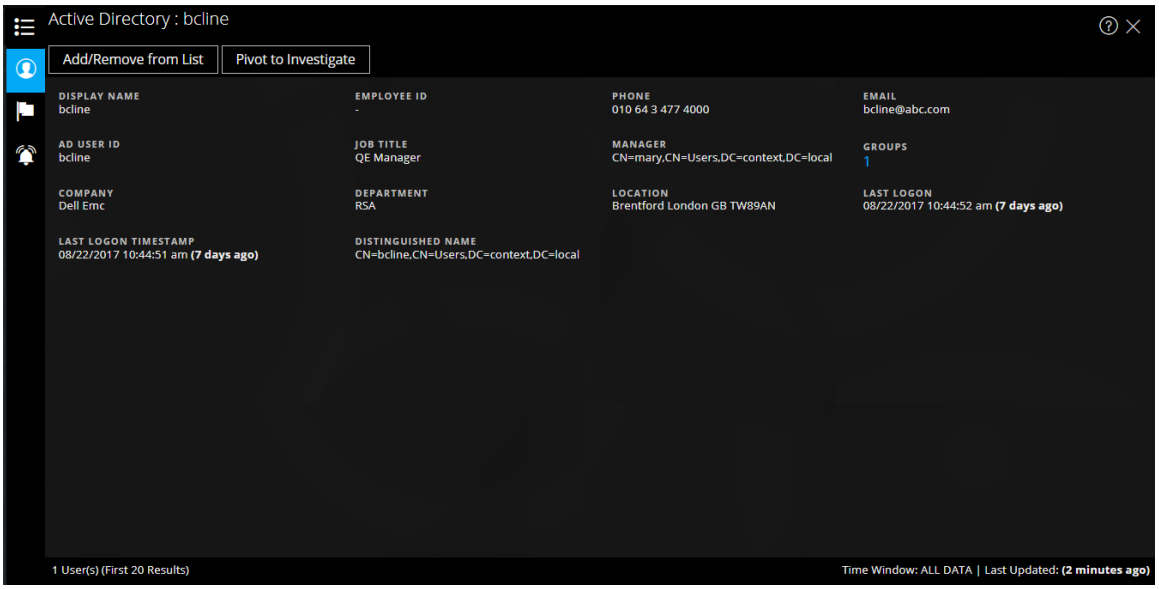


The Context Lookup panel for Lists shows one or more lists associated with the selected entity or meta value. The following figure is an example of the Context Panel for Lists, and the table describes the fields.

Field	Description
Name	The name of the list (defined while creating the list).
Description	The description of the list (defined while creating the list).
Header	Displays the metas available for the list.
Value	Displays the values for each meta in the list.
Author	The owner who created the list.
Created	The date when the list was created.
Updated	The date when the list was last updated or modified.
Count	The number of lists in which the selected entity or meta value is available.
Time Window	The time window based on the value set for the "Query Last" field in the Configure Responses dialog. By default, all Lists data is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Archer Tab

The Context Lookup panel for Archer displays asset information along with criticality ratings using the Archer data source for IP, Host, and Mac entities. The following figure is an example of the Context Lookup panel for Archer, and the table describes each field.



Field	Description
Criticality Rating	The device operational criticality based on the applications it supports. The criticality ratings can be set as Not Rated, Low, Medium-Low, Medium, Medium-High, or High.
Risk Rating	The calculated risk rating for the device based on the most recent assessment and the average risk rating of facilities using the device. The risk rating can be set as Severe, High, Medium, Low, or Minimal.
Device Name	The unique name of the device.
Host Name	The host name of the device.
IP Address	The primary internal IP address of the device.
Device ID	The automatically populated value that uniquely identifies the record across all applications within the system.
Type	The device type, for example, server, laptop, desktop, and others.
Facilities	Links to records in the Facilities application that are related to this device.
Business Unit	Links to records in the Business Unit application that are related to this device. For more than three business unit values, you can hover over the field to view the values.
Device Owner	The person who is responsible for the device and receives read and update rights of the record.

Field	Description
Count	The number of assets available.
Time Window	The time window based on the value that is set for the "Query Last" field in the Configure Responses dialog. By default, all data for Archer is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

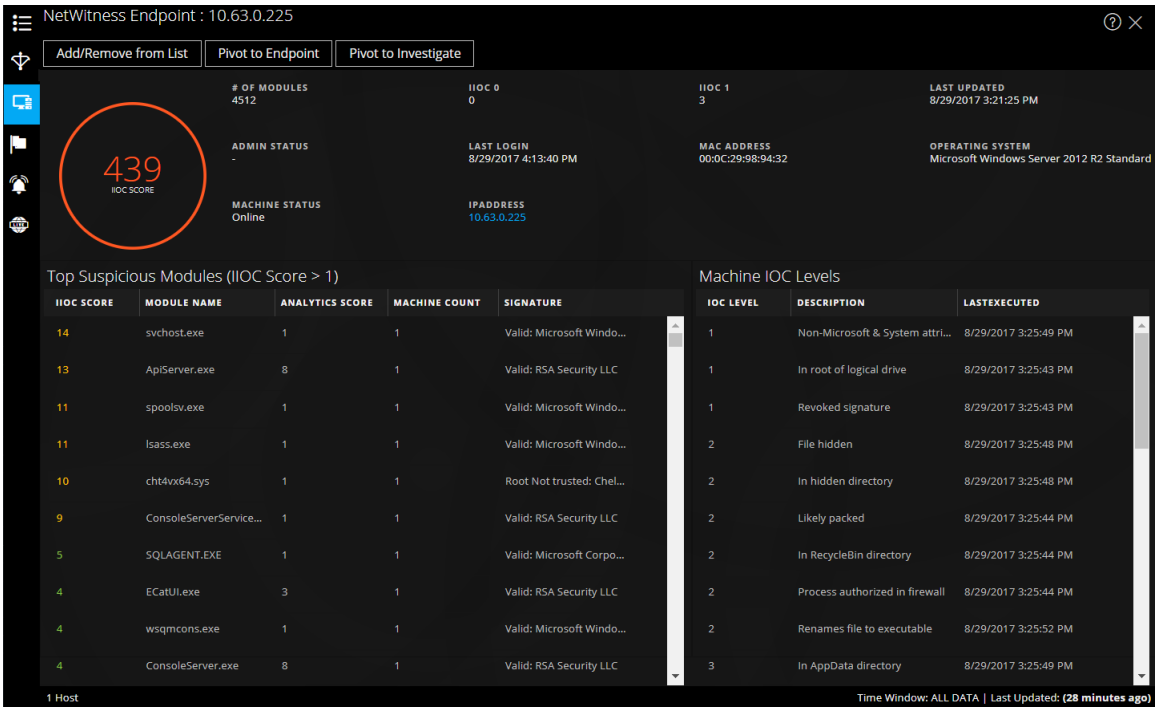
Note: In the localized versions, only these twelve fields are displayed: Criticality Rating, Risk Rating, Device Owner, Business Unit, Host Name, MAC Address, Facilities, IP Address, Type, Device ID, Device Name, and Business Processes.

Active Directory Tab

The following figure is an example of a Context Lookup panel for Active Directory.

The Context Lookup panel for Active Directory displays all the related information, incidents, and alerts for a user. You can perform a look up using the following formats:

- userPrincipalName
- Domain\UserName
- sAMAccountName



The following information is displayed for Active Directory.

Field	Description
Display Name	The name of the user.
Employee ID	The employee ID of the user.

Field	Description
Phone	The phone number of the user.
Email	The email ID of the user.
AD User ID	The unique identification of the user within an organization.
Job Title	The designation of the user.
Manager	The name of the user's manager.
Groups	The list of groups of which the user is a member.
Company	The name of the user's company.
Department	The department name to which the user belongs within the organization.
Location	The location of the user.
Last Logon	The time when the user logged into the system, only if the Global Catalogue is defined.
Last Logon TimeStamp	The time when the user logged into the system.
Distinguished Name	The unique name assigned to the user.
Count	The number of users.
Time Window	The time window based on the value that is set for the "Query Last" field in the Configure Data Source Settings dialog. By default, all data for Active Directory is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

NetWitness Endpoint Tab

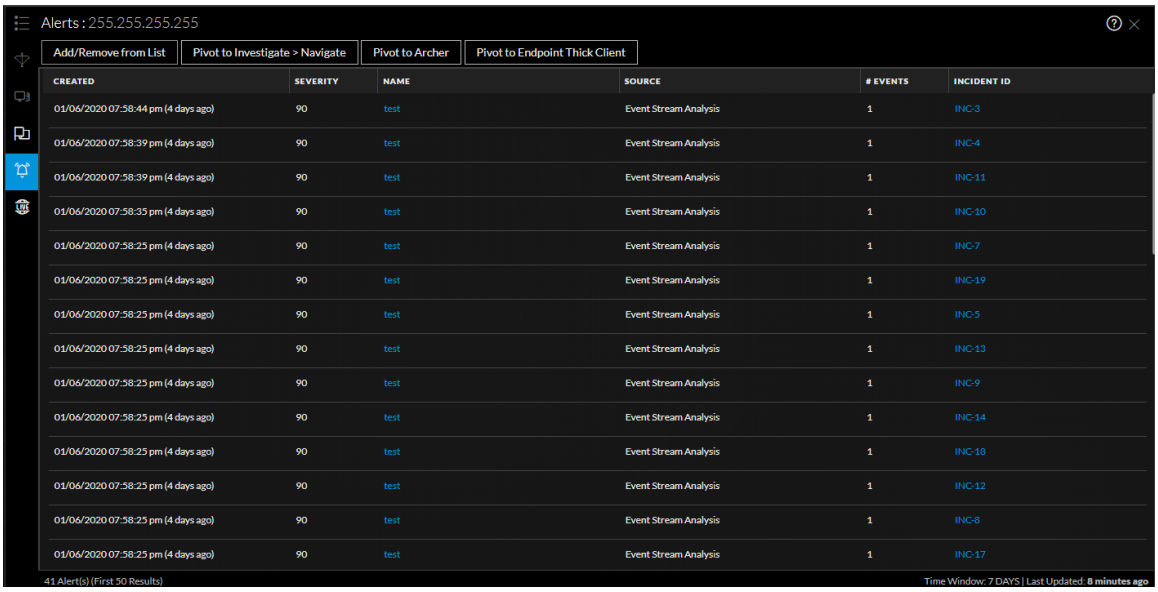
The following figure is an example of the Context Lookup panel for NetWitness Endpoint.

The following information displayed for IIOCs.

Field	Description
# Of Modules	The number modules that are looked up.
Admin Status	The admin status (if any).
Last Updated	The time when the data was last refreshed.
Last Login	The time when the user last logged in.
MAC Address	The Machine MAC Address.
Operating System	The Version of the Operating System used by the NetWitness Endpoint machine.
Machine Status	The state of the module being viewed: Online, Offline, Active, or Inactive.
IP Address	The IP address of the specific module.

The following information is displayed for modules.

Field	Description
IIOC Score	A machine IIOC score is an aggregated score based on the module scores. This is based on the value set for Minimum IIOC Score field in the Context Hub Data Source Settings dialog. The default value for Minimum IIOC Score is 500. See "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.



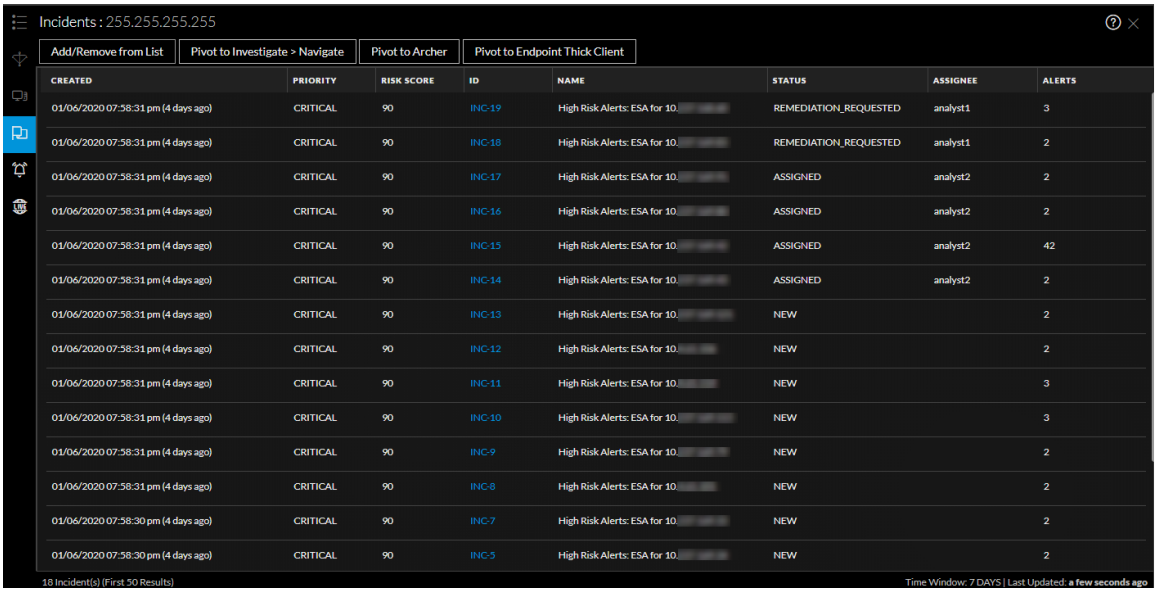
Field	Description
Module Name	The name of the module that is being looked up.
Analytic Score	The number of active files for the selected machine.
Machine Count	The number of machines on which that particular IOC got triggered.
Signature	Indicator of whether the file is signed or unsigned, valid or invalid, and signatory information. For example, Google, Apple, and so on.

The following information is displayed for machines.

Field	Description
IOC Levels	The IOC levels.
Description	The description for he IOC level if available.
Last executed	The time when the action was executed.
Count	The number of hosts that are being looked up.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, all data for NetWitness Endpoint is fetched.
Last Updated	The time when scan results were last updated in NetWitness Endpoint database.

Alerts Tab

The following figure is an example of Context Panel for Alerts that is displayed based on time first (Newest to Oldest) and then severity.

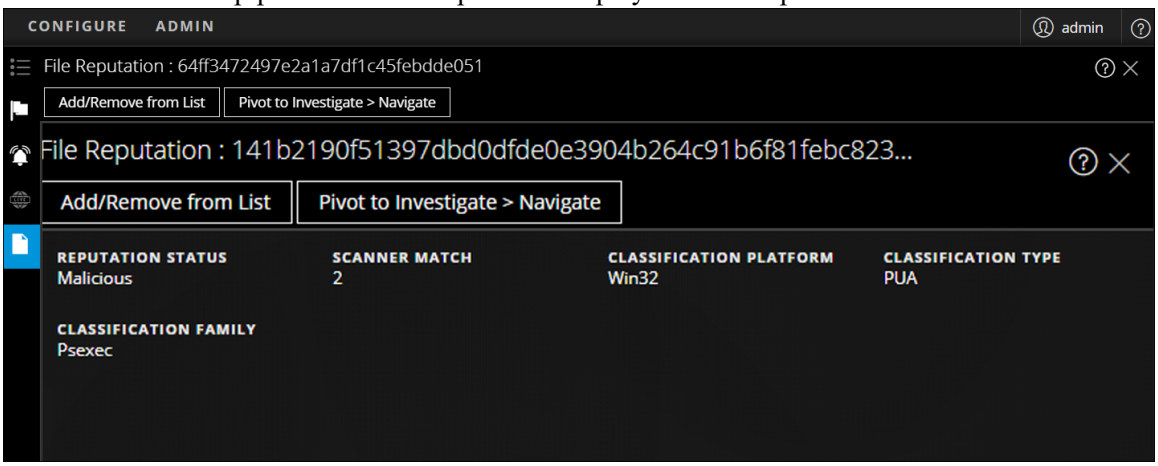


The following information is displayed in the Context Lookup panel for Alerts.

Field	Description
Created	The date and time when the alert was created.
Severity	The severity value of the alerts.
Name	The name of the alert. You can click the name to view the details of a specific alert.
Source	The alert source name from which the alert is triggered.
#Events	The number of events associated with the alert.
Incident ID	The ID of the incident (if any) with which the alert is associated. You can click the ID to view the details of a specific alert.
Count	The number of alerts. By default only the first 100 alerts are displayed. For more information on how to configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	The time when contextual data was last fetched from data source.

Incidents Tab

The following figure is an example of the Context Panel for Incidents, which is based on time first (Newest to Oldest) and then priority status.

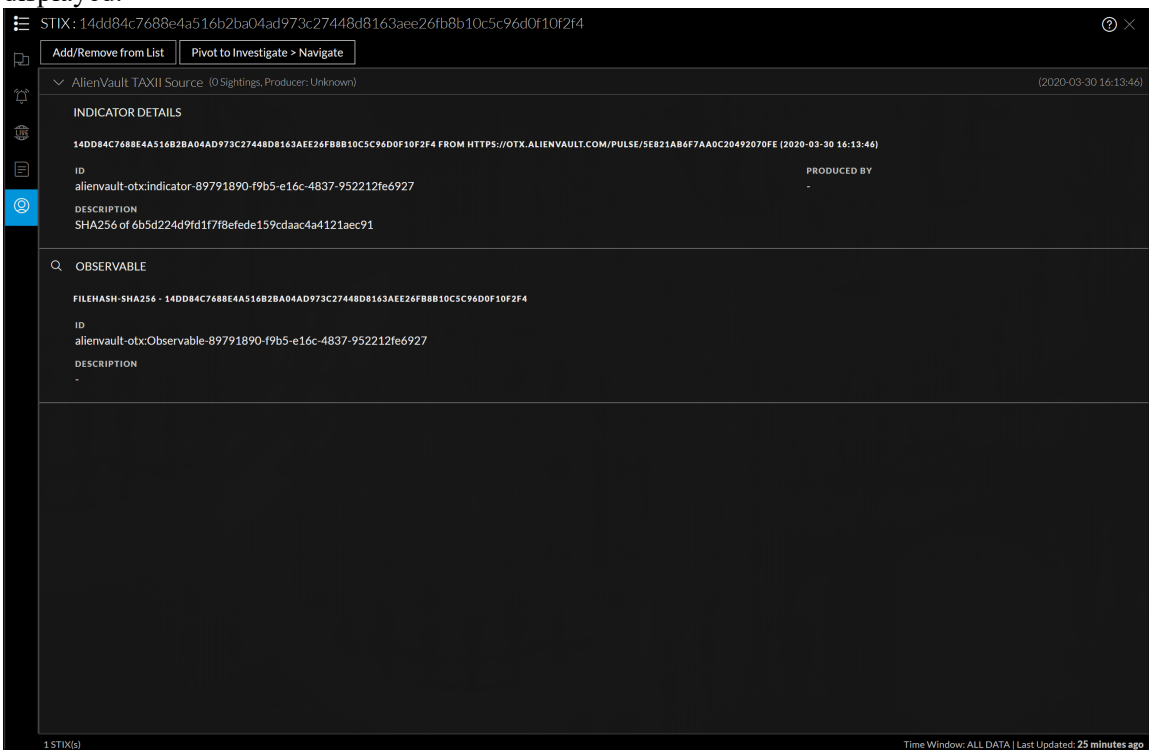


The following information is displayed in the Context Lookup panel for Incidents.

Field	Description
Created	The date when the incident was created.
Priority	The priority status of the incidents.
Risk Score	The risk score of the incidents.
ID	The Incident ID of the incident. You can click on the ID to display further details about the incident.
Name	The incident name.
Status	The status of the incident
Assignee	The current owner of the incident.
Alerts	The number of alerts associated with the incident.
Count	The number of incidents. By default only the first 100 incidents are displayed. For more information on how configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	The time when contextual data was last fetched from data source.

File Reputation Tab

The Context Lookup panel for File Reputation displays the file reputation status of a file.



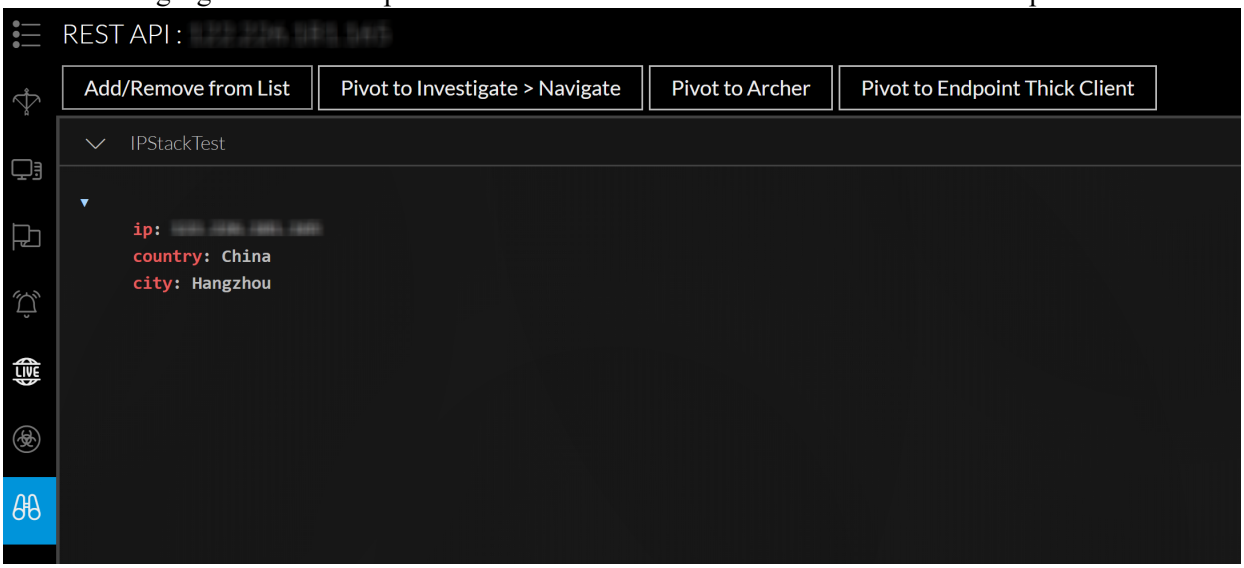
Field	Description
Reputation Status	Reputation Status of filehash. For more information about reputation status, see "View Reputation of files" in the *UEBA User Guide*.

Field	Description
Scanner Match	Number of scanners that detected malware or suspicious activity in the last scan.
Classification Platform	Classification for the queried filehash based on the platform. For example, the platform can be Win 32.
Classification Type	Classification for the queried filehash based on the type.
Classification Family	Classification for the queried filehash based on the malware family name.

TI Tab

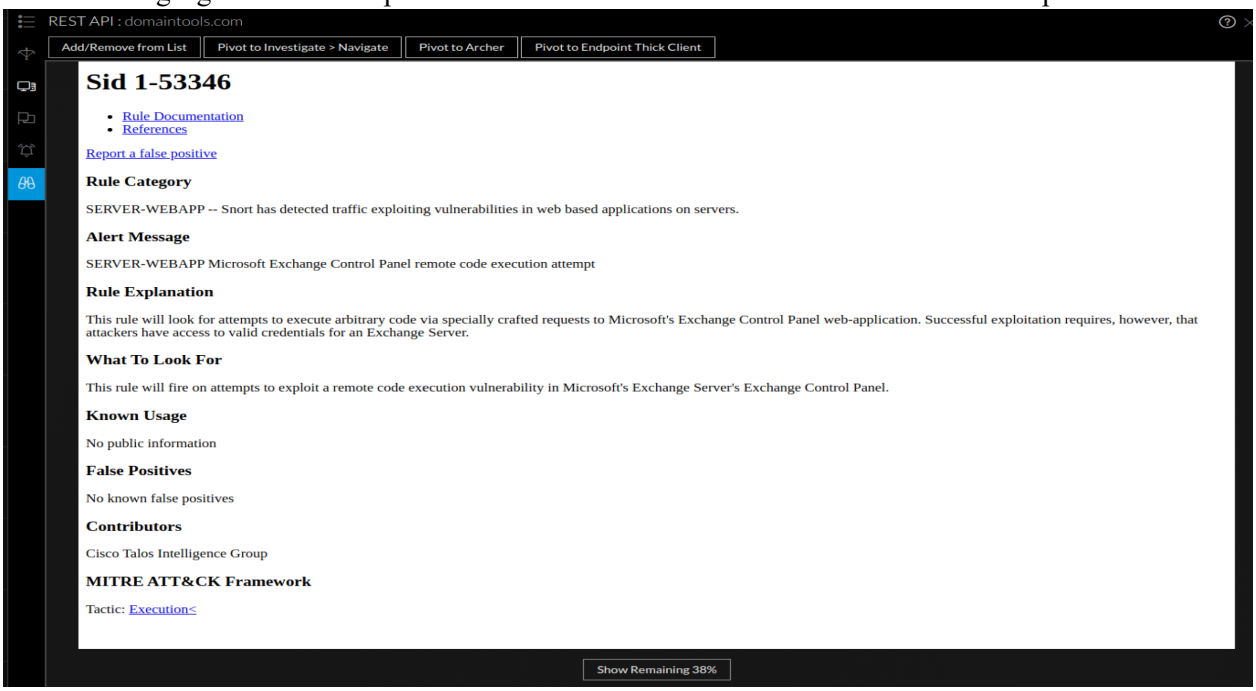
The following figure is an example of a Context Panel for TI, and the table describes the information displayed.

Field	Description
Data Source name	Displays the STIX data source name from where the data is retrieved.
Timestamp	The time when the event was created.



Field	Description
Indicator Details	Indicator Title: Displays the details that contains a pattern that can be used to detect suspicious or malicious cyber activity. ID: Displays the ID of the selected indicator. Produced by: Displays the user role who requested for the STIX data. Description: Displays details about the selected IP address which are being watch listed.
Observable	Observable Title: Displays and conveys information about cyber security related entities such as files, systems, and networks using the STIX Cyber-observable Objects (SCOs). ID: Displays the ID of the selected observable.
(Optional) SightingsREST	Sightings Title: Displays the name of the sighting source. Confidence: Displays the criticality of the sighting. Reference: Displays the reference URL of the sighting source.

REST API Tab



The Context Lookup panel for REST API shows HTML or JSON response (based on the response type configured) associated with the selected entity or meta value.

Note: For JSON response type, the fields that are mapped with friendly names (during REST API configuration) are only displayed for context Lookup. If you have not mapped any fields, all fields are displayed for context lookup.

The following figure is an example of the Context Panel for REST API with JSON response:

The following figure is an example of the Context Panel for REST API with HTML response:

NetWitness® Platform

Version 12.3.1.0

The Basics

This guide describes the basic requirements of a NetWitness deployment and outlines optional scenarios to address the needs of your enterprise. Even in small networks, planning can ensure that all goes smoothly when you are ready to bring the hosts online.

Note: This document refers to several additional documents available on NetWitness Community Link. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

There are many factors you must consider before you deploy NetWitness. The following items are just some of these factors. You need to estimate growth and storage requirements when you consider these factors:

- The size of your enterprise (that is, the number of locations and people that will use NetWitness)
- The volume of network data and logs you need to process
- The performance each NetWitness user role needs to do their jobs effectively.
- The prevention of downtime (that is, how to avoid a single point of failure).
- The environment in which you plan to run NetWitness
  - RSA Physical Hosts (software running on hardware supplied by RSA)
  - Software Only provided by NetWitness:
    - On-Premises (On-Prem) Virtual Hosts
      See the *NetWitness Virtual Host Installation Guide* for detailed instructions on how to deploy on-prem virtual hosts.
    - VCloud:
      - Amazon Web Services (AWS)
        See the *NetWitness AWS Installation Guide* for detailed instructions on how to deploy virtual hosts in AWS.
      - Azure
        See the *NetWitness Azure Installation Guide* for detailed instructions on how to deploy virtual hosts in Azure.
      - Google Cloud Platform (GCP)
        See the *NetWitness Google Cloud Platform Installation Guide* for detailed instructions on how to deploy virtual hosts in Google Cloud.

Basic Deployment

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

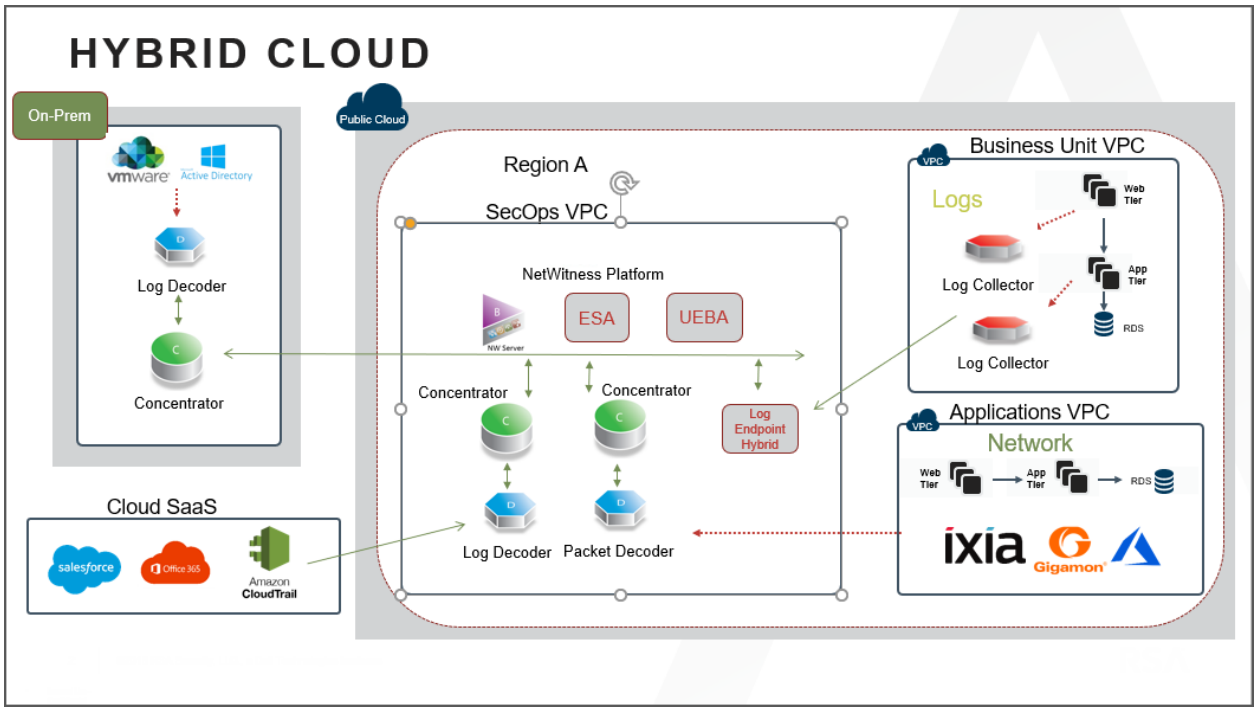
- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When ready to begin deployment, the general sequence is:

- For RSA Physical Hosts:
  1. Install physical hosts and connect to the network as described in the NetWitness Hardware Setup Guides and the *NetWitness Physical Host Installation Guide*.
  2. Set up licensing for NetWitness as described in the *NetWitness Licensing Guide*.
  3. Configure individual physical hosts and services as described in *NetWitness Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.
- For On-Prem virtual hosts, follow the instructions in the *NetWitness Virtual Host Setup Guide*.
- For AWS, follow the instructions in the *NetWitness AWS Installation Guide*.
- For Azure, follow the instructions in the *NetWitness Azure Installation Guide*.
- For Google Cloud, follow the instructions in the *NetWitness Google Cloud Platform Installation Guide*.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *NetWitness Host and Services Getting Started Guide*.



NetWitness High-Level Deployment Diagrams

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log, and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

Deployment Optional Setup Procedures

You can deploy NetWitness with the following options.

Analyst User Interface
Group Aggregation
New Health and Wellness Search
Hybrid Categories on Series 6 (R640) Hardware
NW Server Deployment on ESA Hardware
Second Endpoint Server
Warm Standby NW Server

Analyst User Interface

The Analyst User Interface (UI) gives you access to a subset of features in the NetWitness Platform UI that you can set up in individual locations when you deploy NetWitness Platform in multiple locations. It is designed to reduce latency and improve the performance that can occur when accessing all functionality from the Primary User Interface on the NW Server Host (Primary UI).

You can have can have multiple Analyst UI instances provisioned in the same manner as the other NW component hosts.

Features and Limitations

Each Analyst UI host:

- Can be deployed to specific organizational groups. For example: the Americas, EMEA, APAC, Tier 1 Analysts, Tier 3 Analysts.
- If Analyst UI hosts are deployed regionally, you have the capability of querying those regional brokers directly (less latency), instead of than having to route through the Primary UI.
- Helps distribute load off the Primary UI.
- Has its own Reporting Engine (RE).
- If it becomes unavailable for any planned or unplanned reason, it will not affect the Primary UI or any other Analyst UI instances.
- Provides the same pre-query filter verification, Data Privacy protection, and RBAC functionality as the Primary UI.
- Points back to the primary NW Server for authentication and configuration.
- Does not have access to any administrative functions. All administration functions take place on the Primary UI.
- Does not allow you to create or manage Content (that is, ESA rules, app rules, feeds). All Content creation and management takes place on the Primary UI.

Use Case

Large environments that include Geo distribution with a single data center and multiple NW Servers require Analyst UI instances in all their NetWitness locations or managed entities.

For example, if an Analyst UI is deployed for the EMEA SOC team, analysts can query their EMEA NetWitness Platform hosts directly. If the EMEA team has Broker hosts and Concentrator hosts within the region, the Analyst UI can connect and query them instead of connecting back to Primary user Interface (Primary UI).

Deployment

You must install the **Analyst UI** service category on a dedicated host and you install it in the same manner as any component service category on a host.

See the "Task 2 - Install 11.7 on Other Component Hosts" in the NetWitness Platform Installation Guides for instructions on how to install any component service. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

After you provision the Analyst UI host (that is after you run the nwsetup-tui for the component host designated for the Analyst UI), complete the following steps to install the Analyst UI service category on the provisioned host.

1. Log in to **NetWitness** and go to  (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

2. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

3. Select that host in the **Hosts** view (for example, **Analyst UI**) and click 

   .
   The **Install Services** dialog is displayed.

4. Select **Analyst UI** in **Category** and click **Install**.

5. Configure NetWitness Platform for each Analyst UI instance.Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

   a. Make sure that each Analyst UI instance is connected to the correct local Reporting Engine and has the appropriate Investigation parameters set. The *Getting Started Guide for NetWitness Platform* describes the default Analyst UI Dashboard and how you manage dashboards.

   Note: You must add data sources to each Reporting Engine instance to execute Reports and Charts on an Analyst UI. See "Configure the Data Sources" in the*Reporting Engine Configuration Guide for NetWitness Platform* for instructions.

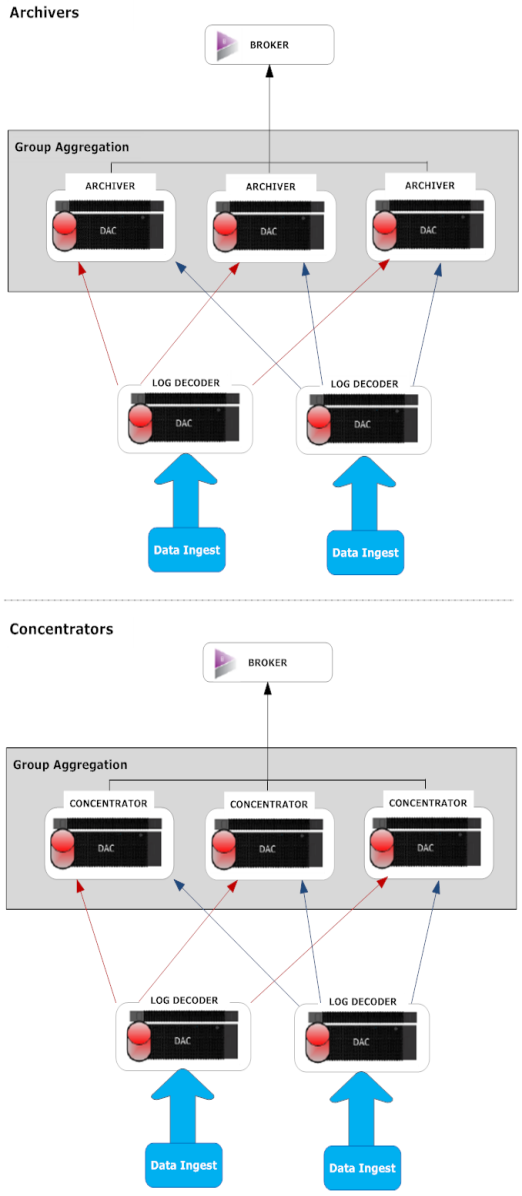
b. Configure whether to normalize alerts for any Respond Server (NW Server or Analyst UI) by enabling or disabling alert normalization. "Configure Analyst UI for Respond Server Alert Normalization" in the *NetWitness Respond Configuration Guide for NetWitness Platform* tells you how to configure Respond Server alert normalization for the Analyst UI.

Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

NetWitness Group Aggregation Deployment Recommendations



NetWitness recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

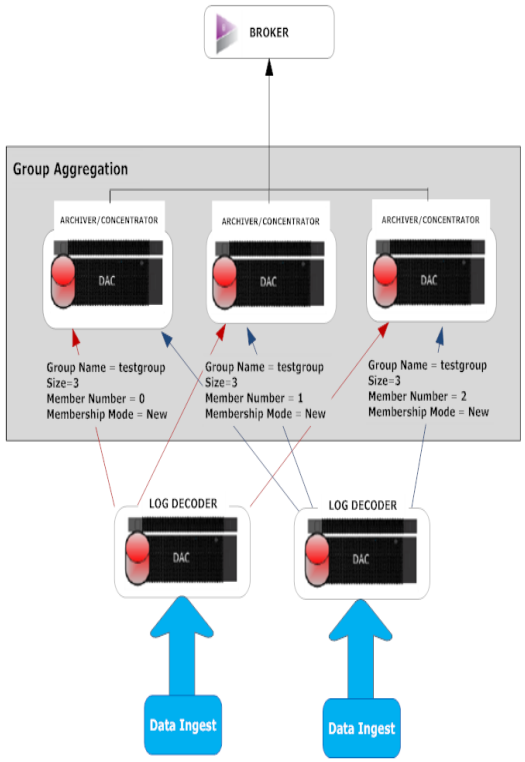
Advantages of Using Group Aggregation

- Increases the speed of NetWitness queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.

You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated sessions between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter set to 10,000, the services would divide the session between themselves as illustrated in the following table.



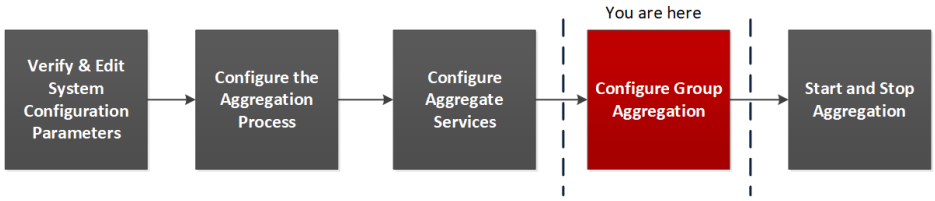
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name.
Size	It determines the number of Archiver or Concentrator services in the aggregation group.
Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: • **New**: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. • **Replace**: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from.

Note: The Membership Mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.

Complete the following steps to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.

2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

   a. Go to **(Admin) > Services**.

   b. Select the Archiver or Concentrator service, and select > **View** > **Config**.

   The Service Config view of the Archiver or Concentrator is displayed.

   c. In the **Aggregate Services** section, select **Log Decoder**.

   d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

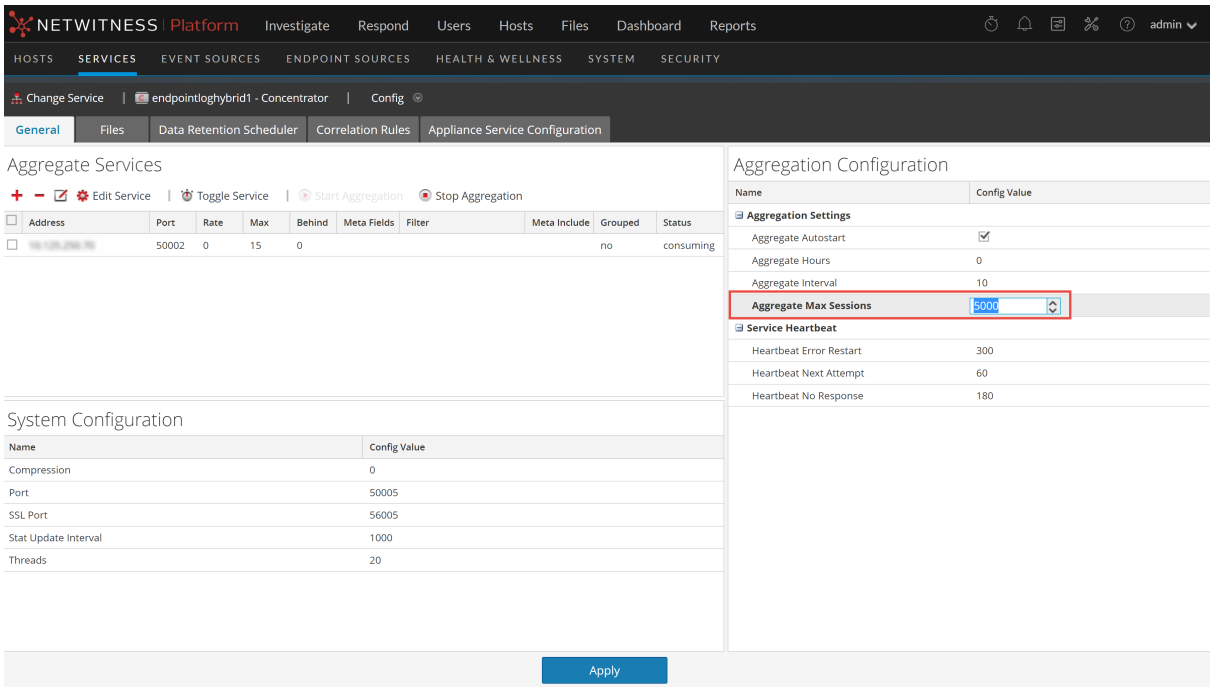
   e. Click .

   The **Edit Aggregate Service** dialog is displayed.

   f. Click Group Aggregation.

   The **Edit Group Aggregation** dialog is displayed.

   g. Select the **Enabled** checkbox and set the following parameters:



- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

i. In the Service Config view, click **Apply**.

j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.

New Health and Wellness

New Health and Wellness is an advanced monitoring and alerting system that provides insights on the operational state of the host and services in your deployment, and helps identify potential issues.

System Requirements

The following tables list the memory, disk, and CPU recommended for the New Health and Wellness based on the size of the deployment.

Note: The recommended values might differ when you install and try the new features and enhancements.

Caution: If the New Health and Wellness node is on a different subnet, you must open the respective NetWitness Platform hosts port. For more information, see "New Health and Wellness on Different Subnet" section in the Network Architecture and Ports.

Standalone Virtual Host

Minimum memory for a standalone virtual host is 16 GB.

Each NetWitness platform host writes 150 MB of New Health and Wellness metrics data into Elasticsearch data per day. For example, if you have 45 NetWitness Platform hosts then 6.6 GB of metrics data is written to Elasticsearch per day.

CPU	Memory
4 cores	16 GB

Physical Host

Deployment Size	Memory	CPU	DISK per day
Small (~5-10 hosts / 20-40 services)	16 GB	15%	1.5 GB
Medium (~150-200 hosts / 300- 400 services)	18 GB	15%	29 GB
Large (~250-300 hosts / 500-600 services)	22 GB	15%	44 GB

Based on the resources available, you can deploy the 11.7 New Health and Wellness feature on any one of the following, listed in the order of preferred deployment method with most preferred first:

- Standalone virtual host (Most preferred recommendation to ensure no performance impact on any other functionality of deployed nodes)

- Physical host:
  - Broker
  - Admin Server
  - ESA

Installing New Health and Wellness enables all hosts in your deployment to start sending metrics to monitor New Health and Wellness. After you deploy New Health and Wellness , see the "Monitor New Health and Wellness " topic in the *System Maintenance Guide* for instructions on how to configure and use this feature.

Please direct any New Health and Wellness feedback to nw.health.wellness.feedback@netwitness.com.

After you provision the New Health and Wellness host, complete the following steps to install the **New Health and Wellness** service category on the provisioned host.

1. Log in to NetWitness and go to  (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   Note: If you are not installing New Health and Wellness on a standalone virtual host ignore step 2.

2. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.
3. Select that host on which New Health and Wellness should be installed in the **Hosts** view (for example, **New Health and Wellness**) and click 

.

The **Install Services** dialog is displayed.

4. Select **New Health and Wellness** in **Category** and click **Install**.
5. Refresh all hosts to write to elastic search.
   a. SSH to the NW Server host.
   b. Run the following commands.
      `nw-manage --refresh-host --host-all`
      This may take few minutes for the changes to take effect based on the number of hosts in your deployment.

Note: (For Standalone Virtual host only) After you review your initial datastore configuration, you may determine that you need to add a new volume. For information on adding a new volume see “Add New Volume and Extend Existing File Systems” topic in the *Virtual Host Installation Guide*.

Note: After you have installed New Health and Wellness, for some reason, if you want to uninstall New Health and Wellness, you must refer to "Uninstall New Health and Wellness" in the *Upgrade guide*.

Hybrid Categories on Series 6 (R640) Hardware

You can install Hybrid Categories such as Log Hybrid and Network (Packet) Hybrid service categories on a Series 6 (R640) Physical host. This gives you the ability to attach multiple PowerVault external storage devices to the Series 6 (R640) Physical host.

NW Server Deployment on ESA Hardware

You now have the option to deploy the NW Server host on Series 6 Analytics hardware. The Series 6 Analytics Hardware has more memory and storage capacity than the standard Core appliance on which NW Server has typically been deployed. This results in better overall responsiveness and larger retention capacity for Report Engine.

Note: You can install the NW Server on ESA hardware, but you cannot co-locate any ESA services (categories) with the NW Server on this hardware.

Second Endpoint Server

Complete the following procedure to deploy a second Endpoint Server.

1. Set up a new host in NetWitness Platform.
   - For a physical host, complete steps 1 to 16 in "Install NetWitness Platform" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.7*.
   - For a virtual host, complete steps 1 to 6 in "Step 4. Install NetWitness Platform" in the *Virtual Host Installation Guide for NetWitness Platform 11.7*.

     Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. SSH to the host that you set up in step 1.
3. Submit the following command string.
   ```
   mkdir -p /etc/pki/nw/nwe-ca
   ```

   Note: You do not need to modify permissions.
4. Copy the following two files from the previously deployed endpoint server to the new/second endpoint server:
   ```
   /etc/pki/nw/nwe-ca/nwerootca-cert.pem
   /etc/pki/nw/nwe-ca/nwerootca-key.pem
   ```
5. nstall Endpoint on the host.
   a. Log in to NetWitness Platform and go to  (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the Hosts view grayed out in the background.

      Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the new host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the **Hosts** view.

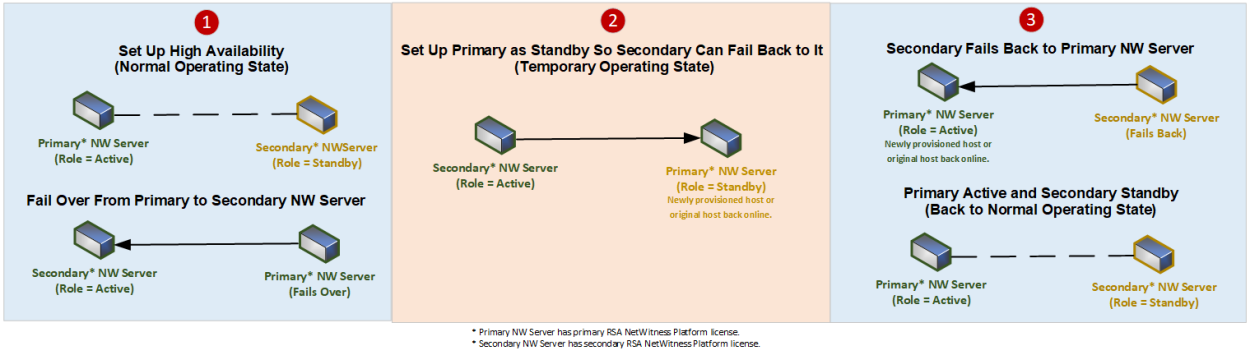
   c. Select that host in the Hosts view (for example, Endpoint Server II) and click 

.
   The **Install Services** dialog is displayed.

   d. Select **Endpoint** in **Host Type** and click **Install**.

Warm Standby NW Server Host

The Warm Standby NW Server duplicates the critical components and configurations of your active NW Server host to increase reliability.



A secondary NW Server remains in the standby role and, when configured, receives backups of the primary NW Server in the active role at regular intervals. If the primary NW Server fails (goes offline), the fail-over procedure must be executed allowing the secondary NW Server to assume the active role.

In version 11.5 and later, we support a secondary NW Server that has a different IP address from the primary NW Server. Having the same IP address for both the primary NW Server and secondary NW Server is no longer necessary.

When you set up a secondary NW Server as a Warm Standby, a failure or scheduled switch from the primary NW Server to the secondary NW Server is referred to as a fail-over. You fail back to return to the normal operating state (that is, primary NW Server in the active role and the secondary NW Server in the standby role).

The following diagram illustrates the fail-over and fail-back process.

1. Set up secondary NW Server as standby (initial setup). This is the normal operating state.
2. The primary NW Server fails over to the secondary NW Server. After the fail-over, get the primary NW Server back online and set it up in the standby role. This is a temporary operating state.
3. Fail the secondary NW Server back to the primary. The primary NW Server is back to the active role and secondary is back to the standby role. This is the normal operating state.

Note: When you set up the secondary NW Server, follow the same administrative procedures, for example, for upgrade and maintenance, as the procedures for the primary active NW Server.

Procedures

Complete the following task to set up a secondary NW Server in the standby role for fail-over:

- Set up a secondary NW Server in the standby role.

Complete the following tasks when required to maintain high availability:

- Fail over the primary NW Server to secondary NW Server.
- Fail back the secondary NW Server to primary NW Server.

Planned Fail-Over Scenario

This scenario occurs when you schedule a fail over (see **Planned Fail-Over** under step 3 in the Fail Over primary NW Server to Secondary NW Server procedure). You should not need do anything after the fail-over completes.

Required Fail-Over Scenario without Hardware Replacement

This scenario occurs when the primary NW Server fails (see *Required Fail-Over* under step 3 in the Fail Over Primary NW Server to Secondary NW Server topic), but you are able to recover it easily without re-imaging (for example, the active NW Server has corrupt or insufficient RAM). You do not need to run the `nwsetup-tui` and you do not need to contact NetWitness Customer Support to reestablish correct licensing when:

1. The active (primary NW Server) fails over to the Standby (secondary NW Server) and that secondary host temporarily assumes the role of the active NW Server.
2. You fix the problem with the primary NW Server (for example, install new RAM) and fail back to it from the secondary host.

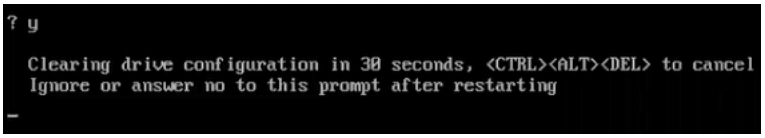
Required Fail-Over Scenario with Hardware Replacement

This scenario occurs when the active NW Server completely fails and the hardware requires replacement, for example you receive a Return Merchandise Authorization (RMA). You need to run reconfigure the host with the `nwsetup-tui` and contact NetWitness Customer Support to reestablish licensing. If you choose to rebuild the replacement host as a temporary standby (for example, until your scheduled fail-back occurs), you must answer "**Yes**" to the **Standby Host Recovery Mode** `nw-setup-tui` prompt when configuring this temporary standby for failing back (see step 4 in the Set Up Secondary NW Server in Standby Role procedure for the context of this prompt).

Set Up Secondary NW Server in Standby Role

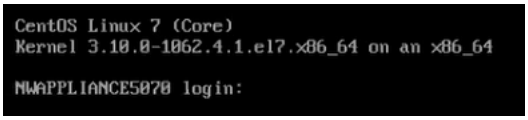
1. Before you install a secondary NW Server host for the standby role, make sure that:
   a. The primary NW Server is running 11.7.
   b. All component hosts are running 11.7
      If you are:
      - Installing NetWitness Platform 11.7, follow the instructions in the *NetWitness Platform Physical Host Installation Guide for Version 11.7*.
      - Updating from 11.x to 11.7, follow the instructions in *NetWitness Platform Update Guide for Version 11.x to 11.7*.
        Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. Create a base image on the secondary NW Server:
   a. Attach media (ISO) to the host.
      See the *NetWitness Platform Build Stick Instructions* for more information.
      - Physical media - use the ISO to create bootable flash drive media the **Etcher®** or another suitable imaging tool etch an Linux file system on the USB drive. See the *NetWitnessBuild Stick Instructions* for information on how to create a build stick from the ISO. Etcher is available at: https://etcher.io.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO file.
   b. Log in to the host and reboot it.

```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```



c. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After some system checks during booting, the following **Welcome to NetWitness Platform 11.7** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.

d. Select **Install NetWitness Platform 11.7** (default selection) and press **Enter**.
The Installation program runs and stops at the **Enter (y/Y) to clear drives** prompt that asks you to format the drives.

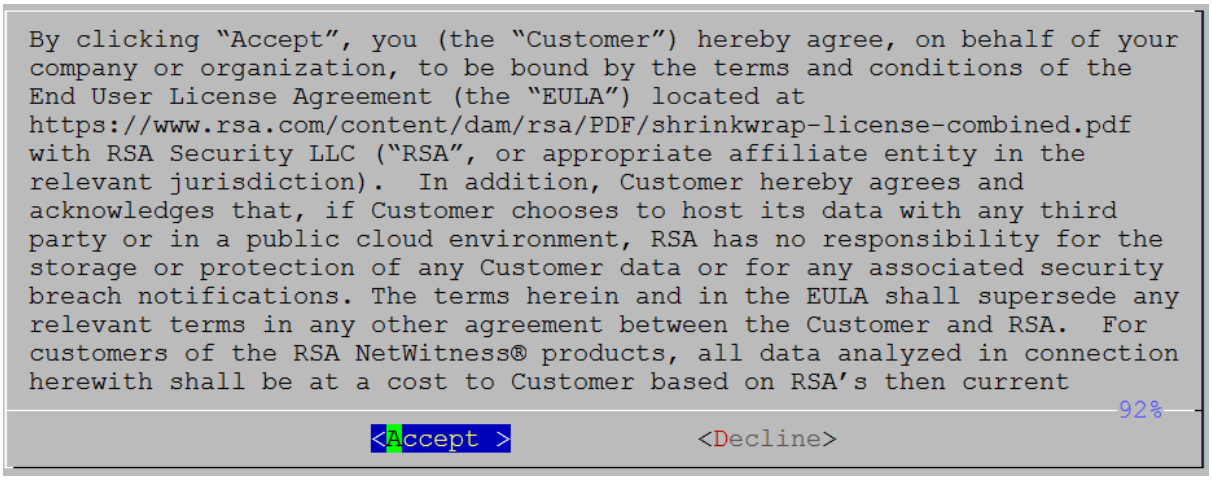


Caution: You must respond y or Y to this prompt even if the host does not have an internal RAID configuration or the installation will fail.

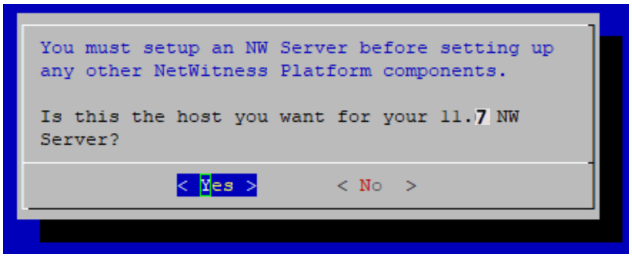
e. Type **Y** to continue.
The default action is No, so if you ignore the prompt and it will select No in 30 seconds and will not clear the drives. The **Press enter to reboot** prompt is displayed.

The system displays the all installation tasks it is performing. This can take a minute or so.After it completes the tasks, the installation program reboots the host.

Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).



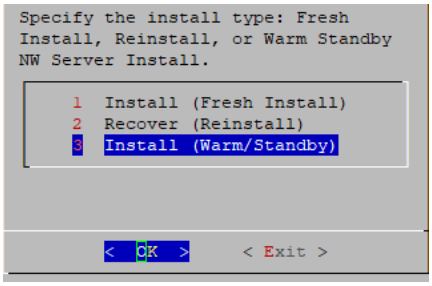
f. Log in to the host with the `root` credentials.



2. Run the `nwsetup-tui` command.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) During the Setup program, when you are prompted for the network configuration of the host, be sure to specify the same network configuration that was used for the original installation of 11.x on this host (it must be exactly the same).

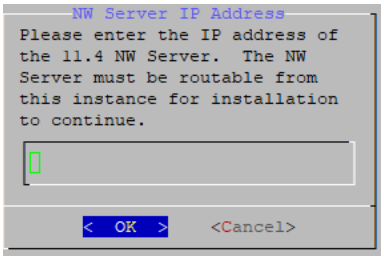
This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.



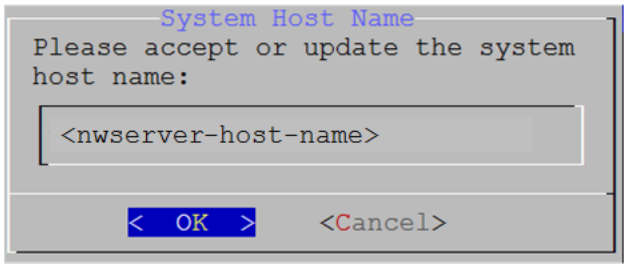
3. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.7 NW Server** prompt is displayed.

   Your response to this prompt identifies a host as either the primary or secondary during a fresh install (and the selected response stays constant regardless of the current or future role, that is active or standby of the host).

4. Tab to **Yes** and press **Enter**.
   The **Install or Recover** prompt is displayed.



5. Tab to **3 Install (Warm Standby)** and press **Enter**.
   The Standby Host Recovery Mode prompt is displayed.



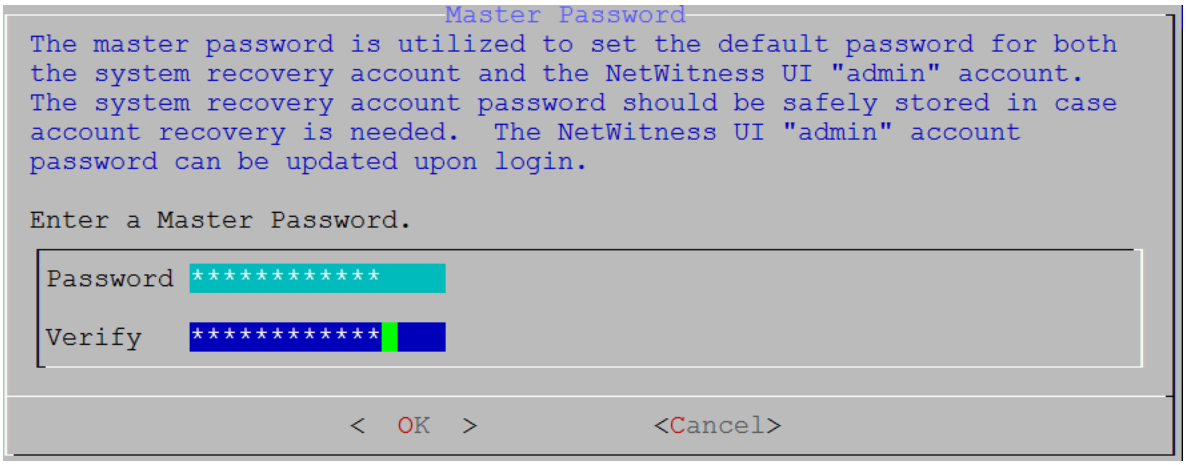
6. Tab to:

   - **No** and press **Enter** to set up a secondary NW Server with the standby role (most common scenario).
   - **Yes** and press **Enter** to set up a host that was previously used as a primary NW Server with the standby role so you can execute a fail-over and fail-back (less common scenario).

     The NW Active Server IP Address prompt is displayed.

7. Type the IP Address of the NW Server in the active role, tab to **OK**, and press **Enter**.
   The **Host Name** prompt is displayed

Caution: If you include "." in a host name, the host name must also include a valid domain name.



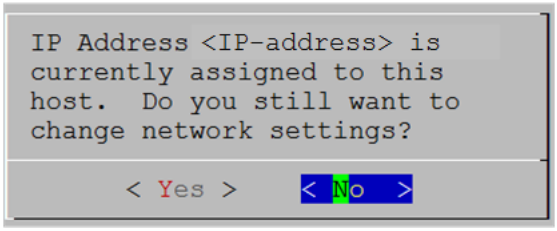
8. Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.
   The **Master Password** prompt is displayed.

   Note: You must use the same Master and Deploy Admin credentials fot the Warm Standby NW Server Host that you used for the Active NW Server Host.

   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols: **! @ # % ^ +**
   - Lowercase Characters: **a-z**
   - Uppercase Characters: **A-Z**

   No ambiguous characters are supported for Master Password and Deployment Password. For example: space { } [ ] ( ) / \ ' " ` ~ ; : .< > -



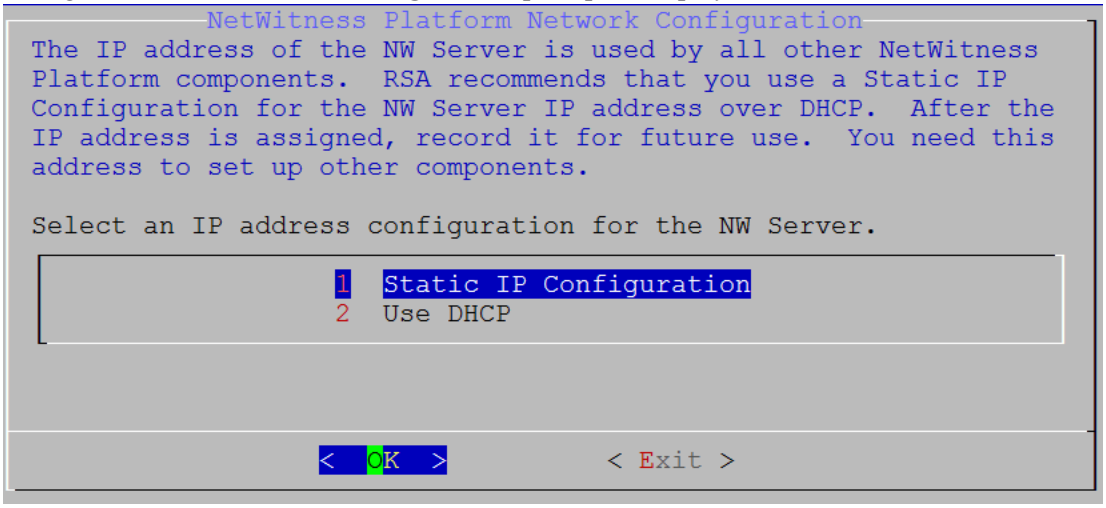
9. Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.
   The **Deployment Password** prompt is displayed.

10. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. One of the following conditional prompts is displayed.

    - If the Setup program finds a valid IP Address for this host, the following prompt is displayed.

      Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.

    - If you are using an SSH connection, the following warning is displayed.



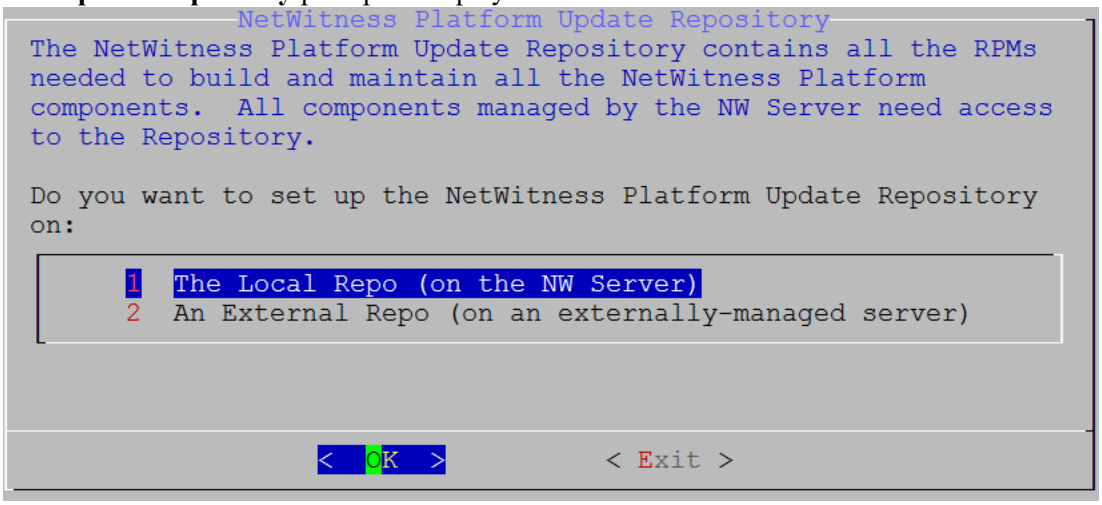
> **Note:** If you connect directly from the host console, the following warning will not be displayed.

      Press **Enter** to close warning prompt.

    - If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 12 to and complete the installation.

    - If the Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

11. Tab to **OK** and press **Enter** to use **Static IP**.
    If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
    The **Network Configuration** prompt is displayed.

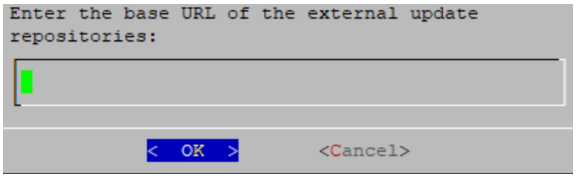


12. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
    The following **Static IP Configuration** prompt is displayed.

13. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

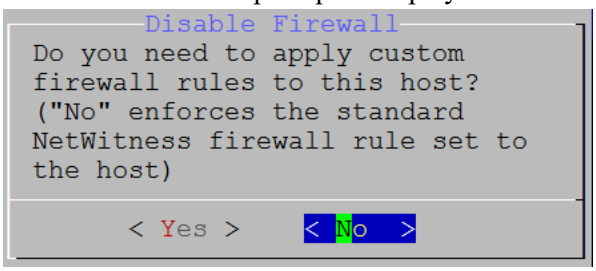
    The **Update Repository** prompt is displayed.



14. Press **Enter** to choose the **Local Repo** on the NW Server.
    If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**.

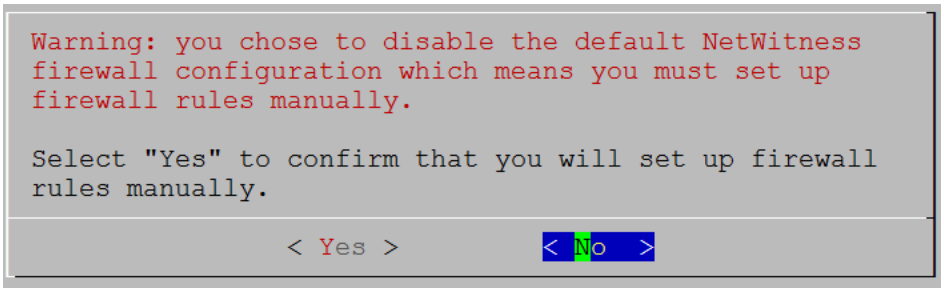
    - If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 11.7
    - .0.0. If the program cannot find the attached media, you receive the following prompt.

- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to NetWitness updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in the *Physical Host Installation Guide* for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



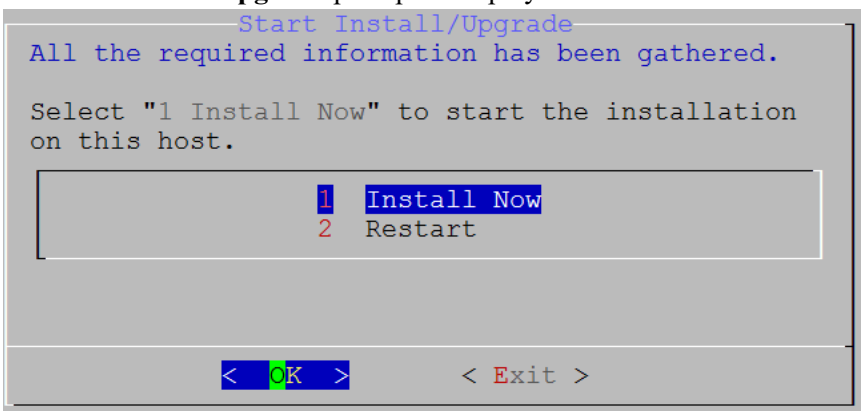
Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

See "Set Up an External Repository with NetWitness and OS Updates" under "Hosts and Services Procedures" in the *NetWitness Platform Hosts and Services Getting Started Guide* for instructions.



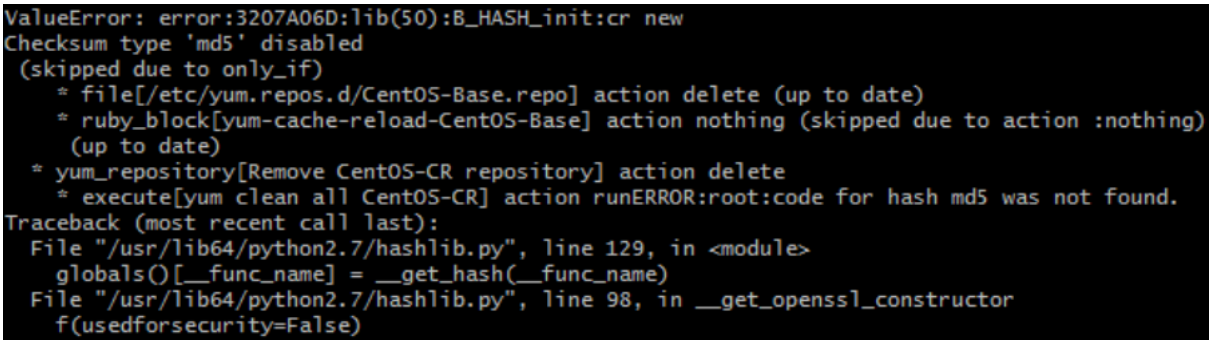
Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

The Disable firewall prompt is displayed.



15. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.



The **Start Install/Upgrade** prompt is displayed.

16. Press **Enter** to install 11.7 on the NW Server.
    When **Installation complete** is displayed, you have installed the 11.7 NW Server on this host.

> **Note:** Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

17. License the secondary NW Server.

    a. Log in to the secondary NW Server User Interface, click  (Admin) > **System** > **Info**, and note the **License Server ID** under **Version Information**.

    b. SSH to the primary NW Server.

    c. Edit the `/opt/netwitness/flexnetls/local-configuration.yaml` file and add the `back up hostid` (that is, the **License Server ID**).
    This is an example of the section of the `local-configuration.yaml` file before you add the **License Server ID**.

```
# Hostid of the backup server, if in fail over configuration.
#backup-hostid:
```

    This is an example of the section of the `local-configuration.yaml` file after you add the MAC address (for example, `000c2918c80d`) of the Warm Standby NW Server Host.

```
# Hostid of the backup server, if in fail over configuration.
backup-hostid: "000c2918c80d"
```

d. Restart the fneserver service.
```
systemctl restart flexnetls-RSALM
```

e. (Conditional) If your NetWitness Platform deployment is prohibited from accessing the Internet (Air Gap), you must:

i. Download the capability request from NetWitness Platform User Interface.

ii. Upload the request to FNO.

iii. Upload the response from FNO to the NetWitness Platform User Interface.

18. Schedule the backup of the primary NW Server and the copying of this backed-up data to the secondary NW Server.

a. SSH to the primary NW Server.

b. Submit the following commands.
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync -d -i <warm-standby-admin-server-ip>
```

Note: If the Warm Standby server becomes active, and if it will be accessed by any NW host with a NAT IP address, the NAT IP address must be added to the command:
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync -d -i <warm-standby-admin-server-ip>-p<warm-standby-NAT-admin-server-ip>
```

This backs up the primary NW Server data and copies the backup archive file to the secondary NW Server daily for future fail-over use. It also schedules the backup and copy to execute on a daily basis. You can display help for the `schedule-standby-admin-data-sync` script with the following command string.
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync --help
```
This returns the following help to which you can refer to customize the host data backup (such as backup frequency).
```
Schedule Data Synch between AdminServer and Standby AdminServer
Script also executes a synchronization each time.
Usage:
schedule-standby-admin-data-sync command [options]
```

```
Commands:

-h, --help                  Display Help
-d, --daily                 Schedule daily data
                            synchronization
-w, --weekly                Schedule weekly data
                            synchronization
-c, --custom <crontab       Schedule custom data
formatted>                  synchronization
                            i.e. to schedule for
                            midnight on 1st and
                            10th of the month:
                            '0 0 1,10 * *'
-i, --standby-ip <IP        (required) IP
address>                    address of standby
                            NW Server
-p, --standy-ip-public <NAT (optional) NAT-based
IP address>                 IP address of
                            standby NW Server
-v, --verbose               Enable verbose
                            output
```

Fail Over Primary NW Server to Secondary NW Server with Same IP Address

Initially, the primary NW Server fails over to the secondary NW Server. When the primary NW Server is back up, the secondary NW Server fails over to the primary NW Server, and that is referred to as a fail-back. When it is possible for the secondary NW Server to have the same IP address as the primary NW Server after failover, complete the following procedure to fail over from the primary NW Server to the secondary NW Server.

1. SSH to the secondary NW Server.

IMPORTANT: If you have installed New Health & Wellness on Admin Server, perform the following:
- Install New Health & Wellness on Standby NW server.
- Back up the Search category (New Health and Wellness) from Primary NW server to standby NW server using the NRT:

```
nw-recovery-tool --export --dump-directory <Backup_directory_path> --category Search
```

You must manually copy files from Primary NW server to Standby NW server after running the above command.

2. Run the `nw-failover` script with the `--make-active` argument:
   ```
   nw-failover --make-active
   ```
3. Complete the following steps for planned and required fail-over.
   a. SSH to the primary NW Server.
   b. Run the fail-over script with the `--make-standby` argument to assign the standby role to the primary NW Server:
      ```
      nw-failover --make-standby
      ```
   c. Shut down the primary NW Server.

   Note: If you have a catastrophic failure, you may need to provision a new host or re-image the primary NW Server and complete the Set Up secondary NW Server in Standby Role procedure for this host to create a new primary NW Server, so that you can fail back to it.
4. Validate that the component hosts have connected to the new active NW Server by running the following command on the new active NW Server:
   ```
   nw-manage --check-hosts-status
   ```

   Note: Do not continue to the next step until all component hosts have successfully connected to the new active NW Server. Rerun `nw-manage --check-hosts-status` as needed to continue verification.
5. Follow the IP address change procedures for the now-active NW Server in "Change Host Network Configuration" in the *System Maintenance Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: If the primary NW Server is going to remain online, you must update its IP address so that it no longer conflicts with the Warm Standby NW Server IP address when it is changed. Follow the IP address change procedures for the now-active NW Server in "Change Host Network Configuration" in the *System Maintenance Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

6. Shut down the primary NW Server, or reboot the primary NW Server and set it up as the new secondary NW Server by completing the steps in Set Up Secondary NW Server in Standby Role for this host to create a new primary NW Server, so that you can fail back to this host.

IMPORTANT: After successful fail over to Standby NW server, restore the Search category (New Health & Wellness) using NRT:
`nw-recovery-tool --import --dump-directory <Backup_directory_path> --category Search`

Fail Over Primary NW Server to Secondary NW Server with Different IP Address

If your secondary NW Server will maintain a different IP address from your primary NW Server after a fail-over event, for example, if the secondary NW Server is located in a different data center from the primary NW Server, follow these steps to fail over from the primary NW Server to the secondary NW Server.

1. SSH to the secondary NW Server.

IMPORTANT: If you have installed New Health & Wellness on Admin Server, perform the following:
- Install New Health & Wellness on Standby NW server.
- Back up the Search category (New Health and Wellness) from Primary NW server to standby NW server using the NRT:
`nw-recovery-tool --export --dump-directory <Backup_directory_path> --category Search`
You must manually copy files from Primary NW server to Standby NW server after running the above command.

2. Run the failover script:
   `nw-failover --make-active`
3. Complete the following steps for planned and required fail-over.
   a. SSH to the primary NW Server.
   b. Run the fail-over script with the `--make-standby` argument to assign the standby role to the primary NW Server:
      `nw-failover --make-standby`
   c. Shut down the primary NW Server.

      Note: If you have a catastrophic failure, you may need to provision a new host or re-image the primary NW Server and complete the Set Up secondary NW Server in Standby Role procedure for this host to create a new primary NW Server, so that you can fail back to it.

4. If you are running in a mixed-version environment, log in to each component host that is still on a version prior to 11.7 and execute the following:
   - `netconfig --update-dns --dns <active-nw-server-ip-address>`
   - `sed -Ei 's/^master:.*/master: <active-nw-server-ip-address>/g' /etc/salt/minion`
   - `systemctl restart salt-minion`

   Note: If you have a component host that uses a NAT IP address to reach the NW Server, substitute the `<NAT-IP-address>` for the `<active-nw-server-ip-address>` in both bullet items above.

5. Shut down the primary NW Server, or reboot the primary NW Server and set it up as the new secondary NW Server by completing the steps in Set Up Secondary NW Server in Standby Role for this host to create a new primary NW Server, so that you can fail back to this host.

IMPORTANT: After successful fail over to Standby NW server, restore the Search category (New Health & Wellness) using NRT:
`nw-recovery-tool --import --dump-directory <Backup_directory_path> --category Search`

Note: If the secondary NW Server had any custom certificates, you must re-apply them after failover. For information about how to re-apply custom certificates, see "(Optional) Use a Custom Server Certificate" in the *System Security and User Management Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: After upgrading the NW Server host or a component host to 11.7 or later version, review the contents of the `/etc/hosts.user` file for any obsolete host entries. The `/etc/hosts.user` file contains system and user-generated entries that are not managed by NetWitness Platform. However, entries from `/etc/hosts.user` are merged with NetWitness Platform-generated host mappings to create and update `/etc/hosts`. To avoid conflicts with NetWitness Platform-generated mappings, and to avoid generating connectivity errors resulting from an IP address change, NetWitness recommends that you remove any entries in `/etc/hosts.user` that include a non-loopback IP address of a NetWitness Platform host. After updating `/etc/hosts.user`, you must refresh the system by running the following command:
`nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>`

Note: While changing a host's IP address or during failover, component hosts can become disconnected from NW Server hosts. Follow these steps to reconnect a host system to its NW Server system.
1. Log in to the component host using SSH or the console.
2. Run the command `nw-manage --override-nws-ip --ipv4 <current IP address of the NW Server.`
When this command completes, the component host is reconnected to the NW Server at the specified IP address.

Follow the steps in the sections that apply to your environment.

- SSO
- Reporting Engine
- UCF
- PAM
- ECAT
- RSA NetWitness Orchestrator (By Demisto)
- Audit Logging
- Health and Wellness
- Malware Analysis
- Windows Legacy Collection

SSO

Update Configuration for Single Sign-On

Note: You must disable SSO configurations ONLY when NW Server IP is changed.

When the host network is configured with a new IP address, the SSO configurations also must be updated.

To do this:

1. Disable the SSO configuration using `nw-shell` after failover from new IP.
   To resolve this issue you must disable SSO manually, using the following commands:
   a. SSH to `admin server node`.
   b. Connect to `nw-shell`.
   c. Connect to admin server service using the `connect --service admin-server` command.
   d. Log in to admin server using the `login` command.
   e. Enter the admin username and password.
   f. Execute the following commands:
      - `cd /rsa/security/authentication/web/saml/sso-enabled`
      - `set false`
      - `logout`
      - `exit`

- `systemctl restart rsa-nw-admin-server`

2. Change the host IP address to the new IP.
3. Generate the new metadata and reupload it in ADFS. For more information, see the "Configure SAML 2.0 provider settings for portals" topic in the Microsoft documentation.

For more information, see the "Troubleshooting" topic in the *System Security and User Management Guide.*

Reporting Engine

Update Configuration for Reporting Engine

Note: You must update the Reporting Engine configurations ONLY when NW Server IP is changed.

When the host network is configured with a new IP address, you must update and verify the Reporting Engin configurations. The hostname for NetWitness configurations under the Output Actions must be updated with the new IP.

To manually configure the new IP, perform the following steps:

1. Log in to NetWitness Platform.
2. Navigate to  (Admin) > **Services > Reporting Engine > View > Config**.
3. Click the **Output Actions** tab.

4. Add the new IP address in the **Hostname** field.
5. Click **Apply**.

UCF

To enable UCF to communicate with NetWitness Platform:

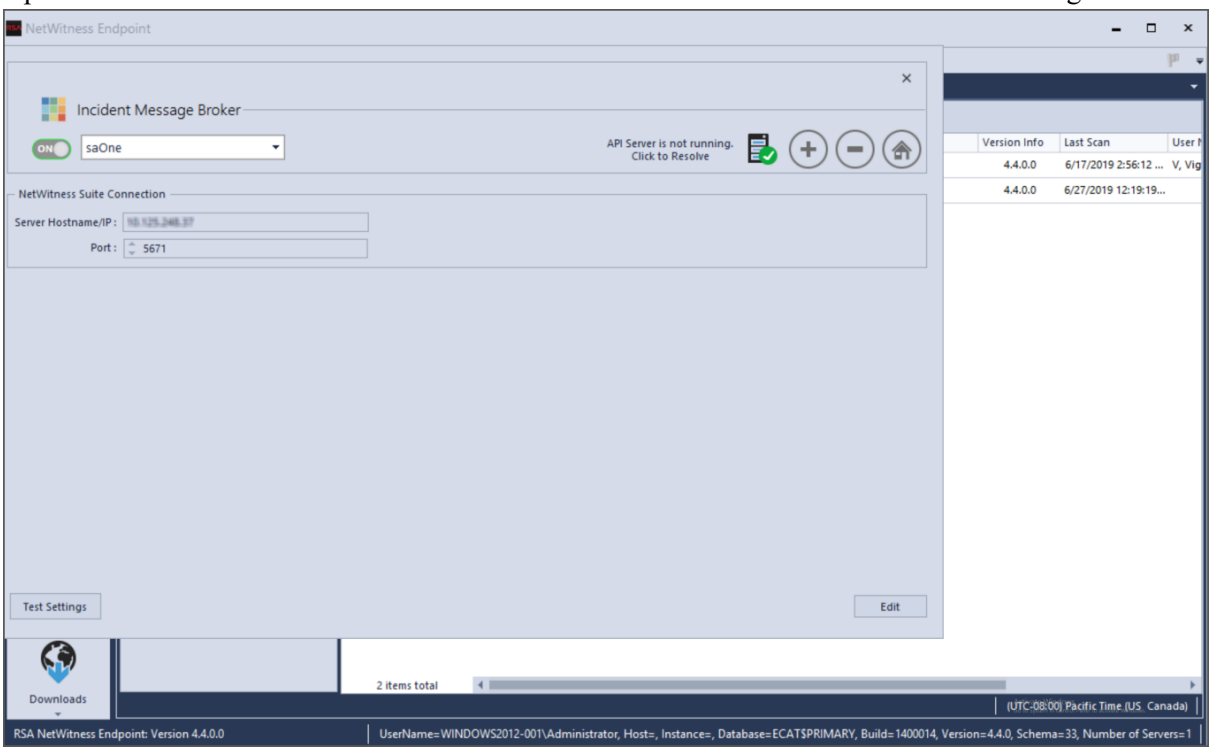
1. On the UCF server, execute the `runConnectionManager.bat` file (the same file that is used for adding connection details).
2. Select **Option #2, Edit endpoints**.
3. Select the NW Server connection from the options that are displayed.
4. When you are prompted for Host Address (the old IP address is shown in parentheses) enter the new IP address.

   Note: Do not change any other setting.

PAM

If you have PAM configured, after the failover, you must configure the system again using the instructions in the "Configure PAM Login Capability" topic in the *System Security and User Management Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

ECAT

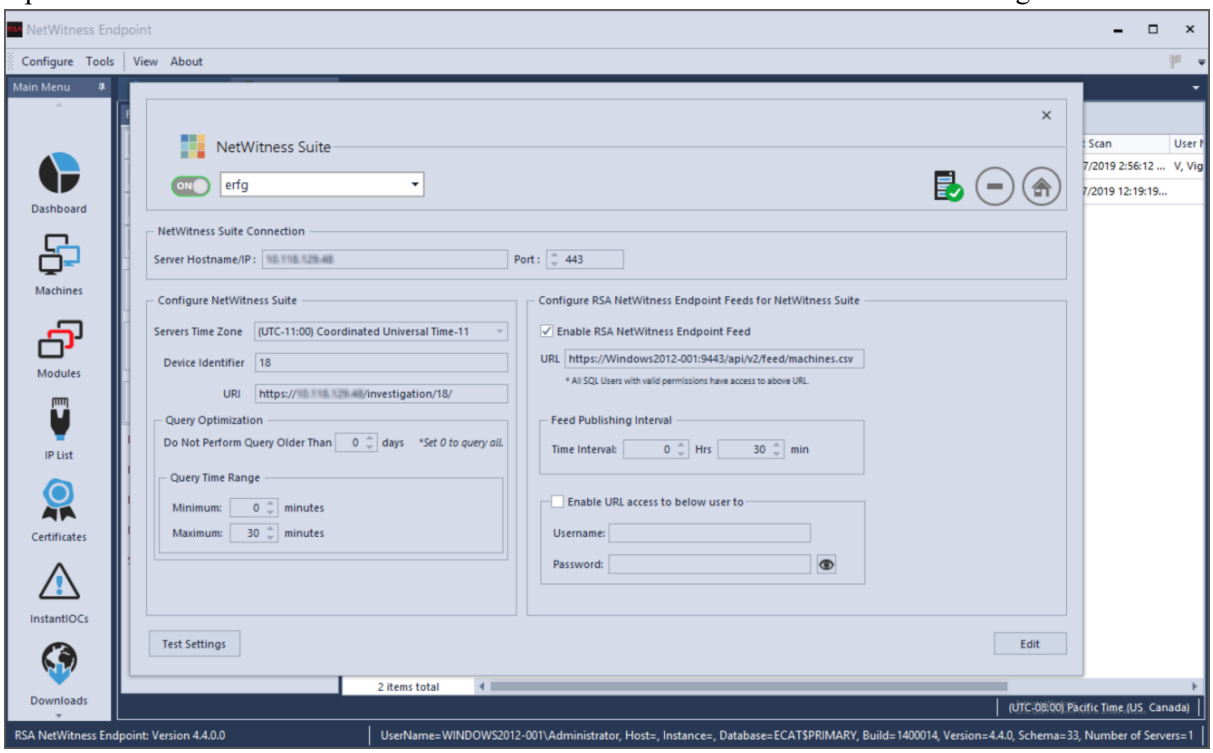


Update the following services:

- Incident Message Broker
- NetWitness Suite
- Syslog Server Settings

Incident Message Broker

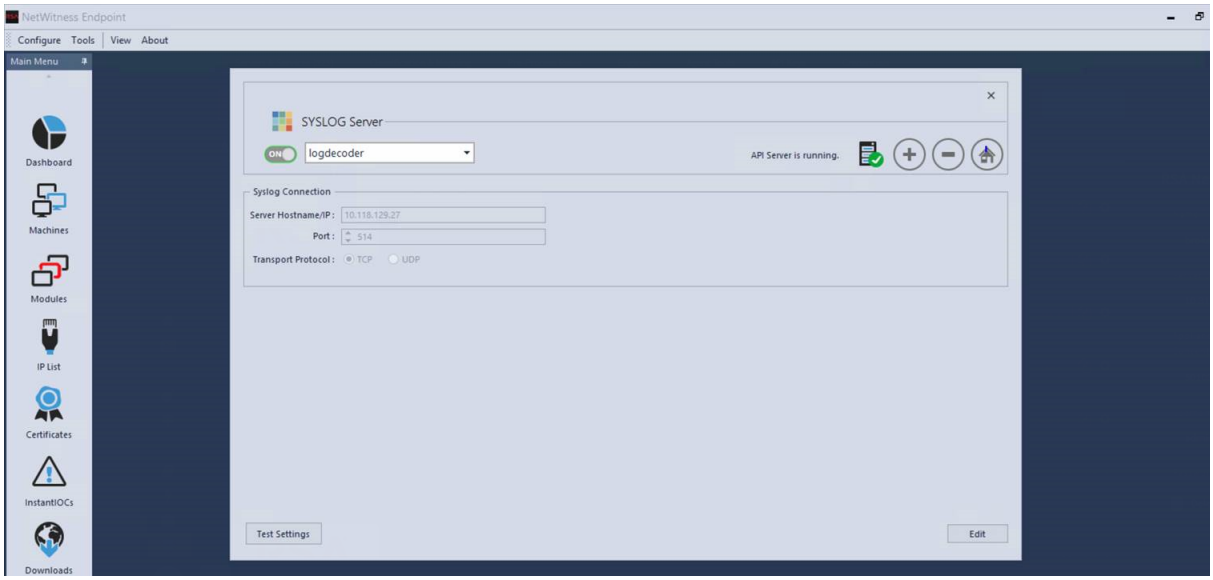
1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Monitoring and External Components Configuration** > **Incident Message Broker**.



2. Update the server Hostname and IP Address to the current active server and test the settings.

NetWitness Suite

1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Monitoring and External Components Configuration** > **Netwitness Suite**.

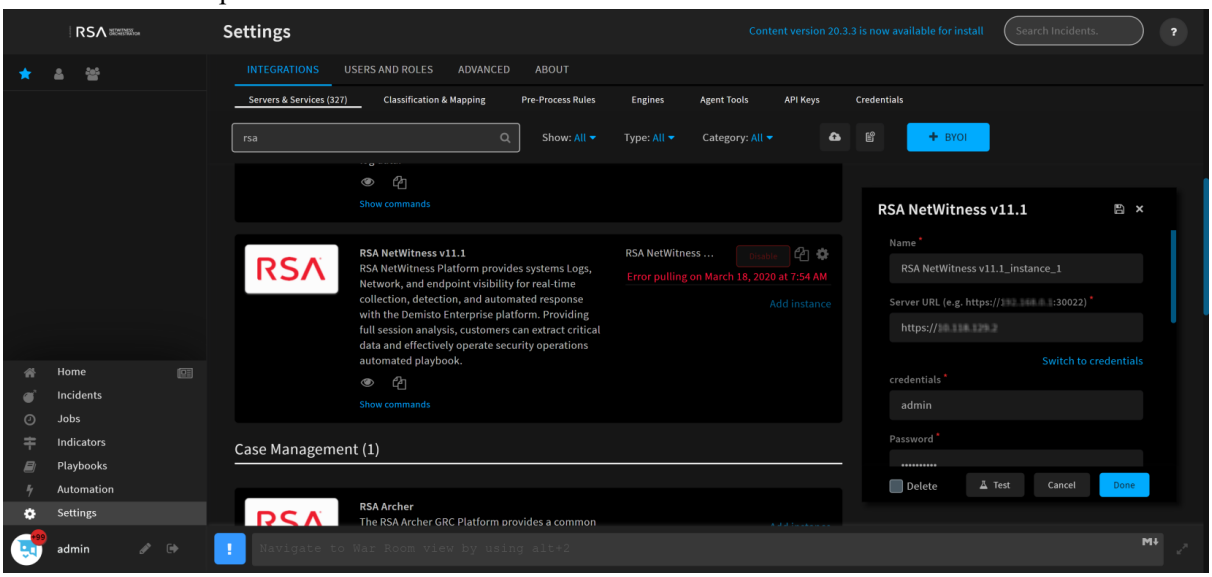


2. Update the server Hostname and IP address to the current active server and test settings.

Syslog Server Settings

If you are forwarding syslog messages to a NetWitness Platform Log Decoder, update the syslog server settings to point to the new IP address of the Log Decoder host.

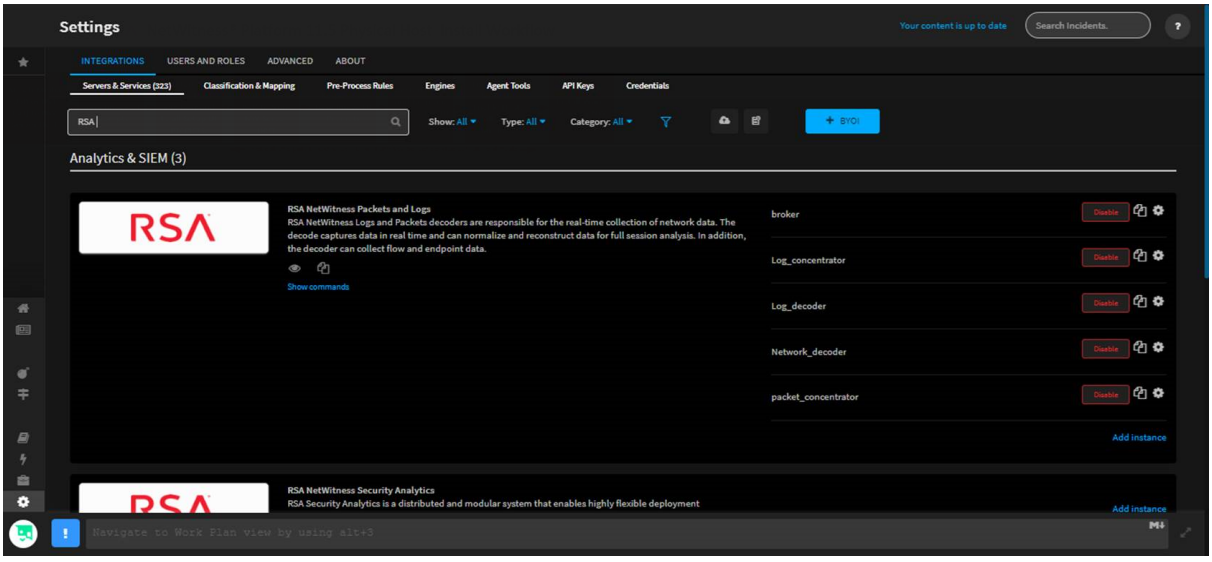
1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Syslog Server**.



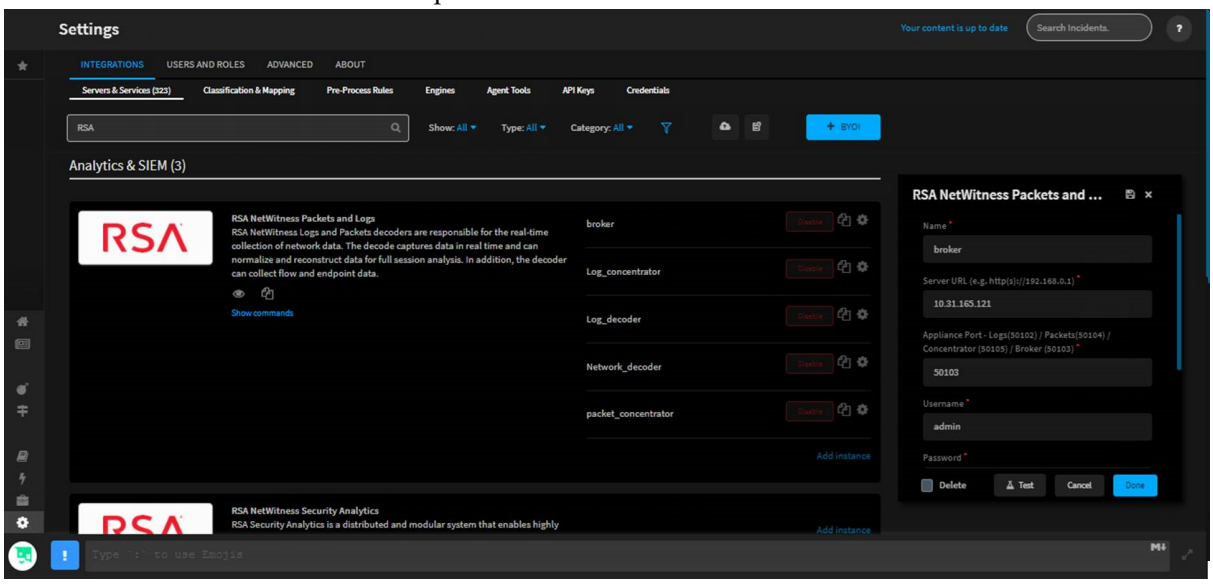
2. Select **logdecoder**, and in **Server Hostname/IP**, enter the new IP address of the Log Decoder host.

RSA NetWitness Orchestrator (By Demisto)

Update the Current Active NW Server to Fetch Respond Incidents and Alerts



1. Log in to Orchestrator and go to **Settings** > **server&services**.
2. Edit the RSA NetWitness V11.1 instance by updating the server URL to the current active NW Server to fetch respond incidents and alerts.



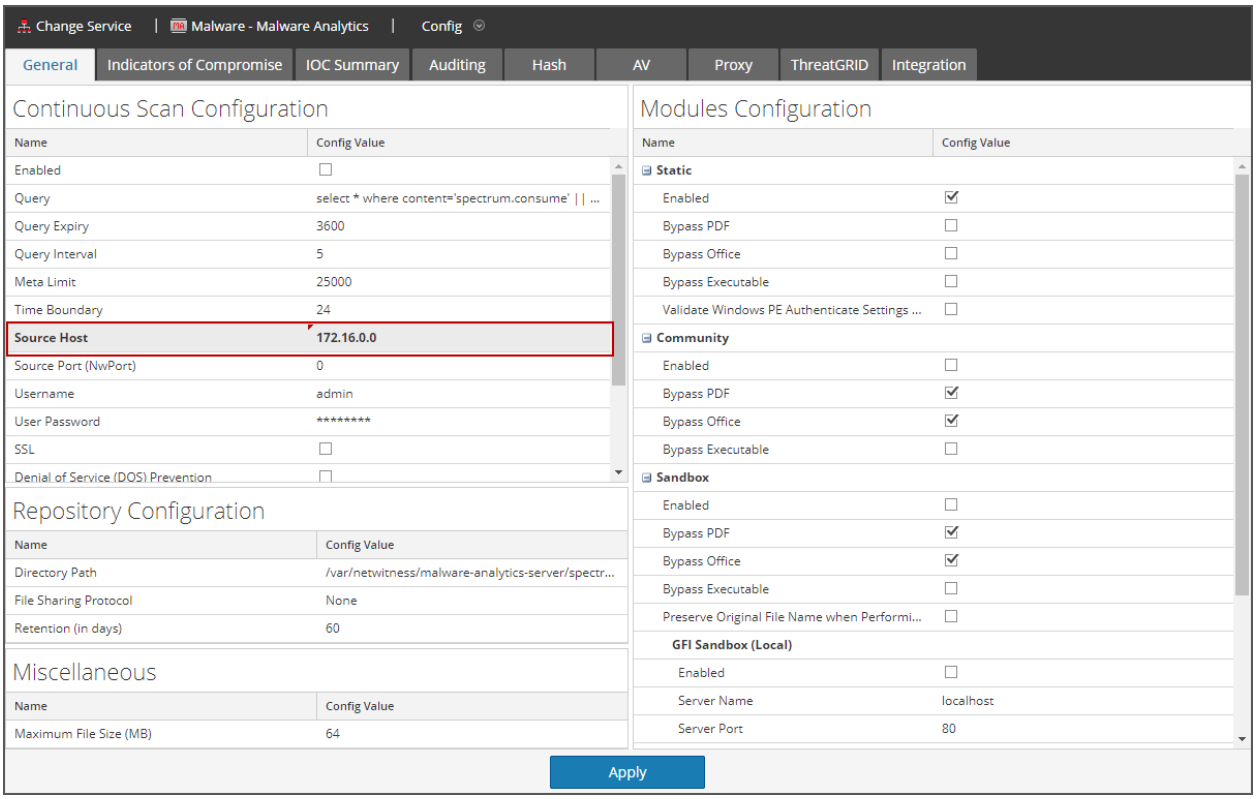
Update Component Hosts Acting as Data Sources

If you change the IP address of a component host, for example, a Concentrator, Network or Log Decoder, or Broker, that is acting as data source to the Orchestrator, update the following settings to point to the new IP address of the host.

1. Log in to Orchestrator and go to **Settings** > **server&services** and select the component host.

2. Enter the new IP address of the component host in **Server URL** and click **Done**.

Audit Logging



If you have changed the IP address of the NW Server, you must reconfigure audit logging. For instructions, see "Configure Global Audit Logging" in the *System Configuration Guide*.

Health and Wellness

If you have any Health and Wellness rules that contain IP addresses that have been changed, you must update those rules with the new IP addresses. For information about managing Health and Wellness rules, see "Monitor Health and Wellness using NetWitness Platform UI" in the *System Maintenance Guide*.

Malware Analysis

Source host IP address changes are not updated in the NetWitness user interface for Malware Analysis continuous scan configurations. You must manually update this configuration in the Malware Analysis Config view > **General** > **Continuous Scan Configuration** and update the source host IP address to the new host IP address.

Windows Legacy Collection

On occasion, you may need to change the IP address of your Windows Legacy Collector. You may also need to edit any Destination Groups that you have configured.

Change WLC IP Address

The following procedure describes how to change the IP address for your system.

1. Log onto the Windows Legacy Collector system and manually change the IP address on the system.
2. In the UI, confirm that the Log Collector service corresponding to the WLC system shows up in error (Red). It might take some time for it to reflect the changed status.
3. On the NetWitness Server, use the **nw-manage** utility to view the host information for the WLC using the following command:

   ```
   nw-manage --list-hosts
   ```

   Sample output from running the command is shown here:

   ```
   {
   "id" : "fdb8150c-e040-459e-8cc5-3c60ec2c65ae",
   "displayName" : "WLC-HOST-104",
   "hostname" : "10.101.216.102",
   "ipv4" : "10.101.216.102",
   "ipv4Public" : null
   } ]
   ```

   You use the value of **"id"** from your output in the following step.

4. Use the **nw-manage** utility to change the IP address of the WLC. For the **host-id** argument, use the value for the **"id"** that you noted from step 3. For the **ipv4** value, use the new IP Address to which you are changing.

   ```
   nw-manage --update-host --host-id "fdb8150c-e040-459e-8cc5-3c60ec2c65ae" --ipv4 10.101.216.105
   ```

5. After you see the message that the previous command ran successfully, go to the NetWitness Server UI and verify that the WLC service is running without any errors.

Edit Destination Groups For Log Collectors and VLCs

The Windows Legacy Collector is often configured with Destination Groups to forward events to Log Collectors or Virtual Log Collectors. If the IP address of any such Destination LC or VLC is changed, the Windows Legacy Collector can no longer forward events. To remediate this, you must edit the Destination groups for the WLC, making sure to select the new LC or VLC IP Address.

Note: If you added any content to the `/etc/hosts` file on the primary server, the contents of that file are available under `/var/netwitness/standby-data/unmanaged/etc` on the failover server. You can manually copy those files to the `/etc/hosts` file on the failover server after the failover is complete.

Fail Back Secondary NW Server to Primary NW Server

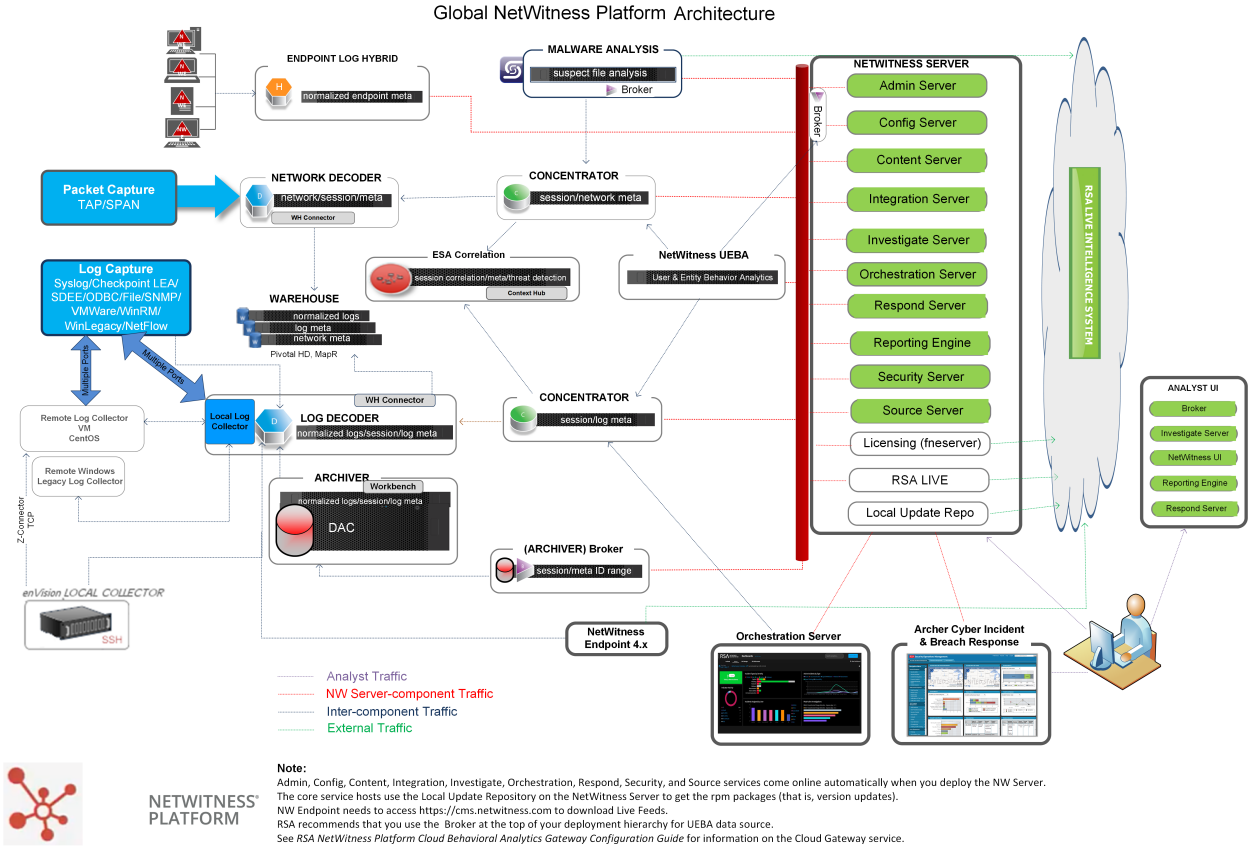
After a fail-over from the primary NW Server to the secondary NW Server, you need to fail back to your original setup of the primary NW Server in the active role and the secondary NW Server in the standby role.

Essentially, you follow the same steps described under Fail Over Primary NW Server to Secondary NW Server to fail back to your original setup (that is primary NW Server-active and secondary NW Server-standby). The difference is that you now need to fail over from the secondary NW Server to the primary NW Server.

Note: The secondary SA becomes active in case of a fail over. You should re-run the `schedule-standby-admin-data-sync` from the secondary SA before failing back to the primary SA.

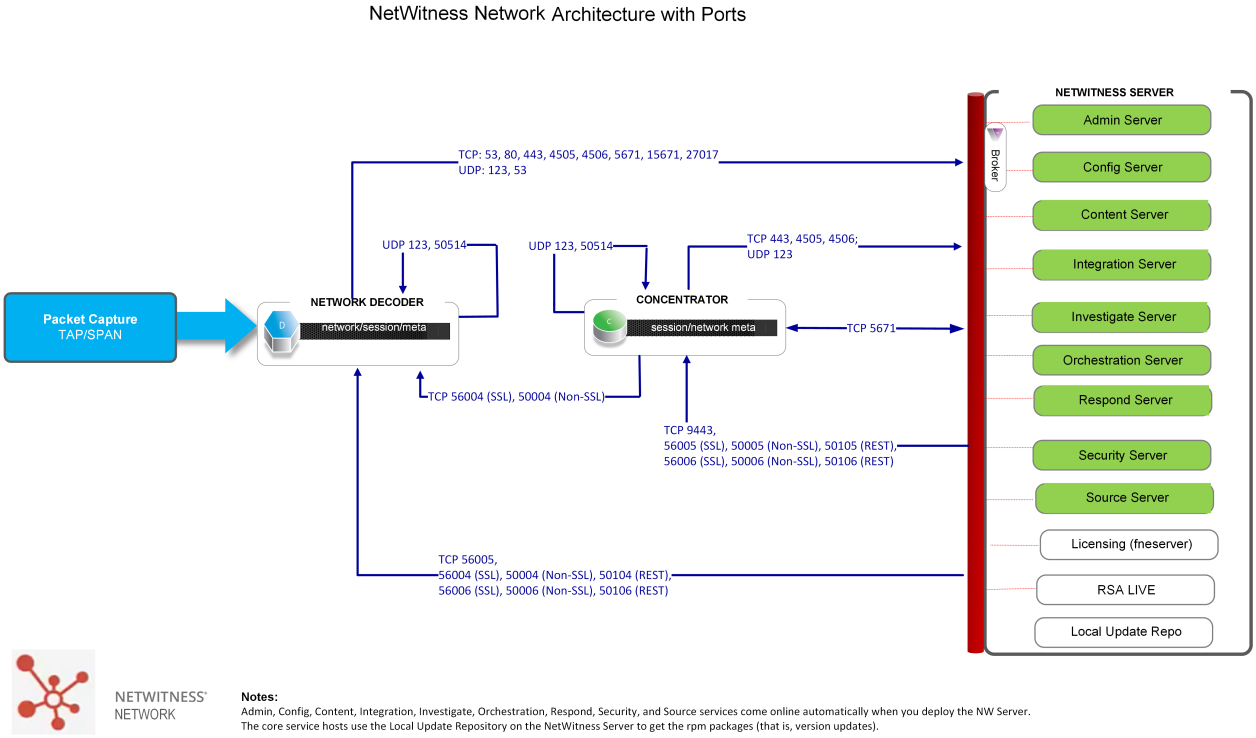
IMPORTANT: When you install and orchestrate a fresh 12.1 core Node-X to the Admin server (Node-0) upgraded from 12.0 or older versions to 12.1, the core services such as Concentrator, Log Decoder, Log Collector, Archiver, Decoder, Appliance, Workbench, Warehouse Connector, and Broker appear inactive under the **Services** column in the **Admin** > **Hosts** view. As a result, you cannot access the core services in the UI. This is not applicable if you are orchestrating a fresh 12.1 core Node-X to the fresh-Installed 12.1 Admin Server (not upgraded from 12.0 or older versions to 12.1). For more information, refer **Orchestration**topic in **Appendix C. Troubleshooting Version Installations and Upgrades** section in the *NetWitness 12.1 Upgrade Guide*.

Network Architecture and Ports



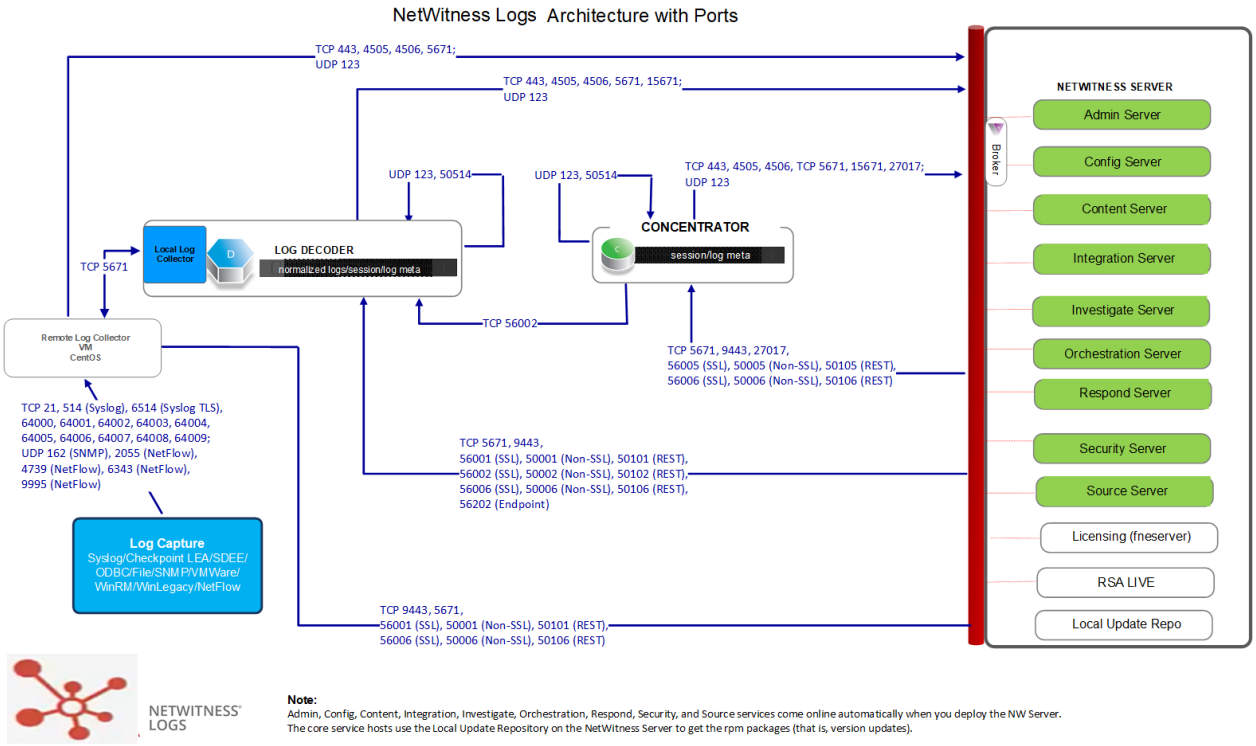
Refer to the following diagrams and port tables to ensure that all the relevant ports are opened for components in your NetWitness deployment to communicate with each other.

See NetWitness Endpoint Architecture at the end of this topic for individual Endpoint Architectural diagrams.



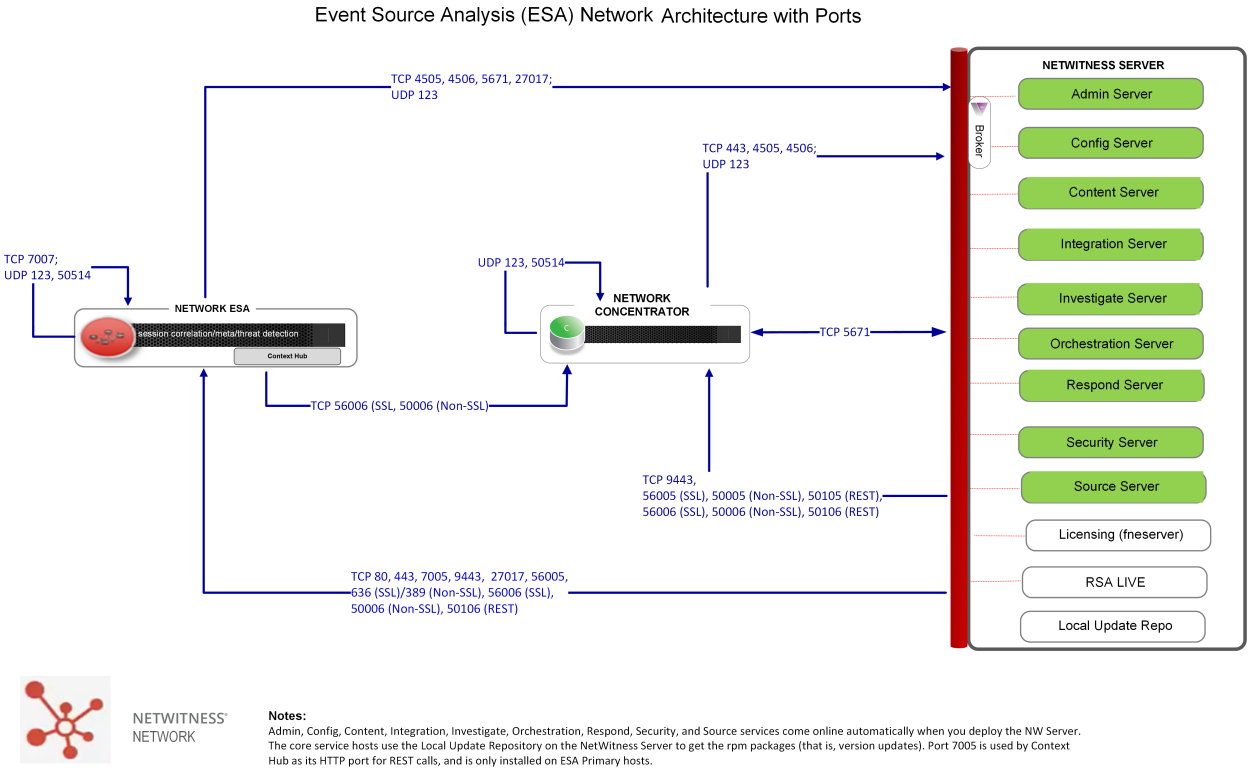
NetWitness Network Architecture Diagram

The following diagram illustrates the NetWitness network architecture including all of its component products.



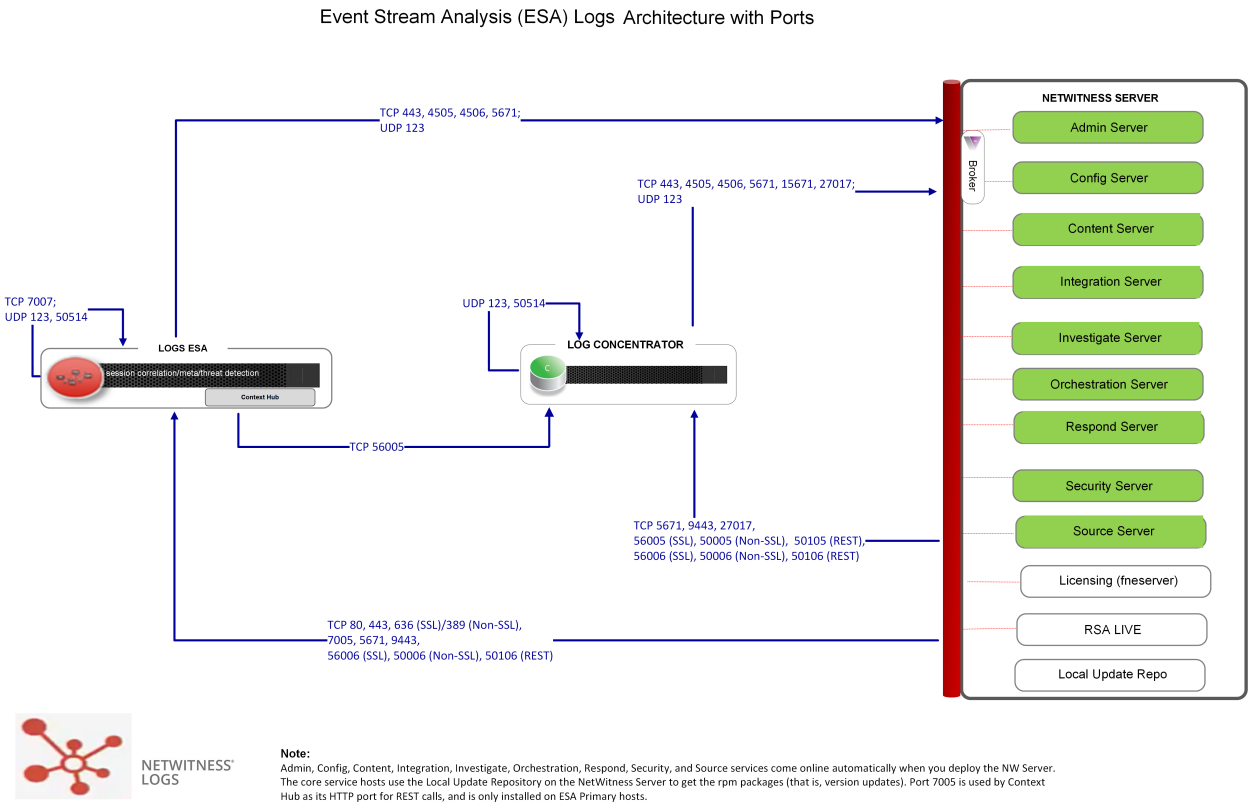
Note: NetWitness core hosts must be able to communicate with the NetWitness Server (Primary Server in a multiple server deployment) through UDP port 123 for Network Time Protocol (NTP) time synchronization.

NetWitness Network (Packets) Architecture Diagram with Ports



NetWitness Logs Architecture Diagram with Ports

Note:
Admin, Config, Content, Integration, Investigate, Orchestration, Respond, Security, and Source services come online automatically when you deploy the NW Server.
The core service hosts use the Local Update Repository on the NetWitness Server to get the rpm packages (that is, version updates).



Event Stream Analysis Network (Packets) Architecture Diagram with Ports

The following diagram illustrates the Event Stream Analysis network architecture with packet capture.

Event Stream Analysis (Logs) Architecture Diagram with Ports

The following diagram illustrates the Event Stream Analysis network architecture with log collection.

NetWitness Firewall Requirements Summary

The following table lists all the ports that need to be open in your firewall by host.

Note: The "NW Server" host ports apply to both the Primary and Warm Standby NW Server. Synchronization between the Primary and Warm Stanby is done through TCP Port 22.

Source Host	Destination Host	Ports
NW Server	ESA Primary	**TCP:** 22, 5671, 7005 **UDP:**123
NW Server	ESA	**TCP:** 22, 5671 **UDP**: 123
NW Server	Network Decoder	**TCP:** 22, 5671, 50004 (Non-SSL), 50006 (Non-SSL), 50104 (REST), 50106 (REST), 56004 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Broker	**TCP:** 5671, 50003 (Non-SSL), 50006 (Non-SSL), 50103 (REST), 50106 (REST) 56003 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Concentrator (Network & Logs)	**TCP:** 22, 5671, 50005 (Non-SSL), 50006 (Non-SSL), 50105 (REST), 50106 (REST), 56005 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Network Hybrid	**TCP:** 22, 5671, 50004 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50104 (REST), 50105 (REST), 50106 (REST), 56004 (SSL), 56005 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Log Decoder	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Log Hybrid	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56005 (SSL), 56006 (SSL) **UDP:** 123

Source Host	Destination Host	Ports
NW Server	Log Hybrid - Retention	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Endpoint Log Hybrid	**TCP:** 22, 5671, 7050, 7054, 50001 (Non-SSL), 50002 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56005 (SSL), 56006 (SSL), 56202 (Endpoint) **UDP:** 123
NW Server	VLC	**TCP:** 22, 5671, 50001 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50106 (REST), 56001 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Archiver	**TCP:** 22, 514, 5671, 6514, 50006(Non-SSL), 50007 (Non-SSL), 50008 (Non-SSL), 50106 (REST), 50107 (REST), 50108 (REST), 56006 (SSL), 56007 (SSL), 56008 (SSL) **UDP:** 123, 514
NW Server	Malware	**TCP:** 22, 5671, 5432, 50003 (Non-SSL), 50006 (Non-SSL), 50103 (REST), 50106 (REST), 56003 (SSL), 56006 (SSL), 60007 **UDP:** 123
NW Server	UEBA	**TCP:** 22, 15671, 5671, 443 **UDP:** 123
ESA	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017, 444 **UDP:** 123, 53
ESA	Active Directory	**TCP:** 389 (Non-SSL), 636 (SSL)
ESA	Archer	**TCP:** 80 (Non-SSL), 443 (SSL),
ESA Secondary	ESA Primary	**TCP:** 27017
ESA Primary or Secondary	Concentrator	**TCP:** 50005 (Non-SSL), 56005 (SSL)
Network Decoder	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017, 444 **UDP:** 53, 123

Source Host	Destination Host	Ports
Concentrator (Network & Logs)	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017, 444 **UDP:** 53, 123
Network Hybrid	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017, 444 **UDP:** 53, 123
Log Decoder	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017, 444 **UDP:** 53, 123
Log Hybrid	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671,15671, 27017, 444 **UDP:** 53, 123
Log Hybrid - Retention	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671,15671, 27017, 444 **UDP:** 53, 123
VLC	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671,15671, 27017, 444 **UDP:** 53, 123
VLC	Log Collector	**TCP:** 5671
Log Collector	VLC	**TCP:** 5671
Endpoint Log Hybrid	NW Server	**TCP:** 53, 80, 443, 5671, 4505, 4506, 15671, 27017, 444 **UDP:** 53, 123
Endpoint Log Hybrid	Log Decoder	**TCP:** 50202 (Non-SSL), 50102 (REST), 56202 (SSL) **UDP:** 514
Endpoint Agent	Log Decoder	**TCP:** 514, 6514 **UDP:** 514
Endpoint Agent	Endpoint Log Hybrid	**TCP:** 443 **UDP:** 444
UEBA	NW Server	**TCP:** 53, 80, 443, 444, 4505, 4506, 5671, 15671, 27017, 50003 (Broker-Non-SSL), 50103 (Broker/REST), 56003 (Broker/SSL) **UDP:** 53, 123
UEBA	Concentrator	**TCP:** 50005 (Non-SSL), 50105 (REST), 56005 (SSL)

Source Host	Destination Host	Ports
www connections		
NW Server	cms.netwitness.com download.rsasecurity.com rsasecurity.subscribenet.com update.netwitness.com	**TCP:** 443
ESA (Primary & Secondary)	cms.netwitness.com	**TCP:** 443
Malware	panacea.threatgrid.com cloud.netwitness.com	**TCP:** 443

Comprehensive List of NetWitness Host, Service, and iDRAC Ports

Note: For ports used in event collection through the NetWitness Logs, see the *Log Collection Configuration Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

This section contains the port specifications for the following hosts:

NW Server Host	iDRAC Ports
Analyst UI Host	Log Collector Host
Archiver Host	Log Decoder Host
Broker Host	Log Hybrid Host
Concentrator Host	Log Hybrid - Retention
Endpoint Log Hybrid Host	Malware Host
Endpoint Relay Server	Network Decoder Host
Event Stream Analysis Host	Network Hybrid Host
New Health & Wellness	UEBA Host

NW Server Host (Primary and Warm Standby NW Server Host)

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	NW Server	TCP 443, 80	nginx - NetWitness UI
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
Admin Workstation	NW Server	TCP 22	SSH Primary to Standby NW Server sy nchronization port.
NW Hosts	NW Server	TCP 444	Node-infra-server check
NW Hosts	NW Server	TCP 53 UDP 53	DNS
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 443	RSA Update Repository
NW Hosts	NW Server	TCP 5671	RabbitMQ-amqp
NW Hosts	NW Server	UDP 123	NTP
NW Hosts	NW Server	TCP 27017	MongoDB
NW Server	cms.netwitness.com	TCP 443	Live Content Management System (CMS) Library
NW Server	download.rsasecurity.com	TCP 443	RSA Licensing
NW Server	rsasecurity.subscribenet.com	TCP 443	RSA Licensing
NW Server	update.netwitness.com	TCP 443	Netwitness Software Updates

Source Host	Destination Host	Destination Ports	Comments
NW Server	NFS Server	TCP 111, 2049, UDP 111, 2049	iDRAC Installations
NW Server	NW Hosts	UDP 123	NTP
NW Server	NW Endpoint	TCP 443, 9443	For NW Endpoint 4.x integrations
NW Hosts	NW Server	TCP 444	nw-node-infra service failover check

Analyst UI Host

Source Host	Destination Host	Destination Ports	Comments
Analyst UI	NW Server	TCP 7006	The Content Server is listening on this port.
Analyst UI	NW Server	TCP 7009	The Admin Server is listening on this port.
Analyst UI	NW Server	TCP 7012	The Integration Server is listening on this port.
Analyst UI	NW Server	TCP 7015	The Source Server is listening on this port.
Analyst UI	NW Server	TCP 7016	The License Server is listening on this port.
NW Hosts	Analyst UI	TCP 5671	RabbitMQ-amqp
Analyst UI	NW Server	UDP 123	NTP
Analyst UI	NW Server	TCP 444	nw-node-infra service failover check

Archiver Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Archiver	TCP 15671	RabbitMQ Management UI
Archiver	NW Server	TCP 15671	RabbitMQ Management UI
Archiver	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Archiver	TCP 22	SSH
NW Server	Archiver	TCP 50008 (Non-SSL), 56008 (SSL), 50108 (REST)	Archiver Application Ports
NW Server	Archiver	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Archiver	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
NW Server	Archiver	TCP 50007 (Non-SSL), 56007 (SSL), 50107 (REST)	Workbench Application Ports
Archiver	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Archiver	NW Server	TCP 444	nw-node-infra service failover check

Broker Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Broker	TCP 15671	RabbitMQ Management UI
Broker	Concentrator	TCP 50005 (Non-SSL), 56005	Concentrator Application Port
Broker	NW Server	TCP 15671	RabbitMQ Management UI
Broker	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Broker	TCP 22	SSH
NW Server	Broker	TCP 50003 (Non-SSL), 56003 (SSL), 50103 (REST)	Broker Application Ports
NW Server	Broker	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Broker	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Broker	NW Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Endpoint Broker	NW Server	TCP 443	RSA Update Repository
Broker	NW Server	TCP 444	nw-node-infra service failover check

Concentrator Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Concentrator	TCP 15671	RabbitMQ Management UI
Concentrator	Log Decoder	TCP 50002 (Non-SSL), 56002 (SSL)	Log Decoder Application Port
Concentrator	Network Decoder	TCP 56004, 50004 (Non-SSL)	Network Application Port
Concentrator	NW Server	TCP 15671	RabbitMQ Management UI
Concentrator	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Concentrator	TCP 22	SSH
NW Server	Concentrator	TCP 50005 (Non-SSL), 56005 (SSL), 50105 (REST)	Concentrator Application Ports
Malware	Concentrator	TCP TCP 50005 (Non-SSL), 56005 (SSL)	Malware
NW Server	Concentrator	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Concentrator	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Concentrator	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Concentrator	NW Server	TCP 444	nw-node-infra service failover check

Endpoint Log Hybrid

Source Host	Destination Host	Destination Ports	Comments
Endpoint Agent	Endpoint Log Hybrid	TCP 443 UDP 444	NGINX HTTPS NGINX UDP. If UDP port 444 is not acceptable in your environment, see How to Change UDP Port for Endpoint Log Hybrid.
Endpoint Agent	Log Decoder or Virtual Log Collector	TCP 514 (Syslog) UDP 514 (Syslog) TLS 6514	Windows Log Collection
Endpoint Log Hybrid	Log Decoder (External)	TCP 50102 (REST) 56202 (Protobuf SSL) 50202 (Protobuf)	To forward meta to an external Log Decoder
Endpoint Log Hybrid	NW Server	TCP 443	RSA Update Repository
NW Server	Endpoint Log Hybrid	TCP 7050	UI web traffic
Endpoint Log Hybrid	NW Server	TCP 5671	Message Bus
Endpoint Log Hybrid	NW Server	TCP 27017	MongoDB
NW Server	Endpoint Log Hybrid	TCP 7054	UI web traffic
NW Server	NFS Server	TCP 111, 2049 UDP 111, 2049	iDRAC Installations
NW Server	Endpoint Log Hybrid	TCP 50001 (Non-SSL), 56001 (SSL), 50101(REST)	Log Collector application ports
NW Server	Endpoint Log Hybrid	TCP 50002 (Non-SSL), 56002 (SSL), 56202 (Endpoint), 50102 (REST)	Log Decoder application ports
Admin Workstation	Endpoint Log Hybrid	TCP 15671	RabbitMQ Management UI

Source Host	Destination Host	Destination Ports	Comments
Endpoint Log Hybrid	NW Server	TCP 15671	RabbitMQ Management UI
Endpoint Log Hybrid	NW Server	TCP 444	nw-node-infra service failover check

Endpoint Relay Server

Source Host	Destination Host	Destination Ports	Comments
Endpoint Agent	Relay Server	TCP 443	To forward host data to the Relay Server
Endpoint Log Hybrid	Relay Server	TCP 443	Pull host data from the Relay Server

Event Stream Analysis (ESA) Host

Note: The ports in this table are for the ESA Primary an ESA Secondary hosts. The Content Hub, Correlation and ESA Analytics services are co-located on the ESA Primary host. The Correlation and ESA Analytics services are co-located on the ESA Secondary host.

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	ESA	TCP 15671	RabbitMQ Management UI
ESA Primary and Secondary	NW Server	TCP 15671	RabbitMQ Management UI
ESA Primary and Secondary	NW Server	TCP 443	RSA Update Repository
Admin Workstation	ESA	TCP 22	SSH
NW Server, ESA Secondary	ESA Primary	TCP 27017	MongoDB
NW Server	ESA Primary	TCP 7005	Context Hub Launch Port - (ESA Primary)
NW Server	ESA	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
ESA Primary and Secondary	cms.netwitness.com	TCP 443	Live
ESA Primary and Secondary	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
ESA Primary and Secondary	Active Directory	636 (SSL)/389 (Non-SSL)	
NW Server	ESA	80 (HTTP)/ 443 (HTTPS)(REST)	
ESA Primary	Archer	443 (SSL)/80 (Non-SSL)	
ESA Primary	ESA Primary	TCP 7007	Launch Port
ESA Primary and Secondary	NW Server	TCP 444	nw-node-infra service failover check

New Health and Wellness

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	New Health and Wellness	TCP 22	SSH
Admin Workstation	New Health and Wellness	TCP 5601	Kibana UI
NW Hosts	New Health and Wellness	TCP 9200	Elasticsearch REST API Port
NW Server	New Health and Wellness	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
NW Server	New Health and Wellness	TCP 15671	RabbitMQ Management UI
NW Server	New Health and Wellness	TCP 7018	Metrics Server Launch Port
NW Server	New Health and Wellness	TCP 7020	Node Infra Server Launch Port

New Health and Wellness on Different Subnet

If the New Health and Wellness is on a different subnet, you must open the respective NetWitness Platform hosts port.

Example:
New Health and Wellness is on subnet A: 10.10.1.0/24 and LogHybrid host is on subnet B: 10.10.2.0/24. In this case, you must open ports for Log Decoder, Log Collector, Concentrator on Metrics Server (New Health and Wellness host) to allow ports in the firewall for communication.

Source Host	Destination Host	Destination Ports	Comments
New Health and Wellness	Log Decoder	50002(Non-SSL),56002 (SSL)	Log Decoder Application Ports
New Health and Wellness	Log Collector	50001(Non-SSL),56001 (SSL)	Log Collector Application Ports
New Health and Wellness	Concentrator	50005(Non-SSL)/56005 (SSL)	Concentrator Application Ports

iDRAC Ports

Port	Function	Comments
22*	SSH	Default, configurable port through which iDRAC listens for connections
443*	HTTP	Default, configurable port through which iDRAC listens for connections
5900*	Virtual Console keyboard and mouse redirection, Virtual Media, Virtual Folders, and Remote File Share.	Default, configurable port through which iDRAC listens for connections
111, 2049	TCP	NetWitness Platform hosts to NFS Server
111, 2049	UDP	NetWitness Platform hosts to NFS Server

Log Collector Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Log Collector	TCP 15671	RabbitMQ Management UI
Log Collector	NW Server	TCP 15671	RabbitMQ Management UI
Log Collector	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Log Collector	TCP 22	SSH
Log Collector	Log Event Sources	See *Log Collection Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.	
Log Event Sources	Log Collector	TCP 514 (Syslog) UDP 162 (SNMP), 514 (Syslog), 2055 (NetFlow), 4739 (NetFlow), 6343 (NetFlow), 9995 (NetFlow)"	Log Collection Ports
Log Event Sources	Log Collector	TCP 21, 64000, 64001, 64002, 64003, 64004, 64005, 64006, 64007, 64008,64009	Log Collection FTP/S Ports
NW Server	Log Collector	TCP 50001 (Non-SSL), 56001 (SSL), 50101 (REST)	Log Collector Application Ports
NW Server	Log Collector	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Log Collector	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Log Collector	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC installations
Log Collector	Virtual Log Collector	TCP 5671	In Pull Mode
Virtual Log Collector	Log Collector	TCP 5671	In Push Mode
Log Collector	NW Server	TCP 444	nw-node-infra service failover check

Log Decoder Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Log Decoder	TCP 15671	RabbitMQ Management UI
Log Decoder	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Log Decoder	TCP 22	SSH
Log Decoder	Log Event Sources	See *Log Collection Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.	
Log Event Sources	Log Decoder	TCP 514 (Syslog), UDP 162 (SNMP), 514 (Syslog), 2055 (NetFlow), 4739 (NetFlow), 6343 (NetFlow), 9995 (NetFlow)	Log Collection Ports
Log Event Sources	Log Decoder	TCP 21, 64000, 64001, 64002, 64003, 64004, 64005, 64006, 64007, 64008, 64009	Log Collection FTP/S Ports
NW Server	Log Decoder	TCP 50001 (Non-SSL),56001 (SSL), 50101 (REST)	Log Collector Application Ports
NW Server	Log Decoder	TCP 50002 (Non-SSL), 56002 (SSL),56202 (Endpoint), 50102 (REST)	Log Decoder Application Ports
NW Server	Log Decoder	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Log Decoder	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Log Decoder	Log Collector	TCP 6514	
Log Decoder	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Log Decoder	NW Server	TCP 15671	RabbitMQ Management UI
Log Decoder	NW Server	TCP 444	nw-node-infra service failover check

Log Hybrid Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Log Hybrid	TCP 15671	RabbitMQ Management UI
Log Hybrid	NW Server	TCP 15671	RabbitMQ Management UI
Log Hybrid	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Log Hybrid	TCP 22	SSH
Log Collector	Log Event Sources	See *Log Collection Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.	
Log Event Sources	Log Hybrid	TCP 514 (Syslog), UDP 162 (SNMP), 514 (Syslog), 2055 (NetFlow), 4739 (NetFlow), 6343 (NetFlow), 9995 (NetFlow)	Log Collection Ports
Log Event Sources	Log Hybrid	TCP 21, 64000, 64001, 64002, 64003, 64004, 64005, 64006, 64007, 64008, 64009	Log Collection FTP/S Ports
NW Server	Log Hybrid	TCP 50001 (Non-SSL), 56001 (SSL), 50101 (REST)	Log Collector Application Ports
NW Server	Log Hybrid	TCP 50002 (Non-SSL), 56002 (SSL), 56202 (Endpoint), 50102 (REST)	Log Decoder Application Ports
NW Server	Log Hybrid	TCP TCP 50005 (Non-SSL), 56005 (SSL), 50105 (REST)	Concentrator Application Ports

Source Host	Destination Host	Destination Ports	Comments
NW Server	Log Hybrid	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Log Hybrid	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Log Hybrid	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Log Hybrid	NW Server	TCP 444	nw-node-infra service failover check

Log Hybrid - Retention Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Log Hybrid - Retention	TCP 15671	RabbitMQ Management UI
Log Hybrid - Retention	NW Server	TCP 15671	RabbitMQ Management UI
Log Hybrid - Retention	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Log Hybrid - Retention	TCP 22	SSH
Log Collector	Log Event Sources	See *Log Collection Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.	
Log Event Sources	Log Hybrid - Retention	TCP 514 (Syslog), UDP 162 (SNMP), 514 (Syslog), 2055 (NetFlow), 4739 (NetFlow), 6343 (NetFlow), 9995 (NetFlow)	Log Collection Ports

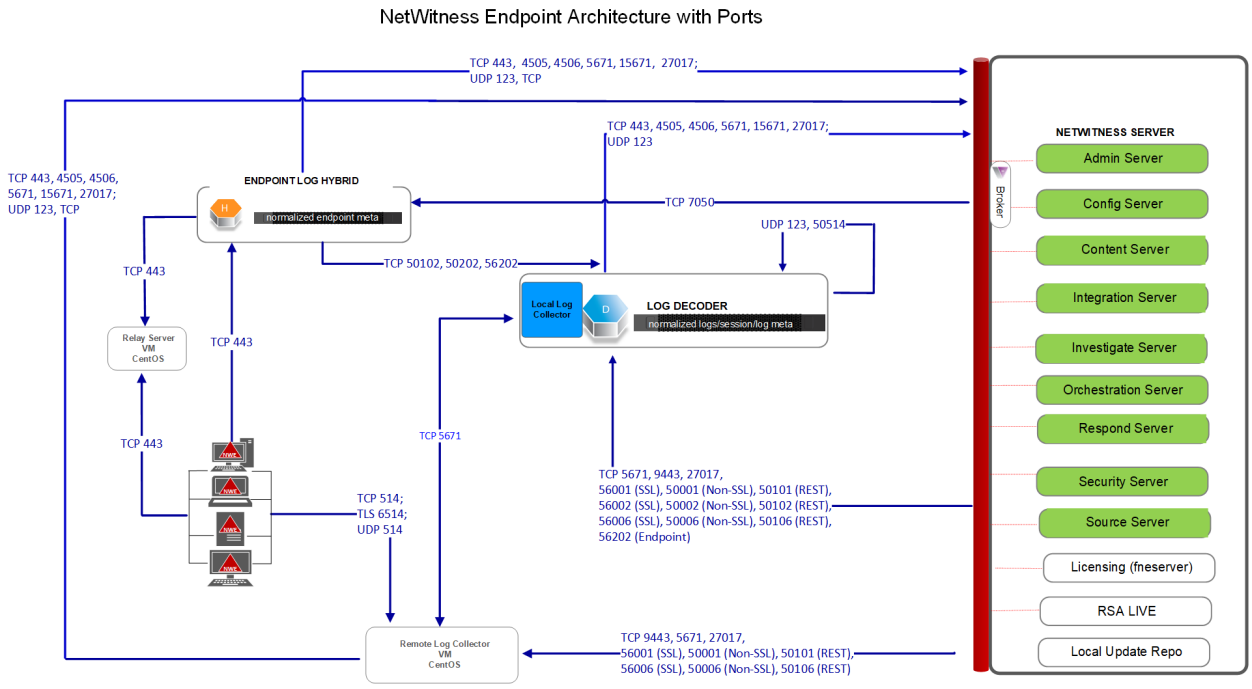
NetWitness Endpoint Architecture



NetWitness Endpoint Architecture

NetWitness Endpoint 4.4 Integration with NetWitness Platform

NetWitness Endpoint Architecture with Ports

For more information on the services running on Endpoint Log Hybrid, see *NetWitness Endpoint Configuration Guide*.

How to Change UDP Port for Endpoint Log Hybrid

The following steps tell you how to change the Endpoint Log Hybrid default UDP port 444 if it is not acceptable in your environment. 555 is the example this procedures uses as a replacement for 444 UDP port.
There are two tasks you need to o change the Endpoint Log Hybrid default UDP port 444:

Task 1 - Tell All Agents to Use a New UDP Port

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

Note: If you did not select the custom firewall rules option when you ran the nwsetup-tui, NetWitness platform overwrites the firewall rules are overwritten after a period of time. Please refer to the following Knowledge Base Article 00036446 (https://community.netwitness.com/t5/netwitness-knowledge-base/how-to-add-custom-firewall-rules-after-nwsetup-tui-has-completed/ta-p/5900) if this is the case.

Task 1 - Tell All Agents to Use a New UDP Port

Complete the following steps to update the UDP port in the default Enterprise Data Replication (EDR) policy, and all other policies you have, to tell all agents to use a new UDP port.

1. In the **NetWitness** menu, select  (Admin) > **Endpoint Sources** > **Policies**.
   The **Policies** view is displayed.
2. Select the **Default EDR Policy** and click **Edit** from the toolbar.
3. roll down to find the **UDP PORT** and change the value (for example, change from **444** to **555**).
4. Click **Publish Policy** at the bottom of the view.

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

SSH to each Endpoint Log Hybrid host in your environment with `admin` credentials and make the following updates.

1. Update the `iptables` rules to allow `555` in place of `444`.
   a. Replace `444` with `555` in the following file.
   ```
   vi /etc/sysconfig/iptables
   ```
   b. Restart `iptables` with the following command string.
   ```
   systemctl restart iptables
   ```
   c. Verify the change with the following command string.
   ```
   iptables -L -n
   ```
   The following is an example of what is displayed for a correct change.
   ```
   ACCEPT udp -- 0.0.0.0/0 0.0.0.0/0 udp multiport dports 555 /*
   EndpointNginxPort */ ctstate NEW
   ```
2. Update the SELinux policy. 555 is a privileged port, so you must update SELinux policy to allow this port.
   a. Run the following command string.
   ```
   semanage port -a -t http_port_t -p udp 555
   ```
   If you received any python errors or warnings, ignored them.
   b. Verify the change with the following command string.
   ```
   semanage port -l | grep http_port_t
   ```
   The following is an example of what is displayed for a correct change.
   ```
   http_port_t udp 555, 444
   ```
   c. (Optional) Remove `444`.
3. Update nginx config.
   a. Edit the following file.
   ```
   vi /etc/nginx/nginx.conf
   ```
   b. Search for the following string.
   ```
   listen 444 udp;
   ```
   c. Replace `444` with `555`.

d. Restart nginx with the following command string.
```
systemctl restart nginx
```

4. Verify that agents are communicating over the new port.

a. Run the following command string.
```
tcpdump -i eth0 port 555
```

b. Wait for 30 seconds because the port sends out a beacon every 30 seconds. If t everything is working correctly, information similar to the following will be displayed.
```
09:20:12.571316 IP 10.40.15.103.60807 > EPS1.rsa.lab.emc.com.dsf: UDP,
length 20
09:20:12.572433 IP EPS1.rsa.lab.emc.com.dsf > 10.40.15.103.60807: UDP,
length 1
```
Both lines must be returned. One is the size request (`20` bytes) and the other is the response size (`1` byte).

Site Requirements and Safety

Make sure that you read this topic thoroughly and observe all warnings and precautions prior to installing or maintaining your NetWitness devices.

Intended Application Uses

This product was evaluated as Information Technology Equipment (ITE) that may be installed in offices, schools, computer rooms, and similar indoor commercial type locations. This device is not intended for any connection to an outdoor type cable.

Service

There are no user-serviceable components inside of this device. Please contact Customer Care in the event of a malfunction. In a fault condition, high temperatures may arise inside the system causing an alarm signal. In the event of the alarm signal, immediately disconnect the device from the power source and contact Customer Care. Further operation of the device will be unsafe and may cause personal injury or property damage.

Safety Information

Site Selection

The system is designed to operate in a typical office environment. Choose a site that is:

- Clean, dry, and free of airborne particles (other than normal room dust).
- Well-ventilated and away from sources of heat, including direct sunlight and radiators.
- Away from sources of vibration or physical shock.
- Isolated from strong electromagnetic fields produced by electrical devices.
- In regions that are susceptible to electrical storms, we recommend you plug your system into a surge suppressor.
- Provided with a properly grounded wall outlet.
- Provided with sufficient space to access the power supply cords, because they serve as the product′s main power disconnect.

Equipment Handling Practices

Reduce the risk of personal injury or equipment damage by:

- Conforming to local occupational health and safety requirements when moving and lifting equipment.
- Using mechanical assistance or other suitable assistance when moving and lifting equipment.

- Reducing the weight for easier handling by removing any easily detachable components.

Power and Electrical Warnings

Caution: The power button, indicated by the standby power marking, DOES NOT completely turn off the system AC power; 5V standby power is active whenever the system is plugged in. To remove power from system, you must unplug the AC power cord(s) from the wall outlet.

- Do not attempt to modify or use an AC power cord if it is not the exact type required. A separate AC cord is required for each system power supply.
- This product contains no user-serviceable parts. Do not open the system.
- When replacing a hot-plug power supply, unplug the power cord to the power supply being replaced before removing it from the server.

Rack Mount Warnings

- The equipment rack must be anchored to an unmovable support to prevent it from tipping when a server or piece of equipment is extended from it. The equipment rack must be installed according to the rack manufacturer's instructions.
- Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.
- Extend only one piece of equipment from the rack at a time.
- To avoid risk of potential electric shock, a proper safety ground must be implemented for the rack and each piece of equipment installed in it.

Cooling and Air Flow

Installation of the equipment should be such that the amount of air flow required for safe operation of the equipment is not compromised.

NetWitness Endpoint Integration

NetWitness customers who are using NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later can integrate into NetWitness 11.x in several different ways.

Note: In Version 11.2 and later, the following components are rebranded:
- NetWitness Suite to NetWitness Platform
- Packet Decoder to Network Decoder

Integration Options

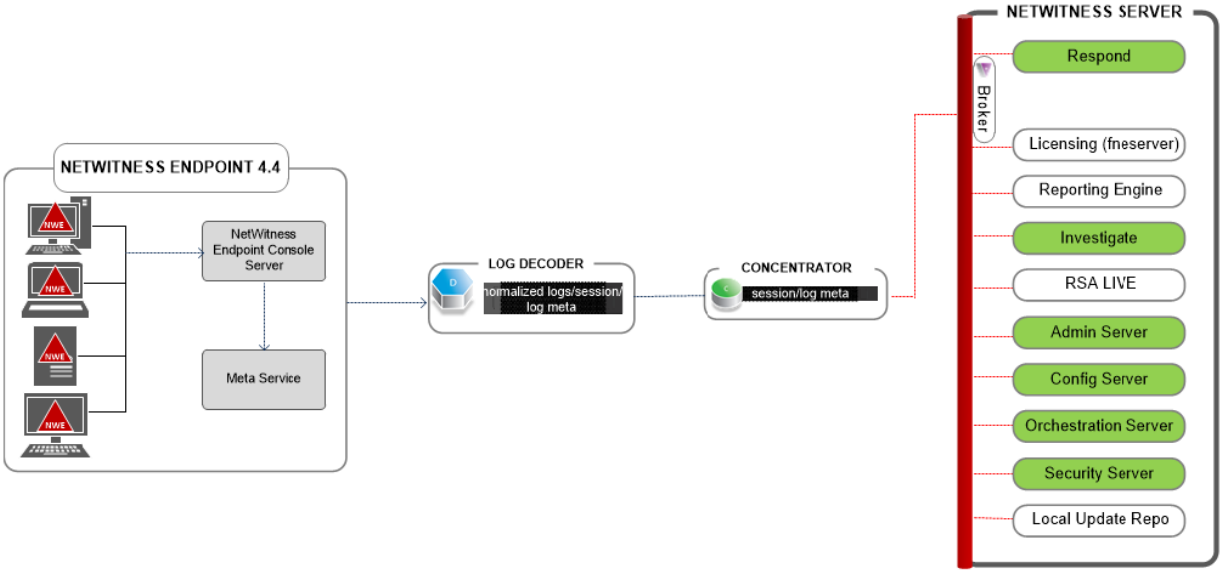
Integration Methods

The following are the NetWitness Endpoint integration methods:

- Configure Endpoint Alerts through Respond
- Configure Contextual Data from Endpoint through Recurring Feed
- Configure Endpoint Alerts through Syslog into a Log Decoder
- Configuring Meta Integrator service in the NetWitness Endpoint 4.4.0.2 or later directly to a Log Decoder

Endpoint alerts into NetWitness Respond. This integration provides the capability for forwarding Endpoint alerts to Respond.

Contextual data from Endpoint through a NetWitness Live recurring feed. This integration can enrich the session displayed in NetWitness Investigation with contextual information; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data.



NetWitness Endpoint alerts through Syslog (CEF) into NetWitness Log Decoders. This integration provides the capability to forward Endpoint events through Syslog and to correlate the events with other log or packet metadata in the NetWitness ecosystem.

(For Version 11.1 and later) **NetWitness Endpoint directly to a Log Decoder.** This integration lets you view the Endpoint metadata in the **Investigate > Navigate** and **Event Analysis** view similar to Logs and Packets.

Note: For information on NetWitness Endpoint 4.4.0.x integration with NetWitness, see *NetWitness Endpoint Configuration Guide*.

NetWitness Endpoint Metadata Integration

The NetWitness Platform provides seamless integration allowing Endpoint metadata to be included into the NetWitness work flow. This lets analyst to investigate an incident and respond using packet, log, and endpoint metadata. The endpoint metadata provides further indicators and context related to a host, user, process, or file. It also provides tracking data that provide data of what has transpired with a host, user, process, or file.

Built-in NetWitness Endpoint Lookup

With the NetWitness Endpoint user interface (UI) installed on the same machine where the analyst is using a browser to access NetWitness, the built-in NetWitness Endpoint Lookup from NetWitness Investigation and NetWitness Respond provides right-click access to the NetWitness Endpoint console server for the following meta keys: IP address (ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip), host (alias-host, domain.dst), client, and file-hash. These are described in the "Launch an External Lookup of a Meta Key" topic in *Investigation and Malware Analysis User Guide* and the "View Alerts" topic in *NetWitness Respond User Guide*.

NetWitness configuration is not required for endpoint lookup when you are using one of the built-in parsers, NetWitness Endpoint or CEF, and you have not customized the default meta keys used when loading metadata in Investigation. For more information, see "Manage and Apply Default Meta Keys in an Investigation" topic in the *Investigation and Malware Analysis User Guide*.

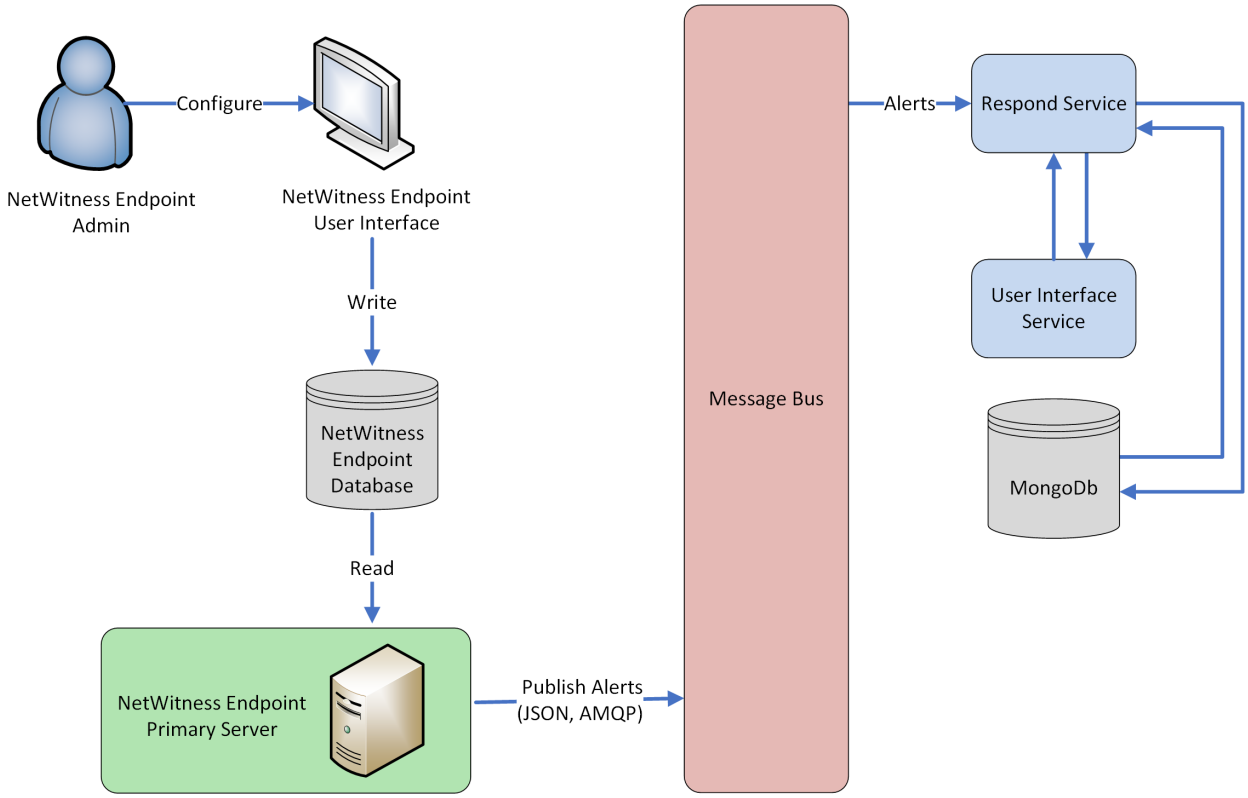
Note: The exception occurs if you customize NetWitness by editing the display setting for the default meta keys in Investigation, add meta keys to the table-map-custom.xml file, or customize NetWitness Endpoint feeds. Some configuration is required to add the custom meta keys to the context menu NetWitness Endpoint Lookup in the  **(Admin)** > System view as described in the "Add Custom Context Menu Actions" topic in the *System Configuration Guide*.

NetWitness Endpoint Alerts and Indicators of Compromise

NetWitness Endpoint IIOC (Instant Indicator of Compromise) is a database query that NetWitness Endpoint runs on collected NetWitness Endpoint scan data to determine the presence of potential malware on scanned hosts. NetWitness Endpoint 4.1.2 or later ships with IOCs that users can enable and mark as alertable. NetWitness Endpoint runs IOC queries regularly on new scan data, which is collected and stored in the database. If the IOC query is satisfied, this indicates a potential indicator of compromise, and the event can be reported to a user or sent to an external system as an alert.

Possible types of alerts are:

- Machine alert: This alert indicates that the machine in question is suspicious.
- Module alert: This alert indicates that a module, such as a file, a DLL, or an executable, is suspicious. It contains details about the module in question.
- Event alert: This alert represents any other suspicious activity detected by NetWitness Endpoint that does not fall into the above categories.



Each of these alert types can be sent to NetWitness.

Configure NetWitness Endpoint Alerts to Respond

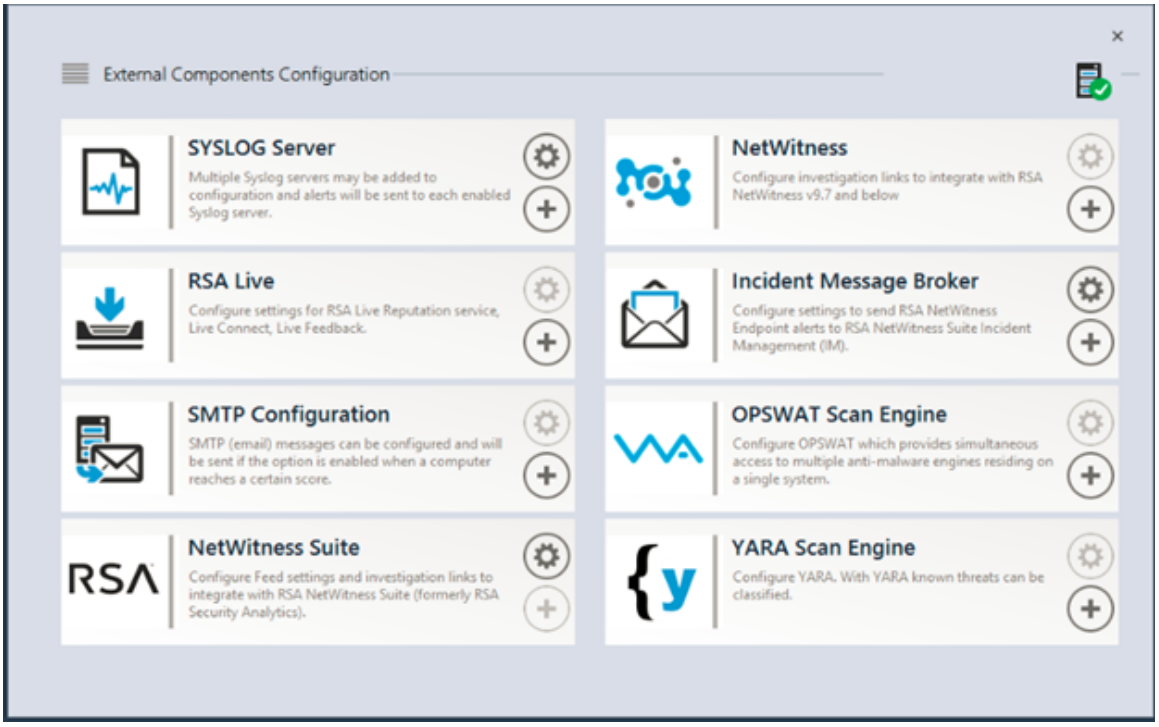
This procedure is required to integrate NetWitness Endpoint with NetWitness so that the NetWitness Endpoint alerts are picked up by the Respond component of NetWitness and displayed in the **Respond > Alerts** view.

Note: NetWitness supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later for NetWitness Respond integration. For more information, see the "NetWitness Suite Integration" topic in the *NetWitness Endpoint User Guide*.

The diagram below represents the flow of NetWitness Endpoint alerts to the Respond Incident List view of NetWitness and its display in the **Respond > Alerts** view.

Prerequisites

Ensure that you have the following:



- The Respond service is installed and running on NetWitness.
- NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later is installed and running.

Configure NetWitness Endpoint to Forward NetWitness Endpoint Alerts

To configure NetWitness Endpoint to send alerts to Respond to the NetWitness user interface:

1. In the NetWitness Endpoint user interface, click **(Configure) > Monitoring and External Components**.

   The External Components Configuration dialog is displayed.

2. From the components listed, select **Incident Message Broker** and click + to add a new IM broker.
3. Enter the following fields:
   a. **Instance Name**: Enter a unique name to identify the IM broker.
   b. **Server Hostname/IP address**: Enter the Host DNS or IP address of the IM broker (NetWitness Server).
   c. **Port number**: The default port is 5671.
4. Click **Save**.
5. Navigate to the **ConsoleServer.exe.config** file in **C:\Program Files\RSA\ECAT\Server**.
6. Modify the virtual host configurations in the file as follows:
   `<add key="IMVirtualHost" value="/rsa/system" />`

Note: In NetWitness 11.0 and 11.1, the virtual host is "/rsa/system". For version 10.6.x and below, the virtual host is "/rsa/sa".

7. Restart the API Server and Console Server.
8. To set up SSL for Respond Alerts, perform the following steps on the NetWitness Endpoint primary console server to set the SSL communications:
   a. Export the NetWitness Endpoint CA certificate to .CER format (Base-64 encoded X.509) from the personal certificate store of the local computer (without selecting the private key).
   b. Generate a client certificate for NetWitness Endpoint using the NetWitness Endpoint CA certificate. (You MUST set the CN name to ecat. Run cmd.exe console with Administrator rights.)

      ```
      makecert -pe -n "CN=ecat" -len 2048 -ss my -sr LocalMachine -a sha1 -sky
      exchange -eku 1.3.6.1.5.5.7.3.2 -in "NweCA" -is MY -ir LocalMachine -sp
      "Microsoft RSA SChannel Cryptographic Provider" -cy end -sy 12
      c:\client.cer
      ```

      Note: In the previous code sample, if you upgraded to version 4.3 (or later) from a previous version and did not generate new certificates, you should substitute `"EcatCA"` for `"NweCA"`. Or, if your current operating system has PowerShell version 5.1 or later, you can use the following code sample:

      ```
      PS C:\> New-SelfSignedCertificate -KeyExportPolicy Exportable -Subject
      "CN=ecat" -KeyAlgorithm RSA -KeyLength 2048 -CertStoreLocation
      "cert:\LocalMachine\My" -HashAlgorithm SHA256 -KeySpec KeyExchange -
      TextExtension @("2.5.29.37={text}1.3.6.1.5.5.7.3.2,1.3.6.1.5.5.7.3.1") -
      Provider "Microsoft RSA SChannel Cryptographic Provider" -KeyUsage
      DigitalSignature, KeyEncipherment, KeyAgreement -Signer (Get-ChildItem -
      Path Cert:\LocalMachine\My\ -DnsName NweCA)-NotAfter (Get-Date).AddYears
      (5); Export-Certificate –Cert (Get-ChildItem –Path
      Cert:\LocalMachine\My\ -DnsName ecat) –FilePath C:\Client.cer
      ```

   c. Make a note of the thumbprint of the client certificate generated in step b. Enter the thumbprint value of the client certificate in the IMBrokerClientCertificateThumbprint section of the ConsoleServer.Exe.Config file as shown.

      ```
      <add key="IMBrokerClientCertificateThumbprint"
      value="896df0efacf0c976d955d5300ba0073383c83abc"/>
      ```

9. On the NetWitness Server, copy the NetWitness Endpoint CA certificate file in .CER format into the import folder:

   `/etc/pki/nw/trust/import`

10. Issue the following command to initiate the necessary Chef run:
    `orchestration-cli-client --update-admin-node`
    This appends all of those certificates into the truststore.
11. Restart the RabbitMQ server:
    `systemctl restart rabbitmq-server`
    The NetWitness Endpoint account should automatically be available on RabbitMQ.
12. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NetWitness Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Troubleshooting

This section suggests how to resolve problems you may encounter when you configure NetWitness Endpoint alerts to Respond.

Known Issues	Solutions
Orchestration fails on admin node.	You must copy and paste the content of NweCA or EcatCA certificate in `/etc/rabbitmq/ssl/truststore.pem` and restart the Rabbitmq service.

Configure Contextual Data from NetWitness Endpoint Through Recurring Feed

You can configure NetWitness Endpoint data in NetWitness to provide contextual data from NetWitness Endpoint to Decoder and Log Decoder sessions. This configuration adds contextual meta values in addition to the instant IOC alerts that can be used to build correlations to other metadata in the NetWitness ecosystem.

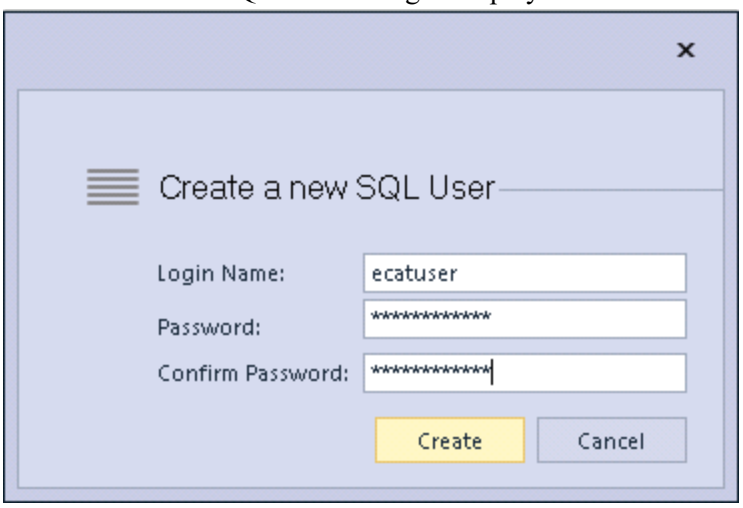
Administrators can configure NetWitness to consume system scan contextual data from NetWitness Endpoint through a NetWitness Live recurring feed. This integration can enrich the session from a Decoder or Log Decoder with contextual information displayed in NetWitness Investigation; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data into sessions from a Decoder or Log Decoder.

Note: Although this feature is targeted for customers with a Network Decoder, a recurring feed can also be implemented in Log Decoders.

Caution: In an environment with many NetWitness Endpoint hosts, using recurring feed may result in decreased performance on the NetWitness ingest devices (Decoder and Log Decoder).

Prerequisites

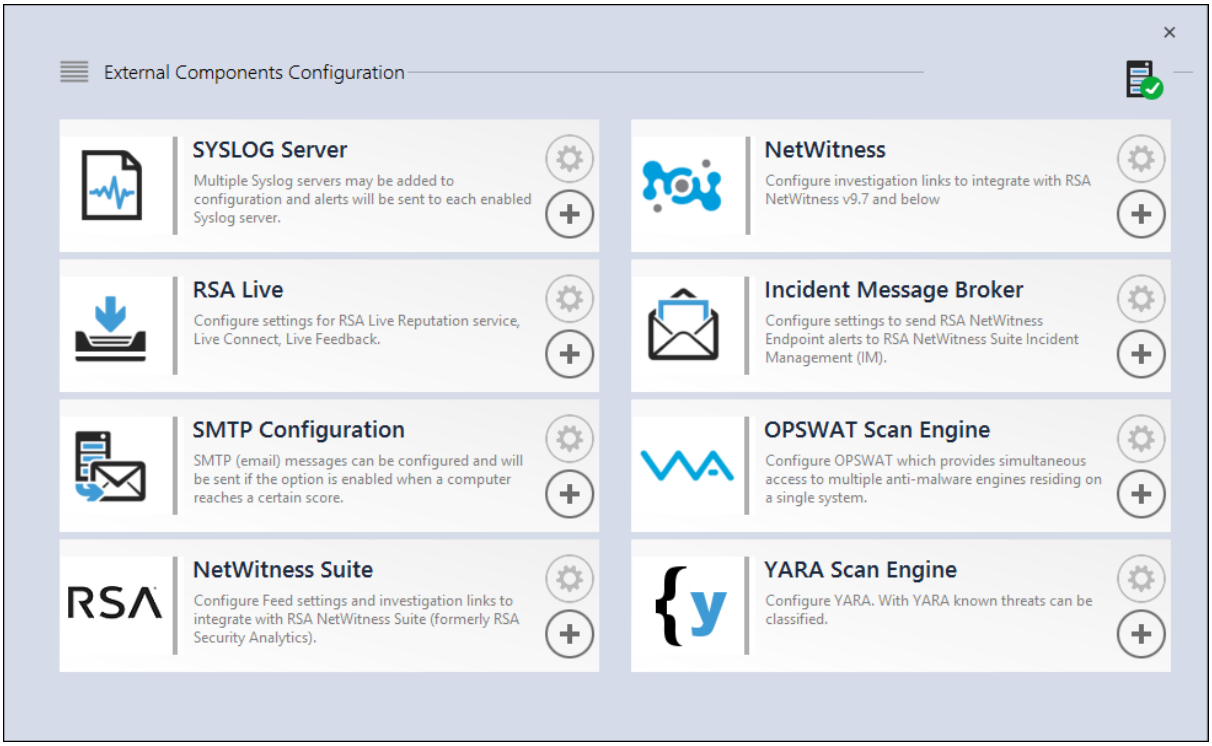
- Version 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later NetWitness Endpoint Console server and NetWitness Server Version 10.4 and above installed.
- Version 11.0 or 11.1 NetWitness Decoder and Concentrator connected to the NetWitness Server in the network.



To Configure Contextual Data from NetWitness Endpoint Through Recurring Feed, perform the following:

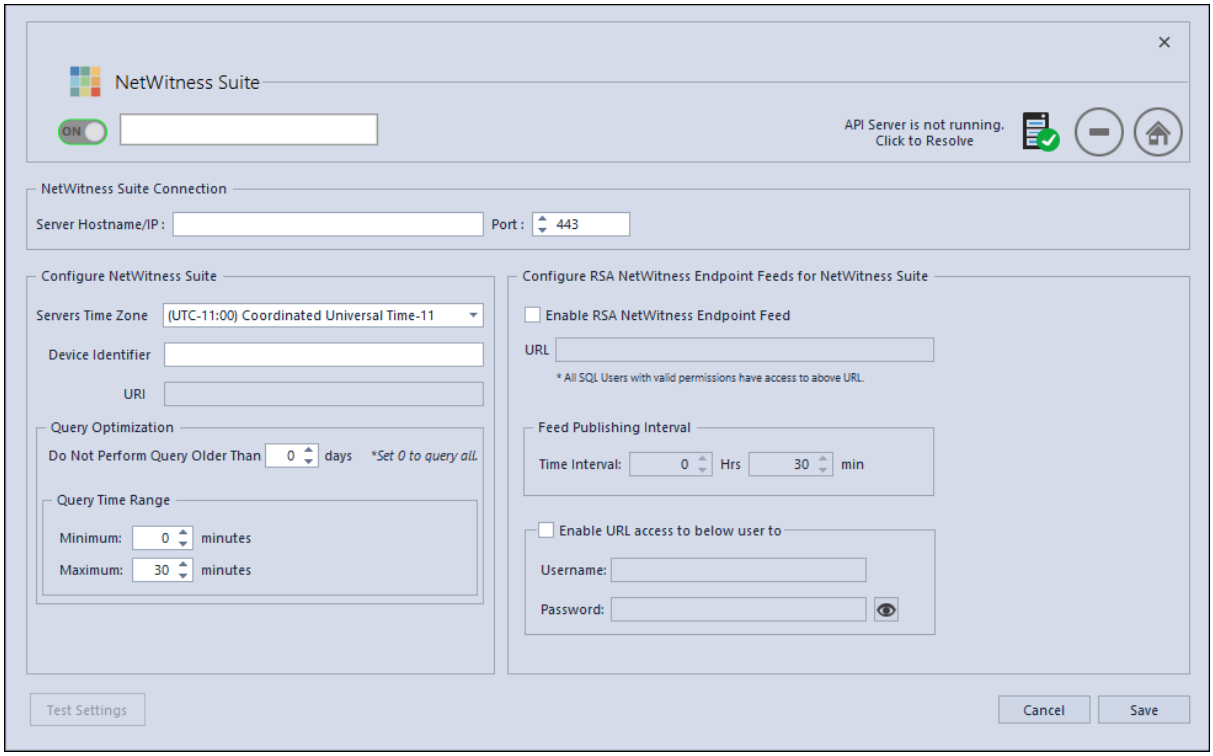
1. Enable the NetWitness Endpoint Feed for NetWitness in the NetWitness Endpoint User Interface.
2. Export the NetWitness Endpoint CA Certificate from the NetWitness Endpoint Console server and Import it into NetWitness trust store.
3. Configure the NetWitness Concentrator service to define which meta keys are indexed.
4. Create a recurring feed in NetWitness Live.

Enable the NetWitness Endpoint Feed for NetWitness



1. In the NetWitness Endpoint user interface, create SQL user in NetWitness Endpoint:
   a. Open the NetWitness Endpoint user interface and log on using the proper credentials.
   b. From the menu bar, select  **(Configure) > Manage Users and Roles**, right-click in the pane, and select **create sql user**.

The Create a new SQL User dialog is displayed.



c. Enter the **Login Name** and **Password** and click **Create**.

2. From the menu bar, select **(Configure) > Monitoring and External Components**.
   The External Components Configuration dialog is displayed.

3. In NetWitness, click +.
   The NetWitness dialog is displayed.

4. In the **NetWitness** panel, in **On**, enter the name to identify the NetWitness component.
5. In the **NetWitness Connection** panel, perform the following.
   a. In the **Server Hostname/IP** field, enter the host name or IP address of the NetWitness Server.
   b. In the **Port** field, enter the port number. By default port number is 443.
6. In the **Configure NetWitness** panel, perform the following:
   a. In the **Servers Time Zone** field, select the time zone for the component from the drop-down list.
   b. In the **Device Identifier** field, enter the NetWitness concentrator device ID.

   Note: You can find the Device Identifier in NetWitness when you look up a Concentrator or Broker in **Investigation > Navigate > <*Concentrator or Broker Name*>**. The Device Identifier is the number in the URL after "investigation." For example, in the URL `https://<IP address>investigation/319/navigate/values`, the Device Identifier is **319**.

   The **URI** field is populated when you click **Save**.
7. In the **Query Optimization** panel, in the **Do Not Perform Query Older Than** field, enter the number of days to limit the query period. Enter **0** if you want to discard this feature.

8. In the **Query Time Range** panel, perform the following:
   a. In the **Minimum** field, enter the number of minutes for the minimum query time range. This value is used to automatically increase the time range submitted to NetWitness. This ensures that a query returns a positive response if the NetWitness Endpoint Agent's reported time is slightly different than NetWitness Endpoint's time.
   b. In the **Maximum** field, enter the number of minutes to limit the time range. This value is used to automatically limit the time range submitted to NetWitness, so that a query does not overload the NetWitness Server.
9. In the **Configure NetWitness Endpoint Feeds for NetWitness** panel, perform the following:
   a. Select **Enable NetWitness Endpoint Feed**.
   b. In the **URL** field, enter the SQL **Username** and **Password** (configured in step 1) to access the location of the feed.
   The **URL** field is populated when you click **Save**.
   c. Enter the time interval for the frequency at which feeds are published.
10. In the **Feed Publishing Interval** panel, in the **Time Interval** field, select the time interval in **hrs** and **mins** for the frequency at which feeds are published.
11. In the **Enable URL access to below user to** panel, enter the **Username** and **Password** of the NetWitness Endpoint user.
12. Click **Save**.
    A feed is created.

Export the NetWitness Endpoint SSL Certificate

Note: This procedure works only for NetWitness 10.5 and above because Java 8 support was added for 10.5. If you are using an earlier version of NetWitness, refer to the applicable version of this guide.

To export the NetWitness Endpoint CA certificate from the NetWitness Endpoint Console server and copy it to the NetWitness host:

1. Log on to the NetWitness Endpoint Console.
2. Open **MMC**.
3. Add a certificate snap-in for **Computer account**.
4. Export the certificate named **`NweCA`** (in NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh install) or **`EcatCA`** (in NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5).
   a. Export without a private key.
   b. Export in DER encoded binary X.509 (`.CER`) format.
   c. Name it **`NweCA.cer`** (in NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh install) or **`EcatCA.cer`** (in NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5).

5. Copy the NetWitness Endpoint CA certificate to the NetWitness host:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5 or 4.4 fresh installation:
     `scp NweCA.cer root@<sa-machine>:.`
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5:
     `scp EcatCA.cer root@<sa-machine>:.`
6. To import the NetWitness Endpoint Endpoint CA certificate into the NetWitness Trusted store, navigate to java directory. Enter the following commands:
   - For NetWitness Endpoint fresh installation:
     `keytool -import -v -trustcacerts -alias nweca -file ~/NweCA.cer -keystore /etc/pki/java/cacerts -storepass changeit`
   - For NetWitness Endpoint upgraded from previous version:
     `keytool -import -v -trustcacerts -alias ecatca -file ~/EcatCA.cer -keystore /etc/pki/java/cacerts -storepass changeit`

   When prompted for certificate update confirmation, enter **Yes**.
7. Create a file `jetty.user` in the `/etc/default` directory and add the following text.
   `JAVA_OPTIONS="${JAVA_OPTIONS} -Djdk.security.allowNonCaAnchor=true"`
8. On the NetWitness host, do one of the following:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh installation, edit**`/etc/hosts.user`** to map the IP address of the NetWitness Endpoint Console server to the name **NweServerCertificate** by adding the following line to the file:

     `<ip-address-ecat-cs> NweServerCertificate`
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, edit **`/etc/hosts.user`** to map the IP address of the upgraded NetWitness Endpoint Console server to the name **`ecatserverexported`** by adding the following line to the file:

     `<ip-address-ecat-cs> ecatserverexported`
9. SSH to ADMIN Server and run the following command.
   `nw-manage --refresh-host --host-all`
10. To restart NetWitness, enter the following command:
    service jetty restart

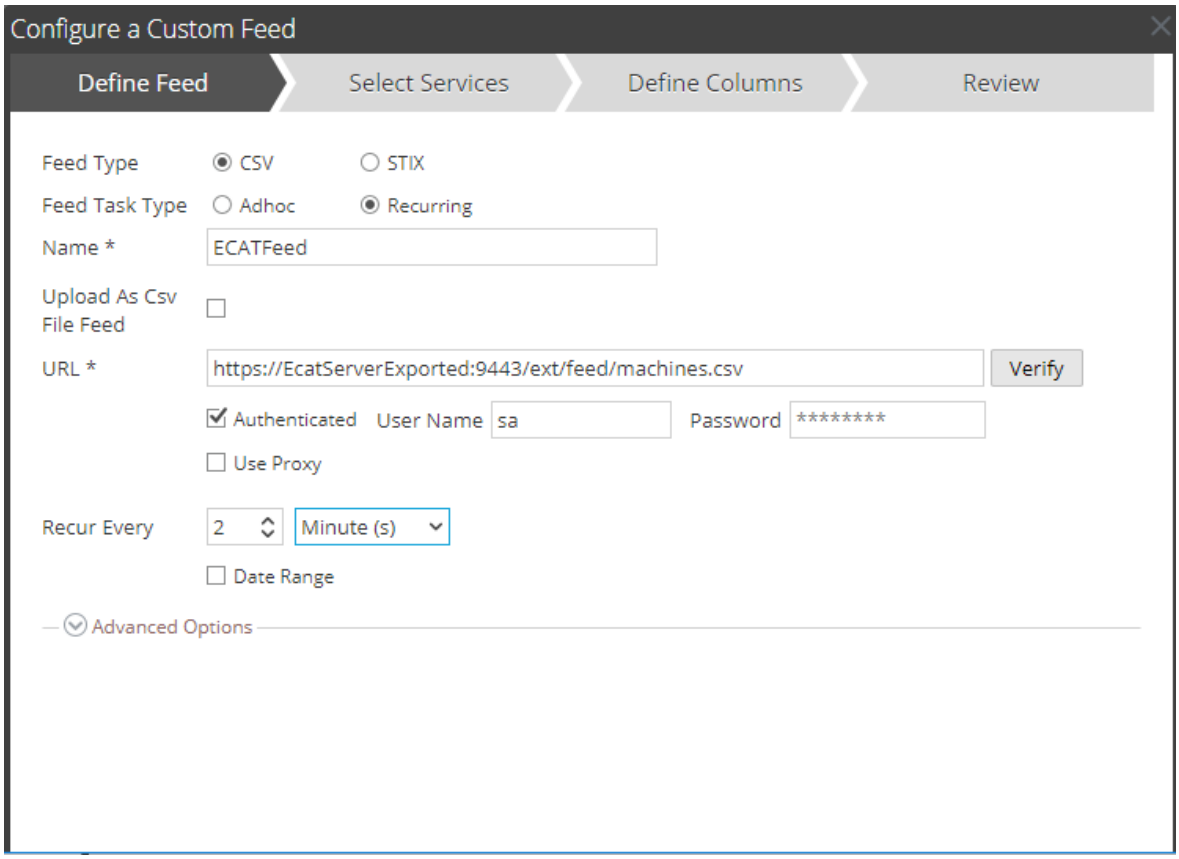
Configure the NetWitness Concentrator Service

1. Log on to NetWitness and go to  **(Admin) > Services**.
2. Select a **Concentrator** from the list and select **View > Config.**
3. Select the **Files** tab, and from the **Files to Edit** drop-down menu, select **index-concentrator-custom.xml**.
4. Add the following NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them. The following lines are examples; make sure the values match your configuration and the column names you included in

the feed definition, where:
description is the name of the meta key you want to display in NetWitness Investigation.
level is "IndexValues"
name matches the column name of the CSV file that NetWitness uses while defining the recurring feed (see the table in *Configure the Recuring Custom Feed Task in NetWitness* below).

```
<key description="Gateway" format="Text" level="IndexValues" name="gateway"
valueMax="250000" defaultAction="Open"/>
<key description="Risk Number" format="Float64" level="IndexValues"
name="risk.num" valueMax="250000" defaultAction="Open"/>
<key description="Strans Addr" format="Text" level="IndexValues"
name="stransaddr" valueMax="250000" defaultAction="Open"/>
<key description="Domain" format="Text" level="IndexValues" name="domain"
valueMax="250000" defaultAction="Open"/>
<key description="User Account" format="Text" level="IndexValues"
name="username" valueMax="250000" defaultAction="Open"/>
<key description="Ecat Connectiontime" format="Text" level="IndexValues"
name="ecat.ctime" valueMax="250000" defaultAction="Open"/>
<key description="Ecat Scantime" format="Text" level="IndexValues"
name="ecat.stime" valueMax="250000" defaultAction="Open"/>
```

5. Restart the Concentrator to activate the custom key updates.

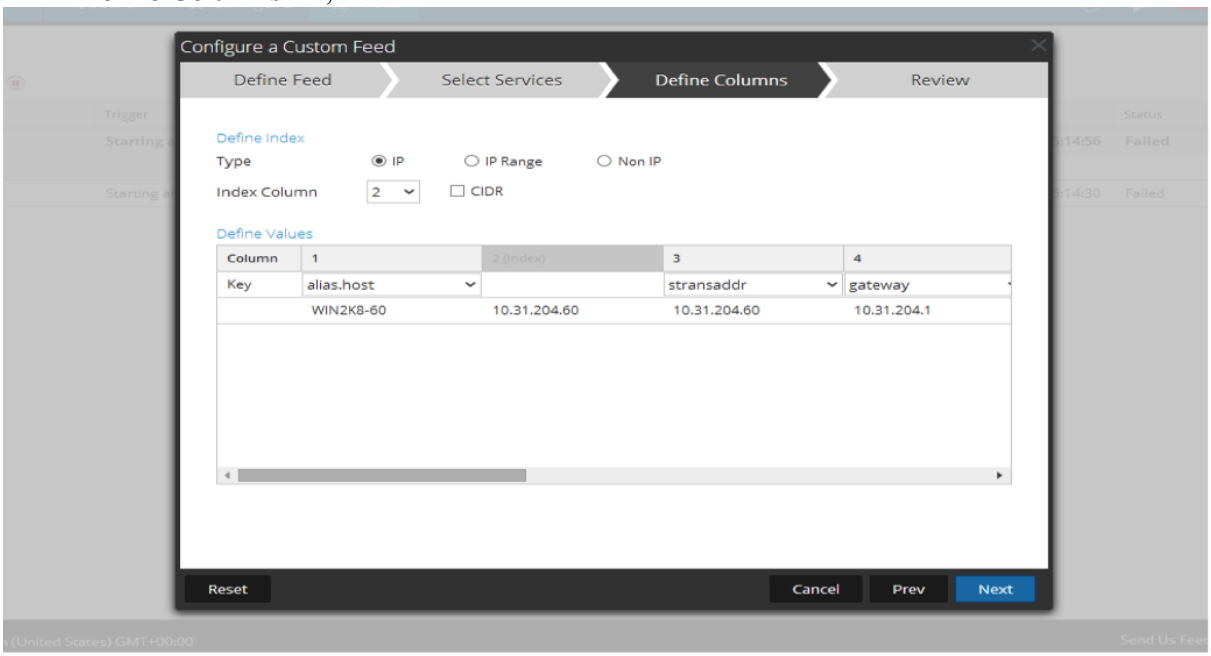


Configure the Recurring Custom Feed Task in NetWitness

1. Log on to NetWitness and go to  **(Configure) > Custom Feeds**.
   The Feeds view is displayed.
2. In the toolbar, click .
   The Setup Feed dialog is displayed.
3. In the Setup Feed dialog, select **Custom Feed** and click **Next**.
   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.
4. In the **Define Feed**, perform the following:
   a. In the **Feed Type** field, select **CSV**.
   b. In the **Feed Task Type** field, select **Recurring**.
   c. In the **Name** field, enter the name of the feed. For example, EndpointFeed.
   d. Enable the **Upload As Csv File Feed** checkbox to upload the feed as a CSV file.
   e. In the **URL** field, enter the URL with the hostname of the Windows server on which NetWitness Endpoint is installed:
      - For NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh installation, use the URL **`https://NweServerCertificate:9443/api/v2/feed/machines.csv`**.
      - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, use the URL **`https://ecatserverexported:9443/api/v2/feed/machines.csv`**.

f. Enable the **Authenticated**checkbox and enter the username and password as noted in *Enable the ECAT Feed* above.

g. Click **Verify** to check if NetWitness can reach the web resource.

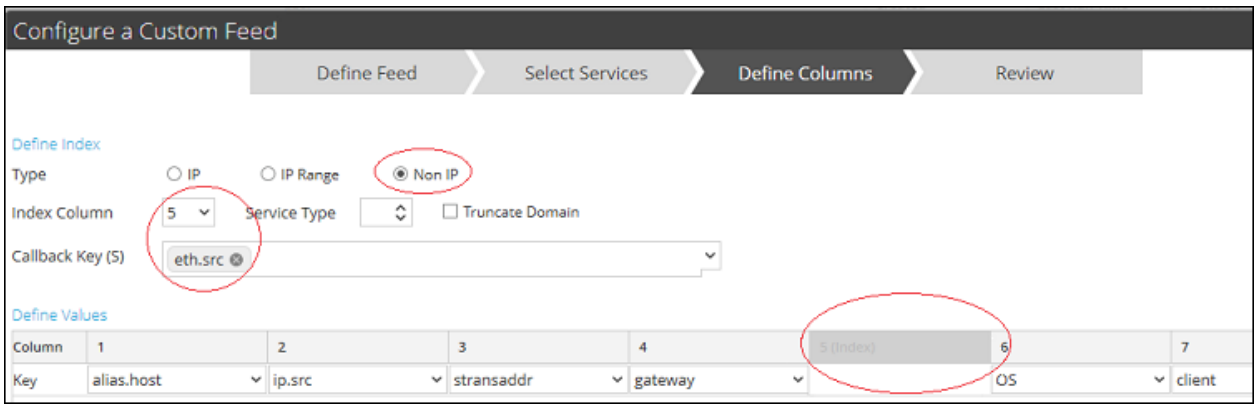


.

h. Define the schedule and click **Next**

5. In the **Select Services** tab, select the Decoder or groups to consume the feed. Click **Next**.

6. In the **Define Columns** tab, enter the column names as shown in the table below and save the feed.



The following table shows the columns in the CSV file for the NetWitness Endpoint feed.

Column	Name	Description	Column Name in NetWitness (Meta Key Name)
1	MachineName	Host name of the Windows agent	alias.host
2	LocalIp	IPv4 address	IP type (indexed column)
3	RemoteIp	Far end IP as seen by the router	stransaddr
4	GatewayIp	IP of the gateway	gateway
5	MacAddress	MAC address	eth.src
6	OperatingSystem	Operating system used by the Windows Agent	OS
7	AgentID	Agent ID of the host (unique ID assigned to the agent)	client
8	ConnectionUTCTime	Last time when the agent connected to NetWitness Endpoint server	ecat.ctime
9	Source Domain	Domain	domain.src
10	ScanUTC time	Last time when the agent was scanned	ecat.stime

Column	Name	Description	Column Name in NetWitness (Meta Key Name)
11	UserName	Username of the client machine	username
12	Machine Score	Score of the agent indicating the suspicious level	risk.num

Note: In the table, the recommended index setting is LocalIp. However, if the LocalIp for NetWitness Endpoint Agent PC is allocated by a DHCP Server and the DHCP lease has expired, and if the IP is then re-allocated to another PC, the metadata created by the feed will be incorrect. To avoid this risk, use the machine name or the Mac address instead of the localIP address as the Feed's index. For example, to use a Mac address, you could enter the values as shown in the following figure.

Result

When viewing feed data in NetWitness, upon a match of the indexed value (ip.src), meta data is populated in Investigation, Reporting, and Alerting Interfaces.

Configure Endpoint Alerts Through Syslog into a Log Decoder

You can configure the use of NetWitness Endpoint data in NetWitness to provide NetWitness Endpoint alerts through Syslog into Log Decoder sessions. This generates metadata that is used by NetWitness Investigation, Alerts, and Reporting Engine.

For NetWitness networks that are consuming logs, this integration of NetWitness Endpoint with NetWitness pushes NetWitness Endpoint events to the Log Decoder through common event format (CEF) syslog messages and generates metadata that is used by NetWitness Investigation, Alerts, and Reporting Engine. The use case for this integration is SIEM Integration to allow centralized event management, correlation of NetWitness Endpoint events with other Log Decoder data, NetWitness reporting on NetWitness Endpoint events, and NetWitness alerting of NetWitness Endpoint events.

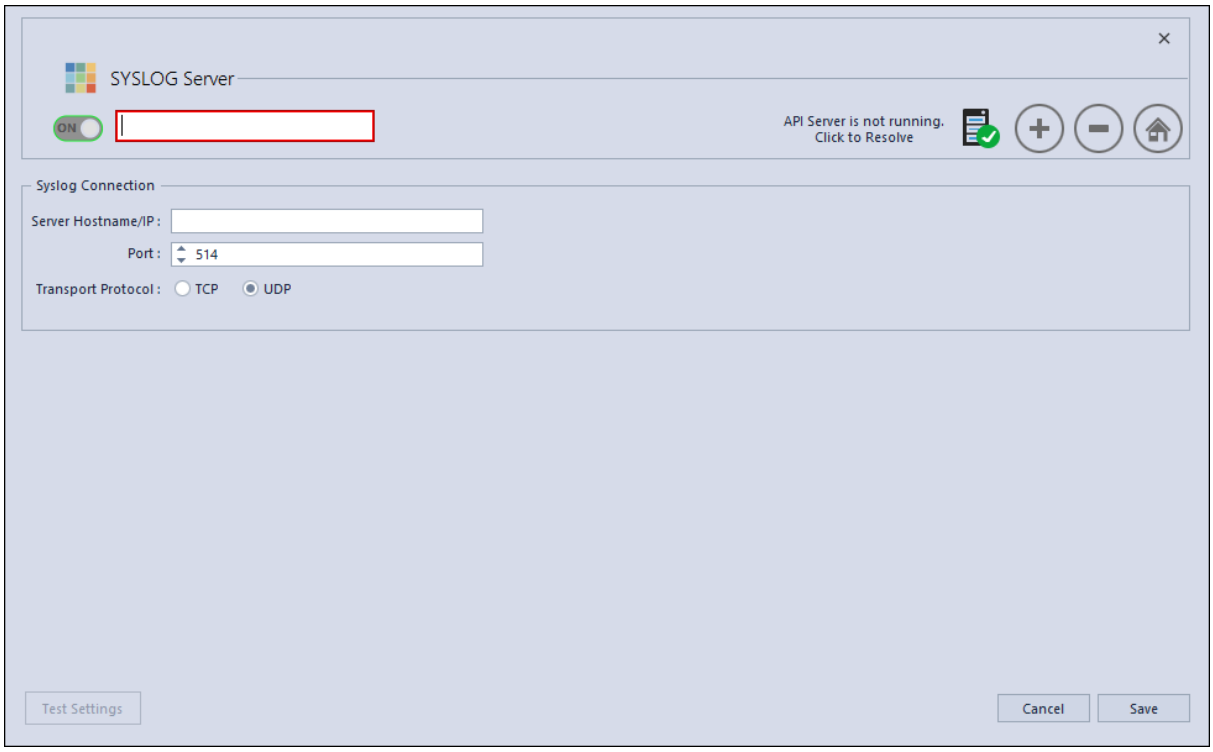
Prerequisites

The following are required for this integration:

- Version 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later NetWitness Endpoint UI.
- NetWitness Server Version 11.1 is installed.
- Version 10.4 or later NetWitness Log Decoder and Concentrator connected to the NetWitness Server in the network.
- Port UDP- 514 or TCP - 1514 open from NetWitness Endpoint server to Log Decoder in the firewall.

Procedure

1. Deploy the required parser (CEF or rsaecat) to the Log Decoder as described in the "Manage Live Resources" topic in *Live Services Management*. After you deploy the parser, make sure the parser is enabled. For more information, see "Services Config View - General Tab" in the *Malware Analysis Configuration Guide*.

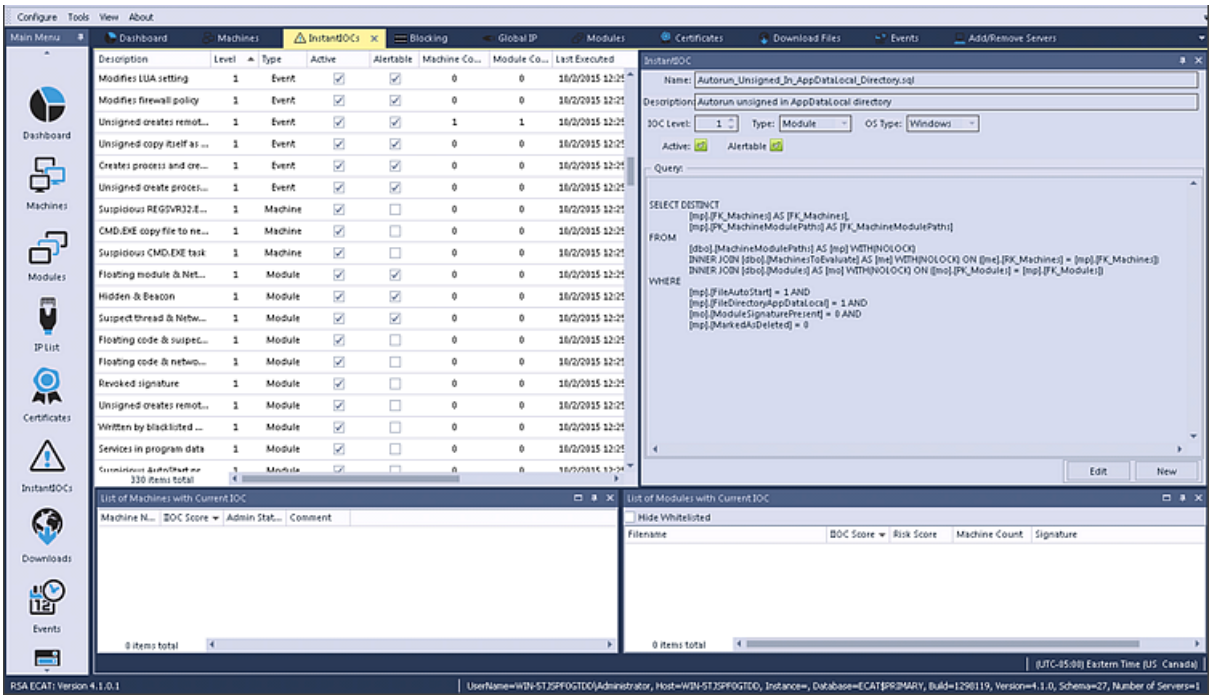


Note: Use only one of these parsers. When the CEF parser is deployed, it supersedes the NetWitness Endpoint parser, and all CEF messages into NetWitness are processed by the CEF parser. Enabling both parsers is an unnecessary burden on performance.

2. Configure NetWitness Endpoint to send syslog output to NetWitness and generate NetWitness Endpoint alerts to the Log Decoder.
3. (Optional) Edit the table mapping in `table-map-custom.xml` and the `index-concentrator-custom.xml` to add fields based on user preferences for metadata to be mapped to NetWitness.

Configure NetWitness Endpoint to Send Syslog Output to NetWitness

To add the Log Decoder as a Syslog external component and generate NetWitness Endpoint alerts to the Log Decoder:



1. Open the NetWitness Endpoint user interface and log on using the proper credentials.
2. From the menu bar, select **(Configure) > Monitoring and External Components**.
   The External Components Configuration dialog is displayed.
3. In **SYSLOG Server**, click .
   The SYSLOG Server dialog is displayed.

4. In the **NetWitness** panel, in **On**, enter the descriptive name for the Log Decoder.
5. In the **Syslog Connection** panel, perform the following to enable Syslog messaging:

   Server Hostname/IP = The hostname DNS or IP address of the NetWitness Log Decoder
   Port = 514
   Transport Protocol = Select **UDP** or **TCP** as appropriate for your Syslog server for the transport protocol.

6. Click **Save**.
7. Open the **InstantIOCs** window in the NetWitness Endpoint UI and, in the **Alertable** column, click to enable each IIOC for which you want alerts sent to the Log Decoder.

When the instant IOCs are triggered, Syslog alerts from the NetWitness Endpoint server are sent to the Log Decoder. Log Decoder alerts are then aggregated to the Concentrator. These events are injected into the Concentrator as metadata.

Edit the Table Mapping in table-map-custom.xml

In the default NetWitness table-map.xml provided by NetWitness, the meta keys in the `table-map.xml` file are set to `Transient`. In order to view the meta keys in Investigation, the keys must be set to `None`. To make changes to the mapping, you must add the entries to the `table-map-custom.xml` on the Log Decoder.

This is the list of meta keys in `table-map.xml`.

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
agentid	client	No
CEF Header Hostname Field	alias.host	No
CEF Header Product Version	version	No
CEF Header Product Name	Product	Yes
CEF Header Severity	severity	Yes

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
CEF Header Signature ID	event.type	No
CEF Header Signature Name	event.desc	No
destinationDnsDomain	ddomain	Yes
deviceDnsDomain	domain	Yes
dhost	host.dst	No
dst	ip.dst	No
end	endtime	Yes
fileHash	checksum	No
fname	filename	No
fsize	filename.size	No
gatewayip	gateway	Yes
instantIOCLevel	threat.desc	No
instantIOCName	threat.category	No
machineOU	dn	No
machineScore	risk.num	No
md5sum	checksum	No
os	OS	No
port	ip.dstport	No
protocol	protocol	Yes
Raw Message	msg	Yes
remoteip	stransaddr	Yes
rt	alias.host	No
sha256sum	checksum	No
shost	host.src	No
smac	eth.src	No
src	ip.src	No
start	starttime	No
suser	user.dst	No
timezone	timezone	No

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
totalreceived	rbytes	Yes
totalsent	bytes.src	No
useragent	user.agent	No
userOU	org	Yes

The following seven keys are not in `table-map.xml`; to use these keys in NetWitness you need to add them to `table-map-custom.xml`, and set the flags to `None`.

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
moduleScore	cs.modulescore	Yes
moduleSignature	cs.modulesign	Yes
Target module	cs.targetmodule	Yes
YARA result	cs.yararesult	Yes
Source module	cs.sourcemodule	Yes
OPSWATResult	cs.opswatresult	Yes
ReputationResult	cs.represult	Yes

Here are the entries to be added to the `table-map-custom.xml` if required.

```
<mapping envisionName="cs_represult" nwName="cs.represult" flags="None"
envisionDisplayName="ReputationResult"/>
 <mapping envisionName="cs_modulescore" nwName="cs.modulescore" format="Int32"
flags="None" envisionDisplayName="ModuleScore"/>
 <mapping envisionName="cs_modulesign" nwName="cs.modulesign" flags="None"
envisionDisplayName="ModuleSignature"/>
 <mapping envisionName="cs_opswatresult" nwName="cs.opswatresult" flags="None"
envisionDisplayName="OpswatResult"/>
 <mapping envisionName="cs_sourcemodule" nwName="cs.sourcemodule" flags="None"
envisionDisplayName="SourceModule"/>
 <mapping envisionName="cs_targetmodule" nwName="cs.targetmodule" flags="None"
envisionDisplayName="TargetModule"/>
 <mapping envisionName="cs_yararesult" nwName="cs.yararesult" flags="None"
envisionDisplayName="YaraResult"/>
```

Note: Restart the Log Decoder or reload the log parsers for the changes to take effect.

Configure the NetWitness Suite Concentrator Service

1. Log on to NetWitness and go to  **(Admin) > Services**.
    1. Select a **Concentrator** from the list and select **View > Config.**
2. Select the **Files** tab, and from the **Files to Edit** drop-down list, select **index-concentrator-custom.xml**.

3. Add the NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them.
4. Restart the Concentrator.
5. To add the Concentrator as a data source in the Reporting Engine, in the  **(Admin) > Services** view, select the **Reporting Engine** and Select **View> Config > Sources.**
   NetWitness Endpoint meta is populated in Reporting Engine, and you can run reports by selecting the appropriate meta keys.

Example

Note: The following lines are examples; make sure the values match your configuration and the column names you included in the feed definition, where:
description is the name of the meta key you want to display in NetWitness Investigation.
level is "IndexValues"
name is the NetWitness Endpoint meta key name from the table below

```
<language>
<key description="Product" format="Text" level="IndexValues" name="product"
valueMax="250000" defaultAction="Open"/>
 <key description="Severity" format="Text" level="IndexValues" name="severity"
valueMax="250000" defaultAction="Open"/>
 <key description="Destination Dns Domain" format="Text" level="IndexValues"
name="ddomain" valueMax="250000" defaultAction="Open"/>
 <key description="Domain" format="Text" level="IndexValues" name="domain"
valueMax="250000" defaultAction="Open"/>
 <key description="Destination Host" format="Text" level="IndexValues" name="host.dst"
valueMax="250000" defaultAction="Open"/>
 <key description="End Time" format="TimeT" level="IndexValues" name="endtime"
valueMax="250000" defaultAction="Open"/>
 <key description="Checksum" format="Text" level="IndexValues" name="checksum"
valueMax="250000" defaultAction="Open"/>
 <key description="Filename Size" format="Int32" level="IndexValues"
name="filename.size" valueMax="250000" defaultAction="Open"/>
 <key description="Gateway" format="Text" level="IndexValues" name="gateway"
valueMax="250000" defaultAction="Open"/>
 <key description="Domain OU" format="Text" level="IndexValues" name="dn"
valueMax="250000" defaultAction="Open"/>
 <key description="Risk Number" format="Float64" level="IndexValues" name="risk.num"
valueMax="250000" defaultAction="Open"/>
 <key description="ReputationResult" format="Text" level="IndexValues"
name="cs.represult" valueMax="250000" defaultAction="Open"/>
 <key description="Module Score" format="Text" level="IndexValues"
name="cs.modulescore" valueMax="250000" defaultAction="Open"/>
 <key description="Module Sign" format="Text" level="IndexValues" name="cs.modulesign"
valueMax="250000" defaultAction="Open"/>
 <key description="opswat result" format="Text" level="IndexValues"
name="cs.opswatresult" valueMax="250000" defaultAction="Open"/>
 <key description="source module" format="Text" level="IndexValues"
name="cs.sourcemodule" valueMax="250000" defaultAction="Open"/>
 <key description="Target Module" format="Text" level="IndexValues"
name="cs.targetmodule" valueMax="250000" defaultAction="Open"/>
 <key description="yara result" format="Text" level="IndexValues" name="cs.yararesult"
valueMax="250000" defaultAction="Open"/>
 <key description="Protocol" format="Text" level="IndexValues" name="protocol"
valueMax="250000" defaultAction="Open"/>
 <key description="Event Time" format="TimeT" level="IndexValues" name="event.time"
valueMax="250000" defaultAction="Open"/>
 <key description="Source Host" format="Text" level="IndexValues" name="host.src"
```

```
valueMax="250000" defaultAction="Open"/>
 <key description="Start Time" format="TimeT" level="IndexValues" name="starttime"
valueMax="250000" defaultAction="Open"/>
 <key description="Timezone" format="Text" level="IndexValues" name="timezone"
valueMax="250000" defaultAction="Open"/>
 <key description="Received Bytes" format="UInt64" level="IndexValues" name="rbytes"
valueMax="250000" defaultAction="Open"/>
 <key description="Agent User" format="Text" level="IndexValues" name="user.agent"
valueMax="250000" defaultAction="Open"/>
 <key description="Source Bytes" format="UInt64" level="IndexValues" name="bytes.src"
valueMax="250000" defaultAction="Open"/>
 <key description="Strans Address" format="Text" level="IndexValues" name="stransaddr"
valueMax="250000" defaultAction="Open"/>
 </language>
```

Result

Analysts can:

- Create NetWitness alerts based on NetWitness Endpoint events by configuring NetWitness Endpoint events as an enrichment source.
- Create ESA rules using NetWitness Endpoint meta as described in the "Add Rules to the Rules Library" topic in the *Alerting Using ESA Guide*.
- Report on NetWitness Endpoint events using NetWitness Endpoint meta as described in the "Configure a Rule" topic in the *Reporting Guide*.
- View NetWitness Endpoint alerts in NetWitness Respond as described in the "View Alerts" topic in *NetWitness Respond User Guide*.
- View NetWitness Endpoint meta keys in Investigation along with standard NetWitness core meta keys as described in the "Conduct an Investigation" topic in *Investigation and Malware Analysis User Guide*.

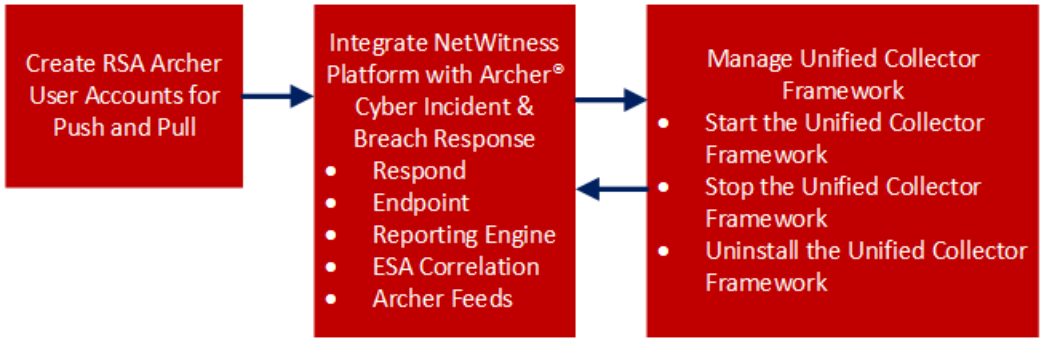
Archer Integration

Administrators can integrate NetWitness with Archer Cyber Incident & Breach Response to send alerts and incidents from NetWitness to Archer for incident management and remediation. This guide provides a high-level workflow for configuring this integration.

Note: When you upgrade from Security Analytics 10.6.5 to NetWitness 11.x, the Archer Cyber Incident & Breach Response integration is no valid, and must be re-configured.

The following table list the NetWitness 11.x integration options with Archer Cyber Incident & Breach Response Version 1.3.1.2.

Archer Cyber Incident & Breach Response Version	NetWitness 11.x Integration	Reference
1.3.1.2	ESA Correlation	See "Configure ESA Correlation for Integration with Archer Cyber Incident & Breach Response" section.
1.3.1.2	Reporting Engine (RE)	See "Configure Reporting Engine for Integration with Archer Cyber Incident & Breach Response" section.
1.3.1.2	Respond	See "Configure Respond for Integration with Archer Cyber Incident & Breach Response 1.3.1.2" section.
1.3.1.2	Archer Feeds	See "Archer Feeds" section.



Configure NetWitness to Work With Archer

The Archer Cyber Incident & Breach Response solution enables you to aggregate all actionable security alerts, allowing you to become more effective, proactive, and targeted in your incident response and SOC management. For more information on Archer Cyber Incident & Breach Response capabilities, see Archer documentation on the Archer Community or on the Archer Exchange Community.

This version of Archer determines how NetWitness will be integrated. For supported Archer platforms, see the *SecOps Installation Guide*.

Archer Cyber Incident & Breach Response1.3.1.2 integrates with NetWitness using the UCF (Unified Collector Framework), which comprises of NetWitness Respond integration service and Archer Cyber Incident & Breach Response Watchdog service.

This figure represents the flow of NetWitness 11.x integration with Archer Cyber Incident & Breach Response 1.3.1.2.

Create Archer User Accounts for Push and Pull

You must create a user account for the web service client to transfer data to the Archer GRC Platform.

You require two Archer user accounts to avoid conflicts while sending and receiving data from NetWitness.

To create a user account for push and pull:

1. On the Archer UI, click **Administration** > **Access Control** > **Users** > **Add New**.
2. In the **First Name** and **Last Name** fields, enter a name that indicates that the Unified Collector Framework (UCF) uses this account to push data into Archer GRC. For example, UCF User, Push.

   Note: When configuring the Pull account, enter a name that indicates that the UCF uses this account to pull data from Archer GRC. For example, UCF User, Pull.

3. (Optional) Enter a user name for the new user account.

   Note: If you do not specify a user name, the Archer GRC Platform creates the user name from the first and last name entered when you save the new user account.

4. In the **Contact Information** panel, in the **Email** field, enter an email address to associate with the new user account.

5. In the **Localization** section, change the time zone to (UTC) Coordinated Universal Time.

   Note: The UCF uses UTC time to baseline all the time-related calculations.

6. In the **Account Maintenance** section, enter and confirm a new password for the new user account.

   Note: Make a note of the user name and password for the new user account that you created. You need to enter these credentials when you set up the UCF to communicate with the Archer GRC Platform through the web service client.

7. Clear the Force Password Change On **Next Sign-In** option.
8. In the **Security Parameter** field, select the security parameter that you want to use for this user.

   Note: If you assign a default security parameter with a password change interval of 90 days, you also must update the user account password stored in the SA IM integration service every 90 days. To avoid this, you can optionally create a new security parameter for the SA IM integration service user account, and set the password change interval to the maximum value allowed by your corporate standards.

9. Click the **Groups** tab, and perform the following:
   a. In the **Groups** panel, click **Lookup**.
   b. In the **Available Groups** window, expand Groups.
   c. Scroll down and select **SOC: Solution Administrator and EM: Read Only**.
   d. Click **OK**.
10. Click **Apply** and click **Save**.
11. If the machine language and regional settings of your Archer GRC system are set to anything other than English-US, perform the following:
    a. Open the user account you just created, and in the **Localization** section, in the **Locale** field, select **English (United States)**, and click **Save**.
    b. On the Windows system hosting your Archer GRC Platform, open **Internet Information Services (IIS) Manager**.
    c. Expand your Archer GRC site, click **.Net Globalization**, in both the **Culture** and **UI Culture** fields, select **English (United States)**, and click **Apply**.
    d. Restart your Archer GRC site.
12. Repeat steps 1 – 11 to create a second user account for the UCF to pull data from Archer GRC.

Integrate NetWitness Platform With Archer Cyber Incident & Breach Response

You have to configure the system integration settings to manage incident workflow in Archer Cyber Incident & Breach Response.

For information on how to configure system integration settings, see the "Manage Incidents in Archer Cyber Incident & Breach Response" in the *NetWitness Respond Configuration Guide*.

Unified Collector Framework

NetWitness integrates with Archer Cyber Incident & Breach Response 1.3.1.2 using the UCF. The UCF integrates with all supported SIEM tools and the Archer Cyber Incident & Breach Response solution. After you configure the system integration settings, all incidents are managed in Archer Cyber Incident & Breach Response instead of NetWitness Respond. Incidents created before the integration will not be managed in Archer Cyber Incident & Breach Response.

Note:
• You must configure the same option in both NetWitness and the Unified Collector Framework.
• Integration of the NetWitness Respond module with Reporting Engine or ESA Correlation can result in duplicate events, alerts, and incidents created in Archer Cyber Incident & Breach Response.

UCF supports multiple SIEM tools connections at the same time, such as supporting NetWitness Reporting Engine, HP ArcSight, and NetWitness Respond. However, different instances of the same SIEM tool are not supported, such as two NetWitness servers connected to the same UCF.

Prerequisites

- Install the Archer Cyber Incident & Breach Response package on Archer. See Archer documentation Archer Community or on the Content Tab at https://www.archerirm.community/t5/exchange-overviews/archer-exchange-offering-list/ta-p/672315.
- Install Archer Cyber Incident & Breach Response 1.3.1.2.
- Ensure you have NetWitness 11.1 as it is compatible with Archer Cyber Incident & Breach Response 1.3.1.2.
- Ensure that Respond is configured inNetWitness.

The UCF allows you to integrate your Archer Cyber Incident & Breach Response system with the following:

- NetWitness Respond
- NetWitness Reporting Engine
- NetWitness ESA Correlation.
- Archer Feeds

Configure Respond for Integration with Archer Cyber Incident & Breach Response

Step 1: Select the Mode for NetWitness Respond

1. Go to  **(Admin) > Services**, select the **Respond Server** service, and select  > **View** > **Explore**.

2. Navigate to `respond/integration/export`.
3. Set the `archer-sec-ops-integration-enabled` field to **true**.
4. Restart the Respond service by running the following command:
   `systemctl restart rsa-nw-respond-server`

Step 2: Configure NetWitness Respond to Forward Alerts to UCF

1. Navigate to `C:\Program Files\RSA\SA IM integration service\cert-tool\certs` in the SecOps Middleware box.
2. Copy both `keystore.crt.pem` and `rootcastore.crt.pem` from the certs folder (to the import folder of NetWitess server):
   ```
   cp rootcastore.crt.pem /etc/pki/nw/trust/import
   cp keystore.crt.pem /etc/pki/nw/trust/import
   ```

   Note: Before you copy the files from UCF to NetWitness Admin server, examine the files to remove any blank lines and save them.

3. SSH to NW-server box
   a. Run the update-admin-node command:
      `orchestration-cli-client --update-admin-node`
   b. Restart the RabbitMQ service:
      `systemctl restart rabbitmq-server`
   c. Restart the SMS service:
      `systemctl restart rsa-sms.service`

      Note: This step is mandatory to avoid receiving the "message bus down" error message which indicates that the EventSourceMessagePublisher has failed to reconnect to RabbitMQ on restart. This can cause some features such as deleting event sources to function improperly.

   d. Create user archer and set permissions for the virtual host '`/rsa/system`'
      ```
      rabbitmqctl add_user archer archer
      rabbitmqctl clear_password archer
      rabbitmqctl set_permissions -p /rsa/system archer ".*" ".*" ".*"
      ```

Step 3: Forward Alerts to the NetWitness Respond

- To forward NetWitness ESA Correlation alerts to the NetWitness Respond:
  a. Go to  **(Admin) > Services > ESA** service.
  b. Select an **ESA Correlation** service and select  **> View > Explore**.
  c. Navigate to the Correlation option in the left panel and select the Alert option.
  d. Edit the respond-enabled option to TRUE.
  e. Restart the Correlation server.

- To forward NetWitness Reporting Engine alerts to NetWitness Respond:
  a. Go to **(Admin) > Services > Reporting Engine** service.
  b. Select the **Reporting Engine** service, and then select **> View > Config**.
  c. Click the **General** tab.
  d. In the **System Configuration section**, select the **Forward Alerts to Respond** checkbox and click **Apply**.
- To forward NetWitness Malware Analysis alerts to NetWitness Respond:
  a. Go to **(Admin) > Services > Malware Analysis** service
  b. Select the **Malware Analysis** service, and select > **View** > **Config**.
  c. Click the **Auditing** tab.
  d. In the **Respond Alerting** panel, verify that the **Enabled Config Value** checkbox is selected. If the checkbox is not selected, select the checkbox, and click **Apply**.

Step 4: Forward Endpoint Alerts to the NetWitness Respond

You can forward Endpoint alerts to the Archer GRC through NetWitness Respond. For more information on how to Configure NetWitness Endpoint Alerts via Message Bus, see "Configure NetWitness Endpoint Alerts via Message Bus" in the *NetWitness Endpoint Integration Guide*.

Step 5: Aggregate Alerts into Incidents

The Respond Server service consumes alerts from the message bus and normalizes the data to a common format (while retaining the original data) to enable simpler rule processing. It periodically runs rules to aggregate multiple alerts into an incident and set some attributes of the Incident (for example, severity, category, and so on). For more information on aggregating alerts, see the "Configure Alert Sources to Display Alerts in Respond View" topic in the *NetWitness Respond Configuration Guide*.

To configure alert aggregation:

1. Go to **(Configure) > Incident Rules**.
2. To enable the rules provided out-of- the-box:
   a. Double-click the rule.
   b. Select **Enabled**.
   c. Click **Save**.
   d. Repeat steps a-c for each rule.
3. To add a new rule:
   a. Click **Create Rule**.
   b. Select **Enabled**.
   c. Enter the values in the following fields:

- Rule Name
- Action
- Match Conditions
- Grouping Options
- Incident Options
- Priority
- Notifications

4. Click **Save**.

Configure Endpoints in Unified Collector Framework

Endpoints provide the connection details required for the UCF to reach both your NetWitness and Archer GRC systems.

Note: Some endpoints are necessary to use different integrations. The following list shows the mandatory endpoints.

Mandatory Endpoint Integration

- Archer Push endpoint
- Archer Pull endpoint
- Mode selection: SecOps or Non SecOps mode.

Note:
• If Non SecOps mode is selected, incidents are managed in NetWitness Respond instead of Archer Cyber Incident & Breach Response.
• You must configure the port depending on the protocol (TCP, UDP, or secure TCP).
• Make sure the certificate subject name for your Archer GRC server matches the hostname.

Procedure

1. On the UCF system, open the Connection Manager, as follows:
   a. Open a command prompt.
   b. Change directories to `<install_dir>\SA IM integration service\data-collector`.
   c. Enter `runConnectionManager.bat`.
2. In the **Connection Manager**, enter **1** for Add Endpoint.
3. Add an endpoint for pushing data to Archer Cyber Incident & Breach Response, as follows:
   a. Enter the number for Archer.

      Note: Enable SSL to add the Archer endpoints.

   b. For the endpoint name, enter **push**.

c. Enter the URL of your Archer GRC system.

d. Enter the instance name of your Archer GRC system.

e. Enter the user name of the user account you created to push data into your Archer GRC system.

f. Enter the password for the user account you created to push data into your Archer GRC system, and confirm the password.

g. When prompted if this account is used for pulling data, enter **False**.

4. Add an endpoint for pulling data from Archer Cyber Incident & Breach Response, as follows:

a. Enter the number for Archer.

> **Note:** SSL must be enabled to add the Archer endpoints.

b. For the endpoint name, enter **pull**.

c. Enter the URL of your Archer GRC system.

d. Enter the instance name of your Archer GRC system.

e. Enter the user name of the user account you created to pull data from your Archer GRC system.

f. Enter the password for the user account you created to pull data from your Archer system, and confirm the password.

g. When prompted if this account is used for pulling data, enter **True**.

5. Add an endpoint for NetWitness:

- For Respond

a. Enter the number for NetWitness IM.

b. Enter a name for the endpoint.

c. Enter the SA Host IP address.

d. For SA Messaging Port, enter **5671**.

e. Enter the target queue for remediation tasks. Selecting All processes both the Archer Integration (GRC) and IT Helpdesk (Operations).

f. When prompted to automatically add certificates to the SA trust store, enter **No**.
The certificates are added manually in previous steps.

> **Note:** If the auto upload of certificates is preferred, then user account credentials cannot be guest/guest. Instead, deploy_admin credentials can be used.

g. In UCF connection manager, select the mode, as follows:

i. Enter the number for Mode Selection.

ii. Select Manage incident workflow exclusively in Archer Cyber Incident & Breach Response from the drop-down.

> **Note:** Make sure you select the second option as the first option is not supported in NetWitness Platform 11.x release.

- For Reporting Engine and ESA Correlation
  a. To use third-party integrations, add the Syslog Server Endpoint, as follows:
     i. Enter the number for Syslog Server Endpoint.
     ii. Enter the following:
     - User defined name
     - SSL Configured TCP port number

       Note: Defaults to 1515. If you do not want to host the Syslog server in this mode, enter **0**.
     - TCP port number - Enter the TCP port if the Syslog client sends the Syslog message in TCP mode.

       Note: Defaults to 1514. If you do not want to host the Syslog server in this mode, enter **0**.
     - UDP port number - Enter the UDP port if the Syslog client sends the Syslog message in UDP mode.

       Note: Defaults to 514. If you do not want to host the Syslog server in this mode, enter **0**.

     By default, the Syslog server runs in the above three modes, unless it is disabled by entering **0**.
  b. To test the Syslog client, enter the number for Test Syslog Client. Use the Test Syslog client with the files from `<install_dir>\SA IM integration service\config\mapping\test-files\`.

6. In the Connection Manager, enter **5** to test each endpoint.

Configure Reporting Engine for Integration with Archer Cyber Incident & Breach Response

To configure Syslog Output Action for the Reporting Engine:

1. Go to  **(Admin) > Services**.
2. Select the **Reporting Engine** service, and click  **View** > **Config**.
3. Click the **Output Actions** tab.
4. In the **NetWitness Platform Configuration** panel, in the **Host Name** field, enter the host name or IP address of the Reporting Engine server.
5. In the **Syslog Configuration** section, add the Syslog Configuration as follows:

a. In the **Server Name** field, enter the host name of the UCF.

b. In the **Server Port** field, enter the port that you selected in the UCF Syslog configuration.

c. In the **Protocol** field, select the transport protocol.

> **Note:** Configure SSL if you select Secure TCP.

6. Click **Save**.

To configure NetWitness Reporting Engine SSL for Secure Syslog Server:

1. Copy the certificate `keystore.crt.der` from the UCF machine to NetWitness server box at `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.161-0.b14.el7_4.x86_64/jre/lib/security`.
2. Run the following command:

```
keytool -import -file keystore.crt.der -alias ucf-syslog -keystore /etc/pki/nw/trust/truststore.jks -storepass changeit
```

> **Note:** Do not copy and paste the above command. Type the command to avoid errors.

3. Enable **ServerCertificateValidationEnabled** to **true:**
   - Go to  **(Admin) > Services**.
   - Select  **> View > Explore** of the **Reporting Engine** service .
   - Expand **com.rsa.soc.re** > **Configuration** > **SSLContextConfiguration**.
   - Expand **SSLContextConfiguration** and set **ServerCertificateValidationEnabled** to **true**.
4. Restart the Reporting Engine service by running the following command:
   `service rsasoc_re restart`

To configure rules in NetWitness Platform:

1. Go to **Reports > Manage**.
   The Manage tab is displayed.
2. In the **Rules > Groups** panel, click **+**.
3. Enter a name for the new group.
4. Select the group you created, and in the Rule toolbar, click **+**.
   1. In the **Rule Type** field, select **NetWitness Platform DB**.
5. Enter a name for the rule.
6. Enter values in the **Select** and **Where** fields based on the rule that you want to create.

> **Note:** Add the Syslog configuration with the Syslog name set above.

7. Click **Save**.

Note: To see the same number of alerts in the Reporting Engine and Archer GRC, make sure that you have selected **Once** for execute in both the Syslog and Record tabs.

To add Alert Templates for the Reporting Engine in NetWitness Platform:

The UCF syslog configuration contains out-of-the-box alert templates that you can use to create an alert with a syslog output action. These templates define the criteria used to aggregate alerts into incidents in your Archer GRC Platform.

The sample templates are located in the following location on the UCF system:

`<install_dir>\SA IM integration service\config\mapping\templates\SecOps_SA_Templates`

1. Go to **Reports > Manage > Alerts**.
2. Select the **Template** tab and click +.

Note: After you copy the template in the Create/Modify Template window, make sure to replace `cs25=${sa.host} cs25Label=sahost` to `cs25=${nw.host} cs25Label=nwhost`.

3. In the **Name** field, enter a name for the alert template.
4. In the **Message** field, enter the alert message.
5. Click **Create**.
6. Repeat steps 3 to 6 for each alert template that you want to add.

To Configure Alerts in NetWitness Platform:

In NetWitness Reporting Engine, an alert is a rule that you can schedule to run on a continuous basis and log its findings to several different alerting outputs.

1. Go to **Reports > Manage > Alerts**.
2. Click +, select **Enable**, then Select the rule you created.
3. Select **Push to Decoders**.

   Note: If you do not enter a value in this field, the link in the Archer Security Alerts application to NetWitness does not work.

4. From the Data Sources list, select your data source.
5. In the **Notification** section, select **Syslog**.
6. Click + and complete the Syslog configuration fields.
7. In the **Body Template** field, select the template that you want to use for this Syslog alert.
8. Click **Save**.

Configure ESA Correlation for Integration with Archer Cyber Incident & Breach Response

To configure ESA Correlation Syslog Notification Settings in NetWitness:

1. Go to  **(Admin) > System > Global Notifications**.
2. Click the **Output** tab.
3. Define and enable an ESA Correlation Syslog notification.
4. Click the **Servers** tab.
5. Define and enable a Syslog notification server.
6. In the Syslog Server Configuration section, enter the following:

   Field Description:

   - Name - Specify the custom name.
   - Server IP (Hostname) - Specify the hostname or IP Address of the system on which you installed the UCF.
   - Port - Specify the port number on which you want the UCF to listen.
   - Facility - Specify the Syslog facility.
   - Protocol - Select the protocol.
7. Click **Save**.

To configure NetWitness Platform ESA Correlation SSL for Secure Syslog Server:

If the Syslog server is configured with Secure TCP, configure the SSL.

1. Copy the `keystore.cert.pem` from UCF machine to NetWitness server.
2. Run the following command:

   ```
   security-cli-client --add-trusts --service integration-server --superuser-id admin --superuser-pwd netwitness --chain-file <path to keystore.cert.pem file>
   ```
3. Restart the integration server by running the following command:

   ```
   service rsa-nw-integration-server restart
   ```

To Add ESA Correlation Alert Templates

The UCF syslog configuration contains out-of-the-box alert templates that you can use to create an alert with a syslog output action. These templates define the criteria used to aggregate alerts into incidents in your Archer GRC Platform.

The sample templates are located in the following location on the UCF system:

`<install_dir>\SA IM integration service\config\mapping\templates\SecOps_SA_Templates\SecOps_SA_ESA_templates.txt`

1. Select  **(Admin) > System > Global Notifications**.
2. Click the **Templates** tab and click .
3. In the **Template Type** field, select ESA Correlation.
4. In the **Name** field, enter the name for the template.
5. 6. (Optional) In the **Description** field, enter a brief description for the template.

6. 7. In the **Template** field, enter the alert message.
7. 8. Click **Save**.
8. 9. Repeat steps 3 – 8 for each alert template that you want to add.

To Create ESA Correlation Rules

1. Click  **(Configure) > ESA Rules**.
2. In the **Rule Library**, click ✚.
3. Select **Rule Builder**.
4. In the **Rule Name** field, enter a name for the rule.
5. In the **Description** field, enter a description for the rule.
6. Select the **Severity**.
7. In the **Condition** panel:
   a. Click ✚ to build a statement.
   b. Enter a name, select a condition type, and add meta data/value pairs for the statement.
   c. Click **Save**.
   d. Repeat steps a – c until you have built all the statements for the rule.
8. In the **Notifications** section, select **Syslog**.
9. Select the notification, Syslog server, and template that were created previously.
10. Click **Save** and click **Close**.
11. In the Deployments section, click .
12. Click ✚ and enter a deployment name.
13. Click ✚ for ESA Correlation services section.
14. Select the ESA Correlation Service.
15. In the Data Source section, click ✚ and select a data source.
16. Click **Save**.
17. In the **ESA Correlation Rules** section, click ✚ to select the ESA Correlation Rule that you created.
18. Click **Save**.
19. Click **Deploy Now**.

Archer Feeds

By default, only the IP address and Criticality Rating fields in the Archer Devices application are fed into NetWitness by the SA IM Integration Service. You can customize the Enterprise Management plug-in to include the Business Unit and Facility fields that are cross-referenced in the Devices application in the feed. For more details, see Archer documentation at https://www.archerirm.community/t5/exchange-overviews/archer-exchange-offering-list/ta-p/672315.

Note: If you want to feed Business Unit and Facility information from your Archer GRC Platform into Live, you must also add keys for these fields in the index-concentrator-custom.xml file.

Update the Concentrator and Decoder Services

The SA IM Integration Service in Archer Cyber Incident & Breach Response manages the files for a custom feed and deposits these files in a local folder that you specify when you configure the Enterprise Management Endpoint. The Live module of NetWitness retrieves the feed files from this folder. Live then pushes the feed to the Decoders, which start creating metadata based on the captured network traffic and the feed definition. To enable the Concentrator to detect a new metadata created by the Decoders, make sure to edit the `index-concentrator-custom.xml`, `index-logdecoder-custom.xml`, and `index-decoder-custom.xml` files.

1. Select  **(Admin) > Services**.
2. Select the **Concentrator** and select  > **View > Config**.
3. Click the **Files** tab.
4. From the drop-down list, select the `index-concentrator-custom.xml` file. Do one of the following:
   - If content already exists in the file, add a key for the new metadata element:

     ```
     <key description="Criticality" format="Text" level="IndexValues"
     name="criticality" defaultAction="Open"/>
     ```

     Note: Do not copy and paste above command . Type the command to avoid errors.
   - If the file is blank, add the following content:

     ```
     <?xml version="1.0" encoding="utf-8"?>
     <language level="IndexNone" defaultAction="Auto">
     <key description="Criticality" format="Text" level="IndexValues"
     name="criticality" defaultAction="Open"/>
     </language>
     ```
5. Click **Apply**.
6. To add multiple devices:
   a. Click **Push**.
   b. Select the devices to which you want to push this file.
   c. Click **OK**.

7. Repeat steps 1 to 6 for the Log Decoders and Index Decoders, using index-logdecoder-custom.xml and index-decoder-custom.xml.
8. Restart the Concentrator and Decoder services by running the following commands:
```
service nwdecoder restart
service nwconcentrator restart
```

Add the Archer Enterprise Management Endpoint in UCF

1. In the UCF connection manager, select the mode:
   a. Enter the number for Mode Selection.
   b. Select one of the following options:
      - Manage incident workflow in NetWitness.
      - Manage incident workflow exclusively in Archer Cyber Incident & Breach Response.
2. Add the Archer Enterprise Management Endpoint:
   a. Enter the number for Enterprise Management.
   b. Enter the values in the fields as described in the table below.

Field	Description
Endpoint Name	Optional endpoint name.
Web Server Port	Defaults to 9090. You can configure this to host the web server url by providing the URL with the port number as in the NetWitness live feed: http://hostname:port/archer/sa/feed.
Criticality	Criticality of the assets to be pulled from Archer GRC. If **false**, pull assets with any criticality. If **true**, pull assets with only high criticality. To configure this manually, edit the em.criticality property in the collector-config properties file to provide a comma-separated list of criticalities: LOW, MEDIUM, HIGH.
Feed Directory	Directory where the assets CSV file from Archer GRC are saved. **Note:** The directory path provided must exist.
Web Server Username	Username for authenticating to the EM web server.
Web Server Password	Password for authenticating to the EM web server.

Field	Description
SSL Mode	Defaults to No. If **No**, the URL uses `http mode: http://hostname:port/archer/sa/feed` If you have not updated the host file, see "Update the NetWitness Host File" section. **Note:** NetWitness currently does not support Archer recurring feeds in SSL mode.

Update the NetWitness Platform Host File

1. Edit the host file on the NetWitness server at the following location: `vi /etc/hosts`.
2. Enter the following for the UCF host IP address:

   `<ucf-host-ip> <ucf-host-name>`
3. Restart NetWitness server by running the following command:

   `service jetty restart`
4. While configuring the NetWitness live feed, enter the host name for the URL instead of the IP address and the port number configured for Enterprise Management endpoint in the UCF:

   `http: //<ucf-host-name> : <EM_Port>/archer/sa/feed.`
5. Verify that the connection works.

Create a Recurring Feed Task

For NetWitness to download feed files from the NetWitness Respond Integration Service and push the feeds to Decoders, you must create a recurring feed task and define the feed settings.

Note: For Archer Cyber Incident & Breach Response 1.2: For NetWitness to download feed files from the UCF machine and push the feeds to Decoders, you must create a recurring feed task and define the feed settings. The procedure is similar to Archer Cyber Incident & Breach Response 1.3, with a few exceptions. See documentation on the Archer Exchange Community for details.

1. Select  **(Configure) > Custom Feeds**.
2. In the **Feeds** view, Click **+**.
3. Select **Custom Feed**, and click **Next**.
4. Select **Recurring**.
5. Enter a name for the feed.
6. In the URL field, enter the following:

   `http://ucf_hostname/archer/sa/feed`

   where, *`http :ucf_hostname_or_ip:port`* is the address of the NetWitness Respond Integration Service system. For example: `http://<ucf-host-name>` .
7. Select **Authenticated**.

8. In the **User Name** and **Password** fields, enter the credentials of the user account you created in the Add the Archer Enterprise Management Endpoint in UCF procedure.
9. Define the recurrence interval for the feed.
10. In the **Date Range** panel, define a start and end date for the feed, and click **Next.**
11. Select each Decoder to which you want to push this feed, and click **Next**.
12. In the **Type** field, amke sure that IP is selected.
13. In the **Index Column** field, select 1.
14. In the second column, set the Key value to criticality, and click **Next**.
15. Review your feed configuration details and click **Finish**.

Manage Unified Collector Framework

This section provides additional tasks for configuring and managing the UCF for Archer Cyber Incident & Breach Response 11.3.1.2 Integration.

Start the Unified Collector Framework

1. Click **Control Panel > Administrative Tools > Services**.
2. Select **RSA Unified Collector Framework**.
3. Click **Start**.

Stop the Unified Collector Framework

1. Click **Control Panel > Administrative Tools > Services**.
2. Stop the Archer Cyber Incident & Breach Response WatchDog Service.

   Note: If you do not stop the Watchdog service, the Watchdog service starts the NetWitness Respond Service.

3. Select **RSA Unified Collector Framework**.
4. Click **Stop**.

Note: If the service takes too long to shutdown, use the Task Manager to end the RSASAIMDCService.

Uninstall the Unified Collector Framework

1. Click **Control Panel** > **Programs and Features**.
2. Select **RSA Unified Collector Framework**.
3. Click **Uninstall**.

Troubleshoot Archer Integration

This section provides resolutions to common problems that you may encounter while configuring Archer Cyber Incident & Breach Response 1.3.1.2 with NetWitness Respond.

Problem	Solutions
After adding the endpoint for NetWitness Respond, the Certificate Authority truststore fails to set. **Resolution**	1. Make sure that the SSH credentials for the NetWitness host are valid. 2. If the credentials are correct, but the error still occurs, manually copy certificates.
Remediation Tasks being pushed to the operations queue through the UCF are not appearing in Archer Cyber Incident & Breach Response as Findings.	1. Open the Connection Manager using the command prompt: • `Change directories to <install_dir>\SA IM integration service\data-collector.` • `Type: runConnectionManager.bat` 1. Enter **2** to edit endpoint. 2. Enter **3** to NetWitness Respond. 3. Make sure the Target Queue is set to **All** or **Operations**.
In the `<install_dir>\SA IM integration service\logs\collector.log`, there are SSL errors between NetWitness and RSA Unified Collector Framework.	1. Verify that the SSL certificates are valid. **Note:** NetWitness Respond certificates are valid for two years. 2. If your certificates are expired, regenerate and copy the expired certificates. **To regenerate and copy the certificates:** 1. In the Command Prompt, go to `<install_dir>\SA IM integration service\data-collector.` 2. Enter `runConnectionManager.bat` 3. Enter the number for Regenerate NetWitness RespondIntegration Service Certificate.

Problem	Solutions
NetWitness unable to forward incidents to UCF.	4. In the NetWitness Respond endpoint, in Connection Manager, enter the number for Edit Endpoint. 5. Enter **Yes** to copy the certificates automatically to the NetWitness trust store. **Note:** If certificates fail to copy, manually copy the certificates. 1. In the collector config (C:\PROGRAM FILES\RSA\SA IM INTEGRATION SERVICE\CONFIG\collector-config), change the following: im.virtualhost=/rsa/im/integration to im.virtualhost=/rsa/system 2. Restart UCF. For more information on restarting UCF, see Start the Unified Collector Framework. 3. In the data collector (C:\PROGRAM FILES\RSA\SA IM INTEGRATION SERVICE\data-collector), double click on the following file to run it. runConnectionmanager.bat

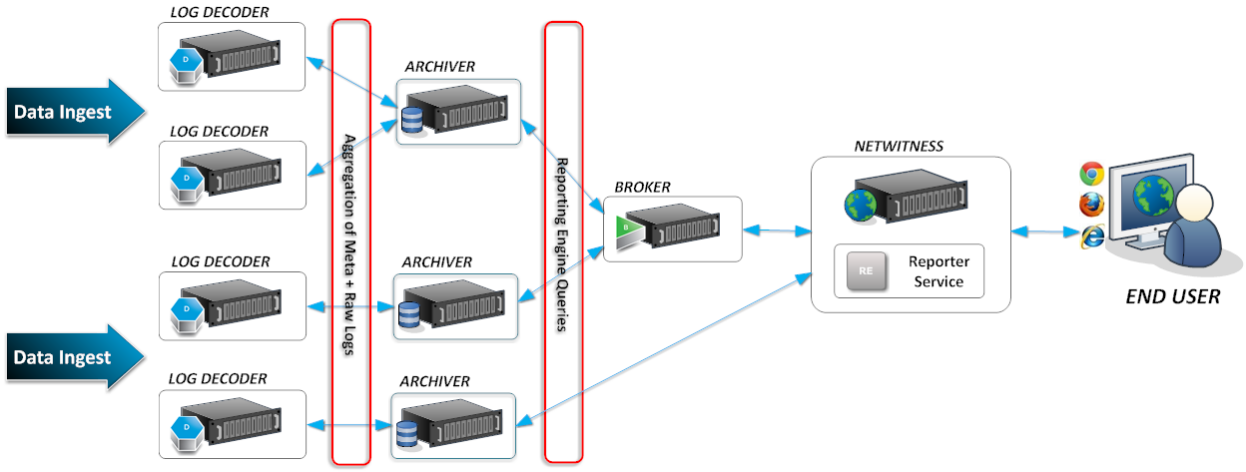
Archiver Overview



This guide provides detailed instructions on how to configure Archiver in your network, additional procedures that are used at other times, and reference materials that describe the user interface for configuring Archiver in your network.

The NetWitness Archiver is an appliance that enables long-term log archiving by indexing and compressing log data and sending it to Archiving storage. The Archiving storage is then optimized for long-term data retention and compliance reporting.

Archiver stores raw logs and log meta from Log Decoders for long-term retention and it uses Direct-Attached Capacity (DAC) for storage.

Note: Raw packet and packet meta are not stored in the Archiver.

The following figure depicts the architecture of a NetWitness network that implements the Archiver.

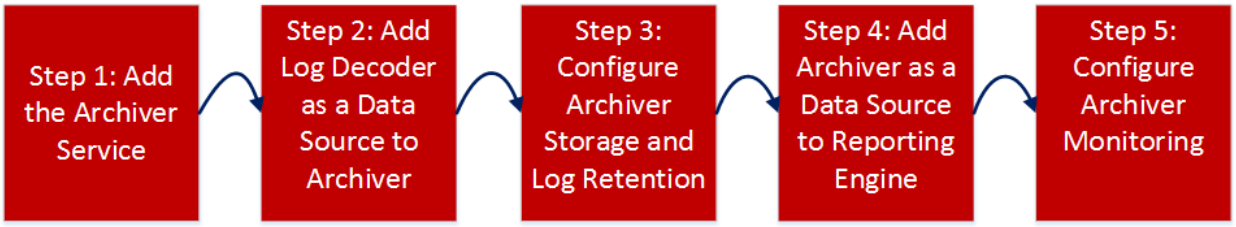
Configuring an Archiver

The NetWitness Archiver is an appliance that enables long-term log archiving by indexing and compressing log data and sending it to Archiving storage. The Archiving storage is then optimized for long-term data retention and compliance reporting.

Archiver stores raw logs and log meta from Log Decoders for long-term retention and it uses Direct-Attached Capacity (DAC) for storage.

Note: Raw packet and packet meta are not stored in the Archiver.

Prerequisites



Ensure that you have:

- Installed the Archiver host in your network environment.
- Installed and configured Log Decoder in your network environment.

If you want to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them, refer to **Group Aggregation** in the *Deployment Guide*.

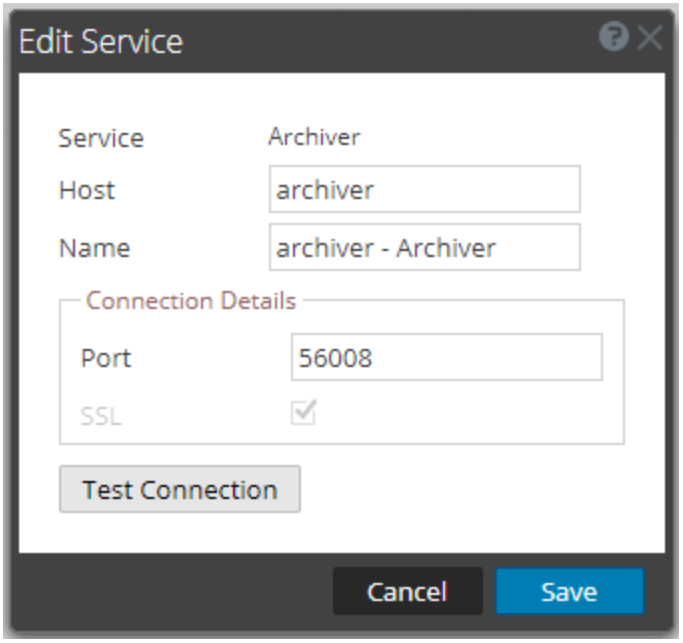
Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

The following table describes the basic steps for configuring an Archiver.The tasks must be completed in the sequence they are given.

Configuration Step	Description
Edit the Archiver Service	Provides information on how to add an Archiver service to the Archiver host and apply a license to it.
Add Log Decoder as a Data Source to Archiver	Provides instructions on how to add a Log Decoder to an Archiver.
Configure Archiver Storage and Log Retention	Provides instructions on how to configure storage and log retention on an Archiver.

Configuration Step	Description
Add Archiver as a Data Source to Reporting Engine	Provides instructions on how to add an Archiver as a data source to Reporting Engine to generate reports for the data collected by an Archiver.
Configure Archiver Monitoring	Provides instructions on how to configure the alert mechanism related to Archiver storage.



Edit the Archiver Service

To add an Archiver service, ensure that you have installed an Archiver host on which you want to run the Archiver service. See "Step 1: Add or Update Host" topic in the *Host and Services Getting Started Guide* for the procedure that explains how to add a host.

Perform the following steps to edit the Archiver service:

1. Go to **(Admin) > Services**.
   The Services panel is displayed.

2. Select an Archiver service and click in the **Services** panel toolbar.
   The Edit Service dialog is displayed.

3. Provide the following details.

Field	Description
Host	Select a host from the drop-down menu.
Name	Type a name for the service.
Port	Default port is 50008.
SSL	Select **SSL** if you want NetWitness to communicate with the service using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. **Note:** If you select SSL, ensure SSL is enabled in the System Configuration panel.

Field	Description
Username	(Optional) Type the username for the service.
Password	(Optional) Type the password for the service.
Entitle Service	Select if you want to apply the entitlements currently configured to this service. For more information, see "Entitlement Capability Implementation" topic in the *Licensing Guide*.

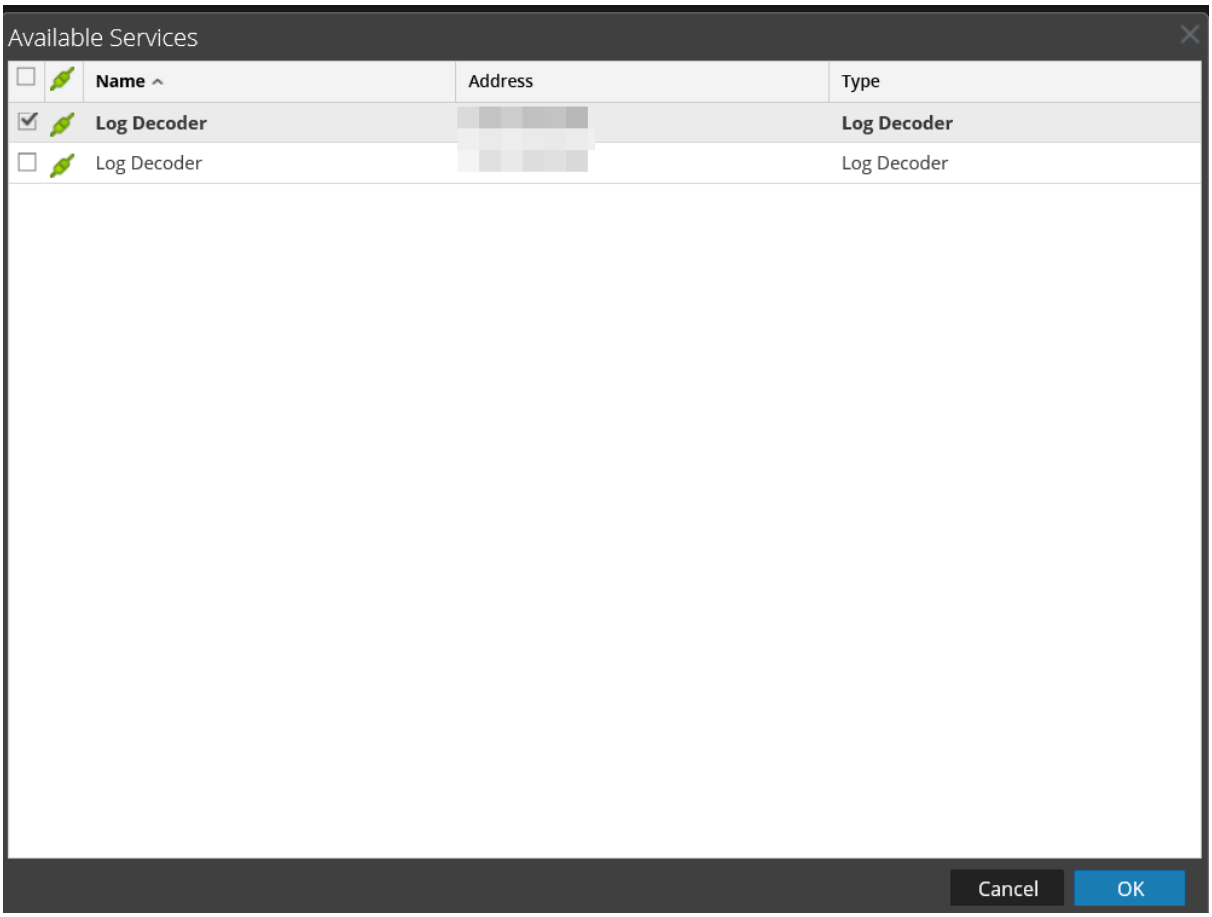
4. Click **Test Connection** to determine if NetWitness connects to the service.
5. When the result is successful, click **Save**.

   The edited service is now displayed in the services panel.

   Note: If the test is unsuccessful, edit the service information and retry.

6. Apply license to the Archiver service.

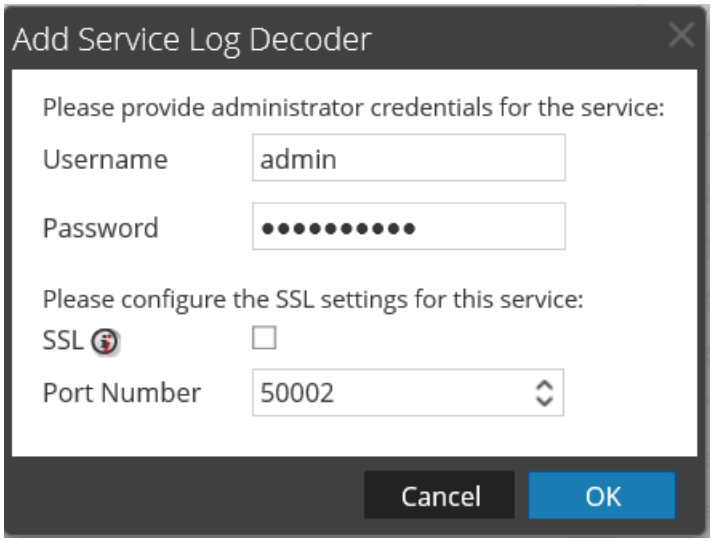
   Refer to the "Synchronize NetWitness Server**"** topic in the *Licensing Guide* for details on the procedure to activate (apply a license to) the Archiver service.



Add Log Decoder as a Data Source to Archiver

To add a Log Decoder as a data source to Archiver, you need to have installed the Archiver host in your network environment, installed and configured a Log Decoder in your network environment, and added the Archiver host to NetWitness and make sure the Archiver service shows as active and licensed.

Add Log Decoder as a Data Source to Archiver



To add a Log Decoder as a data source to an Archiver:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed.
3. On the **General** tab, in the **Aggregate Services** panel, click .
   The Available Services dialog is displayed.

4. Select the Log Decoder service to add as a data source to the Archiver and click **OK**.

5. If the Log Decoder is using the trust model, an Add Service dialog is displayed.

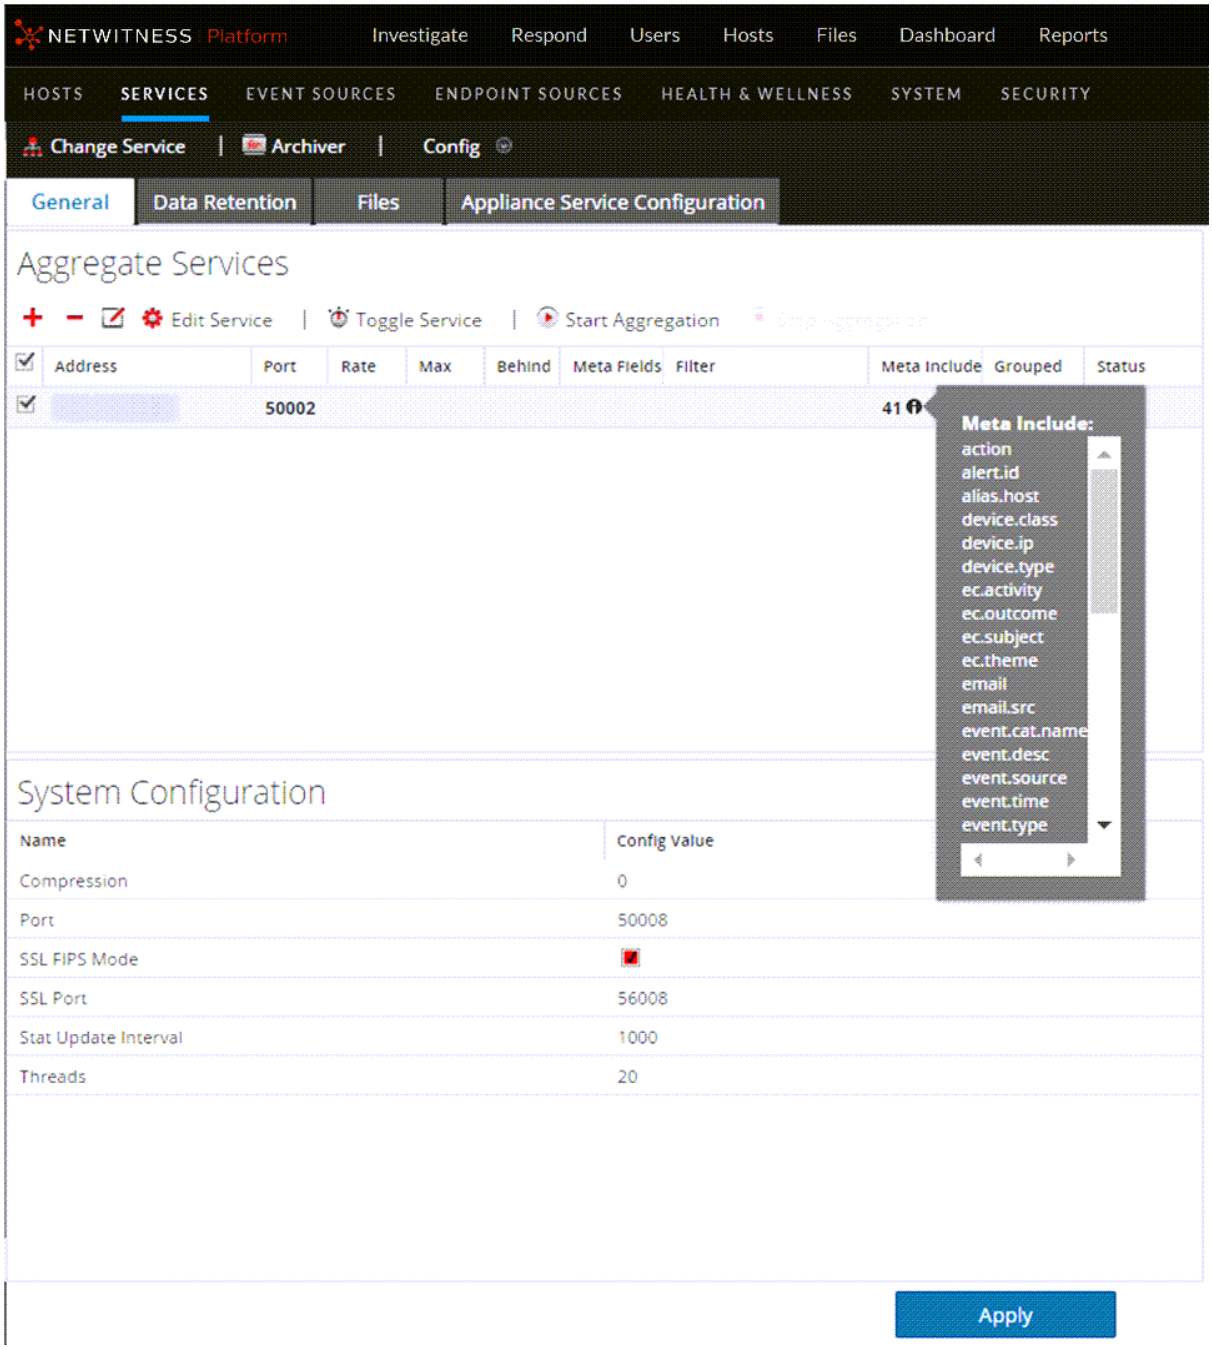
6. Type the username and password for the Log Decoder, and configure the SSL settings.
7. Click **OK**.
   The selected Log Decoder service is listed in the **Aggregate Services** panel.

Archiver Meta Settings Considerations

To maximize retention time, the meta items and index of the Archiver have been reduced (when compared to the Concentrator) to support common reporting needs. This means that, by default, you may not be able to run all of the reports you run on the Concentrator on the Archiver. You can view a list of the current meta and index items used by the Archiver in the following locations:

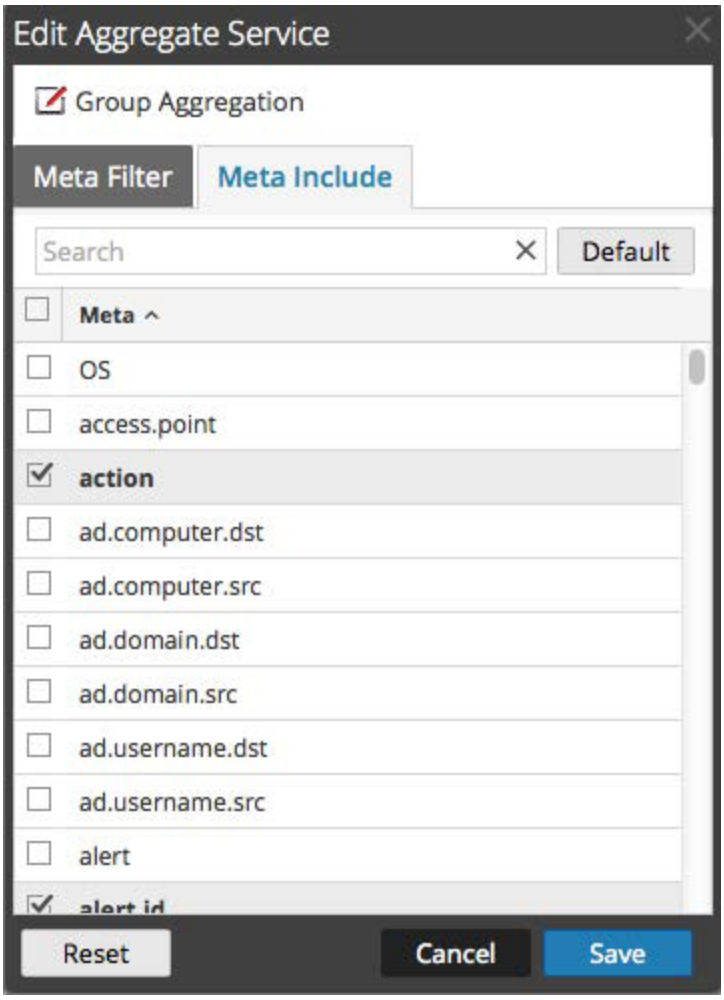
- **Explorer view**: The **/archiver/devices/<logdecoder>/config/options** path in the **metaInclude** field shows the current list of meta items.
- **Config view > Files tab**: The **index-archiver.xml** shows the default index configuration. The **index-archiver-custom.xml** shows any modifications.

