- **History**: View all the actions performed by the user on any incident.
- **Nodal Graph**: Visualize the size and interactions between entities (IP address, MAC address, user, host, domain, file name, or file hash).
- **Events List**: Study the events associated with the incident.
- **Journal**: Add notes and collaborate with other analysts.
- **Tasks**: Create incident tasks and track them to closure.

You can also filter the data in the Incident Details view to study indicators and entities of interest.

Workflow

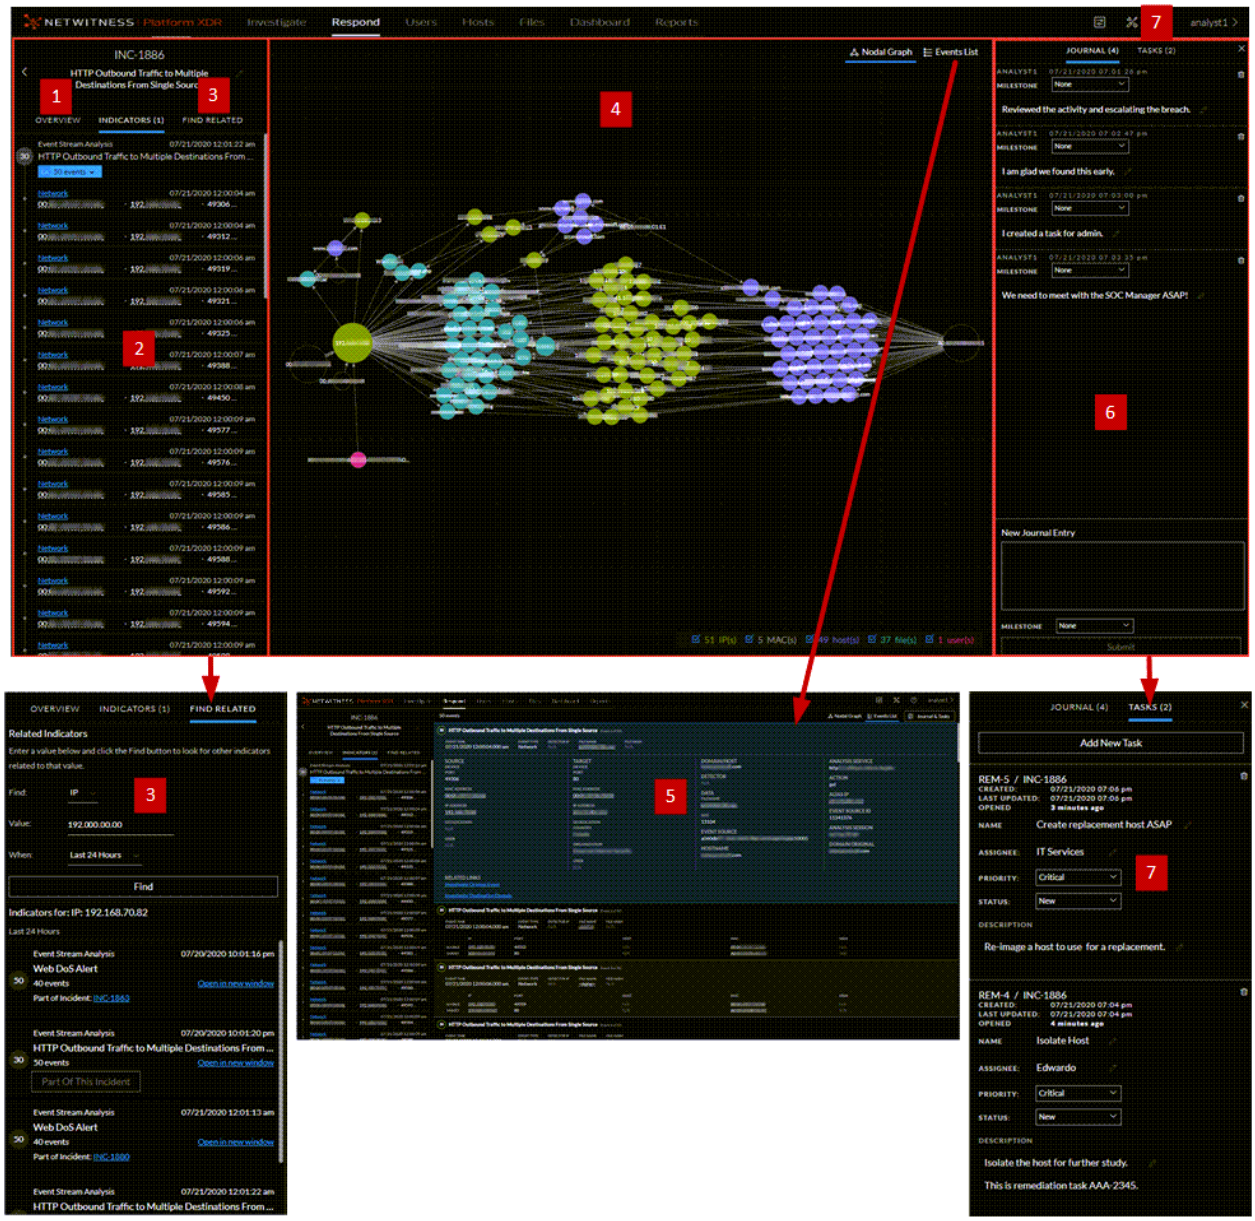
This workflow shows the high-level process that Incident Responders use to respond to incidents in NetWitness.

In the Incident Details view, you can use the extensive information provided about the incidents to determine which incidents require action. You also have the tools and information to investigate the incident, and then escalate or remediate it.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts, and SOC Manager	View prioritized incidents, filter and sort the incident list, find incidents, view my incidents, and assign incidents to myself.	Review Prioritized Incident List
Incident Responders, Analysts	View incident details.*	View Incident Details
Incident Responders, Analysts	View alerts and enrichments.*	View the Indicators and Enrichments
Incident Responders, Analysts	View events.*	View and Study the Events
Incident Responders, Analysts (Additional permissions required)	View event analysis for an event.*	View Event Analysis Details for Indicators
Incident Responders, Analysts	View a graph of the entities involved in the events.*	View and Study the Entities Involved in the Events on the Nodal Graph
Incident Responders, Analysts	Filter the incident data.*	Filter the Data in the Incident Details View
Incident Responders, Analysts	View and add incident notes.*	View Incident Notes and Document Steps Taken Outside of NetWitness
Incident Responders, Analysts	View and create tasks.*	View the Tasks Associated with an Incident and Create a Task
Incident Responders, Analysts	Add related alerts and add them to the incident.*	Find Related Indicators and Add Related Indicators to the Incident
Incident Responders, Analysts	View contextual information about an incident from Context Hub.*	View Contextual Information
Incident Responders, Analysts	Reduce false positives by adding an entity to a whitelist.*	Add an Entity to a Whitelist
Incident Responders, Analysts	Pivot to NetWitness Investigate.*	Pivot to the Investigate > Events View
Incident Responders, Analysts	Pivot to NetWitness Endpoint.*	Pivot to NetWitness Endpoint Thick Client
Incident Responders, Analysts, and SOC Manager	Send an incident to Archer Cyber Incident & Breach Response.*	Send an Incident to Archer

Role	I want to ...	Show me how
Incident Responders, Analysts	Update or close an incident.*	Update an Incident and Close an Incident
Incident Responders, Analysts, and SOC Manager	View all tasks.	Escalate or Remediate the Incident
Incident Responders, Analysts, and SOC Manager	Bulk update incidents and tasks.	Escalate or Remediate the Incident



*You can complete these tasks here (that is, in the Incident Details view).

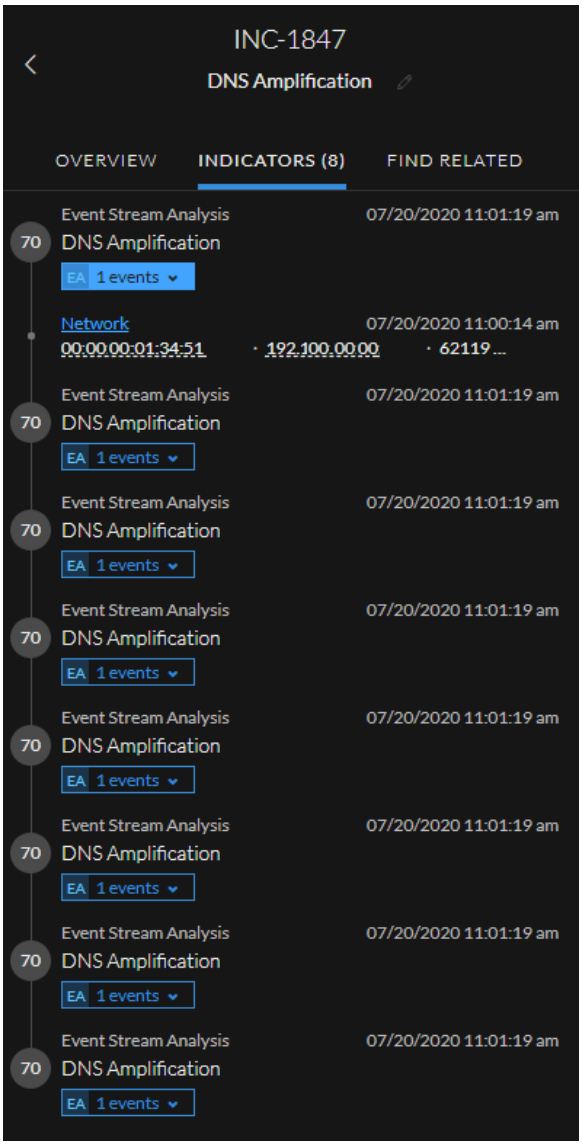
9	UEBA (Click a User Entity Behavior Analytics hyperlink in the Indicators panel to view UEBA.)
10	History Panel

Note: Your Incident Details view may not look like these diagrams because the layout changed in NetWitness 11.3.2 and later versions.
The Related tab is renamed as the Find Related tab and is located on the left-side panel.
The journal is open by default on the right-side panel. When the journal is closed, the Journal & Tasks button enables easy access to notes and tasks.

Overview Panel

The Overview panel shows basic summary information about a selected incident. It also allows you to change the incident name and update the incident priority, status, and assignee. The Overview panel in the Incidents List view contains the same information. The Incidents List view Incident Overview Panel topic provides details.



To view the Overview panel in the Incident Details view, click the **Overview** tab in the left panel.

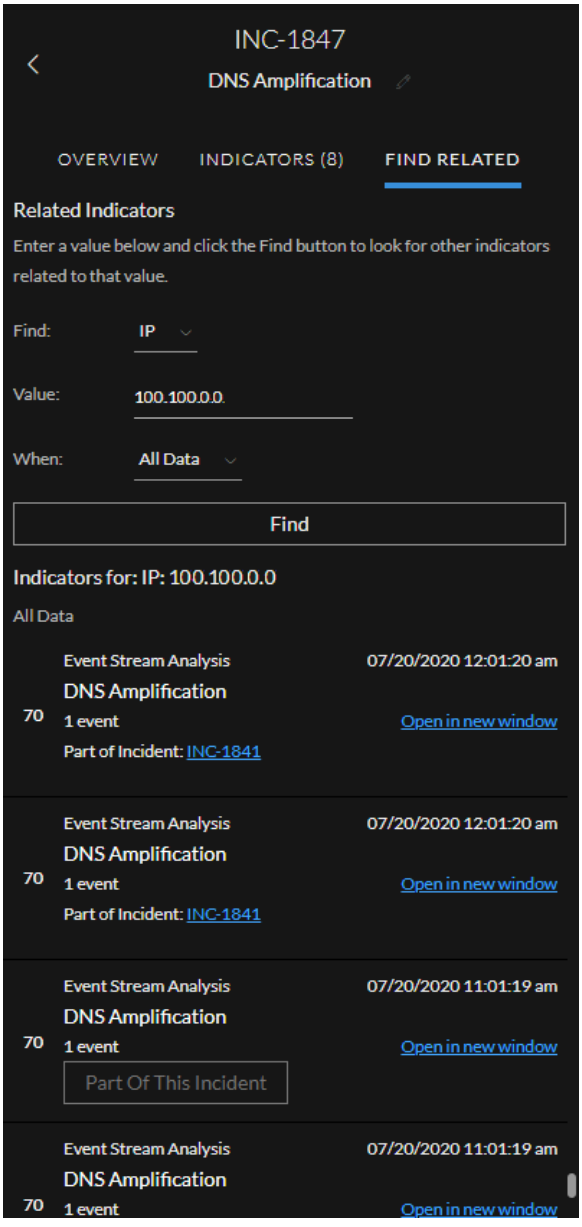
Time To Resolve: 7m 56s
Persisted Status: -

Indicators Panel

The Indicators panel contains a chronological listing of indicators. *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert. (This is different than a timeline, which provides a visual representation of the timing of the events in the incident). This listing helps you to connect indicators and notable data. For example, an IP address connected to a command and communication ESA alert might also have triggered a NetWitness Endpoint alert or other suspicious activities.

To view the Indicators panel, in the left panel of the Incident Details view, click the **Indicators** tab.



Data source information is shown below the names of the indicators. You can also see the creation date and time of the indicator and the number of events in the indicator. In the Indicators panel, you can drill deeper into the events associated with the listed indicators to get a better understanding of the events.

Note: The maximum number of indicators (alerts) displayed in the Indicators panel is 1,000.

Related Indicators Panel

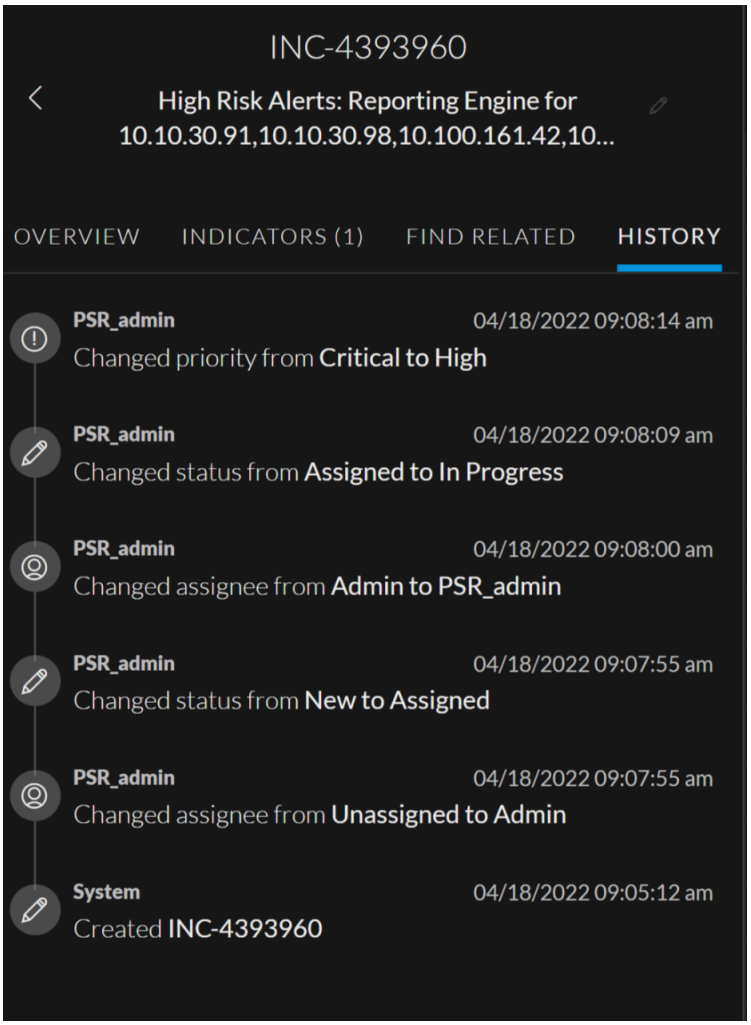
The Related Indicators panel enables you to search the NetWitness alerts database to find alerts that are related to this incident. You can add alerts that you find to the incident if they are not already associated with an incident.

To view the Related Indicators panel, in the left panel of the Incident Details view, click the **Find Related** tab.

The following table describes the fields in the search section at the top of the panel.

Field	Description
Find	Select the entity that you would like to locate in the alerts. For example, IP.
Value	Type the value of the entity. For example, type the actual IP address of the entity.
When	Select a time range to search for the alerts. For example, Last 24 hours.
Find button	Initiates the search. A list of related indicators appear below the **Find** button in the **Indicators for** section.

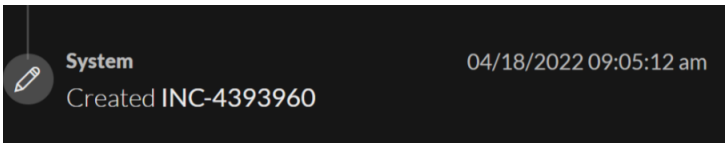
The following table describes the options in the **Indicators for** (results) section at the bottom of the panel.



Option	Description
Indicators For:	Shows the search results.
Open in new window link	Shows alert details for the indicator.
Add To Incident button	Adds the related indicator to the incident. The related indicator adds to the Indicators panel.
Part Of This Incident button	Shows that the indicator is already part of the incident.

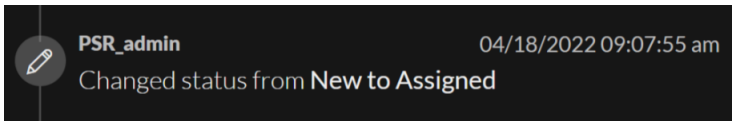
History Panel

The History panel displays every action performed by the user on an incident. The various actions performed on an incident are as shown below



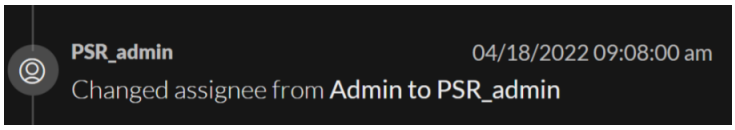
- Incident Assignee Change
- Incident Status Change
- Incident Priority Change
- Incident Creation

Every time a user performs an action on an incident, the date and time also gets recorded and is displayed in the panel. Consider the following example

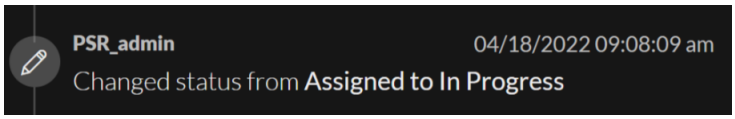


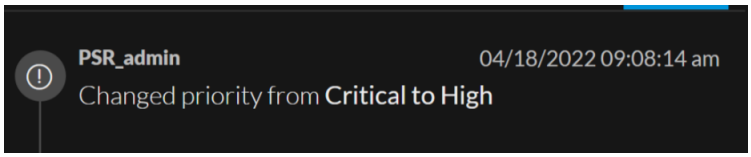
The different actions performed by the user are described below

- In this example, the Incident INC-4393960 was created by the user (System) on 18/04/2022 at 09:05:12 am.



- After the incident creation, PSR_admin assigned the incident to Admin on 18/04/2022 at 09:07:55 am. Hence, the status of the incident is changed from New to Assigned.

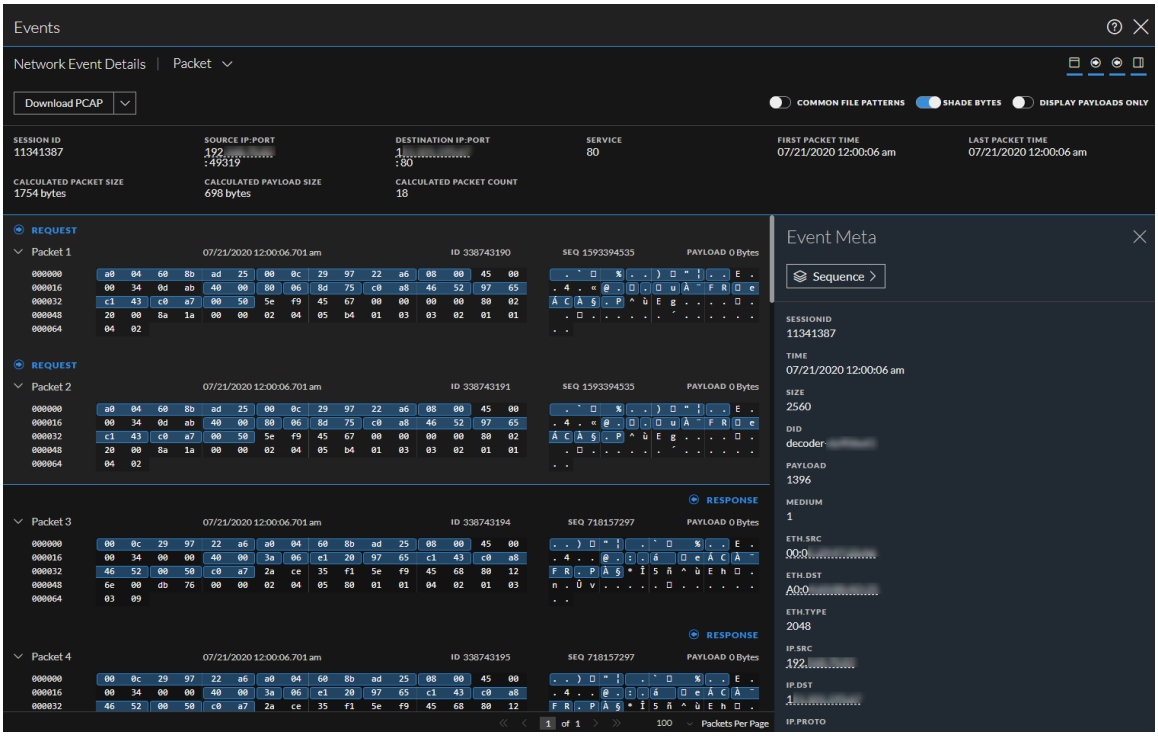




- Later, PSR_admin changed the Incident assignee from Admin to PSR_admin on 18/04/2022 at 09:08:00 am.

- After changing the assignee, PSR_admin changed the Incident status from Assigned to In Progress on 18/04/2022 at 09:08:09 am.

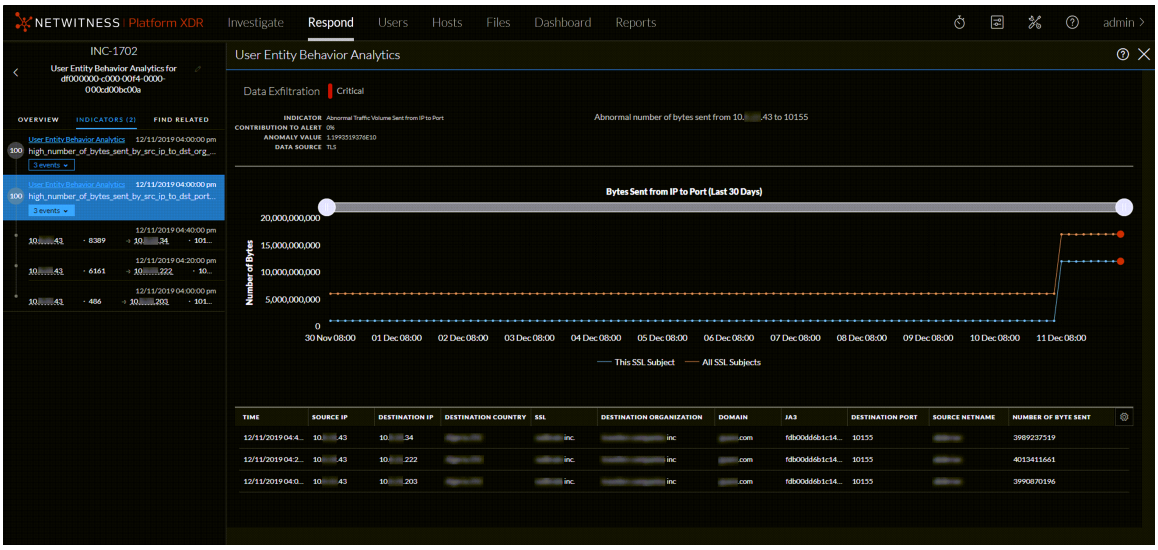
- Later, the Incident priority was changed from Critical to High on 18/04/2022 at 09:08:14 am by PSR_admin.



Events

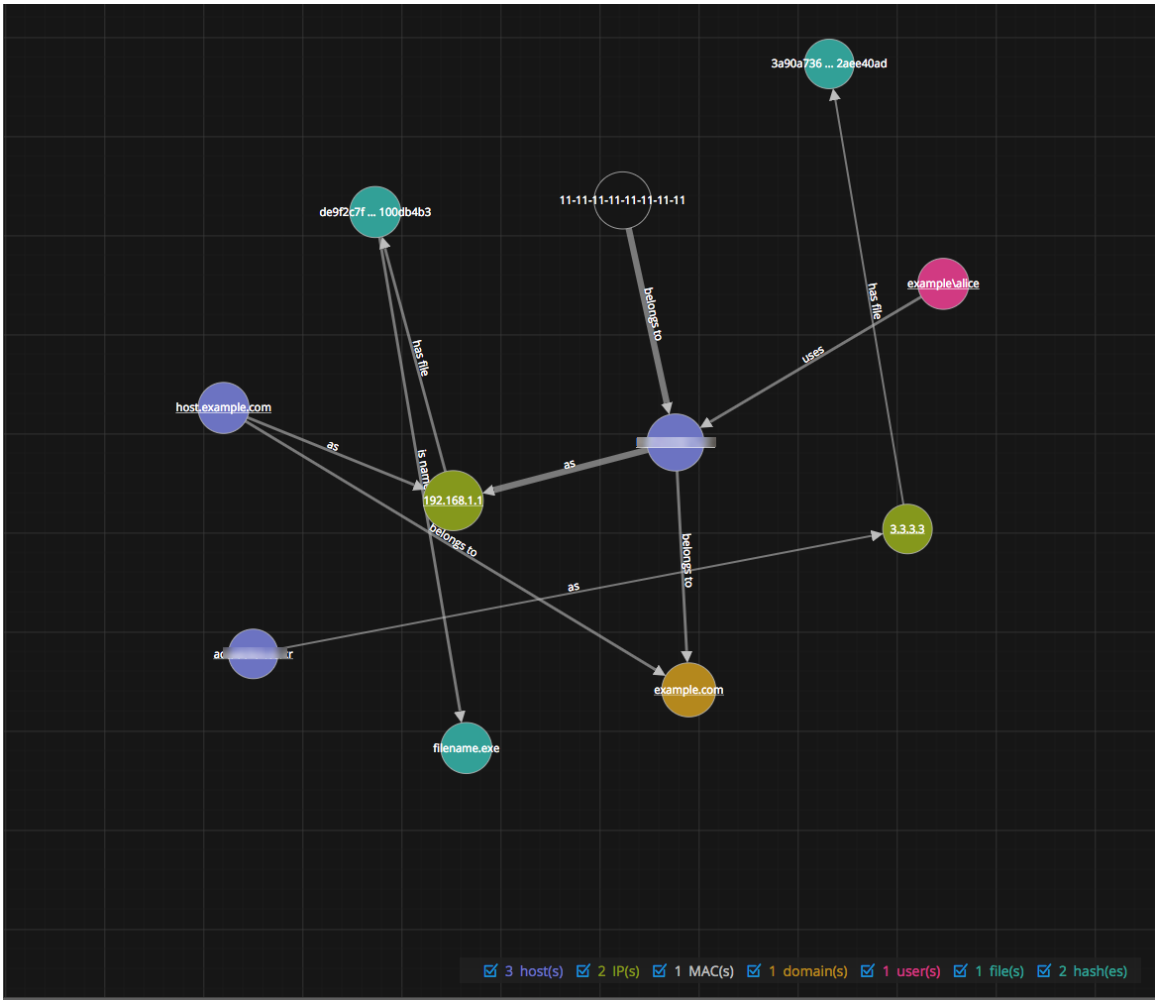
You can perform an event analysis from the Indicators panel. Event counts preceded by an **EA** (event analysis) icon have event reconnaissance information available: 

. You can select an event type hyperlink, such as Network, to access the Events panel for the selected event.

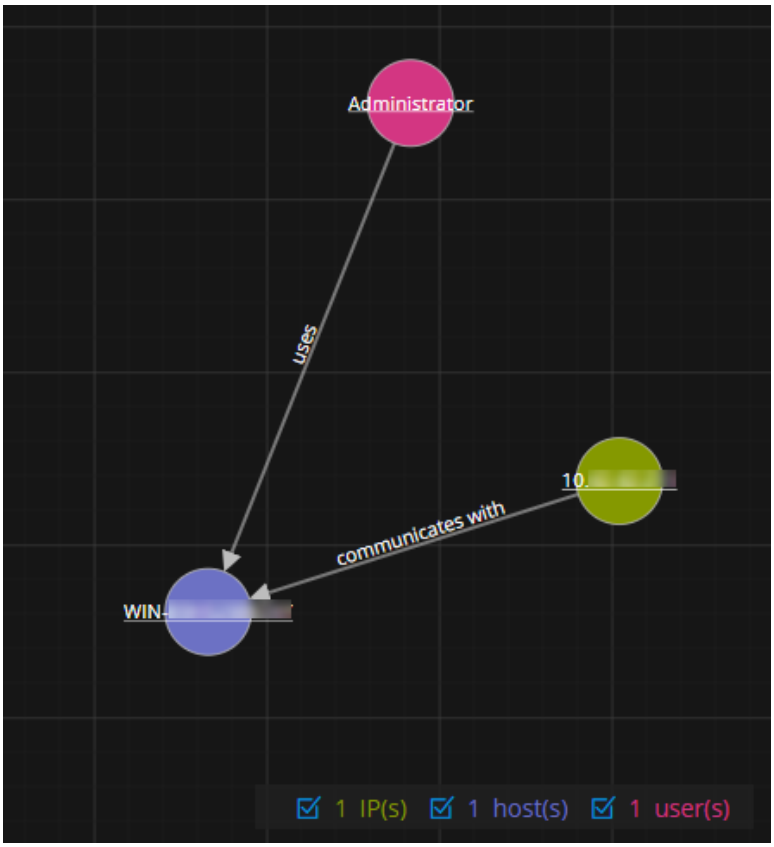


In the Events panel, you can view raw events and metadata with interactive features that enhance your ability to find meaningful patterns in the data. You can examine network, log, and endpoint events. The Events panel in the Respond view shows the Events view from Investigate for specific indicator events. For detailed information about the Events view, see the *NetWitness Investigate User Guide*.

Note: Migrated incidents from NetWitness versions before 11.2 will not show the Events panel in the Respond Incident Details view Indicators panel. Likewise, if you use alerts that were migrated from versions before 11.2 to create incidents in 11.5, you will also not be able to view the Events panel in the Respond view for those incidents.



User Entity Behavior Analytics

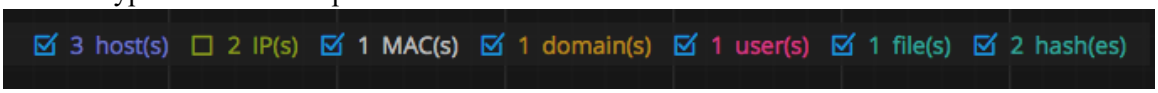


NetWitness UEBA (User and Entity Behavior Analytics) is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all users and entities in your network environment. You can access UEBA from the Respond Incident Details view Indicators panel. Indicators with a **User Entity Behavior Analytics** hyperlink have additional UEBA information available. For detailed information about UEBA, see the *NetWitness UEBA User Guide*.

Nodal Graph

The nodal graph is an interactive graph that shows the entities involved in the incident. An *Entity* is represented by an IP address, MAC address, user, host, domain, file name, or file hash.

Nodes



In the nodal graph, circles represent nodes. The following table describes the nodal graph node types.

Node	Description
IP address	If the event is a detected anomaly, you can see a Detector IP. If the event is a transaction, you can see a Destination IP and a Source IP.
MAC address	You may see a MAC address for each type of IP address.
User	If the machine is associated with a user, you can see a user node.
Host	A host can be physical equipment or a virtual machine, designated by a Fully Qualified Domain Name (FQDN) or IP address, on which any service is installed.
Domain	If a host is associated with a domain, you can see a domain node.
Filename	If the event involves files, you can see a filename.
File Hash	If the event involves files, you may see a file hash.

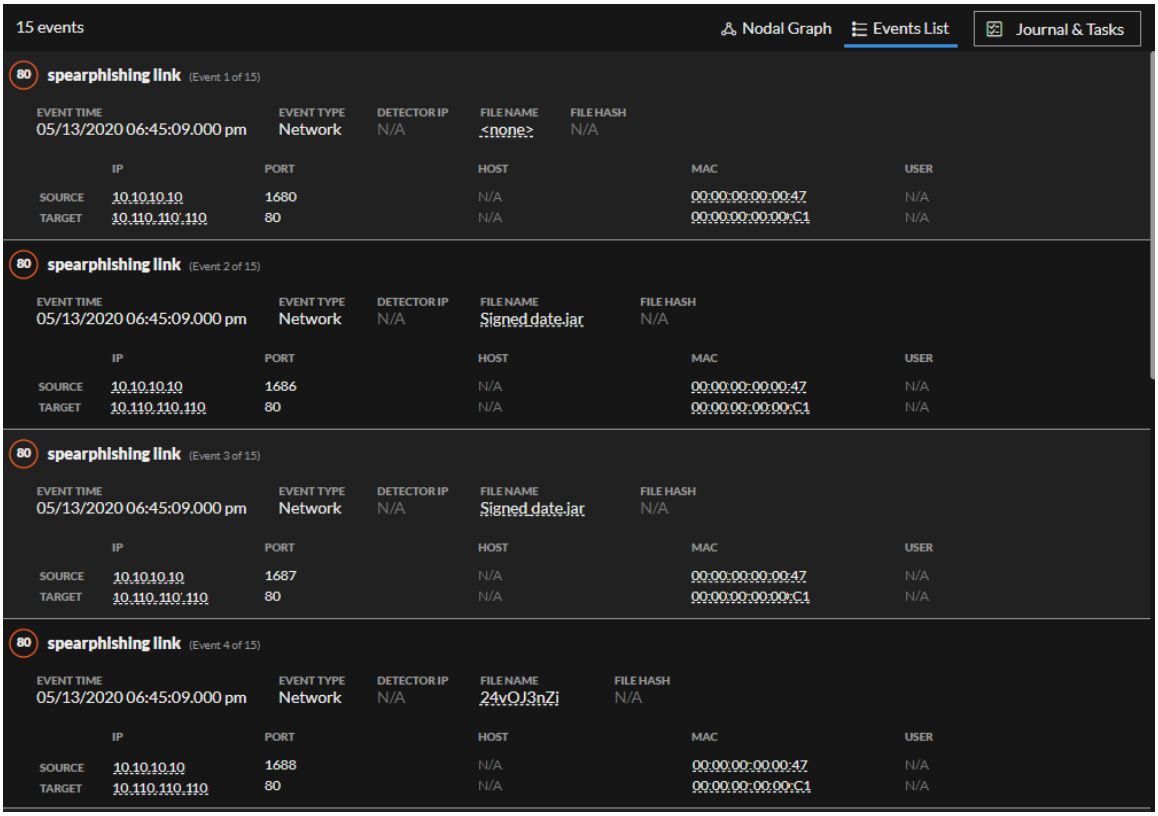
The legend at the bottom of the nodal graph shows the number of nodes of each type and the color coding of the nodes. It also helps you to locate the entities when the values, such as the IP addresses, are hashed.

You can click any node and drag it to reposition it.

In NetWitness Version 11.2 and later, you can select the node types that you want to view by clearing or selecting the checkboxes in the legend. The following figure shows an example nodal graph legend with all node types selected except IP.

Arrows

The arrows between the nodes provide additional information about the entity relationships. The following table describes the nodal graph arrow types.



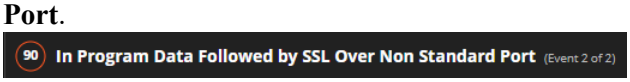
Arrow	Description
Communicates with	An arrow between a Source machine node (IP address or MAC address) and a Destination machine node labeled with "communicates with" shows the direction of the communication.
Has file	An Arrow between a machine node (IP address, MAC address, or Host) and a file hash node labeled with "has file " indicates that the IP address has that file.
Uses	An arrow between a User node and a machine node (IP address, MAC address, or Host) labeled with "uses" shows the machine that the user was using during the event.
Calls	(This arrow is available in NetWitness Platform 11.4 and later.) An arrow between two file hash (checksum) nodes labeled with "calls" indicates the direction of the interaction between the associated files. The source file hash "calls" the target (destination) file hash, which indicates that the source file associated with the source file hash is performing an action on the target file associated with the target file hash.
As	(This relationship type represents attributes of the connected node.) An arrow between nodes labeled with "as" provides additional information about the IP address that the arrow points to. For example, if there is an arrow from the host node circle that points to an IP address node that is labeled with "as", it indicates that the name on the host node circle is the hostname of that IP address and is not a different entity.
Is named	(This relationship type represents attributes of the connected node.) An arrow from a File Hash node to a File Name node labeled with "is named" indicates that the file hash corresponds to a file with that name.
Belongs to	(This relationship type represents attributes of the connected node.) An arrow between two nodes labeled with "belongs to" indicates that they pertain to the same node. For example, an arrow between a MAC address and a Host labeled with "belongs to" indicates that it is the MAC address of the host.

Larger line size arrows indicate more communication between the nodes. Larger nodes (circles) indicate more activity than smaller nodes. The larger nodes are the most common entities mentioned in the events.

Events List

The Events List shows the events associated with the incident. It shows information about the events, such as event time, source IP, destination IP, detector IP, source user, target user, and file information about the events. The amount of information listed depends on the event type. The maximum number of events displayed in the Events List is 1,000.

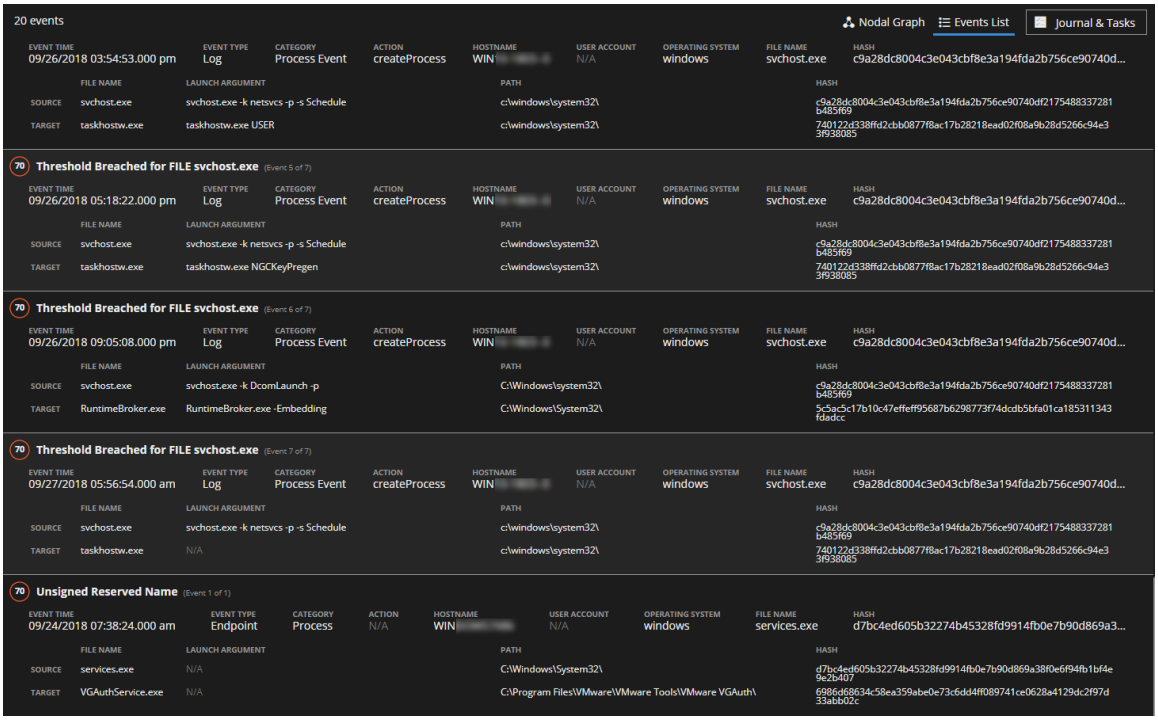
The following figure shows an Events List for network events.



Note: The EVENT TIME displayed on this screen is the same as the COLLECTION TIME from the investigation page.

Each event has a header row with the following information:

- **Risk score**: This is the risk score of the indicator (alert) that contains the event.
- **Title**: This is the name of the event.
- **(Event x of x)**: This indicates the number of the event out of the total number of events in the indicator.



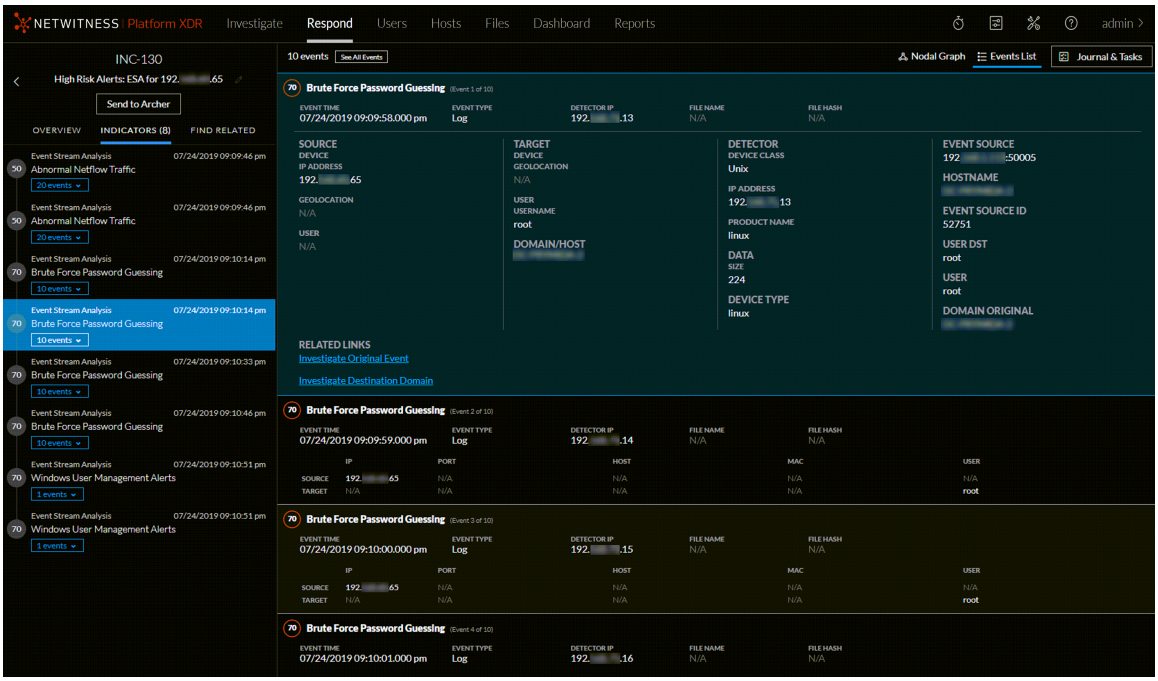
For example, the following event header shows that this event is event 2 of 2 for an indicator (alert) that has a risk score of 90. The event name is **In Program Data Followed by SSL Over Non Standard Port**.

The following table describes the fields in the Events List for network or log events.

Field	Description
EVENT TIME	Shows the time the event occurred.
EVENT TYPE	Shows the type of alert, such as Log and Network.
DETECTOR IP	Shows the IP address of the machine where an anomaly was detected
FILE NAME	Shows the file name if a file is involved with the event.
FILE HASH	Shows a hash of the file contents.
SOURCE IP	Shows the source IP address if there was a transaction between two machines.
SOURCE PORT	Shows the source port of the transaction. The source and destination ports can be on the same IP address.
SOURCE HOST	Shows the destination host where the event took place.
SOURCE MAC	Shows the MAC address of the source machine.
SOURCE USER	Shows the user of the source machine.
TARGET IP	Shows the destination IP address if there was a transaction between two machines
TARGET PORT	Shows the destination port of the transaction. The source and destination ports can be on the same IP address.
TARGET HOST	Shows the HOST name of the destination machine.
TARGET MAC	Shows the MAC address of the destination machine.
TARGET USER	Shows the user of the destination machine.

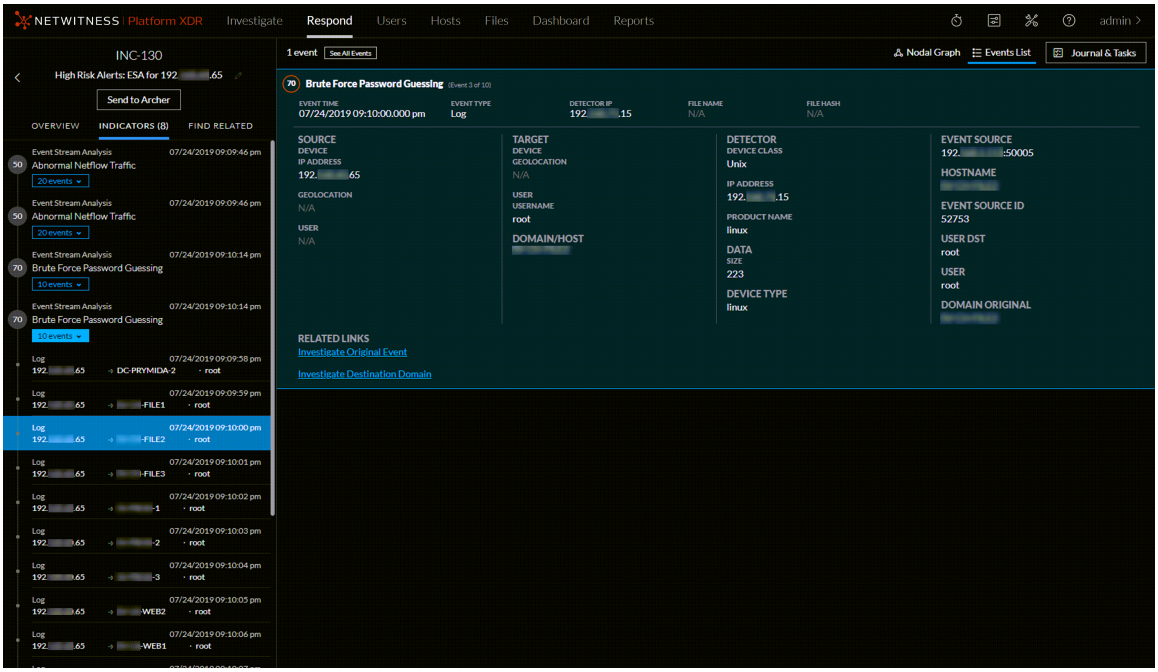
The following figure shows an Events List for NetWitness Endpoint events.

The following table describes the fields in the Events List for NetWitness Endpoint events. NetWitness Endpoint events have an `Endpoint` Event Type and an `nwendpoint` Device Type. NetWitness Endpoint events from version 4.4.x and earlier can have an Event Type that shows the origin of the event.



Field	Description
EVENT TIME	Shows the time the event occurred.
EVENT TYPE	Shows the type of alert, such as Endpoint or Log. NetWitness Endpoint events have an `Endpoint` event type. NetWitness Endpoint events from version 4.4.x and earlier can have an Event Type that shows the origin of the event.
CATEGORY	Shows the NetWitness Endpoint category.
ACTION	Shows the action that the file performed.
HOSTNAME	Shows the name of the machine that is running the agent.
USER ACCOUNT	Shows the username of the actively logged in user.
OPERATING SYSTEM	Shows the operating system of the agent.
FILE HASH	Shows the checksum of the file.

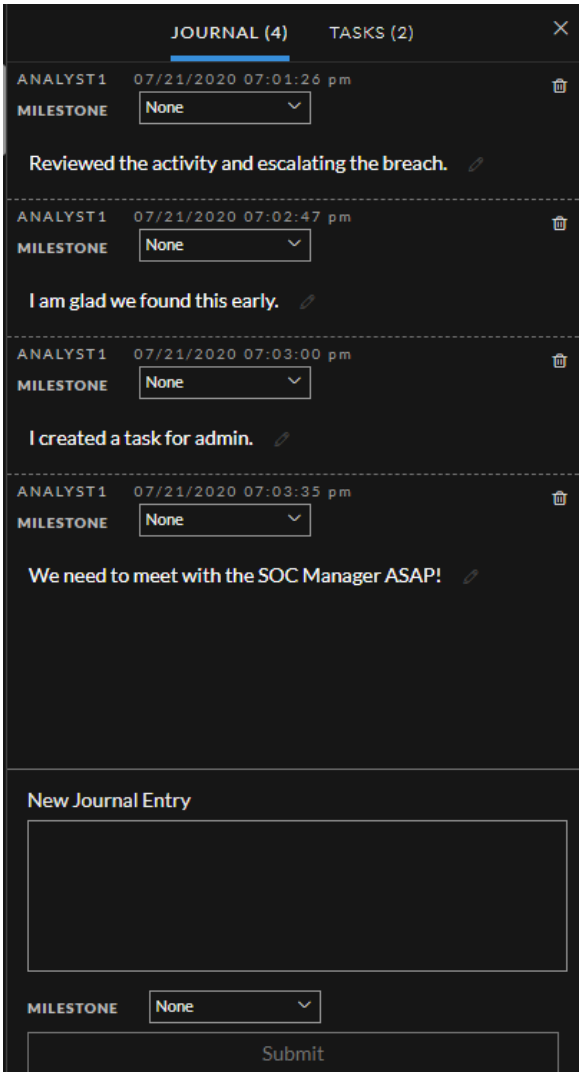
Field	Description
SOURCE FILENAME	Shows the name of the source file.
SOURCE LAUNCH ARGUMENT	Shows the command line argument for the running process.
SOURCE PATH	Shows the path of the source file.
SOURCE HASH	Shows the checksum of the source file.
SOURCE IP ADDRESS	Shows the IP address of the agent.
SOURCE PORT	Shows the source port of the connection.
TARGET FILENAME	Shows the name of the target file.
TARGET LAUNCH ARGUMENT	Shows the command line argument for the running process.
TARGET PATH	Shows the path of the target file.
TARGET HASH	Shows the checksum of the target file.
TARGET IP ADDRESS	Shows the destination IP address of this NetWitness activity.
TARGET PORT	Shows the destination port of the connection.
EVENT SOURCE	Shows the hostname or IP address along with the port of the of the Core service that holds the event information.
DEVICE TYPE	Shows the type of the device from which the data is sent or collected. For example, it shows `nwendpoint` for NetWitness Endpoint.



Event Details

To view the event details, you can click the top of an event in the Events List. The details appear below the event. Viewing inline event details enables you to keep the context of the event as it relates to the other events.

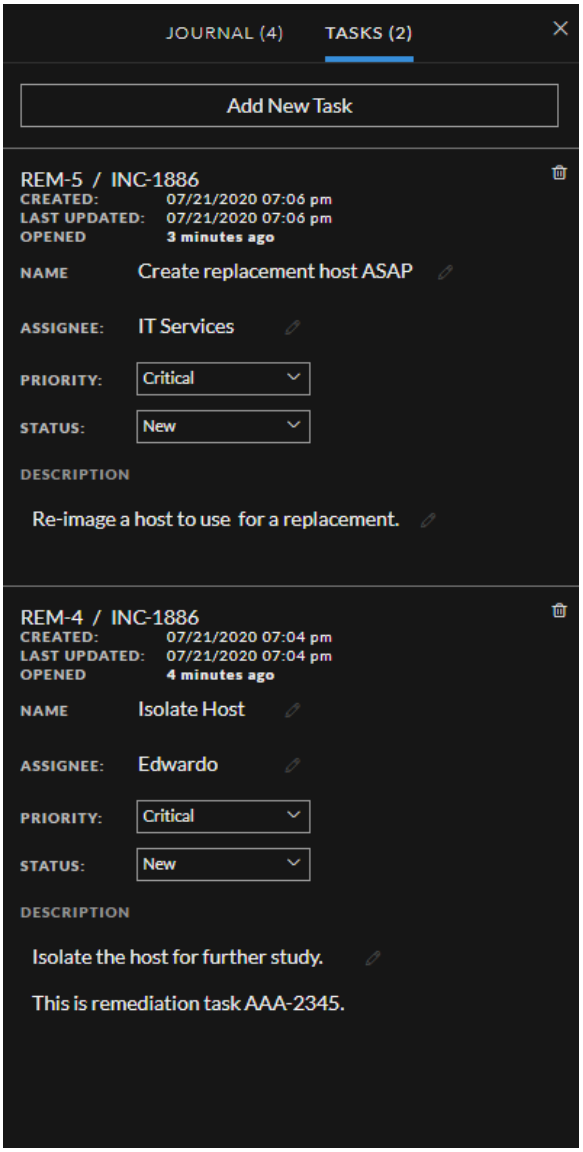
The following figure shows an indicator (alert) selected in the Indicators panel. The events for that indicator appear in the Events List on the right.



The following figure shows a specific indicator event selected in the Indicators panel. Information about the selected event appears in the Events List on the right.

Journal Panel

The incident Journal shows the history of activity on your incident.



The following table describes the New Journal Entry options.

Field	Description
New Journal Entry	Type your note in the field.
Milestone	(Optional) Select a milestone, if applicable. This field is used to track significant events for the incident.
Submit button	Click submit to add an entry to the journal. You journal entry will be visible to anyone who views the incident.

Tasks Panel

In the Tasks panel, you can manage and track the incident tasks to closure.

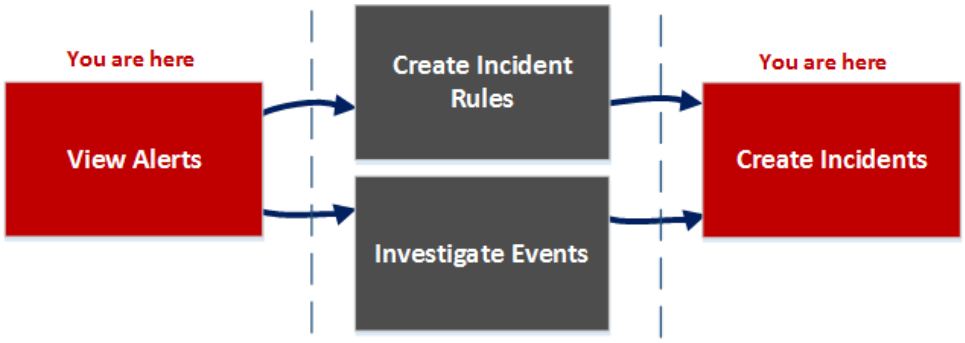
The following table describes the Task fields.

Field	Description
<Task ID / <Incident ID>	The autogenerated Task ID / The incident associated with the task.
Created	The created date of the task.
Last Updated	The date that the task was last modified.

Field	Description
Opened	The time that passed since the task was opened. For example, 3 minutes ago or 2 days ago.
Name	The name of the task. For example: Re-image the machine. You can click this field to edit it.
Assignee	The username of the user assigned to the task. You can click this field to edit it.
Priority	The priority of the task: Low, Medium, High, or Critical. You can click the priority button and select a new priority for the task from the drop-down list.
Status	The status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. You can click the status button and select a new status for the task from the drop-down list.
Description	Type information that describes the task. You may want to include any applicable reference numbers. You can click this field to edit it.

Toolbar Actions

Option	Description
	(Back to Incidents) Enables you to navigate back to the Incidents List view.
	Closes the panel.
	Deletes the entry, such as a journal entry or task.
Priority button	(In the Overview panel) Allows you to change the Priority of one or more selected incidents in the Incidents List.
Status button	(In the Overview panel) Allows you to change the Status of one or more selected incidents.
Assignee button	(In the Overview panel) Allows you to change the Assignee of one or more selected incidents.
	Enables you to view the Nodal Graph.
	Enables you to view the incident Events List. Clicking the top of an event enables you to view the event details below it.
	Enables you to view incident notes and tasks.



Option	Description
 (Journal, Tasks, and Related)	(This option is available in NetWitness Version 11.3.1 and earlier 11.x versions.) Enables you to view the Journal, Tasks, and Related Indicators panels.
	Enables you to show or hide the event header, request, response, and metadata in the Events panel in the Respond Incident Details view. For more information about event analysis, see "Events View" in the *NetWitness Investigate User Guide*.

Alerts List View

The Alerts List view (Respond > Alerts) enables you to view all of the threat alerts and indicators received by NetWitness in one location. This can include alerts received from ESA Correlation Rules, Malware Analysis, Reporting Engine, NetWitness Endpoint, as well as many others. In the Alerts List view you can browse through various alerts, filter them, and group them to create incidents.

Workflow

This workflow shows the high-level process that Analysts use to review alerts and create incidents.

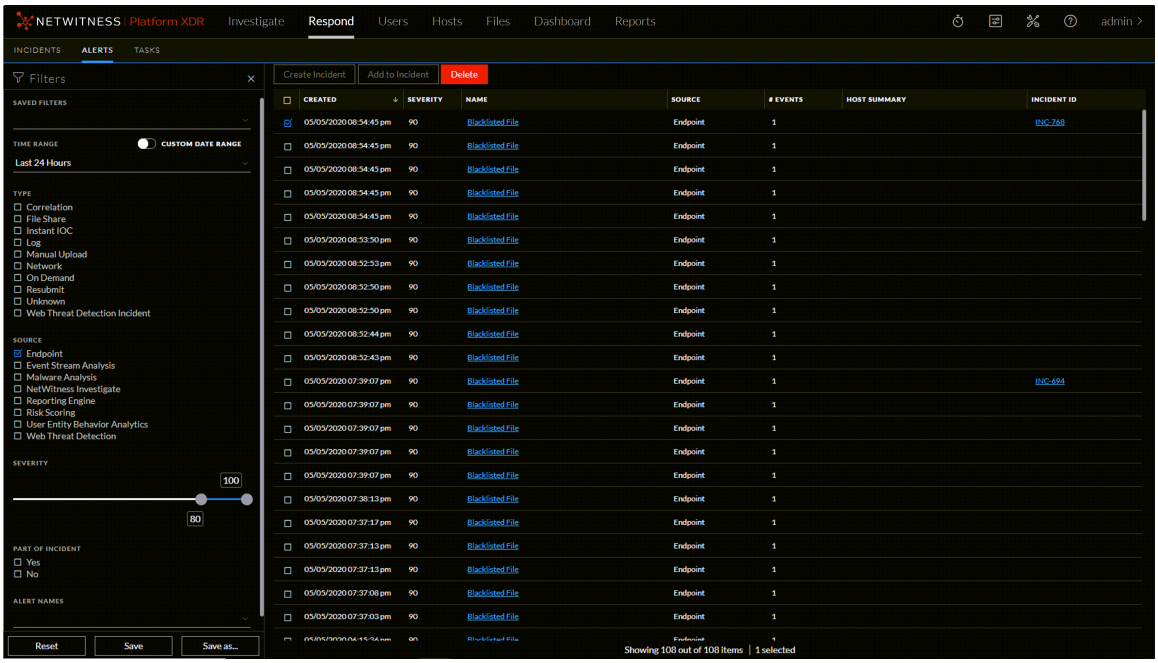
In the Alerts List view, you can review a list of alerts from all sources received by NetWitness. After that, you can investigate those alerts further and create incidents from the alerts or you can create incident rules to create incidents.

Note: You can use NetWitness Automated Threat Detection to create incidents without manually creating rules.

What do you want to do?

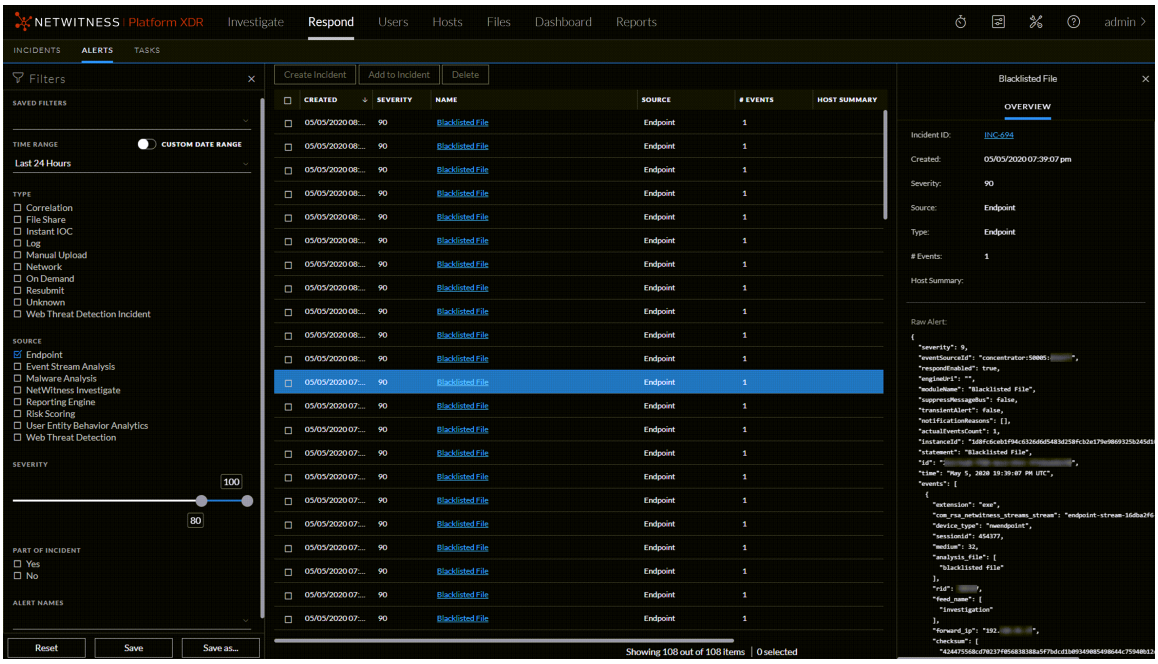
Role	I want to ...	Show me how
Incident Responders, Analysts	View all alerts in NetWitness.*	View Alerts
Incident Responders, Analysts	Filter alerts.*	Filter the Alerts List
Incident Responders, Analysts	View alert overview information and raw alert metadata.*	View Alert Summary Information
Incident Responders, Analysts	Create incidents from alerts.*	Create an Incident Manually

Role	I want to ...	Show me how
Incident Responders, Analysts	(Available in NetWitness Version 11.1 and later) Add alerts to an existing incident.*	Add Alerts to an Incident
Administrators, Data Privacy Officers	Delete alerts.*	Delete Alerts
SOC Managers, Administrators	Create incident rules.	See "Create an Incident Rule for Alerts" in the *NetWitness Respond Configuration Guide*.
Incident Responders, Analysts	Investigate the events in an alert.	View Event Details for an Alert and Investigate Events
Incident Responders, Analysts	Add related alerts to an existing incident.	Add Related Indicators to the Incident



*You can complete these tasks here (that is, in the Alerts List view).

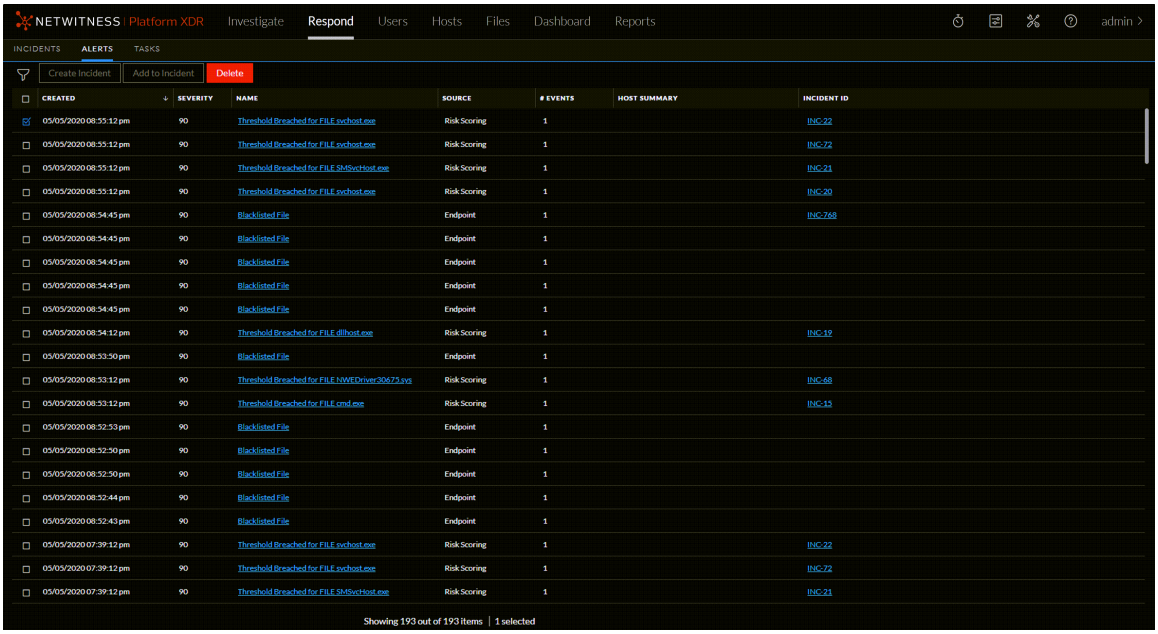
Related Topics



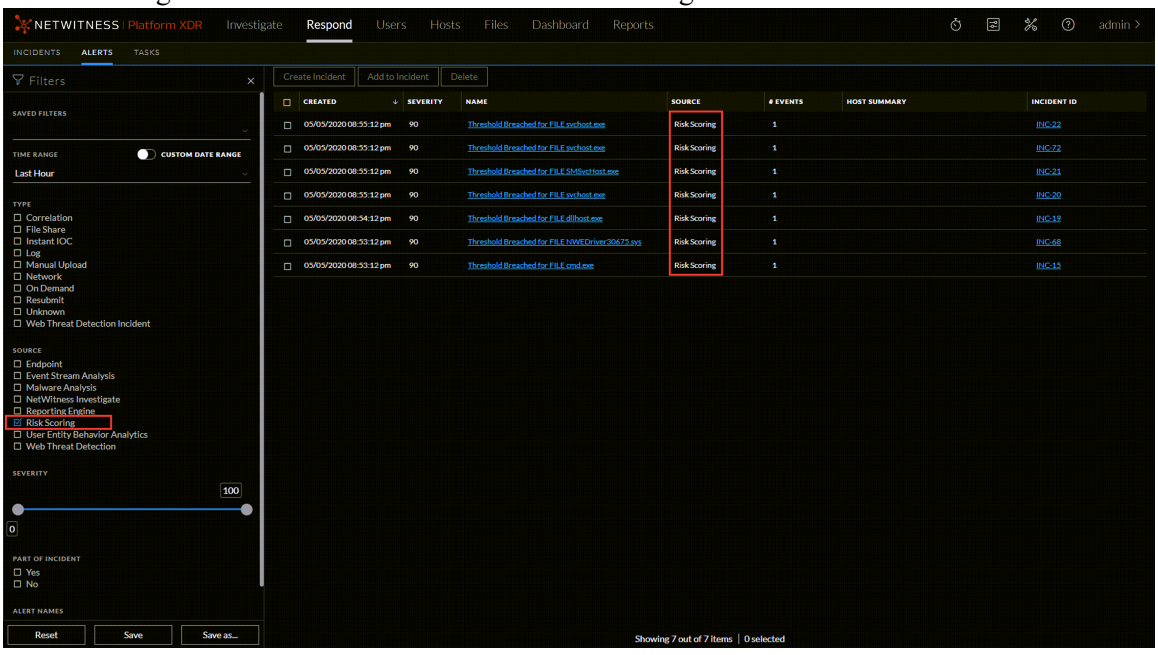
- Alert Details View
- Reviewing Alerts

Quick Look

To access the Alerts List view, go to **Respond > Alerts**. The Alerts List view displays a list of all alerts and indicators received by the Respond Server database in NetWitness. The following figure shows the Filters panel on the left.



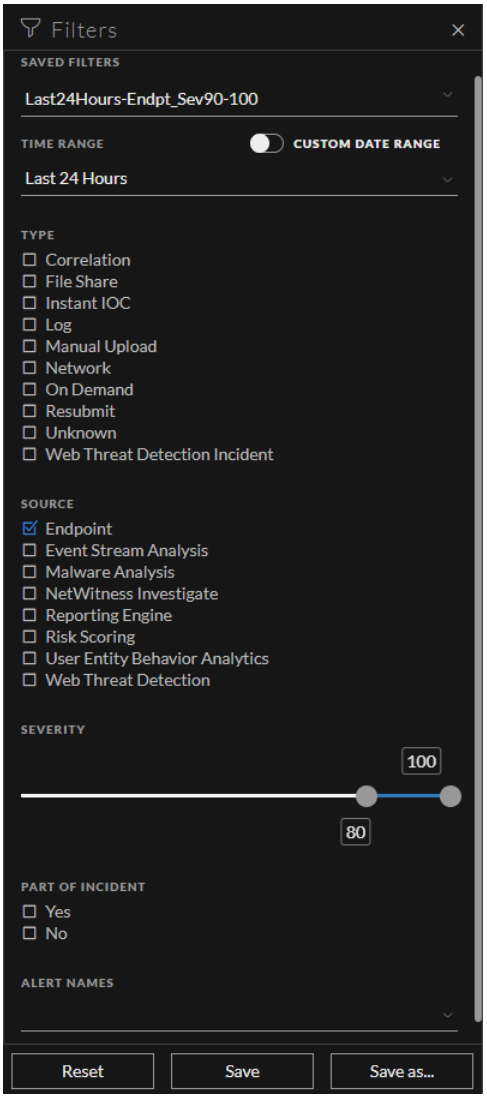
The Alerts List view consists of a Filters panel, an Alerts List, and an Alert Overview panel. You can click an alert in the Alerts list to view the Alert Overview panel on the right.



Alerts List

The Alerts List shows all of the alerts in NetWitness. You can filter this list to only show alerts of interest.

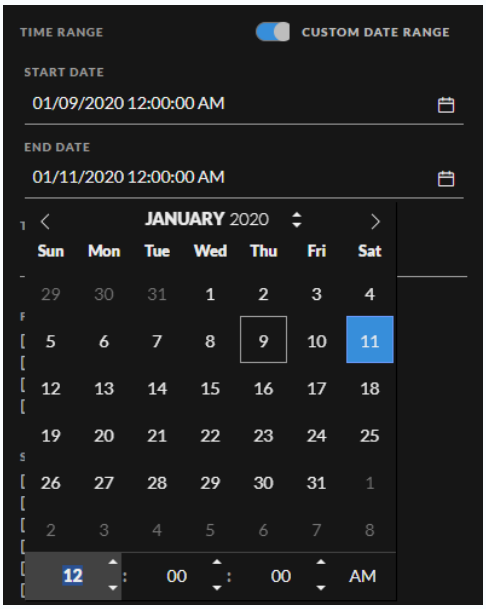
The following Alerts List view is filtered for Risk Scoring Alerts.



The following table describes the columns in the Alerts List.

Column	Description
	Enables you to select one or more alerts to delete. Users with the appropriate permissions, such as Administrators and Data Privacy Officers, can delete alerts.
Created	Displays the date and time when the alert was recorded in the source system.
Severity	Displays the level of severity of the alert. The values are from 1 through 100.
Name	Displays a basic description of the alert.
Source	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, ESA correlation rules, Reporting Engine, Risk Scoring, and many others. **Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint.
# Events	Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky.
Host Summary	Displays details of the host like the host name from where the alert was triggered. The details may include information about the source and destination hosts in an Alert. Some alerts may describe events across more than one host .
Incident ID	Shows the Incident ID of the alert. If there is no incident ID, the alert does not belong to any incident and you can create an incident to include this alert or the alert can be added to an existing incident.

At the bottom of the list, you can see the number of alerts on the current page, the total number of alerts, and the number of alerts selected. For example: **Showing 4 out of 4 items | 1 selected**



Alert Filters Panel

The following figure shows the filters available in the Filters panel.

The Filters panel, on the left of the Alerts List view, has options that you can use to filter the alerts list. When you navigate away from the Filters panel, the Alerts List view retains your filter selections.

Option	Description
Saved Filters	You can select a saved filter to filter the alerts list. Saved filters are global. You can save a filter for other analysts to use and you can use any saved filter. Saved filters are also available for use on the Springboard landing page. Filters used in the Springboard cannot be deleted. (This option is available in NetWitness Platform 11.5 and later.)

Option	Description
Time Range	You can select a specific time period from the Time Range drop-down list. The time range is based on the received date of the alerts. For example, if you select Last Hour, you can see alerts that were received within the last 60 minutes.
Custom Date Range	You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar. 
Type	Indicates the type of events in the alert, for example, logs, network sessions, and so on.
Source	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, Event Stream Analysis (ESA Correlation Rules), Reporting Engine, Web Threat Detection, Risk Scoring, and many others. **Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint.
Severity	Displays the level of severity of the alert. The values are from 1 through 100.
Part of Incident	Categorizes alerts on whether or not they are associated with an incident. Select **Yes** to view alerts that are part of an incident. Select **No** to view alerts that are not part of an incident. For example, before you create incidents from alerts, you may want to select No to view only those alerts that are not already part of an incident.

Option	Description
Alert Names	Shows the names of the alerts being filtered. You can use this filter to search for all alerts generated by a specific rule, for example, Direct Login to an Administrative Account.
Reset	Removes your filter selections. If you reset filters on a saved filter, it takes you to the default empty filter.
Save	Saves the currently applied alerts filter or updates a saved filter. For a new filter, choose a unique name that contains 1-256 alphanumeric characters, underscores, or hyphens. (This option is available in NetWitness Platform 11.5 and later.)
Save As	Saves the currently applied alerts filter for future use. Choose a unique name that contains 1-256 alphanumeric characters, underscores, or hyphens. (This option is available in NetWitness Platform 11.5 and later.)

The Alerts List shows a list of alerts that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the alerts list. For example: **Showing 4 out of 4 items**

Alert Overview Panel

The Overview panel shows basic summary information about a selected alert and raw alert metadata. The Overview panel in the Alert Details view contains the same information, but in the Alerts Details view, you can expand the panel to view more information.

The following table lists the fields displayed in the Alert Overview panel.

Field	Description
<Alert Name>	Displays the name of the alert.
Incident ID	Displays the Incident ID associated with the alert. You can click the incident ID link to go to the Incident Details view of the associated incident. If there is no incident ID, the alert does not belong to an incident. You can create an incident for this alert or you can add it to an incident.
Created	Displays the date and time when the alert was created.
Severity	Displays the level of severity of the alert. The values are from 1 through 100.

Field	Description
Source	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, ESA correlation rules, Reporting Engine, Risk Scoring, and many others. **Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint.
Type	Indicates the type of events in the alert, for example, logs, network sessions, and so on. There can be multiple types listed. **Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint.
Server	Displays details of the UEBA Server from where the alert was triggered. For example, UEBA-2 - UEBA Server. **Note:** This option is displayed only for UEBA servers.
# Events	Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky.
Raw Alert	Shows the raw alert metadata.

Toolbar Actions

This table lists the toolbar actions available in the Alerts List view.

Option	Description
	Enables you to open the Filters panel so that you can specify the alerts that you would like to see in the Alerts List.
	Closes the panel.
Create Incident button	Enables you to create incidents from alerts. The alerts cannot be part of an incident. To get a list of alerts without incidents, you can filter the Alerts List. In thePart of Incident section, select No.

Option	Description
Add to Incident button	(This option is available in NetWitness Version 11.1 and later.) Enables you to add selected alerts to an incident. The alerts cannot be part of an incident. To get a list of alerts without incidents, you can filter the Alerts List. In the Part of Incident section, select No.
Delete button	Allows you to delete alerts.

Alert Details View

In the Alert Details view (Respond > Alerts > click on a row in the Alerts List), you can view the overview of an alert, such as the source of the alert, the number of events within the alert, Incident ID, if it is part of an incident. You can also view the raw alert that contains detailed information about the events.

Workflow

This workflow shows the high-level process that Analysts use to review alerts and create incidents.

After reviewing the alerts list, you can investigate those alerts further and create incidents from the alerts, in the Alert Details view. In the Configure > Incident Rules view, you can create incident rules to create incidents.

Note: You can also use NetWitness Automated Threat Detection to create incidents without manually creating rules.

What do you want to do?

Role	I want to ...	Show me how

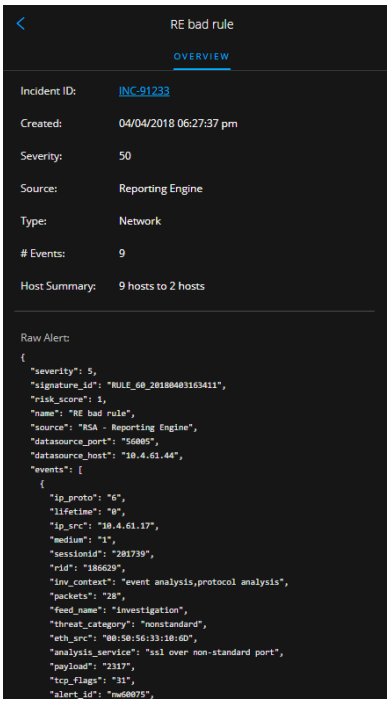
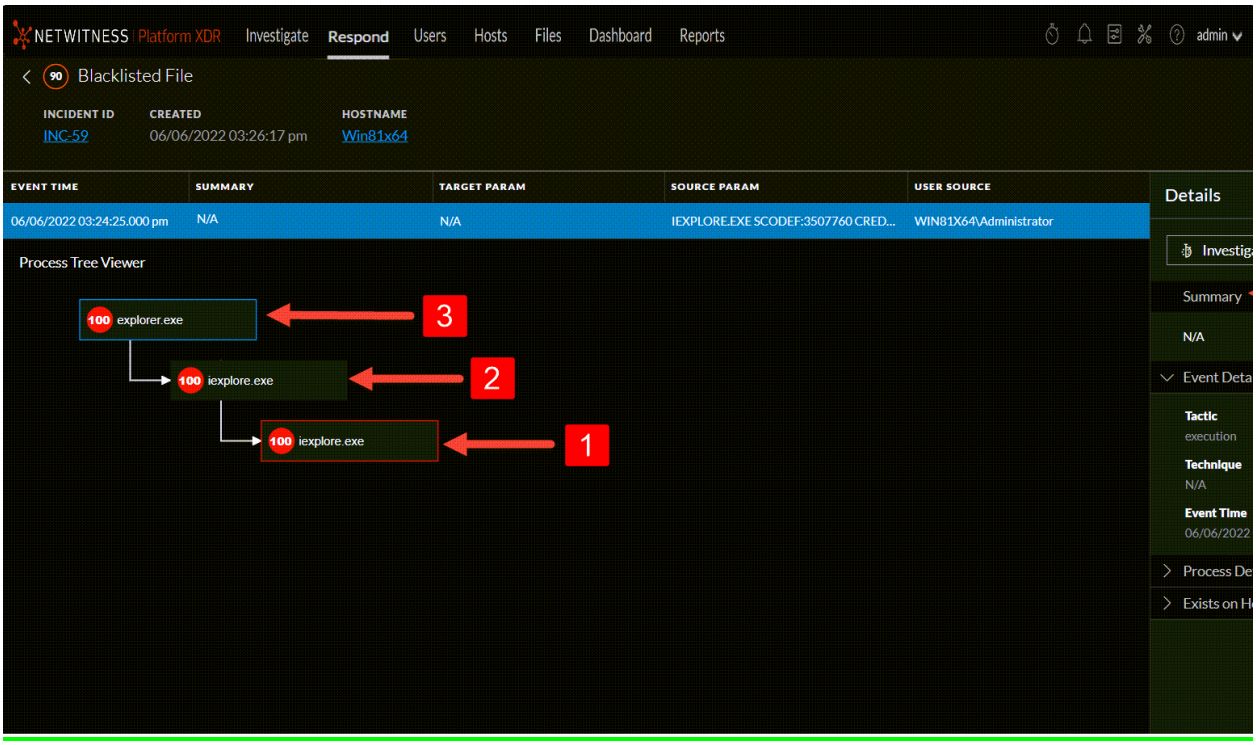
- Alerts List View
- Reviewing Alerts



Quick Look

1. To access the Alert Details view, go to **Respond > Alerts**.
2. In the Alerts list, choose an alert to view and then click the link in the Name column for that alert. The Alert Details view has an Overview panel on the right. You can resize the panels to show more information as shown in the following figure.



Overview Panel

The Overview panel shows basic summary information about a selected alert. The Overview panel on the Alerts List view contains the same information. The Alerts List view Alert Overview Panel topic provides details.

Events - Process Tree View

Click on an event name link to view the event details. The Process Tree Viewer opens and displays the process that caused the alerts and the processes it originated from.

1 -The process that caused the alert is highlighted with a red-colored outline.

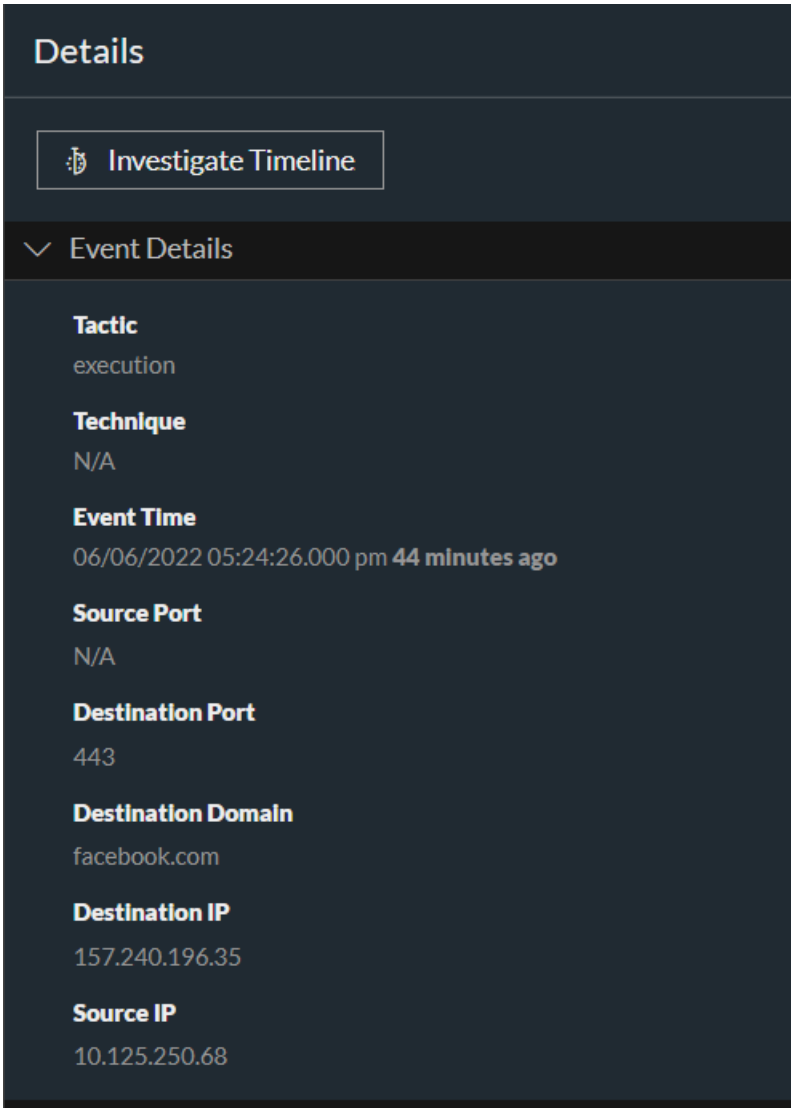
2 & 3 - The processes from which the highlighted process originated.

4 - Summary of the alert.

5 - Event Details section shows the tactics, techniques, and event time stamp.

6 - Process Details section provides detailed insights about the selected process.

7 - Shows the details of Network Connections established by the process; You can view the network connections that took place up to ten minutes before and after the alert triggered time. Network connections details are available only for the process that caused the alert.



8 - Shows the name and a link to the host where the process exists.

Events List

The Events List for a selected alert shows all of the events contained in that alert.

Event Details

The Event Details in the Events panel shows the event metadata for each event in the alert.

Event Details

The following table lists some event details section and subsections shown in the Event Details. This is not an extensive list.

Section	Subsection	Description
Summary		Shows a summary of the event.

Section	Subsection	Description
Event		Shows the destination device and user.
	Device	Shows information about the destination device. See Event Source or Destination Device Attributes below.
	User	Shows information about the user or users of the destinationSee Event Source or Destination User Attributes below.
Detector		Shows the host or software product that detected the issue. This is most relevant for malware scanners and logs.
	Device Class	Shows the device class of the product that detected the alert.
	IP Address	Shows the IP address of the product that detected the alert.
	Product Name	Shows the name of the product that detected the alert.
Domain		Shows the domain associated with the event.
Enrichment		Shows available enrichment information.
Related Links		If available, it shows a link back to the user interface (UI) of the source product.
	Type	Shows the type of event, such as investigate_original_event.
	URL	Shows the URL link back to the UI of the source product.
Size		Shows the size of the transmission or file involved.
Source		Shows the source device and user.
	Device	Shows information about the source machine. See Event Source or Destination Device Attributes below.
	User	Shows information about the user or users of the source machine. See Event Source or Destination User Attributes below.
Timestamp		Shows the time that the event occurred.
Type		Shows the type of the alert, such as log, network, correlation, Resubmit, Manual Upload, On Demand, File Share, or Instant IOC.

Event Source or Destination Device Attributes

The following table lists attributes for an event source or destination device that can be shown in the Events Details.

Name	Description
Asset Type	Displays the type of device, for example, desktop, laptop, server, network equipment, tablet, and so on.
BusinessUnit	Shows the business unit associated with the device.

Name	Description
Compliance Rating	Shows the compliance rating of the device. It can be Low, Medium, or High.
Criticality	Shows how critical the device is to the business (business criticality).
Facility	Shows the location of the device.
Geolocation	Shows the geographic location for the host. It can contain the following attibutes: city, country, latitude, longitude, organization, and domain.
IP Address	Shows the IP address of the device.
MAC Address	Shows the MAC address of the device.
Netbios Name	Shows the NetBIOS name for the device.
Port	Displays the TCP port, UDP port, or the IP Src port (the first one available) used to connect to and from the host.

Event Source or Destination User Attributes

The following table lists attributes for an an event source or destination user that can be shown in the Events Details.

Attribute Name	Description
AD Domain	Shows the Active Directory domain.
AD Username	Shows the Active Directory username.
Email Address	Shows the email address of the user.
Username	Shows a general name if you do not know the source of the username, such as UNIX or a username in a particular system.

Toolbar Actions

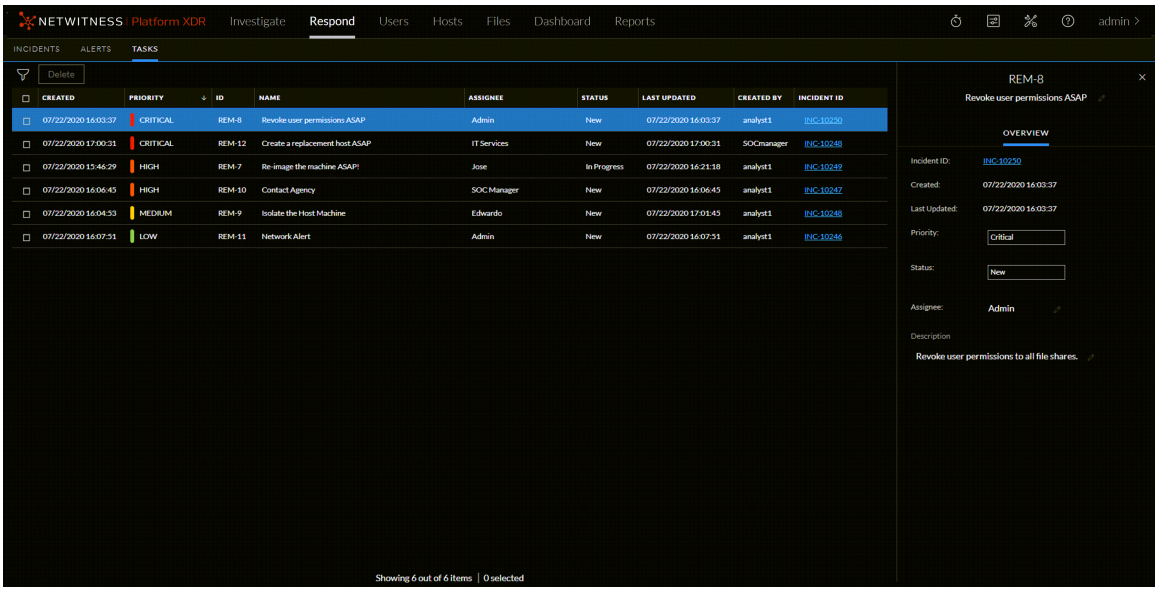
This table lists the toolbar actions available in the Alert Details view.

Option	Description
	(Back to Alerts) Enables you to navigate back to the Alerts List view.
	Click the arrows to navigate through the event meta details for each event in the alert. The numbers, such as "1 of 2" show the number of the event that you are currently viewing. Click **Back to Table** to go back to the Events List view, which is also known as the Events Table.

Tasks List View

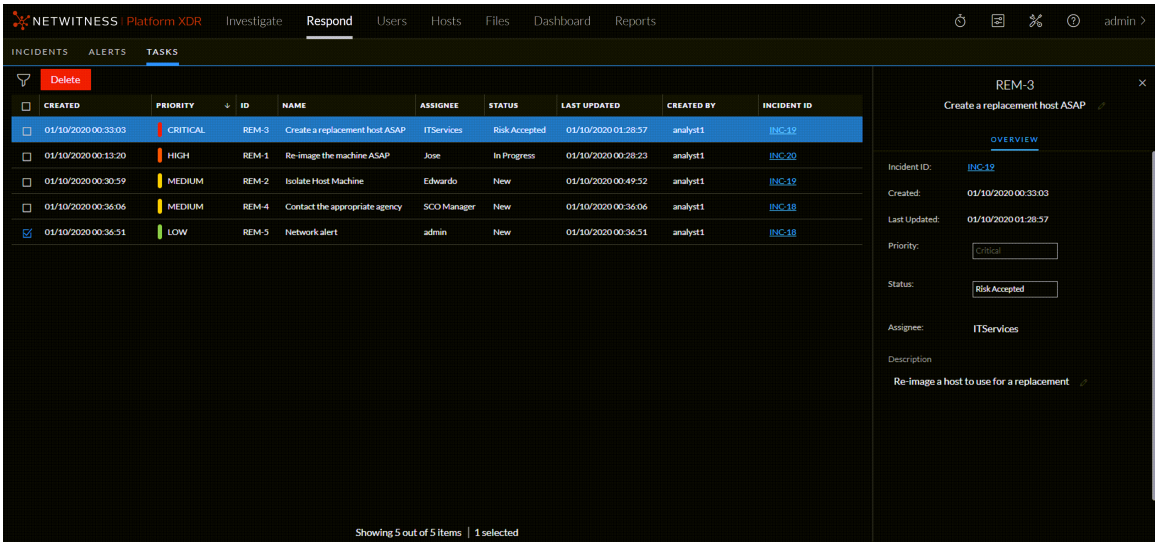
After investigating incidents, in the Tasks List view (Respond > Tasks), you can create and track incident tasks. For example, you can create remediation tasks when you require actions on incidents from teams outside of your security operations. You can reference external ticket numbers within the tasks and then track those tasks to completion. You can also modify and delete tasks as required, depending on your user permissions.

What do you want to do?



Role	I want to ...	Show me how
Incident Responders, Analysts	View tasks	View All Incident Tasks and View the Tasks Associated with an Incident
Incident Responders, Analysts	Filter tasks.	Filter the Tasks List
Incident Responders, Analysts	Create a task.	Create a Task
Incident Responders, Analysts	Find and modify tasks.	Find a Task and Modify a Task
Incident Responders, Analysts	Close a task (Change the Status to Remediated, Risk Accepted, or Not Applicable).	Modify a Task
Incident Responders, Analysts, SOC Managers	Delete a task.	Delete a Task

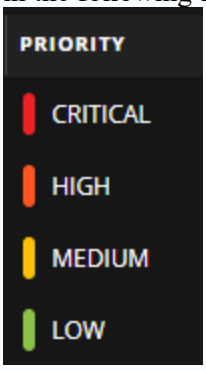
Related Topics



- Incident Details View
- Escalate or Remediate the Incident

Quick Look

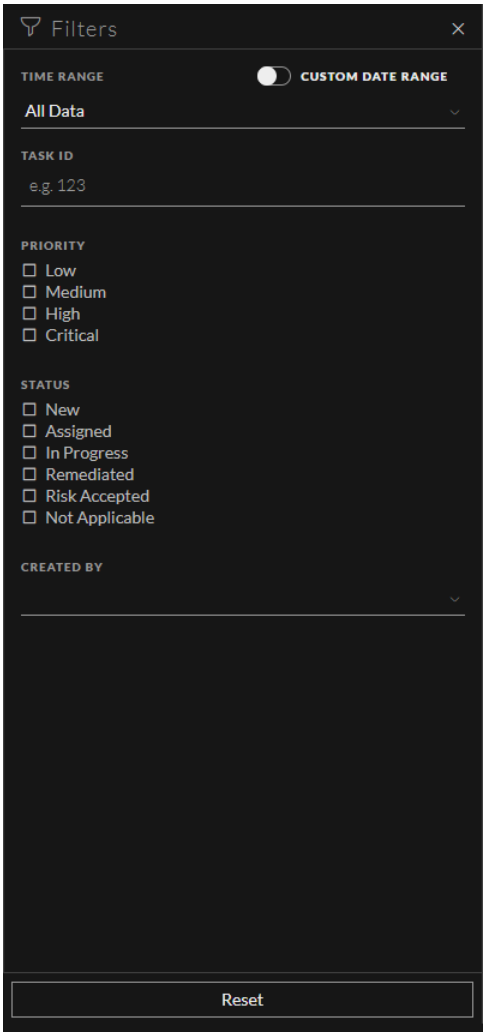
To access the Tasks List view, go to **Respond > Tasks**. The Tasks List view displays a list of all incident tasks.



The Tasks List view consists of a Filters panel, a Tasks List, and a Task Overview panel. The following figure shows the Tasks List and the Overview panel.

Tasks List

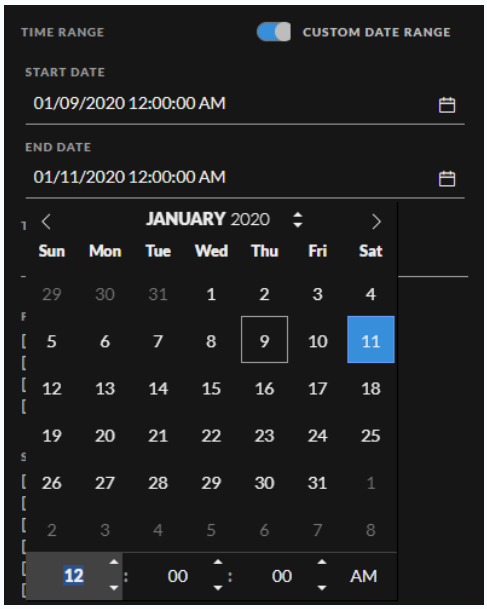
The Tasks List shows all of the incident tasks. You can filter this list to show only tasks of interest.



Column	Description
	Enables you to select one or more tasks to modify or delete. Users with the appropriate permissions can make bulk updates and delete tasks, such as SOC Managers. For example, an SOC Manager may want to assign multiple tasks to a user at the same time.
Created	Displays the date when the task was created.

Column	Description
Priority	Displays the priority assigned to the task. The priority can be any of the following: Critical, High, Medium, or Low. The Priority is also color coded, where red indicates **Critical**, orange represents **High** risk, yellow indicates **Medium** risk, and green represents **Low** risk as shown in the following figure: 
ID	Displays the task ID.
Name	Displays the task name.
Assignee	Displays the name of the user assigned to the task.
Status	Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
Last Updated	Displays the date and time when the task was last updated.
Created By	Displays the user who created the task.
Incident ID	Displays the incident ID for which the task was created. Click the ID to display the details of the incident.

At the bottom of the list, you can see the number of tasks on the current page and the total number of tasks. For example: **Showing 23 out of 23 items**

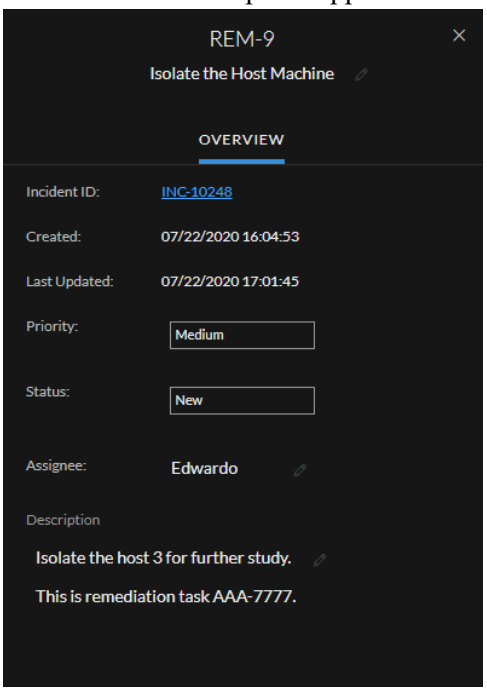


Task Filters Panel

The following figure shows the filters available in the Filters panel.

The Filters panel, on the left of the Tasks List view, has options that you can use to filter the incident tasks.

Option	Description
Time Range	You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the tasks. For example, if you select Last Hour, you can see tasks that were created within the last 60 minutes.



Option	Description
Custom Date Range	You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar. 
Task ID	You can type the Task ID for a task that you would like to locate, for example REM-123.
Priority	You can select the priorities that you would like to view. If you make one or more selections, the Tasks list shows only those tasks with the selected priorities. For example: If you select Critical, the Tasks list shows only the tasks with a priority set to Critical.
Status	You can select the statuses that you would like to view. If you make one or more selections, the Tasks list shows only those tasks with the selected statuses. For example: If you select Assigned, the Tasks panel shows only the tasks that are assigned to users.
Created By	You can select the user who created the tasks that you would like to view. For example, if you only want to view the tasks created by Edwardo, select Edwardo from the CREATED BY drop-down list. If you want to view tasks regardless of the person who created the task, do not make a selection under CREATED BY.
Reset Filters	Removes your filter selections.

The Tasks List shows a list of tasks that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the tasks list. For example: **Showing 18 out of 18 items**

Task Overview Panel

To access the Task Overview panel:

1. Go to **Respond > Tasks**.
2. In the Task list, click the task that you want to view.
   The Task Overview panel appears to the right of the Tasks list.

The following table lists the fields displayed in the Task Overview panel.

Field	Description
<Task ID>	Displays the automatically assigned task ID.
<Task Name>	Displays the task name. This is an editable field. To change the task name, you can click the current task name to open a text editor. For example, you can change a task name from "Reimage a Laptop" to "Reimage a Server".
Incident ID	Displays the Incident ID for which the task was created. Click the ID to display the details of the Incident.
Created	Displays details about the date and time when the task was created.
Last Updated	Displays the date and time when the task was last updated.
Priority	Displays the priority of the task: Low, Medium, High, or Critical. To change the priority, you can click the priority button and select a priority for the task from the drop-down list.

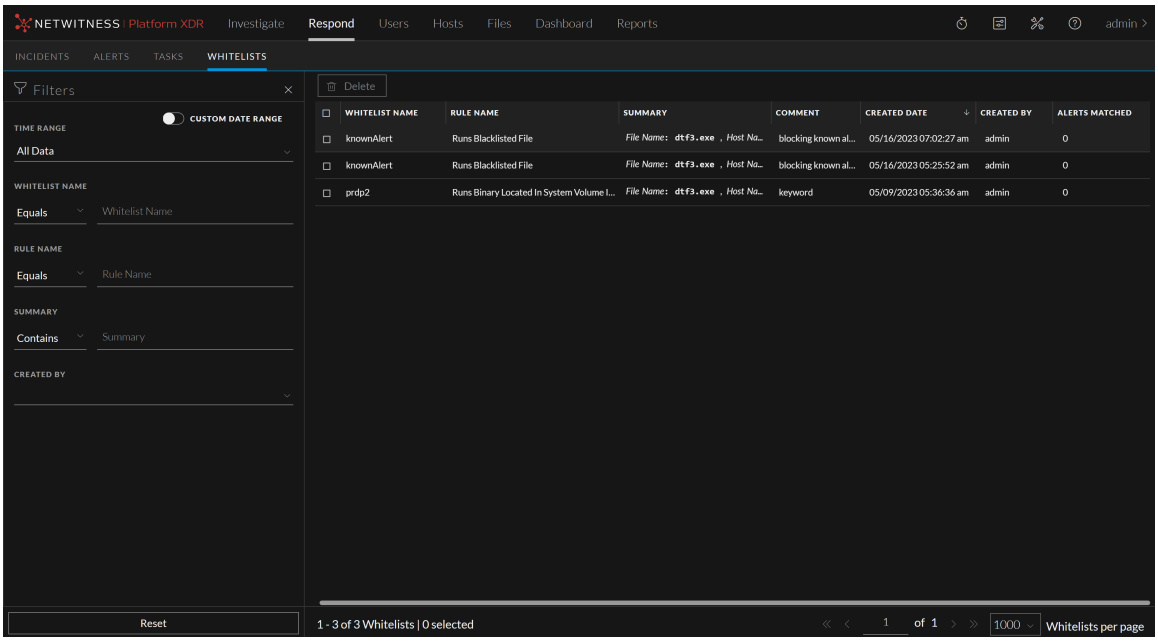
Field	Description
Status	Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. To change the status, you can click the status button and select a status for the task from the drop-down list.
Assignee	Displays the user assigned to the task. To change the user assigned to the task, you can click (Unassigned) or the name of the previous assignee to open a text editor.
Description	Shows task details. To modify the description, you can click the text underneath the description to open a text editor.

Toolbar Actions

This table lists the toolbar actions available in the Tasks List view.

Option	Description
	Enables you to open the Filters panel so that you can specify the tasks that you would like to see in the Tasks List.
	Closes the panel.
Delete button	Allows you to delete the selected tasks.

Whitelists List View



The Whitelists List view (**Respond** > **Whitelists**) enables you to view all the Endpoint Whitelists with the Rule Name, Creation Date, and the Summary associated with the respective Whitelisted Endpoint Alerts.

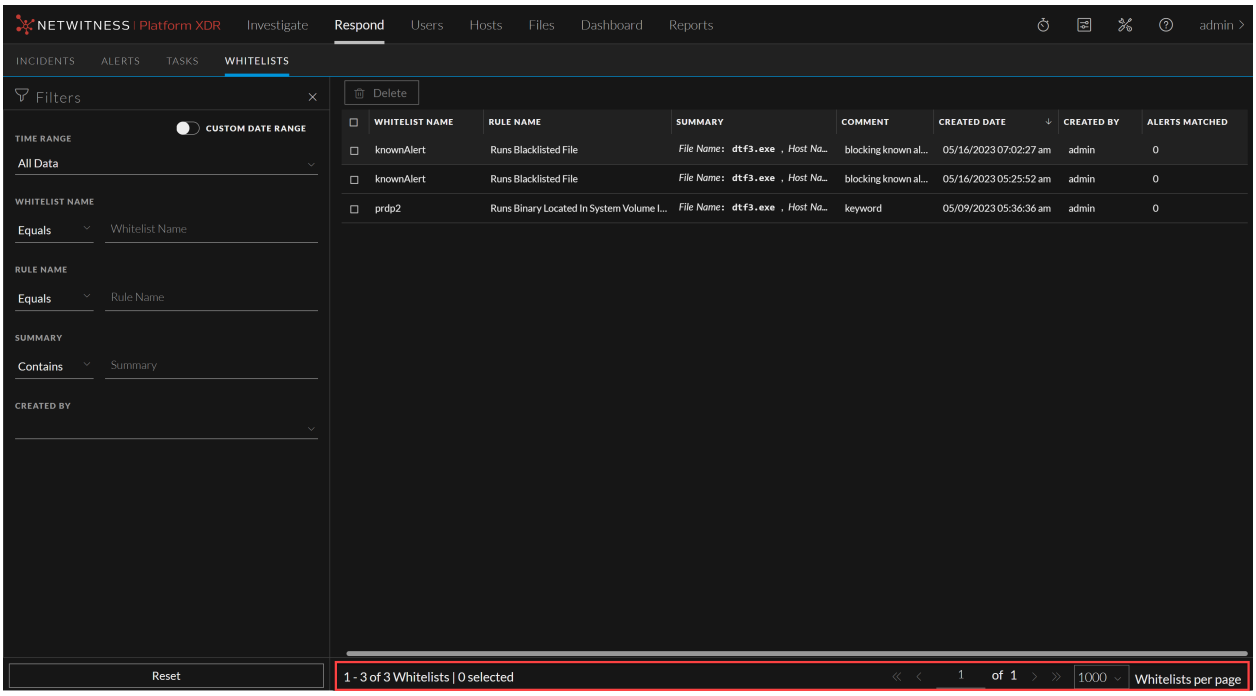
Whitelists List

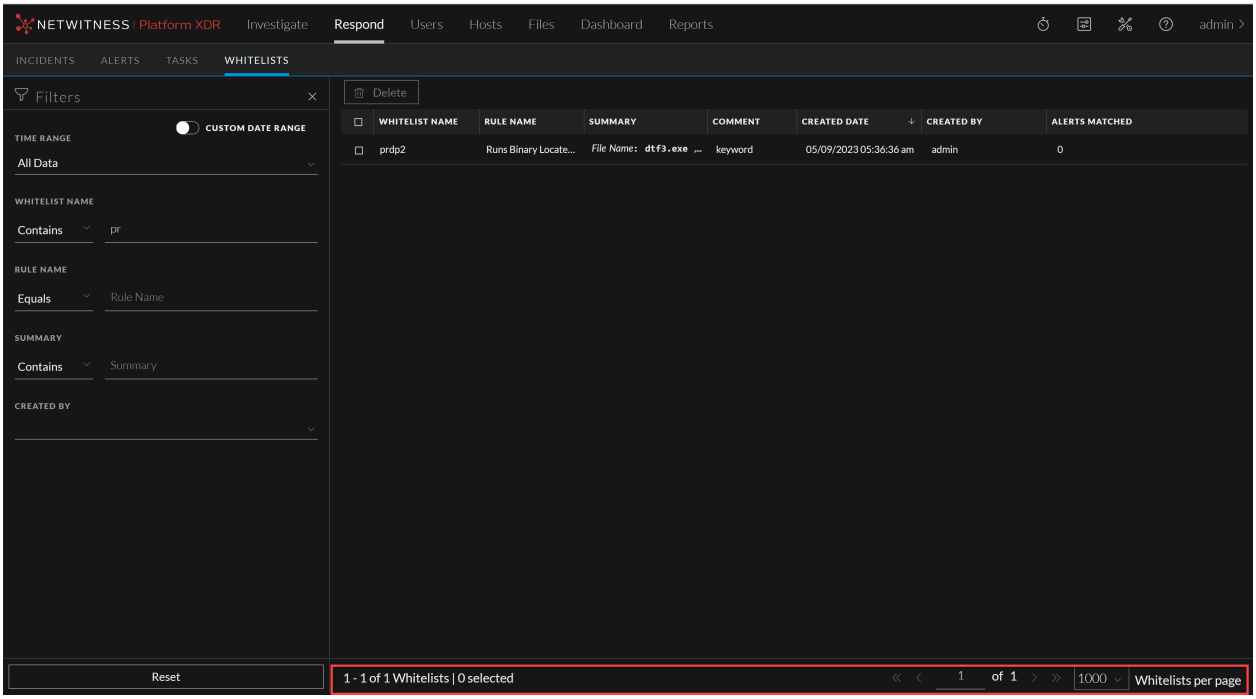
The Whitelists List displays all the Endpoint Whitelists in the NetWitness Platform XDR. You can filter this list to view only the Whitelists of interest.

The following table describes the columns in the Whitelists List.



Columns	Description
Whitelist Name	Displays the name of the Whitelist you provided during the whitelisting of the selected alert.
Rule Name	Displays the rule name associated with the whitelisted alert.
Summary	Displays the details of the entities selected during the whitelisting of the selected alert. For Example: **File name: cmd.exe, Host name: win34.**
Comment	Displays the comment added during the whitelisting of the selected alert.
Created Date	Displays the Whitelist creation date and time.
Created By	Displays the name of the user who created the Whitelist.
Alerts Matched	Displays the number of new matching alerts that are not triggered for the selected entities in the **Respond** > **Alerts** view after whitelisting the selected alert.

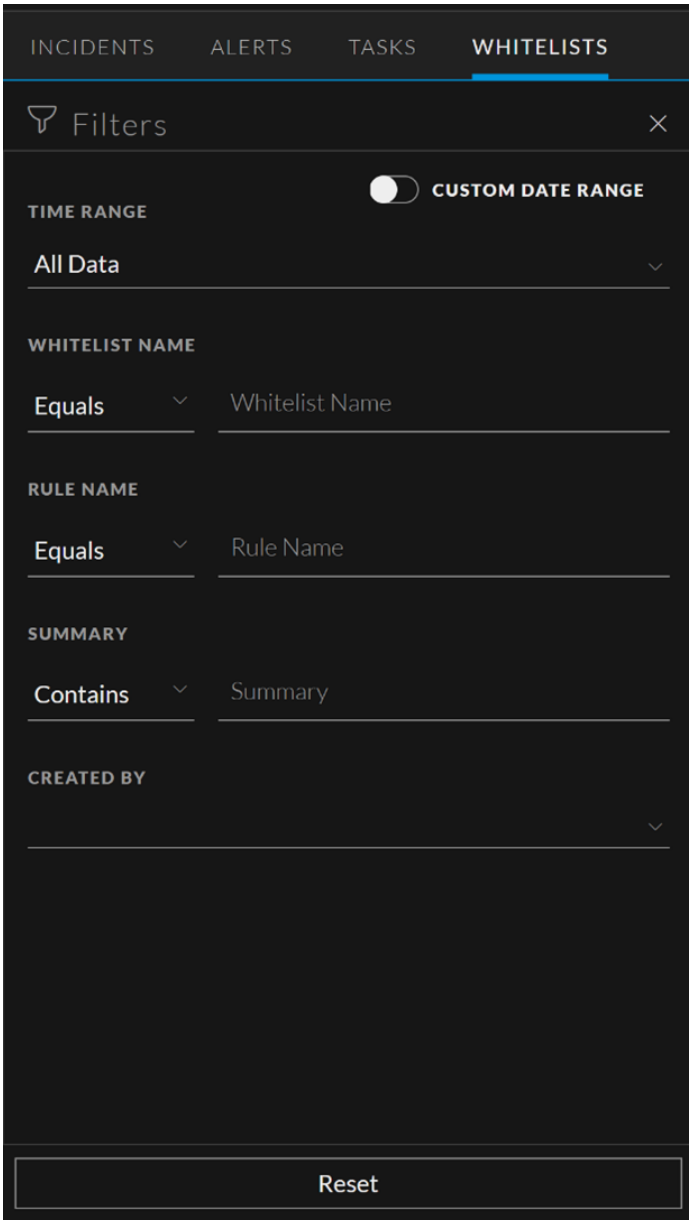
The following parameters are displayed at the bottom of the list.



- The count of the Whitelists displayed on the current page.
- The total number of Whitelists created.
- The number of Whitelists selected in the list.
- The current page number.
- Total number of pages available.
- The maximum number of Whitelists displayed in each page.

The values of the above mentioned parameters vary depending upon the filters you apply.

For example, consider the existing count of the Whitelists displayed on page **1** is **1 - 3** and the total number of Whitelists created is **3**.



After entering the Whitelist name (completely or partially) in the **Filters** panel and filtering the required Whitelist, the count of the Whitelists displayed on page **1** changes to **1 - 1** and the total number of Whitelists created is displayed as **1** since only 1 Whitelist matches the filter applied.

Whitelists Filters Panel

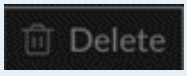
The following figure shows the filters available in the Whitelists **Filters** panel.

You can filter the Whitelists based on the following parameters.

- Time Range
- Whitelist Name
- Rule Name

- Summary associated with the Whitelists
- User who created the Whitelists

The following table lists all the fields displayed in the **Filters** panel.



Fields	Description
Time Range	Allows you to select the required time duration and view the Whitelists created in the time duration selected. **Note:** Turn On the **Custom Date Range** Toggle to select a custom date range of your choice.
Whitelist Name	Allows you to enter the name of required Whitelist.
Rule Name	Allows you to enter the name of the rule associated with the Whitelists created.
Summary	Allows you to enter the complete value or a part of the value of the entities associated with the required Whitelist. For example: **cmd.exe** or **win34** or **analyst1**.
Created By	Allows you to filter the Whitelists on the basis of the user who created them.

You can click **Reset** at the bottom of the **Filters** panel to remove the filters applied.

When you navigate away from the **Filters** panel, the Whitelists List view retains your filter selections.

Toolbar Actions

This table lists the toolbar actions available in the Whitelists List view.

Option	Description
	Select this option and access the **Filters** panel to filter the required Whitelists.
	Select this option to delete the selected Whitelist.

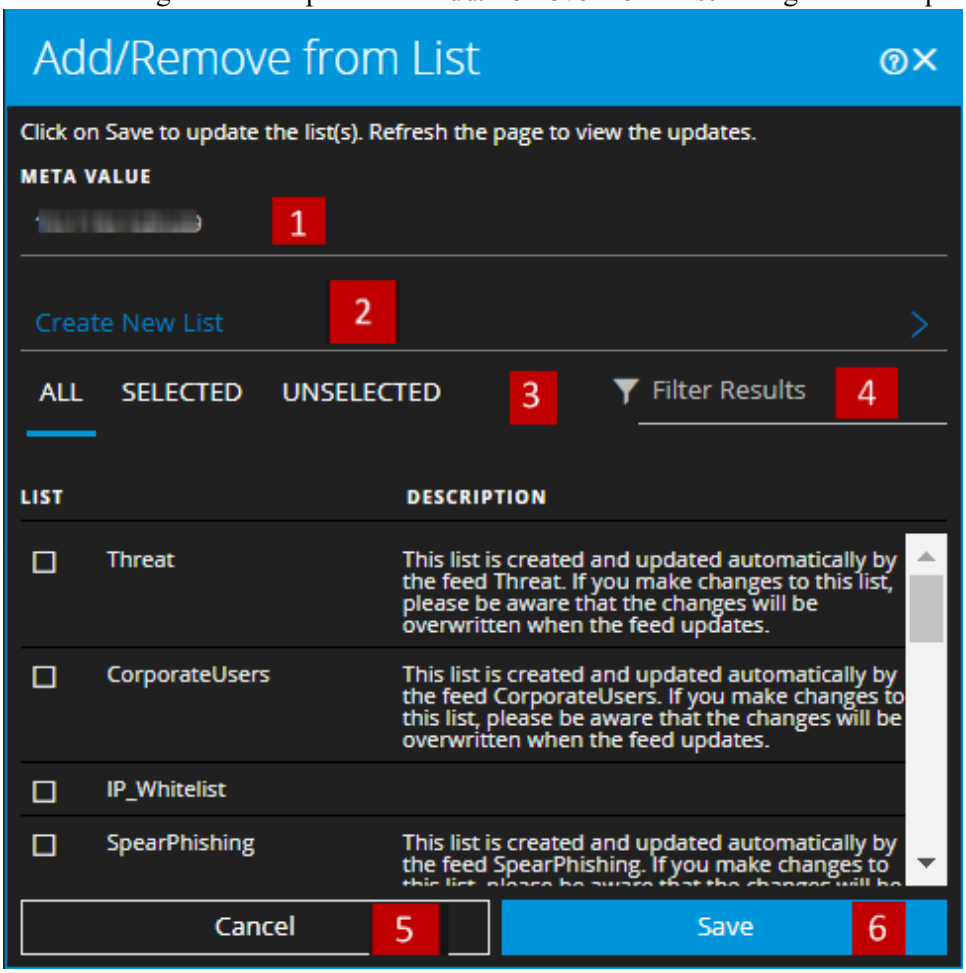
Add/Remove from List Dialog

The Add/Remove from List dialog allows you to add or remove an entity or meta value to an existing list or create a new list. For example, when you look up an IP address and you find it suspicious or interesting, you can add it to a relevant list, which has been added a data source. This improves the visibility of the suspicious IP addresses. You can also add entities or meta values to different lists. For example, you can add them to one list for suspected domains related to command and control connections and to another list for Trojan connections IP addresses related to remote access. If a list is not available, you can create a list. You can also remove the entity or meta value from a list.

Note: From the Add/Remove from List dialog, you can only add or remove entities or meta values from single column lists added as a datasource, not multi-column lists. And when you edit a list or a value in a list from the nodal view or the context lookup view, ensure to refresh the web page to view the updated data.

What do you want to do?

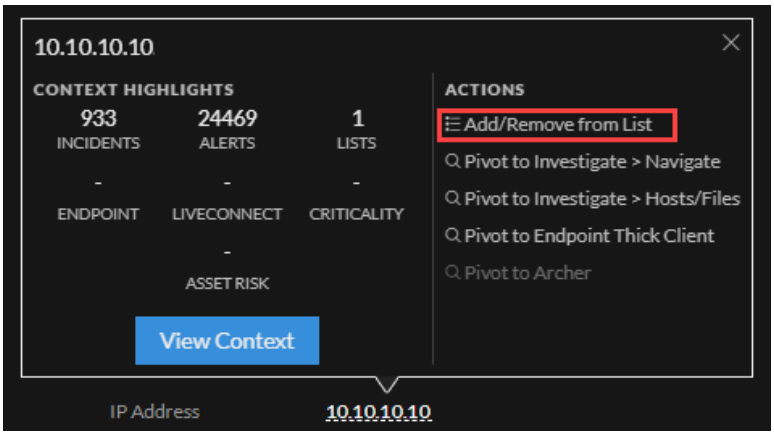
Role	I want to ...	Show me how
Incident Responders, Analysts	Add an entity to a list.	From the Incident Details view, see Add an Entity to a Whitelist. From the Alert Details view, Add an Entity to a Whitelist.
Incident Responders, Analysts	Create a whitelist, blacklist, or other list.	Create a List
Administrators	Add a Context Hub list as a data source.	See "Configure Lists as a Data Source" in the *Context Hub Configuration Guide*.
Administrators	Import or export a list for Context Hub.	See "Import or Export Lists for Context Hub" in the *Context Hub Configuration Guide*.



Related Topics

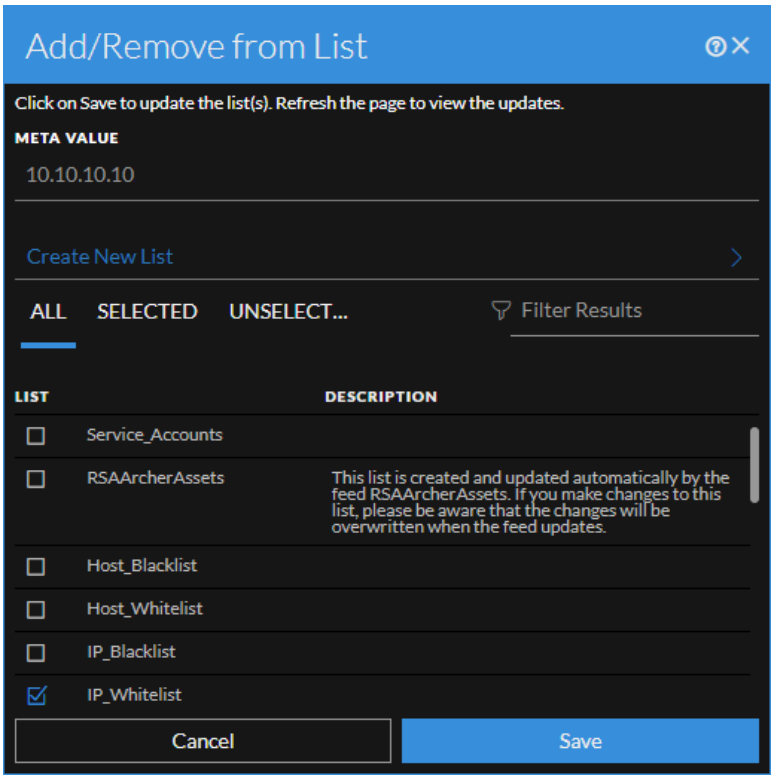
- Investigate the Incident
- Reviewing Alerts
- View Contextual Information (Incident Details view)
- View Contextual Information (Alert Details view)

Note: You cannot delete a list, but you can delete values within a list.



Quick Look

The following is an example of the **Add/Remove from List** dialog in the Respond view.



1 Entities or meta values to be added or removed.
2 Create a new list using the selected meta values.
3 Select any of the tabs: All, Selected, or Unselected.
4 Search using the list name or description.
5 Cancel the action.
6 Save to update lists or create a new list.

To access the Add/Remove from List dialog, in the Incident Details view or the Alert Details view, hover over the underlined entity that you would like to add or remove from a Context Hub list. A context tooltip appears showing the available actions.

In the Actions section of the tooltip, click Add/Remove from List. The Add/Remove From List dialog shows the available lists.

The following table shows the options in the Add/Remove from List dialog.

Option	Description
Meta Value	Displays the selected entity or meta value that needs to be added to or removed from one or more lists. You can also a create a new list using the selected value.
Create New List	When clicked, it displays a dialog to create a new list using the selected meta value.

Option	Description
All	Shows all of the available Context Hub lists. The lists that contain the selected entity or meta value are selected. Select a checkbox to add an entity or meta value to a list. Clear a checkbox to remove it from the list.
Selected	Shows only the lists that contain the selected entity or meta value. (All lists are selected.)
Unselected	Shows only the lists that do not contain the selected entity or meta value. (All lists are unselected.)
Filter Results	Enter the name or description of a specific list to search from multiple lists.
List	Displays the name of all the lists.
Description	Displays information about the selected list. The description that you provide when creating a list appears in this dialog. For example: This list contains all of the blacklisted IP addresses.
Cancel	Cancels the operation.
Save	Saves the changes.

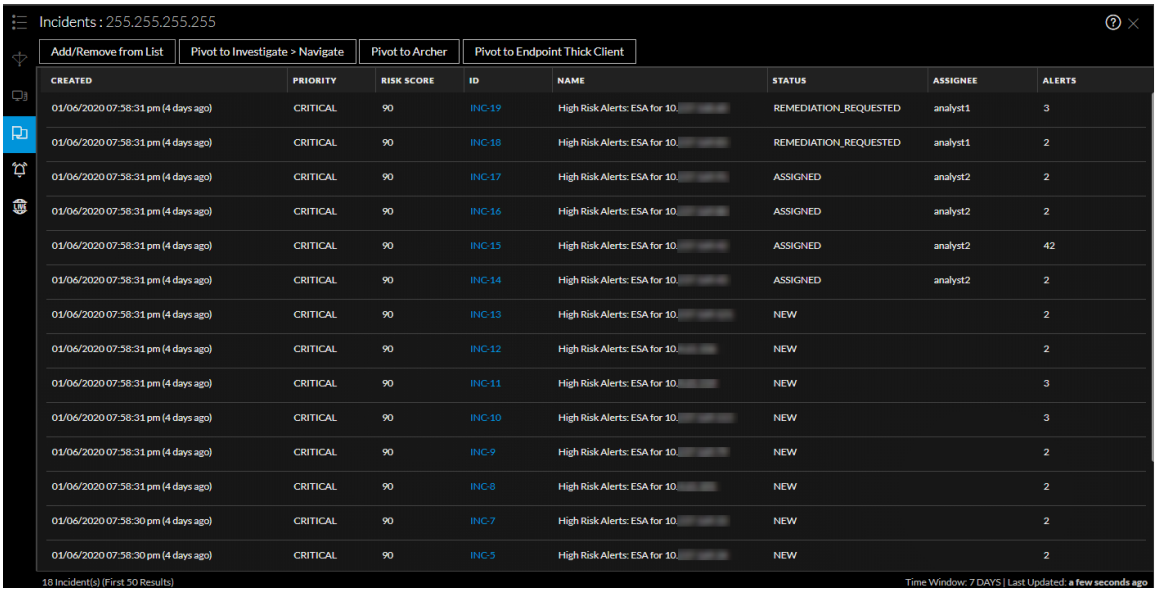
Context Lookup Panel - Respond View

The Context Hub service brings together contextual information from several data sources into the Respond view so that analysts can make better decisions during their analysis and take appropriate action. Seeing the entities, meta values, and contextual information in a single interface helps analysts to prioritize and identify areas of interest. For example, recently created incidents and alerts from the Respond view involving a given entity or meta value will be displayed when the analyst queries for additional information for that entity or meta value. The Context Lookup panel displays contextual information for the selected entities or meta values such as IP address, User, Host, Domain, File Name, or File Hash. The data available depends on the configured sources in the Context Hub.

The Context Lookup panel displays the contextual information based on the data available on the configured sources in the Context Hub.

Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Respond** view to view context lookups for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

What do you want to do?



Role	I want to ...	Show me how
Incident Responders, Analysts, Threat Hunters	Navigate to the Context Lookup panel.	From the Incident Details view, see View Contextual Information. From the Alert Details view, see View Contextual Information.
Incident Responders, Analysts, Threat Hunters	Understand the information in the Context Lookup panel for a selected entity.	See the information in this topic.
Administrator	Configure Data Sources for Context Hub.	See "Configure Data Sources for Context Hub" in the *Context Hub Configuration Guide*.
Administrator	Configure Context Hub settings.	See "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.

Related Topics

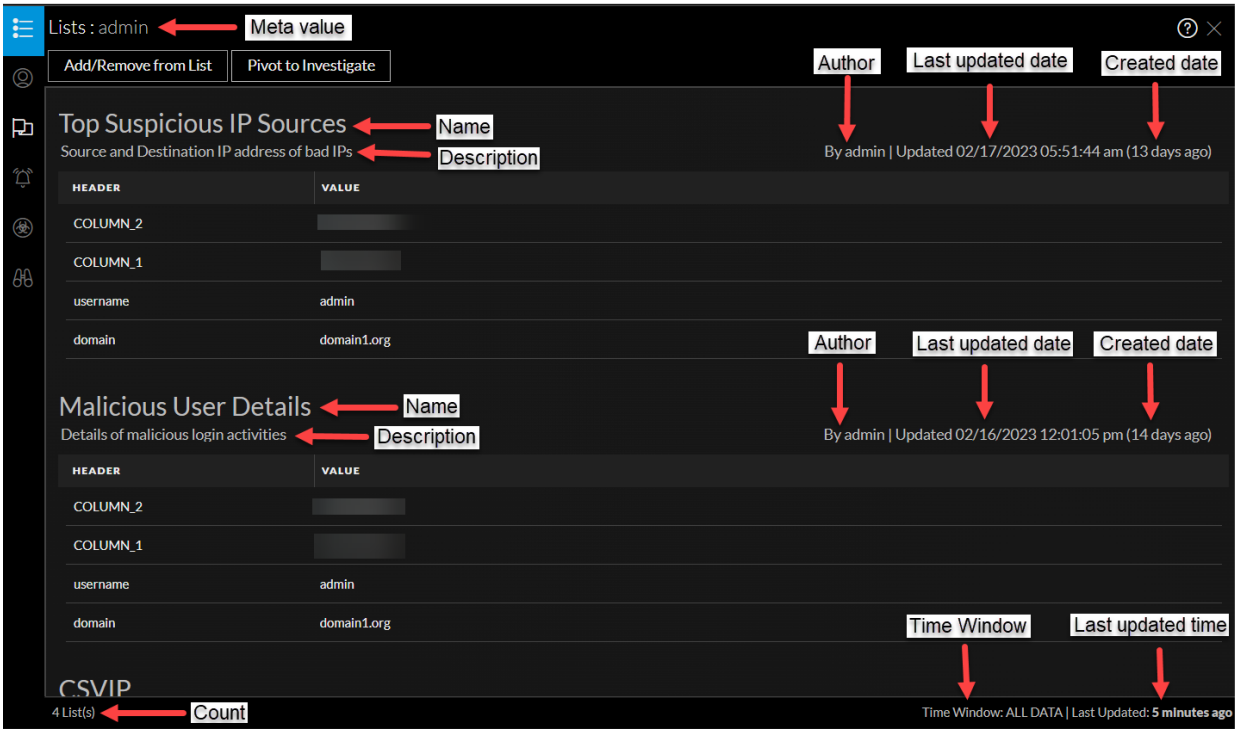
Contextual Information Displayed in the Context Lookup Panel

The contextual information or query results displayed in the Context Lookup panel depends on the selected entity and the associated data sources. The Context Lookup panel has separate tabs for each of the data sources. The tabs are: List data source, Archer, Active Directory, Endpoint, Incidents, Alerts, and REST API. The following figure shows the Context Lookup panel for a selected entity in the Incident Details view.

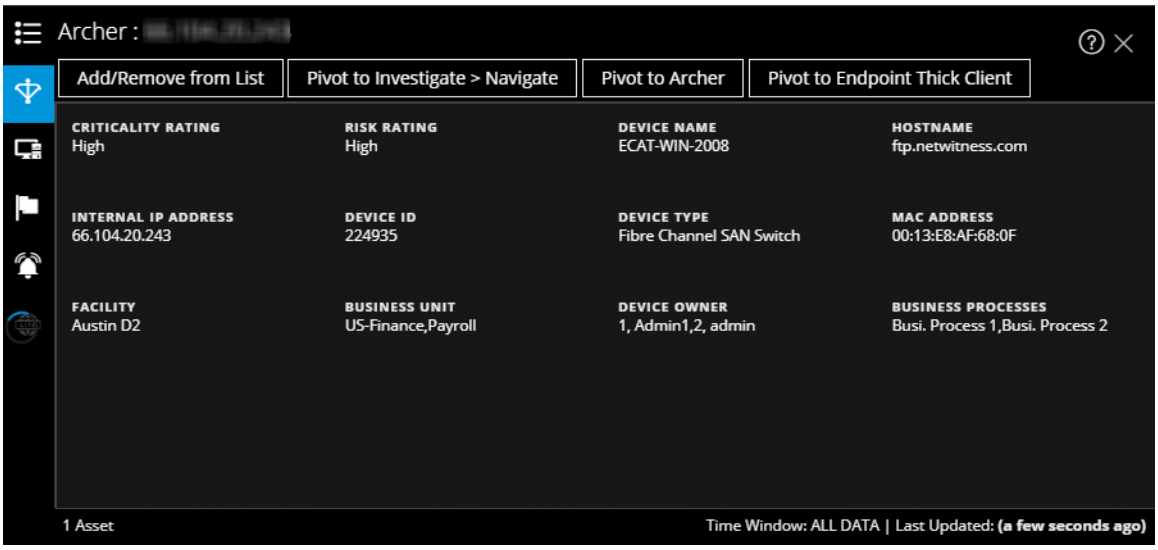


The following table describes the data available on each tab and the supported entities.

Tab	Description	Supported Entities
(Lists)	Displays all of the list data associated with the selected entity or meta value. The result is sorted by the last updated list.	All entities
(Archer)	Displays asset information along with criticality ratings using the Archer data source.	IP, Host, and Mac
(Active Directory)	Displays all user information for the selected user.	User

Tab	Description	Supported Entities
 (NetWitness Endpoint)	Displays the NetWitness Endpoint data source information for the selected entity or meta value, which includes the Machines, Modules, and IIOC levels. Modules are by highest IOC score to lowest IIOC score and IIOC levels are sorted by highest IOC levels to lowest IOC levels.	IP, MAC address, and Host
 (Incidents)	Displays the list of incidents associated with the selected entity or meta value. The result is sorted by newest incidents to oldest incidents.	All entities
 (Alerts)	Displays the list of alerts associated with the selected entity or meta value. The result is sorted by newest alerts to oldest alerts.	All entities
 (Live Connect)	Displays information related to Live Connect.	IP, Domain, and Filehash
 (File Reputation)	Displays file reputation status for Filehash entities.	Filehash entities
 TI	Displays information for STIX data sources.	IP address, email address, domain, filename, URL's, and file hash. **Note:** The context lookup for email address and URL will be displayed only if these metas are mapped. Navigate to  (Admin) > System > Investigation > Context Lookup.
 REST API	Displays the list of REST APIs (enabled in Context Hub) associated with selected the entity.	All entities

Lists Tab

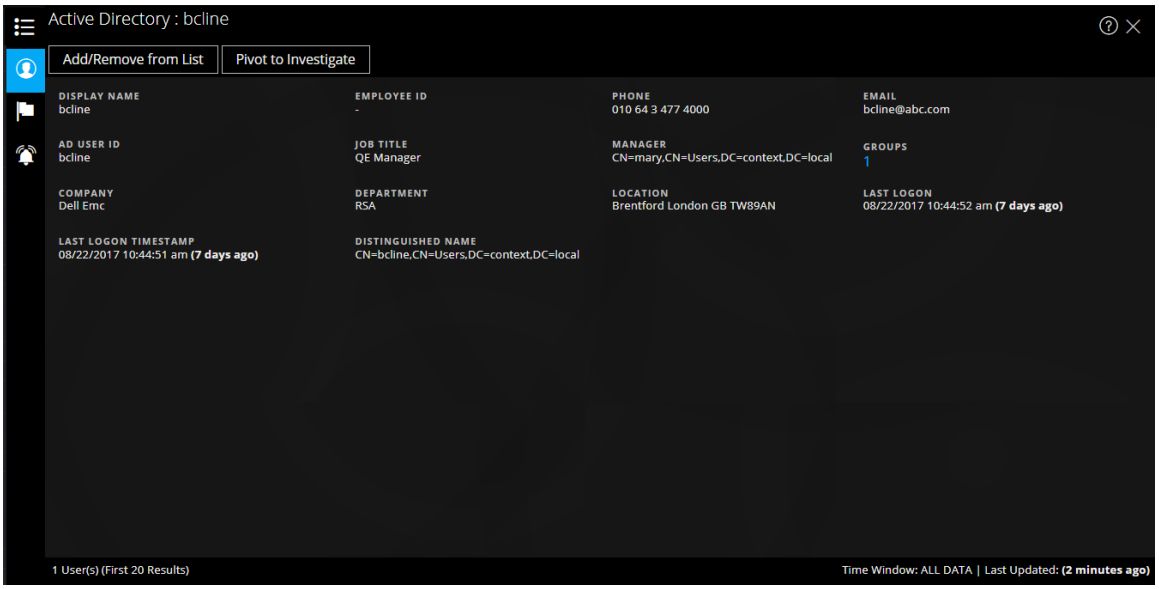


The Context Lookup panel for Lists shows one or more lists associated with the selected entity or meta value. The following figure is an example of the Context Panel for Lists, and the table describes the fields.

Field	Description
Name	The name of the list (defined while creating the list).
Description	The description of the list (defined while creating the list).
Header	Displays the metas available for the list.
Value	Displays the values for each meta in the list.
Author	The owner who created the list.
Created	The date when the list was created.
Updated	The date when the list was last updated or modified.
Count	The number of lists in which the selected entity or meta value is available.
Time Window	The time window based on the value set for the "Query Last" field in the Configure Responses dialog. By default, all Lists data is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Archer Tab

The Context Lookup panel for Archer displays asset information along with criticality ratings using the Archer data source for IP, Host, and Mac entities. The following figure is an example of the Context Lookup panel for Archer, and the table describes each field.



Field	Description
Criticality Rating	The device operational criticality based on the applications it supports. The criticality ratings can be set as Not Rated, Low, Medium-Low, Medium, Medium-High, or High.
Risk Rating	The calculated risk rating for the device based on the most recent assessment and the average risk rating of facilities using the device. The risk rating can be set as Severe, High, Medium, Low, or Minimal.
Device Name	The unique name of the device.
Host Name	The host name of the device.
IP Address	The primary internal IP address of the device.
Device ID	The automatically populated value that uniquely identifies the record across all applications within the system.
Type	The device type, for example, server, laptop, desktop, and others.
Facilities	Links to records in the Facilities application that are related to this device.
Business Unit	Links to records in the Business Unit application that are related to this device. For more than three business unit values, you can hover over the field to view the values.
Device Owner	The person who is responsible for the device and receives read and update rights of the record.

Field	Description
Count	The number of assets available.
Time Window	The time window based on the value that is set for the "Query Last" field in the Configure Responses dialog. By default, all data for Archer is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

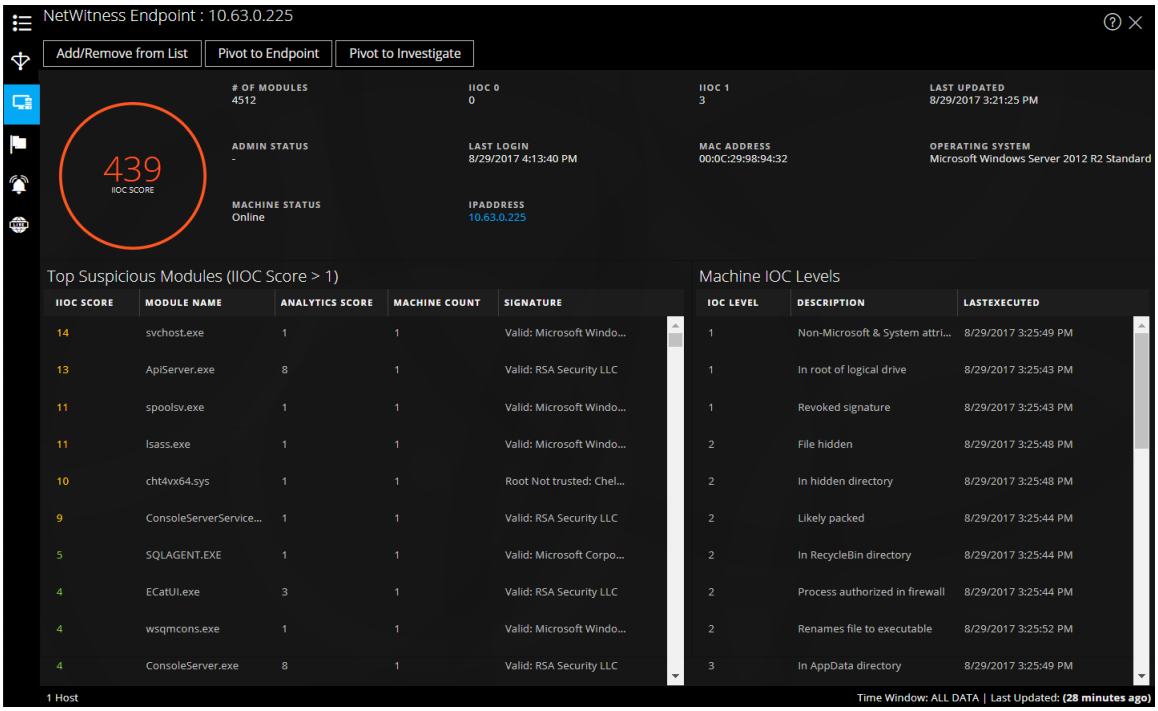
Note: In the localized versions, only these twelve fields are displayed: Criticality Rating, Risk Rating, Device Owner, Business Unit, Host Name, MAC Address, Facilities, IP Address, Type, Device ID, Device Name, and Business Processes.

Active Directory Tab

The following figure is an example of a Context Lookup panel for Active Directory.

The Context Lookup panel for Active Directory displays all the related information, incidents, and alerts for a user. You can perform a look up using the following formats:

- userPrincipalName
- Domain\UserName
- sAMAccountName



The following information is displayed for Active Directory.

Field	Description
Display Name	The name of the user.
Employee ID	The employee ID of the user.

Field	Description
Phone	The phone number of the user.
Email	The email ID of the user.
AD User ID	The unique identification of the user within an organization.
Job Title	The designation of the user.
Manager	The name of the user's manager.
Groups	The list of groups of which the user is a member.
Company	The name of the user's company.
Department	The department name to which the user belongs within the organization.
Location	The location of the user.
Last Logon	The time when the user logged into the system, only if the Global Catalogue is defined.
Last Logon TimeStamp	The time when the user logged into the system.
Distinguished Name	The unique name assigned to the user.
Count	The number of users.
Time Window	The time window based on the value that is set for the "Query Last" field in the Configure Data Source Settings dialog. By default, all data for Active Directory is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

NetWitness Endpoint Tab

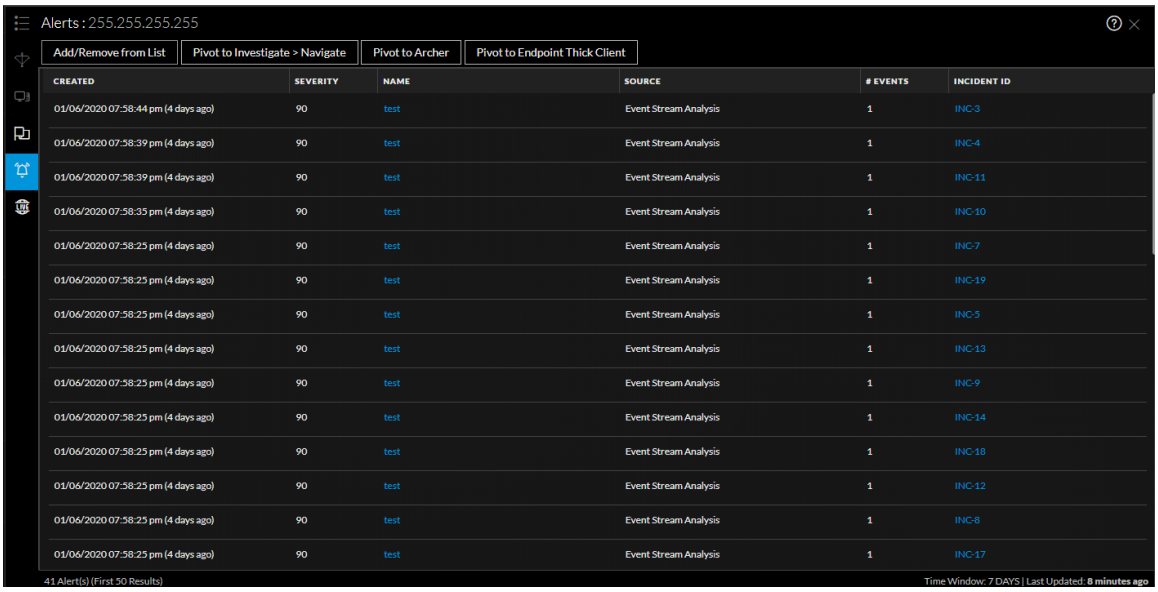
The following figure is an example of the Context Lookup panel for NetWitness Endpoint.

The following information displayed for IIOCs.

Field	Description
# Of Modules	The number modules that are looked up.
Admin Status	The admin status (if any).
Last Updated	The time when the data was last refreshed.
Last Login	The time when the user last logged in.
MAC Address	The Machine MAC Address.
Operating System	The Version of the Operating System used by the NetWitness Endpoint machine.
Machine Status	The state of the module being viewed: Online, Offline, Active, or Inactive.
IP Address	The IP address of the specific module.

The following information is displayed for modules.

Field	Description
IIOC Score	A machine IIOC score is an aggregated score based on the module scores. This is based on the value set for Minimum IIOC Score field in the Context Hub Data Source Settings dialog. The default value for Minimum IIOC Score is 500. See "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.



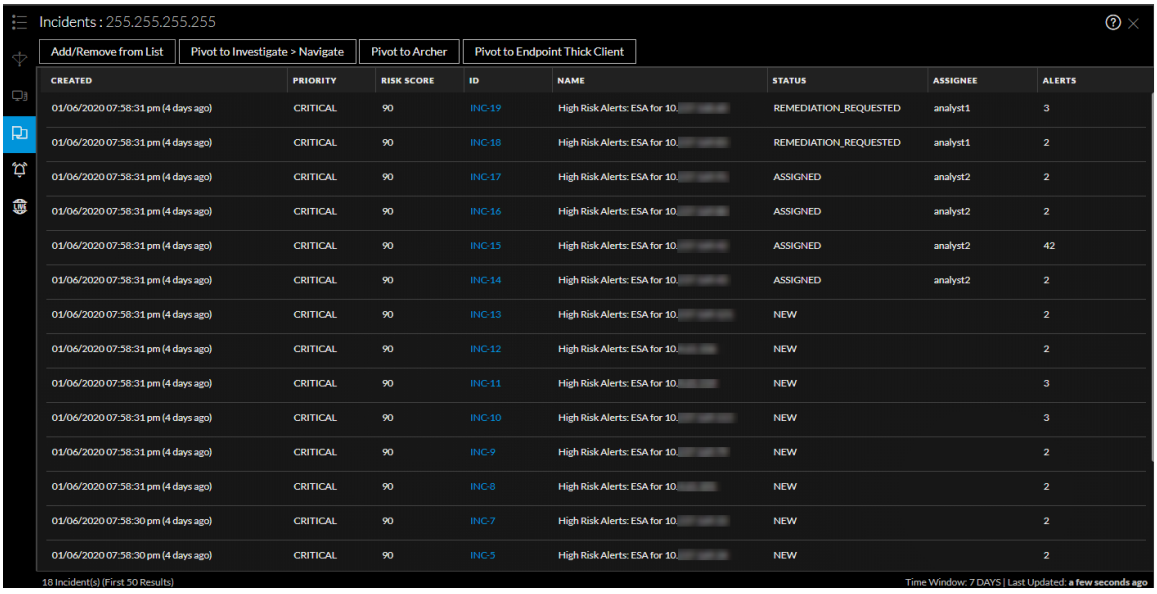
Field	Description
Module Name	The name of the module that is being looked up.
Analytic Score	The number of active files for the selected machine.
Machine Count	The number of machines on which that particular IOC got triggered.
Signature	Indicator of whether the file is signed or unsigned, valid or invalid, and signatory information. For example, Google, Apple, and so on.

The following information is displayed for machines.

Field	Description
IOC Levels	The IOC levels.
Description	The description for he IOC level if available.
Last executed	The time when the action was executed.
Count	The number of hosts that are being looked up.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, all data for NetWitness Endpoint is fetched.
Last Updated	The time when scan results were last updated in NetWitness Endpoint database.

Alerts Tab

The following figure is an example of Context Panel for Alerts that is displayed based on time first (Newest to Oldest) and then severity.

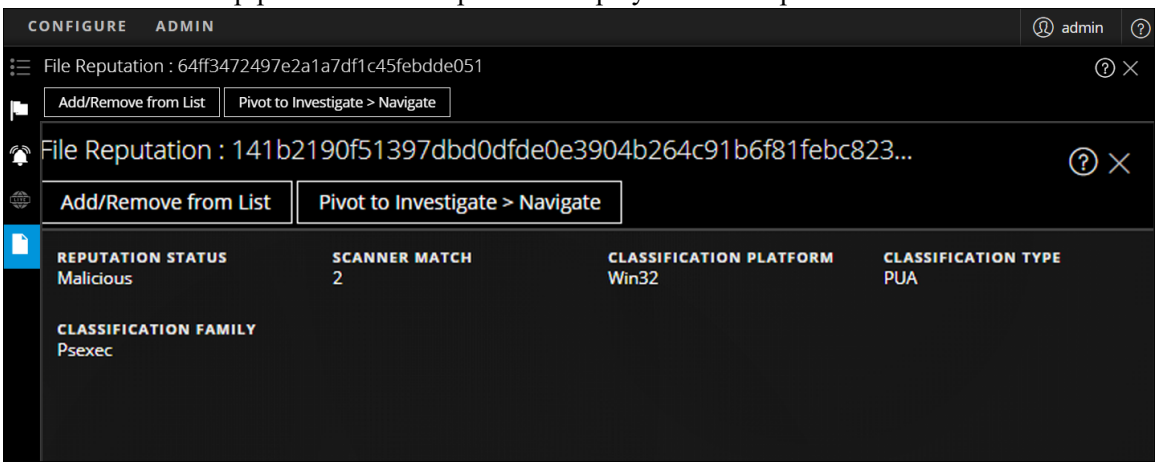


The following information is displayed in the Context Lookup panel for Alerts.

Field	Description
Created	The date and time when the alert was created.
Severity	The severity value of the alerts.
Name	The name of the alert. You can click the name to view the details of a specific alert.
Source	The alert source name from which the alert is triggered.
#Events	The number of events associated with the alert.
Incident ID	The ID of the incident (if any) with which the alert is associated. You can click the ID to view the details of a specific alert.
Count	The number of alerts. By default only the first 100 alerts are displayed. For more information on how to configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	The time when contextual data was last fetched from data source.

Incidents Tab

The following figure is an example of the Context Panel for Incidents, which is based on time first (Newest to Oldest) and then priority status.

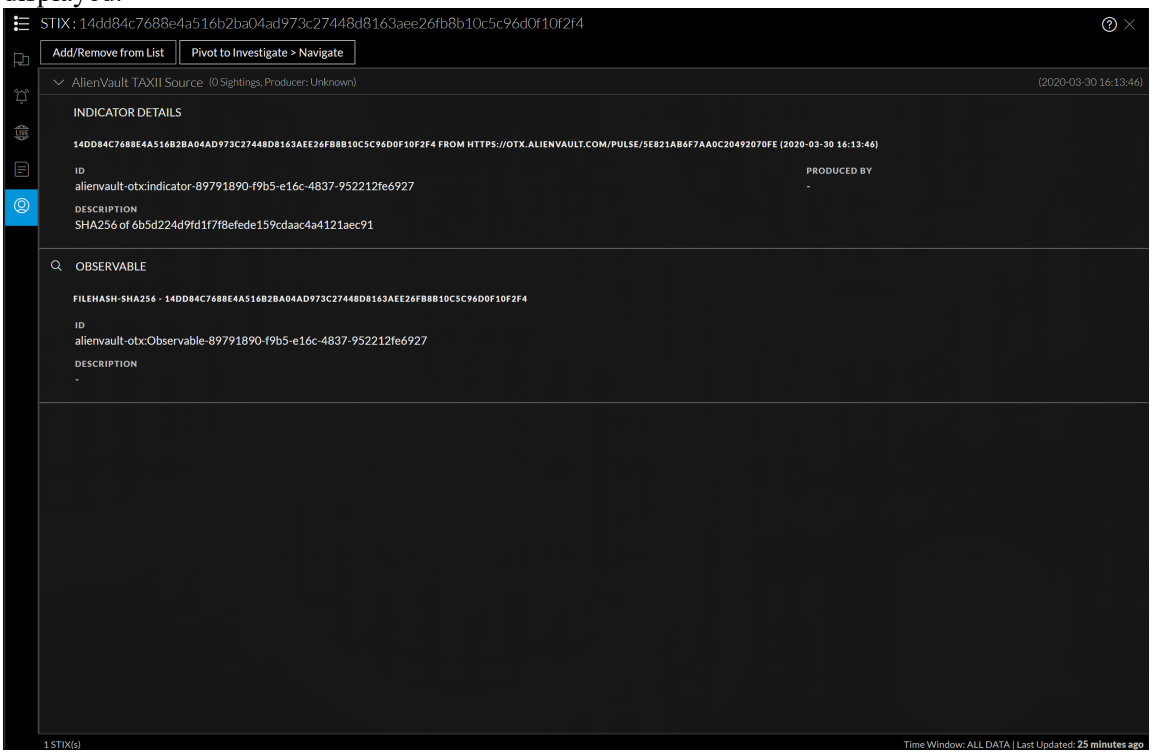


The following information is displayed in the Context Lookup panel for Incidents.

Field	Description
Created	The date when the incident was created.
Priority	The priority status of the incidents.
Risk Score	The risk score of the incidents.
ID	The Incident ID of the incident. You can click on the ID to display further details about the incident.
Name	The incident name.
Status	The status of the incident
Assignee	The current owner of the incident.
Alerts	The number of alerts associated with the incident.
Count	The number of incidents. By default only the first 100 incidents are displayed. For more information on how configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	The time when contextual data was last fetched from data source.

File Reputation Tab

The Context Lookup panel for File Reputation displays the file reputation status of a file.



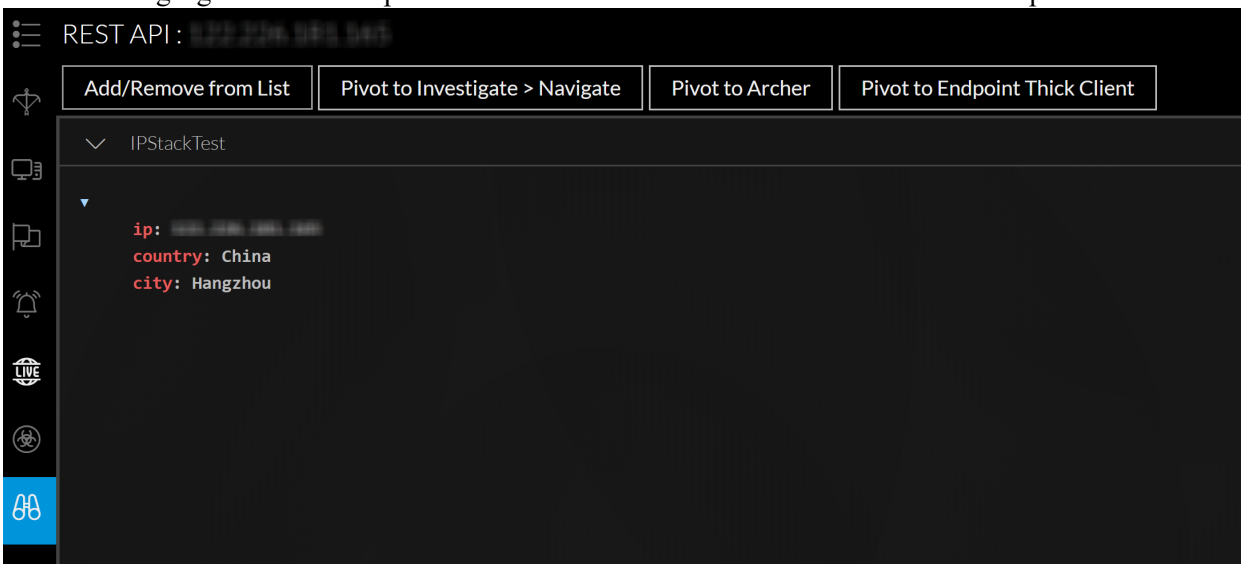
Field	Description
Reputation Status	Reputation Status of filehash. For more information about reputation status, see "View Reputation of files" in the *UEBA User Guide*.

Field	Description
Scanner Match	Number of scanners that detected malware or suspicious activity in the last scan.
Classification Platform	Classification for the queried filehash based on the platform. For example, the platform can be Win 32.
Classification Type	Classification for the queried filehash based on the type.
Classification Family	Classification for the queried filehash based on the malware family name.

TI Tab

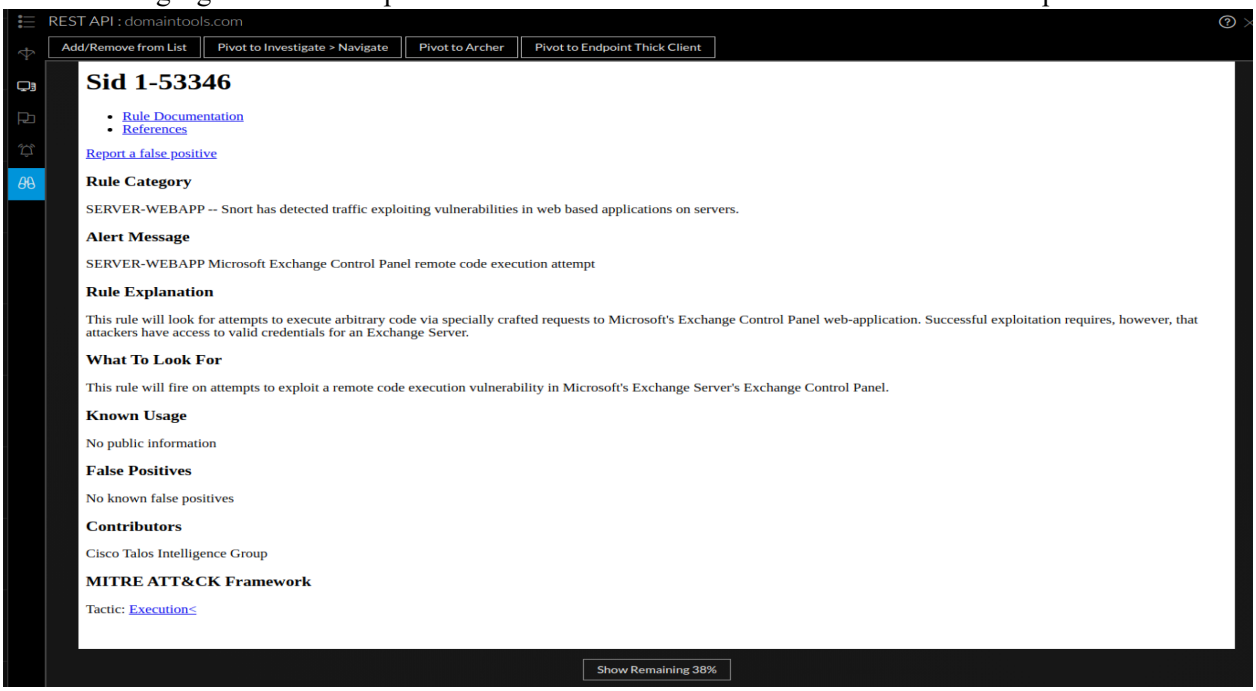
The following figure is an example of a Context Panel for TI, and the table describes the information displayed.

Field	Description
Data Source name	Displays the STIX data source name from where the data is retrieved.
Timestamp	The time when the event was created.



Field	Description
Indicator Details	Indicator Title: Displays the details that contains a pattern that can be used to detect suspicious or malicious cyber activity. ID: Displays the ID of the selected indicator. Produced by: Displays the user role who requested for the STIX data. Description: Displays details about the selected IP address which are being watch listed.
Observable	Observable Title: Displays and conveys information about cyber security related entities such as files, systems, and networks using the STIX Cyber-observable Objects (SCOs). ID: Displays the ID of the selected observable.
(Optional) SightingsREST	Sightings Title: Displays the name of the sighting source. Confidence: Displays the criticality of the sighting. Reference: Displays the reference URL of the sighting source.

REST API Tab



The Context Lookup panel for REST API shows HTML or JSON response (based on the response type configured) associated with the selected entity or meta value.

Note: For JSON response type, the fields that are mapped with friendly names (during REST API configuration) are only displayed for context Lookup. If you have not mapped any fields, all fields are displayed for context lookup.