The meta items and index of the Archiver can be customized to support customer specific reporting needs, however this will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.



See (Optional) Configure Meta Filters for Aggregation and (Optional) Add Index Entries for Archiver Reporting for additional details.

(Optional) Configure Meta Filters for Aggregation



Follow this procedure to view and add additional meta items to the Archiver.

Caution: Adding meta or indexes will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

1. To view the current meta items, in the **Aggregate Services** panel, select the Log Decoder service and click ⓘ in the **Meta Include** field.

2. To add additional meta items, select the Log Decoder service and click ✎.

3. In the Edit Aggregate Service dialog, select the meta items to include in the Meta Include list. For example, you may want to consider including ip.srcport, tcp.srcport, udp.srcport, msg, url, query, bytes, alias.host, ip.dst, ip.dstport, ip.src, tcp.dstport, megabytes, time, event.desc, and word.
4. Click **Save** and then click **Apply**.
5. See (Optional) Add Index Entries for Archiver Reporting below for information on how to index the additional meta keys.

(Optional) Add Index Entries for Archiver Reporting

Caution: Adding meta or indexes will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

The Archiver's default index configuration only includes value indexes for these keys:

- time
- decoder source (did)

- destination user account (user.dst),
- alert ID (alert.id)
- device IP (device.ip)
- source IP address (ip.src)
- destination IP address (ip.dst)
- event description (event.desc)
- device class (device.class)
- medium
- object name (obj.name)
- word

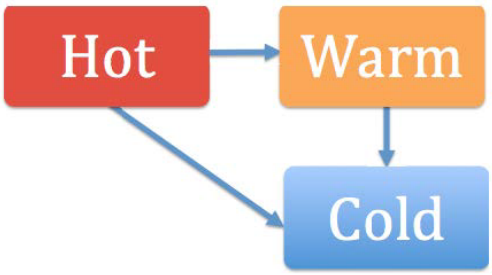
For information on customizing this list, see "Index Customization" in the *Core Database Tuning Guide*.

Configure Archiver Storage and Log Retention

This topic provides instructions for Administrators to configure storage and log retention on an Archiver.

For compliance reasons, it is often necessary to retain some logs longer than other logs. Some logs are legally sensitive and cannot be retained for a long period of time. Other logs have a requirement to be retained for years. In addition to compliance, some logs are useful for historic forensics and other logs have little to no security or operationally relevant value and can be deleted after a short time.

Because business requirements vary, NetWitness enables you to configure Collections, which are log retention sets for storing log data. For each collection, you can specify how much of the total storage space to use and how many days to retain the logs in the collection. To specify the type of logs to put in the collection, you define retention rules to associate with the collections. Retention rules for all of your collections execute sequentially in an order that you define.



To do this, you must first define the total physical storage space for your collections. NetWitness enables you to define three types of storage:

- **Hot Tier Storage**: This storage contains log data that is in active use as part of the business process. Users can access these logs faster than other types of storage and they can use these logs for reporting and other tasks. Hot storage is usually Direct-Access Capacity (DAC) or SAN storage.
- **Warm Tier Storage**: (Optional) This storage contains older log data aggregated by Archiver. Log data access is slower than hot storage. Users can also use these logs for reporting and other tasks. Warm storage is usually Network Attached Storage (NAS).
- **Cold Tier Storage**: (Optional) This storage contains the oldest log data that is either required for the operation of the business or mandated by regulatory requirements. The logs are offline and Archiver cannot access these logs for reporting or other tasks. However, if you want to access this log data, you can restore it to the collections created on the Archiver service and then use it for reporting. Cold storage is usually offline storage, such as NAS, or temporary storage before archiving to tape. Once data moves to the Cold Tier, that data is no longer managed by Archiver. Once moved, it is incumbent on external processes to back it up or manage that Cold Tier space such that it does not reach 100% capacity. If capacity is reached, this will cause the Archiver to stop aggregation until the problem is fixed.

Archivers are preconfigured to use available hot storage and a default log collection, so you do not have to configure Archiver storage and log retention if you do not have complex log retention requirements.

Logs can move from one type of storage to another in the following ways:

- Hot Storage > Cold Storage
- Hot Storage > Warm Storage > Cold Storage

When a collection reaches its retention limits for hot and warm storage, NetWitness deletes the log data from hot or warm storage. With cold storage configured, a copy goes into cold storage before the logs are deleted from hot or warm storage. For example, if you have a collection with Hot Storage of 1 TB, Warm Storage of 1 TB, and Cold Storage enabled, when the log data reaches 1 TB of hot storage, the oldest log data moves to warm storage. When the log data in warm storage reaches 1 TB, the oldest log data from warm storage is copied to cold storage before it is removed from warm storage.

For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first. For example, if you have a collection with Hot Storage of 1 TB, no Warm or Cold Storage, and a Retention period of 20 days, if the Log data exceeds 1 TB after 11 days, the oldest logs over 1 TB are deleted even though the collection has a 20 day retention period.

After you create hot, warm, and cold storage, you configure your log retention storage collections. You can specify the maximum size of the Hot and Warm Storage for the collection, whether to use Cold Storage, the number of days to retain the logs in the collection, the data compression, and whether to use a hash algorithm to be able to verify the data integrity of the files being saved.

After configuring your collections, you define retention rules for your collection. These rules specify the type of logs to be stored in the collection. Each collection must have at least one retention rule associated with it in order to store log data.

Procedure

Perform the following tasks in the order shown to configure storage and log retention.

Task	Reference
1. Configure total hot, warm, and cold storage.	Refer to Configure Hot, Warm, and Cold Storage.
2. Configure log retention storage collections.	Refer to Configure Log Storage Collections.
3. Define retention rules for the collections and determine the order of execution of the overall list of retention rules.	Refer to Define Retention Rules.

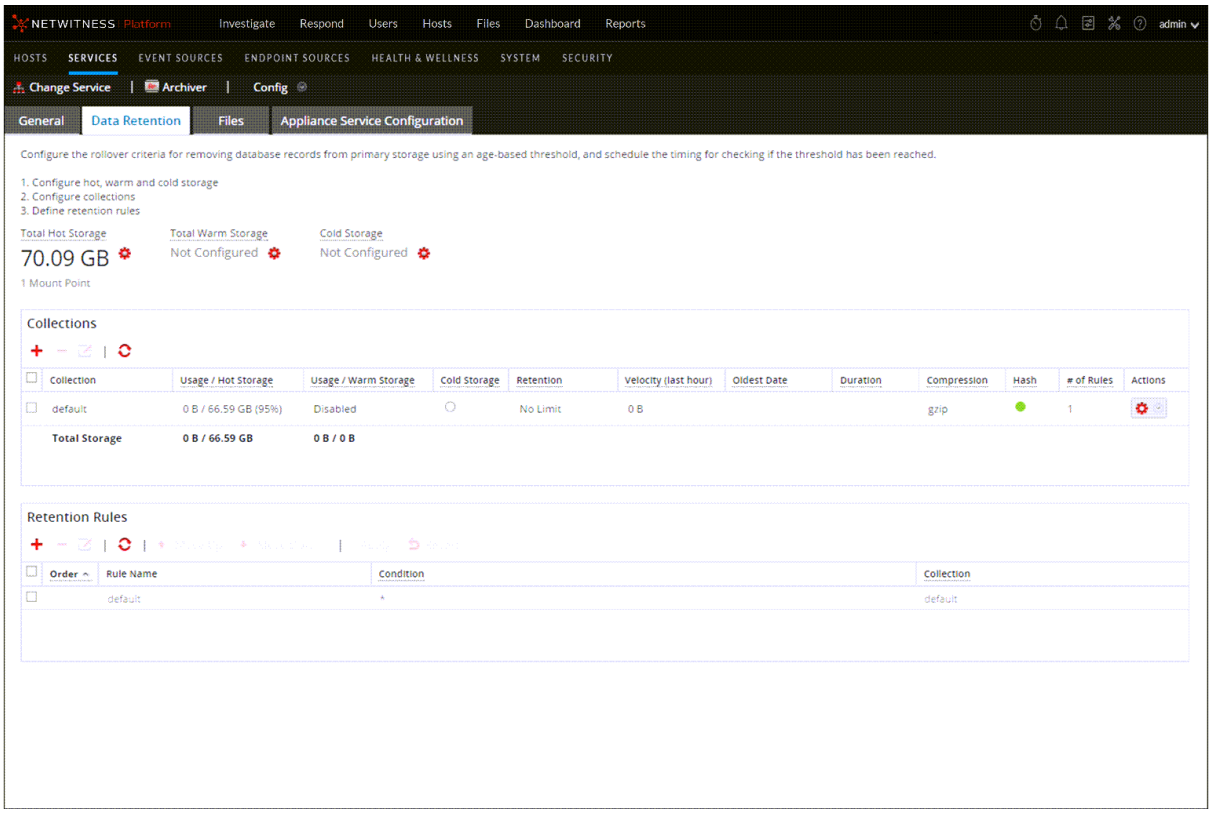
Configure Hot, Warm, and Cold Storage

This topic provides instructions for Administrators on how to configure total hot, warm, and cold storage on an Archiver.

An Archiver host has hot storage pre-configured to the defaults. Administrators can configure total hot, warm, and cold storage to meet their specific business requirements. An Archiver must have total hot storage configured, but warm and cold storage configurations are optional. NetWitness does not manage cold storage.

Prerequisites

Ensure that you have:



1. Installed the Archiver host in your network environment.
2. Installed and configured Log Decoder in your network environment.
3. Added Archiver as a Core service to your NetWitness deployment.
4. Added Log Decoder services as a data source for Archiver.
5. Installed and configured a DAC or other physical storage in your network environment.
6. Determined your log retention and storage requirements.

Procedures

Configure Total Hot Storage for an Archiver

1. Go to  **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click  **> View > Config**.

   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab, in the **Total Hot Storage** section, click  to configure total hot storage.

4. In the **Hot Storage Mount Points** dialog, add the mount points attached to the Archiver host that you want to include in Total Hot Storage.

   These are the paths to high performance storage, such as DAC storage and SAN. Do not add collections or subdirectories to the mount points.

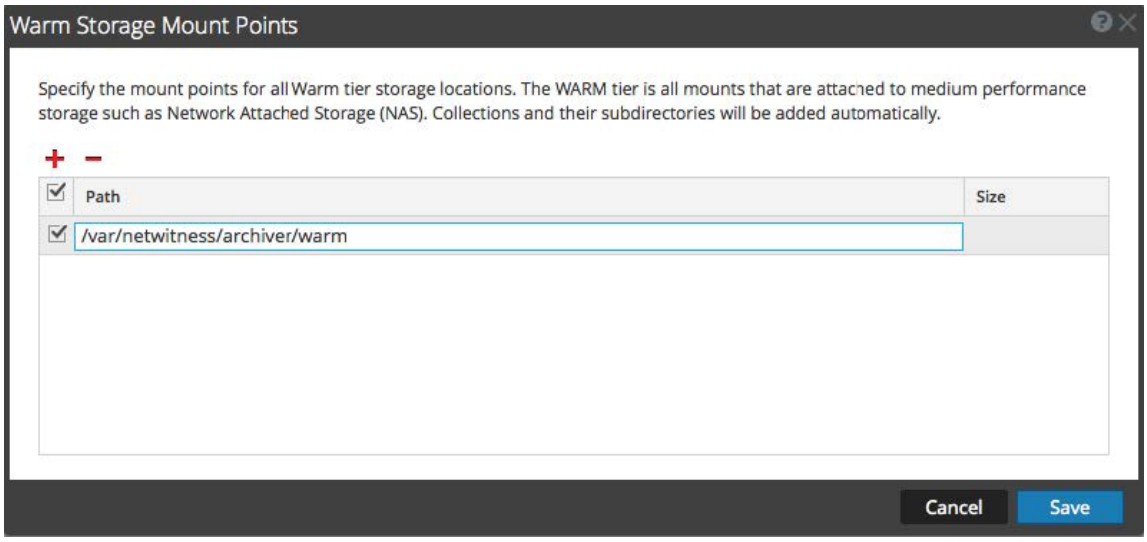
   To add a mount point, click + and type the path to the mount point.

5. Verify that your mount point paths are correct and click **Save**.

NetWitnesswill automatically create metadb, packetdb, sessiondb, and index directories for each collection defined on the Archiver:

```
<storageLocation>/<CollectionName>/metadb
<storageLocation>/<CollectionName>/packetdb
<storageLocation>/<CollectionName>/sessiondb
<storageLocation>/<CollectionName>/index
```

For example, if your mount point is /var/netwitness/archiver, then the following directories will be created for each of your collections:

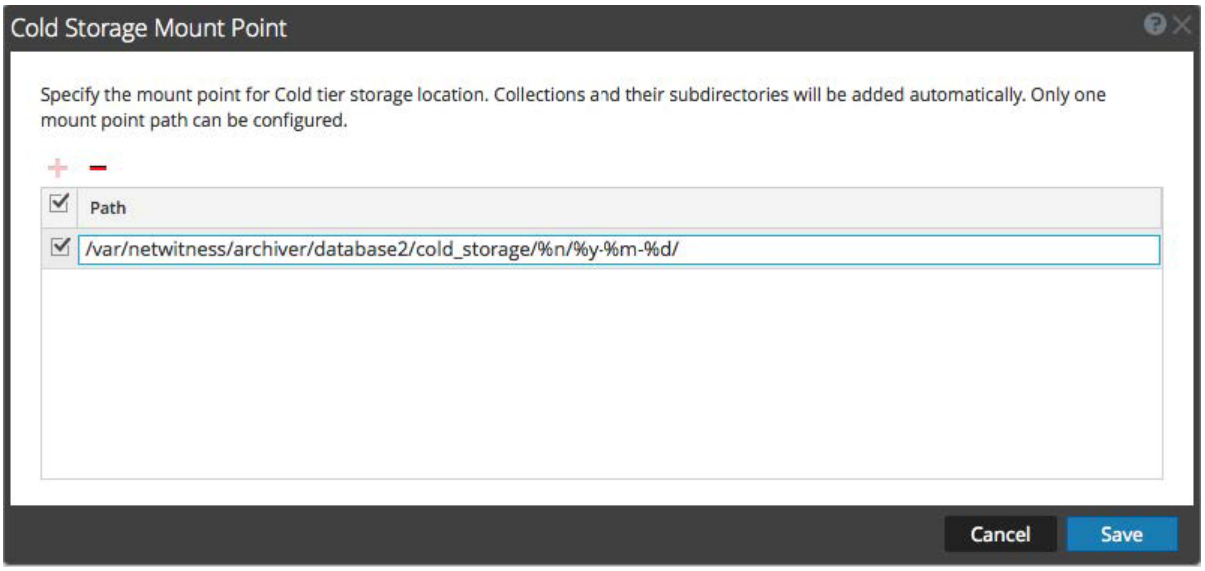


```
/var/netwitness/archiver/<CollectionName>/metadb
/var/netwitness/archiver/<CollectionName>/packetdb
/var/netwitness/archiver/<CollectionName>/sessiondb
/var/netwitness/archiver/<CollectionName>/index
```

After the Archiver service is restarted, data will start being saved to your defined collections. Ensure that your log retention collections are correct before restarting the Archiver service.

Caution: After data has been saved to a mount point, it cannot be removed from the user interface.

Configure Total Warm Storage for an Archiver



(Optional) The procedure to configure Total Warm Storage for an Archiver is the same as for Total Hot Storage, except that you click in the Total Warm Storage section and add the mount points that you want to use for warm storage, which are the physical paths to warm storage, such as Network Attached Storage (NAS).

Configure Total Cold Storage for an Archiver

(Optional) The procedure to configure Total Cold Storage for an Archiver is the same as for Total Hot Storage, except that you click in the Total Cold Storage section and you add only one mount point for cold storage. NetWitness does not manage cold storage.

You must include the collection name format specifier `%n` somewhere in the cold storage mount point path name to avoid filename collisions between collections.

The following format specifiers are allowed in the path:

Format Specifier	Description
%n	collection name (required)
%y	year the data moved to cold storage
%m	month
%d	day
%h	hour
%##r	block of hours for the current day. For example, if you want three 8 hour blocks, you can set it to %8r. The first 8 hours of the day returns 0, the second 8 hours returns 1, and last 8 hours of the day returns 2.

Changes take effect immediately.

For example, if you have a collection named **compliance** and you create the following cold storage path:

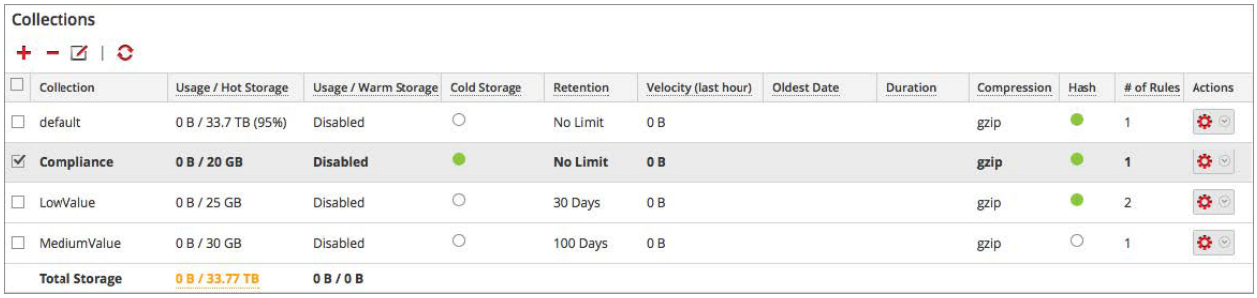
`/sa-cold-storage/%n/%y-%m-%d/`

NetWitness creates a directory each day with the following format:

/sa-cold-storage/compliance/2015-11-20/

Hot, Warm, and Cold Tier Storage Features

The following table describes features of the Hot, Warm, and Cold Tier Storage dialogs.



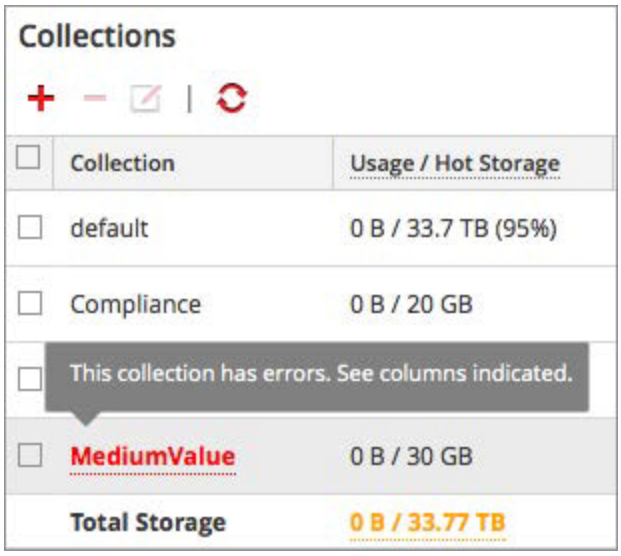
Feature	Description
+	Adds a mount point.
−	Removes a mount point. You cannot delete a mount point that is in use unless you delete the associated collections.
☐	Select the mount points that you want to include for the Total Hot, Warm, and Cold Storage. You can only select one mount point for Total Cold Storage.

Mount Point	Shows the path to the attached physical storage. For example: **/var/netwitness/archiver/database0**, which is the location of the hot storage DAC.
	Do not add collections or subdirectories to the mount points. NetWitness will automatically create metadb, packetdb, sessiondb, and index directories for each collection defined on the Archiver:
	`<storageLocation>/<CollectionName>/metadb`
	`<storageLocation>/<CollectionName>/packetdb`
	`<storageLocation>/<CollectionName>/sessiondb`
	`<storageLocation>/<CollectionName>/index`
	For example, if your hot storage mount point is /var/netwitness/archiver, then the following directories will be created for each of your collections:
	`/var/netwitness/archiver/<CollectionName>/metadb`
	`/var/netwitness/archiver/<CollectionName>/packetdb`
	`/var/netwitness/archiver/<CollectionName>/sessiondb`
	`/var/netwitness/archiver/<CollectionName>/index`
	For Cold Storage, you must include the collection name format specifier `%n` somewhere in the cold storage mount point path name to avoid filename collisions between collections.

Storage Size	Shows the size of the attached storage. The Data Retention tab shows the total amount of storage for your reference.

Collections

The Collections section lists all of your storage collections along with Total Storage for Hot and Warm Storage.



Collections Features

The following table describes the icons and columns of the Collections section. You can hide some of the columns based on your requirements.

Feature	Description
	Opens the Collections dialog, in which you can add a storage collection.
	Removes the selected collection. Deleting the collection permanently removes all stored data from the collection, but the empty data directories remain.
	Opens the Collections dialog, in which you can edit the selected collection.
	Refreshes collection information.
	Selects a collection. For example, you can select a collection for editing or removal.
Collection	Shows the name of your collection, such as Default, Compliance, MediumValue, and LowValue. You can create multiple collections with different criteria for retaining logs. If you do not create any collections, the Default collection is used. If a collection has errors, the collection name and the columns with errors appear in red text.
Usage / Hot Storage	Shows the current hot storage usage and the maximum hot storage for the collection. When the size of the logs reach the maximum hot storage amount, the logs are removed or they roll to the next available storage tier (warm or cold).
Usage / Warm Storage	Shows the current warm storage usage and the maximum warm storage for the collection. When the size of the logs reach the maximum warm storage amount, the logs are removed or they roll to available cold storage.
Cold Storage	Indicates whether cold storage is enabled or disabled. A solid colored green circle indicates that cold storage is enabled ( ). An blank white circle indicates that cold storage is disabled.
Retention	Shows the number of days that logs are retained before being removed or optionally moved to cold storage. No Limit indicates that log retention is not restricted by a specified number of days. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Velocity (last hour)	Shows the number of logs captured over the last hour.
Oldest Date	Shows the date and time of the last log capture.
Duration	Shows how may days ago that the last log was captured. For example: 20 days.
Compression	Shows the compression type used for the meta and raw data in the collection.
Hash	Shows whether hash is enabled or disabled. When enabled, the hash algorithm is used to ensure the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

Feature	Description
# of Rules	Shows the number of rules applied to the collection. Define at least one rule for each collection. A collection without any associated rules shows a zero in red text as a warning: The collection name also appears in red text, which indicates an error in the collection. **Caution:** If a collection does not have a rule, no logs will ever go into that collection.
Actions	Enables you to see the rules associated with a collection in the Retention Rule section when you select <actions button> **> Select Rules**. In the Retention Rule section, you can change the overall priority of the collection rules.
Total Storage	Shows the current total hot storage usage and the maximum total hot storage at the bottom of the **Usage / Hot Storage** column. It also shows the current total warm storage usage and the maximum total warm storage at the bottom of the **Usage / Warm Storage** column.

Any errors in the collection appear in red text. A dotted underline indicates that a tooltip is available with information about the error.

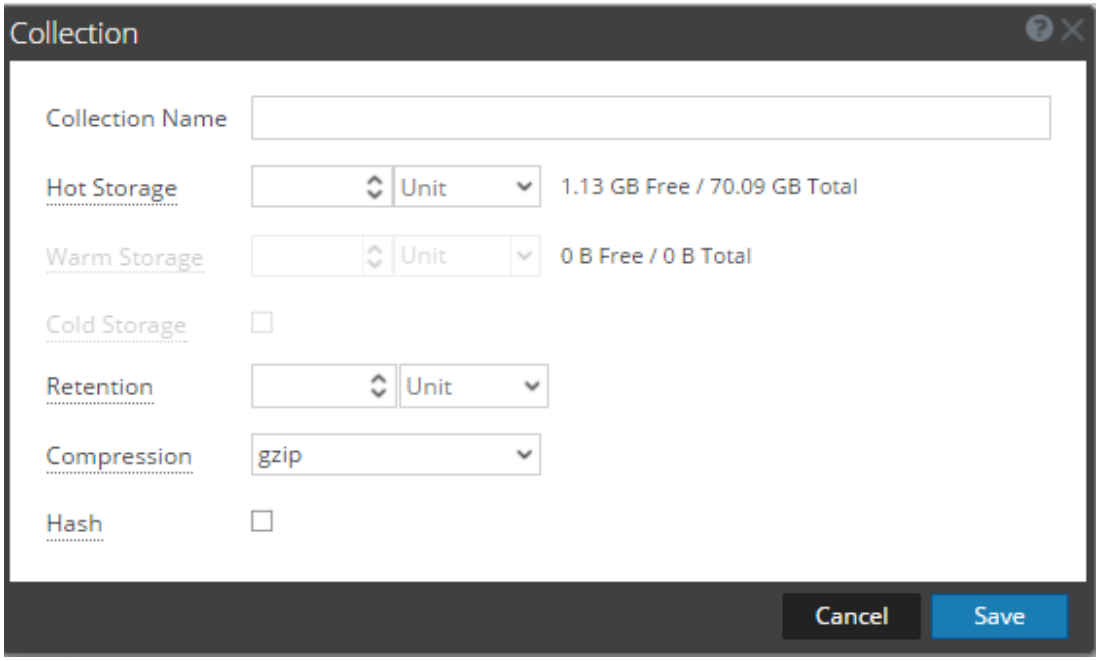
Collections that have editing disabled (grayed out) also have tooltips that provide information on the problem.

Retention Rules

The Retention Rules section lists all of the retention rules used for your storage collections listed in the order of rule execution.

The following table describes the features of the Retention Rule section.

Feature	Description
	Opens the Rule Definition dialog, in which you can add a retention rule to use in a storage collection.
	Removes the selected retention rule. In order for your log collections to gather and store log data, you must associate them with at least one retention rule.
	Opens the Rule Definition dialog, in which you can edit the selected retention rule.
	Refreshes retention rule information.
Move Up	Moves the selected retention rule up in the Retention Rule priority list. Retention Rule order is very important. NetWitness evaluates the the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section. You can also use drag and drop to reorder retention rules.
Move Down	Moves the selected retention rule down in the Retention Rule priority list. Retention Rule order is very important. NetWitness executes the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section.
Apply	Saves the rule order change.
Revert	Reverts the rule order change.
	Selects or shows a selected retention rule.
Order	Shows the order of a rule in the overall list of retention rules.
Rule Name	Shows the name of rule, such as ComplianceDevices and GeneralWindowsLogs.
Condition	Shows the conditions for the rule. These conditions specify the type of logs to include in the collection. Define Retention Rules presents the guidelines for all queries and rule conditions in Core services.
Collection	Shows Collection name and how many days that the collection is retained. For example: MediumValue (30 Days)



Collection Dialog

On the (Admin) > **Services** > **Config** view > **Data Retention** tab of an Archiver, administrators can define the criteria for log retention and storage. In the Collection dialog, which is accessible from the Collections section, you can define individual storage collections to use for different log types. For example, you may want to create collections for compliance reasons or to selectively retain critical logs.

Procedures related to this dialog box are described in Configure Archiver Storage and Log Retention and Configure Log Storage Collections.

To access the Collection dialog:

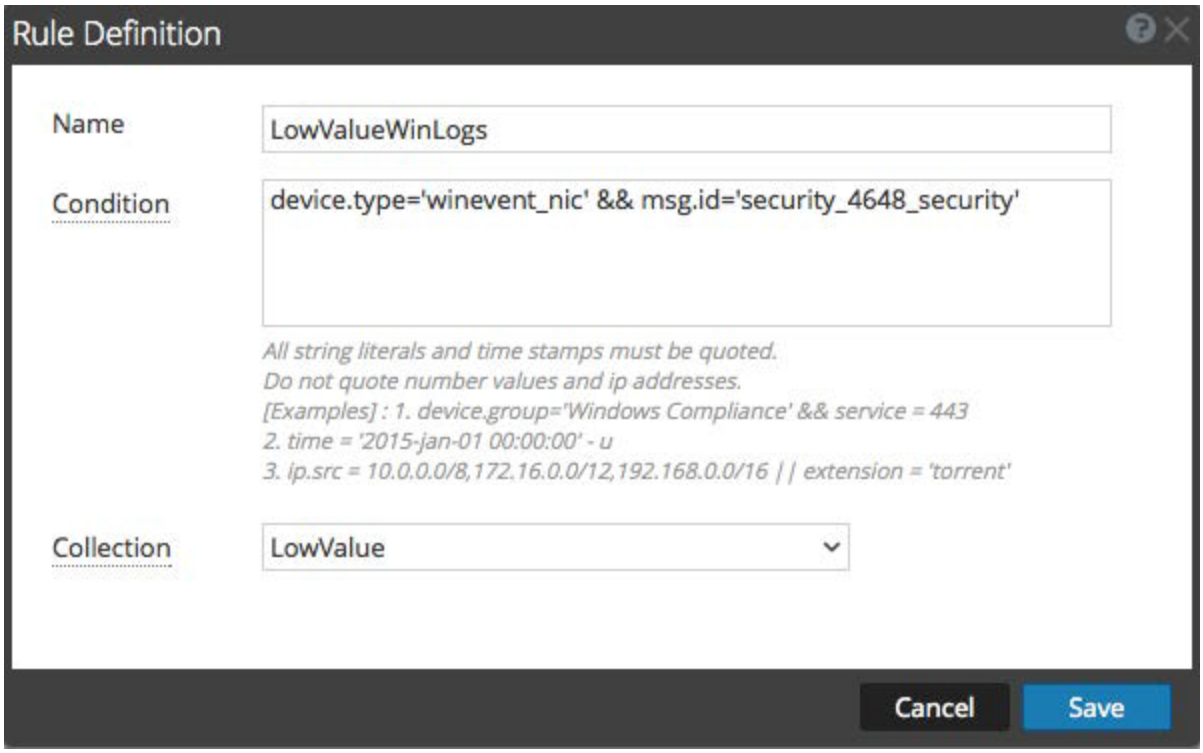
1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab.
4. In the **Collections** section, click to add or edit the rule.
   The Collection dialog is displayed.

The following table describes the fields in the Collection dialog.

Field	Description
Collection Name	Specify a name for your collection, such as Compliance, MediumValue, or LowValue.

Field	Description
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage are shown next to this field. When the size of the logs reach the maximum hot storage size, the logs are removed or they roll to the next available storage tier (warm or cold).
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage are shown next to this field. When the size of the logs reach the maximum warm storage size, the logs are removed or they roll to available cold storage.
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside of the specified size and retention limits roll over to cold storage. If you do not use cold storage, logs outside of the specified size and retention limits are removed.
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.



Rule Definition Dialog

In the  (Admin) > Services > Config view > Data Retention tab of an Archiver, administrators can define the criteria for log retention and storage. In the Rule Definition dialog, which is accessible from the Retention Rules section, you can define retention rules to use for your storage collections.

Procedures related to this dialog box are described in Configure Archiver Storage and Log Retention and .Define Retention Rules

To access the Rule Definition dialog:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab.
4. In the **Retention Rule** section, click or .
   The Rule Definition dialog is displayed.

The following table describes fields in the Rule Definition dialog.

Field	Description
Name	Specify a unique name for your retention rule. For example: ComplianceDevices
Condition	Specify the conditions for the type of logs that you want to include in the collection. All sting literals and time stamps must be quoted. Do not quote number values and IP addresses. For example: `device.group='PCI Devices' || device.group='HIPPA Devices'`
Collection	Select the collection on which you want to apply this rule. For example: Compliance

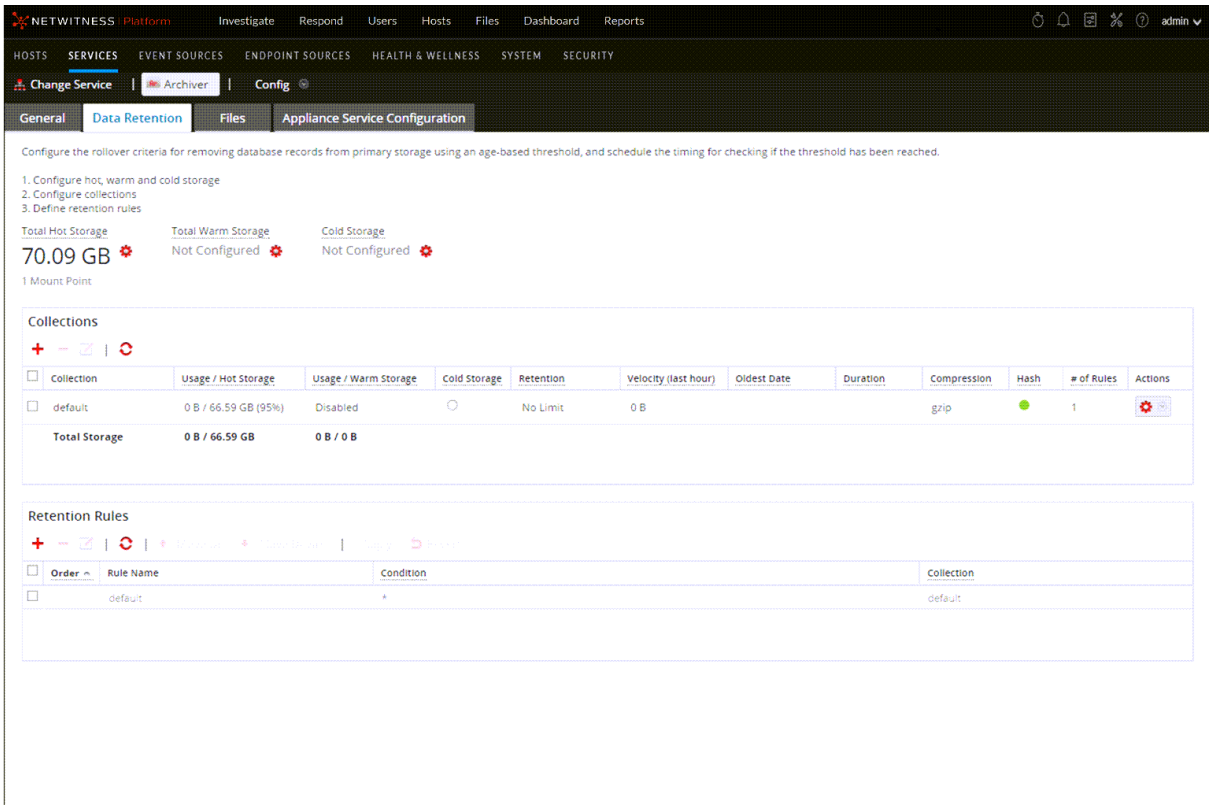
Configure Log Storage Collections

This topic provides instructions for Administrators on how to configure log storage collections on an Archiver.

NetWitness enables you to define individual storage collections for different log types. You can specify the maximum size of the Hot and Warm Storage space used by the collection, whether to use offline storage (Cold Storage), the number of days to retain the logs in the collection, the data compression, and whether to use a hash algorithm to be able to verify the data integrity of the files being saved. You should create collections based on your log retention storage requirements. Each collection that you create must be associated with at least one retention rule.

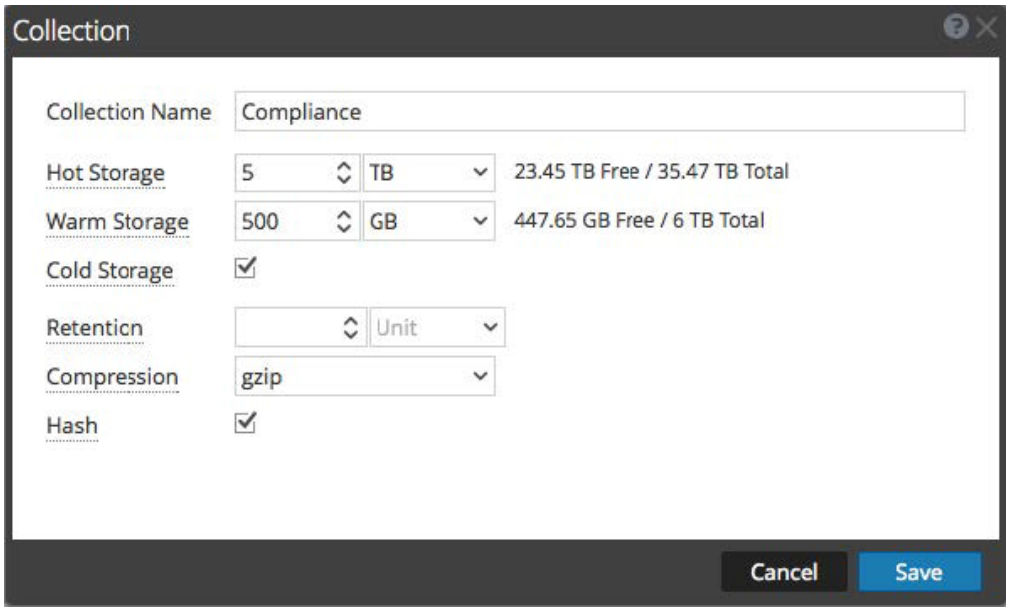
Prerequisites

Before you configure your log retention storage collections, configure total hot, warm, and cold storage.



Configure a Log Storage Collection

To configure a log retention storage collection on an Archiver:



1. Go to  **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click  **> View > Config**.

   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab, in the **Collections** section, click  to add a collection.

   (If you decide to make changes to an existing collection, you can select the collection and click  to change the settings.)

The **Collection** dialog is displayed.

4. Configure the collection as described in the following table.

Field	Description
Collection Name	Specify a unique name for your collection, such as Compliance, MediumValue, or LowValue.

Field	Description
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage is shown next to this field.
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage is shown next to this field.
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside the storage limits are copied to cold storage before they are deleted from hot or warm storage.
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

5. Click **Save**.

   Any errors in the collection appear in red text. A dotted underline indicates that a tooltip is available with information about the error. Your collection name appears in red text until at least one retention rule is defined for your collection.
   If you have a collection with editing disabled (grayed out), look at the associated tooltip for more information.

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

Define Retention Rules

Administrators can define and order retention rules for log storage collections on an Archiver. Retention rules specify the type of logs to be stored in the collection. For your log collections to gather and store log data, you must associate them with at least one retention rule. When you configure a retention rule, you specify a condition and a collection for that rule. The condition (rule definition) determines the type of logs stored in that collection.

For the condition, you can use anything that works in a regular query `where` clause.

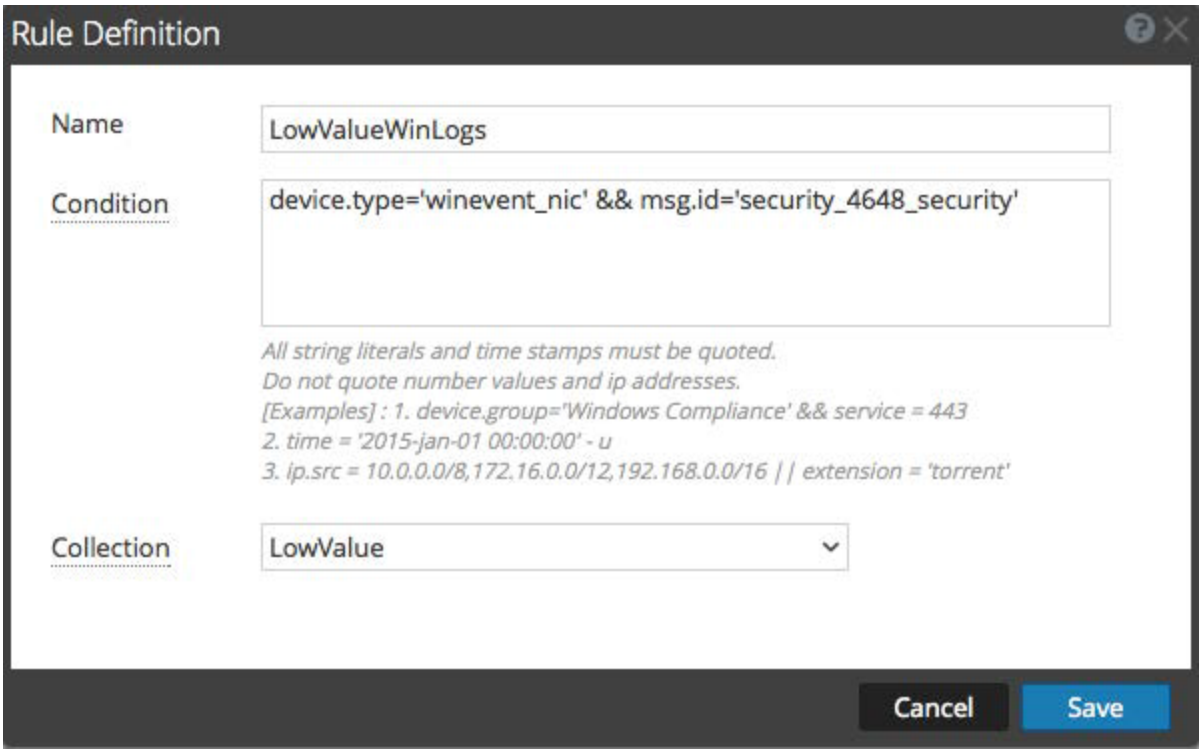
For example, to get logs from compliance services, you can use the following condition:

```
device.group='PCI Devices' || device.group='HIPPA Devices'
```

After you define the retention rules for your collections, it is important that you specify the order of your retention rules. NetWitness evaluates the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section of the Data Retention tab of the Archiver ((Admin) > Services Config view).

Caution: Rule order is very important. It determines the priority for evaluating the log data for storage retention.

Prerequisites



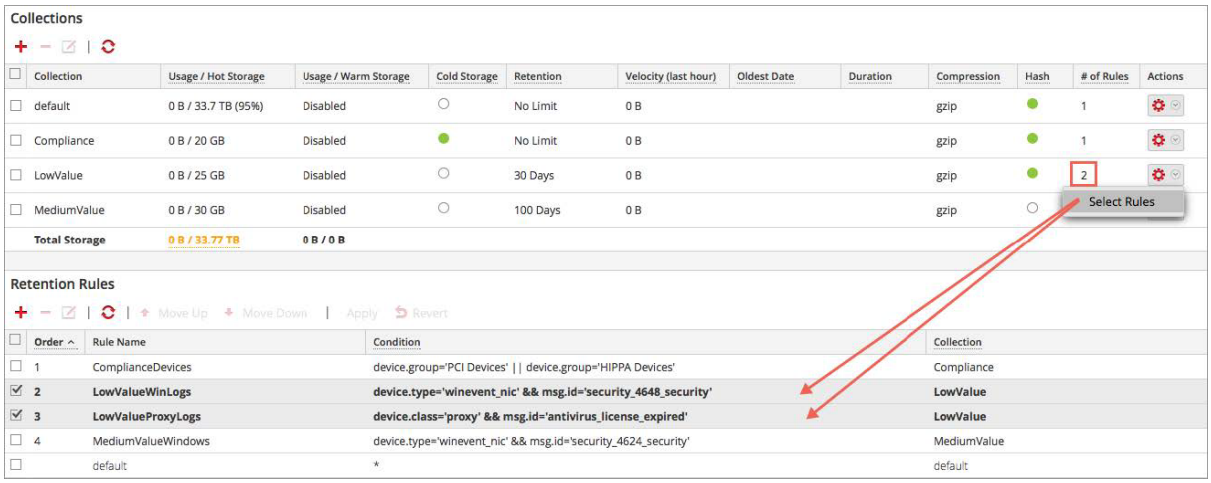
Before you configure your retention rules:

- Configure total hot, warm, and cold storage
- Configure log storage collections

Procedures

Define a Retention Rule for a Collection

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab, in the **Retention Rules** section, click .
   The **Rule Definition** dialog is displayed.



4. Configure the fields in the Rule Definition dialog as described in the following table:

Field	Description
Rule Name	Specify a unique name for your retention rule. It cannot include spaces. For example: LowValueWinLogs
Condition	Specify the conditions for the type of logs that you want to include in the collection. All string literals and time stamps must be quoted. Do not quote number values and IP addresses. For example: `device.type='winevent_nic' && msg.id='security_4648_security'`
Collection	Select the collection on which you want to apply this rule. For example: LowValue.

5. Click **Save**.

   The retention rule that you define becomes associated with the collection you selected. On the **Data Retention** tab, in the **Collections** section, you can click  **> Select Rules** in the **Actions** column for the selected collection to view the retention rules associated with the collection in the **Retention Rule** section.

Specify the Order of your Retention Rules

To prioritize the complete list of all of your retention rules:

1. In the **Retention Rules** section of the **Data Retention** tab, select a retention rule and use drag and drop (or select **Move Up** and **Move Down**) to change its order in the priority list.

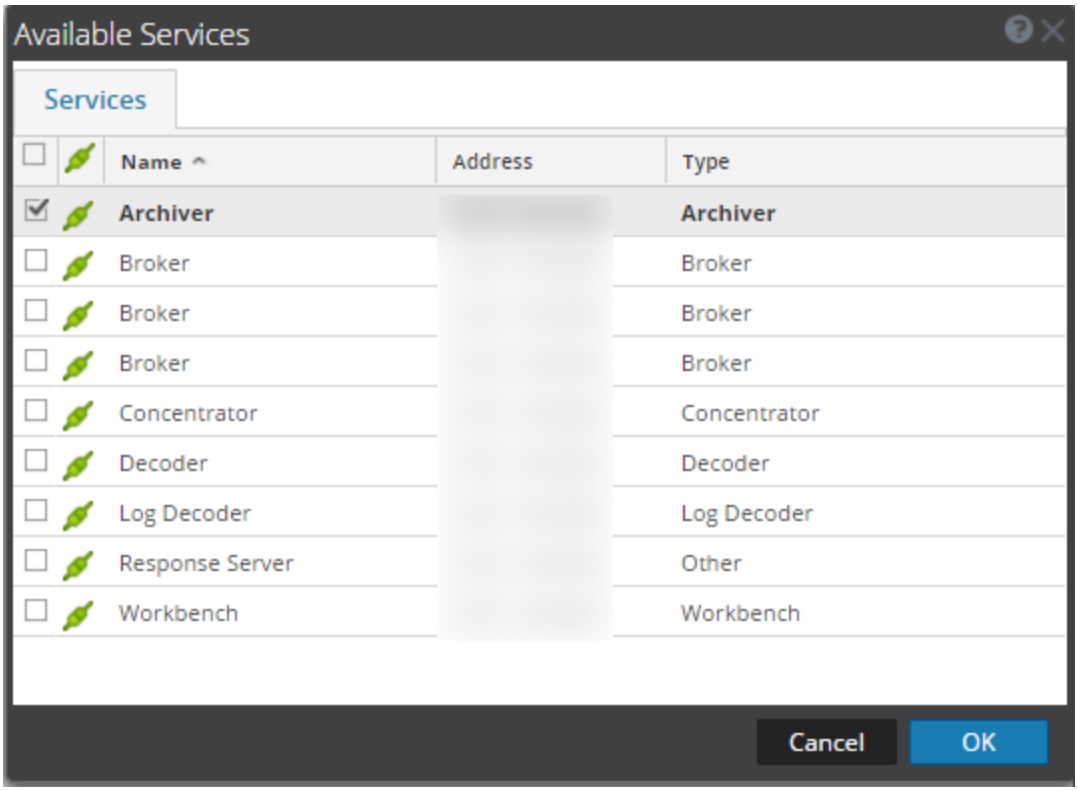
2. Click **Apply** to save the order of the retention rules.

Caution: Rule order is very important. It determines the priority for evaluating the log data for storage retention.

Add Archiver as a Data Source to Reporting Engine

This topic provides instructions on how to add Archiver as a data source to Reporting Engine to generate reports for the data collected by Archiver.

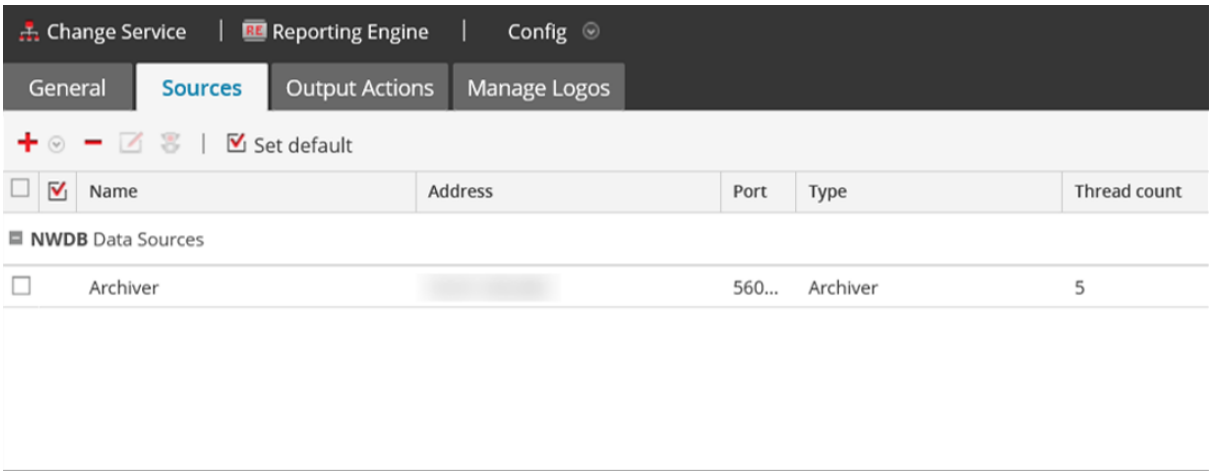
Prerequisites



Ensure that you have:

1. Installed the Archiver host in your network environment.
2. Installed and configured a Log Decoder in your network environment.
3. Verified that Reporting Engine and Archiver services are active.

Procedure

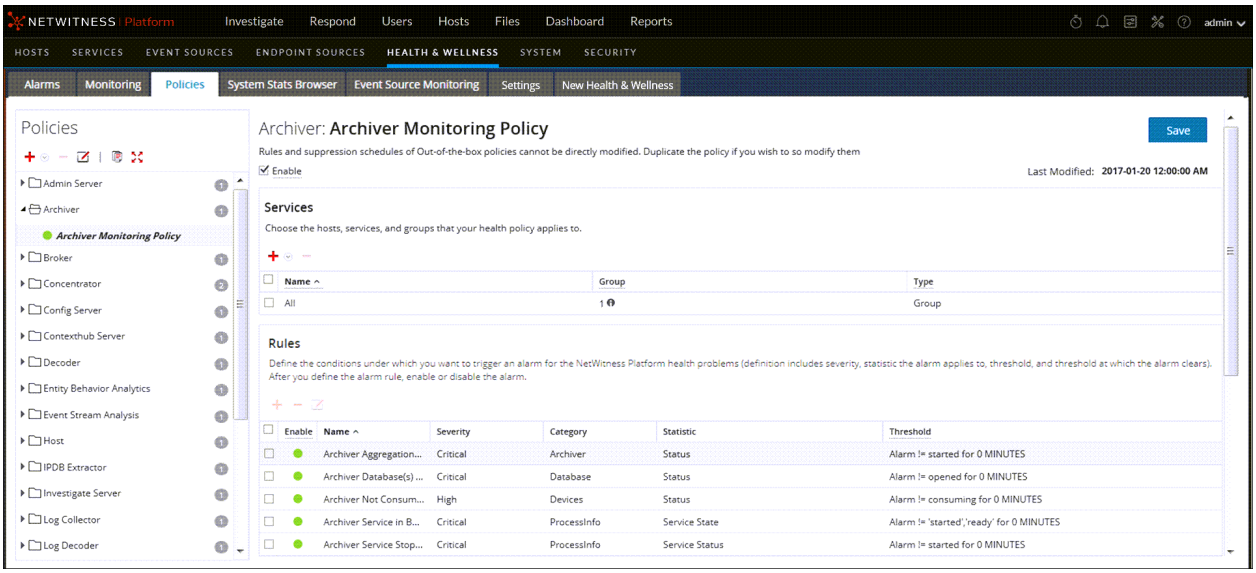


To associate an Archiver data source with Reporting Engine:

1. Go to  **(Admin)** > **Services**, click , and select **Reporting Engine**.
2. In the **Actions** column, select **View** > **Config**.
   The Services Config view of Reporting Engine is displayed with General tab open.
3. Select the **Sources** tab.
4. Click  and select **Available Services**.
   The Available Services dialog is displayed.

5. Select the Archiver that you want to add as data source to the Reporting Engine and click **OK**. The Service Information dialog is displayed.
6. Type the username and password for the Archiver.
7. Click **OK**.

   The selected Archiver is listed in the NWDB Data Sources category.



You can now create reports on the data collected by Archiver.

Configure Archiver Monitoring

Health & Wellness enables you to automatically generate notifications when critical thresholds are met.

Review the Health & Wellness policies for Archiver and Host in the Health & Wellness Policies section. Make updates as required.

For detailed information, see "Manage Policies" in the *System Maintenance Guide.*

Additional Archiver Configuration

This topic is a collection of individual procedures, which an administrator may perform at any time and they are not required to complete the initial setup of the Archiver. These procedures are presented in alphabetical order.

Use this section when you are looking for instructions to perform a specific task after the initial setup of an Archiver.

Configuring Data Backup and Restore

This topic provides information on the data backup and restore feature for an Archiver. You can use this feature to back up Archiver data and retrieve the backed up data.

You can back up the data in the following ways:

- Use scripts to copy files from cold storage backup folders onto an offline storage.
- Use backup software to copy files from cold storage backup folders onto an offline storage.
- Run EMC Networker or other backup software on Archiver and have it do daily incremental backup of the database files.

Note: For details on the procedure to back up data using Networker, see the *Administration Guide for Networker*.

Once you have the data backup, you have to perform the following tasks to restore the backed up data that is installed on the Archiver.

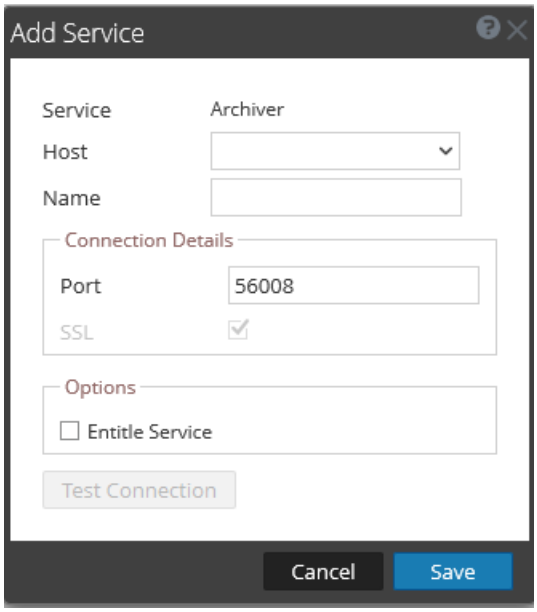
Action	Description
1. Restore your data to a location accessible by the Archiver.	Refer to Create Collection
2. Create a collection in Archiver that uses that location.	Refer to "Manage Collections" topic in the *Workbench Configuration Guide*.
3. Add the Archiver service as a data source on Reporting Engine to generate reports for the data restored on the Archiver service.	Refer to Add Archiver as a Data Source to Reporting Engine

Add Archiver Service

The NetWitness Archiver service enables you to create collections with restored data from Archiver offline (cold) storage. This procedure is only required if you do not have the Archiver service installed.

Prerequisites

Make sure you have added an Archiver host and applied a license to it.



Procedure

Note: This procedure is only required if you do not have Archiver service installed.

Perform the following steps to add the Archiver service:

1. Go to **(Admin) > Services**.
2. In the **Services** panel, select **+>Archiver**.

   The Add Service dialog is displayed, as shown below.

3. Provide the following details.

Field	Description
Host	Select an Archiver host from the drop-down menu.
Name	Type a name for the service.
Port	Default port is 50007.
SSL	Select **SSL** if you want NetWitness to communicate with the service using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. **Note:** If you select SSL, ensure SSL is enabled in the System Configuration panel.
Username	(Optional) Type the username for the service.
Password	(Optional) Type the password for the service.

4. Click **Test Connection** to determine if NetWitness connects to the service.
5. When the result is successful, click **Save**.

   The added service is now displayed in the Services panel.

Note: If the test is unsuccessful, edit the service information and retry.

Create Collection

You can create a collection on an Archiver service using data restored from the backed-up data or an existing subset of data. When you recover the backed-up data, you have to place it in the collection folder created on the Archiver service to enable you to generate the required reports for the retrieved data. For example, if you have backed up the data using EMC Networker at <*location*>, you can use the restore options in Networker to restore the backed-up data to the collection folder created on the Archiver service. For restore procedure using EMC Networker, see the *Administration Guide for Networker*.

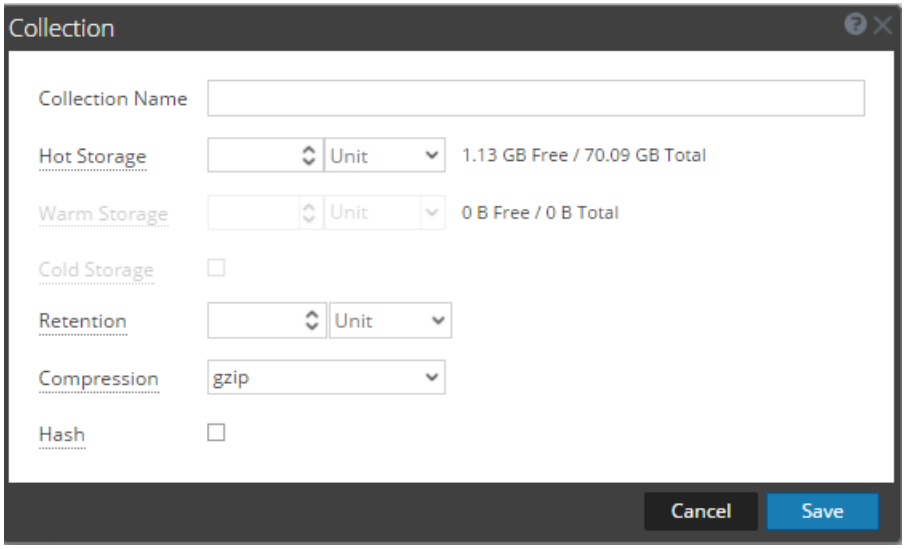
Prerequisites

Ensure that you have the following:

- Archiver service installed on an Archiver host.
- The Archiverservice has enough space to hold the collection.
- The backed-up data placed in a known location on your local host, if you are creating a collection using the data restored from the backed-up data.

Procedure

The Data Retentions tab enables Administrators to restore and save data that is restored from a backup or from an existing set of data.



Note: The Administrator can point the source path to the location of the database files and the restore command copies them to the Archiver. The Administrator needs to mount those directories to the Archiver before a restoration collection can be created.

To create a collection using data restored from the backed-up data or existing subset of data:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.

   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retentions** tab and click in the **Collections** panel to add a collection.

   The **Collection** dialog is displayed.

4. Provide the following information:
   - **Collection Name:** Name of the Archiver collection that you want to restore.
   - **Hot Storage:**Enter the number of Archiver database files and unit size (either Gigabytes or Terabytes) that have been moved from cold storage.
   - **Retention:** Select the number of days or hours that you want to store the collection.
   - **Compression:** Select the compression type for the collection.
5. Click **Save** to restore the collection.

   Note the following:
   - Target is the location where the collection is created.
   - If the source path provided to create the restoration collection does not exist, the following error message is displayed:

     "The source path does not exist '/xxx/xxx/'."

If there is insufficient storage to restore your collection, the following error is displayed:

"Error during disk space checking. Insufficient disk space in location '/xxx/xxx'."

6. The Schedule Job dialog is displayed with the following message:

   "Restoring data into a new collection. Check the jobs page for progress."

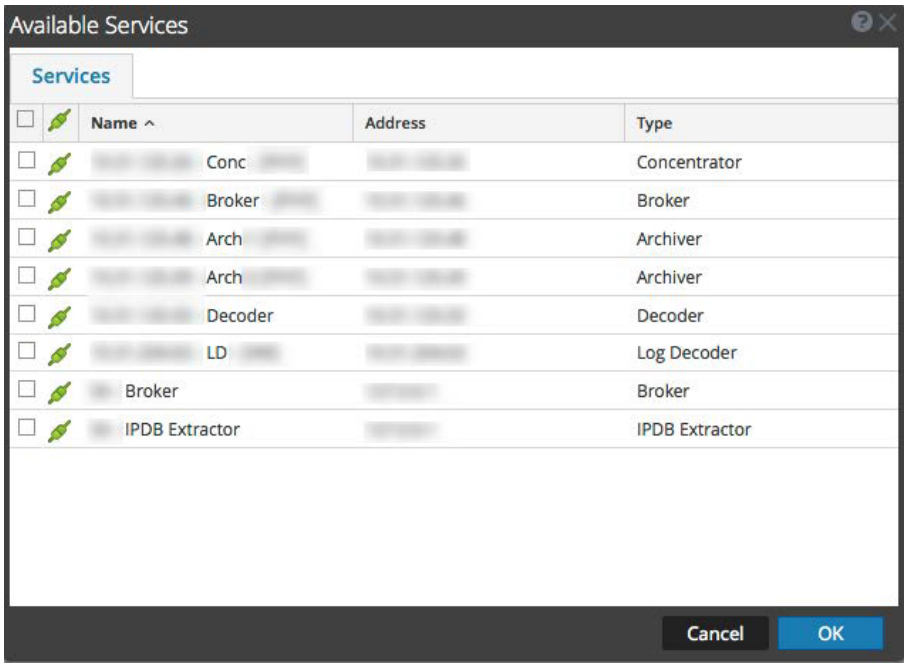
7. Click **Jobs**  icon in the top right area of the main menu to expand the list of restoration collection jobs with their current status.

Note: When restoring a collection, the larger the dataset that you have to restore, the longer the restoration will take. If you are restoring a collection containing hundreds of gigabytes or more, restoration may take several hours.

Add Archiver Service as a Data Source to Reporting Engine

This topic provides instructions on how to add the Archiver service as a data source to Reporting Engine to generate reports for the data restored onto the Archiver.

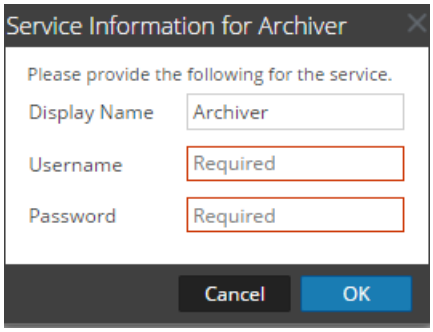
Prerequisites



Ensure that you have:

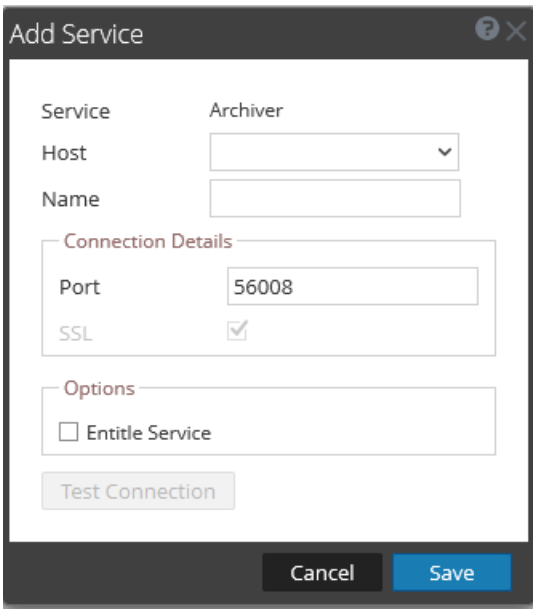
- Installed the Archiver service on the Archiver host.
- Added a collection on the Archiver service.

Procedure



Perform the following steps to add the Archiver service as a data source to Reporting Engine:

1. Go to  **(Admin) > Services**, click  , and select **Reporting Engine** service.
2. In the **Actions** column, click  **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Sources** tab.
4. Click  and select **Available Services**.
   The Available Services dialog is displayed.



5. Select the Archiver service and click **OK**.

   If the Archiver service is using a Trust Model, the Service Information dialog for the selected service is displayed with the username and password fields required. If the service is not using a Trust Model, these fields will be optional.

6. Type the username and password for admin credentials for the service.
7. Click **OK**.

   The Add Service dialog is displayed.

8. Select a host from the drop-down list and click **Save**.

   The Archiver service is now added as a data source to the Reporting Engine and is listed in the NWDB Data Sources list.

Note: This procedure has to be performed for each collection.

An Administrator can create and delete Workbench collections. and view Workbench statistics and logs. This topic provides all of these procedures and an example procedure for restoring a collection for Reporting and Investigation.

- Mount Archiver Directories
- Create a Collection
- Delete a Collection
- Investigate a Collection
- View Workbench Collection Statistics
- View Workbench Logs

Mount Archiver Directories

If data is in offline storage or cold-tier storage, you need to mount the Archiver directories in order to restore the data for reporting and investigation purposes:

1. Go to  **(Admin) > Services**.
2. Select an **Archiver** from the **Services** panel and select  **> View > Explore**.

   The Explorer view for the Archiver is displayed

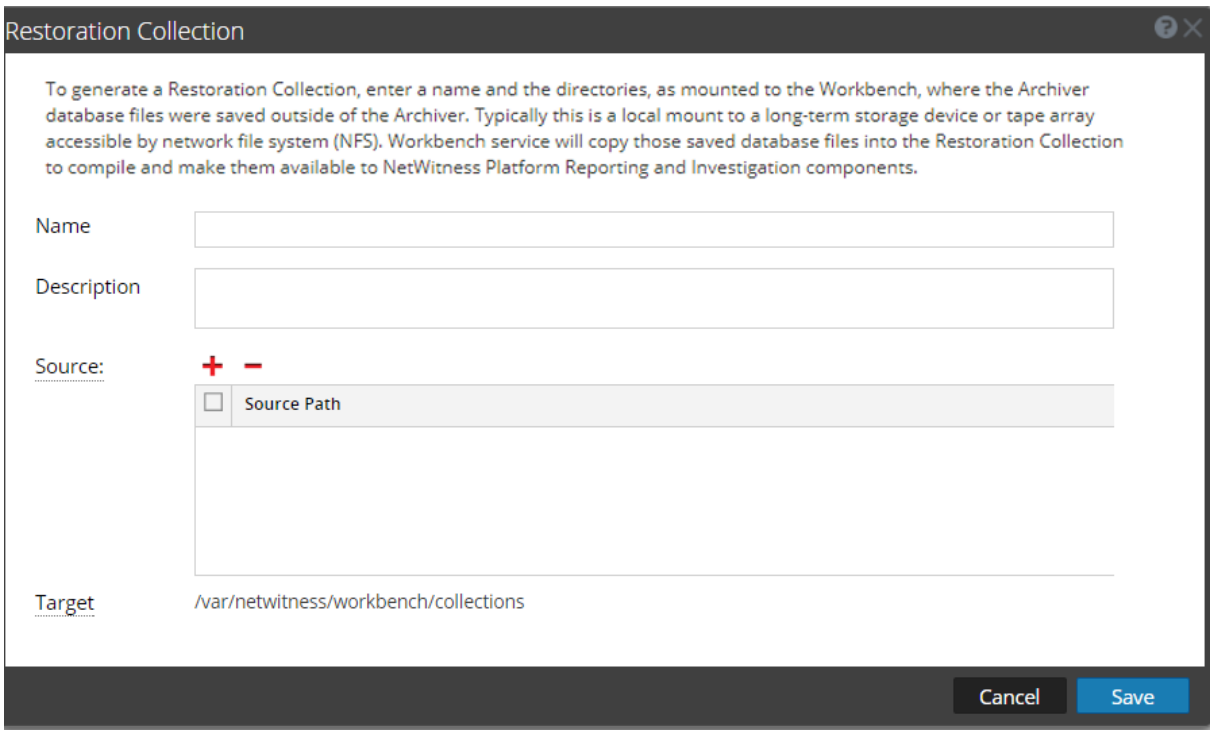
3. Right-click on the **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
4. Run the **manifest** command for a time range, for example, 2015-April-01 to 2015-April-10.

   The search returns all files that need to be restored for the selected query.

Create a Collection

Administrators can create collections of restored data from a backup or from an existing set of data.

Note: You can point the source path to the location of the database files and the restore command copies them to the Archiver. You need to mount those directories to the Archiver (where the Workbench is installed) before a restoration collection can be created.



To create a collection using data restored from the backed up data or existing subset of data:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a **Workbench**, then select **> View > Config**.

   The Services Config view is displayed with the General tab open.
3. Click the **Collections** tab.

   The Collections panel is displayed.
4. Click in the toolbar.

   The Restoration Collection dialog is displayed.

5. Provide the following information:
   - **Name:** Name of the Workbench collection that you want to restore.
   - **Source:** Location where the Archiver database files have been moved from cold storage.

   Note: Target is the location where the collection is created.

6. Click **Save** to restore the collection.

   Note: If the source path provided to create the restoration collection does not exist, the following error message is displayed:
   `The source path does not exist '/xxx/xxx/'.`

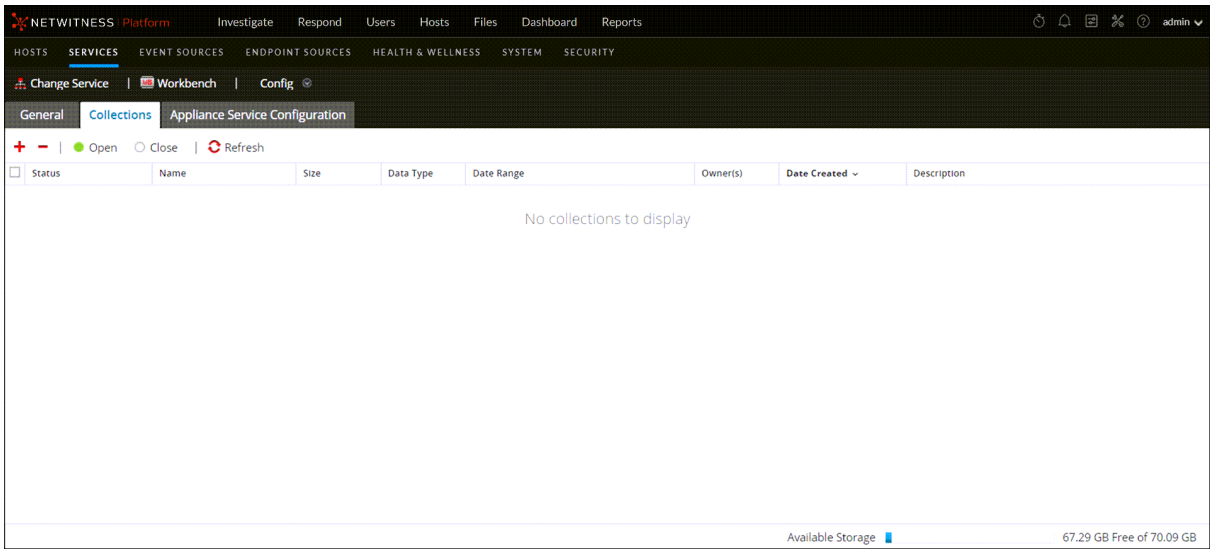
   If there is insufficient storage to restore your collection, the following error is displayed:
   `Error during disk space checking. Insufficient disk space in location '/xxx/xxx'.`

   The Schedule Job dialog is displayed with the following message:
   `Restoring data into a new collection. Check the jobs page for progress.`

7. Click the **Jobs** icon  in the NetWitness toolbar to expand the list of restoration collection jobs with their current status.

Note: Restoring a collection that is larger than 550 GB may take several hours to process.

Delete a Collection



Administrators can delete collections from the Workbench service.

Perform the following steps to delete a collection:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a **Workbench**, and click  **> View > Config**.

   The Services Config view opens with the General tab displayed.
3. Select the **Collections** tab.

   The Collections panel is displayed.

4. In the Collections panel, select the collection that you want to delete.
5. Click − from the toolbar.

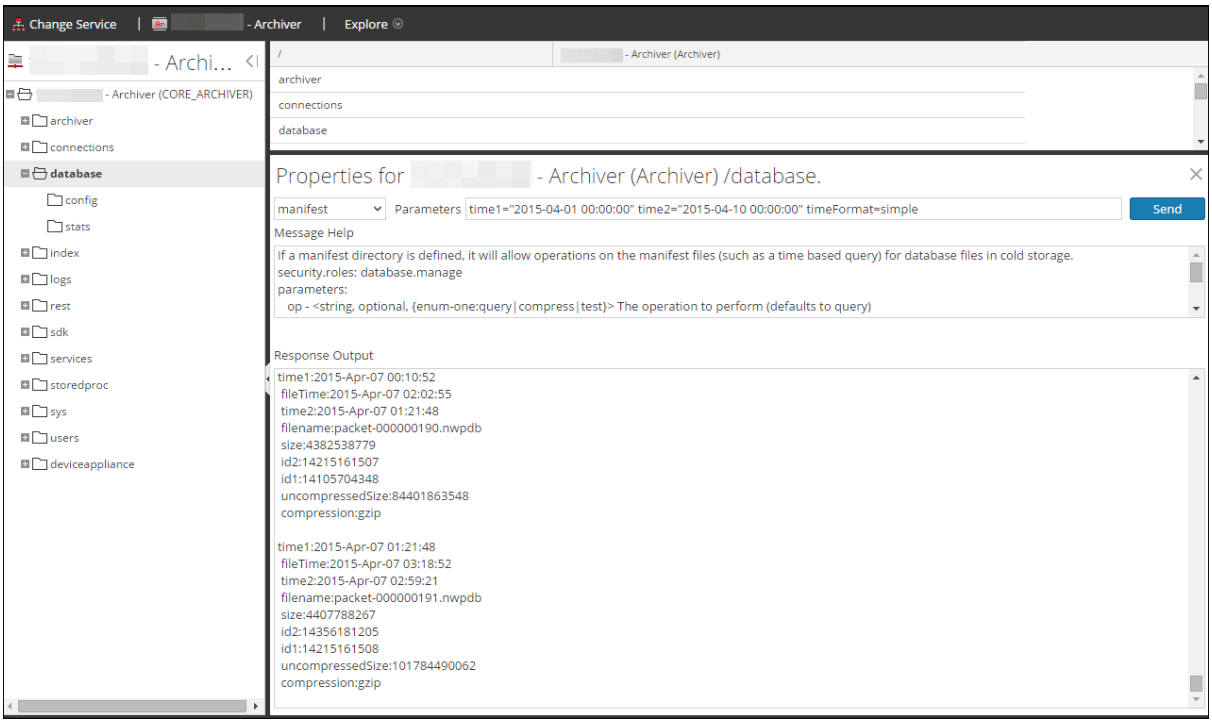
   A warning dialog requests confirmation.
6. If you want to delete the collection, click **Yes**.

   The collection is removed from the Workbench service.

Example Procedure: How to Restore a Collection for Reporting and Investigation

The following steps illustrate how to restore data for reporting and investigation purposes that is in offline storage or cold-tier storage. In the following example, data is restored for the time range beginning on 2015-April-01 through 2015-April-10.

To restore data for reporting and investigation purposes:



1. Go to **(Admin) > Services**, select the **Archiver**, and click **> View > Explore**.

   The Explorer view for Archiver is displayed.
2. Right-click on **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
3. Run the **manifest** command for the selected time range 2015-April-01 to 2015-April-10.

   The search returns all files that need to be restored for your selected query.

   Example Search:

   ```
   time1="2015-04-01 00:00:00" time2="2015-04-10 00:00:00" timeFormat=simple
   ```

4. Go to **(Admin) > Services**, select an **Archiver**, then select **> View > Config**.
   The Services Config view is displayed with the General tab open
5. Select the **Collections** tab.
6. Create a restoration collection with the source path pointing to files listed in the manifest command output.
7. Save the collection.
   After successfully creating a collection, you can use this collection for reporting and investigation purposes.

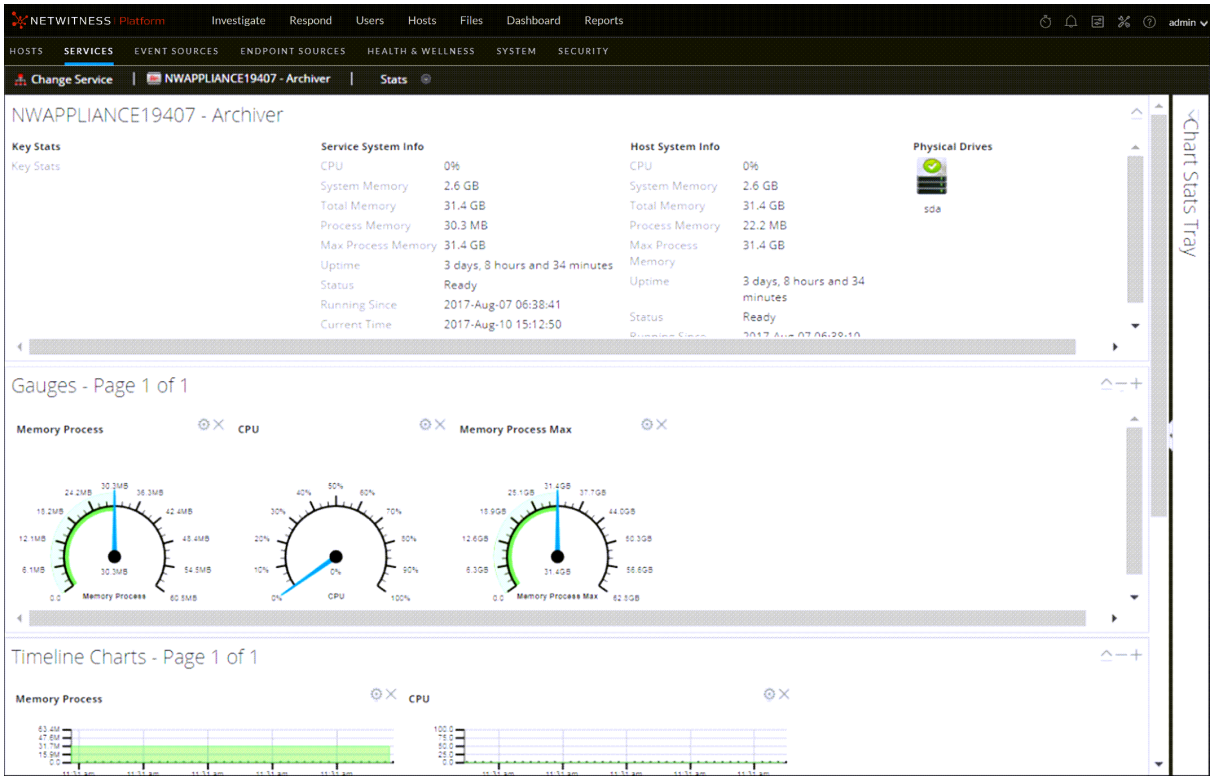
Investigate a Collection

To perform an investigation on an Archiver collection:

1. Go to **Investigate**.
   The Investigate dialog is displayed.
2. Click the **Collections** tab in the Investigate dialog.
3. Select an Archiver service in the left panel.
4. Select the collection you want to investigate in the right panel.
5. Click **Navigate**.

The Navigate view is displayed showing data pertaining to the Archiver collection that you selected.

Note: For detailed information about using Investigate, see the *Investigate User Guide.*.



View Archiver Collection Statistics

The same statistics available for other services are provided for the Archiver service. The Services Stats view displays key statistics and system information that pertain to your selected Archiver service. The information is displayed in several different sections within the Stats view: Archiver, Gauges, Timeline Charts and Chart Stats Tray. The Chart Stats Tray lists all available statistics for the Archiver. Any statistic in the Chart Stats Tray can be displayed in a timeline chart.

Perform the following steps to view Archiver statistics:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select an **Archiver**, then select **View > Stats**

   The Services Stats view is displayed.

Note: For more information about Archiver statistics, see the *Host and Services Getting Started Guide*.

View Archiver Logs

Perform the following steps to view logs on an Archiver service:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a **Archiver**, then select **> View > Logs**

The Services Logs panel is displayed.

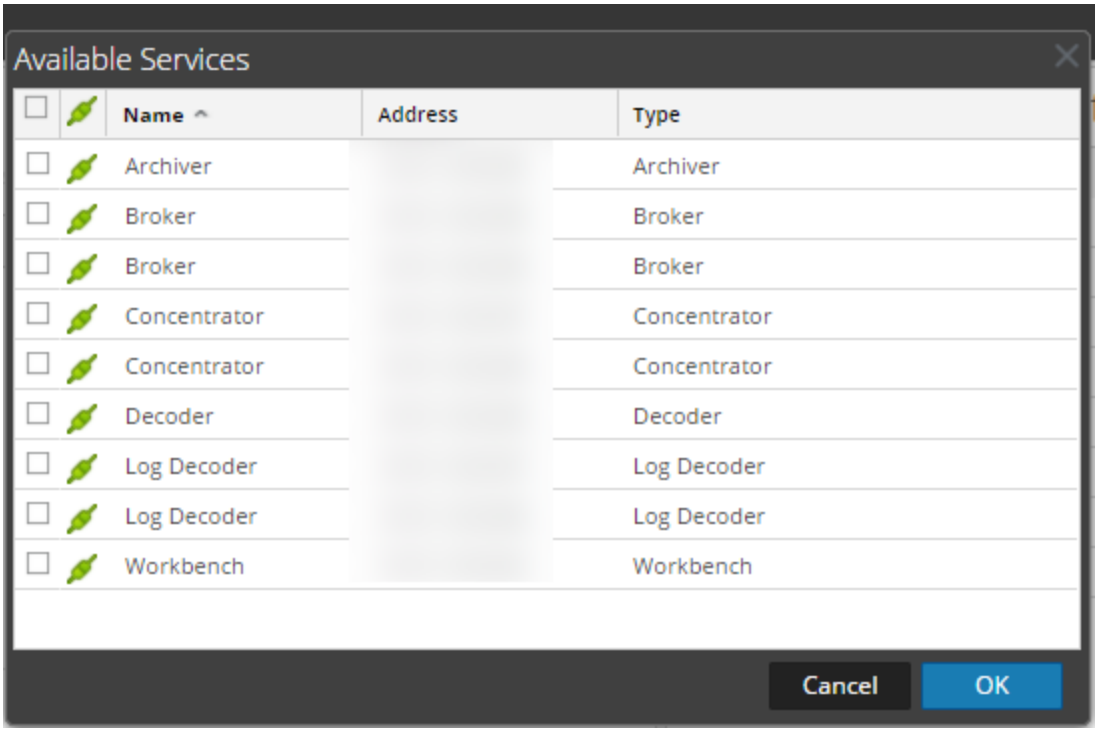
Note: For information about viewing and configuring audit logs, see "Configure Global Audit Logging" topic in the *System Configuration Guide.*

Add Archiver Service as a Data Source to Broker

Adding the Archiver service as a data source to Broker is useful when you have more than one collection and you want a report on the archived data. To do this, you can add more than one collection as a downstream service to a Broker and then generate a report on it.

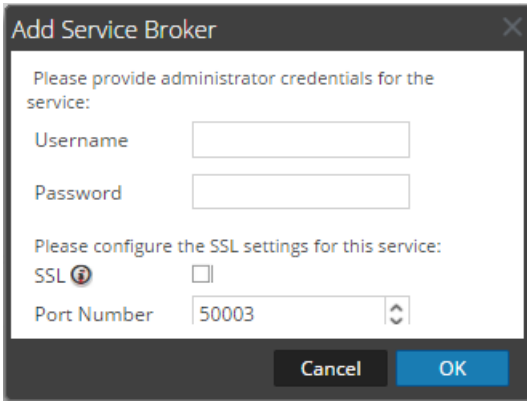
Prerequisites

Ensure that you have:



- Installed the Archiver service on the Archiver host.
- Added a collection on the Archiver service.

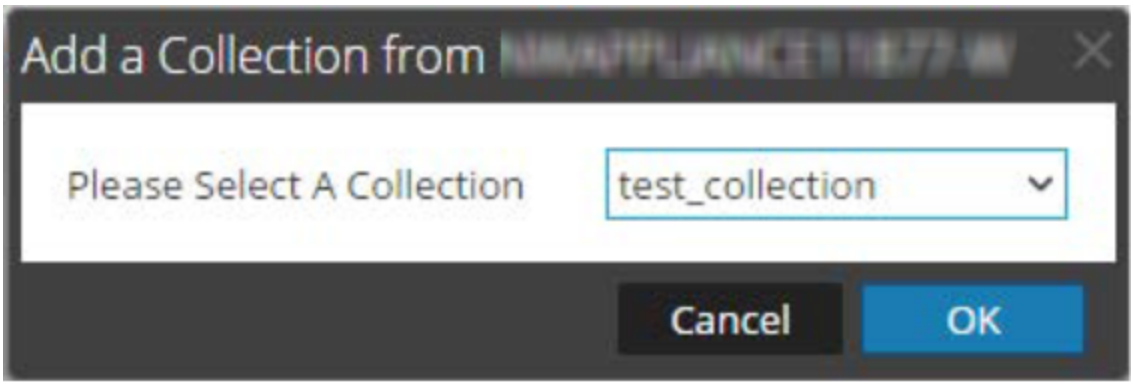
Procedure



To add an Archiver service as a data source on the Broker:

1. Go to  **(Admin) > Services** and select a **Broker** service.
2. In the **Actions** column, select  **> View > Config**.
   The Config view is displayed with the General tab open.
3. In the **Aggregate Services** section, click .

The Available Services dialog is displayed.



6. Select the Broker service and click **OK**.
7. If the Archiver service is using a Trust Model, a Service Information dialog for the selected service is displayed.

8. Type the username and password for admin credentials for the service.
9. Click **OK**.

   The Add Collection dialog is displayed.

10. Select a collection from the drop-down list and click **OK**.

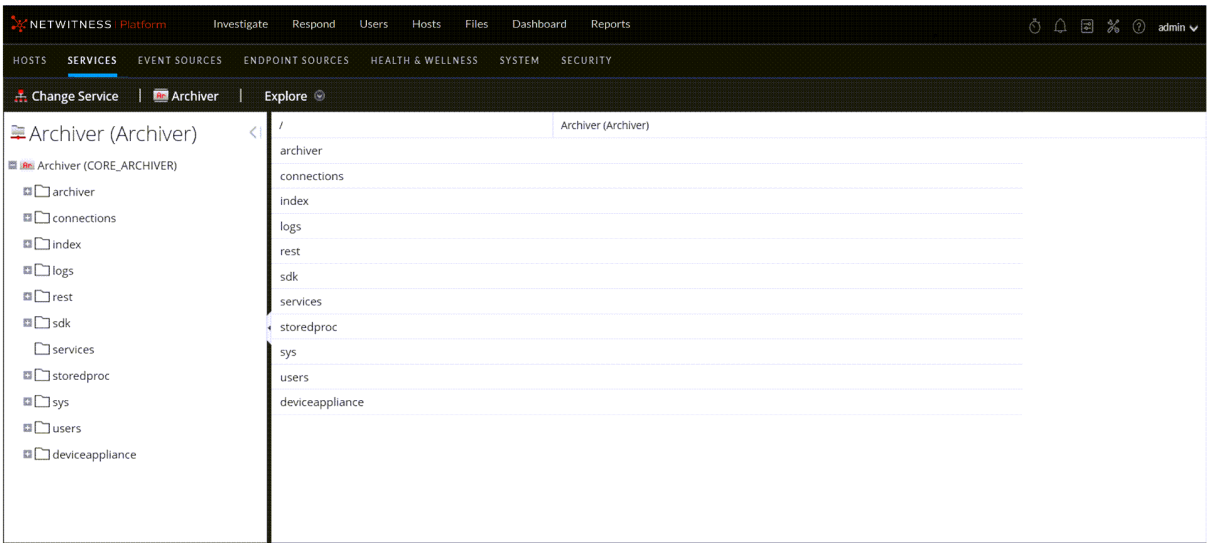
    The Archiver service is now added as a data source to the Broker.

Note: This procedure has to be performed for each collection.

Retrieve Hash Information

Archiver provides a command, **hashInfo**, which you can use to retrieve the hash information for each session, meta, and packet database that meets the session list or date range criteria. The hash information retrieved is in the form of a list of string parameters, each string parameter corresponding to the hash information for a single database file. You can retrieve the hash information of the database files using the Archiver Service Explore view or REST interface of the Archiver service. The hash information thus retrieved is used to compare the database files in the original location and the exported location to validate data integrity.

The following table lists the criteria that you can use to retrieve the hash files from the database.



Criteria	Description
sessions	You can retrieve the hash information of the database files by specifying the sessions that exist or read from the session database to determine the associated meta and packet id required to determine which meta and packet database files are needed to retrieve the hash information. **For example:** sessions=100 - Retrieves the hash information of all database files that contain the constituent components(session, meta, content) of session 100. sessions=100,500000 - Retrieves the hash information of all database files that contain the constituent components(session, meta, content) of session 100 and 500000
beginDate	You can specify a begin date as a filter against the database files. This finds the hash information for the files created after the specified date. The begin date specified has to be in the format YYYY-MM-DD HH:MM:SS.
endDate	You can specify an end date as a filter against the database files. This finds the hash information for the files created before the specified date. The end date specified has to be in the format YYYY-MM-DD HH:MM:SS **For example:** beginDate: “2014-Mar-25 05:52:00” endDate=”2014-Mar-27 05:52:00” – Retrieves the hash information of all the database files in between March 25, 2014 and March 27, 2014 in the specified time range on those days.
directories	By default, the hash information files are stored with the database files they were created for. You can also store the hash information file in different location by defining multiple locations in the hash.dir configuration parameter. You can define the location as a filter and retrieve the hash information files for the configured location. **For example:** directories="/home/hash" – Retrieves the hash information of the database files from the location /home/hash

Procedure

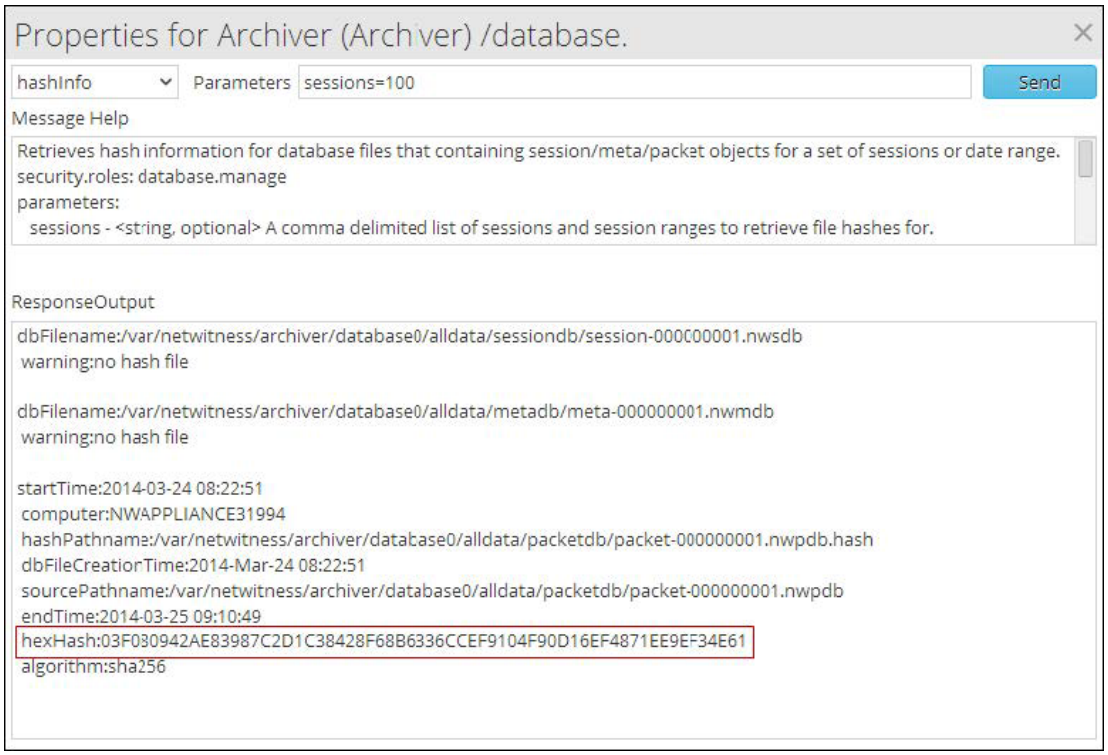
To retrieve hash information of the database files:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, select **View > Explore**.

   The Explore view of the Archiver service is displayed.

3. In the node tree, right-click on **archiver** and select **Properties**.

   The Properties dialog is displayed.



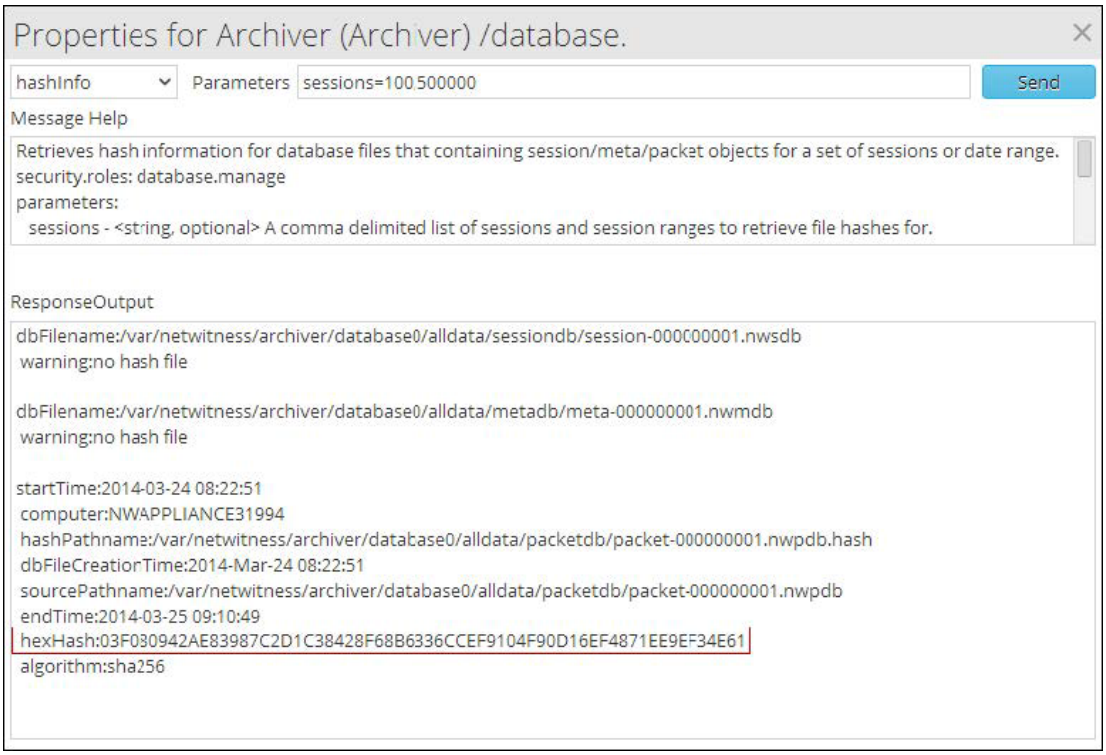
4. In the drop-down menu, select **hashInfo**.
5. In the **Parameters** field, type the criteria that you want to use to retrieve the hash information from the database.
6. Click **Send**.

   The output of the command is displayed in the ReponseOutput textbox. In the output, the hash information is shown in the hexHash parameter. You can use this hash information to verify data integrity manually.

Examples

Retrieve the hash information of the database files for the sessions that exist.
Criteria: sessions=100

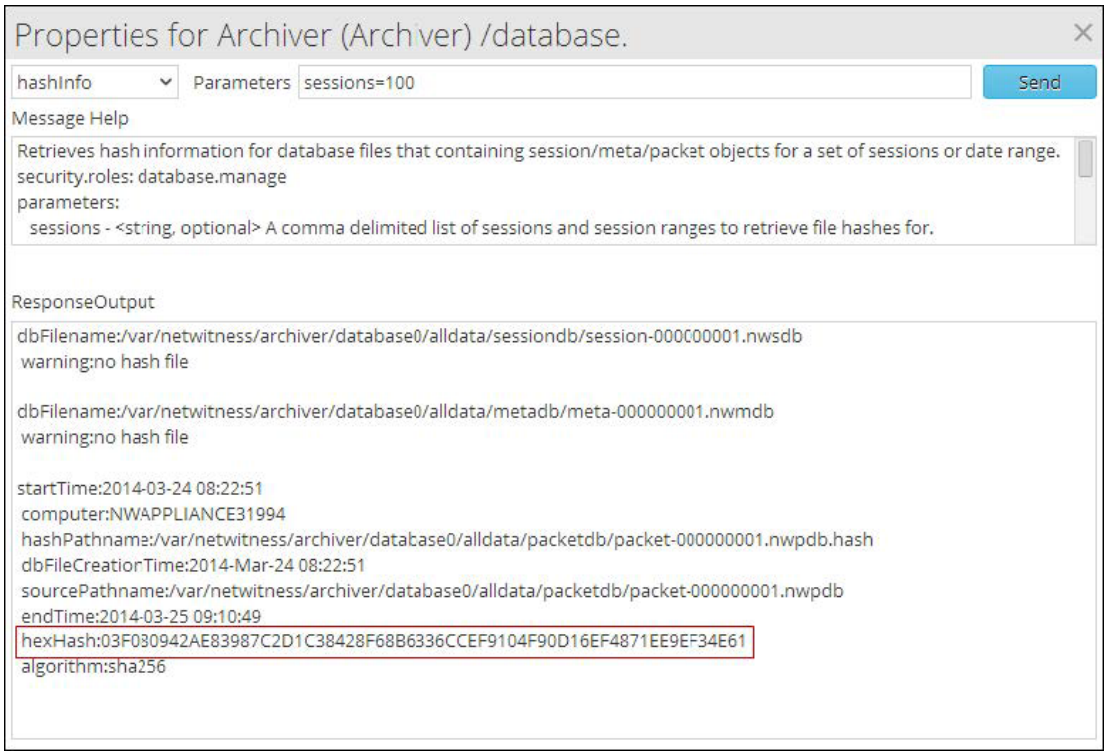
Output



The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for session 100.

Retrieve the hash information of the database files for the session ranges that exist.

Criteria: sessions=100,500000



Output

The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for session range 100 - 500000

Retrieve the hash information of the database files created in the specified date range
Criteria: beginDate="2017-Mar-25 05:52:15" endDate="2017-Mar-27 05:52:15"

Output

The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for the date range specified.

Archiver Collection Dialog

On the (Admin) > Services > Config view > Data Retention tab of an Archiver, administrators can define the criteria for log retention and storage. In the Collection dialog, which is accessible from the Collections section, you can define individual storage collections to use for different log types. For example, you may want to create collections for compliance reasons or to selectively retain critical logs.

Workflow

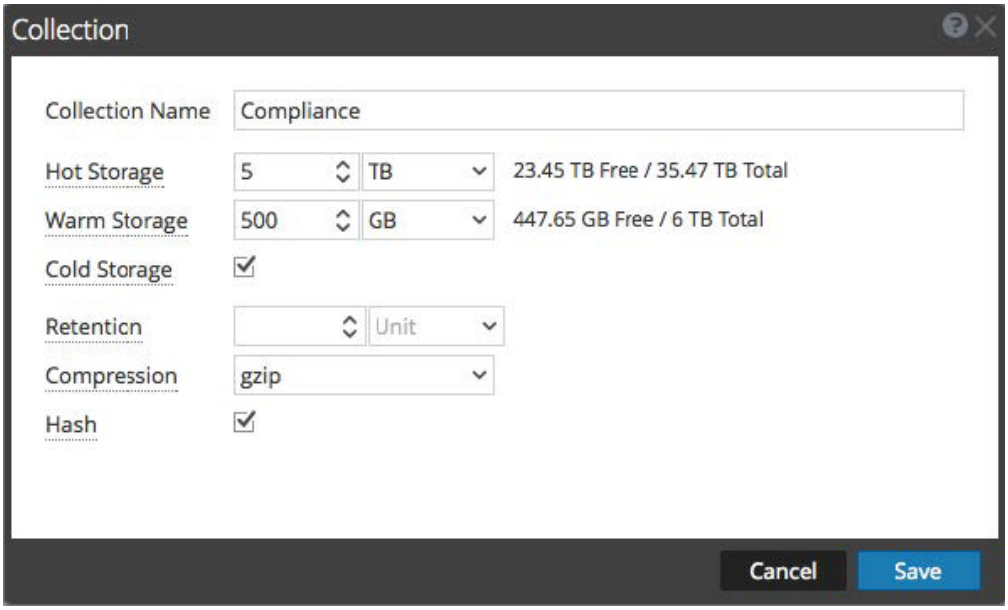
This workflow illustrates the end-to-end installation and configuration process for an Archiver.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add an Archiver service	Edit the Archiver Service
Administrator	Add a Log Decoderas a source to the Archiver	Add Log Decoder as a Data Source to Archiver
Administrator	*Configure Archiver Storage and Log Retention	Configure Archiver Storage and Log Retention
Administrator	Add an Archiver as a Data Source to the Reporting Engine	Add Archiver as a Data Source to Reporting Engine
Administrator	Configure Archiver Monitoring	Configure Archiver Monitoring

*You can perform this task here.

Related Topics



Configuring an Archiver

Quick Look

To access the Collection dialog:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the Actions column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.

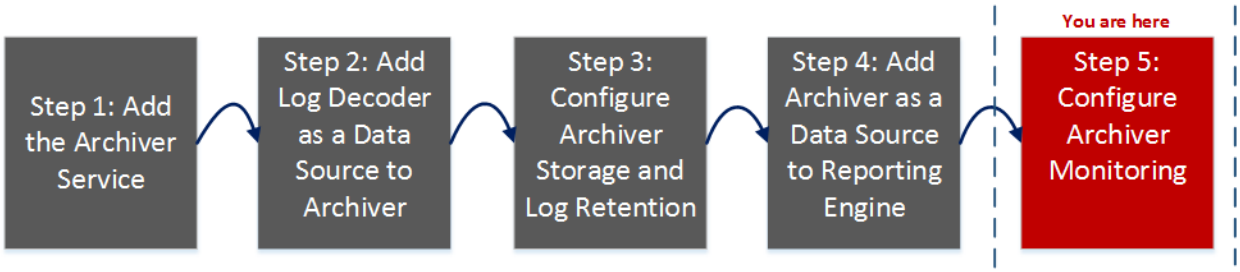
3. Click the **Data Retention tab**.
4. In the Collections section, click .
   The Collection dialog is displayed.

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

The following table describes the fields in the Collection Dialog.

Field	Description
Collection Name	Specify a name for your collection, such as Compliance, MediumValue, or LowValue.
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage are shown next to this field. When the size of the logs reach the maximum hot storage size, the logs are removed or they roll to the next available storage tier (warm or cold).
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage are shown next to this field. When the size of the logs reach the maximum warm storage size, the logs are removed or they roll to available cold storage.
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside of the specified size and retention limits roll over to cold storage. If you do not use cold storage, logs outside of the specified size and retention limits are removed.

Field	Description
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved.



Archiver Services Config View - General Tab

The General tab for an Archiver in the Services Config view helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between an Archiver and the aggregate service.

To access the General tab, go to **(Admin) > Services**, select an **Archiver** service, then select **View > Config**.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Archivers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

Note: Archiver can aggregate from Log Decoder and Archiver (Archiver-Archiver aggregation). Archiver can be aggregated by Archiver and Broker. A Broker can aggregate from either set of concentrators or set of Archivers

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add an Archiver service	Edit the Archiver Service
Administrator	Add a Log Decoder as a Data Source to an Archiver	Add Log Decoder as a Data Source to Archiver

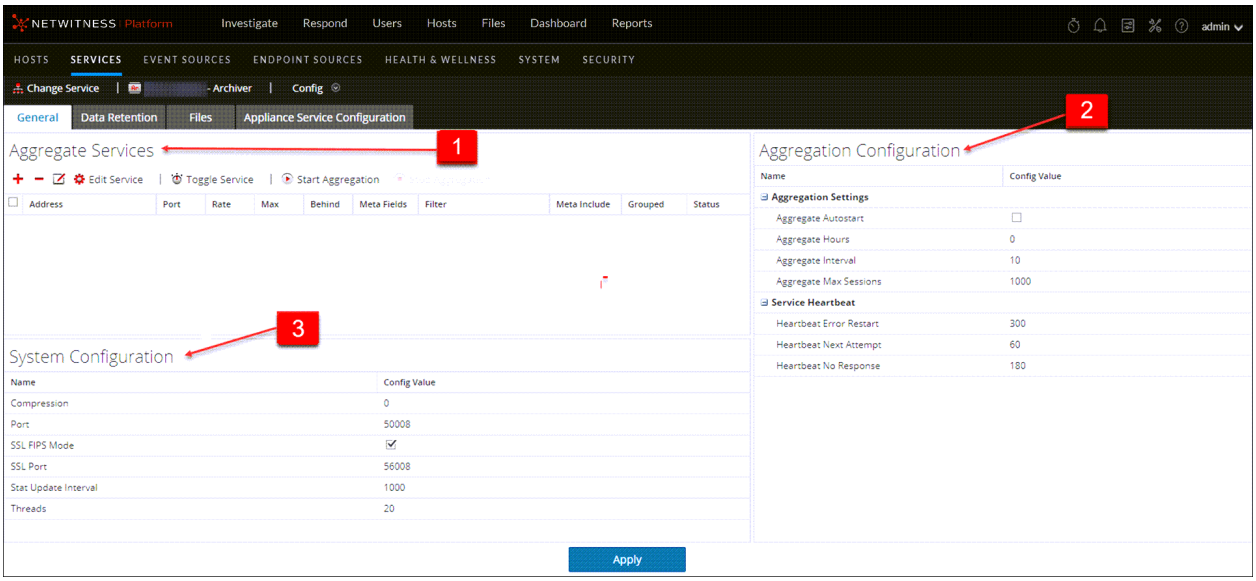
Administrator	Manage System Configuration	System Configuration Section



*You can perform this task here.

Related Topics

Configure Log Storage Collections

Quick Look

This is an example of the General tab.

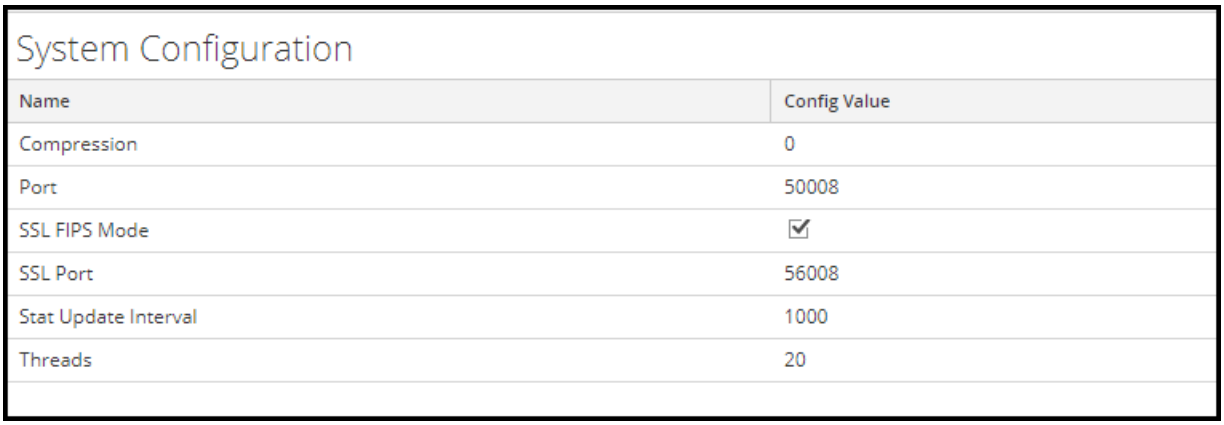
These are the three major sections in the General tab for Archivers:

1. Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.
2. System Configuration section manages service configuration for a service.
3. Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process.

Aggregate Services Section

This is an example of the Aggregate Services section for a Concentrator. The Aggregate Services section toolbar offers these options.

Option	Description
	Opens a dialog in which you can add a Archiver or a Log Decoder.
	Removes the selected aggregate service.
	Opens a dialog to edit **Meta Fields** and **Filter** values.
	When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service.
	When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.
	Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation.



The Aggregate Services section list has these columns.

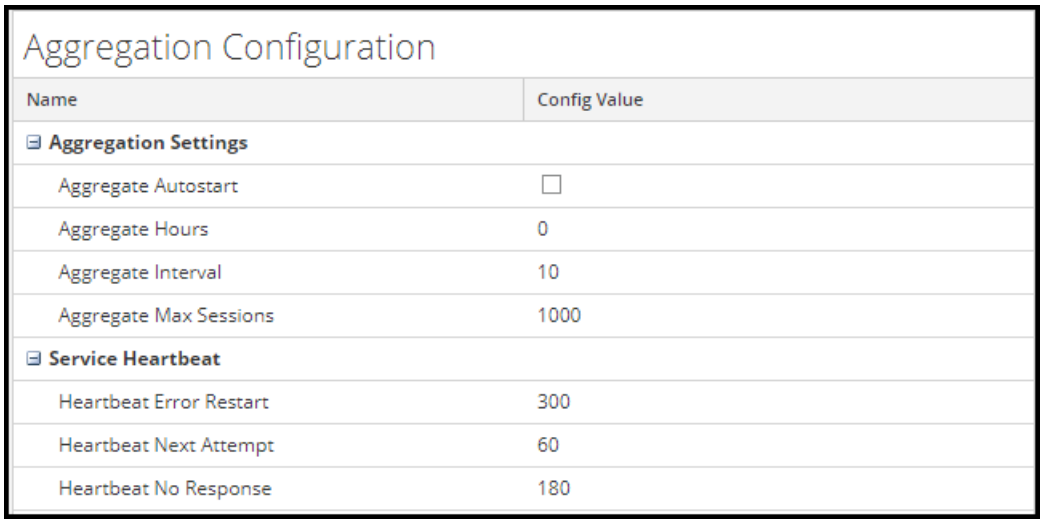
Column	Description
Address	Lists the address of the service.
Port	Lists the port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
Rate	Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**.
Max	Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture.
Behind	Lists the number of sessions on the service that need to be aggregated.

Column	Description
Collection	For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section.
Meta Fields	For Concentrators only, lists the types of metadata being consumed by the aggregate service.
Filter	For Concentrators only, lists any filter being applied to the metadata being consumed by the aggregate service.
Meta Include	For Concentrators only, lists the number of types of meta included in the aggregate service.
Grouped	Whether or not the aggregate service is part of a group.
Status	Lists the current status of the service: • online = available to provide data for consumption by the Broker or Concentrator • offline = not available to provide data for consumption by the Broker or Concentrator • consuming = providing data for consumption by the Broker or Concentrator

System Configuration Section

When a service is first added, default values are in effect. You can edit these values to tune performance.

The System Configuration section has these parameters.



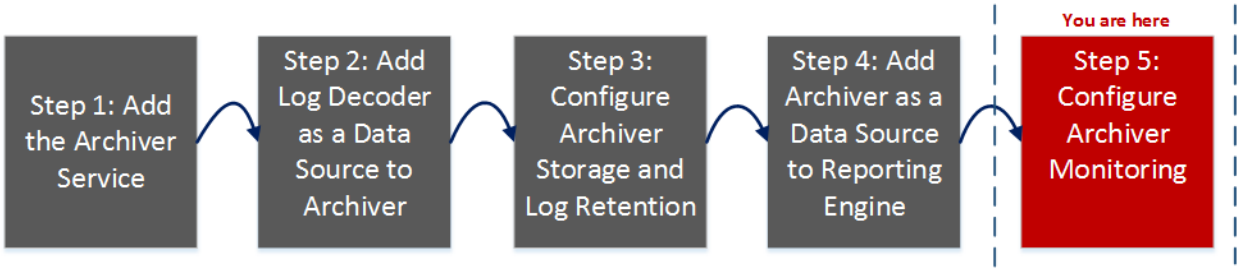
Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.

Parameter	Description
Port	The port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
SSL FIPS Mode	When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
SSL Port	Indicates the SSL port.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**. Changes takes effect on service restart.

Aggregation Configuration Section

The Aggregation Configuration Section provides configuration settings for aggregation. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

Caution: Do not edit any of these settings without guidance from Customer Support.



Archiver Service Configuration

This topic lists and describes the available configuration settings for NetWitness Archivers.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add an Archiver service	Edit the Archiver Service
Administrator	Add a Log Decoder as a Data Source to an Archiver	Add Log Decoder as a Data Source to Archiver
Administrator	Configure Archiver Storage and Log Retention	Configure Archiver Storage and Log Retention
Administrator	Add Archiver as a Data Source to a Reporting Engine	Add Archiver as a Data Source to Reporting Engine
Administrator	*Configure Archiver Monitoring	Configure Archiver Monitoring
Administrator	Configure Archiver settings	/archiver/config
Administrator	Configure Database settings	/database/config
Administrator	Configure Index settings	/index/config
Administrator	Configure Logs settings	/logs/config
Administrator	Configure REST settings	/rest/config
Administrator	Configure SDK settings	/sdk/config
Administrator	Configure Services settings	/services/<service name>/config
Administrator	Configure System settings	/sys/config

*You can perform this task here.

Data Retention Tab - Archiver

From the (Admin) > Services > Config view > Data Retention tab of an Archiver, administrators can define the criteria for log retention and storage.

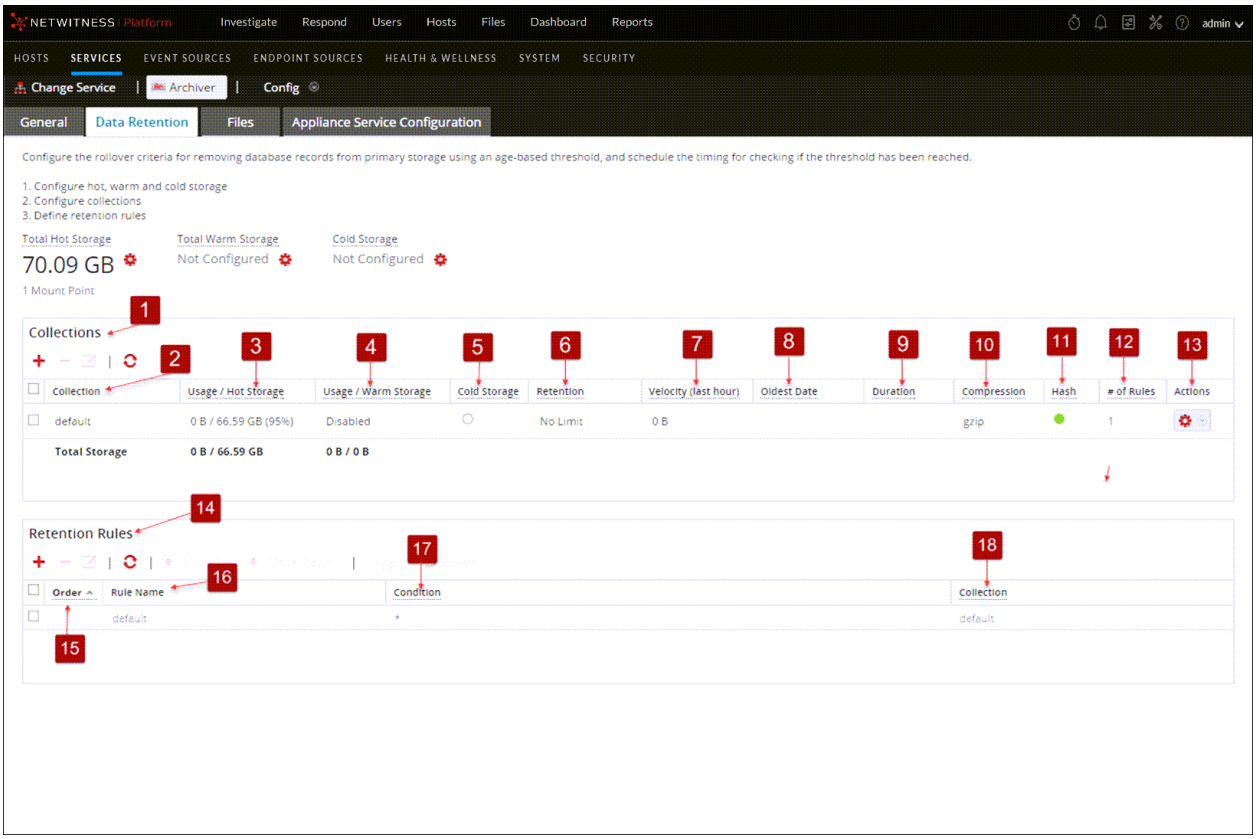
Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver. From the Data Retention Tab you can configure hot, warm, and cold storage along with configuring multiple storage collections for data retention.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add the Archiver service.	Edit the Archiver Service
Administrator	Add Log Decoder as a Data Source to an Archiver.	Add Log Decoder as a Data Source to Archiver
Administrator	*Configure Archiver Storage and Log Retention.	Configure Archiver Storage and Log Retention
Administrator	Add an Archiver as a Data Source to Reporting Engine.	Add Archiver as a Data Source to Reporting Engine
Administrator	Configure Archiver Monitoring.	Configure Archiver Monitoring

*You can perform these tasks here.



Related Topics

Configuring an Archiver

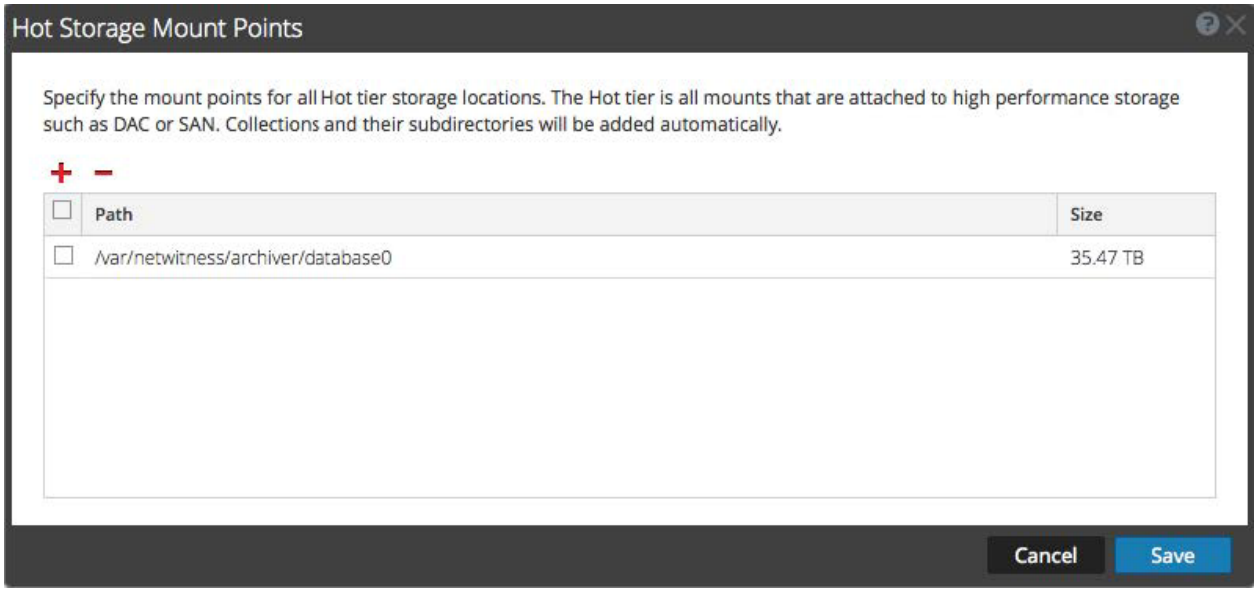
Configure Hot, Warm, and Cold Storage

Quick Look

As an administrator, you can configure hot, warm, and cold storage as well as multiple storage collections with different locations and criteria for retaining logs. For example, you can create a Compliance collection that stores logs for a specific time period as required by government regulations. You can create another collection that stores low value logs in hot storage with a much shorter retention period. The flexibility of these collections enables you to have significantly less overall storage requirements.

1	Displays the Collections panel with the Data Retention tab open.
2	Allows you to sort the collections in ascending or descending order.
3	Displays the allocated hot storage space for the collection, as well as the approximate current usage.
4	Displays the allocated warm storage space for the collection, as well as the approximate current usage.
5	Displays whether the collection uses cold storage for long-term backup.
6	Displays the time range used to determine when data is moved to cold storage or discarded.
7	Displays the amount of data written to the collection during the past hour.
8	Displays the date of the oldest data stored in the collection.
9	Displays the approximate age of the oldest data stored in the collection.
10	Displays the compression type used in collection storage.
11	Displays whether or not hashes are used when storing data in the collection.
12	Displays the number of retention rules that use this collection for storing data.
13	Displays the Actions drop-down menu.
14	Displays the Retention Rules panel.
15	Displays the order in which Retention Rules are evaluated in the execution chain.
16	Displays the name of the Retention Rule.
17	Data that satisfies this condition is stored in the corresponding collection.
18	Displays the collection used to store the data that satisfies this particular rule condition.

Total Hot, Warm, and Cold Storage

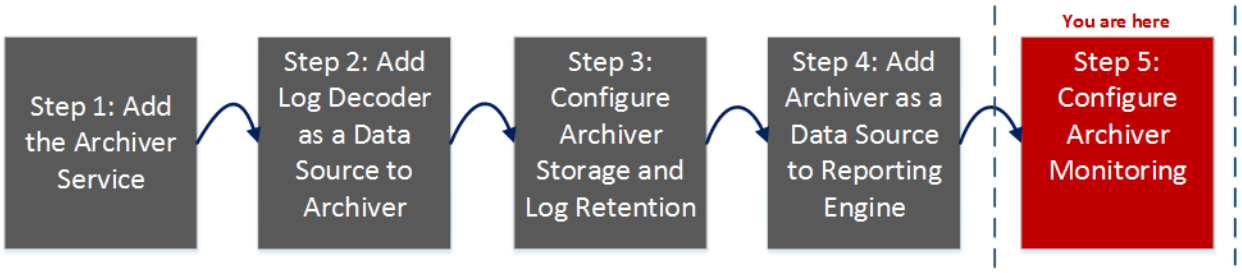


The Total Hot Storage section shows the total amount of Hot storage available and the number of hot storage mount points. The Total Hot Storage section shows the total amount of Warm storage available and the number of warm storage mount points. The Total Cold Storage section shows the total amount of Cold storage and the remaining free space available in Cold storage.

Hot, Warm, and Cold Storage Mount Points Dialogs

In the Hot, Warm, and Cold Storage Mount Points dialogs, you can specify the mount points for your storage locations. You can specify portions of this storage to use for your log storage collections.

To access the Hot, Warm, and Cold Storage Mount Points dialogs, click the  icon near the respective section.



Services Config View - Archiver

The Services Config view ((Admin) > Services > select Archiver service and select >View > Config) provides a way to manage basic service configurations, configure aggregate services, configure log retention and storage, edit service configuration files, and configure the appliance service for an Archiver.

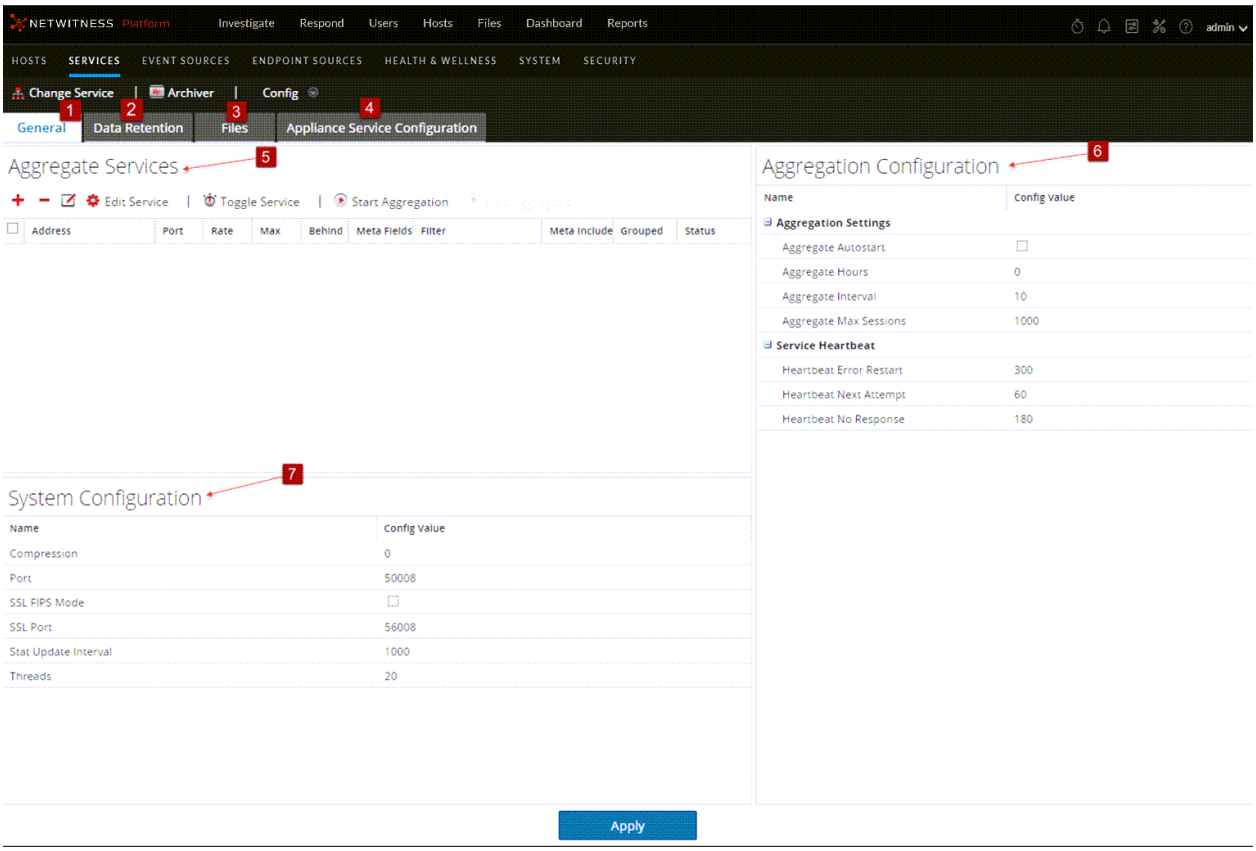
Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add the Archiver service.	Edit the Archiver Service
Administrator	Add a Log Decoder as a Data Source to an Archiver.	Add Log Decoder as a Data Source to Archiver
Administrator	Configure Archiver Storage and Log Retention.	Configure Archiver Storage and Log Retention
Administrator	Add an Archiver as a Data Source to Reporting Engine..	Add Archiver as a Data Source to Reporting Engine
Administrator	Configure Archiver Monitoring.	Configure Archiver Monitoring
Administrator	*Add a Log Decoder as an aggregate service.	Click in the Aggregate Services section.
Administrator	*Remove the selected aggregate service.	Click in the Aggregate Services section.

Role	I want to...	Show me how...
Administrator	*Edit Meta Fields and Filter values of the aggregate service.	Click  in the Aggregate Services section. You can specify the type of metadata that the Archiver consumes from this service. You can also specify a rule to filter data that the Archiver consumes from this service.
Administrator	*Communicate with the Archiver.	Click  in the Aggregate Services section. This enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Archiver.
Administrator	*Toggle the state of a service between offline and online.	Click  in the Aggregate Services section.
Administrator	*Aggregate data using the rules defined for the service.	Click  in the Aggregate Services section. Note that it is necessary to start aggregate service after aggregation has been stopped.
Administrator	*Stop aggregation on the Archiver.	Click  in the Aggregate Services section. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.



*You can perform this task in the current view.

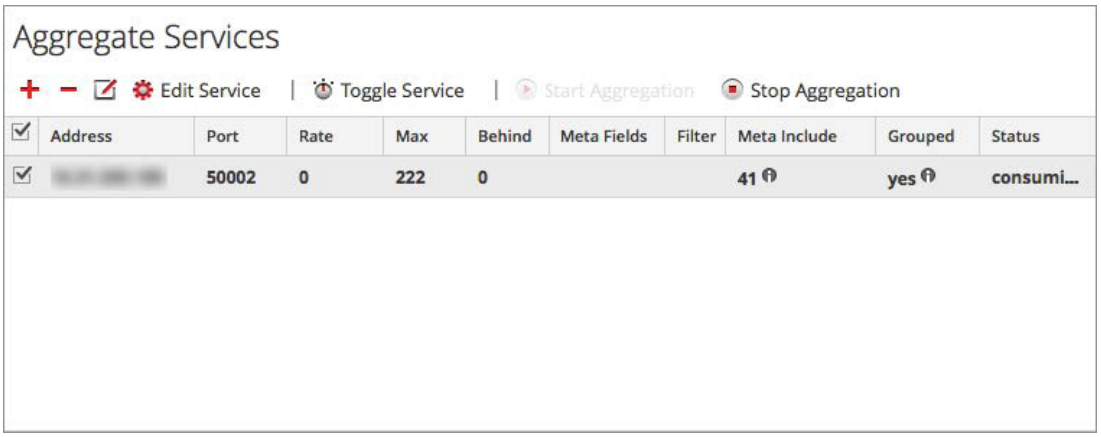
Related Topics

Configure Log Storage Collections

Quick Look

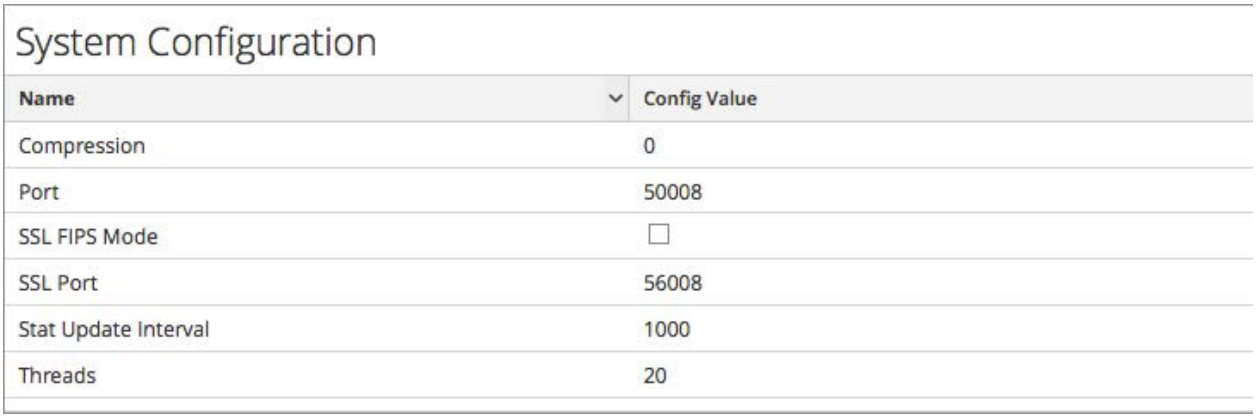
The Services Config view has four tabs and three panels.

1	General tab provides a way to manage basic Archiver service configuration.
2	Data Retention tab provides a way to view and edit collections and retention rules.
3	Files tab allows you to edit enables you to edit the service configuration files for the Archiver as text files
4	Appliance Service Configuration tab provides a way to configure an Archiver service.
5	Aggregate Services panel provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.
6	Aggregation Configuration panel provides configuration settings that affect various aspects of the aggregation process.
7	System Configuration panel provides a way to manage service configuration for an Archiver service.



General

The General tab contains the following sections:

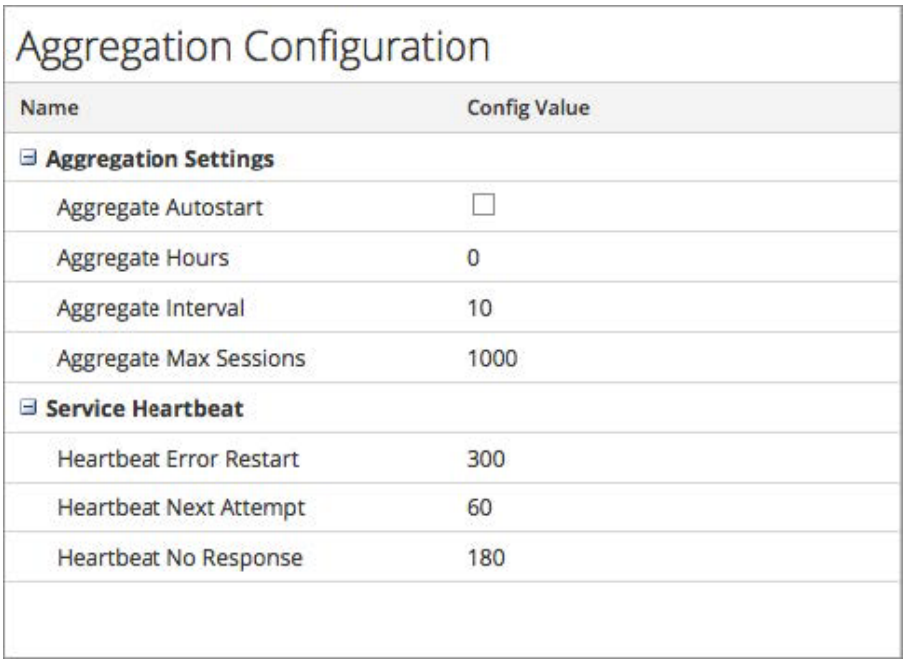


- Aggregate Services
- System Configuration
- Aggregation Configuration

Aggregate Services

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.

System Configuration



When you add an Archiver service, default values are in effect. NetWitness designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance. The following table describes the System Configuration parameters.

Task	Description
Compression	Determines the minimum amount of bytes before a message is compressed. If set to zero, messages are not compressed.
Port	Determines the port used by the service. **Note:** If you change the port number, ensure that you restart the service.
SSL FIPS mode	If enabled, all the data transferred in the network will be encrypted using SSL.
SSL Port	Indicates the port used for encrypting using SSL.

Task	Description
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system.
Threads	Determines the number of threads in the thread pool to handle incoming requests.

Aggregation Configuration

The Aggregation Configuration section contains the following sections:

- Aggregation Settings
- Service Heartbeat

Aggregation Settings

The Aggregations Settings section has the following parameters.

Parameter	Description
Aggregate Autostart	If enabled, data aggregation will automatically restart after a service restart.
Aggregate Hours	Determines the maximum number of hours a service is allowed to start aggregation.
Aggregate Interval	Determines the minimum number of milliseconds before another round of aggregation is requested.

Parameter	Description
Aggregate Max Sessions	Determines the number of sessions to aggregate on each round.

Service Heartbeat

The Service Heartbeat section has the following parameters.

Parameters	Description
Heartbeat Error Restart	Determines the number of seconds to wait after a service error before attempting a service reconnect.
Heartbeat Next Attempt	Determines the number of seconds to wait before attempting a service reconnect.
Heartbeat No Response	Determines the number of seconds to wait before taking unresponsive service to offline.

Files

The **Files** tab in the Service Config view enables you to edit the service configuration files for the Archiver as text files. The files available to edit vary depending upon the type of service being configured.

The following files are common to all core services:

- Service index file
- NetWitness file
- Crash reporter file
- Scheduler file
- Feed definitions file

For more information on the **Files** tab, see "Files Tab" in the *Host and Services Getting Started Guide*.

AWS Installation Overview

Before you can deploy NetWitness in the Amazon Web Services (AWS) you need to:

- Review the recommended compute and memory specifications needed for each NetWitness instance.
- Get familiar with the NetWitness Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see the Storage Guide for NetWitness® Platform 12.3.
- Make sure that you have a NetWitness Throughput license.

When you are ready to begin deployment, you can purchase any of the following Third-Party solutions for packet capture in AWS. If you engage one of these third-parties, they will assign an account representative and a professional services engineer to you who will work closely with NetWitness Support.

- Gigamon® GigaVUE
- Ixia CloudLens™
- f5® BIG-IP

AWS Environment Recommendations

AWS instances have the same functionality as the NetWitness Azure, virtual, and hardware hosts. NetWitness recommends that you perform the following tasks when you set up your AWS environment.

- Based on the resource requirements of the different components, follow the best practices to use the system and the dedicated storage Elastic Block Store (EBS) Volumes appropriately.
- Make sure that the compute capacity provides a write speed of 10% greater than the required sustained capture and ingest rate for the deployment.
- Build a Concentrator directory for the index database on the Provisioned IOPS SSD.

AWS Deployment Scenarios

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

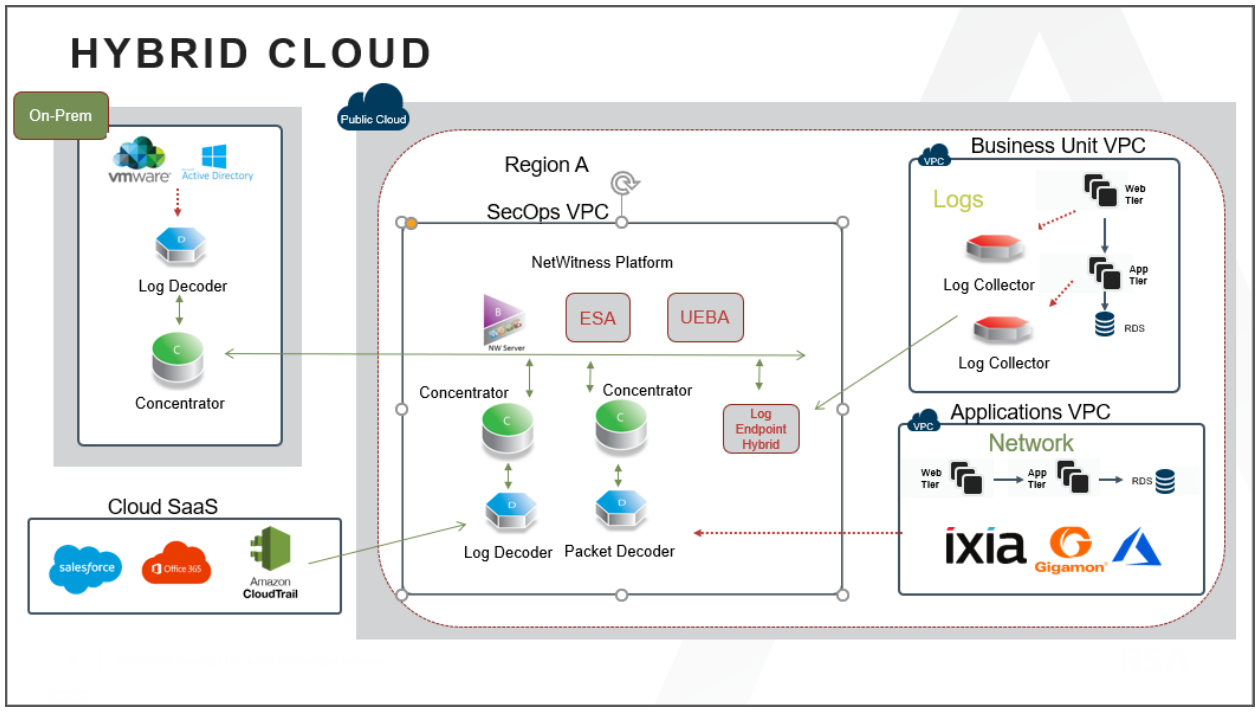
Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *NetWitness Host and Services Getting Started Guide*.



NetWitness High-Level Deployment Diagram

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

Prerequisites

You need the following items before you begin the installation process:

- Ixia account (https://login.ixiacom.com/)
- Access to AWS console
- Network rout-able (and proper AWS Security Groups) for the containers to transfer data to the NetWitness Decoder.

AWS Deployment

This topic contains the rules and high-level tasks that you must follow to deploy NetWitness components in the AWS.

Rules

You must adhere to the following rules when deploying NetWitness in AWS.

- If you reboot the Network Decoder instance, the tunnel is not retained. Create the tunnel on Network Decoder again and restart the Decoder service.
- It is recommended to use private IP addresses when you provision AWS NetWitness instances.

Note: If you assign a public IP to the NW Server Host, update the /etc/nginx/conf.d/nginx.conf configuration file as follows:

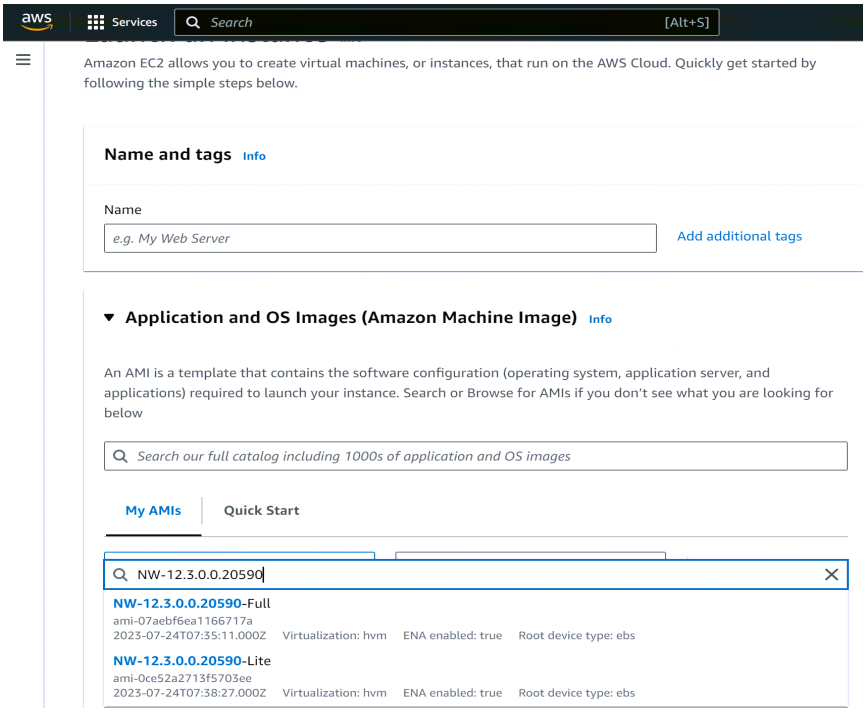
```
location /nwrpmrepo
{
alias /var/lib/netwitness/common/repo;
index index.html index.htm;
allow <Subnet-Gateway>/Subnet mask ;
#example
# allow 10.0.0.1/25;
deny all;
autoindex on;
}
```

Checklist

Step	Description	√
1	Establish AWS Environment	
2	Find NetWitness Platform AMIs	
3	Launch an Instance and Configure a Host	
4	Configure Hosts (Instances) in NetWitness Platform	
5	Configure Packet Capture	

Establish AWS Environment

1. Make sure that you have an AWS environment with the capacity to meet or exceed the NetWitness performance guidelines described in AWS Instance Configuration Recommendations.
2. Go to Find NetWitness Platform AMIs.



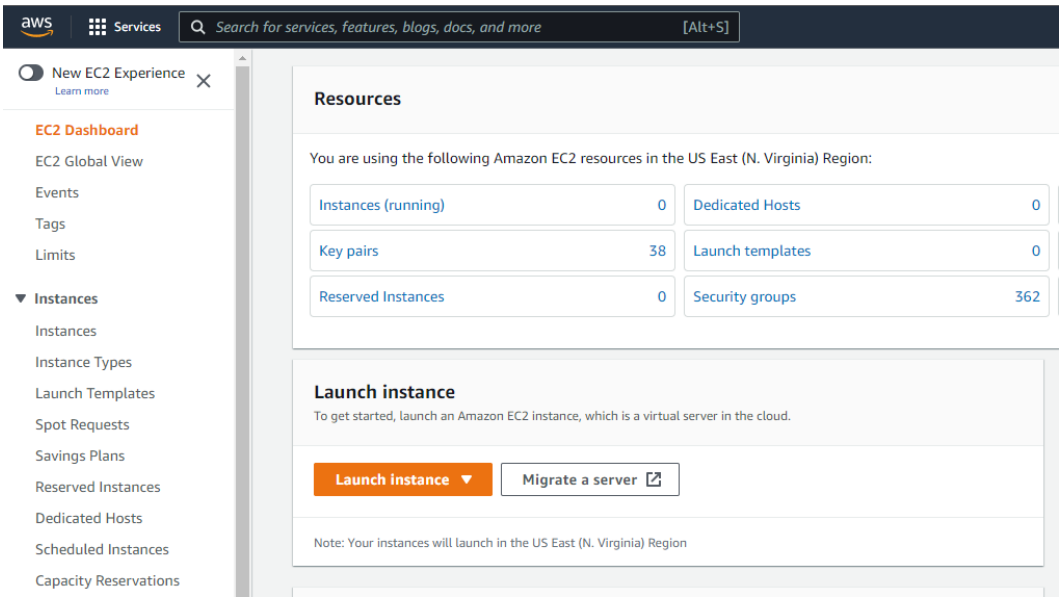
Find NetWitness Platform AMIs

You can search for NW- AMI files within the Public/Shared/Community repository, using the keyword "NW".

Note: NetWitness AMIs are available by default in the US East (N. Virginia) region (us-east-1). If you need AMIs for other regions, contact NetWitness Customer Support.

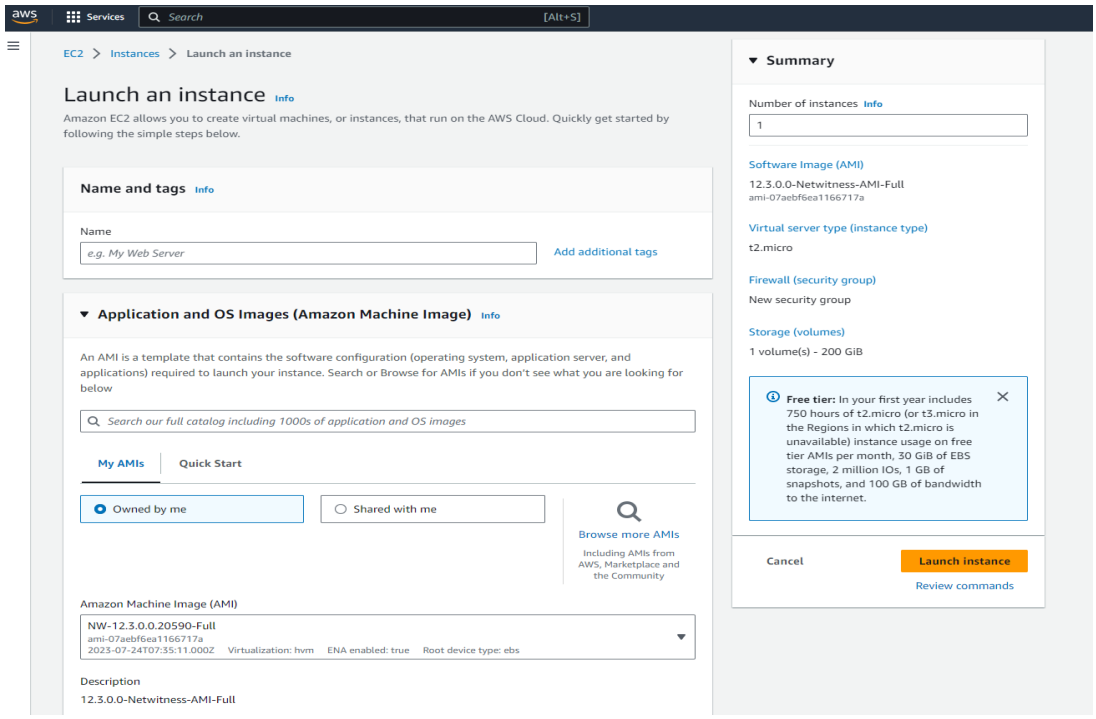
Note: For more information, see AWS **Finding Shared AMIs** documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/usingsharedamis-finding.html).

1. Open the new Amazon EC2 console (New Subscriber Account) at https://console.aws.amazon.com/ec2/.
2. Go to **EC2 Dashboard** and click **Launch Instance**.
   Launch an Instance page is displayed.
3. Under **Application and OS Images (Amazon Machine Image)**, click **My AMIs** and select either **Owned by me** or **Shared with me** option.
4. Search for **NW-12.3** from the **Amazon Machine Image (AMI)** drop-down menu to find the NetWitness AMIs.



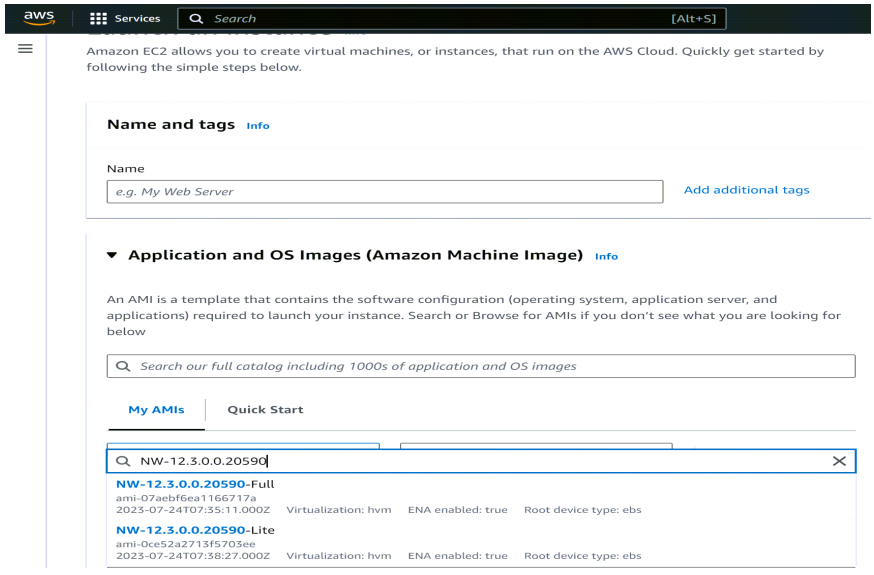
Note: Contact NetWitness Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897) to obtain access to the **NW-12.3.0.0.20590-Full**.

5. Go to Launch an Instance and Configure a Host.



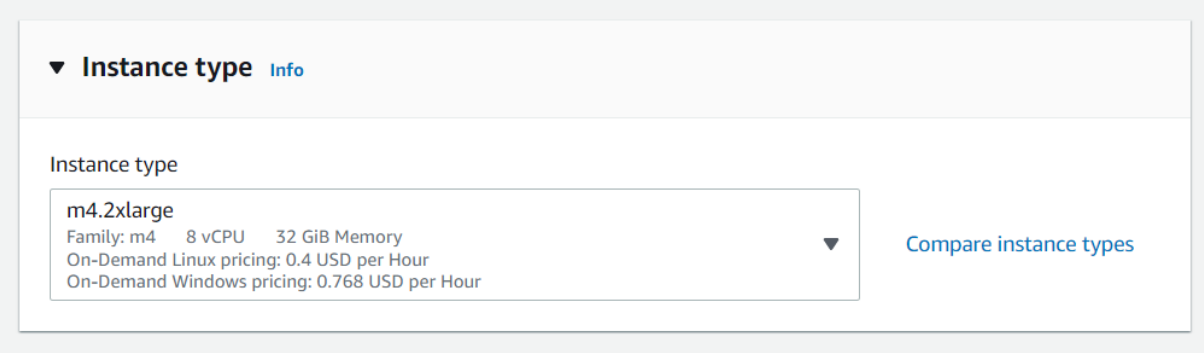
Launch an Instance and Configure a Host

Note: Fore more information, see AWS "Launch an instance using the new launch instance wizard" documentation (https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ec2-launch-instance-wizard.html).

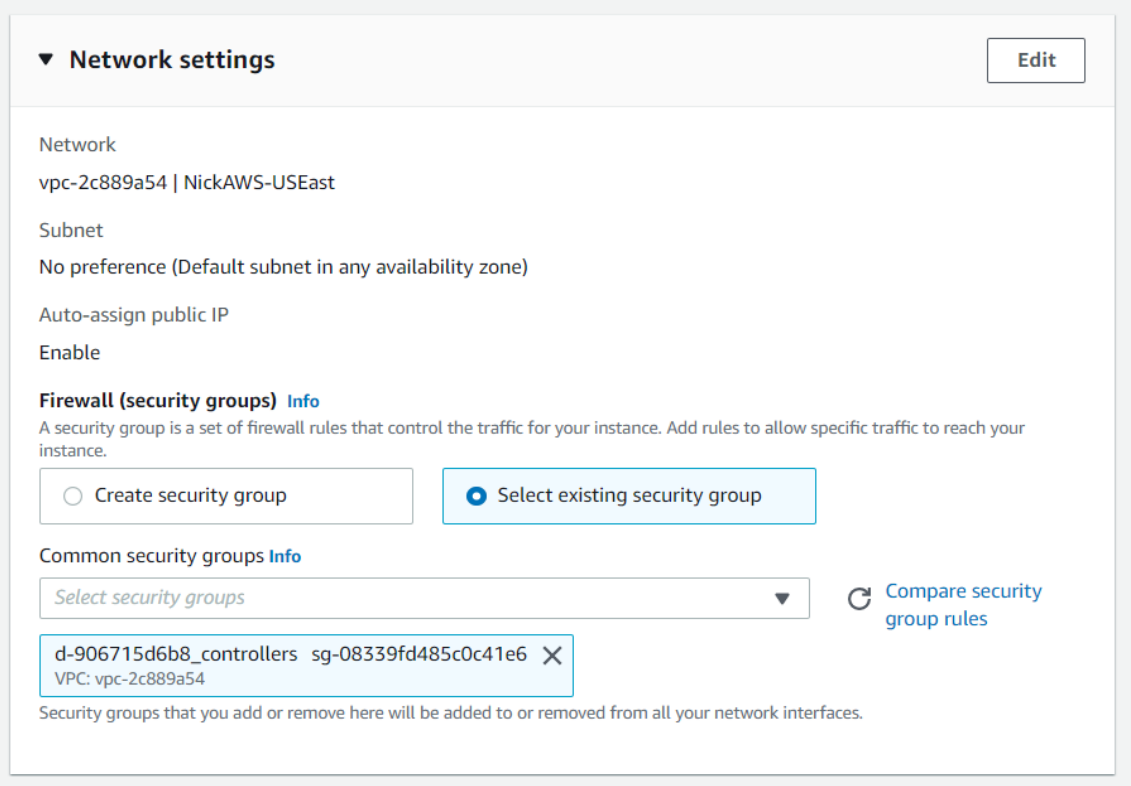


1. Log in to the Amazon EC2 console.
2. Go to **EC2 Dashboard** and click **Launch Instance**.

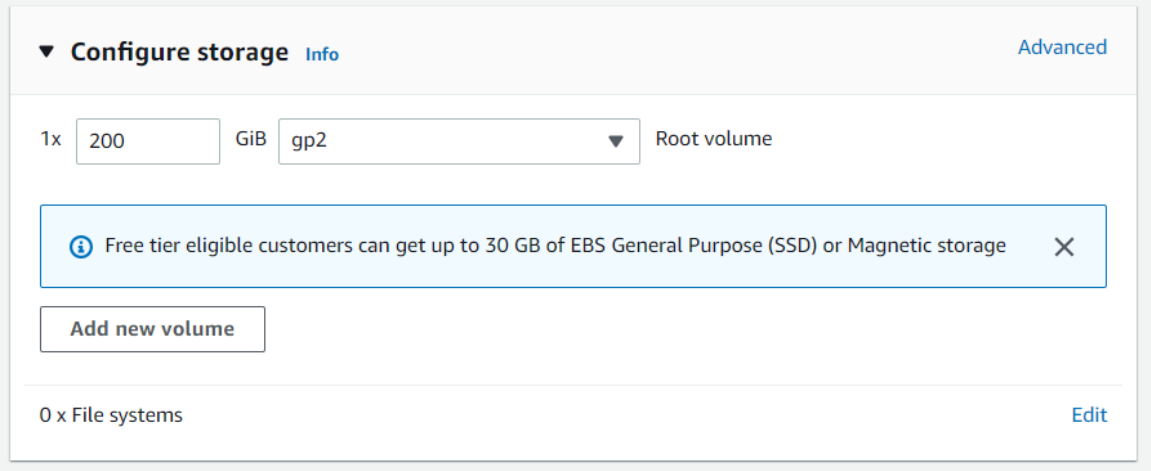
Launch an Instance page is displayed.



3. (Optional) Under **Name and tags**, enter a name for your instance.
4. Under **Application and OS Images (Amazon Machine Image)**, click **My AMIs** and select either **Owned by me** or **Shared with me** option.
5. Search for **NW-12** and select the **NW-12.3.0.0.20590-Full** image from the **Amazon Machine Image (AMI)** drop-down menu.

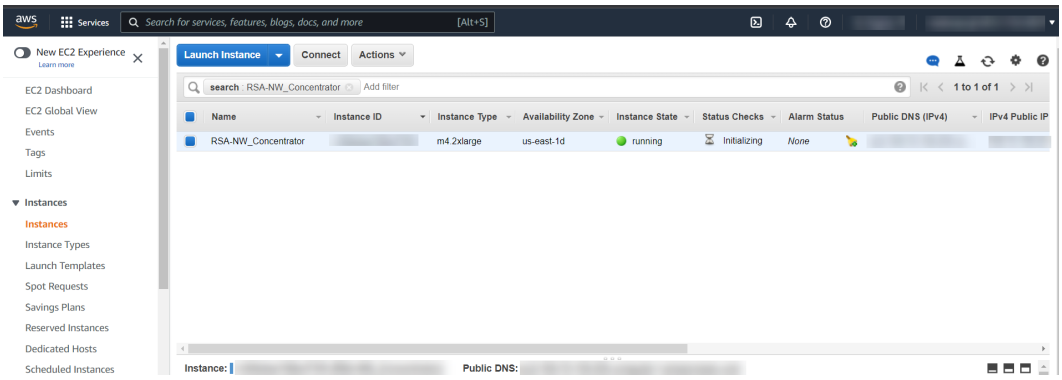


6. Under **Instance type**, Choose the RAM and CPUs by selecting the instance type.
   For more information, see Storage Guide for NetWitness® Platform 12.3 for guidelines on how to configure the EC2 Instance based on the requirements of the NetWitness component (that is, service) for which you are launching an instance. The following example has the **m4.2xlarge** instance type

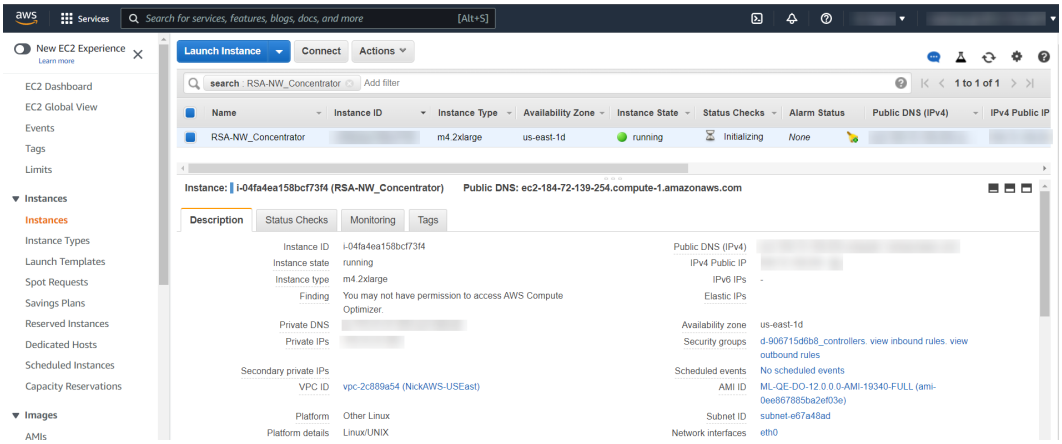


selected with **8** CPUs and **32** GB of RAM.

7. Under **Network settings**, select **Select existing security grop** option and select your security group from **Common security groups** drop-down menu.



8. Under **Configure Storage** specify the size and type of the volume.



For more information, see the Storage Guide for NetWitness® Platform 12.3 for guidelines on how to configure storage based on based on the requirements of the NetWitness component (that is, service) for which you are launching an instance.

9. Under **Summary**, you can specify the number of instances required and to review your instance configuration.
10. Click **Launch Instance**.
11. Click **Instances**.
12. Select **Instances** from the left navigation panel to review all instances that AWS is initializing (for example, the **RSA-NW_Concentrator**) .

The IP Address for the new **RSA-NW-Concentrator** host is ***sample-ip-address***.

13. SSH to the newly-created instance using the default NetWitness credentials.
14. Go to Configure Hosts (Instances) in NetWitness Platform.

Storage Configurations

For storage allocations of all host types, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness® Platform 12.3*.

Installation Tasks

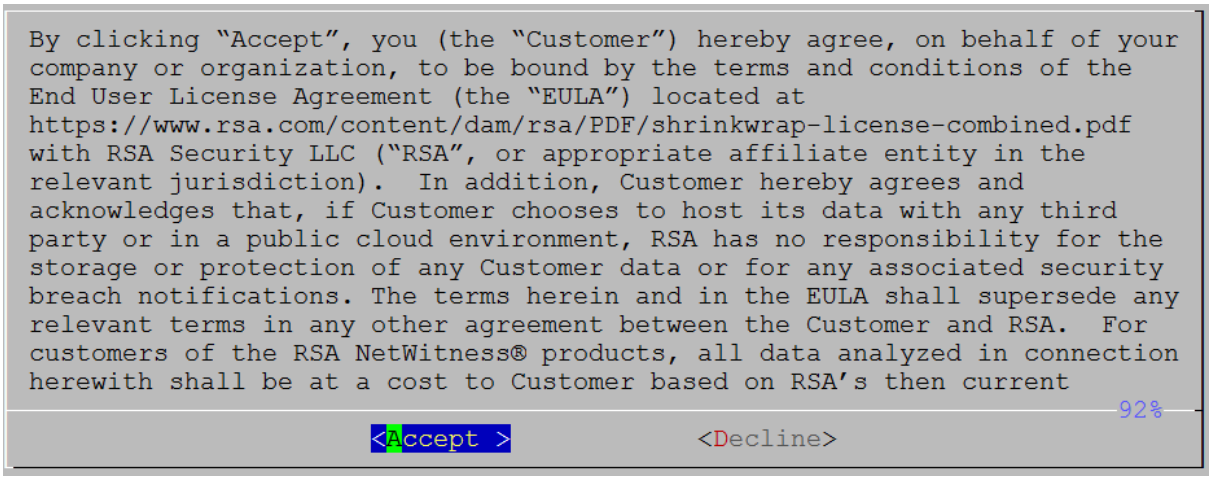
Before you begin the installation tasks make sure you open the firewall ports. For more information on the lists of all the ports in a deployment, see the"Network Architecture and Ports" topic in the *Deployment Guide for NetWitness Platform 12.3*.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

Task 1 - Install 12.3 on the NW Server Host and Component Hosts

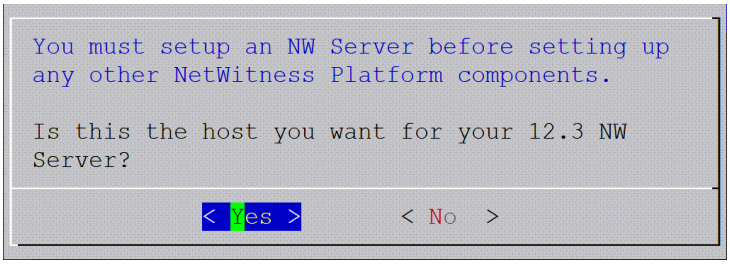
Complete the following steps to install 12.3 on NW Server host and other component hosts. Steps that are specific to the NW Server host or to component hosts are noted.

Note: You can perform this task for **NW-12.3.0.0.20590-Full** instance.



Caution: If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

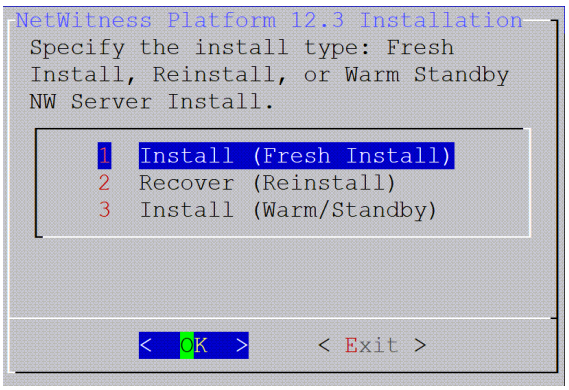
IMPORTANT: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`. If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.



1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

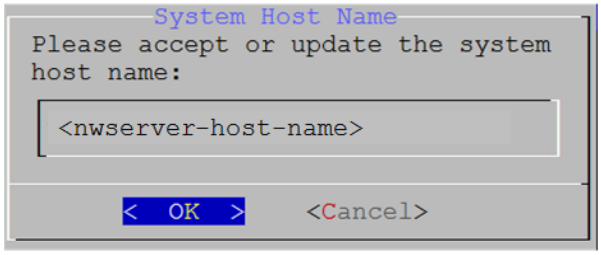
   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

> **Note:** Use the following options to navigate the Setup prompts.
> 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
> 2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
> 3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
> If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 12.3 NW Server** prompt is displayed.

3. Tab to **Yes** and press **Enter** to install 12.3 on the NW Server.
   Tab to **No** and press **Enter** to install 12.3 on other component hosts.



Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

4. The **Install** prompt is displayed (**Recover** does not apply to the installation. It is for 12.3 Disaster Recovery.).
   NW Server Host prompt:

   Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)

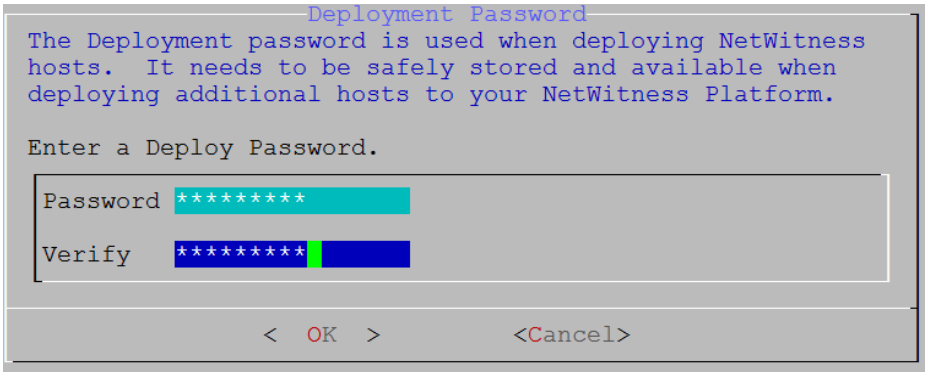
5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   NW Server prompt:

   Other Component Hosts prompt says <non-nwserver-host-name>

   Caution: If you include "." in a host name, the host name must also include a valid domain name.

   Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.

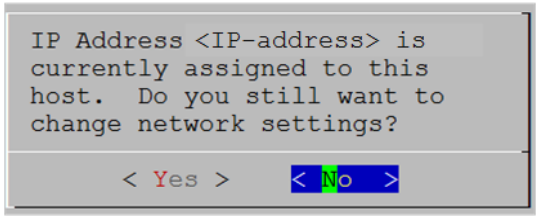


The following list of characters are supported for Master Password and Deployment Password:

- Symbols: **! @ # % ^ +**
- Numbers: **0-9**
- Lowercase Characters: **a-z**
- Uppercase Characters: **A-Z**

No ambiguous characters are supported for Master Password and Deployment Password. For example:
space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.

   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

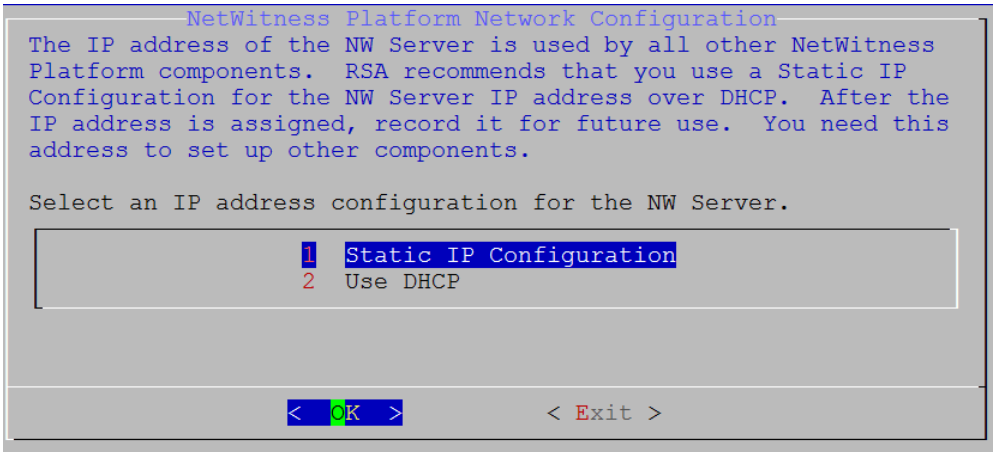
8. One of the following conditional prompts is displayed.

   - If the Setup program finds a valid IP address for this host, the following prompt is displayed.

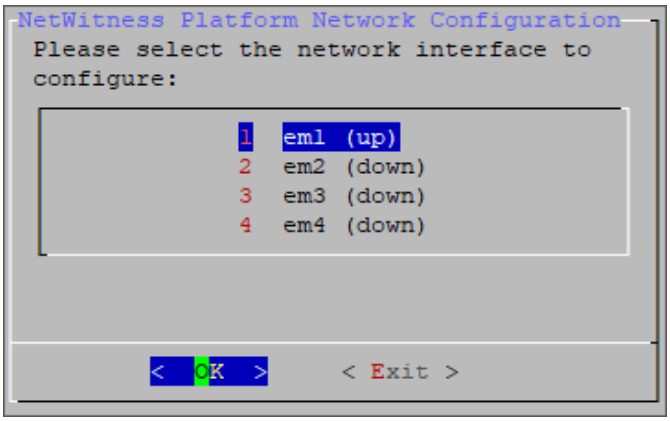
     Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and

press **Enter** if you want to change the IP configuration on the host.

- If you are using an SSH connection, the following warning is displayed.

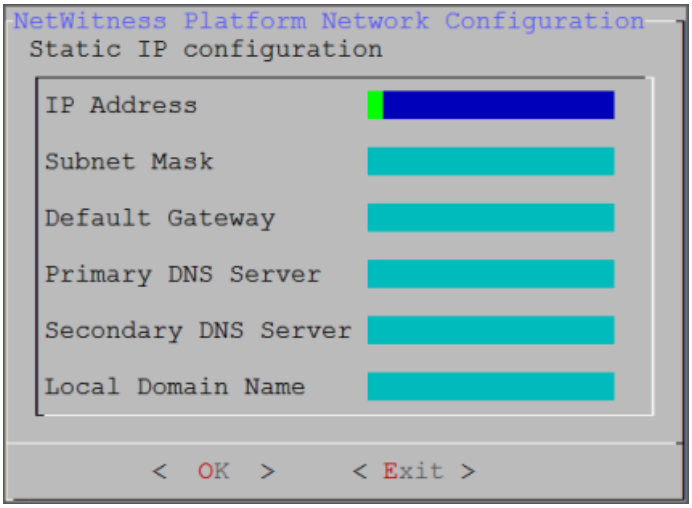


Note: If you connect directly from the host console, the following warning is not displayed.



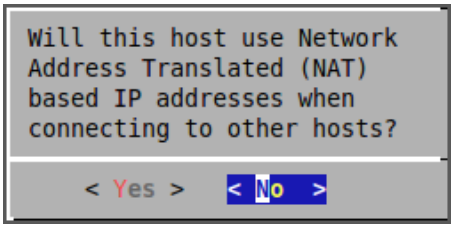
Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.
- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.



Caution: Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.

Tab to **OK** and press **Enter** to use **Static IP**.
If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
The **Network Configuration** prompt is displayed.



9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
   The following **Static IP Configuration** prompt is displayed.

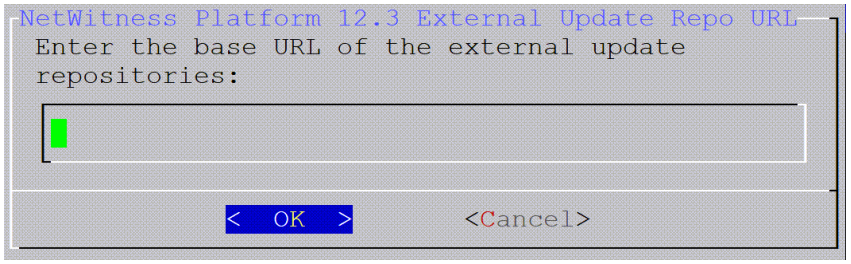
10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

11. The Use Network Address Translation (NAT) prompt is displayed.

    For the NW Server, tab to **No** and press **Enter**.
    For component hosts, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

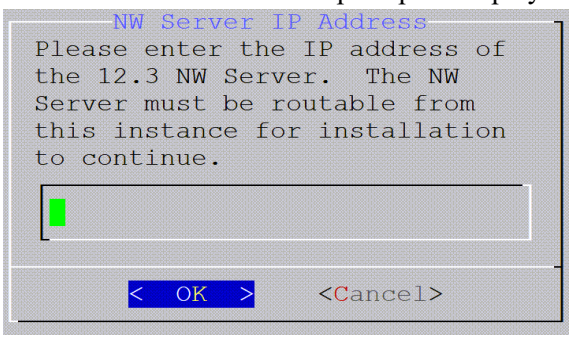
12. The **Update Repository** prompt is displayed.



For the NW Server:

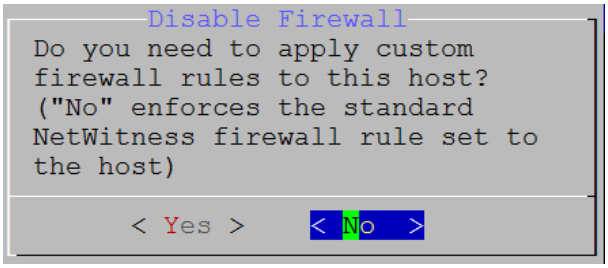
- Press **Enter** to choose the **Local Repo**.
- If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 12.3. If the program cannot find the attached media, you receive the following prompt.

- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



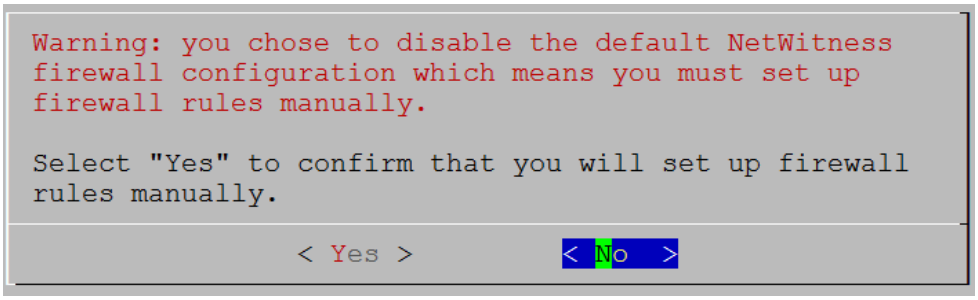
Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

For component hosts:

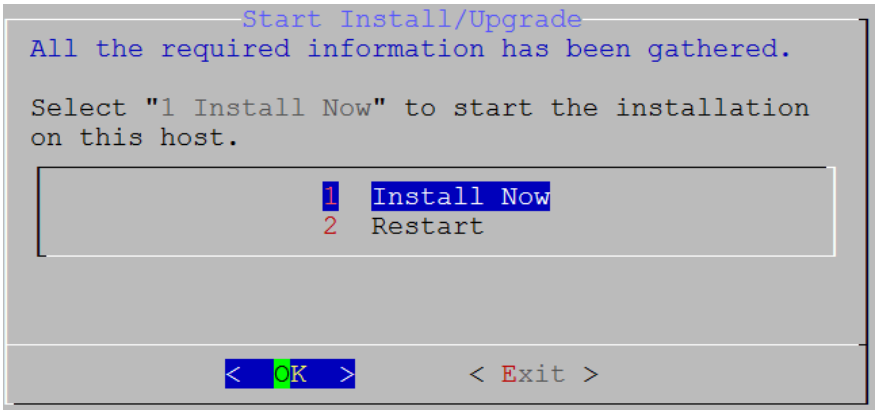


- Select the same repo that you selected when you installed the NW Server host and follow the steps above.

- The NW Server IP Address prompt is displayed.



Type the NW Server IP address. Tab to **OK** and press **Enter**.



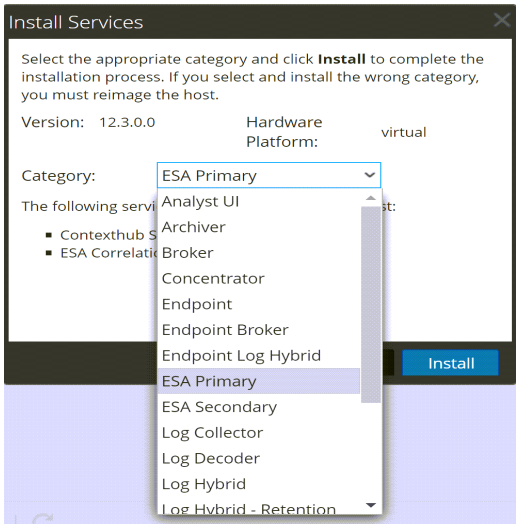
13. The Disable firewall prompt is displayed.

Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.

14. The **Start Install** prompt is displayed.

15. Press **Enter** to install 12.3.
    When **Installation complete** is displayed, you have installed 12.3 on this host.

    Note: Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



```
ValueError: error:3207A06D:lib(50):B_HASH_init:cr new

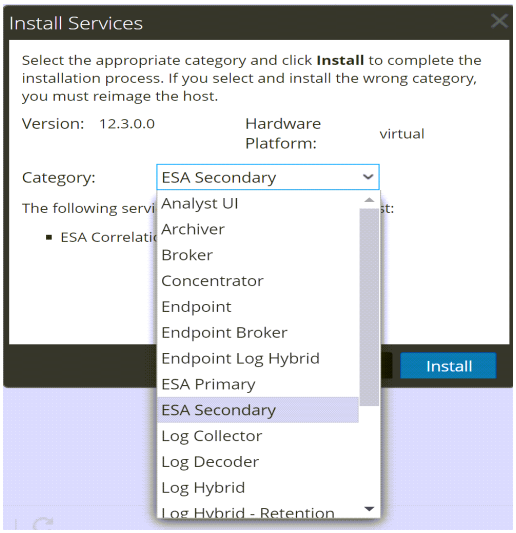
    f(usedforsecurity=False)
```

16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
    `nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`



Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 12.3 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in  (Admin) > **Hosts** > :

- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:

Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host:

   a. Log into NetWitness and go to (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

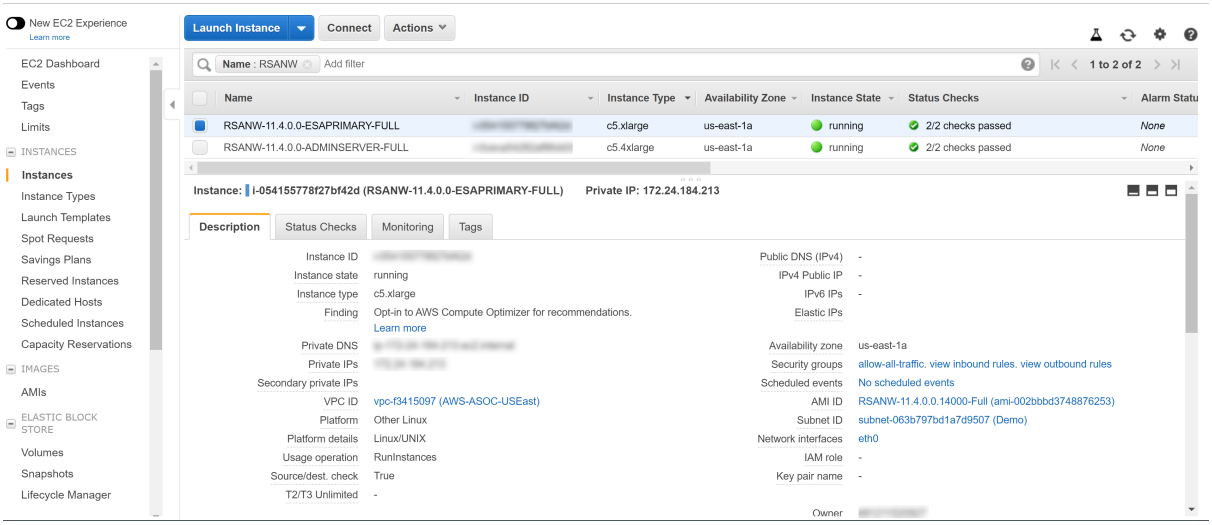
   c. Select that host in the **Hosts** view and click Install.
   The **Install Services** dialog is displayed.

d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.

Complete Licensing Requirements

Complete licensing requirements for installed services. See the *NetWitness Platform 12.3 Licensing Management Guide* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

(Optional) Install Warm Standby NW Server



Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for NetWitness Platform 12.3* for instructions on how to set up a Warm Standby NW Server.

(Optional) Boot NetWitness 11.4 EC2 Instance using c5 Instance Types

Following are the steps:

1. Deploy an EC2 instance using NW 11.4 Lite/Full AMI (RSANW-11.4.0.0.14000-Full, ami-002bbbd3748876253).
2. Select a non-nitro based instance type. For example, "_m4.large_" and boot the instance.
3. Install the package "_dracut-config-generic_" and rebuild the initramfs image.
4. For environment without internet connection, copy the provided RPM package to target 11.4 EC2 instance and install it.
5. Shutdown or stop the EC2 instance. Ensure that the instance shutdown behavior is set to "Stop" and not "_Terminate._".

6. Change the instance type of existing EC2 instance to nitro-based c5 types (For example, c5.4xlarge) and start the EC2 instance.
7. The EC2 instance boots successfully now, passing the system and instance status health checks.

Note: Once the instance is moved to c5 instance types and booted successfully, the system will remain fixed in c5 instance state and cannot be reverted back to m4 instance types.

Configure Hosts (Instances) in NetWitness Platform

Configure individual hosts and services as described in NetWitness *Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

Note: After you successfully launch an instance, AWS assigns a default hostname to it. For more information, see "Change Host Network Configuration" in the *System Maintenance Guide* for instructions on changing a hostname.Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Configure Packet Capture

You can integrate any of the following Third-Party solutions with the Network Decoder to capture packets in the AWS cloud:

- Gigamon® GigaVUE
- Ixia CloudLens™
- f5® BIG-IP
- VPC Traffic Mirroring

Integrate Gigamon GigaVUE with the Network Decoder

There are two main tasks to configure the Gigamon® third-party Tap vendor packet capture solution:

Task 1. Integrate the Gigamon® solution.

Task 2. Configure a tunnel on Network Decoder

Task 1. Integrate the Gigamon Solution

Gigamon® Visibility Platform on AWS will be available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on the Gigamon® solution, see "Gigamon® Visibility Platform for AWS Data Sheet"https://www.gigamon.com/sites/default/files/resources/datasheet/ds-gigamon-visibility-platform-for-aws-4095.pdf.

For more information on the deployment details, see "Gigamon® Visibility Platform for AWS Getting Started Guide" https://www.gigamon.com/sites/default/files/resources/deployment-guide/dg-visibility-platform-for-aws-getting-started-guide-4111.pdf.

After the “Monitoring Session” is deployed within the Gigamon GigaVUE-FM, you can configure the Network Decoder Tunnel.

Task 2. Configure Tunnel on the Network Decoder

1. SSH to the Decoder.
2. Submit the following command strings.

```
$ sudo ip link add tun0 type gretap local any remote <ip_address_of_
VSERIES_NODE_TUNNEL_INTERFACE> ttl 255 key 0

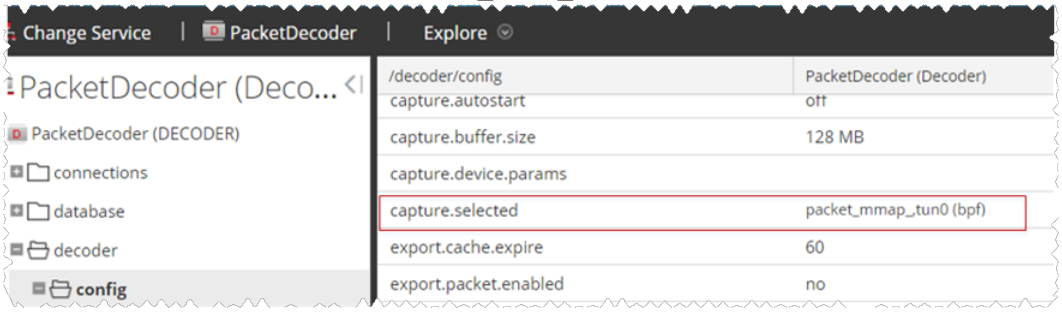
$ sudo ip link set tun0 up mtu <MTU-SIZE>

$ sudo ifconfig (to verify if the tunnel tun0 is being listed in the list
of interfaces)

$ sudo lsmod | grep gre ( to make sure if the below kernel modules are
running:

ip_gre 18245 0

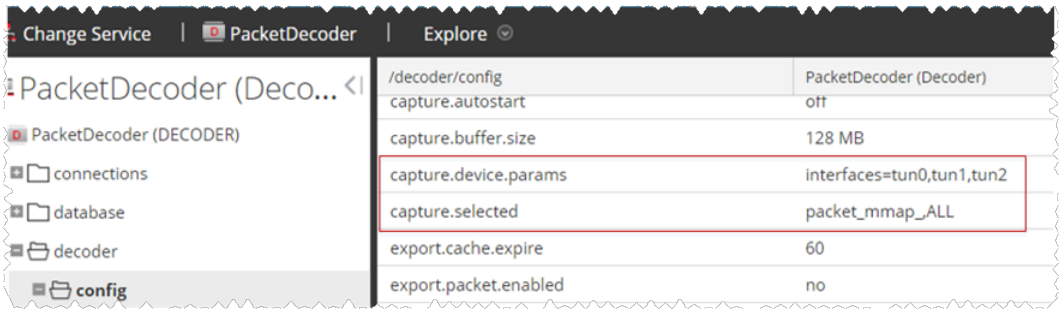
ip_tunnel 25216 1)



If they are not running then execute the below commands to enable the
modules

$ sudo modprobe act_mirred

$ sudo modprobe ip_gre
```



3. Create a firewall rule in the Network Decoder to allow traffic through the tunnel.
   a. Open the `iptables` file.
      `vi /etc/sysconfig/iptables`
   b. Append the line `-A INPUT -p gre -j ACCEPT` before the `commit` statement
   c. Restart `iptables` by executing the following commands.
      `service iptables restart`
      `service ip6tables restart`

4. Set the interface in the Network Decoder.
   a. Log in NetWitness, select the `decoder/config` node in Explorer view for the Network Decoder service.
   b. Set the `capture.selected = packet_mmap_,tun0`.

5. (Conditional) - If you have multiple tunnels on the Network Decoder.
   a. Restart Decoder service after you create the tunnel in Network Decoder.
   b. Log in to NetWitness, select the `decoder/config` node in Explorer view for the Network Decoder service, and set the following parameters.

```
capture.device.params = interfaces=tun0,tun1,tun2
capture.selected = packet_mmap_,All
```

6. Restart decoder service.

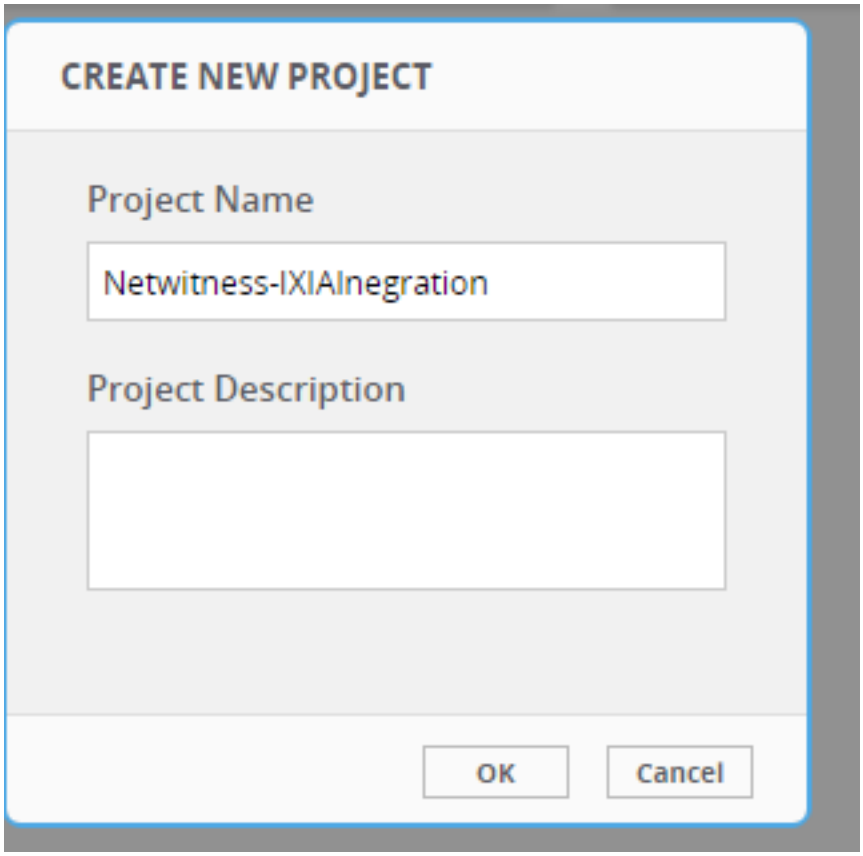
```
$ sudo restart nwdecoder
```

   The user should be all set to capture the network traffic in Decoder.

Integrate Ixia with the Network Decoder

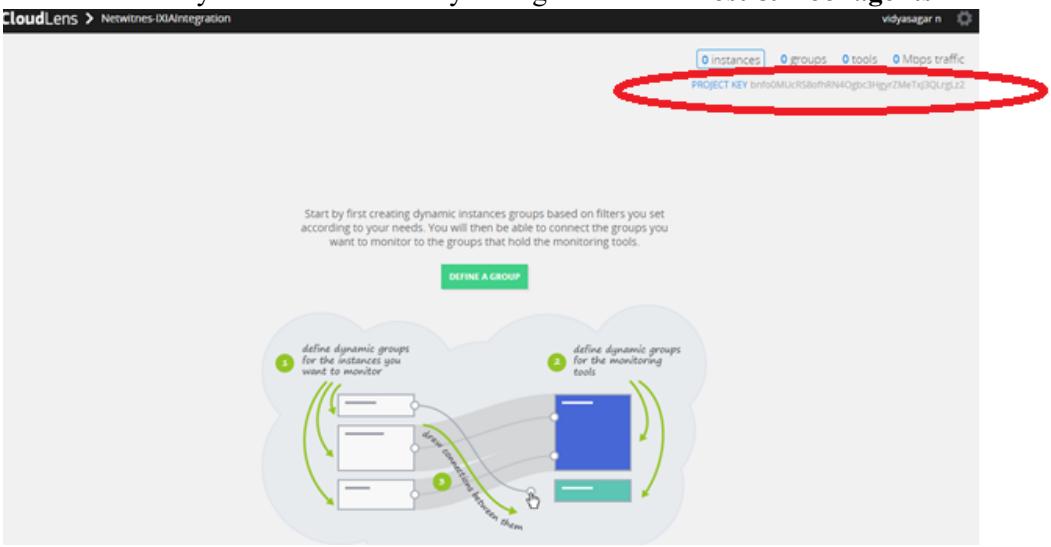
You must complete the following tasks to integrate the Network Decoder with Ixia CloudLens.

Task 1. Deploy Client Machines
Task 2. Create CloudLens Project
Task 3. Install Docker Container on Decoder
Task 4. Install Docker Container on Clients
Task 5. Map Network Decoder to Ixia Clients
Task 6. Validate CloudLens Packets Arriving at Decoder
Task 7. Set Interface in Network Decoder



Task 1. Deploy Client Machines

- Deploy client machines onto which you want to route the traffic to the Network Decoder. See the Ixia CloudLens documentation (https://www.ixia.cloud/help/Default.htm) for specifications needed for supported client machines.
- For Client Machines (as well as Decoder machine) the following ports must be opened on AWS Security Group Inbound Rules; UDP 19993 from all, TCP 22 from Admin IP.



Task 2. Create CloudLens Project

Complete the following steps to create a new project and get your project key.

1. Get Cloudlens login credentials and access to a free trial.
   a. Create an Ixia login account at https://www.ixiacom.com/products/cloudlens-trial-a.
2. Go to the Cloudlens public site (https://www.ixia.cloud).
3. Click + (add) to create a new project with a name of your choosing (for example, **NetWitness-IxiaIntegration**).

4. Click on your newly created project and make note of your Project Key.
   You need the key later for the API key configured on the **Host & Tool agents**.

Task 3. Install Docker Container on Decoder

Complete the following steps to install the Docker container onto the Network Decoder.

1. SSH to the Network Decoder.
2. Enter the following commands to complete the install the Docker service on the Decoder.

```
#yum clean all
# yum -y install docker
```

3. Enter the following command string to start the Docker service.

```
# service docker start
```

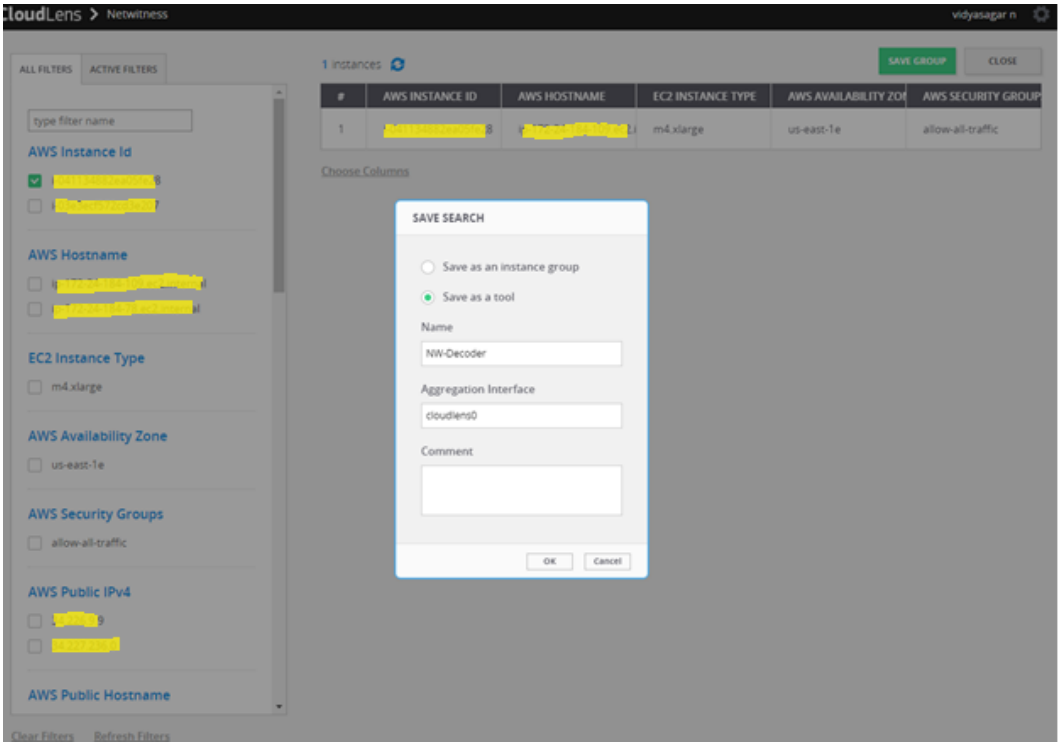
4. Enter the following commands to:
   - Access the Ixia repository and obtain the cloudlens-agent container.
   - Replace the **ProjectKeyFromIxiaProjectPortal** variable, which identifies your project key in Ixia portal, with the Project Key you created in Task 2. Create CloudLens Project.

```
sudo docker run \
--name cloudlens \
 -v /:/host \
-v /var/run/docker.sock:/var/run/docker.sock \
-d --restart=always \
--net=host \
--privileged \
ixiacom/cloudlens-agent:latest \
--server agent.ixia.cloud \
--accept_eula y \
--apikey ProjectKeyFromIxiaProjectPortal \
```

Task 4. Install Docker Container on Clients

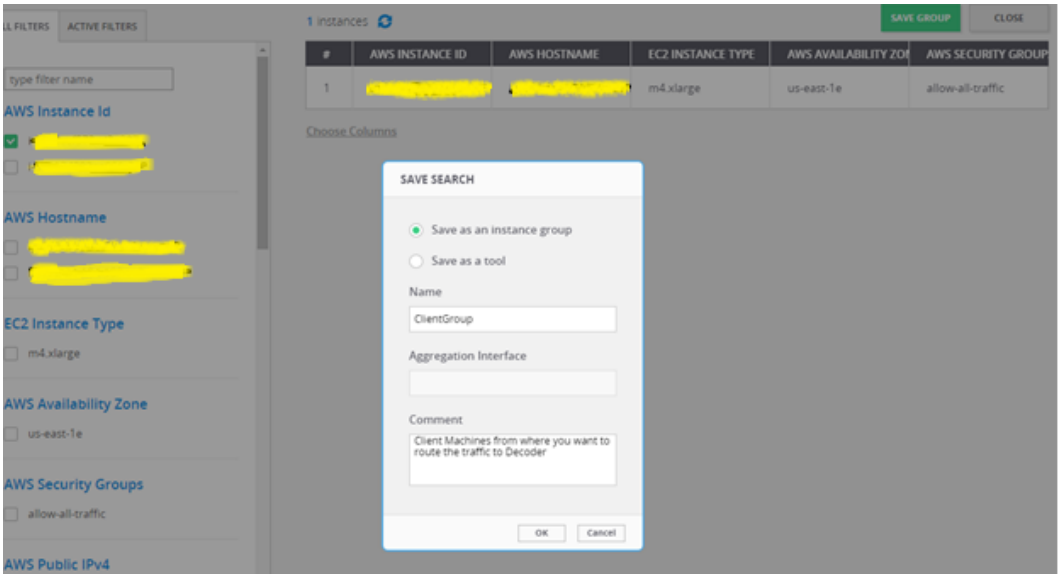
Complete the follow steps to Y install the Docker Container onto the client machines for which you want to route the traffic to the Network Decoder.

1. SSH to the AWS Client instance.
2. Enable root access to OS CLI (for example `sudo su -`).
3. Enter the following commands to install Docker.
   ```
   # yum -y install docker
   ```
   Caution: The above example of the installed docker engine is for CentOS7. The instructions may vary slightly for different Linux Distributions. For more information, see the Docker docs at https://docs.docker/install.
4. Enter the following commands to start the Docker service.
   ```
   # service docker start
   ```
5. Enter the following commands to:
   - Access the Ixia repository and obtain the **cloudlens-agent** container.
   - Replace the variable **ProjectKeyFromIxiaProjectPortal**, which identifies your project key in Ixia portal, with the Project Key you created in the previous section.
     ```
     sudo docker run \
     --name cloudlens \
      -v /:/host \
     -v /var/run/docker.sock:/var/run/docker.sock \
     -d --restart=always \
     --net=host \
     --privileged \
     ixiacom/cloudlens-agent:latest \
     --server agent.ixia.cloud \
     --accept_eula y \
     --apikey ProjectKeyFromIxiaProjectPortal \
     ```



Warning: If you cut and paste commands from a PDF, first paste them into a test editor such as Notepad to confirm the syntax before pasting into the OS CLI. Direct cut and paste between PDF and CLI can contain dashes or other special characters that should not be part of the commands.

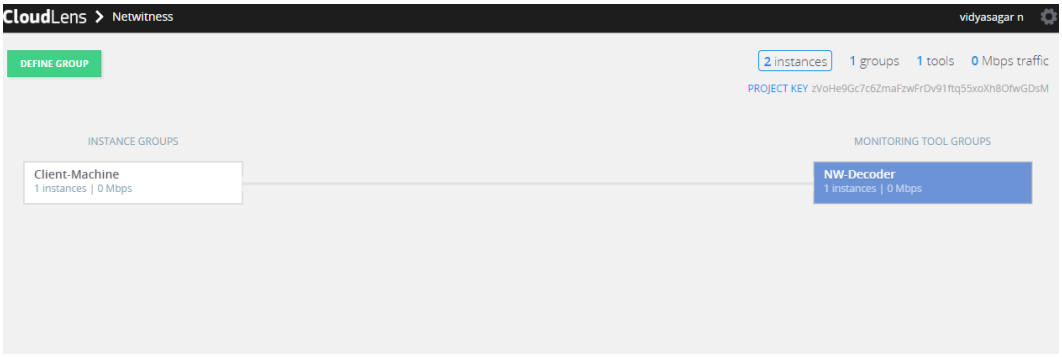
Task 5. Map the Network Decoder to Ixia Clients



Complete the following steps to map the Network Decoder to the client machines to route the traffic to the Network Decoder.

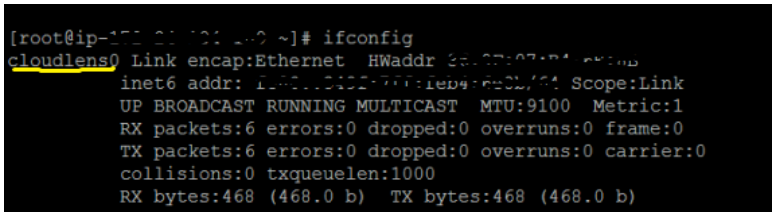
1. Go to the Cloudlens public site (https://www.ixia.cloud).
2. Double-click on your project to open it.
3. Click the **Define Group** button or the Instances count.
   You should see two instances listed, one for your decoder and the other for the client machines.
4. Filter for the decoder instance and click **Save Search**.
5. Choose **Save as a tool**.
6. Specify a name for the tool, and the **Aggregation Interface**.
   Use a meaningful name for the Aggregation Interface (for example **cloudlens0**. This is a virtual

interface that appears in the OS where your Tool is installed. You need to instruct your tool to 'listen' to that interface in a subsequent step.

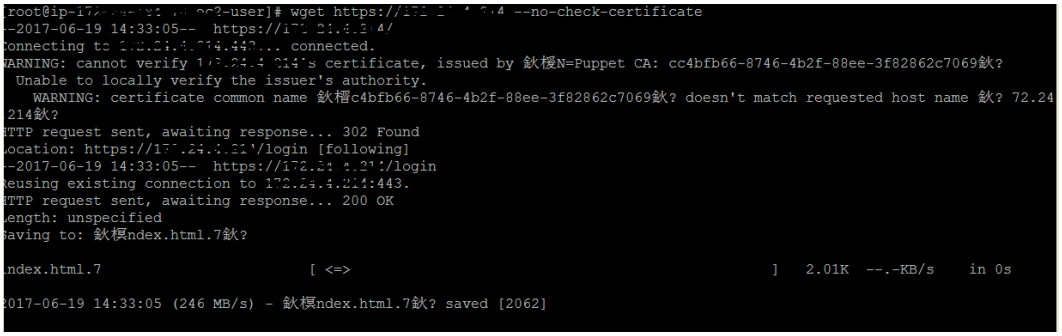


7. Filter the client host instance from the list, and click **Save Search**.

8. Navigate back to the top-level view of the project.
   Your client machine instance and Decoder instance are now displayed.



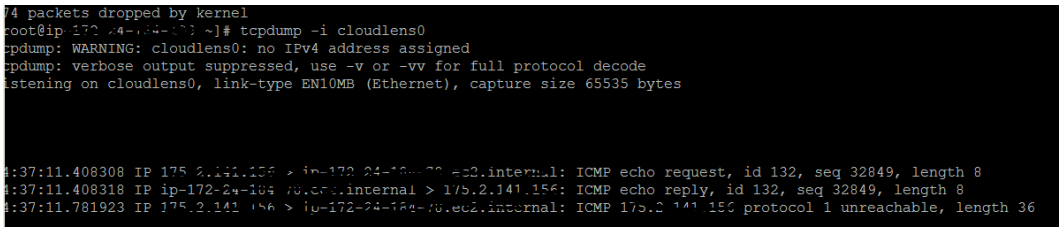
9. Drag a connection between the your client machine instance and Decoder instance to allow the flow of packets.



Task 6. Validate CloudLens Packets Arriving at Decoder

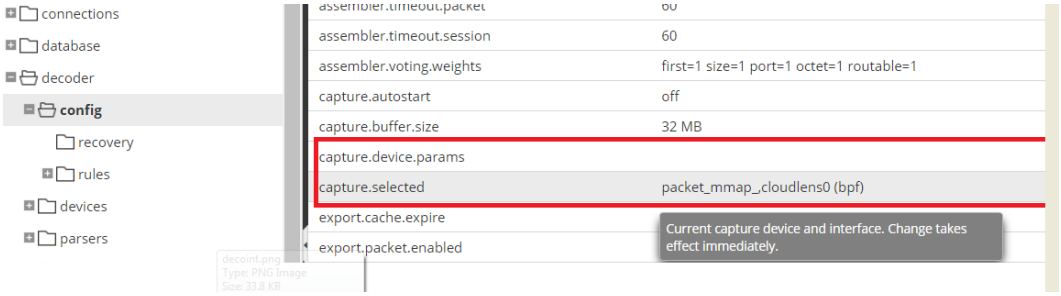
Complete the following steps to validate that packets are actually arriving at the Network Decoder.

1. SSH to the Network Decoder.
2. Enter the following command.
   `ifconfig`
   The new aggregation interface you created is displayed.



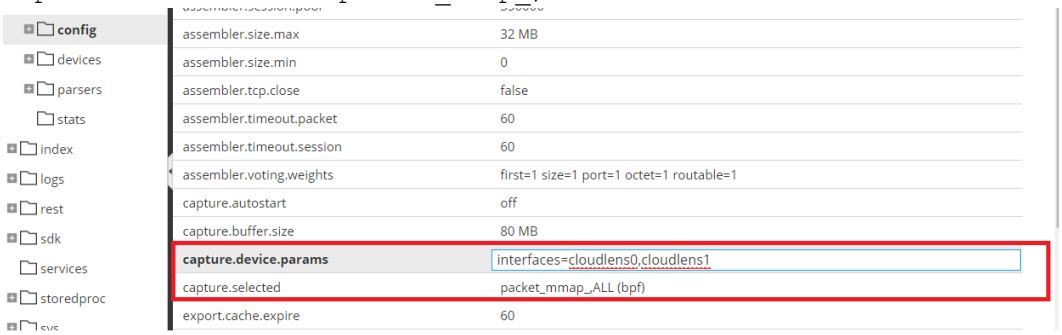
3. Generate traffic from the client OS instance CLI (for example, `wget http://www.google.com/`).

4. SSH to Network Decoder to go to your Network Decoder instance CLI.



5. Enter the following commands to look for suitable results in the tcpdump.
   `tcpdump -I Cloudlens0`

Task 7. Set the Interface in the Network Decoder



Complete the following steps in the Network Decoder to set the interface to use for the Ixia integration.

1. SSH to the Network Decoder.
2. Enter the following commands to restart decoder service.
   `$ sudo restart nwdecoder`
   The Network Decoder is now set to capture network traffic.
3. Log in to NetWitness and click  **(Admin) > Services**.
4. Select a Decoder service and click  > **View > Explore**.
5. Expand the **decoder** node and click **config** to view the configuration settings.
6. Set the **capture.selected** parameter to the following value.
   packet_mmap_,cloudlens0(bpf)

7. (Conditional) - If you have multiple capture interfaces on the Network Decoder, set the parameters with the following values.
   `capture.device.params --> interfaces=cloudlens0,cloudlens1`

```
capture.selected --> packet_mmap_,All
```

8. Restart the Decoder service after you set the **capture.selected** parameter.

Integrate f5® BIG-IP with the Network Decoder

IG-IP Virtual Edition (VE) is an inline virtual server and load balancer. A common use case would be for the f5® box to be a virtual web server that presents a single IP address / host name that manages requests to a pool of web servers in the cloud.

All traffic to NetWitness flows through the f5® BIG-IP VE virtual server.

The virtual server functions of the BIG-IP clone all traffic to a designated computer by re-writing mac addresses and loading them into a subnet shared with the destination sniffer. This guide describes how to set up the Decoder as the sniffer.

f5® BIG-IP VE Deployment Information

f5® BIG-IP VE on AWS will be available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on this solution refer to the f5® BIG-IP DNS Data Sheet (https://www.f5.com/pdf/products/big-ip-dns-datasheet.pdf).

Task 1: Set Up a BIG-IP VE Virtual Server Instance

Set up a BIG-IP VE Virtual Server Instance according to the instructions in the "BIG-IP Virtual Edition 12.1.0 and Amazon Web Services: Multi-NIC Manual" (https://support.f5.com/kb/en-us/products/big-ip_ltm/manuals/product/bigip-ve-multi-nic-setup-amazon-ec2-12-1-0.html). Complete all the steps through the last steps, "Creating a virtual server."

This virtual server performs packet capture. You may need to create multiple virtual servers to depending on your volume.

As part of creating the virtual server, you must have at least one server in your NetWitness domain to handle the traffic routed by the virtual server (for example, you can create another instance in AWS to host the internal server).

Task 2: Create a Clone Pool

1. Make sure that your Decoder has a network interface on the same subnet as one of the network interfaces on the BIG-IP VE instance.
   The clone pool sends packets to the Decoder by rewriting MAC addresses and sending them out a

network interface. MAC address rewriting can be used to route packets to another subnet.

2. Set up the clone pool within the BIG-IP VE virtual server according to the instructions in "K13392: Configuring the BIG-IP system to send traffic to an intrusion detection system (11.x - 13.x)" article (https://support.f5.com/kb/en-us/solutions/public/13000/300/sol13392.html).
   This document explains how to create the clone pool, and how to make an existing virtual server copy traffic to the clone pool. In this case, we will place the Decoder instance in the clone pool.

Guidelines

The following guidelines will help you to configure packet capture correctly using BIG-IP VE.

- The Decoder instance must have its own IP address on one of the same subnets as BIG-IP VE. BIG-IP uses that IP address to identify the Decoder as being part of the clone pool.
- When adding the Decoder instance to the clone pool, BIG-IP asks for a port number in addition to the IP address. This port number does not matter for the cloned traffic. The Decoder will receive all the cloned traffic, regardless of what port number was used here.
- By default, the AWS subnet shared by the Decoder and BIG-IP VE will not allow the cloned traffic to travel from the BIG-IP VE interface to the Decoder interface. You must disable the **`source/dest. check`** on both the Decoder and BIG-IP VE network interfaces in AWS.
- The Decoder instance must have a single network interface, eth0, by default. The Decoder captures traffic on this interface, but it may also receive administrative traffic on this interface. NetWitness recommends using network rules to filter out ssh and nwdecoder traffic from the capture stream. These are ports 22 (ssh) and 50004/56004 (nwdecoder).

Troubleshooting Tips

There are areas to troubleshoot if packets are not being accepted by the Decoder.

- Make sure that the BIG-IP VE is sending the packets out of the correct interface.
  The BIG-IP VE instance contains tcpdump. Use it to verify the cloned packets are being sent out the expected interface. If they are not, there is a problem in the setup of the clone pool or the virtual server.
- Make sure that the Decoder is receiving packets.
  The Decoder has `tcpdump` installed on it. Use it to verify that the Decoder is receiving packets. If the Decoder is not capturing packets, make sure that
  - The AWS **`source/dest. check`** is turned off.
  - The Decoder is on the same subnet as the interface the BIG-IP VE is using to clone packets.

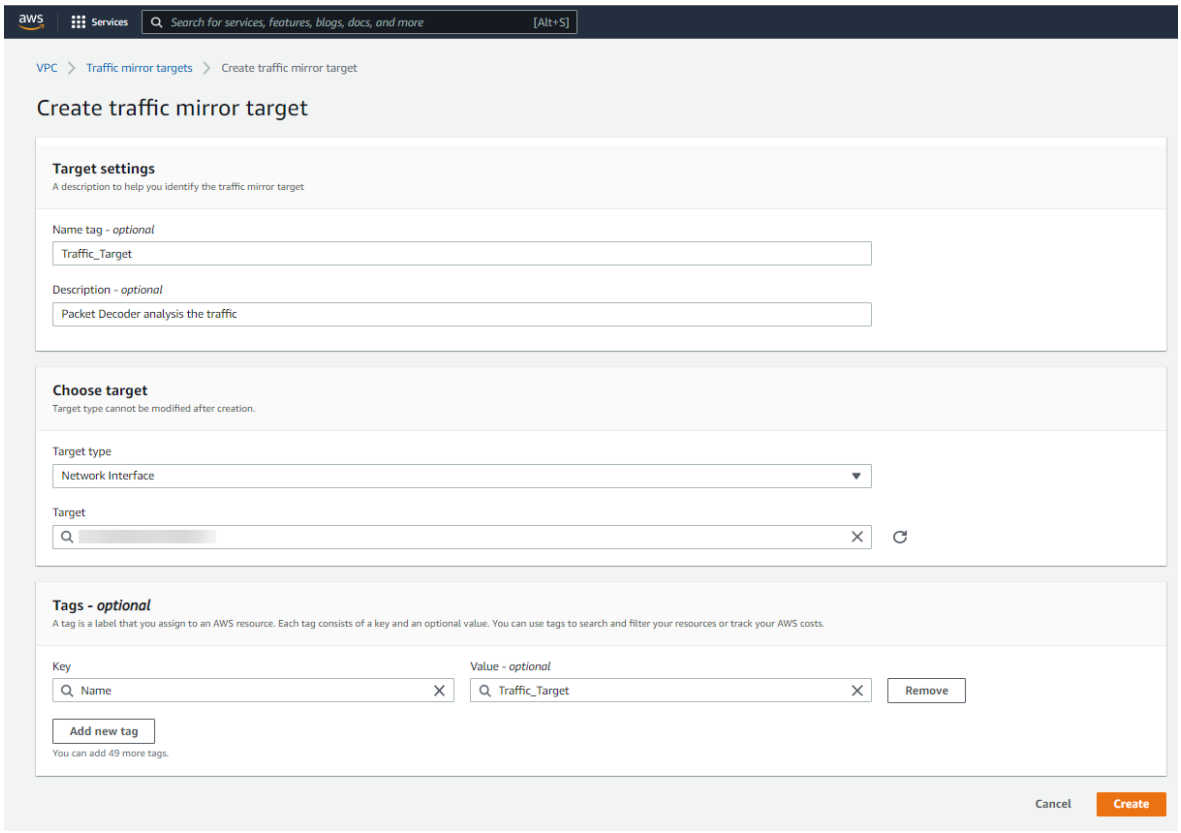
Integrate VPC Traffic Mirroring with the Network Decoder

VPC Traffic Mirroring allows users to capture and inspect network traffic to analyze packets without using any third-party packet forwarding agents. The solution provides insight and access to network traffic across VPC infrastructure. Users can copy network traffic at any ENI (Elastic Network Interfaces) in VPC, and send it to NetWitness to analyze, monitor, and troubleshoot performance issues.

You must complete the following tasks to integrate the Network Decoder with VPC Traffic Mirroring:

Task 1. Configure the Network Decoder as a VPC Traffic Mirroring Destination

Task 2. Configure a VPC Traffic Mirroring Filter



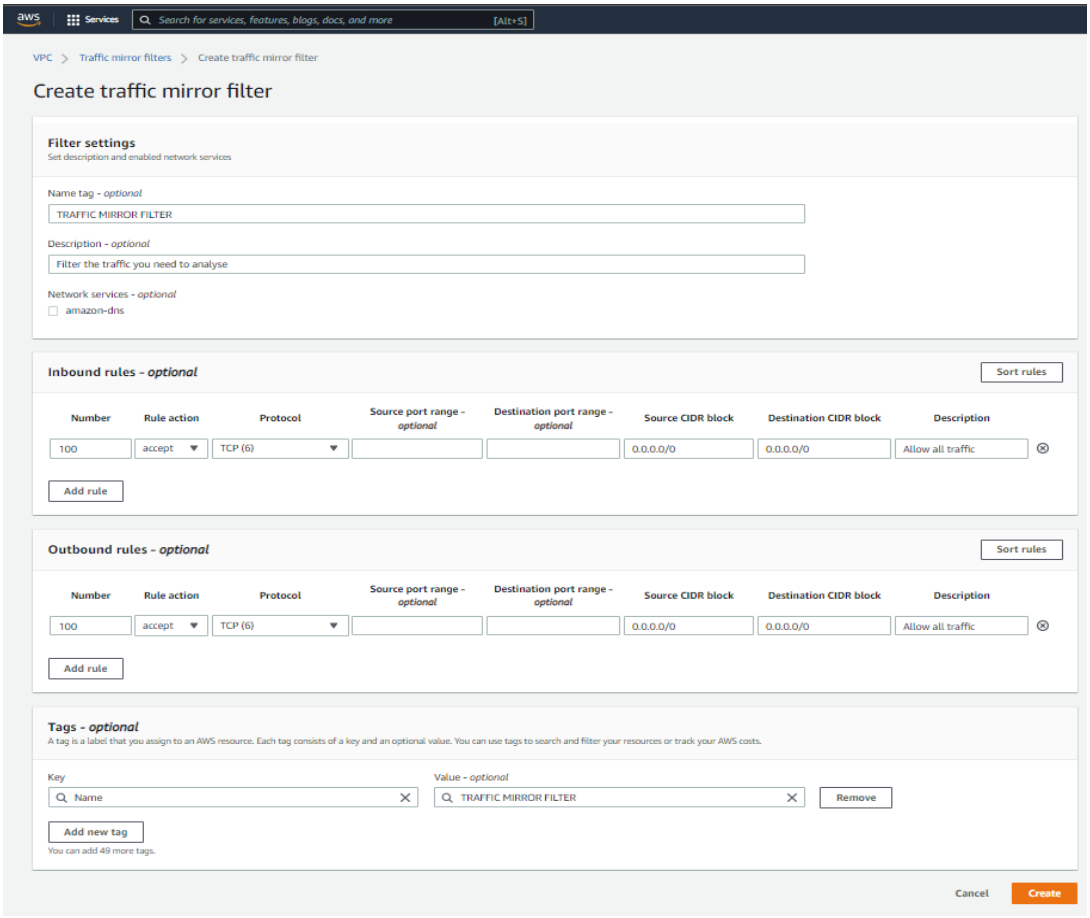
Task 3. Configure a VPC Traffic Mirroring Session

Task 4. Setup a new VXLAN interface on the Network Decoder

Task 5. Validate VPC Traffic Mirroring Packets Arriving at Network Decoder

Task 1. Configure the Network Decoder as a VPC Traffic Mirroring Destination.

1. Open the VPC service console view at https://console.aws.amazon.com/vpc/home.
2. In the navigation panel, select **Traffic mirror targets**.
3. Click **Create traffic mirror target**.



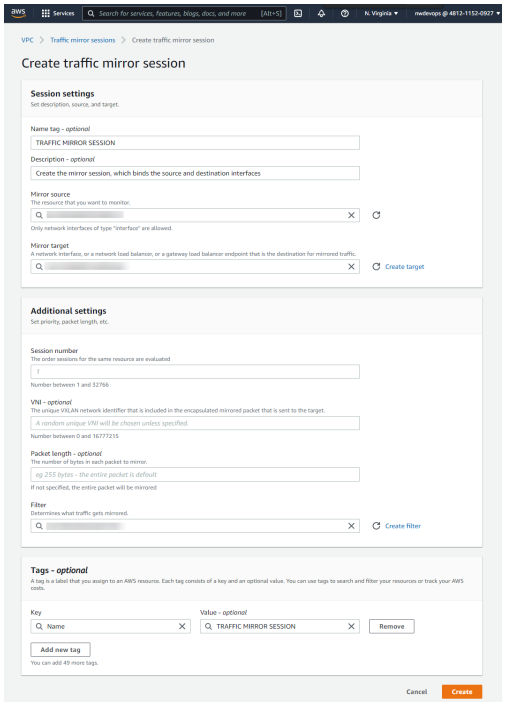
4. In the **Create traffic mirror target** dialog, provide all the required information and click **Create**.

Task 2. Configure a VPC Traffic Mirror Filter

Configure the VPC traffic mirror filter to send only the required packets to the Network Decoder. You can determine if the inbound or outbound traffic needs to be captured or not.

Note: Make sure the UDP port 4789 is open on the AWS instance of Network Decoder.

1. In the navigation panel, select **Traffic mirror filters**.
2. Click **Create traffic mirror filter**.



3. In the **Create traffic mirror filter** dialog, provide all the required information and click **Create**.

Task 3. Configure a VPC Traffic Mirror Session

You must configure a VPC Traffic Mirror Session to mirror the traffic by a communication channel between source ENI and destination ENI.

1. In the navigation panel, select **Traffic mirror sessions**.
2. Click **Create traffic mirror session**.

3. In the **Create traffic mirror session** dialog, provide all the required information and click **Create**.

Task 4. Set Up a new VXLAN Interface on the Network Decoder

To capture the UDP enabled traffic you must create an interface and tunnel it to Network Decoder by performing the following steps.

1. SSH to the Decoder.
2. Enter the following commands.

```
sudo ip link add tun0 type vxlan id <VXNLAN ID> local any dev <primary
interface ex: eth0> dstport 4789

sudo ip link set tun0 up

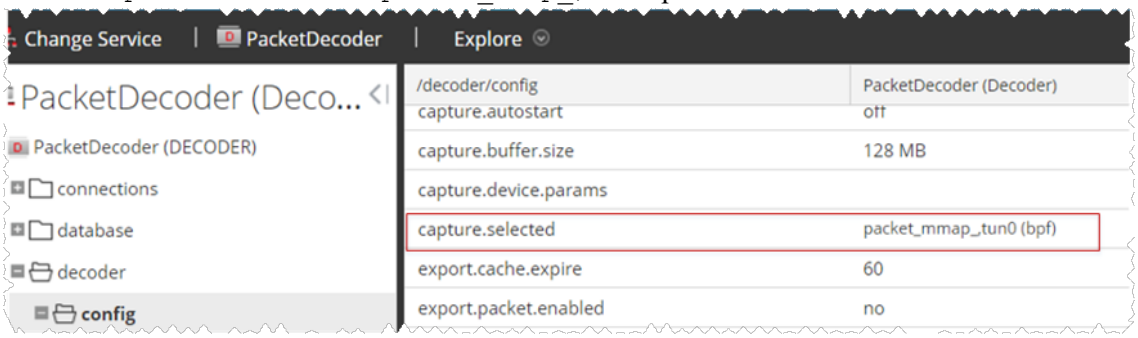
ifconfig
```

```
tun0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 8951
        inet6 fe80::bc58:afff:fe06:ec29  prefixlen 64  scopeid 0x20<link>
        ether be:58:af:06:ec:29  txqueuelen 1000  (Ethernet)
        RX packets 989  bytes 74140 (72.4 KiB)
        RX errors 0  dropped 0  overruns 0  frame 0
        TX packets 0  bytes 0 (0.0 B)
        TX errors 0  dropped 8 overruns 0  carrier 0  collisions 0
```

3. To create a firewall rule in the Network Decoder to allow traffic through the tunnel.

a. Open the IP tables file using the command `vi /etc/sysconfig/iptables`.

b. Append the line `-I INPUT -p udp -m udp --dport 4789 -j ACCEPT`.



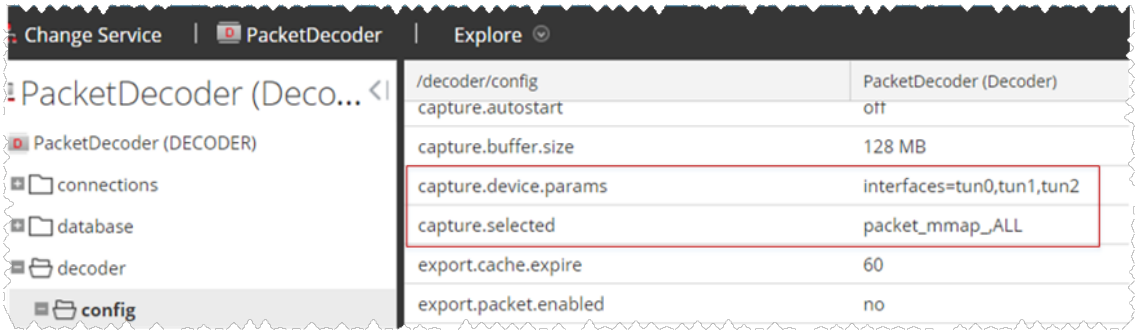
c. Restart IP tables by using the following commands.

```
service iptables restart
service iptables status
```

4. To set the interface in the Network Decoder.

   a. Log in to NetWitness, select the `decoder/config` node in Explorer view of the Network Decoder service.

   b. Set the `capture.selected = packet_mmap_,tun0` parameter.



5. (Conditional) If you have multiple tunnels on the Network Decoder.

   a. Restart the Decoder service after you create the tunnel in Network Decoder.

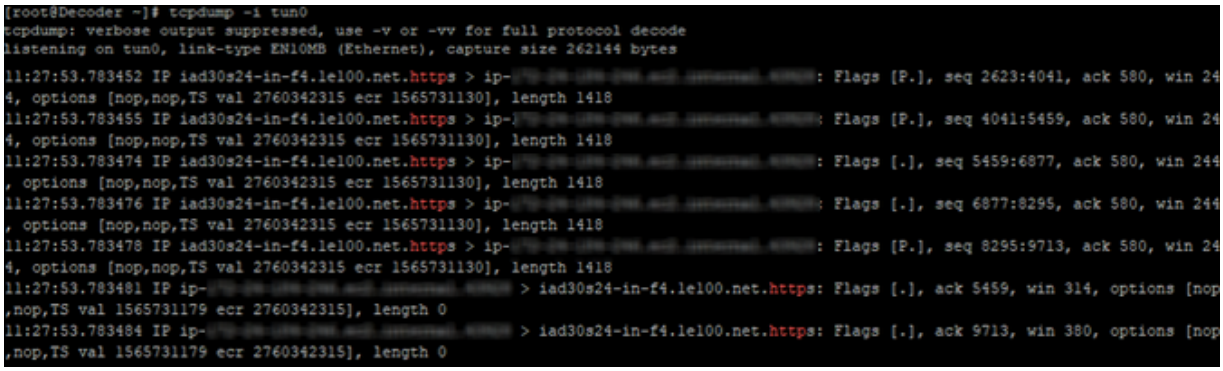
   b. Log in to NetWitness, select the `decoder/config` node in Explorer view of the Network Decoder service, and set the following parameters.

```
capture.device.params = interfaces=tun0,tun1,tun2
capture.selected = packet_mmap_,All
```

6. Restart the Decoder service.

```
$ sudo restart nwdecoder
```

   The user should be all set to capture the network traffic in the Network Decoder.



Task 5. Validate VPC Traffic Mirroring Packets Arriving at the Network Decoder

Perform the following steps to validate if the Network Decoder is receiving the network data (packets) successfully.

1. Generate traffic from the client OS instance CLI (for example, `wget http://www.google.com/`).

2. Enter the `tcpdump -i tun0` command to look for suitable results in the tcpdump.

3. The NetWitness reflects meta values as shown below.

Note: You can mirror traffic from an EC2 instance that is supported by the AWS Nitro system (A1, C5, C5d, C5n, I3en, M5, M5a, M5ad, M5d, p3dn.24xlarge, R5, R5a, R5ad, R5d, T3, T3a, and z1d).

Note: For more information, see "New – VPC Traffic Mirroring" documentation at https://aws.amazon.com/blogs/aws/new-vpc-traffic-mirroring/.

AWS Instance Configuration Recommendations

Note: These recommendations can be used as a baseline for 12.3.0.0 and adjusted as needed.

This topic contains the minimum AWS instance configuration settings recommended for the NetWitness virtual stack components.

- EC2 Instance:
  - Instance type adjustments -you must adjust instance types according to your ingestion rate, content and parsers, dashboard reports, scheduled reports, investigations, and active users.
  - Recommended settings - the recommended settings in the NW component instance tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS and 1.5 Gbps were used.
    - All the components were integrated.
    - The Log stream includes a Log Decoder, Concentrator, and Archiver.
    - The Packet stream includes a Network Decoder and Concentrator.
    - The Endpoint Hybrid stream includes a Endpoint Server, Concentrator and Log Decoder.
    - Respond is receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load includes reports, charts, alerts, investigation, and respond.
- Block Storage

  For more information on the required volumes and the storage allocations, see the Storage Guide for NetWitness® Platform 12.3.

Archiver

EC2 Instance			
EPS	**Instance Type**	**Enhanced Networking Enabled**	**Tenancy Type - Dedicated - Run a Dedicated Instance**

Appendix A. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-
   pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-
   firewall=false --ip-override=false --eula=true
   ```

Note: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to  **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click 

.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

Arguments

Argument	Description
`--help-install-opts`	Display all the arguments in this table.

Argument	Description
`--eula`	Accept or decline the End User License Agreement (EULA). Specify: • `true` (default) to accept the agreement • `false` to decline it and cancel the installation. For example: `--eula=true`
`--is-head`	Designate the host as the NW Server host or a component host. Specify: • `true` for NW Server host. • `false` for Component host. For example: `--is-head=true`
`--host-name`	Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname. For example: `--host-name=<hostname>`
`--master-pass`	Enter master password. For example: `--master-pass=<password>`
`--deploy-pass`	Enter deployment password. For example: `--deploy-pass=<password>`
`--iface-name`	Specify network interface. For example: `--iface-name=eth0`
`--ip-override`	Accept or override IP address found for this host or change the IP configuration found on the host. Specify: • `true` provide IP address. • `false` use IP address found on the host. For example: `--ip-override=false`
`--ip-type`	Select ip address configuration type. Specify: • `1` Static IP Configuration) • `2` DCHP For example: `--ip-type=1`
`--ip-addr`	For Static IP configuration, enter IP Address for static address. For example: `--ip-addr=<ip-address>`
`--ip-netmask`	For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>`

Argument	Description
`--ip-gateway`	For Static IP configuration, enter default gateway for static address. For example: `--ip-gateway=<default-gateway>`
`--ip-nameserver`	IP address assigned to DNS server. `--ip-nameserver=<ip-address>`
`--ip-nameserver-secondary`	Optional - IP address assigned to a secondary DNS server. For example: `--ip-nameserver-secondary=<ip-address>`
`--ip-domain`	For Static IP configuration, enter Local Domain Name for static address. For example: `--ip-domain=<default-gateway>`
`--repo-type`	Select type of update repository. Specify: • `1` Local repository • `2` External repository For example: `--repo-type=1`
`--repo-url`	For an external update repository, specify the url of the repository. For example: `--repo-url=<url>`
`--head-ip`	For a component host, specify IP Address of the NW Server. For example: `--head-ip=<ip-address>`
`--custom-firewall`	Disable default firewall configuration and use your custom configuration. Specify: • `true` use custom firewall configuration. • `false` use default firewall configuration. For example: `--custom-firewall=true`
`--use-nat`	Configure the host to use Network Address Translation (NAT) based IP addresses: • `true` use NAT IPs to connect to other hosts • `false` do not use NAT IPs to connect to other hosts (default) For example: `--use-nat=false`

Appendix A. Silent Installation Using CLI 60

Azure Installation Overview

Azure instances have the same functionality as the NetWitness hardware and virtual hosts. NetWitness recommends that you perform the following tasks when you set up your Azure environment.

Before you can deploy NetWitness in Azure, you need to:

- Review the recommended compute and memory specifications needed for each NetWitness instance.
- Get familiar with the NetWitness Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see Storage Guide for NetWitness® Platform 12.3.
- Make sure that you have a NetWitness Throughput license.
- Use Chrome for your browser (Internet Explorer is not supported).

Azure Environment Recommendations

Azure instances have the same functionality as the NetWitness hardware hosts. NetWitness recommends that you perform the following tasks when you set up your Azure environment.

- Based on the resource requirements of the different components, follow best practices to use the system and dedicated storage appropriately.
- Build Concentrator directory for index database and Decoder directory for Packet database on SSD Disks with high IOPS / write throughput.

Azure Deployment Scenarios

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

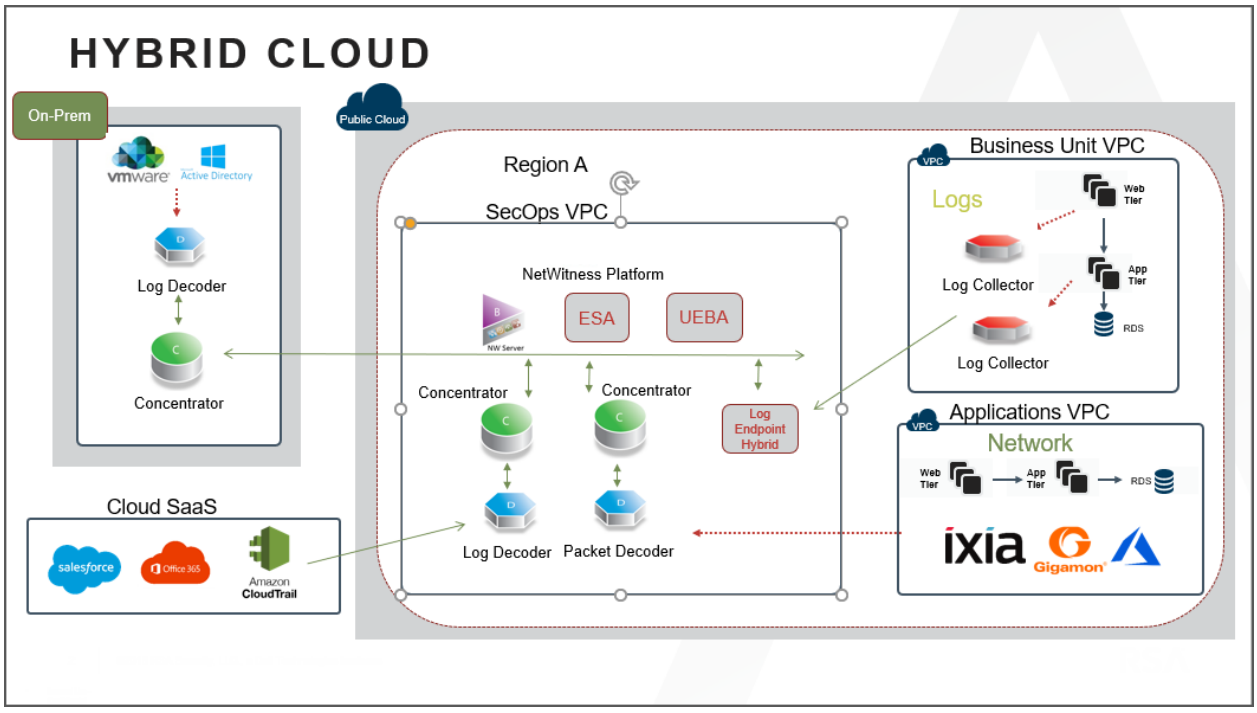
Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *NetWitness Host and Services Getting Started Guide*.



NetWitness High-Level Deployment Diagram

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

Azure Configuration Recommendations

This topic contains the minimum Azure VM configuration settings recommended for the NetWitness (NW) virtual stack components.

- VM:
  - The recommended settings in the NetWitness component VM tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS and 1.5GBps were used.
    - All the components were integrated.
    - The Log stream included a Log Decoder, Concentrator, and Archiver.
    - The Packet stream included a Network Decoder and Concentrator.
    - Incident Management was receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load included reports, charts, alerts, investigation, and respond.
    - The default partition size of Azure VM hosts for `/root` is 8GB and for `/var/netwitness` is 15GB. These partitions can be increased to a minimum of 40GB. For more information see, Updating Partition Size.
- VHD (Storage)
  For more information, see Storage Guide for NetWitness® Platform 12.3 on how to increase the number of volumes based on your storage requirements using the NetWitness Sizing & Scoping Calculator.

Azure Instance Recommendations

The following table shows the storage recommendations for NetWitness Azure VMs.

Azure Image Type	Rate (EPS)	CPU (Cores)	RAM (GB)	Instance Type (Azure Name)
NW Server	Does not apply	16	112	Standard D14_v2
Log Decoder	15,000	32	128	Standard D32s_v3
Log Concentrator	15,000	16	112	Standard DS14_v2
Archiver	15,000	16	112	Standard D14_v2
Log Collector	15,000	8	32	Standard D8s_v3
UEBA*	Does not apply	16	112	Standard D14_v2

Note: *If your log collection volume is low, NetWitness recommends you to deploy UEBA only on a virtual host. If you have a moderate to high log collection volume, NetWitness recommends you to deploy UEBA on the physical host as described under "NetWitness UEBA Host Hardware Specifications" in the *Physical Host Installation Guide*.

Refer to the *Storage Guide for NetWitness Platform* for additional storage information.

Packet Stream Solutions

The following tables show Instance recommendations for Different EPS rates for Packet stream.

Note: NetWitness Decoder is supported with Gigamon Packet broker from version 11.7.x or higher on Azure Cloud environment.

Decoder - Gigamon Solution

Azure Image Type	Rate (Mbps)	CPU (Cores)	RAM (GB)	Instance Type (Azure Name)	Accelerated Networking Enabled
Decoder	500	16	64	Standard D16ds_v4	Yes
Decoder	1000	16	64	Standard D16ds_v4	Yes
Decoder	1500	32	128	Standard D32ds_v4	Yes

Rate (Mbps)	Volumes	Volume Type	IOPS / Baseline Throughput
500	index, session, meta	RAID5 of minimum 3 P15 Premium SSD Disks	80MB/s
500	packet	RAID5 of minimum 3 P15 Premium SSD Disks	80MB/s
1000	index, session, meta	RAID5 of minimum 3 P20 Premium SSD Disks	170MB/s
1000	packet	RAID5 of minimum 3 P30 Premium SSD Disks	170MB/s
1500	index, session, meta	RAID5 of minimum 3 P40 Premium SSD Disks	300MB/s
1500	packet	RAID5 of minimum 3 P40 Premium SSD Disks	300MB/s

Concentrator - Gigamon Solution

Azure Image Type	Rate (Mbps)	CPU (Cores)	RAM (GB)	Instance Type (Azure Name)	Accelerated Networking Enabled
Packet Concentrator	500	16	64	Standard D16ds_v4	No
Packet Concentrator	1000	16	114	Standard DS14_v2	No
Packet Concentrator	1500	16	114	Standard DS14_v2	No

Note: For Packet Concentrator with **500**Mbps rate, if the query load on the environment is on the higher side (max concurrent queries > **5**), it is recommended to use **Standard DS14_v2** Instance.

Rate (Mbps)	Volumes	Volume Type	IOPS / Baseline Throughput
500	index	RAID5 of minimum 3 P30 Premium SSD Disks	10000
500	session, meta	RAID5 of minimum 3 P15 Premium SSD Disks	80MB/s
1000	index	RAID5 of minimum 3 P40 Premium SSD Disks	12000
1000	session, meta	RAID5 of minimum 3 P20 Standard SSD Disks	170MB/s
1500	index	RAID5 of minimum 3 P40 Premium SSD Disks	15000
1500	session, meta	RAID5 of minimum 3 P40 Premium SSD Disks	300MB/s

ESA and Context Hub

The following table shows Instance recommendations for Different EPS rates for ESA.

Rate (EPS)	CPU (Cores)	RAM (GB)	Instance Type	Accelerated Networking Enabled
15,000	16	112	Standard DS14_ v2	No
50,000	20	140	Standard DS15_ v2	Yes
100,000	32	256	Standard E32s_ v3	Yes

Updating Partition Size

You can increase the partition size to a minimum of 40GB each.

After adding additional required disk size to the Azure VM, you can extend the partition sizes using the following commands:

1. SSH to the VM, login as a root user and execute the following command to view the existing partitions along with the new partition added.
   `lsblk`
2. Check the name of the new partition. Eg: `sdc`

```
pvcreate /dev/sdc -y
vgextend netwitness_vg00 /dev/sdc -y
lvextend -L 40G /dev/netwitness_vg00/root -y
xfs_growfs /dev/netwitness_vg00/root
lvextend -L 40G /dev/netwitness_vg00/nwhome -y
xfs_growfs /dev/netwitness_vg00/nwhome
```

These commands are provided assuming that `sdc` is the new disk added and 40GB is the extended partition size for each of the partitions.

Azure Deployment

This topic contains the rules and high-level tasks you must perform to deploy NetWitness components in Azure.

Rules

You must adhere to the following rules:

It is recommended to use private IP addresses when you provision Azure NetWitness VMs.

Checklist

Step	Description	√
1.	Deploy NW Server Host	
2.	Deploy NW Component Hosts in Azure	
3.	Installation Tasks	

Storage Configurations

This topic contains the recommended Azure storage configurations.

For storage allocations of all host types, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness® Platform 12.3*.

Enabling Swap Partition in Azure Deployments

After completing the Azure deployment, you must enable the swap in your deployment.

To do this, perform the following steps:

1. Modify the default parameters at `/etc/waagent.conf` to

```
ResourceDisk.Format=y
ResourceDisk.Filesystem=ext4
ResourceDisk.MountPoint=/mnt/resource
ResourceDisk.EnableSwap=y
ResourceDisk.SwapSizeMB=4096
```

The following screenshot displays the default parameters.

```
# Format if unformatted. If 'n', resource disk will not be mounted.
ResourceDisk.Format=y

# File system on the resource disk
# Typically ext3 or ext4. FreeBSD images should use 'ufs2' here.
ResourceDisk.Filesystem=ext4

# Mount point for the resource disk
ResourceDisk.MountPoint=/mnt/resource

# Create and use swapfile on resource disk.
ResourceDisk.EnableSwap=n

# Size of the swapfile.
ResourceDisk.SwapSizeMB=0
```

The following screenshot displays the modified parameters.

```
# Format if unformatted. If 'n', resource disk will not be mounted.
ResourceDisk.Format=y

# File system on the resource disk
# Typically ext3 or ext4. FreeBSD images should use 'ufs2' here.
ResourceDisk.Filesystem=ext4

# Mount point for the resource disk
ResourceDisk.MountPoint=/mnt/resource

# Create and use swapfile on resource disk.
ResourceDisk.EnableSwap=y

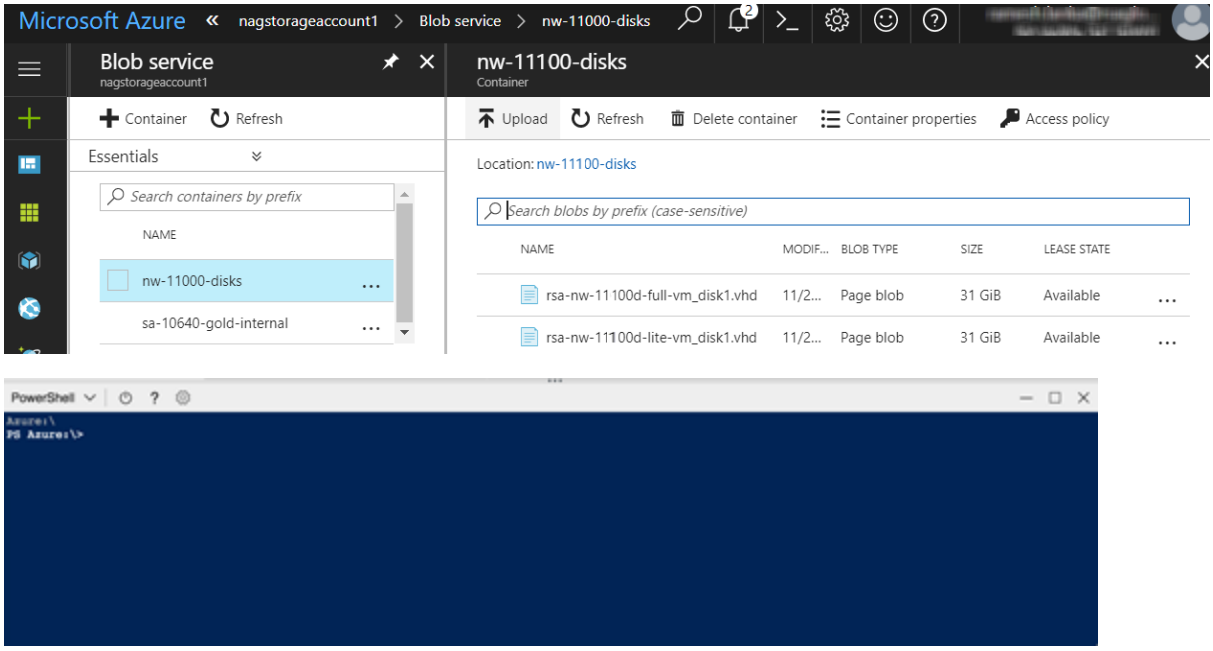
# Size of the swapfile.
ResourceDisk.SwapSizeMB=4096
```

Note: You can set the `ResourceDisk.SwapSizeMB` parameter based on your requirement.

2. Restart the `waagent.service` using the command: `systemctl restart waagent.service`

Note: To check the status of the swap use the command `swapon --show`.

Deploy NW Server Host



The following tasks must be performed to deploy a NetWitness Server (NW Server) on a virtual machine (VM) in the Azure Cloud environment.

Note: It is not mandatory to deploy the NW Server in the Azure Cloud environment . For more information on how to deploy other components, see Azure Deployment Scenarios.

Task 1. - Upload NW Server VHDs

To upload NW Server VHDs to Azure.

1. Contact Customer Support (https://community.netwitness.com/t5/support/ct-p/support) to open a support case requesting the NW Server VHDs. A valid throughput license is required.
2. Customer Support will update the case with VHD URI's.
3. In the Azure Portal, open the Powershell CLI.

You will need a storage account, blob service and container setup. This is where the VHD's are copied. After these are in place, you can execute the following command within the Azure Portal Powershell CLI. Alternatively, you can also run these commands from the Powershell on your workstation:

a. Run this command from Powershell to install AzureRM: `Install-Module -Name AzureRM -AllowClobber`

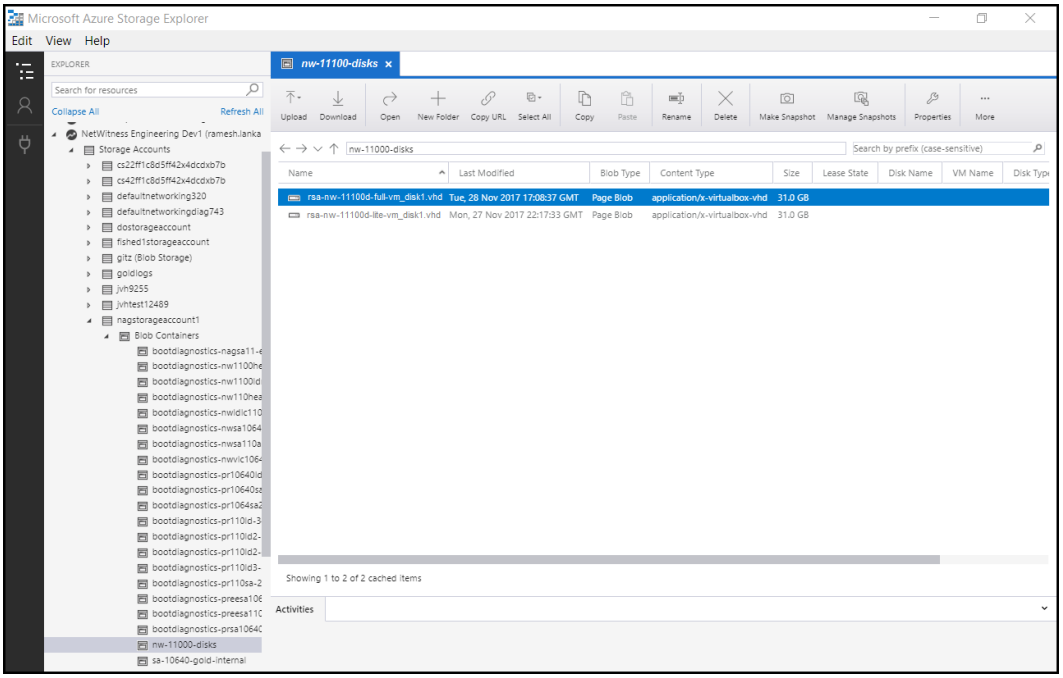
b. Execute this command to verify the installation process has been successfully done: `Import-Module -Name AzureRM`

c. If you find any error regarding execution policy, execute this command: - `Set-ExecutionPolicy -ExecutionPolicy RemoteSigned` (then repeat step b)

d. (Optional) If you are running the commands from the Powershell on your workstation, log in to your Azure account using this command: `Login-AzureRmAccount`

e. Select the Subscription: `Select-AzureRmSubscription -SubscriptionId <subscriptionid>`

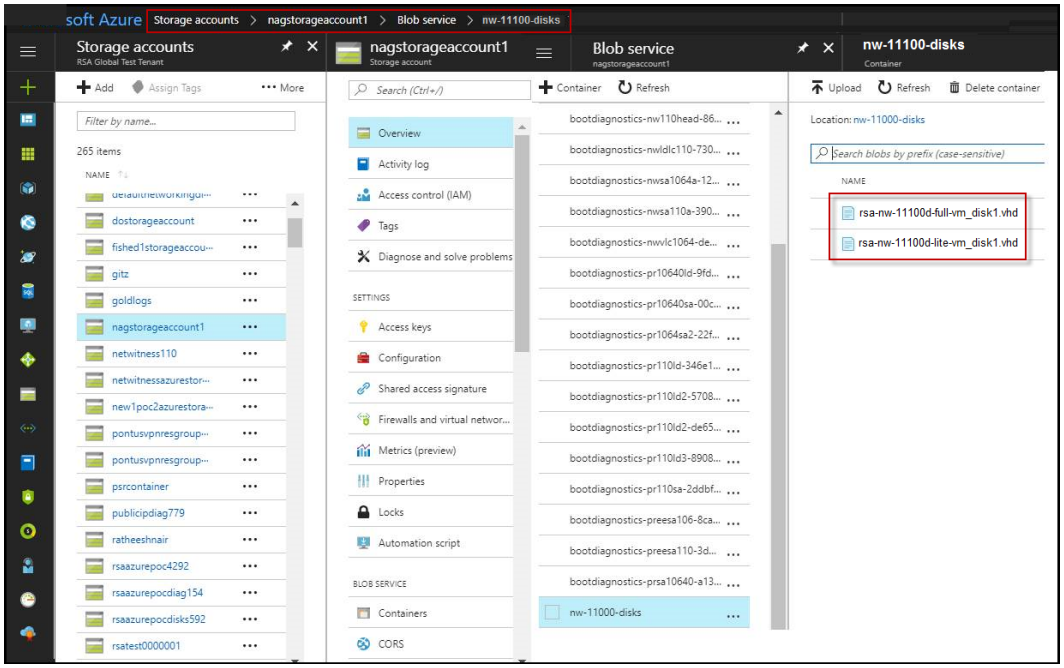
f. Create a target context: `$targetStorageContext = (Get-AzureRmStorageAccount -ResourceGroupName <resource-group-name> -Name <storage-account-name>).Context`



g. Start the copy: `Start-AzureStorageBlobCopy -AbsoluteUri "<SAS-URL>" -DestContainer <container-name> -DestBlob <destination-blob-name> -DestContext $targetStorageContext`

h. Obtain the Blob copy status by using the command: `Get-AzureStorageBlobCopyState -Blob "< destination-blob-name>" -Container "<container-name> " -Context $targetStorageContext`

4. Once the VHD's are successfully copied. You'll must create an image and a VM.

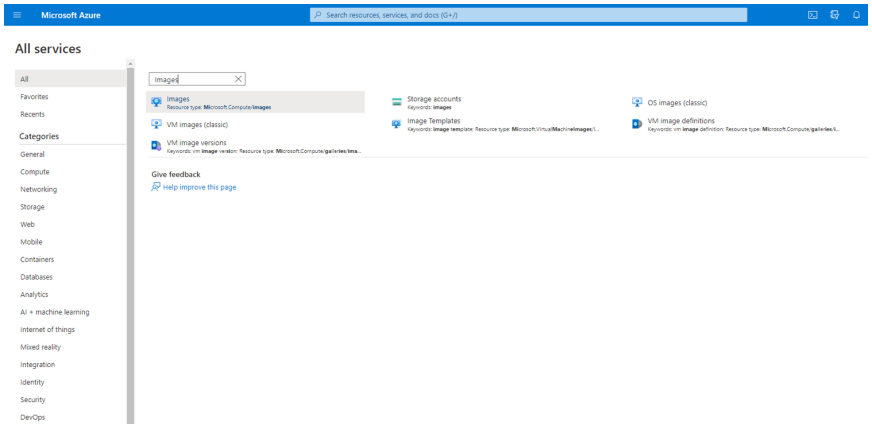


5. Verify if all the NW Server VHDs are uploaded into the Azure Cloud.

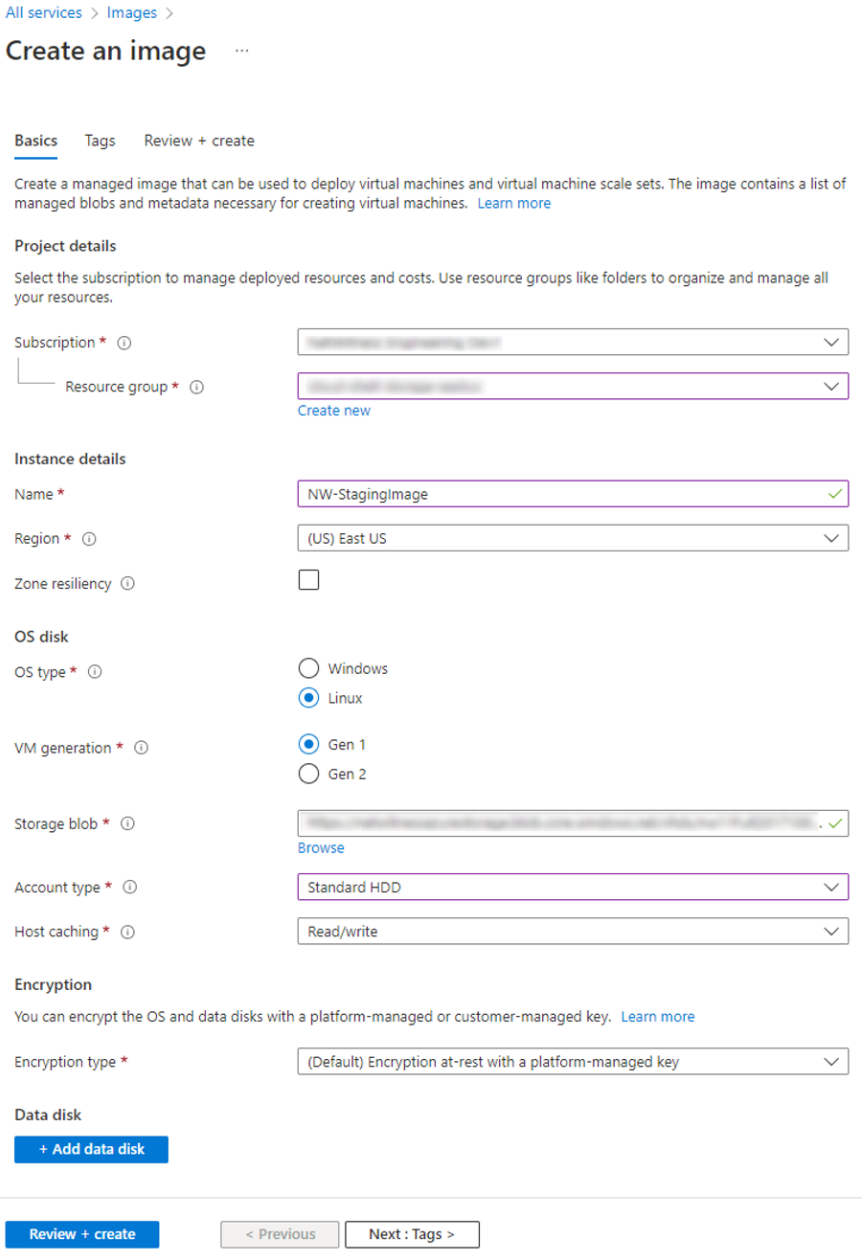
Note: Alternatively, you can use the Microsoft Azure Storage Explorer windows utility (http://storageexplorer.com/) to verify that all the VHDs from the following location subscription exist. This utility helps you manage the contents of your storage.

a. Log in to the Azure portal (https://portal.azure.com).

b. From the right panel, click **Storage accounts** > **netwitnessazurestorage1** > **Blob service** > **nwazurevhdstore**.



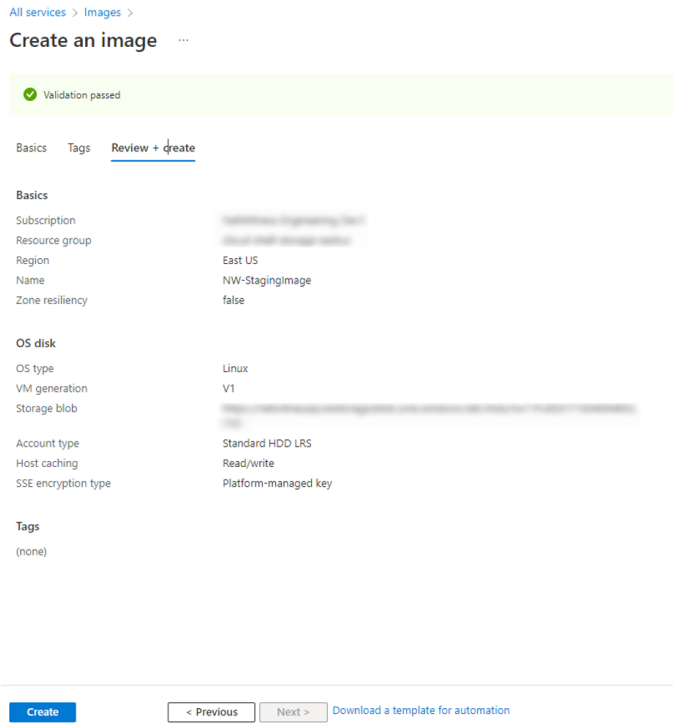
6. (Optional) In the Azure Explorer, go to the **NetWitness** group > **Storage Accounts** > **netwitnessazurestorage1**) > **Blob Containers** > **nwazurevhdstore**).



Task 2. - Create NW Server Image

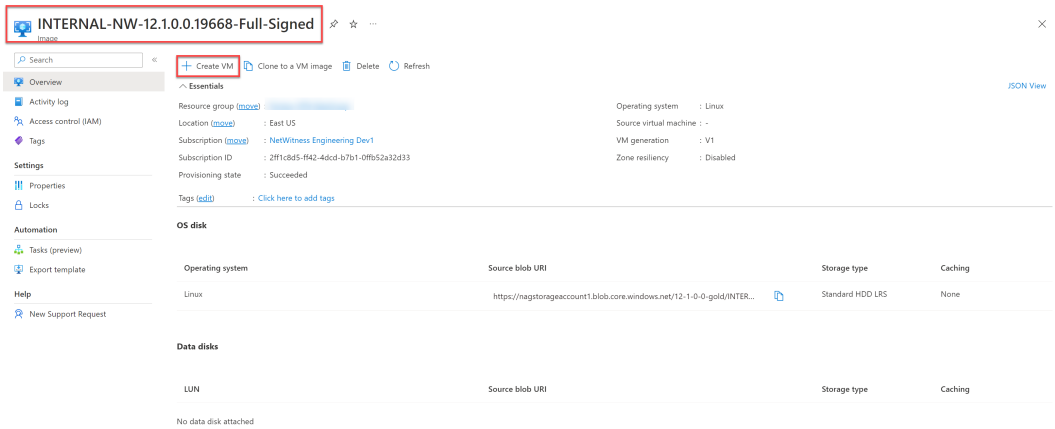
To create a NW Server image in Azure from upload VHDs, perform the following steps:

1. Log in to https://portal.azure.com.
2. From the left panel, click **All Services** and filter by Images.
3. Click **Images**.

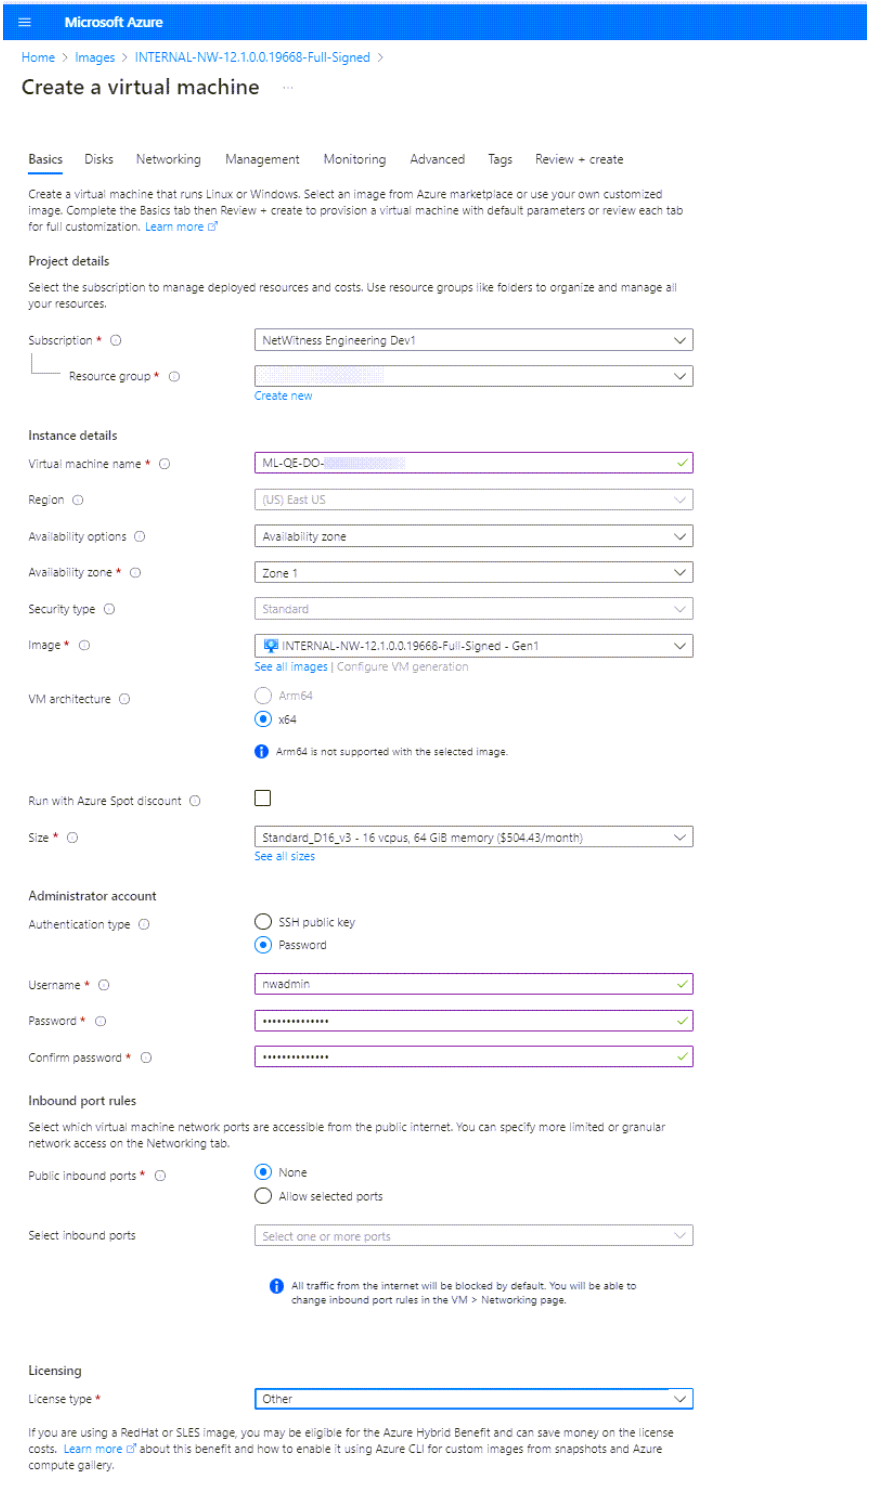


4. To create and configure the Image.
   a. Click **Create**.
   b. Enter an image **Name**, select the correct **Resource Group**, select a valid **Region**, and set the **OS Disk** to Linux.
   In the **Storage blob**, browse to the uploaded location of the VHDs .
   c. Make sure that **Standard (HDD)** is selected for **Account Type**.
   The following screen shot illustrates a completed **Create Image** view.

   d. Click **Next : Tags >** to add the tags for the Image (optional) and then Click **Review + create**.
   Azure does a validation check.



e. Click **Create** to create the image.
Check notifications on top right for the confirmation.

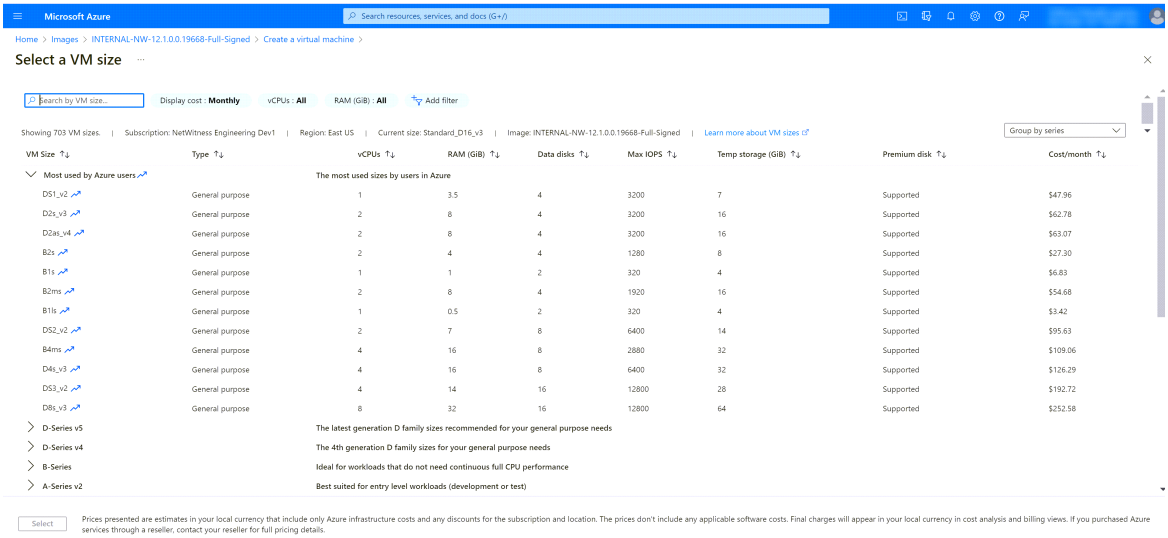


Task 3. Create Virtual Machine (VM)

To create a VM in Azure using the NW Server image:

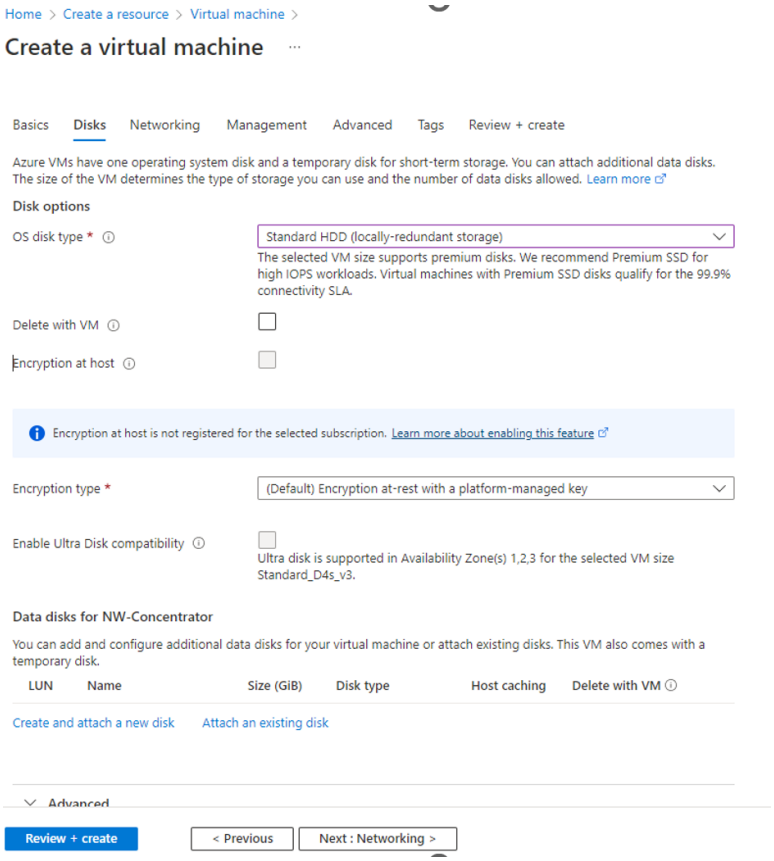
1. Go to **Images** and click **Create VM**.

The **Basics** tab is displayed.



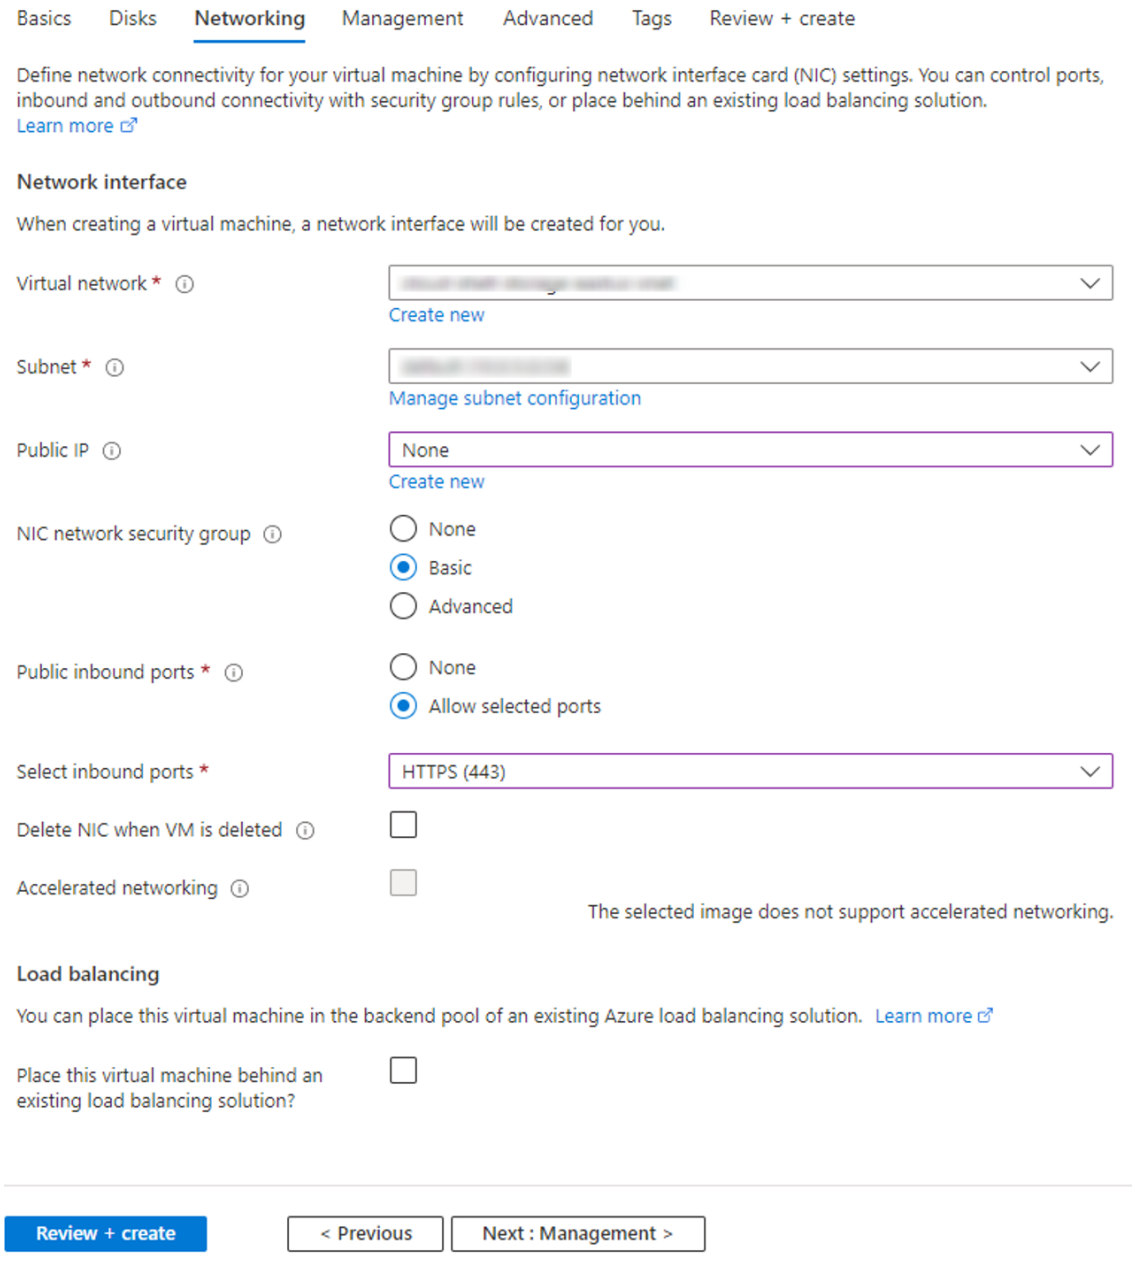
2. Enter the values in following fields.
   a. In the **Name** field, enter a user-defined name (for example, **ML-QE-DO**.

> **Caution:** The username and password that you define is used to login to the system as a non-administrator user. Do not use the root user (the login does not have superuser permissions). You must change the root password the first time that you log in to the VM by executing the `su passwd root` command. This is a critical step and should not be missed. You cannot use `root` for a username (Azure-specific).



> **Note:** Make sure the values selected in the **Subscription**, **Resource group**, and **Region** fields are correct.

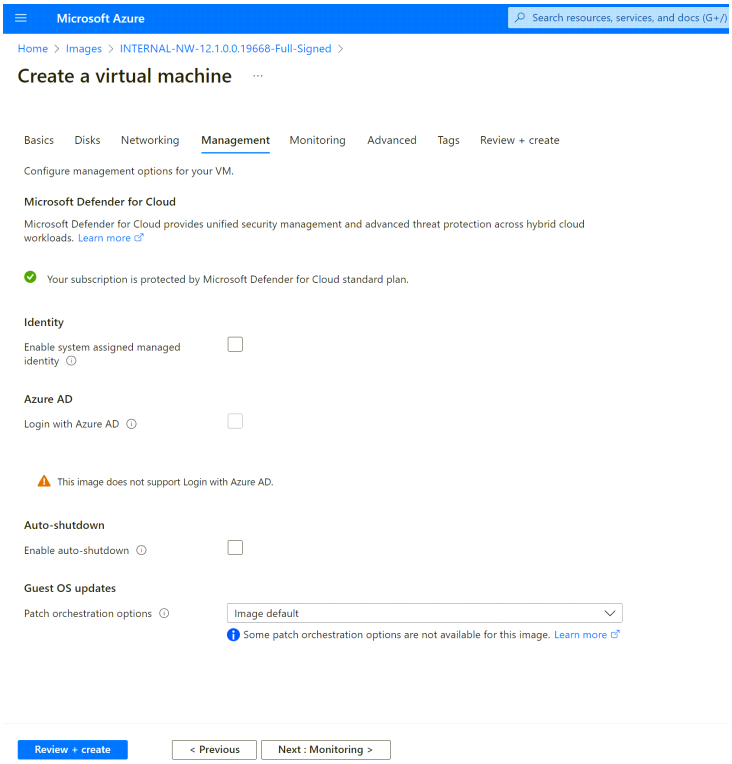
   b. Click **See all sizes** and select appropriate Size and Instance. The recommended instance for Concentrator is **Standard F8**.



> **Note:** The sizing is based upon the capacity requirements of your enterprise. For more information on NetWitness VM size recommendations based on log capture rates, see Azure Configuration Recommendations. The minimum size NetWitness recommends for the NW Server is **F8 Standard**.

   c. In the **User name** field, enter a valid username.
   d. In the **Authentication type** field, click **Password** and enter a strong password that is a combination of lowercase, uppercase, numeral and a symbol (for example, **Password@123**).
   e. Click **Next** : **Disks >**.
   The **Disks** tab is displayed.
3. In the OS Disk type, select **Standard HDD** from the drop-down list and click **Next : Networking >**.

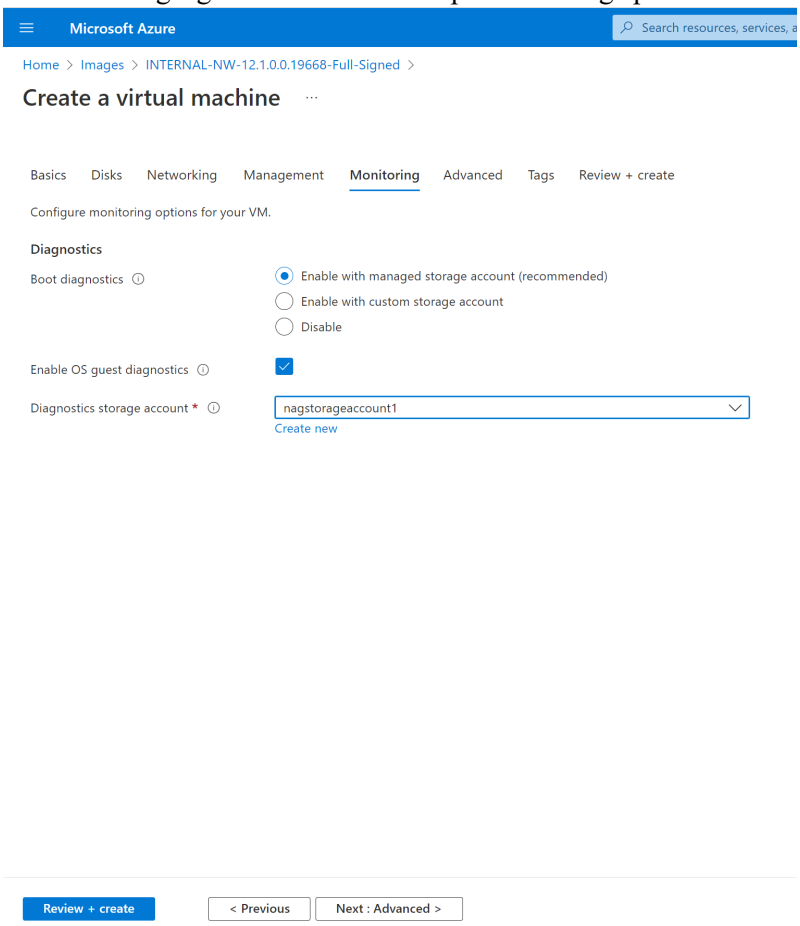
The **Networking** tab is displayed.



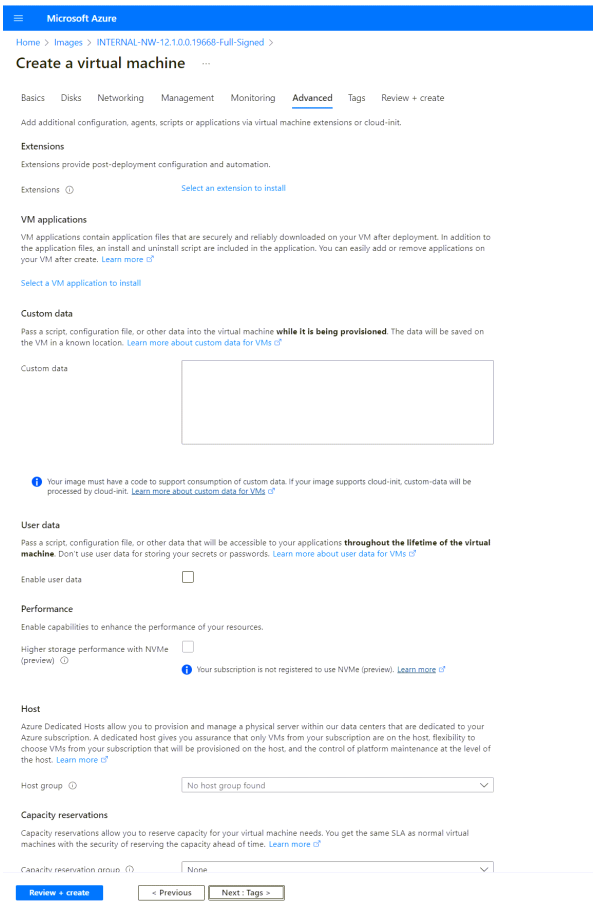
4. Click and define the fields.
   a. In the **Networking** tab, select:
      - A valid **Virtual network** and **Subnet**.

      - **None** for the **Public IP address**.
        NetWitness recommends **None** for the **Public IP address** (this is not mandatory). You can assign a public IP address, but it countermands Best Practices to assign a public IP to something that is based in the Azure Cloud.

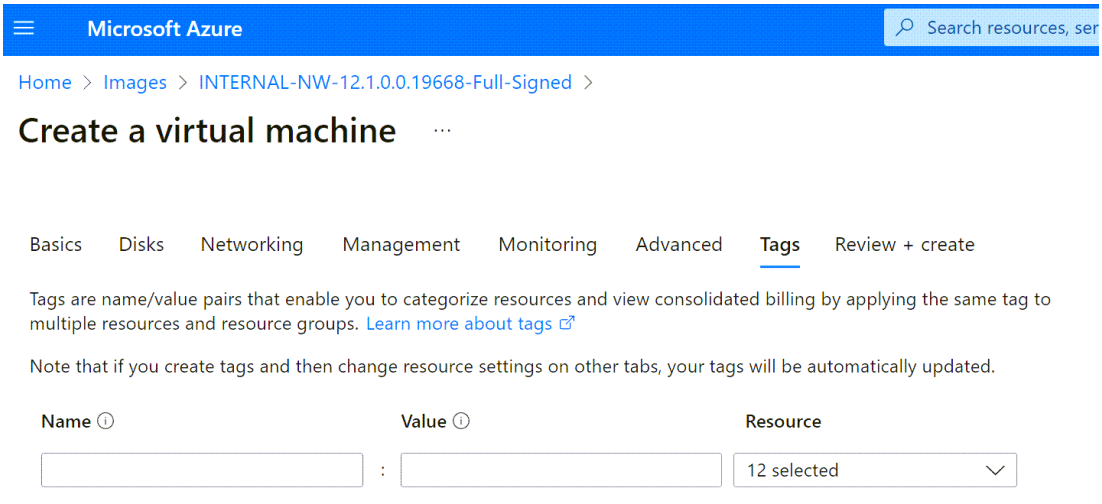
- A valid **Network security group**.
  For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg).



b. (Optional) In the **Management** tab, configure the details if required and click **Review + create**.



c. In the **Monitoring** tab, under Diagnostics, select:



- **On** for **Boot Diagnostics**
- **On** for **OS guest diagnostics**
- a valid **Diagnostics storage account**

The following figure illustrates a completed Settings panel.

Note: By default, the settings remain unchanged in the **Advanced** and **Tags** tab. Add any name and value pairs for tags based on requirement.

Add additional configuration, agents, scripts or applications via virtual machine extensions or cloud-init.
Extensions
Extensions provide post-deployment configuration and automation.
Extensions
Select an extension to install
VM applications
VM applications contain application files that are securely and reliably downloaded on your VM after deployment. In addition to the application files, an install and uninstall script are included in the application. You can easily add or remove applications on your VM after create. Learn more
Select a VM application to install
Custom data
Pass a script, configuration file, or other data into the virtual machine while it is being provisioned. The data will be saved on the VM in a known location. Learn more about custom data for VMs
Custom data
Your image must have a code to support consumption of custom data. If your image supports cloud-init, custom-data will be processed by cloud-init. Learn more about custom data for VMs
User data
Pass a script, configuration file, or other data that will be accessible to your applications throughout the lifetime of the virtual machine. Don't use user data for storing your secrets or passwords. Learn more about user data for VMs
Enable user data
Performance
Enable capabilities to enhance the performance of your resources.
Higher storage performance with NVMe (preview)
Your subscription is not registered to use NVMe (preview). Learn more
Host
Azure Dedicated Hosts allow you to provision and manage a physical server within our data centers that are dedicated to your Azure subscription. A dedicated host gives you assurance that only VMs from your subscription are on the host, flexibility to choose VMs from your subscription that will be provisioned on the host, and the control of platform maintenance at the level of the host. Learn more
Host group
No host group found
Capacity reservations
Capacity reservations allow you to reserve capacity for your virtual machine needs. You get the same SLA as normal virtual machines with the security of reserving the capacity ahead of time. Learn more

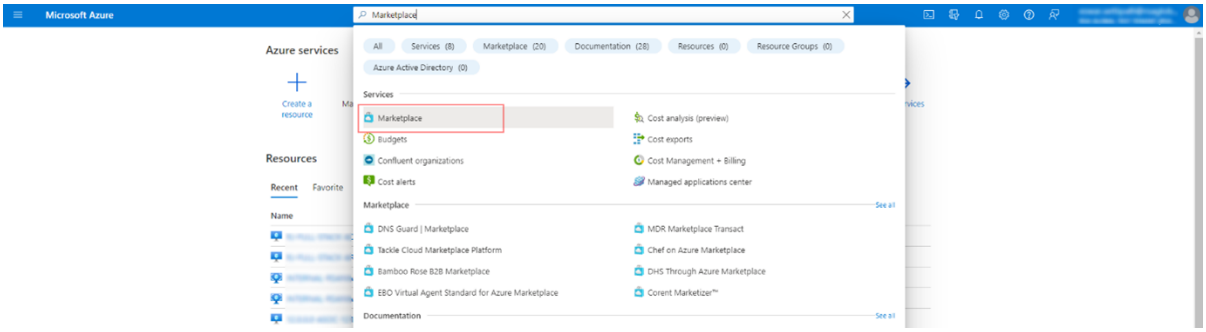
The NW Server VM Deployment is successful when you see the VM status as **Running**.

6. Click **Overview** on the Virtual Machine to view all the required details such as VM status and IP Address.

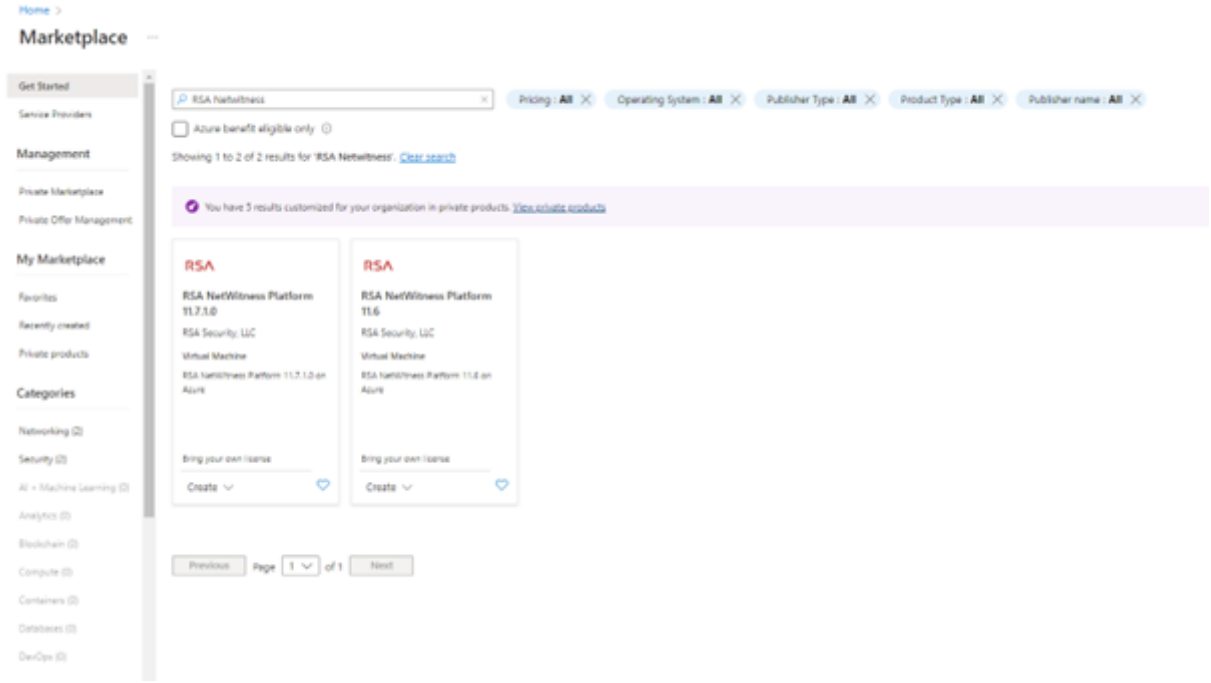
7. SSH to the VM using the username that you specified in Step 2d of Task 3 and reset the **root** password. Use the `su passwd root` command string to reset the root password.

```
[psradmin@12 ~]$ sudo passwd root
[sudo] password for psradmin:
Changing password for user root.
New password:
BAD PASSWORD: The password contains more than 4 characters of the same class consecutively
Retype new password:
passwd: all authentication tokens updated successfully.
```



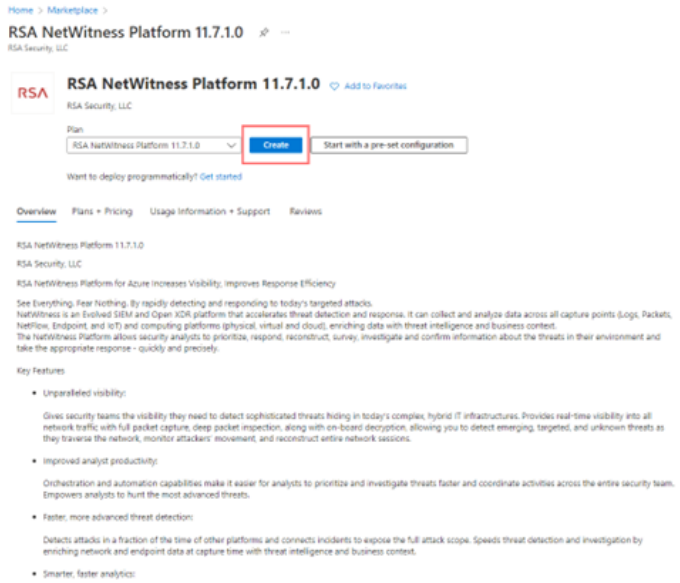
8. Close the current SSH session and open a new SSH session with **root** using the username and the password created in the previous step.

> **Note:** Step 8 is a critical, one-time step for a new deployment. If you do not complete this step, the NetWitness User Interface will not load.



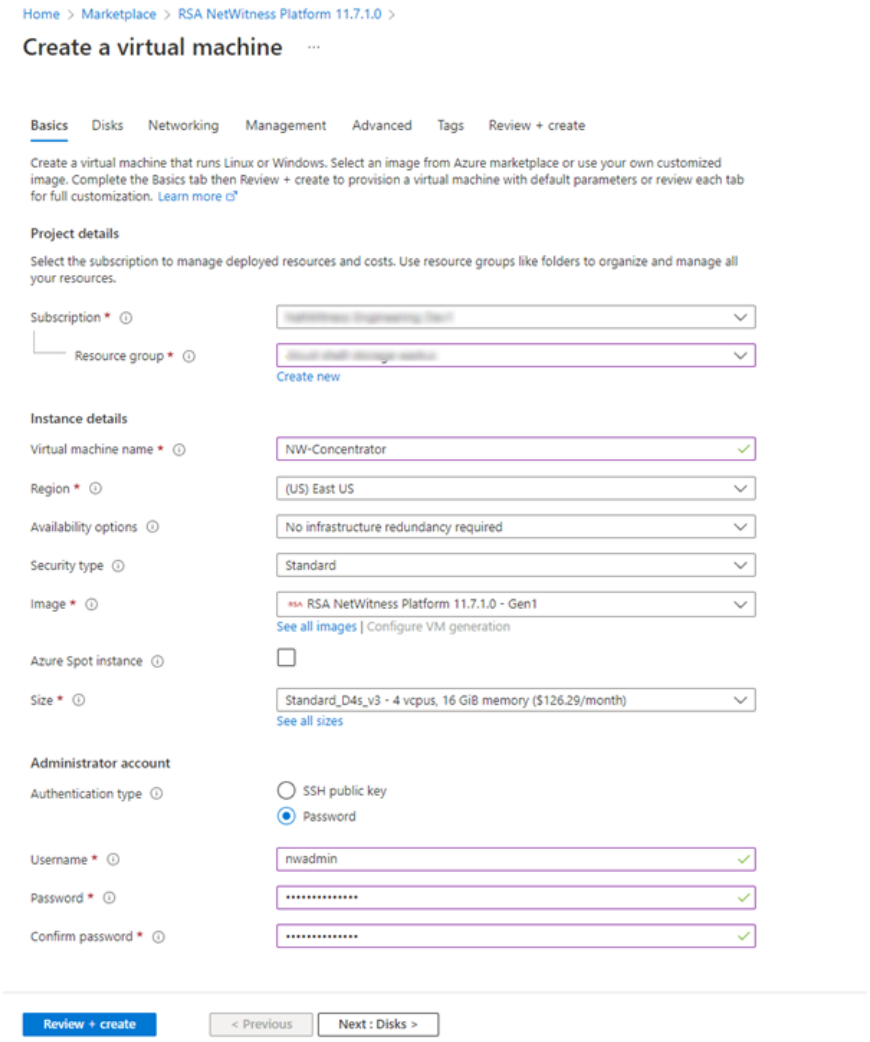
Deploy NW Component Hosts in Azure

You must perform the following tasks to configure a NW Component Host on a Virtual Machine (VMs) in the Azure Cloud environment.



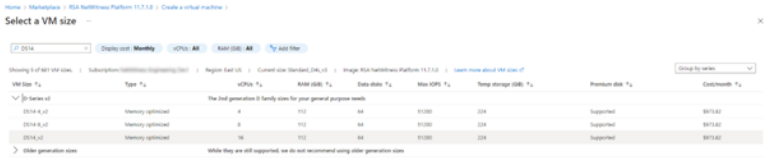
1. Search for Marketplace in Azure portal.

2. Search for **RSA NetWitness**.



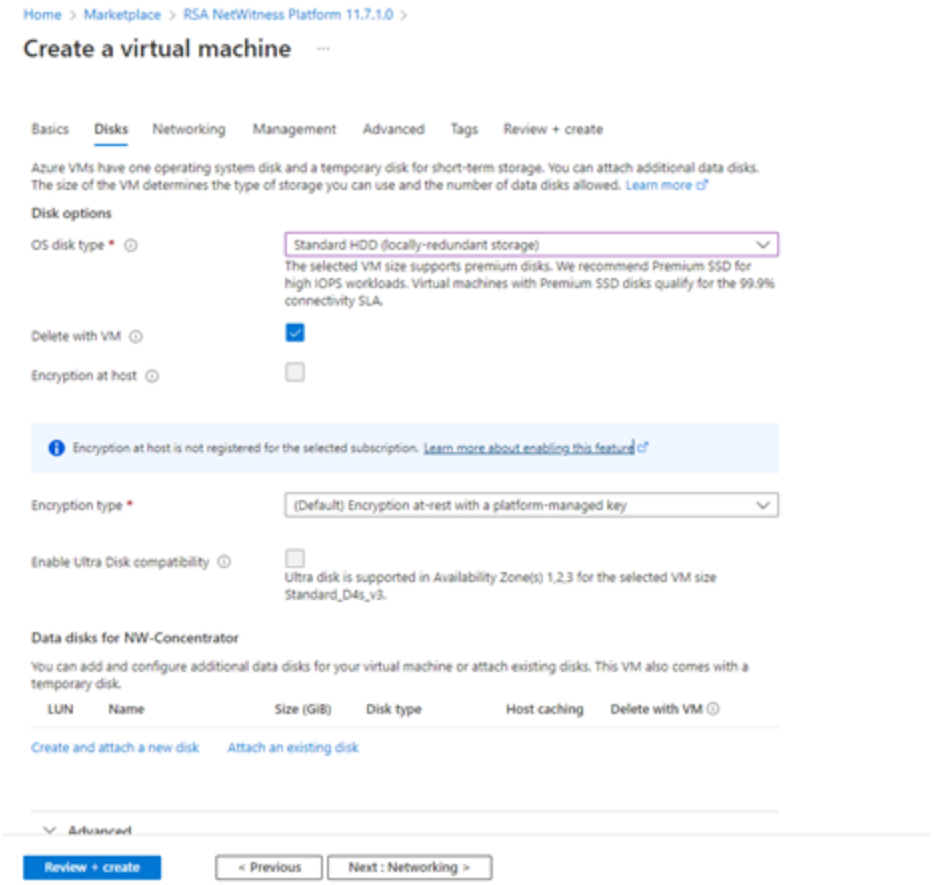
3. Select RSA NetWitness Platform 12.3.0.0 and click **Create**.

The **Create virtual machine** wizard opens and displays the **Basics** tab.



4. Enter the values in the following fields:
   a. Specify a VM **Name** (for example, **NW-Concentrator**).
   b. Select **Password** for **Authentication type**.
   c. Enter your credentials (**User name** and **Password**) and **Confirm Password**.
   d. Click **OK**.

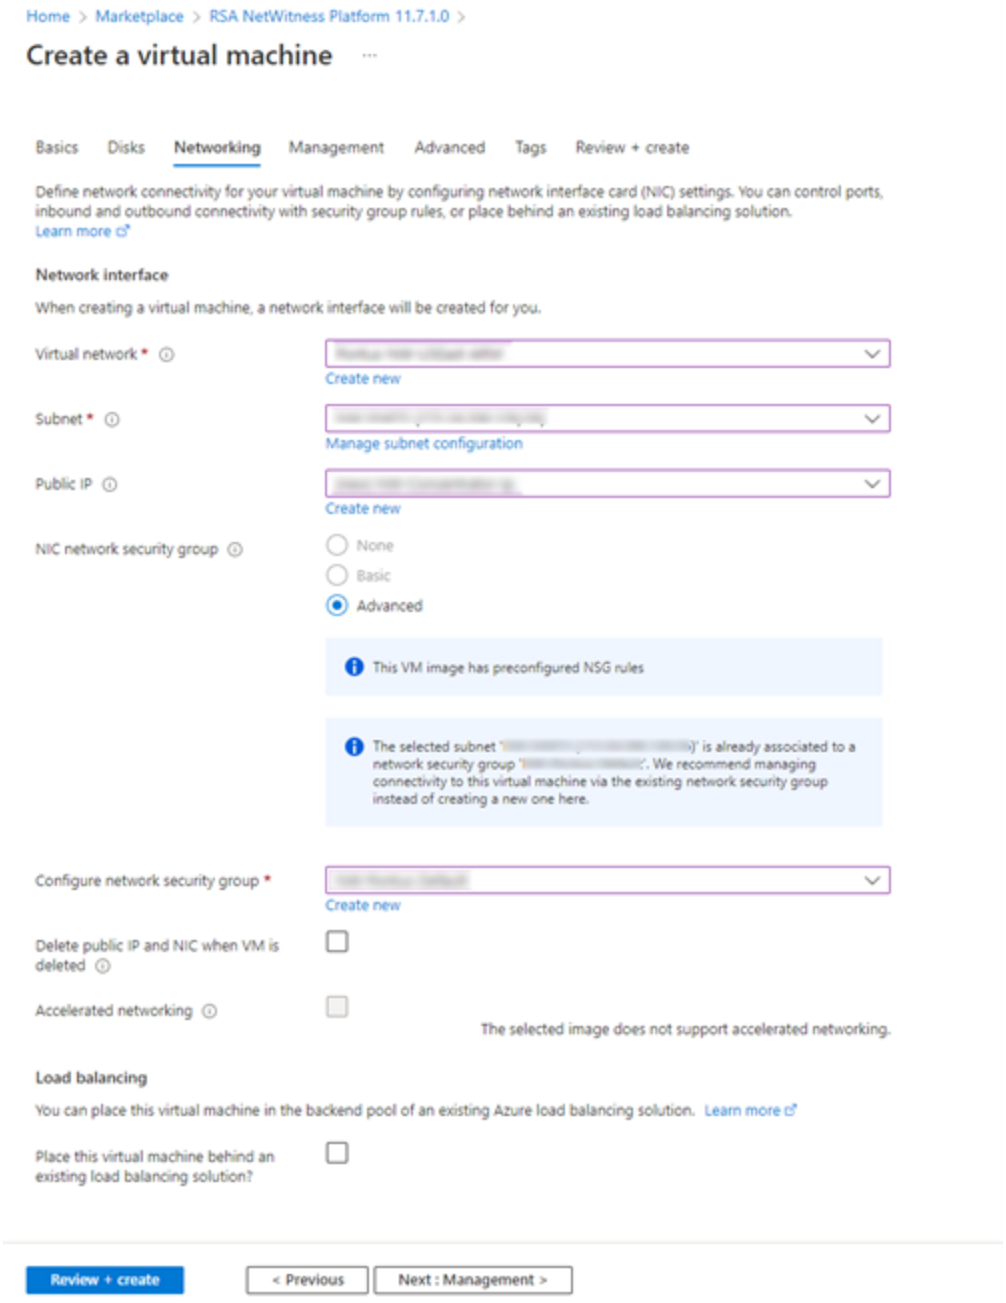
Azure validates the **Basic** specifications and the **2 Size** page is displayed.



5. Click on the appropriate VM size (for example, **Standard DS14 v2** for the Concentrator) for the service and click **Select** for a VM **Size**.

   For more information on NetWitness recommendations of the VM sizes for each service, see Azure Configuration Recommendations.

   Azure validates the **Size** specifications. Click **Next : Disks >**.

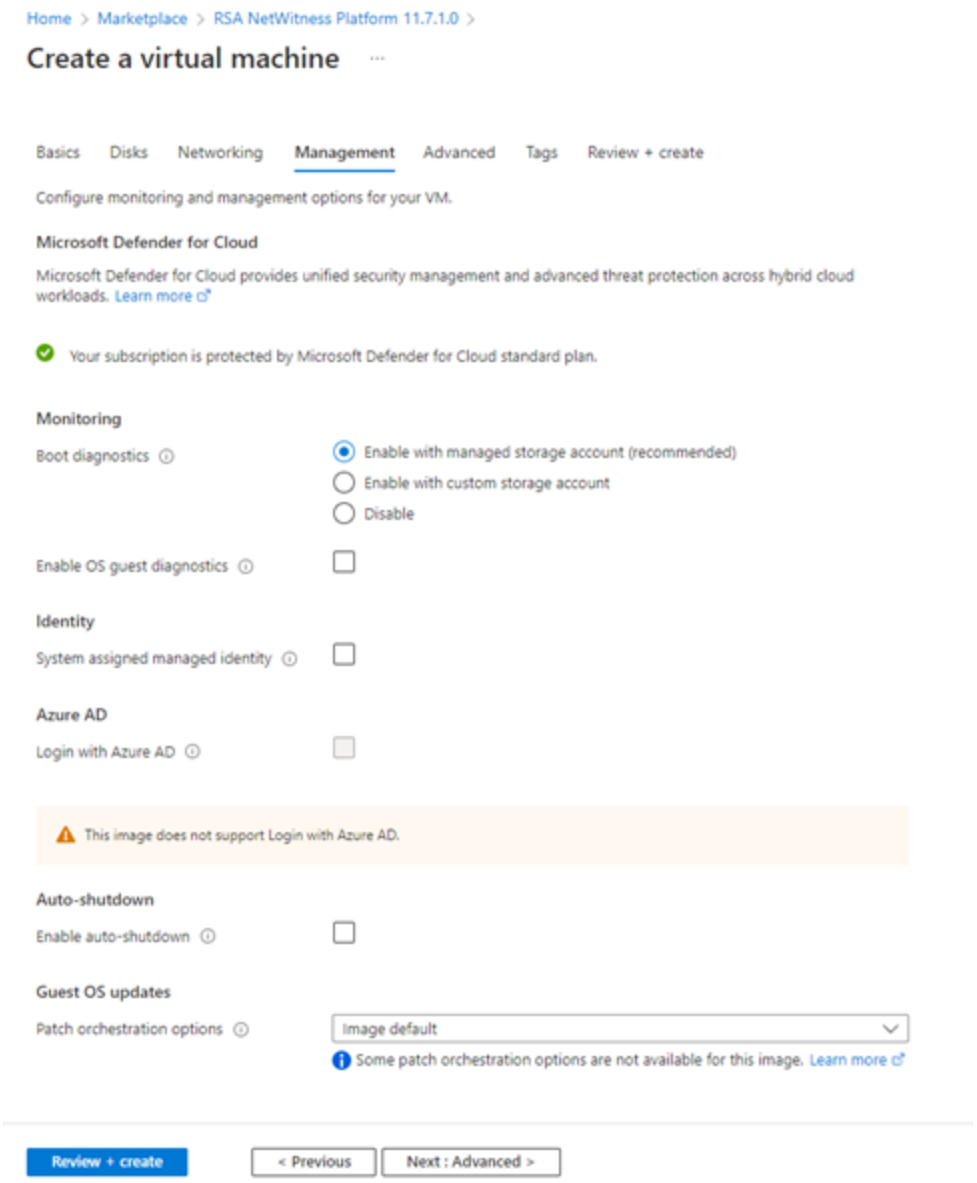


6. Under **Disks** tab, Select **SSD** for the **VM disk type** of the Concentrator or **HDD** for all other components. Solid State Disk (SSD) performs better than a Hard Drive (HDD).

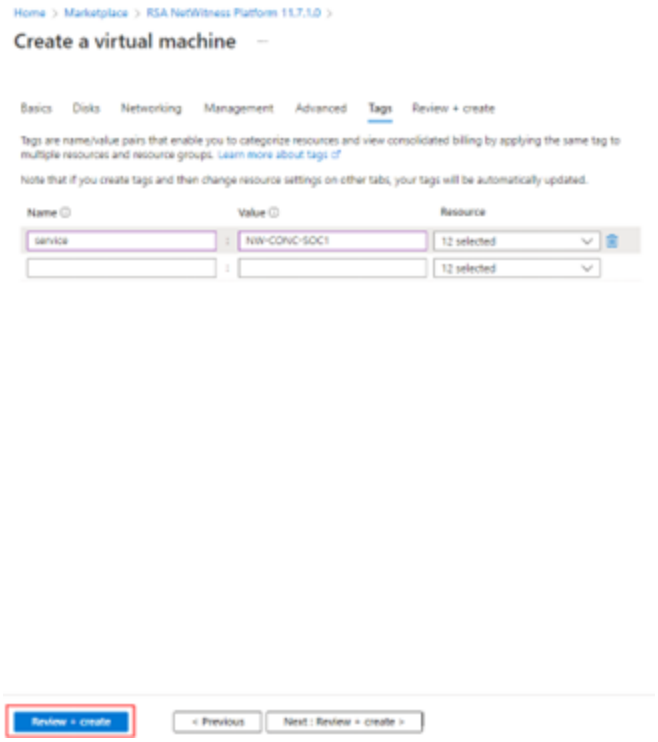
Click **Next : Networking >**.

7. In the **Networking** tab:
   a. Adjust **Virtual network**, **Subnet**, and **Public IP address** according to the requirements of your network.
   b. Enabling **Accelerated Networking** is recommended for Decoder hosts with higher line rates (> **800**Mbps).
   c. Specify a valid **Network Security group**.

> **Note:** For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg). Refer to *Deployment: Network Architecture and Ports* (https://community.netwitness.com/t5/netwitness-platform-online/network-architecture-and-ports/ta-p/668996) for a comprehensive list of the ports you must set up for all NetWitness components.



d. After completing the configurations, click **Next : Management >**.



8. In the **Management** Tab:

   a. Enable Boot diagnostics and OS guest diagnostics.

   b. Configure Identity based on your requirements.

9. Click **Next : Advanced >** to enter **Advanced** settings tab. Make the required changes if any and click **Next : Tags >**.
10. In the **Tags** menu, add **Name**, **Value** pairs if any and click **Review + create**.

Azure validates the VM and displays the status check.

11. Click **Create** to deploy the NW-Concentrator VM in Azure.
12. Configure the host VM in NetWitness 12.3.0.0.
13. Repeat steps 1 through 12 inclusive for the rest of the core NetWitness component services.

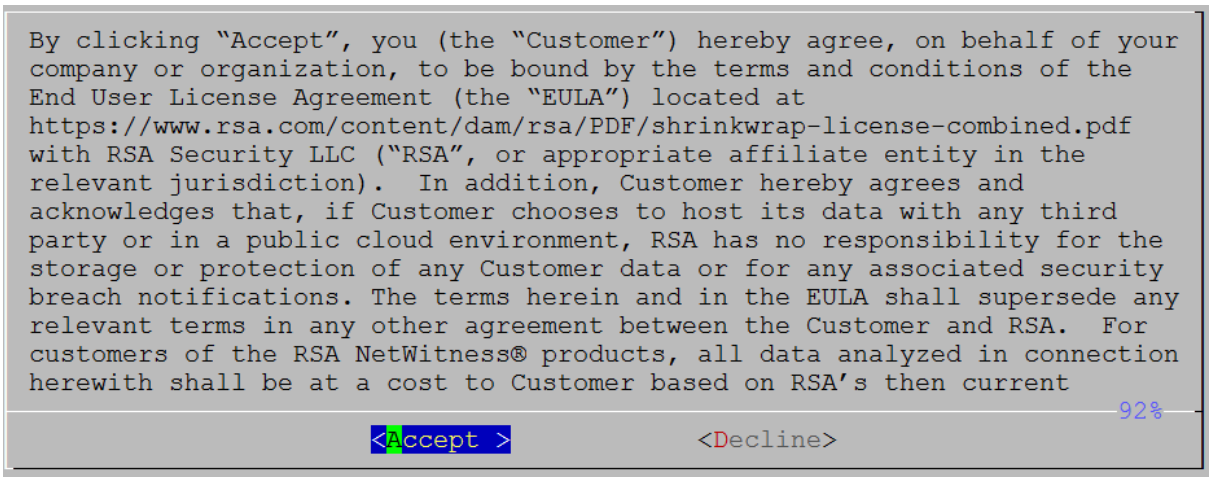
Installation Tasks

Before you begin the installation tasks make sure you open the firewall ports. For more information on the lists of all the ports in a deployment, see the"Network Architecture and Ports" topic in the *Deployment Guide for NetWitness Platform 12.3*.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

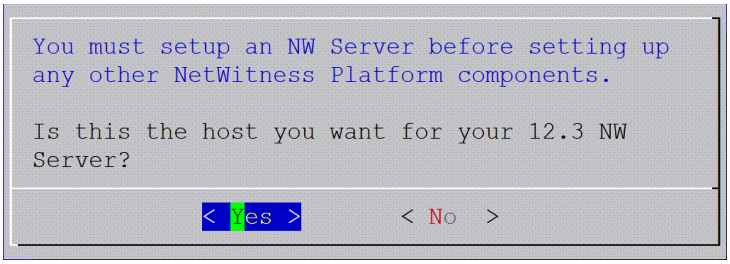
Install 12.3 on the NetWitness Server (NW Server) and Component Hosts

Note: You can perform this task for **INTERNAL-NW-12.3.0.0.20590-Full-Signed** instance.



Caution: If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

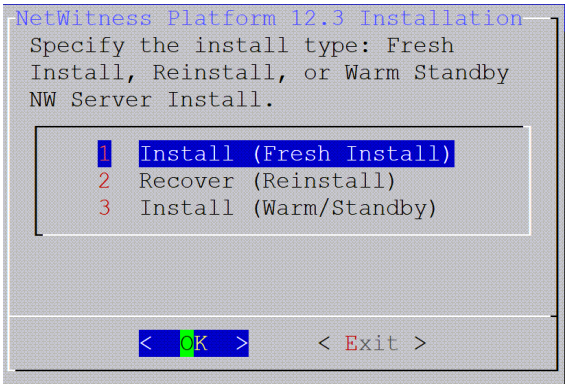
IMPORTANT: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`. If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.



1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

   Note: Use the following options to navigate the Setup prompts.
   1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
   3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
   If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 12.3 NW Server** prompt is displayed.

3. Tab to **Yes** and press **Enter** to install 12.3 on the NW Server.
   Tab to **No** and press **Enter** to install 12.3 on other component hosts.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

4. The **Install** prompt is displayed (**Recover** does not apply to the installation. It is for 12.3 Disaster Recovery.).
   NW Server Host prompt:

Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)

5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   NW Server prompt:

   Other Component Hosts prompt says <non-nwserver-host-name>

   Caution: If you include "." in a host name, the host name must also include a valid domain name.

   Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

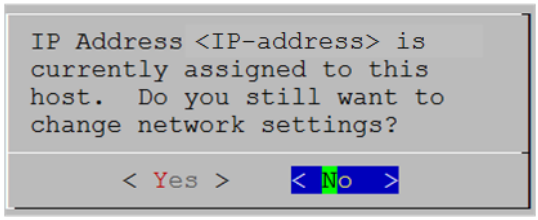
6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.

   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols: **! @ # % ^ +**
   - Numbers: **0-9**
   - Lowercase Characters: **a-z**
   - Uppercase Characters: **A-Z**

   No ambiguous characters are supported for Master Password and Deployment Password. For example:
   space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

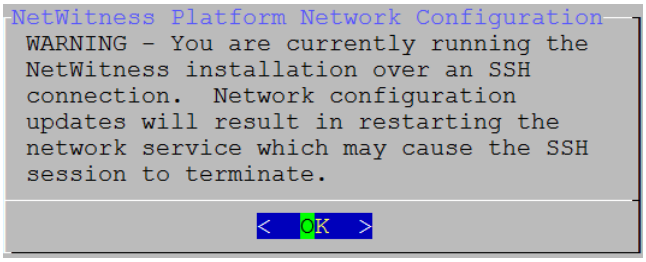
   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.

Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

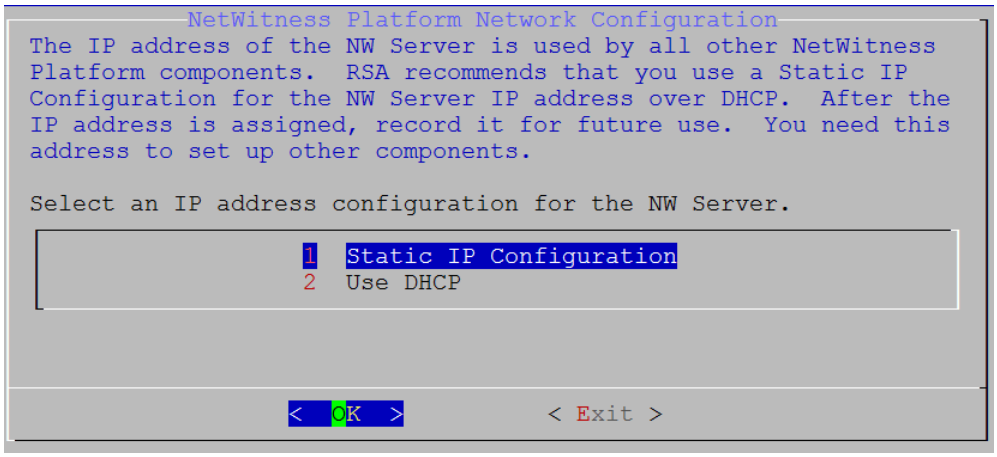
8. One of the following conditional prompts is displayed.



- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration on the host.

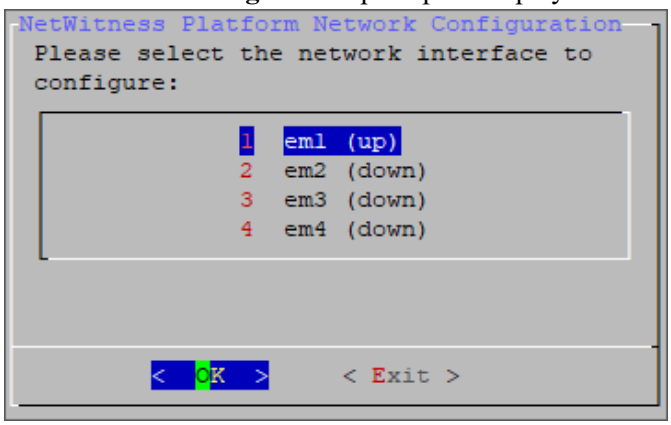
- If you are using an SSH connection, the following warning is displayed.



Note: If you connect directly from the host console, the following warning is not displayed.

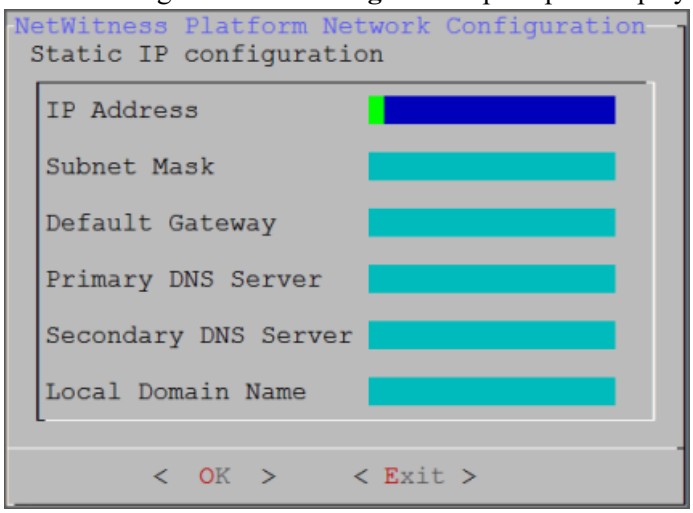
Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.
- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.



Caution: Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.

Tab to **OK** and press **Enter** to use **Static IP**.



If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.

The **Network Configuration** prompt is displayed.

9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**

   The following **Static IP Configuration** prompt is displayed.

10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

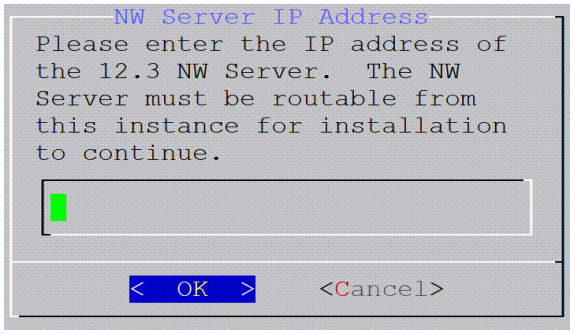
11. The Use Network Address Translation (NAT) prompt is displayed.

    For the NW Server, tab to **No** and press **Enter**.
    For component hosts, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

12. The **Update Repository** prompt is displayed.

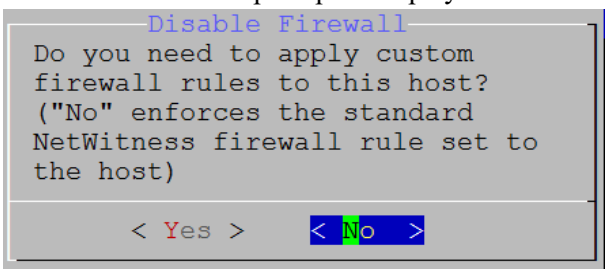
    For the NW Server:

    - Press **Enter** to choose the **Local Repo**.
    - If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 12.3. If the program cannot find the attached media, you receive the following prompt.



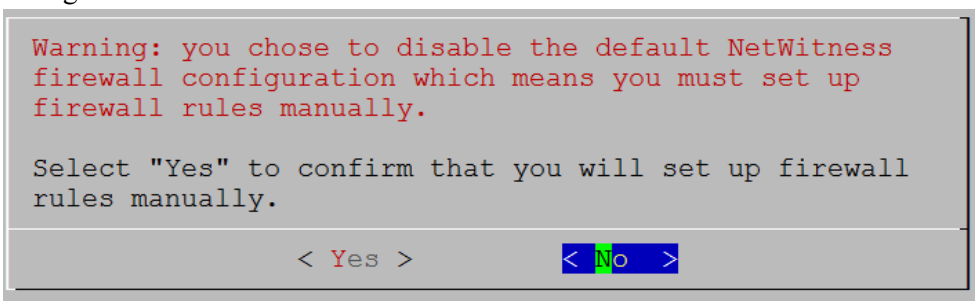
- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.



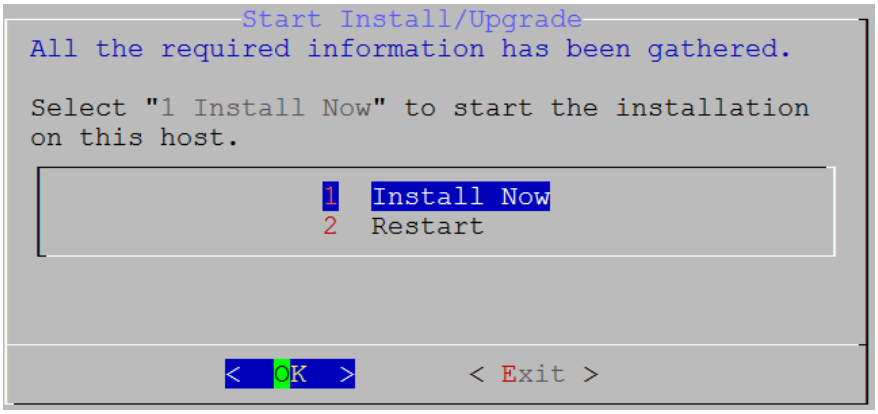
For component hosts:

- Select the same repo that you selected when you installed the NW Server host and follow the steps above.
- The NW Server IP Address prompt is displayed.



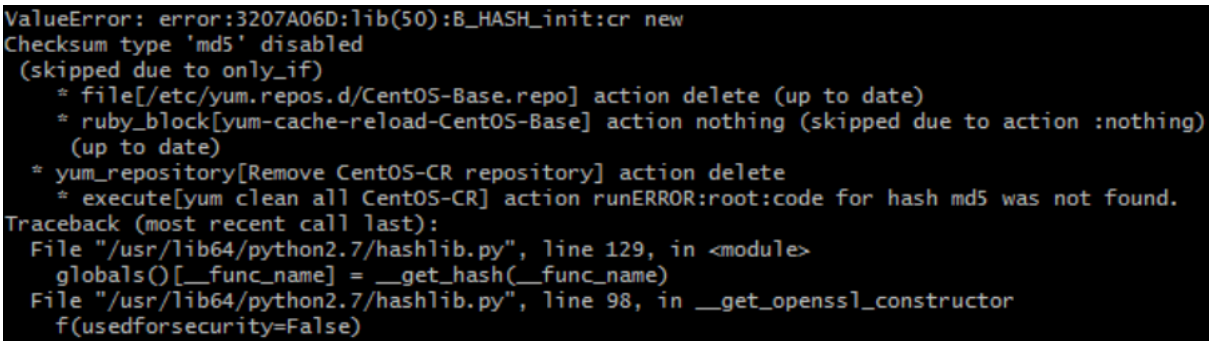
Type the NW Server IP address. Tab to **OK** and press **Enter**.

13. The Disable firewall prompt is displayed.



Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall

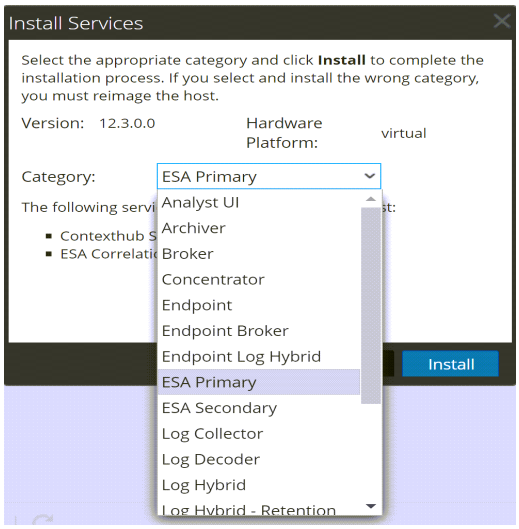
configuration.



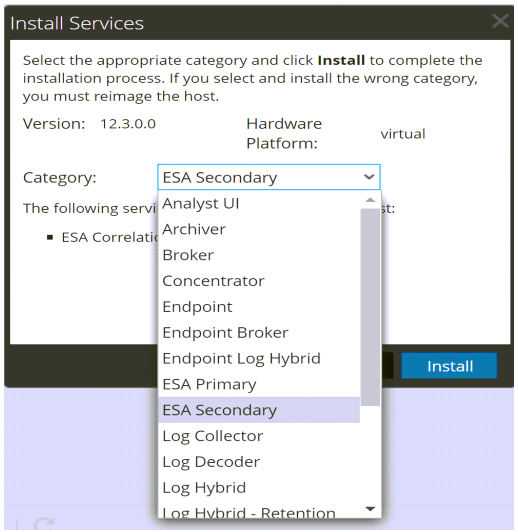
14. The **Start Install** prompt is displayed.

15. Press **Enter** to install 12.3.
When **Installation complete** is displayed, you have installed 12.3 on this host.

Note: Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
`nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`



Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 12.3 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:

- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:

Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host:

   a. Log into NetWitness and go to (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

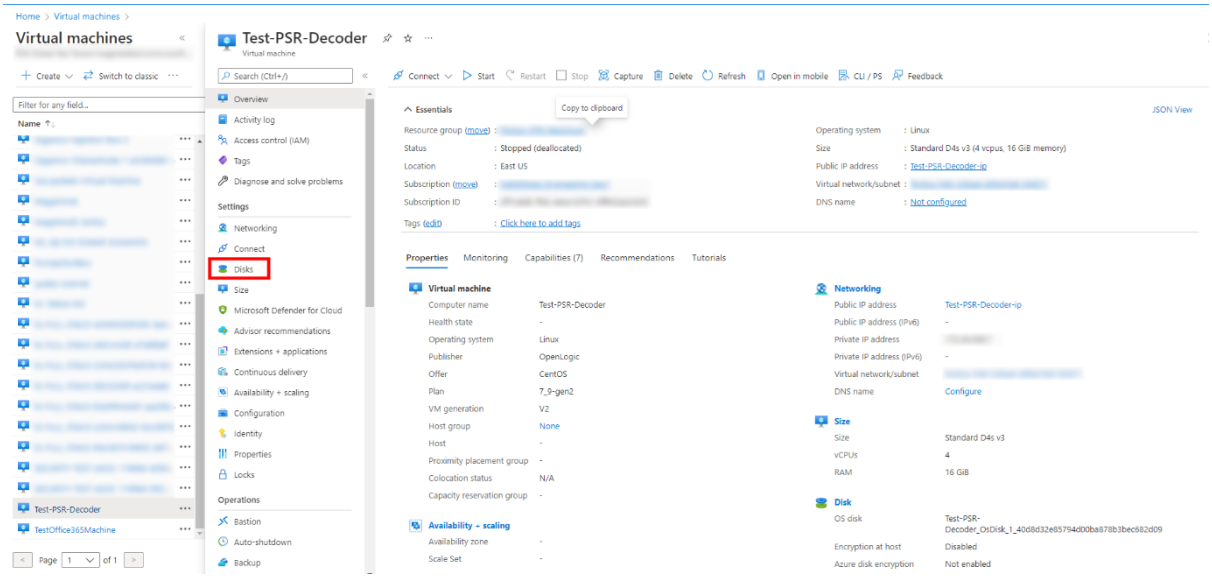
   b. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view and click Install.
   The **Install Services** dialog is displayed.

   d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.

Complete Licensing Requirements

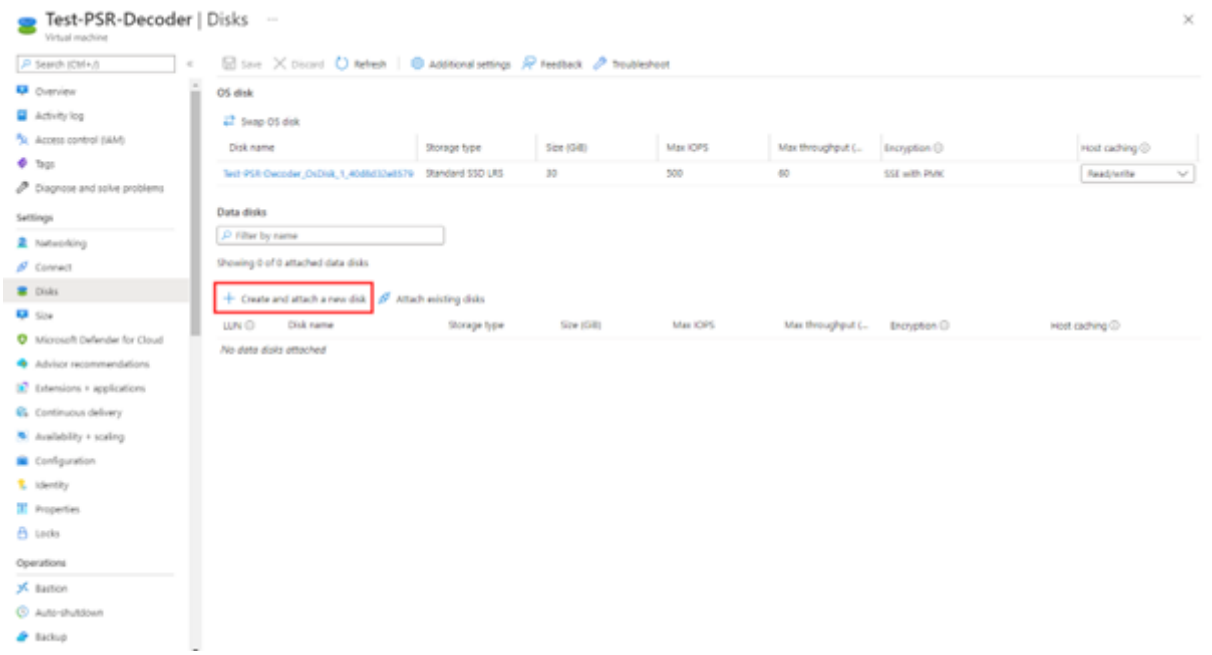
Complete licensing requirements for installed services. See the *NetWitness Platform 12.3 Licensing Management Guide* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.



(Optional) Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for NetWitness Platform 12.3* for instructions on how to set up a Warm Standby NW Server.

NetWitness Azure Storage Allocation Procedure

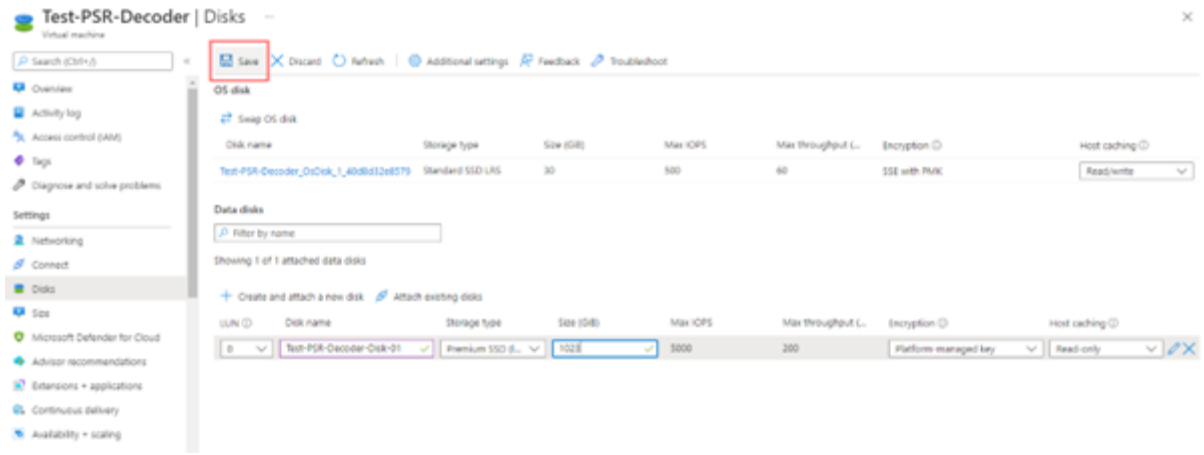


To allocate storage in NetWitness Platform 12.3.0.0, perform the following steps:

1. In Microsoft Azure portal (https://portal.azure.com/), go to **Virtual Machines**.
2. Click the required VM > **Disks**.

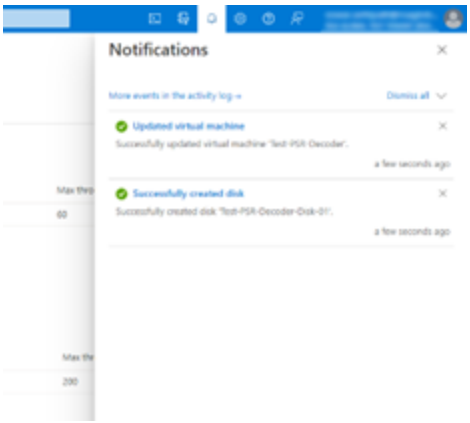
3. Click **Create and attach a new disk**.

> **Note:** You need to add the appropriate amount of disks / IOPS to meet the retention requirements. If you need to add more than a single disk, a RAID configuration is needed.



4. In the Disks view,
   a. Enter the Disk name.
   b. Select the storage type of disk.

Note: Premium SSD with high throughput / IOPS is recommended for Concentrator-IndexDB, Decoder-PacketDB.



c. Select appropriate disk tier and size based on IOPS / Required retention. For more information, refer Azure Managed Disks documentation (https://docs.microsoft.com/en-us/azure/virtual-machines/disks-types).

d. Enable **Read/write** caching.

5. Click **Save** to finish adding the disk.

6. Once the disk is saved, the success notification messages are displayed in the **Notifications** view.

RAID Creation

NetWitness recommends striping the disks to get better performance / IOPS with added disks for deployments that require high IOPS/ throughput (for example: a packet decoder with 1.5Gbps). **Mdadm** Utility is used to create a raid array.

Parameters related to Raid Array Creation

- `--create`: Name of the managed disk you want to create. Usually, the name begins with /dev/md0, /dev/md1, and /dev/md2.
- `--level`: Raid level for creating an array. It can be 0, 1, 5, 6, or 10.
- `--raid-devices`: Total count of the disks to be configured in an array along with device names separated by space.

  For Example: `--raid-devices`=5 /dev/sdc /dev/sdd /dev/sde /dev/sdf /dev/sdg

Steps to create a Raid Array

Follow the steps below after the required disks are added to the Host VM

1. Identify the name of the newly added disks. Run the command `lsblk`.

   For Example: **/dev/sde** and **/dev/sdf**

2. Select the set of disks as part of your RAID-5 configuration.

   For example: Select the disks **/dev/sde**, **/dev/sdf**, **/dev/sdg**, **/dev/sdh** as part of your PacketDB for Decoder.

3. Run the command `mdadm --create /dev/md0 --assume-clean --level 5 --raid-devices=4 /dev/sde /dev/sdf /dev/sdg /dev/sdh`.

4. Check the status of the disks once the RAID configuration is created. Run the following command

   `mdadm--detail`

5. Run the command `vgcreate -s 32 decodersmall1 /dev/md0` to create a volume group **decodersmall1** which will span across the entire RAID configuration.

6. Run the command `lvcreate -L 4T -n packetdb decodersmall1` to create a logical volume **PacketDB** on **decodersmall1**.

7. Run the command `mkfs.xfs /dev/mapper/decodersmall1-packetdb` to format the newly created logical volume to an xfs partition required by the NetWitness services.

8. Make entries in the `/etc/fstab` configuration file to mount the logical volume (created) and retain the logical volumes even after a system reboot.

9. Run the command `mdadm --detail --scan > /etc/mdadm.conf` to create and store the information about the RAID configurations in the file. On system reboot, the RAID configuration is retained.

10. Run `reconfig api` on the core-service database node to update the database directory settings.

Example Scenario

The below commands describe the steps to configure a RAID-5 for PacketDB with 4 disks.

```
mdadm --create /dev/md0 --assume-clean --level 5 --raid-devices=4 /dev/sdc /dev/sdd /dev/sde /dev/sdf

vgcreate -s 32 decoder /dev/md0

lvcreate -L 3.9T -n packetdb decoder

mkfs.xfs /dev/mapper/decoder-packetdb
```

```
echo "/dev/decoder/packetdb /var/netwitness/decoder/packetdb xfs
noatime,nosuid 1 2" >> /etc/fstab
mount -a
mdadm --detail --scan > /etc/mdadm.conf
```

Note: For more information regarding Azure Disks, see Azure managed disk types, Configure software RAID, Performance tiers for managed disks, and Change the performance of Azure managed disks using the Azure portal.

Configure Hosts (Instances) in NetWitness Platform

Configure individual hosts and services as described in NetWitness *Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

Note: After you successfully launch an instance, Azure assigns a default hostname to it. For more information, see "Change Host Network Configuration" in the *System Maintenance Guide* for instructions on changing a hostname. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Configure Packet Capture

You can integrate one of the following third-party solutions with the Network Decoder to capture packets in the Azure cloud environment.

- Gigamon GigaVUE
- Ixia CloudLens

Integrate Gigamon GigaVUE with the Network Decoder

You can access Gigamon Visibility Platform through the Azure Marketplace on the Azure portal. It is activated by a BYOL license. A thirty-day free trial is also available. For more information on the Gigamon solution, see GigaVUE Cloud Suite for Azure.

For more information regarding GigaVUE Deployment, see https://docs.gigamon.com/doclib515/Content/GV-Cloud-Azure/preface-Azure.html?tocpath=GigaVUE%20Cloud%20Suites%7CAzure%7C_____0.

You will see the traffic incoming on NW Decoder Host once the **Monitoring Session** is deployed within the **Gigamon GigaVUE-FM** with Decoder receiver NIC as tunnel.

Integrate Ixia with the Network Decoder

Keysight Ixia CloudLens SaaS is a Network Visibility platform. For more information on the CloudLens solution, see https://www.keysight.com/in/en/products/network-visibility/cloud-visibility/cloudlens/cloudlens-saas.html.

You must complete the following tasks to integrate the Network Decoder with Ixia CloudLens.

Task 1. Deploy Client Machines

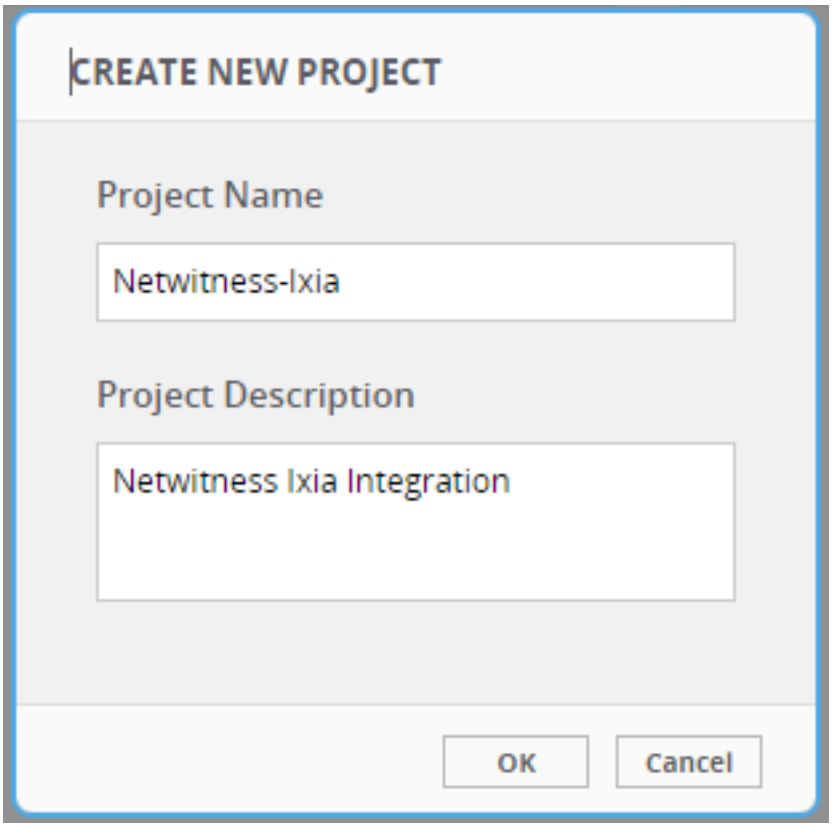
Task 2. Create CloudLens Project
Task 3. Install Docker Container on Decoder
Task 4. Install Docker Container on Clients
Task 5. Map Network Decoder to Ixia Clients
Task 6. Validate CloudLens Packets Arriving at Decoder
Task 7. Set the Interface in the Network Decoder

Task 1. Deploy Client Machines

- Deploy client machines from which you want to route the traffic to the Network Decoder. See the Ixia CloudLens documentation (**https:<CloudLensManager_IP>/cloudlens/docs/Default.htm**) for specifications needed for supported client machines.

Note: <CloudLensManager_IP> is the respective CloudLens Manager instance.

Note: Modify the VM's network security group to allow incoming traffic on following ports:
- **TCP: 22 (SSH)**: Connection to the instance / VM.
- **IP Protocol: 47 (GRE)**: Required by CloudLens Sensor Tap to send the tapped traffic to the Sensor Tool.
- **UDP Protocol: 19993 (Encrypted Tunnel)** – Required by CloudLens Sensor Tap to send the tapped traffic to the Sensor Tool.



For more information, see https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg.

Task 2. Create CloudLens Project

1. Login to **Ixia Cloudlens Manager** and go to the **Configure** Page.
2. Click + (add) to create a new project.
3. In the **CREATE NEW PROJECT** view,
   - Enter the Project Name

     For Example: **Netwitness-Ixia**.
   - Enter the Project Description

     For Example: **Netwitness Ixia Integration**.

4. Click **OK**.
5. Click **SHOW PROJECT KEY** to get the API Key for the project.

   The key is required to configure the **Host and Tool agents**.

Task 3. Install Docker Container on Decoder

1. SSH to Network Decoder.
2. Setup the docker. For more information on how to setup the docker, see https://docs.docker.com/engine/install/centos/.
3. Run the following commands to setup Docker insecure-registry parameter and pull the sensor image from CloudLens:

```
echo "{\"insecure-registries\":[\"<CloudLens_IP_here>\"]}" | sudo tee /etc/docker/daemon.json

sudo systemctl enable docker.service

sudo service docker restart
```

4. Pull the CloudLens agent docker image. Run the following command:

```
sudo docker pull <CloudLens_IP_here>/sensor
```

5. Start the CloudLens agent with **ProjectKeyFromIxiaProjectPortal** retrieved from Task 2. Create CloudLens Project and CloudLens Manager IP. Run the following command:

```
sudo docker run -v /lib/modules:/lib/modules -v /var/log:/var/log/cloudlens -v /:/host -v /var/run/docker.sock:/var/run/docker.sock --cap-add SYS_MODULE --cap-add SYS_RESOURCE --cap-add NET_RAW --cap-add NET_ADMIN --name cloudlens-agent -d --restart=on-failure --net=host --log-opt max-size=50m --log-opt max-file=3 <CloudLens_IP_here>/sensor --accept_eula yes --project_key ProjectKeyFromIxiaProjectPortal --server <CloudLens_IP_here> --ssl_verify no
```

Task 4. Install Docker Container on Clients

1. SSH to Azure VM with root privileges.
2. Setup the docker for the OS / Distributions. For more information, see https://docs.docker.com/engine/install/.
3. Run the following commands to setup Docker insecure-registry parameter and pull the sensor image from CloudLens:

```
echo "{\"insecure-registries\":[\"<CloudLens_IP_here>\"]}" | sudo tee /etc/docker/daemon.json

sudo systemctl enable docker.service

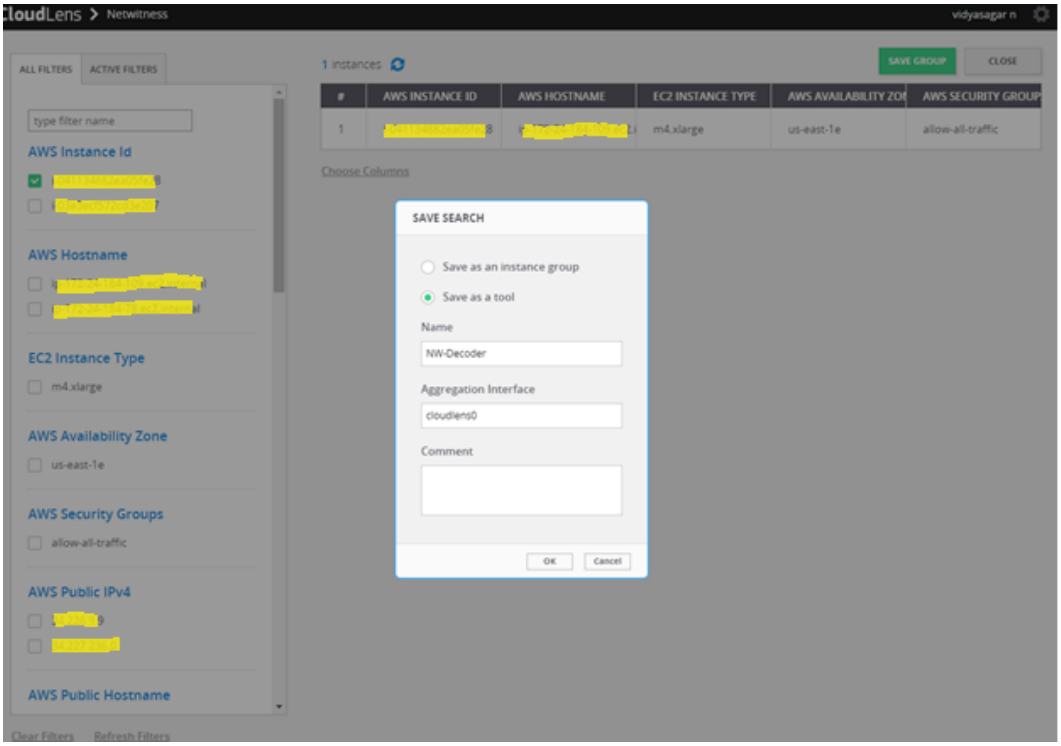
sudo service docker restart
```

4. Pull the CloudLens agent docker image. Run the following command.

```
sudo docker pull <CloudLens_IP_here>/sensor
```

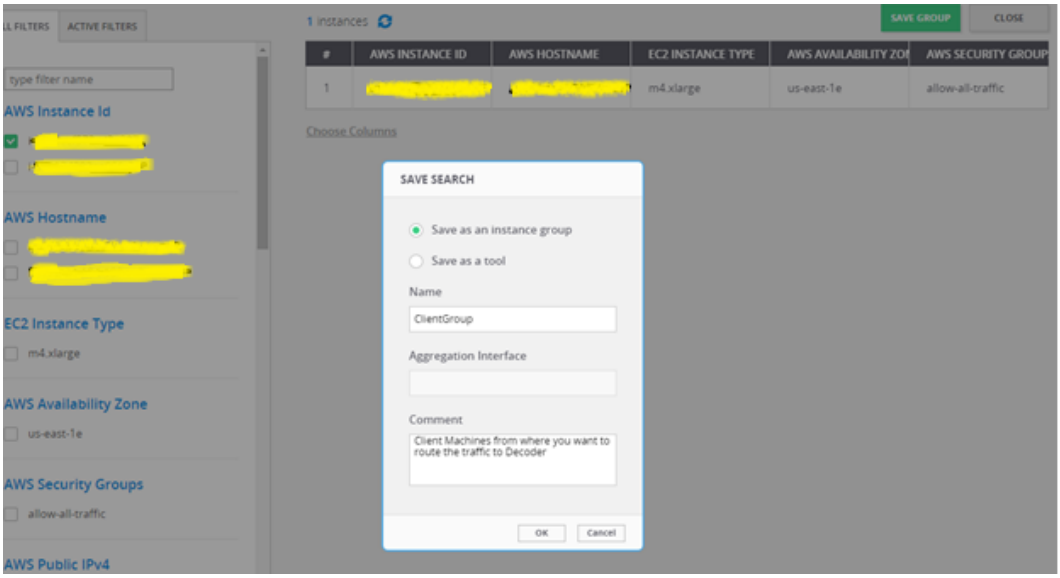
5. Start the CloudLens agent with **ProjectKeyFromIxiaProjectPortal** retrieved from Task 2. Create CloudLens Project and CloudLens Manager IP. Run the following command.

```
sudo docker run -v /lib/modules:/lib/modules -v /var/log:/var/log/cloudlens
-v /:/host -v /var/run/docker.sock:/var/run/docker.sock --cap-add SYS_
MODULE --cap-add SYS_RESOURCE --cap-add NET_RAW --cap-add NET_ADMIN --name
cloudlens-agent -d --restart=on-failure --net=host --log-opt max-size=50m -
-log-opt max-file=3 <CloudLens_IP_here>/sensor --accept_eula yes --project_
key ProjectKeyFromIxiaProjectPortal --server <CloudLens_IP_here> --ssl_
verify no
```



Task 5. Map Network Decoder to Ixia Clients

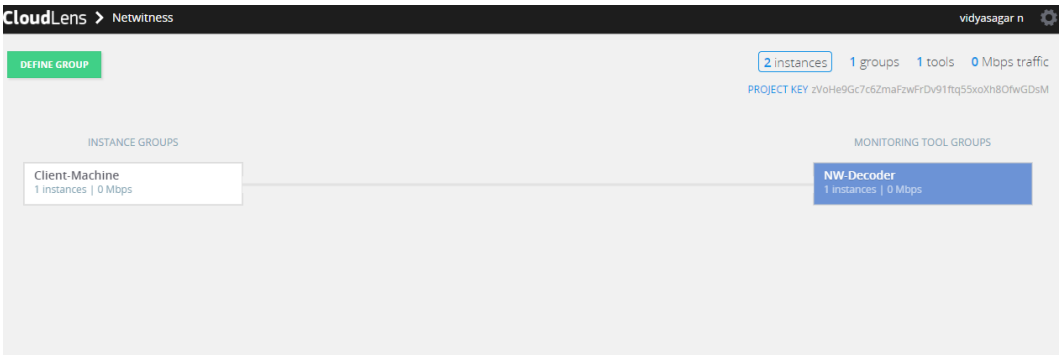
Map the Network Decoder to the client machines to route the traffic to the Network Decoder. Do the following:



1. Go to the **CloudLens Manager** UI.
2. Click on your project and open it.
3. Click **Define Group** or the Instances count.

   You should see two instances listed, one for your decoder and the other for the client machines.
4. Apply filter for the decoder instance and click **Save Search**.
5. Select **Save as a tool**.
6. Specify a name for the tool and the **Aggregation Interface**.

> **Note:** Use a meaningful name for the Aggregation Interface (for example **cloudlens0**. This is a virtual interface that appears in the OS where your Tool is installed. You need to instruct your tool to 'listen' to that interface in a subsequent step.

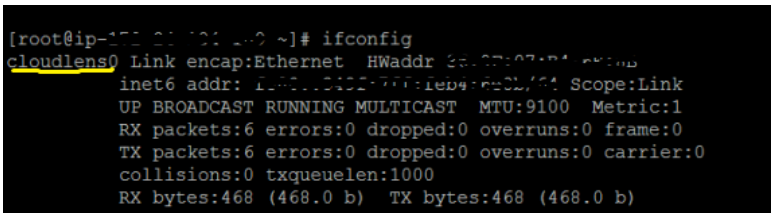


7. Apply filter for the client host instance from the list and click **Save Search**.

8. Navigate back to the top-level view of the project.

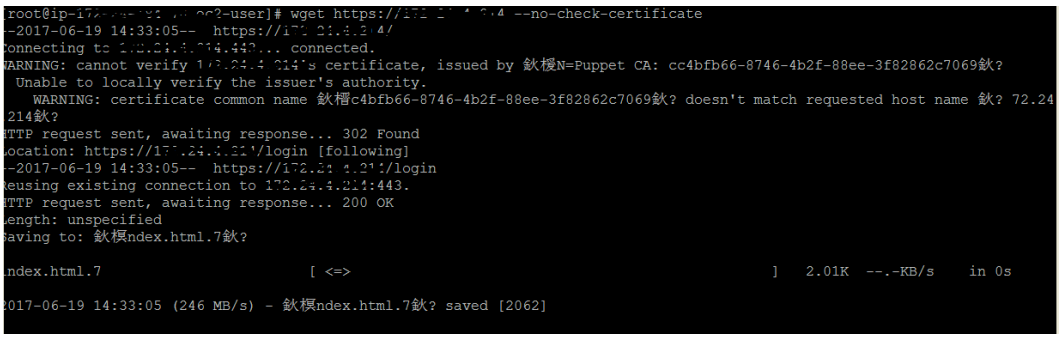
   Your client machine instance and Decoder instance are now displayed.

9. Drag a connection between the client machine instance and Decoder instance to allow the flow of packets.



Task 6. Validate CloudLens Packets Arriving at Decoder

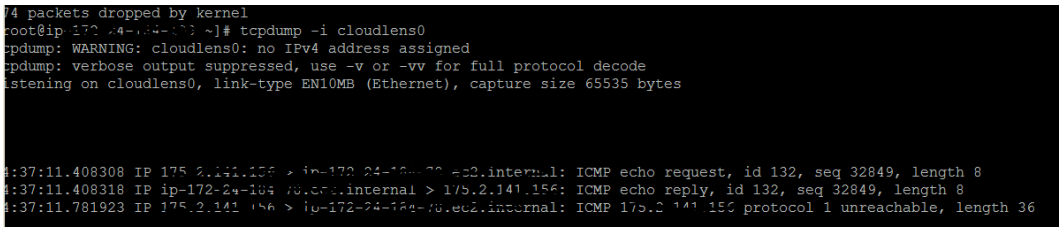
Complete the following steps to validate that the packets are actually arriving at the Network Decoder.



1. SSH to the Network Decoder.
2. Run the following command.

   ```
   ifconfig
   ```

   The new aggregation interface you created is displayed.

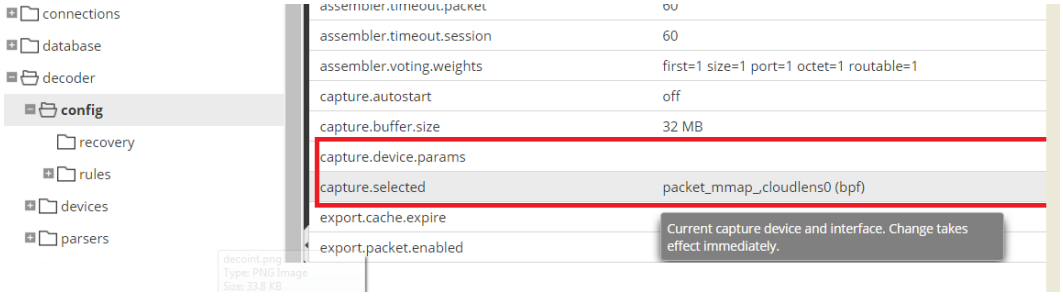


3. Generate traffic from the client OS instance CLI (for example: `wget http://www.google.com/`).

4. SSH to the Network Decoder and go to your Network Decoder instance CLI.
5. Run the following command to look for suitable results in the tcpdump.

   `tcpdump -I Cloudlens0`

Task 7. Set the Interface in the Network Decoder



Complete the following steps in the Network Decoder to set the interface for the Ixia integration.

1. SSH to the Network Decoder.
2. Run the following command to restart the decoder service:

   `$ sudo restart nwdecoder`

   The Network Decoder is now set to capture the network traffic.
3. Log in to NetWitness and click  **(Admin) > Services**.
4. Select a Decoder service and click  > **View > Explore**.
5. Expand the **decoder** node and click **config** to view the configuration settings.

6. Set the **capture.selected** parameter to the following value.
   packet_mmap_,cloudlens0(bpf)

7. Restart the Decoder service after you set the **capture.selected** parameter.

Appendix A. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-firewall=false --ip-override=false --eula=true
   ```

Note: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to  **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click 

.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

Arguments

Argument	Description
`--help-install-opts`	Display all the arguments in this table.

Argument	Description
`--eula`	Accept or decline the End User License Agreement (EULA). Specify: • `true` (default) to accept the agreement • `false` to decline it and cancel the installation. For example: `--eula=true`
`--is-head`	Designate the host as the NW Server host or a component host. Specify: • `true` for NW Server host. • `false` for Component host. For example: `--is-head=true`
`--host-name`	Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname. For example: `--host-name=<hostname>`
`--master-pass`	Enter master password. For example: `--master-pass=<password>`
`--deploy-pass`	Enter deployment password. For example: `--deploy-pass=<password>`
`--iface-name`	Specify network interface. For example: `--iface-name=eth0`
`--ip-override`	Accept or override IP address found for this host or change the IP configuration found on the host. Specify: • `true` provide IP address. • `false` use IP address found on the host. For example: `--ip-override=false`
`--ip-type`	Select ip address configuration type. Specify: • `1` Static IP Configuration) • `2` DCHP For example: `--ip-type=1`
`--ip-addr`	For Static IP configuration, enter IP Address for static address. For example: `--ip-addr=<ip-address>`
`--ip-netmask`	For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>`

Argument	Description
`--ip-gateway`	For Static IP configuration, enter default gateway for static address. For example: `--ip-gateway=<default-gateway>`
`--ip-nameserver`	IP address assigned to DNS server. `--ip-nameserver=<ip-address>`
`--ip-nameserver-secondary`	Optional - IP address assigned to a secondary DNS server. For example: `--ip-nameserver-secondary=<ip-address>`
`--ip-domain`	For Static IP configuration, enter Local Domain Name for static address. For example: `--ip-domain=<default-gateway>`
`--repo-type`	Select type of update repository. Specify: • `1` Local repository • `2` External repository For example: `--repo-type=1`
`--repo-url`	For an external update repository, specify the url of the repository. For example: `--repo-url=<url>`
`--head-ip`	For a component host, specify IP Address of the NW Server. For example: `--head-ip=<ip-address>`
`--custom-firewall`	Disable default firewall configuration and use your custom configuration. Specify: • `true` use custom firewall configuration. • `false` use default firewall configuration. For example: `--custom-firewall=true`
`--use-nat`	Configure the host to use Network Address Translation (NAT) based IP addresses: • `true` use NAT IPs to connect to other hosts • `false` do not use NAT IPs to connect to other hosts (default) For example: `--use-nat=false`

Broker and Concentrator Basics

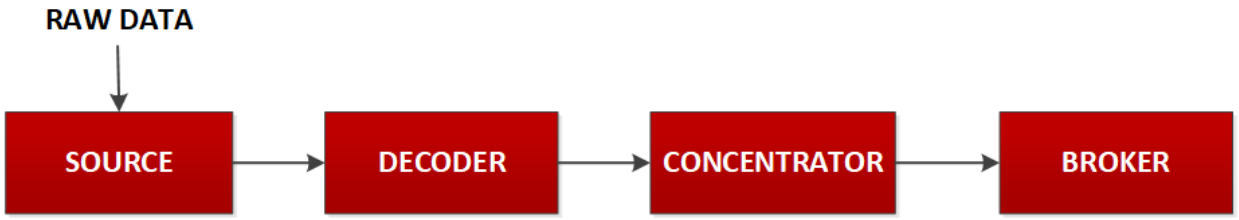
Concentrators and Brokers aggregate data captured or aggregated by other services unlike Decoders, which capture data.

NetWitness supports the following Broker and Concentrator services:

- Brokers - aggregate data across entire infrastructure from configured Concentrators. You can have multiple concentrators aggregating into one broker. You can also have multiple brokers aggregating into a single broker.
- Concentrators - aggregates and analyzes data across multiple capture locations from decoders, indexes and directs queries.

You can configure various Brokers and Concentrators together under a Broker. Brokers are able to pull in data quickly from the Concentrators because they acquire index information only. This configuration is done using the NetWitness user interface. Most of the configuration is performed in the Administration Services view (**(Admin) > Services**).

You can also configure the aggregate services and perform the whole aggregation process using the Services view. This helps setup aggregation autostart, timing and performance parameters, maximum number of open meta and session files. In addition to this, you can also time the attempts to restart, reconnect, or take a non-responsive aggregate service offline. Configuring Aggregate services includes managing Concentrators and Decoders as aggregate services. You can also limit the data being consumed from an aggregate service using meta fields and filters. The aggregation tasks are performed in the General tab of Administration Services view (**(Admin) > Services**).



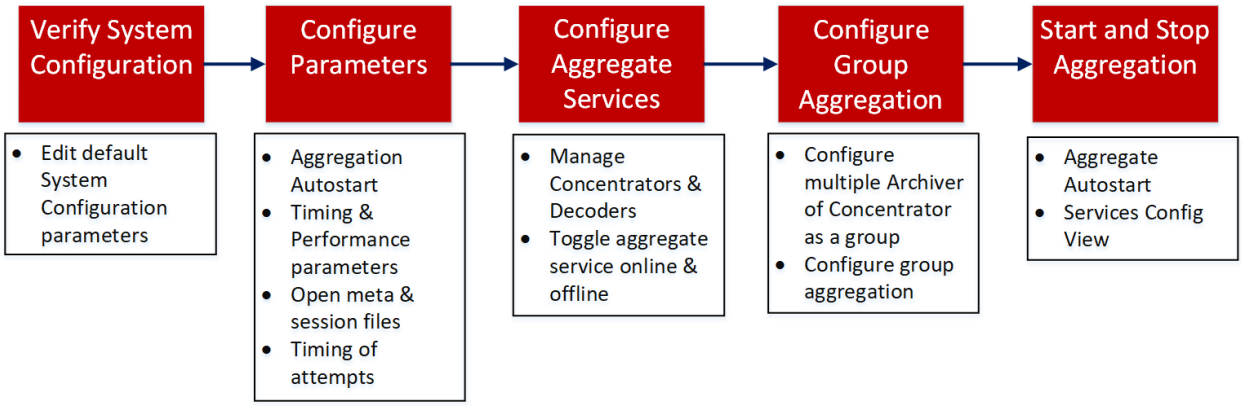
Overview of Broker and Concentrator

Brokers and Concentrators work in conjunction with Decoders and Log Decoders in the NetWitness Platform network. Unlike the two types of Decoders, which capture packets and logs, Concentrators and Brokers aggregate the data captured or aggregated by other services. Brokers aggregate data from configured Concentrators; Concentrators aggregate data from Decoders. A complete overview of the NetWitness Platform is provided in the *NetWitness Platform Getting Started Guide*.

Note: Go to the Master Table of Contents in NetWitness community portal to find and view referenced documents.

As raw data is entered in the system from the source for analysis, it has to be collected and parsed. This raw data is collected, parsed, and stored using a Decoder. The packet data is then indexed, stored, and parsed by the Concentrator. Parsed packet data is also provided as an endpoint for queries. Eventually, the Broker routes queries across multiple Decoder and Concentrator appliances. Here is how information flows to a Concentrator and Broker.

In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

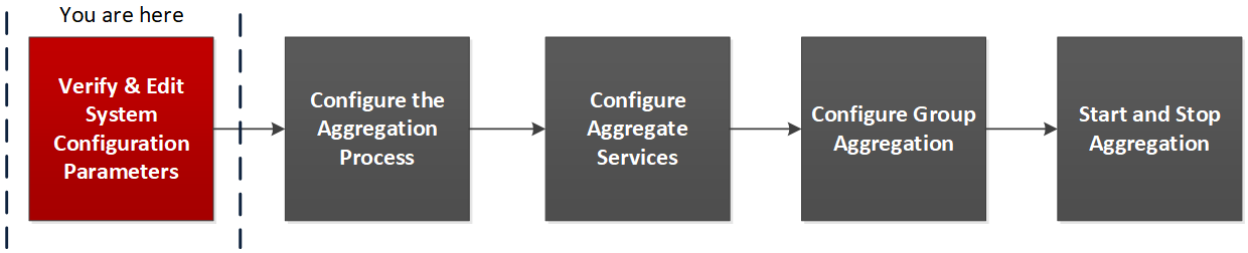


- Concentrator: is required for any large environment to store the Meta data that is generated by the parsers and feeds being triggered by packets and logs ingested into the decoders.
- Broker: The Broker service is similar to the Concentrator service except that it indexes the collected information. It performs virtual mapping of indices on all connected concentrators. Due to the less internal processing performed, the response time is fast. To allow investigation, multiple brokers and/or concentrators report data into a broker.

Broker and Concentrator Configuration

Setting up a Broker or Concentrator involves configuring the basic system parameters, the aggregate services, and the aggregation process between a Broker or Concentrator and the aggregate services.

These are the required configuration steps for a new Broker or Concentrator, and also for changing the configuration of an existing Broker. Perform the steps in the section in the sequence they are given.



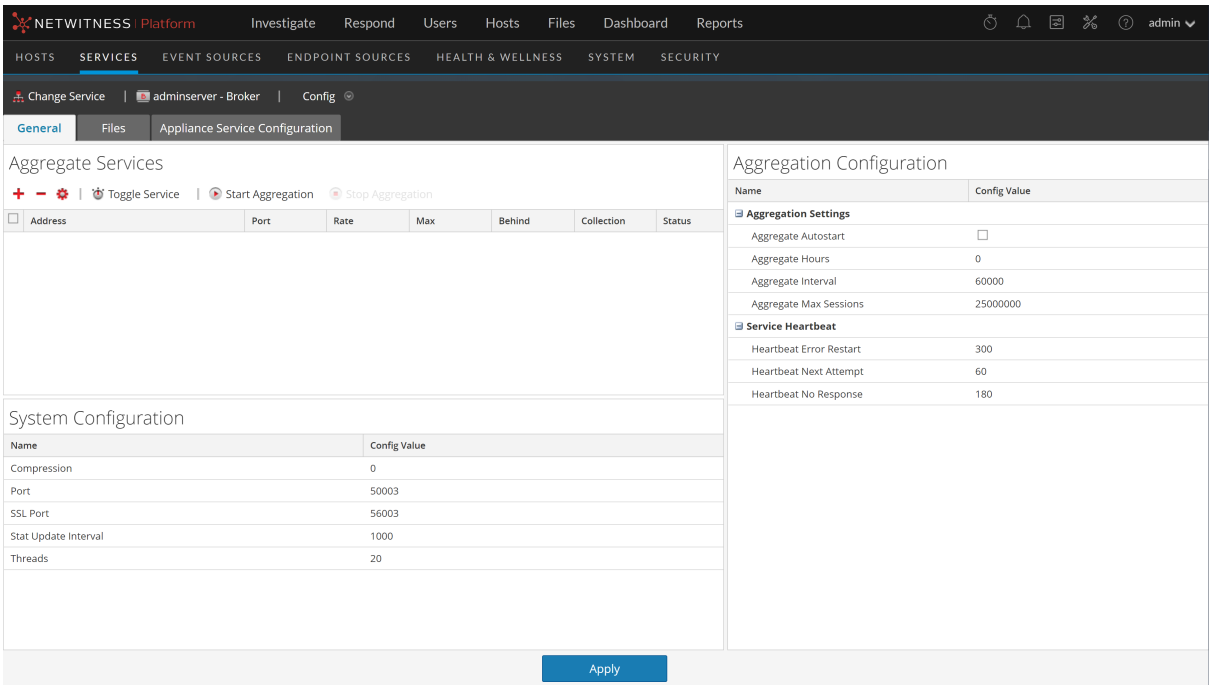
Basic Configuration Checklist

The following checklist provides the sequence for tasks that are required to configure a Broker or Concentrator that has been added to NetWitness in accordance with the *Hosts and Services Guide*.

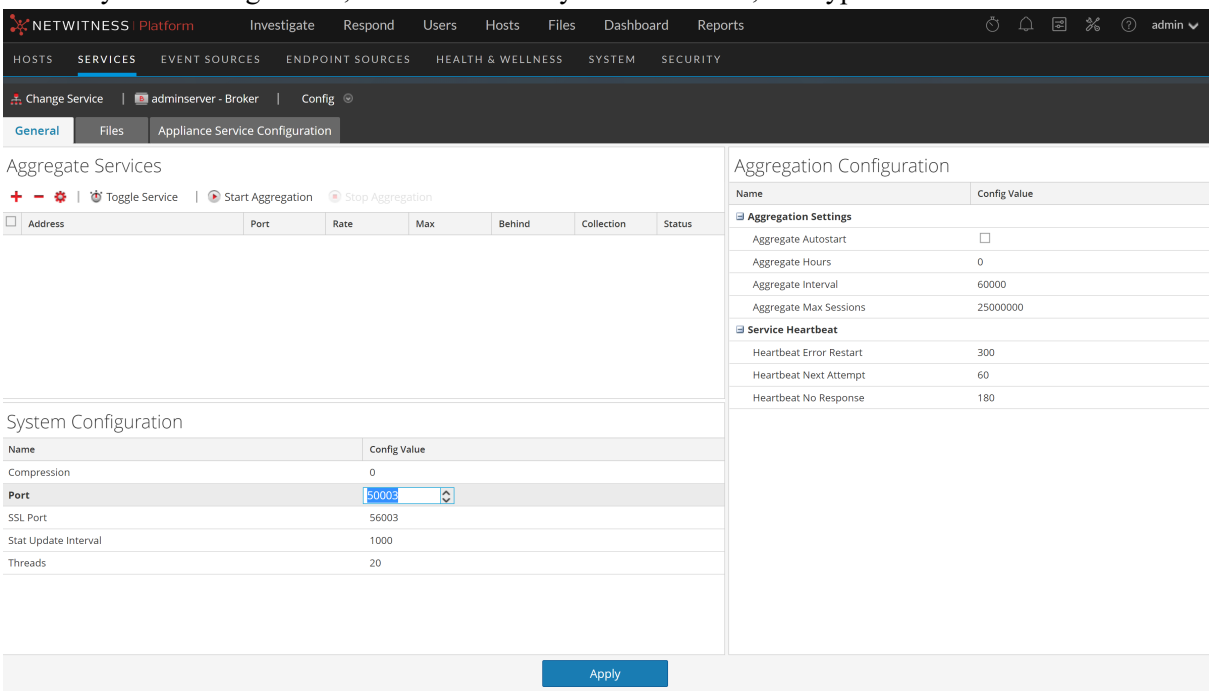
Configuration Step	Description
Step 1 - Verify System Configuration	Verify system configuration default values for the host and service are appropriate as described in Step 1. Verify Service System Configuration
Step 2 - Configure Parameters	Configure parameters that govern the overall aggregation process as described in Step 2. Configure the Aggregation Process
Step 3 - Configure Aggregate Services	Configure aggregate services as described in Step 3. Configure Aggregate Services
Step 4 - Configure Group Aggregation	(Optional) Configure group aggregation as described in Step 4. (Optional) Configuring Group Aggregation
Step 5 - Start and Stop Aggregation	Start and stop aggregation as described in Step 5. Start and Stop Aggregation

Step 1. Verify Service System Configuration

When a service is first added to NetWitness, default values for the system configuration parameters are in effect. You can edit these values to tune performance.



In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

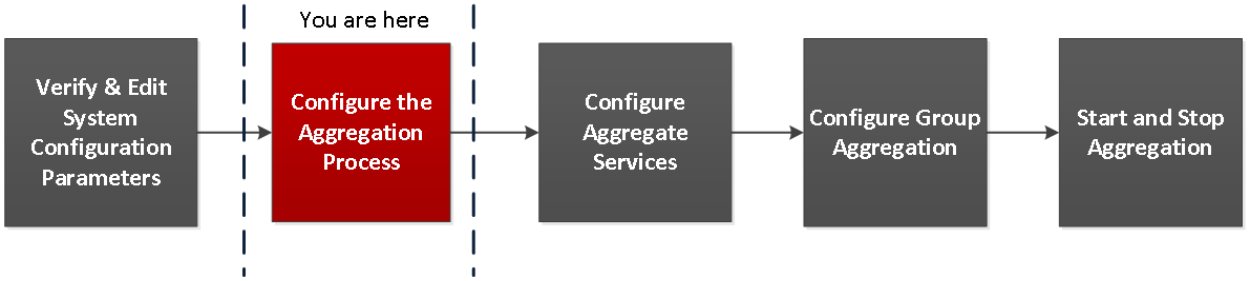


To edit system configuration parameters for a Broker or Concentrator:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select **> View > Config**.

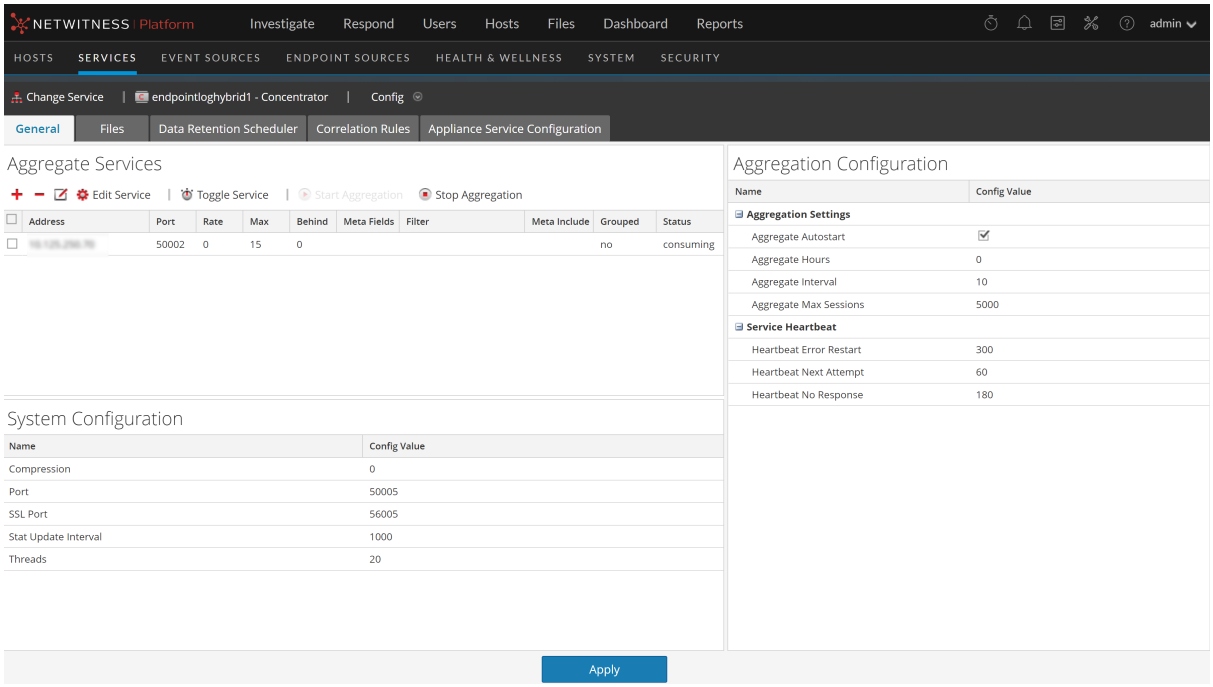
   The Services Config view for the selected service is displayed.

3. Under System Configuration, click a field that you want to edit, and type a new value.



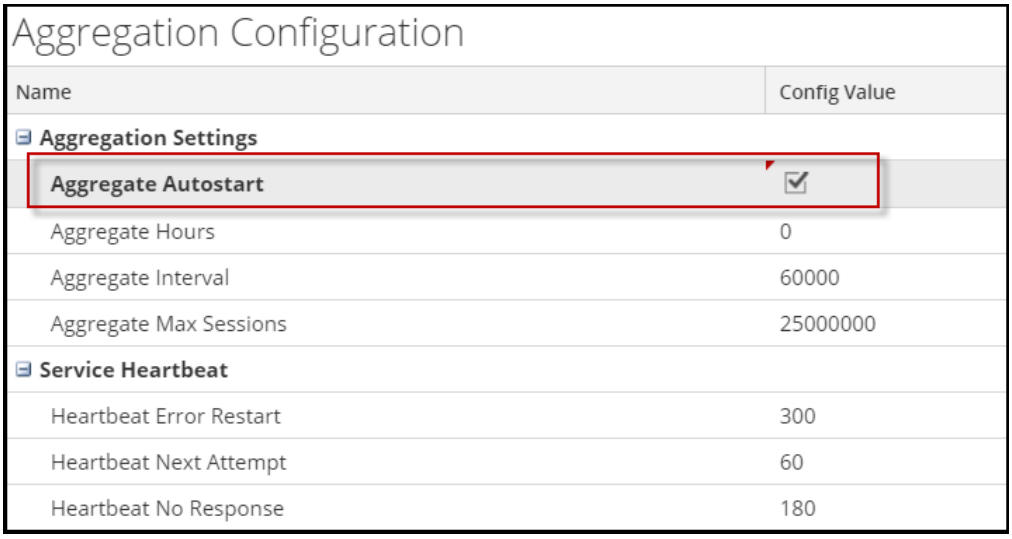
4. When finished editing, click **Apply**.

Step 2. Configure the Aggregation Process



Configuring the aggregation process for a Broker or Concentrator includes setting:

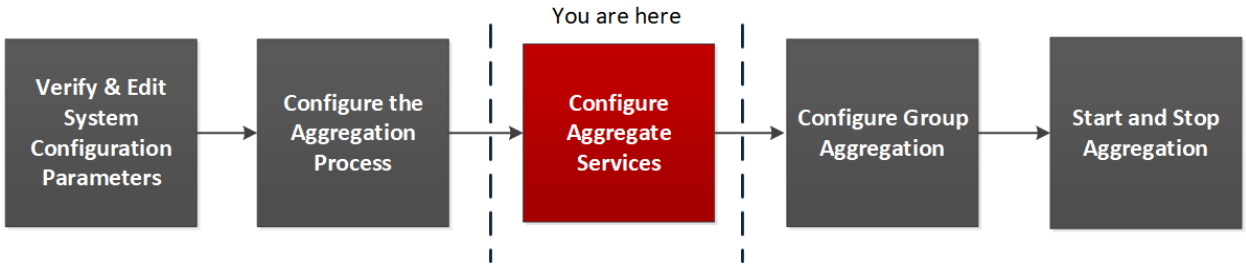
- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- Maximum number of open meta and session files
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service



To configure the aggregation process on a Broker or Concentrator:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select **> View > Config**.
   The Services Config view, which includes the Aggregation Configuration section, is displayed.

3. (Optional) Select **Aggregate Autostart** to enable automatic start of aggregation when a service is online.

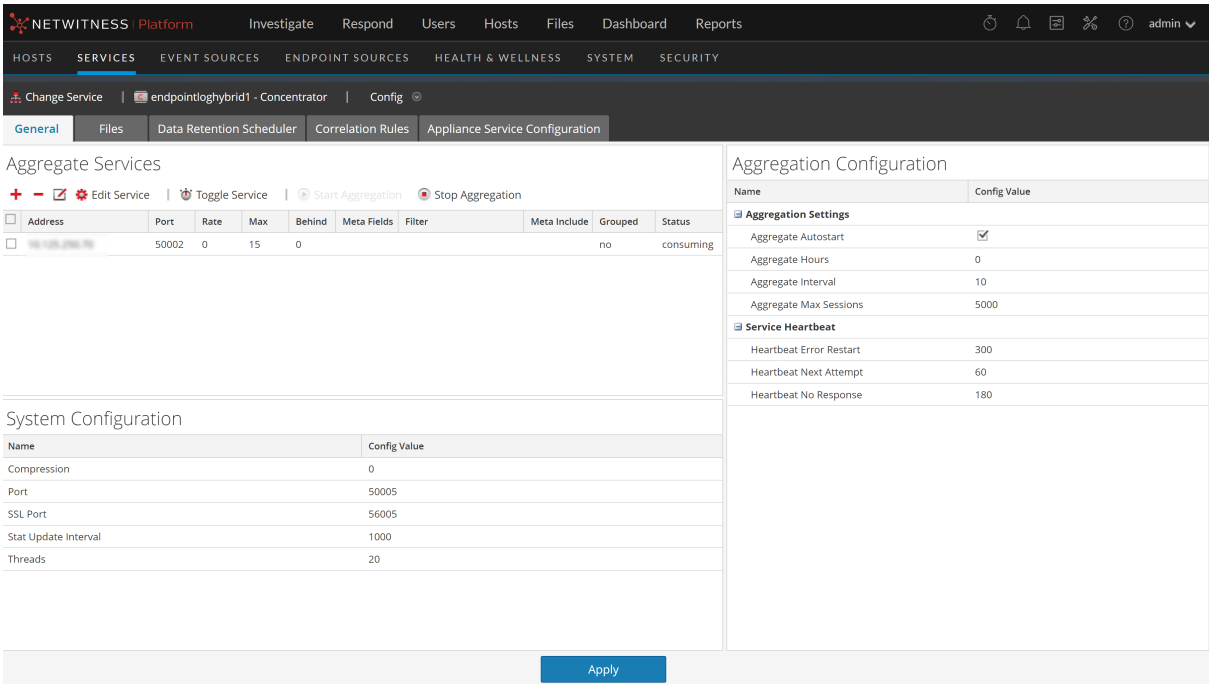


4. (Optional) Edit any of the aggregation settings: the hours back to begin aggregation, the milliseconds between rounds of aggregation, and maximum number of sessions per aggregation round.
5. (Optional) Edit any of the Service Heartbeat settings, which specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.
6. When finished editing the settings, click **Apply**.
   The settings become effective immediately.

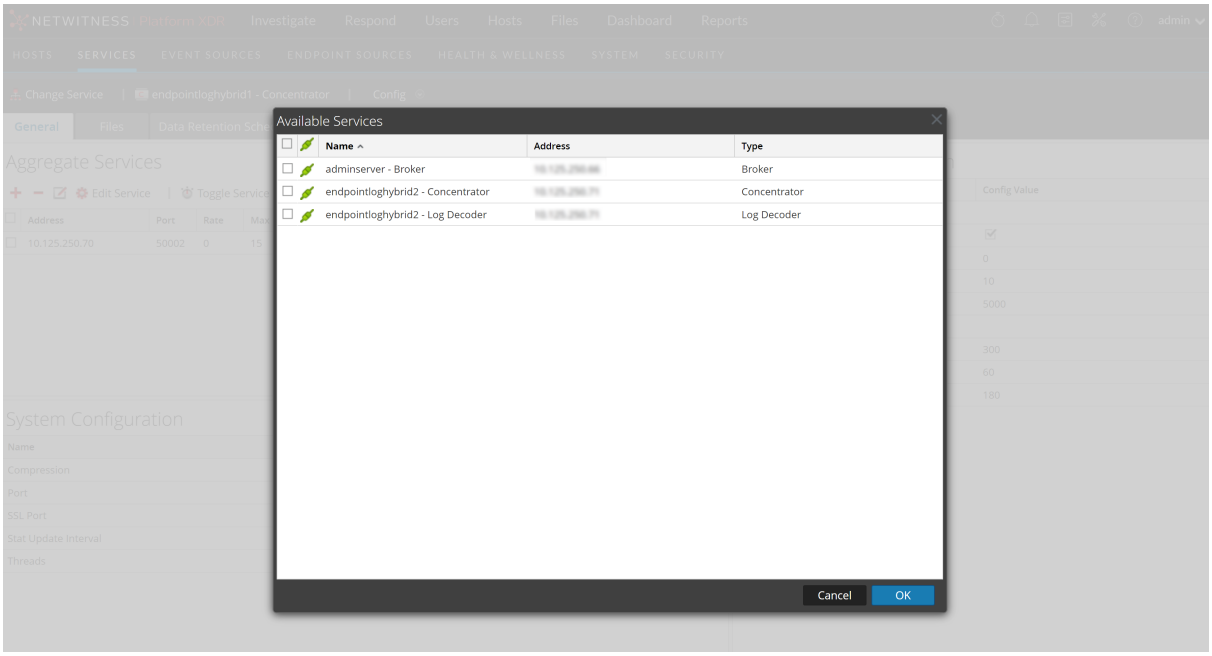
Step 3. Configure Aggregate Services

This topic introduces basic tasks related to data aggregation on Brokers and Concentrators. For information on the optional setup of group aggregation, see Step 4. (Optional) Configuring Group Aggregation.

Configuring the aggregate services (whose data is consumed and aggregated) includes:



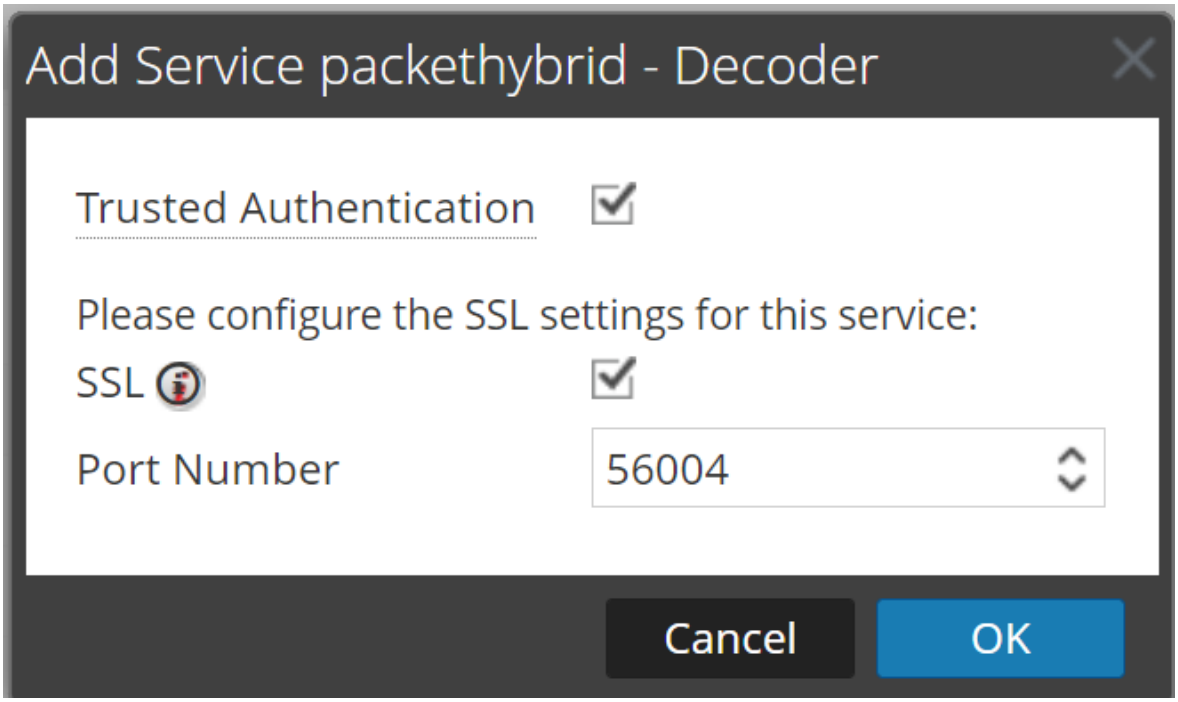
- Adding, editing, and deleting Concentrators and Decoders as aggregate services
- Toggling an aggregate service online and offline



To configure aggregate services to a Broker or Concentrator:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select  **> View > Config**.

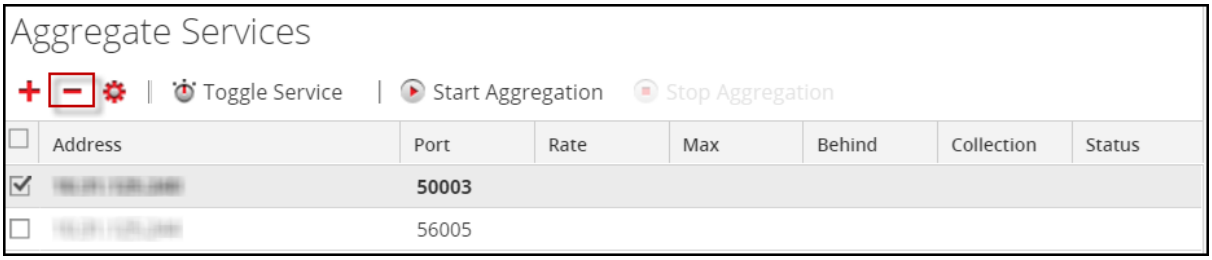
   The Services Config view for the selected service is displayed.



3. Click  in the **Aggregate Services** toolbar.
   The Available Services dialog is displayed.

4. Select one or more services to be added and click **OK**.
5. Use one of the following ways to add a service for aggregation:
   - Use Password-Based Authentication. Enter the Administrator username and password. Click **OK**.

- Select **Trusted Authentication**. Click **OK**.



The added services are listed in the Aggregate Services list.

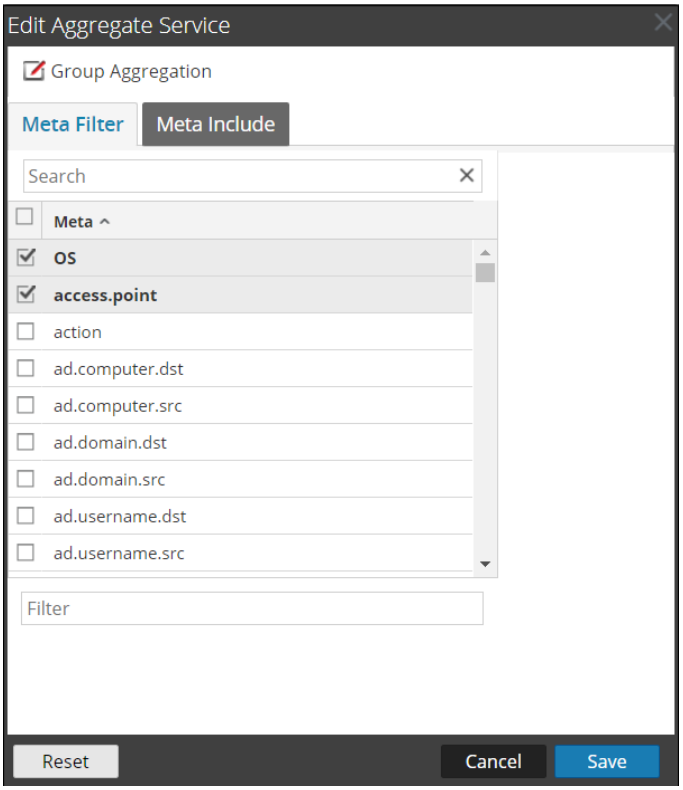
6. To save the changes, click **Apply**.

To remove aggregate services from a Broker or Concentrator:

Note: This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline.

1. In the **Aggregate Services** list, select one or more services.
2. Click − in the toolbar.

The service is removed from Aggregate Services list.



3. To save the change, click **Apply**.

To edit aggregate services on a Concentrator:

Note: This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline. You can edit only one service at a time.

You can limit the data being consumed from an aggregate service using meta fields and filters.

1. Click **Change Service** to change the service to Concentrator.
2. In the **Aggregate Services** list, select one or more services.
3. Click in the toolbar. Enter the authentication information in the pop up dialog box.
   - If the service was added on a different instance of NetWitness, you must add it to this instance of NetWitness in order to edit. A warning dialog allows you to add the service. If you click **Yes**, the Add Service dialog is displayed.
   - If the service is online, a dialog notifies that the service must be offline and requests confirmation that you want to continue. If you click **Yes**, NetWitness takes the service offline and the Edit Aggregate Service dialog is displayed.
   - If the service is offline, the Edit Aggregate Service dialog is displayed with the editable properties for an aggregate service on a Concentrator.
4. Click a type of metadata in the **Meta Include** tab to select the type of metadata for the Concentrator to consume from this service. Click **Save**.

5. To specify a rule to filter data that the Concentrator consumes from this service, compose a rule in the **Meta Filter** tab. Click **Save**.
6. Click **Close**.

   The Edit Aggregate Service dialog closes and the changes are shown in the Aggregate Services list. In this example, two meta were selected on the Meta Include tab. When you click the information icon in the Meta Include field, it shows the selections.
7. To save the changes, click **Apply**.

Toggle a Service

When data aggregation starts, Brokers and Concentrators consume data from aggregate services that are online. When first added to a Broker or Concentrator, aggregate services are offline.

To toggle a service between online and offline:

1. Select a service in the **Aggregate Services** list.
2. Click 

.

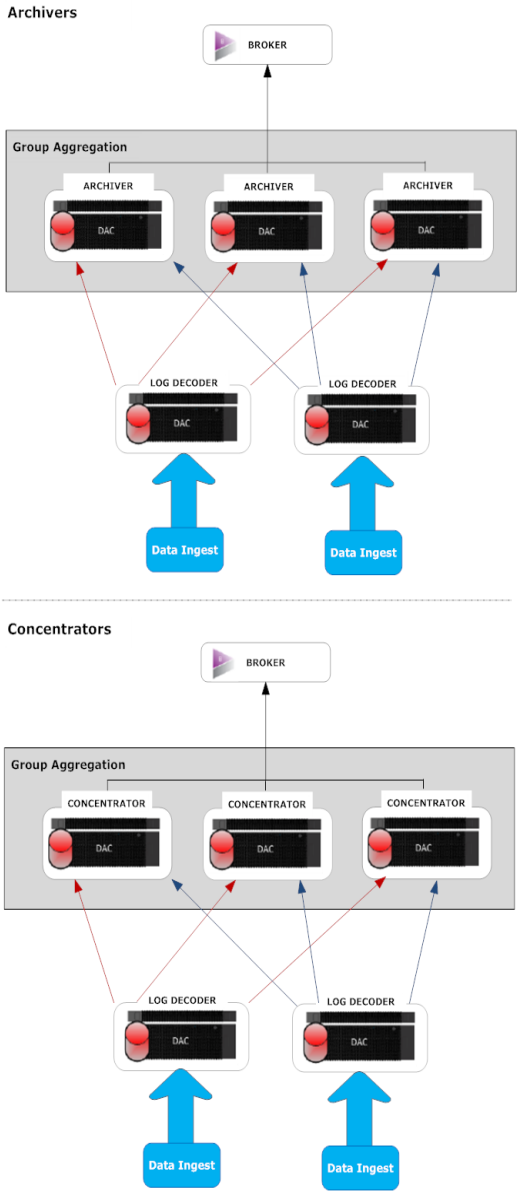
   The status is changed.

Step 4. (Optional) Configuring Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

NetWitness Group Aggregation Deployment Recommendations



NetWitness recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

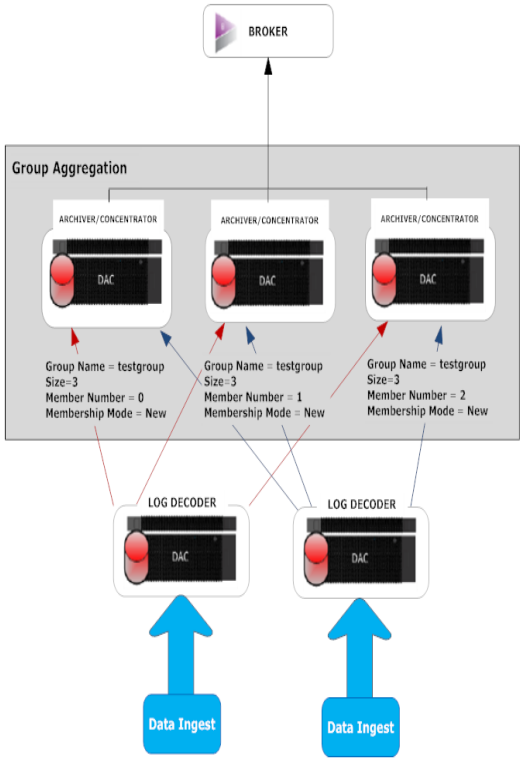
Advantages of Using Group Aggregation

- Increases the speed of NetWitness queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.

You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated sessions between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter set to 10,000, the services would divide the session between themselves as illustrated in the following table.



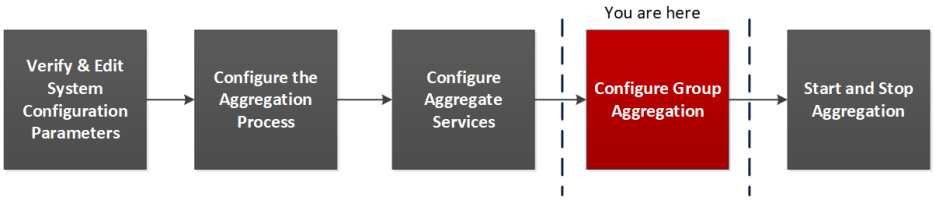
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name.
Size	It determines the number of Archiver or Concentrator services in the aggregation group.
Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: • **New**: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. • **Replace**: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from.

Note: The Membership Mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.

Complete the following steps to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.

2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

   a. Go to **(Admin) > Services**.

   b. Select the Archiver or Concentrator service, and select > **View** > **Config**.

   The Service Config view of the Archiver or Concentrator is displayed.

   c. In the **Aggregate Services** section, select **Log Decoder**.

   d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

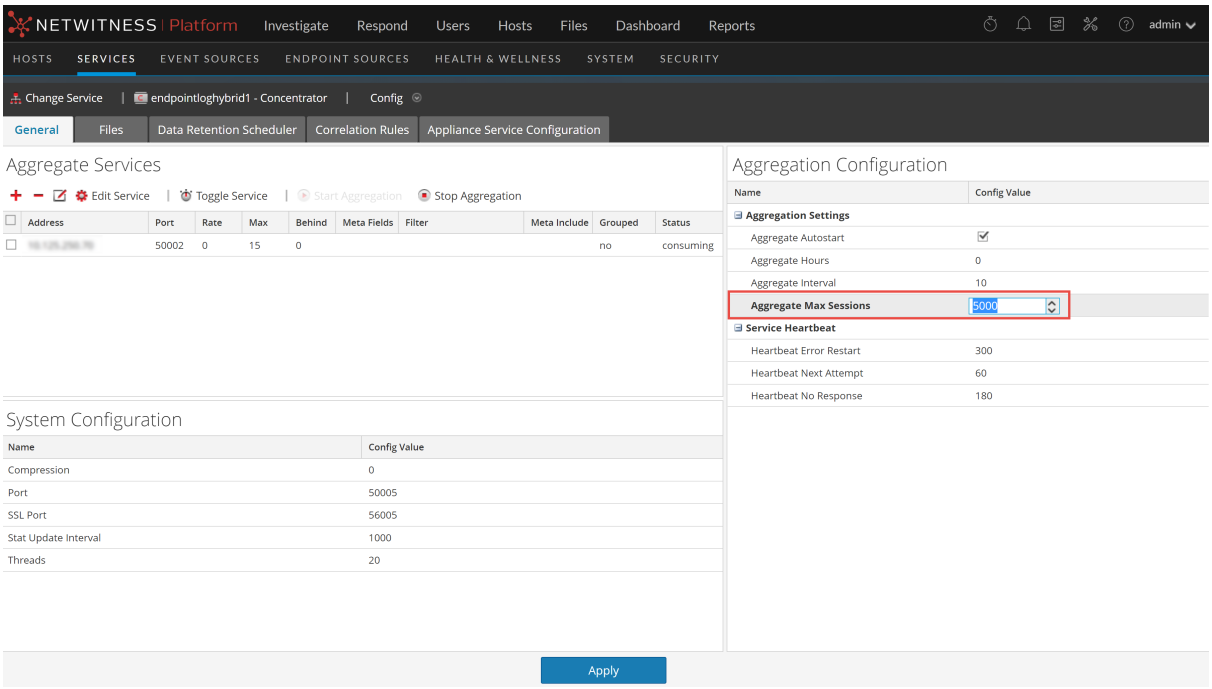
   e. Click .

   The **Edit Aggregate Service** dialog is displayed.

   f. Click Group Aggregation.

   The **Edit Group Aggregation** dialog is displayed.

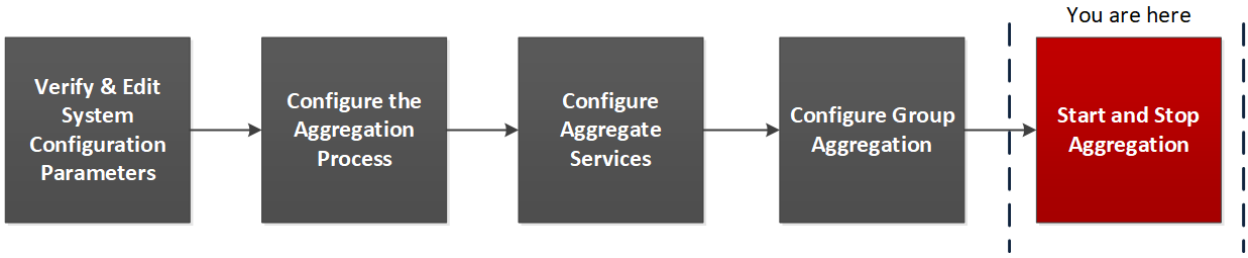
   g. Select the **Enabled** checkbox and set the following parameters:



- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

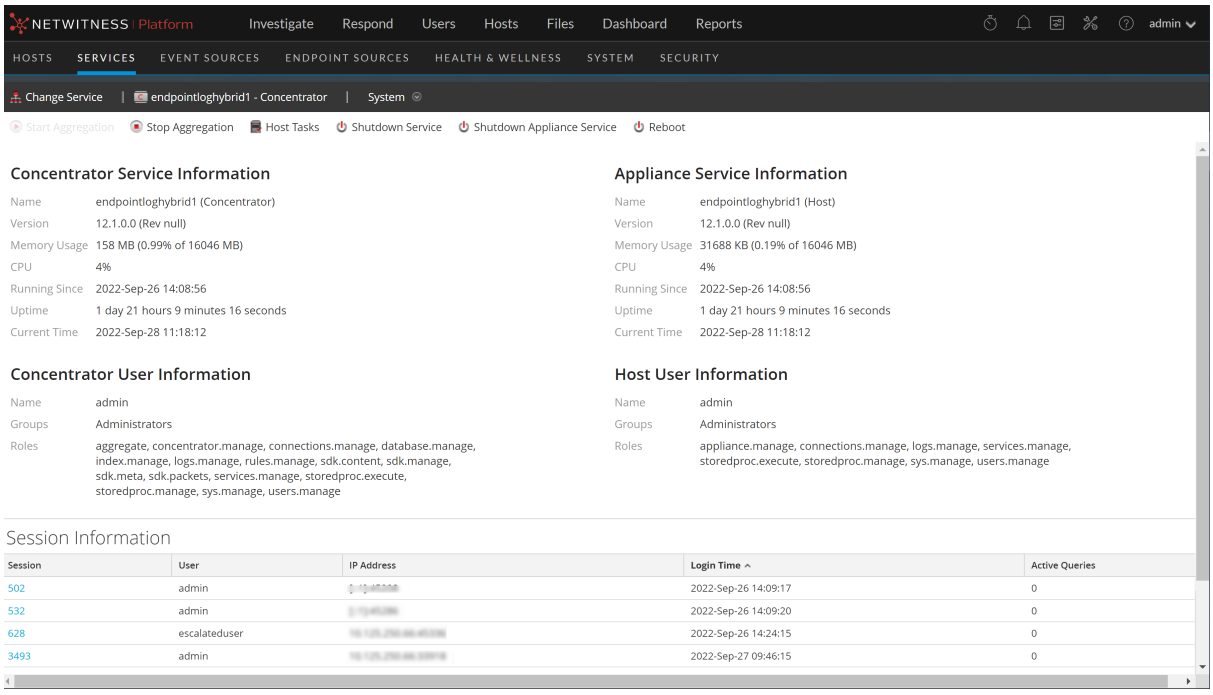
i. In the Service Config view, click **Apply**.



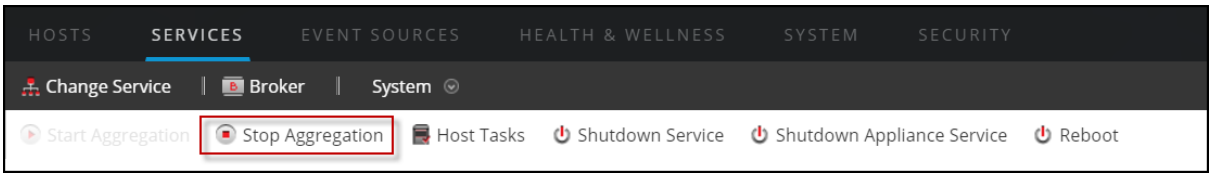
j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.

Step 5. Start and Stop Aggregation



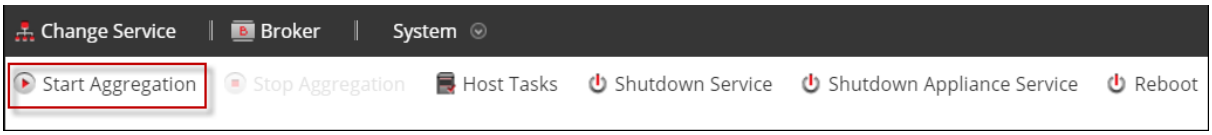
When a Broker or Concentrator starts up, it automatically begins aggregating data if Aggregate Autostart is enabled. When autostart is not enabled, you can start and stop data aggregation manually.



Note: The Aggregate Configuration Settings (in the Services Config View - Broker or Concentrator General Tab) determine whether Aggregate autostart is enabled, as well as the size of a round of aggregation and time between rounds.

To start and stop data aggregation in the services system view:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select > **View** > **System.**



3. To stop a Broker or Concentrator that is capturing data, click **Stop Aggregation** in the toolbar. The service stops aggregating data and the **Stop Aggregation** option in the toolbar is unavailable. The **Start Aggregation** option becomes active.

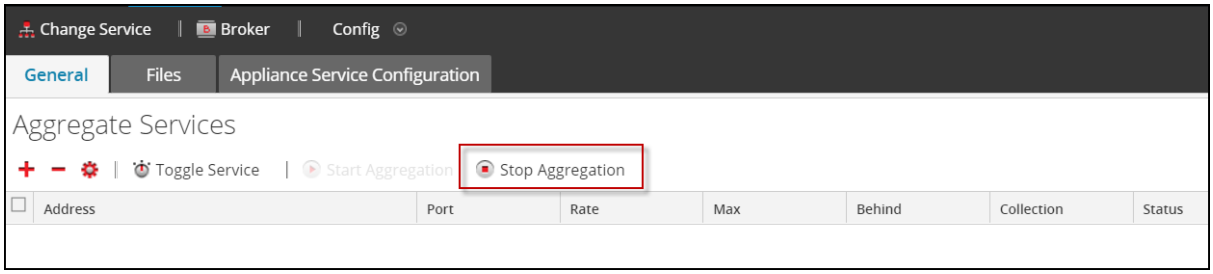
4. If you want the service to start aggregating data again, click **Start Aggregation**.

   You can now investigate the captured data in the Investigation module.

To start and stop aggregation in the services config view:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select > **View** > **Config**.

   The Services Config view, which includes the Aggregate Services section, is displayed.



3. To start aggregation on the selected Broker or Concentrator, click Start Aggregation in the **Aggregate Services** toolbar.

   When aggregation starts, the status of all online aggregate services changes to **consuming**. The Start Aggregation button is disabled and the Stop Aggregation button is enabled.

4. To stop aggregation, click  in the **Aggregate Services** toolbar.

   When aggregation stops, the status of all consuming aggregate services changes to **online**. The Stop Aggregation button is unavailable and the Start Aggregation button is available.

Broker and Concentrator Configuration References

You can configure Brokers and Concentrators using the NetWitness user interface.

In addition to the views described here, you can view the complete service nodes in a tree form in the Services Explore view, see the "Services Explore View" topic in the *Hosts and Services Getting Started Guide*.

Services Config View - Broker or Concentrator General Tab

The General tab for a Broker or Concentrator in the Services Config helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between a Broker or Concentrator and the aggregate service.

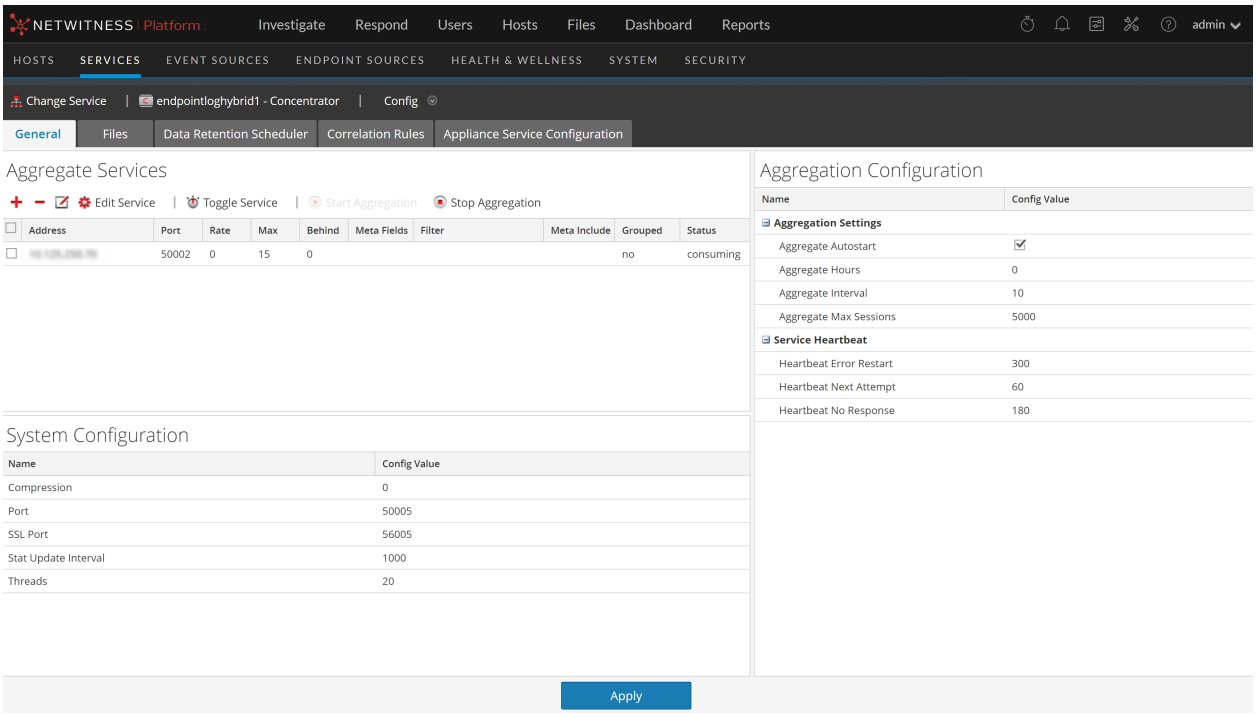
Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Concentrators and Brokers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

What do you want to do?



Role	I want to...	Refer to...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Aggregate Services Section
Administrator	Manage System Configuration	System Configuration Section

Related Topics

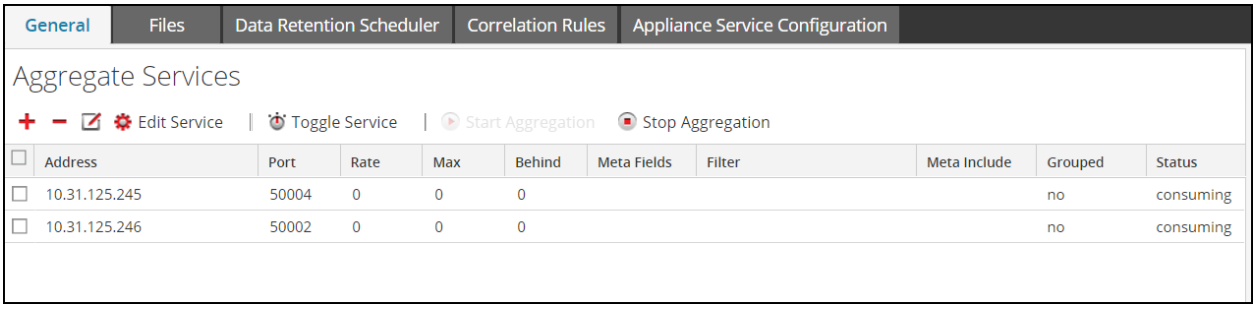
- Broker and Concentrator Configuration

General tab

This is an example of the General tab for a Concentrator.

This is an example of the General tab for a Broker.



These are the three major sections in the General tab for Brokers and Concentrators:

- Aggregate Services
- System Configuration

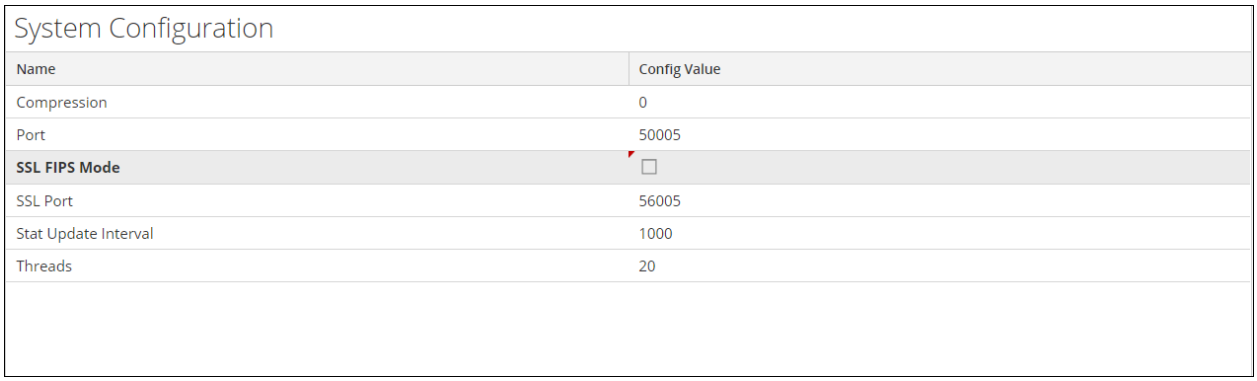
- Aggregation Configuration

Aggregate Services Section

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service. This is an example of the Aggregate Services section for a Concentrator.

The Aggregate Services section toolbar offers these options.

Option	Description
	Opens a dialog in which you can add a Concentrator, Decoder, or Log Decoder as an aggregate service.
	Removes the selected aggregate service.
	For Concentrators only, opens a dialog to edit **Meta Fields** and **Filter** values for the Concentrator.
	Enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Broker or Concentrator.
	When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service.
	When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.
	Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation.



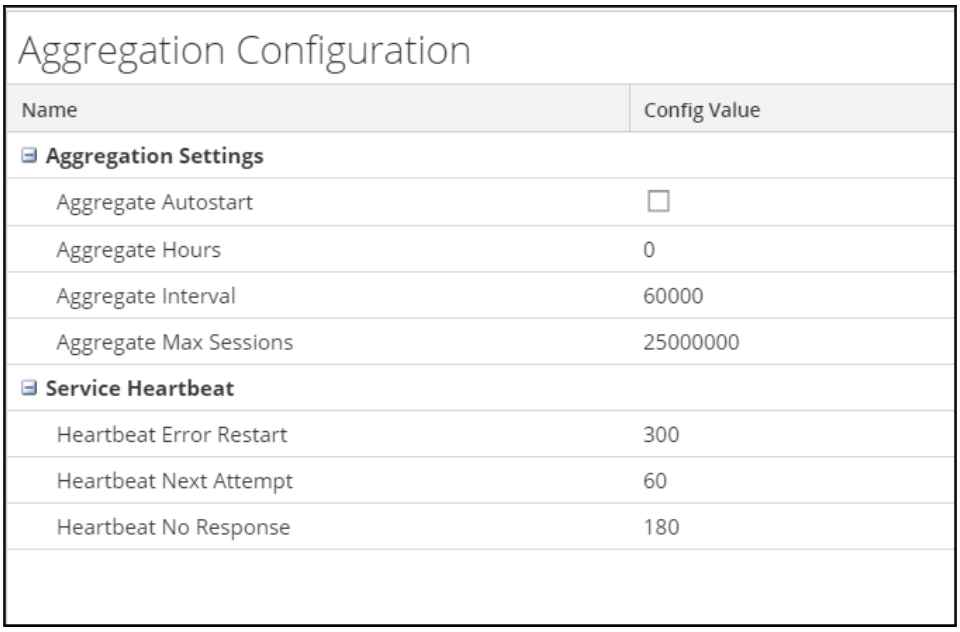
The Aggregate Services section list has these columns.

Column	Description
Address	Lists the address of the service.

Column	Description
Port	Lists the port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
Rate	Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**.
Max	Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture.
Behind	Lists the number of sessions on the service that need to be aggregated.
Collection	For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section.
Meta Fields	For Concentrators only, lists the types of metadata being consumed by the aggregate service.
Filter	For Concentrators only, a rule expression (as used in a 'where' clause) can be used to filter the results. You must add a meta key along with an operator and a value, for example `ip.src !=127.0.0.1 && word exists`
Meta Include	For Concentrators only, lists the number of types of meta included in the aggregate service.
Grouped	Whether or not the aggregate service is part of a group.
Status	Lists the current status of the service: • online = available to provide data for consumption by the Broker or Concentrator • offline = not available to provide data for consumption by the Broker or Concentrator • consuming = providing data for consumption by the Broker or Concentrator

System Configuration Section

The System Configuration section manages service configuration for a service. When a service is first added, default values are in effect. You can edit these values to tune performance.



The System Configuration section has these parameters.

Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
Port	The port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
SSL FIPS Mode	When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
SSL Port	Indicates the SSL port.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**. A change takes effect on service restart.

Aggregation Configuration Section

The Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

Caution: Do not change any of these settings unless guided by the Developers or the Customer Support team. Contact the Customer Support for any questions before editing any of these settings.

The following table describes the aggregation settings

Setting	Description
Aggregate Autostart	Option to start aggregation automatically each time the Broker or Concentrator is started. Checked means yes, unchecked means no. This change takes effect immediately.
Aggregate Hours	The number of hours back for each service that the Concentrator or Broker attempts to recover at the beginning of aggregation. This change takes effect immediately. • If the value is set to 0, aggregation for each service starts where it last left off, no matter the number of hours behind. • If the value is any positive integer, the Concentrator or Broker only consumes sessions less than that number of hours back. For example, if a service's most current session is +10 hours from the last session, this is what happens with two different Aggregate Hours values: • With a value of 12, the Concentrator or Broker starts consuming where it left off. • With a value of 4, all sessions between 5 and 10 hours back are skipped and the Concentrator or Broker starts consuming the session that started 4 hours back.
Aggregate Interval	The number of milliseconds between rounds of service aggregation. All services managed by the Broker or Concentrator request additional rounds of session and metadata to be aggregated. If a Broker or Concentrator is still consuming the previous round of data, it cannot request more until it finishes. Change takes effect immediately.
Aggregate Max Sessions	The maximum number of sessions that the Broker or Concentrator requests in a given round of data aggregation. Change takes effect after restart.

Service Heartbeat

In communicating with each aggregate service, Brokers and Concentrators monitor the heartbeat of the service. These parameters specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.

Setting	Description
Heartbeat Error Restart	After a heartbeat error is detected on an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting a service reconnect.
Heartbeat Next Attempt	After a failed attempt to reconnect to an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting another service reconnect. Change takes effect immediately.
Heartbeat No Response	After failing to reconnect to an unresponsive service, specifies the number of seconds for the Broker or Concentrator to wait before taking the unresponsive service offline. Change takes effect immediately.

When editing parameters in the General tab, you must click **Apply** to save changes.

Services System View - Broker or Concentrator

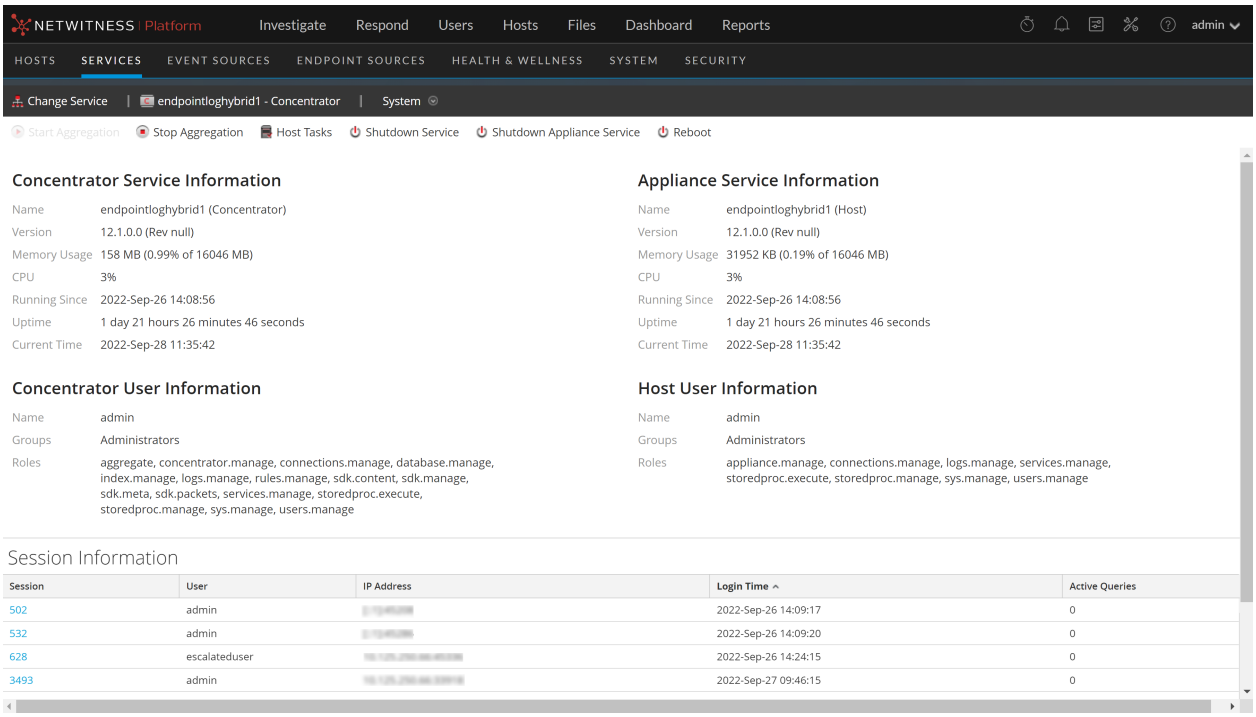
The Services System view displays information specific to specific to Brokers and Concentrators.

While information displayed in this view is the same for all types of Core services, several options in the toolbar are relevant only for Brokers and Concentrators.

What do you want to do?

Role	I want to...	Refer to...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Services System View - Broker or Concentrator
Administrator	Manage System Configuration	Services System View - Broker or Concentrator

Related Topics



- Broker and Concentrator Basics

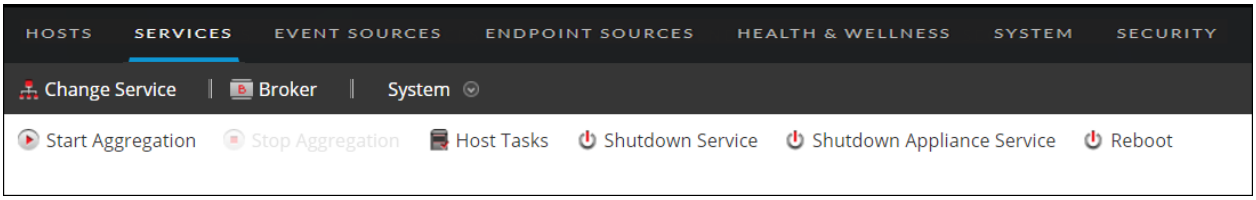
Services System View



You can access this view by doing the following:

1. Go to  **(Admin)** > **Services.**
2. Select a Concentrator or Broker, and select  > **View** > **System**.

   The System view for the selected Concentrator or Broker is displayed.

The following figure is an example of the toolbar for a Broker or Concentrator.

Host Tasks, Shutdown Service, Shutdown Appliance Service or (Shutdown Appliance), and Reboot are common to all services and are described in the "Services System view" topic in the *Host and Services Getting Started Guide*.

This table describes toolbar options that apply only to a Concentrator or Broker. Both buttons are unavailable until aggregator services are configured and consuming data.

Action	Description
Start Aggregation	Starts aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Start Aggregation button is available only when aggregator services are configured and consuming data.
Stop Aggregation	Stops aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Stop Aggregation button is available only when aggregation is occurring.

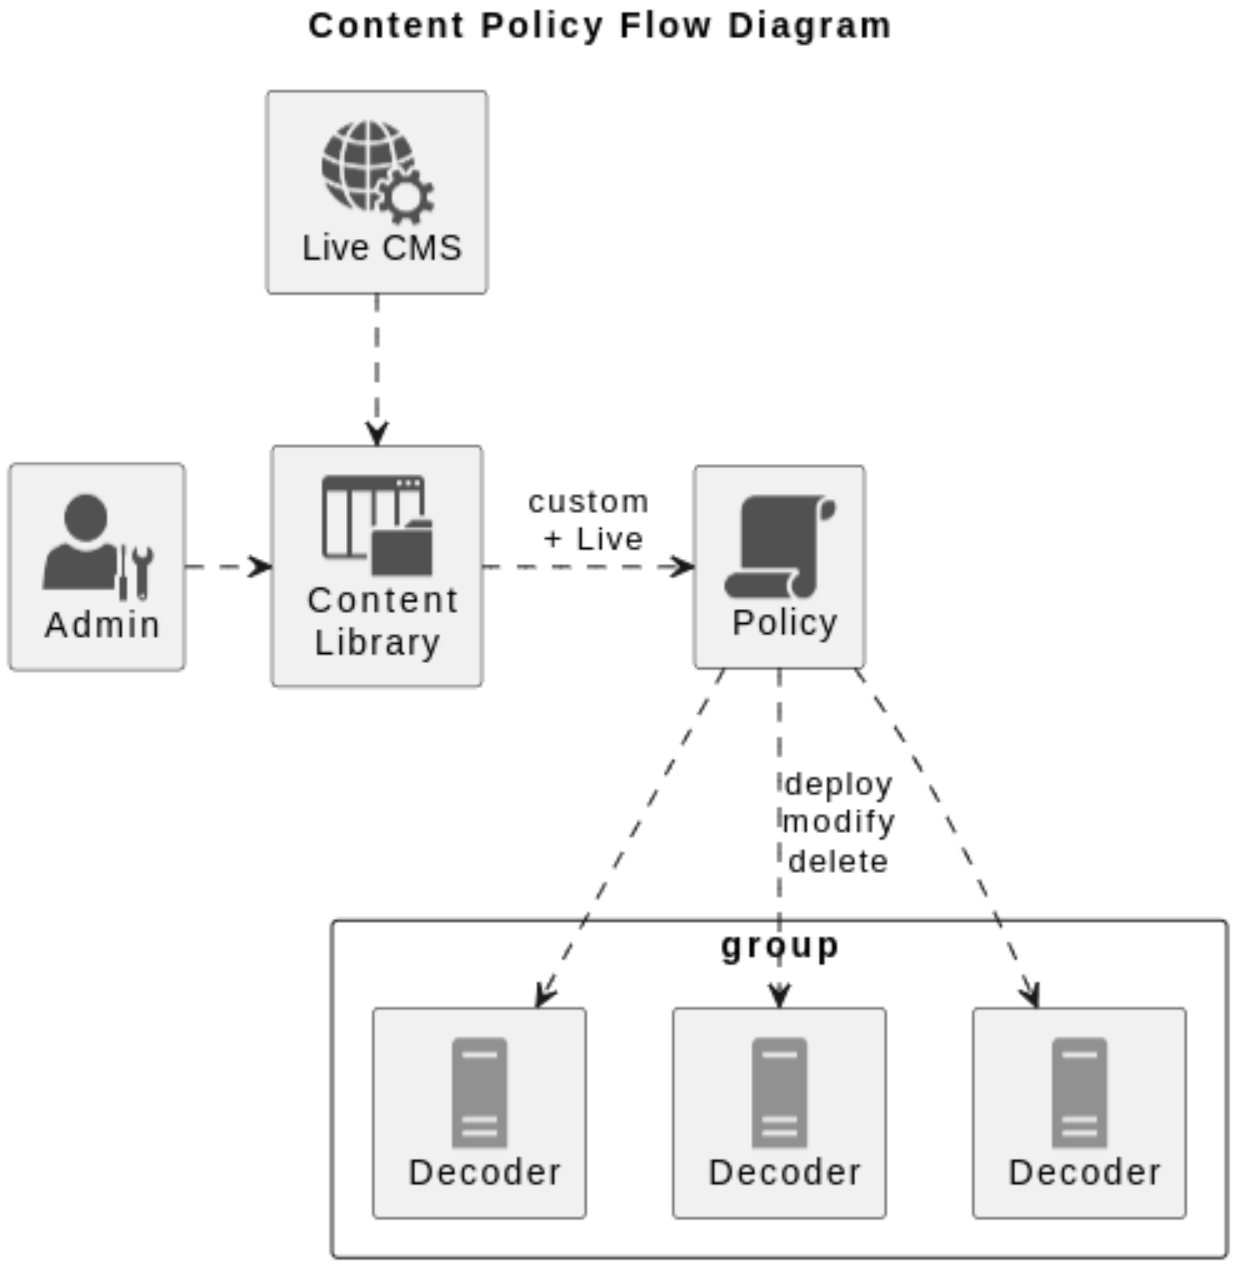
About Policy-based Centralized Content Management (CCM)

Legacy content management involves deploying and managing content in multiple places in the UI.

- **Live Content UI**: Located under the Configuration interface, this allows a “push” deployment of Live content to one or more services, but does not provide any management of content once it is deployed
- **Service Config UI**: Located under **Admin > Services > View Config**, this UI enables you to view, edit or delete content on individual services.



Policy-based Centralized Content Management (CCM) is a unified approach to find, deploy, and manage content through the entire life cycle based on policies that can be assigned to groups of devices. It is a single location to view, modify and manage the content deployed across all services in the environment.

This approach consists of three elements:

- Groups: A collection of NetWitness services (such as Decoders, Log Decoders, and Correlation Servers etc.) to assign and manage content.
- Content Policies: A container of content and subscription settings used to assign and manage content within a Group.
- Content Library: A local repository of content which resides on the Admin Server and is used to assign content to policies. This includes both Live and Custom content.

The Content Library contains Live content (synchronized with the Live CMS) and any custom content you create or import. To deploy, remove or manage content on your services, content is assigned from the Content Library to a Content Policy. Once that content policy is assigned to a group and Published, the content changes are put into effect on the services within the group.

Workflow

Benefits

Benefits of Policy-based Centralized Content Management:

- Add or remove content without repeating the process on each service.
- Add content from RSA Live or add your custom content into a single content repository. You can add content from this repository to a policy.
- Add a new service to an existing group to automatically deploy all necessary content.
- One-click management of subscriptions and automatic updates
- Provides highly responsive and updated UI for browsing RSA Live content that can help you with the following:
  - View Live content along with your content policies and click  to add content from Live.
  - Seamlessly view Live content along with your custom content.
- Create and upload content to the Content Library easily by:
  - Importing log parsers as a zip file instead of converting to ".envision" format.
  - Cloning existing Application Rules and Network Rules.
- Switch services between legacy Content Management UI and the new Centralized Content Management via Groups and Policies using the "toggle" feature. This can prevent content being mistakenly added or modified outside of a Policy, causing an out-of-sync issue.
- Create, modify and publish policies and manage custom content in the Content Library even without an internet connection.
- Find content, policies or groups of interest easily by using the **Filtering** capability of the UI.
- Receives meta key and operator suggestions while creating Application Rule and Network Rule conditions. This eases the creation of error-free rules.
- Manage ESA content and handle multiple deployments seamlessly using Policy.
- Seamlessly view ESA Live content along with your own custom content.
- Add and manage ESA Correlation servers as part of groups.
- Manage all the data sources for the ESA Correlation servers from the **Settings** > **Event Stream Analysis** > **Data Sources** page seamlessly.

IMPORTANT: It is recommended not to use the Centralized Content Management and Service Config page or Live Content page simultaneously for managing the content. Using the Service Config UI to add or modify content can cause the content to become out-of-sync with the Content Policy.

Note: If Policy-based Centralized Content Management is enabled for a service, then the Policy-based Centralized Content Management enabled services will be disabled in Live content UI and user will not be able to manage content of these services from Service Config page as Service Config page becomes read only and no actions except 'export' can be performed from Service Config page.

Enable or Disable CCM for All or Individual Decoder Services

You can choose to use CCM to manage content for selected services or for all services.

When CCM is Enabled:

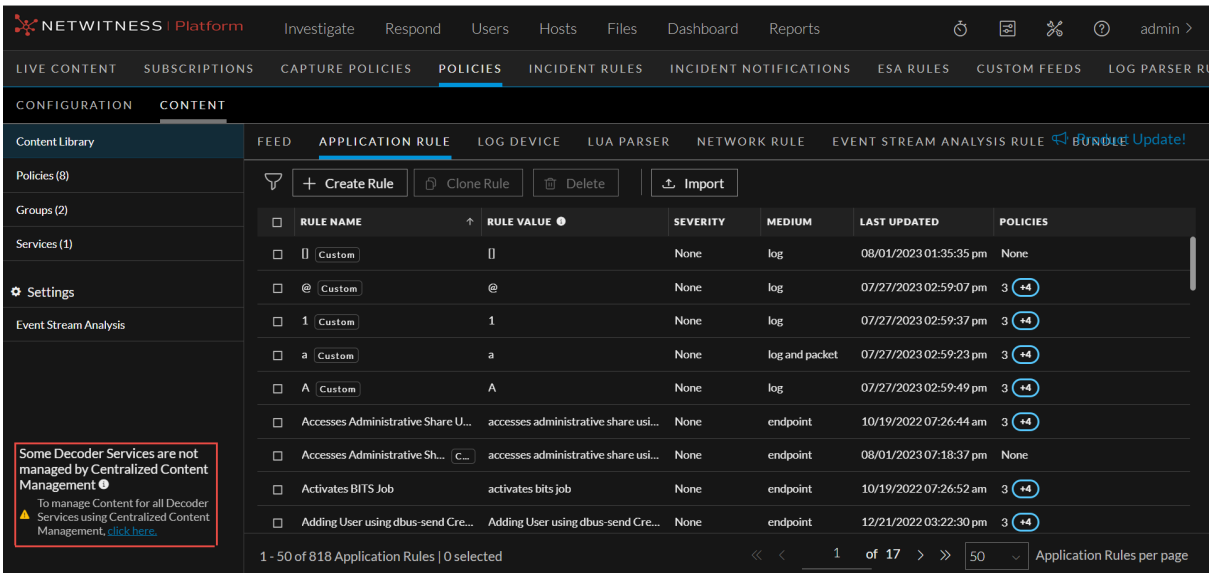
- The service config page is read-only. Only **Export** button is enabled in service config page to export content.
- Content cannot be deployed to CCM enabled services through the Live Content UI.
- Content for all CCM enabled services can be managed through the Content Policies and the Content Library.
- Content subscription from CCM overrides content subscription from **(CONFIGURE) > Subscriptions** page.

When CCM is Disabled:

- Content can be deployed from Live Content UI.
- The content of the service can be managed from service config page. Any changes made through the Service Config page does not reflect in the content policy.
- The service is disabled in the Policy or Group page of CCM and the policy status changes to **Partial**. The policy can be published with a disabled service. However, the policy state always remains **Partial**. Publishing a policy will affect only the services that are enabled for CCM.

> **Note:** When a service, which is part of a group, is added back to CCM, the policy status changes to "Unpublished".

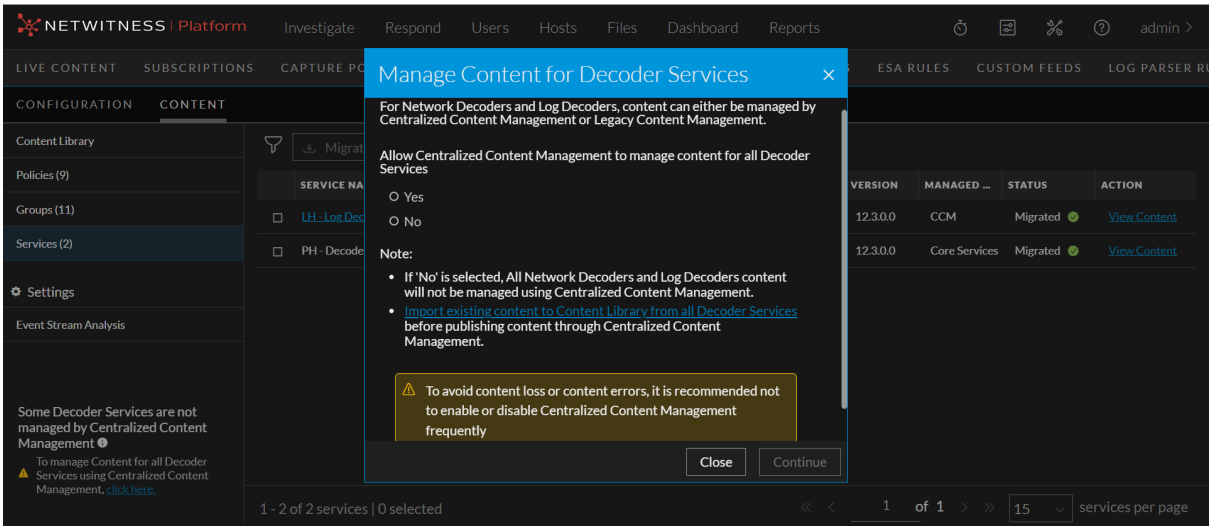
Enable or Disable CCM for All Decoder Services



From 12.2 version onwards, a CCM toggle is introduced to enable or disable CCM for all 12.0+ Decoder Services. The toggle is available on the UI.

To enable or disable CCM for all Decoder Services on the UI

Scenario 1: Some Decoder Services are Managed by CCM



1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click either **Content Library**, **Policies**, **Groups** or **Services**.

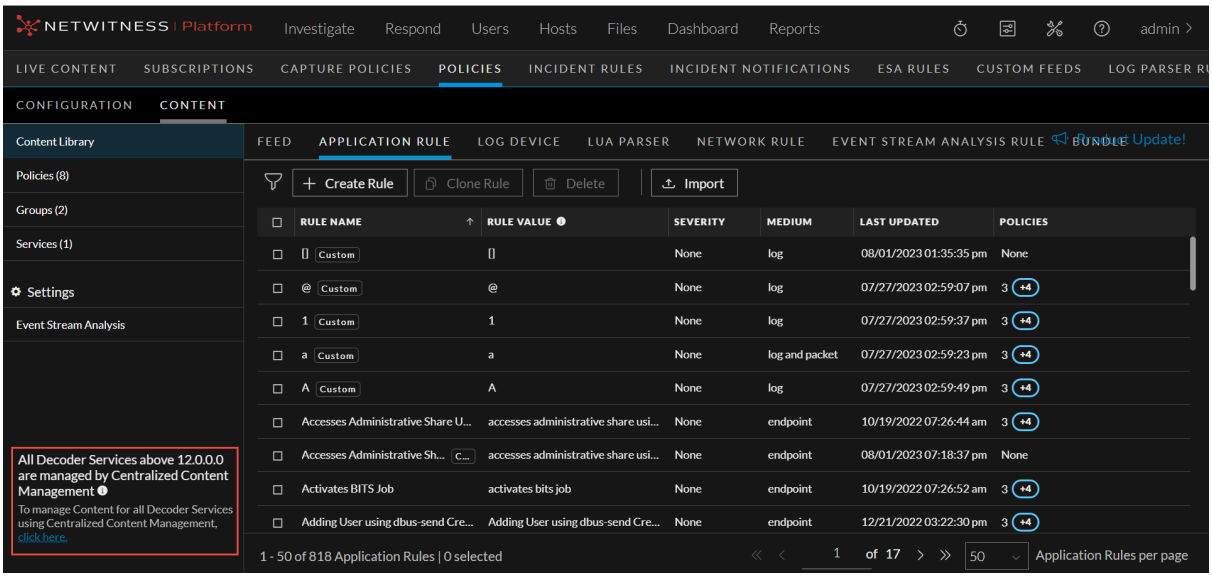
   The respective screens are displayed. On these screens, on the left bottom corner, the message on managing the content is displayed.

4. If the NetWitness platform consists of only few Decoders managed by CCM, then the message "Some Decoder Services are managed by Centralized Content Management" is diplayed. In such a case, you can choose to either manage all the Decoder Services by CCM or not to manage any Decoder Services by CCM by clicking **click here**.

   The **Manage Content for Decoder Services** pop-up window is displayed.

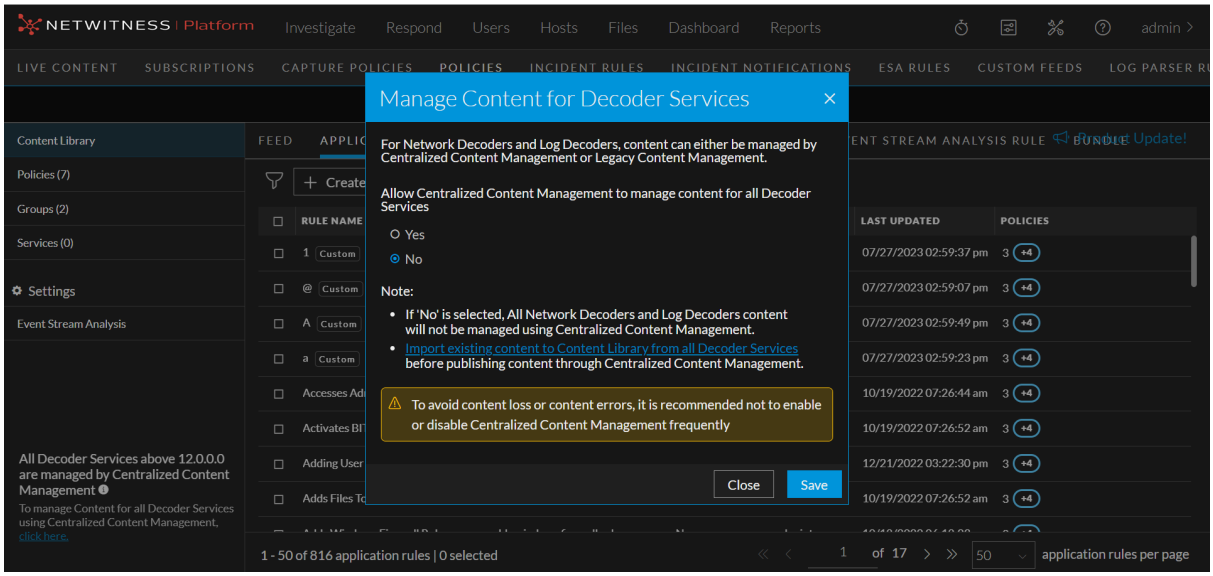
5. On the **Manage Content for Decoder Services** pop-up window, click **Yes** for **Allow Centralized Content Management to manage content for all Decoder Services** to enable CCM for all Decoder Services. Click **No** to disable CCM for all Decoder Services.

   Note: Read the notes on the pop-up window before clicking on **Continue**.



6. Click **Continue**. The **Manage Content for Decoder Services - Review and Confirm** screen is displayed.

7. Click **Confirm** to review and confirm the services which will be enabled or disabled based on the selected option. Else, click **Back** to go back to the previous screen.
8. The success message is displayed on the screen.

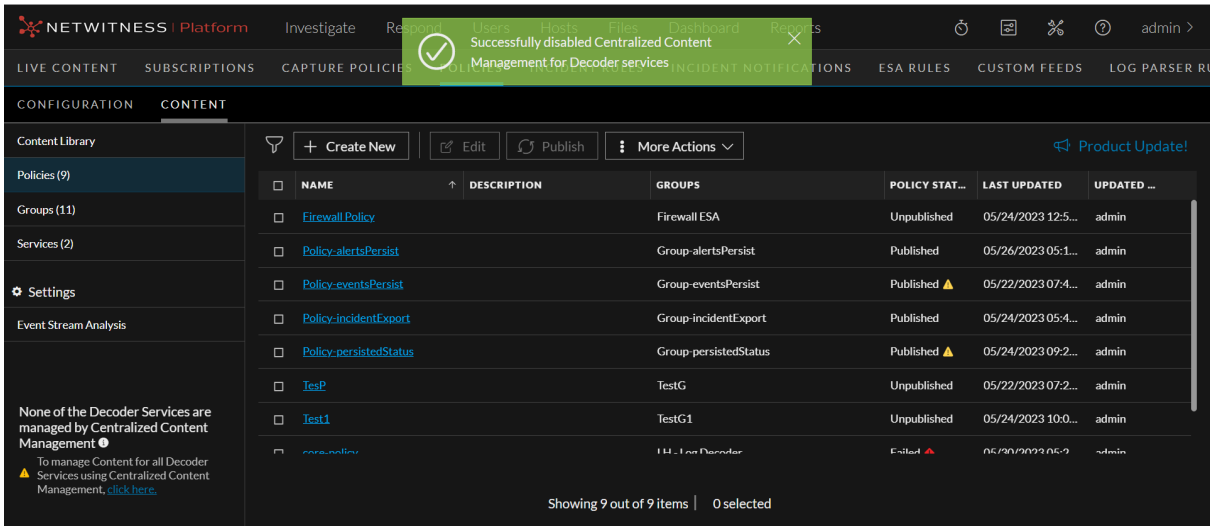


Scenario 2: All Decoder Services are Managed by CCM

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click either **Content Library**, **Policies**, **Groups** or **Services**.
4. The respective screens are displayed. On these screens, on the left bottom corner, the message on managing the content is displayed.

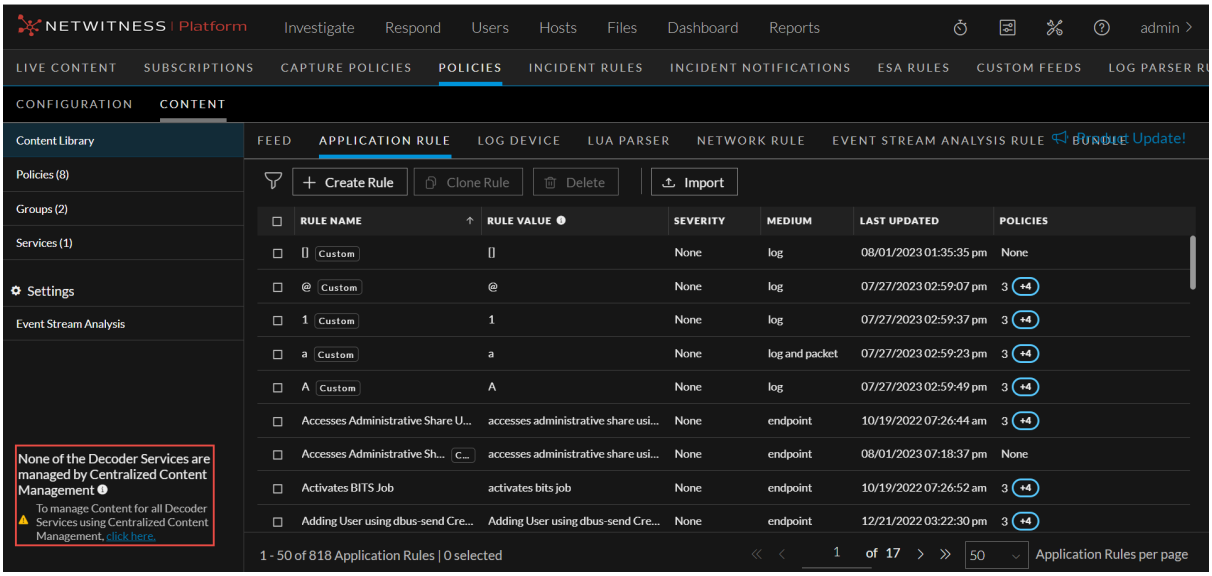
5. 5. If the NetWitness platform consists of all Decoders managed by CCM, then the message "All Decoder Services above 12.0.0.0 are managed by Centralized Content Management" is displayed. In such a case, you can choose to not manage any Decoder Services by CCM by clicking **click here**.

6. The **Manage Content for Decoder Services** pop-up window is displayed.



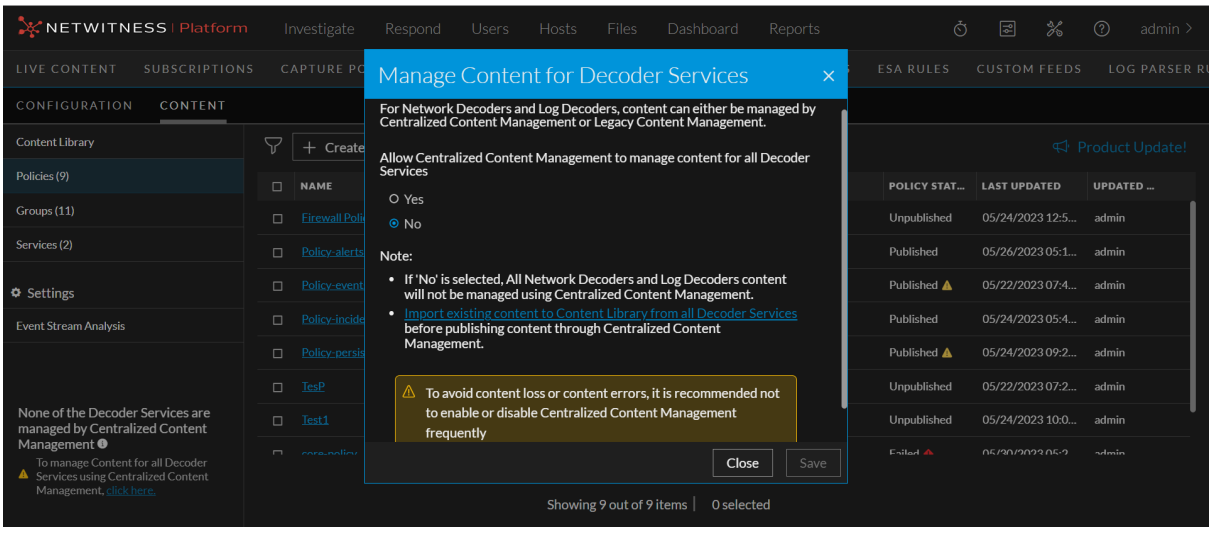
7. On the **Manage Content for Decoder Services** pop-up window, click **No** for **Allow Centralized Content Management to manage content for all Decoder Services** to disable CCM for all Decoder Services.

> **Note:**
> - The **Yes** option is selected by default.
> - Read the notes on the pop-up window before clicking on **Save**.



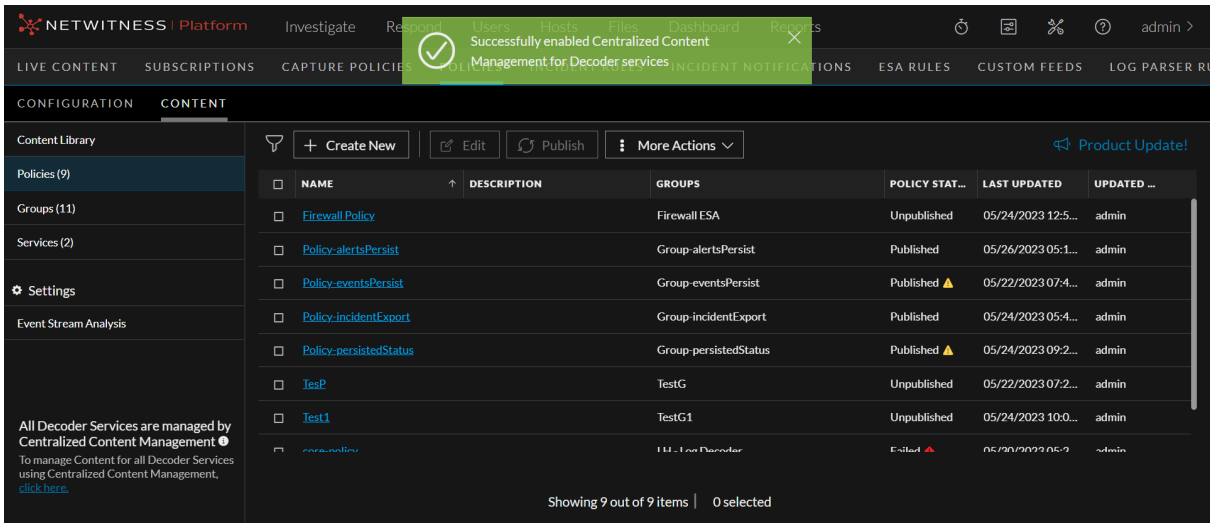
8. Click **Save**. The success message is displayed on the screen.

> **Note:** The **Save** option is enabled only when you select **No**.



Scenario 3: None of the Decoder Services are Managed by CCM

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click either **Content Library**, **Policies**, **Groups** or **Services**.
4. The respective screens are displayed. On these screens, on the left bottom corner, the message on managing the content is displayed.



5. If the NetWitness platform does not consist of any Decoders managed by CCM, then the message "None of the Decoder Services are managed by Centralized Content Management" is displayed. In such a case, you can choose to manage all Decoder Services by CCM by clicking **click here**.
6. The **Manage Content for Decoder Services** pop-up window is displayed.

7. On the **Manage Content for Decoder Services** pop-up window, click **Yes** for **Allow Centralized Content Management to manage content for all Decoder Services** to enable CCM for all Decoder Services.

Note:
- The **No** option is selected by default.
- Read the notes on the pop-up window before clicking on **Save**.

8. Click **Save**. The success message is displayed on the screen.
9. **Note:** The **Save** option is enabled only when you select **Yes**.

Enable or Disable CCM for Individual Decoder Services

To enable or disable CCM for individual Decoder services, see Enable or Disable CCM for Individual Decoder Services *topic under* Manage Services.

Manage Content Library

This section contains:

- Migrate Content from Core Services to Content Library
- Import Content to Content Library
- Create an Application Rule
- Clone Application Rule
- Edit Application Rule
- Delete Application Rule
- View Application Rule Details
- Create a Network Rule
- Edit Network Rule
- Delete Network Rule
- View Network Rule Details
- Create an ESA Rule
- Edit an ESA Rule
- Delete an ESA Rule
- Filter Content Rules

Migrate Content from Core Services to Content Library

The customers who want to use Centralized Content Management, and if their content is already deployed, a migration process is required.

The following types of content can be migrated from Core Services:

- Application Rule
- Network Rule
- Log Device
- Live Feeds
- LUA Parser

Note:
- When the user upgrades a Decoder or Log Decoder from 11.x, 12.0 or 12.1 version to 12.1.1 or later version, a back up of all the content is created automatically. Backup file will be available on Core Services' host under the following path:
For Log Decoder - `/var/netwitness/logdecoder/logdecoder_backupcontent_ccm.tar`
For Network Decoder - `/var/netwitness/decoder/decoder_backupcontent_ccm.tar`

For steps on how to migrate content from Core Services to Content Library, see Migrate Content from Service under Manage Services.

Import Content to Content Library

Before the custom content can be used in policies, it must be imported to the Content Library.

To export Application Rules or Network Rules from Legacy UI

1. Go to  **(Admin) > Services**.
2. Go to Config view of the service where application rule or network rule is deployed.
3. Click either the **Application Rule** or the **Network Rule** tab.

   Note: The **Network Rule** tab is only available for **Network Decoder** services.
4. Select the content to migrate.
5. Click **Export** to export the selected content or click **All** to export all the content.

   The following table lists the supported file types and file extensions for Application Rules and Network Rules:

Content	Supported File Types	Supported File Extensions
Application Rules	**.NWR**	NA
Network Rules	**.NWR**	NA

To export Feeds, LUA Parsers, or Log Devices

The content file locations are as given below:

- Feeds content file location: /etc/netwitness/ng/feeds
- Lua Parsers content file location: /etc/netwitness/ng/parsers
- Log Devices content file location: /etc/netwitness/ng/envision/etc/devices

You can upload the files which are copied locally from these locations and import these files to Content Library.

The following table lists the supported file types and file extensions for Log Devices, LUA Parsers and Feeds:

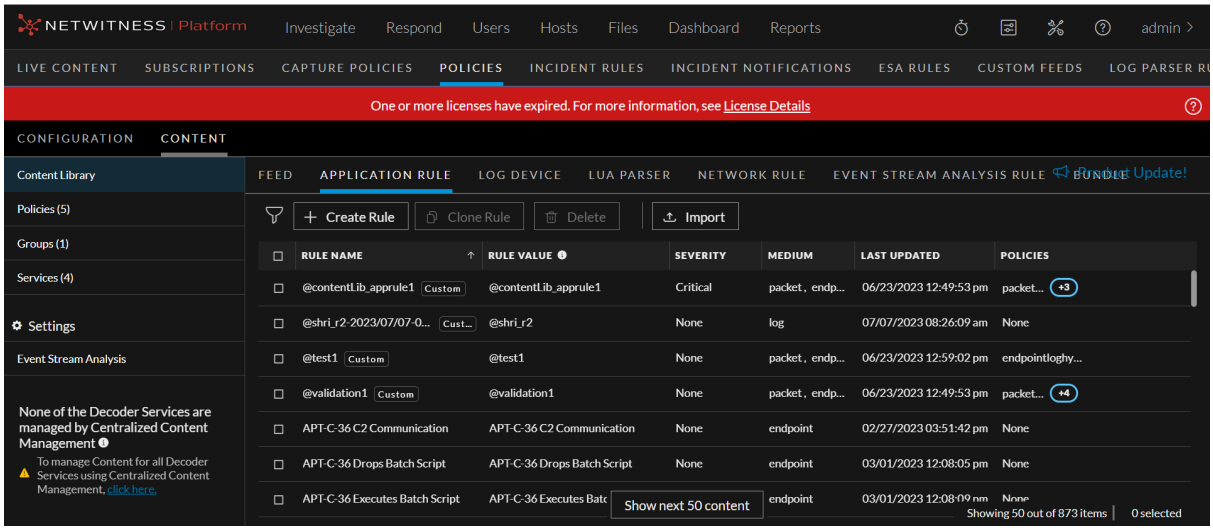
Content	Supported File Types	Supported File Extensions
Feeds	**.zip**	**.feed** and **.token**
Log Devices	**.envision**, **.zip** **Note:** The zip file should have a root folder. The root folder should contain the 'N' folders for 'N' number of content. The 'N' folder names should be the content names. The 'N' folders, will contain the respective xml files.	NA
LUA Parsers	**.zip**	**.luax**, **.lua** and **.flextoken**

Note: Any imported content will be treated as custom content. If imported content has the same name as existing Live content, then it must be renamed upon import. Custom content with the same name can be overwritten.

To create .envision files

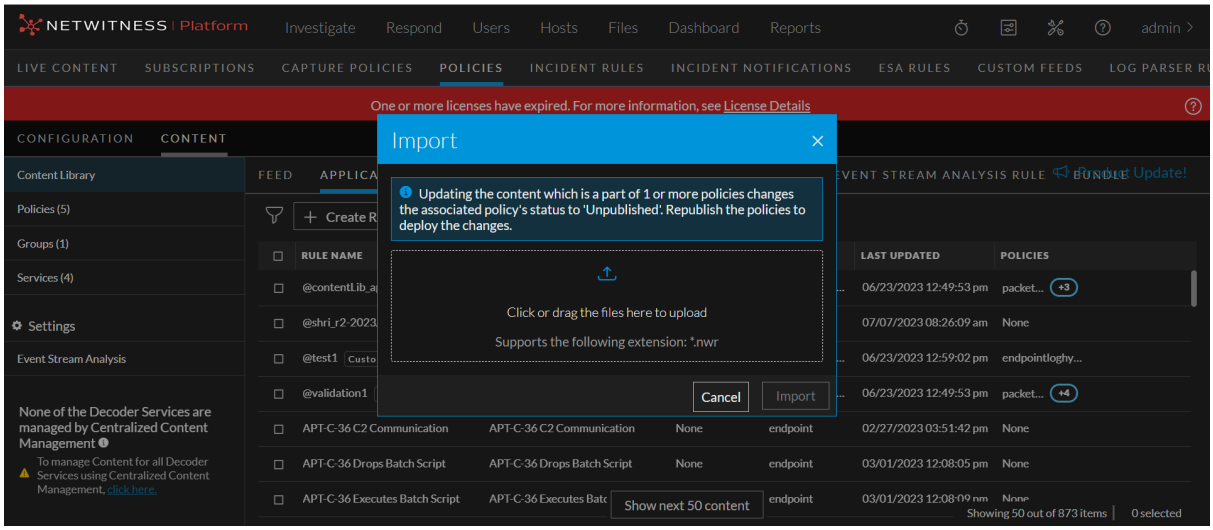
1. Keep all the Log Devices in a root folder in your local drive. For example, "logDevices".
2. From the command prompt, run the python script specified in the NetWitness Community portal with input argument as the path of the above folder.

   Note: The command to run the python script is "python3 pythonscriptname.py inputArg".
3. Once you run the script, a new zip named "nw_content_logDevices.zip" is created. This zip file will contain all the envision files.



IMPORTANT: All actions except 'Export' are disabled for Application Rules, Network Rules, Feeds, LUA Parsers and Log Devices from Service Config page for all core services if the service is managed by Policy-based Centralized Content Management.

To import content to Content Library



1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Depending upon the type of content to be imported, click the following tabs:
   - **Application Rule**
   - **Network Rule**
   - **LUA Parser**

- **Feeds**
- **Log Devices**

Note:
- Log Devices content should be converted to .envision files before importing.
- The name of the application rule or network rule to be imported should not be same as existing rule name.

5. In the respective content panel, click **Import**.

6. In the **Import** panel, click or drag the file to upload.
7. Click **Overwrite** to overwrite content. This is applicable only in case of overriding an already imported content.

Note: You cannot overwrite the content if the content name is same as the rule name of the existing content of the same type from live server. However, you can overwrite the content if the content name is same as the custom content rule name.

8. Select the medium types.
9. Click **Import** to complete the import process.

Create an Application Rule

This topic describes the steps to create an application rule.

To create a new Application Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.

   The available rules are displayed.
4. In the application rule panel, click **+ Create Rule** to add an application rule.
5. In the **New Create Rule** panel, do the following:
   - Enter a unique rule name. If the name of that application rule is the same as an existing rule, an error message is displayed.
   - Enter the rule value. This is the value written to the alert meta. While creating a new rule, the rule value is defaulted with the rule name. However, you can modify the same.
   - Enter the condition for the rule. You can apply two types of conditions for the rule.
     - Normal mode:
       - It gives suggestions for supported metas (ip, host and so on) and operators ("=", "Not Equal To", "Contains", "Exists" and so on).
       - The entered condition will be enclosed in a 'Pill'. When you enter multiple conditions, the conditions are automatically joined by an 'AND' operator. On clicking the 'AND' operator, you can toggle between 'AND' and 'OR' operators.
     - Advanced: You can customize the conditions as a free form text.
   - Select the medium to be applied for the rule.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule. The options are listed below:
     - **Flag Session with rule name in meta key**: Select the meta value for the alert from the drop-down menu. This is mandatory.
     - **Forward**: This option enables the performance of syslog forwarding when the log matches the rule.
     - **Transient**: This option prevents the created alert metadata from being written to the disk.

- **Notify**: This option enables you to choose the **Severity** levels for the application rule and utilize the option to trigger alert generation.
  - Low
  - Medium
  - High
  - Critical

Note: Severity is selected by default as Low.

- Click **Save** to save the new application rule.
- Click **Reset** to reset the fields.
- Click **Cancel** to cancel the operation.

Clone Application Rule

This topic describes the steps to clone an application rule.

To clone an Application Rule

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. The list of application rules is displayed. From the available list of rules, select the rule to be cloned.
5. Click **Clone Rule**.
6. In the **Clone Rule** panel, do the following:
   - Enter a unique rule name. If the name of that application rule is same as an existing rule, an error message is displayed.
   - Enter the rule value.

   Note: You can clone existing rules to generate cloned rules with different rule names but with same rule value.

   - Enter the condition for the rule.
   - Select the medium to be applied for the rule.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule.
   - Select a meta value from the Flag session with rule name in meta key drop-down menu. This is a mandatory field.

- Click **Clone** to clone the rule.
- Click **Cancel** to cancel the operation.

Edit Application Rule

When you edit the application rule, follow these guidelines:

- You can only edit the custom rules.
- The rule name and rule value cannot be edited if the custom rule is assigned to a policy.
- If the custom rule assigned to a policy is edited, then the customer must republish the policy for the changes to take effect in the service.
- The rule value cannot be edited. The rule value can be same for different rule names.
- While editing the rule name, if the name of that application rule is same as an existing rule, an error message is displayed.

To edit an Application Rule

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Select an application rule to edit.
5. Click **Edit Rule** to edit the application rule.
6. In the **Edit Rule** panel, do the following:
   - Enter a unique rule name. If the name of that application rule is the same as an existing rule, an error message is displayed.
   - Enter the rule value. This is the value written to the alert meta.
   - Enter the condition for the rule. You can apply two types of conditions for the rule.
     - Normal mode:
       - It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on).
       - The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators.
     - Advanced: You can customize the conditions as a free form text.
   - Select the medium to be applied for the rule.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.

- Select the session options to be applied for the rule.The options are listed below:
  - **Flag Session with rule name in meta key**: Select the meta value for the alert from the drop-down menu. This is mandatory.
  - **Forward**: This option enables the performance of syslog forwarding when the log matches the rule.
  - **Transient**: This option prevents the created alert metadata from being written to the disk.
  - **Notify**: This option enables you to choose the **Severity** levels for the application rule and utilize the option to trigger alert generation.
    - Low
    - Medium
    - High
    - Critical

  Note: Severity is selected by default as Low.
- Click **Save** to save the application rule details.
- Click **Reset** to reset the fields.
- Click **Cancel** to cancel the operation.

Delete Application Rule

When you delete the application rule, follow these guidelines:

- You can delete only the custom application rules.
- You cannot delete the application rule if it is associated to a policy. You should first disassociate the application rule from the policy and then delete it.

To delete an Application Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Select an application rule to delete.
5. Click **Delete** to permanently delete the selected application rule.

View Application Rule Details

This topic describes the steps to view the application rule details.

To view Application Rule details

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
   The list of application rules is displayed.
4. Click a row to view details about the selected application rule in the right panel.
   The various details of the application rule are displayed.

Create a Network Rule

This topic describes the steps to create a network rule.

To create a Network Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click the **Network Rule** tab.
5. In the network rule panel, click **+ Create Rule** to add a network rule.
6. In the **New Create Rule** panel, do the following:
   - Enter a unique rule name. If the name of that network rule is the same as an existing rule, an error message is displayed.
   - Enter the rule value. This is the value written to the alert meta. While creating a new rule, the rule value is defaulted with the rule name. However, you can modify the same.
   - Enter the condition for the rule. You can apply two types of conditions for the rule.
     - Normal mode:
       - It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on).
       - The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators.
     - Advanced: You can customize the conditions as a free form text.

     Note: The medium is selected as **Packet** by default, and it cannot be modified.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule.

- Click **Cancel** to cancel the operation.
- Click **Reset** to reset the data.
- Click **Save** to save the new network rule.

Clone Network Rule

This topic describes the steps to clone an application rule.

To clone an Application Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **Network Rule** tab.
5. The list of application rules is displayed. From the available list of rules, select the rule to be cloned.
6. Click **Clone Rule**.
7. In the **Clone Rule** panel, do the following:
   - Enter a unique rule name. If the name of that network rule is same as an existing rule, an error message is displayed.
   - Enter the rule value.

     Note: You can clone existing rules to generate cloned rules with different rule names but with same rule value.
   - Enter the condition for the rule.

     Note: The medium is selected as **Packet** by default, and it cannot be modified.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule.
   - Click **Clone** to clone the rule.
   - Click **Cancel** to cancel the operation.

Edit Network Rule

When you edit the network rule, follow these guidelines:

- You can only edit the custom rules.
- The rule name and rule value cannot be edited if the custom rule is assigned to a policy.

- If the custom rule assigned to a policy is edited, then you must republish the policy for the changes to take effect in the service.
- The rule value cannot be edited. The rule value can be same for different rule names.
- While editing the rule name, if the name of that network rule is same as an existing rule, an error message is displayed.

To edit a Network Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click the **Network Rule** tab.
5. Select the network rule to edit.
6. Click **Edit Rule** to edit the network rule.
7. In the **Edit Rule** panel, do the following:
   - Enter a unique rule name. If the name of that network rule is the same as an existing rule, an error message is displayed.
   - Enter the rule value. This is the value written to the alert meta.
   - Enter the condition for the rule. You can apply two types of conditions for the rule.
     - Normal mode:
       - It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on).
       - The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators.
     - Advanced: You can customize the conditions as a free form text.

     Note: The medium is selected as **Packet** by default, and it cannot be modified.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule.
   - Click **Cancel** to cancel the operation.
   - Click **Reset** to reset the data.
   - Click **Save** to save the new network rule.

Delete Network Rule

When you delete the network rule, follow these guidelines:

- You can delete only the custom network rules.
- You cannot delete the network rule if it is associated to a policy. You should first disassociate the network rule from the policy and then delete it.

To delete a Network Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **Network Rule** tab.
5. Select a network rule to delete.
6. Click **Delete** to permanently delete the selected network rule.

View Network Rule Details

This topic describes the steps to view the network rule details.

To view Network Rule details

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click the **Network Rule** tab.
5. The list of network rules is displayed.
6. Click a row to view details about the selected network rule in the right panel.
   The various details of the network rule are displayed.

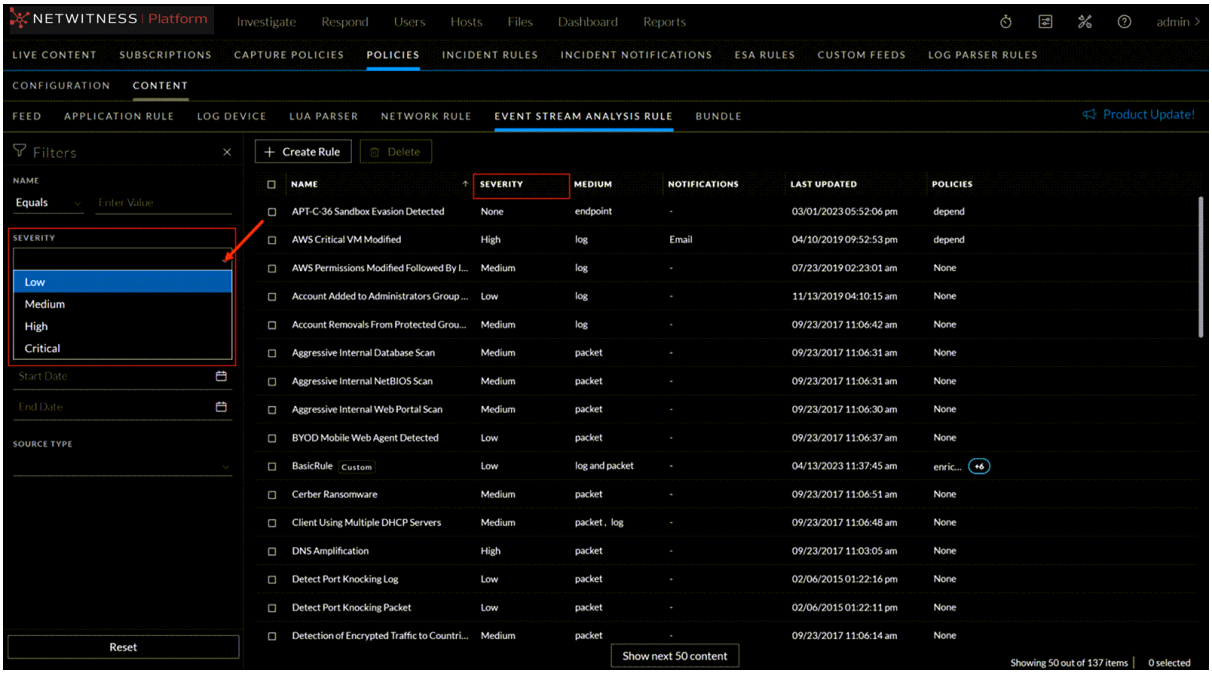
Create an ESA Rule

This topic describes the steps to create an ESA rule.

To create an ESA Rule

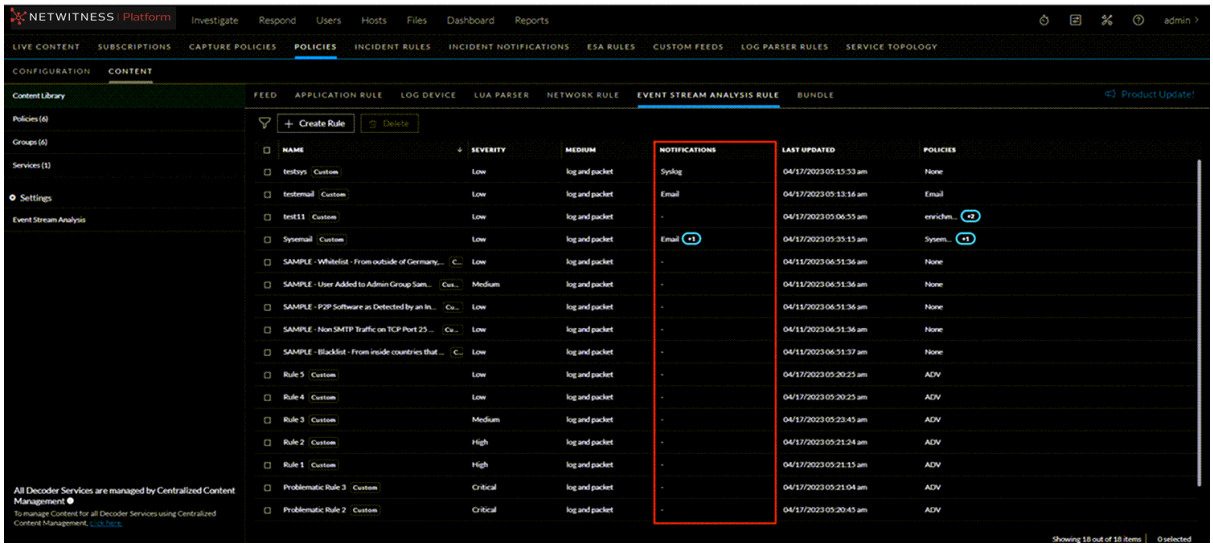
1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
   The available rules are displayed.
4. Click **Event Stream Analysis Rule**.
5. In the ESA rule panel, click **+ Create Rule** to add an ESA rule.

You can select the **Advanced EPL** option or **Rule Builder** option from the dropdown as per your requirement. It navigates to **ESA Rules** > **Rules** view.



See the section Add a Rule Builder Rule for more information on creating rules in Rule Builder.

See the section Add an Advanced EPL for more information on creating Advanced EPL.



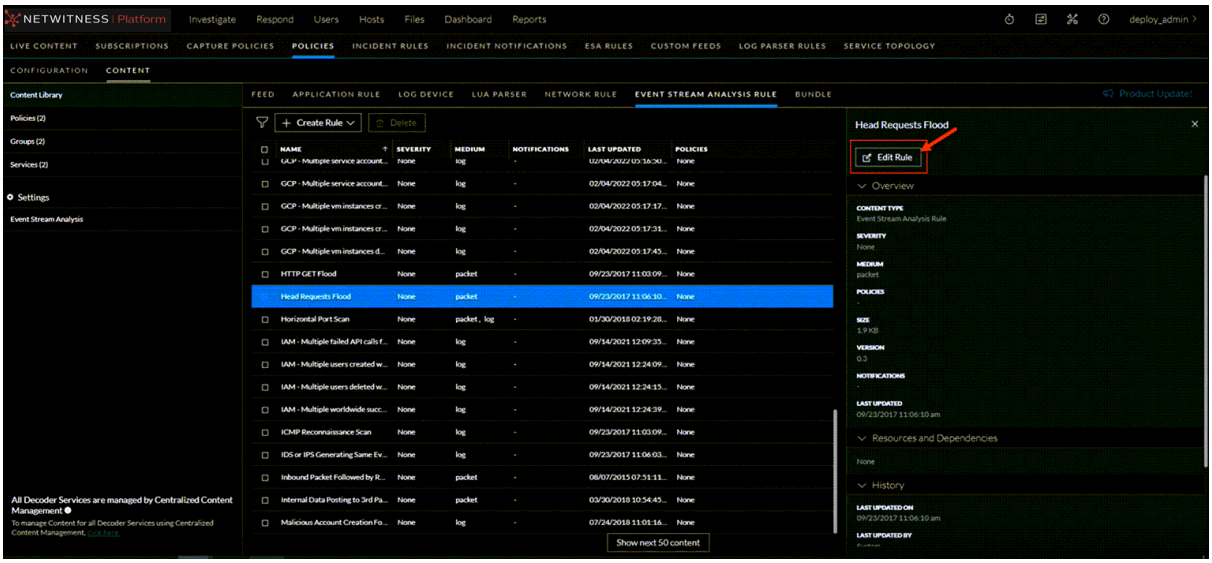
Note: Analysts must have appropriate permissions to view the ESA rules under (**CONFIGURE**) > **ESA Rules** and (**CONFIGURE**) > **Policies** pages. For more information, see the **Source-server** section in the "Role Permissions" topic in the *System Security and User Management Guide*.

From 12.3 and later, **Severity** and **Notifications** list views are added to the **Event Stream Analysis Rule** section.

The Severity list consists of None, Low, Medium, High, and Critical. You can also view rules filtering these options except for None. For more information on filtering these options, see Filter Content Rules.

Rules with syslog and email notifications can be viewed on the **Notifications** list of the **Event Stream Analysis Rule** section.

Edit an ESA Rule



This topic provides instructions to edit an Event Stream Analysis (ESA) rule. When you edit a rule, ESA applies the updated criteria going forward. No changes are made to previously generated alerts.

To edit an ESA Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.

   The available rules are displayed.
4. Click **Event Stream Analysis Rule**.
5. In the ESA rule panel, select the rule that needs to be edited.

   The overview panel opens, showing the Edit Rule tab on top.
6. Click the **Edit Rule** tab.

It navigates to **ESA Rules** > **Rules** view.

For more information on editing an ESA rule, see Edit, Duplicate or Delete a Rule.

Delete an ESA Rule

You can delete one or more ESA rules. Once the ESA rule is deleted, the ESA rule will be removed from the available list.

To delete an ESA Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.

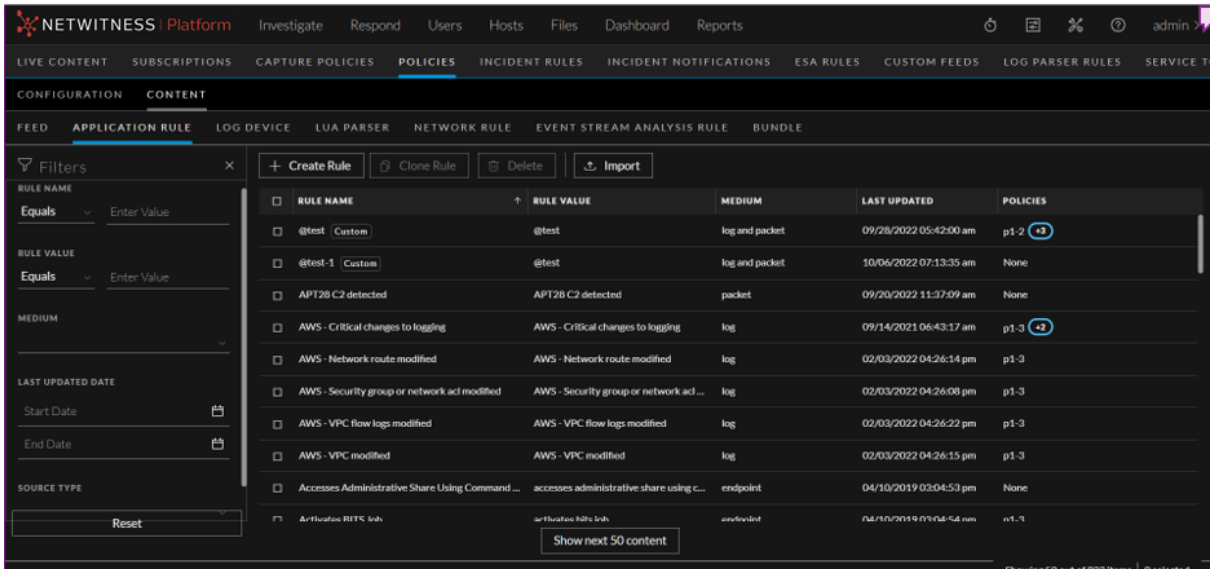
   The available rules are displayed.
4. Click **Event Stream Analysis Rule**.

   The available ESA rules are displayed.

   Note: Only Custom ESA rules that are not assigned to a policy will be available for deletion.
5. Select one or more custom ESA rules and click **Delete**.

   A confirmation pop-up is displayed.
6. Click **Delete**.

Filter Content Rules



The Filters panel allows you to filter the list of displayed contents under the content library based on the name, medium, date range, and source type.

This applies to the following content rule types:

- Feed
- Application Rule
- Log Device
- Lua Parser
- Network Rule
- Event Steam Analysis Rule
- Bundle

To filter the content rules

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Content Library**.
4. By default, the filters panel is hidden, click the (Filters) icon in the toolbar to expand the filters panel.

5. To search by rule name:
   - Set the filter option to **Contains** operator from the drop-down list and start typing the name of the rule. Type one character and a list of rules that contain that character is displayed, as you continue to type the list is filtered to match.
   - Set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular content type will be displayed.
6. To filter by rule value:

- Set the filter option to **Contains** operator from the drop-down list and start typing the rule value. Type one character and a list of rules that contain the rule value with that character is displayed, as you continue to type the list is filtered to match.
- Set the filter option to **Equals** operator from the drop-down list and enter the full rule value. The particular content type will be displayed.

7. To filter by medium, select one or more mediums from the **Medium** drop-down list. The options are listed below:
   - **endpoint**
   - **log**
   - **log and packet**
   - **packet**
8. To filter by date range, under the **Last Update date**, select the start date and end date from the date fields.

   For example, to filter policies that were updated between July 1 and July 30, you select July 1 as the start date and July 30 as the end date. You must enter dates in **mm/dd/yyyy** format or you click and pick dates from a calendar.
9. To filter by source type, select one or more sources from the **Source Type** drop-down list. The options are listed below:
   - **Custom**
   - **Live**
10. To hide, click the  icon at the top-right of the panel.

    The contents are displayed in the right panel according to the filter you selected. Click **Reset** to clear the existing filter results.

Manage Groups

This section contains:

- Create a Group
- View a Group
- Delete a Group
- Edit a Group
- Filter Groups

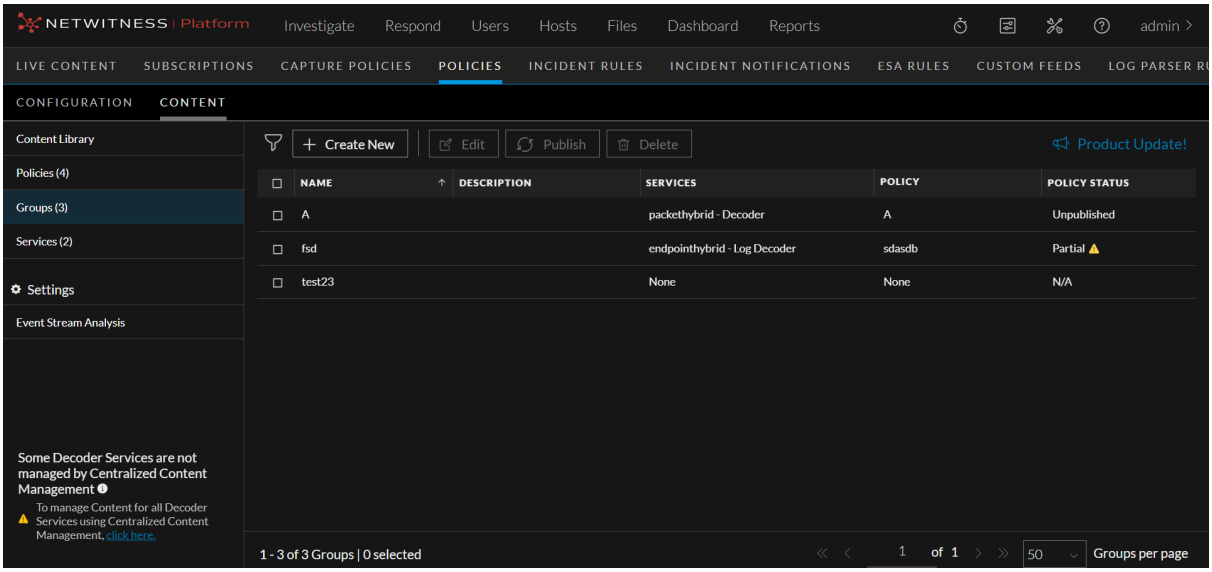
Create a Group

You can create a group with one or more services and assign one policy to it. Groups may be created without any assigned policy; however, a policy must be assigned to a group and Published in order for any content changes to take effect.

To create a Group

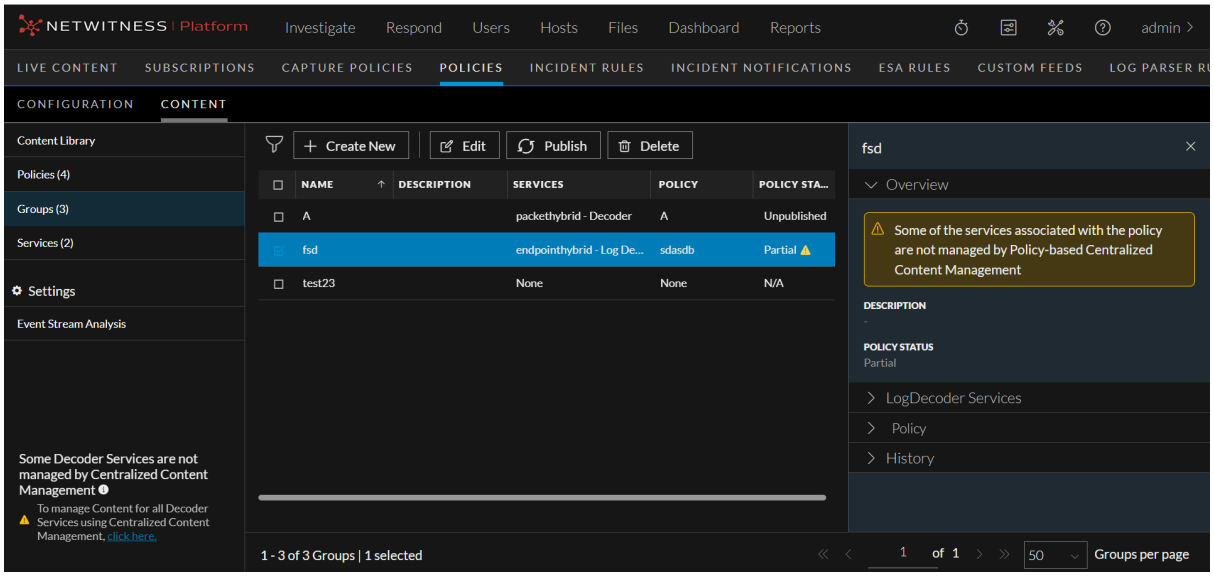
1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Groups**.
4. In the tool bar, click **+ Create New**.
5. In the **New Group** panel, do the following:
   - Enter the name of the group.
   - Enter the description for the group.
6. Click **Next**.
7. In the **Define Group**, click + to assign services to the group.

   Note:
   - A service is disabled if it is assigned to another group.
   - A service is disabled if it is not managed by Policy-based Centralized Content Management.
   - ESA Services are not disabled when assigned to a group, as the ESA services can be assigned to more than one group.
8. Click **Next**.
9. In the **Assign Policies**, click + to assign policies to a group. You can assign only one policy to any particular group.



10. Do any one of the following:
    - Click **Save and Publish** to save and publish the settings.
    - Click **Save and Close** to save the settings.

View a Group



This topic describes the steps to view the properties of Group.

To view the properties of the selected Group

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Groups**. The available groups are displayed. By default, 50 groups are displayed per page. To go to the next page, click . To go to the last page, click .

4. Click a row to view details about the selected group in the right panel.

Caution:

- An icon is displayed in the Groups View indicating policy status unpublished, if any services are part of the selected group and do not have any deployment then some of the associated correlation services require ESA deployments.
- An icon is displayed in the Groups View, indicating that the policy status failed for multiple reasons. Please see the groups overview section in the UI to find the failure reason and the workaround.

Delete a Group

You can delete one or more groups. Once the group is deleted, all services will be removed from the group and all the policy content will be deleted from the services.

To delete a Group

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Groups**. The available groups are displayed.
4. Select one or more Groups and click **Delete**.

   The Delete Groups dialog is displayed.
5. To delete the deployed content from the services upon deleting the group, select the option **Delete deployed content from the services on group removal**. For ESA service, the content will be deleted upon deleting the group.
6. Click **Delete** to permanently delete the selected group.

   The confirmation message is displayed.

Note:
- For a group with multiple services, even if we fail to delete a particular service under the group, the other services will get deleted. The service which is not deleted will be in **Failed** state.
- The group status changes to **Failed** if group deletion fails for any particular reason.

Edit a Group

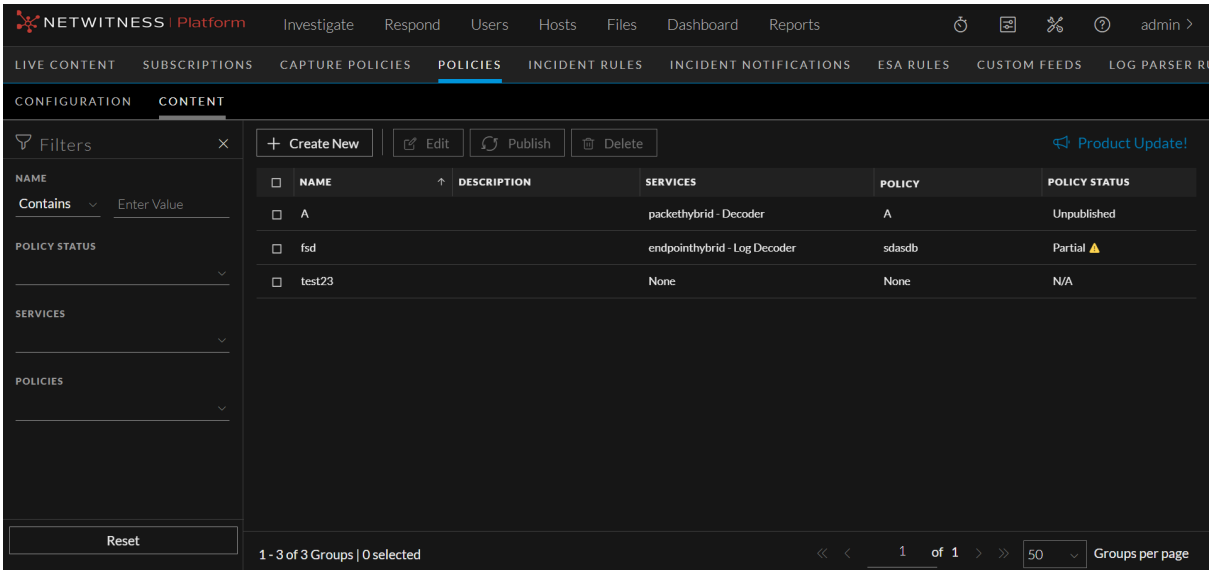
You can edit the properties of the group at any point in time. The status of the updated group is unpublished if you change the service or policies in a group. If you just change the group name and description, then the status remains published (if it is already published).

To edit the selected Group

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Group**. The available groups are displayed.
4. Select a group to edit and click **Edit**.
5. Make the required changes in the group.
6. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.

     Note:
     - While removing a service from the group, you can opt to either delete the content of the service and remove the service or just remove the service from the group.
     - While removing the group from the policy, the ESA content will be deleted by default.
   - The policy will be listed under the Unpublished category.
   - Click **Save and Close** to save the settings and return to the Policies view.

Filter Groups



The Filters Panel for content group allows you to filter the list of displayed groups, based on the group name, policy status, services and policies.

To filter the Groups

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Groups**. The available groups are displayed.

4. To filter the groups, click . The filter panel is displayed.

5. On the filter panel, do the following:

   a. Select the **Name** drop-down value as either **Equals** or **Contains**. To search the group name using the **Contains** operator, set the filter option to **Contains** operator from the drop-down list and start typing the name of the group. Type one character and a list of group that contain that character is displayed, as you continue to type, the list is filtered to match. To search the group name using the **Equals** operator, set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular group name will be displayed.

   b. Select the **Policy Status** from the drop-down list. The various drop-down values are:

      i. **Published**: Groups that are published to use.

      ii. **Unpublished**: Groups that are saved but not published.

      iii. **Failed**: Groups that are failed to publish.

iv. **N/A**: Groups for which publication status is not applicable.

v. **Partial**: Groups that are partially published.

c. Select the **Services** from the drop-down list.

d. Select the **Policies** from the drop-down list.

e. To reset the fields, click **Reset**.

Manage Policies

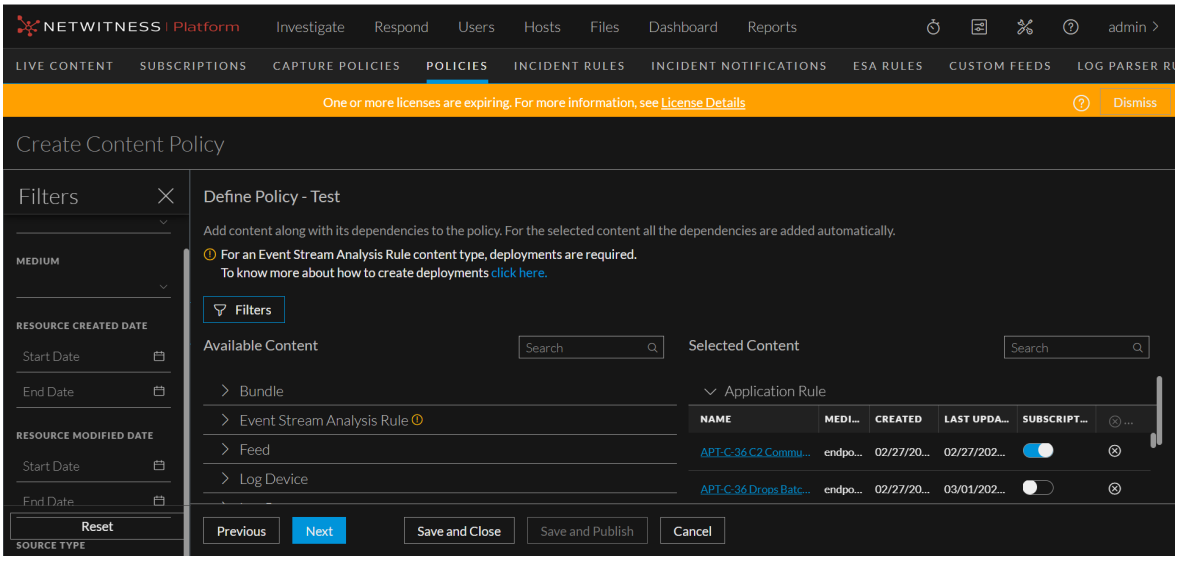
This section contains:

- Create and Publish Policies
- Clone a Policy
- Delete a Policy
- Edit a Policy
- View a Policy
- Enable Content for a Policy
- Disable Content for a Policy
- Subscribe Content for a Policy
- Unsubscribe Content for a Policy
- Filter Policies
- Filter Policy Content Details
- Merge Policy with ESA Content

Create and Publish Policies

You can create a policy and assign it to one or more groups.

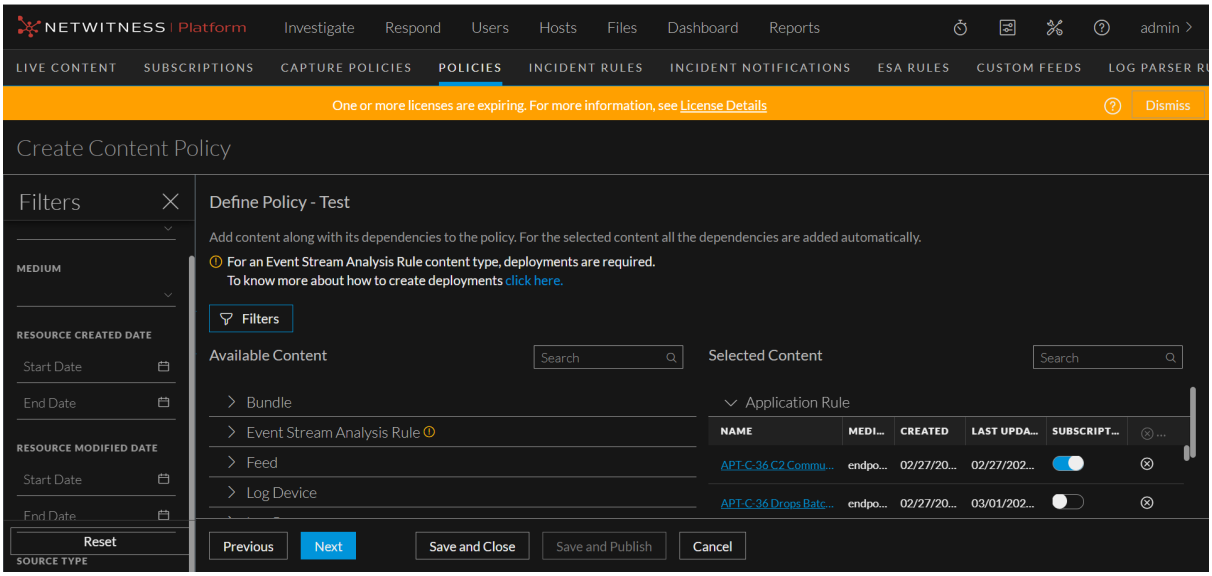
To create a Policy



1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**.

   The available policies are displayed.
4. Click **+ Create New** to add a new policy.
5. In the **New Policy** panel, do the following:
   - Enter a unique policy name.
   - Enter a description for the policy.
6. Click **Next**.
7. In the **Available Content**, select the content type and click + to add the content to the policy. To add all content based on the resource type, click ALL. After you add the content, you can enable subscription (if required) by clicking subscribed toggle. Once the content is subscribed the updates are pushed automatically. To conveniently search the available content, type the initial content text in

the **Search** box available under the **Available Content** .To conveniently search the selected content, type the initial content text in the **Search** box available under the **Selected Content** .

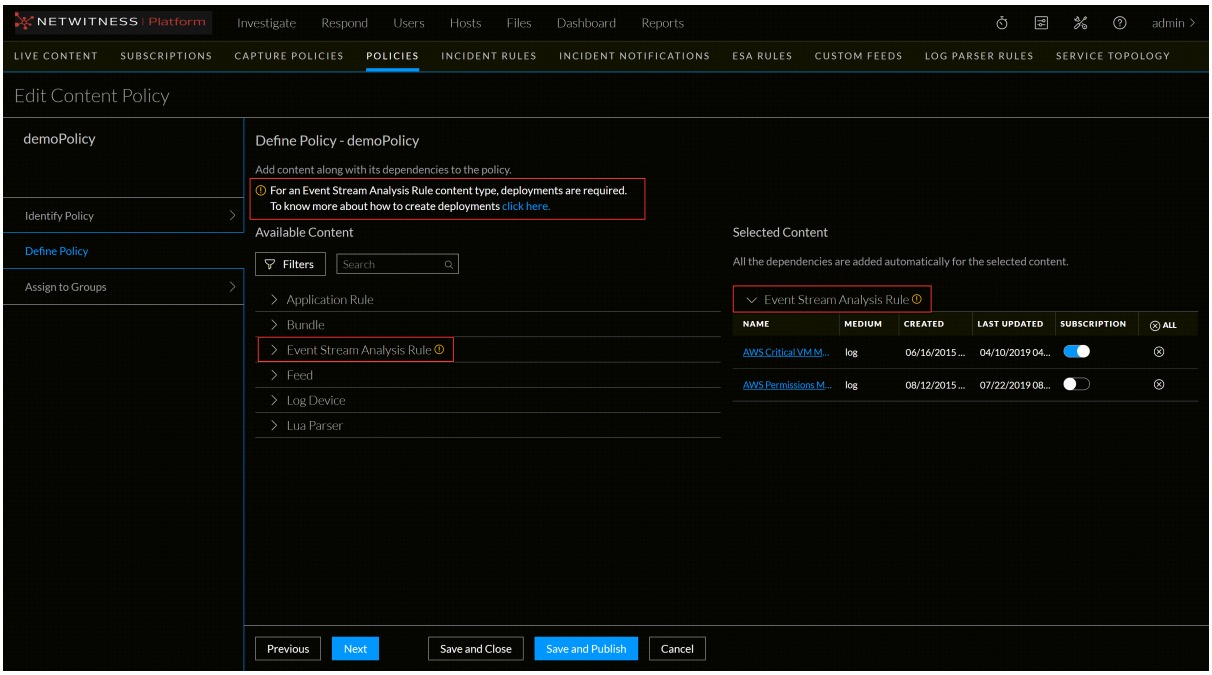


8. To filter both available and selected content, do the following:

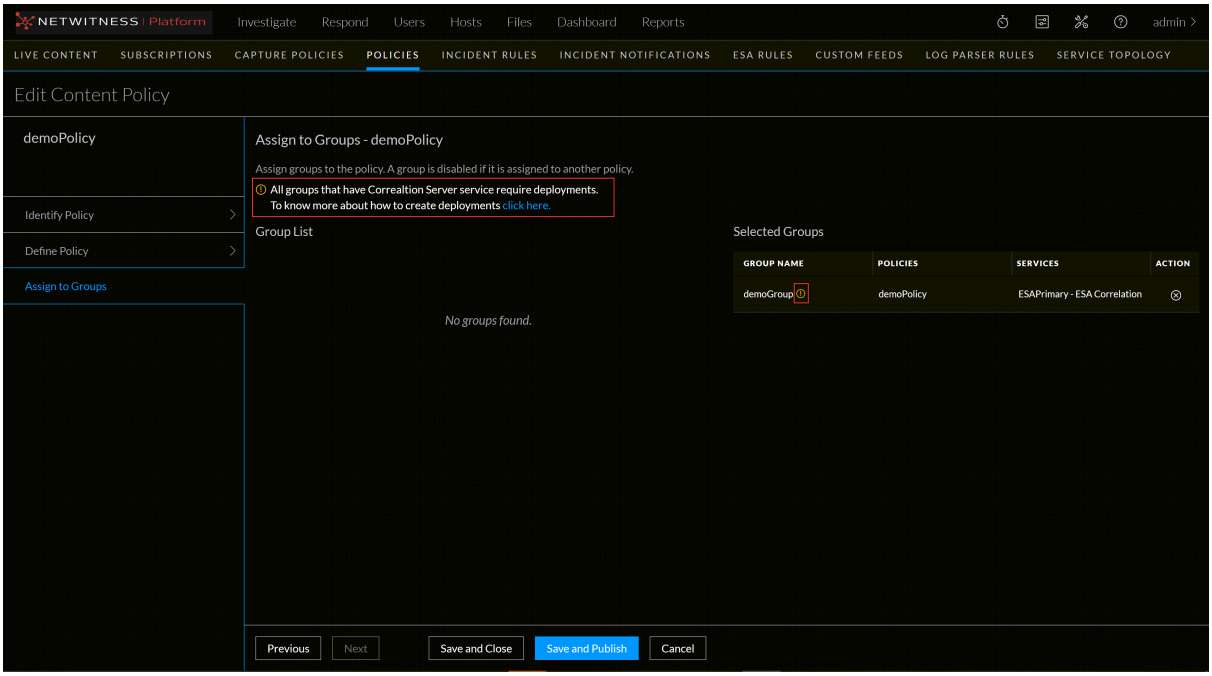
   - Click the  icon. The filter panel window is displayed.

   - Select the **Resource Types** from the available drop-down values.
   - Select the **Medium** from the available drop-down values.
   - Select the **Resource Created Date** and **Resource Modified Date**.
   - To reset the fields, click **Reset**.

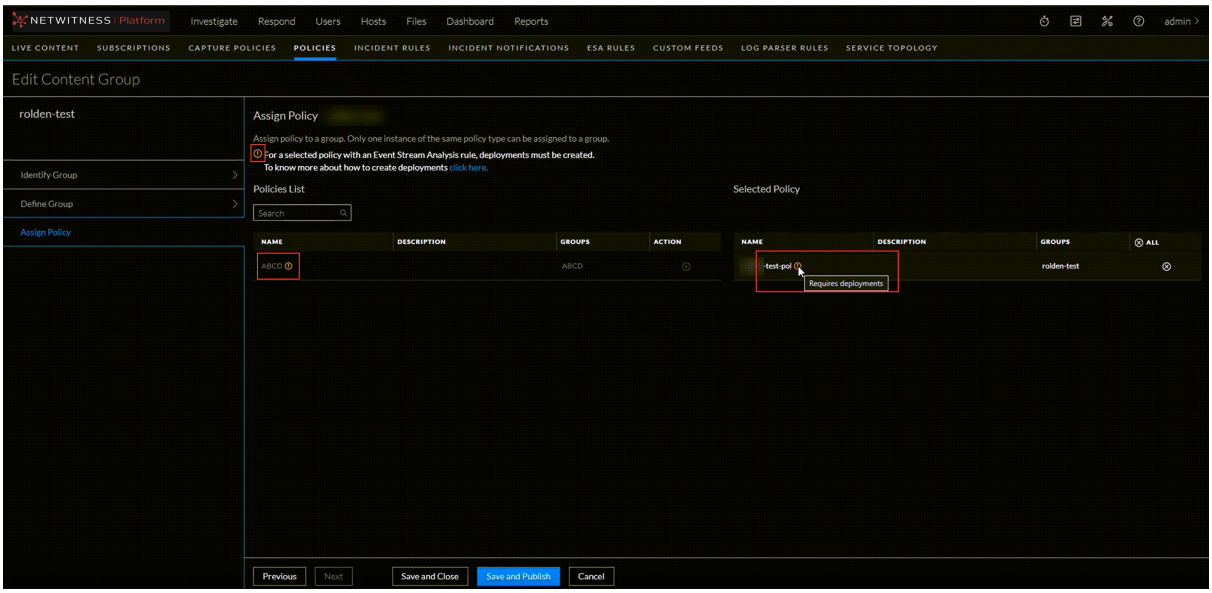
Note: Subscription is not allowed for custom content.



9. **Note:**
- All the dependencies are added automatically for the selected content. You can click on the content name highlighted in blue and look for details such as content description, content type, resources and dependencies and so on. You can also add and subscribe the resource from the details view.

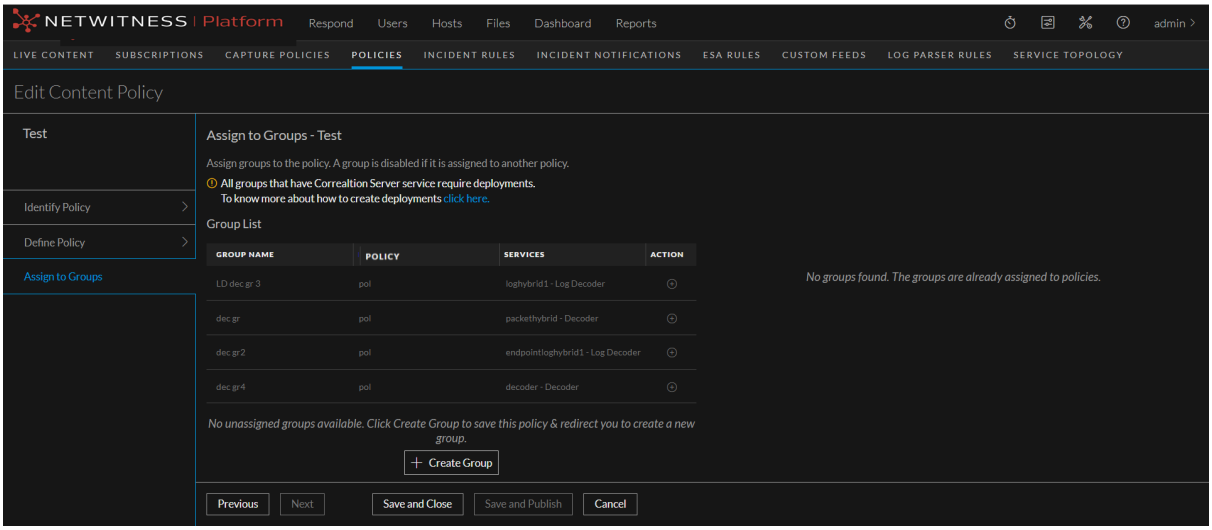


A caution icon is displayed to create a deployment on three scenarios.



- To implement the **Event Stream Analysis Rule** content type, you must have a deployment.

- All groups that have correlation server service must have a deployment.



- For any selected policy with an ESA rule, deployment are must be created.

To create and manage deployments, refer to Manage Deployments feature.

10. In the Group List, click + to assign groups to the policy.

Note: A group is disabled if another policy of the same type is already assigned to this group.

11. If there are no unassigned groups available, click 

to save the policy and redirect you to **Create New Group** screen. For more information on creating a new group, see Create a Group feature.

12. Click **Save and Publish** to save and publish the settings.

Note: You can also publish a policy from **Policy Details** screen. For more information on publishing a policy from **Policy Details** screen, refer View a Policy feature.

13. Click **Cancel** to cancel the publish content dialog.

14. Click **Save and Close** to save the settings.

IMPORTANT:
- From 12.3 version onwards, contents of services are not wiped out while publishing the first policy.
- The endpoint risk scoring requires certain application rules. Refer Endpoint Risk Scoring Rules to view the list of these application rules.

Clone a Policy

When you clone a policy, all the content from the old policy is copied to the new policy. The cloned policy can be assigned to a new group. You can clone only one policy at a time.

To clone a Policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Select a policy to clone and in the More actions drop-down list in the tool bar, click **Clone**.

   The policy is cloned successfully.

Delete a Policy

Deleting a policy removes all content from the associated group.

To delete a Policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Select one or more policies and in the More actions drop-down list in the tool bar, click **Delete**.

   The **Delete Policies** dialog is displayed.
5. To delete the deployed content from the group's services upon deleting the policy, select the option **Delete deployed content from the group's services on policy removal**. For ESA service, the content will be deleted upon deleting the policy.
6. Click **Delete** to permanently delete the selected policy.

   Deletion will take immediate effect and the policy will no longer be available in any group.

Note:
- The services associated with this policy still require a restart if the restart is pending.
- You can also delete a policy from **Policy Details** screen. For more information on deleting a policy from **Policy Details** screen, refer View a Policy feature.
- The policy status changes to **Failed** if policy deletion fails for any particular reason.

Edit a Policy

You can edit the content and settings of the policies. Once the policy is edited, the changes in the policy are reflected upon saving the policy. The changes are applied to the service once published. After saving and before publishing, the publication status of the changed policy is set to **Unpublished** if any settings are changed.

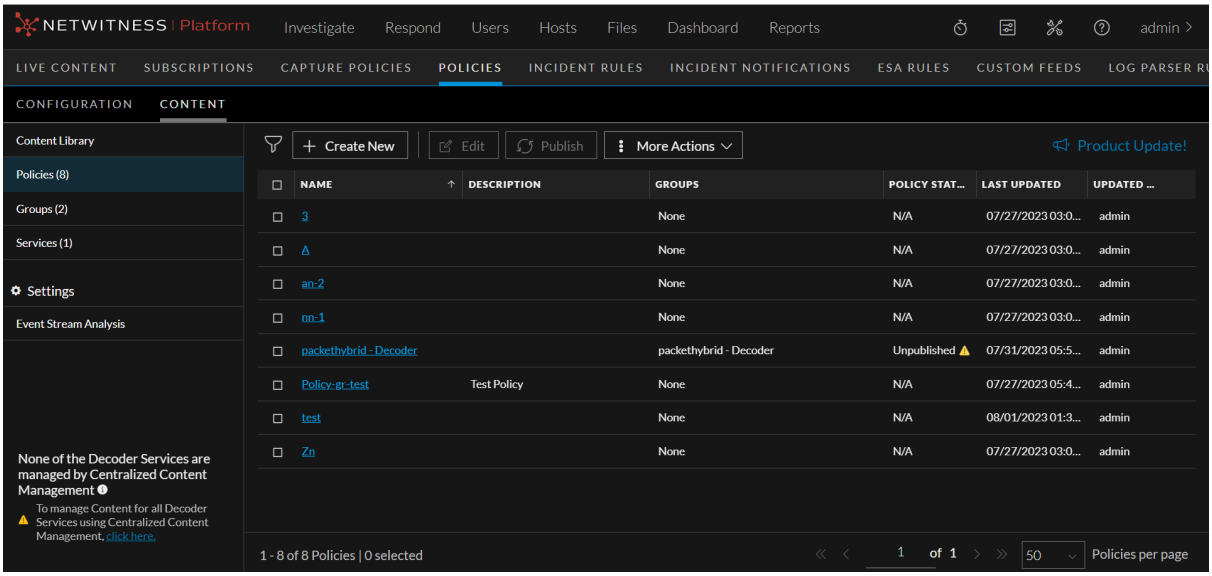
To edit a Policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Select a policy to edit and click **Edit**.
5. Make the required changes in policy.
6. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy. The policy will be listed under the Unpublished category.

     Note:
     - While removing a group from the policy, you can either delete the content of the service and remove the group or just remove the group from the policy.
     - While removing the group from the policy, the ESA content will be deleted by default.

   - Click **Save and Close** to save the settings and return to the Policies view.

Note: You can also edit a policy from **Policy Details** screen. For more information on editing a policy from **Policy Details** screen, see View a Policy feature.

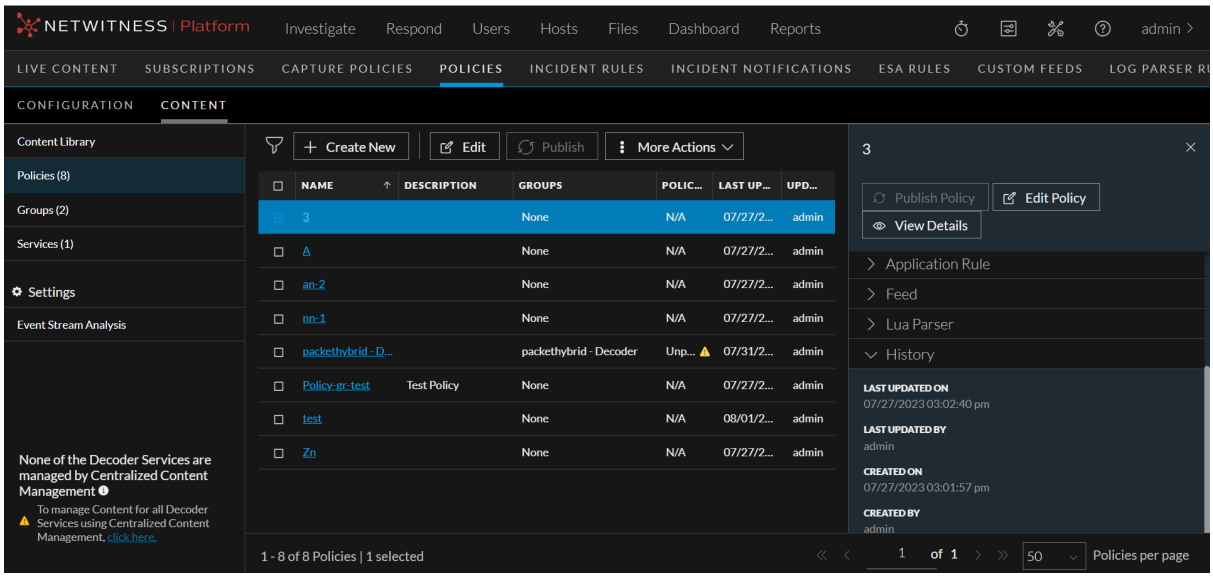


View a Policy

This topic describes the steps to view the properties of a Policy.