The following figure is an example of the Context Panel for REST API with JSON response:

The following figure is an example of the Context Panel for REST API with HTML response:

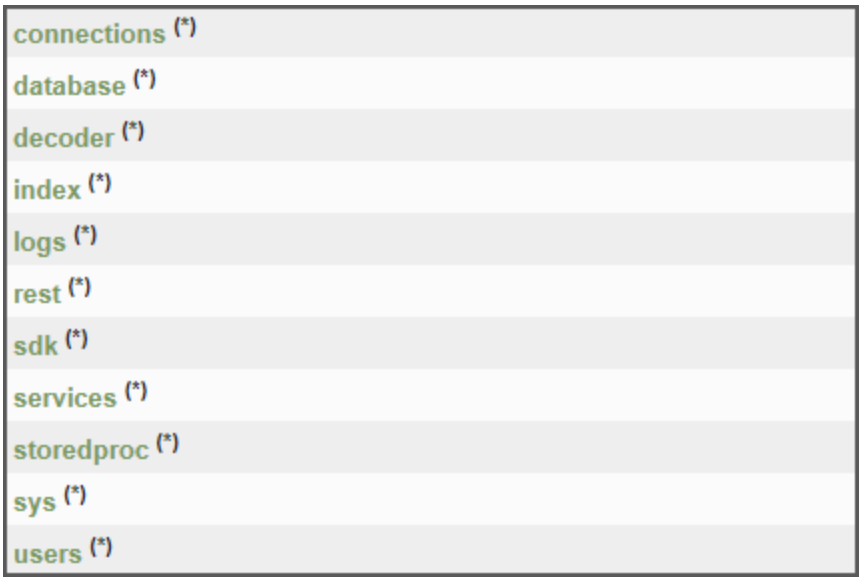
Statistics Graph **12**

SDK Commands **14**

RESTful API

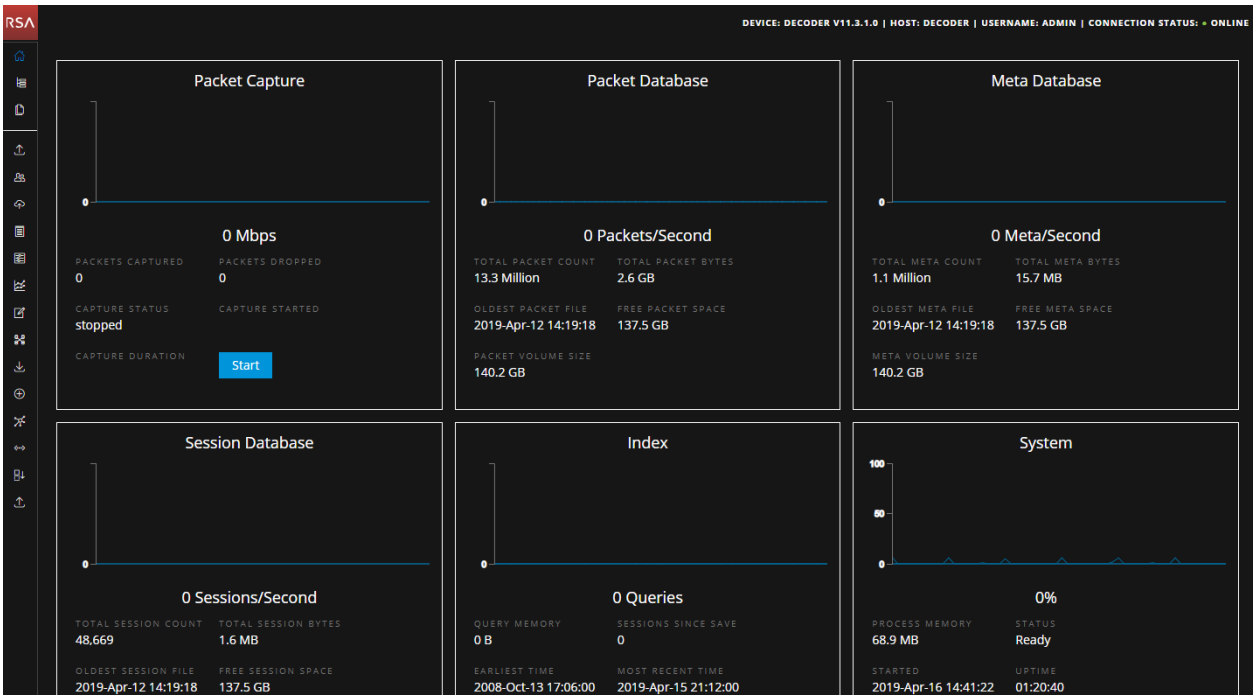
The RESTful API that ships with NetWitness Platform is a way to programmatically communicate with the NetWitness architecture. It must be enabled by setting `/rest/config/enabled` to **on**, which is the default. The default port for communication is the default port + 100 (for example, on a Concentrator, the default port is **50005**, and the REST API is on port **50105**), but that can be changed by setting the `/rest/config/port` parameter. SSL is controled by the setting in `/sys/config/ssl`. For information about how to perform these tasks, see Access the RESTful API in NetWitness Platform.

The API is based on HTTP and is quite easy to use. The acceptable output formats are:



- text/plain
- text/xml
- text/html
- application/json

The content type that is returned can be controlled through the **HTTP Accept** header. It is possible to set the parameter **force-content-type** to one of the previous values.



The easiest way to begin is to point a browser to the REST port (for details about how to perform these tasks, see Access the RESTful API in NetWitness Platform):

`PATH: http://<hostname or IP>:<REST port>`

This command performs the default operation of `ls`, and returns a listing for the root node tree used by NetWitness:

The user interface that is shown above is enabled by default in all Version 10 and 11 deployments. The user interface with the dark background (shown below) is available in Version 11.3.1 and later, and must be enabled if you want to use it.

To enable the user interface with the dark background, set `/rest/config/Enable WebSockets Interface (allow.websockets)` to `true` and restart the service. You can change the user interface back to the light background by setting this parameter to `false` and restarting the service.

Usage

The REST API accepts commands by using URL parameters and by POSTing application/json.

The special content type, `application/x-netwitness-string-params`, passes parameters, as plain text, in the format:

```
param1=value1 param2="value \"2\""
```

Note: Quotes, as part of the value, must be preceded by the backslash \ character. Any character can be escaped in this manner, including the backslash itself \\.

The format of the URL consists of the following components:

```
http://<hostname or IP>:<port>/[node1][/node2][…]?msg=<message name>
[&param1=value1][&param2=value2][…]
```

Usage example: the "/logs" Node

The /logs node supports several different messages:

- **ls**–Returns a list of child nodes. It supports the parameters depth and options.
- **mon**–Monitor this node (and possibly descendants) for changes. However, this message is not supported by the REST API because it requires a persistent connection and pipe that cannot be done via REST. Monitoring currently requires the full NetWitness SDK library.
- **pull**–This command pulls logs from the service. It supports two parameters: **count**, which controls how many logs to return, and **id2**, which controls the ending log ID to return. **id2** is optional and when it is not provided, the last log written is returned.
- **info**–Returns detailed node information.
- **help**–The parameters are covered in more detail in Find More Details.
- **count**–A simple command to return the number of child nodes.
- **stopMon**–Stop monitoring the node from a previous mon command (also not supported by REST).
- **download**–A more complicated command to download a large number of log messages with several parameters to control log types and text matching capabilities. Like the **mon** command, this requires more than a simple request/response, which is not supported by the REST node interface.
- **timeroll**–Any log entries that exceed a given age are deleted.

To get a full list of NetWitness messages and parameters, use the help message:

```
http://localhost:50106/logs?msg=help&force-content-type=text/plain
```

This command returns:

```
description: A container node for other node types
security.roles: everyone,logs.manage
message.list: The list of supported messages for this node
ls: [depth:<uint32>] [options:<string>] [exclude:<string>]
mon: [depth:<uint32>]
pull: [id1:<uint64>] [id2:<uint64>] [count:<uint32>] [timeFormat:<string>]
info:
help: [msg:<string>] [op:<string>] [format:<string>]
count:
stopMon:
download: [id1:<uint64>] [id2:<uint64>] [time1:<date-time>] [time2:<date-
time>] op:<string> [logTypes:<string>] [match:<string>] [regex:<string>]
[timeFormat:<string>] [batchSize:<uint32>]
timeRoll: [timeCalc:<string>] [minutes:<uint32>] [hours:<uint32>]
[days:<uint32>] [date:<string>]
debugGen: [count:<uint32>]
```

Example Syntax

To view the last 100 logs:

```
http://hostname:50105/logs?msg=pull
```

To view the logs in XML format:

```
http://hostname:50105/logs?msg=pull&force-content-type=text/xml
```

To see the last 10 logs in plain text:

```
http://hostname:50105/logs?msg=pull&count=10&force-content-type=text/plain
```

Find More Details

For more detailed information about a message (for example the pull message), request help specific to just that message. The **help** message displayed above uses the parameter name **msg**, but in the URL below, **message** is used, an alias for the help **msg** parameter to avoid conflicts with the REST API **msg**.

```
http://localhost:50106/logs?msg=help&message=pull&force-content-
type=text/plain
```

Returns this text:

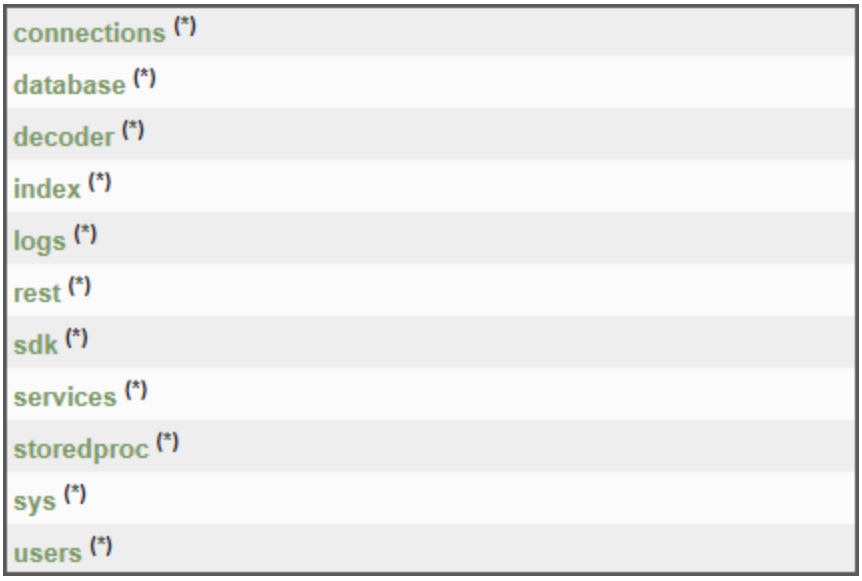
```
pull:
        Downloads N log entries security.roles: logs.manage
        parameters: id1 - <uint64, optional> The first log id
        number to retrieve, this is mutually exclusive with
        id2 id2 - <uint64, optional> The last log id number
        that will be sent, defaults to most recent log message
        when id1 or id2 is not sent count - <uint32, optional,
        {range:1 to 10000}> The number of logs to pull
        timeFormat - <string, optional, {enum-
        one:posix|simple}> The time format used in each log
        message, default is posix time (seconds since 1970)
```

Access the RESTful API in NetWitness Platform

This topic describes how to enable the REST API in NetWitness Platform. The REST API must be enabled by setting `/rest/config/enabled` to **on**, which is the default. The default port for communication is the default port + 100 (for example, **50105** for a Concentrator), but that can be changed by setting the `/rest/config/port` parameter. SSL is controled by the setting in `/sys/config/ssl`.

Note: By default, the REST interface accepts **BOTH** SSL and Non-SSL connections on the REST port. By setting `/sys/config/ssl` to on, **ONLY** SSL connections will be accepted on the REST port.

To enable the REST port:



1. In the NetWitness web user interface, go to  (Admin) > **Services** and select a service, for example, a Concentrator.
2. In the **Host** column, click on the host name. The Hosts page opens, and the IP address of the host is displayed in the **Host** column. Make a note of the IP address.

   Note: If the IP address listed in the Host column is the same as the IP address of the NetWitness web UI, the API is not available for that service.

3. Go to  (Admin) > **Services**, select the service, and then select **View** > **Config**. Under **System Configuration**, note the port number. You will use this port number as a basis for accessing the API, but you must add 100 to it. For example, if the port number is listed as **50005**, you would enter **50105**.
4. In the browser, type the IP address of the service and append the port number to the IP address as shown here:
   `http://<hostname or IP address>:<port>`

   Note: The URL is HTTP, and not HTTPS.

5. In the Authentication dialog, enter the user name and password and click **Log in**. The root node tree used by NetWitness is displayed:

(Optional) Configure Custom SSL Certificate for the REST Interface

IMPORTANT: As a security best practice, using self-signed certificates is not recommended.

Note: In version 11.6, custom certificates are not supported on Log Collector.

By default, NetWitness Platform provides certificates for all the NetWitness Platform Core Services. For example, Decoder uses the `/etc/netwitness/ng/decoder_cert.pem` certificate.

You can provide your own custom certificate (preferably issued by a certification authority) for the REST ports. The custom certificates must be in the OpenSSL PEM format. Perform the following steps to configure the custom certificates:

1. Rename the custom certificate to `<service name>_rest_cert.pem` and upload it to `/etc/netwitness/ng/`. For example, `decoder_rest_cert.pem`.
2. Rename the private key to `<service>_rest_key.pem` and upload it to `/etc/netwitness/ng`. For example, `decoder_rest_key.pem`.

Note: You can combine the certificate and the private key in a single file and name it as `<service>_rest_cert.pem`. For example, `decoder_rest_cert.pem`.

If custom certificates are not detected, the default NetWitness Platform certificates are used.

Packets

You can retrieve a **pcap** file using the REST service.

`http://<hostname>:<port>/sdk/packets`

If you point a browser to this URL, the web page lets you enter a list of session IDs or a time range. When you click **Submit**, it generates a **pcap** based on the supplied criteria.

Programmatically, using HTTP GET or POST, submit either a **sessions** parameter with a comma-separated list of session IDs and session ranges (#-#) or a **time1** and **time2** parameter. Times must be in the format **YYYY-MM-DD HH:MM:SS**, for example: **2010-Apr-20 09:00:00**.

Note: Since the list of sessions can get quite long, this API accepts the content-type `application/x-netwitness-string-params` for a **POST** command.

Importing Packets

You can import packets to a DECODER using the REST service.

`http://<hostname>:<port>/decoder/import`

If you point a browser to this URL, the web page lets you select a **pcap** file for upload. It also accepts pcap files POSTed to this URL.

REST begins processing incoming data immediately after the HTTP header is parsed. This means import of a **pcap** file occurs quickly and allows for large transfers. There is still a limit, but it is much larger (GBs) and is based on how well the import process can keep up with the client POST coming in. If the client posts a huge pcap (many GBs), it is still possible to overfill the current buffer. Any pcap that is 4 GBs or less should be able to process without issue.

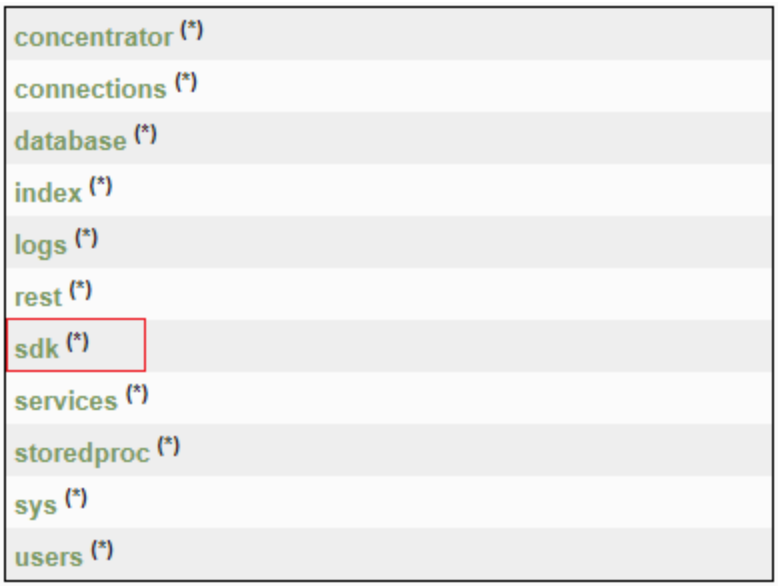
Note: The DECODER cannot be concurrently importing or capturing, or an error results.

Parser/Feed Upload

You can upload Parsers and Feeds using the REST service.

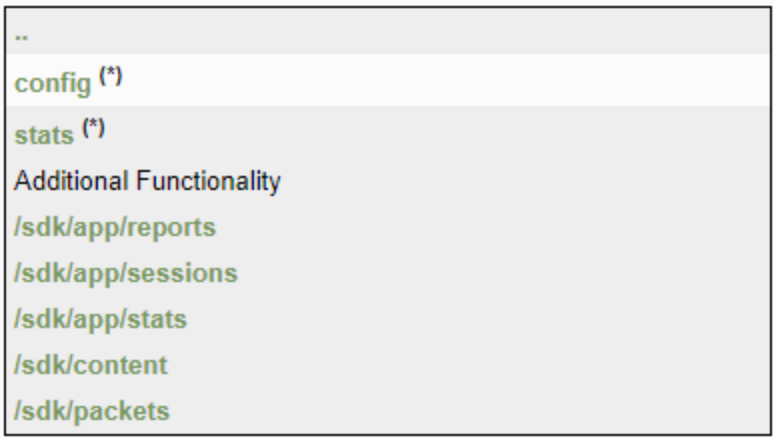
`http://<hostname>:<port>/decoder/parsers/upload`

If you point a browser to this URL, the web page lets you select a parser or feed file for upload.



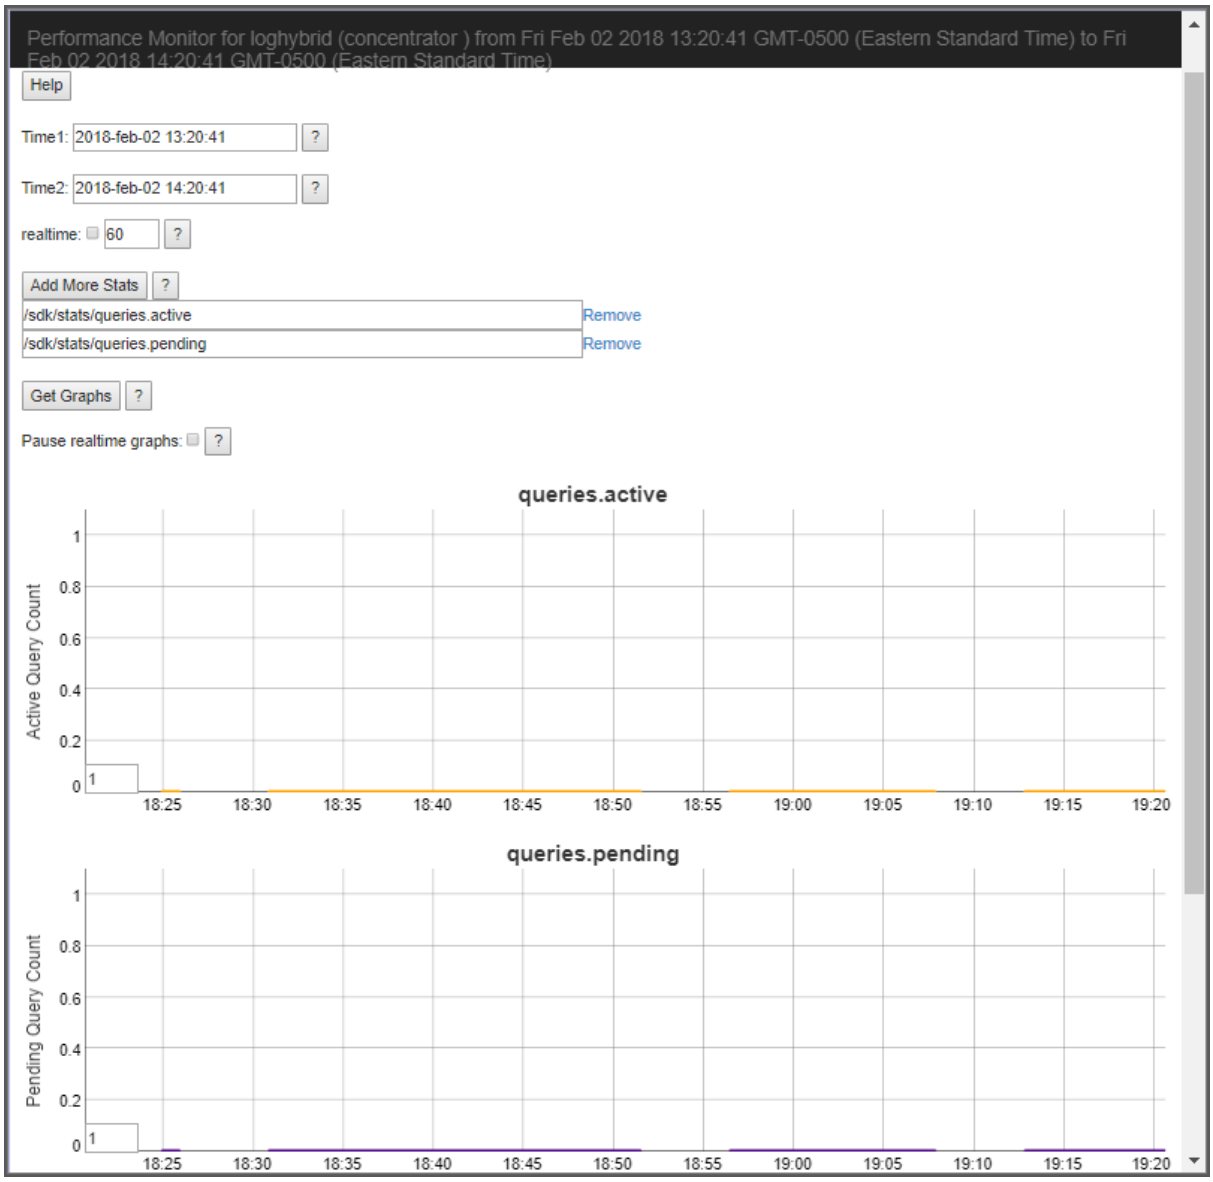
You can also force a reload by selecting the toggle or providing the parameter `reload=1` on the URL.

Statistics Graph



The REST interface has a built-in statistics graphing tool, which helps you monitor performance for a service during a specified time period. You can use this tool to collect and graph single or multiple statistics from a host during a specific time range. You can also graph real-time statistics.

To access the statistical graphing tool:



1. From the root node tree page, click `sdk`. (For information on accessing the root tree note page, see Access the RESTful API in NetWitness Platform.)

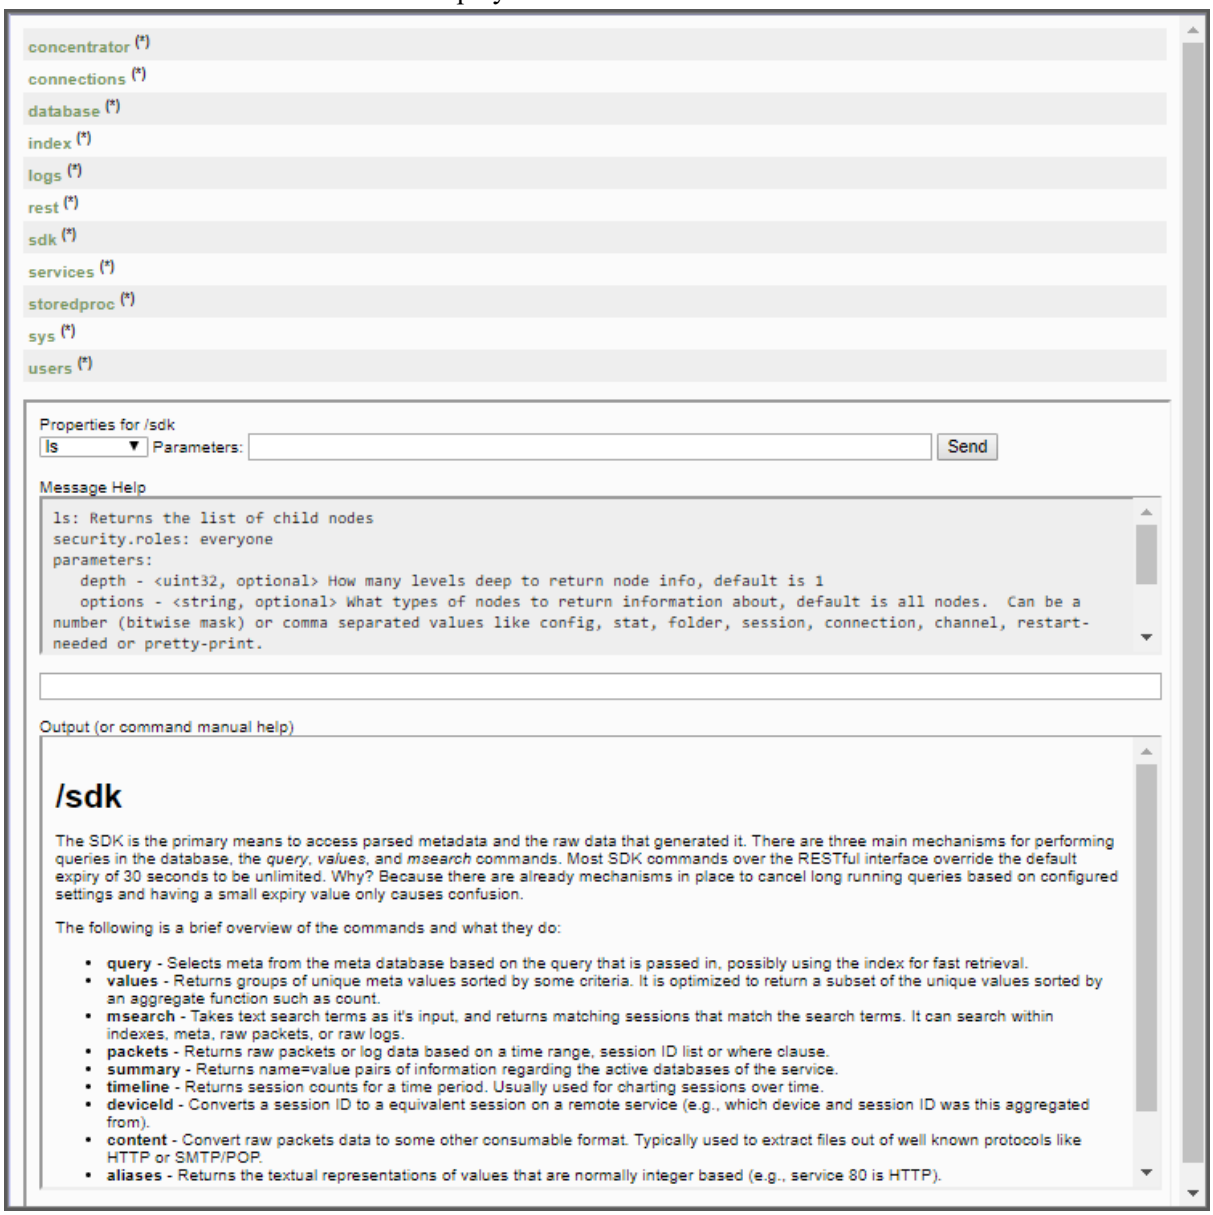
   The options for additional functionality are displayed:

2. Click `sdk/app/stats`. The Performance Monitor window opens, and statistical graphs are displayed at the bottom of the page.

Click the Help buttons for detailed information about this page and the fields it contains.

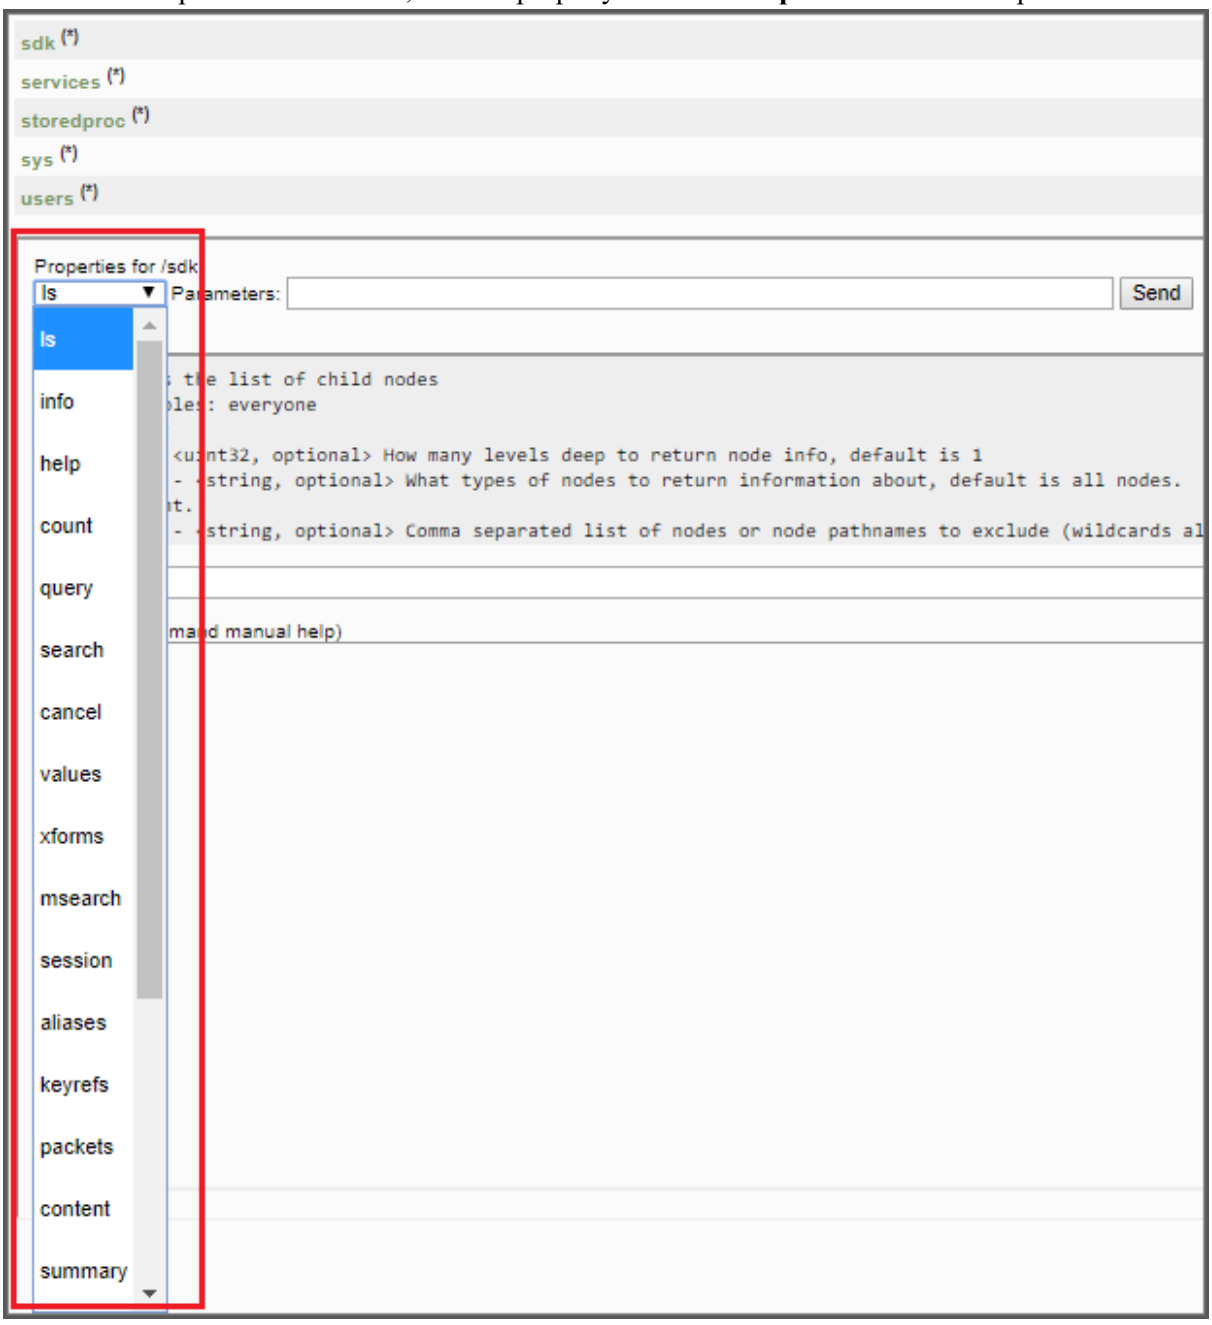
SDK Commands

All queries on the system are performed by commands sent to the **/sdk** node.



The **/sdk** node has built-in help documentation for each message. To view the help for each command, click on the asterisk (*) beside the sdk node and then choose one of the messages from the drop-down menu. The documentation for the message is displayed in the Output window at the bottom of the screen.

To access the help:



1. From the root node tree page, click `sdk`. (For information on accessing the root tree note page, see Access the RESTful API in NetWitness Platform.)
2. Click the asterisk (*) next to sdk.

Information about the **/sdk** node is displayed.

3. To find more specific information, select a property from the **Properties for /sdk** drop-down menu:

The help for the property that you selected is displayed in the Output section:

SDK Commands Further Reference

This guide should be used in conjunction with the SDK documentation, which explains the format of queries and results. This document primarily focuses on how to send queries and parameters via the REST API, not how the queries themselves are formatted. The *Core Database Tuning Guide* explains those concepts in detail. Go to the Master Table of Contents for NetWitness Logs & Packets 11.x to find all NetWitness Platform 11.x documents. All metadata returned via REST is encoded as **UTF-8**.

There is another parameter specific to the REST API called **expiry**. This parameter can be set to the number of seconds to wait for a response before the system returns a timeout error. The default is 30 seconds, which is sufficient for most requests. For queries, the standard SDK sets an infinite timeout. If you set **expiry** to zero (`&expiry=0`), this removes the timeout for that request. It is probably a good idea to set a larger timeout for queries and other requests that may take longer than 30 seconds during normal operations.

Security Configuration Guide Overview

This guide provides information about the security configuration settings and security best practices for NetWitness.

This guide applies to NetWitness version 11.0 or later. There will be periodic updates made to the content.

Anyone using this guide should possess experience as a network engineer, equivalent to at least that of a journeyman, and also have a strong understanding of network concepts and TCP/IP communications.

Security Configuration Settings

This topic describes information about various security configuration settings that are designed to help you securely operate NetWitness.

You can adjust the following security configuration settings:

- Access Control Settings
- Log Settings
- Communication Security Settings
- Data Security Settings
- Alert System Settings
- Other Security Considerations

Access Control Settings

Access control settings are designed to enable the protection of resources against unauthorized access or by external components.

- User Authentication
- User Authorization
- Component Authentication

User Authentication

User authentication settings are designed to control the process of verifying an identity claimed by a user for accessing NetWitness.

Multi-Factor Authentication

You can set up Multi-Factor Authentication (MFA) for NetWitness using one of the following methods:

- ADFS Log in to NetWitness with SecurID Passcode
- PAM SecurID Log in to NetWitness for AD Users

For more information, see "Set Up Multi-Factor Authentication" and "Set Up Single Sign-On Authentication" in the *System Security and User Management Guide*.

NetWitness Platform XDR Core Trusted Connection

NetWitness Core has the ability to connect and authenticate over SSL without having to provide user account information on the service itself. This feature is only available over the native port and not the REST interface. For more information on trusted connection, see *Host and Services Getting Started Guide*.Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

User Accounts

The following table identifies the default NetWitness user roles including the Administrator (admin) account and several service accounts. When deploying, you must enter a password for the System Administrator account and all the service accounts. For more information on passwords and password strength, see "Settings Tab" in the *System Security and User Management Guide*.

Note: Custom roles can be added as required. For instructions, see "Add a Service User Role" in the *Host and Services Getting Started Guide*.

User Roles	Description
Administrators	Full system access
Operators	Access to configurations but not to metadata and session content.
Analysts	Access to metadata and session content but not to configurations.
SOC_Managers	Same access as Analysts plus additional permission to handle incidents.
Malware_ Analysts	Access to malware events and to metadata and session content.
Data_Privacy_ Officers	Access to metadata and session content as well as configuration options that manage obfuscation and viewing of sensitive data within the system (see Data Privacy Management).

User Roles	Description
Respond_ Administrator	Access to all Respond server and Incidents permissions.
UEBA_Analysts	Access to the User and Entity Behavior Analytics (UEBA) service in the **Investigate** > **Users** view. UEBA is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all entities in your network environment. **Note:** You do not need to set up specific permissions for this role. You only need to assign this role to a user, and that user will have access to UEBA.

Configuring New Accounts

Each NetWitness user must have an account to log on to the UI. For more information on how to add new user accounts, see "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

Caution: NetWitness recommends that you ensure that users are approved by the company for logging on to the system before creating an account for them. Even if users are approved, NetWitness recommends that you only assign the minimum set of access permissions that enable the users to perform their jobs.

Authentication Configuration

User authentication settings are designed to control the process of verifying an identity claimed by a user for accessing NetWitness. For more information, see "Set Up System Security" in the *System Security and User Management Guide*.

Below are recommendations for some of the configurations:

- **Default System Administrator Account**: NetWitness recommends that you instruct NetWitness administrators on your corporate IT policy and security best practices to generate and manage passwords for the default System Administrator account. NetWitness recommends that you change the default System Administrator password and the admin passwords for the service accounts per your company's password policy. For more information on password strength settings, see "Password Strength" in the *System Security and User Management Guide*. You should change the System Administrator password using the Admin user preferences. For instructions on how to change the password, see "Change the Default admin Passwords" in the *System Security and User Management Guide*.
- **External Authentication**: NetWitness supports external authentication. For more information, see "Configure External Authentication" in the *System Security and User Management Guide*.

User Passwords

NetWitness Users

Administrators can set the appropriate level of password strength for the user and can force users to change their passwords when password strength policy changes. Administrators can specify the global default user password expiration period and the notification period for the password expiry. For more information, see "Configure System-Level Security Settings" in the *System Security and User Management Guide*.

The following table shows the default security parameters settings for passwords.

Caution: NetWitness recommends that you change these settings in accordance with your corporate policy. Users must ensure the idle period and session time-out is specified.

Parameter	Default Setting
Global Default User Password Expiration Period	0
Notify User <n> Days Prior to Password Expiry	5

NetWitness Core Service Users

Administrators can change the password of a service user and replicate the new password to all the NetWitness Core services with the defined user account. For more information, see "Change a Service User Password" in the *Host and Services Getting Started Guide*.

You can also change your password from the Preferences panel in the Profile view. For more information, see "User Preferences" in the *NetWitness Getting Started Guide*.

Security Parameter Settings

The following table shows the default security parameters settings.

Caution: NetWitness recommends that you change these settings in accordance with your corporate policy.

Parameter	Default Setting
Lockout Period	20 minutes
Idle Period	10 minutes
Session Timeout	480 minutes
Max Login Failures	5

For more information on security parameter settings, see "Configure System-Level Security Settings" in the *System Security and User Management Guide*.

Kibana Health and Wellness Interface

You can change the default password of the Kibana UI. For more information, see the "Changing Kibana Password" in the *System Maintenance Guide*.

User Authorization

User authorization settings are designed to control rights or permissions that are granted to a user for accessing a resource managed by NetWitness.

Access Roles

NetWitness allows you to create access roles that you can assign to users. Each access role is mapped to a list of user authorization settings.

For more information, see the following NetWitness topics:

- "Role Permissions" in the *Alerting Using ESA Guide*.
- "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

Note: NetWitness recommends that you review users' task permissions on a routine basis to ensure that each user is granted the correct task permissions.

NetWitness allows access roles to be assigned to users through external group membership or directly to user accounts. NetWitness recommends that you assign permissions through group membership and not assign permissions directly to user accounts. For more information, see "Map User Roles to External Groups" in the *System Security and User Management Guide*.

The user roles assigned also control permissions that are granted to accounts that need access to a specific component of NetWitness.

Component Authentication

This topic describes how component authentication settings control the process of verifying an identity claimed by an external or internal system or component.

Host Configuration and Service Authentication

When you install or upgrade to NetWitness 12.1, trusted connections are established by default with two settings:

1. SSL is enabled.
2. NetWitness is connected to core services using the encrypted SSL port.

NetWitness allows secure authentication services for the following hosts as SSL is enabled by default:

- NetWitness Server
- Decoder
- Log Decoder
- Concentrator
- Broker
- Log Collector
- Archiver
- ESA
- Malware Analysis
- Endpoint
- UEBA

Note: By default all the services on the hosts have SSL enabled.

For more information, see the *Host and Service Getting Started Guide*.

Changing Credentials for Default Configuration Service Accounts

For information on how to reset the password for an admin of the host service accounts, see "Users Tab" in the *Host and Services Configuration Guide*.

Note: The default user name of the host service accounts (admin) cannot be modified.

Configuring Live Account Authentication

NetWitness supports secure authentication for the Live account connection to the Content Management System (CMS) as the SSL is enabled by default. The default communications port on the CMS is 443. For information on how to configure this setting, see "Configure Live Settings" in the *System Configuration Guide*.

Configuring Lockbox Authentication

Lockbox provides an encrypted file that Warehouse Connector or Log Collector uses to store and protect sensitive data. You need to create the lockbox by providing a lockbox password while configuring the Warehouse Connector or Log Collector for the first time. For more information on lockbox setup, see the following topics:

- "Log Collector - Set Up a Lockbox" in the *Log Collection Guide*.
- "Warehouse Connector - Create Lockbox" in the *Host and Services Getting Started Guide*.

Change Root Account Password On All NW Hosts

You must change the default SSH root account password to a strong password in all the hosts in the NetWitness Deployment.

Display Logon Banner for Remote SSH Connections

NetWitness allows you to customize the logon banner to display standard government or corporate warning signs for SSH remote connections to the hosts.

For example:

"This system is private. Use or misuse may be logged and invalid access pursued."

1. Log on to the appliance using root credentials.
2. Type **cd /etc/** to switch to the **/etc/** directory.
3. Edit the **/etc/issue.net** file with the required banner text.
4. Save the changes and exit.
5. Type **cd /etc/ssh** to switch to the **/etc/ssh** directory.
6. Edit the **/etc/ssh/sshd_config** file to remove the comment for the banner and provide the location of the banner text file (For example, **/etc/issue.net**).
   The following file is an example of an **sshd.config** file before being modified:

   ```
   # no default banner path
   #Banner none
   ```

   The following file is an example of an **sshd.config** file after being modified:

   ```
   # no default banner
   #Banner /etc/issue.net
   ```
7. Save the changes and exit.
8. Type **service sshd restart** in order to restart the sshd service.

Secure Boot Loader

A boot loader password is set to prevent unauthorized modification of boot menu entries. Change the default password to a strong password.

To change the boot loader password:

1. Run the grub2-setpassword command as root.

   ```
   # grub2-setpassword
   ```

2. Enter and confirm the password:

   ```
   Enter password:
   Confirm password:
   ```

Disable Interactive Startup

To prevent users from starting up the system interactively, as root, disable the **PROMPT** parameter in the file:

```
"/etc/sysconfig/init"
PROMPT= no
```

Create a Customized Logon Banner for NetWitness Platform

NetWitness allows you to customize and create a login banner that is displayed when users log on to NetWitness. For more information, see "Create a Customized Login Banner" in the *System Security and User Management Guide*.

Log Settings

A log is a chronological record of system activities that enables the reconstruction and examination of the sequence of environments and activities surrounding or leading to an operation, procedure, or event in a security-relevant transaction.

Global Audit Logging provides NetWitness Auditors with consolidated visibility into user activities within NetWitness in real-time from one centralized location. NetWitness audit logs are collected in a centralized system that converts them into the required format and forwards them to an external syslog system. The external syslog system can be a third-party syslog server or a Log Decoder. For more information, see "Global Audit Logging Overview" in the *System Configuration Guide*.

Log Description

The following table shows the security-relevant logs provided by NetWitness.

Component	Reference
Appliance and Service Logs	See the "Services Explore View" and "Services Logs View" in the *Host and Services Getting Started Guide* and "Configure Log File Settings" in the *System Configuration Guide*.
Audit Logs	See "Configure Global Audit Logging" in *System Configuration Guide*.
Syslogs	See "Configure Syslog and SNMP Settings" in the *System Configuration Guide*.

Log Management and Retrieval

For more information on:

- Log settings, see "Configure Log File Settings" in the *System Configuration Guide*.

  Note: NetWitness recommends that you set the maximum log file size in accordance to your corporate policy.

- Log forwarding, see "Set Syslog Forwarding" in the *Host and Services Getting Started Guide*.
- Setting log overrides:
  You may override the default logging levels if you want to include messages generated by specific modules.

  `Syntax: <module>=<level>`

  `SDK-Language=none`

  Where level is one or more of "`none|debug|info|warning|failure|audit|all`", all options must be separated by a pipe |

  `none`

  and

  `all`

are mutually exclusive with each other and all other options.

Overrides are useful for query auditing (that is, those modules that begin with SDK-) or for debugging by module (that is, Index). The following are the type of logs available :

- Data
- Engine
- Index
- Network
- Packet
- Parse
- Decoder
- Rules
- Concentrator
- Appliance
- SDK
- SDK-Query
- SDK-Values
- SDK-Language
- SDK-Info
- SDK-Session
- SDK-Timeline
- SDK-Content
- SDK-Search

Note: NetWitness recommends that you restrict permissions to the log files folder to the appropriate user.

Communication Security Settings

Communication security settings are designed to enable the establishment of secure communication channels between NetWitness components, as well as between NetWitness components and external systems or components.

Port Usage

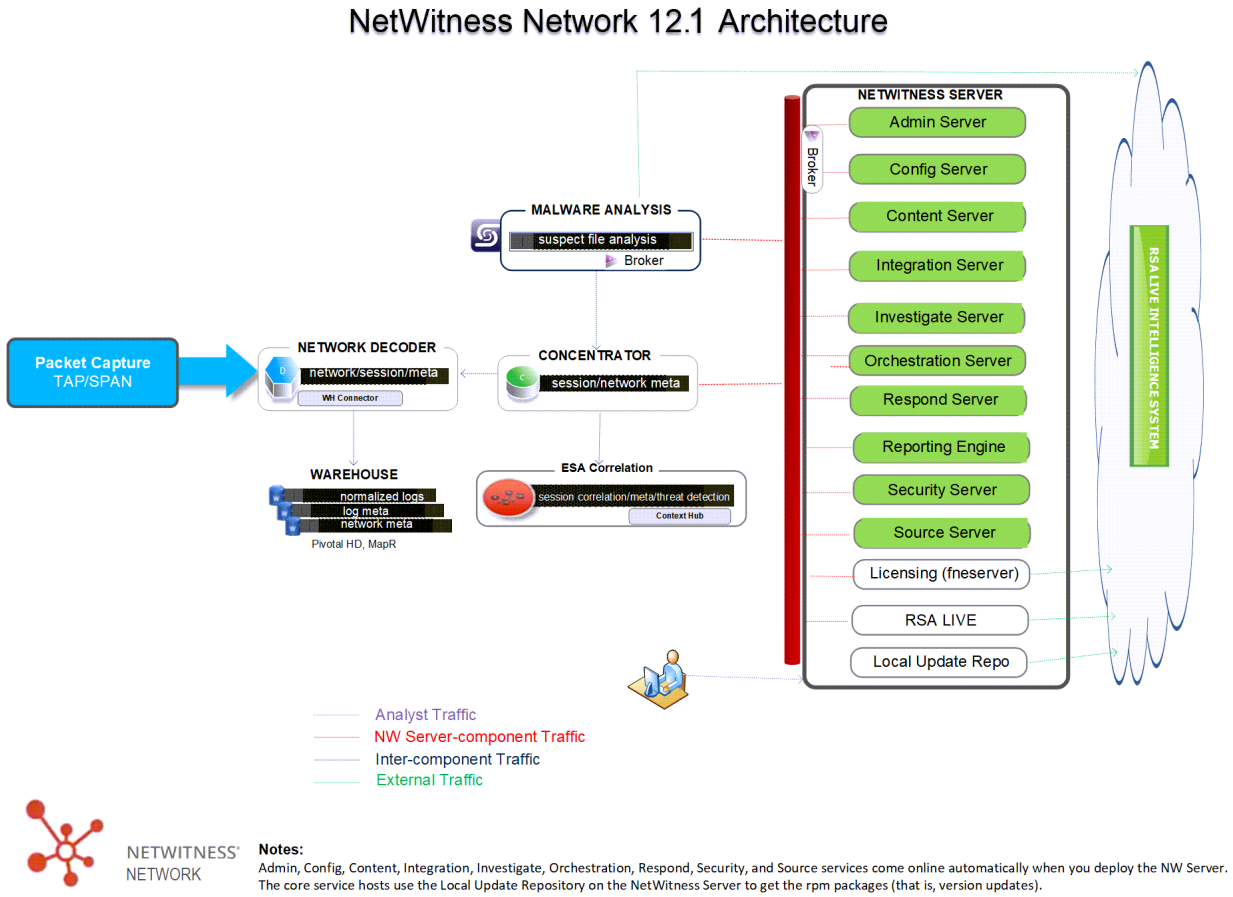
To help ensure security, NetWitness recommends that you configure your firewall rules and access control lists to expose only the ports and protocols necessary for the operation of NetWitness. The services, such as Reporting Engine, Respond Service, Malware, Log Collector, Live account, Broker, Concentrator, Decoder, and Log Decoder, use specific TCP ports to communicate with each other and the following:

- Web user client interfaces
- Live CMS
- LDAP synchronization
- Third-party email server
- NetWitness console

All communication from NetWitness uses the native NetWitness Core ports. The additional native NetWitness Core port per host allows an administrator to enable secure (SSL) network communications while still being able to use non-secure (HTTP and NetWitness Core native) connectivity methods for communication between services that are present on the same host system. Administrators can toggle the ports on and off to support only SSL, only non-SSL, or both.

Refer to the following diagram and port table to ensure that all the relevant ports are opened for components in your NetWitness deployment to communicate with each other.

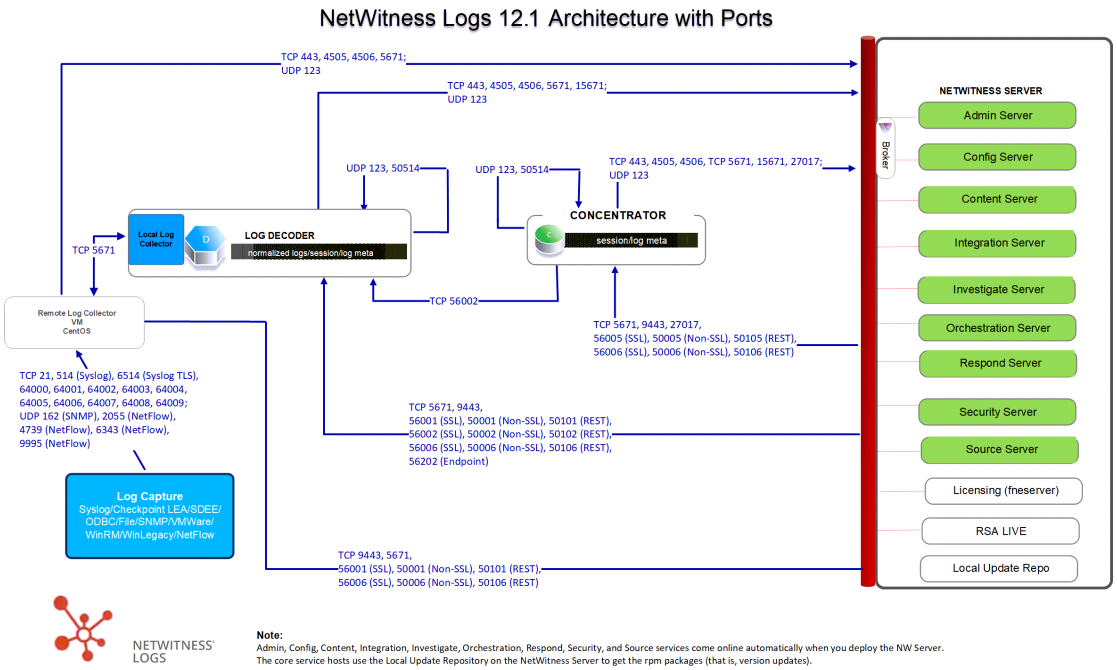
For more information on individual Endpoint Architectural diagrams, see NetWitness Endpoint Architecture at the end of this topic.



Note: enVision Local Collector is not more supported in versions 11.x. Warehouse is supported from version 11.5 and earlier versions.

NetWitness Network Architecture Diagram

The following diagram illustrates the NetWitness network architecture including all of its component products.

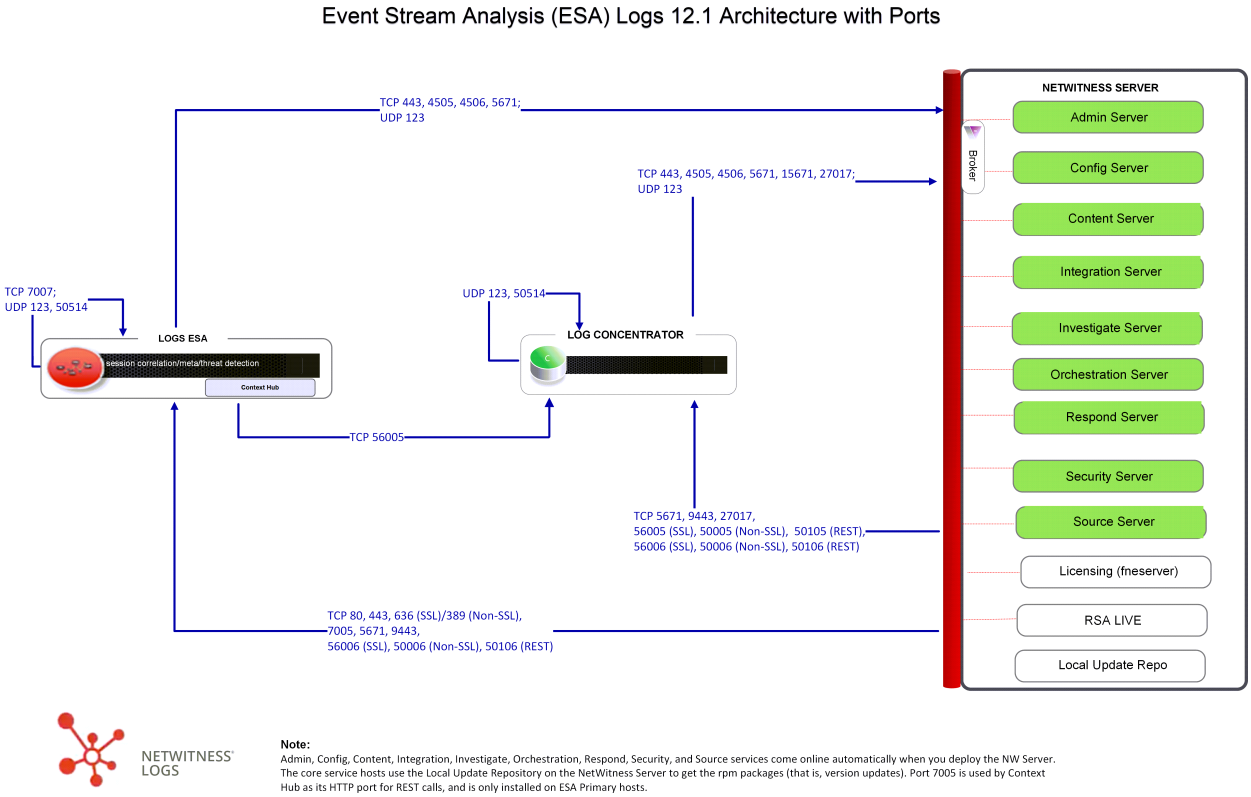


Note: NetWitness core hosts must be able to communicate with the Netwitness Server through UDP port 123 for Network Time Protocol (NTP) time synchronization.

NetWitness Network (Packets) Architecture Diagram with Ports

Notes:
Admin, Config, Content, Integration, Investigate, Orchestration, Respond, Security, and Source services come online automatically when you deploy the NW Server. The core service hosts use the Local Update Repository on the NetWitness Server to get the rpm packages (that is, version updates).

NetWitness Logs Architecture Diagram with Ports



Event Stream Analysis Network (Packets) Architecture Diagram with Ports

The following diagram illustrates the Event Stream Analysis network architecture with packet capture.

Event Stream Analysis (Logs) Architecture Diagram with Ports

The following diagram illustrates the Event Stream Analysis network architecture with log collection.

NetWitness Firewall Requirements Summary

The following table lists all the ports that need to be open in your firewall by host.

Note: The "NW Server" host ports apply to both the Primary and Warm Standby NW Server. Synchronization between the Primary and Warm Stanby is done through TCP Port 22.

Source Host	Destination Host	Ports
NW Server	ESA Primary	**TCP:** 22, 80, 443, 5671, 7005, 50030 (SSL), 50035 (SSL), 50036 (SSL) **UDP:**123
NW Server	ESA	**TCP:** 22, 80, 443, 5671, 50035 (SSL), 50036 (SSL) **UDP**: 123
NW Server	Network Decoder	**TCP:** 22, 5671, 50004 (Non-SSL), 50006 (Non-SSL), 50104 (REST), 50106 (REST), 56004 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Broker	**TCP:** 5671, 50003 (Non-SSL), 50006 (Non-SSL), 50103 (REST), 50106 (REST) 56003 (SSL), 56006 (SSL) **UDP:**123
NW Server	Concentrator (Network & Logs)	**TCP:** 22, 5671, 50005 (Non-SSL), 60006 (Non-SSL), 50105 (REST), 50106 (REST), 56005 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Network Hybrid	**TCP:** 22, 5671, 50004 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50104 (REST), 50105 (REST), 50106 (REST), 56004 (SSL), 56005 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Log Decoder	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Log Hybrid	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56005 (SSL), 56006 (SSL) **UDP:** 123

Source Host	Destination Host	Ports
NW Server	Log Hybrid - Retention	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Endpoint Log Hybrid	**TCP:** 22, 5671, 7050, 7054, 50001 (Non-SSL), 50002 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56005 (SSL), 56006 (SSL), 56202 (Endpoint) **UDP:** 123
NW Server	VLC	**TCP:** 22, 5671, 50001 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50106 (REST), 56001 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Archiver	**TCP:** 22, 514, 5671, 6514, 50006(Non-SSL), 50007 (Non-SSL), 50008 (Non-SSL), 50106 (REST), 50107 (REST), 50108 (REST), 56006 (SSL), 56007 (SSL), 56008 (SSL) **UDP:** 123, 514
NW Server	Malware	**TCP:** 22, 5671, 5432, 50003 (Non-SSL), 50006 (Non-SSL), 50103 (REST), 50106 (REST), 56003 (SSL), 56006 (SSL), 60007 **UDP:** 123
NW Server	UEBA	**TCP:** 22 **UDP:** 123
ESA	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017 **UDP:** 123, 53
ESA	Active Directory	**TCP:** 389 (Non-SSL), 636 (SSL)
ESA	Archer	**TCP:** 80 (Non-SSL), 443 (SSL),
ESA Secondary	ESA Primary	**TCP:** 27017
ESA Primary or Secondary	Concentrator	**TCP:** 50005 (Non-SSL), 56005 (SSL)
Network Decoder	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017, **UDP:** 53, 123

Source Host	Destination Host	Ports
Concentrator (Network & Logs)	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017 **UDP:** 53, 123
Network Hybrid	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017) **UDP:** 53, 123
Log Decoder	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671, 15671, 27017 **UDP:** 53, 123
Log Hybrid	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671,15671, 27017 **UDP:** 53, 123
Log Hybrid - Retention	NW Server	**TCP:** 53, 80, 443, 4505, 4506, 5671,15671, 27017 **UDP:** 53, 123

Comprehensive List of NetWitness Host, Service, and iDRAC Ports

Note: For ports used in event collection through the NetWitness Logs, see the "The Basics" in the *NetWitness Platform Log Collection Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

This section contains the port specifications for the following hosts.

NW Server Host	iDRAC Ports
Analyst UI Host	Log Collector Host
Archiver Host	Log Decoder Host
Broker Host	Log Hybrid Host
Concentrator Host	Log Hybrid - Retention
Endpoint Log Hybrid Host	Malware Host
Endpoint Relay Server	Network Decoder Host
Event Stream Analysis Host	Network Hybrid Host
New Health & Wellness	UEBA Host

NW Server Host (Primary and Warm Standby NW Server Host)

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	NW Server	TCP 443, 80	nginx - NetWitness UI
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
Admin Workstation	NW Server	TCP 22	SSH Primary to Standby NW Server sy nchronization port.
NW Hosts	NW Server	TCP 53 UDP 53	DNS
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 443	RSA Update Repository
NW Hosts	NW Server	TCP 5671	RabbitMQ-amqp
NW Hosts	NW Server	UDP 123	NTP
NW Hosts	NW Server	TCP 27017	MongoDB
NW Server	cloud.netwitness.com	TCP 443	Live
NW Server	cms.netwitness.com	TCP 443	Live
NW Server	smcupdate.emc.com	TCP 443	Live
NW Server	NFS Server	TCP 111, 2049, UDP 111, 2049	iDRAC Installations
NW Server	NW Hosts	UDP 123	NTP
NW Server	NW Endpoint	TCP 443, 9443	For NW Endpoint 4.x integrations

Analyst UI Host

Source Host	Destination Host	Destination Ports	Comments
Analyst UI	NW Server	TCP 7006	The Content Server is listening on this port.
Analyst UI	NW Server	TCP 7009	The Admin Server is listening on this port.
Analyst UI	NW Server	TCP 7012	The Integration Server is listening on this port.
Analyst UI	NW Server	TCP 7015	The Source Server is listening on this port.
Analyst UI	NW Server	TCP 7016	The License Server is listening on this port.
NW Hosts	Analyst UI	TCP 5671	RabbitMQ-amqp
Analyst UI	NW Server	UDP 123	NTP

Note: Make sure you restrict DNS access on the Netwitness Server. You must allow access to DNS service on NetWitness Server only from NeWitness Hosts by adding the firewall rules in NetWitness Server.

Archiver Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Archiver	TCP 15671	RabbitMQ Management UI
Archiver	NW Server	TCP 15671	RabbitMQ Management UI
Archiver	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Archiver	TCP 22	SSH
NW Server	Archiver	TCP 50008 (Non-SSL), 56008 (SSL), 50108 (REST)	Archiver Application Ports
NW Server	Archiver	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Archiver	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
NW Server	Archiver	TCP 50007 (Non-SSL), 56007 (SSL), 50107 (REST)	Workbench Application Ports
Archiver	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations

Broker Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Broker	TCP 15671	RabbitMQ Management UI
Broker	Concentrator	TCP 50005 (Non-SSL), 56005	Concentrator Application Port
Broker	NW Server	TCP 15671	RabbitMQ Management UI
Broker	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Broker	TCP 22	SSH
NW Server	Broker	TCP 50003 (Non-SSL), 56003 (SSL), 50103 (REST)	Broker Application Ports
NW Server	Broker	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Broker	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Broker	NW Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Endpoint Broker	NW Server	TCP 443	RSA Update Repository

Concentrator Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Concentrator	TCP 15671	RabbitMQ Management UI
Concentrator	Log Decoder	TCP 50002 (Non-SSL), 56002 (SSL)	Log Decoder Application Port
Concentrator	Network Decoder	TCP 56004, 50004 (Non-SSL)	Network Application Port
Concentrator	NW Server	TCP 15671	RabbitMQ Management UI
Concentrator	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Concentrator	TCP 22	SSH
NW Server	Concentrator	TCP 50005 (Non-SSL), 56005 (SSL), 50105 (REST)	Concentrator Application Ports
Malware	Concentrator	TCP TCP 50005 (Non-SSL), 56005 (SSL)	Malware
NW Server	Concentrator	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Concentrator	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Concentrator	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations

Endpoint Log Hybrid

Source Host	Destination Host	Destination Ports	Comments
Endpoint Agent	Endpoint Log Hybrid	TCP 443 UDP 444	NGINX HTTPS NGINX UDP. If UDP port 444 is not acceptable in your environment, see How to Change UDP Port for Endpoint Log Hybrid.
Endpoint Agent	Log Decoder or Virtual Log Collector	TCP 514 (Syslog) UDP 514 (Syslog) TLS 6514	Windows Log Collection
Endpoint Log Hybrid	Log Decoder (External)	TCP 50102 (REST) 56202 (Protobuf SSL) 50202 (Protobuf)	To forward meta to an external Log Decoder
Endpoint Log Hybrid	NW Server	TCP 443	RSA Update Repository
NW Server	Endpoint Log Hybrid	TCP 7050	UI web traffic
Endpoint Log Hybrid	NW Server	TCP 5671	Message Bus
Endpoint Log Hybrid	NW Server	TCP 27017	MongoDB
NW Server	Endpoint Log Hybrid	TCP 7054	UI web traffic
NW Server	NFS Server	TCP 111, 2049 UDP 111, 2049	iDRAC Installations
NW Server	Endpoint Log Hybrid	TCP 50001 (Non-SSL), 56001 (SSL), 50101(REST)	Log Collector application ports
NW Server	Endpoint Log Hybrid	TCP 50002 (Non-SSL), 56002 (SSL), 56202 (Endpoint), 50102 (REST)	Log Decoder application ports
Admin Workstation	Endpoint Log Hybrid	TCP 15671	RabbitMQ Management UI
Endpoint Log Hybrid	NW Server	TCP 15671	RabbitMQ Management UI

Endpoint Relay Server

Source Host	Destination Host	Destination Ports	Comments
Endpoint Agent	Relay Server	TCP 443	To forward host data to the Relay Server
Endpoint Log Hybrid	Relay Server	TCP 443	Pull host data from the Relay Server

Event Stream Analysis (ESA) Host

Note: The ports in this table are for the ESA Primary an ESA Secondary hosts. The Content Hub, Correlation and ESA Analytics services are co-located on the ESA Primary host. The Correlation and ESA Analytics services are co-located on the ESA Secondary host.

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	ESA	TCP 15671	RabbitMQ Management UI
ESA Primary and Secondary	NW Server	TCP 15671	RabbitMQ Management UI
ESA Primary and Secondary	NW Server	TCP 443	RSA Update Repository
Admin Workstation	ESA	TCP 22	SSH
NW Server, ESA Secondary	ESA Primary	TCP 27017	MongoDB
NW Server	ESA Primary	TCP 7005	Context Hub Launch Port - (ESA Primary)
NW Server	ESA	TCP 50030 (SSL)	ESA Application Port
NW Server	ESA	TCP 50035 (SSL)	ESA Application Port
NW Server	ESA	TCP 50036 (SSL)	ESA Application Port
NW Server	ESA	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
ESA Primary and Secondary	cms.netwitness.com	TCP 443	Live
ESA Primary and Secondary	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
ESA Primary and Secondary	Active Directory	636 (SSL)/389 (Non-SSL)	
NW Server	ESA	80 (HTTP)/ 443 (HTTPS)(REST)	
ESA Primary	Archer	443 (SSL)/80 (Non-SSL)	
ESA Primary	ESA Primary	TCP 7007	Launch Port

New Health and Wellness

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	New Health and Wellness	TCP 22	SSH
Admin Workstation	New Health and Wellness	TCP 5601	Kibana UI
NW Hosts	New Health and Wellness	TCP 9200	Elasticsearch REST API Port
NW Server	New Health and Wellness	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
NW Server	New Health and Wellness	TCP 15671	RabbitMQ Management UI
NW Server	New Health and Wellness	TCP 7018	Metrics Server Launch Port
NW Server	New Health and Wellness	TCP 7020	Node Infra Server Launch Port

New Health and Wellness on Different Subnet

If the New Health and Wellness is on a different subnet, you must open the respective NetWitness Platform services port.

Example:
New Health and Wellness is on subnet A: 10.10.1.0/24 and NetWitness Platform host LogHybrid is on subnet B: 10.10.2.0/24. In this case, you must open ports for Log Decoder, Log Collector, Concentrator on Metrics Server (New Health and Wellness host) to allow ports in the firewall for communication.

Source Host	Destination Host	Destination Ports	Comments
New Health and Wellness	Log Decoder	50002(Non-SSL),56002 (SSL)	Log Decoder Application Ports
New Health and Wellness	Log Collector	50001(Non-SSL),56001 (SSL)	Log Collector Application Ports
New Health and Wellness	Concentrator	50005(Non-SSL)/56005 (SSL)	Concentrator Application Ports

iDRAC Ports

Port	Function	Comments
22*	SSH	Default, configurable port through which iDRAC listens for connections
443*	HTTP	Default, configurable port through which iDRAC listens for connections
5900*	Virtual Console keyboard and mouse redirection, Virtual Media, Virtual Folders, and Remote File Share.	Default, configurable port through which iDRAC listens for connections
111, 2049	TCP	NetWitness Platform hosts to NFS Server
111, 2049	UDP	NetWitness Platform hosts to NFS Server

Log Collector Host

Source Host	Destination Host	Destination Ports	Comments

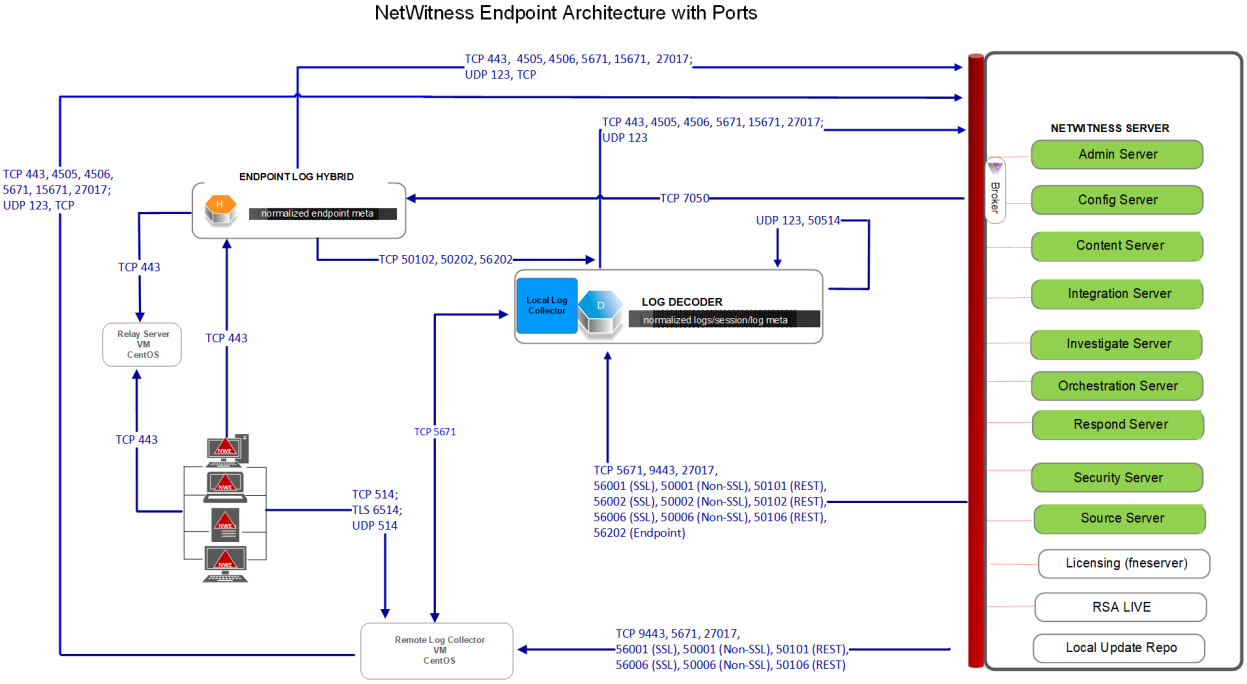
NetWitness Endpoint Architecture



NetWitness Endpoint Architecture

NetWitness Endpoint 4.4 Integration with NetWitness Platform

NetWitness Endpoint Architecture with Ports

For more information on the services running on Endpoint Log Hybrid, see *NetWitness Endpoint Configuration Guide*.

How to Change UDP Port for Endpoint Log Hybrid

The following steps tell you how to change the Endpoint Log Hybrid default UDP port 444 if it is not acceptable in your environment. 555 is the example this procedures uses as a replacement for 444 UDP port.
There are two tasks you need to o change the Endpoint Log Hybrid default UDP port 444:

Task 1 - Tell All Agents to Use a New UDP Port

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

Note: If you did not select the custom firewall rules option when you ran the nwsetup-tui, NetWitness platform overwrites the firewall rules are overwritten after a period of time. Refer to the following Knowledge Base Article 00036446 (https://community.netwitness.com/t5/netwitness-knowledge-base/how-to-add-custom-firewall-rules-after-nwsetup-tui-has-completed/ta-p/5900) if this is the case.

Task 1 - Tell All Agents to Use a New UDP Port

Complete the following steps to update the UDP port in the default Enterprise Data Replication (EDR) policy, and all other policies you have, to tell all agents to use a new UDP port.

1. In the **NetWitness** menu, select **(missing or bad snippet)> Endpoint Sources** > **Policies**. The **Policies** view is displayed.
2. Select the **Default EDR Policy** and click **Edit** from the toolbar.
3. roll down to find the **UDP PORT** and change the value (for example, change from **444** to **555**).
4. Click **Publish Policy** at the bottom of the view.

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

SSH to each Endpoint Log Hybrid host in your environment with `admin` credentials and make the following updates.

1. Update the `iptables` rules to allow `555` in place of `444`.
   a. Replace `444` with `555` in the following file.
   ```
   vi /etc/sysconfig/iptables
   ```
   b. Restart `iptables` with the following command string.
   ```
   systemctl restart iptables
   ```
   c. Verify the change with the following command string.
   ```
   iptables -L -n
   ```
   The following is an example of what is displayed for a correct change.
   ```
   ACCEPT udp -- 0.0.0.0/0 0.0.0.0/0 udp multiport dports 555 /*
   EndpointNginxPort */ ctstate NEW
   ```

2. Update the SELinux policy. 555 is a privileged port, so you must update SELinux policy to allow this port.
   a. Run the following command string.
      `semanage port -a -t http_port_t -p udp 555`
      If you received any python errors or warnings, ignored them.
   b. Verify the change with the following command string.
      `semanage port -l | grep http_port_t`
      The following is an example of what is displayed for a correct change.
      `http_port_t udp 555, 444`
   c. (Optional) Remove `444`.
3. Update nginx config.
   a. Edit the following file.
      `vi /etc/nginx/nginx.conf`
   b. Search for the following string.
      `listen 444 udp;`
   c. Replace `444` with `555`.
   d. Restart nginx with the following command string.
      `systemctl restart nginx`
4. Verify that agents are communicating over the new port.
   a. Run the following command string.
      `tcpdump -i eth0 port 555`
   b. Wait for 30 seconds because the port sends out a beacon every 30 seconds. If t everything is working correctly, information similar to the following will be displayed.
      `09:20:12.571316 IP 10.40.15.103.60807 > EPS1.rsa.lab.emc.com.dsf: UDP, length 20`
      `09:20:12.572433 IP EPS1.rsa.lab.emc.com.dsf > 10.40.15.103.60807: UDP, length 1`
      Both lines must be returned. One is the size request (`20` bytes) and the other is the response size (`1` byte).

Note: For the latest architecture and port usage information, see "Network Architecture and Ports" topic in the *NetWitness Deployment Guide*.

Network Encryption

You can configure NetWitness Platform XDR to send or receive data from external data sources.

Note: NetWitness recommends that whenever you have the option to choose between unsecured and secured versions of a communication protocol, you choose the secured version.

NetWitness Platform Web Server Communications

The NetWitness Platform UI or web server communicates with the Live Service (CMS) over port 443 using the HTTPS protocol.

Note: During installation, the system is engineered to set the default communication protocol to HTTPS over port 443.

Reporting Engine, ESA and Warehouse Connector : External Communication

NetWitness recommends that you use the secure TCP protocol and enable an SSL connection while configuring Reporting Engine, ESA, Warehouse Connector, Licensing, and Malware.

For more information on Reporting Engine, see "Configure Output Actions" in the *Host and Services Getting Started Guide*.

For more information on Malware external communication, see " Configure Malware Analysis Operating Environment" in the *Host and Services Getting Started Guide*.

For more information on ESA, see " Notification Methods" in the *Alerting Using ESA Guide*.

For more information on the Warehouse Connector, see "Configure Warehouse Connector" in the *Host and Services Getting Started Guide*.

For more information on Licensing, see "Configure NetWitness Platform Notifications" in the *Licensing Management Guide*.

Log Collector Service

To help secure communication between the Log Collector service running on the Log Decoder and the event sources, NetWitness recommends the following protocols.

Event Source	Protocol	Resources
File	SFTP, SCP, FTPS	For more information, see " File Collection Protocol Configuration" in the *Log Collection Guide*.

Event Source	Protocol	Resources
ODBC	ODBC	For more information on configuring an ODBC event source, see "ODBC Collection Configuration" in the *Log Collection Guide*. **Note:** Depending on the event source, administrators can configure additional progress driver parameter for secure connections. For more information, see the Progress document at https://www.progress.com/odbc/resources/documentation/books-and-readme-file. For more information on using a certificate, see the certificate creation kit at http://openssl.org/. For more information on securing communication with SQL Server, Oracle, and ODBC, see the URLs: http://technet.microsoft.com/en-us/l...QL.105%29.as http://technet.microsoft.com/en-us/l.../cc754431.aspx http://www.oracle.com/technetwork/database/options/advanced-security/overview/index.html http://www.psdn.progress.com/progres...92/odr/odr.pdf
Windows	HTTPS	For more information on configuring a Windows event source to use certificates and enable HTTPS, see the NetWitness Platformhelp topics in the *Windows Collection Configuration Guide*.
Check Point	OPSEC LEA	For more information on configuring a Check Point event source to use certificates, see the NetWitness Platform help topics in the *Check Point Collection Configuration Guide*.
Netflow	Netflow	For more information on configuring a Netflow event source to use certificates, see the NetWitness Platform help topics in the *Netflow Collection Configuration Guide*.
SDEE	SDEE	For more information on configuring a SDEE event source to use certificates, see the NetWitness Platform help topics in the *SDEE Collection Configuration Guide*.
SNMP	SNMP	For more information on configuring a SNMP event source to use certificates, see the NetWitness Platform help topics in the *SNMP Collection Configuration Guide*.
VMware		For more information on configuring a VMware event source to use certificates, see the NetWitness Platform help topics in the *VMware Collection Configuration Guide*.
Legacy Windows and NetApp		For more information on configuring a Legacy Windows event source to use certificates, see the NetWitness Platform help topics in the *Legacy Windows and NetApp Collection Configuration Guide*

Event Source	Protocol	Resources
Amazon Web Services (AWS) Cloud Trail	HTTPS	For more information on configuring an AWS Cloud Trail event source to use certificates, see the NetWitness Platform help topics in the *AWS (CloudTrail) Collection Configuration Guide*.

Note: For more information on enabling SSL for component communications, see Component Authentication.

Enabling HTTPS on REST Interfaces for Core Services

To enable HTTPS on REST interfaces

1. Log in to REST interface.
2. Go to the **rest** > **config** node.
3. Set **SSL** config to **on**.
4. Restart the service.

Data Security Settings

Data security settings are designed to enable the definition of controls to prevent data permanently stored by NetWitness from being disclosed in an unauthorized manner.

Securing Data

To help protect online data, such as current database, log, and configuration files, NetWitness recommends that you restrict access to the files, database and configure permissions so that only trusted administrators are allowed to access them.

NetWitness recommends that you back up your sensitive data, encrypt it, and keep it in a secure physical location in accordance with your corporate disaster recovery and business continuity policies.

The backup can be done in the following ways:

- Regular backup of Configuration and Data files – You can back up and restore data and configuration files for the core host and services and all the modules of NetWitness. For more information, see the *NetWitness Recovery Tool User Guide*.
- Regular backup of critical configuration – You can export configurations using the Export option available on the UI. For example, you can take a backup of critical rules, reports, alerts, ESA rules, dashboards, investigation profiles, metadata groups, event sources, global notifications, and so on. For more information, see topics:
  - "Export a Rule, Export an Alert and Export a Report" in the *Reporting Guide*.
  - "Rule Library View and Dashboard" in the *Alerting using ESA Guide*.
  - "Manage Profiles Dialog and Export a Meta Group" in the *Investigation and Malware Analysis Guide*.
  - "Events View and Export Event Sources" in the *Event Source Management Guide*.
  - "Global Notifications Panel Toolbar" in the *System Configuration Guide*.

Data Privacy

Data Privacy is very integral and helps you manage privacy-sensitive data. You can achieve data privacy using the Data Privacy Officer (DPO) role. The DPO can configure NetWitness to limit the exposure of metadata and raw content (packets and logs) using a combination of techniques. The methods available to protect data in NetWitness include:

- Data Obfuscation
- Data Retention Enforcement
- Auditing Logging

For more information, see topics in the *Data Privacy Management Guide*.

Default Storage Passwords

The default storage passwords for database accounts that store alerts in ESA, and Respond Service can be changed. For more information, see "Change Default Storage Passwords" in the *Host and Services Getting Started Guide*.

Alert System Settings

For instructions on configuring NetWitness to send alerts or notifications, see the following topics in the *System Configuration Guide*:

- "Email Configuration Panel"
- "Global Audit Logging Configurations Panel"
- "Global Notifications Panel"

FIPS Compliance

This topic provides information on the Federal Information Processing Standards (FIPS) compliant mode for NetWitness. The FIPS publications are guidelines that set best practices for software and hardware security products for the protection of valuable and sensitive information.

When the FIPS compliant mode is used, products that support one or more FIPS standards can be set into a mode where the product uses FIPS approved algorithms and methods only.

NetWitness supports both FIPS approved and non-FIPS approved functions. In FIPS mode, the product is incapable of using any non-FIPS approved methods.

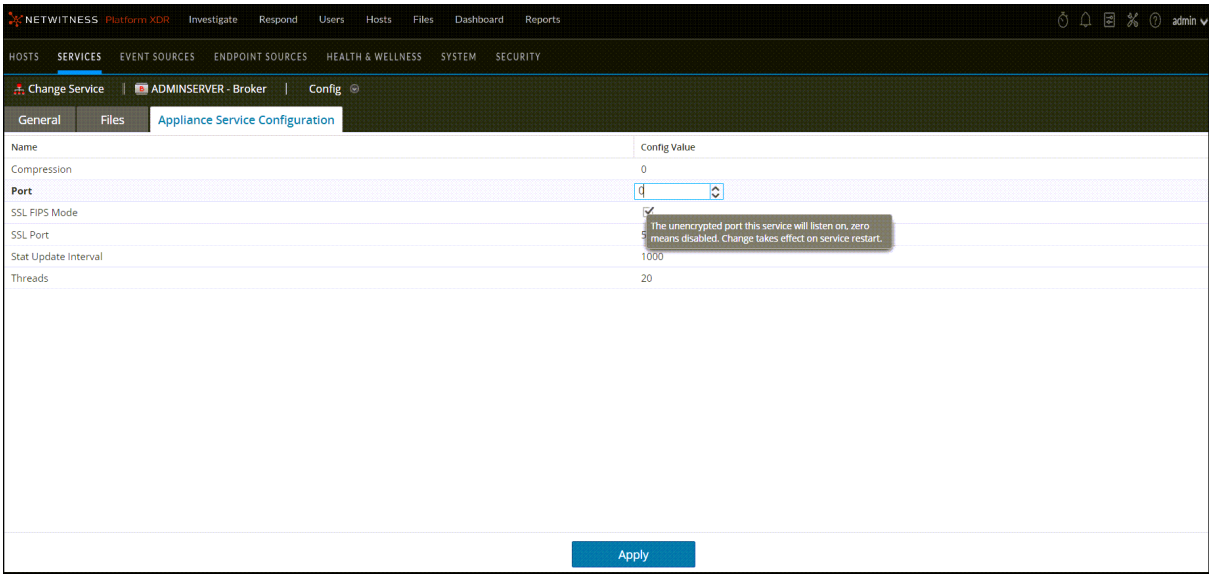
NetWitness Platform XDR Components working in FIPS mode

The table below lists the NetWitness components that work in FIPS mode. The method you use to activate or deactivate FIPS depends on the type of security library used by your NetWitness services. Your NetWitness services use the security libraries, as mentioned in the following table.

Services	Security Library
Event Stream Analysis (ESA), Malware Analysis, Reporting Engine, NetWitness Host, Respond Service, Context Hub and Endpoint	BSAFE
Broker, Concentrator, Decoder, Log Decoder, Warehouse Connector, Archiver, and Workbench	BSAFE

FIPS 140-2 Certified Cryptographic Modules are enabled for all services that perform cryptographic operations. For the following services, although the FIPS Cryptographic Module is leveraged, the use of FIPS cipher suites is not being enforced:

- NTP: UPD Port 123
- TCP: SSH Port 22
- TCP: Salt API Loopback Port 8000
- CollectD
- Log Collector
- Log Decoder



Common Criteria Compliance

This topic provides information on Common Criteria Compliance for NetWitness NetWitness.To support this requirement, you must ensure that only a secure communication is configured for the core services. To achieve this you must disable the unencrypted ports for the NetWitness core services.

Disabling Unencrypted Ports For NetWitness Core Services

To disable an unencrypted port for a NetWitness core service:

1. Log in to NetWitness Platform XDR.
2. Go to  **(Admin) > Services**.
   The Services page is displayed.
   Select a core service to configure.
3. Click  and select **View** > **Config**.
4. Click the **General** tab.
5. In the **Port** field under the System Configuration section, replace the existing value with **0**.
6. Click the **Appliance Service Configuration** tab.
7. In the **Port** field, replace the existing value with **0**
   .

8. Click **Apply** and restart the service, if prompted.

Note: After you apply the changes only the SSL port is configured for the service and no unencrypted interfaces are available to interact with the service.

STIG Compliance

Overview

Note: Security Technical Implementation Guide (STIG) Compliance is available in NetWitness.

This topic provides information on Security Technical Implementation Guide (STIG) Compliance.

STIG Limits Account Access

NetWitness 11.3.1 and later, is STIG compliant which helps to lock down information, systems, and software, which might otherwise be vulnerable to a malicious computer attack by limiting account access to a system.

For example, STIG:

- Ensures that the account password has a length, complexity, expiration period, and lockout period that are in accordance with DISA's best practices.
- Applies auditing and logging of user actions on the appliance.

To be STIG compliant, your organization must implement policies that ensure strong passwords. For more information about STIG and STIG exceptions, see DISA STIG in the *System Maintenance Guide*.

Other Security Considerations

This topic describes various other security configuration settings that are not covered in previous sections.

Changing the RabbitMQ Management Password for Windows Legacy Collectors

For Windows Legacy Log Collectors (WLCs), a default password is used for the "logcollector" username to access the RabbitMQ broker on that machine. NetWitness recommends that you change the password for WLCs, per the procedure outlined, which involves changing the RabbitMQ password for the Log Collector and for the RabbitMQ broker.

Note: For CentOS, changing the RabbitMQ password is not supported.

If you are using a Log Collector, you may have to initialize the "lockbox". For instructions, see "Set Up a Lockbox" in the *Log Collection Guide*.

To change the RabbitMQ password

1. Change the RabbitMQ password in Log Collector:
   a. Go to the Explore view for the Log Collector service.
   b. Right-click the **event-broker** node and select **config**.
   c. Type the new password in the **amqp_password** field. The password is encrypted by a key that is managed through the lockbox of this Log Collector. This only changes the password on the Log Collector side.

   Note: Most of the settings should not be changed. Ensure you do NOT change the Message Queue User Name "amqp_username" because it is referred to in some certificate checks.
2. Change the RabbitMQ password for the RabbitMQ broker:
   a. Go to the Explore view for the Log Collector service.
   b. Right-click the **event-broker** node and select **properties**.
   c. Select **passwd** in the drop-down list.
   d. In the **Parameters** field, type the old and new password.
   Ensure you remember your old password. If it was never changed, it should be "netwitness" by default.
   Example: `Parameters: oldpw=<netwitness> newpw=<YourNewPasswordHere>`
   e. Click **Send**.

Hardening the NetWitness Platform XDR Core service

By default, all NetWitnessCore services ship with a default username and password and with SSL turned off. To harden the service, you have to run it with the command line option `-s harden=true`

Using a Decoder, here's an example command line:

```
NwDecoder -s harden=true -s defaultUsername=<username> -s
defaultPassword=<password>
```

The above command does the following:

1. Removes the default admin account (with caveats, see below).
2. Creates a new account <username> with a password of <password> (thus meeting the password requirements below).
3. Enables SSL on both the native and REST ports.
4. Strengthens default password requirements:
   - /users/config/account.lockout.time = 60
   - /users/config/password.alpha.lowercase.min = 1
   - /users/config/password.alpha.uppercase.min = 1
   - /users/config/password.length.min = 8
   - /users/config/password.numeric.min = 1
   - /users/config/password.symbol.min = 1
5. Sets /rest/config/user.agent.whitelist = Apache-HttpClient/\d\.\d\.\d

   Note: This setting prevents the browsers to connect to the REST port.

The caveat for changing the default user account is that there cannot be an already existing configuration file. This is always true the first time the service is run or before the service is licensed. To harden a service, you must run it before a configuration is written or delete whatever configuration file exists and then harden.

To alter the command line for a service that writes its own upstart script without actually SSHing into the box and modifying the script, there is a new parameter that you can pass to either the /sys shutdown or /decoder reset command (substitute decoder for the actual service name) and this parameter is called "cl" for command line. What you do is pass name=value pairs to the "cl" parameter and those parameters will take affect on the next restart of the service.

Example:

```
/sys shutdown reason="Restart because license was applied"
cl="harden=true default
Username=<username> defaultPassword=<password>"
```

The above command shuts down the service (which should be restarted by Linux upstart) and the command line parameters will be applied on the restart. This command line exactly matches the command line given above for the decoder service. If you want to do a configuration reset, you can use the following:

```
/broker reset config=true cl="harden=true defaultUsername=<username>
defaultPassword=<password>"
```

This will delete the broker configuration file and create a new default configuration that is automatically hardened with the given default account and credentials. The admin account will not exist when the broker restarts, only the <username> account exists.

NFS Access Controls

By default, the NFS mounts are wide open. To lock them down to a specific address, you must edit the exports file and specify the IP addresses that are allowed to interact with the SAW.

The SAW NFS service is managed from the command line using *mapr-nfsserver*.

```
[root@saw-node1 ~]# service mapr-nfsserver
Usage: /etc/init.d/mapr-nfsserver {start|stop|status|restart|}
[root@saw-node1 ~]# service mapr-nfsserver status
nfsserver (pid 5692 5691) is running...
[root@saw-node1 ~]#
```

If nfs-utils is installed on the node, you can execute a *showmount* on the localhost to see the exposed exports.

```
[root@saw-node1 ~]# showmount -e localhost
Export list for localhost:
/mapr *
/mapr/saw *
[root@saw-node1 ~]#
```

Exports are controlled using the exports file in the */opt/mapr/conf* directory.

```
[root@saw-node1 ~]# cat /opt/mapr/conf/exports
# Sample Exports file
# for non /mapr exports
# <Path> <comma separated cldb addresses=host:port> <exports_
control>
# for /mapr exports
# <Path> <exports_control>
#access_control -> order is specific to default
# list the hosts before specifying a default for all
# a.b.c.d,1.2.3.4(ro) d.e.f.g(ro) (rw)
# enforces ro for a.b.c.d & 1.2.3.4 and everybody else is rw
# special path to export clusters in mapr-clusters.conf. To disable
exporting,
```

```
# comment it out. to restrict access use the exports_control
#
/mapr (rw)
#to export only certain clusters, comment out the /mapr & uncomment.
# Note: this will cause /mapr to be unexported
#/mapr/clustername (rw)
#to export /mapr only to certain hosts (using exports_control)
#/mapr a.b.c.d(rw),e.f.g.h(ro)
# export /mapr/cluster1 rw to a.b.c.d & ro to e.f.g.h (denied for
others)
#/mapr/cluster1 a.b.c.d(rw),e.f.g.h(ro)
# export /mapr/cluster2 only to e.f.g.h (denied for others)
#/mapr/cluster2 e.f.g.h(rw)
# export /mapr/cluster3 rw to e.f.g.h & ro to others
#/mapr/cluster2 e.f.g.h(rw) (ro)
[root@saw-node1 ~]#
```

To restrict the SAW exports to a certain IP address or group of IPs, you must first edit the exports file and then restart the *mapr-nfsserver service*.

```
[root@saw-node1 ~]# vi /opt/mapr/conf/exports
[root@saw-node1 ~]# cat /opt/mapr/conf/exports | grep ^/mapr
/mapr 10.42.1.87(rw)
[root@saw-node1 ~]# showmount -e localhost
Export list for localhost:
/mapr *
/mapr/saw *
[root@saw-node1 ~]# service mapr-nfsserver restart
[root@saw-node1 ~]# showmount -e localhost
Export list for localhost:
/mapr 10.42.1.87
/mapr/saw 10.42.1.87
[root@saw-node1 ~]# mount -t nfs -o nolock,tcp localhost:/mapr/saw
/saw
mount.nfs: access denied by server while mounting
localhost:/mapr/saw
[root@saw-node1 ~]#
```

Note: Trying to mount the export on the localhost will fail as only a specific host IP is now allowed to use the NFS mount.

Secure Deployment and Usage Settings

This topic describes the settings for secure deployment and usage. It is very important to protect all physical, local, and remote access to the NetWitness appliances. It is also important to restrict all access methods to the absolute minimum required to maintain NetWitness.

Note: NetWitness recommends that you do not set up the test environments to be exact copies of the full production environment. If the test environment is identical to the production environment, you should take the same precautions to protect the test environment as you do in the production environment.

Security Controls Map

This topic describes the security controls map. An NetWitness deployment can consist of the following components:

- Decoder
- Log Decoder
- Concentrator
- Broker
- Log Collector
- Context Hub
- Malware
- ESA
- Archiver
- NetWitness Server
- Endpoint
- UEBA Server

NetWitness supports integration with products such as NetWitness 4.x and Archer.

NetWitness recommends that you access the host on secure client machines within the network. If you must access the host through remote access, NetWitness recommends that you connect to the network through a secure VPN connection. Only allow remote access to NetWitness hosts for secure maintenance using the Remote Desktop Protocol (RDP) through a secure VPN connection.

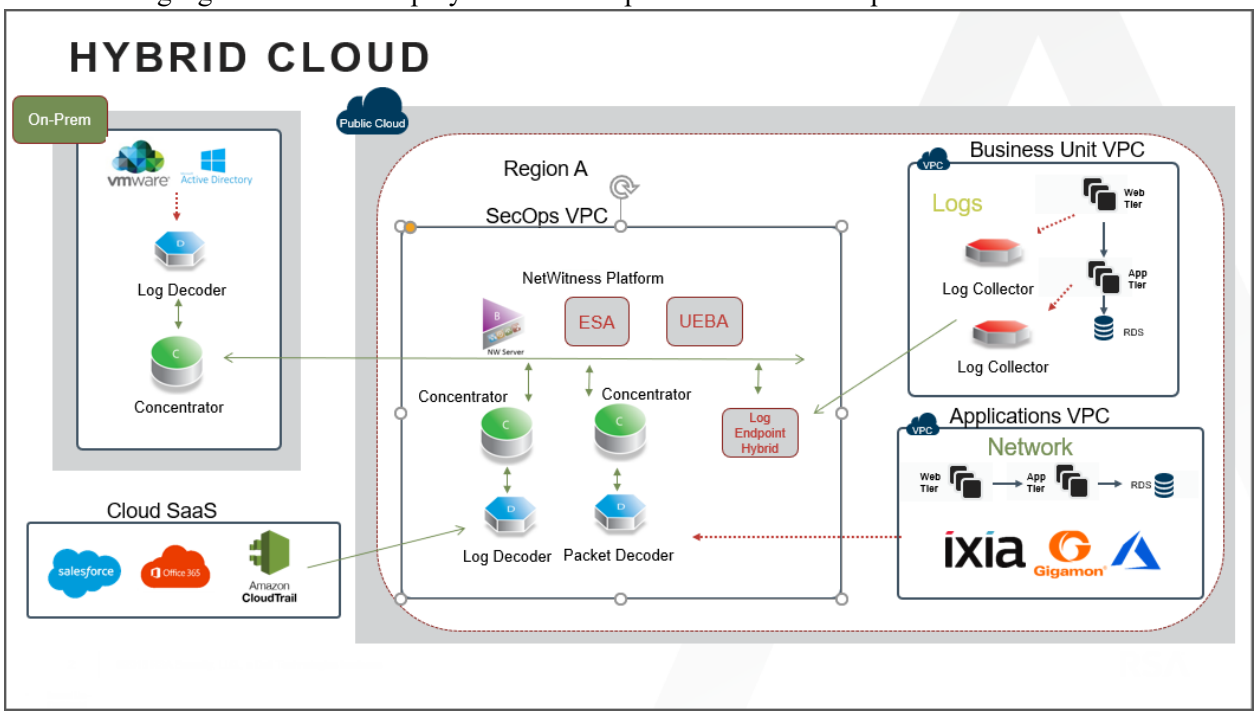
Caution: NetWitness recommends that you deploy the hosts in a secure location, where physical access to the hosts are restricted only to the personnel who manage the hosts.

Secure Enclave

To help protect NetWitness against unauthorized authentication and access by end users or machines, NetWitness recommends that you deploy NetWitness hosts such as Broker, Concentrator, and Decoder.

You can help create a secure enclave by separating the low security corporate network from the high security network with firewalls. To help create a secure enclave, NetWitness recommends that you:

- Implement basic physical security elements, policies, procedures, and processes for the low security network.
- Provide access to the hosts within the secure enclave through a secure virtual private network (VPN) tunnel only, such as IPSec tunnel, to establish encryption and authentication of all network traffic to and from the hosts.



Note: The client machines through which you access NetWitness can be present outside of the Secure Enclave.

Secure Deployment Guidelines

To help ensure a secure deployment, NetWitness recommends that you:

- Deploy multiple hosts in the corporate network. The multiple hosts in the example are in two geographic locations and include the following components:
  - NetWitness
  - Broker
  - Packet Decoder
  - Log Decoder
  - Concentrator
  - ESA
  - Archiver
  - NetWitness Warehouse
  - Malware Analysis
  - Endpoint
  - UEBA Server
- Ensure that all the components are connected to the same subnetwork.
- Deploy firewalls at each site to ensure the secure transfer of data from an instance of NetWitness at one site to another instance of NetWitness located at a different site.
- Configure firewall rules to control all communication between different sites and other components in the network as depicted in the previous figure.
- Implement data transfer between sites using a secure tunnel IPSec.

The following figures show the deployment of multiple sites within a corporate network:

Firewall Rules

It is important that you use a firewall to restrict network traffic between NetWitness and external systems. NetWitness recommends that you configure firewall rules to help ensure secure communication for the following connections:

- Demilitarized zone (DMZ) to corporate network
- Corporate network to site sub network
- Site to site
- Live CMS to DMZ
- External email server to DMZ

Note: NetWitness recommends that you restrict access from client hosts to only known IP addresses. For example, if you set up the NetWitness Client UI on IP address 192.168.0.1, configure your firewall to allow only the IP address 192.168.0.1 to connect to the NetWitness host.

Note: The firewall rules should be configured on an external firewall and not on any of the NetWitness host.

NetWitness recommends that you configure firewall rules as described in the sections below. These recommendations are based on the following assumptions:

- You have a stateful firewall, indicating that only the establishment of TCP ports is considered.
- You specify the direction of communication for the UDP ports because the connections are sessionless.
- You deploy NetWitness as shown in the Security Controls Map.
- The firewall processes the rules top to bottom, finishing with a generic drop of all the packets.

DMZ to Corporate Network

NetWitness recommends that you:

- Configure whitelist communication from the VPN server in the DMZ to the client machines on which you run NetWitness applications such as NetWitness Web UI.
- Create firewall rules for all the machines from which you intended to remotely access the corporate network through Remote Desktop Protocol (RDP).

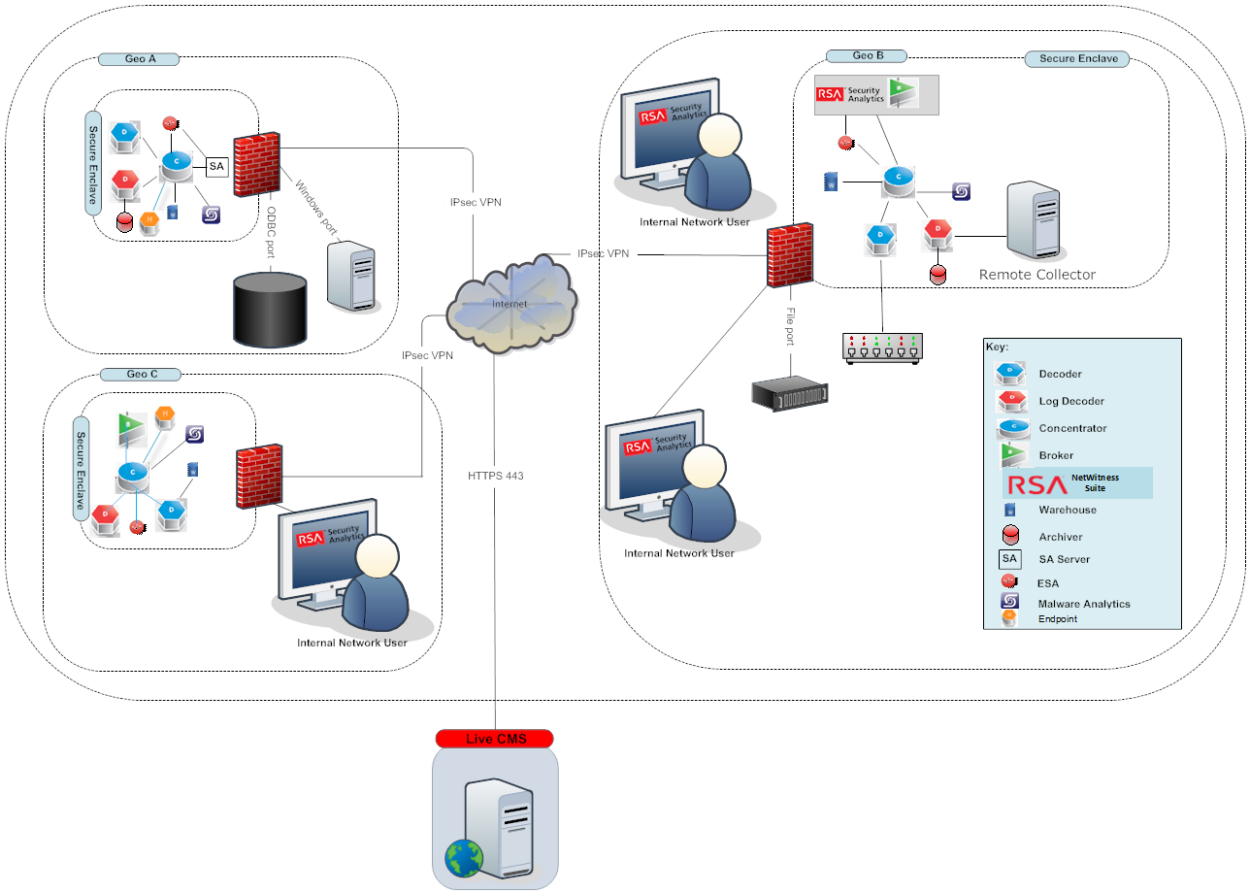
Corporate Network to Site

NetWitness recommends that the firewall at each NetWitness site allow access only from designated client machines through a whitelisted IP address and port.

NetWitness recommends that you secure the following ports to ensure secure communication between the client machine that is set as the NetWitness Web UI and the NetWitness site:

- TCP 443

For more information, see Communication Security Settings. To help ensure secure communication between the client machines that access the NetWitness UI and a site, you must set up the firewall rules as shown below:



ALLOW $nwclient_IP to $nwsite_IP on port 443/tcp

DROP all from * to *

where **nwclient_IP** is the IP address assigned to the client machine that is set as the NetWitness web UI and **nwsite_IP** is the IP address assigned to the Broker host within which the NetWitness web server is running.

Site to Site

NetWitness may run in multiple sub-networks within your corporate network, called sites. You can configure NetWitness to allow the hosts located in one site to communicate with the hosts in another site.

For this scenario, NetWitness recommends that you do the following:

- Ensure that the firewall at each NetWitness site allows communication between two sites only through a whitelisted IP address and port. For a graphical depiction of the site-to-site security control map showing the site firewalls, see the above figure.
- NetWitness system update uses port 80. That means NetWitness site to another site (where brokers, decoders exist), port 80 should be open.

Live CMS to DMZ

To ensure secure communication between the NetWitness site and Live CMS, set up the firewall rules as shown below:

ALLOW $nw_site_IP to $Live_IP on port 443/tcp

DROP all from * to *

where **nw_site_IP** and **Live_IP** are the IP addresses assigned to the NetWitness site and the Live CMS respectively.

Note: If you are using proxy server with self-signed certificate, you must add exception in proxy server rule to allow traffic between Live CMS server (cms.netwitness.com, port 443) and NetWitness.

RSA Download Central to DMZ

To ensure secure communication between the NetWitness site and RSA Download Central, set up the firewall rules as shown below:

ALLOW $nw_site_IP to $rsa_DLC_IP on port 80/tcp

DROP all from * to *

where **nw_site_IP** and **rsa_DLC_IP** are the IP addresses assigned to the NetWitness site and RSA Download Central respectively.

External Email Server to DMZ

To ensure secure communication between the NetWitness site and the External Email Server, set up the firewall rules as shown below:

ALLOW $nw_site_IP to $Email_IP on port 443/tcp

DROP all from * to *

where **nw_site_IP** and **Email_IP** are the IP addresses assigned to the NetWitness site and the external email server respectively.

Syslog Server to Site

If you have enabled the syslog port, to ensure secure communication between the NetWitness site and the Syslog Server, set up the firewall rules as shown below:

ALLOW $nw_site_IP to $Syslog_IP on port 514/udp

DROP all from * to *

where **nw_site_IP** and **Syslog_IP** are the IP addresses assigned to the NetWitness site and the syslog server respectively.

SNMP Server to Site

If you have enabled the SNMP port, to ensure secure communication between the NetWitness site and the SNMP Server, set up the firewall rules as shown below:

ALLOW $nw_site_IP to $SNMP_IP on port 1610/SNMP

DROP all from * to *

where **nw_site_IP** and **SNMP_IP** are the IP addresses assigned to the NetWitness site and the SNMP server respectively.

Secure Deployment Settings

The following table shows the security controls that NetWitness recommends putting in place to help secure the deployment.

Default Deployment Setting	Secure Deployment Settings	Pros of Secure Deployment Settings	Cons of Secure Deployment Settings	Instructions on how to configure secure deployment settings
HTTPS is enabled by default between the NetWitness client and the server	For the best possible security between the client and the server, use certificates from CA.	Provides a high level of protection for the communication between client and server by avoiding tampering, spoofing, and man-in-the middle attacks.	May have impact on performance	For instructions on installing external certificates, see SSL Certificate Guidance for NetWitness

Secure Maintenance

This topic describes some common solutions to help ensure secure maintenance.

Security Patch Upgrade

To apply security patches to any of the required release, see the *Upgrade Guide* for the specific upgrade version.

Security Patch Management

All security patches for NetWitness originate at NetWitness and are available for you via the NetWitness User Interface. For more information, see "Manage NetWitness Updates" in the *System Maintenance Guide* .

The following table lists the third-party components for which patches are needed.

Third-party Component for which patch is needed	Frequency of Patch	EMC Responsibility (Y/N)	Customer Responsibility (Y/N)	Reference to instructions for Applying Patch
NetWitness Hosts	Monthly and Quarterly	Y	Y	Based on NetWitness recommendations

Virus Scanning

NetWitness recommends that you:

- Deploy anti-virus client software on the deployed servers in accordance with your enterprise requirements.
- Run anti-virus and anti-malware tools with the most current definition files on the deployed servers.
- Scan all files/drivers before uploading on the deployed server.
- Follow best practices for patch management and regularly review available patches for all anti-virus and anti-malware software.

Ongoing Monitoring and Auditing

As with any critical infrastructure component, NetWitness recommends that you constantly monitor your system and perform periodic and random audits (for example, configuration, permissions, and security logs). You should ensure that the configurations and user access settings match your company policies and needs. For more information, see "Global Audit Logging Configurations Panel" in the *System Configuration Guide*.

Hardware Replacement

If NetWitness hardware fails or is faulty, order a replacement by contacting NetWitness Customer Support. While awaiting a replacement, the Redundant Array of Independent Disks (RAID) configuration is designed to ensure that there is no data loss due to a hardware failure.

The RAID configuration on NetWitness:

- Hosts are RAID 1.
- Direct Attach Capacity (DAC) disk shelves is RAID 5.

Physical Security Controls Recommendations

Physical security controls help to enable the protection of resources against unauthorized physical access and physical tampering. NetWitness recommends that the physical devices and servers for NetWitness are deployed in a secure data center leveraging the organization's best practices for physically securing a data center, server rack, and/or server.

Supporting Users

This topic describes well-defined policies around help desk procedures for your NetWitness installation.

It is important to have well-defined policies around help desk procedures for your NetWitness installation. NetWitness recommends that your help desk administrators understand the importance of password strength and the sensitivity of data, such as user logon names and passwords. Creating an environment where an end user is frequently asked for this kind of sensitive data increases the opportunity for social engineering attacks. Train end users to provide, and help desk administrators to request, the least amount of information needed in each situation.

Preventing Social Engineering Attacks

Fraudsters frequently use social engineering attacks to trick unsuspecting employees or individuals into divulging sensitive data that can be used to gain access to protected systems. NetWitness recommends that you use the following guidelines to help reduce the likelihood of a successful social engineering attack:

- Help desk administrators should only ask for User IDs over the phone when receiving help desk calls. Help desk administrators should never ask for user passwords.
- The help desk telephone number should be well known to all users.
- Help desk administrators should perform an action to authenticate the user's identity before performing any administrative action on a user's behalf. For example, ask users one or more questions to which only they know the answer.
- If help desk administrators need to initiate contact with a user, they should not request any user information. Instead, users should be instructed to call the help desk back at a well-known help desk telephone number to ensure that the original request is legitimate.

Confirming User Identities

It is critical that your help desk administrators verify end users' identities before performing any help desk operations on their behalf. NetWitness recommends that you verify user identity using the following methods:

- Call the end user back on a phone owned by the organization and on a number that is already stored in the system.

Caution: Be wary of using mobile phones for identity confirmation, even if they are owned by the company because mobile phone numbers are often stored in locations that are vulnerable to tampering or social engineering.

- Send the user an email to a company email address. If possible, use encrypted email.
- Work with the employee's manager to verify the user's identity.
- Verify the identity in person.

- Use multiple open-ended questions from employee records. For example, "Name one person in your group" or "What is your badge number?" Avoid yes or no questions.

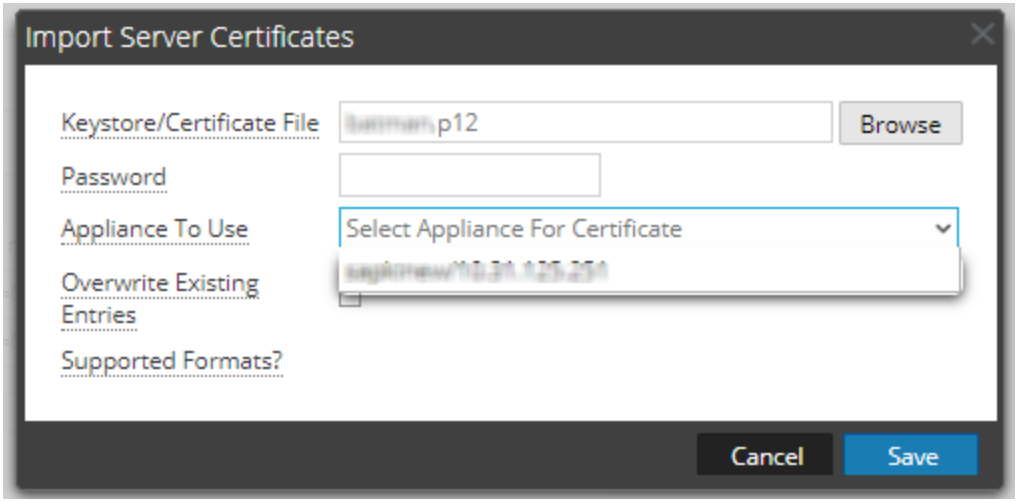
Advice for Your Users

NetWitness recommends that you instruct your users to do the following:

- Never give passwords to anyone.
- Change passwords at regular intervals.
- Inform your users of what information requests to expect from help desk administrators.
- Always log off from the web interface when finished.
- Always lock their desktops when stepping away from their computers.
- Regularly close their browser and clear their cache of data.

Note: Consider regular training to communicate this guidance to users.

Appendix A: Customer Provided Certificates



The procedure tells you how to replace the internally generated NetWitness web server certificate (NGINX front-door) with a customer issued certificate. This enables client browsers to establish a trusted SSL connection.

Caution: The cert files and key files must be `.pem` format. All the files must have the same name and permissions as the original files generated by NetWitness.

1. Rename your certificate files and save them in for NGINX.
   - Rename the customer provided `cert.pem` certificate pem file to `web-server-cert.pem`.
   - Rename the customer provided `key.pem` key pem file to `web-server-key.pem`.
   - Rename customer provided `cert.chain` certificate chain file to `web-server-cert.chain`.
   - Rename `cert.p7b` certificate p7b file to `web-server-cert.p7b`.
2. SSH to the NW Server.
3. Replace the existing NetWitness Platform generated `/etc/pki/nw/web/web-server-cert.pem`, `/etc/pki/nw/web/web-server-key.pem`, `/etc/pki/nw/web/web-server-cert.chain` and `/etc/pki/nw/web/web-server-cert.p7b` files with the files you renamed in step 1.
4. Restart NGINX service.
   ```
   service nginx restart
   ```

To add Custom Server Certificate in PFX, P12 and JKS format.

1. Go to  **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **PKI Settings** tab.
3. In the **Server Certificates** section, click .
   The Import Server Certificates dialog is displayed.

4. In the **Keystore/Certificate File** field, click **Browse** and select the keystore.
5. In the **Password** field, enter the keystore password.
6. In the **Appliance To Use** field, select the appliance for which you want to use this certificate.
7. (Optional) Select the **Overwrite Existing Entries** checkbox to overwrite the entries of the certificate that is already added.
8. Click **Save.**
   The NetWitness Server certificate with its private key is successfully added to NetWitness.

Note: When the certificate is being applied on the selected appliance, no other operation on PKI can be performed until the process is completed.
Double-click on the added entries to view the details of the certificate.

9. To apply the server certificate on a server, select a certificate and click .

Note: Uploading a keystore will add the server certificate and its private key locally. To apply a server certificate on a server, you need to select a server certificate and click the synchronization button .
All server certificates are also synchronized on the appliances when PKI is enabled.

Appendix B: Reissue Certificates

Introduction

For a secure deployment, NetWitness has installed internal NetWitness issued certificates such as CA Certificate and Service certificates.

The validity for NetWitness certificates are as follows:

- CA root certificate for 11.x deployment is valid for 10 years
- CA root certificate for 10.6.x deployment is valid for 5 years
- Service certificates are valid for 1000 days

When these certificates are about to expire or have expired, you must renew and reissue the certificates as soon as possible to avoid any issues with your NetWitness deployment.

Note: You can view the expiration details, by executing the `ca-expire-test-sh` script on the NetWitness Server. For more information, see Reissue root CA security certificates on NetWitness Platform 11.x and download the script.

CA Certificate Reissue

To renew the CA certificates, do the following:

- Before you upgrade from 10.6.x to 11.x, check the expiry and reissue those certificates. For more information, see the Reissue root CA security certificates on NetWitness Platform 11.x.
- If you are on 10.6.x , check the expiry and reissue all the certificates. For more information, see the Reissuing security certificates on NetWitness Platform 10.6.x.

Note: If you have Windows Legacy Collectors (WLC) in your deployment, renew the CA certificate of the WLC after renewing the CA certificate of the NetWitness Admin Server.

Service Certificate Reissue

To renew the Service certificates, do the following:

- In case of a fresh installation of 11.3 or later, you must use the `cert-reissue` script. For more information, see the Reissuing Service Certificate .
- In case of a fresh installation of 11.1 or 11.2, you must use the `nw-root-ca-update` script. For more information, see the Reissue root CA security certificates on NetWitness Platform 11.x.

Note: If you have a host that is decommissioned or plan to remove, do not renew the certificate for that host.

Reissuing Service Certificate

You can reissue service certificates in the following two ways.

- All at once
  Reboot NW Server host after the `cert-reissue --host-key` command completes.
- One at a time
  Reissue the NW Server host certificates first, restart the host,and then reissue each component host. Ensure that you restart the component host as well.

IMPORTANT: If you are reissuing certificates for each host individually (one at a time), you must reissue the certificate for the NW Server host before you can reissue certificates for any other host.

When to Use the `--host-key` Argument

Use the `cert-reissue --host-key` command string if you have a large number of hosts. Make sure that:

- All your hosts are running 11.4.0.0 or later.
- All your hosts are online.
- The NW Server host run time services are running.

`cert-reissue` Arguments and Options for All Hosts

The following tables lists the argument you can use to reissue certificates for all hosts at one time. See Appendix C. Troubleshooting Cert-Reissue Command for additional options you can use with Customer Support to troubleshoot errors.

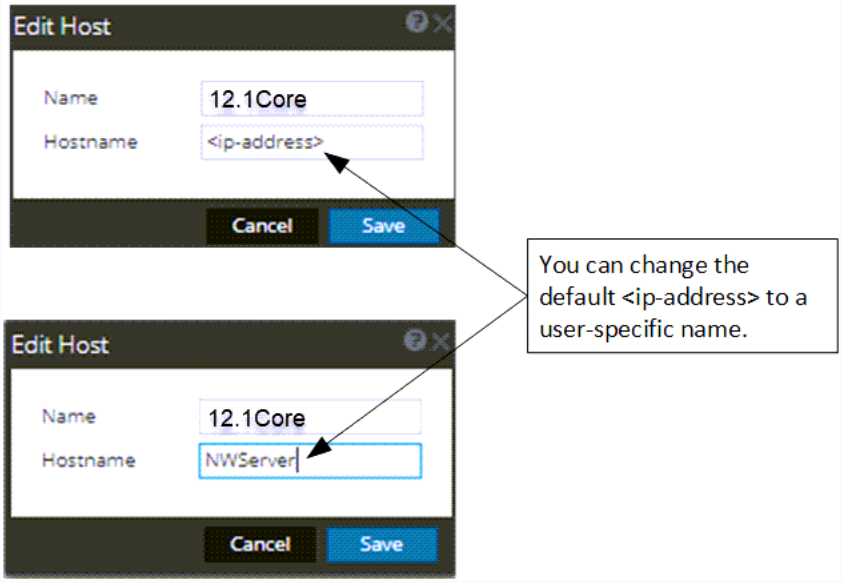
Arguments	Description
`--host-key`	Reissues certificates for all hosts at one time applying system health checks and restarts services. **Note:** If even one host is not online, this command fails. If you have numerous hosts in your deployment, make sure that all hosts are up and running.

Caution: Make sure you do not run this argument on a node or host that you plan to remove or decommission.

When to Use the Individual Host Arguments (`--host-id <id>`, `--host-name <display-name>`, `--host-addr <ip/hostname>`)

The `cert-reissue --host-id <id>`, `cert-reissue --host-name <display-name>`, or `cert-reissue --host-addr <ip/hostname>` reissues a certificate for an individual host. You may want to reissue certificates for an individual host if you have a small number of hosts.

Make sure that:



- Each host is running 11.4.0.0 or later.
- Each host is online.
- The NW Server host run time services are running
- You reissue certificates for the NW Server host first.

`cert-reissue` Arguments and Options for a Single Host

The following tables lists the arguments and options you can use to reissue certificates for a single host (one host at a time). For more information, see the Appendix C. Troubleshooting Cert-Reissue Command section on the additional options you can use with NetWitness Customer Support to troubleshoot errors.

Note: You must run the command for the NW Server host first and reboot that host before you run the command for each component host.

Arguments	Description
`--host-id <id>`	Reissues certificate for the host identified by `<id>` (host identification code).
`--host-name <display-name>`	Reissues certificate for host identified by `<display-name>`. `display-name` is the value shown under **Name** in the (Admin) **> Hosts** View in the NetWitness Platform Interface.

`--host-addr <Hostname-in UI>`
or
`--host-addr <hostname>`
	Reissues certificate for the host identified by the value shown under **Hostname** in the (Admin) **> Hosts > Edit** dialog in the NetWitness Platform XDR Interface. This value can be an ip-addres (default) or a user-specified name.
	
	

Reissuing Certificates for All Hosts Except Windows Legacy Collection (WLC) host

Use the `cert-reissue` command to reissue certificates for all hosts except the WLC host with the following procedures.

Running the Cert-Reissue Command for All Hosts

1. SSH to the NW Server host.
2. Submit the appropriate command string.
   `cert-reissue --host-key`

Running the Cert-Reissue Command for an Individual Host

1. SSH to the NW Server host.
2. Submit the appropriate command string (that is `cert-reissue --host-id` or `--host-name` or `--host-addr`). Each of the following command strings is an example of how you reissue certificates for a specific host.
   - `--host-id <host-identification-code>`
   - `--host-name <named-displayed-under-Name-in-Hosts-view>`
   - `--host-addr <ip-address-default-hostname-or-user-specified-hostname>`

Reissuing Certificates for a WLC Host

You must use the `wlc-cli-client` utility to reissue certificates for a WLC host (you cannot use the `cert-reissue` command). You also need to specify a number of WLC identification parameters with this utility.

Note: The certificates for a Windows Legacy Server host are stored in the following directories on the host.
`C:\ProgramData\netwitness\ng\logcollector_cert.pem`
`C:\ProgramData\netwitness\ng\logcollector_dh2048.pem`
Th validity period of WLC certificates can range from 2 to 20 years. If you rename or remove the files and restart **NwLogCollector** Service, NetWitness regenerates them.
`/ssl/truststore.pem` - is no longer used in 11.x
Every reissue of a certificate on the Windows Legacy server creates a new private key.

To reissue certificates on a WLC host.

1. SSH to the NW Server host.
2. Submit the following command string.
   ```
   wlc-cli-client --cert-renew --host <wlc-host-ip-address> --port 50101 --use-ssl false --username <wlc-username> --password <wlc-password> --ss-username <deploy-admin-username> --ss-password <deploy-admin-password>
   ```

Successful Reissue Summary Report

When you run `cert-reissue --host-key`, the following summary report will be displayed if all hosts are online, all run time services are running, and all hosts on version 11.4.0.0 or later.

```
+---------+--------------------+--------+-----------------------------------------------------+
|         | Host               | Status | Message                                             |
+---------+--------------------+--------+-----------------------------------------------------|
|<host-id>| <IP-address>       |Success |Cert reissue successful                              |
|<host-id>| <IP-address>       |Success |Cert reissue successful                              |
|<host-id>| <IP-address>       |Success |Cert reissue successful                              |
|<host-id>| <IP-address>       |Success |Cert reissue successful                              |
|<host-id>| <IP-address>       |Success |Cert reissue successful                              |
+---------+--------------------+--------+-----------------------------------------------------+
```

Unsuccessful Reissue Summary Reports

You must contact NetWitness Customer Support to troubleshoot problems. You know there is a problem if any `<host-id>` does not return a `Success`**Status**. `Success` indicates that certificates were reissued for a host. The following examples illustrate unsuccessful reissues.

Reissue Failed for Host and Aborted Command

The following three examples illustrate the failure of certificate reissuing for any hosts.

```
+---------+--------------------+--------+-----------------------------------------------------+
|         | Host               | Status | Message                                             |
+---------+--------------------+--------+-----------------------------------------------------|
|<host-id>| <IP-address>       |Failed! |failed to connect, is host online?                   |
|<host-id>| <IP-address>       |Failed! |service(s) down                                      |
|<host-id>| <IP-address>       |N/A     |[ Skipped... ]                                       |
|<host-id>| <IP-address>       |N/A     |[ Skipped... ]                                       |
|<host-id>| <IP-address>       |N/A     |[ Skipped... ]                                       |
+---------+--------------------+--------+-----------------------------------------------------+
```

```
+---------+--------------------+--------+-----------------------------------------------------+
|         | Host               | Status | Message                                             |
+---------+--------------------+--------+-----------------------------------------------------|
|<host-id>| <IP-address>       |Failed! |version <version-earlier-than-11.3.0.0> not supported|
|<host-id>| <IP-address>       |Failed! |version <version-earlier-than-11.3.0.0> not supported|
|<host-id>| <IP-address>       |N/A     |[ Skipped... ]                                       |
|<host-id>| <IP-address>       |N/A     |[ Skipped... ]                                       |
|<host-id>| <IP-address>       |N/A     |[ Skipped... ]                                       |
+---------+--------------------+--------+-----------------------------------------------------+
```