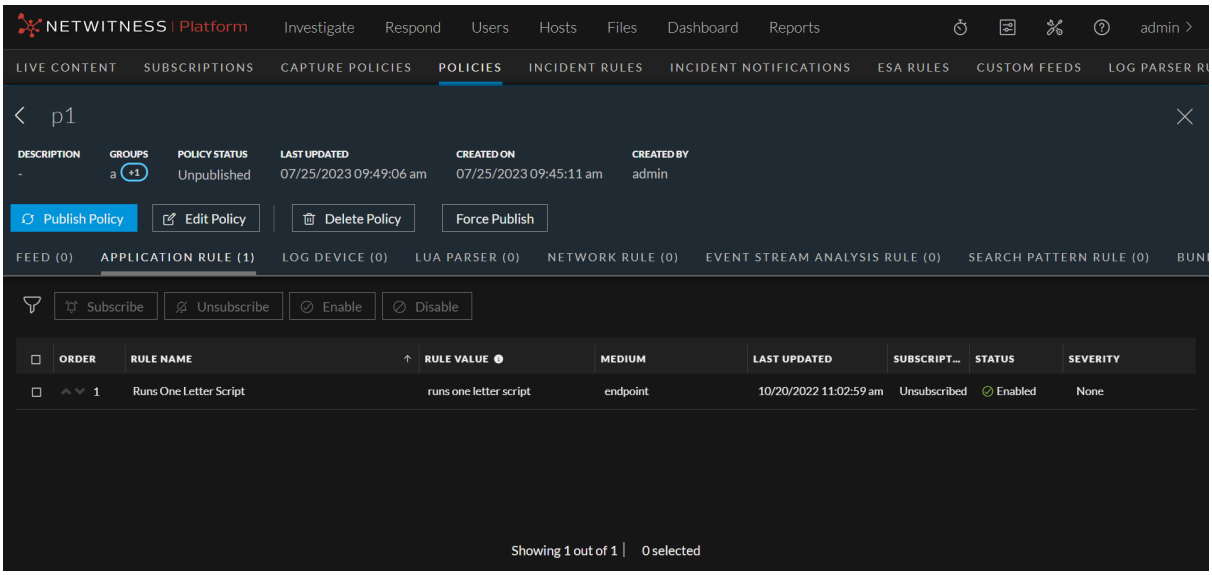
To view properties of the selected Policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed. By default, 50 policies are displayed per page.



To go to the next page, click ›. To go to the last page, click ».

Caution:



- An icon ⚠ is displayed in the Policy View indicating policy status unpublished, if any services are part of the selected policy and do not have any deployment then some of the associated correlation services require ESA deployments.
- An icon ⛔ is displayed in the Policy View, indicating that the policy status failed for multiple reasons. Please see the policy overview section in the UI to find the failure reason and the workaround.

4. From the policy listing page, you can perform the following actions:
   - Select a policy and click **Edit** to edit the policy. For more information on editing a policy, seeEdit a Policy feature.
   - Select the policy and click **Publish** to publish the policy if the policy is unpublished.
   - Select the policy and click **More Actions > Assign to Groups** to assign policy to available group.
   - Select the policy and click **More Actions > Clone** to clone the policy. For more information on cloning a policy, seeEdit a PolicyClone a Policy feature.
   - Select the policy and click **More Actions > Delete** to delete the policy. For more information on deleting a policy, see Delete a Policy feature.
   - Select the policy and click **More Actions > Force Publish** to force publish the policy. This action allows you republish all the content irrespective of the policy status.
5. Click a row to view details about the selected policy on the side panel.

6. To change the order of application rule assigned to the policy, do the following:
   1. To move the application rule or network down the order, click in the **Order** column.
   2. To move the application rule up the order, click in the **Order** column.
   3. You can also manually enter the order number in the **Order** column.
7. To change the order of network rule assigned to the policy, do the following:
   1. Click **Network Rules** tab.
   2. To move the network rule or network down the order, click in the **Order** column.
   3. To move the network rule up the order, click in the **Order** column.
   4. You can also manually enter the order number in the **Order** column.

   IMPORTANT: It is recommended not to order application rules or network rules deployed on the service from Service Config page if the service is part of Centralized Content Management.
8. Click the policy to view the details on the policy in a new page.

9. From the policy details page, you can perform the following actions:
   - To edit the policy, click **Edit Policy**. For more information on editing a policy, see Edit a Policy feature.
   - To delete the policy, click **Delete Policy**. For more information on deleting a policy, see Delete a Policy feature.
   - To publish the policy, click **Publish Policy**. For more information on creating and publishing a policy, see Create and Publish Policies feature.
   - To force publish a policy, click **Force Publish**. This action allows you republish all the content irrespective of the policy status.
   - To filter the content, click . For more information on filtering policy content details, see Filter Policy Content Details feature.
   - To enable or disable subscription, click **Subscribe** or **Unsubscribe** respectively.

     Note:
     - Subscription is not allowed for custom content.
     - The **Subscribe** and **Unsubscribe** button is disabled if any one of the content selected is custom.

Enable Content for a Policy

This topic describes the steps to enable the content for a Policy.

To enable content

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.

4. Click the policy name to view the policy details.
5. In the **Application Rule**, **Network Rule**, **Feed**, **Log Device** or **LUA Parser** panel, click the row to select the content to be enabled. You can either select all content or select any specific content to be enabled.
6. Click **Enable**.

Disable Content for a Policy

This topic describes the steps to disable the content for a Policy.

To disable content

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.
4. Click the policy name to view the policy details.
5. In the **Application Rule**, **Network Rule**, **Feed**, **Log Device** or **LUA Parser** panel, click the row to select the content to be disabled. You can either select all content or select any specific content to be disabled.
6. Click **Disable**.

Subscribe Content for a Policy

This topic describes the steps to subscribe content for a Policy.

To subscribe content

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.
4. Click the policy name to view the policy details.
5. In the **Application Rule**, **Network Rule**, **Feed**, **Log Device**, **LUA Parser**, **Event Stream Analysis Rule** or **Bundles** panel, click the row to select the content to be subscribed. You can either select all content or select any specific content to be subscribed.
6. Click **Subscribe**.

Unsubscribe Content for a Policy

This topic describes the steps to unsubscribe the content for a Policy.

To unsubscribe content

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.
4. Click the policy name to view the policy details.
5. In the **Application Rule**, **Network Rule**, **Feed**, **Log Device**, **LUA Parser**, **Event Stream Analysis Rule** or **Bundles** panel, click the row to select the content to be unsubscribed. You can either select all content or select any specific content to be unsubscribed.
6. Click **Unsubscribe**.

Filter Policies

The Filters Panel allows you to filter the list of displayed policies, based on the policy status and service type:

- **Decoder**
- **Log Decoder**
- **Concentrator**

Additionally, you can filter based on publication status or service status:

- **Published**: Policies that are published to use.
- **Unpublished**: Policies that are saved but not published.
- **Failed**: Policies that are failed to publish.
- **N/A**: Policies for which publication status is not applicable.

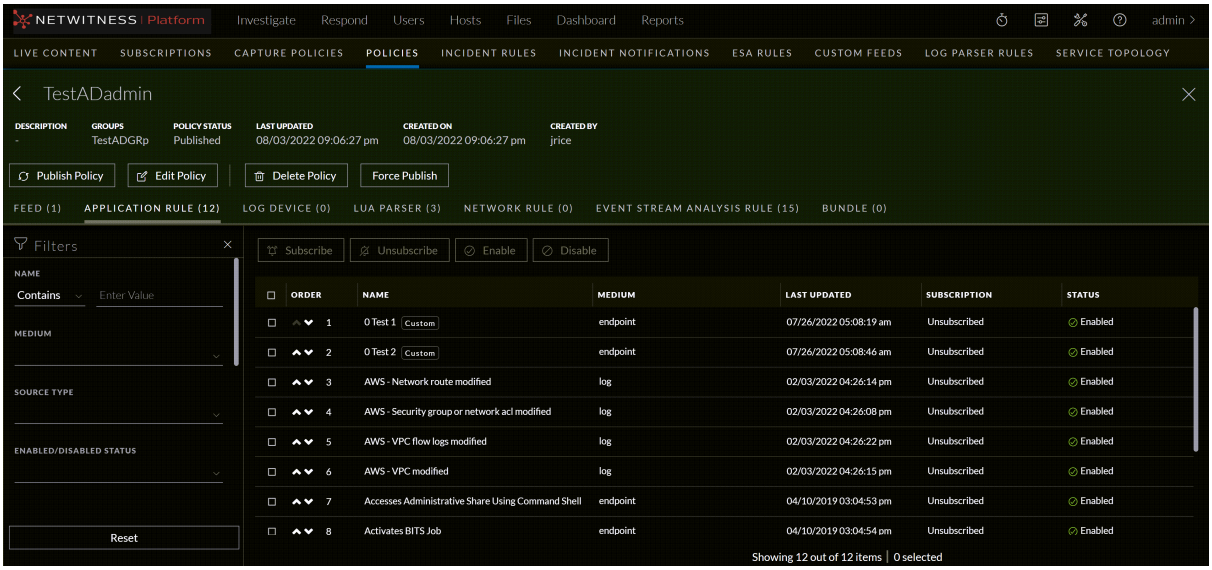
The **Filters** panel can be hidden or displayed:

- To display if hidden, click the icon in the toolbar.
- To hide, click the icon at the top-right of the panel.

Filter Policy Content Details

The Filters panel allows you to filter the list of displayed content in the policy details view based on the name, medium, source type, enabled/disabled status, subscription status, severity, resource created date, and last updated date.

This applies to the following content types:



- Feed
- Application Rule

- Log Device
- Lua Parser
- Network Rule
- Event Steam Analysis Rule
- Bundle

To filter policy content details

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Do one of the following:
   - Click a policy name.
   - Click a row to view details about the selected policy and click **View Details**.

   The policy details view is displayed.

5. By default, the filters panel is hidden, click the (Filters) icon in the toolbar to expand the filters panel.
6. To search by name:
   - Set the filter option to **Contains** operator from the drop-down list and start typing the name of the content rules. Type one character and a list of content rules that contain that character is displayed, as you continue to type the list is filtered to match.
   - Set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular content type will be displayed.

7. To filter by medium, select one or more mediums from the **Medium** drop-down list. The options are listed below:
   - **endpoint**
   - **log**
   - **log and packet**
   - **packet**
8. To filter by source type, select one or more sources from the **Source Type** drop-down list. The options are listed below:
   - **Custom**
   - **Live**
9. To filter by enabled/disabled status, select one or more statuses from the **Enabled/Disabled Status** drop-down list. The options are listed below:
   - **Enabled**
   - **Disabled**

   Note: Enabled/Disabled Status filtering is not applicable to Event Stream Analysis Rule content.
10. To filter by subscription status, select one or more statuses from the **Subscription** drop-down list. The options are listed below:
    - **Subscribed**
    - **Unsubscribed**
11. To filter by severity of the content, under the **Severity** field, select the drop-down values as either **Low**, **Medium**, **High** or **Critical**.

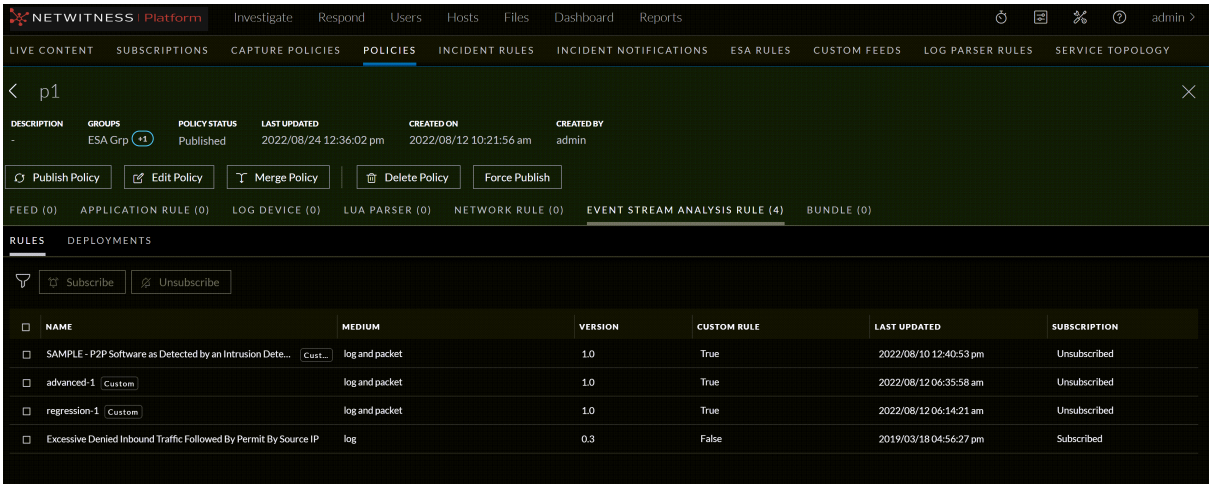
    Note: This field is applicable only for the content type 'Application Rule'.
12. To filter by a resource created date range, under the **Resource Created Date**, select the start date and end date from the date fields.

    For example, to filter contents that were created between July 1 and July 30, you select July 1 as the start date and July 30 as the end date. You must enter dates in **mm/dd/yyyy** format or you click and pick dates from a calendar.
13. To filter by date range, under the **Last Update date**, select the start date and end date from the date fields.

    For example, to filter contents that were updated between July 1 and July 30, you select July 1 as the start date and July 30 as the end date. You must enter dates in **mm/dd/yyyy** format or you click and pick dates from a calendar.
14. To hide, click the  icon at the top-right of the panel.

    The contents are displayed in the right panel according to the filter you selected. Click **Reset** to clear the existing filter results.

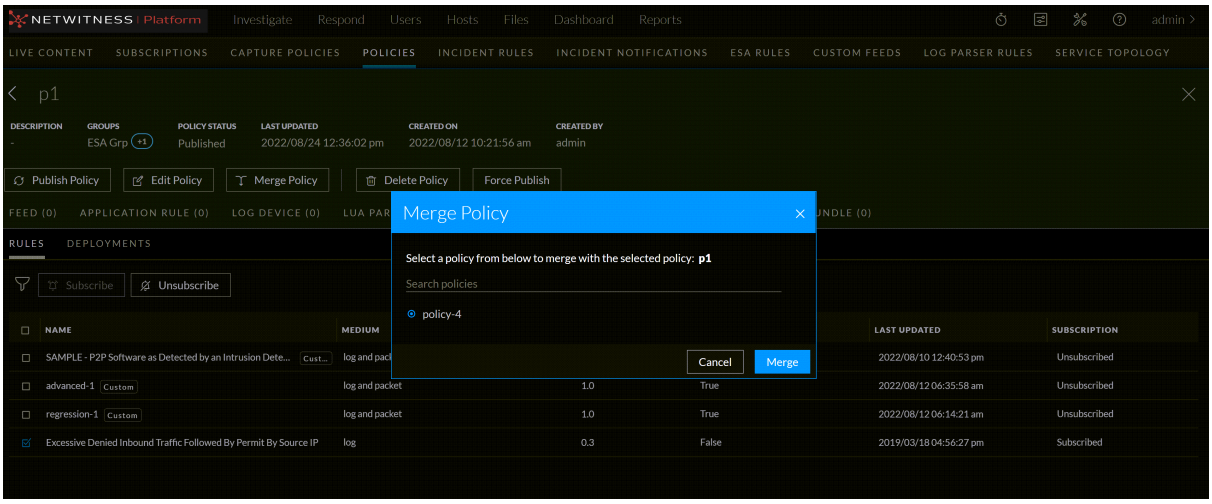
Merge Policy with ESA Content



From the 12.1 version, the ESA content is managed through the **(CONFIGURE)** > **Policies** page. After you upgrade to the 12.1 version, all the existing ESA deployments will be migrated to the policies and groups view. The **Merge Policy** button will be available only for the policy having ESA content and can only be merged with a policy with no ESA content.

Note: On merging a policy with another policy, the original policy gets deleted, and the other policy gets updated with the original policy content.

To merge Policy with an ESA Content



1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Select a policy having ESA content to merge with another policy.

   The selected policy with ESA content view is displayed.

4. Click **Merge Policy**.

   The Merge Policy dialog is displayed.

5. Select a policy from the list or search for the name and Click **Merge**.

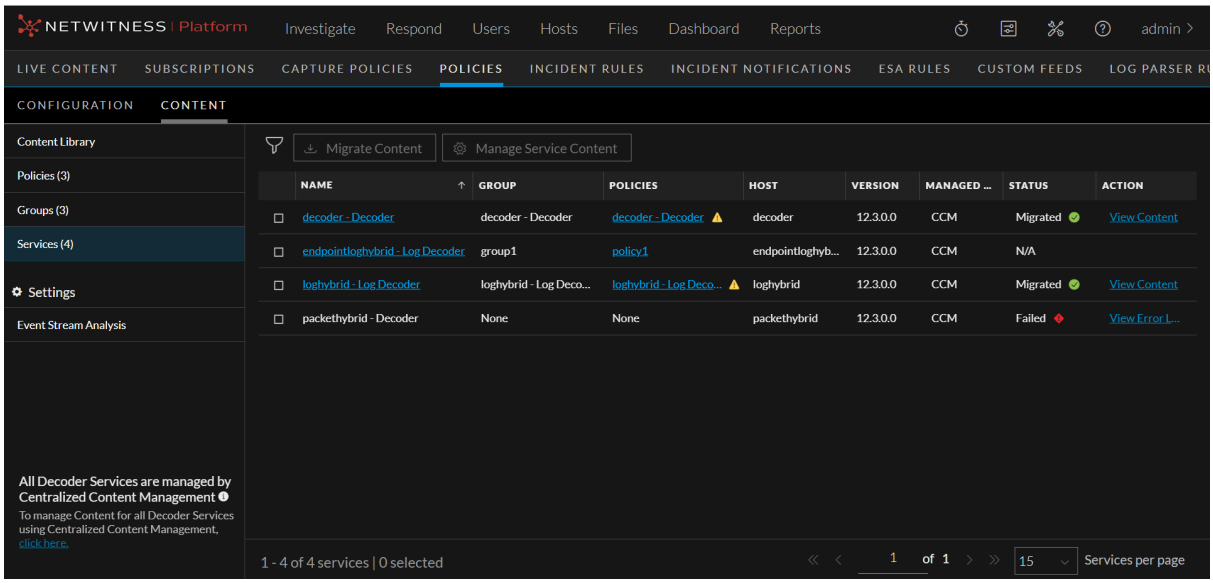
   A confirmation pop-up is displayed.

6. Click **Confirm**.

Manage Services

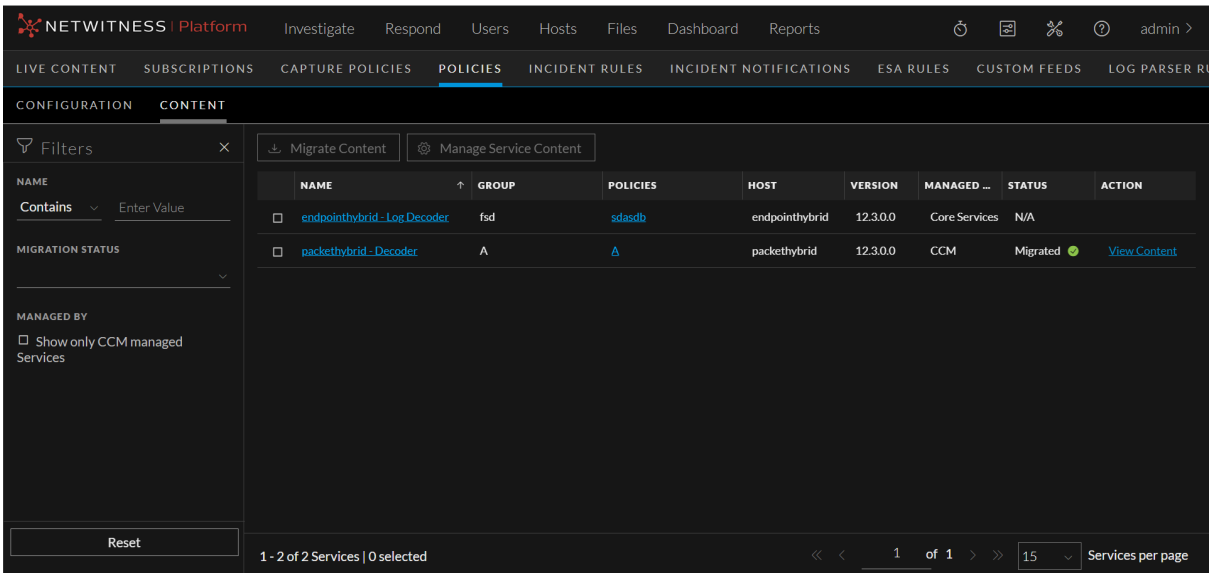
A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host.

This sections contains:



- Migrate Content from Service
- View a Service
- Enable or Disable CCM for Individual Decoder Services

View a Service



This topic describes the steps to view the details of a service.

To view details of the selected Service

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Services**. The list of services are displayed. By default, 15 services are displayed per page. To go to the next page, click . To go to the last page, click .

4. To filter the services, click . The **Filters** panel is displayed.

5. On the **Filters** panel, do the following:

   i. Select the **Name** drop-down value as either **Equals** or **Contains**. To search the service name using the **Contains** operator, set the filter option to **Contains** operator from the drop-down list and start typing the name of the service. Type one character and a list of service that contain that character is displayed, as you continue to type, the list is filtered to match. To search the service name using the **Equals** operator, set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular service name will be displayed.

   ii. Select the **Migration Status** drop-down value.

   iii. Select **Show only CCM Managed Services** check-box under the **Managed By** field to display only the CCM managed services.

   iv. To reset the fields, click **Reset**.

6. Click the service to view the details of the service. The different details of the service are displayed. These details include the contents which will be deployed to the services from CCM policies.

7. To filter the content based on various parameters, click .
8. Click the content to view the details of the content on the right side panel. The complete content details such as **Overview**, **Resources and Dependencies**, and **History** are displayed.

9. To view the details of the policy for the migrated service, click the policy name present under the **Policies** column in the **Service List** page.

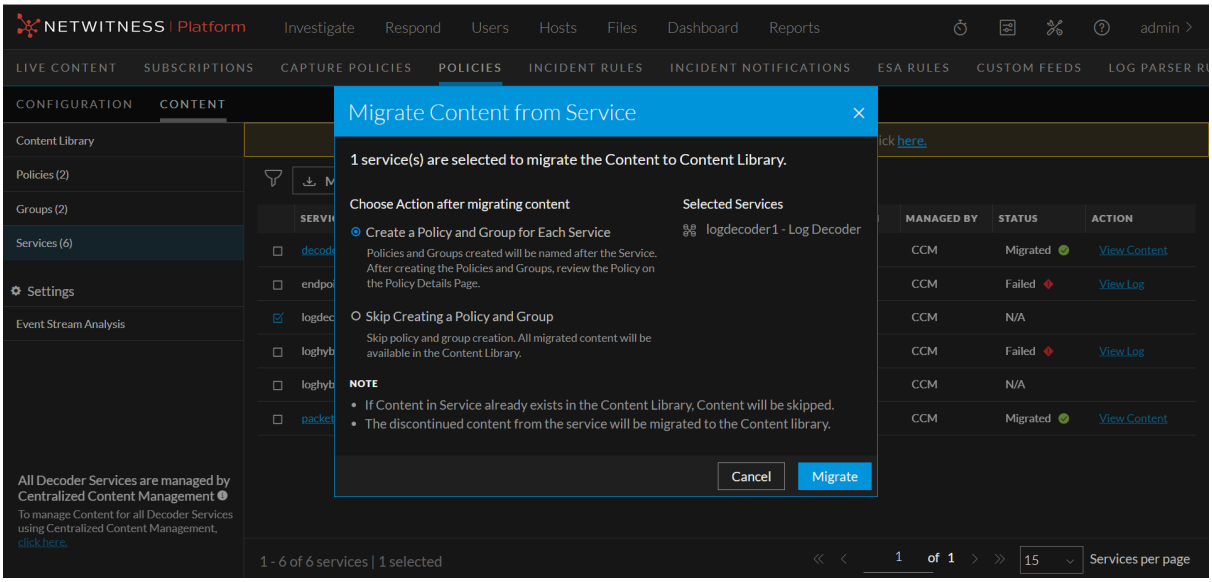
   For more details on the policy details, see View a Policy feature.

10. To view the details of the migrated content for the service, click the **View Content** hyperlink present under the **Action** column in the **Service List** page.
11. To view the details of the logs for failed migration, click the **View Error Log** hyperlink present under the **Action** column in the **Service List** page.

For more details on the migrating content from service, viewing migrated content and viewing error logs, see Migrate Content from Service feature.

Migrate Content from Service

This option allows you to migrate the contents of 12.3 and above version services.



To migrate Content from Service

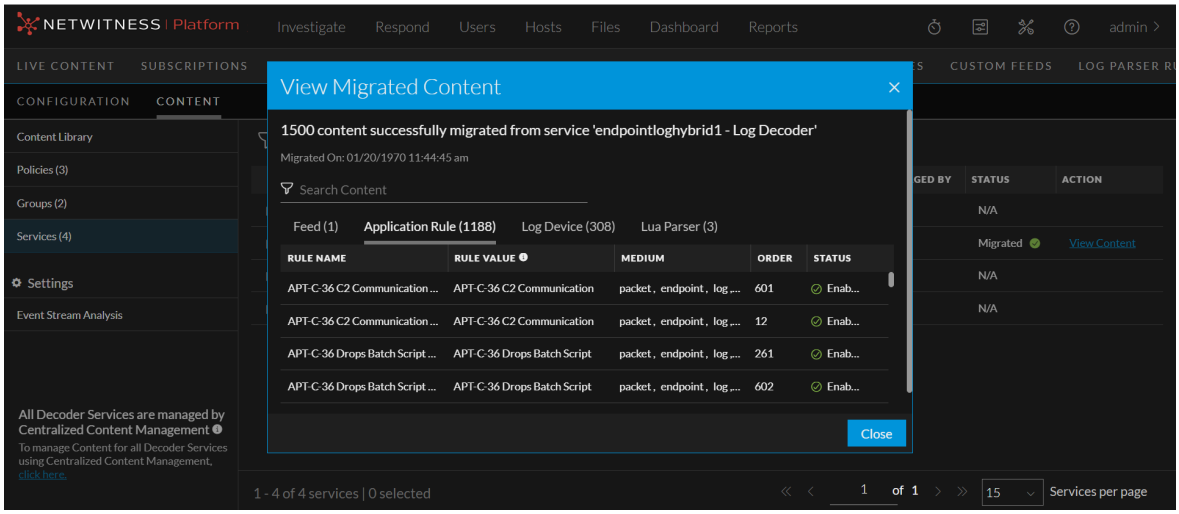
1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Services**. The list of services are displayed.
4. Select the services from which you want to migrate the content.

   Note: By default, you can select up to 5 services for migration. This also includes the services which are under migration. However, you can modify this number from **Admin -> Source Server -> Explore -> Central/Content -> Migration**.

5. Click **Migrate Content**.

   The **Migrate Content from Service** pop-up window is displayed.

6. On the **Migrate Content from Service** pop-up window, choose action and click **Migrate**.
   - If you select **Create a Policy and Group for Each Service**, policy and group will be created for each service selected for migration. Once the migration process is complete, the policy and group will be listed under the respective listing pages. The policy and group which is created for the service will be in 'Unpublished' state and it can be published only after it is reviewed. In the **Policy Listing** page, the **Publish** button for such a policy will be disabled until the policy is reviewed. The policy can be published only after reviewing it either from **Policy Details** page or



Edit Policy Page.

- If you select **Skip Creating a Policy and Group**, only the content will be migrated. All the migrated content will be available in Content Library.

> **Note:** The **Skip Creating a Policy and Group** option is disabled once the migration is successful. You can select the service again and select **Create a Policy and Group for Each Service** to create policy and group for the service.

7. The migration initiation message is displayed on the screen. The **Status** column displays the following values based on the status of migration:
   - Queued
   - Initializing
   - Analyzing Content
   - Migrating Content
   - Migrated
   - Failed
8. To view the migrated content details, do the following:
   - Click the **View Content** hyperlink present under the **Action** column. The hyperlink is available only after the migration process is complete.

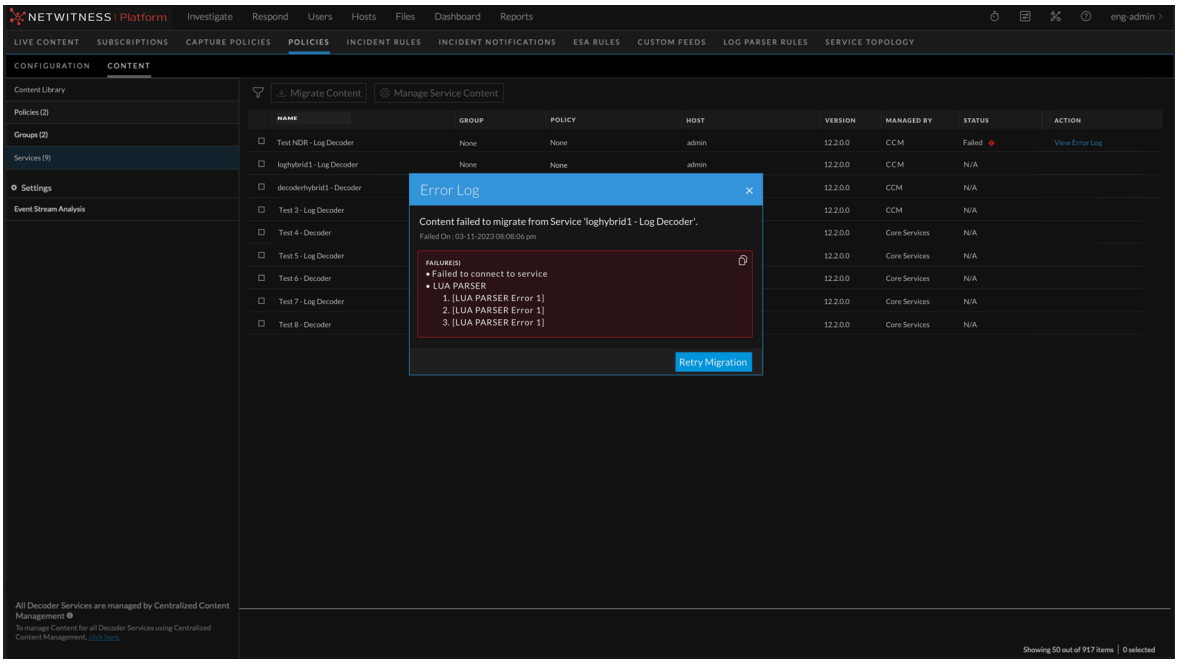
     The **View Migrated Content** pop-up window is displayed with the different tabs such as **Feed**, **Application Rule**, **Network Rule**, **Log Device** and **LUA Parser**.

> **Note:**
> - **Network Rules** tab is not applicable for Log Decoders.
> - **Log Device** tab is not applicable for Decoders.

IMPORTANT: During the process of migration, if a Decoder that is being migrated contains multiple application rules and/or network rules with the exact same rule name and rule condition, only one of those rules will be retained in the service. The remaining rules will be considered duplicates and removed. Therefore, post migration, none of the migrated services will have multiple rules with the same rule name and the same rule value.

- Click  to search the migrated content based on various parameters.

Note:
- For Application Rule and Network Rule, the search is based on **Rule Name** and **Rule Value**.
- For Feeds, Log Device and LUA Parser, the search is based on the **Name**.



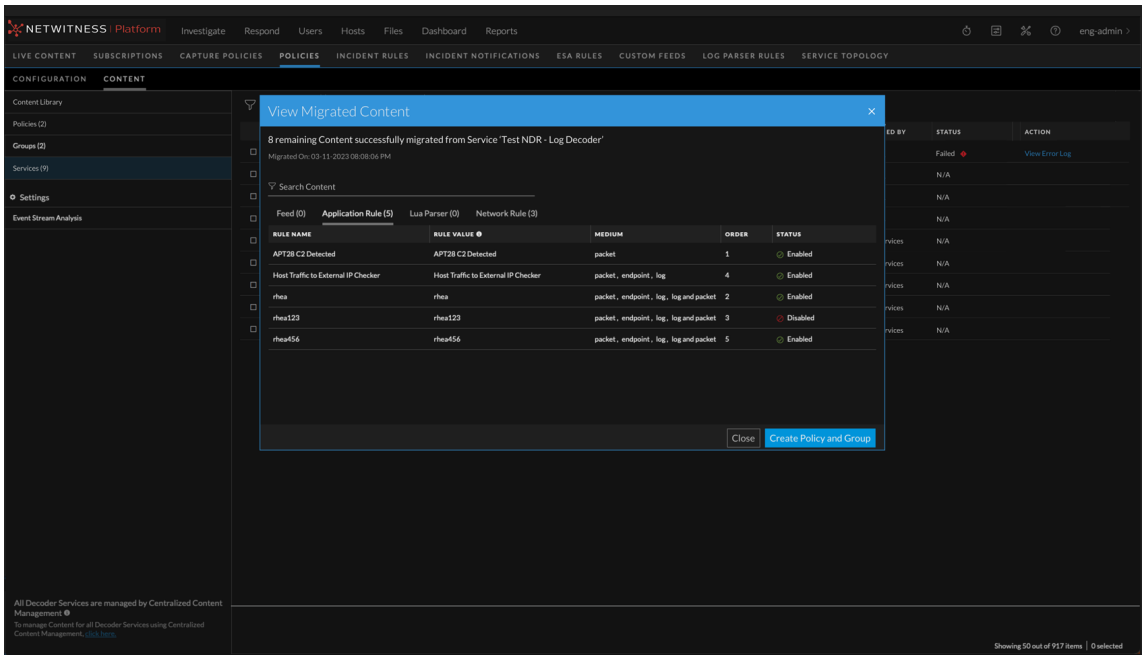
- Click each tab to view the content details. The **Application Rule** and **Network Rule** tabs will have details such as **Rule Name**, **Rule Value**, **Medium**, **Order** and **Status**. The **Log Device**, **Feeds** and **LUA Parser** tabs will have details such as **Name**, **Medium** and **Status**.

9. To view the error log details in case of failed migration, do the following:

- Click the **View Error Log** hyperlink present under the **Action** column. The hyperlink is available only if the migration process has failed due to some reason.

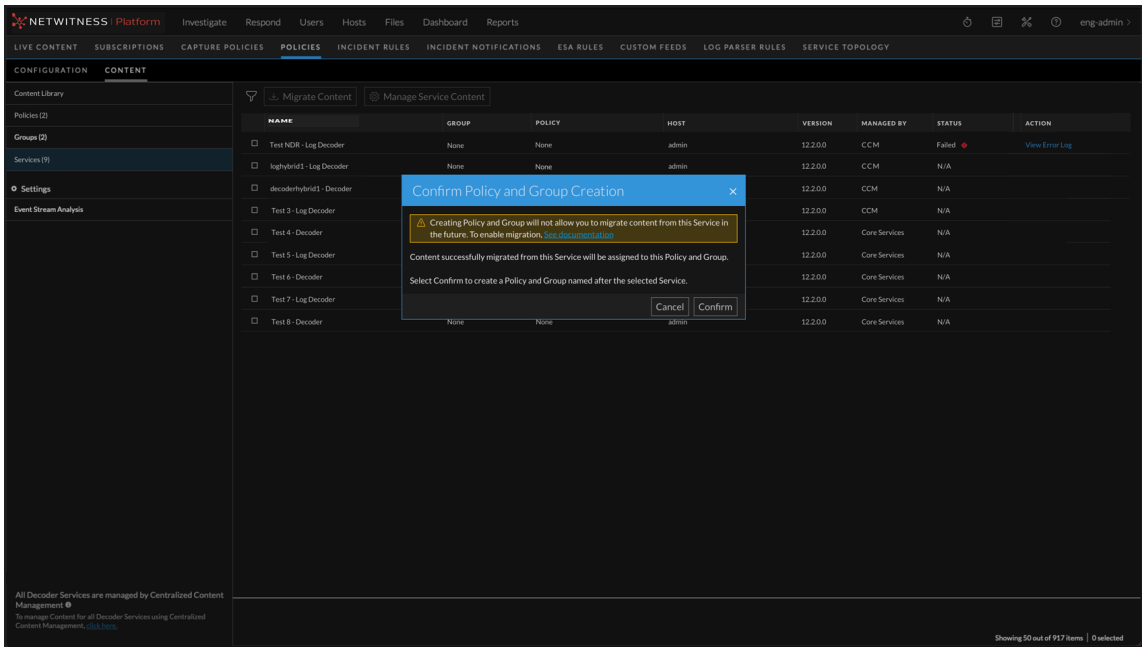
  The **Error Log** pop-up window is displayed with the details of error.

  The following screen is displayed if no content is migrated to Content Library.



Note: You should manually migrate the content in case of failed automated migration.

The following screen is displayed if some content is migrated is Content Library.



- To copy the error logs, click .
- To retry migration, click **Retry Migration**.
- In case of partial migration, to view the content that have been migrated successfully, do the following:
  - Click **View Migrated Content**. The **View Migrated Content** pop-up window is displayed with the details of migrated content.

- To create policy and group for the service which is partially migrated, click **Create Policy and Group**.

  The **Confirm Policy and Group Creation** pop-up window is displayed.

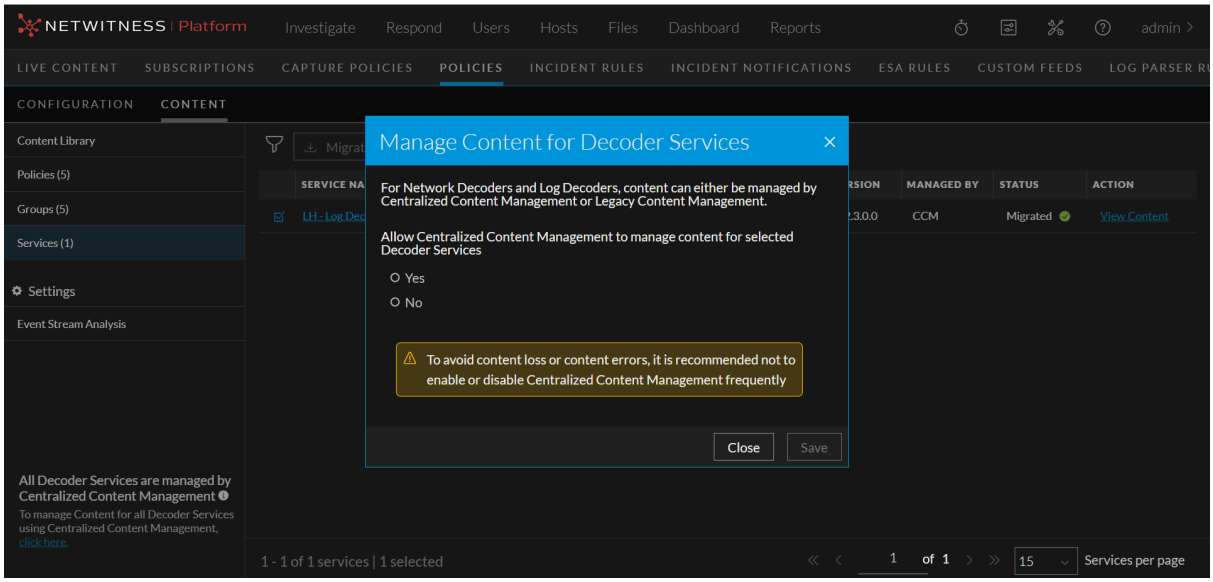
Best Practice Recommendation: Before creating policy and group for partially migrated service, it is recommended to retry migration.

- To confirm creation of policy and group, click **Confirm**. The policy and group will be listed under the **Policy Listing** and **Group Listing** pages.
- To go back to the **Service List** page, click **Cancel**.
- If you do not want to create policy and group for partially migrated service, click **Close in View Migrated Content** pop-up window.

10. To cancel the migration, click **Cancel** in the **Migrate Content from Service** pop-up window.

Note: Migrated Live contents will be categorized as Custom contents, if:
- You have modified the Live content manually before migrating it.
- The migrated Live content is an older version of the content.

Enable or Disable CCM for Individual Decoder Services



This topic describes the steps to enable or disable CCM for individual Decoder Services.

To enable or disable CCM for individual Decoder Service

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.

3. In the left panel, click **Services**. The list of services are displayed.
4. Select the service(s) for which you want to enable or disable CCM and click **Manage Service Content**.

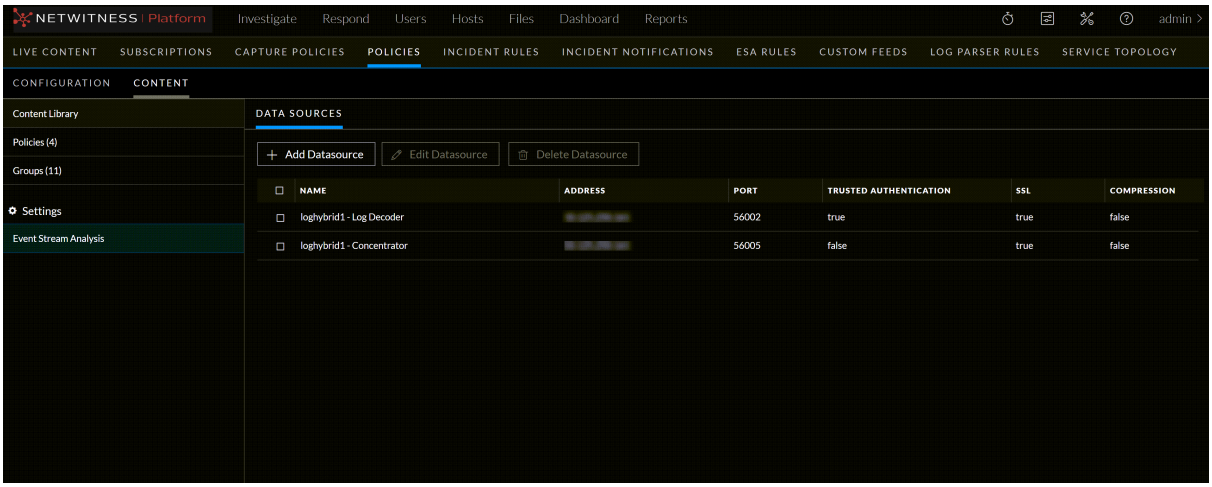
   The **Manage Content for Decoder Services** pop-up window is displayed.

5. In the pop-up window, select **Yes** for **Allow Centralized Content Management to Manage Content for Selected Decoder Services** to enable CCM for the selected service. Select **No** to disable CCM for the selected service.
6. Click **Save** to save the changes.

Manage ESA Datasources

This section contains:

- View an ESA Datasource
- Add an ESA Datasource
- Edit an ESA Datasource
- Delete an ESA Datasource



View an ESA Datasource

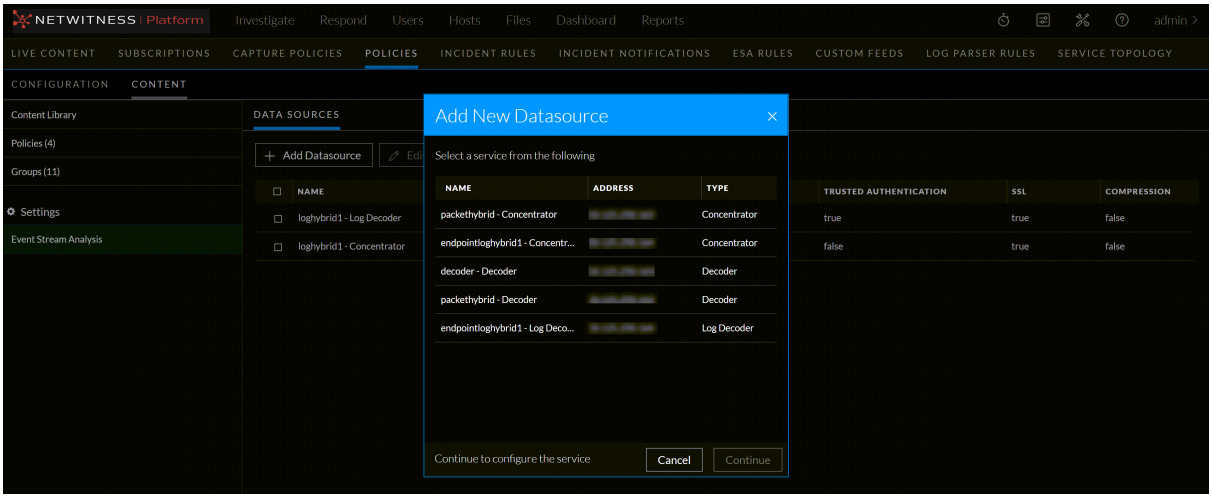
This topic describes the steps to view the ESA datsources available.

To view an ESA Datasource

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Under **Settings**, click **Event Stream Analysis** > **Data Sources**.

   The available datasources are displayed.

Add an ESA Datasource



You can add one or more ESA data sources, such as Concentrators, to use for your selected ESA Service. This enables you to specify different data sources for each deployment.

To add an ESA Datasource

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.

3. Under **Settings**, click **Event Stream Analysis** > **Data Sources**.
4. Click + **Add Datasource**.

   The Add New Datasource dialog is displayed.

Note: You can add a Log Decoder as a data source for ESA. But, it is better to add a Concentrator to take advantage of undivided aggregation as the Decoder may have other processes aggregating from it.

5. Select a service and click **Continue**.

Note: You can add only one service at a time.

6. Do one of the following:
   - Select the **Trusted Authentication** checkbox.
   - Enter your credentials (username and password) for the datasource.

Note:
- If you select **Trusted Authentication** instead of username and password. This option will enable the use of SSL by default. However, you can still configure the compression settings.
- If you choose to enter your username and password. You can configure both SSL and compression settings.

7. To enable the SSL settings, select the **SSL** checkbox. You can set your desired port number.

IMPORTANT: Ensure that you turn on SSL only if necessary, in order to avoid performance impact on the SSL protocol.

8. (Optional) You have the option to adjust the Compression Level for Concentrators on ESA. To enable compression, select the **Compression** checkbox. You can set the **Compression Level** for a Concentrator from 0-9:

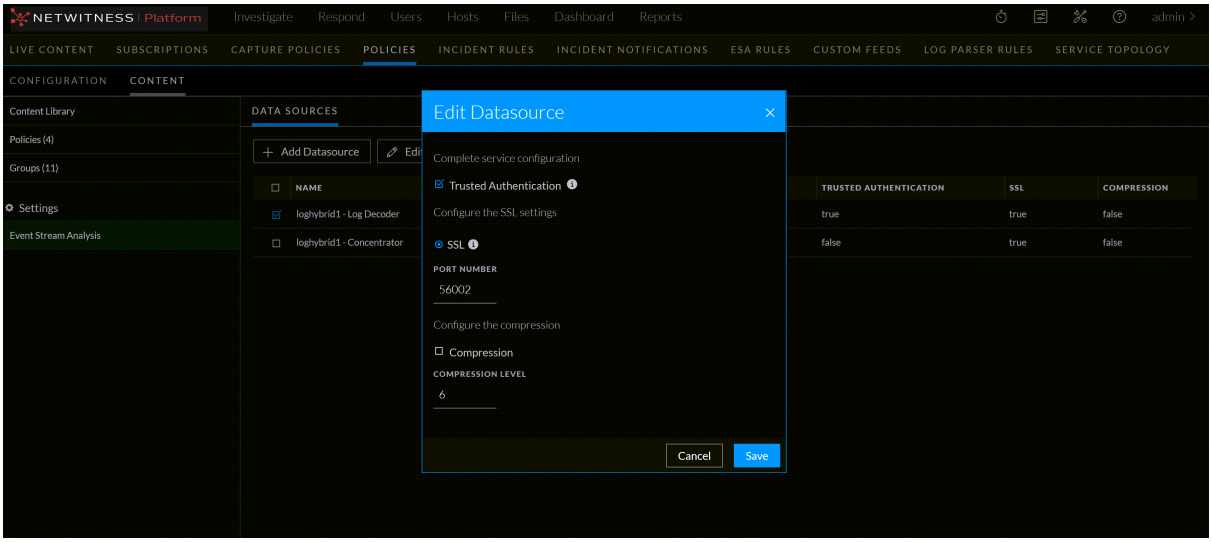
   - Compression Level = **0** (If compression is enabled, it allows Core Services to control the amount of compression.)
   - Compression Level = **1** (It uses the lowest amount of compression and has the highest performance.)
   - Compression Level = **9** (It uses the highest amount of compression and has the worst performance.)

   Somewhere in the middle between 1 and 9 is usually the best setting, which is what you get when you select a compression level of 0. For more detailed information, see the *Core Database Tuning Guide*.

Note: When you set the compression level for a Concentrator on ESA, it sets the same compression level for that Concentrator for ESA Correlation Rules.

9. Click **Test Configuration** to make sure that it can communicate with the ESA service.
10. Click **Save**.

    After you configure your data sources and they appear in the Available Configured Data Sources dialog, you can use them for your deployment.



Edit an ESA Datasource

You can edit the properties of the datasource at any point in time. You can edit the user credentials, SSL, port, and compression value of the datasource. When a data source password changes, it is important to change the password on the data source so that ESA can continue to communicate with the data source.

To edit an ESA Datasource

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Under **Settings**, click **Event Stream Analysis** > **Data Sources**.
4. Select a datasource and click **Edit Datasource**.

The Edit Datasource dialog is displayed.

5. Make the required changes in the datasource.
6. Click **Save**.

Delete an ESA Datasource

You can delete one or more ESA datasources. Once the datasource is deleted, the service will be removed from the available configured list.

To delete an ESA Datasource

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Under **Settings**, click **Event Stream Analysis** > **Data Sources**.
4. Select a datasource and click **Delete Datasource**.

   A confirmation pop-up is displayed.
5. Click **Delete Datasource**.

Manage Deployments

The ESA deployment consists of a policy with ESA rules, ESA services, and data sources. The ESA service scans your network for suspicious activity whenever you deploy policies. An ESA rule detects a different event every time, such as when a user account is created and deleted within 24 hours.

In addition, you can perform other steps on your deployment, such as changing a data source, editing or deleting a rule from the deployment through policy, renaming or deleting the deployment, or showing updates to the deployment, see Additional ESA Correlation Rules Procedures

In 12.1 and later versions, you must create a policy with the ESA rule content type and associate the policy with the group having a correlation service to create a deployment.

For more information on policies, see Policies

For more information about groups, see Groups

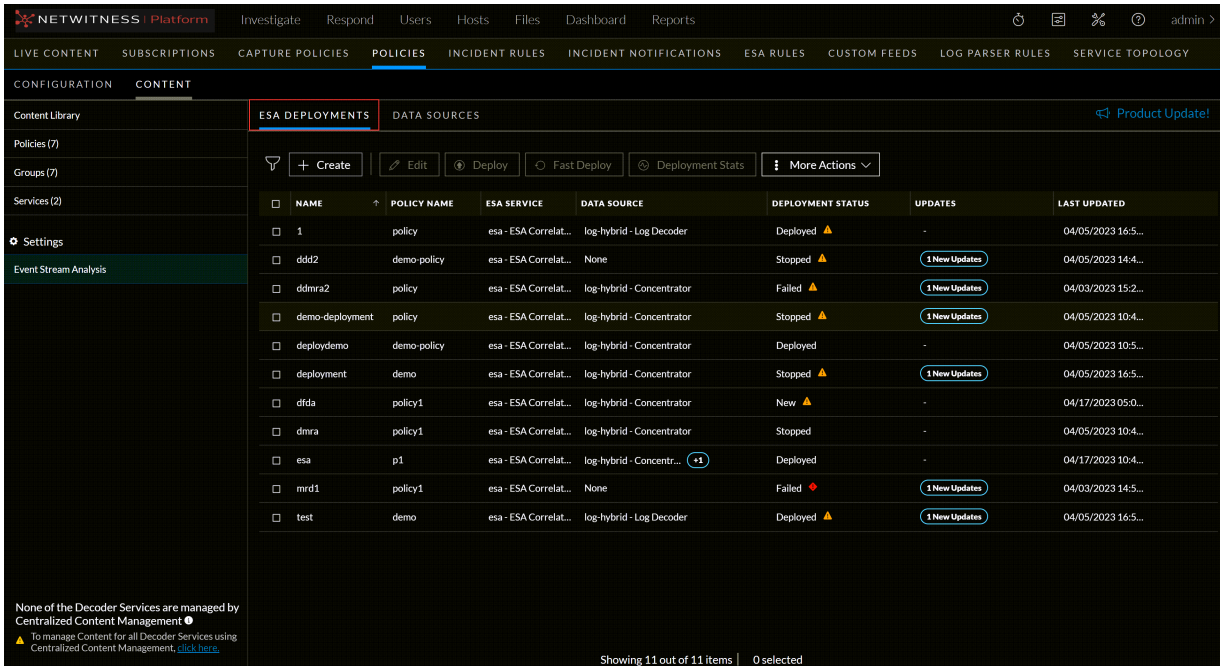
Note: With the unified ESA Deployments tab, you can manage deployments from a single view across all policies within Policy-based Centralized Content Management (CCM).

You can do the following:

- View a Deployment
- Create a Deployment
- Edit a Deployment
- Start a Deployment
- Fast Deployment
- Deployment Stats
- Remove a Deployment
- Stop a Deployment
- Migrate ESA Deployments to Policies and Groups

View a Deployment

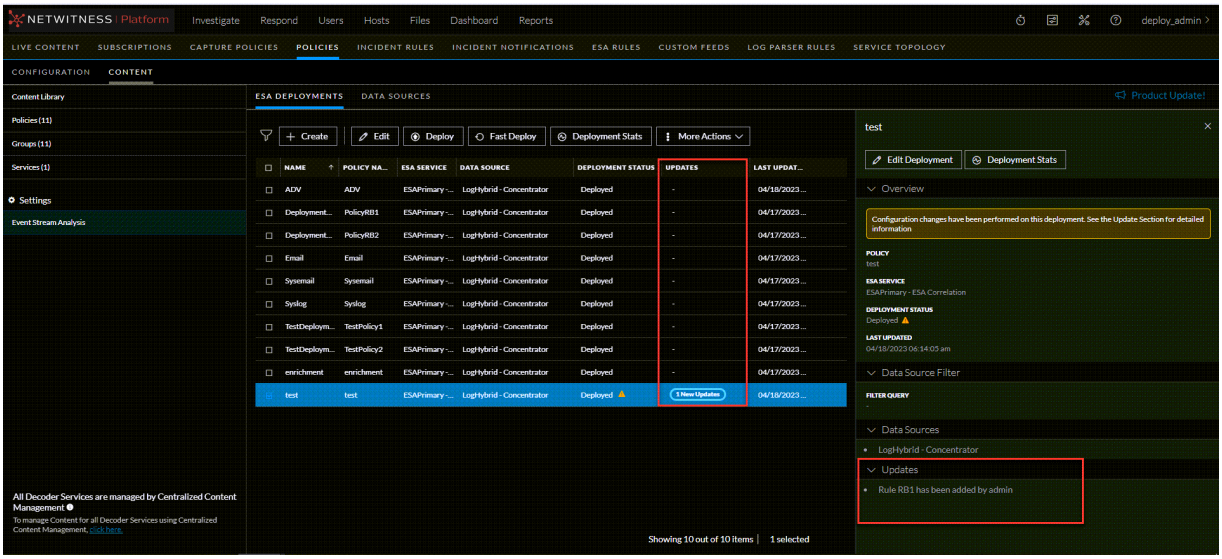
In the ESA deployment view, you can view a list of all the deployments associated with the policies and the actions you can perform with them. It helps you manage and set-up deployments within CCM to create, edit, deploy, remove, and stop deployments. NetWitness Platform provides two methods to manage deployments.



You can view deployments in the following ways:

- Using the **ESA Deployments** tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can create, edit, remove, and pause deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and create, edit, remove and pause a deployment.

To view all deployments using the ESA Deployments tab



1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

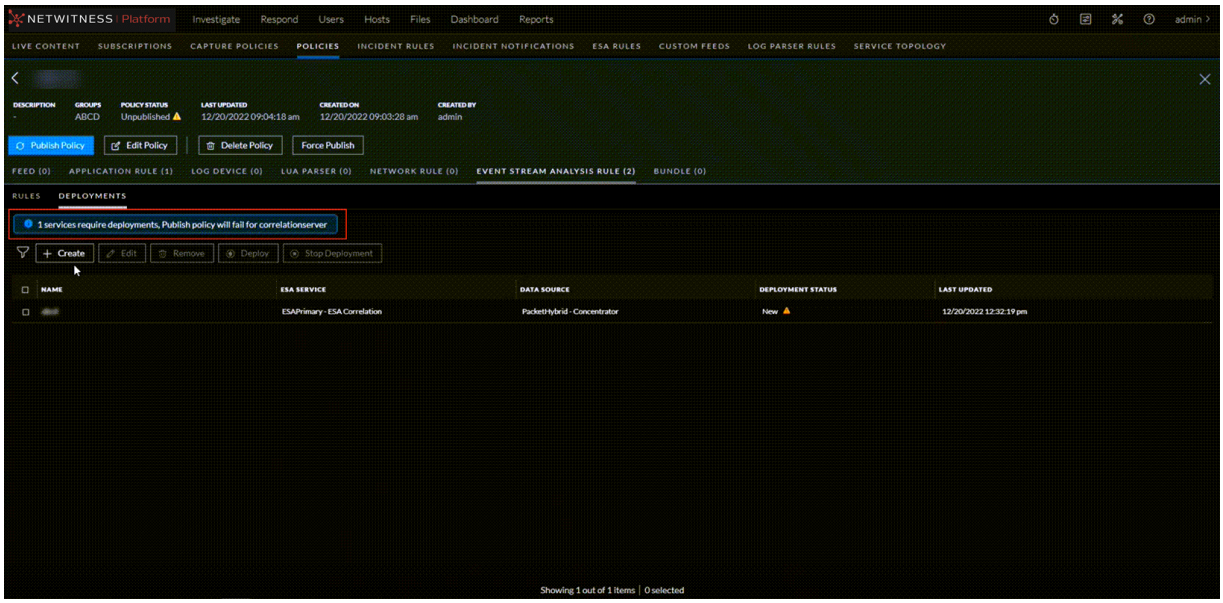
Note: Any changes made, like add / edit / delete to **rules**, **notifications**, and **enrichments** on the **ESA Rules** page for deployments, are displayed in the **Updates** section of the **ESA Deployments** view.

IMPORTANT: Any changes required for rule configurations must be made on the **ESA Rules** page only.

To view a deployment from a selected policy

1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.

The available policies are displayed.



3. Click a Policy.

The selected policy view is displayed, and the Application Rule is default selected.

4. Click **Event Stream Analysis Rule** > **Deployments**.

The available deployments for the selected policy are displayed.

Caution: An icon is displayed in the deployments view indicating services require deployments, publish policy will fail for correlation servers. You may need to create deployments for such services if required.

Create a Deployment

When you create a deployment, you need to select a policy, ESA service, and data sources. An ESA rule deployment consists of an ESA service, one or more data sources, and a set of ESA rules. When you deploy rules, the ESA service runs them to detect suspicious or undesirable activity in your network. Each ESA rule detects a different event, such as when a user account is created and deleted within one hour.

For more information on data sources, see Data Source

In 12.1 and later versions, you must create a policy with the ESA rule content type and associate the policy with the group having a correlation service to create a deployment.

For more information on policies, see Policies

You can create deployments in the following ways:

- Using the ESA Deployments tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can create deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and create a deployment.

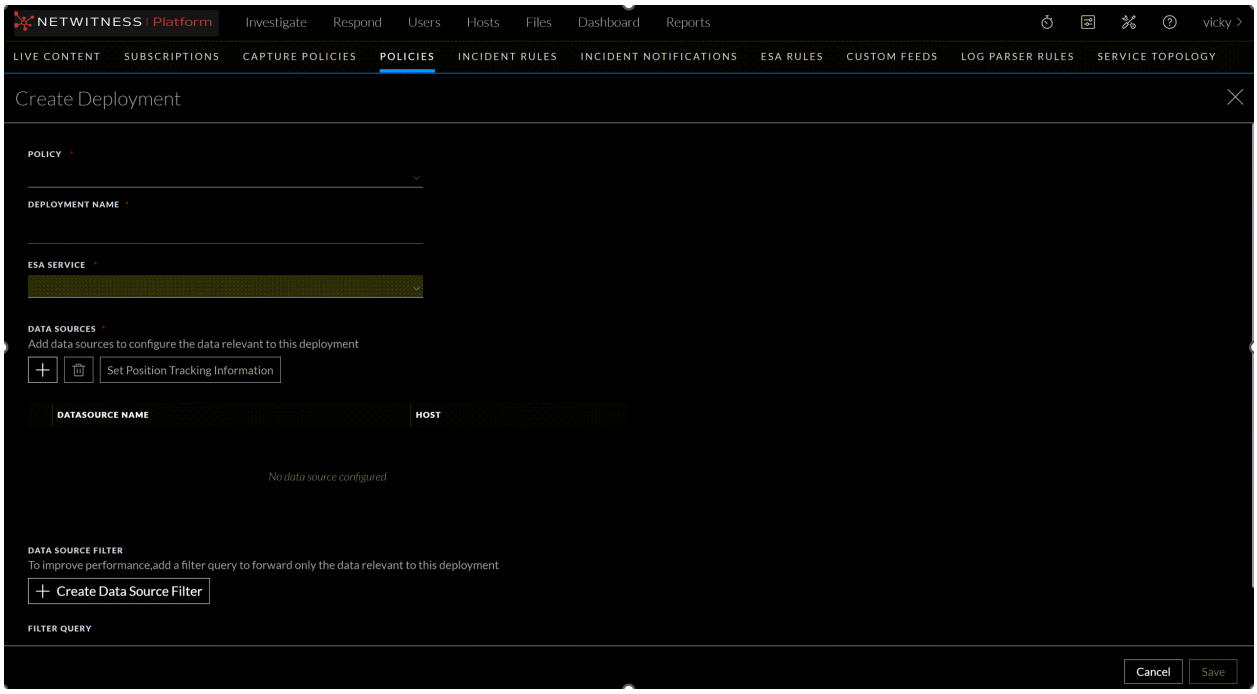
Prerequisites

- The group is assigned to a policy
- The Correlation server service is available in the groups assigned.

- A minimum of one ESA rule is added to the policy.
- ESA data source must be configured.

  For more information about groups, see Groups

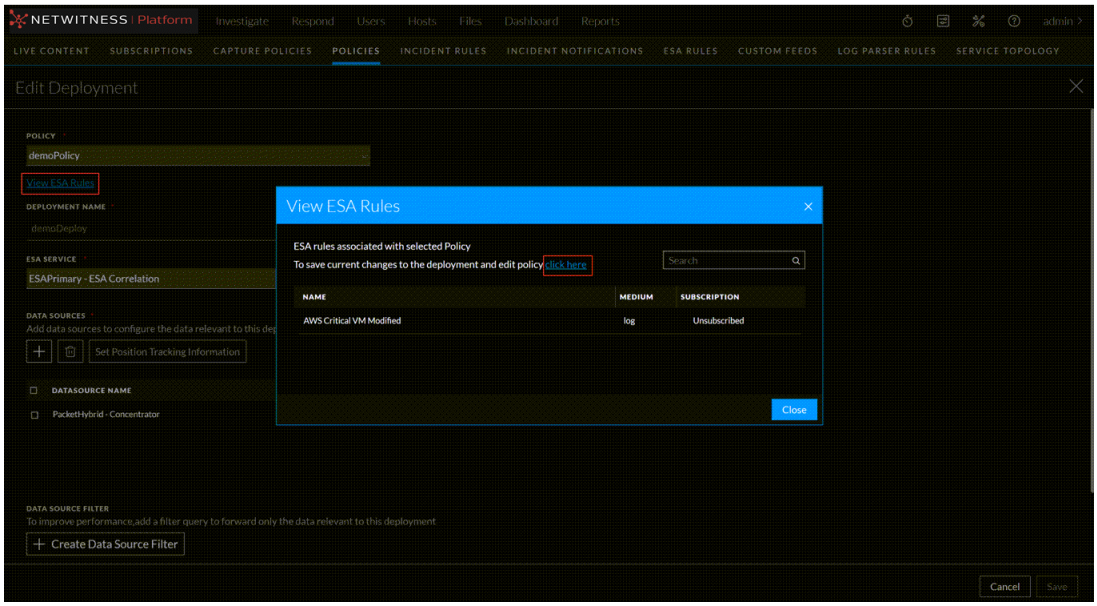
To create a deployment using the ESA Deployments tab



1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

3. Click + **Create**

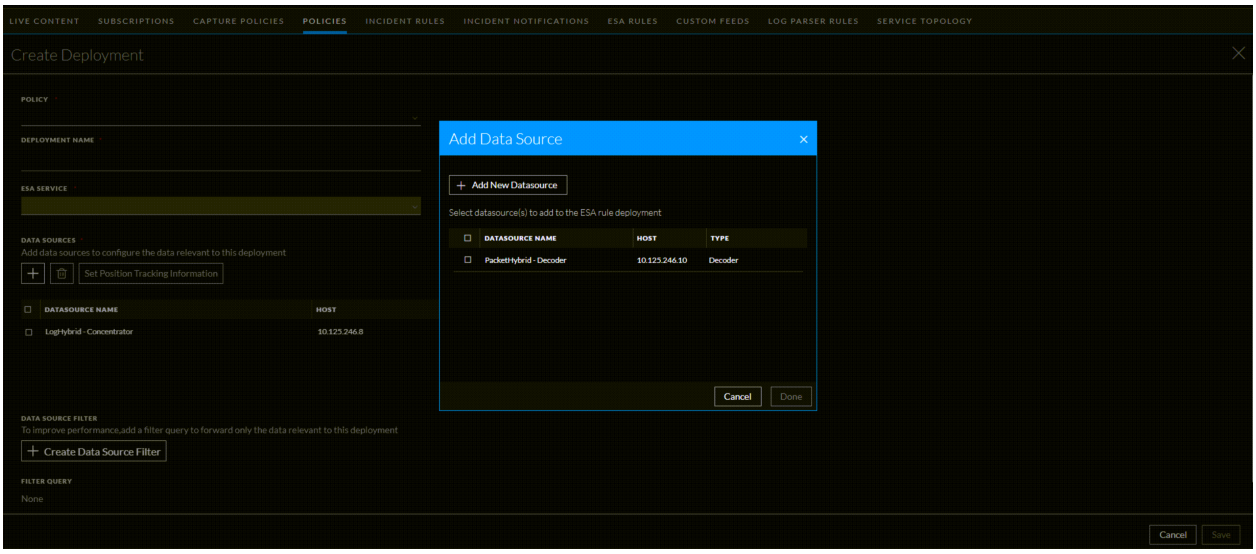


The Create Deployment dialog is displayed.

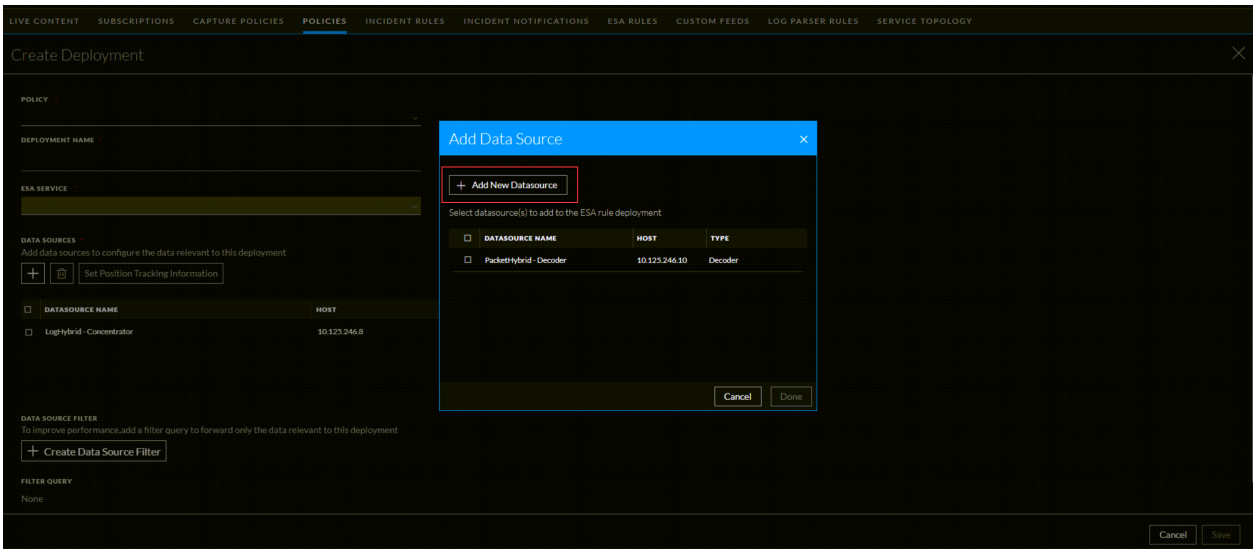
4. Select an eligible policy from the policy list.

Note: All the policies that meet the criteria mentioned above are listed in the policy drop-down. It is required to select a policy to proceed further.

If required, you can click on View ESA Rules to search for rules associated with selected policy.



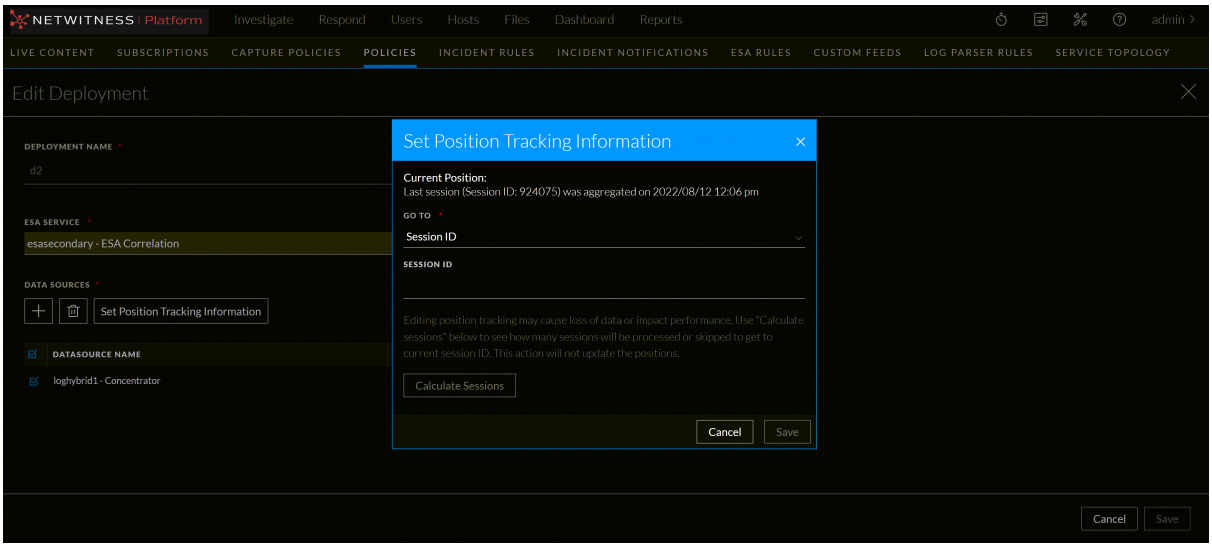
5. Enter a name for the deployment.
6. Select a service from the **ESA Service** drop-down list.



Note: Once the deployment is saved, the selected policy, name and ESA service cannot be modified.

7. Under **Data Sources**, click + to add a data source.

   The **Add Data Source** dialog is displayed.



If required, you can add a new data source by selecting + **Add New Datasource** tab in the dialog-box.

IMPORTANT: If the data sources are not listed, you can add the required datasource. For more information, see the topic Add an ESA Datasource.

8. Select one or more data sources and click Done.
9. To delete the data source, select the data source and click .
10. (Optional) Select the required data source and click **Set Position Tracking Information** to process specific or ignore certain sessions.

    The Set Position Tracking Information dialog is displayed.

a. In the Position Tracking Information dialog, perform the following:

   i. If you want to set the position tracking information based on date and time stamp:

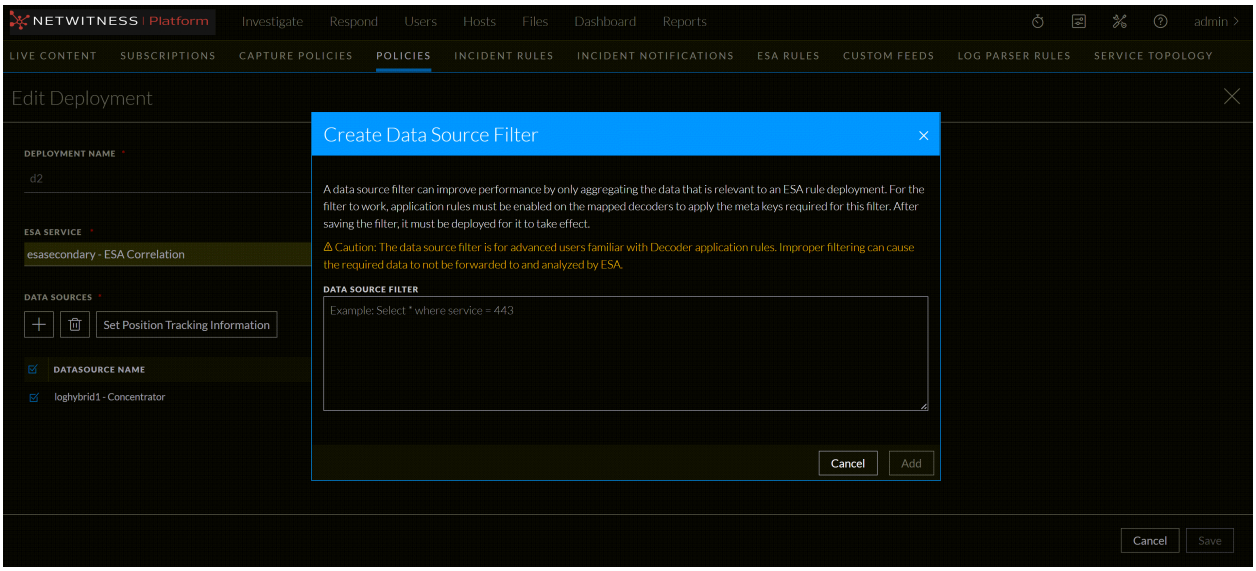
      In the **Go To** drop-down menu, select **Date and Time** and enter the date and time.

   ii. If you want to set the position tracking information, based on the session ID:

      In the **Go To** drop-down menu, select **Session ID** and enter the session ID in the **Session ID** field.

      The ESA Correlation service starts processing the events from the session ID that you entered.

b. Click **Calculate Sessions** to calculate the number of sessions that will be processed to the existing position of the data source, if any.



c. To save the edited position tracking data source, click **Save**.

   For more information on Position Tracking Information, see Position Tracking Information.

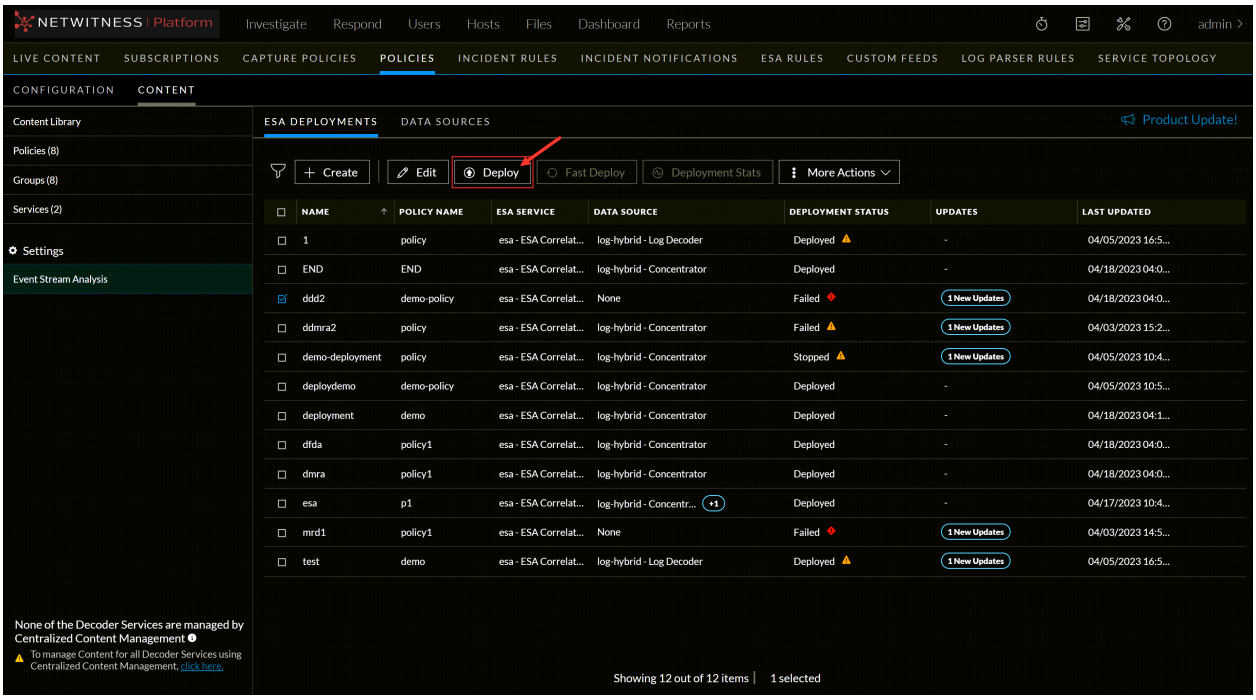
11. (Optional) To filter out specific session data coming into ESA, under Data Source Filter, click + **Create Data Source Filter**.

Caution: The data source filter is for advanced users familiar with Decoder application rules. Improper filtering can cause the required data not to be forwarded to and analyzed by ESA.

The **Create Data Source Filter** dialog is displayed.

a. Specify the filter query in the below format as shown in the following example:

Select *where service = 443



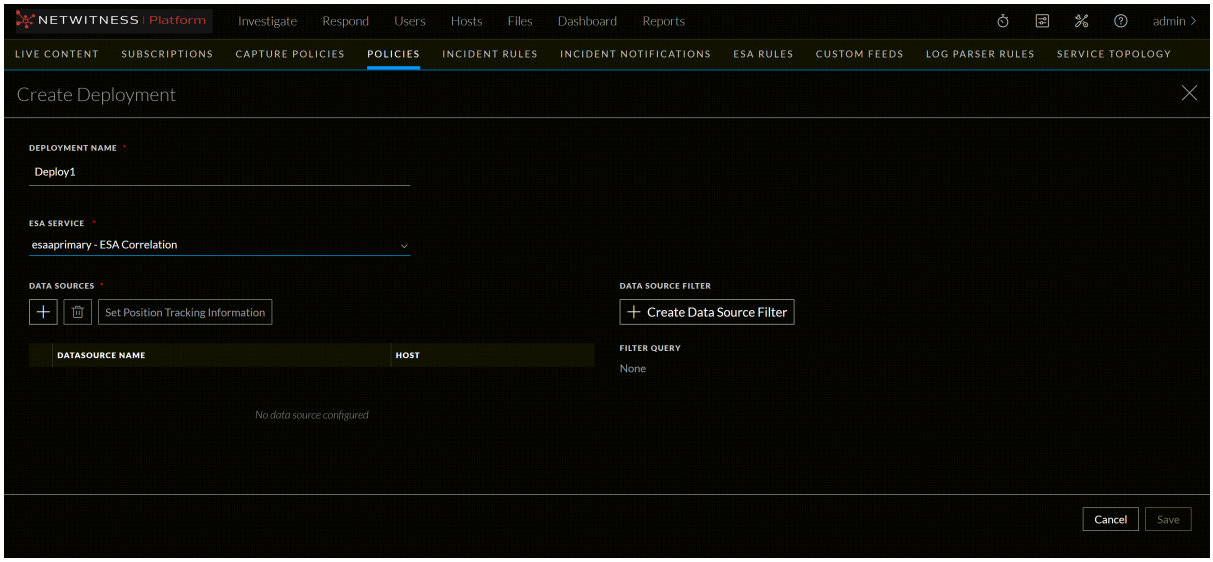
Based on the query processed, it will filter out only HTTPS logs-related sessions and will be forwarded to the ESA.

b. Click **Add**.

c. If you want to delete the existing data sources filter, click **Clear Data Source Filter**, and **Save** to remove it permanently.

12. To save the deployment, click **Save**.

13. Select the created deployment and click **Deploy**.



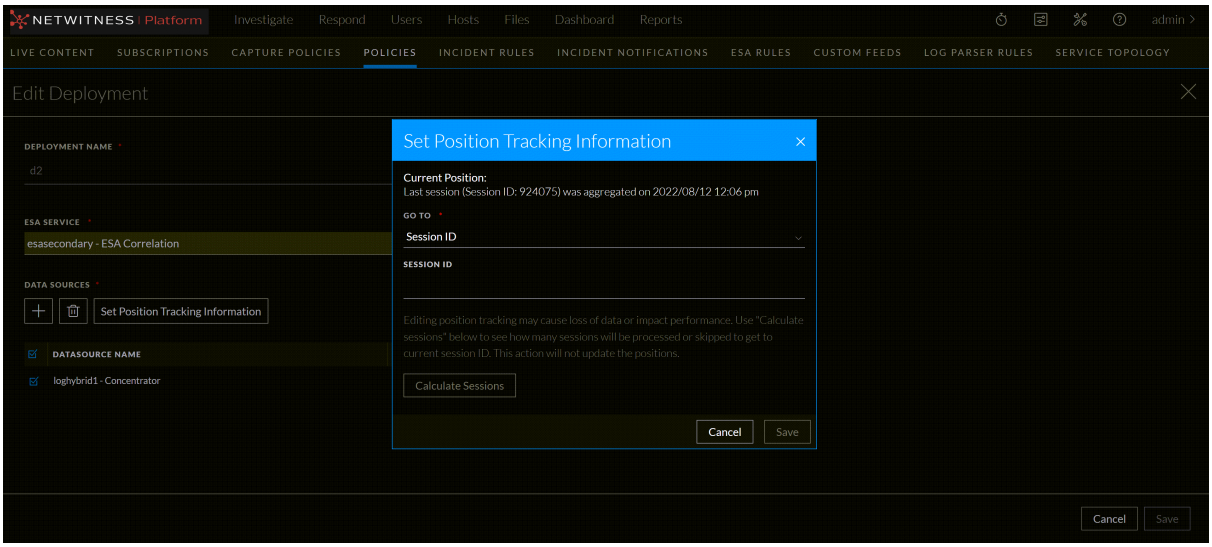
To create a deployment from a selected policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.
4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.
5. Click + **Create Deployment**.

   The Create Deployment dialog is displayed.



6. Enter a name for the deployment.

   Note: The policy is preselected as the user creates the deployment from the policy details view.
7. Select a service from the **ESA Service** drop-down list.
8. Under **Data Sources**, click + to add a data source.

   The Add Data Source dialog is displayed.
9. Select one or more data sources and click **Done**.

   IMPORTANT: If the data sources are not listed, you can add the required datasource. For more information, see the topic Add an ESA Datasource.
10. To delete the data source, select the data source and click .
11. (Optional) the required data source and click **Set Position Tracking Information** to reprocess specific sessions or ignore certain sessions.

    The Set Position Tracking Information dialog is displayed.

a. In the Position Tracking Information dialog, perform the following:

   i. If you want to set the position tracking information based on date and time stamp:

      In the **Go To** drop-down menu, select **Date and Time** and enter the date and time.

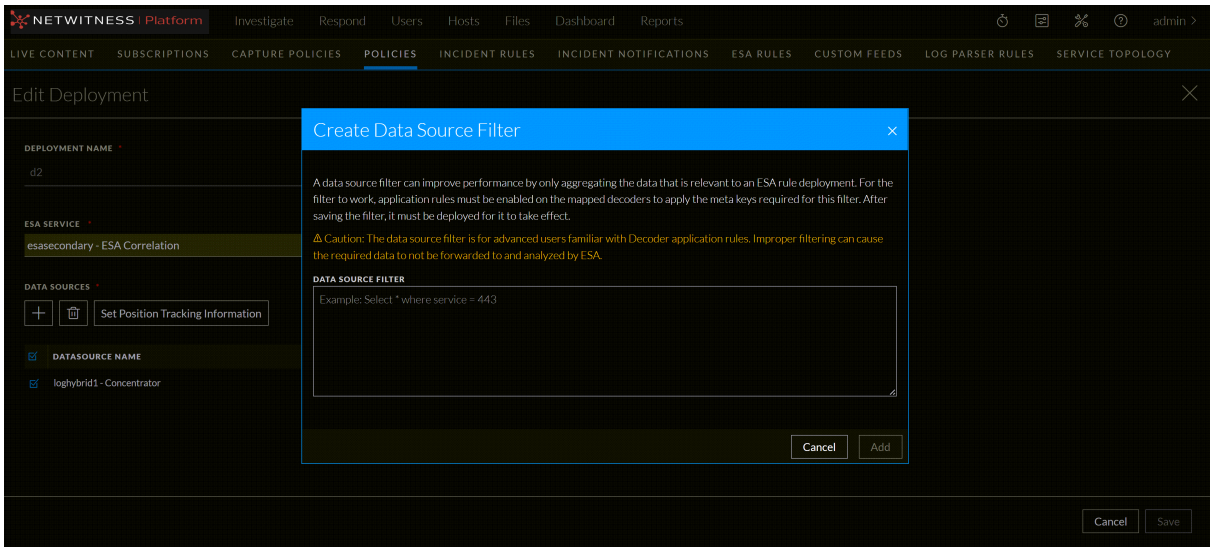
   ii. If you want to set the position tracking information, based on the session ID:

      In the **Go To** drop-down menu, select **Session ID** and enter the session ID in the **Session ID** field.

      The ESA Correlation service starts processing the events from the session ID that you entered.

b. Click **Calculate Sessions** to calculate the number of sessions that will be processed with respect to the existing position of the data source, if any.

c. To save the edited position tracking data source, click **Save**.



d. The tracking position information will be deployed to the ESA Correlation service, only when the deployment is successfully completed.

   For more information on Position Tracking Information, see Position Tracking Information.

12. (Optional) To filter out certain session data coming into ESA, under Data Source Filter, click + **Create Data Source Filter**.

Caution: The data source filter is for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.

The Create Data Source Filter dialog is displayed.

a. Specify the filter query in the below format as shown in the following example:

Select *where service = 443

Based on the query processed, it will filter out only HTTPS logs related sessions and will be forwarded to the ESA.

b. Click **Add**.

c. If you want to delete the existing data sources filter, click **Clear Data Source Filter** and click **Save** to remove it permanently.

13. To save deployment, click **Save**.

14. Select the created deployment and click **Deploy**.

Edit a Deployment

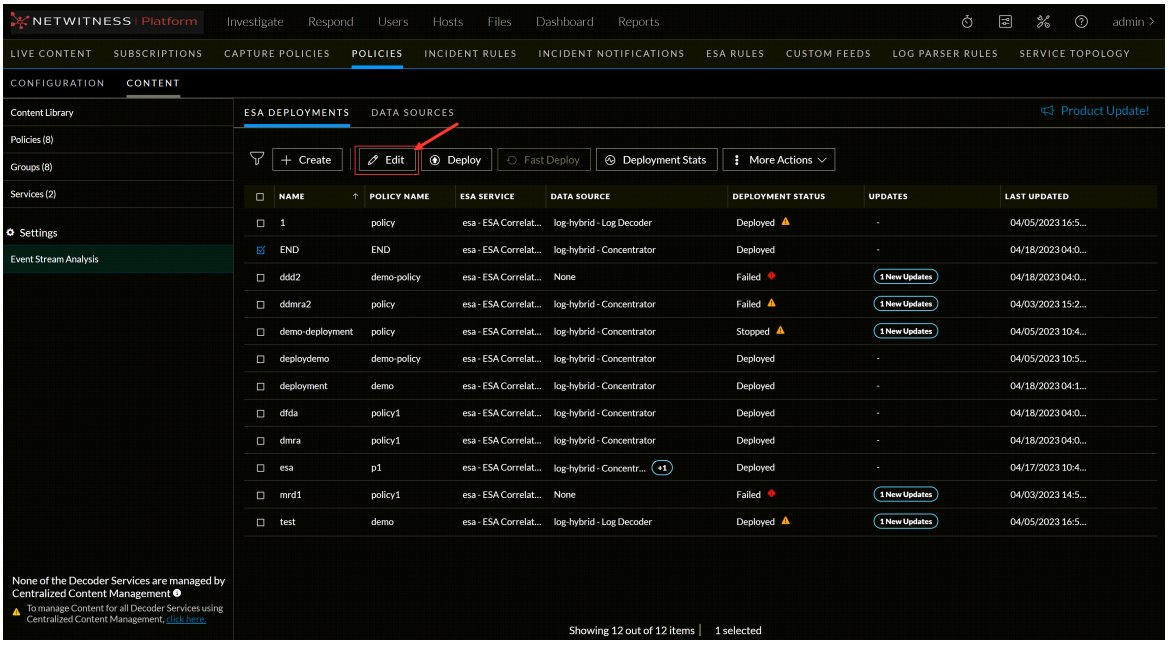
You can edit a deployment to change the data source, create a data source filter, and view ESA rules that are associated with this deployment. A data source filter can improve performance by only aggregating the data that is relevant to an ESA rule deployment. For the filter to work, application rules must be enabled on the mapped decoders to apply the meta keys required for this filter. After saving the filter, it must be deployed for it to take effect.

However, you cannot change the deployment name, or ESA service that are associated with the deployment.

You can edit deployments in the following ways:

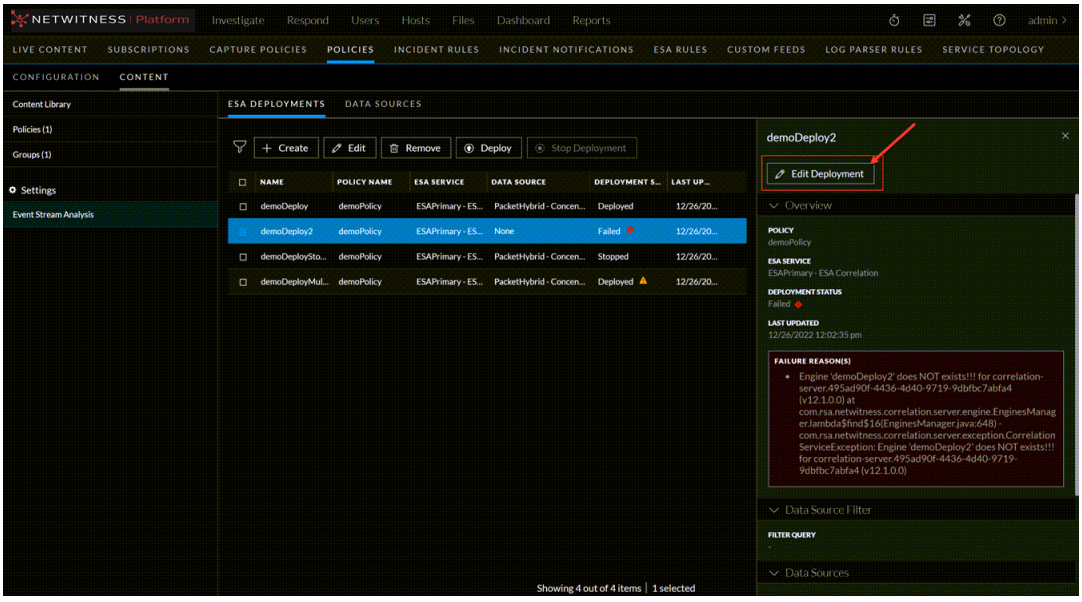
- Using the ESA Deployments tab. The **ESA Deployments** tab provides a consolidated view of all the available deployments within CCM. You can edit deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and edit a deployment.

To edit a deployment from the ESA Deployments tab



1. Go to **(CONFIGURE)** > **Policies** > **Content**.

2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.



The available deployments are displayed.

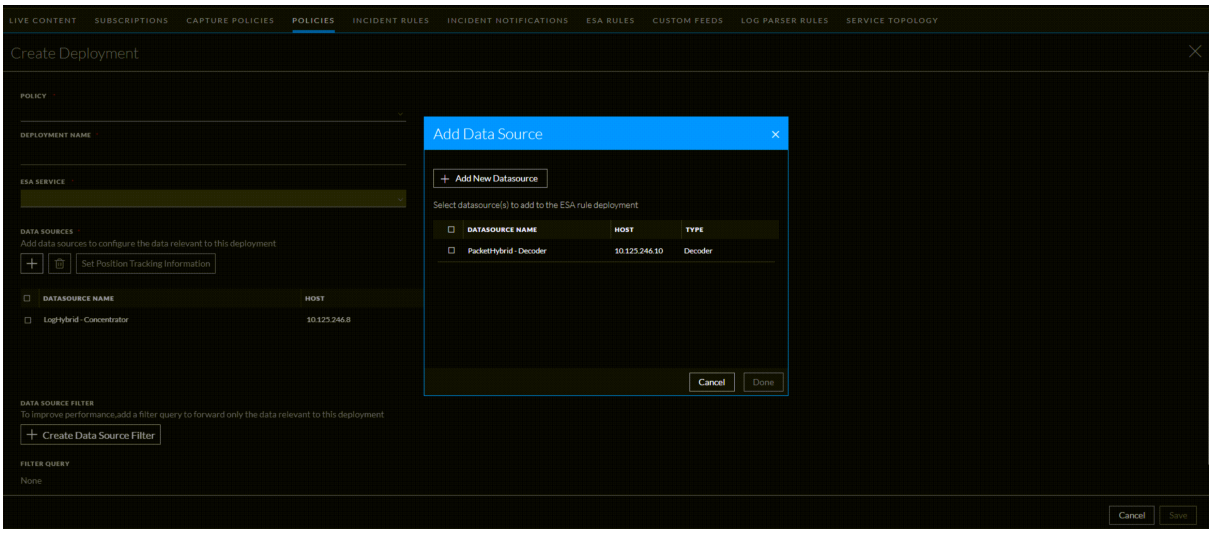
3. Select a deployment and click **Edit** or **Edit Deployment**.

   a. When you select the checkbox and click **Edit**.

   b. When you select or click a row of the deployment, a right panel is displayed to click **Edit Deployment**.

The **Edit Deployment** dialog is displayed.

4. (Optional) you can click on **View ESA Rules** to search for rules associated with selected policy. To save current changes to the deployment and modify the policy, select **click here** and navigate to the **Edit Content Policy** page.



5. Make the required changes in the deployment.

   Policy, deployment name, and ESA service are pre-populated and cannot be modified.

6. Under **Data Sources**, click + to add a data source.

   The **Add Data Source** dialog is displayed.

7. If required, you can add a new data source by selecting + **Add New Datasource** tab in the dialog-box.

IMPORTANT: If the data sources are not listed, you can add the required datasource. For more information, see the topic Add an ESA Datasource.

8. Click **Save**.
9. Select the deployment and click **Deploy**.

To edit a deployment from a selected policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.

4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.

5. Select a deployment to edit and click **Edit Deployment**.

   The **Edit Deployment** dialog is displayed.

6. Make the required changes in the deployment.
7. Click **Save**.
8. Select the deployment and click **Deploy**.

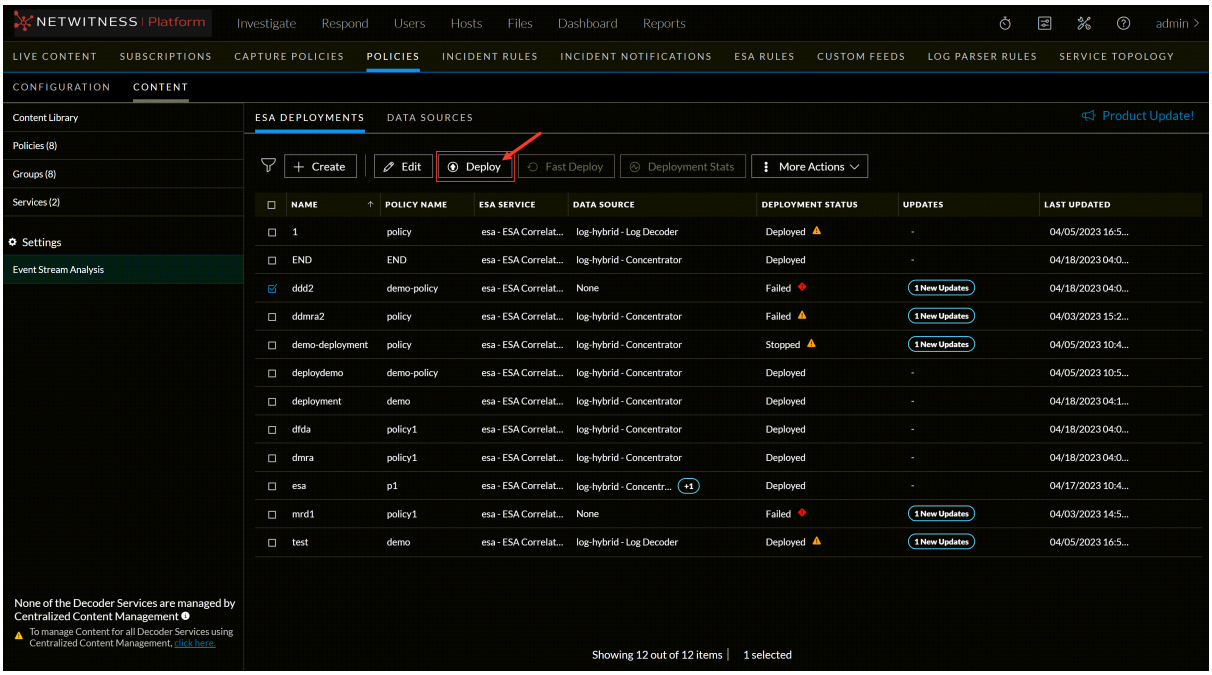
   Note: You can deploy the changes either by performing a **Deploy** action on selected deployment or by publishing the policy. Publishing a policy with deployment in stopped state, will not deploy the deployment.

Start a Deployment

The deployment includes ESA services with policy and associated ESA rules. When you initiate deployment, the correlation services start processing sessions from the configured data sources for matching events for the selected ESA rules in the policy.

For more information about ESA services and rules, see Alerting with ESA Correlation Rules

You can start deployments in the following ways:



- Using the ESA Deployments tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can initiate deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and initiate a deployment.

To initiate a deployment, with the ESA Deployments tab

1. Go to (CONFIGURE) > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

3. Select a deployment and click **Deploy**.

To start a deployment with selected policy

1. Go to (CONFIGURE) > **Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

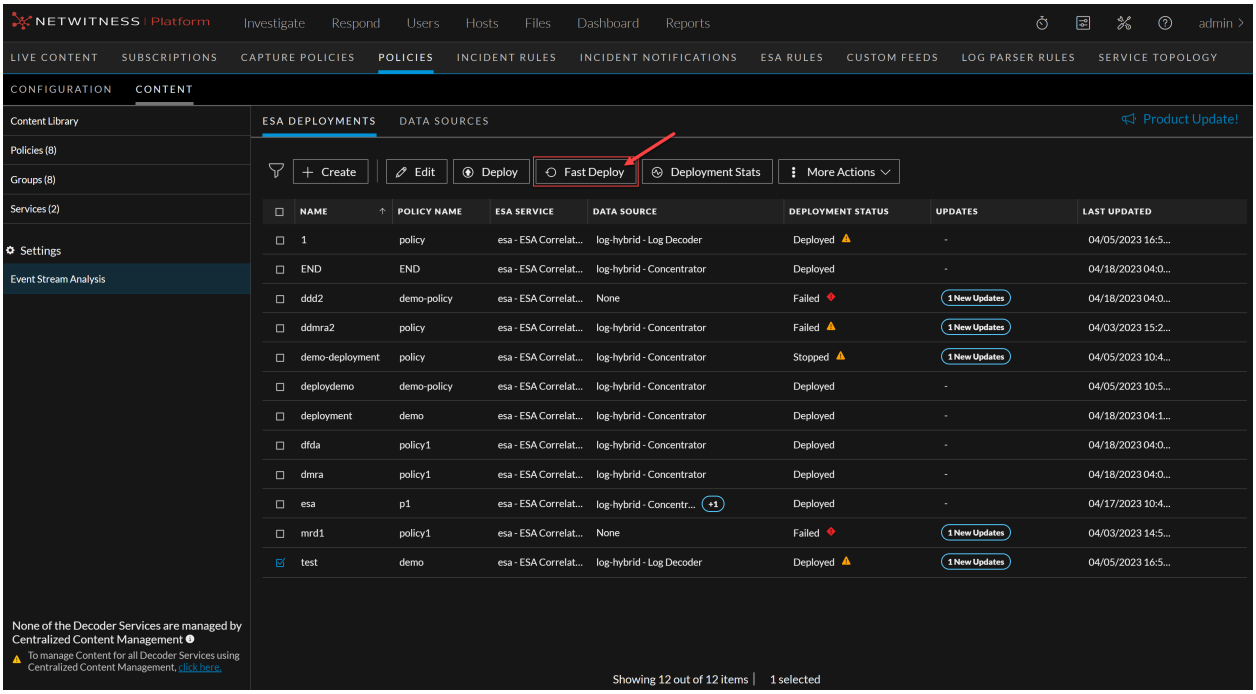
   The selected policy view is displayed and by default **Application Rule** is selected.
4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.
5. Select the deployment to deploy and click **Deploy**.

> **Note:** You can deploy the changes either by performing a Deploy action on selected deployment or by publishing the policy. Publishing a policy with deployment in stopped state, will not deploy the deployment.

Fast Deployment

The **Fast Deploy** option is a feature that allows a user to quickly load the latest rule that runs entirely on the Esper Engine without redeploying the entire engine.



To do fast deployment

1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

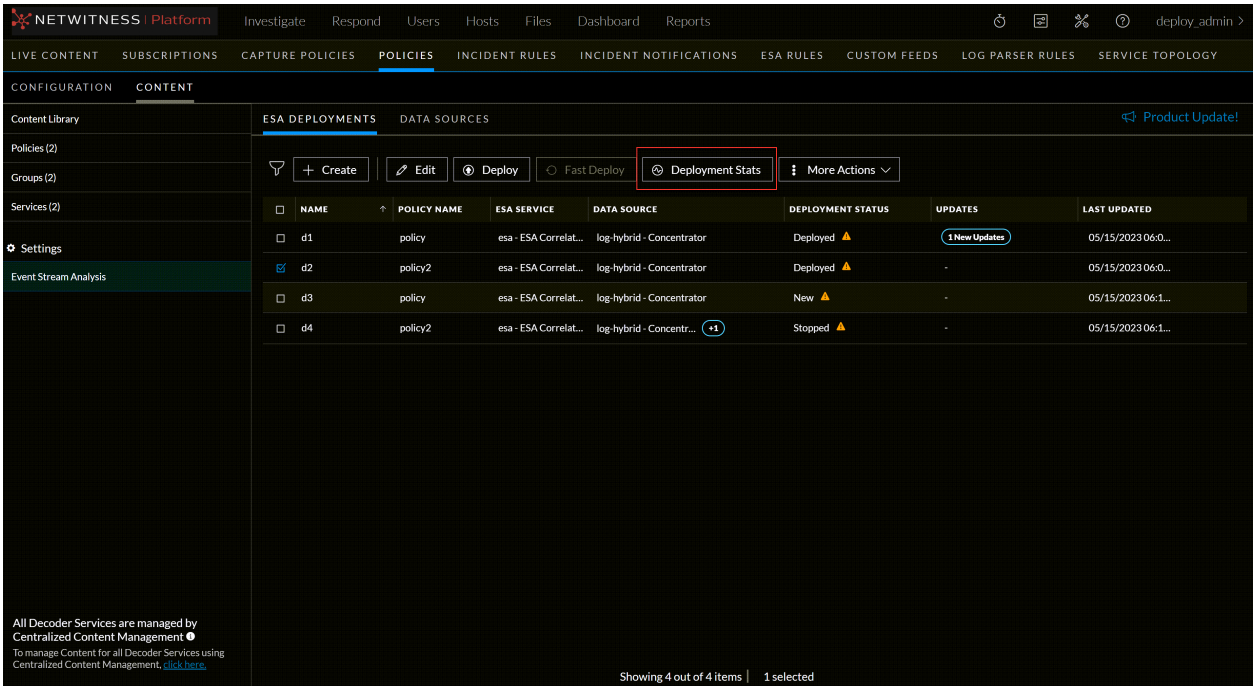
You can use the **Fast Deploy** option when there has been a change to an ESA rule, i.e., a rule has been added, modified, or deleted. If any other changes have been made, such as adding a data source, then the **Fast Deploy** option will not be available.

3. Select the deployments that are updated and need to be deployed.
4. Click **Fast Deploy**.

Deployment Stats

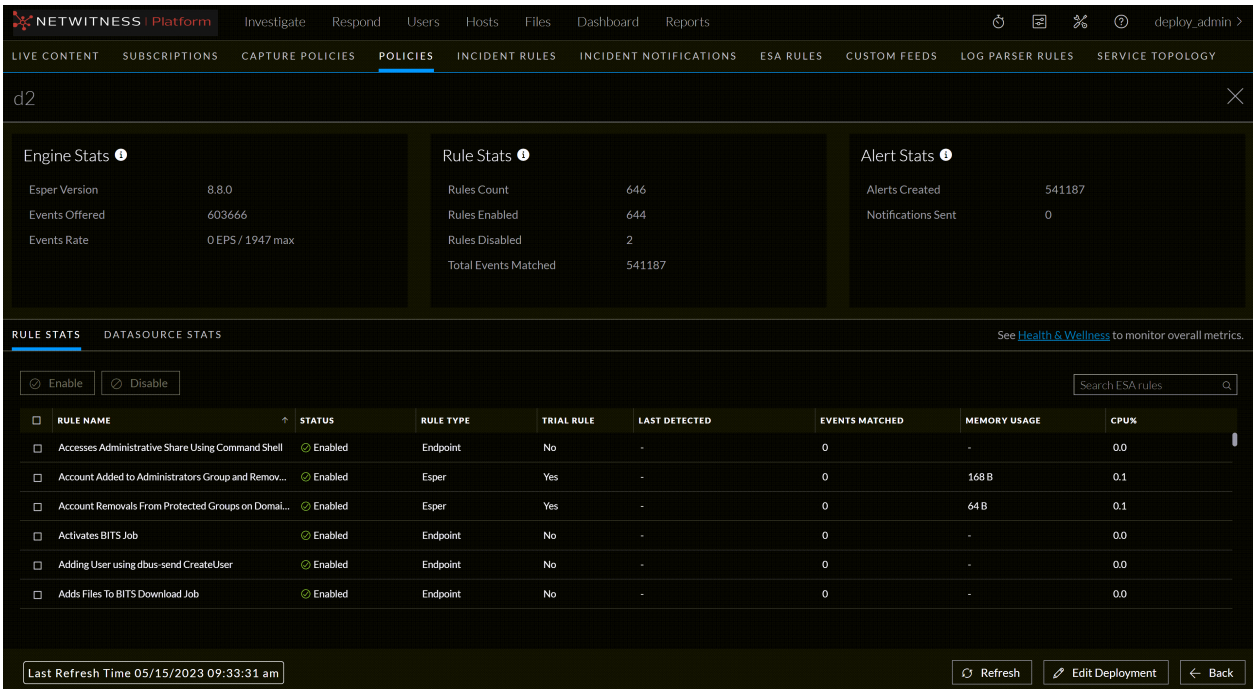
When an ESA deployment is deployed, you can view details about how the deployment is performing, such as statistics on the engine, rule, and alert. You can also view information on which rules are enabled or disabled and change their status.

This topic describes how to view an ESA Correlation service's deployment statistics (stats). This procedure is useful when determining a rule's effectiveness or troubleshooting an ESA rule deployment.



Caution: When you modify and re-deploy an ESA rule deployment, all the stats are removed from that deployment. The generated alerts are not removed from NetWitness.

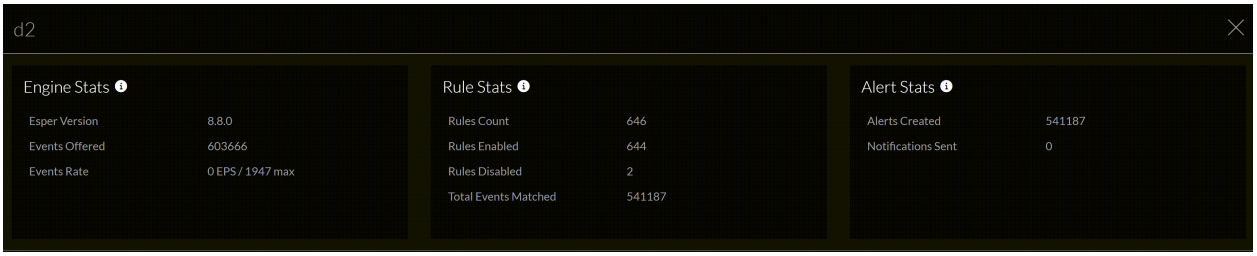
To view a Deployment Stats



1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

3. Select a deployment you want to see the stats.
4. Click on the **Deployment Stats** tab.



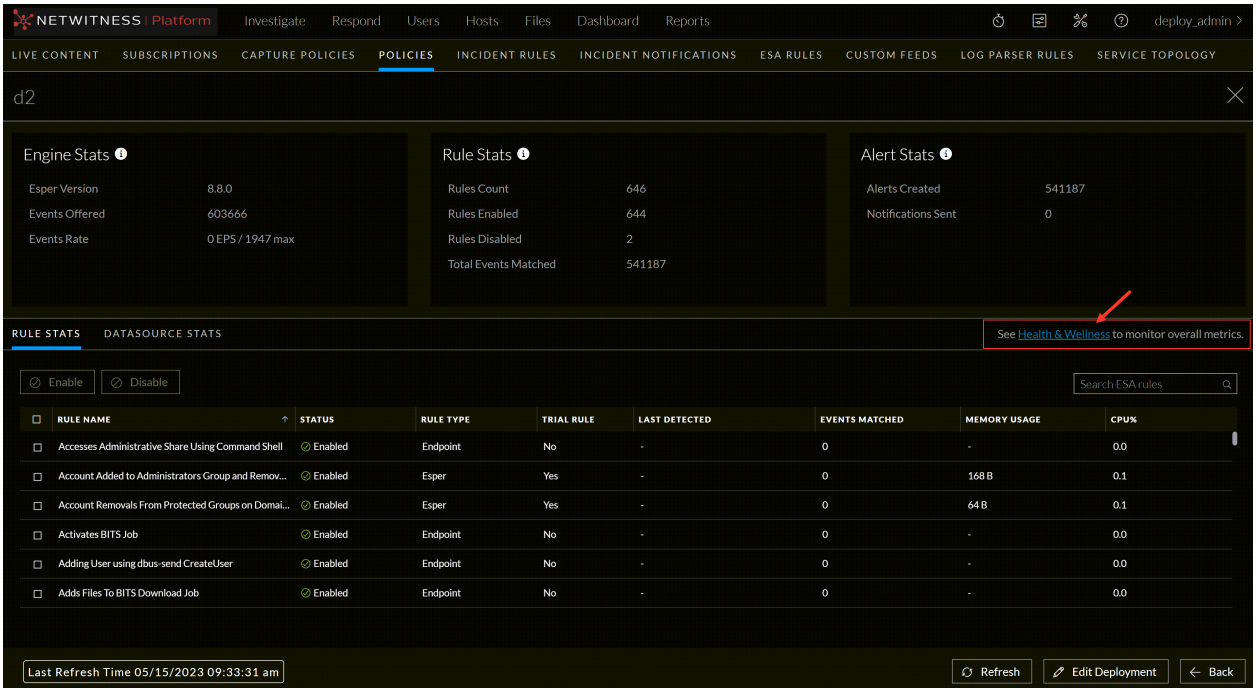
The deployment stats for the selected service are displayed.

Review the following sections of selected Deployment Stats. For a complete description of each statistic in each section, see the Deployment Stats Information.

- **Engine Stats**
- **Rule Stats**
- **Alert Stats**

The following figure shows the Deployment Stats panel.

5. Review the list of details about the rules deployed on the ESA.



- If the rule is enabled or disabled
- Rule name
- Rule type
- Rule trial mode
- Last detected
- Events matched
- Rule memory usage

- Deployment CPU percentage used by the rule.

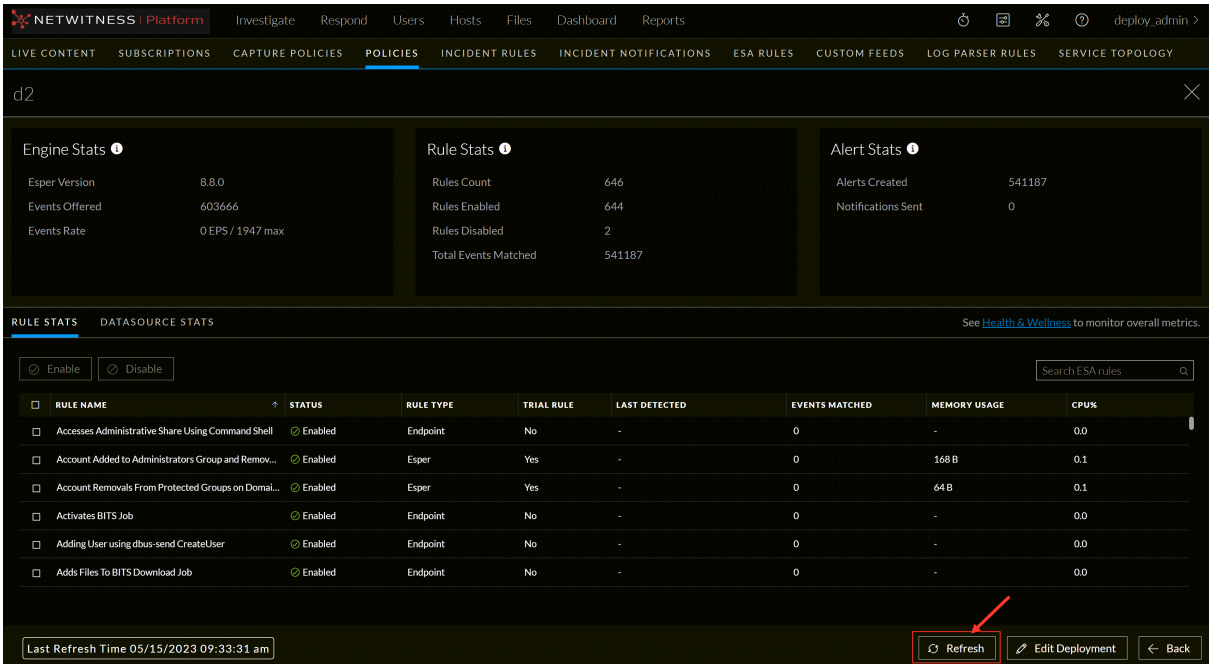
  For a complete description of each column in each section, see Deployment Stats Information.

Check Health and Wellness

To monitor your ESA Correlation service's overall memory usage and health, click **Health & Wellness**.

To Enable or Disable Rules

1. Select a rule from the **Rule Stats** panel grid.
2. Click **Enable** to enable the rule or click **Disable** to disable the rule.



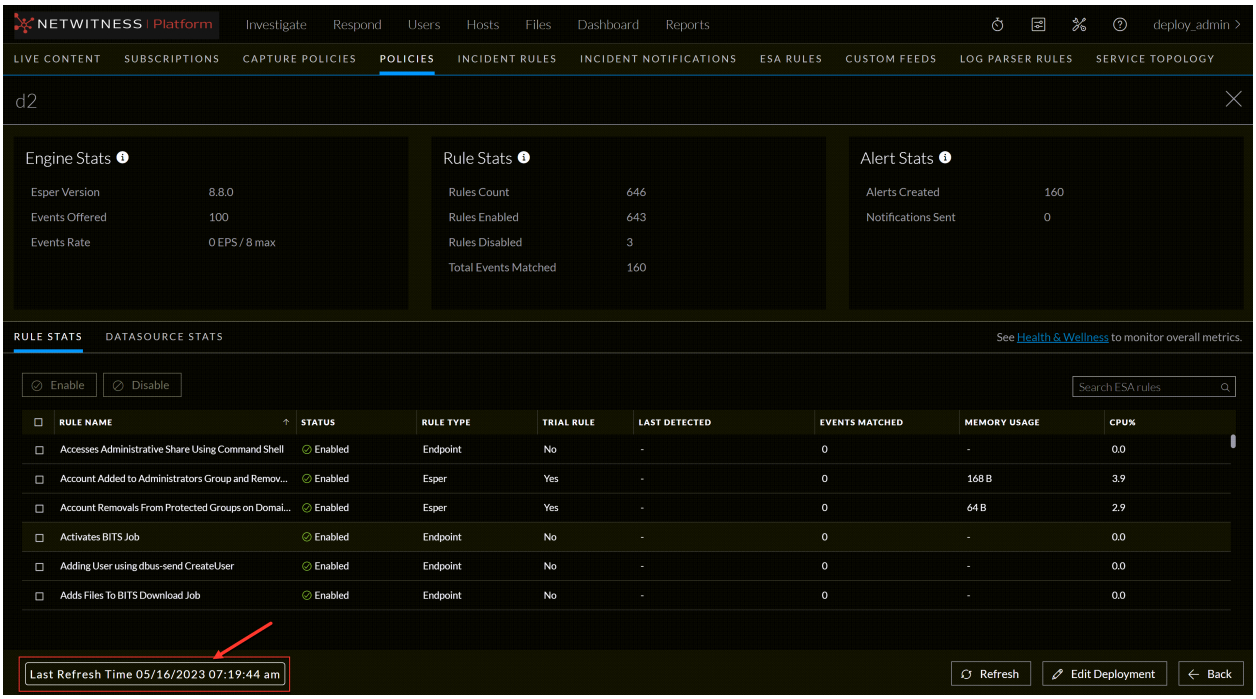
To Refresh the Statistics

The Services tab does not update statistics automatically unless you enable or disable a rule.

1. Click the **Refresh** tab in the bottom right corner to refresh the information.

   The Services tab is refreshed to show the changes which take effect immediately.

2. View the updated information.

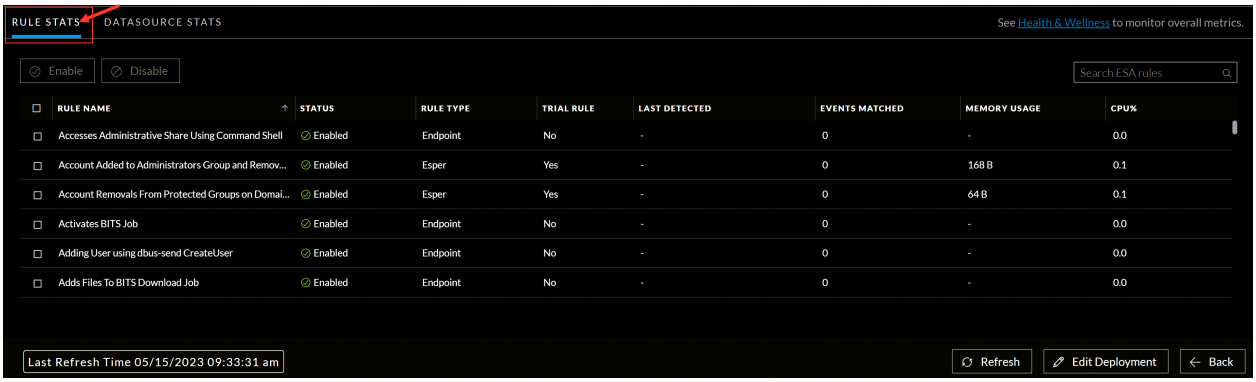


Edit the Deployment

To edit the deployment, Click the **Edit Deployment** tab in the bottom right corner of the page.

Last Refresh Time

This information indicates the last time when the deployment stats page was refreshed.

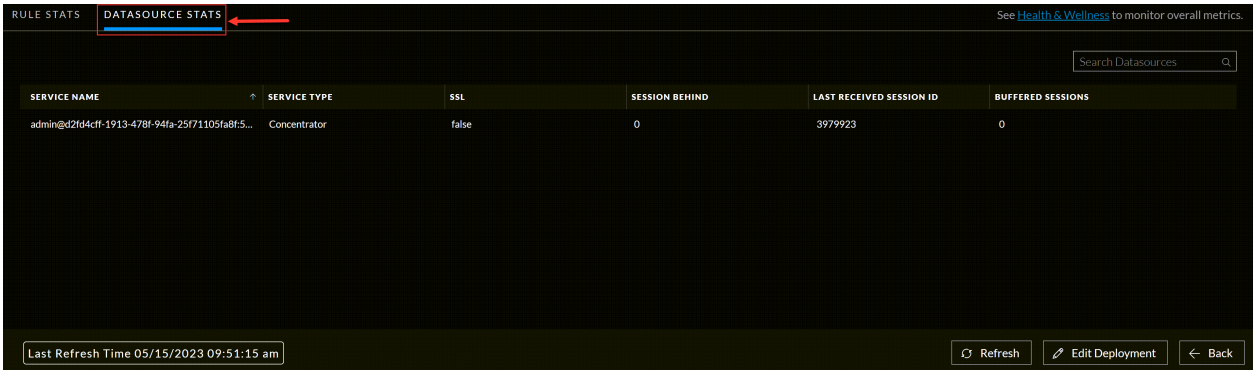


Sections	Parameter	Description
Engine Stats	Esper Version	Esper version running on the ESA service
	Events Offered	Number of events processed by the ESA service since the last service started.
	Events Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events.

Sections	Parameter	Description
Rule Stats	Rules Enabled	The number of rules enabled.
	Rules Disabled	The number of rules disabled.
	Rules Count	The number of rules inside a deployment.
	Total Events Matched	Total number of events matched to all rules on the ESA service.
Alert Stats	Notifications	The total number of notifications sent by email, SNMP, syslog, or script for the deployment. (ESA SNMP notifications are not supported in NetWitness Platform version 11.3 and later.)
	Alerts Created	The total number of alerts sent to Respond for the deployment.

The Rule Stats panel details:

The Rules Stats provides details on the rules that are deployed on the ESA service. The following figure shows the **Rule Stats** panel.



The table below lists the various parameters in the Rules Stats view and their description.

Parameters	Description
	Enables a rule that was disabled.
	Disables a rule that was enabled.
Health & Wellness link	Enables you to monitor overall memory usage and health of your ESA Correlation service.
Status	Indicates whether the rule is enabled or disabled. A green circle icon  indicates that the rule is enabled. A white circle icon  indicates that the rule is disabled. **Note:** If a rule has an error on deployment, it shows up as **'Failed'**. Hover over the Failed icon to view the error message in the tooltip.
Rule Name	Name of the ESA rule.

Parameters	Description
Rule Type	**Endpoint** indicates a rule from the Endpoint Risk Scoring Bundle and **Esper** indicates Esper-specific rules, such as Rule Builder and Advanced EPL rules.
Trial Rule	Indicates if the rule is running in trial rule mode.
Last Detected	The last time alert was triggered for the rule.
Events Matched	The total number of events that matched the rule.
Memory Usage	The total amount of memory used by the rule. **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show memory usage.

Parameters	Description
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each. **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show CPU usage.

The Data Source Stats panel details:

Parameters	Description
Service Name	Identity of the service.
Service Type	Type of the service.

Parameters	Description
SSL	Data Source connected to ESA deployment over an SSL connection using SSL port (For example, for the concentrator, it is 56005).
Session Behind	Difference between the last latest session id on the concentrator and the currently processed session id on ESA.
Last Received Session ID	The latest session id received by the deployment from the data source.
Buffered Sessions	Number of sessions in the ESA buffer to be consumed by the Esper engine.

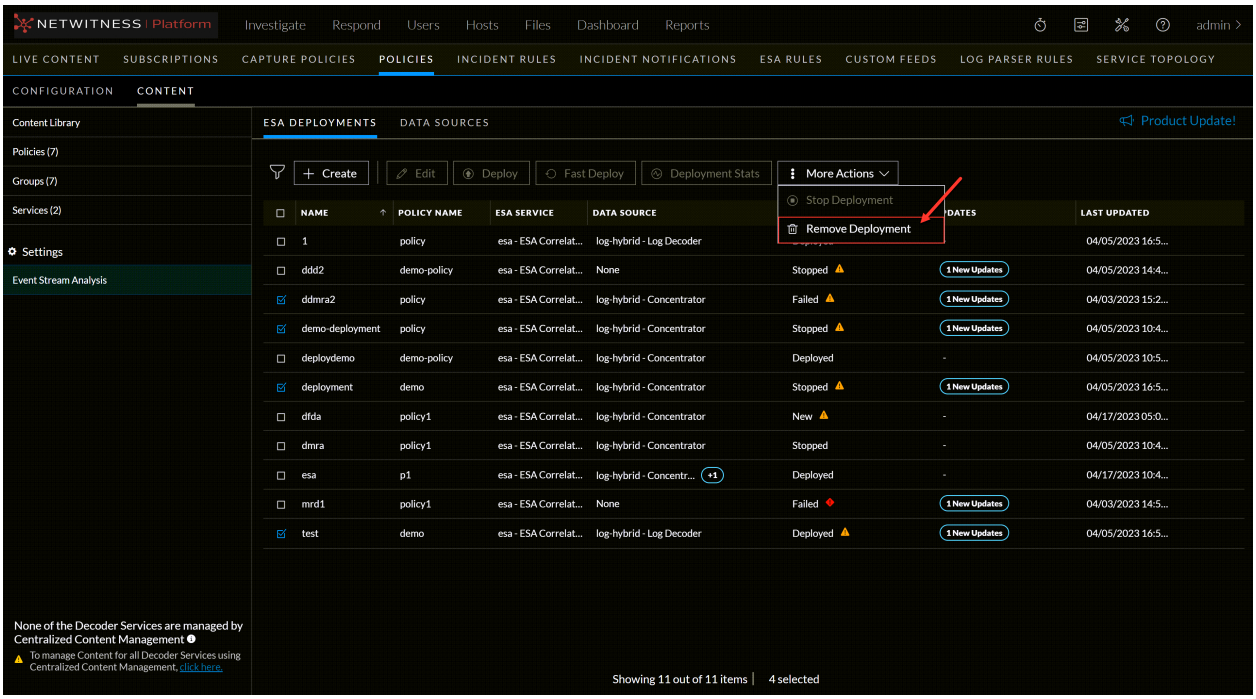
Remove a Deployment

You can delete one or more deployments when those deployments are not required. Once the deployment is deleted, all the configurations associated with the deployment will be permanently deleted from the correlation server. The alert process will be stopped for the deleted deployment.

You can remove deployments in the following ways:

- Using the **ESA Deployments** tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can remove deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and remove a deployment.

To remove a deployment from the ESA Deployments tab



1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

3. Select the deployment that needs to be removed and click **Remove**.

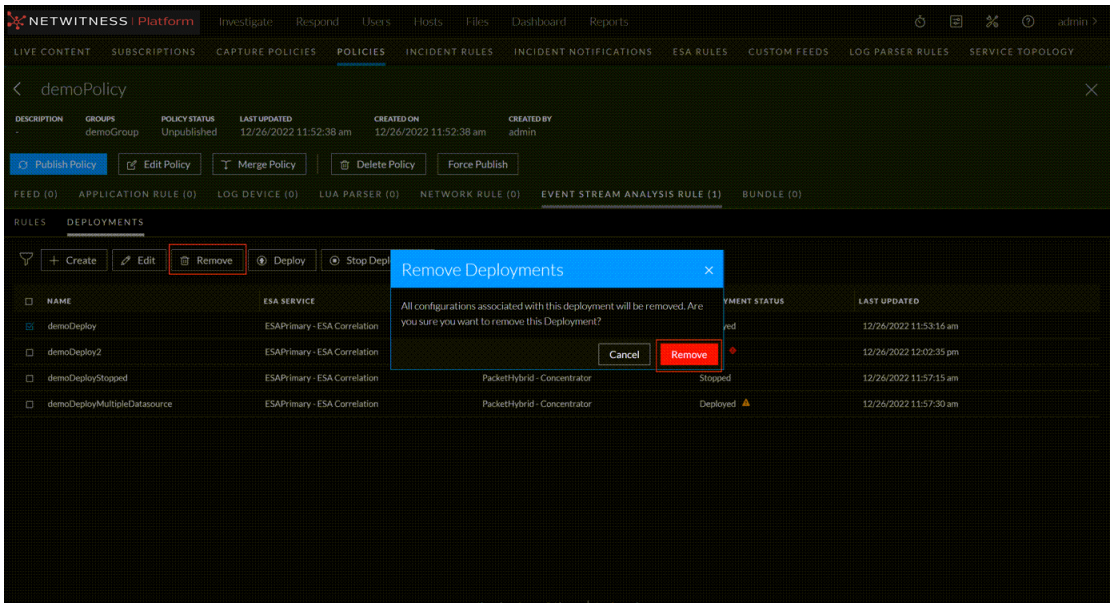
   A confirmation pop-up is displayed to confirm.

4. Click **Remove**.

To remove a deployment from a selected policy

1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.



4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.

5. Select the deployment that needs to be removed and click **Remove Deployment**.

   A confirmation pop-up is displayed to confirm if you want to remove it.

6. Click **Remove**.

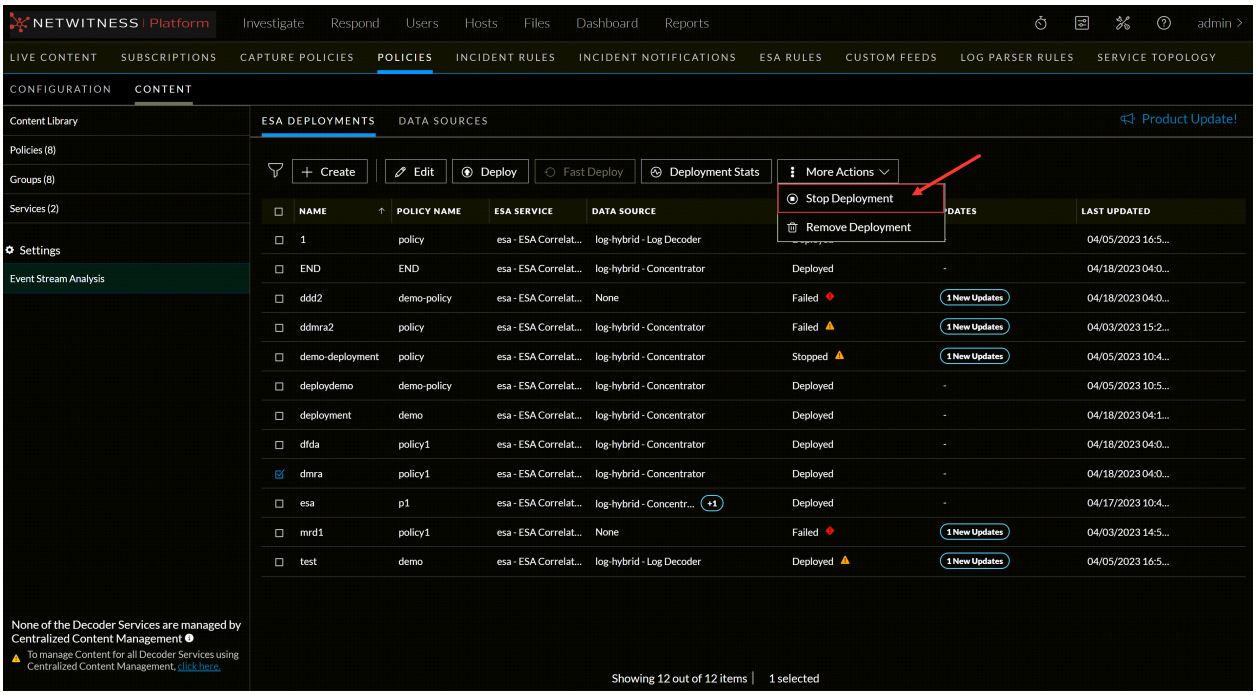
Note: It is required to have at least one deployment associated with the correlation service present in the group associated with the policy.

Stop a Deployment

You can stop a deployment to temporarily pause an ESA deployment. This will stop processing the event stream analysis alerts corresponding to the deployed policy.

To delete a deployment completely, see Remove a Deployment

To initiate a deployment again, see Start a Deployment



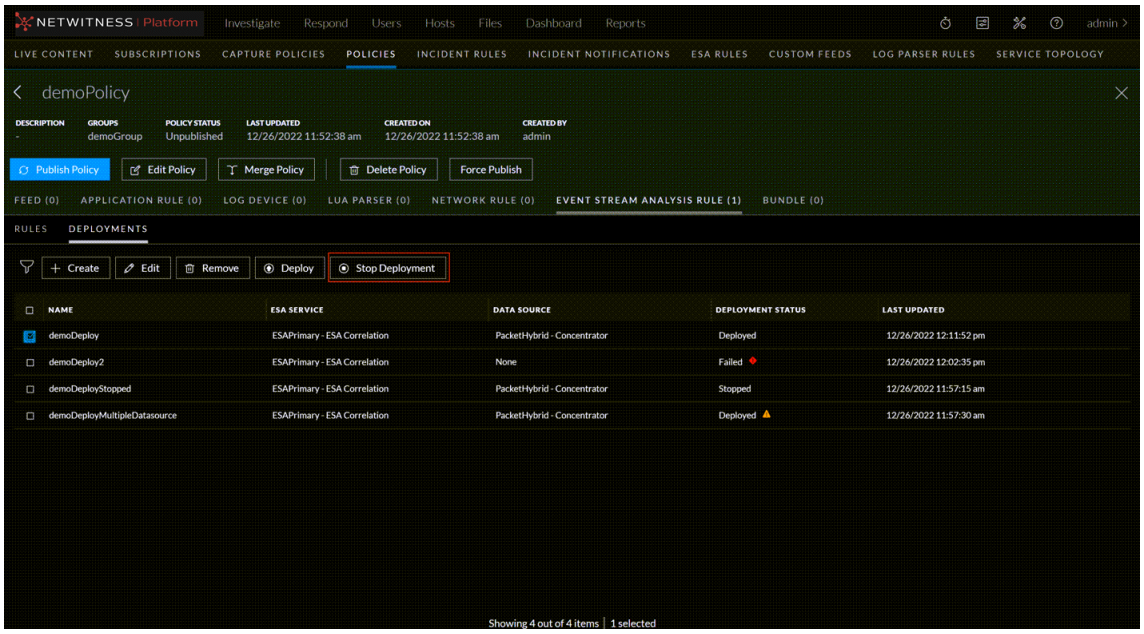
You can stop deployments in the following ways:

- Using the ESA Deployments tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can stop deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and stop a deployment.

To stop a deployment from the ESA Deployments tab

1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

   The available deployments are displayed.
3. Select the deployment that must be stopped temporarily and click **Stop Deployment**.



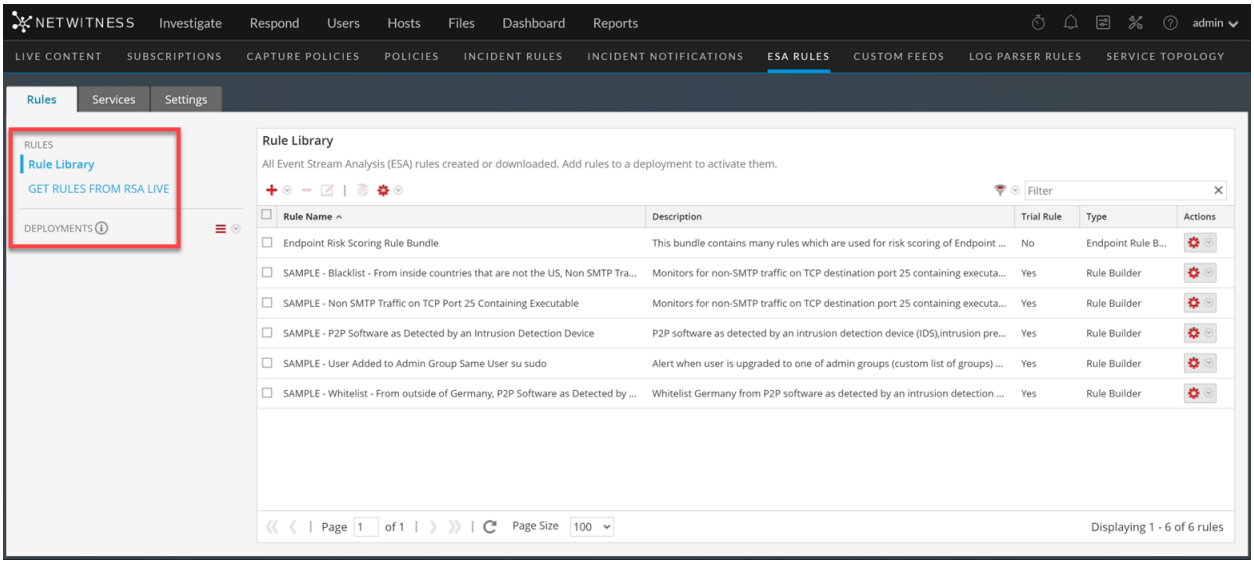
To stop a deployment from a selected policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed
3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.
4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.
5. Select the deployment that needs to be stopped temporally and click **Stop Deployment**.

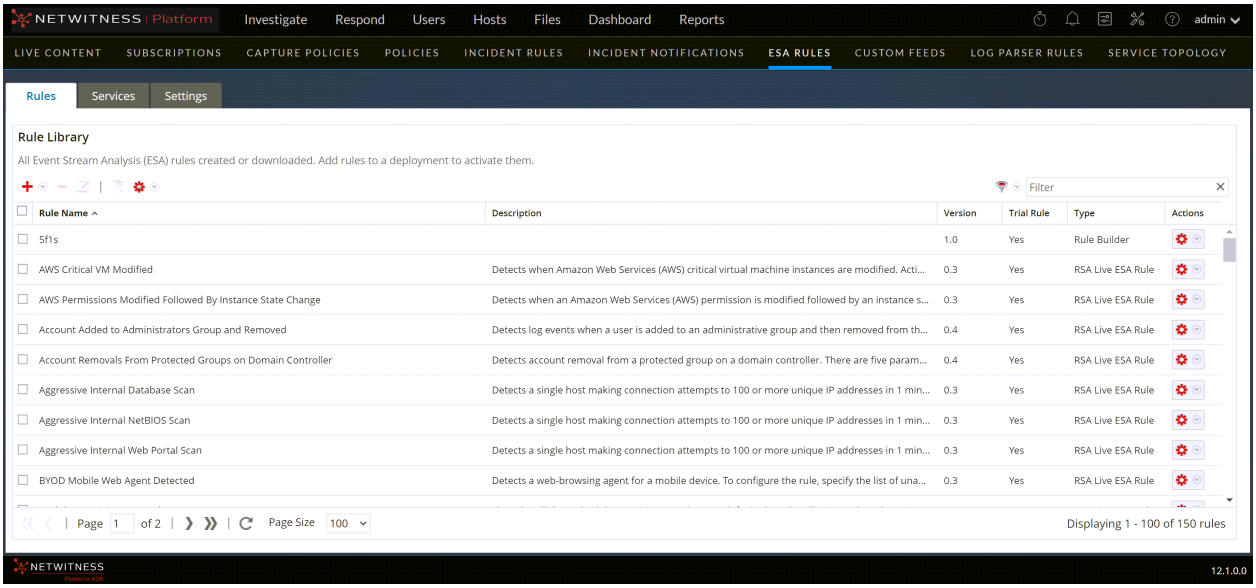
Note: Publishing the policy will not deploy the stopped deployments.



Migrate ESA Deployments to Policies and Groups

From version 12.1 and later, on successful upgrade of the Admin Server, the ESA deployments are managed by the policies and groups page. The deployments are not available on **(CONFIGURE)** > **ESA Rules** page.

12.0 and Earlier version



ESA Rules page in the 12.0 version.

12.1 version

Updated ESA Rules page in 12.1 version, where only rule libraries are available.

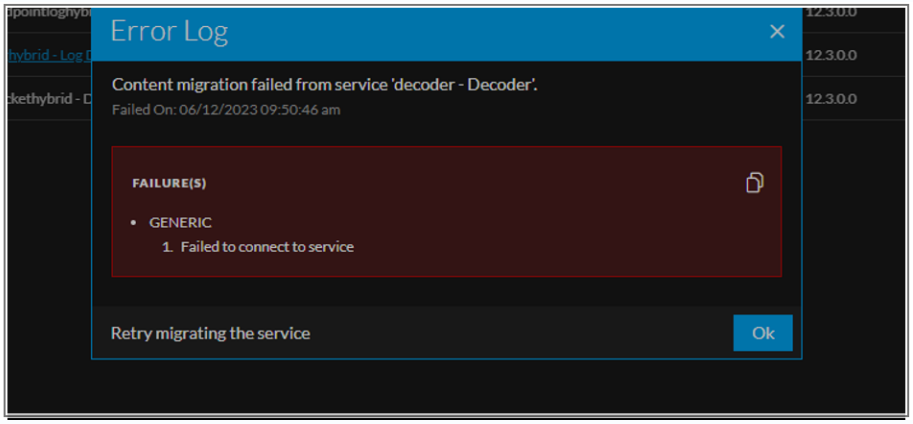
Note: The ESA deployments, after upgrading the Admin Server to 12.1 are not available to view or modify until the Correlation servers are also upgraded to the 12.1 version. However, the events are consumed, and ESA alerts are processed by the Correlation server.

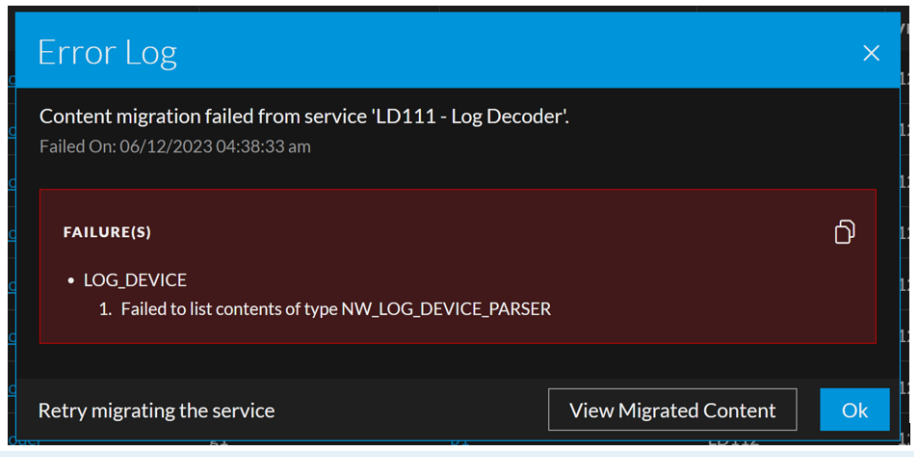
All the deployments are automatically migrated to policies and groups:

- Each deployment is converted into a policy and a group.
- Once the ESA Correlation server is upgraded to the 12.1 version, you can access these deployments as groups and policies.

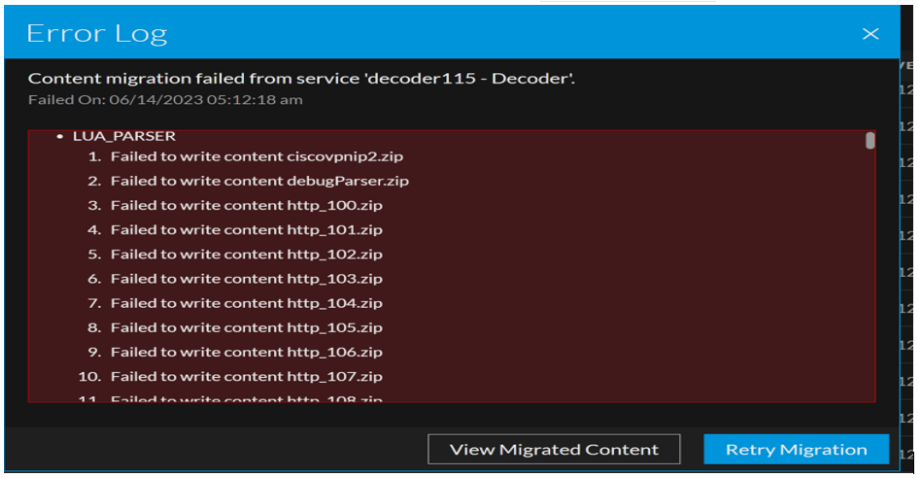
IMPORTANT: If there is any need to import ESA Rules and Enrichments. NetWitness recommends importing those missing rules and enrichments before the upgrade.

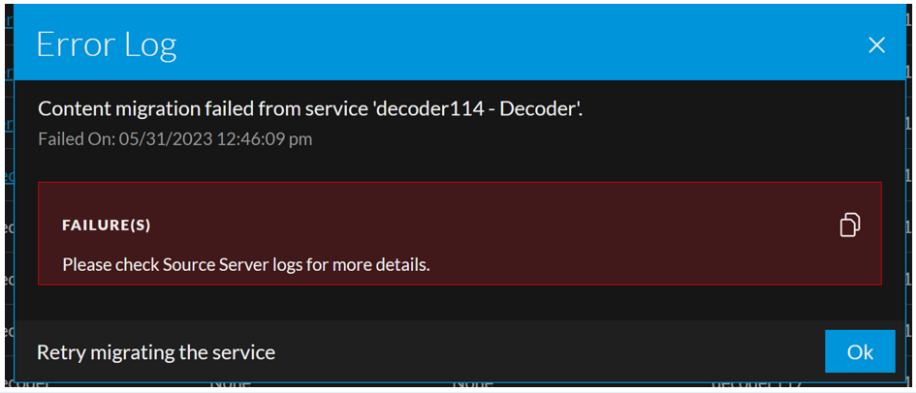
The following table provides the information on different deployment states for Policy and Groups:



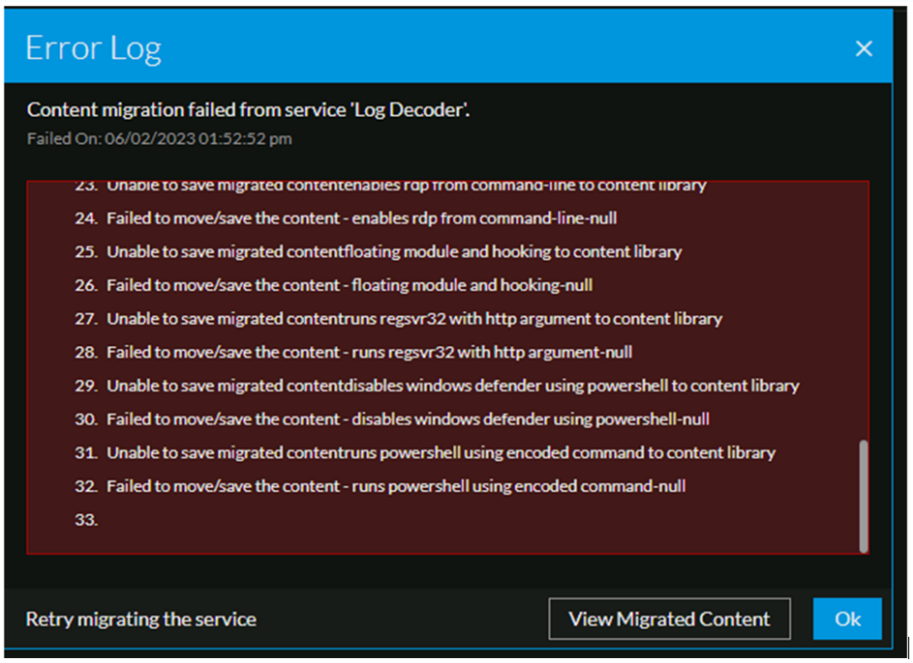


SlNo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No





Healthy deployment contains no errors, and the required resources such as ESA Server, Data source, and ESA rule are added.



Note: NetWitness recommends that all the deployments maintain an error-free state and also remove any unnecessary or unused ESA deployments.

Troubleshooting

This topic provides information about possible issues that NetWitness users may encounter when using Centralized Content Management (CCM) in NetWitness. You can look up explanations of issues and their solutions.

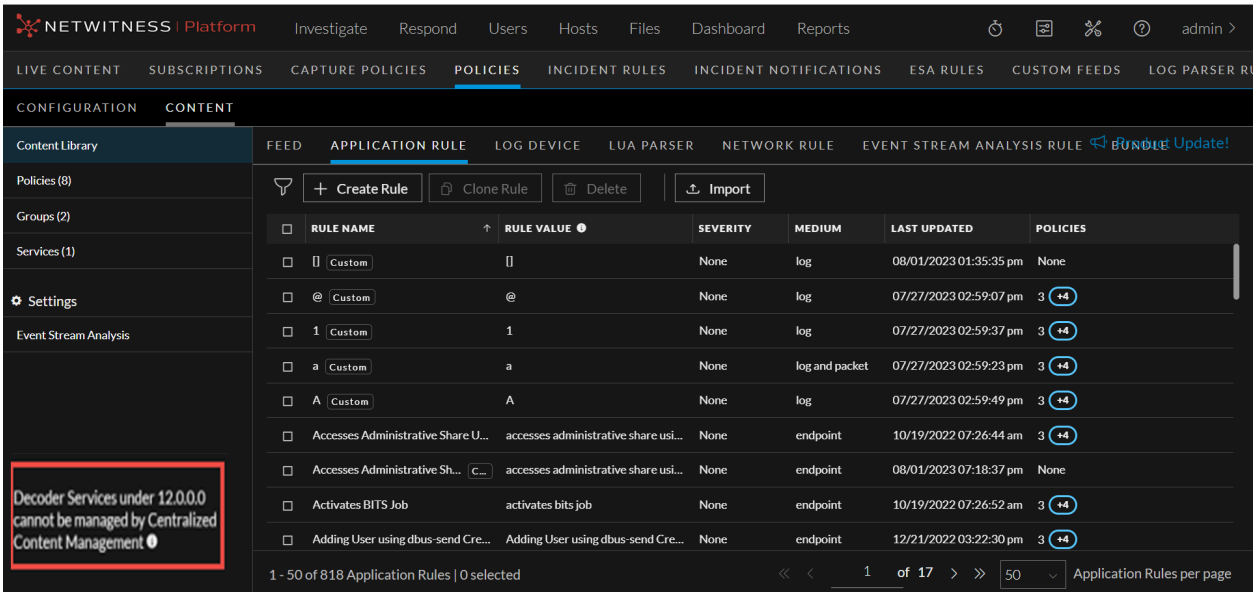
Problem	Solution
Failed to connect to service	Generally this error occurs when service is offline. If the service status is offline, then restart service and retry migration. If the service status is online, then retry migration. 
Failed to list content of type LOG_DEVICE_ PARSER	This is a temporary failure. Retrying migration resolves this issue. 

Problem	Solution
Failed to write content	This is a temporary failure. Retrying migration resolves this issue. 
Please check source server logs for more details.	This error occurs when source server goes offline during migration. Hence, restart source server and retry migration. 

Problem	Solution
Failed to move/save the content	This error may occur for various reasons and needs more investigation. Hence, please raise a CE ticket and share mongo dump and source server log with ticket. 

References

This section is a collection of references, which describe the user interface and more detailed information about how Policy-based Centralized Content Management works in NetWitness. The topics are presented in alphabetical order.



- Content Library Tab

Application Rules per page

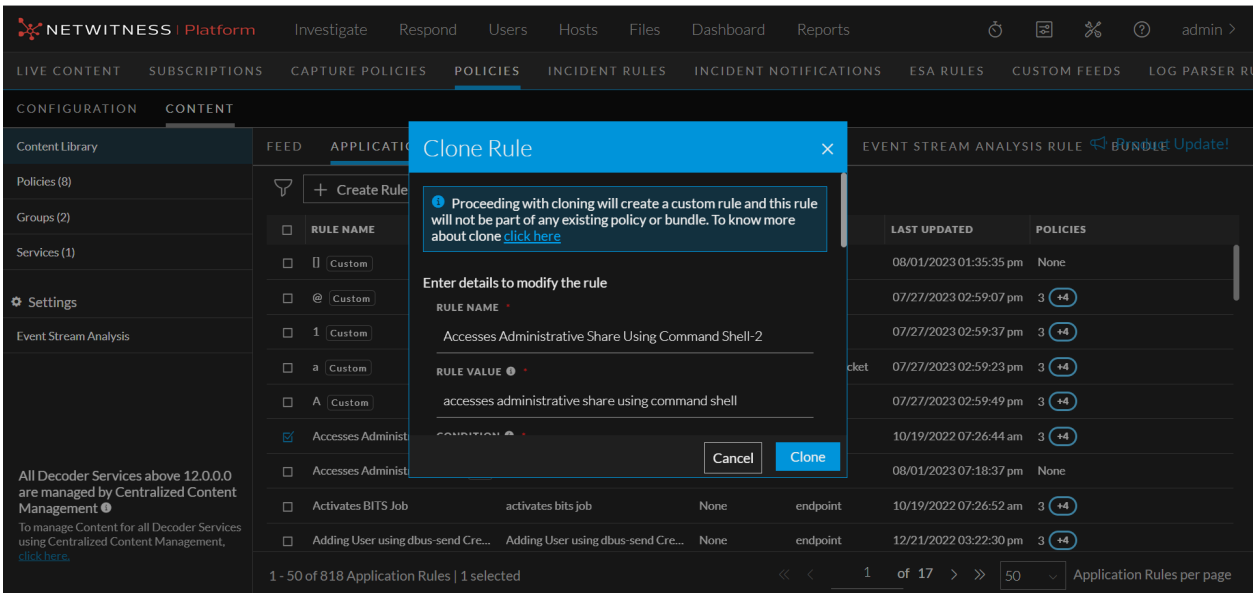
The following table describes the Content Library tab.

1	By default, 50 contents are displayed per page. To go to the next page, click . To go to the last page, click .
2	Toolbar • Create Rule - Lets you create a rule. • Clone Rue - Lets you clone an application rule or network rule. For more information, see Clone Application Rule or Clone Network Rule. • Delete - Lets you delete an application rule or network rule. For more information, see Delete Application Rule or Delete Network Rule. • Import - Lets you import an application rule or network rule. For more information, see Import Content to Content Library.
3	Rule List Pane • Rule Name - Name of the rule. • Rule Value - The rule value. • Medium - Medium through which the rule is created. • Last Updated - Displays the time when the rule is updated. • Policies - Policies to which the rule is applied. You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.

Create New Rule dialog:

Below is an example of the Create New Rule dialog:



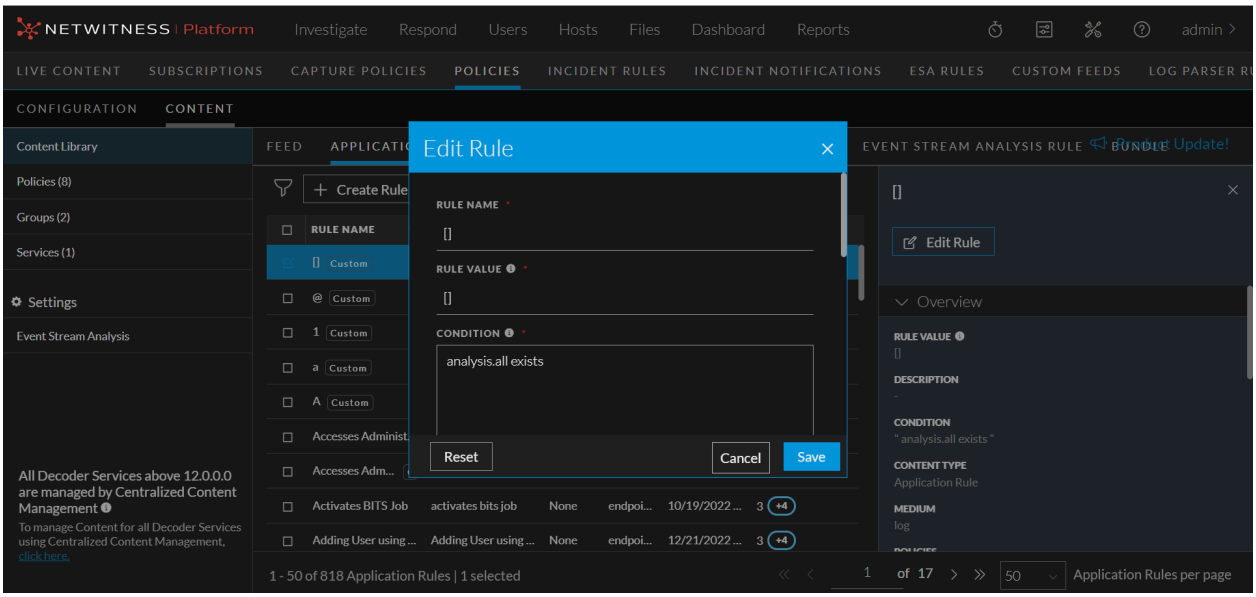
The table describes the information and options in the Create New Rule dialog:

Field	Description
Rule Name	Name of the new rule. The name should be unique.
Rule Value	The rule value. While creating a new rule, the rule value is defaulted with the rule name. However, you can modify the same.
Condition	Condition for the new rule. You can apply two types of conditions for the rule. **Normal mode:** It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on). The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators. **Advanced:** You can customize the conditions as a free form text.
Medium	Medium through which the rule is created. For a network rule, the value of medium is selected as **Packet** as default and you cannot edit it.
Description	The description of the new rule.
Session Data	Session data for the new rule. Indicates if the rule processing should stop, keep, filter or truncate when the session data is running.
Session Options	Session options for the new rule. Indicates if the session options should be alert, forward or transient.

Flag session with rule name in meta key	Conditions for which the alert should be turned on.
Save	Saves the settings and closes the Create New Rule dialog.
Cancel	Cancels the operations.

Clone Rule dialog:

Below is an example of the Clone Rule dialog.



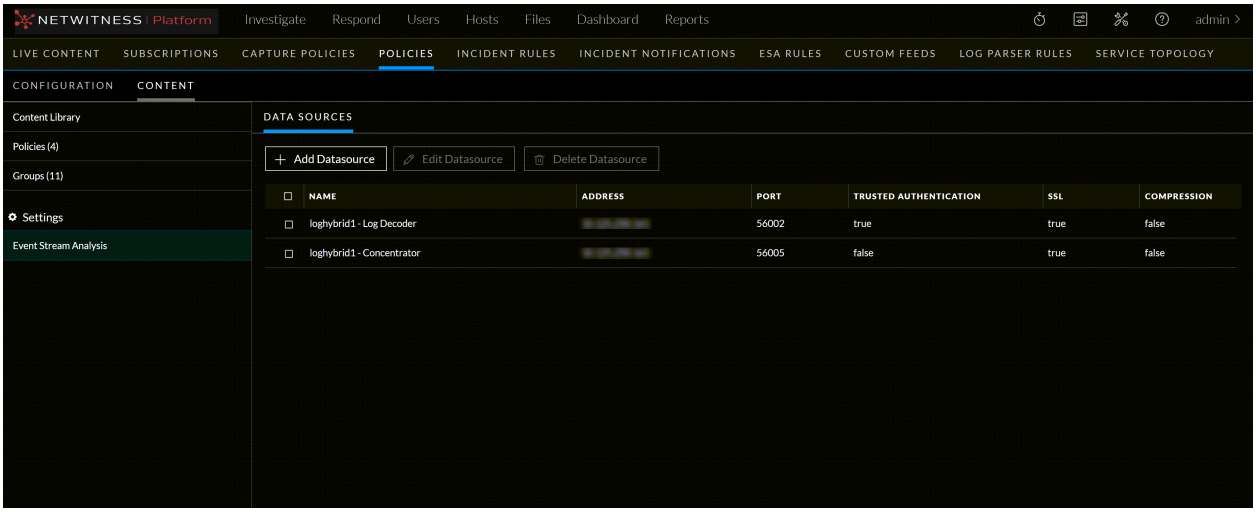
The table describes the information and options in the Clone Rule dialog:

Field	Description
Rule Name	Name of the cloned rule. The name should be unique.
Rule Value	The rule value written to the alert meta.
Condition	Condition for the new rule. You can apply two types of conditions for the rule. **Normal mode:** It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on). The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators. **Advanced:** You can customize the conditions as a free form text.
Medium	Medium through which the rule is created. For a network rule, the value of medium is selected as **Packet** as default and you cannot edit it.

Description	The description of the new rule.
Session Data	Session data for the new rule. Indicates if the rule processing should stop, keep, filter or truncate when the session data is running.
Session Options	Session options for the new rule. Indicates if the session options should be alert, forward or transient.
Flag session with rule name in meta key	Conditions for which the alert should be turned on.
Clone	Clones the rule and closes the Cone Rule dialog.
Cancel	Cancels the operation.

Edit Rule dialog:

Below is an example of the Edit Rule dialog:

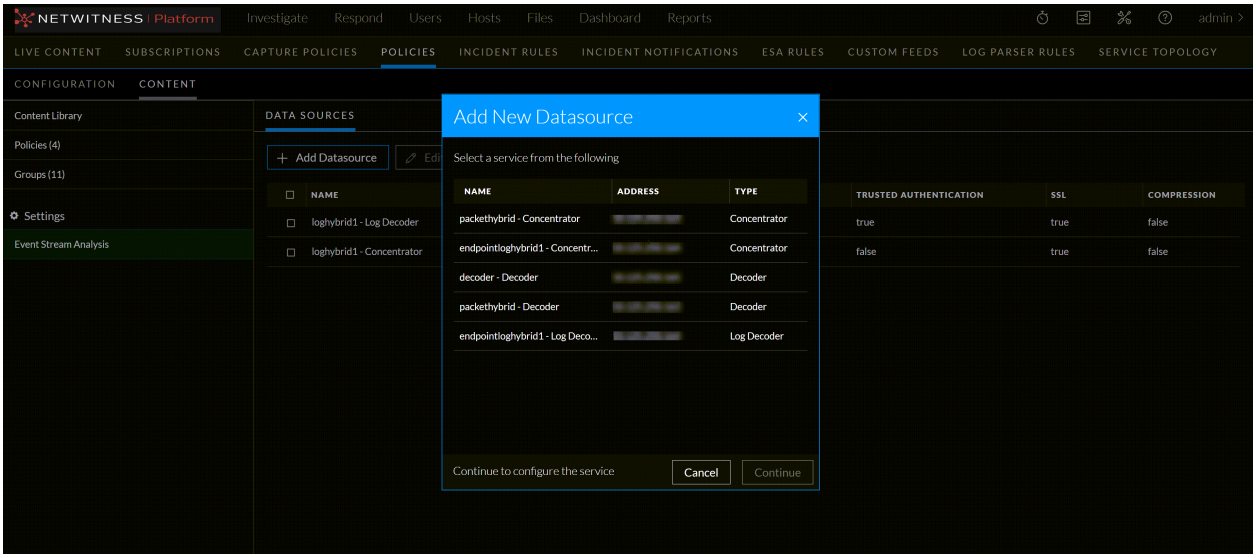


The table describes the information and options in the Edit Rule dialog:

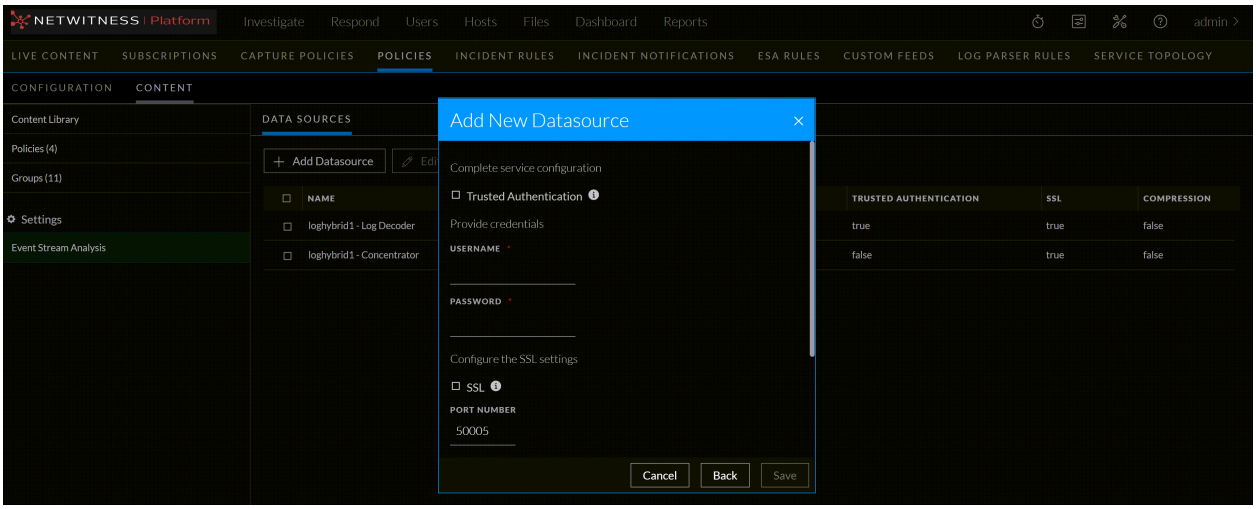
Field	Description
Rule Name	Name of the new rule. The name should be unique.
Rule Value	The rule value.

Condition	Condition for the new rule. You can apply two types of conditions for the rule. **Normal mode:** It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on). The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators. **Advanced:** You can customize the conditions as a free form text.
Medium	Medium through which the rule is created. For a network rule, the value of medium is selected as **Packet** as default and you cannot edit it.
Description	The description of the new rule.
Session Data	Session data for the new rule. Indicates if the rule processing should stop, keep, filter or truncate when the session data is running.
Session Options	Session options for the new rule. Indicates if the session options should be alert, forward or transient.
Flag session with rule name in meta key	Conditions for which the alert should be turned on.
Save	Saves the settings and closes the Edit Rule dialog.
Reset	Reset the fields.
Cancel	Cancels the operation.

Data Sources Tab



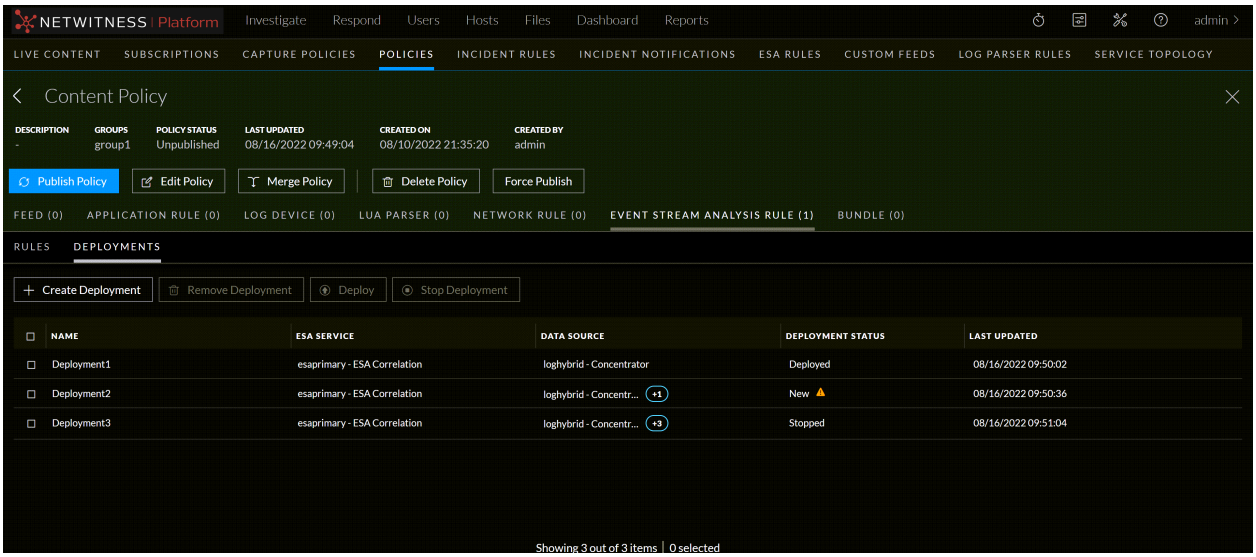
Below is an example of the **Content** > **Settings** > **Event Stream Analysis** > **Data Sources** tab:



The following table describes the Data Sources tab.

1	Toolbar • Add Datasource- Lets you to add a new Datasource. For more information, see Add an ESA Datasource. • Edit - Datasource - Lets you edit the Datasource. For more information, see Edit an ESA Datasource. • Delete Datasource - Deletes the selected Datasource.
2	Data Sources List Pane • Name - Shows the name of the data sources used by the selected ESA service. Data sources can be Concentrators or Decoders. • Address - IP address of the datasource where the ESA service is installed. • Port - Shows the port number used for authentication. • Trusted Authentication - Indicates that it uses Trusted Authentication for communication with ESA Service. • SSL - Indicates that it uses SSL for Authentication. • Compression - Enables you to adjust the Compression Level on different datasources for ESA.

Below is an example of the **Add New Datasource** dialog:

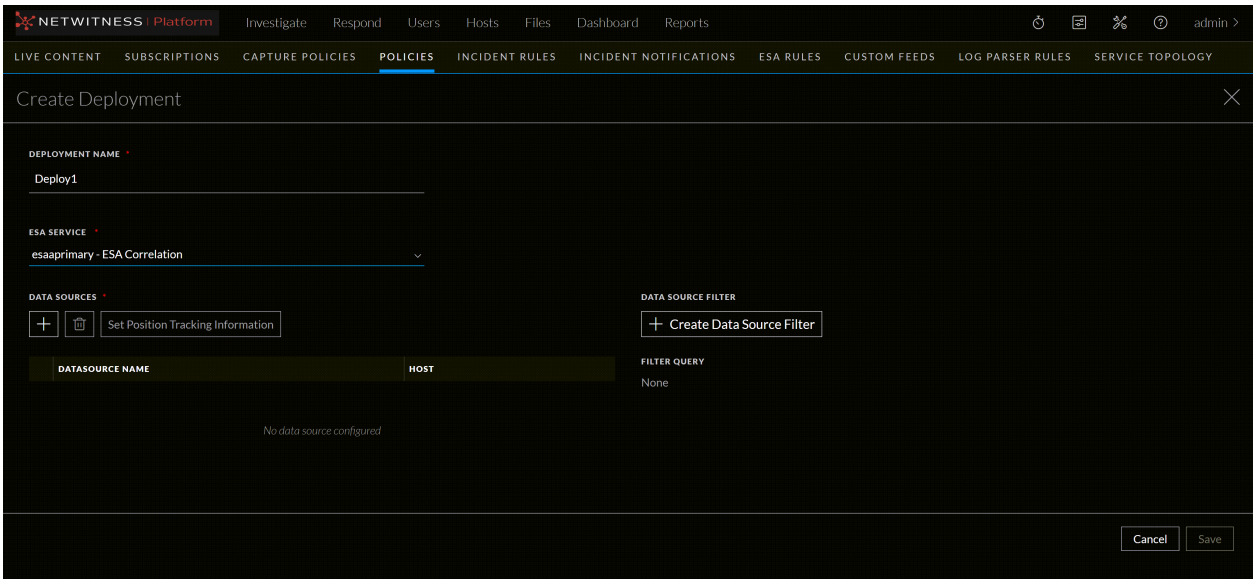


The table describes the information and options in the **Add New Datasource** dialog.

Field	Description
Trusted Authentication	This option will enable the use of SSL by default for authentication.
Username	The username used to sign in to your account for authenticating the datasource.
Password	The password for authenticating the datasource.
SSL	This will enable the use of SSL for authentication.
Port Number	This will enable the use of the port number for authentication.
Compression	This option enables you to adjust the Compression Level on different datasources for ESA.
Compression Level	Enables you to set different compression level. Compression Level: **0**, **1**, and **9**. For more information, see Add an ESA Datasource.
Test Configuration	Validates the provided configuration.
Save	Saves the settings and closes the Add New Datasource dialog.
Cancel	Cancels the operations.

Deployments Tab

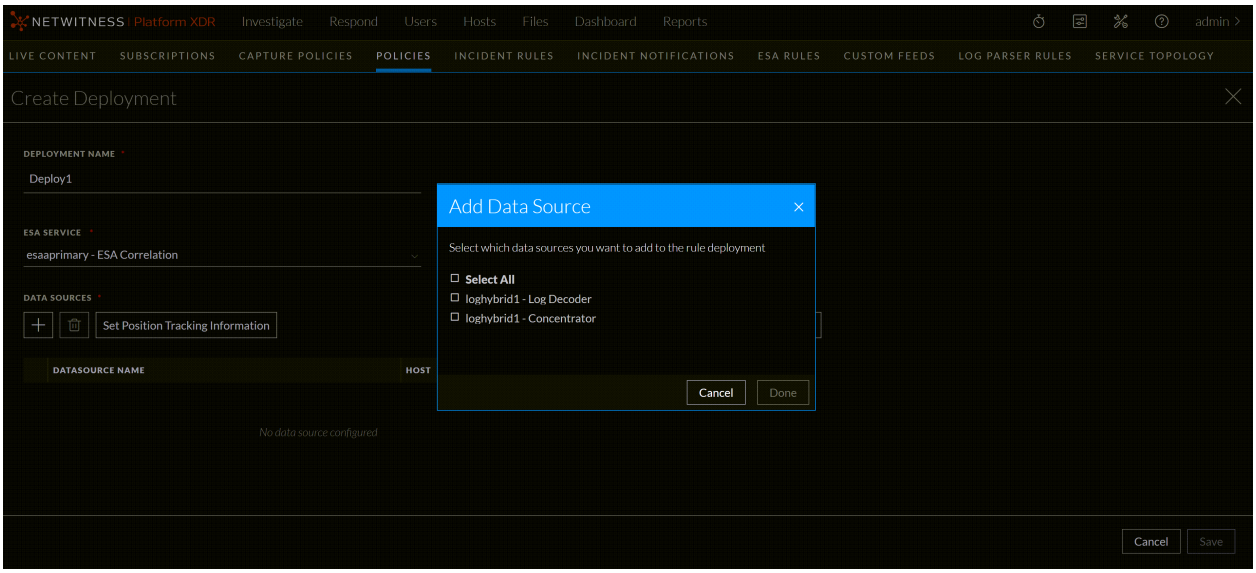
Below is an example of the **Content** > **Policies** > select a policy > **Event Stream Analysis Rule** > **Deployments** tab:



The following table describes the Deployments tab.

1	Toolbar • Create Deployment - Lets you to Add a new Deployment. For more information, see Create a Deployment. • Remove Deployment - Lets you to remove the Deployment.For more information, see Remove a Deployment. • Deploy - Lets you to deploy the Deployment. • Stop Deployment - Lets you to stop the selected Deployment.
2	Deployment List Pane • Name - Name of the content. • ESA Service - Displays the ESA service selected. • Data Source - Displays the Datasource added for ESA deployment. • Deployment Status - Status of the deployment. The values are: Deploying, Deployed, New, Stopping, Stopped, and Failed. • Last Updated - Displays the time when the deployment is updated.

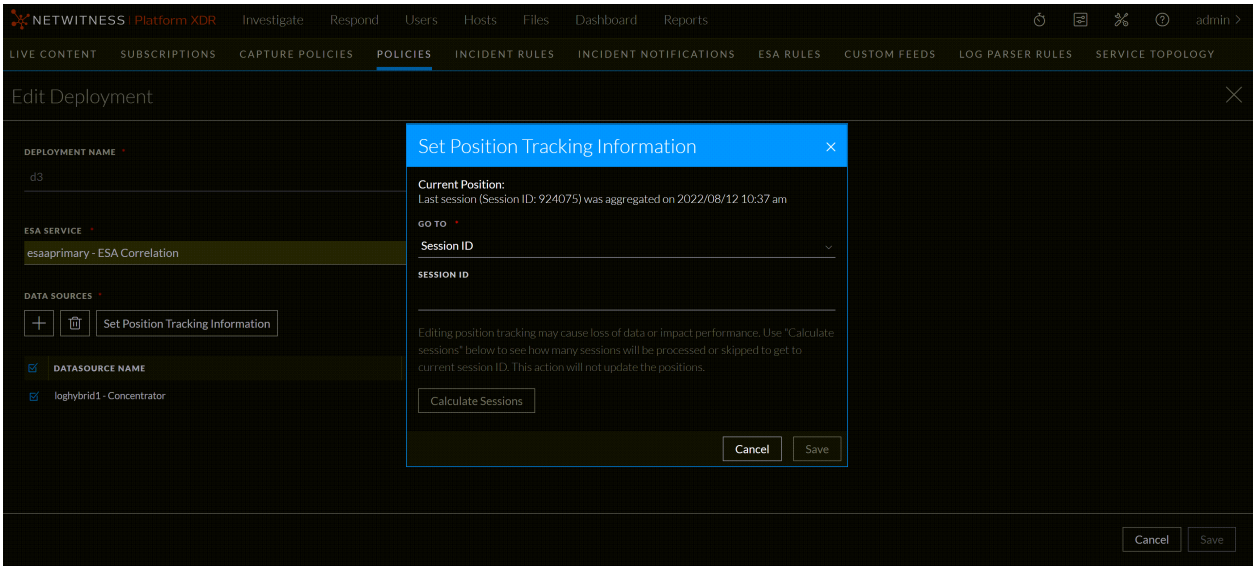
Create Deployment dialog:



Below is an example of the Create Deployment dialog:

The table describes the information and options in the **Create Deployment** dialog.

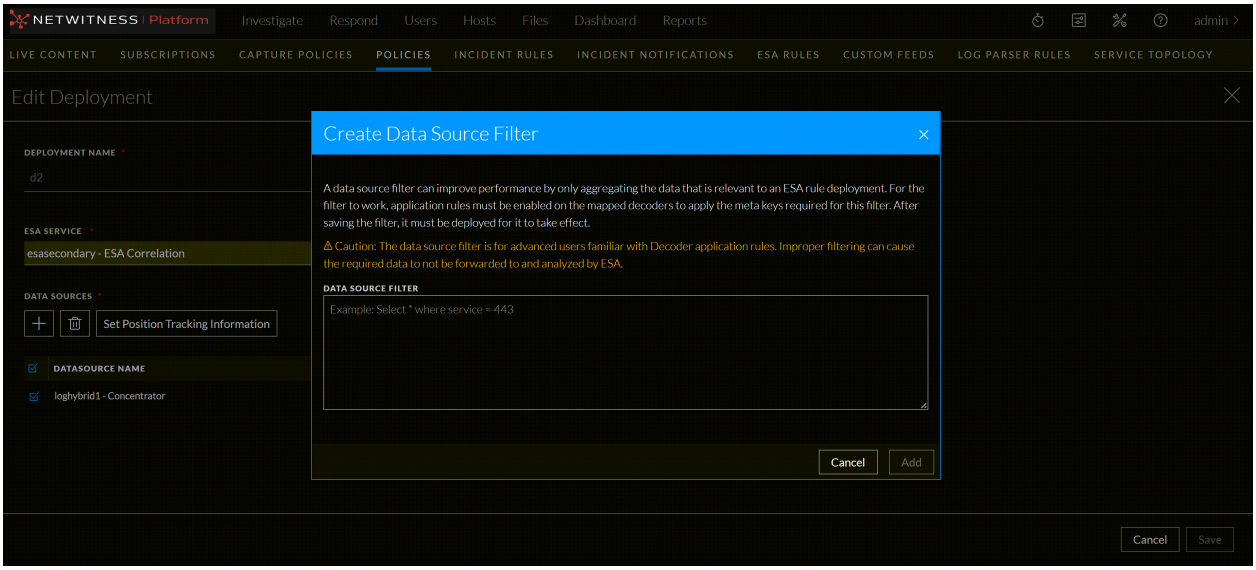
Field	Description
Deployment Name	Name of the deployment. The name must be unique.
ESA Service	Displays the list of ESA services from the drop-down list. • esaprimary – ESA Correlation • esasecondary – ESA Correlation
	Adds a Datasource from the available list. At least one Datasource is required to set the position tracking information for ESA.
	Deletes the datasource that you are currently editing.
Set Position Tracking Information	Adds a position tracking information on different datasources for ESA. Position Tracking Information enables you to visualize the progress of the sessions that ESA has processed, and provides information on the session IDs and the time/date when the events were processed. For more information, see Position Tracking Information.
Create Data Source Filter	Enables you to create the datasource filter to get the required results.
Save	Saves the settings and closes the Create Deployment dialog.
Cancel	Cancels the operations.



Below is an example of **Add Data Source** Dialog.

The table describes the information and options in the **Add Data Source** dialog.

Field	Description
Select Datasource / Select All	Allows you to select one or more datasources.
Done	Adds the datasource and closes the Add Data Source dialog.
Cancel	Cancels the operations.

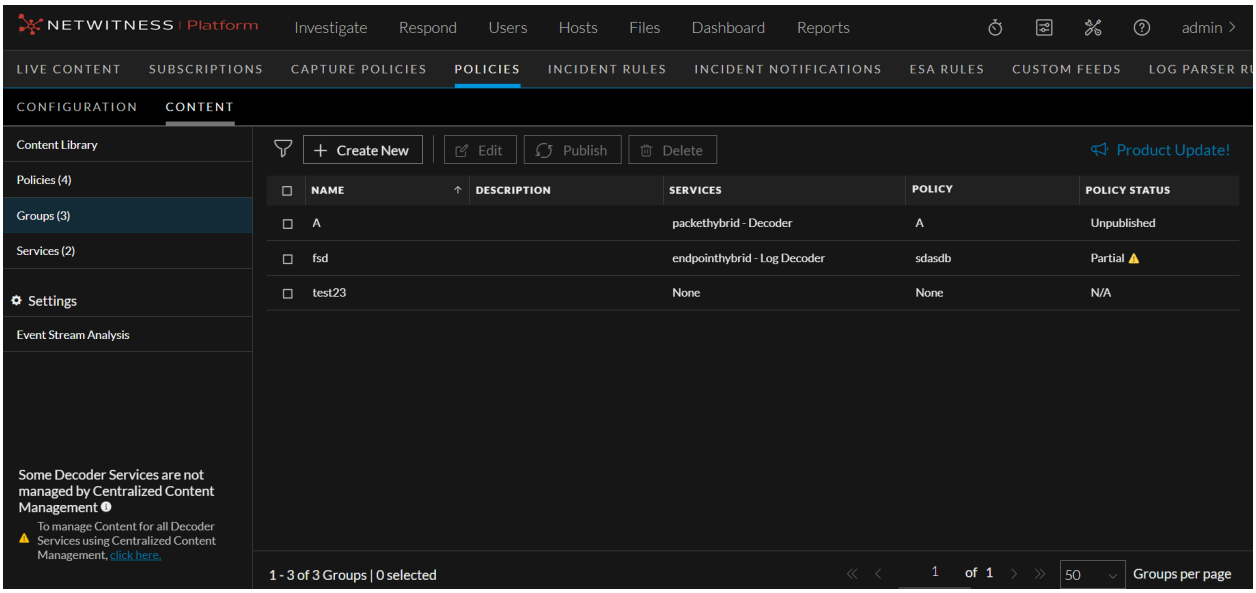


Below is an example of **Set Position Tracking Information** dialog.

The table describes the information and options in the **Set Position Tracking Information** dialog.

Field	Description
Go To	This option will enable the use of Session ID and data and time for ESA Correlation Service for the events.
Session ID	The ESA Correlation service starts processing the events from the session ID that you entered.
Date and Time	The ESA Correlation service starts processing the events from the date and time that you entered.
Calculate Sessions	This will calculate the number of sessions that will be processed with respect to the existing position of the data source.
Save	Saves the settings and closes the Set Position Tracking Information dialog.
Cancel	Cancels the operations.

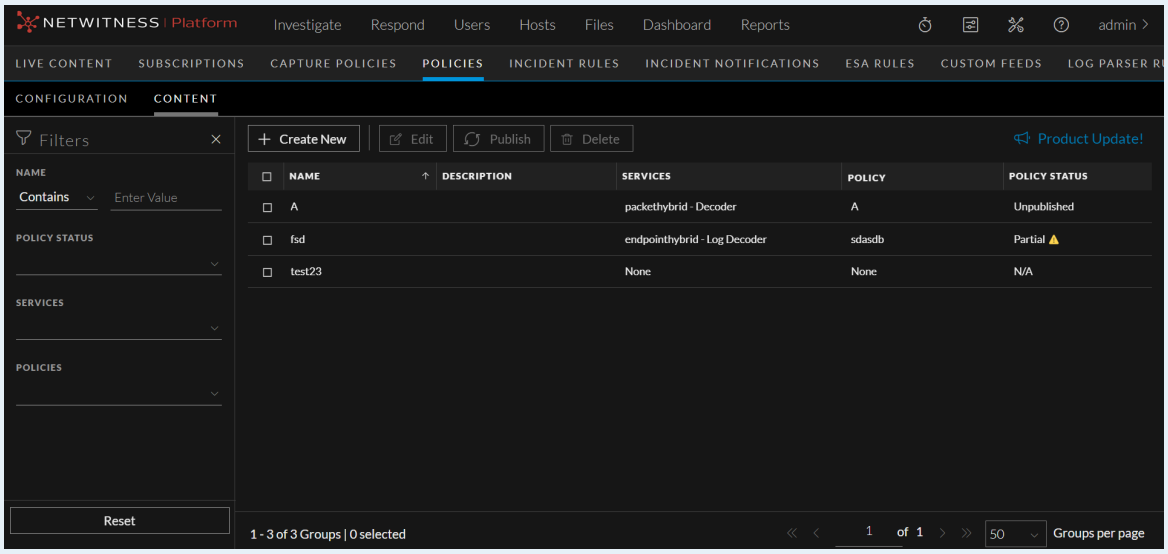
Below is an example of **Create Data Source Filter** Dialog



The table describes the information and options in the **Create Data Source Filter** dialog.

Field	Description
Data Source Filter	Enables you to enter the data source filter. For example, you can type **Select *where service = 443** to filter based on the query processed, it will filter out only HTTPS logs related sessions and will be forwarded to the ESA.
Add	Adds the configurations and closes the Create Data Source Filter dialog.
Cancel	Cancels the operations.

Groups Tab



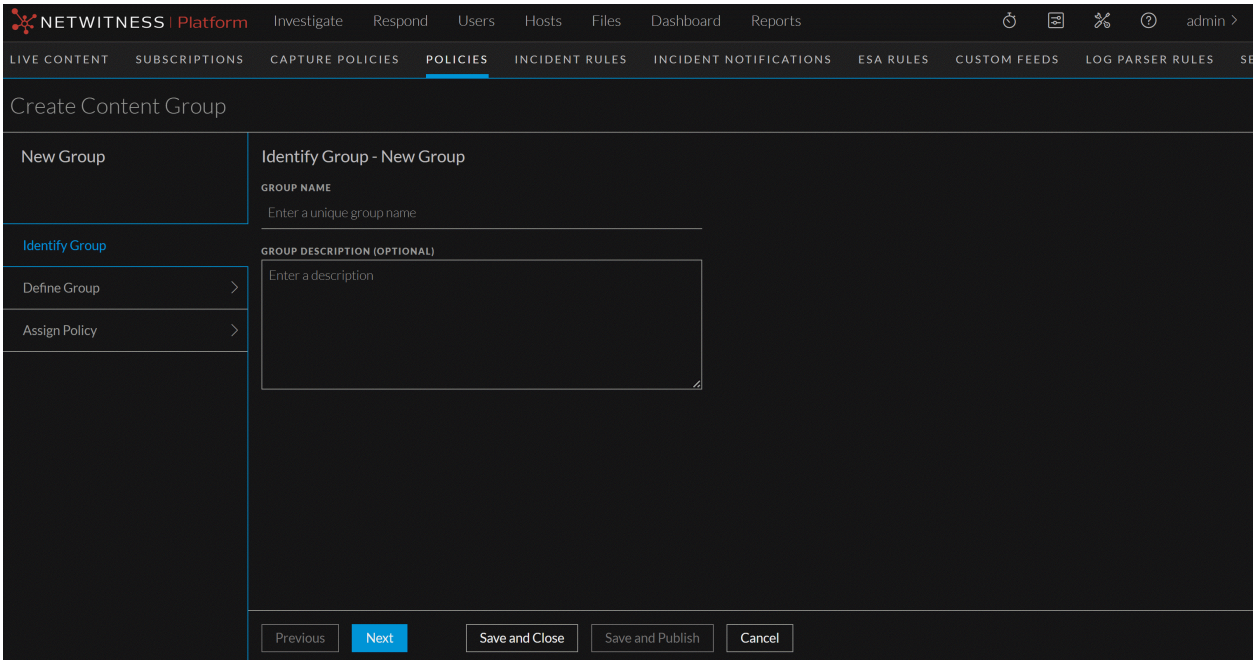
Below is an example of the Content > Groups tab:

The following table describes the Groups tab.

1	By default, 50 groups are displayed per page. To go to the next page, click ›. To go to the last page, click ».

2 - Filter the groups based on various parameters.

Filter Panel:

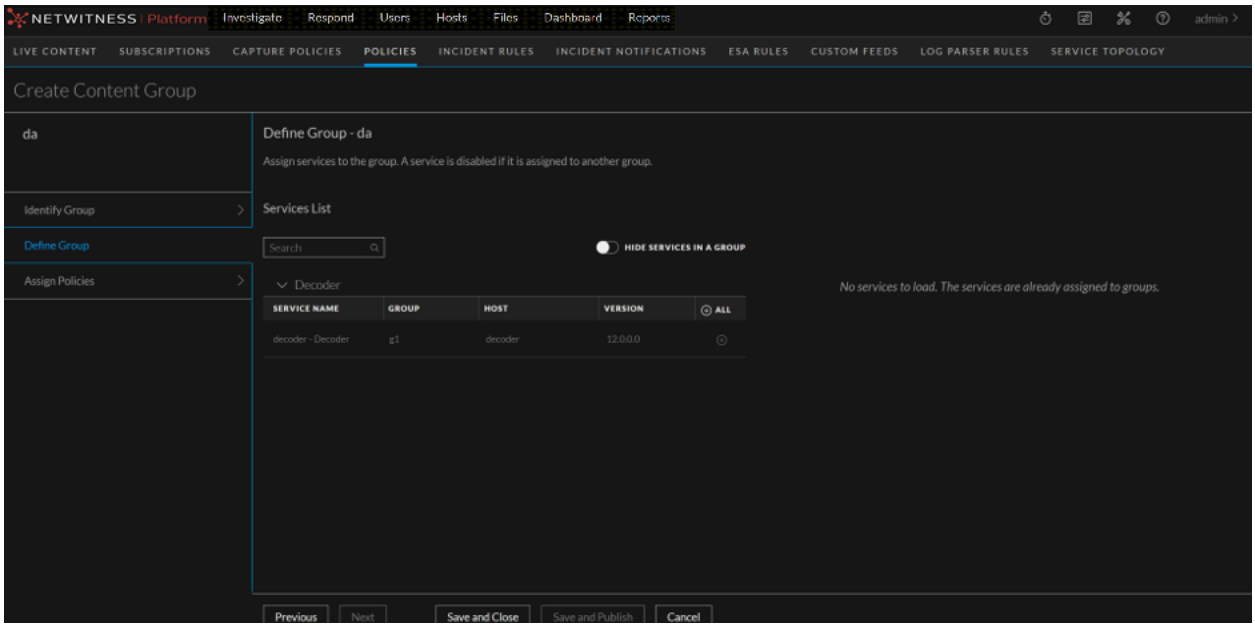


- Name - Select the **Name** drop-down value as either **Equals** or **Contains**. To search the group name using the **Contains** operator, set the filter option to **Contains** operator from the drop-down list and start typing the name of the group. Type one character and a list of group that contain that character is displayed, as you continue to type, the list is filtered to match. To search the group name using the **Equals** operator, set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular group name will be displayed.
- Policy Status - Select the **Policy Status** from the drop-down list. The various drop-down values are:
  - **Published**: Groups that are published to use.
  - **Unpublished**: Groups that are saved but not published.
  - **Failed**: Groups that are failed to publish.
  - **N/A**: Groups for which publication status is not applicable.
  - **Partial**: Groups that are partially published.
- Services - The service type to which the group is attached.
- Policies – The policies to which the group is attached.

3 Toolbar

- Create New - Lets you create a new group. For more information, see Create a group.
- Edit - Lets you edit the group. For more information, see Managing Groups.
- Publish - Publishes selected groups.
- Delete - Deletes the selected group.

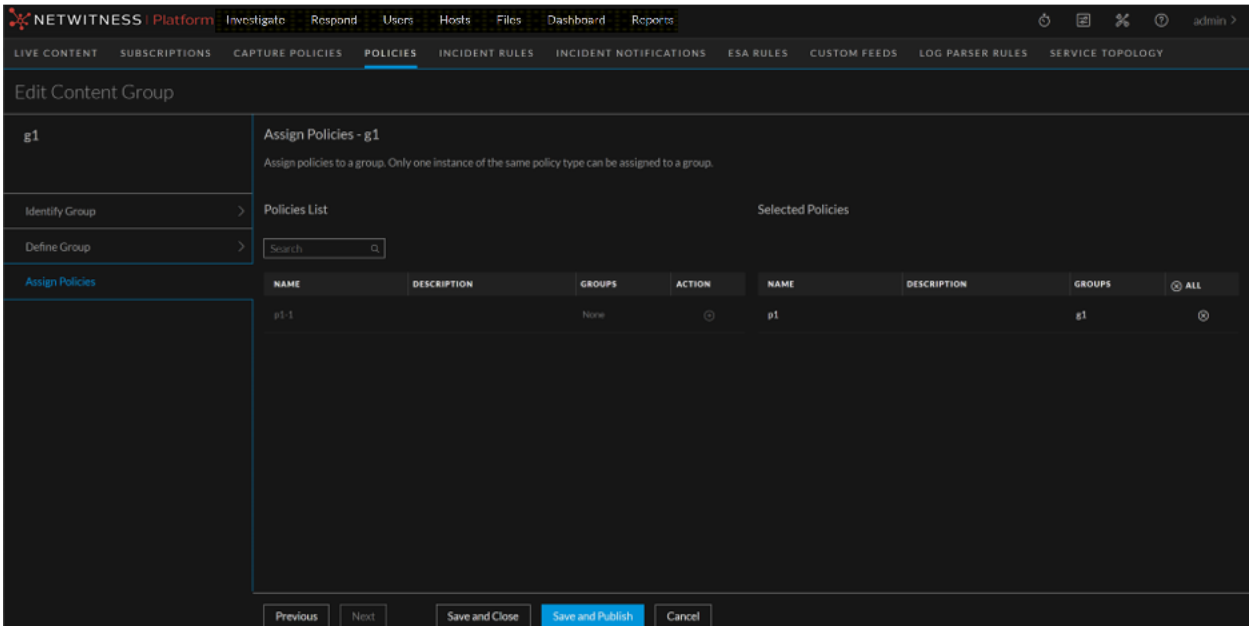
4	Group List Pane • Name - Name of the group. • Description - Description of the group. • Services - Displays the service to the which the group is applied. • Policies - Displays the policy to which the group is applied. • Policy Status - Status of the policy. The values are: Published, Unpublished, Failed, N/A. You can also sort on any column. If you mouse over a column header, a sort icon is displayed:  . Click  to sort by the selected column.
5	Groups Details Panel Displays the properties of the selected group.



Below is an example of the Create group dialog:

The table describes the information and options in the Create Group dialog:

Field	Description
Group Name	Name of the group. The name should be unique.
Group Description (Optional)	Description of the group. Description should not exceed 8000 characters.
Save and Close	Saves the settings and closes the Create Group dialog.

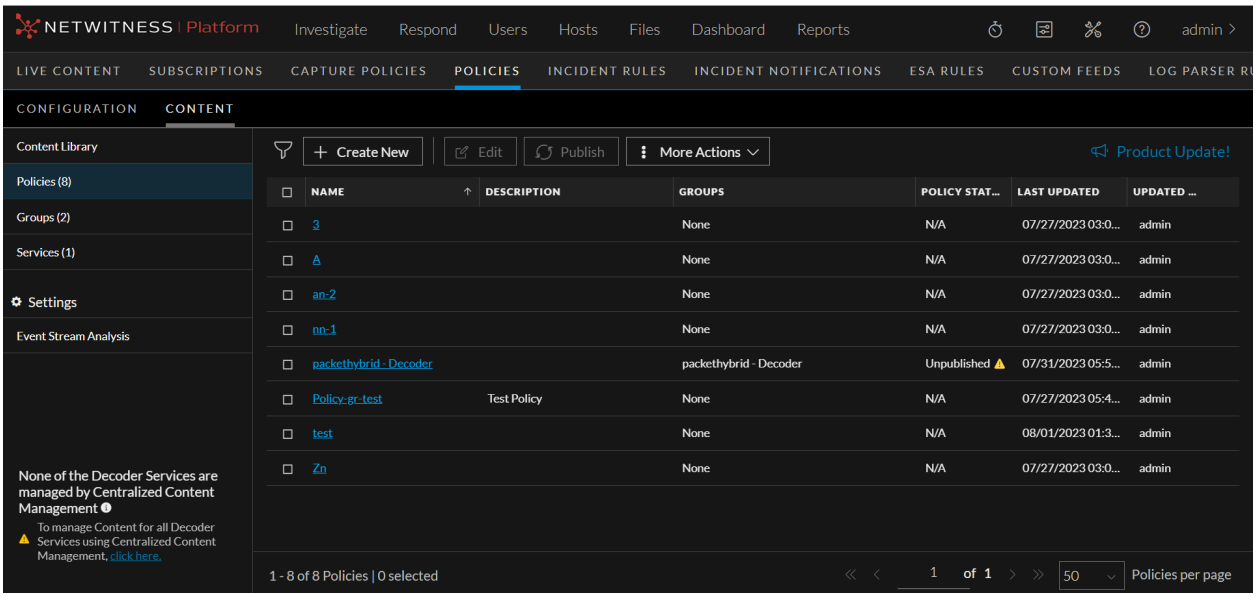


Below is an example of the define group dialog:

The table describes the information and options in the Define Group dialog:

Field	Description
Services List	Displays the list of services. The following describes services list: Service name – Name of the service. • Group - Name of the group. • Host - Host name of the service. • Version - Service version. • All - Lets you to add services to the group. You can either click to add all services or click to add specific service.
Hide Services in a Group	Displays the services that is not assigned to any group. By default, this option is disabled.
Selected Services	Displays the list of selected services for the group.
Save and Close	Saves the setting and closed the create group dialog.
Save and Publish	Saves and publishes the created group. **Note:** This option is disabled if you have not: - Assigned services. - Assigned policies.

Below is an example of Assign policy dialog:



The following table describes assign policy dialog:

Field	Description
Policies List	Displays the list of policies associated with the group. The following describes policies list: • Name - Name of the policy. • Description - Description of the policy. • Groups - Groups associated with the policy. • Action - Click to add policies to the group.
Selected Policies	Displays the list of selected policies for the group.
Save and Close	Saves the setting and closed the create group dialog.
Save and Publish	Saves and publishes the created group. **Note:** This option is disabled if you have not: - Assigned services. - Assigned policies.

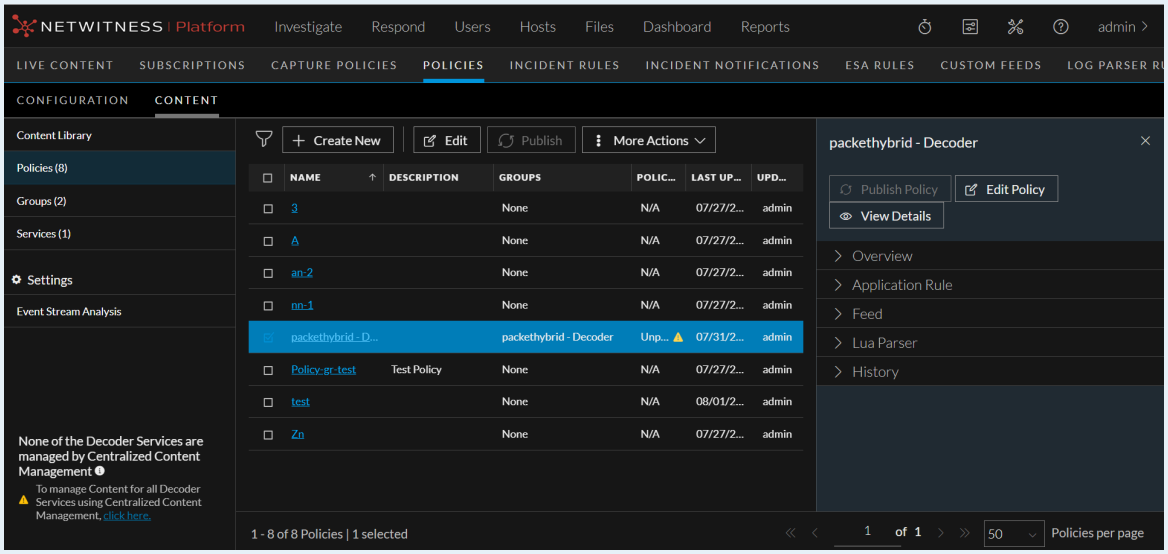
Policies Tab

The **(CONFIGURE) > Policies** view contains two tabs: **Configuration** and **Content**.
Below is an example of the **Content > Policies** tab:

The following table describes the Policies tab.

1	By default, 50 policies are displayed per page. To go to the next page, click ›. To go to the last page, click ».

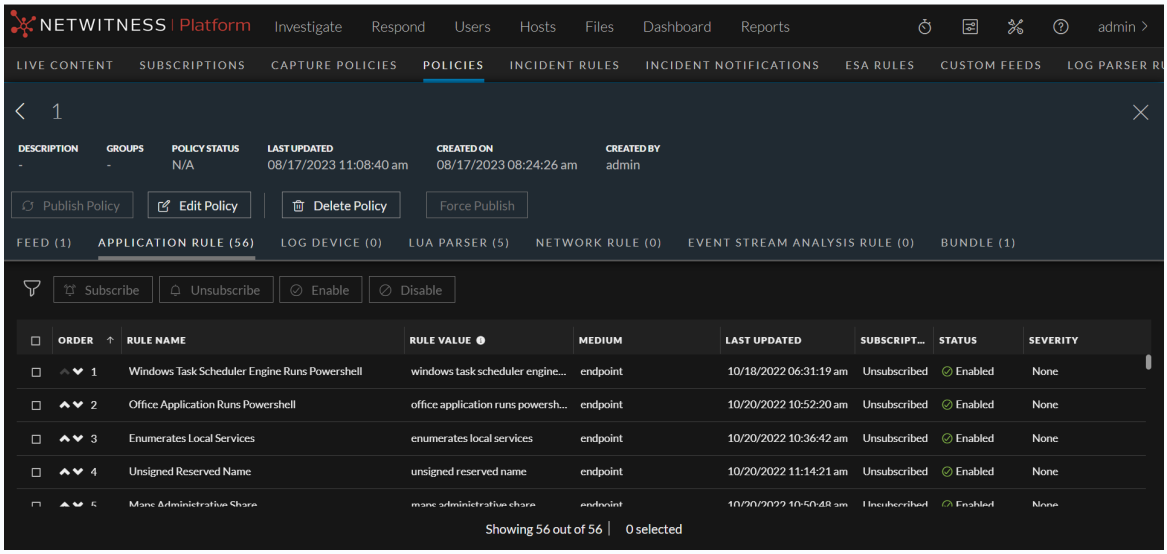
2 Toolbar:



- Create New - Lets you create a new policy. For more information, see Create a policy.
- Edit - Lets you edit the policy. For more information, see Edit a Policy.
- Publish - Publishes selected policy or policies.
- More Actions:
  - Assign to Group --Lets you assign policy to a group.
  - Clone - Lets you clone a policy.
  - Revert to - Lets you view the previous policy versions and revert policy to any previous version.

    Note:
    - The current version of the policy is disabled.
    - This option is disabled either if no policy is selected or multiple policies are selected.
  -  - Lets you name a policy version when you revert the policy.
  - Delete - Deletes the selected group or groups permanently.
  - Force Publish - Lets you republish all the content irrespective of the policy status. This option allows you to re-push all content or configurations to all services in the group. Some of the scenarios where you might want to force publish the policy are:
    - There was a service that was down or did not successfully receive content when it was first pushed out.
    - Some content may have been modified or removed locally on a service (outside of CCM control) and you want to re-apply the content from the policy.

3 Policy List Pane:



- Name - Name of the policy.
- Description - Description of the policy.
- Groups - Lists the group to which this policy is applied.
- Policy Status - Status of the policy. The values are: Published, Unpublished, Failed, N/A.
- Last Updated - Displays the time when the policy is updated.
- Updated By - The user who updated the policy. You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the  icon to sort by the selected column.

4 Policy List - Side Pane:

- Publish Policy - Lets you publish all the unpublished and/or failed content. For more information, see Create a policy.
- Edit Policy - Lets you edit the policy. For more information, see Edit a Policy.
- View Details - Lets you view the complete policy details.
- Expand the sections **Overview**, **Application Rule**, **Bundle**, **Feed**, **Lua Parser** and **History** to view the details of the policy.
- The table contains details such as **Policy Version**, **Version Name** and **Published By**.

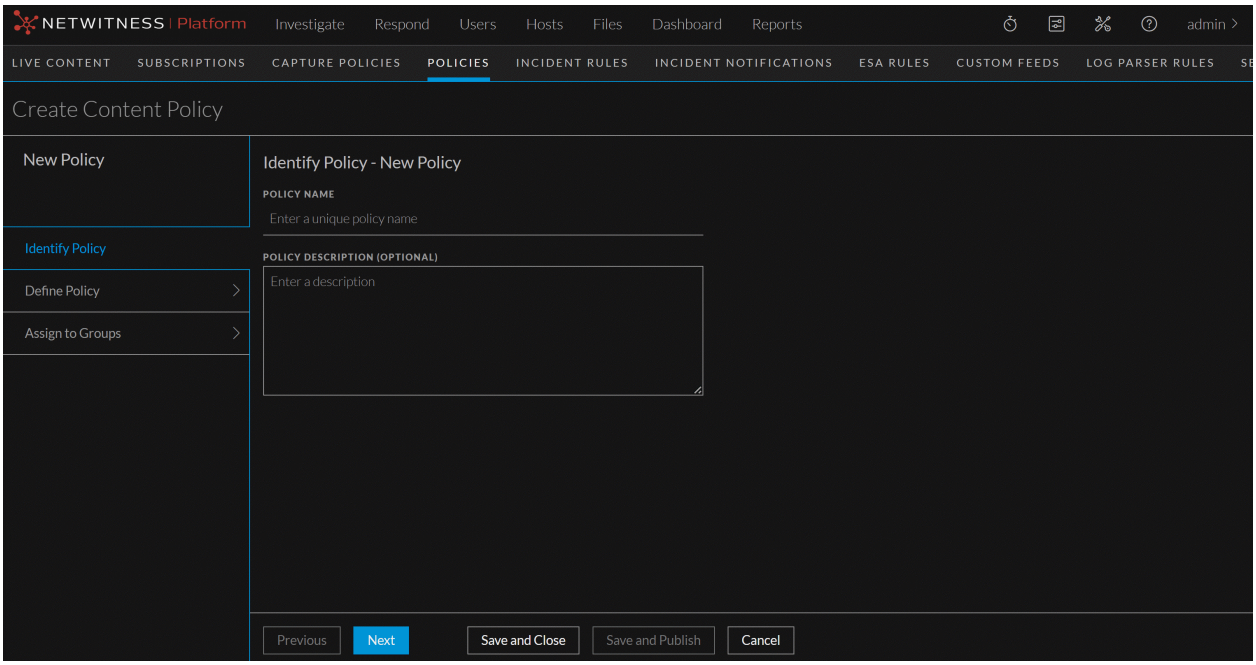
5 Policy Details Panel:

Displays the properties of the selected policy.

Toolbar:

- Publish Policy - Lets you publish all the unpublished and/or failed content. For more information, see Create a policy.
- Edit Policy - Lets you edit the policy. For more information, see Edit a Policy.
- Delete Policy - Deletes the selected policy or policies permanently.
- Force Publish - Lets you republish all the content irrespective of the policy status.

Policy Details Pane:

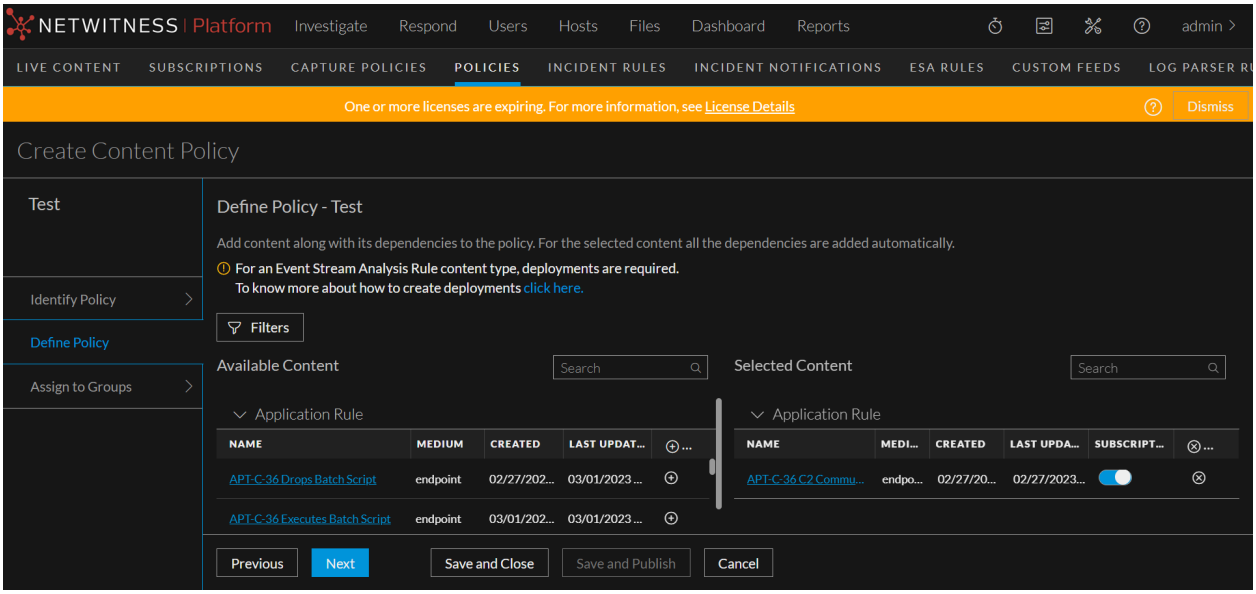


- Order - Order of the content. Click  to sort and display the content in the ascending order. Click  to sort and display the content in descending order.
- Rule Name - Name of the rule. The rule name will be unique.
- Rule Value - The rule value. It is the value written to the alert meta. The rule value can be duplicate. You can clone existing rules with different rule names, but with same rule value.
- Medium - Meta data source medium.
- Last Updated - Displays the time when the content is last updated.
- Subscription - Indicates if the content is subscribed or unsubscribed.
- Status - The status of resource.
-  - Filter the list of displayed content in the policy details view based on the name, medium, source type, enabled/disabled status, subscription status, severity, resource created date, and last updated date. Following are the fields available in the filter panel:
  - Name - If you set the filter option to **Contains** operator from the drop-down list and start typing the name of the content rules, a list of content rules that contain that character is

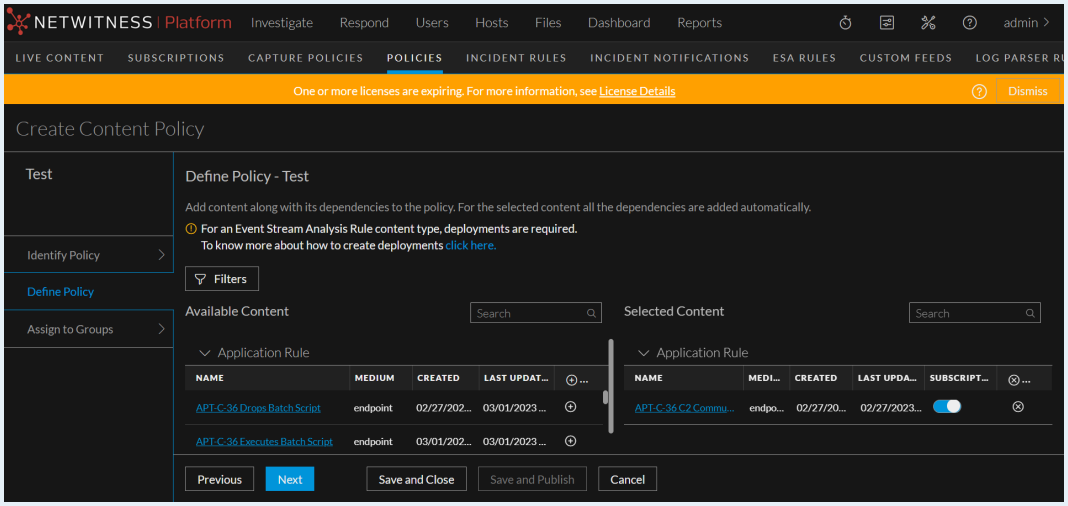
displayed, as you continue to type the list is filtered to match. If you set the filter option to **Equals** operator from the drop-down list and enter the full name, the particular content type will be displayed.

- Medium - Select one or more mediums from the drop-down list. The available options are 'endpoint', 'log', 'log and packet' and 'packet'.
- Source Type - Select one or more sources from the drop-down list. The available options are 'Custom' and 'Live'.
- Enabled/Disabled Status - Select one or more statuses from the drop-down list. The available options are 'Enabled' and 'Disabled'. This field is not applicable for Event Stream Analysis Rule content type.
- Subscription - Select one or more statuses from the drop-down list. The available options are 'Subscribed' and 'Unsubscribed'.
- Severity - Select the severity from the drop-down list. The available options are 'Low', 'Medium', 'High' and 'Critical'. This field is applicable only for Application Rule and ESA content type.
- Resource Created Date - Select the resource created date range.
- Last Update Date - Select the last update date range.

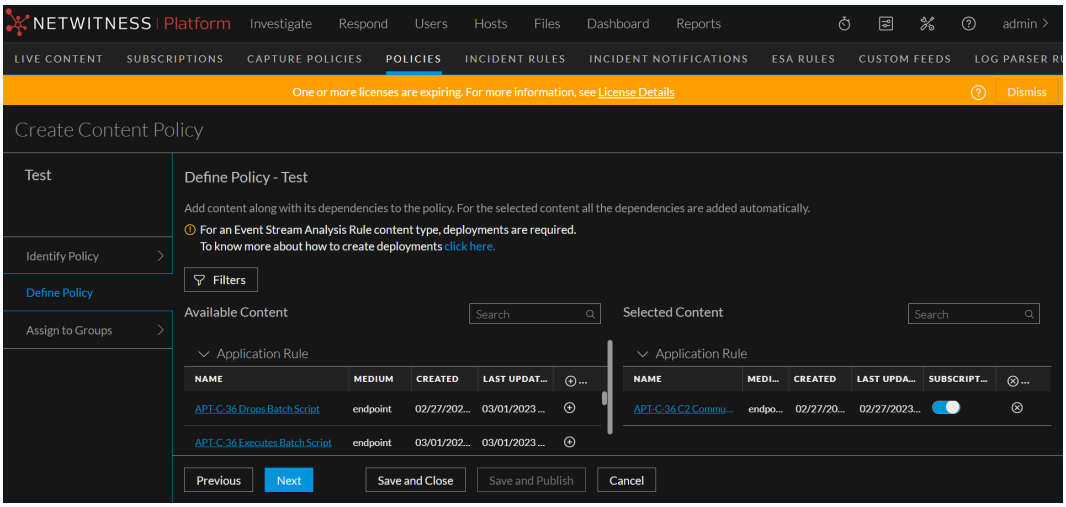
- Subscribe - Lets you subscribe for the content if it is unsubscribed.
- Unsubscribe - Lets you unsubscribe for the content if it is subscribed.
- Enable - Lets you enable the content for the policy.
- Disable - Lets you disable the content from the policy.
-  - Move the content down the order.
-  - Move the content up the order.



Below is an example of the Create Content Policy dialog.

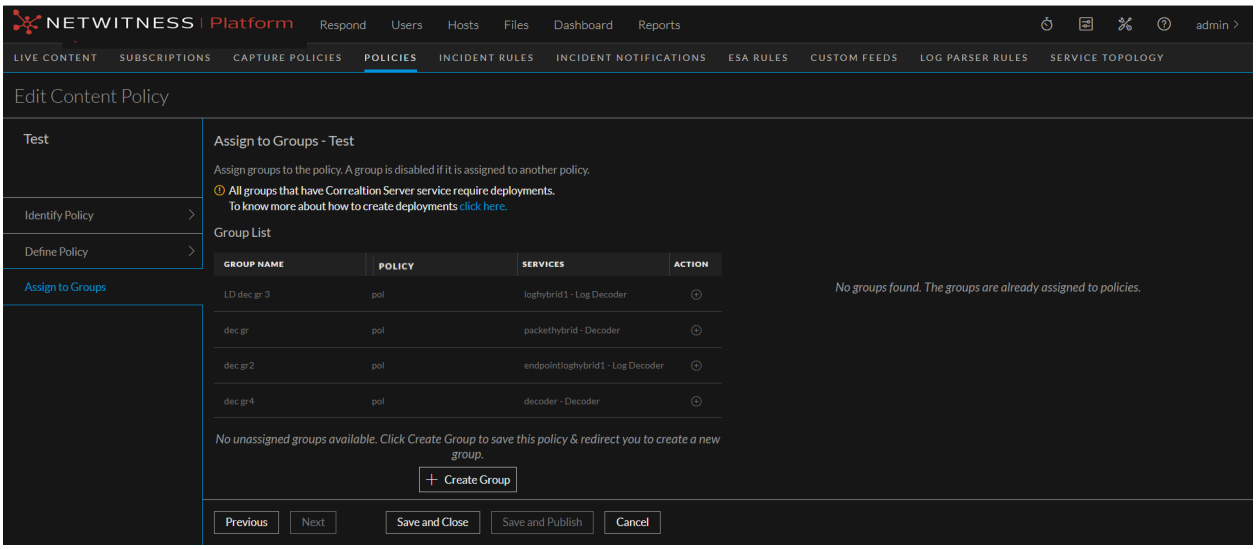


The table describes the information and options in the Create Policy dialog:



Field	Description
Policy Name	Name of the policy. The name should be unique.
Policy Description (Optional)	Description of the policy. Description should not exceed 8000 characters.

Define Policy Settings:

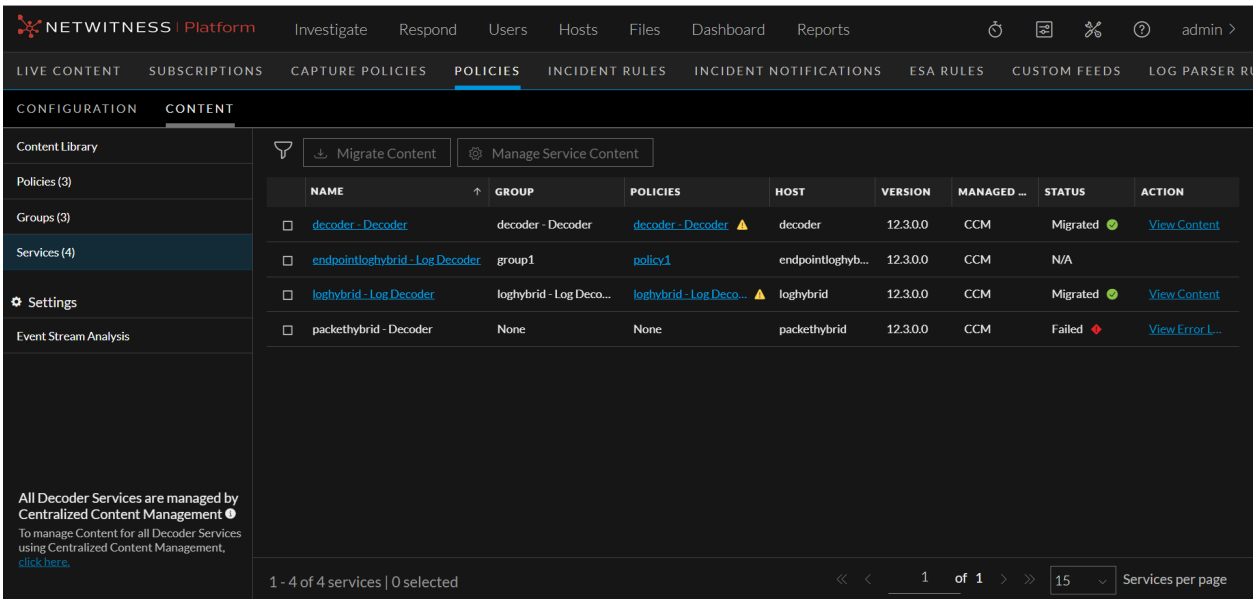


Field	Description

Available Content	Displays the available content resources in your deployment. Click  expand the resource type.
	
	The following describes resource type:
	• Name - Name of the resource.
	• Medium - Meta data source medium. Available values for medium are as follows:
	  • **Endpoint**: applied to content that uses meta derived from endpoint agent and endpoint server data
	  • **Log**: applied to content that uses meta derived from log data
	  • **Packet**: applied to content that uses meta derived from network packets
	  • **Log and packet**: applied to content that correlates meta derived across log and packet data
	• Created - Displays the time when the resource is created
	• Last Updated - Displays the time when the resource is updated last.
	• Action- Click + to add the resource and its dependencies to your deployment.
	•  - Click to add all content based on the resource type.
	•  - Filter the available content based on the following parameters:
	  ◦ **Resource Types** - The resource or the content type.
	  ◦ **Medium** - Meta data source medium. Available values for medium are as follows:
	  ◦ **Endpoint**: Applied to content that uses meta derived from endpoint agent and endpoint server data
	  ◦ **Log**: Applied to content that uses meta derived from log data
	  ◦ **Packet**: Applied to content that uses meta derived from network packets
	  ◦ **Log and packet**: Applied to content that correlates meta derived across log and packet data

	◦ **Resource Created Date** - The date on which the content was created. ◦ **Resource Modified Date** - The date on which the content was modified. ◦ **Reset** - Reset the fields. • **Search** - Conveniently search the available content.
Selected Content	Lists the selected resource. Additionally, you can subscribe the content. Once the content is subscribed, the content resources are updated automatically in case of any changes.  •  - Filter the selected content based on the following parameters: ◦ **Resource Types** - The resource or the content type. ◦ **Medium** - Meta data source medium. Available values for medium are as follows: ◦ **Endpoint**: Applied to content that uses meta derived from endpoint agent and endpoint server data ◦ **Log**: Applied to content that uses meta derived from log data ◦ **Packet**: Applied to content that uses meta derived from network packets ◦ **Log and packet**: Applied to content that correlates meta derived across log and packet data ◦ **Resource Created Date** - The date on which the content was created. ◦ **Resource Modified Date** - The date on which the content was modified. ◦ **Reset** - Reset the fields. • **Search** - Conveniently search the selected content.

Assign to Group:



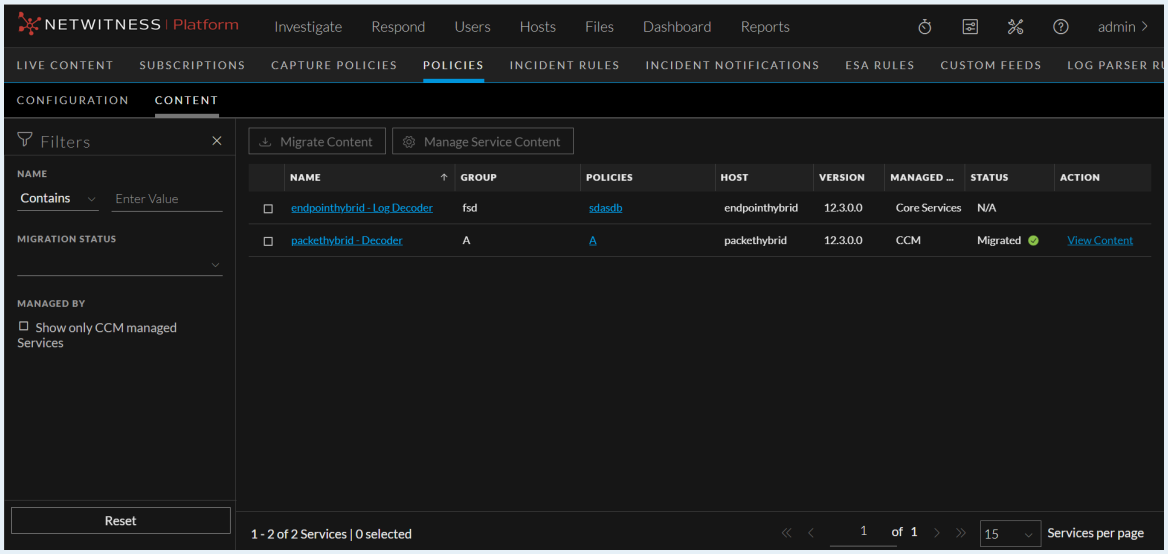
Group List	Displays the list of groups associated with the policy. A group is disabled if it is already assigned to another policy. • Group Name • Policies • Services • Action
	Click to create new group.
Selected Group	Lists the selected groups. Click  to add groups.
Save and Close	Saves the settings and closes the Create Policy dialog.
Save and Publish	Saves and publishes the created policy. **Note:** This option is disabled if: - Policy settings are not customized. - Policy is not assigned to groups.

Services Tab

The  **(CONFIGURE)** > **Policies** view contains two tabs: **Configuration** and **Content**.

The **CONTENT** tab has **Content Library**, **Policies**, **Groups** and **Services** on the left panel.

Below is an example of the Content > Services tab:

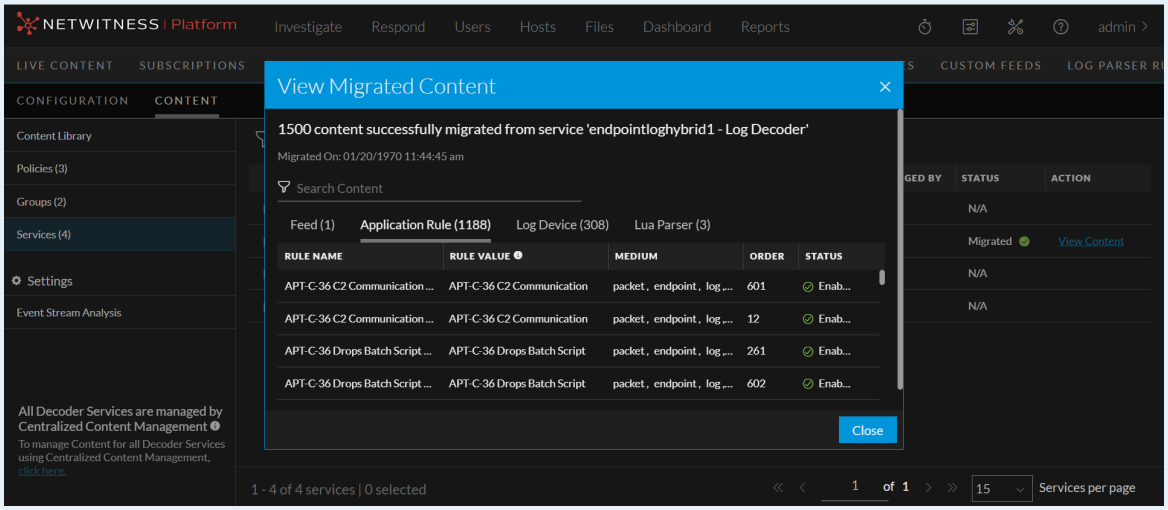


By default, 15 services are displayed per page. To go to the next page, click . To go to the last page, click .

1 Toolbar

- Migrate Content - Lets you migrate content from service. For more information, see Migrate Content from Service.
- Manage Service Content - Lets you enable or disable CCM for individual service(s). For more information, see Enable or Disable CCM for Individual Decoder Services.

2 - Filter services based on various parameters.



Filter Panel:

- Name - Select the **Name** drop-down value as either **Equals** or **Contains**. To search the service name using the **Contains** operator, set the filter option to **Contains** operator from the drop-down list and start typing the name of the service. Type one character and a list of service that contain that character is displayed, as you continue to type, the list is filtered to match. To search the service name using the **Equals** operator, set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular service name will be displayed.
- Migration Status - The **Migration Status** drop-down value. The drop-down values are 'Migrated', 'Migrating', 'Failed' and 'NA'.
- Managed By - Select the **Show only CCM Managed Services** to display only the CCM managed services.
- Reset - Reset the fields.

3 Services List Pane:

- Name - Name of the service.
- Group - The group to which service belongs.
- Policies - The policy to which the service is assigned. Click the policy name to view the details of the policy.
- Host - The service host name .
- Version - The service version number.
- Managed By - Indicates if the service is managed by CCM or Core Services.
- Status - Displays the migration status of the service. The column displays the following values based on the status of migration:
  - Queued
  - Initializing
  - Analyzing Content
  - Migrating Content
  - Migrated
  - Failed
- Action - Displays the action on the migrated content. The following actions are available:
  - View Content - If the **Status** is 'Migrated'.
  - View Error Log - If the **Status** is 'Failed'.

4 View Content - Click the hyperlink under the **Action** column to view the migrated content details in the **View Migrated Content** Pop-up window.

Available Tabs in the **View Migrated Content** Pop-up Window:

- Feed
- Application Rule
- Network Rule
- Log Device
- LUA Parser

Note:
- **Network Rules** tab is not applicable or Log Decoders.
- **Log Device** tab is not applicable for Decoders.

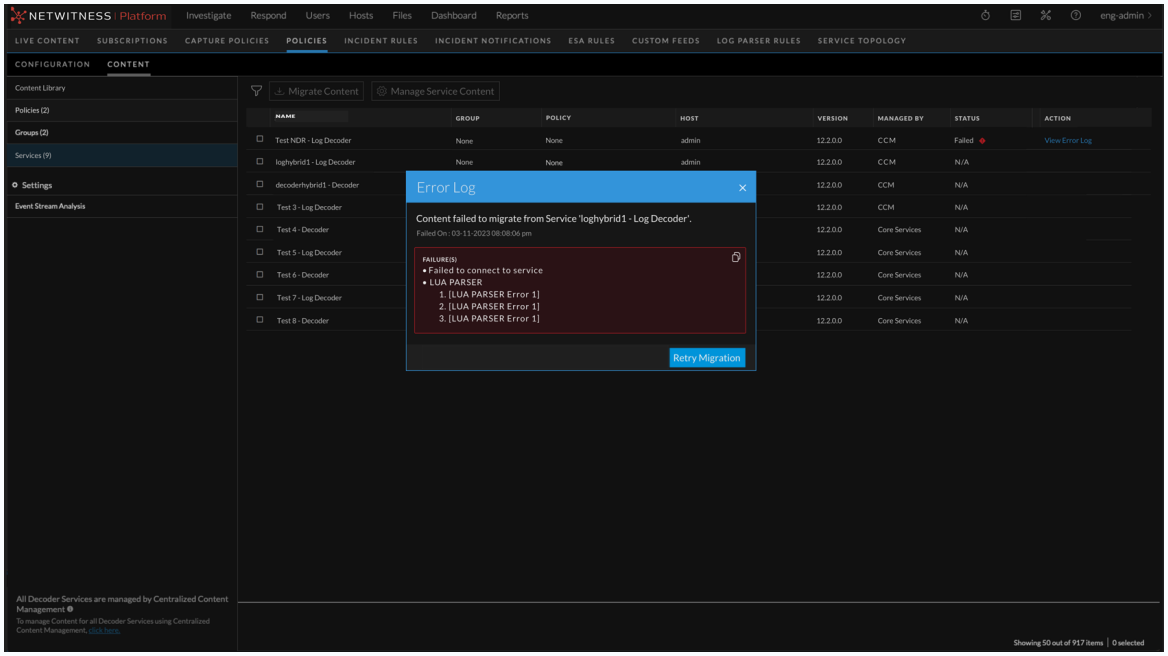
IMPORTANT: During the process of migration, if a Decoder that is being migrated contains multiple application rules and/or network rules with the exact same rule name and rule condition, only one of those rules will be retained in the service. The remaining rules will be considered duplicates and removed. Therefore, post migration, none of the migrated services will have multiple rules with the same rule name and the same rule value.

 - Search the migrated content based on various parameters.

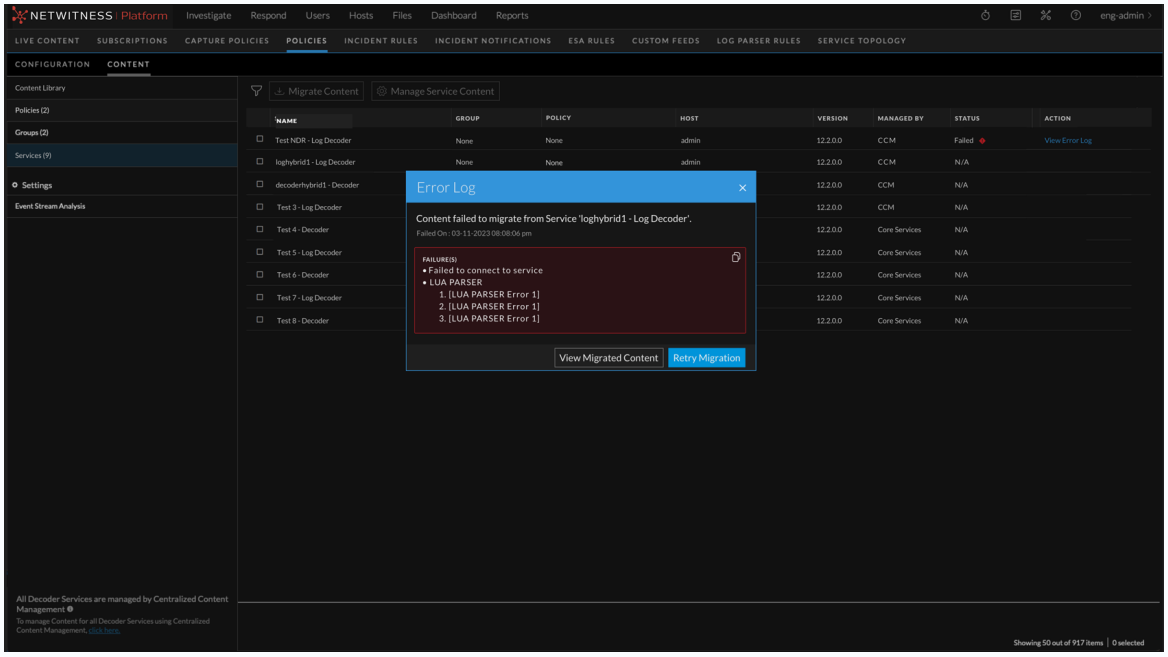
Note:
- For Application Rule and Network Rule, the search is based on **Rule Name** and **Rule Value**.
- For Feeds, Log Device and LUA Parser, the search is based on the **Name**.

Content Details for Feeds, Log Device and LUA Parser:

- Name - The content name.
- Medium - Meta data source medium.
- Status - The status of resource. For example, Enabled or Disabled.



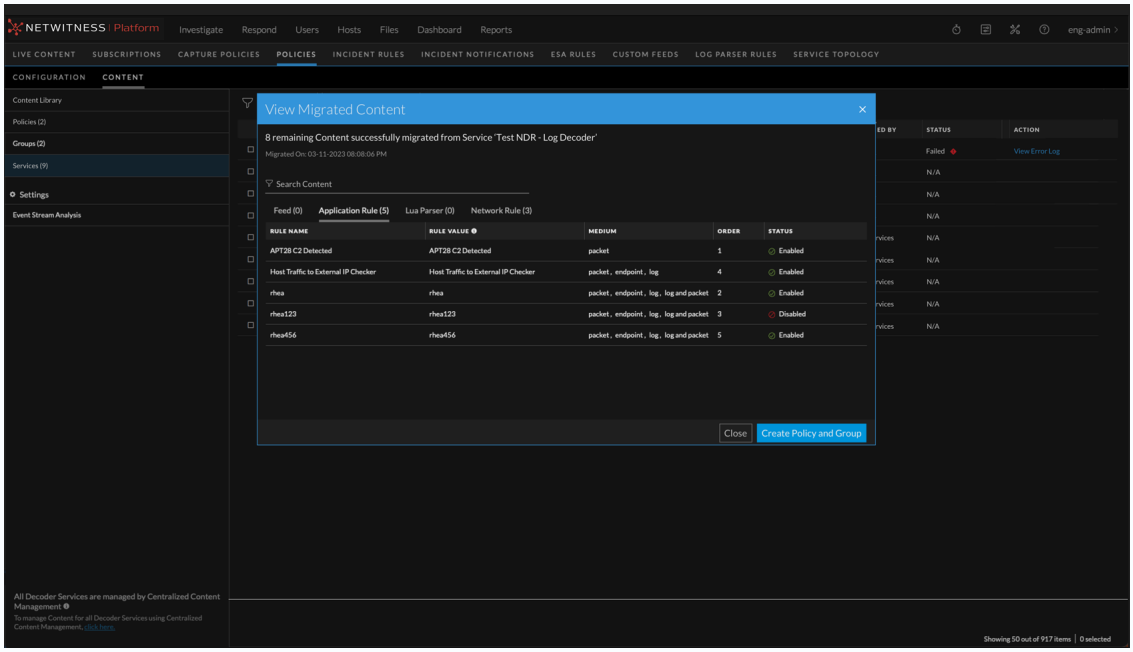
Content Details for Application Rule and Network Rule:



- Rule Name - Name of the rule. The rule name will be unique.
- Rule Value - The rule value. It is the value written to the alert meta. The rule value can be duplicate. You can clone existing rules with different rule names, but with same rule value.
- Medium - Meta data source medium.
- Order - The order of rule.
- Status - The status of resource. The status of resource. For example, Enabled or Disabled.

Available button in the **View Migrated Content** Pop-up Window:

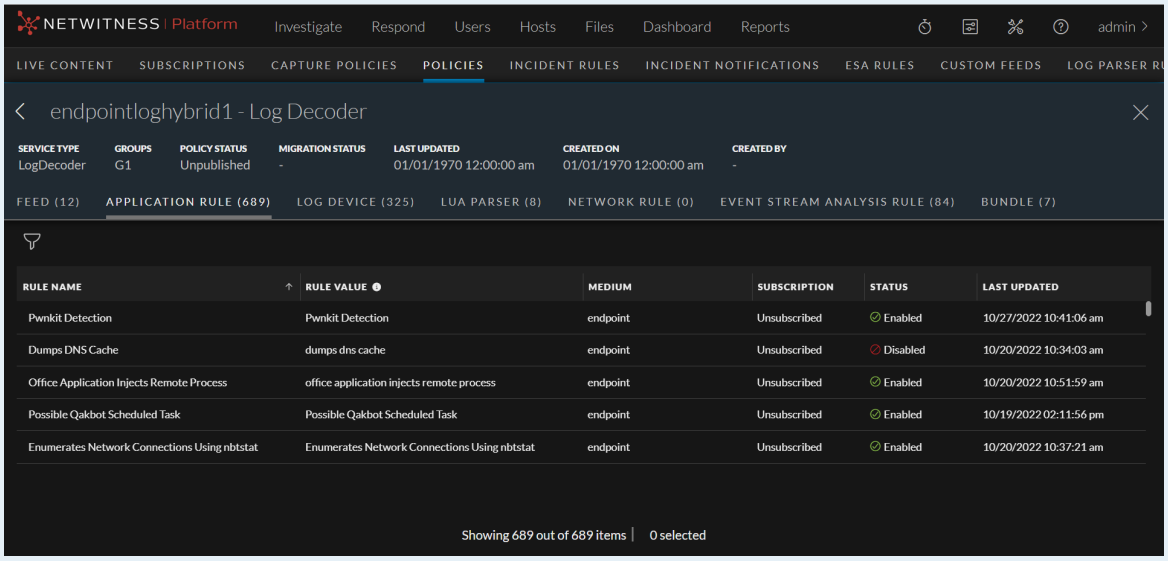
- Close - Close the pop-up window and return to **Service List** page.



5 View Error Log - Click the hyperlink under the **Action** column to view the log details in case the migration is failed.

Available buttons and Icons in the **Error Log** Pop-up Window:

-  - Copy the error logs.
- View Migrated Content - Click to View the content that have been migrated successfully. This button is present only in case of partial migration.



Available buttons and Icons in the **View Migrated Content** Pop-up Window:

- Close - Closes the pop-up window.
- Create Policy and Group - Creates policy and group for the partially migrated service.

- Retry migration - Retry migration.

6 Service Details Panel:

Displays the properties of the selected service.

Toolbar:

- Service Type - The type of service. For example, LogDecoder.
- Groups - The groups associated with the service.
- Policy Status -Indicates if the policy associated with the service is published or unpublished.
- Migration Status - The migration status of the service content.
- Last Updated - The date and time stamp on which the service was last updated.
- Created On - The date and time stamp on which the service was created.
- Created By - The user ID of the user who has created the service.

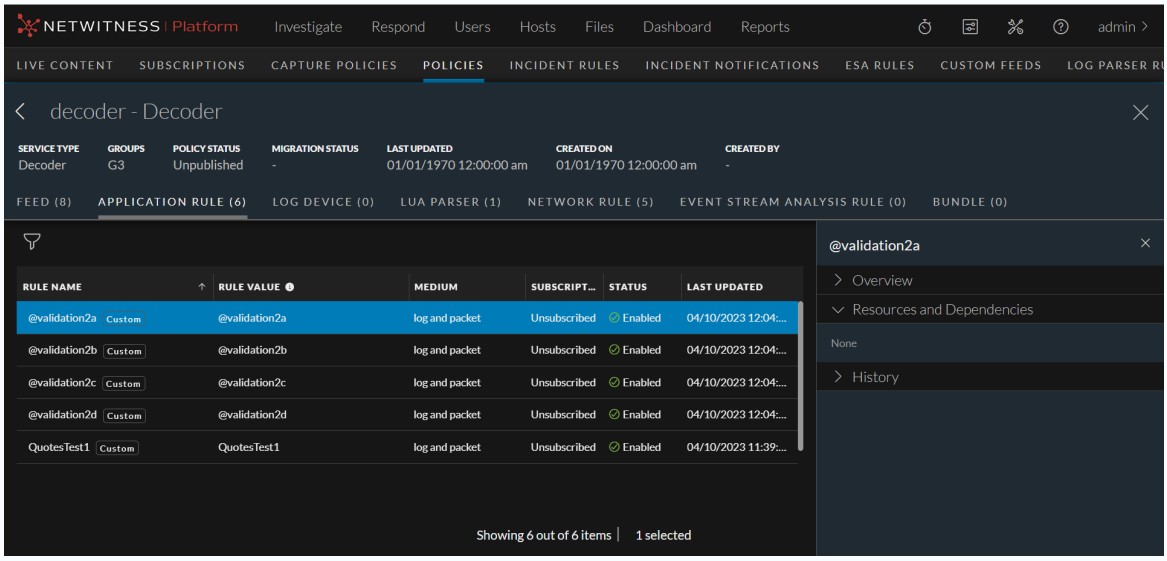
Available Content Tabs:

- Feed
- Application Rule
- Log Device. This tab is not applicable for service type 'Packet Decoder'.
- LUA Parser
- Network Rule. This tab is not applicable for service type 'LogDecoder'.
- Bundle

Service Details Pane for Feeds, Log Device, LUA Parser and Bundle:

- Name - The content name.
- Medium - Meta data source medium.
- Last Updated - Displays the time when the content is last updated.

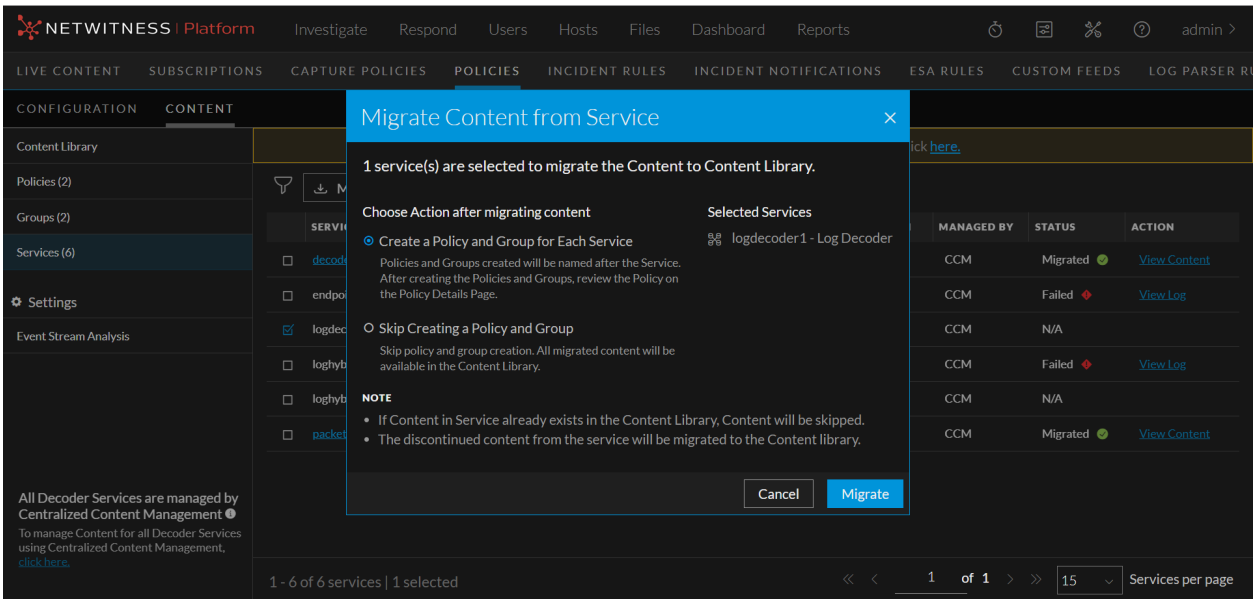
- Subscription - Indicates if the content is subscribed or unsubscribed.
- Status - The status of resource.



Service Details Pane for Application Rule and Network Rule:

- Rule Name - Name of the rule. The rule name will be unique.
- Rule Value - The rule value. It is the value written to the alert meta. The rule value can be duplicate. You can clone existing rules with different rule names, but with same rule value.
- Medium - Meta data source medium.
- Last Updated - Displays the time when the content is last updated.
- Subscription - Indicates if the content is subscribed or unsubscribed.
- Status - The status of resource.

 - Filter the content based on various parameters.



7 Service Details Right Panel:

Displays the complete content details such as **Overview**, **Resources and Dependencies** and **History**.

Migrate Content from Service dialog:

Below is an example of the Migrate Content from Service dialog:

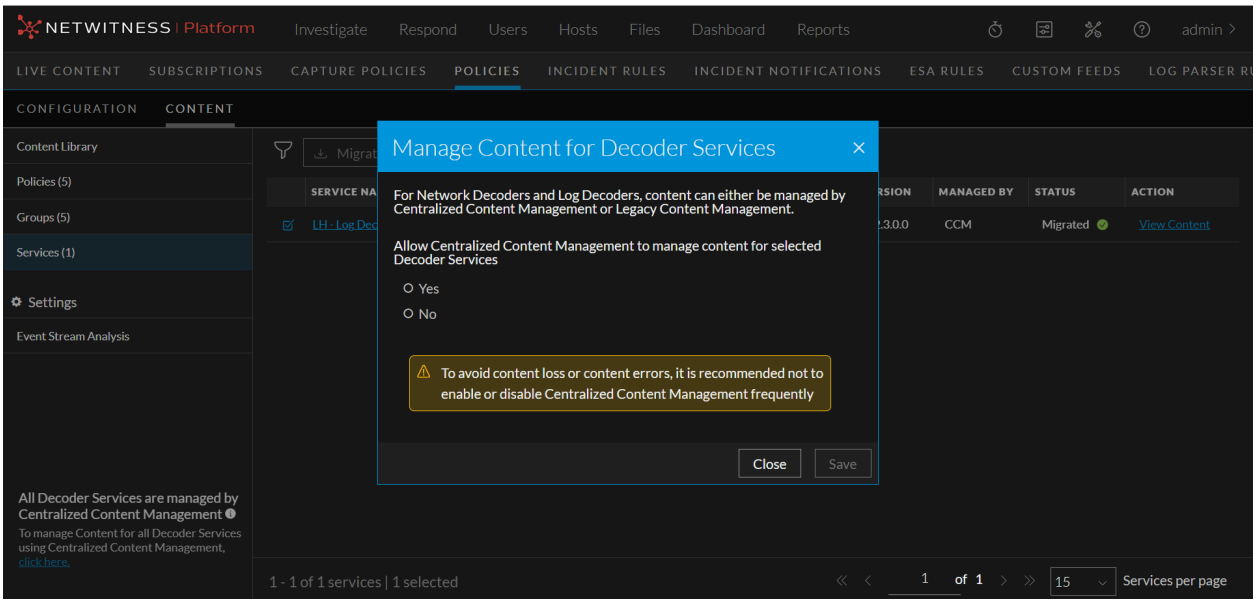
Note:
- If you select **Create a Policy and Group for Each Service**, policy and group created will be the created for each service selected for migration. Once the migration process is complete, the policy and group will be listed under the respective pages.
- The policy and group which is created for the service will be in 'Unpublished' state and it can be published only after it is reviewed. In the **Policy Listing** page, the **Publish** button for such a policy will be disabled. The policy can be published only after reviewing it either from **Policy Details** page or **Edit Policy** Page.
- If you select **Skip Creating a Policy and Group**, only the content will be migrated. All the migrated content will be available in Content Library.

For more details on publishing a policy, refer Create and Publish Policies feature.

For more details on editing a policy, refer Edit a Policy feature.

For more details on policy details, refer View a Policy feature.

For more details on editing a group, refer Edit a Group feature.



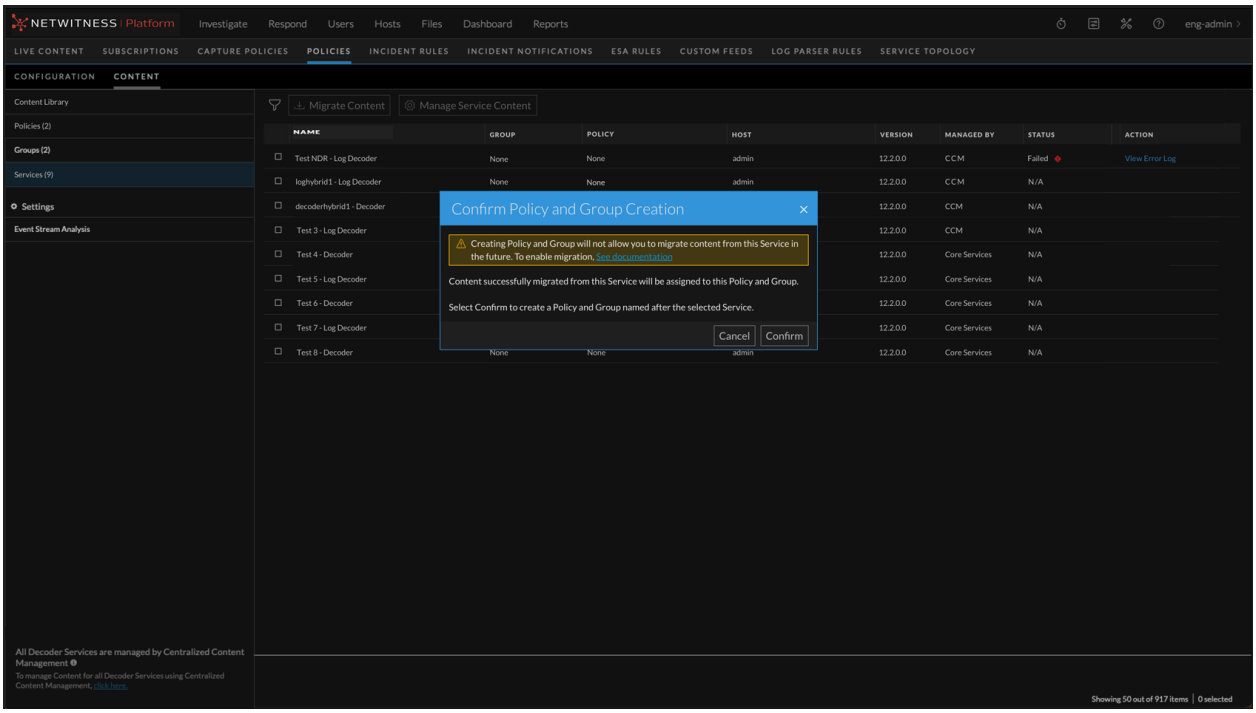
For more details on group details, refer View a Group feature.

The table describes the information and options in the Migrate Content from Service dialog:

Field	Description
Migrate	Initiate the migration of content for the selected service.
Cancel	Cancels the operation.

Manage Content for Decoder Services dialog:

Below is an example of the Manage Content for Decoder Services dialog:



The table describes the information and options in the Manage Content for Decoder Services dialog:

Field	Description
Allow Centralized Content Management to Manage Content for Selected Decoder Services	Select **Yes** to enable CCM for selected service(s). Select **No** to disable CCM for selected service(s).
Save	Save the changes.
Close	Close the **Manage Content for Decoder Services** pop-up window.

Confirm Policy and Group Creation dialog:

Below is an example of the Confirm Policy and Group Creation dialog:

The table describes the information and options in the Confirm Policy and Group Creation dialog dialog:

Field	Description
Cancel	Close the pop-up window and cancel the policy and group creation for the partially migrated service.
Confirm	Creates the policy and group for the partially migrated service. The policy and group will be listed under the Policy Listing and Group Listing pages.

Appendix A: Endpoint Risk Scoring Rules

Endpoint risk scoring requires the following content:

- "accesses administrative share using command shell"
- "activates bits job"
- "adds files to bits download job"
- "adds firewall rule"
- "allocates remote memory"
- "antivirus disabled"
- "archiving software reads multiple documents"
- "autorun debian package mismatch"
- "autorun file path not part of debian package"
- "autorun file path not part of rpm"
- "autorun key contains non-printable characters"
- "autorun"
- "autorun rpm mismatch"
- "autorun unsigned active setup"
- "autorun unsigned appinit_dlls"
- "autorun unsigned bho"
- "autorun unsigned bootexecute registry startup method"
- "autorun unsigned explorer registry startup method"
- "autorun unsigned hidden"
- "autorun unsigned hidden only executable in directory"
- "autorun unsigned ie toolbar"
- "autorun unsigned in appdatalocal directory"
- "autorun unsigned in appdataroaming directory"
- "autorun unsigned in programdata directory"
- "autorun unsigned in temp directory"
- "autorun unsigned logontype registry startup method"

- "autorun unsigned lsa provider"
- "autorun unsigned servicedll"
- "autorun unsigned winlogon helper dll"
- "autorun unsigned winsock lsp"
- "bad certificate warning disabled"
- "blacklisted file"
- "browser runs command prompt"
- "browser runs mshta"
- "browser runs powershell"
- "builds script incrementally"
- "clears application event log"
- "clears event logs using powershell"
- "clears security event log"
- "clears setup event log"
- "clears system event log"
- "combines binaries using command prompt"
- "command line usage of archiving software"
- "command line writes script files"
- "command prompt obfuscation"
- "command prompt obfuscation using value extraction"
- "command shell runs rundll32"
- "completes bits download job"
- "configures image hijacking"
- "configures port redirection"
- "copies binary over administrative share"
- "created in last month"
- "creates browser extension"
- "creates domain user account"
- "creates executable in startup directory"
- "creates local driver service"

- "creates local service"
- "creates local task"
- "creates local user account"
- "creates password-protected archive"
- "creates recursive archive"
- "creates remote process using wmi command-line tool"
- "creates remote service"
- "creates remote task"
- "creates run key"
- "creates shadow volume for logical drive"
- "creates suspicious service running command prompt"
- "debian package hash mismatch in important system directory"
- "debian package hash mismatch"
- "deletes backup catalog"
- "deletes firewall rule"
- "deletes shadow volume copies"
- "deletes shadow volume copies using powershell"
- "deletes usn change journal"
- "disables event logging service"
- "disables firewall"
- "disables safe mode"
- "disables security service"
- "disables startup repair"
- "disables uac"
- "disables uac remote restrictions"
- "disables windows audit policy"
- "disables windows defender using powershell"
- "downloads binary using certutil"
- "drops credential dumping tools"
- "dumps dns cache"

- "dyld inserted"
- "enables cleartext credential storage"
- "enables login bypass"
- "enables rdp from command-line"
- "enables safe mode"
- "enumerates arp table"
- "enumerates available systems on network"
- "enumerates domain account policy"
- "enumerates domain administrators"
- "enumerates domain computers"
- "enumerates domain controllers"
- "enumerates domain groups"
- "enumerates domain users"
- "enumerates enterprise administrators"
- "enumerates exchange domain servers"
- "enumerates exchange servers"
- "enumerates ip configuration"
- "enumerates local account policy"
- "enumerates local administrators"
- "enumerates local administrators on domain controller"
- "enumerates local groups"
- "enumerates local services"
- "enumerates local users"
- "enumerates logical disk"
- "enumerates mapped resources"
- "enumerates network connections"
- "enumerates primary domain controller"
- "enumerates processes on local system"
- "enumerates processes on remote system"
- "enumerates remote netbios name table"

- "enumerates remote resources"
- "enumerates route table"
- "enumerates services hosted in processes"
- "enumerates system info"
- "enumerates trusted domains"
- "evades scanning within windows defender"
- "evasive powershell used over network"
- "event viewer executes uncommon binary"
- "execute dll through rundll32"
- "exports sensitive registry hive"
- "extracts password-protected archive"
- "file encrypted"
- "file hidden"
- "file path not part of debian package in important system directory"
- "file path not part of debian package"
- "file path not part of rpm in important system directory"
- "file path not part of rpm"
- "file vault disabled"
- "floating module and hooking"
- "floating module in browser process"
- "floating module in os process"
- "floating module"
- "gatekeeper disabled"
- "gets current user as system"
- "gets current username and group information"
- "gets current username"
- "gets hostname"
- "gets remote time"
- "gina replacement"
- "graylisted file"

- "hidden and hooking"
- "hidden in appdata"
- "hidden plist and autorun"
- "hidden running as root"
- "hooks audio output function"
- "hooks authentication function"
- "hooks crypto function"
- "hooks dnsquery function"
- "hooks gui function"
- "hooks network http function"
- "hooks network io function"
- "hooks ntldr function"
- "hooks registry access function"
- "hooks registry enumeration function"
- "http daemon runs command prompt"
- "http daemon runs powershell"
- "http daemon runs reconnaissance tool"
- "http daemon writes executable"
- "ie dep disabled"
- "ie enhanced security disabled"
- "in appdata directory"
- "in hidden directory"
- "in recycle bin directory"
- "in root of appdatalocal directory"
- "in root of appdataroaming directory"
- "in root of logical drive"
- "in root of program directory"
- "in root of users directory"
- "installs root certificate"
- "in system volume information directory"

- "in temporary directory"
- "in uncommon directory"
- "invalid signature"
- "kext signature validation disabled"
- "lateral movement with credentials using net utility"
- "ld preload"
- "library preferences directory"
- "lists anti-spyware products"
- "lists antivirus products"
- "lists firewall products"
- "login bypass configured"
- "lua disabled"
- "mac firewall disabled"
- "malicious file by reputation service"
- "maps administrative share"
- "maps ipc$ share"
- "misleading file extension"
- "modifies file associations"
- "modifies image file execution for persistence"
- "modifies registry using command-line registry tool"
- "modifies run key"
- "modifies shell-open-command file association"
- "modifies startup folder location"
- "modifies winlogon dll for persistence"
- "modifies winlogon registry settings"
- "mshta runs command prompt"
- "mshta runs powershell"
- "mshta runs scripting engine"
- "mshta writes executable"
- "network access"

- "no antivirus notification disabled"
- "no firewall notification disabled"
- "non-microsoft modifies bad certificate warning setting"
- "non-microsoft modifies firewall policy"
- "non-microsoft modifies internet zone setting"
- "non-microsoft modifies lua setting"
- "non-microsoft modifies registry editor setting"
- "non-microsoft modifies security center config"
- "non-microsoft modifies services imagepath"
- "non-microsoft modifies task manager setting"
- "non-microsoft modifies windows system policy"
- "non-microsoft modifies zone crossing warning setting"
- "no uac notification disabled"
- "no windows update notification disabled"
- "office application crashed"
- "office application injects remote process"
- "office application runs bits"
- "office application runs command prompt"
- "office application runs powershell"
- "office application runs scripted ftp"
- "office application runs scripting engine"
- "office application runs task scheduler"
- "office application runs wmi scripting engine"
- "office application writes executable"
- "opens browser process"
- "opens os process"
- "opens process"
- "opswat reported infected"
- "opswat reported suspicious"
- "os process runs command shell"

- "packed and autorun"
- "packed and network access"
- "packed"
- "performs scripted file transfer"
- "possible login bypass"
- "possible mimikatz activity"
- "possible rdp session hijacking"

- "command shell copy items"

Position Tracking Information

The ESA Correlation service continuously streams data from the data sources like decoders (log and network), and concentrators. ESA retrieves events from the data sources, and applies rules to generate alerts to detect malicious activities. When you deploy a data source, ESA starts processing information from the latest available session, by default. Position Tracking Information enables you to visualize the progress of the sessions that ESA has processed, and provides information on the session IDs and the date and time when the events were processed.