Reissue Certificate Partially Executed

The NW Server Host certificates were reissued but failed to properly distribute the reissued certificates to one or more component hosts.

```
+---------+--------------------+
|         | Host               |
+---------+--------------------+
|<host-id>| <IP-address>       |
|<host-id>| <IP-address>       |
+---------+--------------------+
...
+---------+--------------------+--------+-----------------------------------------------------+

Appendix C. Troubleshooting Cert-Reissue Command

You must contact NetWitness Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897) to troubleshoot problems. You know there is a problem if any `<host-id>` does not return a `Success`**Status**. `Success` indicates that certificates were reissued for a host.

Argument Options Used for Troubleshooting

You use the following argument options with `cert-reissue --host-all` to troubleshoot problems.

You can run `cert-reissue --host--all<arguments>` multiple times without an adverse effect.

Note: Use the following Argument Options with caution. They force the `cert-reissue` command to execute for all the hosts.

Argument Option	Description
`--skip-health-checks`	Reissues certificates for all hosts at one time without applying system health checks (force Reissue). This means that the command does not: • verify that all hosts are online line. • verify that all services are running. **Use case:** You have numerous hosts and you know that a small minority of them will fail. This updates all the hosts that conform to the checking rules and you can reissue certificates for the others subsequently with the help of Customer Support.
`--skip-version-checks`	Do not verify that hosts are running version 11.3.0.0 or later. **Use Case:** You have numerous hosts and your know that some of them are not updated to 11.3 or later. This reissues certificates for all the hosts that are at 11.3 or later and you can reissue certificates for the others subsequently with the help of Customer Support.
`--ignore-trigger-errors`	Ignore any errors that trigger failures. This option forces the cert reissue process to continue disregarding the errors instead of aborting or failing the cert reissue command quickly. When a cert reissue for a host succeeds, the reissued certificates on that host are not provisioned to other dependent hosts (referred to as trusts). In this case, the: • host with reissued certificates is reported as “Partial.” • the hosts with trusts that failed to update are listed separately in the summary table to tell you that these hosts may require a refresh using the new `--refresh-trusts-only` option.
`--refresh-trusts-only`	Refreshes trusts exclusively for host identified by `<id>` (does not reissue certificates for that host).

Problems and How to Troubleshoot Them

This section describes solutions to problems that you may encounter when running the cert-reissue command to reissue certificates with suggested causes and solutions.

Status	Failed!
Error Message	... 2019-02-06 13:34:39.646 INFO 8540 --- [main] c.r.n.i.o.client.OrchestrationClient : Checking host connections... ... 2019-02-06 13:34:57.861 ERROR 8540 --- [main] c.r.n.i.o.client.HostValidator : Host '192.168.200.99' (nw-platform-esa-primary) verification failed! ... 2019-02-06 13:34:57.862 INFO 8540 --- [main] c.r.n.i.o.client.OrchestrationClient : Checking status of services... 2019-02-06 13:35:57.931 ERROR 8540 --- [main] c.r.n.i.o.client.HostValidator : Service 'nw-platform-node-zero - Investigate Server' not available! ... +---------+--------------------+--------+---+ | | Host | Status | Message | +---------+--------------------+--------+---+ |<host-id>| <IP-address> |Failed! |failed to connect, is host online? | |<host-id>| <IP-address> |Failed! |service(s) down | |<host-id>| <IP-address> |N/A |[Skipped...] | |<host-id>| <IP-address> |N/A |[Skipped...] | |<host-id>| <IP-address> |N/A |[Skipped...] | +---------+--------------------+--------+---+
Cause	`cert-reissue --host-all` failed because one or more hosts are offline or one or more run time services are unreachable. You can force this command to run in spite of this error by specifying the `--skip-health-checks` option, that is: `cert-reissue --host-all--skip-health-checks`
Solution	1. Bring appropriate hosts back online or make sure the NW Server hosts run time services are running. 2. Run `cert-reissue` for the hosts affected.

Status	Failed!
Error Message	... 2019-02-06 13:34:39.643 ERROR 8540 --- [main] c.r.n.i.o.client.HostValidator : Host '192.168.200.102' (nw-platform-decoder) version '11.2.0.0' not supported, minimum required version: 11.3.0.0 2019-02-06 13:34:39.644 ERROR 8540 --- [main] c.r.n.i.o.client.HostValidator : Host '192.168.200.101' (nw-platform-concentrator) version '11.2.0.0' not supported, minimum required version: 11.3.0.0 ... +---------+--------------------+--------+--+ | | Host | Status | Message | +---------+--------------------+--------+--+ |<host-id>| <IP-address> |Failed! |version <version-earlier-than-11.3.0.0> not supported| |<host-id>| <IP-address> |Failed! |version <version-earlier-than-11.3.0.0> not supported| |<host-id>| <IP-address> |N/A |[Skipped...] | |<host-id>| <IP-address> |N/A |[Skipped...] | |<host-id>| <IP-address> |N/A |[Skipped...] | +---------+--------------------+--------+--+
Cause	`cert-reissue -host-all` command string failed because one or more hosts are running a version earlier than 11.3.0.0 **Note:** You can force the reissue of certificates for the remaining hosts using the `-skip-version-checks` argument.
Solution	Update the host to 11.3 or later and run `cert-reissue` for that host again.

Status	Partial
Error Message	... 2019-02-06 02:27:09.078 ERROR 20647 --- [main] c.r.n.i.o.client.OrchestrationClient : Trigger failed for host '<IP-address>' (nw-platform-decoder) 2019-02-06 02:27:09.079 ERROR 20647 --- [main] c.r.n.i.o.client.OrchestrationClient : Trigger failed for host '<IP-address>' (nw-platform-concentrator) ... 2019-02-06 02:27:09.118 WARN 20647 --- [main] c.r.n.i.o.client.OrchestrationClient : One or more host(s) may require manual refresh due to failed triggers: +---------+--------------------+ | | Host | +---------+--------------------+ |<host-id>| <IP-address> | |<host-id>| <IP-address> | +---------+--------------------+ ... +---------+--------------------+--------+--+ | | Host | Status | Message | +---------+--------------------+--------+--+ |<host-id>| <IP-address> |Partial |Reissue completed, triggers failed | |<host-id>| <IP-address> |N/A |[Skipped…] | |<host-id>| <IP-address> |N/A |[Skipped...] | |<host-id>| <IP-address> |N/A |[Skipped...] | |<host-id>| <IP-address> |N/A |[Skipped...] | +---------+--------------------+--------+--+
Cause	`cert-reissue` command completed on NW Server host however one or more triggers failed. This aborted the `cert-reissue` command for other hosts.
Solution	Address all the errors and run the `cert-reissue --host--all<arguments>` command string again.

Status	Partial
Error Message	... 2019-02-06 14:18:03.208 ERROR 17800 --- [main] c.r.n.i.o.client.OrchestrationClient : Trigger failed for host '192.168.200.82' (nw-platform-node-x) ... ... 2019-02-06 14:29:05.200 WARN 17800 --- [main] c.r.n.i.o.client.OrchestrationClient : One or more host(s) may require manual refresh due to failed triggers: +---------+--------------------+ | | Host | +---------+--------------------+ |<host-id>| <IP-address> | +---------+--------------------+ ... +---------+--------------------+--------+---+ | | Host | Status | Message | +---------+--------------------+--------+---+ |<host-id>| <IP-address> |Failed! |Cert reissue failed! | |<host-id>| <IP-address> |Partial |Reissue completed, triggers failed | |<host-id>| <IP-address> |Success | Cert reissue successful | |<host-id>| <IP-address> |Success | Cert reissue successful | |<host-id>| <IP-address> |Success | Cert reissue successful | +---------+--------------------+--------+---+
Cause	One or more hosts did not pass system health checks. In addition, one or more of the unhealthy hosts are running core services, which will result in the NW Server host `cert-reissue` to fail (because of failed triggers explained above). By disabling health checks and trigger errors, you can continue the process and reissue certificates for the remaining hosts. The NW Server host **Status** is reported as `Partial` because the `cert-reissue` command completed for the NW Server but downstream triggers failed for other hosts.
Solution	Manually refresh the failed core hosts (to synchronize trust peers). Submit the following command string to reissue certificates for healthy hosts. `cert-reissue --host-all --skip-health-checks --ignore-trigger-errors`

Status	Failed!

Error Message	When cert reissue fails for Respond server only when ESA is not present in the stack, the following messages are displayed in the "`/var/log/netwitness/config-management/chef-solo.log`":
	`1. [2022-05-31T02:11:20+00:00] ERROR: Running exception handlers`
	`2. [2022-05-31T02:11:20+00:00] ERROR: Exception handlers complete`
	`3. 2-05-31T02:11:20+00:00] FATAL: Stacktrace dumped to /var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	`4. [2022-05-31T02:11:20+00:00] FATAL: Please provide the contents of the stacktrace.out file if you file a bug report`
	`5. [202[2022-05-31T02:11:20+00:00] FATAL: Mixlib::ShellOut::ShellCommandFailed: nw_pki_bootstrap_launch[reissue certs for rsa-nw-respond-server] (rsa-response::certreissue line 13) had an error: Mixlib::ShellOut::ShellCommandFailed: execute[respond-server-get-operational-csr] (/var/lib/netwitness/config-management/cache/cookbooks/nw-pki/resources/bootstrap_launch.rb line 242) had an error: Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource`

Solution	Ignore the cert renewal for the respond server service and go ahead with other cert renewal process of other service present in the stack. **Note:** You might see other devices are offline status on UI with temporary cert-mismatch after reboot Admin server in this case if you reissue the service certificate "One at a time" way. However, you can also proceed to cert renewal with other present node-x services.

Introduction

This guide provides descriptions and consolidated information for each NetWitness Platform management service configuration property in one place, for example, for services like security-server, investigate-server, and correlation-server. All of these configuration properties have valid default values wherever applicable and do not need to be changed. Please use caution if you need to modify any of these values.

Note: Some of the service configuration values are set during the deployment of NetWitness Platform and are not reflected in this guide. If any of these values need to be overridden, the user must have Administrator privileges.

You can use the NetWitness nw-shell utility or the NetWitness Platform user interface to modify these values. For information about how to use the nw-shell utility, see the *Shell User Guide for NetWitness Platform*. For information about how to use the user interface to modify these values, see the *Hosts and Services Getting Started Guide for NetWitness Platform* and the *Deployment Guide for NetWitness Platform*.

Admin-server Configuration

ContextConfigProperties

Name	Default value	Type	Description
rsa.admin-server.contexthub.enabled	false	boolean	Context Hub integration in Admin Server
rsa.admin-server.contexthub.host		string	
rsa.admin-server.contexthub.port	0	integer	
rsa.admin-server.contexthub.query-timeout		seconds	timeout time for async context response query

UsageTrackingConfigurationProperties

Name	Default value	Type	Description
rsa.admin.ceip-viewed	false	boolean	CEIP(customer enhancement improvement program) tracking value, disabled by default
rsa.admin.usage-tracking-enabled	true	boolean	Usage tracking configuration value, enabled by default

SamlProperties

Name	Default value	Type	Description
rsa.security.authentication.web.saml.auto-lookup-idp-metadata	false	boolean	Controls remote lookup of IDP metadata
rsa.security.authentication.web.saml.default-idp		identityprovider metadata$identityprovider	SAML IDP to be used by default

Name	Default value	Type	Description
rsa.security.authentication.web.saml.entity-id		string	A globally unique identifier used to identify this deployment of Netwitness as a client entity in the identity provider. Every SAML message contains the entity ID.
rsa.security.authentication.web.saml.global-logout-enabled	false	boolean	Flag to determine if global logout request has to be sent to IDP
rsa.security.authentication.web.saml.idp-metadata-url		string	URL to fetch IDP metadata
rsa.security.authentication.web.saml.keystore-alias	nw-saml	string	Alias for storing signing/encryption keys in the SAML keystore
rsa.security.authentication.web.saml.metadata-reload-interval	15 minutes	seconds	Time interval between reloading IDP metadata. Defaults to 15 minutes
rsa.security.authentication.web.saml.saml-response-skew	60 minutes	seconds	Sets the maximum allowed difference between the clocks of the IDP and SP systems. Defaults to 60 seconds.
rsa.security.authentication.web.saml.sp-metadata-filename	nw_saml_metadata.xml	string	Default filename to be set when exporting the service provider metadata

Name	Default value	Type	Description
rsa.security.authentication.web.saml.sso-enabled	false	boolean	Flag to enable or disable SAML based SSO authentication
rsa.security.authentication.web.saml.trust-all-certs-for-idp-metadata	false	boolean	Flag to ignore certificate verification while downloading IDP metadata from the given URL
rsa.security.authentication.web.saml.use-proxy	false	boolean	Determines if requests to IDP has to be routed through a proxy (if configured)

WebSocketMessagingProperties

Name	Default value	Type	Description
rsa.websocket.messaging.batch-size	10	long	The number of entries to send, per message.

Analysis-server Configuration

AnalysisProperties

Name	Default value	Type	Description
rsa.analysis.auto-analyze	true	boolean	{@code true} to automatically start analyze
rsa.analysis.definition-files		set	{@link Set} of definition files to be analyzed
rsa.analysis.nws	false	boolean	Enable NWS device support.
rsa.analysis.periodic-task-wait-time	1	seconds	Time period to wait between tasks.
rsa.analysis.time-allowance	15	seconds	Time to wait before issuing the query. Ex: If the time frame is 9-10pm and time allowance is 15 minutes, query at 10:15pm.
rsa.analysis.time-frame-interval	1	seconds	Time Interval to use for each analysis time frame as we advance forward

NwDbProperties

Name	Default value	Type	Description
rsa.analysis.nwdb.host	localhost	string	NetWitness Core Query Broker host address
rsa.analysis.nwdb.password		string	NetWitness Core connection password
rsa.analysis.nwdb.port	50005	integer	NetWitness Core Query Broker port
rsa.analysis.nwdb.ssl	false	boolean	NwtWitness Core SSL flag
rsa.analysis.nwdb.start-time		string	The start time to analyze with the format of "yyyy-MM-dd HH:mm" UTC.
rsa.analysis.nwdb.user	admin	string	NetWitness Core connection user

AnalysisProperties$Temporal

Name	Default value	Type	Description
rsa.analysis.temporal.enabled	true	boolean	Use temporal services instead of Repositories
rsa.analysis.temporal.max-entries	1000	integer	Maximum number of {@link java.util.Map} entries.
rsa.analysis.temporal.retention-period	30	seconds	The period of time to retain the data.

Config-server Configuration

ConfigServerProperties

Name	Default value	Type	Description
rsa.configuration.notify-delay	5	seconds	The length of time to delay notifications to wait for more changes for an identity

Content-server Configuration

DeployProperties

Name	Default value	Type	Description
rsa.content-server.deploy.deploy-timeout	2	seconds	Max time allotted to deploy a single content to an endpoint Default is 2 minutes Minimum of 30 seconds Maximum of 1 hour
rsa.content-server.deploy.max-content-deployer-threads	4	integer	The size of the content deployer thread pool
rsa.content-server.deploy.max-policy-deployer-threads	2	integer	The size of the policy deployer thread pool

LogDeviceParserProperties

Name	Default value	Type	Description
rsa.content.parser.cache-duration	24	seconds	Time it takes for the cache that stores data to expire
rsa.content.parser.cache-duration-for-service-status	5	seconds	Time it takes for the cache that stores service status data to expire

Name	Default value	Type	Description
rsa.content.parser.database-initialization-enabled	true	boolean	Enable database initialization task
rsa.content.parser.json-feature	true	boolean	Feature toggle for whether JSON data types are supported.
rsa.content.parser.log-decoder-sync-interval	12 hours	seconds	The interval between log decoder sync sweeps.
rsa.content.parser.max-try-counter-for-ld-sync-failure	3	integer	Switch to a new Log decoder from environment after trying below configured times to previously/user configured LD
rsa.content.parser.preferred-log-decoder-name-for-sync		string	Display name of the preferred log decoder for sync job. Sync job will use this only if it is online and contains parser details
rsa.content.parser.previously-synced-log-decoder-id		string	ID of the previously synced log decoder
rsa.content.parser.remove-previous-sync-parsers-for-new-log-decoder	false	boolean	Flag to indicate that remove previously synced log device parser information in the case of new log decoder found.
rsa.content.parser.retrieval-timeout	30	seconds	Timeout to wait for nextgen response
rsa.content.parser.sleep-interval-after-notification	60	seconds	Sleep interval before triggering a task after receiving notification
rsa.content.parser.sync-from-log-decoder-enabled	true	boolean	Enable automatic sync of parsers task

Contexthub-server Configuration

LiveConfig

Name	Default value	Type	Description
rsa.cms.client.host		string	
rsa.cms.client.password		string	
rsa.cms.client.port	0	integer	
rsa.cms.client.use-ssl	false	boolean	
rsa.cms.client.username		string	

LiveConnectPathConfig

Name	Default value	Type	Description
rsa.cms.client.lc-auth-path	/authlive/authenticate/LIVECONNECT	string	
rsa.cms.client.lc-feedback-path	/liveconnect/v2/feedback/meta	string	

ServiceProperties

Name	Default value	Type	Description
rsa.contexthub.backup-data-path		string	Migration data backup location
rsa.contexthub.config-dir-path		string	Config directory which contains all the configuration files
rsa.contexthub.data-dir-path		string	Data Directory
rsa.contexthub.file-system-service		filesystemservice	
rsa.contexthub.jobs-dir-path		string	Jobs directory which contains all the job configurations

Name	Default value	Type	Description
rsa.contexthub.max-entries-for-list	100000	integer	List datasource max limit
rsa.contexthub.ootb-list-version		string	OOTB List Version
rsa.contexthub.prefetch-pool-size	3	integer	Prefetch job pool size
rsa.contexthub.replace-config	false	boolean	Replace the batch config files on service boot
rsa.contexthub.templates-dir-path		string	Template directory which contains all the templates
rsa.contexthub.tried-adding-respond-server	false	boolean	Now when the service boots-up and if there is Respond-Server already in the deployment, we should try to add that as a CH data-source, but this should be done already once, so in case user deletes the source we shouldn't add it again.

ServiceDataProperties

Name	Default value	Type	Description
rsa.contexthub.data.disk-size	120	bytes	Max database disk space allocated for the Contexthub service.
rsa.contexthub.data.used-disk-upper-threshold	95	double	

GlobalQueryResponseCachePolicy

Name	Default value	Type	Description
rsa.contexthub.query-response-cache.available-memory	0	long	
rsa.contexthub.query-response-cache.cache-name		string	

Name	Default value	Type	Description
rsa.contexthub.query-response-cache.cache-store-bulk-insert-size	20	integer	
rsa.contexthub.query-response-cache.enabled	true	boolean	
rsa.contexthub.query-response-cache.max-seconds-in-cache	1800	seconds	
rsa.contexthub.query-response-cache.modification-queue	20	integer	
rsa.contexthub.query-response-cache.percentage-of-heap-as-cache	50	double	
rsa.contexthub.query-response-cache.preload	true	boolean	
rsa.contexthub.query-response-cache.thread-pool	2	integer	
rsa.contexthub.query-response-cache.used-cache-upper-threshold	100	double	

AsyncServiceProperites

Name	Default value	Type	Description
rsa.contexthub.query-threads.core-pool-size	20	integer	
rsa.contexthub.query-threads.max-pool-size	250	integer	
rsa.contexthub.query-threads.max-seconds-before-results-expire	0	long	
rsa.contexthub.query-threads.queue-capacity	1000	integer	

ReputationProperties

Name	Default value	Type	Description
rsa.contexthub.reputation.batch-size	1000	integer	Size of the batch to be send to Reputation Server
rsa.contexthub.reputation.max-hashes-to-be-queried	595000	integer	Maximum number of hashes to be considered for refreshing in 1 day
rsa.contexthub.reputation.max-query-supported-by-reputation-server	600000	integer	Maximum number of queries supported by the live reputation service.
rsa.contexthub.reputation.max-staged-count-for-refresh	1	long	Maximum staged entries in staging store if present, prefetch will be retried in refreshCheckInterval seconds. This is done to give priority to new reputation queries. Eg: Prefetch starts at 9 PM on a day. CH checks whether the "Staged" entries in Staging store are less than maxStagedCountForRefresh. If it is less prefetch starts else prefetch is skipped for this time and retried in refreshCheckInterval seconds.
rsa.contexthub.reputation.preferred-hashing-algorithm	md5	string	Algorithms that should be used while interaction with Reputation Server
rsa.contexthub.reputation.refresh-batch-interval	15	seconds	Time Interval between 2 batches sent to reputation server for refresh
rsa.contexthub.reputation.refresh-check-interval	15	seconds	Configuration to handle "Staging Store has entries" or Any other exception/error in case of refresh (prefetch). Staged entries should get priority over refresh job. And in case of any failures CH should retry refresh after this interval. Eg: At t1, CH started refresh job but finds that there are some entries in staging store with status - "Staged" CH will check if the no. of entries are > minStagedCountForRefresh, and if thats the case it will retry refresh after seconds configured here until that day’s 11:55 PM UTC

Name	Default value	Type	Description
rsa.contexthub.reputation.reputation-query-batch-interval	2	seconds	If CH does not gets any batch from staging store for RS, next time it queries staging store for a batch is after the seconds configured here. Eg: At t1, CH got a batch from staging store and RS was queried At t2, CH did not get any batch from staging store Now at t3 (t2 + reputationQueryBatchInterval) , CH again queried staging store for a batch

StixProperties

Name	Default value	Type	Description
rsa.contexthub.stix.data-store-read-page-size	100	integer	When reading the entire data store of a STIX source, this property determines the page size

TaxiiServiceProperties

Name	Default value	Type	Description
rsa.enrichment.stix.config.disabled-xml-features		list	
rsa.enrichment.stix.config.max-taxii-poll-window	7	seconds	Maximum time range to query TAXII server in one cycle. Defaults to 7 days. E.g., If the total range to query the TAXII server is 30 days, the range will be divided into shorter time windows of 7 days each.
rsa.enrichment.stix.config.taxii-service-max-attempts	2	integer	Max number of attempts to query TAXII Service
rsa.enrichment.stix.config.taxii-service-retry-wait-in-sec	10	integer	Max number of attempts to query TAXII Service

HttpProxyProperties

Name	Default value	Type	Description
rsa.transport.http.proxy.enabled	false	boolean	
rsa.transport.http.proxy.host		string	
rsa.transport.http.proxy.ntlm-domain		string	
rsa.transport.http.proxy.password		string	
rsa.transport.http.proxy.port		integer	
rsa.transport.http.proxy.reinitialize-proxy	false	boolean	
rsa.transport.http.proxy.use-ntlm-auth	false	boolean	
rsa.transport.http.proxy.use-ssl	false	boolean	Flag indicating whether we should use HTTP or HTTPS
rsa.transport.http.proxy.user		string	

rryCorrelation-server Configuration

AlertProperties

Name	Default value	Type	Description
rsa.correlation.alert.keep-alive-time	0	long	The keepAlive time for threads
rsa.correlation.alert.max-alerts-queue-size	10000	integer	The max rabbitmq alerter queue size
rsa.correlation.alert.num-threads	3	integer	No. of threads to process
rsa.correlation.alert.respond-enabled	true	boolean	The respond is enabled globally
rsa.correlation.alert.respond-endpoint-severities		list	The list of severities which can be consumed by respond and are related to app-rules
rsa.correlation.alert.retry-delay	1	seconds	retry time for each interval
rsa.correlation.alert.risk-score-severities		list	The list in severities which can be consumed by risk score and are related to app-rules
rsa.correlation.alert.sleep-time	1000	long	The max time to sleep in thread
rsa.correlation.alert.statement-name-max-length	128	integer	The maximum length of the entire statement @Name
rsa.correlation.alert.statement-name-place-holder-max-length	64	integer	The maximum length for each place holder value in the statement @Name
rsa.correlation.alert.timeout-retry-policy	3650	seconds	Retry time in seconds for total timeout
rsa.correlation.alert.total-threads	10	integer	The total number of threads in the pool
rsa.correlation.alert.transient-enabled	true	boolean	The transient is enabled globally. Currently used only for key-value rule and not in basic rule

ContextHubProperties

Name	Default value	Type	Description
rsa.correlation.contexthub.data-expired-in-seconds	5	integer	The duration of time before the ContextHub content is too old and need to be re-retrieved.
rsa.correlation.contexthub.fail-on-retrieve-retry-count	3	integer	Number of times to retry when failed to retrieve data from ContextHub.
rsa.correlation.contexthub.fail-on-retrieve-wait-between-retries	5	seconds	Wait duration between retries when failed to retrieve data from ContextHub.
rsa.correlation.contexthub.fail-on-set-entries-wait-between-retries	5	seconds	Wait duration between retries when failed to add/delete entries to/from ContextHub.
rsa.correlation.contexthub.file-backed-dir		string	Location on local disk where to store the paged files.
rsa.correlation.contexthub.mapped-memory-size	0	integer	Total number of bytes of data that are kept in memory.
rsa.correlation.contexthub.notification-handler-thread-pool-size	8	integer	Number of concurrent notification handler threads.
rsa.correlation.contexthub.page-file-size	4096	integer	The size of each paged file stored on local disk.
rsa.correlation.contexthub.set-entries-thread-pool-size	128	integer	Number of RSAContext set entries concurrent Threads pool size.

DataPrivacyProperties

Name	Default value	Type	Description
rsa.correlation.data-privacy.global-private-fields		list	List of fields that are always removed from the output for data privacy, regardless of source

DebugProperties

Name	Default value	Type	Description
rsa.correlation.debug.actions		string	
rsa.correlation.debug.enabled	false	boolean	
rsa.correlation.debug.resource-ids		string	

EndpointProperties

Name	Default value	Type	Description
rsa.correlation.endpoint.app-rules-paths		list	{@link List} of Endpoint App Rules candidate paths of the resource file.
rsa.correlation.endpoint.enabled	true	boolean	{@code true} if Endpoint Rules processing is enabled.

EngineProperties

Name	Default value	Type	Description
rsa.correlation.engine.auto-start	true	boolean	Determines if all {@link Engine} should start on service deployed.
rsa.correlation.engine.concurrent-deployment	10	integer	Number of asynchronous Engine deployment Tasks.
rsa.correlation.engine.send-event-heart-beat-frequency	1	seconds	Log send Event heartbeat frequency.
rsa.correlation.engine.startup-error-retry-interval	10	seconds	Retry interval if error occurs during startup.

EsperProperties

Name	Default value	Type	Description
rsa.correlation.esper.background-metrics-enabled	true	boolean	Set to {@code false} to get Esper metrics on demand.
rsa.correlation.esper.background-metrics-frequency	5	seconds	How often should the background Esper metrics process should be performed.
rsa.correlation.esper.config-resource	classpath:esper/esper-config.xml	string	Esper Configuration xml Resource.
rsa.correlation.esper.enable-statement-metric	false	boolean	Set true if esper Metrics needs to be enabled. By default it is set to false by Esper. Making it true will allow to capture additional esper-metrics but note that activating Esper metrics may cause performance impacts
rsa.correlation.esper.metrics-memory-back-off	1	seconds	How long to back off for after reaching a metrics timeout error.
rsa.correlation.esper.metrics-num-threads	16	integer	The number of threads to use for calculating metrics, per engine. Each thread gets metrics for a single rule.
rsa.correlation.esper.metrics-timeout	15	seconds	How long we should allow for retrieval of metrics for a single rule. Counting memory for rules that are using a lot of memory takes a lot of time and cpu that blocks processing of new events. <p> In the case of a timeout, we will capture the error for reporting purposes.
rsa.correlation.esper.snapshot-dir		string	RSAPersist snapshot directory.
rsa.correlation.esper.snapshot-frequency	5	seconds	Taking snapshot periodic duration.
rsa.correlation.esper.use-external-clock	true	boolean	{@code true} for Esper to process CurrentTimeEvent.

FileMapProperties

Name	Default value	Type	Description
rsa.correlation.filemap.file-backed-dir		string	Location on local disk where to store the paged files.
rsa.correlation.filemap.page-file-size	4096	integer	The size of each paged file stored on local disk.
rsa.correlation.filemap.total-memory-size	0	integer	Total number of bytes of data that are kept in memory.

GeoIpProperties

Name	Default value	Type	Description
rsa.correlation.geoip.city-resource		string	The City database Resource.
rsa.correlation.geoip.local-dir		string	Local store folder where to store the database files.
rsa.correlation.geoip.org-resource		string	The Organization database Resource.

HealthProperties

Name	Default value	Type	Description
rsa.correlation.health.check-every	15	seconds	The
rsa.correlation.health.fatal-percentage	90	integer	The percentage of memory consumption at which it is considered to be in fatal state
rsa.correlation.health.health-check-id	memory-check	string	The name which is required to set the HealthCheck
rsa.correlation.health.warning-percentage	80	integer	The percentage of memory consumption at which it is considered to be Warning in Warning state

MetricProperties

Name	Default value	Type	Description
rsa.correlation.metric.collectd-max-value-length	64	integer	CollectD field value maximum length.

ServiceProperties

Name	Default value	Type	Description
rsa.correlation.re-deployment-cycle	0	integer	The current re-deployment cycle.
rsa.correlation.re-deployment-required	0	integer	The number of re-deployment required.
rsa.correlation.send-re-deployment-notification	true	boolean	{@code true} to notify SA to re-deploy all active {@code Engine}s.
rsa.correlation.version		string	Project version.
rsa.correlation.wait-before-checking-for-success-re-deployment	1	seconds	Wait duration before checking to see if SA response re-deployment is successful.

RuleProperties

Name	Default value	Type	Description
rsa.correlation.rule.fired-rules-heart-beat		integer	Number of permits for a duration.
rsa.correlation.rule.fired-rules-heart-beat-every	1	seconds	A length of time to apply the permits. Minimum of 1 second and max at 1 day.
rsa.correlation.rule.log-fired-rules	false	boolean	Should we log the rules as soon as it fired with the relevant events.
rsa.correlation.rule.max-constituent-events	0	integer	Maximum number of Events in the List sent to AlertManager.

StatsProperties

Name	Default value	Type	Description
rsa.correlation.stats.days-to-keep-stats-file	3	integer	

StreamProperties

Name	Default value	Type	Description
rsa.correlation.stream.aggregation-queue-size	10	integer	Size of the queue that holds aggregation Events staging them before sending them to Rule Engine.
rsa.correlation.stream.batch-size	0	integer	Controls how many records do we ask for at a time.
rsa.correlation.stream.big-integer-to-long	true	boolean	Choose if we want to convert {@code BigInteger} {@code Meta} value to {@code Long} like sessionid.
rsa.correlation.stream.buffer-size	0	integer	Controls the number of records the stream can keep outstanding.
rsa.correlation.stream.check-supply	false	boolean	Should this source check for supply
rsa.correlation.stream.collection-duration-in-minutes	0	integer	For query based aggregation this parameter determines if it should operate on continuous mode or finite mode. By Default it is 0 which means continuous mode. CollectionDuration should be specified in minutes.
rsa.correlation.stream.compression	0	integer	The number of bytes in each message before it will be compressed. Zero is no compression at all. range:0 to 131071
rsa.correlation.stream.compression-level	0	integer	The level of compression. 1 is fastest and 9 is the best compression. A value of zero means pick the best balance between speed and compression. range:0 to 9
rsa.correlation.stream.connection-time-out	0	integer	Override connection timeout in sources. Only if greater than 0.

Name	Default value	Type	Description
rsa.correlation.stream.default-multi-valued		list	New multi-valued fields for this version. These fields should all be migrated to multi-valued with Rule changes. A warning message will be logged if multi-valued does NOT contain all of these fields.
rsa.correlation.stream.default-single-valued		list	New single-valued fields for this version. These fields should all be migrated to single-valued with Rule changes. A warning message will be logged if single-valued does NOT contain all of these fields.
rsa.correlation.stream.dots-to-underscores	true	boolean	Choose if we want to translate "user.dst" to "user_dst".
rsa.correlation.stream.event-batch-size	1000	integer	Number of Events in a batch store in the queue.
rsa.correlation.stream.event-enrichment-queue-size	10	integer	Size of the queue to be used to enrich the {@code Event} before offer to {@code Rule} {@code Engine}.
rsa.correlation.stream.event-enrichment-thread-pool-size	8	integer	Concurrent Event enrichment Thread pool size.
rsa.correlation.stream.event-polling-timeout-in-milli-seconds	1000	long	Event polling from queue timeout in milliseconds.
rsa.correlation.stream.event-source-id	false	boolean	Controls whether we need to add the event source identifier (ESA compatibility)
rsa.correlation.stream.filter		string	Filter to be sent across to the source
rsa.correlation.stream.idle-retry-interval	0	integer	Controls how long to wait (in milli-seconds) before retrying an idle source.
rsa.correlation.stream.lag-time	15	seconds	Lag time is the expected time an event takes to pass through the different levels of capture/parse etc and become available to query in the concentrator.
rsa.correlation.stream.lowercase		list	Choose if the fields to translate to lower case

Name	Default value	Type	Description
rsa.correlation.stream.max-sessions	0	integer	Controls the number of sessions in a batch. The more you filter out ESA data source traffic, the lower you should set this value.
rsa.correlation.stream.mechanism		string	NextGen core devices send and receive type 'AGGREGATION' or 'QUERY'.
rsa.correlation.stream.minutes-back	5	integer	Controls how far back in time should we go for a fresh start.
rsa.correlation.stream.multi-valued		list	Choose the fields considered as multi-valued.
rsa.correlation.stream.multi-valued-as-array	false	boolean	{@code true} to convert multi-valued Collection to Array.
rsa.correlation.stream.no-system-meta	false	boolean	Controls the addition of system meta to records.
rsa.correlation.stream.pre-fetch	0	integer	Controls how many batches to pull and keep ready in anticipation of demand
rsa.correlation.stream.query		string	Query Based RecordStream select clause for all sources.
rsa.correlation.stream.reader-buffer-size	1048576	integer	
rsa.correlation.stream.retrieve-record-stream-stats-every	2	seconds	How often should the {@code RecordStream} status be retrieved.
rsa.correlation.stream.retrieve-schema-every	5	seconds	A length of time to apply the permits. Minimum of 1 second and max at 1 day.
rsa.correlation.stream.retrieve-schema-frequency	1	integer	Number of permits for a duration.
rsa.correlation.stream.retry-timeout	0	integer	Controls how long to wait (in milli-seconds) before retrying a failed source.
rsa.correlation.stream.save-position-every	1	seconds	A length of time to apply the permits. Minimum of 1 second and max at 1 day.
rsa.correlation.stream.save-position-frequency	1	integer	Number of permits for a duration.

Name	Default value	Type	Description
rsa.correlation.stream.single-valued		list	Uses by Rules deployment process to ensure that these fields are not be treated as multi-valued.
rsa.correlation.stream.socket-timeout	0	integer	Override socket timeout in sources. Only if greater than 0.
rsa.correlation.stream.source-poll-interval	0	integer	Controls the parameters passed to {@code RecordSourceSubscription}.
rsa.correlation.stream.start-session-id	0	long	Override StartSession Id in sources for debug purposes. Only if greater than 0.
rsa.correlation.stream.tcp-no-delay	false	boolean	
rsa.correlation.stream.thread-pool-size	0	integer	Controls the size of the thread pool used the stream executor. Default to 100.
rsa.correlation.stream.time-batch-in-seconds	0	integer	Determines the batch size for the query based aggregation in seconds. By default it will be a 60 second window. This for now will not be configurable for user. This is because concentrator operates most efficiently when the time window is a minute.
rsa.correlation.stream.time-measured-in-seconds	true	boolean	{@code true} if time meta is measured in seconds in the event.
rsa.correlation.stream.time-meta-field	time	string	Decides what field should be used for time.
rsa.correlation.stream.time-order-by-field		string	Controls the name of the field that we consider the timestamp. This must be a long value.
rsa.correlation.stream.time-order-hold-interval	0	integer	To order records from multiple sources, we need to allow some "hold" time for sessions within a time window to arrive from all sources. This parameter specifies the hold interval (in milli-seconds)
rsa.correlation.stream.time-order-no-inflow-give-up-interval	0	integer	Controls the interval (in milliseconds) after which we take a "quiet" source out of the equation to allow progress on a time ordered stream. The default value is 0, which implies that we wait forever for events to arrive.

Name	Default value	Type	Description
rsa.correlation.stream.time-order-offline-give-up-interval	0	integer	Controls the interval (in milli-seconds) after which we take an offline source out of the equation to allow progress on a time ordered stream. The default value is 0, which implies that we wait forever. This parameter does not affect the re-connection retries; those which are performed in all cases.
rsa.correlation.stream.time-ordered	false	boolean	Enables source time synchronization and ordering.
rsa.correlation.stream.use-direct-buffer	false	boolean	
rsa.correlation.stream.use-event-time-for-esper	false	boolean	{@code true} to use the timeMetaField in the Event for Esper CurrentTimeEvent.

MigrationProperties

Name	Default value	Type	Description
rsa.migration.home-data-path	/var/netwitness/esa	string	The location of ESA home directory

RecordStreamMetrics

Name	Default value	Type	Description
rsa.records.stream.version		string	

Endpoint-broker-server Configuration

AggregationProperties

Name	Default value	Type	Description
rsa.endpoint.broker.cache-enabled	true	boolean	Cache enabled
rsa.endpoint.broker.cache-entry-limit	1000	integer	Cache entries limit
rsa.endpoint.broker.fetched-machines-limit	100	integer	The number of machine infos fetched for a given checksum. This is used to fetch the top 'n' risky machine-infos for a given file.
rsa.endpoint.broker.last-accessed-interval	120	seconds	Time interval when server would fetch the accessible endpoint servers in active session
rsa.endpoint.broker.last-updated-interval	600	seconds	Time interval when server would fetch the accessible endpoint servers when no request is sent for a long time
rsa.endpoint.broker.max-response-pages	10	integer	Max pages that an be viewed in UI host and file list views.
rsa.endpoint.broker.ping-timeout	2	seconds	Max time server will wait for the ping query to complete
rsa.endpoint.broker.query-timeout	10	seconds	Max timeout for individual endpoint server query to complete
rsa.endpoint.broker.threads	30	integer	Max number of request handler threads

ExportProperties

Name	Default value	Type	Description
rsa.endpoint.broker.export.directory-context	ExportDirectory	string	Represents the directory context (reference name) for the files to be exported
rsa.endpoint.broker.export.file-cleanup-interval	1800	seconds	Schedule interval for cleanup of files/directories
rsa.endpoint.broker.export.file-expiration-time	3600	seconds	Expiration time for the file(s) created

Name	Default value	Type	Description
rsa.endpoint.broker.export.path-prefix	temp/export	string	Represents the path prefix for files to be exported

FileContextProperties

Name	Default value	Type	Description
rsa.endpoint.broker.file-search.timeout	30	seconds	File context keyword search operation time out in seconds

Endpoint-server Configuration

CertificateStatusProperties

Name	Default value	Type	Description
rsa.endpoint.certificate.status.ignored-notifications-retry-interval	60	seconds	Notifications are ignored once posting file status fails. These ignored notifications are queried periodically. The property defines the interval.
rsa.endpoint.certificate.status.new-files-query-for-automatic-status-interval	300	seconds	Time (in seconds) between subsequent querying of new files for automatic assignment of file status to be send to Contexthub server
rsa.endpoint.certificate.status.query-batch-size	3000	integer	* Max number of thumbprints those should be fetched from repository in a single query
rsa.endpoint.certificate.status.request-batch-size	500	integer	* Max number of thumbprints those should be part of the request sent to Contexthub-Server
rsa.endpoint.certificate.status.request-interval	300	seconds	Time (in seconds) between querying for any new Certificates seen in endpoint server Defaulting to 5 minutes

AgentCommandProperties

Name	Default value	Type	Description
rsa.endpoint.command.cache-reload-delay	5	seconds	Interval delay to reload pending commands cache
rsa.endpoint.command.cancel-interval	24	seconds	Interval to cancel expired commands
rsa.endpoint.command.expiration-count	5	integer	Indicates the maximum number of times command would be resent to agent(s)

Name	Default value	Type	Description
rsa.endpoint.command.expiration-time	20	seconds	Indicates the duration until when command will not be resent to agent(s)

DataRetentionProperties

Name	Default value	Type	Description
rsa.endpoint.config.data-retention.enabled	true	boolean	Indicates if all machine data older than configured threshold {@code #thresholdInDays}, is to be deleted. This is enabled by default.
rsa.endpoint.config.data-retention.initial-rollover-delay	1	seconds	Time to delay before the first execution of the storage size based retention job
rsa.endpoint.config.data-retention.recurrence-interval	0 0 0 * * *	string	Indicates the time and frequency to run the deletion task. Configured to run everyday at 12:00:00 AM, by default.
rsa.endpoint.config.data-retention.rollover-after	80	double	The threshold (in %) indicating the storage size used, after which data should be cleaned up from the database
rsa.endpoint.config.data-retention.rollover-chunk-size	10	double	The chuck of data that should be cleanup up from the database. For example, 10 indicates 10% of the data should be cleaned up. Used for storage size based data retention job.
rsa.endpoint.config.data-retention.rollover-delay	10	seconds	Delay between invocations of the storage size based retention job
rsa.endpoint.config.data-retention.size-based-rollover-enabled	true	boolean	Indicates if storage size based retention job is enabled. This involves clearing up the disk, if it reaches a certain threshold {@see #rolloverAfter}. This is enabled by default.
rsa.endpoint.config.data-retention.threshold-in-days	30	integer	The retention threshold specified (in days)

DownloadedDataRetentionProperties

Name	Default value	Type	Description
rsa.endpoint.config.downloaded-data-retention.enabled	true	boolean	Indicates retention active status. This is enabled by default.
rsa.endpoint.config.downloaded-data-retention.recurrence-interval	0 0 0 * * *	string	Indicates the time and frequency to run the deletion task. Configured to run everyday at 00:00:00 AM, by default.
rsa.endpoint.config.downloaded-data-retention.threshold-in-days	90	integer	The retention threshold specified (in days)

InactiveMachineRetentionProperties

Name	Default value	Type	Description
rsa.endpoint.config.inactive-machine-retention.enabled	true	boolean	Indicates if all machines inactive for more than the configured threshold {@code #thresholdInDays}, is to be deleted. This is enabled by default.
rsa.endpoint.config.inactive-machine-retention.recurrence-interval	0 0 1 * * *	string	Indicates the time and frequency to run the deletion task. Configured to run everyday at 01:00:00 AM, by default.
rsa.endpoint.config.inactive-machine-retention.threshold-in-days	90	integer	The retention threshold specified (in days)

DataStoreHealthProperties

Name	Default value	Type	Description
rsa.endpoint.data-store-thresholds.fatal-percent	95	integer	
rsa.endpoint.data-store-thresholds.warning-percent	85	integer	

DataStoreProperties

Name	Default value	Type	Description
rsa.endpoint.data.application.compression-factor	2.5	double	Indicates the compression ratio used by mongo while writing to the filesystem
rsa.endpoint.data.application.db-path		string	Specify the path/directory allocated for the database files. Assumed to be /var/netwitness/mongo by default

RepositoryProperties

Name	Default value	Type	Description
rsa.endpoint.datastore.index-creation-enabled	true	boolean	Determines whether the indexes should be be created on the service startup

FileDownloadProperties

Name	Default value	Type	Description
rsa.endpoint.download.agent-beacon-threshold	5	seconds	Indicates the agent beacon time considered to (re)attempt file download
rsa.endpoint.download.base-path		string	Path in endpoint server where downloaded files are stored. Assumed to be /var/netwitness/endpoint-server by default
rsa.endpoint.download.batch-size	1000	integer	Number of entries to fetch & process from {@link CollectionConstants#GLOBAL_FILE_DOWNLOAD_REQUEST_COLLECTION} collection
rsa.endpoint.download.command-expiration-time	20	seconds	Indicates the expiration time for automatic file download commands, after which command would be cancelled

Name	Default value	Type	Description
rsa.endpoint.download.disk-check-interval	5	seconds	Indicates the interval to check the health of disk to which files will be downloaded
rsa.endpoint.download.download-threads	10	integer	Max number of auto file download handler threads
rsa.endpoint.download.downloaded-files-cache-size	2000000	integer	Max number of entries to store as part of downloaded files cache
rsa.endpoint.download.file-processor-batch-size	100	integer	Maximum number of concurrent processing requests that should be handled by server
rsa.endpoint.download.max-attempts	50	integer	Maximum number of agents that will be tried against in order to get the file downloaded to server, following which the next server takes over (if any)
rsa.endpoint.download.max-pending-commands	50	integer	Defines the maximum cap of unprocessed file download commands that can exist for a given agent, i.e. although {@link AgentCommandRequestType#Manual} commands can still be created, it is used to restrict addition of {@link AgentCommandRequestType#Automatic} file download commands
rsa.endpoint.download.periodic-cleanup-delay	2	seconds	Interval between successive lookups and attempts made by the server to delete pending requests which are no longer required
rsa.endpoint.download.periodic-hash-cleanup-delay	1	seconds	Interval between successive lookups and attempts made by the server to delete requests for files identified to be downloaded
rsa.endpoint.download.periodic-marking-delay	5	seconds	Interval between marking requests to be considered for processing by server(s)
rsa.endpoint.download.periodic-processing-delay	1	seconds	Interval between successive lookups and attempts made by server to process pending file download requests, i.e. to create/issue file download commands
rsa.endpoint.download.periodic-retry-processing-delay	5	seconds	Interval between successive lookups and attempts made by server to retry processing of older pending file download requests

Name	Default value	Type	Description
rsa.endpoint.download.request-cache-size	2000000	integer	Max number of entries to store as part of downloaded files request cache
rsa.endpoint.download.threads	2	integer	Max number of request handler threads
rsa.endpoint.download.update-interval	5	seconds	Interval in which downloaded status of newly added files is updated

ExecutionRetryProperties

Name	Default value	Type	Description
rsa.endpoint.execution.retry.file-persistence-delay	50	seconds	Indicates the wait time for retrying file data persistence
rsa.endpoint.execution.retry.max-delay	2	seconds	Indicates the maximum delay to be used between retries
rsa.endpoint.execution.retry.min-delay	30	seconds	Indicates the minimum delay to be used between retries

ExportProperties

Name	Default value	Type	Description
rsa.endpoint.export.directory-context	ExportDirectory	string	Represents the directory context (reference name) for the files to be exported
rsa.endpoint.export.file-cleanup-interval	1800	seconds	Schedule interval for cleanup of files/directories
rsa.endpoint.export.file-expiration-time	3600	seconds	Expiration time for the file(s) created
rsa.endpoint.export.max-exportable-entries	100000	integer	Maximum entries that can be exported into csv from the database, for files
rsa.endpoint.export.path-prefix	temp/export	string	Represents the path prefix for files to be exported

FileDownloadDiskHealthProperties

Name	Default value	Type	Description
rsa.endpoint.file-download-disk-thresholds.fatal-percent	70	integer	
rsa.endpoint.file-download-disk-thresholds.warning-percent	60	integer	

FileCacheProperties

Name	Default value	Type	Description
rsa.endpoint.file.cache.expiration-time	1800	seconds	Expiration threshold, since last access of item(s)
rsa.endpoint.file.cache.size	100000	long	Maximum items in the cache

FileReputationStatusProperties

Name	Default value	Type	Description
rsa.endpoint.file.reputation.ignored-notifications-query-interval	300	seconds	Time (in seconds) between subsequent check for ignored notifications querying
rsa.endpoint.file.reputation.known-signed-providers	microsoft,apple	string	List of signature providers for which we don’t need to compute the reputation. This is only accounted when filterOutKnowFiles = true/
rsa.endpoint.file.reputation.query-batch-size	2000	integer	* Max number of hashes those should be fetched from repository in a single query
rsa.endpoint.file.reputation.request-batch-size	500	integer	* Max number of hashes those should be part of the request sent to Contexthub-Server

Name	Default value	Type	Description
rsa.endpoint.file.reputation.request-interval	10	seconds	Time (in seconds) between subsequent requests to be send to Reputation-Server
rsa.endpoint.file.reputation.skip-known-good-files	true	boolean	Should reputation be computed for files from know sources ? This can be files that are signed by known CA's or maybe what the customer might have configured to be white-listed files

RiskScoreProperties

Name	Default value	Type	Description
rsa.endpoint.file.score.query-batch-size	2000	integer	Max number of file/machines to be fetched from repository in a single query
rsa.endpoint.file.score.request-interval	20	seconds	Time (in seconds) between subsequent requests to be sent

FileContextProperties

Name	Default value	Type	Description
rsa.endpoint.file.search.timeout	30	seconds	File context keyword search operation time out in seconds
rsa.endpoint.file.search.total-count	100	integer	Max number of results that will be returned for a/any snapshot response

FileStatusProperties

Name	Default value	Type	Description
rsa.endpoint.file.status.ignored-notifications-query-interval	300	seconds	Time (in seconds) between subsequent check for ignored notifications querying

Name	Default value	Type	Description
rsa.endpoint.file.status.query-batch-size	3000	integer	* Max number of hashes those should be fetched from repository in a single query
rsa.endpoint.file.status.request-batch-size	500	integer	* Max number of hashes those should be part of the request sent to Contexthub-Server
rsa.endpoint.file.status.request-interval	10	seconds	Time (in seconds) between subsequent requests to be send to Reputation-Server

GroupPolicyProperties

Name	Default value	Type	Description
rsa.endpoint.group-policy.bulk-write-count	1000	integer	Number of items to be written as part of a batch/bulk write operation performed, to assign/update group-policy to machines present in the deployment
rsa.endpoint.group-policy.initial-sync-delay	20	seconds	Time to wait for the initial group-policy details to be synced
rsa.endpoint.group-policy.periodic-evaluation-delay	30	seconds	Interval between successive evaluations performed (if required), to assign/update group-policy to machines present in the deployment

MachineFileProperties

Name	Default value	Type	Description
rsa.endpoint.machine-file.delete-task-delay	5	seconds	Initial delay to clean-up {@link CollectionConstants#MACHINE_FILE_ COLLECTION} collection for un-managed agents and decrement host count
rsa.endpoint.machine-file.fetch-limit	50	integer	Number of documents to be fetched from {@link CollectionConstants#MACHINE_ FILE_STAGE_COLLECTION} collection amd merge to the {@link CollectionConstants#MACHINE_FILE_ COLLECTION} collection

Name	Default value	Type	Description
rsa.endpoint.machine-file.periodic-bookmark-update-time	60	seconds	Interval between successive merging of {@link CollectionConstants#MACHINE_FILE_STAGE_COLLECTION} collection to {@link CollectionConstants#MACHINE_FILE_COLLECTION} collection
rsa.endpoint.machine-file.periodic-merge-delay	30	seconds	Interval between successive merging of {@link CollectionConstants#MACHINE_FILE_STAGE_COLLECTION} collection to {@link CollectionConstants#MACHINE_FILE_COLLECTION} collection
rsa.endpoint.machine-file.refresh-time	86400	seconds	Time interval to refresh the files present in a machine. The min value is set to 8h and max value is 48h.
rsa.endpoint.machine-file.refresh-time-delay	900	seconds	This is the time interval to check if agent files needs to be refreshed and create command for the agent if so.
rsa.endpoint.machine-file.retry-count	500	integer	Indicates the number of times it must be retried
rsa.endpoint.machine-file.retry-wait-time	10	seconds	Indicates the wait time for retrying to save machineFileHistory
rsa.endpoint.machine-file.staged-machine-file-deletion-delay	10	seconds	Delay between cleaning up of machine file data from {@link CollectionConstants#MACHINE_FILE_STAGE_COLLECTION} collection
rsa.endpoint.machine-file.threads	20	integer	Max number of merge machine file handler threads
rsa.endpoint.machine-file.update-history-limit	1000	integer	Number of documents to be updated into {@link CollectionConstants#MACHINE_FILE_HISTORY_COLLECTION} collection

MachineServiceProperties

Name	Default value	Type	Description
rsa.endpoint.machine.fetched-machines-limit	100	integer	The number of machine infos fetched for a given checksum. This is used to fetch the top 'n' risky machine-infos for a given file.

Name	Default value	Type	Description
rsa.endpoint.machine.search-query-timeout	10	seconds	Max timeout for machine detail to query to complete in milliseconds
rsa.endpoint.machine.status-persistence-interval	30	seconds	Interval in seconds in which machine/agent status will be persisted to db. Since it is a costly operation higher value is preferred and more higher the value is more inaccuracy will be in status related db queries

MachineFileScoreConfigurationProperties

Name	Default value	Type	Description
rsa.endpoint.machine.file.score.limit-of-checksums-in-batch	500	integer	
rsa.endpoint.machine.file.score.min-delay-for-refresh-seconds	120	seconds	

MetaForwardProperties

Name	Default value	Type	Description
rsa.endpoint.meta.enabled	false	boolean	Enable/Disable Meta integration
rsa.endpoint.meta.ld-buffer-check-enabled	true	boolean	Configuration option to disable the throttling on Log decoder buffer availability.
rsa.endpoint.meta.ld-buffer-limit-percentage	75	integer	Pool.packet.capture / pool.packet.page percentage at which we need to throttle.
rsa.endpoint.meta.logdecoder-host-id		string	The unique identifier of the host in which the Log decoder resides.
rsa.endpoint.meta.logdecoder-port	0	integer	Log decoder Port to which metas are to be posted
rsa.endpoint.meta.logdecoder-rest-password		string	Password to access the logdecoder rest port

Name	Default value	Type	Description
rsa.endpoint.meta.logdecoder-rest-port	0	integer	Log decoder REST Port to which metas are to be posted. This port number is used to query the available buffer before sending the meta.
rsa.endpoint.meta.logdecoder-rest-username		string	Username to access the logdecoder rest port
rsa.endpoint.meta.protobuf-ssl-enabled	false	boolean	SSL or Non SSL communication
rsa.endpoint.meta.rest-ssl-enabled	false	boolean	REST SSL or Non REST SSL communication
rsa.endpoint.meta.logdecoder-host		string	Log decoder Ip or hostname to which metas are to be posted @deprecated (since 6.0.0, To handle DHCP scenarios as well as manual IP change / load balancing scenarios, .use of ` logdecoderHost ` for LD communication is deprecated.The ` logdecoderHostId ` will be used instead of ` logdecoderHost ` for all log decoder communicationin future versions.

PackagerProperties

Name	Default value	Type	Description
rsa.endpoint.packager.agent-cert-name	client.p12	string	
rsa.endpoint.packager.beacon-interval	600	seconds	
rsa.endpoint.packager.packager-dir	/usr/lib/netwitness/endpoint-agents	string	

MachineDataHandlerProperties

Name	Default value	Type	Description
rsa.endpoint.queue.file-properties-drain-at-close	false	boolean	Optionally drain the queued files data to disk when the service is shutdown normally

Name	Default value	Type	Description
rsa.endpoint.queue.file-size	100	integer	Max number of concurrent data requests that should be handled by server for processing file data
rsa.endpoint.queue.file-threads	20	integer	Max number of file persistence threads
rsa.endpoint.queue.size	100	integer	Max number of concurrent data requests that should be handled by server
rsa.endpoint.queue.threads	10	integer	Max number of request handler threads

QueueFileSystemPersistenceProperties

Name	Default value	Type	Description
rsa.endpoint.queue.file.directory-context	dataDirectory	string	Represents the directory context (reference name) for the files to be persisted from file queues
rsa.endpoint.queue.file.path-prefix	temp/queue/files	string	Represents the path prefix for files to be persisted from Files queues

RelayCommunicationProperties

Name	Default value	Type	Description
rsa.endpoint.relay.communication.connect-timeout	30	seconds	Common connect timeout for all connections.
rsa.endpoint.relay.communication.initial-delay	30	seconds	Time to wait before attempting to connect to relay server
rsa.endpoint.relay.communication.max-connections	100	integer	Maximum number of connections allowed to nchan from relay server

Name	Default value	Type	Description
rsa.endpoint.relay.communication.nchan-base-url	https://localhost:7056	string	
rsa.endpoint.relay.communication.publish-channel	/agent/publish	string	
rsa.endpoint.relay.communication.request-timeout	30	seconds	Common request timeout for all connections.
rsa.endpoint.relay.communication.retry-interval	10	seconds	Delay between connection attempts
rsa.endpoint.relay.communication.subscribe-channel	/endpoint_ server/subscribe	string	
rsa.endpoint.relay.communication.subscribe-request-timeout	5	seconds	0s is infinite time.
rsa.endpoint.relay.communication.thread-pool-size	100	integer	

RelayInstallerProperties

Name	Default value	Type	Description
rsa.endpoint.relay.installer.cert-name	relay-server-cert.p12	string	Relay-server certificate file name
rsa.endpoint.relay.installer.dependency-dir	/var/netwitness/ endpoint-server/relay	string	Directory where relay-server dependencies will be downloaded. Non root user must have read, write access.
rsa.endpoint.relay.installer.download-on-restart	true	boolean	Flag to decide whether to delete local copy of relay-server dependencies and download from configured yum repo on every endpoint server restart. It might take sometime for the downloading to complete, during which user will not be able to download relay-server installer.

Name	Default value	Type	Description
rsa.endpoint.relay.installer.init-delay	20	seconds	Delay for Background task which will download relay-server dependencies.

RelayMetricsProperties

Name	Default value	Type	Description
rsa.endpoint.relay.metrics.periodic-evaluation-delay	300	seconds	Time interval to evaluate if any relay-server config was modified and update the metrics if required
rsa.endpoint.relay.metrics.refresh-time	300	seconds	Time interval to refresh the metrics from relay-server server

SslContextProperties

Name	Default value	Type	Description
rsa.endpoint.ssl.ssl-session-cache-size	0	integer	Max number of sessions to be kept in ssl session cache
rsa.endpoint.ssl.ssl-session-timeout	0	seconds	Max time an SSL session can be reused

ThrottlingConfigurationProperties

Name	Default value	Type	Description
rsa.endpoint.throttling.enabled	true	boolean	
rsa.endpoint.throttling.max	70	integer	

UdpProperties

Name	Default value	Type	Description
rsa.transport.udp.enabled	true	boolean	Boolean to indicate if server can consume Udp packet
rsa.transport.udp.port	0	integer	UDP port
rsa.transport.udp.size	5000	integer	Max number of concurrent data requests that should be handled by server
rsa.transport.udp.threads	20	integer	Max number of request handler threads

Enrichment-server Configuration

EngineProperties

Name	Default value	Type	Description
rsa.enrichment.engine.auto-start	true	boolean	Determines if all {@link Engine} should start on service deployed.
rsa.enrichment.engine.startup-error-retry-interval	10	seconds	Retry interval if error occurs during startup.

StreamProperties

Name	Default value	Type	Description
rsa.enrichment.stream.buffer-size	40000	integer	Controls the number of records the stream can keep outstanding.
rsa.enrichment.stream.connection-time-out	0	long	Override connection timeout in sources. Only if greater than 0.
rsa.enrichment.stream.dots-to-underscores	true	boolean	Choose if we want to translate "user.dst" to "user_dst".
rsa.enrichment.stream.event-source-id	true	boolean	Controls whether we need to add the event source identifier (ESA compatibility)
rsa.enrichment.stream.lag-time	15	seconds	Lag time is the expected time an event takes to pass through the different levels of capture/parse etc and become available to query in the concentrator.
rsa.enrichment.stream.mechanism		string	{@link StreamSettings.Mechanism}.
rsa.enrichment.stream.minutes-back	5	integer	Controls how far back in time should we go for a fresh start.
rsa.enrichment.stream.multi-valued		list	Choose the fields considered as multi-valued.
rsa.enrichment.stream.reader-buffer-size	1048576	integer	

Name	Default value	Type	Description
rsa.enrichment.stream.save-position-every	1	seconds	A length of time to apply the permits. Minimum of 1 second and max at 1 day.
rsa.enrichment.stream.save-position-frequency	1	integer	Number of permits for a duration.
rsa.enrichment.stream.socket-timeout	0	long	Override socket timeout in sources. Only if greater than 0.
rsa.enrichment.stream.source-poll-interval	1000	integer	Controls the parameters passed to RecordSource#poll(int, TimeUnit).
rsa.enrichment.stream.start-session-id	0	long	Override StartSession Id in sources for debug purposes. Only if greater than 0.
rsa.enrichment.stream.tcp-no-delay	true	boolean	
rsa.enrichment.stream.time-batch-in-seconds	60	integer	Determines the batch size for the query based aggregation in seconds. By default it will be a 60 second window. This for now will not be configurable for user. This is because concentrator operates most efficiently when the time window is a minute.
rsa.enrichment.stream.time-measured-in-seconds	true	boolean	{@code true} if time meta is measured in seconds in the event.
rsa.enrichment.stream.time-meta-field	time	string	Decides what field should be used for time.
rsa.enrichment.stream.time-ordered	false	boolean	Decides if the stream should be time ordered.
rsa.enrichment.stream.use-event-time-for-esper	false	boolean	{@code true} to use the timeMetaField in the Event for Esper CurrentTimeEvent.

Integration-server Configuration

DeploymentNotificationProperties

Name	Default value	Type	Description
rsa.notification.startup-retry-interval	15s	seconds	The service startup failure retry interval.

Investigate-server Configuration

AliasesProperties

Name	Default value	Type	Description
rsa.investigate.aliases.cache-duration	24	seconds	Time it takes for the cache that stores aliases to expire
rsa.investigate.aliases.retrieval-timeout	30	seconds	Timeout to wait for aliases sdk response

ColumnGroupProperties

Name	Default value	Type	Description
rsa.investigate.column.group.number-of-visible-columns	15	integer	

EventAnalysisProperties

Name	Default value	Type	Description
rsa.investigate.eventanalysis.legacy-events-enabled	false	boolean	Flag to determine if legacy events tab and related links have to be enabled
rsa.investigate.eventanalysis.limit	5000	integer	The default event limit
rsa.investigate.eventanalysis.role-event-limit		map	The per-role event limit

IncidentProperties

Name	Default value	Type	Description
rsa.investigate.incident.max-events-per-alert	60	long	Max. number of events that should be added to a single alert when creating incidents from events

KeyrefsProperties

Name	Default value	Type	Description
rsa.investigate.keyrefs.cache-duration	2	seconds	Time it takes for the cache that stores aliases to expire
rsa.investigate.keyrefs.retrieval-timeout	30	seconds	Timeout to wait for aliases sdk response

MetaKeyCacheProperties

Name	Default value	Type	Description
rsa.investigate.metakey.cache.cache-duration	7	seconds	Number of seconds a metakey should live in the cache. Default: 1 WEEK

ReconstructionProperties

Name	Default value	Type	Description
rsa.investigate.reconstruction.clear-cache-older-than	24	seconds	Cache files which are older than this time interval would be cleared
rsa.investigate.reconstruction.compressed-file-password	netwitness	string	Default zip file password for email recon downloads

Name	Default value	Type	Description
rsa.investigate.reconstruction.content-type-file-extractor-max-size	4	bytes	From NetWitness Core documentation <p> The max number of bytes to return, zero means no limit. This parameter is used to control the maximum bytes that a large network session should return and is mainly meant to prevent an extraordinary large network session from consuming a large number of resources during the transfer. Be careful setting this parameter to zero.
rsa.investigate.reconstruction.email-attachment-hash-provider		reconstructionproperties $emailattachmenthashprovider	The calculated hash type for any email attachments
rsa.investigate.reconstruction.email-full-render	true	boolean	Flag to enable/disable full rendering of email messages. <p> When set to true email bodies will be fully reconstructed which will benefit email's with HTML body content. Styling will be preserved as best as possible—external styles and references must be removed—and inline content (images), if included in the session, will be displayed. Placeholders will be shown for content that is not available or cannot be rendered and any inline script should be made inactive but displayed to the user for informational purposes. <p> If set to false, standard rendering is used which will render the email body as best as possible and return it as text in the `bodyContent` field of the {@link Email} object. <p> This setting is dependent on the Reconstruction Object Cache being enabled. (see {@link ReconstructionProperties#objectCacheEnabled}) It is ignored otherwise.

Name	Default value	Type	Description
rsa.investigate.reconstruction.endpoint-enrichment-time-window	30	seconds	Endpoint Enrichment Query time window in seconds. Network events will be correlated with endpoint events triggered within this time window of the network event's time. If network event time is x, endpoint events will be queried from 'x - @endpointEnrichmentTimeWindow' time
rsa.investigate.reconstruction.endpoint-enrichment-time-window-buffer	5	seconds	Additional buffer time range used to query for endpoint enrichment data. If network event time is x, endpoint events will be queried till 'x + @endpointEnrichmentTimeWindow Buffer' time
rsa.investigate.reconstruction.endpoint-events-query-time-out	5	seconds	Max time allowed in seconds for all endpoint core queries to complete
rsa.investigate.reconstruction.enrichment-instance-init-delay	1	seconds	Initial delay to fetch the investigate service details from all orchestrated endpoint services
rsa.investigate.reconstruction.image-placeholder-url		uri	Url used in Email recon for web email when original images cannot be loaded
rsa.investigate.reconstruction.object-cache-enabled	true	boolean	Flag to enable/disable reconstruction object cache. In addition to caching the content (protobuf files) that are downloaded from core devices, the investigate service will attempt to cache any objects and files that are created while reconstructing sessions. For this release (11.4—the first release with the object cache) this only pertains to email reconstruction.
rsa.investigate.reconstruction.reactive-message-size	256	bytes	Used in reactive streaming to configure the maximum buffer size for holding reconstructed data.

Name	Default value	Type	Description
rsa.investigate.reconstruction.reactive-text-streaming	true	boolean	Flag to turn on reactive streaming for text reconstruction. Reactive streaming prevents web socket overload by sending as many reconstructed text blocks that fit into a known buffer size and stopping until the caller tells the service to proceed.
rsa.investigate.reconstruction.session-enrichment-time-out	10	seconds	Max time allowed in seconds for all enrichment queries to complete including core, endpoint and other enrichment queries
rsa.investigate.reconstruction.support-script-urls		uri[]	If html is generated in reconstruction, that is served to the UI via an IFRAME (as to not interfere with the functionality/styling of the main application) this setting stores an array of strings (url's) to javascript files that will be injected into the html. The javascript is injected via <script /> elements at the time of HTML file creation and therefore will be saved to the object-cache. Any updates to this array would require clearing of the object-cache and/or a service restart.
rsa.investigate.reconstruction.sync-core-timeout	600	seconds	Max time to wait for operations for caching core content to complete to prevent deadlocks. Internal setting. Not recommended for customer use.
rsa.investigate.reconstruction.wire-size-provider		reconstructionproperties $wiresizeprovider	The method used to determine object size when transmitting objects via websocket

ResponseProperties

Name	Default value	Type	Description
rsa.investigate.response.events-batch-size	5000	long	Number of data size to send per message. If client send request with stream batch size and it is smaller than this, the client batch size will be used instead.

EventsStreamProperties

Name	Default value	Type	Description
rsa.investigate.stream.events.factor-of-multiple-meta-values-with-same-key	5	integer	Like the above property. This property is used to calculate a safety threshold if not specified. It's a factor to allow for multiple meta values existing in the same key and should be something reasonably high.
rsa.investigate.stream.events.safe-num-of-column-selected	50	integer	Used to calculate a safety value for "threshold" in the query to avoid the query going unbounded if threshold is not specified. The value of threshold is calculate by the formula below: threshold = (num of sessions desired) * (num of column selected) * (factor of multiple meta values with same key) If the above (num of column selected) can't be inferred from "select" field, this default value would be used.

Launch-framework Configuration

ConfigurationModuleProperties

Name	Default value	Type	Description
rsa.configuration.backoff-duration	1	seconds	Amount of time to wait until a retry is attempted if the config-server is unavailable
rsa.configuration.connection-timeout	30	seconds	A timeout how long to wait if the config-server is unavailable
rsa.configuration.remote-enabled	false	boolean	If the configuration server is even attempted
rsa.configuration.schema-synchronization-retry-interval	1	seconds	This property controls how long to wait before retrying a failed schema synchronization attempt.

ContentProperties

Name	Default value	Type	Description
rsa.content.disk-path		path	The path where the content resides on disk

DataProperties

Name	Default value	Type	Description
rsa.data.application.advanced		map	A set of advanced properties specific to the data provider
rsa.data.application.auth-mechanism	SCRAM	string	Default username/password authentication "SCRAM". Alternative: "PLAIN"
rsa.data.application.connection-timeout	5	seconds	How long to wait before giving up on a connection attempt
rsa.data.application.database		string	The database name

Name	Default value	Type	Description
rsa.data.application.enabled	false	boolean	If true will enable database support
rsa.data.application.map-key-dot-replacement		string	Mongo disallows "." in map keys, if a value is provided, dots in map keys are replaced by it.
rsa.data.application.password		string	The connection password
rsa.data.application.secure	false	boolean	Use an SSL/TLS connection to the database
rsa.data.application.servers	[localhost]	string[]	A comma separated list of database servers
rsa.data.application.stat-cache-timeout	15	seconds	How long to wait before refreshing database statistics?
rsa.data.application.user		string	The connection user
rsa.data.control.advanced		map	A set of advanced properties specific to the data provider
rsa.data.control.auth-mechanism	SCRAM	string	Default username/password authentication "SCRAM". Alternative: "PLAIN"
rsa.data.control.connection-timeout	5	seconds	How long to wait before giving up on a connection attempt
rsa.data.control.database		string	The database name
rsa.data.control.enabled	false	boolean	If true will enable database support
rsa.data.control.map-key-dot-replacement		string	Mongo disallows "." in map keys, if a value is provided, dots in map keys are replaced by it.
rsa.data.control.password		string	The connection password
rsa.data.control.secure	false	boolean	Use an SSL/TLS connection to the database
rsa.data.control.servers	[localhost]	string[]	A comma separated list of database servers
rsa.data.control.stat-cache-timeout	15	seconds	How long to wait before refreshing database statistics?
rsa.data.control.user		string	The connection user

FileSystemProperties

Name	Default value	Type	Description
rsa.filesystem.conf-path	/etc/netwitness	string	The path to directory where all service configuration resides. Ignored if prefix is specified.
rsa.filesystem.data-path	/var/lib/netwitness	string	The path to directory where all service data resides. Ignored if prefix is specified.
rsa.filesystem.logs-path	/var/log/netwitness	string	The path to directory where all service logs reside. Ignored if prefix is specified.
rsa.filesystem.prefix		string	If not empty the prefix specifies the root for all service file system state. When empty, the individual values are used.

HealthCheckProperties

Name	Default value	Type	Description
rsa.health.check-every	15	seconds	Rate at which health checks are scheduled to run.
rsa.health.concurrency	5	integer	Number of concurrent threads that runs health checks.
rsa.health.timeout	30	seconds	Time out for a {@link com.rsa.asoc.launch.api.health.HealthCheck} when service health checks are run. If a component is unable to respond with health status with in this period, it is marked as {@link com.rsa.asoc.launch.api.health.Health.Status#Unhealthy}

LoggingAuditProperties

Name	Default value	Type	Description
rsa.logging.audit.max-file-count	10	integer	The maximum number of archive files to retain.
rsa.logging.audit.max-file-size	10	bytes	The maximum size a log file is allowed to grow

LogForwarderProperties

Name	Default value	Type	Description
rsa.logging.forward.categories		string[]	The log categories to choose for forwarding
rsa.logging.forward.destination		logforwarderproperties$destination	The forwarding destination
rsa.logging.forward.enabled	true	boolean	Is forwarding enabled?
rsa.logging.forward.host	localhost	string	The destination host address
rsa.logging.forward.port	50514	integer	The destination port
rsa.logging.forward.secure	false	boolean	Use TLS for forwarding (only supported with LOGSTASH_TCP)

LoggingProperties

Name	Default value	Type	Description
rsa.logging.levels		string	Service log levels specified as a comma separated sequence of "logger:level". Note logger names are case sensitive.

LoggingOperationalProperties

Name	Default value	Type	Description
rsa.logging.operations.max-file-count	10	integer	The maximum number of archive files to retain.

Name	Default value	Type	Description
rsa.logging.operations.max-file-size	10	bytes	Maximum file size of each file allowed to grow

MetricsAggregationProperties

Name	Default value	Type	Description
rsa.metrics.aggregation.enabled	true	boolean	Is the reporter enabled?
rsa.metrics.aggregation.filter-prefixes		list	What to report? The default behavior is to report everything, if a selection of metrics must be reported add their prefixes to this list.
rsa.metrics.aggregation.host		string	The host name of the aggregator.
rsa.metrics.aggregation.interval	1	seconds	How often to report?
rsa.metrics.aggregation.port	0	integer	The port number.

MetricsElasticProperties

Name	Default value	Type	Description
rsa.metrics.elastic.enabled	true	boolean	Is the reporter enabled?

MetricsHistoricalProperties

Name	Default value	Type	Description
rsa.metrics.historical.enabled	true	boolean	Is the reporter enabled?
rsa.metrics.historical.filter-prefixes		list	What to report? The default behavior is to report everything, if a selection of metrics must be reported add their prefixes to this list.
rsa.metrics.historical.interval	1	seconds	How often to report?

Name	Default value	Type	Description
rsa.metrics.historical.max-file-count	10	integer	The maximum number of archive files to retain.
rsa.metrics.historical.max-file-size	10	bytes	Maximum file size of each file allowed to grow

MetricsJmxProperties

Name	Default value	Type	Description
rsa.metrics.jmx.enabled	true	boolean	Is the reporter enabled?
rsa.metrics.jmx.filter-prefixes		list	What to report? The default behavior is to report everything, if a selection of metrics must be reported add their prefixes to this list.
rsa.metrics.jmx.interval	1	seconds	How often to report?

MetricsProperties

Name	Default value	Type	Description
rsa.metrics.profile-api-invocation	true	boolean	Profiles timing of all {@link com.rsa.asoc.launch.api.annotation.LaunchApi} methods.

NotificationProperties

Name	Default value	Type	Description
rsa.notification.drain-at-shutdown	true	boolean	The flag to control if we drain the notification queue before shutdown. If there are a lot of pending notifications this may cause noticeable delays in shutdown time, particularly if the deployment integration server is unavailable and each forward goes through the retry attempts.

Name	Default value	Type	Description
rsa.notification.max-pending	1000	integer	The maximum number of notifications left pending.
rsa.notification.max-threads	1	integer	The size of the thread pool.
rsa.notification.retry-at-shutdown	true	boolean	The flag to control if we should retry failed notifications when the service is going down. This is true by default but can lead to delayed shutdowns if notifications cannot be forwarded.
rsa.notification.retry-attempts		integer	The number of times we retry if a notification cannot be forwarded to the centralized notification service. The default setting is to never give up but can be changed to smaller value (e.g. 10) if it is OK to drop some notifications.
rsa.notification.retry-delay	10s	seconds	The delay between successive retry attempts.

ProcessJvmMemoryProperties

Name	Default value	Type	Description
rsa.process.jvm.memory-thresholds.fatal-percent	95	integer	Percent of heap memory usage, above which JVM health is marked Fatal
rsa.process.jvm.memory-thresholds.warning-percent	80	integer	Percent of heap memory usage, above which JVM health is marked Unhealthy

ProcessProperties

Name	Default value	Type	Description
rsa.process.shutdown-delay	5	seconds	The delay between a request to shutdown and the eventual shutdown trigger.

AuthenticationProperties

Name	Default value	Type	Description
rsa.security.authentication.prefetch-before	5	seconds	If prefetch service token enabled, fetch next when there is this much seconds left for expiry of current token
rsa.security.authentication.prefetch-service-token	true	boolean	Prefetch service tokens before they expire
rsa.security.authentication.refresh-token-lifetime	30	seconds	The time-to-live on a refresh token.
rsa.security.authentication.remote-enabled	false	boolean	Support remote authentication.
rsa.security.authentication.remote-timeout	30	seconds	The time to wait for a response before failing a remote authentication.
rsa.security.authentication.token-lifetime	8	seconds	The time-to-live on a token.
rsa.security.authentication.trusted-channel-enabled	true	boolean	Support trusted channel authentication.

AuthorizationProperties

Name	Default value	Type	Description
rsa.security.authorization.permission-cache-expiry	15	seconds	This property controls cache expiry interval for the role to permissions mapping.
rsa.security.authorization.permission-cache-size	100	integer	This property controls number of role definitions cached in the service.
rsa.security.authorization.permission-synchronization-retry-interval	1	seconds	This property controls how long to wait before retrying a failed permission synchronization attempt.
rsa.security.authorization.remote-enabled	true	boolean	This property controls if the service must synchronize its permissions to the deployment Security Server.

CertificateAuthorityProperties

Name	Default value	Type	Description
rsa.security.ca.alias	Service CA	string	The alias for the CA keypair.
rsa.security.ca.auto-sign-operational-certificate	false	boolean	Should the service operational certificate be automatically signed by the embedded CA?
rsa.security.ca.certificate-lifetime	1000	seconds	The certificate validity lifetime
rsa.security.ca.issued-time-allowance	10	seconds	The certificate issued time can allow some clock drift.
rsa.security.ca.store-certificates	false	boolean	Should the service store certificates it signs

PkiProperties

Name	Default value	Type	Description
rsa.security.pki.audit-tls-hand-shakes	true	boolean	Enables auditing of TLS handshakes
rsa.security.pki.ciphers	[TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256, TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256, TLS_DHE_RSA_WITH_AES_128_GCM_SHA256]	string[]	This property controls the list of SSL cipher suites used by the service.
rsa.security.pki.client-auth		ssl$clientauth	This property controls the SSL client authentication preference.
rsa.security.pki.tls-protocols		string[]	This property controls the TLS protocol versions supported by the applications.

Name	Default value	Type	Description
rsa.security.pki.trust-synchronization-retry-interval	1	seconds	This property controls how long to wait before retrying a deployment trust synchronization attempt.
rsa.security.pki.use-deployment-trust	true	boolean	This property controls if the deployment security-server must be trusted.
rsa.security.pki.use-jvm-trust	false	boolean	This property controls if the JVM trust store should be used to validate peer certificates.
rsa.security.pki.verify-certificates	true	boolean	This property controls whether we must verify server certificates.

ServiceAccountProperties

Name	Default value	Type	Description
rsa.security.serviceaccounts.auth-request-validity	1	seconds	Validity of the auth request
rsa.security.serviceaccounts.max-request-cache-size	10000	integer	Cache hashes of previously authenticated requests to prevent renegotiation attacks
rsa.security.serviceaccounts.min-interval-between-authentications	30	seconds	Minimum interval between authentications to prevent brut-force attacks
rsa.security.serviceaccounts.token-lifetime	1	seconds	The time-to-live for a service account token.

TransportBusProperties

Name	Default value	Type	Description
rsa.transport.bus.advanced		map	A map that holds any other RabbitProperties configuration
rsa.transport.bus.enabled	true	boolean	Defines if Bus is enabled
rsa.transport.bus.host	localhost	string	The connection host
rsa.transport.bus.max-consumers	16	integer	Maximum number of consumers reading the queues
rsa.transport.bus.message-prefetch	1	integer	Number of messages to be handled in a single request
rsa.transport.bus.min-consumers	8	integer	Minimum number of consumers reading the queues
rsa.transport.bus.password		string	The connection password
rsa.transport.bus.port	5672	integer	The connection port
rsa.transport.bus.recovery-interval	15	seconds	The time to wait between attempts to recover a broken RabbitMQ broker connection.
rsa.transport.bus.reply-timeout	15	seconds	The time to wait for replies to arrive before giving up. AMQP is not connection-oriented so the absence of a service on the bus can only be determined by the absence of a reply. This timeout determines how long the framework waits before giving up.
rsa.transport.bus.secure	false	boolean	Use an SSL/TLS connection to the broker
rsa.transport.bus.shutdown-timeout	5	seconds	The time to wait for workers after the container is stopped, and before the connection is forced closed. If any workers are active when the shutdown signal comes they will be allowed to finish processing as long as they can finish within this timeout. Otherwise the connection is closed and messages remain unacked (if the channel is transactional).
rsa.transport.bus.username		string	The connection user
rsa.transport.bus.virtual-host	/rsa/system	string	The connection virtual host

TransportBusSubscriptionProperties

Name	Default value	Type	Description
rsa.transport.bus.subscription.subscribe-retry-interval	5	seconds	The interval to retry declaring the bindings for subscriptions if the exchange is unavailable or missing.

TransportProperties

Name	Default value	Type	Description
rsa.transport.detailed-errors-enabled	false	boolean	A boolean indicating whether the server should return detailed errors that may contain additional implementation details.

TransportHttpProperties

Name	Default value	Type	Description
rsa.transport.http.access-token-headers		string[]	Defines the HTTP headers to check for an access token
rsa.transport.http.basic-auth-enabled	false	boolean	Defines if web security basic authentication should be enabled.
rsa.transport.http.enabled	true	boolean	Defines if HTTP is enabled
rsa.transport.http.keep-alive-timeout	60s	seconds	The number of seconds this Connector will wait for another HTTP request before closing the connection. Setting the value to 0 will indicate no (i.e. infinite) timeout.
rsa.transport.http.max-keep-alive-requests	100	integer	The maximum number of HTTP requests which can be pipelined until the connection is closed by the server. Setting this to -1 will allow an unlimited amount of pipelined or keep-alive HTTP requests.

Name	Default value	Type	Description
rsa.transport.http.port	8080	short	Defines the HTTP port
rsa.transport.http.secure	true	boolean	Defines if HTTPS must be used
rsa.transport.http.session-id-random-algorithm	HMACDRBG	string	This property controls the algorithm to use for the SecureRandom used to generate HTTP session IDs.

License-server Configuration

LicenseProperties

Name	Default value	Type	Description
rsa.license.auto-cleanup-enabled	true	boolean	Whether to enable data retention job
rsa.license.auto-cleanup-interval	24 hours	seconds	Data retention job interval. The job cleans License usage and history data older than `dataRetention` property value
rsa.license.auto-refresh-interval	60 minutes	seconds	Periodic entitlement refresh interval
rsa.license.compliance-cache-expiry	60 minutes	seconds	Compliance will be evaluated and cached for this duration before evaluating again. Set to 0 to disable cache. Maximum cache expiry duration is 6 hours
rsa.license.data-retention-period	365 days	seconds	Days to retain license usage and history data in repository

FneProperties

Name	Default value	Type	Description
rsa.license.fne.base-url	/api/1.0/	string	Base URL path of REST API, all other URLs are appended to baseUrl
rsa.license.fne.capability-request-url	/capability_request/offline	string	URL to generate a new capability request
rsa.license.fne.capability-response-url	/capability_response	string	URL to post a response of capability request
rsa.license.fne.delay-before-proxy-update	2	seconds	Wait time to hold the proxy update job before receiving all the proxy config change notifications.

Name	Default value	Type	Description
rsa.license.fne.feature-page-size	25	integer	Requests to local flexnet server is paginated. This property controls the number of features that FlexnetLS returns in a single request. Defaults to 25.
rsa.license.fne.features-url	/features	string	URL to fetch features, %s is replaced with FNE License Server instance id
rsa.license.fne.fne-restart-timeout	5 minutes	seconds	Maximum time to wait for the FNE server to restart before timing out.
rsa.license.fne.host	localhost	string	Host where FNE License Server is running, defaults to localhost
rsa.license.fne.host-id-url	/hostids/selected	string	URL to fetch Unique identifier of the environment that maps licenses
rsa.license.fne.host-ids-url	/hostids	string	URL to fetch all host identifiers available in the environment
rsa.license.fne.local-config-file	/opt/netwitness/flexnetls/local-configuration.yaml	string	Local Configuration file
rsa.license.fne.max-pages	50	integer	Maximum number of pages to be requested from FlexnetLS features response. This is to prevent requesting infinite number of pages from FlexnetLS because of any reason which may cause end-of-response to not be detected.
rsa.license.fne.port	3333	integer	Port number where FNE License Server accepts REST requests, defaults to 3333
rsa.license.fne.proxy-config-file	/etc/netwitness/flexnetls/proxy.conf	string	Proxy configuration file
rsa.license.fne.sync-url	/capability_request	string	URL to force an online sync from FNE License Server to FNO remote service to fetch Features

Name	Default value	Type	Description
rsa.license.fne.trust-store-path	/var/netwitness/flexnetls	string	Path to the directory which contains FNE server trust store files
rsa.license.fne.use-ssl	false	boolean	Is the REST API secured

Metrics-server Configuration

MetricsProperties

Name	Default value	Type	Description
rsa.metrics.content.content-sync-interval	2 minutes	seconds	Time interval at which content available should be tried to upload to Elastic-Kibana
rsa.metrics.content.elastic-health-check-interval	1 minute	seconds	Time interval at which Elastic and Kibana health should be checked
rsa.metrics.content.metrics-health-check-interval	30 minutes	seconds	Time interval at which metrics collection health for Netwitness services should be checked
rsa.metrics.content.orchestration-sync-interval	30 Seconds	seconds	Interval at which orchestration-server should be queried to get deployment details
rsa.metrics.content.overwrite-index-template	false	boolean	Controls if NW index template need to be overridden
rsa.metrics.content.saved-objects-created	false	boolean	Whether to create saved objects

AlertProcessingProperties

Name	Default value	Type	Description
rsa.metrics.elastic.alert.metrics-interval	900	seconds	Duration (in seconds) after which Alarm metrics is uploaded to elastic
rsa.metrics.elastic.alert.retry-delay	1	seconds	Interval between subsequent retries
rsa.metrics.elastic.alert.wait-time	1	seconds	Wait time post which, first retry attempt on Alert Notification will be done
rsa.metrics.elastic.alert.work-interval	60	seconds	Frequency (in seconds) how often Alerts need to collected from Elastic

ElasticRetentionProperties

Name	Default value	Type	Description
rsa.metrics.elastic.data.retention.alert-retention-threshold	60	seconds	Time duration (in days) for which alerts need to be retained
rsa.metrics.elastic.data.retention.allocated-size	100	bytes	Disk space permissible to be used for Netwitness indexes in Elastic
rsa.metrics.elastic.data.retention.time-retention-frequency	4	seconds	Interval between invocations of the time based retention job
rsa.metrics.elastic.data.retention.time-threshold	30	seconds	Time (in days) for which Additional Telemetry data needs to be retained

ElasticProperties

Name	Default value	Type	Description
rsa.metrics.elastic.host		string	Host Elastic node/cluster is running on
rsa.metrics.elastic.password		string	Password for Elastic
rsa.metrics.elastic.port	9200	integer	Port Elastic node/cluster is running on
rsa.metrics.elastic.secure	true	boolean	Secure to decide protocol for Elastic
rsa.metrics.elastic.username		string	Username to connect Elastic
rsa.metrics.elastic.verify-hostname	false	boolean	Whether to verify Elastic hostname on SSL validation

ElasticClientCertAuthenticatorProperties

Name	Default value	Type	Description
rsa.metrics.elastic.security.authenticator.clientcert.http-enabled	false	boolean	Whether HTTP authentication requests are enabled
rsa.metrics.elastic.security.authenticator.clientcert.order	0	integer	Numerical order of this authentication domain
rsa.metrics.elastic.security.authenticator.clientcert.roles-attribute		string	DN attribute in X509 certificate that identifies role of the subject principal. In NW product suite, username is mapped to a role name in elasticsearch
rsa.metrics.elastic.security.authenticator.clientcert.transport-enabled	false	boolean	Whether authentication enabled at Transport level
rsa.metrics.elastic.security.authenticator.clientcert.username-attribute		string	DN attribute in X509 Certificate that identifies subject principal (username), defaults to 'cn' (Common name)

ElasticJwtAuthenticatorProperties

Name	Default value	Type	Description
rsa.metrics.elastic.security.authenticator.jwt.http-enabled	false	boolean	Whether HTTP authentication requests are enabled
rsa.metrics.elastic.security.authenticator.jwt.jwt-header		string	Authentication backend defines how to validate username or credentials, this is specific to authenticator
rsa.metrics.elastic.security.authenticator.jwt.order	0	integer	Numerical order of this authentication domain
rsa.metrics.elastic.security.authenticator.jwt.roles-key		string	Key name in the JWT claim that contains to user roles
rsa.metrics.elastic.security.authenticator.jwt.signing-key		string	Public key from the issuer certificate that issued JWT token in Base64 format without headers (i.e.without `----BEGIN/END Publi Key----`)
rsa.metrics.elastic.security.authenticator.jwt.subject-key		string	Name of the key in JWT claim that identifies subject principal (user)
rsa.metrics.elastic.security.authenticator.jwt.transport-enabled	false	boolean	Whether authentication enabled at Transport level

ElasticServiceProperties

Name	Default value	Type	Description
rsa.metrics.elastic.service.password		string	Password for nw-service user to be used for metrics collection

KibanaProperties

Name	Default value	Type	Description
rsa.metrics.kibana.base-path		string	
rsa.metrics.kibana.connection-time-out	30	seconds	Time to changes connection timeout
rsa.metrics.kibana.host		string	Host Kibana node/cluster is running on
rsa.metrics.kibana.password		string	Password for kibana
rsa.metrics.kibana.port	0	integer	Port Kibana node/cluster is running on
rsa.metrics.kibana.secure	false	boolean	Secure to decide protocol for Kibana
rsa.metrics.kibana.username		string	Username to connect kibana
rsa.metrics.kibana.verify-hostname	false	boolean	Whether to verify kibana hostname on SSL validation

MetricsRetryProperties

Name	Default value	Type	Description
rsa.metrics.retry.retry-attempts	5	integer	The number of times we retry if a service can be configured with the latest configuration.
rsa.metrics.retry.retry-delay	4min	seconds	The delay between successive retry attempts.

TelemetryProperties

Name	Default value	Type	Description
rsa.telemetry.collect-click-stream-metrics	false	boolean	Controls if the click stream stats are to be collected
rsa.telemetry.config-load-retry-interval	2	seconds	Controls the interval to load the telemetry config

MongoDataRetentionProperties

Name	Default value	Type	Description
rsa.telemetry.mongo.data.retention.additional-data-threshold	7	seconds	Time (in days) for which Additional Telemetry data needs to be retained
rsa.telemetry.mongo.data.retention.disk-allocated-size	50	integer	Size of the data (in GB) that is allowed to be consumed by Telemetry data
rsa.telemetry.mongo.data.retention.mandatory-data-threshold	365	seconds	Time (in days) for which Mandatory Telemetry data needs to be retained
rsa.telemetry.mongo.data.retention.size-retention-frequency	1	seconds	Interval between invocations of the storage size based retention job

Node-infra-server Configuration

AdminNodeTrackerProperties

Name	Default value	Type	Description
rsa.platform.node.admin-node-ip-list-save-path	/etc/netwitness/node-infra-server/admin-node-ip-list.json	string	Path to persist ip list of possible admin nodes
rsa.platform.node.call-home-interval	15	seconds	Call home interval Reaches out to orchestration server at this given interval
rsa.platform.node.chef-status-check-interval	1	seconds	Override wait time between checks for chef status checks
rsa.platform.node.enable-call-home	true	boolean	Enable call home feature
rsa.platform.node.enable-track-admin-hosts	true	boolean	Enable tracking of admin hosts feature
rsa.platform.node.path-for-admin-node-primary-check	/nodeMode	string	Part of the URL path to find information about the admin node being primary or not
rsa.platform.node.primary-admin-host-ip-path	/etc/netwitness/node-infra-server/primary-admin-host-ip	string	Path to save the primary admin host's ip before running chef. Chef / Ohai plugin reads this file.
rsa.platform.node.restart-after-admin-node-ip-change	true	boolean	Restart service after Admin node Ip change
rsa.platform.node.switch-master-run-list	nw-dns-client	string	Chef run list to switch to new master ip
rsa.platform.node.track-admin-hosts-interval	5	seconds	Node mode check interval Reaches out to admin node to verify if it is still the primary

ChefRunProperties

Name	Default value	Type	Description
rsa.platform.node.chefrun.chef-client-command	/usr/bin/chef-client	string	Path to chef client

Name	Default value	Type	Description
rsa.platform.node.chefrun.chef-client-log-level		chefrunproperties$ chefclientloglevel	The log level of chef client
rsa.platform.node.chefrun.chef-config-location	/var/lib/netwitness/config-management/client.rb	string	The location of the Chef solo configuration
rsa.platform.node.chefrun.chef-log-location	/var/log/netwitness/config-management/chef-client.log	string	The location to write the log file for a Chef client execution
rsa.platform.node.chefrun.chef-run-timeout	1	seconds	Timeout for chef run before marking task as failed
rsa.platform.node.chefrun.sudo	true	boolean	Execute command with sudo

No-op-server Configuration

TestProperties

Name	Default value	Type	Description
rsa.noop.test.array-string		string[]	
rsa.noop.test.map-uri		map	
rsa.noop.test.pojo-array		testproppojo[]	
rsa.noop.test.pojo-list		list	
rsa.noop.test.pojo-map		map	
rsa.noop.test.simple-long		long	
rsa.noop.test.simple-pojo		testproppojo	
rsa.noop.test.simple-string		string	
rsa.noop.test.some-interval		seconds	
rsa.noop.test.some-size		bytes	

Orchestration-server Configuration

HostProperties

Name	Default value	Type	Description
rsa.orchestration.engine.host-infra.back-off-interval	15	seconds	Backoff interval in seconds
rsa.orchestration.engine.host-infra.max-backoff-factor	5	integer	Maximum call-home delay factor. Used to exponentially back off for subsequent host refresh failures.

SaltClientProperties

Name	Default value	Type	Description
rsa.orchestration.engine.salt.client.api-uri	https://localhost:8000/run	uri	The URI for the SaltStack API
rsa.orchestration.engine.salt.client.external-authentication	pam	string	The Salt API authentication mechanism
rsa.orchestration.engine.salt.client.host-verification-enabled	true	boolean	The certificate host validation when communicating with the Salt API
rsa.orchestration.engine.salt.client.password		string	The Salt API password
rsa.orchestration.engine.salt.client.retry-interval	5	seconds	The amount of time in between retries
rsa.orchestration.engine.salt.client.retry-timeout	2	seconds	The maximum amount of time to wait during retries of Salt API commands {@link #retryInterval}
rsa.orchestration.engine.salt.client.username		string	The Salt API username

ChefConfigurationProperties

Name	Default value	Type	Description
rsa.orchestration.engine.salt.component.chef-cache-run-list-location	/var/lib/netwitness/config-management/nodes	string	Directory where chef stores the json from the previous chef runs
rsa.orchestration.engine.salt.component.chef-config-location	/var/lib/netwitness/config-management/client.rb	string	The location of the Chef solo configuration
rsa.orchestration.engine.salt.component.chef-log-location	/var/log/netwitness/config-management/chef-solo.log	string	The location to write the log file for a Chef solo execution
rsa.orchestration.engine.salt.component.chef-run-list-location	/etc/netwitness/config-management/node.json	string	The location to write the Chef run list
rsa.orchestration.engine.salt.component.descriptor-location	/etc/netwitness/component-descriptor/descriptor	string	The location of the component descriptor JSON file
rsa.orchestration.engine.salt.component.use-stable-package-versions	true	boolean	When enabled, the RPM version in the component descriptor file will be used. If disabled, the latest RPM version available in the yum repository will be used instead.

ProvisionHostProperties

Name	Default value	Type	Description
rsa.orchestration.engine.salt.task.provision-host.interval	5	seconds	The amount of time in between the availability checks.
rsa.orchestration.engine.salt.task.provision-host.ping-timeout	30	seconds	Timeout for ping
rsa.orchestration.engine.salt.task.provision-host.timeout	1	seconds	The amount of time to wait for the host/minion to connect to the Salt master. The checks will happen at the configured {@link #interval}

DeploymentProperties

Name	Default value	Type	Description
rsa.orchestration.platform.node-mode	active	string	

TaskExecutionProperties

Name	Default value	Type	Description
rsa.orchestration.task.async-keep-alive-time	10	long	maximum time that excess idle threads will wait for new tasks before terminating for async tasks
rsa.orchestration.task.async-keep-alive-time-unit		timeunit	Time unit for above
rsa.orchestration.task.async-pool-size	1	integer	the maximum number of threads to allow for asynchronous executor service
rsa.orchestration.task.cleanup-interval	7	seconds	The interval at which to delete existing Tasks
rsa.orchestration.task.freeze-detection-threshold	15	seconds	Time after which a stuck monitor thread is considered frozen

Name	Default value	Type	Description
rsa.orchestration.task.number-of-threads	5	integer	Number of threads in the pool for the sync execution service
rsa.orchestration.task.retain-task-duration	30	seconds	The amount of time to keep the jobs since its created. After the configured time elapses since the task created, task will be deleted.
rsa.orchestration.task.salt-job-schedule-wait-time	5	seconds	Grace period to wait for a salt job to be scheduled
rsa.orchestration.task.shutdown-timeout	30	seconds	The amount of time to wait, after receiving a shutdown request, for an executing task to finish before interrupting the execution.
rsa.orchestration.task.task-monitor-interval	30	seconds	Interval to check for new tasks and submit them
rsa.orchestration.task.update-interval	15	seconds	Amount of time between status check of currently running asynchronous jobs

Relay-server Configuration

NchanProperties

Name	Default value	Type	Description
rsa.netwitness.relay.agent-subscribe-channel	/agent/subscribe	string	Subscription nchan URL to get the responses published by endpoint-server
rsa.netwitness.relay.connection-timeout	60	seconds	Max time to wait for the connection to be created
rsa.netwitness.relay.max-connections	100	integer	Maximum number of connections allowed to nchan from relay server
rsa.netwitness.relay.nchan-base-url	https://localhost	string	URL of the Nchan service
rsa.netwitness.relay.read-timeout	120	seconds	Max time to wait for the response before throwing error
rsa.netwitness.relay.server-metrics-url	/nchan_stub_ status	string	URL to get the nchan metrics
rsa.netwitness.relay.server-publish-channel	/endpoint_ server/publish	string	Publish nchan URL to forward the requests and endpoint-server will read from there

RelayPkiProperties

Name	Default value	Type	Description
rsa.netwitness.relay.pki.certificate-path	/etc/pki/nw/service/import	string	location of the certificate and private key
rsa.netwitness.relay.pki.initial-delay	5	seconds	Time to wait before reloading the keystore if needed
rsa.netwitness.relay.pki.relay-cert-name	relay-server-cert.chain	string	the file name of the relay-server certificate chain
rsa.netwitness.relay.pki.relay-key-name	relay-server-key.pem	string	the file name of the relay-server private key

Respond-server Configuration

MigrationProperties

Name	Default value	Type	Description
rsa.migration.im-data-path	/opt/rsa/im	string	The location of the 10.x IM service
rsa.migration.max-retries	200	integer	Number of time respond attempts to run the migration in case unable to connect mongo or mongo is down.
rsa.migration.time-to-wait-between-retries	60	seconds	Frequency (in seconds) how often respond try to connect mongo

RespondPrimaryProperties

Name	Default value	Type	Description
rsa.primary.host	true	boolean	Determine whether the current respond service is running on the primary
rsa.primary.mode		respondprimaryproperties$scheduledjobsmode	Mode of current respond server

AlertRuleProperties

Name	Default value	Type	Description
rsa.respond.alertrule.batch-size	1000	long	The number of alerts to be processed by rule in a batch
rsa.respond.alertrule.counter-reset-interval-days	7	integer	How often should rule counters be reset
rsa.respond.alertrule.enabled	true	boolean	Alert rules enabled

Name	Default value	Type	Description
rsa.respond.alertrule.frequency	5	seconds	The frequency of the alert rule job
rsa.respond.alertrule.last-counter-reset-time	0	long	Timestamp for when the rule counters were reset

ArcherIntegrationProperties

Name	Default value	Type	Description
rsa.respond.archer.export.user-domain		string	Archer UserDomain, to be set only when LDAP is enabled on Archer

RespondCacheProperties

Name	Default value	Type	Description
rsa.respond.cache.user-cache-expiry	2	seconds	How often to query security server for the latest user information like their email
rsa.respond.cache.user-cache-size	1000	integer	Total size of the user cache

DataRetentionConfiguration

Name	Default value	Type	Description
rsa.respond.dataretention.enabled	false	boolean	Is the data retention job enabled
rsa.respond.dataretention.execution-hour	0	integer	Hour at which to run the job
rsa.respond.dataretention.frequency	24	seconds	How often should the job to delete old alerts/incidents run
rsa.respond.dataretention.retention-period	90	seconds	How long should alerts/incidents be stored

IndicatorAggregationJobConfig

Name	Default value	Type	Description
rsa.respond.indicatoraggregationrule.schedule-delay	0	long	Delay and frequency of indicator aggregation jobs
rsa.respond.indicatoraggregationrule.schedule-rate	5000	long	
rsa.respond.indicatoraggregationrule.seek-ahead-days	0	integer	How many days ahead should indicator aggregation go from incident window close time.
rsa.respond.indicatoraggregationrule.seek-back-days	1	integer	How many days back should indicator aggregation go from first alert received time when aggregating indicators

IntegrationExportProperties

Name	Default value	Type	Description
rsa.respond.integration.export.archer-exchange-name	incidents.archer	string	
rsa.respond.integration.export.archer-sec-ops-integration-enabled	false	boolean	
rsa.respond.integration.export.breach-integration-enabled	false	boolean	
rsa.respond.integration.export.escalation-settings		map	
rsa.respond.integration.export.export-incident-enabled	true	boolean	
rsa.respond.integration.export.help-desk-integration-enabled	false	boolean	

NormalizationProperties

Name	Default value	Type	Description
rsa.respond.normalization.alerts-queued	100	integer	The number of alerts to queue from rabbit before waiting to consume further The more you increase it, the higher chance of losing alerts if respond goes down during normalization
rsa.respond.normalization.custom-script-filename	custom_ normalize_ alerts.js	string	The name of the main custom JavaScript file used to normalize alerts.
rsa.respond.normalization.indicator-normalization-enabled	true	boolean	Determines whether the legacy and indicator bindings should be created or not
rsa.respond.normalization.max-legacy-consumers	10	integer	The maximum number of consumers that can consume from the legacy alerting exchange.
rsa.respond.normalization.script-directory	scripts	string	The name of the directory, relative to the service home directory, that contains the normalization JavaScript files.
rsa.respond.normalization.script-filename	normalize_ alerts.js	string	The name of the main JavaScript file used to normalize alerts.
rsa.respond.normalization.shutdown-timeout	30	seconds	The maximum amount of time to wait to finish processing alerts that have been received before shutting down the service.
rsa.respond.normalization.thread-count	4	integer	The number of threads to use to normalize and persist alerts.
rsa.respond.normalization.transient-indicator-normalization-enabled	true	boolean	Determines whether the low priority transient alerts binding should be created or not

QueryProperties

Name	Default value	Type	Description
rsa.respond.query.default-batch-size	100	long	Default chunk/batch size to send a stream of items to the client (client may override)
rsa.respond.query.default-query-limit	1000	long	Default number of items to send to the client in response to a single request (client may override)
rsa.respond.query.max-query-limit	5000	long	Max number of items to send to the client in response to a single request

RiskProcessingProperties

Name	Default value	Type	Description
rsa.respond.risk.alert.processing.concurrent-processors	4	integer	Concurrent number of staging that should be done.
rsa.respond.risk.alert.processing.context-limit	1000	integer	Maximum number of alert contexts per rule in a category
rsa.respond.risk.alert.processing.default-files	cmd.exe, powershell.exe, wscript.exe, cscript.exe, rundll32.exe	string	Name of files those are considered to be default OS provided files
rsa.respond.risk.alert.processing.page-size	100	integer	Page size for query while querying for persisted alerts
rsa.respond.risk.alert.processing.persisted-collection-interval	30	seconds	Interval at which alert collection should be queried for persisted alerts
rsa.respond.risk.alert.processing.staging-cleanup-interval	5	seconds	Cleanup interval for processed AlertRule from staging collection

Name	Default value	Type	Description
rsa.respond.risk.alert.processing.staging-fetch-size	5000	integer	Number of AlertRule to be fetched from staging in a single request
rsa.respond.risk.alert.processing.staging-work-interval	10	seconds	Frequency (in seconds) how often staged entries need to fetched for processing
rsa.respond.risk.alert.processing.track-file-name-change	false	boolean	Over time file-name might change for a hash, should that changes be tracked and latest name should be saved
rsa.respond.risk.alert.processing.track-host-name-change	true	boolean	Over time host-name might change for a host, should that changes be tracked and latest name should be saved

RiskCachingProperties

Name	Default value	Type	Description
rsa.respond.risk.caching.expiration-time	60	seconds	Time (in minutes) since last access of entry post which it will expire from cache.
rsa.respond.risk.caching.grouped-cache-expiration-time	5	seconds	Time (in minutes) since last access of entry post which it will expire from grouped cache
rsa.respond.risk.caching.grouped-cache-size	10000	integer	Max number of entries to be stored in the grouped cache
rsa.respond.risk.caching.size	500000	integer	Size of entries to be stored in cache

RiskRetentionProperties

Name	Default value	Type	Description
rsa.respond.risk.data.retention.frequency	1	seconds	Frequency to run the retention job
rsa.respond.risk.data.retention.retention-period	30	seconds	The retention threshold specified (in days)
rsa.respond.risk.data.retention.roll-up-to-day	false	boolean	Controls if the rollup-time needs to be calculate from start of the day when the task is executed.

RespondScheduledJobsProperties

Name	Default value	Type	Description
rsa.respond.scheduled.jobs.aggregation-job-enabled	true	boolean	Determine whether the aggregation job enabled/disabled
rsa.respond.scheduled.jobs.data-retention-job-enabled	true	boolean	Determine whether the data retention job enabled/disabled
rsa.respond.scheduled.jobs.risk-scoring-enabled	true	boolean	Determine whether the risk scoring functionality enabled/disabled

SecurIdIntegrationProperties

Name	Default value	Type	Description
rsa.respond.securid.alert-page-size	100	integer	Alerts are fetched from incidents pagewise. This property controls the maximum number of alerts to be fetched per page
rsa.respond.securid.alert-scan-json-paths	$.events[*]..	list	List of JSONPaths to scan the given userMetas in an alert. By default, it has just one JSONPath enough to read all direct occurrences of the given userMeta values from source and destination metas in all events in an alert.

Name	Default value	Type	Description
rsa.respond.securid.incident-processing-threads	3	integer	Number of threads to process the incident update events
rsa.respond.securid.max-incident-queue-size	100	integer	Maximum size of the queue used to hold the incident change events for processing.
rsa.respond.securid.secur-id-list-update-task-interval	15 minutes	seconds	Interval of the periodic task which updates the high-risk users' list in the SecurId cloud
rsa.respond.securid.secur-id-request-batch-size	100	integer	Maximum number of users to be sent in a single request to SecurId cloud.
rsa.respond.securid.user-meta	email_ address	string	The "respond specific" meta in an alert that identifies the user to be added to SecurID high-risk users' list Defaults to email_ address

Security-server Configuration

MigrationProperties

Name	Default value	Type	Description
rsa.migration.enable	true	boolean	Flag to be used in case of unit and integration tests for disabling migration check on first boot.
rsa.migration.ui-data-path	/backup/var/lib/netwitness/uax	string	The location of 10.x SA UI data

PasswordPolicyProperties

Name	Default value	Type	Description
rsa.security.account.password-policy.cannot-include-id	false	boolean	Can the password include the account identifier in it?
rsa.security.account.password-policy.min-chars	8	integer	The minimum number of characters the password must have.
rsa.security.account.password-policy.min-lower-chars	0	integer	The minimum number of lower-case characters the password must have.
rsa.security.account.password-policy.min-non-latin-chars	0	integer	The minimum number of non-latin characters a password must have
rsa.security.account.password-policy.min-numeric-chars	0	integer	The minimum number of numeric characters the password must have.
rsa.security.account.password-policy.min-special-chars	0	integer	The minimum number of special characters the password must have.
rsa.security.account.password-policy.min-upper-chars	0	integer	The minimum number of upper-case characters the password must have.
rsa.security.account.password-policy.passwords-expire-after	30	seconds	The maximum time an account password is valid before it must be changed.
rsa.security.account.password-policy.special-chars	~!@#$%^&*_-+=`$|(){}[]:;'"<>,.?/	string	The characters that are considered "special"

PkiAuthenticationProperties

Name	Default value	Type	Description
rsa.security.authentication.pki.enabled	false	boolean	This property controls if the PKI authentication feature is enabled
rsa.security.authentication.pki.retry-interval	1	seconds	This property controls how long to wait before retrying an initialization task.

AuthenticationPolicyProperties

Name	Default value	Type	Description
rsa.security.authentication.policy.account-lockout	20	seconds	Account lockout interval
rsa.security.authentication.policy.auto-create-external-users	true	boolean	Automatically create user profiles for external accounts
rsa.security.authentication.policy.case-sensitive	true	boolean	Case sensitivity of account identifiers
rsa.security.authentication.policy.max-successive-failures-before-lockout	5	integer	Accounts are locked after successive failures
rsa.security.authentication.policy.must-have-a-role	true	boolean	Require role mapping for external users

DeploymentProperties

Name	Default value	Type	Description
rsa.security.deployment.bootstrap-retry-interval	30	seconds	The amount of time to wait before retrying a failed bootstrap attempt.

SamlUserAccountProperties

Name	Default value	Type	Description
rsa.security.saml.account.user-account-type		accounttype	Account type of the users authenticated by SAML

Source-server Configuration

FeatureProperties

Name	Default value	Type	Description
rsa.features.file-policy-feature	true	boolean	rsa.usm feature toggle to control if creating File policies are supported
rsa.features.view-sources-feature	false	boolean	rsa.usm feature toggle to control if creating File policies are supported

UsmProperties

Name	Default value	Type	Description
rsa.usm.cache-duration	24	seconds	Time it takes for the cache that stores data to expire
rsa.usm.content-initialization-enabled	true	boolean	Enable content initialization task
rsa.usm.content-sync-interval	1	seconds	The interval between content sync tasks.
rsa.usm.database-initialization-enabled	true	boolean	Enable database initialization task
rsa.usm.page-size	1000	integer	Default page size for paged response
rsa.usm.policy-ip-to-uuid-migration-enabled	true	boolean	Enable policy ip to uuid migration
rsa.usm.source-count-sync-interval	10	seconds	The interval between source count sync tasks.

Storage Overview

This guide provides you with storage requirements and the instructions on how to allocate storage for physical (DACs, PowerVaults, Unity) and virtual storage devices for NetWitness Platform. It also includes the following topics.

- Detect Encryption on Existing PowerVault
- Migrate Data to Another Device

Refer to the following Hardware Setup Guides for information on how to connect these device to NetWitness Platform Core and Hybrid physical hosts:

- PowerVault (MD 1400) Setup Guide (see the "Enclosure Options" section of "Hardware Description") - NetWitness Community.
- 60-Drive DAC Setup Guide - NetWitness Community.
- 15-Drive DAC Setup Guide - NetWitness Community.

Storage Requirements

This section contains all the storage requirements needed to successfully attach storage to your NetWitness Platform deployment host systems. It contains the required drive types, appropriate volumes, and performance IOPS that are needed.

Drive Specifications

General specifications for core NetWitness Platform Hosts are:

- IO size 490/Dec
- Response/Latency < 20ms
- Decoder 10/90 read/write (low random I/O)
- Concentrator 50/50 read/write (high random I/O)

RAID Group	Suitable Volumes
NL-SAS or 10K SAS	All Packet Decoder volumes All Log Decoder volumes All Archiver volumes Concentrator meta volume
SSD	Concentrator index volume

Required NetWitness Platform Storage Volumes

Service Volume Names

Service	Volume Name	File Systems Created
Network Decoder	decoder	packetdb
Network Decoder	decodersmall	decoder root, index, sessiondb, metadb
Log Decoder	logdecoder	packetdb
Log Decoder	logdecodersmall	logdecoder root, index, sessiondb, metadb
Concentrator	concentrator	concentrator root, metadb, sessiondb
Concentrator	index	index
Archiver	archiver	database

Volume Sizing

The volume sizes below are automatically created when using the NetWitness Platform storage tool, described in Configure Storage Using the REST API.

Volume	Filesystem	Mount Point	Size
decodersmall	decoroot	/var/netwitness/decoder	10 GB
decodersmall	index	/var/netwitness/decoder/index	30 GB
decodersmall	sessiondb	/var/netwitness/decoder/sessiondb	600 GB
decodersmall	metadb	/var/netwitness/decoder/metadb	100% of free space on decodersmall volume
decoder	packetdb	/var/netwitness/decoder/packetdb	100% of free space on decoder volume
logdecodersmall	decoroot	/var/netwitness/logdecoder	10 GB
logdecodersmall	index	/var/netwitness/logdecoder/index	30 GB
logdecodersmall	sessiondb	/var/netwitness/logdecoder/sessiond	600 GB
logdecodersmall	metadb	/var/netwitness/logdecoder/metadb	100% of free space on logdecodersmall volume
logdecoder	packetdb	/var/netwitness/logdecoder/packetdb	100% of free space on logdecoder volume
concentrator	root	/var/netwitness/concentrator	30 GB
concentrator	sessiondb	/var/netwitness/concentrator/sessiondb	10% of free space on concentrator volume
concentrator	metadb	/var/netwitness/concentrator/metadb	100% of free space on concentrator volume
index	index	/var/netwitness/concentrator/index	100% of free space on index volume
archiver	database	/var/netwitness/archiver/database	100% of free space on archiver volume

Performance Recommendations

NetWitness recommends that Packet and Log Decoders receive two LUNs or Block Devices, one for Packet data, the other for all other databases. This allows you to segregate the high-bandwidth Packet Database from the other databases so they do not compete for I/O bandwidth with other activity.

Concentrators require a separate SSD-based index volume for best performance. You must house this index volume on a different RAID group than the Concentrator Meta database volume, which you can stored on NL-SAS. Archivers can use a single large NL-SAS storage volume per appliance.

Input/Output Operations Per Second

The following table lists the IOPS requirements for the Decoder and Concentrator hosts.

Logs	Log Decoder	Concentrator
10K EPS	400	8,000
20K EPS	550	10,300
25K EPS	1,200	10,800

Packets	Network Decoder	Concentrator
1Gbps	600	6,050
2 Gbps	950	8,300
4 Gbps	1,650	12,800
6 Gbps	2,400	17,300
8 Gbps	3,200	21,800

General Description of How NetWitness Platform Hosts Store Data

For information about how NetWitness Platform hosts store data, see Appendix A. How NetWitness Platform Hosts Store Data.

Configure Drive Pack(s)

Note: The terms 'Meta Disk Kit' and 'Meta Drive Pack' mean the same and are interchangeable.

Benefits of Series 6/6E Drive Pack

You can add additional drives to the Series 6 or 6E appliances to accommodate various use cases. These drives provide the capability for the decoder meta or concentrator index volumes to reside on the appliance. Each Meta Disk Kit has 3 drives. A maximum of 2 Meta Disk Kits can be installed on series 6/6E appliances. The Meta cache or index size determines the number of Meta Disk Kits. A standard Series 6/6E appliance has 4 drives in slots 0,1,2 and 3. The remaining slots, 4 through 9 are empty (highlighted in red in the Series 6/6E Disk Layout image below). These slots are used to install the Meta Disk Kit(s).

Series 6/6E Disk Layout

- **Maximize PowerVault Storage Capacity** - Traditionally, PowerVault storage allocates a volume for the Decoder metadata. This reduces the usable storage on the PowerVault. Drive Packs reduce this issue by providing 20TB of extra usable PV storage.
- **Reduces Cost for Meta Only Use Case** - In Meta Data Only deployments, the use of drive packs can help remove the requirement for the use of a single PowerVault on these Decoders..
- **Enable existing deployments to utilize compression options** - For existing deployments, an SSD index drive pack is required if you need to enable compression. When compressing the packetdb (Decoders) and metadb (Concentrators), additional indexing is needed to support compression of those databases.
- **Provides capability for expanding meta keys and associated indexing** - The index storage needs are scaled based on the NetWitness Platform deployment retention requirements. If additional meta keys are enabled and indexed, it may impact index retention.

Decoder Meta Use Cases

- Meta-Only
- Maximize Power Vault Storage

Three or more 2.4TB 10K SAS SED drives can be added to a Decoder for the decodersmall or logdecodersmall volumes. These volumes are used to store the meta cache on the Decoders.

Both the Log Decoders and Network Decoders parse out meta data from the raw captured traffic. The meta data is then aggregated to a Concentrator for indexing.

The host requires storage to store a cache for the meta extracted during the data capture for Concentrator aggregation. The meta cache on a Decoder is generally fixed in size, but you can expand it to support additional cache to avoid possible connectivity loss between the Decoder and the corresponding Concentrator.

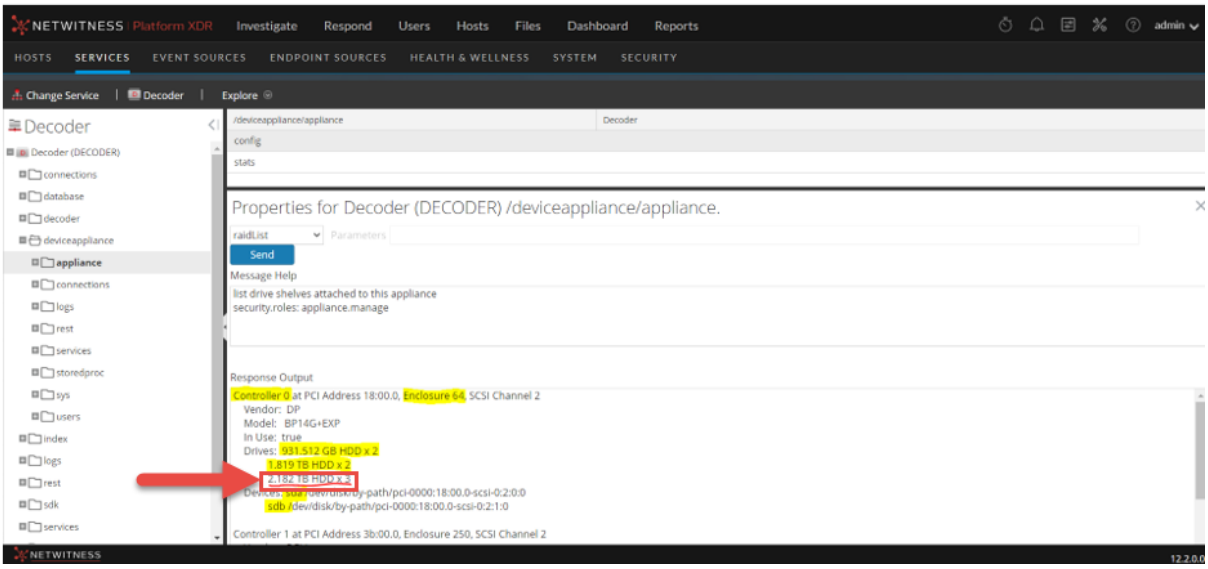
Typically, the decodersmall or logdecodersmall volumes are stored on the first three drives of the first PowerVault enclosure and, in 10G configurations, second PowerVault enclosure. By utilizing the drive pack option, these three drives can instead be used for the packetdb (maximizing Power Vault storage).

For meta-only scenarios, the decodersmall volume would be stored on the drive pack, therefore eliminating the need for a Power Vault.

Sample Storage Configuration Scenarios for Meta Disk Kit(s) on Decoder

This section describes how to configure a Meta Disk kit on a decoder as meta-only and maximized PowerVault storage capacity.

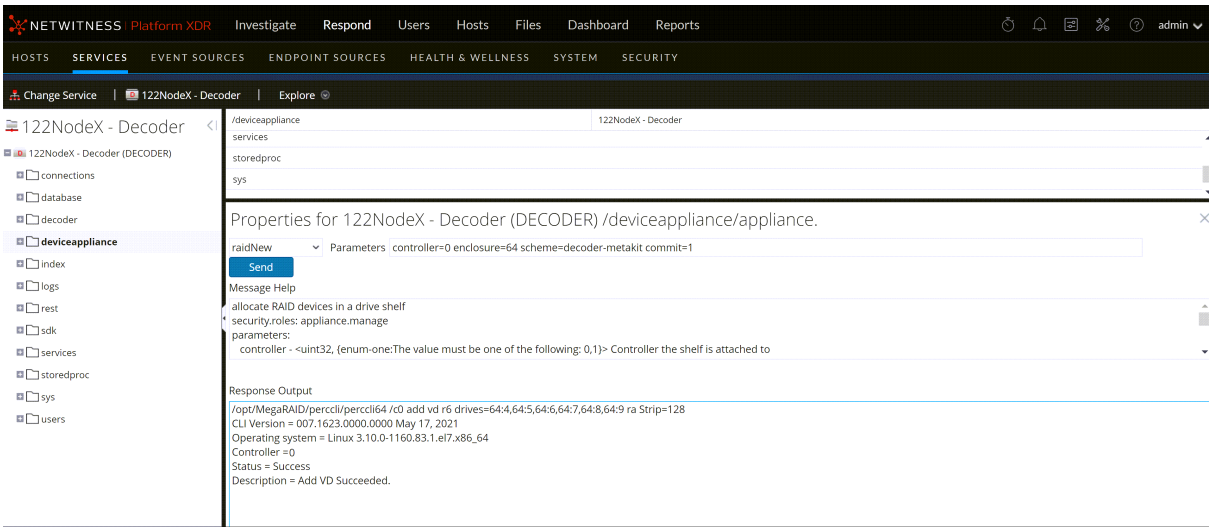
Meta-Only (No Externally Attached Storage)



Install and configure one Meta Disk Kit (3 SED Drives configured as RAID 5) on a S6 Core Appliance that has been orchestrated as a Decoder with one attached and unconfigured PowerVault:

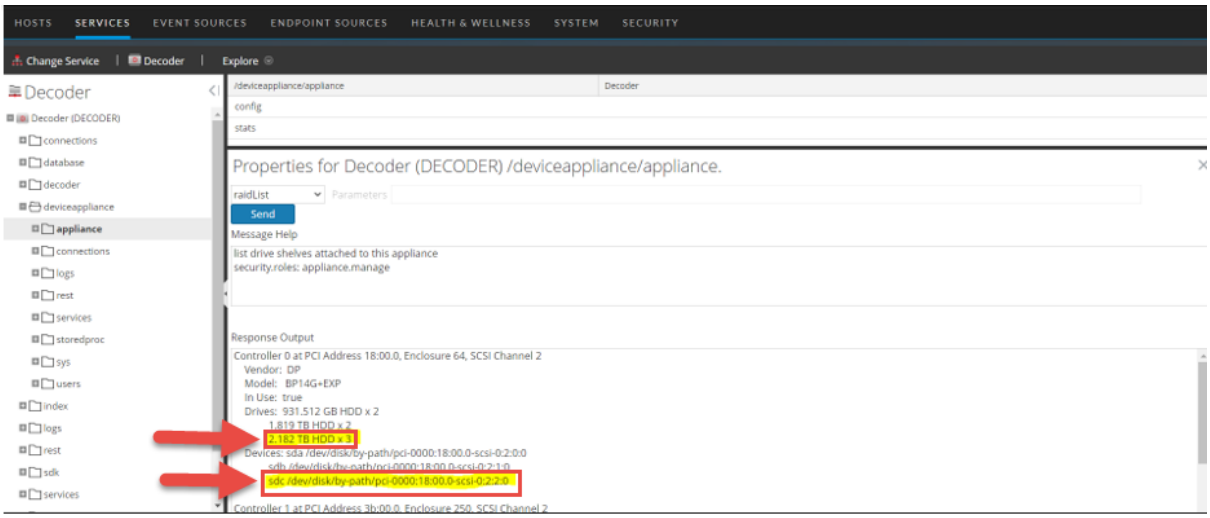
Note:
1. The configuration for Log Decoder is similar to Network Decoder. Substitute the service and volume names for Log Decoder that would normally be associated with Network Decoder.
2. One Meta Disk pack is configured as RAID5 (3 drives) and two Meta Disk packs (6 drives) are configured as RAID6.
3.When configuring two Meta Disk Packs, the disks are installed in slots 4 through 9 and when adding second Meta Disk Pack, the disks are installed in slots 7 though 9. Refer Series 6/6E Disk Layout for slot details.

On the Series 6 (Dell R640) appliance, the Meta Drive Pack disks are installed in slots 4, 5 and 6. The virtual drive configuration requires identifying the controller ID and Enclosure ID (EID). On Series 6 appliance, the controller ID and Enclosure IDs are 0 and 64, respectively. The nwraidtool.py script, that is installed on every orchestrated server, can help to confirm these ID numbers.



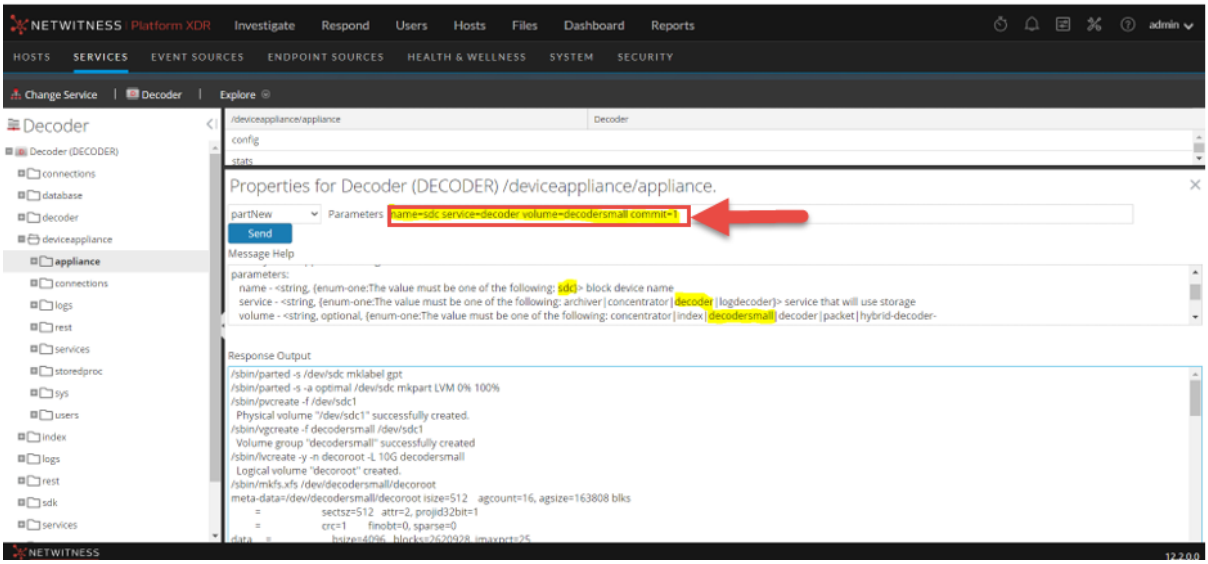
1. Install the three drives in the Drive Pack in slots 4, 5 and 6. Refer Series 6/6E Disk Layout for slot details.
2. Identify the existing block devices using `raidList' property. Login to **NW UI > Hosts > Select the Decoder Host > Actions > View > Explore > deviceAppliance > appliance (Right Click to access properties) > raidList** and click **Send**.

   The existing devices on Controller 0, Enclosure 64 are highlighted in Yellow. The installed Drive Pack in slots 4,5 and 6 is highlighted in Red.



3. Access **NW UI->Hosts->Select the Decoder Host->Actions->View->Explore->deviceAppliance->appliance (Right Click to access properties)->raidNew**, specify the controller, enclosure, and scheme, click **Send**.

Note: For decoder the scheme is decoder-metakit, for logdecoder the scheme is logdecoder-metakit

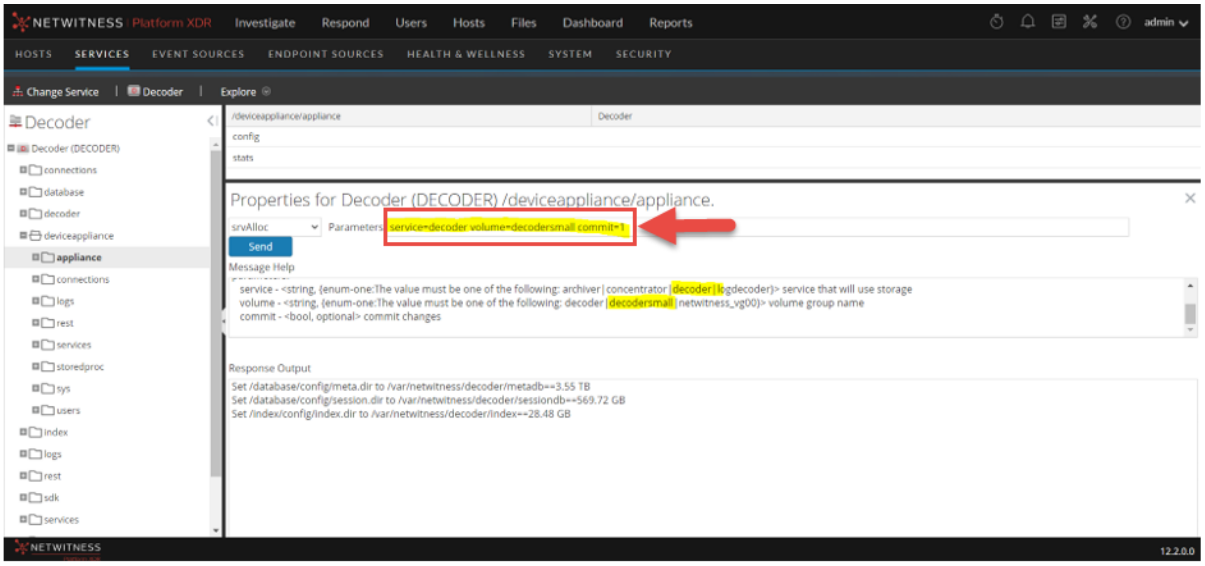


4. Identify the new device (highlighted in Yellow) using raidList command. In this case it is ‘sdc’. Access **NW UI->Hosts->Select the Decoder Host->Actions->View->Explore->deviceAppliance->Appliance (Right Click to access properties)->raidList->Click on Send**.

5. Execute the **partNew** command by selecting it from the Properties drop-down to create the decodersmall partition (decoder dir, index, metadb, sessiondb) with the following parameters.

```
name=sdc service=decoder volume=decodersmall commit=1
```

Note: For logdecoder, use the command `name=sdc service=logdecoder volume=logdecodersmall commit=1`



```
[root@s6Core ~]# df -hP
Filesystem                          Size  Used Avail Use% Mounted on
devtmpfs                             63G     0   63G   0% /dev
tmpfs                                63G  100K   63G   1% /dev/shm
tmpfs                                63G   11M   63G   1% /run
tmpfs                                63G     0   63G   0% /sys/fs/cgroup
/dev/mapper/netwitness_vg00-root     30G  4.1G   26G  14% /
/dev/mapper/netwitness_vg00-nwhome  2.7T  516M  2.7T   1% /var/netwitness
/dev/mapper/netwitness_vg00-varlog   10G   70M   10G   1% /var/log
/dev/mapper/netwitness_vg00-usrhome  10G   33M   10G   1% /home
/dev/sda1                          1014M   91M  924M   9% /boot
tmpfs                                13G     0   13G   0% /run/user/0
/dev/mapper/decodersmall-decoroot    10G   33M   10G   1% /var/netwitness/decoder
/dev/mapper/decodersmall-index       30G   33M   30G   1% /var/netwitness/decoder/index
/dev/mapper/decodersmall-sessiondb  600G   34M  600G   1% /var/netwitness/decoder/sessiondb
/dev/mapper/decodersmall-metadb     3.8T   34M  3.8T   1% /var/netwitness/decoder/metadb
[root@s6Core ~]#
```

6. Allocate the decodersmall to Decoder service using ‘srvAlloc’.

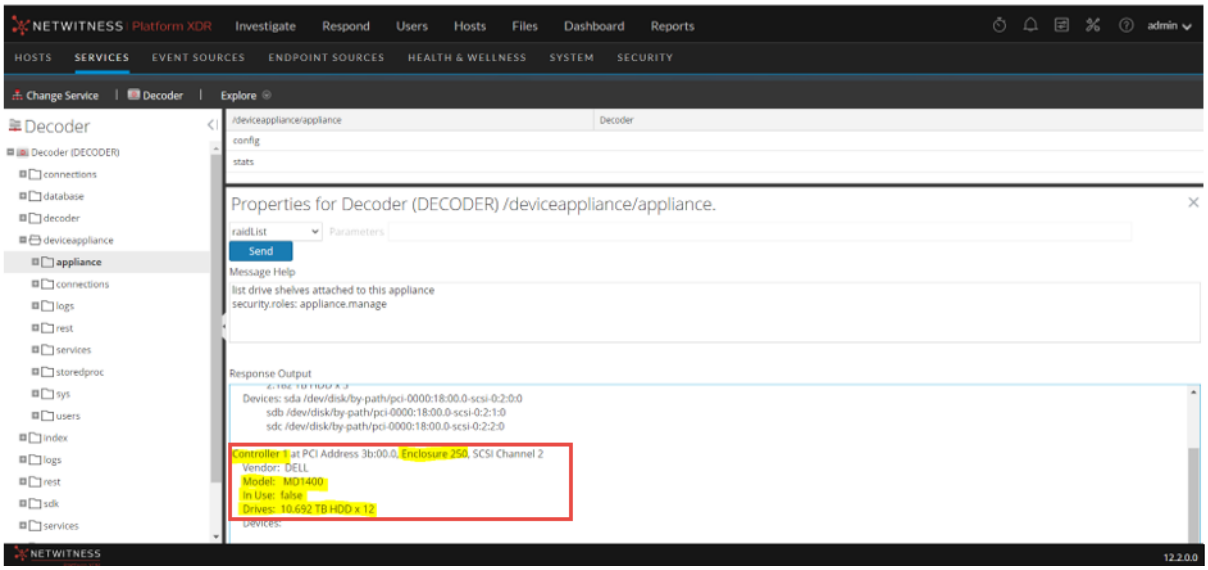
   `service=decoder volume=decodersmall commit=1`

Note:
- For logdecoder, use the command `service=logdecoder volume=logdecodersmall commit=1`
- If a second Drive Pack is being configured, the volume for decoder would be ‘decodersmall0’. For logdecoder, it is ‘logdecodersmall0’.

Maximize PowerVault Storage Capacity

Installing and configuring a Drive pack on the Decoder appliance as decodersmall frees the first three drives on the attached Power Vault for storing additional packet data.

Best Practice Recommendation: When 1 to 4 PowerVaults are configured, one (1) Meta Disk kit is recommended. When 5 to 8 PowerVaults are configured, two (2) Meta Disk kits are recommended.



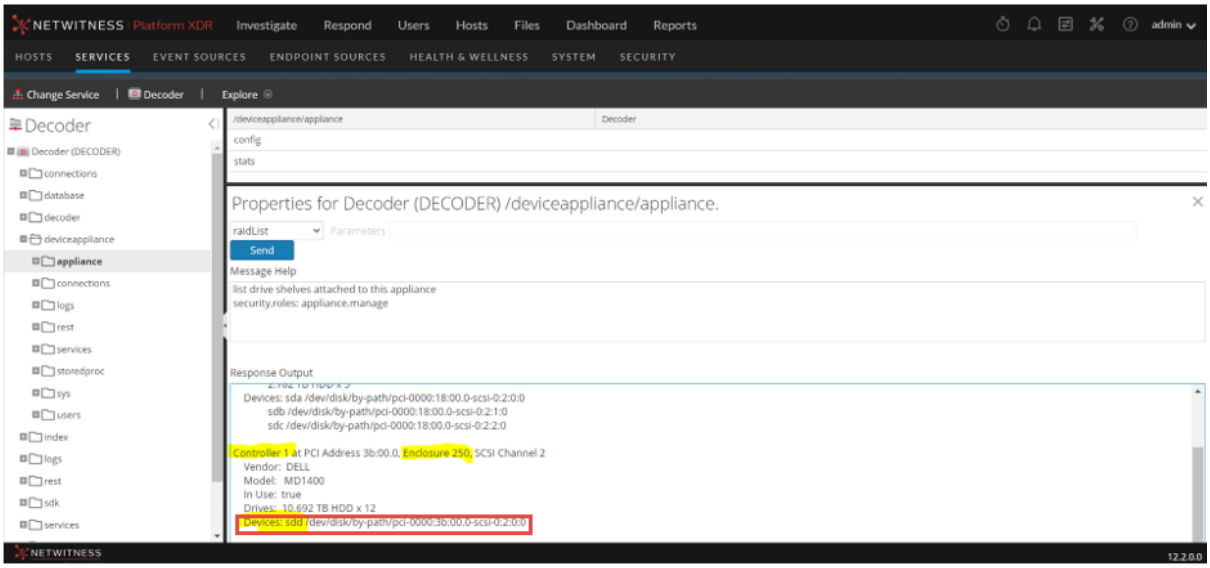
Note: This sample scenario assumes a S6/S6E appliance orchestrated as a Decoder and connected to a PowerVault (but not configured as storage).

1. Follow all the steps in Meta Only: No Externally Attached Storage section to configure one meta disk pack on decoder as the decodersmall partition.
2. Use the **Explorer** view (Login into UI, select **Hosts->Services->Decoder ->Actions->View->Explorer->deviceAppliance->appliance(right click)->properties) -> raidList ->Click on Send**, to identify and confirm the Controller Number, Enclosure Number, In Use, Drives, Devices, Drive Count, Size, and Vendor (highlighted in yellow).

   You should see the following information.

   In Use: FALSE

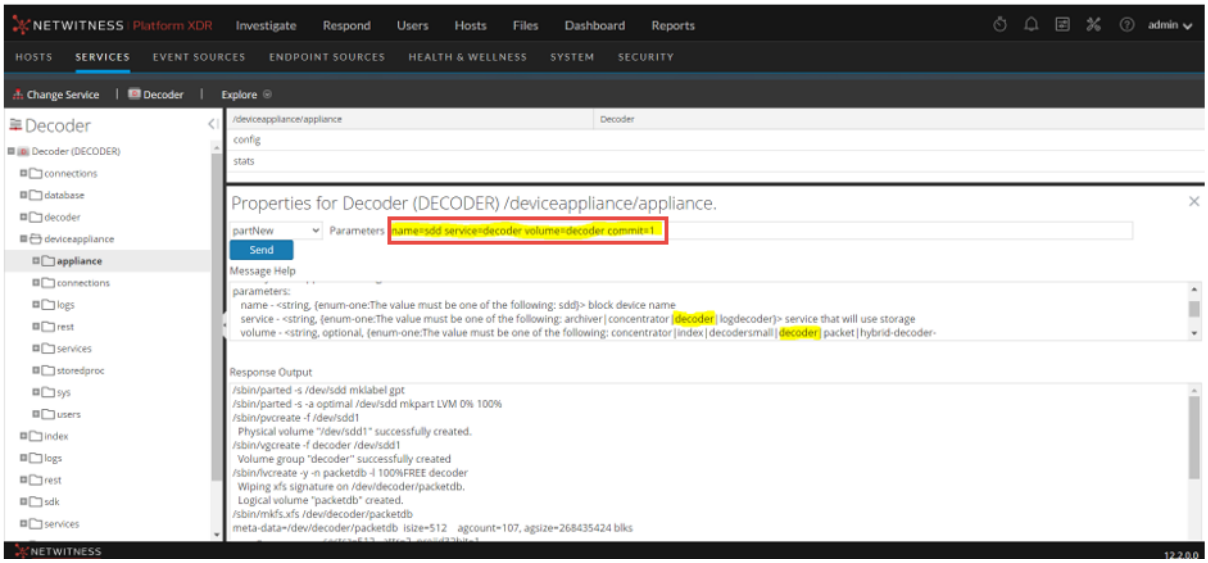
   Devices: <EMPTY>



3. Create the raid using ‘raidNew’ from the properties drop-down (passing the below parameters) on the attached PowerVault. Identify the controller and enclosure from ‘raidList’. Encryption can be turned on after configuring storage using the steps listed in Appendix B. Encrypt a Series 6E Core or Hybrid Host.

   ```
   controller=1 enclosure=250 scheme=packet-expansion commit=1
   ```

4. Identify the block device created in the earlier step. Use ‘raidList’ to retrieve all the block devices. In this case, it is ‘sdd’ (highlighted in Yellow).

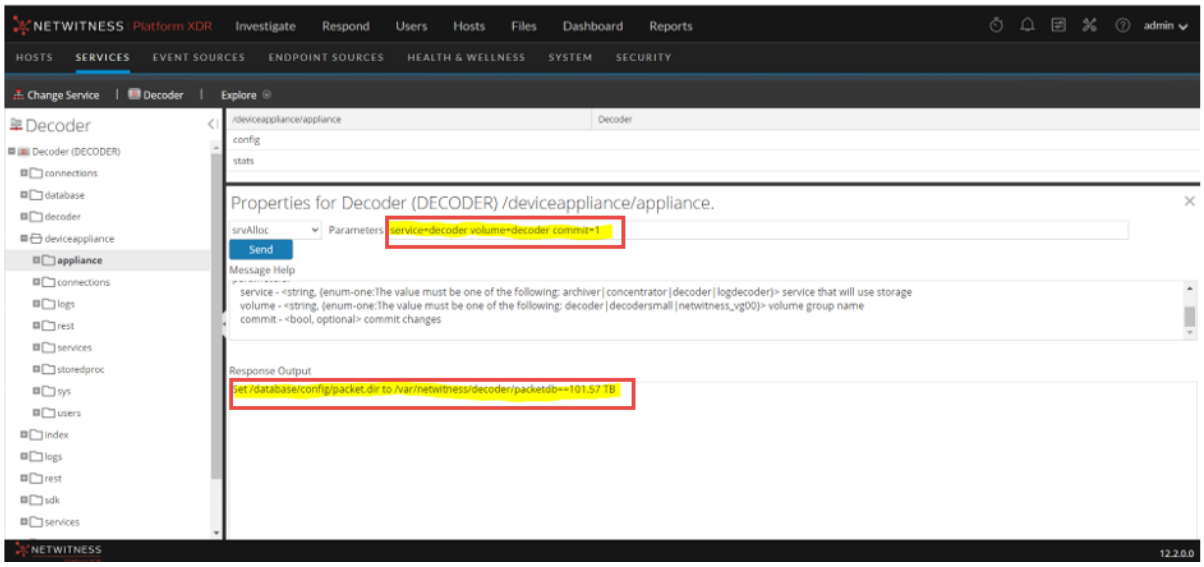


5. Make partitions on the block device (‘sdd’) using ‘partNew’.

   ```
   name=sdd service=decoder volume=decoder commit=1
   ```

   For logdecoder, use the following command.

   ```
   name=sdd service=logdecoder volume=logdecoder commit=1
   ```



```
[root@s6Core ~]# df -hP
Filesystem                          Size  Used Avail Use% Mounted on

[root@s6Core ~]#
```

6. Allocate the decoder volume to Decoder service using ‘srvAlloc’.

   ```
   service=decoder volume=decoder commit=1
   ```

   For logdecoder, use the following command.

   ```
   service=logdecoder volume=logdecoder commit=1
   ```

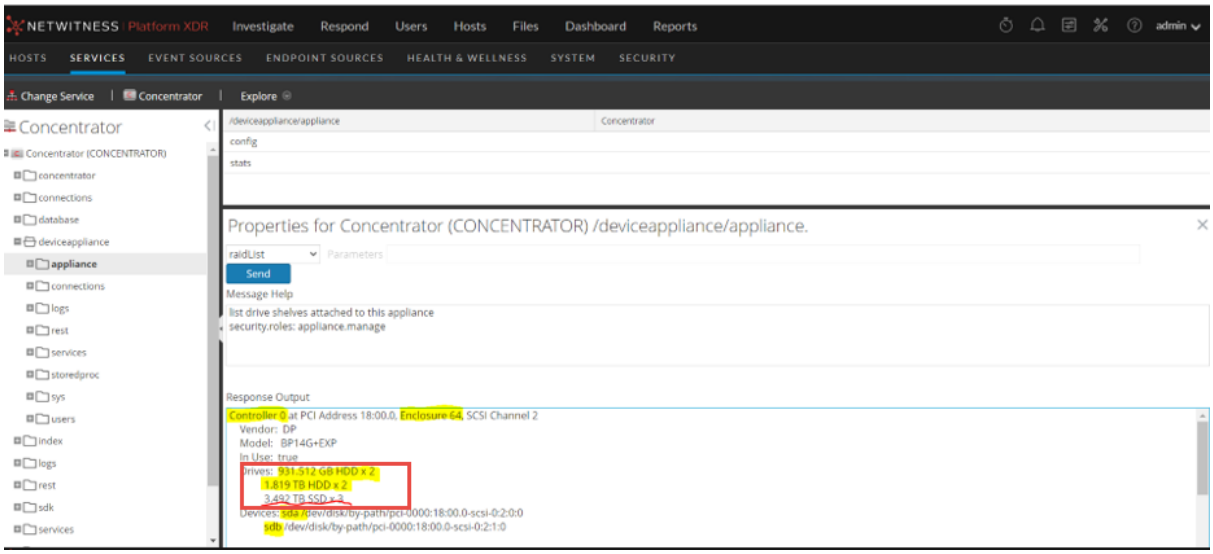
Concentrator Index Use Cases

- Support Additional Meta-Key Indexing
- Capability to Enable compression for Existing Deployments

Three or more 3.84 TB SSD SED drives can be added to a Concentrator to increase the index volume. The index storage needs are scaled based on the NetWitness Platform deployment retention requirements. If additional meta keys are enabled and indexed, it may impact index retention.

For existing deployments, an SSD index drive pack is required if you need to enable compression. When compressing the packetdb (Decoders) and metadb (Concentrators), additional indexing is needed to support compression of those databases.



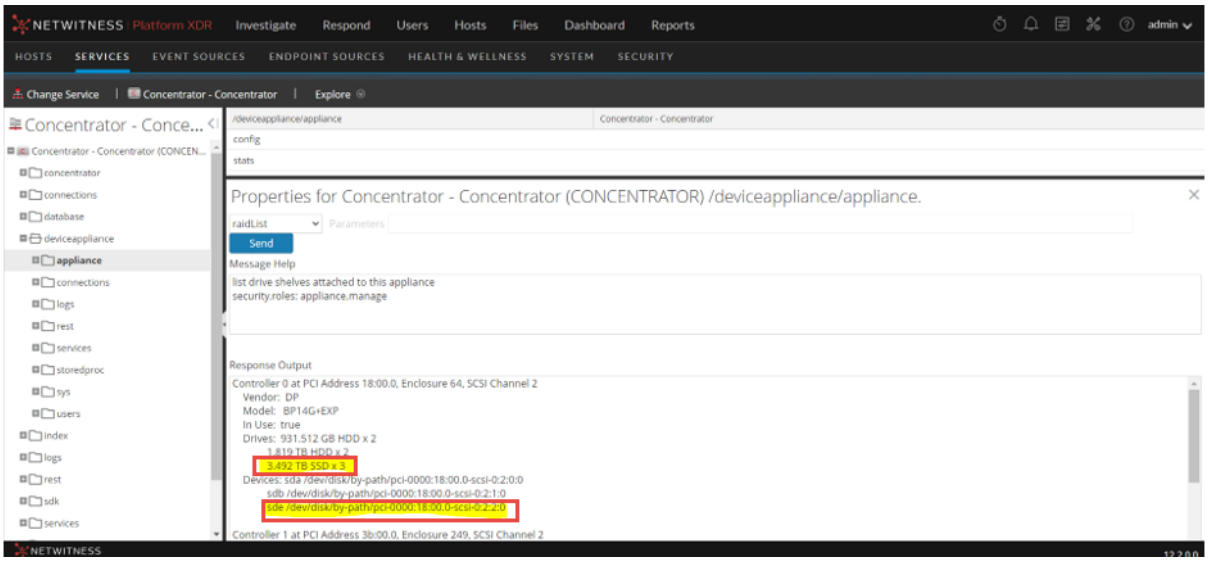
Sample Storage Configuration for Concentrator Index with One Meta Disk Kit (Three SSD's)

This section describes the steps to configure a Meta Disk Kit (Three SSD's) installed on a Series 6/6E appliance orchestrated as Concentrator and **configured with One Power Vault**.

Note:
- Concentrator index usecase supports a maximum of Two Meta Disk Kits. A single Meta Disk pack is configured as RAID5 (3 drives) or two Meta Disk packs (6 drives) are configured as RAID6.
- Even though each Meta Disk Kit consist of 3 SSD's, In rare circumstances when there is no need for very large index expansion and to control costs, users may choose to install only two SSD's (in slots 4 and 5 and configured as RAID1) instead of 3 SSD's (One Meta Disk Kit).
- When configuring two Meta Disk Packs, the disks are installed in slots 4 through 9 and when adding second Meta Disk Pack, the disks are installed in slots 7 though 9. Refer to Series 6/6E Disk Layout for slot details.

On the Series 6 (Dell R640) appliance, the Meta Drive Pack disks are installed in slots 4, 5 and 6. The virtual drive configuration requires identifying the controller ID and Enclosure ID (EID). On Series 6 appliance, the controller ID and Enclosure IDs are 0 and 64. However, the `nwraidtool.py` script that is installed on every server can help to confirm these ID numbers.

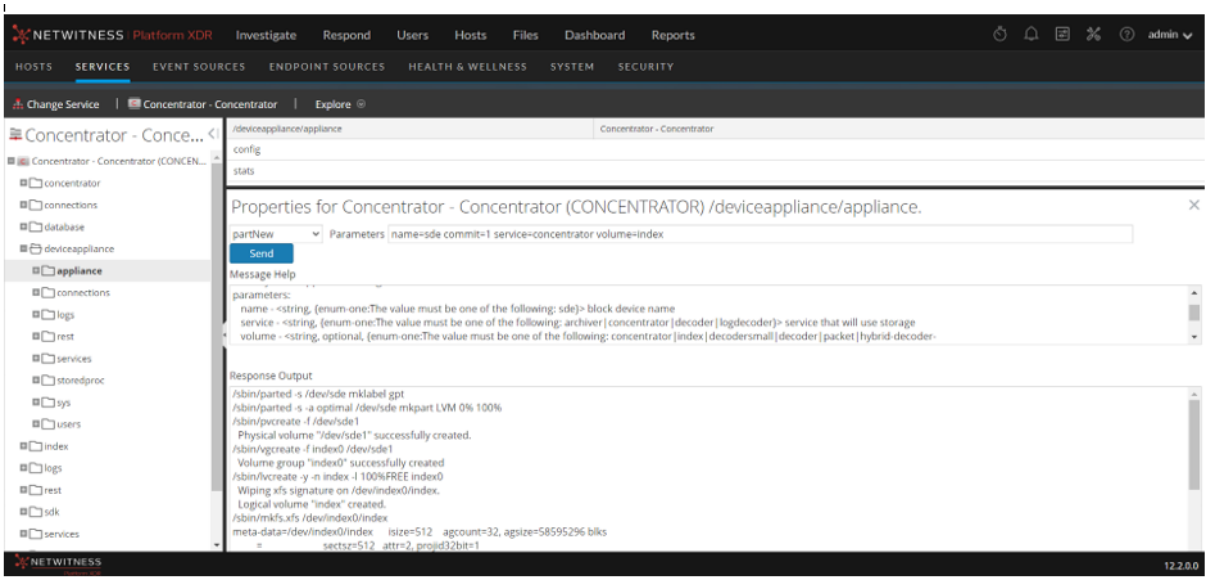
1. Install the three SSDs in the Meta Disk kit in slots 4, 5 and 6 on the Concentrator Appliance. Refer to Series 6/6E Disk Layout for slot details.
2. Identify the existing block devices using **raidList** property. Login to **NW UI > Hosts > Select the Concentrator Host > Actions > View > Explore > deviceAppliance > appliance (Right Click to access properties) > raidList** and click **Send**.



3. SSH to the Concentrator appliance or use iDRAC to connect to the console. Use **perccli** to create the virtual drive with installed Meta Pack kit. Create the Virtual Drive or Drive Group (DG) on the internal controller using the disks in slot 4 through 6 using the below command.

```
/opt/MegaRAID/perccli/perccli64 /c0 add vd type=raid5 drives=64:4-6
strip=128
```

Note:
- To configure two Meta Disk Packs, use the following command.
`/opt/MegaRAID/perccli/perccli64 /c0 add vd type=raid6 drives=64:4-9 strip=128`
- To add a second Meta Disk Pack (First Meta Disk Pack already configured in slots 4,5 and 6), use the following command.
`/opt/MegaRAID/perccli/perccli64 /c0 add vd type=raid5 drives=64:7-9 strip=128`
- To configure only 2 SSD's (instead of 3 SSD's) from a Meta Disk Pack, use the following command. `/opt/MegaRAID/perccli/perccli64 /c0 add vd type=raid1 drives=64:4-5 strip=128`



```
[root@S6CoreConc ~]# /opt/MegaRAID/perccli/perccli64 /c0 add vd type=raid5 drives=64:4-6 strip=128
CLI Version = 007.1623.0000.0000 May 17, 2021
Operating system = Linux 3.10.0-1160.83.1.el7.x86_64
Controller = 0
Status = Success
Description = Add VD Succeeded.
```

4. Identify the new device (highlighted in Yellow) using **raidList** command. In this case it is 'sde'. Login to **NW UI->Hosts->Select the Concentrator Host->Actions->View->Explore->deviceAppliance->Appliance (Right Click to access properties)->raidList->Click on Send.**

5. Execute the **partNew** command with the below parameters to create the new index partition on the block device (sde) created in earlier step:

   ```
   name=sde service=concentrator volume=index commit=1
   ```

6. The concentrator appliance is already configured with a Power Vault (an `index` volume is created and configured along with other volumes on the Power Vault) before adding the Meta Disk Kit. The new ‘index’ volume created in the earlier step is named as ‘index0’.

   Allocate the new index volume (index0) using srvAlloc property to concentrator service using the below parameters:

   ```
   service=concentrator volume=index0 commit=1
   ```

```
[root@Concentrator ~]# df -hP

Enable Security on SED Capable Drives

To enable Security on the SED Capable Drive Group on PERC H740 Mini and PERC H840 Adaptors, see Appendix B. Encrypt a Series 6E Core or Hybrid Host (encryptSedVd.py) .

Prepare Virtual or Cloud Storage

This section describes how to set up virtual or cloud storage for the following types of component hosts:

- Decoder, Log Decoder, Concentrator, Archiver
- NW Server, ESA Primary, ESA Secondary and Malware Analysis
- Log Collector
- Endpoint Log Hybrid
- Additional Endpoint Log Hybrid Partitions
- UEBA

Decoder, Log Decoder, Concentrator, Archiver

Virtual or Cloud NetWitness hosts for Decoders, Log Decoders, Concentrators, and Archivers need block storage attached. Make sure that the allocated storage meets all of the storage requirements. Specifically, make sure that the required storage volumes are created (see "Required NetWitness Platform Storage Volumes" in Storage Requirements), and:

- At least two Block Devices are created for Decoders (meta /session and packet volumes)
- At least two block devices are created for Concentrators (index and meta volumes)
- Ensure that block devices can meet the minimum IOPS for expected ingestion rates

Attach the allocated storage to the NetWitness host by following the hosting platforms native procedure.

- VmWare – Vsphere Console (add disk to VM)
- Hyper-V – Manager Console (add disk to VM)
- Azure – Add Managed Disks to virtual instance
- AWS – Add EBS Storage to virtual instance
- Google Cloud Platform (GCP) - Add storage to virtual instance

After the storage is attached to the virtual host, proceed to "Task 3 - Allocate Block Devices to Partitions, Volume Groups, and Logical Volumes" in Configure Storage Using the REST API.

NW Server, ESA Primary, ESA Secondary and Malware Analysis

For an extension of `/var/netwitness/` partition, attach an external volume.

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `/dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`

3. `lvresize --resizefs --extents +100%FREE /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

NetWitness recommends the following partition definitions. However, you can change these values based on the retention days.

LVM	Folder	Block Storage
/dev/netwitness_vg00/nwhome	/var/netwitness/	Refer to the Cloud Provider Block Storage setup (storage) tables.

Log Collector

For an extension of `/var/netwitness/` partition, attach an external volume

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvresize --resizefs --extents +100%FREE /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

NetWitness recommends the following partition definitions. However, you can change these values based on the retention days.

LVM	Folder	Block Storage
/dev/netwitness_ vg00/nwhome	/var/netwitness/	Refer to the Cloud Provider Block Storage setup (storage) tables.

Endpoint Log Hybrid

The total disk size required depends on the data retention period. You can use the below per day disk usage indicative values to calculate the required disk size for your deployment. For example, to retain 30 days of data, multiply the below per day disk usage values with 30.

The following table provides disk usage for one full scan. The full scan disk usage values are based on the below event count:

- Files count -1100
- Processes count -100
- Dlls count - 500
- Drivers count -150
- Services count - 500
- Tasks count -100

Endpoint Log Hybrid(50K Advance Agents - Disk usage per full scan)					
	MetaDB	PacketDB	SessionDB	Index	Total
Log Decoder	220 GB	12 GB	5 GB	NA	237 GB
Concentrator	230 GB	NA	5 GB	6 GB	241 GB
MongoDB	NA	NA	NA	NA	35 GB (First full scan) 30 GB (Subsequent per scan increase)

The following tables provide per day disk usage for tracking data. The total tracking events per agent per day is 29000.

Endpoint Log Hybrid (50K Advance Agents - Tracking data without Expanded Network Visibility)					
	MetaDB	PacketDB	SessionDB	Index	Total
Log Decoder	1500 GB	140 GB	46 GB	NA	1,686 GB
Concentrator	1600 GB	NA	46 GB	30 GB	1,676 GB
MongoDB	NA	NA	NA	NA	35 GB (First full scan) 1.5 GB (Tracking data per day increase)

The following tables provide per day disk usage for tracking data. Total tracking events per agent per day is 33000

Endpoint Log Hybrid (50K Advance Agents - Tracking data with Expanded Network Visibility)					
	MetaDB	PacketDB	SessionDB	Index	Total
Log Decoder	1800 GB	152 GB	55 GB	NA	2007 GB
Concentrator	1900 GB	NA	55 GB	36 GB	1991 GB
MongoDB	NA	NA	NA	NA	35 GB (First full scan) 1.5 GB (Tracking data per day increase)

The following table provides per day disk usage for insight agents. The total tracking data per agent per day is 10800 plus 1 full scan daily.

Endpoint Log Hybrid (50K Insights Agents with Expanded Network Visibility)					
	MetaDB	PacketDB	SessionDB	Index	Total
Log Decoder	500 GB	52 GB	18 GB	NA	570 GB

Endpoint Log Hybrid (50K Insights Agents with Expanded Network Visibility)					
Concentrator	600 GB	NA	18 GB	13 GB	631 GB
MongoDB	NA	NA	NA	NA	35 GB (First full scan) 30 GB (Subsequent per scan increase)

The following table provides Endpoint Agents sizing based on the feature.

Feature	Description	Agent or Endpoint Server
Endpoint Only	Only scan and tracking data	Maximum 50K Endpoint Agents only
Windows Logs Only	Only Windows Logs from agents. Assuming 20K events per second supported by Hybrid.	Maximum 20K Agents: • Generates 20K log events per second
File Collection Only	Only File Collection from agents. Assuming 20K events per second supported by Hybrid	Maximum 20K Agents : • Generates 20K log events per second
Endpoint and Windows Logs	Event per second per agent • (For Windows Logs) 1 event sent by 1 agent every second • (For Tracking Events) 0.4 event sent by 1 agent every second • 20K events per second supported by Hybrid **Note:** Total agents should be calculated as below: Hybrid events per second/ (Windows Logs Endpoint Server of 1 agent + Tracking Event Endpoint Server for 1 agent) For example, 20000 / (1.0 + 0.4)	Maximum 15K (approximately) Agents: • Generates 15K (approximately) Windows log events Plus • Generates 15K (approximately) Agents EDR data

Feature	Description	Agent or Endpoint Server
Endpoint, Windows Logs and File Collection	Event per second per agent: • (For Windows Logs) 1 event sent by 1 agent every second • (For Tracking Events) 0.4 event sent by 1 agent every second • (For File Collection) 1 event sent by 1 agent every second • 20, 000 events per second supported by Hybrid **Note:** Total agents should be calculated as below: Hybrid events per second/ (Windows Logs Endpoint Server of 1 agent + Tracking Event Endpoint Server for 1 agent + File Collection) For example, 20000 / (1.0 + 1.0 + 0.4)	Maximum 10K (approximately) Agents: • Generates 10K (approximately) Windows log events Plus • Generates 10K (approximately) Endpoint Agents data Plus • Generates 10K (approximately) Agents File Collection data

Extending File Systems

For Endpoint Server, attach external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as `nwhome`.

Follow these steps:

1. Ensure you have added a new disk. For more information, see "Task 1. Add New Disk" in the *Virtual Hosts Installation Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

2. Execute `lsblk` and get the physical volume name

3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`

4. `vgextend netwitness_vg00 /dev/sdc`

5. `lvresize --resizefs --extents +100%FREE /dev/netwitness_vg00/nwhome`

6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`

NetWitness recommended partition for Endpoint Server (can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	6TB	HDD

For Mongo DB, attach external disk for extension of `/var/netwitness/mongo` partition, create an external disk with suffix as `nwhome`.

Follow these steps:

1. Ensure you have added a new disk. For more information, see "Task 1. Add New Disk" in the *Virtual Hosts Installation Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. Execute `lsblk` and get the physical volume name
3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc1`
4. `vgextend hybrid /dev/sdc1`
5. `lvresize --resizefs --extents +100%FREE /dev/hybrid-vlmng`
6. `xfs_growfs /dev/mapper/hybrid-vlmng`

NetWitness recommended partition for Mongo DB (Can be changed based on the retention days). Minimum recommended size for var/netwitness is 500 GB.

LVM	Folder	Size	Disk Type
`/dev/hybrid-vlmng`	`/var/netwitness/mongo`	6TB	HDD

Additional Endpoint Log Hybrid Partitions

The following partition should be on the volume group endpoint and should be in a single RAID 0 array.

Folder	LVM	Volume Group
/var/netwitness/mongo	hybrid-mongo	endpoint
/var/netwitness/concentrator	concentrator-concroot	endpoint
/var/netwitness/concentrator/index	hybrid-concinde	endpoint
/var/netwitness/logdecoder	hybrid-ldecroot	endpoint

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md0`
2. `vgcreate -s 32 endpoint /dev/md0`
3. `lvcreate -L <disk_size> -n <lvm_name> endpoint`
4. `mkfs.xfs /dev/ endpoint /<lvm_name>`
5. Repeat the above steps for all the LVMs mentioned.

NetWitness recommends the following partitions. However, you can change these values based on the retention days.

LVM	Folder	Block Storage
/dev/netwitness_vg00/nwhome	/var/netwitness/	Refer to the Cloud Provider Block Storage setup (storage) tables.

LVM	Folder	Block Storage
/dev/endpoint/hybridmongo	/var/netwitness/mongo	Refer to the Cloud Provider Block Storage setup (storage) tables.
/dev/endpoint/concentratorconcroot	/var/netwitness/concentrator	Refer to the Cloud Provider Block Storage setup (storage) tables.
/dev/endpoint/hybridconcinde	/var/netwitness/concentrator/index	Refer to the Cloud Provider Block Storage setup (storage) tables.
/dev/endpoint/hybridldecroot	/var/netwitness/logdecoder	Refer to the Cloud Provider Block Storage setup (storage) tables.

UEBA

The following procedure attaches an external disk and extends the `/var/netwitness/` partition. You must use `nwhome` as the eternal disk suffix. This procedure illustrates how to add a 2TB disk.

Note: `/var/netwitness` is the only partition that can reside on this volume.

1. List the physical volume name.
   `lsblk` (for example, `dev/mapper/sdc`)
2. Extend the `/var/netwitness/` partition.

```
pvcreate <pv_name>where pv_name is dev/mapper/sdc
vgextend netwitness_vg00 /dev/mapper/sdc
lvresize --resizefs --extents +100%FREE /dev/mapper/netwitness_vg00/nwhome
xfs_growfs /dev/mapper/netwitness_vg00-nwhome
```

This partition is the NetWitness recommended partition for UEBA. You can change it based on retention days.

Configure Storage Using the REST API

In NetWitness Platform 11.3 and later releases, you can use the REST API for all storage configuration operations. For information about how to use the REST API, see the *RESTful API User Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

REST API Storage Configuration Commands

Each of the commands listed below has built-in help that describes their function and usage. If you are using the REST interface, select the command from the drop-down menu to see the help text. For examples of REST API storage configuration commands, see Appendix D. Sample Storage Configuration Scenarios for 15-Drive DACs.

Commands for Direct-Attached RAID Volumes

- `raidList` : List the RAID controllers and direct-attach enclosures that are present on this host.
- `raidNew` : Allocate direct-attached enclosures to block devices.

Commands for Allocating Block Devices as Storage

- `devlist` : List available block devices on the host.
- `partNew` : Allocate partitions on a block device and create volume groups.
- `vgs` : Summarize how block devices are organized into volume groups.

Commands for Allocating Storage to Services

- `srvList` : List services on the host and their allocated storage paths.
- `srvAlloc` : Allocate a volume group to a service.
- `srvFree` : Remove a volume group from a service.
- `multipath-II` : To verify if SAN devices are attached.

Command to Reconfigure Services to Detect and Use All of the New Storage

- `reconfig` - After configuring new storage, detect and use new storage on the associated service and database.

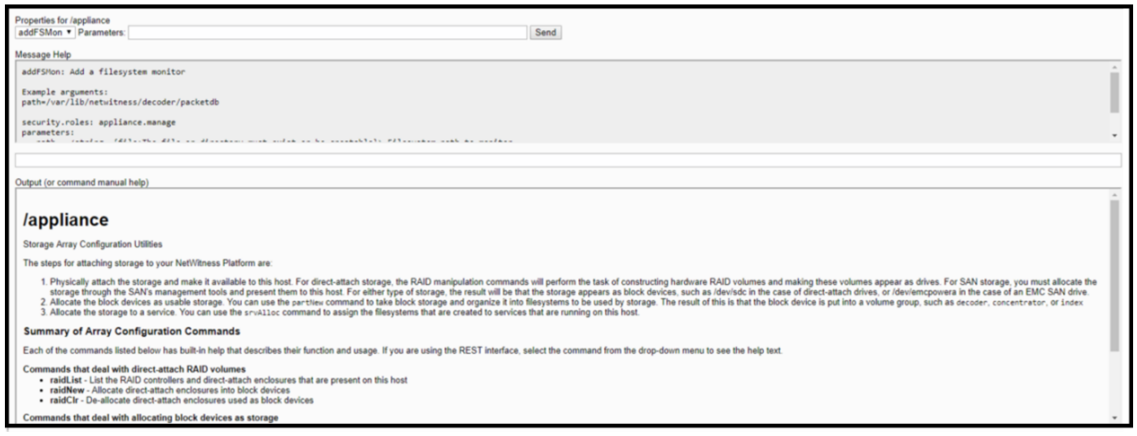
Storage Configuration Tasks

Task 1 - Attach storage to the host and access the REST API storage configuration commands.
Task 2 - (Conditional) Configure RAID if necessary.
Task 3 - Allocate block devices to partitions, volume groups, and logical volumes.
Task 4 - Allocate volume groups to NetWitness services.
Task 5 - Reconfigure services and databases to detect and appropriately use new storage.

Task 1 - Attach Storage to the Host and Access the REST API Storage Commands

IMPORTANT: Task 1 is not applicable for NetWitness version 11.5.0.0 and 11.5.0.1.

Complete the following steps to attach an external storage device to a host and access the storage configuration commands available through the REST API.

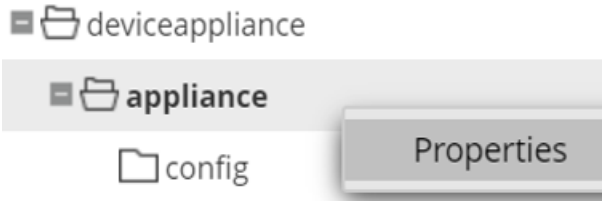


1. Attach the storage and make it available to this host.
   - To attach PV storage, refer to the *PowerVault (Dell MD 1400) Setup Guide*.
   - For third-party storage, create the RAID groups to match the volumes listed in Storage Requirements
2. There are two ways that you can access the REST API storage commands: from a Browser, or from the **Services** > **Explore** view from the User Interface.

   Note: Once you have accessed the REST API, the steps that you perform are the same, no matter which method you used to access it.

- From a Browser.
  a. Open a Browser and specify the ip-address of the host with port **50106**.
  The following example is the Decoder, but you need to use port 50106 for any host hardware for which you are configuring storage using the REST API.
  `https://<decoder-ip-address>:50106`
  b. Log in with the `admin` account credentials.
  The following REST API menu is displayed.

  c. Click on the `(*)` next to **appliance** to access the REST command set.
  The **Properties for /appliance** dialog is displayed under the initial REST menu. The **Output (or command manual help)** section describes the commands that the REST API can send to the device, their usage, and their parameters.



- From the User Interface.

  a. In the **NetWitness** menu, go to  (Admin) > **SERVICES**.

  b. Select the service (for example, a Concentrator).

  c. Under  (actions), select **View** > **Explore**.

  d. Navigate to **deviceappliance/appliance**, right click, and click **Properties**.

Note: If you are on NetWitness version 11.5.0.0 or 11.5.0.1, you must navigate to **System** > **Host Tasks** >**Task**.

You can now access the storage commands from the **Properties** dialog.

3. Proceed to:

- Task 2 if you need to configure RAID for PowerVault or DACs.
- Task 3 if you do not need to configure RAID and already have a block device available.

Task 2 - (Conditional) RAID Configuration for PowerVault and DACs

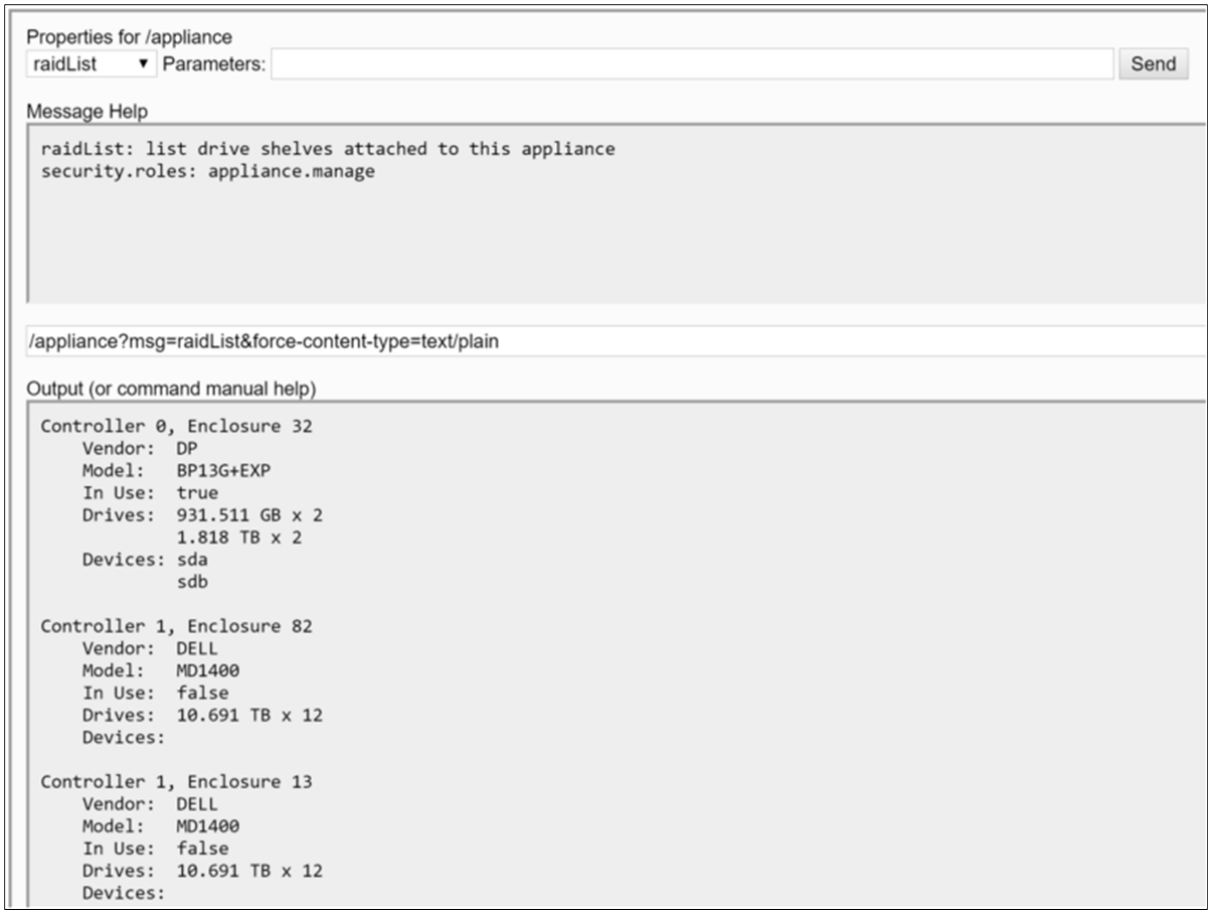
IMPORTANT: Task 2 is mandatory if you are on NetWitness version 11.5.0.0 or 11.5.0.1.

NetWitness Platform hardware uses direct-attached SAS drives for storage. These drives are housed in a SAS enclosure. SAS enclosures are shelves of drives attached to the NetWitness node by a cable connected to the SAS host bus adapter.

SAS enclosures are also known as other names, such as "DAC" (Direct-Attached Capacity), or "JBOD" (Jumbo Box of Disks), or "Dell PowerVault".

NetWitness Platform utilizes Dell PERC SAS host bus adapters. NetWitness Platform devices typically include two SAS host bus adapters. One is used for controller drives that are internal to the NetWitness Node, and another is used for controlling drives attached to the SAS enclosures. The internal controller and drives are configured when the node is built, but the external SAS enclosures are not. You execute the `raidList` and `raidNew` commands to identify and configure the external SAS enclosures.

These commands work with the following SAS enclosure types:



- EMC ESAS 15-drive enclosures
- EMC ESAS 60-drive enclosures
- Dell PowerVault 12-drive enclosures
- Dell PowerVault 8-drive enclosures

Note: EMC 60-drive enclosures are logically organized as four separate 15-drive sub-enclosures. They behave as if there are four 15-drive enclosures, each of which can be configured independently.

The `raidList` and `raidNew` commands operate on entire enclosures. Execute `raidList` to identify the enclosues. execute `raidNew` to configure an enclosure to perform one of the pre-determined roles within a NetWitness Platform node.

After you attach storage to the host and access the REST API storage commands, complete the following steps to create RAID if required.

1. Execute the `raidList` command to identify the controllers and enclosures that are attached to the system.
   In the following example, Controller 1 does not display any block devices. This indicates the array is not configured.

2. Select a RAID layout scheme for the Enclosure.

The following tables list the PV to Supported Hosts Mapping.

Type	SKU	Specification	Supported Hosts
High Density	NW-PV-A	Dell Storage MD1400 12 x 12 TB NL-SAS SED	Decoder, LogDecoder, Archiver, Log Hybrid, Network Hybrid, Endpoint Log Hybrid

Type	SKU	Specification	Supported Hosts
High Density	NW-PV-B	Dell Storage MD 1400 8 x 12TB NL-SAS SED	Decoder, LogDecoder, Archiver, Log Hybrid, Network Hybrid, Endpoint Log Hybrid
High Performance	NW-PV-C	Dell Storage MD 1400 6 x 12TB NL-SAS SED, 2 x 3.8TB SSD SED	Concentrator
High Performance	NW-PV-D	Dell Storage MD 1400 9 x 12TB NL-SAS SED, 3 x 3.8TB SSD SED	Concentrator

Type	SKU	Specification	Supported Hosts
High Density	192TB (NWPV-A-N)	Dell Storage MD1400 12 x 16 TB NL-SAS SED	Decoder, LogDecoder, Archiver, Log Hybrid, Network Hybrid, Endpoint Log Hybrid
High Density	128TV (NWPV-B-N)	Dell Storage MD 1400 8 x 16TB NL-SAS SED	Decoder, LogDecoder, Archiver, Log Hybrid, Network Hybrid, Endpoint Log Hybrid
High Performance	103TB (NWPV-C-N)	Dell Storage MD 1400 6 x 16TB NL-SAS SED, 2 x 3.8TB SSD SED	Concentrator
High Performance	155TB (NWPV-D-N)	Dell Storage MD 1400 9 x 16TB NL-SAS SED, 3 x 3.8TB SSD SED	Concentrator

The following tables show you the supported allocation schemes.

Note:
- On a Series 6 Network Decoder or newer with multiple PowerVault storage trays, use the decoder-hotspare RAID scheme for the first enclosure and the packet-expansion RAID scheme for subsequent enclosures.
- On a Series 5 Network Decoder with multiple PowerVault storage trays, use the decoder-hotspare RAID scheme for the first two enclosures and the packet-expansion RAID scheme for subsequent enclosures. The PowerVault trays connected to a S5 appliance and configured as decoder-hotspare must be attached to independent PERC ports and not daisy chained to each other. These configurations will maximize storage capacity and performance.

Scheme	Drives Required	Allocation
decoder-hotspare	8 or 12 or 15 HDDs	2x Drives in RAID 1 for decoder small, 1 drive as hotspare, all remaining drives in RAID 5 for decoder

Scheme	Drives Required	Allocation
logdecoder-hotspare	8 or 12 or 15 HDDs	Same as decoder-hotspare configuration
archiver	8 or 12 or 15 HDDs	All drives in RAID 6 for archiver or decoder database volume
network-hybrid	8 or 12 or 15 HDDs	3x drives in RAID 5 for meta expansion, all remaining drives in RAID 5 for packet expansion
log-hybrid **Note:** log-hybrid scheme is **also** used to configure a **PowerVault** for Endpoint Log Hybrid host.	8 or 12 or 15 HDDs	Half of the drives in RAID 5 for meta expansion, half the drives in RAID 5 for packet expansion
concentrator	2 or more SSDs, 4 or more HDDs	All SSDs in RAID 1 or RAID 5 for index, all HDDs in RAID 6 for meta
packet-expansion	8 or 12 or 15 HDDs	All drives in RAID 6 for decoder volume, no drives allocated for decodersmall
decoder-metakit	1 metakit (3 HDDs) or 2 metakits (6 HDDs)	3x drives in RAID 5 or 6x drives in RAID 6 for meta
logdecoder-metakit	1 metakit (3 HDDs) or 2 metakits (6 HDDs)	3x drives in RAID 5 or 6x drives in RAID 6 for meta
concentrator-metakit	1 metakit (3 SDDs) or 2 metakits (6 SDDs)	3x drives in RAID 5 or 6x drives in RAID 6 for index. If two drive configuration, then 2x drives in RAID 1 for index.
decoder or logdecoder **Note:** The decoder and logdecoder scheme has been deprecated in favour of decoder-hotspare and logdecoder-hotspare.	8 or 12 or 15 HDDs	3x drives in RAID 5 for decodersmall or logdecodersmall, all remaining drives in RAID 5

3. After the controller, enclosure, and scheme are identified, execute the `raidNew` command to create RAID Volumes. For example:
   ```
   send /appliance raidNew controller=1 enclosure=82 scheme=decoder-hotspare preferSecure=false
   ```
   Add the `commit=1` parameter to actually execute this operation. Execute the `raidList` command to

list the created block devices.

4. (Optional) Configure SEDs (Self-Encrypting Drives). If the `raidNew` command detects self-encrypting drives and a security key has been set on the controller, the `raidNew` command will attempt to create a secure array. To set a security key on the controller, execute the `raidKey` command. For example:
   `send /appliance raidKey controller=1 key=myPasssphrase keyId=1`
   - To create a secured (that is, encrypted) array on physical devices attached to a controller with a security key set, specify `preferSecure=true` when using `raidNew`
   - To create an unsecured (that is, unencrypted) array on physical devices attached to a controller with a security key set, specify `preferSecure=false` when using `raidNew`.
5. Go to Task 3 - Allocate Block Devices to Partitions, Volume Groups, and Logical Volumes, after you create RAID volumes.

Task 3 - Allocate Block Devices to Partitions, Volume Groups, and Logical Volumes

The `partNew` command prepares a storage device to use in NetWitness Platform. It performs the following tasks.

- Creates the partition table on the block device.
- Creates the Linux Volume Manager physical device partition.
- Creates a volume group containing the physical device.
- Creates logical volumes in the volume group.
- Creates XFS filesystems on each logical volume.
- Creates `/etc/fstab` entries for each logical volume.
- Mounts each logical volume.

Complete the following steps to allocate block devices to partitions, volume groups, and logical volumes.

1. Run the `devlist` command to locate unused block devices. The following example shows the `devlist` command output.

   Output (or command manual help)

   ```
   sda: vendor=DELL model="PERC H730P Mini" size="931 GB" used=1
   sdb: vendor=DELL model="PERC H730P Mini" size="1.81 TB" used=1
   sdc: vendor=DELL model="PERC H830 Adp" size="21.38 TB" used=1
   sdd: vendor=DELL model="PERC H830 Adp" size="85.53 TB" used=1
   ```

   Also,you must provide a name for the service that will be used with the storage, for example, **decoder** for the Network Decoder service, or **concentrator** for the Concentrator service. You have the option of providing the volume type. The default volume type has the same name as the service.

Note: Run the `devlist` command to see if the multipath user-friendly names are listed correctly.

2. Run the `multipath_II` command to make sure that SAN devices are attached. The following is an example when SAN devices are attached.

Note: Block devices should be configured with a user-friendly name such as mpatha, mpathb etc.

3. Execute the `partNew` command to allocate block devices to partitions, volume groups, and logical volumes.
   By default, the `partNew` command does not make changes. It displays the actions that will be taken if you commit the command string. To actually make the changes to the system, add the `commit=true` parameter to the command.
   For example, to assign devices `sdd` and `sde` to Decoder:

```
send /appliance partNew name=sdc service=decoder volume=decodersmall
commit=true
send /appliance partNew name=sdd service=decoder volume=decoder commit=true
```

Caution: For the **decoder** and **concentrator** services, you must create storage volumes in a specific order.
- The **decoder** has the **decodersmall** and **decoder** volumes. Create the **decodersmall** volume before the **decoder** volume because **decodersmall** contains the small filesystem mounted at `/var/netwitness/decoder`.
- The **concentrator** has the **concentrator** and **index** volumes. Create the **concentrator** volume before **index** volume or it will fail and you receive the following message.

```
Failed to process message partNew for /appliance
com.rsa.netwitness.carlos.transport.TransportException: Volumes for index
require mount point /var/netwitness/concentrator to be created and
mounted first.
```

4. Execute the `vgs` command to validate that the `partNew` command created the correct Logical Volumes.
   The output of this command:
   - Enumerates all the volume groups on this host.
   - Displays the physical volumes that the volume group consists of, and the logical volumes within the volume group.
5. Go to Task 4 - Allocate Volume Groups to NetWitness Services- `srvAlloc`.

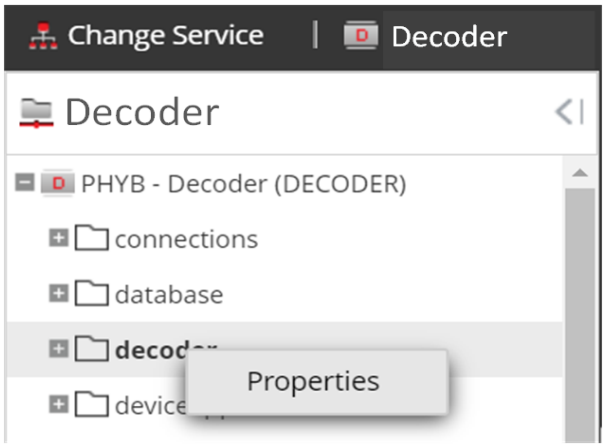
Task 4 - Allocate Volume Groups to NetWitness Services - `srvAlloc`

The `srvAlloc` command configures services on a host to use storage in a volume group. You must provide the name of the service to configure and the volume group to assign to the service (the service you provide must be installed on the host). For information about NetWitness Platform service volumes, see "NetWitness Platform Service Volume Reference" in Storage Requirements.

Allocate services in the following order:

- For the Decoder, allocate `decodersmall` first then the `decoder`.
- For a Concentrator, allocate `concentrator` first then `index`.

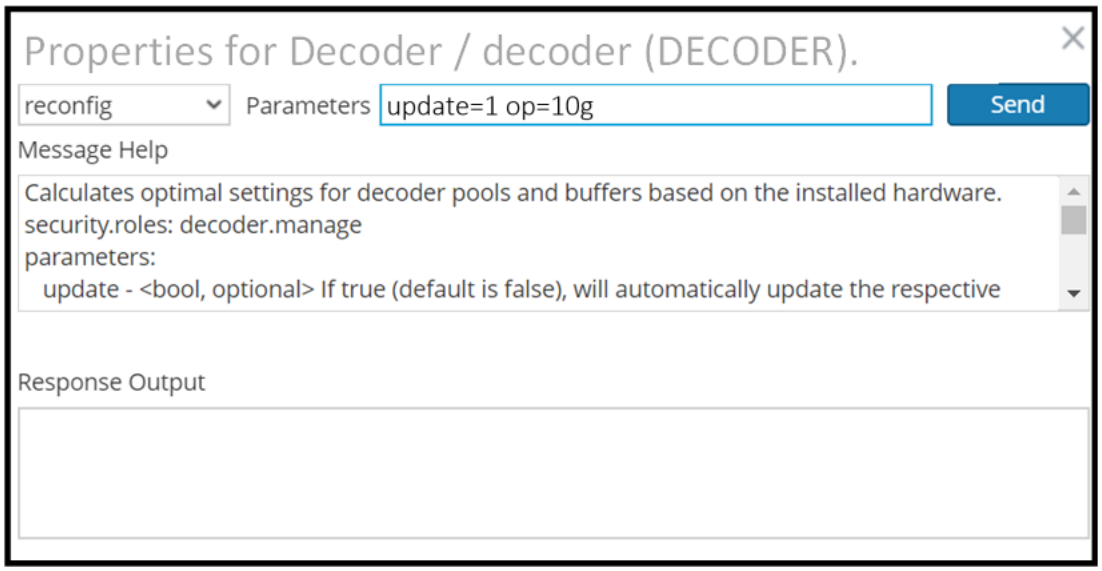
Note: By default, the `srvAlloc` command does not make changes. You must append the `commit=1` parameter to the command string to actually make the changes to the system and restart the specified service after making changes.



1. Execute the `srvList` command to see a list of services installed on this host.
   The `srvList` command communicates with the service through the SSL port. You install a Category on a host. A Category can be a single service, or multiple related services, located on the same host.
2. Execute the `srvAlloc` command to configure a service on a host to use storage in a volume group.
   For example:
   ```
   service=concentrator volume=concentrator commit=1
   service=concentrator volume=index commit=1
   ```
3. Go to Task 5 - Reconfigure Services and Databases to Detect and Appropriately Use New Storage.

Task 5 - (Optional) Reconfigure Storage Configuration for 10G Capture

You need to reconfigure the Decoder service and databases for 10G capture. Complete the following steps so that the Network Decoder service and its database detect and use new free space.

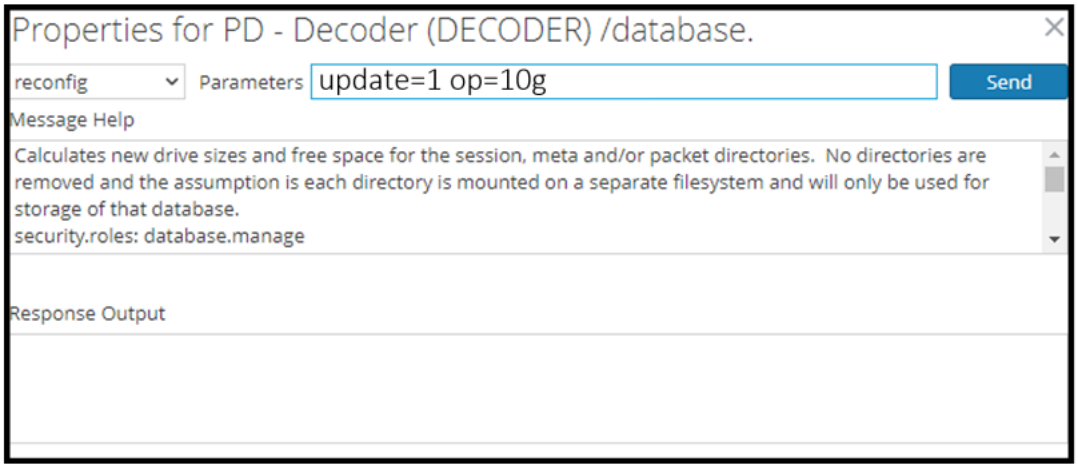


1. In the **NetWitness** menu, go to  (Admin) > **SERVICES**.
   The **SERVICES** view is displayed.
2. Select the **decoder**.
3. Under  (actions), select **View** > **Explore**.
   The **Explore** tree for the service is displayed.

4. Reconfigure space on the **decoder** service.
   a. Navigate to the **decoder**, right click, and click **Properties**.

   The **Properties** dialog is displayed.

   b. Execute the `reconfig` command by selecting it from the drop-down list, specifiy `update=1 op=10g` in **Parameters**, and click **Send**.



5. Reconfigure space on the database.
   a. Navigate to **database** in the service **Explore** tree, right click, and click **Properties**.

   The **Properties** dialog is displayed.

   b. Execute the `reconfig` command by selecting it from the drop-down list, specifiy `update=1 op=10g` in **Parameters**, and click **Send**.

Prepare Unity Storage

You must work with your Dell EMC Storage Engineer to allocate storage within your Unity environment for the NetWitness Platform and ensure the allocated storage meets all of the NetWitness Platform Storage Requirements. Specifically, make sure that:

- You have at least two LUNS created for Decoders (meta /session and packet volumes).
- You have at least two LUNS created for Concentrators (index and meta volumes).
- Ensure block devices can meet the minimum IOPS for expected ingestion rates.

You must add every NetWitness host that uses the Unity storage as a host within the Unity interface. After you create hosts and LUNs, you must assign the LUNs to the hosts. Assigning the LUNs to hosts makes the storage visible to the hosts so they can locate the storage through the host-based Dell EMC PowerPath software.

Note: A Dell EMC engineer will configure the following Unity Array.

You need to perform the following tasks to prepare Unity Storage.

Task 1 - Access Unisphere User Interface (UI)

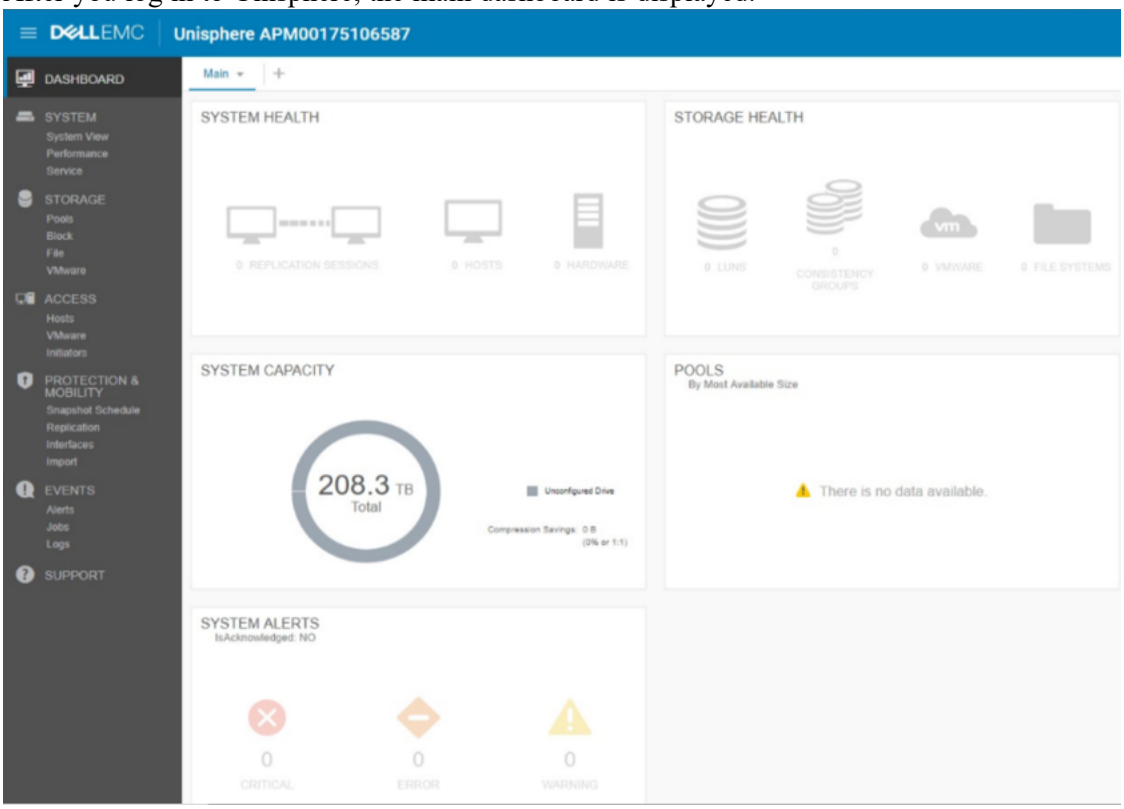
Task 2 - Create Pools

Task 3 - Create LUNS

Task 4 - Register Hosts

Task 5 - Assign LUNS to Hosts

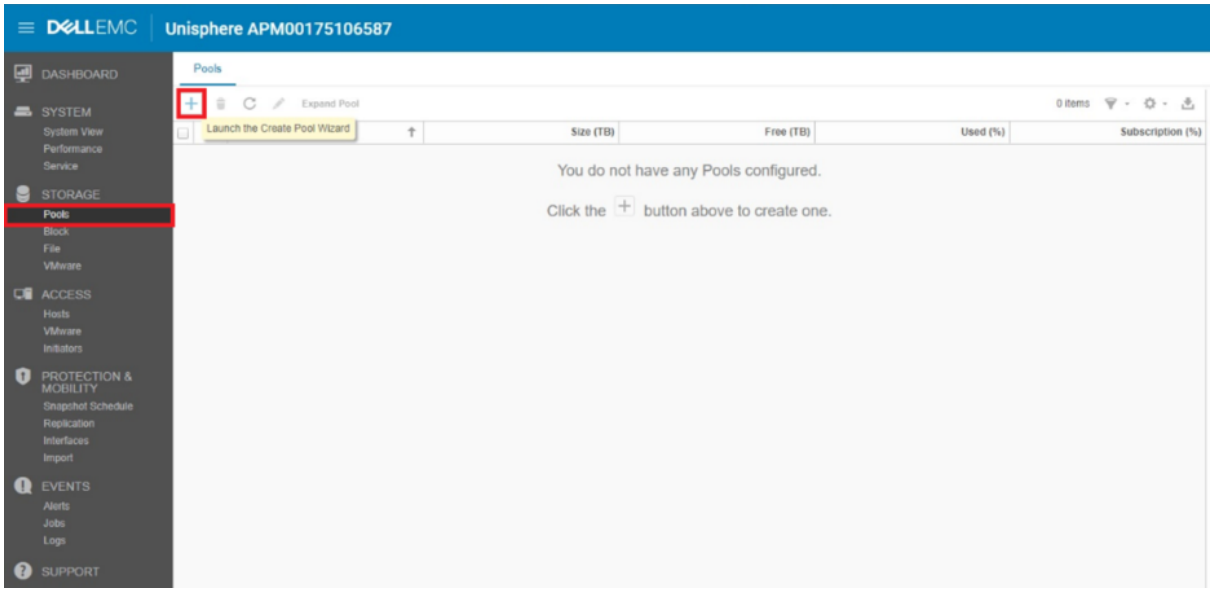
Task 6 - Install PowerPath



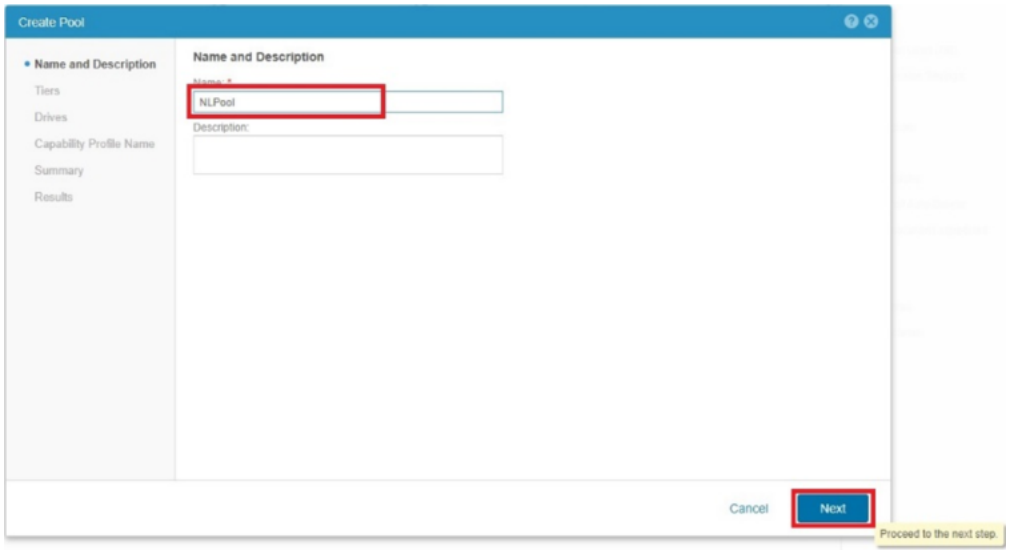
Task 1 - Access Unisphere User Interface (UI)

1. Connect your workstation on the same subnet as the UNITY.
2. Open a browser and go to **http://<unisphereIP>** to connect to the Unisphere UI.
3. Log in with the credentials provided by the DellEMC CE. The default credentials are **admin/Password123#**.

Note: Unisphere will ask you to change password the first time log in. It also asks you to install the license before you can configure array (DellEMC CE may do this for you. You must get the new admin password from them).

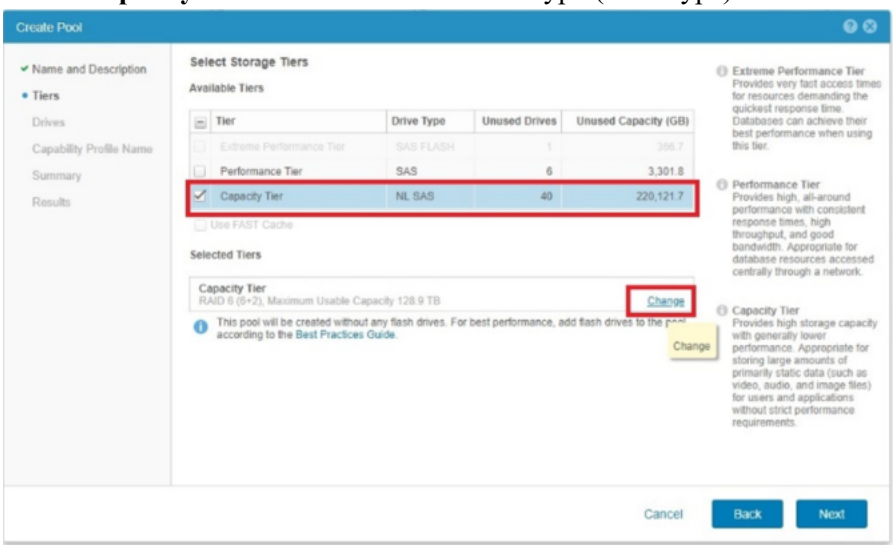


After you log in to Unisphere, the main dashboard is displayed.



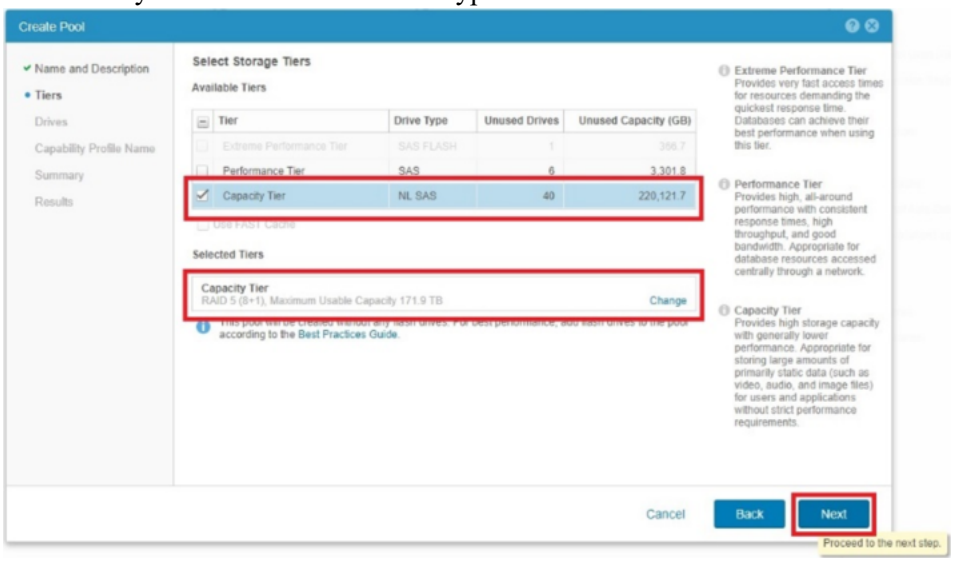
Task 2 - Create Pools

The NetWitness configuration consists of two different pools. One pool is dedicated to the NL-SAS drives and the other pool is dedicated to the SSDs.

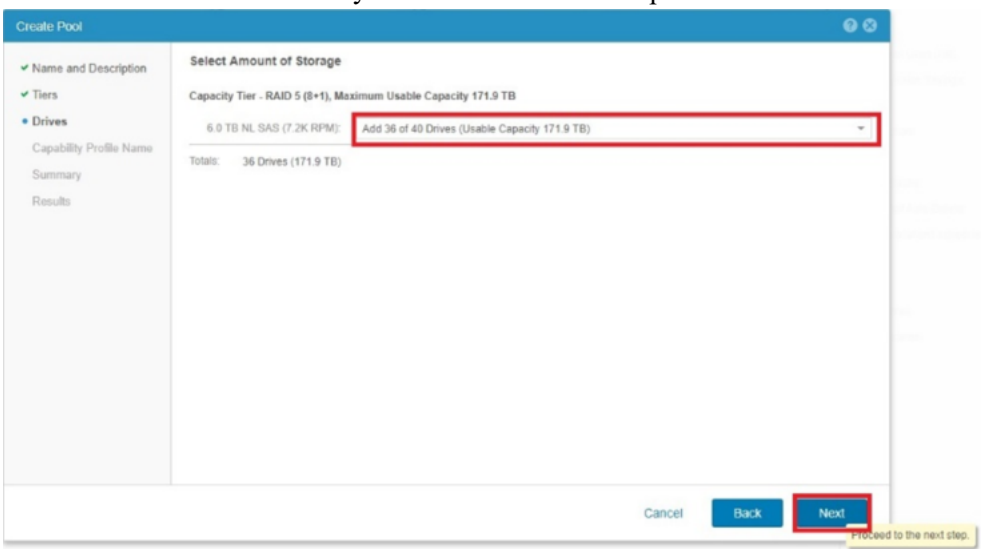


1. From **Storage Section**,click > **Pools** > (Add) to launch the Create Pool Wizard.

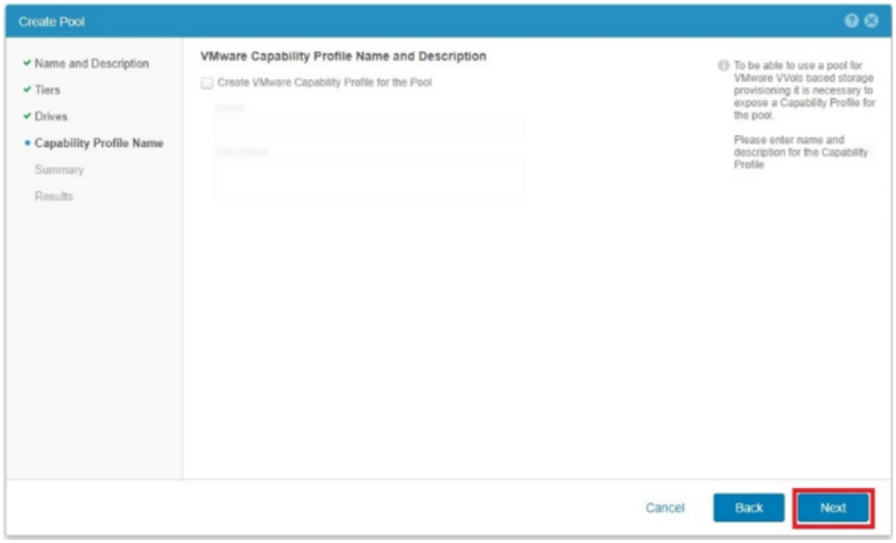
2. Enter in a name for the pool (for example, **NLPool**) and click **Next**. Optionally, you can also enter a description for the pool.



3. Select **Capacity Tier** under **Tier** for the tier type (drive type) and click **Change**.

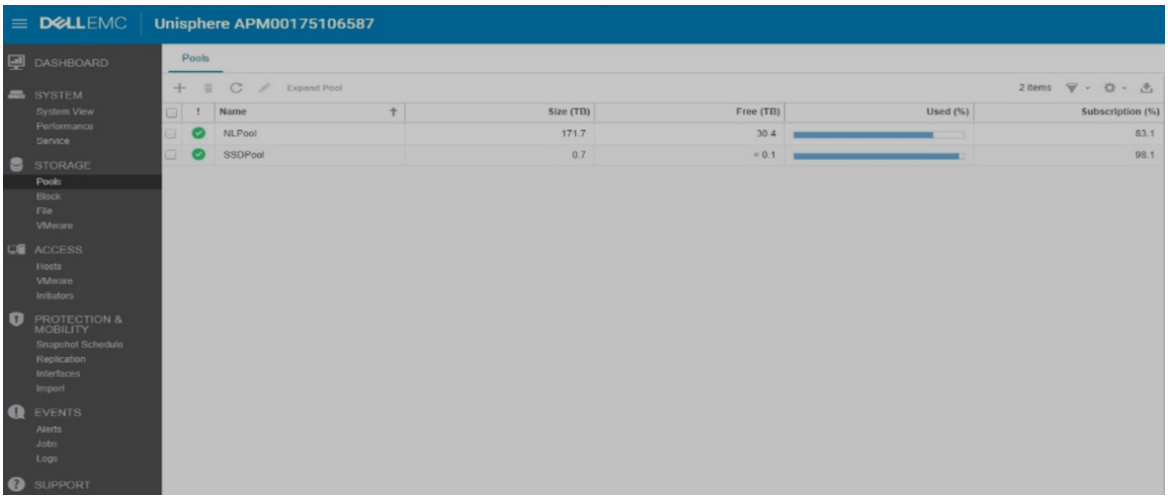


4. Choose the RAID type and from the drop down and select the RAID size.
   The RAID type and size are a customer preference. The only requirement is to make sure you have enough IOPS within the pool to accommodate the log or packet capture and queries. In the following example, a **RAID 5 (8+1)** configuration is selected, however some customers may prefer a **RAID 6 (10+2 or 12 +2)**.

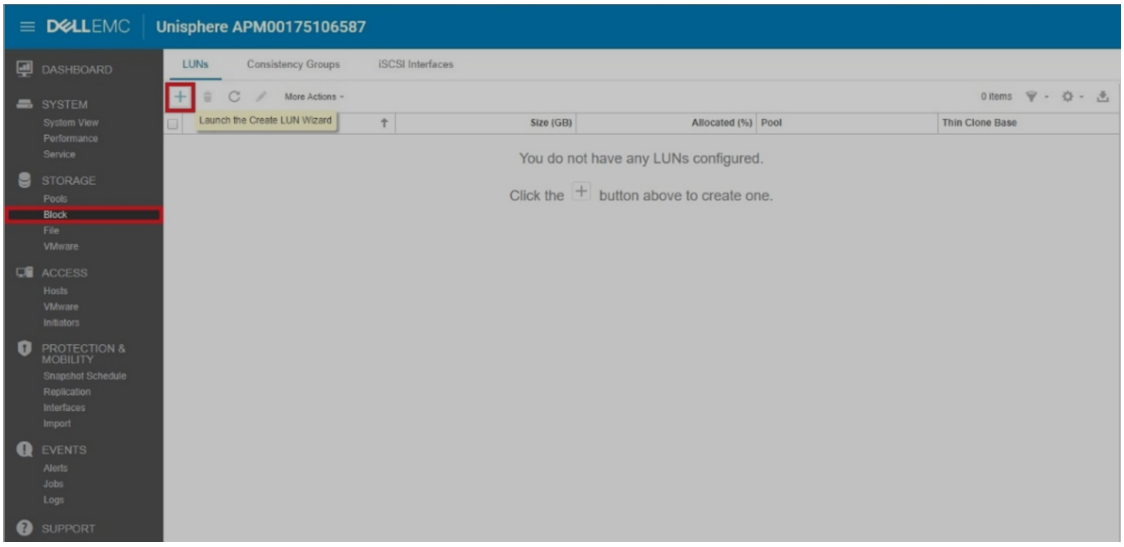


5. Make sure you have the correct Raid type and size selected.

6. Choose the number of drives you want to add into the pool and click **Next**.



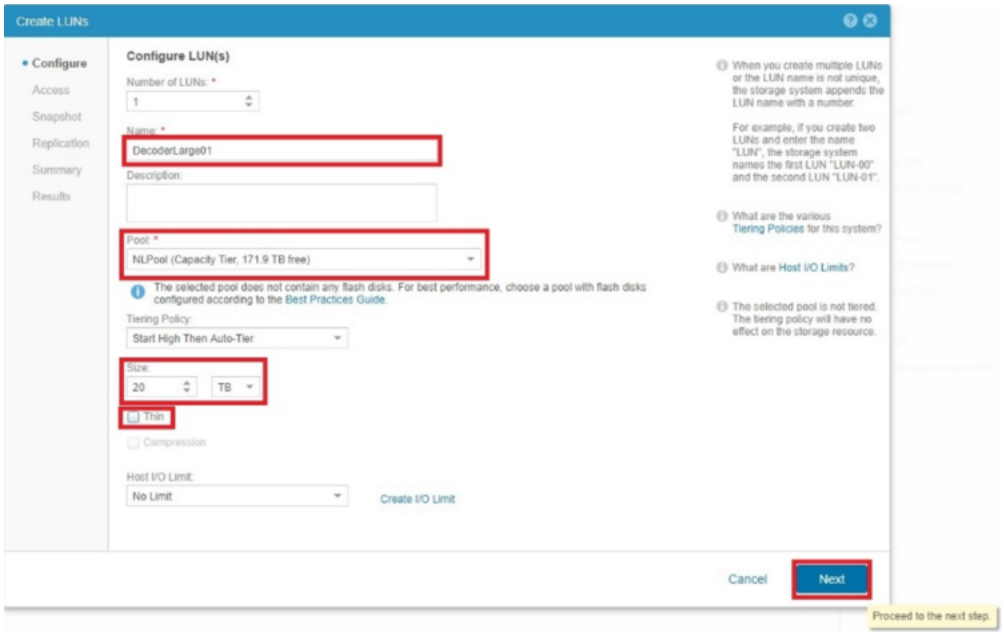
7. Skip the **VMware Capability** section and click **Next**.



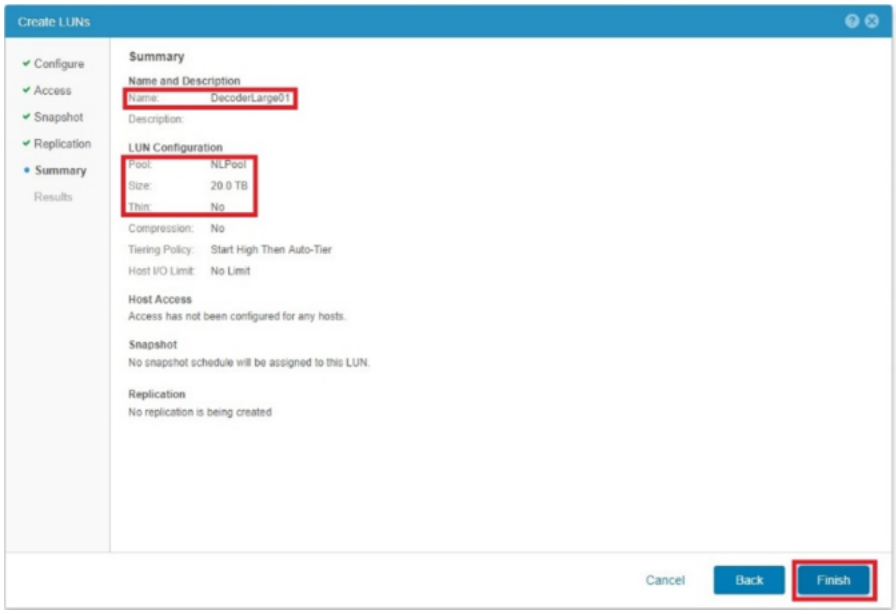
8. Make sure that everything is correct on the Summary tab, and click **Finish**.
9. Create another pool for the SSDs using steps 2 – 8.
   a. Enter in a name for theother pool (for example, **SDDPool**) and click **Next**. Optionally, you can also enter a description for the pool.
   b. Select **Extreme Performance Tier** under **Tier** for the tier type (drive type) and click **Change**.
   c. Choose the RAID type and from the drop down, select the RAID size, and click **OK**.

> **Note:** Raid 5 (4+1) RAID Configuration is different then Capacity Tier.

Task 3 - Create LUNS



1. From **Storage** section, click **Block** > (Add) to launch the **Create LUN Wizard**.

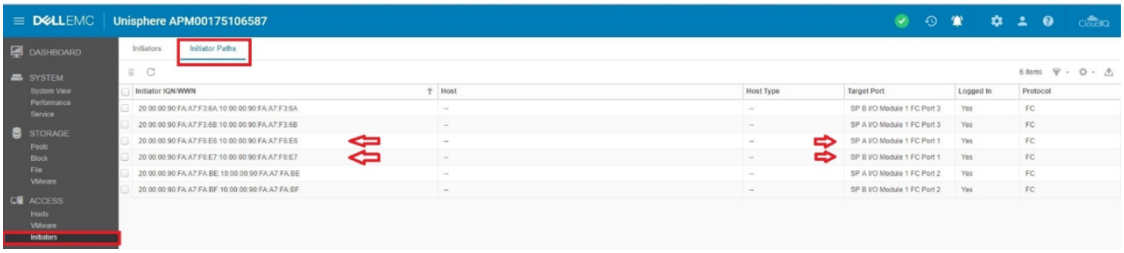


The table below list all of the possible LUNS you may need to create. The ConIndex is the only LUN you need to assign to the SSD Pool. Make sure that the LUN sizes do not exceed what is listed below.

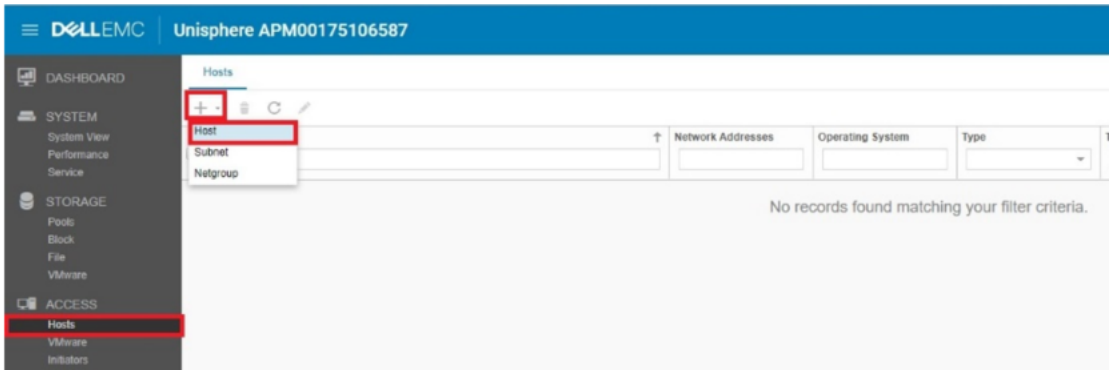
DecoderLarge01	75 TB orLess	NL Pool	No
DecoderSmall01	20 TB or Less	NL Pool	No
Concentrator01	15 TB or Less	NL Pool	No
Archiver01	75 TB or Less	NL Pool	No
ConIndex01	3 TB or Less	**SSD Pool**	No

2. Enter the LUN Name from the list. Optionally, you can enter a description of LUN.
3. Select the appropriate pool from the list on the drop-down menu.
4. Deselect the **Thin** checkbox (These will be fully provisioned LUNs).
5. Select **Next** to proceed to the next menu.

6. Click **Next** until you get to the summary section.
7. Verify that the **Name**, **Pool**, **Size** and **Thin** selections are all correct.
8. Click **Finish** to complete LUN creation.



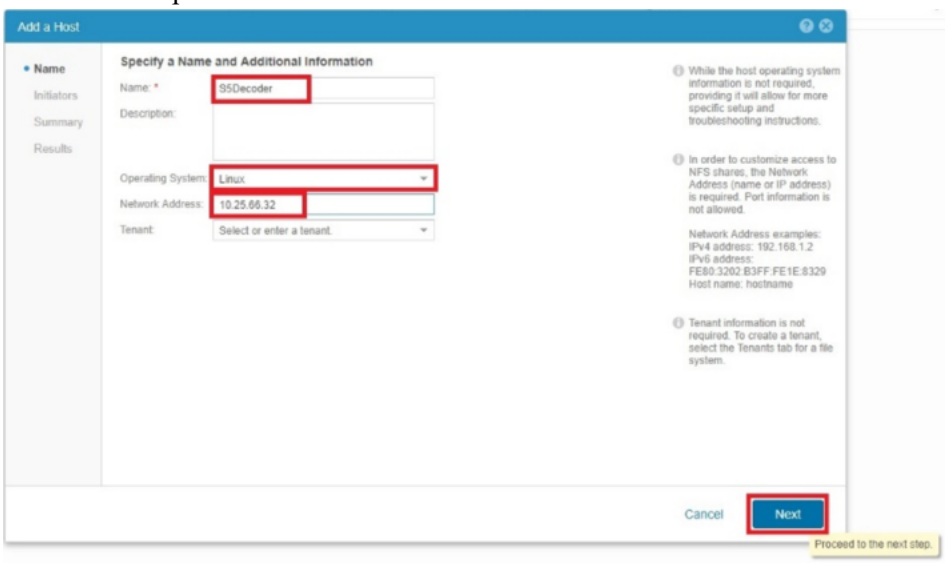
9. Repeat steps 2- 8 for the remaining LUN creations.



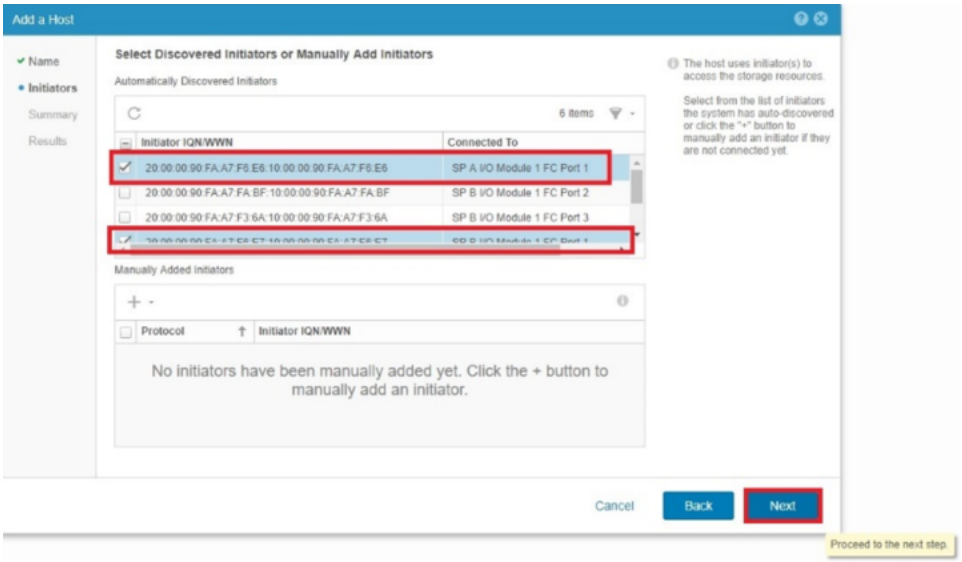
Task 4 - Register Hosts

Before proceeding, record the hostname and IP address of the Head Unit and make sure that the HBAs in the head unit are properly cabled to the UNITY.

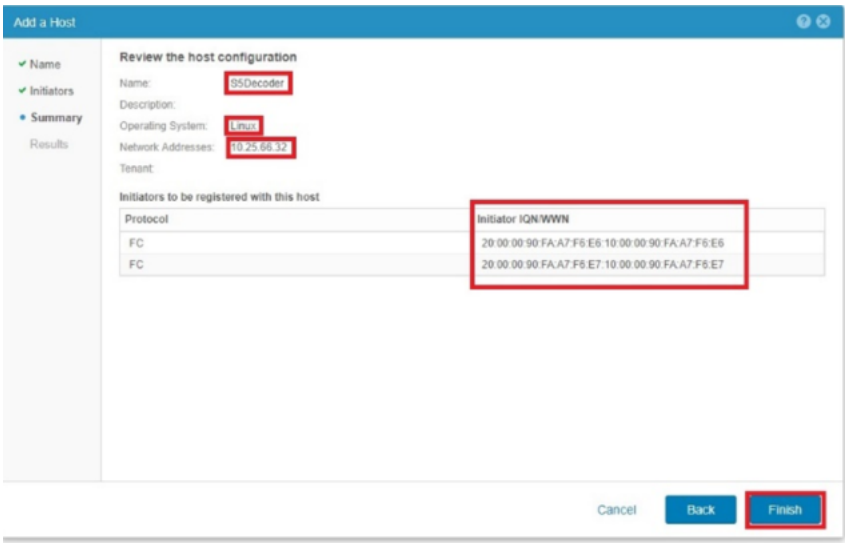
1. From the Access section, click **Initiators**.
2. Under the **Initiator Paths** tab, make sure that the correct HBAs are selected that you will use to register the Head Unit.
   You should see two initiators per Head Unit. This represents the fiber connection from port 1 to SPA and port 1 to SPB. If you have multiple head units, the easiest method is to power each down and then power them up and register one by one.



3. From the **Access** section, click **Hosts** > (Add) > **Host** to add a host configuration.

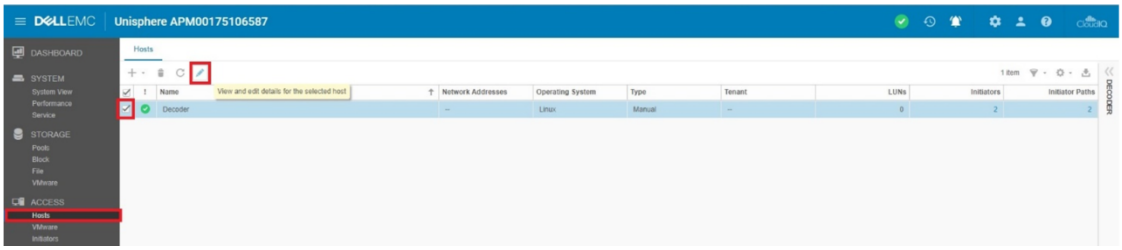


4. Enter the Hostname of the Head Unit.
5. Under **Operating System**, select **Linix** from the-drop down menu.
6. Enter the IP address of the Head Unit.

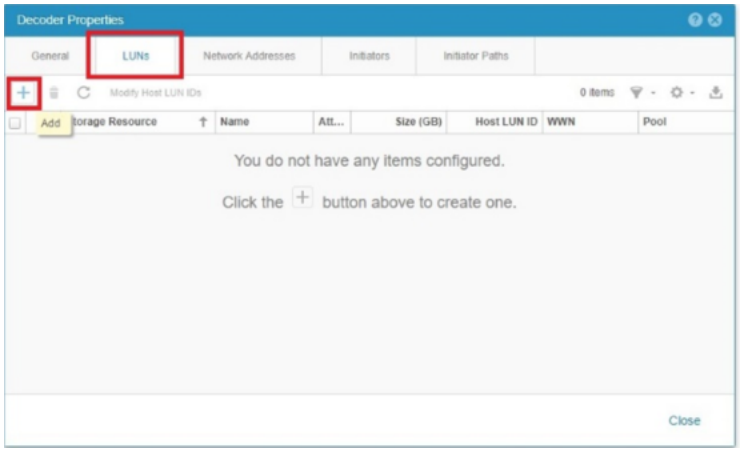


7. Click **Next** to proceed to the next section.

8. In the Initiators section, select the two initiators that correspond to the correct port associated with the Head Unit and click **Next** to proceed.

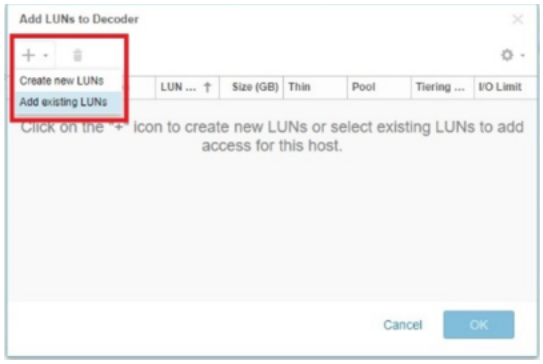


9. Make sure that the **Name**, **OS**, **IP** and **WWNs** are correct and click **Finish**.

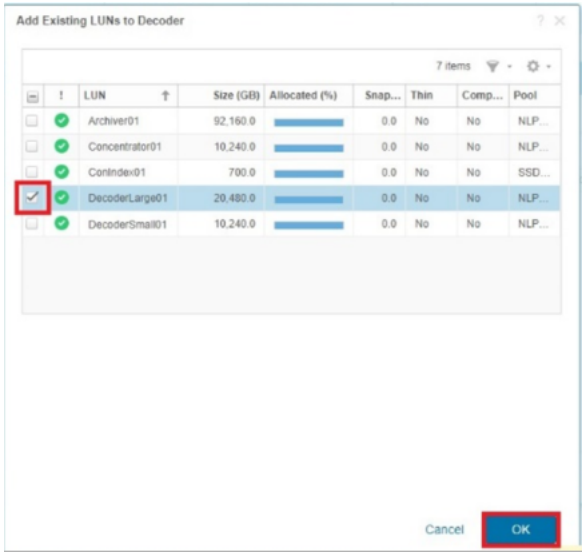


10. Repeat steps 2-9 for all Head Units.
11. In the Initiators section, select the two initiators that correspond to the correct port associated with the Head Unit. Then click “Next” to proceed.

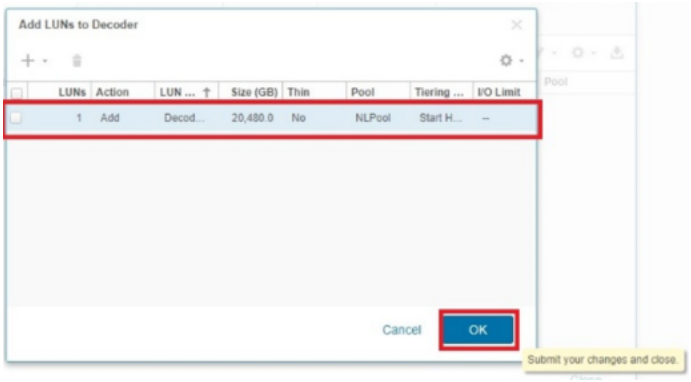
Task 5 - Assign LUNS to Hosts



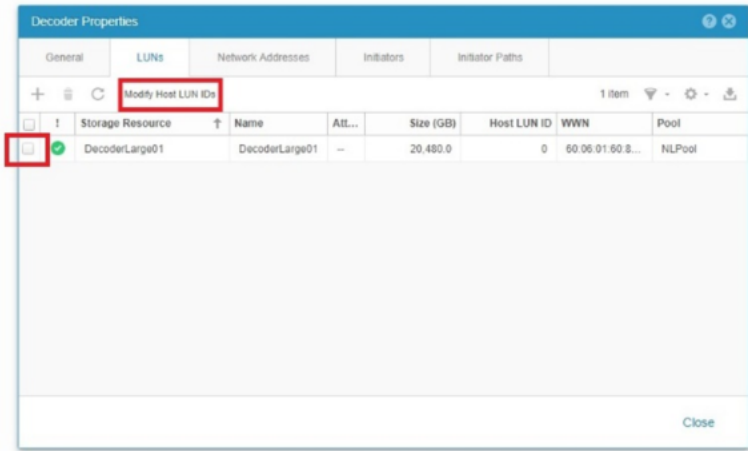
1. From the **Access** section, click **Hosts**, select the head unit (for example, **Decoder**) and click  (edit) to view and edit details for the selected host.



2. In the **Properties** section, select the **LUNS** tab and click (Add icon).



3. From the **Add LUNs to <Host>** popup, click > **Add existing LUNs**.



4. Select the LUN to add to the Head Unit and **OK**.

5. Make sure that the correct LUN was added to the host and click **OK**.

6. (OPTIONAL) If you need to modify the HLU (Host LUNN Unique ID):
   a. Select the LUN you want to change.
   b. Click **Modify Host LUN IDs**.

7. Click  (edit), change the HLU to the number you want, and click **OK**.

Task 6 - Install PowerPath

1. Make sure that the Emulex ports on the Decoder host are attached to the Unity.
2. Log in to `root` on the Decoder attached to the Unity with the `admin` credentials.
3. Install PowerPath and register the Dell EMC PowerPath licenses for Unity hardware.
   `yum install DellEMCPower.LINUX-6.4.0.00.00-95.RHEL7.x86_64.rpm`

> **Note:** When you purchase an NetWitness Provided Unity, PowerPath licenses are sent to you. You can download PowerPath at support.dell.com.

Note: It is possible that the RPM downloaded from Dell EMC is not signed with a cert that the NetWitness device has available, which can cause the installation to fail with the `package not signed` error. Run the yum install with the `--ngpgcheck` option to enable the software to install.

4. Make sure that all the PowerPath connections are correct.
   `powermt display dev=all`
   The following output is an example of valid PowerPath connections.

```
============================================================================
--------------- Host ---------------   - Stor -   -- I/O Path --   -- Stats ---
###  HW Path                I/O Paths    Interf.   Mode     State   Q-IOs Errors
============================================================================
  15 lpfc                    sde        SP A6     active   alive       0      0
  18 lpfc                    sdg        SP B6     active   alive       0      0

Pseudo name=emcpowerb
Unity ID=APM00174407815 [Host_62]
Logical device ID=600601609D90460069967 45A46B60AB6 [DecoderSmall01]
state=alive; policy=CLAROpt; queued-IOs=0
Owner: default=SP A, current=SP A       Array failover mode: 4
============================================================================
--------------- Host ---------------   - Stor -   -- I/O Path --   -- Stats ---
###  HW Path                I/O Paths    Interf.   Mode     State   Q-IOs Errors
============================================================================
  15 lpfc                    sdd        SP A6     active   alive       0      0
  18 lpfc                    sdf        SP B6     active   alive       0      0
```

5. Verify that the PowerPath license is installed using the `emcpreg` command.

```
[root@NWAPPLIANCE24932 ~]# emcpreg -list
Key BQPO-DB4M-VFC2-Q24R-ML9Z-EQTU
 Product: PowerPath
 Capabilities: Al
```

6. Add the following string to the `/etc/lvm/lvm.conf` file to filter the LVM (Logical Volume Manager) so that it ignores duplicate volumes.

```
filter = [ "a|^/dev/sda2$|", "a|^/dev/sdb1$|",
"a|^/dev/emcpower.*|", "r|.*/|" ]
```

7. Run the following commands in this order:
   a. `systemctl enable PowerPath.service`
   b. `systemctl start PowerPath.service`
8. Reboot the Decoder.
9. Complete the instructions in Configure Storage Using the REST API to complete storage configuration.

Migrate Data to Another Storage Type

This section provides two options for moving data from DACs to PowerVaults:

Migrate Data Using the Warm and Hot Tier Option

Move Data From DAC to PowerVault

Refer to the Hardware Setup Guides on NetWitness Community for detailed instructions for setting up NetWitness Platform host and storage hardware.

Migrate Data Using the Warm and Hot Tier Option

In this procedure, you configure a warm tier for the DAC's, so that they do not write any new data. The warm tier continues to be available for analyst operations. You configure the PowerVaults as a hot tier, where new data can be written and available for analysts. When the required data retention is available on the hot tier, the warm tier can be decommissioned.

To set up the warm and hot tiers, perform the following tasks:

- Stop the Service
- Set Up PowerVault
- Configure The Mount Points
- Set up Warm and Hot Tiers
- Decommision the DAC

Stop the Service

1. Log in to the NetWitness Platform user interface.
2. Go to  (Admin) > **SERVICES** and select the service (for example, Log Decoder).
3. Click  > **View** > **Config**, and under Log Decoder Configuration, clear the **Capture Autostart** checkbox, and then click **Apply**.
4. In the menu bar, click the down arrow next to **Config**, select **System**, and at the top of the panel, click **Stop Capture**.
5. From the command line interface in NwConsole, stop the service by running the following command:
   `systemctl stop nwlogdecoder`

Set Up PowerVault

1. Go to the REST API for the service by entering the IP address of the service, in this example, the Log Decoder. For example, `172.16.0.1:50106`.
2. Click the asterisk (*) next to the service. for example, **decoder (*)**.

3. Under **Properties for /decoder**, click the down arrow, select **RaidNew** and enter the following parameters, entering the name of the service for `scheme`. In this example, we use `logdecoder`.
   ```
   controller=1 enclosure=75 scheme=logdecoder-hotspare commit=1
   ```
4. Click **Send**.
5. To configure the partitions, click the down arrow again, select **PartNew**, and enter the following parameters,
   ```
   name=sde service=logdecoder volume=logdecodersmall commit=1
   ```
6. Click **Send**.
7. With **PartNew** still selected, enter the following parameters:
   ```
   name=sdf service=logdecoder volume=logdecoder commit=1
   ```

   Note: To validate the partition definitions before committing them, you can enter these parameters without `commit=1`, and click **Send**. After you validate the parameters, add `#commit=1` and then click **Send** to commit the parameter settings.

Configure The Mount Points

1. On the NwConsole at the root level of the service (for example, the Log Decoder), run `df -h`.
   A list of mounted partitions is displayed.
2. Unmount all of the old storage points of the DAC and copy all the data to the Log Decoder. At the root level, run the `umount` command and the path name of each partition. You can concatonate the path names, for example:
   ```
   umount /var/netwitness/logdecoder/index
   /var/netwitness/logdecoder/sessiondb /var/netwitness/logdecoder/metadb
   /var/netwitness/logdecoder/packetdb /var/netwitness/logdecoder/index0
   /var/netwitness/logdecoder/sessiondb0 /var/netwitness/logdecoder/metadb0
   /var/netwitness/logdecoder/packetdb0
   ```
3. Temporarily mount the petitions in the `decoroot` folder in the `/mnt` directory in order to access the files. For example:
   ```
   mount /dev/mapper/logdecodersmall-decoroot /mnt/decoroot/
   ```
4. Copy the contents of decoroot from /mnt to /var/netwitness/logdecoder, answering Y (yes) to the prompts:
   ```
   cp -R statdb /var/netwitness/logdecoder/
   ```
5. Unmount `/mnt/decoroot`.
   ```
   umount /mnt/decoroot
   ```
6. Comment out `decoroot` from `/etc/fstab`, as this was on the DAC and the DAC will be decomissioned.
   ```
   #/dev/logdecodersmall/decoroot
   /var/netwitness/logdecoder/xfs/noatime,nosuid 1 2
   ```
7. Mount all the remaining file systems.
   ```
   mount -a
   ```
8. Start the nwlogdecoder service (with capture still disabled).
   ```
   systemctl start nwlogdecoder
   ```

Set up Warm and Hot Tiers

Caution: Before you set up warm and hot tiers, be sure that you know the right warm and hot tier entries for each collection so that you can set them up accurately.

1. Go to (Admin) > **SERVICES** and select the service (for example, Log Decoder).
2. For the Log Decoder service, click > **View** > **Explore**, and go to **database** > **config**.
   a. Copy the contents of `meta.dir` and paste them to `meta.dir.warm` as shown in the following example:

   b. In the same way, copy the packet database in `packet.dir` to `packet.dir.warm`.
   c. Copy the session database in `session.dir` to `session.dir.warm`.
3. Go to **index** > **config** and copy `index.dir` to `index.dir.warm`.

Note that the new volumes end in 0, so PowerVault will write to the directories ending in 0, for example:

```
[root@logdecoder ~]# df -h
Filesystem                              Size  Used Avail Use% Mounted on
/dev/mapper/netwitness_vg00-root         30G  3.3G   27G  11% /
devtmpfs                                 63G     0   63G   0% /dev
tmpfs                                    63G   12K   63G   1% /dev/shm
tmpfs                                    63G   34M   63G   1% /run
tmpfs                                    63G     0   63G   0% /sys/fs/cgroup
/dev/sda1                              1019M   96M  924M  10% /boot
/dev/mapper/netwitness_vg00-nwhome       3.3T  1.2G  3.3T   1% /var/netwitness

tmpfs                                     13G     0   13G   0% /run/user/0
/dev/mapper/logdecodersmall-index         30G   54M   30G   1% /var/netwitness/logdecoder/index
/dev/mapper/logdecodersmall-sessiondb    600G  733M  599G   1% /var/netwitness/logdecoder/sessiondb
/dev/mapper/logdecodersmall-metadb       4.9T   11G  4.9T   1% /var/netwitness/logdecoder/metadb
/dev/mapper/logdecoder-packetdb           31T   12G   31T   1% /var/netwitness/logdecoder/packetdb
/dev/mapper/logdecodersmall0-index        30G   33M   30G   1% /var/netwitness/logdecoder/index0
/dev/mapper/logdecodersmall0-sessiondb   600G   34M  600G   1% /var/netwitness/logdecoder/sessiondb0
/dev/mapper/logdecodersmall0-metadb       21T   34M   21T   1% /var/netwitness/logdecoder/metadb0
/dev/mapper/logdecoder0-packetdb          86T   35M   86T   1% /var/netwitness/logdecoder/packetdb0
[root@logdecoder ~]#
```

Update the Decoder configuration with the path to the PowerVault mount by adding a 0 to the path.

1. In the /database/config column, right-click **meta.dir** and click **Properties**.
2. In **Properties for logdecoder**, select **set**, and in **Parameters**, enter `value="var/netwitness/logdecoder/metadb0=4.58 TB' and add force=true`, as shown in this example, and then click **Send**.

3. Repeat step 2 for **session.dir**, **packet.dir**, and **index.dir**. Do not be concerned if the size is the same as the DAC in "=xx GB". This will be updated in the next step.

   Note: We are only putting the PowerVault paths into the *.dir values.

4. Update the sizes for the live PowerVault volumes.
   a. In the Log Decoder Explore view, in the left panel, right-click **database** and click **Properties**.
   b. Select **reconfig** and in **Parameters**, enter `update=1` and click **Send**.
   c. Repeat steps a and b for **index**.
5. Restart the service.
   `systemctl restart nwlogdecoder`

6. Go to  (Admin) > **SERVICES**, select the Log Decoder service, and click  > **View** > **System**.
7. Click **Start Capture**.
8. Go to the **Config** view, select **Capture Autostart**, and click **Apply**.
9. Reboot the host.

Decommision the DAC

When the DAC data has aged, you should go back into the Explore view and remove all of the *.dir.warm configurations for session, meta, packet and index. You can determine when the DAC data has aged by going to the Log Decoder  > **View** Explore view. Since we have a hot and warm tier, there are two sets of configuration stats that you need to be aware of. For example, for a packet Decoder, when you look at the packet oldest time in `packet.oldest.file.time`, look at the packet.oldest.file.time.hot value and if you see that your DAC had storage up until 30 days ago you can take your DAC offline and decommission it.

These are the basic steps for decommissioning a DAC. NetWitness recommends that you work with your Customer Support representative when you decommission your DACs.

1. Go to  (Admin) > **SERVICES** and select the service (for example, Log Decoder).
2. Click  > **View** > **Config**, and under Log Decoder Configuration, clear the **Capture Autostart** checkbox, and then click **Apply**.
3. In the menu bar, click the down arrow next to **Config**, select **System**, and at the top of the panel, click **Stop Capture**.
4. From the commandline interface in NwConsole, stop the service by running the following command:
   `systemctl stop nwlogdecoder`
5. Unmount the warm tier. At the root level, run the `umount` command and the path name of each partition. You can concatonate the path names, for example:
   ```
   umount /var/netwitness/logdecoder/index
   /var/netwitness/logdecoder/sessiondb /var/netwitness/logdecoder/metadb
   /var/netwitness/logdecoder/packetdb /var/netwitness/logdecoder/index0
   /var/netwitness/logdecoder/sessiondb0 /var/netwitness/logdecoder/metadb0
   /var/netwitness/logdecoder/packetdb0
   ```
6. Comment out all the old DAC dbs from `/etc/fstab`, so that only the PowerVault dbs remain.
7. Start the service.
   `systemctl start nwlogdecoder`
8. In the user interface, go to  (Admin) > **SERVICES** and select the Log Decoder service.
9. Click  > **View** > **Explore** and remove the warm tier configurations:
   a. In **database** > **config**, delete the content for `meta.dir.warm`, `packet.dir.warm`, `session.dir.warm`.

b. In **index** > **config**, delete the content for `index.dir.warm`.

c. Go to the **Config** view, select **Capture Autostart**, and click **Apply**

d. Go to the **System** view and click **Start Capture**.

10. Restart the service.
    `systemctl restart nwlogdecoder`

The DAC is now unmounted, and is no longer configured in the Decoder for warm storage and is ready to be wiped clean.

1. Remove the logical volume. Run `lvscan` to get a list of the logical volumes.
2. Run `lvremove` on the old logical volumes, for example:
   `/dev/logdecodersmall/decoroot /devlvremove /dev/logdecodersmall/index /dev/logdecodersmall/sessiondb /dev/logdecodersmall/metadb /dev/logdecodersmall/packetdb`
3. Remove the volume groups. Run `vgscan` to get a list of volume groups.
4. Run `vgremove` on the old volume groups (be careful not to remove any volume groups that end in 0, as they are PowerVault).
5. Run `pvscan` to view block devices that are freed up.
6. When the DAC has been successfully removed, reboot the host.

Move Data From DAC to PowerVault

The following procedure describes how to move data from DAC to PowerVault. Before you move data from 2 DACs to 2 PowerVaults, a table, similar to the following table, is displayed if you run the `pvs` (Physical Volume Size) command from the Decoder Linux console (or SSH to the Decoder) with 2 DACs attached and configured to the Decoder. The column headings are Physical Volume (PV), Volume Group(VG), Linux Format (Fmt), Linux Attribute (Attr), Physical Volume Size (PSize), and Physical Volume Free Space(PFree).

PV	VG	Fmt	Attr	PSize	PFree
/dev/sda2	netwitness_vg00	lvm2	a--	<930.00g	0
/dev/sdb1	netwitness_vg00	lvm2	a--	<1.82t	0
/dev/sdc	decodersmall	lvm2	a--	<5.46t	0
/dev/sdd	decoder	lvm2	a--	<27.29t	0
/dev/sde	decodersmall0	lvm2	a--	<5.46t	0
/dev/sdf	decoder0	lvm2	a--	<27.29t	0

Complete the following steps to move data from a DAC to a PowerVault.

1. Attach two PowerVaults to a separate PERC controller on the Decoder.
2. Create the devices.
   a. Open a Browser and specify the ip-address of the Network Decoder and port **50106** to access the REST tool.
   b. Log in with the `admin` account credentials.

   c. Click on the `(*)` next to **appliance** to access the REST command set.
   d. Run `raidList` to display the Controller/Enclosure combination with the new PowerVault enclosures.
   In the following example, the output shows **dev/sdg** and **/dev/sdh** on **Controller 2, Enclosure 246**.

```
Controller 2, Enclosure 246
    Vendor:  DELL
    Model:   MD1400
    In Use:  true
    Drives:  10.691 TB x 12
    Devices: sdg
             sdh
```

   e. Under **Properties for /appliance**, select `raidNew`, specify `controller=<PowerVault-controller-id> enclosure=<PowerVault-enclosure-id> scheme=decoder-hotspare preferSecure=false`, and click **Send**.

> **Note:** You specify **preferSecure=false** if the PowerVault drives are not SED drives. If PowerVault drives are SED drives and you do not want to encrypt them you specify **preferSecure=false**. You must specify **preferSecure=true** if PowerVault drives are SED drives and you want to encrypt them.

3. Go to the Decoder Linux console or SSH to the Decoder and run the following commands.

```
parted -s /dev/sdg mklabel gpt
parted -s -a optimal /dev/sdg mkpart LVM 0% 100%
pvcreate -f /dev/sdg
parted -s /dev/sdh mklabel gpt
parted -s -a optimal /dev/sdh mkpart LVM 0% 100%
```

```
pvcreate -f /dev/sdh
```

If the volume is created successfully, the following message is displayed.

```
Physical volume "/dev/sdg" successfully created
```

Note: Repeat this step for every block device. The block device names may be different depending on how many enclosures per perc card slot.

4. Run the following command strings to extend the DAC volume group (**decoder**, **decodersmall**) to the Powervault Physical volume.

```
vgextend decoder /dev/sdg
vgextend decodersmall /dev/sdh
```

5. Run the following command strings to move the data from the DAC to the PowerVault. In this following command string, the DAC is **/dev/sdc** and the PowerVault is **/dev/sdg**.

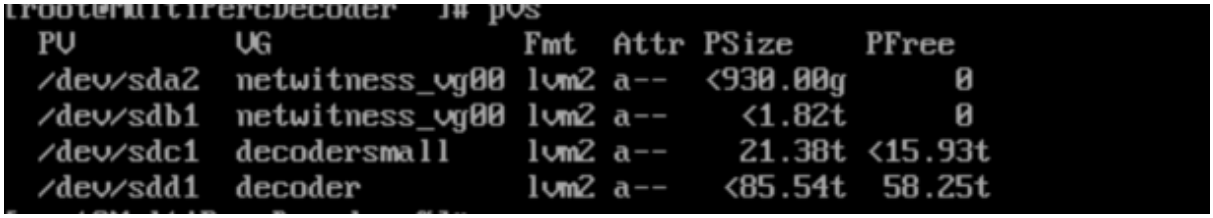
```
pvmove /dev/sdc /dev/sdg
pvmove /dev/sdd /dev/sdh
```

Note: 1.) The `pvmove` command synchronizes data across volumes so that NetWitness can continue ingesting or aggregating data while the migration is executing. You can run the `pvmove` command multiple times if it fails. 2.) Depending on the amount of data on the drives, the move can take a long time complete depending on the amount of data. For example, in a test, it took four hours to move one TB of data.

6. After the move is complete, run the following commands to reduce and remove the DAC drive.

```
vgreduce decoder /dev/sdc
pvremove /dev/sdc
vgreduce decodersmall /dev/sdd
pvremove /dev/sdd
```

7. Detach the physical connections from the DACs to the host.



8. Verify that the Physical volumes are moved from the DACs to the PowerVaults.

   a. Reboot the host.

   ```
   reboot
   ```

   b. Verify that the **/etc/fstab** file is correct.

   c. Run the `pvs` command and make sure that the **PSize** and **PFree** values are correct on the PowerVault.

Data on PowerVault After Move from DAC

After you move data from 2 DACs to 2 PowerVaults, a table, similar to the following table, is displayed if you run the `pvs` (Physical Volume Size) command from the Decoder Linux console (or SSH to the Decoder) with 2 PowerVaults attached and configured to the Decoder. The column headings are Physical Volume (PV), Volume Group(VG), Linux Format (Fmt), Linux Attribute (Attr), Physical Volume Size (PSize), and Physical Volume Free Space(PFree).

PV	VG	Fmt	Attr	PSize	PFree
/dev/sda2	netwitness_vg00	lvm2	a--	<930.00g	0
/dev/sdb1	netwitness_vg00	lvm2	a--	<1.82t	0
/dev/sdc1	decodersmall	lvm2	a--	21.38t	<15.93t
/dev/sdd1	decoder	lvm2	a--	<85.54t	58.25t

Appendix A. How NetWitness Platform Hosts Store Data

In most deployments, NetWitness Platform Decoders, Log Decoders, Concentrators, Archivers, and Hybrid hosts require external storage to house their data. Each host uses the external storage in different ways and with different expectations on throughput and performance of the external storage. Some hosts have a higher occurrence of sequential writes and some hosts have a higher occurrence of random reads and writes.

Decoder Hosts

Log Decoders and Network Decoders capture data and parse meta. The difference between these two hosts is in the type of data they capture:

- Log Decoder captures logs.
- Network Decoder captures packets.

Both Log Decoders and Network Decoders parse out meta data from the raw captured traffic. The meta data is then aggregated to a Concentrator for indexing. The host requires storage to house the raw payload data (raw packets or raw logs) and a cache for the meta extracted during data capture for Concentrator aggregation.

Your retention requirements is a key factor in determining the amount of storage you need for the raw packets or raw logs. In most deployments, you add storage over time based on increased retention requirements and increased capture rates. The storage for the raw data must support a high amount of sequential writes with random reads. Especially in the case of higher speed Network Decoder environments, it is recommended to have a minimum of two partitions exposed to the host to support the throttling between partitions for reads and writes.

The meta cache on a Decoder is generally fixed in size but you can expand it to support additional cache the possible loss of connectivity between the Decoder and a corresponding Concentrator. The meta cache must support a random IOPS rate for sustained writes from the Decoder of meta extracted and the corresponding reads from the Concentrator as meta is aggregated to a Concentrator.

Concentrator Host

A Concentrator aggregates and indexes the meta data from a Decoder. Both the meta and index storage needs are scaled based on your NetWitness Platform deployment retention requirements. Similar to raw data stored on the Decoders, you may need to increase the storage for both meta data and index data over time to meet your retention requirements.

The meta storage houses all meta data extracted from either a Network Decoder or Log Decoder. Although the ratio of how much meta is extracted may change, the expectations for performance against meta storage is the same for both packet capture and log capture environments. The meta storage must support a sustained amount of sequential writes with random reads of meta data.

The index storage houses the live index generated from the meta data aggregated to a Concentrator. The size of the index is directly related to the size of the meta store. In addition to supporting IOPS for sustained writes, the index also needs to support a much higher rate IOPS for reads than meta based on interactive queries run through analyst interaction and reports and alerts.

Archiver Host

The Archiver host requires a single partition for both meta and raw log storage. The storage pool deals primarily with sequential writes for long term data written from a Log Decoder or Network Decoder and random reads for reports and analysis.

Hybrid Hosts

A Hybrid hosts two or more services on a single host. For example:

- A Network Hybrid hosts both the Decoder and Concentrator services handling packets exclusively. It captures packet data and indexes this data to the Concentrator service. Expectations for storage performance match what is outlined for a dedicated Network Decoder host and dedicated Concentrator host.
- A Log Hybrid hosts both the Log Decoder and Concentrator services handling logs exclusively. It captures log data and indexes the data to a Concentrator service. Expectations for performance match what is outlined for a dedicated Log Decoder and dedicated Concentrator.
- An Endpoint Log Hybrid hosts the Endpoint Server, Log Decoder, Concentrator, Log Collector, and Endpoint Broker services. It collects and manages endpoint (host) data from Windows, Mac, and Linux hosts, collects log files and Windows logs from Windows hosts, and generates metadata to correlate endpoint data with sessions from other events sources, such as logs and packets.

Options for SAN Configurations

If you want to use a Storage Area Network (SAN) , use the same basic drive groups and partition organization that you use for the other NetWitness storage devices. Depending on the SAN configuration and overhead, SAN configurations may require more enclosures and drives to operate with the same performance as on PowerVault or DAC. When deciding whether to use SAN, PowerVault, or DAC, any additional overhead on the SAN will be important to determine the minimum storage required.

Performance Recommendations

NetWitness recommends that Packet and Log Decoders receive two LUNs or Block Devices, one for Packet data, the other for all other databases. This allows you to segregate the high-bandwidth Packet Database from the other databases so they do not compete for I/O bandwidth with other activity.

Concentrators require a separate SSD-based index volume for best performance. You must house this index volume on a different RAID group than the Concentrator Meta database volume, which you can stored on NL-SAS. Archivers can use a single large NL-SAS storage volume per appliance.

Enable Security on SED Capable Drive groups on Host with a mix of SED and NON SED Drives

The encryptSedVd.py may fail to identify the SED Capable Virtual Drives when there is mix of both SED and NON-SED drives on the appliance. The below steps are applicable when both SED and NON-SED capable virtual drives exist on the host.

1. SSH to the appliance and enable security on the PERC H740 (mini) Adaptor. The controller number for this adaptor is **0**. The PERC H840 Adaptor is shown as **1**.
   To list all the controllers on the appliance:
   `/opt/MegaRAID/perccli/perccli64 show | egrep -A3 'Model'`
   The first column (**Ctl**) lists out the controller index on the appliance. In this case, the controller '**0**' corresponds to '**PERC H740 Mini**' and controller '**1**' corresponds to '**PERC H840 Adaptor**' . The columns '**DGs**' and '**VDs**' displays the virtual drives and drive groups on the controller.

```
[root@116Decoder perccli]# /opt/MegaRAID/perccli/perccli64 show | egrep -A3 'Model'
Ctl Model          Ports PDs DGs DNOpt VDs VNOpt BBU sPR DS EHS ASOs Hlth
--------------------------------------------------------------------------
  0 PERCH740PMini       8  10   3     0   3     0 Opt On  -  N      0 Opt
  1 PERCH840Adapter     8  12   1     0   1     0 Opt On  -  N      0 Opt
[root@116Decoder perccli]#
```

2. To enable the security on the 'PERC H740 (mini) Adaptor', for example, Controller '**0**', execute the following command:
   `/opt/MegaRAID/perccli/perccli64 /c0 set securitykey='<SOME_STRING_VALUE>'!' keyid='< SOME_STRING_VALUE >'`
   Example:
   `/opt/MegaRAID/perccli/perccli64 /c0 set securitykey='Netwitness1!' keyid=1`
   `'Netwitness1' is the securityKey and '1' is ID. Preserve both the Key and keyID securely.`

```
[root@116Decoder perccli]# /opt/MegaRAID/perccli/perccli64 /c0 set securitykey='Netwitness1!' keyid='netwitness'
Controller = 0
Status = Success
Description = None

Controller Properties :
=====================

--------------------
Ctrl Method  Result
--------------------
   0 set Key Success
--------------------
```

3. Identify the correct Drive group (DG) / Virtual Drive (VD) corresponding to the SED Capable drives that you are trying to enable security.
   `/opt/MegaRAID/perccli/perccli64 /c0 /vall show | egrep -A5 'DG/VD'`
   Refer to first two and last column to identify the correct Drive Group (DG) / Virtual Drive (VD) correspond to the 6 SED enabled drives. On Series 6 appliances, there is only one DG/VD with **RAID6**. '**NAME**' column can be used to identify the VD/DG. In this case, the DG/VD is '**2**'. Using a combination of '**Type**', '**Name**' and '**Size**' columns (these are defined by the user when the VDs are created above).

```
[root@116Decoder perccli]# /opt/MegaRAID/perccli/perccli64 /c0 /vall show | egrep -A5 'DG/VD'
DG/VD TYPE  State Access Consist Cache Cac sCC     Size Name
------------------------------------------------------------------------
0/0   RAID1 Optl  RW     Yes     RWBD  -   OFF 931.0 GB
1/1   RAID1 Optl  RW     Yes     RWBD  -   OFF 1.818 TB
2/2   RAID6 Optl  RW     Yes     RWBD  -   OFF 8.730 TB Virtual Disk 2
------------------------------------------------------------------------
[root@116Decoder perccli]#
```

4. To turn on Security on the disk group (created out of the 6 SED Capable drives), execute the below command:

```
/opt/MegaRAID/perccli/perccli64 /c0 /d2 set security=on
```

```
[root@116Decoder perccli]# /opt/MegaRAID/perccli/perccli64 /c0 /d2 set security=on
Controller = 0
Status = Success
Description = Success
```

5. Get the Enclosure ID (**EID**) using on the controller '**0**'. In this case, it is '64'

```
/opt/MegaRAID/perccli/perccli64 /c0 /eall show
```

```
[root@116Decoder perccli]# /opt/MegaRAID/perccli/perccli64 /c0 /eall show
Controller = 0
Status = Success
Description = None

Properties :
==========

------------------------------------------------------------------------------
EID State Slots PD PS Fans TSs Alms SIM Port#      ProdID    VendorSpecific
------------------------------------------------------------------------------
 64 OK       10 10  0    0   0    0   1 00 & 00 x8 BP14G+EXP  +
------------------------------------------------------------------------------

EID-Enclosure Device ID |PD-Physical drive count |PS-Power Supply count|
TSs-Temperature sensor count |Alms-Alarm count |SIM-SIM Count

[root@116Decoder perccli]#
```

6. To confirm that the drives / Drive Groups (DG) are **SED Enabled** and **Secured**, run the below command and verify the **SED Capable**, **Secured**, **SED Enabled** flags are set as '**Yes**' for drives in slots 4 (**s4**) through 9 (**s9**).

```
/opt/MegaRAID/perccli/perccli64 /c0 /e64/sall show all | egrep -i '
(Policies/Settings |SED Capable|Secured|SED Enabled)'
```

```
Drive /c0/e64/s0 Policies/Settings :
SED Capable = No
SED Enabled = No
Secured = No
Drive /c0/e64/s1 Policies/Settings :
SED Capable = No
SED Enabled = No
Secured = No
Drive /c0/e64/s2 Policies/Settings :
SED Capable = No
SED Enabled = No
Secured = No
Drive /c0/e64/s3 Policies/Settings :
SED Capable = No
SED Enabled = No
```

```
Secured = No
Drive /c0/e64/s4 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s5 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s6 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s7 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s8 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s9 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
```

Appendix B. Encrypt a Series 6E Core or Hybrid Host (encryptSedVd.py)

NetWitness Series 6E Core and Hybrid hosts have Self-Encrypting Drives (SED). The `encryptSedVd.py` script:

- Validates that the Series 6E host has the correct setup for encryption.
- Encrypts unencrypted drives.

Note: For external storage devices such as PowerVault, refer to "Configure Storage Using the REST API" under "Using the REST API to Configure Storage" for instructions on how to encrypt their SED drives.

The following scenarios are examples of why you would use the `encryptSedVd.py` script.

- You want to know if a physical host has encryption. In this case, if the script determines that the device does not have encryption, it gives you the opportunity to encrypt it.
- You set up a device without encryption and you want to encrypt it.

You will find this script in the `rsa-sa-tools` directory for releases 11.4.0.0 and later. The following directory is for 11.4.0.0.

`rsa-sa-tools-11.4.0.0-xxxx.noarch.rpm`

The following procedure illustrates how to use the script.

1. Log in as `root`.
2. Change the directory to the rsa-sa-tools RPM base directory:

   ```
   cd /opt/rsa/saTools/supportScript/
   ```

3. Execute the following command:

   ```
   OWB_ALLOW_NON_FIPS=1 ./encryptSedVd.py
   ```

   The script tells you if the disks are encrypted or not encrypted.

   - If the drives are encrypted, the script displays the following message.

     ```
     No unencrypted RAID virtual drives with SED physical drives found.
     ```

   - If the drives are not encrypted, the script identifies the unencrypted drives as shown in the following example.

4. If the drives are not encrypted and you want to encrypt them:

   a. Select the drives you want to encrypt with the space bar and press **Enter**.
   The following prompt is displayed.

   b. In the **Enter Passphrase** text box, type the `<passphrase>`, for example `nFreDaW$792`, and press **Tab**.

   c. In the **Verify Passphrase** text box, re-enter passphrase again for validation.

   d. In the **Key ID (optional)** text box, enter an optional ID string for the security key less than 256 characters or press Enter for none.
   The following prompt is displayed.

   e. Select `<Y>` and press **Enter** to confirm that you added the Passphrase.

   f. Submit the following command string to verify that the SED drives are encrypted.
   `/opt/MegaRAID/perccli/perccli64 /c0 show more`
   The following information is displayed. You can see that all four SED drives are encrypted (that is, Y is displayed for each drive in the SED column).

Note: The SED Enabled and Secured label values are set to Yes, if the drives are SED enabled and secured.
To check the drives on controller 0 and enclosure 247 use the below command:
`/opt/MegaRAID/perccli/perccli64 /c1 /e247/sall show all | egrep -i '(Policies/Settings|SED Capable|Secured|SED Enabled)'`

You will find detailed information on `perccli` commands in the Dell PowerEdge RAID Controller CLI Reference Guide (http://l4u-00.jinr.ru/pub/misc/h-w/LSI/dell-sas-hba-12gbps_reference-guide_en-us.pdf).

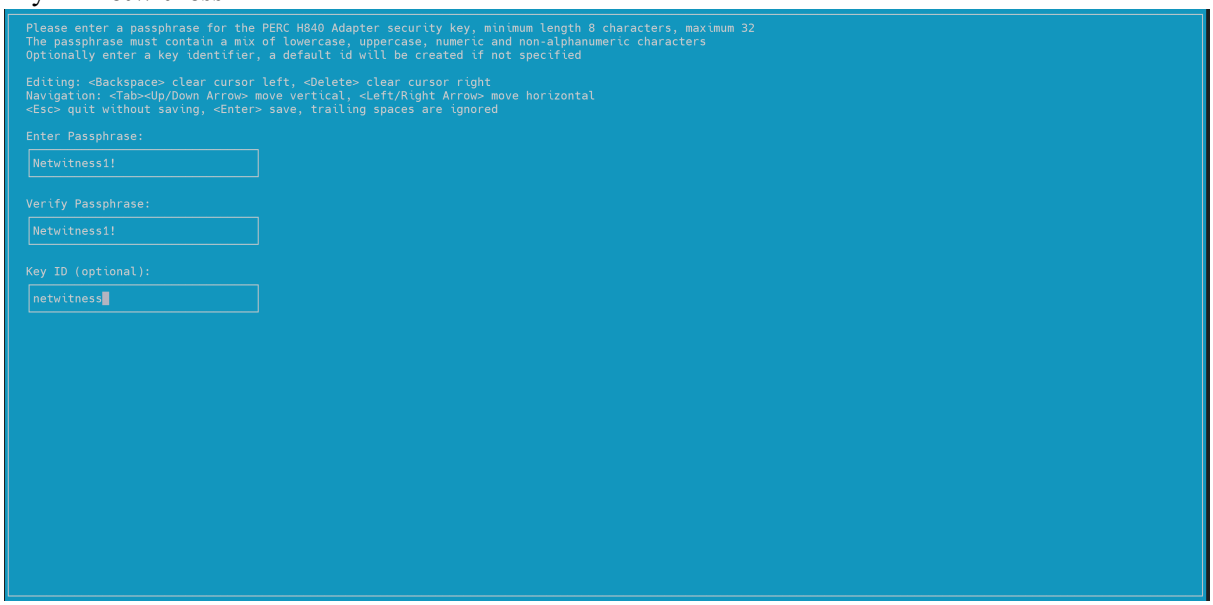
Enable SED on configured Drive Groups

Virtual Drives configured are SED Capable but are NOT SED Enabled.

To enable virtual drives or drive groups using PERC H840 Adaptors (External storage):

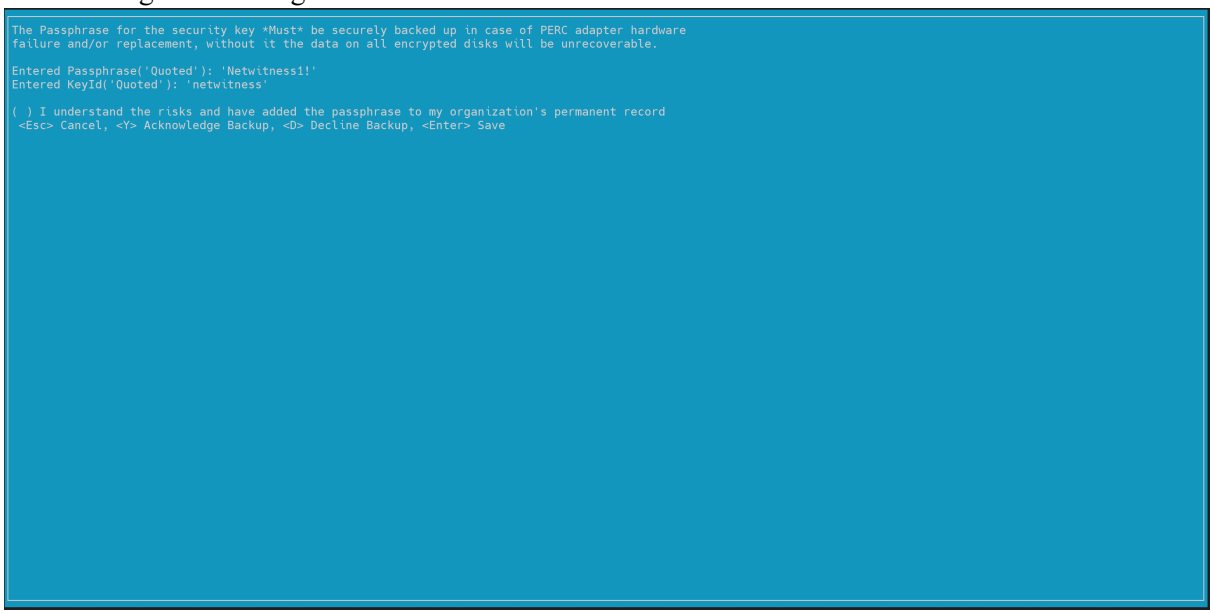
1. SSH to the appliance and run the below script to encrypt the virtual drive (on external storage).

Note: The encryptSedVd.py script turn on the SED feature only on Virtual Drives or Drive Groups on the PERC H840 Adaptors (external storage) and NOT on PERC H740 mini. Refer to Enable Virtual Drives / Drive Groups - PERC H740 (Mini) Adaptors (Internal storage) to enable SED on PERC H740 Mini .



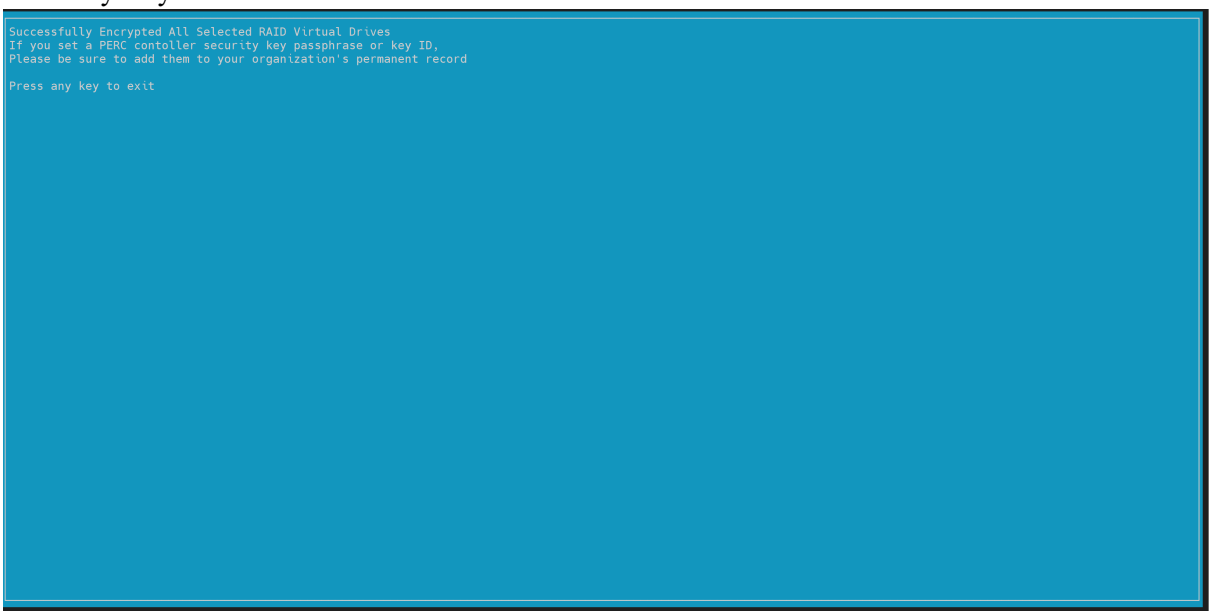
```
OWB_ALLOW_NON_FIPS=true /opt/rsa/saTools/supportScript/encryptSedVd.py
```

2. Select the Virtual Drive and press **Enter**.
   Passphrase screen is displayed.



3. Enter the Passphrase and press **Enter**.
   For Example,

   Passphrase : **Netwitness1!**



keyID: **netwitness**

4. Acknowledge the message and Press **Enter** to Save.

5. Press any Key to Exit.

6. To confirm that the drives are SED Enabled and secured, run the following command and verify the SED Enabled and Secured returns Yes.

```
/opt/MegaRAID/perccli/perccli64 /c1 /e247/sall show all | egrep -i '
(Policies/Settings|SED Capable|Secured|SED Enabled)'
Drive /c1/e247/s0 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s1 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s2 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s3 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s4 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s5 Policies/Settings :
SED Capable = Yes
```

```
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s6 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s7 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s8 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s9 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s10 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s11 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
```

Enable Virtual Drives / Drive Groups - PERC H740 (Mini) Adaptors (Internal storage)

You can enable the SED capability on the Virtual Drive or Drive Groups created out of on-board SED capable drives (in slots 4 through 9 – total of 6 drives) using the percli64 utility. You cannot use `/opt/rsa/saTools/supportScript/encryptSedVd.py` to turn on Security on the Virtual drives on the PERC H740 (mini) Adaptor.

1. SSH to the appliance and enable security on the PERC H740 (mini) Adaptor. The controller number for this adaptor is **0**. The PERC H840 Adaptor is shown as **1**.

To list all the controllers on the appliance run the following command:

```
/opt/MegaRAID/perccli/perccli64 show | egrep -A3 'Model'
```

The first column (**Ctl**) lists out the controller index on the appliance. In this case, the controller **0** corresponds to **PERC H740 Mini** and controller **1** corresponds to **PERC H840 Adaptor**. The columns **DGs** and **VDs** dislpays the virtual drives and drive groups on the controller.

2. To enable the security on the **PERC H740 (mini) Adaptor**, for example, Controller **0**, run the following command:
   ```
   /opt/MegaRAID/perccli/perccli64 /c0 set securitykey=’<String>’!'
   keyid=’<String>’
   ```
   Example:
   ```
   /opt/MegaRAID/perccli/perccli64 /c0 set securitykey='Netwitness1!'
   keyid='netwitness'
   ```
   ```
   'Netwitness1’ is the securityKey and ‘netwintess’ is ID.
   ```
   Make a note of both the Key and keyID securely.
3. Identify the correct Drive group (DG) or Virtual Drive (VD) corresponding to the SED Capable drives that you want to enable security.
   ```
   /opt/MegaRAID/perccli/perccli64 /c0 /vall show | egrep -A5 'DG/VD'
   ```
   Check the first two and last column to identify the correct Drive Group / Virtual Drive correspond to the 6 SED enabled drives that are SED Capable. On Series 6 appliances, there is only one DG or VD with **RAID6** type. Name column can be used to identify the VD or DG. In this case, the DG or VD is **2**. Using a combination of **Type**, **Name** and **Size** columns (these are defined when you created VDs above).
4. To turn on Security on the disk group (created out of the 6 SED Capable drives) for **decodersmall** volume group, run the below command:
   ```
   /opt/MegaRAID/perccli/perccli64 /c0 /d2 set security=on
   ```
5. Get the Enclosure ID (**EID**) using on the controller **0**. In this case, it is **64**
   ```
   /opt/MegaRAID/perccli/perccli64 /c0 /eall show
   ```
6. To confirm that the drives or drive groups are **SED Enabled** and **Secured**, run the below command and verify the **SED Capable**, **Secured**, **SED Enabled** flags are set as **Yes** for drives in slots 4 (s4) through 9 (s9).
   ```
   /opt/MegaRAID/perccli/perccli64 /c0 /e64/sall show all | egrep -i '
   (Policies/Settings |SED Capable|Secured|SED Enabled)'
   ```

Drive /c0/e64/s0 Policies/Settings :

```
SED Capable = No
SED Enabled = No
Secured = No
Drive /c0/e64/s1 Policies/Settings :
SED Capable = No
SED Enabled = No
Secured = No
Drive /c0/e64/s2 Policies/Settings :
SED Capable = No
SED Enabled = No
Secured = No
Drive /c0/e64/s3 Policies/Settings :
```

```
SED Capable = No
SED Enabled = No
Secured = No
Drive /c0/e64/s4 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes

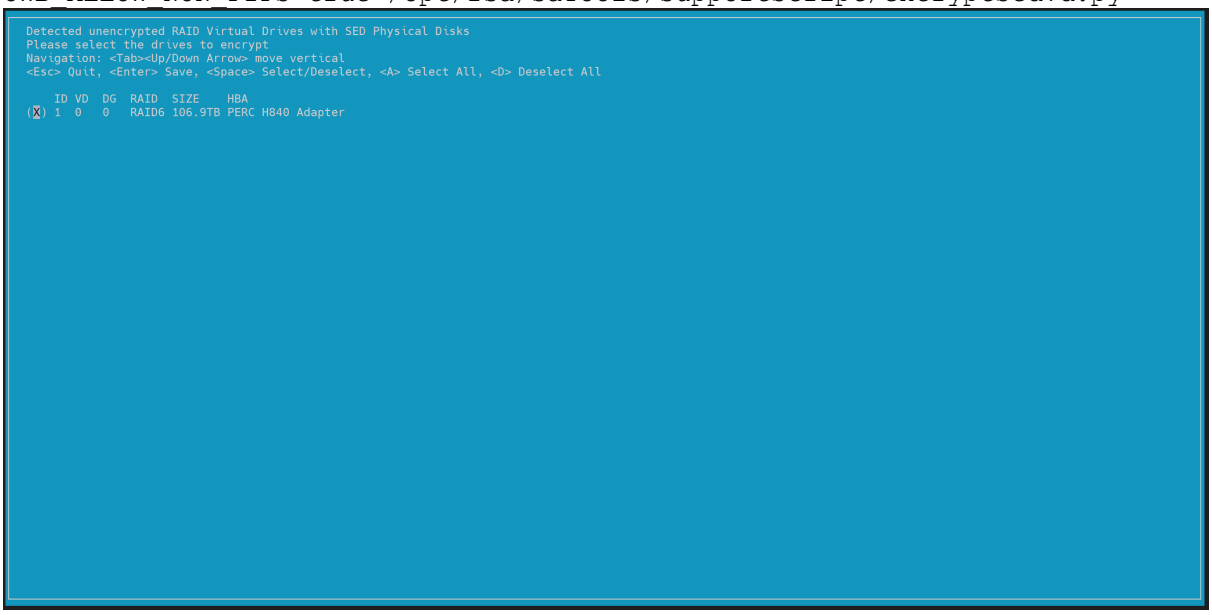
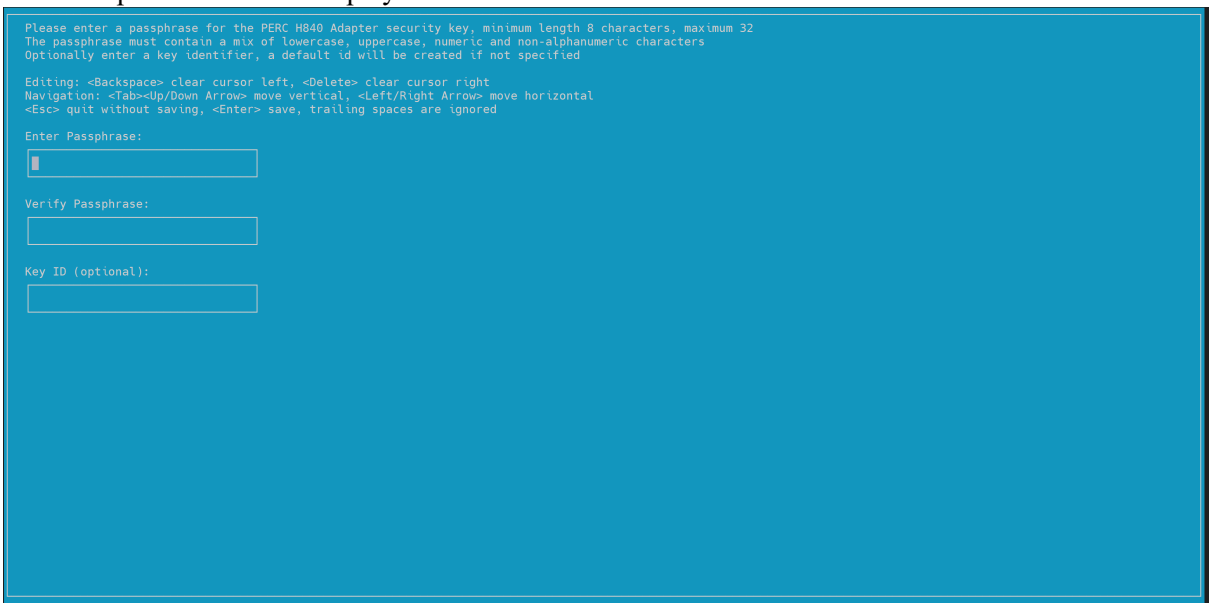
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s6 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s7 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s8 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s9 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
```

Enable SED on configured Virtual Drives/ Drive Groups on Power Vault (PERC 840)



Enable Virtual Drives / Drive Groups - PERC H840 Adaptors

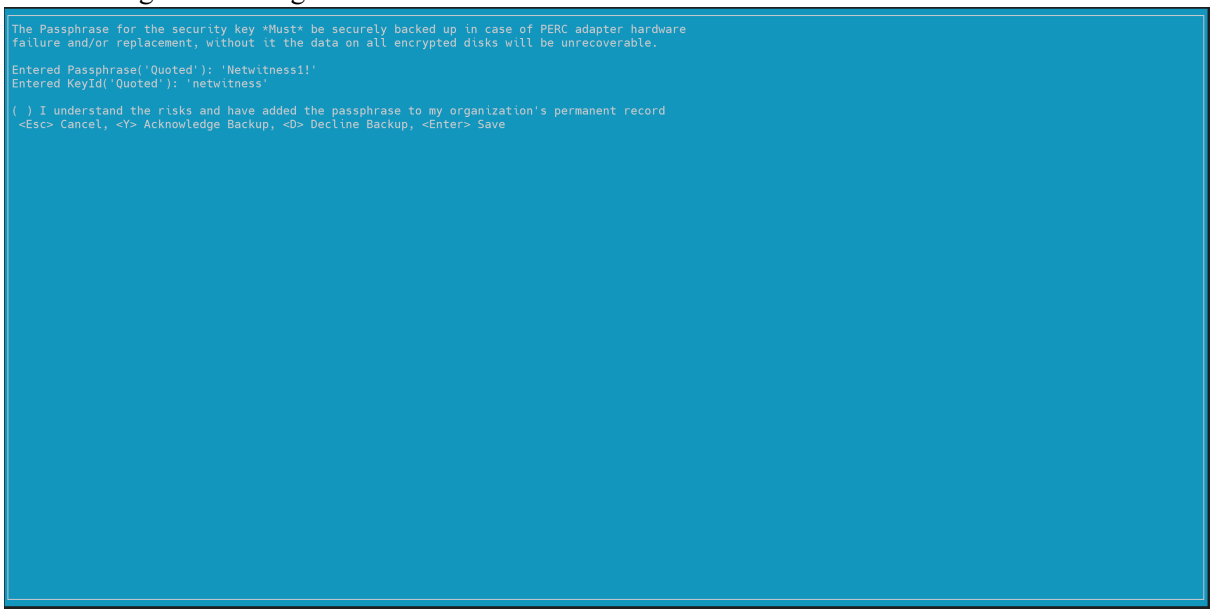
Note: The virtual disk created in *Configure Block Devices for PowerVaults* section in Configure Drive Pack(s) is SED capable but NOT SED Enabled.



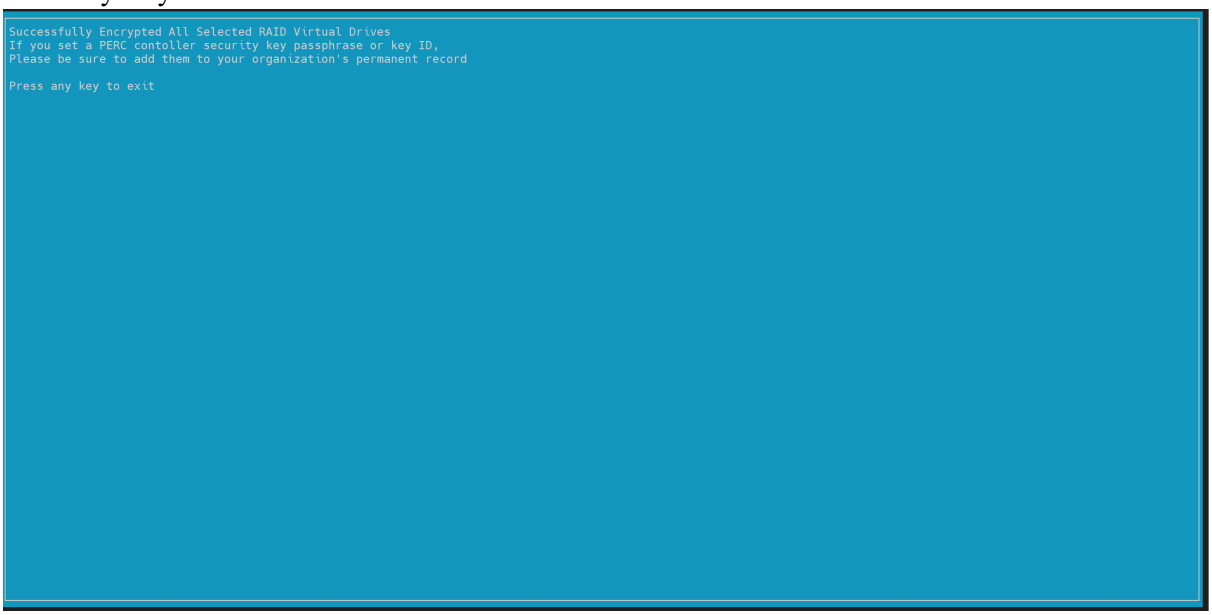
1. To enable, SSH into the appliance and run the below script to encrypt the VD (on external storage).
   `OWB_ALLOW_NON_FIPS=true /opt/rsa/saTools/supportScript/encryptSedVd.py`

   Note: The `encryptSedVd.py` script turn on the SED feature only on Virtual Drives or Drive Groups on the PERC H840 Adaptors (external storage) and NOT on PERC H740 mini. Refer to **Enable Virtual Drives / Drive Groups - PERC H740 (Mini) Adaptors (Internal storage)** to enable SED on PERC H740 Mini

   `OWB_ALLOW_NON_FIPS=true /opt/rsa/saTools/supportScript/encryptSedVd.py`



2. Select both the **Virtula Disks** and press **Enter**.
   The Passphrase screen is displayed.



3. Enter the Passphrase and press **Enter**.
   For example,
   Passphrase : **Netwitness1!**
   keyID: **netwitness**

4. Acknowledge the message and Press **Enter** to Save.

5. Press any Key to Exit.

6. To confirm that the drives are SED Enabled and secured, run the below command and verify the SED Enabled and Secured returns Yes.
   `/opt/MegaRAID/perccli/perccli64 /c1 /e247/sall show all | egrep -i '(Policies/Settings|SED Capable|Secured|SED Enabled)'`
   Drive /c1/e247/s0 Policies/Settings :

```
SED Capable = Yes

SED Enabled = Yes

Secured = Yes

Drive /c1/e247/s1 Policies/Settings :

SED Capable = Yes

SED Enabled = Yes

Secured = Yes

Drive /c1/e247/s2 Policies/Settings :

SED Capable = Yes

SED Enabled = Yes

Secured = Yes

Drive /c1/e247/s3 Policies/Settings :

SED Capable = Yes

SED Enabled = Yes

Secured = Yes

Drive /c1/e247/s4 Policies/Settings :

SED Capable = Yes

SED Enabled = Yes
```

```
Secured = Yes
Drive /c1/e247/s5 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s6 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s7 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s8 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s9 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s10 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c1/e247/s11 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
```

Enable Security on SED Capable Drive groups on Host with a mix of SED and NON SED Drives

The encryptSedVd.py may fail to identify the SED Capable Virtual Drives when there is mix of both SED and NON-SED drives on the appliance. The below steps are applicable when both SED and NON-SED capable virtual drives exist on the host.

1. SSH to the appliance and enable security on the PERC H740 (mini) Adaptor. The controller number for this adaptor is **0**. The PERC H840 Adaptor is shown as **1**.
   To list all the controllers on the appliance:
   `/opt/MegaRAID/perccli/perccli64 show | egrep -A3 'Model'`
   The first column **(Ctl)** lists out the controller index on the appliance. In this case, the controller '**0**' corresponds to '**PERC H740 Mini**' and controller '**1**' corresponds to '**PERC H840 Adaptor**' . The columns '**DGs**' and '**VDs**' displays the drive groups and virtual drives on the controller.

```
[root@116Decoder perccli]# /opt/MegaRAID/perccli/perccli64 show | egrep -A3 'Model'
Ctl Model          Ports PDs DGs DNOpt VDs VNOpt BBU sPR DS EHS ASOs Hlth
------------------------------------------------------------------------
  0 PERCH740PMini      8  10   3     0   3     0 Opt On  -  N      0 Opt
  1 PERCH840Adapter    8  12   1     0   1     0 Opt On  -  N      0 Opt
[root@116Decoder perccli]#
```

2. To enable the security on the 'PERC H740 (mini) Adaptor' i.e Controller '**0**', execute the following command:
   `/opt/MegaRAID/perccli/perccli64 /c0 set securitykey='<SOME_STRING_VALUE>'!' keyid='< SOME_STRING_VALUE >'`

   Example:
   `/opt/MegaRAID/perccli/perccli64 /c0 set securitykey='Netwitness1!' keyid=1`

   'Netwitness1' is the securityKey and '1' is ID. Preserve both the Key and keyID securely.

```
[root@116Decoder perccli]# /opt/MegaRAID/perccli/perccli64 /c0 set securitykey='Netwitness1!' keyid='netwitness'
Controller = 0
Status = Success
Description = None

Controller Properties :
=====================

---------------------
Ctrl Method  Result
---------------------
   0 set Key Success
---------------------
```

3. Identify the correct Drive group (DG) / Virtual Drive (VD) corresponding to the SED Capable drives that we are trying to enable security.
   `/opt/MegaRAID/perccli/perccli64 /c0 /vall show | egrep -A5 'DG/VD'`

   Refer to first two and last column to identify the correct Drive Group (DG) / Virtual Drive (VD) correspond to the 6 SED enabled drives. On Series 6 appliances, there is only one DG/VD with **RAID6**. '**Name**' column can be used to identify the VD/DG. In this case, the DG/VD is '**2**'. Using a combination of '**Type**', '**Name**' and '**Size**' columns (these were defined by the user when the VDs are created above).

```
[root@116Decoder perccli]# /opt/MegaRAID/perccli/perccli64 /c0 /vall show | egrep -A5 'DG/VD'
DG/VD TYPE  State Access Consist Cache Cac sCC     Size Name
-------------------------------------------------------------------------
0/0   RAID1 Optl  RW     Yes     RWBD  -   OFF 931.0 GB
1/1   RAID1 Optl  RW     Yes     RWBD  -   OFF 1.818 TB
2/2   RAID6 Optl  RW     Yes     RWBD  -   OFF 8.730 TB Virtual Disk 2
-------------------------------------------------------------------------
[root@116Decoder perccli]#
```

4. To turn on Security on the disk group (created out of the 6 SED Capable drives), execute the below command:

```
/opt/MegaRAID/perccli/perccli64 /c0 /d2 set security=on
```

```
[root@116Decoder perccli]# /opt/MegaRAID/perccli/perccli64 /c0 /d2 set security=on
Controller = 0
Status = Success
Description = Success
```

5. Get the Enclosure ID (**EID**) using on the controller '**0**'. In this case, it is '64'

```
/opt/MegaRAID/perccli/perccli64 /c0 /eall show
```

```
[root@116Decoder perccli]# /opt/MegaRAID/perccli/perccli64 /c0 /eall show
Controller = 0
Status = Success
Description = None

Properties :
==========

------------------------------------------------------------------------------
EID State Slots PD PS Fans TSs Alms SIM Port#      ProdID    VendorSpecific
------------------------------------------------------------------------------

------------------------------------------------------------------------------

EID-Enclosure Device ID |PD-Physical drive count |PS-Power Supply count|
TSs-Temperature sensor count |Alms-Alarm count |SIM-SIM Count

[root@116Decoder perccli]#
```

6. To confirm that the drives / Drive Groups (DG) are **SED Enabled** and **Secured**, run the below command and verify the **SED Capable**, **Secured**, **SED Enabled** flags are set as '**Yes**' for drives in slots 4 (**s4**) through 9 (**s9**).

```
/opt/MegaRAID/perccli/perccli64 /c0 /e64/sall show all | egrep -i '
(Policies/Settings |SED Capable|Secured|SED Enabled)'

Drive /c0/e64/s0 Policies/Settings :

SED Capable = No

SED Enabled = No

Secured = No

Drive /c0/e64/s1 Policies/Settings :

SED Capable = No

SED Enabled = No

Secured = No

Drive /c0/e64/s2 Policies/Settings :

SED Capable = No

SED Enabled = No

Secured = No
```

```
Drive /c0/e64/s3 Policies/Settings :
SED Capable = No
SED Enabled = No
Secured = No
Drive /c0/e64/s4 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s5 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s6 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s7 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s8 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
Drive /c0/e64/s9 Policies/Settings :
SED Capable = Yes
SED Enabled = Yes
Secured = Yes
```

Appendix C. Troubleshooting

This section contains instructions on how to resolve various storage tasks using the REST API.

Reconfigure Pre-Configured DAC Attached to Decoder Using REST API

Th scenario covers how to reconfigure a DAC using the REST API that was configured using another tool and clear any pre-existing data (if no longer need or backed up to another storage device).

The following information describes the state of the host and storage hardware prior to the attempt to reconfigure the storage devices using the REST API.

When the DAC was added, it had old data and was configured (but not using the REST API). This prevented the REST API from executing the `raidNew` command and returned the `Physical disk does not have appropriate attributes` error message.

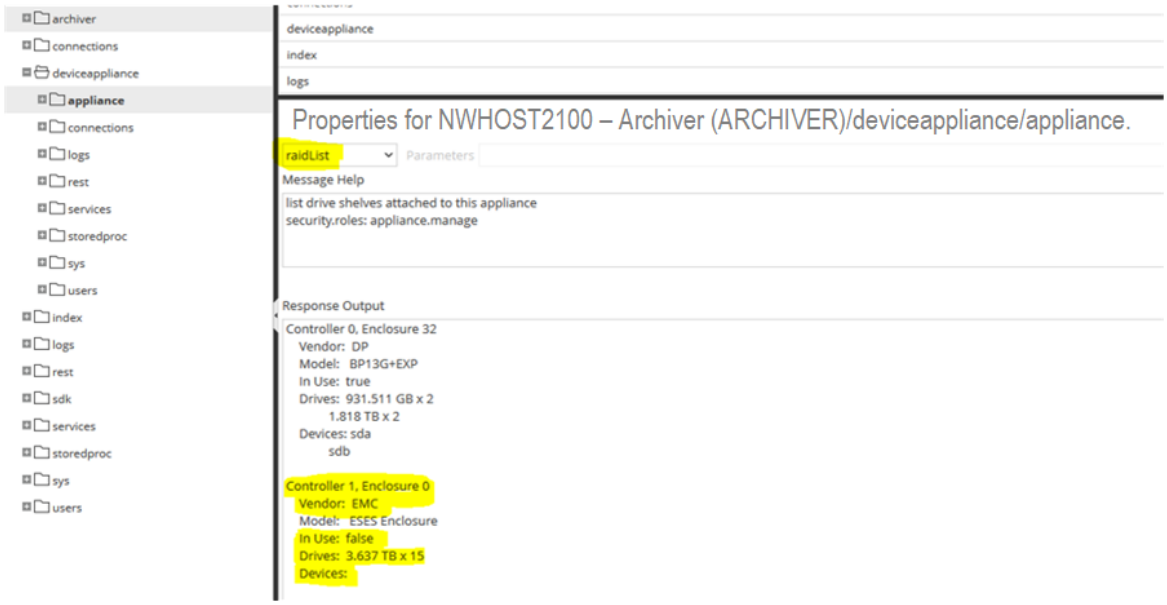
The following steps describe the scenario and with its resolution.

1. From the Decoder Linux console (or SSH to Decoder), submitted the following command string.
   `/opt/MegaRAID/perccli/perccli64 /c2/fall del`
   You will find detailed information on perccli commands in the **Dell PowerEdge RAID Controller CLI Reference Guide** (https://topics-cdn.dell.com/pdf/dell-sas-hba-12gbps_reference-guide_en-us.pdf).
   This deleted all foreign configuration from controller 2 and cleared all data from the DAC.
2. Tried to partition the DAC, but the `partNew` command failed because that information was already defined on the DAC. `partNew` displayed that you must use one an available device, but `devList` showed it in use.
3. Assuming that the partitions were defined, tried to allocate the storage devices, but this did not work because the DAC was not mounted.
4. Tried to mount the DAC from the command line, but received `mount failed: structure needs to be cleaned` error message.
5. There was no data that needed to be preserved on the DAC, so submitted the following command strings to clean the structure.
   ```
   mkfs.xfs -f /dev/decoder0/packetdb
   mkfs.xfs -f /dev/decoder1/packetdb
   ```
6. Mounted devices to their appropriate locations in `/var/netwitness/decoder`.
7. Completed the remainder of the applicable steps as described in Configure Storage Using the REST API to reconfigure the DAC

Appendix D. Sample Storage Configuration Scenarios for 15-Drive DACs

This appendix illustrates the following example of how to configure storage on two non-encrypted 15-drive DAC external storage devices.

- Configure Storage for Archiver
- Configure Storage for Network (Packet) Decoder
- Configure Storage for Network Concentrator
- Configure Storage for Log Decoder Hybrid



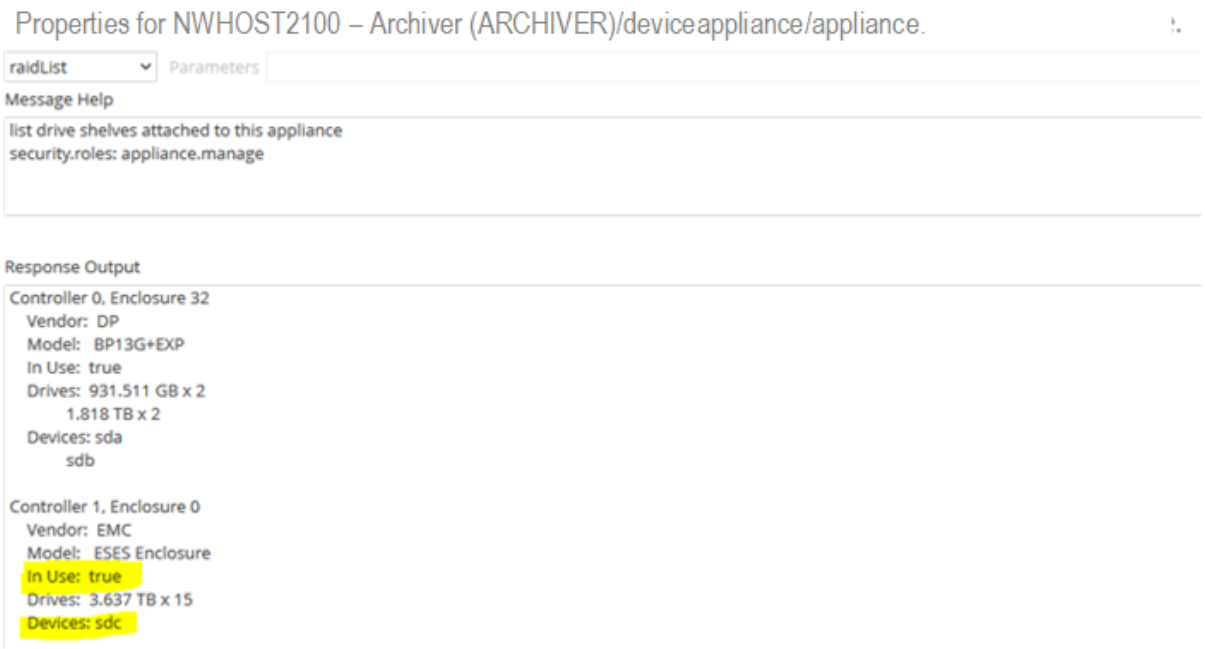
Configure Storage for Archiver

The following scenario configures storage on one, non-encrypted, 15-Drive DAC for an Archiver physical host.

1. Execute the `raidList` command.

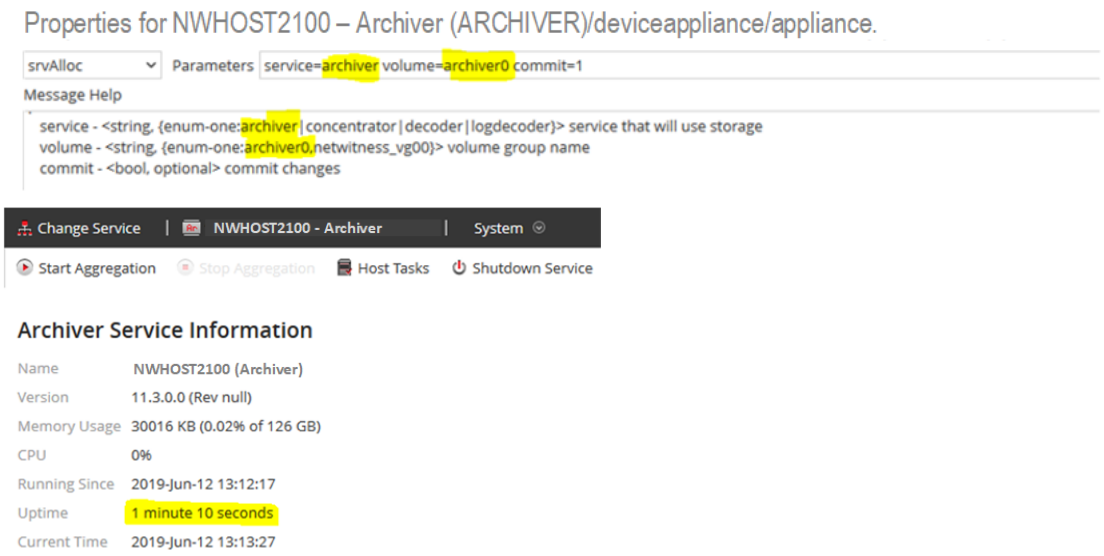
   a. Record the Controller Number, Enclosure Number, In Use, Drives, and Devices.
   You should see the following information.
   ```
   In Use: FALSE
   Devices: <empty>
   ```

   b. Verify the Drive Count, Size, and Vendor.
   The following example illustrates what you should see before you create a RAID array.

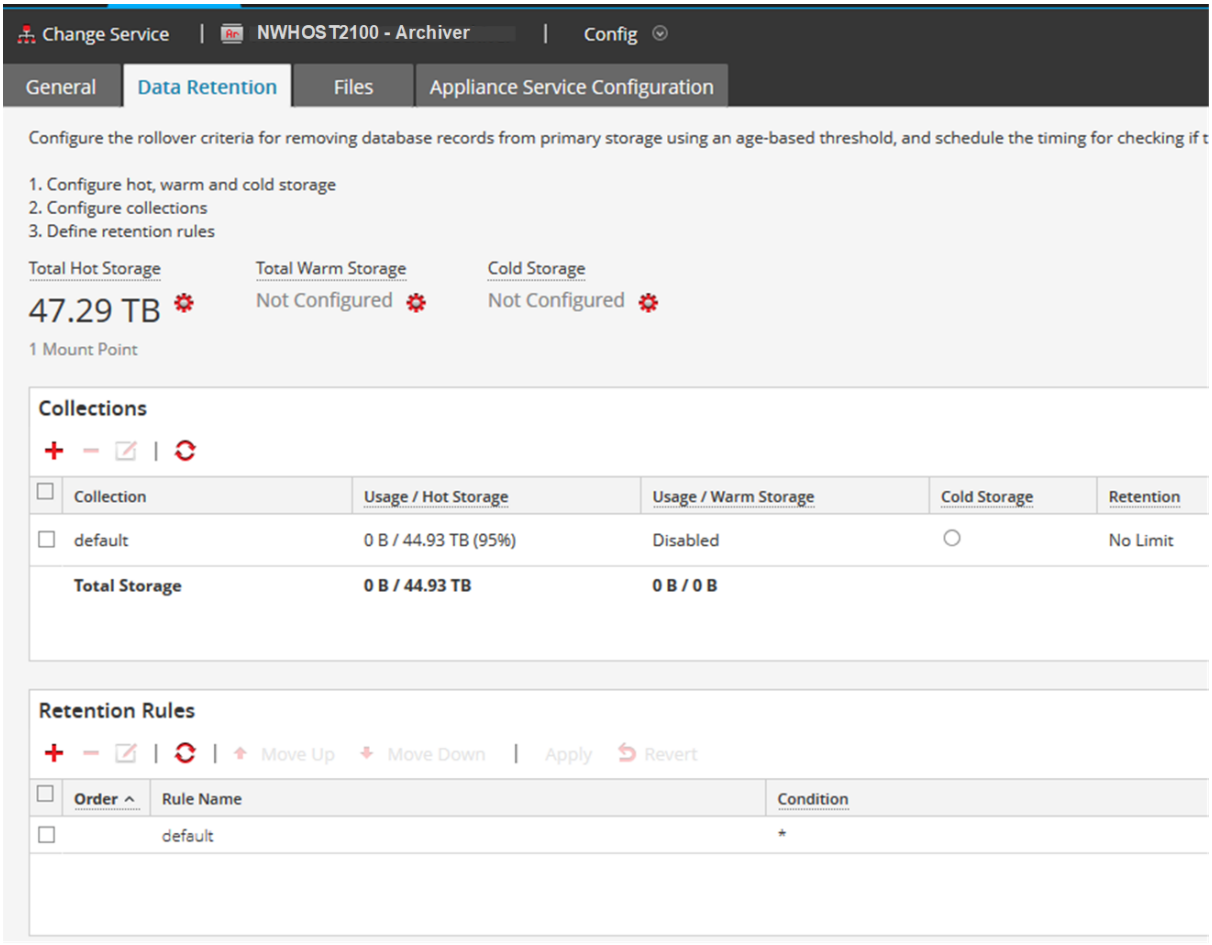


2. Execute the `raidNew` command with the following parameters using the controller number and the enclosure number you just recorded.
   ```
   controller=1 enclosure=0 scheme=archiver commit=1
   ```

The following example illustrates what you should see after you create a RAID array.



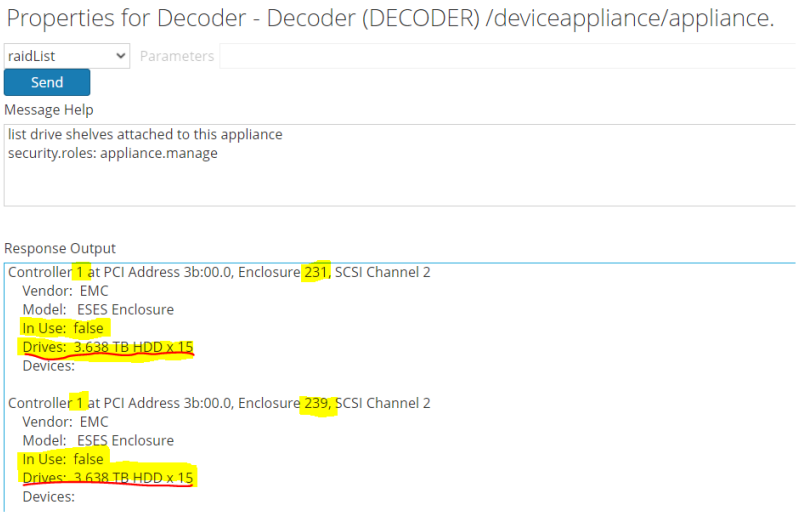
3. Execute the `raidList` command to verify the new RAID array.
   You should now see the following information.
   `In Use: TRUE`
   `Devices: <device>` (for example, `sdc`)



4. Execute the `partNew` command with the following parameters to create partitions and mount points in the `etc/fstab` file.
   `name=<device> (for example, sdc) service=archiver volume=archiver commit=1`

5. Execute the `srvAlloc` command with the following parameters to allocate the space to the archiver service. This adds storage to the archiver service configuration and restarts the service every time it is executed.
   `service=archiver volume=archiver0 commit=1`

6. Confirm the “Hot Storage” in “Data Retention”.



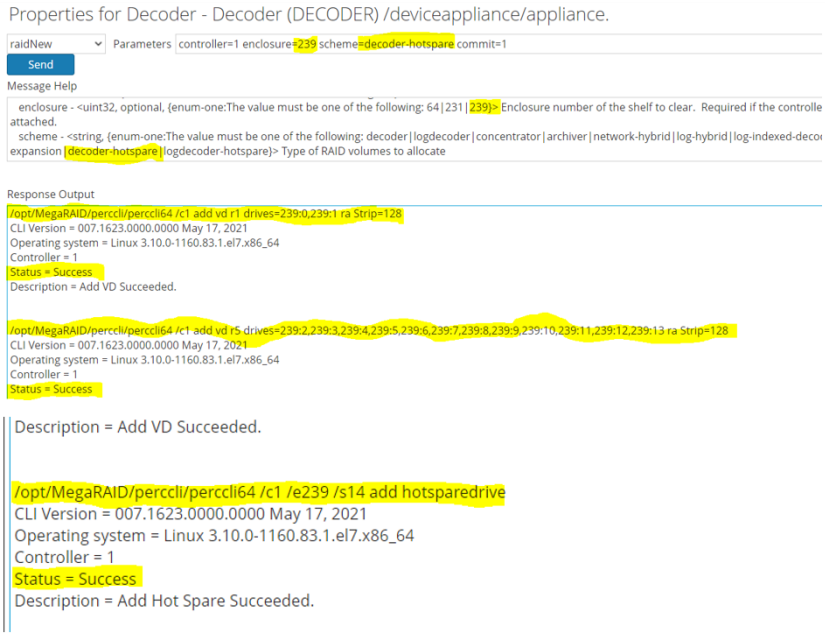
Configure Storage for Network (Packet) Decoder

The following scenario configures storage on two, non-encrypted, 15-Drive DACs for a Network Decoder for 10G Capture physical host.

1. Execute the `raidList` command.

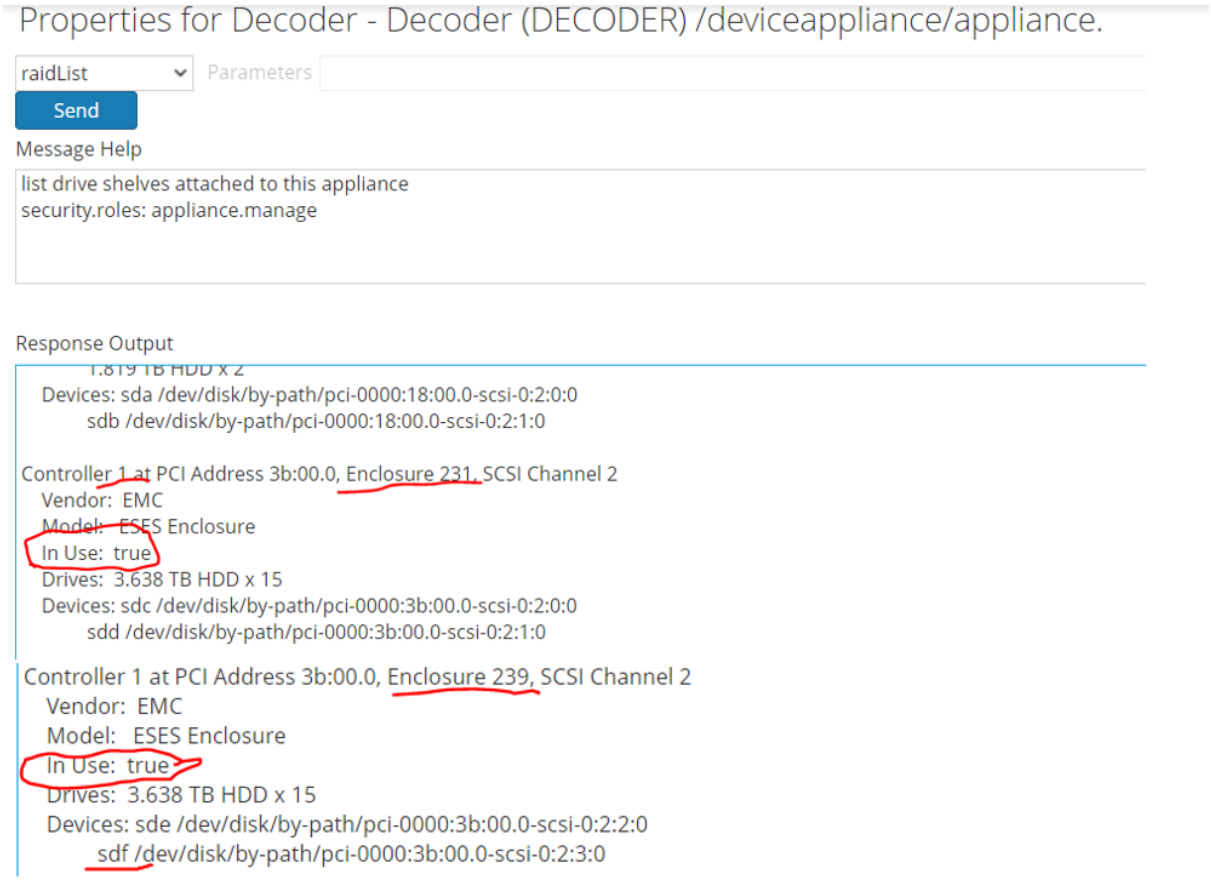
   a. Record the Controller Number, Enclosure Number, In Use, Drives, and Devices.
   You should see the following information.
   ```
   In Use: FALSE
   Devices: <empty>
   ```

   b. Verify the Drive Count, Size, and Vendor.
   The following example illustrates what you should see before you create a RAID array.



2. Execute the `raidNew` command with the following parameters using the controller number and the enclosure number you just recorded.

   - Parameters for the first enclosure:
     ```
     controller=1 enclosure=231 scheme=decoder-hotspare commit=1
     ```



Properties for Decoder - Decoder (DECODER) /deviceappliance/appliance.

Controller = 1
Status = Success
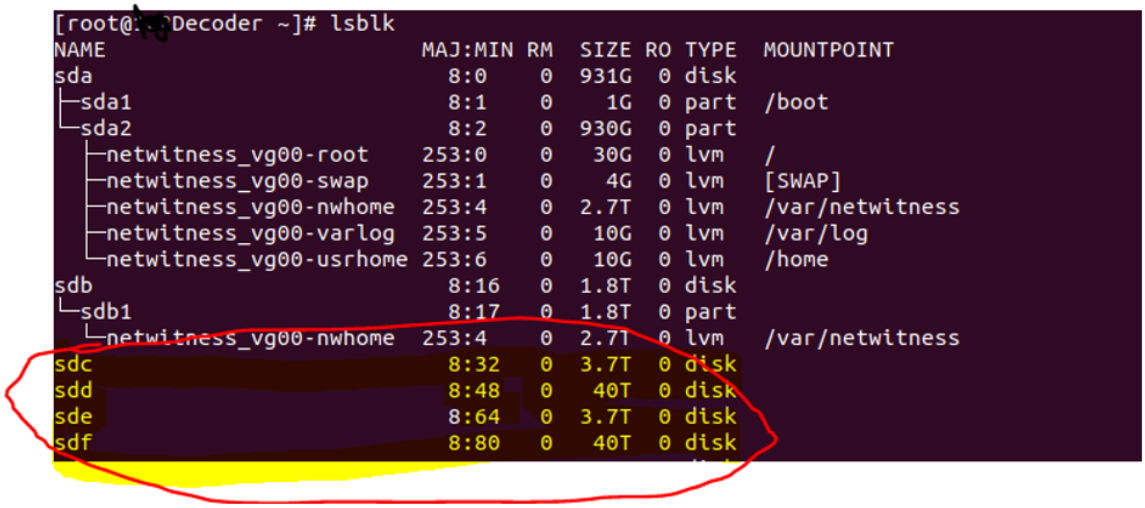
Description = Add Hot Spare Succeeded.

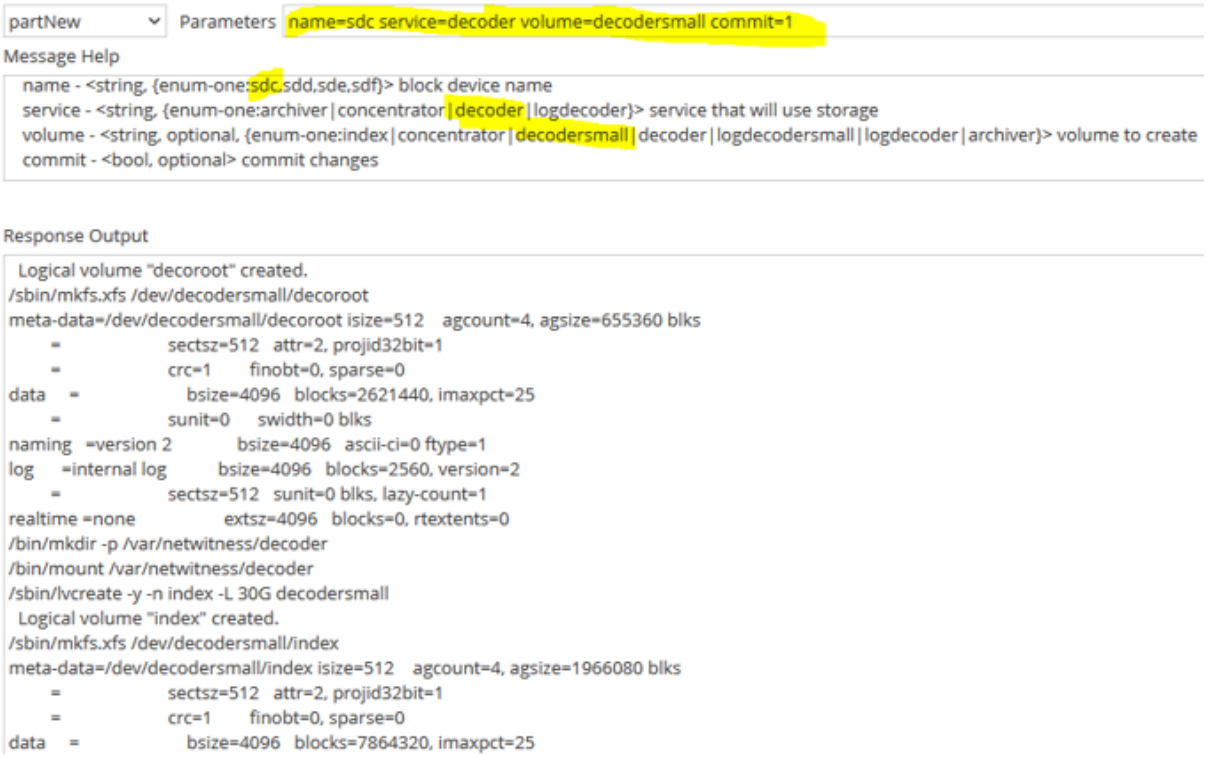
- Parameters for the second enclosure:
  `controller=1 enclosure=239 scheme=decoder-hotspare commit=1`

3. Use the `raidList` command to display block devices for enclosures so you can verify `In Use: TRUE`.



4. Use devlist to view the new block devices and their sizes. The new devices are highlighted in red.

5. SSH to the Network Decoder and use the **`lsblk`** command to confirm the block device sizes. The smaller block devices are always allocated to decodersmall and larger devices are allocated to



decoder volume.

Note: When configuring for 10g capture, use decoder-hotspare for both the enclosures for performance reasons. For non 10g captures, use decoder-hotspare for the first enclosure and packet-expansion for the second enclosure.

6. Execute the `partNew` command to create the **decodersmall** partition first (decoder dir, index, metadb, sessiondb) (First Enclosure, SDC, SDD) with the following parameters.

   `name=sdc service=decoder volume=decodersmall commit=1`

```
[root@NWHOST2000 ~]# df -h
Filesystem                              Size  Used Avail Use% Mounted on
/dev/mapper/netwitness_vg00-root         30G  2.5G   28G   9% /

```

At this point, you add the second DAC enclosure.

8. Execute the `partNew` command to create the decodersmall partition first (Second Enclosure, SDE, SDF) with the following parameters.

   `name=sde service=decoder volume=decodersmall commit=1`

9. Execute the `partNew` command to create the `packetdb` decoder volume (Second Enclosure SDE, SDF) with the following parameters.
   `name=sdf service=decoder volume=decoder commit=1`

partNew Parameters name=sdf service=decoder volume=decoder commit=1

Message Help

```
name - <string, {enum-one:sdc,sdd,sde,sdf}> block device name
service - <string, {enum-one:archiver|concentrator|decoder|logdecoder}> service that will use storage
volume - <string, optional, {enum-one:index|concentrator|decodersmall|decoder|logdecodersmall|logdecoder|archiver}> volume to create
commit - <bool, optional> commit changes
```

```

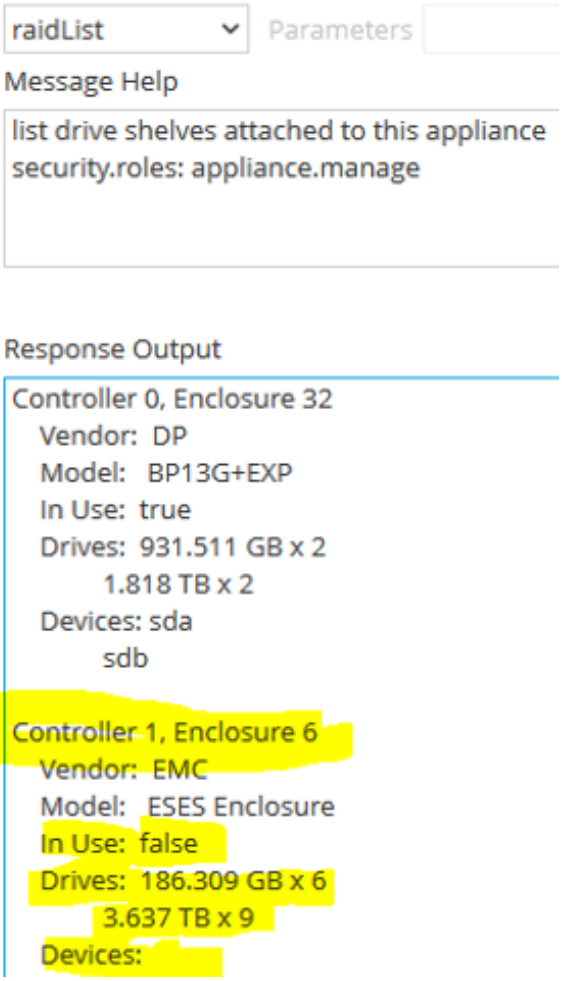
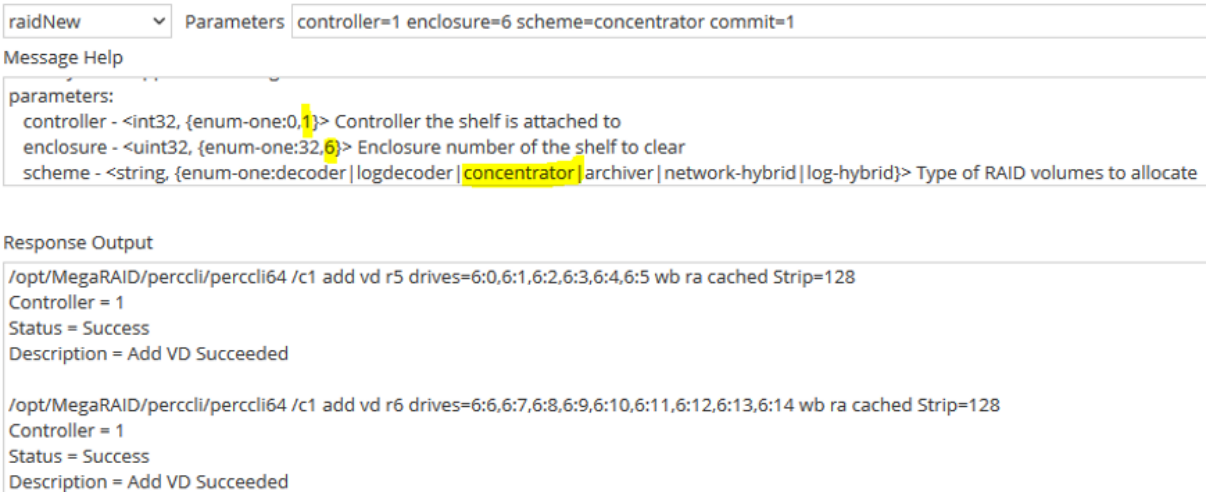
10. Execute the `srvAlloc` command with the following parameters to add the storage information into the Service Configuration settings.
    - `service=decoder volume=decodersmall commit=1`
    - `service=decoder volume=decodersmall0 commit=1`
    - `service=decoder volume=decoder commit=1`
    - `service=decoder volume=decoder0 commit=1`
11. Allocate decodersmall and decodersmall0 volumes to decoder service as shown below. Similarly, decoder and decoder0 volumes are allocated to decoder service.

12. Use **Explore->database->config->Meta Database Directory / Session Database Directory / Packet/Log Database Directory** parameter to confirm the values set using srvAlloc.

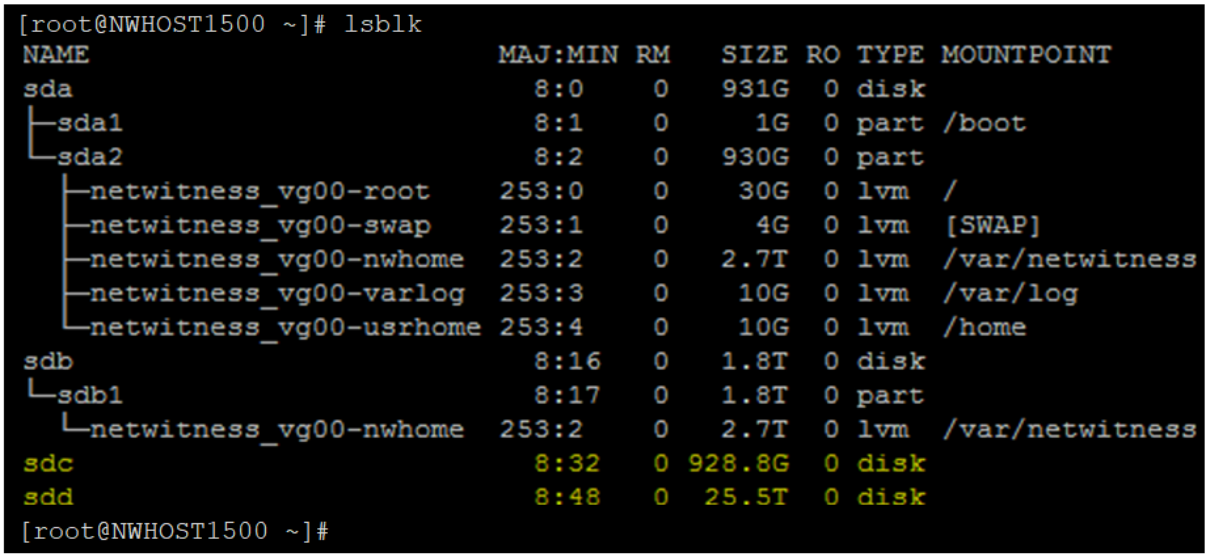


Packet Open Files (packet.files)	auto
Packet Minimum Free Space (packet.free.space.min)	23 GB
Packet Index Fidelity (packet.index.fidelity)	1
Packet Integrity Flush (packet.integrity.flush)	sync
Packet Write Block Size (packet.write.block.size)	64 KB
Session Database Directory (session.dir)	/var/netwitness/decoder/sessiondb==569.72 GB;/var/netwitness/decoder/sessiondb0==569.72 GB
Cold Session Database Directory (session.dir.cold)	
Warm Session Database Directory (session.dir.warm)	
Session File Size (session.file.size)	**auto**
Session Open Files (session.files)	auto
Session Minimum Free Space (session.free.space.min)	23 GB
Session Integrity Flush (session.integrity.flush)	sync
Session Write Block Size (session.write.block.size)	32 KB

13. Reconfigure the following Network Decoder service and its database to detect and take advantage of all of the free space as described in Task 5 - (Optional) Reconfigure Storage Configuration for 10G Capture.

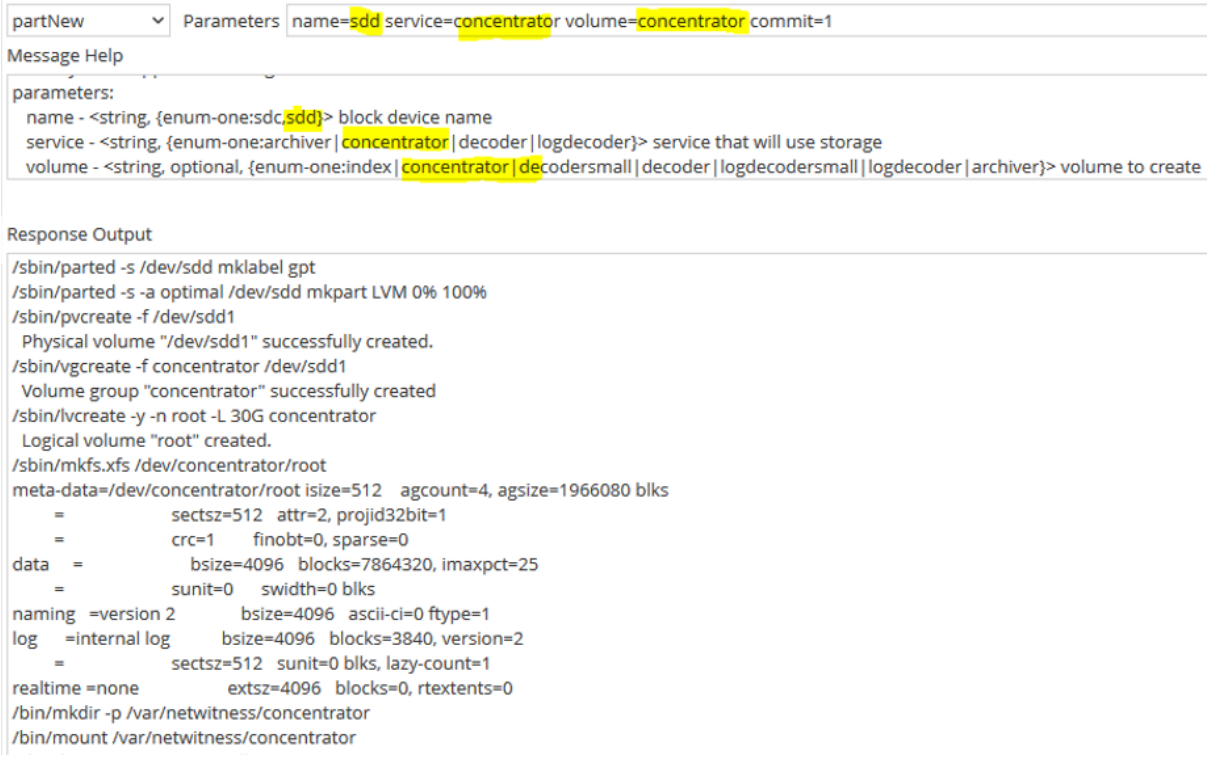


Configure Storage for Network Concentrator



The following scenario configures storage on one, non-encrypted, 15-Drive DAC for a Network Concentrator physical host.

1. Execute the `raidList` command.



2. Execute the `raidNew` command with the following parameters.
   `controller=1 enclosure=6 scheme=concentrator`

3. Execute the `partNew` command to create the **concentrator** partition first with the following parameters. You must create the **concentrator** volume before **index** volume or it will fail.

```
name=sdd service=concentrator volume=concentrator commit=1
```

```
[root@NWHOST1500 ~]# lsblk
NAME                          MAJ:MIN RM   SIZE RO TYPE MOUNTPOINT

Message Help

parameters:
service - <string, {enum-one:archiver|concentrator|decoder|logdecoder}> service that will use storage
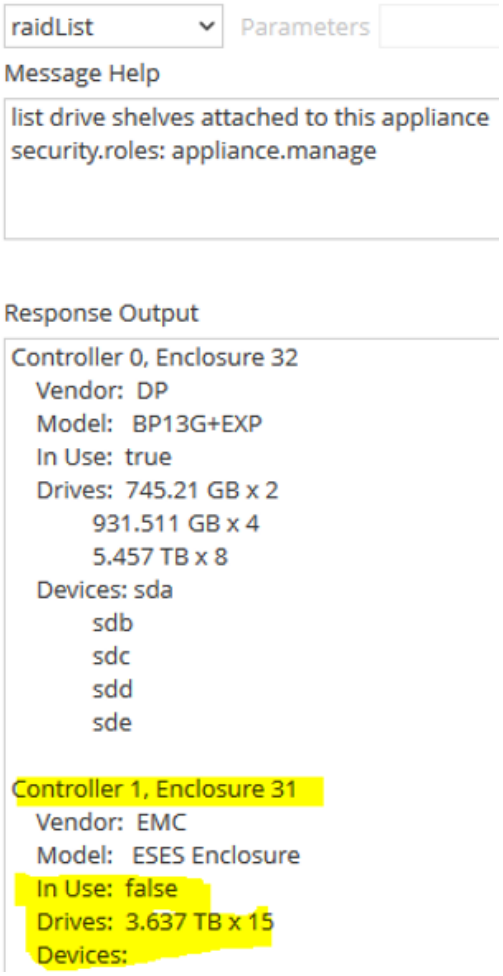
volume - <string, {enum-one:concentrator,index,netwitness_vg00}> volume group name
commit - <bool, optional> commit changes

Response Output



Set /database/config/meta.dir to /var/netwitness/concentrator/metadb==23.6 TB
Set /database/config/session.dir to /var/netwitness/concentrator/sessiondb==569.72 GB

Configure Storage for Log Decoder Hybrid

The following scenario configures storage on one, non-encrypted, 15-Drive DAC for a Log Decoder Hybrid physical host.

1. Execute the `raidList` command.

2. Execute the `raidNew` command with the following parameters.

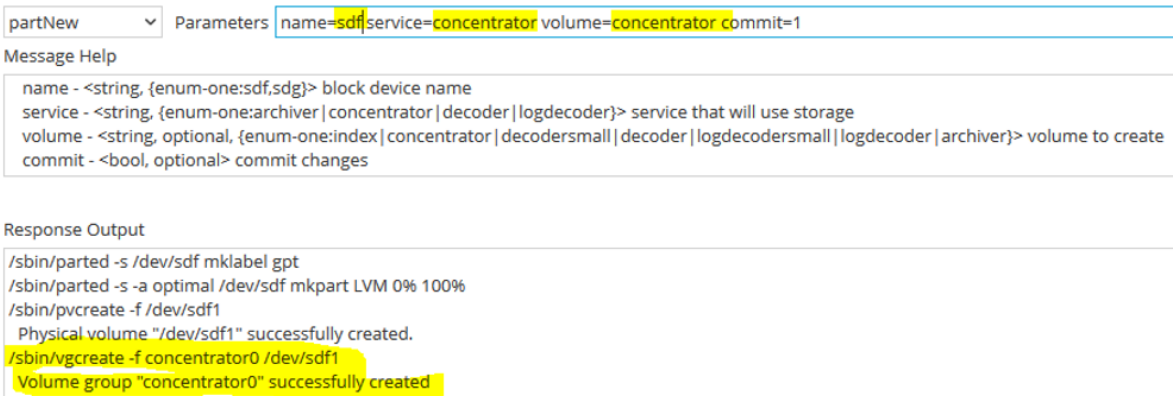
```
controller=1 enclosure=31 scheme=log-hybrid commit=1
```

raidNew Parameters controller=1 enclosure=31 scheme=log-hybrid commit=1

Message Help

```
controller - <int32, {enum-one:0,1}> Controller the shelf is attached to
enclosure - <uint32, {enum-one:32,31}> Enclosure number of the shelf to clear
scheme - <string, {enum-one:decoder|logdecoder|concentrator|archiver|network-hybrid|log-hybrid}> Type of RAID volumes to allocate
preferSecure - <bool, optional, {bool:0,1,yes,no,true,false,on,off}> Prefer creation of a secure array given compatible physical drives and a controller with a security key set
```

Response Output



```
/opt/MegaRAID/perccli/perccli64 /c1 add vd r5 drives=31:0,31:1,31:2,31:3,31:4,31:5,31:6 wb ra cached Strip=128
Controller = 1
Status = Success
Description = Add VD Succeeded

/opt/MegaRAID/perccli/perccli64 /c1 add vd r5 drives=31:7,31:8,31:9,31:10,31:11,31:12,31:13,31:14 wb ra cached Strip=128
Controller = 1

```

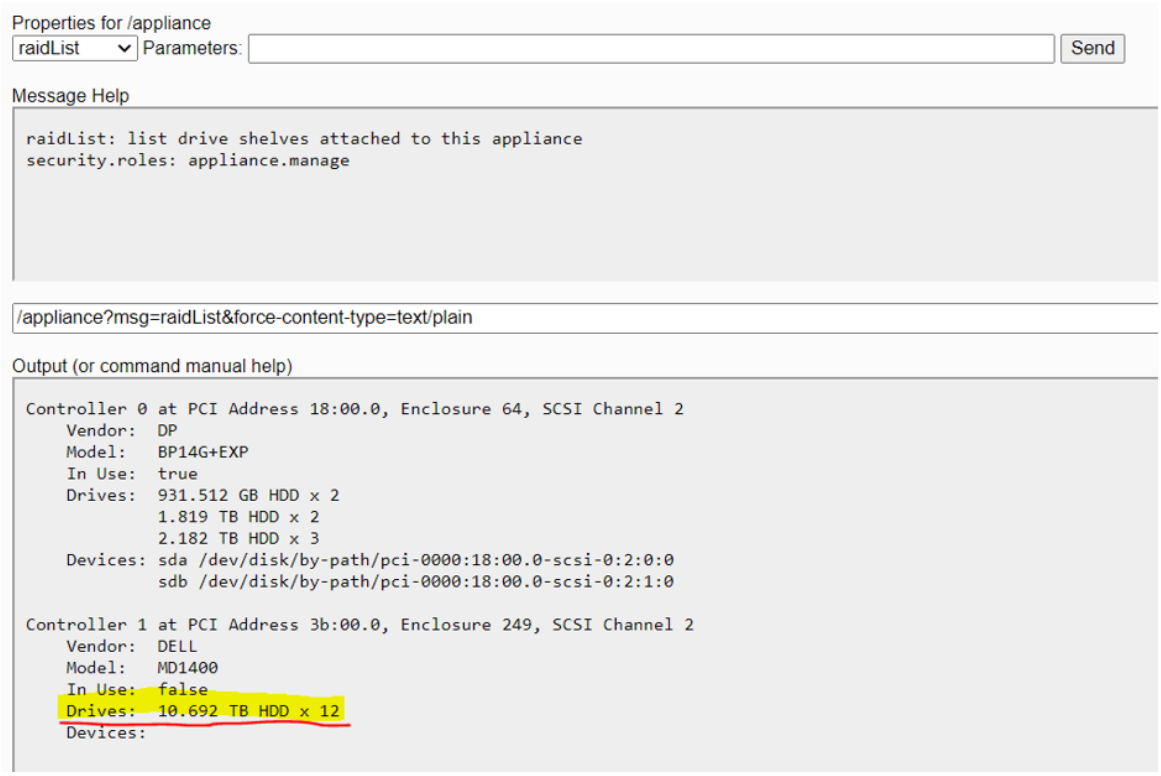
4. Execute the `srvAlloc` command with the following parameters.

   - `service=concentrator volume=concentrator0 commit=1`

   - `service=logdecoder volume=logdecoder0 commit=1`

Appendix E. Sample Storage Configuration Scenarios for 8 or 12-Drive PowerVault

This appendix illustrates the following example of how to configure storage on one non-encrypted 8 or 12-drive PowerVault external storage devices.



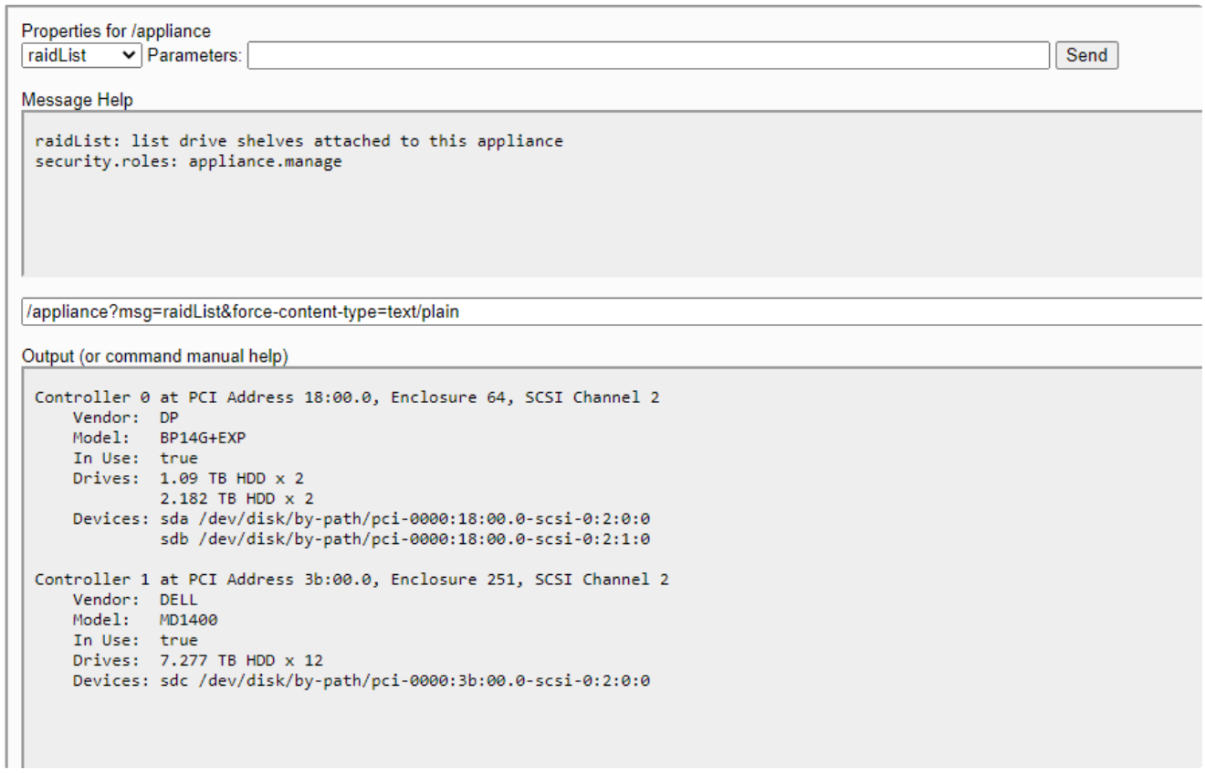
- Configure Storage for Archiver using NW-PV-A/NW-PV-A-N
- Configure Storage for Decoder using NW-PV-B/NW-PV-B-N
- Configure Storage for Concentrator using NW-PV-C/NW-PV-C-N
- Configure Storage for Concentrator using NW-PV-D/NW-PV-D-N
- Configure Storage for Log Hybrid using NW-PV-A/NW-PV-A-N
- Configure Storage for Network Hybrid using NW-PV-A/NW-PV-A-N
- Configure Storage for Endpoint Log Hybrid using NW-PV-A/NW-PV-A-N

Configure Storage for Archiver using NW-PV-A/NW-PV-A-N

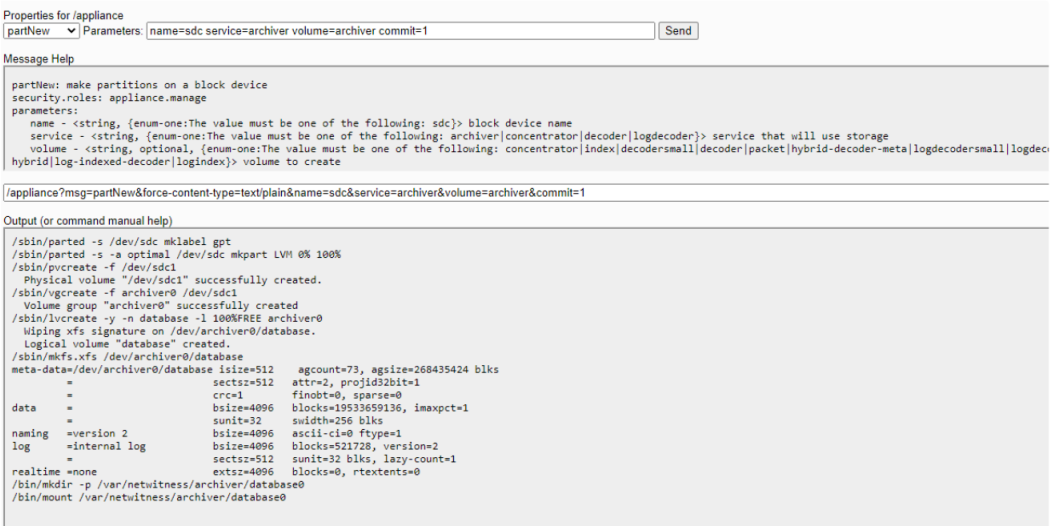
The following scenario configures storage on one, non-encrypted, 12-Drive PowerVault for an Archiver physical host.

1. Execute the `raidList` command.
   a. Record the Controller Number, Enclosure Number, In Use, Drives, and Devices.
   You should see the following information.
   ```
   In Use: FALSE
   Devices: <empty>
   ```

b. Verify the Drive Count, Size, and Vendor.
The following example illustrates what you should see before you create a RAID array.



2. Execute the `raidNew` command with the following parameters using the controller number and the enclosure number you just recorded.
`controller=1 enclosure=251 scheme=archiver commit=1`
The following example illustrates what you should see after you create a RAID array.



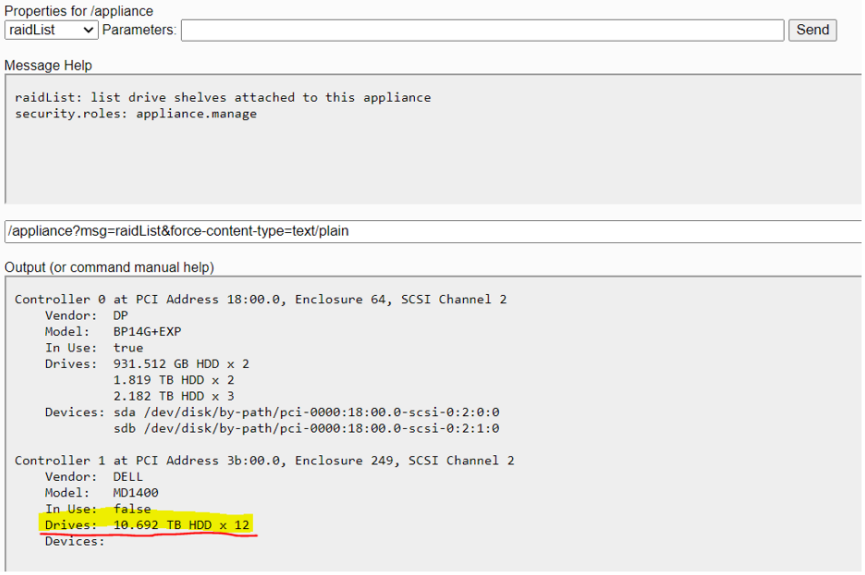
3. Execute the `raidList` command to verify the new RAID array.
You should now see the following information.
`In Use: TRUE`

`Devices: <device>` (for example, `sdc`)

4. Execute the `partNew` command with the following parameters to create partitions and mount points in the `etc/fstab` file.
   `name=sdc service=archiver volume=archiver commit=1`

5. Execute the `srvAlloc` command with the following parameters to allocate the space to the archiver service. This adds storage to the archiver service configuration and restarts the service every time it is executed.
   `service=archiver volume=archiver0 commit=1`

Configure Storage for Decoder using NW-PV-B/NW-PV-B-N



The following scenario configures storage on one, non-encrypted, 12-Drive PowerVault for a Network Decoder physical host.

Note: The block device size depends on the PV type (drive count) and the drive size (8 TB or 12 TB or 16 TB).

1. Execute the `raidList` command.

   a. Record the Controller Number, Enclosure Number, In Use, Drives, and Devices.
   You should see the following information.
   ```
   In Use: FALSE
   Devices: <empty>
   ```

   b. Verify the Drive Count, Size, and Vendor.
   The following example illustrates what you should see before you create a RAID array.