Set Position Tracking Information enables you to:

- Visualize the number of sessions that a particular ESA data source has already analyzed, review the number of sessions ESA would process after you edit the position tracking, and plan your work.
- Set the tracking position information based on:
  - Session ID
  - Date and Time (Collection Time)
- Set position tracking for multiple data sources before you deploy them.
- Calculate the number of sessions that the ESA Correlation Service is scheduled to process for a particular data source to either process, reprocess, or skip sessions with respect to the current position of the data source.

Note: The Position tracking feature with the Date and Time option works based on the profile time settings in the NetWitness Platform UI. This time-zone based time from the UI is converted to UTC, and is sent to the core, to retrieve the corresponding session ID for that time stamp.
Example: If the UI follows IST, the UI converts it to UTC and sends it to the core. The session ID is fetched for the specific UTC time stamp, and set to position tracking at deployment.

Use Case Scenario

This section provides information about how you can use position tracking information in a real-world scenario.

Case 1: If you have deployed a data source with a total of 400 sessions that ESA has already processed, and if you want to start processing the events from the beginning, perform the following steps to reprocess the sessions.

Edit the position Tracking Information

1. Select the deployment and click **Edit Deployment**.
2. Select the datasource and click **Set Position Tracking Information**.

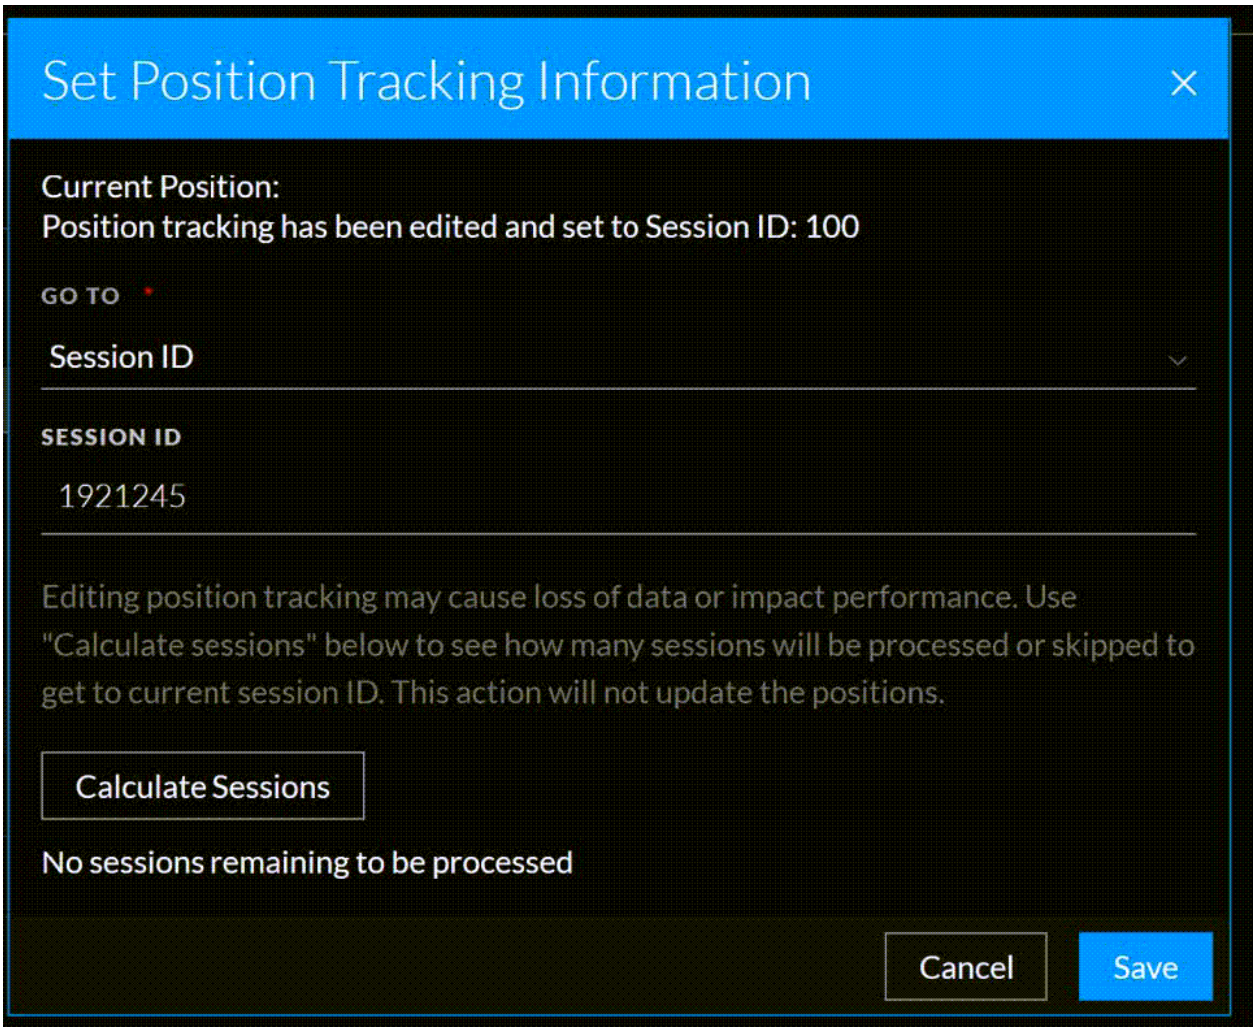
   The Set Position Tracking Information dialog is displayed.
3. In the **Go To** drop-down menu, select the **Session ID** and enter the session number as 1 in the **Session ID** text field.

You can also set the position tracking information based on date and time and the sessions will be calculated using data and time.

4. Click **Calculate Sessions**.
5. Click **Save** twice.
6. Select the Deployment and click **Deploy**.

   All the 400 sessions will be reprocessed.

   The following image shows the use case scenario.



Case 2: If you have deployed a data source with a total of 700 sessions available and the current position of the data source is at 100 and if you set the sessions ID to 250. In this case, 150 sessions will be skipped. You can also set the sessions based on the date and time.

The following image shows the use case scenario.

Case 3: If you have deployed a data source that has a total of 1921237 sessions available and if you set the session ID higher than the available sessions for the data source. In this case, no remaining sessions will be processed. You can also set the sessions based on date and time.

The following image shows the use case scenario.

Note: Editing the tracking information is optional. If you add a new data source to an existing ESA deployment, and you do not edit the tracking information, ESA follows the default behavior to process events.

How Context Hub Works

Context Hub service provides enrichment lookup capability in the Respond and Investigate views. An Administrator can configure the Context Hub service and the data sources to enable an Analyst to perform the context lookup for the required data sources.

By default, the Context Hub service supports enrichment lookups for meta types such as IP address, User, Domain, MAC address, File Name, File Hash, and Host.

The following data sources are supported by NetWitness and provide enriched data when configured.

Lists- Provides contextual information from a list of blacklists, whitelists, or watchlists.

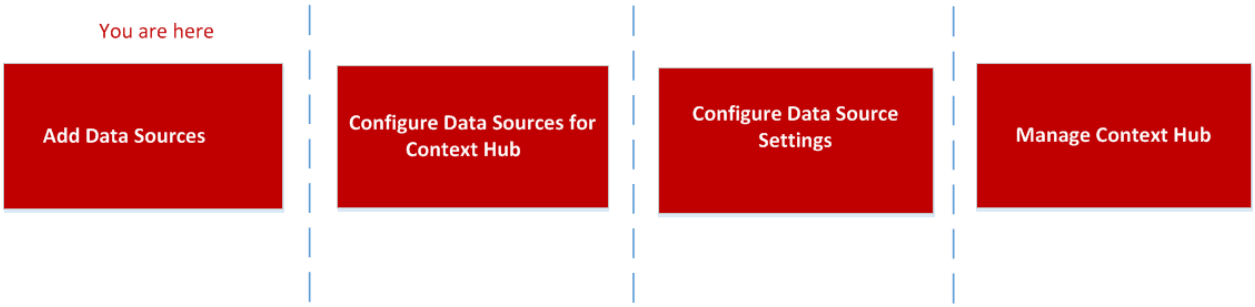
Archer- Provides Criticality information of a device or specific asset based on the IP or Host which needs constant monitoring.

Active Directory - Provides contextual information of a user to help determine if the user is suspicious or not.

NetWitness Endpoint - Provides context information for endpoint module and machine indicators and to help determine if any of the Endpoint devices are compromised.

Respond- Provides contextual information of a specific meta available in respond and enables analyst to respond faster based on context data.

File Reputation Server - Provides contextual information for reputation status of files.



STIX - Provides contextual information on IP address, email address, domain, filename, URL, and file hash from STIX sources.

REST API - Provides contextual information for any accessible web service with an exposed REST API.

Overview of Context Hub Configuration

The Administrator needs to perform each step in the proper sequence to configure the services to perform the context lookup effectively. In the **(Admin) > Services**. Services Config view of Context Hub service, an administrator can configure data sources for Context Hub Service. The administrator can also configure Context Lookups for custom meta keys, if required and also import lists or export lists.

The workflow below describes how the Context Hub service can be configured:

Context Hub service is pre-installed on primary ESA host, and automatically added to the NetWitness.

Note: You can have only one Context Hub service instance enabled in your NetWitness deployment. If there are multiple ESA service in NetWitness, you must choose the appropriate ESA host for Context Hub. A minimum of 8GB space is required to configure Context Hub on ESA host.

Configure Lists as a Data Source

Lists as a Data Source use the Context Hub service to fetch contextual information for meta types that support context lookup. You can create one or more lists and add relevant list values to the list. Make sure that you create meaningful lists such as blacklisted IPs, whitelisted IPs, and so on. The lists can contain supported entities such as IP address, MAC address, User name, Host name, Domain name, File name or File hash. You can import a single-column list or a multi-column list from the Data Source tab. Additionally, all feeds (except STIX feeds) that are created are converted to lists and displayed on the context lookup. If Context Hub is not configured or the service is down, then the feeds will be made available whenever Context Hub is up and running. For more information on creating feeds, see the *Live Services Management Guide*.

Note: When you create a feed, a list is automatically generated with the same name as the feed. If the list name already exists, then the name of the new list is suffixed with the number '2". For example if the existing feed name is test1.csv, then the new list will be named as test2.csv.

List values are in CSV format available in an external location and can be accessed through the following two methods:

- **Local File Store**: You can share a file from a local location.
- **HTTP(S)**: You can share a file using a web server location.

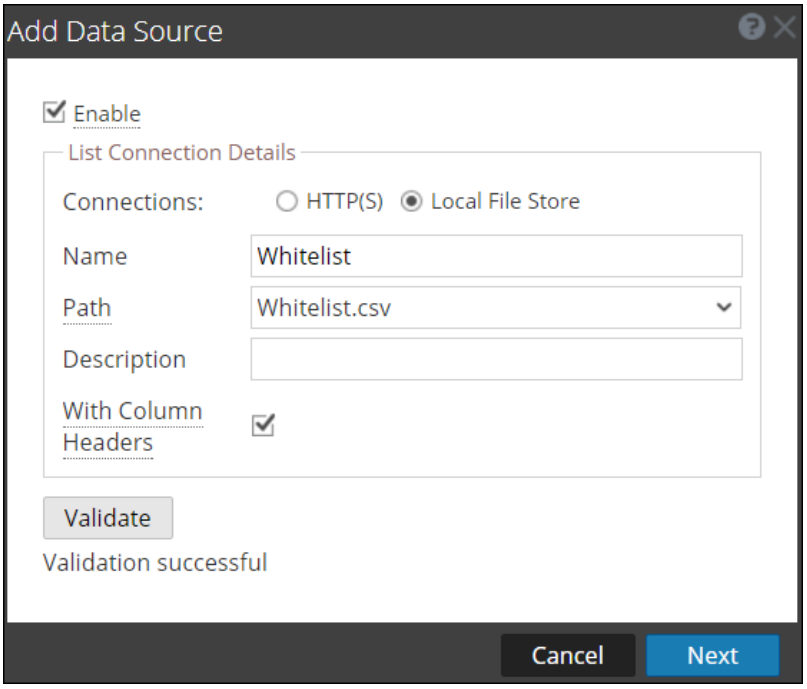
Note: You can also set up recurring job to fetch data on regular intervals by using the Prefetch settings while configuring meta mapping.

Prerequisites

Before you configure Lists data source, ensure that:

- User should have admin permissions.
- Context Hub service is available in  **(Admin) > Services** view of NetWitness.
- If you are using Local File Store or HTTP(S) server, the path mentioned should contain the CSV file In case of remote Local File Store, the file must be mounted or placed on the local drive location `/var/lib/netwitness/contexthub-server/data`.
- The NetWitness user must have read permission to access the file.

Caution: If you are creating a Context Hub list for use as an enrichment source in ESA, the list name cannot include any spaces or special characters, or start with a number. If you do not follow this naming convention, when you attempt to add the list as an enrichment source in ESA, an error message will be displayed and you will not be allowed to add the list.

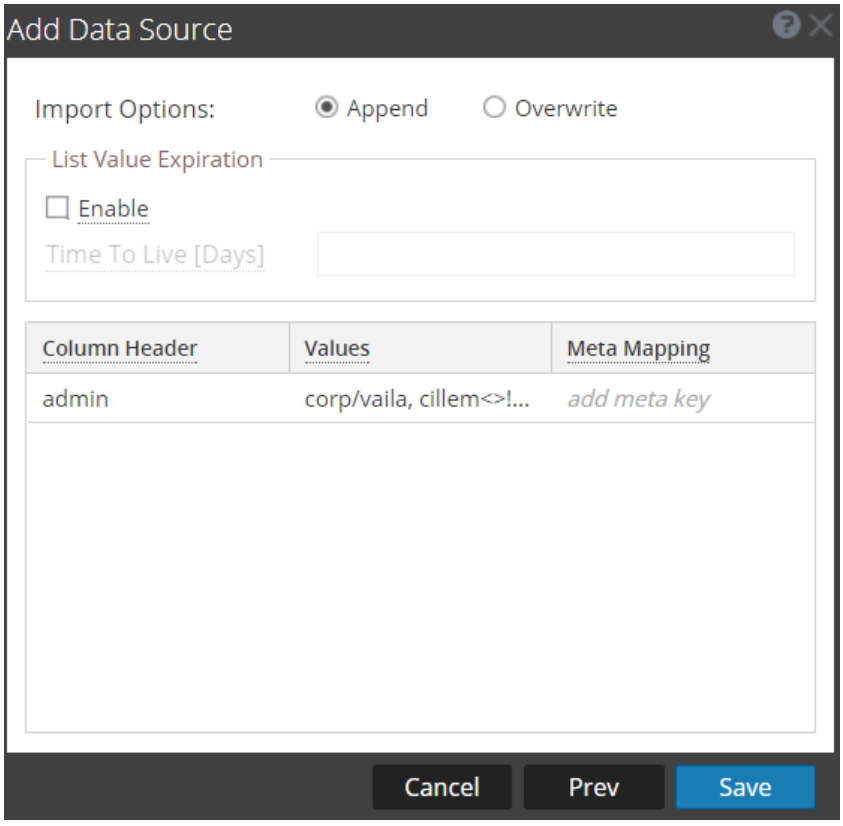


Add List data source using Local File Store

To add a List as a data source:

1. Go to **(Admin) > Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click > **LIST**.
   The **Add Data Source** dialog is displayed.
4. By default, the **Enable** checkbox is selected. If this option is unchecked, the Next button is disabled, you cannot add the data source, view the list in the list tab and view the contextual information.
5. By default, the Context Highlighting checkbox is enabled. This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub.

Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.



6. Select the **Local File Store** Connection Type.

7. Provide the following database connection details. Enter the following fields for Local File Store Connection Type:
   - **Name:** Provide a name for the list data source.
   - **Path:** This field displays all the data files available in the data folder `/var/lib/netwitness/contexthub-server/data`, where context hub service is running. Select the file name from the drop-down.
     A maximum of 32 columns of CSV file are supported that adhere to the RFC1480 standards.
   - (Optional) **Description**: Add a description for the selected file.
   - **With Column Headers**: Select this option to consider the first row as column headers from the CSV file. If you don't select this option, you need to enter the column headers in the next screen.
8. Click **Validate**.

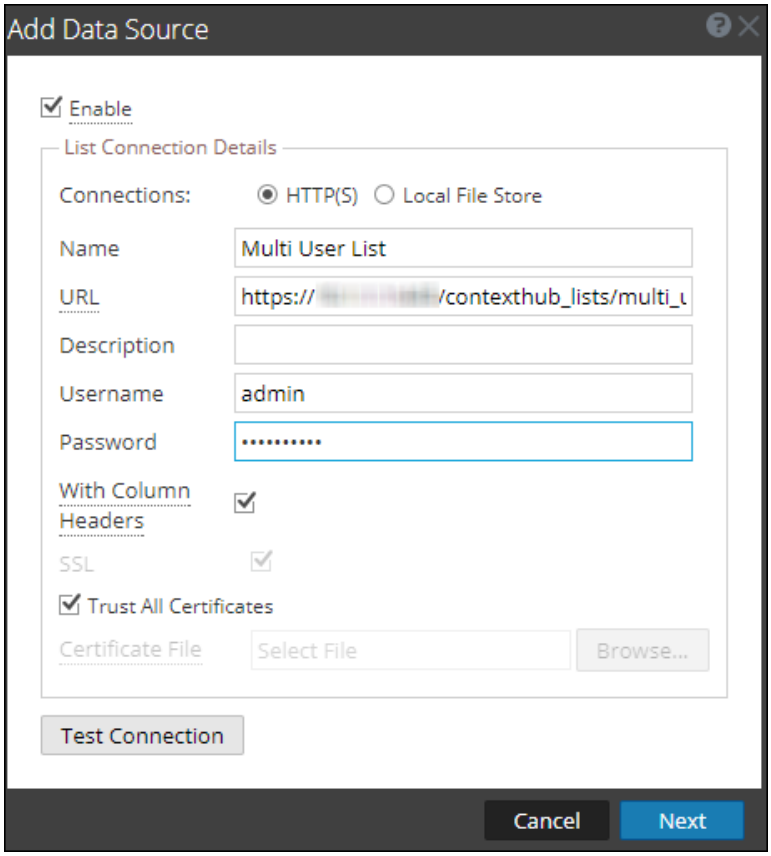
   If the validation fails, you cannot add the data source.
9. Click **Next**.

   The next dialog is displayed.

10. Select any one of the following options:
    - **Append** - Select this option to add the imported values to an existing list.
    - **Overwrite** - Select this option to replace the values in an existing list with the imported values.
11. In the **List Value Expiration** section, the **Enable** option is unchecked, by default. If you want to store the looked up list values in the cache for a specified number of days then select the **Enable**

checkbox and enter the number of days in the **Time to Live (days)** field for the list values to be retained.

12. In the next screen, map at least one meta key with one or more meta types by mapping a column header with a meta. The description for each field is as follows:
    - **Column Header**: Display headers of the CSV file which must be mapped to a meta type.
    - **Meta Mapping**: Maps a column header field to a meta type.
    - **Values**: Displays the first three values from the imported list.
13. Click **Save**.



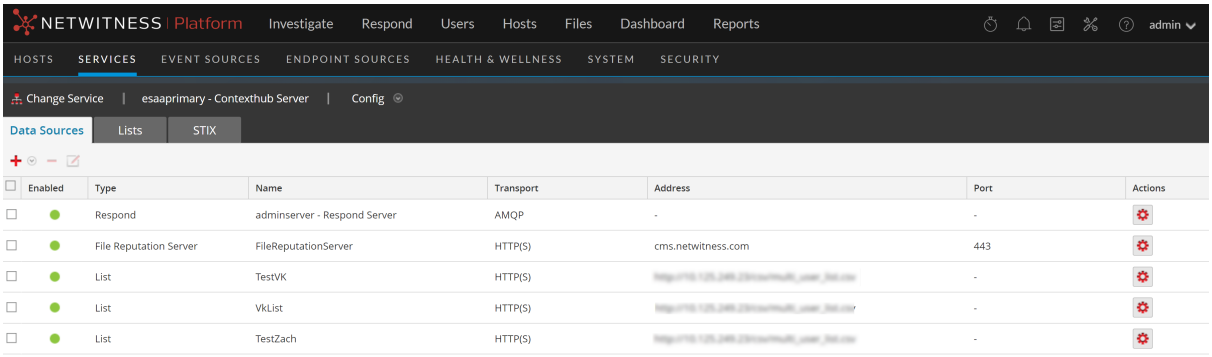
Add List data source using HTTP(S)

To add List as a data source:

1. Select  **(Admin) > Services**.
   The services view is displayed.
2. Select the Context Hub service and click  > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click  > **LIST**.
   The **Add Data Source** dialog is displayed.
4. By default, the **Enable** checkbox is selected. If this option is unchecked, the Next button is disabled, you cannot add the data source, view the list in the list tab and view the contextual information.
5. By default, the Context Highlighting checkbox is enabled. This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

6. Select the HTTP(S) Connection Type.



- Enter the following fields for HTTP(S) Connection Type:
  - **Name:** Provide a name for the list data source.
  - **URL**: Enter the path of the CSV file available on the HTTP(S) location along with the host name or IP address of the remote machine where the list is stored. The URL must be of the format: `https://<Hostname or IP-address of the HTTP(S)server>:<Port on which the HTTP(S) server is hosted>/<Absolute path of CSV file>`. For example, `https://10.1.1.1:443/contexthub_lists/multi_user_list.csv`
  - (Optional) **Description**: Add a description for the selected file.
  - (Optional) **Username:** Enter the username to connect to the HTTP(S) server requires basic authentication.
  - (Optional) **Password:** Enter the password to connect to the HTTP(S) server requires basic authentication.
  - **With Column Headers**: Select this option if you want to import a CSV file with headers. If this option is selected and you import the CSV without headers, the first row will be considered as a header which can be edited.
  - **SSL:** If you enter a URL with HTTPS in this field, then this is selected automatically. If you enter a URL with HTTP, then this checkbox is unselected.

- **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid .cer or .crt format HTTP (S)server certificate for the connection to be successful.

7. Click **Test Connection** to test the connection between Context Hub and the data source.
8. Click **Save** to save the settings.

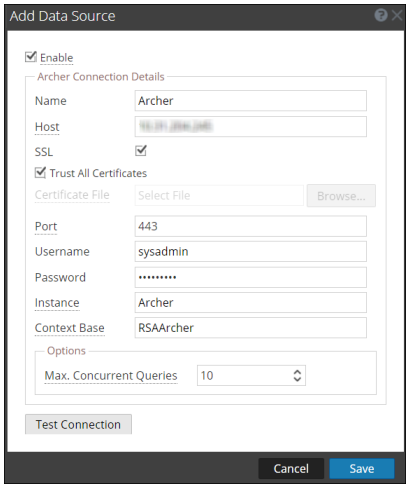
   List is added as a data source for the configured Context Hub and is displayed in the **Data Sources** tab.

Next Steps

- Add, edit, or remove values from a specific list.
- Configure the data source settings to determine the data source fields to be displayed in the Context panel. For instructions, see Configure Context Hub Data Source Settings .
- Import and export a list. For more information, see Import or Export Lists for Context Hub.
- View the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and *NetWitness Investigate User Guide*.

Configure Archer as Data Source

You can configure Archer as a data source for Context Hub and use the Context Hub service to fetch contextual information from Archer. Use the procedures in this topic to add Archer as a data source for Context Hub service and configure the settings (if required) for Archer.



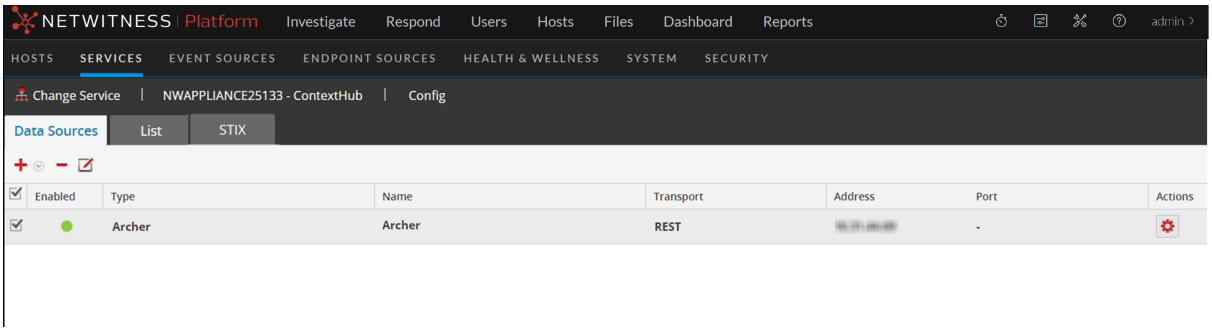
Prerequisites

Before you configure Archer data source, ensure that:

- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- Archer is installed with Licensed Devices application.

To add Archer as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service, and click > **View** > **Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, click > **Archer**.
   The **Add Data Source** dialog is displayed.



4. Provide the following information:
   - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
   - **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

- Enter the following fields:
  - **Name**: Enter a name for Archer data source.
  - **Host**: Enter the hostname or IP address where Archer server is installed.
  - **SSL**: By default this option is selected and enables SSL communication to Archer .
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid Archer server certificate for the connection to be successful.
  - **Port**: The default port is 443.
  - **Username**: Enter the Archer Server username.
  - **Password**: Enter the Archer Server password.
  - **Instance**: Enter the Instance name from which you want to extract data. An Archer instance is a single set up that includes unique content in a database, the connection to the database, the interface, and log-in. You might have individual instances for each office location or region or for development, test, and production environments. The Instance Database stores the Archer content for a specific instance.
  - **Context Base**: Enter the virtual directory name where the files are stored. For example, archer located at the Archer web address https://archer.company.com/**rsaarcher**/default.aspx. If the files are stored in the IIS default web address https://archer.company.com/default.aspx, then this field must be empty.
  - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the Archer data source.
6. Click **Save**.

   Archer is added as a data source for Context Hub and is displayed in the **Data Sources** tab.

After adding the data source, you can configure data source settings. For instructions, see Configure Context Hub Data Source Settings . And View the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, see the *NetWitness Respond User Guide* and *Investigate User Guide*.

Configure Archer Data Source

After you have configured the required data sources you can customize the settings for the data sources based on your requirement.

To access and configure settings:

1. Go to **(Admin) > Services**.

   The services view is displayed.

2. In the Services panel, select the Context Hub service and click > **View** > **Config**.

   The Services Config view of Context Hub is displayed.

3. Select the data source for which you want to configure the settings and click in the Actions column.

   The following screenshot is an example of the Configure Archer dialog:

4. In the **Settings** tab. Configure the following fields:

Field	Description
Enable	This option is enabled by default (checked) and can be used to enable or disable the response from the selected data source.
Cache Settings	Any lookup from Context Hub can be stored in the Context Hub cache for a configured time. Response to any subsequent matching request will be fetched from the Context Hub cache. Use this section to define the following cache settings for query lookup: • **Cache Enabled**: By default, this checkbox is selected and the query response is cached. • **Cache Expiration (Minutes)**: The maximum time the query lookup is retained in cache. The default time is 30 minutes and maximum is 7200 minutes that you can configure.

5. Click **Cache Settings**. Configure the following fields.

Field	Description
Export Attributes Configuration	In **Settings**, **Export Attributes Configuration**, click **Export** to export the Archer Attributes Configuration. These are the attributes visible in Context Lookup while viewing Archer details for a IP, Host, or Mac. A JSON configuration file gets downloaded and the order of the attributes in sync with the listing in the context panel is maintained in the JSON file.
Import Attributes Configuration	If you want to update or edit the configuration settings, in **Settings**, **Import Attributes Configuration**, click **Browse**. Select the JSON file containing the configuration attributes. The attributes appear in the Context Lookup panel when a user views the context, in the order which they were imported. **Note:** You can backup the previous attributes before importing any changes made to existing attributes.
Data Prefetch Settings	In **Settings**, **Data Prefetch Settings** helps prefetch the data. Configure the **Schedule Recurrence** to provide data faster when you hover over the intended entity in Respond.
Schedule Recurrence	In the **Recur Every** field, enter a value or use the drop-down to configure the recurrence for prefetch. The default time duration can be selected from the drop-down list for configuring the duration of recurrence. Available values are minutes, hours, days, or weeks.

6. Click any one of the following options:

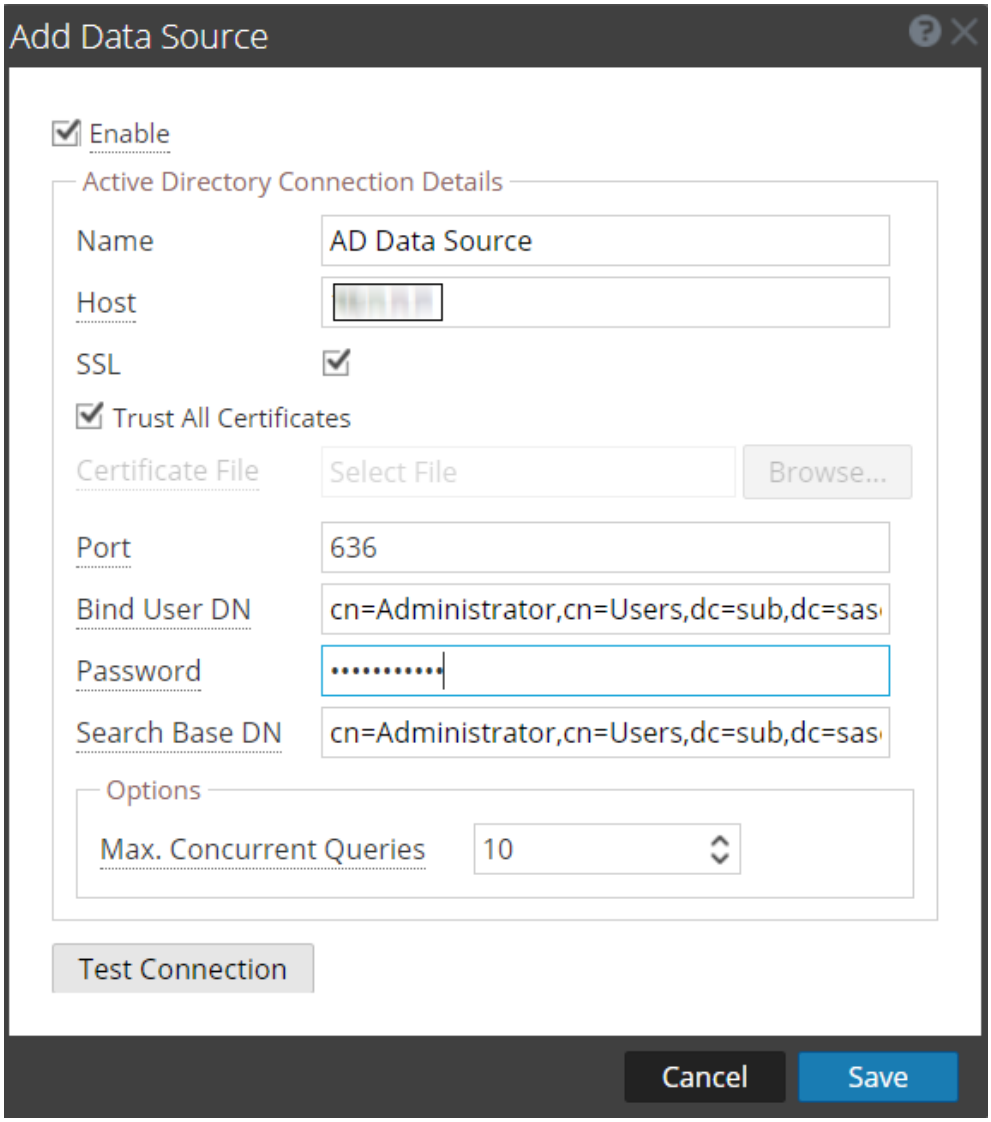
- **Cancel** - select this option to cancel the changes.
- **Save** - select this option to save the changes.
- **Save and Close** - select this option to save and close the dialog.

Note: After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to  **(Admin) > Services**> **View** > **Explore** view. Make sure you restart the Context Hub service if you make any configuration changes in the Explore view.

Configure Active Directory as a Data Source

You can configure Active Directory (AD) as a data source for Context Hub using LDAP and use the Context Hub service to fetch contextual information from AD. Use the procedures in this topic to add AD as a data source for Context Hub service and configure the settings(if required) for AD.

Prerequisites



Before you configure Active Directory data source, ensure that:

- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- AD is available and is running on Windows versions 2003, 2008, and 2012 are supported.

To add AD as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The services view is displayed.
2. Select the Context Hub service and click **> View> Config**.
   The Services Config View of Context Hub is displayed.

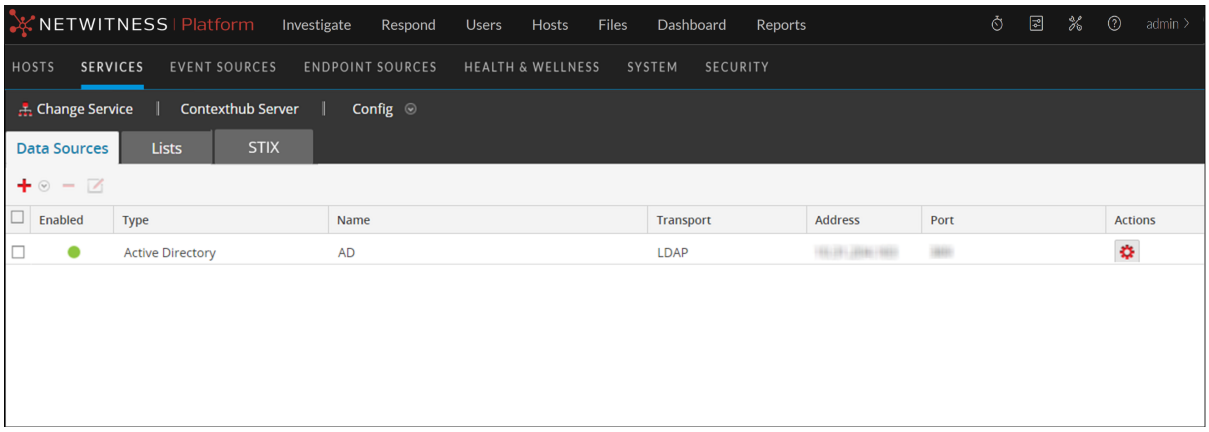
3. In the **Data Sources** tab, click + **> Active Directory**.
   The **Add Data Source** dialog is displayed.

You need to configure the Active Directory schema to replicate the following attributes to view the data in the Respond page:

- Employee ID
- Department
- Company
- Title
- Postal Code

All the other attributes replicate automatically.

4. Provide the following database connection details:



- By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
- Enter the following fields.
  - **Name:** Enter a name for the AD data source.
  - **Host:** Enter the host name or IP address of the AD.
  - **SSL:** By default this will be checked with 636 port number which will connect to the data source using Secure Sockets Layer (SSL) connection.
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid .cer or .crt format Active Directory server certificate for the connection to be successful. If you add multiple AD data sources with ssl, you should configure all the data sources with either a valid certificate or a Trust All Certificates.
  - **Port:** The default port is 636 with SSL and 389 without SSL.
    If you want to fetch data from multi-domains you can configure a single data source with the Global catalog port (3269 with SSL or 3268 without SSL).

    Alternately, for multi-domain, you can configure a single data source for each domain with the default port (389 with SSL or 636 without SSL).

    Multi-forest is a collection of multi-domains. If you want to fetch data from multi-forest you need to configure each forest with the Global catalog port (3269 with SSL or 3268 without SSL).
  - **Password:** Enter password of the user DN used to bind with AD.
  - **Bind User DN:** The distinguished name of the user that will authenticate to the search directory. For example, cn=Administrator,cn=Users,dc=sub,dc=saserver,dc=local.
  - **Search Base DN:** The base distinguished name, or base DN, identifies the entry in the directory from which searches are initiated; the base DN is often referred to as the search base. For example, dc=sub,dc=saserver,dc=local.

5. Click **Test Connection** to test the connection between Context Hub and the data source.
6. Click **Save**.
   AD is added as a data source for the configured Context Hub. The added AD data source is displayed

in the **Data Sources** tab.

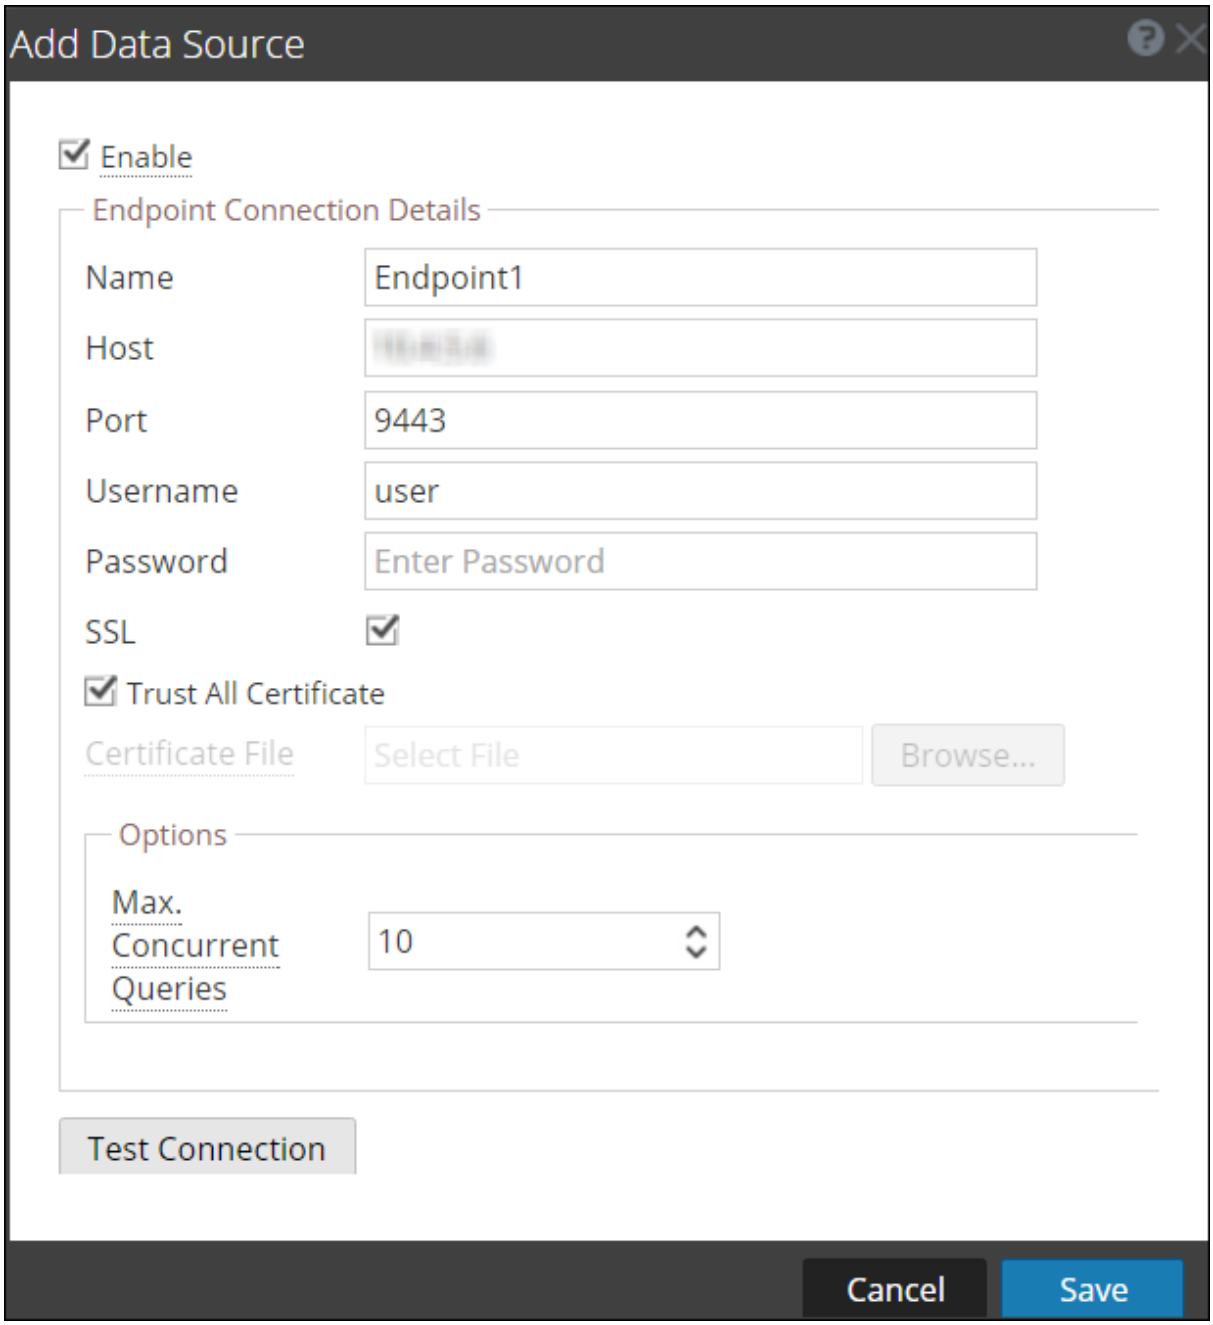
After adding the data source, you can configure the data source settings. For instructions, see Configure Context Hub Data Source Settings .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, see the **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

Configure NetWitness Endpoint as a Data Source

You can configure NetWitness Endpoint as a data source for Context Hub and use the Context Hub server to fetch contextual information from NetWitness Endpoint. Use the procedures in this topic to add NetWitness Endpoint as a data source for Context Hub service and configure the settings (if required) for NetWitness Endpoint.



Prerequisites

Before you configure NetWitness Endpoint data source, ensure that:

- Context Hub service is available in  **(Admin) > Services**.view of NetWitness.
- NetWitness Endpoint (v4.1.1 to 4.3.0.5) is installed and configured.
  For more information on how to install, configure and for detailed information on NetWitness Endpoint, see the NetWitness Endpoint documents available at NetWitness Community.

To add NetWitness Endpoint as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service, and click > **View** > **Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, click > **Endpoint**.
   The **Add Data Source** dialog is displayed.

4. Provide the following information:

   - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
   - **Context Highlighting** – This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

   Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

   - Enter the following fields:
     - **Name**: Enter a name for NetWitness Endpoint data source.
     - **Host**: Enter the hostname or IP address where NetWitness Endpoint API server is installed.
     - **Port**: The default port is 9443.
     - **SSL**: Select SSL if you want NetWitness to communicate with the host using SSL. This is enabled by default.
     - **Username**: Enter the NetWitness Endpoint API Server username.
     - **Password**: Enter the NetWitness Endpoint API Server password.
     - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid server generated or CA certificate to authenticate the connection with the supported formats of .cer or .crt of Base64 [PEM] encoded or DER encoded.
     - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the NetWitness Endpoint.

6. Click **Save**.
   NetWitness Endpoint is added as a data source for Context Hub and is displayed in the **Data Sources** tab.

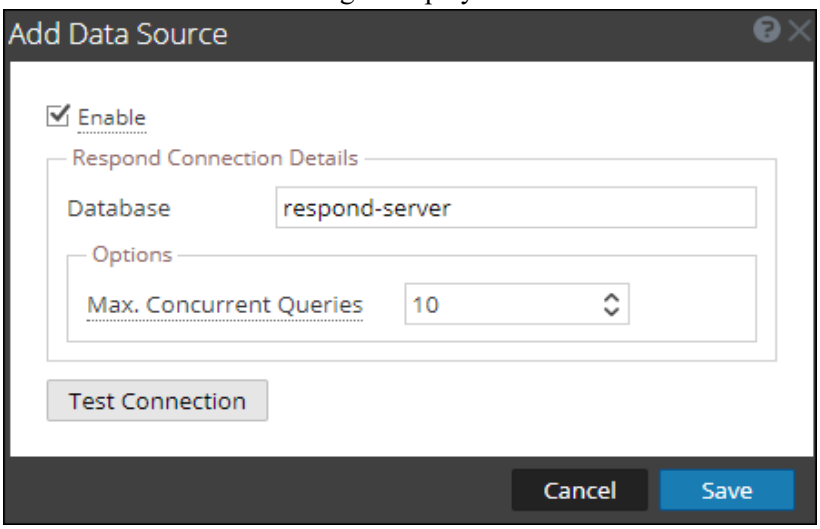
Next steps

After adding the data source, you can configure the settings. For more information, see Configure Context Hub Data Source Settings .

Also you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*

Configure Respond as a Data Source

You can configure Respond as a data source for Context Hub and use the Context Hub service to fetch contextual information from Respond service. If Respond service is already configured, the configuration details are pre-populated while adding Respond as a data source. Use the procedures in this topic to add Respond as a data source for Context Hub service and configure the settings.



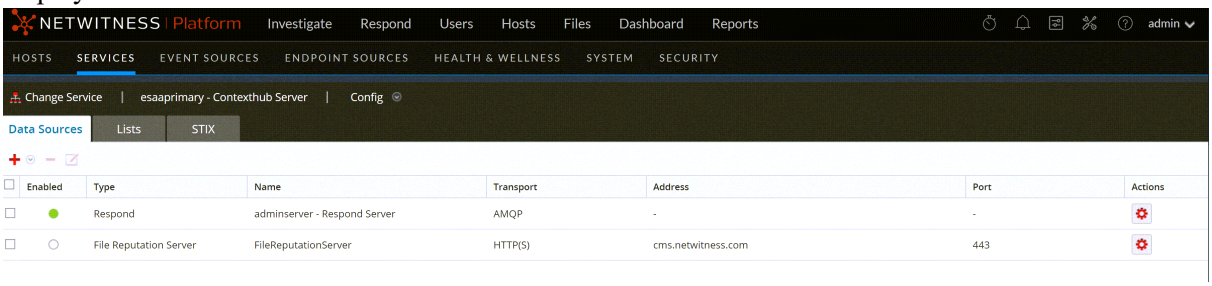
Prerequisites

Before you configure Respond data source, ensure that:

- Context Hub service is available in **(Admin) > Services** view of NetWitness.
- Respond service is available.

To add Respond as a data source for Context Hub:

1. Go to **(Admin) Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click > **Respond**.
   The **Add Data Source** dialog is displayed.



The required fields to configure the Respond data source are automatically updated.

You can enable or disable Context Highlighting. This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.

> **Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

4. Click **Test Connection** to test the connection between Context Hub and the data source.
5. Click **Save**.
   Respond is added as a data source for the configured Context Hub. The added Respond data source is displayed in the **Data Sources** tab.

After adding the data source, you can configure the settings. For more information, see Configure Context Hub Data Source Settings .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

Configure File Reputation Server as a Data Source

File Reputation Server provides analysts the opportunity to view reputation status of files. By default, File Reputation is enabled in Additional Live Services section.

If Context Hub service is configured, File Reputation Server is automatically added as data source for Context Hub.

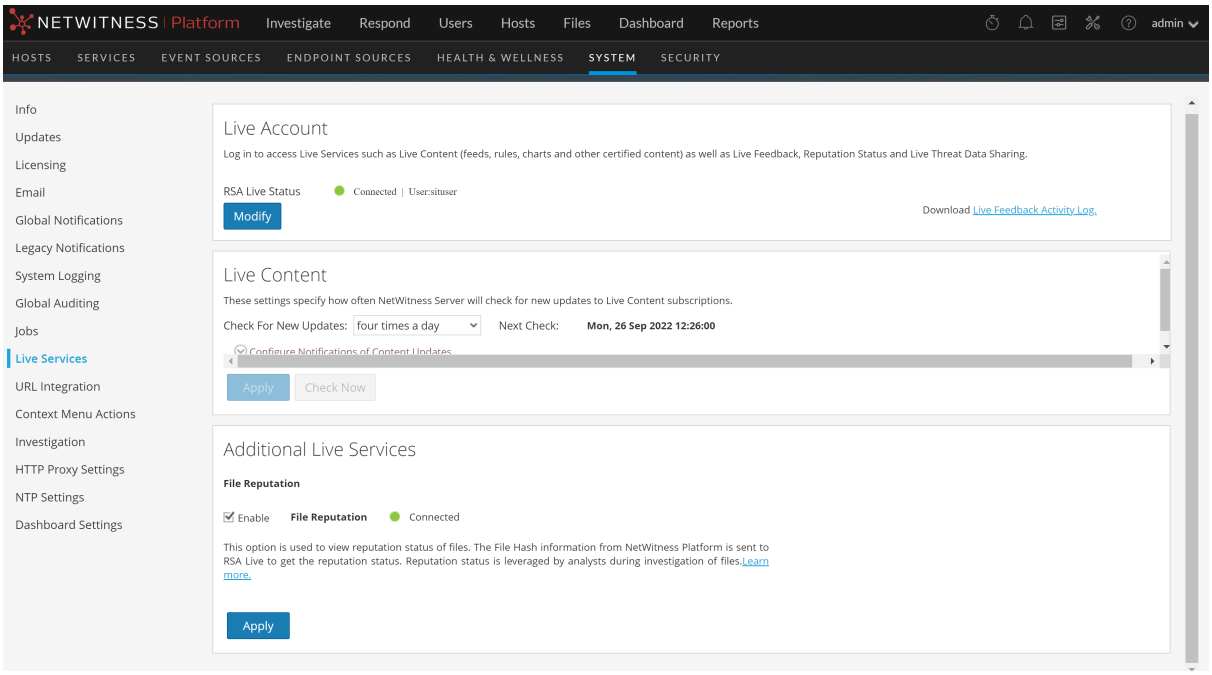
Prerequisites

Ensure the followings:

- Context Hub is enabled and the service is available in **(Admin)** > **Services** view of NetWitness.
- NetWitness Live Account is available.

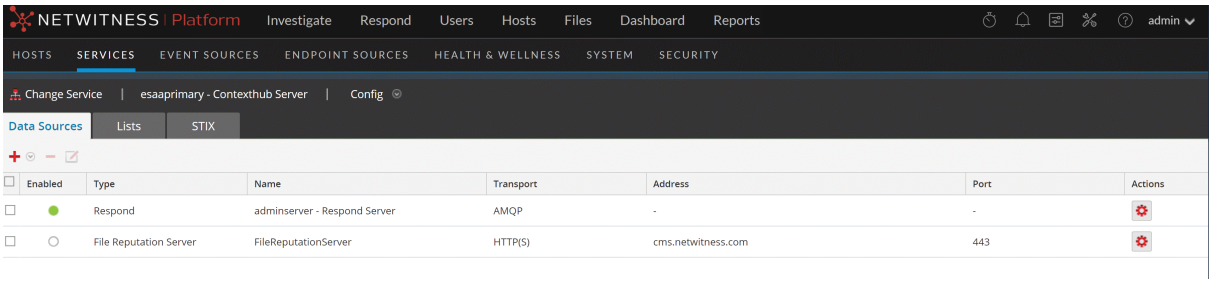
Note: To create a Live Account, see the **Step 1. Create Live Account** topic in the *Live Services Management Guide*.

By default, **File Reputation** is enabled in **Additional Live Services** section. Before setting up File Reputation data source, make sure that you have signed in to your Live account with your Live Account Credentials and Context Hub is enabled. File Reputation is automatically added as a data source for context hub.



For information about configuring Live Account and Live Services, see the **Configure Live Services Settings** topic in the *System Configuration Guide*.

For information about configuring Context Hub service, see the **Step 1. Add the Context Hub Service** topic in the *Context Hub Configuration Guide*.



Enable or Disable File Reputation Data Source

To enable or disable File Reputation data source for Context Hub:

1. Go to **(Admin) > System**.
2. In the left navigation pane, select **Live Services**.
3. In the **Additional Live Services** section, enable **File Reputation**.

4. Click **Apply**.
   File Reputation Server data source is enabled for Context Hub service.
5. To verify, go to the **Data Sources** tab and view the available sources.
   File Reputation source must be added to the list of available sources and the **Enabled** field must be a solid green circle ( ).

6. To disable File Reputation data source, disable **File Reputation** in Additional Live Services panel and click **Apply**.

   File Reputation data source is disabled for Context Hub service.

Edit File Reputation Server Data Source Settings

To edit File Reputation Server data source for Context Hub:

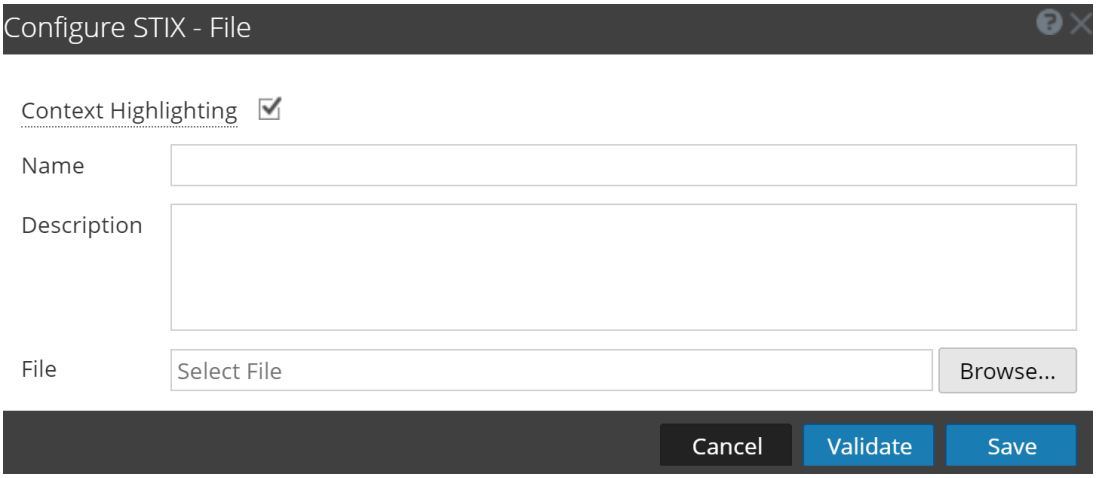
1. Select **(Admin) > Services**.
   The Services view is displayed.

2. In the **Services** panel, select the Context Hub service, and **> View > Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, select the File Reputation Server source and click .
   The **Edit Data Source** dialog is displayed.

4. Edit the required fields:

Field	Description
Context Highlighting	This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled. **Note:** You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.
Max. Concurrent Queries	You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 25.

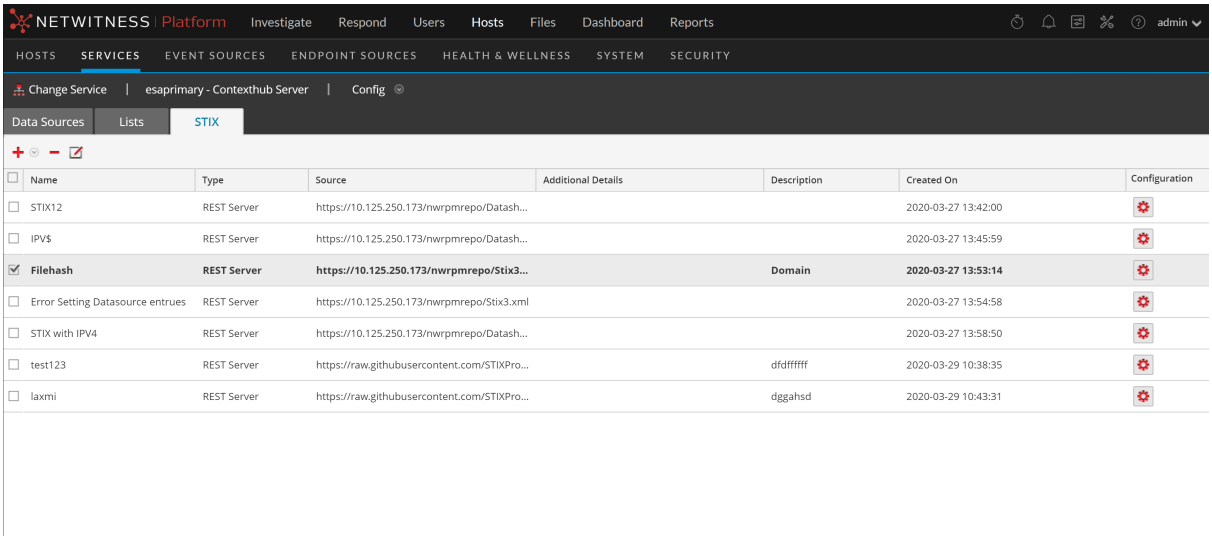
5. To edit the Proxy settings, see **the HTTP Proxy Settings Panel** topic in the *System Configuration Guide*.
6. Click **Test Connection** to test the connection between Context Hub and the data source.
7. Click **Save** to save the settings.



Configure STIX as a Data Source

You can configure Structured Threat Information eXpression (STIX) as a data source for Context Hub and use the Context Hub service to fetch contextual threat intelligence information from a STIX source.

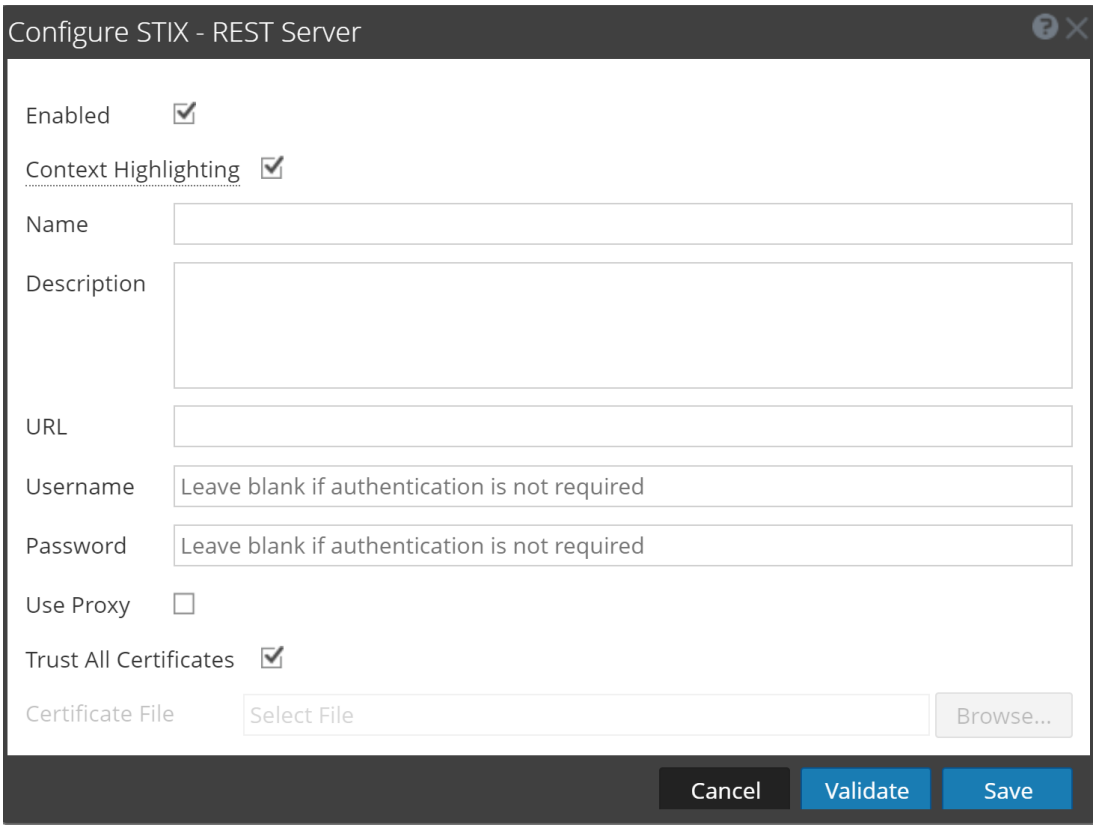
Configure STIX File



To add STIX as a data source for Context Hub:

1. Go to **(Admin) > Services** .
   The Services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services config view of Context Hub is displayed.
3. Click the **STIX** tab, and click .
4. Select **File** as data source.

4. Provide the following details:
   a. **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.
   b. **Name**: Provide a name for the STIX file data source.
   c. **Description**: Provide description of the data source.
   d. **File**: Browse for the file you want to add as a data source.
5. Click **Validate** to verify the format of the file.



6. Click **Save** to configure the data source.
   The File is added as a data source for the configured Context Hub and is displayed in the **STIX** tab.

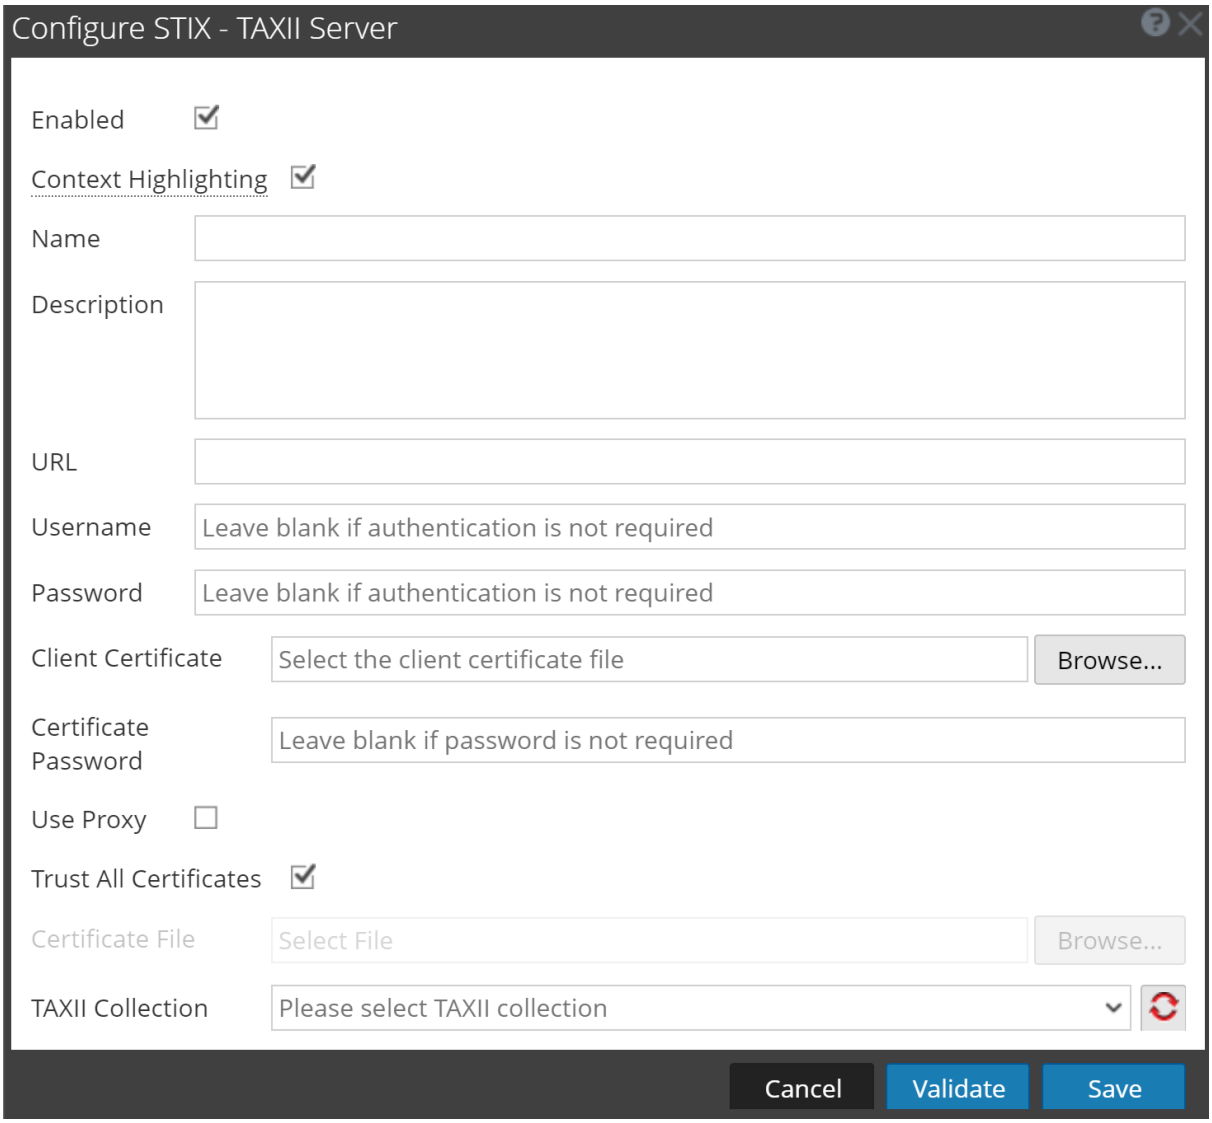
Configure REST Server

To add REST as a data source for Context Hub:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services config view of Context Hub is displayed.
3. Click the **STIX** tab, and click .
4. Select **REST Server** as data source.

4. Provide the following details:
   a. **Enabled**: Select this checkbox to enable the connection.
   b. **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.
   c. **Name**: Provide a name for the REST Server data source.
   d. **Description**: Provide a description for the data source.
   e. **URL**: Specify the URL to the STIX file to be hosted on the server.
   f. (Optional) **Username**: Enter the username for the REST server.
   g. (Optional) **Password**: Enter the password for the REST server.
   h. **Use Proxy**: Select this checkbox to use proxy.
   i. (Optional) **Trust All Certificates**: Select this checkbox if you want to trust all certificates and do not have a custom certificate.
   j. (Optional) **Certificate File**: Browse for the certificate file if you have not selected the Trust All certificates checkbox.
5. Click **Validate** to verify the connection parameters to the REST Server.

6. Click **Save** to configure the data source.
   The REST Server is added as a data source for the configured Context Hub and is displayed in the **STIX** tab.



After adding the data source, you can configure additional settings. For more information, see Configure Context Hub Data Source Settings .

Configure TAXII Server

To add TAXII Server as a data source for Context Hub:

1. Go to  **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service and click  > **View** > **Config**.
   The Services config view of Context Hub is displayed.
3. Click the **STIX** tab, and click .

4. Select **TAXII Server** as data source.

5. Provide the following details:
   a. **Enabled**: Select this checkbox to enable the connection.
   b. **Context Highlighting**: This highlights the meta values (in the **Investigate** > **Navigate**, **Events**, **Event details** and **Nodal graph**) for which the contextual information is available for this data source in the Context Hub. By default, this option is enabled.
   c. **Name**: Provide a name for the TAXII Server data source.
   d. **Description**: Provide a description for the data source.
   e. **URL**: Specify the discovery URL to the TAXII Server.
   f. (Optional) **Username**: Enter the username for the TAXII server.
   g. (Optional) **Password**: Enter the password for the TAXII server.

h. (Optional) **Client Certificate**: Browse to upload a pkcs12 format client certificate available on your local system.

i. (Optional) **Certificate Password**: Enter the password to the certificate, if it is password-protected.

j. (Optional) **User Proxy**: Select this checkbox to use proxy.

k. (Optional) **Trust All Certificates**: Select this checkbox if yoenabu want to trust all certificates and do not have a custom certificate.

l. (Optional) **Certificate File**: Browse for the certificate file if you have not selected the Trust All certificates checkbox.

m. **TAXII Collection**: Select the TAXII Collection name from the drop-down to automatically download the collection.

6. (Optional) Click  to manually retrieve the list of collections available in the TAXII server , if the collections are not downloaded automatically.
7. Click **Validate** to verify the connection parameters to the TAXII Server.
8. Click **Save** to configure the data source.
   The TAXII Server is added as a data source and is displayed in the **STIX** tab.

After adding the data source, you can configure additional settings. For more information, see Configure Context Hub Data Source Settings .

Note: You can disable the context highlighting globally in the Context Hub explorer view. After you disable this option, the entity values for all the data sources configured will not be highlighted if there are any contextual information.

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

Configure REST API as a Data Source

You can configure REST API as a data source for Context Hub which allows analysts to use the Context Hub during an investigation to fetch contextual information from any accessible web service with an exposed REST API. Use the procedures in this topic to add REST API as a data source for Context Hub service and configure the settings (if required) for REST API. The maximum number of REST APIs supported by default is ten.

Prerequisites

Before you configure REST API data source, ensure that:

• Context Hub service is available in  (Admin) > **Services** view of NetWitness Platform.

• Third-party REST API web server is reachable.

To add REST API as a data source for Context Hub:

1. Go to (**Admin**) > **Services**.
   The Services view is displayed.

2. Select the Context Hub service and click  > **View** > **Config**.
   The Services Config view is displayed.

3. In the **Data Sources** tab, click  > **REST API**.
   The Add Data Source dialog is displayed.

4. Provide the following information:
   - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
   - Enter the following fields.
     a. **Name** - Enter a name for the REST API data source.
     b. **URL** - Specify the REST API URL with the query parameters.
     The following table lists some examples of URL and associated parameters:

URL	Parameters
https://www.virustotal.com/vtapi/v2/file/report?apikey=<API Key>&resource=$metaValue	• **API key** – Specify your API key • **$metaValue** - You must specify the Test meta value in step 7 to test the REST API connection. For example, C5D0065B594A4775E26FA9875B21189F

URL	Parameters
https://www.virustotal.com/vtapi/v2/url/report?apikey= 1bfdf66f3b0f1875381830ec933f7151f5b48c1cbaa54ac625f2d5a74312e9a2&resource=$metaValue	• **API key** – Specify your API key • **$metaValue** - You must specify the Test meta value in step 7 to test the REST API connection. For example, textspeier.de

c. **Description** – Enter the description of the REST API data source.

d. **User name**: Enter the username of the REST API if it needs to be authenticated.

e. **Password**: Enter the password of the RSET API if it needs to be authenticated.

f. **Response Type**: Select the REST API response type. Possible values are:

- HTML
- JSON

g. **Test Meta value**: Enter the meta value to test the REST API connection.

Note:
- The meta value you specify will be replaced with `$metavalue` in the URL mentioned in step 2 for test connection.
- During context lookup, the `$metavalue` variable is replaced with meta value in the REST API call.

h. **SSL** - Enables SSL communication to REST API. By default, this option is selected.

i. (Optional) **Trust All Certificates**: Select this checkbox if you want to trust all certificates and do not have a custom certificate. By default, this option is enabled.

j. (Optional) **Certificate File**: Browse for the certificate file if you have not selected the Trust All certificates checkbox.

5. Click **Test Connection** to test the connection between Context Hub and the REST API data source.
6. Click **Next**.
7. In the **Response Preview** section, you can view the live response for the REST API configured, using the test meta value as a placeholder.
8. In the **Meta Mapping** section, select one or more meta type supported by the REST API to view context lookup (for meta values) in the Respond and Investigation views.
9. In the **Field Mapping** section, you can add friendly display name for the response field for which you want to perform context lookup. Do the following:

a. Click .

b. In the **Field** drop-down, enter the path for which you want to add a friendly name. As you type the path, the auto-suggest function looks for the matches in the JSON path returned in the response preview. You can also add the path that is not available in the response preview but available for other meta values.

c. **Value (from Preview)** field is filled automatically when you select the path.

d. In the **Display Name** field, enter the friendly name.

> **Note:** After configuration, only the fields that are mapped with friendly names are displayed during context lookup. If you do not map any fields, all fields in the JSON will be available during context lookup.

10. Click **Save** to configure the data source.

> **Note:** After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to  (**ADMIN**) > **Services**> **View** > **Explore** view.

Edit REST API Data Source

To edit REST API data source for Context Hub:

1. Go to  (**Admin**) > **Services**.
2. Select the Context Hub service and click  > **View** > **Config**.
3. In the Data Sources tab, click  > **REST API**.
4. Edit the required fields.
5. Click **Test Connection** to test the connection between Context Hub and the data source.
6. In the **Meta and Field Mapping** and **Cache settings**, edit the required fields.
7. Click **Save** to save the settings.

> **Note:** In 12.3 and later versions, field mapping and Data Preview are enabled for authenticated REST API without providing the username and password.

Delete REST API Data Source

To edit REST API data source for Context Hub:

1. Go to  (**Admin**) > **Services**.
2. Select the Context Hub service and click  > **View** > **Config**.
3. In the **Data Sources** tab, select the data source you want to delete.
4. Click .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

Configure Context Hub Data Source Settings

After you have configured the required data sources you can customize the settings for the data sources based on your requirement.

To access and configure settings:

1. Go to  **(Admin) > Services**.

   The services view is displayed.

2. In the Services panel, select the Context Hub service and click > **View** > **Config**.

   The Services Config view of Context Hub is displayed.

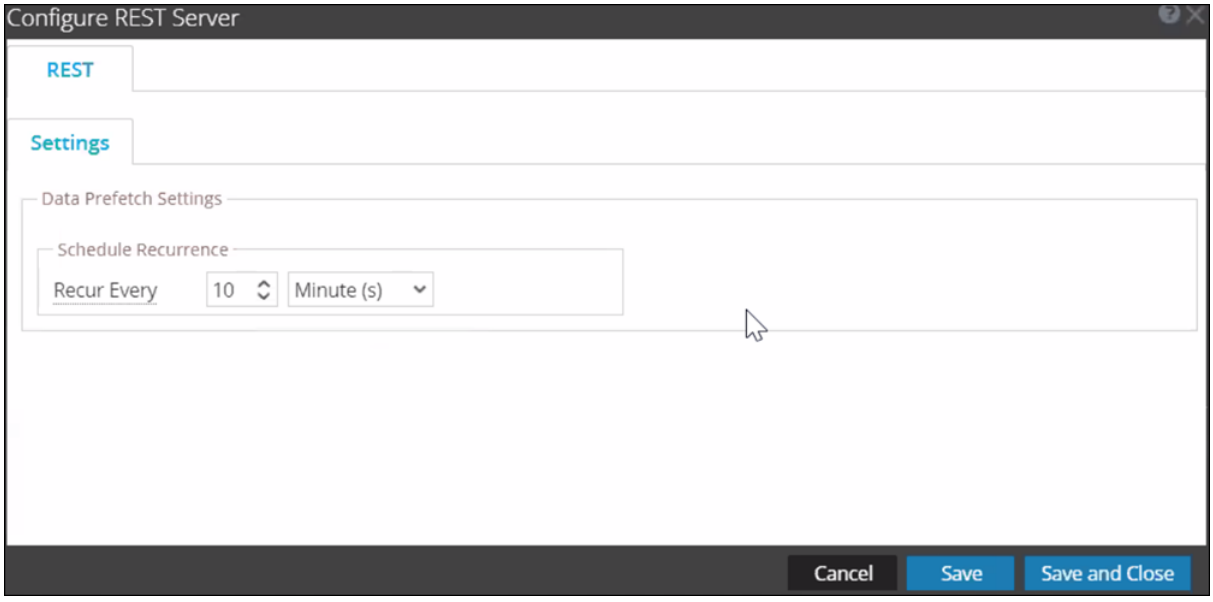
3. Select the data source for which you want to configure the settings and click  in the Actions column.

   The following screenshot is an example of the NetWitness Endpoint settings dialog:

The following screenshot is an example of the REST API settings dialog:

4. Configure the following fields:

Field	Description
Enable	This option is enabled by default (checked) and can be used to enable or disable the response from the selected data source.

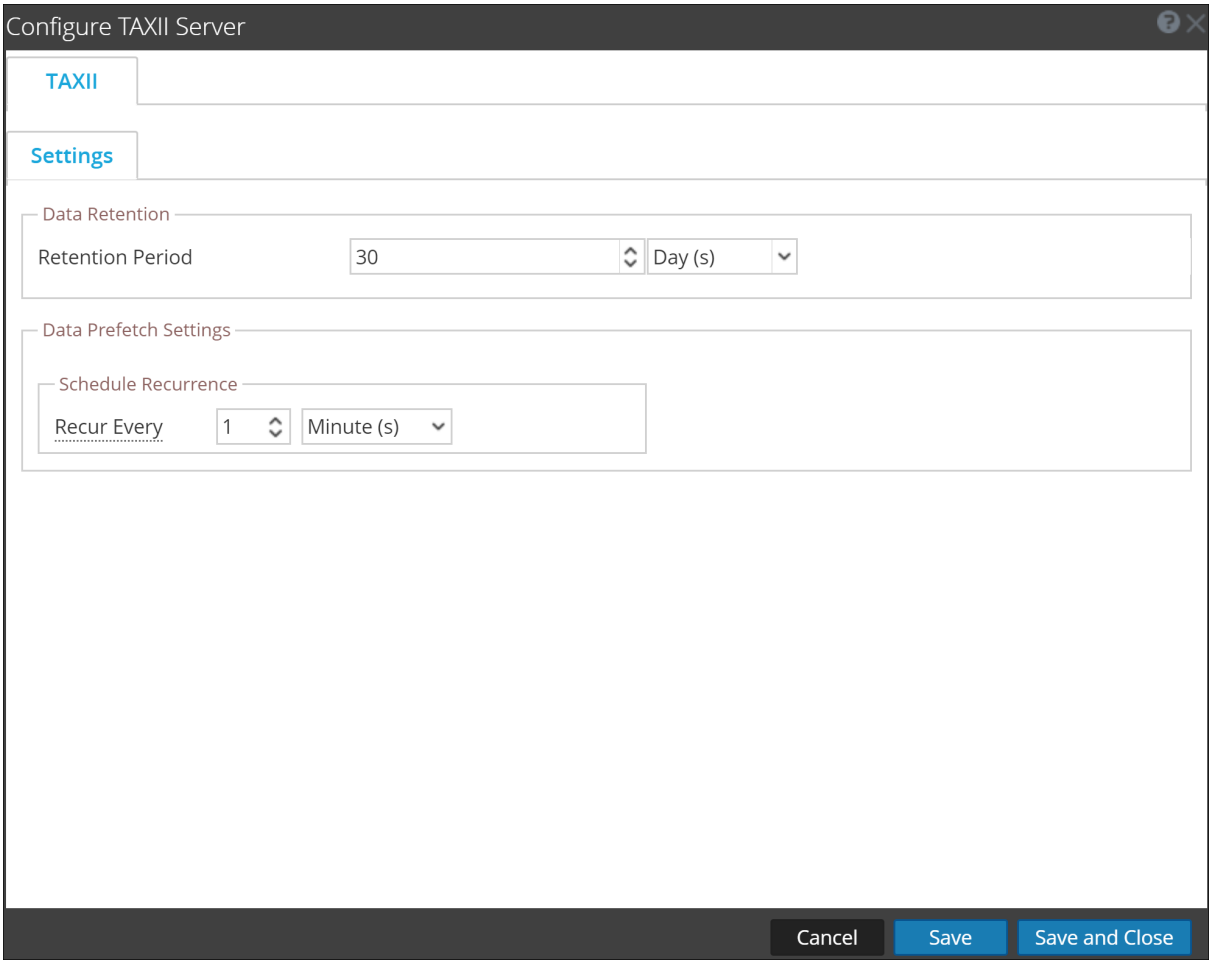


Field	Description
Cache Settings	Any lookup from Context Hub can be stored in the Context Hub cache for a configured time. Response to any subsequent matching request will be fetched from the Context Hub cache. Use this section to define the following cache settings for query lookup: • **Cache Enabled**: By default, this checkbox is selected and the query response is cached. • **Cache Expiration (Minutes)**: The maximum time the query lookup is retained in cache. The default time is 30 minutes and maximum is 7200 minutes that you can configure.
List value Expiration	**Enable**: Select Enable to define the number of days the list values must be available. By default, this option is disabled and the values are retained. **Time to Live (Days)**: Enter the number of days you want to the list values to be retained.
Meta Mapping	Any list stored in Context Hub should be made available for a lookup. The lookup in Context Hub is performed based on meta type or entities. Examples IP, HOST, MAC ADDRESS, DOMAIN, FILE_NAME, FILE_HASH, USER. **Meta Type**: Entities available in Context Hub. **Context Hub Fields**: Column headers from CSV file you have added when creating a list.
Meta and Field Mapping	**Response Preview**: You can view the live response for the REST API configured, using the test meta value as a placeholder. **Copy**: Copies the response preview. **Meta Mapping**: Any REST API stored in Context Hub should be made available for a lookup. The lookup in Context Hub is performed based on meta type or entities selected. Examples IP, HOST, MAC ADDRESS, DOMAIN, FILE_NAME, FILE_HASH, USER. **Meta Type**: Entities available in Context Hub. **Field Mapping**: Add friendly display name for the response field which is displayed during the context lookup.  - Add a field mapping. - Delete a field mapping. **Field**- Enter the path for which you want to add a friendly name. **Value (from Preview)**- The value is filled automatically based on the path. **Display Name**- Enter friendly name.
Minimum IIOC Score	The minimum IIOC score to be considered for fetching contextual information of NetWitness Endpoint modules.

Field	Description
Query Last (Days)	The duration (in days) for which the Context Data must be queried.
Limit	The maximum number of records to be displayed when Context Lookup is performed.
Recur Every	Configure recurring schedule to fetch and store contextual data for the required intervals.

5. Click any one of the following options:
   - **Cancel** - select this option to cancel the changes.
   - **Save** - select this option to save the changes.
   - **Save and Close** - select this option to save and close the dialog.

To access and configure settings for STIX data sources



1. Go to **(Admin) > Services** and select Context Hub service.
2. Click > **View** > **Config** > **STIX** tab.
3. Select the data source for which you want to configure the settings and click in the Configurations column.
   a. For REST Server, the following fields are displayed.

Configure the following fields for REST Server.

Field	Description
Recur Every	Specify the time frequency in minutes, hours, days or weeks to retrieve the content from the data source.

b. For TAXII Server, the following fields are displayed.

Configure the following fields for TAXII Server.

Field	Description
Retention Period	Specify the number of days the content retrieved from the taxi data source must be retained before it is automatically deleted.
Recur Every	Specify the time frequency in minutes, hours, days or weeks to retrieve the content from the data source .

Based on the data source you select, the Response Groups differ. The following table describes the response groups for every data source.

Data Source (Connection)	Response Supported Groups	Field Settings
List	List	Meta Mapping Meta Type Context Hub Fields Settings Data Prefetch Settings Schedule Recurrence List Value Expiration Cache Settings Cache Enabled Cache Expiration (Minutes) [Min is 30 minutes Max is 7200 minutes]
Archer	Archer	Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Export Attributes Configuration Export Attributes Data Prefetch Settings Schedule Recurrence
Active Directory	Users	Meta Mapping Meta Type Context Hub Fields Settings Data Prefetch Settings Schedule Recurrence List Value Expiration Cache Settings Cache Enabled Cache Expiration (Minutes)[Min is 30 minutes Max is 7200 minutes]

Data Source (Connection)	Response Supported Groups	Field Settings
NetWitness Endpoint	IOC Machines Modules	Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Context Panel Settings Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Context Panel Settings Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Minimum IIOC Score Context Panel Settings
Respond	Alerts Incidents	Context Panel Settings Data Prefetch Settings Query Last [Days Cache Settings Cache Enabled Cache Expiration (Minutes)
File Reputation Server	File Reputation Server	Cache Settings Cache Enabled Cache Expiration (Minutes)
TI	Displays information for STIX data sources.	IP address, email address, domain, filename, URL's, and file hash. **Note:** The context lookup for email address and URL will be displayed only if these metas are mapped. To map the metas, navigate to (Configure) > **System** > **Investigation** > **Context Lookup**.

Data Source (Connection)	Response Supported Groups	Field Settings
REST API	REST API	• Meta and Field Mapping • Meta Type • Field • Value (from Preview) • Display Name • Cache Settings • Cache Enabled • Cache Expiration (Minutes)

Note: After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to **(Admin) > Services**> **View** > **Explore** view. Make sure you restart the Context Hub service if you make any configuration changes in the Explore view.

Import or Export Lists for Context Hub

As an administrator you can import or export a list that is configured in the Context Hub service which can be used by an analyst. The file to be imported or exported is a CSV file and you can add multiple lists as Data Sources.

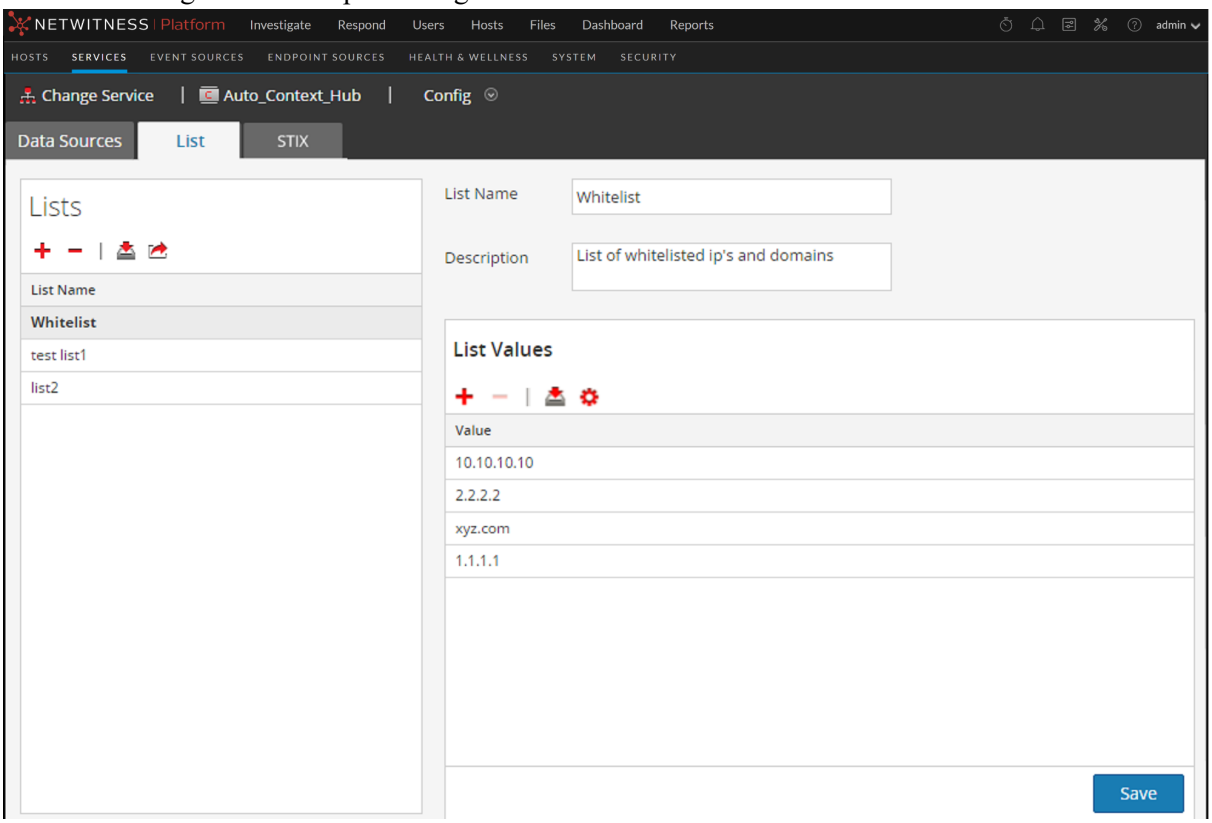
Prerequisites

Ensure that Context Hub is enabled and the service is available in  **(Admin) > Services** view of NetWitness.

Import a List

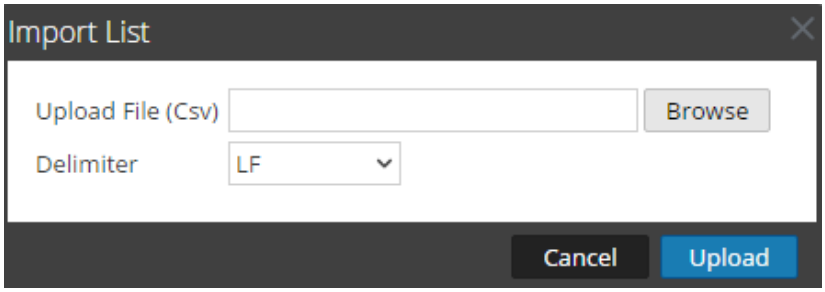
After you have imported a list, you can perform the following tasks:

- Import values to an existing list
- Add row to a list
- Edit a list name and description
- Edit a value from a list
- Delete a list
- Delete row from a list



Note: You have to make the same changes to the relevant .CSV file, so that the changes get reflected the next time the schedule recurs. Otherwise, when you import values into an existing single-column or multi-column list, the data is overwritten from the source file when the schedule recurs. In case of a custom feed list, if the feed is edited or deleted, the corresponding Context Hub list also gets edited or deleted.

Import Single-Column List



To import a list:

1. Select  **(Admin) > Services**.
   The services view is displayed.
2. In the **Services** panel, select the Context Hub service and click  > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.

The below image is an example of single-column list.

4. Click  on the **Lists** panel.
   The **Import List** dialog is displayed.

5. In the **Import List** dialog, complete the following steps:
   a. In the **Upload File (.CSV)** field, browse and select the `CSV` file.
   b. In the **Delimiter** field, select the delimiter to separate the values in a list from the options—**Comma**, **CR** (Carriage Return), and **LF** (Line Feed).
6. Click **Upload** to upload the CSV file to Context Hub.

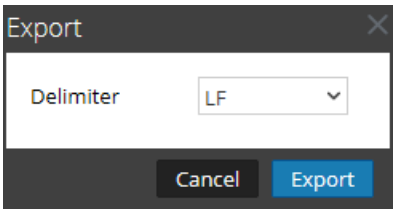
These lists are considered as data sources for retrieving contextual information. But you can append to an existing multi-column list. The data will be appended only if the number of columns match.

Note: You cannot create a new multi column list by directly importing a CSV file. However, all the feeds that are converted into multi-colum lists will be displayed in the List tab. For information on how to import multi-column list, see Configure Lists as a Data Source

Import Values to an existing List

When you are importing into existing multi- column list the data is overwritten from the source file when the schedule recurs.

To import values to a list:



1. Go to  **(Admin) > Services**.
   The services view is displayed.
2. Service and click  > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.
4. In the Lists panel, select a list for which you want to import the values.
5. Click  on the **List Values** panel.
   The **Import List** dialog is displayed.
6. In the **Import List** dialog, complete the following steps:
   a. In the **Upload File (Csv)** field, browse and select the `CSV` file.
   b. In the **Delimiter** field, select the delimiter to separate the values in a list from the options—**Comma**, **CR**(Carriage Return), and **LF**(Line Feed).
7. Click **Upload** to upload the CSV file to NetWitness.

The list values are imported to the selected list. These lists are considered as data sources for retrieving contextual information. But you can append an existing multi column list. The data will be appended only if the number of column match.

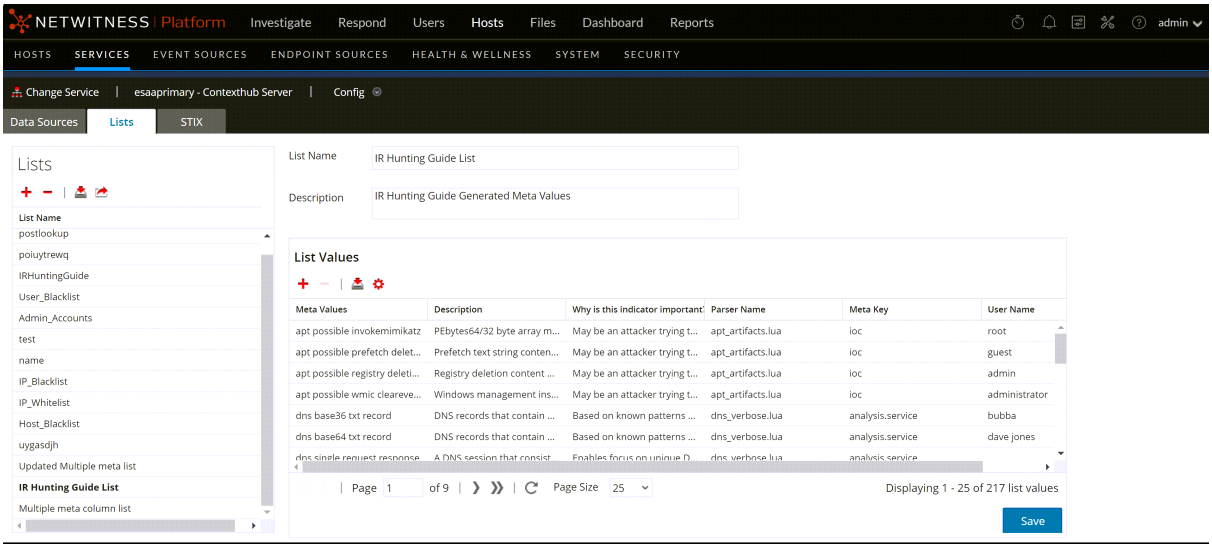
Export List for Context Hub

To export a list:

1. On the **Lists** tab of the Services Config view of the Context Hub service, click  .
   The **Export** dialog is displayed.

2. In the **Delimiter** field, select the delimiter to separate the values in an exported list from the drop-down [**Comma**, **CR** (Carriage Return), and **LF** (Line Feed)].
3. Click **Export**.

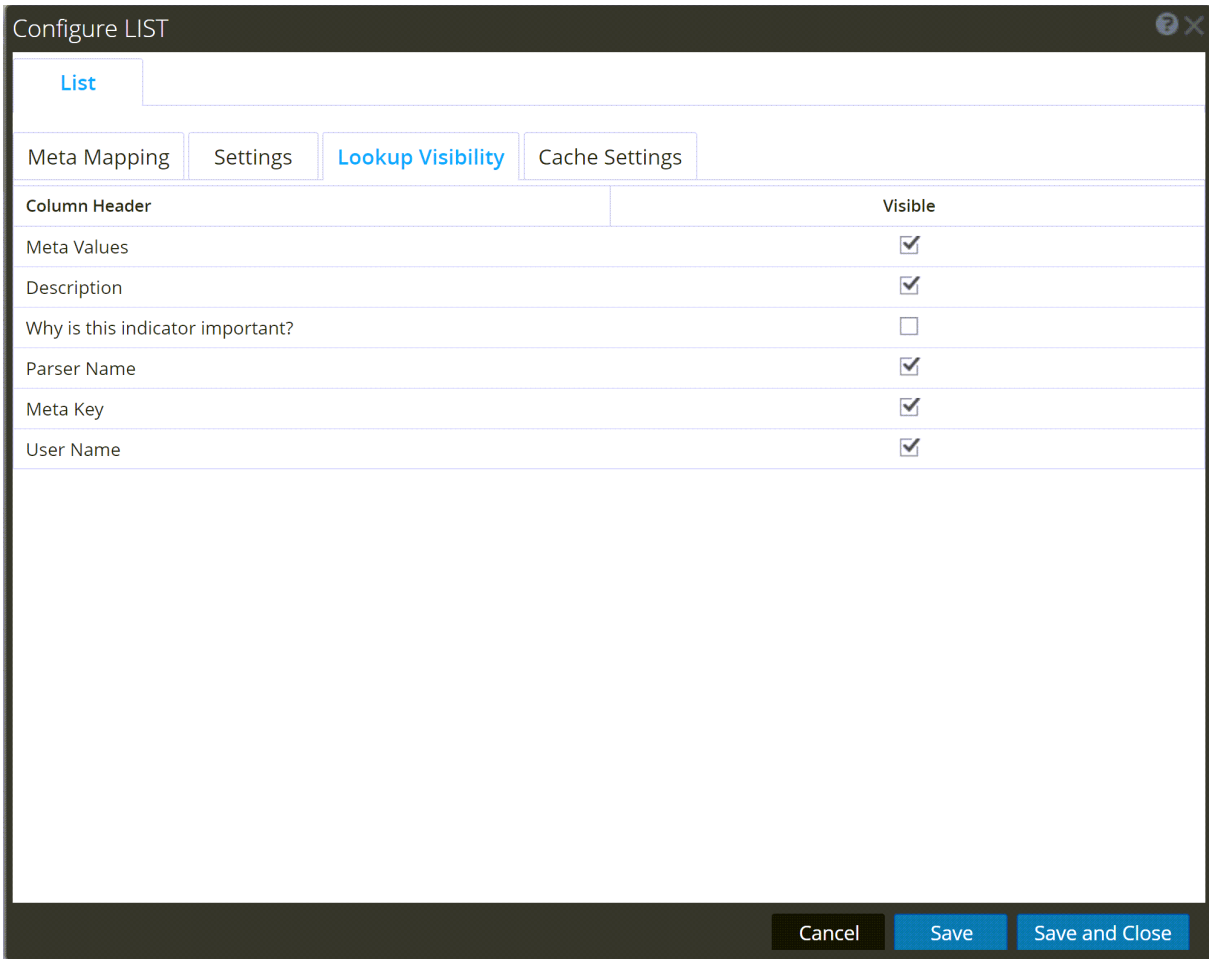
In case of a single-column list, you can select the delimiter. And, in case of a multi-column list, the list is exported as CSV file to the local machine.



Note: When a custom feed is converted into a Context Hub list, you must map at least one meta key with one or more entity mapping for a column header with a meta. However, if you want to add or edit more entities you can do so by clicking ⚙.

Manage Meta values for Context Hub Lists

From NetWitness Platform 12.3 version or later, administrators can view and manage headers and values in the context Hub lists panel's newly added **List Details** tab. This enhancement helps administrators with more flexibility in enabling and disabling required meta values and helps analysts to have better visibility in the **Investigate** and **Respond** Context lookup Lists Panel for further analysis and investigation.



To view and manage context hub lists Meta keys

1. Go to  **(Admin) > Services**.
   The services view is displayed.
2. In the **Services** panel, select the Context Hub service and click  > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.
   The below image is an example of multi-column lists.

4. In the Lists panel, select a list name for which you want to configure the settings and click on the  **Actions** column.
   The Configure List dialog is displayed.
5. Click the **List Details** tab.

   The available configured meta key for the lists is displayed.

6. By default, five meta keys will be enabled. You can deselect the required meta keys from the lists and select the required ones.

   Note:
   - The List Details tab must have at least one meta key enabled.
   - You can enable a maximum of only five meta keys in the Lists Details tab.

7. Click **Save**.

   You can now navigate to **Investigate** > **Events** or **Respond** view and click on the selected meta key or entity associated with the lists, the context look-up panel opens with the details of the selected meta keys on the Lists tab for further analysis. For more information, see topic Context Lookup Panel Lists Tab in the *NetWitness Investigate User Guide*.

Configure Meta Type Mapping for Context Hub

As an administrator you manage the mapping of Context Hub meta types with NetWitness meta keys.

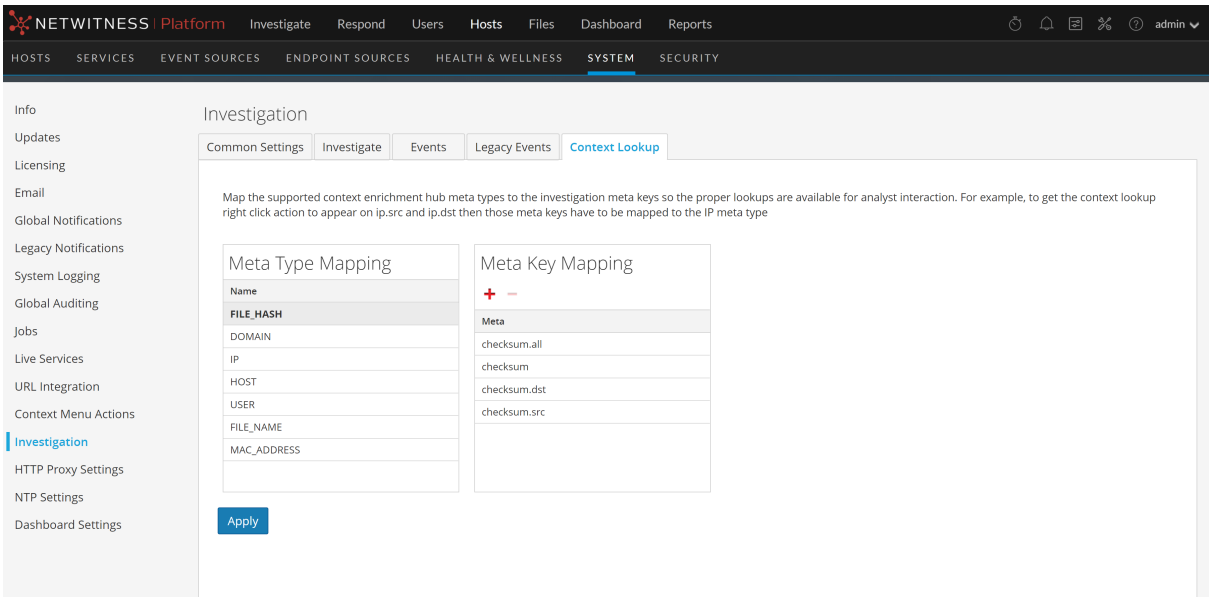
The Context Hub service provides context lookup for meta values in the Respond and Investigation views. These meta values are grouped into meta types based on the category they belong to. For example, meta keys of NetWitness Respond and Investigation like `ip.src` and `ip.dst`are grouped into the meta type `IP` in Context Hub. The meta type `IP` is in turn mapped to metas like `alert.events.source.device.ip_address` and `alert.events.destination.device.ip_address` in the Respond database.

In the  (Admin) **> System > Investigation** view, the Context Lookup tab enables the administrator to configure the NetWitness meta keys and meta type mapping. The administrator can add or remove meta keys to the list of meta types supported by Context Hub.

The Context Hub service is pre-configured with default meta type and meta key mapping, which is expected to work with most deployments, unless there are some custom mappings created for your specific deployment.

Note: You cannot add a new Meta Type.

The default mapping is given below:



Meta Type Name	Meta Keys
IP	device.ip, ip.dst, ip.src, ip.addr, paddr, ip.all, alias.ip
USER	user.all, user.src, user.dst, username
DOMAIN	domain.src, domain.all, domain.dst
MAC_ADDRESS	eth.dst, eth.src, eth.all
FILE_NAME	filename, filename.all, filename.src, filename.dst, sourcefile
FILE_HASH	checksum.all, checksum, checksum.dst, checksum.src
HOST	device.host, alias.host, host.all

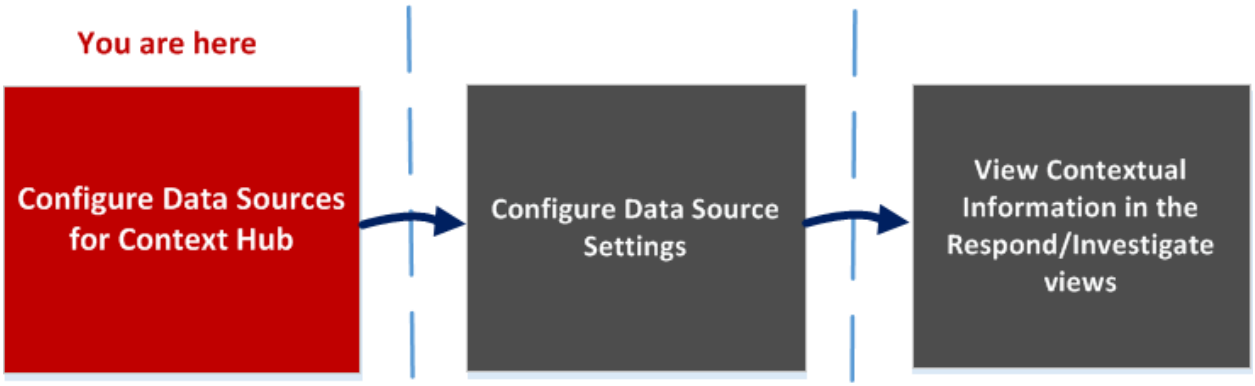
Procedure

To manage Investigation meta keys mapping:

1. Go to  **(Admin) > System**.
2. In the options panel, select **Investigation**.

   The Investigation Configuration panel is displayed.
3. Select the **Context Lookup** tab.

4. Select a meta type to view the default meta keys that are mapped with this meta type.
5. To add a meta key, click + and enter the meta key.
6. To remove a meta key, select the meta key and click −.
7. To save the changes, click **Apply**.
8. In order to add a new meta, they need to be included in the Concentrator's custom index file. For example, if you want to add a meta "**fqdn**" then you need to add an new entry: **<key name="fqdn" description="Fully Qualified Domain Name="IndexValues" form-at="Text" valueMax="100" />** in the index file. For more information on how to include a new meta in the index file, see Index Customization topic in the *Core Database Tuning Guide*. After you add the new meta, you can view the contextual information on clicking the Pivot to investigate option in the Respond view.



In case a new meta key is added, the Context Lookup menu option is enabled for the meta values under that meta key. For more information, see the "Investigation Configuration Panel" topic in the *System Configuration Guide*

Context Hub Data Sources Tab

In the **Data Sources** tab, you can configure one or more data sources for Context Hub service. Navigate to **(Admin) > Services** > Select Context Hub service > **View** > **Config** > **Data Sources** tab.

Workflow

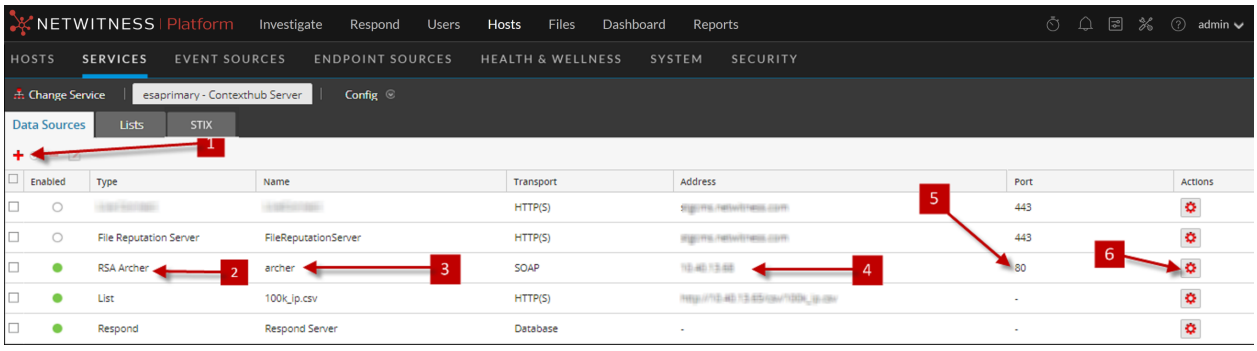
This workflow shows the procedure to configure data sources for Context Hub service to view contextual information in the Respond / Investigate views.

- The first task is to add a data source
- The second task is to configure data sources settings to enhance your deployment. This task is optional as the settings for each data source is already configured with default values for optimal performance.
- And the third task is to view and analyze the contextual information in the Context Summary panel of the Respond or Investigate views.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Data Sources for Context Hub*	Configure Lists as a Data Source Configure Archer as Data Source Configure Active Directory as a Data Source Configure NetWitness Endpoint as a Data Source Configure REST API as a Data Source Configure File Reputation Server as a Data Source Configure STIX as a Data Source
Administrator	Configure Hub Data Settings*	Configure Context Hub Data Source Settings

Role	I want to ...	Show me how
Analyst	View Contextual Information in Respond View	See the *NetWitness Respond User Guide*.
Analyst	Add, create and delete list from the Respond or Investigate View	See the *NetWitness Respond User Guide*. See the *Investigate User Guide*.
Analyst	Add or delete an entry from an existing list	See the *NetWitness Respond User Guide*.



*You can complete this task here (that is in the Context Hub Data Sources Tab.)

- Configure REST API as a Data Source

Quick Look

The following example illustrates how to add a data source for Context Hub service.

1 Click + to display the **Add Data Source** dialog.
2 Displays the type of Data Source.
3 Name that identifies the Data Source.
4 The IP address or hostname of the data source.
5 The connection port for the data source.

6 Opens the **Configure Settings** dialog. You can view and edit the settings to be displayed on the Context Summary panel in the Respond or Investigate views.

7 Click **Test Connection** to verify that the host is connected to the Context Hub service.

Toolbar

The following table describes the toolbar actions.

Feature	Description
	Opens the Add Data Source dialog so that you can add a data source. You can add only one data source of each type. Except in case of Lists and Active Directory data sources which can be added in multiples. For detailed instructions to add a data source, see Configure Lists as a Data Source.
	Delete a data source. If you delete a data source, Context Hub does not consider the deleted service as a data source. All contextual information fetched previously will not be available.
	Opens the Edit Data Source dialog.
	Opens the Configure Settings dialog. You can view and edit the settings for the data sources. For description of each field in Configure Responses dialog, see Configure Context Hub Data Source Settings .

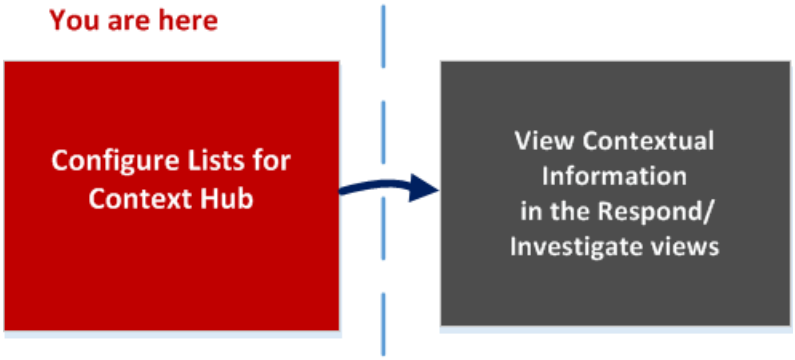
Data Source Configurations

The following table describes the listed configurations.

Feature	Description
Enabled	Indicates whether the data source is enabled or disabled. A solid colored green circle indicates that data source is enabled (). An blank white circle indicates that data source is disabled.
Type	The type of data source. For example, Lists, Archer, Active Directory, Endpoint, Respond, REST API or File Reputation server.
Name	The unique name to identify the data source. For example, Respond.
Address	The IP address or hostname of the data source.
Port	The connection port for the data source and vary based on the data source being added. For example, for Endpoint the port is 9443, for Lists the port is 80 and so on.

Context Hub Lists Tab

In the **Lists** tab, you can create and configure lists for Context Hub. Navigate to **(Admin) > Services** > Select Context Hub service > **View** > **Config** > **Lists** tab.



The Lists tab of the Context Hub service allows you to create one or more lists and add relevant list values to the list. These lists are automatically considered as data sources for the Context Hub service.

These lists may be populated with items either by importing external or custom feed CSV files or by adding meta values by using the option Add/Remove from List in Investigation and Respond views.

Note: You can also create lists and add list values from Respond and Investigation views. For more information, see the *NetWitness Respond User Guide* and the *NetWitness Investigate User Guide*.

Workflow

This workflow shows the procedure to configure lists for Context Hub service and to view contextual information in the Respond and Investigate views.

Creating one or more list is the first task in this workflow. The lists can contain supported metas such as an IP address, User, Host, Domain, MAC address, File Name or File Hash. The next task is to analyze or use the list data to view contextual data in Respond and Investigate views.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure List Data Source for Context Hub*	Configure Lists as a Data Source
Administrator/ Analyst	View Contextual Information in Respond View	See the *NetWitness Respond User Guide*.

Role	I want to ...	Show me how
Administrator/ Analyst	"Manage Lists and List Values in Investigation	See the *Investigate User Guide*.
Administrator/ Analyst	Create a list	See the *NetWitness Respond User Guide* and *Investigate User Guide*
Administrator/ Analyst	Update a list	See the *NetWitness Respond User Guide* and *Investigate User Guide*
Administrator/ Analyst	Delete list	See the *NetWitness Respond User Guide* and *Investigate User Guide*
Administrator/ Analyst	Import a list	Import or Export Lists for Context Hub
Administrator/ Analyst	Export list	Import or Export Lists for Context Hub

*You can complete this task here (that is in the Context Hub Lists Tab).

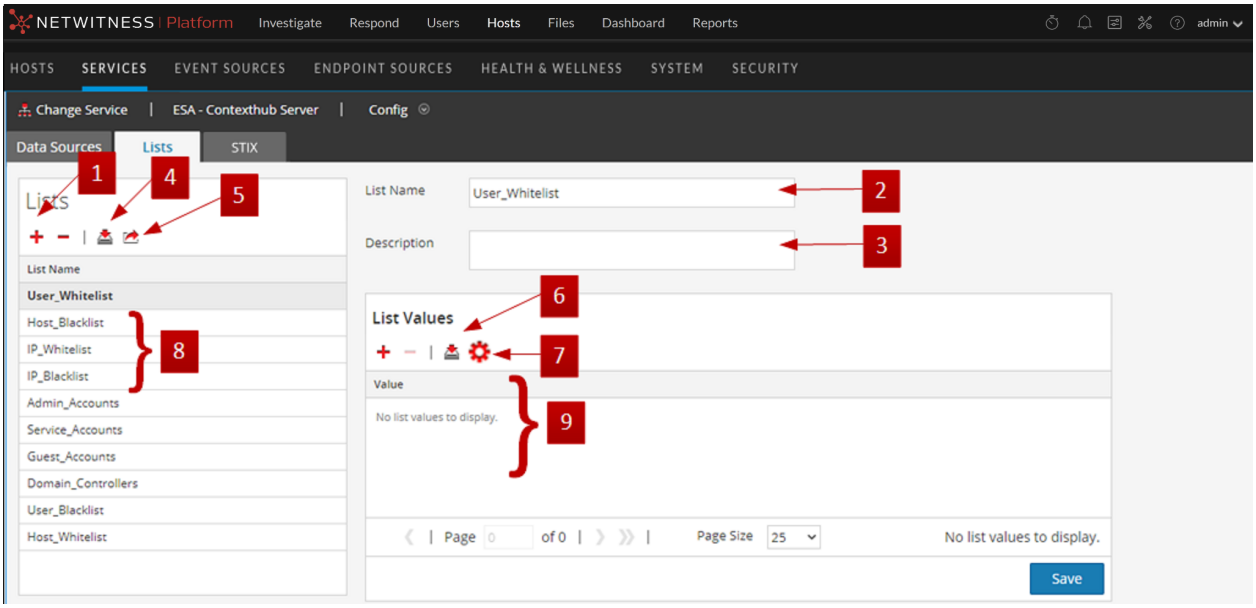
Quick Look

The following example illustrates how to add lists for Context Hub service.

The List tab consists of the **Lists** panel and **List Values** panel. The **Lists** panel has a toolbar with options to add, delete, import, and export lists. The entries under **List Name** are lists that are added or imported for the Context Hub service.



By default, 10 empty single-column lists are available in NetWitness11.1. These lists are empty and you need to add information to these lists. The out of the box 10 list names are used in ESA rules, for more information on ESA rules, see the *Alerting with ESA Correlation Rules User Guide*. For users upgrading from previous versions, they will be able to view these new lists in addition to their previously created lists. The lists available by default are:

- Admin_Accounts
- Guest_Accounts
- Service_Accounts
- User_Blacklist
- User_Whitelist
- Host_Whitelist

- Domain_Controllers
- IP_Blacklist
- IP_Whitelist
- Host_Blacklist

Note: If a list with the same name already exists prior to updating to or installing NetWitness12.3.1.0, then that list will be retained. Either rename that list before updating to 11.1 or update the contents in such a way that it can be used in ESA rules.

The lists are available in ESA rules tab in CONFIGURE > ESA Rules > Settings > Enrichment Sources. For more information on ESA rules, see the *Alerting with ESA Correlation Rules User Guide for Version 11.1*.
The **List Values** panel has a toolbar with options to add, delete, and import list values to the selected list. The entries under **Value** identify each list entry included in the list.

1	Click + to add a new list.
2	Name that identifies the list.
3	Description of the list.
4	Click to import list(s) to Context Hub.
5	Click to export a list to the local machine.
6	Click to import list values to selected list.
7	Click to add or edit entity mapping.

8	Displays the custom list(s) that are added to Context Hub.
9	Displays the list values that are added to the selected list.

Toolbar

The following table describes the toolbar actions.

Feature	Description
	Add a new list. For more information, see Configure Lists as a Data Source.
	Delete a list. If you delete a list from Context Hub, the list is no longer considered as a data source for retrieving contextual information.
	Import lists to Context Hub. For more information, see Import or Export Lists for Context Hub.
	Export a list to the local machine. For more information, see Import or Export Lists for Context Hub.

Note: You can select multiple lists at a time. Do one of the following:
1. Select a list, press and hold Ctrl key, and click the lists to be selected.
2. Select a list, press and hold Shift Key, and use arrow keys to select other lists.

List View Options

The following table describes the Lists configurations.

Feature	Description
List Name	Unique name to identify the list.
Description	Description of the list.
Save	Saves the changes made to the list.

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

Context Hub STIX Tab

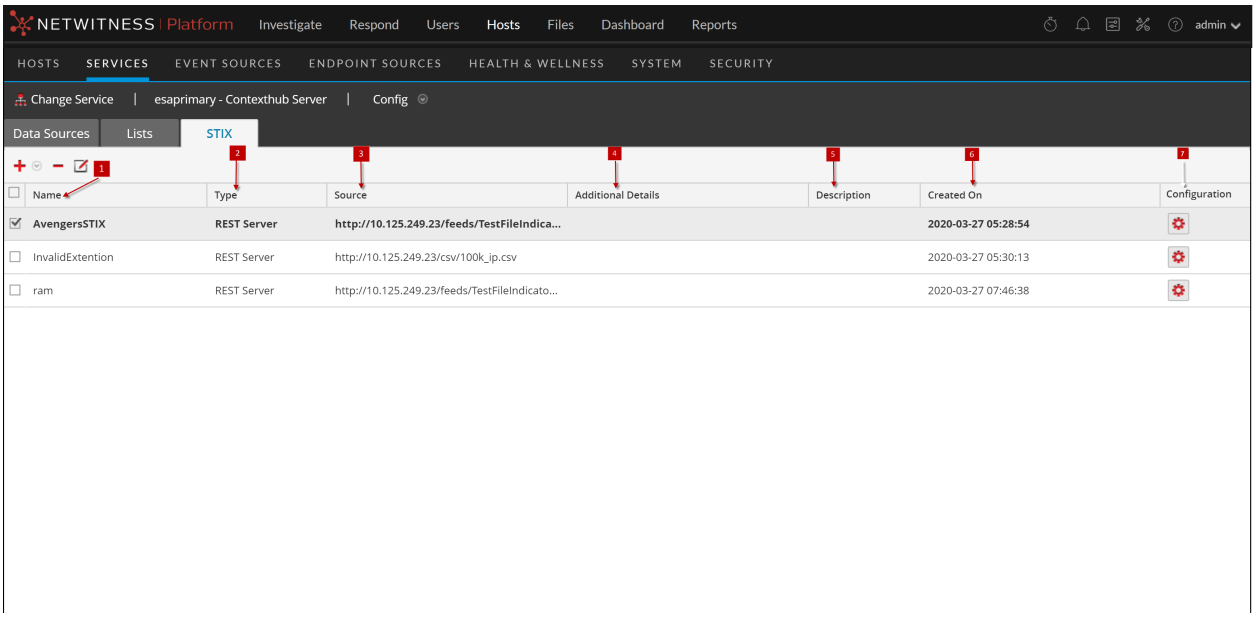
In the **STIX** tab, you can create and configure Structured Threat Information eXpression (STIX) data source for Context Hub. Navigate to  **(Admin) > Services**> Select Context Hub service > **View** > **Config** > **STIX** tab.

The STIX tab of the Context Hub service allows you to create one or more STIX, REST URLs, or TAXII data sources and edit them whenever required. When STIX is configured, Context Hub service automatically considers it as a data source.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure STIX Data Source for Context Hub*	Configure STIX as a Data Source
Administrator/ Analyst	View Contextual Information in Respond View	See the *NetWitness Respond User Guide*.

*You can complete this task here (that is in the Context Hub Lists Tab).



Related Topics

- Configure STIX as a Data Source

Quick Look

The following example illustrates how to add STIX to Context Hub service.

The STIX tab consists of add, delete and edit data sources options.

1	Name that identifies the added STIX source.
2	Type of data source - REST server, STIX or TAXII server.
3	The path of the source from which the STIX files are obtained.
4	Additional details related to the data source being added.
5	Description of the data source.
6	Date when the data source was created.
7	Click to edit the selected data source and configure advanced settings.

Toolbar

The following table describes the toolbar actions.

Feature	Description
+	Add a new data source such as File, REST Server, or TAXII Server. For more information, see Configure STIX as a Data Source .
−	Delete the selected data source.
✎	Edit the selected data source.

The following table describes the all the data source server configuration options.

Field	Description
Common Configuration Options	

Field	Description
Enabled	Select this checkbox to enable the configuration.
Name	Provide a name to the data source you want to add.
Description	Description of the data source.
Cancel	Click to revert the data source addition.
Validate	Click to verify the URL path to the Server.
Save	Click to save the configuration and add the required server as a data source.
REST Server Configuration Options	
URL	URL of the REST server.
Username (Optional)	Provide the username of the REST server if it needs to be authenticated.
Password (Optional)	Provide the password of REST server if it needs to be authenticated.
Trust All Certificates	Select this checkbox to trust all certificates.
Certificate File	Click browse to navigate to the location of the certificate file.
TAXII Server Configuration Options	
URL	URL of the TAXII server.
Username (Optional)	Provide the username of TAXII server if it needs to be authenticated.
Password (Optional)	Provide the password of REST server if it needs to be authenticated.
Client Certificate	Browse to upload a pkcs12 format client certificate available on your local system.
Certificate Password	Enter the password to the certificate, if it is password-protected.
UserProxy	Select this checkbox to enable proxy.
Trust All Certificates	Select this checkbox to trust all certificates.
Certificate File	Browse and select the certificate file.
TAXII Collections	Select the TAXII Collection name from the drop-down to automatically download the collection.
	Click to manually retrieve the list of available TAXII Servers, if the collections are not downloaded automatically.

Field	Description
STIX File Configuration Options	
File	Browse and select the STIX file.

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

Troubleshooting

This topic provides information about possible issues that NetWitness users may encounter when setting up their ContextHub service in NetWitness.

Problem	Solutions
Prefetch for list fails if the list is created in append mode.	**Details:** The following error message is displayed in logs indicating that, entries in list exceeds the max allowed. `Error setting data source entries com.rsa.asoc.contexthub.exception.ContextHubException: total.entries.exceed.max` Also, Health & Wellness sets the stat - `Contexthub.Datasource.Health.Data-Sources-Health` to `Unhealthy` and displays the names of the lists for which prefetch has failed. For example, number of entries in the list are 50001 and number of records in the CSV file are 50001 (user did not change the csv since last prefetch.). Upper limit on number of entries in list is 100,000. Now on prefetch, Context Hub will try to append 50001 entries to the list but since 50001 + 50001 > 100,000, prefetch fails. **Solutions:** You should add only those entries in the .csv file which they wish to append to the existing .csv file. If, you do not want to append any entries to the list then perform one of the options, as applicable: • If you created the list with headers: remove all rows from the csv except the header. • If you created list without headers: you should have 0 rows in csv.
The Respond service is not able to send incidents to Archer with third party signed certificates.	As a workaround, you need to run a command to add a PEM certificate to the Respond trust store Run the following command on the Respond host: `security-cli-client --add-trusts -s respond-server -x <pem_certfilename> -u <username> -k <password>` Where: • `<pem_certfilename>` is the name of the certificate file. • `<username>` and `<password>` are your NetWitness administrator credentials.
SSL handshake with Archer certificate fails while adding it as a data source.	Use an archer generated certificate with the Trust All Certificates option configured.

Problem	Solutions
Pivot to Investigate option on the Respond page does not navigate to the correct link.	When you stop and restart the RabbitMQ server, the Pivot to Investigate option available on the respond screen is not visible. And the context panel for Pivot to Investigate reopens the same page. You need to restart the jetty service on the NetWitness Server, login to the NetWitness Server Host and enter the service jetty restart command.
When you import a list with missing quotes such as "172.16.0.0, the list is saved without any data to display.	This is because of the Apache bug (CSV-141), which does not parse CSV files with incorrect formats. To fix, import a list with correct quotes to avoid displaying an empty file. For example, “172.16.0.0”, “host.mycompany.com” and so on.
Increasing the limit settings for Alerts and Incidents leads to lookup error.	By default, the limit settings to view number of Alerts and Incidents is set to 50. If the limit is increased, the looked-up meta for alerts and incidents may lead to lookup error. This happens due to an internal database restriction. Make sure to keep the limit for viewing number of Alerts and Incidents to 50 or less.
Multiple incident and alert tabs are displayed while editing advanced configuration of Respond datasource.	You must delete duplicate entries in the Context Hub MongoDB and restart the MongoDB Context Hub Server. Perform the following: 1. Log in to control MongoDB on Admin Server. 2. Go to contexthub-server > ds_meta collection. **Note:** Make a note of '_id' value of duplicate entries for the incident and alerts documents that you want to delete. 3. In the ds_meta collection, delete 1 Incident and 1 Alert document. Once the duplicate entries are deleted only 1 Incident and 1 Alert type document will be available in the ds_meta collection. 4. Log in to application MongoDB on ESA Primary. 5. Go to contexthub-server, locate and delete the below collections: • ds_entries*_*<id-of-incident-doc-deleted-in-step 3> • ds_entries*_*<id-of-alert-doc-deleted-in-step 3> 6. Under bookmark_store collection, locate and delete documents with id same as _id of Incident and Alert from ds_meta collection. 7. Restart Context Hub Server.

Data Privacy Overview

This topic introduces the concept and implementation considerations for a data privacy officer or administrator who is managing exposure of privacy-sensitive data in NetWitness. In addition, information about recommended use cases is included.

Note: A data privacy plan touches on most components of NetWitness. The person who configures data privacy needs to understand NetWitness network components, configuration of NetWitness hosts and services as described in the *Host and Services Getting Started Guide*, and the types of information that need to be protected.

Regulatory mandates in some locations, for example the European Union (EU), require that information systems have a means of protecting privacy-sensitive data. Any data that could directly or indirectly identify "Who did what when?" may be considered privacy-sensitive data. A few examples are user names, email addresses, and host names. NetWitness provides a range of controls that customers can leverage to protect privacy-sensitive data. These controls can be used in a variety of combinations to protect privacy-sensitive data, without significantly reducing analytical capability.

A user role for a Data Privacy Officer (DPO) supports the management of privacy-sensitive data. The DPO can configure NetWitness to limit exposure of metadata and raw content (packets and logs) using a combination of techniques. The methods available to protect data in NetWitness include:

- Data Obfuscation
- Data Retention Enforcement
- Audit Logging

Data Obfuscation

NetWitness has configurable options for data obfuscation. Data privacy officers and administrators can specify which meta keys in their environment are privacy-sensitive and limit where the meta values and raw data for those keys are displayed in the NetWitness network. In place of the original values, NetWitness can provide obfuscated representations to enable investigation and analytics. In addition, DPOs and administrators can prevent persistence of privacy-sensitive meta values and raw logs or packets.

Three methods work together to implement data obfuscation:

- Obfuscation of meta values for privacy-sensitive meta keys with an optional salt. Meta keys configured as protected are represented by obfuscated values at the time of creation on a Decoder or Log Decoder; the obfuscated values are hashed and considered to be impossible to read. To implement, you must configure the Decoder and Log Decoder hash algorithm and salt, and configure privacy-sensitive language keys as protected on all Core services.
- Role-based access (RBAC) to the raw logs or packets and the privacy-sensitive meta values. The DPO can use roles with granular permission capabilities to restrict what an analyst versus a data privacy officer is able to view during configuration, analysis, and investigation. The *System Security and User Management Guide* provides in-depth coverage of the RBAC implementation in NetWitness. To implement, you must configure metadata and content visibility per role on individual Brokers, Concentrators, Decoders, Log Decoders, and Archivers.

- Preventing persistence of privacy-sensitive meta values and raw logs or packets. To implement, you must configure meta keys on parsers for individual Decoders and Log Decoders as transient.

Data Retention Enforcement

NetWitness can ensure that data is retained only as long as necessary or as specified. An administrator can configure data retention using age and time thresholds on a per-service basis. Schedulers running on each service automatically delete data meeting those thresholds. Once the data is deleted, it is no longer available through user interfaces, queries, or application programming interface (API) calls. Some of the NetWitness components also support purging of data through overwrites.

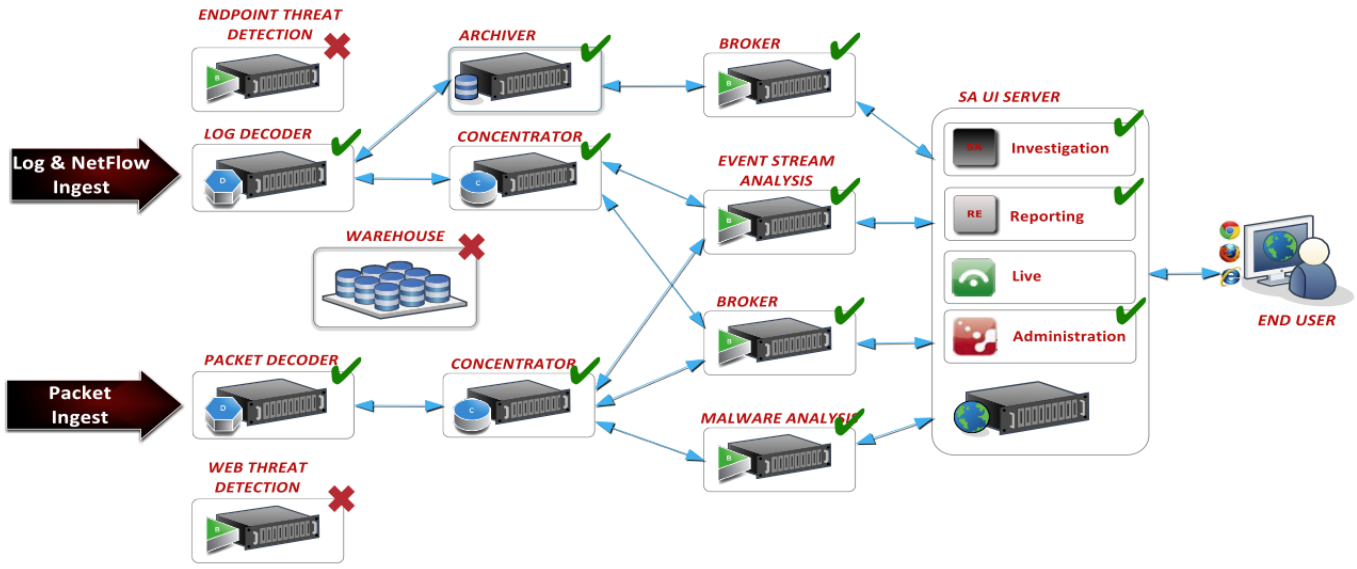
An administrator can manage data retention in several ways:

- Configure how long data persists in storage on the system.
- For Core services, strategically remove privacy-sensitive data that may have been written by configuring automatic removal of data of a specific age.
- Configure NetWitness so that original data is not sent or saved to the other components. If privacy-sensitive data makes its way into another database on the Reporting Engine, Malware Analysis, and NetWitness Servers, data retention can be managed there as well. This configuration for Event Stream Analysis is managed in the Services Explorer view.

Note: If a situation arises where the DPO decides that already collected data is privacy-sensitive after the system is functional, the administrator can manually overwrite the data from databases or files where the data is saved.

Audit Logging

Administrators can leverage audit logs that NetWitness creates using the Global Audit Logging feature. The audit logging feature generates audit log entries about many activities, and the following are examples of log entries that are relevant to data privacy:



- Modifications to permissions and users assigned to roles.
- Failed and successful attempts to log on to NetWitness and log off.
- Data deletion.
- Data exports and downloads.
- Navigation by users to user interfaces and queries that users performed.
- Attempts (successful or not) to view or modify privacy-sensitive data, including an identification of the user who made the attempts.

All audit log entries are part of a standard audit trail for NetWitness. Administrators can configure NetWitness to forward audit logs to a designated destination, including third-party systems to provide additional filtering and reporting capabilities. For more information on Global Audit Logging, see "Configure Global Audit Logging" in the *System Configuration Guide*.

Components Covered by the Data Privacy Feature

The figure below identifies the NetWitness components covered by the Version 11.x data privacy feature with a green check mark. Components marked with an X are not supported by data privacy functions. The *NetWitness Getting Started Guide* provides a functional description of NetWitness components.

Note: NetWitness data privacy features are not supported for Warehouse and protected metadata can make it to Warehouse through Warehouse Connector, unless explicitly configured to be filtered out using Warehouse Connector Meta Filters. If protected metadata makes it to Warehouse, users having direct access to Warehouse can query such data. Data privacy officers need to prevent that through administrative, technical, and procedural controls outside of NetWitness.

Data Privacy Feature Implementation by Component

The following table identifies which data privacy features are supported for each NetWitness component. For each component, a check mark indicates if the component supports data obfuscation, data retention enforcement, data overwriting, and audit logging.

Component	Data Obfuscation	Data Retention Enforcement	Data Overwriting	Audit Logging
Ingestion				
Decoder	✓	✓	✓	✓
Log Decoder	✓	✓	✓	✓
Meta Aggregation				
Concentrator	✓	✓	✓	✓

Component	Data Obfuscation	Data Retention Enforcement	Data Overwriting	Audit Logging
Broker	n/a	✓ (stored in DPO cache only)[1]		✓
Real-Time Analysis				
Investigate	✓	✓ (stored in DPO cache only)[2]		✓
Event Stream Analysis	✓			✓
Malware Analysis	✓	✓		✓
Respond	✓	✓		✓
Reporting				
Reporting Engine	✓	✓		✓
Long-Term Analytics				
Archiver	✓	✓	✓(uncompressed)[3]	✓
Warehouse				

Notes:
1 - Brokers can cache data and this needs to be cleared by configuring an independent rollover and other removal of cache as required. The administrator can configure cache rollover for a Broker using the Scheduler in the Services Config view Files tab.
2 - Investigate and the NetWitness Server cache data, and this is cleared automatically every 24 hours.
3 - The overwriting procedure described in Configure Data Retention applies to uncompressed data.

Component-Specific Configuration Guidelines

NetWitness components and modules that obtain access to privacy-sensitive metadata and their obfuscated counterparts are Investigate, Event Stream Analysis (ESA), Malware Analysis, Respond, and Reports. They get access to data based on the permissions defined for the role to which the user belongs. The Administrator or DPO configures each Decoder or Log Decoder to identify meta keys that are flagged for obfuscation.

These components have additional guidelines to ensure that they function as expected with a data privacy scheme:

- **Event Stream Analysis**. When ESA receives privacy-sensitive data from NetWitness core, ESA passes on only the obfuscated version of the data. ESA does not store or show protected data. There are some additional guidelines for configuring advanced EPL rules and enrichment sources as well as information on how to remove sensitive data globally from all alerts (see "How ESA Handles Sensitive Data" in the *Alerting with ESA Correlation Rules User Guide*).

- **Malware Analysis**. Malware Analysis references certain meta keys during scoring, including `alias.host`, `client`, and others. To ensure no loss of analytical functionality Malware Analysis should be configured as a trusted client; that is, configured to connect to the NetWitness Core infrastructure with an account equivalent to a user in DPO role. Otherwise, if meta keys referenced by Malware Analysis do get tagged for obfuscation and are not accessible to Malware Analysis, some of the Indicators of Compromise (IOCs) may be rendered ineffective.
- **Respond Server service.** The Respond Server service uses a data privacy mapping file to display obfuscated data in alerts.(see "Obfuscate Private Data" in the *NetWitness Respond User Guide*) and has a configurable data retention period for alerts (see "Set a Retention Period for Alerts and Incidents" in the *NetWitness Respond User Guide*).
- **Reports.** In Reporting Engine, each Core service is added as two separate data sources, using the two separate service accounts; one data source has a service account representing the Data Privacy Officer role and the other data source has a service account representing a non-Data Privacy Officer role. "Configure Data Privacy for Reporting Engine" in the *Reporting Engine Configuration Guide* provides procedures to configure data privacy for Reporting Engine.

Recommended Configurations

This topic describes the recommended data privacy implementation for NetWitness and several additional use cases for managing exposure of privacy-sensitive data in NetWitness. Administrators can set up the NetWitness hosts and services to meet data privacy requirements for their environment. This section provides recommended configurations for data privacy and data retention.

Recommended Data Privacy Configuration

The recommended configuration to obtain the best analytical value with data obfuscation enabled is to define privacy-sensitive metadata and keep both original and obfuscated (hash) values of privacy-sensitive data on disk for Decoders, Log Decoders, Concentrators, and Brokers.

The assumption is that only a handful of metadata (approximately 10 meta keys) will be classified as protected and a FIPS 140-compliant algorithm for hashing will be used along with a salt to make reverse engineering the original value difficult. The recommended solution is SHA-256 with a salt length of at least 16 characters and up to 60 characters.

Note: By default, hash values are stored in binary format for faster response times and because it requires less storage space in the database when compared to saving them in string format. The recommended storage method is text/string.

Brokers and Investigate may have original and obfuscated data in cache due to data privacy officers using Investigate to confirm the original value to which the obfuscated value maps during investigations. Downstream services can also limit the use of the original sensitive values to in-memory processing so that data does not persist on disk in those downstream systems; this holds true for ESA and Malware Analysis.

The recommended solution to delete data when ready is the built-in and automatic data retention enforcement, which deletes data at a certain threshold. You can use this method for the following components: Decoder, Log Decoder, Log Collector, Archiver, Malware Analysis, NetWitness Respond, and Reporting Engine. You can manually configure Event Stream Analysis to support similar automatic data retention enforcement.

To manage cache storage, the NetWitness Server clears cache related to investigations of events every 24 hours. The Broker can also be configured to execute a periodic removal of locally stored cache.

Options for Data Retention Configurations

NetWitness provides alternative controls that the administrator can apply to enforce stronger restrictions on privacy-sensitive data storage when data obfuscation is enabled.

Data Storage With Data Retention Options in Effect

The following table summarizes where data is stored in the default configuration with no data privacy as well as for each data retention alternative. A checkmark indicates that privacy-sensitive data is saved on the component; a blank indicates that no privacy-sensitive data is stored on the component.

Component	Default Configuration	Data Storage Options		
	Original Data Stored	Original Data and Hash Stored (recommended)	Only Hash Stored	No Data Stored (all metadata is transient)
Ingestion				
Decoder	✓	✓		
Log Decoder	✓	✓		
Meta Aggregation				
Concentrator	✓	✓		
Broker	✓ (Cache only)	✓ (Cache only)		
Real-Time Analysis				
Investigate	✓	✓ (Cache only)		
Event Stream Analysis	✓			
Malware Analysis	✓			
Respond	✓			
Reporting				
Reporting Engine	✓	✓ (Optional)		
Long-Term Analytics				
Archiver	✓ (Optional)	✓ (Optional)		
Warehouse	✓ (Optional)	✓ (Optional)		
Content				
Live	n/a	n/a	n/a	n/a
Fraud Analysis				
RSA Fraud and Risk Intelligence Suite	n/a	n/a	n/a	n/a

Component	Default Configuration	Data Storage Options		
	Original Data Stored	Original Data and Hash Stored (recommended)	Only Hash Stored	No Data Stored (all metadata is transient)
End Point Protection				
NetWitness Endpoint	n/a	n/a	n/a	n/a

Notes:
Cache Only means that sensitive data is in the Broker or NetWitness Server cache. Configure Data Retention provides details about automated and manual clearing of cache.
Optional means that sensitive data storage does occur, but can be limited by optional configurations. For example, to limit where sensitive data is stored, do not enable DPO access for Reporting and do not aggregate original protected data into the Archiver.

Option 1: No Original Data Saved to Disk, Only Hash Stored

Administrators can eliminate the persistence of sensitive data to disk and store only an obfuscated value if the risk of exposure is too great. In this scenario, metadata generated during parsing on the Decoders and Log Decoders is used only in memory and not written to disk. Administrators can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that sensitive metadata is not written to disk. Downstream services do not see original values and must use obfuscated values to conduct investigation and analytics.

To configure this data privacy scheme, data obfuscation must be enabled with hash values configured. You can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that original values are not written to disk.

- Original values identified as sensitive are extracted from the raw data during parsing on the Decoder and Log Decoder and are accessible to the system during parsing (parsers, rules, feeds).
- The Decoder does not save the original values for meta keys identified as sensitive, storing only the hash of original values along with other non-sensitive metadata related to the event.

A side effect of these options is some loss in analytical capability, but you can configure these to suit the needs of your environment.

- By configuring all sensitive data as Transient, sensitive values are not persisted to disk, and the analytic capabilities using the original value are available at parse time only (parsers, rules, feeds).
- Event stream analysis (ESA) and Malware Analysis systems must rely only on the obfuscated meta values when doing their correlation and scoring respectively.
- Reporting Engine is limited to pulling reports using the non-sensitive and obfuscated values.

- The data privacy officer cannot view the original value, but can use the configured hash and salt to determine if an obfuscated value represents a specific known original value.

Option 2: No Original or Obfuscated Values Stored: Not Recommended

Administrators can eliminate the persistence of the original value to disk entirely if the risk of exposure is too great. As in Option 1, in this scenario, metadata generated during parsing on the Decoders and Log Decoders is used only in memory and not written to disk. Administrators can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that sensitive metadata is not written to disk. Downstream services do not see original values and have no obfuscated values to conduct investigation and analytics.

To configure this data privacy scheme, configure individual meta keys on a Decoder or Log Decoder as transient to ensure that original values are not written to disk.

- Original values identified as sensitive are extracted from the raw data during parsing on the Decoder and Log Decoder and are accessible to the system during parsing (parsers, rules, feeds).
- The Decoder does not save not save the original values for meta keys identified as sensitive, storing only non-sensitive metadata related to the event.

A side effect of these options is significant loss in analytical capability, but you can configure these to suit the needs of your environment.

- By configuring all sensitive data as Transient, sensitive values are not persisted to disk, and the analytic capabilities using the original value are available at parse time only (parsers, rules, feeds). See Configure Data Retention.
- All downstream components have no visibility in the original values, obfuscated or otherwise.
- The data privacy officer has no visibility into the original value obfuscated or otherwise.

Optional Data Overwriting Options

Several options for overwriting data are available, and you should thoroughly understand each one before implementing data overwriting.

Option 1: Limit Disk Space for Continuous Overwriting of Older Data

If the desired data retention period to store the data, and therefore the amount of storage required for that data, is known, the size of the underlying hardware or the partition can be limited to that size. By reducing the hard drive storage or the partition size, the amount of free space available that has to be filled before new data overwrites it would also be limited. The newly ingested data continually overwrites the older data. Either solution must be done at deployment time to be effective.

Side effects of this option are:

- The removal of some disks will limit the number of resources available to distribute the I/O, causing some degradation in performance.

- The smaller partition size may cause some degradation in performance, but would alleviate some of the performance impact of removing disks.

Option 2: Use Tiered Storage to Overwrite Data on a Scheduled Basis

If overwriting of data is required on a scheduled automatic basis, you can configure the Decoders and Concentrators to use tiered storage. The tiered storage configuration provides a mechanism for invoking a script after a database file has been removed from the application but prior to its removal from the file system. If necessary, instead of moving the file to the second tier, or cold storage, (the intended function in a tiered storage use case), the script can use a utility like the CentOS `shred` utility to overwrite the file. This tool is less effective when the database is stored in a journaling file system like XFS, in which the Core database resides, and on a RAID logical drive like the ones with which the Core hosts connect.

Most other NetWitness components do not have this option; their data is stored in a database that does not support the tiered storage mechanism. The only other component that could use this overwrite method is the Reporting Engine since it saves reports and alerts as individual files. However, the Reporting Engine charts are stored in a database so they would be immune to this technique.

Option 3: Purge Data Using String and Pattern Redaction Option

Data purging provides a mechanism to strategically overwrite a specific subset of data from the system in case any sensitive data has been persisted either on purpose or by accident. The NetWitness `wipe` utility allows for unique patterns to be written over the data in the meta and packet databases for Core services, which may contain RAW packets or logs for existing sessions, based on a session identifier. All Core components have the capability to overwrite a subset of data that has been found by executing a query string, including regex patterns. The session identifiers resulting from the query are fed into the NetWitness `wipe` utility.

Note: This option is not available if the data in the Core database has been compressed (as typically done in Archiver deployments).

In most NetWitness components the database in use does not provide a built-in redaction or secure deletion mechanism. The Malware Analysis component can overwrite the data object in the database with the value `private` instead of deleting it during the data retention management process, but this is not meant to be a secure deletion mechanism.

Caution: Using this method on a large number of sessions has two drawbacks: it can be time-consuming and impact performance.

See Purge Data Using String and Pattern Redaction Option for procedure.

Limitations to Data Overwriting

There are limitations to the overwriting techniques described as Option 2 and 3. To perform the overwrite of the data in the disk sectors, the above options for overwriting and the overwrite command line tool provided as an alternative method (`shred`, a function of CentOS) make assumptions about the disk layout. NetWitness hosts use SSD drives and RAID configurations for performance and reliability reasons, and these inhibit the functionality of the overwrite techniques. If overwrite techniques alter SSD drives and RAID configurations in an attempt to increase security, there will inevitably be an associated performance cost reflected in ingest rates, query speeds, and potentially other areas. The command line tools available for overwrite are recommended only for special use cases when it is necessary to redact specific data. The tools are not for use in a real-time continuous method because of the potential performance cost that will be incurred.

Quick Start Procedures

This section provides end-to-end instructions for preparing to configure data privacy features, then completing the configuration of the recommended data privacy solution.

- Prepare to Configure Data Privacy
- Configure the Recommended Data Privacy Solution

Prepare to Configure Data Privacy

This topic provides general guidelines for planning and configuring data privacy policies in the NetWitness network. Before beginning configuration, you must understand the data that needs to be protected on your network and develop a plan. You will need to:

1. Identify the meta keys that hold privacy-sensitive data and need to be protected. This decision is based on requirements specific to your site.
2. Decide which users need access to privacy-sensitive metadata and raw content. The first decision is whether to separate the DPO and administrator roles for your site by configuring a custom administrators system role on Decoder and Log Decoders and removing the `dpo.manage` permission. By default, administrators have all permissions including the ability to configure the salted hash transform used to obfuscate data; some sites may want to reserve this access for data privacy officers. "Service User Roles and Permissions" in the *Hosts and Services Getting Started Guide* has more details on exactly what permissions each role has and the purpose of the permissions.
3. Plan the configuration changes you need to make in your NetWitness deployment to support adequate data privacy.
4. Assess how your configuration may impact out-of-the-box and custom content. For example, by default content available through Live for Reporting Engine is not geared toward obfuscated meta values.

In a single deployment, certain data-privacy configurations in the Core services must be the same. The following table lists these settings and uses a checkmark to identify the services for which the configuration must be the same. In the heading, the following abbreviations are used: D = Decoder, LD = Log Decoder, A = Archiver, C = Concentrator, and B = Broker.

	Configuration must be the same for these services:				
Setting	**D**	**LD**	**A**	**C**	**B**
Hash algorithm and salt for privacy-sensitive data	✓	✓			
Language key data privacy attributes in the custom index file (includes configuring keys as protected)	✓	✓	✓	✓	✓
Transient meta keys (not persisted on disk) per service and parser	✓	✓			
Meta data and raw content visibility per system user group. (The meta keys must exist in the custom index file.)	✓	✓	✓	✓	✓
User who has the `Aggregation` service user role assigned is added.*	✓	✓	✓		

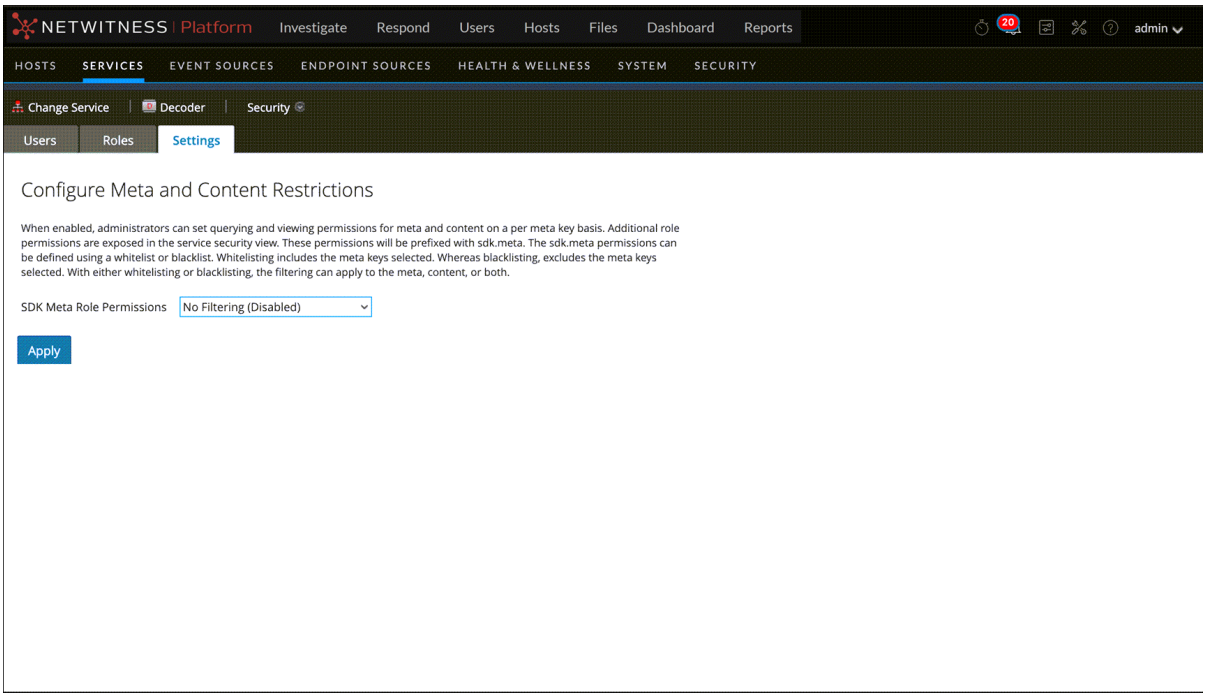
* When trying to access data on an aggregate service, the Log Collector or Broker requests authentication. When prompted to enter user name and password, you must authenticate as a user who is assigned the `Aggregation` service role. "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide* provides detailed information about this role. Follow the instructions in "Add, Replicate or Delete a Service User" in the *Hosts and Services Getting Started Guide* to create a user and assign the new user the Aggregation service user role.

Configure the Recommended Data Privacy Solution

This topic tells administrators and data privacy officers how to configure the recommended data privacy solution in a NetWitness network. These are the basic steps to follow to configure the NetWitness system to identify sensitive data and determine who can see the sensitive data. The recommended configuration generates obfuscated values of certain original meta keys and then persists both the original and obfuscated data so that it is available to users assigned privileged role access.

This configuration has several parts:

1. Create two users with different levels of permissions. One user (the data privacy officer) can view all metadata and another user (an analyst) is restricted from seeing certain metadata and content with associated metadata.
2. Set up two transforms using a salt and hash to create an obfuscated version of original `username` and `ip.src` meta keys.
3. Configure data retention on the Decoder and Concentrator services.

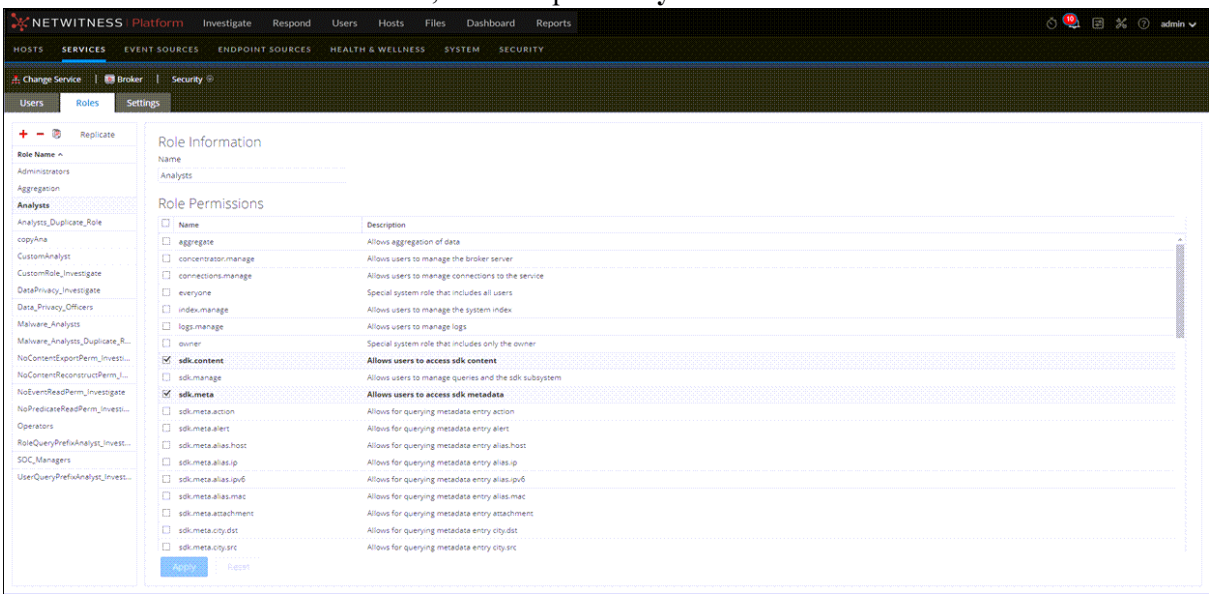


Note: The following conditions are required in order to complete this procedure:
-The Concentrator and Decoder must be added to the NetWitness Server using trusted connections.
-The NW Server version must be 11.x or later.
-The Core services must be 11.x or later.
-Aggregation must use Aggregators accounts on all Core services.

Configure Metadata and Content Restrictions on Brokers, Concentrators, and Decoders

Note: In version 11.6, if these 12 metas namely `'sessionid','nwe.callback_id', 'medium','session.split','ip.dst','ip.src','ipv6.src','ipv6.dst','tcp.dstport','tcp.srcport','udp.dstport', and 'udp.srcport'` are restricted then the group events option will be disabled.

To restrict the metadata and raw content that users can view, you must enable SDK system roles to allow more granular controls by configuring metadata and content restrictions on each service in the Services Security view.



1. Go to  **(Admin)** > **Services**, select a service and then select  **> View > Security**.
2. Click the **Settings** tab.

3. In the **SDK Meta Role Permissions** field, select **Blacklist meta and content**. Click **Apply**.

   This allows the administrator to blacklist individual meta keys so that only the data privacy officer can see the meta keys and content. New roles per meta key are added to the Roles tab.

4. Click the **Roles** tab and select a role, for example **Analysts**.

5. In the **Roles** tab,

   a. Select the meta keys that you do not want analysts to see, for example, select `sdk.meta.username` and `sdk.meta.ip.src`.
   This restricts the analyst from seeing the privacy-sensitive meta keys `username` and `ip.src` as well as any content for any session that contains that metadata within it.

b. Ensure that `sdk.packets` is selected.
   If it is de-selected, analysts lose the ability to bulk export raw packets and logs. In NetWitness Platform 11.0 and later, RBAC just works for packets. Sessions that are restricted are just skipped during pcap generation in Investigate. Sessions that are allowed have packets returned. For more information on RBAC, see the *System Security and User Management Guide*.

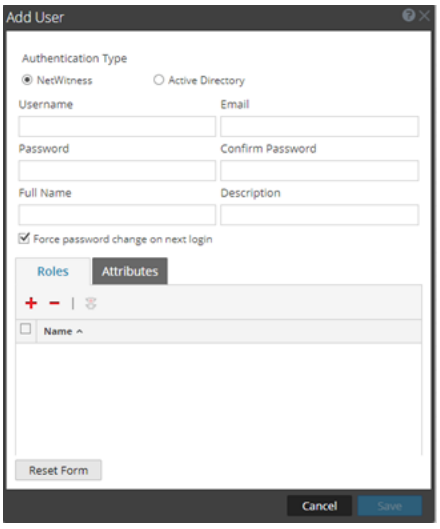
c. Click **Apply**.

6. In the Roles tab, ensure that the `Data_Privacy_Officers` role has no `sdk.meta.values` selected. Click **Apply**.

   A DPO can view any metadata and any session.

   In the Roles tab, ensure that the `Aggregation` role has the following permissions: select `aggregate`, `sdk.content`, `sdk.meta`, and `sdk.packets`.

Add Data Privacy Officer and Analyst Accounts on the NetWitness Server



You must add two new user accounts in NetWitness at the system level to depict a privileged data privacy officer and a typical analyst. If the environment is configured using the default trusted connections, you do not need to create the new user accounts on the Core services (Brokers, Concentrators, and Decoders). When a user is created in the NetWitness Server, that user can log on to the services.

Note: The role name is required to exist on both the server and the services, and the role name for all must be identical. If you create a new custom role on the NetWitness Server, make sure to add it to all Core services as well.

1. Create a new user account for the data privacy officer:

   a. Go to **(Admin)** > **Security**, select the **Users** tab. In the **Users** tab toolbar, click .

   The Add User dialog is displayed.

   b. Create the new account with the following credentials.

Username = <new user name for logon, for example, DPOadmin>
Email = <new user's email, for example, DPOadmin@rsa.com>
Password = <new user's password for logging on, for example, RSAprivacy1!@>
Full Name = <new user's full name, for example, DPO Administrator>

c. Click the Roles tab, , and select the `Data_Privacy_Officers` role for the new user.

d. Select **Save**.

2. Create a new user account for the analyst with limited privileges:

a. In the **Services Security** view, select the **Users** tab. In the **Users** tab toolbar, click .

The Add User dialog is displayed.

b. Create the new account with the following credentials:

Username = <new user name for logon, for example, NonprivAnalyst>
Email = <new user's email, for example, NonprivAnalyst@rsa.com>
Password = <new user's password for logging on, for example, RSAprivacy2!@>
Full Name = <new user's full name, for example, Nonprivileged Analyst>

c. Click the Roles tab, , and select the `Analysts` role for the new user.

d. Select **Save**.

Configure Obfuscated Data on Decoders and Concentrators

This procedure creates the obfuscated values to provide to users who do not have access to the original values.

1. Configure a salt so that the obfuscated value becomes unique. Different companies may have analysts of the same first name and potentially the same login username, and using a salt limits the possibility of someone outside your organization determining your obfuscation mechanism. In this example, you use a simple salt and SHA-256, but the salt is configurable and the hash algorithm can be changed. For additional information, see Configure Data Obfuscation.

a. To define the salt and hash algorithm, go to  **(Admin) > Services**.

b. Select a Decoder in the **Admin Services** view and select  > **View > Config**.

c. Click the **Data Privacy** tab, and select hash algorithm (SHA-256). In the Salt field, type a hash, for example, **rsasecurity**, and click **Apply**.

2. Define the transforms, including the hash format, between the original meta key and obfuscated meta key on the Decoder. The default hash format is binary, but the recommended configuration calls for using the text/string format.

a. While still in the Services Config view, click the **Files** tab, and in the drop-down menu select **index-decoder-custom.xml.** (You can apply this same configuration to the Log Decoder in the `index-logdecoder-custom.xml` file.)

b. Enter the following lines in the available input area:

```
<?xml version="1.0" encoding="utf-8"?>
<language level="IndexNone" defaultAction="Auto">
<key name="username" description="Username" format="Text"
protected="true"><transform destination="username.hash"/></key>
<key name="username.hash" description="Username Hash"
format="Text"/>
<key name="ip.src" description="Source IP Address" format="IPv4"
protected="true"><transform destination="ip.src.hash"/></key>
<key name="ip.src.hash" description="Source IP Address Hash"
format="Text"/>
</language>
```

c. To restart the Decoder service, go to **(Admin)** > **Services**, find the Decoder service you want to restart, and select > **Restart**.
The service should automatically restart.

3. Define the meta keys on the Concentrator in the `index-concentrator-custom.xml` file:

a. Go to **(Admin)** > **Services**, select a Concentrator in the **Admin Services** view, and select > **View > Config**.

b. Click the **Files** tab, and in the drop-down menu select **index-concentrator-custom.xml**

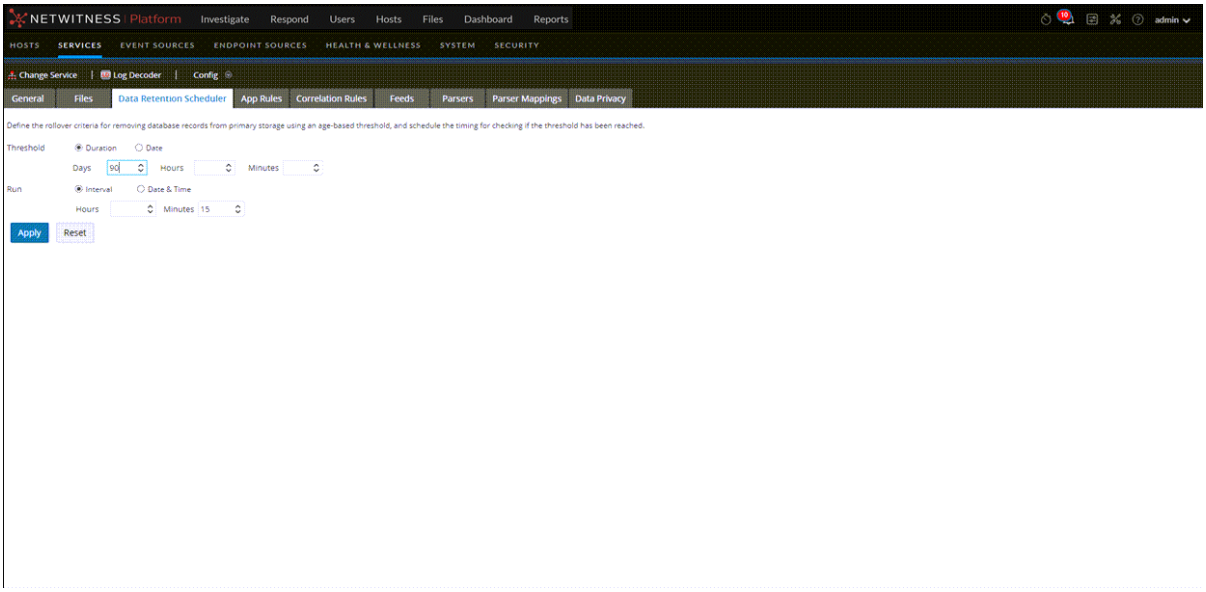
c. Enter the following lines in the available input area:

```
<?xml version="1.0" encoding="utf-8"?>
<language level="IndexValues" defaultAction="Auto">
<key name="username" description="Username" format="Text"
level="IndexValues" protected="true"/>
<key name="username.hash" description="Username Hash"
format="Text" level="IndexValues" token="true"/>
<key name="ip.src" description="Source IP Address" format="IPv4"
level="IndexValues" protected="true"/>
<key name="ip.src.hash" description="Source IP Address Hash"
format="Text" level="IndexValues" token="true"/>
</language>
```

d. To restart the Concentrator service, go to **(Admin)** > **Services**, find the concentrator service you want to restart, and select > **Restart**.
The service should automatically restart.

Configure Data Retention on Concentrators and Decoders

Data retention configuration ensures that the data residing in the NetWitness Core components is deleted after a certain time. Configuring data retention on Concentrators and Decoders is not required for all environments, but it may be necessary to be in compliance with applicable laws and regulations. It is important to evaluate an appropriate retention period for your environment. The Data Retention Scheduler settings that you set apply to ALL data on a Concentrator or Decoder.



In the following example, NetWitness is configured to execute a check every 15 minutes to determine if the duration threshold has been met. If the threshold is met, NetWitness deletes data older than 90 days in the relevant databases.

Caution: The 90 day retention period is just an example. Adjust your rollover criteria depending on the location of the data and the applicable laws. In a strict data privacy environment, such as in Europe where laws require that Personally Identifiable Information (PII) not be saved or removed frequently, you may need to adjust the time.

This procedure is optional. If you do not set a time retention limit, the system automatically deletes the oldest data when the hard drive space is full.

(Optional) For each Concentrator and Decoder:

1. Navigate to the **Services Config** view **> Data Retention Scheduler** tab.

2. Define the data retention period. For example, set the **Threshold** to **Duration**, and type **90** in the **Days** field.
3. Define how often the scheduler checks to see if the threshold has been met. For example, set the runtime to **Interval** and select **15** in the **Minutes** field.
4. To save the configuration, click **Apply**.

Validate Data Privacy Protection

At this point, users have been added with roles that have permissions around specific types of metadata. The next step is to make sure the restricted user (the analyst) cannot view what the unrestricted user (the DPO) can. Also you need to ensure that the data retention configuration is limiting how long data is kept on the systems.

1. View role-based obfuscation in action:
   a. Log on as the unrestricted user (DPOadmin) and make sure this user can see all the data including the protected sensitive data `username` and `ip.src` along with any session that contains that metadata.
   b. Log off and the back on as the DPO user.

c. For each Decoder and Log Decoder, import a PCAP or logfile into the Services System view. Go to  **(Admin)** > Services, click a service, and use the **Upload Packet Capture File** option to upload a PCAP file that contains `username` and `ip.src` metadata.

d. When the import is complete, go to **Investigate > Navigate**, select the Concentrator connected to the Decoder to which the data was just imported.

e. Scroll down to make sure the `username` and `ip.src` meta keys and corresponding values are visible.

f. Click one of the green numbers next to a `username` or `ip.src` value and verify that the session loads in the Events view.

g. Make a note of the session ID to check when logging on as the restricted user.

h. Log off and log on as the restricted user (NonprivAnalyst).

i. Repeat steps c through f to verify that the user cannot see any `username` or `ip.src` metadata or sessions with that metadata including the one previously mentioned.

j. To jump to a specific session in the **Navigate** view, in the **Actions** menu, select **Go to Event** and enter the session ID.

2. Validate that the data retained in the database falls within the retention time configured in the Data Retention Scheduler.

a. Log off and log on as the unrestricted user (DPOadmin).

b. On the Concentrator, navigate to the **Services > Explore** view.

c. In the node tree, select the **database** node and then **stats**.

d. Observe the `meta.oldest.file.time` value and verify that this is not older then the threshold put on the data retention scheduler.

e. Change the service to the Decoder and repeat steps b through d, check for `stats meta.oldest.file.time` and `packet.oldest.file.time`.

In-Depth Procedures

This topic is a collection of procedures that a Data Privacy Officer uses to implement a data privacy plan for the NetWitness network. These procedures are part of an overall configuration, and are performed as needed to implement the data privacy plan and manage the flow of information in the network.

- Configure Data Obfuscation
- Configure Data Retention
- Configure User Accounts for Use in Data Privacy

Configure Data Obfuscation

This topic provides the procedures for configuring data obfuscation in NetWitness. In a single deployment, all Core service configurations for a data privacy solution must be the same; be sure to use the same hash and salt across all Decoders and Log Decoders.

Note: In order for data obfuscation to work, user accounts need to be configured as described in Configure User Accounts for Use in Data Privacy.

Configure the Decoder Hash Algorithm and Salt

Value hashing accomplished as part of the data privacy solution occurs at the time of meta key creation on the Decoder and Log Decoder. Both services have default settings for use with all meta keys whose values are transformed without a specified hash algorithm type or salt value. The initial NetWitness values for defaults are: hash algorithm (SHA-256) and salt (none).

Note: The SHA-1 algorithm and it is not available.

If you want to change the default settings, you can edit them in the Services Config view > Data Privacy tab or in the following nodes in the NetWitness Services Explorer view:

- `/decoder/parsers/transforms/default.type`

  The algorithm to use for any keys with a transform defined that does not specify `type`. The supported algorithms are: `duplicate` and `sha-256`.

- `/decoder/parsers/transforms/default.salt`

  The salt value prepended to any value that is hashed (`sha-256`). This value is optional, an empty salt is valid and produces an unsalted hash. The salt is not defined by default so that you can create a unique salt for your environment. In general, the longer and more complex the salt, the better the security. A salt of up to 60 characters can be used without any major impact. A salt of at least 16 characters is recommended.

To edit the default hash algorithm and salt

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Decoder or Log Decoder service, and select  **> View > Config > Data Privacy**.

3. In the **Configure Hash Algorithm and Salt** section, select a **Hash Algorithm** to use for any meta keys with a defined transform that does not specify type: `sha-256`. (A second algorithm, `duplicate`, is available for administrators to use in validating that expected hashing behavior is occurring in the network.)
4. (Optional) In the **Salt** field, enter a salt value to be prepended to any value that is hashed. This value is optional, an empty salt is valid and produces an unsalted hash. The salt is not defined by default so that you can create a unique salt for your environment. In general, the longer and more complex the salt, the better the security. Best practices for security purposes dictate a salt value that is no less than 100 bits or 16 characters in length. If a unique salt is required for each individual meta key, that needs to be configured in the index file as shown in example 3 below.
5. Click **Apply**.

   The new settings become effective immediately.

Configure Language Keys

The NetWitness Core Language has several language key attributes to facilitate data privacy. You can edit these attributes in the custom index file for each Decoder or Log Decoder. The custom index file (for example, `index-decoder-custom.xml`) is editable in the Services Configuration view > Files tab. After making changes in the index file, like the ones shown in the examples below, a service restart in a specific sequence is required.

Based on the data privacy requirements for your site, configure individual meta keys to be protected using the following `key` attributes:

- `protected`

  This attribute specifies that NetWitness should consider the values as protected and tightly control any release of the value. When propagating the protected attribute, NetWitness ensures that any downstream trusted system treats the values accordingly. Add this attribute to all services that create the protected values (that is, Decoder or Log Decoder) and any services that will provide trusted access (software development kit (SDK) query/values, aggregation) outside of Core services. The exception to this rule is that a Broker with no index file specified does not need to have the attribute added.

- `token`

  This attribute specifies that values for this key are stand-ins for another value and may not be visually interesting. The `token` attribute is informational, primarily for UI elements to display the value in a more useful or visually pleasing format.

- `transform`

  This child element of `key` indicates that any values for a given meta key should be transformed and the resulting value persisted in another meta key. The `transform` element is only required on Decoders and Log Decoders and is informational if specified on any other Core services. The `transform` element has the following attributes and children:

Name	Type	Description	Optional or Required
`destination`	attribute	Specifies the key name where the transformed value will be persisted.	required
`type`	attribute	The transform algorithm to apply. If not specified, the value of `/decoder/parsers/transforms/default.type` is used.	optional
`param`	child-element	A name/value pair, where each `param` element has a required attribute `name` and the child text is the value. The only supported `param` is used to specify a meta key-specific `salt` value. If not specified, the following value is used: `/decoder/parsers/transforms/default.salt`	optional

Example 1

On a Decoder or Log Decoder, mark `username` as protected and hash all values into `username.hash` with the default algorithm and salt:

```
<key name="username" description="Username" format="Text" protected="true">
<transform destination="username.hash"/></key>
```

Example 2

On a Concentrator, mark `username` as protected and `username.hash` as token:

```
<?xml version="1.0" encoding="utf-8"?> <language level="IndexNone"
defaultAction="Auto">
<key description="Username" format="Text" level="IndexValues" name="username"
protected="true"/>
<key description="Username Hash" format="Binary" level="IndexValues"
name="username.hash"
token="true"/> </language>
```

Example 3

On a Decoder or Log Decoder, mark `username` as protected and hash all values into `username.bin` with the specified algorithm and salt:

```
<key name="username" description="Username" format="Text" protected="true">
<transform destination="username.bin" type="sha-256">
param name="salt">0000</param> </transform></key>
```

Configure Metadata and Content Visibility Per User Role on Core Services

On individual Broker, Concentrator, Decoder, Log Decoder, and Archiver services being viewed in the Services Security view (**Admin) > Services > Security**), administrators can configure the visibility of metadata and content based on the user group or role assigned to a user. This is called the SDK meta roles capability, and it is enabled by default. Administrators who want to configure metadata and content visibility per user must not disable the `sdk.content` permission (in the Roles tab). If the `sdk.content` permission has been disabled in the Roles tab, packets and raw logs are not visible to `system.roles` node. The `system.roles` node handles the filtering using the method configured in the Settings tab.

With `sdk.content` capability enabled, the next step is to select the method of filtering metadata and content in the Settings tab. Selecting a blacklist or whitelist option makes additional permissions for specific meta keys available in the Roles tab. The result is that administrators can choose a user role, such as analyst, in the Roles tab and select specific meta keys (and content) to be blacklisted or whitelisted for that user group. The permissions apply to any user in the user group.

For the Events view to display events correctly, the `sdk.meta.medium` meta key must be enabled to display values in the Type column (one of the default columns in the Events list). In addition, any meta keys used in a Query Prefix under User Settings in the Users tab or a PreQuery configured for Investigate must be enabled (**Admin) > Security > Users** or **(Admin) > Security > Roles**). If the meta key is not enabled for the user group, the column will not be displayed in the Events list.

Note: In the Version 11.4 and later Events panel, events are listed even when the user does not have permission to view the event reconstruction. In addition, the download options may still be available when a user does not have permission to view the event reconstruction. In these cases the user is allowed to download the events, but the output is an empty file because restricted permissions are enforced during the download.

The following table lists the options for filtering in the Settings tab and the numeric values used to disable (0) and the types of filtering (1 through 6). There is no need to know the numeric value unless configuring metadata and content visibility manually in the `system.roles` node.

system.roles Node Value	Settings Tab Option	Event Metadata	Original Event
0	**No Filtering.** System roles that define permissions on a per meta key basis are disabled.	Visible	Visible
1	**Whitelist meta and content.** By default no meta keys and no packets are visible. Selecting individual SDK meta roles per user group allows users to see metadata and packets for that SDK meta role.	Not Visible-Select to Show	Not Visible-Select to Show
2	**Whitelist only meta.** By default packets are shown, but no metadata is visible. Selecting individual SDK meta roles per user group allows users to see metadata for that SDK meta role.	Not Visible-Select to Show	Visible
3	**Whitelist only content.** By default metadata is visible, but no packets are visible. Selecting individual SDK meta roles per user group allows users to see packets for that SDK meta role.	Visible	Not Visible-Select to Show
4	**Blacklist meta and content.** By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing metadata and packets for that SDK meta role.	Visible-Select to Hide	Visible-Select to Hide
5	**Blacklist only meta.** By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing metadata for that SDK meta role.	Visible-Select to Hide	Visible
6	**Blacklist only content.** By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing packets for that SDK meta role.	Visible	Visible-Select to Hide

Three factors determine what a user sees:

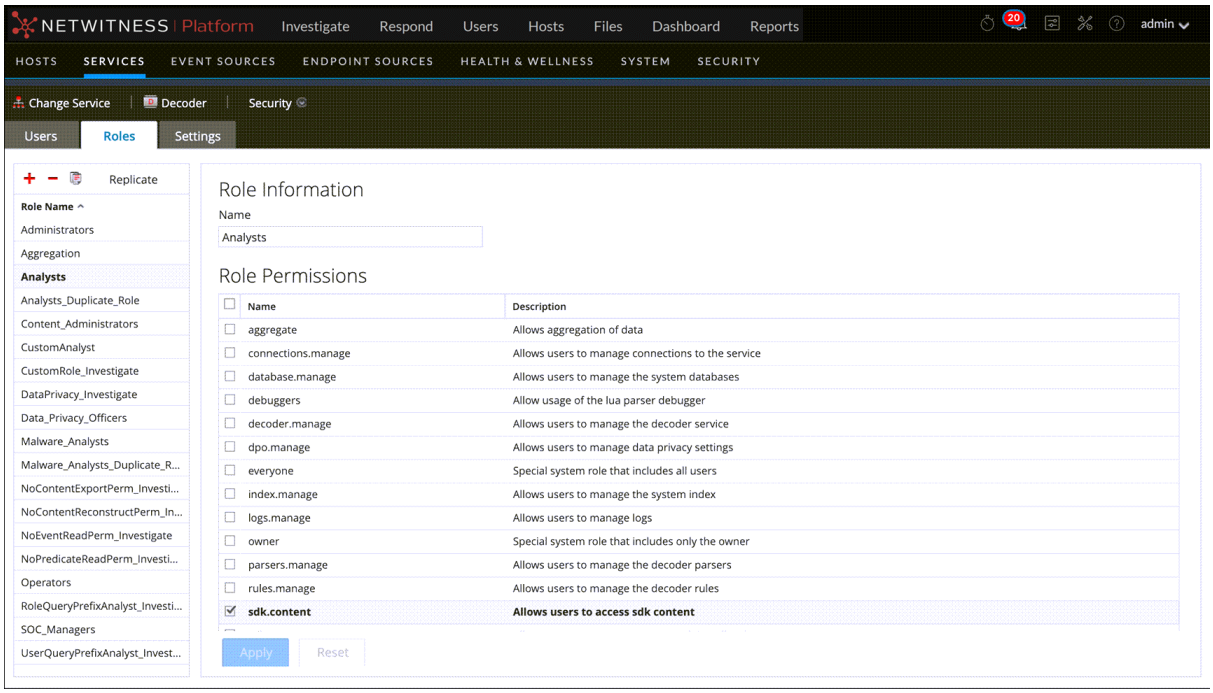
- The SDK meta role setting (blacklist or whitelist).
- The restricted meta keys configured for the group to which the user belongs.

- The meta keys in the session being analyzed. These include meta keys specified in a query prefix for a user at the service level, and for roles and users at the system level.

Caution: Be aware that with blacklisting, implicit trust is granted for all except the configured metadata. For a Decoder to have RBAC enabled and use implicit trust, it must only use a blacklist system setting; a whitelist setting will result in some issues with meta keys that are not explicitly enabled and therefore not visible. It is impossible to grant implicit trust under whitelist rules because the universe of meta keys cannot be known. If you want to use whitelisting, a workaround is to turn RBAC off for the Decoder and disable any user accounts from connecting directly to the Decoder if they should use RBAC.

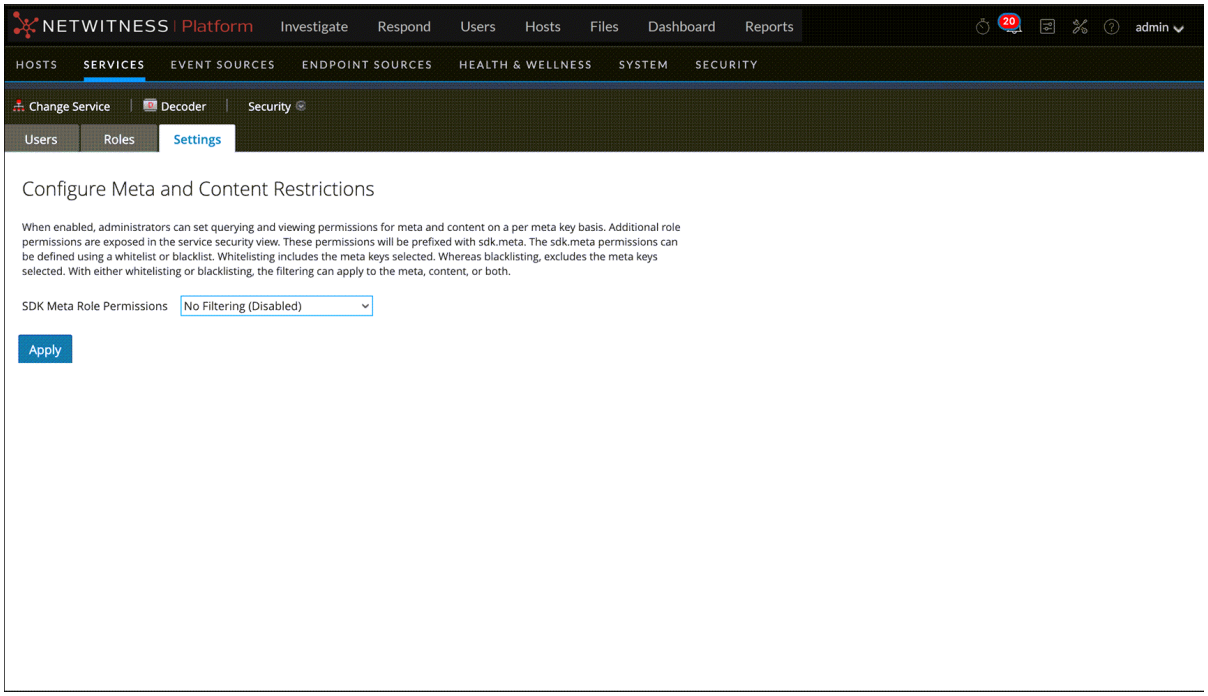
Here is an example of how the SDK meta role configuration meshes with a Group that has restricted meta keys.

Configuration:



- The SDK meta role setting is **Blacklist meta and content**. With this option implemented, all metadata and all content (packets and logs) are visible by default.
- The administrator has restricted meta keys configured for the Analysts group to prevent viewing of sensitive data (for example, `username`).
- The packets and logs for any session that includes the `username` meta key are not visible to an analyst.

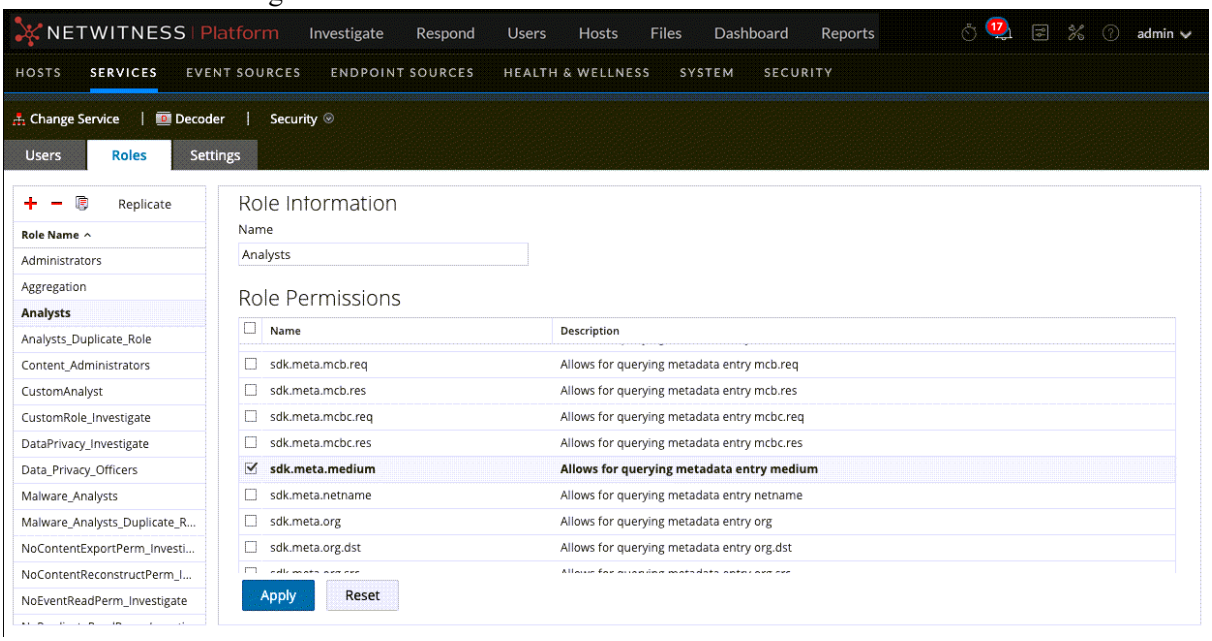
Result: Now a user who is a member of the Analyst Group investigates a session. Depending on the content of the session, the results are different:



- Session 1 includes the following meta keys: `ip`, `eth`, `host`, and `file` The session does not include `username` so all packets and logs in the session are displayed.
- Session 2 includes the following meta keys, `ip`, `time`, `size`, `file`, and `username`, Because the session includes `username` , no packets or logs from the session are displayed for the analyst.

To configure metadata and content restrictions for a Decoder or Log Decoder:

1. Go to  **(Admin)** > **Services**.
2. In the **Services** view, select a Broker, Concentrator, Decoder, Log Decoder, or Archiver service and select  **> View > Security**. Click the **Roles** tab, select a role, and verify that the `sdk.content` permission is enabled.



3. Click the **Settings** tab.

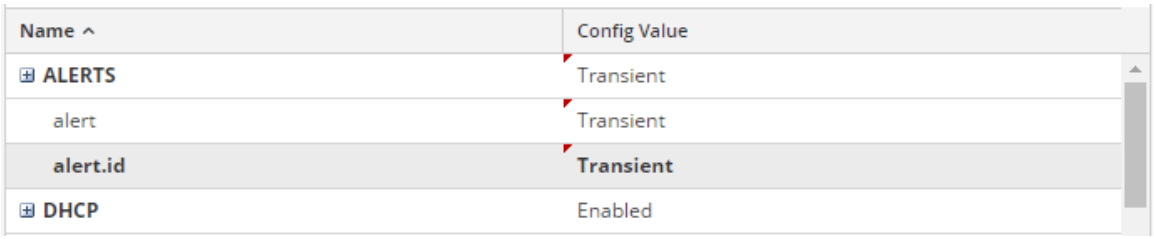
4. Select one of the filtering methods (blacklist or whitelist) and content types (meta and content, meta only, or content only), and click **Apply**.
5. Click the **Roles** tab and a role for which you want to allow content (whitelist) or block content (blacklist) as specified in the SDK Meta Role Permissions setting.

The Role Permissions for the selected role are displayed, and the SDK Meta Role Permissions are available for selection, for example, `sdk.meta.medium`. If you selected one of the whitelist options in the SDK Role Permissions setting, you must assign each SDK meta role to make the selected content visible to users assigned that SDK meta role. The `sdk.meta.medium` permission must be enabled in order for the Type column to be displayed in the Investigate > Events view. If you selected one of the blacklist options in the SDK Role Permissions setting, selected content will be hidden from users assigned that SDK meta role.

6. Select the SDK meta role permissions for users assigned this role. Click **Apply**.

The settings become effective immediately and apply to new packets and logs processed by the Decoder or Log Decoder.

Configure Meta Keys Not Written to Disk Per Parser on a Decoder



On a Decoder and Log Decoder, a Data Privacy Officer can configure individual meta keys that are not written to disk. To do so, the DPO specifies the meta keys as transient in the index and the parser configuration.

Note: The same capability was previously available on Log Decoders, and was configured when setting up parsers by modifying the table-map.xml file. Now it is integrated in the Services Config view.

To configure selected meta keys on individual parsers that will not written to disk:

1. Go to **(Admin)** > **Services**.
2. In the **Services** view, select a Decoder or Log Decoder service and select **> View > Config**.
3. In the **Parsers Configuration** section of the **General** tab, select a parser and then select **Transient** in the **Config Value** drop-down list. Access the list by clicking on the configuration value (Enabled, Disabled, or Transient).

The configuration change is marked by a red triangle.

4. Click **Apply**.

   The change is effective immediately. The parser configured as Transient will no longer store meta keys to disk.

Configure Data Retention

A NetWitness user with the role of Administrator can configure NetWitness to ensure that sensitive data has been removed after a specific retention period, regardless of system ingest rate. For instance, the policy might be to keep packets (both raw data and metadata) for no more than 24 hours, and to keep some logs (both raw data and metadata) for up to seven days. If sensitive data makes its way into another database on the Reporting Engine, Malware Analysis, Event Stream Analysis, and NetWitness Servers, data retention can be managed there as well. The administrator needs to set up each service individually across all NetWitness components (except Event Stream Analysis) based on policy and data privacy laws.

Sensitive data may also be in cache.

- Brokers can cache data and this needs to be cleared by configuring an independent rollover and other removal of cache as required. The administrator can configure cache rollover for a Broker by editing the `Scheduler` file in the Services Config view Files tab.
- Investigate and the NetWitness Server cache data, and this is cleared automatically every 24 hours.
- If the Data Privacy Officer (DPO) exports data, that is the same as saving data on the NetWitness Server in the jobs queue. To clear this data, the administrator or DPO should clean up the jobs queue on a regular basis.

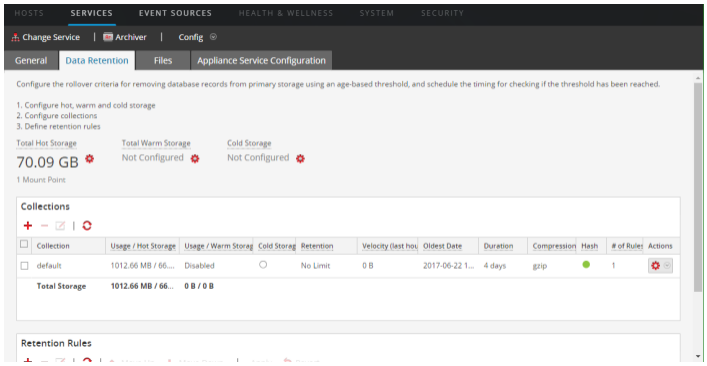
Data Retention

You can schedule a recurring job for Decoder, Log Decoder, and Concentrator services in NetWitness to check if data is ready to be removed. The Data Retention Scheduler provides a means to configure basic scheduling (see below), and advanced Scheduler settings are also available by editing the `Scheduler` file in the Services Config view Files tab or the node in the Explorer view.

The Archiver has flexible data storage and retention options. You can place different types of log data into individual collections and manage them separately. These collections enable you to specify how much of the total storage space to use and how many days to store the logs in the collection. You can also determine whether to delete the log data or to move it to offline cold storage after it reaches the maximum specified storage space for the collection.

For example, you can put sensitive information in a collection and configure a limitation on how long to keep it, such as 30 days. To delete the data after 30 days, you would not enable warm or cold storage for that collection.

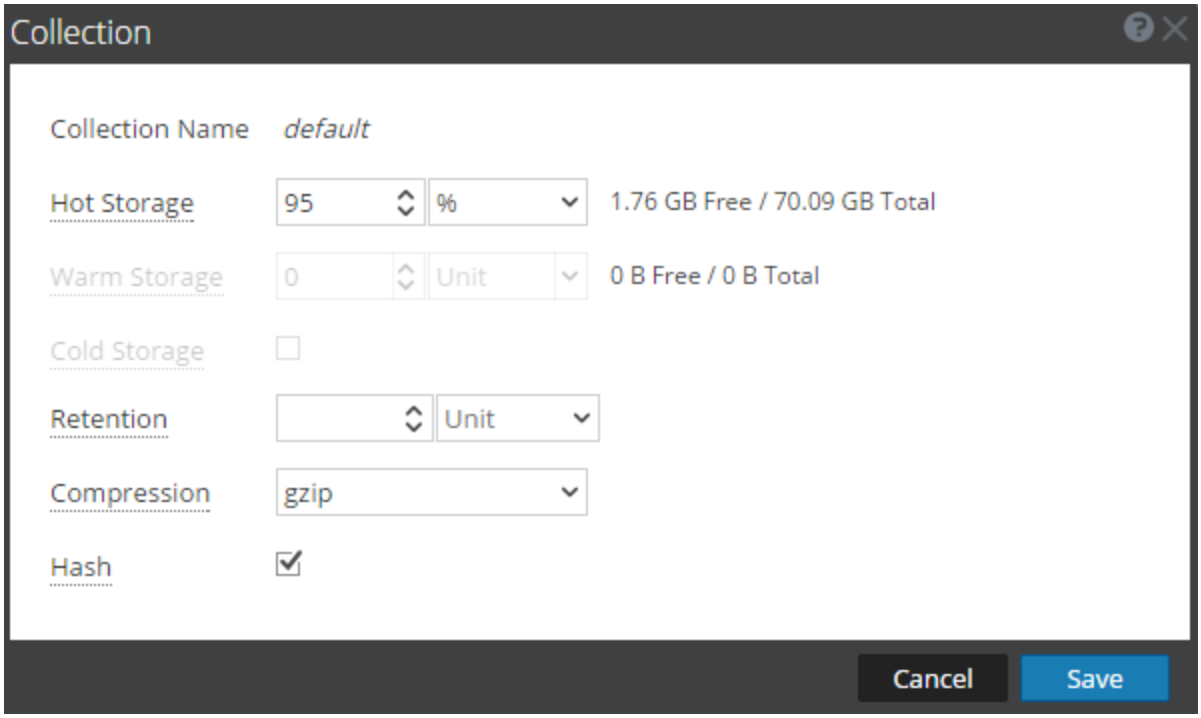
Deleting versus Retaining Log Data



Administrators can configure hot, warm, and cold tiered storage on an Archiver. Cold storage contains the oldest log data that is either required for the operation of the business or mandated by regulatory requirements. When a collection reaches its retention limits for hot and warm storage, NetWitness deletes the log data from hot or warm storage. With cold storage configured, a copy goes into cold storage before the logs are deleted from hot or warm storage. You can choose whether to enable cold storage for each log storage collection. NetWitness does not manage cold storage.

Enable or Disable Cold Storage in a Log Storage Collection

When log data in a collection reaches its retention limits for hot and warm storage, you can delete it or move it to offline (cold) storage.



To enable or disable cold storage in a log retention storage collection on an Archiver:

1. Go to **(Admin)** > **Services**.
2. Select the Archiver service and select **> View > Config**.
3. Click the **Data Retention** tab.

4. In the **Collections** section of the Data Retention tab, select a collection and click .

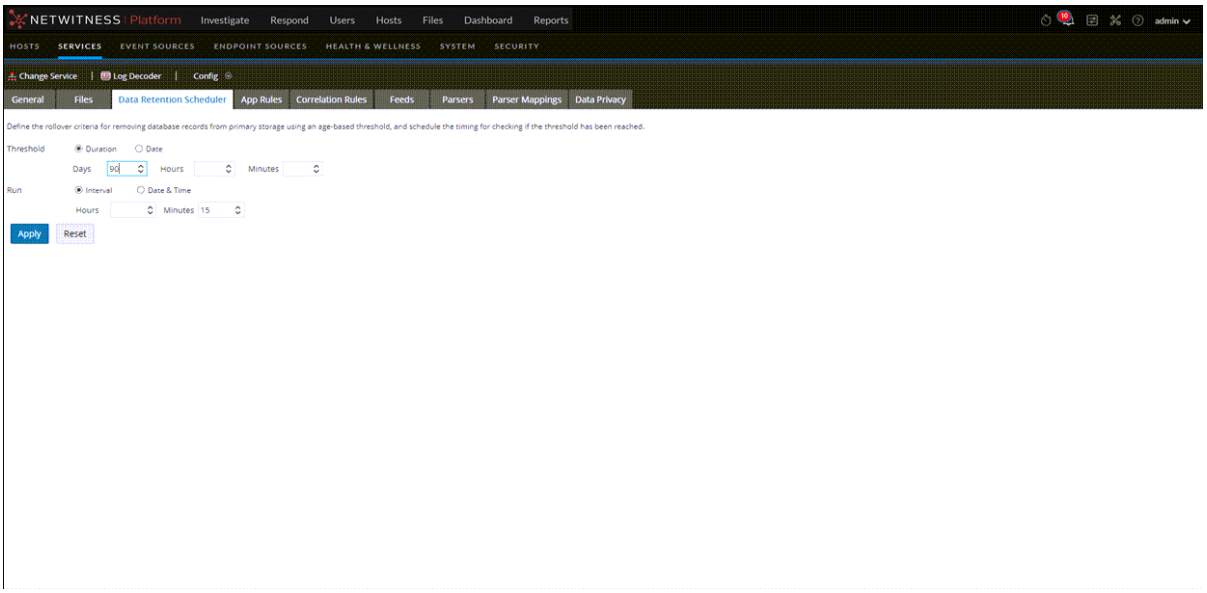
   The Collection dialog is displayed.

Note: If the maximum storage size of the collection does not allow full data retention for the retention period specified, NetWitness deletes the data or it goes to warm or cold storage if specified in the collection.

5. Enable or disable cold storage:
   - To delete log data when the collection reaches its specified retention limits, clear the **Cold Storage** checkbox.
   - To move log data to offline storage when the collection reaches its specified retention limits, select the **Cold Storage** checkbox.
6. Click **Save**.

Configure Log Retention and Storage on an Archiver

To configure log retention and storage on an Archiver, see "Configure Archiver Storage and Log Retention" in the *Archiver Configuration Guide*.



Schedule a Recurring Job to Check Data Retention Thresholds

The data retention scheduler configuration ensures that the data residing in the Decoder, Log Decoder, and Concentrator components is deleted after a certain time. For example, data retention on a Decoder might be configured to execute a check every 15 minutes to determine if the specified duration threshold has been met. If the threshold is met, NetWitness deletes data older then 4 hours in the relevant databases.

Caution: The schedule overwrites any previous schedule and becomes effective immediately. If the retention period is decreased, the data exceeding this retention period is removed.

For a Decoder, Log Decoder, or Concentrator:

1. Go to  **(Admin)** > **Services**.
2. In the **Services** view, select a Decoder, Log Decoder, or Concentrator service and select  **> View > Config**.
3. Click the **Data Retention Scheduler** tab.

4. Set the threshold based on the duration of time the data has been stored or the date on which the data was stored. Do one of the following:

   a. To define the duration of time that data can be stored before removal, select **Duration**, and then specify the number of days (365 maximum), hours (24 maximum), and minutes (60 maximum) that have elapsed since the time stamp on the data.

   b. To define the removal of data based on the date of the timestamp, select **Date**, and then specify the monthly date and time in the Calendar and Time fields.

5. Do one of the following to configure the **schedule for checking rollover criteria**:

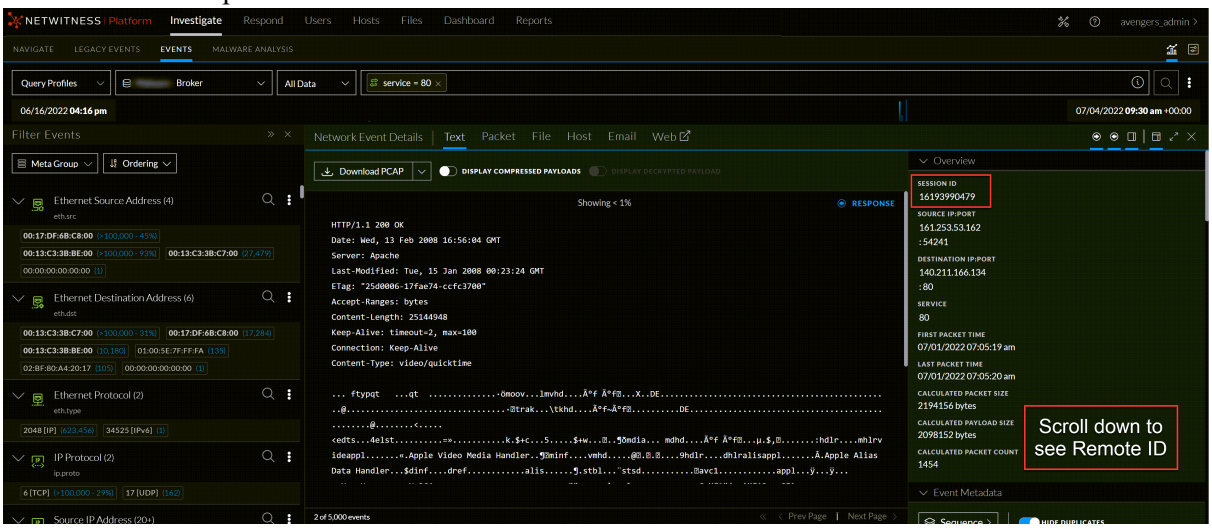
   a. If you want to set a regular interval at which the scheduled database check occurs, select **Interval** and specify the **Hours** and **Minutes** between the scheduled checks.

   b. If you want to set a regular date and time at which the scheduled database check occurs, select **Date and Time** and specify the system clock time in `hh:mm:ss` format for the rollover.

      - To specify the day, select **Every Day**, **Weekdays,** or **Weekends**. The Scheduler defaults to **Every Day**.
      - To specify a different set of days of the week, select **Custom** and click on each day on which the database check occurs.

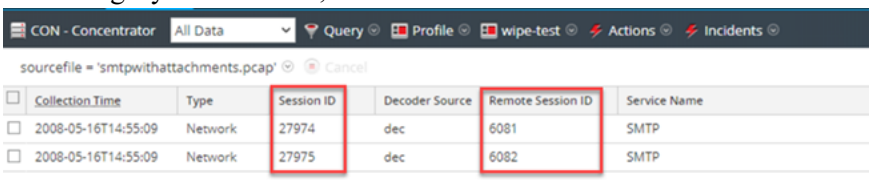
      Caution: The schedule overwrites any previous schedule and becomes effective immediately. If the retention period is decreased, the data exceeding this retention period is removed.

6. Click **Apply** to complete the configuration.



Purge Data Using String and Pattern Redaction Option

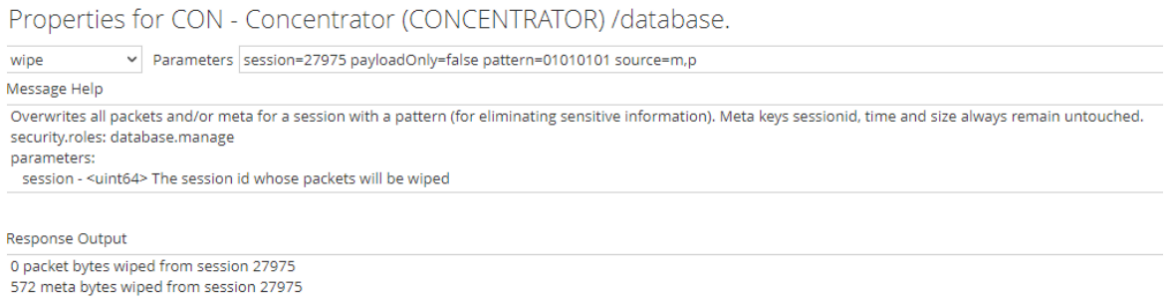
If you have data where you do not want it to be (for example, you have classified data in your unclassified Network Decoder), purging data using string and pattern redaction is the fastest way to wipe data. It is ideal for smaller amounts of data. This method requires that you identify the data to be purged by using a query in either the Investigate view, the REST API interface, or the NwConsole. Using the Investigate view requires additional steps to clear user interface cache on the admin server. This procedure includes the extra steps needed when you find the data to be purged using the Investigate view.



Note: If a large amount of data needs to be purged, it is best to start with the data on the storage component. Refer to Optional Data Overwriting Options for additional information.

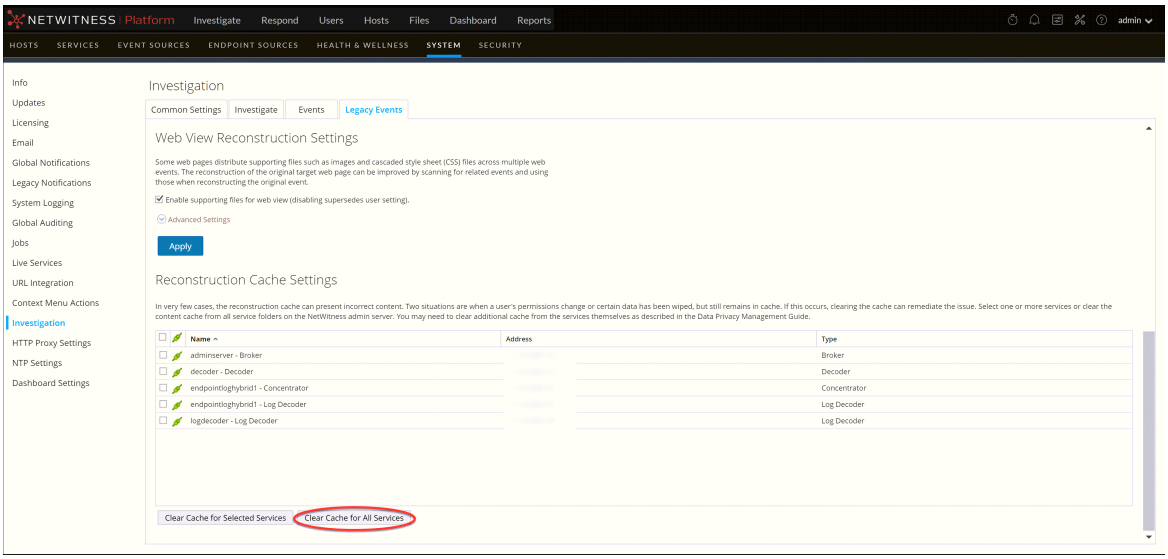
To purge the data:

1. Go to **Investigate** > **Events** or **Investigate** > **Legacy Events** and find the events that you want to purge. In the Events view you can see the session ID in the Overview panel. You need to scroll down in the Event Meta panel to see the remote ID.

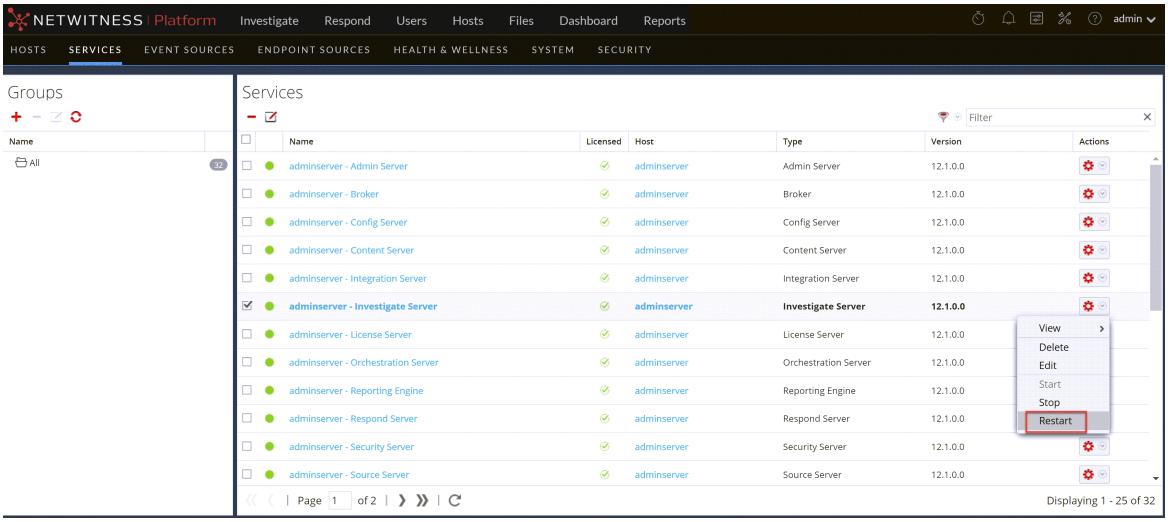


In the Legacy Events view, both IDs are visible in the Events list.

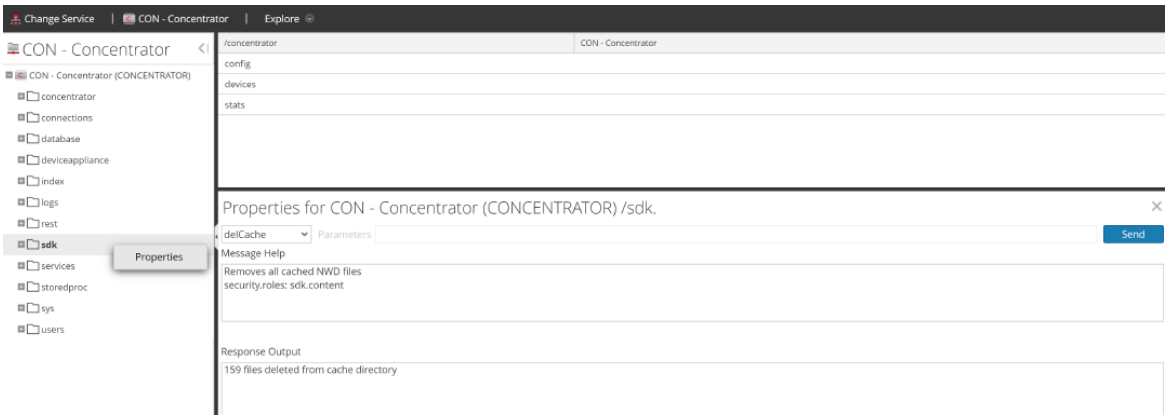
2. Make a note of the session ID and the remote ID of each event to be deleted. In the example above, the session IDs are 27974 and 27975. The remote IDs are 6081 and 6082.
3. Starting with the Concentrator, view the service using the REST API. Refer to the *RESTful API User Guide* for instructions. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
   In the REST API, enter the `wipe` command with the following parameters:



- **`session=<uint64>`**: The session ID whose packets will be wiped.
- **`payloadOnly=<bool, optional>`**: If `payloadOnly` is `true`, only the packet payload will be overwritten. The default value is `true`.
- **`pattern=<string, optional>`**: The pattern uses all zeros by default. If you use a string as your pattern, it will not overwrite any meta values that are not a string type. Therefore, it is best to keep the pattern as a numerical value.
- **`metaList=<string, optional>`**: Comma-separated list of metadata to wipe. The default (empty) is all metadata.
- **`source=<string, optional, {enum-any:m|p}>`**: The types of data to wipe: metadata, packets, or both. The default is packets only. The best option here is to wipe both metadata and packets `(m,p)`.



4. For each Network Decoder and Log Decoder in the path of the query, use the `wipe` command and the remote session IDs to overwrite the raw sessions on disk.



5. To ensure that the indexed meta values that were stored on the Concentrator index are removed, rebuild the index. This can take a long time but is necessary because the `wipe` command does not remove any data from the Concentrator index. Refer to the *Core Database Tuning Guide* for instructions.
6. (Optional) If the data was discovered using the Investigate view, additional steps are necessary:
   a. To clear the query path to prevent an analyst from bringing up an old copy of the session, go to: **(Admin)** > **System** > **Investigation** > **Legacy Events** and click **Clear Cache for All Services**.

b. To clear the cache for a reconstruction in the Events view, restart the Investigate service.

c. To clear the cache for the Concentrator and Network Decoder, go to  **(Admin)** > **Services** > **Concentrator** > right-click **sdk** > **Properties** and  **(Admin)** > **Services** > **Decoder** > right-click **sdk** > **Properties** and execute the `delCache` command. The figure below shows this path for the Concentrator.

An analyst attempting to view the same session in Investigate will see that the raw data is unavailable for viewing and the metadata has been overwritten.

Configure User Accounts for Use in Data Privacy

This topic provides the procedures for configuring user accounts that work with data obfuscation in NetWitness. In order for data obfuscation to work, accounts and permissions for several types of users must be configured.

- Customize the default Administrators system role in NetWitness to remove permissions that should be available only to the Data Privacy Officer.
- Add two new user accounts at the system level to depict a data privacy officer and a typical analyst.
- Add a user account at the service level with the aggregation role so that Decoders and Log Decoders can aggregate data to a Concentrator or Broker.
- On the Reporting Engine, configure two separate service accounts. One service account for general purpose reporting that does not include any sensitive data and the other account for privileged users with access to all data including sensitive data. This procedure is described in "Configure Data Source Permissions" in the *Reporting Engine Configuration Guide*.

Customize the Default Administrators User Role at the Service Level

To separate the data privacy officer and administrator functions on each Decoder and Log Decoder, you need to remove the `dpo.manage` permission from a clone of the Administrators role.

1. Go to  **(Admin)** > **Services**, select a Decoder or Log Decoder, then select  **> View > Security**.
2. In the **Services Security** view, click the **Roles** tab, select **Administrators** and click .
   In the **Enter Role Name** dialog, enter a new role name such as Non_DPO_Administrators and click **Save**.
3. Select the new role.

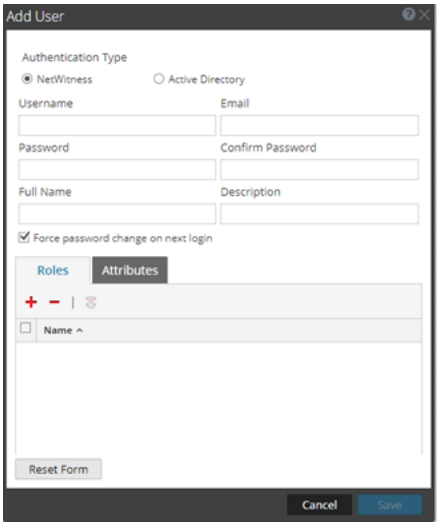
   The Role Information is displayed for editing.
4. Clear the box next to **dpo.manage** so that it is no longer checked and click **Apply**.

   The permission to manage data privacy configuration is removed for the new role.
5. In the **Users** tab, select each user who has the **Administrators** role, and change their role to the cloned role.
6. Validate that the users with the modified Administrators role can login as with admin privileges.
7. Validate that the users with the modified Administrators role cannot configure metadata and content restrictions in the Settings tab.

Add a User Account with the Aggregation User Role at the Service Level

To ensure that Decoders and Log Decoders can aggregate data to a Concentrator or Broker:

1. **Go to** **(Admin)** > **Services,** select a **Decoder** or **Log Decoder,** then select **> View > Security.**
2. In the **Users** tab, add a user with the `Aggregation` role and click **Apply**.



Note: "Aggregation Role" in the *Hosts and Services Getting Started Guide* provides details about the application of this user role.

Add Data Privacy Officer and Analyst Accounts on the NetWitness Server

You need to add two new user accounts in NetWitness at the system level to depict a privileged data privacy officer and a typical analyst. If the environment is configured using the default trusted connections, you do not need to create the new user accounts on the Core services (Brokers, Concentrators, and Decoders). When a user is created in the NetWitness Server, that user can log on to the services.

Note: The role name is required to exist on both the server and the services, and the role name for all places must be identical. If you create a new custom role on the NetWitness Server, make sure to add it to all Core services as well.

1. Create a new user account for the data privacy officer:
   a. **Go to** **(Admin)** > **Security,** select the **Users tab** and click **.**
   The Add User dialog is displayed.

   b. Create the new account with the following credentials.

   Username = <new user name for logon, for example, DPOadmin>
   Email = <new user's email, for example, DPOadmin@rsa.com>
   Password = <new user's password for logging on, for example, RSAprivacy!@>
   Full Name = <new user's full name, for example, DPO Administrator>

c. Click the **Roles** tab, , and select the `Data_Privacy_Officers` role for the new user.

d. Select **Save**.

2. Create a new user account for the analyst with limited privileges:

a. In the  **(Admin)** > **Security** view, click the **Users** tab. In the **Users** tab toolbar, click .

The Add User dialog is displayed.

b. Create the new account with the following credentials:

Username = <new user name for logon, for example, NonprivAnalyst>
Email = <new user's email, for example, NonprivAnalyst@rsa.com>
Password = <new user's password for logging on, for example, RSAprivacy!@>
Full Name = <new user's full name, for example, Nonprivileged Analyst>

c. Click the **Roles** tab, , and select the `Analysts` role for the new user.

d. Select **Save**.

Data Privacy References

The following reference materials are available for management of data privacy and data retention. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

- See "Data Privacy Tab" in the *Decoder and Log Decoder Configuration Guide.*
- See "Data Retention Tab - Archiver" in the *Archiver Configuration Guide.*
- See "Data Retention Scheduler Tab"in the *Hosts and Services Getting Started Guide.*

NetWitness Core Database Introduction

This topic provides an overview of the NetWitness Platform Core database. The NetWitness Platform Core services contain a proprietary database developed specifically for use within the NetWitness Platform products. It bears little resemblance to traditional relational databases, and is not based on any off-the-shelf database technology. As such, many users find that there is a steep learning curve to understanding how the Core database works, and how to make best use of it. The purpose of this guide is to help NetWitness Platform users understand the database and use it to its fullest potential.

As a System Administrator, you can use this information to help plan your NetWitness Platform deployment, and to tune it for best performance. As an Analyst, you can use this guide to structure your analysis in ways that will return reports faster. As a Content Developer, you can use this guide to help write content that will be processed efficiently by the database system.

NetWitness Platform Products Covered by this Guide

This guide covers the capabilities of NetWitness Platform. The following NetWitness Platform components contain the Core database:

- Concentrator
- Archiver
- Decoder
- Log Decoder
- Workbench

Frequently Used Terms

Definitions for terms that are used throughout this document are presented here. The terms are listed in the order in which they enter the NetWitness Platform system:

- **Packet DB** : The packet database contains the raw captured data. On a Decoder, the packet database contains packets as captured from the network. Log Decoders use the packet database to store raw logs. The raw data stored in the packet database is accessible by a Packet ID, however, this ID is typically never visible to the end user.
- **Packet ID** : A number used to uniquely identify a packet or log in a packet database.
- **Meta DB** : The meta database contains items of information that are extracted by a Decoder or Log Decoder from the raw data stream. Parsers, rules, or feeds can generate meta items.
- **Meta ID** : A number used to uniquely identify a meta item in the meta database.
- **Meta Key** : A name used to classify the type of each meta item. Common meta keys include ip.src, time, or service.
- **Meta Value** : Each meta item contains a value. The value is what each parser, feed, or rule generates.

- **Session DB** : The session database contains information that ties the packet and meta items together into sessions.
- **Session** : On a packet Decoder, a session represents a single logical network stream. For example, a TCP/IP connection is one session. On a Log Decoder, each log event is one session. Each session contains the references to all the Packet IDs and Meta IDs that refer to the session.
- **Session ID** : A number used to uniquely identify sessions in the Session DB.
- **Index** : The index is a collection of files that provides a way to look up Session IDs using Meta Values.
- **Core Database** : This refers to the combination of the Packet, Meta, Session, and Index.

For syntax definitions, this document uses EBNF grammar definitions.

NetWitness Core Database History

NetWitness developed the Core database for use in packet capture systems. Early in the history of NetWitness, developers identified that existing database technologies would not be able to keep up with the high ingest rate inherent in full packet capture. Contemporary database technologies were not anywhere close to being able to keep up with capturing the number of sessions received every second, much less sorting every packet. Likewise, the volume of data meant that packet storage would need to be discarded and reused just as quickly as it was consumed. This was also a weakness of databases at the time. Thus, NetWitness created a database consisting of the packet, session, and meta databases.

In order to provide the analytical capabilities of NetWitness Investigator, a meta index was added to the NetWitness database. The index shared the same design goals as the original databases. It was designed to sustain a very high insert rate into a high number of very large indices.

The index has evolved considerably over the years. Early versions of the index were only capable of providing summary estimates about how many unique meta values were present in the meta database. Other versions have had great challenges in meeting acceptable query performance. For example, NetWitness 9.0 more frequently measured report times in minutes rather than seconds. The current version of the index is derived from the NetWitness 9.0 index, but has evolved considerably in order to meet performance expectations and to add new features.

Core Database Strengths and Weaknesses

Strengths:

- High sustained insert rates, without needing down time for bulk inserts.
- Decent query performance simultaneous with high insert rates.
- Automatic cleanup and rollover of old data with minimal fragmentation.
- Extremely high number of meta value indices: more than 100 enabled by default on a Concentrator.
- Ability to scale to Petabyte database sizes and Terabyte index sizes within a single node.

- Using meta key-value pairs, it is very flexible for storing arbitrary meta items within a session. Thus a session can be used to represent nearly any kind of data record.

Weaknesses:

- The query functionality is limited and low level.
- The packet, meta, and session DB schema is fixed, and all customization is done through custom meta keys and values.
- The database provides no transaction atomicity guarantees as you might expect to find in a SQL database.

Basic Database Configuration

This topic covers basic database configuration settings of NetWitness Core services. For information on how to configure the Core services by editing configuration files, see "Service Configuration Settings" in the *Host and Services Getting Started Guide* .

This document assumes that the reader has some familiarity with adjusting the configuration of a NetWitness Core service. To use this document, you should be familiar with one of the mechanisms for modifying the configuration tree of Core services. Examples of such mechanisms include the Explorer view of the Administration pages within the NetWitness Platform user interface, or the REST interface accessible on each service through a web browser.

Find Help within the Core Service

Each configuration item within a Core service has a built-in help description of what the item does. You can view this help information by hovering your mouse over the configuration item in the Explorer view. Each configuration item also indicates whether it can be changed without restarting or if a restart of the service is needed for the change to take effect.

Developers using the REST API can retrieve the help text for each configuration item by sending the `help` message to the configuration node path.

Packet, Meta, and Session Storage

Each of the packet, meta, and session databases are configured through the `/database/config` folder on each NetWitness Core service. Each database has a configurable parameter to specify where the Core service stores data. Packet, meta, and session databases follow a predictable pattern for all of their configuration entries. Configuration items for the packet database start with the prefix `packet` , meta database configuration starts with the prefix `meta` , and the session database configuration items start with the prefix `session` .

Index Storage

The index configuration is stored in the `/index/config` folder on each Core service.

- Tiered Database Storage
- Manifests

Tiered Database Storage

This topic describes tiered database storage and provides recommendations for Hot, Warm, and Cold tier storage.

Starting with version 10.4, the Archiver service has the capability to be configured to use tiered storage. The concept of tiered storage is to put the most recent data on a Hot tier, which is the fastest storage available on the Archiver.

All services use the Hot tier by default.

The next tier is known as Warm and is typically cheaper and slower storage, such as a network-attached storage (NAS). The Warm tier contains older data; how old depends upon how much storage is allocated on the Hot tier and the average ingest rate. When the Hot tier reaches max utilization, the natural progression is to move the oldest data from the Hot tier to the Warm tier. When configured correctly, this happens automatically and is invisible to the end user. Queries and data access happen automatically no matter what tier (Hot or Warm) the data resides on. However, there can be a performance impact when accessing data on the Warm tier as compared to the Hot tier, because access times on the Warm tier are typically slower.

In addition to Hot and Warm, there is also a Cold tier. The Cold tier is only used as a staging area for offline backup. NetWitness Core services do not access data on the Cold tier. NetWitness Core services move the oldest data to the Cold tier and consider it abandoned (the service no longer accesses the data). This data can then be backed up to long-term storage like tape for possible restoration months or even years later, depending on requirements. The backing up and subsequent removal of data on the Cold tier must be handled outside of NetWitness Core services via scripts or other processes.

If the Cold tier becomes full because external processes are not removing data in a timely manner, this causes the NetWitness Core service to eventually stop the ingestion of new data until the problem is corrected.

When moving data to the Cold tier, NetWitness recommends that the directory remain on the same mount point as where it is being moved from. Therefore, if the files are coming from the Warm tier, it is far better for performance reasons to set the Cold tier directory on the same file system. The reason for this is that the service attempts to simply move the file and directory to the Cold tier, which is a nearly instantaneous operation on the same file system. If the move fails, the fallback is to copy the data to the Cold tier, which takes more processing time and causes additional I/O contention on the tier from which it is being copied.

Archiver

The tiers of storage capabilities are used by the Archiver. You can configure Archiver to only use Hot storage (the default), Hot and Warm, or all three (Hot, Warm and Cold). All services must use Hot, you cannot configure a service to only use Warm. Data flows from Hot to Warm and finally to Cold. You can also skip Warm and go from Hot to Cold. If Cold (offline) storage is not configured, the oldest data is deleted on the last configured tier, which has been the standard operating procedure.

The typical Archiver deployment sets all the databases to unlimited size (packet.dir, meta.dir, session.dir, index.dir, and optionally the Warm tier variants), which means that the size specifier is left off or set to zero. This lets the databases and index grow unbounded. Instead of each database managing their own size and rolling out only when each individual database exceeds their configured size, Archiver rolls out everything together using the `/index sizeRoll` command. This enables the databases and index to roll out in unison. For more information on sizeRoll, see "Asynchronous Rollover" in Rollover .

Archiver is typically configured to place the index, session, meta, and packet (log) DB on the same volume, instead of multiple volumes like a Concentrator or Decoder. Although this can potentially cause more I/O contention when concurrent reads happen across multiple databases, it also maximizes overall retention. Because all databases are on the same volume, they are configured to roll out together, which minimizes orphaning of data. Decoder and Concentrator are configured for maximum I/O speed, but can suffer from estimates on the proper volume sizing.

For example, if the session DB is too large, it may have enough storage for six months of retention, whereas the meta DB and index only have retention for four months. Because the session, meta DB, and index are intricately tied together, the shortest retention period for all three define the overall retention period (in this case, four months). Retention of individual databases is mostly affected by factors beyond our control, such as traffic captured, meta generated (parsers, feeds, rules) and filtering. The databases are easily resized by a simple configuration change, but this usually also involves changes at the hardware and file system level to adjust partitions, which complicates dynamic resizing. Archiver avoids these problems by using a single volume for everything, with the trade-off of somewhat slower I/O speed.

Manifests

This topic describes manifest files and provides an example manifest for a meta DB file. It also describes manifest searching and provides an example manifest search.

Manifest files are created with every session, meta, and packet (log) DB file and index slice directory. A manifest file is a file that describes several key pieces of information about the data to which it refers. Manifest files are written as a JSON record. Manifest files travel with the data they represent from tier to tier. If the data they represent is deleted, the manifest file is also deleted, except in the following special case. If the service has `/database/config/manifest.dir` configured to a valid directory, at the point when the manifest data is deleted, a copy of the manifest file is placed into the directory pointed at by `manifest.dir` (the directory is created if it does not exist). This enables a NetWitness Platform feature called historical manifest searching.

The intention of this process is to keep historical manifest files for years, in one location for offline querying. As you might imagine from a service running for many years, this can potentially generate hundreds of thousands of files. This should not be a concern however, as the service automatically compresses files into a single archive in order to save space when they grow too numerous. Manifest files are very small and compress well.

Example manifest (`meta-000000023.nwmdb.manifest`) for a meta DB file:

```
{
    "filename" : "meta-000000023.nwmdb",
    "size" : 185153768,
    "fileTime" : 1403903940,
    "id1" : 150814110,
    "id2" : 159341086,
    "session1" : 4023382,
    "session2" : 4250442,
    "time1" : 1403903879,
    "time2" : 1404739851
}
```

```
filename  = The filename for the db file the manifest represents
size      = The size in bytes of the db file
fileTime  = The time the file was created
id1       = The starting id in the file (for this example, the starting meta
ID)
id2       = The last id in the file (for this example, the last meta ID)
session1  = The starting session ID of the first meta in the file
session2  = The last session ID of the last meta in the file
time1     = The POSIX time of the first "time" meta found in the file
time2     = The POSIX time of the last "time" meta found in the file
```

In this example manifest, the most important fields are `fileTime` , `time1` and `time2` . All three fields are written in POSIX time. `time1` and `time2` are the starting and stopping times of the meta recorded in the meta DB file `meta-000000023.nwmdb` . In particular, `fileTime` is always the time in which the file was created (not last modified). `time1` and `time2` are representative of the min and max range of the parsed data within the meta DB file. When doing historical searches by time, `time1` and `time2` are preferred over `fileTime` , when they are present. Manifest files for the other databases and index contain some different fields, but all have enough information to perform time based queries.

Search Historical Manifests

When manifests are collected in the directory pointed to by `manifest.dir` , it is assumed that the data they refer to was copied to the Cold tier and eventually backed up to offline storage. Because the historical manifests are still accessible by the service, this allows time-based queries to be performed on offline data, in order to determine what data needs to be restored for a given time range.

You can search manifests using the `/database manifest` command:

```
manifest: If a manifest directory is defined, it will allow operations on the
manifest files (such as a time based query) for database files in cold
storage.
security.roles: database.manage
parameters:
   op - <string, optional, {enum-one:query|compress}> The operation to perform
(defaults to query)
   time1 - <date-time, optional> The beginning time (UTC) for matching offline
database files
   time2 - <date-time, optional> The ending time (UTC) for matching offline
```

```
database files
   timeFormat - <string, optional, {enum-one:posix|simple}> Specify the time
format that is returned (posix, simple), default is posix
```

Example search:

```
/database manifest time1="2014-04-20 11:00:00" time2="2014-04-11
11:20:00" timeFormat=simple
```

The search returns all manifests that match the query:

```
[ filename=meta-000001691.nwmdb size=4843826176 fileTime="2014-Apr-20
11:06:34" id1=301555027452 id2=301733101896 session1=15352020201
session2=15361024200 time1="2014-Apr-20 11:05:34" time2="2014-Apr-20 11:16:34"
compression=gzip ]
[ filename=session-000001865.nwsdb size=268439552 fileTime="2014-Apr-20
11:06:35" id1=14674145801 id2=14682041000 metaId1=288217522208
metaId2=288370660984 packetId1=11733872441 packetId2=11741745303 ]
[ filename=session-000001866.nwsdb size=268439552 fileTime="2014-Apr-20
11:18:31" id1=14682041001 id2=14689936200 metaId1=288370660985
metaId2=288520616949 packetId1=11741745304 packetId2=11749618589 ]
```

The returned results can be used to correlate which files should be restored from backup for the given time range. For versions 10.4 and later, a service called Workbench can be used to take the restored files and provide a query interface over the restored data using one or more collections.

Setup of the Workbench service is beyond the scope of this document. For more information, see "Configure Data Backup and Restore" in the *Archiver Configuration Guide* .

Advanced Database Configuration

This topic explains the advanced configuration options of the NetWitness Core database.

The configuration options of the NetWitness Core database may change from one release to the next. However, many of the configuration items do not change frequently and are documented here. This is not an exhaustive list, since new features are added in every release, and they may require new configuration items. For the most up-to-date documentation, refer to the built-in help functionality of the NetWitness Core service.

Database Configuration Nodes

This topic describes database configuration nodes. The following database configuration nodes are some of the advanced database configuration items of the NetWitness Core database that do not change frequently.

packet.dir,meta.dir,session.dir

This is the primary configuration entry for each database (also known as the Hot tier). It controls where in the file system the respective databases are stored. This configuration entry understands a complex syntax for specifying many directories as storage locations.

Configuration syntax:

```
config-value = directory, { ";" , directory } ;
directory    = path, [ ( "=" | "==" ) , size ] ;
path         = ? linux filesystem path ? ;
size         = number size_unit ;
size_unit    = "t" | "TB" | "g" | "GB" | "m" | "MB" ;
number       = ? decimal number ? ;
```

Example:

```
/var/lib/netwitness/decoder/packetdb=10
t;/var/lib/netwitness/decoder0/packetdb=20.5 t
```

The size values are optional. If set, they indicate the maximum total size of files stored there before databases roll over. If the size is not present, the database does not automatically roll over, but its size can be managed using other mechanisms.

The use of = or == is significant. The default behavior of the databases is to automatically create directories specified when the Core service starts. However, this behavior can be overridden by using the == syntax. If == is used, the service does not create any directories. If the directories do not exist when the service starts, the service does not successfully start processing. This gives the service resilience against file systems that are missing or unmounted when the host boots.

If you modify the size of a directory in use, the size takes effect immediately, as long as it is larger. If the size is smaller, it is ignored if it is more than 10 percent smaller than the existing size. This prevents an accidental mistype that causes a enormous loss of data. For example, if the packet database was configured for `12 TB` and someone mistyped it as `12 GB` , the database would end up deleting over 11 TBs of data in order to shrink it down to just 12 GB. Instead, the database ignores the `12 GB` setting and logs a warning, so that the error can be caught quickly. Of course, if the size specified is actually correct and more than a 10 percent difference from the existing size, the only recourse for it to take effect is to restart the service. When it starts back up, it assumes the size is correct and adjusts the database to the new size by rolling out the oldest data until the new size is reached. If you actually do want to adjust the size downward and by more than 10 percent without restarting the service, you need to modify the size multiple times, each time adjusting it by less than 10 percent. Watch the service logs to know when the database has adjusted to the new size, as it only adjusts the total database size when the latest file being written has been closed.

If new directories get added or deleted (semicolon separated), they do not take effect until the service restarts.

packet.dir.warm , meta.dir.warm , session.dir.warm

These settings are optional and are used for Warm tier storage on an Archiver. By default, they are blank and unused. If configured, they follow the same format and behavior as `packet.dir` , `meta.dir` , and `session.dir` (see _ `packet.dir` , `meta.dir` , and `session.dir` _ above). When configured, the oldest file on the Hot tier moves to the Warm tier when no available space remains in the Hot tier.

packet.dir.cold , meta.dir.cold , session.dir.cold

These settings are optional and are used to move files from either a Hot or Warm tier storage system to the Cold tier directory specified. Specifically, this setting is nothing more than a directory, there are no size specifiers. However, the defined path name has a few special format specifiers that you can use to name the directory with the date of the data in it.

```
%y   = The year of the data being moved to the cold tier
%m   = The month of the data being moved to the cold tier
```

```
%d   = The day of the data being moved to the cold tier
%h   = The hour of the data being moved to the cold tier
%##r = A block of time within a day. So %12r would create two blocks, 00 and
01\. 00 for all data in the AM, 01 for all PM data
```

Example setting:

```
packet.dir.cold = /var/lib/netwitness/archiver/database1/alldata/cold-
storage-%y-%m-%d-%8r
```

For the setting above, if a log database file was about to be moved to cold storage and it was created on `2014-03-02 15:00:00`, it would be moved to the following directory on the Cold tier:

```
/var/lib/netwitness/archiver/database1/alldata/cold-storage-2014-03-02-01
```

The last number `01` needs some explanation. The `%8r` specifier breaks the hours of the day into 24 / 8 = 3 parts. The first eight hours of the day would be block `00`, so 12 a.m. to 8 a.m. The next eight hours are from 8 a.m. to 4 p.m. and are assigned block `01`. Since the data being moved to cold storage was created at 3 p.m., it falls into block `01`. The `%r` format specifier is useful for backing up files with a granularity somewhere between a day `%d` and a single hour `%h`. The Cold storage directory is created on demand and is defined by the data being moved when the format specifiers are used.

The ability to add a date to the path of the data is just a convenience added for backup and restore. It is a way of tagging the data with a date in the path.

packet.file.size, meta.file.size, session.file.size

This controls the size of the files created with each database. It is normally not necessary to change these values as the default values typically work well. This setting takes effect immediately for subsequent files.

packet.files, meta.files, session.files

This setting controls the number of files held open by the database. You can increase this value to improve performance: however, the operating system has an overall limit on the number of files that service can keep open. If this limit is exceeded, an error is reported and the service does not function. This setting takes effect immediately.

In versions 10.6 and later, the default value for packet.files, meta.files, and session.files is `auto` and the service manages the number of open files based on this criteria:

1. Number of collections
2. Amount of system memory

When set to `auto` , the number is dynamic and you can view it in the logs when it changes. NetWitness recommends that you leave this value as `auto` and do not change it to a specific number.

packet.free.space.min , meta.free.space.min , session.free.space.min

This setting provides a safety limit on the minimum free space that exists on the paths specified by the packet.dir, meta.dir, and session.dir directories, respectively. This setting is used to prevent the service from running out of space in the event that other programs have filled up the space that should be dedicated to each of the databases. This setting takes effect immediately.

packet.index.fidelity , meta.index.fidelity

This setting controls how frequently packet ID locations and meta ID locations are indexed. This setting can be increased to reduce the amount of space needed by each packet or meta nwindex file, but increasing the setting reduces the speed at which individual packets or meta items can be located. This setting takes effect immediately.

The session database does not have a fidelity setting because it does not generate index files.

packet.integrity.flush , meta.integrity.flush , session.integrity.flush

This setting controls whether the database forces a sync operation on the file system when it is finished writing a file. The default value is `sync` , which means when a file is closed there will be a significant delay while the data writes to non-volatile storage. It may be necessary to set this to `normal` in order to achieve higher sustained write rates, especially on a Decoder. This setting takes effect on the next file created. Therefore, it is expected that at least one more sync will happen if the value was just changed to `normal` .

If packet drops are occurring and packet.integrity.flush is set to `sync` , set it to `normal` and monitor. Keep the session and meta flush settings on `sync` If packet drops are still problematic, then set all three to `normal` and monitor.

packet.write.block.size , meta.write.block.size , session.write.block.size

The block size represents how much data is allocated at a time within each database file. Larger block sizes can provide higher throughput and compression ratios, and can improve the rate at which items can be retrieved from the database sequentially. However, larger block sizes have a detrimental impact on random read speed for compressed packet and meta items. This setting takes effect immediately.

packet.compression , meta.compression

These parameters control whether the databases compress data. Compression reduces the amount of storage needed by each database, but it can have a major detrimental impact on the speed at which items are written to the database, and the speed at which items are retrieved from the database. Changes take effect immediately on the next file creation.

Note: The Packet db format `pcapng` cannot be compressed.

As of version 12.3, the valid values for this parameter are `gzip, zstd, bzip2, lzma` or `none`. `gzip` or `zstd` are the preferred algorithms when compression is used, because they provide a good balance between performance and space savings. Both `bzip2` and `lzma` can achieve better space savings, but the tradeoff in speed is substantial and likely should only be considered for low ingest speeds and when storage space is at a premium.

packet.compression.level , meta.compression.level

You can use these settings to further refine how the compression algorithms behave. They have no effect when compression is disabled. The valid values are between 0–9 (between 0-22 for `zstd`). The default value of zero means let the software pick the best setting for speed and compression. The values between 1 and 9 are used as a sliding scale between performance (1) and compression (9). The value of 9 (or 22 for `zstd`) typically gives you the best compression for a given algorithm, but the worst performance. Somewhere in the middle is usually the best setting, which is what zero picks.

hash.algorithm

This setting controls how the database files are hashed. The default value is `none` , so no hashing is performed. The valid values are `none` , `sha256` , `sha1` , or `md5` . Database files can be hashed to provide evidence that they have not been tampered with since they were closed. Hashing is time intensive and affects ingest performance when enabled. This change takes effect immediately.

hash.databases

This setting controls which databases are hashed. Valid values are `session` , `meta` , and `packet` and are comma separated when hashing multiple databases. This change takes effect immediately.

hash.dir

This setting is normally empty, which means the hash file is created in the same directory as the database file that was hashed. If this setting is defined, the hash file is written to the directory specified instead. This could be some form of write-once storage for resilience against hash tampering.

Hash files are small XML files containing the hex encoded hash along with metadata about the database file that was hashed.

Index Configuration Nodes

This topic describes index configuration nodes. The following index configuration nodes are some of the advanced database configuration items of the NetWitness Core database that do not change frequently.

index.dir

The `index.dir` setting controls where the files used by the index are stored. This setting supports the same syntax as the `packet.dir` , `meta.dir` , and `session.dir` settings.

index.dir.warm

The Warm tier storage for index slices. This setting supports the same syntax as `packet.dir.warm` , `meta.dir.warm` , and `ession.dir.warm` .

index.dir.cold

The Cold tier storage for index slices. This setting supports the same syntax as `packet.dir.cold` , `meta.dir.cold` , and `session.dir.cold` .

index.slices.open

This setting controls the number of index slices held open by the index. Index slices are opened automatically as needed by queries. When queries complete, the index engine may hold the slices open so that subsequent queries execute faster. The most recently created slices are the slices that will be held open, since they are mostly likely to be used by queries.

If queries against the index require the index to open slices, then they will execute slower than if the slices were already open. Therefore, this parameter should be tuned such that most queries executed against the index will work on open slices. However, each open index slice consumes some resources, such as file handles and memory. If there are too many index slices open, the overall performance of the service can suffer.

You should set this parameter so that the open index slices will cover most of the time ranges that most queries will need. For example, if most queries are over the past two weeks, and there are index slices created every 8 hours, then there are 14 days x 3 slices per day, or 42 slices created over the past two weeks. Thus, you could set index.slices.open to 42 so that only slices that are likely to be used are held open.

If this parameter is set to 0, then all slices are held open until the next index save. In this scenario, the only thing limiting the number of slices open in the process is the number of slices in the index.

page.compression

Deprecated. Versions of the NetWitness Core index between 9.8 and 10.2 supported two different index compression algorithms, and you can choose between them using this setting. As of 10.3, the only recommended value is the default of `huffhybrid` .

save.session.count

This setting controls how often the index is automatically saved when new sessions are inserted. If the value of save.session.count is greater than 0, any time more than `save.session.count` sessions are added to the index, the index automatically saves itself. If the `save.session.count` is set to 0, this feature is disabled and the index will not automatically save itself when new sessions are added to the index.

`save.session.count` can be used to implement an automatic save pattern that is based on the volume of data that enters the index. This is useful because it allows a lightly loaded system to generate save points less often.

For more information on the topic of index saves, see the section in this guide on Optimization Techniques .

reindex.enable

This setting controls the operation of the background reindexer .

SDK Configuration Nodes

This topic describes the SDK configuration nodes that affect the database. There are some additional configuration items in each Core service that affect the database, but do not actually affect how the database stores or retrieves data. These settings exist in the `/sdk/config` folder.

max.concurrent.queries

This setting controls how many query operations are allowed on the database simultaneously. Allowing more simultaneous query operations can improve overall responsiveness for more users, but if the query load of the Core service is very I/O bound, having a high max.concurrent.queries value can have a detrimental effect. The recommended value is near the number of cores on the system, including hyper threading. Thus, for an appliance with 16 cores, the value should be somewhere close to 32\. Subtract a few for aggregation threads and general system response threads. Subtract a few more if this is a hybrid system (for example, both a Decoder and Concentrator running on the same appliance). There is no magic number, but somewhere between 16 and 32 should work well.

max.pending.queries

This setting controls the backlog size for the query engine of the database. Larger values allow the database to queue more operations for execution. A queued query does not make progress on its execution, so it may be more useful to make the system produce errors when the queue is full, rather than allowing the queue to grow very large. However, on a system that is primarily performing batch operations such as reports, there may be no detrimental effect to having a large queue.

cache.window.minutes

This setting controls a feature of the query engine that is intended to improve query responsiveness when there are a large number of simultaneous users. For more information on cache window, see Optimization Techniques .

max.where.clause.cache

The where clause cache controls how much memory can be consumed by query operations that need to produce a large temporary data set to evaluate sorting or counting. If the where clause cache size is overflowed, the query still works, but it is much slower. If the where clause cache is too large, it is possible for queries to allocate so much memory that the service would be forced into swap or run out of memory. Thus, this value multiplied by the max.concurrent.queries should always be much less than the size of physical RAM. This setting understands sizes in the form of a number followed by a unit, for example `1.5 GB`.

max.unique.values

The maximum unique values limits how much memory can be consumed by the SDK Values function. SDK Values produces a sorted list of unique values. In order to produce accurate results, it may need to merge together large numbers of unique values from many slices. This merged set of values must be held in memory, so this parameter exists to put a limit on how much memory the merged value set can consume. The default value will limit memory usage to approximately 1/10th of total RAM.

query.level.1.minutes, query.level.2.minutes, query.level.3.minutes

These settings are available in 10.4 and earlier versions.

In versions 10.4 and earlier, the Core database supports three query priority levels. Each user is assigned to one of the priority levels. Therefore, there are up to three groups of users that can be defined for the purposes of performance tuning. These settings control how long each user level is allowed to execute the queries. For example, lower privileged users may have a lower value so that they are not able to use all the resources of the Core service with long-running queries.

query.timeout

This setting is available in 10.5 and later versions.

Query levels have been replaced in versions 10.5 and later with per user account query timeouts. For trusted connections, these timeouts are configured on the NetWitness Platform server. For accounts on Core services, there is a new config node under each account called `query.timeout`, which is the maximum amount of time in minutes that each query can run. Setting this value to zero means no query timeout will be enforced by the Core service.

max.where.clause.sessions

This setting will be deprecated in a future release. Use `max.query.memory` to limit overall query memory usage.

This setting imposes a limit on how many sessions can be scanned by a single query. For example, if a user selects all meta from the database, the database stops processing results once the number of sessions read for the query reaches this configuration value. The value of 0 disables this limit.

The number of sessions needed to fully process a query is equal to the number of sessions that match the WHERE clause of the query, assuming that all terms in the where clause have a suitable index. If there are terms in the where clause that are not indexed, the database has to read more sessions and meta, and reaches this limit sooner.

max.query.groups

This setting will be deprecated in a future release. Use `max.query.memory` to limit overall query memory usage.

This setting imposes a limit on the number of unique groups collected in a single query. For example, if a query has a group by clause with multiple metas that have high unique value counts, the amount of memory needed for that query could easily outpace the amount of RAM available on the server. Thus, this limit exists to prevent out-of-memory conditions from happening.

Setting a value of 0 disables this limit.

packet.read.throttle

This is a decoder-only setting that affects the access to the packets database. When packet.read.throttle is set to a value greater than 0, the decoder attempts to throttle packet reads when it detects packet contention on the packet database. Higher numbers provide more throttling. Changes takes effect immediately.

cache.dir , cache.size

All NetWitness Platform Core services maintain a small file cache of raw content extracted from the device. These parameters control the location (cache.dir) and size (cache.size) of this cache.

pin.cache.dir , pin.cache.size

All NetWitness Platform Core services provide a separate file cache of raw content that is marked (or pinned) for long-term retention. These parameters control the location (pin.cache.dir) and size (pin.cache.size) of this cache. You can configure the maximum size of the pinned cache at `/sdk/config/pin.cache.size`. The default size is zero that prevents pinning of new sessions once storage decreases below 100 MB. If you configure it with a non-zero value, then it will reduce the cached files when the total size exceeds the configured size by deleting the oldest pinned sessions.

parallel.values

This setting is available in 10.5 and later versions.

This setting allows SDK-values operations to be executed in parallel. If this is set to 0, it will disable parallel execution. If it is set to a value greater than 0, it represents the number of threads created when each SDK-values operation is executed. The maximum value is the number of logical CPUs available when the process started.

Setting a higher value for parallel.values is useful when there are small numbers of simultaneous users, since it will allow for more complex Investigations to be executed more quickly. If there are many simultaneous users, it is better to use a low value here, since there will be many independent SDK-values operations executed simultaneously.

parallel.query

This setting is available in 10.5 and later versions.

This configuration is similar to the parallel.values setting in that the maximum value is the number of logical CPUs. Setting parallel.query to a specific value should take into account the number of simultaneous users to maximize CPU utilization without consistently exceeding available resources.

Setting a higher value for parallel.query is useful when there are small numbers of simultaneous users and queries, since it will allow more complex queries to be executed more quickly. If there are many simultaneous users and queries, it is better to use a low value, since there will be many independent SDK-query operations executed simultaneously.

Query operations are limited by the meta database read rate, so setting parallel.query to a value higher than 4 is unlikely to produce dramatically better results than the default value of 0\. The best number to use for parallel.query will depend on the type of storage attached. Experiment with different values of parallel.query to determine the best results for your storage system.

Per-User Configuration Nodes

This topic describes the per-user configuration nodes. There are settings that influence the actions users are allowed to perform on the database. These settings are stored in the configuration tree at `/users/accounts/<username>/config` , where `<username>` is the name of the user to which the settings apply.

query.prefix

A query prefix applies a filter to every query operation that the user performs. This is implemented by taking the `query.prefix` values and appending it the the where clause of each query using the logical && (and) operator. For more information on Where Clauses, see Queries .

query.level

This setting is available in 10.4 and earlier versions.

The query.level setting assigns the query level that the users have for every query they perform. These influence whether their queries are limited by the query.level.1.minutes, query.level.2.minutes, or query.level.3.minutes.

query.timeout

This setting is available in 10.5 and later versions.

The query.timeout setting assigns the maximum amount of time in minutes that a user can run each query. For trusted connections, these timeouts are configured on the NetWitness Platform server. For accounts on Core services, this setting is stored in the configuration tree at `/users/accounts/<username>/config` , where `<username>` is the name of the user to which the setting applies. When this value is set to zero, the Core service does not enforce the query timeout.

session.threshold

The session.threshold setting assigns a maximum session threshold for the user. If set, this threshold value is assigned to all values calls that the user performs. A detailed discussion of both the values call and thresholds is covered in this guide.

Scheduler

This topic provides a brief introduction to the scheduler and explains how to schedule commands. All NetWitness Core services come with a built-in scheduler found under `/sys/config/scheduler` . To use the scheduler, you add the command you want to run periodically using one of two messages:

`/sys/config/scheduler addInter` - Add a command to run at the specified interval (every N hours, minutes or seconds)

or

`/sys/config/scheduler addMil` - Add a command to run at the specified time of day or even specific days of the week

Example

For example, suppose that you have a use case to delete all packet data that is greater than seven days old. Since you cannot configure the packet.dir setting to rollout data based on a time interval, you need to schedule the `/database timeRoll` command to run every so often. For this example, create a timeRoll to run every 20 minutes:

```
addIter minutes=20 pathname=/database msg=timeRoll params="type=packet days=7"
```

This command adds a scheduled task (it is persisted between restarts of the service) to run every 20 minutes, on the `/database` node, and ages out all packet data older than seven days. The `params` parameter is used to pass all the parameters to the command specified (in this case `timeRoll`). Notice how it quotes all the embedded parameters (`type` and `days`) so they are not interpreted as parameters to be passed to the outer `addIter` command. If the parameters inside `params` need to use quotes, you must escape the inner quotes with a backslash. You can rewrite it with embedded quotes, which does not alter the command in any way:

```
addIter minutes="20" pathname="/database" msg="timeRoll"
params="type=\"packet\" days=\"7\""
```

This command works identically to the original, but demonstrates how to escape complicated parameter passing. Additional useful scheduler commands are:

`/sys/config/scheduler print` - Print all scheduled commands (you can also see them by doing an `ls` on the scheduler node).

`/sys/config/scheduler delSched` - Delete a scheduled command by passing in the identifier shown in the `print` (or `ls`) command.

This is a brief introduction to the scheduler. For more information on command parameters, send the `help` message to the scheduler node and pass in the command name via the `msg` parameter. For more information, see the "Services Explore View" topic in the *Host and Services Getting Started Guide* .

Rollover

This topic describes the two rollover mechanisms. The database operates as a first-in, first-out (FIFO) queue. New data is always appended to the database, and the oldest data is automatically removed as needed. Data that is in the middle of the database is immutable, meaning it cannot be modified.

There are two mechanisms to for rollover: synchronous and asynchronous.

Synchronous Rollover

Synchronous rollover refers to rollover settings that are applied in response to a write operation on the database. That means data is removed from the database in direct response to the need to write new data. Synchronous rollover is configured by setting size values on the configuration for `packet.dir` , `meta.dir` , `session.dir` , and `index.dir` .

Synchronous rollover on the packet, meta, and session databases can occur within any write operation. Synchronous rollover on the index occurs when the index is saved.

Asynchronous Rollover

Asynchronous rollover refers to database file removal that occurs when an explicit rollover command is issued to the database. Most commonly this type of rollover is scheduled to run periodically using the built-in scheduler of the Core service. The user can also explicitly request it.

The asynchronous rollover command is the `sizeRoll` message present on the `/index` and `/database` nodes of the configuration tree. The message on the `/database` node does size rollover on packet, meta, and session databases only, while the message on the `/index` node can do simultaneous rollover on both the index and the packet, meta, and session databases.

The `sizeRoll` command has the following parameter syntax:

```
size-roll-params    = {type-param, space}, (max-size-param | min-free-param |
max-percent-param), {max-size-warm-param, space}
type-param          = "type=", {type-flag} , { ",", type-flag } ;
type-flag           = "packet" | "meta" | "session" ;
max-size-param      = "maxSize=", number, {space}, unit ;
max-percent-param   = "maxPercent=", number, {space}, unit ;
min-free-param      = "minFree=", number, {space}, unit ;
max-size-warm-param = "maxSizeWarm=", number, {space}, unit ;
unit                = "t" | "TB" | "g" | "GB" | "m" | "MB" ;
```

```
number              = ? decimal number ? ;
percentage          = ? number between 0 and 100 ? ;
```

The `type` parameter controls the databases to consider for removing the oldest data based on total size or space remaining. If type is not specified on the `/index` sizeRoll, only the index is considered for rollover operations.

The `maxSize` parameter sets a current maximum size of the database or index. If the database is larger than this size, oldest data is deleted first (or moved to the Warm or Cold tier, depending on the configuration) until total size is less than `maxSize` . The `sizeRoll` operation determines which data is oldest out of all the databases and the index based on session IDs. Sessions or index entries with lowest session IDs are deleted first, possibly including removing meta and packet databases that are orphaned by removing entries from the session database. The index data is rolled out if the sessions that it refers to are removed.

The `maxSizeWarm` parameter sets a current maximum size on the *Warm* tier, but otherwise behaves identically to the `maxSize` parameter. When data is rolled out on the Warm tier, it is moved to the Cold tier (if configured) or deleted.

The `maxPercent` parameter sets a maximum percentage of all the volumes of all databases passed in `type` parameter combined. When exceeded, oldest data is deleted first until total size is less than maxPercent of total volumes.

The `minFree` parameter sets a minimum allowed free space on the volumes before oldest data is deleted.

Each call to the sizeRoll operation provides a single pass through the database to delete files. When the operation completes, the current size utilization of the database will have met the criteria specified by the `maxSize` , `maxPercent` , or `minFree` parameters and the optional `maxSizeWarm` . Therefore, this operation can be scheduled periodically to ensure that the database can continue to operate uninterrupted.

Example

The following example shows a typical sizeRoll scheduler entry for an Archiver:

```
pathname=/index minutes=5 msg=sizeRoll params="type=meta,session,packet
maxSize=25TB maxSizeWarm=150TB"
```

This scheduler entry specifies that every five minutes the database ensures that the max size of the meta, session, packet, and index does not exceed 25 terabytes on the Hot tier and does not exceed 150 terabytes on the Warm tier.

Snort Rules and Configuration

Snort® rules and configuration are added to the parsers/snort directory for Investigator and Decoder. Decoder supports the payload detection capabilities of Snort rules. The rules files must have the extension `.rules` and the configuration files must have the extension `.conf` . The Decoder implementation of Snort rules is centered on using the content strings defined in a Snort rule as a token. Once a token is matched, the rule header and additional rule options can be evaluated. Currently, rules that do not define any content (via `content` or `uricontent` rule options) are not supported.

Configuration

The configuration files are loaded prior to loading rules.

Variable Definitions	Description
`ipvar`	The full language for defining IP Address variables is supported, including lists, CIDR, and negation.
`portvar`	The full language for defining IP Address variables is supported, including lists, ranges, and negation.
`var`	Not supported; use `ipvar` or `portvar` .

Action Definitions	Description
`ruletype`	The definition of additional `ruletype` s is supported. However, only rules that have a base rule type of **alert** are supported.

General Configuration	Description
`nopcre`	This configuration option disables all rules with **pcres**.

Meta key usage

Starting with the 11.3 release, an attempt has been made to align better the Snort parser's meta key usage with that of other parsers. As of the 11.3 release, the default mode operation continues to write to the legacy key set (consistent with previous releases). To use the aligned key set, set the `udm` option to `true` for the Snort parser in the `parser.options` configuration node. Refer to the **General options** section, below, for a description of how the two modes differ.

Rules

- Any rule that does not properly parse is ignored.
- Any valid Snort rule should successfully parse; however,there are rule options that are not supported by Decoder that are not fully parsed.

Snort rules are parsed and loaded when PCS is loaded (any import/capture in Investigator, initial capture start and parser reload in Decoder).

Section	Description
Header	The header conditions are evaluated when a rule receives the first token callback for a stream. The header is evaluated once per stream, and prevents any further consideration of a rule against a specific stream if the conditions are not met.
Actions	The specified action or a rule must be defined (either one of the native Snort actions or defined in the configuration using the `ruletype` statement) for the rule to be considered valid. Decoder only utilizes rules with alert actions.
Protocols	Decoder supports the current Snort protocol keywords (`tcp` , `udp` , `icmp` , `ip`).
IP Addresses	The full language for defining IP addresses is supported, including lists, CIDR, and negation.
Port Numbers	The full language for defining port numbers is supported, including lists, ranges and negation.
Direction Operator	The directional operator supports the from-to (`->`) and bidirectional (`<>`) values. The to-from (`<-`) value is invalid and will cause the rule to fail to load.

General options

Snort rule general options can result in different meta keys being written depending on whether the Snort parser is in legacy mode or not.

Aligned key mode:

Option	Description
`msg`	If the rule matches, the `msg` value is added as `sig.name` meta.
`sid`	If the rule matches, the `sig.id` value is added as meta.
`classtype`	If the rule matches, the `classtype` name is added as `threat.cat` meta.

Option	Description
`priority`	If the rule matches and it has a `priority` option, it is used for the value of the `risk.num` meta.

Legacy key mode:

Option	Description
`msg`	If the rule matches, the `msg` value is added as `risk.info` , `risk.warning` , or `risk.suspicious` meta, depending on rule priority.
`sid`	If the rule matches, the `sid` value is added as meta.
`classtype`	If the rule matches, the `classtype` name is added as `threat.cat` meta.
`priority`	If the rule matches and it has a `priority` option, it is used to determine the type of risk meta associated with the `msg` value.

Payload options

Decoder supports the following payload rule options:

Option	Description
`content`	The `content` option creates a token for Decoder to match. Only tokens of three or more bytes are accepted. It is also important to note that Decoder differs from Snort in that rules are evaluated across the payload of the reconstructed stream and not just a single packet. This can result in differences in rules matches between Snort and Decoder, especially when considering positional options.
`nocase`	Currently not supported. This option is ignored and case-sensitive matching is used.
`depth`	This option is applied to the distance of the token from the beginning of the stream. If the token position is greater than this value, it is not a match.
`offset`	This option is applied to the distance of the token from the beginning of the stream. If the token position is less than this value, it is not a match.
`distance`	This option is applied to the distance of the token from the end of the previous token match. If the relative token position is less than this value, it is not a match.
`within`	This option is applied to the distance of the token from the end of the previous token match. If the relative token position is greater than this value, it is not a match.

Option	Description
`http_uri`	Any token that hits is verified to fall within an `http_uri` as indicated by the HTTP parser. No URI normalization is applied.
`uricontent`	There is no URI normalization applied. Otherwise, this is equivalent to the content option with the `http_uri` modifier.
`pcre`	Currently, PCREs are only applied to URIs and must specify the U option.

Non-payload options

Option	Description
`flow`	Verifies that the rule is only applied to the client or server stream.
`to_client`	Limits the rule to only matching on a stream that Decoder has defined as Server.
`from_server`	Synonym for `to_client` .
`from_client`	Limits the rule to only matching on a stream that Decoder has defined as Client.
`flowbits`	Maintains state per session and are reset at the end of each session.
`set`	When the rule matches, the specified flowbit is set.
`unset`	When the rule matches, the specified flowbit is cleared.
`toggle`	When the rule matches, the specified flowbit is flipped.
`isset`	When the rule is evaluated, the specified flowbit state must be set for the rule to match.
`isnotset`	When the rule is evaluated, the specified flowbit state must not be set for the rule to match.
`noalert`	Prevents the rule from generating meta data if it matches.

Queries

This topic covers the database query syntax. There are three main mechanisms for performing queries in the database, the `query` , `values` , and `msearch` calls on the `/sdk` folder on each Core service.

The `query` call returns meta items from the meta database, possibly using the index for fast retrieval.

The `values` call returns groups of unique meta values sorted by some criteria. It is optimized to return a subset of the unique values sorted by an aggregate function such as count.

The `msearch` call takes text search terms as it's input, and returns matching sessions that match the search terms. It can search within indexes, meta, raw packets, or raw logs.

`query` Syntax

The `query` message has the following syntax:

```
query-params     = size-param, space, query-param, {space, start-meta-param},
{space, end-meta-param}, {space, search-param} ;
size-param       = "size=", ? integer between 0 and 1,677,721 ? ;
query-param      = "query=", query-string ;
start-meta-param = "id1=", metaid ;
end-meta-param   = "id2=", metaid ;
search-param     = "search=", search-string ;
metaid           = ? any meta ID from the meta database ? ;
```

The `id1` , `id2` , and `size` parameters form a paging mechanism for returning a large number of results from the database. Their usage mostly benefits developers who are writing applications directly against the NetWitness Core database. Normally, results are returned in the order of oldest to newest data (higher meta IDs are always more recent). In order to return results from most recent to oldest, reverse the IDs such that `id1` is larger than `id2` . This has a slight performance penalty, because the where clause must be completely evaluated before processing in reverse order can begin.

When size is left off or set to zero, the system streams back all results without paging. For the RESTful interface, this results in the full response to be returned with chunked-encoding. The native protocol returns the results over multiple messages.

The `query` parameter is a `query` command string with its own NetWitness-specific syntax:

```
query-string      = select-clause {, where-clause} {, group-by-clause {,
order-by-clause } } ;
select-clause     = "select ",  ( "*" | meta-or-aggregate {, meta-or-
aggregate} ) ;
```

```
where-clause      = " where ",  { where-criteria } ;
meta-or-entity    = (meta_key | entity) ;
meta-or-aggregate = meta-or-entity | aggregate_func, "(", meta-or-entity, ")"
;
aggregate_func    = "sum" | "count" | "min" | "max" | "avg" | "distinct" |
"first" | "last" | "len" | "avglen" | "countdistinct" ;
group-by-clause   = " group by ", meta-key-list
meta-key-list     = meta-or-entity {, meta-key-list}
order-by-clause   = " order by ", order-by-column
order-by-column   = meta-or-aggregate { "asc" | "desc" } {, order-by-column}
```

The `select` clause allows you to specify either `*` to return all the meta in all the sessions that match the where clause, or a set of meta field names and aggregate functions to select a subset of the meta with each session.

The `select` clause may contain entity names in the place of meta key names. If an entity name is in the select clause, meta items returned by the query will have their key name set to the entity name, rather than their actual meta key name stored in the session. Thus, the names of the meta items returned in the query will match the names of the metas in the select clause. For example, if there is an entity `ip` that consists of `ip.dst` and `ip.src` , then a query containing `select ip` will only return `ip` fields, with nothing to distiguish `ip.dst` meta items from `ip.src` meta items in the result set.

The `select` clause may contain renamed meta key names. Any fields appearing in the result set as a result of a renamed key in the `select` clause will be returned with the meta key name matching the name used in the `select` clause. For example, if the key `port_src` is used to rename `tcp.srcport` , then a query containing `select port_src` will only return `port_src` fields, even if the underlying meta had type `tcp.srcport` .

Note: Usage of renamed meta key pairs in the `select` clause cannot be combined with fixed-size result paging for a query. Doing so causes discrepancies in the results returned to Brokers. The reason for the discrepancies is that Concentrators cannot return only one of the key values of a renamed meta key pair and still preserve the correctness of the result set for the requested size. Hence, the Concentrator omits renamed meta key pair results to preserve the correctness of the result set, which causes the Broker to pull the result from the next Concentrator and advance the IDs that are returned.

Example: `select ip.proto,ipv6.proto` cannot be combined with `size=10` (a paging query) `size=10 flags=0 threshold=0 query="select time,ip.src,ip.dst, ip.proto,ipv6.proto,eth.type,size,payload,lifetime,client,did`

The aggregate functions have the following effect on the query result set.

Function	Result
`sum`	Add all meta values together; only works on numbers
`count`	The total number of meta fields that would have been returned

Function	Result
min	The minimum value seen
max	The maximum value seen
avg	The average value for the number
distinct	Returns a list of all unique values seen
countdistinct	Returns the number of unique values seen. countdistinct is equivalent to the number of metas that would have been returned by the distinct function.
first	Returns the first value seen
last	Returns the last value seen
len	Converts all field values to a UInt32 length instead of returning the actual value. This length is the number of bytes to store the actual value, not the length of the structure stored in the meta database. For example, the word "NetWitness" returns a length of 10. All IPv4 fields, like ip.src , return 4 bytes.
avglen	Returns a single value which is the average value returned from the len function. The result is always a float64 value.

where Clauses

The where clause is a filter specification that allows you to select sessions out of the collection by using the index.

Syntax:

```
where-criteria    = criteria-or-group, { space, logical-op, space, criteria-
or-group } ;
criteria-or-group = criteria | group ;
criteria          = (meta-key | entity), ( unary-op | binary-op meta-value-
ranges ) ;
group             = ["~"], "(" where-clause ")" ;
logical-op        = "&&" | "||" ;
unary-op          = "exists" | "!exists" ;
binary-op         = "=" | "!=" | "<" | ">" | ">=" | "<=" | "begins" |
"contains" | "ends" | "regex" ;
meta-value-ranges = meta-value-range, { ",", meta-value-range } ;
meta-value-range  = (meta-value | "l" ), [ "-", ( meta-value | "u" ) ] ;
```

```
meta-value          = number | quoted-value | ip-address | mac-address |
relative-time ;
number              = ? any numeric value ? | ( '"' text '"' )
quoted-value        = ( '"' text '"' ) | ( '"' date-time '"' ) ;
relative-time       = "rtp(" , time-boundary , "," ,  positive-integer , time-
unit, ")" ;
time-boundary       = "earliest" | "latest" | "now" ;
positive-integer    = ? any non-negative integral number ?
time-unit           = "s" | "m" | "h" ;
```

When specifying rule criteria, the `meta-value` part of the clause is expected to match the type of the meta specified by the `meta-key` . For example, if the key is `ip.src` the `meta-value` should be an IPv4 address. Entity names are allowed in any location where a meta-key name is required.

Queries using a `meta-key` name will match meta items corresponding both to the `meta-key` name as well as to the names of any "renames" specified for the key. See "Key Renaming" under the Index Customization topic for details on key renaming.

Query Operators

The following table describes the function of each operator.

Operator	Function
=	Match sessions containing the meta value exactly. If a range of values is specified, any of the values is considered a match.
!=	Matches all sessions that would not match the same clause as if it were written with the = operator.
<	For numeric values, matches sessions containing meta with the numeric value less than the right side. If the right side is a range, the first value in the range is considered. If multiple ranges are specified, the behavior is undefined. For text metas, a lexicographical comparison is performed.
<=	Same behavior as < , but sessions containing meta that equals the value exactly are also considered matches.
>	Similar to the < operator, but matches sessions where the numeric value is greater than the right side. If the right side is a range, the last value in the range is considered for the comparison.
>=	Same behavior as > , but sessions containing meta that equals the value exactly are also considered matches.
begins	Matches sessions that contain text meta value that starts with the same characters as the right side.

Operator	Function
`ends`	Matches sessions that contain text meta that ends with the same characters as the right side.
`contains`	Matches sessions that contain text meta that contains the substring given on the right side.
`regex`	Matches sessions that contain text meta that matches the regex given on the right side. The regex parsing is handled by boost::regex.
`exists`	Matches sessions that contain any meta value with the given meta key.
`!exists`	Matches sessions that do not contain any meta value with the given meta key.
`length`	Matches sessions that contain text meta values of a certain length. The expression on the right side must be a non-negative number.

Text Values

The system expects quoted text values. Unless it can be parsed as a time (see below), a quoted value is interpreted as text.

> It is also important to quote any text value that may contain – so that it is not interpreted as a range.

For text values, the backslash character \ is used as an escape value. This character is used when you need to search for a value containing quote characters. If you need to search for a backslash character, then the backslash itself must be escaped, as \\ . Note that if you are wrapping the query parameters within another language, such as the parameter fields of the REST interface, you may need to add additional escape levels as required by whatever API or interface you are using to interact with the core service.

IP Addresses

IP addresses can be expressed using standard text representations for IPv4 and IPv6 addresses. In addition, the query can use CIDR notation to express a range of addresses. If CIDR notation is used, it is expanded to the equivalent value range.

MAC Addresses

A MAC address can be specified using standard MAC address notation: `aa:bb:cc:dd:ee:ff`

Numeric Values

In a where clause, you can specify numeric search values. Numbers should not be surrounded by quotes.

Bucketed Numeric Indexes

Meta keys indexed with bucketing can be used like any other numeric search value. Under most situations such searches will return sessions that have a meta value that exactly matches the requested search criteria.

Special behavior is invoked for queries that select only `sessionid` , for example a query of the form `select sessionid where size = 2048` . Selecting `sessionid` explicitly bypasses all meta database read operations, and only returns index information. If selecting `sessionid` only, and if the numeric value specified is exactly equal to one of the bucket values, then the system will return all sessions that match somewhere in the bucket, rather than an exact match. For example, the search term `size = 2048` will match all sessions in the 2 KB bucket, which is the range from 2048 to 3171 bytes. However, if the search values does not match a bucket values, then the system will return only matches for the exact byte value. For example, the search term `size = 2049` will only match sessions with a size meta value exactly 2049. In this mode of operation, specifying a non-bucket value in a where clause is slower than searching within a bucket value. The 'where' clause parameter to the `values` API also invokes this optimization.

Using bucketed values in other forms of `query` does not invoke special behavior. The same is true for the `msearch` API. For those APIs, the use of a bucketed index in the where clause is evaluated accurately, without special meaning applied to bucket values. To search within an entire bucket using these APIs, specify the bucket range explicitly. For example `size=2048-3171` .

More information on how to tell if an index is bucketing is in the topic Index Customization .

Numeric Value Aliases

For numeric values, aliases specified in the index can be used in a query as a quoted string in place of where a literal numeric value would be used; e.g.,

```
select * where service = "NFS"
```

Numeric value aliases can be used anywhere a numeric literal might be used: as a single value, as the beginning or end of a range, or in a comma-delimited list of values (and/or ranges).

Refer to the topic Index Customization for details of how value aliases can be specified in the index.

Date and Time Expressions

In NetWitness Platform, dates are represented using Unix epoch time, which is the number of seconds since Jan 1, 1970 UTC. In queries, you can express the time as this number of seconds, or you can use the string representation. The string representation for the date and time is `"YYYY-mmm-DD HH:MM:SS"` . A three-letter abbreviation represents the month. You can also express the Month as a two-digit number, 01-12.

Time values must be quoted.

All times specified in queries are expected to be in UTC.

Relative Time Points

Relative time points allow a where clause to reference a value at some fixed offset relative to the earliest or latest time metas seen in the collection. It can also be used to reference a point in time relative the the current time.

A relative time point expression has the syntax `rtp(boundary, duration)` .

The boundary is either `earliest` , `latest` , or `now` .

The duration is an expression of hours, minutes, or seconds. For example, `24h` , `60m` , or `60s` . When the boundary is `earliest` , the duration represents the amount of time **after** the earliest time present in the collection. If the boundary is `latest` , the duration represents the amount of time **before** the earliest time present in the collection. If the boundary is `now` , the duration represents the amount **before** the current time.

When the boundary is `now` , the system clock of the Core service host is used to determine what time it is.

Boundary can be represented as 0 seconds if you wish to specify the relative time point with no duration offset. This is most useful in the case of the `now` boundary, since it is possible that the highest, latest, time observed in the collection may be much earlier than the current time.

Relative time points can only be used in SDK operations, where there is a collection from which to get the boundaries for earliest and latest time metas.

Relative time points only work on indexed meta types. The default indexed meta types are `time` and `event.time` .

Examples:

```
Last 90m of collection time:
time = rtp(latest, 90m) - u

First 2 days of event time:
event.time = l - rtp(earliest, 48h)

Events added in the last hour:
time = rtp(now, 60m) - rtp(now,0s)
```

Special Range Values

Ranges are normally expressed with the syntax * `smallest` * - * `largest` *, but there are some special placeholder values you can use in range expressions. You can use the letter `l` to represent the lower-bound of the all meta values as the start of the range, and `u` to represent the upper bound. The bounds are determined by looking at the smallest or largest meta value found in the index out of all the meta values that have already entered the index.

If you use the `l` or `u` tag, it should be unquoted.

For example, the expression `time = "2014-may-20 11:57:00" - u` would match all time from that 2014-may-20 11:57:00 to the most recent time found in the collection.

Notice that it is easy to confuse a range expression with a text string. Make sure that text values that contain − are quoted, and that hyphens within range expressions are not within quoted text.

`group by` Clause (since 10.5)

The query API has the ability to generate aggregate groups from the results of a query call. This is done using a `group by` clause on the query. When `group by` is specified, the result set for the query is subdivided into groups. Each group of results is uniquely identified by the meta values indicated in the group by clause.

For example, consider the query `select count(ip.dst)` . This query returns a count of all ip.dst metas in the database. However, if you add a `group by` clause, like this: `select count(ip.dst) group by ip.src` , the query returns a count of the ip.dst metas found for each unique ip.src.

As of version 10.5, you can utilize up to 6 meta fields in a `group by` clause.

The `group by` clause shares some of the same functionality as the `values` call, but it offers significantly more advanced groups at the expense of longer query times. Producing the results of a grouped query involves reading the meta from the meta database for all sessions that match the `where` clause, while a values call can produce its aggregates by reading the index only.

The contents of each group returned by the query are defined by the `select` clause. The `select` clause can contain any of the aggregate functions or meta fields selected. If multiple aggregates are selected, the result of the aggregate function is defined for each group. If nonaggregate fields are selected, the meta fields are returned in batches for each group.

The result set of a `group by` query is encoded with the following rules:

1. All meta items associated with a group are delivered with the same group number.
2. The first meta items returned to the group identify the group key. For example, if the `group by` clause specifies `group by ip.src` , then the first meta item of each group will be an `ip.src` .
3. The normal, nonaggregate meta items are returned after the `group key` , but they all will have the same group number as the group key metas.
4. The aggregate result meta fields for each group are returned next.
5. All fields within a group are returned together. Different group results will not be interleaved.

If one of the `group by` meta items is missing from one of the sessions matched by the `where` clause, that meta field is treated as a NULL for the purposes of that group. When the results for that group are returned, the NULL-valued parts of the group key will be omitted from the group's results, since the database has no concept of NULL.

The semantics of a `group by` query differ from a SQL-like database in terms of what meta fields are returned. SQL databases require you to select the `group by` columns explicitly in the `select` clause if you want them to be returned in the result set. The NetWitness Core database always implicitly returns the group columns first.

A query with a `group by` clause honors the result set `size` parameter if one is provided. However, due to the nature of the grouping, it puts an additional burden on the caller to page and reform groups if a fixed-size result set is requested. For this reason, you should not specify an explicit result size when making a `group by` call. By not specifying an explicit size, the entire result set will be delivered as partial results.

`group by` clauses allow results to be grouped by an entity definition.

The following table describes the database honors configuration parameters that limit I/O or memory impact of a group by query.

Parameter	Function
/sdk/config/max.query.groups	This is the limit on how many groups can be held in memory to calculate aggregates. This parameter allows you to limit the overall memory usage of the query.
/sdk/config/max.where.clause.sessions	This is the limit on how many sessions from the where clause can be processed in a query. This parameter allows you to set a limit on the number of sessions that have to be read from the meta and session databases to resolve a query.

order by Clause (since 10.5)

An order by clause can be added to a query that contains a group by clause. The order by clause causes the set of grouped results to be returned in sorted order.

An order by consists of a set of items to sort by in ascending or descending order. Sorting can be performed on any data field that will be returned in the result set. This includes meta specified by the select clause, aggregate function results specified by the select clause, or group by meta fields.

The order by clause can sort over many columns. There is no limit on the number of order by columns allowed in the query; but a practical limit exists in that each of the order by columns must refer to something returned by the select clause or group by clause. The multiple column sort is imposed lexicographically, meaning that if two groups have equal values for the first column, then they are sorted by the second columns. If they are equal in the second column, they are sorted by the third column, and so on for however many order by columns are provided. Groups that do not contain any of the metas referenced by the order by clause are sorted first in the result set in the case of an ascending sort, and last in the case of a descending sort.

The NetWitness Core database is unique in that the groups of results returned by a query may each have many values for a selection. For example, it is possible to select all meta items that match a meta type and organize them into groups, and it is possible to use the distinct() function to return groups of distinct meta values. If an order by clause references one of the fields in the group that has multiple values, the sorting order is applied as follows:

1. Within each group, the fields with multiple matching values are ordered by the ordering clause
2. All the groups are sorted by comparing the first occurrence of the ordered field found within each group

The order by clause is only available in queries that have a group by clause, since groups are required to organize the meta fields into distinct records. If you wish to sort an arbitrary query as if there were no grouping applied, use group by sessionid . This ensures that results are returned in groups of distinct sessions or events.

group by clauses are naturally returned in ascending group key order; but, an order by clause can be used to return groups in a different order.

If an order by column does not specify asc or desc , the default ordering is ascending.

Examples:

```
select countdistinct(ip.dst) GROUP BY ip.src ORDER BY countdistinct(ip.dst)
select countdistinct(ip.dst) GROUP BY ip.src ORDER BY countdistinct(ip.dst)
desc
select countdistinct(ip.dst),sum(size) GROUP BY ip.src ORDER BY sum(size)
desc, countdistinct(ip.dst)
select sum(size) GROUP BY ip.src, ip.dst ORDER BY ip.dst desc
select user.dst,time GROUP BY sessionid ORDER BY user.dst
select * GROUP BY sessionid ORDER BY time
```

`search` parameter

The `query` API supports a `search` parameter to perform free text searching. The syntax of the search parameter is identical to the search parameter utilized by the `msearch` API call. Refer to the `msearch` documentation for a description of the search field syntax.

The `search` parameter acts as an extension of the `where` clause in the `query` parameter. This means that the `query` and `search` parameters work together. Use the `query` parameter to specify the `select` clause, the `group by` clause, or the `order by` clause. Any `where` clause criteria specified in the `query` parameter are combined with the search filter as if they were joined with an `AND` operation.

Searches through the `query` API are always done against indexed meta, in case-insensitive mode. It has the same behavior as specifying flags `si,sm,ci` to the `msearch` API.

`values` call

The index provides a low-level `values` function to access the unique meta values that have been stored in the index. This function allows developers to perform more advanced operations on groups of unique meta values.

The `values` call parameter syntax:

```
values-params          = field-name-param, space, where-param, space, size-
param, {space, flags-param} {space, start-meta-param}, {space, end-meta-
param}, {space, threshold-param}, {space, aggregate-func-param}, {space,
aggregate-field-param}, {space, min-param}, {space, max-param}, {space,
search-param} ;
field-name-param       = "fieldName=", (meta-key | entity) ;
where-param            = "where=", where-clause ;
```

```
size-param            = "size=", ? integer between 1 and 1,677,721 ? ;
start-meta-param      = ? same as query message ?
end-meta-param        = ? same as query message ?
flags-param           = "flags=", {values-flag, {"," values-flag} } ;
values-flag           = "sessions" | "size" | "packets" | "sort-total" |
"sort-value" | "order-ascending" | "order-descending" ;
threshold-flag        = "threshold=", ? non-negative integer ? ;
aggregate-func-param  = "aggregateFunction=", { aggregate-func-flag } ;
aggregate-func-flag   = "count" | "sum" ;
aggregate-field-param = "aggregateFieldName=", ( meta-key | entity ) ;
min-param             = "min=", meta-value ;
max-param             = "max=", meta-value ;
search-param          = "search=", search-string ;
```

The `values` call provides the function of returning a set of unique meta values for a given meta key. For each unique value, the `values` call can provide an aggregate total count. The function used to generate the total is controlled by the flags parameter.

Parameters

The following table describes the function of each parameter.

Parameter	Function
`fieldName`	This is the meta key name for which you retrieve unique values. For example, if `fieldName` is `ip.src` , this function returns the unique source IP values in the collection. Entities can be used for the field name, in which case the result is defined as the combined set of field values for all the referenced meta keys. If the `fieldName` refers to a key with rename references, the result is defined as the combined set of field values for the given meta key name plus all of the references' meta keys.
`where`	This is a `where` clause which filters the set of sessions for which the unique values are returned. For example, if the `fieldName` is `ip.src` , and the `where` clause is `ip.src = 192.168.0.0/16` , only values in the range of `192.168.0.0` to `192.168.255.255` are returned. For information on the `where` clause syntax, see *Where Clauses* .
`size`	The size of the set of unique values to return. This function is optimized to return a small subset of the possible unique values in the database.

Parameter	Function
id1 , id2	These optional parameters limit the scope of the search for unique values to a specific region of the meta database and the index. Setting the id1 and id2 parameters to a limited range of the meta database is very important to running searches quickly on large collections.
flags	Flags control how the values are sorted and totaled. Flags are described in the following Values Flags section.
threshold	Setting the threshold parameter allows the values call to short-cut collection of the total associated with each value once the threshold is reached. By providing a threshold, the caller can reduce the amount of index and meta items that must be retrieved from the database. If the threshold parameter is omitted or set to 0, this optimization is not used.
aggregateFunction	Optional parameter used to change the default behavior from counting sessions, packets, or size to counting or summing the numeric field defined by aggregateFieldName . Both parameters must be specified when either is defined. Pass either sum or count to specify which behavior to perform.
aggregateFieldName	The meta field on which to perform the aggregateFunction . Both aggregateFunction and aggregateFieldName parameters must be specified when the aggregate flag is set. Performing a values call using one of the aggregate functions can be significantly slower than a values call that collects totals of sessions, packets, or size. The reason for this is that each session that matches the where clause must be retrieved from the meta database. This scan causes a large portion of the query to be I/O bound on the meta DB volumes. The time taken to run an aggregate values call is linearly proportional to the number of sessions that match the where clause.
min , max	The minimum and maximum value that should be returned from the call. These parameters are used to iterate (or page) over an extremely large number of values, typically more values than could be returned from a single call. Primarily used in conjuction with the flags sort-value,sort-ascending such that the highest value returned would be used in a subsequent call as the min parameter value. The values are exclusive. If min="rsa" was specified and rsa was a valid value, rsa would not be returned; instead, the next highest value would be returned.
search	Text search pattern to be used to further refine the where parameter

values Flags

The flags parameter controls how the values call operates. There are three groups of flags that correspond to the different modes of operation as shown in the following table.

Flag	Description
`sessions` , `size` , `packets`	The `values` call allows you to specify one of these flags to determine how the total for each value is calculated. If the flag is `sessions` , the `values` call returns a count of sessions that contain each value. If the flag is `size` , the `values` call totals the size of all sessions that contain each unique value, and reports the total size for each unique value. If the flag is `packets` , the values call totals the number of packets in all sessions that contain each unique value, and then reports that total for each unique value.
`sort-total` , `sort-value`	These flags control how results are sorted. If the flag is `sort-total` , the result set is sorted in order of the totals collected. If the flag is `sort-value` , the results are returned in order of the sorting order of the values.
`order-ascending` , `order-descending`	These flags control the sort order of the result set. For example, if sorting by total in descending order, the values with the greatest total are returned first.
`suggest`	Enables suggestion mode for the values API. All other flags are ignored if this flag is set
`database-scan`	Make the values call bypass the index and instead collect unique values as if where traversing the meta database. This mode is slow on most cases, but it can be fast if the where clause matches very few sessions.
`ignore-cache` , `clear-cache`	These flags control result set caching on the set of values returned by this call. Normally these should not be used.

`values` Call Example

The `values` call is used extensively by the Navigation view in NetWitness Platform. The default view generates calls that look like this:

```
/sdk/values id1=198564099173 id2=1542925695937 size=20 flags=sessions,sort-total,order-descending threshold=100000 fieldName=ip.src where="time=\"2014-May-20 13:12:00\"-\"2014-May-21 13:11:59\""
```

In this example, the Navigation view requests unique values for `ip.src` . It requests unique values of `ip.src` in the time range given. It asks for the count of sessions that match each `ip.src` , and the results are the top 20 `ip.src` values when sorted by the number total count of sessions in descending order. In addition, the Navigation view has a meta ID range in order to provide an optimization hint to the query engine.

Values call and bucketing mode

When a values call is executed with a `fieldName` parameter that specifies a bucketed indexed meta, the system will only return the bucket values present within the rest of the criteria. This has the side effect of producing counts and totals that represent all sessions within each returned bucket. This is useful because it summarizes size meta into groups that represent human-readable ranges like 1 MB, 2 MB, and so one.

When the number of sessions scanned by the values call drops below 1000 sessions, the values call operates in meta-scanning mode, and at that point it returns exact values for numeric value indexes, regardless of the bucketing setting on the index.

Suggestion Mode

The `values` call has an additional execution mode that is used to provide suggested search values. In this mode of operation, the `values` call only identifies unique values stored with the given meta key name. It provides these results within milliseconds. To achieve this it does not provide any session counts, it will not utilize any other sort flags. The suggestion mode does utilize the `where` parameter to refine suggestions, but it only utilizes the time range clause if provided. Other portions of the `where` clause are not utilized to refine suggestion.

Suggestion mode is enabled by setting the `suggest` flag in the `flags` parameter.

Suggestion mode gives special meaning to the `min` parameter. The `min` parameter can contain the starting point for the suggested values. The return values of `suggest` mode will only include values that start with the text provided in the `min` parameter.

`search` parameter

The `values` API supports a `search` parameter to perform free text searching. The syntax of the search parameter is identical to the search parameter utilized by the `msearch` API call. Refer to the `msearch` documentation for a description of the search field syntax.

The `search` parameter acts as an extension of the `where` parameter. This means that the `where` and `search` parameters work together. Any `where` parameter specified is combined with the search filter as if they were joined with an `AND` operation.

Searches through the `values` API are always done against indexed meta, in case-insensitive mode.

The `values` API only operates on index entries for most requests, in order to provide fast totals over a large numbers of events. When the search parameter operates over in-exact indexes, such as N-Gram indexes, it may include sessions with near matches instead of narrowing the search to exact matches.

`msearch` Call

The index provides a low-level `msearch` function to perform text searches against all meta types. This type of search does not require users to define their queries in terms of known meta types. Instead, it searches all parts of the database for matches. `msearch` is used by the Events view text search. See the "Filter and Search Results in the Events View" topic in the *Investigation and Malware Analysis Guide* for detail on the accepted search forms and examples.

`msearch` parameters:

```
msearch-params  = search-param, {space, where-param}, {space, limit-param},
{space, size-param}, {space, flags-param};
search-param    = "search=", ? free-form search string ? ;
where-param     = "where=", ? optional where clause ? ;
limit-param     = "limit=", ? optional session scan limit ? ;
size-param     = "size=", ? optional result count limit ? ;
flags           = "flags=", {msearch-flag, {"," msearch-flag} };
msearch-flag    = "sp" | "sm" | "si" | "ci" | "regex" ;
```

The `msearch` algorithm works as follows:

1. A set of sessions is identified from the index by finding the intersection of three sets:
   - (Set 1) All sessions in the database
   - (Set 2) Sessions that match the `where` clause parameter
   - (Set 3) If the `si` flag is specified, sessions that indexed values that match the search string parameter.
2. If the search specifies the `sm` parameter, all meta items from the set of sessions identified in step 1 are read and scanned to see if they match the search string parameter. The meta items will be read from the service nearest to the point where the search was executed. For example, if the search is performed on a Broker, the meta items may be read from the Concentrator nearest to the broker, but if the search is performed on an Archiver the meta items will be read from the Archiver itself.
3. If the search specifies the `sp` parameter, all raw packet or log entries from the set of sessions identified in step 1 are read and scanned to see if they match the search string parameter. The packets will be read from the service nearest to the point where the search was executed. For example, if the search is performed on a Concentrator, the packet data will be read from the Decoder, but if the search is performed on an Archiver, the packet data will be read from the Archiver itself.
4. Matches from step 2 and step 3 are returned as they are found, up to the point where the `limit` parameter is reached or the `size` count is reached, whichever occurs first. The `limit` parameter specifies the maximum number of sessions for which meta and packet data will be scanned. If `limit` is not specified, the entire set of sessions determined in step 1 is scanned. The `size` parameter specifies the maximum number of results that will be returned. In practice, the `size` parameter acts more as a suggestion. It is possible that slightly more results than specified will be returned, but fewer results will never be returned. If the `size` parameter is not specified, all results matching the search will be returned.

`msearch` Flags

Flag	Description
`sp`	Scans raw packet data
`sm`	Scans all meta data
`si`	Does index lookups for all search parameters before scanning meta
`ci`	Performs a case insensitive search. Returned results are case-preserving.
`regex`	Treats the search parameter as a regular expression. Only a single regular expression can be specified, but the regular expression may be arbitrarily complex.

`msearch` Index Search Mode

Using the index search mode, specified by using the `si` flag, causes results to be returned significantly faster than any other mode. The main limitation of this mode is that it only returns matches on text terms that match value-indexed meta values.

- The `si` parameter must be combined with the `sm` flag. The `si` parameter implies the search only matches indexed meta.
- The `si` parameter can be used with regex searches, however only text indexed values will match. IP addresses and numbers will not match the regex.

Text Search Syntax

The search parameter given to `msearch` is composed of 1 or more words, separated by whitespace. For example, searching for `foo` returns sessions that contain the word foo.

If multiple terms are provided for the search, they are implicitly considered to be an AND operation. For example, searching for `foo bar` returns sessions that contain both foo AND bar. Sessions that contain only foo or only bar are filtered out. If you want to search for sessions containing any of two or more terms, you must explicitly separate the terms with the word OR. For example, searching for `foo OR bar` returns sessions that contain either foo or bar.

Search Syntax And Index Modes

The searches given to the `msearch` command are interpreted according to the index level on all the indexes. `msearch` works on the value-indexed keys in the index. Search terms provided to `msearch` will find values that are an exact match to values that were indexed.

As of version 11.1, there are new index modes available that allow `msearch` to locate text that is not an exact match to the search input. `msearch` supports wildcard searches on the word meta index, if the word meta index has the ngram option enabled. For details on the ngram option, see the topic Index Customization.

The wildcard search allows the use of the `*` and `?` characters as wildcards in search terms. The `*` can stand for 0 or more characters, while the `?` may stand for any single character. To search for those characters in an N-gram enabled index, you may escape them with a backslash character.

If the word index has the 'edge' N-gram option enabled, then it can be used to locate searches that end in a wildcard. This means it is only useful for finding text that begins with a known prefix.

If the word index has the 'all' N-gram option enabled, then wildcards may appear anywhere in the search term.

This table summarizes the relationship between word index level, and the types of searches that `msearch` will locate.

Search input	Non-indexed	IndexValues	IndexValues with Edge N-grams	IndexValues with All N-grams
"foo"	no match	"foo"	words starting with "foo"	words containing "foo"
"foo*"	no match	literal "foo*"	words starting with "foo"	words starting with "foo"
"*foo"	no match	literal "*foo"	no match	words ending with "foo"
"*foo*"	no match	literal "*foo*"	words staring with foo	words containing "foo"
"foo*"	no match	literal "foo*"	literal "foo*"	literal "foo*"

`msearch` Tips

- Always use the `where` clause to specify a time range for the search.
- To search for IP address ranges, specify them in the `where` clause.
- Use the `limit` parameter when not using the index search mode. Without it, there will be an extremely large amount of data read by the meta and packet databases.

Stored Procedures

The `query` and `values` calls provide more low-level search functionality. For more advanced use cases, server-side stored procedures exist.

Use of Quotes in Query Syntax

The query parser does not care whether you use single or double quotes within a query statement. A single- or double-quoted value is treated as text meta.

The query parser attempts to make sense of whatever you put in the statement. It is not very strict about what it will accept.

For example:

`reference.id=4752`

This clause identifies sessions that have a `reference.id` meta value that has a *numeric* value of 4752.

`reference.id='4752'` or `reference.id="4752"`

This clause identifies sessions that have a `reference.id` meta value that has a *string* value of `4752` .

However, the query engine implicitly compares numbers and strings that look like numbers as equal when the values are semantically the same. So it works with either syntax.

For most efficient performance, however, it is always a good idea to construct the queries such that the query syntax matches the data types generated by the parser.

For example, if the parser is creating `reference.id` as a numeric data type (such as `uint32` or `uint64`), then use the numeric syntax.

If the parser is creating `reference.id` as a text data type, then use the string syntax.

`hierarch` Call

The `hierarch` call returns information about the hierarchy of devices attached to the collection represented in this database.

A hierarchy consists of this device, plus any devices that this device is connected to. For each device, the contents of the `/sys/stats` folder is returned. This information includes the device name, it's UUID, and it's version information.

The hierarchy command returns it's information as a MessagePack object, which may be translated into different representations depending on what API you are using to access the Core service. For example, using the REST API it is translated to a JSON object.

For devices that connect to upstream devices, such as a Broker or Concentrator, the hierarchy message will contain a `devices` member. The `devices` member is an array that holds the contents of the `hierarch` message as executed on each upstream device. In this way, the `hierarch` message forms a hierarchical directory of all services that the device connects to, both directly and indirectly.

Index Customization

This topic describes how to use the custom index file to customize the index. Each NetWitness NextGen service is installed with a default index configuration that is intended to cover the index needs for most users of the product. However, it is possible to index new meta keys in order to use the index with custom content that generated custom meta.

Index Configuration File Locations

The index customization is accomplished by making changes to the custom index file. The location of this file is **/etc/netwitness/ng/index-<servicename>-custom.xml** , where **<servicename>** corresponds to the name of the product that you are customizing. For example, the Concentrator custom index file is /etc/netwitness/ng/index-concentrator-custom.xml.

Concentrator products also include a file that describes the default index configuration: **/etc/netwitness/ng/index-concentrator.xml** . This file is useful as a template to show how the custom index file is formatted.

If you make customizations to the index in the custom index file, those customizations override any conflict with the default index configuration.

You can make changes to the custom index file while the service is running. When the service receives an index save command, the changes to the custom index file are read and applied to the index.

Changes to the index can only be applied to new incoming data. Data cannot be retroactively reindexed with a new custom index configuration, except by Rebuilding the Index .

Index configuration entries

The custom index file is an XML document. The root element of this document is the `language` element, and inside there are elements for each meta key to describe each custom index. Each element of the custom index configuration looks like this:

```
<key name="did" description="Decoder Source" level="IndexValues"
format="Text" valueMax="100"  />
```

Definitions for each attribute in this element:

Attribute	Description
name	The name of the meta key that will be indexed
description	A human-readable description for the meta type
level	The type of index that will be created for this meta key
valueMax	The maximum unique values that will be stored for this key per slice
format	The format of the data held by all meta items with this meta key name

Attribute	Description
bucket	Enable size bucketing
ngrams	Enable ngram generation
threshold	Threshold for approximate value merging on ngram indexes
defaultAction	Default Navigate view action for this key: Open, Closed, Auto, Hidden

The next few sections examine these parameters in greater detail.

Meta names

The meta name used by the index refers to the meta key name present within every meta item in the meta database. These meta names are generated by the Decoders when parsing. Parsers can choose to generate meta with any meta key name. Therefore, the custom index allows you to choose which of the meta items generated by the Decoder are indexed.

Meta key names can be 16 characters long, and contain only letters or the '.' character.

Data Types

When the Decoder generates meta items, it assigns a data type. Each parser can choose the data type of the meta it generates. However, there are recommended and standard data types for each of the default meta keys. For example, ip.src and ip.dst are stored as the IPv4 meta type, and alias.host is stored as the Text meta type. Each parser must agree on the data format for each meta key generated by the Decoder.

When adding a custom index to the Concentrator, the data type of the custom index must match the format of the data generated by the Decoder. If the types do not match, the Concentrator attempts to convert the meta generated into the type specified for the custom index. However, these conversions sometimes fail, and the resulting index can produce undefined results.

Likewise, when many Decoders and Concentrators work together as part of a NetWitness installation, they must all agree on the types for each meta key. Conflicts of meta types between NetWitness NextGen services can lead to undefined behavior.

The following table shows the metadata types supported by the NetWitness NextGen services.

Type	Size in bytes	Description
Int8	1	Signed 8-bit integer
UInt8	1	Unsigned 8-bit integer
Int16	2	Signed 16-bit integer
UInt16	2	Unsigned 16-bit integer
Int32	4	Signed 32-bit integer
UInt32	4	Unsigned 32-bit integer
Int64	8	Signed 64-bit integer

Type	Size in bytes	Description
UInt64	8	Unsigned 64-bit integer
UInt128	16	Unsigned 128-bit integer
Float32	4	32-bit floating point number, single precision
Float64	8	64-bit floating point number, double precision
TimeT	8	Unix epoc timestamp
Binary	1-255	Arbitrary binary data
Text	1-255	UTF-8 Encoded text data
IPv4	4	IPv4 address bytes
IPv6	16	IPv6 address bytes
MAC	6	MAC Address bytes

When defining a custom index, it is important to use the best data type for the meta. For example, never store IP addresses as Text, since the Text representation takes more bytes than the IPv4 representation.

Index Levels

There are three levels, or types, of indexing: IndexNone, IndexKeys, and IndexValues.

IndexNone

This type of custom index is not really an index at all. Custom index entries with the IndexNone level exist only to define and document the meta key. IndexNone entries can be used in custom Decoder indices to enforce a specific data type for a meta key across all the parsers on a Decoder.

IndexKeys

This type of custom index indicates that the index only keeps track of sessions that contain meta items with this meta key name. However, it does not index any unique values in the meta database for the meta key.

Key-level indices take much less storage space, memory, and CPU time to manage, but they require a lot more work from the query engine when you perform query or values operations using them.

If used in a where clause, a meta key indexed at the key level can only be used to resolve operations such as exists or !exists.

IndexValues

This type of custom index keeps sessions that contain each individual unique value for the meta key. This type of index is also known as a "full index".

This type of index is needed for efficient processing of most where clauses, and for use of this meta key as the fieldName parameter of a values call.

Value Max

Value max is a parameter that can have a very significant impact on the accuracy and performance of a Value-level index.

As a Decoder parses packets or logs, it is allowed to create meta of any type with any value. Usually, these meta items are created from data copied directly out of the packet or log. Therefore, anyone can create unique meta values in response to nearly any event.

The performance of the index is directly dependent on the number of unique values it has found for each meta key. As the number of unique values increases, the rate at which new meta is indexed can decrease, and the speed with which queries are completed decreases. Since any person can influence the creation of unique meta values, it is possible for any person to affect the performance of the index.

The value max parameter limits the number of unique values that can enter the index. Therefore, a malicious user cannot flood the system with a large number of unique values in an attempt to make the NetWitness system not work.

It is important to set a value max on any meta key that may have its value influenced directly by incoming packets or logs.

The value max applies only to values added since the last index save operation.

The limit for how high value max can be set varies from version to version and on the amount of RAM available to the NetWitness NextGen service. As of 10.3, the recommended ceiling for value max is 5,000,000 for any meta key. If there are a lot of custom indices, then the value max may have to be lower.

maxLength

The max length parameter is used exclusively on the `word` meta type. The meaning of the `maxLength` parameter depends on whether the index is storing N-grams, as indicated by the `ngrams` parameter. The default and recommended value for `maxLength` is 5.

Max Length without N-Grams

If N-Gram support is turned off, then the `maxLength` parameter indicates that search terms need to be truncated so that they will match truncated values in the index and meta database. If this is the case, the `maxLength`**must** be less than or equal to the corresponding setting for **/decoder/parsers/config/token.max.length** on the Log Decoder service that is generating `word` token metas. The index will use the `maxLength` to properly interpret search terms fed into the `msearch` SDK function.

Max Length with N-Grams

If N-Gram support is turned on, by setting `ngrams="Edge"` or `ngrams="All"` , then the maxLength parameter controls the maximum length of N-Grams extracted from the meta item. In this scenario, the maxLength does not have to match the length of `word` meta items generated on the Log Decoder.

minLength

The minimum length parameter is used exclusively on the `word` meta type. It only has an effect when N-grams are generated. It indicates the smallest length N-gram that will be extracted from the `word` meta items. The default and recommended minimum N-Gram length is 3, which means that searches against the `word` index must have at least 3 characters.

ngrams

The `ngrams` parameter is used exclusively on the `word` meta type. N-gram indexes extract information that allow for fast lookup of searches that only match part of the word. For example they allow for finding 'ball' inside the word 'basketball'. If set to the value of `all` , then the index will create entries for all N-grams within the word meta values. The minimum value of N is specified by `minLength` , and the maximum value of N is specified by `maxLength` .

The `ngrams` parameter also supports the value `edge` , which indicates the index will only store N-grams that appear at the beginning of a word. Edge N-grams are useful for type-ahead search matching, and take less space than storing all N-grams. However they are not useful to locate matches inside the word or at the end of the word.

The `ngrams` parameter supports the `` `allvalue` `` value for the text format meta keys. It means that the index for a meta key will store `` `all` `` N-grams within the meta values and also `` `IndexValues` `` limited by ValueMax.

This index type enhances the search capability on overflowed index values due to Value Max limits. The N-grams index provides the ability to search any meta value and the Values index provides the ability to retrieve top N available values.

The `` `minLength` `` parameter specifies the minimum value of N, the `` `maxLength` `` parameter specifies the maximum value of N, and the `` `ValueMax` `` parameter specifies maximum unique values. The following are some guidelines to follow while using these parameters:

- It is recommended to set `minLength=3` and `maxLength=3` for compact index storage of N-grams and also use ValueMax to limit value index storage. When compared to Text format keys indexed by IndexValues and ValueMax=0 (unlimited) this N-gram index configuration provides better search functionality with compact index storage and memory usage.
- The `contains` operation in queries runs faster for meta keys indexed with this Ngram index type when compared to IndexValues.
- As the index type uses both N-grams and IndexValues for the same meta key, it increases the index memory and the index storage usage for the meta key and eventually reduces index retention. Hence it is recommended to choose this index type `only` for desired meta keys to consider storage and index retention.
- When you switch to this N-gram type and if the new behavior is required on the whole index, you must perform a re-index.

N-gram indexing has a major impact on the functionality of the text indexes. Using the N-gram settings of 'all' or 'allvalue' N-grams with maxLength 3, a meta key index will consume approximately 2 times more space than if N-grams were not enabled.

Note: Note: When you switch from ngrams 'allvalue' or 'all' to IndexValues, then you may need to consider re-index as index slices created before the configuration change would be ngram indexes and the values call would return ngrams.

N-gram indexing has a major impact on the functionality of the text indexes. Using the N-gram settings of `all` N-grams with maxLength 3, a meta key index will consume approximately 2 times more space than if N-grams were not enabled.

In the default index configuration, only the `word` meta key has N-gram indexing enabled. This meta key is used to index text tokens extracted from unparsed logs on the Log Decoder.

The N-gram index mode supports a 'threshold' tunable parameter that controls the precision of the index. The threshold is used to merge similar index values together depending on how closely the set of indexed sessions matches. Values greater than 0 and less than or equal to 1.0 are accepted. A value of 1.0 means that the index will only merge values if they were found in the same set of sessions. Higher values mean that the index will merge fewer values, at the expense of requiring more time to create the index during aggregation. Lower values mean the index will merge more values together, at the expense of longer search execution time due to more database access. The threshold parameter does **not** affect search accuracy.

Index All Values

The `valueMax="0"` parameter option for the meta key specifies to include all the meta key values. It enhances the capability to search all the meta values for the key configured. This parameter can be applied only for meta keys indexed by level `IndexValues` with `valueMax`.

Example: `<key description="Filename" name="filename" format="Text" level="IndexValues" valueMax="0"/>`

The `valueMax="0"` setting can index all unique values for the key; many unique values could flood the system and affect the index and system performance. Hence `slice.memory.max`, a new index config threshold, is introduced in 12.2.

When the index slice memory usage exceeds the threshold, an index save will flush the index to disk, keeping index memory usage in control.

The default value for `slice.memory.max` is 4% of the system memory RAM, and the setting can also be configured. Setting the value zero `slice.memory.max=0` disables the threshold validation.

A new index stat `slice.memory.usage` is also made available to monitor the current index slice memory usage.

The following are guidelines to follow while using the `valueMax="0"`

- The Query execution would now see more values with `valueMax="0"` as it includes all the values of the meta key indexed. Hence the execution time would increase based on the data.
- Index storage usage would increase as all the meta key values are included and reduces Index retention. Hence, to consider storage and index retention, it is recommended to set the index parameter only for desired meta keys.
- When you set this parameter and if the new behavior is required on the whole index, you must perform a re-index.
    - On full re-index, the re-indexer checks for keys configured with `valueMax="0"` and adjusts (almost doubles) the index slice count to distribute sessions per slice.

Numeric Bucketing

Indexes on meta formats that are unsigned integers, specifically UInt32 and UInt64, can make use of size bucketing to improve performance.

Size bucketing rounds down the size values in the index to their nearest traditional byte unit of information. Enabling this option on a numeric index reduces the number of unique values to track in the index, which improves aggregation and query performance.

The bucketing option is enabled by the boolean parameter `bucket` on the key element. `bucket` may have the value `0` , for off or `1` for on. The default is `0` .

Examples of bucket number values:

Raw Value	Value Stored in Index	Explanation
0 - 1,023	0 - 1,023	Values 0-1023 are stored unmodified
1,024 - 1,048,575	1 KB, 2 KB, 3 KB ... 1,023 KB	Values under 1 MB are stored in 1 KB buckets
1,048,576 - 1,073,741,823	1 MB, 2 MB, 3 MB ... 1,023 MB	Values under 1 GB are stored in 1 MB buckets
1,073,741,824 - 1,099,511,627,775	1 GB, 2 GB, 3 GB ... 1,023 GB	Values under 1 TB are stored in 1 GB buckets

Key Value Aliases

Value aliases can be specified for keys. Value aliases are text representations that correspond to specific values for a key. These text representations may be easier to remember and more convenient to display. Aliases can be used in the rule/query language (see Queries) and are accessible via the SDK.

Value aliases are specified using the `aliases` and `alias` elements:

```
<key description="Service Type" format="UInt32" level="IndexValues"
name="service" valueMax="75" defaultAction="Open">
       <aliases>
              <alias format="$alias" value="0">OTHER</alias>
              <alias format="$alias" value="20">FTPD</alias>
              <alias format="$alias" value="21">FTP</alias>
              <alias format="$alias" value="22">SSH</alias>
              <alias format="$alias" value="23">TELNET</alias>
              <alias format="$alias" value="25">SMTP</alias>
              ⋮
       </aliases>
</key>
```

Key Renaming

The index language supports the concept of key renaming. This feature is used to provide backwards compatibility for new key names to deprecate and replace old key names. A renaming is achieved by adding `rename` elements to the key. This has the effect of indicating the parent key renames the key in the rename element. For example, the key definition below defines a new key named `port_src` that renames the key `tcp.srcport` .

```
<key name="port_src" description="Source Port" format="UInt16"
level="IndexValues">
       <rename name="tcp.srcport"/>
</key>
```

The rename element indicates to the database that uses of the parent key, in this case `port_src` , will include both meta items with type port_src and meta items with type tcp.srcport. Thus, new meta items can be added to the database and queried using `port_src` , and such queries will return information that was previously stored in tcp.srcport as well.

The rename element accepts a single attribute, `name` , that refers to a previously defined key.

Keys referred by rename elements must have the same type as the parent key.

Keys referred by rename elements must have the same index level as the parent key.

If a key is redefined in a custom index file, and the redefined key contains rename elements, then those rename elements replace any previously defined rename elements.

Note: Usage of renamed meta key pairs in the `select` clause cannot be combined with fixed-size result paging for a query. For more information, see the Queries topic.

Entities

The index configuration is used to define entities. Entities provide a convenient way to work with several meta keys at the same time. An entity definition is an alias that groups together the results from other meta keys. You can use an entity definition anywhere you would use a normal meta name. The primary use for entities is to organize similar meta types into a single, easier to use, meta type. For example, the default NextGen database language includes distinct meta types for IP source and IP destination. You could define an entity that represents the combined set of all IP sources and destinations using an `entity` element:

```
<entity name="ip.all" description="any ip entity">
       <keyref name="ip.src"/>
       <keyref name="ip.dst"/>
</entity>
```

The `entity` element accepts the following attributes:

Name	Description
name	(Required) The name of the entity
description	(Optional) A description of the entity
defaultAction	(Optional) Navigate view action for this entity: Open, Closed, Auto, Hidden

Entity definitions create new entries in the NextGen service language. Since they are returned in the SDK `language` call, they can be used by older client applications that are not directly aware of the concept of entities.

Each entity definition must contain one or more `keyref` elements. The keyref element only allows a single `name` attribute that must refer to a real meta `key` element defined somewhere else in the device's language. The `keyref` is also allowed to refer to meta types defined in the default language.

Meta entities can be utilized in application rules, but are not supported in network rules as meta available is too limited.

Entity Definition Rules

- All the keys referenced by an entity must have the same data type
- All the keys referenced by an entity must have the same index level
- An entity name cannot conflict with any existing meta type
- Keyrefs must refer to meta key names that are defined earlier in the index configuration

Entities in Brokers

Brokers will inherit entity definitions from up-stream devices, in the same way that meta key definitions are inherited. If the upstream devices attached to the broker do not all have the same set of entities defined, the Broker will log a warning. All upstream devices should have the same entity configuration. A broker operating with mismatched entity definitions may produce undefined behavior.

Rebuilding the Index

Under normal operation, changes made to the index configuration for a service are only applied to new data that enters the collection. Rebuilding the index over all the data in the collection is a time-consuming process because it requires all of the meta database storage to be read from disk.

In version 11.0 and later, it is possible to rebuild the index while the service is online. Version 11.0 services rebuild indexes in the background whenever the service detects that part of the session and meta databases is unindexed.

Activating the Background Reindexer

The background reindexer is activated whenever the service starts. During startup, the indexer checks for gaps between sessions that are indexed and sessions that are present in the session and meta database. If any gaps are found, the background reindexer begins reindexing the session and meta database on the service.

Examples of events that may activate the background reindexer:

1. A power failure or crash occurred, rendering the last slice of the index corrupt. The corrupt data is deleted at startup, leaving a gap in the index.
2. Index data is forcibly deleted, either by doing an index reset or deleting files from the filesystem.

Controlling the Background Reindexer

The operation of the background indexer is controlled by the configuration node `/index/config/reindex.enable` . If `reindex.enable` is set to true, the next time the service starts the reindexer will operate. If `reindex.enable` is set to false, the reindexer will not start the next time the service starts, but will continue to operate until the service is restarted.

Background Reindexing Algorithm

The operation of the background indexer is as follows:

1. The index examines the ranges of sessions that are present in the index and compares them to the ranges of sessions that have valid meta data. Any discrepancies between the two are considered gaps.
2. The gaps in the index are subdivided into slices based on the current value of `/index/config/save.session.count` .
3. For each slice that is missing, a temporary index is created in one of the directories specified by `/index/config/index.dir` . The slices are reindexed in reverse numerical order. Thus, the most recently collected sessions are indexed first.
4. Once the slice is completely reindexed, it is moved into its valid location in the online index. If the reindexed slice belongs on the warm tier, it is moved to the warm tier.
5. The newly indexed data appears as part of the collection.

Background indexer status

The stat node `/index/stats/updater.state` indicates the current state of the background reindexer. This node will say `running`, `not running`, or `failed`. If the status is `failed`, check the service log for more diagnostic information.

Effects on Aggregation

Services that perform aggregation utilize the index to keep track of sessions that have already been aggregated. If the index does not have enough information to begin aggregation, aggregation will be offline until enough slices have been reindexed. During this time the aggregation status for the upstream device will indicate that it is waiting on aggregation.

Forcing A Reindex

To force the index on a service to be rebuilt:

1. Ensure that `/index/config/reindex.enable` is true.
2. Reset the index by using the `reset` message on the service. For example: `/concentrator/reset index=1` will restart the service and delete all the index files.
3. Wait for the service to restart. Background reindexing will start.
4. The most recently collected data will be available for queries as soon as the index slice representing those sessions has been reindexed.

Optimization Techniques

This topic describes optimization techniques for the NetWitness Core database. The NetWitness Core database is set up to work with a wide variety of work loads by default. However, like any database technology, its performance can be very sensitive to both the nature of the data being ingested, and the nature of the searches that the user performs against the database.

Thresholds

Thresholds are a useful optimization that can have a dramatic effect on how fast results are returned to the NetWitness Platform Navigate view. Thresholds are applied to the `values` call. For more information about the `values` call, see Queries .

The threshold defines a limit to how much of the database is retrieved from disk in order to produce a count. For most queries, the number of sessions that match the `where` clause is very large. For example, selecting all the log events for just one hour running at 30,000 events per second matches 108,000,000 sessions.

NetWitness introduced the threshold feature based on the observation that most cases where a count of sessions is required do not have to have results that are accurate down to the very last session. For example, when looking at the top 20 IP addresses present over the past hour, it is not very important if the report indicates that an IP value matched 10,000,000 or 10,000,001 sessions exactly. The estimate is good enough. In these scenarios, we can make an estimate for the value of the count returned when our count exceeds the threshold parameter. When the threshold is reached, the remaining count is estimated, and the results are sorted based on the estimated counts, if necessary.

Complex `where` Clauses

The amount of time it takes for the NetWitness Core database to produce a result is dependent on the complexity of the query. Queries that align directly with the indexes present on the meta can be resolved quickly, but it is very easy to write queries that cannot be resolved quickly. Sometimes, queries that cannot be returned quickly can be processed by the Core database and the index differently to produce much more satisfying results for the customer.

It is useful to know the relative *cost* of each part of the `where` clause. A clause with a high cost takes longer to execute. In the following table, the query operations are ordered in terms of their relative cost, from lowest to highest.

Operation	Cost
exists, !exists	Constant
= , !=	Logarithmic in terms of the number of unique values for the meta key, linear in terms of the number of unique elements that match a range expression
< , > , <= , >=	Logarithmic in terms of unique value lookup, but more likely to be linear since the expression matches a large range of values
`begins` , `ends` , `contains`	Linear in terms of the number of unique values for the meta key

Operation	Cost
`regex`	Linear in terms of the number of unique values for the meta key with a high per-value cost

`AND` and `OR`

When constructing a `where` clause, keep in mind that constructing many terms using the `AND` operator can have a beneficial affect on the performance of a query. Any time that multiple criteria can be used to filter down the set of sessions matching the `where` clause, there is less work for the query to do. Likewise, each `OR` clause creates a larger set of sessions to process for each query.

As a general rule of thumb, the more `AND` clauses in the query, the faster it completes, but the more `OR` clauses in the query, the slower it completes.

Use Case: Match a Large Subnet

It is common for users to construct queries that attempt to include or exclude a large subnet. This type of query is common because the users are trying to include or exclude some large portion of their internal network from their investigation.

Starting with NetWitness 11.4, all /8, /16, and /24 IPv4 subnets get their own index entries. So, no special action is needed to help optimize these queries.

For versions of NetWitness 11.3 and earlier, it is slower for the query engine to resolve this query using the `ip.src` or `ip.dst` indices alone. The issue arises from the fact that a `where` clause such as this:

```
ip.src = 10.0.0.0/23
```

Actually must be interpreted as:

```
ip.src = 10.0.0.0 || ip.src = 10.0.0.1 || ip.src = 10.0.0.2 || ... || ip.src =
10.0.1.255
```

Thus, the index could have to create a `where` clause with 512 terms.

The solution to this problem is to use the Decoder to tag common networks of interest using application rules. For example, you could create meta items with an application rule that looks like this:

```
name=internal rule="ip.src = 10.0.0.0/23" order=3 alert=network
```

This rule creates meta items in the meta key network with the value internal for any IP address in the 10.0.0.0/23 network.

The `where` clause could be expressed as:

```
network = "internal"
```

Assuming there is a `value-level` index on the network meta data, the index does not have to expand this query into anything more complex, and the sessions matching the desired subnet are matched very quickly.

Use Case: Substring Matching

Using the operators `begins` , `ends` , `contains` , and `regex` in a `where` clause can be very slow if there are a large number of unique values for the meta key. Each of these operators is evaluated independently against each unique value. For example, if the operator is `regex` , the `regex` must be run independently against each unique value.

To work around this, the most effective strategy is to reorganize the meta items such that the user does not have to use a substring match.

For example, consider if the users are attempting to find the host name within a URL somewhere in the session. The users might write a `where` clause such as:

```
url contains 'www.rsa.com'
```

In this scenario, it is likely that the `url` meta key contains one unique value for every session that was captured by the Decoder, and therefore has a huge number of unique values. In this case, the contains operation is slow.

The best approach is to identify the part of meta data they are attempting to match, and move the matching into the content parser.

For example, if there is meta data being generated for each URL, a parser could also break down the URL into its constituent components. For example, if the Decoder generates URL meta data with the value `http://www.rsa.com/netwitness` , it could also generate `alias.host` meta data with the value `www.rsa.com` . Queries could be performed using:

```
alias.host = 'www.rsa.com'
```

Since the substring operator is no longer needed, the query is much faster.

Index Saves

The Core index is subdivided by save points, also known as slices. When the index is saved, all the data in the index is flushed to disk, and that portion of the index is marked as read-only. Saves serve two functions:

- Each save point represents a place where the index could be recovered in the case of a power failure.
- Periodically saving can ensure that the portion of the index that is actively being updated does not grow larger than RAM.

Save points have the effect of partitioning the index into independent, non-overlapping segments. When a query must cross over multiple save points, it must re-execute parts of the query and merge the results together. This ultimately makes the query take longer to complete.

By default, for installations of versions 10.5 and later, a save is performed on the Core index every time 600,000,000 sessions are added to the database. This interval is set by the index configuration parameter `save.session.count` . For more information, see Index Configuration Nodes .

Older versions of NetWitness Platform, or systems that have been upgraded from versions prior to 10.5, use a time-based save schedule that saves the index every 8 hours. You can see the current save interval by using the scheduler editor in the NetWitness Admin UI for the service. The default entry looks like this:

```
hours=8 pathname=/index msg=save
```

By adjusting the interval, you can control how often saves are created.

Affects of Increasing the Save Interval

By increasing the save interval, save points are created less frequently, and therefore fewer save points exist. This has a positive effect on query performance, because it becomes less likely that queries traverse slices, and when slices do have to be traversed, there are not as many to traverse.

There are downsides to increasing the save interval though. First, the Concentrator is more likely to hit the `valueMax` limit set on any of the indices. Second, the recovery time in the event of a forced shutdown or power failure is increased. And third, the aggregation rate may suffer if the index slice grows too large to fit in memory.

Affects of Decreasing the Save Interval

By decreasing the save interval, it is possible to avoid hitting the `valueMax` limits while maintaining a full value index for meta data that contains a large number of unique values. Decreasing the save interval does have a detrimental impact on query performance, since more slices are created.

Working with `valueMax`

The `valueMax` limitation can be frustrating to customers who want to index all possible unique meta. Unfortunately that is not possible in the general case. Meta keys exist that can have arbitrary random data from anywhere on the Internet, and all unique values cannot be indexed.

However, it is possible to work around some of the limitations of `valueMax` by using key level indices instead of value indices. Key level indices are not influenced by `valueMax` .

It is possible to use the Navigate view on a meta key indexed at the key level. The database uses value level indices in the `where` clause where possible, but meta database scanning is used to resolve unique values for the `values` call. This approach works well when the `where` clause provides an effective filter to limit search scope to a small number of sessions, perhaps less than 10,000 sessions.

In cases where the `valueMax` is reached, the users can perform a database scan on their queries to ensure no relevant values were dropped. This feature is accessible in the Investigator 9.8 client via the right-click menu on the Navigation view. Although the meta database scan takes a long time, it reassures the customer that they are not missing anything in their reports.

Parallelize Workloads

When the customer is using a lot of reports, ensure that they are making full use of the parallel executing options within Reporting Engine. Likewise, ensure that the number of `max.concurrent.queries` is appropriate for the hardware.

The NetWitness Platform Navigate view has the ability to run the components of its output in parallel, which can have a significant impact on the perceived performance of the NetWitness Core service.

Index Rebuild

In rare cases, a Core service might benefit from an index rebuild. Examples:

- The NetWitness Core service has index slices created by a very old version of the product and has not rolled out any data in more than six months.
- The index was configured incorrectly, and the customer wants to re-index all meta with a new index configuration.
- The traffic load into the Core service was very light, and the save interval was large, causing more slices than needed to be generated.

In these cases, an index rebuild may provide performance improvements. To do so, you must send the message `reset` with the parameter `index=1` to the `/decoder` folder on a Decoder, the `/concentrator` folder on a Concentrator, or the `/archiver` folder on an Archiver.

Be aware that a full reindex takes days to complete on a fully loaded Concentrator, and possibly weeks on a full Archiver.

Scaling Retention

There are several ways to improve the retention of the NetWitness Core database. Retention refers to the period of time that is covered by data stored in the database.

The first step in analyzing retention is to determine which part of the database is the limiting factor in terms of retention. The packet, meta, and session databases provide the `packet.oldest.file.time` , `meta.oldest.file.time` , and `session.oldest.file.time` stats in the `/database/stats` folder to show the age of the oldest file in the database. The index provides the `/index/stats/time.begin` stat to show the oldest session time stored in the index.

Increasing Packet and Meta Retention

The primary mechanism for increasing retention on these databases is adding more storage. If adding more storage to the NetWitness Core service is not possible, then it may be necessary to use the compression options on the packet and meta database to reduce the amount of data each database writes.

If meta retention is a concern, you may want to remove unneeded content from the Decoder generating meta. Many parsers generate meta that the customer does not need to store long term.

Increasing Index Retention

Usually the index has longer retention than the databases, but with a complex custom index the index retention may be shorter. Usually the easiest course of action is to remove unneeded value-level indices from the custom config, or perhaps override some of the default value-level indices with key-level indices.

It is also possible to scale the index by adding additional index storage. However, the index storage should be extended using solid-state drives only.

Scaling Horizontally

Starting in version 10.3, Concentrators and Archivers have the ability to be clustered using group aggregation. Group aggregation allows a single Decoder to feed sessions to multiple Concentrators or Archivers in a load-balanced manner. Group aggregation enables the query and aggregation workload to be split among an arbitrarily large pool of hardware.

For more information, see the "Group Aggregation" topic in the *Deployment Guide* .

Grouping Workloads

The NetWitness Core database works much better when all the users of the system are working within the same region of the database. Since the database is fed data from the Decoder with a first-in-first-out scheme, data in the database typically is clustered together according to the time it was captured and stored. Therefore, the database works better when all users are working on the same time period of data.

It is not always possible for all users to be working on the same time period simultaneously. The NetWitness Core database can handle that use case, but it is slow to do so because it must alternate between having different periods of time in RAM. It is not possible to have all of the time periods in RAM at the same time. Typically less than 1 percent of the database and less than 10 percent of the index fits in RAM.

To make NetWitness Platform work for the customer, it is important to get the customer to organize their users into groups that tend to work on the same time ranges. For example, users who do daily monitoring over the most recent data may be one user group. Perhaps there is another user group that does queries further back in time as part of an investigation. And perhaps another set of users do reports over large periods of time. Attempting to serve all the groups from a single database can lead to frustration and long wait times for results to be produced. However, if the different use cases can be spread to different Concentrator hardware, the perceived performance can be much better. In this case, it may be beneficial to utilize more Concentrator services with less RAM and CPU power rather than a single large and expensive Concentrator intended to meet all needs.

Cache Window

Consider this sequence of events:

1. At 9:00 a.m., user "kevin" logs in to a Concentrator and requests a report on the last one hour of collection time.
2. The Concentrator retrieves reports for the time range 8:00 a.m. to 9:00 a.m.
3. At 9:02 a.m., user "scott" logs in to the same Concentrator and also requests a report on the last one hour of collection time.
4. The Concentrator retrieves reports for the time range 8:02 a.m. to 9:02 a.m.

Notice that even though both users were looking at time ranges that were close together, the work done by the Concentrator to produce reports for Kevin could not be re-sent to Scott, since the time ranges are slightly different. The Concentrator had to re-calculate most of the reports for Scott.

The setting `cache.window.minutes` on the `/sdk` node allows you to optimize this situation. When a user logs in, the point in time representing the most recent data for the collection only moves forward in increments of the the number of minutes in this setting.

For example, assume the `/sdk/config/cache.window.minutes` is 10\. Re-evaluating the above action changes the sequence of events.

1. At 9:00 a.m., user "kevin" logs in to a Concentrator and requests a report on the last one hour of collection time.
2. The Concentrator retrieves reports for the time range 8:00 a.m. to 9:00 a.m.
3. At 9:02 a.m., user "scott" logs in to the same Concentrator and also requests a report on the last one hour of collection time.
4. The Concentrator retrieves reports for the time range 8:00 a.m. to 9:00 a.m.
5. At 9:10 a.m., user "scott" re-loads the reports for the last one hour of collection time.
6. The Concentrator retrieves reports for the time range 8:10 a.m. to 9:10 a.m.

The report returned in step 3 falls in the cache window, so it is returned instantaneously. This gives Scott the impression that the Concentrator is very fast.

Thus, larger `cache.window` settings improve perceived performance, at the cost of introducing small delays until the latest data is available to search.

Time Limits

When a query is running on the NetWitness Core database for a very long time, the Core service dedicates more and more CPU time and RAM to that query in order to get it to complete faster. This can have a detrimental impact on other queries and aggregation. In order to prevent lower privileged users from using more than their share of the Core service resources, it is a good idea to put time limits on the queries run by normal users.

Query Priority

Some calls in `/sdk` support a `queryPriority` parameter. This parameter is used when the query execution pool is full and other queries are waiting to be executed. Those waiting queries are executed as resources become available and in the order of their priority. The `queryPriority` parameter uses the same scale as the Linux `nice` command. When the `queryPriority` parameter is passed to a query on a downstream device (ie. Broker, Concentrator), it is passed along with other parameters to the upstream devices (ie. Decoder, Log Decoder).

If this parameter is not passed, the calls will default to the current user's `query.priority` setting. See Per-User Configuration Nodes .

This parameter can be used on the following calls: `language` , `msearch` , `packets` , `query` , `timeline` and `values` .

All queries and rule conditions in NetWitness Core services must follow these guidelines:

All string literals, value aliases, and time stamps must be quoted. Do not quote numbers, MAC, or IP addresses.

- `extension = 'torrent'`
- `time='2015-jan-01 00:00:00'`
- `service=80`
- `ip.src = 192.168.0.1`

The space on the right and the left of an operator is optional. For example, you can use `service=80` or `service = 80`.

Rule Examples

The following table shows examples of rule conditions. You can use rule conditions for log retention collections in an Archiver and for application, network, and correlation rules on a Decoder, Log Decoder, or Concentrator. Rule conditions are also used in all `WHERE` clauses in all Core database queries.

For detailed information on rule syntax in NetWitness Platform, see **WHERE Clauses** in the Queries .

Rule Name	Condition
ComplianceDevices	`device.group='PCI Devices' || device.group='HIPPA Devices'`
HighValueWindows	`device.group='Windows Compliance'`
MediumValueWindows	`device.type='winevent_nic' && msg.id='security_4624_security'`
LowValueWinLogs	`device.type='winevent_nic' && msg.id='security_4648_security'`
LowValueProxyLogs	`device.class='proxy' && msg.id='antivirus_license_expired'`
GeneralWindows	`device.type='winevent_nic'`

Correcting invalid rules

Since version 11.0, NetWitness Platform has been using a parser for rules and queries that strictly defines valid syntax. When a Core service encounters invalid syntax, it writes a warning in the NetWitness Platform logs indicating the error.

NetWitness Platform 11.0 and later do not support parsing of legacy syntax rules (as Security Analytics 10.6 did).

After you update to NetWitness Platform 11.0 (or later), rules with invalid syntax are highlighted in the user interface. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. See "Fix Rules with Invalid Syntax" in the *Decoder and Log Decoder Configuration Guide* .

The `/decoder/config/rules/rule.errors` and `/concentrator/config/rules/rule.errors` stats, introduced in 10.6, contain the count of rules with errors. If `rule.errors` is nonzero, NetWitness Platform generates a Health and Wellness alert to indicate that you need to fix the rules.

Valid Syntax with the Modern Parser

- All text types must quote literal values. Example: `username = 'user1'`
- Quotes can use single or double quotes; but they must match. (You cannot start with a single quote and finish with a double quote.)
- If the literal value has a quote, you can escape it (using a backslash) or use a different starting quote character. Both of the following examples are valid: `username = "User's"` , `username = 'User\'s'`

The following are valid syntax rules using the modern parser:

- To use a backslash in a literal string, escape it using an extra backslash: `\\`
- All time types should use quotes for dates in this form: `time = 'YYYY-MM-DD HH:MM:SS'`
- All time types that are the number of seconds since EPOCH (Jan 1, 1970), should not be quoted. Example: `time = 1448034064`
- **Everything** else is unquoted: IP addresses, MAC addresses, numerics, and so on. Example: `service = 80 && ip.src = 192.168.1.1/16`

Appendix A: Statistics

This topic describes statistics used to monitor system operation. The Core services provide a very large number of statistics for monitoring the operation of the system. Some of them are useful for monitoring performance, while some of them exist for monitoring the operation of the system or for debugging purposes.

Statistics in /database/stats

The following table shows the meaning of the statistics in **/database/stats** .

Statistic	Meaning
`meta.bytes` , `packet.bytes` , `session.bytes`	The total size of data (in bytes) stored in each database
`meta.first.id` , `packet.first.id` , `session.first.id`	The first meta ID, packet ID, and session ID, respectively, stored in the database
`meta.last.id` , `packet.last.id` , `session.last.id`	The last meta ID, packet ID, and session ID, respectively, stored in the database
`meta.oldest.file.time` , `packet.oldest.file.time` , `session.oldest.file.time`	The creation date of the oldest file in each database
`meta.rate` , `packet.rate` , `session.rate`	The count of the number of meta, packet, and session objects added to each database over the last second
`meta.total` , `packet.total` , `session.total`	The total number of meta, packet, and session objects within each database
`meta.volume.bytes` , `packet.volume.bytes` , `session.volume.bytes`	The approximate total volume size (in bytes) for all directories used by each database
`meta.free.space` , `packet.free.space` , `session.free.space`	The approximate total unused space (in bytes) across all directories used by each database

Statistics in /index/stats

The following table shows the meaning of the statistics in **/index/stats** .

Statistic	Meaning
`checkpoint.page` , `checkpoint.summary`	The last objects stored the last time an index save was created (debugging)

Statistic	Meaning
index.bytes	An approximate measure of how much disk space is required by index files
index.last.load.time	The timestamp when the current index configuration was loaded from the index configuration files
memory.used	An approximate measure of how much memory is occupied by the index
page.first.id, summary.first.id	The first page and summary object stored in the index (debugging)
page.last.id, summary.last.id	The last page and summary object stored in the index (debugging)
page.total, summary.total	Number of pages and summaries in the index (debugging)
session.first.id	The ID of the first session indexed
session.last.id	The ID of the last session indexed
sessions.since.save	The number of sessions currently held by the current index slice
values.added	The number of unique values added to the current index slice
slices.total	The number of slices in the index
time.begin	The oldest time meta indexed
time.end	The most recent time meta indexed
updater.state	The status of background reindexer

Statistics in /sdk/stats

The following table shows the meaning of the statistics in **/sdk/stats**

Statistic	Meaning
cache.window.time.begin	The beginning of the current time enforced by cache.window.minutes
cache.window.time.end	The end of the current time enforced by cache.window.minutes
queries.active	The number of queries currently executing in the index
queries.queued	The number of queries waiting for execution
values.calls	The number of calls made to the "values" function since the process was started

Statistic	Meaning
values.calls.cached	The number of calls made to the "values" function that were resolved by the values call result cache

Per-query Statistics

SDK operations, such as query and values, provide information about their execution status in /sdk/config/stats/queries/<handleid> , where <handleid> is a unique identifier for the query operation.

The following table shows the meaning of per-query statistics.

Statistic	Meaning
channel.path	This stat provides a link to the connection channel over which the operation is communicating. This channel is used to communicate results back to the client.
query.type	The type of operation being performed, such as queries or values
query	The complete set of parameters given to the query
query.progress	The percentage of the query execution that has completed
query.status	A message describing what stage of the query execution is currently occurring
running.since	The time at which the query began execution
user	The user name that executed the query

Appendix B: Index Inspect

The NetWitness Core database index has a built-in debugging feature called `inspect` that provides detailed information about the composition of its indexes. The index inspect feature is located at `/index/inspect` in every Core service configuration tree. Services that do not actually have an index, like Broker, do not have the `/index/inspect` feature.

Parameters

Options

Type: String This parameter may be set to the value `all-slices` to collect inspect information about every slice in the index. If it is not set, information on the current, most recently created slice is returned.

Collecting information on all slices may take a very long time to complete if there are many index slices.

Response

Inspect returns many rows of key value pairs that represent the state of the index.

Slice Summary

The first row returned for every slice is a summary with the following values.

`session1`	The first session ID indexed in the slice
`session2`	The last session ID indexed in the slice
`meta1`	The first meta ID in the first session indexed in the slice
`meta2`	The last meta ID in the last session indexed in the slice

Per-Index Summary

There will be per-index summary rows returned for each index. Only value-level indexes are reported.

`key`	The meta key name for the index
`pathname`	The path on disk to this index
`values`	The number of unique values stored in this index
`summaries`	The number of summary entries occupied by this index in the summary.db file
`pages`	The number of page entries occupied by this index in the page.db file
`sessions`	The number of sessions that had a value that was inserted into this index
`size`	The cumulative "size" meta values for all sessions that inserted a value into this index

`packets`	The cumulative count of packets for all sessions that inserted a value into this index
`summary1`	The first summary ID used by this index
`summary2`	The last summary ID used by this index
`session1`	The first session ID referenced by this index
`session2`	The last session ID referenced by this index

Slice Summary Footer

The last row in each inspect report contains cumulative statistics for all the indexes in the slice.

`totalKeys`	The number of indexed meta types
`totalValues`	The number of unique values tracked by all indices in this slice
`totalMemory`	An approximate total of the memory needed to open this index slice

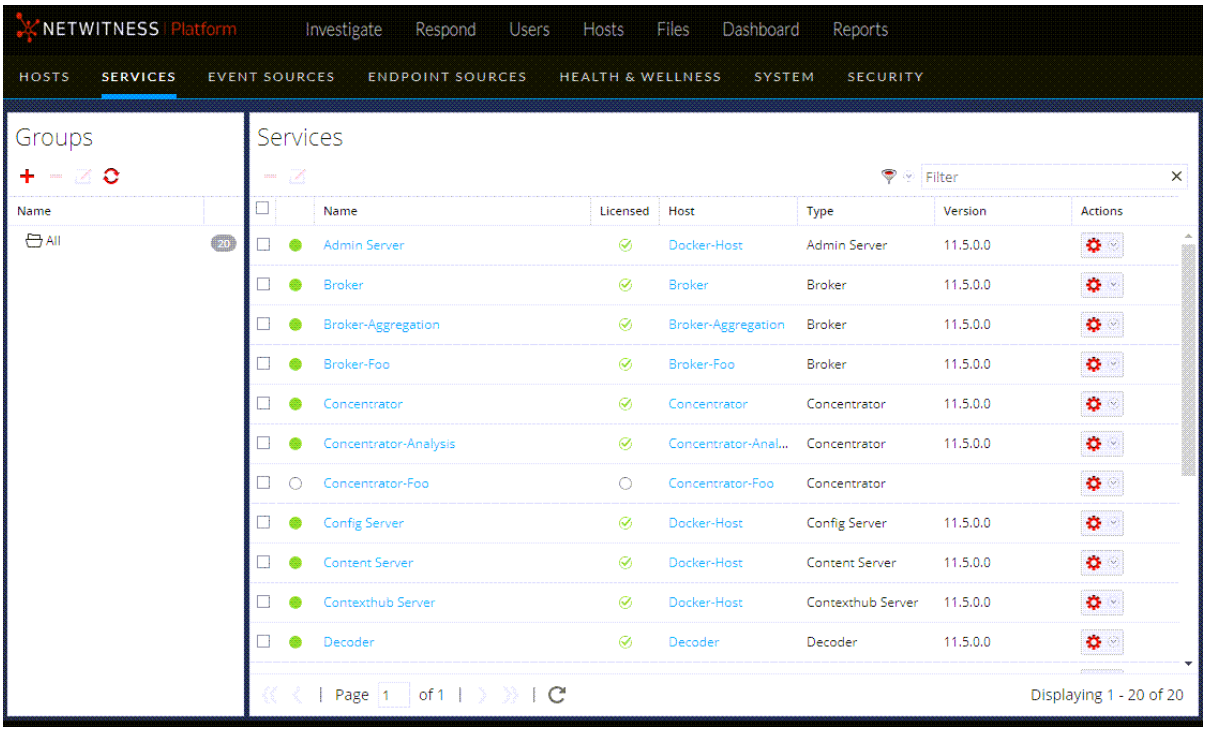
Decoder and Log Decoder Quick Setup

A basic NetWitness network includes at minimum Brokers, Concentrators, and Decoders. Brokers aggregate data from Concentrators, and Concentrators consume data from at least one Network Decoder or Log Decoder. The basic network may include both types of Decoders. Network Decoders are usually referred to as Decoders, and they capture network data in packet form. Log Decoders capture log data as events.

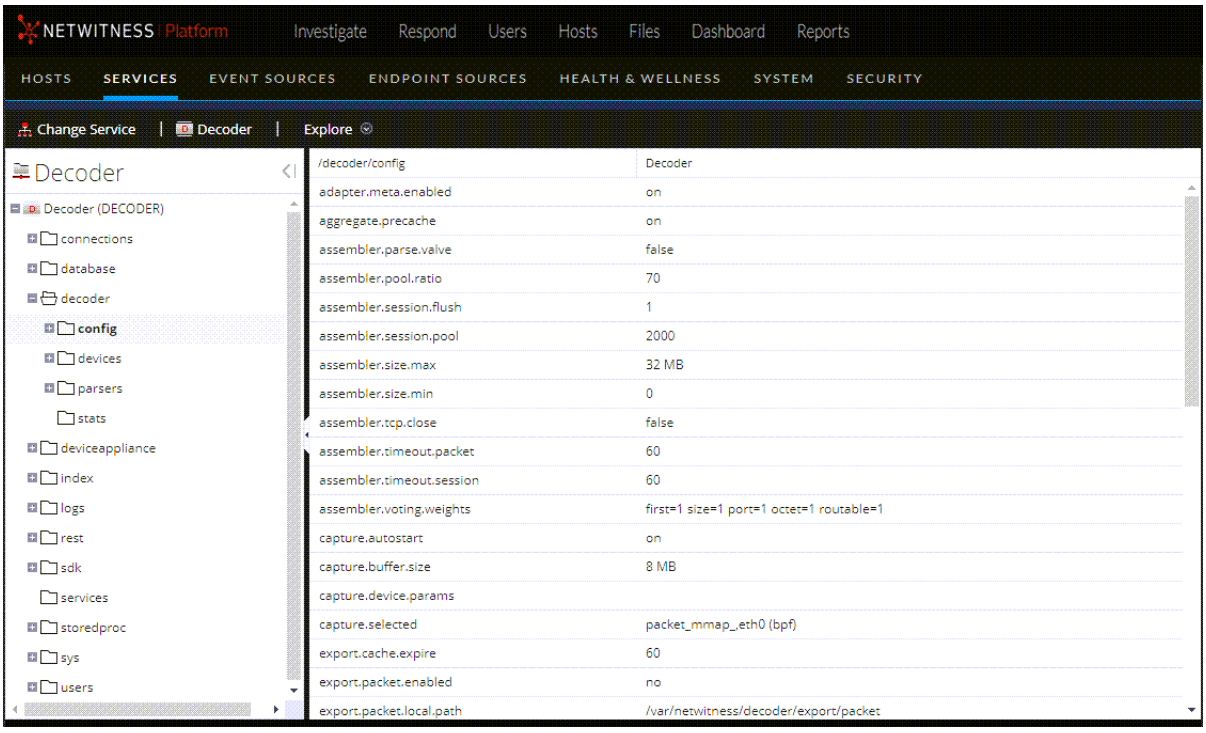
Adding a Decoder makes it visible and available for use with NetWitness Administration, Live Services, and Investigate. To add a service in NetWitness, you select the service type, provide service connection information, and validate that the service can be reached. The *Hosts and Services Getting Started Guide* provides the information you need to understand and install all NetWitness services.

After the services are added, you need to configure each service. This is the preferred order for configuring your system:



1. Decoders
2. Log Decoders
3. Concentrators (refer to the *Broker and Concentrator Configuration Guide*)
4. Brokers (refer to the *Broker and Concentrator Configuration Guide*)

Note: A Log Decoder is a special type of Decoder, which is configured and managed in a similar way to a Decoder. Most of the information in this guide refers to both types of Decoders. "Decoder" refers to both types of Decoders. Information that applies exclusively to Network Decoders or Log Decoders is clearly identified.

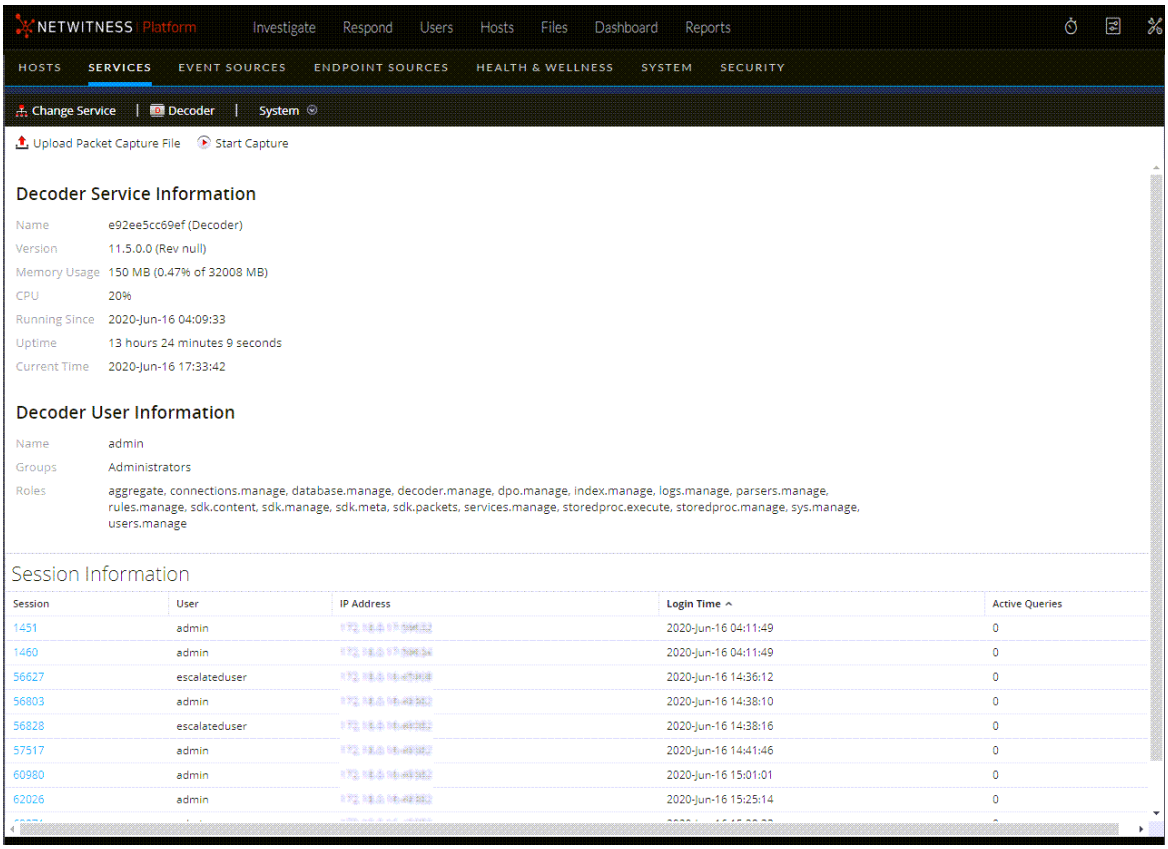


Basic configuration of the Decoder involves selecting a network adapter interface and starting data capture.

In addition, you can configure each Decoder to control the type of traffic captured using rules, feeds, and parsers. Advanced configuration tasks enable additional features that are relevant to specific applications. For example, configure a 10G Decoder, create custom meta keys, or decrypt incoming packets.

The easiest way to configure all of the required Decoder and Log Decoder settings is to use the options in the NetWitness user interface. For the most part, configuration is performed in the Administration Services view ( (Admin) > Services).

Administrators who feel comfortable working outside of the user interface can configure the basic parameters as well as advanced settings by editing database nodes in the Decoder node tree using the Services Explore view.



Perform Initial Quick Setup

This procedure accomplishes the initial, basic configuration of a Decoder, and starts data capture. When the basic setup is complete, the Decoder begins capturing data for the Concentrator to consume.

To configure a Decoder and start capturing data:

1. Assign a network interface for capturing data. For details, see "Select a Network Adapter" in Configure Capture Settings.
2. Do one of the following:
   a. To start capture, select the Decoder and  **> View > System**. In the toolbar click .

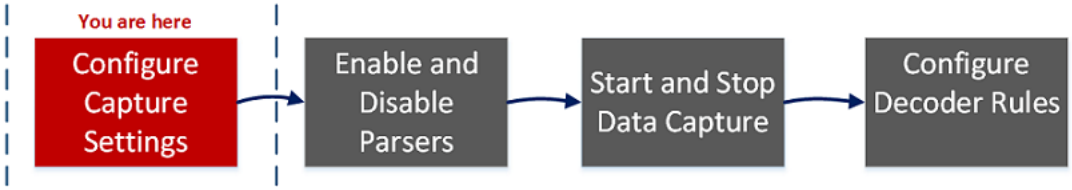
   b. To enable Capture Autostart, see "Configure a Decoder to Begin Capturing Data Automatically" in Configure Capture Settings.
   The Decoder begins capturing data for consumption by a Concentrator. For additional configuration options, refer to Configure Common Settings on a Decoder Configure Common Settings on a Decoder and or Decoder and Log Decoder Additional Procedures

Configure Common Settings on a Decoder

This section introduces commonly used configuration settings on a Decoder with procedures and background information. After you have completed Decoder and Log Decoder Quick Setup, you can refine your configuration by using parsers, feeds, and rules to limit the captured data.

Note: A Log Decoder is a special type of Decoder, which is configured and managed in a similar way to a Decoder. Most of the information in this guide refers to both types of Decoders. "Decoder" refers to both types of Decoders. Information that applies exclusively to Network Decoders or Log Decoders is clearly identified.

The following workflow illustrates commonly used settings and breaks the configuration process into four steps.



Configuration Step	Description
Configure Capture Settings	When initially setting up the Decoder, configuring the network adapter interface is required. Additional optional capture settings are available; one that is frequently used is Capture Autostart.
Enable and Disable Parsers and Log Parsers	View the parsers that have been downloaded and deployed from Live, and manage which ones are enabled or disabled.
Start and Stop Data Capture	When a Decoder starts up, it automatically begins aggregating data if Capture Autostart is enabled. When autostart is not enabled, you can start and stop data capture manually.

Configuration Step	Description
Configure Decoder Rules	Capture rules can add alerts or contextual information to sessions or logs. They can also define which data a Decoder or Log Decoder filters out. By default, no capture rules are defined when you first configure NetWitness. Unless rules are specified and the rules are valid, the packets are not filtered. You can deploy the latest rules from Live as described in the *Live Services Management Guide*. You can define capture rules at any time, and you can fix rules that use invalid syntax (Fix Rules with Invalid Syntax).

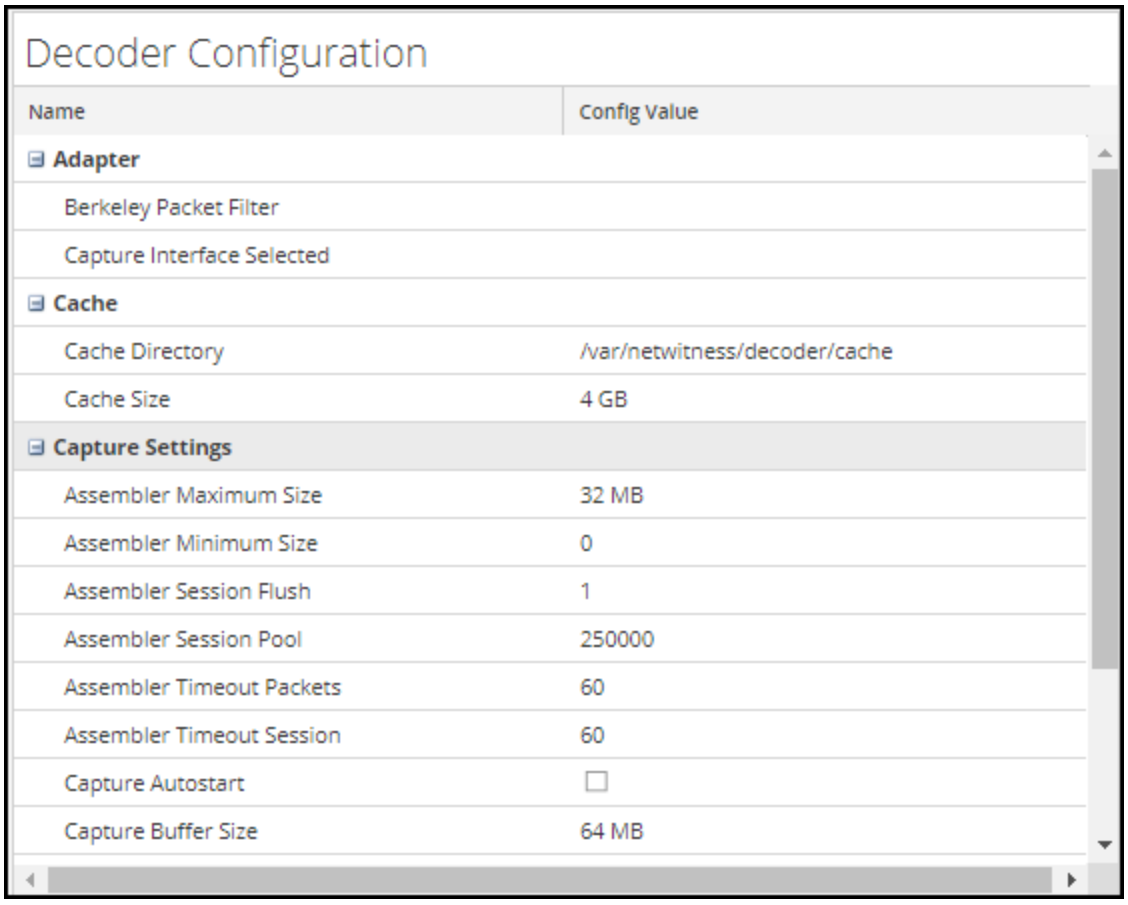
Configure Capture Settings

When initially setting up the Decoder, configuring the network adapter interface is required. Additional optional capture settings are available; two that are frequently used are the Berkeley Packet Filter, and Capture Autostart.

Besides the basic network adapter interface setup, you may decide to use one of the special-purpose configurations described in (Optional) Preserve VLAN Tags When Using the Packet MMAP Capture Interface or (Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces

The rest of the capture settings have default values chosen to be effective in most cases (see a detailed list in Services Config View - General Tab). You can adjust these in some circumstances, for example, if Customer Support advises a change. You can edit the capture settings at any time.

Select a Network Adapter

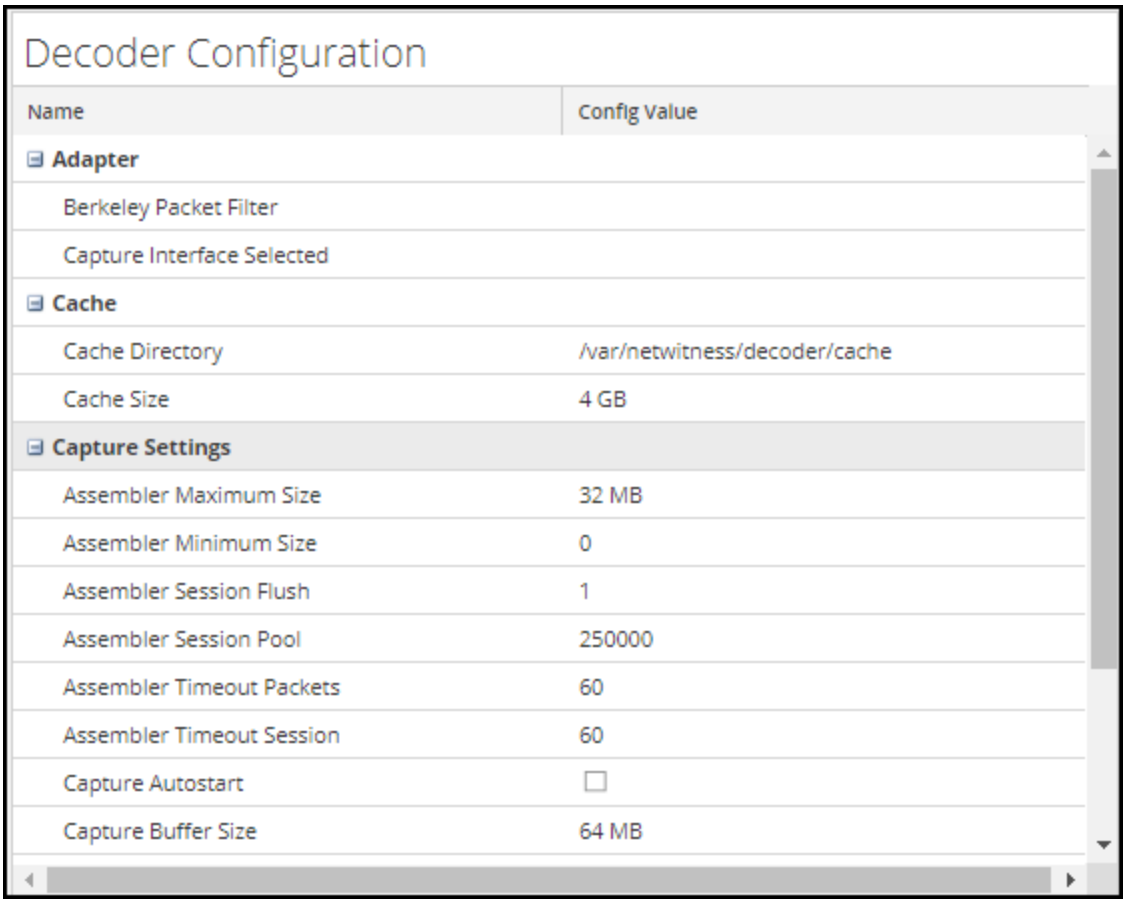


The table below describes the Network Adapter settings for a Decoder. The system administrator sets the default network adapters when the Decoder is installed. Consult your System Administrator for more information.

Adapter Parameter	Description
Berkeley Packet Filter	Berkeley Packet Filters (BPF) are applied to the packet stream before the packets are copied to the Decoder adapter for analysis. This allows unwanted traffic to be efficiently discarded. However, any packets discarded are not accounted for in any Decoder statistics (capture rate, packets dropped, and packets filtered and total packets).

Adapter Parameter	Description
Capture Interface Selected	Select an adapter through which the Decoder captures packets. For the lower speed internal capture interface, use the `packet_mmap_,7,eth1` adapter, which corresponds to the monitor port located on the motherboard. There are six additional capture ports: • `packet_mmap_,1,lo (bpf)` • `packet_mmap_,2,eth2 (bpf)` • `packet_mmap_,3,eth3 (bpf)` • `packet_mmap_,4,eth4 (bpf)` • `packet_mmap_,5,eth5 (bpf)` • `packet_mmap_,8,ALL (bpf)` There are three wireless capture services available: • `packet_netmon_ (Microsoft Netmon)` • `packet_mac80211_ (Linux mac80211)` • `packet_airport_ (Mac OS X AirPort)`
Capture Interface Selected for Log Decoder	The following capture service is available: • `log_events,Log Events`

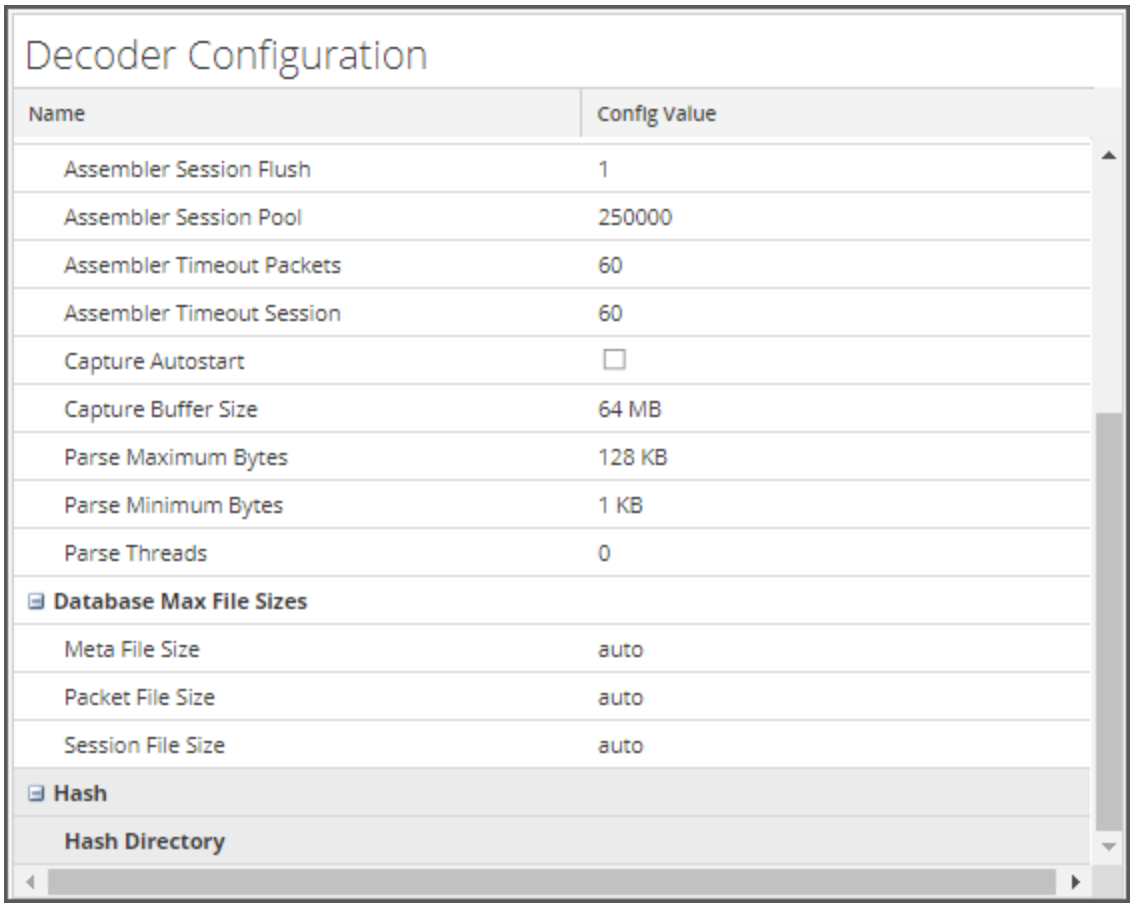
To configure the network adapter on a Decoder:



1. Go to  (Admin) **> Services**.
2. In the **Administration Services view**, select the Decoder and  **> View > Config.**
   The Services Config view is displayed with the General tab open.

3. In the **Capture Interface Selected** field, select the network adapter that best suits the Decoder.
4. To save the changes, click **Apply.**
5. If necessary to put the changes into effect, navigate back up to the **Administration Services view**, select the Decoder, and select > **Restart**.

Configure a Decoder to Begin Capturing Data Automatically



1. Go to (Admin) **> Services**.
2. In the **Administration Services view**, select the Decoder and **> View > Config.**
   The Services Config view is displayed with the General tab open.

3. Under **Capture Settings**, select the **Capture Autostart** checkbox.
4. To save the changes, click **Apply.**
5. If necessary to put the changes into effect, navigate back up to the **Administration Services view**, select the Decoder, and select > **Restart**.

Configure Optional Capture Settings

1. Go to (Admin) > **Services**.
2. In the **Administration Services view**, select the Decoder and > **View** > **Config**.
   The Services Config view is displayed with the General tab open.

3. If you want to apply a system-level filter to the packet stream before the packets are copied to the Decoder adapter for analysis, configure the Berkeley Packet Filter as described in (Optional) Configure System-Level (BPF) Packet Filtering.
4. In the **Capture Settings** sections, review the default values. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change. See Services Config View - General Tab for an explanation of these settings.
5. In the **Database Max File Sizes** section, review the default values. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change. See Services Config View - General Tab for an explanation of these settings.
6. In the **Hash** section, define a directory for hash files if you are using this feature. See Services Config View - General Tab for an explanation of these settings.

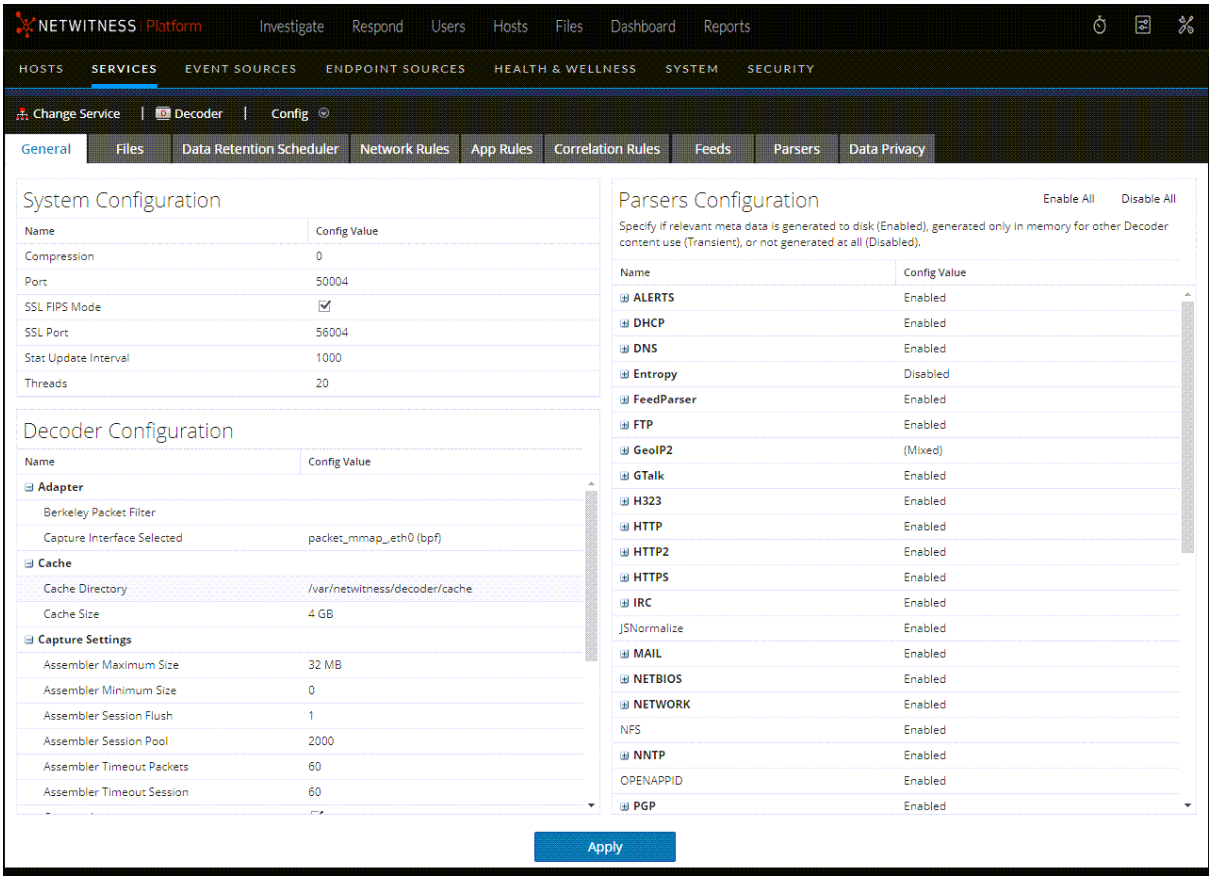
(Optional) Configure System-Level (BPF) Packet Filtering

You can use Berkeley Packet Filters to control which packets and logs are processed by a Decoder.

Berkeley Packet Filters (BPF) are applied to the packet stream before the packets are copied to the Decoder adapter for analysis. This allows unwanted traffic to be efficiently discarded. These discarded packets are not accounted for in any Decoder statistics (capture rate, packets dropped, and packets filtered and total packets).

The Decoder also supports system-level packet filtering defined using `tcpdump/libpcap` syntax. Specifying a `Libpcap` filter can efficiently reduce packet volume based on Layer 2 - Layer 4 attributes. A `Libpcap` filter is appropriate for use when a Decoder is receiving a traffic volume that is placing a load against the physical resources of the platform. In this scenario, the Decoder may consistently drop packets and have a large number of capture pages available(`/decoder/stats/capture.pagefree` is high).
The following is an example of a `libpcap` filter to keep only packets that do not have both source and destination addresses in the 10.21.0.0/16 subnet.

```
not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)
```



For a full reference of the `Libpcap` filter syntax, see the main pages for:

- tcpdump (http://www.tcpdump.org/tcpdump_man.html).
- pcap-filter (http://www.unix.com/man-page/FreeBSD/7/pcap-filter/).

To add a system-level Berkeley Packet Filter:

1. Go to  (Admin) **> Services.**

2. In the Administration Services view, select a Decoder service and  **> View > Config.**
   The Services Config view is displayed with the General tab open.

3. In the **Decoder Configuration Section**, under **Adapter**, click in the field next to **Berkeley Packet Filter**.
4. Type only one filter in the field. If you want to filter multiple items, join multiple expressions using `and`. Several examples are provided below.
   The user interface validates input at the time you enter your filter string.
5. To save the filter, click **Apply**.
   If the syntax is correct, a confirmation message is displayed.
   If the syntax is incorrect, a **Packet filter is not valid** message is displayed and a corresponding log message will follow in the log messages on the Decoder:
   ```
   164474800 2020-May-01 19:03:08 warning Decoder Failed to parse filter 'example_badrule': syntax error
   ```
6. To activate the filter, you must stop and start capture on the Decoder:
   a. Change the **Config** view to the **System** view.
   b. Click **Stop Capture**.
   c. Click **Start Capture**.
      The active filter will be displayed in the Decoder logs.

Examples

These are several filter examples:

- Drop packets to or from any address in the 10.21.0.0/16 subnet:
  `not (net 10.21.0.0/16)`
- Drop packets that have both source and destination addresses in the 10.21.0.0/16 subnet:
  `not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)`
- Drop packets that are from 10.21.1.2 or are headed to 10.21.1.3.
  `not (src host 10.21.1.2 or dst host 10.21.1.3)`
- Combine both IP and HOST:
  `not (host 192.168.1.10) and not (host api.wxbug.net)`
- Drop all port 53 traffic, both TCP & UDP:
  `not (port 53)`
- Drop only UDP port 53 traffic:
  `not (udp port 53)`
- Drop all IP protocol 50 (IPSEC) traffic:
  `not (ip proto 50)`
- Drop all traffic on TCP ports 133 through 135.
  `not (tcp portrange 133-135)`

The following filters combine some of the above to demonstrate how to put multiple directives into one filter:

- Drop any port 53(DNS) traffic sourced from 10.21.1.2 or destined to 10.21.1.3.
  `not (port 53) and not (src host 10.21.1.2 or dst host 10.21.1.3)`
- Drop any traffic using IP proto 50 or port 53 or any traffic from net 10.21.0.0/16 destined to net 10.21.0.0/16
  `not (ip proto 50 or port 53) or not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)`

Caution: The use of parentheses can have a large and potentially disruptive effect on the use of Packet Filters. As a best practice, keep "not" operations outside of parentheses and always test your rules before deploying them. Failure to properly format your rules (despite input validation) can cause a packet filter to drop ALL traffic or behave in other unexpected ways. This is due to the way packet `Libpcap` filters work and is not the result of any logic within NetWitness software.

Testing

BPF filters can and should be tested using either `tcpdump` or `windump` to ensure that they will provide the expected behavior before implementing them. This example shows a test of a filter using windump:

```
windump -nni 2 not (port 53 or port 443) or not (ip proto 50)
```

Conversions

If for the sake of performance, you have decided that an existing network rule filter would be better running as a System-Level Packet Filter, you can convert it. There are a few things to remember when doing conversions.

- `&&` becomes `and`
- `alias.ip` becomes `host` if a single host or `net` if a network.
- `ip.src` becomes `src host` if a single host or `src net` if a network.
- `ip.dst` becomes `dst host` if a single host or `dst net` if a network.
- Use CIDR notation when listing a network (that is, 10.10.10.0/24).
- `||` becomes `or`
- `!` becomes `not`
- Multiple rules must be joined with `and`.

The manual for TCPDump also gives examples of filters and strings that can be used: http://www.tcpdump.org/tcpdump_man.html

Additionally, the following site provides an excellent reference for BPF-style packet filters: http://biot.com/capstats/bpf.html

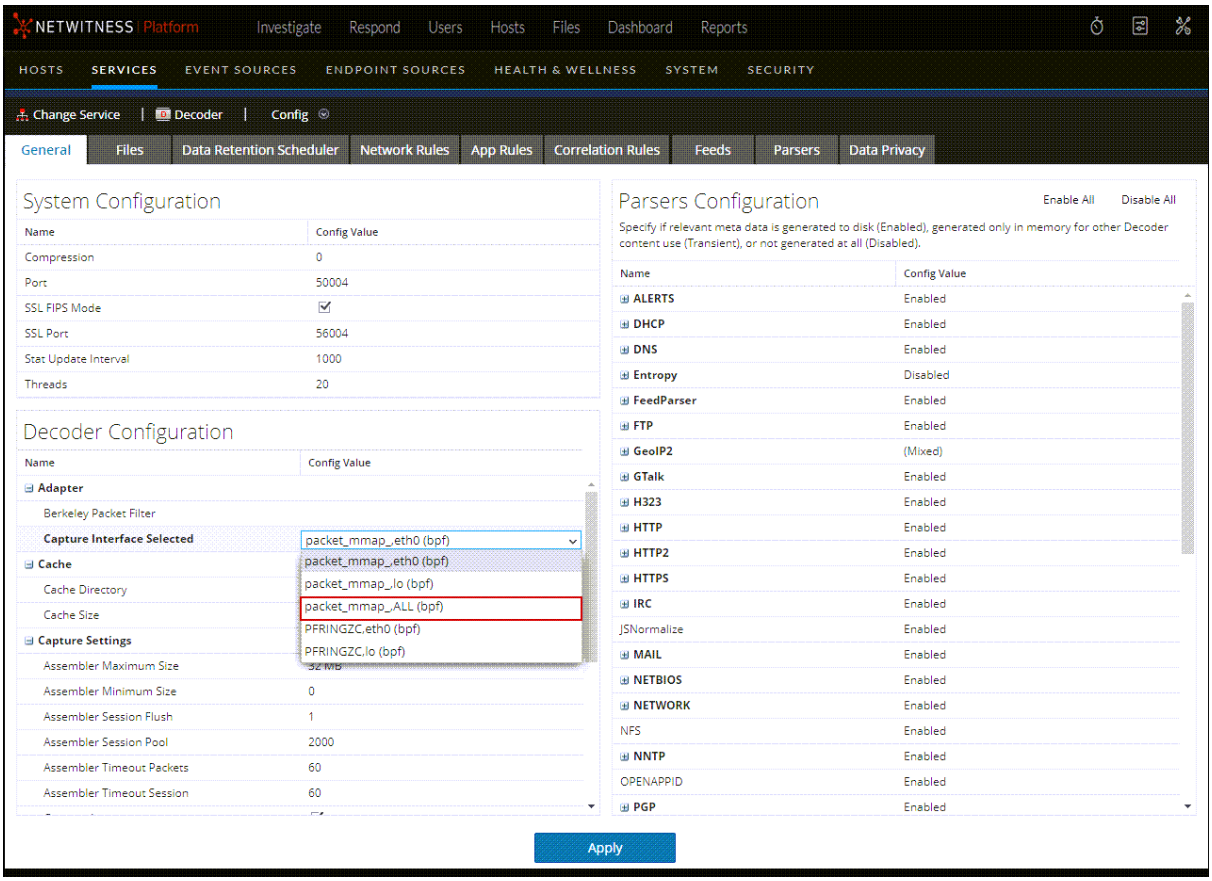
Caution: If you are capturing `vlan` tagged packets, above standard bpf filter may not work. For example, if you use `not (udp port 123)` to filter `vlan` tagged NTP traffic on udp port 123, it will not work. This is because the bpf filter machinery is simple and does not account for protocols not referenced in the rule. So the OS executing the bpf filter will look for the `udp port` values at the byte offset they would occur in a standard Ethernet/udp packet; but the optional `vlan` tag fields in the Ethernet header pushes those values by 4 bytes, thus the bpf filter rule will fail. To fix it, you need to change the bpf filter to: `not (vlan and udp port 123)`.

(Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces

The `packet_mmap_,ALL` adapter is capable of capturing across all types of network interfaces at the same time. For example, this can include things like physical network interfaces over different media types and tunnel interfaces.

The default behavior of the `ALL` adapter is to capture from all interfaces from the system, except for the hard-coded defaults of `lo`, `eth0`, and `em1`.

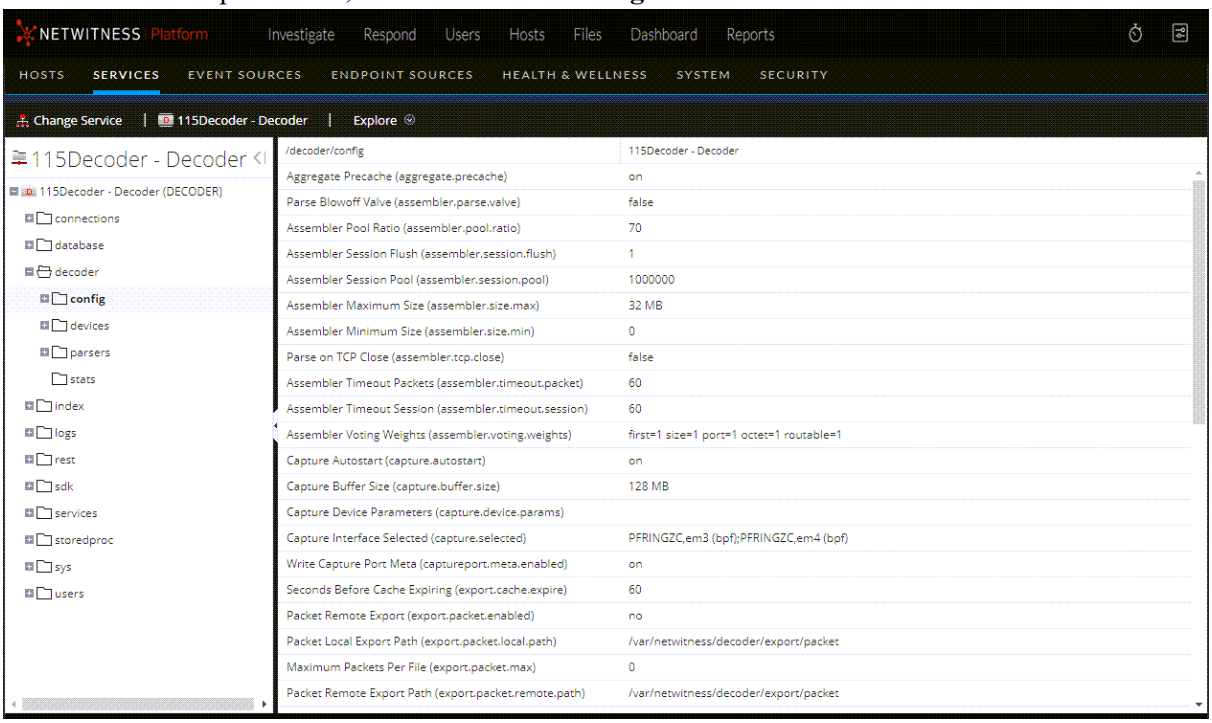
You can select any subset of the capture interfaces by editing the Decoder configuration node `/decoder/config/capture.device.params` to include an `interfaces=` parameter. The `interfaces` parameter contains a comma-separate list of interfaces that are used for capture. Instead of using all interfaces for capture, only the specified interfaces are used.



For example, if you want to force capture on interfaces `em1`, `em2`, and `em4`, and ignore `em3`, you can select the `packet_mmap_,ALL` adapter, and then add this line to `capture.device.params`: `interfaces=em1,em2,em4`

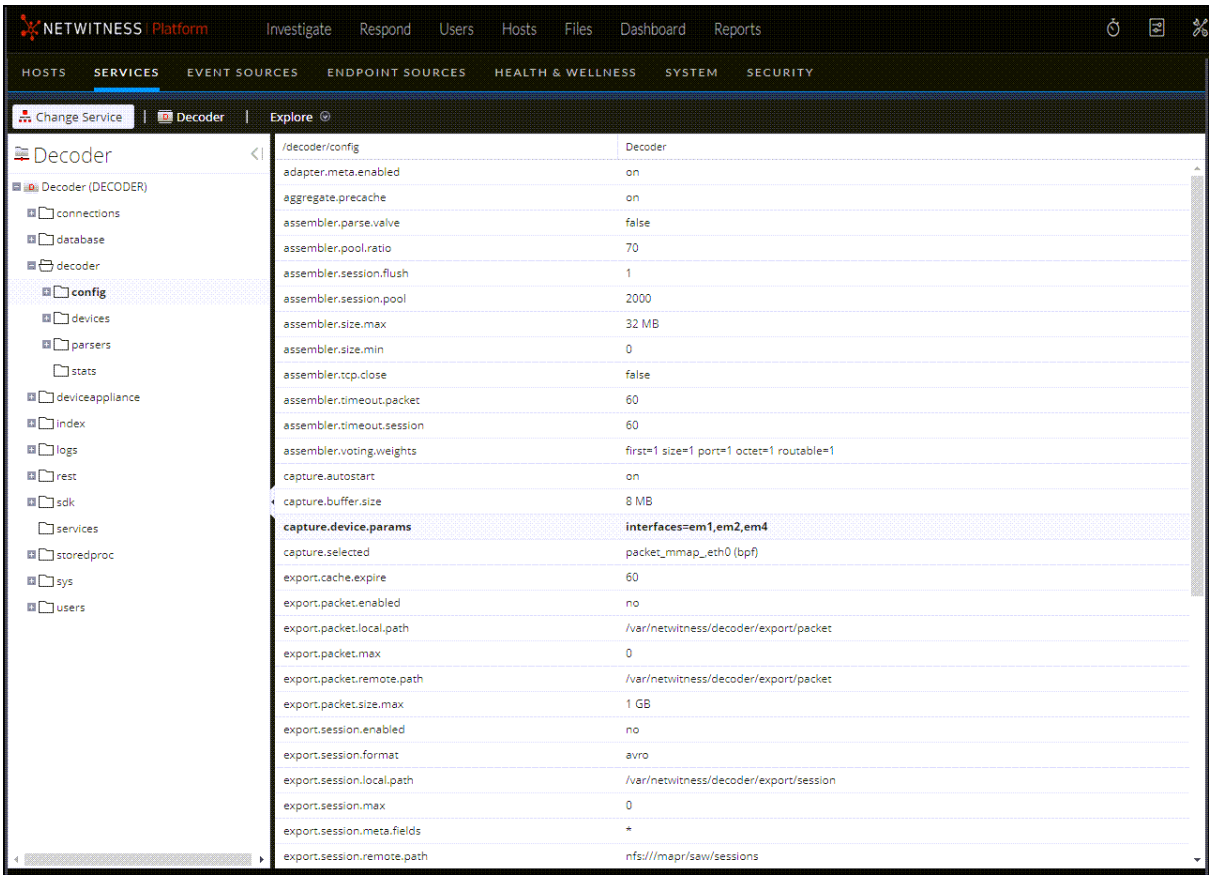
Note: Decoder automatically performs decapsulation of Virtual Extensible LAN (VXLAN) protocol from network traffic on UDP-4789 so that parsing can take place on the decapsulated Ethernet frames. During the decapsulation, the VXLAN ID is extracted and stored in the VXLAN meta key. By default, the VXLAN ID extraction is enabled. To disable, navigate to the `VlanGre` parser in the Parser Configuration settings. Click the drop-down list for `vlan` in the **Config Value** column and select **Disabled**. Each parser is configurable in the Services Config View - General Tab. The Parser Configuration panel provides a way to enable or disable parsers to use on Decoders in addition to limiting the metadata that the parser creates.

Note: Using the `interfaces` parameter to select `eth0`, `lo`, or `em1` overrides the default behavior, which is to drop traffic from those ports.



To configure the `packet_mmap_,ALL` adapter to capture from specific interfaces instead of all interfaces:

1. Go to (Admin) > **Services**, select the Decoder service and > **View > Config.**
2. In the **Services Config view**, set **Capture Interface Selected** to `packet_mmap_,ALL` adapter.



3. Click **Apply**, and then restart the Decoder service.

4. Go to (Admin) > **Services**, select the Decoder service, and click > **Config** > **Explore**.
5. In the Services Explore view, select **decoder** > **config**.

6. Click in the values column next to `capture.device.params`, type **`interfaces=em1,em2,em4`**, and press **Enter**.

The change goes into effect immediately; only traffic on `em1`, `em2`, and `em4` interfaces is captured.

(Optional) Configure Meta-Only Decoders

You can configure Decoders so that packets and logs can be processed, and then dropped before they are written to disk. This is called a Meta-Only Decoder, which uses the Meta-Only license, and can save storage space (however, analysts cannot reconstruct events in Investigate if you use this option). The configuration option `/decoder/config/packet.write.disabled` controls this feature. If this option is set to `true`, all packets are dropped after parsing, so they are never written to the database. This applies to both Log and Network Decoders. The ingested logs and packets flow through the system normally so that parsing and other operations are not impacted. The default setting is `false`, which preserves the normal behavior of writing packets to disk.

Note: You must purchase the Meta-Only license before you can realize the full benefit of using this option. For information about purchasing licenses, see the *Licensing Management Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

To configure a Meta-Only Decoder where packets and logs are parsed and not written to disk:

1. Go to  (Admin) > **Services** and select a Decoder.
2. Click  > **View** > **Explore**, and in the left panel, expand **decoder** and click **config**.
3. In the right pane, go to `packet.write.disabled`, and change the value from `false` to `true`.

Note: You can make this configuration update while capture is running, but the update does not take affect until capture is restarted.

For an example of how to use the Meta-Only license to apply centrally-managed capture policies across your Network Decoders, see (Optional) Configure Selective Network Data Collection

(Optional) Configure Selective Network Data Collection

Selective network data collection gives administrators the ability to apply centrally managed capture policies across their Network Decoders. This results in better use of service resources, including hard drive space, which leads to more predictable costs and lessens the burden of managing multiple services. Administrators can determine which traffic is stored and how it is stored by using policies. Each policy contains a list of supported base protocols and definitions for handling any other protocols that are detected.

Note: Administrators can use this feature to create policies for metadata-only while using the cost-effective Meta-Only license, without having to pay for additional storage or throughput licensing. To use this license, work with your NetWitness Customer Support Representative to purchase the license, and then enable the functionality as described in (Optional) Configure Meta-Only Decoders.

The administrator can choose to deploy predefined policies that capture:

- All base and other protocols (Full Capture - All Protocols)
- Only metadata on all base and other protocols (Capture Meta Only - All Protocols)
- Only metadata on all base protocols and drop all other protocols (Capture Meta on Base Protocols, Drop all other protocols)
- All base protocols and only metadata on all other protocols (Full Capture on Base Protocols, Meta only on all other protocols)

The predefined policies are not configurable. The only way you can edit predefined policies is by assigning services (such as Decoders) to deploy them.

Administrators can create custom policies to give further control over the deployment. A base set of protocols are available for alterations by the administrator, allowing you to choose what level of capture you prefer on a per-protocol basis. If you are only making slight changes, a good start for customization is to clone one of the predefined polices and alter it. These centrally-managed policies are then applied to services (Network Decoders) to allow handling multiple use cases across your environment.

Here are some example use cases and how an administrator would deploy these.

Use Case 1: Predefined Policy for Internal Assets

To gain further visibility into internal lateral traffic going East-West through the environment, a Network Decoder is deployed in the interior of the network to capture this traffic. Applying full packet capture for this segment may generate too much data to manage at a reasonable cost point. Instead, the predefined "Capture Meta Only – All Protocols" policy can be applied to achieve the same parsing and detection while only saving the metadata, limiting the amount of storage required of the solution. In this situation, the only steps you must complete is to choose the predefined policy, edit it, and then enable it by assigning it to the appropriate internal services (Decoders). For an example of how to set up this policy, see Use Predefined Policies.

Use Case 2: Custom Policy for DMZ Assets

To protect the public-facing web servers, a Network Decoder is deployed into the demilitarized zone (DMZ). The network communications between these web servers and other network devices are a subset of the base protocols. To make sure you can harvest forensic evidence for any communications related to these high-value assets, you would want to do full packet capture on HTTP, SMTP, FTP, and DNS protocols. You still want visibility into any other traffic these servers are engaged in, so you would prefer metadata generated for all other protocols. The suggested steps to create this custom policy would have you choose the predefined policy "Full Capture on Base Protocols, Meta only on all other protocols" and then clone it to adjust it to the protocols aligned with the DMZ scenario. During the clone process, the name and description can be updated to identify the new purpose of the policy. The define policy step allows all the base protocol rules inside the policy except HTTP, SMTP, FTP, and DNS to be altered from "Collect All" to "Collect Meta Only" to achieve the desired policy. The last steps are assigning the policy to the appropriate DMZ services (Decoders). For an example of how to set up this policy, see Create New Policies from Predefined Ones.

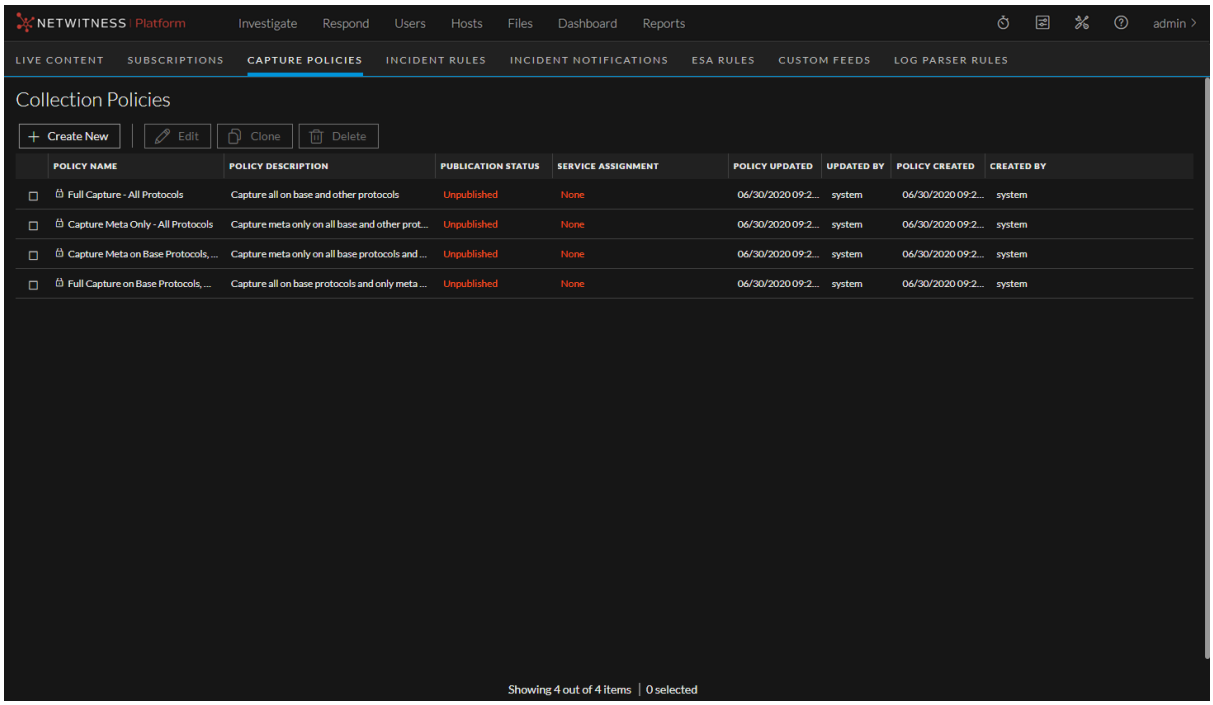
Note: When a Decoder is being managed by a selective collection policy, it is possible that the Decoder specifications in the policy could be overwritten if the Decoder configuration is edited outside of the policy. To try and avoid this situation, the following warning message is displayed at the top of the Parsers section of the Decoder Configuration page: `This Decoder is being managed by the following capture policy: <policy-name>. Some parsers are required by the capture policy, and changes made here may overwrite that policy. Review of the capture policy is recommended.`
Another warning message is displayed at the top of the Application Rule section: `This Decoder is being managed by the following capture policy: <policy-name>. Some application rules are required by the capture policy, and changes made here may overwrite that policy. Review of the capture policy is recommended.`

The following sections describe configuring and using selective network data collection.

- Use Predefined Policies
- Create New Policies from Predefined Ones
- Create Custom Policies
- Unpublish Policies
- Delete Policies
- Supported Protocols for Selective Network Data Collection

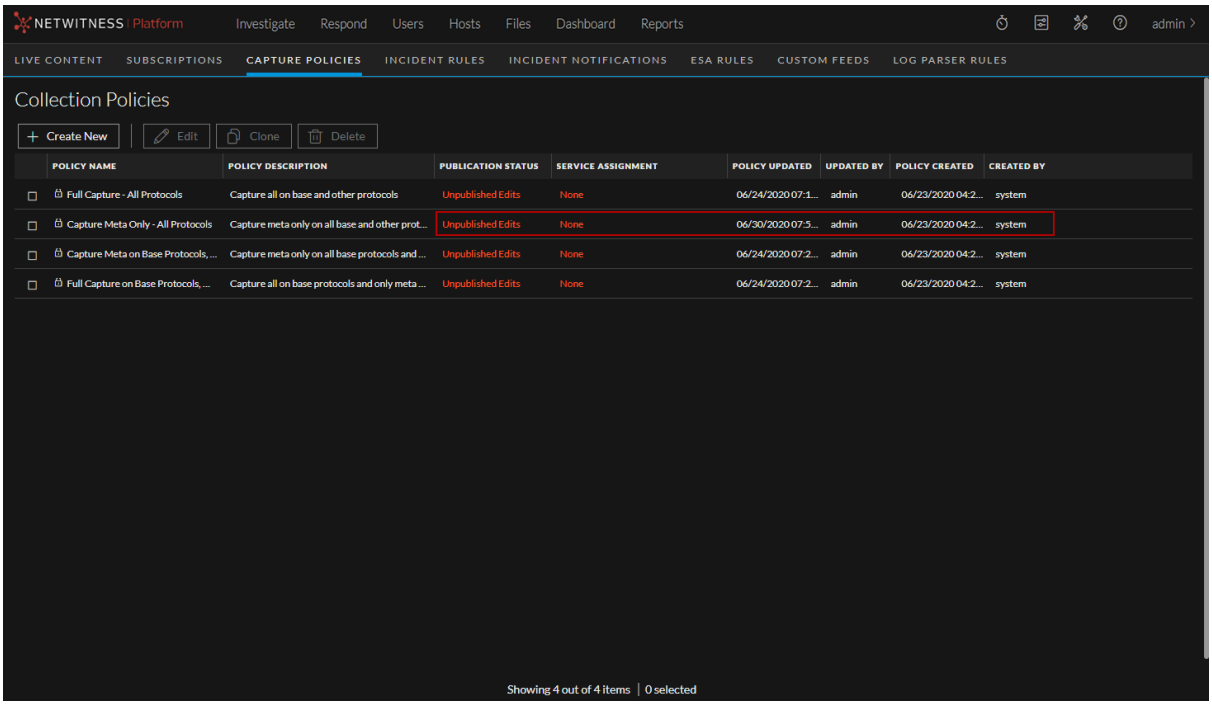
For detailed information about the Selective Collection user interface, see:

- Services Config View - Capture Policies Tab
- Services Config View - Edit Capture Policies Wizard



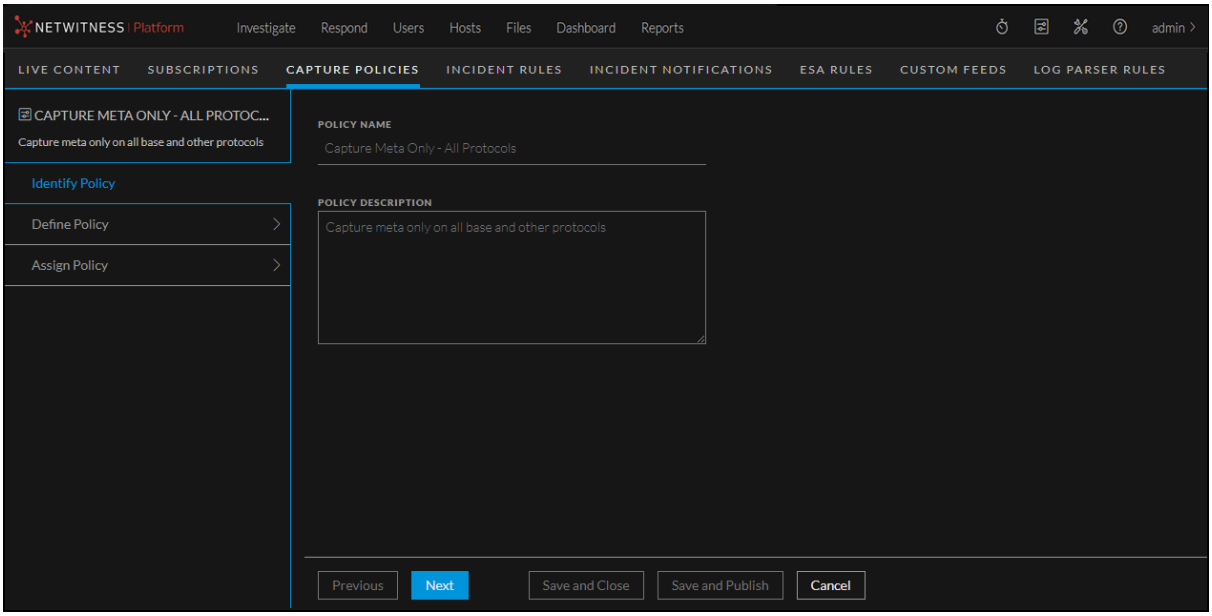
Use Predefined Policies

This procedure describes how to use the predefined policies. You can use this procedure to configure a policy for internal assets. For example, as described in Use Case 1: Predefined Policy for Internal Assets , to gain further visibility into internal lateral traffic going East-West through the environment, you could deploy a Network Decoder in the interior of your network to capture the traffic. Applying full packet capture for this segment may generate too much data to manage at a reasonable cost point. Instead, use the predefined "Capture Meta Only – All Protocols" policy to achieve the same parsing and detection while only saving the metadata, limiting the amount of storage required for this solution.

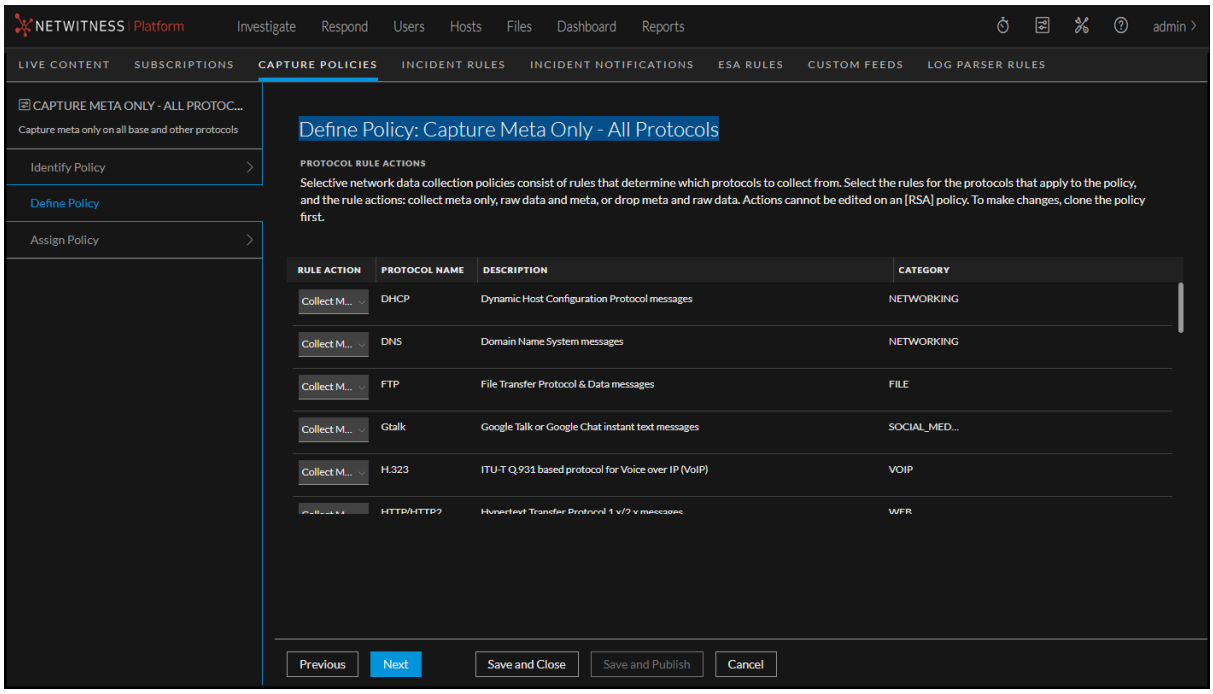


In this situation, the only steps you must complete is to select the "Capture Meta Only – All Protocols" predefined policy to edit it, enable it by assigning it to the appropriate Decoders, and then publish the policy to start collecting the data.

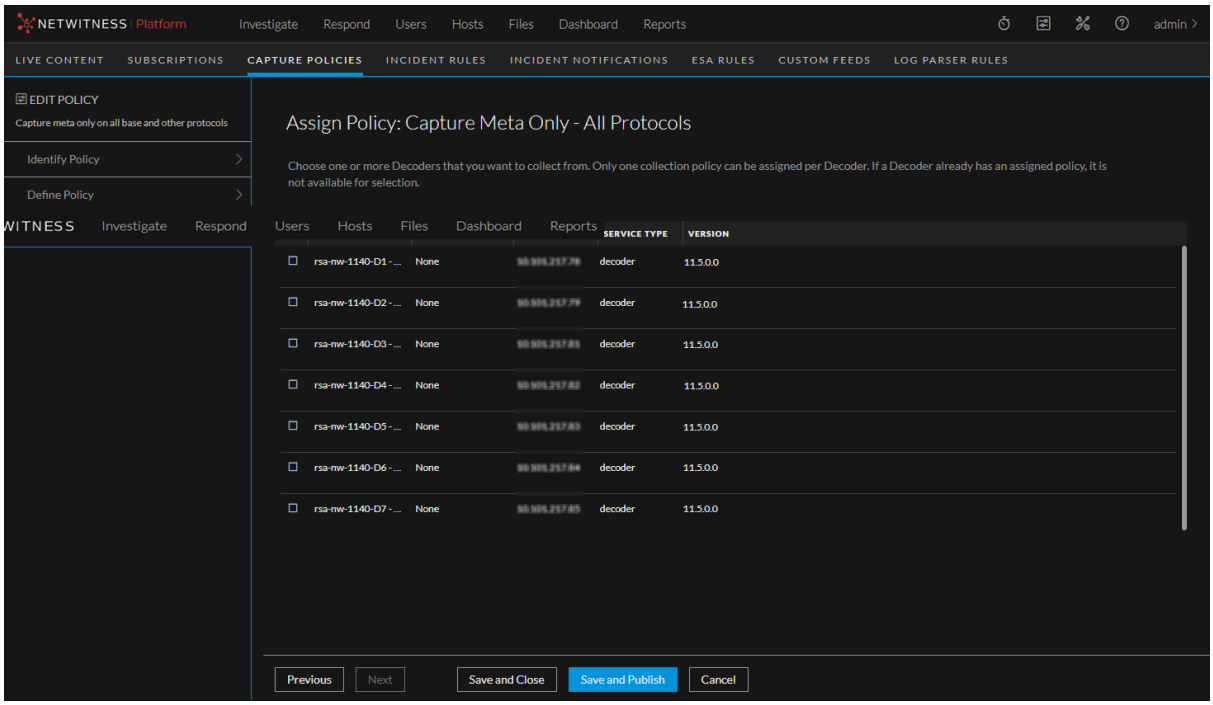
To work with a predefined policy:



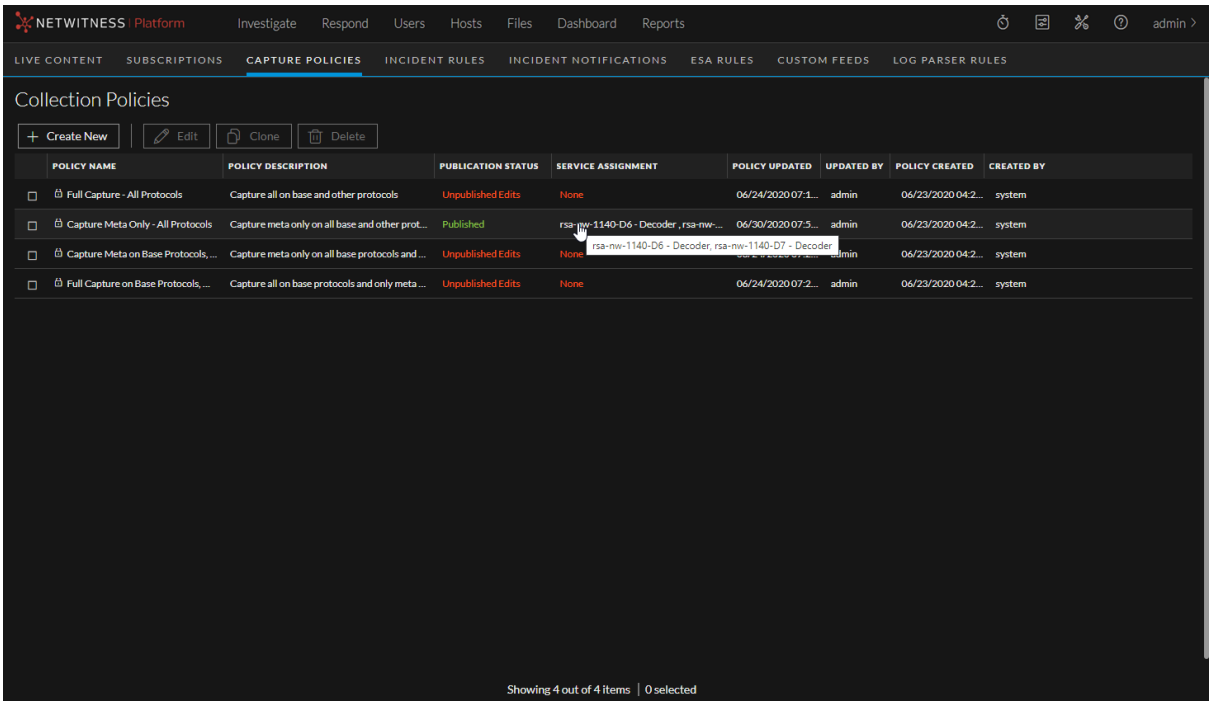
1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.



Notice that the PUBLICATION STATUS column lists each of the predefined policies with the status of **Unpublished**. The only way to edit a predefined policy is to assign Decoders to apply the policy. If changes are made to the Decoder assignments but are not published, the status changes to **Unpublished Edits**, the date the change was made is displayed in the POLICY UPDATED column, and the user name of the person who made the change is displayed in the UPDATED BY column. In predefined policies, the CREATED BY field is always **system**.
The following figure shows the statuses of the policies.



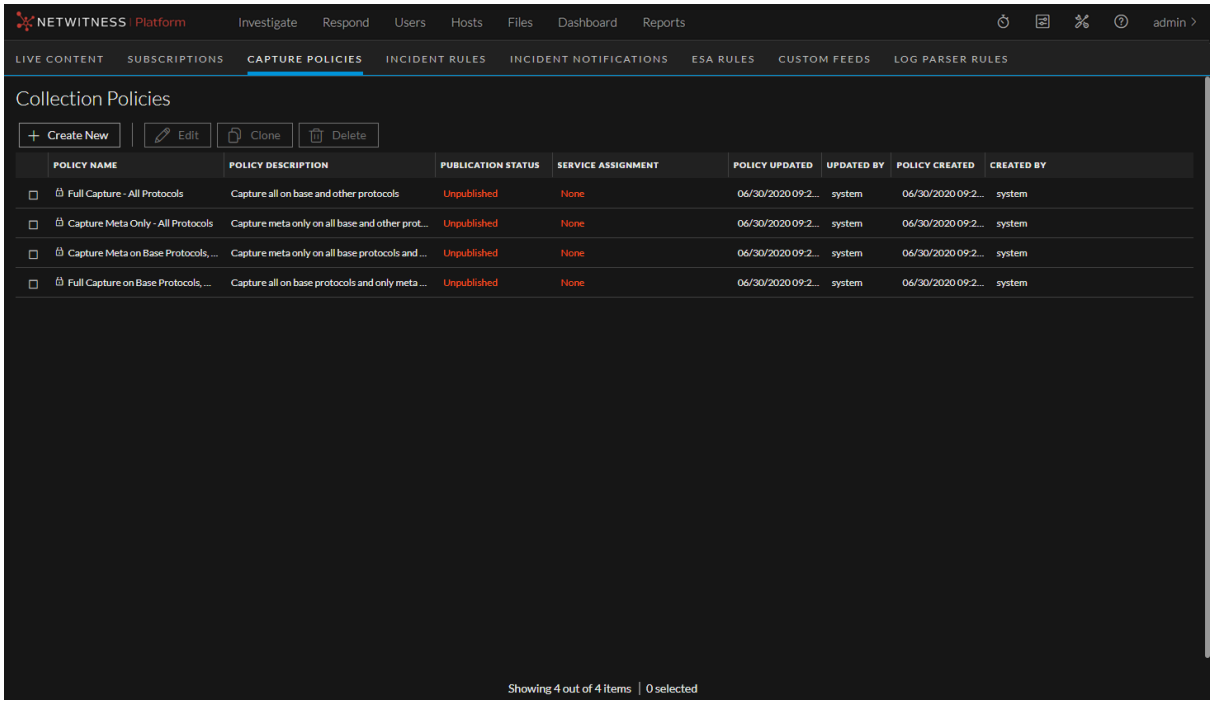
2. Select **Capture Meta Only - All Protocols**, and then click **Edit**.
The editing view is displayed with the **Identify Policy** option active.



3. Because this is a predefined policy, you cannot change the policy name or description. Click **Next**.
The Define Policy: Capture Meta Only - All Protocols page is displayed.

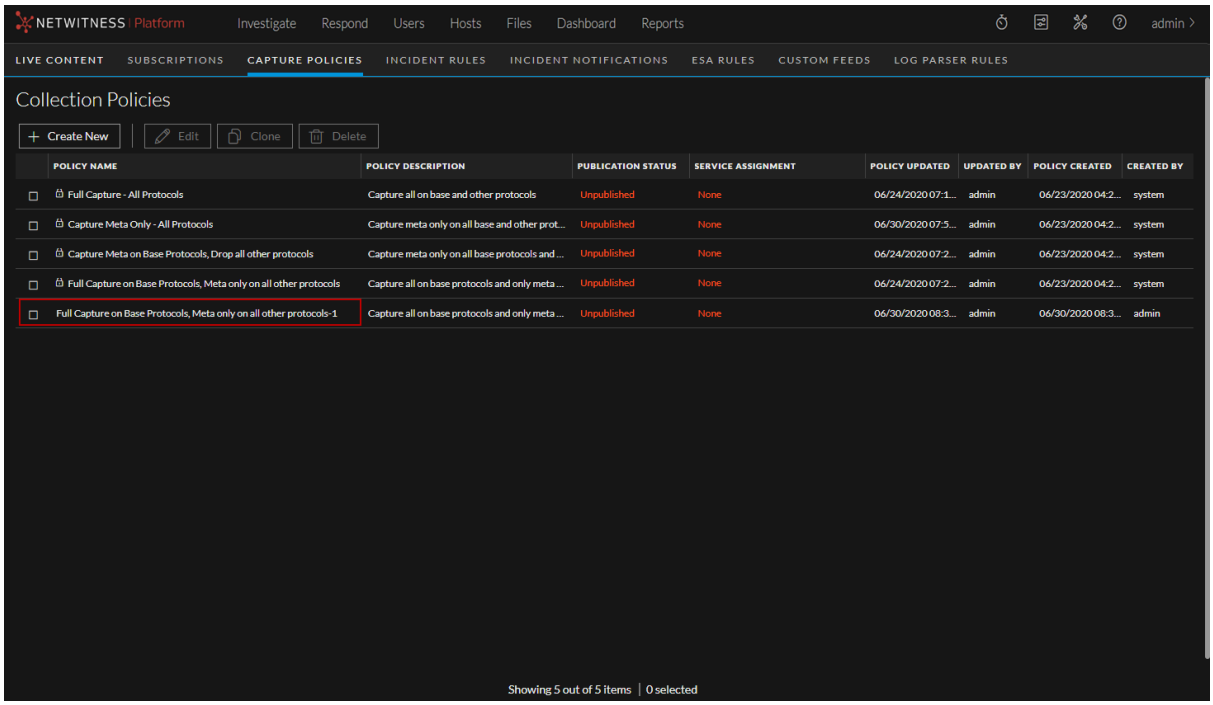
4. Because this is a predefined policy, you cannot edit this page. Review the rules on this page to understand the actions that will be enabled when you publish this policy. Click **Next**.
   The Assign Policy page is displayed.

5. Select the Decoders that you want to collect from, and then click **Save and Publish**.
   The publication status moves to **Updating**. It changes to **Published** when the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as **Published**, so even if not all of the Decoders are available (and the publication status is not **Published**), data will begin to be collected on the Decoders that are available. When the status moves to **Published**, all the services are displayed in the Service Assignment column. You can hover over the names of the Decoders to see their full names, as shown in the following figure.



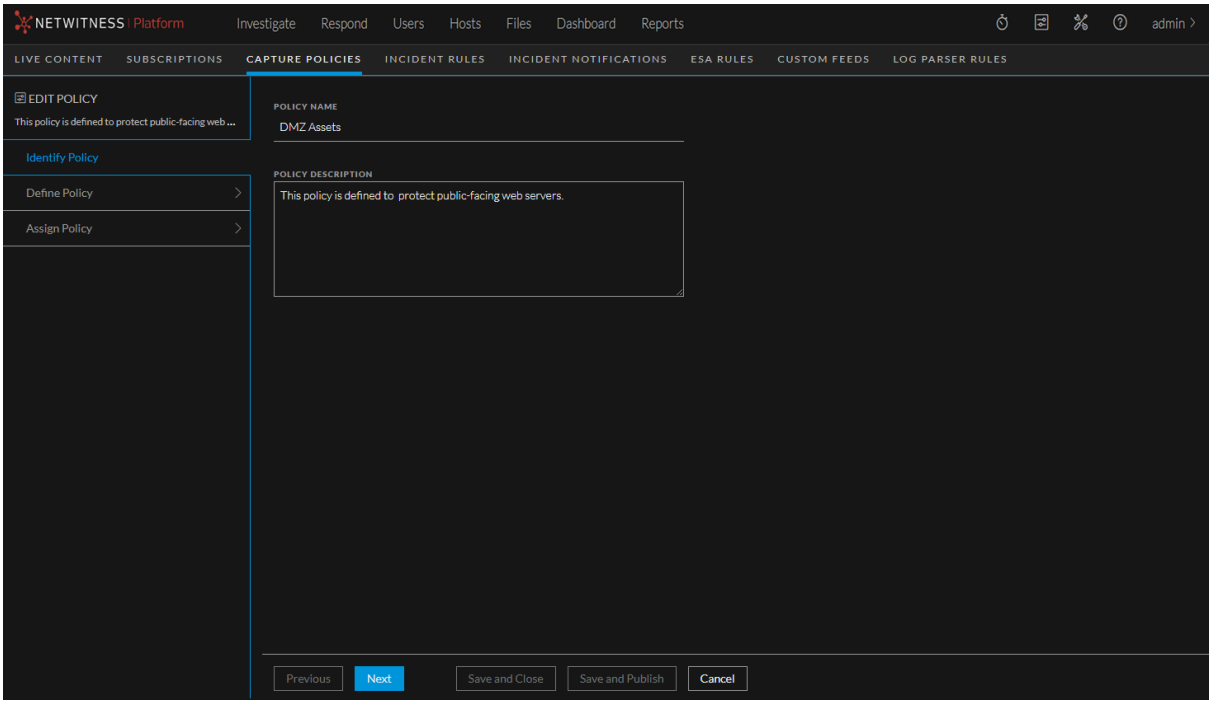
Create New Policies from Predefined Ones

This procedure describes the steps for creating a new policy from a predefined one, and provides an example of how you might use this policy.



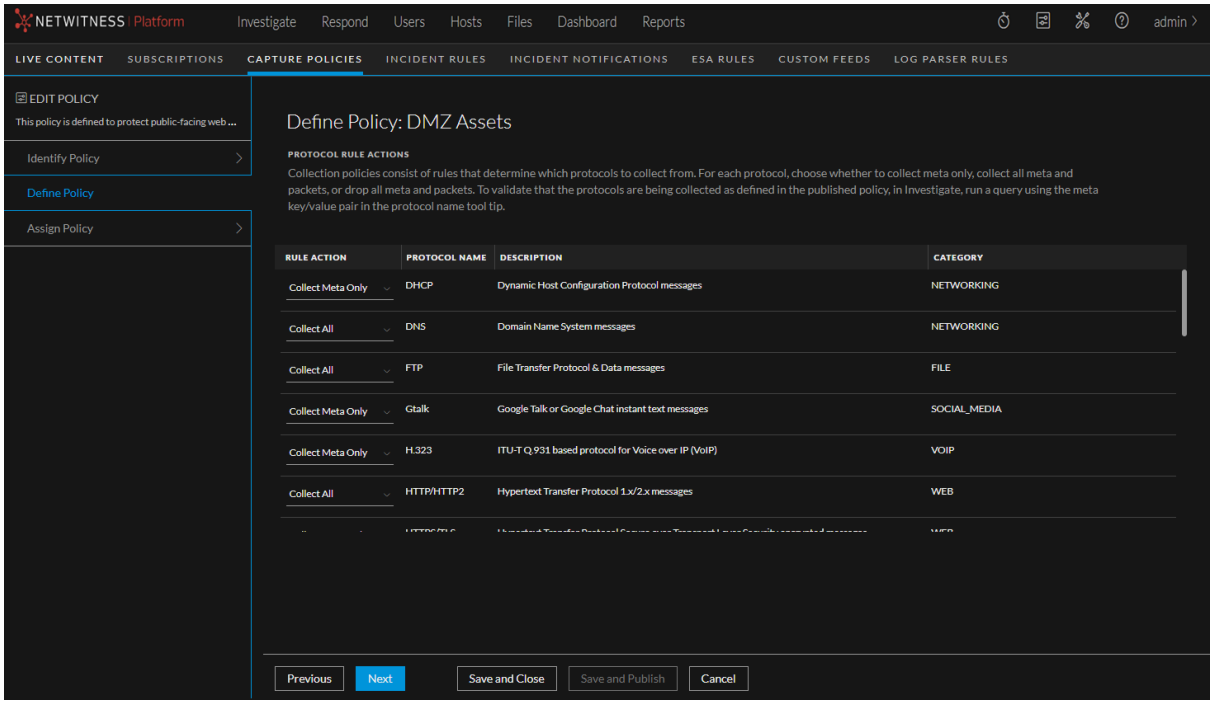
For example, as described in Use Case 2: Custom Policy for DMZ Assets , suppose a Network Decoder has been deployed into the demilitarized zone (DMZ) to protect public-facing web servers. The network communications between these web servers and other network devices are a subset of the base protocols. To make sure they can harvest forensic evidence for any communications related to these high value assets, you would want to get full packet capture on HTTP, SMTP, FTP, and DNS protocols. To provide visibility into any other traffic these servers are engaged in, you would want to generate metadata for all other protocols.

To configure a policy that would achieve the results described here, you would select the predefined policy "Full Capture on Base Protocols, Meta only on all other protocols," clone it, and then edit it to align the protocols with the DMZ scenario. During the clone process, you can update the name and description to identify the new purpose of the policy. In the step where you define the policy, you can change all the base protocol rules inside the policy (except HTTP, SMTP, FTP, and DNS) from "Collect All" to "Collect Meta Only" to achieve the desired results. The last steps assign the policy to the appropriate DMZ Decoders.

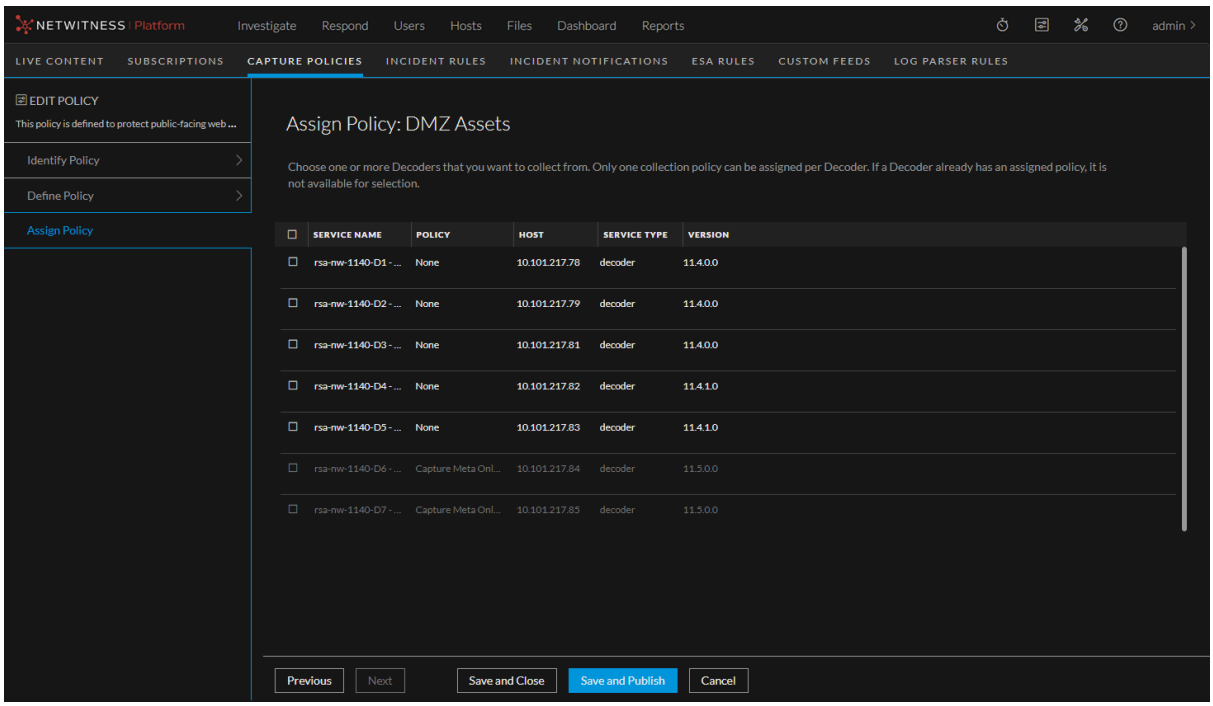


1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.

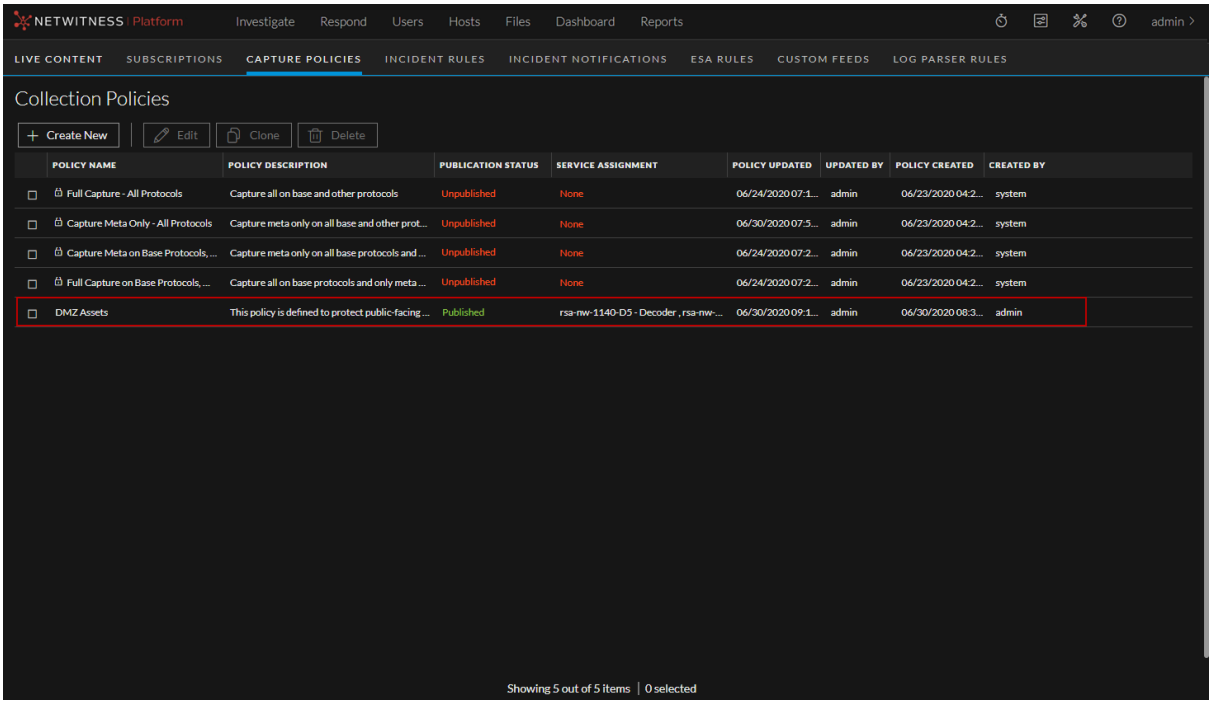
2. Select **Full Capture on Base Protocols, Meta only on all other protocols** and then click **Clone**. The Collection Policies view is displayed with the cloned policy at the bottom of the list, identified by appending -1 to the policy name.



3. Select the cloned policy and click **Edit**.
   The editing view is displayed with the **Identify Policy** option active.
   In this example, we are naming this policy "DMZ Assets" and providing the description "This policy is defined to protect public-facing web servers."

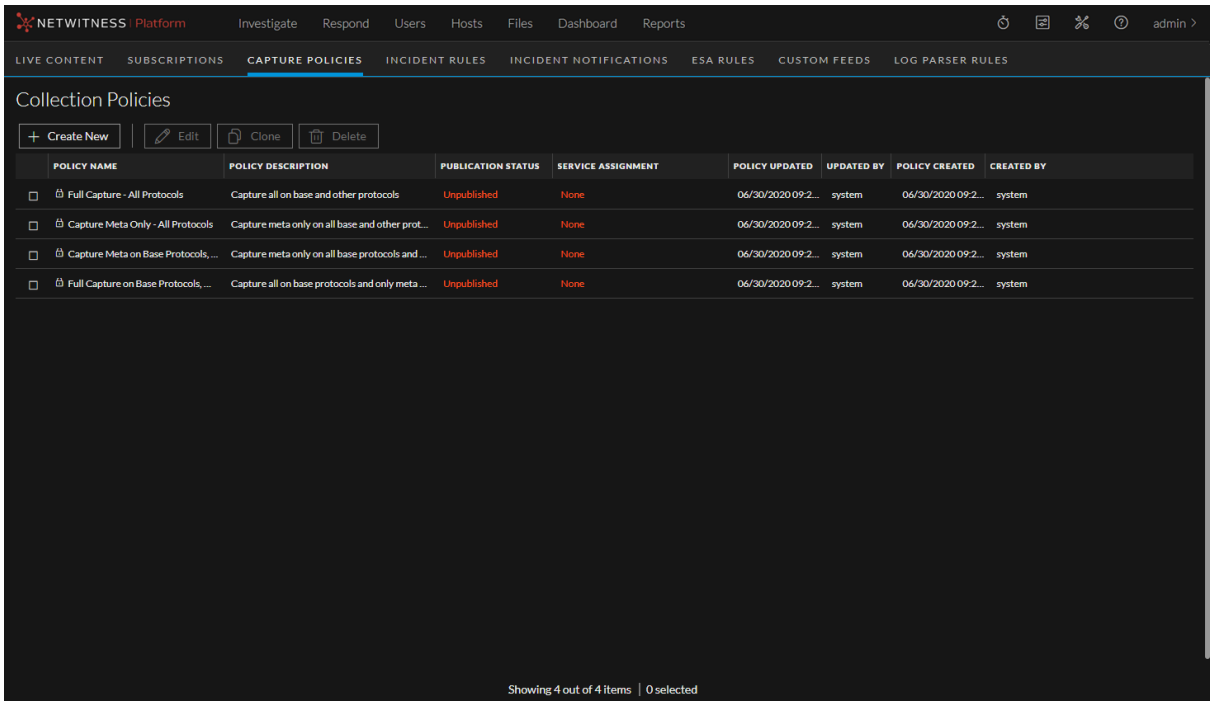


4. Click **Next**. The Define Policy view is displayed, with a list of rules you can use to define the policy. You can select the following options for rule actions:
   - **Collect Meta Only**: Collect metadata
   - **Drop All**: Drop metadata and network packets
   - **Collect All**: Collect metadata and network packets

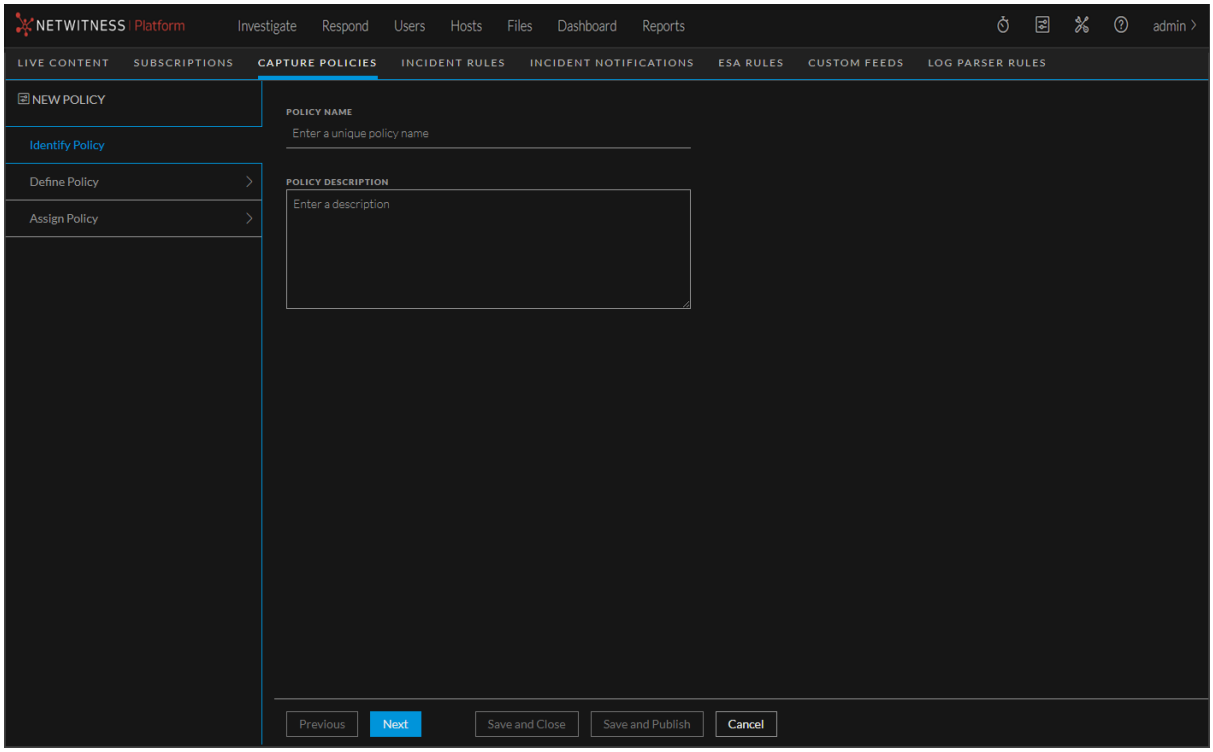


To collect the targeted data for the DMZ Assets policy, we are going to change all the base protocol rules inside the policy (except HTTP, SMTP, FTP, and DNS) from **Collect All** to **Collect Meta Only**, as shown below.

5. Click **Next**.
   The Assign Policy page is displayed.

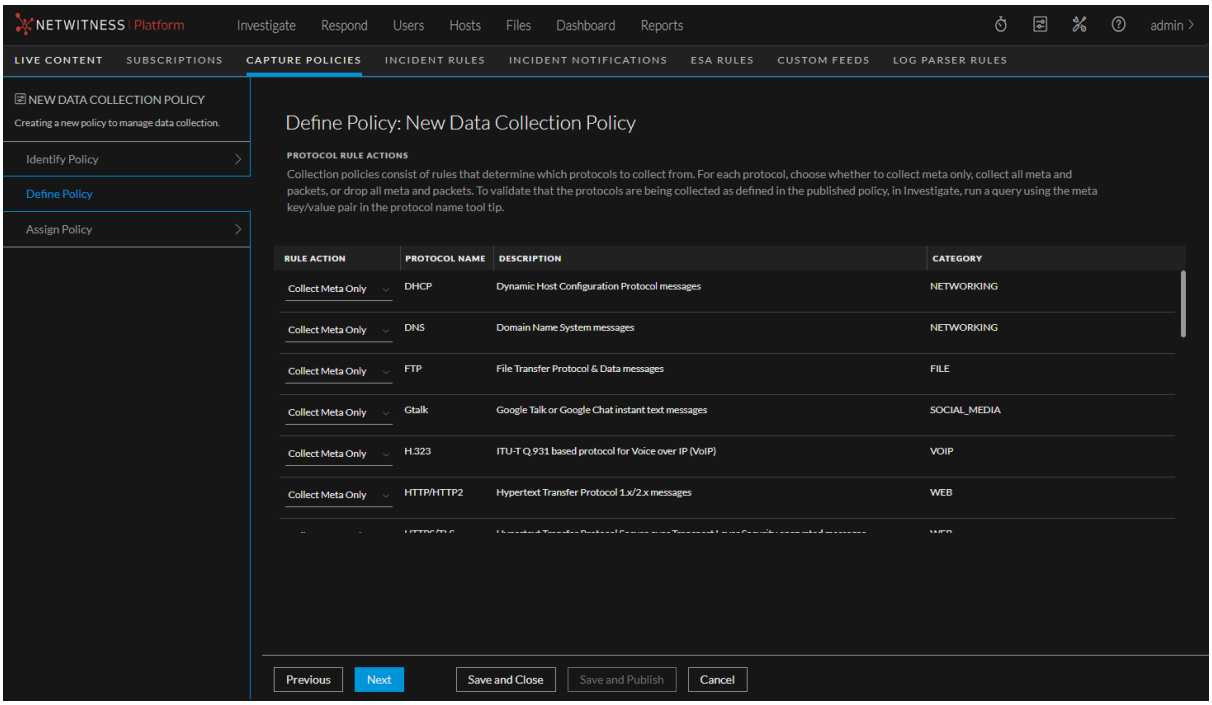


6. A Decoder can only be assigned to one policy. Decoders that are not available are greyed-out, because they are already assigned to other policies. Select the Decoders to collect the targeted data, and then click **Save and Publish**. The publication status moves to **Updating**. It changes to **Published** when the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as **Published**, so even if not all of the Decoders are available (and the publication status is not **Published**), data will begin to be collected on the Decoders that are available.
   Your new policy is displayed in the Collection Polices view, with the services displayed in the Service Assignment column.



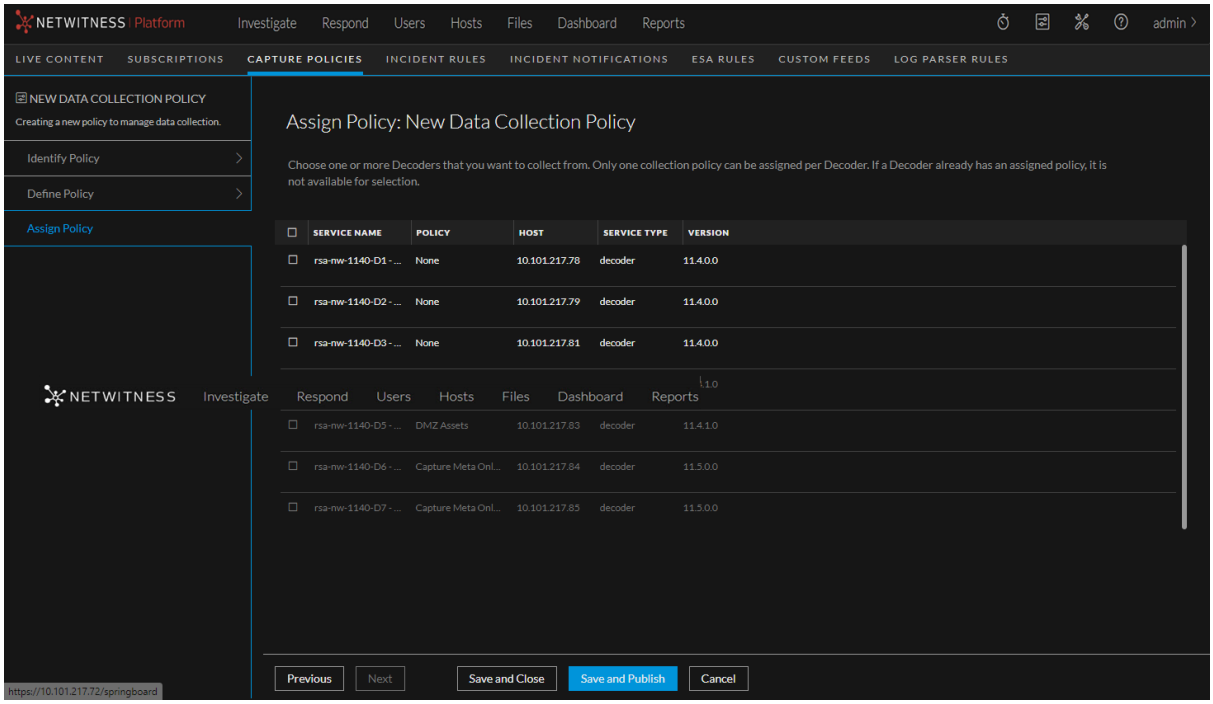
Create Custom Policies

You can create a custom Selective Network Decoder policy, where you can select specific protocols on which to collect data, as well as the rules that apply to them.

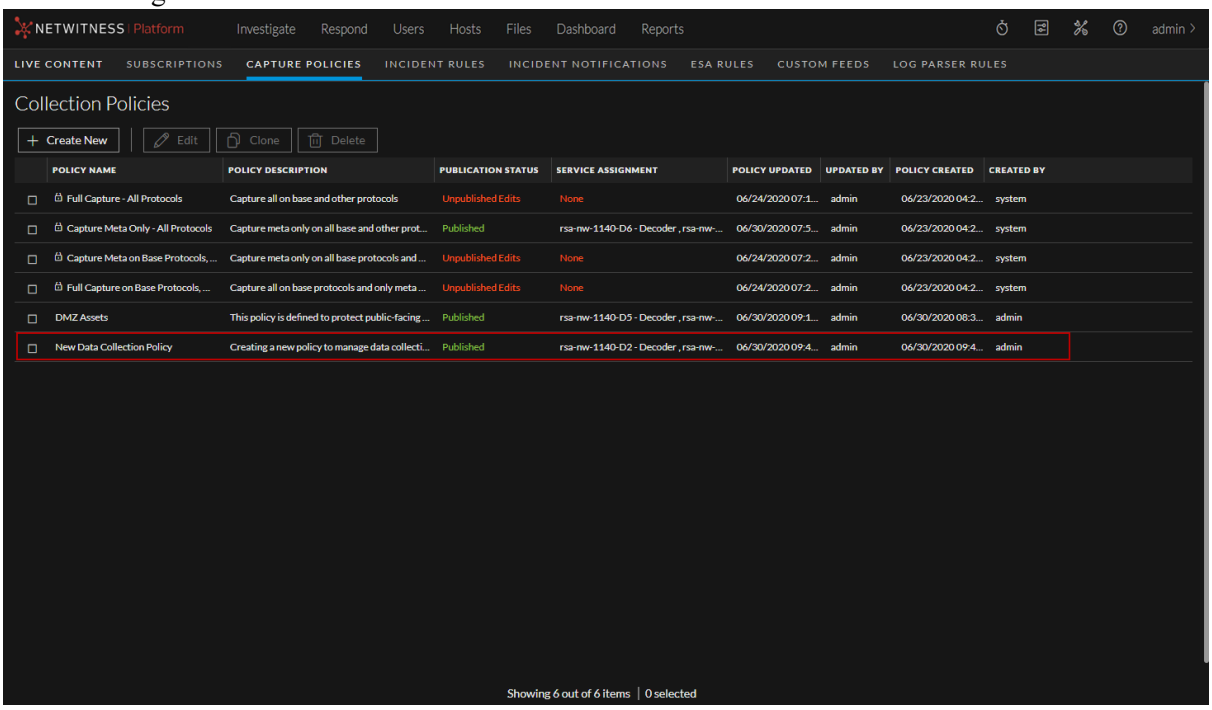


1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.

2. Click **Create New**.
   The editing view is displayed with the **Identify Policy** option active.



3. Enter a name and description for your policy, and then click **Next**.
   The Define Policy view is displayed.

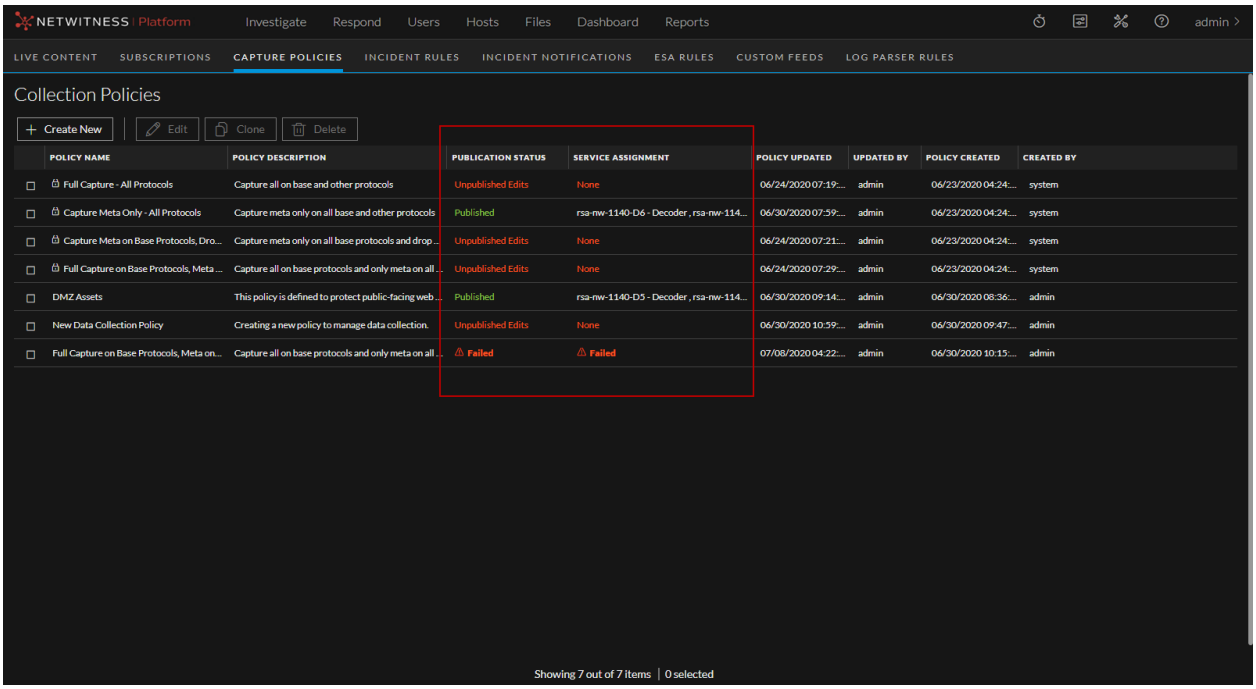


4. Define the actions for each of the protocols. The options for **RULE ACTION** are:
   - **Collect Meta Only**: Collect metadata
   - **Drop All**: Drop metadata and network packets
   - **Collect All**: Collect metadata and network packets

5. Click **Next**.
   The Assign Policy view is displayed.

6. A Decoder can only be assigned to one policy. Decoders that are not available are greyed-out, because they are already assigned to other policies. Select the Decoders to collect the targeted data, and then click **Save and Publish**. The publication status moves to **Updating**. It changes to **Published** when the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as **Published**, so even if not all of the Decoders are available (and the publication status is not **Published**), data will begin to be collected on the Decoders that are available.

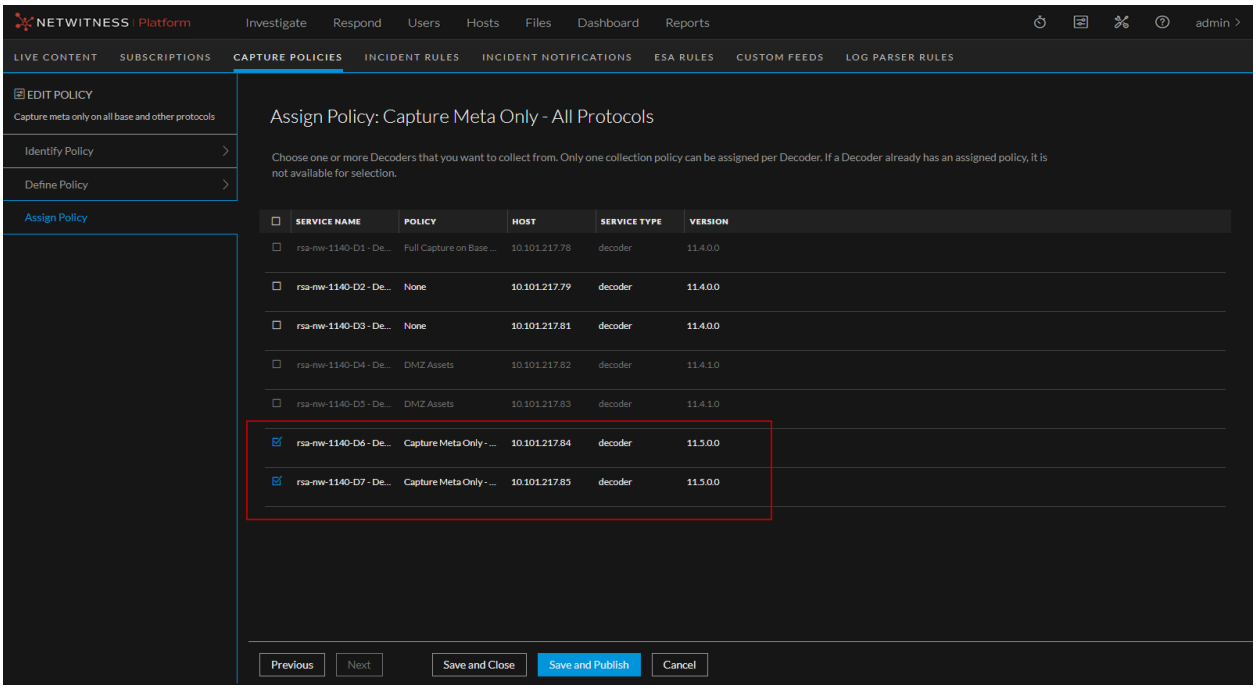
Your new policy is displayed in the Collection Polices view, with the services displayed in the Service Assignment column.



Verify Published Policies

When a policy has been published, the policy is applied to the Decoders that were designated in the policy assignment step. The Decoders that are assigned to the policy start collecting the data defined in the policy. There are a few ways to validate the policy is functioning as expected.

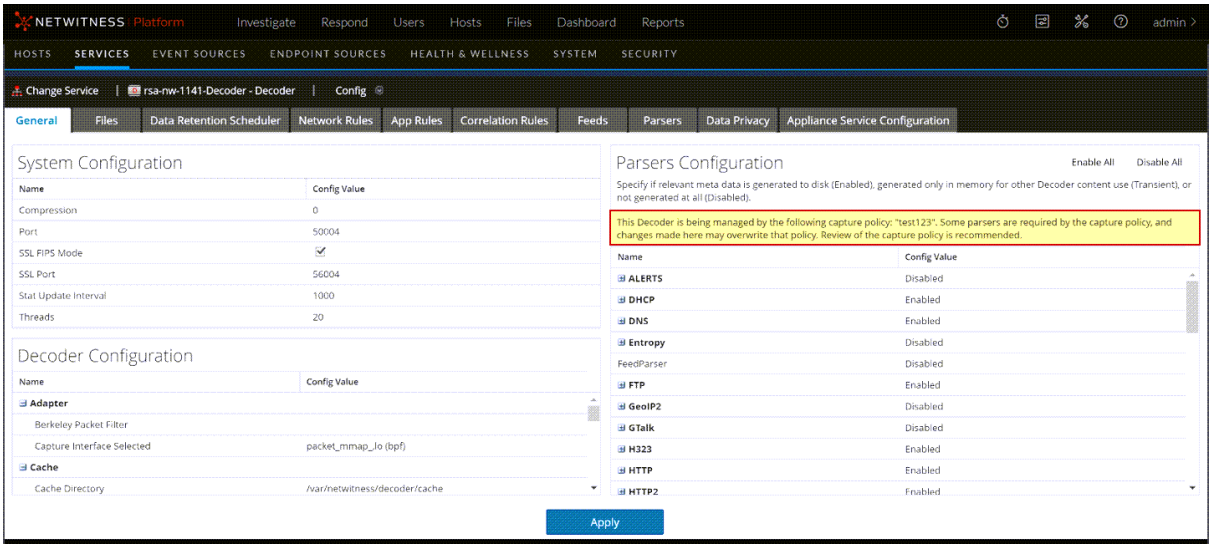
View Publication Status



Publication status is indicated in the Capture Polices view in the PUBLICATION STATUS column. You can also see which Decoders are assigned to the policy in the SERVICE ASSIGNMENT COLUMN.

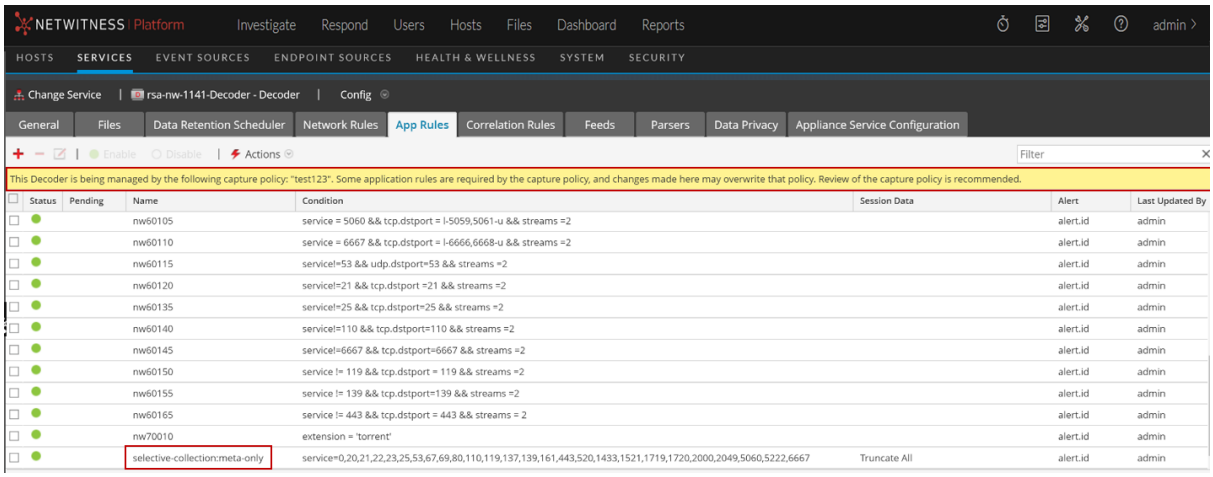
The publication statuses are:

- **Unpublished** - the rule actions of the policy have been defined and Decoders may have been assigned to the policy, but the policy has not been deployed to any Decoders.
- **Unpublished Edits** - policies that have been updated but are not deployed to Decoders. Clicking **Save and Close** after making edits keeps them from automatically being published, allowing the administrator to wait until a specific outage window to publish them. This would display as **Unpublished** (for policies not previously published to Decoders) or **Unpublished Edits** (for policies that have been previously published to Decoders, but the updates have not been deployed to Decoders).
- **Published** - the policy has been successfully deployed to all the Decoders that you selected. However, the Decoders that are available start gathering data immediately, before the policy is displayed as Published, so even if not all of the Decoders are available (and the publication status is not Published), data will begin to be collected on the Decoders that are available.
- **Failed** - policies that failed to execute, for example, if a Decoder is offline or a system is down.



You can also select a published policy, and then click **Edit** to verify the Decoders that are assigned to the policy.

Verify Policies in Admin > Services

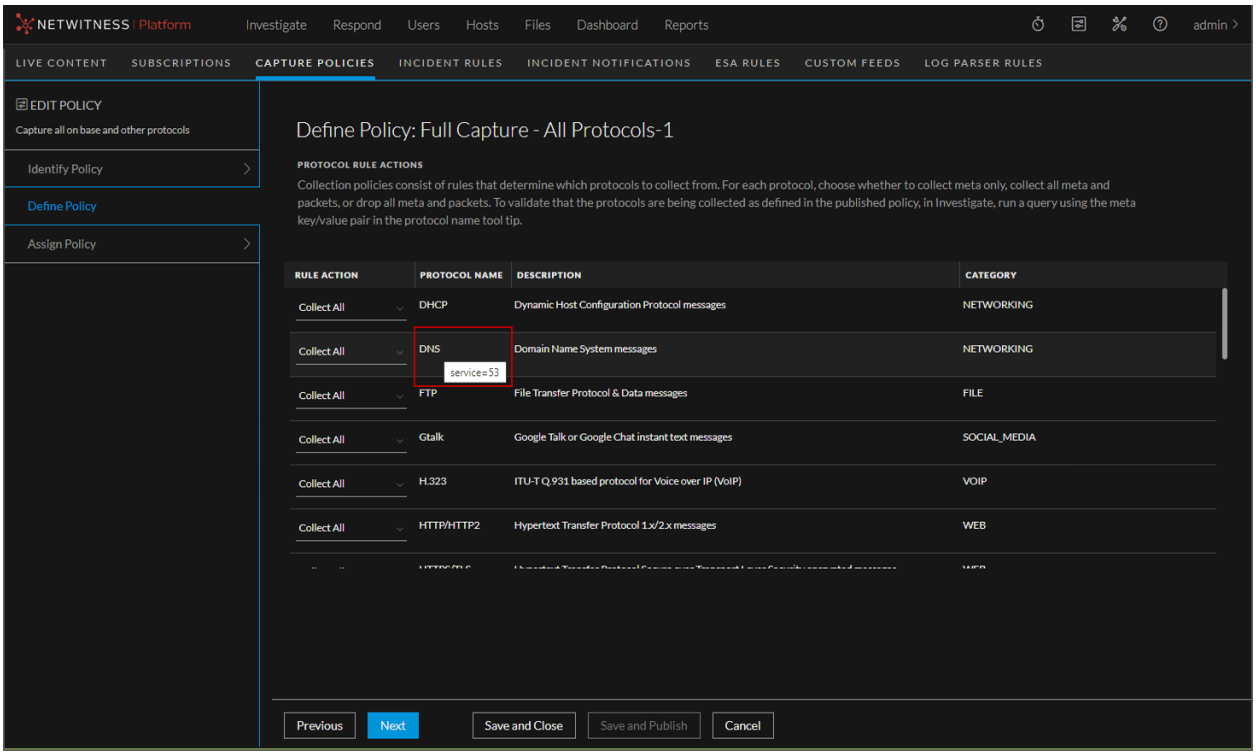


1. As an administrator, log in to the NetWitness user interface to view the Decoders that have been assigned to the policy.

2. Go to  (Admin) > **Services** > **<decoder name>** >  **(Actions)** > **View** > **Config**. On the General tab, in the right panel, there is a list of parsers that are installed on the Decoder by default. If a policy is administering this Decoder and requires any of those parsers to function, a message is displayed as shown below.

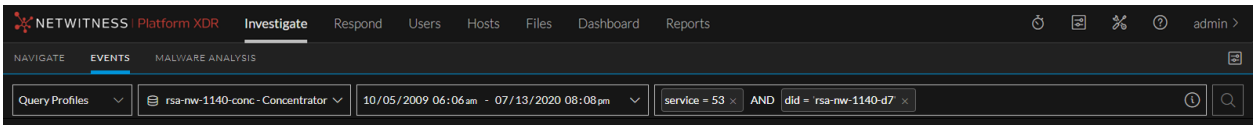
3. On the **App Rules** tab, a similar message indicates that some of the rules are required for the policy to function. You can search for "selective collection" to find the specific rules required, as the rule names contain that information.

> **Note:** In Investigate, you must have the **Alert** session option selected for the selective collection policy to be displayed.



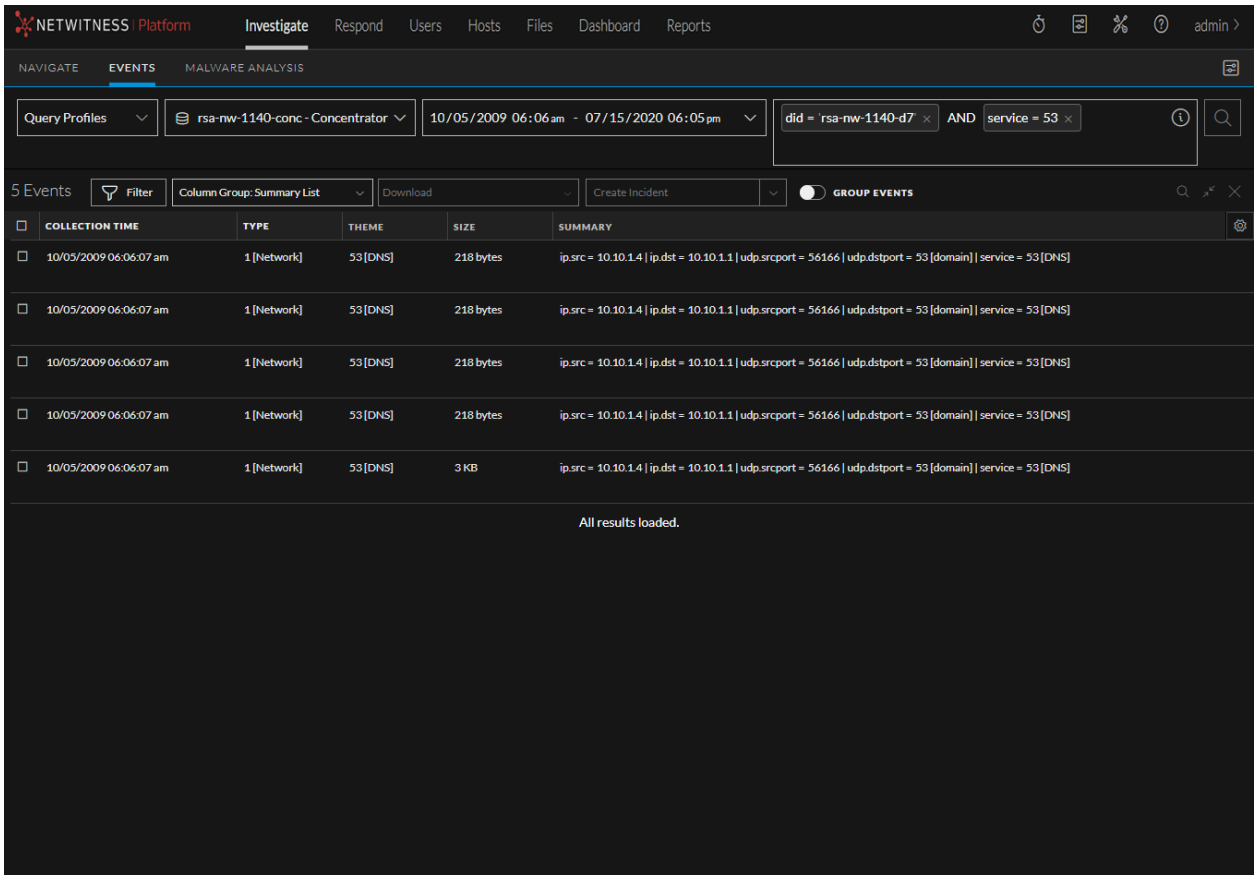
By default, the selective collection rules are added to the bottom of the rule set when the policy is applied. However, an administrator can directly affect the policy by altering the selective policy rules or by moving conflicting rules (rules with the same services) above the selective collection rules. In both cases, those changes take effect when they are saved locally on the individual Decoders, until the next time the policy is published from the central configuration page, when that policy will override changes made individually on the Decoders.

> **Note:** There currently is no feedback in the centralized configuration page denoting that the configuration related to the policy has been altered locally on the Decoders. To avoid this situation, manage all the policy rules from the centralized configuration page. If that is not possible, as additional application rules outside of collection policies may be required, follow standard security practices, including separation of duties, to limit people who need access to alter application rules and general parsers.

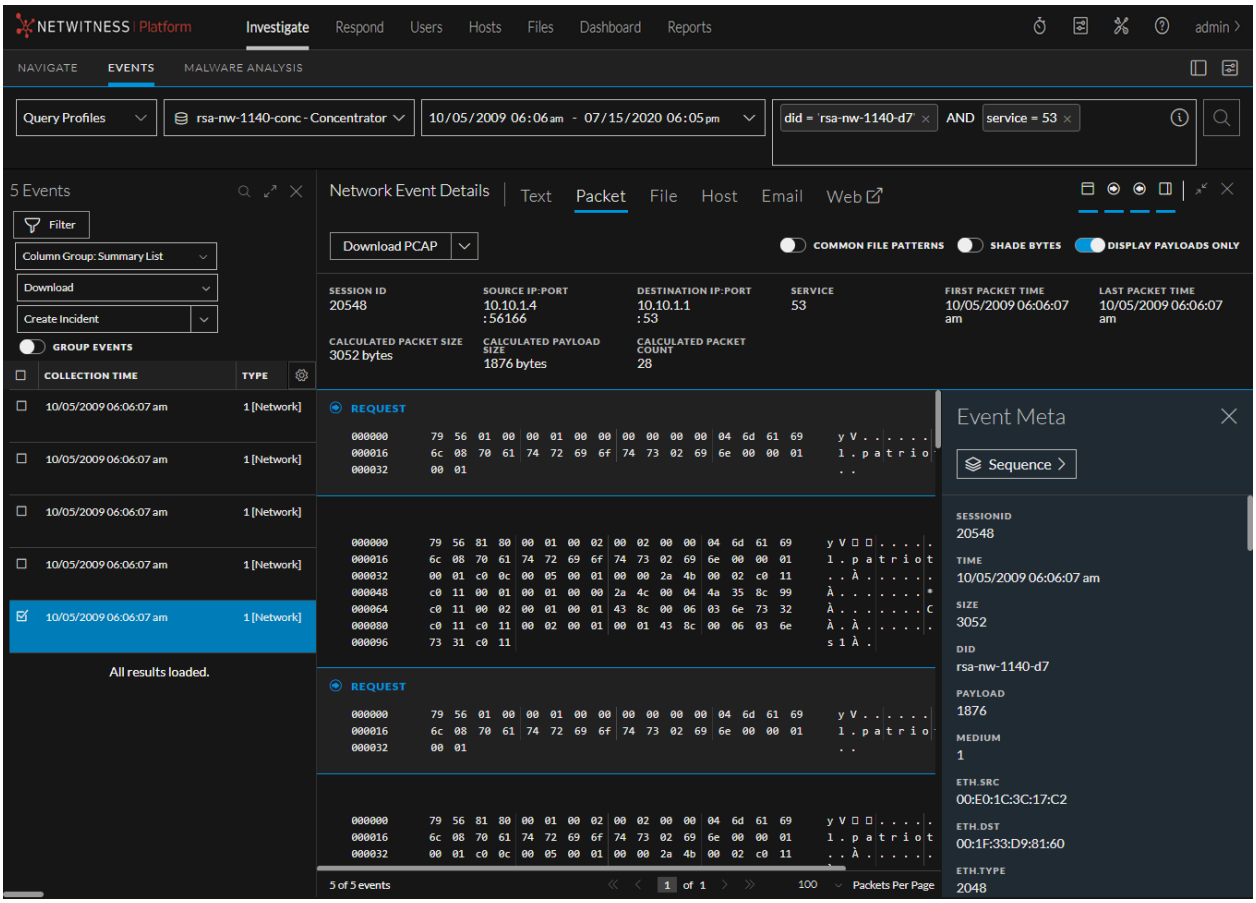


Verify Policies in the Investigate View

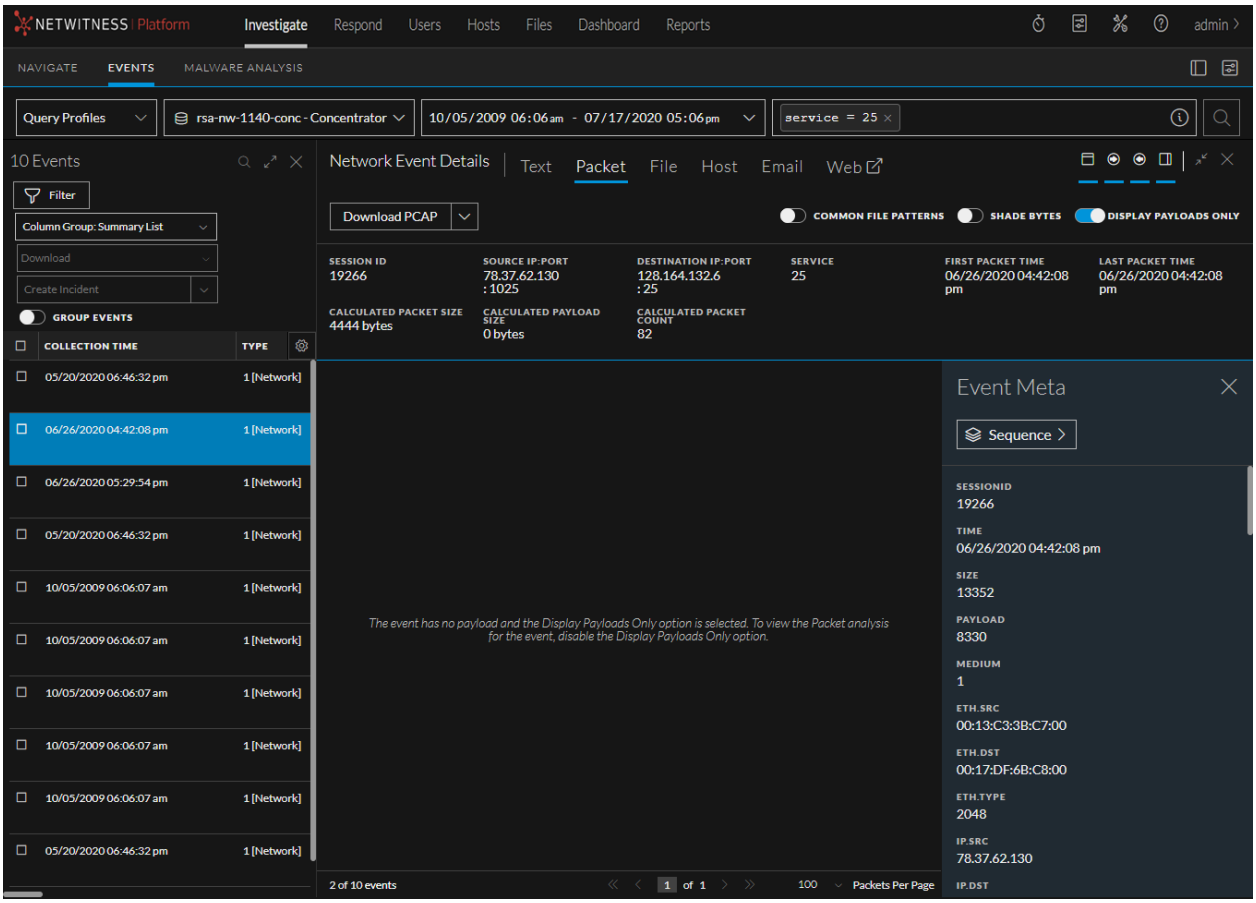
You can further verify that the policy is working as expected (the protocols are being collected as published) in the Investigate view. In the centralized configuration page for selective collection, the administrator can get a translation of what the query parameter would be for each individual protocol when viewing the rules inside the policy.



For example, in  (Configure) > **Capture Policies** > **<select a policy>** > **Edit** > **Define Policy**, if you hover over the DNS protocol name, `service=53` is displayed.

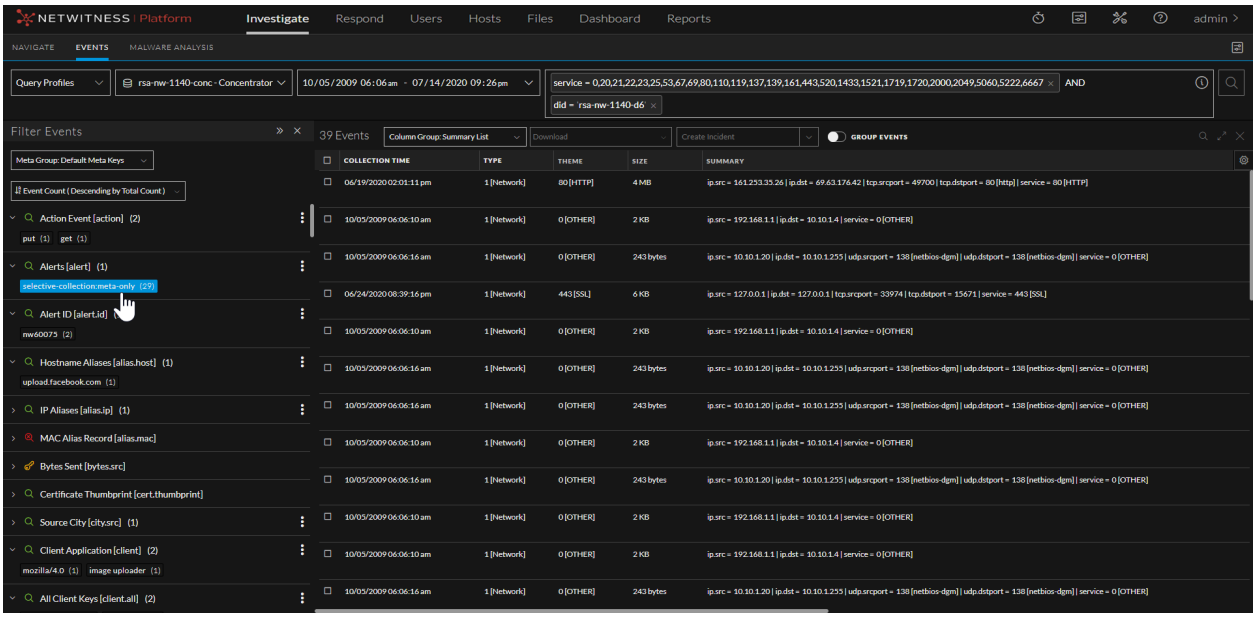


To determine if the appropriate action has been taken for DNS traffic, in **Investigate** > **Events** you can add the query parameter (for example, `service=53`) as a filter in the query bar and run the query against the Broker or Concentrator the Network Decoder is associated with for the time the policy has been active on the Network Decoder. To make sure you are only seeing the traffic from the Decoders that you want, you can add the Decoder Source, or `did` meta key as another filter in the query bar.



After running the query, if there are any related results, those events are displayed in the table (unless you applied an action to drop them).

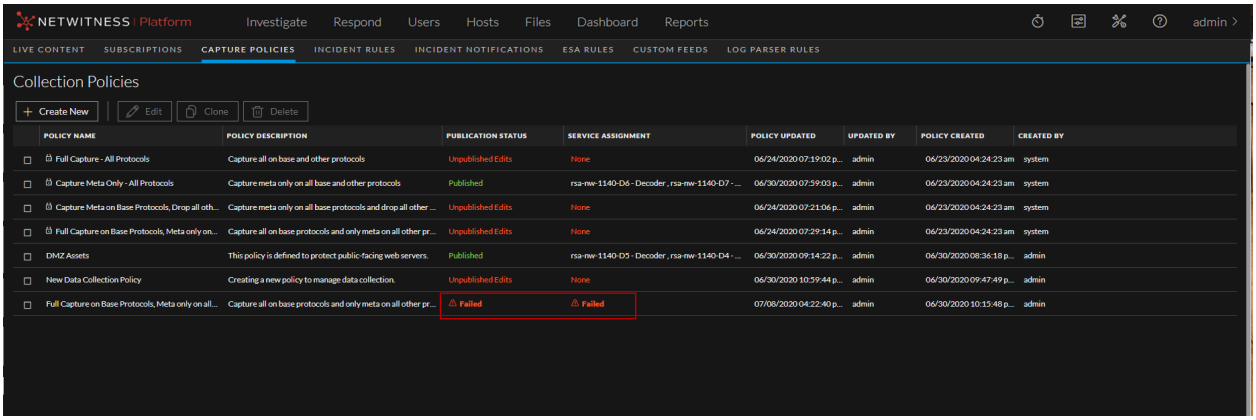
If you chose the action to `collect all` you can click on one of the events and review the metadata and the payload information for that packet session.



If you chose the action to `collect meta only`, you can click on one of the events and review the metadata, however, a message would be displayed instead of the packet payloads, as shown in the following figure.

To expedite this process, you can also take the application rules from one of the Network Decoders the policy is applied to and use it as the filter in the **Investigate** > **Events** query bar.

The following figure shows an entire `collect meta only` configuration by using the application rule shown here, created on the Decoder (in Verify Policies in Admin > Services):
`(service=0,20,21,22,23,25,53,67,69,80,110,119,137,139,161,443,520,1433,1521,1719,1720,2000,2049,5060,5222,6667) truncate`:



Note: If the findings do not align with what is expected from the policy, make sure that there are not other rules on the individual Decoders that might be conflicting with the selective collection policy rules. In addition, make sure when checking in Investigate that you are looking at only the traffic associated with the Decoders related to the policy.

Troubleshooting Policy Deployments That Fail

Policy deployment can fail for the following reasons:

- A Decoder service assigned to the policy is not running
- A Decoder host system is down when you try to deploy the policy

When a policy deployment fails, the Failed icon is displayed in the PUBLICATION STATUS and SERVICE ASSIGNMENT columns as shown in the following figure.

Use the following options to research publication failures:

Check the status of the Decoders

Check to see if the Decoder system is down, or if the Decoder service has stopped capturing data.

1. Select the policy, click **Edit**, and go to the Assign Policy page to determine which Decoders are assigned to the policy,
2. Go to  (Admin) > **Services**, select the Decoder, click  > **View** > **System** to investigate the status of the Decoder.

Review the content-server.log file

You can review the content in this file to troubleshoot errors. This file is located in the following directory on the NW Server host:

```
/var/log/netwitness/content-server/content-server.log
```

The following example shows a content-server log snippet that is displayed when publishing a policy fails:

```
2020-07-08 16:22:45,287 [ nioEventLoopGroup-2-2]
INFO     DataAccess|Finished publishing policy 'Full Capture on Base
Protocols, Meta only on all other protocols-1' outcome:FAILED
```

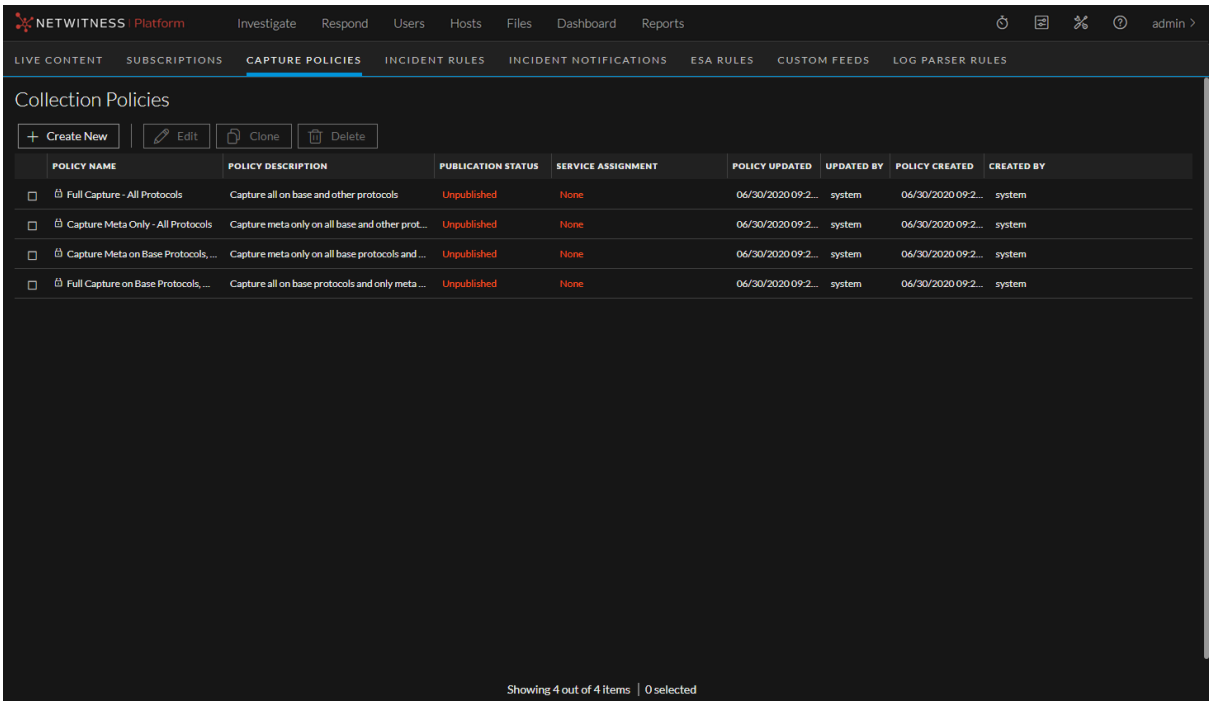
This is an example of a content server log snippet for successfully publishing a policy:

```
2020-06-23 17:40:50,373 [ nioEventLoopGroup-2-7]
INFO     DataAccess|Finished publishing policy 'Policy 1' outcome:SUCCESS
```

Review `/var/log/messages` on Decoder Systems

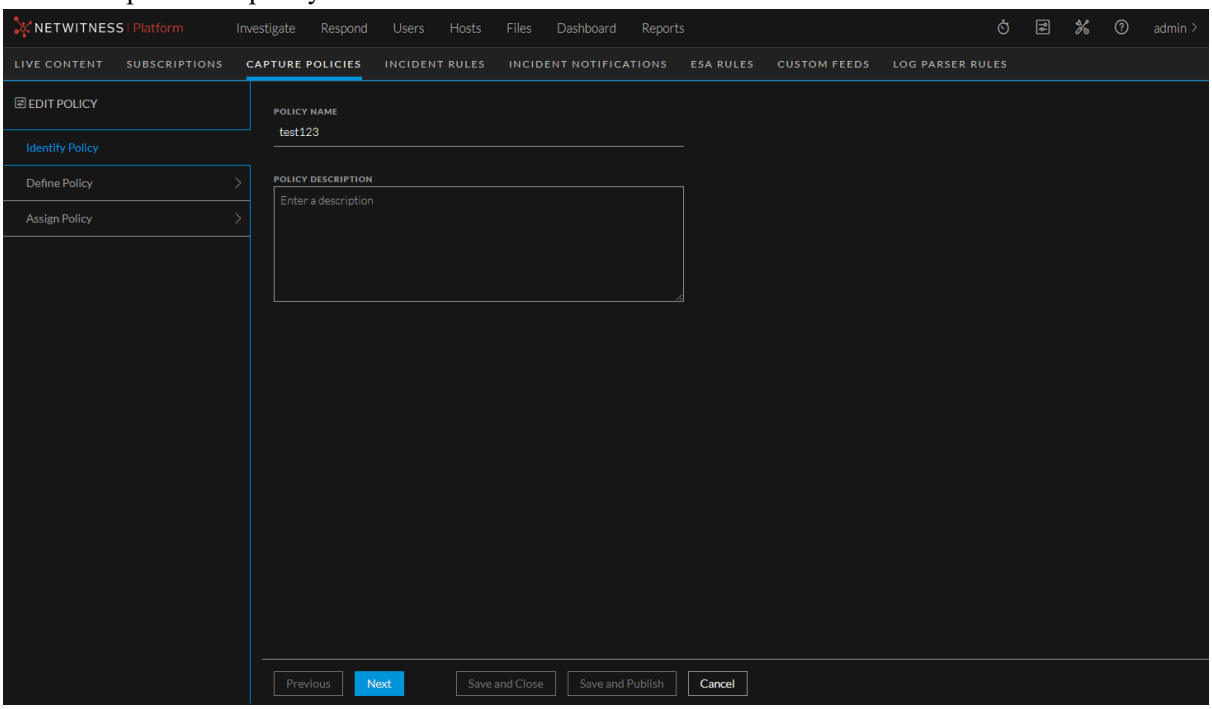
You can view publication status in `/var/log/messages` on a Decoder system.

The following is an example of successful publication in `/var/log/messages`:



```
Jun 15 18:35:17 rsa-nw-1141-Decoder-1 NwDecoder[8260]: [Rules] [audit] User
admin (session 26182, 10.237.169.43:55380) has added application rule
'selective-collection:meta-only' at position 38
```

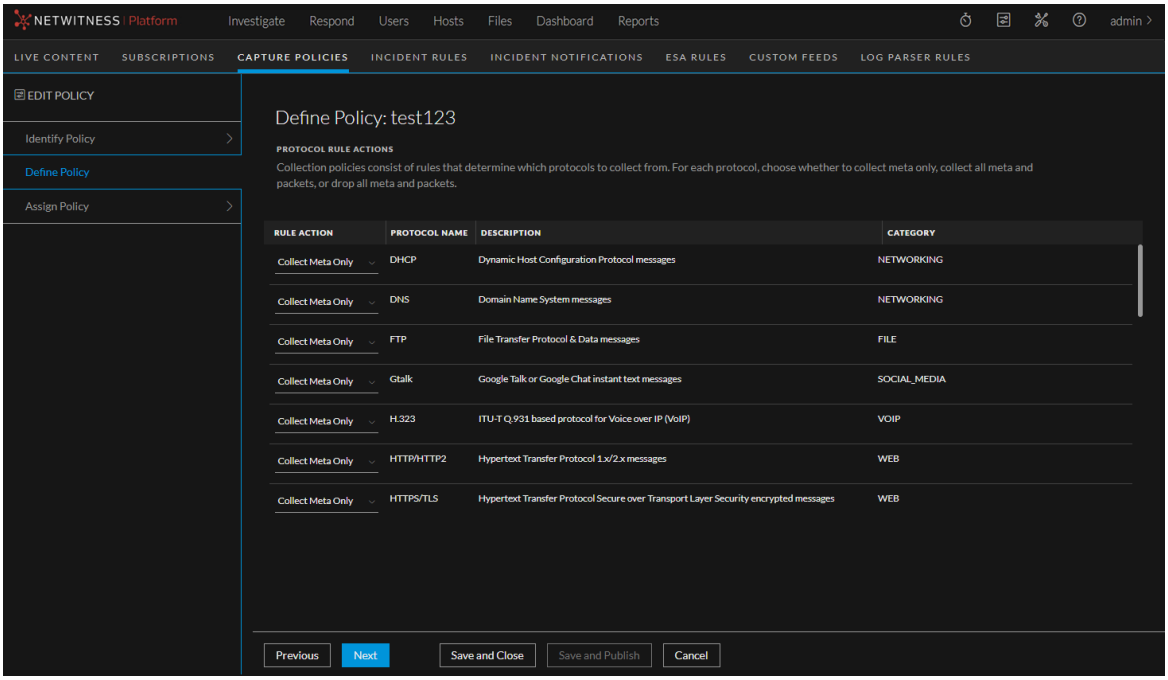
Unpublish Policies



You can unpublish a policy by unassigning the Network Decoders from the policy, which preserves the policy but makes it inactive so that the data it defines is not being collected. You can then change or remove a portion of policy, or remove the entire policy from the Decoders to which they are assigned.

To unpublish a policy:

1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.



2. Select the published policy and click **Edit**.

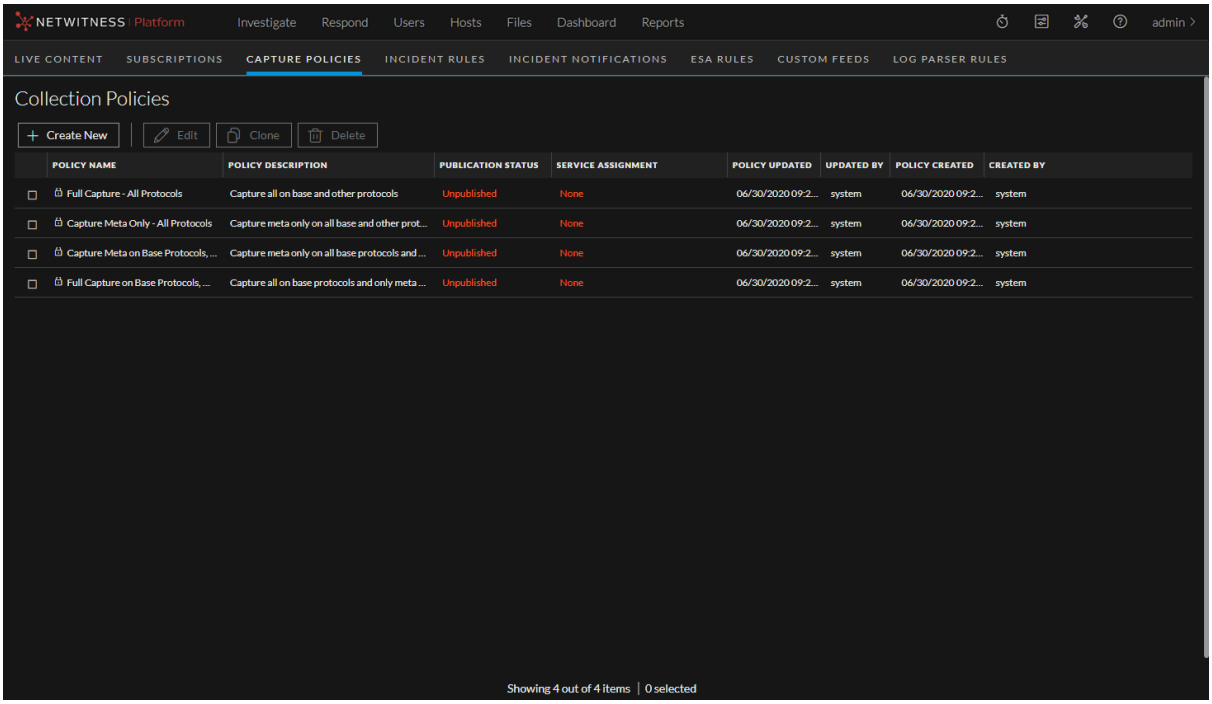
   a. To change the name or description of the policy, update the policy name or description in the Identify Policy view.

b. To change the protocols that are collected, click **Next** and then edit the rule actions in the Define Policy view.

c. To unassign or reassign Decoders to this policy, click **Next**.

- To fully unpublish this policy, deselect all the Decoders and then click **Save and Publish**.
- To change the Decoders that are assigned to this policy, select or deselect the Decoders as needed and then click **Save and Publish.**

When the changes to the policy status have been completed and the Decoders updated, the policy status is displayed in green text as **Published** on the Collection Policies tab. If you unassigned all the Decoders without assigning any new ones, the publication status is **Unpublished Edits**.



Delete Policies

You can only delete customized policies. Predefined policies can be unpublished, but cannot be deleted. You can only delete one policy at a time. When you delete a policy, any Decoders that were assigned to the policy immediately stop applying the rules in the policy.

For information about how to unpublish a policy, see Unpublish Policies.

To delete a policy:

1. In the NetWitness user interface, go to (Configure) and select the **CAPTURE POLICIES** tab.

2. Select a customized policy and click **Delete**.
   The policy is removed from the system.

Caution: If you delete a policy that is published to Decoders, a warning is displayed. If you click **Accept** in the warning, that policy is removed from the Decoders, the collection status is changed, and the policy is deleted.

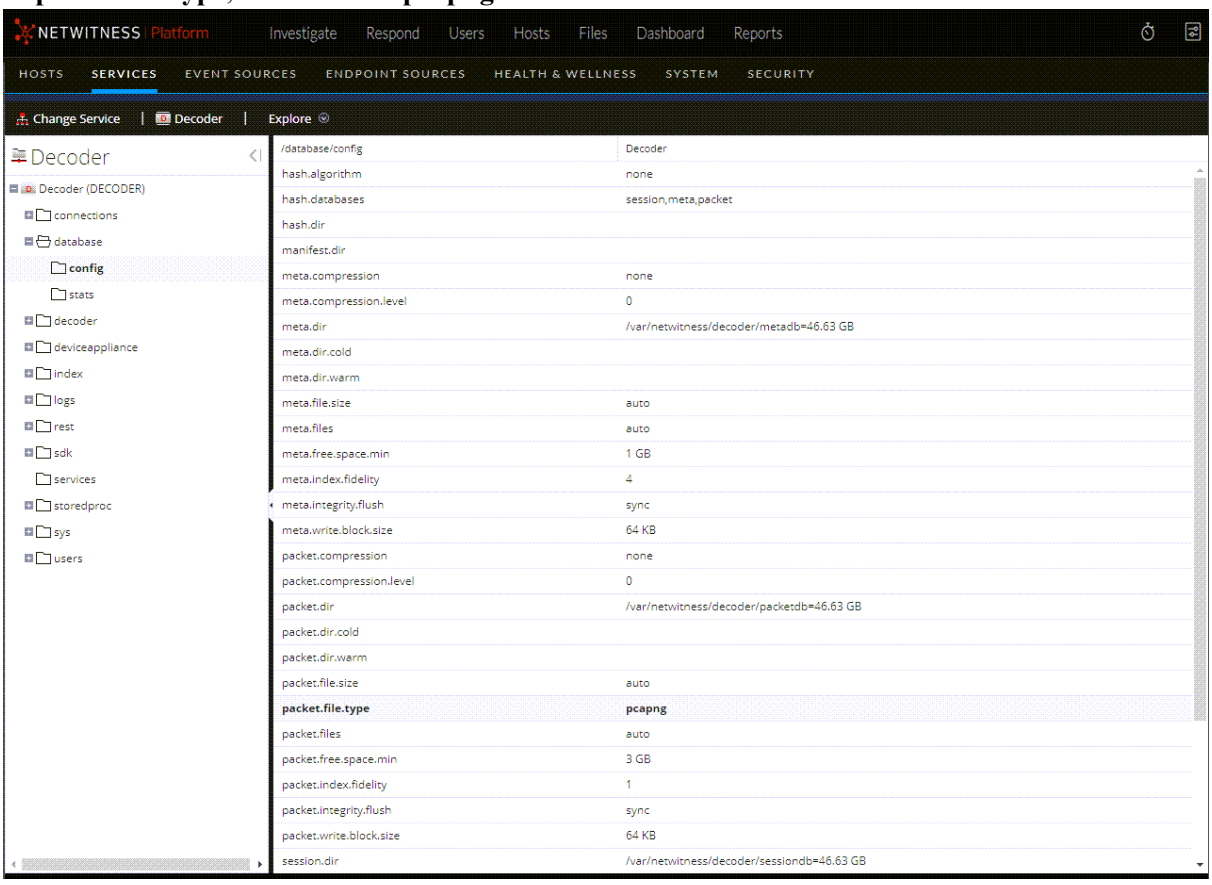
Supported Protocols for Selective Network Data Collection

The protocols in this list are supported for selective network data collection. These protocols have descriptive tool tips in the user interface. You can choose how to handle each of these protocols individually by dropping, capturing metadata only, or capturing all data related to them. There is also an additional rule for each policy that handles all other unidentified protocols not included in this list. The policies apply the collect or drop actions based on protocol characteristics, regardless of the port that they are captured on.

Category	Protocol	Description
Database	TNS	Transparent Network Substrate Oracle database networking protocol messages
	TDS	Tabular Data Stream for SQL server communications
Email	SMTP	Simple Mail Transport Protocol messages

Category	Protocol	Description
	POP3	Post Office Protocol v3 messages (Email clients use to retrieve mail from server)
File	SMB	Server Message Block (or CIFS) network communication protocol file sharing communications
	NFS	Network File System protocol messages
	FTP	File Transfer Protocol messages
	TFTP	Trivial File Transfer Protocol messages
Networking	SNMP	Simple Network Management Protocol messages
	DNS	Domain Name System messages
	DHCP	Dynamic Host Configuration Protocol messages
	NETBIOS	Network Basic Input/Output System networking protocol messages
Remote Access	SSH	Secure Shell secure remote connections
	TELNET	Teletype network remote interface protocol messages
	SCCP	Cisco Skinny Client Control Protocol terminal control protocol messages
Routing	RIP	Routing Information Protocol distance-vector routing protocol messages
Social Media	GTalk	Google Talk or Google Chat instant text messages
	IRC	Internet Relay Chat protocol text messages
	NNTP	Network News Transfer Protocol for Usenet news articles
VoIP	RTP	Real-time Transport Protocol audio and video streaming protocol messages
	SIP	Session Initiation Protocol text-based messaging application control protocol messages
	H323	ITU-T Q.931 based protocol for Voice over IP (VoIP)
Web	HTTP/HTTP2	HyperText Transfer Protocol 1.x/2.x messages
	HTTPS/TLS	HyperText Transfer Protocol Secure over Transport Layer Security or Secure Sockets Layer encrypted messages

Note: When selective network data collection is set up to collect metadata only for the HTTPS/TLS protocol, it truncates the traffic after the SSL/TLS handshake to ensure that all the certificates and other details are retained for analysis purposes while the encrypted packet payloads are dropped.



(Optional) Configure a Decoder to Write Standard pcap-formatted Files

To provide a more open database format, the Network Decoder can write standard pcap-formatted files. You can enable pcapng-formatted database files with the configuration node:
`/database/config/packet.file.type = 'pcapng' or 'netwitness'`

Note: This capability is enabled by default if you install 11.2 or later. If you upgrade from a previous version to 11.2, you must enable pcapng-formatted database files manually, which can result in an approximate 4% decrease in disk space (as the pcapng files require more space than the NetWitness nwdb files).

To enable writing standard pcap-formatted files:

1. Go to (Admin) > **Services**, select a Network Decoder service, and then select > **View > Explore**.
2. Go to **database** > **config**.
3. In **packet.file.type**, the default is **pcapng**.

4. To change the packet file type to NetWitness formatting, type **netwitness** and press **Enter**. This change will take effect immediately on the next packet file that is created.

Note: In the pcapng database file format, the data is in clear text, and is not obfuscated by our proprietary format, which can improve security.

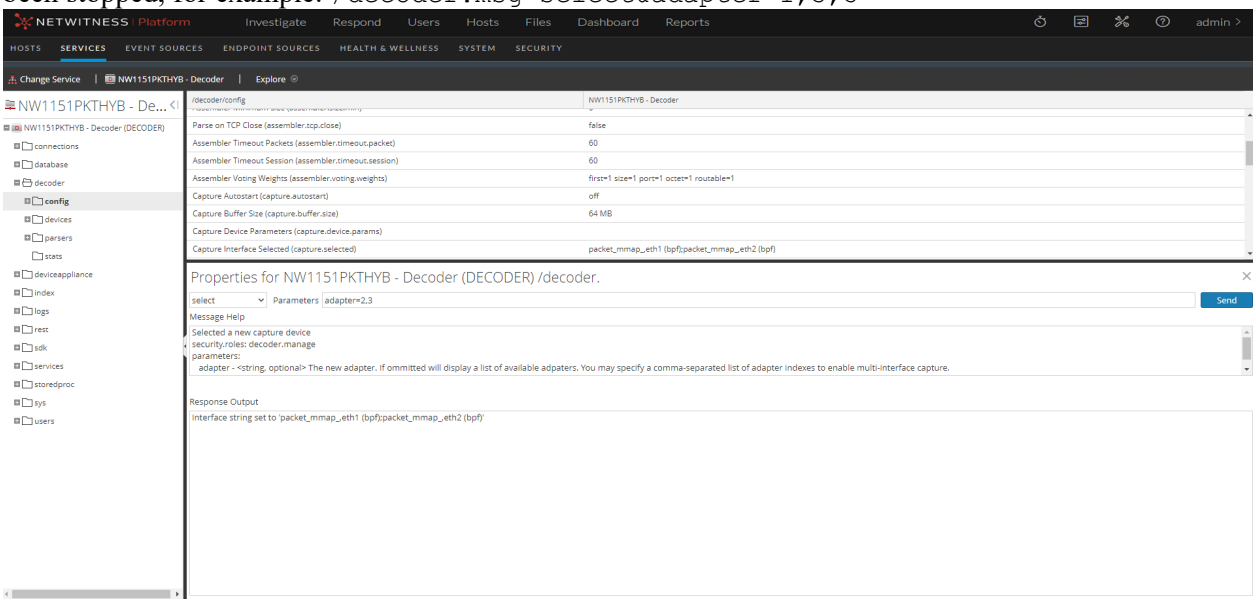
Caution: Please do not touch any files in the packet database directories! You must not read or edit any `pcapng` file in the packet database directories, as they are always in use while Decoder is running. Decoder always expects full and exclusive access to those files, and other processes reading those files prevent normal Decoder operation. The proper way to access the `pcapng` files is to set up a cold storage directory. This allows Decoder to copy `pcapng` files to the cold storage directory before deletion. At that point, you are responsible for managing the `pcapng` files, including making sure that the cold storage volume never fills up. Keep in mind that copying the `pcapng` files to cold storage requires a non-trivial amount of I/O and could interfere with packet capture. Cold storage for `pcapng` is not supported at 10G speeds.

(Optional) Multiple Adapter Packet Capture

Beginning with 11.5, the Network Decoder can capture from multiple interfaces simultaneously. This functionality allows Network Decoders to capture from multiple physical Network Interface Cards (NICs), or multiple ports on multiple interfaces, while leveraging the same network rules, application rules, and parsers for each NIC. The benefit of capturing from multiple physical NICs is that this method multi-threads the capture process for each adapter interface, which also multi-threads network rule evaluation.

For example, prior to 11.5, defining `capture.selected=PFRINGZC, em3` along with `capture.device.params=device=zc:em3,zc:em4` allocated a single thread for the Network Decoder to capture any traffic that came into either `em3` or `em4` interfaces. This also meant that all network rules were evaluated in a single thread.

However, in 11.5, configuring `capture.selected=PFRINGZC,em3; PFRINGZC,em4` allocates two threads for the Network Decoder to capture the traffic collected on either `em3` or `em4`, which provides more resources to the capture pipeline.



In this topic, the term "adapter" refers to a capture device within the Decoder. An adapter's name consists of the device (for example, the software API that the Decoder uses to interact with an adapter), and an interface (the physical device). A device can have multiple interfaces, and an interface can be compatible with multiple devices.

Configure Multiple Adapter Packet Capture

Note: Changes to capture device configuration do not take effect until service restart.

You can define multiple adapter packet capture for Decoders in the config setting `/decoder/config/capture.selected`. It accepts a semi-colon separated list of adapters, for example: `bpf,en5 (bpf);null_device,Null Capture`. This setting can be edited while capture is running, however, the changes do not take effect until the service has been restarted.

You can use the `/decoder?msg=select` command to select one or more adapters after capture has been stopped, for example: `/decoder?msg=select&adapter=1,3,5`

Note: As of 11.5, this configuration is not yet available in the `decoder` > `config` page. Use the `decoder` > `explore` page or the REST API. You can the Explore view by selecting a Decoder in the user interface and going to  (actions)> **View** > **Explore**. You can access the REST API by opening a browser and specifying the IP address of the host, for example, `https://<decoder-ip-address>:50106`.

Per Interface Configuration

The `/device/config/device.capture.params` configuration is a global configuration setting, and is applied to every interface when capture is started.

There is also a configuration setting for individual interfaces, which is `/decoder/devices/<devicename>/<interfacename>/config`. Currently, the only option available in this configuration setting is `capture.params`. Any value in this setting will override the global configuration setting.

Stat Nodes

As with configuration, there are per-interface stats and aggregate stats (similar to the global configuration). When there is a single device configured, these stat nodes function as in previous versions. When there is more than one device configured, the stat settings `/decoder/stats/capture.device` and `/decoder/stats/capture.selected` read `multi`.

Per-Interface Stats

The stats for each interface can be found in:
`/decoder/devices/<devicename>/<interfacename>/stats`

The captured stats are:

- capture.avg.size
- capture.dropped
- capture.filtered
- capture.header.bytes
- capture.kept
- capture.payload.bytes
- capture.received
- capture.total.bytes
- pool.packet.captured

Aggregate Stats

The capture stats under /decoder/stats represent an aggregate of the individual interface stats.

In the following table, for example, capture.avg.size is the maximum average size among all the interfaces, where capture.dropped is the total captures that were dropped for all the interfaces.

capture.rate	SUM
capture.avg.size	MAX
capture.dropped	SUM
capture.filtered	SUM
capture.header.bytes	SUM
capture.kept	SUM
capture.payload.bytes	SUM
capture.received	SUM
capture.total.bytes	SUM
pool.packet.captured	MIN

Pool Stats

All the network packet and session pool pages are tracked in /decoder/stats/pool/.

The stats under /decoder/stats/pool represents the total number of capture pages configured in Decoder. These include packet pool and session pool pages.

capture.port Meta Key

Each session is given a capture.port meta key which identifies the adapter from which the packets in the session were captured. This meta key can optionally be turned off with the /decoder/config/captureport.meta.enabled option. This meta key is on by default for Network Decoders, and is off by default for Log Decoders.

IMPORTANT: The `capture.port` meta key does not work with the `packet_mmap_,ALL` adapter. You must specify individual ports while using `capture.port`. The `packet_mmap_,ALL` adapter is capable of capturing across all types of network interfaces at the same time. For more information, see (Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces.

Note: If you turn the `capture.port` meta key off, you must perform a capture restart for the change to take affect since this is a configuration change.

Special Devices

The nwimport device is for handling PCAP imports while simultaneously capturing network data. For more information on PCAP imports, see Upload a Packet Capture File.

`nwimport`: This device is not selectable but does have stat and config nodes. The config node for `nwimport` is ignored.

`Packet arrived out of order` Message

This message means that the Decoder is seeing old packets. This can be a side-effect of running import while capture is running. This message is usually suppressed at the beginning of import and then unsuppressed at the end. However, packets can still be in the state of being processed even after the upload of the imported file has completed. This means that this warning can be unsuppressed before the processing of the imported packets is completed, which results in displaying this message.

For information about updating Decoder configurations, see the *RESTful API User Guide for NetWitness Platform*. For information about stopping and restarting capture, see Configure Capture Settings. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Multi-Assembler Modes

The process that reassembles captured packets into streams is known as the Assembler. You can customize the Assembler operation to suit the packet capture configuration. It works in two modes (`on` and `off`) that are configured using the `/decoder/config/assembler.threading.enabled` variable. The value of `assembler.threading.enabled` only takes effect if multi-adapter packet capture is enabled.

Note: If you change the value of `assembler.threading.enabled`, you must perform a capture restart.

OFF Mode: If assembler threading is `off`, then one Assembler is used to assemble all packets captured from all interfaces. Packets from a stream may appear on any capture interface and the single assembler will put them back together.

- Assembler threading must be `off` to allow assembler to reconstruct streams that are capture across multiple capture interfaces.
- When assembler threading is `off`, the single Assembler instance may limit the maximum packet rate that the Decoder can process.

ON Mode: If assembler threading is `on`, there will be a separate Assembler for each capture interface. Each Assembler will only reassemble the packets it receives from it's capture interface.

- This mode of operation enables higher throughput because each Assembler instance operates on a dedicated processor.
- Each logical stream of packets must be ingested by one interface only. For example, the streams on each capture interface could come from different networks.

For compatibility with previous releases, the Multi Assembler mode is `off` by default.

When importing packets, the imported packets are fed to one of the existing assemblers, or the single Assembler instance when Assembler threading is `off`. Importing packets does not create a separate Assembler process.

(Optional) Internet Content Adaptation Protocol Capture

Internet Content Adaptation Protocol (ICAP) is a service protocol that encapsulates HTTP messages into ICAP Messages and forwards them to an ICAP server for processing.

NwDecoder supports capturing ICAP Messages and converting the HTTP requests and responses into packets. The capture device is named `icap`, `ICAP Server`, and can be used simultaneously with other capture devices (i.e., packet capture).

ICAP Capture Options

The capture options are specified on Decoder in the configuration node `/decoder/config/capture.params`

You must restart the capture before any changes take effect.

- `reqmod=<bool>` - By default, the Decoder will process both `REQMOD` and `RESPMOD` messages. Since the `RESPMOD` contains both the request and response, it may be advantageous for Decoder to ignore `REQMOD` messages and only process `RESPMOD`. If you set the `reqmod=false`, the Decoder will generate a request packet and response packets from a single `RESPMOD` message. The default behavior is equivalent to `reqmod=true`

- `client_ip=<string>` - You can configure some ICAP Clients to include the originating IP address in the ICAP headers. The name of the header with this information can vary, so you can use this setting to specify the name of the client IP header. For example, `client_ip=X-Client-IP` would configure the Decoder to extract the IP from the `X-Client-IP` header. Ignoring this setting will disable searching for the header.

(Optional) Data Plane Development Kit Packet Capture

The NetWitness Decoder supports capturing packets through the Data Plane Development Kit, also known as DPDK. DPDK is a set of libraries and drivers that support applications that work on directly on packets. DPDK's web site, www.dpdk.org, provides more information.

Advantages

The Decoder can use the DPDK to ingest packets from Ethernet interfaces. It is an alternative to existing packet capture options built into the Decoder. DPDK offers these advantages:

- It is entirely open source, with no binary-only driver components, unlike PF_RING.
- It is directly supported by multiple vendors, including our main vendor, Intel.
- Since the kernel-level interface is in the mainline Linux kernel, there are no separate driver packages to compile and distribute.
- DPDK devices are completely separate from the Linux network stack, which avoids unintentional interaction between Linux networking and packet capture.
- DPDK is capable of capturing at greater than 10G, unlike the `packet_mmap`.

How it Works

DPDK completely detaches the Ethernet interface from the Linux kernel. It does this by doing the following:

- It uses a Linux User I/O driver mechanism to expose the raw PCI-Express device to normal Linux programs. This means that it can take the raw memory space mapped to the PCI device and expose it, so that a normal Linux program can directly manipulate the hardware. There are a couple of drivers built into the Linux mainline kernel that can accomplish this. Decoder is designed to use `vfio_pci_generic`.

  Note: Only one driver can be attached to an Ethernet interface at a time. When `vfio_pci_generic` is attached to an interface, the Linux network driver for that interface is detached.

- The DPDK provides its own user-space implementation of the hardware drivers for a wide variety of Ethernet cards. When a DPDK application like Decoder is loaded, it can attach directly to the PCI device and manipulate it using DPDK-specific library functions. When a device is attached to DPDK, the Decoder can see it and automatically sets the device up with the DPDK Capture Device option.

Migrate PF_RING Devices to DPDK

For configurations using multiple adapter packet capture (available in 11.5 and later), you must use the manual procedure outlined in Manually Move a Capture Interface to DPDK . For example, the migration (`dpdk migrate`) does not support a Decoder when capture is configured with: `capture.interface=PFRINGZC,em3; PFRINGZC,em4;packet_mmap,em2`.

For configurations prior to 11.5, the procedure that uses the devices parameter to capture from multiple `PF_RING`-supported interfaces (for example, `ixgbe` and `i40e`) will be converted to using DPDK, along with the multiple adapter packet capture, so that one capture thread is used per interface.

For example, the migration will work if configured as follows:

- For multi-interface capture: `capture.interface=PFRINGZC,em3` along with `capture.device.params=device=zc:em3,zc:em4`
- For single interface capture: `capture.interface=PFRINGZC,em3`

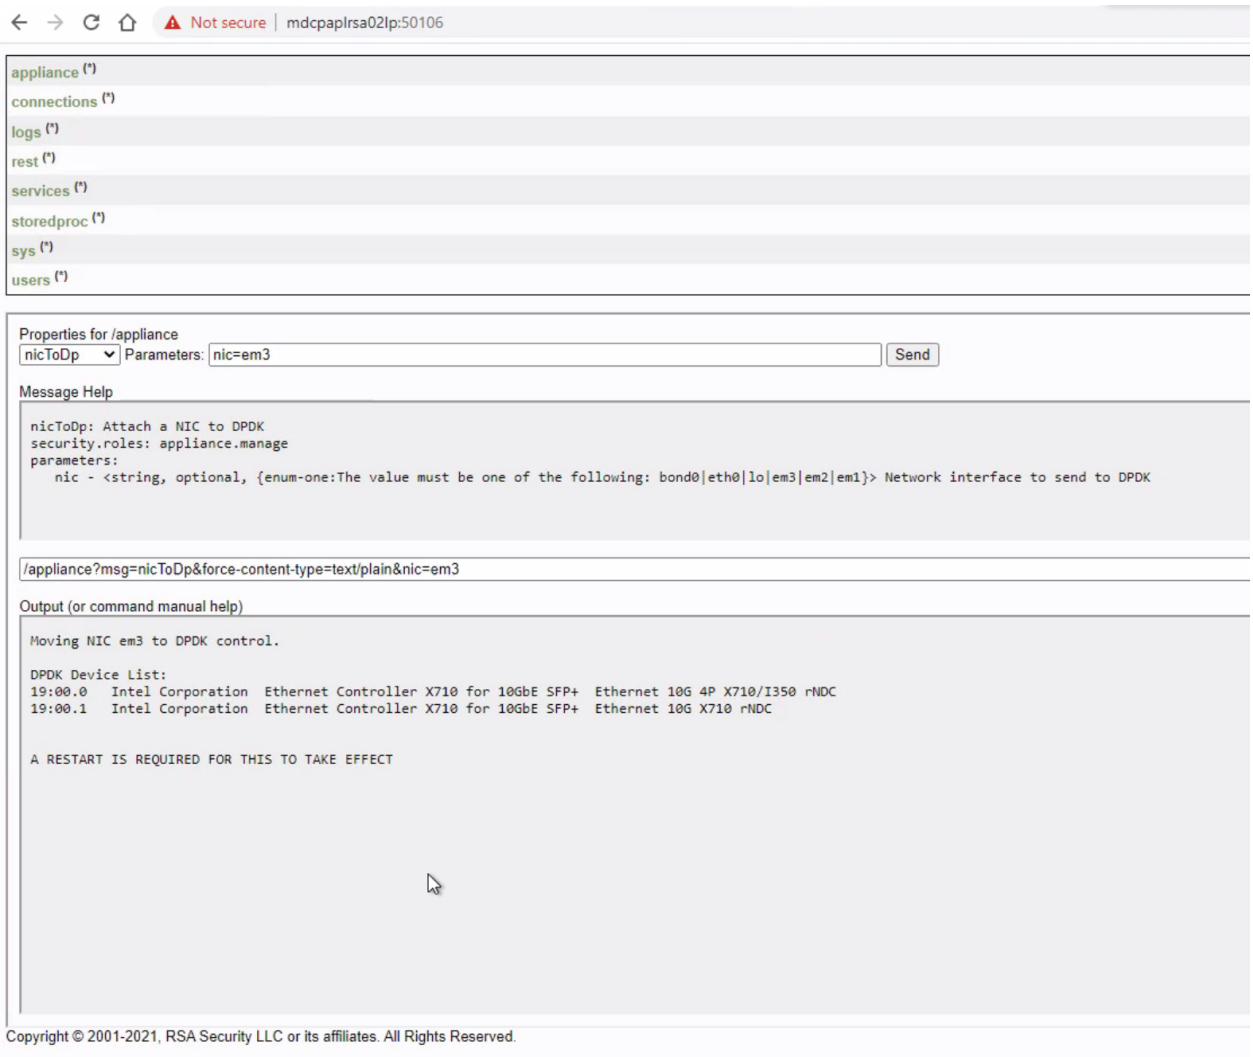
Note: `dpdk migrate` only functions with `PFRINGZC`, not `mmap` interfaces.

If you are using `PF_RING` to capture packets on your Decoder, you can use the Decoder's `dpdk migrate` command to migrate your existing PF_RING capture devices to DPDK. This command uses your currently-selected capture device configuration to determine which network interfaces are moved to DPDK control.

1. Go to  (Admin) > Services and select a Decoder.
2. Click  > **View** > **Explore**, right-click **decoder** and select **Properties**.
3. From the command drop-down list, select the `dpdk` command, type the parameter `migrate`, and click **Send**.

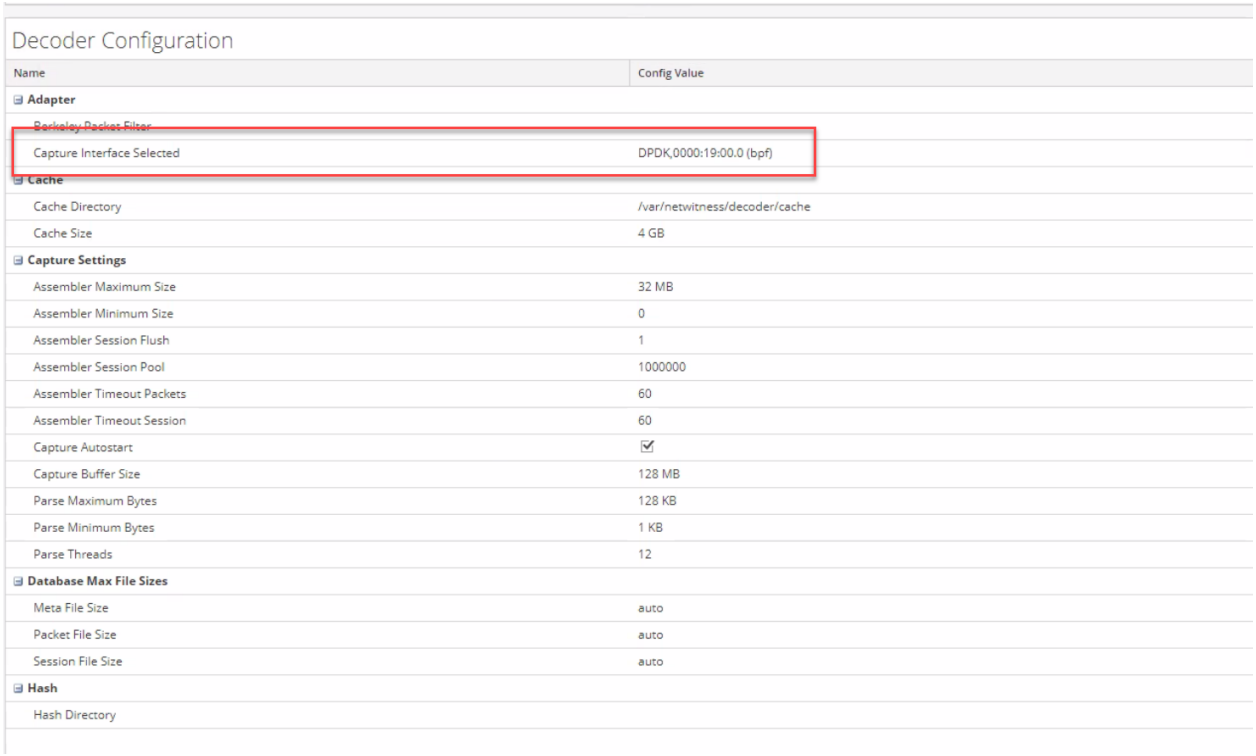
4. In the command output window, the changes that will be made on the Decoder to perform the migration are displayed. If everything looks correct for the migration, add the parameter `commit=1` to the command after `migrate` to actually make the changes on the Decoder.

1. At the reboot prompt, reboot the host to make the driver loading changes.
2. (Optional) Run the `/decoder/devices/<devicename>/msg=prune` command to remove configuration options for devices and interfaces that no longer exist after the migration.



> **Note:** The `prune` command removes only the undetected interface folders. Also, it ignores the `interfaces`, `stats`, `nwimport`, and `flow_events` folders available in `/decoder/devices/`.

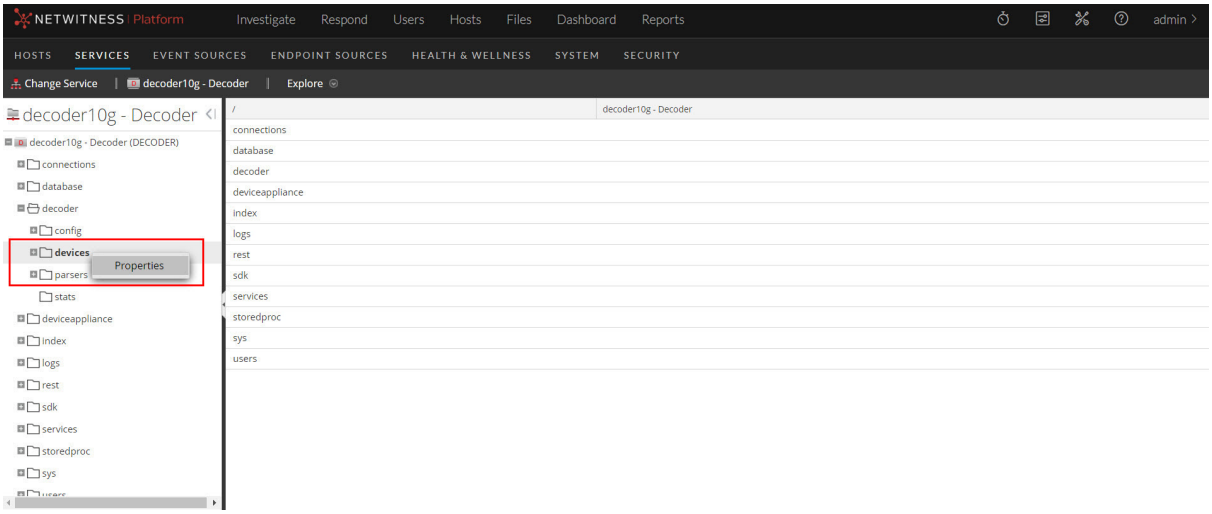
Manually Move a Capture Interface to DPDK



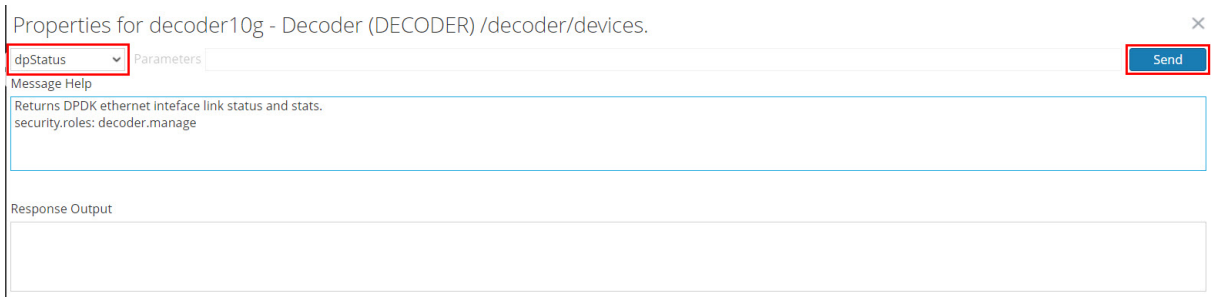
1. Run the new host service command `/appliance/nicToDp`, that converts a named network interface and sends it to DPDK.
   For example, if you provide `nicToDp` an interface name like `p1p1` it detaches it and sets it up for DPDK to use. It does the following:
   a. Identifies the PCI address of the named interface.