2. Execute the `raidNew` command with the following parameters using the controller number and the enclosure number you just recorded. Parameters for the first enclosure:
   `controller=1 enclosure=0 scheme=decoder-hotspare commit=1`

Scheme	Enclosure Type	Drives Required	Allocation
decoder	External	8 or 12 or 15 HDDs	3x drives in RAID 5 for decodersmall, all remaining drives in RAID 5 for decoder
log decoder	External	8 or 12 or 15 HDDs	Same as decoder configuration
decoder hot spare	External	8 or 12 or 15 HDDs	2x drives in RAID 1 for decodersmall, 1 drive as hot spare, all remaining drives in RAID 5 for decoder
log decoder hot spare	External	8 or 12 or 15 HDDs	Same as decoder hot spare configuration
archiver	External	8 or 12 or 15 HDDs	All drives in RAID 6 for archiver database volume
packet expansion	External	8 or 12 or 15 HDDs	All drives in RAID 6 for decoder volume. No drives allocated for decodersmall.
network hybrid	External	8 or 12 or 15 HDDs	3x drives in RAID 5 for meta expansion, all remaining drives in RAID 5 for packet expansion
network hybrid	Internal	S5 / S6 hybrid drive set	2x small HDD RAID 1 for decoder meta, 5x large HDD decoder, 3x large HDD concentrator, 2x SSD index
log hybrid	External	8 or 12 or 15 HDDs	Half of the drives in RAID 5 for meta expansion, half the drives in RAID 5 for packet expansion
log hybrid	Internal	S5 / S6 hybrid drive set	2x small HDD RAID 1 for decoder meta, 4x large HDD decoder, 4x large HDD concentrator, 2x SSD index
endpoint hybrid	Internal	S5 / S6 hybrid drive set	2x small HDD RAID 1 for decoder meta, 4x large HDD RAID 10 for log decoder and endpoint, 4x large HDD RAID 5 for concentrator, 2x SSD index
log indexed decoder	Internal	S6E hybrid drive set	10x HDD RAID 6 for log decoder meta and packet, 2x SSD index
concentrator	External	2 or more SSDs, 4 or more HDDs	All SSDs in RAID 1 or RAID 5 for index, all HDDs in RAID 6 for meta

```

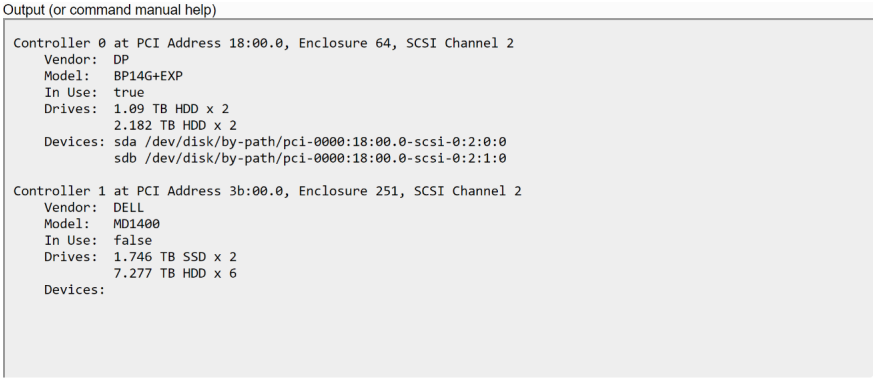
5. Execute the `srvAlloc` command with the following parameters to add the storage information into the Service Configuration settings.
   - `service=decoder volume=decodersmall commit=1`

- `service=decoder volume=decoder commit=1`



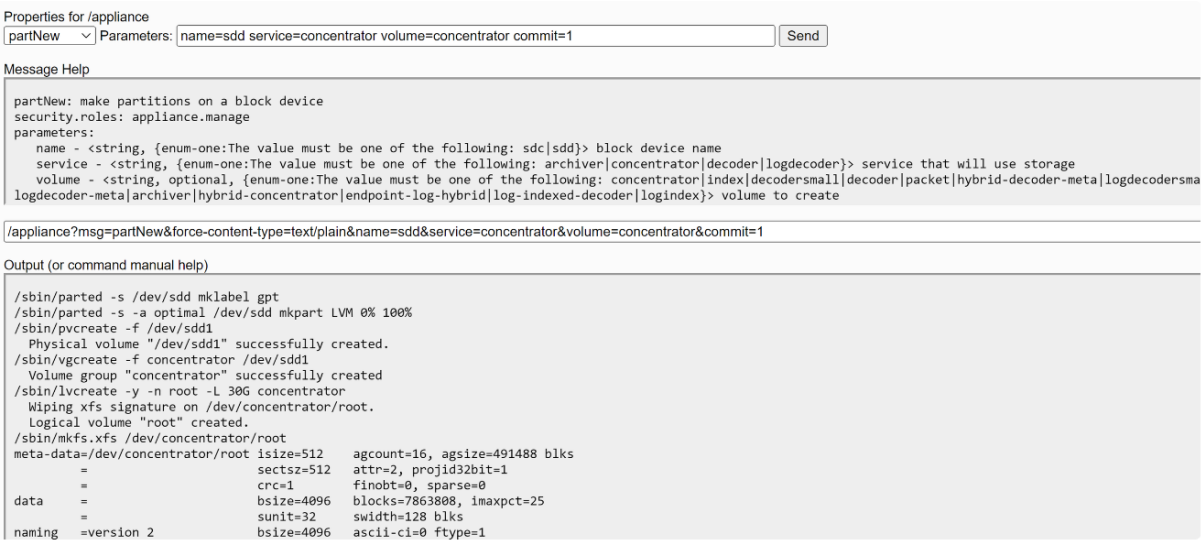
Configure Storage for Concentrator using NW-PV-C/NW-PV-C-N

The following scenario configures storage on one, non-encrypted, 8-Drive PowerVault for a Network Concentrator physical host.

1. Execute the `raidList` command.

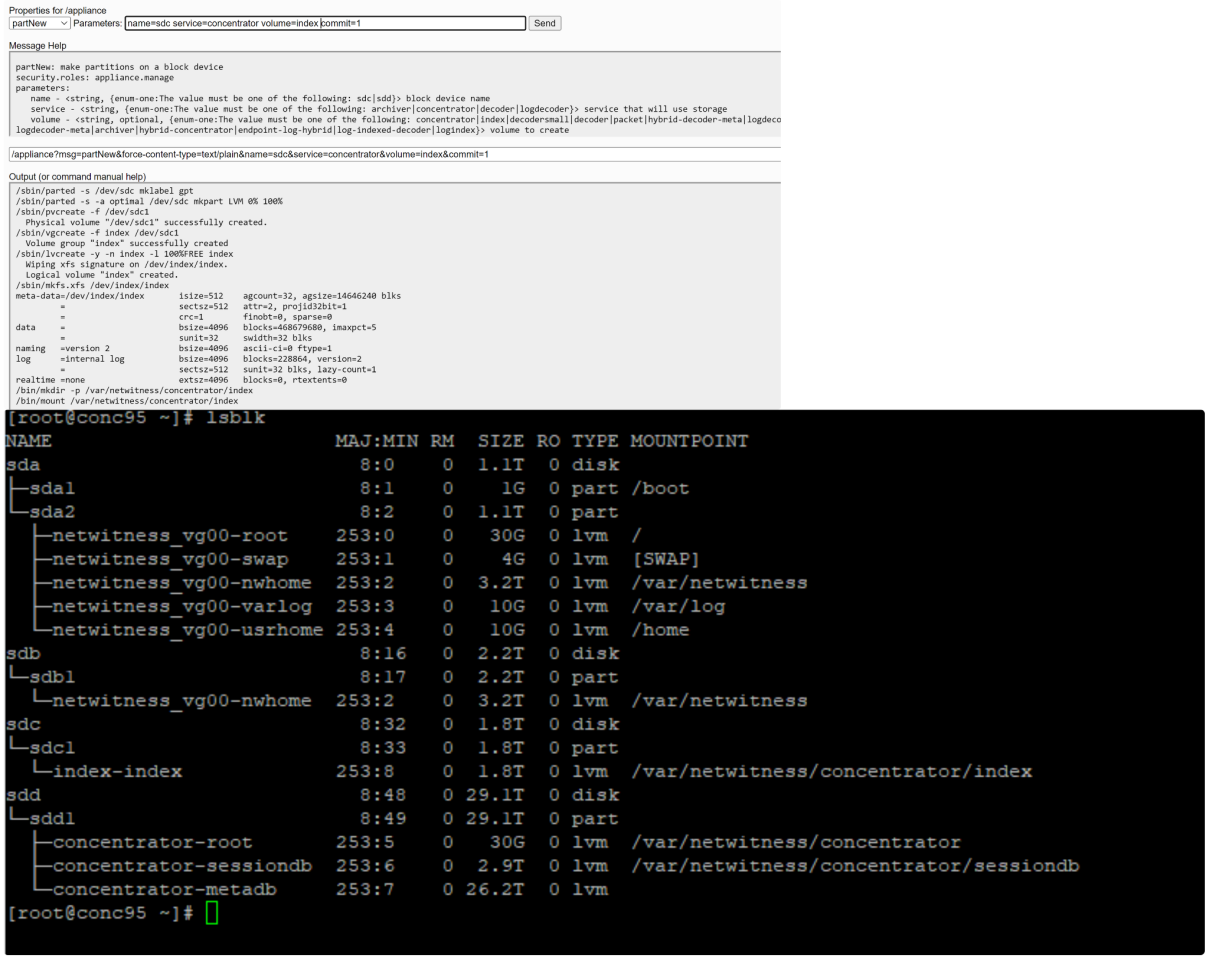
   a. Record the Controller Number, Enclosure Number, In Use, Drives, and Devices.
   You should see the following information.
   ```
   In Use: FALSE
   Devices: <empty>
   ```

   b. Verify the Drive Count, Size, and Vendor.
   The following example illustrates what you should see before you create a RAID array.



2. Execute the `raidNew` command with the following parameters using the controller number and the enclosure number you just recorded.
   ```
   controller=1 enclosure=251 scheme=concentrator commit=1
   ```

The following example illustrates what you should see after you create a RAID array.



3. Execute the `partNew` command to create the **concentrator** partition first with the following parameters. You must create the **concentrator** volume before **index** volume or it will fail.

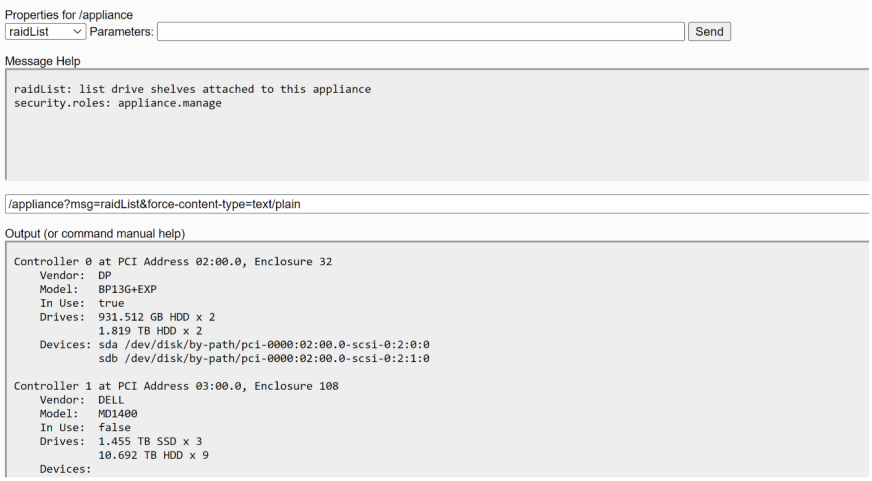
```
name=sdd service=concentrator volume=concentrator commit=1
```

4. Execute the partNew command with the following parameters to create an **index** on SSDs.

```
name=sdc service=concentrator volume=index commit=1
```

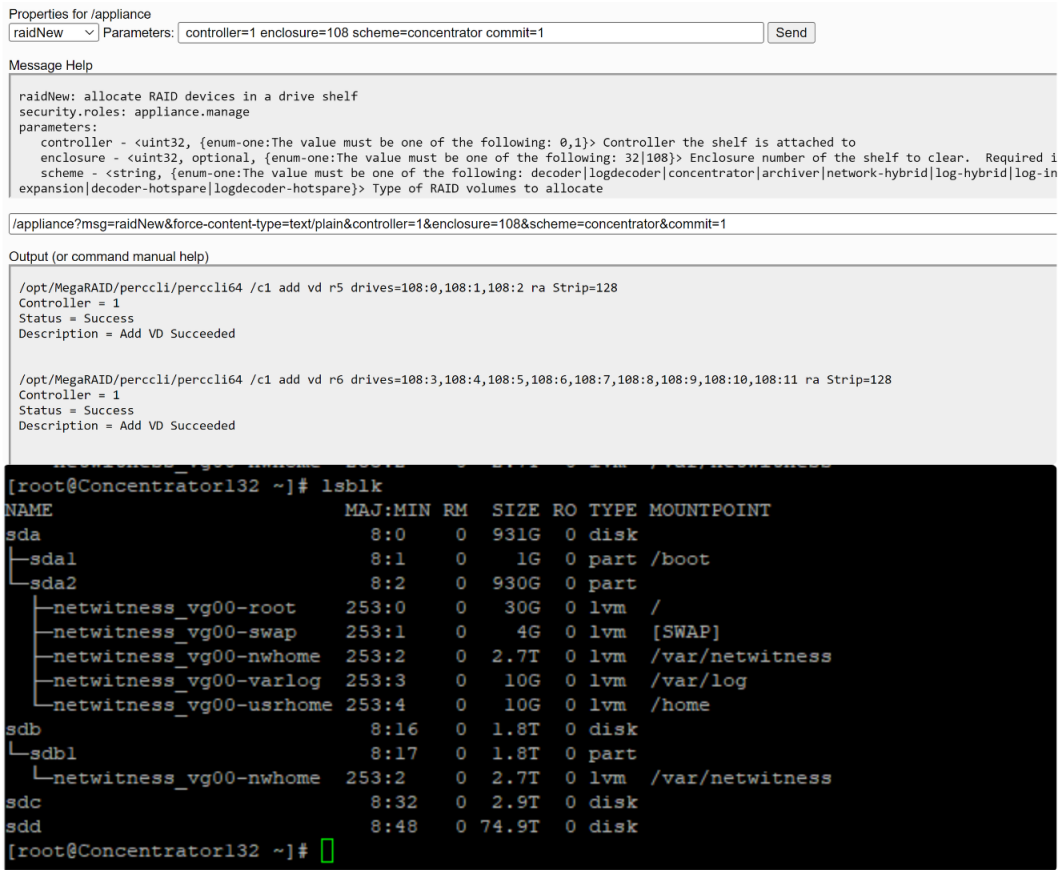
5. Execute the `srvAlloc` command with the following parameters.

```
service=concentrator volume=concentrator commit=1
```



Configure Storage for Concentrator using NW-PV-D/NW-PV-D-N

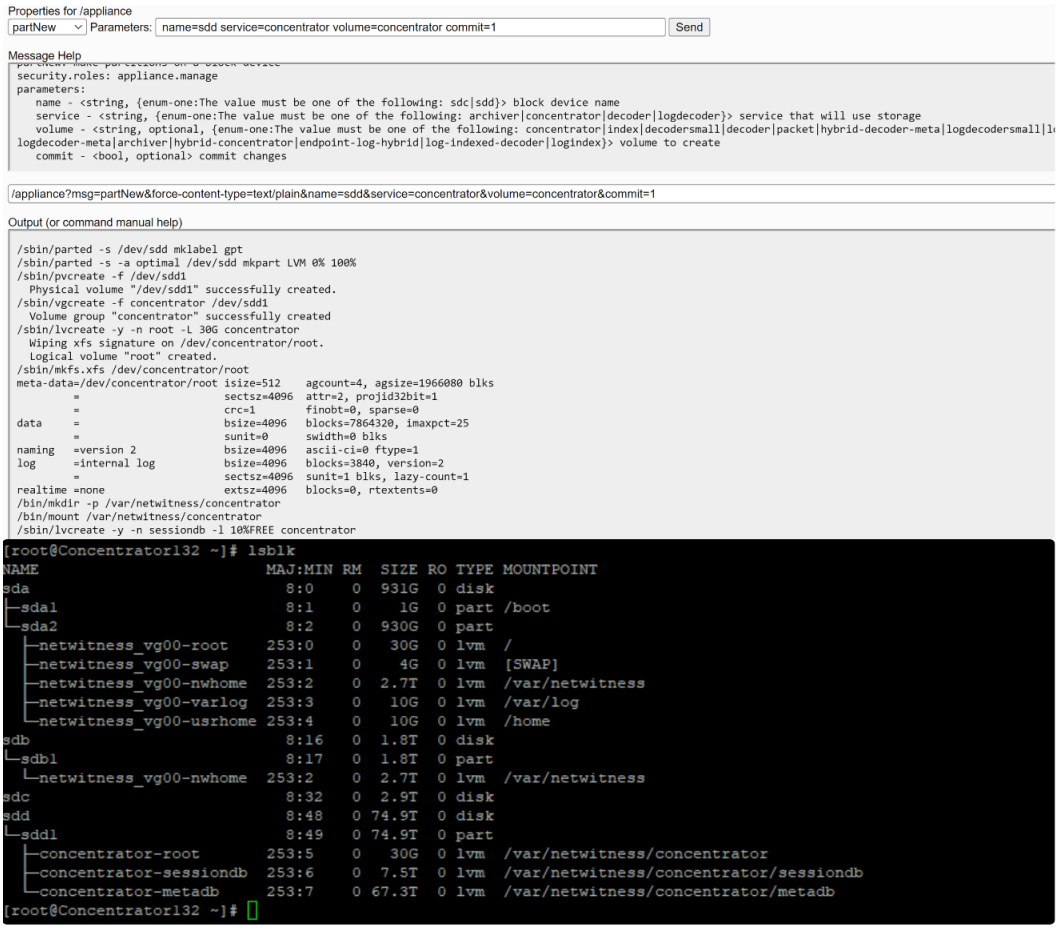
The following scenario configures storage on one, non-encrypted, 12-Drive PowerVault for a Log Decoder Hybrid physical host.



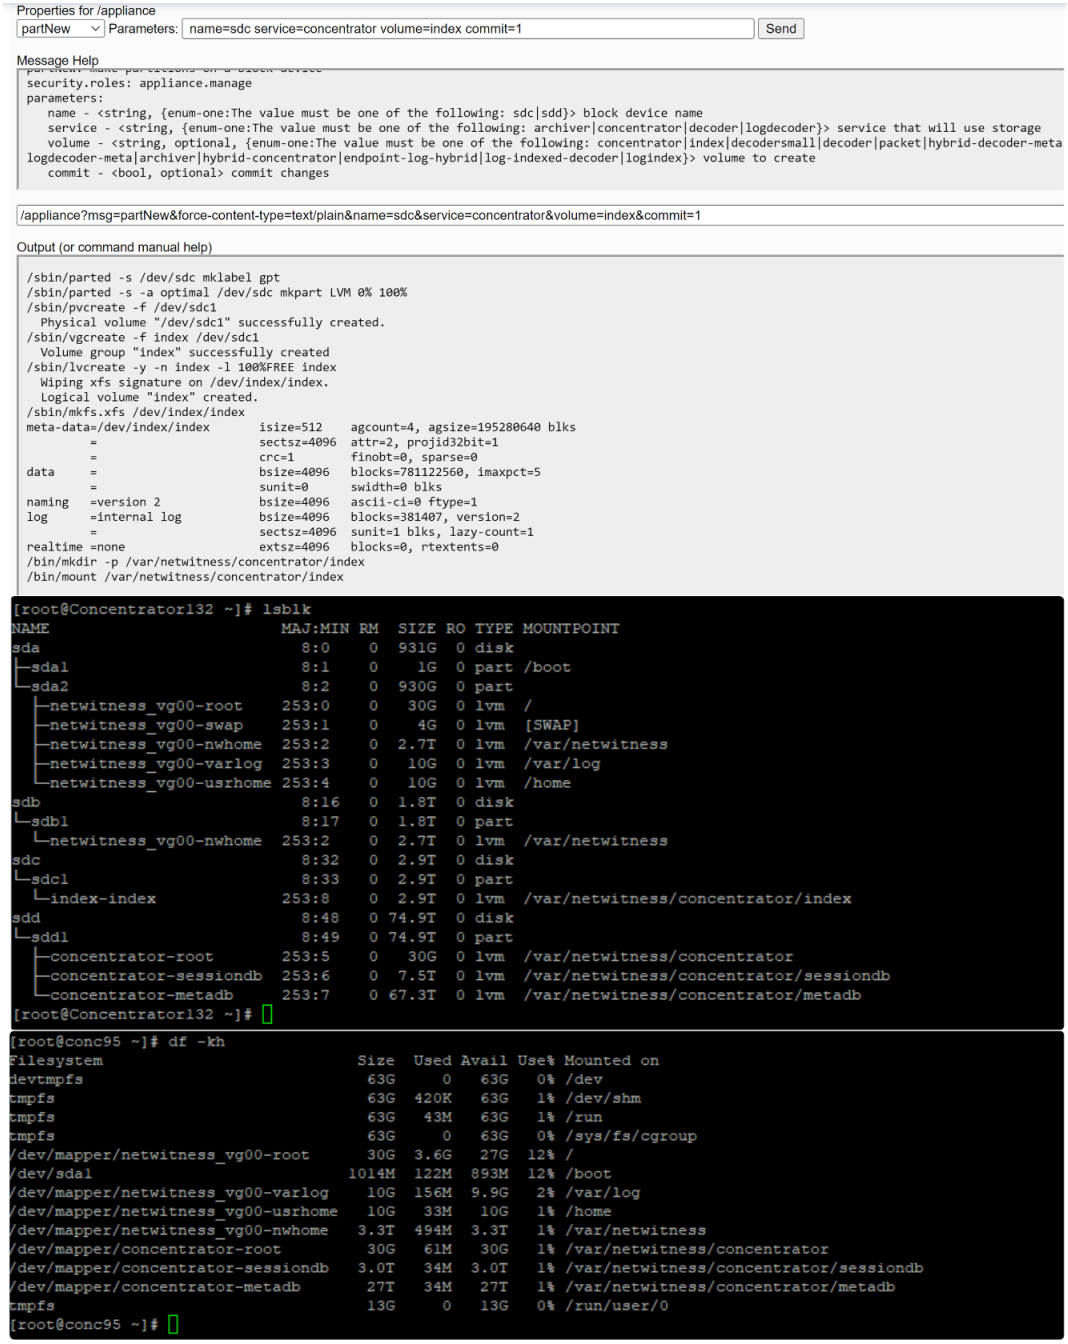
1. Execute the `raidList` command.

   a. Record the Controller Number, Enclosure Number, In Use, Drives, and Devices.
   You should see the following information.
   ```
   In Use: FALSE
   Devices: <empty>
   ```

   b. Verify the Drive Count, Size, and Vendor.
   The following example illustrates what you should see before you create a RAID array.



2. Execute the `raidNew` command with the following parameters using the controller number and the enclosure number you just recorded.
   `controller=1 enclosure=108 scheme=concentrator commit=1`
   The following example illustrates what you should see after you create a RAID array.



3. Execute the `partNew` command to create the **concentrator** partition first with the following parameters. You must create the concentrator volume before index volume or it will fail.

   `name=sdd service=concentrator volume=concentrator commit=1`

4. Execute the `partNew` command with the following parameters to create an **index** on SSDs.

   `name=sdc service=concentrator volume=index commit=1`

5. Execute the `srvAlloc` command with the following parameters.

   `service=concentrator volume=concentrator commit=1`

Configure Storage for Log Hybrid using NW-PV-A/NW-PV-A-N

The following scenario configures storage on one, non-encrypted, 12-Drive PowerVault for a Log Hybrid physical host.

1. Execute the `raidList` command

   a. Record the Controller Number, Enclosure Number, In Use, Drives, and Devices. You should see the following information.

   ```
   In Use: FALSE

   Devices: <empty>
   ```

   b. Verify the Drive Count, Size, and Vendor.

   The following example illustrates what you should see before you create a RAID array.

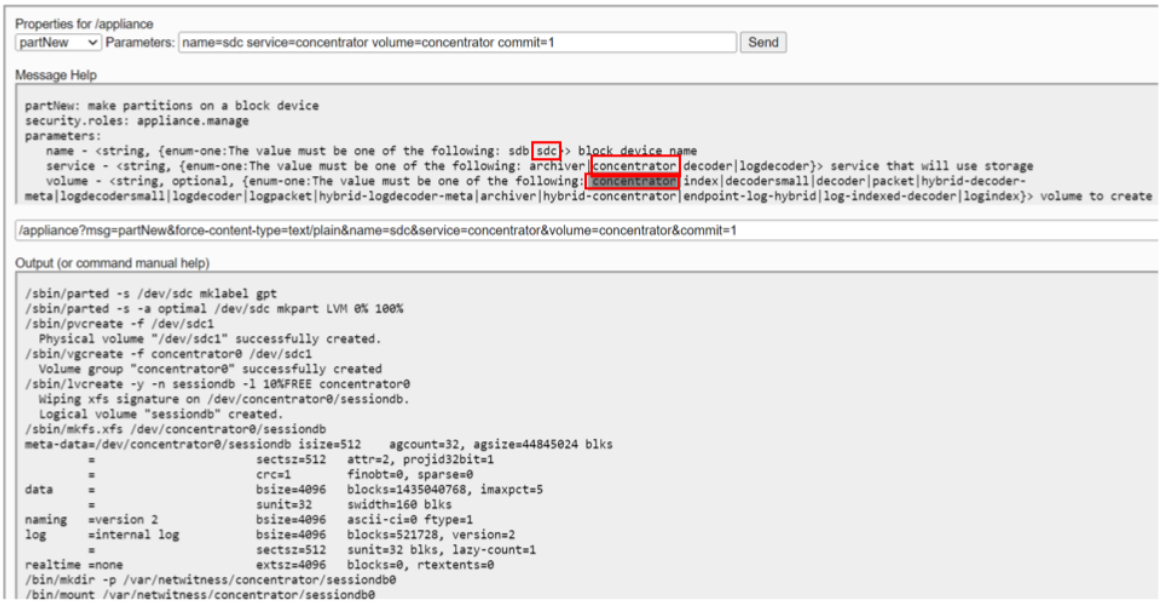
2. Execute the `raidNew` command with the following parameters using the controller number and the enclosure number you just recorded.

   ```
   controller=1 enclosure=72 scheme=log-hybrid preferSecure=1 commit=1
   ```

   a. The following example illustrates what you should see after you create a RAID array.

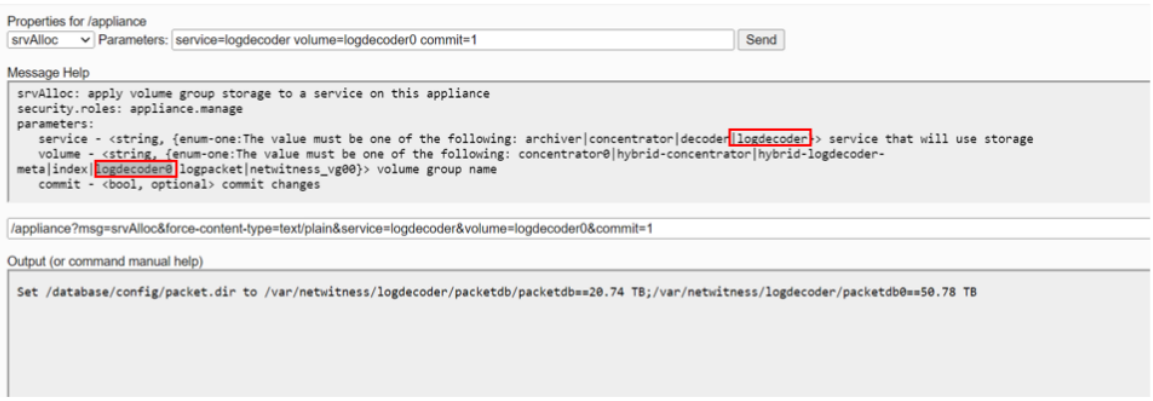
   b. Execute the `devlist` command to find the exact memory distribution between the newly created RAIDS,

   in log-hybrid the distribution is exactly equal so any service can be installed in any of the



RAIDS.

3. Execute the `partNew` command with the following parameters to create partitions and mount points in the `/etc/fstab` file.
   a. `name=sdb service=logdecoder volume=logdecoder commit=1`



b. `name=sdc service=concentrator volume=concentrator commit=1`

4. Execute the `srvAlloc` command with the following parameters to allocate the space to logdecoder and concentrator services.

   a. This adds storage to the logdecoder service configuration and restarts the service every time it is executed.

   `service=logdecoder volume=logdecoder0 commit=1`

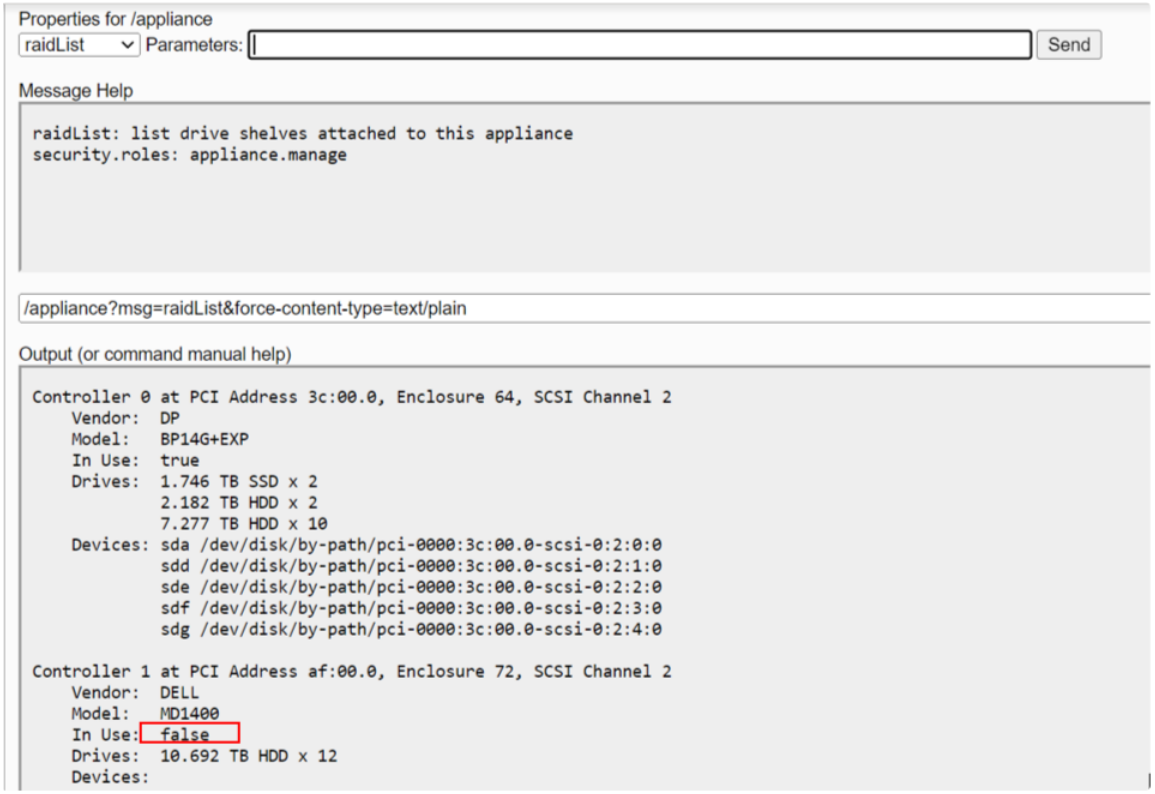
   b. This adds storage to concentrator service configuration and restarts the service every time it is executed.

```
service=concentrator volume=concentrator0 commit=1
```

5. Execute the `lsblk` command in backed to see all the raids and partitions inside the service.

Configure Storage for Network Hybrid using NW-PV-A/NW-PV-A-N

The following scenario configures storage on one, non-encrypted, 12-Drive PowerVault for a Network Hybrid physical host.



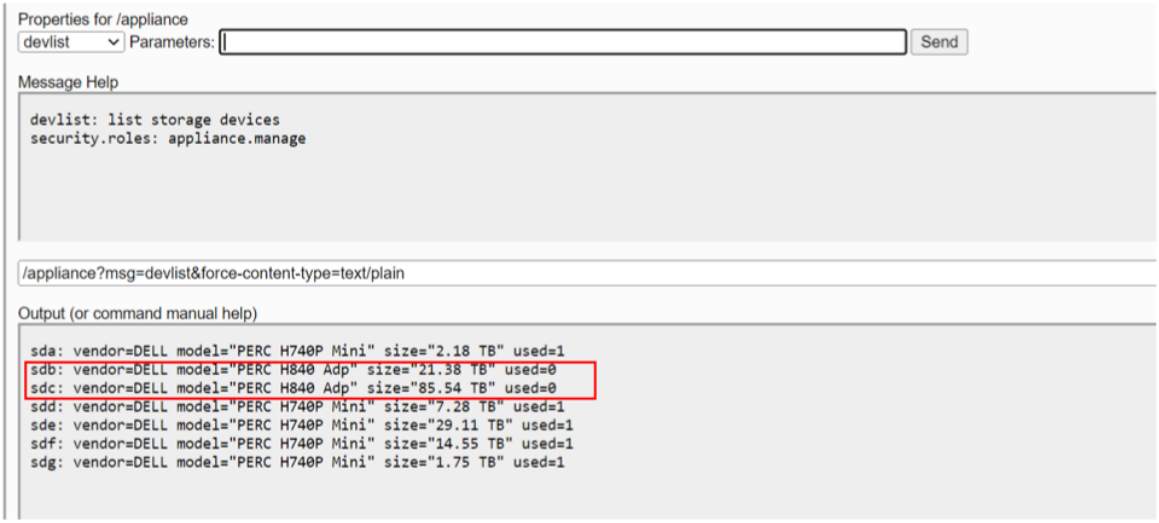
1. Execute the raidList command
   a. Record the Controller Number, Enclosure Number, In Use, Drives, and Devices. You should see the following information.

      ```
      In Use: FALSE
      ```

      ```
      Devices: <empty>
      ```

   b. Verify the Drive Count, Size, and Vendor.

The following example illustrates what you should see before you create a RAID array.

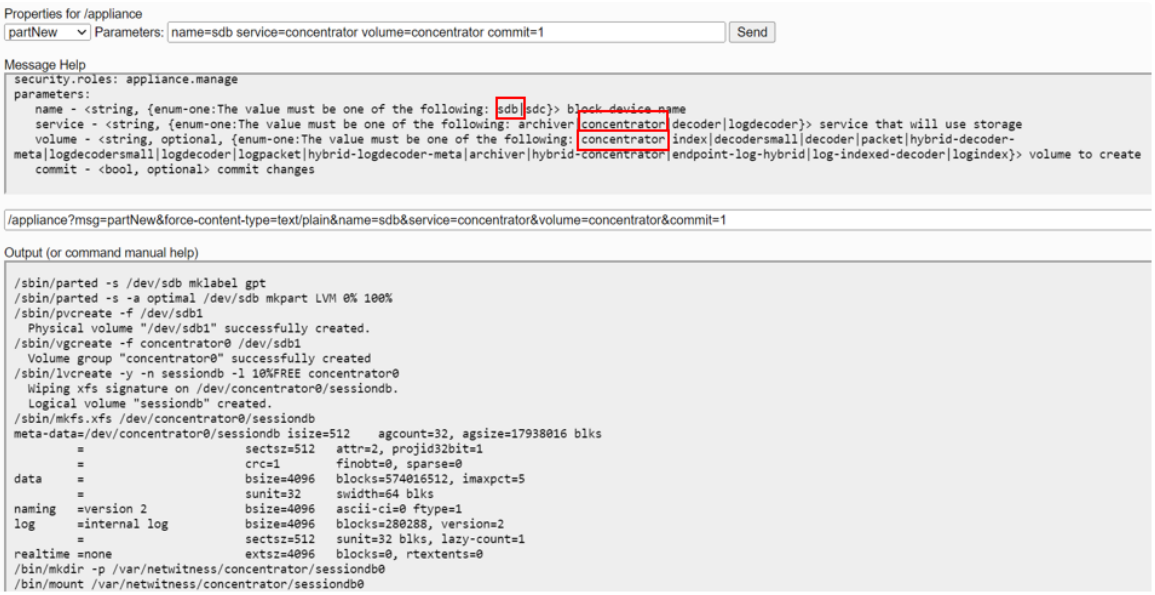


2. Execute the `raidNew` command with the following parameters using the controller number and the enclosure number you just recorded.

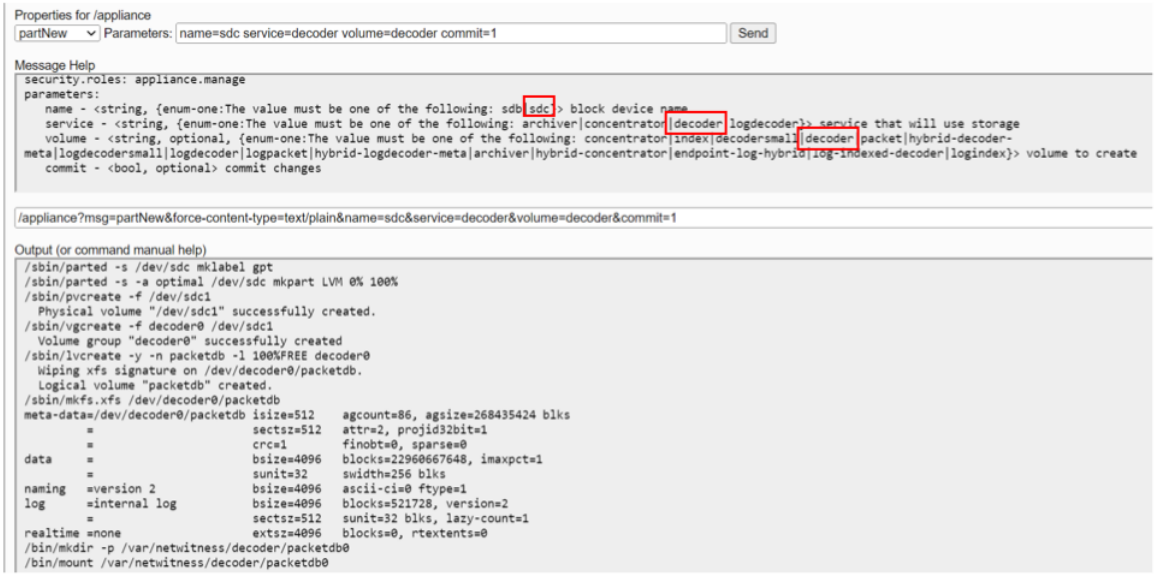
   ```
   controller=1 enclosure=72 scheme=network-hybrid preferSecure=1 commit=1
   ```

   a. The following example illustrates what you should see after you create a RAID array.

b. Execute `devlist` command to find the exact memory distribution between the newly created raids , in network hybrid the memory for ‘sdc’ raid is more than ‘sdb' raid ,therefore packetdb will be installed in the raid with higher memory allocated that is 'sdc’ .

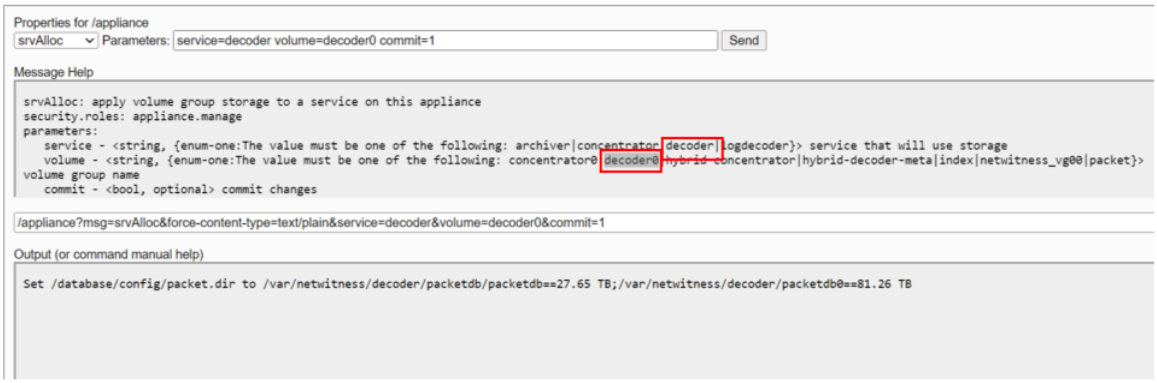


c. Execute the `lsblk` command to list all the raids that are newly created.



3. Execute the `partNew` command with the following parameters to create partitions and mount points in the `/etc/fstab` file.

a. `name=sdb service=concentrator volume=concentrator commit=1`

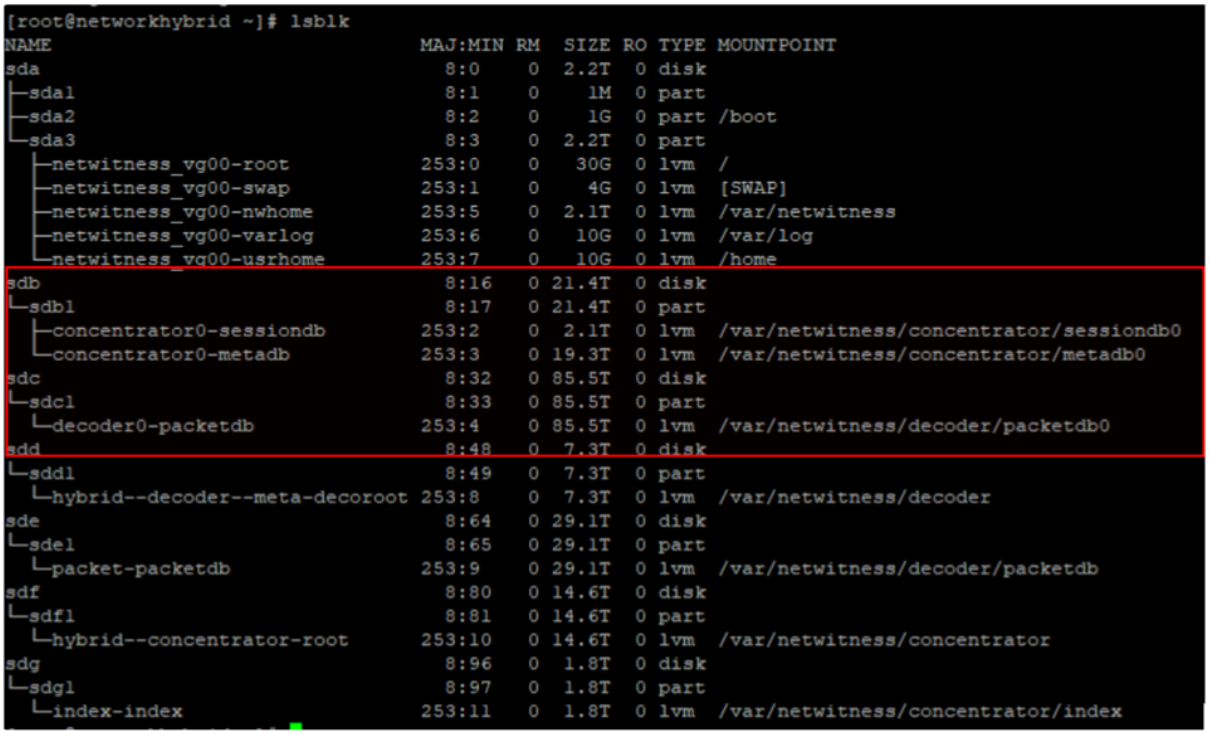


b. `name=sdc service=decoder volume=decoder commit=1`

4. Execute the `srvAlloc` command with the following parameters to allocate the space to decoder and concentrator services.

   a. This adds storage to the decoder service configuration and restarts the service every time it is executed.

      `service=decoder volume=decoder0 commit=1`



b. This adds storage to the concentrator service configuration and restarts the service every time it is executed.

```
service=concentrator volume=concentrator0 commit=1
```

5. Execute the `lsblk` command to list all the raids and partition in the service.

```
[root@networkhybrid ~]# lsblk

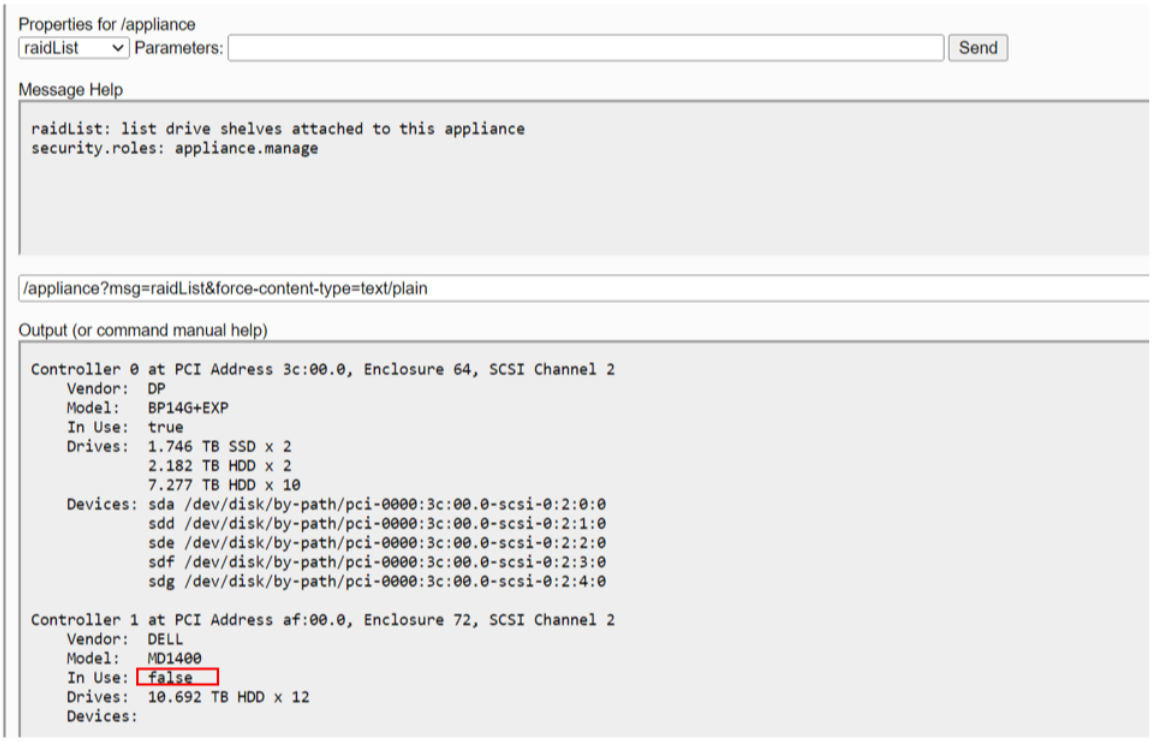
Configure Storage for Endpoint Log Hybrid using NW-PV-A/NW-PV-A-N

The following scenario configures storage on one, non-encrypted, 12-Drive PowerVault for a Endpoint Log Hybrid physical host.

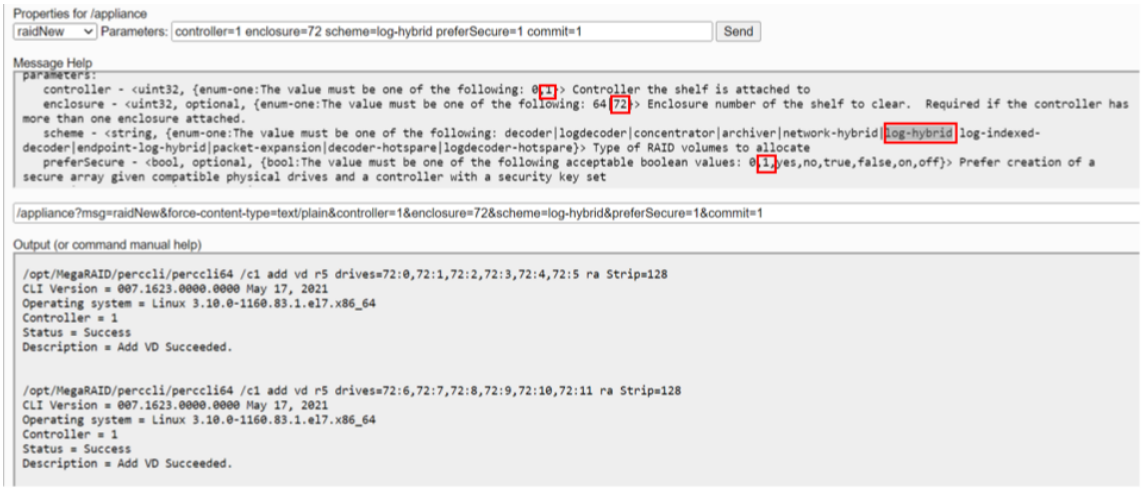


1. Execute the `raidList` command.
   a. Record the Controller Number, Enclosure Number, In Use, Drives, and Devices. You should see the following information.

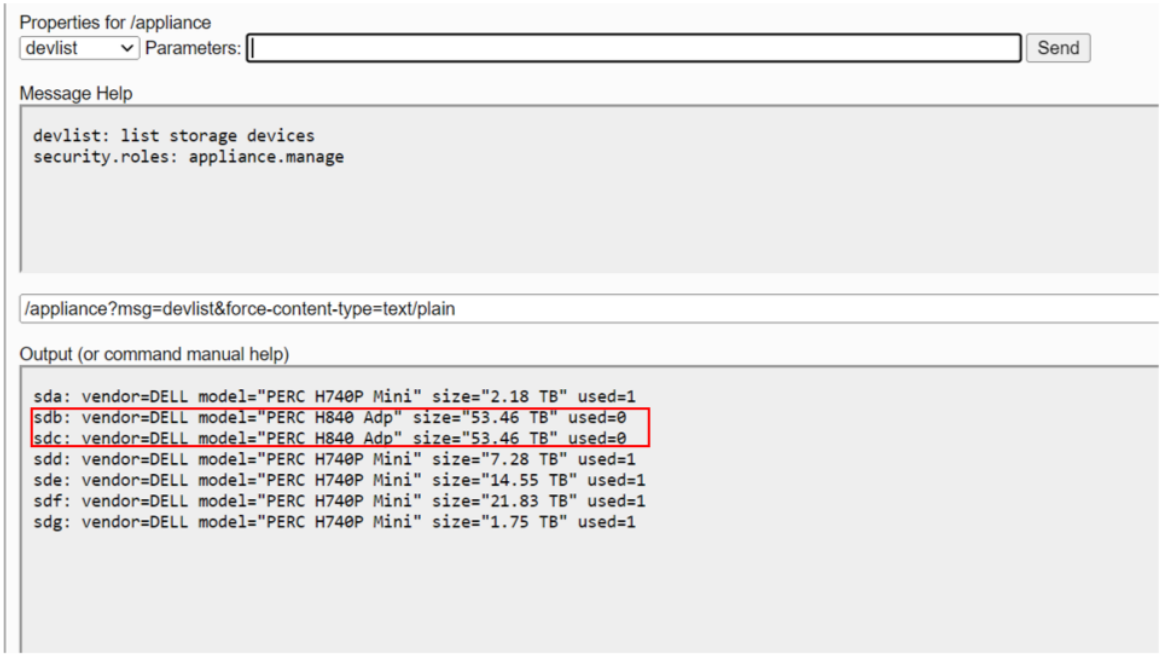
      `In Use: FALSE`

      `Devices: <empty>`

   b. Verify the Drive Count, Size, and Vendor.



The following example illustrates what you should see before you create a RAID array.

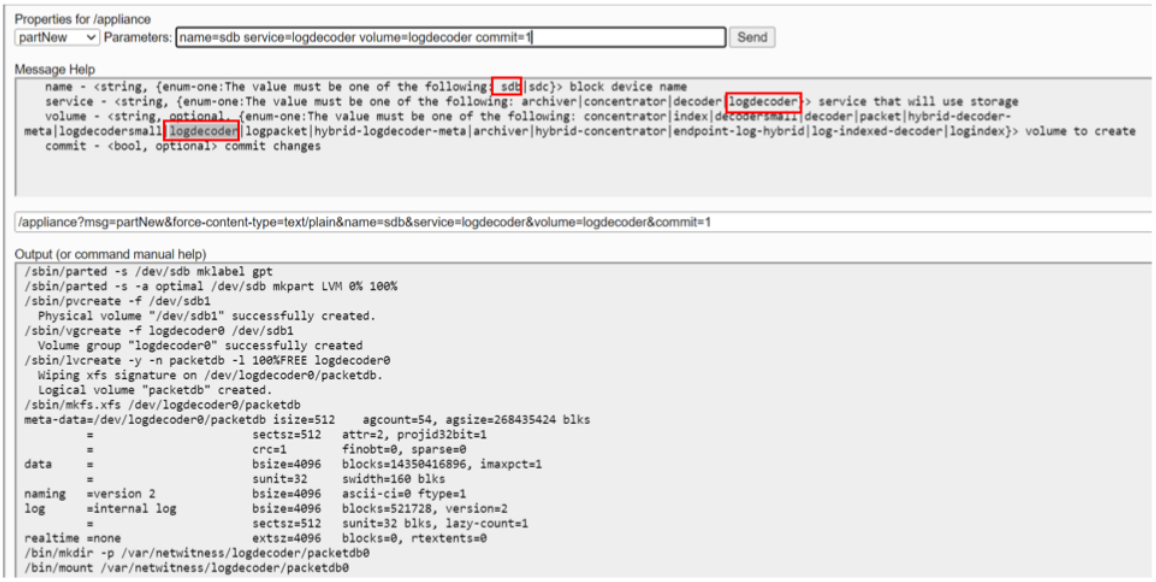


2. Execute the `raidNew` command with the following parameters using the controller number and the enclosure number you just recorded.

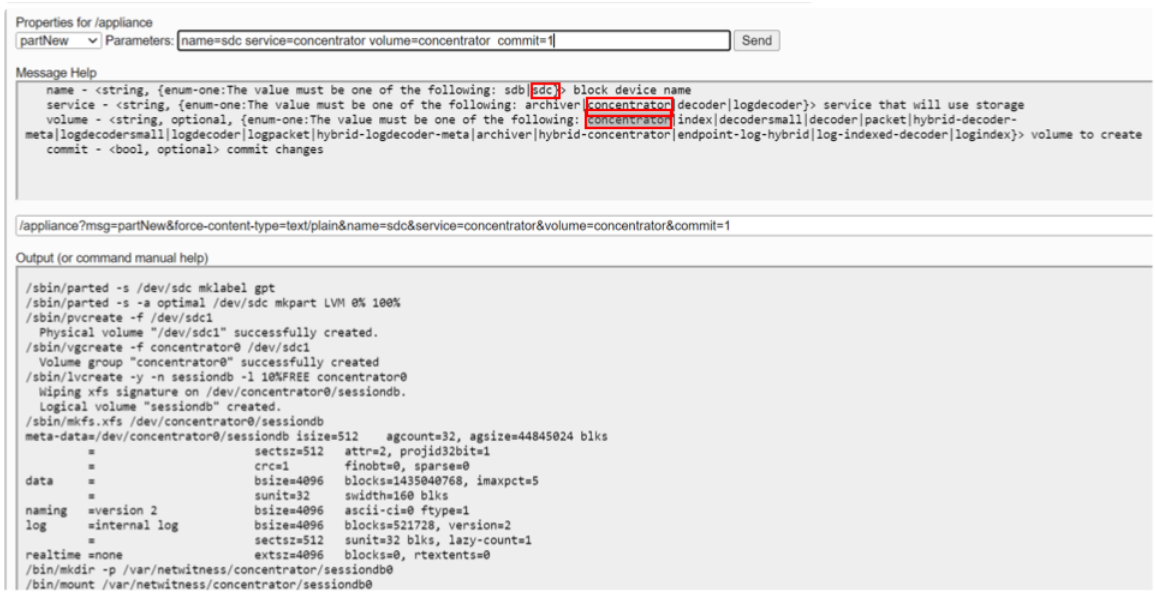
   `controller=1 enclosure=72 scheme=log-hybrid preferSecure=1 commit=1`

   a. The following example illustrates what you should see after you create a RAID array.

   b. Execute the `devlist` command to find the exact memory distribution for the newly created raids, in endpoint-log-hybrid both are exactly equal , therefore any service can be installed in any of the raid.



c. Execute the `lsblk` command at backend to list the newly created raids.



3. Execute the `partNew` command with the following parameters to create partitions and mount points in the `/etc/fstab` file.

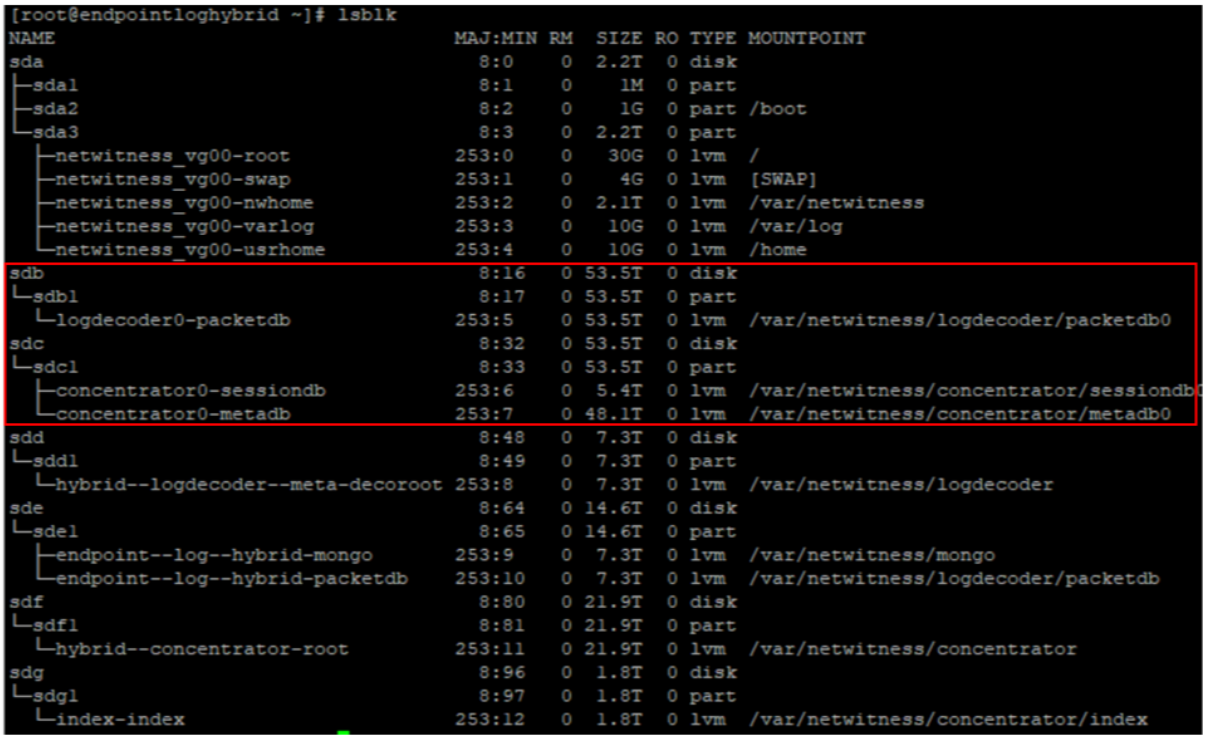
a. `name=sdb service=logdecoder volume=logdecoder commit=1`

b. `name=sdc service=concentrator volume=concentrator commit=1`

4. Execute the `srvAlloc` command with the following parameters to allocate the space to logdecoder and concentrator services.

   a. This adds storage to the logdecoder service configuration and restarts the service every time it is executed.

      `service=logdecoder volume=logdecoder0 commit=1`



b. This adds storage to the concentrator service configuration and restarts the service every time it is executed.

```
service=concentrator volume=concentrator0 commit=1
```

5. Execute `lsblk` command to list all the raids and partitions in the service.

```
[root@endpointloghybrid ~]# lsblk
NAME                                 MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT

Set Up System Security

This guide provides information about setting up system-wide security in NetWitness Platform and controlling user access. The system administrator needs to understand system-wide security settings, user accounts, system roles, permissions, and access to services.

This guide contains the following sections:

- Setting Up System Security
- How Role-Based Access Control Works
- Manage Users with Roles and Permissions
- (Optional) Set Up Public Key Infrastructure (PKI) Authentication
- References

Setting Up System Security

Setting up system security involves configuring password complexity and other system-level security settings for users to securely log in to NetWitness and to prevent unauthorized user access.

Set Up System Security Workflow

This figure shows the high-level workflow for setting up the system security.

First, you can configure password complexity by setting up password strength by specifying maximum password length, decimals, special characters, and so on. Next, you should change the default administrator passwords. Then you can configure system-level security by adjusting the security settings such as lockout period, maximum login failures, session timeout, idle period, and case-sensitive usernames. You can also configure optional settings for external authentication, PKI authentication, and a customized login banner.

These are the procedures for setting up system security:

- Configure Password Complexity
- Change the Default Admin Passwords
- Configure System-Level Security Settings
- (Optional) Configure External Authentication
- (Optional) Configure PKI Authentication
- (Optional) Create a Customized Login Banner

Configure Password Complexity

Passwords are an important part of your network security strategy. They provide critical front-line protection for your computer systems and help prevent attacks and unauthorized access to private information.

Password policies, designed to enhance the security of corporate networks, vary depending on the industry, corporate requirements, and regulations. Because of these password policy variations, NetWitness software allows you to configure the password complexity requirements for internal NetWitness users to conform to your corporate password policy guidelines.

Password complexity requirements apply only to internal users and are not enforced for external users. External users rely on their own methods and systems to enforce password complexity.

In addition, you can set a global default user expiration period and determine if and when internal users receive notification that their passwords are about to expire. The password expiration notification consists of a password expiration message when a user logs on to NetWitness.

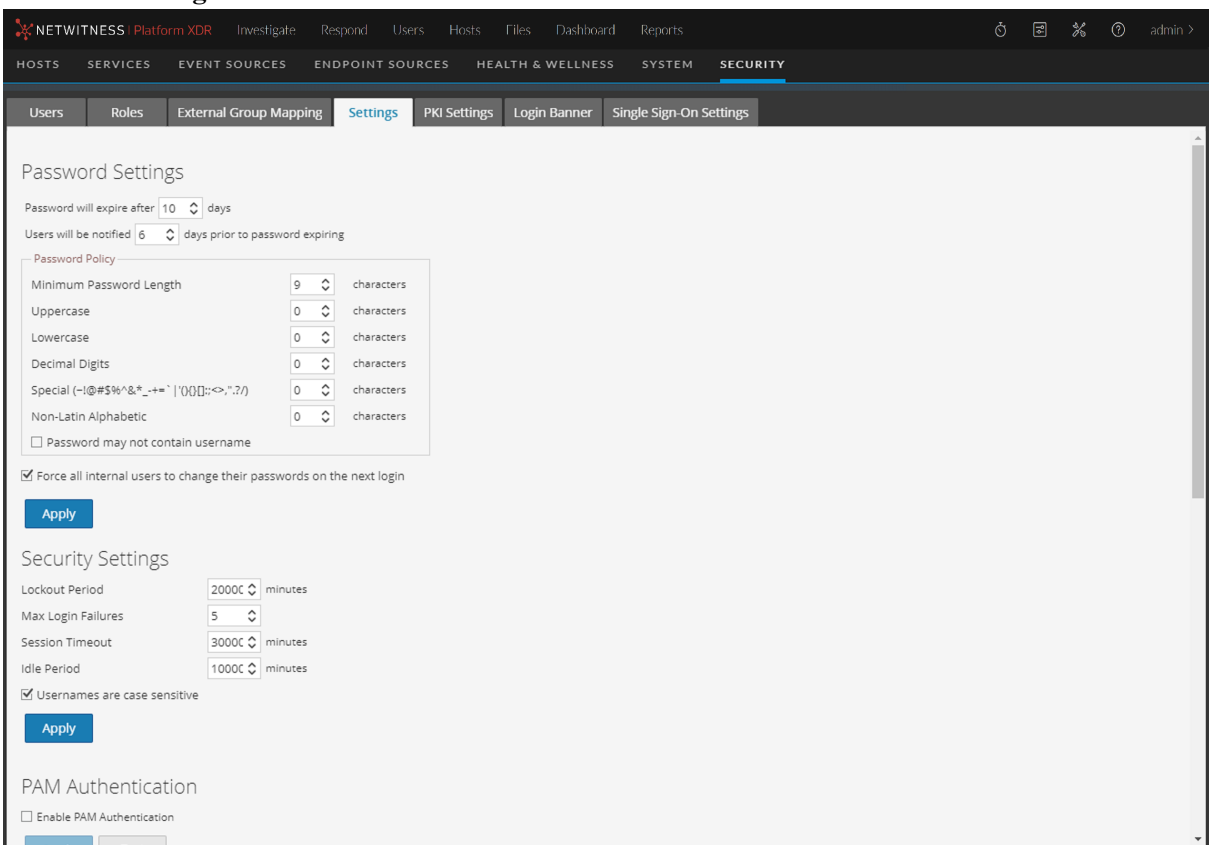
Password Strength

Strong passwords make it more difficult for attackers to guess user passwords and help prevent unauthorized access to your organization's network. You can define the appropriate level of password strength for your NetWitness users. When you configure the password strength settings, they apply to internal NetWitness users, including the admin user.

You can choose to enforce any combination of the following password strength requirements when a NetWitness user creates or changes their password:

- Minimum password length
- Minimum number of uppercase characters
- Minimum number of lowercase characters
- Minimum number of decimals (0 through 9)
- Minimum number of special characters
- Minimum number of non-Latin alphabetic characters (includes Unicode characters from Asian languages)
- Whether or not the password can contain the username

For example, you can create a strong password requirement that has a minimum of 9 characters, cannot contain the username of the user, and contains a mix of uppercase and lowercase letters, numbers, and special characters.



If you choose to enforce a minimum number of non-Latin alphabetic characters, ensure that your users have these characters available to them when setting their passwords.

For an example of a strong password policy, see the "STIG Compliant Passwords" in the *System Maintenance Guide*.

Configure Password Strength

1. In NetWitness, go to  **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.

2. Click the **Settings** tab.

3. In the **Password Settings** section, select the password complexity requirements to enforce when NetWitness users set their passwords and specify the minimum characters required, if applicable. Set the value to 0 for requirements you do not want to enforce, except for Minimum Password Length, which has a minimum value of 9 characters.

Note: In 11.2 and previous versions, the minimum password length is 8. Hence, on upgrade or update from previous versions to 11.3, you must set the minimum password length to 9 characters.

Requirement	Description
Password will expire after <n> days	The default number of days before a password expires for all internal NetWitness users. A value of zero (0) disables password expiration. For new installations, the default value is 30. For upgrades, the previous value will migrate automatically to the upgraded installation.
Users will be notified <n> days prior to password expiring	The number of days before the password expiration date, to notify a user that their password is about to expire. Users see a Password Expiration Message dialog when they log on to NetWitness. The minimum value is 1 day.

Requirement	Description
Minimum Password Length	Specifies a minimum password length. A minimum password length prevents users from using short passwords that are easy to guess. There is a minimum password length of 9 characters required by default. **Note:** In Version 11.2 and earlier versions, the minimum password length is 8. In Version 11.3, the minimum password length changed to 9. On upgrade or update from earlier versions to Version 11.3, users can still create a password with 8 characters until you explicitly set the minimum password length to 9 characters.
Uppercase	Specifies a minimum number of uppercase characters for the password. This includes European language characters A through Z, with diacritic marks, Greek characters, and Cyrillic characters. For example: • Cyrillic uppercase: Д Ц • Greek uppercase: Π Λ
Lowercase	Specifies a minimum number of lowercase characters for the password. This includes European language characters a through z, sharp-s, with diacritic marks, Greek characters, and Cyrillic characters. For example: • Cyrillic lowercase: д ц • Greek lowercase: π λ
Decimal Digits	Specifies a minimum number of decimal characters (0 through 9) for the password.
Special (~!@#$%^&*_-+=`|'(){}[];:<>,".?/)	Specifies a minimum number of special characters for the password: `~!@#$%^&*_-+=`|'(){}[];:<>,".?/`
Non-Latin Alphabetic	Specifies a minimum number of Unicode alphabetic characters that are not uppercase or lowercase. This includes Unicode characters from Asian languages. For example: • Kanji (Japanese): 頁 (leaf) 枒 (tree)
Password May Not Contain Username	Specifies that a password cannot contain the case-insensitive username of the user.

4. If you want your password policy changes to take effect at the next login instead of the next password change, select **Force all internal users to change their passwords on the next login**. Note that this setting is selected by default.
5. Click **Apply**.
   The password strength settings take effect when internal users create or change their passwords. If you selected **Force all internal users to change their passwords on the next login**, all internal users must change their password the next time they log on to NetWitness.

Change the Default Admin Passwords

The system administrator's user account is installed with NetWitness. The username is **admin** and the default password is the password that was entered in the Text-based User Interface (TUI) during the NetWitness installation process. The **Administrators** role is assigned to admin. This role has full system privileges to control what a user can do and which services a user can access. The only modification you can make to this account is to change the password. Unlike other NetWitness users, changes to the **admin** user password do not automatically propagate to downstream services. When you configure the password strength settings, they apply to all NetWitness users, including the admin user.

Passwords, an important aspect of computer security, are the front line of protection for your system. The **admin** user is pre-installed in NetWitness and on each Core service. For security, you create the users and roles for your organization in NetWitness, and on each Core service.

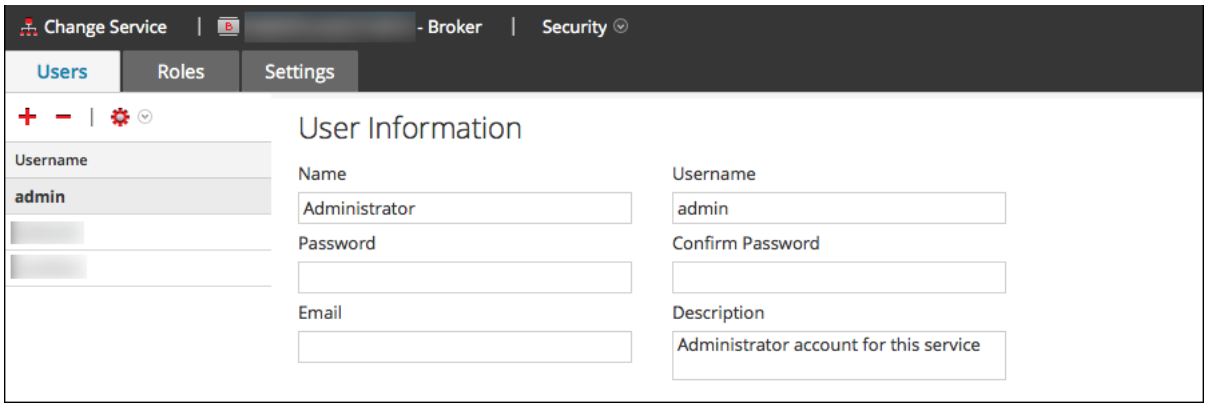
Best Practices

NetWitness recommends the following best practices:

- Change the **admin** password of each service from the default.
- Create a different password for the **admin** account on each service.

Change the admin Password for the NetWitness

Change the **admin** password for the NetWitness in the Profile view. See "Change Password" in the *NetWitness Getting Started Guide*. The password of the **admin** user does not propagate to Core services.



Note: After you change the admin password, you must remove and re-add a data source on the Reporting Engine. For more information, see the **Remove and re-add a Data Source on the Reporting Engine** section below.

Change the admin Password for Core Services

To change the admin password for a Core service:

1. Go to  **(Admin) > Services.**
2. Select a service, and then select  **> View > Security**.

3. On the **Users** tab, select the **admin** user.

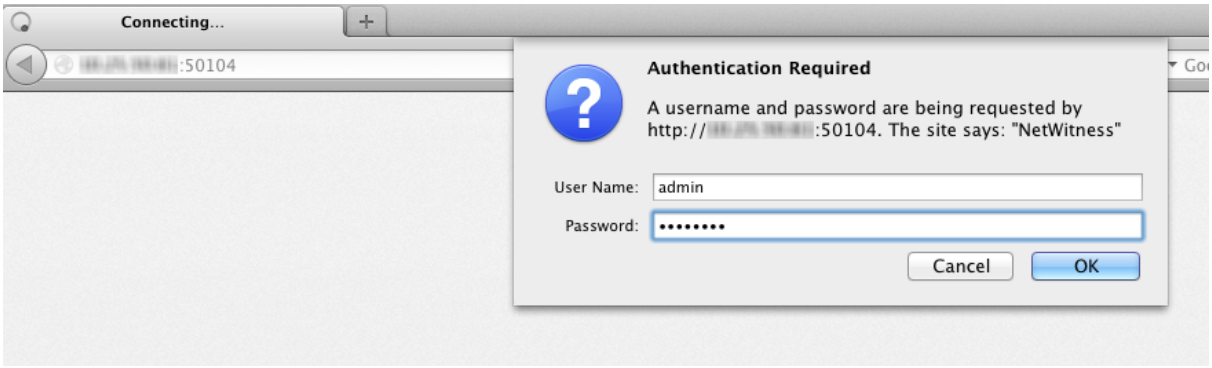
4. In the **Password** field, type a new admin password for the selected service.
5. In the **Confirm Password** field, retype the new password.
6. Click **Apply**.

Note: After you change the admin password, you must remove and re-add a data source on the Reporting Engine. For more information, see **Remove and re-add a Data Source on the Reporting Engine** below.

Remove and Re-add a Data Source on the Reporting Engine

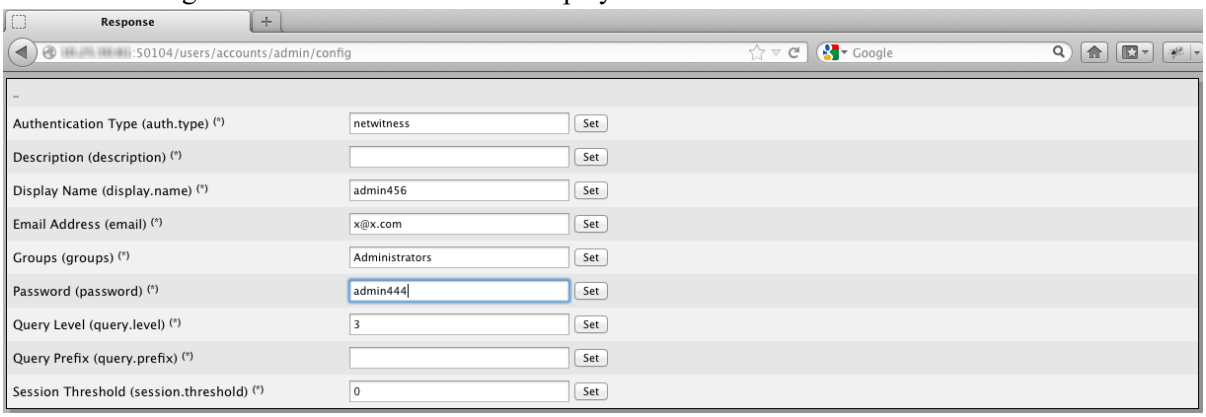
Reporting Engine validates a data source using the data source username and password. If you change the username or password of a data source, you must remove and re-add the data source.

To remove and re-add a data source on the Reporting Engine:



1. Go to **(Admin) > Services**.
2. In the Services view, select Reporting Engine and **View > Config**.
3. Click the **Sources** tab.
4. Select a service to remove and click .
5. Click and select **Available Services.**
6. Select the service you removed in step 4 and click **OK**.
7. When prompted, enter the new username and password for the service.

Change the admin Password for a Service Using the REST API



In rare circumstances, you may need to change the admin password for a Core service outside of the NetWitness user interface. This is simply another way to perform the Core service password change, and is not the preferred method.

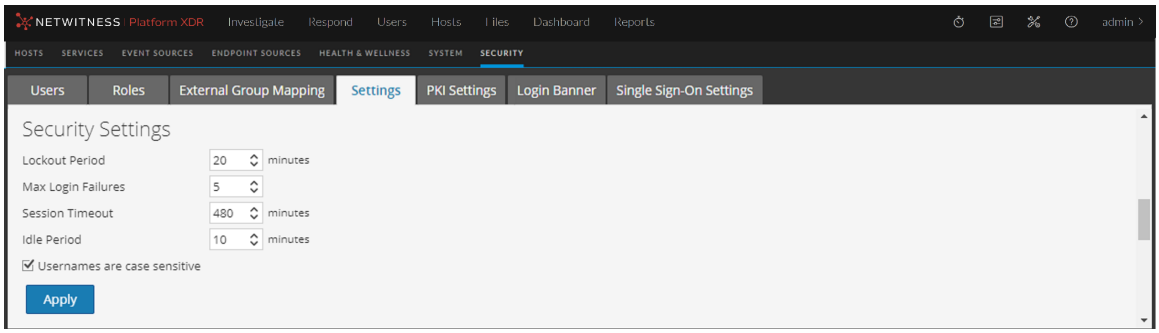
To change the admin password for the service using the REST User Interface:

1. Open a web browser, and go to the following URL:
   <hostname>:<port>
   where the **hostname** is the name of a NetWitness Core service and **port** is the port used for REST communication. Here is an example for a Decoder: `http://10.20.30.40:50104`
   The authentication dialog is displayed.

2. In the dialog, enter the user name and password used for authentication as admin on the service, and click **OK**. The default user name is **admin** and the default password is **netwitness**.
   The REST window for the service is displayed.
3. Navigate through the node structure to **users/accounts/admin/config**.
   The user configuration fields for admin are displayed in the browser window.

4. In the Password field, type a new admin password and click **Set**.

Configure System-Level Security Settings



Most global security settings, such as the maximum number of failed login attempts to allow, apply to all NetWitness users and sessions. Settings related to passwords in the Password Strength section, such as password expiration period and the default number of days before user passwords expire, apply to internal NetWitness users, but not external users.

Configure Security Settings

1. Go to  **(Admin) > Security**.

   The Security view is displayed with the **Users** tab open.

2. Click the **Settings** tab.

3. In the **Security Settings** section, specify values for the fields as described in the following table.

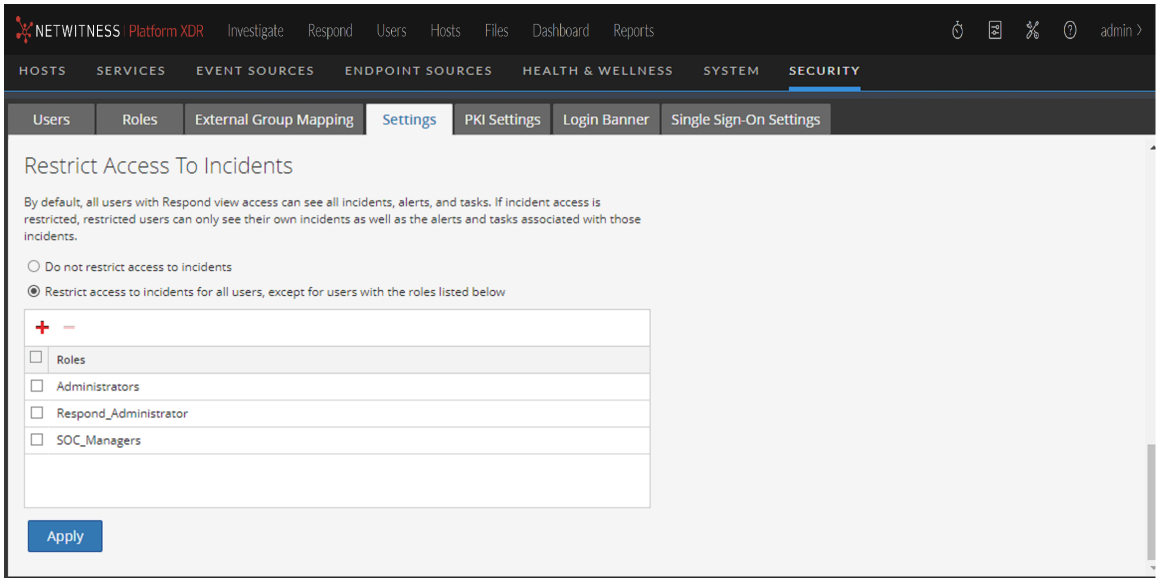
Field	Description
Lockout Period	Number of minutes to lock a user out of NetWitness after the configured number of failed logins is exceeded. The default value is 20 minutes.
Max Login Failures	The maximum number of unsuccessful login attempts before a user is locked out. The default value is 5.
Session Timeout	The maximum duration of a user session before timing out in minutes. The default value is 480. The session times out when the configured time has elapsed, after which the user must log in again. The maximum allowed value is 30,000. **Note:** If you migrated to NetWitness 11.x from version 10.6.x and previously used a value of 0 for an unlimited session timeout, the value was reset automatically to 30,000 minutes, as a value of 0 is no longer supported.

Field	Description
Idle Period	Number of minutes of inactivity before a session times out. The default value is 10. The maximum allowed value is 30,000. **Note:** If you migrated to NetWitness 11.x from version 10.6.x and previously used a value of 0 for an unlimited idle period, the value was reset automatically to the default value of 10, as a value of 0 is no longer supported.
Usernames are case sensitive	Select this option if you want the Username field on the NetWitness login to be case sensitive. For example, if usernames are case sensitive, you could use admin to log on to NetWitness, but you could not use Admin.

4. Click **Apply**. The Security Settings take effect immediately. If a password expires, the user receives a prompt to change the password when they log on to NetWitness.

Restrict Access to Incidents

By default, analysts can view all of the incidents, alerts, and tasks in the Respond view. If you have sensitive or restricted information that should not be shared, you can restrict what analysts and other users can see in the Respond view.



If you restrict access to incidents:

- Analysts can only see incidents assigned to them as well as the alerts and tasks associated with those incidents. Likewise, they can only change the status of and add journal entries (notes) to their own incidents.
- Analysts cannot see the Alerts and Tasks tabs in the Respond view (Respond > Tasks and Respond > Alerts are hidden), so they cannot view all alerts and tasks.
- Analysts cannot see the Assignee button or change the assignee of an incident.
- Analysts cannot see the Related Indicators (alerts) panel (Incident Details view > Find Related tab in the left-side panel).
- When adding events to incidents from the Investigate views, users can only add events to incidents to which they have access. The list of incidents to which users can add events only shows incidents that the user can access.
- When creating incidents from the Investigate views, users must have access to those incidents to view them in the Respond view. For example, when creating incidents from the Investigate view, Analysts must assign the incidents to themselves to view them in the Respond view.

Caution: These restrictions apply to all NetWitness users, except users with the **Administrators**, **Respond_Administrator**, and **SOC_Managers** roles. However, you can adjust the list of user roles whose access to incidents should not be restricted.

To restrict access to incidents:

1. Go to **(Admin) > Security** and click the **Settings** tab.
2. In the **Restrict Access to Incidents** section, select **Restrict access to incidents for all users, except for users with the roles listed below**.

3. In the list, add the user roles whose access to incidents should not be restricted.
4. Click **Apply**.
   Changes take effect on the next log in to NetWitness.

(Optional) Configure External Authentication

When a user logs in, NetWitness first attempts to authenticate locally. If no local user is found, and External Authentication configuration is enabled, an attempt is made to authenticate externally.

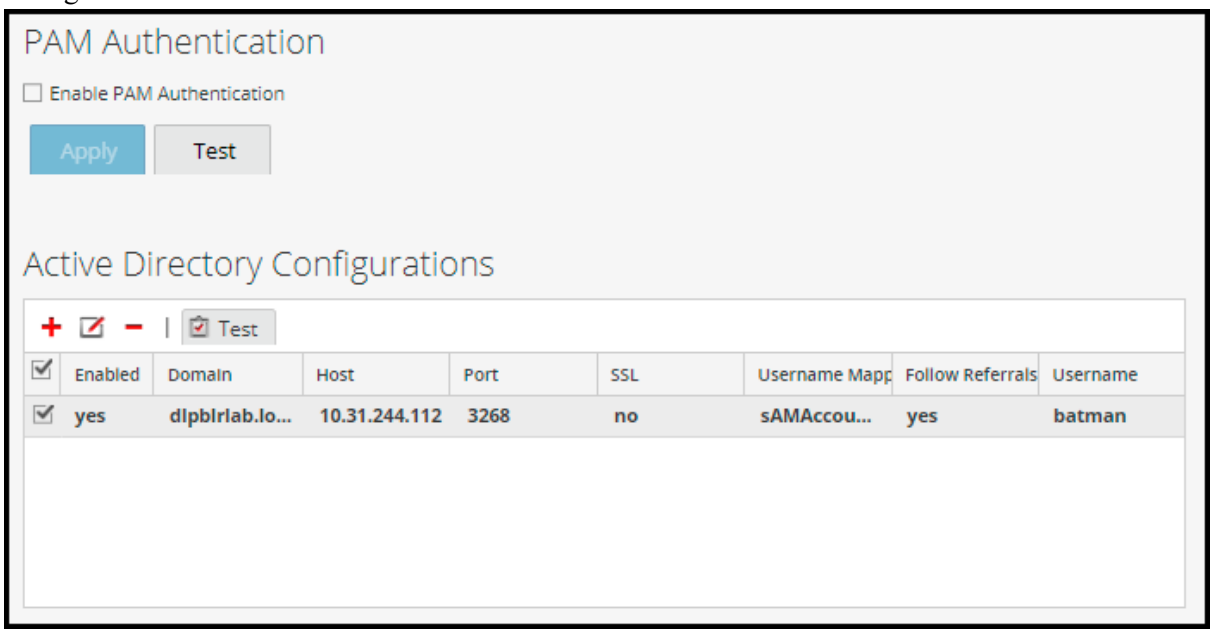
External authentication allows users who do not have an internal NetWitness user account to log on to NetWitness and receive role-based permissions.

NetWitness supports two methods of external authentication, Active Directory and Pluggable Authentication Modules (PAM). The below procedures describe how to configure and test each method.

Configure Active Directory

When a user logs in, NetWitness first attempts to authenticate locally. If no local user is found, and Active Directory configuration is enabled, an attempt is made to authenticate with Active Directory Service. You can configure Active Directory settings to enable authentication of external groups in the  (Admin) > Security view > Settings tab.

In an environment with multiple authentication servers, LDAP forwarding allows LDAP referral following for AD group lookups. LDAP forwarding can increase the time required to log on because AD group lookups are extended to connected authentication servers. When your AD instance attempts to contact domain controllers that are blocked by your firewall, users can experience a delay of several minutes in logging on to NetWitness. NetWitness has a configuration option that specifies whether LDAP forwarding occurs; by default, LDAP referrals are disabled. When disabled, your AD instance does not attempt to contact referred domain controllers.



Note: The Settings tab also provides the option to enable PAM configuration, which can be used simultaneously with Active Directory configurations. For information on enabling and configuring PAM authentication, see Configure PAM Login Capability.

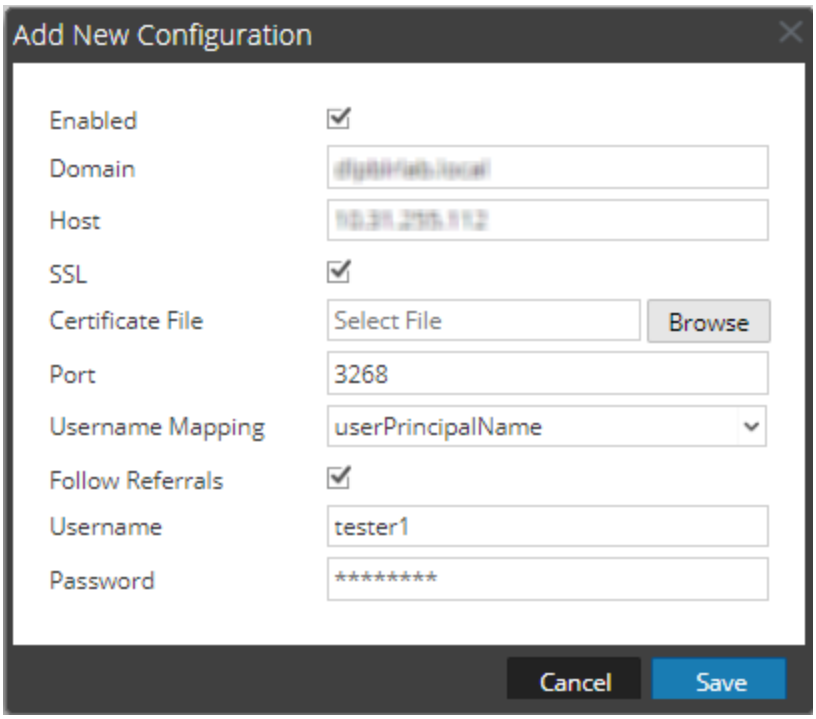
Configure Active Directory Authentication

To configure Active Directory authentication:

1. Go to  **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Settings** tab.
   The Active Directory Configurations list is displayed in the panel so that you can add or edit a

configuration.

3. Add, edit, or delete domains as necessary, as described in the following sections.
   The domains added to this list are automatically populated in the External Group Mapping tab so that you can map security roles to each group.



Note: To configure security roles used for Active Directory access, see (Optional) Map User Roles to External Groups.

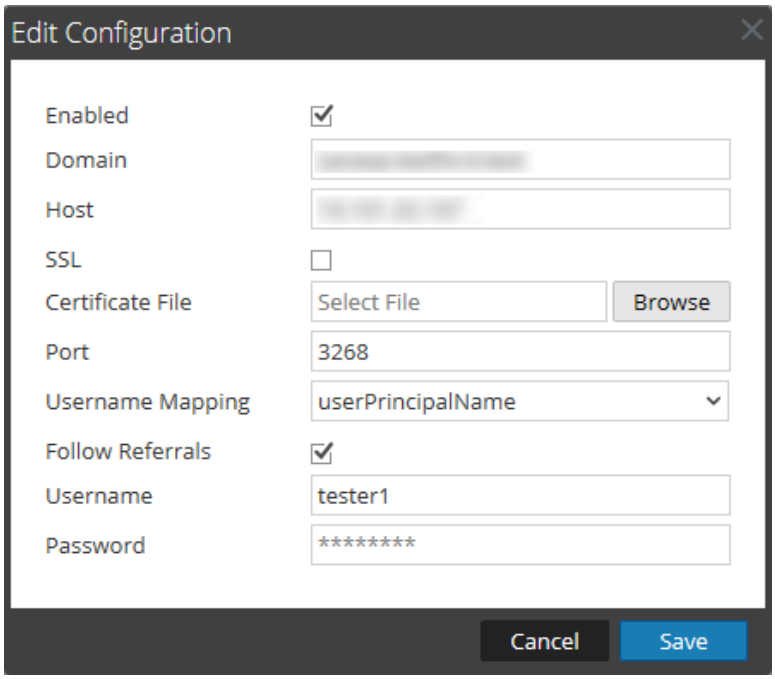
Note: After configuring an active directory with a domain in **Admin** > **Security** > **Settings**, once you authenticate successfully using the respective active directory credentials, you are tied to that specific active directory and the domain thus configured.

Add a New Active Directory Configuration

To add a new active directory configuration in the Active Directory Configurations list:

1. Under Active Directory Configurations, click +.
   The Add New Configuration dialog is displayed.

2. Select the **Enabled** checkbox.
3. Enter **Domain**, **Host** and **Port** information for the Active Directory Service.
4. (Optional) To select SSL for this configuration, select the **SSL** checkbox. You must then enter the Active Directory server certificate file by clicking **Browse** and selecting the desired file to upload.
5. In the **Username Mapping** field, select the Active Directory search field to use for username mapping. You can select userPrincipalName (UPN) or sAMAccountName.
6. For sites that have multiple authentication servers, click **Follow Referrals** to enable or disable LDAP referral following for AD group lookups.
7. In the **Username** and **Password** fields, enter the username and password for a bind user to access Active Directory. This is usually a service account that has permissions to query the domain and validate user accounts and group membership.



Note: If you selected sAMAccountName in the **Username Mapping** field, you must enter the username in the format "domain\user" to authenticate.

8. Click **Save**.
   The new configuration is listed in the Active Directory Configurations list.

Edit an Active Directory Configuration

To edit an active directory configuration in the Active Directory Configurations list:

1. Under **Active Directory Configurations**, select the configuration you wish to edit and click .
   The Edit Configuration dialog is displayed.

2. (Optional) Enter the **Domain**, **Host** and **Port** information for the Active Directory Service.
3. (Optional) To select SSL for this configuration, select the **SSL** checkbox. You must then enter the Active Directory server certificate file by clicking **Browse** and selecting the desired file to upload.
4. (Optional) In the **Username Mapping** field, select the the Active Directory search field to use for username mapping.
5. To specify the Follow LDAP referrals behavior in environments with multiple authentication servers, select the **Follow Referrals** checkbox.
   a. If you want to disable LDAP forwarding, clear the box.
   b. If you want to enable LDAP forwarding, select the box.
6. In the **Username** and **Password** fields, enter the username and password for a bind user to access Active Directory. This is usually a service account that has permissions to query the domain and validate user accounts and group membership.
7. Click **Save**.
   The configuration is listed in the Active Directory Configurations list.

Test an Active Directory Configuration

To test an Active Directory configuration:

1. Select the configuration to be tested from the Active Directory Configurations list.
2. In the toolbar, click Test.
   A message that the test is successful is displayed.
3. If the test does not succeed, review and edit the configuration.

Delete an Active Directory Configuration

To delete an Active Directory configuration:

1. Under Active Directory Configurations, select the configuration to be deleted from the Active Directory Configurations list.
2. In the toolbar, click −.
   A message is displayed warning you that all users in the selected Active Directory configuration will not be able to log in to NetWitness if it is deleted.
3. Do one of the following:
   a. To confirm the deletion, click **Yes**.
   b. To cancel the deletion, click **No**.

Configure PAM Login Capability

Pluggable Authentication Module (PAM) login capability involves two separate components:

- PAM for user authentication
- NSS for group authorization

Together they provide external users the capability to log on to NetWitness without having an internal NetWitness account, and to receive permissions or roles determined by mapping the external group to a NetWitness security role. Both components are required for a login to succeed.

External authentication is a system-level setting. Before configuring PAM, carefully review all of the information here.

Pluggable Authentication Modules

PAM is a Linux-provided library responsible for authenticating users against authentication providers such as RADIUS, Kerberos, and Agent for SecurID. For implementation, each authentication provider uses its own module, which is in the form of an operating system (OS) package such as pam_krb5. NetWitness uses the OS-provided PAM library, and the module that the PAM library is configured to use, to authenticate users.

Note: PAM provides only the ability to authenticate.

Name Service Switch

NSS is a Linux feature that provides databases that the OS and applications use to discover information like hostnames; user attributes like home directory, primary group, and login shell; and to list users that belong to a given group. Similar to PAM, NSS is configurable and uses modules to interact with different types of providers. NetWitness uses OS-provided NSS capabilities to authorize external PAM users by looking up whether a user is known to NSS and then requesting from NSS the groups of which that user is a member. NetWitness compares the results of the request to the NetWitness External Group Mapping and if a matching group is found, the user is granted access to log on to NetWitness with the level of security defined in the External Group Mapping.

Note: NSS does not provide authentication.

PAM and NSS Combination

Both PAM (authentication) and NSS (authorization) must succeed in order for an external user to be allowed to log on to NetWitness. The procedure for configuring and troubleshooting PAM is different than the procedure for configuring and troubleshooting NSS. The PAM examples in this guide include Kerberos, RADIUS, and SecurID. The NSS example includes UNIX. The PAM and NSS module combination used is determined by site needs.

Process Overview

To configure PAM login capability, follow the instructions in this document to complete each step:

1. Configure and test the PAM module.
2. Configure and test the NSS service.
3. Enable PAM in NetWitness Server.
4. Create group mappings in NetWitness Server.

Before beginning the setup of PAM, review the procedure and gather the external authentication server details depending on the PAM module you want to implement.

Before beginning the setup of NSS, review the procedure, identify the group names that you will use in the External Group mapping, and gather the external authentication server details, depending on the NSS service being used.

Before beginning setup of PAM in NetWitness, identify the group names that you will use in the External Group mapping. When mapping roles, the role in NetWitness must match a group name that exists in the external authentication server.

Configure and Test the PAM Module

Choose one of the following sections to set up and configure the PAM component:

- PAM Kerberos
- PAM RADIUS
- PAM Agent for SecurID

PAM Kerberos

Kerberos Communication Ports – TCP 88

To configure PAM authentication using Kerberos:

1. Execute the following command (but first verify that the `krb5-workstation` package is installed in your environment):
   `yum install krb5-workstation pam_krb5`
2. Edit the following lines in the Kerberos configuration file `/etc/krb5.conf`. Replace variables, which are delimited by <angle brackets>, with your values and omitting the angle brackets. Capitalization is required where shown.

```
# Configuration snippets may be placed in this directory as well
includedir /etc/krb5.conf.d/

[logging]
default = FILE:/var/log/krb5libs.log
kdc = FILE:/var/log/krb5kdc.log
admin_server = FILE:/var/log/kadmind.log

[libdefaults]
 dns_lookup_realm = false
 ticket_lifetime = 24h
 dns_lookup_kdc = true
 renew_lifetime = 7d
 forwardable = true
 rdns = false
 default_realm = <DOMAIN.COM>
 default_ccache_name = KEYRING:persistent:%{uid}

[realms]
 <DOMAIN.COM> = {
 kdc = <SERVER.DOMAIN.COM>
 admin_server = <SERVER.DOMAIN.COM>
 }

 [domain_realm]
 <domain.com> = <DOMAIN.COM>
 <.domain.com> = <DOMAIN.COM>
```

3. Test the Kerberos configuration with the command:
   `kinit <user>@<DOMAIN.COM>`
   No output after entering the password indicates success.
4. Edit the NetWitness Server PAM configuration file `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:
   `auth sufficient pam_krb5.so no_user_check`

This completes the configuration for PAM Kerberos. Now, go to the next section, Configure and Test the NSS UNIX Service.

PAM RADIUS

Radius Communication Ports - UDP 1812 or UDP 1813

To configure PAM authentication using Radius you must add the NetWitness Server to your Radius Server's Client list and configure a shared secret. Contact the Radius Server Administrator for this procedure.

To configure PAM authentication using RADIUS:

1. Execute the following command (but first verify that the `pam_radius_auth` package is installed in your environment):

   ```
   yum install pam_radius_auth
   ```

2. Edit the RADIUS configuration file, `/etc/raddb/server` as follows:

   ```
   # server[:port] shared_secret  timeout (s)
   server    secret     3
   ```

3. Edit the NetWitness Server PAM configuration file `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:

   ```
   auth sufficient pam_radius_auth.so
   ```

4. Execute the following command to copy the RADIUS library:

   ```
   cp /usr/lib/security/pam_radius_auth.so /usr/lib64/security/
   ```

Caution: For PAM RADIUS to work, the `/etc/raddb/server` files must have write permission. The command needed for this is: `chown netwitness:netwitness /etc/raddb/server`.

Caution: You must restart the Jetty server after making the above changes for PAM RADIUS. The command for this is:
`systemctl restart jetty`

The PAM Modules and associated services output information to `/var/log/messages` and `/var/log/secure`. These outputs can be used to assist in troubleshooting configuration problems.

The following procedure is an example of the steps to configure PAM authentication for RADIUS using SecurID:

Note: The examples in these tasks use Authentication Manager as the RADIUS server.

1. Execute the following command (but first verify that the `pam_radius_auth` package is installed in your environment):

   ```
   yum install pam_radius_auth
   ```

2. Edit the RADIUS configuration file, `/etc/raddb/server` and update it with the authentication manager instance hostname, shared secret and timeout value:

   ```
   # server[:port] shared_secret timeout (s)
    111.222.33.44         secret        1
    #other-server        other-secret 3
    192.168.12.200:6369 securid      10
   ```

Note: You must comment out `127.0.0.1` and `other-server` lines and add the IP address of the authentication manager primary instance with RADIUS port number (for example, `192.168.12.200:1812`), RADIUS shared secret, and a timeout value of 10.

3. Edit the NetWitness Server PAM configuration file `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:

   ```
   auth sufficient pam_radius_auth.so
   ```

   Note: You can add `debug` to the end of the above line in the `/etc/pam.d/securityanalytics` file to enables PAM debugging (for example, `auth sufficient pam_radius_auth.so debug`)

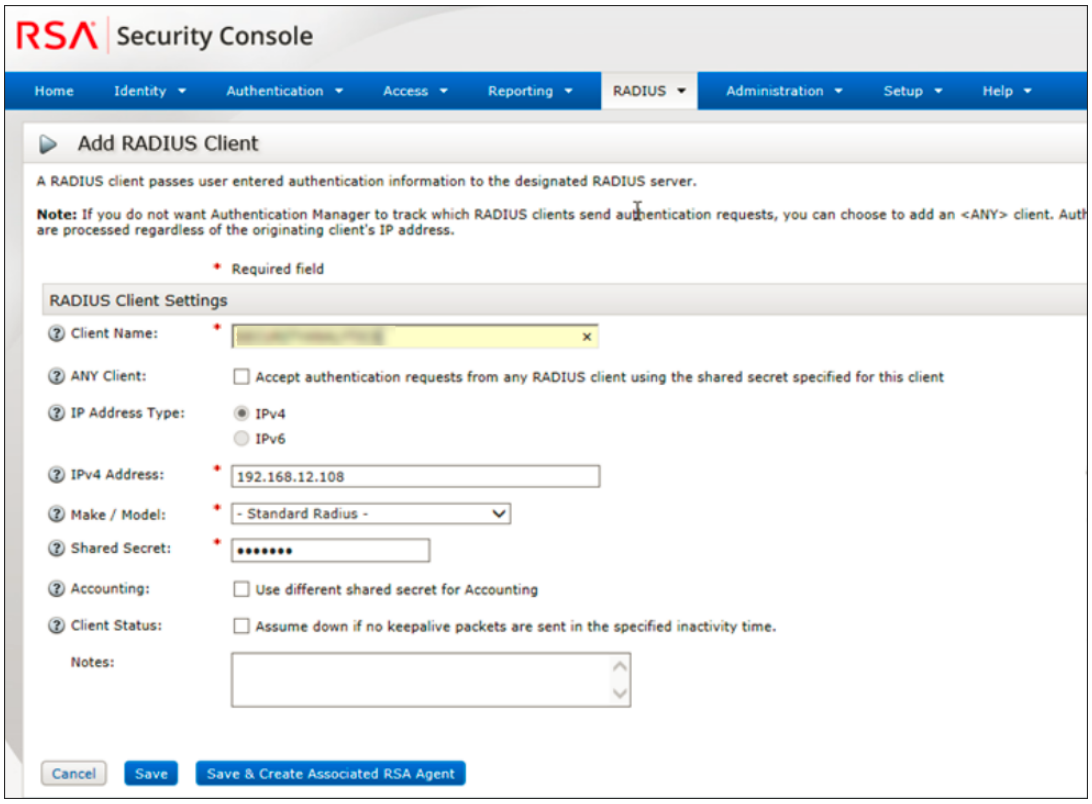
4. Run the following command to copy the RADIUS library:

   ```
   cp /usr/lib/security/pam_radius_auth.so /usr/lib64/security/
   ```

The PAM Modules and associated services output information to `/var/log/messages` and `/var/log/secure`.These outputs can be used to assist in troubleshooting configuration problems.

Add a RADIUS Client and Associated Agent

Note: The examples in these tasks use Authentication Manager as the RADIUS server.
You must use administrative account credentials to log on Authentication Manager Security Console.



To add a RADIUS Client and Associated Agent:

1. Log on to Authentication Manager.

   The Security Console is displayed.

2. In the Security Console, click **RADIUS > RADIUS Client > Add New**.

   The Add RADIUS Client page is displayed.

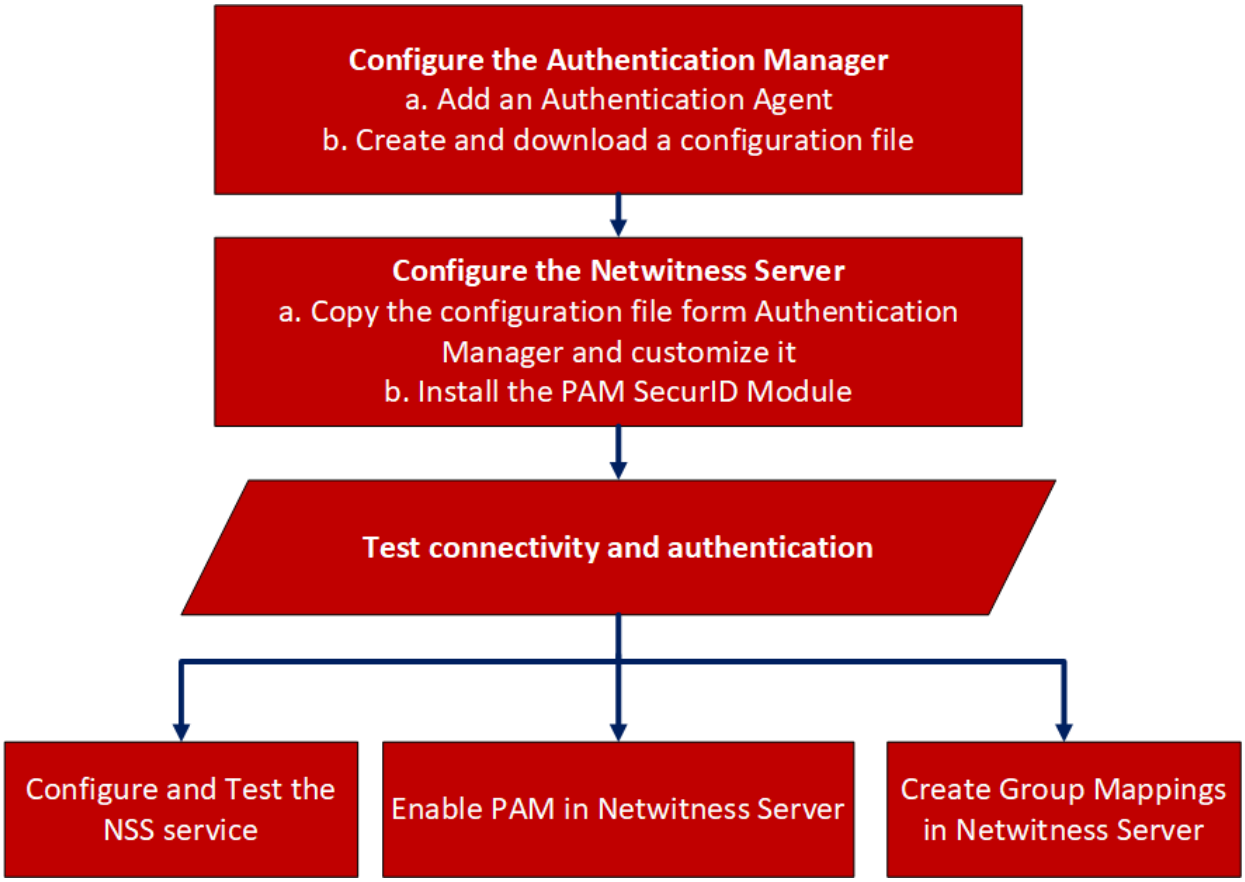
3. In RADIUS Client Settings, provide the following information:
   a. In the **Client Name** field, enter the name of the client, for example, NetWitness.
   b. In the **IPv4 Address** field, enter the IPv4 address of the RADIUS client, for example, 192.168.12.108.
   c. In the **Make/Model** drop-down list, select the type of RADIUS client, for example, Fortinet.
   d. In the **Shared Secret** field, enter the authentication shared secret.
4. Click **Save & Create Associated Netwitness Agent**.

5. Click **Save**.

If the Authentication Manager instance is unable to find the authentication agent on the network, a warning page is displayed. Click **Yes, Save Agent**.

For more information, see the "Add a RADIUS Client" topic in *Authentication Manager 8.2 Administrator's Guide*.

This completes the configuration for PAM RADIUS. Now, go to the next section, Configure and Test the NSS UNIX Service.

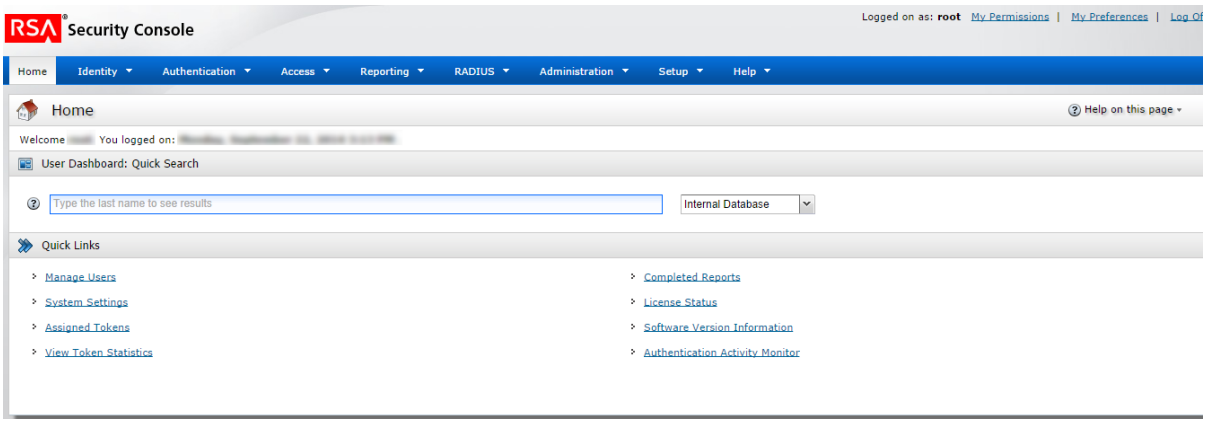


PAM Agent for SecurID

PAM Communication Port - UDP 5500

The SecurID PAM module is supported only under the following condition:

Trusted connections must be enabled and functioning between NetWitness and Core services.



Configure the SecurID PAM Module

To configure Authentication Manager:

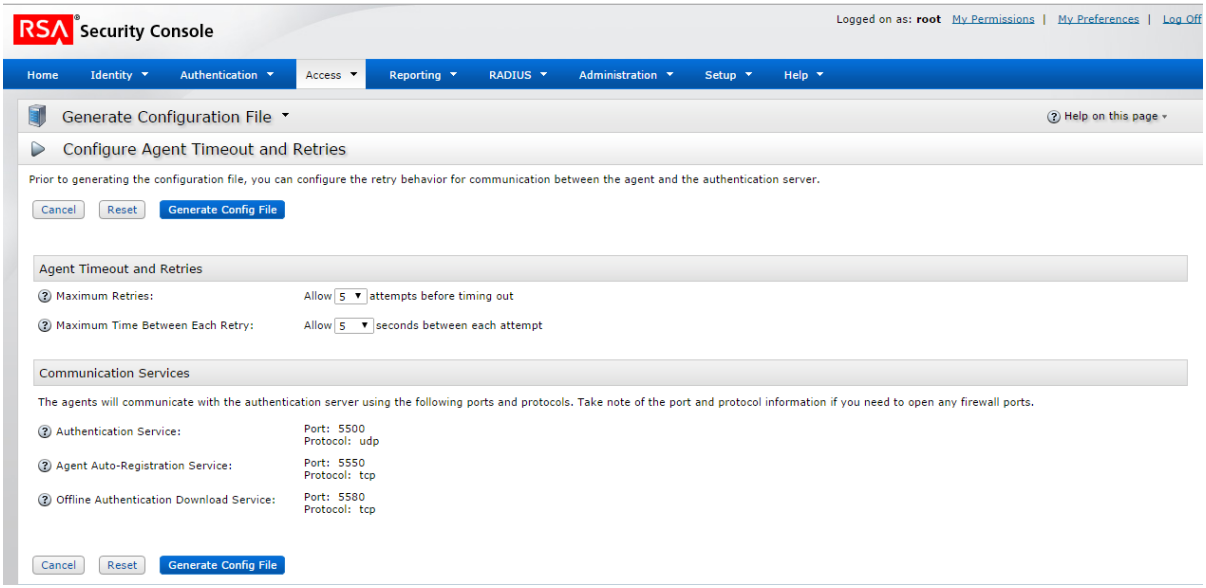
1. Log on to Authentication Manager.

   The Security Console is displayed.

2. In the Security Console, add a new authentication agent.

   Click **Access > Authentication Agents > Add New**.

   The Add New Authentication Agent page is displayed.



3. In the **Hostname** field, type the hostname of the NetWitness Server.
4. Click **Resolve IP**.

The IP address of the NetWitness Server is automatically displayed in the **IP Address** field.

5. Keep the default settings and click **Save**.
6. Generate a configuration file.

   Go to **Access > Authentication Agents > Generate Configuration File**.

   The Generate Configuration File page is displayed.

7. Keep the defaults and click **Generate Config File**.

   This creates **AM_Config.zip**, which contains two files.

8. Click **Download Now**.

To install and configure the PAM SecurID module:

1. On the NetWitness Server, make the following directory:

   `mkdir /var/ace`

2. On the NetWitness Server, copy `sdconf.rec` from the .zip file to `/var/ace`.
3. Create the text file `sdopts.rec` in the `/var/ace` directory.
4. Insert the following line:

   `CLIENT_IP=<IP address of NetWitness Server>`

5. Install the SecurID Authorization Agent for PAM, which is available in the yum repository:

   `yum install sid-pam-installer`

6. Run the install script:

   `/opt/rsa/pam-agent-installer/install_pam.sh`

7. Follow the prompts to accept or change the defaults.

8. Edit the NetWitness Server PAM configuration file, `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:

   ```
   auth sufficient pam_securid.so
   ```

This completes the installation of the SecurID PAM module. Next, test the connectivity and authentication. Then, follow the procedures in Configure and Test the NSS UNIX Service.

Note: If the PAM SecurID setup is not complete, it may crash the Jetty server and the NetWitness UI will not be displayed. You must wait until the PAM authentication configuration is complete and then restart the Jetty server.

To test connectivity and authentication:

1. Run `/opt/pam/bin/64bit/acetest`, and enter the **username** and **passcode**.
2. (Optional) If acetest fails, turn on debugging:

   ```
   vi/etc/sd_pam.conf
   RSATRACELEVEL=15
   ```

3. Run `/opt/pam/bin/64bit/acestatus`. The output is displayed as shown below.

   ```
   RSA ACE/Server Limits
    ---------------------
    Configuration Version : 15 Client Retries : 5
    Client Timeout : 5 DES Enabled : Yes

   RSA ACE/Static Information
    --------------------------
    Service : securid Protocol : udp Port Number : 5500

   RSA ACE/Dynamic Information
    ---------------------------
    Server Release : 8.1.0.0 Communication : 5

   RSA ACE/Server List
    -------------------
    Server Name :  auth81.netwitness.local
    Server Address :  192.168.100.10
    Server Active Address : 192.168.100.10
    Master : Yes Slave : No Primary : Yes
    Usage : Available for Authentications
   ```

4. (Optional) To troubleshoot the Authentication Manager server, go to **Reporting > Real-time Activity Monitors > Authentication Activity Monitor.** Then click **Start Monitor**.
5. If you changed the setting, reset RSATRACELEVEL to 0:

   ```
   vi/etc/sd_pam.conf
   RSATRACELEVEL=0
   ```

Caution: After installation, verify that VAR_ACE in the `/etc/sd_pam.conf` file points to the correct location of the sdconf.rec file. This is the path to the configuration files. The command needed for this is: `chown -R netwitness:netwitness /var/ace`.

This completes the configuration for PAM Agent for SecurID. Now, go to the next section, Configure and Test the NSS UNIX Service.

Configure and Test the NSS UNIX Service

Configuration

No configuration is necessary to enable the NSS UNIX module; it is enabled in the host operating system by default. To authorize a user for a specific group, simply add that user to the operating system and add them to a group:

1. Create an OS group to use add your external user to with this command:

   ```
   groupadd <groupname>
   ```

2. Add the external user to the OS with this command:

   ```
   adduser -G <groupname> -M -N <externalusername>
   ```

Note: This does NOT permit or allow access to the NetWitness Server console.

This completes the configuration for NSS UNIX. Next, go to Test NSS Functionality.

Test NSS Functionality

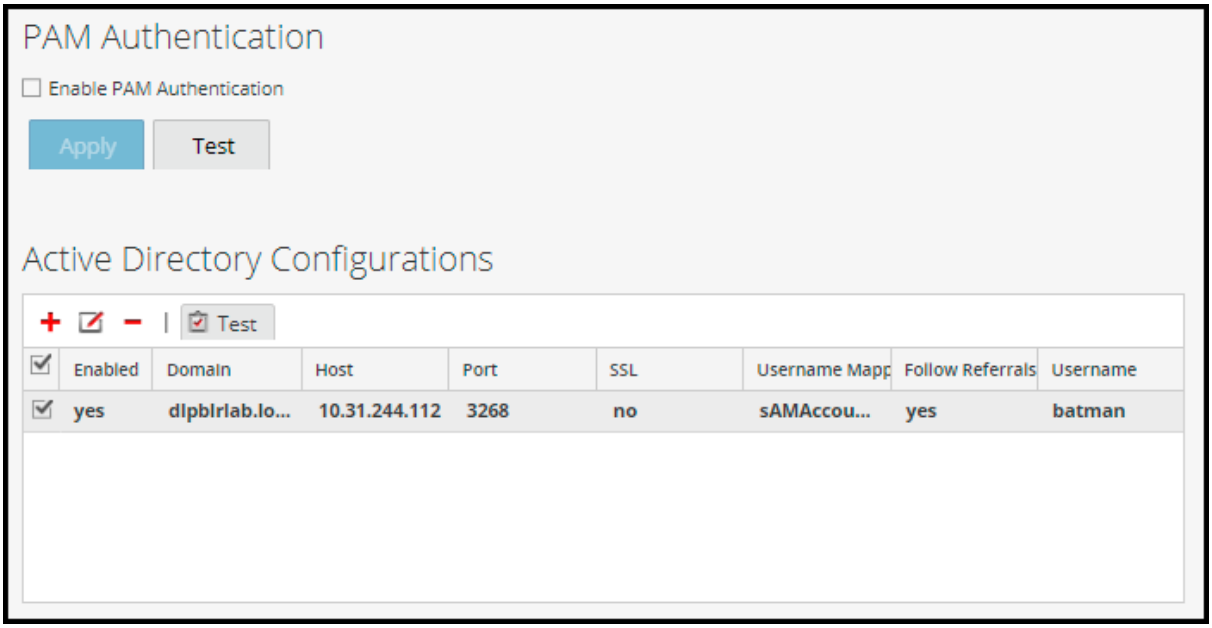
To test whether NSS is working with any of the previous NSS services, use the following commands:

```
getent passwd <pamUser>
 getent group <groupOfPamUser>
```

Output should be similar to:

```
[root@~]# getent passwd myuser
 myuser:*:10000:10000::/home/myuser:/bin/sh
[root@~]# getent group mygroup
 mygroup:*:10000:myuser3
```

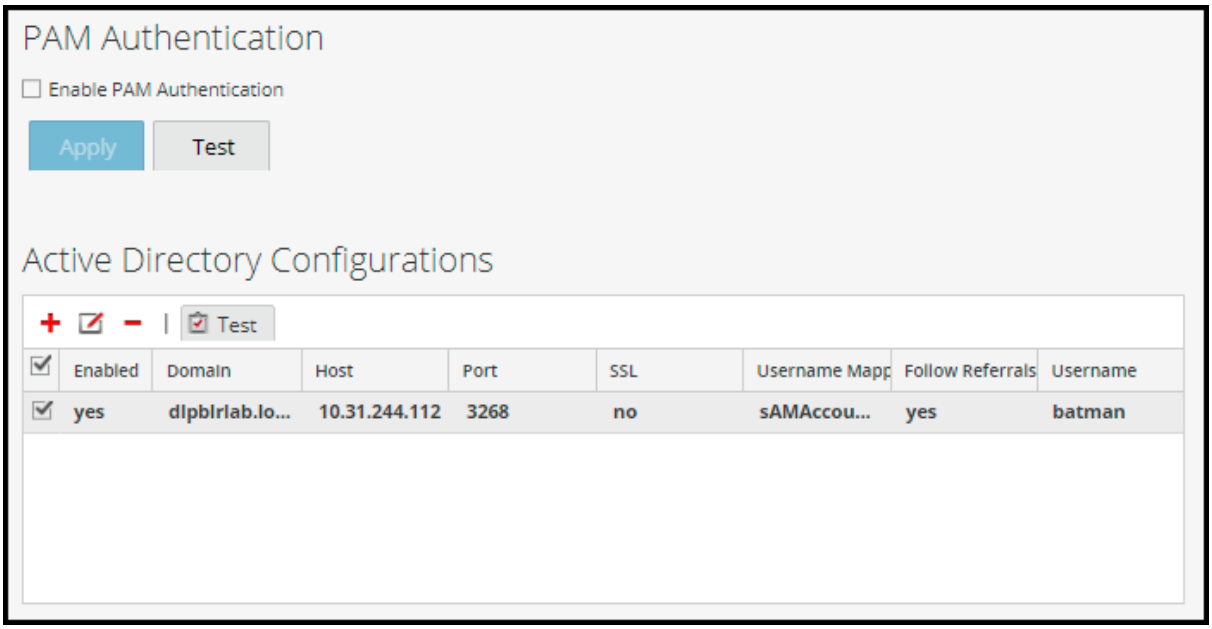
- If neither command produces output, NSS is not working properly for external authorization. Refer to the troubleshooting guidance for your NSS module provided in this document.
- If `getent` commands succeed and authentication success is confirmed in `/var/log/secure` but NetWitness still fails to allow External users to login:
  - Was the correct group name specified for the NSS group in NW External Group Mapping? See Enable PAM and Create Group Mappings below.
  - It is possible that the NSS configuration has changed and NetWitness has not picked up the change. A reboot of the NetWitness host will cause NetWitness to pick up NSS configuration changes. A restart of the Jetty server is not sufficient.



Enable PAM in NetWitness Server

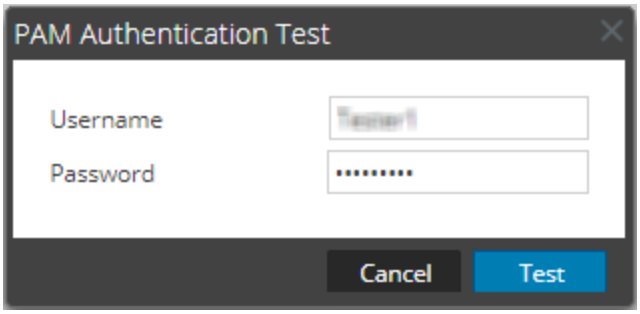
1. Go to  **(Admin) > Security**.

   The Security view is displayed with the Users tab open.



2. Click the **Settings** tab.

3. Under **PAM Authentication**, select **Enable PAM Authentication** and click **Apply**.



Test External Authentication for PAM

1. Go to **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Settings** tab.
3. Under **PAM Authentication**, select **Enable PAM Authentication**.

4. Under **PAM Authentication** options, click **Test**.

The PAM Authentication Test dialog is displayed.

5. Type a user name and password that you want to test for authentication using the current PAM configuration.
6. Click **Test**.

   The external authentication method is tested to ensure connectivity.
7. If the test does not succeed, review and edit the configuration.

PAM is enabled, and Active Directory configurations will also remain enabled. PAM configurations are automatically populated in the External Group Mapping tab so that you can map security roles to each group.

Create Group Mappings in NetWitness Server

To configure security roles used for PAM access, see (Optional) Map User Roles to External Groups.

(Optional) Configure PKI Authentication

PKI (Public Key Infrastructure) authentication feature enables the user to securely login to NetWitness Platform using a smart card. The smart card is a hardware device and contains a Certificate and a password protected Private Key corresponding to the Certificate which enables PKI to validate the user. The certificate is provided by the CA and is unique for a user. For more information on how to configure PKI Authentication, see (Optional) Set Up Public Key Infrastructure (PKI) Authentication.

(Optional) Use a Custom Server Certificate

NetWitness also allows you to configure custom web server certificate to be used as NetWitness Server certificate. By default NetWitness Server uses a web server certificate generated by NetWitness for HTTPS connection. You can configure custom web server certificate even if PKI is not enabled.

Supported Keystore Formats

You must select the format that meets your requirement. The following keystore formats are supported:

- For server certificate with its private key:
  - pfx/pkcs/p12 (PKCS8/PKCS12 are the standards)
  - jks (JKS standard)

Note: The .pfx, .p12 and .jks are containers that can contain one or more private keys and its corresponding chains or certificates.

(Optional) Create a Certificate Signing Request (CSR) and Certificate Store for a Server Certificate

Note: The steps provided in this procedure allows you to create a CSR and Certificate Store for a Server Certificate.

If a server certificate is already created along with its private key, you can directly upload the certificate to the NetWitness Server. If the server certificate is not created, based on the CSR created, the CSR can be submitted to the Certificate Authority (CA) server to obtain a server certificate. Once the certificate is created, perform the following steps to package the private key and the signed certificate that must uploaded to the NetWitness Server to be used as a server certificate.

To create a CSR for a Server Certificate:

1. Change the directory to /root:

```
cd /root
```

2. Create a new directory:

```
mkdir nw_pki_server_cert
```

3. Change the directory to the newly created directory:

```
cd nw_pki_server_cert
```

4. Create a Private Key of 2048 Bits:

```
openssl genrsa -out nw_server_pki_private_key.key 2048
```

5. Create a CSR:

```
openssl req -new -sha256 -key nw_server_pki_private_key.key -out server_cert_
request.csr
```

For example, if country: US, location: RT, and unit:

CN: ABCD (Hostname or IP Address of the Machine)

For multiple names, use values such as : CN=ABCD, CN=10.XX.XXX.XX

email: example@rsa.com

6. Check the CSR and Private Key match.

```
openssl req -noout -modulus -in server_cert_request.csr | openssl sha256
openssl rsa -noout -modulus -in nw_server_pki_private_key.key | openssl sha256
```

For example:

```
[root@ABCD open_ssl_test]# openssl rsa -noout -modulus -in server_private.key
| openssl sha256
(stdin)= 88df3d1ea5b2f411712b96d2ed4a72f5
[root@ABCD open_ssl_test]# openssl req -noout -modulus -in server_cert_
request.csr | openssl sha256
(stdin)= 88df3d1ea5b2f411712b96d2ed4a72f5
```

Note: You make a note of both stdin's.

7. Submit the CSR to the CA and get a signed Server Certificate.

8. Copy the certificate in PEM format to the new directory:

```
/root/nw_pki_server_cert/signed_certificate.pem
```

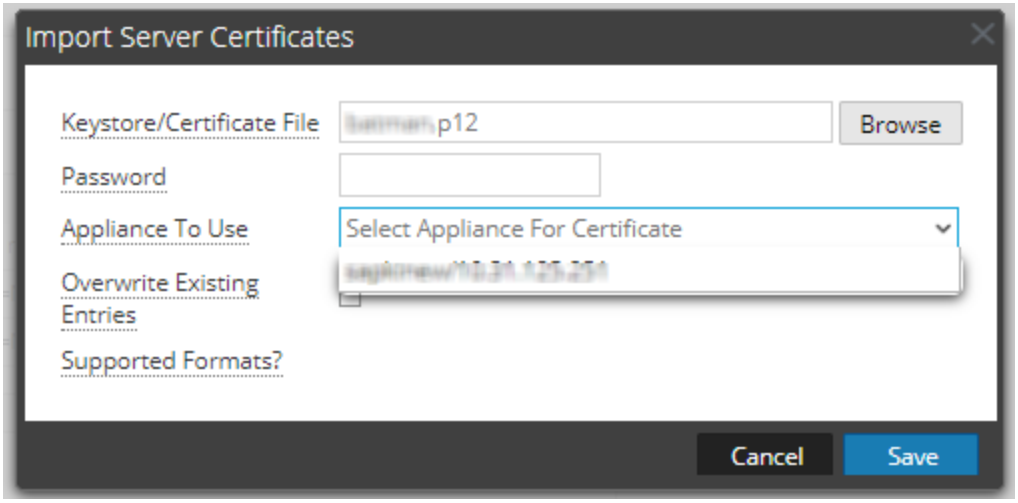
9. Check the certificate for the correct public key.

```
openssl x509 -noout -modulus -in certificate.pem | openssl sha256
```

For example :

```
[root@ABCD open_ssl_test]# mv test.pem certificate.pem
[root@ABCD open_ssl_test]# openssl x509 -noout -modulus -in certificate.pem |
openssl sha256
(stdin)= 3e2f4bbd1f32ae097902afcc1893089e
[root@ABCD open_ssl_test]# openssl rsa -noout -modulus -in sa_server_pki_
private_key.key | openssl sha256
(stdin)= 3e2f4bbd1f32ae097902afcc1893089e
[root@ABCD open_ssl_test]# openssl req -noout -modulus -in server_cert_
request.csr | openssl sha256
(stdin)= 3e2f4bbd1f32ae097902afcc1893089e
```

10. Copy the Private Key and Certificate to a Key Store.