   > **Note:** From this point on, the Ethernet interface is identified by its PCI address alone, which is a physical characteristic based on where the Ethernet interface is installed in the computer.

   b. Creates configuration files that describe which PCI addresses DPDK is allowed to use.
   c. Sets up a systemd unit that binds the configured PCI addresses to DPDK instead of to the default Linux drivers on the next system reboot. The following figure shows a successful command.

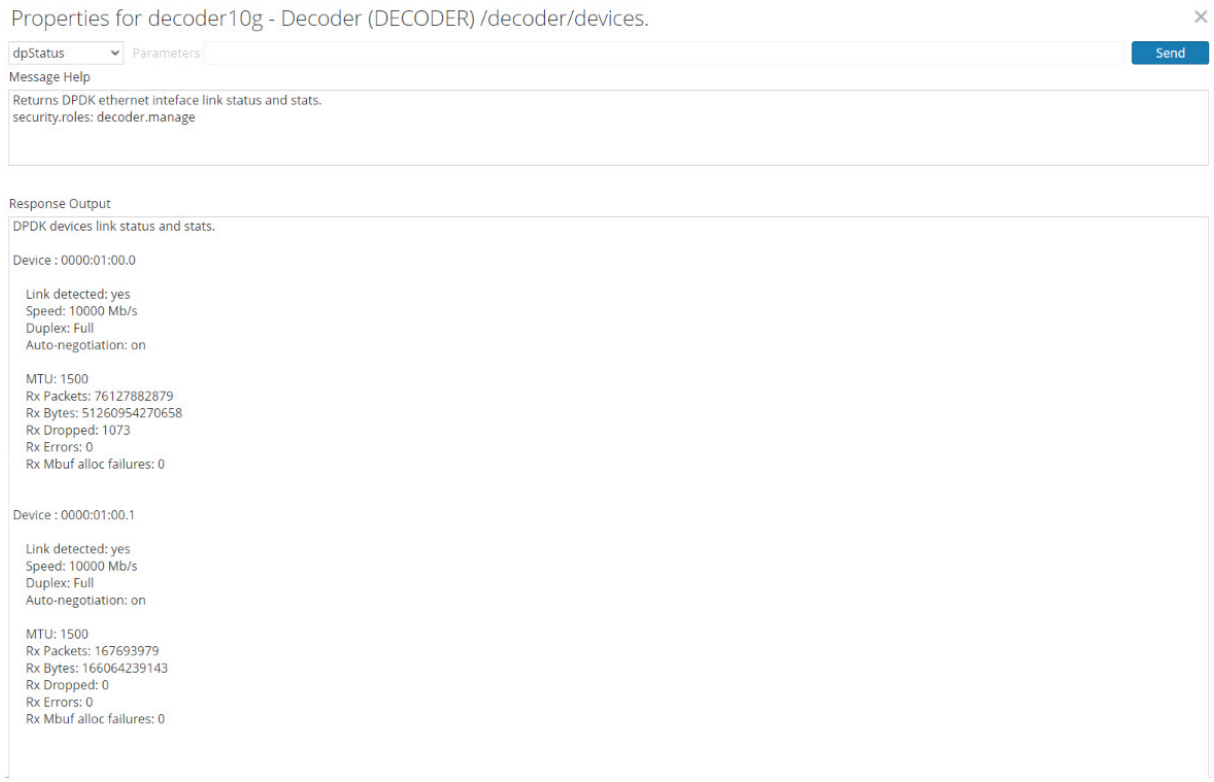


2. Reboot the Decoder host. The reboot accomplishes the following:
   a. Ensures that live capture on the interfaces stops before the network driver is unloaded.
   b. Binds the `vfio_pci_generic` driver to the configured interfaces.
   c. Pre-allocates some Huge Page memory for each interface, as required by the DPDK libraries.
3. After the reboot, the Decoder does not start capturing, since the network interface it had been using to capture has been moved to DPDK. Change the Decoder's capture configuration to select the DPDK device that is now available. For information about how to change the capture configuration, see Configure Capture Settings.
4. Restart the service. The following figure shows the Decoder configuration after a restart.



Check the device status and stats of DPDK interfaces

When you capture using DPDK interfaces, the link status and stats of the DPDK can be obtained using the command `/decoder/devices dpStatus`. The traditional commands like `ethtool` or `ifconfig`, which are used for other capture interfaces, will not fetch the link status and stats of DPDK devices.



1. Go to (Admin) > **Services**.
2. In the Administration Services view, select the Decoder and **View > Explore**.
3. Navigate to **decoder > devices**, right click on **devices** and select **Properties**.

4. Select **dpStatus** from the drop-down and click **Send**.

The link status and stats of DPDK devices are displayed in the **Response Output** section.

Check link status and stats from NwConsole

Run `/decoder/devices dpStatus` on NwConsole. Sample output when capture is in **Start** state:

```
[localhost:56004] /> send /decoder/devices dpStatus
DPDK devices link status and stats.

Device : 0000:01:00.0

    Link detected: yes
    Speed: 10000 Mb/s
    Duplex: Full
    Auto-negotiation: on

    MTU: 1500
    Rx Packets: 416843663
    Rx Bytes: 281110914127
    Rx Dropped: 314
    Rx Errors: 0
    Rx Mbuf alloc failures: 0

Device : 0000:01:00.1

    Link detected: yes
    Speed: 10000 Mb/s
    Duplex: Full
    Auto-negotiation: on

    MTU: 1500
    Rx Packets: 597764
    Rx Bytes: 373053232
    Rx Dropped: 0
    Rx Errors: 0
    Rx Mbuf alloc failures: 0
```

Sample ouput when the capture is in **Stop** state:

```
Device : 0000:01:00.0
Link detected: no
Device : 0000:01:00.1
Link detected: no
```

Utilizing Receive Side Scaling with DPDK

Receive Side Scaling (RSS) efficiently distributes the network receive processing across multiple CPUs in a multi-processor system. RSS ensures that the processing associated with a given connection stays on the assigned CPU.

IMPORTANT: Receive Side Scaling is supported on DPDK devices using the ixgbe or i40e device drivers only.

Advantages

When RSS is enabled, the DPDK capture devices split the incoming packet stream into multiple queues providing following benefits:

- Each queue is processed with a dedicated capture worker thread. As there are more threads processing the capture work, it allows more CPU time available for Berkeley Packet Filters (BPF) rule and network rule evaluation.

- Each capture worker thread can feed multiple assemble worker threads simultaneously which allows more CPU time available for assembly.
- Each CPU thread processes only a fraction of the packet stream. However, the total number of packets processed from all queues working in parallel increases the overall output (packets processed per second) of Decoder.

Configuring Receive Side Scaling

To enable RSS in a DPDK controlled NIC, set the `/decoder/devices/DPDK/(PCI_ID)/config/rss` value to a value greater than `1`. The typical values of RSS must be a small power of 2, for example, `4` or `8`. This value determines the number of CPU threads to be allotted for packet processing during the next capture. Similarly, if assembler threading is enabled, a matching number of assembler threads will be created to process the packets on each incoming queue.

For example, the following sample configuration will utilize a total of eight threads (four capture threads + four assembler threads) for multi-adapter packet capture with DPDK and multi-assembler threading turned on. This is the maximum recommended value for an eight core Decoder CPU.

`assembler.threading.enabled` set to `on` or `true`

```
/decoder/devices/DPDK/0000:01:00.1/config/rss=2
/decoder/devices/DPDK/0000:01:00.0/config/rss=2
```

To minimize packet drops, it is recommended that you keep the total number of capture and assembler threads less than the number of cores per CPU.

How it Works

When RSS is enabled, Decoder utilizes the RSS hardware acceleration on the capture NIC to apply a symmetric RSS hash function. The hash function sends packets from both directions of a given stream to the same queue. It enables the packets received on that queue to be processed by a dedicated assembler thread. This eliminates the need for Decoder to merge streams from different RSS queues and reassemble the streams. Hence, it is recommended that you enable multi-threaded assembly when using RSS. To enable, set `/decoder/config/assembler.threading.enabled` to `true` or `on`.

Configure the Decoder Capture Failover in Load Balance Deployments

The DPDK capture in the decoder service provides the ability for load balancers to failover and avoid data loss when decoder capture is off or when the service is shut down due to maintenance activity. When the decoder capture is stopped, the DPDK capture interface link status is down. This provides the ability for the traffic ingestion physical load balancers (for example, Keysight Ixia, Gigamon) which monitor interface links to switch to a different decoder and avoid data loss.

Configuration Failover on DPDK Capture Interfaces

Refer to the (Optional) Data Plane Development Kit Packet Capture *topic for instructions to configure DPDK capture on the decoder*.

- You can migrate existing PF_RING devices to DPDK

  (Or)

- Manually move capture interfaces to DPDK

Disable Wake On LAN (WOL) in BIOS settings

Some load balancers monitor interface link status through NIC link lights. You must disable WOL as the interface will not be down if WOL is enabled. To disable WOL in the BIOS, follow the BIOS instructions.

Example: f2 -> Device Settings -> "Integrated NIC 1" (capture interfaces) -> "NIC Configuration" -> "Wake on LAN" = Disabled

Note: When you restart the device and if capture does not auto-start, the lights on the capture interface are on. But if you turn on capture and turn it off again the lights will be off.

(Optional) Remove DPDK on Capture Interfaces

In case you need to revert DPDK on capture interfaces you can use the Appliance service `dpToNic` command.

- If you run this command without arguments, it lists the ethernet devices controlled by DPDK.
  - **Example:** /appliance dpToNic

    DPDK Device List:

    82:00.1 Intel Corporation 82599ES 10-Gigabit SFI/SFP+ Network Connection Ethernet Server Adapter X520-2
- If you specify an ethernet interface using the 'eth' parameter, it removes the interface from DPDK so that when the system reboots it will be treated as a normal Linux network interface.
  - Example: /appliance dpToNic eth=82:00.1

    Detaching PCI Device 82:00.1 from DPDK.

    DPDK Device List: A RESTART IS REQUIRED FOR THIS TO TAKE EFFECT

Validate Link Status

- On Capture Start
  - During the decoder capture start, the service logs DPDK interface link status
    - [DPDK] eth dev 0000:05:00.0 link is up
  - On the upstream traffic ingest Load Balancer, the link status would be detected.
    - If it is a Linux-based device, you can use the ethtool <interface name> command to check link status
- On Capture Stop
  - During the decoder capture stop, the service logs that capture is stopped on DPDK interfaces
    - [Thread] Stopped thread: Capture Work (DPDK, 0000:05:00.0) id: 31214
  - On the upstream traffic ingest Load Balancer, the link status would not be detected.
    - If it is a Linux-based device, you can use the ethtool <interface name> command to check link status.

DPDK Interface Configuration and Statistics

- The `dpdk-devbind --status` command displays the status of DPDK and other known network interfaces. It displays the PCI domain, bus, slot, and function, along with a text description of the device.
  - Example: `dpdk-devbind --status`
    - 0000:01:00.0 '82599ES 10-Gigabit SFI/SFP+ Network Connection 10fb' drv=vfio-pci unused=ixgbe_zc
    - 0000:01:00.1 '82599ES 10-Gigabit SFI/SFP+ Network Connection 10fb' drv=vfio-pci unused=ixgbe_zc
- The default MTU is 2048. If you need to adjust the MTU for capture, add the `snaplen` parameter to `/decoder/config/capture.device.params` .
- VLAN offload is disabled.
- The DPDK interface capture stats are updated under /decoder/devices/dpdk/
  - Example: /decoder/devices/DPDK/0000:01:00.1/stats/
    - Received packets (Rx packets) - capture.received
    - Received bytes (Rx bytes) - capture.total.bytes
    - Received dropped (Rx dropped) - capture.dropped

For information on checking device status and stats of DPDK interfaces, refer to Check the device status and stats of DPDK interfaces

(Optional) Preserve VLAN Tags When Using the Packet MMAP Capture Interface

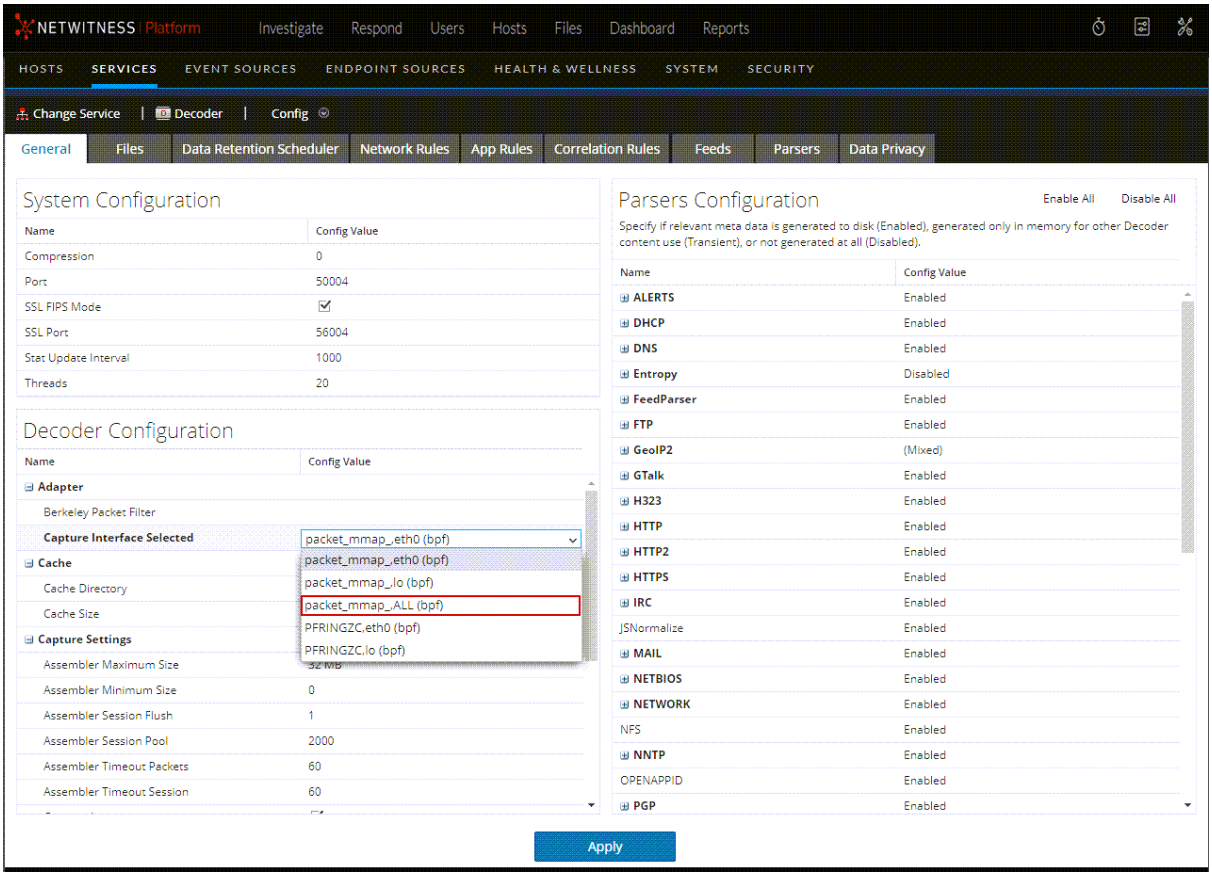
When capturing traffic containing VLAN tags, you may need to configure the Packet MMAP capture interface to preserve the VLAN tags in the packets (VLAN fixup). By default, the network capture hardware removes the tags. Performing this procedure preserves the tags in the packets, and the tag values are parsed into VLAN meta data for further analysis.

There are two mechanisms for enabling the VLAN fixup.

- Option 1: Set `vlan-fix=true` within `capture.device.params`. This option performs the VLAN fixup on all traffic entering the Decoder. This option is appropriate in most cases, since it is assumed that all the traffic will be VLAN tagged.This mechanism works on either single-interface mode, or on all-interfaces mode. This option overrides the VLAN fixup settings on individual interfaces; even interfaces that are not configured to do VLAN fixup will have the feature enabled.
- Option 2: Use the `interfaces` parameter within `capture.device.params` on a per-device basis. The `interfaces` parameter accepts a comma-separated list of interface names on which to capture packets. By adding `:vlan` to an interface name, you can enable the VLAN fixup on individual

interfaces. If the interface does not have the `:vlan` suffix added, then it will not perform the VLAN fixup.

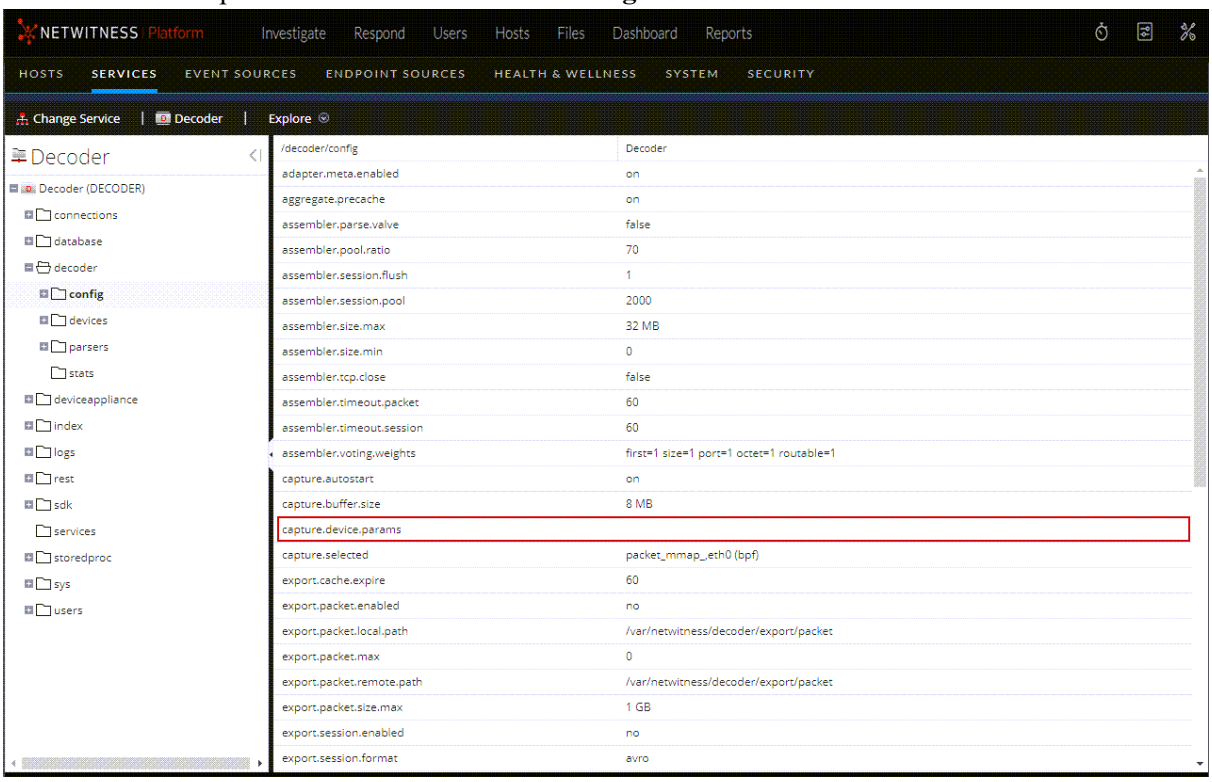
After editing this parameter, you must restart capture on the Decoder in order for changes to `capture.device.params` to take effect.



These are `vlan` examples of both options. If you need to pass multiple settings for `capture.device.params`, use the following synax. Notice that quotes are needed to delineate whitespace. For more information about how to use quotes for whitespace, see the "Connecting to a Service" topic in the *NwConsole User Guide for NetWitness Platform*.
`name1="value1" name2="value2"`.

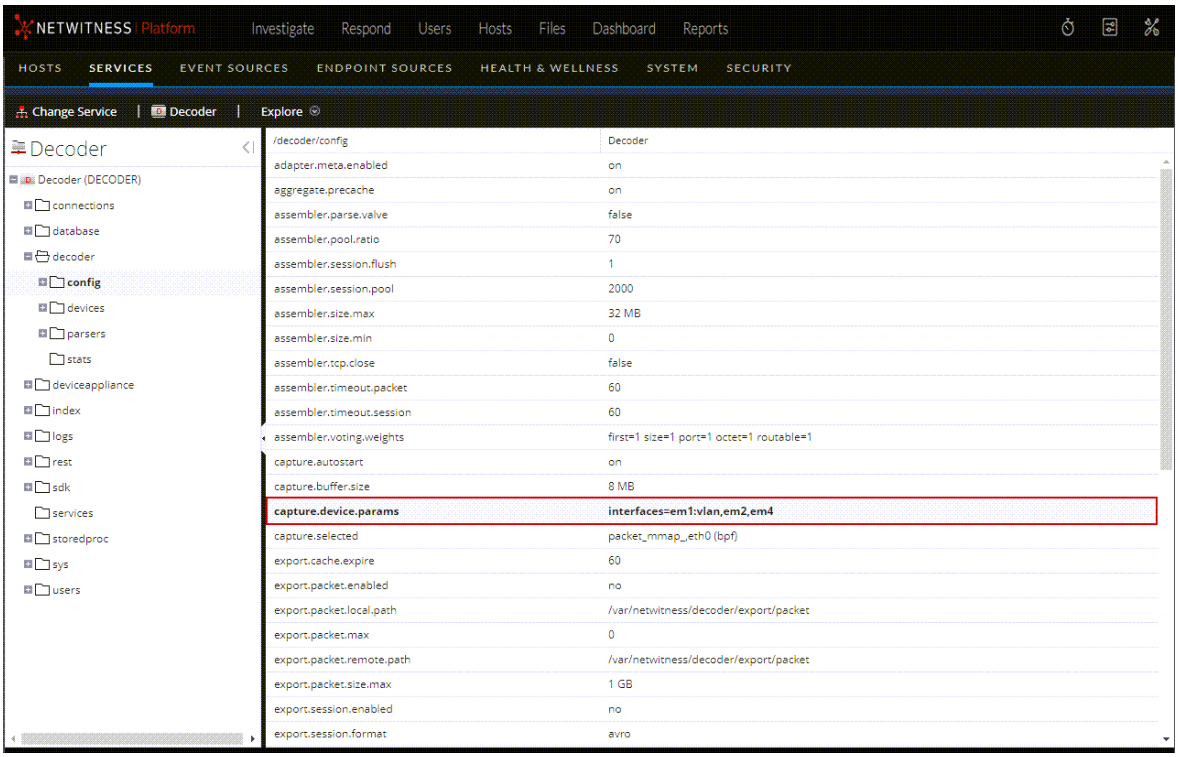
Parameter	Value	Effect
`capture.device.params`	`vlan-fix=true`	VLAN fixup always performed on all interfaces. The default value is `vlan-fix=false`.
`capture.device.params`	`interfaces=eth0:vlan,eth1`	VLAN fixup performed on traffic capture on `eth0` interface only
`capture.device.params`	`interfaces=eth0:vlan,eth1 vlan-fix=true`	VLAN fixup always performed because the `vlan-fix` setting overrides the interfaces setting.

To configure the `packet_mmap_` adapter to preserve the VLAN tags in packets:



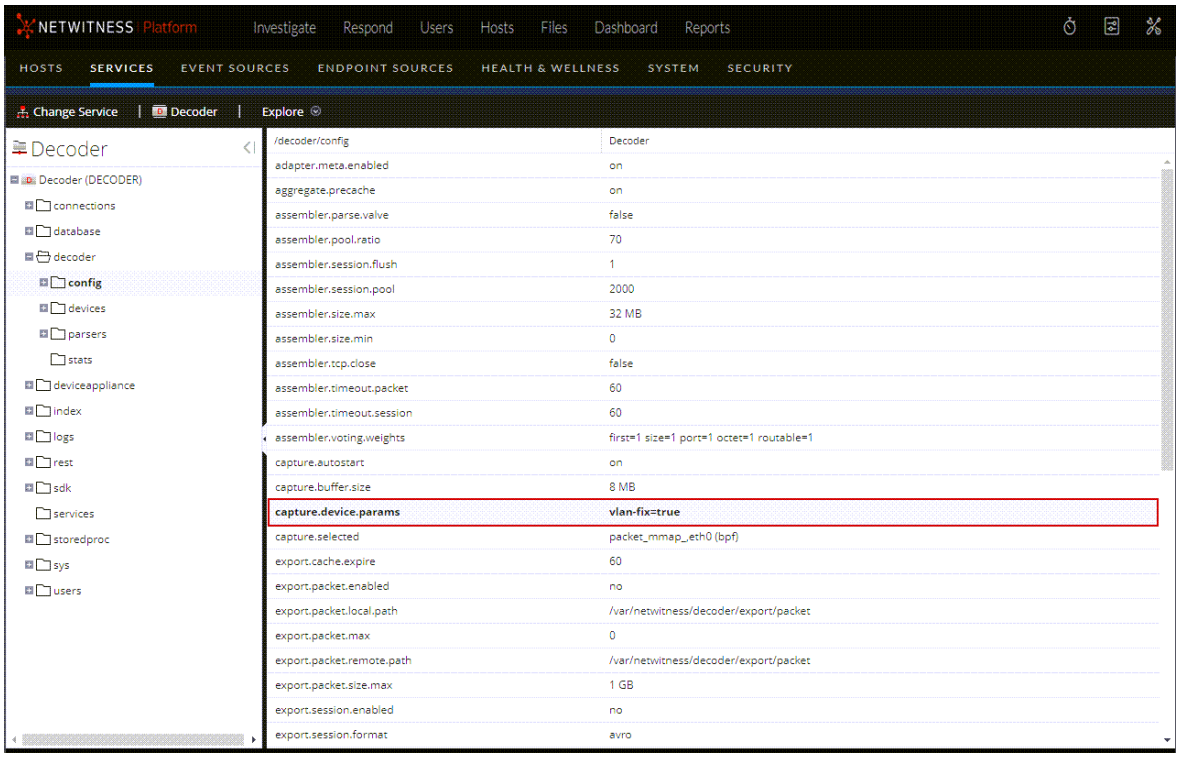
1. Go to  (Admin) , select the Decoder service and  **> View > Config.**

2. In the **Decoder Configuration** panel, set **Capture Interface Selected** to the `packet_mmap_,ALL` adapter.



3. To go to the **Explore** view, click **Config** in the toolbar and select **Explore** in the drop-down list.

4. In the Services Explore view select **decoder** > **config**.



5. Click in the values column next to `capture.device.params`, and do one of the following:

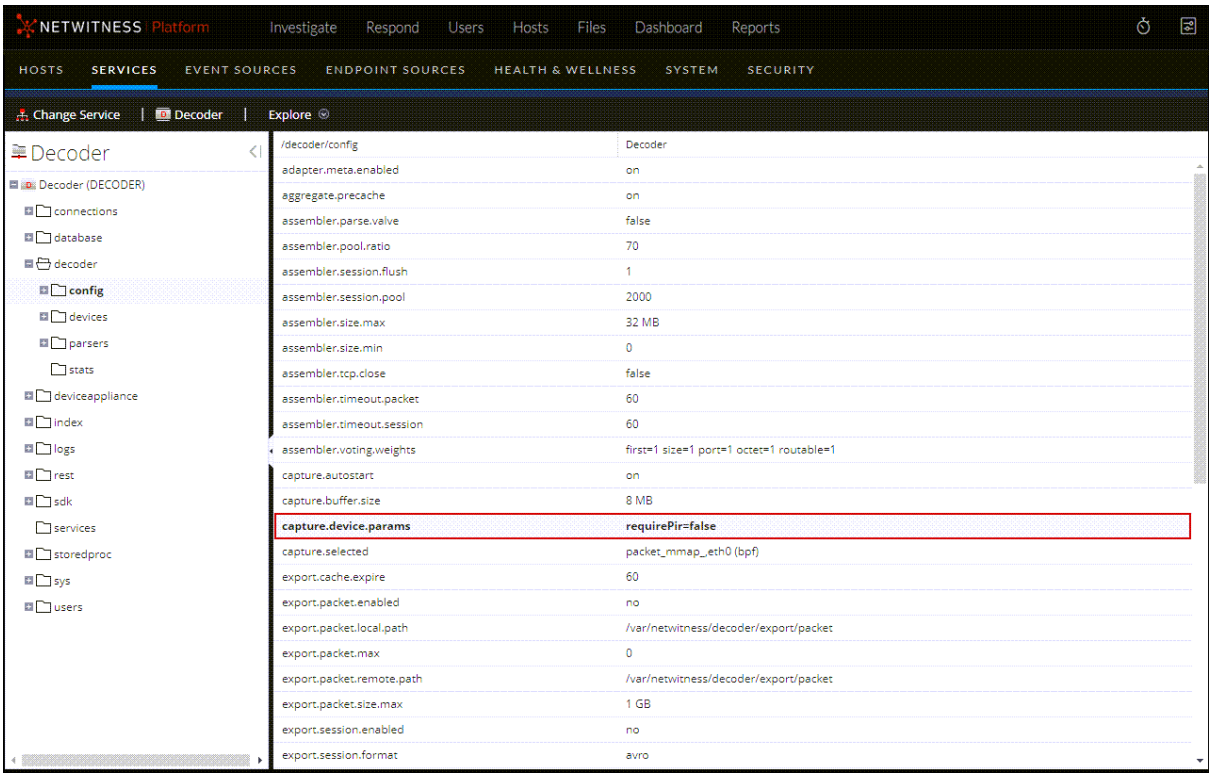
   - To preserve VLAN tags on an interface in the interfaces list, add **`:vlan`** after the interface name and press **Enter**.
     For example, this specifies that VLAN tags are preserved on `em1`, but not on `em2` and `em4`:
     `interfaces=em1:vlan,em2,em4`

The change goes into effect after restarting capture; only traffic on `em1` has the VLAN tags preserved.

- To preserve VLAN tags on all interfaces, enter the following and press **Enter**:
  `vlan-fix=true`

VLAN tags are preserved on all capture interfaces.

6. Select Start Capture (Start Capture). The change takes affect after capture is restarted.



(Optional) Process Raw Syslog Data without Priority Field

You have the option to process raw syslog data that does not contain a valid priority (`PRI`) field.

To configure a Log Decoder to process syslog without a Priority field:

1. Go to (Admin) > **Services**, select the Log Decoder service and > **View > System**.
2. Select Stop Capture (Stop Capture).
3. From the drop-down menu, where System is shown, select **Explore**.
4. Select **decoder** > **config**.
5. In the `capture.device.params` field, add the following text, and then click **Enter** to save the changes:

   `requirePri=false`

6. From the drop-down menu, where Explore is shown, select **System**.
7. Select Start Capture (Start Capture). The change takes affect after capture is restarted.

(Optional) Configure Decoder to Support OpenAppID

The NetWitness Decoder can identify applications using the OpenAppID detectors. OpenAppID from Cisco is an application-layer network security plug-in for Snort (an open source network intrusion detection system). It is a set of open source Lua libraries (detectors) that identifies applications in the network traffic.

When Network Decoder detects an application with an OpenAppID detector, the `appid` meta is created. The value of the `appid` meta helps in identifying the application as it is the application's entry in the `appMapping.data` file. The `appMapping.data` file is part of the OpenAppID distribution and contains metadata of the application detectors.

Note: By default, all detectors are disabled to avoid any negative impact on the performance.

To configure the OpenAppID detectors:

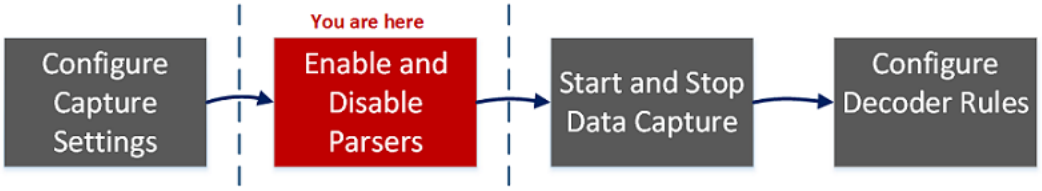
IMPORTANT: Ensure that you enable only the required OpenAppID detectors. Enabling all the OpenAppID detectors can reduce the performance. Before you enable any detector, understand your application detection requirements and enable only the specific detectors. For example, enabling the `service_*` detector or any other detector that attempts to match short generic patterns can cause severe impact on the performance.

1. Download the OpenAppID source package (`snort-openappid.tar.gz`) from the Snort Downloads (https://www.snort.org/downloads) page.
2. Upload the OpenAppID source package to the network decoder (`http://<networkdecoder>:50104/decoder/parsers/upload`), which can be accessed using the REST interface.
   Once uploaded, decoder will extract the package to an appropriate folder. The default folder is `/etc/netwitness/ng/odp`.
3. To enable detectors, modify the `/decoder/parsers/config/openappid.enabled` file with a combination of detector filenames or wildcards, separated by commas. For example, `client_*, payload_slashdot.lua, payload_reddit.lua`.
   The following table describes the detector group filenames and their functions. You can extract the complete set of detectors from the OpenAppID source package (`snort-openappid.tar.gz`) or it can be viewed on the Decoder file system at `/etc/netwitness/ng/odp/lua`.

Detector Group Filename	Description
`client_*`	Detectors for client applications (for example, Facebook, MacAppStore).
`content_group*`	Detectors for a specific type of network attribute such as protocol, port, or service (for example, port_services which contains many services identified by their common ports).
`payload_*`	Detectors for the host based traffic (for example, Hulu, Reddit).
`service_*`	Detectors for service applications (for example, Minecraft, VNC).
`ssl_host_group_*`	Detectors for SSL hosts logically grouped together (for example, 334 which contains many ecommerce websites).

4. Ensure that you specify the detector filenames correctly. If you specify an incorrect filename, the detector will not load. The following table lists some good and bad file naming conventions and their status on subsequent loading.

Detector Group Filename	Status
`client_9P.lua`	loaded
`client_9p.lua`	not loaded (Linux only)
`client_9P`	not loaded
`client_9P*`	loaded
`client_`	loaded



Detector Group Filename	Status
9P.*	
lient_ 9P.lua	not loaded
lient_ 9P.*	not loaded
*lient_ 9P.lua	loaded

5. Once the required detectors are enabled, reload the parser to load the detectors. The following example message will confirm that the detectors and enabled successfully.
```
2020-May-14 17:03:37 [OpenAppID] 59 detectors loaded out of 59
```

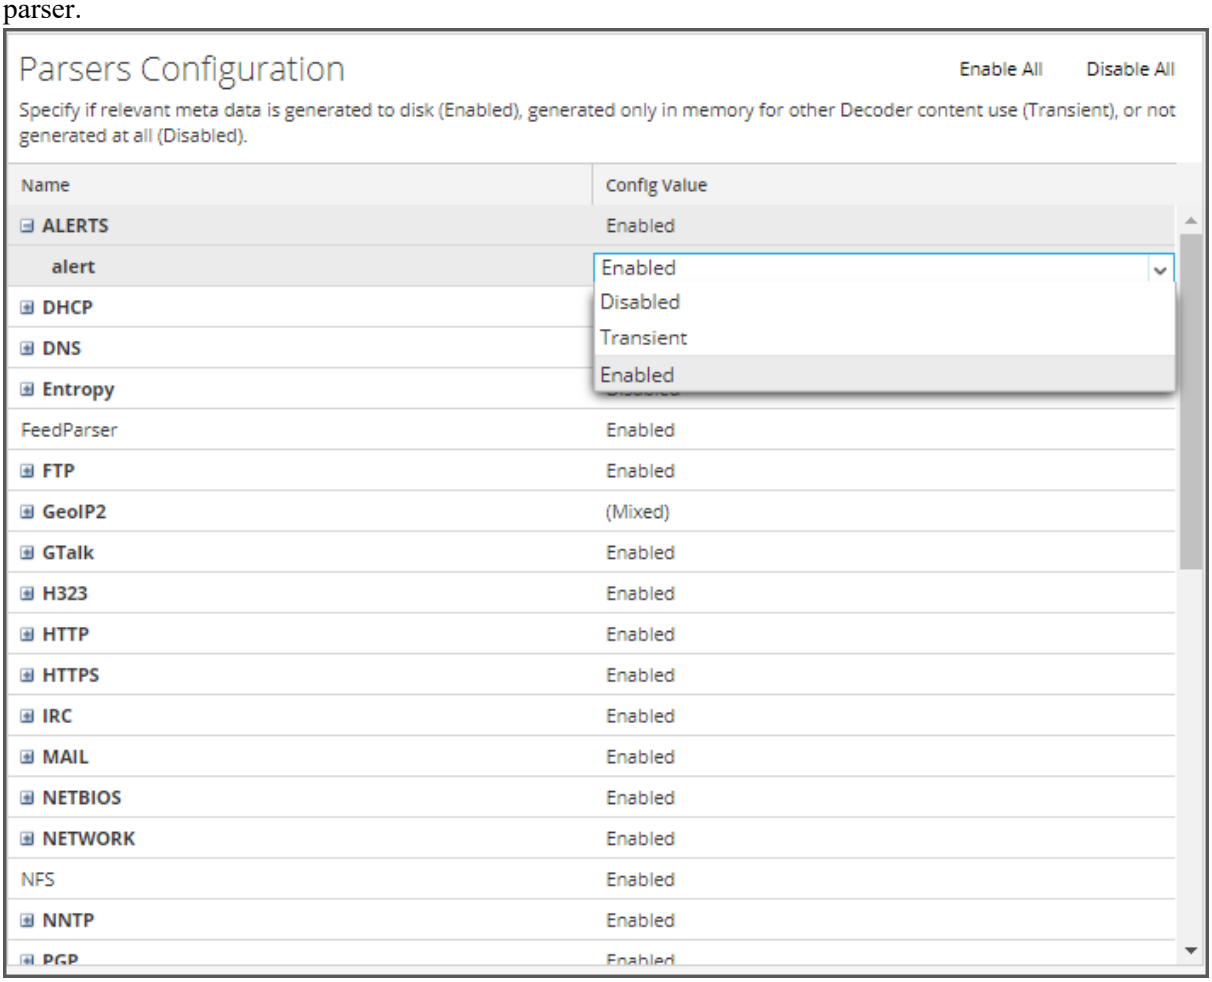
Enable and Disable Parsers and Log Parsers

Administrators can see which parsers have been downloaded from Live and deployed on a Decoder or Log Decoder, see which of these have been enabled, and enable or disable parsers and log parsers.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup.

You should only download and deploy the parsers you need for the following reasons:

- There is an impact on performance as you increase the number of deployed parsers.
- The more parsers you deploy, the more meta data created, which impacts data retention.
- Not having extra (unnecessary) log parsers deployed reduces the potential for mis-identification of messages.



The Parsers Configuration panel provides a way to select parsers to use on the Decoder. Within some parsers, you can also configure the metadata that the parser creates. These are the options in the Parsers Configuration panel.

Option	Description
Enable All **Disable All**	These options provide a way to quickly select either all parsers or no parsers.
Name	The names of parsers available to the Decoder. A plus sign indicates that the metadata generated by the parser is configurable. Clicking the plus sign displays the metadata that the parser can create.
Config Value	A drop-down list changes the setting for the parser or metadata to **Enabled**, **Disabled**, or **Transient**. • When **Enabled**, the Decoder is using the parser to filter traffic. • When **Transient**, the Decoder is using the parser to filter traffic, and the generated metadata is not stored on disk. The transient metadata is available in memory to additional content (that is, parsers, feeds, and application rules) on that Decoder. This helps administrators to protect certain data and is usually done as part of a data privacy plan (see the *Data Privacy Management Guide*). • When **Disabled**, the Decoder is not using the parser. If the generated metadata for the parser is configurable, clicking the plus sign to expand the parser displays configurable meta keys and the same drop-down list selects the meta key the parser will create.

Note: For a Log Decoder, you must have previously deployed log parsers from Live. See the **Find and Deploy Live Resources** topic in the *Live Services Management* Guide for details. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

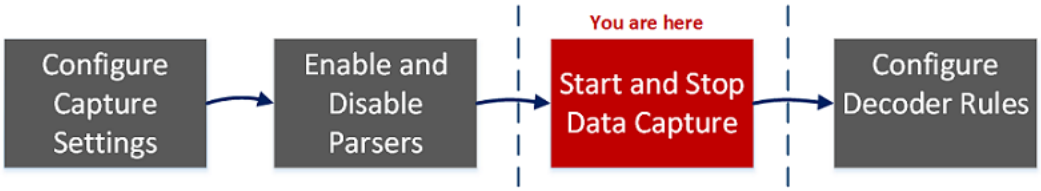
To enable or disable a parser, or to view the status for each parser:

1. Go to (Admin) > **Services**.
2. In the **Administration Services view**, select a Log Decoder or a Decoder, and **>View** > **Config**.
3. In the **Parsers Configuration** panel, look for the Decoder parser or the Log Decoder event source parser.

4. In the **Config Value** column, note the current status for your parser.

   You can update the status of any individual parser by selecting its **Config Value** and selecting **Disabled**, **Transient**, or **Enabled** from the drop-down menu. Alternatively, you can select **Enable All** or **Disable All** to update the status for all of your log parsers at once.

5. Click **Apply**.



When you click **Apply**, note that all parsers are reloaded into NetWitness. The status for each parser is updated, based on your selections.

Start and Stop Data Capture

When a Decoder starts up, it automatically begins aggregating data if **Capture Autostart** is enabled. When autostart is not enabled, you can start and stop data capture manually.

Note: The Capture Configuration Settings in the Service Config view for a Decoder determine whether Capture Autostart is enabled.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup. You may want to stop and start capture at other times, for example, before you shut down the service.

To start and stop capture:

1. Go to (Admin) > **Services**.
2. Select a Decoder or Log Decoder service, and select **> View > System**.
3. In the toolbar, click **Start Capture**.

   If the service is a Decoder, it begins capturing packets. If the service is a Log Decoder, it begins capturing logs.

   When packet or log capture is in progress, the option in the toolbar changes to **Stop Capture**, and the option to upload a file is unavailable.
4. Whenever you want to discontinue traffic capture on a Decoder, click **Stop Capture**.

   Packet or log capture ceases, and the option to upload a file to the service is again available.

Note: When you stop the Log Decoder service while capture is running, all events currently in Log Decoder memory will be processed and persisted. Should an issue arise where it is necessary to quickly shutdown the service, use the Services Explore view to stop capture (`/decoder stop`), passing the parameters `flush=false` before stopping the Log Decoder service. For further information, see the "Services Explore View" in the *Host and Services Getting Started Guide*.

Configure Decoder Rules

This topic provides procedures for creating and managing rules for Decoder or Log Decoder traffic capture in the **Services Config view** > **Rules** tabs . Services Config View - Rules Tabs provides details about the Rules tab options.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup.

Capture rules can add alerts or contextual information to sessions or logs. They can also define which data is filtered out by a Decoder or Log Decoder. Rules are created for specific metadata patterns, which result in predefined actions when matches are found. For example, to keep all traffic that fits certain criteria, but discard all other traffic, you can create a rule to perform the necessary actions. When applied, rules affect both packet capture file importing, as well as live network capture.

Rule and Query Guidelines provides guidelines that all queries and rule conditions in NetWitness Core Services must follow.

By default, no rules are defined when you first install NetWitness. Until rules are specified, the packets are not filtered. You can deploy the latest rules from Live. You can define three types of rules: Network Rules, Application Rules, and Correlation Rules.

- Network rules are applied at the packet level and are made up of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied to the Decoder. Rules can be applied to multiple layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules are only available on Network Decoders.
- Application rules are applied at the session level. If the first rule listed is not a match, the Decoder then attempts to match the next rule listed, until a match is found.
- Correlation rules are applied over a configurable sliding time window. When a match is found, the service creates a new super session that identifies other sessions that match the rule, then creates a session list for analysis.

The two most common uses of rules are:

- To alert, and thereby create a custom alert meta value, when certain conditions are found.
- To filter out certain types of traffic that do not add value to the analysis of the data.

Groups of capture rules form rule sets, which you can import and export. This feature enables use of multiple rule sets for various scenarios. You can import the exported rule set, in the form of an .nwr file, to other NetWitness services, simplifying the deployment and configuration of multiple services.

Rule Processing

These are the principles governing capture rule processing:

- Multiple rules can be applied to the Decoder.
- Capture rules are executed one after the other, in sequence.
- Rule processing stops when all rules are processed or after a rule configured to stop rule processing is matched.
- A default rule can be used to either include or exclude all traffic not otherwise selected by a rule. A default rule, if used, must always be placed at the bottom of the rule list. Otherwise, rule processing stops as soon as the default rule is evaluated since, by definition, all traffic is selected by the default rule.
- When rule processing stops, the session is saved using the configured session options and debug options.

Rule and Query Guidelines

All queries and rule conditions in NetWitness Core services must follow these guidelines:

All string literals and time stamps must be quoted. Do not quote numbers, MAC, or IP addresses.

- `extension = 'torrent'`
- `time='2015-jan-01 00:00:00'`
- `service=80`
- `ip.src = 192.168.0.1`

Note: The space on the right and the left of an operator is optional. For example, you can type a rule as `service=80` or `service = 80` .

Rule Examples

The following table shows examples of rule conditions. You can use rule conditions for log retention collections in an Archiver and for application, network, and correlation rules on a Decoder, Log Decoder, or Concentrator. Rule conditions are also used in all `WHERE` clauses in all Core database queries.

For detailed information on rule syntax in NetWitness, see "`WHERE` Clauses" in the "Queries" section of the *Core Database Tuning Guide* .

Rule Name	Condition
ComplianceDevices	`device.group='PCI Devices' || device.group='HIPPA Devices'`
HighValueWindows	`device.group='Windows Compliance'`
MediumValueWindows	`device.type='winevent_nic' && msg.id='security_4624_security'`

Rule Name	Condition
LowValueWinLogs	`device.type='winevent_nic' && msg.id='security_4648_security'`
LowValueProxyLogs	`device.class='proxy' && msg.id='antivirus_license_expired'`
GeneralWindows	`device.type='winevent_nic'`

Invalid Rules

NetWitness uses a rule parser that strictly defines valid syntax for rules and queries. When a Core service encounters invalid syntax, it writes a warning in the NetWitness logs indicating the error.

Note: NetWitness 11.x does not support parsing of legacy syntax rules (as version 10.6 did). After you update to NetWitness 11.x, rules with invalid syntax are highlighted in the user interface, and no rules will be applied until the invalid rules are corrected. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. See Fix Rules with Invalid Syntax.

The `/decoder/config/rules/rule.errors` and `/concentrator/config/rules/rule.errors` stats, contain the count of rules with errors. If `rule.errors` is nonzero, NetWitness generates a Health and Wellness alert to indicate that you need to fix the rules.

General Syntax Guidelines

- All text values must quote literal values. Example: `user = 'user1'`
- Quotes can use single or double quotes; but they must match. (You cannot start with a single quote and finish with a double quote.)
- If the literal value has a quote, you can escape it using double quotes. Example: `user = "User's"`

The following are valid syntax rules:

- All time values should use quotes for dates in this form: `time = 'YYYY-MM-DD HH:MM:SS'`
- All time values that are the number of seconds since EPOCH (Jan 1, 1970), should not be quoted. Example: `time = 1448034064`
- Everything else is unquoted: IP addresses, MAC addresses, numerics, and so on. Example: `service = 80 && ip.src = 192.168.1.1/16`

Capture Rule Syntax

Capture rules compare fields to values or to other fields. This is an example of a simple expression with a meta key on the left side of the operator and a value on the right side.

```
ip.dst=192.168.1.1
```

The syntax allows a meta key on the right side of the operator in Decoders and Log Decoders for application and network rules. Meta key comparison does not apply in the `where` clause in queries. This is an example of a simple expression with a meta key on the left side of the operator and a meta key on the right side.

```
ip.src=ip.dst
```

Rules that include a meta key comparison support renamed meta keys; if a rule queries a meta key that has been renamed, the rule is parsed for the renamed meta key. For example, if the meta key `ip_dst` is used in a rule, it is transparently mapped to the renamed meta key: `ip.dst`. Existing rules that include original keys will trigger alerts that include data for the renamed meta key.

This is an example of a rule that finds packets having the same `ip.src` address and `ip.dst` address on a Decoder, and generates an alert on the Concentrator.

```
alert=ioc name=testRule8 rule="ip.src=ip.dst" order=38
```

This rule would generate an error because `eth.src` and `ip.src` are incompatible formats.

```
rule="eth.src=ip.src" name="testRule99" alert=ioc
```

Values can be expressed as discrete values, a range of values, an upper or lower bound, or a combination of these three. You can create a greater than or less than comparison, and test equality or inequality against a range of values or an upper/lower bound.

`key 0-5` (a range of values)

`key = 0-u` is the same as `key >= 0` (upper bound, greater than or equal to)

The following table summarizes the operators on meta keys.

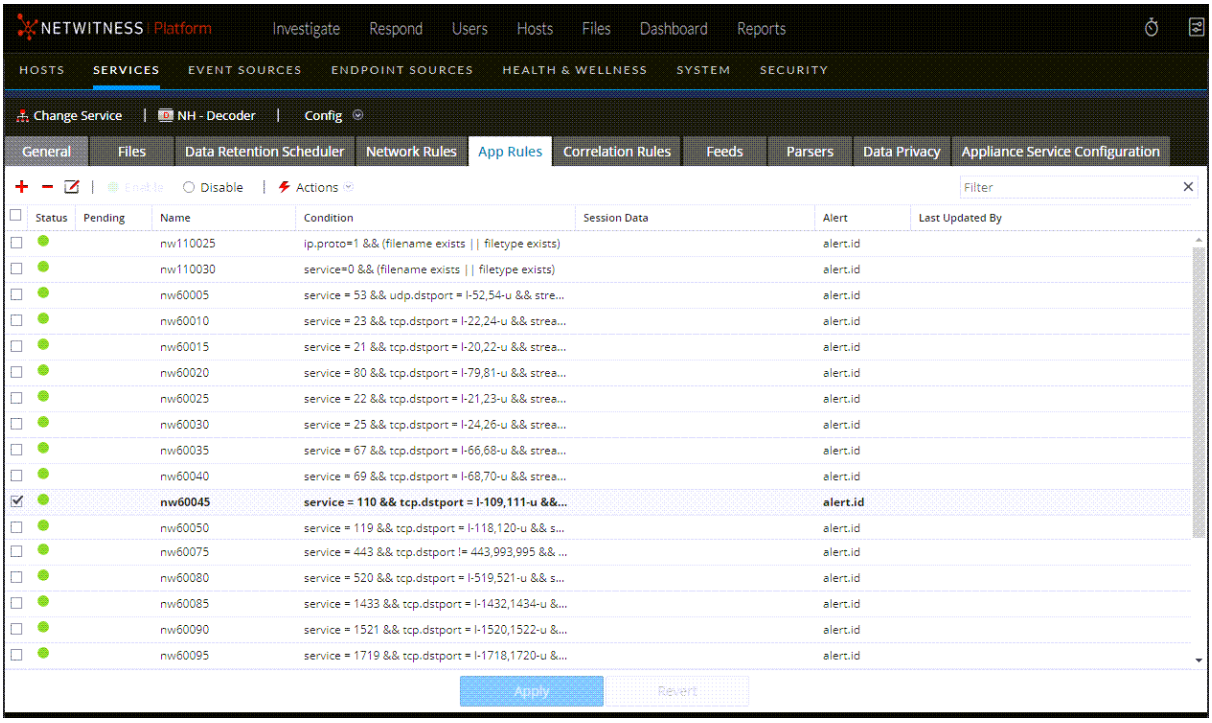
Left Operand Format	Operator	Right Operand Format	Description
any	=	compatible with left operand	Equality operator. You can use values or meta keys on the right side of the equality operator.
any	!=	compatible with left operand	Inequality operator. You can use values or meta keys on the right side of the inequality operator.
any	<	compatible with left operand	Less than operator. You can use values or meta keys on the right side of this operator.

Left Operand Format	Operator	Right Operand Format	Description
any	`<=`	compatible with left operand	Less than or equal to operator. You can use values or meta keys on the right side of this operator.
any	`>`	compatible with left operand	Greater than operator. You can use values or meta keys on the right side of this operator.
any	`>=`	compatible with left operand	Greater than or equal to operator. You can use values or meta keys on the right side of this operator.
text	`contains`	text	Find values that contain the right operand. You can use meta keys or values on the right side of this operator.
text	`begins`	text	Find values that begin with the right operand. You can use meta keys or values on the right side of this operator.
text	`ends`	text	Find values that end with the right operand. You can use meta keys or values on the right side of this operator.
text	`length`	integer	Find strings of a certain length. You can use meta keys or values on the right side of this operator.
any	`count`	integer	Find values with a specific number of occurrences within the session. You can use meta keys or values on the right side of this operator.
any	`ucount` and `unique`	integer	Finds a number of uniquely occurring values. You can use meta keys or values on the right side of this operator. For example, if the results include instances of a meta key with five unique values and three of the same value, the `ucount` is six.
N/A	`exists`	any	Finds any values for the meta key. You can use meta keys or values on the right side of this operator.
N/A	`!exists`	any	Finds any sessions in which the meta key does not occur. You can use meta keys or values on the right side of this operator.
text	`regex`	text	Finds values matching a regular expression. You can use values on the right side of this operator.

The following table summarizes other syntax elements used in rules.

Syntax element	Description
*	Default rule. By using an asterisk (*) as the sole character in a rule, that rule will select all traffic.
u	Upper bound of a range of times, IP addresses, or numeric formats. For example, to select all TCP ports above 40000, the syntax would be: `tcp.port = 40000-u`
l	Lower bound of a range of times, IP addresses, or numeric values. For example, to select all TCP ports below 40000, the syntax would be: `tcp.port = l-40000`
- (dash)	Denotes a range. This is only applicable to time values, IP or MAC addresses, or numeric values. Separate the lower and upper bounds of the range with a dash (-) character. For example, to select TCP ports between 25 and 443, the syntax would be: `tcp.port = 25-443`
, (comma)	Denotes a list of ranges or values or meta keys. Single values may be used as well as any combination of ranges and upper or lower bounds. Single meta keys may be used in a list. Meta keys and literal values cannot both appear on the right-hand side of an operator. For example, the following is valid syntax: `tcp.port = 1-10,25,110,143-225,40000-u`
( )	Grouping operator. An expression can be enclosed in parentheses to create a new logical expression. For example, the following would select traffic on port 80 to/from 192.168.1.1 OR traffic on port 443 to/from 10.10.10.1: `(alias.ip=192.168.1.1 && tcp.port=80) || (alias.ip=10.10.10.1 && tcp.port=443)`
~	Logical NOT operator, a negation of an expression.
&&	Logical AND operator, a conjunction of two expressions.
||	Logical OR operator, a disjunction of two expressions.

Configure Capture Rules



The Decoder and Log Decoder rules are editable in the Services Config view. While each type of rule (network, application, and correlation) has its own tab; the functions are similar for all types of rules. You can:

- Add, edit, and delete rules
- Enable and disable rules
- Change the execution sequence of rules
- Import rules from a file
- Export rules to a file

- Push rules to another service
- Revert or apply rule changes
- Restore one of the last ten rule configurations from a snapshot

To configure rules in the Rules tabs

1. Go to (Admin) > **Services**.
2. In the **Services** view, select a Decoder service and > **View** > **Config**.
3. In the **Services Config** view, select one of the Rules tabs: Network Rules, App Rules, or Correlation Rules.
   The rules list for the selected rule type is displayed.

Each type of rule has a list with slightly different columns and different parameters. Several basic guidelines apply to all rule management activities:

- The rules are executed in the sequence they are displayed in the list. To change the execution sequence of rules, drag and drop rules to the appropriate location in the list or use the context menu options to arrange the rules in the list.
- To select a single row, click the row.
- To select a group of adjacent rows, click the first, then shift-click the row at the end of the group.
- To select multiple non-adjacent rows, click the first, then control-click the others.
- When editing rules in the Rules tab, you must apply the configuration changes in order to activate.
- Until changes are applied, you can discard edits to the list and revert to the unedited rules.

- Once rules are applied, you can recover the last ten rules configurations using the **History** option in the **Actions** menu.

To add a rule in any Rules tab, do one of the following:

- Click  .
- Right-click a rule, and select **Insert Above** or **Insert Below** from the context menu.
  The Rule Editor dialog for that type of rule is displayed.

To remove a rule:

1. From any Rules tab, select the rules to remove from the rules list.
2. Click .
   The selected rules are removed from the list, but still exist on the service.

To edit a rule

1. From any Rules tab, select the rule to edit.
2. Click  or double-click the rule row.
   The Rule Editor dialog for that type of rule is displayed.

To disable a rule:

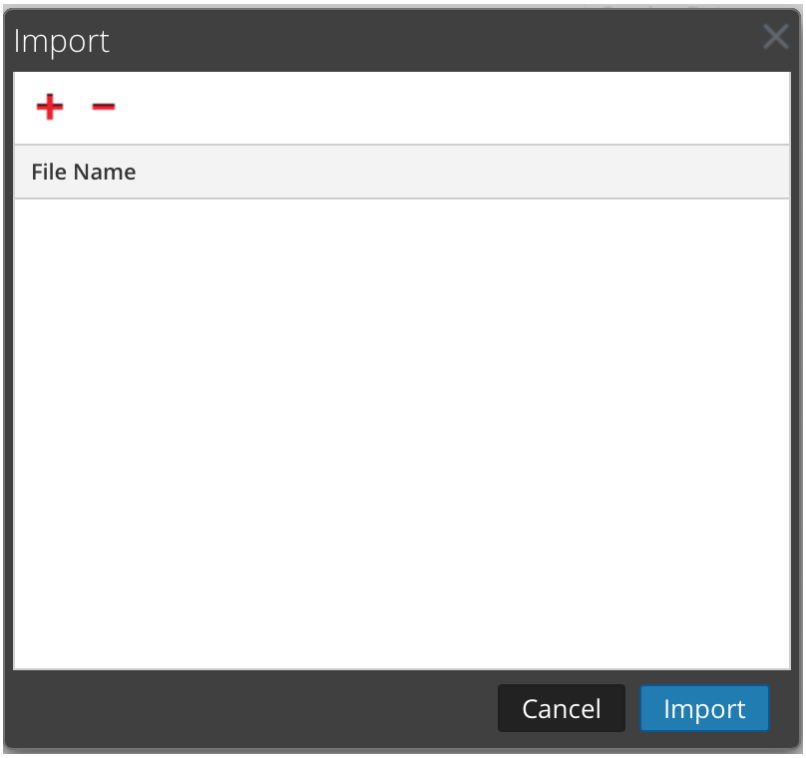
1. From any Rules tab, select the rules to disable.
2. Click 

   .
   The status changes to disabled in the rules list, but the rule is still enabled on the service.

To enable a rule:

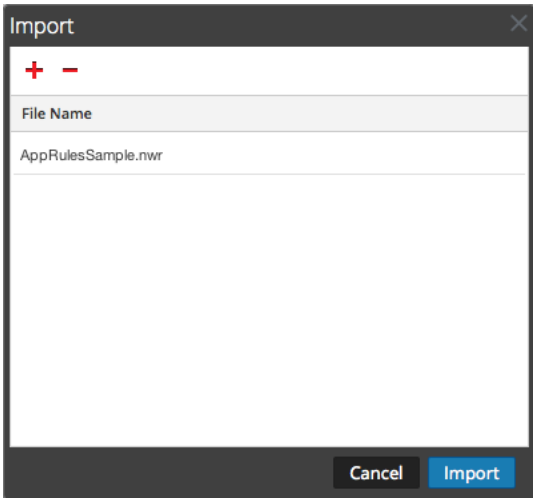
1. From any Rules tab, select the rules to enable.
2. Click 

   .
   The status changes to enabled in the rules list, but the rule is still disabled on the service.



Import Rules from a File and Export Rules

You can import network, application, and correlation rules to a Decoder from a file that contains rules of the same type. After the rules are imported, you can edit and manage them as you would any other rules.



When you attempt to import a group of rules, NetWitness Administration checks the type of rules imported. If you are successful, a message displays the number of rules imported. If the rule type differs from the active tab type, the rules are not imported. You must re-import the rules under the correct tab or select another file to import.

To import rules to a service:

1. From any Rules tab, select Actions > Import .
   The Import dialog is displayed.

2. Click + .
   A view of the directory structure is displayed.
3. Choose one or more NetWitness rules (.nwr) files to import, and click **Open**.
   The file is added to the list in the Import dialog.

4. Click **Import**.
   The rules are imported into the user interface. Imported rules have a red corner in each edited column.
5. Edit or reorder the rules if needed.
6. To save the rules to the service, click **Apply**.
   The rules for the service are updated with the changes.

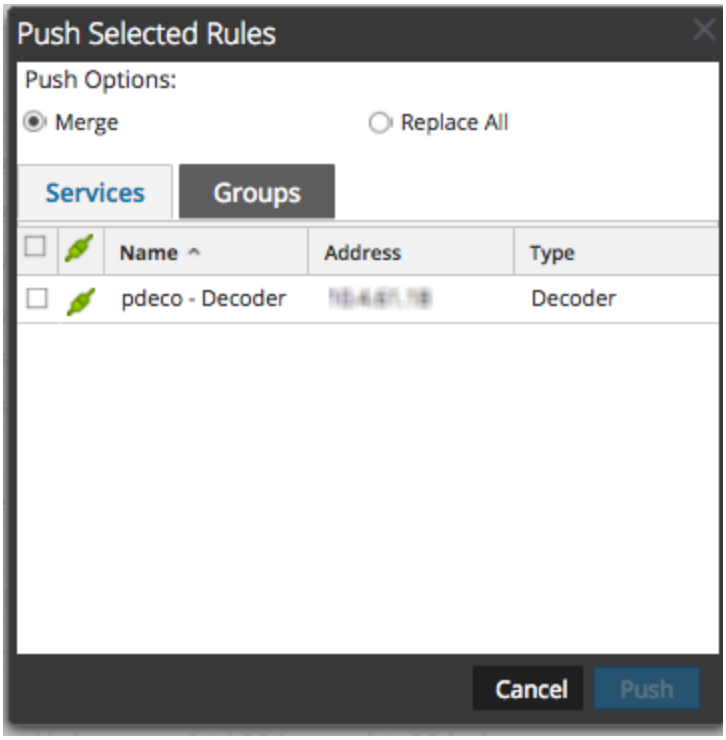
To export a rule to a file:

1. To export a subset of the rules, select the rules to be exported.
2. Do one of the following:
   - In the toolbar, select 

 > Export > Selection. (**Export > All** exports all rules in the rules list even if you have a subset selected for export.)
   - Right-click the selected rules and select **Export Selection**.

     A prompt for the filename is displayed.
3. Enter the filename and click **Export**.
   The .**nwr** file is downloaded.

Push Rules to Other Services

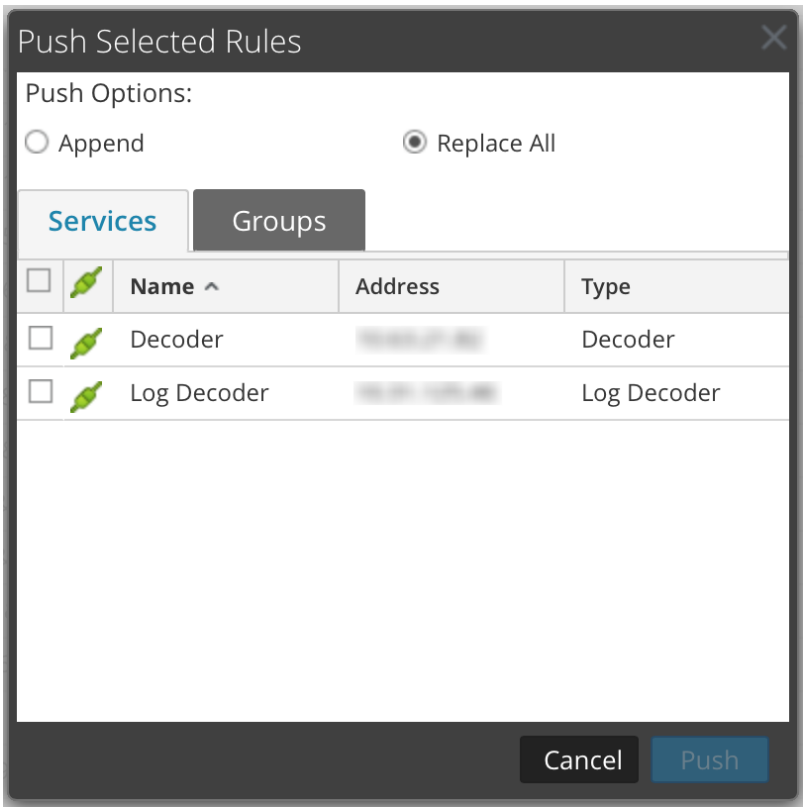


You can apply (push) rules or selected rules to other services (Decoders or Log Decoders) or service groups. When you push all rules to other services, all rules on the target services are removed and replaced with all of the rules on the source service.

To push selected rules from this Decoder to other Decoders:

1. From any Rules tab, select the rules that you want to push to another Decoder.
2. Do one of the following:
   - Select 

 > Push > Selection.



- Right-click the selected rules and select **Push Selected Rules**.
  The Push Selected Rules dialog is displayed.

3. Select a Push Option:
   - Select **Replace All** to delete all rules on the target services and replace them with the selected rules. This is the default selection.
   - Select **Merge** to merge the selected rules with the existing rules on the target services.
4. On the **Services** tab, select the target services to receive the pushed rules, or select the groups of services from the **Groups** tab.
5. Click **Push**.
   The rules are pushed to the selected services and become effective immediately.

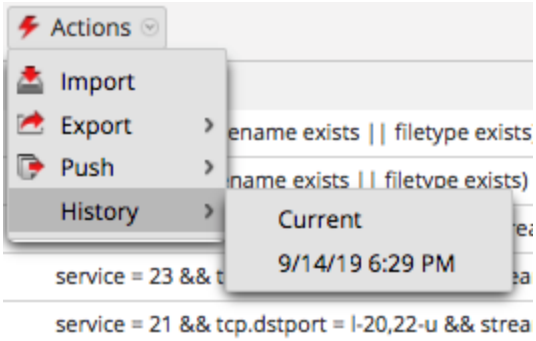
To push all rules from this Decoder to other Decoders:

1. From any Rules tab, select Actions **> Push > All**.
   (**Push > All** pushes all rules in the rules list even if you have a subset selected to push.) The Push Selected Rules dialog is displayed.

2. On the **Services** tab, select the target services to receive the pushed rules, or select the groups of services from the **Groups** tab.
3. Click **Push**.
   All rules from the target services are deleted and replaced with all of the rules from source service. The rules become effective immediately.

Change Execution Order of Rules

Capture rules are applied in the order they are displayed in the rules list. To reorder rules, use either of these methods:



- Drag and drop the rules in the appropriate location in the rules list.
- Right-click a rule to display the context menu, and use the **Cut** and **Paste** options.

Restore a Rule Snapshot from History

NetWitness keeps the last ten snapshots of rules applied to a service.

To restore a rules snapshot from history:

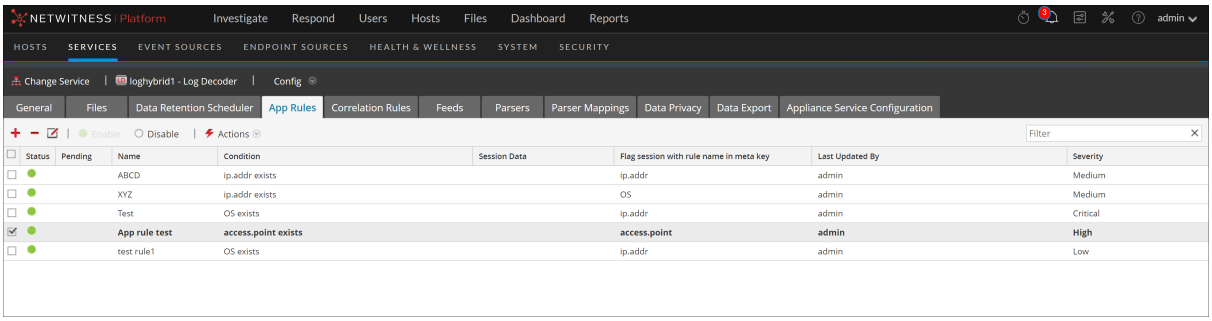
1. Select Actions > **History**.
   A submenu of snapshots is displayed.

2. Select the snapshot time from the submenu.
   The rules from the snapshot are loaded into the rules list, replacing the current set. But the current set is still in use on the service.
3. To apply the rules to the service, click **Apply**.
   The rules are applied to the service.

Configure Application Rules

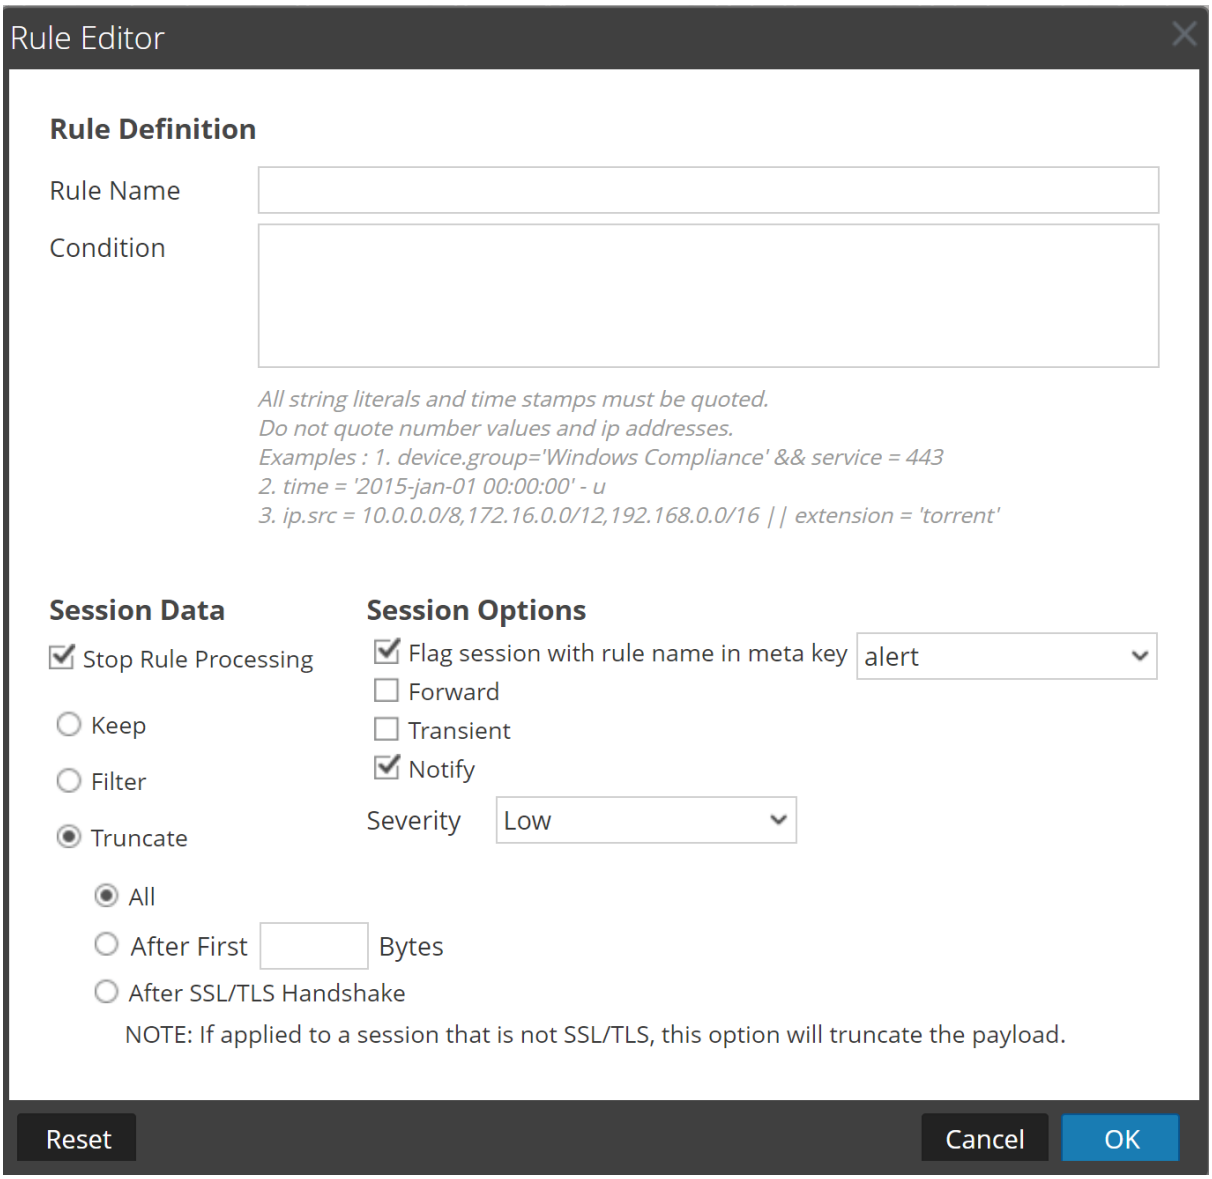
Application layer rules are applied at the session level. The following are sample application rules.

To truncate packets carried via Server Message Block protocol (SMB), create a rule as follows:



- Rule Name: Truncate SMB
- Condition: `service=139`
- Rule Action: Truncate All

To retain email to and from a specific e-mail address, create a rule as follows:



- Rule Name: Retain Email Tom Jones
- Condition: `email='Tom.Jones@TheShop.com'`
- Rule Action: Keep

To add or edit an application rule

1. Go to  (Admin) > **Services**.
2. Select a Decoder or Log Decoder service and  > **View** > **Config**.
   The Systems Config view for the selected service is displayed.
3. Select the **App Rules** tab.

4. Do one of the following:
   - If adding a new rule, click .
   - If editing a rule, select the rule from the rules list and click .
5. The Rule Editor Dialog is displayed with application rule parameters.

a. In the **Rule Name** field, type a name for the rule. For example, for a rule that truncates all SMB, type **Truncate SMB**.

b. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, NetWitness displays syntax errors and warnings. For example, to truncate all SMB, type **service=139**.

   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.

c. If you want rule evaluation to end with this rule, check the **Stop Rule Processing** checkbox.

d. In the **Session Data** section, choose one of the following actions to apply when a matching packet is found:

- **Keep**: The packet payload and associated meta are saved when they match the rule.
- **Filter**: The packet is not saved when it matches the rule.
- **Truncate**: Select a truncate option to execute when a packet matches the rule. The example uses the **All** option.
- **Truncate All** to save the packet headers and associated metadata, and do not save the packet payload.
- **Truncate After First <n> Bytes** to save the packet headers and associated metadata, and do not save the packet payload after the specified first <n> bytes, where <n> is a number of bytes.
- **Truncate SSL/TLS Handshake** to truncates the payload for all sessions except in the case of an SSL/TLS session, where the SSL exchange is preserved, but the rest of the payload is not saved. This option is for use with SSL parsers.

e. In the **Session Options** section, do any of the following:

- Enable the **Flag session with rule name in meta key** and select the metadata for the alert from the drop-down list, which generates a custom alert when metadata matches the rule. This is mandatory.
- **To perform syslog forwarding** when the log matches the rule, enable the **Forward** flag. Make sure that:
  - You have enabled both the Alert and Forward flags to carry out syslog forwarding.
  - The name of the rule mentioned in the Rule Editor dialog matches the syslog forwarding destination name specified in the Log Decoder > View > Explore > `/decoder/config/logs.forwarding.destination` parameter
- **To prevent the alert metadata that is created from being written to the disk**, enable the **Transient** flag.
- Enable the **Notify** option to choose the **Severity** level from the drop-down menu for the application rule created. The available options are listed below:
  - Low
  - Medium
  - High
  - Critical

  Note: Severity is selected by default as **Low**.

6. To save the rule and add it to the grid, click **OK**.

   The rule is added at the end of the grid or inserted where you specified in the context menu. The plus sign is displayed in the **Pending** column.

7. Check that the rule is in the correct execution sequence with other rules in the grid. If necessary, move the rule.
8. To apply the updated rule set to the Decoder or Log Decoder, click **Apply**.

NetWitness saves a snapshot of the currently applied rules, then applies the updated set to the Decoder and removes the pending indicator from the rules that were pending.

Monitor Application Rules

The Decoder and Log Decoder keep track of how many times each application rule matches a session. These stats can be viewed by connecting to the Decoder or Log Decoder Explore view and viewing the properties on the `/decoder/config/rules/application` folder. Then, send the command "`statdump`" to that folder. The output of this message is a listing of the number of times each application rule is hit. The listing is ordered in the same order as the contents of the rule definitions in the `/decoder/config/rules/application` folder. For example, on a system with three application rules:

```
0001: hits=6543 loaded=true
0002: hits=9294 loaded=true
0003: hits=43 loaded=true
```

The hit counters for the application rules are reset whenever the parsers are reloaded.

Configure Correlation Rules

Basic Correlation Rules are applied at the session level and alert the user to specific activities that may be occurring in their environment. NetWitness applies correlation rules over a configurable sliding time window. When the conditions are met, alert metadata is created for this activity and there is a visible indicator of the suspicious activity.

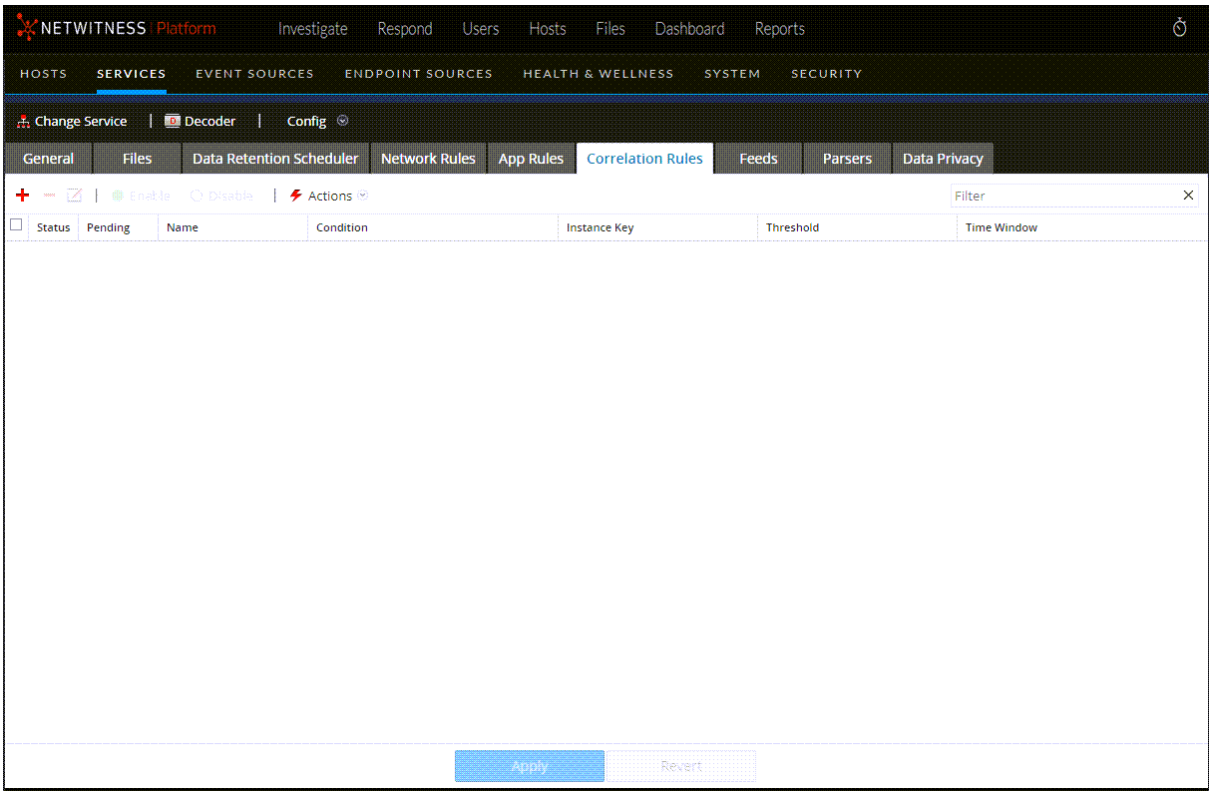
The following are sample correlation rules illustrating two use cases and the syntax.

Objective: In sessions where `port.dst` exists, if there is any combination of ip.src and ip.dst where the count of unique instances of `port.dst > 5` within one minute, then alert. To achieve this objective, create a rule as follows:

- Rule Name: IPv6 Vertical TCP Port Scan 5
- Rule: `port.dst exists`
- Instance Key: `ip.src,ip.dst`
- Threshold: `u_count(port.dst)>5`
- Time Window: 1 min

Objective: In sessions where `action==login` and `error==fail`, if there is any combination of `ip.src` and `ip.dst` that appears in more than 10 sessions within five minutes, then alert. To achieve this objective, create a rule as follows:

- Rule Name: IPv4 Potential Brute Force 10
- Rule: action=`'login' && error='fail'`
- Instance Key: `ip.src,ip.dst`
- Threshold: `count()>10`
- Time window: 5 mins

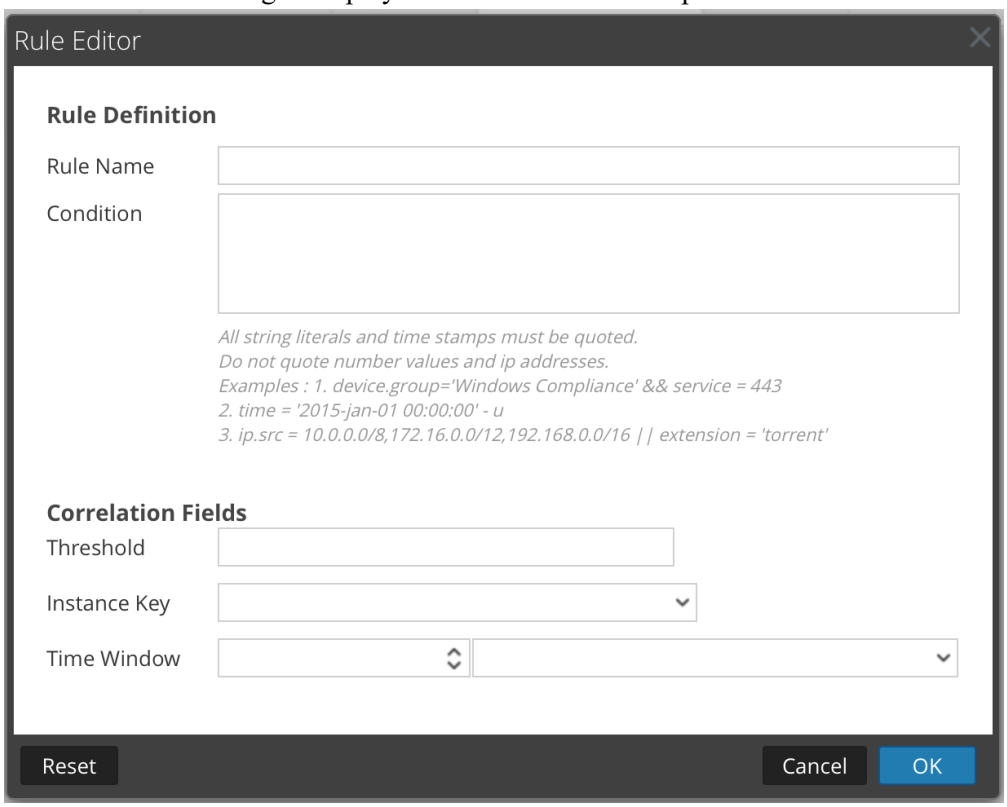


Both sample rules have the same instance key: `ip.src` and `ip.dst`. Because we are looking for unique combinations of `ip.src` and `ip.dst` that match the correlation condition, **`ip.src`** and **`ip.dst`** are **primary keys**.
Threshold can include an **associated key** that identifies the meta type that we are counting to determine if the condition is satisfied. In the first example, the associated key specified in Threshold is `port.dst`. We are counting unique instances of `port.dst` for every `ip.src/ip.dst` pair. In the second example, the associated key is not specified in the Threshold because it is merely a count of sessions. It is helpful to think of this scenario as counting unique session IDs and the associated meta is implicitly session.id. We are counting unique `session.id` for every `ip.src/ip.dst` pair.

Invalid use case: In sessions where (rule), if there is any combination of `ip.src` and `ip.dst` that have a unique count of `ipv6.dst > 5` within (time window), then alert. This case does not work because the associated key `ipv6.dst` is an IPv6 meta type. IPv4 and IPv6 meta types are not permitted to be used as associated keys.

To add or edit a correlation rule

1. Go to  (Admin) > **Services**, select a service, and click  > **View** > **Config**.
   The Service Config view for the selected service is displayed.



2. Select the **Correlation Rules** tab.

3. In the **Correlation Rules** tab, do one of the following:

   - If adding a new rule, click .

- If editing a rule, select the rule from the rules grid and click .
  The Rule Editor dialog is displayed with correlation rule parameters.

4. In the **Rule Name** field, type a name for the rule. For example, to create the sample rule, **IPv6 Vertical TCP Port Scan 5**.
5. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, syntax errors and warnings are displayed by NetWitness. For example, to create the sample rule, type **tcp.dstport exists**. When this condition is matched, the session data action is performed.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
6. In the **Threshold** field, use one of the threshold parameters to specify the minimum number of occurrences required to create a correlation session and an associated key if required. The associated key cannot be an IPv4 or IPv6 meta type.
   - `u_count(associated_key)` = the count of unique values of the specified key
   - `sum(associated_key)` = the values of the specified key
   - `count` = number of sessions (no associated key is specified)
7. In the **Instance Key** field, select the target indicator to base the event upon. This can be a single key or a compound key (two primary keys, separated by a comma).

8. In the **Time Window**, set the duration during which the threshold must be reached to create a correlation session.
9. To save the rule and add it to the grid, click **OK**.
   The rule is added at the end of the grid or inserted where you specified in the context menu. The plus sign is displayed in the **Pending** column.
10. Check that the rule is in the correct execution sequence with other rules in the grid. If necessary, move the rule.
11. To apply the updated rule set to the service, click **Apply**.
    NetWitness saves a snapshot of the currently applied rules, then applies the updated set to the Decoder or Log Decoder.

Configure Network Rules

Network rules are applied at the packet level on a Decoder and are made up of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied at the packet level to a Decoder. Network rules can apply to multiple network layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules do not apply to Log Decoders, they apply only to Network Decoders.

You can create and manage network rules in the Services Config view > Network Rules tab.

Note: Because network rules are applied on the packet level, you must specify both the source and destination meta keys in the rule condition. This is because the packet flow can occur on both sides at the packet level, while the directions are still not determined. For example, if you want to filter traffic on port 553 and port 55553, the condition should be written as follows:
`port.src=553 || port.dst=553 || port.src=55553 || port.dst=55553`
You must also specify both the source and destination meta keys in the conditions for `ip.src` and `ip.dst`. Specifying only source or destination in the condition will not work as expected.

Supported Meta Keys in Network Rule Conditions

The following table describes the meta keys that NetWitness supports for use in network rule conditions.

Meta Key	Description
`eth.addr`	Ethernet source or destination address. Commonly known as the MAC address.
`eth.dst`	Destination Ethernet address. This is the same as the Ethernet address field except that it selects only packets where the destination address matches the selected value (s).
`eth.src`	Same as Ethernet destination except that it focuses on the source address.
`eth.type`	Ethernet frame type.
`hdlc.type`	Frame type of the HDLC frame.
`alias.ip`	IPv4 source or destination address in standard form. IP addresses can be entered in CIDR notation for subnets.
`ip.dst`	Destination IPv4 address in standard form. IP addresses can be entered in CIDR notation for subnets.
`ip.proto`	IPv4 protocol field.
`ip.src`	Source IPv4 address in standard form. IP addresses can be entered in CIDR notation for subnets.
`alias.ipv6`	IPv6 source or destination address in hex format. Generally IPv6 addresses are written as eight groups of four hex digits, thus expressing the entire 128 bit address length. Supports notation to represent multiple blocks of 0000 in an address. Does not support CIDR notation.

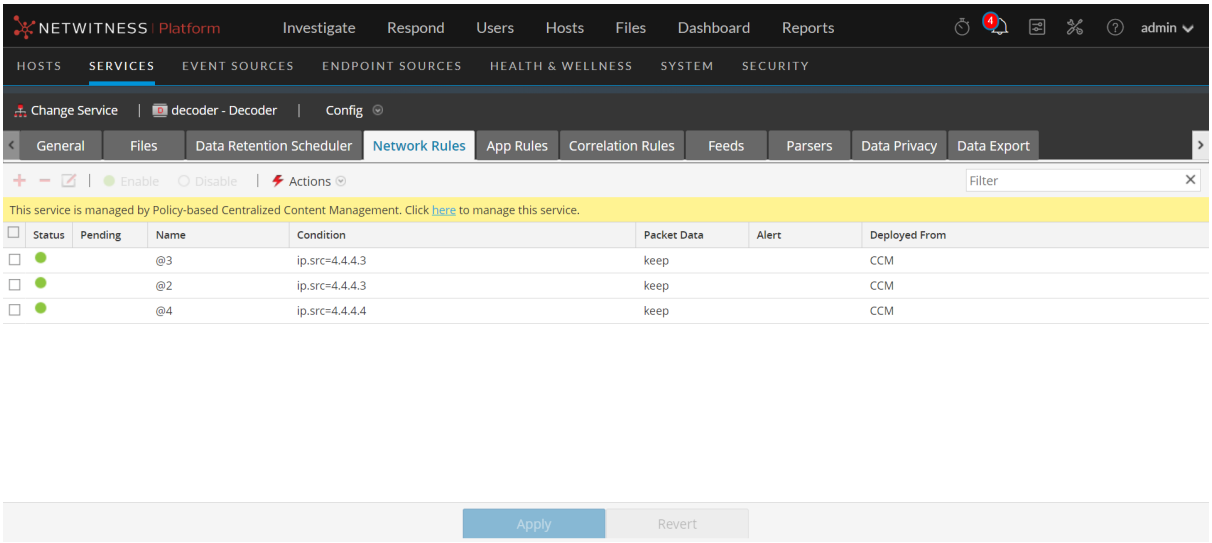
Meta Key	Description
ipv6.dst	Destination IPv6 address in hex format.
ip.proto	IPv6 protocol field. This maps to the Next Header field in the IPv6 header and uses the same values as the IPv4 protocol field.
ipv6.src	Source IPv6 address in hex format.
port.dst	Destination TCP port.
tcp.port	TCP source or destination port.
port.src	Source TCP port.
port.dst	Destination UDP port.
udp.port	UDP source or destination port.
port.src	Source UDP port.

The following are sample network rules.

To truncate all SSL from the source port, create a rule as follows:

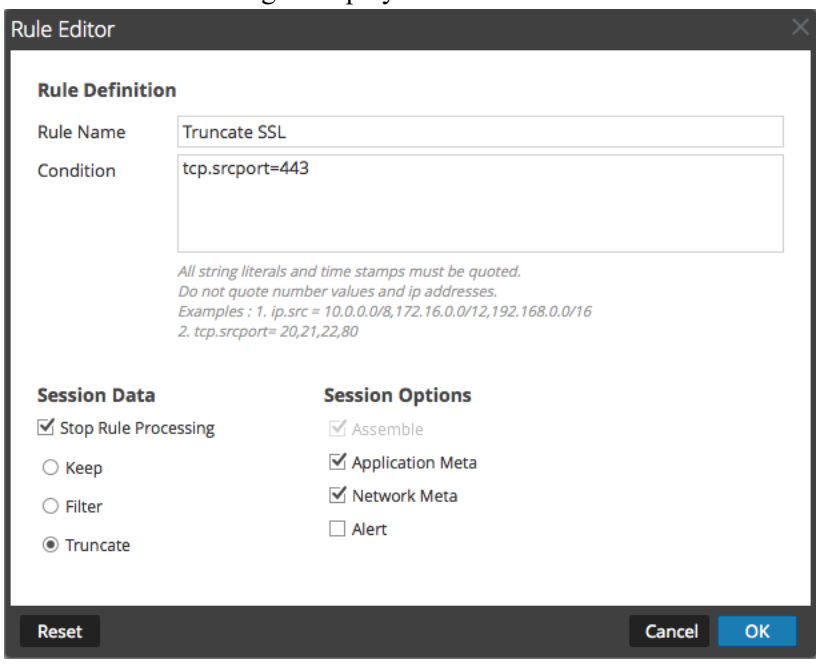
- Rule Name: Truncate SSL
- Condition: `port.src=443`
- Rule Action: Truncate

To filter subnet traffic, create a rule as follows:



- Rule Name: Subnet Filter
- Condition: `alias.ip=192.168.2.0/24`
- Rule Action: Filter

Meta entities, which provide a way to work with several meta keys at the same time, can be used in application rules, but are not supported in network rules as the metadata available are too limited. For more information on meta entities, see the *Core Database Tuning Guide*.



To add or edit a network rule:

1. Go to  (Admin) > **Services**, select a Decoder service, and  **> View > Config**.
   The Services Config view for the selected service is displayed.

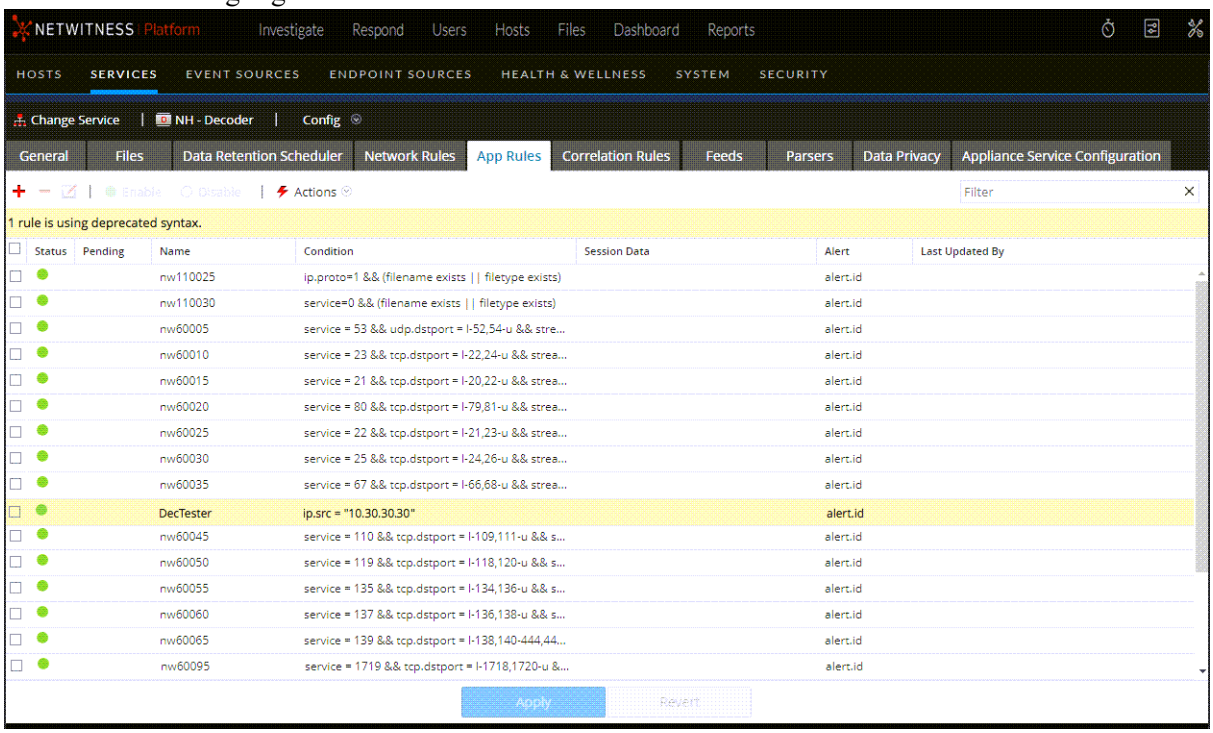
2. Select the **Network Rules tab**.
   The Network Rules tab is displayed.

3. In the **Network Rules** tab, do one of the following:
   - If adding a new rule, click .
   - If editing a rule, select the rule from the rules list and click .
     The Rule Editor dialog is displayed.

4. In the **Rule Name** field, provide a name for the rule. For example, for a rule that truncates all SSL from the source port, type **SSL Truncate**.
5. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta values from the window actions. As you build the rule definition, NetWitness displays syntax errors and warnings. For example, to

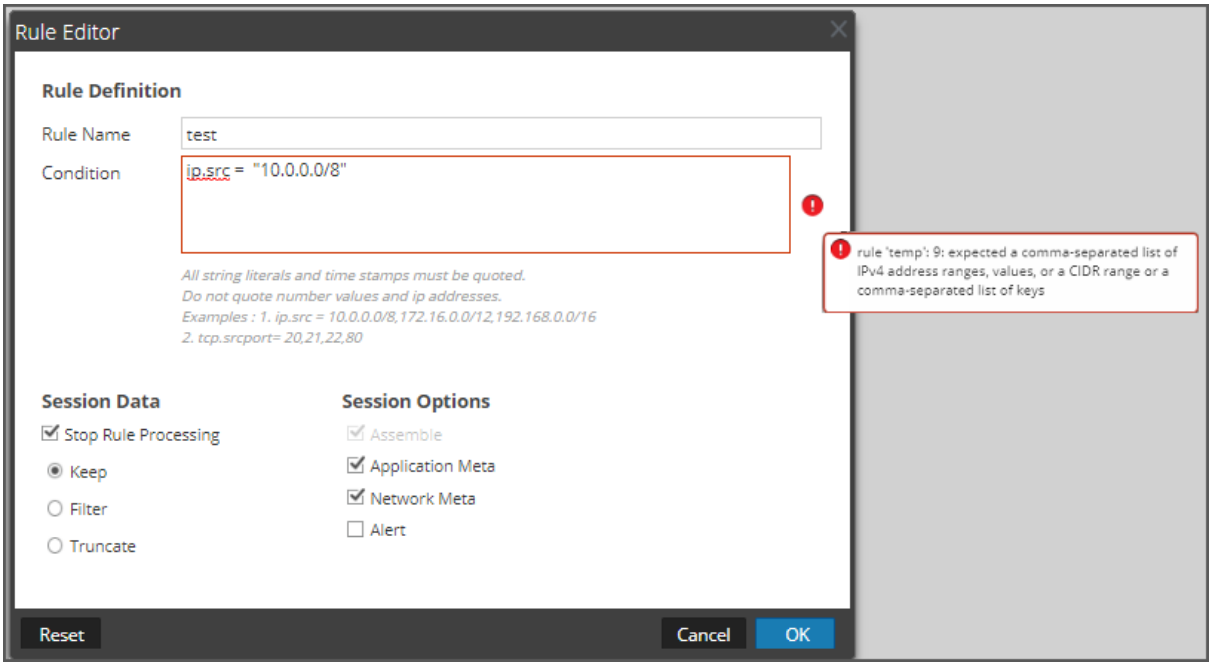
truncate all SSL from the source port, **`tcp.srcport=443`**.

All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details. Supported Meta Keys in Network Rule Conditions describes the meta keys that NetWitness supports for use in network rule conditions.



6. If you want rule evaluation to end with this rule, select the **Stop Rule Processing** checkbox.
7. In the **Session Data** section, choose one of the following actions to apply when a matching packet is found:
   - **Keep**: The packet payload and associated metadata are saved when they match the rule.
   - **Filter**: The packet is not saved when it matches the rule.
   - **Truncate**: The packet payload is not saved when it matches the rule, but packet headers and associated metadata are retained.
8. In the **Session Options** section, select all options that apply of these four.
   - **Assemble**: The assembler assembles the packet chain when it matches the rule.
   - **Network Meta:** The packet generates network metadata when it matches the rule.
   - **Application Meta**: The packet generates application metadata when it matches the rule.
   - **Alert**: The packet generates a custom alert when metadata matches the rule.
9. To save the rule and add it to the rules list, click **OK**.
   The rule is added at the end of the list or inserted where you specified in the context menu.
10. Check that the rule is in the correct execution sequence with other rules in the list. If necessary, move the rule.
11. To apply the updated rule set to the Decoder, click **Apply**.
    NetWitness saves a snapshot of the currently applied rules, then applies the updated set to the Decoder and removes the pending indicator from the rules that were pending.

Fix Rules with Invalid Syntax



After an update to NetWitness 11.x, the user interface highlights any rules with invalid syntax. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. Configure Decoder Rules provides guidelines that all queries and rule conditions in NetWitness must follow.

To correct rules with invalid syntax:

1. Go to (Admin) > **Services**.
2. In the **Services** view, select a Decoder and **> View > Config**.
3. In the **Services Config** view, select one of the Rules tabs: Network Rules, App Rules, or Correlation Rules.
   The Rules tab for the selected rule type shows the number of rules using invalid syntax and the invalid rules are highlighted.

4. Select an invalid rule and click .
   The Rules Editor shows additional information for the invalid rule.

5. In the **Condition** field, correct the rule syntax.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
   For example, if the invalid rule condition is `ip.src="10.30.30.30"`, correct the syntax by removing the quotes: `ip.src=10.30.30.30`
6. Do one of the following:
   - To correct the rule individually, click **Save**.
     The corrected rule is applied independently to the Decoder. The corrected rule appears on the Rules tab without highlights.
   - To correct the rule and apply the rule to the Decoder later with other rules, click **OK**.
     The corrected rule appears on the Rules tab without highlights. The rule is not applied to the Decoder.

Decoder Commands for Managing Rules

In the NetWitness Core database, the Rules tree holds the main functionality related to managing rules for all Core services that have rules: Concentrators, Decoders, Log Decoders, and Archivers. Although you can manage rules in the NetWitness user interface, advanced users may prefer to manage rules using a command line to add, merge, replace, delete, and validate rules on a service. This section provides a brief overview of the commands and their usage. These are the available commands:

- `add` - Adds a single rule at the specified position.
- `clear` - Deletes all existing rules in the current node on the service. For example, using the command in `/decoder/config/rules/application` node deletes all existing application rules on the Decoder.
- `delete` - Deletes one or more rules at a specified position and count.
- `merge` - Merges a pushed rule set with an existing rule set. Existing rules that match the incoming rules (by name or rule) are replaced; otherwise, rules are inserted by the position indicated as described in merge Command.
- `replace` - Deletes all existing rules and replaces them with the incoming rule set.
- `validate` - Validates the syntax of a rule, but does not validate the meta keys.

add Command

The `add` command adds the rule to the existing rule set. Formatting is important because the API uses double quotes in the rule language and also uses double quotes as parameters to all NetWitness APIs. Therefore, you must escape any double quotes in the rule itself by preceding it with a backslash (\) character. This is the syntax of the command:

```
add rule=<string> name=<string> alert=<string, optional> atPos=<uint32, optional>
```

- `rule` is the rule to add. Be sure to place double quotes around any rules with white space and to escape any double quotes that are part of the rule with a backslash.
- `name` is the name of the rule.
- `alert` is the alert for the rule (if any).
- `atPos` is the position at which the rule should be added (1 based). Zero is the top of the list and any number larger than the current size of the list is appended to the list.

This is an example of command to add a rule using NwConsole

```
send /decoder/config/rules/application add rule="ip.src exists" order=1 alert=ioc name=testrule
```

For example, take the following rule:

```
alias.host = "myPC" && country.src="china","russian federation"
```

To add this as a rule, you would need to send the parameters as follows:

```
rule="alias.host = \"myPC\" && country.src=\"china\",\"russian federation\"" name=myRule filter
```

Notice how all the double quotes had to be escaped inside the rule parameter. A simple trick to make this more readable is to use single quotes inside the rule. Single and double quotes are interchangeable in the rule and query language, but not in parameters for the API (only double quotes are supported there). Therefore, this is more readable:

```
rule="alias.host = 'myPC' && country.src='china','russian federation'"
name=myRule filter
```

merge Command

The `merge` command is used to merge an incoming list of rules with the existing rules on the service. This is how it works:

- It finds existing rules that match via the name OR via a matching rule, updates the existing rule name, and keeps the same position.
- It inserts new rules into the rule list based on the NUMBER position. If the number is zero, it goes to the top of the list.
- It processes the rules in the order received so if you have two rules numbered zero, the second rule is processed after the first and claims the top spot. All existing rules are pushed down two places. Any numbers higher than existing rule positions are appended after the last existing rule and numbered in sequence.
- Any non-numbered rule is appended after the last existing rule and numbered in sequence.

This is the syntax of the merge command:

```
merge --file-data=<string> --file-format<string>
```

- `file-data` is the full path and name of the rules file to merge.
- `file-format` is the format of the rules file. Valid values are `params-list`, `string, params`, `binary`, and `params-binary`.

Methods of Sending a List of Rules to a Service

There are two ways to send a list of rules. You can send them as a `.nwr` (NetWitness Rule) file or as a numbered set of parameters, each number indicates the position to insert the rule at as well as the encoded rule. If you want to see the current list of rules on a service, you need to run the `ls` command on the rule category (for instance, application rules on a Decoder are found in `/decoder/config/rules/application`).

This is an example of commands to list the existing rules using NwConsole:

```
login <hostname>:50004 <username> <password>
cd /decoder/config/rules/application
ls
```

This is another example to list existing rules in NwConsole:

```
send /decoder/config/rules/application ls
```

This is an example of the command to point to network rules in the RESTful port, which supports a basic `admin HTML` app.

```
http[s]://<decoder>:50104/decoder/config/rules/network
```

Send a NetWitness Rule File

Let's start with an example `nwr` file, each rule must be on a separate line:

```
rule="ip.src=192.168.0.1" name=first keep
rule="ip.src=192.168.1.1" name=second alert=ioc
rule="ip.src=192.168.2.1" name=third filter
```

To push and merge rules using NwConsole, use the following commands:

```
login <hostname>:50004 <username> <password>
send /decoder/config/rules/application merge --file-data=/root/App_
Rules.nwr --file-format=params-list
```

To replace the existing rules with the rules in the file, instead of using the `merge` command, use the `replace` command.

```
send /decoder/config/rules/application replace --file-
data=<pathname> --file-format=params-list
```

To merge the rules in an `nwr` file using the RESTful port, you can use a `curl` command that pushes the rules:

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-
stream" --data-binary @<pathname> -X POST
"http://<hostname>:50104/decoder/config/rules/application?msg=merge"
```

The examples are pushing application rules. To push network rules, send the rules to `/decoder/config/rules/network`. For correlation rules, send the rules to `/decoder/config/rules/correlation`.

Send Numbered Parameters

The other way to send a list of rules is to send them as numbered parameters. The difficulty with this method is remembering to escape the quotes within each numbered rule. Though it is only a problem if you are trying to do it by hand. For instance, to send the same rules above as parameters via NwConsole, use the following command:

```
send /decoder/config/rules/application merge
1="rule=\"ip.src=192.168.0.1\" name=first keep"
2="rule=\"ip.src=192.168.1.1\" name=second alert=ioc"
3="rule=\"ip.src=192.168.2.1\" name=third filter"
```

This command is hard to read because you have to escape the inner quotes with a backslash (\). Otherwise, these two commands accomplish the same thing. Merging or adding three rules in positions 1, 2 and 3. If you think the above was hard to read, this is what the equivalent `curl` command looks like:

```
curl -u "<username>:<password>"
"http://<hostname>:50104/decoder/config/rules/application?msg=merge&1=rule%3D
%22ip.src%3D192.168.0.1%22%20name%3Dfirst%20keep&2=rule%3D%22ip.src%3D192.168
.1.1%22%20name%3Dsecond%20alert%3Dioc&3=rule%3D%22ip.src%3D192.168.2.1%22%20n
ame%3Dthird%20filter"
```

For more details on how to escape double quotes inside parameters, see add Command.

Ordering Rules When Pushing

Pushed rules are ordered in one of two ways. When passing as parameters, the number of each parameter determines the insertion order. If it is not actually a number, `merge` checks for an `order` parameter within the rule itself and uses that value if found.

Note: Using `order` is the only way to set the order with a `.nwr` file. If neither a number nor an `order` parameter is found, there are no guarantees of the insertion order.

Example

A Decoder has the following application rules installed; notice the numbering is ALWAYS consecutive and starts at 1:

```
0001 : rule="ip.src = 192.168.0.1 || ip.dst = 192.168.0.1 || alias.host = 'My-PC'" name=first keep
0002 : rule="ip.src=192.168.1.1" name=second alert=ioc
0003 : rule="ip.src=192.168.2.1" name=third filter
```

And you want to merge the following four rules:

```
rule="ip.src=192.168.3.1" name=third keep
rule="ip.dst=192.168.4.1" name=NewRule filter order=0
rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=append
rule="service=80,443" name=web filter order=3
```

Use any method to push your rules and this is what you end up with:

```
0001 : rule="ip.dst=192.168.4.1" name=NewRule filter order=1
0002 : rule="ip.src = 192.168.0.1 || ip.dst = 192.168.0.1 || alias.host = 'My-PC'" name=first keep order=2
0003 : rule="service=80,443" name=web filter order=3
0004 : rule="ip.src=192.168.1.1" name=second alert=ioc order=4
0005 : rule="ip.src=192.168.3.1" name=third keep order=5
0006 : rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=6
```

Are there any surprises here? This is how each rule was processed.

```
1. rule="ip.src=192.168.3.1" name=third keep
```

This rule had the same name as an existing rule on the Decoder (third). So the rule updated the existing rule, `changing _filter_ to _keep_`.

```
2. rule="ip.dst=192.168.4.1" name=NewRule filter order=0
```

This rule is new and had `order=0` in it, which means insert at the very top.

```
3. rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=append
```

This rule had a non-number `append` for `order`, therefore, it went to the end of the list. You can accomplish the same thing by giving a very large number, like `999999`.

```
4. rule="service=80,443" name=web filter order=3
```

This rule is last but has `order=3`, therefore, if it does not match an existing rule by name or the text of the rule itself, it should be placed in position 3. And there it is, the third rule in the list. Any rules that follow were pushed further down.

replace Command

The `replace` command removes all existing rules and replaces them with the incoming rule list. Refer to merge Command for details on how to format the incoming rule list and how ordering works.

This is an example of the `replace` command using a NetWitness Rule File :

```
send /decoder/config/rules/application replace --file-data=/root/Decoder-AppRules.nwr --file-format=string
```

This is an example of the `replace` command using Numbered Parameters :

```
send /decoder/config/rules/application replace 1="rule=\"ip.src exists\" name=\"test rule\" order=1 alert=ioc"
```

clear Command

The `clear` command removes all existing rules on the service. This is an example of the command:

```
send /decoder/config/rules/application clear
```

delete Command

The `delete` command deletes one or more rules on the service.

```
delete atPos <uint32> count <uint32, optional>
```

- `atPos` deletes the rule at the given position. Rules are numbered starting with 1 and go in sequential order.
- `count` deletes one or more rules starting `atPos`. This is an optional parameter defining the number of rules to delete starting `atPos`. The default value is 1.

This example of the command deletes four rules beginning at position 0003:

```
send /decoder/config/rules/application delete atPos=0003 count=4
```

validate Command

The `validate` command takes the provided rule and verifies that it parses correctly. Keep in mind that this command cannot verify whether language keys and entities are valid.

```
validate rule <string>
```

`rule` - is the name of the rule to validate. Make sure to place double quotes around any rules with white space.

Configure Parsers and Feeds

Parsers and feeds are responsible for analyzing the packets and logs when captured or imported in Decoders. Most commonly, they are used for static metadata extraction and service identification. The flexible definition allows custom extension of the core defined services to provide extra service type identification and metadata extraction. This is important due to the volume of custom applications that are used on networks.

See the following sections for details about configuring parsers and feeds.

- Configure Parsers
- Configure Feeds

Configure Parsers

NetWitness has a set of native parsers that are defined by the system, and also provides the option to add additional parsers. Each parser is configurable in the Services Config View - General Tab. The Parser Configuration panel provides a way to enable or disable parsers to use on Decoders in addition to limiting the metadata that the parser creates.

There are also several types of custom configurable parsers:

- GeoIP2 – This parser associates IP addresses with geographical locations. For new installations and upgrades, the GeoIP2 parser is enabled by default. For more information on these parsers, see GeoIP2 Parsers.
- Search – This parser is user-configured to generate metadata by scanning for pre-defined keywords and regular expressions.
- FLEXPARSE (deprecated) – This is a generic parser definition language for extending the existing application protocol support of the Decoder. By default this parser is disabled (see Enable or Disable Lua and Flex Parsing Systems).
- Lua – This parser is defined using the Lua scripting language for extending the existing application protocol support of the Decoder.
- Log – This application parser supports the Log Decoder and is configured to generate metadata by scanning log files.
- Snort® – This parser supports the payload detection capabilities of Snort IDS rules. Snort rules and configuration are added to the `parsers/snort` directory for Investigation and Decoder (see Decoder Snort Detection).

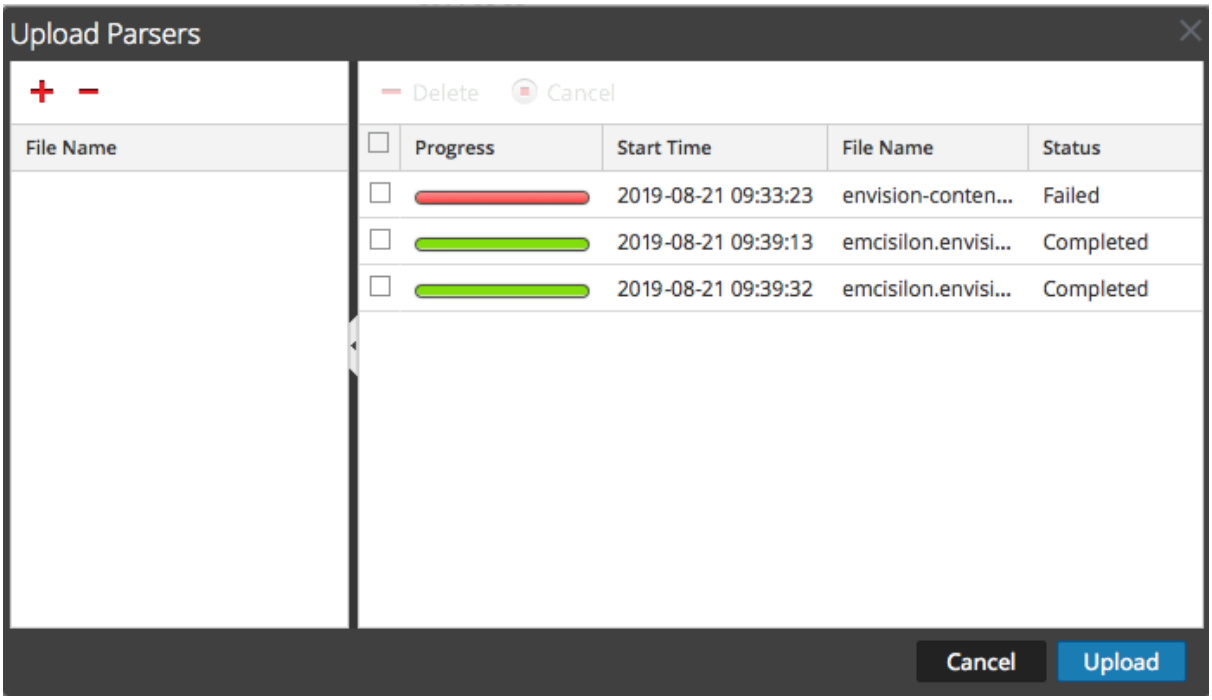
In the Services Config view > Parsers tab, you can view deployed parsers on a Decoder, upload parsers, and delete deployed parsers. The user interface includes an Indicator if the parser originated from Live Services, installed through NetWitness, or uploaded manually. Parsers can be added and removed while a Decoder is running without affecting capture.

Note: To pass options to parsers, you must first give the name of the parser and then the options to be passed in this format:
`<ParserName>="<ParserOptions>"<Whitespace><ParserName2>="<Parser2Options>"`
Each `ParserName=Value` option must be separated by whitespace. Normally, the `Value` must have double quotes around it. The `Value` itself can sometimes list multiple `Option=Value` pairs, each separated by whitespace, and if those values have whitespace, they must be in escaped double quotes. To escape a quote, place a backslash before it: `\"`.
This is an example of defining options for Parser1, Parser2, and Parser3:

```
Parser1="Option1=\"Option1 Value With Space\" Option2=Option2ValueNoSpace"
Parser2="Option1=Value" Parser3="op1=val1 op2=val2 op3=\"another value\""
```

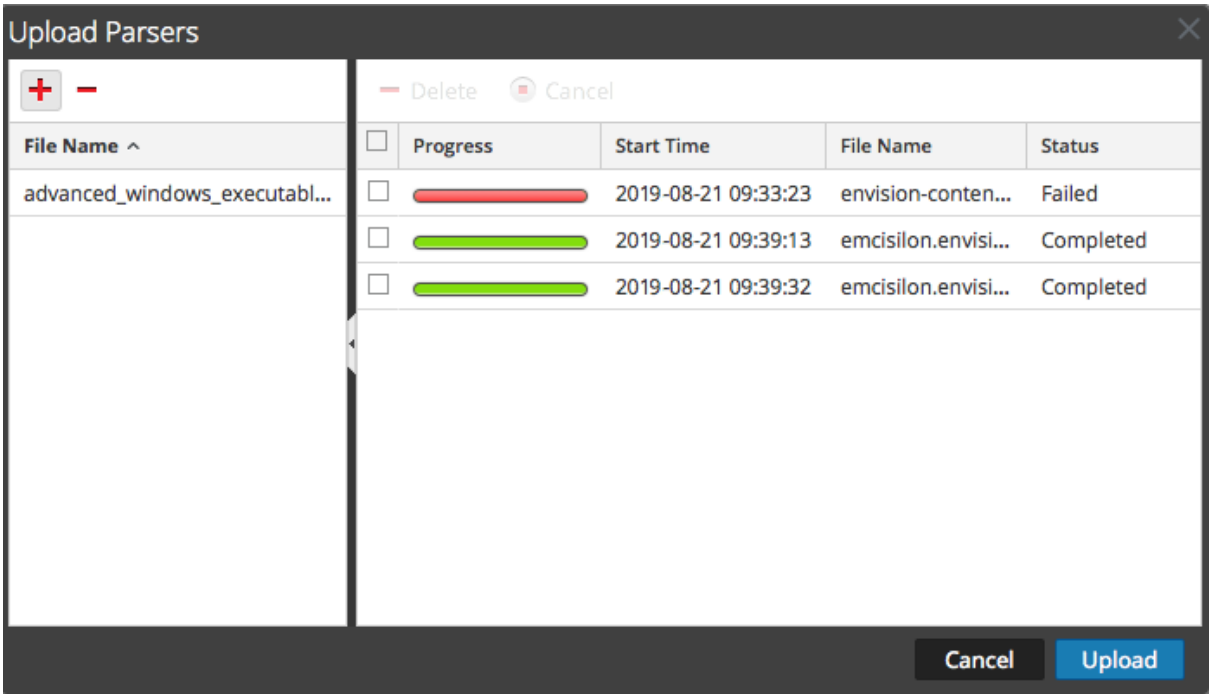
In addition, you can download parsers using NetWitness Live Services.

Upload and Delete Custom Parsers



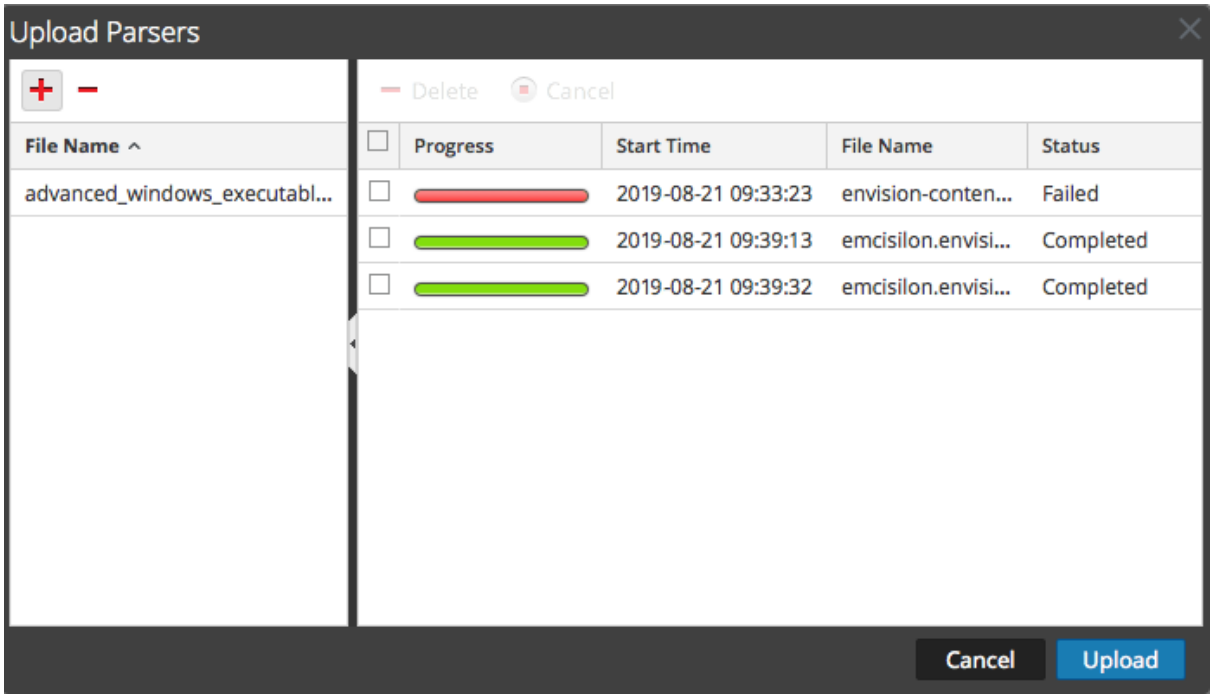
NetWitness has the ability to upload parsers from your local system and delete these parsers.

Upload Parsers to a Decoder or Log Decoder



The Upload option in the Service Config view > Parsers tab displays the Upload Parsers dialog, in which you can manage the uploading of parsers to a Decoder or Log Decoder. In the File list, you prepare a list of parsers for uploading. You can add files from a directory structure, and delete files from the list if you decide that you don't want to upload a particular file. When the list is ready, clicking Upload starts the upload process.

1. Go to  (Admin) > **Services**, select a service, and click  **> View > Config.**
   The Config view for the selected service is displayed.
2. Click the **Parsers** tab.



3. Click Upload.
   The Upload Parsers dialog is displayed.

4. Click .
   A file selection dialog is displayed.
5. Select the **.flex**, **.parser**, and **.lua** files to be updated, and click **Open**.
   The dialog closes, and the selected files are displayed in the File list.

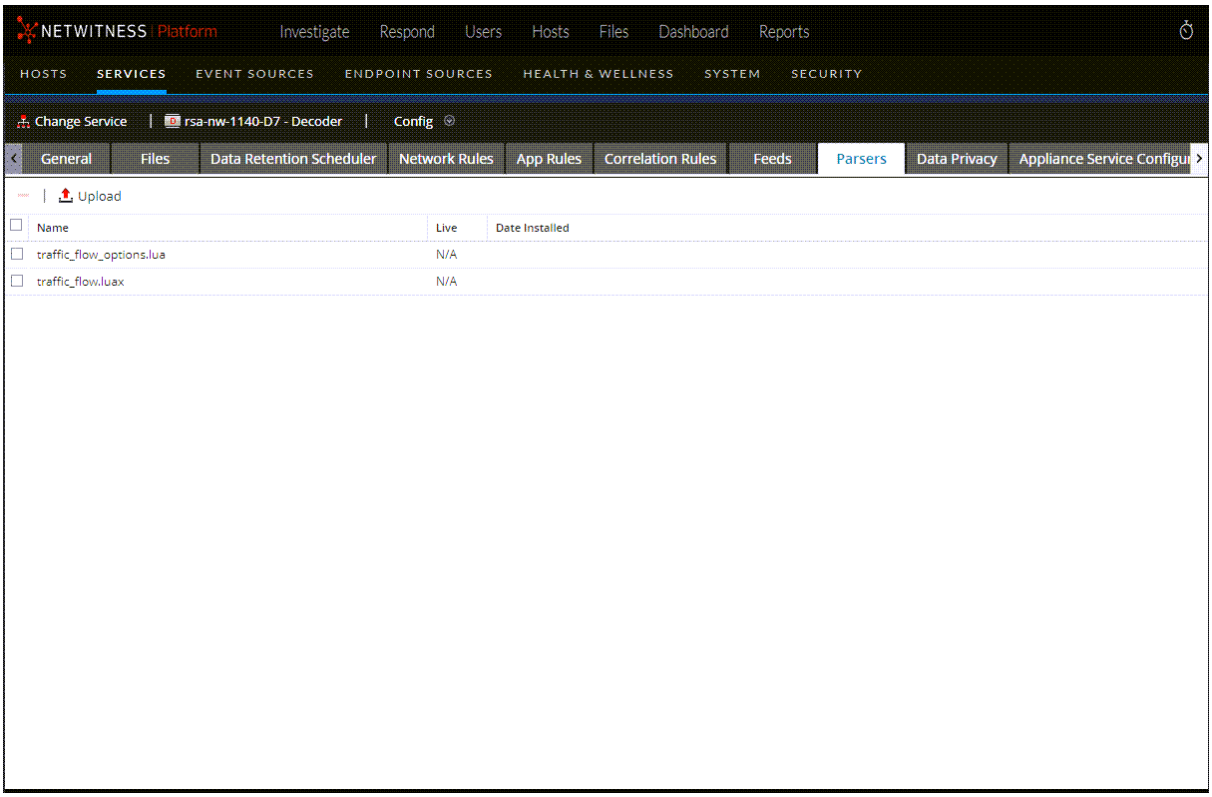
6. Click **Upload**.
   The Upload Job grid shows the progress of the upload jobs with each job representing a file being uploaded.

7. Use any of the Upload grid tools to manage the upload of selected jobs: pause and resume, cancel, and delete.
   Once a job is complete, it is deployed on the Decoder and listed with the deployed parsers in Parsers tab.

Manage Upload Jobs

You can use any of the Upload grid tools to manage the upload of selected jobs: pause, resume, cancel, and delete.

- To cancel uploading a set of parsers while the upload is in queue or progress, click Cancel.
- To pause uploading a set of parsers, if the upload is not yet complete, click Pause.
- To resume uploading a set of parsers after a pause, click Resume.
- To delete an upload job, click .



Delete Deployed Parsers

The Delete option in the Service Config view > Parsers tab provides a way to delete deployed parsers from a Decoder or Log Decoder. Parsers can be added and removed while a Decoder is running without affecting capture.

Note: Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

To delete a parser from a Decoder:

1. Go to (Admin) > **Services**, select a Decoder, and > **View** > **Config.**
   The Services Config view for the selected service is displayed.
2. Click the **Parsers** tab.

3. In the **Parsers** tab, select one or more parsers to delete.
4. Click −.
   A dialog requests confirmation that you want to delete the parsers.
5. If you want to delete the parsers, click **Yes**.
   The parsers are removed from the Decoder immediately.

Enable and Configure the Entropy Parser

Beginning with NetWitness 11.0, the administrator can configure a Decoder to use a NetWitness native parser, known as the Entropy parser. When the Entropy parser is enabled, analysts have visibility into channels that are trying to blend in with other traffic, but do not follow normal protocol behavior. This helps to identify channels that do not conform to the normal environment traffic baseline, and may be worthy of investigation.

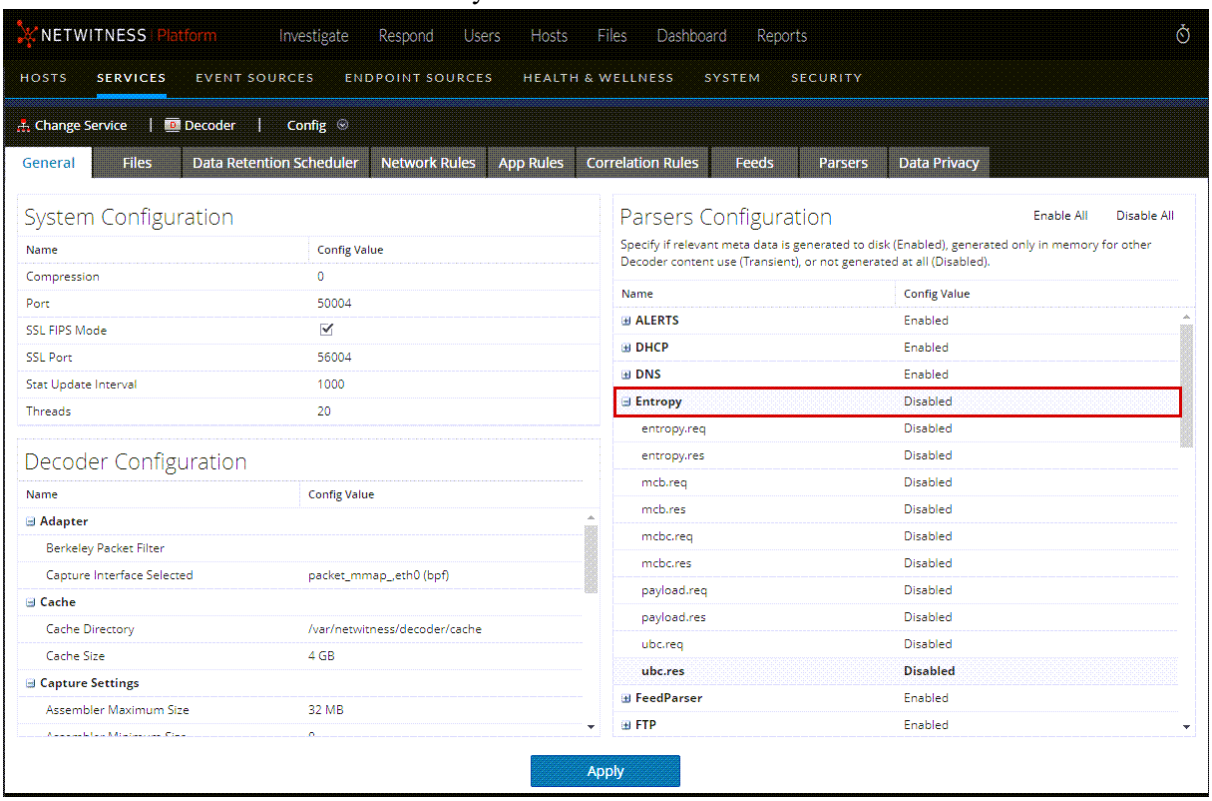
The parser creates meta keys, based on statistics collected by the native NetWitness parser, that help to identify behavior of any channel that is getting lots of network traffic. When the parser is first enabled, the analyst needs to become familiar with overall behavior for the different channels seen in a captured session to understand the frequency of bytes and the normal client and server payload. Once the normal behavior is known, analysts can use the meta keys to find behavior that does not match the expected.

By default, the Entropy parser generates 10 additional meta keys that do not add significantly to the load on a Decoder, and are useful for this specialized case. The parser is disabled by default.

Enable indexing if you have interest in exploring interesting sessions based on payload byte analysis of the packets. By default, to make indexing easier, the normal `Float32` value for `entropy.req` and `entropy.res` is multiplied by 10k and stored in a `UInt16` (thus giving four digits of precision, 0 to 10,000).

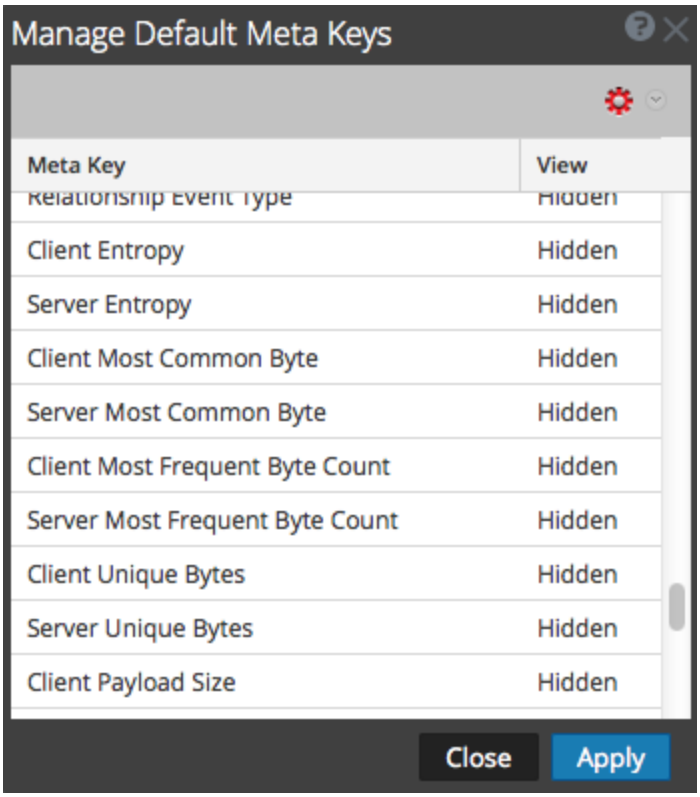
However, if you define the `entropy.*` fields in the Decoder language to be `Float32`, the Decoder will store it as a float with a range of 0.0 to 1.0. Take care to change the language everywhere if you decide to keep it as a `Float32`.

NetWitness does not recommend indexing as a `Float32` because of the high unique counts due to minute changes in precision.



These are the new meta keys generated by the Entropy parser by default:

- `entropy.req` and `entropy.res`: These meta keys capture entropy using the Shannon entropy equation, which has a floating point value as a result. The floating point value of 0 to 1.000 is multiplied by 10000 and written in NetWitness as `UInt 16`, an unsigned integer of 0 through 10000. .
- `mcb.req` and `mcb.res`: The most common byte is simply which byte for each side (0 thru 255) was seen the most.
- `mcbc.req` and `mcbc.res`: The most common byte count is the number of times the most common byte (above) was seen in the session streams.
- `ubc.req` and `ubc.res`: - Unique byte count is the number of unique bytes seen in each stream. 256 would mean all byte values of 0 thru 255 were seen at least once.



To enable and configure the Entropy parser on a Decoder:

1. Go to  (Admin) > **Services**, select a Decoder service and click  **View > Config**.
   The Services Config view for the selected Decoder is displayed.
2. The Entropy parser is disabled by default. Click the drop-down list for **Entropy** in the **Config Value** column, and select **Enabled**. If you want to disable some of the meta keys, click the drop-down list

and select **Disabled** next to the meta key.

3. Click **Apply**.
   The Entropy parser is enabled and begins creating the new meta keys as configured in the Concentrator custom index file.
4. In the Service Config view select the Concentrator that is aggregating traffic from this Decoder. Select **View > Files** and open the Custom Index file for the Concentrator. Look for the Entropy parser meta keys to see if they are included and uncommented.
   By default the keys are commented out and therefore not enabled. To enable that part of the language the administrator needs to copy that part of index file into the `index-concentrator-custom.xml` and uncomment the `key description` line for each meta key. An example of the custom index file with the Entropy parser keys and instructions is shown below in Entropy Parser Configuration in the Concentrator Custom Index File.
5. With the Entropy meta keys enabled, they are available to analysts in Investigate, but hidden by default. To make the meta keys visible in the Investigate Values view, edit the default meta keys in the Default Meta Keys dialog so that they are open instead of hidden. You can manage these meta key the same way you manage other meta keys.

Entropy Parser Configuration in the Concentrator Custom Index File

The following is an excerpt of the Concentrator Index file lines that the administrator must copy to the custom index file. The comments provide guidance on configuring the parser.

```
<!-- This section is commented out because it's only used by the Entropy
parser which is disabled by default. To enable this part of the language, copy
to index-concentrator-custom.xml and uncomment the keys. HOWEVER, take note
that depending on how the Entropy parser is configured, the entropy.req and
entropy.res format might be a Float32 instead of a UInt16. So make sure to
change to the correct type if necessary.-->

<!-- Entropy parser meta - enable indexing if you have interest in exploring
this for interesting sessions based on payload byte analysis of the packets.
By default, to make indexing easier, the normal Float32 value for entropy.req
and entropy.res is multiplied by 10k and stored in a UInt16 (thus giving 4
digits of precision, 0 to 10,000). However, if you define the entropy.* fields
in the Decoder language to be Float32, it will store it as a float with a
range of 0.0 to 1.0. Take care to change the language everywhere if you decide
to keep it as a Float32. We do not recommend indexing as a Float32 because of
the high unique counts due to minute changes in precision. -->

<!--

<key description="Entropy Request (Client)" format="UInt16" level="IndexNone"
name="entropy.req" valueMax="10001"/>

<key description="Entropy Response (Server)" format="UInt16" level="IndexNone"
name="entropy.res" valueMax="10001"/>

-->
```

```
<!-- The most common byte is simply which byte for each side (0 thru 255) was
seen the most -->

<!--

-->

<!-- The payload size metrics are the payload sizes of each session side at
the time of parsing. However, in order to keep indexing from having high
unique counts (bad for performance), the two payload size metas below are
indexed in buckets. -->

<!--

<key description="Payload Size Request" format="UInt32" level="IndexNone"
bucket="true" name="payload.req" valueMax="500000"/>

<key description="Payload Size Response" format="UInt32" level="IndexNone"
bucket="true" name="payload.res" valueMax="500000"/>

-->
```

Flex Parsers

There are two kinds of Flex parsers:

- **Service identification based solely on port.** These are parsers that use only the source or destination ports to identify the session application type (service). These are the most basic and easiest to define.
- **Service identification based on a found token(s).** These parsers use tokens to identify the service type. This is also an easy way to expand which service types are identified. These are important when identifying non-internet standard applications. These parsers require that the protocol has a definable token that can uniquely identify the service type.

Five common parser operations are:

- Match Port and Identify Immediately
- Match Port and Delay Identification
- Match Token and Identify Immediately
- Match Multiple Tokens
- Match Token and Create Metadata

Detailed language information and samples are provided in this topic. This topic describes the XML schema used to define a FlexParse file. The SML node, attribute, and values referenced in descriptive text are **bold**. The root node of every file must be the **parsers** node. Under that node there can be any number of parser nodes. Each parser node defines a single parser. A parser node can have an optional **declaration** node and any number of **match** nodes.

Topics

- Arithmetic Functions
- Common Parser Operations
- General Functions
- Logging Functions
- Nodes
- Payload Functions
- Regex
- String Functions

Arithmetic Functions

This topic defines language for the flex parser arithmetic functions.

This topic defines language for the flex parser arithmetic functions. All numbers are 64-bit unsigned values and subject to both underflow and overflow, depending on the operation.

Language Definition

The following table provides language definitions.

Node Name	Attribute Name	Description
`and`		Performs bitwise AND between two numbers.
	`name`	Variable to AND result into.
	`value`	Number to AND into result.
`or`		Performs bitwise OR between two numbers.
	`name`	Variable to OR result into.
	`value`	Number to OR into result.
`increment`		Performs ADDITION of two numbers.
	`name`	Variable containing the initial value AND to receive ADDITION results.
	`value`	Number to ADD to initial value.
`decrement`		Performs SUBTRACTION of two numbers.
	`name`	Variable containing initial value AND to receive SUBTRACTION results.
	`value`	Number to SUBTRACT from initial value.
`divide`		Performs DIVISION of two numbers.
	`name`	Variable containing the initial value AND to receive DIVISION results.
	`value`	Number by which to divide the initial value. Division by zero generates an error and stops any further processing of the current session by this parser.
`modulo`		Performs MODULO of two numbers.
	`name`	Variable containing the initial value AND to receive MODULO results.

Node Name	Attribute Name	Description
	value	Number by which to divide the initial value. Division by zero generates an error and stops any further processing of the current session by this parser.
multiply		Performs MULTIPLICATION of two numbers.
	name	Variable containing the initial value AND to receive MULTIPLICATION results.
	value	Number by which to MULTIPLY the initial value.
shiftleft		Performs a binary shift left.
	name	Variable containing the initial value AND to receive shift results.
	value	Number of bits to shift by.
shiftright		Performs a binary shift right.
	name	Variable containing the inital value AND to receive shift results.
	value	Number of bits to shift by.

Common Parser Operations

This topic provides some examples of common parser operations.

This topic includes five common parser operations.

Match Port and Identify Immediately

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="parsers.xsd">
          <parser name="CustApp" desc="Acme Custom App" service="45324">
               <declaration>
                    <port name="port" value="45324" />
               <declaration>
               </match name="port">
                    <identify />
               </match>
          </parser>
</parsers>
```

Match Port and Delay Identification

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="MSRPC" desc="Microsoft RPC protocol" service=135">
          <declaration>
               <port name="port" value="135" />
               <number name="state" scope="session" />
               <session name="end" value="end" />
          </declaration>
          <match name="port">
               <assign name="state" value="1" />
          </match>
          <match name="end">
               <if name="state" equal="1" />
                    <identify />
               </if>
          </match>
     </parser>
```

```
</parsers>
```

Match Token and Identify Immediately

```
<?xml version="1.0" encoding="utf-8?>
<parsers
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="RDP" desc="Remote Desktop Protocol" service="3389">
          <declaration>
               <token name="signature" value="Cookie: mstshash=" />
          </declaration>
          <match name="signature">
               <identify />
          </match>
     </parser>
</parsers>
```

Match Multiple Tokens

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="MyServiceMultiToken" desc="Multiple Tokens" service="333">
          <declaration>
               <number name="state" scope="stream" />
               <token name="user" value="USER " />
               <token name="pass" value="PASS " />
               <session name="session" value="end" />
          </declaration>
          <match name="user">
               <or name="state" value="1" />
          </match>
          <match name="pass">
               <or name="state" value="2" />
          </match>
          <match name="session">
               <if name="state" equal="3">
                    <identify />
               </if>
          </match>
```

```
     </parser>
</parsers>
```

Match Token and Create Metadata

```
<?xml version="1.0" encoding="utf-8"?>
<parsers xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="SHELL" desc="Command Shell Identification">
          <declaration>
               <token name="cmd.exe" value=" (C) Copyright 1985-2001 Microsoft
               Corp" options="linestart" />
               <meta name="client" key="client" format="Text" />
          </declaration>
          <match name="cmd.exe"
               <register  name="client" value="MS Command Shell" />
          </match>
     </parser>
</parsers>
```

General Functions

This topic defines language for the flex parser general functions.

General Functions Language Definition

Node Name	Attribute Name	Description
apptype		Gets the currently defined service type for the current session.
	name	A number variable to receive the current service type.
identify		Marks the session with the parser's service type if the service type has not already been identified.
assign		Assigns a value to a variable.
	name	The unique identifier assigned to the item in the declaration section.
	value	Optional. If specified, the action defined in the match is only applied when the declaration matches the given value.
getmeta		Retrieves the value of meta that generated a callback. This function will return empty results (0, zero length string) if called when there was no meta callback.
	name	The variable to receive the value of the meta key that generated the callback.
gettoken		Returns the current matched token.
	name	A string variable to receive the current matched token. If there is no current token, the variable is assigned an empty string.
end		This terminates the execution of the current **match** section.
if		Compares two values. If the comparison is true, executes any sub-actions. Comparisons can be **number** or **string** types, as long as both values are the same type.
	name	The unique variable identifier assigned to the item in the **declaration** section.
	equal notequal less lessequal greater greaterequal and or	The operation value to compare. If true, any sub-actions are executed.
register		Adds metadata to the session.

Node Name	Attribute Name	Description
	name	The unique identifier of a meta variable to be created, as defined in the **declaration** section.
	value	The value of the metadata to be created.
while		Compares two values and executes any sub-actions if the comparison is true. Comparisons can be **number** or **string** types, as long as both values are the same type.
	name	The unique variable identifier assigned to the item in the declaration section.
	equal notequal less lessequal greater greaterequal and or	Specifies the operation value to compare. If true, any sub-action is executed. The **and** and **or** attributes signify bitwise operations and can only be applied to **number** variables.
call		Executes the specified **match** element. This can be any match element defined in the same flex parser regardless of how it was declared.
	value	The name of the match element, or a string variable containing the name of a match element. • If the match element name is specified, the parser will not load if the named matched element doesn't exist. • If a string variable is specified, the **call** element will execute any child elements that it may have if the string value resolves to a match element after executing the named match element. • If no **match** element can be found matching the string value, no action is taken.

Logging Functions

This topic defines language for the flex parser logging functions.

Logging functions provide a means for a flex parser to write to the system log. Logging functions can be extremely useful when creating a new flex parser, but should be kept to an absolute minimum when a flex parser is deployed to a production system.

Language Definition

Node Name	Attribute Name	Description
`failure`		Logs a message to the system log with the log level **Failure.**
	`value`	A string to include as the log message.
`warning`		Logs a message to the system log with the log level **Warning.**
	`value`	A string to include as the log message.
`info`		Logs a message to the system log with the log level **Info**.
	`value`	A string to include as the log message.
`debug`		Logs a message to the system log with the log level **Debug.**
	`value`	A string to include as the log message.

Nodes

This topic defines language for the flex parser nodes.

Nodes Language Definition

Node Name	Attribute Name	Description
`parsers`		The root node in each definition file.
	`xmins:xsi`	Defines the namespace to use for the schema inclusion. This attribute is not required; however, language definition is not possible without it. This node must have the following value: http://www.w3.org/2001/XMLSchema-instance
	`xsi:noNamespaceSchemaLocation`	Defines the XSD schema validation file used to validate the language definition. This attribute is not required; however, language definition is not possible without it. This node must have the following value: parsers.xsd
`parser`		The node that defines a single parser definition. This node must be directly under the `parsers` node. There can be more than one per file.
	`name`	The name that uniquely identifies the parser. This name should be short and succinct. This is used by the system to allow enabling and disabling. It should contain only the letters [a-z] and [A-Z].
	`desc`	Provides a friendly description of what the parser does.
	`service`	The unique number assigned to the session when identified.
`declaration`		Delineates the definition. Each of these definitions can have an associated `match` entry.

Node Name	Attribute Name	Description
token		Specifies a definition for identifying a token somewhere in the session protocol. This defines a match callback when the specified tokens are encountered in a session payload. The read position is set to the byte immediately following the matched token.
	name	This is a unique identifier for the declaration.
	value	This is the exact token value to be identified.
	options	Options specify that the token should start on a new line or at an end of a line (linestart or linestop).
meta-callback		Registers a callback for the flex parser whenever meta of a specific format is created. This can be further qualified to generate callbacks only for sessions that have been identified as a specific apptype (for example, 80 for HTTP).
	name	Name of the match element to be executed when a callback occurs. (String)
	key	Name of the meta key that generates callbacks. (String)
	format	The data type of the meta key that will generate the meta.
	apptype	The meta callback is only generated if the session being parsed has been identified with the specified apptype. (Unsigned Integer, Optional)
number		Defines a numeric variable that can be referenced elsewhere within the parser definition. All numeric values are 64-bit unsigned values.
	name	This is a unique identifier for the declaration.

Node Name	Attribute Name	Description
	`scope` (optional)	Specifies when to reset the variable. This can either be for each side of a two-sided session or only after a new session is detected. The possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
`string`		Defines a numeric variable that can be referenced elsewhere within the parser definition.
	`name`	This is a unique identifier for the declaration.
	`scope` (optional)	Specifies when to reset the variable. This can either be for each side of a two-sided session or only after a new session is detected. The possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
port		Defines a **match** callback when a session is encountered using the specified port. The **read** position is set to the first byte of the first stream (client) in the session.
	`name`	This is a unique identifier for the declaration.
	`value`	This is the port number to identify.
`session`		Defines a `match` callback for session begin/end events. These events only occur if a token for the parser is encountered in the session.
	`name`	This is a unique identifier for the declaration.
	`value`	Specifies that processing takes place at the beginning of a new session or at the end of a session (`begin` or `end`).
`stream`		Defines a `match` callback for stream begin/end events. These events only occur if a token for the parser is encountered in the stream.
	`name`	This is a unique identifier for the declaration

Node Name	Attribute Name	Description
	`value`	Specifies that processing takes place at the beginning or at the end of a stream (`begin` or `end`).
`function`		Defines a `match` section that can be used as a generic function. No callbacks are associated with this declaration.
	`name`	This is a unique identifier for the declaration.
`meta`		Defines the type of data that the parser will create.
	`key`	Specifies the key name. The key needs to be 1-16 bytes in size.
	`format`	Specifies the variant type (for example, **`Text`**, **`IPv4`**, **`UInt32`**). Refer to the SDK documentation for a full list.
`pattern`		Defines a regular expression variable for use by the `regex` function
	`name`	This is a unique identifier for the declaration.
	`scope` (optional)	Specifies when to reset the variable. This can be for each side of a two-sided session or only after a new session is detected. Possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
	`value` (optional)	Specifies a regular expression to assign to the pattern variable. This attribute is only valid when the **`scope attribute`** is set to `constant`.
`match`		The possible entries for taking an action once a match criterion has been found for a declaration. These nodes can be nested to provide deeper logic. There are several categories of execution elements (functions) that can appear as children of a match element: • General • Arithmetic • String • Payload

Payload Functions

This topic defines language for the flex parser payload functions.

These functions operate on a `read` position, set at the beginning of a `match` element.

Language Definition

Node Name	Attribute Name	Description
`find`		Searches the stream payload starting at the read position for a provided string value. If the value is found, the offset from the read position is returned. Any child elements will then execute. If not found, any child elements will not execute.
	`name`	A `number` variable to receive the offset from the `read` position where the match begins.
	`value`	A string to find.
	`length` (optional)	A limit to the length of the payload to be searched. If a limit is not provided, the remainder of the payload is searched. It is recommended to always use the smallest value possible here in order to reduce the effect on performance.
`install-decoder`		To enable tokens to match on payload data that may be fragmented or otherwise encoded. A scan decoder can be installed to preprocess a section of the payload before it is scanned for tokens. An example would be an HTTP response that uses the chunked transfer encoding with gzip content encoding. By parsing the HTTP header, the necessary type, offset, and length parameters can all be set, after which the HTTP response payload would appear to the token scanning as if neither encoding had been applied. However, this incurs significant overhead.
	`type`	The type of decoder to install. Valid options are: gzip, deflate, chunked, chunked-gzip, chunked-deflate.
	`offset`	Offset from the current read position to begin decoding.
	`length`	The maximum payload length to decode.
`isdecoding`		Tests whether an installed decoder is currently active. If so, any children of this function will execute. This function has no parameters.

Node Name	Attribute Name	Description
`move`		Moves the `read` position forward in the current stream by a specified number of bytes. If there is sufficient data in the stream, the `read` position is updated and any child elements will then execute. If not found, the `read` position remains unchanged and any child elements will not execute.
	`value`	The number of bytes to move the `read` position.
	`direction` (optional)	The direction to move the current read position. Can be `forward` (default) or **`reverse.`**
`packetid`		Returns the id of the packet for the current read position. It is possible for the result to be 0, which indicates that the packet id could not be determined.
	`name`	A number variable to receive the current packet id.
`payload-position`		Returns the current read position. This is a zero based index into the stream payload.
	`name`	A number variable to receive the current read position.
`read`		Reads a specified number of bytes starting at the `read` position into a variable. If there is sufficient data in the stream, the `read` position is updated, the data read assigned, and any child elements will then execute. If not found, the `read` position remains unchanged and any child elements will not execute.
	`name`	The name of a `string` or `number` variable to receive stream data. If a `number` variable is provided, the bytes read are interpreted as a single unsigned numeric value.
	`length`	The number of bytes to read from a stream.
	`endianess` (optional)	The byte ordering to use when reading into a number variable. Can be `big` (default) or `little`. The attribute is invalid when reading into a `string` variable.

Regex

This topic defines language for the flex parser regex node.

Regex searches the stream payload starting at the `read` position for matches to a provided regular expression. If matches are found, the offset from the `read` position and, optionally the matched string, is returned. Any child elements execute. If no matches are found, child elements do not execute.

Language Definition

Attribute Name	Description
`name`	A `number` variable to receive the offset from the `read` position where the match begins.
`value`	A regular expression to find.
`length` (optional)	A limit to the length of the payload to be searched. If a limit is not provided, the remainder of the payload is searched. It is recommended to always use the smallest value possible here in order to reduce the effect on performance.
`found` (optional)	The name of a `string` variable to receive a matched string.

String Functions

This topic provides language definitions for the flex parser string functions.

String Functions Language Definition

Node Name	Attribute Name	Description
`append`		Attaches a number or string to the end of a `string` variable.
	`name`	The unique identifier of a string variable to which the specified value is to be attached.
	`value`	A number or string to attach.
`find`		Searches a string for a provided string value. If it is found, the position is returned and any child elements will execute. Otherwise, child elements will not execute.
	`name`	A `number` variable to receive the zero-based position, where the provided value string was found in the **in** string.
	`value`	A string to find.
	`in`	A string to search.
	`length` (optional)	A limit to the length of the **in** string to be searched. If a limit is not provided, all of **in** will be searched.
`length`		Assigns the length of a string to a `number` variable.
	`name`	A `number` variable to receive the length of the specified string.
	`value`	A string value whose length is to be determined.
`regex`		Searches a string for matches to the provided regular expression. If a match is found, the position and, optionally, the matching string is returned. Any child elements will then execute. If not found, any child elements will not execute. Regular expression operations can adversely affect system performance.
	`name`	A number variable to receive the zero-based position, where the provided regular expression matched in the in string.
	`value`	A regular expression to be searched for.

Node Name	Attribute Name	Description
	in	A string to search.
	length (optional)	A limit to the length of the in string to be searched. If a limit is not provided, all of **in** will be searched.
	found (optional)	The name of a string variable to receive the matched string.
substring		At least one of the optional attributes from and length must be specified.
	name	The unique identifier of a string variable to receive the extracted value.
	value	A string value from which to extract a substring.
	from (optional)	The zero-based position from which to begin the substring. If not specified, it defaults to zero.
	length (optional)	The number of characters to extract. If not specified, it defaults to the remaining length of the string.
tolower		Converts a string to all lowercase letters.
	name	The name of a string variable to process.
toupper		Converts a string to all uppercase letters.
	name	The name of a string variable to process.
urldecode		Decodes a string containing url-encoded characters.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.
base64decode		Decodes a base-64 encoded string.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.
uudecode		Decode a uuencoded string.
	name	A string variable to receive the decoded string.
	value	A uuencoded string. The header and trailing lines should not be included.
quotedprintabledecode		Decode a Quoted-printable encoded string.
	name	A string variable to receive the decoded string.
	value	A quoted-printable encoded string.

Node Name	Attribute Name	Description
convert-ebcdic		Convert an EBCDIC string to its ASCII equivalent.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.

GeoIP2 Parsers

This topic describes the GeoIP2 parser for Decoders. This parser converts IP addresses into geographic locations, such as the country name and city where the IP address is typically found.

Note: In version 11.3 and later, the native GeoIP2 parser replaces the GeoIP parser (which has been permanently removed). The GeoIP2 parser provides the same basic functionality as the GeoIP parser as well as many enhancements. For example, it converts IP addresses into geographic locations, provides the latest Maxmind GeoIP package, and supports IPv6 addresses as well as IPv4.

Available in NetWitness version 11.2 or later, the GeoIP2 Parser is enabled by default for upgrades and new installations. The GeoIP2 parser provides the latest Maxmind GeoIP package and supports IPv6 addresses as well as IPv4.

To edit the GeoIP2 parser configuration:

1. Go to  (Admin) > **Services**.
2. In the **Administration services** view, select a Log Decoder or a Decoder.
3. Click the settings icon () and select **View** > **Config**. In the Parsers Configuration panel, select **GeoIP2** to view and update configuration options.
4. Define the IP addresses to lookup. The GeoIP2 parser enables the following IP addresses by default: `ip.src`, `ip.dst`, `ipv6.src`, and `ipv6.dst`. You can update options by using `parsers.options` to remove or add new IP addresses. For example, you can edit `parsers.options` and pass a comma-separated list of IP addresses to use as follows:
   `GeoIP2="ipaddr=ip.src,ip.dst,ipv6.src,ipv6.dst,alias.ip"`
   This adds a new IP address to lookup called `ip.addr`. However, since `alias.ip` does not end in `.src` or `.dst`, the parser will elect to place the GeoIP2 metadata generated in meta keys without a `.src` or `.dst` suffix. So, you would see country, city, and so on, after the `alias.ip` metadata.
5. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

Note: The list you pass for `alias.ip` replaces the default list. So, if you pass `alias.ip=ip.src`, it generates only GeoIP2 metadata for `ip.src`, and generates no metadata for other IP addresses.

Note: `parsers.options` is used for passing options to multiple parsers. So if you add GeoIP2 to it, you should not delete any other options being passed to other parsers (like Entropy).

The following table provides the full list of metadata that the GeoIP2 parser can potentially generate and indicates which metadata is or is not enabled by default:

Enabled by Default	Not Enabled
country, country.src, country.dst	latdec, latdec.src, latdec.dst
	longdec, longdec.src, longdec.dst
domain, domain.src, domain.dst	isp, isp.src, isp.dst
org, org.src, org.dst	city, city.src, city.dst

You can enable the other metadata using the standard parser configurations.

Note: By disabling some metadata by default, the GeoIP2 parser does not work the same as the GeoIP parser (which did not, by default, disable any metadata it generated). If you need any of the disabled metadata, you need to enable them (once only) for each Decoder, after upgrading to 11.2 or later. Keep in mind that the `isp` and `org` meta keys usually produce an equivalent value to `domain`.

Lua Parsers

There are a number of Lua parsers available from Live. See NetWitness Content for:

- A complete list of these parsers
- Their interdependencies
- The Flex parsers that are subsumed by each Lua parser

Five common parser operations are:

- Match Port and Identify Immediately
- Match Port and Delay Identification
- Match Token and Identify Immediately
- Match Multiple Tokens
- Match Token and Create Metadata

HTTP Parsers

The HTTP parser is a native parser that is used for Decoders to parse both requests and responses in HTTP messages. In version 11.4 and later, the HTTP parser provides a decompression option.

The decompression option mimics the decompression option in the Lua HTTP parser and is controlled by the `'decompression'` option for the HTTP parser. Parser options are set in the `/decoder/parsers/config/parsers.options` configuration node. To set an option on the HTTP parser, you append an `HTTP=""` clause to the `parsers.options` field so that HTTP can understand the `'decompression'` option.

For example, you could add `HTTP="decompression=true"` to the parser option list to enable decompression of all HTTP compressed bodies.

You can use the following values in the `'decompression'` field.

Value	Description	Example Entry in parsers.options
`true`	Decompress all bodies	`HTTP="decompress=true"`
`false`	Do not decompress. This is the default.	`HTTP="decompress=false"`
`1`	Decompress `application/*` content	`HTTP="decompress=1"`
`2`	Decompress `audio/*` content	`HTTP="decompress=2"`
`4`	Decompress `font/*` content	`HTTP="decompress=4"`
`8`	Decompress `image/*` content	`HTTP="decompress=8"`
`16`	Decompress `message/*` content	`HTTP="decompress=16"`
`32`	Decompress `model/*` content	`HTTP="decompress=32"`
`64`	Decompress `text/*` content	`HTTP="decompress=64"`
`128`	Decompress `video/*` content	`HTTP="decompress=128"`

The numeric values can be combined by addition to search for multiple types of content. For example, if you want to decompress application and text content, use `1 + 64 = 65`, which becomes `HTTP="decompress=65"`.

To set the decompression option:

1. Go to  (Admin) > **Services** and select a Decoder, and in the actions menu (), select **View** > **Explore**.
2. Expland **decoder** > **parser**s and select **config**.
3. In **parsers.options**, append `HTTP="decompress=<option from table>"`.

4. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

Visibility into HTTP/2 Sessions

You can search for metadata items derived from headers and data in the HTTP/2 stream to gain visibility into HTTP/2 sessions. The HTTP/2 parser supports demultiplexing interleaved streams and extracts the application payload for detections in other parsers looking at the tokens in the payload.

To turn on header parsing and decompression for HTTP/2 sessions:

1. Go to  (Admin) > **Services** and select a Decoder, and in the actions menu (), select **View** > **Explore**.
2. Expland **decoder** > **parser**s and select **config**.
3. In **parsers.options**, append any option shared below:
   a. For header only parsing.
   Append `HTTP2="headers=true"`
   b. For header parsing and header extraction to other parsers (example: HTTP_lua).
   Append `HTTP2="headers=true extract=headers"`
   c. For header parsing, header extraction and data decompression (example: gzip and brotli encodings).
   Append `HTTP2="headers=true extract=all"`

   Note: On enabling data decompression with `extract=all` the capture rate reduces by 10%.
4. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

Note: On content reconstruction HTTP/2 compressed streams are automatically detected and decompressed.

To avoid duplicate meta from HTTP/2 parser when Lua parser HTTP_lua is enabled:

1. Disable the HTTP/2 parser.

   To disable parser refer to the topic: Enable and Disable Parsers and Log Parsers
2. Go to  (Admin) > **Services** and select a Decoder, and in the actions menu (), select **View** > **Explore**.
3. Expand **decoder** > **parsers** and select **config**.
4. Make sure to append `HTTP2="headers=true extract=headers"` or `HTTP2="headers=true extract=all"` in **parsers.options**.

   Note: On enabling data decompression with `extract=all` the capture rate reduces by 10%.

5. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

This would make HTTP/2 force enabled but with meta generation disabled, thus avoiding duplicate meta generation.

Decoder Snort Detection

Snort is a free and open-source intrusion prevention system that uses a rule-based language to detect malicious network traffic. The NetWitness Platform Decoder offers compatibility with Snort detection rules, sometimes referred to as Snort signatures. NetWitness supports importing existing Snort rules into the Decoder, extending the known threats that can be detected. There are many sources for Snort rules, as it is an open source solution. In most cases, the behavior of Snort rules in the Decoder is the same as the rules in other network analysis tools. However, the Decoder does not have coverage for all Snort rule options. The topics in this section highlight NetWitness Platform Decoder-specific details of how to set up Snort parsers, how Snort rules are handled, and explain cases where Decoder might differ in behavior from Snort.

Using Snort Rules in Decoders

The Snort Detection engine is implemented as a built-in native parser in Decoders. The parser's identifier is `Snort`, and can be found in the Decoder Parsers Configuration page along with the other native parsers enabled by default. The Snort parser reads files from the directory `/etc/netwitness/ng/parsers/snort`. All files in this directory are read during the Decoder service restart. Files that end in the extension `.conf` are treated as configuration files. The format for configuration files matches the configuration file format for Snort, although not all configuration directives are supported. Further details are in Configuration Directives . Files that end in the extension `.rules` are treated as Snort rules files. A rules file can contain one or more rules, and the Snort directory can contain more than one rules file. The rule file format is the same as for Snort itself. The Snort rule files can be loaded into the Decoder by any of the following methods:

1. The Decoder service starts.
2. The `reload` message is sent to the `/decoder/parsers` folder. This allows for rules to be reloaded while capture is running.

However, note the following:

- Any rule that does not properly parse is ignored.
- Any valid Snort rule should successfully parse; however, there are rule options that are not supported by Decoders which are not fully parsed. For more information, see Snort Parser Capabilities .

Note: NetWitness recommends that the maximum number of Snort rules in use per Decoder is 1,000.

Initial Decoder Snort Configuration

Follow these steps to set up an initial configuration of Snort on a Decoder.

1. Edit the `snort.conf` file in the `/etc/netwitness/ng/parsers/snort` directory, and configure it according to the instructions in Configuration Directives , which describes the details of the variables inside the configuration file. If the variables `HOME_NET, EXTERNAL_NET` and `HTTP_PORTS` are not defined, they default to the value of `any`.
   A sample `snort.conf` file is shown below, but depending on where the Decoder is placed in the network, and which threats need to be captured, you might need to alter the configuration.
   For example, you can be more specific about the internal subnets by defining `ipvar HOME_NET [192.168.0.0/16, 10.0.0.0/8, 172.16.0.0/12]`. However, if the Decoder is capturing

traffic on a DMZ, those subnets might not be accurate.
Also, if `HOME_NET` has been defined, and the `EXTERNAL_NET` has also been narrowed down to `ipvar EXTERNAL_NET !$HOME_NET`, then you may miss lateral movement traffic (for example, `192.168/16` to `192.168/16`) within your environment. In general we suggest you align this configuration file with how you configure the `traffic_flow` configuration for the corresponding Traffic Flow Lua parser.

An example `snort.conf` file that is a good starting point:

```
#Configure the network addresses you are protecting
ipvar HOME_NET any
#Configure the network addresses external to your environment
ipvar EXTERNAL_NET any
#Configure any specific network ports
portvar HTTP_PORTS any
```

2. Generate or upload a Snort rules file into the same directory (`/etc/netwitness/ng/parsers/snort`). Read the Snort documentation at https://www.snort.org/#documents for details on how to construct rules. There are many free community-generated Snort rules available as well, that can be uploaded from https://www.snort.org/downloads/#rule-downloads. Several other sites publish Snort signatures as responses to new threats that are found. The basic rule structure and supported sections are mentioned in Rule Sections.

   Note: Only the Snort V2.x rules are supported. There are some rule options that are not supported, which are described in Snort Parser Capabilities .

3. Make sure the Snort configuration and rules files do not cause any errors when initialized by the Decoder by running the service restart command on the Decoder.
   The reload will check in the Snort rules without restarting, but does not log any messages about whether there are any issues with the rules or configuration.

   a. In the NetWitness user interface, go to  (Admin) > **Services** > **Decoder** >  > **View** > **System**.

   b. Select **Shutdown Service** and confirm. (The Decoder will automatically restart.)

   c. Go to > **Services** > **Decoder** >  > **View** > **Logs**.

   d. Search for Snort to validate that the rules files loaded.
      The log will indicate if the rules files are loaded completely (`full`), partially (`partial`), or if any rules railed to load (`failed`).
      The following are example log entries, using `mysnort.rules`, with two fully supported rules in the file. If any of the rules are marked partial or failure, examine the rules to determine why the load was not successful.

```
Loaded mysnort.rules, full 2, partial 0, failures 0
Loaded 2 snort rules, 2 small tokens, 0 with pcres, 0 partial, 0
unsupported
```

      When you search for Snort, you can find details on configuration variables and warning messages

if they are not defined. The following is an example log entry for a `snort.conf` file that is not fully populated with the minimal IP and port variables.

```
Undefined snort ip variables (will default to any): EXTERNAL_NET, HOME_
NET
Undefined snort port variables (will default to any): HTTPS_PORTS
```

e. Alternatively, you can perform the service restart and review of the logs from the Decoder console:

```
systemctl restart nwdecoder
tail -f /var/log/messages | grep -i snort
```

4. Import or capture network traffic that is known to trigger the Snort rules to validate they are functioning.
5. Validate that the Snort rules are getting triggered by the network traffic or by sample uploaded PCAPs. The Snort statistics can be used to track which rules have been evaluated, compared to generated metadata. For more information, see Rule Statistics . The default metadata generated by Snort rules are: `sig.id`, `sig.name`, `threat.category`, `threat.source`, and `risk.num`. The mapping of Snort rule information to NetWitness Platform metadata, and how to change it, is described in Snort Parser Output.

Snort Parser Output

When a Snort rule matches a session, it produces meta items. The meta items generated may change depending on the configuration of the Snort parser. Snort parser meta key usage has been updated with a new option for the Snort parser. The option, `Snort="udm=true"` (set to true by default), uses the Aligned Unified Data Model (UDM) key set. For information about UDM, see https://community.netwitness.com/t5/netwitness-platform-unified-data/introduction-to-the-rsa-netwitness-platform-unified-data-model/ta-p/565620. By default, the Aligned UDM key set is used.

Note: To pass options to parsers, you must first give the name of the parser and then the options to be passed in this format:
`<ParserName>="<ParserOptions>"<Whitespace><ParserName2>="<Parser2Options>"`
Each `ParserName=Value` option must be separated by whitespace. Normally, the `Value` must have double quotes around it. The `Value` itself can sometimes list multiple `Option=Value` pairs, each separated by whitespace, and if those values have whitespace, they must be in escaped double quotes. To escape a quote, place a backslash before it: `\"`.
This is an example of defining options for Parser1, Parser2, and Parser3:

```
Parser1="Option1=\"Option1 Value With Space\" Option2=Option2ValueNoSpace"
Parser2="Option1=Value" Parser3="op1=val1 op2=val2 op3=\"another value\""
```

The following keys are generated in the Aligned Unified Data Mode:

- `sig.id` with the value of the rule's `sid` field
- `threat.category` with the value of the rule's `classtype` field
- `sig.name` with the value of the rule's `msg` field
- `risk.num` with the value of the rule's priority

The following keys are generated in Legacy Key Mode:

- `alert.id` with the value of rule's `sid` field
- `threat.category` with the value of the rule's `classtype` field
- `risk.info`, `risk.suspicious`, or `risk.warning` depending on the priority of the rule. The value of the risk meta is the rule's `msg` field.

If you want to use the legacy key set which contains keys that are consistent with previous releases for Snort parser meta keys, follow these steps.

1. In the NetWitness User Interface, go to **ADMIN** > **Services**.
2. Select a Decoder and then click ⚙ > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.
4. In the right panel, in `parser.options`, add `Snort="udm=false"`.

Rule Statistics

The Snort parser maintains counters to monitor the activity of each rule. These counters can be retrieved using the running `snrtStat` on the Decoder's `/decoder/parsers` node, which can be accessed through the NwConsole utility or the REST interface. The statistics reported for each rule are:

- `evaluations`: This counts the number of times the rule was evaluated. A rule can be evaluated once for each stream in a session. Typically a rule will only match one side of a session, and will be evaluated, at most, once. The `content` strings determine if a rule will be evaluated in a session. A `content` pattern must match somewhere in the session in order for it to be evaluated.
- `hits`: This counts the number of times a rule matched and the corresponding alert meta item was created.

To review the Snort statistics when using the Decoder console:

1. Log in to the console locally or remotely
2. Type the command `NwConsole`
3. Log in to `localhost:50004 <admin> <netwitness>` (change login credentials accordingly)
4. Enter `/decoder/parsers snrtStat`

The output is a JSON structure listing the number of evaluations and hits performed, along with the options evaluated, for each Snort ID.

Configuration Directives

Decoder supports a limited number of configuration directives.

Variable Definitions

Decoder supports definitions of variables that hold the value of IP ranges using `ipvar` or Port ranges using `portvar`. For example, Snort rules usually make use of `HOME_NET, EXTERNAL_NET` and `HTTP_PORTS` variables. These have to be defined in your configuration file. If they are undefined, they default to the special value `any`.

ruletype

The definition of additional rule types is supported. However, only rules that have a base rule type of `alert` are supported. Rule type definitions follow the same definition format as Snort configuration.

Other Configuration Entries

config detection: debug

Adding this configuration line turns on debug messages that are generated as the rule is being processed. These debug messages are generally emitted only emitted when a rule matches a session by one of the content patterns, but then fails to match other options within the rule. This is useful for debugging complex filters in Snort rules, to determine why they may not be matching as expected.

config nopcre

Adding this configuration line turns off the PCRE (regular expression) capability.

config classification

Classification configuration influences how meta is generated when a rule matches a session. Meta output from Snort rule matches is described in Snort Parser Output.

Snort Parser Capabilities

The general format of a Snort rule is that it contains a rule header and rule options. The rule header consists of the rule action, protocol type, source-destination criteria (IP addresses, ports), and the direction of traffic. The rule options consist of the message (`msg`) which describe what the rule has detected, the references related to the threat or where the rule was generated, the classification of the rule, the unique signature (`rule`) identifier, and a long list of attributes (for example, `flow`, `content`, `pcre`) to define how the traffic is identified. The specific details on which header and rule options are supported are outlined in the remainder of this section.

Rule Sections

Section	Description
Header	The header conditions are evaluated when a rule receives the first token callback for a stream. The header is evaluated once per stream, and prevents any further consideration of a rule against a specific stream if the conditions are not met.
Actions	The specified action or a rule must be defined (either one of the native Snort actions, or defined in the configuration using the `ruletype` statement) for the rule to be considered valid. The Decoder only uses rules with alert actions.
Protocols	The Decoder supports the current Snort protocol keywords (`tcp`, `udp`, `icmp`, `ip`).
IP Addresses	The full language for defining IP addresses is supported, including lists, CIDR, and negation.
Port Numbers	The full language for defining port numbers is supported, including lists, ranges and negation.

Section	Description
Direction Operator	The directional operator supports the from-to (‘->’) and bidirectional (‘<>’) values. The to-from (‘<-’) value is invalid and causes the rule to fail to load.

Content

The Snort `content` statement makes up the bulk of the Snort pattern detection capability. For best performance, Decoder strives to map `content` patterns to the Token Parser used by most NetWitness parsers. Therefore, the `content` strings are the main mechanism to activate the rule matching engine on a session for a particular rule. If the rule does not have any content patterns, it is effectively unsupported. The Snort parser allows for very short strings patterns in content, but be aware that a rule that contains only very short content may have to be evaluated for every session, which will make the Snort Engine run much more slowly.

The Snort parser supports most forms of `content` statements, including the following modifiers. All modifiers effect the last `content` pattern declared in the rule.

Option	Description
`nocase`	Case-insensitive pattern matching is used.
`offset`	This option is applied to the distance of the token from the beginning of the packet. If the number of bytes between the offset point and the start of the token is **less** than this value, it is not a match.
`depth`	This option is applied to the distance of the token from the current offset position, or the beginning of the packet if no offset is set. If the number of bytes between the 'offset' point and the beginning of the token is **greater** than this value, it is not a match.
`distance`	This option is applied to the distance of the token from the current Detection Offset End (DOE) point. If the number of bytes between the current token and the DOE is **less** than this value, the token is not a match.
`within`	This option is applied to the distance of the token from the current Detection Offset End (DOE) point. If the number of bytes between the current token and the DOE is **greater** than this value, the token is not a match.

These content modifiers are supported if the Snort parser is used in conjuction with AppHTTP native parser:

Option	Description
`http_client_body`	The token must appear in the body of an HTTP request.
`http_cookie`	The token must appear in an HTTP cookie header.
`http_header`	The token must appear any where in in an HTTP request or response header.

Option	Description
`http_method`	The token must appear in the HTTP method field. The detection engine does not currently restrict the method tokens, such as `GET` or `POST`, to the HTTP method field, so these matches will work even if `AppHTTP` is turned off.
`http_uri`	The token must appear in the **normalized** HTTP header. Non-normalized header matches are not supported.

Further detail on the HTTP related modifiers is described below in HTTP Parsing.

Flow

The flow directive verifies that the rule is only applied to the client or server stream. It supports the following options.

Option	Description
`to_client`	Limits the rule to only matching on a stream that a Decoder has defined as Server.
`from_server`	Synonym for `to_client`.
`from_client`	Limits the rule to only matching on a stream that a Decoder has defined as Client.

Fast Pattern

The Snort parser uses `content` tagged with `fast_pattern` to indicate tokens that should always be used as tokens in the Decoder's token scanner. Decoder supports the `fast_pattern` and `fast_pattern:only` directives, but it does not support the `fast_pattern:offset,length` directive.

PCRE

The Snort parser implements `pcre` regex matching using the same libpcre library as other tools. It supports most of the flags documented for the `pcre` tag, with a few minor exceptions as described later in this document.

HTTP Parsing

The Snort parser relies on the native HTTP parser to notify it when HTTP is being parsed. The HTTP parser feeds information to the Snort engine to let it know which regions of the session should be used to evaluate the `http content` flags. The `pcre` implementation has option flags analogous to the `http content` options, and these are supported as well. If the native HTTP parser is disabled, then these features are also disabled in the Snort parser.

File Data

The Snort parser supports the `file_data` tag for HTTP response bodies only. This functionality relies on the native HTTP parser being enabled. If the Native HTTP parser has the decompression feature turned on, the Snort parser also uses decompressed responses to implement rule matching inside of `file_data` regions. You can enable the HTTP decompression feature by adding the token `HTTP="decompress=true"` to the configuration field `/decoder/config/parsers.options`.

The Decoder has a Javascript normalization parser that functions similarly to the `normalize_javascript` feature in Snort's HTTP preprocessor. It also affects data presented to Snort rules using `file_data`. To enable the Javascript normalization parser, add the token `JSNormalize="unescape=true"` to the configuration field `/decoder/config/parsers.options`.

The Snort parser emulates the `file_data` behavior in the same way as Snort. Directives that appear after `file_data` are implicitly evaluated whenever a content match is found inside of a `file_data` region. Because of this, `file_data` has side effects on other statements that appear after it in a rule.

Binary (byte) Directives

The Snort parser supports the `byte_test`, `byte_extract` and `byte_jump` directives.

The detection engine supports most options on these directives:

- The options for extracting the value, such as the offset, the little endian / big endian options, and relative options are supported. The relative flag causes the extraction of the byte value to occur relative to the DOE (Detection Offset End) pointer.
- `byte_jump` and `byte_extract` support the `align` and `multiplier` options to manipulate the extracted value.

The '`byte_extract` directive stores values in variable names that can be used to substitute a number into a few specific locations elsewhere in the rule. These locations are supported:

- The `value` field in a subsequent `byte_test`
- The value of a `within` statement on a subsequent content pattern
- The value of a `distance` statement on a subsequent content declaration.

The `byte_jump` option explicitly moves the DOE (Detection Offset End) pointer for use by subsequent directives, like `byte_test`, content marked with distance or within, or PCRE patterns marked as relative.

There are some less common byte operations that are not supported:

- The byte options do not support the `string` option for converting text into a binary value
- The byte options do not support the `bitmask` option.
- The byte options do not support the `dce` option.

Default option / fallback

When the Snort parser encounters rule options it does not yet support, it skips those options and assumes they did not prevent the rule from matching. In such cases it relies on the implementation of options it does support, such as the content or pcre statements, to determine if the rule matches. This behavior means that the Snort parser is more likely to fail in the `false-positive` direction rather than the `false-negative` direction when using features that Decoder does not yet support.

Packet Scanning/Scoping

Depending on how the rule is formed, it may be intended to match content entirely within single packets, or it may be intended to match data that spans multiple packets. The Snort parser attempts to handle both cases. Rule statements that are implicitly packet-scoped may be evaluated for every packet available in a session at parse time, and the Snort parser correctly scopes such rules so they only match if the elements of the rule match in a single packet. Conversely, if the rule uses a feature that implies reassembly and reconstruction, such as `file_data`, the Snort parser will allow the rule to be evaluated for the reconstructed portion of the stream that the rule references. This allows the Snort parser to emulate the various buffers that the Snort product provides.

Known Limitations for Snort Parser

Decoder Token Match Limits

The Snort Parser is activated by token scanning in Decoder, and therefore is subject to the same limitations on matches as all Decoder parsers. Configuration items such as `parse.bytes.min`, `parse.bytes.max`, timeouts, and size limits all apply to the Snort parser. The Decoder configuration guide describes these parameters in great detail. The Snort parser is implemented on top of reassembled sessions only so that features that require an assembled session can be supported.

Flow Bits

Flow bit directives, which start with the keyword `flowbits`, are currently mostly ignored by the Snort detection engine. Statements in rules that test flow bits currently always pass. However, the detection engine will honor flowbit directives that specify `noalert`. Rules marked as `noalert` never generate meta, even if they match.

DCE Preprocessor

The Snort parser does not currently implement any DCE preprocessors, so any features that rely on the DCE preprocessor are not implemented.

Thresholds and Filters

The Snort parser implements the `threshold` filters option only. It does not yet implement the `detection_filter` filter.

Raw Byte Scanning

The Snort parser does not currently allow rules to individually bypass the normalization or decoding using tags like `rawbytes`.

IPv6

The Snort rule parser does not currently allow rules to utilize IPv6 addresses as part of their header.

Note: Only the Snort V2.x rules are supported.

Performance Considerations

The performance of the Snort parser is dependent entirely on the rules that are being evaluated. Therefore it will vary greatly from one installation to another.

Content Tokens

Content tokens form the main entry point into the Snort engine. Hence they are the main factor affecting rules performance. The more times that a content string is found in the packet stream, the more work the Snort parser performs, and the more CPU time it uses. Therefore, it's important to use content tokens that are long, unique, and unlikely to appear in random data. Short tokens will spuriously activate the Snort parser, wasting CPU time.

Negation

Statements like `content` and `pcre` support negation, meaning they only allow the rule to match if a content string is not found or if a regex doesn't match. These are usually detrimental to performance because they still tend to contain strings that will activate rule evaluation, yet will often fail since they are intended to filter out patterns. For example, a negated `pcre` search still has to be evaluated if it is negated, and if it is used to filter out common text. it will produce lots of CPU activity on traffic that does not actually match the Snort rule.

Search Parser

The Search Parser is a custom parser used to generate metadata by scanning for predefined keywords and regular expressions. The parser searches the payload of a reconstructed session for string matches and can execute a regular expression search. You can configure the parser by editing the **search.ini** file.

Caution: The search parser can have a significant impact on system performance. It is important that both the search mechanism and the data to which it is applied to be well understood before creating new search definitions and enabling the search parser.

The search definition is used across all protocols. There are three basic search methods:

- Keyword: Search a stream for a specific set of words
- Pattern: Search a stream for a regular expression match
- Keyword + Pattern: Search a stream for a regular expression if it contains any of a given set of keywords.

Search Methods

The Search parser uses three basic search methods:

- Keyword: Search a stream for a specific set of words.
- Pattern: Search a stream for a regular expression match.
- Keyword+Pattern: Search a stream for a regular expression if it contains any of a given set of key words.

Syntax

```
Maxrecon=<max_size>Maxsearch=<max_ssearch_length>MatchLimit=<max_matches_per_
stream
Search Name
Services=<service_id_list>Keywords=<keyword_list>|Pattern=<expression>Case=0|1
Proximity=<number_of_bytes>Recon=0|1
Raw=0|1
```

Parameters

Parameters used in this command:

Parameter	Description
`autocheck`	Automatically fixes all problems without prompting
`header Only`	Check/display the header of each file

Parameter	Description
`chatty`	Displays a hex dump of every object in the file (huge amount of data)
`dump#-#`	Indicates a zero-based object or range of objects in the file to output in hex to the console

Example

Following is an example of the command:

To check all NetWitness database files located in the Collection named Default. If any problems are found, the command will describe the problem and ask if you would like to fix it.

```
dbcheck C:\Documents and Settings\User\My Documents\NetWitness\
Investigations\Default\*.nw*
```

Wireless LAN Configuration

One of the files available for editing in the Services Config view > Files tab is **`wlan-config.xml`**, the wireless LAN configuration file.

It controls the 802.11 parsers. Its chief purpose is to control decryption of raw 802.11 frames captured by the Decoder. This file is optional. If decryption of 802.11 traffic is not desired, there is no need to create the file.

There are five link-level parsers related to wireless LAN packet capture:

- IEEE 802.11 parser (data frames and beacons only)
- Radiotap w/ 802.11 header
- Absolute Value Systems (AVS) w/ 802.11 header
- Prism II w/ 802.11 header
- CACE's ″Per Packet Information″ (PPI) w/ 802.11 header

The 802.11 wireless parsers introduced in 9.8 all share a single configuration file. This wlan-config.xml file is used to define any wireless access points the user may have in the network, and its primary purpose is to control decryption. The BSSID of the access point and the SSID that it's authoritative for is added to this file as well as all of the active default keys used by the access point.

Troubleshooting Parsers

This topic provides guidance for troubleshooting issues related to parsers.

Lua Parser Errors

Lua parsers occasionally generate errors. If a parser enters a state where it generates multiple errors, these errors can hinder performance. Beginning with 11.4, a new option is available for Lua parsers that instructs the Decoder to automatically disable the parser after a configurable number of errors.

The value is set on the `/decoder/parsers/config/parsers.options` configuration node as shown in the following example:

```
Entropy="log2=true" GeoIP2="ipaddr=ip.src,ip.dst,ipv6.src,ipv6.dst" error_
parser="errorMax=5" addy_parser="errorMax=10"
```

This configuration node enables you to set options for different parsers. In this example, the Lua parser `error_parser` is configured with a maximum error count of 5, and the `addy_parser` to 10. The `errorMax` setting has a valid range of values from 0 (meaning the feature is disabled) to 65,535, and takes effect when parsers are loaded or reloaded.

To disable a Lua parser after a defined number of errors:

1. Go to **ADMIN** > **Services**, select a Decoder and then select  > **View** > **Explore**.
2. In the left panel, expand **decoder** > **parsers**, and select **config**.
3. In **parsers.options**, add the following command, where `<any_parser>` is the Lua parser for which you want to limit errors, and `<n>` is the number of errors to which the parser is limited:
   `<any_parser>="errorMax=<n>"`

4. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**.

Results of Automatically Disabling a Parser

When a parser is automatically disabled, a log message is generated (per parser thread) and states that the parser has been disabled, as shown in the following example:

```
(W) 2019-Apr-25 16:25:33 [Parse] Lua parser 'error_parser' has been disabled
because it exceeded the configured error threshold (5)
```

If detailed statistics for parsers are enabled, the text of the last error is populated in the parser's detailed statistics under `/decoder/parsers/definitions/<parser-name>`. Also, a new attribute has been added to the XML returned by the `/decoder/parsers?msg=schema` call. When the parser is in an error state, the attribute `error` is set to `1` and the `enabled` attribute is set to `0`. When the parser is reset, the values are reset to `0` and `1` respectively.

Resetting the Parser

If a parser is disabled because it has exceeded the error threshold, it can be reset by reloading the parser. This causes the statistics to reset so that if the faulty parser is still in place, it will function again until the error threshold is met.

Configure Feeds

NetWitness uses feeds to create metadata based on externally defined metadata values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created. This data could identify and classify malicious IPs or incorporate additional information such as department and location based on internal network assignments. Some examples of feeds include threat feeds to identify BOTNets, DHCP mappings, or even Active Directory (AD) information such as physical location or logical department.

You can use the Live module in NetWitness to obtain feeds from outside sources. "Live Content in NetWitness" in the *Live Services Management Guide* provides an overview of the Live content management tool.

Within the NetWitness user interface, you can view the list of currently deployed feeds, along with an indicator if a feed that originated from Live was installed through NetWitness or manually. Feeds can be added, removed, and updated while a Decoder is running without affecting capture.

Custom Feed Definition File Structure

The NetWitness Custom Feed wizard allows creation and deployment of custom Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides users through the process to create both on-demand and recurring feeds, it is helpful to understand the form and content of a feed file when you create a feed.

Before you create or modify custom feeds, keys, or data types, ensure that you have a good understanding of the relationship between keys and datatypes in databases. It is important that any custom keys that you create match the corresponding datatypes. If your feed utilizes a custom meta key, you must define that key's data type in `index-decoder-custom.xml`. This is to ensure that the key data is generated with correct data format.

Also, to enable investigation on the custom meta key, you must define its index on the concentrator, using the `index-concentrator-custom.xml` file. For more information on how to write the `index-decoder-custom.xml` or `index-concentrator-custom.xml` file, see the topic "Index Customization" in the *Core Database Tuning Guide for RSA NetWitness Platform*.

Feed filenames in RSA NetWitness are in the form `<filename>.feed`. To create a feed, NetWitness requires a feed data file in `.csv` or `.xml` format and a feed definition file in `.xml` format, which describes the structure of a feed data file. The Custom Feed wizard can create the feed definition file based on a feed data file, or based on a feed data file and the corresponding feed definition file.

The files that you use to create an on-demand feed must be stored on your local file system. The files used to create a recurring feed must be stored at an accessible URL, whence NetWitness can fetch the most current version of the file for each recurrence. After a NetWitness feed is created, you can download the feed to your local file system, edit the feed files, and then edit the NetWitness feed to use the updated feed files.

Sample Feed Definition File

This is an example of a feed definition file named `dynamic_dns.xml`, which NetWitness creates based on your entries in the Custom Feed wizard. It defines the structure of the feed data file named `dynamic_dns.csv`.

Note: The feed file path should be `.csv` regardless of the Feed Type (Default or STIX).

```
<?xml version="1.0" encoding="utf-8"?>
 <FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">

   <FlatFileFeed name="Dynamic DNS Domain Feed"
   path="dynamic_dns.csv"
   separator=","
   comment="#"
   version="1">

   <MetaCallback
   name="alias.host"
   valuetype="Text"
   apptype="0"
   truncdomain="true"/>

   <LanguageKeys>
            <LanguageKey name="threat.source" valuetype="Text" />
            <LanguageKey name="threat.category" valuetype="Text" />
            <LanguageKey name="threat.desc" valuetype="Text" />
```

```
        </LanguageKeys>

        <Fields>
        <Field index="1" type="index" key="alias.host" />
        <Field index="4" type="value" key="threat.desc" />
        <Field index="2" type="value" key="threat.source" />
        <Field index="3" type="value" key="threat.category" />
        </Fields>
        </FlatFileFeed>

      </FDF>
```

Define Multiple Values in a Single Field

The information in this section applies to NetWitness version 11.3.1 and later.

Custom feeds support multiple values in a single field. This allows feeds to generate multiple values of the same meta.

For example:

```
<Fields>

     <Field index="1" type="index" key="lc.cid" />

     <Field index="2" type="value" key="user" separator=";" openchar="("
     closechar=")"/>

</Fields>
```

The second field is defined to accept multiple values in the corresponding CSV file. The following is an example of the defined values:

```
clc1,(bob;tom;sam) clc12,susan clc123,doris
```

This definition means that when we see the `lc.id` with a value of `cic1`, three `username` meta values are generated with the values of `bob`, `tom` and `sam`.

The separator in the field definition for a multi-value field **must** be different than the separator for the feed file itself. Escaping the separator character in field values is **not** supported.

Feed Definition Equivalents for Custom Feed Wizard Parameters

The NetWitness Custom Feed wizard provides options to define the structure of the data feed file. These correspond directly to attributes in the feed definition (`.xml`) file.

NetWitness Parameter	Feed Definition File Equivalent
(Define Feed Tab) Feed Type	Select: **Default** - to define a feed based on a `.csv` formatted feed data file. **STIX** - to define a feed based on STIX formatted `.xml` file.
(Define Feed Tab) Feed Task Type	Select: **Adhoc** - to create an on-demand feed. **Recurring** - to update the `.csv` or `.xml` file persistently and store it in a location accessible by NetWitness, so NetWitness downloads a file at regular intervals and pushes it to the downstream devices.

NetWitness Parameter	Feed Definition File Equivalent
(Define Feed tab) **Name**	The custom feed name in the feed data file. It corresponds to the `flatfeedfile name` attribute in the feed definition file. For example, Dynamic DNS Test Feed. **Note:** You can use special characters to define the name of the custom feed.
(Define Feed tab) **File**/ **Browse**	This is the name of the feed data file. It corresponds to the `flatfeedfile path` attribute in the feed definition file. For example, `dynamic_dns.csv`.
(Advanced Options tab) **XML Feed File**	The name of the feed definition file. For example, `dynamic_dns.xml`.
(Advanced Options tab) **Separator**	The separator character used to separate attributes in the feed data file. It corresponds to the `flatfeedfile separator` in the feed definition file. For example, a comma.
(Advanced Options tab) **Comment**	The character used to identify a comment in the feed data file. It corresponds to the `flatfeedfile comment` attribute in the feed definition file. For example, `#`.
(Define Columns tab, Define Index) **Type**	The type of lookup value in the index position of the feed data file. **IP** means that each row in the feed data file contains an IP address in the lookup value position. The IP value is in dotted-decimal format (for example, 10.5.187.42). **IP Range** means that each row in the feed data file contains a range of IP addresses in the lookup value position. The IP range is in CIDR format (for example, 192.168.2.0/24). **Non IP** means that the each row in the feed data file contains a metadata value other than IP address in the lookup value position. The Service Type and Truncate Domain, and Callback Keys fields become active for a Non IP index.
(Define Columns tab, Define Index) **CIDR**	Specifies that the IP value in the lookup position is in CIDR format. The **CIDR** attribute sets the IP address format in the field to Classless Inter-Domain Routing (CIDR) notation.
(Define Columns tab, Define Index) **Service Type**	For a Non IP index, the integer service type to filter meta lookups. It corresponds to the `MetaCallback apptype` attribute in the feed definition file. A value of 0 indicates no filtering by service type.
(Define Columns tab, Define Index) **Truncate Domain**	For a Non IP index, for meta values that contain domain names (for example, hostnames), the system can strip off the host specific element in the data. Truncate Domain corresponds to the `MetaCallback truncdomain` attribute. If the value is `www.example.com`, it is truncated to `example.com`. A value of **False** selects no truncation, and **True** selects truncation.

NetWitness Parameter	Feed Definition File Equivalent
(Define Columns tab, Define Index) **Callback Keys**	For a Non IP index, the available meta keys to match on instead of ip.src/ip.dst (the defaults for IP index type) are selectable from the drop-down list. The Callback Key corresponds to the `MetaCallback name` attribute, and the index column of the csv file must contain data that can match the chosen meta key. For example, if the `user` meta key is chosen, the index column of the `.csv` file needs to be populated with users to be matched.
(Define Columns tab, Define Index) **Index Column**	Identifies the column in the feed data file that provides the lookup value for the row. Each position in each row of the feed data file is identified by a **Field index** attribute in the feed definition file. A field with an index of **1** is the first entry in a row, the second field has an index of **2**, the third field has an index of **3**, and so on.
(DEFINE VALUES) **Key**	The name of the `LanguageKey`, as defined in the feed definition file, for which meta is created from this row of the feed data file. It corresponds to the `Field key` attribute in the feed definition file. A key applies only to a field whose type is set to `value`. In the feed definition file, there is a list of `LanguageKeys` from `index.xml`, or a summary name if Source Name and Destination Name are used. For example, `reputation` is a summary name for `reputation.src` and `reputation.dst`. This value is referenced by the Field key attribute.

Sample Files for a MetaCallback Feed Using CIDR Index Range for IPv4 and IPv6

These sample files demonstrate how to use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using MetaCallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a `.csv` file and an `.xml` file for a MetaCallback feed using CIDR index ranges for IPv4.

`.csv file:`

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

`.xml file:`

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
      <MetaCallback name="DstIP" valuetype="IPv4" apptype="0"
truncdomain="false">
            <Meta name="ip.dst"/>
      </MetaCallback>
      <LanguageKeys>
            <LanguageKey name="alert" valuetype="Text" />
```

```
      </LanguageKeys>
      <Fields>
            <Field index="1" type="index" range="cidr"/>
            <Field index="2" type="value" key="alert" />
      </Fields>
</FlatFileFeed>
</FDF>
```

The following example shows the contents of both a `.csv` file and an `.xml` file for a MetaCallback feed using CIDR index ranges for IPv6.

`.csv file:`

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

`.xml file:`

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
      <MetaCallback name="DstIP" valuetype="IPv6" apptype="0"
truncdomain="false">
            <Meta name="ip.dst"/>
      </MetaCallback>
      <LanguageKeys>
            <LanguageKey name="alert" valuetype="Text" />
      </LanguageKeys>
      <Fields>
            <Field index="1" type="index" range="cidr"/>
            <Field index="2" type="value" key="alert" />
      </Fields>
</FlatFileFeed>
</FDF>
```

Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with `range="cidr"`. Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Feed Definitions File

This topic introduces the feed definitions file, which is available for editing in the Services Config view > Files tab. One of the files available for editing in the Services Config view > Files tab is **`feed-definitions.xml`**, the feed definitions file.

You can define feeds in the `feed-definitions.xml` file. The Decoder uses an XML schema to define feed messages when it creates a binary .feed file from the feeds defined here.

For details on the feed definition language, refer to Custom Feed Definition File Structure

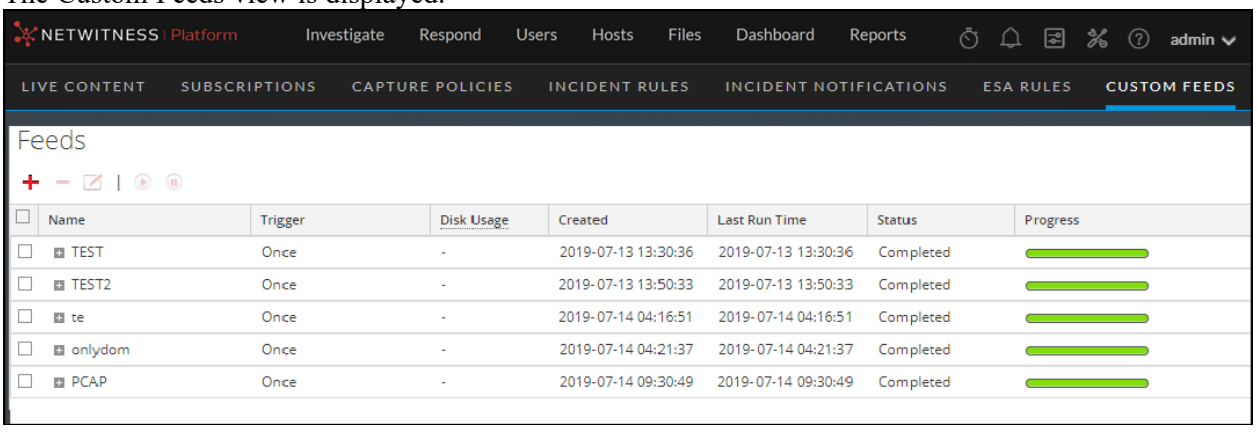
Create a Custom Feed

You can create a custom feed using the Custom Feed wizard. To complete this procedure, you need a feed data file in `.csv` or `.xml` format. If you also have an associated feed definition file in `.xml` format, which describes the structure of the feed data file, you can use the feed definition file to create a feed. The Custom Feed wizard can create the feed based on a feed data file, or based on a feed data file and corresponding feed definition file.

Before you create or modify custom feeds, keys, or data types, ensure that you have a good understanding of the relationship between keys and datatypes in databases. It is important that any custom keys that you create match the corresponding datatypes. If your feed utilizes a custom meta key, you must define that key's data type in `index-decoder-custom.xml`. This is to ensure that the key data is generated with correct data format.

Also, to enable investigation on the custom meta key, you must define its index on the concentrator, using the `index-concentrator-custom.xml` file. For more information on how to write the `index-decoder-custom.xml` or `index-concentrator-custom.xml` file, see the topic "Index Customization" in the *Core Database Tuning Guide for RSA NetWitness Platform*.

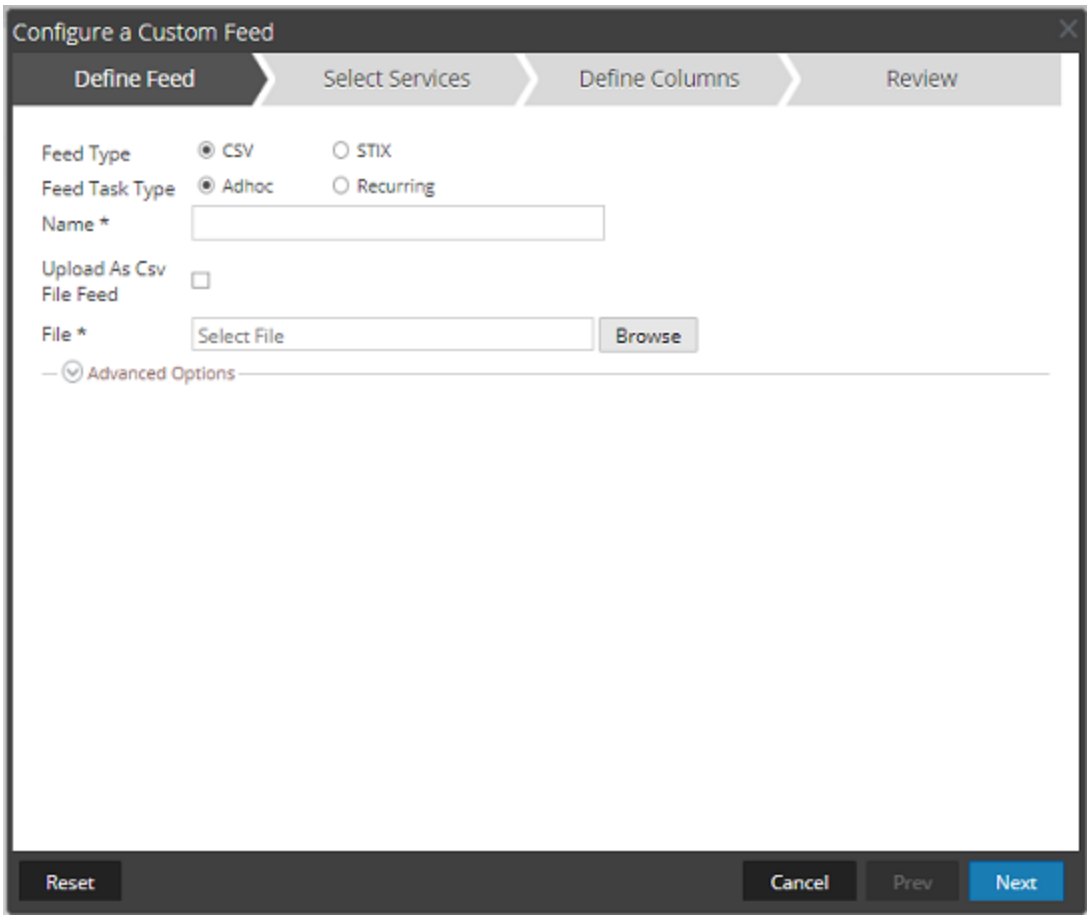
Note: For information about STIX and creating a STIX custom feed, see "Create a STIX Custom Feed" in the *Decoder and Log Decoder Configuration Guide*.



The feed data file and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

Note: When you create a source and destination-based feed on a Log Decoder, it only populates the source meta key. You cannot use a range-based or CIDR feed. You must list every single IP address. To resolve this issue, create two different feeds using IP addresses and you can use CIDR in these feeds.

To create a custom feed:

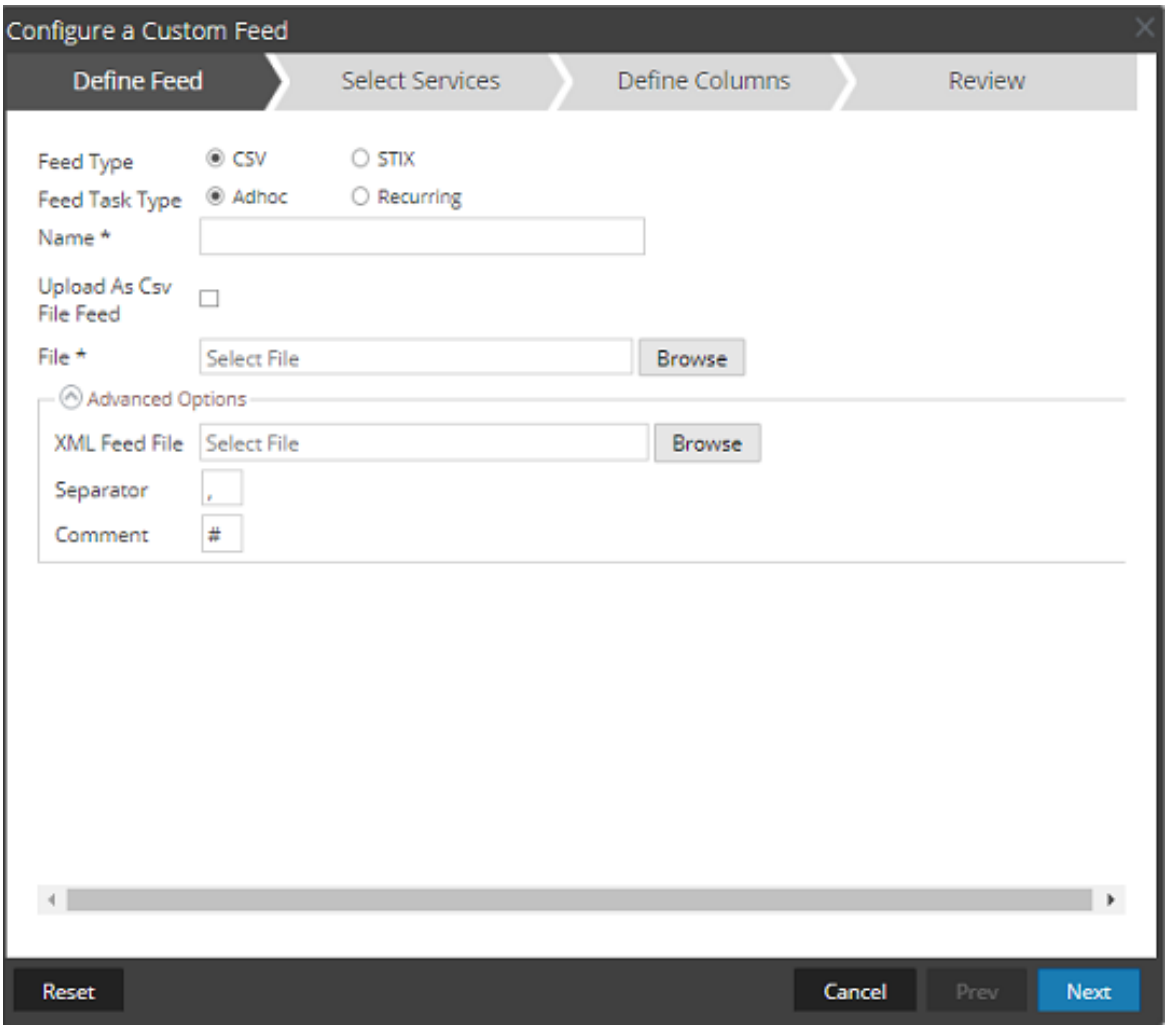


1. Go to **Configure > Custom Feeds.**

   The Custom Feeds view is displayed.

2. In the **Feeds** panel, click + > **Custom Feed** > **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.



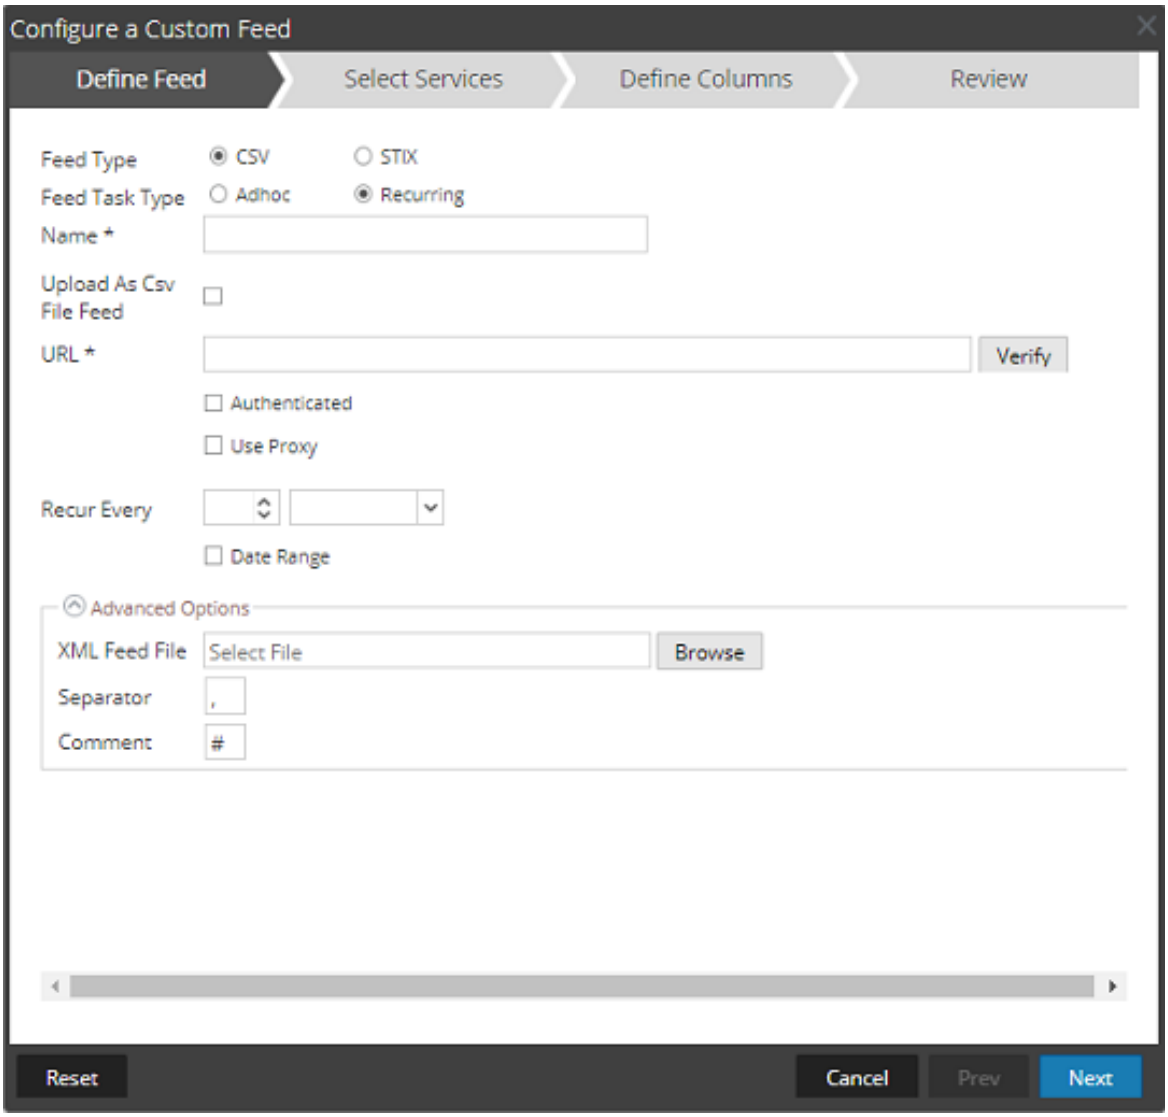
3. Select the Feed Type: **CSV** or **STIX**.
4. To define a feed based on a `.csv` formatted feed data file, select **CSV** (which is the default) in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on a CsvFileFeed file, select the **Upload as Csv File Feed** checkbox, type the feed **Name**, select a .csv content file from the local file system, and click **Next**. If you do not select the checkbox, the .csv file will be a FlatFileFeed file.

      Note: When you select the Upload as Csv File Feed checkbox, the XML feed options under Advanced are unavailable.

   b. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      Note: Ensure that the Upload as Csv File Feed checkbox is deselected.

      The Advanced Options are displayed:



c. Select an XML feed file from the local file system, choose the separator (default is comma), specify the comment characters used in the feed data file (default is #), and click **Next**.
The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.

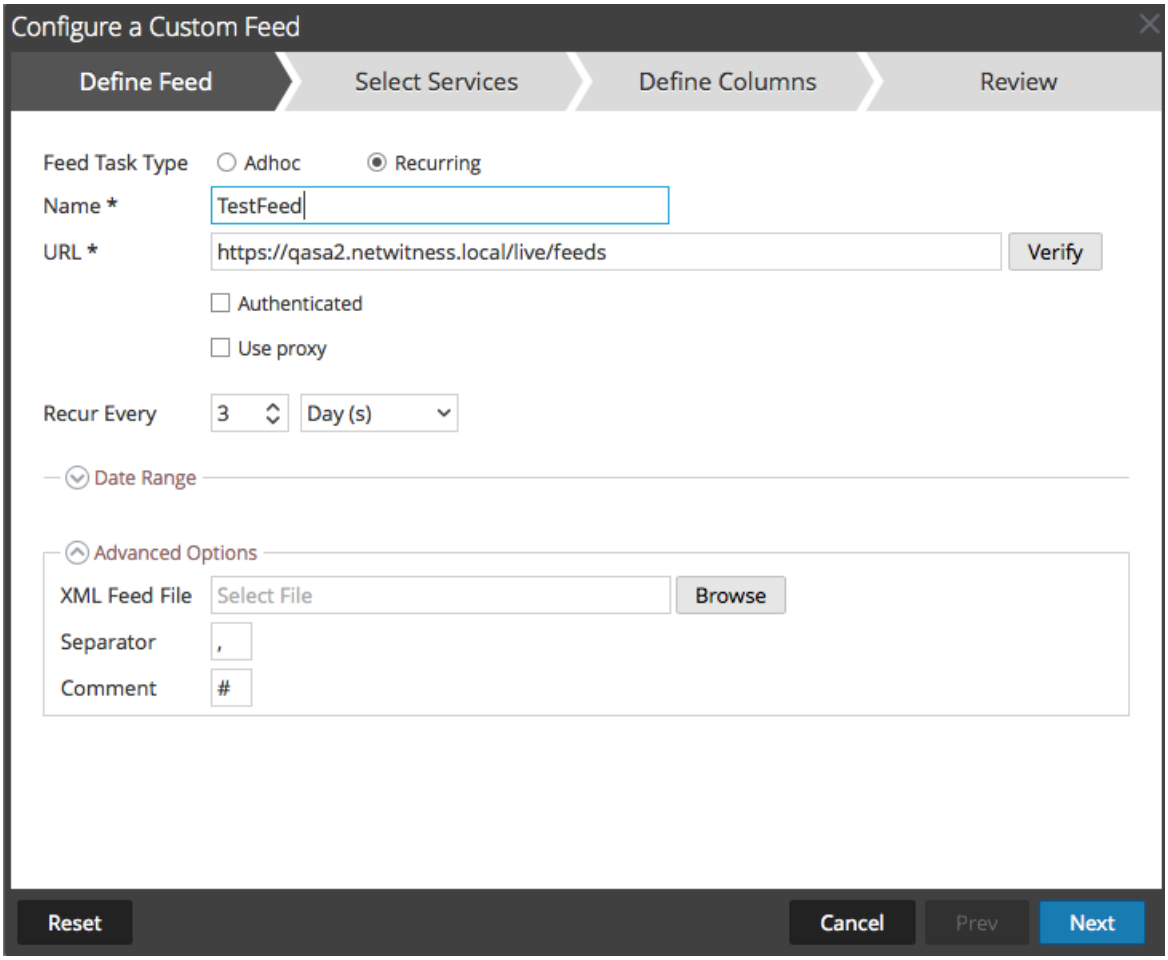
6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range:

   a. In the Define Feed form, select **Recurring** in the **Feed Task Type** field.

      The Define Feed form includes the fields for a recurring feed.

b. In the **URL** field, enter the URL where the feed data file is located, for example, `http://<hostname>/<feeddatafile>.csv`, and click **Verify**. NetWitness verifies the location where the file is stored in order to enable checking for the latest file automatically before each recurrence.

c. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.
NetWitness provides your user name and password for authentication to the URL.

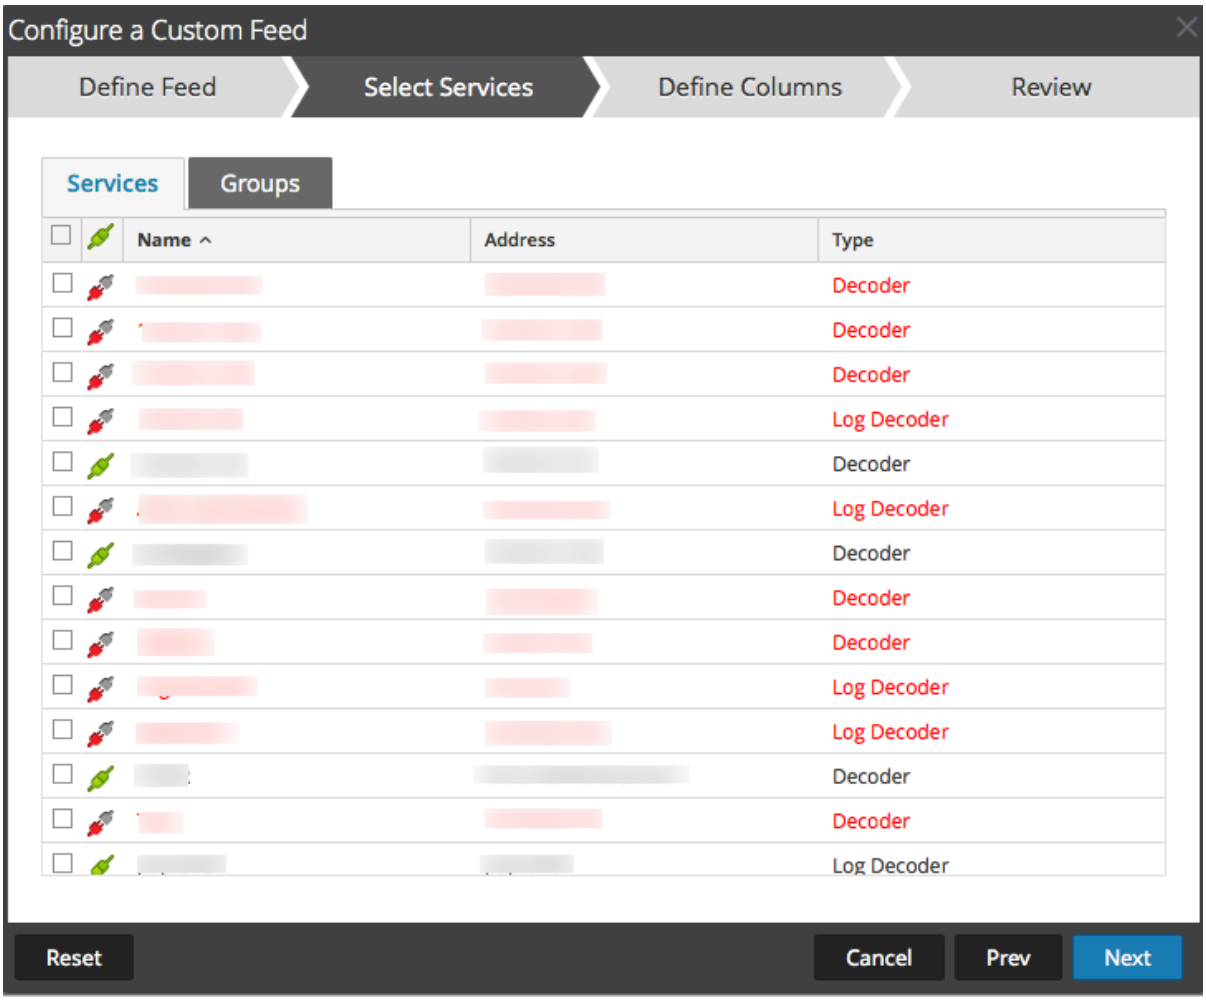


d. If you want the NetWitness server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see "Configure Proxy for NetWitness" in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not set.

e. To define the interval for recurrence, do one of the following:

- Specify the number of minutes, hours, or days between recurrences of the feed.

- Specify recurrence every week, and select the days of the week.

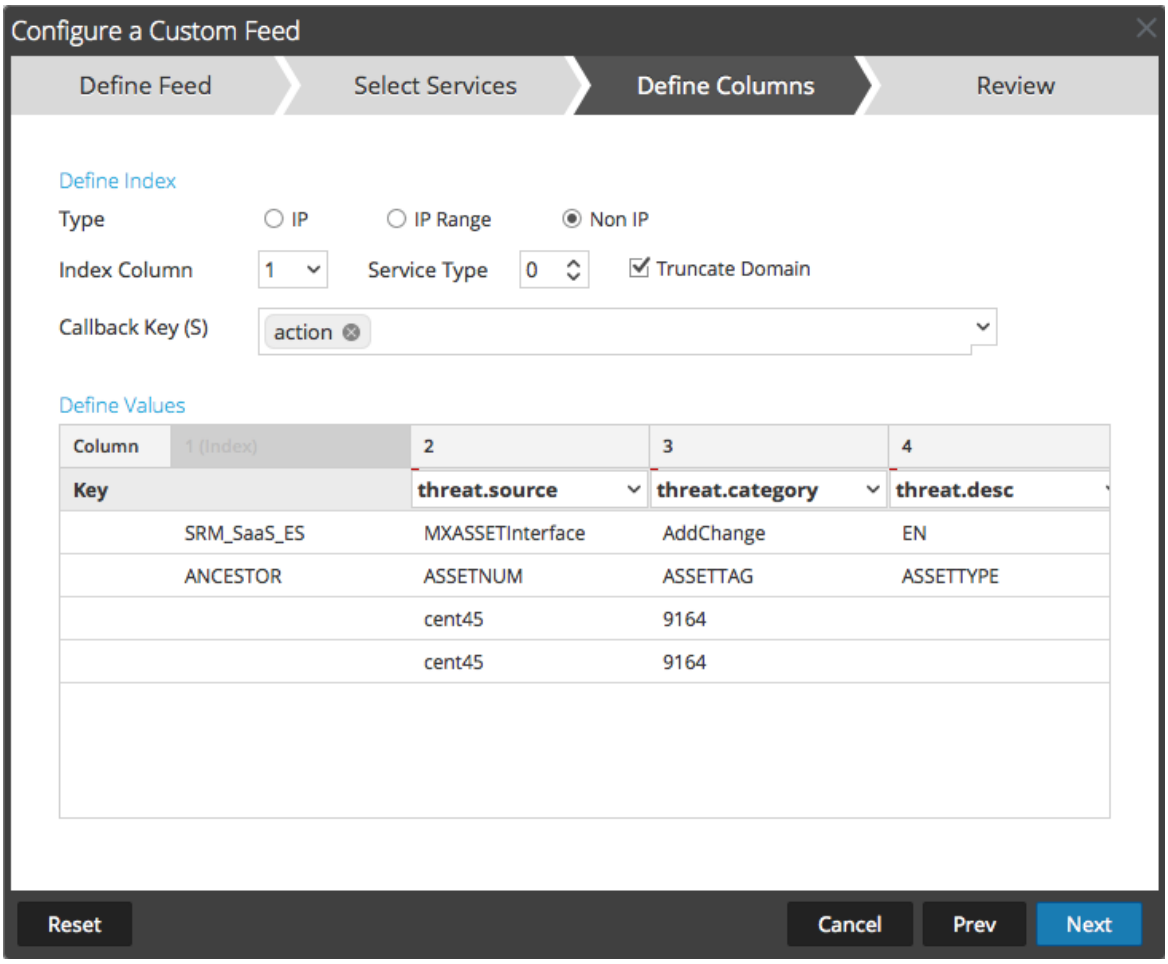


f. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

7. (Conditional) If you want to define a feed based on an XML feed file:

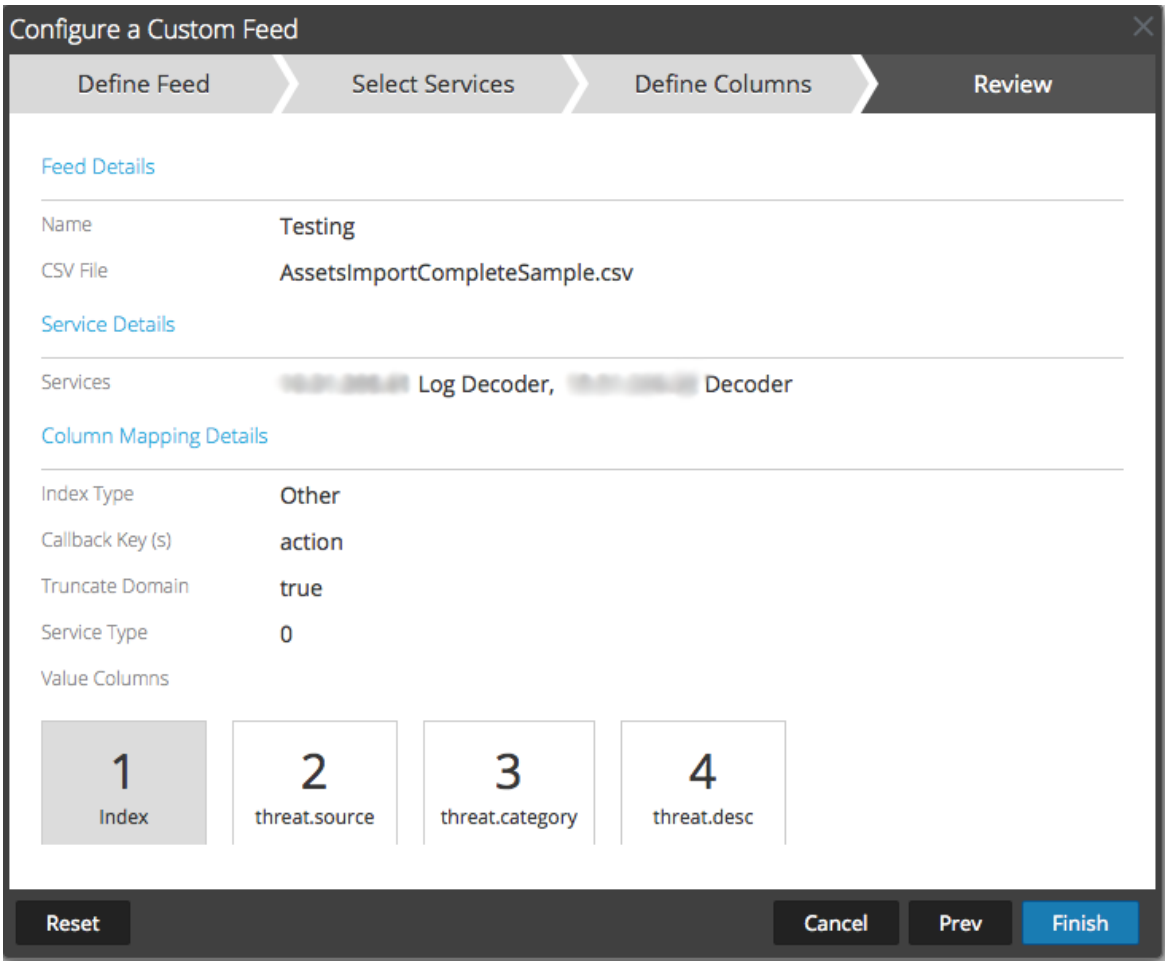
   a. Type the feed **Name**, select **Advanced Options**. The Advanced Options fields are displayed.

   b. Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #) and click **Next**. The Select Services form is displayed.



8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**
   b. Click the **Groups** tab and select a group. Click **Next**.

      The Define Columns form is displayed.
9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.



d. Select the language key to apply to the data in each column from the drop-down list. The meta keys displayed in the drop-down list is based on the meta keys available for the service define values. You can also add other meta keys based on advanced expertise.

e. Click **Next**.

The Review form is displayed.

10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Create a STIX Custom Feed

Structured Threat Information Expression (STIX™) is a structured language for describing cyber threat information so it can be shared, stored, and analyzed in a consistent manner. For more information about STIX, see https://stixproject.github.io/.

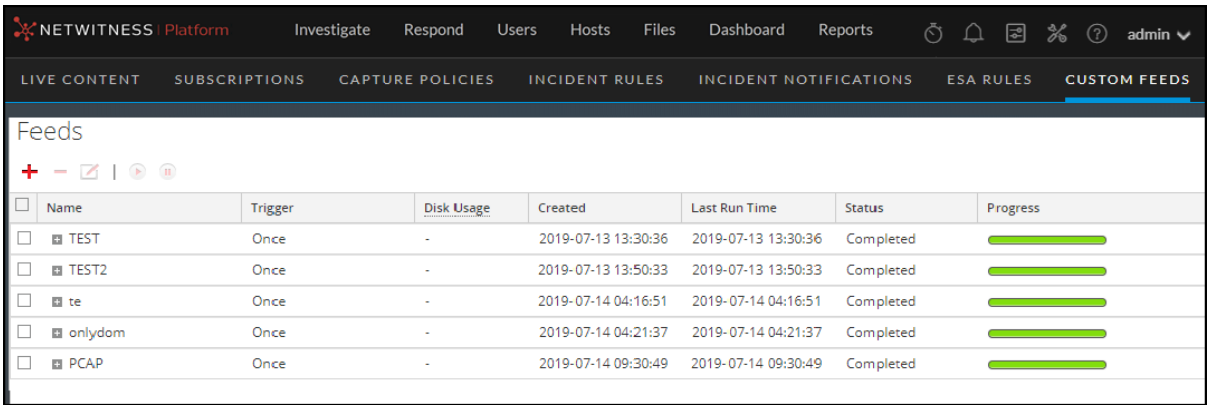
You can create a custom feed using a STIX-formatted feed data file (`.xml`) in RSA NetWitness. NetWitness supports Structured Threat Information Expression (STIX) 1.0, 1.1 and 1.2 versions only.

Caution: If a STIX recurring feed is configured and you update Security Analytics from 10.6.x to NetWitness 11.x, you must re-configure the STIX recurring feed.

In NetWitness, STIX feeds of type Indicator or Observable that contain properties such as the IP addresses, File hashes, Domain names, URIs and Email addresses are supported. The property values in the Equals operator are supported. Attributes such as Type and Title are also read from the STIX. A STIX file with a single STIX_Package is supported.

TAXII (Trusted Automated eXchange of Indicator Information) is the main transport mechanism for cyber threat information represented in STIX. Using the TAXII services, organizations can share cyber threat information in a secure and automated manner.

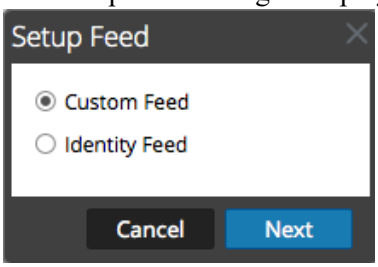
The STIX and TAXII communities work closely together to ensure that they continue to provide a full stack for sharing threat intelligence.



Apart from the TAXII server, STIX data can also reside on a REST server and you can fetch the STIX file from the REST server by providing the URL of the REST server. For example, `http://stixrestserver.internal.com`.

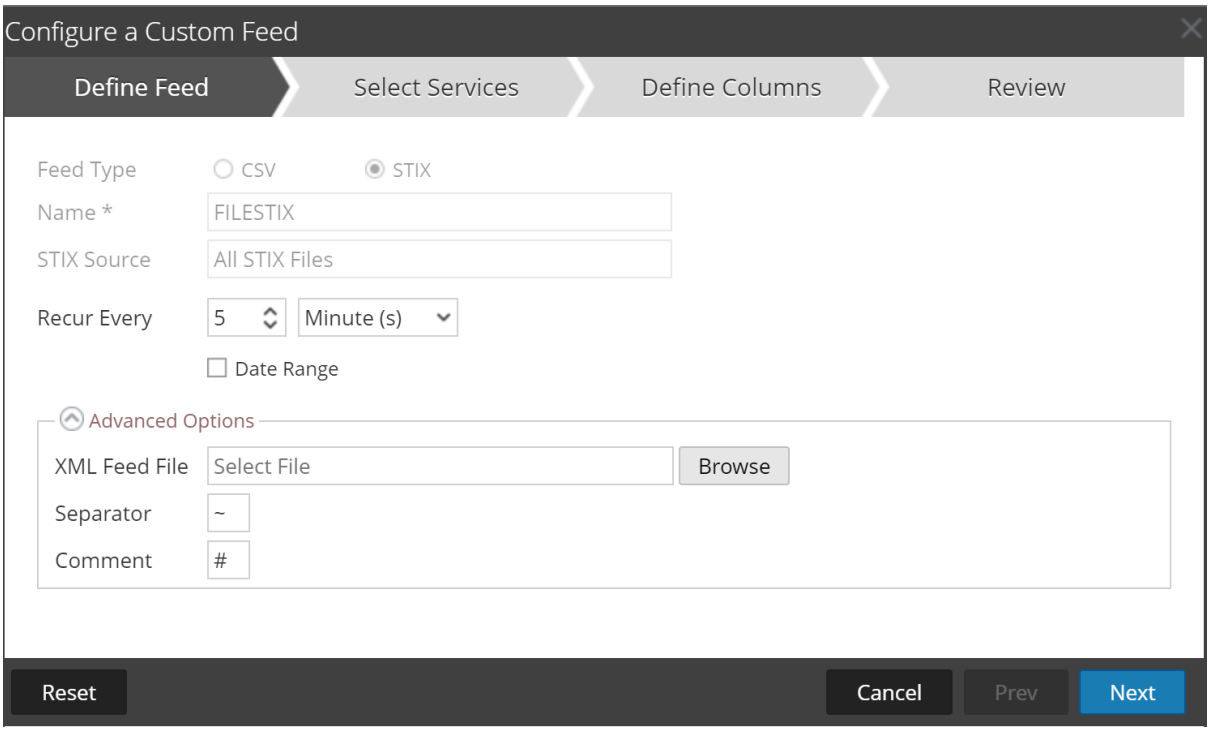
The STIX feed data file and optionally the feed definition file, both in `.xml` format must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

To create a STIX custom feed:



1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



2. In the toolbar, click .

The Setup Feed dialog is displayed.

3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed dialog open.

4. Enter the following details:

   a. **Feed Type**: Select **STIX**, to define a feed based on a STIX formatted `.xml` file.

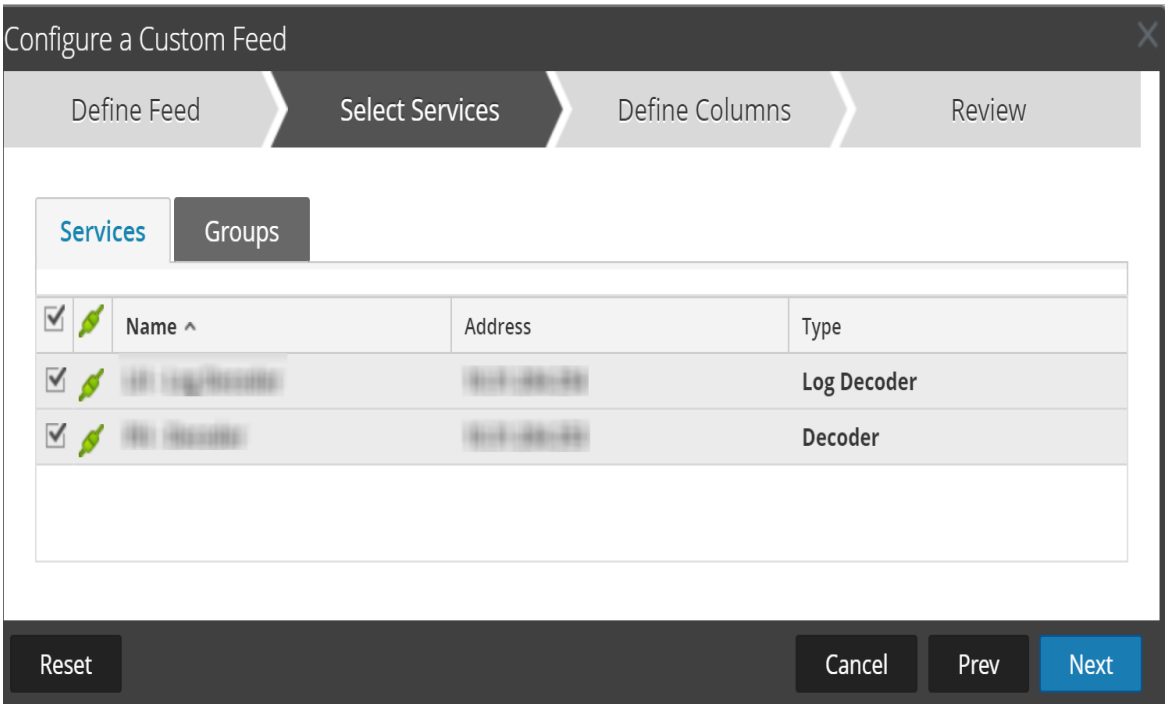
   b. **Name**: type the feed name, to define a feed based on STIX formatted `.xml` file.

   c. **STIX Source**:Select a STIX data source from the drop-down which is added in Context Hub.

   d. **Recur Every**: Specify a recurring feed task that executes repeatedly at specified intervals.

   Note: NetWitness verifies the connection to the server, so that NetWitness can check for the latest file automatically before each recurrence.

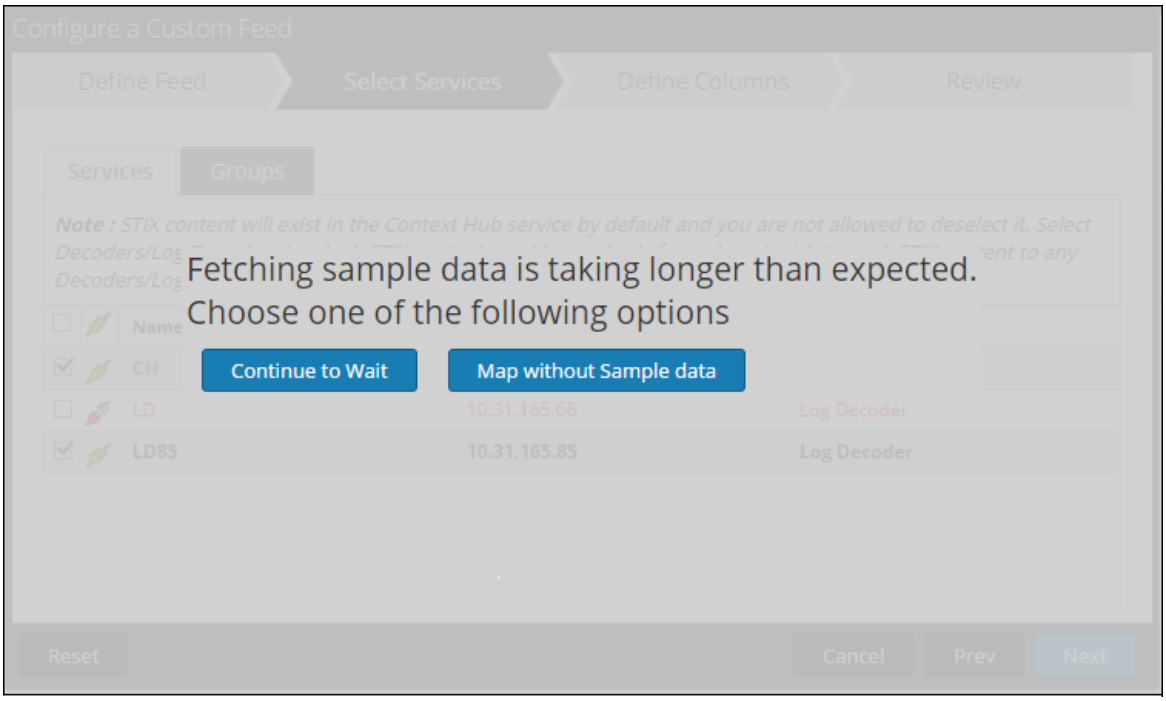
   e. **Date Range**: Select the checkbox and specify the date range for the feed task to recur.



5. (Optional) Select **Advanced Options**,to define a feed based on an XML feed file.

   a. **XML Feed file**: Browse and select an XML feed file from the local file system.

   b. **Separator**: Choose a separator (default is comma).



c. **Comment**: Specify the comment characters used in the feed data file (default is #).

6. Click **Next**.
7. The Select Services dialog is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.

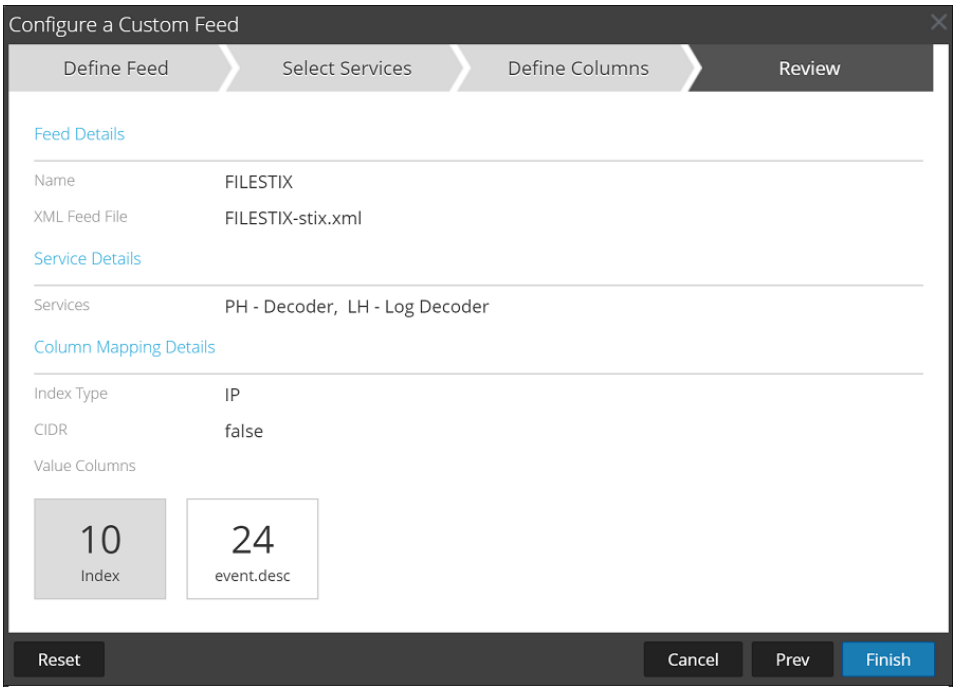
8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**.
   b. In case of STIX feed, Context Hub will be selected by default and you are not allowed to deselect it. In addition, you can select one or more Decoders and Log Decoders and click **Next** or Click the **Groups** tab and select a group. Click **Next**.

      If the data from the STIX server is large, the following message is displayed:

- If you click **Continue to Wait**, it continues to wait till the sample data is fetched or timeout (10 minutes) whichever is sooner. In case of timeout no sample data is retrieved even after 10 minutes.
- If you click **Map Without Sample data**, the mapping column is displayed without any sample data.

The Define Columns dialog is displayed.

9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Optional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. (Optional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.



Note:
- If the **Index Type** is Non IP, you can select multiple index columns in the **Index Column(S)**. The values from all the selected columns are merged in the first index column that you selected and the merged values are pushed to the Log Decoder for parsing. For example, in the **Index Column(S)** if you select 2,4,7 as index columns the values from the 2,4 and 7 columns are merged in the column 2 and the values are pushed to Log Decoder for parsing.
- Indexing cannot be done for the columns such as Indicator Title, Indicator Description, Observable Title, Observable Description, as the look up cannot be performed for those columns.

d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

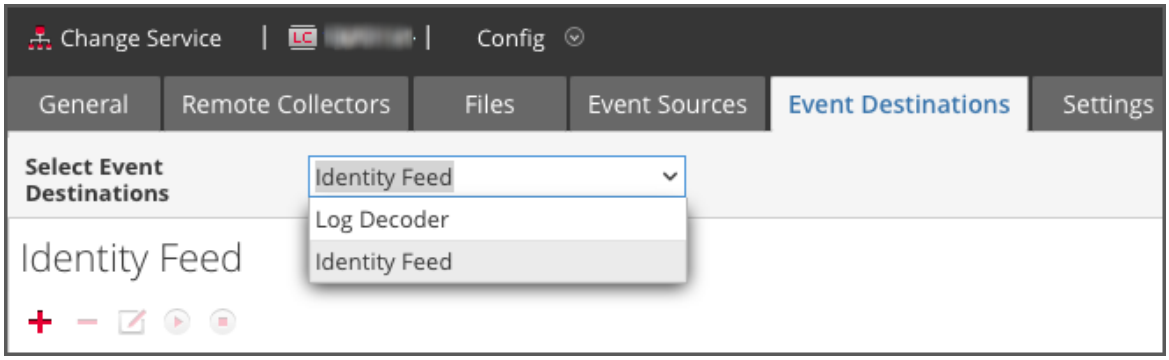
e. Click **Next**.

   The Review dialog is displayed.

10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next dialog (if not viewing the last form).
    - Click **Prev** to display the previous dialog (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.

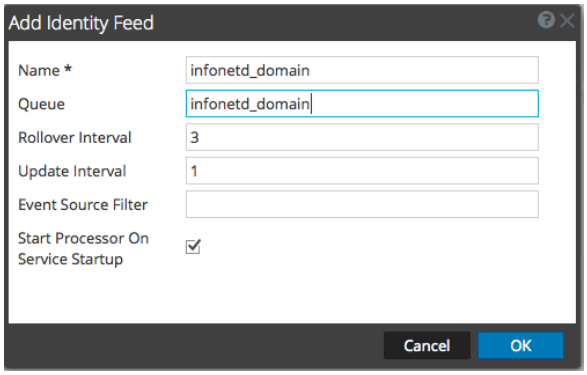
Upon successful creation of the feed definition file, the Create Feed wizard closes, the feed and corresponding token file are listed in the Feed grid, and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Note: Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy due to low memory. For more information on how to troubleshoot `OutOfMemoryError` on `Contexthub` Server, refer to "Troubleshooting" in the *Live Services Management Guide*.



Create an Identity Feed

You can create an Identity feed and populate it to selected Decoders and Log Decoders. In order to create an identity feed, you need to have:



- A Log Collector service with an Identity Feed Event Processor
- A Log Collector service with Windows Collection configured and enabled

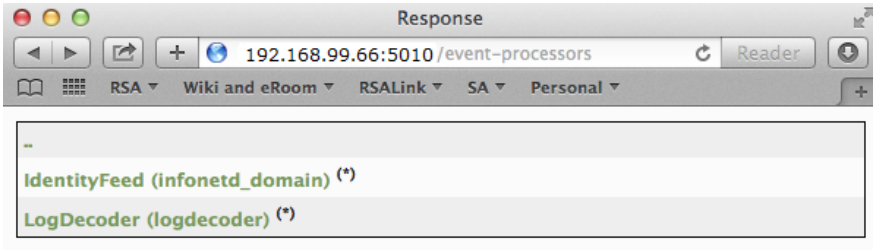
To create an identity feed:

1. Add a destination for the feed.
   a. Go to **(Admin) > Services** and in the **Services**.
   b. In the list of services, select a **Log Collector** service, and select **View > Config**.
   c. Select the **Event Destinations** tab.
   d. In the Select **Event Destinations** field, select **Identity Feed**.

   e. Click and enter a unique name for the feed.
   The Queue name identifies the feed within the Log Collector. Use the name of the feed for the Queue.

   f. Click **OK**.
2. Test generation of messages.

a. Have users log into Windows boxes on the domain to generate the appropriate log messages on the domain controllers for testing.

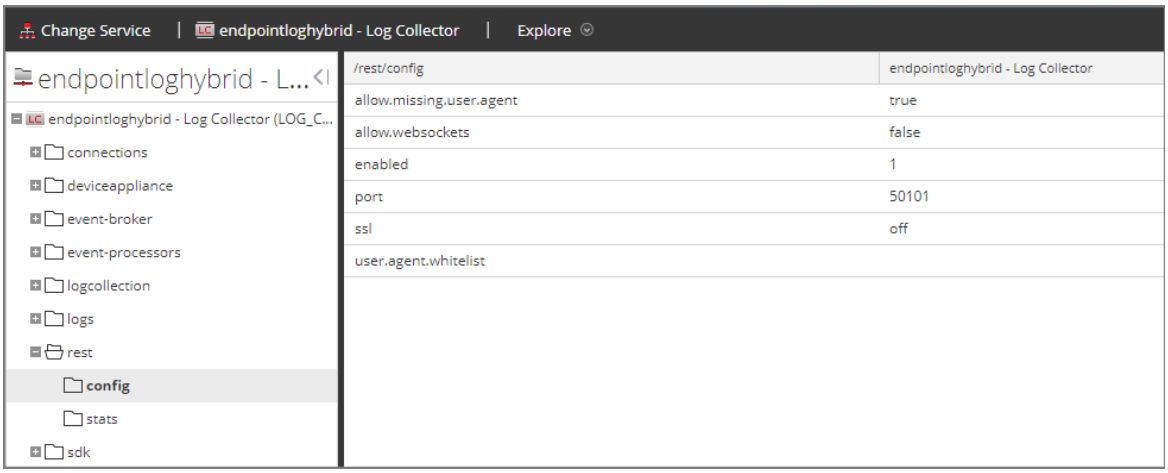


b. Verify that data is written to the feed files. SSH to the Log Decoder/Collector or Virtual Log Collector being configured. Navigate to `/var/netwitness/logcollector/runtime/identity-feed` and verify that the `Identity_deploy` files are getting populated with data.

c. Open up a web browser (Non-Internet Explorer browsers preferred) and log in to the REST interface of the Log Collector. Use administrative credentials when logging in. For example, if the IP address of your Log Collector is 192.168.99.66, the URL would be:

- SSL not enabled: **http://192.168.99.66:50101/event-processors**
- SSL enabled: **https://192.168.99.66:50101/event-processors**

The browser screen should look like this:

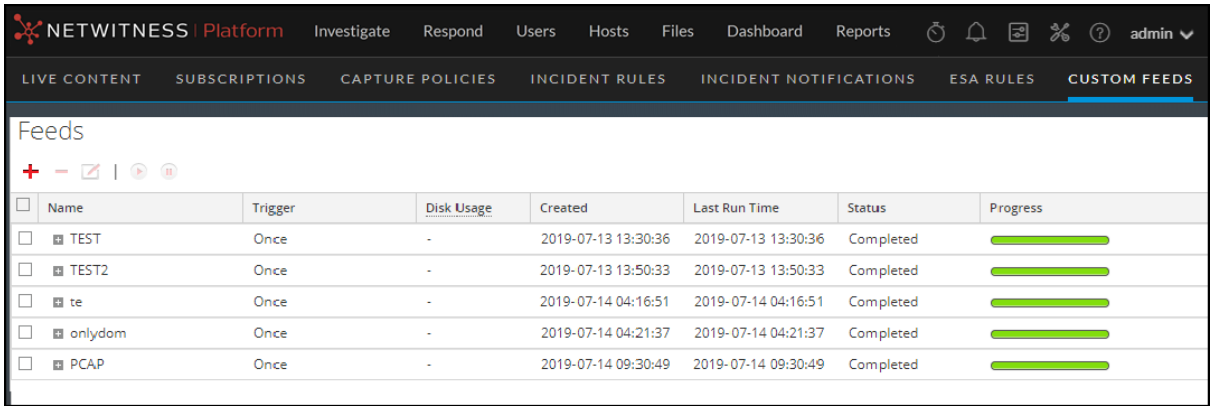


The screen contains the name of the identity feed you created earlier (`infonetd_domain`, in this example).

For the identity feed to function correctly, port 50101 must be active on the Log Collector, and you must determine whether SSL encryption is active.

d. Go to **(Admin) > Services > *<Log Collector being setup>*** **> View > Explore**.

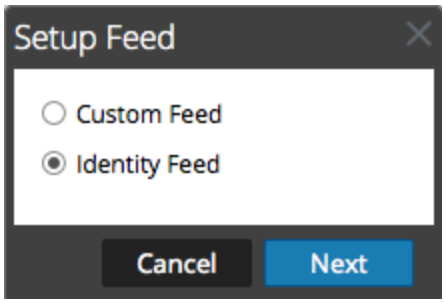
e. In the left pane, expand **rest > config**.



For REST to be active, **enabled** must be set to **1**.

f. Note the value for **ssl**. If SSL should be enabled for your environment, this must be set to **on**.

> **Note:** If you changed the setting for either the **enabled** or **ssl** option you must restart the Log Collector service before moving forward.

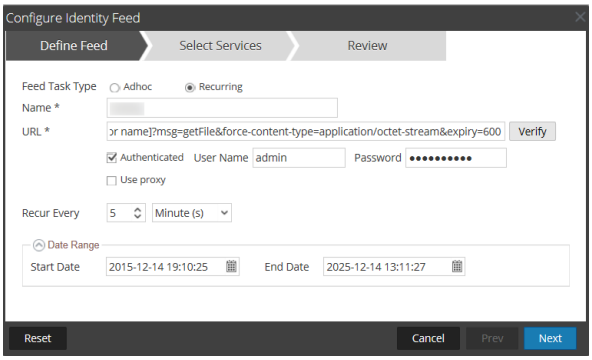


3. Go to **(Configure) > Custom Feeds**.

The Feeds dialog is displayed.

4. In the toolbar, click **+**.

The Setup Feed dialog is displayed.



5. Make sure **Identity Feed** is selected and click **Next**.

The Configure Identity Feed panel opens with the **Define Feed** tab displayed.

6. (Conditional) You can create an on-demand or recurring feed.

   - To define an on-demand Identity feed task that executes once, select **Adhoc** in the **Feed Task Type** field, type the feed **Name**, and browse for and open the feed.
   - To define a recurring Identity Feed task that executes on a recurring basis, select **Recurring** in the **Feed Task Type** field.

     The **Define Feed** dialog includes the fields for a recurring feed.

Note: NetWitness verifies the location where the file is stored, so that NetWitness can check for the latest file automatically before each recurrence.

7. Enter a value and verify the URL field.

   a. In the **URL** field, enter the URL where the feed data file is located. This is the REST API interface that was setup earlier. Make sure you have the following information to construct the URL:

      - The IP address of the Log Collector being used to construct the Identity Feed file.
      - The identity queue name, as set in step 2c.
      - Whether or not SSL is enabled on the Log Collector REST port, as set in step 2f.

      You can construct this value as follows:

      - SSL enabled: `https://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`
      - SSL not enabled: `http://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`

      So, using the example from earlier, the complete value that you would enter into this field is as follows:

      ```
      http://192.168.99.66:50101/event-processors/infonetd_
      domain?msg=getFile&force-content-type=application/octet-
      stream&expiry=600?msg=getFile&force-content-type=application/octet-
      stream&expiry=600
      ```

b. For the URL verification to work correctly, it is important that the NetWitness UI server can access the Log Collector's REST API port (50101). This can be tested by going to the NetWitness UI server via SSH. Once there, run the following command:

- SSL enabled: `curl -vk https://<ip of log collector>:50101`
- SSL not enabled: `curl -v http://<ip of log collector>:50101`

If the `curl` command does not connect then there may be a network firewall or routing issue between the NetWitness UI server and the Log Collector.

Example of a bad connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... No route to host
* couldn't connect to host
* Closing connection #0
curl: (7) couldn't connect to host
```

Example of a good connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... connected
* Connected to 192.168.99.66 (192.168.99.66) port 50105 (#0)
> GET / HTTP/1.1
> User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu) libcurl/7.19.7
NSS/3.19.1 Basic ECC zlib/1.2.3 libidn/1.18 libssh2/1.4.2
> Host: 192.168.99.66:50105
> Accept: */*
>
< HTTP/1.1 401 Unauthorized
< Content-Length: 71
< Connection: Keep-Alive
< Pragma: no-cache
< Expires: -1
< Cache-Control: no-cache, no-store, must-revalidate
< WWW-Authenticate: Basic realm="NetWitness"
< Content-Type: text/xml; charset=utf-8
<

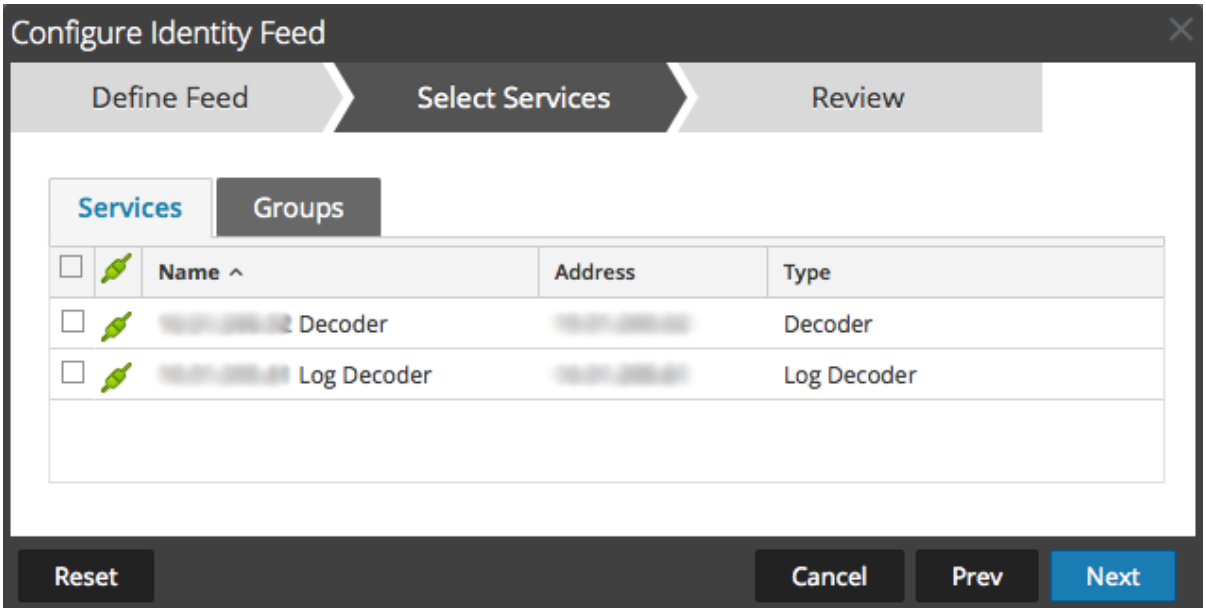
<?xml version="1.0" encoding="utf-8"?>
<error>401 Unauthorized</error>
* Connection #0 to host 192.168.99.66 left intact
* Closing connection #0
```

8. The REST API requires a username and password when attempting to pull the `identity_deploy.csv` file from the Log Collector. This can be any username and password that is available on the service itself. For more information, see the "Services Security View" topic in the *Hosts and Services Guide*.

   To see which accounts are available, go to  **(Admin) > Services > <log collector being setup> > Actions > View > Security**.

   Under the Users table, you see all the users that can be used in this step. It is suggested that a separate user account is created specifically for this setup, and is used nowhere else in the environment, for added security. For details, see "Add a User and Assign a Role" in the *System Security and User Management Guide*. (Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.)

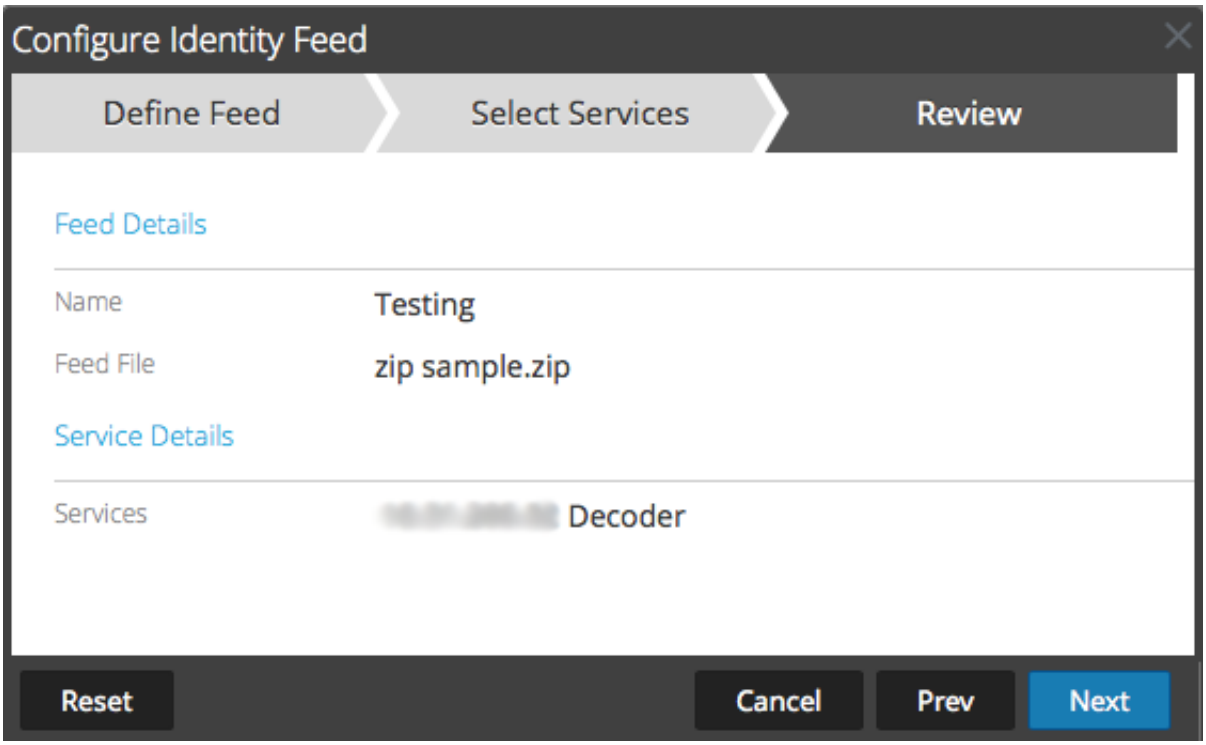
9. To define the recurrence interval, do one of the following:



- Specify the number of minutes, hours, or days between recurrences of the feed.
- Enter the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

10. If using SSL encryption, you need to install the REST API SSL certificate for the Log Collector into the NetWitness UI server. For more information, see Import the SSL Certificate.

    If, after importing the SSL certificate, the verification of the URL still fails, see Cannot Verify Identity Feed URL.



11. Click **Verify** to verify your identity feed configuration before you proceed to the Select Services dialog.
12. Click **Next**.

    The Select Services dialog is displayed.

13. To identify services on which to deploy the feed, select one or more Decoders and Log Decoders and click **Next**.
14. Click the **Groups** tab, select a group, and click **Next**.

    The Review dialog is displayed.

Note: If a group of devices with Decoders and Log Decoders is used to create recurring or custom feeds and this group is deleted, you can edit the feed and add a new group to the feed.

15. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
16. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Import the SSL Certificate

If SSL is configured on the Identity feed's Log Collector, follow these steps to import the Log Collector's SSL certificate into the NetWitness UI server key store. If this certificate is not imported, the NetWitness UI server will be unable to pull the Identify feed file from the Log Collector.

1. To pull the SSL certificate off the Log Collector, SSH into the NetWitness UI server and run the following command:

   ```
   echo -n | openssl s_client -connect <HOST>:<PORT> | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/<SERVERNAME>.cert
   ```

   This command saves the SSL certificate to `/tmp/<SERVERNAME>.cert`. For example:

   ```
   echo -n | openssl s_client -connect 192.168.99.66:50101 | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/logcollector.cert
   ```

2. To import the SSL certificate into the NetWitness UI server, SSH into the UI server and run the following command:

   ```
   keytool -importcert -alias <name an alias for the cert> -file <the cert file pathname> -keystore /etc/pki/java/cacerts
   ```

   For example:

   ```
   keytool -importcert -alias logcollector01 -file /tmp/logcollector.cert -keystore /etc/pki/java/cacerts
   ```

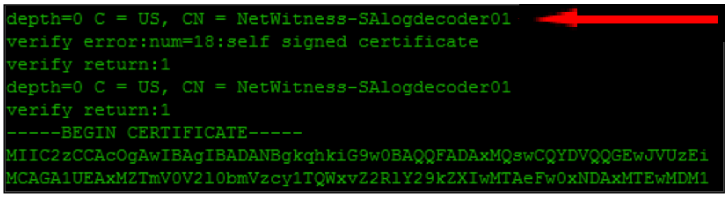
3. The system requests a password. Enter the password for the keystore on the NetWitness UI server, not for the jetty keystore. The default password is **changeit**.

4. Restart **jettysrv** to allow jetty to read the new certificate in the store.

Cannot Verify Identity Feed URL

If the Identity feed URL cannot be verified, and you are using SSL, make sure you followed the steps in Import the SSL Certificate.

If there are issues, it is possible that the internal name of the certificate does not match the hostname of the Log Collector. The following procedure checks this.



1. SSH to the NetWitness UI server.
2. Run the following command to output the CN name of the SSL cert:

   ```
   echo -n | openssl s_client -connect <log decoder>:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

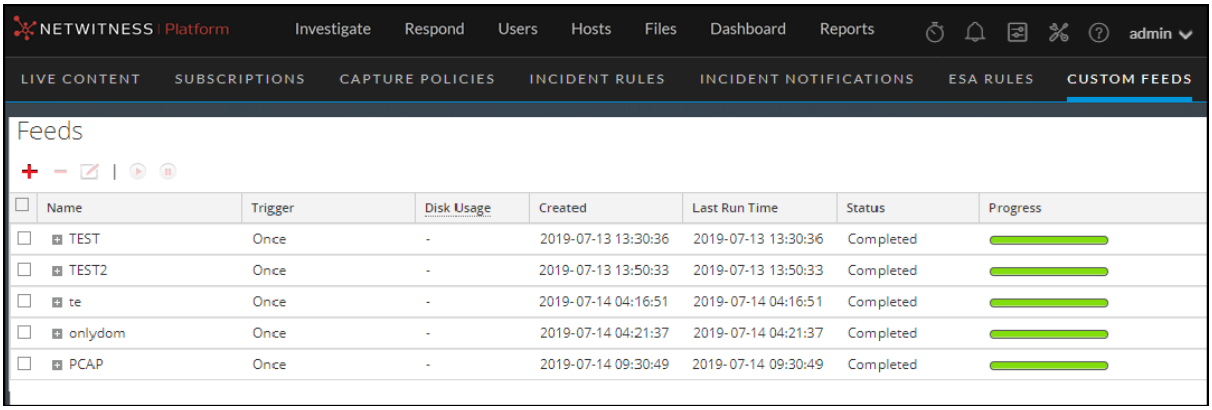
   For example:

   ```
   echo -n | openssl s_client -connect salogdecoder01:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

3. Retrieve the CN name of the SSL certificate.

4. Edit the `/etc/hosts` file and add the IP address and CN name to the file.

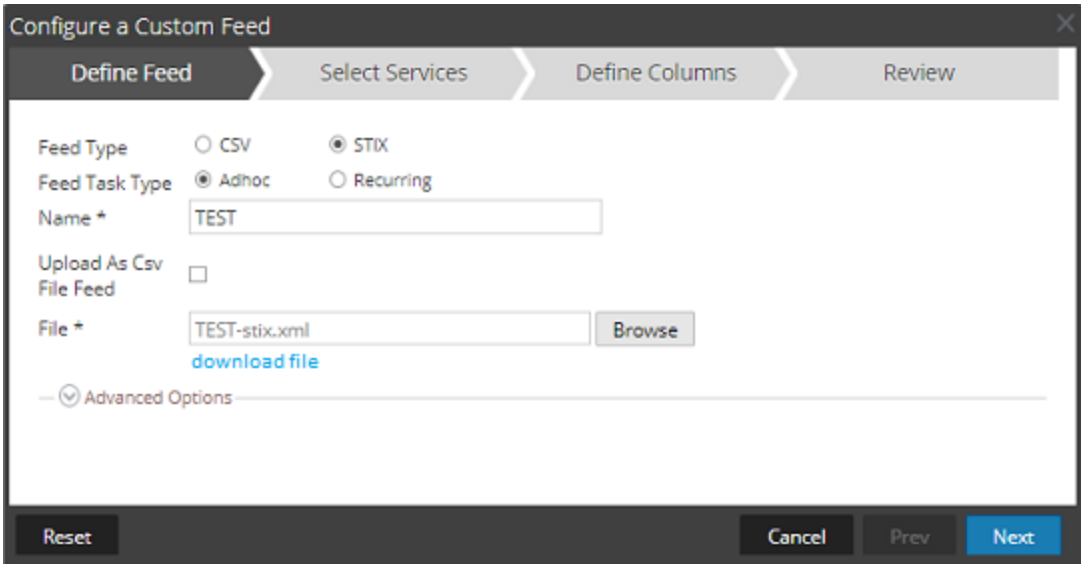
5. Restart the network service on the appliance.
6. Confirm that the name placed in the **/etc/hosts** file is used instead of the FQDN or IP address in the Identity feed URL.
7. Re-verify the Identity feed URL.



Edit, Upload, or Remove a Feed

You can upload a feed, edit an existing feed, or remove a feed.

To edit an existing feed:



1. Go to (Configure) > **Custom Feeds**.

   The Feeds view is displayed.

2. In the toolbar, select a feed and click .

   The Configure Custom Feed or Configure Identity Feed panel opens in the Custom Feed wizard.

3. If you want to edit the feed file:

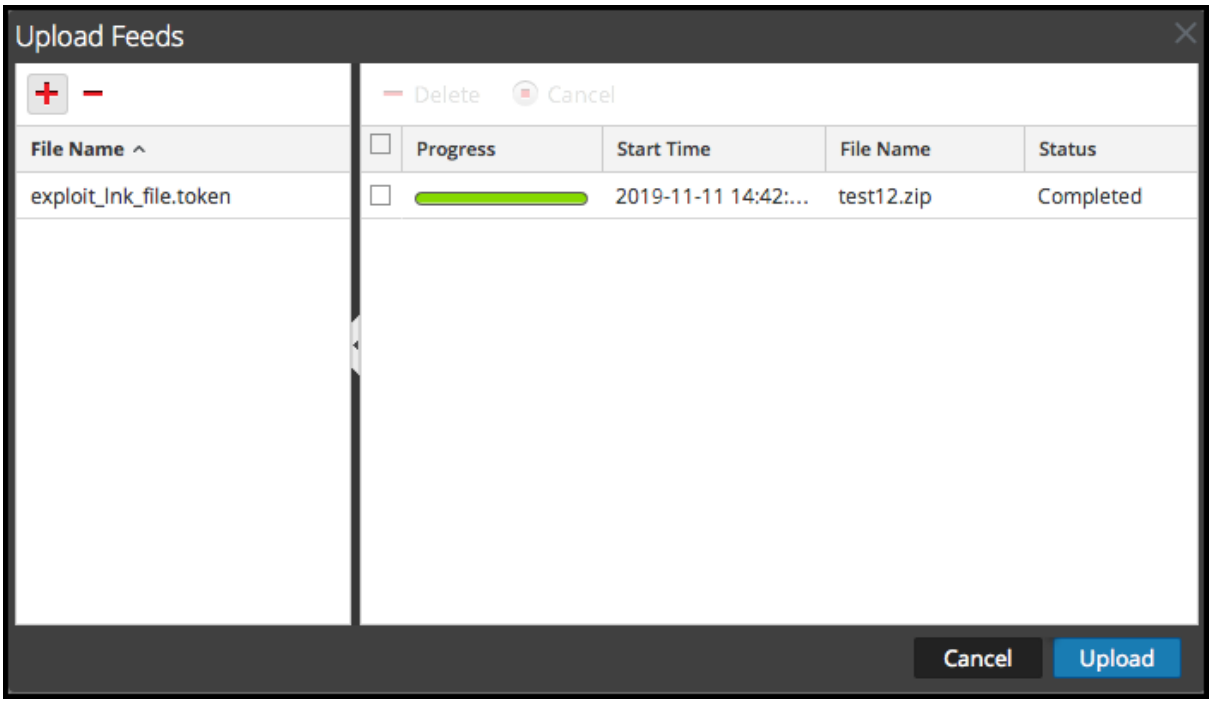
   a. Click **download file**.

      For an Identity feed, the .zip file is downloaded. For a custom feed, the .csv or .xml file is downloaded to your local file system. For a STIX feed, the .xml file is downloaded to your local file system.

b. Edit and save the file.

c. In the **Define Feed** tab, browse for and open the edited file.

4. Edit any other parameters in the **Define Feed** tab, **Select Services** tab, and **Define Columns** tab that apply to the type of feed.
5. Anytime before you click **Finish**, you can:
   - Click **Cancel** to close the wizard without saving your changes.
   - Click **Reset** to clear the data in the wizard.
   - Click **Next** to display the next form (if not viewing the last form).
   - Click **Prev** to display the previous form (if not viewing the first form).
6. In the **Review** tab, review the feed information, and if correct, click **Finish**.



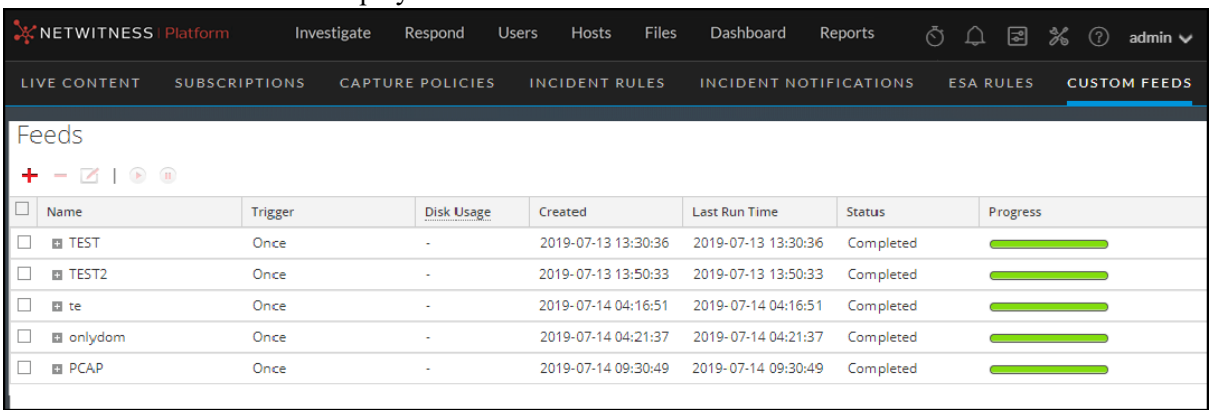
The feed is recreated with the updated file and new feed specifications. The feed is added to the Feeds list and progress bar tracks completion. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file is listed in the Feeds list. You can expand or collapse the entry to see how many services are included, and which services are successful.

To upload a feed to a Decoder or Log Decoder:

1. Go to  (Admin) > **Services**.
2. Select a Decoder or Log Decoder service and click  **> View > Config**.

   The Services Config view is displayed with the General tab open.
3. Select the **Feeds** tab.
4. In the Feeds tab toolbar, click .

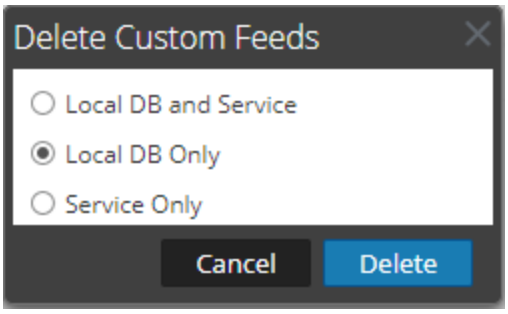
   The Upload Feeds dialog is displayed.



5. In the **File** grid, click + and select a feed file. Supported files are *.feed, *.token, and *.filter.
6. Select the feed file from the **File** list and click **Upload**.

   The Upload Job list is updated to show the progress and status of the uploaded feed.

To remove a feed:



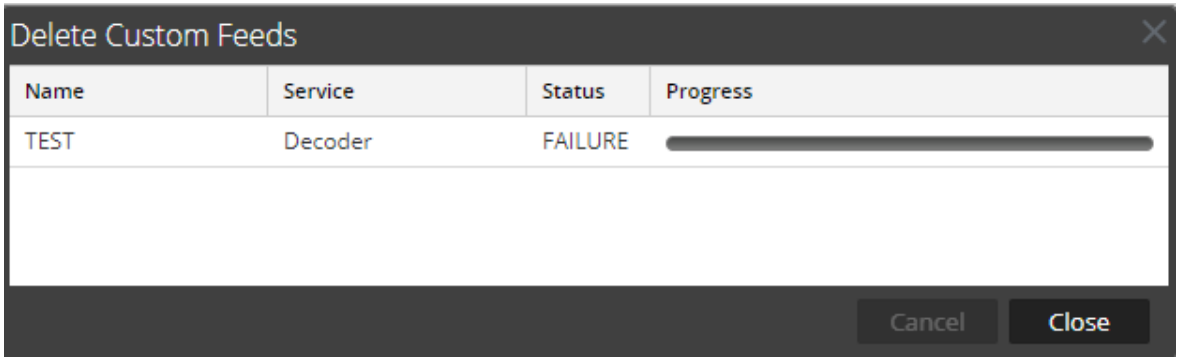
1. Go to (Configure) > **Custom Feeds**.

   The Custom Feeds view is displayed.

2. In the toolbar, select a feed and click − .

   The Delete Custom Feeds dialog is displayed.

You can select one of the following options to delete the feed:



- If you choose to delete the feed from **Local DB and Service**, the feed is deleted from both the service and the local NetWitness box. The deleted feed will no longer be seen on the NetWitness user interface.
- If you choose to delete the feed from **Local DB Only**, the feed is deleted from the local NetWitness box. The deleted feed will not be seen on the NetWitness user interface; however, the last deployed version of the feeds will be present on the service. The undeployed feeds will be deleted forever.
- If you choose to delete the feed from **Service Only**, the feed is deleted from the service. The deleted feed will appear on the NetWitness user interface and can be deployed again.

3. Select where you want to delete the feed and click **Delete**.

   A warning dialog is displayed.

4. Click **yes** to confirm that you want to delete the feed from the select areas.

   - If you chose to delete the feed from the **Local DB Only**, the feed is deleted.
   - If you chose to delete the feed from the **Local DB and Service** or **Service Only**, the Delete Custom Feeds view is displayed showing the progress of the deletion on the service.

Create Custom Meta Keys Using a Custom Feed

This topic provides information on how to add custom meta keys using a custom feed in the Log Decoder, and highlights the configuration changes to reflect the custom meta keys in the Concentrator, ESA, Archiver, Warehouse Connector, and Reporting Engine schema. You can create custom meta keys to retrieve data, to investigate and analyze the logs and packets. Custom meta keys enable you to add an enrichment context for the log and packet data.

Here is an example of creating a custom meta key in the Log Decoder. In this scenario, an organization wants to track the location of an asset such as a printer. So, a custom meta key **source location** is introduced, which indicates the location of the asset, for example Printer1, which is located in the 'Fifth Floor A wing'.

Note: Custom meta keys can be created in the Decoder as well. Select the `index-decoder-custom.xml` file when you create a custom meta key in the Decoder.

Add a Custom Meta Key in the Log Decoder

To add custom meta keys using custom feed:

1. Go to  (Admin) > **Services** .
2. Select a Log Decoder service and click  > **View** > **Config** > **Files** tab > **index-logdecoder-custom.xml.**

```
<Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location" level="IndexNone"
name="location.src" format="Text"/>
 </Language>
 name = Name of the key (max is 16 chars)
```

3. Restart the Log Decoder service. In the Services view, click  > **Restart**.

Note: Following are the NetWitness reserved keywords. Do not use these keywords as custom meta keys as it can cause display error in the NetWitness user interface due to CSS conflicts referencing to the same keywords.

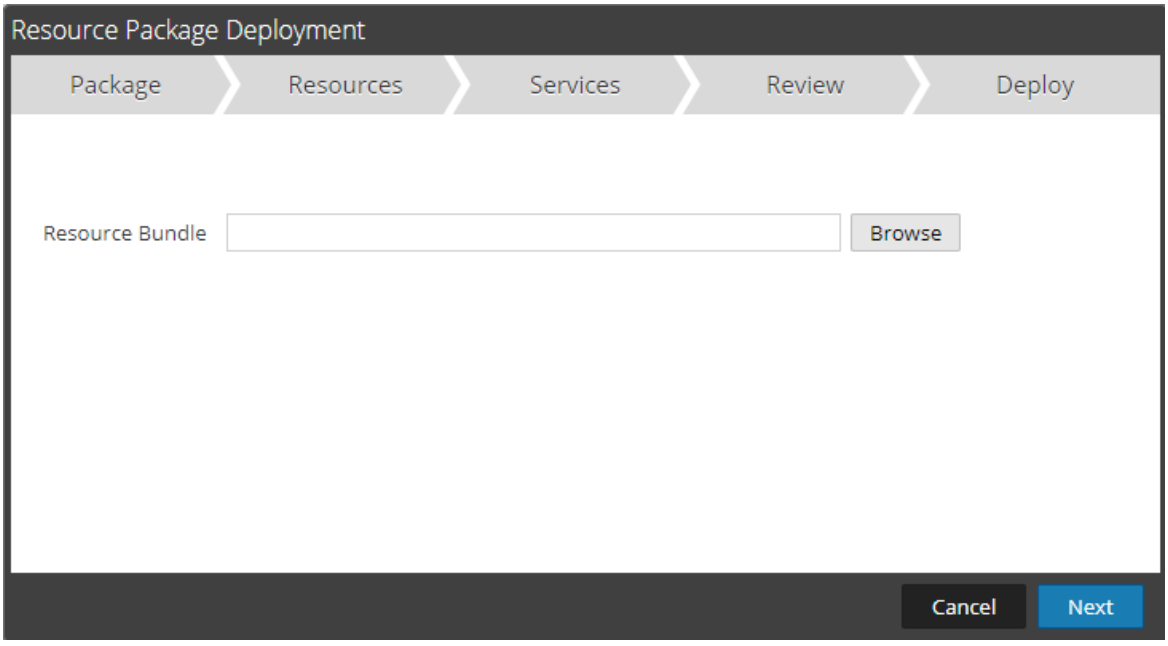
Deploy a Log Decoder Feed in Live

To deploy the feed in the live environment:

1. Go to  (Configure) > **Live Content**
2. Select a group of resources, or a previously created resource package. To select a resource or group of resources:
   a. In the **Live Search View,** browse Live resources (for example, search for the **Log Collector** resource Type).
   b. In the **Matching Resources** panel, select **Show Results > Grid**.

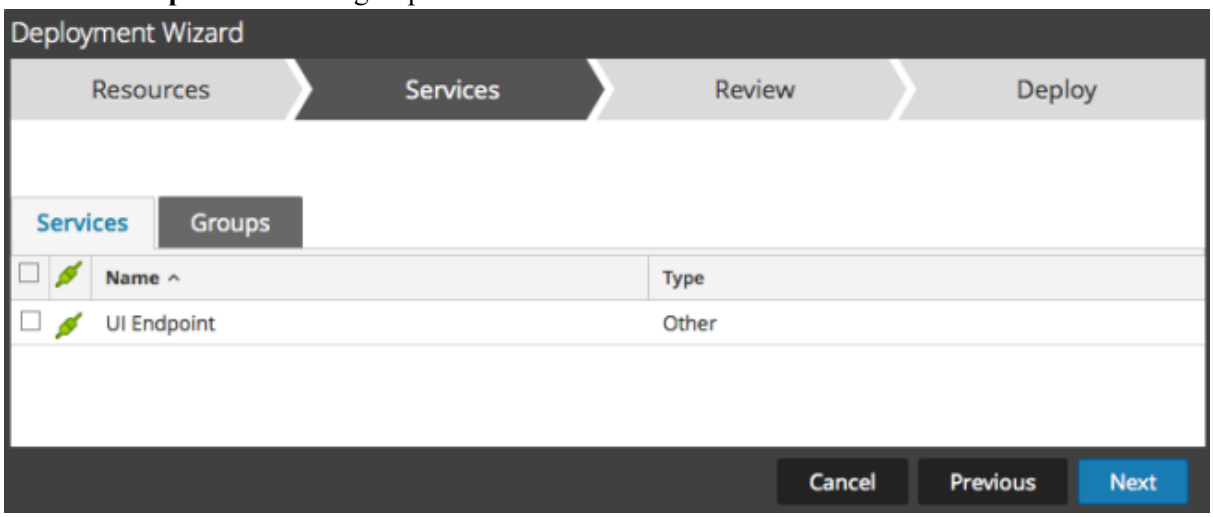


c. Select the checkbox to the left of the resources that you want to deploy.

d. In the Matching Resources toolbar, click Deploy.

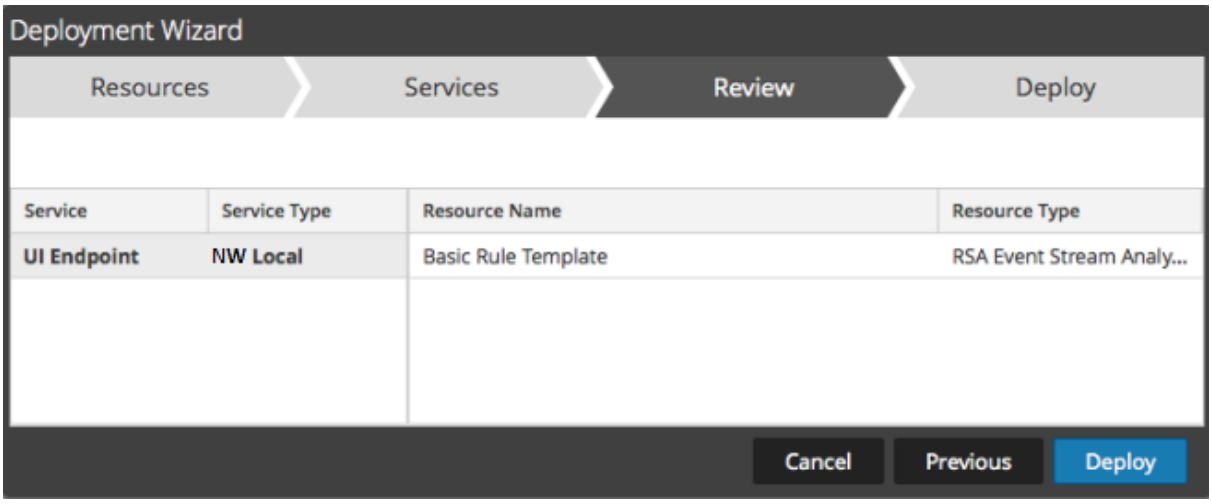
3. To select a resource package to deploy:

a. In the **Live Search** view **- Matching Resources** toolbar, select **Package** > **Deploy** :
The Package page of the Resource Package Deployment wizard is displayed.



b. Click **Browse** and select a package from your network.

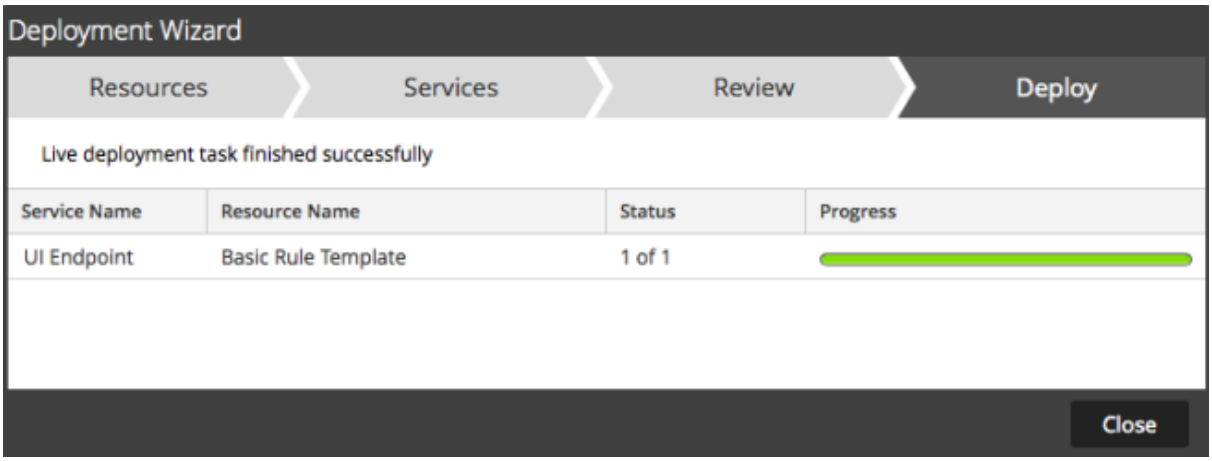
c. Click **Open.**
At this point, whether you are deploying a package or a group of resources, the Deployment Wizard opens, and the Resources page is displayed.



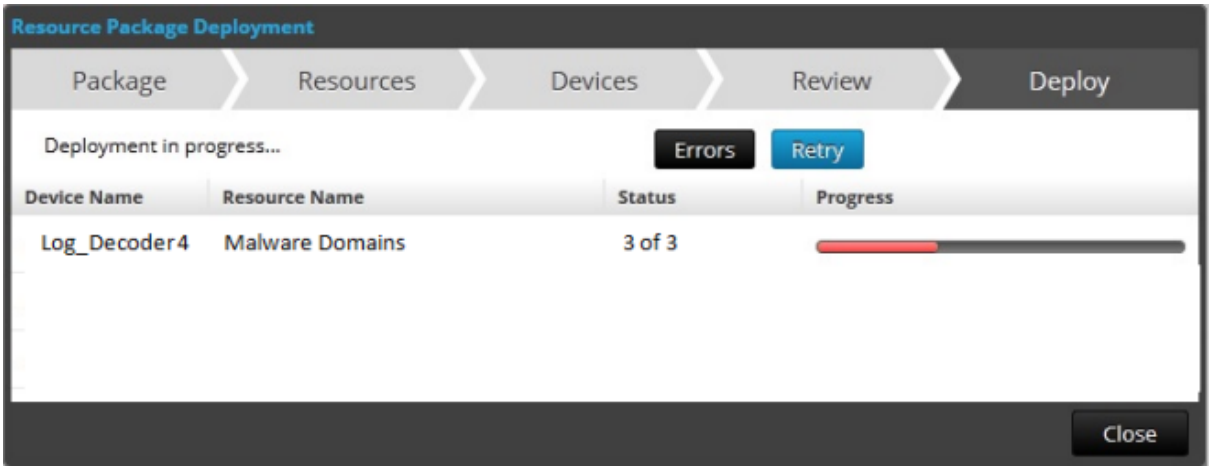
3. Click **Next**.
The **Services** page is displayed. It has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the (Admin) > Services view. The columns are a subset of the columns available in the Services view.

Note: The Live server is "smart" about deploying resources to Services. For example, it does not deploy resources that have a Medium of packets to any Log Decoders. This means that only applicable content resources are deployed to each Service.

4. Select the services to which you want to deploy the content. You can select any combination of services and service groups.
Use the **Services** tab to select individual services, list of services and service groups that are configured in the Admin Services view.
Use the **Groups** tab to select groups of services.



5. Click **Next**.
The **Review** page is displayed.



Make sure that you have selected correct resources and the services to which you want to deploy them.

6. Click **Deploy**.
   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.

If you try to deploy resources and services that are not compatible, NetWitness displays the Errors and Retry buttons, which you click to review the errors and retry the deployment.

7. Click **Close**.

> **Note:** The Source IP should be indexed by selecting the type as 'IP' as the ip.src. and ip.dst are in IPv4 format.

In this scenario, a custom meta key location.src (location source) is added by indexing the hostname (alias.host). In this example, the printer hostname are populated in meta key 'alias.host'. Select **alias.host** as callback key, and index type as 'Non IP' in the Feed Wizard as shown below. In the Define Values section, select the custom meta key from the drop down menu.

Add the Custom Meta Key Entry in the Concentrator Custom Index file

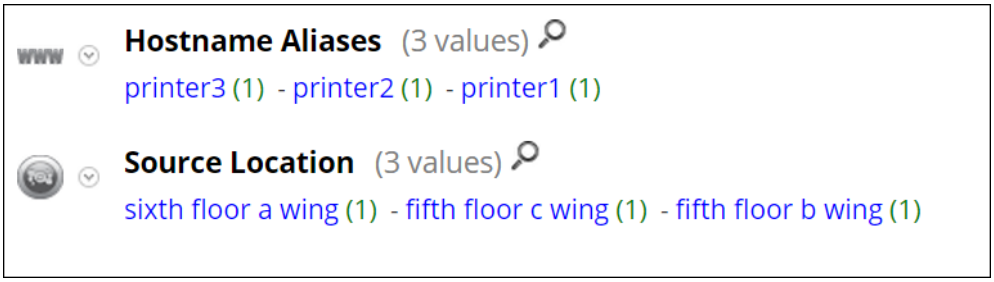
To add the custom meta key entry in the Concentrator custom index file:

1. Go to  (Admin) > **Services** > **Concentrator**.
2. Click  > **View** > **Config** > **Files** tab > **index-concentrator-custom.xml.**
3. Add the custom meta key entry in the Concentrator index file.

```
 <Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
   <!-- Reserved Meta key for Feed -->
   <Key description="Source Location"  level="IndexValues"
name="location.src" format="Text"  valueMax="10000"
defaultAction="Open"/>
  </Language>
```

4. To restart the Concentrator service, in the Services view, click  > **Restart**.

> **Note:** In case of the Broker, the Broker derives its index from the Concentrator from which it aggregates. So you do not need to create custom meta in the Broker. If you have not indexed the meta key in the Concentrator, the Broker does not display the meta key in Investigate.



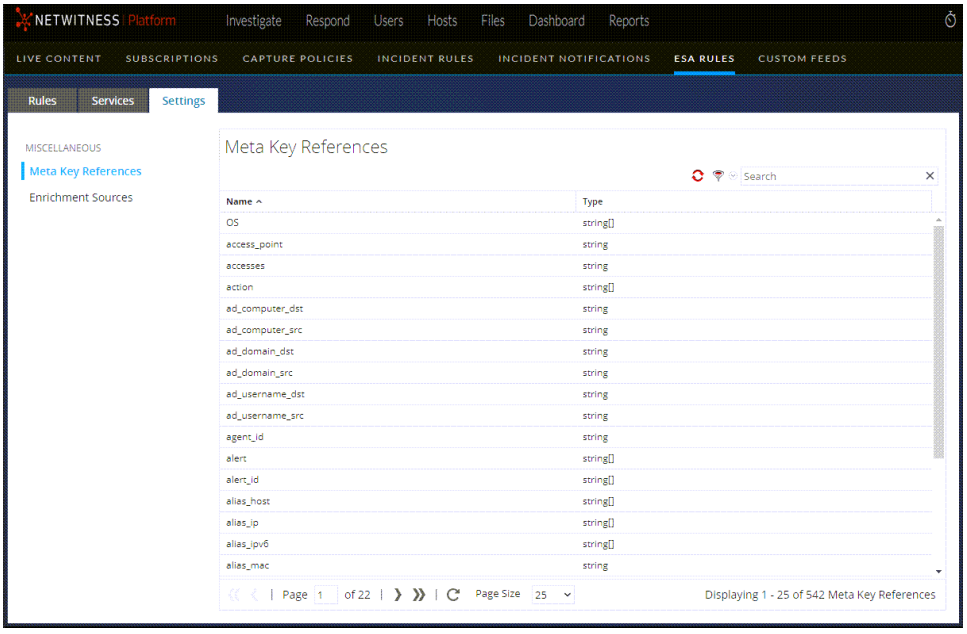
Investigate a Custom Meta Key

> **Note:** You have to log out and log back in to the NetWitness User Interface in order to view the custom meta key in Investigate.

To investigate a custom meta key:

1. Go to **Investigate**.
   The Investigate dialog, which provides services, is displayed.

2. Select a Concentrator service, and click **Navigate**.



Additional Procedures

The following procedures must be executed if you have Warehouse Connector, Archiver, Reporting Engine, and ESA configured.

Verify the Custom Meta Keys on ESA

After you add custom meta keys on the Concentrator, you can verify that your meta keys are updated on ESA.

1. Go to (Configure) > **ESA RULES** > **Settings** tab.

2. In the Meta Key References, click the Meta Re-Sync (Refresh) icon ( ).

3. Verify that the custom meta keys appear on ESA. If you do not see the meta keys, you may need to restart the Concentrator.

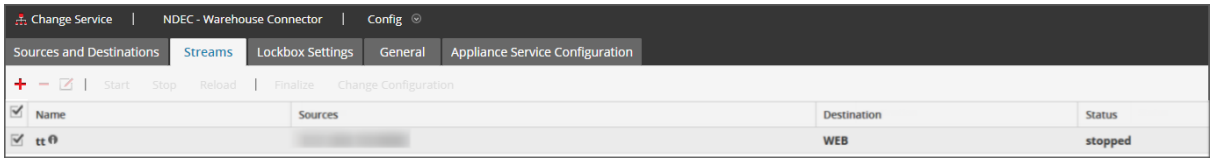
Update the Schema in Archiver

If you want to configure the Archiver, using the new custom meta keys, you need to update the Archiver schema in the Reporting Engine. To update the Archiver schema in Reporting Engine:

1. Go to **(Admin)** > **Services** > **Archiver**.
2. Select > **View** > **Config** > **Files** > **index-archiver-custom.xml**.
3. Add the custom meta key entry in the Archiver index file.

```
<Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location" level="IndexValues"
name="location.src" format="Text"
  valueMax="10000" defaultAction="Open"/>
 </Language>
```

4. To restart the Archiver service, click > **Restart.**
   The Archiver schema is updated with the custom meta key.



Update the Schema in Warehouse Connector

If you want to configure the Warehouse Connector with custom metadata and use it in a Warehouse Connector report then you need to update the Warehouse Connector schema in the Reporting Engine.

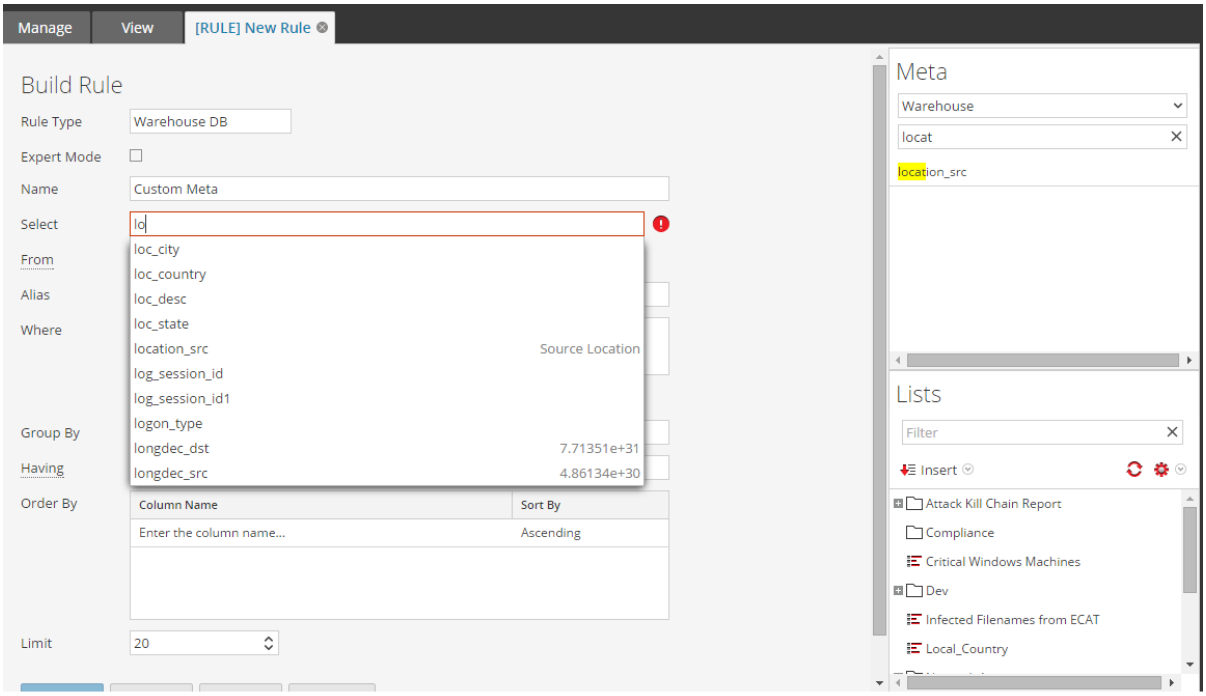
If the Log Decoder or Decoder, where the custom meta key is added, is one of the sources in the Warehouse Connector stream, you need to update the schema in the Warehouse Connector.

To update the Warehouse Connector schema in the Reporting Engine:

1. Go to (Admin) > **Services** > **Warehouse Connector**.
2. Click > **View** > **Config**.
   The Services Config view of Warehouse Connector is displayed.
3. Click the **Streams** tab.
4. Select the stream and then click **Reload**.
   The Warehouse Connector pulls the schema from the downstream devices (Log Decoder/Decoder).

For more information on streams, see "Configure Streams" in the *Warehouse Connector Configuration Guide*.

Update the Schema in Reporting Engine



To update the schema in Reporting Engine:

1. Go to **(Admin)** > **Services** > **Reporting Engine.**
2. Click > **Restart.**

Note: Restart the Reporting Engine or wait for thirty minutes for the schema to be updated.

To view the custom meta key:

1. Navigate to **Monitor** > **Reports** > **Rules**.
2. In the toolbar, click .
3. Select **Warehouse DB**.
4. In the **Build Rule** tab, search for the custom meta from the right panel.
   The custom meta key is displayed.

or Decoder and Log Decoder Additional Procedures

This topic explains the additional procedures an administrator could choose to follow which are not essential for the configuration of the Decoder or Log Decoder.

Topics

- Configure High Speed Packet Capture Capability (Version 11.6 and Later)
- Configure a Log Decoder to Accept Protobuf
- Configure Session Split Timeouts
- Configure Syslog Forwarding to Destination
- Configure Transaction Handling on a Decoder
- Configure Data Export
- Decrypt Incoming Packets (TLS 1.2)
- Decrypt Incoming Packets TLS 1.3
- Edit Decoder System Configuration
- Enable CPU Usage Statistics for Installed Content
- Enable Parser Mappings
- Enable or Disable Lua and Flex Parsing Systems
- Map IP Address to Service Type for Log Parsing
- Map an IP Address to a Time Zone
- Obtain Log Files from a Pre-11.0 Log Decoder
- Upload a Log File to a Log Decoder
- Upload a Packet Capture File
- Troubleshooting Packet Drops (11.x and above)

Configure High Speed Packet Capture Capability (Version 11.6 and Later)

This topic guides administrators on how to tune a Network Decoder specifically for high speed packet capture using NetWitness 11.6. This applies when capturing packets on 10G, 40G, or higher speed interface cards.

IMPORTANT: Packet capture at high speeds requires careful configuration and pushes the Decoder hardware to its limits, so you must read this entire topic while implementing a high speed capture solution.

NetWitness provides support for high-speed collection on the Decoder. You can capture network packet data from higher speed networks and optimize your Network Decoder to capture network traffic up to 40 Gbit/s. These network capture speeds can be easily achieved on a Decoder but make a note that not all NetWitness Platform features operate at these rates. The actual throughput of Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and deep packet inspection. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.
- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Enhancements that facilitate capture in these high speed environments include the following:

- Utilization of the DPDK capture drivers to leverage the commodity 10G and 40G Intel NIC cards for high-speed capture environments. For more information on how to configure DPDK, see (Optional) Data Plane Development Kit Packet Capture.
- Introduction of `assembler.parse.valve` configuration, which automatically disables application parsers when certain thresholds are exceeded, to limit risk of packet loss. When the application parsers are disabled, network layer parsers are still active. When stats fall below exceeded thresholds, application parsers are automatically re-enabled.
- Utilization of Berkeley Packet Filters (BPF) in 10G environments. For more information, see (Optional) Configure System-Level (BPF) Packet Filtering in Configure Capture Settings.
- Decoder will utilize the symmetric RSS to distribute capture loads among multiple CPU cores. For more information see, "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture
- Decoder will distribute the session reassembly work among multiple CPU cores as well, provided that the packets fed into each assembly are naturally segregated using the RSS features or as a result of being captured on different physical interfaces.

Note: Beginning with 11.5, the Network Decoder can capture from multiple interfaces simultaneously. This functionality allows Network Decoders to capture from multiple physical Network Interface Cards (NICs) while leveraging the same network rules, application rules, and parsers for each NIC. You can use this feature in all capture environments. For more information, see (Optional) Multiple Adapter Packet Capture.

Note: Enabling intra-session for HTTP pipelining is not supported when capturing at 10G rates on a single Decoder as the HTTP_Lua parser required to function can cause dropped packets at that rate of ingest. In this case, the load should be spread across multiple Concentrator-Decoder pairs.

Hardware Prerequisites

- A Series 5 or Series 6 Decoder
- An Intel 82599-based ethernet card, such as the Intel x520 or an Intel i40e-based card like the Intel XL710. All NetWitness-provided 10G cards meet this requirement such as the following:
  - All SMC-10GE cards provided by NetWitness.
  - A Dell Network Daughter Card using an Intel controller to provide 10G network interfaces. This is included in all Series 5 hardware.
- Sufficiently large and fast storage to meet the capture requirement of packets in case you set up in a mode other than meta-only. Storage considerations are covered later in this topic.
- If the Decoder will reassemble and handle high numbers of sessions, for example 30000 sessions per second or more, then at least two physical storage volumes are required. This will allow one volume to be used for writing session data while the other to read session data and deliver it for down-stream analytics.
- Each Network Decoder configured with a minimum of 2 DACs or SAN connectivity when set up in mode other than meta-only.

Software Prerequisites

NetWitness Platform 11.6 or later.

Decoder Installation

Perform the following steps to install the Decoder.

Install the Decoder Service on Host that Will Perform the Capture

The Network Decoder service package contains the necessary software components to utilize the features described in the document. The Network Decoder service package and all other required packages are installed during the Decoder installation.

Select the Capture Interfaces and Assign Interfaces to DPDK

You must choose the physical network connections that will be used for packet ingest. The physical interface type will depend on the type of network traffic sent to the Decoder. The interface you select must match the physical characteristics of the Decoder feed (or network link) used to receive packets. For example, if you want to capture at 40G speeds on a cable, then you need a 40G interface capable of attaching to that cable.

For information on how to assign interfaces to DPDK, see (Optional) Data Plane Development Kit Packet Capture.

Verify the Decoder Packages Installation

Perform the following steps to verify the Decoder package installation:

- After you configure the interfaces to use with DPDK, ensure that you reboot the Decoder host.
- After the reboot, ensure that the DPDK interfaces appear in the Decoder's capture adapter list.

Select the Decoder Operating Mode

You can configure Decoder to handle any type of capture scenario that ranges from a very deep application-level inspection to very fast and simple network connection tracking. The Decoder includes the following three built-in templates that serve as a starting point for configuring your capture needs:

1. **Normal**: It is the default Decoder mode with no defined resource allocation and all tunable parameters set to default. It can be a good option if your capture rate is less than 5 Gbit/s or if you want to run a large amount of deep inspection content such as application parsers, feeds, OpenAppID detectors, complex Snort rules, and so on. For more information, see Configure the Decoder for Normal Mode (Default Mode).
2. **10G**: This mode is available in NetWitness 10.4 and later. You can use this mode if your capture rate is under 10 Gbit/s. This mode assumes that most of the packets are retained and saved in the packet database. Make a note that not all parsers can run at 10 Gbit/s speeds as some parsers are too complex for high speeds. For more information, see Configure the Decoder for 10G Mode.
3. **NDR**: This mode is to capture beyond the 10 Gbit/s speeds, but below 40Gb/sec. Make a note of the following points while using this mode:
   a. By default, this mode assumes that packets are not retained as the rate at which this mode consumes storage is significantly high.
   b. By default, the ingested packets are dropped. You must insert the network rules before the drop statement to pick portions of the network stream and keep the incoming packet feed for further analysis.
   c. Make a note that at higher speeds only a limited amount of deep packet inspection content can be used.
   d. Ensure that you enable the multi-thread assembly while using this mode.

   For more information, see Configure the Decoder for NDR Mode.

Configure the Decoder for Normal Mode (Default Mode)

By default, the Decoder runs in the normal mode and requires no additional configuration. The default normal mode captures up to 5Gb/sec with large amounts of deep packet inspection while storing network sessions.

Configure the Decoder for 10G Mode

The instructions in this section are to configure the Decoder for capture speeds up to 10Gb/sec with medium amounts of deep packet inspection while storing network sessions.

To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=10g`
   Ensure that the correct parameter is displayed in the output.
2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters can be `op=10g update=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=10g`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

      ```
      1: packet_mmap_,eth0
      2: DPDK,0000:41:00.0
      3: DPDK,0000:41:00.1
      ```

   c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.
   d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.
6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:
   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.

- You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.

7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.
8. The following configuration parameters are deprecated and no longer necessary.
   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory
   - Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

Note: An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping the unwanted traffic as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
   The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

IMPORTANT: Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

Storage Considerations

Packet Retention Requires Extremely High Sustained Throughput

When capturing at 10G line rates, the storage system holding the packet and meta databases must be capable of sustained write throughput of 1400 MBytes/s. Make a note that many SANs are not capable of achieving these speeds.

Using SAN and Other Storage Configurations

The Decoder allows any storage configuration that can meet the sustained throughput requirement. The standard 8 Gbit FC link to a SAN is not sufficient to store packet data at 10G; in order to use a SAN it may be required to perform aggregation across multiple targets using a software-RAID Scheme. Thus environments using SAN are required to configure connectivity to the SAN using multiple FCs.

Optimize Read/Write Operations When Adding New Storage

A 10G Decoder is optimized to stagger read and write operations across multiple volumes so that the current file being written is on a different volume from the next file that will be written. This allows maximum throughput on the raid volume when reading data from the last file being written while writing the current file on a different volume. However, if volumes are added after a Decoder has been in use, the ability to stagger is limited because one or more volumes are already full so the new volume is the only place new files can be written.

To remedy this situation, an administrator can run a `stagger` command on an existing NetWitness database (packet, log, meta, or session), that has at least two volumes, to stagger the files across all volumes in the most optimal read/write pattern. The major use case is when new storage is added to an existing Decoder and you want to stagger the volumes before restarting capture.

The configuration nodes for this command are the session, meta, and packet databases. Each of these lives under `/database/config`, which is usually a root node. The config nodes for a Decoder are:

- `/database/config/packet.dir`
- `/database/config/meta.dir`
- `/database/config/session.dir`

The *NetWitness Platform Core Database Tuning Guide* has information on how those configurations are formatted.

The `stagger` command is typically only useful for a 10G Decoder and usually just for the packet database. Maximum performance is achieved for storing and retrieving packets when multiple volumes are present. In this scenario, the Decoder always fills the volume with the most free space. When the volumes are roughly the same size, this results in a staggered write pattern, which allows maximum throughput for reading and writing across all volumes. However, this only naturally occurs when multiple packet storage volumes are present at the time the Decoder is first deployed.

A typical use case is adding more storage to an existing Decoder to increase retention. However, when adding storage to an deployment that has already filled the existing volumes with stored packets, the Decoder will naturally fill the new storage with packets before rolling out any packets on the existing storage. This results in a suboptimal read/write pattern because most reads will occur on the same volume that is currently being written to. In a 10G deployment, reads are blocked from the volume when writes are occurring. This does not stop ALL reads on that volume, because the file is buffered in memory before being written, but it does result in suboptimal read performance.

With the `stagger` command, you can add more storage and then have the service naturally stagger the files across ALL volumes (existing and new) so that read performance is optimized.

Caution: This command should only be performed after the storage is mounted and the Decoder configured to use it (for example, after adding the mount point(s) to `packet.dir`).

The downside to this command is it can take some time to stagger and the Decoder should not be capturing during the stagger operation.

Recommended workflow:

1. Add all storage and configure mount points.
2. Add new storage mount points to `packet.dir` (or `session.dir`/`meta.dir`) and restart service (very important!).
3. Ensure capture is stopped.
4. Run the stagger operation. You must not terminate the connection that initiated the stagger operation until the operation is complete. If you run stagger from NwConsole, run the `timeout 0` command before sending the `stagger` command. This will prevent the normal 30 second command timeout.
5. Start capture after the `stagger` command finishes.

The following are the parameters for the stagger command:

- `type` - The database that will be staggered (session, meta, or packet). Typically only the packet database is useful for staggering, but it is possible to do the session or meta database when multiple volumes are present for those databases. Since the session and meta databases write far less data than the packet database, typically staggering those databases results in less noticeable performance gains.
- `dryRun` - If `true` (the default), will only return a description of the operations that would be performed. If `false`, then the files will actually be moved to an optimal read/write pattern. You MUST pass false to actually stagger the files.

Example usage from NwConsole:

```
login <decoder>:50004 <username> <password>
timeout 0
send /database stagger type=packet dryRun=false
```

Note: If you run this command using the RESTful API, pass the additional parameter `expiry=0` to prevent a timeout from the service. You will also need to ensure the HTTP client does not disconnect before the operation completes.

IMPORTANT: If you perform the database stagger operation from the UI Explore page, it takes a long time to complete the operation based on the data and results in a timeout. NetWitness recommends that you use the RESTful API or NwConsole to perform the database stagger operation.

Parsing and Content Considerations

Parsing raw packets at high speeds presents unique challenges. Given the high session and packet rates, parsing efficiency is paramount. A single parser that is inefficient (spends too long examining packets) can slow the whole system down to the point where packets are dropped at the card.

For initial 10G testing, start with only native parsers (except SMB/WebMail). Use the native parsers to establish baseline performance and with little to no packet drops. Do not download any Live content until this has been done and the system is proven to capture without issue at high speeds.

After the system has been operational and running smoothly, Live content should be added very slowly, especially the parsers.

Best Practices

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss. One caveat is that if you are updating a current 10G deployment but not adding any additional traffic. For example, a current Decoder capturing off a 10G card at 2G sustained should see no difference in performance, unless part of the update also entails adding additional traffic for capture.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- Although lesser performance impacts, feeds should also be reviewed and added in a phased approach to help measure performance impacts.
- Application Rules also tend to have little observable impact, though again, it is best not to add a large number of rules at once without measuring the performance impact.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Also, making the recommended configuration changes outlined in the Configuration section will help minimize potential issues.

Use Case 1: 10G Mode - Egress, Deep Packet Inspection

In this setup the goal is to ingest at 10G sustained line rates, perform Deep Packet Inspection (DPI), store metadata, and store raw packets for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- MA content (7 Lua parsers, 1 feed, 1 application rule)
- 4 feeds (alert ids info, nwmalwaredomains, warning, and suspicious)
- 41 application rules
- DNS_verbose_lua (disable DNS)
- fingerprint_javascript_lua
- fingerprint_pdf_lua
- fingerprint_rar_lua
- fingerprint_rtf_lua
- MAIL_lua (disable MAIL)
- SNMP_lua (disable SNMP)
- spectrum_lua
- SSH_lua (disable SSH)
- TLS_lua
- windows_command_shell
- windows_executable

Not Tested

- SMB_lua, native SMB disabled by default
- html_threat

Other

- HTTP_lua reduces the capture rate from >9G to <7G. At just under 5G this parser can be used in place of the native without dropping (in addition to the list above).
- xor_executable pushes parse CPU to 100% and the system can drop significantly due to parse backup.

Aggregation Adjustments Based on Tested Live Content

A 10G Decoder can serve aggregation to a single Concentrator while running at 10G speeds. Deployments using Malware Analysis, Event Stream Analysis, Warehouse Connector, and Reporting Engine are expected to impact performance and can lead to packet loss.

For the tested scenario, the Concentrator aggregates between 45 and 70k sessions per second. The 10G Decoder captures between 40 and 50k sessions per second. With the content identified above, this is about 1.5 to 2 million meta per second. Due to the high volume of session rates, the following configuration changes are recommended:

- Nice aggregation on the Concentrator limits the performance impact on the 10G Decoder. The following command turns on nice aggregation.
  `/concentrator/config/aggregate.nice = true`
- Due to the high volume of sessions on the Concentrator, you may consider activating parallel values mode on the Concentrator by setting `/sdk/config/parallel.values` to `16`. This improves Investigation performance when the number of sessions per second is greater than 30,000.
- If multiple aggregation streams are necessary, aggregating from the Concentrator instead has less impact on the Decoder.
- Further review for content and parsing is required for deployments where you want to use other NetWitness components (Warehouse Connector, Malware Analysis, ESA, and Reporting Engine).

Configure the Decoder for NDR Mode

The instructions in this section are to configure the Decoder for capture speeds more than 10Gb/sec but less than 40Gb/sec with small amounts of DPI while storing only metadata.

To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=ndr`
   Ensure that the correct parameter is displayed in the output.
2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters will be `op=ndrupdate=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=ndr`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

```
1: packet_mmap_,eth0
2: DPDK,0000:41:00.0
3: DPDK,0000:41:00.1
```

c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.

d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.

6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:

- When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
- Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
- Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
- The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
- When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
- The assembler session pool should be large enough that it is not forcing sessions.
- You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.

7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.

8. The following configuration parameters are deprecated and no longer necessary.

- The `core= parameter` in `capture.device.params`
- Any configuration files under `/etc/pf_ring` directory
- Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

Note: An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping traffic that you don't need to retain as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
   The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

   IMPORTANT: Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
   Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

   For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

Storage Considerations

NDR Mode Assumes No Packet Retention

The base or default configuration for NDR mode starts with all packet writes disabled. So, in this scenario the storage throughput requirements are relatively less. If you choose to turn on packet retention, be aware that it is relatively easy to overwhelm the I/O throughput of most storage solutions with a 40G network feed.

Parsing and Content Considerations

Parsing at Speeds Greater than 10G

As network ingest speeds increase, less CPU time is available to examine each packet or each session. It means that only limited amount of parsing can be performed. Fortunately, you only need to account for the amount of traffic that enters Decoder's parsing sub-system. For example, if you are ingesting 40 Gbit/s but filter out 30 Gbit/s of traffic, you only need to allow 10 Gbit/s of traffic to move through the parsers. At raw 40 Gbit/s speeds, only the "well-behaved" content works. The "well-behaved" content can defined as:

- Content that only activate when a large, uncommon search token is registered. It includes the Snort rules with a large, uncommon "fast-pattern" content field. For more information on fast-pattern and Snort rules, see Decoder Snort Detection.
- Content that generates a finite number of metas per session.
- Parsers that do not activate on session begin/end events.

The overall maximum throughput of the reassembly and parsing systems on Decoder is about 100,000 sessions (or streams) per second. However, in practical terms, very few downstream analytical or database services can handle such activity. If you find that your session rate is too high, or that your down-stream services cannot handle how many sessions the Decoder is generating, consider filtering out lower value traffic as it is ingested.

Best Practices

The NDR mode has a network rule configured to drop all incoming traffic by default. In general, when capturing above 10Gb/sec, you must limit the amount of traffic analyzed using DPI. These use cases in this document are example guidelines that do not guarantee the actual throughput of the Decoder. As mentioned previously in this document, the actual throughput of the Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and DPI. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.
- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Use Case 1: NDR Mode - Egress, General Purpose

Generate NetFlow Style Meta Only + Small Subset of Snort Rules + All Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- The **`NETWORK`** native parsers
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.

- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Use Case 2: NDR Mode - Egress, Data Exfiltration

Generate NetFlow Style Meta Only + Exfiltration Focused Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- Native parsers - HTTP, HTTPS(SSL), SMTP, DNS, FTP, SFTP/SSH, and VNC
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Use Case 3: NDR Mode - Lateral Movement

Generate NetFlow Style Meta Only + Small Subset of Snort Rules + Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- Native parsers - Kerberos, SMB, VNC, and SFTP/SSH
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Disable the Snort rule related to SMB traffic (for example, `M.HackTool.SMB.Impacket-Obfuscation.[Service Names]`). It is recommended because large regex parameters can cause Snort parser to utilize more than 50% CPU.
- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Configure High Speed Packet Capture Capability (Version 11.6 and Later)

This topic guides administrators on how to tune a Network Decoder specifically for high speed packet capture using NetWitness 11.6. This applies when capturing packets on 10G, 40G, or higher speed interface cards.

IMPORTANT: Packet capture at high speeds requires careful configuration and pushes the Decoder hardware to its limits, so you must read this entire topic while implementing a high speed capture solution.

NetWitness provides support for high-speed collection on the Decoder. You can capture network packet data from higher speed networks and optimize your Network Decoder to capture network traffic up to 40 Gbit/s. These network capture speeds can be easily achieved on a Decoder but make a note that not all NetWitness Platform features operate at these rates. The actual throughput of Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and deep packet inspection. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.
- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Enhancements that facilitate capture in these high speed environments include the following:

- Utilization of the DPDK capture drivers to leverage the commodity 10G and 40G Intel NIC cards for high-speed capture environments. For more information on how to configure DPDK, see (Optional) Data Plane Development Kit Packet Capture.
- Introduction of `assembler.parse.valve` configuration, which automatically disables application parsers when certain thresholds are exceeded, to limit risk of packet loss. When the application parsers are disabled, network layer parsers are still active. When stats fall below exceeded thresholds, application parsers are automatically re-enabled.

- Utilization of Berkeley Packet Filters (BPF) in 10G environments. For more information, see (Optional) Configure System-Level (BPF) Packet Filtering in Configure Capture Settings.
- Decoder will utilize the symmetric RSS to distribute capture loads among multiple CPU cores. For more information see, "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture
- Decoder will distribute the session reassembly work among multiple CPU cores as well, provided that the packets fed into each assembly are naturally segregated using the RSS features or as a result of being captured on different physical interfaces.

Note: Beginning with 11.5, the Network Decoder can capture from multiple interfaces simultaneously. This functionality allows Network Decoders to capture from multiple physical Network Interface Cards (NICs) while leveraging the same network rules, application rules, and parsers for each NIC. You can use this feature in all capture environments. For more information, see (Optional) Multiple Adapter Packet Capture.

Note: Enabling intra-session for HTTP pipelining is not supported when capturing at 10G rates on a single Decoder as the HTTP_Lua parser required to function can cause dropped packets at that rate of ingest. In this case, the load should be spread across multiple Concentrator-Decoder pairs.

Hardware Prerequisites

- A Series 5 or Series 6 Decoder
- An Intel 82599-based ethernet card, such as the Intel x520 or an Intel i40e-based card like the Intel XL710. All NetWitness-provided 10G cards meet this requirement such as the following:
  - All SMC-10GE cards provided by NetWitness.
  - A Dell Network Daughter Card using an Intel controller to provide 10G network interfaces. This is included in all Series 5 hardware.
- Sufficiently large and fast storage to meet the capture requirement of packets in case you set up in a mode other than meta-only. Storage considerations are covered later in this topic.
- If the Decoder will reassemble and handle high numbers of sessions, for example 30000 sessions per second or more, then at least two physical storage volumes are required. This will allow one volume to be used for writing session data while the other to read session data and deliver it for down-stream analytics.
- Each Network Decoder configured with a minimum of 2 DACs or SAN connectivity when set up in mode other than meta-only.

Software Prerequisites

NetWitness Platform 11.6 or later.

Decoder Installation

Perform the following steps to install the Decoder.

Install the Decoder Service on Host that Will Perform the Capture

The Network Decoder service package contains the necessary software components to utilize the features described in the document. The Network Decoder service package and all other required packages are installed during the Decoder installation.

Select the Capture Interfaces and Assign Interfaces to DPDK

You must choose the physical network connections that will be used for packet ingest. The physical interface type will depend on the type of network traffic sent to the Decoder. The interface you select must match the physical characteristics of the Decoder feed (or network link) used to receive packets. For example, if you want to capture at 40G speeds on a cable, then you need a 40G interface capable of attaching to that cable.

For information on how to assign interfaces to DPDK, see (Optional) Data Plane Development Kit Packet Capture.

Verify the Decoder Packages Installation

Perform the following steps to verify the Decoder package installation:

- After you configure the interfaces to use with DPDK, ensure that you reboot the Decoder host.
- After the reboot, ensure that the DPDK interfaces appear in the Decoder's capture adapter list.

Select the Decoder Operating Mode

You can configure Decoder to handle any type of capture scenario that ranges from a very deep application-level inspection to very fast and simple network connection tracking. The Decoder includes the following three built-in templates that serve as a starting point for configuring your capture needs:

1. **Normal**: It is the default Decoder mode with no defined resource allocation and all tunable parameters set to default. It can be a good option if your capture rate is less than 5 Gbit/s or if you want to run a large amount of deep inspection content such as application parsers, feeds, OpenAppID detectors, complex Snort rules, and so on. For more information, see Configure the Decoder for Normal Mode (Default Mode).
2. **10G**: This mode is available in NetWitness 10.4 and later. You can use this mode if your capture rate is under 10 Gbit/s. This mode assumes that most of the packets are retained and saved in the packet database. Make a note that not all parsers can run at 10 Gbit/s speeds as some parsers are too complex for high speeds. For more information, see Configure the Decoder for 10G Mode.
3. **NDR**: This mode is to capture beyond the 10 Gbit/s speeds, but below 40Gb/sec. Make a note of the following points while using this mode:
    a. By default, this mode assumes that packets are not retained as the rate at which this mode consumes storage is significantly high.
    b. By default, the ingested packets are dropped. You must insert the network rules before the drop statement to pick portions of the network stream and keep the incoming packet feed for further analysis.

c. Make a note that at higher speeds only a limited amount of deep packet inspection content can be used.

d. Ensure that you enable the multi-thread assembly while using this mode.

For more information, see Configure the Decoder for NDR Mode.

Configure the Decoder for Normal Mode (Default Mode)

By default, the Decoder runs in the normal mode and requires no additional configuration. The default normal mode captures up to 5Gb/sec with large amounts of deep packet inspection while storing network sessions.

Configure the Decoder for 10G Mode

The instructions in this section are to configure the Decoder for capture speeds up to 10Gb/sec with medium amounts of deep packet inspection while storing network sessions.

To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=10g`
   Ensure that the correct parameter is displayed in the output.
2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters can be `op=10g update=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=10g`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

      ```
      1: packet_mmap_,eth0
      2: DPDK,0000:41:00.0
      3: DPDK,0000:41:00.1
      ```

   c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.
   d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.

6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:
   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.
   - You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.
7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.
8. The following configuration parameters are deprecated and no longer necessary.
   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory
   - Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

   Note: An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping the unwanted traffic as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be

handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

IMPORTANT: Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

Storage Considerations

Packet Retention Requires Extremely High Sustained Throughput

When capturing at 10G line rates, the storage system holding the packet and meta databases must be capable of sustained write throughput of 1400 MBytes/s. Make a note that many SANs are not capable of achieving these speeds.

Using SAN and Other Storage Configurations

The Decoder allows any storage configuration that can meet the sustained throughput requirement. The standard 8 Gbit FC link to a SAN is not sufficient to store packet data at 10G; in order to use a SAN it may be required to perform aggregation across multiple targets using a software-RAID Scheme. Thus environments using SAN are required to configure connectivity to the SAN using multiple FCs.

Optimize Read/Write Operations When Adding New Storage

A 10G Decoder is optimized to stagger read and write operations across multiple volumes so that the current file being written is on a different volume from the next file that will be written. This allows maximum throughput on the raid volume when reading data from the last file being written while writing the current file on a different volume. However, if volumes are added after a Decoder has been in use, the ability to stagger is limited because one or more volumes are already full so the new volume is the only place new files can be written.

To remedy this situation, an administrator can run a `stagger` command on an existing NetWitness database (packet, log, meta, or session), that has at least two volumes, to stagger the files across all volumes in the most optimal read/write pattern. The major use case is when new storage is added to an existing Decoder and you want to stagger the volumes before restarting capture.

The configuration nodes for this command are the session, meta, and packet databases. Each of these lives under `/database/config`, which is usually a root node. The config nodes for a Decoder are:

- `/database/config/packet.dir`
- `/database/config/meta.dir`
- `/database/config/session.dir`

The *NetWitness Platform Core Database Tuning Guide* has information on how those configurations are formatted.

The `stagger` command is typically only useful for a 10G Decoder and usually just for the packet database. Maximum performance is achieved for storing and retrieving packets when multiple volumes are present. In this scenario, the Decoder always fills the volume with the most free space. When the volumes are roughly the same size, this results in a staggered write pattern, which allows maximum throughput for reading and writing across all volumes. However, this only naturally occurs when multiple packet storage volumes are present at the time the Decoder is first deployed.

A typical use case is adding more storage to an existing Decoder to increase retention. However, when adding storage to an deployment that has already filled the existing volumes with stored packets, the Decoder will naturally fill the new storage with packets before rolling out any packets on the existing storage. This results in a suboptimal read/write pattern because most reads will occur on the same volume that is currently being written to. In a 10G deployment, reads are blocked from the volume when writes are occurring. This does not stop ALL reads on that volume, because the file is buffered in memory before being written, but it does result in suboptimal read performance.

With the `stagger` command, you can add more storage and then have the service naturally stagger the files across ALL volumes (existing and new) so that read performance is optimized.

Caution: This command should only be performed after the storage is mounted and the Decoder configured to use it (for example, after adding the mount point(s) to `packet.dir`).

The downside to this command is it can take some time to stagger and the Decoder should not be capturing during the stagger operation.

Recommended workflow:

1. Add all storage and configure mount points.
2. Add new storage mount points to `packet.dir` (or `session.dir`/`meta.dir`) and restart service (very important!).
3. Ensure capture is stopped.
4. Run the stagger operation. You must not terminate the connection that initiated the stagger operation until the operation is complete. If you run stagger from NwConsole, run the `timeout 0` command before sending the `stagger` command. This will prevent the normal 30 second command timeout.
5. Start capture after the `stagger` command finishes.

The following are the parameters for the stagger command:

- `type` - The database that will be staggered (session, meta, or packet). Typically only the packet database is useful for staggering, but it is possible to do the session or meta database when multiple volumes are present for those databases. Since the session and meta databases write far less data than the packet database, typically staggering those databases results in less noticeable performance gains.

- `dryRun` - If `true` (the default), will only return a description of the operations that would be performed. If `false`, then the files will actually be moved to an optimal read/write pattern. You MUST pass false to actually stagger the files.

Example usage from NwConsole:

```
login <decoder>:50004 <username> <password>
timeout 0
send /database stagger type=packet dryRun=false
```

Note: If you run this command using the RESTful API, pass the additional parameter `expiry=0` to prevent a timeout from the service. You will also need to ensure the HTTP client does not disconnect before the operation completes.

IMPORTANT: If you perform the database stagger operation from the UI Explore page, it takes a long time to complete the operation based on the data and results in a timeout. NetWitness recommends that you use the RESTful API or NwConsole to perform the database stagger operation.

Parsing and Content Considerations

Parsing raw packets at high speeds presents unique challenges. Given the high session and packet rates, parsing efficiency is paramount. A single parser that is inefficient (spends too long examining packets) can slow the whole system down to the point where packets are dropped at the card.

For initial 10G testing, start with only native parsers (except SMB/WebMail). Use the native parsers to establish baseline performance and with little to no packet drops. Do not download any Live content until this has been done and the system is proven to capture without issue at high speeds.

After the system has been operational and running smoothly, Live content should be added very slowly, especially the parsers.

Best Practices

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss. One caveat is that if you are updating a current 10G deployment but not adding any additional traffic. For example, a current Decoder capturing off a 10G card at 2G sustained should see no difference in performance, unless part of the update also entails adding additional traffic for capture.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.

- Although lesser performance impacts, feeds should also be reviewed and added in a phased approach to help measure performance impacts.
- Application Rules also tend to have little observable impact, though again, it is best not to add a large number of rules at once without measuring the performance impact.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Also, making the recommended configuration changes outlined in the Configuration section will help minimize potential issues.

Use Case 1: 10G Mode - Egress, Deep Packet Inspection

In this setup the goal is to ingest at 10G sustained line rates, perform Deep Packet Inspection (DPI), store metadata, and store raw packets for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- MA content (7 Lua parsers, 1 feed, 1 application rule)
- 4 feeds (alert ids info, nwmalwaredomains, warning, and suspicious)
- 41 application rules
- DNS_verbose_lua (disable DNS)
- fingerprint_javascript_lua
- fingerprint_pdf_lua
- fingerprint_rar_lua
- fingerprint_rtf_lua
- MAIL_lua (disable MAIL)
- SNMP_lua (disable SNMP)
- spectrum_lua
- SSH_lua (disable SSH)
- TLS_lua
- windows_command_shell
- windows_executable

Not Tested

- SMB_lua, native SMB disabled by default
- html_threat

Other

- HTTP_lua reduces the capture rate from >9G to <7G. At just under 5G this parser can be used in place of the native without dropping (in addition to the list above).
- xor_executable pushes parse CPU to 100% and the system can drop significantly due to parse backup.

Aggregation Adjustments Based on Tested Live Content

A 10G Decoder can serve aggregation to a single Concentrator while running at 10G speeds. Deployments using Malware Analysis, Event Stream Analysis, Warehouse Connector, and Reporting Engine are expected to impact performance and can lead to packet loss.

For the tested scenario, the Concentrator aggregates between 45 and 70k sessions per second. The 10G Decoder captures between 40 and 50k sessions per second. With the content identified above, this is about 1.5 to 2 million meta per second. Due to the high volume of session rates, the following configuration changes are recommended:

- Nice aggregation on the Concentrator limits the performance impact on the 10G Decoder. The following command turns on nice aggregation.
  `/concentrator/config/aggregate.nice = true`
- Due to the high volume of sessions on the Concentrator, you may consider activating parallel values mode on the Concentrator by setting `/sdk/config/parallel.values` to `16`. This improves Investigation performance when the number of sessions per second is greater than 30,000.
- If multiple aggregation streams are necessary, aggregating from the Concentrator instead has less impact on the Decoder.
- Further review for content and parsing is required for deployments where you want to use other NetWitness components (Warehouse Connector, Malware Analysis, ESA, and Reporting Engine).

Configure the Decoder for NDR Mode

The instructions in this section are to configure the Decoder for capture speeds more than 10Gb/sec but less than 40Gb/sec with small amounts of DPI while storing only metadata.

To configure the Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `op=ndr`
   Ensure that the correct parameter is displayed in the output.

2. Add the `update=true` parameter and run **reconfig** again to save the configuration changes. For example, your final parameters will be `op=ndrupdate=true`.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=ndr`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Perform the following steps to select capture interfaces:
   a. In the **Decoder Explore** view, right-click on **Decoder** and select **Properties**.
   b. In the **Properties** drop-down menu, click **select** and run the command to view the available adapters. For example, this might produce output like the list below. The actual list of adapters will vary depending on the hardware available on the Decoder host.

      ```
      1: packet_mmap_,eth0
      2: DPDK,0000:41:00.0
      3: DPDK,0000:41:00.1
      ```

   c. To select a single interface for capture, enter the parameter `adapter=N` where `N` is the capture interface. For example, using the list above you might choose to capture on the first DPDK interface using the `adapter=2` parameter.
   d. To select more than one interface for capture, enter the parameter `adapter=N,M,...` where `N,M` and so on are the capture interfaces. For example, using the list above you might choose to capture on both DPDK interfaces using the `adapter=2,3` parameter.
6. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:
   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.
   - You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.

7. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.
8. The following configuration parameters are deprecated and no longer necessary.
   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory
   - Separate `device= parameters` in `capture.device.params`. All multi-interface selection is performed with the **select** command described in Step 5 (b).

   Note: An Ethernet device installed post imaging must be added to DPDK if you want to use it as a capture interface. Similarly, it also require configuration if used as a network interface, or for system tools to access it without manual configuration.

Performance Tuning Parameters

By default, the following tunable parameters are disabled. It is recommended that you enable these to achieve high capture rates and consistent performance.

1. You can use the BPF filter to perform fast filtering of the packets. The BPF filter is the fastest way to remove packets from ingest. By dropping traffic that you don't need to retain as early as possible, you can reduce the workload on the Decoder and ensure that essential packets are not dropped. For more information on BPF/PCAP filter, see Configure Capture Settings.
2. You can turn on the Receive Side Scaling (RSS) feature for your network capture interface. The RSS feature splits the traffic coming into the interface in separate queues. It allows each queue to be handled by a different thread, and therefore run on a different CPU core. This provides more CPU time to execute per-packet operations like evaluating BPF and Network rules. RSS makes handling of higher packet rates easier.
   The correct value for RSS will depends on the number of CPUs available on the host. A good starting point for the number of RSS threads depends on how many Cores per CPU socket are present in your Decoder host. Take the number of Cores present on a single CPU, and divide it by 2. For example, on a 12 core processor, you might use up to 6 RSS queues. You can distribute the RSS unequally between interfaces. For example you can assign 4 RSS queues to a busy interface and 2 to a less busy interface.

   IMPORTANT: Ensure that a Network Interface on a Decoder host is typically attached to only one CPU socket. Therefore, you must count only the CPU cores of the CPU socket that is attached to the network interfaces.
   Setting higher numbers of RSS queues is possible, but there are diminishing returns if the total number of RSS queues spawns more Capture and Assembly threads than there are physical cores on the Decoder host.

   For more details on how to configure RSS, see "*Utilizing Receive Side Scaling with DPDK*" in (Optional) Data Plane Development Kit Packet Capture.

Storage Considerations

NDR Mode Assumes No Packet Retention

The base or default configuration for NDR mode starts with all packet writes disabled. So, in this scenario the storage throughput requirements are relatively less. If you choose to turn on packet retention, be aware that it is relatively easy to overwhelm the I/O throughput of most storage solutions with a 40G network feed.

Parsing and Content Considerations

Parsing at Speeds Greater than 10G

As network ingest speeds increase, less CPU time is available to examine each packet or each session. It means that only limited amount of parsing can be performed. Fortunately, you only need to account for the amount of traffic that enters Decoder's parsing sub-system. For example, if you are ingesting 40 Gbit/s but filter out 30 Gbit/s of traffic, you only need to allow 10 Gbit/s of traffic to move through the parsers. At raw 40 Gbit/s speeds, only the "well-behaved" content works. The "well-behaved" content can defined as:

- Content that only activate when a large, uncommon search token is registered. It includes the Snort rules with a large, uncommon "fast-pattern" content field. For more information on fast-pattern and Snort rules, see Decoder Snort Detection.
- Content that generates a finite number of metas per session.
- Parsers that do not activate on session begin/end events.

The overall maximum throughput of the reassembly and parsing systems on Decoder is about 100,000 sessions (or streams) per second. However, in practical terms, very few downstream analytical or database services can handle such activity. If you find that your session rate is too high, or that your down-stream services cannot handle how many sessions the Decoder is generating, consider filtering out lower value traffic as it is ingested.

Best Practices

The NDR mode has a network rule configured to drop all incoming traffic by default. In general, when capturing above 10Gb/sec, you must limit the amount of traffic analyzed using DPI. These use cases in this document are example guidelines that do not guarantee the actual throughput of the Decoder. As mentioned previously in this document, the actual throughput of the Decoder depends on the following factors:

- **Amount of packets filtered vs. the amount of packets retained**
  It is important to filter the traffic that enters the Decoder to minimize packet drops. You can use Network Rules or a BPF Rule to filter the traffic before it enters advanced features such as stream reassembly and DPI. For more information, see Configure Network Rules and (Optional) Configure System-Level (BPF) Packet Filtering.
- **Average packet size**
  Decoder capturing small packets, for example 64 byte packets, can decrease the overall throughput of

the Decoder. If average packet sizes are small, the line rate of Decoder ingest will fall significantly below the network link speed. It occurs due to the amount of per-packet overhead between each Ethernet frame.

- **Shared system resources**
  If the Decoder host is also hosting other applications or add-on features that manipulate data and perform other analysis, it can lower the overall throughput of the Decoder. Even if these add-on applications are not utilizing the CPU, these will utilize the shared resources like memory bandwidth and CPU interconnect bandwidth.

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to re-factor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- If you regularly get a timeout message in the Investigate > Events view, such as `The query on channel 192577 was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time. If there are no messages indicating any specific warnings then try increasing the Core Query Timeout from the default 5 minutes to 10 minutes as described in "View Query and Session Attributes per Role" section of the *System Security and User Management Guide*.

Use Case 1: NDR Mode - Egress, General Purpose

Generate NetFlow Style Meta Only + Small Subset of Snort Rules + All Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- The **`NETWORK`** native parsers
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Use Case 2: NDR Mode - Egress, Data Exfiltration

Generate NetFlow Style Meta Only + Exfiltration Focused Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- Native parsers - HTTP, HTTPS(SSL), SMTP, DNS, FTP, SFTP/SSH, and VNC
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

The following considerations are recommended while running the Decoder in the NDR mode:

- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Use Case 3: NDR Mode - Lateral Movement

Generate NetFlow Style Meta Only + Small Subset of Snort Rules + Specific Native Parsers

In this setup the goal is to ingest at rates higher than 10G sustained line rates, perform DPI with only native network parsers (non-Lua), and store only metadata for some time.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

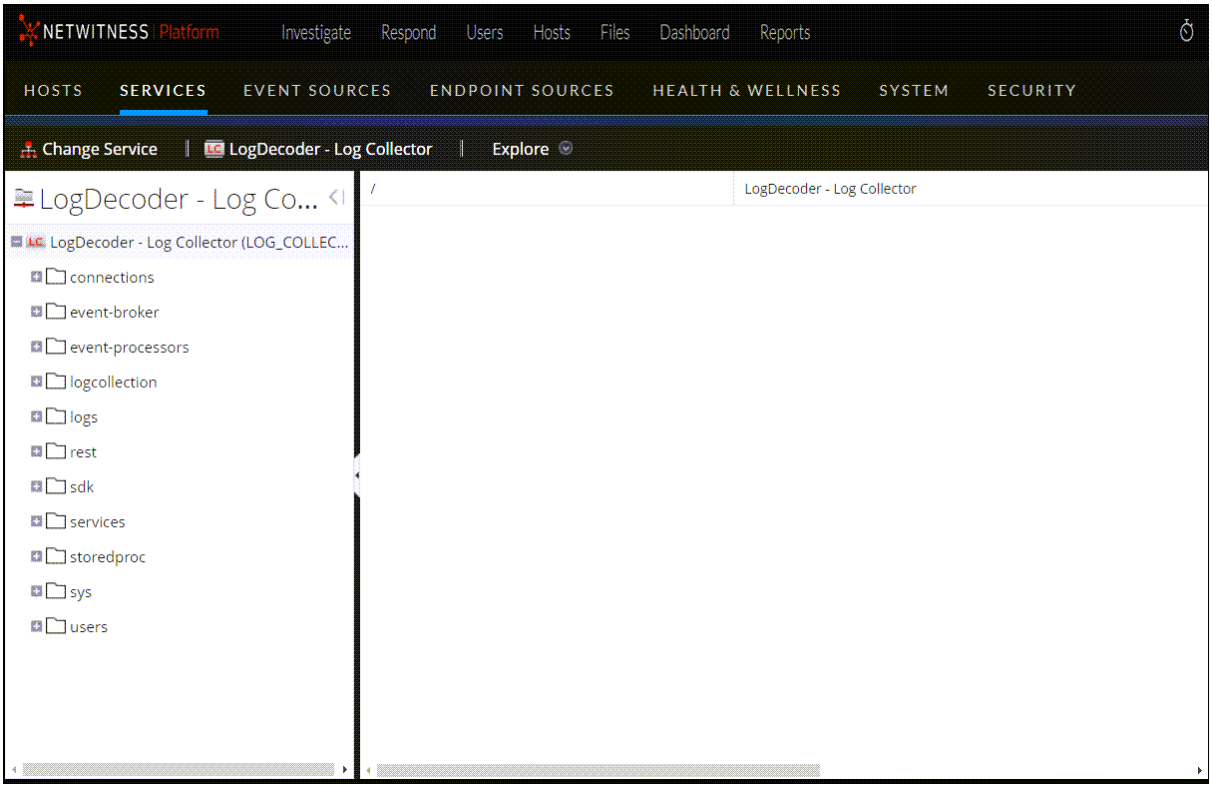
- Native parsers - Kerberos, SMB, VNC, and SFTP/SSH
- 35 Snort rules for FireEye red team tool detection

Not Tested

All Lua parsers.

Other

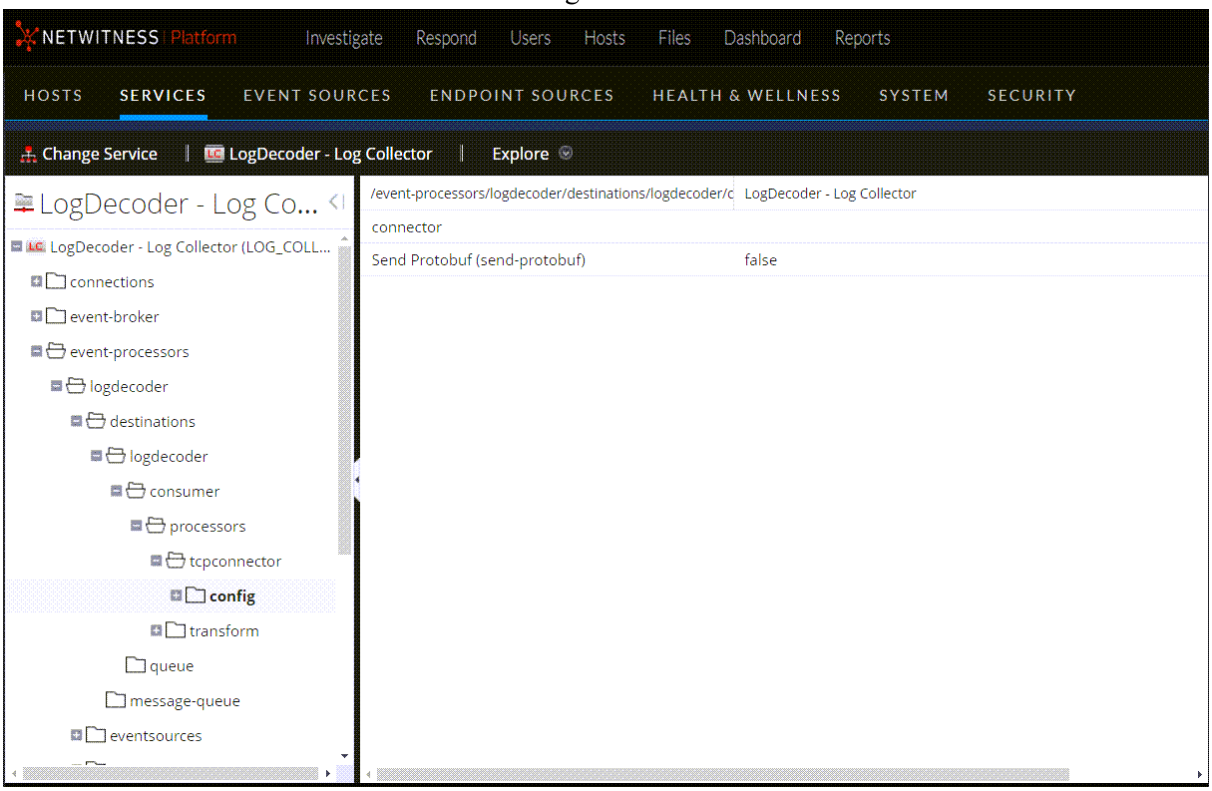
The following considerations are recommended while running the Decoder in the NDR mode:



- Disable the Snort rule related to SMB traffic (for example, `M.HackTool.SMB.Impacket-Obfuscation.[Service Names]`). It is recommended because large regex parameters can cause Snort parser to utilize more than 50% CPU.
- Some native parsers should be disabled in some environments. For example, the DNS parser might generate too many small sessions or too much meta per session.
- It is recommended to keep the session rate less than 35,000 sessions per second. This is to limit the packet drops to less than 1% at such high throughput rates.
- Configure rules to filter the traffic that you do not require. For more information on BPF/PCAP filter, see Configure Capture Settings.

Configure a Log Decoder to Accept Protobuf

There are occasions when you want to analyze log files that are in protobuf (Protocol Buffer) format. You can configure a Log Decoder with a Log Collector service to accept logs in protobuf (Protocol Buffer) format.



To import a log file to a Log Decoder:

1. Go to **(Admin) > Services**.
2. Select a Log Decoder with a Log Collector service in the **Service** list, and select **> View > Explore**.
   The Explore view for the Log Decoder -Log Collector is displayed.

3. Navigate to **`event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config`**

Your screen should look similar to the following.

4. For the **send-protobuf** field, select **false**, and change the value to **true.**
5. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config/connector/channel/tcp` and change the **port** value to **50202**.
6. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config/connector/event` and change the following parameters:
   - Clear the **delimiter** field
   - Change **format** to **%text%**

Configure Session Split Timeouts

The default behavior of the Decoder is to automatically end sessions that exceed a configured size or have been inactive for a period of time. When the session is ended due to timeout, any subsequent packets received in that session appear to be stored in a new session. You can mitigate the effect of session splitting due to long periods of inactivity between packets using this procedure.

When a Decoder session exceeds a configured size (32MB by default, the `/decoder/config/assembler.size.max`) or has been inactive for a period of time, the session is split. NetWitness has the previous packet and the next packet and can propagate session state from the initial session fragment to the subsequent session fragment.

Each session fragment is annotated (`session.split` meta) such that it can be identified and associated with other fragments from the actual network session. Directionality as determined by the initial session reduces the occurrence of fragments having reversed directionality.

If there is a gap in time between packets large enough that there are no longer any packets for the session in memory, the session is removed from the Decoder. If a subsequent packet shows up after this occurs, a new session is created with no context to the preceding session. The issue is the inability to continue a session when we encounter a gap between packets of a session that is larger than the packets we are buffering (based upon available memory and timeout configurations). Once the last packet of a session is removed from memory, the session is also removed, and with it the necessary context for ensuring consistent directionality.

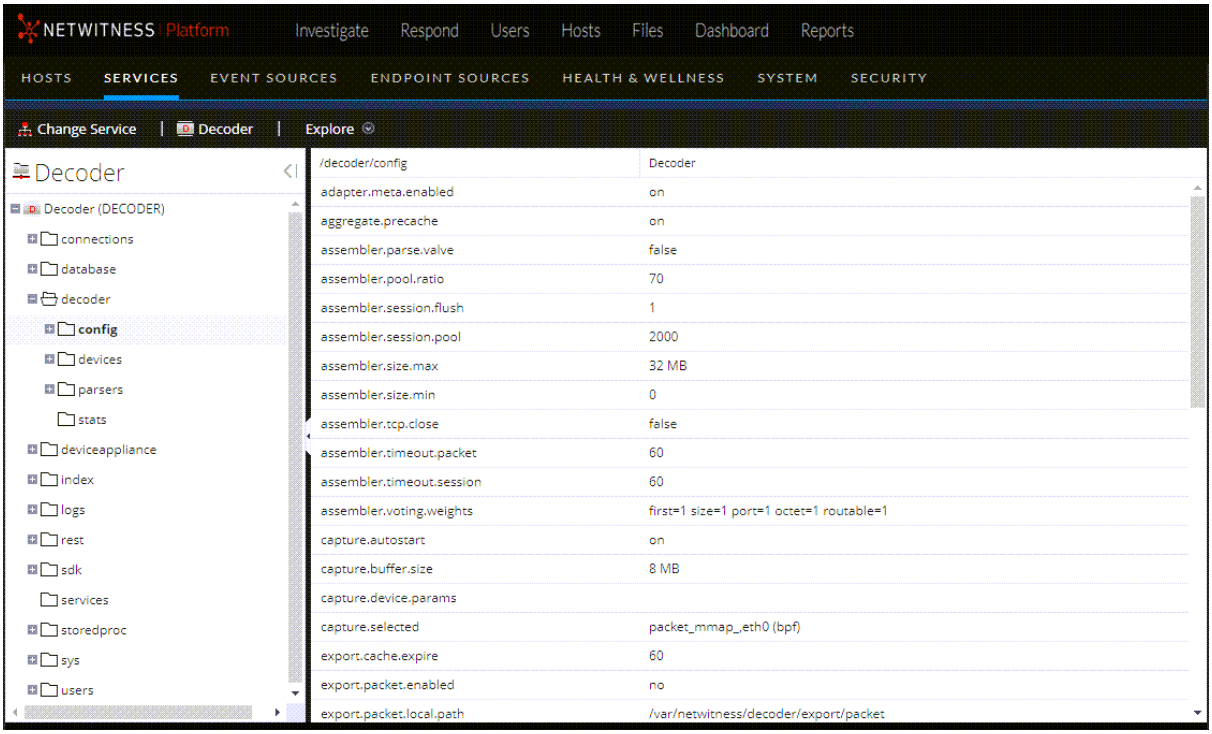
There are two timeout settings in a Network Decoder, `/decoder/config/assember.timeout.session` and `assembler.timeout.packet`. Both default to 60 seconds. The setting `assembler.timeout.session` controls how long a session lives in Assembler without receiving another packet. The setting `assembler.timeout.packet` controls how long a session waits before getting parsed. If the session is kicked out of Assembler before this timeout, then it automatically goes to parsing.

The session timeout is the number of seconds since the last packet was added to that session. Therefore, this timeout resets on every packet added to that session. The packet timeout is the number of seconds since the very first packet for that session was added (in other words, the packet that created the session). This is never reset and once the timeout expires, the session is parsed.

The important point is a session can be parsed but still remain in Assembler. A session in Assembler can still have packets added to it, even if it has already been parsed. Packets added after the session is parsed will never be seen by parsers, but they will be attached to the session and can be viewed by a subsequent `/sdk content` or `/sdk packets` call.

After a session is parsed, the session AND its metadata are written to disk. At this point, they can be aggregated and "seen" by `sdk` commands. Packets are written in order of capture and are not reordered by what session they belong to. Nor are they necessarily written when the session and meta data are written.

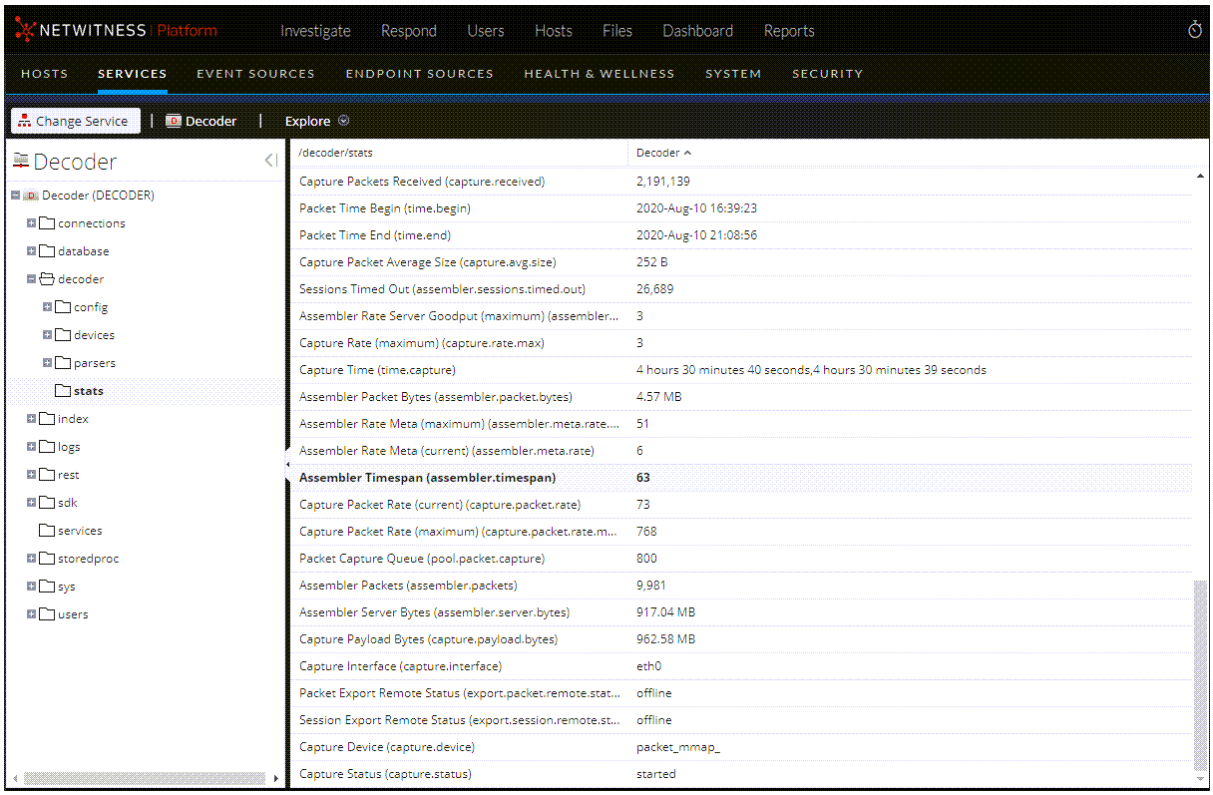
You can disable both timeout nodes, `/decoder/config/assembler.timeout.session` and `assembler.timeout.packet`, by setting them to zero in the Services Explore view.



If both timeouts are disabled, the sessions are still split due to time or size expiration. However, the Decoder keeps track of the network stream for as long as it has sufficient memory. Thus, when more packets arrive on the same network stream, the Decoder adds `split` meta items to the subsequent sessions. Using a combination of the `split` metadata and the stream key, it is possible to reconstruct the network stream from the multiple sessions.

The length of time for which sessions are tracked is limited by the number of session pool entries available on the Decoder, and therefore the actual time window varies according to the rate at which new sessions are added. If new sessions are added at a high rate, the size of the time window decreases. The size of the pool is set using the configuration entry `/decoder/config/assembler.session.pool`, which sets the maximum number of sessions that will be tracked at a time.

The `/decoder/stats/assembler.timespan` statistic allows you to see when the Decoder is no longer tracking session splits because the ingest rate is too high and the Decoder does not have enough memory to track. This statistic shows the number of seconds tracked within the session table, which is the effective time window in which the Decoder can link together sessions. Under normal operation this statistic matches the value of `/decoder/config/assembler.timeout.session`, but when running in Time Split mode, the `/decoder/stats/assembler.timespan` statistic grows or shrinks depending on the ingest rate.



To configure Time Split mode, set the following configuration parameters and restart the Decoder:

1. In the (Admin) > **Services** view, select the Decoder service and **> View > Explore.**
2. In the Services Explore view select **decoder** > **config**.

3. Click in the **Value** column next to the parameter and set these two parameters :
   `/decoder/config/assembler.session.flush = 0`
   `/decoder/config/assembler.timeout.session = 0`
4. To see when the Decoder is no longer tracking session splits because the ingest rate is too high and the Decoder does not have enough memory to track, view the `/decoder/stats/assembler.timespan` statistic, in the Services Explore view select **decoder** >

stats.

Configure Syslog Forwarding to Destination

In addition to collecting Syslog messages, you can configure the Log Decoder to forward Syslog messages to another Syslog receiver.

Note: No configuration is necessary to collect Syslog messages on the Log Decoder.

NetWitness forwards Syslog messages after it has parsed the messages and before it writes the messages to the Log Decoder.

Note: You must configure Syslog Forwarding using the steps defined in this topic using the **Explore** view.

The Log Decoder must be in the **Started** state before you can configure Syslog Forwarding. To configure Syslog Forwarding:

1. Configure Log Decoder application layer rules (Application rules) to tag Syslog messages with metadata that instructs NetWitness to forward the messages:

   a. In the **Services** view, select a Log Decoder, and in the Actions column, select > **View** > **Explore**.

   b. Go to the **/decoder/config/rules/application** node, right-click **application,** and click **Properties**.

   c. In the **Properties** view, specify the **add** command with the following parameters:

   `rule=<query> name=<name>`

   Example 1: `rule=* name=receiver1`

   Example 2: `rule="device.type='winevent_nic'" name=receiver`)

   d. Click **Send**.

NetWitnesscreates the `name=receiver1 rule=* order=<n>` rule. NetWitness inserts the order number (for example, `order=49`) based on when you set up the rule.

e. Go to the `/decoder/config/rules/application` node and click the `name=receiver1 rule=* order=49` rule.

f. Add **alert forward** parameters to the rule parameters.

```
rule=* name=receiver1 order=49 alert forward
```

or

```
rule=* name=receiver1 forward
```

All other rule parameters have the same meaning as they do in other application rules.

The following Application rule example selects all logs with the * rule. It creates a transient alert meta with the value "receiver1" and tags the entire log for forwarding it to the syslog forwarding destination. You can define as many different forwarding rules as you need with the same name or unique names.

2. Define Syslog forwarding destinations and enable forwarding.

a. In the **Services** view, select a Log Decoder, and  **> View > Explore**.

b. Syslog forwarding destinations are defined in the configuration node.

```
/decoder/config/logs.forwarding.destination
```

This configuration node contains one or more name/value pairs. The name corresponds to the name parameter in the application rule that you used to tag logs with forwarding meta. The value is a colon-separated triple of transport, host, and port followed by an optional formatting parameter.

```
name=(udp|tcp|tls):host:port[:(retainsource|rfc3164)]
```

The first parameter indicates the transport protocol and must be one of udp, tcp, or tls. Specifying udp will forward logs via RFC 3164 / RFC 5426 UDP syslog protocol. Specifying tcp will forward logs via a TCP connection with RFC 6587 framing. Specifying tls will forward logs in accordance with RFC 5425.

The host is an IPv4 address, IPv6 address, or host name.

The port is the port to which the logs are sent. This is typically port 514 for UDP syslog, and 6514 for TLS connections. There is no standard port assignment for syslog over TCP.

Optionally, `retainsource` or `rfc3164` can be specified at the and of the destination string to indicate that additional formatting and information should be included with each log forwarded. Specifying `retainsource` will include z-connector headers at the beginning of the log based and will be populated by the `time`, `device.(ip|ipv6|host)`, and `lc.cid` meta and is best used for forwarding to other log decoders. The `rfc3164` option will prepend a valid RFC3164 header to all events forwarded constructed of the `syslog.pri`, `time`, and `device.(ip|ipv6|host)` meta. In both cases, the original log text is unmodified.

Example forwarding destination:

```
gears=tls:gears.netwitness.local:6514
```

Example forwarding over tcp to blackout on port 514 with z-connector headers:

```
fwdrule=tcp:blackout.netwitness.local:514:retainsource
```

In the `/decoder/config/logs.forwarding.destination` parameter, specify the destination. For example:

TLS Connections: `receiver1=tls:receiver1.netwitness.local:6514`

UDP Connections: `receiver1=udp:receiver1.netwitness.local:514`

TCP Connections: `receiver1=tcp:receiver1.netwitness.local:514`

Note:
You can configure:
- Multiple rules to forward logs to the same destination.
- Multiple rules to forward logs to multiple destination.

For TLS connections, the certificate of the forwarding destination must be validated. The certificate authority that signed the destination's certificate must be present in the Log Decoder's CA trust store and the certificate must reside on the destination or Syslog receiver. Refer to "Configure Certificates" in the *Log Collection Configuration Guide* for information about manipulating the Log Decoder's CA trust store. (Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.)

c. In the `/decoder/config/logs.forwarding.enabled` parameter, specify **true**.

Configure Transaction Handling on a Decoder

Administrators can configure a Decoder to subdivide incoming sessions into smaller transaction sessions when using Lua parsers designed to create transactions. The feature allows analysts to perform analytics on the split sessions in downstream services such as Investigate.

Caution: Use caution when enabling this feature when you are above the standard ingest rate supported by the Network Decoder as it may start to cause backups with aggregation and dropped packets.

Transaction Handling

The Decoder service configuration node has a new parameter for configuration of transaction handling: `/decoder/parsers/config/parser.transaction.mode`. This node controls the behavior of the Decoder when a parser defines a transaction within a network session.

The values for `parser.transaction.mode` correspond to the operating modes:

- `off` (transactions off)
- `meta` (transactions represented as meta items)
- `split` (transactions split sessions)

Transactions Off

When transactions mode is off, any application-level transactions created by parsers are ignored, and nothing is stored in the collection to represent the transaction.

Transactions Represented as Meta Items

In this mode of operation, when a parser generates an application-level transaction, a new meta item of type `{{trans}}` is added to the session in which the transaction occurred. The `{{trans}}` meta item contains a list of other meta items that constitute the transaction.

Transactions Split Sessions

In this mode of operation, when a parser generates an application-level transaction, the session is split. The session splitting is accomplished by:

1. A new session item is created.
2. Network meta items are copied from the parsed session into the new session.
3. Meta items marked in the transaction are moved from the original session to the new session.

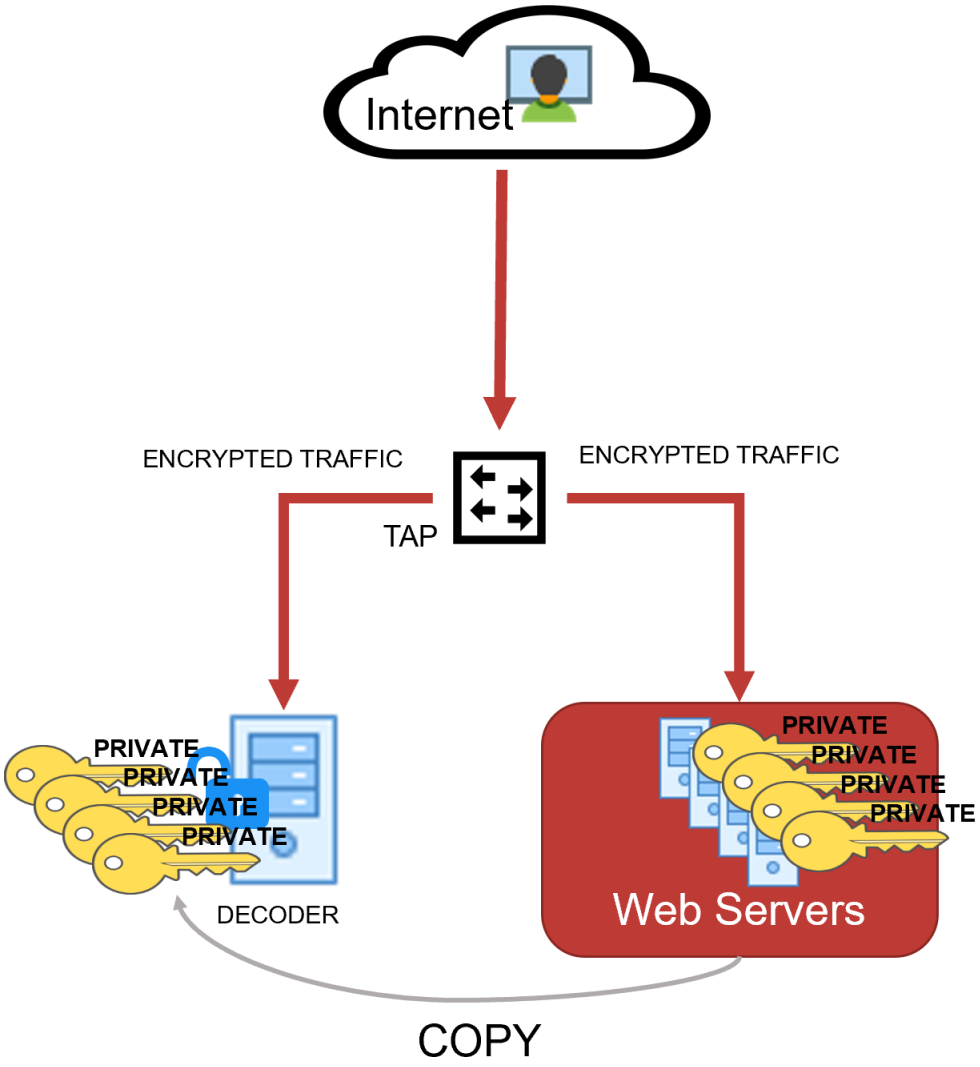
The following meta items are duplicated into the split session from the session that was parsed:

- `time`
- `medium`
- `eth.src`
- `eth.dst`
- `eth.type`
- `ip.proto`
- `ip.src`
- `ip.dst`
- `ipv6.src`
- `ipv6.dst`
- `ip.proto`
- `port.src`
- `port.dst`
- `tcp.flags`
- `udp.srcport`
- `udp.dstport`
- `service`
- `udp.srcport`
- `udp.srcport`
- `tls.premaster`

Configure Data Export

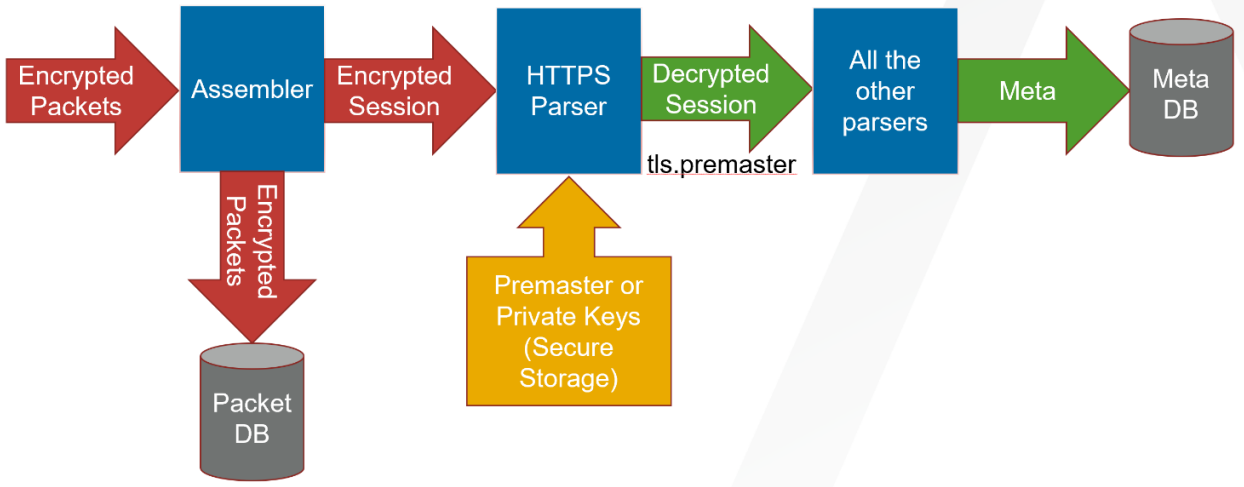
This exports meta data and raw logs from the Decoder or Log Decoder and converts it to Logstash JSON object. To enable data export you must configure the export connector through Logstash.

To configure the data export:



1. Go to  **(Admin) > Services** and select a Decoder or Log Decoder.
2. Select  **> View > Config**.
3. In the Configuration view, select the **Data Export** tab.
4. In the Data Export list, click the name of the host.

The Event Source tab is displayed with export connector typespec selected.



For more information on configuring export connector, see Configure Logstash Event Sources in NetWitness.

Decrypt Incoming Packets (TLS 1.2)

Administrators can configure a Network Decoder to decrypt incoming network packets. This capability is currently supported with encrypted communications to managed servers using TLS 1.2 or earlier and certain cipher suites, which are described in Supported Cipher Suites . The following figure illustrates the supported configuration of a Network Decoder deployed as a passive network device where it captures network traffic for managed servers. The Network Decoder is able to decrypt the traffic by using private keys uploaded to it from the managed servers .

As the network traffic is collected and passed through the system, the encrypted packets are stored as captured even if the system has been able to decrypt them. As the Decoder parses the encrypted traffic, it uses any private keys that have been uploaded, and determines if the network traffic can be decrypted. If the Decoder is able to decrypt the traffic, it generates an additional meta key, defined as `tls.premaster`, which contains the decryption key for that particular session. Whether the traffic is decrypted or not, the metadata `service` is tagged as 443 or SSL/TLS traffic, as the Decoder is port agnostic, even though it is marked with the default port number. The following figure shows the basic progression through the NetWitness platform as the packets are being decrypted and the session metadata is generated.

Follow the steps below to configure the Network Decoder to natively decrypt this network traffic.

- Step 1: Validate That The Network Decoder Captures Encrypted Traffic
- Step 2: Obtain Private Keys from Managed Servers
- Step 3: Validate That The Private Key Cipher Suite is Supported
- Step 4: Confirm HTTPS Parser is Enabled on Decoders
- Step 5: Upload the Supported Private Keys to Decoders
- Step 6: Reload HTTPS Parser on Decoders
- Step 7: View Decrypted Sessions

Note: Currently, you cannot review the decypted payloads directly in the in the user interface. However, you can review them using the RESTful API interface and the NwConsole. However, the Decoders being able to decrypt traffic enables them to detect and generate potentially malicious communications that would otherwise not be detected.

See Troubleshooting for resolving any issues you might encounter while performing these steps.

Step 1: Validate That The Network Decoder Captures Encrypted Traffic

First, make sure the Decoder is actually capturing the SSL/TLS traffic from the managed servers that you want to use to gain visibility into the encrypted sessions. You can do this by searching in the Investigate views (Navigate or Events) using the IP addresses of the servers as the destination IP addresses, and the service as SSL/TLS.

For example, if you are searching for HTTPS traffic to 192.168.1.2 and 192.168.1.3, you can run the following query:

```
service = 443 && ip.dst = 192.168.1.2, 192.168.1.3
```

Conduct this search on the Concentrator that aggregates metadata from the Decoder that is expected to capture this network segment, or on a Broker that may have access to all collected metadata.

(Version 11.6 or later) In case of simultaneous ingestion of the encrypted and decrypted traffic streams in the Decoder, ensure that multi-thread assembly is enabled. This is to prevent mixing of packets from different sessions by single thread assembly. For more information, see the following topics:

- Perform Simultaneous Ingestion of the Encrypted and Decrypted Traffic Streams to Decoder
- (Optional) Multiple Adapter Packet Capture

Step 2: Obtain Private Keys from Managed Servers

Private keys are the asymmetric keys generated by services that accept TLS traffic. They are normally stored in PEM files. These keys are used during the TLS handshake to encrypt the premaster symmetric key that is used for the rest of the payload encryption.

Note: The method to export private keys from web servers (from which to decrypt traffic) varies depending on the product. Refer to the product documentation for instructions for exporting private keys.

Extracting Certificates for the Decoder SSL Decryption

Extracting the proper key materials from popular servers is required to leverage the Decoder built-in decryption capability. The following are a few examples to extract private keys and certificates from popular servers like Apache, Microsoft IIS, and Exchange.

Note: These procedures can also be used as references to extract keys from other servers as well.

Extract private key from Apache

The private key file location would be referenced in the main Apache configuration file, which is `httpd.conf` or `apache2.conf`. The config directive `SSLCertificateKeyFile` will specify the path on your server where private keys are stored.

If Apache is using OpenSSL default certificates and keys, then locate private keys (which are usually saved to the folder /usr/local/ssl by default). You can run the command openssl version –a to find OPENSSLDIR where your server is saving the keys.

If the private key is password protected, then it can be extracted using the below command with the password.

```
openssl rsa -in yourcertificate.pem -out serverkey.pem
```

Validate the located private key using the following command.

```
openssl rsa -in serverkey.pem -check -noout
```

Extract Private Key and Certificate from Windows Servers

Windows servers provide the interface to extract certificates and private keys in PKCS12 format files (.pfx format). It is recommended to use password protection while exporting private keys.

After exporting keys to the pfx file, you can use the OpenSSL tool to extract private keys as PEM files and upload them to Decoder.

Step 2 (a): Extract PKCS12 file from Internet Information Services (IIS)

There are multiple ways to extract certificates from IIS and the following are few examples.

Using IIS Manager App

- Open Internet Information Services Manager App.
- Under IIS > Navigate to Select Certificates > Select Features view > Select the required web or application server certificate.
- Right-click the certificate and select the Export option. In the export wizard, select the file path to save the pfx file (PKCS12 format)
- Example: C:\ServerCerts\servercrt.pfx.
- Enter the password and confirm the password in the export.
- This would create password protected pfx file which contains a private key and associated certificate.

Using Microsoft Management Console (MMC)

- Open Microsoft Management Console (MMC).
- In the Console Root expand Certificates (Local Computer).
- If the Certificates folder is not available then navigate to File > Add Snap In > Add Certificates.
- Locate your server certificate, it is located in the Web Server or Personal sub-folders.
- Right-click the certificate, identified by the Common Name, select Export, and follow the wizard. Use password to protect the pfx file.
- This would create password protected pfx file which contains a private key and associated certificate.

Step 2 (b): Extract PKCS12 file from Exchange Servers

Refer the Export a Certificate from an Exchange Server document for information on how to extract the pfx file from the Exchange server.

Step 2 (c): Extract Private Key From a pfx File Using OpenSSL

OpenSSL tool provides API to export keys in PEM format.

1. Extract private key in PEM format, at the openssl prompt use the password to decrypt the pfx file.
   ```
   openssl pkcs12 -in servercrt.pfx -nocerts -nodes -out serverkey.pem
   ```
2. Validate the private key generated
   ```
   openssl rsa -in serverkey.pem -check -noout
   ```
3. Extract cert in PEM format to validate compatibility with private key
   ```
   openssl pkcs12 -in servercrt.pfx -nokeys -out serverkey.crt
   ```
4. Validate private key and certificate modulus. The modulus should be the same for both the private key and its certificate.
   ```
   openssl rsa -noout -modulus -in serverkey.pem
   openssl x509 -noout -modulus -in serverkey.crt
   ```

Recommendations

Once private keys are extracted from servers and imported to Decoder, it is recommended to secure or delete the extracted PEM file of the private key (serverkey.pem) generated by the above OpenSSL commands.

Step 3: Validate That The Private Key Cipher Suite is Supported

As a passive collection device, the Network Decoder can only decrypt ciphers that use the RSA key exchange. The list of supported keys, and whether the keys are FIPS compliant, are listed in Supported Cipher Suites and Unsupported Cipher Suites . If you are expecting to decrypt less-secure channels of communication, you might need to disable FIPS. However, this is a system change to the entire Decoder, not just the parsing of captured traffic, so take caution before disabling FIPS. If you require more-secure cipher suites for the managed server communications, search for "SSL decrypt" in our third party partner integrations section at NetWitness Community (https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions).

Note: If FIPS is enabled, the list of ciphers for decryption is restricted to only those that are FIPS-compliant.

Supported Cipher Suites

The following table lists which cipher-suites are supported using private keys.

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_RSA_WITH_AES_256_GCM_SHA384	AES256-GCM-SHA384	[0x9d]	TLSv1.2	Kx=RSA	Compliant
TLS_RSA_WITH_AES_256_CBC_SHA256	AES256-SHA256	[0x3d]	TLSv1.2	Kx=RSA	Compliant

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_RSA_WITH_AES_256_CBC_SHA	AES256-SHA	[0x35]	SSLv3	Kx=RSA	Compliant
TLS_RSA_WITH_CAMELLIA_256_CBC_SHA	CAMELLIA256-SHA	[0x84]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_3DES_EDE_CBC_SHA	DES-CBC3-SHA	[0x0a]	SSLv3	Kx=RSA	Compliant
TLS_RSA_WITH_AES_128_GCM_SHA256	AES128-GCM-SHA256	[0x9c]	TLSv1.2	Kx=RSA	Compliant
TLS_RSA_WITH_AES_128_CBC_SHA256	AES128-SHA256	[0x3c]	TLSv1.2	Kx=RSA	Compliant
TLS_RSA_WITH_AES_128_CBC_SHA	AES128-SHA	[0x2f]	SSLv3	Kx=RSA	Compliant
TLS_RSA_WITH_SEED_CBC_SHA	SEED-SHA	[0x96]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_CAMELLIA_128_CBC_SHA	CAMELLIA128-SHA	[0x41]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_IDEA_CBC_SHA	IDEA-CBC-SHA	[0x07]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_RC4_128_SHA	RC4-SHA	[0x05]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_WITH_DES_CBC_SHA	DES-CBC-SHA	[0x09]	SSLv3	Kx=RSA	Non-Compliant
TLS_RSA_EXPORT_WITH_DES40_CBC_SHA	EXP-DES-CBC-SHA	[0x08]	SSLv3	Kx=DES	Non-Compliant

Unsupported Cipher Suites

The following table lists which cipher-suites are not supported using private keys.

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384	ECDHE-RSA-AES256-GCM-SHA384	[0xc030]	TLSv1.2	Kx=ECDH	Compliant
TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384	ECDHE-ECDSA-AES256-GCM-SHA384	[0xc02c]	TLSv1.2	Kx=ECDH	Compliant
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384	ECDHE-RSA-AES256-SHA384	[0xc028]	TLSv1.2	Kx=ECDH	Compliant

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384	ECDHE-ECDSA-AES256-SHA384	[0xc024]	TLSv1.2	Kx=ECDH	Compliant
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA	ECDHE-RSA-AES256-SHA	[0xc014]	SSLv3	Kx=ECDH	Compliant
TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA	ECDHE-ECDSA-AES256-SHA	[0xc00a]	SSLv3	Kx=ECDH	Compliant
TLS_DHE_DSS_WITH_AES_256_GCM_SHA384	DHE-DSS-AES256-GCM-SHA384	[0xa3]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_RSA_WITH_AES_256_GCM_SHA384	DHE-RSA-AES256-GCM-SHA384	[0x9f]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_RSA_WITH_AES_256_CBC_SHA256	DHE-RSA-AES256-SHA256	[0x6b]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_DSS_WITH_AES_256_CBC_SHA256	DHE-DSS-AES256-SHA256	[0x6a]	TLSv1.2	Kx=DH	Compliant
TLS_DHE_RSA_WITH_AES_256_CBC_SHA	DHE-RSA-AES256-SHA	[0x39]	SSLv3	Kx=DH	Compliant
TLS_DHE_DSS_WITH_AES_256_CBC_SHA	DHE-DSS-AES256-SHA	[0x38]	SSLv3	Kx=DH	Compliant
TLS_DHE_RSA_WITH_CAMELLIA_256_CBC_SHA	DHE-RSA-CAMELLIA256-SHA	[0x88]	SSLv3	Kx=DH	Non-Compliant
TLS_DHE_DSS_WITH_CAMELLIA_256_CBC_SHA	DHE-DSS-CAMELLIA256-SHA	[0x87]	SSLv3	Kx=DH	Non-Compliant
TLS_ECDH_RSA_WITH_AES_256_GCM_SHA384	ECDH-RSA-AES256-GCM-SHA384	[0xc032]	SSLv3	Kx=ECDH/RSA	Compliant
TLS_ECDH_ECDSA_WITH_AES_256_GCM_SHA384	ECDH-ECDSA-AES256-GCM-SHA384	[0xc02e]	TLSv1.2	Kx=ECDH/ECDSA	Compliant
TLS_ECDH_RSA_WITH_AES_256_CBC_SHA384	ECDH-RSA-AES256-SHA384	[0xc02a]	TLSv1.2	Kx=ECDH/RSA	Compliant

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS
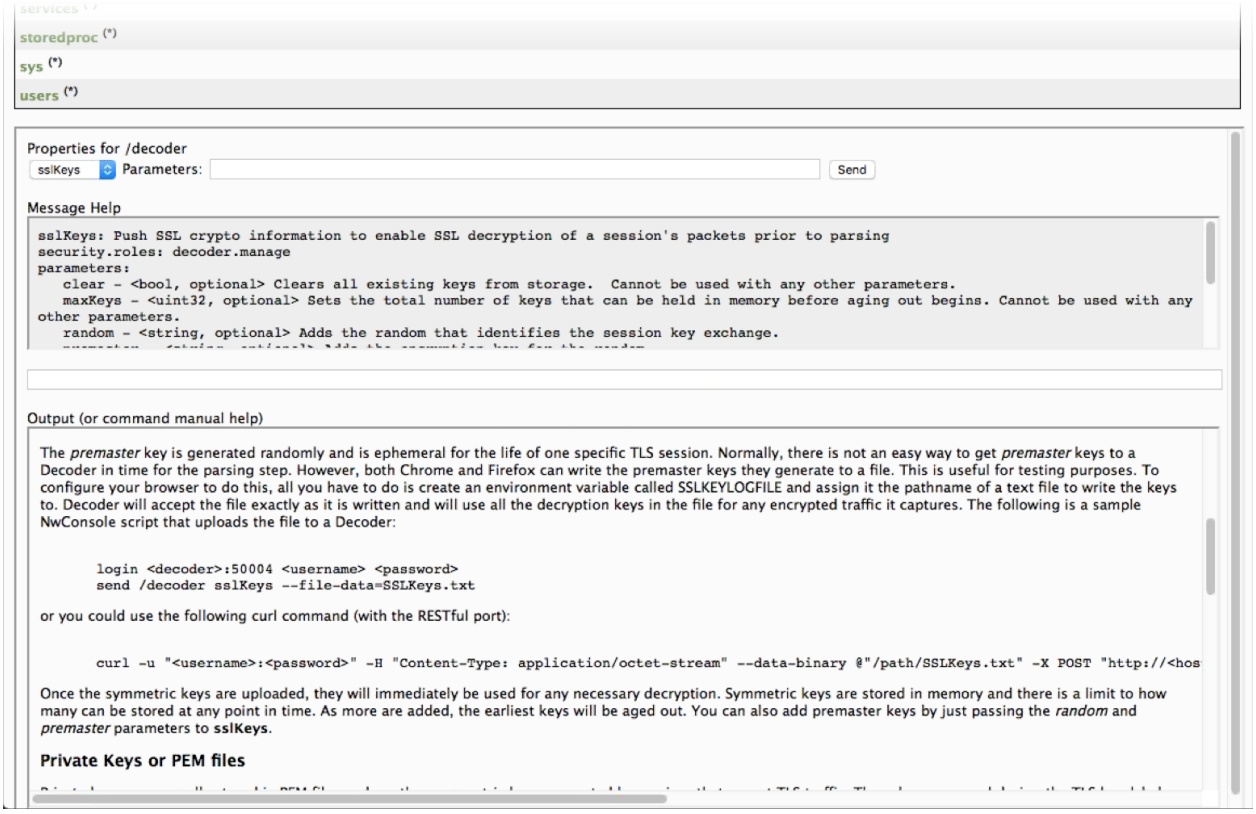
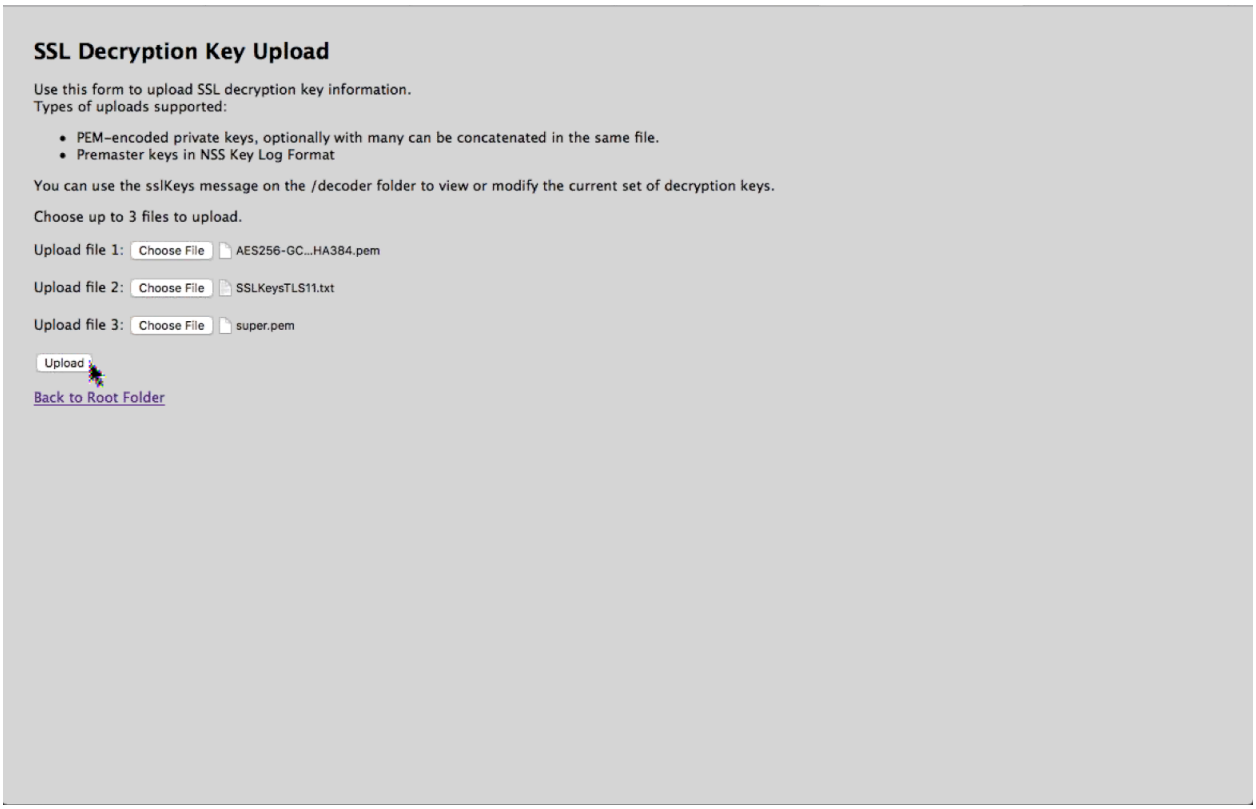
TLS_DHE_DSS_EXPORT_WITH_DES40_CBC_SHA	EXP-EDH-DSS-DES-CBC-SHA	[0x11]	SSLv3	Kx=DSS	Non-Compliant

Step 4: Confirm HTTPS Parser is Enabled on Decoders



The decryption process requires the native HTTPS parser to be enabled to examine the TLS handshake and to compare the uploaded encryption keys to determine if they decrypt the traffic. This can be validated in (Admin) > **Services** > **Decoder** > **Config** > Parsers Configuration panel as shown in the following figure.

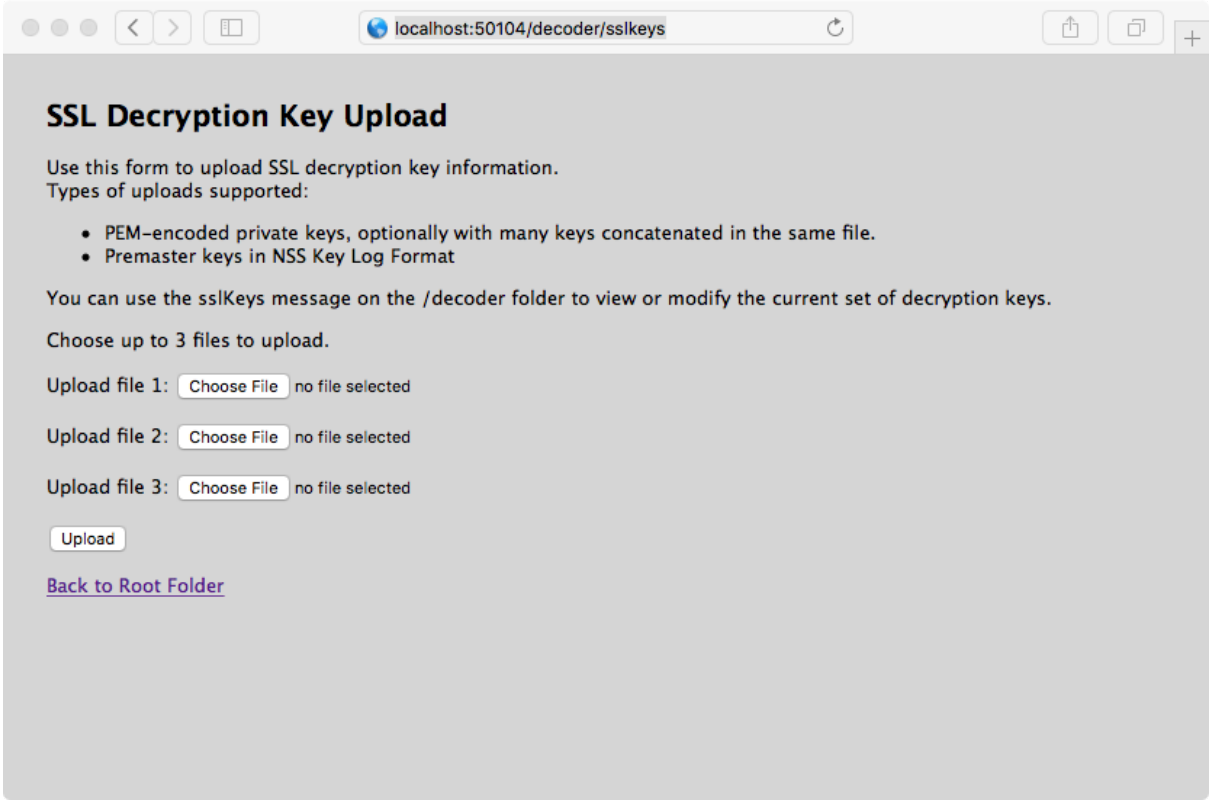


Step 5: Upload the Supported Private Keys to Decoders

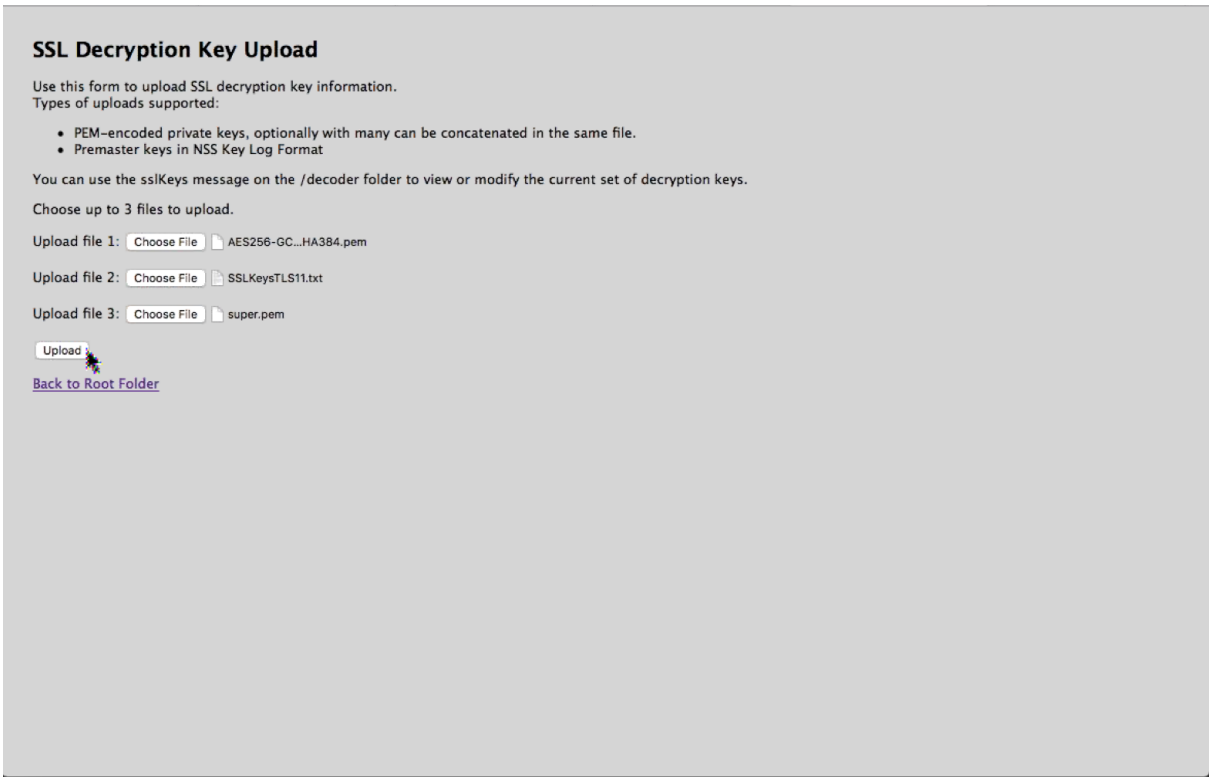
The `sslKeys` command provides a way to upload premaster or private keys to the Decoder, so that captured encrypted packets that match the keys can be decrypted before parsing. Administrators configure the Decoder by entering the `sslKeys` command using the NwConsole command line interface or the Decoder RESTful interface. After upload, you must issue a parser reload command so that the newly installed key becomes visible to the HTTPS parser. Now, all TLS handshakes that use that private key will be able to be decrypted by the Decoder.

For information about how to use the NwConsole command line interface, see the *NwConsole User Guide for NetWitness Platform*. For information about how to use the RESTful interface, see the *RESTful API User Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

The RESTful interface form at the path `/decoder/sslkeys` allows uploading a single PEM-encoded private key, a single file containing multiple private keys concatenated together, or a single file of multiple premaster keys.



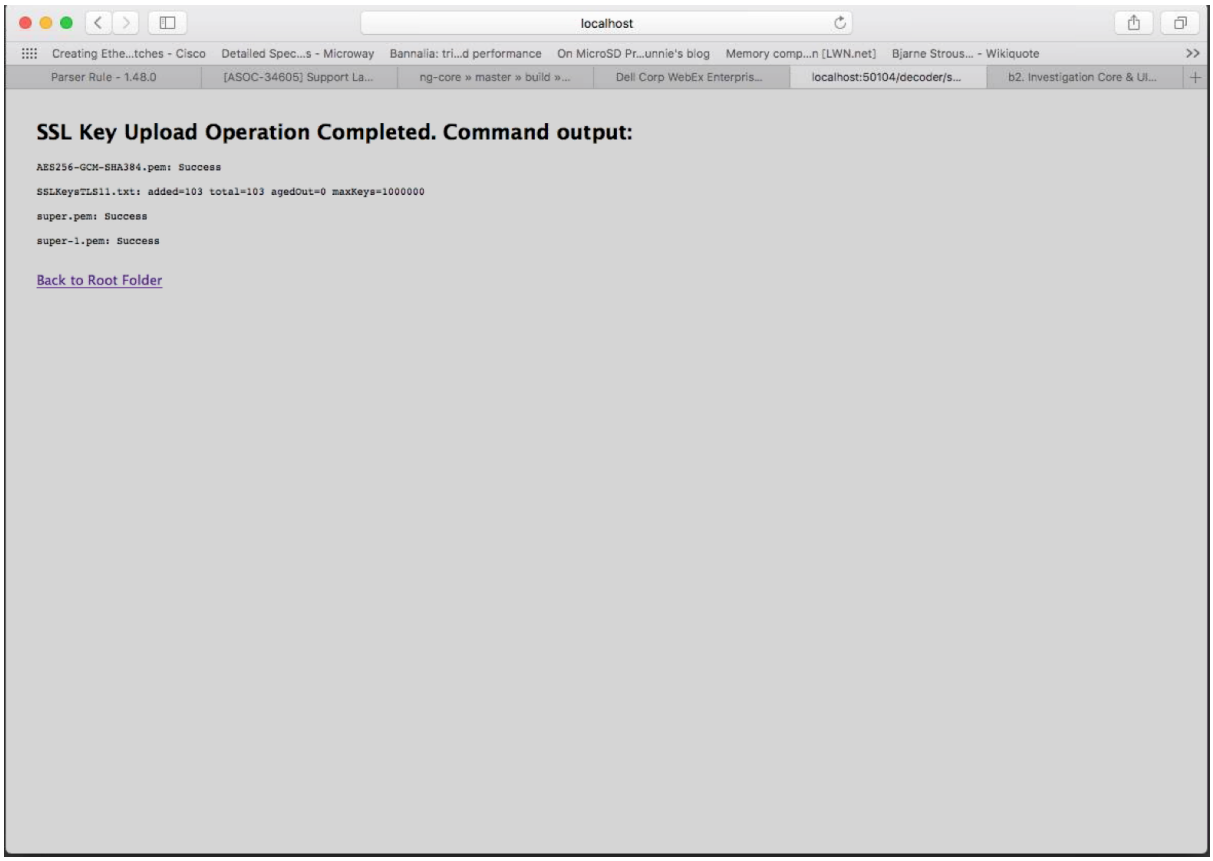
Upload Multiple Premaster and Private Keys



Note: As of 11.5, uploading premaster keys is not officially supported yet for real-time capture, but can be used to validate that decryption is functioning properly on the Decoder.

You can use the RESTful interface form to facilitate uploading of multiple keys, both premaster and private at the same time.

1. Open the RESTful API in your browser and navigate to this path on the Decoder that you want to configure: `/decoder/sslkeys`.



2. Next to **Upload File 1**, click **Choose File** and locate the premaster key file or PEM file that you want to upload on your local file system.
3. (Optional) Repeat for **Upload File 2** and **Upload File 3**.

4. Click **Upload**.

   The files are uploaded to the Decoder and results are displayed in the form.

Parameters for Managing Keys

The `sslKeys` command has several parameters for managing premaster and private keys. This is the full list of parameters:

Parameter	Description
`clear`	Removes all premaster keys from memory. Does not delete any PEM files installed on the system.
`maxKeys`	Changes the maximum number of premaster keys that are stored in memory.
`listPems`	Returns a list of all installed private key PEM files.
`deletePem`	Deletes the named PEM file from the file system. You can pass this parameter more than once to remove multiple files.
`random`	The random hash used to identify the premaster key.
`premaster`	The premaster key that will be installed for the previous `random` parameter. They must show up in pairs and `random` must be first.

Return Values

Most `sslKeys` commands return name/value pairs of statistics about the premaster keys in memory. The statistics are listed in the following table.

Name	Description
`added`	The number of premaster keys just added during this command.
`total`	The total number of premaster keys loaded in memory.
`agedOut`	The total number of premaster keys that were removed during this command; this is not a lifetime stat.
`maxKeys`	The current maximum allowed premaster keys

Encryption Keys

The `sslKeys` command accepts two types of encryption keys:

- Premaster key: the symmetric key used in the TLS payload stream for encryption and decryption.
- Private key: the asymmetric private key used during the TLS handshake that encrypts the premaster.

Premaster Key

The premaster key is generated randomly and is ephemeral for the life of one specific TLS session. Normally, there is not a good way to get premaster keys to a Decoder in time for the parsing step. However, both Chrome and Firefox can write the premaster keys they generate to a file. This is useful for testing purposes. To configure your browser to do this, create an environment variable called `SSLKEYLOGFILE` and assign it the pathname of a file to which the keys will be written. The Decoder will accept the file exactly as written and will use all the decryption keys in the file for any encrypted traffic it captures.

This is a sample NwConsole script that uploads the file to a Decoder:

```
login <decoder>:50004 <username> <password>
send /decoder sslKeys --file-data=SSLKeys.txt
```

This is an example using a curl command (with the RESTful port) to upload the file to a Decoder:

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/SSLKeys.txt" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys"
```

After the symmetric keys are uploaded, they will immediately be used for any necessary decryption. Symmetric keys are stored in memory and there is a limit to how many can be stored at any point in time. As more keys are added, the earliest keys will be aged out. You can also add premaster keys by just passing the `random` and `premaster` parameters to `sslKeys`.

Private Keys or PEM Files

Private keys are normally stored in PEM files and are the asymmetric keys generated by services that accept TLS traffic. These keys are used during the TLS handshake to encrypt the premaster symmetric key that will be used for the rest of the payload encryption.

For example, if you have a web server whose traffic you want visibility into, you need to upload the private key it uses to encrypt traffic. You only need to do this once, as it is stored permanently (or until removed by a delete command). Private keys are automatically encrypted before storing to protect them. After upload, you must issue a parser reload command so that the newly installed key becomes visible to the HTTPS parser. Now, all TLS handshakes that use that private key will be able to be decrypted by the Decoder.

Note: Not all ciphers suites use a "known" private key (for example, Ephemeral Diffie Hellman). Encrypted traffic with those ciphers cannot be decrypted unless the premaster key is uploaded to the Decoder before the session is parsed.

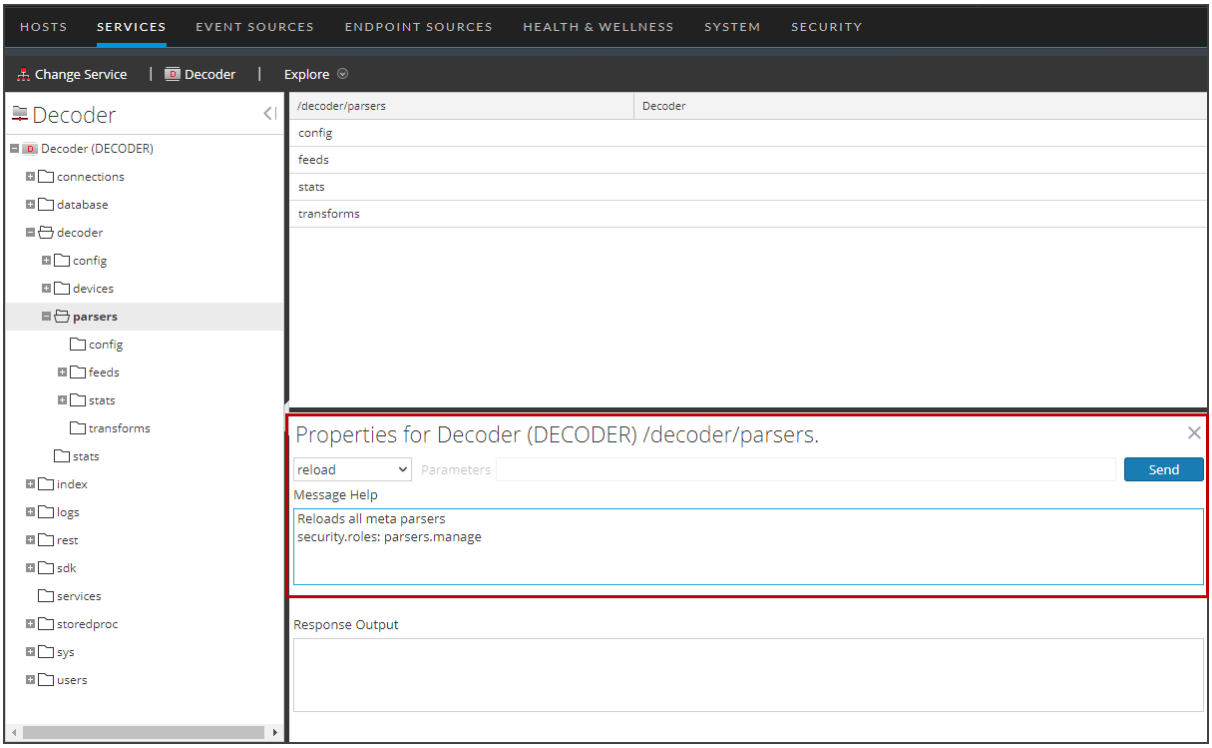
These are some sample commands that upload a PEM file to be used for decryption.

Using NwConsole:

```
send /decoder sslKeys pemFilename=MyKey.pem --file-data=/path/MyKey.pem
```

Using the RESTful interface (you must provide the `pemFilename` parameter in the URL):

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/MyKey.pem" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys&pemFilename=MyKey.pem"
```



Step 6: Reload HTTPS Parser on Decoders

After uploading the private keys, you must issue a parser reload command so that the newly-installed key becomes visible to the HTTPS parser. All TLS handshakes that use that private key are now able to be decrypted by the Decoder.

To issue a parser reload command:

1. Go to  (Admin) > **Services** and select the Decoder.
2. Click  > **View** > **Explore** > **decoder**, right-click **parsers** and select **Properties**.

3. In the Properties for Decoder (DECODER) /decoder/parsers pane, select reload from the drop-down menu and click **Send**.

Step 7: View Decrypted Sessions

All storage of the packets is still encrypted, so when you search for any decrypted traffic, your query should still focus on `service=443` or HTTPS (HTTP over SSL/TLS). If any packets were able to be decrypted, `tls.premaster` metadata is associated with the session that has the premaster key required for decrypting that session. The session will also have crypto metadata denoting the cipher suite, with crypto formated as `tls.premaster`.

Viewing Unencrypted Traffic

If packets are decrypted during the parse stage, encrypted packets are written to disk, and the matching premaster key used for decrypting is written to the `tls.premaster` meta key, analysts can view the unencrypted packets using the `tls.premaster` meta key.

One Decoder API that you can use to see the unencrypted packets is the `/sdk/content` RESTful service. You need to know the Session ID of the encrypted packets and the `flags` parameter masked to the value 128 (or 0x80 in hex). Point your browser to the Decoder RESTful interface and type in the following command, substituting the actual Session ID for `<id>`:

`http://<decoder>:50104/sdk/content?session=<id>&flags=128&render=text`

The Decoder returns a simple web page showing the packets after they are decrypted.

If you want to see what the packets look like encrypted, type in one of the following commands, substituting the Session ID for <id>:

`http://<decoder>:50104/sdk/content&session=<id>&render=text`

`http://<decoder>:50104/sdk/content&session=<id>&flags&render=text`

For more information on the `/sdk/content` service, see the manual page for `/sdk content`.

Alternatively, you can use the NetWitness Investigator thick client to decrypt and display the network sessions, as it can communicate to a Concentrator or have PCAPs and private keys loaded locally.

If you are not able to view the encrypted sessions, check Troubleshooting. However, if you are able to see the `tls.premaster` metadata, that confirms that the Decoder is able to see inside the encrypted session, which enables parsers to see the unencrypted packet payload and create metadata accordingly. For these decrypted sessions, look for additional metadata around usernames, passwords, or HTTP body content that would be obfuscated when encrypted, which would result in metadata not being generated.

Troubleshooting

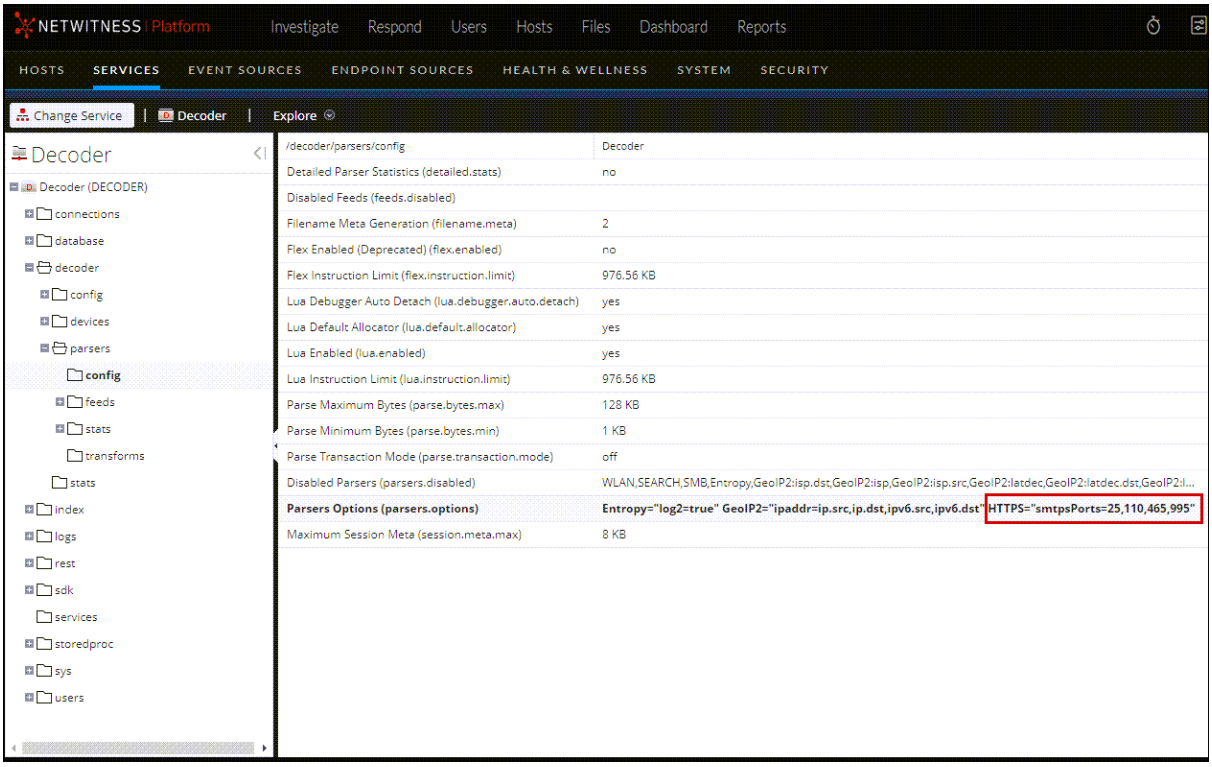
If you are still not able to decrypt or view the decrypted payloads after attempting the steps above, try these steps.

1. Validate that your private key is using an acceptable cipher-suite.
2. Make sure your Network Decoder is capturing the traffic matching the server for which you have the private key. To check, you can upload the private key and PCAP into Wireshark and see if it is able to decrypt it.

Decryption of Secure SMTP

In version 11.3, NetWitness supports opportunistic SSL/TLS decryption, which addresses RFC 3207 (https://tools.ietf.org/html/rfc3207). You can add an HTTPS parser option that provides a .csv list of destination ports of the session where the STARTTLS command will be searched, with at least one encryption key that has been uploaded. This enables the STARTTLS functionality.

Note: The .csv list must include all the destination ports of a session. If a destination port is not in the list, the search for STARTTLS will not be started.



The STARTTLS search is limited to the first 1024 bytes of the session's payload, to prevent performance degradation. If STARTTLS is found, the parser uses the next client packet with payload as the start of a TLS negotiation.

To add an HTTPS parser option for secure SMTP decryption:

1. In the NetWitness User Interface, go to **(Admin)** > **Services**.
2. Select a Log Decoder service and click > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.
4. In **parsers.options**, enter an HTTPS parser option in the following format that provides a .csv list of the destination ports of the session where the STARTTLS command is searched:

   `HTTPS="smtpsPorts=<port#1,port#2,port#n>"`

The following image shows an example of an HTTPS parser option for secure SMTP decryption.

Performance Considerations

Decrypting packets in real time requires extra work in the parsing stage. Before implementing this feature, plan carefully to ensure the incoming traffic bandwidth does not overwhelm the available compute power. You may need more Decoders to decrypt traffic than you would need if not decrypting.

Packets captured on a Decoder normally have a timeout of ~60 seconds in the assembly stage before they are sent to the parsing step. If the Decoder is under memory pressure due to very high bandwidth, the lifetime of the packets in Assembler may be shortened. To alleviate this situation, you can configure a longer timeout value and increase the amount of memory available to hold packets in Assembly. Also, in order to perform decryption of the packets, the Decoder must receive the decryption key before the parsing stage.

Note: Currently, only TLS 1.2 and earlier protocols can be decrypted

With no feeds loaded, the following parsers enabled, and 50% of the sessions being decrypted, a Decoder can process traffic at 3 Gbps .

Parser Name	Description
SYSTEM	Session Details
NETWORK	Network Layer
ALERTS	Alerts
GeoIP	Geographic data based on ip.src and ip.dst
GeoIP2	Geographic data by default based on IPv4 (`ip.src`, `ip.dst`) and IPv6 (`ipv6.src`, `ipv6.dst`) meta keys
HTTP	Hyper Text Transport Protocol (HTTP)
HTTP_Lua	Hyper Text Transport Protocol (HTTP) Lua
FTP	File Transfer Protocol (FTP)
TELNET	TELNET Protocol
SMTP	Simple Mail Transport Protocol (SMTP)
POP3	Post Office Protocol (POP3)
NNTP	Network News Transport Protocol (NNTP)
DNS	Domain Name Service (DNS)
HTTPS	Secure Socket Layer (SSL) Protocol
MAIL	Standard E-Mail Format (RFC822)
VCARD	Extracts VCARD fullname and email information
PGP	Identifies PGP blocks within network traffic
SMIME	Identifies SMIME blocks within network traffic
SSH	Secure Shell (SSH)
TFTP	Trivial File Transfer Protocol (TFTP)
DHCP	Dynamic Host Configuration Protocol (DHCP and BOOTP)
NETBIOS	Extracts NETBIOS computer name information.
SNMP	Simple Network Management Protocol (SNMP)
NFS	Network File System (NFS) protocol
RIP	Routing Information Protocol (RIP).
TDS	MSSQL and Sybase database protocol (TDS)

Parser Name	Description
TNS	Oracle database protocol (TNS)
IRC	Internet Relay Chat (IRC) protocol
RTP	Real Time Protocol (RTP) for audio/video
SIP	Session Initiation Protocol (SIP)
H323	H.323 Teleconferencing protocol
SCCP	Cisco Skinny Client Control Protocol
GTalk	Google Talk (GTalk)
VlanGre	Vlan ID and GRE/EtherIP tunnel addresses
BITTORRENT	BitTorrent File Sharing Protocol
FIX	Financial Information eXchange Protocol
GNUTELLA	Gnutella file sharing protocol
IMAP	Internet Message Access Protocol
MSRPC	Microsoft Remote Procedure Call protocol
RDP	Remote Desktop Protocol
SHELL	Command Shell Identification
TLSv1	TLSv1
SearchEngines	A parser that extracts search terms
FeedParser	External Feed Parser

TLS Certificate Hashing

The Network Decoder can produce hashes of certificates that are seen in the packet stream. These hashes are the SHA-1 value of any DER-encoded certificate encountered during a TLS handshake. The hashes produced can be used to compare network traffic with hashes from public SSL blacklists, such as the one from sslbl.abuse.ch.

The TLS Certificate hashing feature is disabled by default. To enable TLS Certificate hashing:

1. Go to  **(Admin)** > **Services**, select a Network Decoder service and  > **View > Explore.**
2. Select **decoder** > **parsers** > **config**.
3. In the values column next to `parsers.options`, type `HTTPS="cert.sha1=true"`.
   When this option is enabled, the SHA-1 is stored as a text value in the `cert.thumbprint` meta key.

4. The change takes effect on parser reload. In the left panel, right-click **parsers** and click **Properties**. In the drop-down menu, select **reload** and then click **Send**

The SHA-256 hash of the certificate can be enabled by adding the parser option:

```
HTTPS="cert.sha256=true"
```

to a Network Decoder's `/decoder/parsers/config/parsers.options` configuration.

When this option is enabled, SHA-256 is stored as a text value in the meta keys:

```
cert.sha256
cert.thumbprint
```

JA3 and JA3S TLS Fingerprints

The Network Decoder can produce the JA3 value of TLS clients and the JA3S value of TLS servers that are observed in a Network session. The values that are produced conform to the values generated by the open source JA3 tools (https://github.com/salesforce/ja3). The JA3 features are disabled by default.

To enable JA3 features:

1. In the NetWitness Platform User Interface, go to  **(Admin)** > **Services**.
2. Select a Decoder service and click  > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.
4. In **parsers.options**, add `HTTPS="ja3=true ja3s=true"`.
5. In the left panel, right click on **parsers** and select **properties**.
6. In the right panel, in the lower pane, set the value in the first drop down to **Reload**.
7. Click **Send**.

JA3 and JA3S can be enabled independently using these options. When enabled, the JA3 is stored as a text value in the meta key `ja3`. The JA3S is stored as a text value in the meta key `ja3s`.

Additional meta keys are activated using a mechanism similar to the JA3S and JA3S meta items. For example, `ja3.orig` is enabled by adding `ja3.orig=true` to the HTTPS parser options. This is also true for `ja3s.orig`, `tls.extensionlen`, and `tls.cipherlen`.

`ja3.orig`, `tls.extensionlen`, and `tls.cipherlen` are only created if JA3 is enabled.

`ja3s.orig` is only created if JA3S is enabled.

Perform Simultaneous Ingestion of the Encrypted and Decrypted Traffic Streams to Decoder

In previous versions, ingesting encrypted and decrypted traffic streams of the same session to a Decoder causes packets from both the sessions to mix on the Decoder as reassembly is performed by the same thread. It cause session parsing and content extraction inaccuracies.

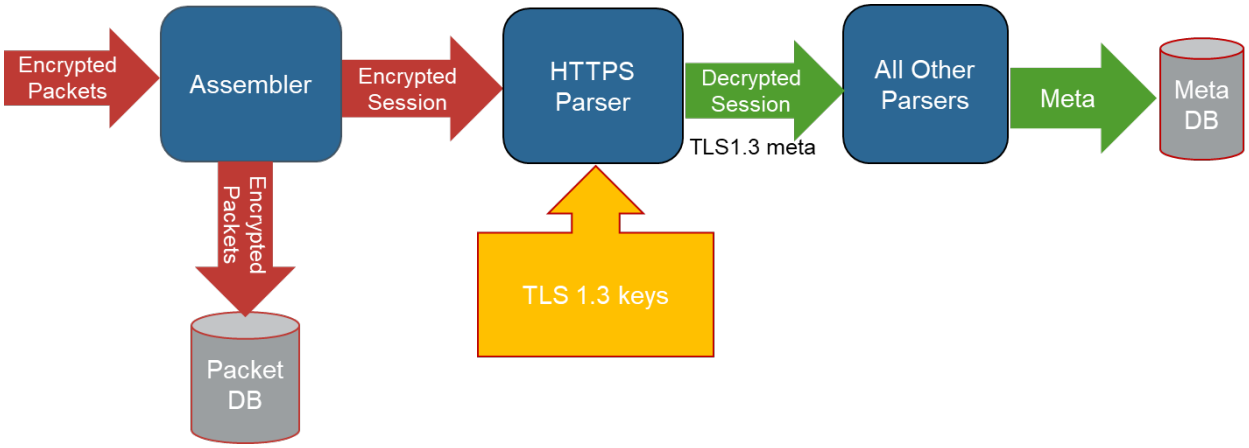
In NetWitness 11.6, using multi-adapter capture and multi-thread assembler features, you can configure the Decoder to receive encrypted and decrypted streams on separate adapters. The multi-thread assembler feature allows decoder to assemble packets from its corresponding capture work thread. It keeps the packets from encrypted and decrypted sessions separate during assembly and avoid inaccuracies in session parsing and content extraction.

To configure the Decoder for the simultaneous ingestion of the encrypted and decrypted traffic streams:

1. Configure Decoder to capture from multiple adapters simultaneously, see (Optional) Multiple Adapter Packet Capture.
2. Set `/decoder/config/assembler.threading.enabled=on` to enable multi-thread assembler.
3. Restart the Decoder service.

Community ID

The Network Decoder generates Community ID flow hash values that are compatible with the Community ID specification defined by `https://github.com/corelight/community-id-spec`.



The Community ID is written to a text-formatted meta key named `community`.

The Community ID is generated on sessions containing TCP over IPv4, TCP over IPv6, UDP over IPV4, and UDP over IPV6.

Decrypt Incoming Packets TLS 1.3

Administrators can configure a `nonfips` Network Decoder to decrypt incoming TLS 1.3 network packets. This capability is currently supported with encrypted communications to managed servers using TLS 1.3 or earlier.

For TLS 1.2 and earlier protocols refer Decrypt Incoming Packets (TLS 1.2)

As the network traffic is collected and passed through the system, the encrypted packets are stored as captured even if the system can decrypt them. As the Decoder parses the encrypted traffic, it uses TLS 1.3 keys that have been pushed or uploaded, and determines if the network traffic can be decrypted. If the Decoder is able to decrypt the traffic, it generates an additional meta keys, defined as `tls.client.hdshk, tls.server.hdshk, tls.client.app, tls.server.app, tls.client.early` which contains the decryption keys for that particular session. Whether the traffic is decrypted or not, the metadata service is tagged as 443 or SSL/TLS traffic, as the Decoder is port agnostic, even though it is marked with the default port number.

Non-FIPS Builds

Network Decoder TLS 1.3 decryption is supported ONLY through special `nonfips` rpm builds which run in NON FIPS mode. The `nonfips` builds use crypto library which has pending FIPS certification in NIST, hence they are labeled as `nonfips`. If you are restricted to run only FIPS in your environment then TLS 1.3 decryption feature is not supported.

The following nonfips builds for components Decoder, Appliance , Concentrator and Broker are required to be installed, as they provide dependencies and support to TLS 1.3 decryption in session parsing and during content reconstruction.

Decoder (rsa-nw-decoder-nonfips rpm)	Decrypt on Session Parsing and Content Reconstruction
Concentrator (rsa-nw-concentrator-nonfips rpm)	Decrypt on Content Reconstruction

Broker (rsa-nw-broker-nonfips rpm)	Decrypt on Content Reconstruction
Appliance (rsa-nw-appliance-nonfips rpm)	Installs dependencies and scripts for TLS 1.3 Decryption

Install or update Non-FIPS builds

The `rsa-nw-appliance` rpm now includes a script `nw-nonfips-override-generator.sh` to generate `nonfips` override descriptors. It will be installed at the path: `/usr/local/sbin/nw-nonfips-override-generator.sh`

(Option 1) Instructions to install nonfips rpms during an upgrade

Step 1: Upgrade Node-Zero

- Follow upgrade instructions for node-zero from UI or command line, this would install the latest repo under `/var/netwitness/common/repo/`

Step 2: Before upgrading other Node-X hosts with core services, run the script on Node-Zero.

- `/usr/local/sbin/nw-nonfips-override-generator.sh`
  - This would invoke script in default mode which uses latest installed version ex: 12.0.0.0 and repo /var/netwitness/common/repo/12.0.0.0/RSA .
  - The script generates and validates nonfips descriptor override files.

Step 3: Refresh Node-Zero to apply applicable nonfips rpms (broker, appliance) using the command:

- `nw-manage --refresh-host --host-key <node-zero-ip-address>`
- Reboot Node-Zero

Step 4: Upgrade each Node-X

- (Option 1) : Upgrade Node-X via Command line
  - Start upgrade host Node-X with the following command from Node-Zero.
    - Example: upgrade-cli-client –-upgrade --host-key <Host UUID or IP address> --version 12.0.0.0
  - Reboot the Node-X
- (Option 2): Upgrade Node-X from UI:
  - Continue upgrading from UI and follow instructions to upgrade the remaining hosts.
- If applicable, all the hosts would have the nonfips rpms (decoder, concentrator, broker, appliance) installed.

(Option 2) Instructions to install nonfips rpms after upgrade

After upgrading Node-Zero and all other Node-X hosts, and if you wish to install nonfips rpms at later then following are instructions:

- Step 1: Run the script on Node-Zero
  - `/usr/local/sbin/nw-nonfips-override-generator.sh`
    - This would invoke script in default mode which uses latest installed version ex: 12.0.0.0 and repo /var/netwitness/common/repo/12.0.0.0/RSA .
    - The script generates and validates nonfips descriptor override files.
- Step 2: Command line update:
  - Refresh all the hosts (including Node-Zero) to apply applicable nonfips rpms (decoder, concentrator, broker, appliance).
    - nw-manage --refresh-host --host-all
    - Reboot all the hosts.

Note: The `/usr/local/sbin/nw-nonfips-override-generator.sh` script would generate logs while running the commands, and also update `/var/log/messages` using the logger command.

TLS 1.3 Keys and Cipher suites

According to RFC 8446 the TLS 1.3 protocol doesn't support Private key based decryption and it only support a set of ephemeral symmetric keys also called as key secrets for the life of one specific TLS 1.3 session. The TLS 1.3 session also encrypts handshake, all the TLS records after Server Hello are encrypted , and at each stage a corresponding key is used for the encryption ex: client handshake, server handshake, client application and server application etc.. . So in order for decrypting a TLS 1.3 session all the required session keys `tls.client.hdshk, tls.server.hdshk, tls.client.app, tls.server.app, tls.client.early`(optional) are needed to be available.

Cipher Suites

TLS 1.3 protocol recommends to support only strong and advanced Cipher suites. The Network Decoder supports all the advertised cipher suites from RFC-8446, however on integration with Thirdparty key forwarder the supported cipher suites might be limited to list supported by Thirdparty server. Example only GCM ciphers are supported etc..

The following is list of cipher suited supported in Network Decoder

- TLS_AES_128_GCM_SHA256
- TLS_AES_256_GCM_SHA384
- TLS_CHACHA20_POLY1305_SHA256
- TLS_AES_128_CCM_SHA256
- TLS_AES_128_CCM_8_SHA256

Steps to configure Network Decoder to decrypt TLS 1.3 traffic

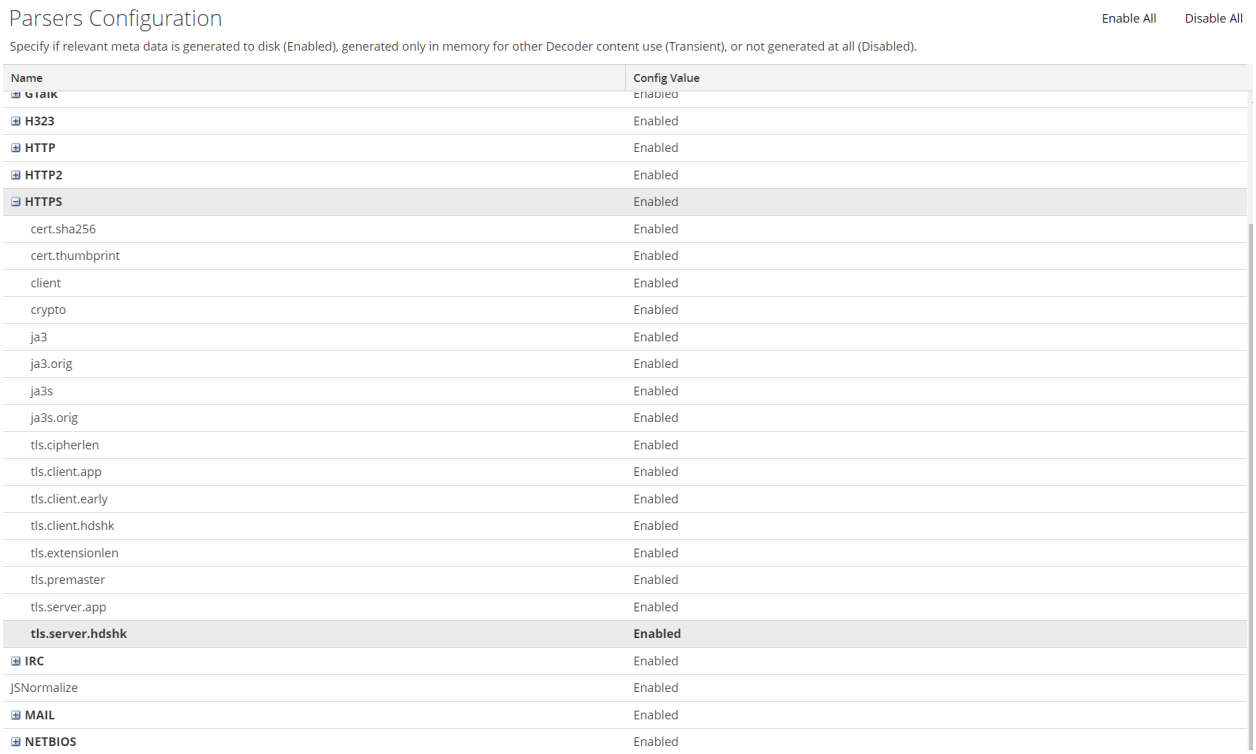
- Step 1: Validate that the Network Decoder Captures Encrypted TLS 1.3 Traffic
- Step 2: Confirm HTTPS Parser is Enabled on Decoders
- Step 3: Integrate Network Decoder to receive keys from Thirdparty TLS 1.3 key forwarder
- Step 4: (Optional) Upload TLS 1.3 keys to validate Decryption
- Step 5: Validate TLS 1.3 keys are received on Decoder
- Step 6: View Decrypted Sessions

Step 1: Validate that the Network Decoder Captures Encrypted TLS 1.3 Traffic

First, make sure the Decoder is actually capturing the SSL/TLS traffic from the managed servers that you want to use to gain visibility into the encrypted sessions. You can do this by searching in the Investigate views (Navigate or Events) using the IP addresses of the servers as the destination IP addresses, and the service as SSL/TLS.

For example, if you are searching for HTTPS traffic to 192.168.1.2 and 192.168.1.3, you can run the following query:

```
service = 443 && ip.dst = 192.168.1.2, 192.168.1.3
```



Conduct this search on the Concentrator that aggregates metadata from the Decoder that is expected to capture this network segment, or on a Broker that may have access to all collected metadata.

(Version 11.6 or later) In case of simultaneous ingestion of the encrypted and decrypted traffic streams in the Decoder, ensure that multi-thread assembly is enabled. This is to prevent mixing of packets from different sessions by single thread assembly. For more information, see the following topics:

- Perform Simultaneous Ingestion of the Encrypted and Decrypted Traffic Streams to Decoder
- (Optional) Multiple Adapter Packet Capture

Step 2: Confirm HTTPS Parser is Enabled on Decoders

The decryption process requires the native HTTPS parser to be enabled to examine the TLS handshake and to compare the uploaded encryption keys to determine if they decrypt the traffic. This can be validated in **Admin > Services > Decoder > Config** > Parsers Configuration panel as shown in the following figure.

If TLS_Lua parser is enabled then meta version: TLS 1.3 is registered for TLS 1.3 encrypted traffic.

Step 3: Integrate Network Decoder to receive keys from Thirdparty TLS 1.3 key forwarder

TLS 1.3 protocol only support ephemeral keys which are unique per session and Network Decoder need to receive those keys in time for parsing step.

Network Decoder provides `sslKeys` API which can receive the keys forwarded or injected to Decoder on RESTful interface.

A Thirdparty TLS 1.3 key forwarder which acts as Man-In-The-Middle (MITM) gateway for TLS 1.3 may intercept SSL handshake and forward the TLS 1.3 keys to Network Decoder.

Example: F5 BIG-IP Local Traffic Manager.

Option 1: Configure F5 BIG-IP Local Traffic Manager (LTM)

If you are using BIG-IP LTM in your environment for application traffic management, load balancing etc.. and if you would like to decrypt and analyze TLS 1.3 traffic handled by BIG-IP LTM, then refer the following section to Configure F5 BIG-IP LTM and forward keys to Network Decoder.

For more information refer: F5 BIG IP - Netwitness Perfect Forward Secrecy Inspection Visibility

Option 2: Using sslKeys API

If you are using other Man-In-The-Middle (MITM) gateway which can intercept TLS 1.3 handshake and forward the keys, then you can refer the following information and parameters to send keys to `sslKeys` API on Network Decoder.

The `sslKeys` API is used to push SSL crypto information to enable SSL decryption of a session's packets prior to parsing.

Parameters for Managing Keys

The `sslKeys` command has several parameters for managing premaster and private keys. This is the full list of parameters:

Parameter	Description
clear	Removes all premaster and TLS 1.3 keys from memory. Will not delete any PEM files installed on the system.
maxKeys	Changes the maximum number of premaster and TLS 1.3 keys that will be stored in memory.
counts	Returns key counts for sslKeys. Cannot be used with any other parameters.
listPems	Returns a list of all installed private key PEM files.
deletePem	Deletes the named PEM file from the file system. You can pass this parameter more than once to remove multiple files.
random	The random hash used to identify the premaster key or TLS 1.3 keys.
premaster	The premaster key that will be installed for the previous random parameter. They must show up in pairs and random must be first.
CETS	The TLS 1.3 client early traffic secret key that will be installed for the previous random parameter. It must show up with random parameter.
CHTS	The TLS 1.3 client handshake traffic secret key that will be installed for the previous random parameter. It must show up with random parameter.
SHTS	The TLS 1.3 server handshake traffic secret key that will be installed for the previous random parameter. It must show up with random parameter.
CTS0	The TLS 1.3 client traffic secret 0 key (application) that will be installed for the previous random parameter. It must show up with random parameter.
STS0	The TLS 1.3 server traffic secret 0 key (application) that will be installed for the previous random parameter. It must show up with random parameter.

Usage:

The Client random and TLS 1.3 keys can be passed as parameters to `sslKeys`, ex:

- Using Native port 56004:
  - `/decoder sslKeys random=`<value> `CETS=`<value> `CHTS=`<value> `SHTS=`<value> `CTS0=`<value> `STS0=`<value>
- Using RESTful port 50104:
  - `/decoder?msg=sslKeys&random=`<value>`&CETS=`<value>`&CHTS=`<value>`&SHTS=`<value>`&CTS0=`<value>`&STS0=`<value>
- Replace <value> with base64 encoded TLS 1.3 key value in the above cases.

Note: For most of the sessions the CETS (CLIENT_EARLY_TRAFFIC_SECRET) key may not be generated or used by TLS clients and it is normal. However, if the other keys (handshake and application keys) are not generated and not available then TLS 1.3 decryption will NOT be successful.

Return Values

Most commands return name/value pairs of statistics about the premaster and TLS 1.3 keys in memory. The statistics are listed in the following table.

Parameter	Description
added	The number of premaster and TLS 1.3 keys just added during this command.
total	The total number of premaster and TLS 1.3 keys loaded in memory.
agedOut	The total number of premaster and TLS 1.3 keys that were removed during this command (this is not a lifetime stat).
maxKeys	The current maximum allowed premaster and TLS 1.3 keys.
premaster	The total number of premaster keys loaded in memory.
tls13	The total number of TLS 1.3 keys loaded in memory.

Step 4: (Optional) Upload TLS 1.3 keys to validate Decryption

Note: Uploading TLS 1.3 keys is not supported for real-time capture, but can be used to validate that decryption is functioning properly on the Decoder.

The `sslKeys` command provides a way to upload TLS 1.3 keys to the Decoder, so that captured encrypted packets that match the keys can be decrypted before parsing. Administrators configure the Decoder by entering the `sslKeys` command using the NwConsole command line interface or the Decoder RESTful interface. Now, all TLS handshakes that use the TLS 1.3 keys and will be able to be decrypted by the Decoder.

For information about how to use the NwConsole command line interface, see the *NwConsole User Guide for NetWitness Platform*. For information about how to use the RESTful interface, see the *RESTful API User Guide for NetWitness Platform*. Go to the *Master Table of Contents* to find all NetWitness Platform 11.x documents.

You can use the RESTful interface form to facilitate uploading of multiple keys, both premaster and private at the same time.

1. Open the RESTful API in your browser and navigate to this path on the Decoder that you want to configure:

   `/decoder/sslkeys`.

2. Click **Choose File** Next to **Upload File 1**, and locate the TLS 1.3 keys file that you want to upload on your local file system.
3. Click **Upload**. The files are uploaded to the Decoder and results are displayed in the form.

TLS 1.3 Keys

Similar to `premaster` key, capturing TLS 1.3 keys and uploading to Decoder in time for parsing is not an easy way. However, well known browsers like Chrome , Firefox and IE can write the TLS 1.3 keys they generate to a file and this is useful for testing purposes. To configure your browser to do this, create an environment variable called SSLKEYLOGFILE and set with a pathname to text file to write the keys. Decoder will accept the file exactly as it is written and will use all the decryption keys in the file for any encrypted traffic it captures.

The following is a sample NwConsole script that uploads the file to a Decoder:

```
login <decoder>:50004 <username> <password>
send /decoder sslKeys --file-data=SSLKeys.txt
```

Optionally the parameters can be passed in as list in the upload file, ex:

```
send /decoder sslKeys --file-data=SSLKeys.txt --file-format=params-list
```

or you could use the following curl command (with the RESTful port):

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/SSLKeys.txt" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys"
```

Once the symmetric keys are uploaded, they will immediately be used for any necessary decryption. Symmetric keys are stored in memory and there is a limit to how many can be stored at any point in time. As more are added, the earliest keys will be aged out. You can also add available TLS 1.3 keys by just passing the `random`, `CETS` , `CHTS` , `SHTS` , `CTS0` and `STS0` parameters to `sslKeys`.

Note: For most of the sessions the CLIENT_EARLY_TRAFFIC_SECRET key may not be generated or used by TLS clients and it is normal. However, if handshake and application keys are not generated and not available then TLS 1.3 decryption wouldn't be successful.

Step 5: Validate TLS 1.3 keys are received on Decoder

It is advised to validate if Decoder is receiving keys to Decrypt TLS 1.3 sessions. As Decryption wouldn’t be successful if the keys are not available.

The following are few ways:

1. Decoder generates the following TLS 1.3 meta per session

`tls.client.hdshk`, `tls.server.hdshk`, `tls.client.app`, `tls.server.app`, and `tls.client.early`

2. The `sslKeys` API provides an option to display current key stats using counts=true .

Example: `/decoder sslKeys counts=true`

```
premasterKeys: 478
tls13Keys: 341
total: 819
maxKeys: 1000000
```

Step 6: View Decrypted Sessions

All storage of the packets is still encrypted, so when you search for any decrypted traffic, your query should still focus on `service=443` or HTTPS (HTTP over SSL/TLS). If any packets were able to be decrypted, the `tls.client.hdshk`, `tls.server.hdshk`, `tls.client.app`, `tls.server.app`, and `tls.client.early` metadata is associated with the session that has the TLS 1.3 keys required for decrypting that session. The session will also have crypto metadata denoting the cipher suite.

Viewing Unencrypted Traffic

If packets are decrypted during the parse stage, encrypted packets are written to disk, and the matching TLS 1.3 keys used for decrypting is written to the TLS 1.3 meta, analysts can view the unencrypted packets using the TLS 1.3 meta keys.

Option 1 : Using Event Analysis UI

Starting 12.0 the Event Analysis View support Displaying Decrypted and Encrypted Payloads of TLS sessions when TLS keys meta are registered.

Option 2 : Using RESTful API on Decoder service

The Decoder API that you can use to see the unencrypted packets is the `/sdk/content` RESTful service. You need to know the Session ID of the encrypted packets and the `flags` parameter masked to the value 128 (or 0x80 in hex). Point your browser to the Decoder RESTful interface and type in the following command, substituting the actual Session ID for `<id>`:

`http://<decoder>:50104/sdk/content?session=<id>&flags=128&render=text`

The Decoder returns a simple web page showing the packets after they are decrypted.

If you want to see what the packets look like encrypted, type in one of the following commands, substituting the Session ID for <id>:

`http://<decoder>:50104/sdk/content&session=<id>&render=text`

`http://<decoder>:50104/sdk/content&session=<id>&flags&render=text`

For more information on the `/sdk/content` service, see the manual page for `/sdk content`.

If you are not able to view the encrypted sessions, check Troubleshooting. However, if you are able to see the TLS 1.3 metadata, that confirms that the Decoder is able to see inside the encrypted session, which enables parsers to see the unencrypted packet payload and create metadata accordingly. For these decrypted sessions, look for additional metadata around usernames, passwords, or HTTP body content that would be obfuscated when encrypted, which would result in metadata not being generated.

Troubleshooting

If you are still not able to decrypt or view the decrypted payloads after attempting the steps above, try these steps.

1. Validate if Decoder is receiving TLS 1.3 keys. Refer #Step 5 listed above.
2. Validate that your TLS 1.3 session key is using an acceptable cipher-suite.
3. Make sure your Network Decoder is capturing the traffic matching the server for which you have the TLS 1.3 keys. To check, you can upload the TLS 1.3 keys and PCAP into Wireshark and see if it is able to decrypt it.

Additional Features

The following features which are supported in TLS 1.2 are also supported in TLS 1.3 decryption.

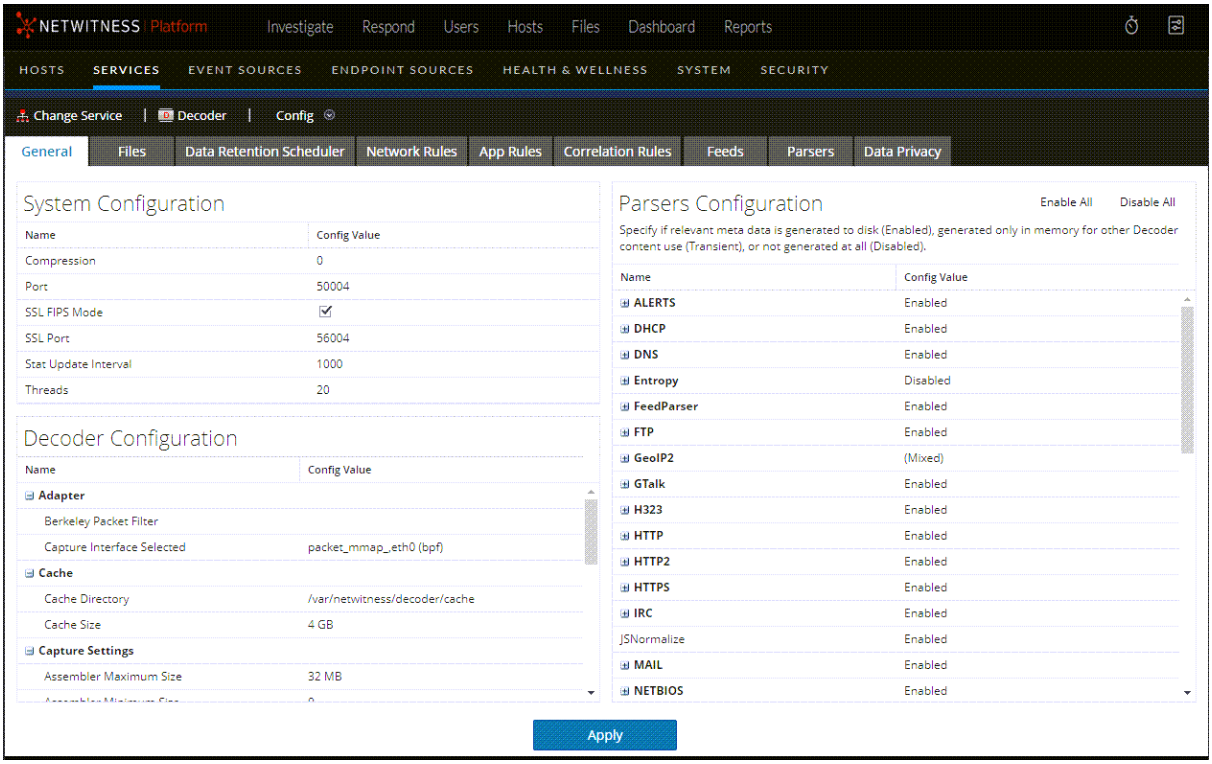
1. TLS Certificate Hashing
2. JA3 and JA3S TLS Fingerprints
3. Performance Considerations

For more details refer Decrypt Incoming Packets (TLS 1.2)

Edit Decoder System Configuration

When a service is first added to NetWitness, default values for the system configuration parameters are in effect. In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance. You do not need to edit these setting unless an NetWitness Customer Support technician advises you to change them.

System Configuration



Name	Config Value
Compression	0
Port	50004
SSL FIPS Mode	☐
SSL Port	56004
Stat Update Interval	1000
Threads	20

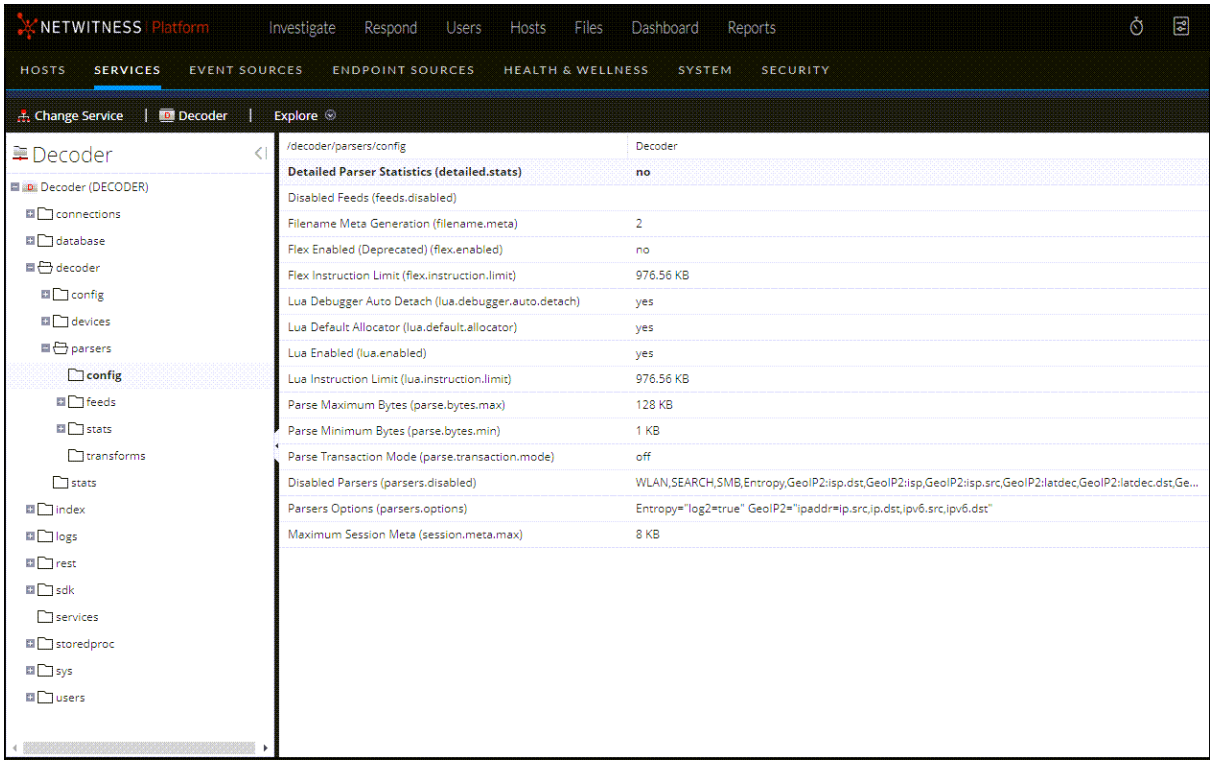
One parameter that you may want to change for your environment is the SSL setting, which by default is not enabled. When enabled, the security of data transmission is managed by encrypting information and providing authentication with SSL certificates.

To edit system configuration parameters for a Decoder or Log Decoder:

1. Go to  **(Admin) > Services**.

2. Select a Decoder or Log Decoder service, and select  **> View > Config**.
   The Services Config view for the service is displayed with the General tab open.

3. Under **System Configuration**, click in a field that you want to edit **(Compression**, **Port**, **SSL FIPS Mode**, **SSL Port**, **Stat Update Intervals**, or **Threads**). Type a new value.
4. When finished editing, click **Apply.**
   The settings become effective immediately.



Enable CPU Usage Statistics for Installed Content

The Decoder provides CPU utilization statistics for all installed content, which you can use to reveal how much CPU time is used by parsers, feeds, application rules, and lexical scanning. The statistics are visible as Stat nodes in the service tree from the Explore view when `/decoder/parsers/config/detailed.stats` is enabled and the Decoder is capturing the stats.

Each piece of content is accounted as a single percentage value (0-100) regardless of the number of parse threads running. The percentage represents an average of the CPU utilization for the content across all threads.

To enable usage statistics monitoring:

1. In the NetWitness User Interface, go to **(Admin)** > **Services**.
2. Select a Decoder service and click > **View** > **Explore**.
   The Explore view for the Decoder is displayed.
3. Open `/decoder/parsers/config/` and in the right pane, select the `detailed.stats` parameter.

4. Change the value to **yes**. If the Decoder is not capturing data, start capture.
   When you open the Decoder Stats node in the Explore view, the new statistic is visible.

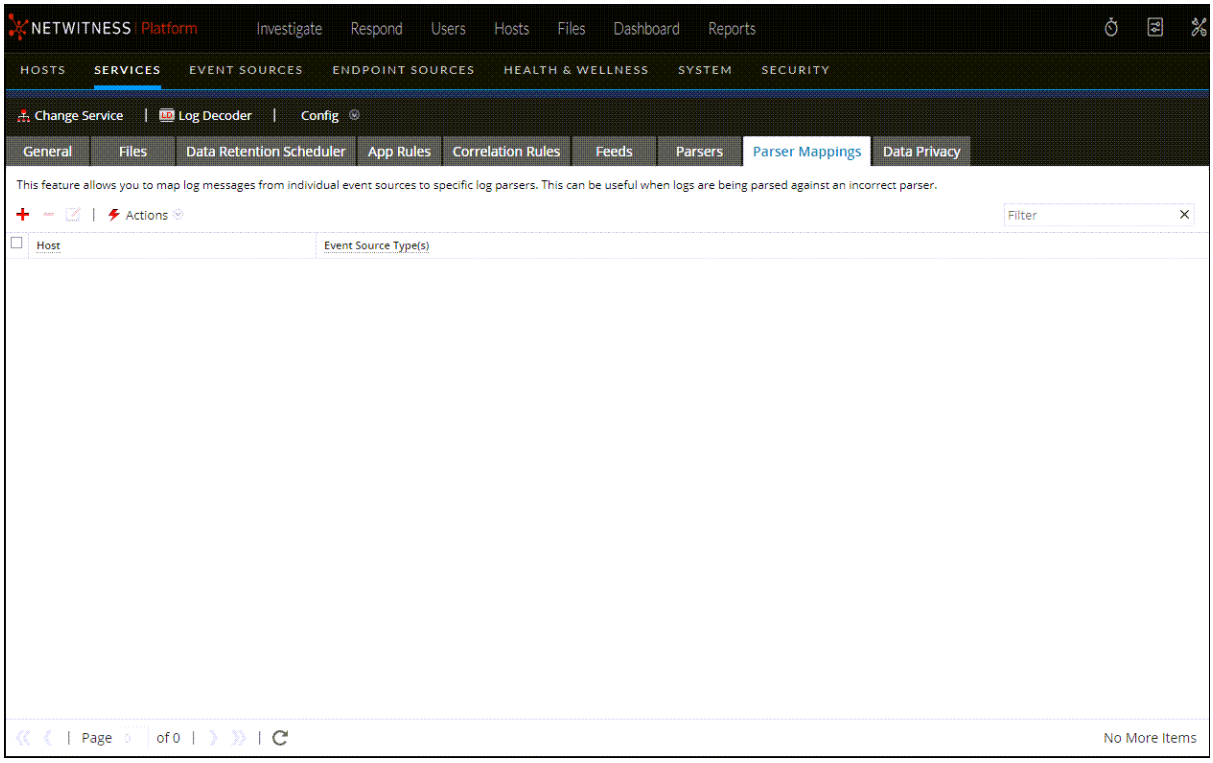
Enable Parser Mappings

This topic tells administrators how to enable event source mapping on a Log Decoder.

The Log Collector discovers the event source type on a per-message basis. If the correct parser is not identified for the event source, a small percentage of logs may be misidentified. The misclassified messages do not populate event source rules and alerts, and the reports do not have the correct data. If there are multiple event source types associated with an IP address, it makes it difficult for the parsers to identify the exact event source from which the logs are generated.

If you map an IP address to its event source type, the Log Decoder can identify the event source from which the log is generated. When messages are delivered to the Log Decoder from a mapped event source, only the assigned parsers are queried to find event matches.

You can assign event source types to IPV4, IPV6, or the hostname value of the event source. You can also assign multiple event source types to a single IP address. You can also use the Log Collector ID when different event source types with the same IP address are sent to different Log Collectors.



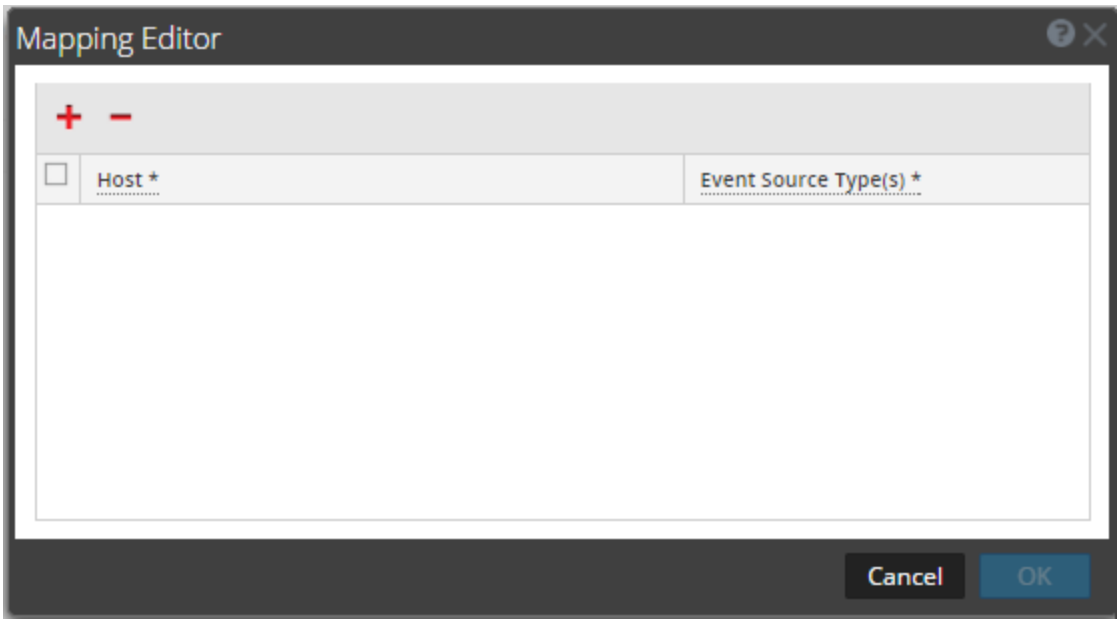
Note: You can also enable parser mapping functions by navigating to  (Admin) **> Event Sources > Discovery.**

Enable IP Address to Event Source Mapping

To enable an IP address to event source mapping:

1. Go to  **(Admin) > Services** and select a Log Decoder.
2. Select  **> View > Config**.
3. In the Configuration page, select the **Parser Mappings** tab.

The Parser Mappings tab is displayed in the Services Config view.



Update IP to Event Source Mapping

To update an IP to event source mapping:

1. Go to (Admin) > **Services**.
2. Select a **Log Decoder**, and in the **Actions** column, select > **View** > **Config**.

   The Services Config view is displayed.
3. Select the **Parsers Mapping** tab.
4. Click .

   The Mapping Editor is displayed.

5. Any of the following mappings can be defined:
   - **One Host and One Event Source Type**

     In the **Host** field, enter the hostname.

     For example: `10.0.0.1`
   - In the **Event Sources(**s) field, enter the event source type.

     For example: `apache`
   - **One Host and One or More Event Source Types**

     In the **Host** field, enter the hostname.

     For example: `10.0.0.1`
   - In the **Event Source(s)** field, enter the event source type.

     For example: `apache,sap,aix`
   - **One Host, One Log Collector, and One Event Source Type**

     In the **Host** field, enter the hostname and Log Collector ID.

     For example: `10.0.0.1,LC-1`
   - In the **Event Source(s)** field, enter the event source type.

     For example: `apache`
   - **One Host, One Log Collector ID, and One or More Event Source Types**

     In the **Host** field, enter the hostname and Log Collector ID.

     For example: `10.0.0.1,LC-1`
   - In the **Event Source(s)** field, enter the event source type.

     For example: `apache,sap,aix`

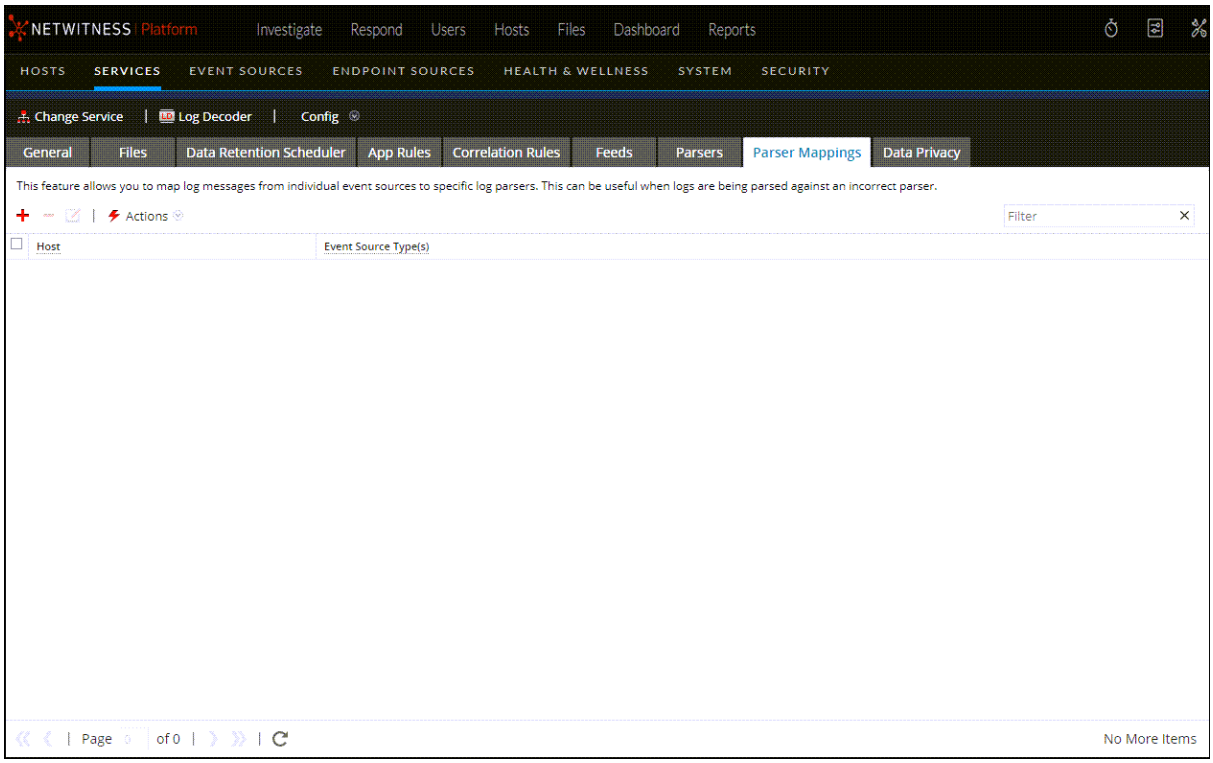
Note: The event source types are processed in the order you enter the parsers and if one or more parsers matches a log, the first parser in the list is queried. The Host/IP can be IPv4, IPv6, or Hostname.

6. Click **OK**.

   The Parser Mapping is added.

7. To cancel the parser mappings selection, click **Cancel**.

Read IP to Event Source Type Mappings



To read an IP to event source type mappings:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Services Config view is displayed.

3. Select the **Parsers Mapping** tab.

   The mappings are displayed.

Edit IP to Event Source Type Mappings

To edit IP to event source type mappings:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mapping you want to edit.

   Note: You can only edit one mapping at a time.
5. Click .
6. In the **Event Source(s)** field, modify the event source(s).

   Note: The host is not editable and the field is disabled.
7. Click **OK** to accept the edited Event Source.
8. To cancel the changes, click **Cancel**.

Delete IP to Event Source Type Mappings

To delete IP to event source type mappings:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mapping you want to delete.
5. Click .

   The mapping is deleted and the grid is refreshed.
6. To cancel the changes, click **Cancel**.

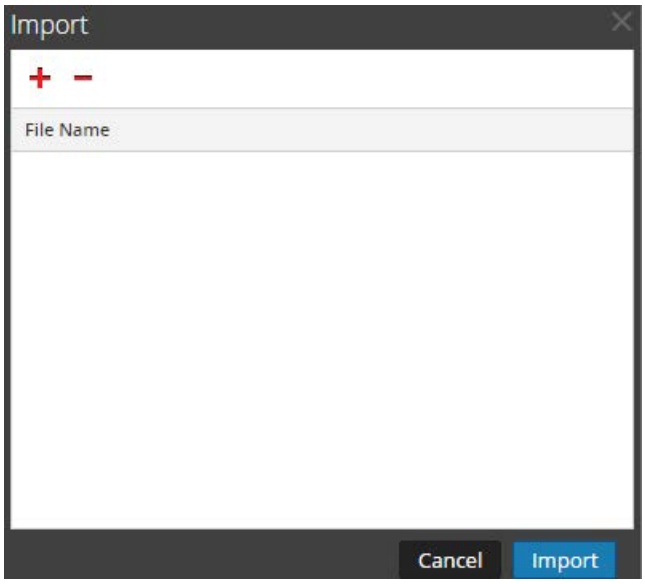
Sort the Hostname or Event Source Type

To sort the hostname or event source type:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. To sort a column, click in the column header.

Event Source Types are applied for your selected IP address. Logs are parsed against the parsers in the order they are listed.



Import IP to Event Source Mapping Entries

To import IP to event source mapping entries:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select **Actions > Import**.

   The Import dialog is displayed.

5. Click .
6. Select the file you want to import and click **OK**.
7. To load the parser, click **Import**.

Note: You can only import one .csv file at a time.

Export IP to Event Source Mapping Entries

To export IP to event source mapping entries:

1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mappings you want to export.

5. Select **Actions > Export > Selection**.

   The Export Selection dialog is displayed.

6. Enter the file name and click **Export**.

Search IP to Event Source Mapping Entries

To search IP to event source mapping entries:

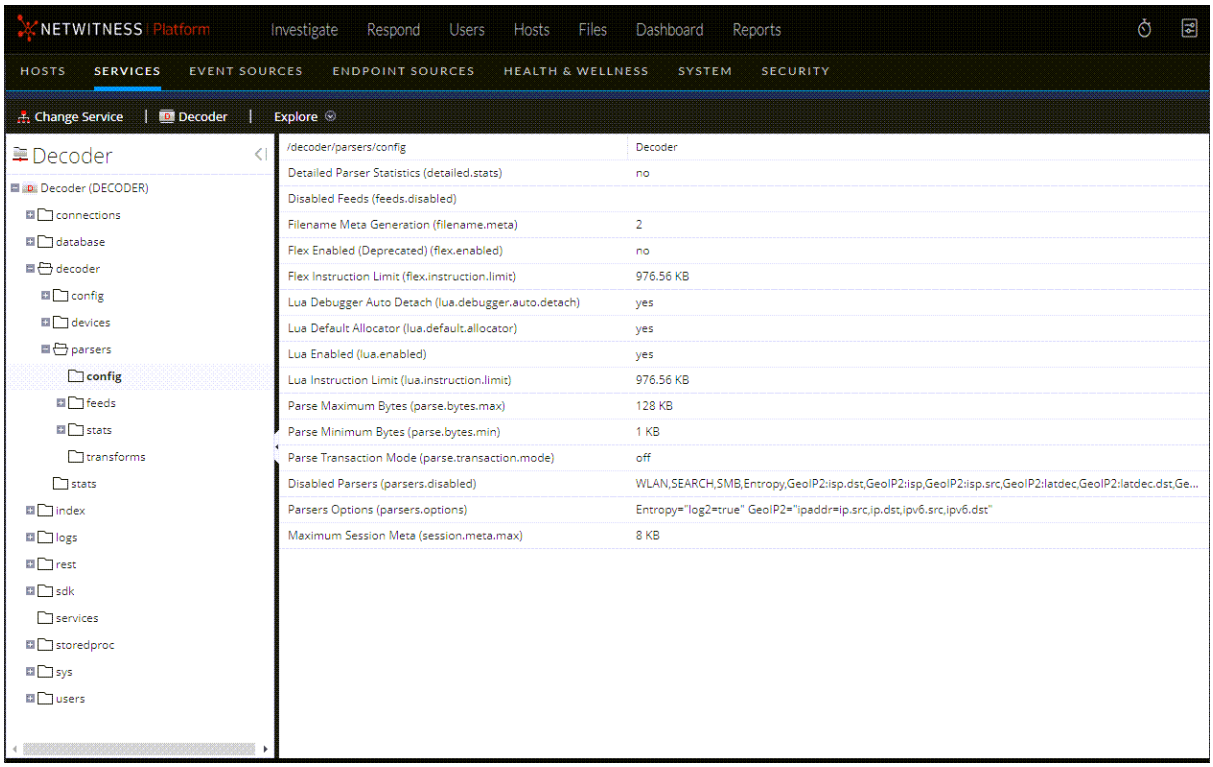
1. Go to **(Admin) > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.

   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. In the Parsers Mappings toolbar, enter the Host or Event Source in the **Filter** field.
5. Click **Enter**.

The Hosts or Event Sources that match the names entered in the **Filter** field are displayed.

Enable or Disable Lua and Flex Parsing Systems

This topic tells administrators how to enable or disable Lua and Flex parsing systems on a Decoder or Log Decoder. Flex parsers are deprecated and disabled by default.



The settings to enable or disable Lua and Flex parsing systems are configured correctly by default and you do not typically have to change them. However, you may need to adjust these settings at the request of NetWitness Customer Care or for troubleshooting purposes.

In addition to configuring individual parsers, you can enable and disable all Lua parsing as well as all Flex parsing in the Services Explore view. You enable and disable the Lua parsing and Flex parsing systems settings separately, but they work in the same way.

- If you **disable** the Lua or Flex parsing system, the corresponding parsing system is disabled and no parsers are loaded.
- If you **enable** the Lua or Flex parsing system, the corresponding parsing system is enabled and individual parsers are enabled and disabled following the current individual configurations.

To enable or disable Lua and Flex parsing systems on a Decoder or Log Decoder:

1. Go to **(Admin) > Services.**
2. Select a Decoder or Log Decoder and **> View > Explore.**
   The Services Explore view for the selected service is displayed.
3. In the Node list, navigate to and select **`/decoder/parsers/config`**.

4. In the values panel:
   - To enable the Lua parsing system, in the value field for `lua.enabled`, type **yes**.
   - To disable the Lua parsing system, in the value field for `lua.enabled`, type **no**.
   - To enable the Flex parsing system, in the value field for `flex.enabled`, type **yes**.
   - To disable the Flex parsing system, in the value field for `flex.enabled`, type **no**.

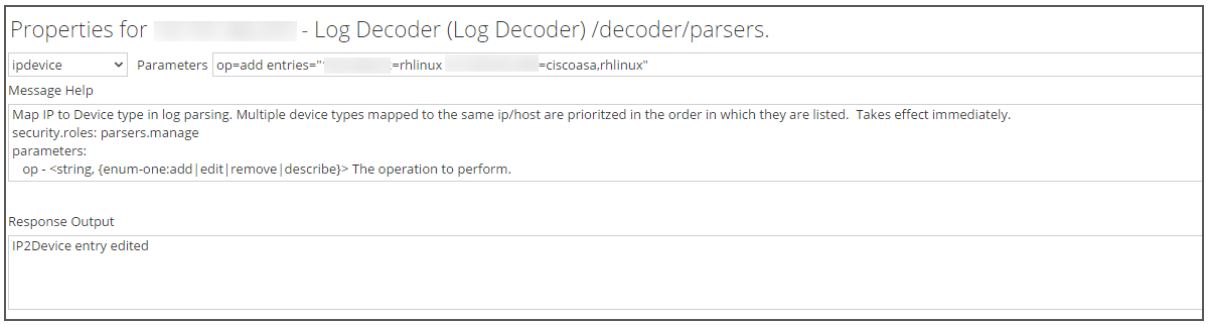
Map IP Address to Service Type for Log Parsing

This topic describes the procedure to map an IP address to a service type for log parsing.

The Log Collector discovers event source type on a per-message basis. If the correct parser is not used for the specific event source, the messages that are common between event source types are misclassified. The misidentified messages will not populate service rules and alerts, and the reports will not have proper information. Also, if there are multiple services associated with an IP address, it can be difficult for the parsers to identify the exact service from which the log is generated.

If you map an IP address to its services, the Log Decoder can identify the service from which the log is generated. When messages come into the log decoder from a mapped service, the assigned parsers are loaded to find event matches.

You can assign service types to IPV4, IPV6 or hostname value of the event source. You can also assign multiple service types to a single IP address. You can also use the CollectorID when different service types with the same IP address are sent to different collectors.



Map an IP Address to a Service Type

To map an IP address to a service type, do the following:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select  **> View > Explore**.
3. Go to **/decoder/parsers** node, right-click **parsers**, and select **Properties**.
4. In the **Properties** view, specify the **ipdevice** command with the following parameters:

   `op=add/remove entries="`***`ipaddress`***`=`***`service`***`"`

   for example, `op=add entries="10.100.201.300=ciscoasa"`
5. Click **Send**.

IPdevice Command

In the `ipdevice` command, three operations are available:

- `add`: This operation adds or updates entries in the ipdevice map. Multiple space delimited address/type pairs may be specified.

  `op=add entries="`***`address`***`=`***`service type`***`"`

- `remove`: This operation removes entries from the ipdevice map. Multiple space delimited address/type pairs may be specified.

  `op=remove entries="`***`address`***`"`

- `describe`: This operation returns the values currently in the ipdevice map.

Map an IP Address to a Time Zone

This topic discusses NetWitness support for Event Time.

Often times logs do not fully specify timestamps and may be missing time zone information. To properly normalize such timestamps to UTC, the Log Decoder provides the ability to associate devices from a specific address (IPv4 or IPv6) or hostname to a time zone or a fixed offset.

Timestamp consideration for log files:

- Some logs are in UTC format.
- Some logs that are not in UTC include a timezone offset value to adjust the time accordingly.
- For logs that use local time, with no offset provided, you can create a source mapping to manually adjust times for logs from that event source.

Three time zone formats are currently accepted and are shown in the following examples:

- Olson format: `America/Anguilla`
- POSIX format: `AST2:45ADT0:45,M4.1.6/1:45,M10.5.6/2:45`
- Offset by Minutes format: `= -500`

NetWitness maps the device address (IPv4 or IPv6) or hostname to a specific time zone or offset. Event time meta that is parsed from a log that is from a mapped address and does not include an offset or time zone as part of the timestamp is adjusted to UTC according to the mapping.

To map an IP address to a time zone, do the following:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.
4. In the **Properties** view, specify the `iptmzone` command with the following parameters:

   `op=add entries="`***`ipaddress`***`=`***`timezone`***`"`

   for example: `op=add entries="10.10.10.10=Africa/Addis Ababa"`
5. Click **Send**.

tzinfo Command

You can view the strings that can be used to specify the time zone by using the `tzinfo` command.

To view the time zone strings, do the following:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.

4. In the **Properties** view, specify the `tzinfo` command with the following parameters:

   `op=tznames`

5. Click **Send**.

The list of time zone strings is returned in the **Response Output** text box.

iptmzone Command

In the `iptmzone` command, three operations are available:

- `add`: This operation adds or updates entries in the iptmzone map. Multiple space delimited address/type pairs may be specified.

  `op=add entries="address=time zone"`

- `remove`: This operation removes entries in the iptmzone map. Multiple space delimited address/type pairs may be specified.

  `op=remove entries="address"`

- `describe`: This operation returns the values currently in the iptmzone map.

Examples

The following examples provide instances for mapping IP addresses to time zones:

- If you want to map two different entries with different IPV4 values and time zone, enter the following parameter in the **iptmzone** command and click **Send**

  `op=add entries="10.10.10.10=America/Anguilla 10.10.10.11=Pacific/Rarotonga"`

- If you want to remove an entry for a single IPV4 value and time zone, enter the following parameter in the **iptmzone** command and click **Send**.

  `op=remove entries="10.5.245.9"`

- If you want to create a single entry for an IPV6 value and time zone, enter the following parameter in the **iptmzone** command and click **Send**.

  `op=add entries="2001:DB8:85A3::8A2E:370:7334=America/Anguilla"`

- If you want to create a single entry to map an IPV4, IPV6, or hostname with the Minute Offset, Olson, or POSIX format, enter the following string in the **iptmzone** command and click **Send**.

  ```
  op=add entries="10.168.0.2=America/Anguilla
  2001:DB8:85A3::8A2E:370:7334=0500 nwappliance21=EST5EDT,M3.2.0/2,M11.1.0"
  ```

Change the Date format

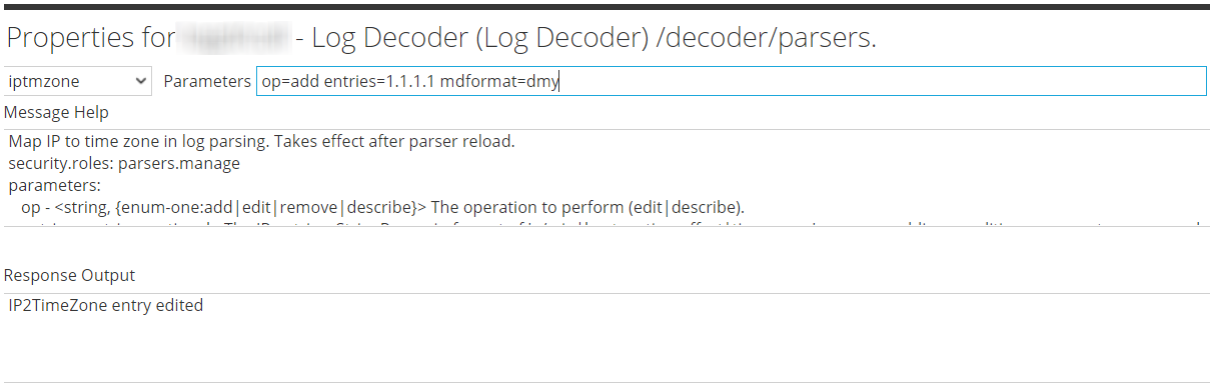
The Log Decoder parsing engine uses the `event.time` meta key to keep track of the time an event occurs for incoming log messages. You can use the `mdformat` for the **iptmzone** command to change the date format. The Log Decoder currently has the ability to change the dates in the logs to have the following format:

```
mdy or dmy (month/day/year or day/month/year)
```

Notes:

- Event time metadata in a parser does not account for `dmy` and `mdy`.
- Currently, there is no functionality to detect this scenario and adjust parsing automatically.

To change the date format, do the following:



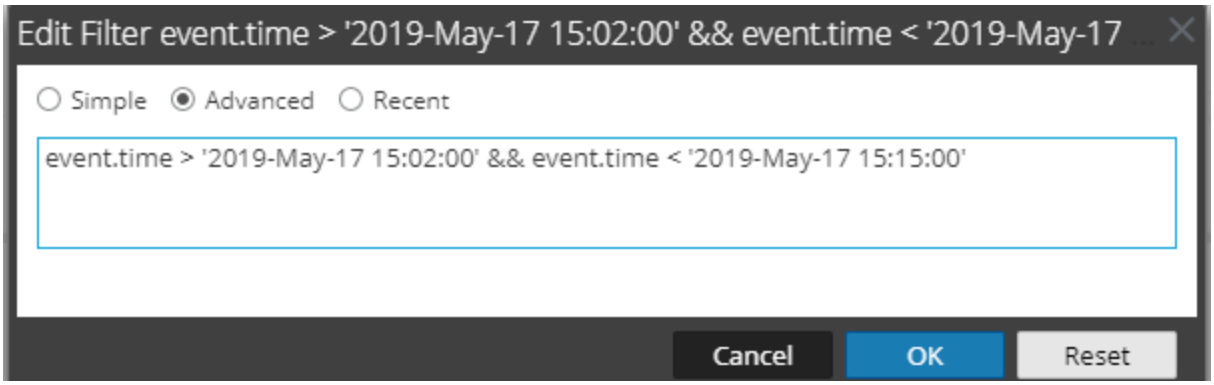
1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select; **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.
4. In the **Properties** view, select **iptmzone** from the drop-down list, and specify the command with the following parameters:

   `op=add entries="<ipaddress>" mdformat=[dmy | mdy | none]`

   for example: `op=add entries="1.1.1.1" mdformat=dmy`

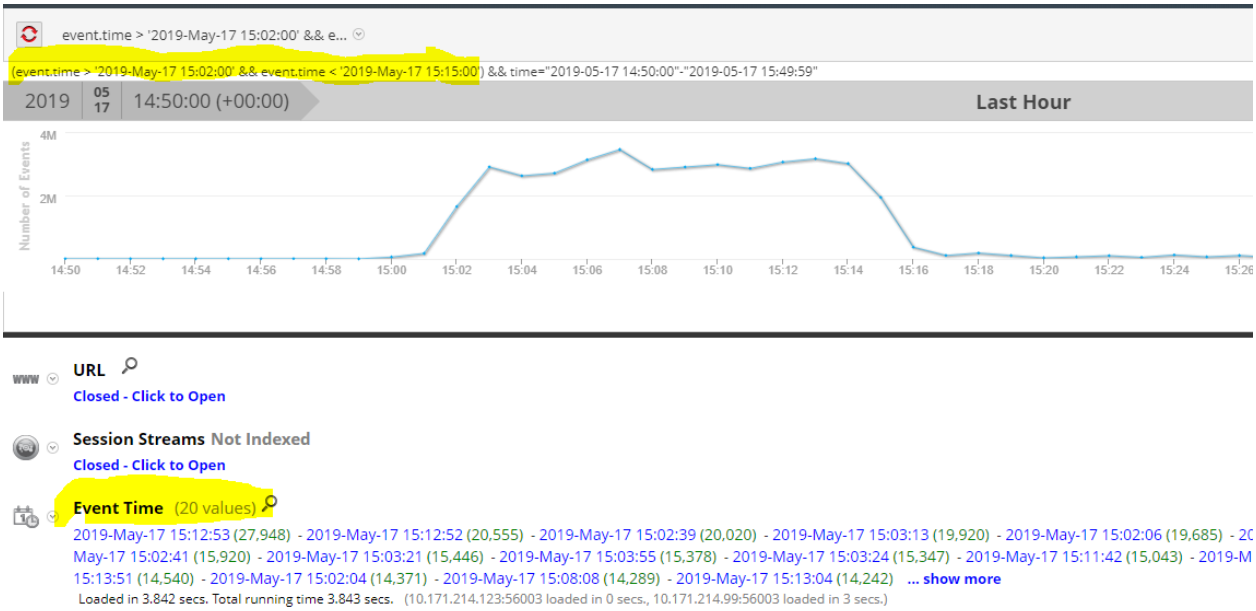
   Where:

   - `ipaddress` is the Device IP address, and
   - `mdformat` can be **dmy**, **mdy**, or **none**.



5. Click **Send**.

NetWitness maps the IP address along with the date format in the Log Decoder. Event time meta items are updated according to their respective mappings.



Event Time Filter Example

If you want to see logs that have an event time between 3:02 PM and 3:15 PM on May 17, 2019, create the following filter:

Note: The query builder may tell you "invalid expression," but that is a validation error in the User Interface. The query works because even though this is a text (string) search, the system actually compares the ASCII values. So, for example the expression **A < B** would be true.

Below is a sample of the event meta values returned from the query:

Missing Year Support

If there is no year associated with a format string, the parser attempts to populate the year heuristically. In most cases, the value is populated based on the current year. The current year is assigned as the message year (UTC), as per the clock on the Log Decoder.

The following are the various other scenarios:

1. Latent log during transition to new year.
2. Logs from forward time zones (or skewed clocks) just before new year transition.
3. Latent logs received where a leap day cannot be successfully assigned to an appropriate leap year.

Latent log during transition to new year

If the day is more than 31 days into the future, the year is decremented.

For example,

The message date is Dec-31. The current date is 2018-Jan-1. The temporary assigned date, 2018-Dec-31, will be more than 31 days into the future.

This will cause the year component to be decremented to 2017, resulting in a reasonable message time.

Logs from forward time zones (or skewed clocks) just before new year transition

If the day is more than 334 days into the past, the year is incremented.

For example,

The message date is Jan-1. The current date is 2017-Dec-31. The temporary assigned date, 2017-Jan-1, will be more than 334 days into the past.

This will cause the year component to be incremented to 2018, resulting in a reasonable message time.

Latent logs received where a leap day cannot be successfully assigned to an appropriate leap year

If the day (Feb 29) is invalid (say, the assigned year is NOT a leap year), the relative position to the current time cannot be calculated. To do this, the year is decremented in an attempt get a valid time stamp.

Because the position of the leap day relative to the transition to the new year, along with the expectation that no logs would be received this far into the future, we do not ever make an attempt to increment the year to produce a valid time stamp.

After the year is decremented, the same logic is then followed (refer to statement 1 and 2). If the result is still an invalid day. The parser throws and a valid message time cannot be parsed.

Limitations

Note: Currently, there is no mechanism to assign a year to the import of logs.

As this pertains to leap days, if you find the correct leap year, an inconsistent data would result. For example, if a set of messages is two years old and during a leap year, only a single day would remain which is accurate. Because of the heuristic described above, the remaining set of messages would have time stamps one year too.

For data consistency, usually you cannot find valid leap years beyond 1 month and less than 11 months.

Examples

The following examples provide instances for logs with year and logs without year:

- If the log is with year, event time is generated as below:

```
%emcavamar: 1704^^2017-04-07^^07:50:02^^1^^<event-source NodeID="avamar"
ProgramName="com.avamar"/>^^1270626^^SYSTEM^^ERROR^^OK^^MCS:DPN_
Proxy^^Internal server error^
<MESSAGE
     id1="1:01"
     id2="1"
     eventcategory="1605020000"
     functions="&lt;@msg:*PARMVAL($MSG)&gt;&lt;@event_time:*EVNTTIME
     ($MSG,'%W-%G-%F %H:%U:%O',fld2,fld3)&gt;"
     content="&lt;fld1&gt;^^&lt;fld2&gt;^^&lt;fld3&gt;^^&lt;fld4&gt;^^
     &lt;&lt;event-source NodeID=&quot;&lt;hostname&gt;&quot;
     ProgramName=&quot;&lt;fld8&gt;&quot;/&gt;^^&lt;fld9&gt;^^&lt;cate
     gory&gt;^^&lt;severity&gt;^^&lt;event_
     type&gt;^^&lt;agent&gt;^^&lt;event_description&gt;" />
```

- If the log is without year, event time is still generated, The current year is assigned as the message year (UTC), as per the clock on the Log Decoder.

```
%emcavamar: 1704^^04-07^^07:50:02^^1^^<event-source NodeID="avamar"
ProgramName="com.avamar"/>^^1270626^^SYSTEM^^ERROR^^OK^^MCS:DPN_
Proxy^^Internal server error^
<MESSAGE
     id1="1:01"
     id2="1"
     eventcategory="1605020000"
     functions="&lt;@msg:*PARMVAL($MSG)&gt;&lt;@event_time:*EVNTTIME
     ($MSG,'%G-%F %H:%U:%O',fld2,fld3)&gt;"
     content="&lt;fld1&gt;^^&lt;fld2&gt;^^&lt;fld3&gt;^^&lt;fld4&gt;^^
     &lt;&lt;event-source NodeID=&quot;&lt;hostname&gt;&quot;
     ProgramName=&quot;&lt;fld8&gt;&quot;/&gt;^^&lt;fld9&gt;^^&lt;cate
     gory&gt;^^&lt;severity&gt;^^&lt;event_
     type&gt;^^&lt;agent&gt;^^&lt;event_description&gt;" />
```

Obtain Log Files from a Pre-11.0 Log Decoder

NetWitness 11.0. added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available.

To enable logs preview for a pre-11.0 Log Decoder, follow these steps on the Log Decoder:

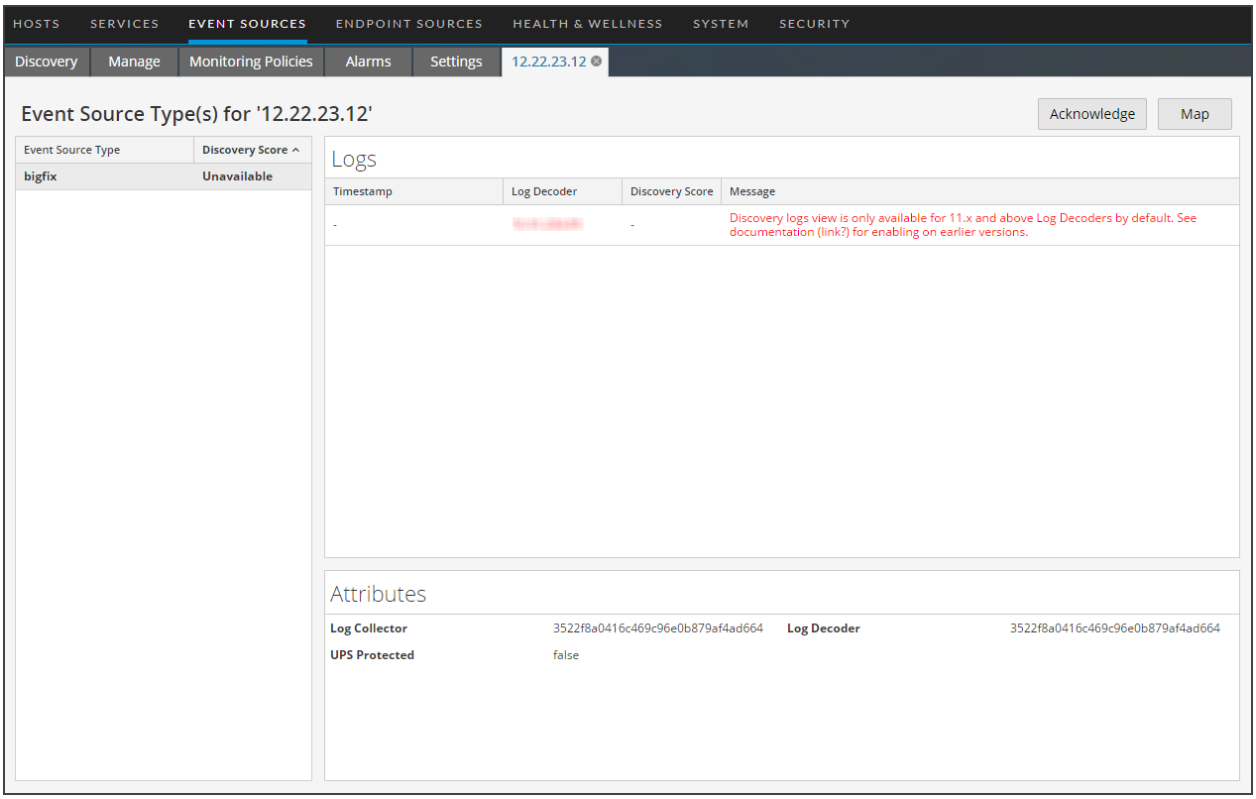
1. Go to (Admin) > **Services** > select a **Log Decoder**, then select > **View** > **Config**.
2. Click the **Files** tab and select **index-logdecoder-custom.xml** from the drop-down menu.
3. Add the following three lines at the end of the file (before the closing language tag):

```
<key description="Device IP" level="IndexValues" name="device.ip" format="IPv4"
valueMax="100000" defaultAction="Open"/>
<key description="Device IPv6" level="IndexValues" name="device.ipv6" format="IPv6"
valueMax="100000" defaultAction="Open"/>
<key description="Device Host" level="IndexValues" name="device.host" format="Text"
valueMax="100000" defaultAction="Open"/>
```

4. Click **Apply**.
5. Restart the Log Decoder service as follows.

   Select Log Decoder service > **Explore** > **decoder** > **Properties** > **reset**. You select **reset** from a drop down menu.

Click **Send** after you select reset.



This is an example of the **index-logdecoder-custom.xml** file.

Note: Discovery Scores are only available for 11.x and above Log Decoders. Discovery Scores for pre-11.x Log Decoders are displayed as Unavailable.

The following example shows the Discovery Score as **Unavailable** in the **Details** view for a pre-11.0 Log Decoder.

Note: Device logs are only available for 11.x and above Log Decoders.

The following example shows the message that is displayed in the Logs panel for a pre-11.0 Log Decoder.

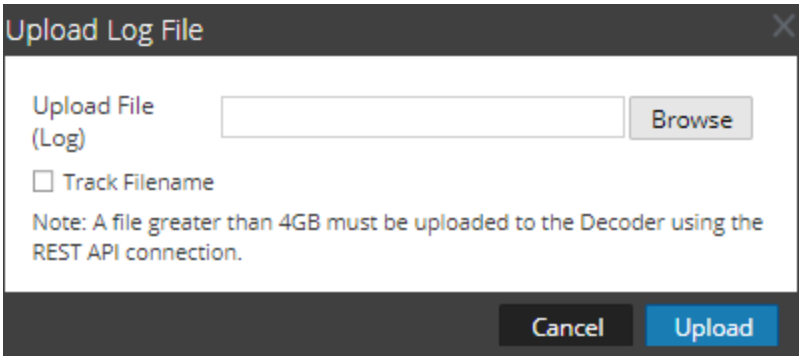
Upload a Log File to a Log Decoder



There are occasions when you want to analyze a log file that is not available on the service you are using. You can upload a log file captured on another service to NetWitness. Log filenames are of the type **.log**.

When a log file is uploaded to a Log Decoder, the Log Decoder analyzes and generates meta for each log it contains. These logs are added to the already decoded logs on the Log Decoder and are available for analysis. NetWitness includes a filename tracking option that makes searching for a particular set of logs easier. When the log file is uploaded with file tracking, the Log Decoder adds meta to each log based on the uploaded filename. You can then filter sessions for analysis using that meta.

The option to upload a log file is dimmed when other Log Decoder operations prevent an upload from occurring, for example, when the Log Decoder is capturing logs.

To import a log file to a Log Decoder:

1. Go to  **(Admin)** **Services**.
2. Select a Log Decoder in the **Service** grid, and select  **> View > System**.
   The Services System view for the Log Decoder is displayed.
3. In the toolbar, click **Upload Log File**.

4. To choose a log file, click **Browse**.
   A directory view is displayed.
5. Select the log file that you want to upload.
   The filename is displayed in the **Upload File** field.
6. If you want the Log Decoder to add meta to the logs based on the filename, click the checkbox next to **Track Filename**.
7. To upload the file, click **Upload**.
   The selected file is uploaded and a status message indicates that the file is uploaded. The log file is available for analysis.

Upload a Packet Capture File

There are occasions when you want to analyze a packet capture file that is not available on the service you are using. You can upload a file captured on another service to NetWitness. Supported packet capture file types are `pcap` and `pcap.gz`.

When a packet capture file is uploaded to a Decoder, the Decoder creates sessions from the packet capture file packets. These sessions are added to the already decoded sessions on the Decoder and are available for analysis. NetWitness includes a filename tracking option that makes searching for a particular set of sessions easier. When the packet capture file is uploaded with file tracking, the Decoder adds meta to the sessions based on the uploaded filename. You can then filter sessions for analysis using that meta.

The option to upload a packet capture file is dimmed when other Decoder operations prevent an upload from occurring; for example, when the Decoder is capturing packets.

To select and upload a packet capture file:

1. Go to **(Admin)** > **Services**.

   The Administration Services view is displayed.

2. Select the Decoder name, and **> View > System**.

   The Services System view for the Decoder is displayed.

3. In the toolbar, click **Upload Packet Capture File**.

   The **Upload Packet Capture File dialog** is displayed.

4. To choose a capture file, click **Select**.

   A directory view is displayed.

5. Browse the directory and select the packet capture file that you want to upload.

   The filename is displayed in the **Upload File (pcap, pcap.gz)** field.

6. If you want the Decoder to add meta to the sessions based on the filename, click the checkbox next to **Track Filename**.

7. To upload the file, click **Upload**.

   A progress bar shows upload progress.

Upload time varies depending on the size of the file. When the file upload is complete, a status message is displayed. The file is now available for investigation.

Simultaneous Import and Capture

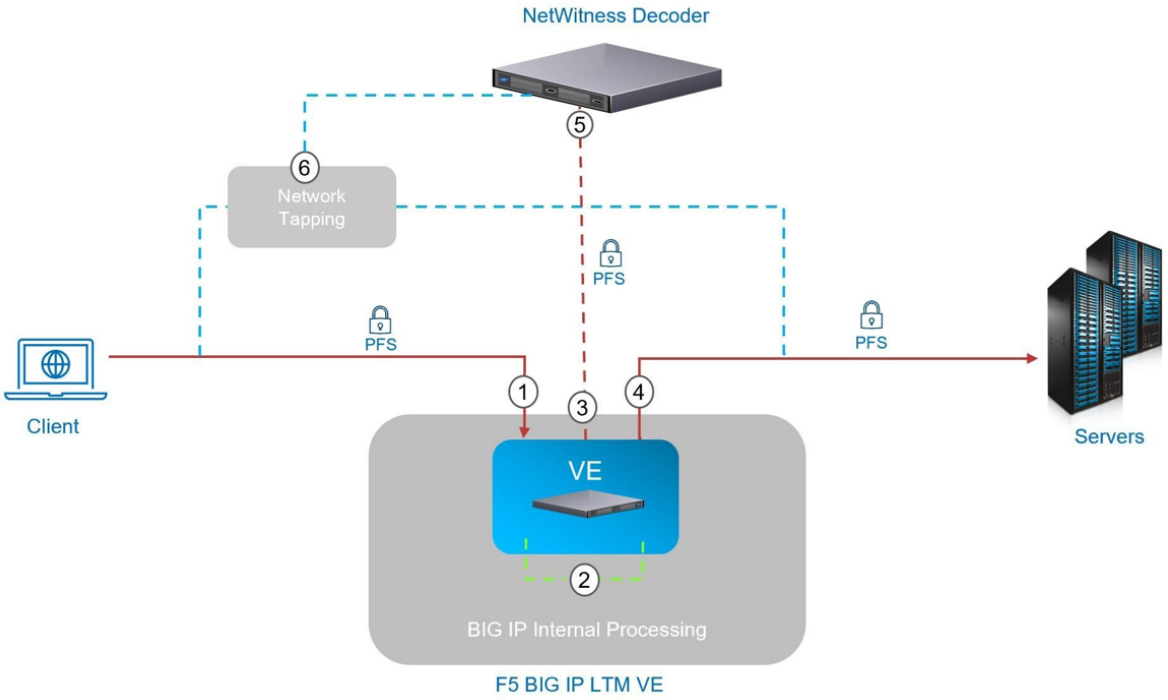
You can import or upload PCAPs while the capture is running using RESTful API. Make a note of the following points before you start importing during capture:

- The source file metadata is not created for imported PCAPs when the capture is running. If capture is stopped, the source file metadata is created as in older versions.
- The NWD files can be imported, but not while the capture is running. If you attempt to import an NWD file while the capture is running, the Decoder returns an error. An active import will block starting/stopping of import and capture.
- The file tracking meta is not created during the simultaneous import and capture.

F5 BIG IP - NetWitness Perfect Forward Secrecy Inspection Visibility

This topic discusses Perfect Forward Secrecy (PFS) Inspection Visibility with F5 BIG-IP Local Traffic Manager (LTM) and NetWitness Decoder integration.

NetWitness Decoder allows administrators to receive session keys from PFS sessions and decrypt each session traffic. It can receive session keys through its RESTful port, the PFS encrypted traffic through its capture interface, and supports the traffic decryption for inspection.



This solution utilizes functionality in iRule to extract session keys and deliver them to NetWitness Decoder via a sideband connection.

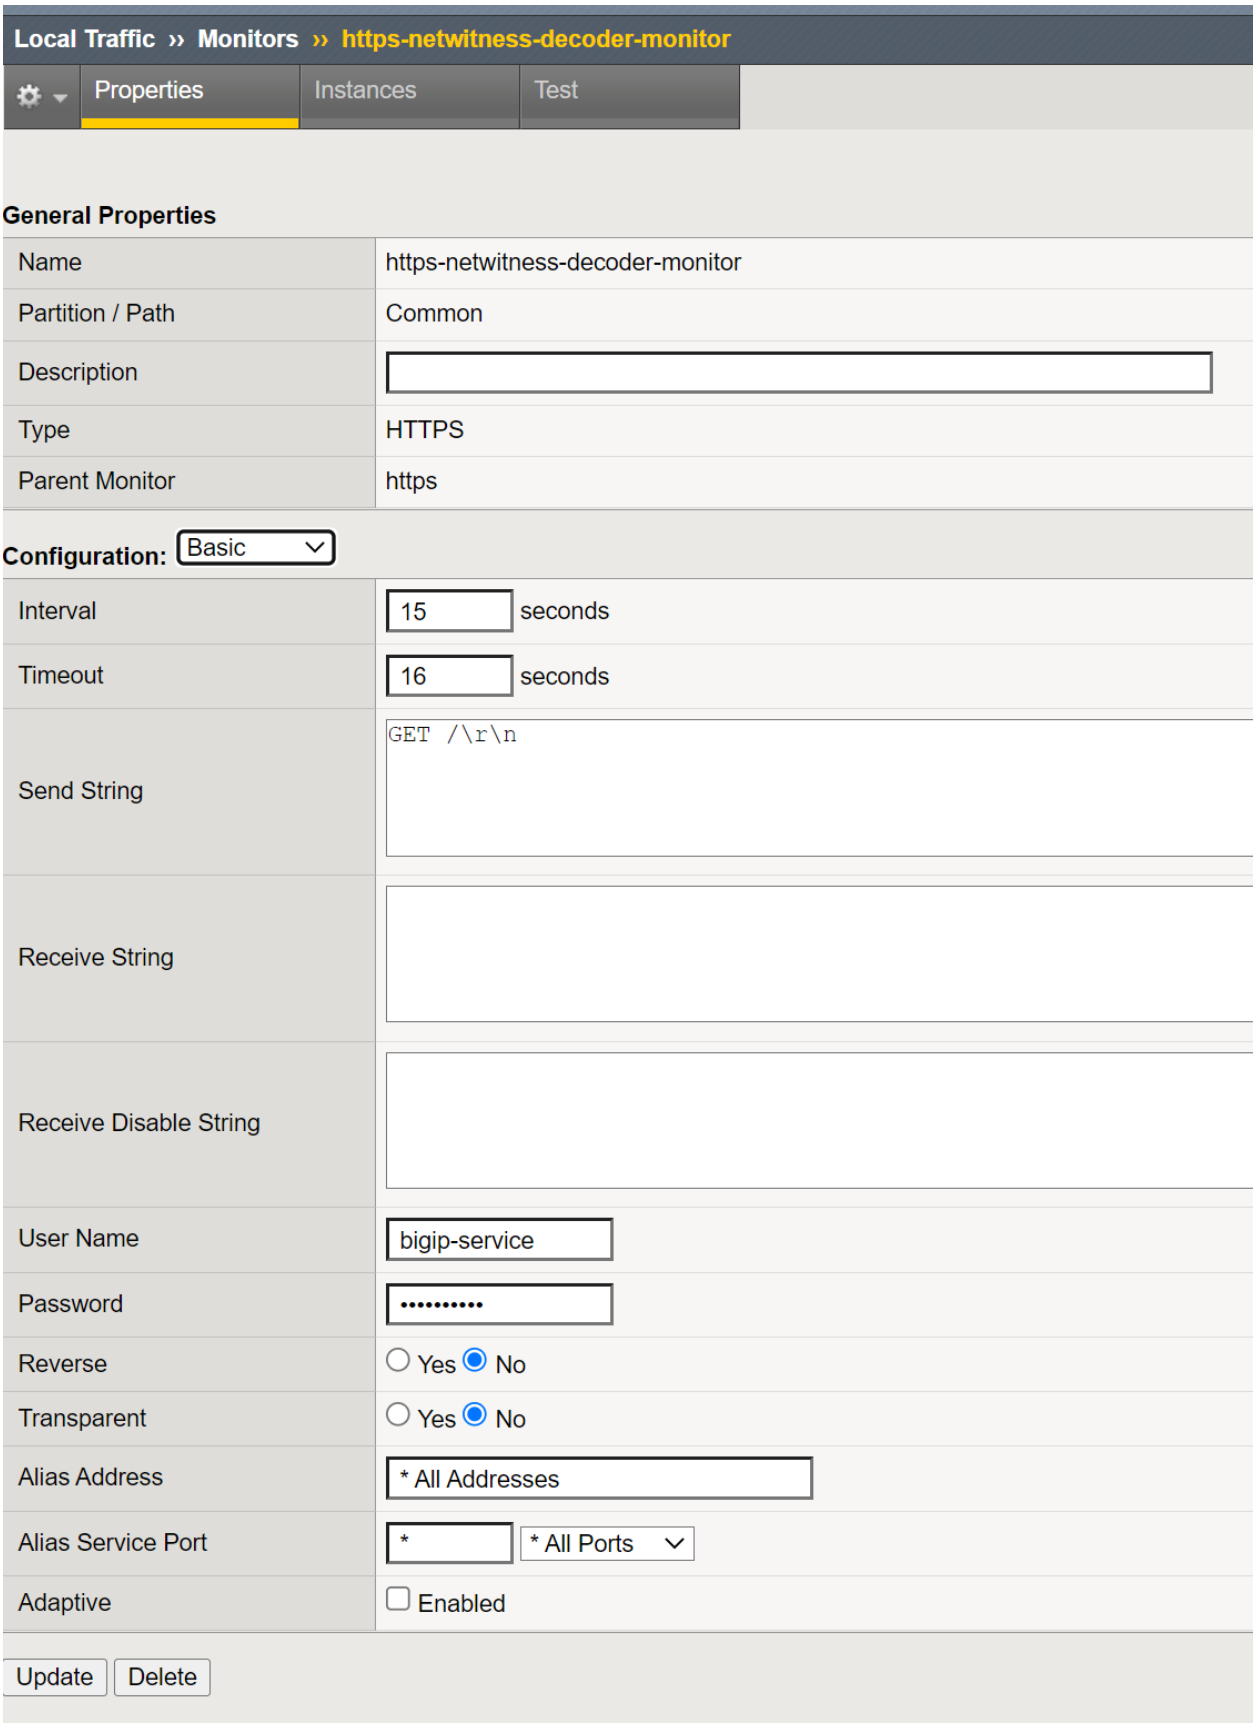
Prerequisites

A few prerequisites need to be considered in your environment for the integration of BIG-IP LTM and NetWitness Decoder.

- Deploy and Configure BIG IP LTM External Virtual Server (version 15.1.5 and above)
  - Configure Client SSL Profile with TLS 1.3 enabled.
  - Configure Server SSL Profile with TLS 1.3 enabled.
- Deploy and Configure NetWitness Decoder NON-FIPS (version 12.0 and above)
  - Install Decoder `nonfips` builds which support TLS 1.3 decryption.
  - Allow NetWitness Decoder RESTful port (default 50104) in your Network Firewall to receive keys from BIG-IP LTM.
    - NetWitness Decoder receives keys via HTTPS on RESTful port.
  - Create an Administrator account on the Decoder Device with role permissions `security.roles: decoder.manage` to forward TLS keys to Decoder.
    - Example name: bigip-service
  - Consider deploying NetWitness Decoder close to BIG-IP LTM so that it's feasible to mirror the encrypted traffic via TAP or Switch and avoid Network Latency in receiving TLS keys.

Deployment

1. A client connects to BIG-IP LTM using TLS with PFS cipher. The External Virtual Server has `clientssl` profile to decrypt traffic for inspection.
2. While inspecting the traffic an `iRule` on External Virtual Server collects the session keys and makes a `sideband` connection to Internal Virtual Server with the NetWitness Decoder as a `pool member`. The Internal Virtual Server has a `serverssl` profile to ensure traffic between BIG-IP LTM and NetWitness Decoder is protected since session keys are forwarded.
3. The Internal Virtual Server has a `HTTP profile` applied to manage the key transfer via HTTPS between BIG-IP LTM and NetWitness Decoder. `Oneconnect` profile is utilized and session keys will be sent on existing connections if available to reduce the connection setup overhead with NetWitness Decoder.
4. The External Virtual Server also has a `serverssl` profile to re-encrypt the traffic back to server pool.
5. The NetWitness Decoder receives the TLS keys from BIG-IP LTM on its RESTful port and decrypts the traffic ingested.
6. The Payload is not sent from BIG-IP LTM to NetWitness Decoder, this is received either from port mirroring configurations or a Network TAP infrastructure as shown above.



BIG-IP LTM Configurations

The BIG-IP configuration objects required include the following:

- HTTPS Monitor for monitoring NetWitness Decoder Node and Pool status (e.g online, offline etc…)
- Node and Pool objects for NetWitness Decoder.
- HTTP profile for managing key transfer to NetWitness Decoder via HTTPS.
- Server SSL profile for HTTPS sideband connection to NetWitness Decoder.
- Internal Virtual Server for receiving session keys and sideband communication with NetWitness Decoder.
- iRule: for session keys copying and sideband communication with Internal Virtual Server.

HTTPS Monitor

- Configure HTTPS monitor for NetWitness Decoder.
- Set the User Name and Password of the Administrator account created on Decoder device for BIG-IP transactions. Example Configuration using bigip-service account.

```

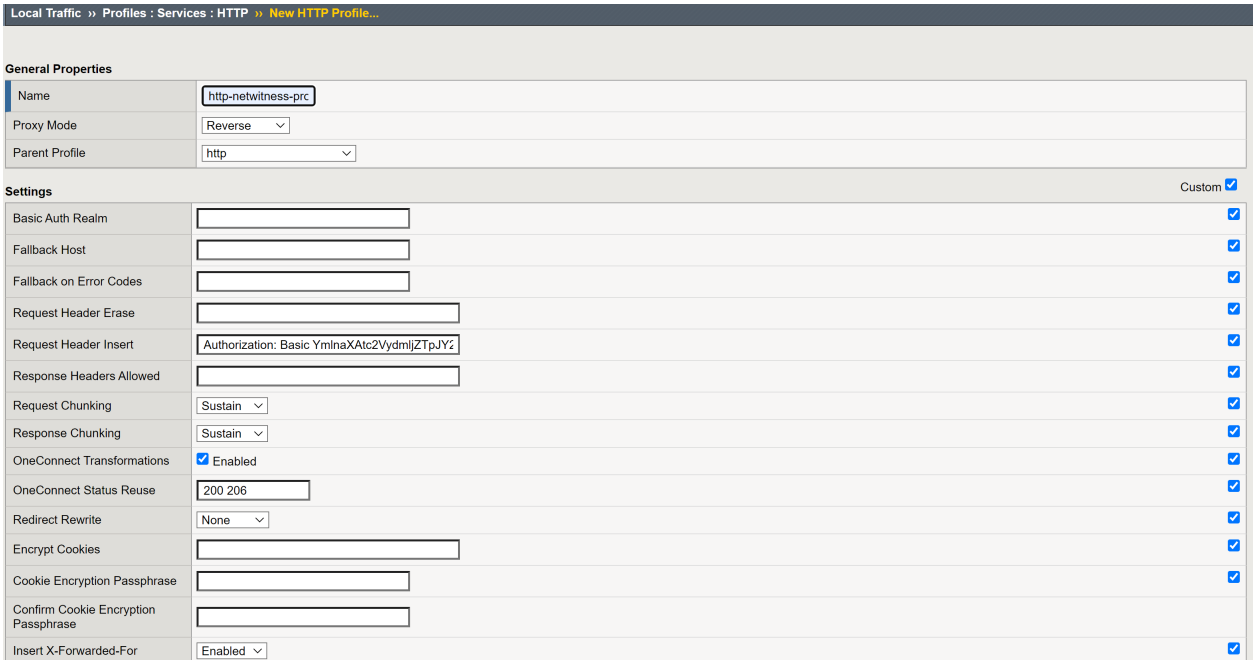
Pool & Node

Configure Pool and Node objects.

- Select **Health Monitors** `https-NetWitness-decoder-monitor`
- Add **New Node** with the following:
  - Set **Node Name** example: `node-NetWitness-decoder`
  - **Address**: <Decoder IP Address >, **Service Port**: 50104 HTTPS and then click **Add**.
- Click **Finished** to create Pool with a Node.

```
ltm pool /Common/pool-netwitness-decoder-https {
members {
/Common/node-netwitness-decoder:50104 {
address 10.10.10.140
}
}
monitor /Common/https-netwitness-decoder-monitor
}
```



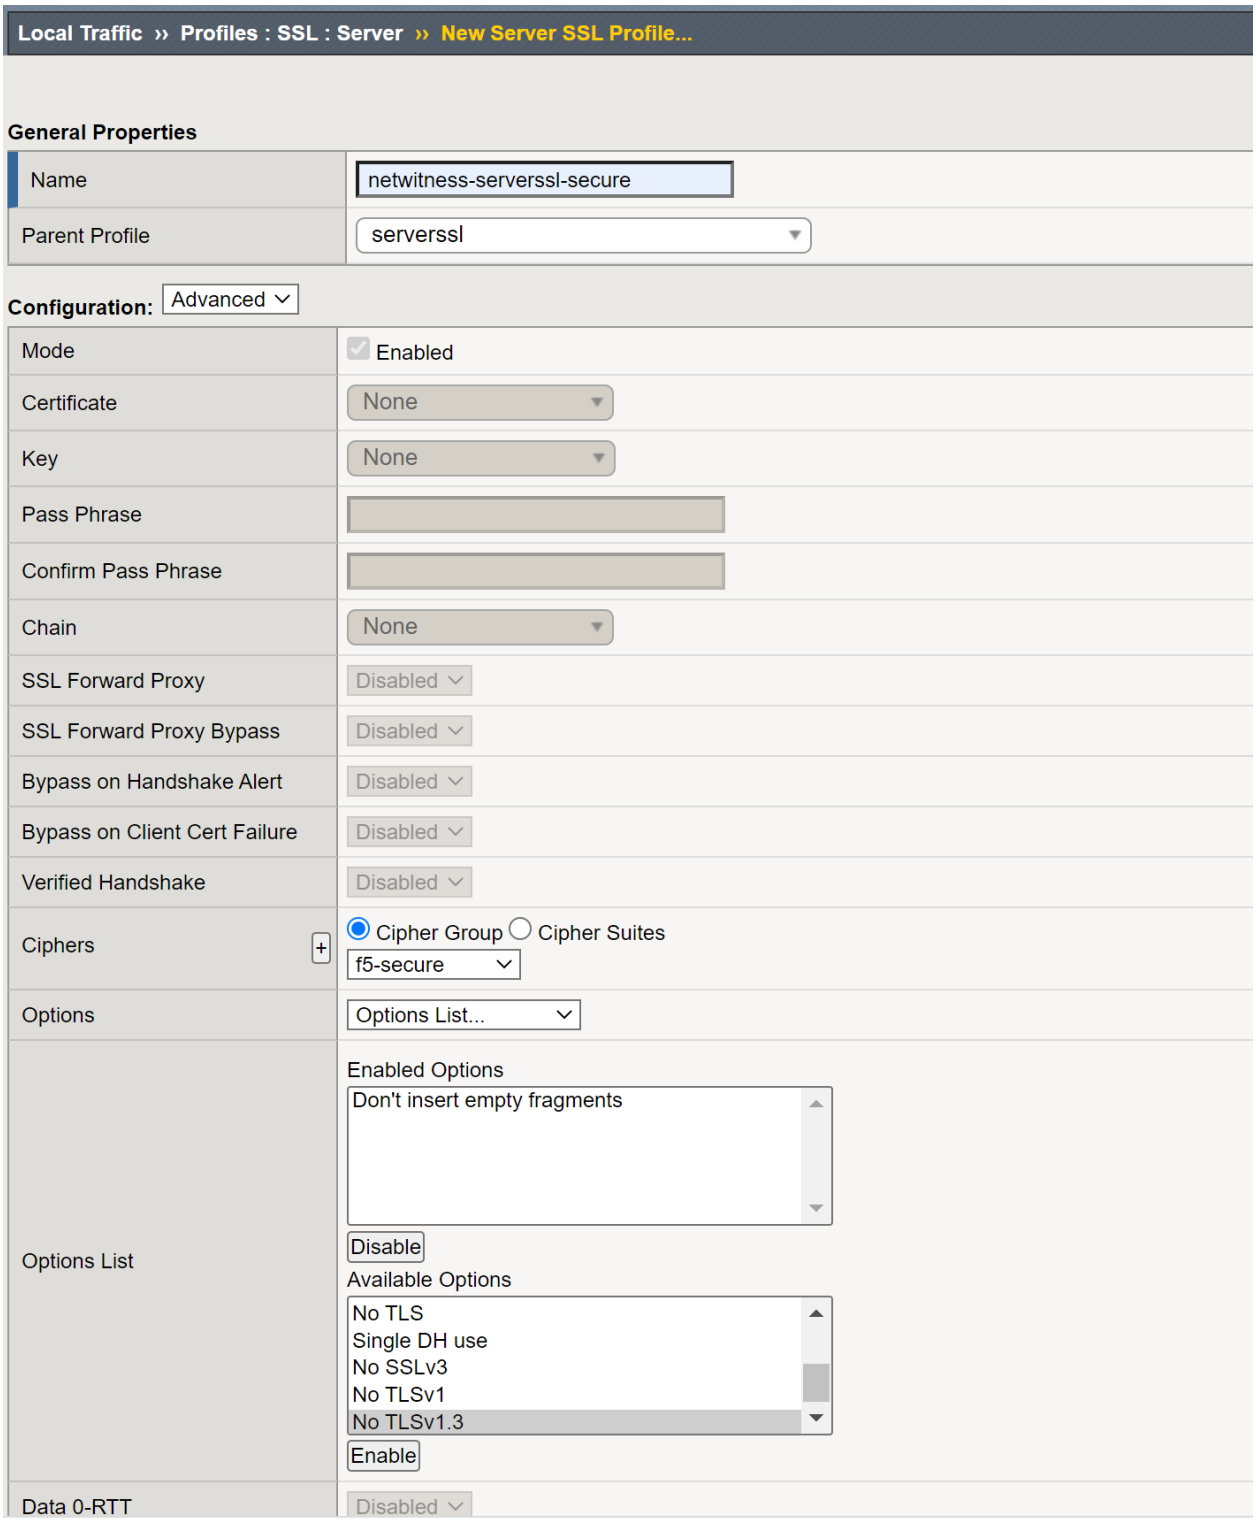
HTTP Profile

- Configure HTTP Profile **Name** `http-NetWitness-profile` to authenticate NetWitness Decoder device and send TLS keys.
- Set **Parent Profile** as **http**
- Check the **Custom** check box to edit the Settings.
- Set **Request Header Insert** field with basic Authorization header string
  - `"Authorization: Basic <Base64 encoded stirng (username:password)>"`
  - Example: `"Authorization: Basic YmlnaXAtc2VydmljZTpJY2FuU2VleW91QDEyMyE="`

- Where
  - username - Administrator account on Decoder device (example: bigip-service)
  - password - The account password

- Set **Insert X-Forwarded-For** as **Enabled** , this would add X-Forwarded-For header with the original Client IP of the session.

Rest of the other configurations can remain as default values.



```
ltm profile http /Common/http-NetWitness-profile {
accept-xff disabled
app-service none
basic-auth-realm none
defaults-from /Common/http
encrypt-cookies none
enforcement {