```
openssl pkcs12 -export -descert -name <myservercert> -in signed_
certificate.pem -inkey nw_server_pki_private_key.key -out keystore.p12
```

11. Enter the keystore password, for example **NetWitness@123**, to the Keystore.

Import an NW Server Certificate with its Private Key

Note: .p12, .jks, and .pfx are the supported server certificate formats. Execute the following OpenSSL command to convert certificates to the supported format:
`openssl pkcs12 -export -out cert.p12 -in cert.cer -inkey nw_server_pki_private_key.key`
Only certificates that are configured with an export password can be uploaded to the NetWitness UI.

1. Go to **(Admin) > Security.**
   The Security view is displayed with the **Users** tab open.
2. Click the **PKI Settings** tab.
3. In the **Server Certificates** section, click +.
   The Import Server Certificates dialog is displayed.

4. In the **Keystore/Certificate File** field, click **Browse** and select the keystore.
5. In the **Password** field, enter the keystore password.
6. In the **Appliance To Use** field, select the appliance for which you want to use this certificate.
7. (Optional) Select the **Overwrite Existing Entries** checkbox to overwrite the entries of the certificate that is already added.
8. Click **Save.**
   The NetWitness Server certificate with its private key is successfully added to NetWitness.

Note: When the certificate is being applied on the selected appliance, no other operation on PKI can be performed until the process is completed.
Double-click on the added entries to view the details of the certificate.

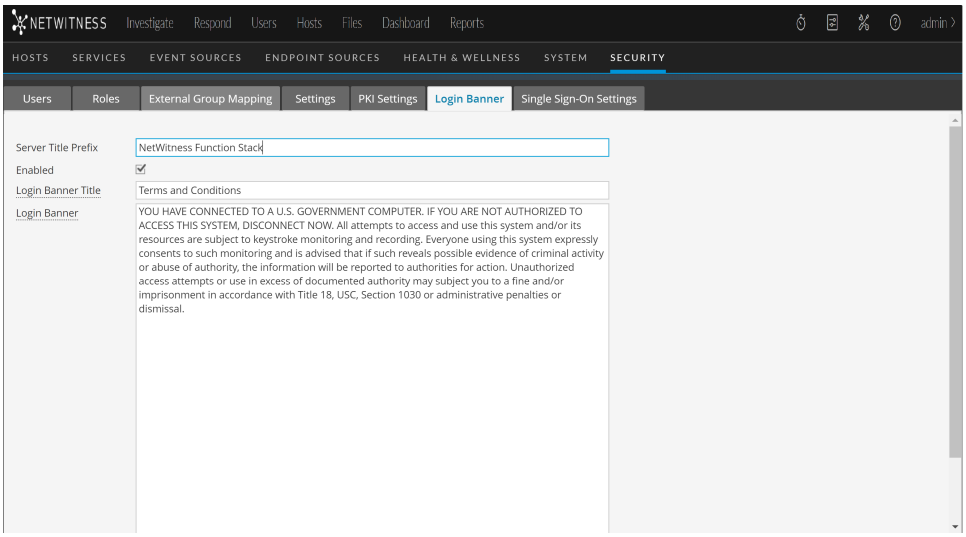
9. To apply the server certificate on a server, select a certificate and click .

Note: Uploading a keystore will add the server certificate and its private key locally. To apply a server certificate on a server, you need to select a server certificate and click the synchronization button . All server certificates are also synchronized on the appliances when PKI is enabled.

Note: To complete the certificate update process, log into the Admin Server (node-0) stop and start the nginx with the command `systemctl restart nginx`.

(Optional) Create a Customized Login Banner

You can create and enable customized login banner that is displayed before users log on to NetWitness asking users to agree the conditions. Users who do not agree are not able to log on.



To create and enable a customized login banner:

1. Go to  **(Admin) > Security**.

   The Security view is displayed with the Users tab open.

2. Click the **Login Banner** tab and select the **Enabled** checkbox to toggle between enabling and disabling the banner.

   When Enable is selected, the Login Banner Title and Login Banner fields become active with default content in place.

3. Use the default content or type the custom title and content for your banner and click **Apply**. The banner is enabled and becomes active immediately.

   Note: While both plain text and text with HTML tags are allowed, any suspicious tags will be removed. For example, all links must use HTTPS protocols.

4. To test the banner, log out. The banner is displayed in front of the fields for entering NetWitness credentials.

5. Click **Agree**.

   The banner closes and you can log on.

How Role-Based Access Control Works

In the NetWitness Platform, roles determine what users can do. A role has permissions assigned to it and you must assign a role to each user. The user then has permission to do what the role allows. Role-bsed access control (RBAC) is established when there is a trusted connection between NetWitness Server and a Core service.

Preconfigured Roles

To simplify the process of creating roles and assigning permissions, there are preconfigured roles in NetWitness. You can also add roles customized for your organization.

The following table lists each preconfigured role and the permissions assigned to it. All permissions are assigned to the Administrators role. A subset of permissions is assigned to each of the other roles.

Role	Permission
Administrators	Full system access. The System Administrators persona is granted all permissions by default.
Analysts	Access to meta and session content but not to configurations. The Security Operation Center (SOC) Analysts persona is centered around investigation, ESA Alerting, Reporting, and Respond, but not system configuration.
Reporting_Engine_ Content_Administrators	Access to manage the Live content. Users with the Reporting Engine Content Administrator role can deploy Reporting Engine content (rules, reports, charts, and lists) from Live Content, view and manage permissions to the deployed content in Reporting Engine.
Data_Privacy_Officers	The Data Privacy Officer (DPO) persona is similar to Administrators with additional focus on configuration options that manage obfuscation and viewing of sensitive data within the system (see the *Data Privacy Management Guide*). Users with the DPO role can see which meta keys are flagged for obfuscation, and they also see obfuscated meta keys and values created for the flagged meta keys.
Malware_Analysts	Access to investigations and malware events. The only access granted to the Malware Analysts persona is the Malware Analysis module.
Operators	Access to configurations but not to meta and session content. The System Operators persona is focused on system configuration, but not investigation, ESA, Alerting, Reporting, and Respond.
Respond_Administrator	Access to all Respond permissions. The Respond Administrator persona is focused on system configuration of Respond.
SOC_Managers	Same access as Analysts plus additional permission to handle incidents. The SOC Managers persona is identical to Analysts, but with permissions necessary to configure Respond.

Role	Permission
UEBA_Analysts	Access to the NetWitness UEBA service in the **Investigate** > **Users** view. NetWitness UEBA is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all entities in your network environment. **Note:** You do not need to set up specific permissions for this role. You only need to assign this role to a user, and that user will have access to NetWitness UEBA.

Trusted Connections Between Server and Service

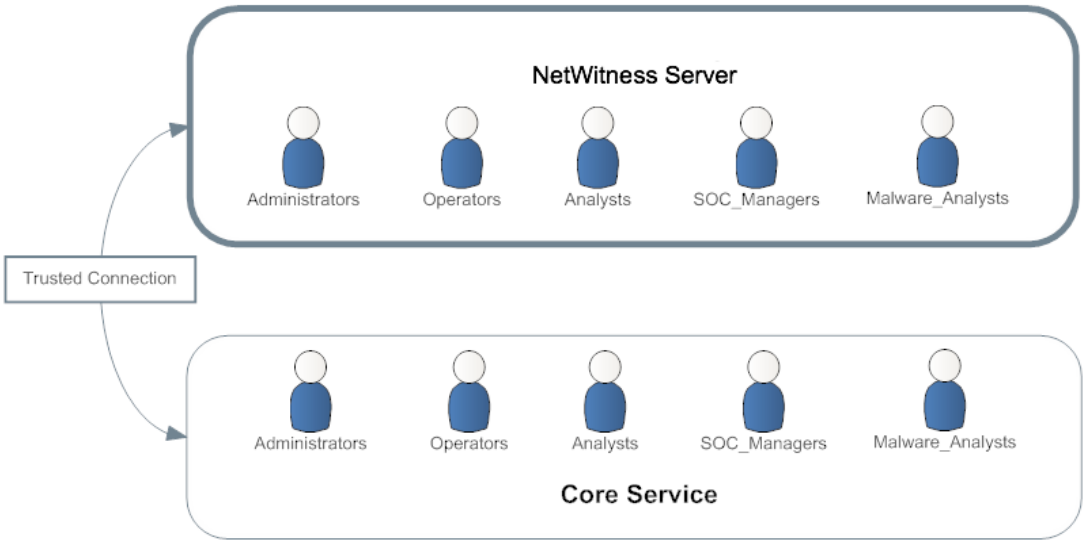
In a trusted connection, a service explicitly trusts NetWitness Server to manage and authenticate users. This reduces administration on each service because authenticated users do not have to be defined locally in each Core service.

As the following table shows, you perform all user management tasks on the server.

Task	Location
Add a user	Server
Maintain usernames	Server
Maintain passwords	Server
Authenticate internal NetWitness users	Server
(Optional) Authenticate external users with: - Active Directory - PAM	 Server Server
Install and configure PAM	Server

The benefits of a trusted connection and centralized user management are that:

- You perform all user administration tasks once, on NetWitness Server only.
- You control access to services but do not have to set up and authenticate users on the services.
- Users enter passwords once at NetWitness logon and are authenticated by the server.
- Users, already authenticated by the server, access every Core service in (Admin) > Services without entering a password.

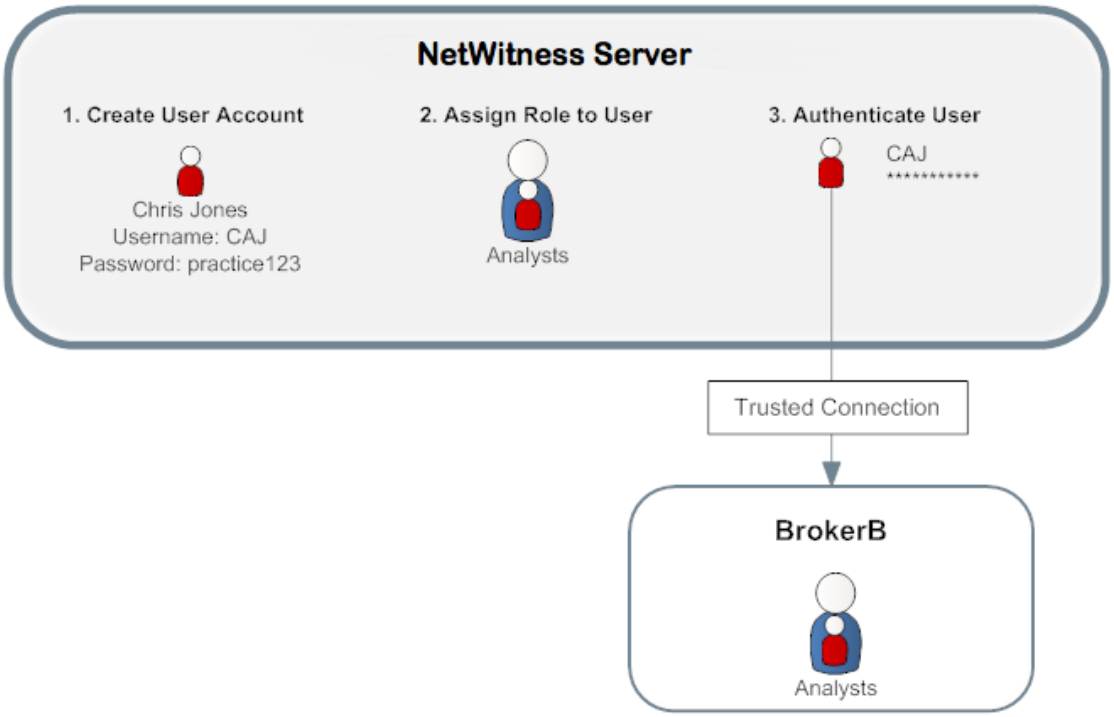


How Trusted Connections Are Established

When you install or upgrade to 11.x, trusted connections are established by default with two settings:

- SSL is enabled.
- The Core service is connected to an encrypted SSL port.

Common Role Names on the Server and Services



Trusted connections rely on common role names on the server and service. On a fresh installation, NetWitness installs the five preconfigured roles on the server and each Core service.

If you add a custom role, such as JuniorAnalysts, you must add the role to each service, such as ArchiverA and BrokerB. Role names are case-senstive, cannot contain spaces and must be identical. For example, JuniorAnalyst (singular) and JuniorAnalysts (plural) do not meet the requirements for common role names.

End-to-End Workflow for User Setup and Service Access

This workflow shows how role-based access control works when there is a trusted connection between NetWitness Server and the service BrokerB.

1. On NetWitness Server, create an account for a new user:
   Name: Chris Jones
   Username: CAJ
   Password: practice123
2. Determine if you want to assign a preconfigured or custom role to Chris Jones:
   - **Preconfigured role**
     a. Keep or modify the default permissions assigned to the **Analysts role,** which include permissions such as access to the Alerting, Investigation and Malware modules,
     b. Assign the Analysts role to Chris Jones.
   - **Custom role**
     a. Create the custom role, such as JuniorAnalysts.
     b. Assign permissions to the **JuniorAnalysts role**.
     c. Assign the JuniorAnalysts role to Chris Jones.
     d. Add the JuniorAnalysts role to the service, such as BrokerB.
3. The user, Chris Jones, logs on to NetWitness Server:

- Username: CAJ
- Password: practice123

4. The server authenticates Chris.
5. The trusted connection allows the authenticated user, Chris, to access BrokerB without entering another password.

For more detailed descriptions and procedures, see Manage Users with Roles and Permissions.

Role Permissions

InNetWitness, user can access each module, dashlet, and view is restricted based on the assigned permissions. You can locate these role permissions in the Add or Edit Roles dialogs accessible from the  (Admin) > **Security** > **Roles** tab.

In the Add or Edit Role dialogs, the tabs in the Permission section represent different areas of NetWitness and show the available permissions for those areas. For example, the Administration tab shows the permissions available in the Admin view.

Note: There is no Configure tab in the Add/Edit Role dialogs that corresponds to the Configure view. To assign permissions in the Configure view, assign permissions to the views contained within the Configure view: Live Content (Live), Incident Rules (Incidents), Respond Notifications (Incidents, Respond-server, Integration server), ESA Rules (Alerting), Subscriptions (Live), and Custom Feeds (Live).

Note: To the left of the Administration tab is a tab marked with an asterisk (*). This tab indicates access to management of backend services only.

The tables that follow show the default permissions assigned to each NetWitness user role:

- Administrators
- Respond Administrators (RAs)
- Reporting Engine Content Administrators (RE CAs)
- Data Privacy Officers (DPOs)
- SOC Managers (SOC Mgrs)
- Operators
- Malware Analysts (MAs)
- Analysts
- UEBA Analysts

Since the Administrators role has all of the permissions by default, it is not included in the tables.

Service Permissions Format for New Services

The service permissions for some new NetWitness services contain three parts in the following format:

<service name>.<resource>.<action>

For example, for the **investigate-server.metrics.read** permission:

- `service name` = **investigate-server**
- `resource` = **metrics**
- `action` = **read**

Users assigned this permission can read any metrics that the investigate-server service exposes.

Admin-server

The following table describes the permissions in the Admin-server tab.

Permission	Description
admin-server.configuration.manage	Permission to modify all service configuration parameters
admin-server.health.read	Permission to view any health notifications that the service exposes
admin-server.logs.manage	Permission to change log-related configuration
admin-server.metrics.read	Permission to view any metrics that the service exposes
admin-server.process.manage	Permission to start and stop the service
admin-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
admin-server.security.read	Permission to view security-related resources

Administration

The following table describes the list of permissions in Administration tab.

Permission	Description
Access Administration Module	Permission to access all the administration modules
Access Health & Wellness	Permission to access the health and wellness module
Apply System Updates	Permission to update the system
Can Opt In to Live Intelligence Sharing	Permission to opt for Live Intelligence sharing
Manage Advanced Settings	Permission to modify the advanced settings
Manage ATD Settings	Permission to modify the ATD settings
Manage Auditing	Permission to modify the auditing

Permission	Description
Manage Email	Permission to change the email settings
Manage Global Auditing	Permission to modify global auditing
Manage Health & Wellness Policy	Permission to update the health & wellness policy
Manage Jobs	Permission to change the job settings
Manage LLS	Permission to modify LLS
Manage Logs	Permission to modify log related configurations
Manage Notifications	Permission to change notification settings
Manage Plugins	Permission to modify the plugins
Manage Predicates	Permission to modify the predicates
Manage Reconstruction	Permission to change the reconstruction
Manage Security	Permission to update the security settings
Manage Services	Permission to start and stop the services
Manage SSL Security	Permission to manage PKI setting
Manage System Settings	Permission to the modify the system settings
Modify ESA Settings	Permission to modify the ESA settings
Modify Event Sources	Permission to modify the ESA sources
Modify Hosts	Permission to modify the hosts
Modify Services	Permission to modify the services
View Event Sources	Permission to view the event sources
View Health & Wellness Policy	Permission to view the health & wellness policy
View Health & Wellness Stats Browser	Permission to view the health and wellness status in the browser
View Hosts	Permission to view the hosts
View Services	Permission to view the services
View Unified Sources	Permission to view the unified sources

The following table lists the permissions in the Administration tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts	UEBA Analysts
Access Administration Module		Yes	Yes	Yes	Yes	Yes	
Access Health & Wellness		Yes	Yes	Yes	Yes	Yes	
Apply System Updates				Yes			
Can Opt In to Live Intelligence Sharing				Yes			
Manage Advanced Settings				Yes			
Manage ATD Settings	Yes	Yes	Yes	Yes			
Manage Auditing		Yes		Yes			
Manage Email				Yes			
Manage Global Auditing		Yes		Yes			
Manage Health & Wellness Policy				Yes			
Manage Jobs		Yes	Yes	Yes			
Manage LLS				Yes			
Manage Logs		Yes		Yes			
Manage Notifications				Yes			
Manage Plugins		Yes	Yes	Yes		Yes	
Manage Predicates				Yes			
Manage Reconstruction				Yes			

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts	UEBA Analysts
Manage Security		Yes		Yes			
Manage Services		Yes		Yes			
Manage SSL Security							
Manage System Settings		Yes	Yes	Yes		Yes	
Modify ESA Settings				Yes			
Modify Event Sources				Yes			
Modify Hosts				Yes			
Modify Services		Yes		Yes			
View Event Sources			Yes	Yes			
View Health & Wellness Policy			Yes	Yes		Yes	
View Health & Wellness Stats Browser		Yes	Yes	Yes		Yes	
View Hosts		Yes		Yes			
View Services		Yes		Yes			
View Unified Sources		Yes	Yes	Yes		Yes	

Alerting

The following table describes the permissions in the Alerting tab.

Permission	Description
Access Alerting Module	Permission to access the alerting module
Manage Rules	Permission to update the rules

Permission	Description
View Alerts	Permission to view the alerts
View Rules	Permission to view the rules

The following table lists the permissions in the Alerting tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
Access Alerting Module	Yes	Yes	Yes	Yes		Yes
Manage Rules	Yes	Yes	Yes	Yes		
View Alerts	Yes	Yes	Yes			Yes
View Rules		Yes	Yes	Yes		

Config-server

The following table describes the permissions in the Config-server tab. The Administrators role has all of the permissions and is the only role granted permissions by default.

Permission	Description
config-server.*	All permissions (everything below)
config-server.configuration.manage	Permission to modify all service configuration parameters
config-server.health.read	Permission to view any health notifications that the service exposes
config-server.logs.manage	Permission to change log-related configuration
config-server.metrics.read	Permission to view any metrics that the service exposes
config-server.process.manage	Permission to start and stop the service
config-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
config-server.security.read	Permission to view security-related resources

Content-server

The following table describes the permissions in the Content-server tab.

Permission	Description
content-server.*	All permissions (everything below)
content-server.collection.read	Permission to read selective collection content
content-server.configuration.manage	Permission to modify all service configuration parameters
content-server.health.read	Permission to view any health notifications that the service exposes
content-server.logparser.manage	Permission to manage log parser configurations
content-server.logparser.read	Permission to view log parser configurations
content-server.logs.manage	Permission to change log-related configuration
content-server.metrics.read	Permission to view any metrics that the service exposes
content-server.policy.read	Permission to read policies
content-server.process.manage	Permission to start and stop the service
content-server.rule.manage	Permission to manage content rules
content-server.rule.read	Permission to view content rules
content-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
content-server.security.read	Permission to view security-related resources

The following table lists the permissions in the Content-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrator role has all of the permissions by default and is not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
content-server.*		Yes		Yes		
content-server.collection.read						
content-server.configuration.manage						
content-server.health.read						
content-server.logparser.manage						
content-server.logparser.read			Yes			Yes
content-server.logs.manage						

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
content-server.metrics.read						
content-server.policy.read						
content-server.process.manage						
content-server.rule.manage						
content-server.rule.read						
content-server.security.manage						
content-server.security.read						

Contexthub-server

The following table describes the permissions in the Contexthub-server tab.

Permission	Description
contexthub-server.*	All permissions (everything below)
contexthub-server.configuration.manage	Permission to modify all service configuration parameters
contexthub-server.connection.manage	Permission to modify all connection settings
contexthub-server.connection.read	Permission to view all connection settings
contexthub-server.connectiontypes.read	Permission to view all configured connection types
contexthub-server.datasource.manage	Permission to modify data source settings
contexthub-server.datasource.read	Permission to view data source settings
contexthub-server.health.read	Permission to view any health notifications that the service exposes
contexthub-server.listentries.manage	Permission to modify list entries
contexthub-server.logs.manage	Permission to change log-related configuration
contexthub-server.metrics.read	Permission to view any metrics that the service exposes
contexthub-server.process.manage	Permission to start and stop the service

Permission	Description
contexthub-server.query.read	Permission to view queries
contexthub-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
contexthub-server.security.read	Permission to view security-related resources
contexthub-server.stix.read	Permission to view stix settings
contexthub-server.taxiidatasource.manage	Permission to modify settings for the taxii data source
contexthub-server.taxiidatasource.read	Permission to view settings for the taxii data source
contexthub-server.contextlookup.read	Permission to enable or disable the context lookup and perform Add/Remove from List actions on the Users, Hosts, Files, Respond, and Investigate Events view.

The following table lists the permissions in the Contexthub-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrator role has all of the permissions by default and is not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
contexthub-server.*		Yes				
contexthub-server.configuration.manage						
contexthub-server.connection.manage						
contexthub-server.connection.read	Yes		Yes		Yes	Yes
contexthub-server.connectiontypes.read			Yes			
contexthub-server.datasource.manage	Yes		Yes		Yes	Yes
contexthub-server.datasource.read	Yes		Yes		Yes	Yes
contexthub-server.health.read						
contexthub-server.listentries.manage	Yes		Yes		Yes	Yes

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
contexthub-server.logs.manage						
contexthub-server.metrics.read						
contexthub-server.process.manage						
contexthub-server.query.read	Yes		Yes		Yes	Yes
contexthub-server.security.manage						
contexthub-server.security.read						
contexthub-server.stix.read			Yes		Yes	Yes
contexthub-server.taxiidatasource.manage			Yes		Yes	Yes
contexthub-server.taxiidatasource.read			Yes		Yes	Yes
contexthub-server.contextlookup.read	Yes		Yes		Yes	Yes

Correlation-server

The following table describes the permissions in the Correlation-server tab. These permissions pertain to ESA Correlation.

Permission	Description
correlation-server.*	All permissions (everything below)
correlation-server.configuration.manage	Permission to modify all service configuration parameters
correlation-server.endpoint.manage	Permission to modify all endpoint configuration parameters
correlation-server.endpoint.read	Permission to view all endpoint configuration parameters
correlation-server.engine.manage	Permission to modify all engine configuration parameters
correlation-server.engine.read	Permission to view all engine configuration parameters
correlation-server.esperrule.manage	Permission to modify all esperrule configuration parameters
correlation-server.esperrule.read	Permission to view all esperrule configuration parameters
correlation-server.health.read	Permission to view any health notifications that the service exposes

Permission	Description
correlation-server.keyvaluerule.manage	Permission to modify all keyvaluerule configuration parameters
correlation-server.keyvaluerule.read	Permission to view all keyvaluerule configuration parameters
correlation-server.logs.manage	Permission to change log-related configuration
correlation-server.metrics.read	Permission to view any metrics that the service exposes
correlation-server.module.manage	Permission to modify each module
correlation-server.module.read	Permission to view each module
correlation-server.process.manage	Permission to start and stop the service
correlation-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
correlation-server.security.read	Permission to view security-related resources
correlation-server.stream.manage	Permission to edit stream configuration settings
correlation-server.stream.read	Permission to view stream configuration settings
correlation-server.telemetry.read	Permission to view telemetry configuration settings

The following table lists the permissions in the Correlation-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrator role has all of the permissions by default and is not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
correlation-server.*		Yes				
correlation-server.configuration.manage						
correlation-server.endpoint.manage						
correlation-server.endpoint.read						
correlation-server.engine.manage	Yes		Yes	Yes		
correlation-server.engine.read	Yes		Yes	Yes		
correlation-server.esperrule.manage						

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
correlation-server.esperrule.read						
correlation-server.health.read						
correlation-server.keyvaluerule.manage						
correlation-server.keyvaluerule.read						
correlation-server.logs.manage						
correlation-server.metrics.read						
correlation-server.module.manage	Yes		Yes	Yes		
correlation-server.module.read	Yes		Yes	Yes		
correlation-server.process.manage						
correlation-server.security.manage						
correlation-server.security.read						
correlation-server.stream.manage	Yes		Yes	Yes		
correlation-server.stream.read	Yes		Yes	Yes		
correlation-server.telemetry.read						

Dashboard

The following table describes the permissions in the Dashboard tab.

Permission	Description
Dashlet Access - Admin Device List Dashlet	Permission to access Admin Device List Dashlet
Dashlet Access - Admin Device Monitor Dashlet	Permission to access Admin Device Monitor Dashlet

Permission	Description
Dashlet Access - Admin News Dashlet	Permission to access Admin News Dashlet
Dashlet Access - Alert Variance Dashlet	Permission to access Alert Variance Dashlet
Dashlet Access - Alerting Recent Alerts Dashlet	Permission to access Alerting Recent Alerts Dashlet
Dashlet Access - Investigation Jobs Dashlet	Permission to access Investigation Jobs Dashlet
Dashlet Access - Investigation Top Values Dashlet	Permission to access Investigation Top Values Dashlet
Dashlet Access - Live Featured Resources Dashlet	Permission to access Live Featured Resources Dashlet
Dashlet Access - Live New Resources Dashlet	Permission to access Live New Resources Dashlet
Dashlet Access - Live Subscriptions Dashlet	Permission to access Live Subscriptions Dashlet
Dashlet Access - Live Updated Resources Dashlet	Permission to access Live Updated Resources Dashlet
Dashlet Access - Malware Jobs Dashlet	Permission to access Malware Jobs Dashlet
Dashlet Access - Reporting Recent Report Dashlet	Permission to access Reporting Recent Report Dashlet
Dashlet Access - Reporting Charts Dashlet	Permission to access Reporting Charts Dashlet
Dashlet Access - Top Alerts Dashlet	Permission to access Top Alerts Dashlet
Dashlet Access - Unified First Watch Dashlet	Permission to access Unified First Watch Dashlet
Dashlet Access - Unified Shortcuts Dashlet	Permission to access Unified Shortcuts Dashlet

The following table lists the permissions in the Dashboard tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	RA	DPOs	SOC Mgrs	Operators	MAs	Analysts
Dashlet Access - Admin Device List Dashlet	Yes	Yes	Yes	Yes		Yes
Dashlet Access - Admin Device Monitor Dashlet		Yes				
Dashlet Access - Admin News Dashlet	Yes	Yes	Yes	Yes		Yes
Dashlet Access - Alert Variance Dashlet	Yes	Yes	Yes			Yes

Permission	RA	DPOs	SOC Mgrs	Operators	MAs	Analysts
Dashlet Access - Alerting Recent Alerts Dashlet	Yes	Yes	Yes			Yes
Dashlet Access - Investigation Jobs Dashlet	Yes	Yes	Yes			Yes
Dashlet Access - Investigation Top Values Dashlet	Yes	Yes	Yes			Yes
Dashlet Access - Live Featured Resources Dashlet	Yes	Yes	Yes	Yes		Yes
Dashlet Access - Live New Resources Dashlet	Yes	Yes	Yes	Yes		Yes
Dashlet Access - Live Subscriptions Dashlet	Yes	Yes	Yes	Yes		Yes
Dashlet Access - Live Updated Resources Dashlet	Yes	Yes	Yes	Yes		Yes
Dashlet Access - Malware Jobs Dashlet	Yes	Yes	Yes			Yes
Dashlet Access - Reporting Recent Report Dashlet	Yes	Yes	Yes			Yes
Dashlet Access - Reporting Charts Dashlet	Yes	Yes	Yes			Yes
Dashlet Access - Top Alerts Dashlet	Yes	Yes	Yes			Yes
Dashlet Access - Unified First Watch Dashlet	Yes	Yes	Yes	Yes		Yes
Dashlet Access - Unified Shortcuts Dashlet	Yes	Yes	Yes	Yes		Yes

Endpoint-broker-server

The following table describes the permissions in the Endpoint Broker server tab.

Permission	Description
endpoint-broker-server*	All permissions (everything below)

Permission	Description
endpoint-broker-server.agent.manage	Permission to manage the agent, that is start or stop scan, downloading file from host, delete agent data from the Endpoint Log Hybrid and so on.
endpoint-broker-server.agent.read	Permission to view the endpoint data received from the agent such as host, file, certificate, events and so on.
endpoint-broker-server.configuration.manage	Permission to modify all endpoint broker configuration parameters
endpoint-broker-server.health.read	Permission to view any health notifications that the service exposes
endpoint-broker-server.logs.manage	Permission to change log-related configuration
endpoint-broker-server.metrics.read	Permission to view any metrics that the service exposes
endpoint-broker-server.policy.read	Permission to view existing policy details
endpoint-broker-server.process.manage	Permission to start and stop the service
endpoint-broker-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
endpoint-broker-server.security.read	Permission to view security-related resources

The following table lists the permissions in the Endpoint-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrator role has all of the permissions by default and is not listed.

Permission	RA	DPOs	SOC Mgrs	Operators	MAs	Analysts
endpoint-broker-server*						
endpoint-broker-server.agent.manage				Yes		Yes
endpoint-broker-server.agent.read				Yes		Yes
endpoint-broker-server.configuration.manage						
endpoint-broker-server.health.read						
endpoint-broker-server.logs.manage						
endpoint-broker-server.metrics.read						

Permission	RA	DPOs	SOC Mgrs	Operators	MAs	Analysts
endpoint-broker-server.policy.read						Yes
endpoint-broker-server.process.manage						
endpoint-broker-server.security.manage						
endpoint-broker-server.security.read						

Endpoint-server

The following table describes the permissions in the Endpoint-server tab.

Permission	Description
endpoint-server*	All permissions (everything below)
endpoint-server.agent.manage	Permission to generate and download the agent packager. Permission to manage the agent, that is start or stop scan, downloading files, master file table (MFT), memory dumps from host, isolate host from network, delete agent data from the Endpoint Log Hybrid and so on Note: Analyze file, Scan With OPSWAT, Save Local Copy have been moved to endpoint-server.file.analyze (from version 11.7)
endpoint-server.agent.read	Permission to view the agent packager configuration Permission to view the endpoint data received from the agent such as host, file, certificate, events, and so on
endpoint-server.agentupdate.manage	Permission to upgrade agent and uninstall agent
endpoint-server.ca.manage	Permission to generate and download the agent packager Permission to upgrade agent
endpoint-server.ca.read	Permission to generate and download the agent packager
endpoint-server.configuration.manage	Permission to modify all endpoint configuration parameters
endpoint-server.file.analyze	Permission to analyze file, save local copy, and initiate OPSWAT scans
endpoint-server.filter.manage	Permission to save, modify, and delete filters

Permission	Description
endpoint-server.filter.read	Permission to view filters
endpoint-server.health.read	Permission to view any health notifications that the service exposes
endpoint-server.logs.manage	Permission to change log-related configuration
endpoint-server.metrics.read	Permission to view any metrics that the service exposes
endpoint-server.policy.read	Permission to view existing policy details
endpoint-server.process.manage	Permission to start and stop the service
endpoint-server.relay.manage	Permission to modify Relay Server Configuration
endpoint-server.relay.read	Permissions to view Relay Server details
endpoint-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
endpoint-server.security.read	Permission to view security-related resources
endpoint-server.tag.manage	Permission to manage Tags (Create and Delete)

The following table lists the permissions in the Endpoint-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrator role has all of the permissions by default and is not listed.

Permission	RA	DPOs	SOC Mgrs	Operators	MAs	Analysts
endpoint-server*						
endpoint-server.agent.manage				Yes		Yes
endpoint-server.agent.read				Yes		Yes
endpoint-server.agentupdate.manage						
endpoint-server.ca.manage				Yes		
endpoint-server.ca.read				Yes		
endpoint-server.configuration.manage						
endpoint-server.filter.manage						Yes
endpoint-server.filter.read						Yes
endpoint-server.health.read						
endpoint-server.logs.manage						

Permission	RA	DPOs	SOC Mgrs	Operators	MAs	Analysts
endpoint-server.metrics.read						
endpoint-server.policy.read						Yes
endpoint-server.process.manage						
endpoint-server.rar.manage						
endpoint-server.rar.read						
endpoint-server.relay.manage				Yes		
endpoint-server.relay.read				Yes		
endpoint-server.security.manage						
endpoint-server.security.read						

Incidents

The following table describes the permissions in the Incidents tab.

Permission	Description
Access Incident Module	Permission to access the Incident module
Configure Incident Management Integration	Permission to configure incident management integration
Delete Alerts and incidents	Permission o delete alerts and incidents
Manage Alert Handling Rules	Permission to modify the alert handling rules
View and Manage Incidents	Permission to modify the incidents

The following table lists the permissions in the Incidents tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
Access Incident Module	Yes	Yes	Yes		Yes	Yes
Configure Incident Management Integration	Yes	Yes	Yes			

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
Delete Alerts and incidents	Yes	Yes				
Manage Alert Handling Rules	Yes	Yes	Yes			
View and Manage Incidents	Yes	Yes	Yes		Yes	Yes

Integration-server

(The Integration-server permissions are available in NetWitness version 11.1 and later.)

The following table describes the permissions in the Integration-server tab.

Permission	Description
integration-server.*	All permissions (everything below)
integration-server.api.access	Permission to authorize external requests from 3rd party applications
integration-server.configuration.manage	Permission to view and modify all service integration configuration parameters
integration-server.health.read	Permission to read any health notifications that the service exposes
integration-server.logs.manage	Permission to change log-related integration configurations
integration-server.metrics.read	Permission to read any metrics that the service exposes
integration-server.notification.manage	Permission to change global notification configurations (for example, SMTP server)
integration-server.notification.read	Permission to read global notification configurations (for example, SMTP server)
integration-server.notification.send	Permission to send notifications (for example, Email)
integration-server.process.manage	Permission to start and stop the service
integration-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
integration-server.security.read	Permission to read security-related resources
integration-server.template.manage	Permission to change notification template
integration-server.template.read	Permission to read notification template

The following table lists the permissions in the Integration-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrator role has all of the permissions by default and is not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
integration-server.*		Yes				
integration-server.api.access						
integration-server.configuration.manage						
integration-server.health.read						
integration-server.logs.manage						
integration-server.metrics.read						
integration-server.notification.manage	Yes		Yes	Yes		
integration-server.notification.read	Yes		Yes	Yes		
integration-server.notification.send	Yes		Yes	Yes		
integration-server.process.manage						
integration-server.security.manage						
integration-server.security.read						
integration-server.template.manage	Yes		Yes	Yes		
integration-server.template.read	Yes		Yes	Yes		

Investigate

The following table describes the permissions in the Investigate tab.

Permission	Description
Access Investigation Module	Permission to access investigation module
Context Lookup	Permission to access context lookup
Create Incidents from Investigation	Permission to create incidents from investigation
Manage List from Investigation	Permission to modify the list of investigation
Navigate Events	Permission to navigate the events
Navigate Values	Permission to navigate the values

The following table lists the permissions in the Investigate tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
Access Investigation Module	Yes	Yes	Yes		Yes	Yes
Context Lookup	Yes		Yes		Yes	Yes
Create Incidents from Investigation	Yes		Yes		Yes	Yes
Manage List from Investigation	Yes		Yes		Yes	Yes
Navigate Events	Yes	Yes	Yes		Yes	Yes
Navigate Values	Yes	Yes	Yes		Yes	Yes

Investigate-server

The following table describes the permissions in the Investigate-server tab.

Permission	Description
investigate-server.*	All permissions (everything below) for 11.4 and above Events view, and 11.3 and earlier Event Analysis view.
investigate-server.column group.read	Permission to access column groups

Permission	Description
investigate-server.configuration.manage	Permission to change any configuration properties for the service
investigate-server.content.export	Permission to export content from the service
investigate-server-content.manage	Permission to clear all per service or per user reconstruction cache
investigate-server.content.reconstruct	Permission to view the summary view, the packet, packet map, text, log, and file reconstructions, as well as the packet count
investigate-server.event.filter	Permission to view the Filter Events panel in the Events view
investigate-server.event.read	Permission to view events that the service exposes
investigate-server.health.read	Permission to view any health notifications that the service exposes
investigate-server.incident.manage	Create or update an incident in Respond
investigate-server.logs.manage	Permission to change log-related configuration
investigate-server.metagroup.manage	Permission to manage meta groups
investigate-server.metagroup.read	Permission to view and use meta groups
investigate-server.metrics.read	Permission to view any metrics that the service exposes
investigate-server.predicate.manage	Permission to edit or remove one or more predicates
investigate-server.predicate.read	Permission to filter events in the Navigate view, Legacy EventsEvents view, and Events view. Note: This permission is required with investigate-server.event.read permission to provide access to the and Events view.
investigate-server.process.manage	Permission to start and stop the service
investigate-server.profile.read	Permission to access profiles.
investigate-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
investigate-server.security.read	Permission to view security-related resources
investigate-server.alert.manage	Permission to create alert from Investigate Events view.
investigate-server.content.report	Permission to create and schedule reports from Investigate Events view.

The following table lists the permissions in the Investigate-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed. The UEBA Analysts and Content Administrators roles have none of these permissions by default and are not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
investigate-server.*	Yes	Yes				
investigate-server.columngroup.read			Yes		Yes	Yes
investigate-server.configuration.manage						
investigate-server.content.export			Yes		Yes	Yes
investigate-server.content.manage						
investigate-server.content.reconstruct			Yes		Yes	Yes
investigate-server.event.filter	Yes	Yes	Yes		Yes	Yes
investigate-server.event.read			Yes		Yes	Yes
investigate-server.health.read						
investigate-server.incident.manage						Yes
investigate-server.logs.manage						
investigate-server.metagroup.manage						
investigate-server.metagroup.read			Yes		Yes	Yes
investigate-server.metrics.read						
investigate-server.predicate.manage						
investigate-server.predicate.read			Yes		Yes	Yes
investigate-server.process.manage						
investigate-server.profile.read			Yes		Yes	Yes
investigate-server.security.manage						

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
investigate-server.security.read						
investigate-server.alert.manage						

License-server

The following table describes the permissions in the License-server tab. The Administrator and Operator have all of the permissions and are the only roles granted permissions by default.

Permission	Description
license-server.*	All permissions (everything below)
license-server.configuration.manage	Permission to modify all service configuration parameters
license-server.health.read	Permission to view any health notifications that the service exposes
license-server.license.manage	Permission to manage license related configurations
license-server.license.read	Permission to view license related configurations
license-server.logs.manage	Permission to change log-related configuration
license-server.metrics.read	Permission to view any metrics that the service exposes
license-server.process.manage	Permission to start and stop the service
license-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
license-server.security.read	Permission to view security-related resources

Live

The following table describes the permissions in the Live tab.

Permission	Permission
Live	
Access Live Module	Permission to access live module

Permission	Permission
Manage Live System Settings	Permission to modify the live system settings
Resources	
Deploy Live Resources	Permission to deploy live resources
Manage Live Feeds	Permission to modify live feeds
Manage Live Resources	Permission to modify live resources
Search Live Resources	Permission to search live resources
View Live Resource Details	Permission to view live resource details

The following table lists the permissions in the Live tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
Live						
Access Live Module		Yes	Yes	Yes		Yes
Manage Live System Settings				Yes		
Resources						
Deploy Live Resources		Yes		Yes		
Manage Live Feeds		Yes		Yes		
Manage Live Resources		Yes		Yes		
Search Live Resources		Yes	Yes	Yes		Yes
View Live Resource Details		Yes	Yes	Yes		

Malware

The following table describes the permissions in the Malware tab.

Permission	Operators
Download Malware File(s)	Permission to donwnload the malware files for investigation
Initiate Malware Analysis Scan	Permission to start the malware analysis scan

Permission	Operators
View Malware Analysis Events	Permission to view the malware analysis events

The following table lists the permissions in the Malware tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
Download Malware File (s)		Yes	Yes		Yes	Yes
Initiate Malware Analysis Scan		Yes	Yes		Yes	Yes
View Malware Analysis Events		Yes	Yes		Yes	Yes

Metrics-server

The following table describes the permissions in the Metrics-server tab. The Administrators role have all of the permissions and are the only roles granted permissions by default.

Permission	Description
metrics-server .*	All permissions (everything below)
metrics-server.configuration.manage	Permission to modify all service configuration parameters
metrics-server-content.manage	Permission to modify configuration parameters in the service
metrics-server-content.read	Permission to view configuration parameters of the service
metrics-server.health.read	Permission to view any health notifications that the service exposes
metrics-server.logs.manage	Permission to change log-related configuration
metrics-server.metric.manage	Permission to modify all the configuration parameters
metrics-server.metric.read	Permission to view configuration of New Health and Wellness
metrics-server.metrics.read	Permission to view any metrics that the service exposes
metrics-server.process.manage	Permission to start and stop the service
metrics-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
metrics-server.security.read	Permission to view security-related resources

The following table lists the permissions in the Metrics-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	RA	DPOs	SOC Mgrs	Operator	MAs	Analysts	UEBA Analysts
metrics-server .*							
metrics-server.configuration.manage							
metrics-server-content.manage							
metrics-server-content.read							
metrics-server.health.read							
metrics-server.logs.manage							
metrics-server.metric.manage							
metrics-server.metric.read		Yes	Yes	Yes	Yes	Yes	
metrics-server.metrics.read							
metrics-server.process.manage							
metrics-server.security.manage							
metrics-server.security.read							

Orchestration-server

The following table describes the permissions in the Orchestration-server tab. The Administrators, Operators, and Data Privacy Officers roles have all of the permissions and are the only roles granted permissions by default.

Permission	Description
orchestration-server.*	All permissions (everything below)
orchestration-server.configuration.manage	Permission to modify all service configuration parameters

Permission	Description
orchestration-server.file.read	Permission to view files
orchestration-server.health.read	Permission to view any health notifications that the service exposes
orchestration-server.logs.manage	Permission to change log-related configuration
orchestration-server.metrics.read	Permission to view any metrics that the service exposes
orchestration-server.process.manage	Permission to start and stop the service
orchestration-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
orchestration-server.security.read	Permission to view security-related resources

Reports

The following table describes the permissions in the Reports tab.

Permission	Description
Alert	
Define RE Alert	Permission to define the RE alerts
Export RE Alert Definition	Permission to export the RE alert definistions
Manage RE Alerts	Permission to to modify the RE alerts
View RE Alerts	Permission to view the RE alerts
View Scheduled RE Alerts	Permission to view the scheduled RE alerts
Chart	
Define Chart	Permission to define the charts
Delete Chart	Permission to delete the charts
Export Chart Definition	Permission to export the chart definistions
Manage Charts	Permission to modify the charts
View Charts	Permission to view the charts
List	
Define Lists	Permission to define the lists

Permission	Description
Delete List	Permission to delete the lists
Export List	Permission to export the lists
Manage Lists	Permission to modify the lists
Report	
Define Report	Permission to define the reports
Delete Report	Permission to delete the reports
Export Report	Permission to export the reports
Manage Reports	Permission to modify the reports
View Reports	Permission to view the reports
Reports	
Access Configure	Permission to access Configure module
Access Reporter Module	Permission to access Reporter module
Access Reporter search	Permission to access Reporter search
Access View	Permission to access Reports view
Rule	
Add RE Alert Definition from Rule	Permission to add RE alert definition from the rules
Define Rule	Permission to define the rules
Delete Rule	Permission to delete the rules
Export Rule	Permission to export the rules
Manage Rules	Permission to modify the rules
View Rule Usage	Permission to view the rules usage
Schedules	
Define Schedule	Permission to define the schedules
Delete Schedule	Permission to delete the schedules
View Schedules	Permission to view the schedules
Warehouse Analytics	

Permission	Description
Define Jobs	Permission to define the warehouse analytics jobs
Delete Jobs	Permission to delete the warehouse analytics jobs
Manage Jobs	Permission to modify the warehouse analytics jobs
View Jobs	Permission to view the warehouse analytics jobs

The following table lists the permissions in the Reports tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
Alert						
Define RE Alert		Yes	Yes			Yes
Export RE Alert Definition		Yes	Yes			Yes
Manage RE Alerts		Yes	Yes			Yes
View RE Alerts	Yes	Yes	Yes			Yes
View Scheduled RE Alerts		Yes	Yes			Yes
Chart						
Define Chart		Yes	Yes			Yes
Delete Chart		Yes	Yes			Yes
Export Chart Definition		Yes	Yes			Yes
Manage Charts		Yes	Yes			Yes
View Charts		Yes	Yes			Yes
List						
Define Lists		Yes	Yes			Yes

Respond-server

The following table describes the permissions in the Respond-server tab.

Note: For viewing and managing the Risk Score feature, users who have installed NetWitness Platform 11.3 or upgraded from NetWitness 10.6.x to 11.3, risk score permissions will be already present for Analysts. For users updating from NetWitness 11.x to NetWitness Platform 11.3, the Administrator has to provide Analysts' permissions to manage and view risk score.

Permission	Description
respond-server.*	All permissions (everything below)
respond-server.alert.delete	Permission to delete alerts
respond-server.alert.manage	Permission to create, update, or delete alerts and alert filters
respond-server.alert.read	Permission to view alerts and alert filters
respond-server.alertrule.manage	Permission to create, update, or delete alert aggregation rules
respond-server.alertrule.read	Permission to view alert aggregation rules
respond-server.configuration.manage	Permission to change any configuration properties for the service
respond-server.health.read	Permission to view any health notifications that the service exposes
respond-server.incident.delete	Permission to delete incidents
respond-server.incident.manage	Permission to create, update, or delete incidents and incident filters including permission to view the Create Incident and Add to Incident options in the Investigate > Events view
respond-server.incident.read	Permission to view incidents and incident filters
respond-server.journal.manage	Permission to create, update, or delete journal entries for an incident
respond-server.journal.read	Permission to view journal entries for an incident
respond-server.logs.manage	Permission to change log-related configuration
respond-server.metrics.read	Permission to view any metrics that the service exposes
respond-server.notification.manage	(This permission is available in NetWitness version 11.1 and later.) Permission to configure incident email notification settings such as the selected email server, SOC Managers, and who will be sent the notifications (Assignee and SOC Managers)
respond-server.notification.read	(This permission is available in NetWitness version 11.1 and later.) Permission to view incident email notification settings
respond-server.process.manage	Permission to start and stop the service
respond-server.remediation.manage	Permission to create, update, or delete remediation tasks

Permission	Description
respond-server.remediation.read	Permission to view remediation tasks
respond-server.risk.manage	Permission to manage risk score
respond-server.risk.read	Permission to view risk score
respond-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
respond-server.security.read	Permission to view security-related resources

The following table lists the permissions in the Respond-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrator has all of the permissions by default and are not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
respond-server.*	Yes	Yes				
respond-server.alert.delete						
respond-server.alert.manage			Yes		Yes	Yes
respond-server.alert.read			Yes		Yes	Yes
respond-server.alertrule.manage			Yes			
respond-server.alertrule.read			Yes			
respond-server.configuration.manage						
respond-server.health.read						
respond-server.incident.delete						
respond-server.incident.manage			Yes		Yes	Yes
respond-server.incident.read			Yes		Yes	Yes
respond-server.journal.manage			Yes		Yes	Yes
respond-server.journal.read			Yes		Yes	Yes
respond-server.logs.manage						
respond-server.metrics.read						

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
respond-server.notification.manage			Yes			
respond-server.notification.read			Yes			
respond-server.process.manage						
respond-server.remediation.manage			Yes		Yes	Yes
respond-server.remediation.read			Yes		Yes	Yes
respond-server.risk.manage						Yes
respond-server.risk.read						Yes
respond-server.security.manage						
respond-server.security.read						

Incident Email Notification Settings Permissions

Note: Incident email notification setting permissions are available in NetWitness version 11.1 and later.
If you are updating from NetWitness version 11.0 to 11.1 or later, you will need to add additional permissions to your existing built-in NetWitness user roles. For all upgrades to 11.1 or later, you will need to add additional permissions to custom roles.

The following permissions are required for Respond Administrators, Data Privacy Officers, and SOC Managers to access Incident Email Notification Settings [(Configure) > Incident Notifications].

Incidents tab:

- Configure Incident Management Integration

Respond-server tab:

- respond-server.notification.manage
- respond-server.notification.read

Integration-server tab:

- integration-server.notification.read
- integration-server.notification.manage

Respond Event Analysis Permissions

Note: The Event Analysis panel in the Respond view is available in NetWitness version 11.2 and later.

The Events panel in the Respond view, formerly known as the Event Analysis panel, shows the Events view from Investigate for specific indicator events. The following permissions are required to view the Events panel in the Respond view. These permissions are provided by default for users with the Analysts role.

Investigate-server tab:

- investigate-server.event.read
- investigate-server.content.reconstruct
- investigate-server.content.export

Administration tab:

- Access Administration Module

Respond Saved Filter Permissions

Note: Saved filters for the incidents and alerts lists in Respond are available in NetWitness version 11.5 and later.

The following permissions are required for the incidents and alerts filters (Respond > Incidents and Respond > Alerts). The Analysts role has the required Respond filter permissions by default.

Respond-server tab:

- respond-server.incident.manage
- respond-server.incident.read
- respond-server.alert.manage
- respond-server.alert.read

Security-server

The following table describes the permissions in the Security-server tab. The Administrators, Operators, and Data Privacy Officers roles have all of the permissions and are the only roles granted permissions by default.

Permission	Description
security-server.*	All permissions (everything below)
security-server.account.manage	Permission to view, create, modify, or remove NetWitness local accounts
security-server.account.read	Permission to view NetWitness local accounts

Permission	Description
security-server.ca.manage	Permission to manage NetWitness deployment PKI parameters (for example, sign certificates, and so on)
security-server.ca.read	Permission to view NetWitness deployment PKI parameters
security-server.configuration.manage	Permission to modify all service configuration parameters
security-server.connection.manage	Permission to modify all connection configuration parameters
security-server.health.read	Permission to view any health notifications that the service exposes
security-server.logs.manage	Permission to change log-related configuration
security-server.metrics.read	Permission to view any metrics that the service exposes
security-server.permission.manage	Permission to create or remove NetWitness permissions
security-server.pki.manage	Permission to modify all pki configuration parameters
security-server.process.manage	Permission to start and stop the service
security-server.role.manage	Permission to create, modify, or remove NetWitness roles (for example, add role permissions)
security-server.role.read	Permission to view NetWitness role definitions
security-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
security-server.security.read	Permission to view security-related resources
security-server.test.manage	Permission to modify all test configuration parameters
security-server.user.manage	Permission to view, create, modify, or remove NetWitness user profiles
security-server.user.read	Permission to view NetWitness user profile details (for example, roles, login times, and so on)

Source-server

The following table describes the permissions in the Source-server tab.

Permission	Description
source-server.*	All permissions (everything below)
source-server.configuration.manage	Permission to change any configuration properties for the service

Permission	Description
source-server.group.manage	Permission to create and manage USM groups
source-server.group.manage.nopolicy	Permission to manage nopolicy
source-server.group.read	Permission to view USM groups
source-server.grouppolicy.read	Permission to view the canonical groups and policies
source-server.health.read	Permission to view any health notifications that the service exposes
source-server.logs.manage	Permission to change log-related configuration
source-server.metrics.read	Permission to view any metrics that the service exposes
source-server.policy.manage	Permission to create and manage USM policies
source-server.policy.read	Permission to view USM policies
source-server.process.manage	Permission to start and stop the service
source-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
source-server.security.read	Permission to view security-related resources
source-server.centralgroup.read	Permission to view the Centralized Content Management groups
source-server.centralpolicy.read	Permission to view the Centralized Content Management policies
source-server.centralservice.read	Permission to view the core services and ESA services

The following table lists the permissions in the Source-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators and Operators roles have all of the permissions by default and are not listed.

Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
source-server.*						
source-server.configuration.manage						
source-server.group.manage						
source-server.group.manage.nopolicy						

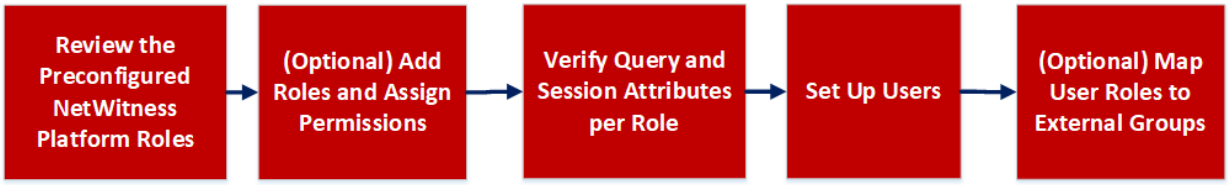
Permission	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
source-server.group.read		Yes	Yes			Yes
source-server.grouppolicy.read						
source-server.health.read						
source-server.logs.manage						
source-server.metrics.read						
source-server.policy.manage						
source-server.policy.read		Yes	Yes			Yes
source-server.process.manage						
source-server.security.manage						
source-server.security.read						Yes
source-server.centralgroup.read						Yes
source-server.centralpolicy.read						Yes
source-server.centralservice.read						Yes

Springboard

The following table describes the permissions in Springboard tab.

Permission	Description
springboard.*	All Permissions (everything below)
springboard.manage	Permission to manage the Springboard, that is view, add, delete, and rearrange panels, and also restore system default settings.
springboard.read	Permission to view Springboard.

The following table lists the permissions in the Springboard tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all the permissions by default and is not listed.



Permissions	RAs	DPOs	SOC Mgrs	Operators	MAs	Analysts
springboard.*						
springboard.manage						
springboard.read	Yes		Yes		Yes	Yes

Manage Users with Roles and Permissions

A set of end-to-end procedures for managing users in NetWitness is described in this section. These steps explain how to add a user in NetWitness and then how to control what the user can do.

Manage Users Workflow

This figure shows the high-level workflow for managing the users in NetWitness.

First, review the preconfigured NetWitness roles such as Administrators, Respond Administrators, Data Privacy Officers, SOC managers, Operators, Malware analysts, Analysts, and UEBA analysts. Determine if you need to make any adjustments to these roles for your environment. You can add new custom roles and assign permissions to each role. After you define the roles, you can verify the query and session attributes that are set for each role. Then you can set up the users by adding new users and assigning roles to them. You can also map external group users to the NetWitness roles.

These are the procedures for setting up and managing users:

- Review the Preconfigured NetWitness Platform Roles
- (Optional) Add a Role and Assign Permissions
- Verify Query and Session Attributes per Role
- Set Up Users
- (Optional) Map User Roles to External Groups

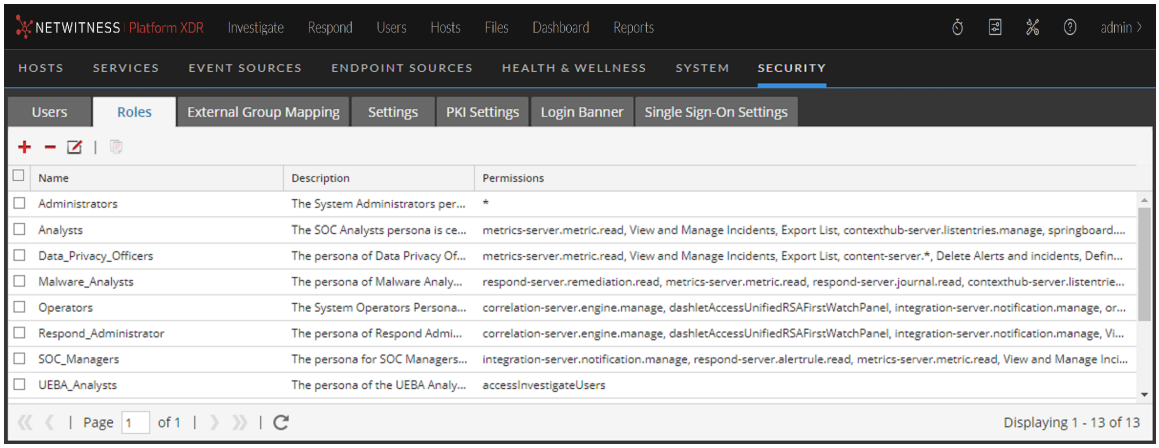
Review the Preconfigured NetWitness Platform Roles

To simplify the process of creating roles and assigning permissions, there are preconfigured roles in NetWitness.

Role	Permission
Administrators	Full system access. The System Administrators persona is granted all permissions by default.
Analysts	Access to meta and session content but not to configurations. The Security Operation Center (SOC) Analysts persona is centered around investigation, ESA Alerting, Reporting, and Respond, but not system configuration.

Role	Permission
Reporting_Engine_ Content_Administrators	Access to manage the Live content. Users with the Reporting Engine Content Administrator role can deploy Reporting Engine content (rules, reports, charts, and lists) from Live Content, view and manage permissions to the deployed content in Reporting Engine.
Data_Privacy_Officers	The Data Privacy Officer (DPO) persona is similar to Administrators with additional focus on configuration options that manage obfuscation and viewing of sensitive data within the system (see the *Data Privacy Management Guide*). Users with the DPO role can see which meta keys are flagged for obfuscation, and they also see obfuscated meta keys and values created for the flagged meta keys.
Malware_Analysts	Access to investigations and malware events. The only access granted to the Malware Analysts persona is the Malware Analysis module.
Operators	Access to configurations but not to meta and session content. The System Operators persona is focused on system configuration, but not investigation, ESA, Alerting, Reporting, and Respond.
Respond_Administrator	Access to all Respond permissions. The Respond Administrator persona is focused on system configuration of Respond.
SOC_Managers	Same access as Analysts plus additional permission to handle incidents. The SOC Managers persona is identical to Analysts, but with permissions necessary to configure Respond.
UEBA_Analysts	Access to the NetWitness UEBA service in the **Investigate** > **Users** view. NetWitness UEBA is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all entities in your network environment. **Note:** You do not need to set up specific permissions for this role. You only need to assign this role to a user, and that user will have access to NetWitness UEBA.

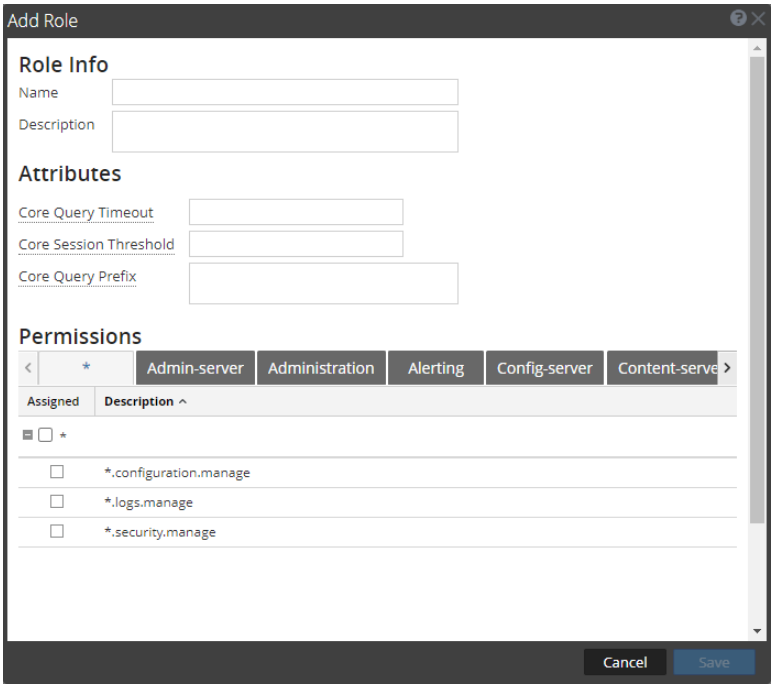
The administrator can also add custom roles.



(Optional) Add a Role and Assign Permissions

Although NetWitness has preconfigured roles, you can add custom roles. For example, in addition to the preconfigured Analysts role you could add custom roles for AnalystsEurope and AnalystsAsia. For a detailed list of permissions, see Role Permissions.

Each of the following procedures starts on the **Roles** tab.



To navigate to the Roles tab:

1. Go to **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Roles** tab.

Add a Role and Assign Permissions

1. In the **Roles** tab, click ✚ in the toolbar.
2. The **Add Role** dialog is displayed.

3. In the **Role Info** section, type the following information for the role:
   - **Name**
   - (Optional) **Description**
4. In the **Attributes** section, enter the desired values for each attribute. For more information on attributes, see Verify Query and Session Attributes per Role.
5. In the **Permissions** section:
   - Click ‹ and › to scroll through the modules.
   - Select a module the role will access.
   - Select each permission the role will have.
6. Repeat the previous step until you select all permissions to assign to the role.
7. Click **Save** to add the new role, which is effective immediately. You can now assign the new role to users.

Change Permissions Assigned to a Role

1. In the **Roles** tab, select the role and click .
   The **Edit Role** dialog is displayed.
2. In the **Permissions** section:

- Click  and  to scroll through the modules. Select a module to revise permissions for it. Select or deselect each permission.
- Select a module to revise permissions for it.
- Select or deselect each permission.

3. Repeat the previous step until the role has the required permissions.
4. Click **Save**. The revised permissions are effective immediately.

Duplicate a Role

An efficient way to add a new role is to duplicate a similar role, save it with a new name and revise the permissions that are already assigned.

1. In the **Roles** tab, select the role you want to duplicate and click .
2. Type a new role name and click **Save**.
3. To change the permissions, follow the steps in the next procedure.

Delete a Role

You can delete a role if it is not assigned to any users.

1. In the **Roles** tab, select the role and click .
2. A dialog requests confirmation that you want to delete the role. Click **Yes**.

Verify Query and Session Attributes per Role

After you define your user roles, it is important to verify the query and session attributes that are set for each role. You can adjust these settings according to your requirements.

You can understand how these role settings impact individual user settings and what happens if a user is a member of multiple roles.

Query and Session Attributes

Query and session attributes determine how to handle the queries that a user runs. These attributes enable you to lock down the information that users can retrieve, and the attributes apply to all sessions of users assigned to a role.

Depending on your requirements, you can specify the following query-handling attributes for a user role:

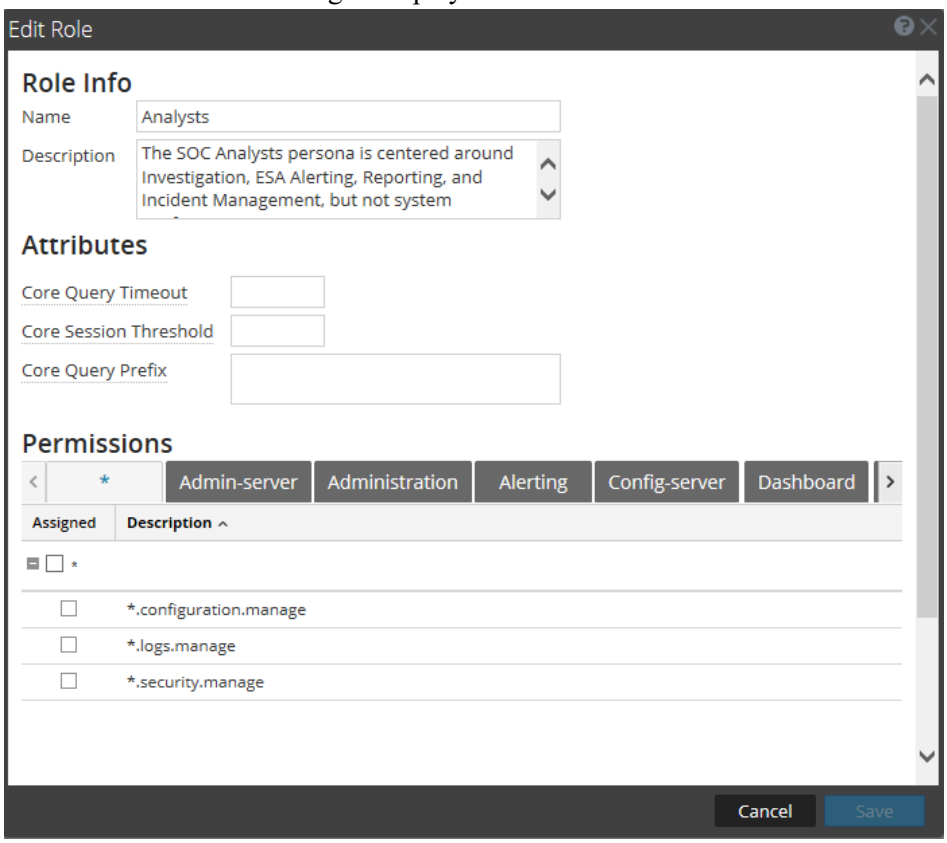
- **Core Query Timeout** is an optional setting that applies to NetWitness Core services. It specifies the maximum number of minutes that a user can run a query. If this value is set, it must be zero (0) or greater. A value of zero represents no timeout. The default value is 5 minutes.
- **Core Session Threshold** is a required setting. This value must be zero (0) or greater. The default is 100000. The limit you specify here overrides the **Max Session Export** value defined in the Investigate view settings. If the threshold is greater than zero, a query optimization will extrapolate the total session counts that exceed the threshold. When the meta value count returned by the query reaches the threshold, the system will:
  - Stop its determination of the session count.
  - Show the threshold and percentage of query time used to reach the threshold.
- **Core Query Prefix** is an optional filter applied to queries the user runs. The prefix restricts query results that the user sees. For example, the `'service' = 80` query prefix is prepended to any queries run by the user, and the user can only access metadata of HTTP sessions. If you set up data privacy using a whitelist, every meta key specified in the core query prefix must also be whitelisted as described in the *Data Privacy Management Guide*.

Note: In Version 11.1 and later, you can use configured meta entities in a Core Query Prefix. For additional information about configuring meta entities, refer to the *Core Database Tuning Guide*.

The query-handing attribute settings applied for a user depend on the role memberships of the user. It is important to verify the query-handling attribute settings for your roles.

How Query-Handling Attribute Settings Apply to Individual Users

If a user is a member of multiple roles, the following logic applies for the user:



- **Query Timeout:** The most permissive (highest) value of all assigned roles is applied to the user.
- **Query Prefix:** The query prefixes of each of the user roles are AND'd together.

- **Session Threshold:** The highest value of all the assigned roles is applied to the user.

Set Query Handling Attributes for a User Role

1. Go to **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.

2. Click the **Roles** tab. If you are adding a role, click . If you are editing a role, select the role and click .
   The Add or Edit Role dialog is displayed.

3. To set the attributes for the role, in the **Attributes** section:
   - (Optional) In the **Core Query Timeout** field, type the maximum number of minutes that a user can run a query. This timeout applies to queries performed from Investigate.
   - Type a **Core Session Threshold** for the system to stop its determination of the session count.
   - (Optional) Type a **Core Query Prefix** to filter query results that role members see in the Investigate Navigate view, Events view, and Event Analysis view. You can specify a query that is prepended to all queries executed by users with a specific role. For example, if the `'service' = 80` query prefix is prepended to all queries by users in this role, the users can only access

metadata of HTTP sessions. If users attempt to navigate to non-HTTP event, the view is not displayed.

Caution: If you add or modify a query prefix, and a user who has access to everything falls into a user role that is now restricted by a query prefix, that user will still be able to access cached data and view restricted content. To remove visibility of restricted content and enforce the query prefix in the Navigate or Events view, go to  (Admin) > System > Investigation, and use Reconstruction Cache Settings to clear the cache for all services available to affected users. The user will still be able to access cached data and view restricted content in the Event Analysis view until the analyst restarts the NetWitness Investigate services or the cache is cleared automatically after 24 hours.

4. Click **Save.**

Set Up Users

The procedures to set up a new user are described below.

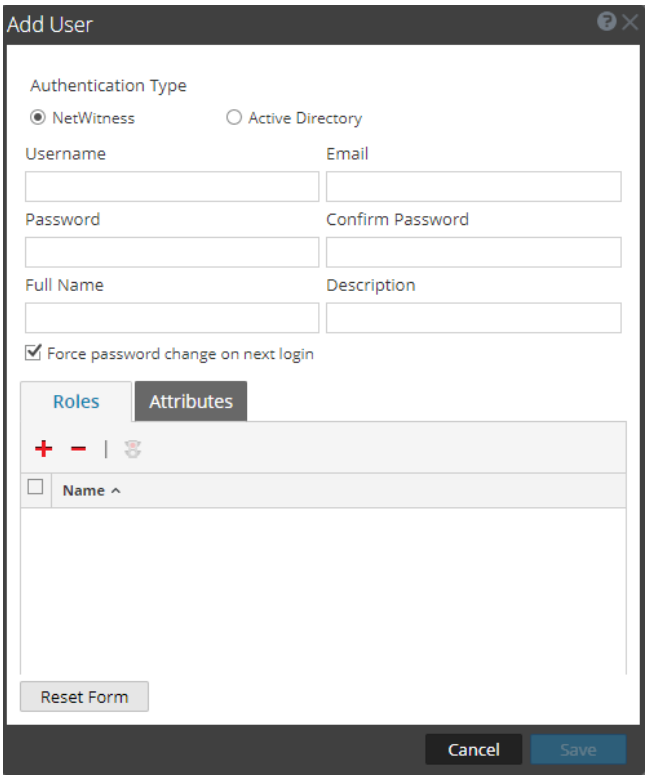
- Add a User and Assign a Role
- Enable, Unlock, and Delete User Accounts

Add a User and Assign a Role

All NetWitness users must have a local or external user account. You can add a new user to each type of user account, local and external. You can assign role to a local user.

The following considerations are important when managing local and external user accounts.

Local User Account	External User Account
Managed within NetWitness.	Managed externally and outside the scope of this document.
Roles assigned directly.	Roles assigned by external group mapping.
Derives permissions from each role assigned to the user	Derives permissions from each role mapped to the account's external user group, as explained in (Optional) Map User Roles to External Groups.
NetWitness manages all user information.	NetWitness manages user identification only. This includes Username, Full Name and Email.



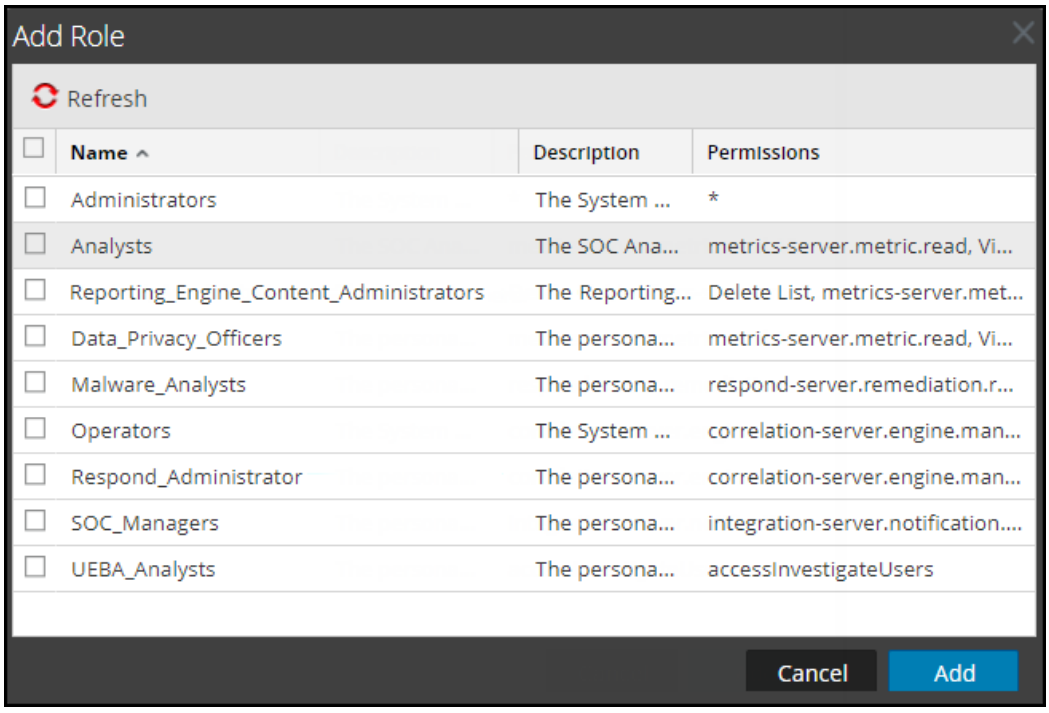
Each of the following procedures starts on the Users tab. To navigate to the Users tab, go to  (Admin) > Security. The Security view is displayed with the Users tab open.

Add a Local User

To add a local user account and assign a role to the user:

1. In the **Users** tab, click  in the toolbar.

   The **Add User** dialog is displayed.

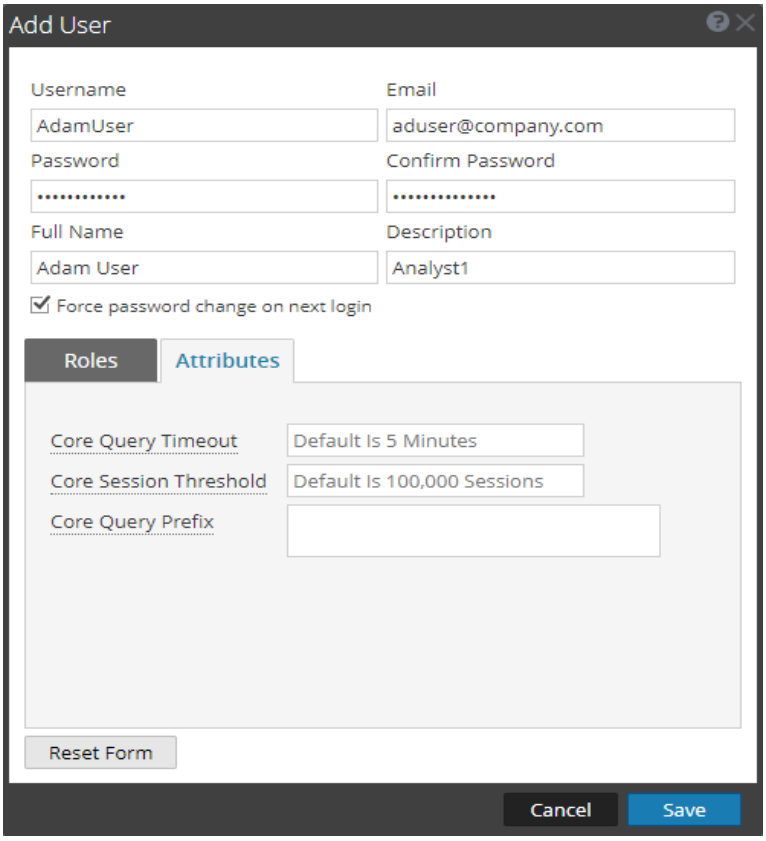


2. Type the following account information for the new user:
   - **Authentication Type**: **NetWitness** is selected by default and is the correct choice when adding a local user. This option is only displayed when there are AD or PAM configurations set up to allow for selecting that authentication type.

     Note: If there are no AD or PAM configurations, the authentication type is set to NetWitness automatically and there are no other options available.
   - **Username** for logging on to NetWitness
   - **Email** address
   - Password for logging on to NetWitness, in the **Password** and **Confirm Password** fields
   - **Full Name** of the new user
   - (Optional) **Description** of the user account
3. To expire the user password the next time the user logs on, select **Force password change on next login**.

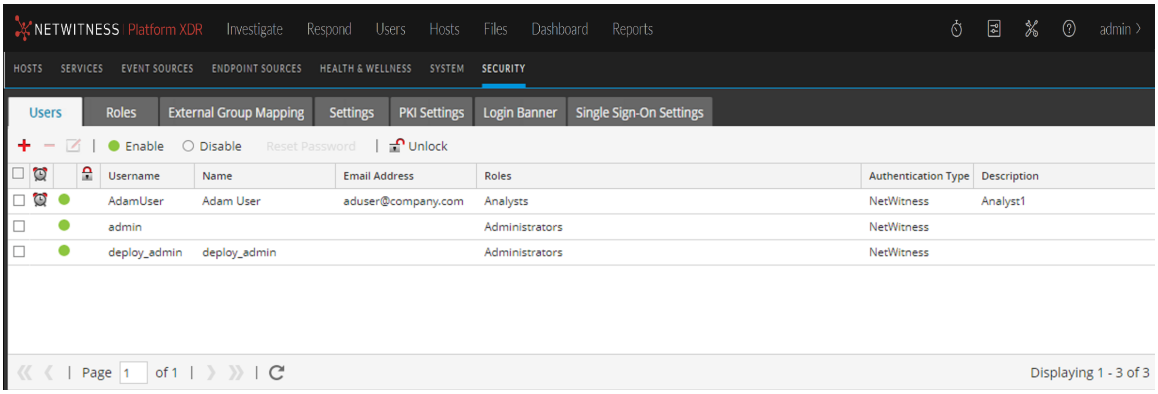
   This does not affect any active user sessions. The  appears in the user row to show that the user password expired. After a password is expired, you cannot undo it. This checkbox is cleared the next time you edit the user account.
4. To assign a role to the user, click + in the **Roles** tab.

   The **Add Role** selection dialog shows the list of available roles.



5. Select each role to assign and click **Add**.

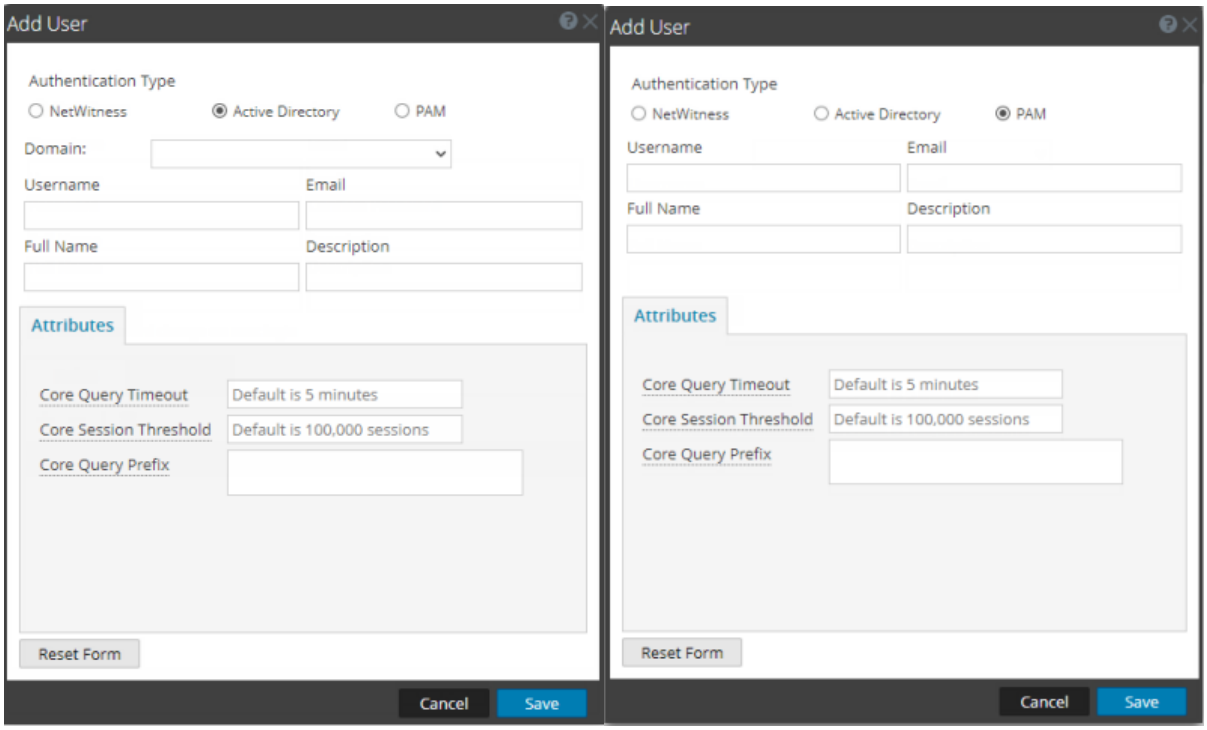
   The **Add User** dialog shows each role assigned to the user.



6. (Optional) To assign attributes to a user, go to **Attributes** and modify the appropriate values. These attributes are unique to the user and follow all the same rules for attributes within roles. For more information on attributes, see Query and Session Attributes.

7. (Optional) Select a role and click to **Show all permissions** for the role.
8. Click **Save**.

   The **Users** tab shows the new user and each role assigned to the user. The account is active immediately.



Add a User for External Authentication

To add a user for external authentication:

1. In the **Users** tab, click + in the toolbar.

   The **Add User** dialog is displayed.

2. For **Authentication Type**, select either **Active Directory** or **PAM**. The dialog will update to show the required fields for the selected external authentication type.

3. Type the following information:

   - **Domain** (if select Active Directory authentication only): Select the Active Directory domain for the user from the drop-down list of available domains.
   - **Username** for logging on to NetWitness
   - **Email** address
   - **Full Name** of the new user
   - (Optional) **Description** of the user account

4. In the Attributes section, type the following information.

   a. **Core Query Timeout**- most permissive (highest) value of all assigned roles is applied to the user.

   b. **Core Session Threshold** - query prefixes of each of the user roles are AND'd together.

   c. **Core Query Prefix** - highest value of all the assigned roles is applied to the user.

5. Click **Save**. The Users tab shows the new user account, which still needs a role and permissions.

6. To map a role to the new user, see (Optional) Map User Roles to External Groups.

Change User Information or Roles

To change a user's account information or assigned roles:

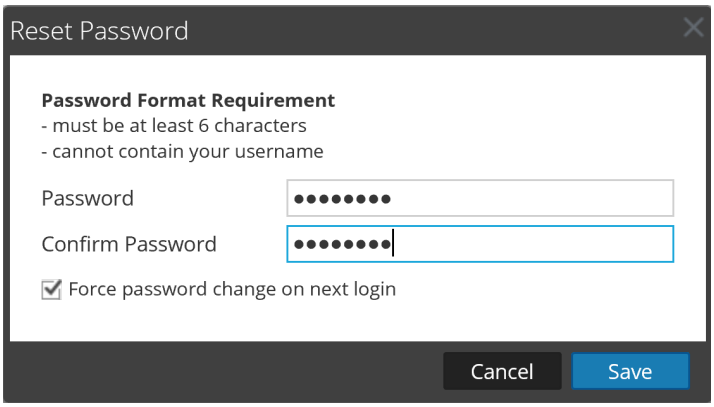
1. In the **Users** tab, select a user and click in the toolbar.

   The **Edit User** dialog is displayed.
2. To edit user information, change any of the following fields:
   - **Email**
   - **Full Name**
   - **Description**
3. To expire the **internal** user password the next time the user logs on, select **Force password change on next login**.

   This does not affect any active user sessions. The appears in the user row to show that the user password expired. After a password is expired, you cannot undo it. This checkbox is cleared the next time you edit the user account.
4. In the **Roles** section:
   - To assign another role, click , select a role and click **Add**.
   - To remove an assigned role, select the role and click .
5. Click **Save**.

Delete a User

To delete a user:



1. In the **Users** tab, select a user.
2. In the toolbar, click .
3. Click **Save**.

Note: To fully delete a user that is externally authenticated by Active Directory, you must also delete the user from the AD Group.

Reset a User Password

To reset a user password:

1. In the **Users** tab, select a user.
2. In the toolbar, click **Reset Password**.

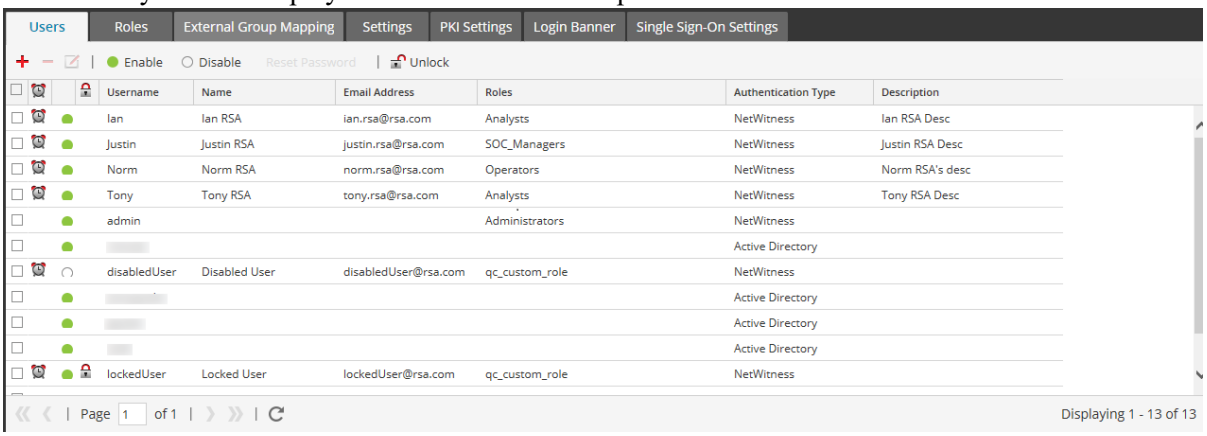
The **Password Format Requirement** section lists the specific requirements for the password. Administrators can adjust these requirements for all internal users in the password policy. See Configure Password Complexity.

3. Choose whether to force a password change the next time the user logs in to NetWitness.
4. Click **Save**.

Enable, Unlock, and Delete User Accounts

All users of NetWitness must either have a local user account with username and password or have an external user account. Within NetWitness, you can enable, disable, and delete local user accounts.

The first time an external user logs into NetWitness, a new user entry is automatically created with NetWitness. NetWitness manages only user identification information; for example, Full Name and Email.



You can unlock locked accounts for both local and external users.

Enable Disabled NetWitness User Accounts

To enable NetWitness user accounts that have been disabled:

1. Go to **(Admin) > Security**.

   The Security view is displayed with the **Users** tab open.

2. In the **Users** grid, select one or more accounts.
3. Click Enable.
   A successful message displays for enabled accounts, and the users can log in to NetWitness.

Disable NetWitness User Accounts

You can block user access by disabling users. Disabling the user does not delete user preferences. This action blocks user access without deleting user preferences so that upon re-enabling users, user preferences are intact. You can re-enable users to restore user access. Disabling users applies only to Local users and not External Users.

To disable NetWitness user accounts:

1. In the **Users** grid, select one or more accounts.
2. Click Disable.
   A successful message displays for disabled accounts, and the users can no longer log in to NetWitness.

Unlock Locked NetWitness User Accounts

A user is locked out for a period of time after a number of failed consecutive login attempts. To unlock NetWitness user accounts that are locked due to excessive failed login attempts:

1. In the **Users** grid, select one or more accounts.
2. Click Unlock.
   A successful message displays for unlocked accounts, and the users can log in to NetWitness.

Delete NetWitness User Accounts

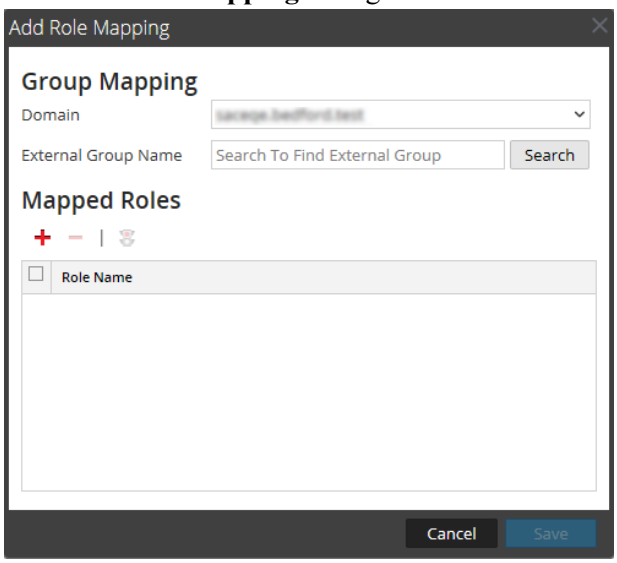
If not using External Authentication, a user can log on to NetWitness using a local account. These local accounts are directly managed using NetWitness. To revoke access to a local user, either disable the account or delete the account completely from the system.

Note: This deletes all user preferences for the account from NetWitness. If this is not the intention, disable the user instead of deleting the user.

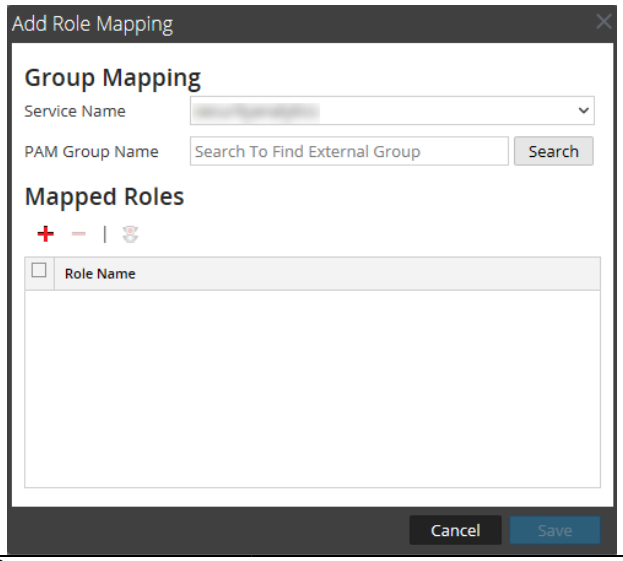
To delete NetWitness user accounts:

1. Go to  **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. In the Users list, select one or more accounts.
3. Click .
   A warning dialog requests confirmation.
4. If you want to delete the accounts, click **Yes**.
   The accounts are removed from NetWitness, and the users can no longer log in to NetWitness.

(Optional) Map User Roles to External Groups

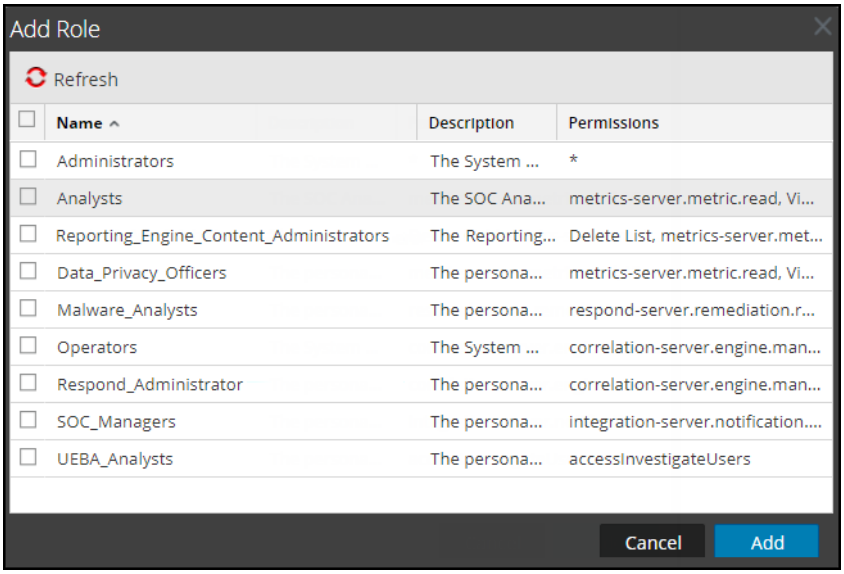


In NetWitness, external groups derive permissions for various modules and views from NetWitness user roles, which have permissions assigned to them. To provide access to an external group, map user roles to it. To modify an external group's access, edit the roles mapped to it. Add and delete roles until the external group has the necessary access. Changes take effect immediately.



In the Settings tab, you must set up a method for external user authentication to make external groups visible to NetWitness.

Add Role Mapping for an External Group



To add role mapping for an external group:

1. Go to **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **External Group Mapping** tab.
3. In the toolbar, click +.
   The **Add Role Mapping** dialog for the external authentication method you selected is displayed.

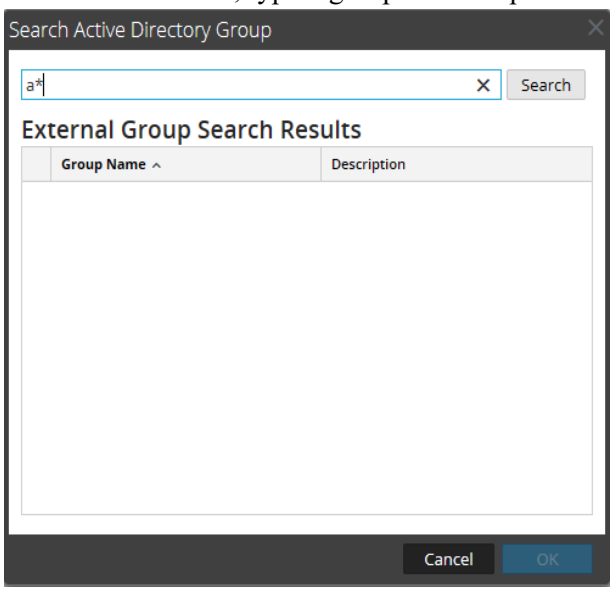
4. Click **Search** and search for an external group name in the Search for External Groups, then select an external group name.
5. To add roles to the group mapping, click + in the **Mapped Roles** section.
   The **Add Role** dialog is displayed.

6. Select the checkbox in the title bar to select all roles, or select roles individually.
7. To add the roles to the **Mapped Roles** section in the Add Role Mapping dialog, click **Add**.
   The dialog closes and the selected roles are displayed in the Mapped Roles section.
8. If you want to delete roles from the **Mapped Roles** section, select the roles and click − .
9. When the **Add Role Mapping** dialog reflects the role mapping that you want to define for the group, click **Save**.
   The Add Role Mapping dialog closes, and the new role mapping is listed in the External Group Mapping tab list.

Edit Role Mapping for a Group

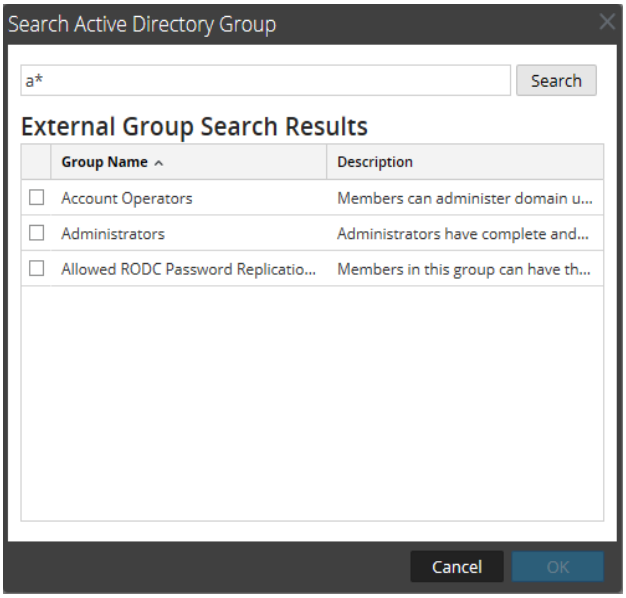
To edit role mapping in a group:

1. In the **External Group Mapping** action bar, click **Edit**.
   The **Edit Role Mapping** dialog is displayed with the group name in the **External Group Name** field.
2. To add roles to the mapping, click + in the **Mapped Roles** section.
   The Add Role dialog is displayed.
3. Select the checkbox in the title bar to select all roles, or select roles individually.
4. To add the roles to the **Mapped Roles** section in the **Add Role Mapping** dialog, click **Add**.
   The dialog closes, and the selected roles are displayed in the Mapped Roles section.



5. If you want to delete roles from the **Mapped Roles** section, select the roles and click .
6. When the **Edit Role Mapping** dialog reflects the role mapping that you want to define for the group, click **Save**.
   The dialog closes, and the edited role mapping is listed in the External Group Mapping tab.

Search for External Groups



The instructions for searching for external groups that have NetWitness user roles mapped to them.

To search for an external group:

1. Go to **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **External Group Mapping** tab.
3. In the toolbar, click or .
   The **Add Role Mapping** dialog for the external authentication method you selected is displayed.
4. The **Group Mapping** section is dependent on the selected external authentication method.
   - For **Active Directory**, select a **Domain**. Then click **Search** next to **External Group Name**.
   - For **PAM**, click **Search** next to **PAM Group Name**.
     The **Search External Groups** dialog is displayed.
5. In **Common Name**, type a group name or part of a group name with the wild card character (*).

6. Click **Search**.
   The results are displayed in the **External Group Search Results** section.

7. Select the group to which you want to assign roles and click **OK**.

Set Up Multi-Factor Authentication

You can set up Multi-Factor Authentication (MFA) for NetWitness using one of the following methods:

- ADFS Log in to NetWitness with SecurID Passcode.
- PAM SecurID Log in to NetWitness for AD Users.

ADFS Log in to NetWitness with SecurID Passcode

Single Sign-On (SSO) functionality of NetWitness can be leveraged where the user authenticates using ADFS log in user interface with AD user credentials followed by the SecurID passcode.

Note: This method is suitable only for single AD users.

Prerequisites

- NetWitness Platform (NW) version 11.4 or later
- MS Active Directory Federation Services (ADFS) - MS Windows Server 2012 R2 or later
- MS Active Directory (AD) – MS Windows Server 2008 R2 or later
- Authentication Manager (AM) 8.4 or later
- Authentication Agent for ADFS 1.0 or later

Perform the following configurations:

1. Configure Authentication Manager.
2. Configure NetWitness.
3. Configure ADFS.

Configure Authentication Manager

Configure Active Directory as an Identity Source in Authentication Manager using the steps described in the section Add an Identity Source.

Configure NetWitness

1. Configure Active Directory for External Authentication to NetWitness using the steps described in the section Configure Active Directory.
2. NetWitness must be configured for SSO using the steps described in the section Configure Single Sign-On.

Configure ADFS

ADFS must be configured for SSO in NetWitness. You must copy the exported metadata (see step 9 in Configure Single Sign-On) to ADFS and perform the following steps:

1. Go to **Server Manager > Tools > ADFS management > Trust Relationships**.
2. On the right-side, click **Add Relying Part Trust > Start**.
3. Click **Import data about the relying party from a file** and select the metadata file.
4. Click **Next**, and enter a display name.
5. Click **Next** until the **Close** button is displayed.
6. Ensure the **Open the Edit Claim Rules** option is selected.
7. Click **Close**.
8. In the **Edit Claim Rules** dialog, click **Add Rule**.
9. In the **Add Transform Claim Wizard** dialog, click **Next**.
10. Enter a claim rule name.
11. In the **Attribute Store** drop-down menu, select **Active Directory**.
12. In the Mapping of LDAP attributes table, on the left-side select **SAM-Account-Name** and on right-side, select **Name ID**.

    Note: Only one mapping is required.

13. Click **Finish**.
14. Click **Apply**.
15. Click **OK**.

    Next you need to configure MFA using Authentication Agent in ADFS. The agent is freely available at (https://community.securid.com/t5/securid-authentication-agent-for/tkb-p/auth-agent-ad-fs-documentation) and for more information on configuration, see ® Authentication Agent 2.0.3 for Microsoft® AD FS Administrator's Guide.

PAM SecurID Log in to NetWitness for AD Users

In this method only SecurID Passcode is required for authenticating to NetWitness. Authentication Manager takes care of the authentication to AD without requiring the password from the user.

After the configuration, the user registered in the Active Directory can log in to NetWitness using the SecurID passcode.

Prerequisites

- NetWitness Platform (NW) version 11.0 or later
- MS Active Directory (AD) – MS Windows Server 2008 R2 or later
- Authentication Manager (AM) 8.2 or later

Perform the following configurations:

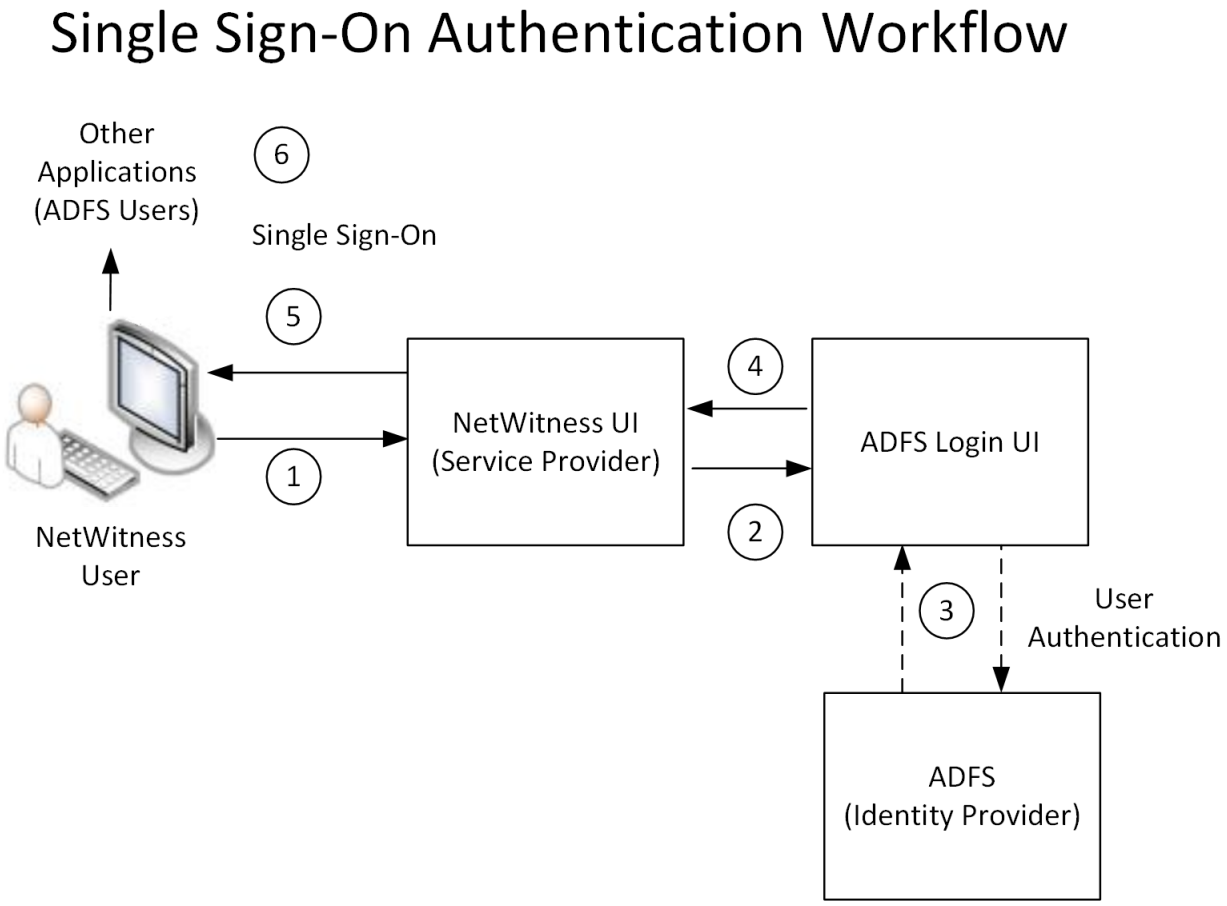
1. Configure Authentication Manager.
2. Configure NetWitness.

Configure Authentication Manager

Configure Active Directory as a Identity Source in Authentication Manager using the steps described in the section Add an Identity Source.

Configure NetWitness

Complete the additional configuration for Authentication Manager and NetWitness configuration as described in the section Configure PAM Login Capability.



Set Up Single Sign-On Authentication

Note: In 11.4 or later, Single Sign-On (SSO) authentication can be used to access the UI however only one Active Directory is supported. SSO authentication is not supported on an Analyst UI Deployment.

Single Sign-On authentication enables the user to log in to NetWitness or any other application if the user is authenticated by the same Identity Provider (IDP). The Active Directory Federation Services (ADFS) is the only supported IDP and the protocol used for SSO is SAML 2.0.

NetWitness Single Sign-On Authentication Workflow

The following workflow shows how the user can access NetWitness using Single Sign-On authentication.

The workflow of SSO authentication shows the following:

1. User tries to access the NetWitness UI using the web browser. For example, https://nw-host/login.
2. The user is prompted to login into the IDP (ADFS) login page.

3. The user enters the credentials for authentication.
4. If the authentication is successful, NetWitness authorizes the user based on the user groups configured on the Active Directory Server and External Role Mapping in NetWitness.
5. If the authorization is successful, the user is logged into the NetWitness.

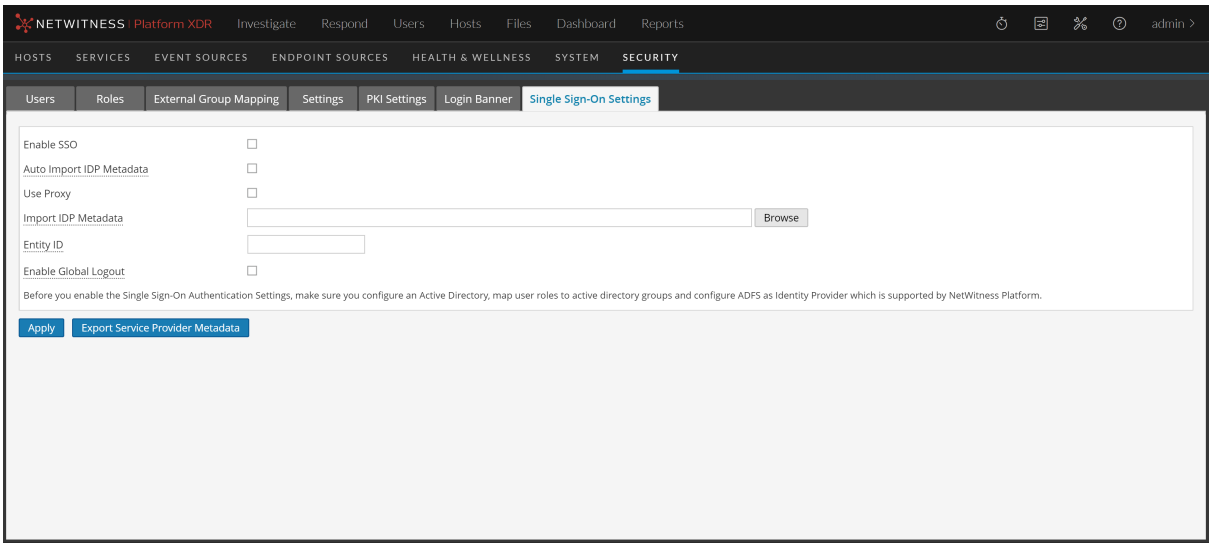
Note: If the single sign-on authentication fails, the user cannot access the NetWitness. For more information, see Troubleshooting.

Configure Single Sign-On

The following workflow describes the tasks to be performed in sequence to configure Single Sign-On authentication on NetWitness.

Configure ADFS as IDP for NetWitness

For instructions on how to configure ADFS as IDP for NetWitness, see the *Configure SAML 2.0 provider settings for portals* topic in Microsoft documentation.



Map User Roles to External Groups

Atleast one Active Directory group should be mapped to an administrator role in NetWitness. For instructions on how to map user roles to Active Directory groups, see (Optional) Map User Roles to External Groups.

Enable Single Sign-On

1. Go to  **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Single Sign-On Settings** tab.

3. Select the **Enable SSO** checkbox.

4. Select the **Auto Import IDP Metadata** if you want the latest IDP metadata to be automatically downloaded at regular intervals.
   When you select this check box, a **Metadata URL** field will be displayed where you must enter the IDP metadata URL.

5. Select **Use proxy** checkbox for the requests to IDP tobe routed through the proxy configured in **(Admin)** > **System** > **HTTP Proxy settings**.

6. Select **Import IDP Metadata** to manually import the meta data and enter the IDP metadata URL.
   Note: Make sure you update the link every time the IDP metadata is updated.

7. Enter a unique entity ID to identify the NetWitness instance in the Identity Provider.

8. (Optional) Select the **Enable Global Logout** checkbox if you want to be logged out of NetWitness along with all the other associated sessions authenticated by IDP.

9. Click **Apply**.
   This may take some time however we recommend you to restart the admin-server immediately. To export the metadata in an XML format either click the link in the notification tray and download the metadata or click **Export Service Provider Metadata** .

Note: The exported Service Provider metadata must be imported to IDP. For more information, see the *Configure SAML 2.0 provider settings for portals* topic in Microsoft documentation.

(Optional) Set Up Public Key Infrastructure (PKI) Authentication

Note: In 11.3 or later, PKI authentication can be used to access the NetWitness UI.

PKI is an authentication method which allows the users to access the NetWitness User Interface (UI) using digital certificates.

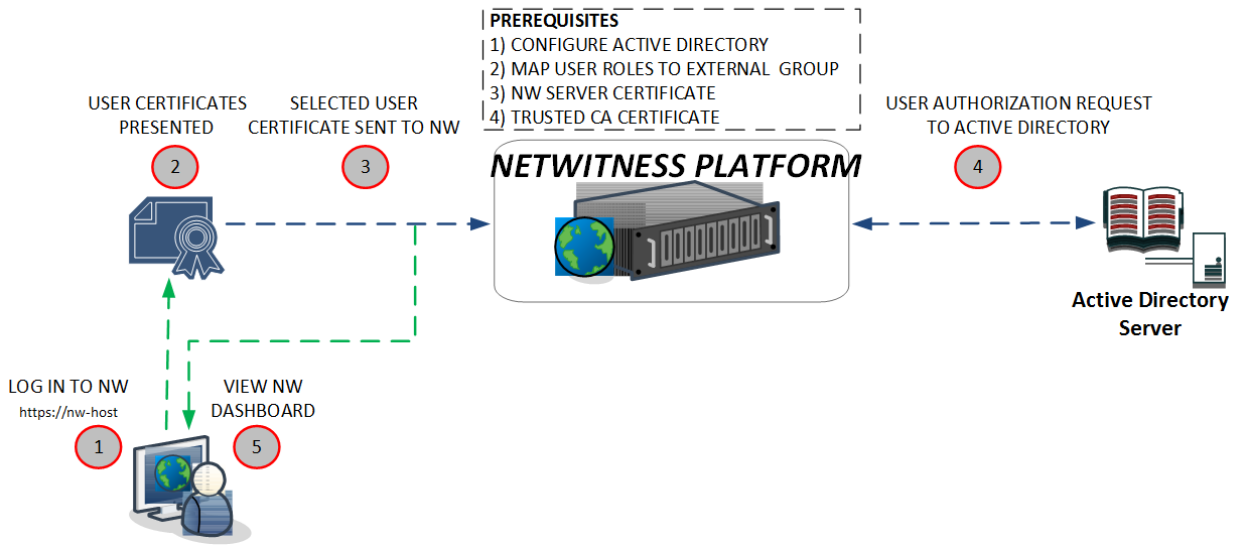
The certificates are issued by a Third-Party Certificate Authority (CA) which is external to NetWitness. The following categories of certificates are required for PKI authentication:

- Trusted CA Certificates
- User Certificate (issued by the CA)
- NetWitness Server Certificate (private key and its certificate chain) - Optional

Trusted CA Certificates

Trusted CA certificates are a collection of certificates used by NetWitness as trusted authorities to validate the certificate provided by the user. If the user does not have a certificate signed by one of these CA(s), the user cannot access the NetWitness Platform UI.

User Certificate



A user certificate is issued by a CA that is trusted by NetWitness and is used by the NetWitness Platform user to present the user identity. By default, user certificates are identified by most browsers. If the certificates are not displayed, you must import the certificates into the browser certificates store.

NetWitness Server Certificate (Optional)

A NetWitness Server certificate is issued by a trusted CA and is used by NetWitness Server to present its identity. If you access the NetWitness Platform UI using HTTPS, the certificate is displayed in the web browser.

NetWitness PKI Authentication Workflow

The following workflow shows how the user can access NetWitness using PKI authentication.

The workflow of PKI authentication shows the following:

1. Access the NetWitness UI using the web browser. For example, https://nw-host/login.
2. The user is prompted to select the user certificate.

Note: The certificate prompt appears differently depending on the browser.

3. The user selects the certificate. The browser sends the selected certificate to the NetWitness for authentication.
4. If the authentication is successful, the NetWitness authorizes the user based on the user groups configured on the Active Directory Server and External Role Mapping in NetWitness.
5. If the authorization is successful, the user is logged into the NetWitness.

Note: If the certificate validation fails, the user cannot access the NetWitness.

Configure PKI Authentication

Perform the following tasks in sequence to configure PKI authentication on NetWitness.

1. Configure Active Directory
2. Map User Roles to External Groups
3. Import Server Certificate and Trusted CA Certificate
4. Enable PKI Authentication

Note: Only Active Directory is supported for PKI Authentication.

Configure Active Directory

For instructions on how to use Active Directory to authenticate external user logins, see Configure Active Directory.

Map User Roles to External Groups

To enable PKI based authentication, a minimum of one external group should be mapped to administrator role in NetWitness. For instructions on how to map user roles to external groups to provide necessary access, see (Optional) Map User Roles to External Groups.

Import Server Certificate and Trusted CA Certificate

To enable PKI authentication, you must import the Trusted CA certificate into the NetWitness. You can import the server certificate and the trusted CA certificate in the  (Admin) > Security view > PKI Settings tab.

Certificate Revocation List

A Certificate Revocation List (CRL) is a file that contains a list of revoked certificates with details such as the serial number and revocation date of each certificate. When a certificate validity is expired, it must be revoked to avoid any compromise of the certificate by unauthorized users. For example, if a NetWitness user resigns from an organization, then the user's certificate must be revoked by the issuing CA.

You can import the CRL or specify the HTTP URL issued by your trusted CA, so that NetWitness can validate with the CRL to block unauthorized users from accessing NetWitness.

To import the CRL or specify a HTTP URL into NetWitness, choose one of the following methods:

- **HTTP server** - This is the most common CRL location where the CA publishes the CRL to external applications using an HTTP server. The NetWitness reads the CRL using the HTTP URL.
- **Local CRL** - This allows the users to manually download the CRL from the CA and upload it to the NetWitness.
- **OCSP (Online Certificate Status Protocol) Responder** - This allows NetWitness to verify the revocation status of a particular certificate instead of validating the complete CRL. To specify a OCSP Responder, you need to provide the HTTP URL and optionally the OCSP Responder's Signing certificate. Make sure the OCSP Responder is online while adding the entry. When the OCSP Responder Signing Certificate is updated, you need to manually update the certificate in NetWitness.

Note: You can configure the CRL when you import the CA certificate or after importing the CA certificate.

User Principal Settings

User Principal Settings allow NetWitness to uniquely identify the user from the user certificate for PKI authentication. To identify the user, you must specify an attribute in the user certificate to extract the user name or user id. NetWitness must be configured to read the value of this attribute. NetWitness uses the extracted value of this attribute as username or user id for authorization and retrieves the user groups from an Active Directory (AD) server. By default, NetWitness extracts the entire value of the selected attribute, without filtering any characters. You can apply regular expression (RegEx) to refine the value extracted.

Note: The conversion of Distinguished Names (attribute in Subject Name or Subject Alternative Name) to a human readable format is done based on RFC2253 (LDAPv3). Therefore, any Relative Distinguished Name apart from the one defined in RFC2253 (LDAPv3) may display in hex format. For example, email attribute value may display #1160bcghryy637bchs774. You can apply RegEX to extract the value. NetWitness tries its best to extract values for such attributes.

User Principal settings can be configured when you import the Trusted CA certificate.

Lookup Query

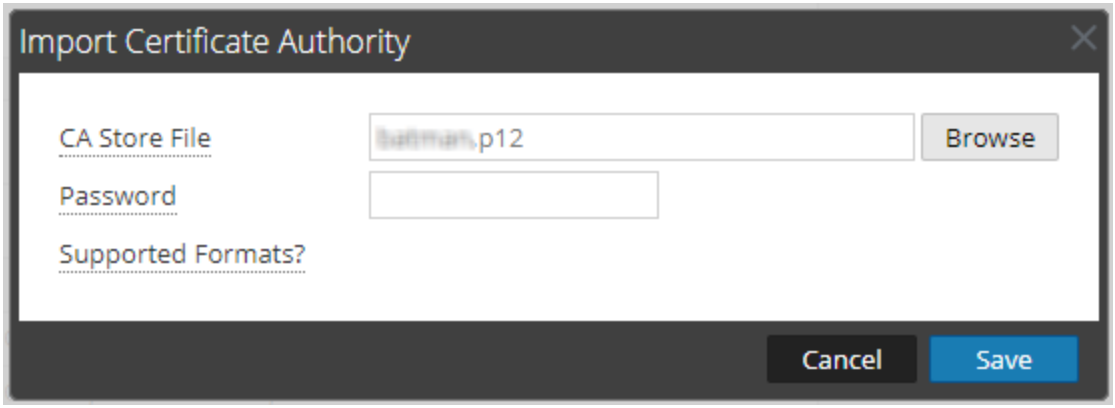
A Lookup Query sends a specific query to Active Directory to retrieve the user object. Here is an example of a sample query for retrieving a user object from the Active Directory.

```
Sample Query:(&(objectCategory=Person)(objectClass=User)(CN=${nw-pki-user}))
nw-pki-user is replaced with the value extracted from the user certificate.
```

Caution: Make sure that the AD user account is active. AD does not return the user account expiry (accountExpires) information to NetWitness along with user details. Therefore, the NetWitness cannot validate the AD user account is expired or not.

Note: NetWitness does not validate the syntax of the lookup query. You must ensure proper query syntax is used to retrieve the user object from Active Directory.

Import NW Server Certificate with its Private Key



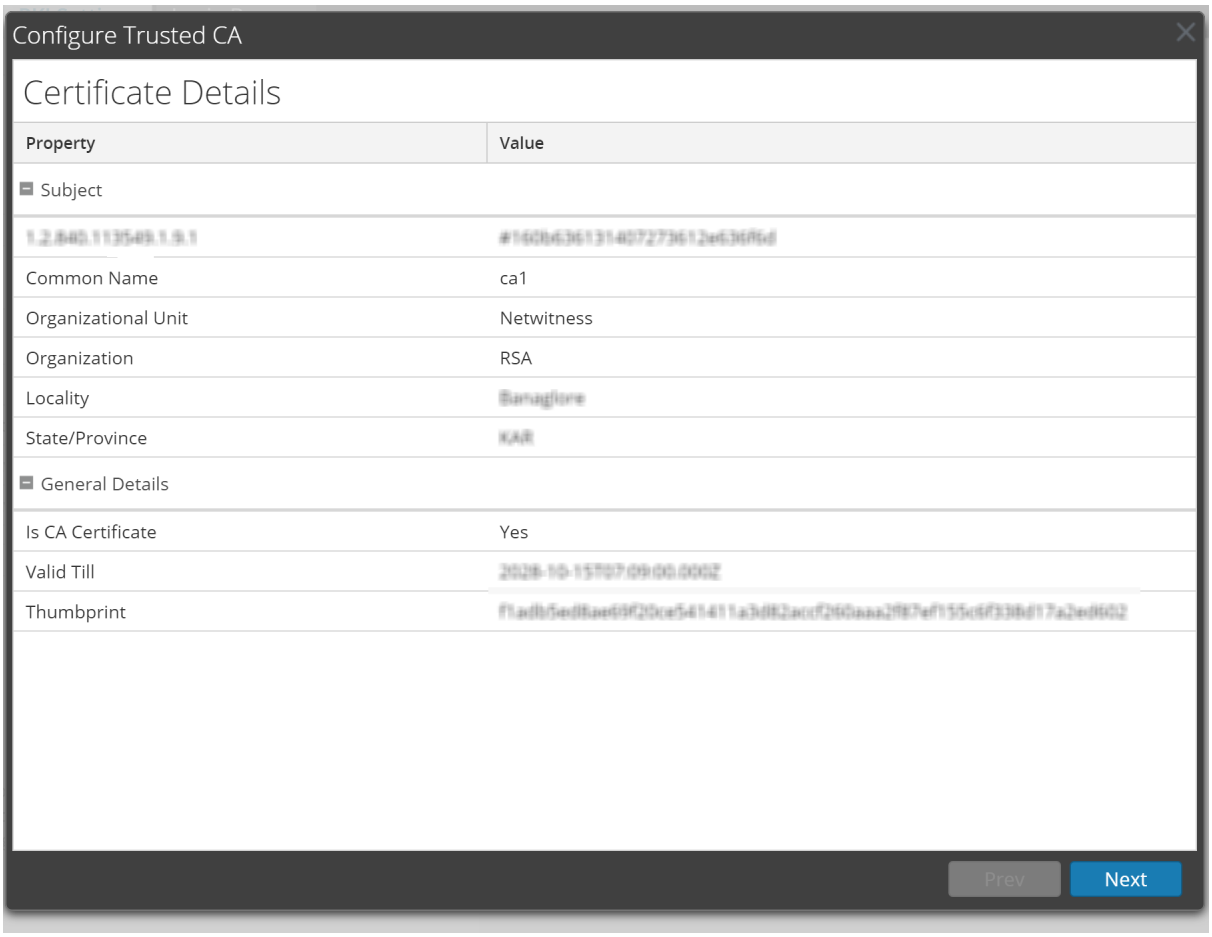
For instructions on how to import the NetWitness Server Certificate with its private key, see (Optional) Use a Custom Server Certificate.

Import Trusted CAs, Configuring CRL and User Principal Settings

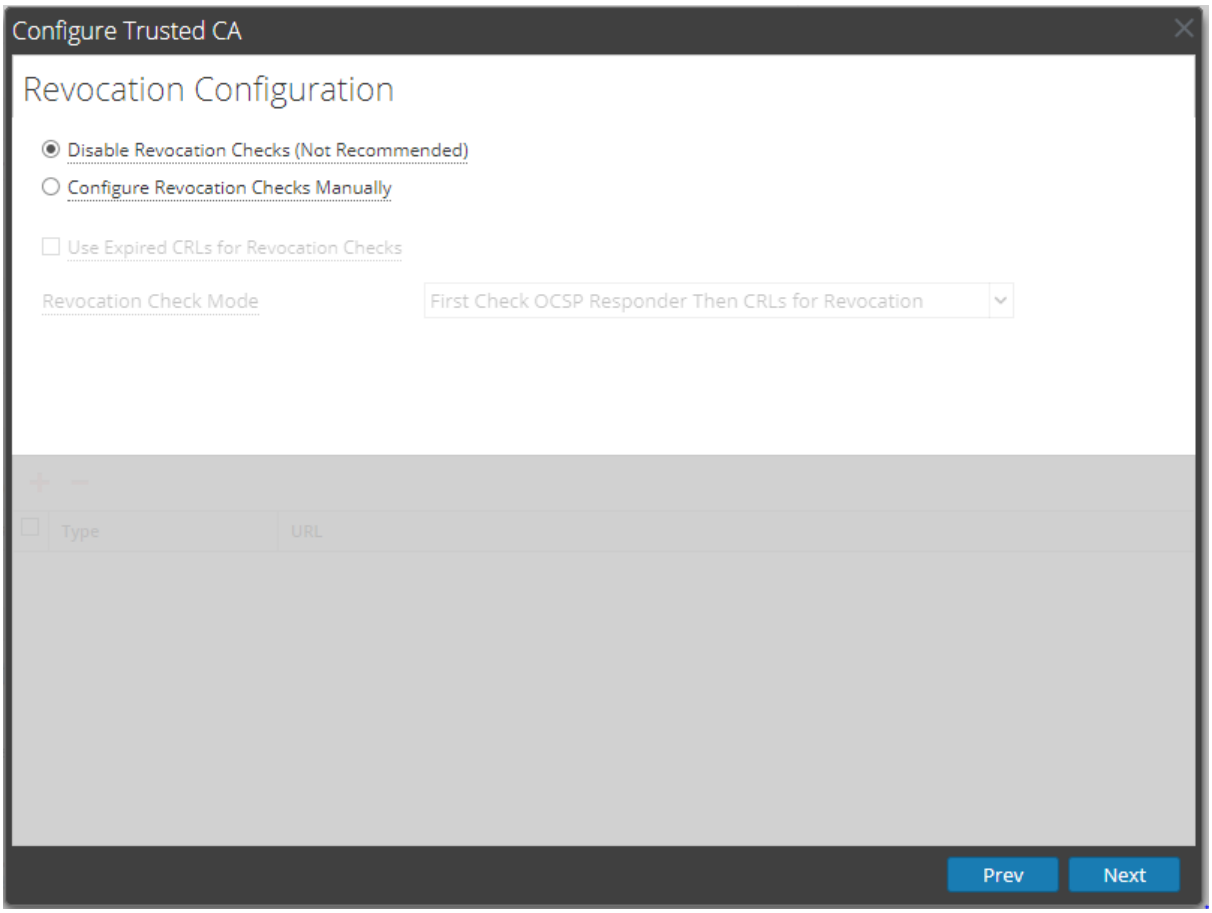
To import a trusted CA:

1. Go to  **(Admin) > Security.**
   The Security view is displayed with the **Users** tab open.
2. Click the **PKI Settings** tab.

3. In the **Trusted CAs** section, click  .
   The Import Certificate Authority dialog is displayed.



Note: The supported formats are .p12, .jks, .pfx, .pem, .crt, .der, and .cer



4. In the **CA Store File** field, click **Browse** and select a certificate.
5. In the **Password** field, enter the password of the certificate.

Note: The password is applicable only for .p12, .pfx and .jks certificate formats.

6. Click **Save**.
   A Configure Trusted CA dialog is displayed with Certificate Details.

Next

7. Click **Next**.

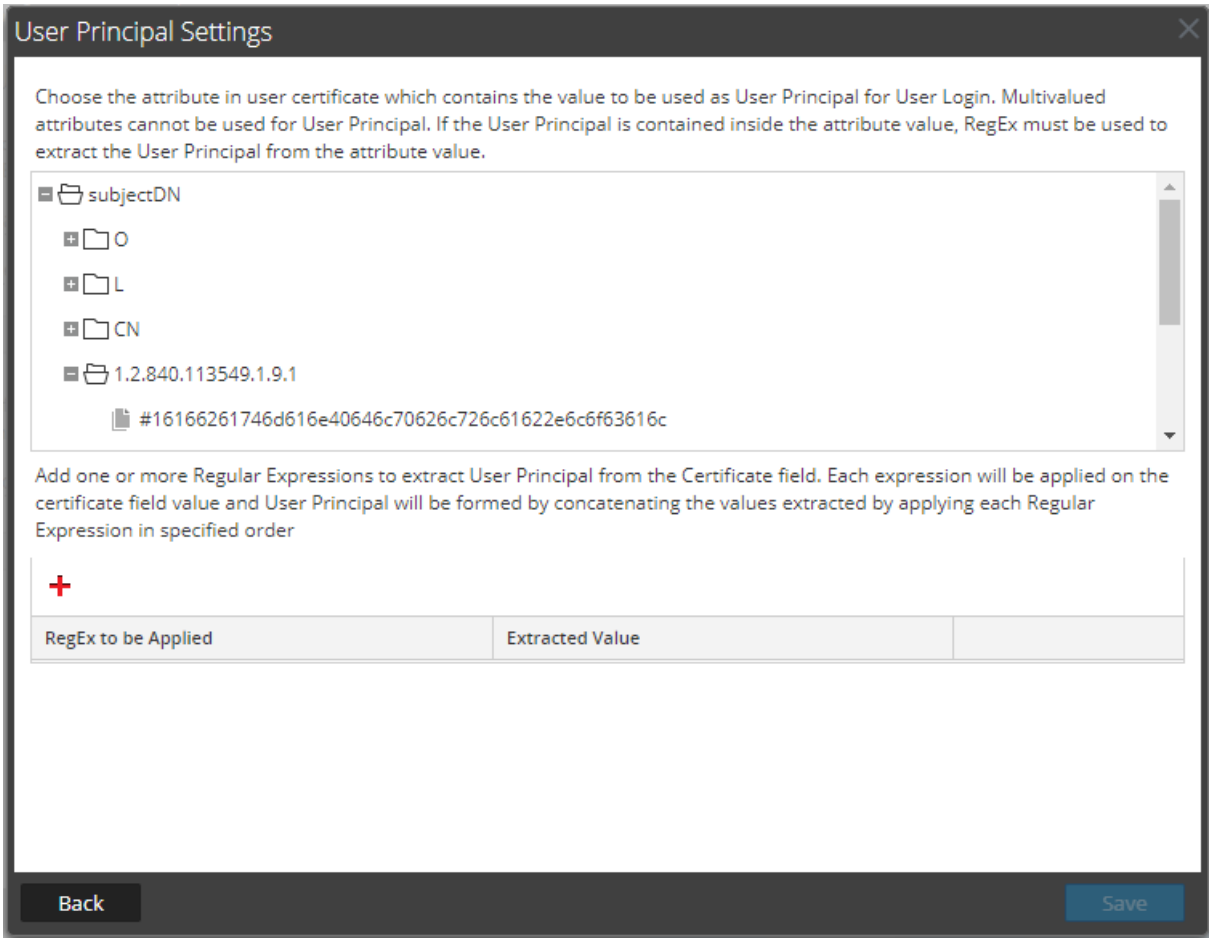
8. In the Revocation Configuration section, do one of the following to configure the CRL revocation check.

   - Select **Disable Revocation Checks** to disable the CRL revocation check.

   Warning: Disabling the revocation check may increase the risk of unauthorized users logging in to NetWitness.

   - Select **Configure Revocation Checks Manually** to manually configure the CRL revocation check.
     For more information, see (Optional) Configure the CRL Manually.

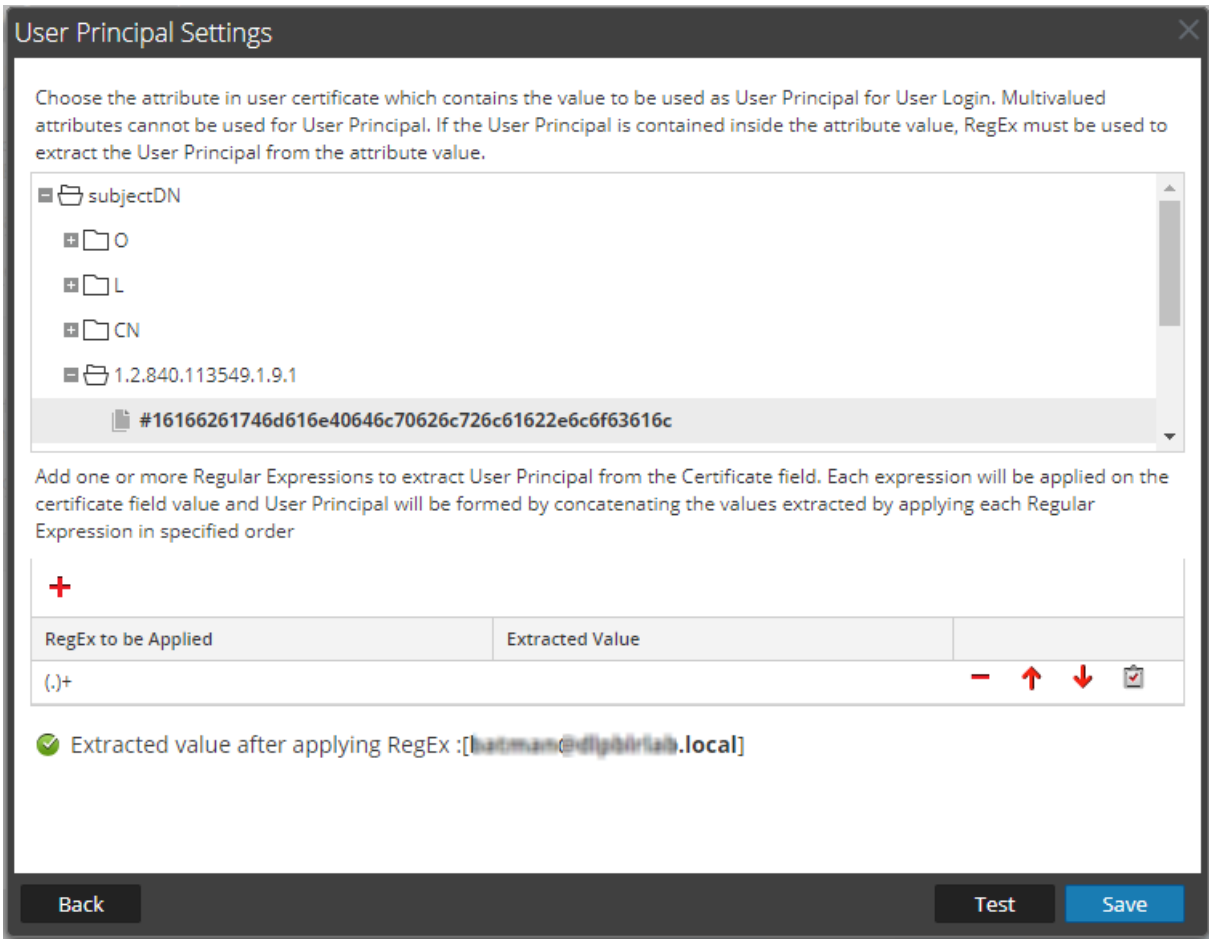
9. Click **Next**.



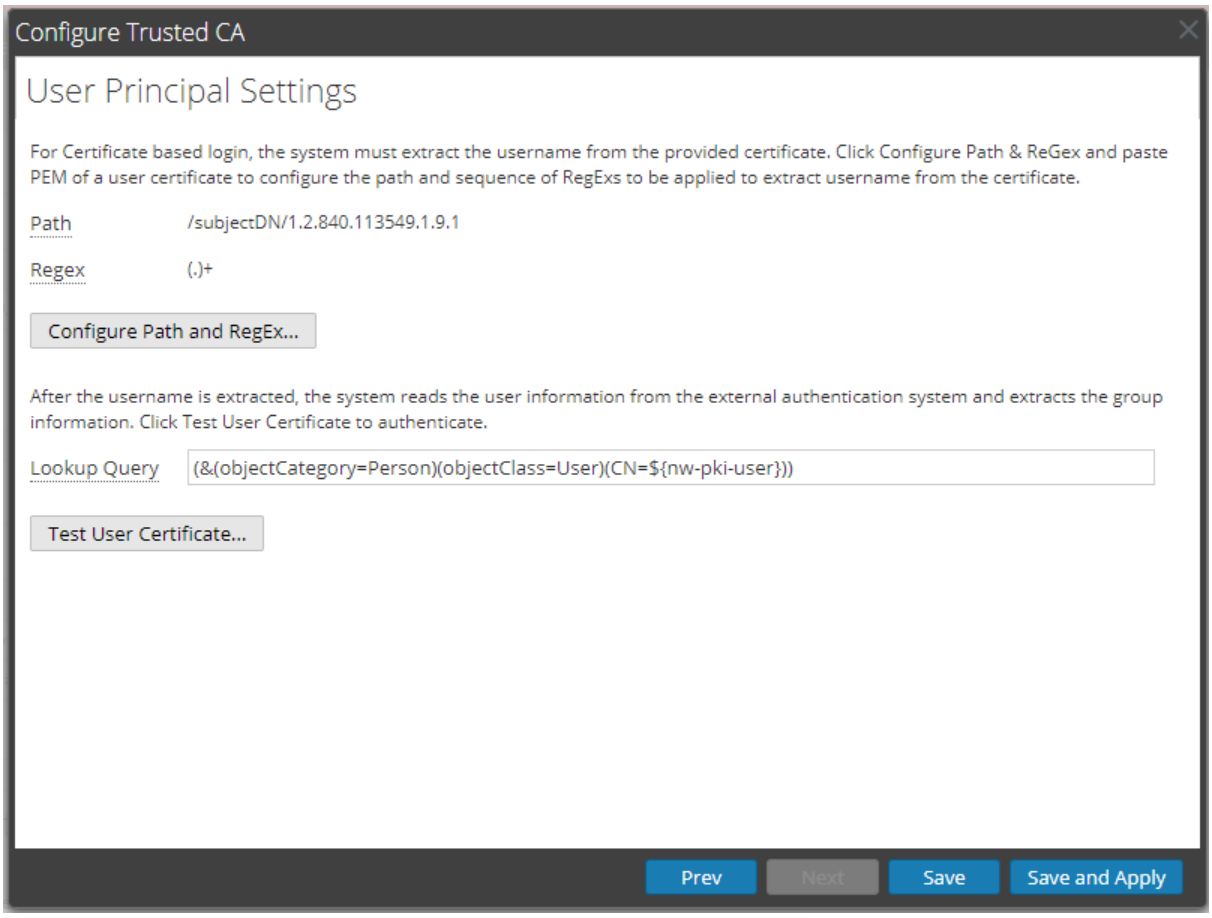
10. To configure user principal settings, in the User Principal Settings section, click **Configure Path and RegEx**.

11. In the **Certificate** field, paste the PEM (Base64) encoded user certificate.

12. Click **Next**.
    The **subjectDN**, **subjectAltnames**, and **extenstions** attributes are displayed.



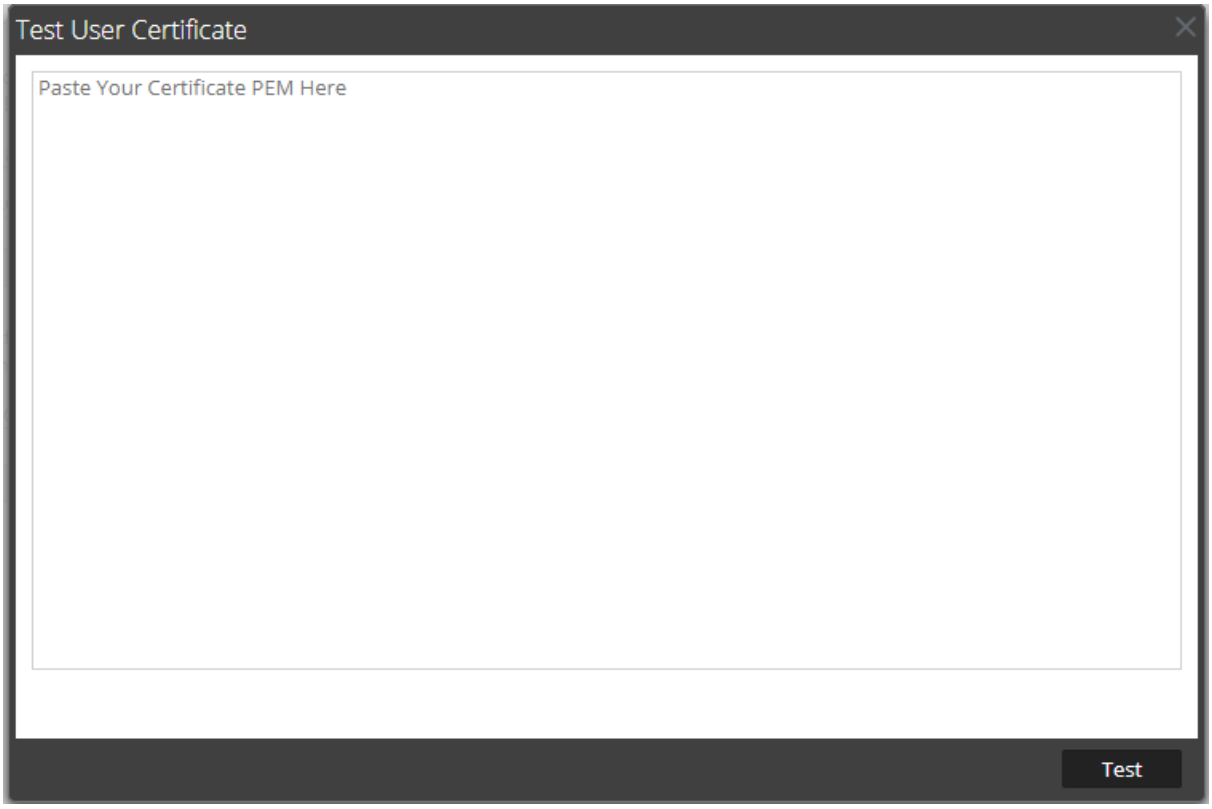
13. Select a unique attribute value to extract the username or user id.



14. To apply RegEx, click .

> **Note:** You can apply multiple RegEx to extract a username or user id. All of the extracted values are concatenated to generate the final username or user id.

15. Click **Test**.
    The final user name or user id after applying RegEx is extracted and displayed.



User Principal Settings
Choose the attribute in user certificate which contains the value to be used as User Principal for User Login. Multivalued attributes cannot be used for User Principal. If the User Principal is contained inside the attribute value, RegEx must be used to extract the User Principal from the attribute value.

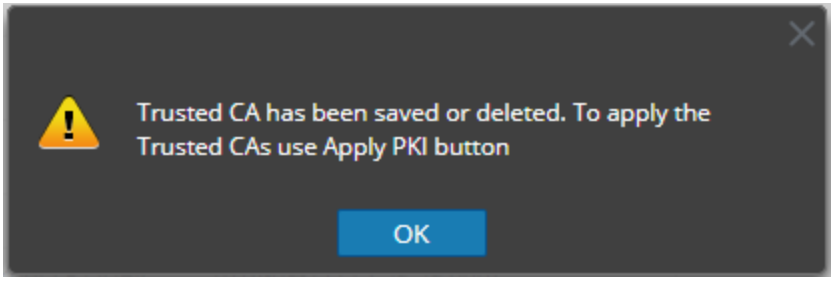
Save

16. Click **Save**.

17. Enter the query in the **Lookup Query** field to query the external authentication system for retrieving the user objects.



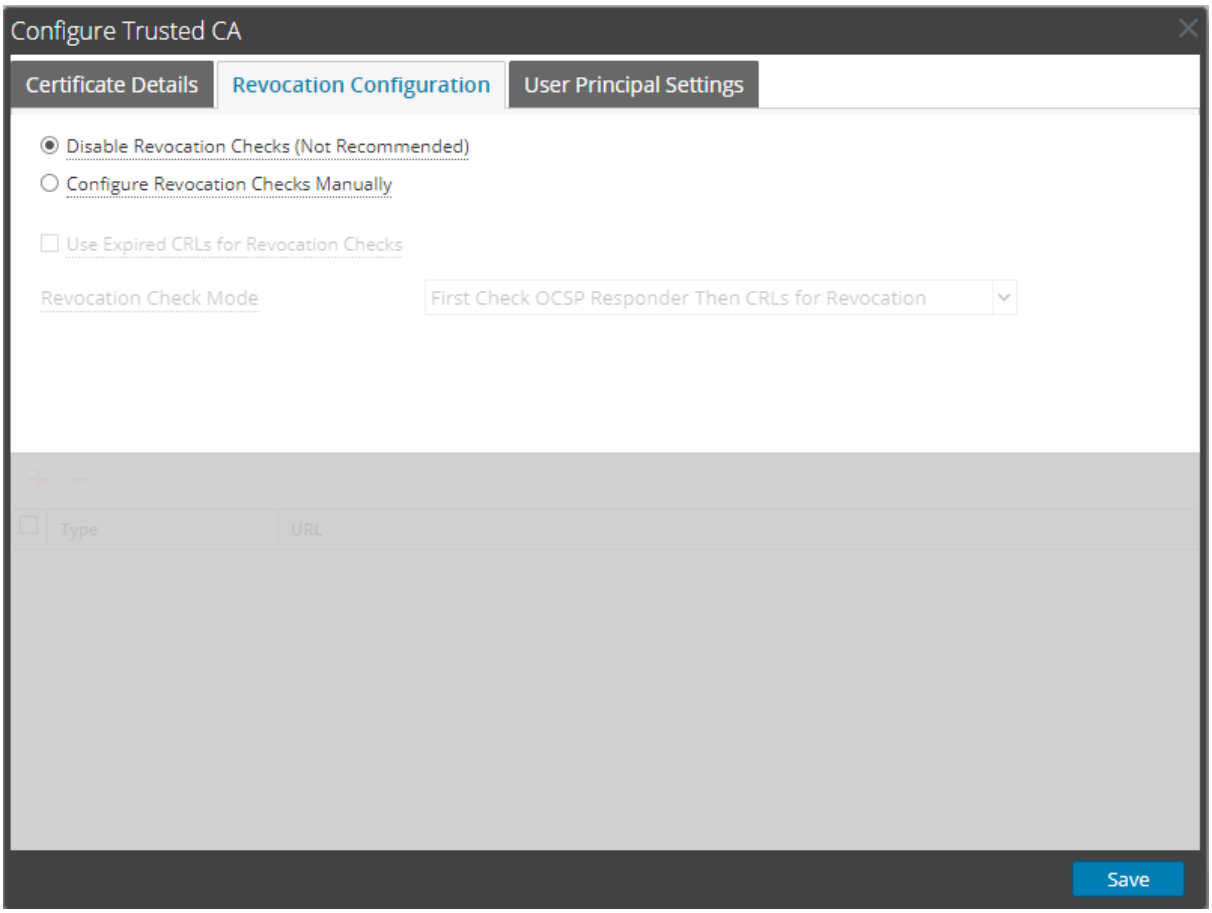
18. Click **Test User Certificate**.
    The Test User Certificate dialog is displayed.

19. Paste the PEM of the user certificate and click **Test**.

Note: The user Certificate is used by NetWitness for a dry-run of the trusted CA configuration. If the user certificate validation and the user id extraction from the certificate is successful, a confirmation message is displayed.

20. After the certificate is validated, click **Save**.
    The following message is displayed.

21. Click **OK**.
    The Trusted CA certificate is added to the NetWitness.



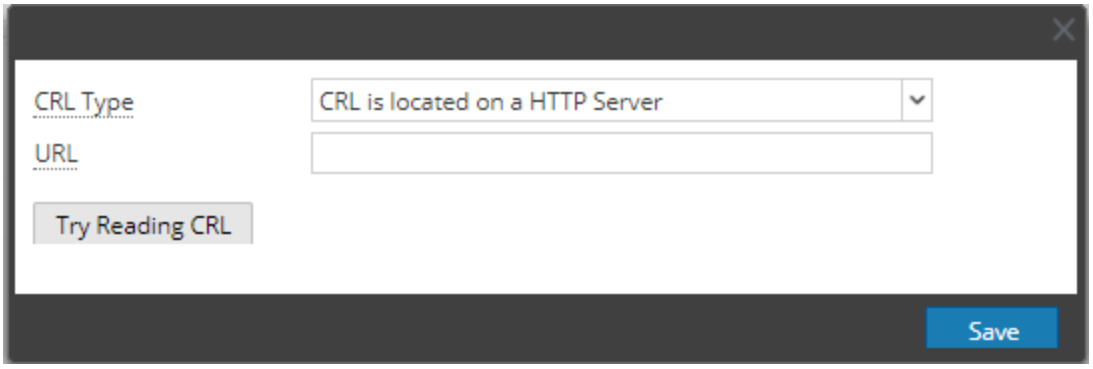
Note: You can add multiple Trusted CA certificates.

(Optional) Configure the CRL Manually

To configure the CRL manually:

1. Double click on the imported CA certificate.

   The Configure Trusted CA dialog is displayed.



2. In the Revocation Configuration section, select **Configure Revocation Checks Manually**.
3. If the latest CRL is not available, select **Use Expired CRLs for Revocation Checks** to use the expired CRL for revocation.

   Caution: If the above option is enabled, the first CRL in the sequence will be used. This option is useful when you want the NetWitness to work even if PKI system is not available. Make note that first CRL in the sequence is always valid and it will not expire.

4. In the **Revocation Check Mode** field, do one of the following to validate the user certificate.
   - Select **Check only CRLs for Revocation** to use only the CRLs.
   - Select **Check only OCSP Responder for Revocation** to use only the OCSP Responders.
   - Select **First Check CRLs then OCSP Responder for Revocation** to use the CRL. If all the CRLs are expired, use the OCSP Responders.

- Select **First Check OCSP Responder Then CRLs for Revocation** to use the OCSP Responders. If all the Responders are offline or unavailable, use the CRLs.

5. Click  to add the CRL.

6. To add a CRL published on a HTTP server:
   a. In the **CRL Type** field, select **CRL is located on a HTTP server**.
   b. In the **URL** field, specify the HTTP URL to access the CRL

Note: Make sure that the CRL is available and HTTP server is accessible from NetWitness.

7. To upload a CRL file downloaded from the CA:
   a. In the **CRL Type** field, select **CRL is available as a File**.
   b. In the **CRL file** field, click **Browse** to upload the CRL file.

Note: Make sure that the CRL is downloaded from CDP location.

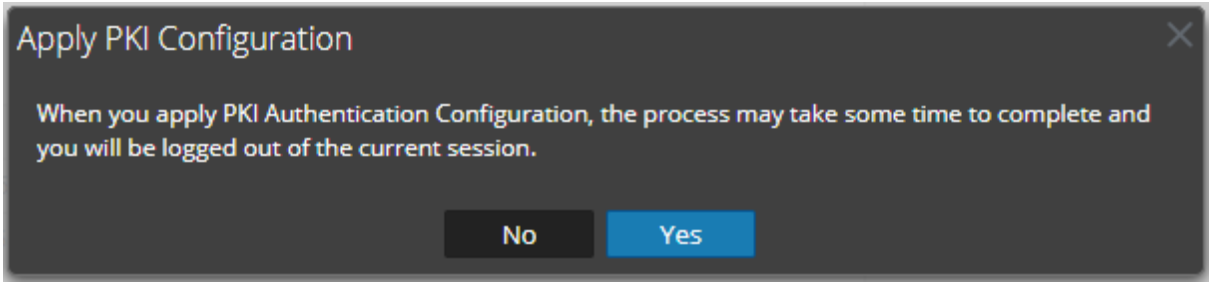
8. To add a OCSP Responder:
   a. In the **CRL Type** field, select **HTTP URL for OCSP Responder.**
   b. In the **URL** field, specify the HTTP URL.
   c. In the **Certificate** field, click **Browse** to upload the OCSP Responder Signing Certificate.

Note: Make sure that the OCSP Responder is accessible from NetWitness.

9. Click **Try Reading CRL**.

   The NetWitness UI displays the extracted information from the CRL.

Note: The CRL revocation check is done in the sequence that the CRL is added.
For example:
- If there are two CRLs configured and both are valid, only the first CRL is considered for revocation. The second CRL is considered for revocation only after the first CRL expires.
- If there are two CRLs configured, if the first CRL is expired and you select **Use Expired CRLs for Revocation Checks**, the first CRL is only considered for revocation check and second CRL is ignored.



If the HTTP URL is located on the HTTPS location, the NetWitness does not validate the web server certificate of the HTTP server on which the CRL is located.

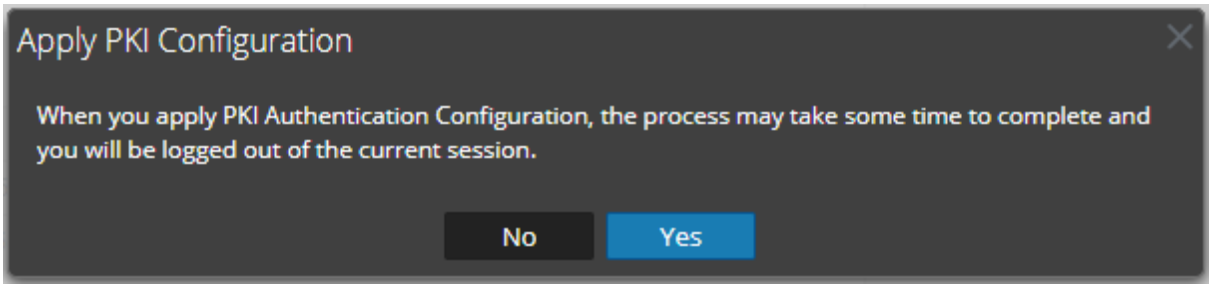
10. Click **Save**.

    The CRL file is added to the NetWitness.

Enable PKI Authentication

1. Go to  **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **PKI Settings** tab.
3. In the PKI Based Authentication Status section, select **Enabled**.
4. Click **Apply PKI Configuration**.
   The PKI Based Authentication Enabled dialog is displayed.

5. Click **Yes**.



Note: After you enable PKI,
- Do not delete the AD configuration and external group mapping that corresponds to the user certificate's domain.
- Log out from a PKI based session by closing the browser used to access NetWitness.
- If audit log is enabled, the user login and activity is logged using the user DN.

Disable PKI

Note: If NetWitness users or Administrators are unable to access the NetWitness UI and want to use user name and password based authentication, you must disable PKI using the command line. See, Disable PKI using command line.

Disable PKI Authentication

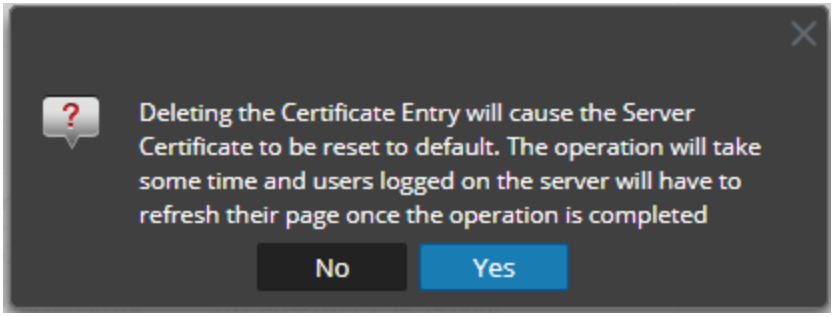
1. Go to  **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **PKI Settings** tab.
3. In the PKI Based Authentication Status section, select **Disabled**.
   The PKI Based Authentication Disabled dialog is displayed.

4. Click **Yes**.

Note: After disabling the PKI, wait for some time, close the browser, and open NetWitness in a new browser.

Disable PKI using command line

1. SSH to access root@node-0.
2. Run the following command:
   a. `nw-shell`.
   b. `login` {Enter the username and password to login}
   c. `connect --service orchestration-server`
   d. `cd /rsa/orchestration/userpki/disable-pki-on-hosts`
   e. `invoke`
   f. `connect --service admin-server`
   g. `cd /rsa/security/authentication/web/pki-enabled`
   h. `set false`
   i. `cd/rsa/security/pki/client-auth`
   j. `set WANT`
   k. `exit`
   l. `systemctl reset rsa-nw-admin-server`
   m. `systemctl reset-nw-security-server`



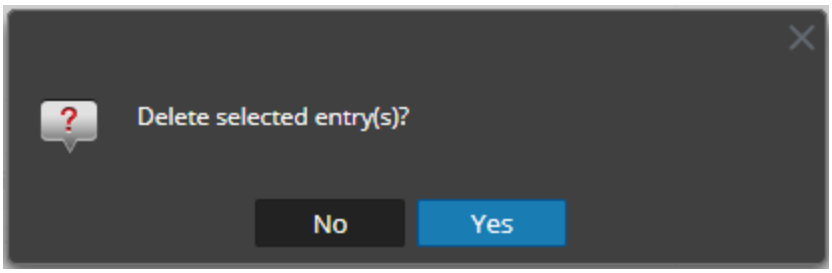
Note: The command `systemctl restart rsa-nw-admin-server` restarts the admin server and `systemctl restart rsa-nw-security-server` restarts the security server.

Delete Server Certificate and Trusted CA Certificate

Note: Deleting the server certificate may cause NetWitness to apply the default server certificate on the selected appliance.

To delete a NetWitness Server Certificate with its Private Key:

1. Go to **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **PKI Settings** tab.
3. In the **Server Certificates** section, select the certificate to delete.
4. Click .
   The following message is displayed.



5. Click **Yes**.

Note: When the certificate is being applied on the selected appliance, no other operation on PKI can be performed until the process is completed.

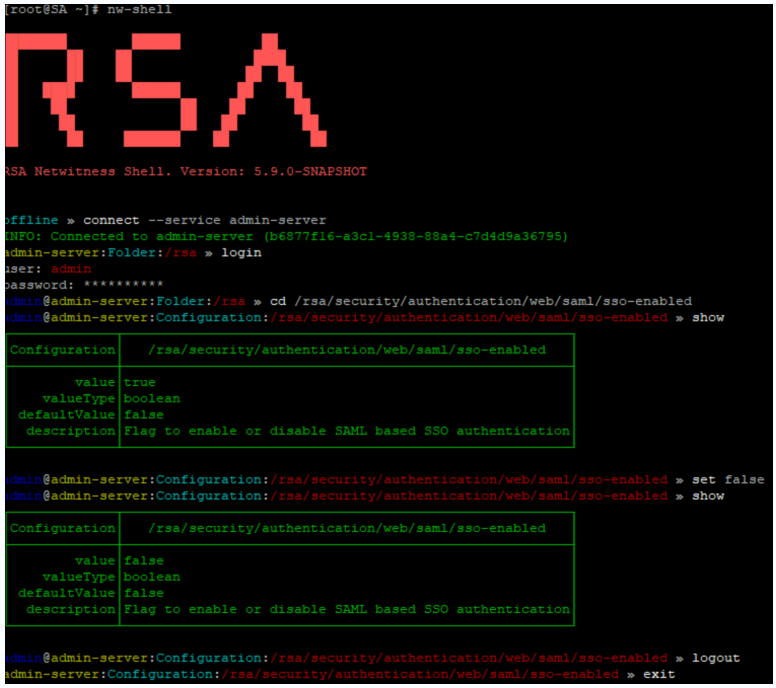
To delete a Trusted CA Certificate:

1. Go to **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **PKI Settings** tab.
3. In the **Trusted CAs** section, select the certificate to delete.
4. Click .
   The following message is displayed.

5. Click **Yes**.

Note: Make sure you apply the PKI configuration again after deleting the Trusted CA certificate.

Troubleshooting



This topic provides information about possible issues that NetWitness users may encounter when configuring the System Security and User Management settings in NetWitness. You can look up explanations of issues and their solutions.

Users are able to create a password of 8-chracters or less despite the configured minimum password length of 9 characters in Version 11.3

Problem	Solutions
When NetWitness was upgraded from 11.2 and previous versions to Version 11.3, the administrator did not set the minimum password length to 9 characters.	In 11.2 and earlier versions, the minimum password length is 8. The minimum password length changed to 9, in Versions 11.3. If you upgrade or update from earlier versions to 11.3, users can still create a password of 8 characters until you explicitly set the minimum password length to 9 characters as described in Configure Password Complexity.

Unable to log in to NetWitness Platform using SSO

Problem	Solutions
When the Administrator configures the SSO incorrectly and is unable to log in to NetWitness.	**Manual Steps to Disable SSO** To resolve this issue you must disable SSO manually, using the following commands: 1. SSH to `admin server node`. 2. Connect to `nw-shell`. 3. Connect to admin server service using the `connect --service admin-server` command. 4. Log in to admin server using the `login` command. 5. Enter the admin username and password. 6. Execute the following commands: • `cd /rsa/security/authentication/web/saml/sso-enabled` • `set false` • `logout` • `exit` • `systemctl restart rsa-nw-admin-server`

Problem	Solutions
Unable to connect to IDP and request session has timed out	• Check if the admin server is able to reach the specific IDP metadata URL. • Check if the IDP can be to accessed over the internet, if not configure the proxy and try again.
SSL handshake failed as the certificate is not verified	• Enable the `trust-all-certs-for-idp-metadata` flag in the explorer view of admin-server by navigating to RSA>Security>Authentication>Web>SAML. • Import the SSL certificate of the IDP metadata server to the JVM trust store, run the command `keytool -import -trustcacerts -file /root/selfsignedadfs.cer -alias selfsignedcert -keystore /usr/lib/jvm/java-1.8.0-openjdk-1.8.0.222.b10-0.el7_6.x86_64/jre/lib/security/cacerts` on the Admin node.
SSL handshake failed as the hostname is not verified	• Check the IDP metadata server's SSL certificate has a valid DN and matches the server hostname. • Enable the `trust-all-certs-for-idp-metadata` flag in the explorer view of admin-server by navigating to RSA>Security>Authentication>Web>SAML.
Fail over IP address changed	Perform the following manual steps to configure the new IP address. 1. Disable SSO using nw-shell after failover from new IP. For more information, see Manual Steps to Disable SSO 2. Generate the new metadata and reupload it in ADFS. For more information, see see the *Configure SAML 2.0 provider settings for portals* topic in Microsoft documentation.

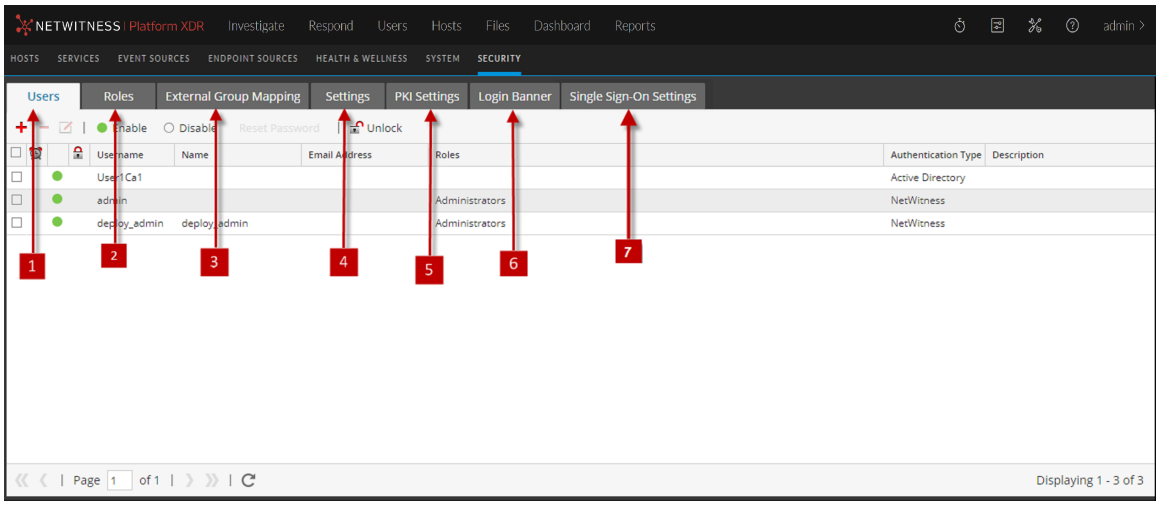
Admin Security View

The Admin Security view provides the capability to manage user accounts, manage user roles, map external groups to NetWitness roles, and modify other security-related system parameters. These apply to the NetWitness system and are used in conjunction with the security settings for individual services.

What do you want to do?



Role	I want to ...	Show me how
Admin	Manage users	Set Up Users
Admin	Manage roles	Review the Preconfigured NetWitness Platform Roles (Optional) Add a Role and Assign Permissions
Admin	Configure settings	Configure System-Level Security Settings
Admin	(Optional) Configure external group mappings	(Optional) Map User Roles to External Groups
Admin	(Optional) Set login conditions	(Optional) Create a Customized Login Banner
Admin	(Optional) Set up PKI	Configure PKI Authentication

Related Topics

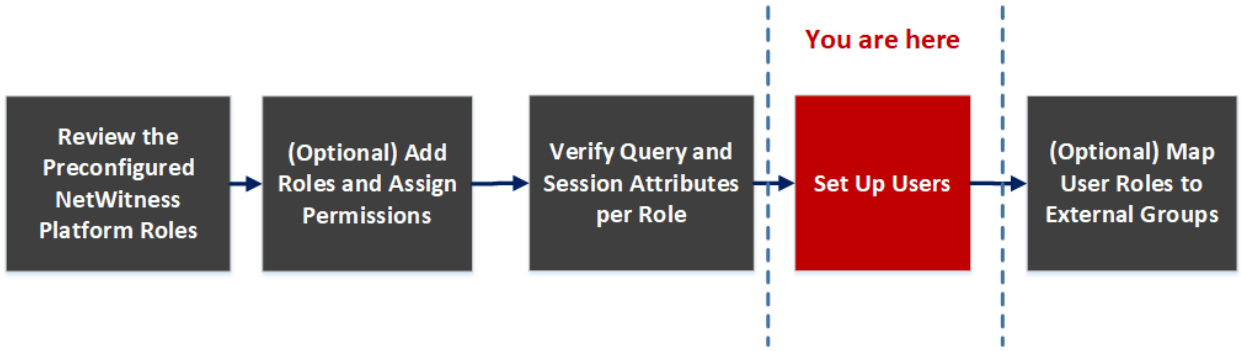
Quick Look

To display the Admin Security view, go to  **(Admin) > Security**.



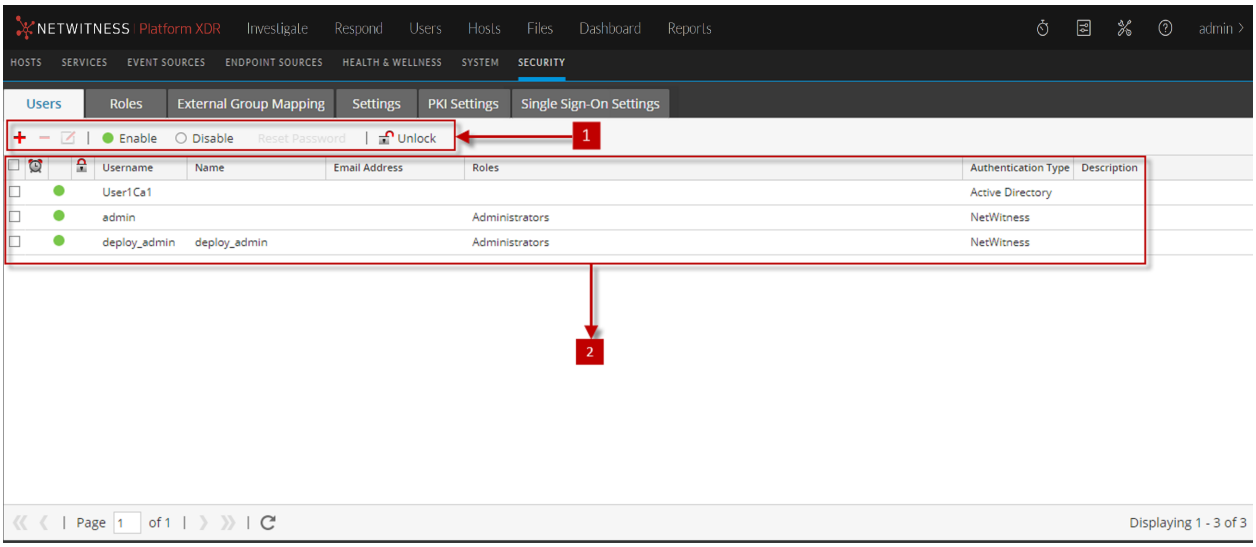
1. **Users** tab allows you to manage user accounts.
2. **Roles** tab allows you to define security roles and assign roles to user accounts.
3. **External Group Mapping** tab allows you to manage access parameters for LDAP groups.
4. **Settings** tab allows you to configure password complexity and expiration for internal NetWitness users and to configure system behavior due to failed logins and inactivity. It also allows you to configure external authentication.
5. **PKI Settings** allows you to enable and disable the PKI authentication.
6. **Login Banner** tab allows you to set conditions which must be agreed to before gaining access to the login screen.
7. **Single Sign-On Settings** tab allows you to enable and disable the SSO authentication.

Users Tab

The Users tab in the Admin Security view allows you to set up user accounts. Each NetWitness user must have a user account. In the Users tab, you can create, edit, delete, enable, disable, and unlock a user account.

Workflow

What do you want to do?



Role	I want to ...	Show me how
Admin	Set up a new user	Set Up Users
Admin	Manage user accounts	

Related Topics

- Add or Edit User Dialog

Quick Look

To access this view, go to  **(Admin) > Security**. The Security view displayed with **Users** tab open.

The Users tab includes the following panels.

1 **Users** toolbar
2 **Users** list

Users Toolbar

The following table describes the Users toolbar.

Feature	Description
+	Opens the Add User dialog.
−	Deletes the selected user.
	Opens the Edit User dialog for the selected user.
Enable	Enables a disabled user account with all user preferences intact.
Disable	Blocks user access without deleting user preferences so that upon re-enabling users, user preferences are intact.
Reset Password	Opens the Reset Password dialog, which enables you to change the password of the selected user. This dialog lists the password format requirements necessary to change the password and allows you to force the user to change their password on the next login.
Unlock	Unlocks a user account that has been locked due to too many failed login attempts.

Users List

The following table describes the columns in the Users list.

Column	Description
	If this icon appears in a user row, it indicates that the user password has expired.
Username	Username to log on to NetWitness.
Name	Name of the user to whom the account belongs.
Email Address	Email address of the user.
Roles	Role assigned to the user.
Authentication Type	Authentication method, which could be external by Active Directory or PAM or internal by NetWitness.
Description	Description of the user account.

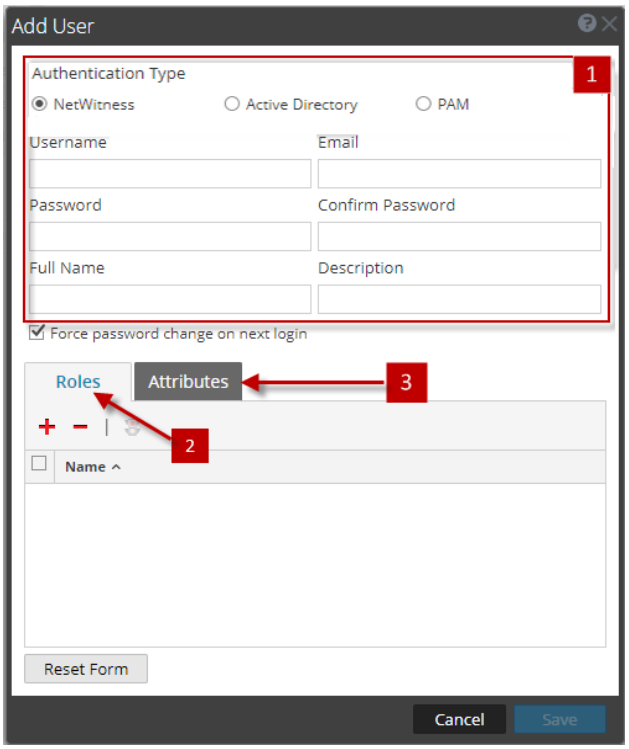
Add or Edit User Dialog

All users must either have a local user account with a username and password or an external user account that is mapped to NetWitness.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Add a User and Assign a Role	
Administrator	Change User Information	
Administrator	Reset a User Password	
Administrator	Add a User for External Authentication	

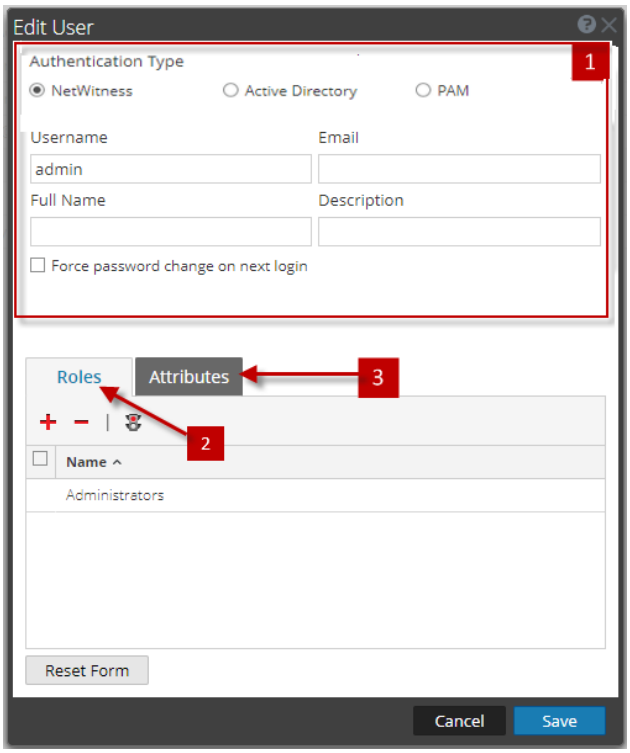
Related Topics



- Manage Users with Roles and Permissions

Quick Look

To access Add or Edit User dialog, go to  **(Admin) > Security > Users** tab and in the toolbar, click , or select a user and click .



Add User Dialog

This is the Add User dialog for an internal user.

Edit User Dialog

This is the Edit User dialog for an internal user.

The Add User and Edit User dialogs are the same except that the Add User dialog contains additional **Password** and **Confirm Password** fields. You can add a password for a new user in the Add User dialog. Users can change their own passwords in the user preferences. You can reset a password for a user directly from the Users tab.

The Add User and Edit User dialogs have following sections:

1. User information
2. **Roles** tab
3. **Attributes** tab

User Information

The following table provides descriptions of the user information.

Field	Description
NetWitness	Authenticate with NetWitness.
Active Directory	Authenticate with Active Directory.
PAM	Authenticate with PAM.
Username	Username for the NetWitness user account.
Email	Email address of the user.
Password	(Add User dialog only) Password to log on to NetWitness.
Confirm Password	(Add User dialog only) Password confirmation for adding the user password.
Full Name	Name of the user.
Description	(Optional) Description of the user.
Force password change on next login	Expires the user password the next time the user logs on to NetWitness. This field applies only to internal users. This does not affect any active user sessions. The ⏰ appears in the user row to show that the user password expired. After a password is expired, you cannot undo it. This checkbox is cleared the next time you edit the user account.
Reset Form	Removes any changes in process.

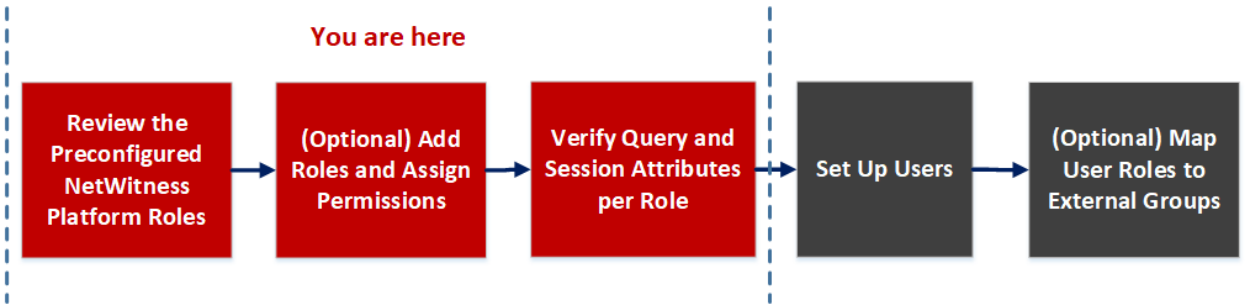
Roles Tab

The following table provides descriptions of the **Roles** tab options. The Roles tab shows the roles that are assigned to the user.

Option	Description
+	Opens the Add Role dialog that lists roles you could assign to the user.

Option	Description
	Removes the selected role from being assigned to the user.
	Shows permissions for the selected role.
Name	Lists each role assigned to the user.

Attributes Tab



The following table lists the descriptions of the **Attributes** tab options. The **Attributes** tab shows the attributes that are assigned to the user.

Option	Description
Core Query Timeout	(Optional) Specifies the maximum number of minutes that a user can run a query. The default value is 5 minutes. This timeout only applies to queries performed from Investigation. If this value is set, it must be zero (0) or greater. A value of zero represents no timeout.
Core Session Threshold	Controls how the service scans meta values to determine session counts. This value must be zero (0) or greater. If this value is greater than zero, a query optimization will extrapolate the total session counts that exceed the threshold. When the meta value returned by the query reaches the threshold, the system will: • Stop its determination of the session count • Show the threshold and percentage of query time used to reach the threshold The default value is `100000`. The limit you specify here overrides the **Max Session Export** value defined in the Investigate view settings.
Core Query Prefix	(Optional) Filters query results to restrict what the role members see. By default, this is blank. For example, the `'service' = 80` query prefix prepends to any queries run by the user and the user can only access meta of HTTP sessions.

Roles Tab

Roles are assigned to all NetWitness users. Users receive the permissions the roles allow. In the Roles tab you can create, duplicate, edit and delete a role. You can also see a list of all roles and their respective permissions.

Workflow

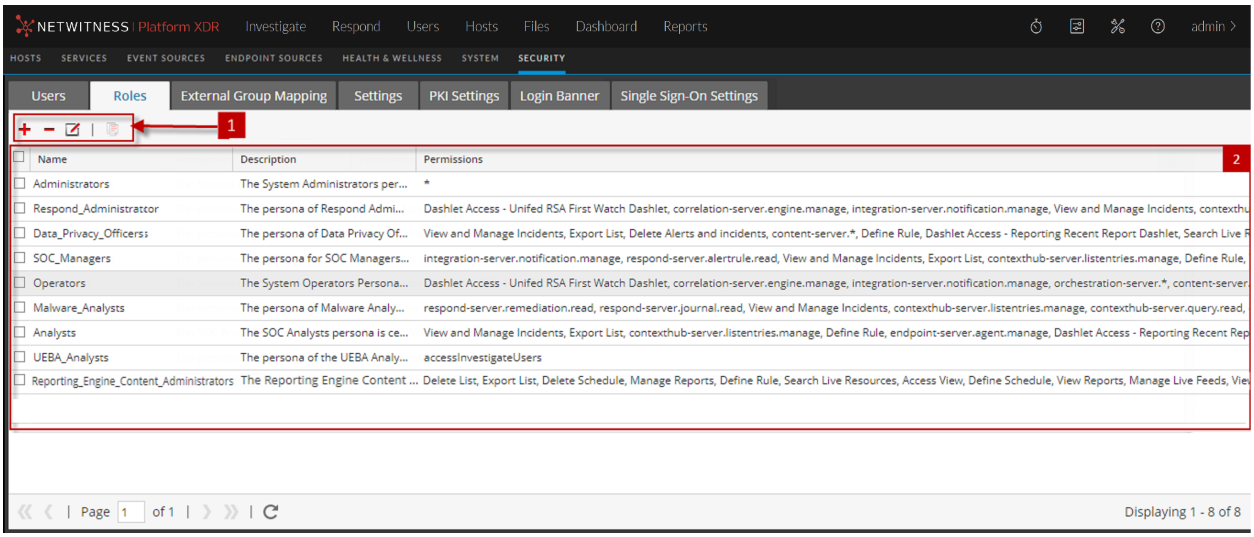
What do you want to do?



Role	I want to ...	Show me how
Admin	View preconfigured roles	Review the Preconfigured NetWitness Platform Roles
Admin	Create a new role	(Optional) Add a Role and Assign Permissions

Related Topics

- Add or Edit Role Dialog

Quick Look

To access **Roles** tab view, go to  **(Admin) > Security** and click the **Roles** tab.

The Roles tab has the following sections.

1 **Roles** toolbar
2 **Roles** list

Roles Toolbar

The following table describes the **Roles** toolbar.

Icon	Description
	Displays the Add Role dialog.
	Displays the Edit Role dialog.
	Displays a warning message, and asks for confirmation that you want to delete a role.
	Duplicates a role to save with a different name.

Roles list

The following table describes the columns in the **Roles** list.

Column	Description
Name	Displays the name of a role that can be given to a user.
Description	Displays a description of the role.
Permissions	Displays the permissions assigned to the role.

Add or Edit Role Dialog

In the Add Role and Edit Role dialogs, you can add or edit a role and the permissions assigned to it. You can also specify the query-handling attributes for role members to lock down the information that they can retrieve. The structure of these dialogs is the same. The only difference is that you either add a new role or modify an existing role.

When you change permissions for a role, the change is immediately applied to users who are assigned the particular role after the role is saved.

What do you want to do?

Role	I want to ...	Show me how
Admin	View preconfigured roles	Review the Preconfigured NetWitness Platform Roles

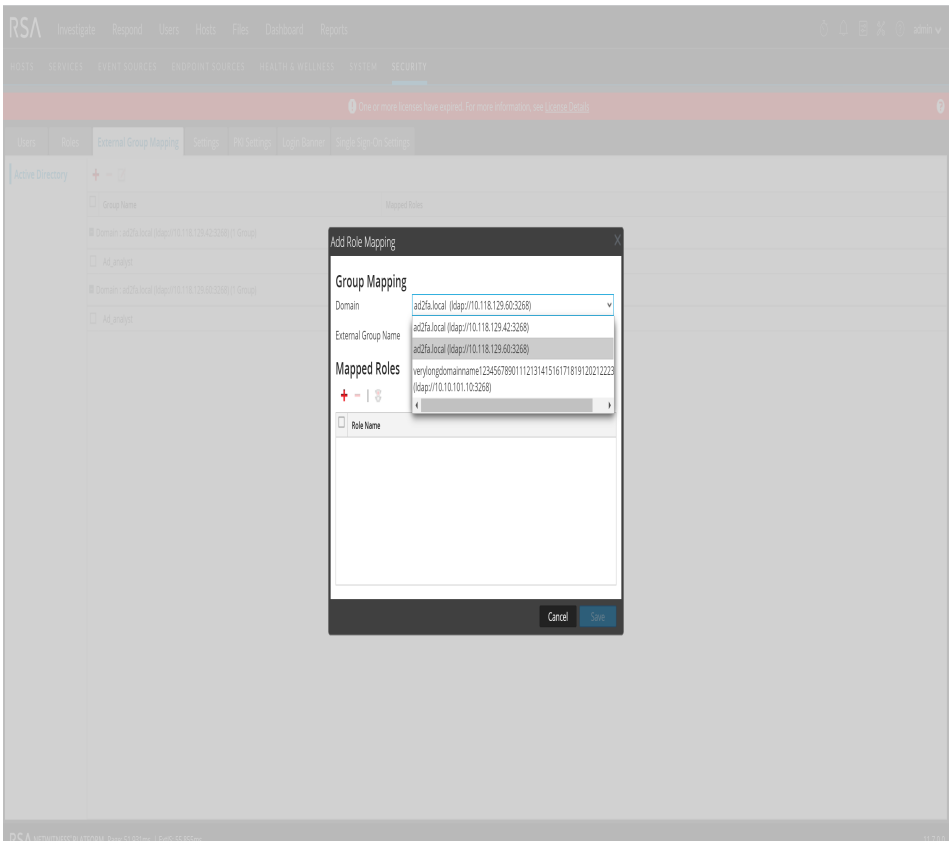
Admin	Edit a role	(Optional) Add a Role and Assign Permissions
Admin	Delete a role	(Optional) Add a Role and Assign Permissions



Related Topics

Verify Query and Session Attributes per Role

Role Permissions

Quick Look

To access this view, go to  **(Admin) > Security > Roles** tab and in the toolbar, click , or select a role and click .

The Add Role and Edit Role dialogs include three sections.

1. **Role info**
2. **Attributes**
3. **Permissions**

Role Info

This is the information in the **Role Info** section.

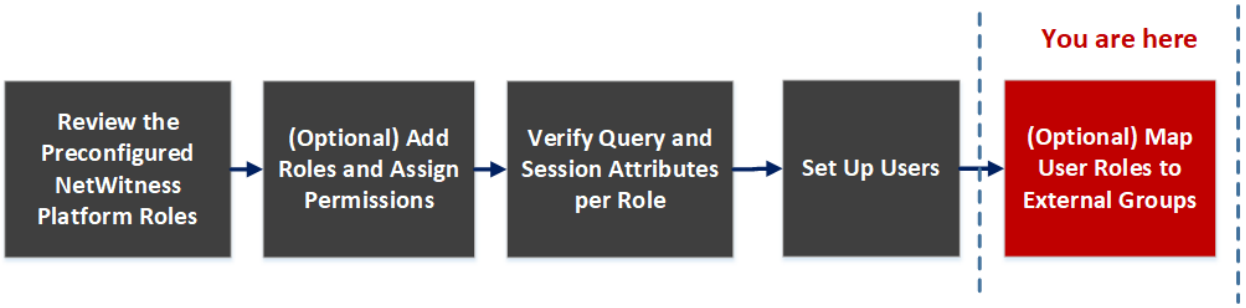
Feature	Description
Name	The name of the user role.
Description	An optional description of the user role.

Attributes

The following table describes the fields in the **Attributes** section..

Field	Description
Core Query Timeout	(Optional) Specifies the maximum number of minutes that a user can run a query. The default value is 5 minutes. This timeout only applies to queries performed from Investigation. If this value is set, it must be zero (0) or greater. A value of zero represents no timeout.
Core Session Threshold	Controls how the service scans meta values to determine session counts. This value must be zero (0) or greater. If this value is greater than zero, a query optimization will extrapolate the total session counts that exceed the threshold. When the meta value returned by the query reaches the threshold, the system will: • Stop its determination of the session count • Show the threshold and percentage of query time used to reach the threshold The default value is `100000`. The limit you specify here overrides the **Max Session Export** value defined in the Investigate view settings.
Core Query Prefix	(Optional) Filters query results to restrict what the role members see. By default, this is blank. For example, the `'service' = 80` query prefix prepends to any queries run by the user and the user can only access meta of HTTP sessions.

Permissions



The following table describes the features in the **Permission** section.

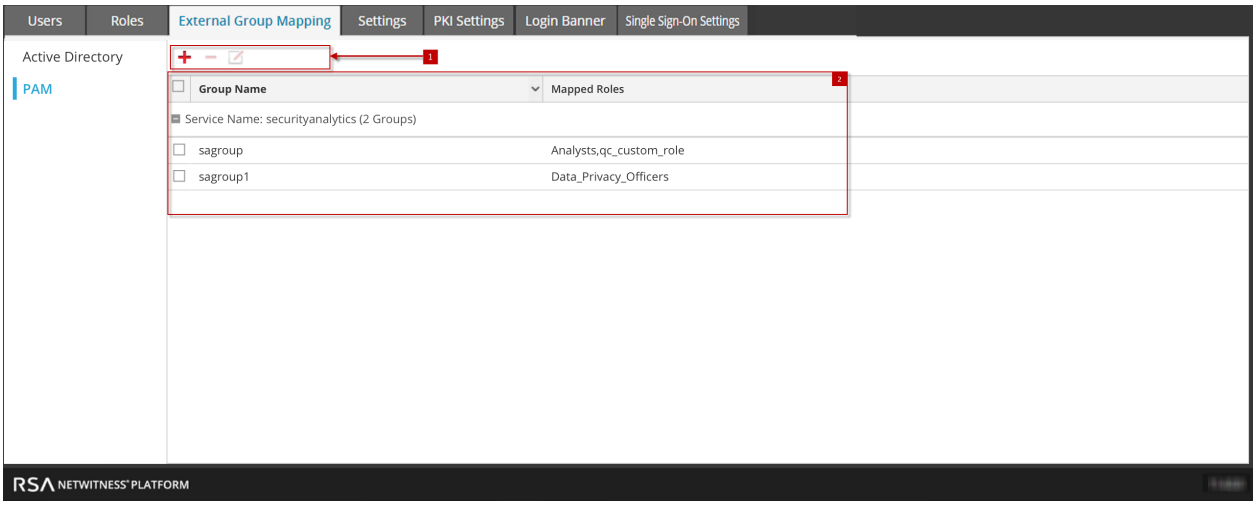
Feature	Description
Module tabs	There are fifteen default tabs, one for each module: Administration, Admin-server, Alerting, Config-server, Incidents, Investigation, Investigation-server, Integration-server, Live, Malware, Orchestration-server, Reports, Response-server, Security-server and Dashboard. Additional tabs may be available based on the installation. Each tab lists the permissions for a module.
Assigned column	Checkbox that indicates if a module permission is assigned to the role.
Description column	List of all permissions for the module.
Save	Saves the role with the selected permissions assigned to it.
Cancel	Cancels any work and closes the dialog.

External Group Mapping Tab

If you set up external user authentication, you can map NetWitness user roles to an external group. The External Group Mapping tab provides information about each external group to which you have mapped roles.

Workflow

What do you want to do?



Role	I want to ...	Show me how
Admin	Map a role to an external group	(Optional) Map User Roles to External Groups
Admin	Search for an external group	Search for External Groups

Related Topics

- Add Role Mapping Dialog
- Search External Groups Dialog

Quick Look

To access this view, go to **(Admin) > Security** and click the **External Group Mapping** tab.

The External Group Mapping includes the following sections.

1 Toolbar
2 List

Toolbar

The following table describes the **External Group Mapping** toolbar.

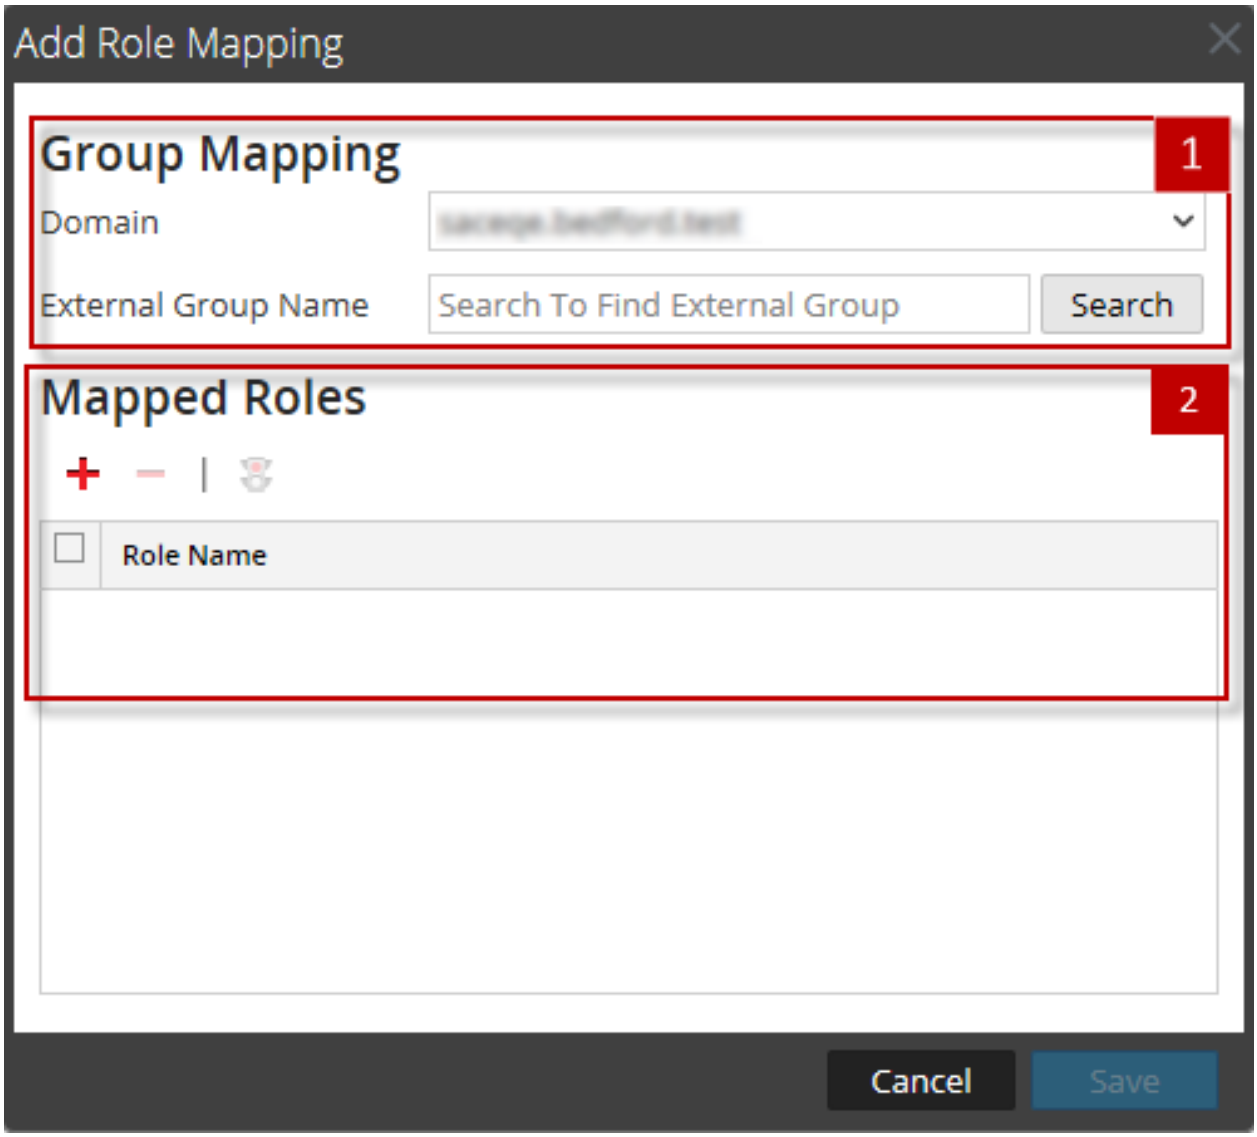
Icon	Description
	Displays the Add Role Mapping dialog in which you can select an external group and map it to a NetWitness role.
	Displays a warning message and asks for confirmation to remove all NetWitness roles mapped to the external group.
	Displays the Edit Role Mapping dialog in which you can add or remove NetWitness roles from the external group.

List

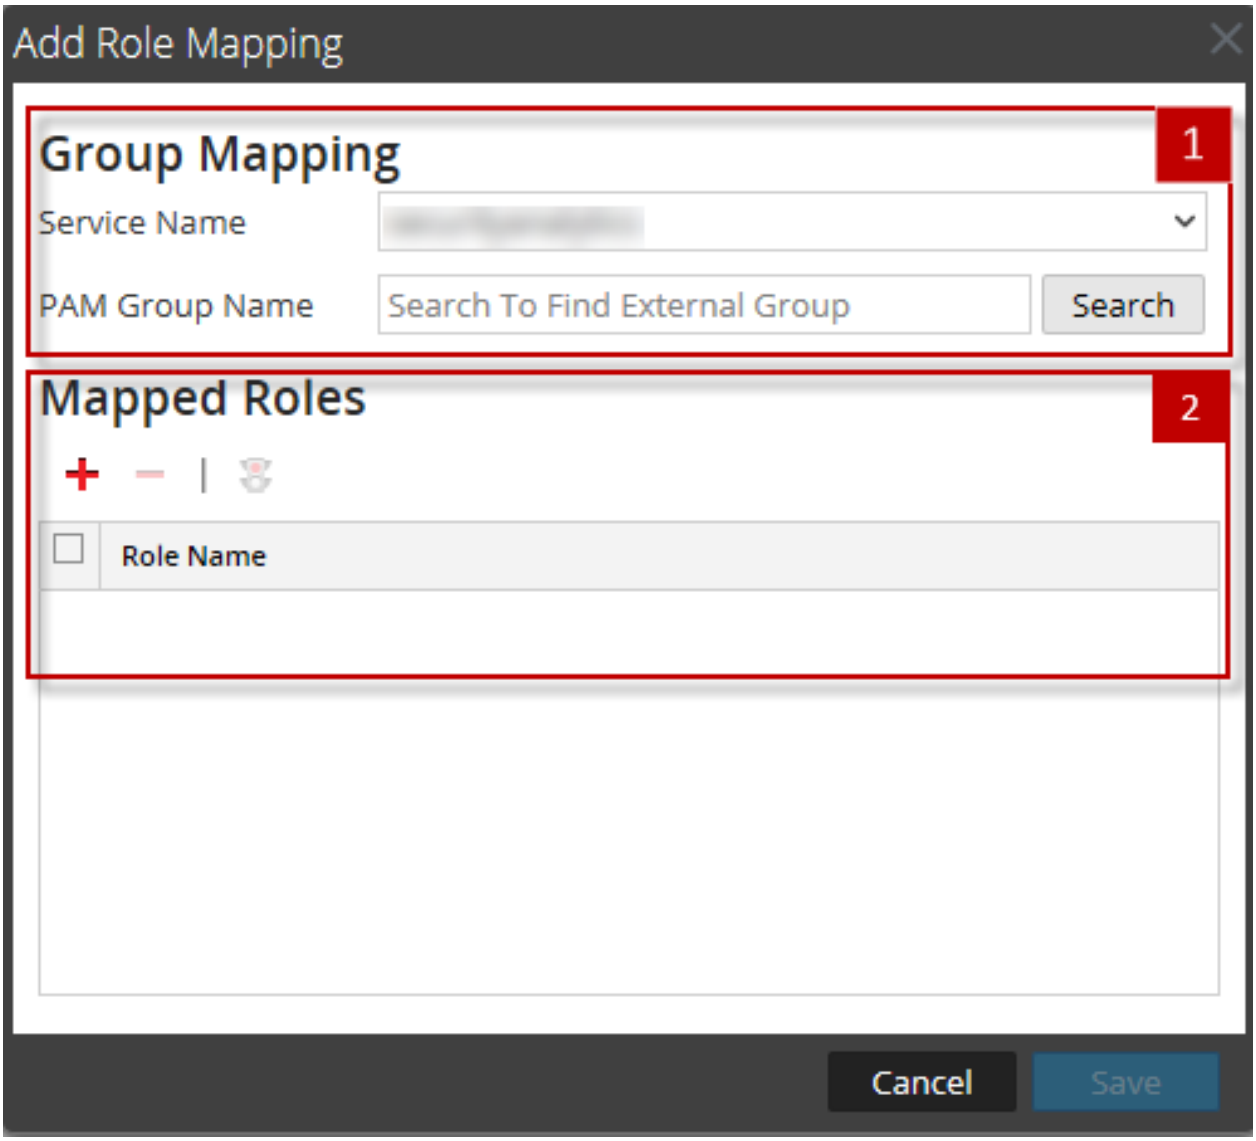
The following table describes the **External Group Mapping** list.

Feature	Description
Group type	In the column on the left, click either **Active Directory** or **PAM** to show groups for the selected type.
Selection box	In a row, toggles selection of a group name. In the title bar, toggles selection of all group names.
Group Name	Displays the name of the external group that has access to NetWitness.
Mapped Roles	Displays the NetWitness roles mapped to the external group.

Add Role Mapping Dialog



In NetWitness each user role has its own set of permissions. You can map one or more NetWitness roles to an external group, which grants the group the same set of permissions that each role has.



What do you want to do?

Role	I want to ...	Show me how
Admin	Map a role to an external group	(Optional) Map User Roles to External Groups
Admin	Search for an external group	Search for External Groups

Quick Look

To access this dialog, go to  **(Admin) > Security**, click the **External Group Mapping** tab, and in the toolbar, click +. The **Add Role Mapping** dialog for the external authentication method that you set up is displayed.

Add Role Mapping
Group Mapping
1
Domain
External Group Name
Search To Find External Group
Search
Mapped Roles
2
Role Name
Cancel
Save

Note: The Add Role Mapping and the Edit Role Mapping dialogs are nearly identical. The only difference is that you cannot search in the Edit Role Mapping dialog.

The **Add Role Mapping** tab includes the following sections.

1 **Group Mapping**
2 **Mapped Roles**

Group Mapping

The following table describes the **Group Mapping** section features.

Feature	Description
Domain	Displayed if you set up Active Directory for external user authentication. The domain name of the external AD group to which roles are mapped.
External Group Name	Displayed if you set up Active Directory for external user authentication. The external group to which roles are mapped.
PAM Group Name	Displayed if you configured PAM for external user authentication. The name of the external group to which roles are mapped.
Search	Displays a search dialog in which you can search for external groups using domain name and host. Search is not available in the Edit Role Mapping dialog.

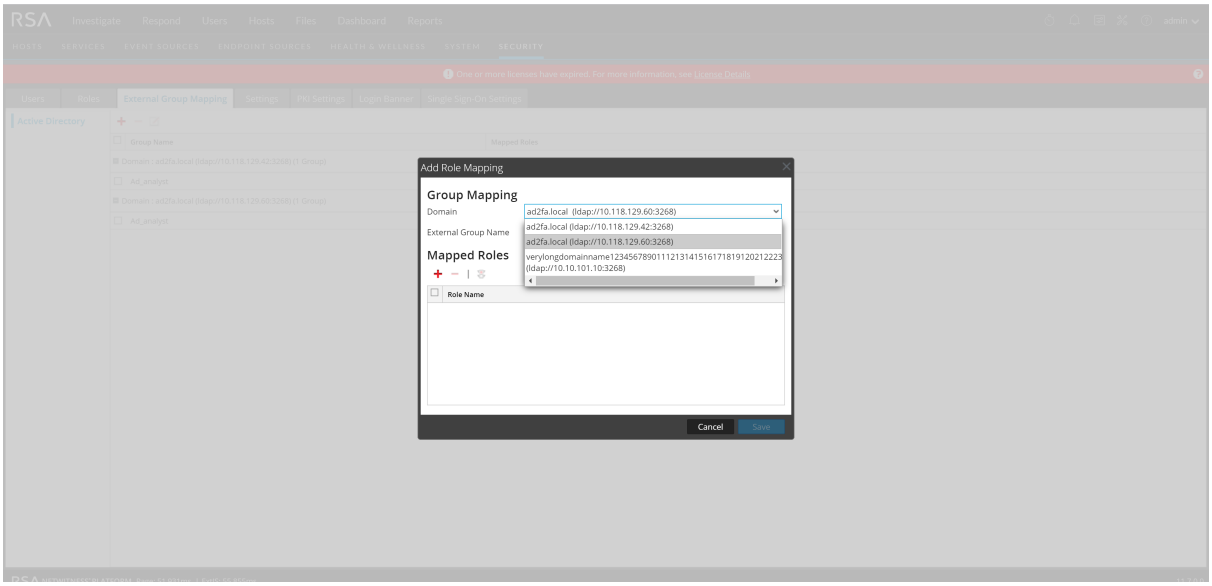
Mapped Roles

The following table describes the **Mapped Roles** section features.

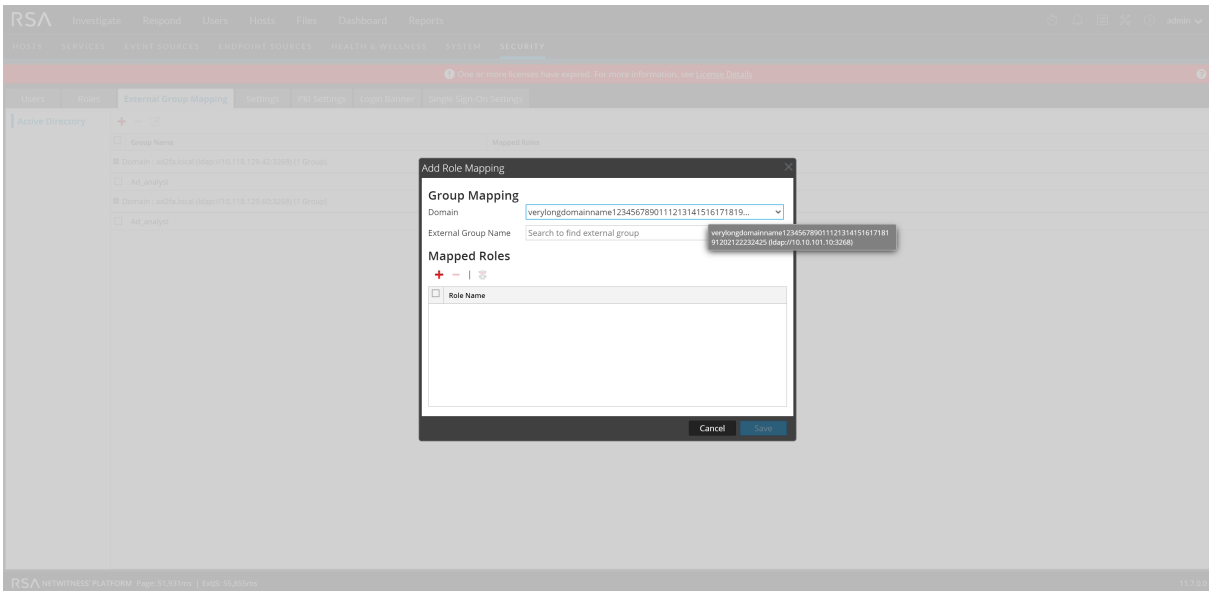
Feature	Description
	Opens the Add Role dialog, in which configured NetWitness user roles to add are listed.
	Removes selected roles from the Mapped Roles grid.
Name	Displays the name of the NetWitness user role.
Permissions	Displays the permissions associated with the NetWitness user role.
Cancel	Cancels the new group mapping or changed group mapping and closes the dialog.
Save	Saves the new group mapping or changed group mapping and closes the dialog.

Search External Groups Dialog

If you set up external user authentication, you can map NetWitness user roles to external groups. You search for external groups to select the groups to which you want to map NetWitness roles.



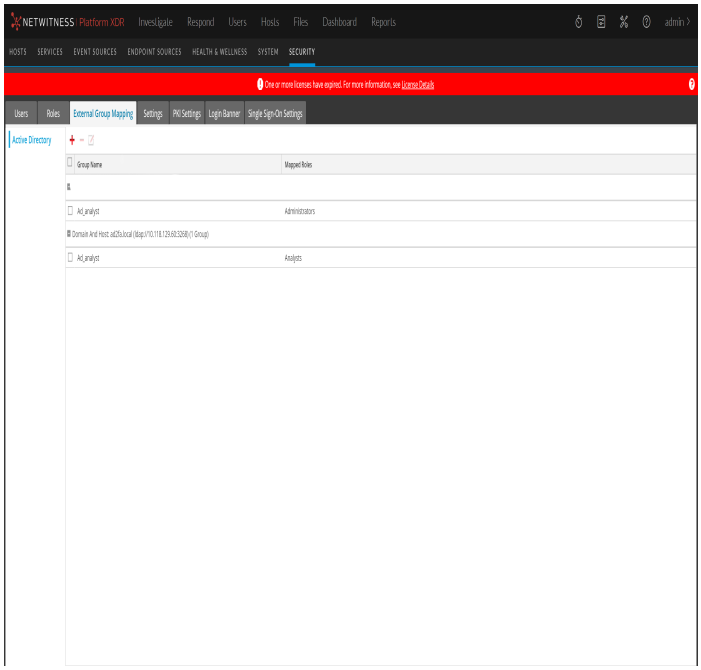
What do you want to do?



Role	I want to ...	Show me how
Admin	Map a role to an external group	(Optional) Map User Roles to External Groups
Admin	View external group mappings	External Group Mapping Tab
Admin	Search for external groups	Search for External Groups

Quick Look

To access this dialog:

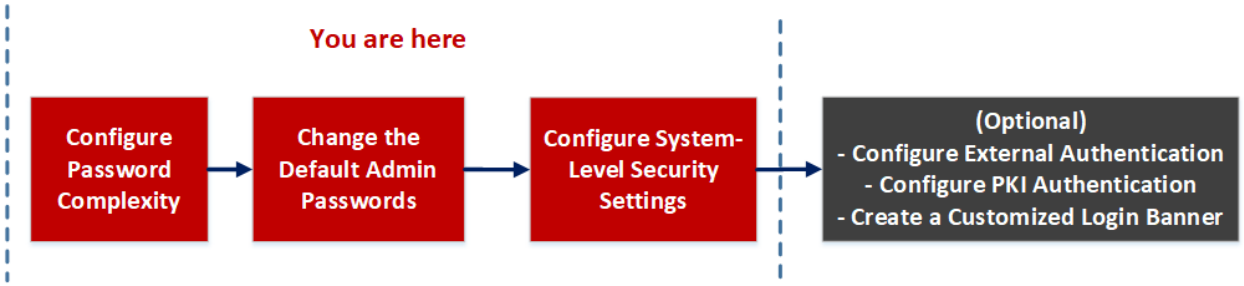


1. Go to **(Admin) > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **External Group Mapping** tab.
3. In the toolbar, click +.
   The Add Role Mapping dialog for the external authentication method you set up is displayed.

4. In the Group Mapping section, select a **Domain**.

5. In the Group Mapping section, click **Search** next to **External Group Name** field.
   The **Search External Groups** dialog is displayed.

The following table describes the features of the **Search External Group** dialog.



Feature	Description
Retrieve all groups or enter a search criteria	Group name for which you are searching. Can be the exact name or can contain the wild card character (*) to match any character.
Group Name	External group to which you could map roles.
Description	Optional text about the group.
OK	Displays the Add Role Mapping dialog, showing the external group you selected.
Cancel	Closes the dialog.

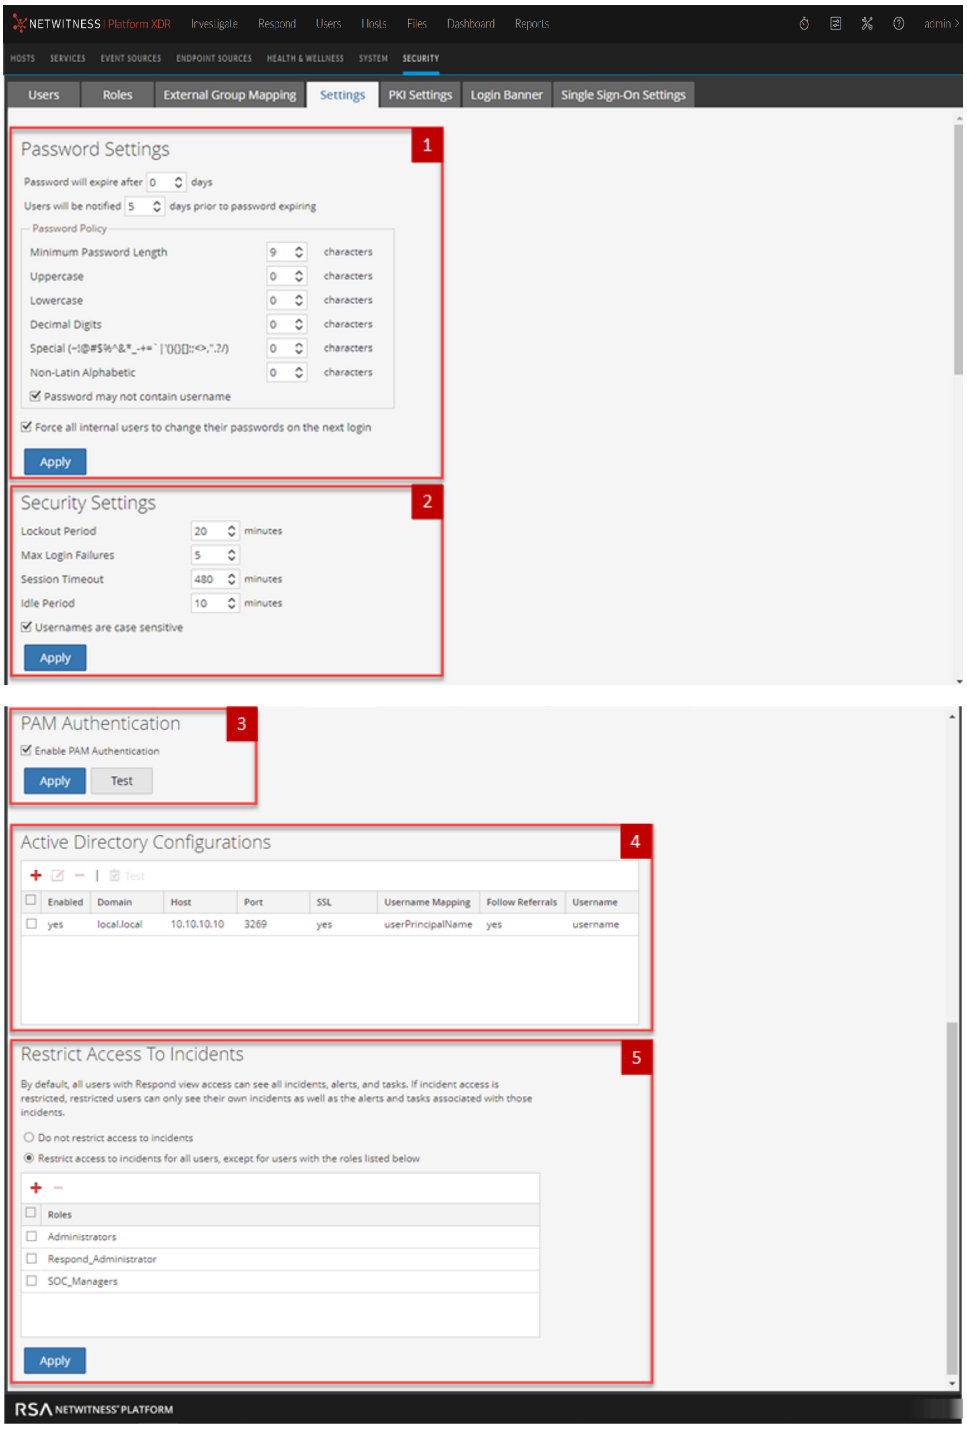
Settings Tab

In the Settings tab, you can configure password complexity for internal NetWitness users and set system-wide security parameters. You can also restrict access to incidents in the Respond view.

Password complexity requirements apply only to internal users and are not enforced for external users. External users rely on their own methods and systems to enforce password complexity.

Workflow

What do you want to do?



Role	I want to ...	Show me how
Admin	Configure password complexity	Configure Password Complexity
Admin	Configure system-level security settings	Configure System-Level Security Settings
Admin	Restrict access to incidents.	Configure System-Level Security Settings
Admin	(Optional) Configure external authentication	(Optional) Configure External Authentication

Related Topics

- Set Up System Security

Quick Look

To access this view, go to  **(Admin) > Security** and click the **Settings** tab.

The **Settings** tab includes the following sections.

1 **Password Settings**
2 **Security Settings**
3 **PAM Authentication**
4 **Active Directory Configurations**
5 **Restrict Access To Incidents**

Password Settings

The Password Policy section enables you to configure password complexity requirements for internal NetWitness users when they set their passwords.

Option	Description
Password will expire after <n> days	The default number of days before a password expires for all internal NetWitness users. A value of zero (0) disables password expiration. For new installations, the default value is 30. For upgrades, the previous value will migrate automatically to the upgraded installation.
Users will be notified <n> days prior to password expiring	The number of days before the password expiration date, to notify a user that their password is about to expire. Users receive a one-time email on the specified date before their passwords expire. They also see a Password Expiration Message dialog when they log on to NetWitness. The minimum value is 1 day.
Minimum Password Length	Specifies a minimum password length requirement for NetWitness user passwords. A minimum password length prevents users from using short passwords that are easy to guess.
Uppercase	Specifies a minimum number of uppercase characters for the password. This includes European language characters A through Z, with diacritic marks, Greek characters, and Cyrillic characters. For example: • Cyrillic uppercase: Д Ц • Greek uppercase: Π Λ
Lowercase	Specifies a minimum number of lowercase characters for the password. This includes European language characters a through z, sharp-s, with diacritic marks, Greek characters, and Cyrillic characters. For example: • Cyrillic lowercase: д ц • Greek lowercase: π λ
Decimal Digits	Specifies a minimum number of decimal characters (0 through 9) for the password.
Special (~!@#$%^&*_-+=`|'(){}[]:;<>,".?/)	Specifies a minimum number of special characters for the password: `~!@#$%^&*_-+=`|'(){}[]:;<>,".?/`
Non-Latin Alphabetic	Specifies a minimum number of Unicode alphabetic characters that are not uppercase or lowercase. This includes Unicode characters from Asian languages. For example: • Kanji (Japanese): 頁 (leaf) 枒 (tree)
Password May Not Contain Username	Specifies that a password cannot contain the case-insensitive username of the user.

Option	Description
Force all internal users to change their passwords on the next login	Forces all internal users to change their passwords the next time they log on to NetWitness instead of when they create or change their passwords. Note that this setting is checked by default.
Apply	Password strength settings take effect when NetWitness users create or change their passwords. If **Force all internal users to change their passwords on the next login** is selected, all internal users must change their password the next time they log on to NetWitness.

Security Settings

The Security Settings section enables you to configure global security settings for NetWitness users.

Option	Description
Lockout Period	Number of minutes to lock a user out of NetWitness after the configured number of failed logins is exceeded. The default value is 20 minutes.
Max Login Failures	The maximum number of unsuccessful login attempts before a user is locked out. The default value is 5
Session Timeout	The maximum duration of a user session before timing out in minutes. The default value is 600. If the value is 0, there is no maximum time for a session. If the value is a positive integer, the session times out when the configured time has elapsed. The user must log in again.
Idle Period	Number of minutes of inactivity before a session times out. The default value is 10. If the value is 0, the session will not timeout.
Usernames are case sensitive	Select this option if you want the Username field on the NetWitness login screen to be case sensitive. For example, if usernames are case sensitive, you could use admin to log on to NetWitness, but you could not use Admin. This is a mandatory field.
Password	Enter the password if you want to add or edit the Active Directory Security Settings. This is a mandatory field.
Apply	Makes the settings become effective immediately.

PAM Authentication

The PAM Authentication section enables you to configure NetWitness to use Active Directory or PAM to authenticate and test external user logins.

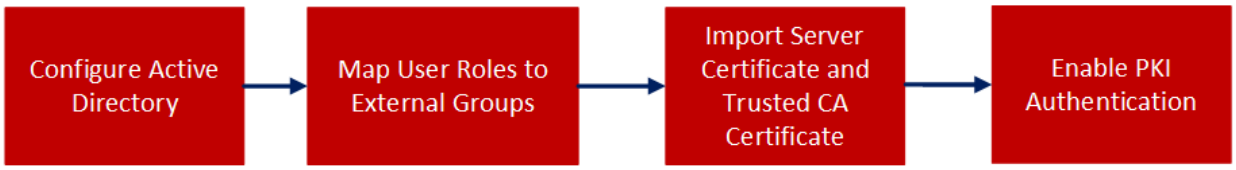
Option	Description
Enable PAM Authentication	Allows NetWitness to use Pluggable Authentication Modules (PAM) to authenticate external user logons.
Apply	Makes the PAM configuration settings become effective in the next logon.
Test	Prompts for a username and password, then tests the currently enabled PAM authentication method.

Active Directory Configurations

The Active Directory Configuration section enables you to configure NetWitness to use Active Directory to authenticate external user logins.

Option	Description
Enabled	Enables Active Directory authentication for NetWitness users.
Domain	Domain name where the Active Directory Service is located.
Host	Host name or IP address where the Active Directory Service is located.
Port	Port on the host that is used for Active Directory Service authentication.
SSL	Indicates whether the Active Directory Service uses Secure Sockets Layer (SSL). To enable SSL so that your Active Directory Service can communicate with NetWitness version 11.1 and later, you must upload an Active Directory server certificate.
Username Mapping	Indicates the Active Directory search field to use for username mapping. You can specify userPrincipalName (UPN) or sAMAccountName.
Follow Referrals	Indicates whether NetWitness will follow LDAP referrals made by Active Directory.
Username	Username of the user that binds to the Active Directory Service while searching Active Directory groups. This is usually a service account that has permissions to query the domain and validate user accounts and group membership. This credential is not used for any other purpose.
Password	Password of the user that binds to the Active Directory Service while searching Active Directory groups. This is usually a service account that has permissions to query the domain and validate user accounts and group membership. This credential is not used for any other purpose.

Restrict Access to Incidents



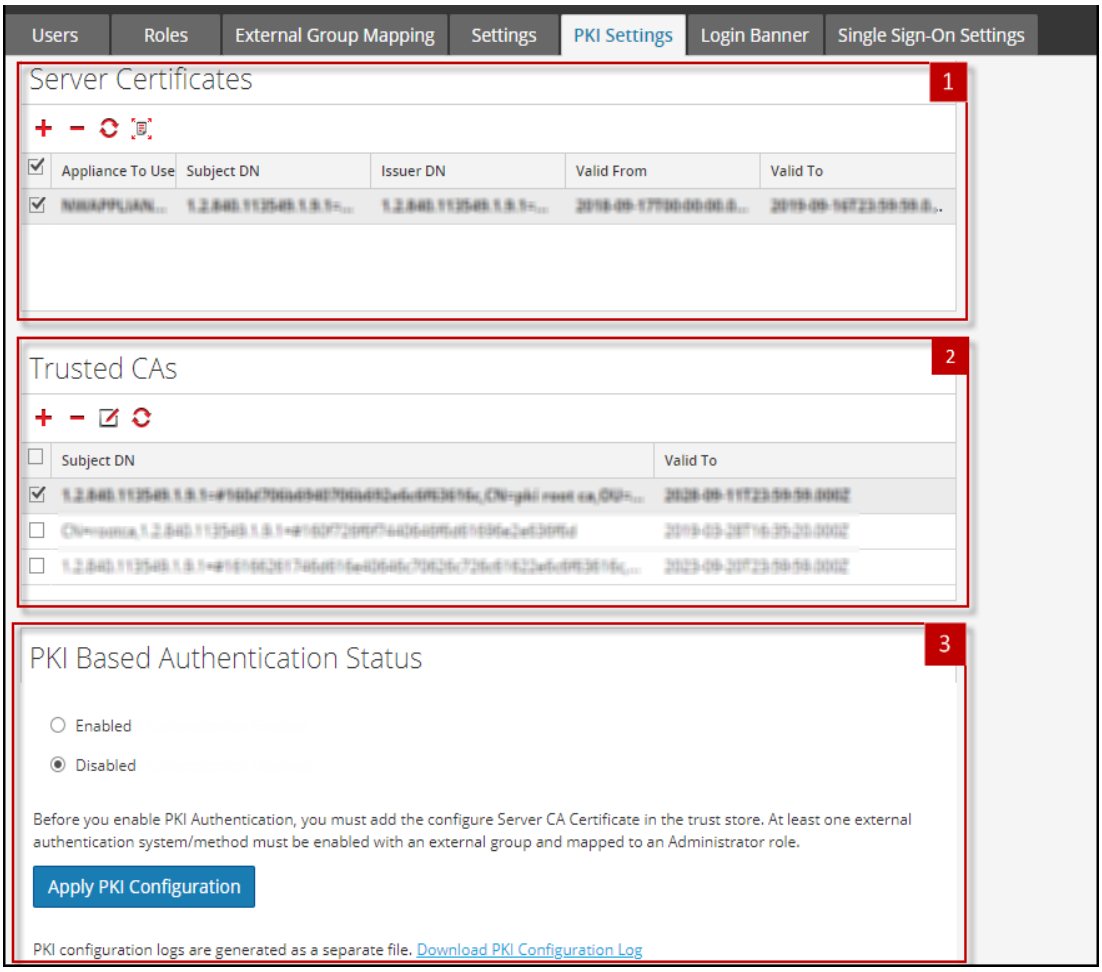
By default, analysts can view all of the incidents, alerts, and tasks in the Respond view. If you have sensitive or restricted information that should not be shared, you can restrict what analysts and other users can see in the Respond view.

Option	Description
Do not restrict access to incidents	Enables analysts to view all of the incidents, alerts, and tasks in the Respond view. This is the default setting.
Restrict access to incidents for all users, except for users with the roles listed below	Restricts what analysts and other users can see in the Respond view. Analysts can only see incidents assigned to them as well as the alerts and tasks associated with those incidents.
(List of user roles whose access to incidents is not restricted.)	When you select to restrict access to incidents, this list shows the user roles that do not have restricted access to incidents. You can adjust this list of user roles independently from your restriction selection. For example, you can add and adjust the list of non-restricted user roles before you make the selection to restrict access to incidents.
Apply	Changes take effect on the next log in to NetWitness Platform.

PKI Settings Tab

The Public Key Infrastructure (PKI) Settings tab enables you to configure PKI authentication for NetWitness.

Workflow



What do you want to do?

Role	I want to ...	Show me how
Admin	Configure External Authentication	Configure Active Directory
Admin	Map user Roles to External Groups	(Optional) Map User Roles to External Groups
Admin	Import Server Certificate	Import Server Certificate and Trusted CA Certificate
Admin	Enable PKI Authentication	Enable PKI Authentication

Quick Look

To access this view, go to  **(Admin) > Security** and click the **PKI Settings** tab.

The **PKI Settings** tab includes the following sections.

1 **Server Certificates**
2 **Trusted CAs**
3 **PKI Based Authentication Status**

Server Certificates

The **Server Certificates** section enables you to import a server certificate with its private key to NetWitness Server. The following table lists the **Server Certificates** features and their description.

Feature	Description
Appliance to Use	The device to use the certificate
Subject DN	The entity to which the certificate is issued.
Issuer DN	The entity which issued the certificate.
Valid From	The start date for the certificate validity.
Valid To	The end date till when a certificate is valid.

Trusted CAs

The **Trusted CAs** section enables you to import a Certificate Authority (CA) certificate to NetWitness. The following table lists the **Trusted CAs** features and their description.

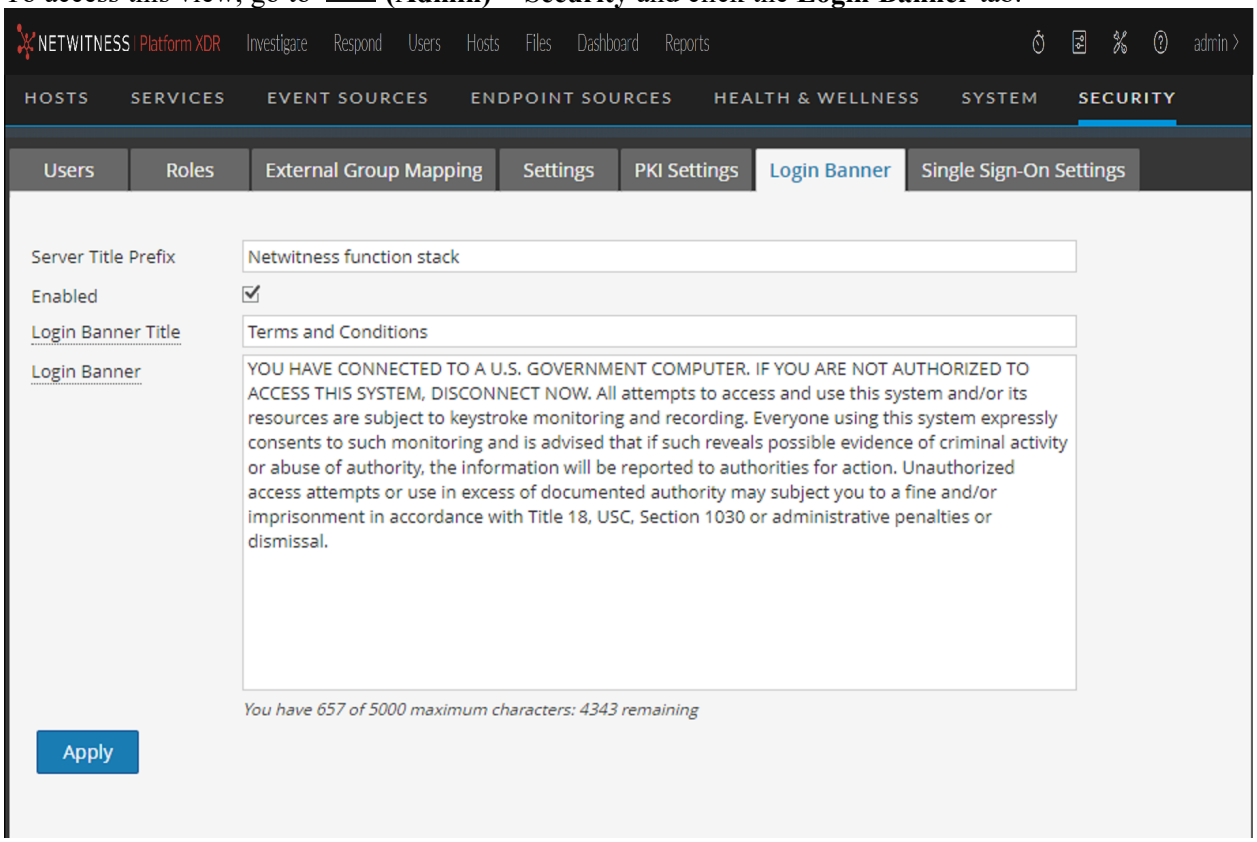
Feature	Description
Subject DN	The entity to which the certificate is issued.
CA	Indicates whether the certificate is Certificate Authority (CA).
Valid To	The end date till when a certificate is valid.

PKI Based Authentication Status

The **PKI Based Authentication Status** section enables you to enable PKI authentication in NetWitness. The following table list the **PKI Based Authentication Status** features and their description.

Feature	Description
Enabled	Select the option to enable PKI.
Disabled	Select the option to disable PKI.
Apply PKI Configuration	Enables PKI authentication for NetWitness users.

Login Banner Tab



The Login Banner tab provides a way to add a banner to the NetWitness login screen, which will prevent a user from logging on until they agree to the conditions. Add the server title prefix to differentiate the NetWitness Server of the current tab, when you have multiple deployed in your system. You can customize the default title and text of the login banner. The banner is disabled by default.

What do you want to do?

Role	I want to ...	Show me how
Admin	Create or enable a login banner	(Optional) Create a Customized Login Banner

Quick Look

To access this view, go to **(Admin) > Security** and click the **Login Banner** tab.

The following table lists the features of the Login Banner tab.

Feature	Description
Server Title Prefix	Displays the prefix of the NetWitness Server on the title bar.
Enabled	Checkbox that indicates whether or not the login banner is enabled. This box is cleared by default.
Login Banner Title	Shows the title of the dialog box that contains the login conditions.
Login Banner	Shows the conditions the user must acknowledge.

Single Sign-On Settings Tab

The SSO Settings tab provides a way to enable SSO.

What do you want to do?

Role	I want to ...	Show me how
Admin	Enable SSO Settings	Configure Single Sign-On
Admin	Configure Active Directory	Configure Active Directory
Admin	Configure ADFS as IDP for NetWitness	For instructions on how to configure ADFS as IDP for NetWitness, see the *Configure SAML 2.0 provider settings for portals* topic in Microsoft documentation.
Admin	Map User Roles to External Groups	Manage Users with Roles and Permissions

Quick Look

To access this view, go to  **(Admin) > Security** and click the **Single Sign-On Settings** tab.

The following table lists the features of the Single Sign-On tab.

Feature	Description
Enable SSO	Checkbox that indicates whether or not the single sign-on is enabled. This box is cleared by default.
Auto Import IDP Metadata	If selected the latest IDP metadata is downloaded at regular intervals.
Metadata URL	Enter the metadata URL generated when the connection was established with the ADFS.
Use Proxy	If enabled, the requests to IDP will be routed through the proxy configured in  (Admin) > System > HTTP Proxy settings.
Import IDP Metadata	Enter the metadata URL generated when the connection was established with the ADFS. **Note:** Make sure you update the link every time the IDP metadata is updated.
Entity ID	A unique identifier for NetWitness unique amongst all the applications managed by the same IDP.

Feature	Description
Enable Global Logout	Checkbox that enables Global Logout setting for users. When Global Logout is enabled, the user is logged out of NetWitness and also from other applications authenticated by ADFS.
Apply	The admin-server is restarted after which you will get notified in the notification tray when the metadata is ready to be downloaded.
Export Service Provider Metadata	Exports an XML file which is uploaded to IDP to establish the connection between NetWitness (SP) and IDP (ADFS) for authentication.

System Configuration Overview

In the Administration System view, administrators can configure system settings to receive optimal performance from NetWitness. This diagram show the available configuration options.

In this guide, the standard procedures provide instructions for administrators who want to customize settings that apply across the system in NetWitness. Although some of these settings have default values, the administrator needs to view and evaluate all default values.

Additional procedures are not essential for the set up of NetWitness, they include certain customization options that are beyond the usual setup; for example, adding custom context menus or setting up a proxy.

In addition, reference topics and troubleshooting topics supply detailed information about the user interface and suggestions for resolving possible issues.

The following sections describe system configuration:

- Standard Procedures provide instructions for administrators who want to customize settings that apply across the system in NetWitness.
- Additional Procedures provide instructions for setting up customization options that are beyond the usual system configuration.

Standard Procedures

The topics in this section provide instructions for administrators who want to customize settings that apply across the system in NetWitness. Although some of these settings have default values, the administrator needs to view and evaluate all default values. The procedures can be performed in any sequence and are listed alphabetically.

Access System Settings

Configure Notification Servers

Configure Notification Outputs

Configure Templates for Notifications

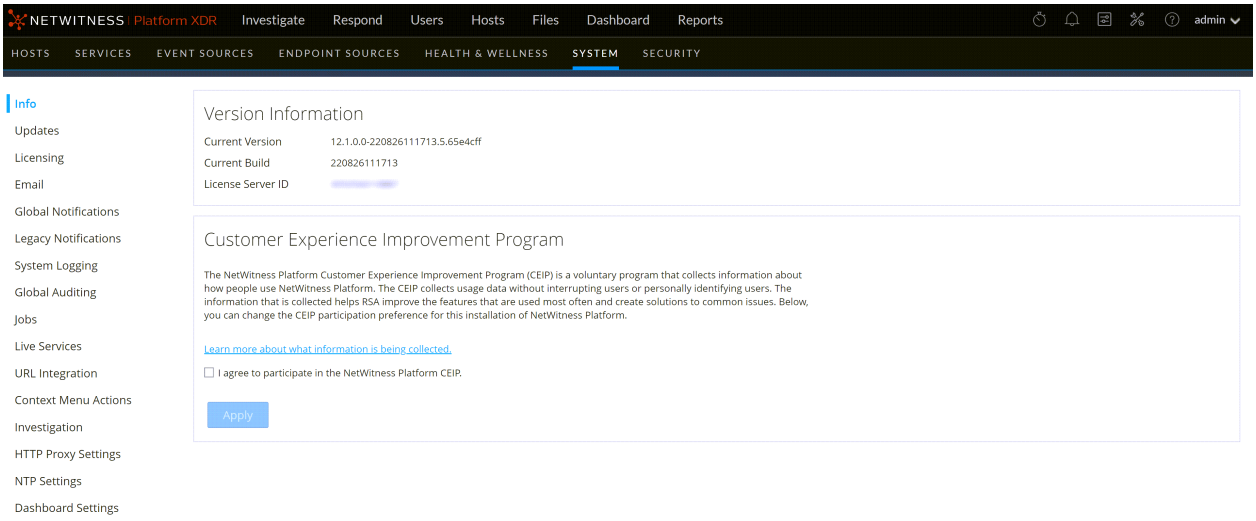
Configure the Email Settings as Notification Server

Configure Email Servers and Notification Accounts

Configure Global Audit Logging

Configure Investigation Settings

Configure Live Services Settings



Configure Log File Settings

Access System Settings

This topic introduces the system configuration capabilities of NetWitness in the Administration System view. Administrators can configure notifications, email notifications, global audit logging, logging settings, connection to Live Services, and URL integration in NetWitness.

To access the system settings:

Go to  **(Admin)** > **System**.
The Administration System view is displayed.

On the left panel of the Administration System view is an options panel listing all system nodes available for configuration. When you select a node, the associated content is displayed in the right panel.

Configure Notification Servers

This topic provides instructions on how to configure notification servers. For ESA, notification servers are required to define an ESA rule. A notification server is also required to configure global audit logging.

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond. Notification Servers define the servers from which you want to receive notifications from the system. For Global Audit Logging, define Log Decoders as Syslog Notification Servers.

You can define, delete, edit, import, and export a notification server in NetWitness. Individual topics describe the relevant procedures. For more information on ESA alert configuration, see "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide*. You delete, edit, import, and export notification outputs and notification servers in the same way as templates. You cannot disable or delete notification servers associated with global audit logging configurations.

Notification Servers Overview

This topic provides an overview of notification servers. You configure notification servers in the Administration System view ( (Admin) > **System** > **Global Notifications** > **Servers** tab).

Global Notifications are used by a variety of components in NetWitness, such as Event Stream Analysis (ESA), Respond, Health and Wellness, New Health and Wellness, Event Source Management (ESM), and Global Audit Logging. Notification settings are called **Notification Servers**.

Event Stream Analysis sends notifications to users through email, SNMP, or Syslog about various system events. In ESA, these alert notification settings are called Notification Servers. You can configure multiple notification servers and use them while defining an ESA rule, for example, you can configure multiple mail servers or Syslog servers and use the settings while defining an ESA rule.

Note: New Health and Wellness supports only Email and Syslog notifications.

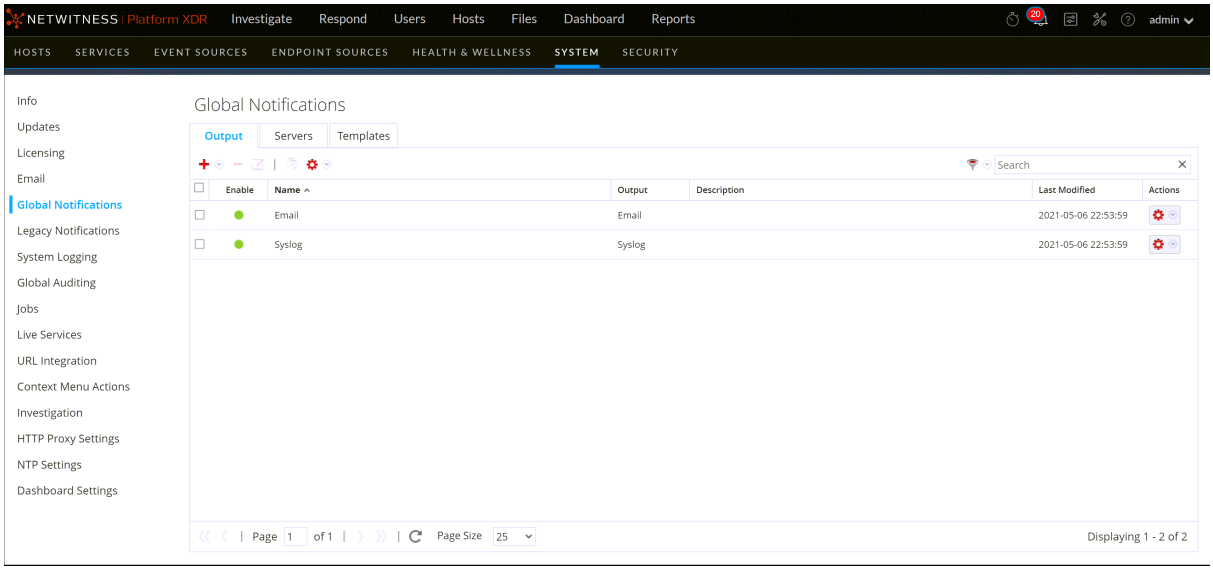
Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

You can configure the following notification servers:

- Email
- SNMP
- Syslog
- Script

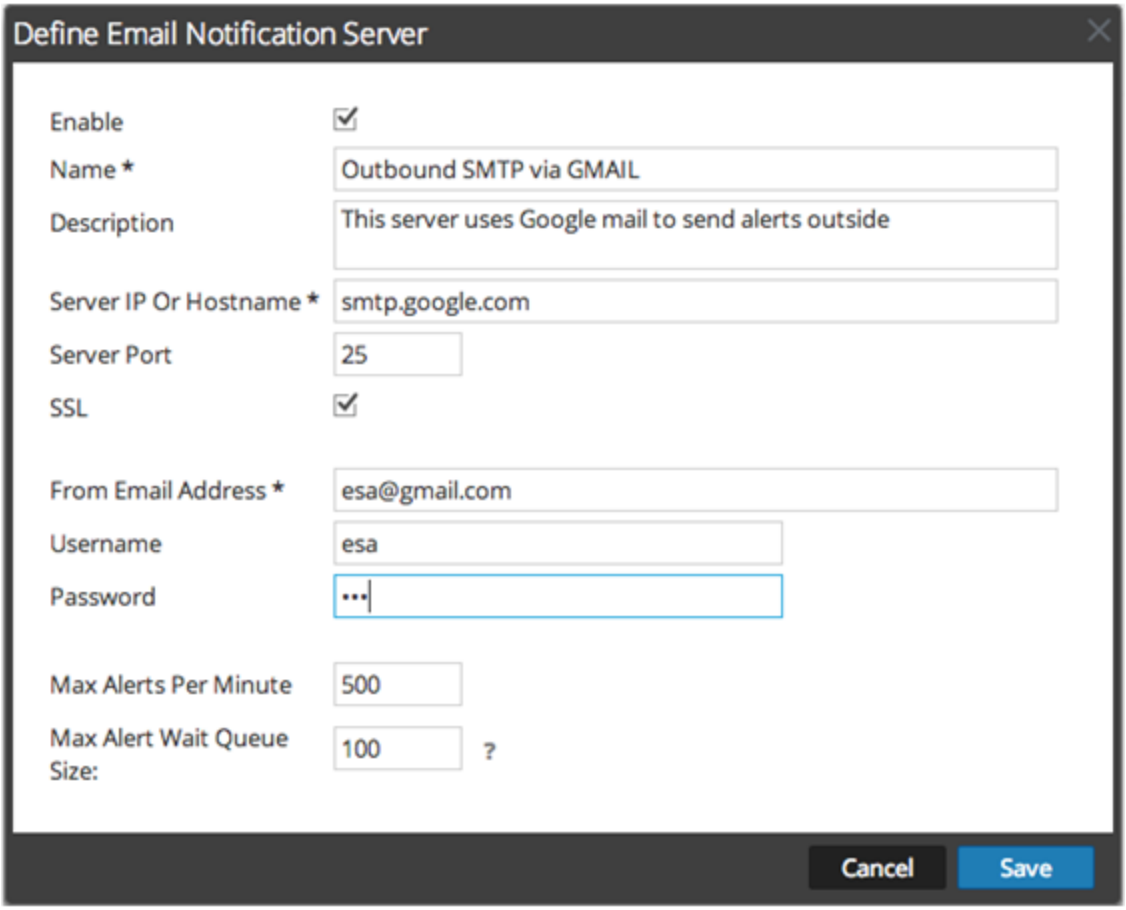
Email notification servers enable you to configure email server settings to send alert notifications. SNMP notification servers enable you to configure SNMP trap host settings as a notification server to send alert notifications.

Syslog notification servers enable you to configure Syslog settings as a notification server to send notifications. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis. For Global Audit Logging, you can only use Syslog Notification Servers.



Script notification servers enable you to configure Script as a notification server.

For detailed information on the different notification server configurations, including parameters and descriptions, see Define Notification Server Dialogs.



Configure the Email Settings as Notification Server

To configure email server settings as a notification server to send alert notifications:

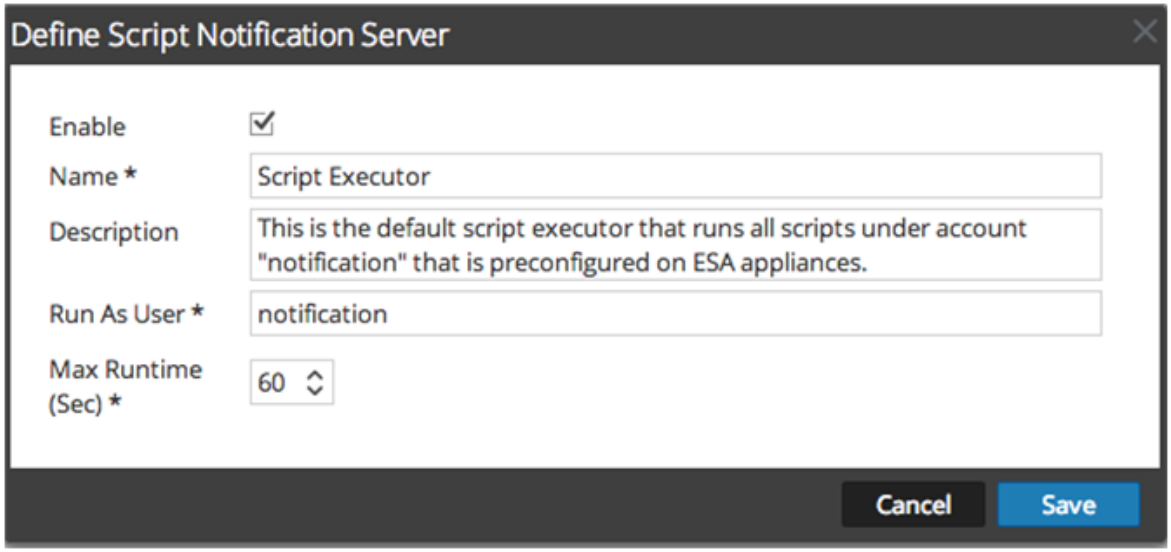
1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
   The **Notifications** configuration panel is displayed with the **Output** tab open.
3. Click the **Servers** tab.

4. From the drop-down menu, select **Email**.

5. In the **Define Email Notification Server** dialog, provide the required information and click **Save**.

Note: For ESM/SMS and ESA notifications, you must specify only the hostname/FQDN in the Server IP or Hostname field.

For details of the parameters and descriptions, see Define Notification Server Dialogs



Configure Script as a Notification Server

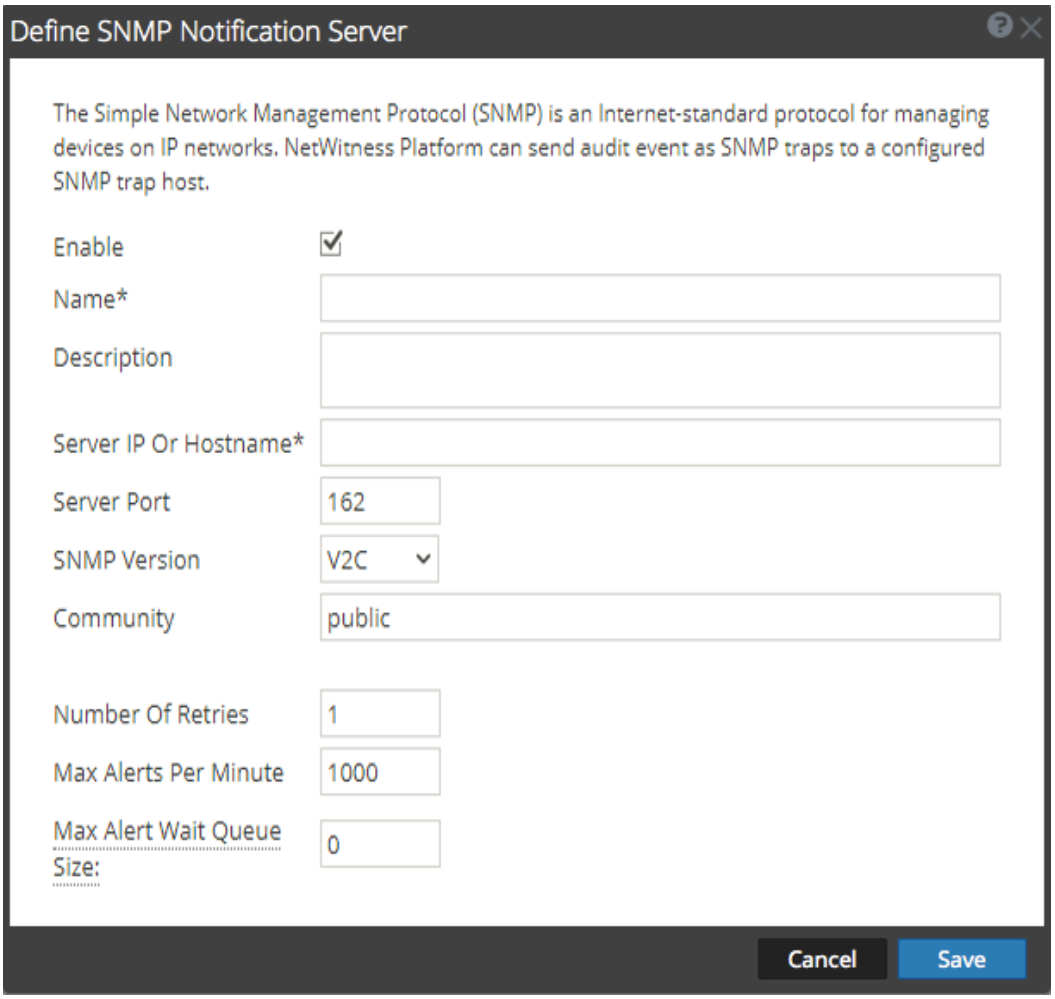
ESA allows you to run scripts in response to ESA alerts. However, you must first configure the user identity and other details that are required to run the scripts.

To configure Script as a notification server:

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the  drop-down menu, select **Script**.

5. In the **Define Script Notification Server** dialog, provide the required information and click **Save**.



For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure the SNMP Settings as Notification Server

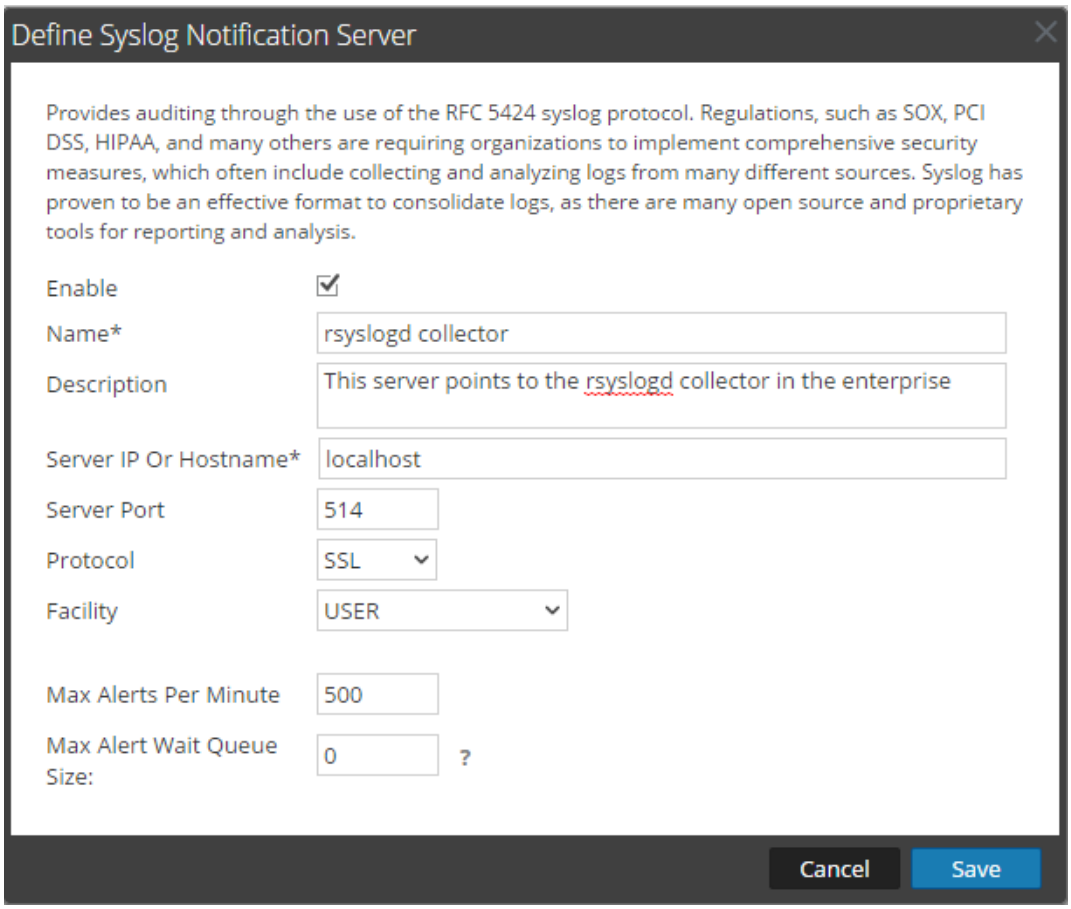
To configure the SNMP trap host settings as a notification server to send alert notifications:

1. Go to  **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the  drop-down menu, select **SNMP**.

5. In the **Define SNMP Notification Server** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.



Configure a Syslog Notification Server

This topic provides instructions on how to configure a Syslog notification server. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

To configure Syslog as a notification server:

1. Go to  **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the drop-down menu, select **Syslog**.

5. In the **Define Syslog Notification Server** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Notification Outputs

This topic provides instructions on how configure notification outputs. These notification outputs are required to define an ESA rule.

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

Note: You do not need to configure the Output tab for Global Audit Logging.

Notification Output configurations define email addresses and subject lines, SNMP trap OID settings, syslog output settings, and script code.

You can define, delete, edit, import, and export notification outputs in NetWitness. Individual topics describe the relevant procedures. For more information on ESA alert configuration, see "Notification Methods." in the *Alerting with ESA Correlation Rules User Guide*. You delete, edit, import, and export notification outputs and notification servers in the same way as templates. If you attempt to delete a notification output being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use.

Notification Outputs Overview

This topic provides an overview of notification outputs. notification outputs are required when defining an ESA rule. You can configure notification outputs in the Administration System view ((Admin) > **System** > **Global Notifications** > **Output** tab).

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

Note: You do not need to configure notification outputs (the Output tab) for Global Audit Logging.

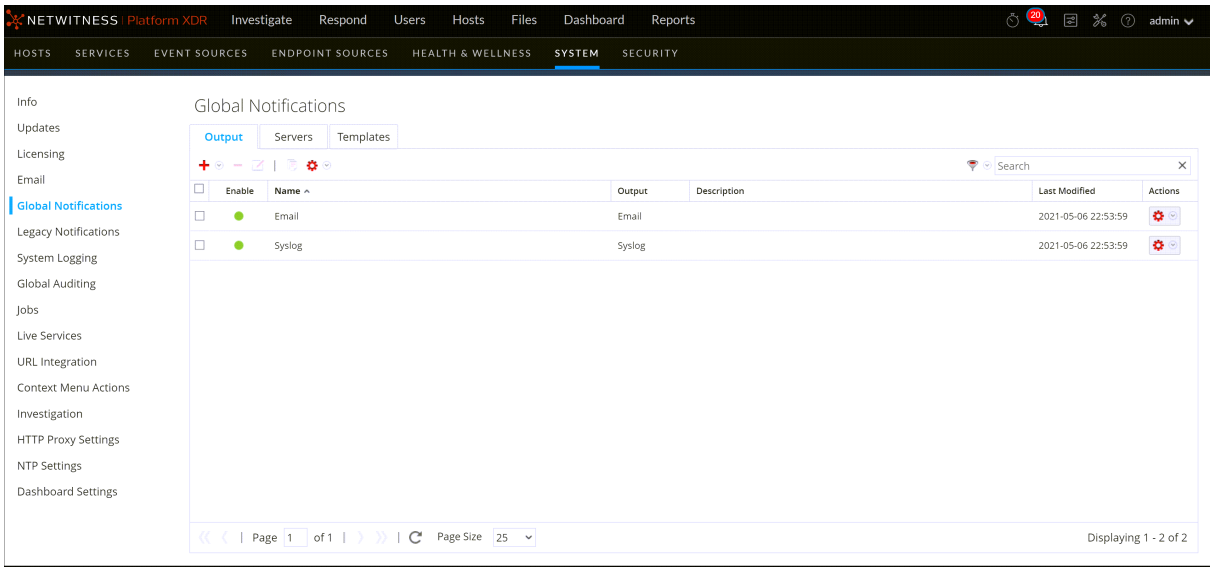
Notification outputs are the destinations used for sending notifications. For ESA, notification outputs enable you to define how you want to receive the ESA alerts. The following are the different notification outputs supported by NetWitness:

- Email
- SNMP
- Syslog
- Script

Note: New Health and Wellness supports only Email and Syslog notification outputs.

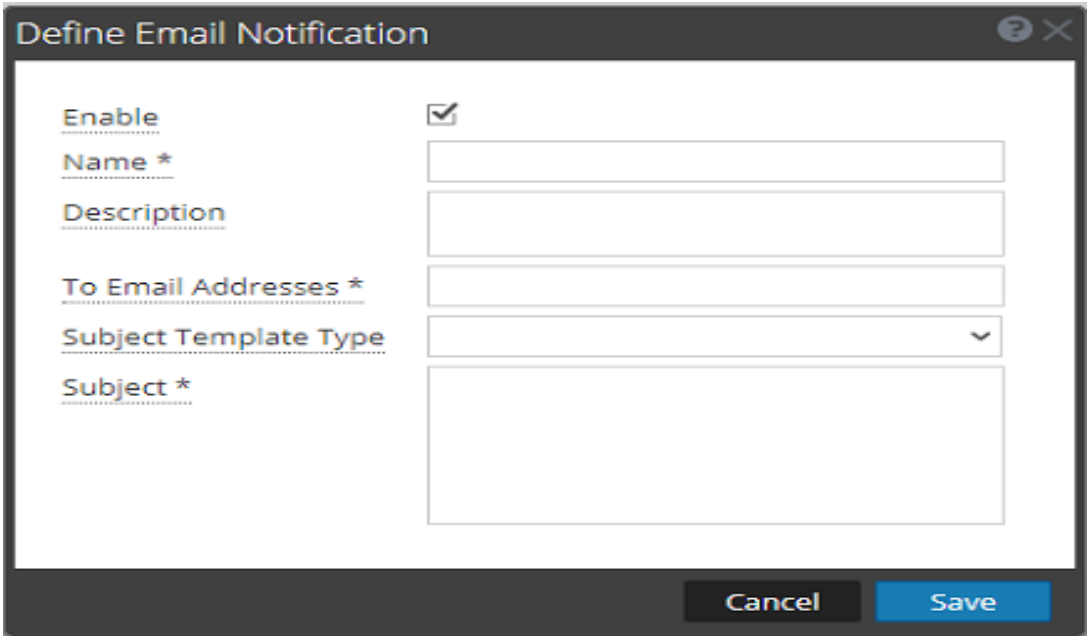
Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

Email notification settings define the destination email address to which you can send the alerts. You can also add a custom description in the subject of the email and define multiple destination email addresses.



SNMP notification settings enable you to define the SNMP settings to send alert notifications. Syslog notifications enable you to define the Syslog settings used to send alert notifications. Script notifications enable you to define the Script that executes in response to the alert.

For detailed information on the notification configurations, including parameters and descriptions, see Define Notification Server Dialogs.



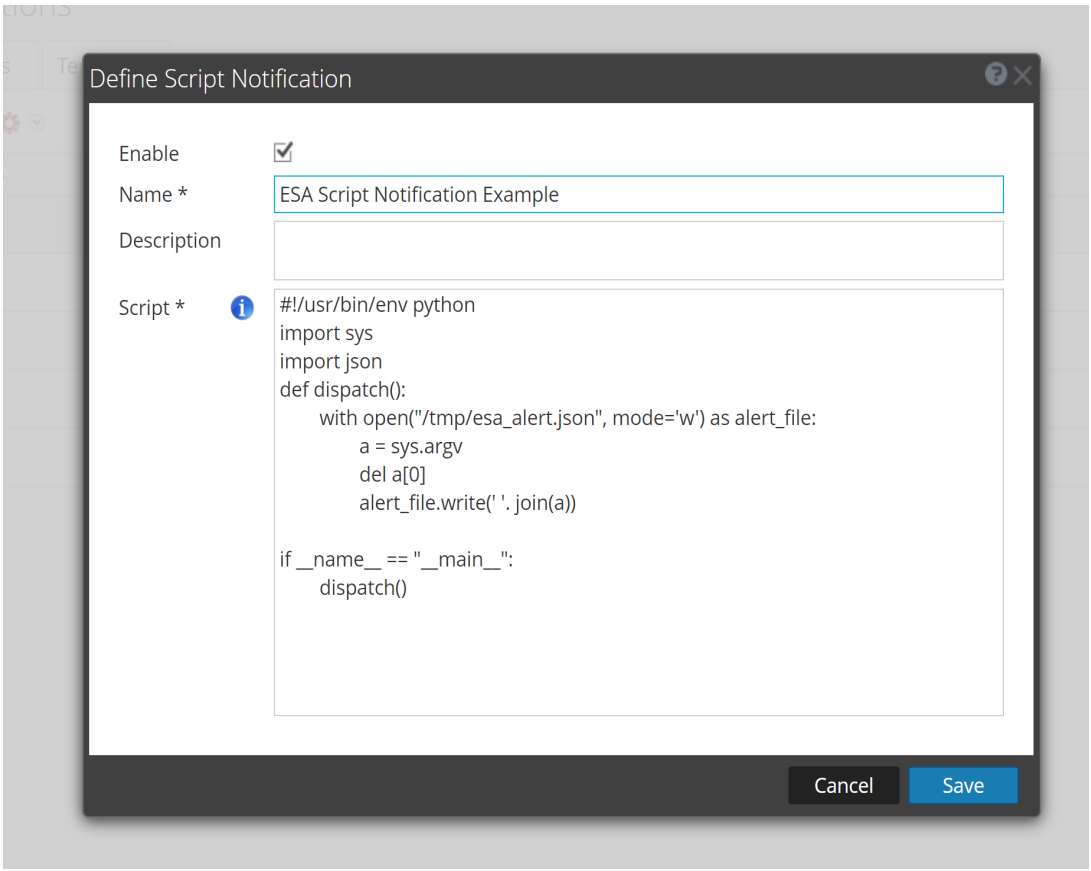
Configure Email as a Notification

To configure Email as a notification:

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.

3. On the **Output** tab, from the  drop-down menu, select **Email**.

4. In the **Define Email Notification** dialog, provide the required information and click **Save**.



For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Script as a Notification

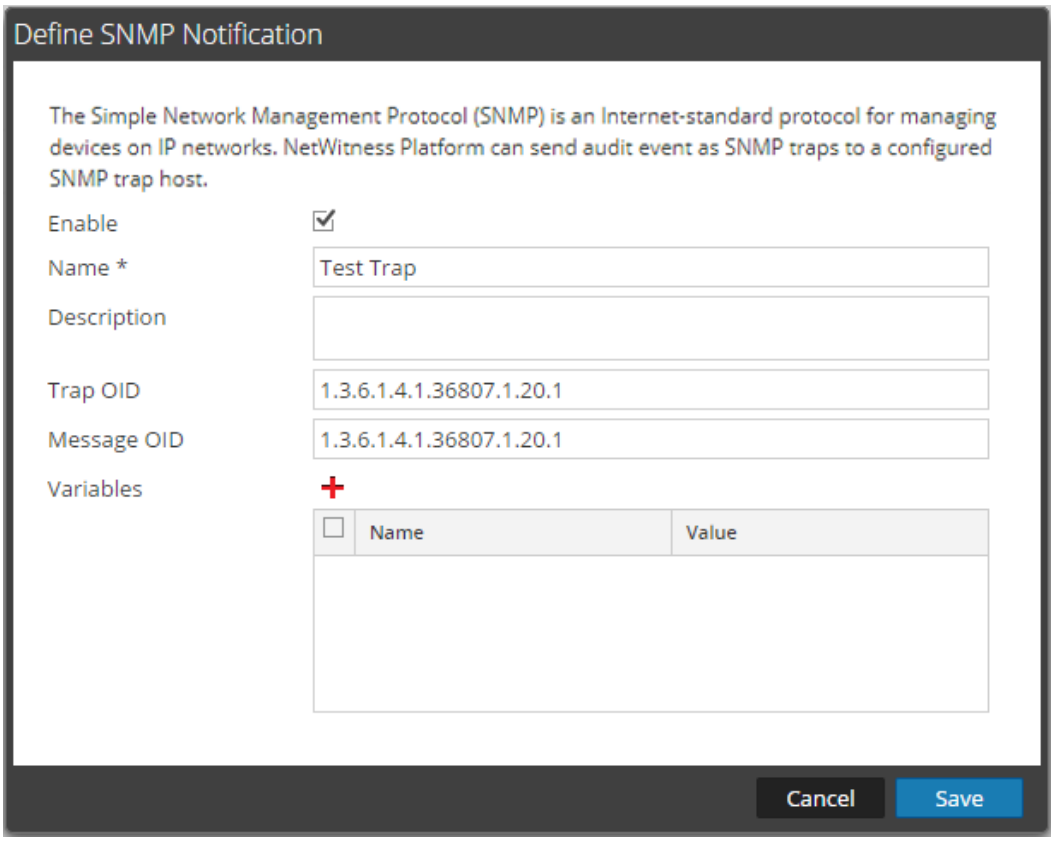
This topic provides instructions to define and configure a Script as a notification output. ESA allows you to run scripts in response to ESA alerts. You need to define the script using the  (Admin) > **System** > **Notifications** > **Output** tab. You can use any script for ESA notifications.

To configure the script as a notification:

1. Go to  **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. On the Output tab, from the  drop-down menu, select **Script**.

4. In the **Define Script Notification** dialog, provide the required information and click **Save**.

> **Note:** To retrieve alerts information in the scripts, use command line arguments based on the scripting language. For Example:
> - If you are using Python as the scripting language, use sys.argv (command line arguments) to retrieve alerts information.
> - If you are using Bash as the scripting language, use $*, $1, $2, and $@ (command line arguments) to retrieve alerts information.



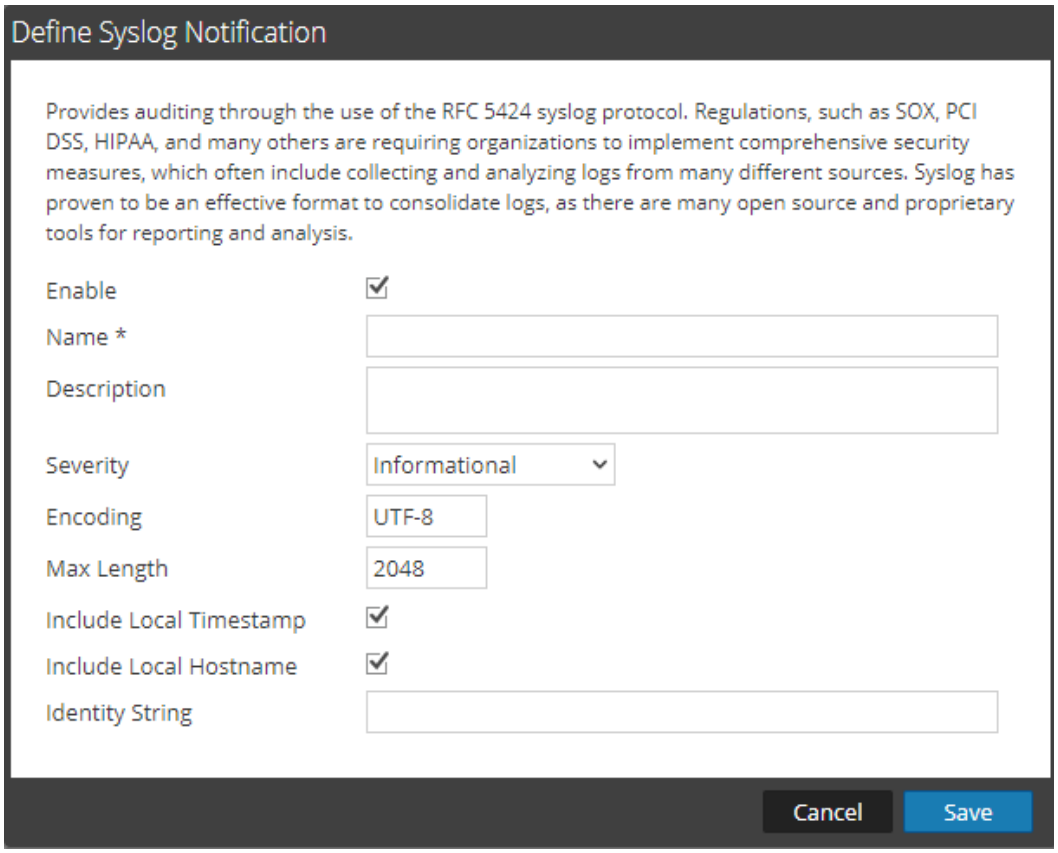
> **Note:** Use **Temp** folder to create files or folders as a part of the script.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure SNMP as a Notification

To configure SNMP as a notification output to send alert notifications:

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. On the Output tab, from the drop-down menu, select **SNMP**.



4. In the SNMP Notification dialog, provide the required information and click **Save**.
   For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Syslog as a Notification

To configure Syslog as a notification output when sending alert notifications:

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.

3. On the Output tab, from the  drop-down menu, select **Syslog**.

4. In the **Define Syslog Notification** dialog, provide the required information and click **Save**. For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Templates for Notifications

You configure notification templates in the Administration System view ((Admin) > **System** > **Global Notifications** > **Templates** tab). A notification template defines the format and message fields of the notifications. There are different template types for the notifications that you can configure:

- Audit Logging
- Event Stream Analysis
- Event Source Monitoring
- Health Alarms
- New Health & Wellness Alarms.

You can use the available default templates or you can configure your own templates for Email (SMTP), SNMP, Syslog, and Script, depending on the template type. To learn how to modify or configure your own template, see Define Notification Template Dialog.

Global audit logging sends audit logs in the format specified in the Audit Logging template. You can use the default audit logging templates or you can define your own audit logging template. For more information on how to define an Audit Logging template, see Define a Template for Global Audit Logging.

Event Stream Analysis (ESA) sends notifications in the format specified in the Event Stream Analysis templates. The default Event Stream Analysis templates for email, SNMP, Syslog, and Script are available on installation. You can customize these templates as well as create new templates which you can use for the notifications. For more information on how to define ESA templates, see Define a Template for ESA Alert Notifications.

For more information on ESA alert configuration, see "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide*. You cannot delete templates associated with global audit log configurations.

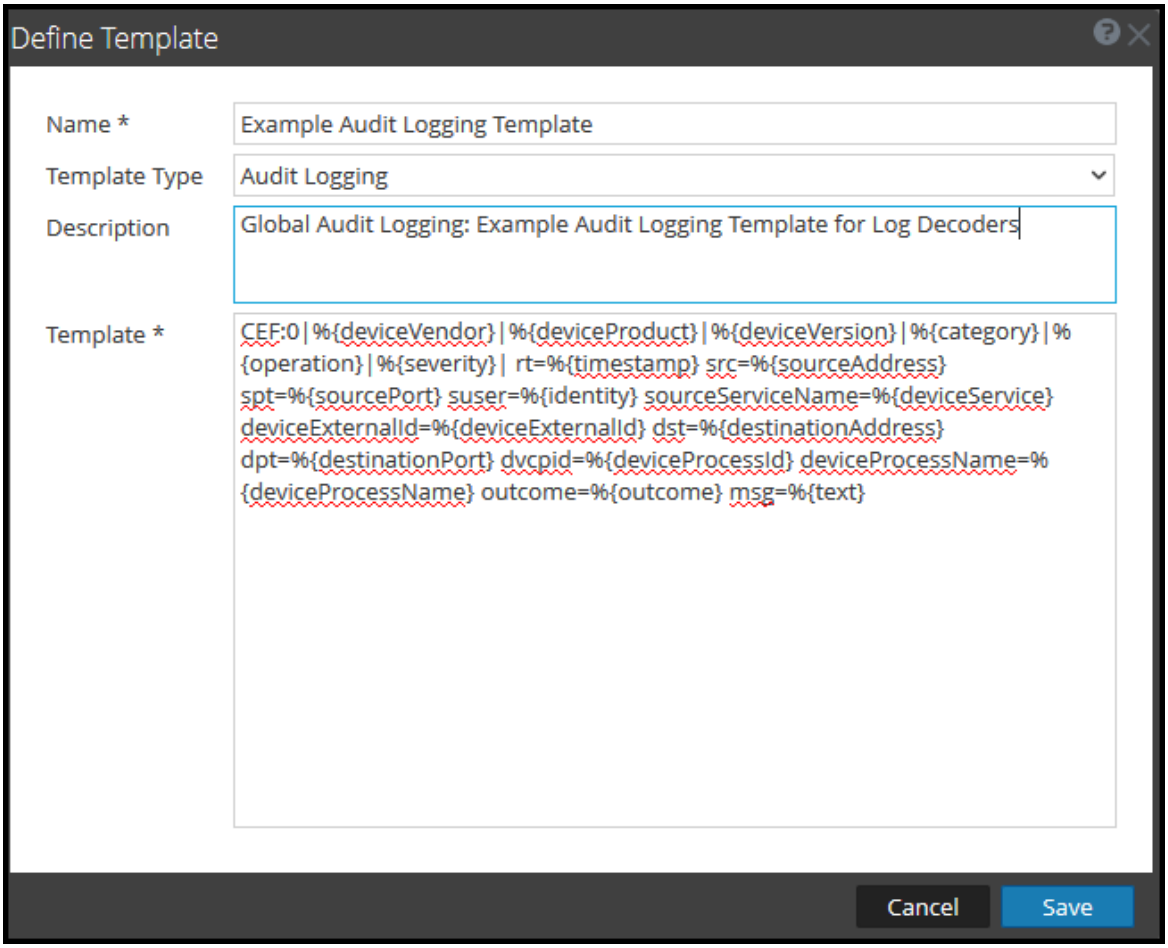
To learn how to define, delete, edit, duplicate, import, and export a notification template in NetWitness, see:

- Configure Global Notifications Templates
- Define a Template for ESA Alert Notifications
- Import and Export a Global Notifications Template

Configure Global Notifications Templates

This topic provides instructions for adding, editing, duplicating, and deleting global notifications templates.

Note: New Health and Wellness supports only Email and Syslog notification outputs.

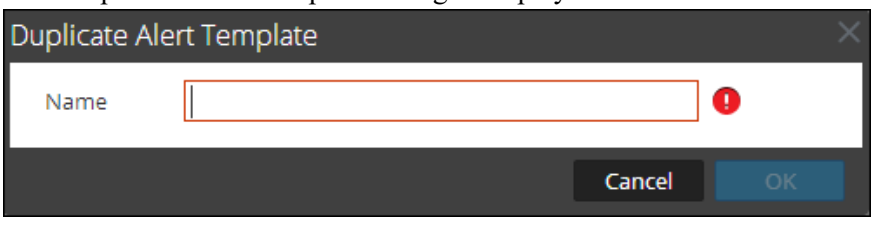


Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

Add a Template

You can use the default templates provided or you can configure your own templates. To configure your own template:

1. Go to  **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Click  to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the type of template you want to create. For example, if you are creating a template for global audit logging, select the Audit Logging template type. For New Health and Wellness, select New Health & Wellness Alarms template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, specify the format for the template, see Define Notification Template Dialog.



e. Click **Save** to save the template.
The following is an example of a template for Audit Logging.

Duplicate a Template

You can make a copy of an existing default or user-defined template. To duplicate a template:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select the template that you want to duplicate and click .
The Duplicate Alert Template dialog is displayed.

5. Type the name for the duplicate template.
6. Click **OK**.

You can modify a default or user-defined template. When you edit a template, the changes are reflected only when the alert is triggered.

Edit a Template

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select a template and click .
5. In the **Define Template** dialog, modify the **Name**, **Template Type**, **Description**, and **Template** fields as required.
6. Click **Save** to save the template.

Delete a Template

You can delete a user-defined template. When you delete a template that is used in an ESA rule, the Event Stream Analysis default template is used for alerts. You cannot delete templates associated with global audit logging configurations.

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select one or more templates and click .
   A confirmation dialog is displayed.
5. Click **Yes**.
   The selected template is deleted.

Define a Template for ESA Alert Notifications

This topic describes how you can define a template for alert notifications. Event Stream Analysis (ESA) allows you to define useful templates for alerts. You need to have a good understanding of FreeMarker and the ESA data model to define a template. For more information on FreeMarker, see FreeMarker Template Author's Guide.

ESA Data Model

Consider an ESA alert rule as shown below:

```
@Name('module_144d43f5_f0b4_4cd0_8c6c_5ce65c37e624_Alert')
@Description('Brute Force Login To Same Destination')
@RSAAlert(oneInSeconds=0, identifiers={"ip_dst"})
SELECT* FROMEvent (ec_activity = 'Logon',ec_theme = 'Authentication',ec
outcome = 'Failure',ip_dst IS NOT NULL)
.std:groupwin(ip_dst)
.win:time_length_batch(60 seconds, 2)
GROUPBYip_dst HAVING COUNT(*) = 2;
```

When a rule like the above is fired, the alert generated has two constituent events, each resembling a NextGen session with multiple meta values. The alert data-object passed to the FreeMarker template evaluator are as follows:

```
(root)
  |
  +- id = "4e67012f-9c53-4f0b-ac44-753e2c982b79"                    // Unique identifier for each alert
  |
  +- severity = 1                                                    // The severity of the alert
  +- time = 2018-12-31T11:02Z                                        // The alert time (needs a ?datetime for
proper rendering)
  |  +- moduleType = "ootb"                                          // The module type
  |
  +- moduleName = "Brute Force Login To Same Destination"            // A description of the module
  |
  +- statement = "module_144d43f5_f0b4_4cd0_8c6c_5ce65c37e624_Alert" // The name of the EPL statement
  |  +- events                                                       // The constituent events - as a sequence
of event maps
       |   +- [0]                                                    // offset 0 (i.e. the first constituent
event)
       |   |       |   |
       |   +- event_cat_name = "User.Activity.Failed Logins"
       |   +- device_class = "Firewall"                             // event meta (accessible as ${events
[0].device_class}$)
       |   |       |   +- event_source_id = "uttam:50002:1703395"    // Investigation URI to the individual
session (used by SA)
       |   |
       |   +- ...                                                   // Other meta
       |   |
       |   +- sessionid = 1703395                                   // NextGen sessionid
       |   |
       |   +- time = 1388487764                                     // event/session time at NextGen source
(as a long Unix timestamp)
       |   |
       |   +- user_dst = "user5"
       |
       +- [1]                                                       // offset 1 (i.e. the second consituent
event)
           |
           +- device_class = "Firewall"
           |
           +- event_cat_name = "User.Activity.Failed Logins"
           |
           +- event_source_id = "uttam:50002:1703405"
           |
           +- ...
           |
           +- sessionid = 1703405
           |
           +- time = 1388487766
           |
           +- user_dst = "user5"
```

There are two types of template variables available in the data model:

- **Alert Meta Data**: These hold alert level details like statement name, module name, alert id, alert time, severity, and others. In FreeMarker terminology, these are top level variables associated with the alert instance itself and can be referenced simply by their names like `${moduleName}`. The `time` meta

is special because it is of type `Date` and it needs to be suffixed with a `?datetime` to be properly rendered.

- **Constituent Event Meta Data**: These include the session meta fields from individual events that constitute the alert. An alert can have multiple constituent events, so there can be more than one such map in the same alert. These show up as a sequence of hashes to the FreeMarker template evaluator and must be referenced. For instance, the alert has two constituent events the event_source_id for the first is available as `${events[0].event_source_id}` and the same for the second is accessible as ${`events[1].event_source_id`.} You also need to be aware of which meta fields are multi-valued because those need be treated as sequences, for example ${`events[0].alias_host`} will not work because it is a sequence.

Note: The metadata available in the constituent events for a given alert is determined by the EPL SELECT clause. For example, alerts from `SELECT sessionid, time FROM ...` have only two meta values available (sessionid, time). Constituent events in `SELECT * FROM Event ...` will carry all meta fields from the `Event` type with **non-null** values.

If your template uses meta keys that are not present in all alert output, you should consider using the FreeMarker provisions for default values.

For example, if a template with text Id=${id},ec_outcome=${ec_outcome} is evaluated for an alert which does not include the meta key `ec_outcome` then the template evaluation fails. In such cases, you can use the missing value placeholder `${ec_outcome!"default"}`.

Import and Export a Global Notifications Template

This topic provides instructions on how to import and export a template for notifications.

- You can export default or user-defined templates.
- You can import a template that has been exported from the NetWitness instance. If you import a template with the same name as an existing template, then the existing template will be overwritten.

Import a Template

1. Go to  **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. In the toolbar, select  **> Import**.
   The **Import** dialog is displayed.
5. In the **Select File**field, type the filename or click **Browse** and select the file to be imported.
6. Click **Import**.

Export a Template

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select the template you want to export.

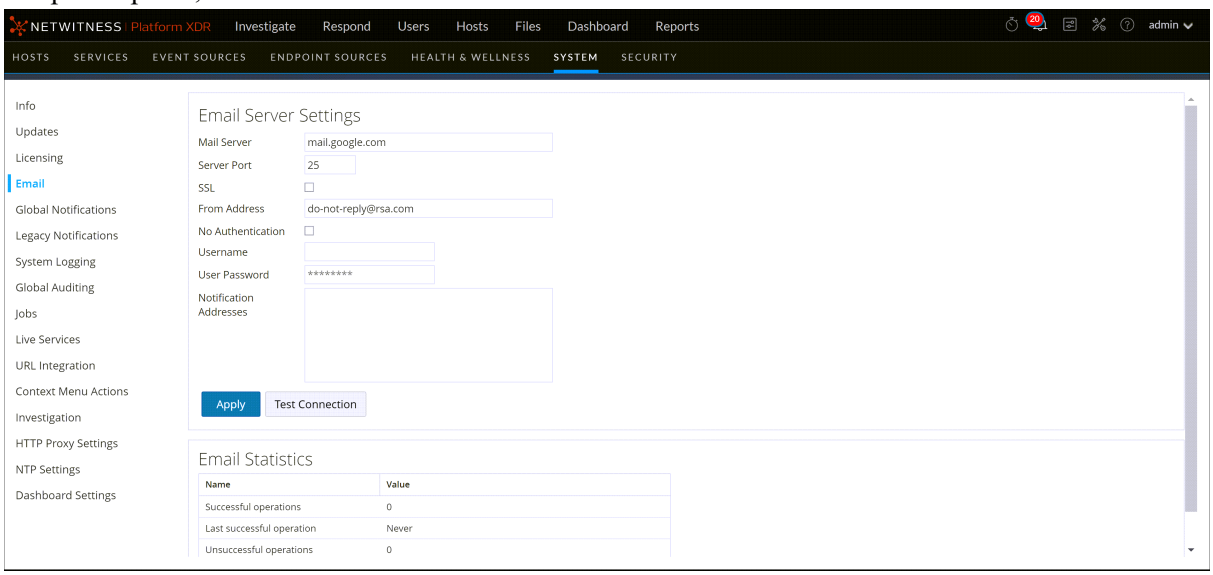
   Note: You can export all the templates using the > **Export All** option.

5. In the **Actions** column, select > **Export**.
   The **Export** dialog is displayed.
6. In the **Enter File Name** field, type the filename.
7. Click **Save**.

Configure Email Servers and Notification Accounts

This topic provides instructions for configuring email so that users can receive notifications in NetWitness. NetWitness Platform XDR can send notifications to users through email about various system events. To be able to configure these email notifications, you must first configure the SMTP email server. The Email Configuration panel provides a way to:

- Configure the email server.
- Set up an email account to receive notifications.
- View statistics on email operations.



NetWitness requires access to an SMTP mail server in order to send reports to users. Each user account can be configured to receive emailed reports. These reports can be generated manually, through the user interface, or automatically, through the auditing system. The following guidelines apply:

- Any SMTP mail host can be used to deliver emails, and each host requires a different configuration. The SMTP provider provides the settings for configuration.
- Some SMTP servers require user authentication in order to relay emails successfully. Typically, this is the login and password for the email account.
- Best practice is to create a new, dedicated email account on the SMTP email server for NetWitness reports.

To configure NetWitness email notifications:

1. Go to **(Admin) > System**.
   The Administration System view is displayed.

2. In options panel, select **Email**.

3. If you want to change the default mail server, specify the **Mail server** name and **Server port**.
4. If the email server communicates with NetWitness using SSL, set the box next to **Use SSL**.
5. In the **From address** field, type the name of the email account sending NetWitness email notifications.
6. If the SMTP server requires user authentication to relay emails successfully, type the **Username** and **User Password** for logging in to the email account.
7. To activate the settings, click **Apply**.
   You can now configure NetWitness modules to receive various notifications by email.

Configure Global Audit Logging

Global Audit Logging provides NetWitness Auditors with consolidated visibility into user activities within NetWitness in real-time from one centralized location. This visibility includes audit logs gathered from the NetWitness system and the different services throughout the NetWitness infrastructure.

NetWitness audit logs collect in a centralized system that converts them into the required format and forwards them to an external syslog system. The external syslog system can be a third-party syslog server or a Log Decoder.

You configure global audit logging in the Global Audit Logging Configurations panel. An audit logging template defines the format and message fields of the audit log entries. A Syslog Notification Server configuration defines the destination to send the audit logs. If you want to forward audit logs to a Log Decoder, configure a Syslog type of Notification Server for the Log Decoder.

The following are some of the user actions logged from NetWitness:

- User logouts
- All UI pages accessed
- Committed configuration changes
- Queries performed by the user
- Data export operations

Note: For examples of some of the user actions logged, see Add New Configuration Dialog

After you create a global audit logging configuration, audit logs containing these user actions automatically go to the external syslog system in the format specified in the selected Audit Logging template. You can create multiple global audit logging configurations for different destinations that use different templates. For example, you can create a global audit logging configuration for an external Syslog server with a template that contains all of the available meta keys and another configuration for a Log Decoder with a template that contains selected meta keys.

For Log Decoders, you use the Default Audit CEF Template. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions and Supported CEF Meta Keys describes the CEF meta keys available to use in the audit logging templates.

For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.

Auditors can view the audit logs on the selected Log Decoder or third-party syslog server. If using a Log Decoder, auditors can view the audit logs using NetWitness Investigations or Reports.

The following figure shows global audit logs in Investigation (**Investigate** > **Events**).

For examples of some of the user actions logged, see Add New Configuration Dialog. For a list of message types being logged by the various NetWitness components, see Global Audit Logging Operation Reference.

Global Audit Logging - High-Level Procedure

Global Audit Logging is configured in the Global Audit Logging Configurations panel, which is accessed from (Admin) > System view > Global Auditing. Before you can configure Global Audit Logging, you need to configure a Syslog Notification Server and an Audit Logging template. A Syslog Notification Server defines the destination to send the audit logs. An Audit Logging template defines the format and message fields of the audit log entry.

The Global Audit Logging Configuration panel provides a **view settings** link that takes you to the Global Notifications panel ((Admin) > System view > Global Notifications) where you can configure the Syslog Notification Server and Audit Logging template.

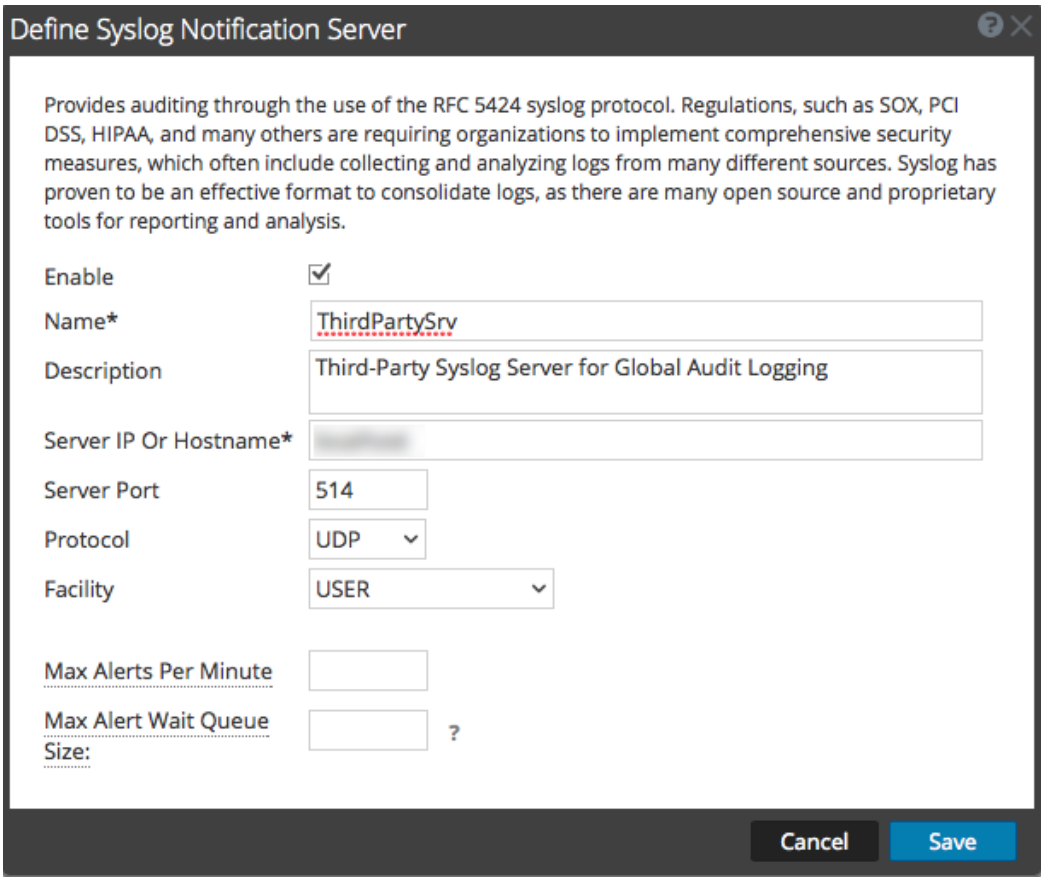
Perform the following procedures in the order shown to configure Global Audit Logging.

Procedures	Reference / Instructions
1. Configure a Syslog Notification Server.	Configure a Syslog Notification Server to use for Global Audit Logging. You can define a third-party syslog server or Log Decoder as a destination to receive the audit logs. Configure a Destination to Receive Global Audit Logs. Global Audit Logging configurations use the Syslog notification server type. If you want to forward audit logs to a Log Decoder, create a Notification Server of the Syslog type.
2. Select or configure an Audit Logging template to use.	Select an Audit Logging template for the Syslog notification server. You can use a default Audit Logging template or define your own audit logging template. Global Audit Logging configurations use the Audit Logging template type and a Syslog notification server. Configure Templates for Notifications provides additional information. For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions. For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.
3. (Optional - Only if consuming with a Log Decoder) Deploy the Common Event Format parser to your Log Decoder from Live.	Ensure that you have deployed and enabled the latest Common Event Format parser from Live. Find and Deploy Live Resources and Enable and Disable Log Parsers provide instructions.

Procedures	Reference / Instructions
4. Define a global audit logging configuration, which defines how the global audit logs are forwarded to external Syslog systems.	Define a Global Audit Logging Configuration provides instructions. After you add a Global Audit Logging configuration, audit logs are forwarded to the selected Notification Server in the configuration.
5. Verify that the global audit logs show the audit events.	Test your audit logs to ensure that they show the audit events as defined in your audit logging template. Verify Global Audit Logs provides instructions.

Configure a Destination to Receive Global Audit Logs

In Global Audit Logging, Syslog Notification Servers are the configurations that define the destinations to receive global audit logs. You need to configure a Syslog Notification Server to use Global Audit Logging. You can define a third-party syslog server or a Log Decoder as the destination to receive the audit logs.



Configure a Syslog Notification Server for a Third-Party Syslog Server

1. Go to  **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

   Note: You do not need to configure the Output tab for Global Audit Logging.

4. From the  drop-down menu, select **Syslog**.

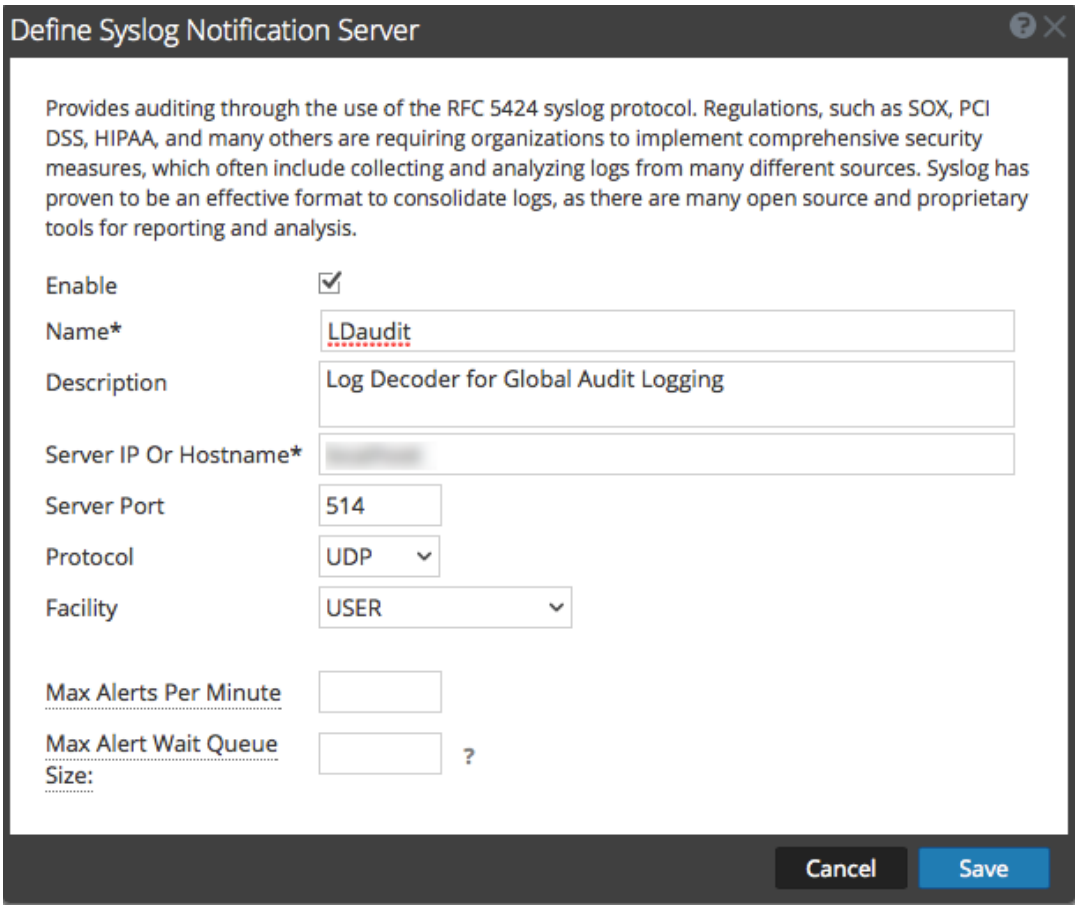
   The **Define Syslog Notification Server** dialog is displayed.

5. Configure the Syslog notification server as described in the following table.

Field	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the third-party syslog server.
Description	(Optional) A brief description of the notification server.
Server IP or Hostname	The third-party syslog server hostname or IP address.
Server Port	The port number where the target syslog process is listening.
Protocol	The protocol to be used for transferring formatted audit logs to the third-party syslog server.
Facility	The syslog facility to be used for writing formatted audit logs to the third-party syslog server.

The **Max Alerts Per Minute** and **Max Alert Wait Queue Size** fields are not used for Global Audit Logging.

6. Click **Save**.



Configure a Syslog Notification Server for a Log Decoder

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

   Note: You do not need to configure the Output tab for Global Audit Logging.

4. From the + drop-down menu, select **Syslog**.

   The **Define Syslog Notification Server** dialog is displayed.

5. Configure the Syslog notification server as described in the following table.

Field	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the Log Decoder syslog notification server.

Field	Description
Description	(Optional) A brief description of the notification server.
Server IP or Hostname	The Log Decoder hostname or IP address.
Server Port	The port number where the target syslog process is listening.
Protocol	The protocol to be used for transferring formatted audit logs to the Log Decoder.
Facility	The Syslog facility to be used for writing formatted audit logs to the Log Decoder.

The **Max Alerts Per Minute** and **Max Alert Wait Queue Size** fields are not used for Global Audit Logging.

6. Click **Save**.

Next Steps

Select a default Audit Logging template to use for Global Audit Logging. If necessary, you can define your own custom template. Define a Template for Global Audit Logging provides additional information.

Define a Template for Global Audit Logging

This topic provides instructions on how to define an audit logging template to use for Global Audit Logging. Before you configure Global Audit Logging, configure a Syslog notification server and select an Audit Logging template. You can choose to use a default audit logging template or you can define your own template.

NetWitness includes two default audit logging templates:

- **Default Audit CEF Template**: You can use this template for Log Decoders and third-party syslog servers.
- **Default Audit Human-Readable Format**: You can use this template only for third-party syslog servers. Do not forward messages from this template to a Log Decoder.

The first procedure provides instructions on how to define an audit logging template for a Log Decoder. The audit logging template defines the format and message fields of the audit logs sent to the Log Decoder or third-party syslog server.

Global audit logging templates that you define for a Log Decoder use Common Event Format (CEF) and must meet the following specific standard requirements:

- Include the CEF headers in the template.
- Use only the extensions (Key=Value) listed in the Supported CEF Meta Keys table.
- Ensure that the extensions are in the `key=%{string}<space>key=%{string}` format.

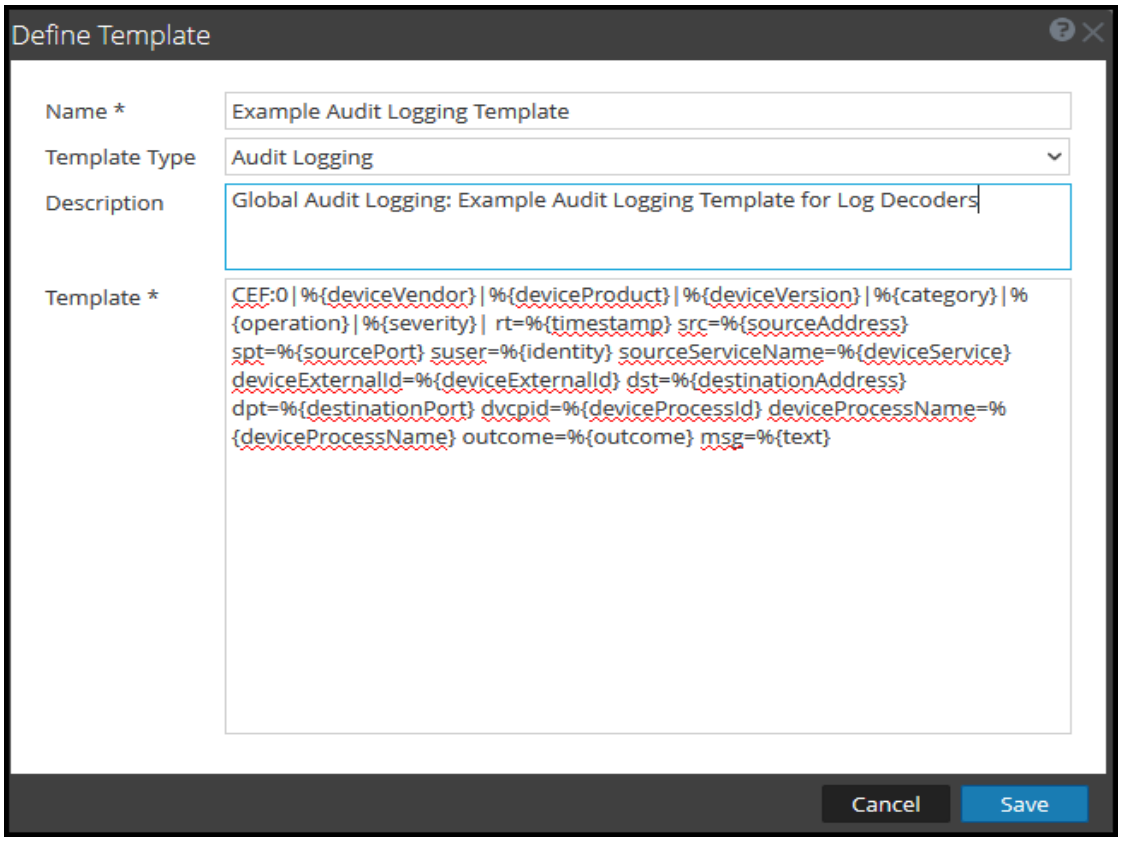
The second procedure provides instructions on how to define a custom global audit logging template in human-readable format for a third-party syslog server. For third-party syslog servers, you can define your own format (CEF or non-CEF).

Define a Global Audit Logging Template for a Log Decoder

You can use the **Default Audit CEF Template** to send global audit logs to a Log Decoder. To define your own template:

1. Go to  **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Click  to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the **Audit Logging** template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, enter the format for the audit logging template.
   The following format is a customized template provided as an example. It differs from the default CEF template.

```
CEF:0|%{deviceVendor}|%{deviceProduct}|%{deviceVersion}|%{category}|
%{operation}|%{severity}|
rt=%{timestamp} src=%{sourceAddress} spt=%{sourcePort} dpt=
%{destinationPort} dst=%{destinationAddress} dvcpid=%{deviceProcessId}
tpt=%{transportProtocol} sessionId=%{sessionId} scope=%{scope} suser=
%{identity} sourceServiceName=%{deviceService} deviceExternalId=
%{deviceExternalId} deviceProcessName=%{deviceProcessName} device
Facility=%{deviceFacility} outcome=%{outcome} msg=%{text} remoteAddress
=%{remoteAddress} reasonForFailure=%{reasonForFailure} reason=%{reason}
arguments=%{Arguments} user=%{User} referrerURL=%{referrer} role=%{Role}
id=%{id} account=%{Account} deviceIDs=%{deviceIDs} file=%{file} account
Provider=%{AccountProvider} uri=%{uri} addRole=%{Add.Role} addPermission
=%{Add.Permission} userAgent=%{userAgent} userGroup=%{userGroup}
userRole=%{userRole} key=%{key} value=%{value} paramKey=%{Key}
paramValue=%{Value} alert=%{alert} incident=%{incident} action=%{action}
notification Binding=%{NotificationBinding} name=%{name} enabled=
%{enabled} disabled=%{disabled} params=%{parameters}
```



The highlighted CEF syslog header is required to conform to the CEF standard and is a requirement for the CEF parser in the Log Decoder. The other keys are optional and you can configure them. See all the supported meta keys that are supported by the CEF parser in the Log

Decoder in the Supported CEF Meta Keys table.

Note: Use all of the extensions in the following format:
`deviceProcessName=%{deviceProcessName} outcome=%{outcome}`
Include a `<space>` between each key=%{string} pair in the extension keys section.

Note: After you upgrade to 11.x from earlier versions, then '$' is replaced with '%' automatically

6. Click **Save**.

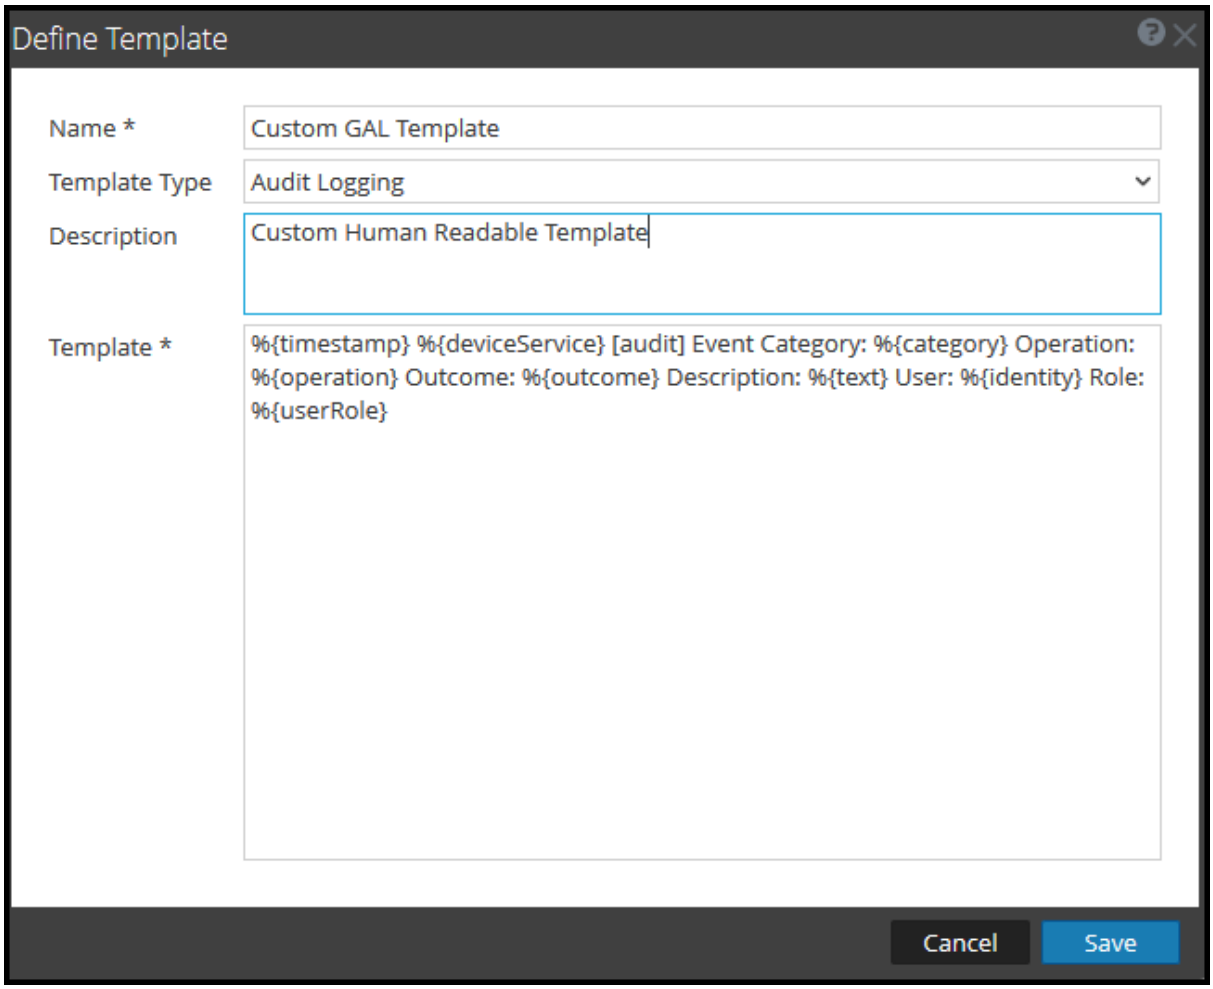
After you define the CEF audit logging template, ensure that you have deployed and enabled the latest Common Event Format (CEF) parser from Live. "Find and Deploy Live Resources" in the *Live Services Management Guide* provides instructions.

Note: If you need to use a specific meta key for Investigations and Reporting, ensure that the meta keys that you select are indexed in the **table-map-custom.xml** file on the Log Decoder. If they are not indexed, follow the instructions in the "Maintain the Table Map Files" topic in the *Host and Services Configuration Guide* procedure to update the table mappings. Ensure that the meta keys are also indexed in the **index-concentrator-custom.xml** on the Concentrator. See the "Edit a Service Index File" topic in the *Host and Services Configuration Guide* for additional information.

Define a Custom Global Audit Logging Template

For third-party syslog servers, you can define your own template format (CEF or non-CEF). You can use the **Default Audit Human-Readable Format** template to send global audit logs to a third-party syslog server in a format that is easier to read than the CEF format. If you want to define your own template in human-readable format, follow this procedure.

For Log Decoders, you must use a CEF template with some specific requirements. The *Define an Audit Logging Template for a Log Decoder* procedure above provides instructions for creating a template in CEF format.



To define a custom global audit logging template in human-readable format:

1. Go to  **(Admin) > System**.
2. In the left navigation panel, select **Notifications**.
3. Click the **Templates** tab.
4. Click  to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the **Audit Logging** template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, enter the format for the audit logging template. The following example is in human-readable format with selected meta key variables.

```
%{timestamp} %{deviceService} [audit] Event Category: %{category}
Operation: %{operation} Outcome: %{outcome} Description: %{text}
User: %{identity} Role: %{userRole} Parameters: %{parameters}
```

You can use any of the meta key variables that are supported by global audit logging shown in the Supported Global Audit Logging Meta Key Variables table.

6. Click **Save**.

The following example shows global audit logs in human-readable format for this template:

```
Jun 11 2019 04:53:54 UpdateStackConcentrator Jun 11 2019 04:53:54 CONCENTRATOR
[audit] Event Category: DATA_ACCESS Operation: sdk.info Outcome: pending
Description: has requested the SDK summary info User: admin Role: null
params=flags\=1
```

```
Jun 11 2019 04:53:55 updatestackadminserver Jun 11 2019 04:53:55 source-server
[audit] Event Category: API Operation: /rsa/process/ready Outcome: success
Description: null User: Netwitness Web(nw-web) Role: null params=
{"Arguments":"[]"}
```

```
Jun 11 2019 05:15:46 UpdateStackeplh Jun 11 2019 05:15:46 LOG_DECODER [audit]
Event Category: MANAGEMENT Operation: upload Outcome: pending Description: has
started uploading file User: escalateduser Role: null params=file\=esmFeed.zip
```

Next Step

Define a Global Audit Logging Configuration provides instructions for defining a global audit logging configuration for NetWitness.

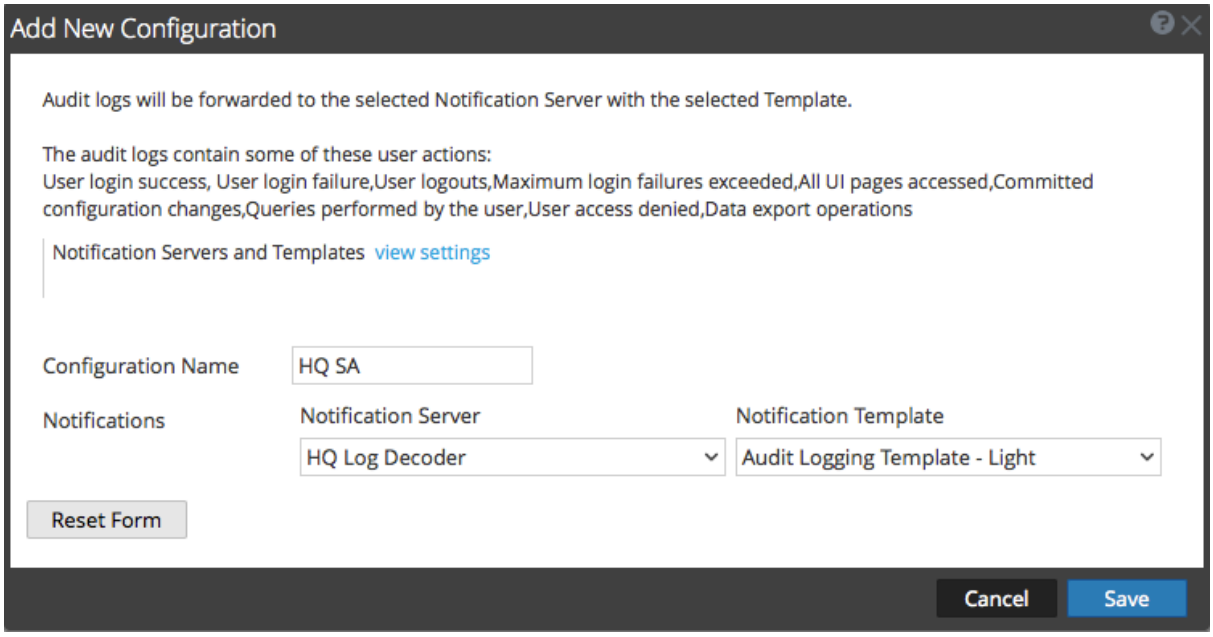
Define a Global Audit Logging Configuration

This topic tells administrators how to define a global audit logging configuration. This procedure is required only if you choose to set up centralized audit logging in your environment. These global audit logging configurations define how the global audit logs are forwarded to external syslog systems or Log Decoders. Audit logs are forwarded to the selected Notification Servers.

Prerequisites

Before starting this procedure, configure the following to use for global audit logging:

- Syslog Notification Server
- Audit Logging Template



You configure the notification server and template on the Global Notifications panel. You can access the Global Notifications panel by going to  (Admin) > System and select Global Notifications. You can only define a Syslog type of Notification Server for global audit logging. For Log Decoders, use a Syslog type of Notification Server and a Common Event Format (CEF) audit logging template. You can use a default audit logging template or define your own template. You can create multiple audit logging templates and Syslog Notification Servers to use for your global audit logging configurations.

If you are forwarding global audit logs to a Log Decoder, deploy the Common Event Format parser to your Log Decoder from Live.

Add a Global Audit Logging Configuration

1. Go to  **(Admin) > System**.
2. In the options panel, select **Global Auditing**.
   The **Global Audit Logging Configurations** panel is displayed.

3. Click + to add a global audit logging configuration.
   The **Add New Configuration** dialog is displayed.

4. In the **Configuration Name** field, type a unique name for the global audit logging configuration. For example, you can create a configuration for a specific type of global audit logging configuration, such as HQ NW for a NetWitness headquarters configuration.
5. In the **Notifications** section, select the syslog **Notification Server** to use for this configuration. The notification server is the destination to send the global audit logs.
6. Select the audit logging **Notification Template** to use for this configuration. The Audit Logging template defines the format and audit log message fields to be sent.
7. Click **Save**.

Add New Configuration Dialog provides additional information and examples of the user actions logged. For a list of message types being logged by the various NetWitness components, see Global Audit Logging Operation Reference.

Edit a Global Audit Logging Configuration

This topic provides instructions on how to edit a global audit logging configuration. You can edit a global audit logging configuration to change the destination of the global audit logs for your user audits by selecting a different Notification Server. You can also change the format and message fields of the global audit log entries by selecting a different Notification Template. You make changes to the Notification Server or Template on the Global Notifications panel. You can access the Global Notifications panel by clicking the **view settings** link on the Global Audit Logging Configurations panel.

You cannot change which NetWitness user actions are logged and sent in the global audit logs.

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Auditing**.

3. In the **Global Audit Logging Configurations** panel, select a configuration to edit and click .
4. In the **Add New Configuration** dialog, modify the global audit logging configuration as required. You can modify the **Configuration Name** and select a different **NotificationServer** or **Template**.
5. Click **Save.**

Delete a Global Audit Logging Configuration

Deleting a global audit configuration does not delete the associated notification server and template. After you delete a global audit logging configuration, the forwarding of global audit logs specified in that configuration is discontinued.

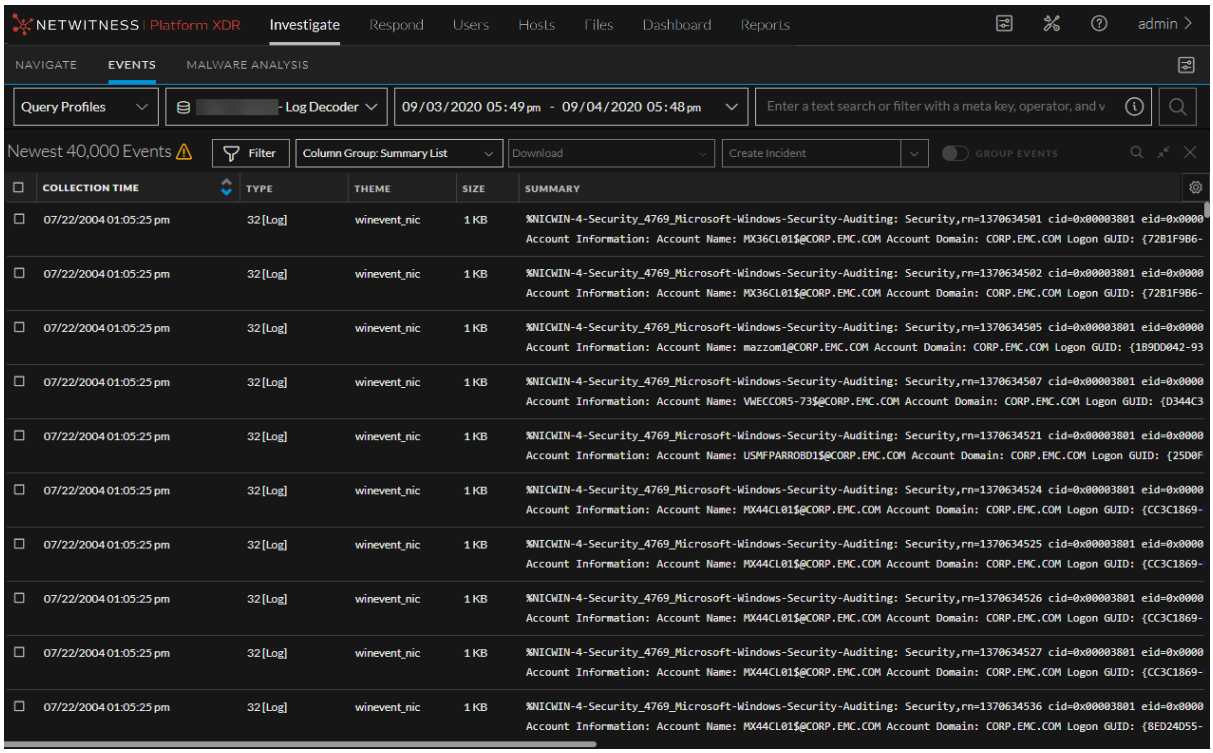
1. Go to  **(Admin) > System**.
2. In the options panel, select **Global Auditing**.
3. In the **Global Audit Logging Configurations** panel, select a configuration to delete and click .
   A confirmation dialog is displayed.
4. Click **Yes**.
   The selected configuration is deleted.

Verify Global Audit Logs

This topic provides instructions on how to verify global audit logs. After you have configured global audit logging, you need to test your global audit logs to ensure that they show the audit events as defined in your global audit logging template.

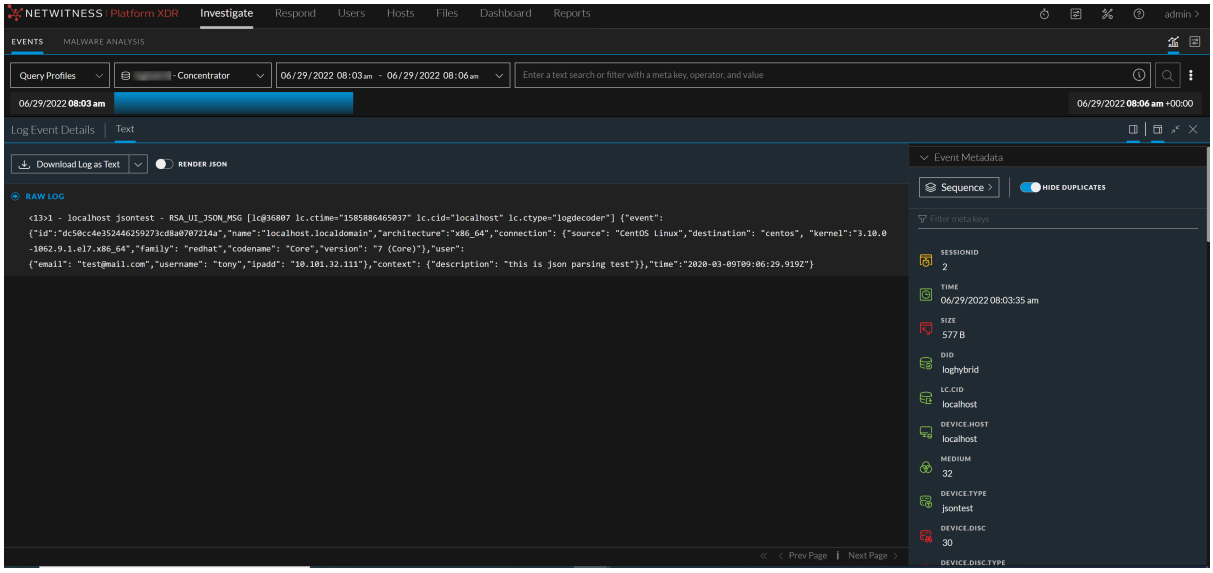
In version 11.5 and later, audit logging provides information about the aggregation account and the actual user who submitted the query. For example, the information is displayed as follows in the audit log:

```
User aggAccount (session 478, [::1]:1133, on behalf of <username of submitter>) has requested the SDK transforms.
```



This information is available through multiple levels of Brokers and Concentrators.

Note: If you are running a mixed-version environment, any version earlier than 11.5 will not provide the real user information.



Before starting this task, complete the steps detailed in Configure Global Audit Logging.

To view and verify the global audit logs if you are using a Log Decoder:

1. Go to **Investigate > Events**, select the Log Decoder service and click the submit query icon () to the right of the query bar.

2. Compare the fields in the global audit logs with the fields defined in the global audit logging template that you used in your global audit logging configuration.
3. Double-click a log to open the reconstruction and click  to open the Event Meta panel.
4. Verify that the meta that you want to audit is correct.

Example CEF Output

The following example shows global audit logs for an audit logging Common Event Format (CEF) template.

Template:

```
CEF:0|%{deviceVendor}|%{deviceProduct}|%{deviceVersion}|%{category}|%
{operation}|%{severity}|
t=%{timestamp} src=%{sourceAddress} spt=%{sourcePort} tpt=%{transport
Protocol} scope=%{scope} suser=%{identity} sourceServiceName=%{device Service}
deviceExternalId=%{deviceExternalId} deviceProcessName=%{device ProcessName}
outcome=%{outcome} msg=%{text} remoteAddress=%{remoteAddress}
reasonForFailure=%{reasonForFailure} reason=%{reason} arguments= %{Arguments}
user=%{User} referrerURL=%{referrer} role=%{Role} id=%{id} account=%{Account}
deviceIDs=%{deviceIDs} file=%{file} accountProvider= %{AccountProvider} uri=%
{uri} addRole=%{Add.Role} addPermission= %{Add.Permission} userAgent=%
{userAgent} userGroup=%{userGroup} userRole= %{userRole} key=%{Key} value=%
{Value} alert=%{alert} incident=%{incident} action=%{action}
notificationBinding=%{NotificationBinding} name=%{name} enabled=%{enabled}
disabled=%{disabled} params=%{parameters}
```

Example logs:

```
Jun 07 2019 09:06:05 UpdateStackConcentrator CEF:0|RSA|NetWitness Audit|
11.3.1.0|AUTHENTICATION|logoff|6|rt=Jun 07 2019 09:06:05 src=101.101.101.

users.manage \r\n
```

Configure Centralized Audit Logging

NetWitness Platform XDR collects audit logs from all the NetWitness services and aggregates it into a single file in a centralized location on the NetWitness Admin Server. This aggregated log file provides the advantage for faster access and easy analysis of the audit logs.

The aggregated logs from all services are sent to the following centralized location:

- `/var/netwitness/logstash/logs/rsa-netwitness-audit.log` (JSON format)
- Syslog running on the local host (human-readable format)

Centralized audit logging is enabled by default. To forward the aggregated logs to the external syslog system (a third-party Syslog server or Log Decoder), you must configure the Global Audit logging in  **(Admin) > System > Global Auditing**. The aggregated logs are sent in the format specified in the selected Audit Logging template. A Syslog Notification Server configuration defines the destination to send the audit logs. To forward the audit logs to a Log Decoder, configure a Syslog type of Notification Server for the Log Decoder.

- For instructions on how to define a template, see Define a Template for Global Audit Logging
- For instructions on how to configure a syslog notification server, see Configure a Destination to Receive Global Audit Logs
- For instructions on how to configure global Audit logging, see Define a Global Audit Logging Configuration

Filtering the Aggregated Logs

Before the logs are aggregated, standard filters are applied to the logs to reduce redundancy and filter out logs that are not useful. The filters contain entries that control the content written to the aggregated log file. The following default filters are available in `/etc/logstash/` location.

- `json-filter-action.yaml`
- `json-filter-category.yaml`

`json-filter-action.yaml` - This filter blacklists the log messages based on the `operation` meta key and stops the log message being written to aggregated log file. For example, if `"/rsa/process/ready":"true"` is entered in `json-filter-action.yaml`, any raw log that contains `"/rsa/process/ready"` in the `operation` meta key is blacklisted and not written to aggregated log file.

Note: If you do not want to apply filters, then delete all the default entries and replace with `{}` character. Note that this increases the log size and the logs may be redundant.

`json-filter-category.yaml` - This filter whitelists the log messages based on the `category` meta key and writes the log message to the aggregated log file. For example, if `'\b(?i)SECURITY\b':"true"` is entered in `json-filter-category.yaml`, any raw log that contains 'SECURITY' in the `category` meta key is whitelisted and written to the aggregated log file.

Log Retention Policy

The aggregated log file is retained as per the following default settings:

- If the file size reaches 250 MB, the file is compressed as a single zip file.
- If the number of zip files exceed 90, the oldest zip file in the directory is automatically deleted.

You can modify the log retention policy in the file `logstash` available in `/etc/logrotate.d/` location.

Note: The size of the aggregated log file depends on the filters applied, so make sure to set up filters correctly for optimal directory space.

Disable Centralized Audit Logging

If you do not want the logs to be aggregated, in the `json-filter-category.yaml` filter, delete all the default entries and replace with the `{}` character.

Configure Investigation Settings

This topic provides instructions for administrators who are configuring the settings that apply to all investigations on the NetWitness instance being configured. The settings for configuring and tuning behavior of NetWitness Investigate are available in the  (Admin) > **System** > **Investigation** panel. These settings apply to all investigations and reconstructions on the current instance of NetWitness.

Map Context Hub Meta Types

The Context Hub is preconfigured with meta fields mapped to entities. NetWitness Respond and Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.

Caution: For the Context Lookup to work correctly in the Respond and Investigate views, when mapping meta keys in the  (Admin) > System > Investigation > Context Lookup tab, it is best practice to add only meta keys to the Meta Key Mappings. Do not add fields in the MongoDB to the Meta Key Mappings. Here is a sample meta key and Mongo DB field; `ip.address` is a meta key and `ip_address` is a field in the MongoDB.

In the **Context Lookup** tab, you can manage mapping of Context Hub meta types with meta keys in Investigate. You can add or remove meta keys in the list of meta types supported in Investigate by Context Hub. Procedures associated with this tab are provided in "Manage Context Hub Lists and List Values in the Navigate and Events Views" in the *NetWitness Investigate User Guide*.

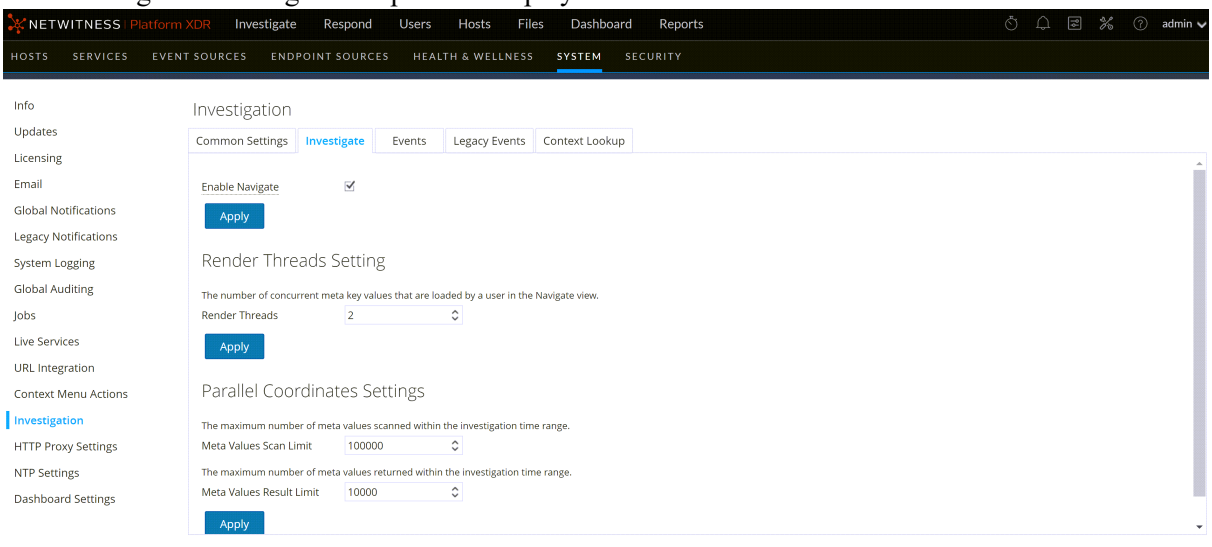
Configure Common Settings

In version 11.5 and later, the Common Settings tab allows you to configure settings that apply to the Navigate view, the Events view, and the Legacy Events view. Initially, the only setting that you can set for all views is the time format used when downloading metadata and logs, and other settings may be added in future versions.

By default, the time format for downloads is Epoch format, which shows the time as a numerical value representing the number of seconds from the Unix epoch, January 1, 1970. The resulting number requires a conversion to be understood. You can change the setting to get a more understandable format that combines the user preference time zone, date format, and time format into an easily understood representation, which follows the industry standard ISO 8601 representation when possible.

This setting applies to all 11.7 Investigate views.

1. Go to **(Admin) > System**, and in the options panel, select **Investigation**.
   The Investigation Configuration panel is displayed.



2. In the **Common Settings** tab, do the following:
   a. Select the time format to be used in metadata and log downloads in Investigate.
   b. Edit the time in minutes to set the extraction timeout when the logs are downloaded before the session expires.
      By default, it is set to 30 minutes and can be set to a maximum of 60 minutes.
3. Click **Apply**.
   The setting goes into effect immediately.

Configure Navigate and Legacy Events View Settings

The name of the Version 11.3 and earlier Events tab was changed to Legacy Events tab in Version 11.4.

1. Go to **(Admin) > System.**
2. In the options panel, select **Investigation.**

   The Investigation Configuration panel is displayed.

3. In the **Investigate** tab, in the **Render Threads Settings** field, select the maximum number of concurrent meta key values that are loaded by a single user in the Navigate view. Click **Apply**.
4. In the **Investigate** tab, in the **Parallel Coordinates Settings** section, set the maximum limits for meta values scanned and meta value results that can be included in a parallel coordinates visualization. For better performance, these are the recommended settings: Meta Values Scan Limit - 100000 and Meta Values Result Limit to 1,000-10,000
   Click **Apply**.

5. In the **Legacy Events** tab, in the **Enable Legacy Events** section, select the check box to view the legacy sub menus and legacy events in classic view. Click **Apply**.
6. In the **Legacy Events** tab, in the **Event Search Settings** section, set the maximum numbers of events scanned and event results displayed when an analyst is conducting an event search in the Legacy Events view. The actual number of events scanned and displayed may be slightly greater than the limit set here. Click **Apply**.
7. In the **Legacy Events** tab, in the **Reconstruction Settings** section, set the limits for the amount of data processed in the reconstruction of a single event. The default values are 500 maximum packets and 2097152 bytes. If analysts are seeing slow performance when reconstructing sessions in Investigate, the reconstruction settings may need adjustment. Click **Apply**.

   Caution: Setting a higher value affects the performance of the NetWitness Server by increasing the time and memory taken to create a reconstruction of an event. Setting the value to zero disables any limit and may lead to a NetWitness Server crash.

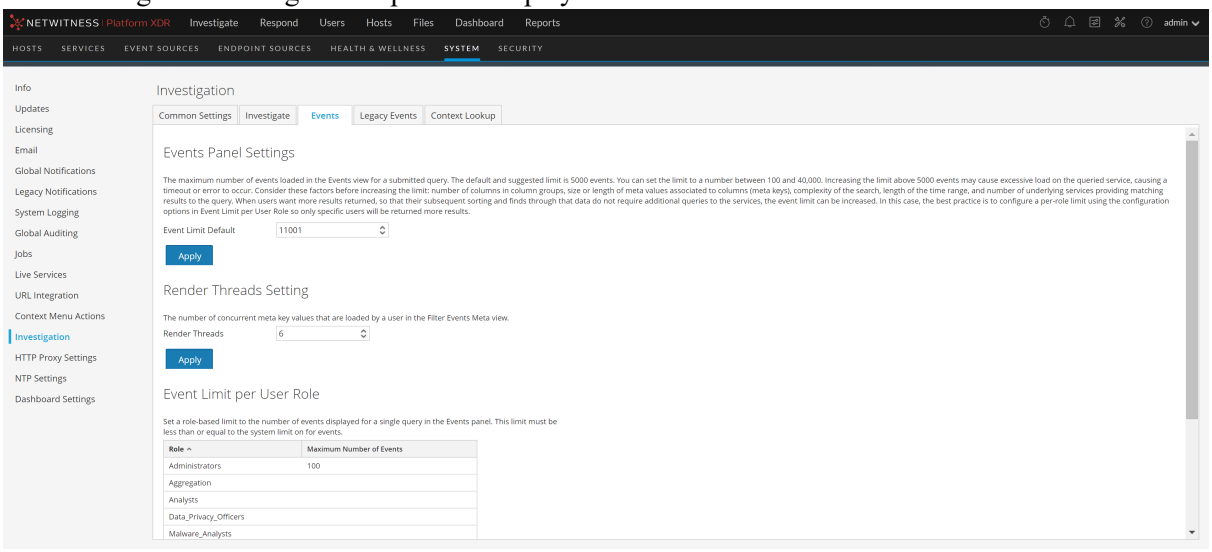
7. (Optional) In the **Legacy Events** tab, in the **Web View Reconstruction Settings** section, enable the use of supporting files in a web view reconstruction, and configure the additional settings to calibrate web view reconstructions. These include the time range (in seconds) to scan for related events, the maximum number of related events to scan, and overrides to Reconstruction Settings for use with web view reconstructions. Click **Apply**.

Clear Reconstruction Cache for Services

Under Reconstruction Cache Settings, administrators can clear the cache for one or more services. For example, the administrator can clear the cache for a single Broker, a Broker and Decoder, or all connected services. These are a few examples of causes for stale cache being used in a reconstruction.

- The downstream services may have their sessions invalidated or data reset. As an example, if Investigate is browsing a Broker and a downstream Concentrator or Decoder has a data reset, the metadata and session data for the investigating service (Broker) does not match the content if the downstream service has reset and repopulated. The reconstruction in Investigate shows content from cache, which does not match the real content. Even if the Decoder is offline, content is still displayed in the Broker reconstruction. Clearing cache on the Broker causes the NetWitness to reach out to the Decoder and an error is returned because the Decoder is offline.
- Another case where cache may be stale is when a service ID for a downstream service changes. This can happen when exporting, importing, deleting, and adding services to NetWitness because NetWitness can reuse service IDs. In this case, clearing the cache on the Broker causes NetWitness to request data from the services.

To clear reconstruction cache, do one of the following:



1. To clear cache for one or more services, select the services and click **Clear Cache for the Selected Services**.
2. To clear the cache for all listed services, click **Clear Cache for All Services.**
   The reconstruction cache for the selected services is cleared. NetWitness sends a request for data to the services.

Configure Events View Settings

These settings apply to the 11.3 and earlier Event Analysis view and the 11.4 and later Events view.

1. Go to  **(Admin) > System**, and in the options panel, click **Investigation**.

   The Investigation Configuration panel is displayed.

2. In the **Events** tab, in the **Event Limit Default** field under **Events Panel Settings**, select the maximum number of events loaded in the Events panel when a query is submitted.
   The default and suggested value is 10,000 events, and you can select a value between 100 and 40,000 events. Increasing the limit above 10,000 events may cause excessive load on the queried service, causing a timeout or error to occur. Consider these factors before increasing the limit: number of columns in column groups, size or length of meta values associated to columns (meta keys), complexity of the search, length of the time range, and number of underlying services providing matching results to the query.
   When users want more results returned, so that their subsequent sorting and finds through that data do not require additional queries to the services, the event limit can be increased. In this case, the best practice is to configure a per-role limit using the configuration options in Event Limit per User Role so only specific users are returned more results. For example, set the global Event Limit Default to 5,000, and then create different Analyst roles that can be set to higher limits, up to the maximum 40,000 events.
3. If a query returns more events than the configured Event Limit Default, the Events panel title shows the analyst that more results are available but are not listed due to the limit. Increasing the limit may place additional load on the queried service; the ideal limit is determined by your environment.
4. Click **Apply**.

   The change becomes effective immediately, and applies to any new queries submitted by analysts.
5. Under **Render Threads Settings** in the **Render Threads** field, select the maximum number of concurrent meta key values that are loaded by a single user in the Events Meta view. The Render Threads value should be between **1-8**. The default value is **2**.

Note: By increasing the number of render threads, the meta values within the Events Meta panel are loaded simultaneously.

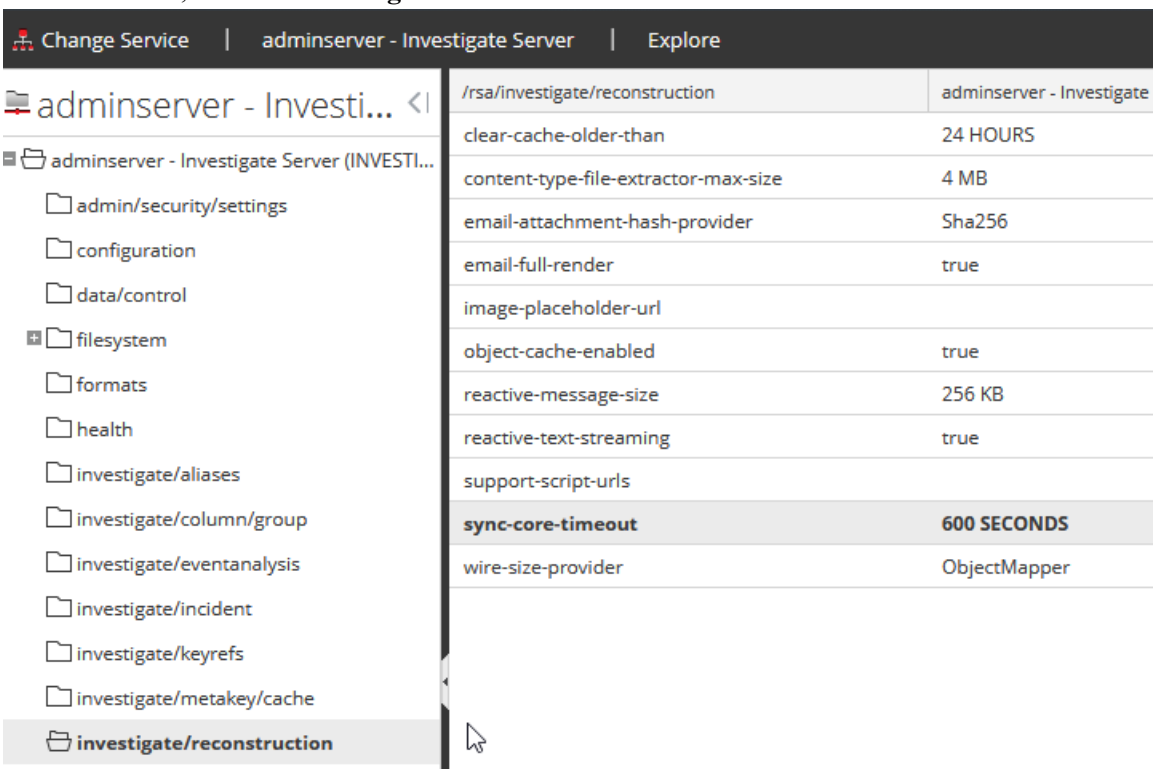
6. Click **Apply**.

   The change becomes effective immediately, and applies to any new queries submitted by analysts.

7. Under **Event Limit Per User Role**, select the maximum number of events loaded for a single query for individual user roles. This limit must be less than or equal to the system events limit of 40,000 events; it can be larger than the default or configured limit set under Event Limit Default.

8. Click **Apply**.

   The change becomes effective immediately, and applies to any new queries submitted by users assigned to the user role.



Configure the Sync Core Timeout to Remedy Deadlocks in Events View Reconstructions

The `sync-core-timeout` is a setting in the `/investigate/reconstruction` node that determines the maximum time to wait for operations for caching core content to complete to prevent deadlocks. The default value is 600 seconds (10 minutes) and needs no adjustment under most circumstances. If analysts are seeing a spinner for a very long time (>10 minutes) when loading a reconstruction in the Events view, for example from events on a 10G Decoder, increasing the length of this timeout may improve the ability to reconstruct events.

Caution: Changing the timeout setting to more than 600 seconds may lead to stability issues.

To adjust the sync-core-timeout:

1. Go to **(Admin) > Services > Investigate-server** and **View > Explorer**.
2. In the node list, click the **investigate-reconstruction** node.

3. In the **sync-core-timeout** field, type a new value for the number of seconds before timeout and press **RETURN**.
   The setting is applied and goes into effect immediately.

Configure Live Services Settings

Options for configuring Live Services are in the System view > Live Services Configuration panel. The Live Configuration panel allows you to configure:

- The Live account.
- The Live Content update schedule and preferences for notification of updates.
- Participation in Live Services Feedback (Version 11.4.0 and earlier).
- Sharing Live Content Usage
- RSA Live Connect (Version 11.5.0 and earlier).

Prerequisites

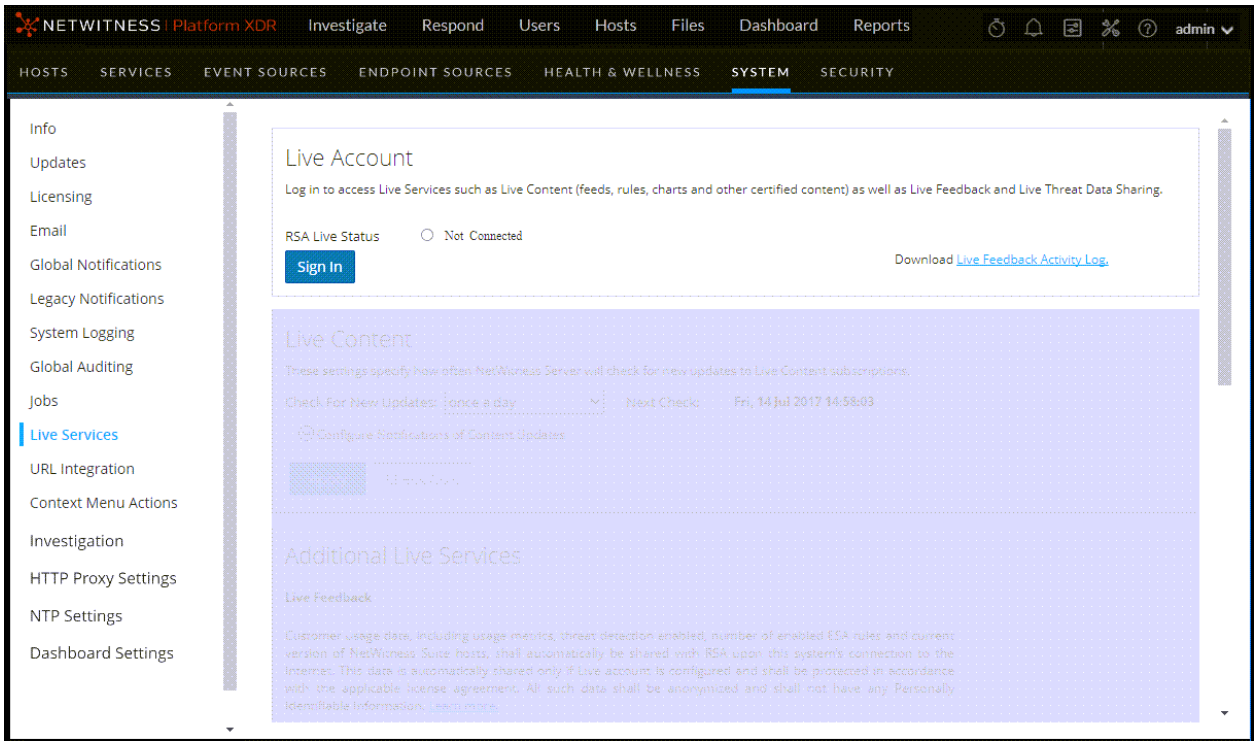
To activate your Live account for NetWitness, please contact NetWitness Customer Support. When you have a confirmation that your Live account has been set up, you can configure and test the CMS server connection.

For information on Analyst Behaviors and Data Sharing, see "NetWitness Feedback and Data Sharing" topic in the *Live Services Management Guide*.

About Live Feedback Participation

Once you sign up for a Live account, Live Feedback automatically collects relevant information for further improvement and anonymously sends it to RSA. The shared data is protected in accordance with the applicable license agreement. For information on Live Feedback, see Live Feedback Overview. For information, see Configure Live Services Settings

If needed, you can manually download historical usage data and share it with RSA. For information on how to download historical usage data and share it with RSA, see Upload Data to RSA for Live Feedback.



This topic contains the following procedures:

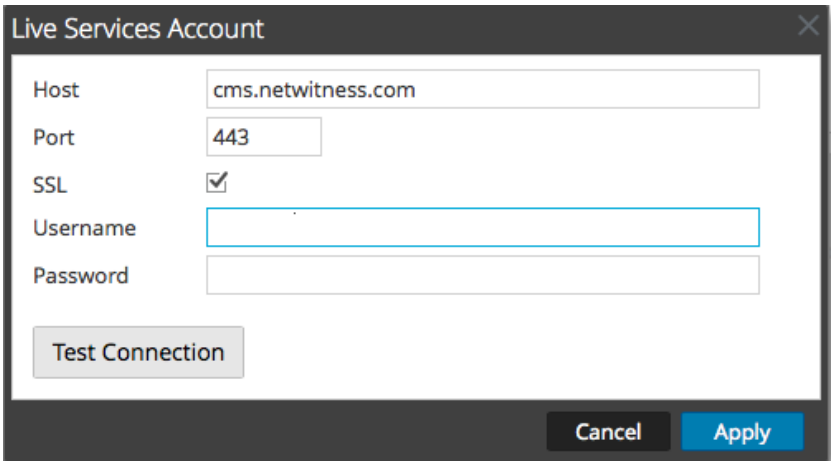
- Access the Live Services Configuration Panel
- Configure Live Account
- Configure the Live Content Synchronization Interval and Notification
- Force Immediate Synchronization

Access the Live Services Configuration Panel

1. Go to  **(Admin) > System**.
2. In the options panel, select **Live Services**.

Note: If you are not signed in with your Live Account credentials, a masked screen is displayed.

Configure Live Account



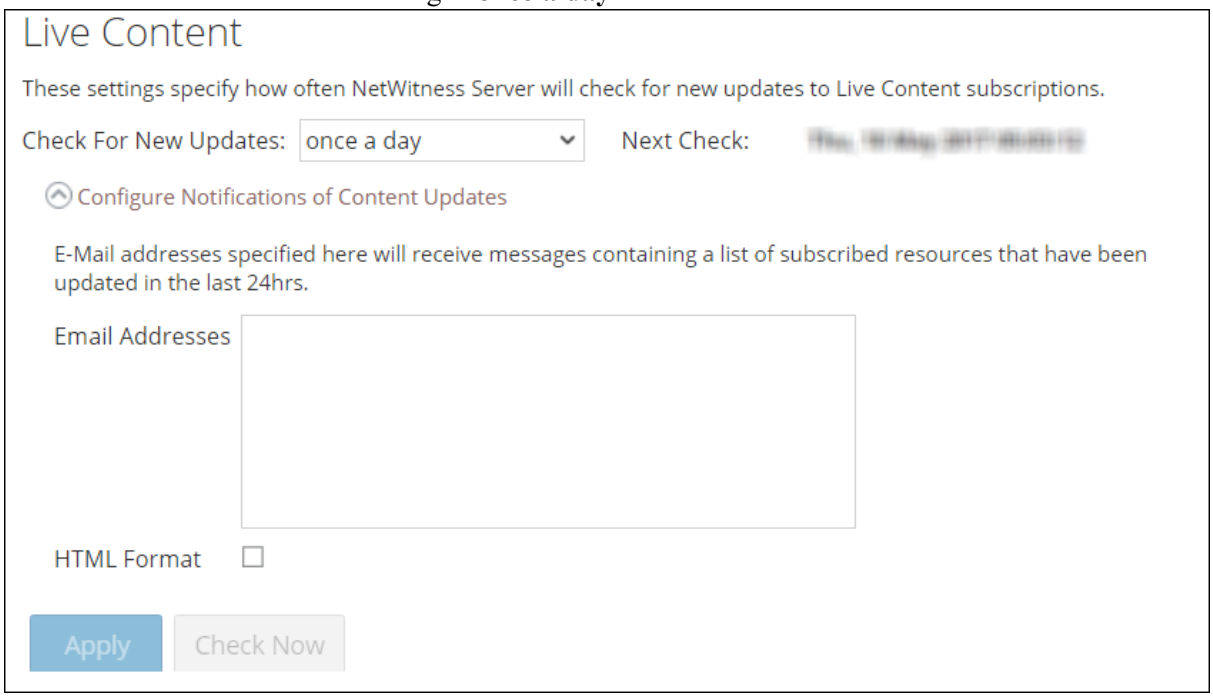
In the **Live Account** section, you must set up the user's Live account. The information needed to set up the user's Live account consists of the Username, Password, and Live URL for the Content Management System. This information is provided by Customer Care.

To configure a Live account:

1. In the **Live Account** section, click **Sign In**.

   Note: The **Modify** button shows that the live account is configured. Click **Modify** to change the user that is accessing Live Services.

2. In the Live Services Account dialog box, enter the Host (typically **cms.netwitness.com**) and type your username and password.



3. (Optional) If you are using a different CMS, type the host URL for the Content Management System. The default points to the CMS at **cms.netwitness.com**.
4. (Optional) If you are using a different CMS, type the communications port for Live to send requests to the Content Management System. The default for this field is **443**, which is the communications port on the Content Management System.
5. (Optional) If you do not want to use SSL, uncheck the **SSL** option. (SSL is enabled by default.)
6. Click **Test connection** to test the connection to CMS.
7. To save and apply the configuration, click **Apply**.

Configure the Live Content Synchronization Interval and Notification

You can change the interval at which NetWitness checks for new updates to Live Content:

1. Use the **Check for New Updates** field to change the interval. Select an interval from the drop-down list. The default value for this setting is **once a day**.

2. To configure Live Services to send update reports to one or more people, in the **Email Addresses** field, type the email addresses as a comma-separated list, for example, **john@company.com,ted@company.com,brian@company.com**
3. (Optional) To receive messages in HTML format rather than plain text, select **HTML Format**.
4. To save and apply, click **Apply**.

   The time and date of the next scheduled Live synchronization based on the configured interval for checking is displayed.

Force Immediate Synchronization

Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness. One use for this is to see the immediate impact of a configuration change. For example, a new service has been added, or new resources have been toggled for automatic deployment. The scheduled synchronization could take place hours later if Live Services is set to synchronize a few times a day.

Caution: Synchronization can cause a parser reload if a FlexParser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.

To force immediate synchronization, click **Check Now**. NetWitness checks for updates in subscribed resources.

File Reputation

File Reputation provides analysts the opportunity to view reputation status of files.

By default, **File Reputation** is enabled in **Additional Live Services** section.

Live Feedback Overview

This topic provides an introduction to Live Feedback. Live Feedback collects relevant information such as the Licensing usage data for Network Decoder, Log Decoder and Malware Analysis, Threat Detection Enabled or Disabled status, Number of enabled ESA rules,and version number details of all the services of NetWitness. For more information about the licensing usage data for Packer Decoder, Log Decoder and Malware Analysis, see the **License Details** tab topic in the *Licensing Guide*. The information is collected to improve future releases of NetWitness. You will automatically be signed on to live feedback and you cannot disable this option.

In addition to this, information on the Live Content Usage can also be shared with NetWitness. Live Content usage metrics for resource types from  **(Configure) > Live Content > Search Criteria** such as total count of NetWitness Application Rule, NetWitness Correlation Rule etc. can be shared with NetWitness. The information collected is used to improve the use of Live Content. For more information about sharing live content configuration, see Live Services Configuration Panel.

About Live Feedback Participation

Once you sign up for a Live account, Live Feedback automatically collects relevant information for further improvement and anonymously sends it to RSA. The shared data is protected in accordance with the applicable license agreement. For information on Live Feedback, see Live Feedback Overview. For information, see Configure Live Services Settings

If needed, you can manually download historical usage data and share it with RSA. For information on how to download historical usage data and share it with RSA, see Upload Data to RSA for Live Feedback.

Note: Live Feedback is activated only if you have configured your Live account.

The Live Feedback data is in JSON format as mentioned below. When you sign up with your Live Account credentials, a single encrypted JSON file is automatically uploaded to the NetWitness servers everyday.

JSON File

The JSON file consists of usage data information for a component or a set of components. In case of a set of components with the same license id, the usage data for all the components is aggregated and represented as a component called Entitlement. However, even if there is a single component such as a log decoder or decoder, an Entitlement component will be generated and will display the usage data for a single component. This aggregation is for components namely log decoders, decoders or malware analysis.

Note: The version of Entitlement is always null as it is the aggregate for a license data.

For example, if there are three Decoders with the same license id "xxx" with the following usage data:
Decoder1 = 150 MB
Decoder2 = 250 MB
Decoder3 = 100 MB
The aggregated usage data of 500 MB is displayed.

This JSON file is described in the following sections:

- Components
- Metrics
- Other Product Details
- Sample

Components

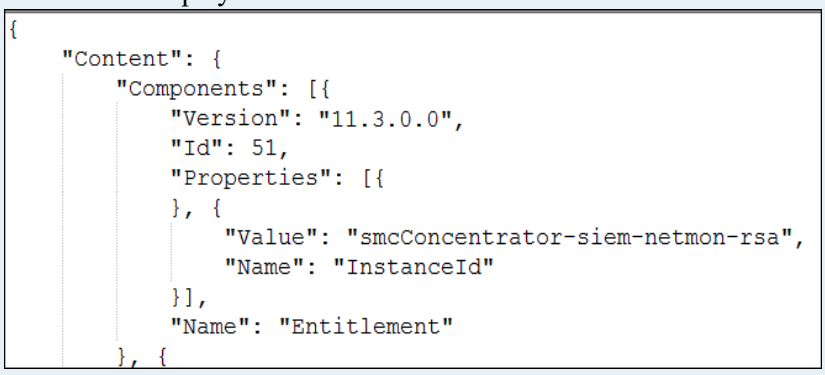
Details of each service in your NetWitness deployment. This is represented as Component. For each component the following details are displayed.

Component	Description
Version	Version number of the component in the NetWitness deployment. For example, 11.1.0.0.x.x.x.x.
ID	This is the unique Component ID that represents the host and is used to link to the metrics generated.
Properties	• **Name** - This is the name of the property for that component. For example, malware analysis, ESA, log decoder, etc. • **Value** - This is the unique value to identify the component.

Metrics

Metrics of the components (hosts) such as Log Decoder, Decoder and Malware Analysis. The license usage data for each host is shared. For Live Content usage metrics, resource types from  **(Configure) > Live Content > Search Criteria** such as total count of NetWitness Application Rule, NetWitness Correlation Rule and so on are shared.

Component	Description
Usage	• **Value** - This is the value generated for the specific component ID for each component. • **Name** - This is the name of the statistics for which the metrics is collected. For example, Capture Total Bytes.
StartTimeUTC	This is the time from when the metrics is collected. (in EPOCH format).
EndTimeUTC	This is the time when the metrics collection is complete (in EPOCH format).
Component ID	This is the ID of the component for which the value is recorded.



Other Product Details

- **End Time** - This is the time when the metrics collection is complete (in EPOCH format).
- **Product Name** - This is the name of the product. In this example, the Product Type is **NetWitness**.
- **Version** - This is the version of the JSON file which tracks the changes made to the file format.

- **Start Time** - This is the time from when the metrics is collected. (in EPOCH format).
- **Product Type** - This is the name of the product. In this example, the Product Type is **NetWitness**.
- **Product Version** - This is the version of the product from which the metrics is collected. In this example, the Product Version is **11.3.0.0-SNAPSHOT**.
- **Product Instance** - This is the License Server ID.
- **Checksum** - This is the information which is used for integrity checks.

The following table describes details of the JSON file with examples.

Metrics	Description
Content	Displays the content that contains all the Components, Metrics, Product Type and Product Instance data except Checksum.

Metrics	Description
Components	The details of all the services in NetWitness are represented as a Component. The details of the component such as the version number of the component, the name, and the value is displayed.  **Version**: Displays the version of NetWitness service. For example, 11.3.0.0. **ID**: Displays an unique id which is generated for the NetWitness service and is used to link to the metrics for that particular component. In this example, the ID for Malware Analysis is 5 and the metrics is displayed for ComponentId 5 in bytes:  **Properties**: Displays the properties for the component such as name and value as shown in the above figure. **Value**: Displays the value of the property which is an internal UUID for a component as shown in the above figure This is generated by NetWitness. For example, For malware analysis the value displayed as "55f7a0b30e502231c42d063f" **Name: "InstanceId"**: Displays the name of the property as shown in the above figure.

Metrics	Description
	Name": "malwareanalysis": Displays the name of component which is a service name such as LogDecoder, Decoder, or MalwareAnalysis.

Metrics	Displays the list of the metrics with the usage data for components namely MacHosts, LinuHosts and WinHosts.
	In this example, the metrics is displayed for ComponentId 1 in bytes.
	
	}],
	"Metrics": [{
	"Usage": [{
	"Value": "0.0",
	"Name": "MacHosts"
	}, {
	"Value": "0.0",
	"Name": "LinuxHosts"
	}, {
	"Value": "0.0",
	"Name": "WinHosts"
	}, {
	"Value": "0.0",
	"Name": "TotalHosts"
	}],
	"StartTimeUTC": 1539043200000,
	"EndTimeUTC": 1539129599000,
	"ComponentId": 1
	}, {

	StartTimeUTC: Displays the time when the metrics is collected, in the EPOCH format.
	Usage: Displays the usage value and usage type statistics of the component.
	Value: Displays the value of the statistics. For example, "Value": "1582940012678" as shown in the above figure.
	Name: Displays the name of the statistics. For example, Capture Total Bytes or Total File bytes.
	EndTimeUTC: Displays the time when the metrics collection is complete, in the EPOCH format.
	ComponentId: Displays the component id for which the metric values are collected. This is the same as the "ID" in the Components section.
Content	Displays the content that contains all the Components, Metrics, Product Type and Product Instance data except Checksum.
ProductType	Displays the product type that generates the file. For example, `"ProductType": "NetWitness Platform"`
ProductInstance	Displays the License server Id and is unique per NetWitness. For example, `"ProductInstance": "00-0C-29-6C-66-E3"`

Metrics	Description
Checksum	Displays the Checksum for the "Content" section in the file. Used by NetWitness for integrity check. For example, `"Checksum": "883DACF97E4BCD9F590A1461A4DD0A312B5883A6CF82E0518E77AAB6A6DDB654"`

Example

Here is a sample JSON file.

```
{
    "Content": {
        "Components": [{
            "Version": "11.3.0.0",
            "Id": 7,
            "Properties": [{
                "Value": "57470c96e4b0cf62c7bfbd53",
                "Name": "InstanceId"
            }],
            "Name": "esa"
        },
        {
            "Version": "11.3.0.0",
            "Id": 4,
            "Properties": [{
                "Value": "5714c78be4b0ea5bd2b96e69",
                "Name": "InstanceId"
            }],
            "Name": "incidentmanagement"
        },
        {
            "Version": "11.3.0.0",
            "Id": 2,
            "Properties": [{
                "Value": "5714c78be4b0ea5bd2b96e65",
                "Name": "InstanceId"
            }],
            "Name": "sa"
        },
        {
            "Version": "11.3.0.0",
            "Id": 1,
            "Properties": [{
                "Value": "5714c78be4b0ea5bd2b96e63",
                "Name": "InstanceId"
            }],
            "Name": "malwareanalysis"
        },
        {
            "Version": "11.3.0.0",
            "Id": 3,
            "Properties": [{
                "Value": "5714c78be4b0ea5bd2b96e67",
                "Name": "InstanceId"
            }],
            "Name": "reportingengine"
        }],
        "Metrics": [{
            "StartTimeUTC": 1464480000000,
            "Stats": [{
                "Value": "Disabled",
                "Name": "Threat Detection"
            },
            {
                "Value": "3.0",
                "Name": "Number Of Enabled ESA Rules"
            }],
            "EndTimeUTC": 1464566399000,
            "ComponentId": 7
        }],
        "EndTime": 1464566399000,
        "Version": "1.0",
        "StartTime": 1464479999000,
        "ProductType": "Security Analytics",
        "ProductInstance": "00-0C-29-A2-57-B4"
    },
    "Checksum": "6445C704D3F9E67D24DBA8F11EB6C003CBCC0E199576342E6E6D2545524F583F"
}
```

The JSON file includes details of all the licenses currently available on the appliance. Here is a sample of the Entitlement information within the JSON file for a appliance license for Broker.

```
    }, {
        "Version": "2015.0506",
        "Id": 14,
        "Properties": [{
            "Value": "M133206102",

            "Value": "permanent",
            "Name": "LicenseEndDate"
        }, {
            "Value": "20t-52osb7",
            "Name": "FeatureId"
        }, {
            "Value": "smcBroker",
            "Name": "Name"
        }, {
            "Value": "20t-52osb7",
            "Name": "InstanceId"
        }],
        "Name": "Entitlement"
    }, {
```

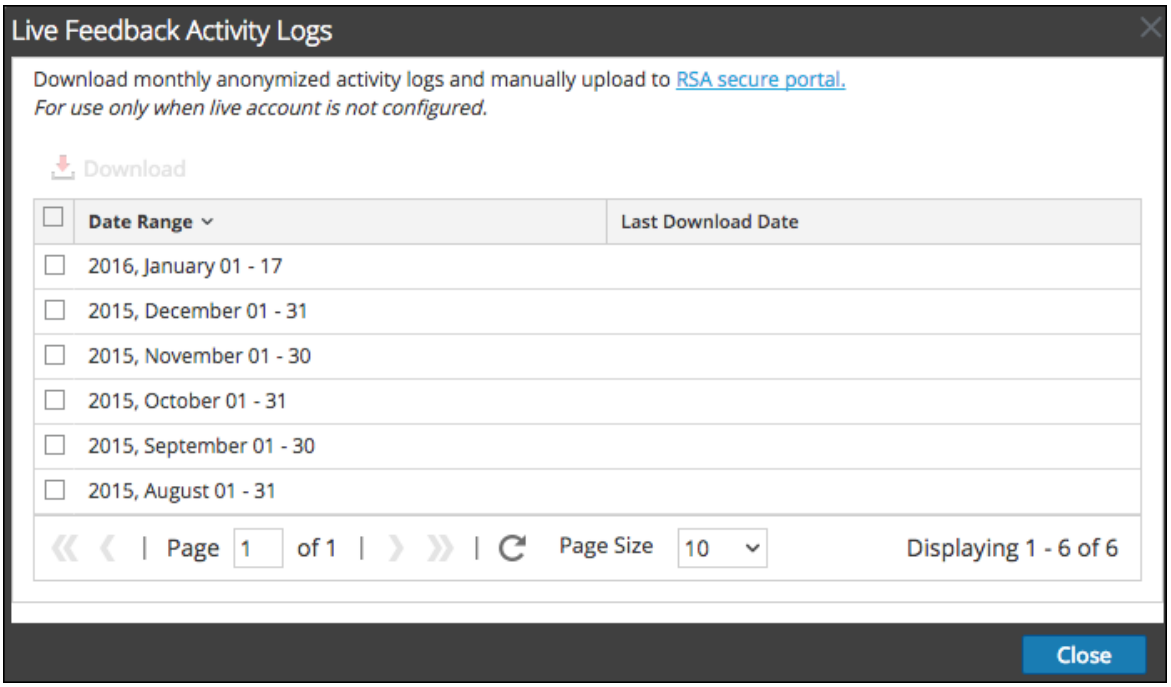
Upload Data to RSA for Live Feedback

This topic provides instructions for a NetWitness administrator to export the metrics in NetWitness for Live Feedback.

If the Live Account is not configured, you can manually upload the usage data to RSA. For more information, see Live Services Configuration Panel.

The Live Account section has a Live Feedback Activity Log which enables you to download the usage data required for Live Feedback. This is active regardless of the Live Account configuration.

You can first download the Live Feedback historical data, and then upload it to share with RSA.



Download Live Feedback Historical Data

To download the Live Feedback historical data:

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Live Services**.

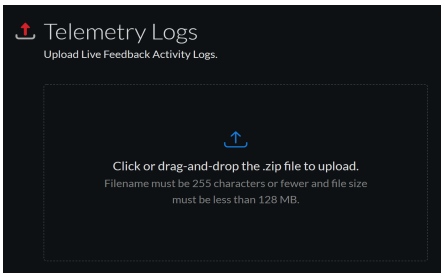
   The **Live Account** screen is displayed which consists of the **RSA Live Status** and Download **Live Feedback Activity Log**.
3. Click the **Live Feedback Activity Log**.

   The **Live Feedback Activity Log** window opens which allows the NetWitness user to download the required Live Feedback historical data.

4. Select one or multiple entries by setting the checkboxes and click **Download**.

   Note: If you select multiple entries in the history table, the downloaded zip file consists of an individual JSON file for each month.

The downloaded Live Feedback data is in JSON format, and is bundled as a .zip file. For more information, see Live Feedback Overview.



Share Data with NetWitness

After you download the Live Feedback data, you can then upload it using the following procedure.

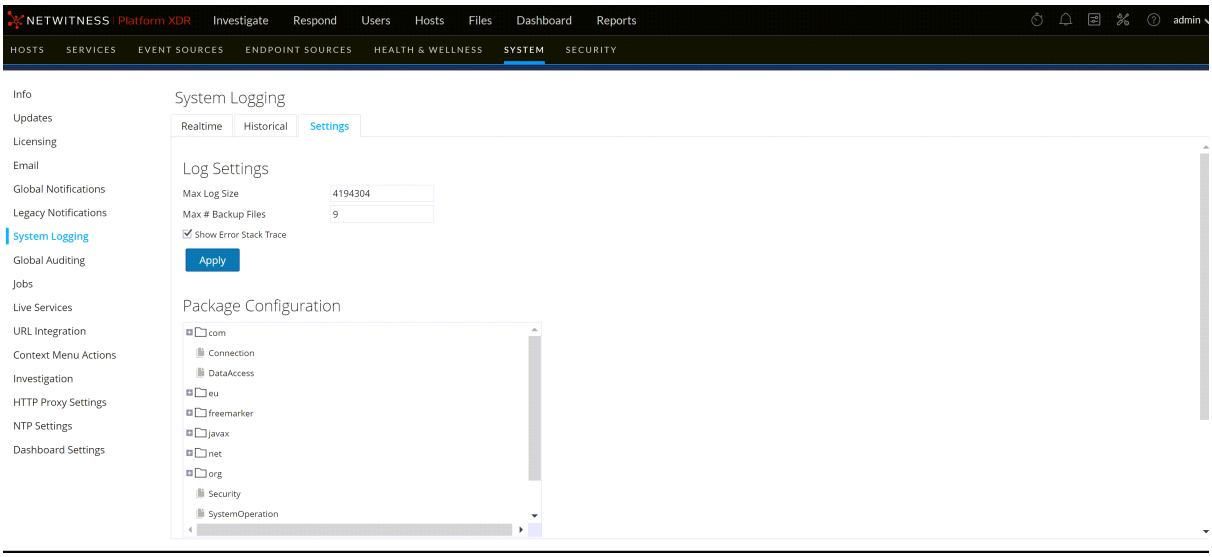
Note:
- To download the Live Feedback data, see topic Download Live Feedback Historical Data.
- You can share data using the new live registration portal. For more information, Create Live Account.

To share the data to NetWitness

1. Log in to the NetWitness XDR Cloud Services using your credentials.
2. Click  on the left panel.
   The **Telemetry Logs** dialog is displayed.

Note:
- You can upload only .zip files.
- Filename must be 255 characters or less and file size must be less than 128 MB.

3. Click or drag-and-drop a file onto this area to upload.



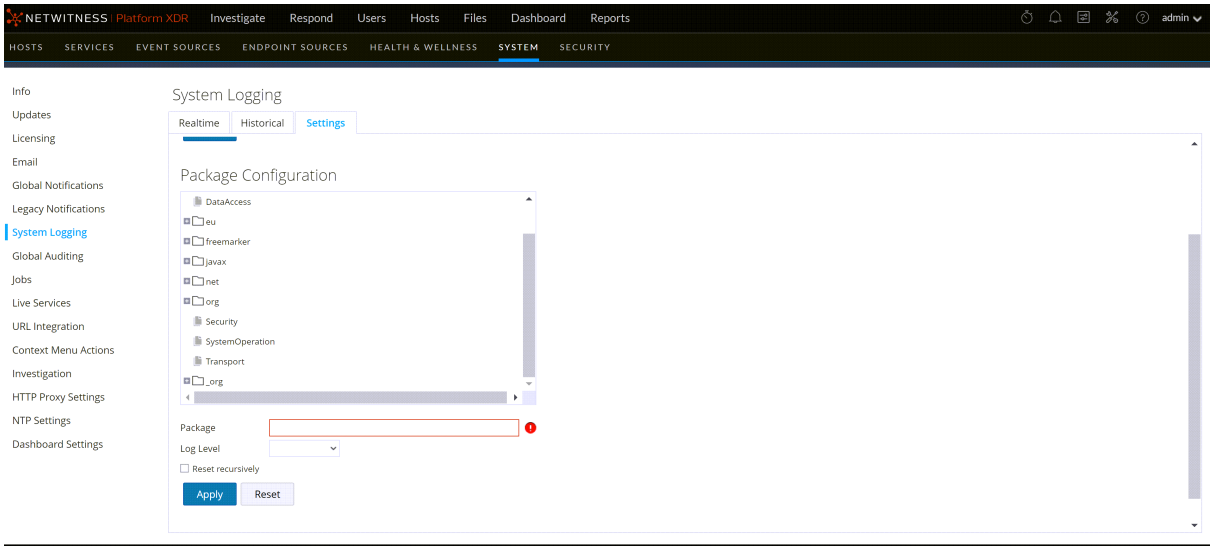
Configure Log File Settings

In NetWitness Platform XDR, you can configure the size of the log files, the number of backup log files maintained, as well as the default logging levels for the packages within NetWitness.

Configure System Log File Size and Backup Count

The log file size and backup count are configured with default values. If you want to change the default values for the log file size and number of backups:

1. Go to  **(Admin) > System.**
2. In options panel, select **System Logging**.
   The System Logging Configuration panel opens to the Realtime tab by default.



3. Click the **Settings** tab.
4. In the **Max Log Size** field, type the maximum size in bytes. The minimum value for this setting is **4096**.
5. In the **Max # Backup Files** field, type the maximum number of backup logs to maintain. The minimum value for this setting is **0**. When the maximum number of log files is attained, and a new backup file is made, the oldest backup is discarded.
6. Click **Apply**.
   The changes go into effect immediately.

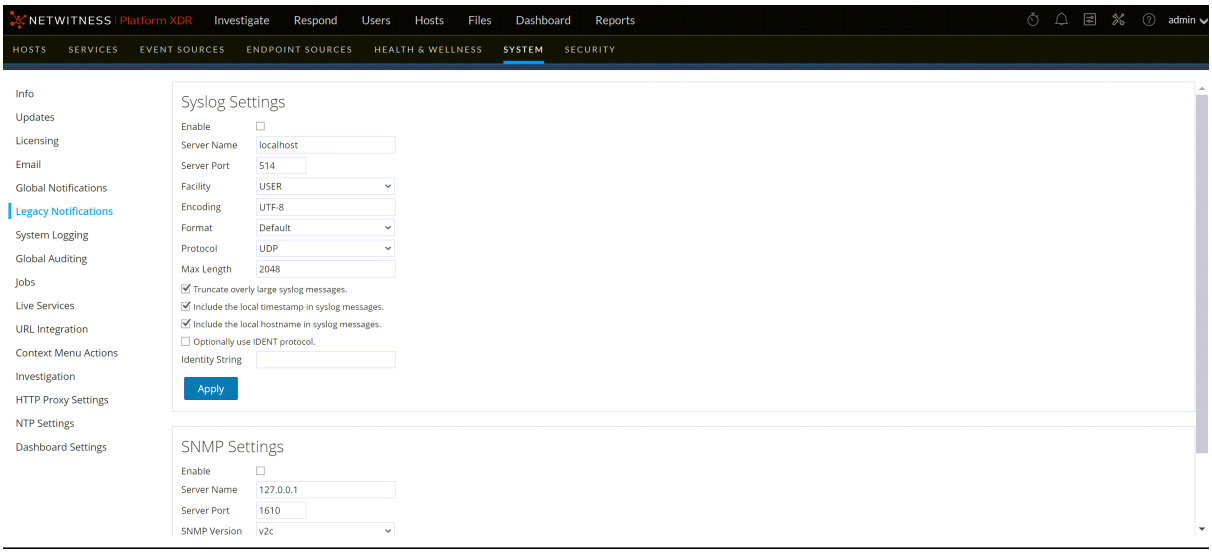
Set the Log Level for an Individual Package

The Package Configuration section shows the NetWitness Network in a tree structure. The tree contains all the packages used within NetWitness. You can drill down into the tree to view the log levels of each package. The log level for all packages that are not explicitly set is the same as the **root** log level. To set the log level for a package:

1. Select the package in the **Package** tree.
   The name of the package is displayed in the **Package** field. If a log level is already set for the

package, that level is shown.

2. Select the **Log Level** in the drop-down list.
3. Click **Apply**.
   The new log level becomes effective immediately.
4. (Optional) If you want to revert to the default log level specified for **root**, click **Reset**.



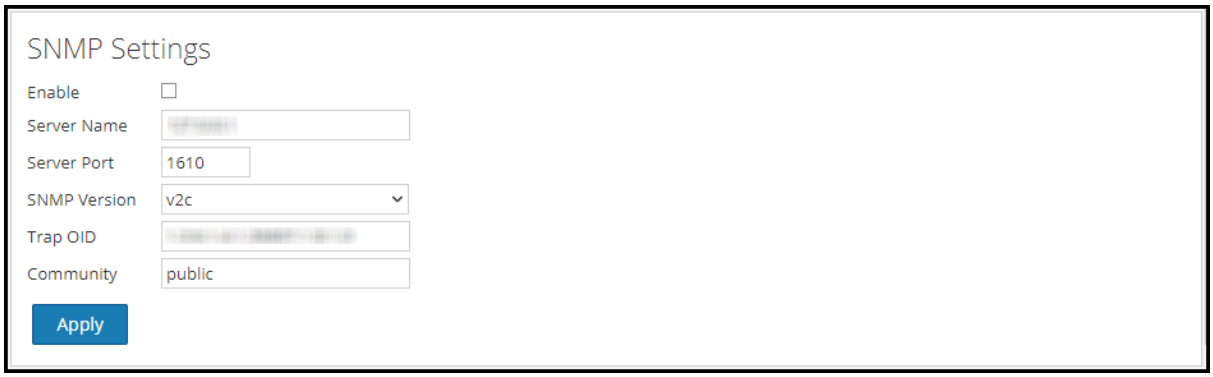
Configure Syslog and SNMP Settings

On the Legacy Notifications panel, you can configure syslog and SNMP notification settings. These configurations are used for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Configure and Enable Syslog Settings

1. Go to  **(Admin) > System**.
2. In the options panel, select **Legacy Notifications**.

   The Legacy Notifications Configuration panel is displayed.



3. In the **Server Name** and **Server Port** fields under **Syslog Settings**, type the host name where the target syslog process is running and the port where the target syslog process is listening.
4. In the **Facility**, **Encoding**, **Format**, and **Max length** fields, specify the syslog facility, message text encoding, message format, and maximum message length.
5. In the **Protocol** field, select either UDP or TCP.
6. (Optional) Select the options for what to include in messages: **Truncate overly large syslog messages**, **Include the local timestamp in syslog messages**, and **Include the local hostname in syslog messages**.
7. (Optional) Configure syslog to prepend an Identity String before each syslog alert.
8. Set the **Enable** checkbox.
9. Click **Apply**.

Syslog notifications are immediately enabled. Legacy Notifications Configuration Panel provides detailed information about these settings.

Configure and Enable SNMP Settings

1. Go to **(Admin) > System**.
2. In the options panel, select **Legacy Notifications**.

   The Legacy Notifications Configuration panel is displayed, with SNMP Settings at the bottom of the panel.

3. In the **Server Name** and **Server Port** fields under **SNMP Settings**, type the host name and listening port of the SNMP trap host.
4. Select the **SNMP version** in the drop-down menu, **v1** or **v2c**.
5. In the **Trap OID** field. specify the object ID for the SNMP trap on the trap host that receives the audit event. The default value is **0.0.0.0.0.1**.
6. In the **Community** field, specify the community string used to authenticate on the SNMP trap host, the default value is **public**.
7. Set the **Enable** checkbox.
8. Click **Apply**.

SNMP notifications are immediately enabled. Legacy Notifications Configuration Panel provides detailed information about these settings.

Disable Syslog or SNMP Settings

To disable syslog or SNMP settings on this NetWitness instance:

1. Clear the appropriate **Enable** checkbox.
2. Click **Apply**.
   The selected settings are immediately disabled.

Additional Procedures

Additional procedures are not essential for the set up of NetWitness, they include certain customization options that are beyond the usual setup; for example, adding custom context menus or setting up a proxy.

Add Custom Context Menu Actions

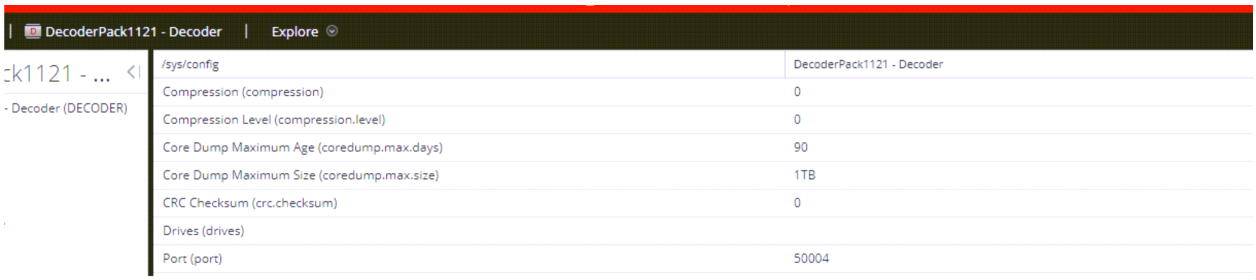
Configure NTP Servers

Configure Proxy for NetWitness Platform XDR

Add New Configuration Dialog

Supported CEF Meta Keys

Supported Global Audit Logging Meta Key Variables



Global Audit Logging Operation Reference

Local Audit Log Locations

Configure Core Dump Retention

When a NetWitness service starts, it checks the cores directory for core files. If any are older than 90 days, they are deleted. Then, if the core files take up more than 500 GB, the service will delete them from the oldest until the core files are under this limit.

From 12.3 and later, a new feature is added to all NetWitness services allowing the user to customize the time and size limits using new configuration parameters under the `/sys/config` node in the Explore view.

This picture shows the new parameters in the explore screen on a decoder. To update, simply click the value and enter a new value as you would with any other configuration parameter. The new values will take effect the next time the service starts.

Parameters

- Core Dump Maximum Age
- Core Dump Maximum Size

Core Dump Maximum Age

This parameter controls the maximum number of days that the service will keep core files. Any core file older than the number shown here (in days) will be deleted when the service starts. The default is 90. The values range from 10 to 1825 (5 years)

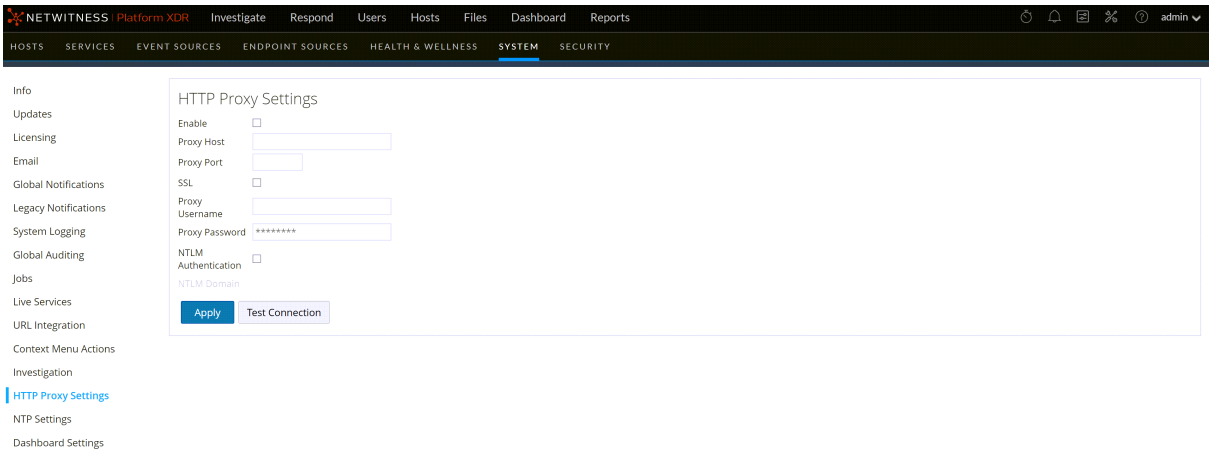
Core Dump Maximum Size

This parameter controls the maximum number of bytes that core files can take on the disk. When the service starts, if the total of all core files is over this limit, the service will start deleting files starting with the oldest until the total amount of disk space used is under this limit. The default is 500 GB, and the range is 10 GB -1000000000 GB. "0" is allowed and means unlimited.

Caution: As the core files are kept on the same drive as the meta DB. As such, the value for Core Dump Max Size should be coordinated with the meta DB space limitations and the physical storage size.

Configure Proxy for NetWitness Platform XDR

This topic provides a procedure for setting up a proxy that is used across NetWitness modules and services.



Note: Proxy support is only for HTTP and HTTPS proxies and not SOCKS5.

You can configure a proxy that is used across NetWitness modules and services in the System View > Advance Configuration panel. The Proxy Settings in the Advanced Configuration panel set up a proxy to be used wherever a proxy is needed in NetWitness. These settings override any proxy settings configured for an individual service or module, such as Malware Analysis or Live.

To configure a proxy for use across NetWitness modules:

1. Go to  **(Admin) > System**.
2. In the options panel, select **HTTP Proxy Settings**.

   The HTTP Proxy Settings panel is displayed.

3. Click the **Enable** checkbox.

   The fields where you configure the proxy settings are activated.

4. Type the hostname for the proxy server and the port used for communications on the proxy server.
5. (Optional) Type the username and password that serve as credentials to access the proxy server if authentication is required.
6. (Optional) Enable **Use NTLM Authentication** and type the NTLM domain name.
7. (Optional) Enable **Use SSL** if communications use Secure Socket Layer. If you enable **Use SSL**, ensure that you import the required certificates for the services to retrieve information.

   You need to import certificates and add the certificate in the head node for all the specific services that communicate externally over a proxy. If there are any other service that communicates with external resources over the internet, ensure that you add the certificates. For more on how to add the certificates, see Import Certificates for HTTPS Service
8. The proxy is immediately available for use throughout NetWitness modules and services, for example, Live and Malware Analysis.
9. To save and apply the configuration, click **Apply**.

Import Certificates for HTTPS Service

Import certificates to communicate with the HTTPS services:

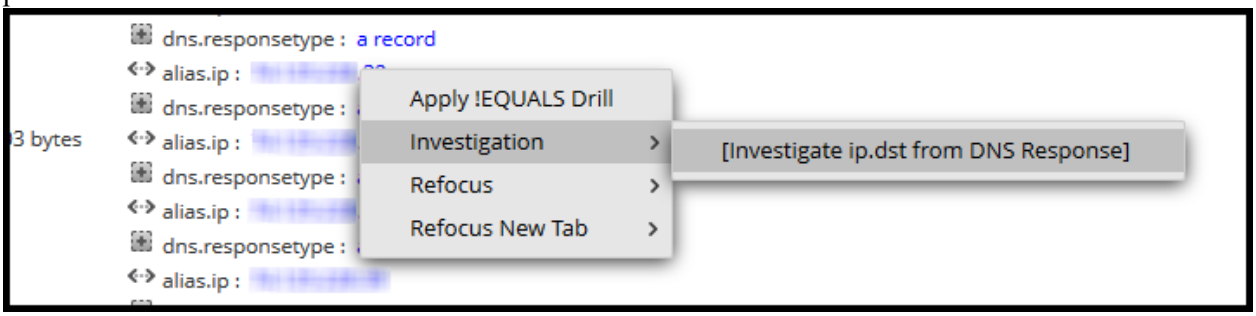
1. SSH to the NW node and copy the CA certificate located in the following directory:
   /etc/pki/ca-trust/source/
2. Execute the following command to update the certificates:
   `update-ca-trust`
3. Execute the following command to add the certificate to the java keystore:

```
keytool -list -keystore /etc/pki/java/cacerts -storepass changeit |& head
```

4. Restart the service on the NW node.

Note: Perform the procedure for all the HTTPS servers.
Example: HTTPS proxy server and HTTPS feed server.

Add Custom Context Menu Actions

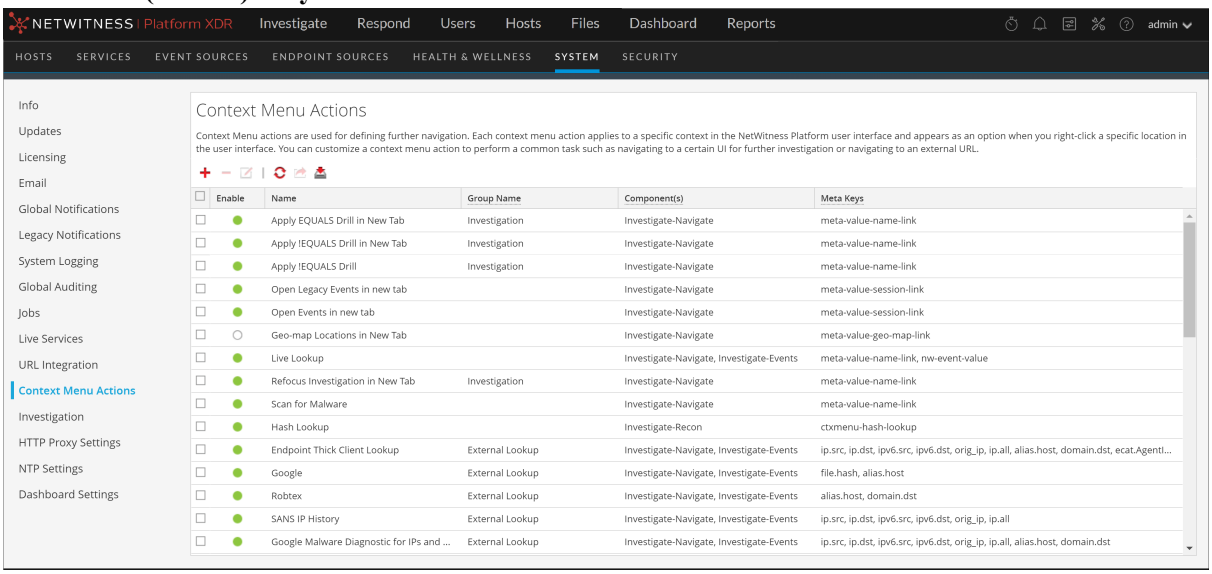


In the Context Menu Actions panel, Data Privacy Officer, Administrator, Analyst, and SOC Manager can view, add, edit, delete, import, and export context menu actions for the current instance of NetWitness. Each context menu action applies to a specific context in the NetWitness user interface, and appears as an option when you right-click a specific location in the user interface.

If you want to create a custom variation of a built-in context menu action, you can copy the configuration to a new context menu action and modify the custom context menu action. To copy, switch to the Advanced view, open the action and copy the JSON configuration file, create a new action/edit an existing action and paste. A context menu action is defined by:

- Action: The title of the action in the context menu.
- Component: The NetWitness module in which the context menu is available.
- Meta key: The content to which the action applies.
- Definition: The definition of the action.

Note: All context menu actions created before you upgrade to 11.3, functions as configured.

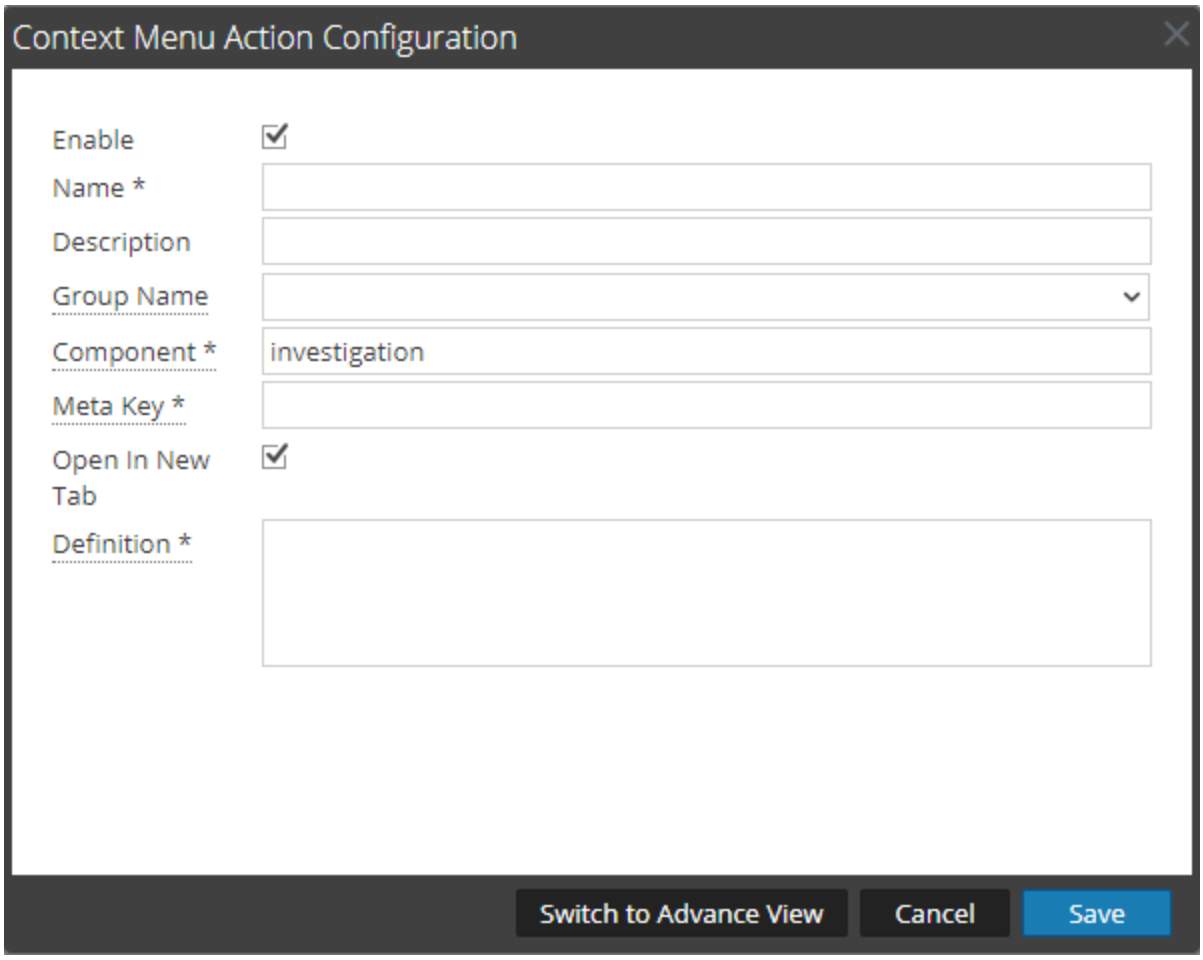


This is an example of a custom context menu action; the steps to create this example are provided as a procedure below.

View Context Menu Actions in NetWitness

To view existing context actions in NetWitness both default and custom:

1. Go to **(Admin) > System.**



2. In the options panel, select **Context Menu Actions**.
   All the new actions which were available in NetWitness Suite 11.1 in the Investigate > Events tab can now be configured using the context menu actions. Details of the information in the Context Menu Action panel are provided in Context Menu Actions Panel.

Add a Context Menu Action

To add a context menu action in NetWitness:

1. In the toolbar, click .
   The Context Menu Action Configuration dialog is displayed.

Fill the required fields:

a. Enable: Select Enable to enable this context menu action.

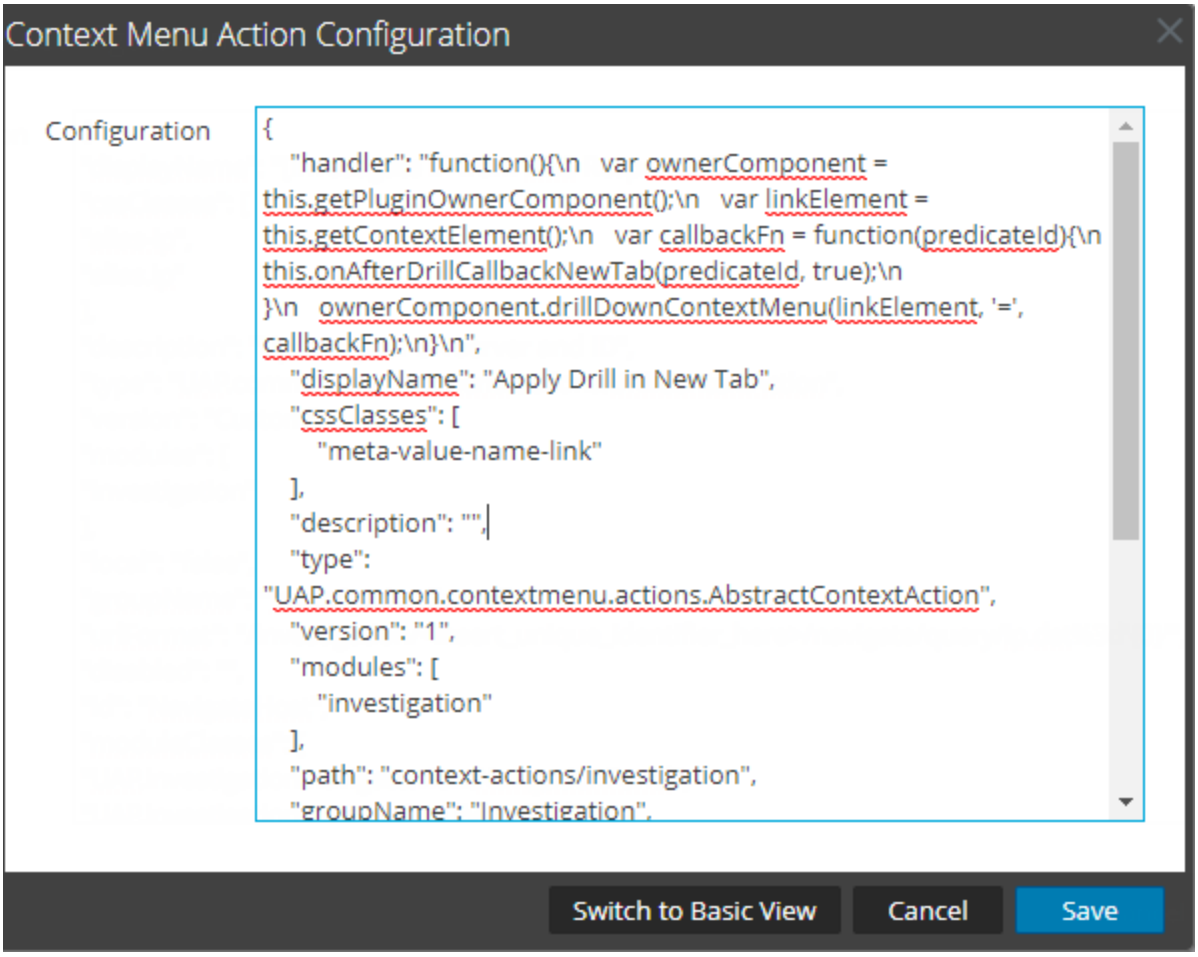
b. Name: Enter the name of the context menu action.

c. Description: Enter a description of the context menu action.

d. Group Name: Select the group name from the drop-down menu. The action appears under this group in Context menu.

e. Component: The name of the component under which action will appear in the user interface. For example. under Investigate, the Context menu action can appear under Investigate-Navigate, Investigate-Legacy Events, Investigate-Event Recon and Investigate-Events.

Note: The Investigate-Legacy Events option and related data is displayed only if the Enable Legacy Events checkbox is enabled under **(Admin)** > **System** > **Investigation** > **Legacy Events**.



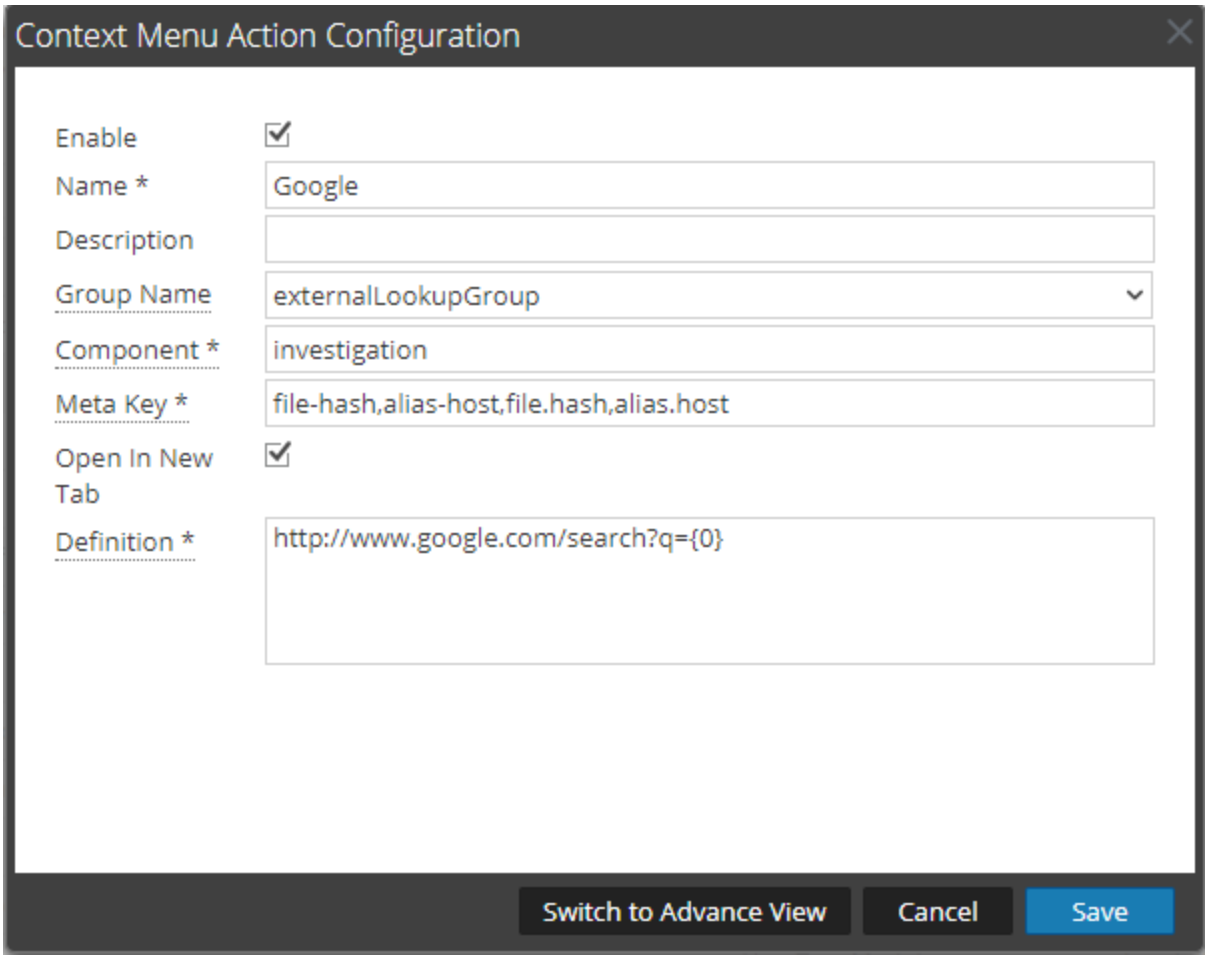
f. Meta Key: Enter the meta key separated by commas to further narrow-down scope for the context menu action. The action will appear on these meta key. Context menu actions have to be defined specifically for each meta key, the key references in a meta key do not inherit a context menu actions. For example, a context menu action created for ip.all are not created for ip.src as well. A

separate action has to be created for the sub-category or key reference of a meta.

g. Open in New Tab: Select this option to open the context menu action in a new tab.

h. Definition: Enter further action performed for this context menu action. For example, open a certain user interface or navigate to an external URL.

2. You can also type the CSS code to define the context menu action. The example procedure at the end of this topic provides step-by-step instructions that you can use to create a useful context menu action. Click **Switch to Advance View** to add the context menu action.



3. Click **OK.**
The new context menu action is created and added at the end of the list of context menu actions.

4. The context menu action becomes available in the configured location.

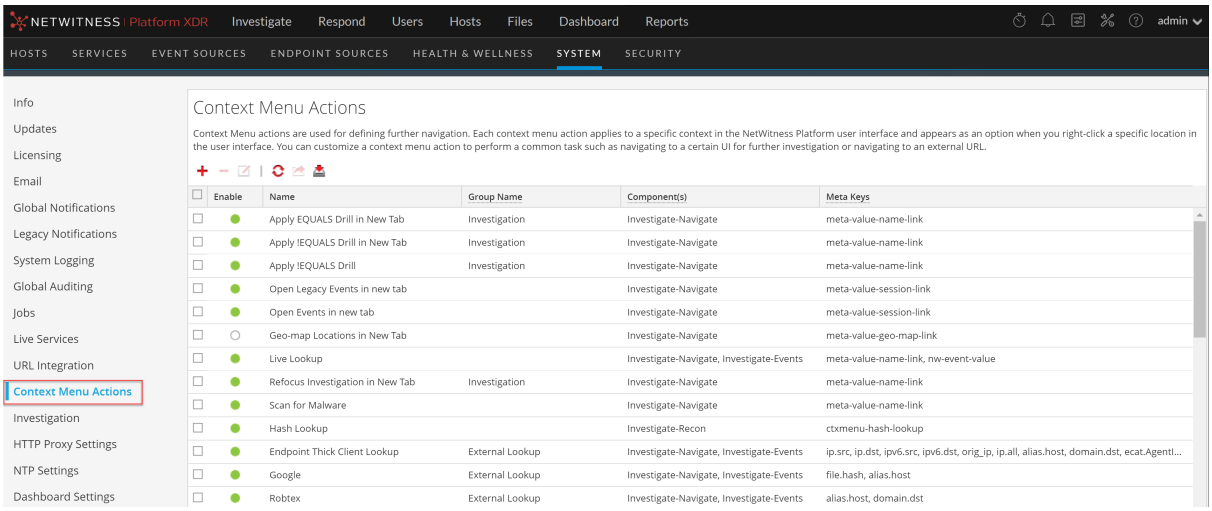
Edit a Context Action

To edit a context action:

1. Select the row in the grid and either **double-click** the row or click .
The **Context Menu Action Configuration Dialog** is displayed.

2. Edit the **Configuration**.
3. To save the changes, click **OK**.

Delete a Context Action

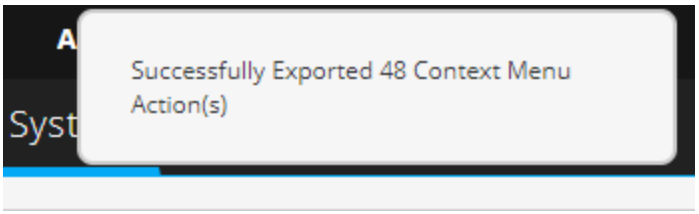


To remove a context menu action from NetWitness entirely:

1. Select the action.
2. Click .
   A dialog requests confirmation that you want to delete the context menu action.
3. Click **Yes**.
   The option is removed from the Context Menu Actions panel.

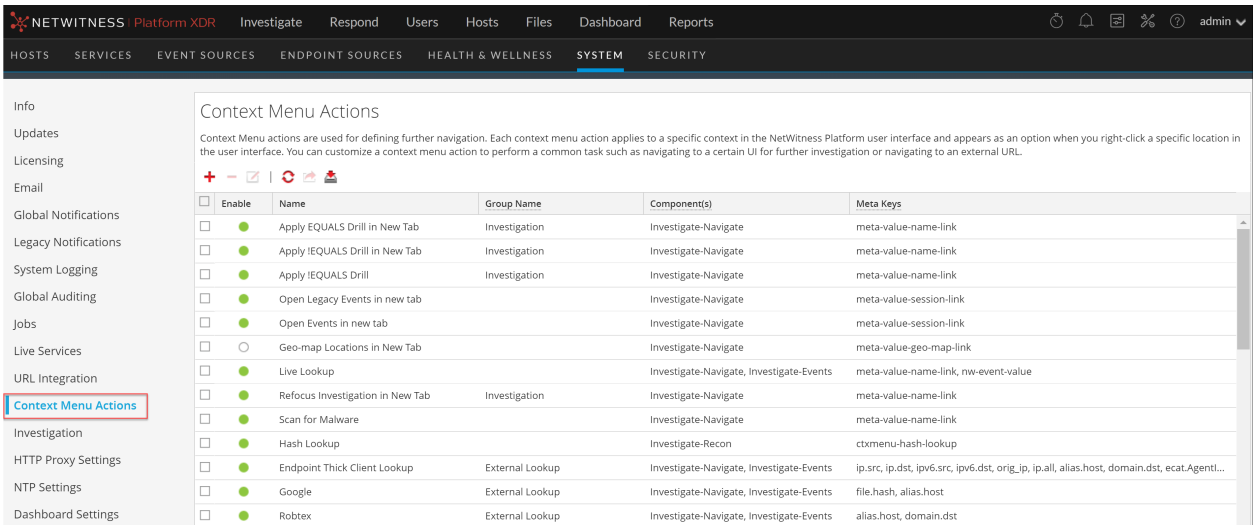
Export Context Menu Actions

You can export context menu action to a zip file. The zip file contains the JSON files with each each JSON file mapping to a context menu action. To export the context menu action, follow these steps:



1. Go to **(Admin) > System**.
2. Click **Context Menu Actions**.

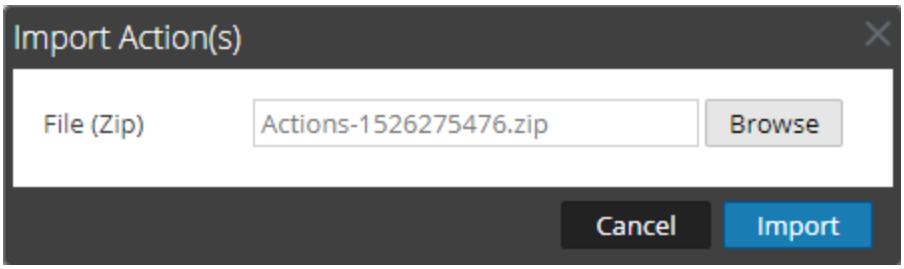
3. Click to select a context menu action to import. Click the header to select ALL the context menu actions.



4. Click Export Action(s) under Context Menu Actions.
5. The success message confirming the actions uploaded successfully is displayed.

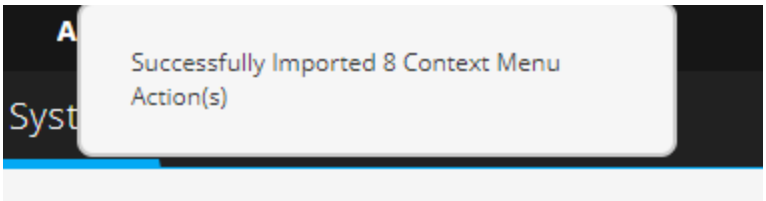
Import Context Menu Actions

You can import ccontext actions in Context Menu Actions tab. These actions can then be edited or used as is for investigating context where applicable. Follow these steps to import a context menu action(s):



1. Go to **(Admin) > System**.
2. Click **Context Menu Actions**.

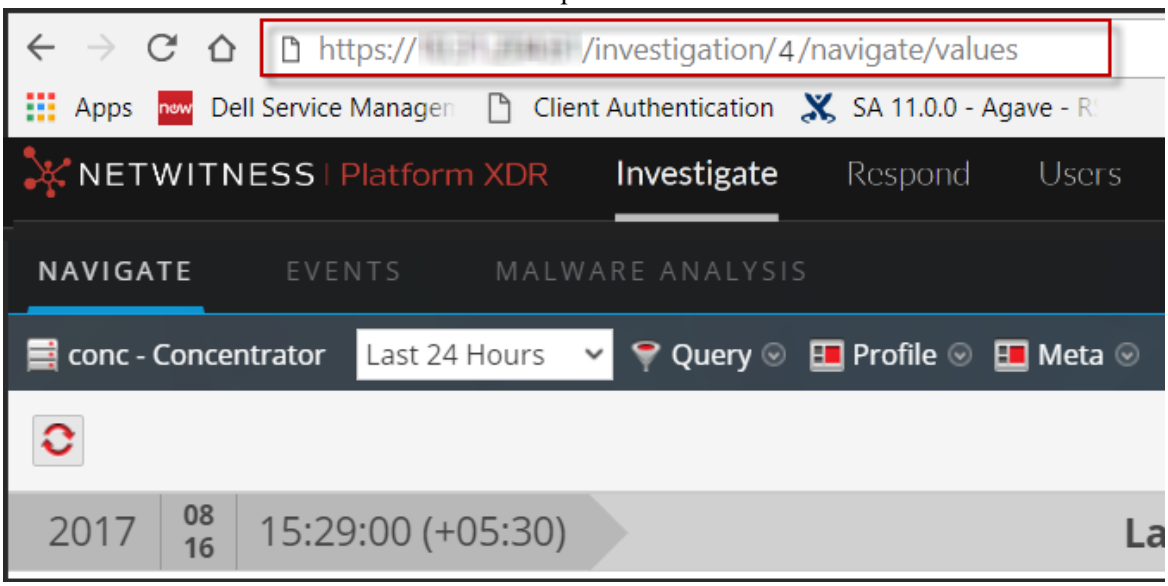
3. Click Import Action under Context Menu Actions.
4. In Import Action click **Browse** to locate and select the file. The zip file typically contains the json files containing context menu actions exported previously.



5. Select the Zip file and click **Open**.
6. Click **Import**

Note: There is no validation for an action for Events with a Javascript function.

7. The success message confirming the actions uploaded successfully are displayed.

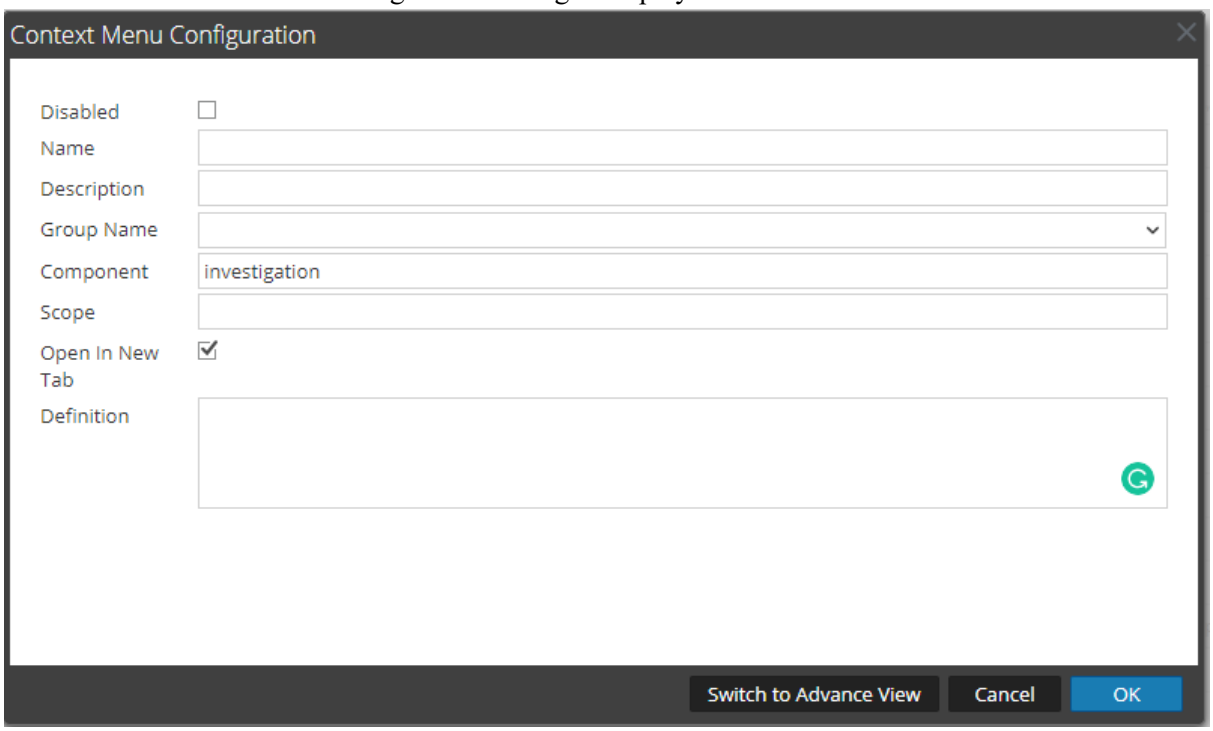


Note: If an error message is displayed, check the log files and try importing the context menu actions file again.

Example Procedure: Context Menu Action to Investigate ip.dst from alias.ip

This example adds a context menu action that allows analysts to pivot from the `alias.ip` values (the IP addresses returned from a DNS request) to the `ip.dst` meta key. It helps analysts to locate any detected traffic to the IP address that was returned for a DNS query.

To implement the context menu action:

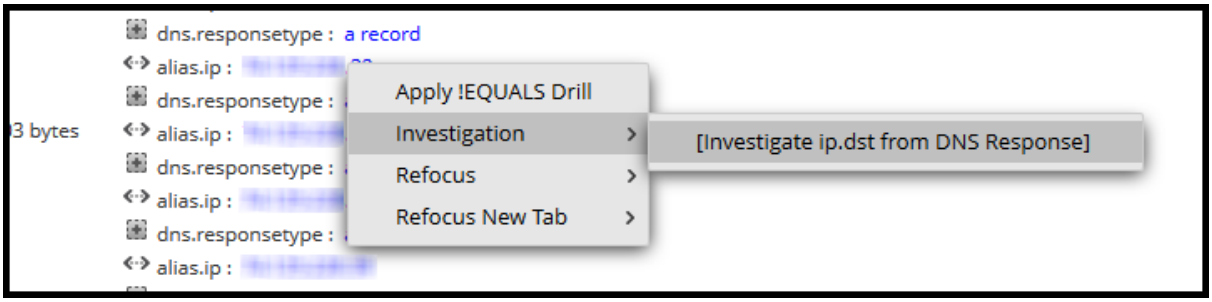


1. Determine the unique identifier for your NetWitness Server as follows:
   a. Log onto NetWitness , go to **Investigate > Navigate**, choose a service (for example, a Concentrator) to investigate, and wait for the values to load.
   b. Look for the URL and locate the number after `investigation`. In this example, the unique identifier for the action is 4. You need this unique identifier to add to the context menu action.

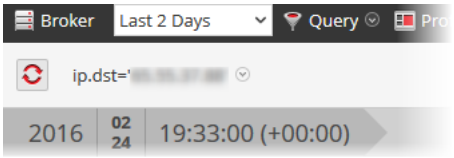
2. Go to **(Admin) > System > Context Menu Actions**

   In the toolbar, click .

The Context Menu Action Configuration dialog is displayed.



3. Copy the entire sample code block below and paste it in the window.



```
{
    "displayName": "[Investigate IP from DNS Response]",
    "cssClasses": [
        "alias-ip",
        "alias.ip"
    ],
    "description": "Update your NW server and ID",
    "type": "UAP.common.contextmenu.actions.URLContextAction",
    "version": "Custom",
    "modules": [
        "investigation"
    ],
    "local": "false",
    "groupName": "investigationGroup",
    "urlFormat": "/investigation/<insert_unique_identifier_
here>/navigate/query/ip.dst%3d'{0}'",
    "disabled": "",
    "id": "NavigateHost",
    "moduleClasses": [
        "UAP.investigation.navigate.view.NavigationPanel",
        "UAP.investigation.events.view.EventGrid"
    ],
```

```
    "openInNewTab": "true"
}
```

4. In the **urlFormat** line replace **<insert-unique_identifier_here>** with your unique identifier. The URL should look like this:
   `"/investigation/4/navigate/query/ip.dst%3d'{0}'"`
5. Click **OK**, and restart your browser.
6. To test the action, open an investigation in the Navigate view and right-click on the meta key `alias.ip`.
   The context menu with the Investigation option should look like the following figure.

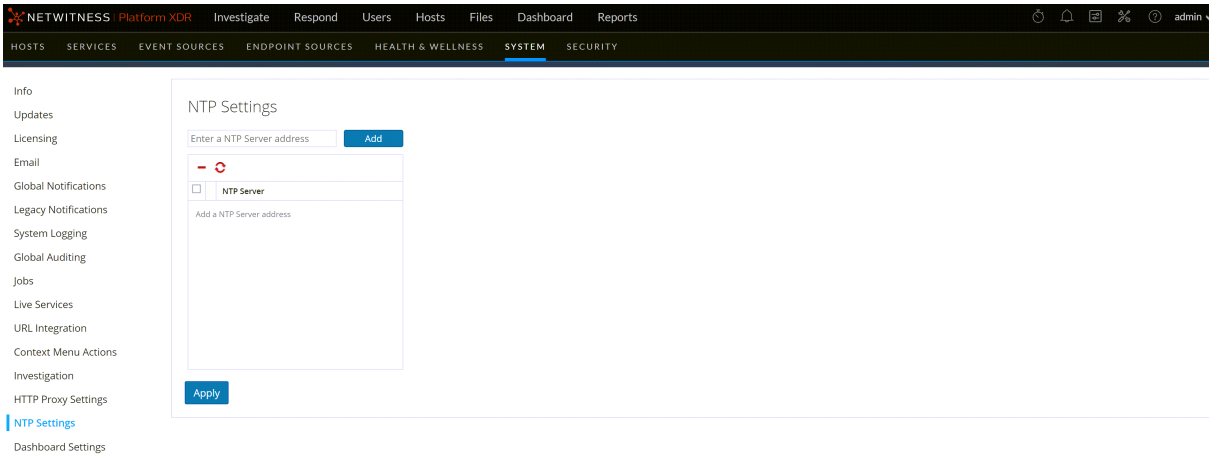
7. Should produce a pivot like this.

8. If you are using this example for DNS traffic investigation, you may want to consider creating a meta group specific to DNS traffic as described in "Manage User-Defined Meta Groups" in the *NetWitness Investigate Guide*.

Configure NTP Servers

This topic provides instructions on how to configure Network Time Protocol (NTP) servers. NTP is a protocol designed to synchronize host machine clocks over a network. For more information on NTP go to their home page (http://www.ntp.org/).

Note: NetWitness Server Core hosts must be able to communicate with the NetWitness Server host with UDP port 123 for NTP time synchronization.



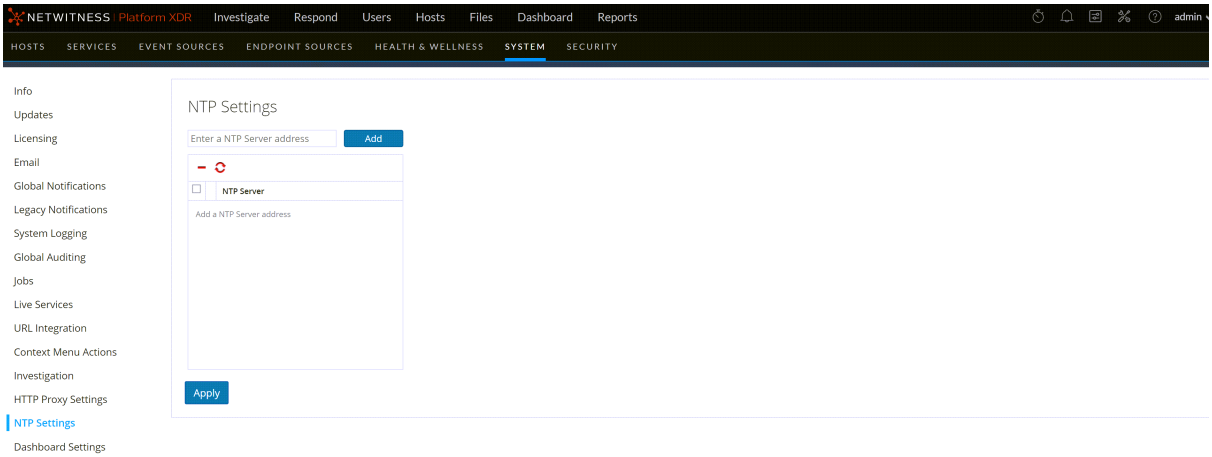
You use the **(Admin)** > **System** > **NTP Settings** view to configure one or more NTP servers. After you configure an NTP server, NetWitness uses NTP to synchronize the host machine clocks. You configure multiple NTP servers for Fail Over purposes. This topic contains the following procedures:

- Add an NTP Server
- Modify an NTP Server

Add an NTP Server

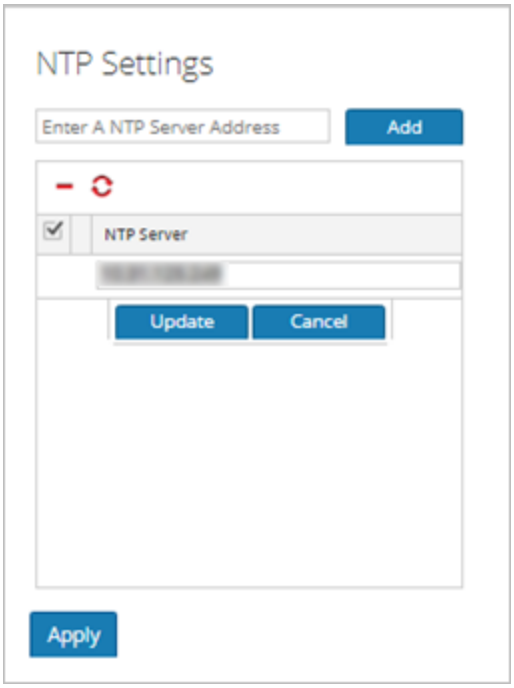
To add an NTP server:

1. Go to **(Admin) > System**.
2. In the options panel, select **NTP Settings**.
   The NTP Settings panel is displayed prompting you to enter the hostname (that is, the IP Address or FQDN) of an NTP server.



3. Enter the IP address or FQDN for an NTP server.
   If the hostname syntax is invalid, NetWitness disables the **Add** and **Apply** buttons and displays **Entered an invalid hostname**.
4. Click **Add**.
   - If the hostname syntax is valid and NetWitness can reach the server, it displays **Validating**.
   - If the hostname syntax is valid and NetWitness cannot reach a server, the following is displayed, where ***hostname*** is the hostname that you attempted to add: **The NTP server *hostname* is unreachable. Please verify the address or check your firewall settings.**
5. Click **Apply**.
   A dialog displays notification that the settings have been saved and requests confirmation that you want to apply the settings now.
6. Click **Yes**.
   The NTP server specified now ensures that your host machine clocks are synchronized. If you decide to configure multiple NTP servers and a server is down, NetWitness will fail over to next server configured.

For details of the parameters and descriptions, see NTP Settings Panel.



Modify an NTP Server

To modify an existing NTP server:

1. Go to **(Admin) > System**.
2. In the options panel, select **NTP Settings**.
   The NTP Setting panel is displayed.

3. Double-click the **NTP Server** hostname that you want to modify.
   The NTP Server textbox becomes editable and the Update and Cancel buttons are displayed.

4. Edit the hostname, click **Update**, and click **Apply.** (click **Cancel** before you click **Apply** to cancel the edit.)
   NetWitness changes the hostname according to your edits.

Troubleshoot System Configuration

The topics in this section provide troubleshooting information for administrators who are configuring settings that apply across the system in NetWitness.

- Troubleshoot Global Audit Logging
- Troubleshoot Issues identified in the NTP Settings Panel or Log Files Messages
- Troubleshoot Global Notifications

Troubleshoot Global Audit Logging

This topic provides information about possible issues that NetWitness users may encounter when implementing Global Audit Logging in NetWitness. Look for explanations and solutions in this topic.

After you configure Global Audit Logging, you should test your audit logs to ensure that they show the audit events as defined in your audit logging template. If you cannot view the audit logs on your third-party syslog server or Log Decoder, or the audit logs do not appear as expected, look at the basic troubleshooting suggestions below. If you are still having issues, you can look at the advanced troubleshooting suggestions.

Basic Troubleshooting

If you cannot view audit logs on a third-party syslog server or Log Decoder:

- Verify that RabbitMQ is up and running.
- Verify the syslog notification server configuration and make sure it is enabled.

  (This configuration is located at  (Admin) > System > Global Notifications. Do not select Legacy Notifications.)
- Check the Global Audit Logging configuration.

Configure Global Audit Logging and Verify Global Audit Logs provide instructions. If you are sending audit logs to a Log Decoder:

- Ensure that the Log Decoder is aggregating on the Concentrator on the same host:

   (Admin) > Services > (Select Concentrator) >  > View > Config.
- Verify that the latest CEF parser is deployed and enabled.
- Check the audit logging notification template. You must use a CEF template and all logs feeding into the Log Decoder must use a CEF template.

If you are sending audit logs to a third-party syslog server, Ensure that the destination port configured for the third-party syslog server is not blocked by a firewall.

Advanced Troubleshooting

In order to use Global Audit Logging on your network, RabbitMQ must be functioning.

For centralized audit logging, each of the NetWitness services writes audit logs to rsyslog listening on port 50514 using UDP on the local host. The rsyslog plugin provided in the audit logging package adds additional information and uploads these logs to RabbitMQ. Logstash running on the NetWitness Server host aggregates audit logs from all of the NetWitness services, coverts them to the required format, and sends them to a third-party syslog server or Log Decoder for investigation. You configure the format of the global audit logs and the destination used by Logstash through the NetWitness user interface.

Define a Global Audit Logging Configuration provides instructions.

Verify the Packages and Services on the Hosts

NetWitness Host

The following packages or services must be present on the NetWitness Server host:

- rsyslog-8.4.1
- rsa-audit-rt
- logstash-5.6.4
- rsa-audit-plugins
- rabbitmq server

Services on a Host other than the NetWitness Host

The following packages or services must be present on each of the NetWitness hosts other than the NetWitness Server host:

- rsyslog-8.4.1
- rsa-audit-rt
- rabbitmq server

Log Decoder

If you forward global audit logs to a Log Decoder, the following parser should be present and enabled:

- CEF

Possible Issues

What if I perform an action on a service but audit logs do not reach the configured third-party syslog server or Log Decoder?

The possible causes could be one or all of the following:

- A service is not logging to the local syslog server.
- Audit logs are not getting uploaded to RabbitMQ from the local syslog.
- Audit logs are not aggregated on the NetWitness Server host.
- Aggregated logs on the NetWitness Server host are not being forwarded to the configured third-party syslog server or Log Decoder.

- The Log Decoder is not configured to receive global audit logs in CEF format:
  - Log Decoder capture is not turned on
  - CEF Parser is not present
  - CEF Parser is not enabled

Possible Solutions

The following table provides possible solutions for the issues.

Issue	Possible Solutions

A service is not logging to the local syslog server.	• Ensure that rsyslog is up and running.
	You could use the following command:
	`service rsyslog status`
	• Ensure that rsyslog is listening on port 50514 using UDP.
	You could use the following command:
	`netstat -tulnp|grep rsyslog`
	• Ensure the application or component is sending audit logs to port 50514. Run the tcpdump utility on the local interface for port 50514.
	You could use the following command:
	`sudo tcpdump -i lo -A udp and port 50514`
	See "Solution Examples" below to view the command outputs.

Audit logs are not getting uploaded to RabbitMQ from the local syslog.	• Ensure that the rsyslog plugin is up and running.
	You could use the following command:
	`ps -ef|grep rsa_audit_onramp`
	• Ensure the RabbitMQ server is up and running.
	You could use the following command:
	`service rabbitmq-server status`
	See "Solution Examples" to view the command outputs.

Audit logs are not aggregated on the NetWitness Server host.	• Ensure Logstash is up and running.
	You could use the following commands:
	`ps -ef|grep logstash`
	`service logstash status`
	• Ensure the RabbitMQ server is up and running.
	You could use the following command:
	`service rabbitmq-server status`
	• Ensure the RabbitMQ server is listening on port 5672.

Issue	Possible Solutions

	You could use the following command:
	`netstat -tulnp|grep 5672`
	• Check for any errors generated at the Logstash level.
	You could use the following command for the location of the log files:
	`ls -l /var/log/logstash/logstash.*`
	See "Solution Examples" to view the command outputs.

Aggregated logs on the NetWitness Server host are not being forwarded to the configured third-party syslog server or Log Decoder.	• Ensure Logstash is up and running.
	You could use the following commands:
	`ps -ef|grep logstash`
	`service logstash status`
	• Check for any errors generated at the Logstash level.
	You could type the following command for the location of the log files:
	`ls -l /var/log/logstash/logstash*`
	See "Solution Examples" below to view the command outputs.
	• Ensure that the destination service is up and running.
	• Ensure that the destination service is listening on the correct port using the correct protocol.
	• Ensure that the configured port on the destination host is not blocked.

Audit logs forwarded from the Logstash lead to parse failure at the Log Decoder.	• Ensure that you are using an appropriate notification template. Audit Logs parsed by a Log Decoder must be in CEF format. The destination from which audit logs directly or indirectly make their way to the Log Decoder must also use a CEF Template. • The Notification Template must follow the CEF standard. Follow the steps in this guide to either use the default CEF template or create a custom CEF template following strict guidelines. Define a Template for Global Audit Logging provides additional information. • Verify the Logstash configuration.

Why can't we see the custom metadata in Investigation?

Usually, if a meta key is not visible in Investigation, it is not being indexed. If you need to use custom meta keys for Investigations and Reporting, ensure that the meta keys that you select are indexed in the **table-map-custom.xml** file on the Log Decoder. Follow the "Maintain the Table Map Files" procedure to modify the **table-map-custom.xml** file on the Log Decoder.

Ensure that the custom meta keys are also indexed in the **index-concentrator-custom.xml** on the Concentrator. "Edit a Service Index File" provides additional information.

The following figure shows an example **table-map-custom.xml** file in NetWitness Server ((Admin) > Services > (select the Log Decoder) > >View > Config) with a custom meta `url` example highlighted.

The `url` custom meta example is highlighted in the following code sample from the **table-map-custom.xml** file above:

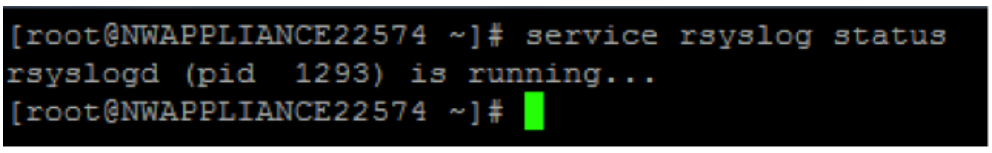
```
<mapping envisionName="url" nwName="url" flags="None"
envisionDisplayName="Url"/>
<mapping envisionName="protocol" nwName="protocol" flags="None"
envisionDisplayName="Protocol"/><mapping envisionName="cs_devservice"
nwName="cs.devservice" flags="None" envisionDisplayName="DeviceService"
/><mapping envisionName="cs_paramkey" nwName="cs.paramkey" flags="None"
envisionDisplayName="ParamKey" /><mapping envisionName="cs_paramvalue"
nwName="cs.paramvalue" flags="None" envisionDisplayName="ParamValue"
/><mapping envisionName="cs_operation" nwName="cs.operation" flags="None"
envisionDisplayName="Operation" /><mapping envisionName="sessionid"
nwName="log.session.id" flags="None" envisionDisplayName="sessionid"
/><mapping envisionName="group" nwName="group" flags="None"
envisionDisplayName="group" /><mapping envisionName="process" nwName="process"
flags="None" envisionDisplayName="process" /><mapping envisionName="user_
agent" nwName="user.agent" flags="None"/><mapping envisionName="info"
nwName="index" flags="None"/>
```

The following figure shows an example **index-concentrator-custom.xml** file in NetWitness Server ((Admin) > Services > (select the Concentrator) > > View > Config) with a custom meta `url` example highlighted.

The `url` custom meta example is highlighted in the following code sample from the **index-concentrator-custom.xml** file above:

```
<key description="Severity" level="IndexValues" name="severity"
```

```
valueMax="10000" format="Text"/><key description="Result" level="IndexValues"
name="result" format="Text"/><key level="IndexValues"  name="ip.srcport"
format="UInt16" description="SourcePort"/><key description="Process"
level="IndexValues" name="process" format="Text"/><key description="Process
ID" level="IndexValues" name="process_id" format="Text"/><key
description="Protocol" level="IndexValues" name="protocol" format="Text"/><key
description="UserAgent" level="IndexValues" name="user_agent"
format="Text"/><key description="DestinationAddress" level="IndexValues"
name="ip.dst" format="IPv4"/><key description="SourceProcessName"
level="IndexValues" name="process.src" format="Text"/><key
description="Username" level="IndexValues" name="username"
format="Text"/><key description="Info" level="IndexValues" name="index"
format="Text"/><key description="customdevservice" level="IndexValues"
name="cs.devservice"  format="Text"/>
<key description="url" level="IndexValues" name="url"  format="Text"/>
<key description="Custom Key" level="IndexValues" name="cs.paramkey"
format="Text"/><key description="Custom Value" level="IndexValues"
name="cs.paramvalue"  format="Text"/><key description="Operation"
level="IndexValues" name="cs.operation"  format="Text"/><key description="CS
Device Service" level="IndexValues" name="cs.device" format="Text"
valueMax="10000" defaultAction="Closed"/>
```



Solution Examples

The following possible solution examples show the outputs of the example commands. See the above table for the complete listing of possible solutions.

Ensure that rsyslog is up and running

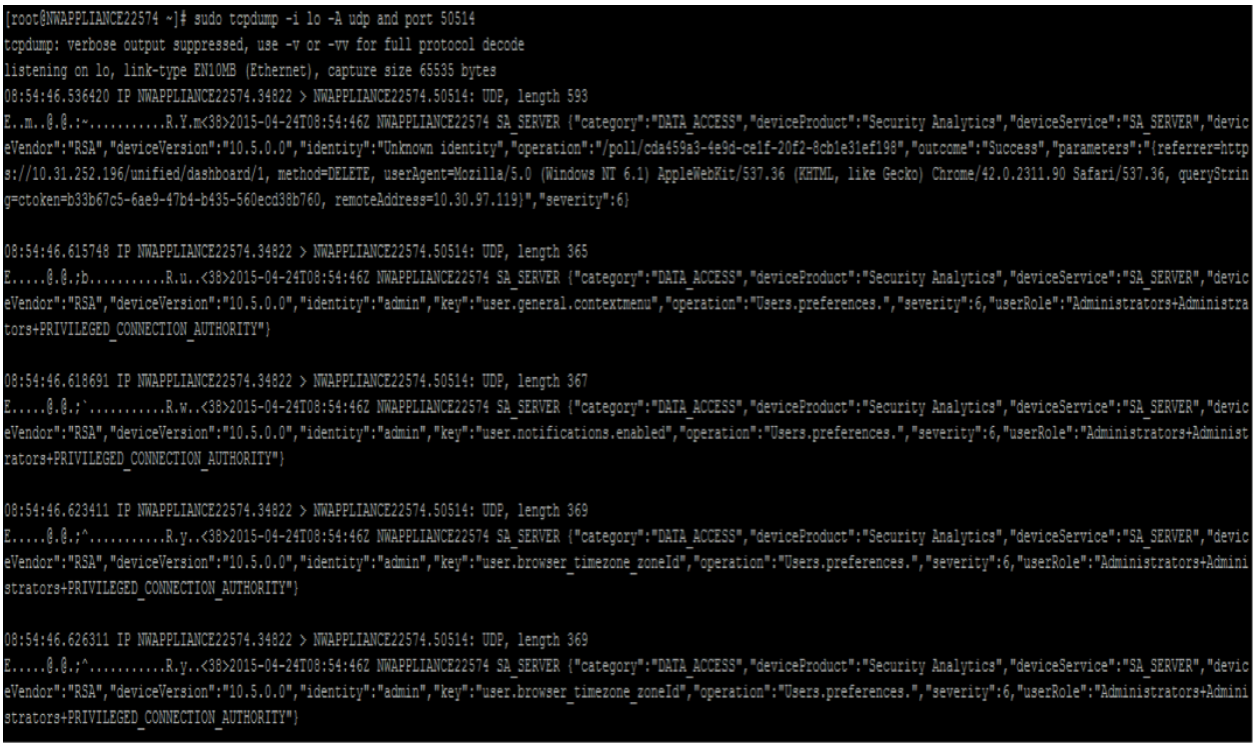
You can use the following command:

```
service rsyslog status
```

Ensure that rsyslog is listening on port 50514 using UDP

You can use the following command:

```
netstat -tulnp|grep rsyslog
```



```
[root@NWAPPLIANCE22574 ~]# netstat -tulnp|grep rsyslog
udp        0      0 127.0.0.1:50514             0.0.0.0:*                           1293/rsyslogd
[root@NWAPPLIANCE22574 ~]#
```

Ensure that the application or component is sending audit logs to port 50514

The following figure shows the output of running the tcpdump utility on the local interface for port 50514.

You can use the following command:

```
sudo tcpdump -i lo -A udp and port 50514
```

Ensure that the rsyslog plugin is up and running

You can use the following command:

```
ps -ef|grep rsa_audit_onramp
```

```
[root@NWAPPLIANCE22574 ~]# ps -ef|grep rsa_audit_onramp
root      1636  1293  0 06:05 ?        00:00:03 /usr/sbin/rsa_audit_onramp --node_id=96b08193-a9d0-4a79-b362-87b56851f411
root     22248  6921  0 09:09 pts/0    00:00:00 grep rsa_audit_onramp
[root@NWAPPLIANCE22574 ~]#
```

Ensure the RabbitMQ server is up and running

You can use the following command:

```
service rabbitmq-server status
```

```
[root@NWAPPLIANCE22574 ~]# service rabbitmq-server status
Status of node sa@localhost ...
[{pid,1862},
 {running_applications,
     [{rabbitmq_federation_management,"RabbitMQ Federation Management",
         "3.4.2"},
      {rabbitmq_management,"RabbitMQ Management Console","3.4.2"},
      {rabbitmq_web_dispatch,"RabbitMQ Web Dispatcher","3.4.2"},
      {webmachine,"webmachine","1.10.3-rmq3.4.2-gite9359c7"},
      {mochiweb,"MochiMedia Web Server","2.7.0-rmq3.4.2-git680dba8"},
      {rabbitmq_federation,"RabbitMQ Federation","3.4.2"},
      {rabbitmq_stomp,"Embedded Rabbit Stomp Adapter","3.4.2"},
      {rabbitmq_management_agent,"RabbitMQ Management Agent","3.4.2"},
      {rabbit,"RabbitMQ","3.4.2"},
      {ssl,"Erlang/OTP SSL application","5.3.2"},
      {public_key,"Public key infrastructure","0.21"},
      {crypto,"CRYPTO version 2","3.2"},
      {asn1,"The Erlang ASN1 compiler version 2.0.4","2.0.4"},

      {xmerl,"XML parser","1.3.5"},
      {sasl,"SASL  CXC 138 11","2.3.4"},
      {stdlib,"ERTS  CXC 138 10","1.19.4"},
      {kernel,"ERTS  CXC 138 10","2.16.4"}]},
 {os,{unix,linux}},
 {erlang_version,
     "Erlang R16B03 (erts-5.10.4) [source] [64-bit] [smp:2:2] [async-threads:30] [kernel-poll:true]\n"},
 {memory,
```

Ensure logstash is up and running

You can use the following commands:

```
ps -ef | grep logstash
service logstash status
```

```
[root@NWAPPLIANCE22574 ~]# ps -ef|grep logstash
logstash  1583     1  0 06:05 ?        00:01:09 /usr/bin/java -Djava.io.tmpdir=/var/lib/logstash -Xmx500m -XX:+UseParNewGC -XX:+UseConcMarkSweepGC -Djava.awt.headless=true -XX:C
MSInitiatingOccupancyFraction=75 -XX:+UseCMSInitiatingOccupancyOnly -jar /opt/logstash/vendor/jar/jruby-complete-1.7.11.jar -I/opt/logstash/lib /opt/logstash/lib/logstash/runner
.rb agent --pluginpath /opt/logstash -f /etc/logstash/conf.d -l /var/log/logstash/logstash.log
root      8509  6921  0 09:31 pts/0    00:00:00 grep logstash
[root@NWAPPLIANCE22574 ~]# service logstash status
logstash is running
[root@NWAPPLIANCE22574 ~]#
```

Ensure the RabbitMQ server is listening on port 5672

For example, type the following command:

```
netstat -tulnp | grep 5672
```

```
[root@NWAPPLIANCE22574 ~]# netstat -tulnp|grep 5672
tcp        0      0 127.0.0.1:5672              0.0.0.0:*                   LISTEN      1862/beam.smp
tcp        0      0 0.0.0.0:25672               0.0.0.0:*                   LISTEN      1862/beam.smp
[root@NWAPPLIANCE22574 ~]#
```

Check for any errors generated at the Logstash level

You can type the following command for the location of the log files:

```
ls -l /var/log/logstash/logstash.*
```

```
[root@NWAPPLIANCE22574 ~]# ls -l /var/log/logstash/logstash.*
-rw-r--r--. 1 root     root        0 Apr 24 06:05 /var/log/logstash/logstash.err
-rw-r--r--. 1 logstash logstash 1043 Apr 24 06:04 /var/log/logstash/logstash.log
-rw-r--r--. 1 root     root       57 Apr 24 06:12 /var/log/logstash/logstash.stdout
[root@NWAPPLIANCE22574 ~]#
```

See the Possible Solutions table above for the complete listing of issues and possible solutions.

Troubleshoot Issues identified in the NTP Settings Panel or Log Files Messages

This section provides troubleshooting information for issues identified by messages NetWitness displays in the NTP Settings panel and log files.

Issue	Possible Solutions
Message	User Interface: **Unexpected error occurred. First check the logs then contact Customer Care to resolve error.** **System Log:** **Timestamp Level Message** *yyyy-dd-mmThh:mm:ss:ms* ERROR com.rsa.smc.sa.adm.exception.MCOAgent Exception: No request sent, we did not discover any nodes
Possible Cause	Low level NetWitness configuration is in error or supporting service is not running.
Solution	Contact Customer Care.
Message	User Interface: **Specified an invalid Hostname syntax**.
Possible Cause	Tried to enter NTP server hostname that does not confirm to IP address or FQDN syntax.
Solution	Reenter hostname in using correct syntax.
Message	User Interface: **Specified NTP server that already exists.**
Possible Cause	Tried to enter NTP server hostname that is already defined in NetWitness.
Solution	Enter hostname for an NTP server not configured in NetWitness.
Message	User Interface: **Cannot reach NTP server *hostname***. Please verify the server address and your firewall settings.
Possible	The server address or firewall settings may be in error.

Issue	Possible Solutions
Cause	
Solution	Verify the server address and your firewall settings and correct them if required.

Troubleshoot Global Notifications

This topic provides information about possible issues that NetWitness users may encounter when implementing Global Notifications in NetWitness.

Issue	Possible Solution
We are not receiving notifications that were configured for a service, but the service log file does not show any errors.	For any notification-related troubleshooting, check the `integration-server log` file in addition to the log file of the service creating the notification. For example, when troubleshooting ESA rule notifications, check both the ESA Correlation service log files (`/var/log/netwitness/correlation-server/correlation-server.log`) AND the Integration-Server log files on the NetWitness Server (`/var/log/netwitness/integration-server/integration-server.log`). If the `integration-server.log` file shows a failure when the Integration-Server attempts to send a notification to the notification server, you should check the notification server configuration in the Global Notifications settings (**(Admin) > System > Global Notifications > Servers** tab).

References

This topic provides reference materials that describe the user interface for configuring system settings in NetWitness and define parameters. Administrators use options in the Administration System view to configure system settings. Each panel is described in a separate topic.

- Context Menu Actions Panel
- Legacy Notifications Configuration Panel

Global Audit Logging Configurations Panel

In the **Global Audit Logging Configurations** panel ((Admin) > **System** > **Global Auditing**), you configure global audit logging by adding configurations that define how global audit logs are forwarded to external syslog systems. Global audit logs are forwarded to the selected Notification Server in your global audit logging configuration using the selected Notification Template.

Global Audit Logging provides auditors with consolidated visibility into user activities within NetWitness in real-time from one centralized location.

Workflow

This workflow shows the necessary procedures to configure and verify Global Audit Logging.

Before you can define a Global Audit Logging configuration, you need to create a Syslog Notification Server on the **Global Notifications** > **Server** tab. The Syslog Notification Server is the destination that receives the global audit logs. Next, you need to select or define an Audit Logging template on the **Global Notifications** > **Templates** tab. The Audit Logging template defines the format and message fields of the audit logs sent to the Log Decoder or third-party syslog server. If you are consuming with a Log Decoder, deploy the Common Event Format parser to your Log Decoder from Live.

Note: You do not need to configure the Global Notifications > Output tab for Global Audit Logging.

After you add a Global Audit Logging configuration here, audit logs are forwarded to the selected Notification Server in the configuration. Verify your audit logs to ensure that they show the audit events as defined in your audit logging template.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Create a Syslog Notification Server.	Configure a Destination to Receive Global Audit Logs
Administrator	Choose an Audit Logging template.	Define a Template for Global Audit Logging

Role	I want to ...	Show me how
Administrator	Configure Global Audit Logging	Define a Global Audit Logging Configuration For the complete procedure, see "Global Audit Logging - High-Level Procedure" in Configure Global Audit Logging.
Administrator	Verify Global Audit logs	Verify Global Audit Logs

Quick Look

The following example illustrates a Global Audit Logging configuration. The configuration defines how NetWitness forwards global audit logs to external syslog systems.

1 Displays the Global Audit Logging Configurations panel.
2 Name that identifies the Global Audit Logging configuration.
3 Notification Server assigned to the Global Audit Logging configuration.
4 Notification Template assigned to the Global Audit Logging configuration.
5 Displays the Global Notifications panel where you set up Servers and Templates required to configure a Global Audit Logging configuration.

Toolbar

The following table describes the toolbar actions

Icon	Description
+	Adds a global audit logging configuration.
-	Deletes a global audit logging configuration. Deleting a global audit configuration does not delete the associated notification server and template. After you delete a global audit logging configuration, the forwarding of global audit logs specified in that configuration is discontinued.

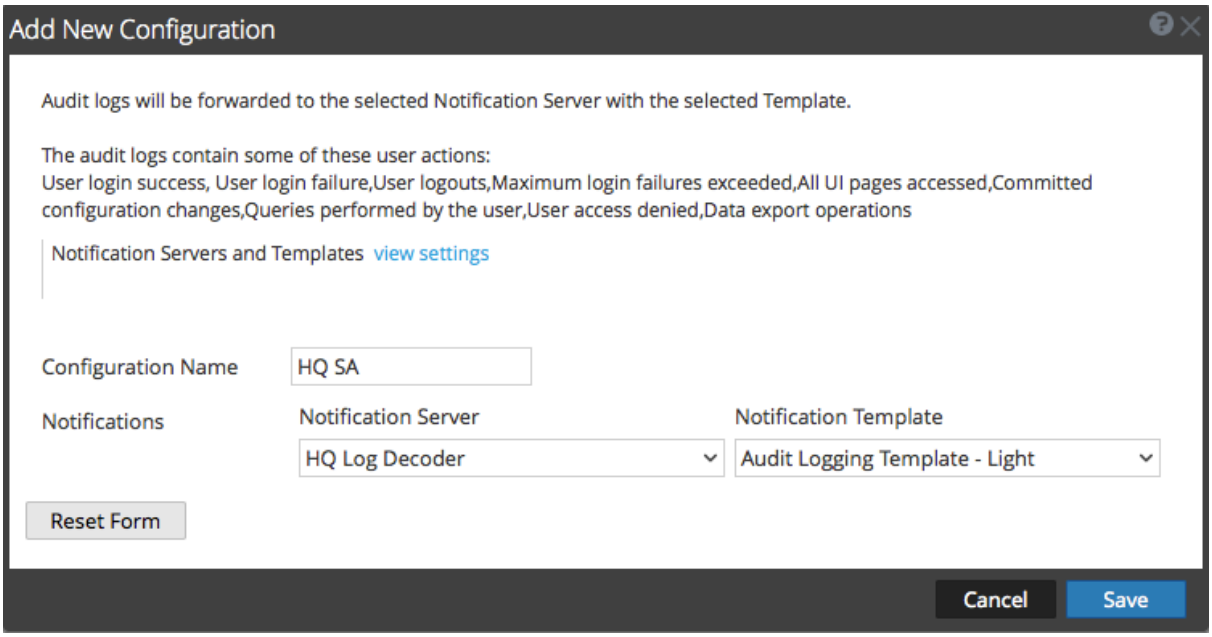
Icon	Description
	Edits a global audit logging configuration. You can change the destination of the global audit logs for your user audits by selecting a different Notification Server. You can also change the format and message fields of the global audit log entries by selecting a different Notification Template. You cannot change which NetWitness user actions are logged and sent in the global audit logs.

Configurations

The following table describes the listed configurations.

Title	Description
	To select an individual configuration, select the checkbox next to the configuration. To select all configurations, select the checkbox in the title bar of the table.
Name	Displays the name of the global auditing configuration. For example, you can name the configurations based on the destination of the global audit logs, such as HQ SA and My Syslog Server.
Notification Server	Displays the Syslog Notification Server selected as the destination for the global audit logs. If you want to forward global audit logs to a Log Decoder, create a Syslog type of Notification Server. Configure a Destination to Receive Global Audit Logs provides instructions on how to create a Syslog Notification Server for global audit logging.
Notification Template	Displays the Audit Logging Notification Template selected for the configuration. It defines the format and message fields of the audit log entries. For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions and Supported CEF Meta Keys describes the available CEF meta keys. For, third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available meta key variables.

Add New Configuration Dialog



In the NetWitness Platform XDR, Administration System view Global Audit Logging Configurations panel, you can create multiple global audit logging configurations. These configurations are used to forward global audit logs to a central location to perform user audits.

Procedures related to global audit logging are described in Configure Global Audit Logging.

To access the **Add New Configuration** dialog:

1. Go to select **(Admin)** > **System**.
2. In the options panel, select **Global Auditing**.
3. In the **Global Audit Logging Configurations** panel, click .

   The **Add New Configuration** dialog is displayed.

   The Notifications section enables you to select a syslog notification server for the global audit logging configuration and a template to use for the global audit logs. The template defines the details of the global audit log entries.

Features

The following table describes the features in the Add New Configuration and Edit Configuration dialogs.

Feature	Description
Notifications Servers and Templates **view settings** link	Takes you to the Global Notifications panel where you can view or configure the notification server and template settings. A syslog notification server and an audit logging template are required before you can create a global audit configuration.
Configuration Name	Specifies the unique name used to identify the global audit logging configuration.
Notification Server	Specifies the syslog notification server to send the selected audit log information. Configure a Destination to Receive Global Audit Logs provides instructions on how to create a Syslog Notification Server for global audit logging.
Notification Template	Specifies the template to use for the global audit logging configuration. The template should be an Audit Logging template. For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions. For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.
Reset Form button	Clears the configuration settings in the dialog.

User Actions Logged

The following table provides examples of some of the user actions logged from NetWitness. These actions are the minimum user actions logged when applicable.

User Action	Example
User login success	A user logs on with valid credentials.
User login failure	A user tries to log on using invalid credentials.
User logouts	A user logs out from NetWitness (Administration > Sign Out) or a user logs out due to a session timeout.
Max login failures exceeded	A user tries to log on using invalid credentials five times. Five (5) is the number of Max Login Failures defined in Administration Security view > Settings tab (Administration > Security > Settings tab).
All UI pages accessed	When a user accesses the Reporting module (Administration > Reports), it logs as `[REP] Reports`. When a user accesses the Administration System view (Administration > System), it logs as `[ADM] System`.

User Action	Example
Committed configuration changes	A user changes his or her password and or any security setting (Administration > Security > Settings tab).
Queries performed by the user	A user performs an investigation query.
User access denied	A user tries to access a module and does not have permissions to access it.
Data export operations	A user exports data from the Events view (Investigation > Events > Actions > Export).

The following table shows examples of internal audit logs logged from NetWitness

User Actions	Audit Log Examples

For lists of message type being logged by the various NetWitness components, see Global Audit Logging Operation Reference.

Supported CEF Meta Keys

This topic describes the Common Event Format (CEF) meta keys that NetWitness global audit logging supports.

Global audit logging templates that you define for a Log Decoder use Common Event Format (CEF) and must meet the following specific standard requirements:

- Include the CEF headers in the template.
- Use only the extensions and custom extensions in a (Key=Value) format from the meta key table below.
- Ensure that the extensions and custom extensions are in the `key=%{string}<space>key=%{string}` format.

For third-party syslog servers, you can define your own format (CEF or non-CEF).

Procedures related to this table are described in Define a Template for Global Audit Logging and Configure Global Audit Logging.

Supported Common Event Format (CEF) Meta Keys

The following table describes the CEF Syslog meta keys that NetWitness global audit logging supports. The Datetime and Hostname fields in the Syslog Prefix are not configurable and not included in the template, but they are prepended to every log message by default. The CEF Header is required to conform to the CEF standard and for any CEF parser. The Extensions and Custom Extensions are optional. The Default Audit CEF Template contains many of the fields in this table. You can add any of the Extensions and Custom Extensions listed to the global audit logging template that you define.

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
Syslog Prefix				
Datetime	Not Configurable	Syslog Header date time	event.time.str	Transient
Hostname	Not Configurable	Syslog Header hostname	alias.host	None
CEF Header		The CEF Header fields are required to conform to the CEF standard and for any CEF parser.		
CEF:Version	CEF:0	CEF Header	--STATIC--	N/A
DeviceVendor	%{deviceVendor}	The product vendor, NetWitness	-	N/A
DeviceProduct	%{deviceProduct}	The product family. This is always NetWitness Audit.	product	Transient
DeviceVersion	%{deviceVersion}	Host/Service version	version	Transient

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
Signature ID	%{category}	Identifier of the audit event. It specifies the the category of the audit event.	event.type	None
Name	%{operation}	Description of the event	event.desc	None
Severity	%{severity}	Severity of the audit event	severity	Transient
Extensions				
deviceExternalId	%{deviceExternalId}	Unique ID of the host or service generating the audit event	hardware.id	Transient
deviceFacility	%{deviceFacility}	Syslog facility used when writing the event to syslog daemon. For example, authpriv.	cs.devfacility	Custom
deviceProcessName	%{deviceProcessName}	Name of the executable corresponding to dvcpid	process	None
dpt	%{destinationPort}	Destination Port	ip.dstport	None
dst	%{destinationAddress}	Destination IP Address	ip.dst	None
dvcpid	%{deviceProcessId}	ID of the process generating the event, which is the process ID of the NetWitness service	process.id	Transient
msg	%{text}	Free text, extra information, or actual description for the event	msg	Transient
outcome	%{outcome}	Outcome of the operation performed corresponding to the audit event	result	Transient
tpt	%{transportProtocol}	Network protocol used	protocol	Transient
userAgent	%{userAgent}	Browser detail of the user accessing the page	user.agent	Transient
rt	%{timestamp}	Time at which the event is reported	event.time	None
sourceServiceName	%{deviceService}	The service that is responsible for generating this event	service.name	Transient

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
spt	%{sourcePort}	Source Port	ip.srcport	Transient
userRole	%{userRole}	User role permissions assignment. For example: admin.owner, appliance.manage, connections.manage, everyone, logs.manage, services.manage, storedproc.execute, storedproc.manage, sys.manage, users.manage	user.role	Transient
src	%{sourceAddress}	Source IP Address	ip.src	None
suser	%{identity}	Identity of the logged on user responsible for generating the audit event	user.dst	None
Custom Extensions				
params	%{parameters}	API and Operation parameters, which capture specific parameters about a query	index	Transient
paramKey	%{key}	A configuration item key. It is the config param for which the audit event is captured. For example: /sys/config/stat.interval	obj.name	None
paramValue	%{value}	A configuration value. It is the value captured during the update.	no meta key	Custom
userGroup	%{userGroup}	Role assignment. For example: Administrators, Analysts, MalwareAnalysts, Malware_Analysts, Operators, PRIVILEGED_CONNECTION_AUTHORITY, SOC_Managers	group	None

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
referrerURL	%{referrer}	The parent URL that refers to the current URL	referer	None
sessionId	%{sessionId}	Session or connection identifier	log.session.id	Transient
remoteAddress	%{remoteAddress}	Ip address of the destination	ip.src	None
reasonForFailure	%{reasonForFailure}	reason for failure for the certain action performed	result	None
reason	%{reason}	Reason for certain action performed	result	None
addRole	%{Add.Role}	User role Assignment	user.role	Transient
id	%{id}	Incident id or host id	no meta key	Transient
arguments	%{arguments}	Value passes between programs or functions	index	Transient
uri	%{uri}	Directory	directory	None
user	%{User}	Name of the user from the source or destination	user.dst	None
accountProvider	%{AccountProvider}	Authentication account for the user. For example, PAM, and PKI.	index	Transient
file	%{file}	Name of the content file used for deployment	filename	File
deviceIDs	%{deviceIDs}	Device id for the particular service	hardware.id	Transient
role	%{Role}	User role assignment	user.role	Transient
account	%{Account}	user account	user.dst	None
addPermission	%{Add.Permission}	User role permission assignment	permissions	Transient
key	%{Key}	Name of a configuration/rule	obj.name	None
value	%{Value}	Value of a configuration change. For example, "Value":"HR12". In this example, hours format is changed to 12 hours.	no meta key	Custom

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
alert	%(alert}	Id of the alert, For example, id:5ce457afec6c0f02ffb85ace	alert	Transient
moduleSettings	%{ModuleSettings}	Message or name of a setting	index	Transient
incident	%{incident}	Id of the incident. For example, INC-313	context	None
action	%{action}	Action performed by the user. For example, service.stop	action	None
notificationBinding	%{NotificationBinding}	Type of notification. For example, incident created, alert, incident removed	index	Transient
name	%{name}	name of a configuration or rule	alert	Transient
enabled	%{enabled}	Enable the rule	no meta key	Custom
disabled	%{disabled}	Disable the rule	no meta key	Custom

Note: Use all of the extensions in the following format:
`deviceProcessName=%{deviceProcessName} outcome=%{outcome}`
Include a `<space>` between a value and a tagname.

By default, all meta keys are not indexed. In the above table, the **Index in Log Decoder** column shows the state of the `flags` keyword (Transient, None, and Custom). If a key is set to `Transient`, it is parsed but not stored in the database. If it is set to `None`, it is indexed and stored in the database. A key listed as "Custom" does not exist in the table-map.xml file and, therefore, it is not stored or parsed at all.

For more information, see the following documentation:

- The "Maintain the Table Map Files" section in the "Hosts and Services Procedures" topic in the *Hosts and Services Getting Started Guide* provides instructions for verifying and updating the table mappings.
- The "Edit a Service Index File" section in the "Hosts and Services Procedures" topic in the *Hosts and Services Getting Started Guide* provides information on updating the custom index file on the Concentrator.

Supported Global Audit Logging Meta Key Variables

This topic describes the meta key variables that NetWitness global audit logging supports.

NetWitness provides predefined global audit logging templates that you can use for your global audit logging configurations. For third-party syslog servers, you can define your own template format (CEF or non-CEF) using supported meta key variables.

Procedures related to this table are described in Define a Template for Global Audit Logging and Configure Global Audit Logging.

Supported Global Audit Logging Meta Key Variables

The following table describes the meta key variables that NetWitness global audit logging supports. Use these values to create a custom audit logging template for a third-party syslog server.

Variable	Description
%{category}	Identifier of the audit event. It specifies the the category of the audit event.
%{destinationAddress}	Destination IP Address
%{destinationPort}	Destination Port
%{deviceExternalId}	Unique ID of the service generating the audit event
%{deviceFacility}	Syslog facility used when writing the event to syslog daemon. For example, authpriv.
%{deviceProcessId}	ID of the process generating the event, which is the process ID of the NetWitness service
%{deviceProcessName}	Name of the executable corresponding to dvcpid
%{deviceProduct}	The product family. This is always NetWitness Audit.
%{deviceService}	Service responsible for generating the event
%{deviceVendor}	The product vendor, RSA
%{deviceVersion}	Host/Service version
%{identity}	Identity of the logged on user responsible for generating the audit event
%{key}	A configuration item key. It is the config param for which the audit event is captured.
%{operation}	Description of the event

Variable	Description
%{outcome}	Outcome of the operation performed corresponding to the audit event
%{parameters}	API and Operation parameters, which capture specific parameters about a query
%{referrerUrl}	The parent URL that refers to the current URL
%{sessionId}	Session or connection identifier
%{severity}	Severity of the audit event
%{sourceAddress}	Source IP Address
%{sourcePort}	Source Port
%{sourceService}	The service that is responsible for generating this event
%{text}	Free text, extra information, or actual description for the event
%{timestamp}	Time at which the event is reported
%{transportProtocol}	Network protocol used
%{userAgent}	Browser detail of the user accessing the page
%{userGroup}	Role assignment
%{userRole}	User role permissions assignment
%{value}	A configuration value. It is the value captured during the update

Global Audit Logging Operation Reference

This topic lists message types being logged by the various NetWitness components. Most messages plainly state the operation being logged; when necessary the meaning of the message is explained.

After you create a global audit logging configuration, audit logs automatically go to the external syslog system in the format specified in the selected audit logging template. The message types being logged by the various NetWitness components are shown in the following tables.

CARLOS

The following table lists the operations logged by CARLOS.

Serial #	Operation Name	Meaning
1	SetProviderConfiguration	A new notification server (for example, SMTP server) was added or updated
2	SetInstanceConfiguration	A new notification type (for example, email destination) was added or updated
3	SetTemplateDefinition	A new template was added or updated
4	RemoveProviderConfiguration	A notification server was removed
5	RemoveInstanceConfiguration	A notification type was removed
6	RemoveTemplateDefinition	A template definition was removed
7	Commit	A configuration bean change was committed
8	Set	A JMX property value was set via NetWitness Explore view

ESA

The following table lists the operations logged by the Event Stream Analysis (ESA).

Serial #	Operation Name	Meaning
9	SetSourceRequest	A concentrator was added or updated to ESA as source
10	RemoveSourceRequest	A concentrator was removed from ESA as source
11	SetEplModule	An EPL module was deployed or updated to ESA
12	RemoveEplModule	An EPL module was removed from ESA

Serial #	Operation Name	Meaning
13	SetEnrichmentSourceRequest	An ESA enrichment source was added/updated
14	RemoveEnrichmentSourceRequest	An ESA enrichment source was removed
15	SetDatabaseReference	An enrichment database reference was made to ESA
16	UpdateEnrichmentData	Data rows added to an ESA enrichment source
17	SetEnrichmentConnection	A connection was made between an EPL module and an enrichment source
18	RemoveEnrichmentConnection	A connection between an EPL module and an enrichment source was removed
19	DisableTrialModule	ESA Trial rules were disabled

Investigation

The following table lists the operations logged by Investigations.

Serial #	Operation Name	Meaning
1	VisualizePreferences	Operations related to Informer Visualization Request.
2	ParallelCoordinates	Operations related to Loading of Co-Ordinate View Navigation.
3	TimeLine	Operations related to Loading of Timeline View Navigation.
4	ExteralQuery	Operation when a Direct Query is fired via URL.
5	PrintView	Operations to open Investigation in Print View.
6	submitExtractFiles	Operation to submit a Request to Extract files from Sessions.
7	submitExtractLogs	Operation to submit a Request to Extract Logs from Sessions.
8	submitExtractPcap	Operation to submit a Request to Extract Sessions from Sessions.
9	DataScienceDrill	Operation to investigate from Data Science Report.
10	breadCrumbs	Operation to access the Query Breadcumbs.
11	Create	Operation when a new Investigation Query is being saved as a predicate to be used for URL Integration.
12	userPredicates	Operation to access Recent Queries of a user.

Serial #	Operation Name	Meaning
13	chartDefaultMetas	Operation to access last used Meta for generating Coordinate Chart.
14	defaultDevice	Operation to access the Default Investigation Device.
15	deleteDefaultDevice	Operation to delete the Default Investigation Device.
16	chartPreferences	Operation to edit an Investigation Navigation Chart Parameters such as Height.
17	devicePreferences	Operation to save the preferences about the Investigation Device such asTime Range, Profile, Meta Groups etc.
18	topValues	Operation to get the Top Values for Metas. Normally called from Top Values Dashlet.
19	MetaLanguages	Operation to read the Meta Languages from a Device.
20	MetaGroups	Operations related to Investigation Meta Groups.
21	DefaultMetaKeys	Operations related to Investigation Default Meta Keys.
22	UpdateDefaultMetaKeys	Operations to update Investigation Default Meta Keys.
23	UpdateMetaGroup	Operations to update Investigation Meta Groups.
24	ApplyMetaGroup	Operations to use Investigation Meta Groups.
25	DeactivateMetaGroup	Operations to reset Investigation Meta Groups in UI.
26	DeleteMetaGroup	Operations to remove Investigation Meta Group.
27	DeleteMetaGroups	Operations to remove multiple Investigation Meta Groups.
28	ImportMetaGroups	Operations to import Investigation Meta Groups.
29	ExportMetaGroup	Operations to export multiple Investigation Meta Groups.
30	GeoMap	Operation to access the Geo Map View of Investigation.
31	deleteEndpointCache	Operation to clear Reconstruction Cache of a Device.
32	delete	Operation to delete Alert Templates.
33	CustomColumnGroup	Operation to apply or read Custom Column Group.
34	Import	Operations related to Import of Column Group or Profiles.
35	Export	Operations related to Export of Column Group or Profiles.
36	SaveProfile	Operation to save an Investigation Profile.
37	ApplyProfile	Operation to apply an Investigation Profile.

Serial #	Operation Name	Meaning
38	DeactivateProfile	Operation to deactivate an Investigation Profile.
39	DeleteProfile	Operation to delete an Investigation Profile.
40	DeleteProfiles	Operation to delete multiple Investigation Profiles.

Reporting Engine

The following table lists the operations logged by the Reporting Engine.

Serial #	Operation Name	Meaning
1	TEMPLATE	For all operations related to template
2	CHART	For all operations related to chart
3	REPORT	For all operations related to report
4	RULE	For all operations related to rule
5	IMAGE	For all operations related to Logo Images used in Reports.
6	LIST	For all operations related to list
7	ALERT	For all operations related to alert
8	CONFIG	For all operations related to configuration change
9	SCHEDULE	For all operations related to schedule
10	ROLE	For all operations related to role/authorization
11	BATCH_JOB	For all operations related to batch jobs
12	SCHEDULER	For all operations related to scheduler
13	QUERYPROCESSOR	For all operations related to queryprocessor
14	FORMATTER	For all operations related to formatter
15	OUTPUTACTION	For all operations related to outputaction
16	STATUSMANAGER	For all operations related to statusmanager
17	BATCH_RUNDEF	For all operations related to batch rundef
18	CHARTGROUP	For all operations related to chart group
19	REPORTGROUP	For all operations related to report group
20	RULEGROUP	For all operations related to rule group

Serial #	Operation Name	Meaning
21	LISTGROUP	For all operations related to list group
22	DISKSPACE	For all operations related to disk space

Warehouse Connector

The following table lists the operations logged by the Warehouse Connector.

Serial #	Operation Name	Meaning
1	LockBox Password Create	Operation to create LockBox Password.
2	LockBox Password Update	Operation to update LockBox Password.
3	LockBox Password Refresh	Operation to refresh LockBox Password.
4	Adding Stream	Operation to add a Stream.
5	Adding Source	Operation to add a Source.
6	Adding Destination	Operation to add a Destination.
7	Removing	Operation to remove a Source, Stream, or Destination.
8	Changing Password	Operation to change the Password.
9	Updating Source	Operation to update a Source.
10	Adding Source to Stream	Operation to add a Source to a Stream.
11	Deleting Source from Stream	Operation to delete a Source from a Stream.
12	Setting Destination to Stream	Operation to set a Destination to a Stream.
13	Finalizing Stream	Operation to finalize a Stream and initiate the aggregation.
14	Stopping Stream	Operation to stop a Stream.
15	Starting Stream	Operation to start a Stream.
16	Reloading Stream	Operation to reload a Stream.

Health & Wellness

The following table lists the operations logged by Health & Wellness.

Serial #	Operation Name	Meaning
1	SavePolicyRequest	Operation while adding or modifying a Policy.
2	RemovePolicyRequest	Operation while removing a Policy.

NetWitness Core Services

The following table lists the operations logged by NetWitness Core Services.

Serial #	Operation Name	Meaning
1	FILE-Command	Operation to list, retrieve and delete files from approved directories on this device.
2	SERVICE-Start	Service started
3	SERVICE-Stop	Service stopped
4	REDIRECT-Syslog	Operation for syslog forwarding.
5	ADD-Monitor	Issuing a filesystem monitor operation
6	DELETE-Monitor	Issuing a filesystem monitor deletion operation
7	SHUTDOWN-Service/shutdown.service	Shutting down appliance service
8	REBOOT-Service	Restarting appliance service
9	CONFIGURE-Network	Issuing Network Configuration change
10	SET-NTP	Issuing NTP set operation
11	STOP-NTP	Issuing NTP stop operation
12	NTP-Timesync	Issuing NTP time sync operation
13	SET-SNMP	Issuing SNMP set
14	UPGRADE/upgrade	Issuing upgrade operation
15	create.collection	Operation to create an empty collection.
16	restore	Issuing restore
17	session.aggregation	Issuing aggregation start/stop
18	add.device	Adding a device for aggregation
19	edit.device	Editing a device used for aggregation
20	delete.device	Deleting a device used for aggregation
21	capture.start	Starting capture operation
22	capture.stop	Stopping capture operation
23	select.interface	Selecting capture interface
24	export	Operation to export packets or sessions.

Serial #	Operation Name	Meaning
25	reload	Issuing a parser reload
26	schema	Issuing a schema request for loaded parsers
27	upload/file.upload	Issuing file upload
28	notify	Issuing feed notify
29	delete	Issuing file deletion
30	edit.config	Configuration change operation
31	parsers.transforms	Perform a language key transformation
32	data.reset	Data reset operation
33	timeout	REST request timeout
34	cancel	Cancel a running query
35	timeroll	Operation to delete the database files that exceed a given limit.
36	dump	Operation to dump information out of the database in nwd formatted files.
37	session.wipe	Issuing a session wipe operation
38	REPLACE-Rule	Issuing a rule replace operation
39	MERGE-Rule	Issuing a rule merge operation
40	ERASE-Rule	Issuing deletion of a set of all rules
41	ADD-Rule	Issuing a rule addition operation
42	DELETE-Rule	Issuing deletion of a set of rules
43	sdk.info	Issuing SDK summary info.
44	sdk.session	Issuing SDK session info.
45	sdk.language	Issuing SDK language
46	sdk.aliases	Issuing SDK alias request
47	sdk.transform	Issuing SDK transformation request
48	sdk.search	Issuing session content search request
49	sdk.cache	Operation related to session content cache
50	sdk.content	Issuing session content request

Serial #	Operation Name	Meaning
51	check.authorization	Operation to check user roles for permissions to execute an operation.
52	close.connection	Issuing a connection close operation
53	handshake	Issuing an SSL handshake
54	logon/login	Operation to login from NW to the other services, mostly to privileged users.
55	STOREDPROCOP	Issuing file upload cancel/start
56	ADD-Task	Added scheduled task
57	DELETE-Task	Deleted scheduled task
58	logoff	Issuing logout operation
59	list.cacerts	Issuing list trusted CA certificate operation
60	delete.cacerts	Issuing delete trusted CA certificate operation
61	add.cacerts	Issuing addition of trusted CA certificate operation
62	restart.command	Issuing restart command line option
63	delete.file/file.delete	Operation to delete system configuration files.
64	update.file/file.update	Operation to update system configuration file.
65	create.file	Issuing file creation operation
66	query	Issue a database query
67	unlock	Issuing unlock user account operation
68	user.add	Operation to create user accounts on individual devices.
69	user.delete	Operation to delete a user on individual devices.
70	group.create	Operation to add a new group to the system.
71	user.remove	Remove a user account from a group
72	group.delete	Delete a group from the /users/groups tree
73	add.user	Issuing add user command to collection
74	delete.user	Issuing delete user command to collection
75	remove.user	Removing an user from collection
76	collection.open	Issuing an open command for a collection

Serial #	Operation Name	Meaning
77	collection.close	Issuing a close command for a collection
78	collection.delete	Issuing collection deletion command
79	reingest.start	Operation to start reingesting of packet data in collection.
80	feed.notify	Issuing a feed notify command
81	collect	Issuing a collect command
82	collect.start	Issuing a data collection start
83	collection.global	Issuing import parser command
84	parser.reload	Issuing parser reload command
85	reingest	Operation to reingest packet data in collection.
86	collection.create	Issuing a create collection command
87	collection.restore	Issuing a restore collection command
88	collection.clone	Issuing a clone collection command
89	parser.reload	Issuing parser reload command
90	sdk.query	Performs a query against the meta database
91	sdk.msearch	Search for pattern matches in many sessions or packets
92	sdk.values	Performs a value count query and returns the matching values for a report
93	sdk.timeline	Returns the count of sessions/size/packets in discrete time intervals

Malware Analysis

The following table lists the operations logged by the Malware Analysis (MA) component.

Serial #	Operation Name	Meaning
1	GetDashBoardSummaryRequest	Get dashboard analysis statistics
2	GetFileScoreSummaryRequest	Get aggregated file scores by score type and risk level
3	CountEventsAndFilesRequest	Get count of events and files over a time frame
4	GetAvVendorDetectionRequest	Get AV vendor analysis results

Serial #	Operation Name	Meaning
5	GetAVVendorsRequest	Get list of AV Vendors supported
6	SetInstalledAVVendors	Request Update list of installed AV Vendors in config
7	CountEventByCriteriaRequest	Count events by criteria
8	FindEventByIdRequest	Get event by id
9	FindEventByCriteriaRequest	Get event by criteria
10	DeleteEventRequest	Delete event
11	CommentOnEventRequest	Add comment to event
12	ReSubmitEventRequest	Resubmit event for analysis
13	FindEventScoreByIdRequest	Get event score by event id
14	FindEventScoreByCriteriaRequest	Get event score by criteria
15	FindMetaByIdRequest	Get meta by id
16	FindMetaByCriteriaRequest	Get meta by criteria
17	FindMetaValueByCriteriaRequest	Get meta value by criteria
18	CountByDistinctMetaValueRequest	Count distinct meta values
19	CountByMetaNameAndValueWithDate RangeIntervalRequest	Count meta and values with interval for charting
20	CountByValueAndAverageOverallScore Request	Count meta and map to overall scores for events
21	CountByValueAndAverageGroupScore Request	Count meta and map to group scores for events
22	CountFileEntryByCriteriaRequest	Count files by criteria
23	FindFileEntryByIdRequest	Get file by id
24	FindFileEntryByCriteriaRequest	Get file by criteria
25	ReSubmitFileEntryRequest	Resubmit file for analysis
26	FileDownloadRequest	Download file from repository
27	FileUploadRequest	Upload file for analysis
28	FindFileScoreByIdRequest	Get file score by id
29	FindFileScoreByCriteriaRequest	Get file score by criteria

Serial #	Operation Name	Meaning
30	FindHashValueByIdRequest	Get whitelist/blacklist Hash value by id
31	FindHashValueByCriteriaRequest	Get whitelist/blacklist Hash value by criteria
32	AddHashValueRequest	Add whitelist/blacklist Hash value
33	UpdateHashValueRequest	Update whitelist/blacklist Hash value
34	DeleteHashValueRequest	Delete whitelist/blacklist Hash value
35	FindHashValueByMd5Request	Find whitelist/blacklist Hash value by md5
36	AddHashValueInFileRequest	Add File to repository as well as hash value
37	GetDefaultRulesRequest	Get default IOC Rules configuration
38	ResetToDefaultRulesRequest	Reset IOC Rules configuration to default
39	GetAllOverrideRulesRequest	Get IOC Rules user created override configuration
40	FindOverrideRuleByIdRequest	Find IOC override rule by id
41	AddOverrideRuleRequest	Add IOC override rule
42	UpdateOverrideRuleRequest	Update IOC override rule
43	DeleteOverrideRuleRequest	Delete IOC override rule
44	SubmitOnDemandNextGenRequest	Submit new ondemand nextgen scan
45	FindOnDemandJobEntryByIdRequest	Get ondemand job entity by id
46	FindOnDemandJobEntryByCriteria Request	Get ondemand job entity by criteria
47	GetOnDemandJobInfoRequest	Get ondemand job reference entity by id
48	GetOnDemandDefaultConfiguration	Request Get ondemand default configuration
49	CancelOnDemandJobRequest	Cancel ondemand job in progress
50	DeleteOnDemandJobRequest	Delete ondemand job
51	ReSubmitOnDemandJobRequest	Resubmit ondemand job
52	SubscriptionRequest	Subscribe to MA Cloud communication
53	UnSubscribeRequest	Unsubscribe from MA Cloud communication
54	GetTopEventInfluencesRequest	Get Top N event influences

Serial #	Operation Name	Meaning
55	GetServerInfoRequest	Get server info, such as server time
56	DataResetRequest	Reset database
57	OnDemandJobStatusNotification	Report ondemandjob progress to subscribers
58	LicenseStatusNotification	Report license status - num samples analyzed
59	DataResetNotification	Report that data was reset
60	GetIocSummaryRequest	Get IOC rules aggregated by event/file scores
61	FindAlertTemplatesByCriteriaRequest	Get rabbitmq alert templates by criteria
62	SaveAlertTemplateRequest	Update alert template
63	DeleteAlertTemplateRequest	Delete alert template
64	GetJobStatusRequest	Get in progress job analysis thread status
65	GetEventTypeCountSummaryRequest	Get event analysis counts by date chart
66	Logon	Logon to the MA Service
67	Modified	Modifying config changes
68	GetNextGenSummaryRequest	Get nextgen dashboard summary statistics

NetWitness User Interface

The following table lists the operations logged by the NetWitness User Interface component.

Serial #	Operation Name	Meaning
1	uploadTrialLicense	Upload Trial License
2	LicenseEntitle	Entitle License
3	LicenseDeactivation	Deactivate License
4	ExpiredLicense	License Expired
5	LicenseOutOfComplianceAcknowledgement	EULA Acknowledgement
6	resetLicense	Reset License
7	usageDateExport	License data usage - csv/pdf

Serial #	Operation Name	Meaning
8	refreshLicense	Refresh LLS license
9	LicenseOutOfCompliance	Out of Compliance
10	OOTBEntitlementOutOfCompliance	OOTB Trial license Out of Compliance
11	OOTBEntitlementFirstLoginTimeModified	OOTB time modified
12	OOTBEntitlementFileDeleted	OOTB File deleted
13	OOTBEntitlementDataTampering	OOTB data tampering
14	uploadOfflineResponse	Upload offline response
15	offlineDownloadCapRequest	Download offline request
16	movePerpetualToThroughput	Move Appliance license to Throughput
17	moveThroughputToPerpetual	Mover Throughput to Appliance license
18	mapApplianceLicense	Map Service to Real license
19	delete	Operation to delete Alert Templates.
20	HttpRequest	Operation for Audit Logging of the accessed URL.
21	Page Accessed	Operation for Audit Logging of the accessed page.
22	Navigate	Operation to navigate to the accessed page.
23	Events	Operation to view the accessed event page.
24	Recon	Operation for Event Reconstruction requested.
25	Services	Operation while reading the list of available devices for investigation.
26	Service	Operation for a List of devices requested to be investigated.
27	Collections	Operation to view the list of collections requested.
28	Profiles	Operation to apply a Profile.
29	ColumnGroups	Operation to apply or read Column Group.

Serial #	Operation Name	Meaning
30	ParallelCoordinates	Operations related to Loading of co-ordinate view navigation.
31	Timeline	Operations related to loading of timeline view navigation.
32	PrintView	Operations to open investigation in print view.
33	Preferences	Operations related to Informer Request.
34	import	Operations related to Import of Column Group or Profiles.
35	export	Operations related to Export of Column Group or Profiles.
36	Predicate	Operations related to Queries (Predicates) used for Investigation.
37	Languages	Operation for Language requested from a Device.
38	CancelLanguageLoad	Operation for Language Load Canceled from Navigate Page.
39	summary	Operation for a summary requested from a Device.
40	languages	Operation for a language requested from a device.
41	aliases	Operation for meta aliases requested from a device.
42	query	Operation for SDK Query requested from a device.
43	msearch	Operation for a meta search requested from a device.
44	nodeListing	Node Listing for a node requested from a Device.
45	content	SDK Content call requested from a Device for downloading a PCAP or Log.
46	Export Files	File Listing Requested for a Session in File View or Extraction jobs.
47	packets	Packets requested for sessions in Packet View or Extraction Jobs.

Serial #	Operation Name	Meaning
48	deleteEndpointCache	Operation to clear reconstruction cache of a device.
49	Logon	Operation for user to sign in to NetWitness User Interface.
50	Logoff	Operation for user to sign out of NetWitness User Interface.
51	defaultDevice	Operation to access the Default SA UI Device.
52	deleteDefaultDevice	Operation to delete the Default investigation device.
53	submitExtractFiles	Operation to submit a request to Extract files from Sessions.
54	submitExtractLogs	Operation to submit a Request to Extract Logs from Sessions.
55	submitExtractPcap	Operation to submit a Request to Extract Sessions from Sessions.
56	MetaGroup	Operations related to SA UI Meta Groups.
57	ExternalQuery	Operation when a Direct Query is fired via URL.
58	GeoMap	Operation to access the Geo Map View of Investigation.
59	SaveProfile	Operation to save an Investigation Profile.
60	ApplyProfile	Operation to apply an Investigation Profile.
61	DeleteProfile	Operation to apply an Investigation Profile.
62	DeactivateProfile	Operation to apply an Investigation Profile.
63	VisualizePreferences	Operations related to Informer Visualization Request.
64	ExportMetaGroup	Operations to export multiple SA UI Meta Groups.
65	userPredicates	Operations to export multiple SA UI Meta Groups.

Serial #	Operation Name	Meaning
66	FileView	Operation for reconstruction request for File View.
67	resource.update	Operation when Live Subscription State changes.

Respond

The following table lists the operations logged by the Respond component.

Serial #	Operation Name	Meaning
1	update	Update notification setting
2	update	Update integration settings configuration
3	delete	Delete Alerts
4	create	Create new incident
5	update	Update incident details
6	read	Read incident details
7	delete	Delete incidents
8	read	Read remediation tasks
9	delete	Delete Remediation tasks
10	update	Update remediation tasks
11	create	Create new rule
12	update	Update existing alert rule
13	reorder	Reorder priority of alert rules

Investigate Server

Serial #	Operation name	Meaning
1	Aliases	Fetch aliases
2	BackgroundJob	Category for all background job
3	ColumnGroup	Category for all column group operation

Serial #	Operation name	Meaning
4	Count-query	Default Investigate
5	Countdistict-query	Default Investigate
6	Content	Default Session Content
7	Create	User entity
8	Create	User preferences
9	Create	Predicate
10	Delete	User preferences
11	Delete	Predicate
12	Extract-content	Extract Content from Session
13	Folders	Category for all folder operation
14	Files	SDK content request
15	InvestigateExport	Category for extraction invocation
16	Key-refs	Fetch meta keys
17	Languages	SDK language call
18	MetaGroup	Category for all meta group operation
19	Metakey	Category for all metakey operation
20	MailReconstruction	Category for all mail reconstruction operation
21	ParsingRequest	Category for all request parsing operation
22	PacketReconstruction	Category for all packet reconstruction operation
23	Predicate InvestigateIncidents	Category for all predicate operation
24	Query	SDK query
25	Reconstruction	Category for common shared reconstruction operation
26	ReconstructionCache	Category for reconstruction caching operation
27	ReconstructionStreaming	Category for reconstruction streaming operation
28	ReconstructDataSecurity	Category for reconstruction security operations (data-scrubbing)
29	Session-Meta	SDK query to get session meta

Serial #	Operation name	Meaning
30	Summary	SDK summary
31	Search-meta-value	Search meta-value based on field name
32	TextReconstruction	Category for all text reconstruction operation
33	Timeline	Timeline request
34	UserPreferences	Category for all user preferences operation
35	Update	User entity
36	Update	User preferences
37	Update	Profile group
38	Update	Predicate
39	Values	SDK values
40	Validate-query	Validate SDK query

Security Server

The following table lists the events logged by the Security Server.

Log Category	Description
Create:	Add record for a role with new ID.
Create:	Add user record with new ID.
Update:	Update the user account with a new ID.
Authentication:	Logs events pertaining to user logins and logouts.
Authorization:	Logs events pertaining to user access checks and RBAC management.
UserAccount	Logs events pertaining to NetWitness domain account management.
ExternalProvider:	Tracks events pertaining with external account providers (for example, Active Directory).

The following example shows an event logged by the Security Server:

```
2018-03-13 16:25:02,938 UserAccount{action=ExpirePassword, success=true,
identity=admin, parameters={id=Justin}}
```

Admin Server

The following table lists the events logged by the Admin Server.

Log Category	Description
Restore:	System operation to restore a data springboard.

Config Server

The following table lists the events logged by the Admin Server.

Log Category	Description
newregistration:	Record the registration to config server that manages the collection storage.

Context Hub Server

The following table lists the events logged by the Admin Server.

Log Category	Description
verifyconnection:	System operation to check if the connection is live.
addconnection	Create new connection to access data.

Local Audit Log Locations

NetWitness has global audit logging capabilities. When you configure global audit logging, audit logs from all NetWitness components collect in a centralized system, which converts them into the required format and forwards them to a third-party syslog server or a Log Decoder.

To view audit logs from the individual services, you can look at the local audit log locations.The following table shows the local directory paths of the audit logs for the NetWitness user interface and the various NetWitness services.

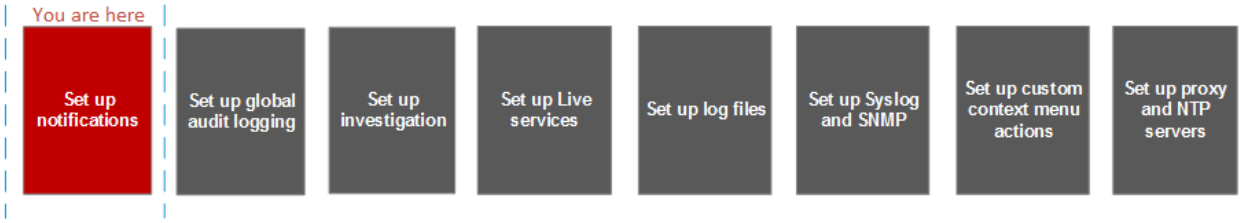
Service/Module	Audit Log Location
NetWitness User Interface (NetWitness Web Server)	The NetWitness user interface sends audit logs to the following locations: • `/var/lib/netwitness/uax/logs/audit/audit.log` (human-readable format) • Syslog running on the local host (JSON format) The NetWitness user interface uses the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (`/var/lib/netwitness/uax/logs/audit/audit.log`).
Core Services (Decoder, Log Decoder, Concentrator, Broker, and Archiver), Log Collector, Warehouse Connector, and Workbench	The Core services and similar services send audit logs to Syslog running on the local host. Path: `/var/log/secure` (JSON format) The Core services use the AUTHPRIV facility of syslog to write audit logs to syslog.

Service/Module	Audit Log Location

Reporting Engine,
Malware Analysis,
Respond,
ESA Correlation (11.3 and later),
and Event Stream Analysis
(11.2 and earlier)
	These services send audit logs to the following locations:
	• `<application-home-directory>/logs/audit/audit.log` (human-readable format)
	• Syslog running on the local host (JSON format)
	
	The following are the audit log locations of these services:
	Reporting Engine:
	`/var/netwitness/re-server/rsa/soc/reporting-engine/logs/audit/audit.log`
	Respond Server:
	`/var/log/netwitness/respond-server/respond-server.audit.log`
	Malware Analysis:
	`/var/lib/netwitness/malware-analytics-server/spectrum/logs/audit/audit.log`
	ESA Correlation (11.3 and later):
	`/var/log/netwitness/correlation-server/correlation-server.audit.log`
	Event Stream Analysis (11.2 and earlier):
	`/opt/rsa/esa/logs/audit/audit.log`
	These services use the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (`<application-home-directory>/logs/audit/audit.log`).

Health & Wellness, Event Source Management (ESM), and Appliance and Service Grouping (ASG)	These Services send audit logs to the following locations: • `/opt/rsa/sms/logs/audit/audit.log` (human-readable format) • Syslog running on the local host (JSON format) These services use the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (`/opt/rsa/sms/logs/audit/audit.log`).
Aggregated Audit Logs	The aggregated audit logs from all the services are sent to the following locations: • `/var/netwitness/logstash/logs/rsa-netwitness-audit.log` (JSON format) • Syslog running on the local host (human-readable format)

Global Notifications Panel



Global Notifications panel introduces the features for configuring notification settings. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

In the Global Notifications panel, you can configure the following global notification settings:

- Notification Outputs
- Notification Servers
- Templates

Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

WorkFlow

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Notification Servers	Servers Tab
Administrator	Configure Notification Outputs	Output Tab
Administrator	Configure Notification Templates	Templates Tab

Related Topics

- Configure a Syslog Notification Server
- Configure Script as a Notification Server

Quick Look

To access the Notifications configuration panel:

1. In the main menu, select (Admin) > **System**.
2. In the options panel, select **Global Notifications.**

1 Displays the Global Notification Panel.
2 Displays the Output Tab
3 Displays the Servers Tab
4 Displays the Templates Tab

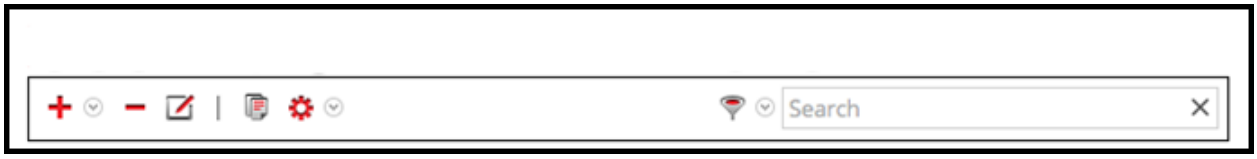
Toolbar and Features

The Global Notifications panel has three tabs: Output, Servers, and Templates.

Feature	Description
Output tab	This tab enables you to configure notification outputs. See Output Tab for more information.
Servers tab	This tab enables you to configure notification servers. See Servers Tab for more information.
Templates tab	This tab enables you to configure notification templates. See Templates Tab for more information.

This table describes the columns in the grid for Notification Outputs and Notification Servers.

Column	Description
	Selects a row for an action in the toolbar. Clicking the checkbox in the column title selects or deselects all rows in the grid.
Enable	Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled.
Name	A name that identifies or labels the configuration.
Output	The configuration output. The outputs are Email, SNMP, Syslog, and Script.
Description	A brief description about the configuration.
Last Modified	Shows the date and time of the last configuration change.
Actions	Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

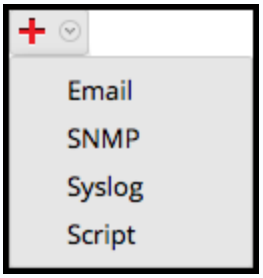


This table describes the columns in the grid for Notification Templates.

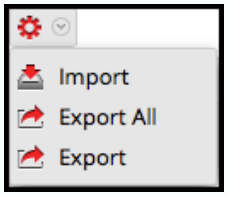
Column	Description
	Selects a row for an action in the toolbar. Clicking the checkbox in the column title selects or deselects all rows in the grid.
Name	A name that identifies or labels the template.
Template Type	The type of template. The types are Audit Logging, Event Stream Analysis, Event Source Monitoring, and Health Alarms.
Description	A brief description about the template.
Actions	Provides an Actions menu  for the selected configuration with actions that can be taken on the template. The Actions menu enables you to delete, edit, duplicate, and export the template.

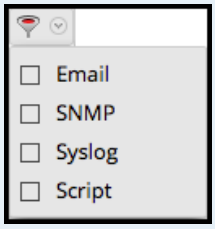
Global Notifications Panel Toolbar

The Global Notifications panel toolbar is at the top of the Output, Servers, and Templates tabs.



The following figure shows the toolbar on the Output and Servers tabs.





The following figure shows the toolbar on the Templates tab.

The following table describes the features of the Global Notifications panel toolbar.

Feature	Description
 	Adds a notification server on the Servers tab, adds a notification output (notification) on the Output tab, and adds a notification template on the Templates tab. On the Servers and Output tabs, you can select to configure Email, SNMP, Syslog, and Script notification settings.

Feature	Description
	Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting  > Delete.
	Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting  > Edit.
	Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting  > Duplicate.
	Displays the following options: • **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration. • **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations. • **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting  > Export.
	Filters by Email, SNMP, Syslog, or Script.
	Searches configurations in the grid.

Define Notification Server Dialogs

This topic describes the Define Notification Server dialogs used to configure the settings of the various types of notification servers. You configure notification servers in the (Admin) > **System** > **Global Notifications** > **Servers** tab.

Notifications are used by a variety of components in NetWitness, such as Event Stream Analysis (ESA), Respond, and Global Audit Logging. Notification settings are called Notification Servers. In the Servers tab of the Administration System view Notifications panel, you can create multiple Notification Server configurations.

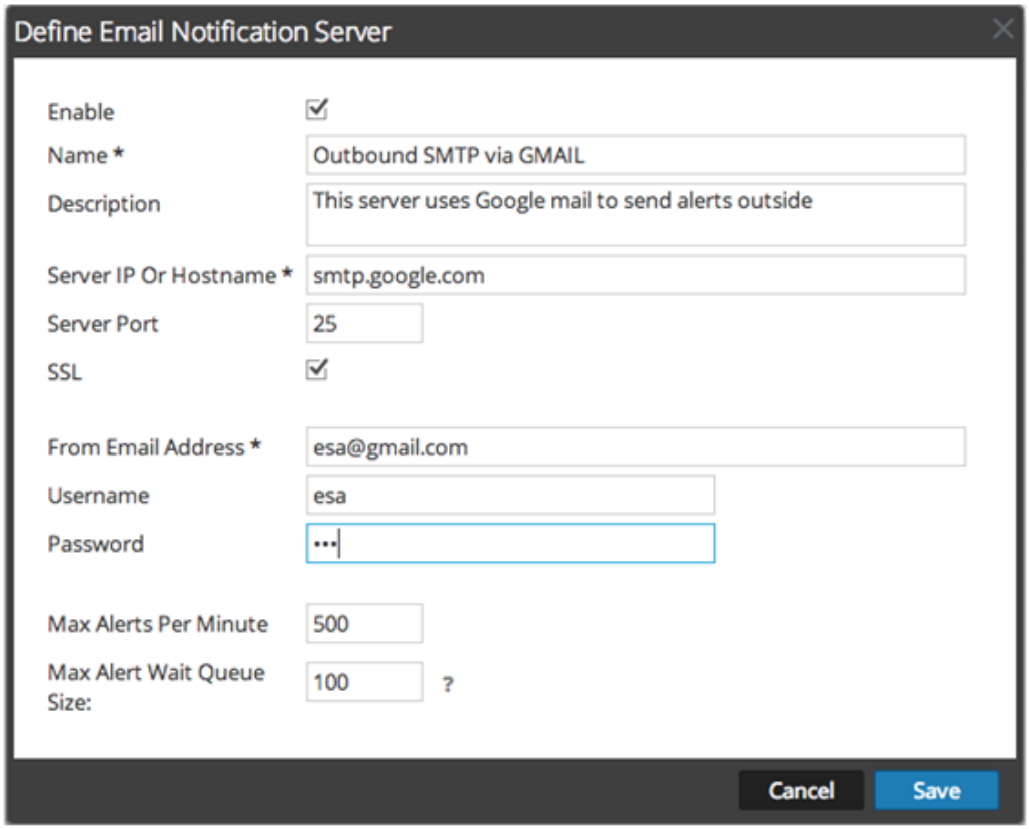
You can configure the following types of notification server settings in NetWitness:

- Email
- SNMP
- Syslog
- Script

For Global Audit Logging, you can only use Syslog Notification Servers.

Procedures related to notification servers are described in Configure Notification Servers.

To access the Define Notification Server dialogs



1. Go to **(Admin) > System**.
2. In the left navigation panel, select **Global Notifications**.
3. In the **Notifications Servers** panel, click and then select a type of notification server (Email, SNMP, Syslog, or Script)
   The Define Notification Server dialog is displayed for your selection.

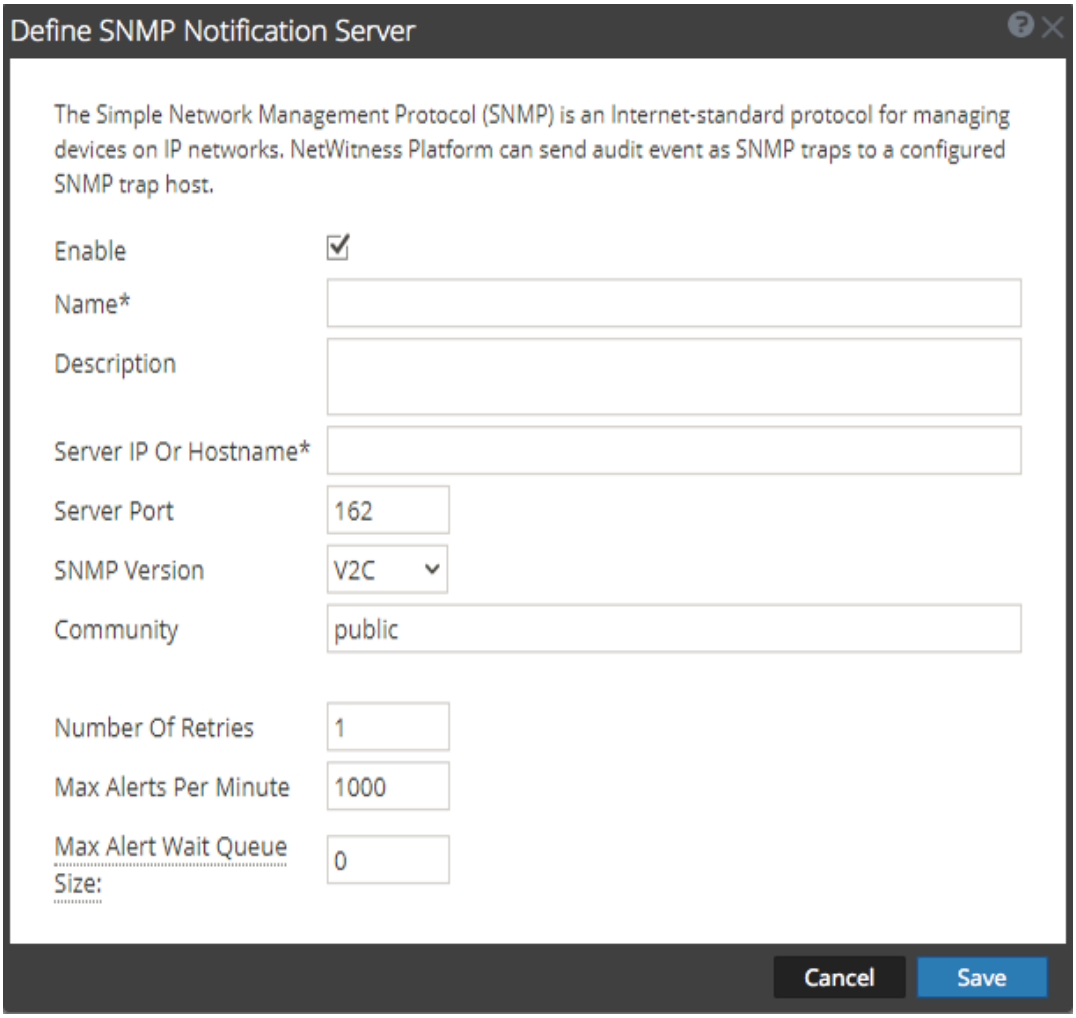
There are four notification server dialogs, which allow you to configure notification servers.

Email

Email notification servers enable you to configure email server settings to send alert notifications.

The following figure shows the Define Email Notification Server dialog.

The following table lists the various parameters that you need to define for the email notification servers.



Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Server IP Or Hostname	Hostname of the email server. For ESM/SMS and ESA notifications, you must specify only the hostname/FQDN.
Server Port	The server port.
SSL	Select the option if you want the communication to happen through SSL.
From EMail Address	Email account from which you want to send email notifications.
Username	Username for logging into the email account if the SMTP server requires user authentication to relay emails successfully.

Parameters	Description
Password	User password for logging into the email account if the SMTP server requires user authentication to relay emails successfully.
Max Alerts Per Minute	Describes the maximum number of alerts per minute.
Max Alert Wait Queue Size	Describes the maximum number of alerts to be queued before they are dropped.

SNMP

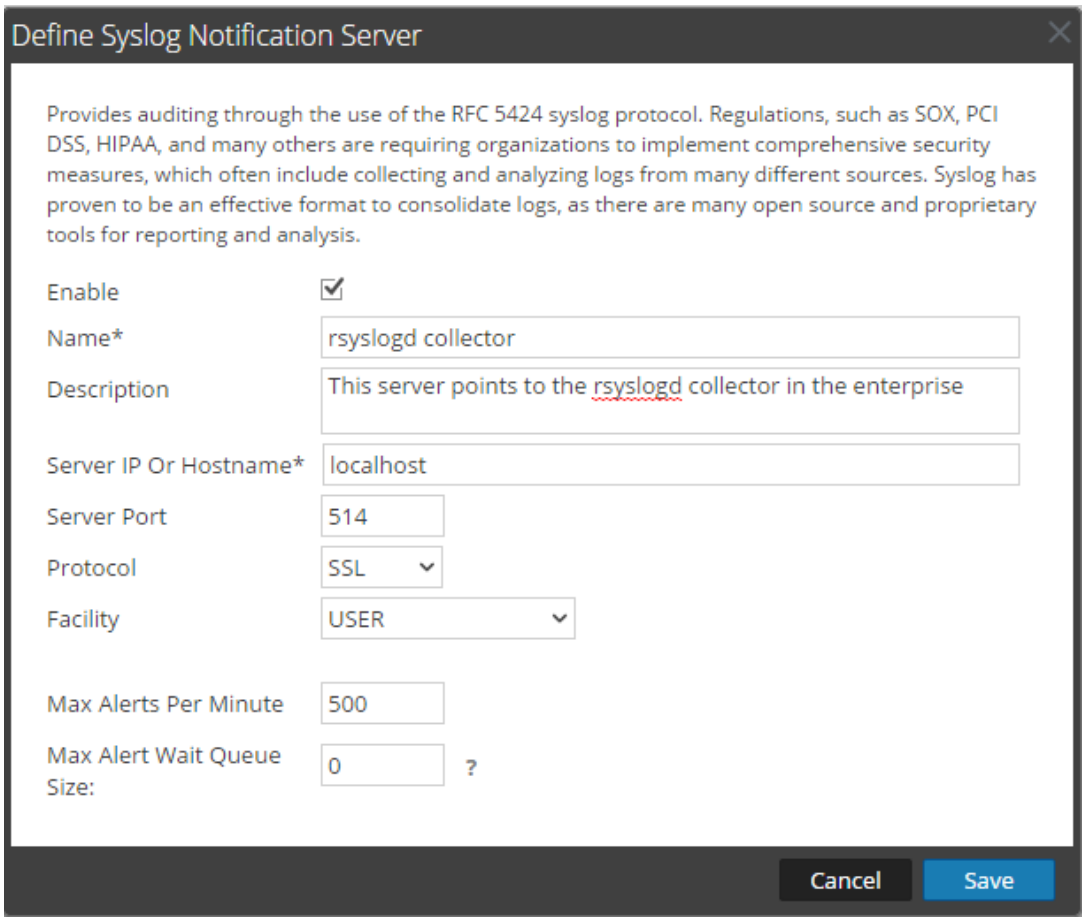
SNMP notification servers enable you to configure SNMP trap host settings as a notification server to send alert notifications.

The following figure shows the Define SNMP Notification Server dialog.

The following table lists the various parameters that you need to define for the SNMP notification servers.

Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Server IP Or Hostname	SNMP trap host IP address or hostname.
Server Port	Listening port number on the SNMP trap host.

<table>
<tr><th>Parameters</th><th>Description</th></tr>
<tr><td>SNMP Version</td><td>SNMP version. The following are the options:
V1
V2C
V3
If you select SNMP Version 3 (v3), the following parameters are displayed:
<table>
<tr><th>Parameters</th><th>Description</th></tr>
<tr><td>Notification Type</td><td>Based on the notification type a SNMP messages are sent each time an alert is generated.
The following notification types are supported:
Inform - Inform is acknowledged trap. The sender gets an acknowledgement from the receiver.
Trap - Trap is unacknowledged notification</td></tr>
<tr><td>Authoritative Engine ID (This optioin is availabe only for notification type TRAP)</td><td>An identifier which is used to identify the agents. Authoritative engine ID along with the username is used to uniquely identify the agent.</td></tr>
<tr><td>Security Level</td><td>Define the security level. The following are the options:
Unauthenticated and Unencrypted
Authenticated and Unencrypted
Authenticated and Encrypted</td></tr>
<tr><td>Auth Protocol (This option is available only for security level Authenticated and Unencrypted and Authenticated and Encrypted)</td><td>Authentication protocol which is used to validate a user before providing an access to the server. The options are:
SHA
MD5</td></tr>
<tr><td>Auth Key (This option is available only for security level Authenticated and</td><td>A password that you want to use for authentication.</td></tr>
</table></td></tr>
</table>



Parameters	Description
	Unencrypted and Authenticated and Encrypted) Privacy Protocol (This option is available only for security level Authenticated and Encrypted) — Privacy protocol is an encryption technique for data communication. Private Key (This option is avaliable only for security level Authenticated and Encrypted) — A password that you want to use for encryption.
Community	Community string used to authenticate on the SNMP trap host. The default value is **public**.
Number of Retries	Number of retries for the trap.
Max Alerts Per Minute	Maximum number of alerts per minute.
Max Alert Wait Queue Size	Maximum number of alerts to be queued before they are dropped.

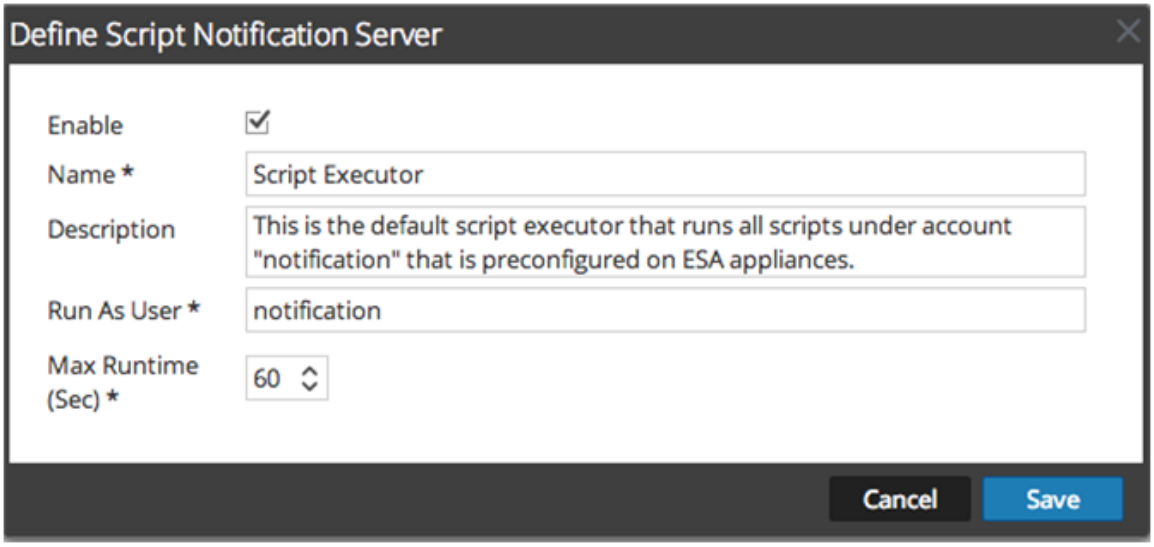
Syslog

Syslog notification servers allow you to configure Syslog settings as a notification server to send notifications. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

You cannot disable notification servers associated with global audit logging configurations.

The following figure shows the Define Syslog Notification Server dialog.

The following table lists the various parameters that you need to define for the Syslog notification servers.



Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Server IP Or Hostname	The hostname of the host where the target Syslog process is running.
Server Port	The port number where the target Syslog process is listening.
Protocol	The protocol to be used to transfer the Syslog files.
Facility	The designated Syslog facility to use for all outgoing messages. It is used to specify what type of program is logging the message. Some possible values are KERN, USER, MAIL, and DAEMON. This lets the configuration file specify that messages from different facilities will be handled differently.

Parameters	Description
Max Alerts Per Minute	Maximum number of alerts per minute. This field is not used for Global Audit Logging.
Max Alert Wait Queue Size	Maximum number of alerts to be queued before they are dropped. This field is not used for Global Audit Logging.

Script

Script notification servers enable you to configure Script as a Notification Server.

The following figure shows the Define Script Notification Server dialog.

The following table lists the various parameters that you need to define for the Script notification servers.

Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Run As User	Name of the user identity under which the script is executed. The default user identity is **notification**. For ESA, you cannot set this to anything else unless you have created the account on the ESA host.
Max Runtime (Sec)	The maximum time (in seconds) the script is allowed to run.

Define Notification Output Dialogs

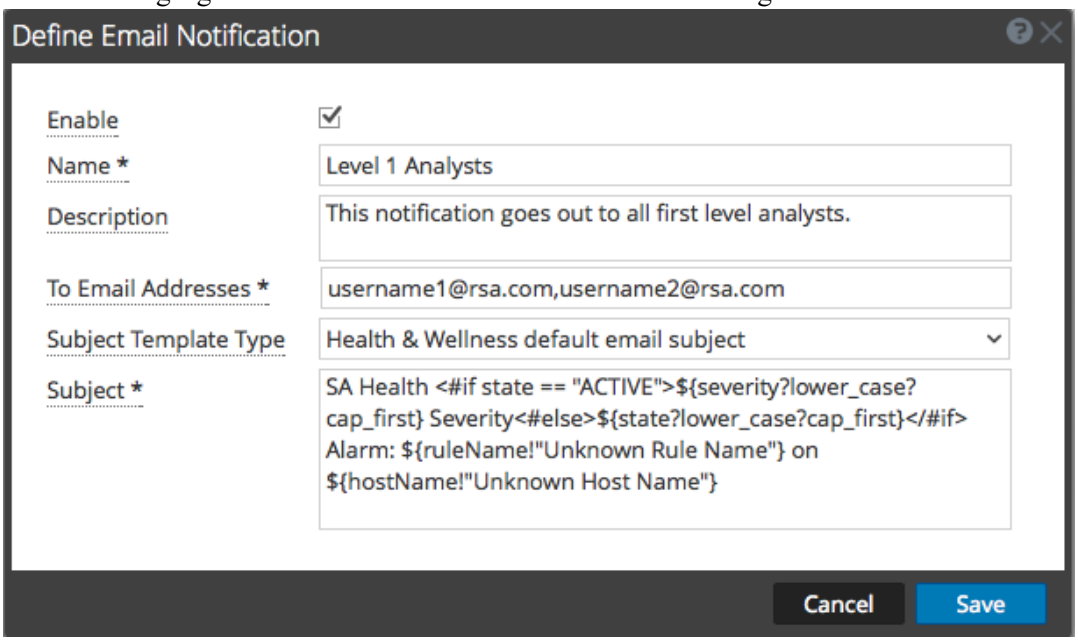
This topic provides descriptions of the various notification output dialogs. You configure notification outputs in the (Admin) > System > Global Notifications > Output tab. Notifications are basically the destinations used for sending notifications. For ESA, notifications enable you to define how you want to receive the ESA alerts. The following are the different notifications supported by NetWitness:

- Email
- SNMP
- Syslog
- Script

Procedures related to notifications are described in Configure Notification Outputs.

To access the Define Notification dialogs

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. On the **Output** tab, click and then select a notification output (Email, SNMP, Syslog, or Script) The Define Notification dialog is displayed for your selection.



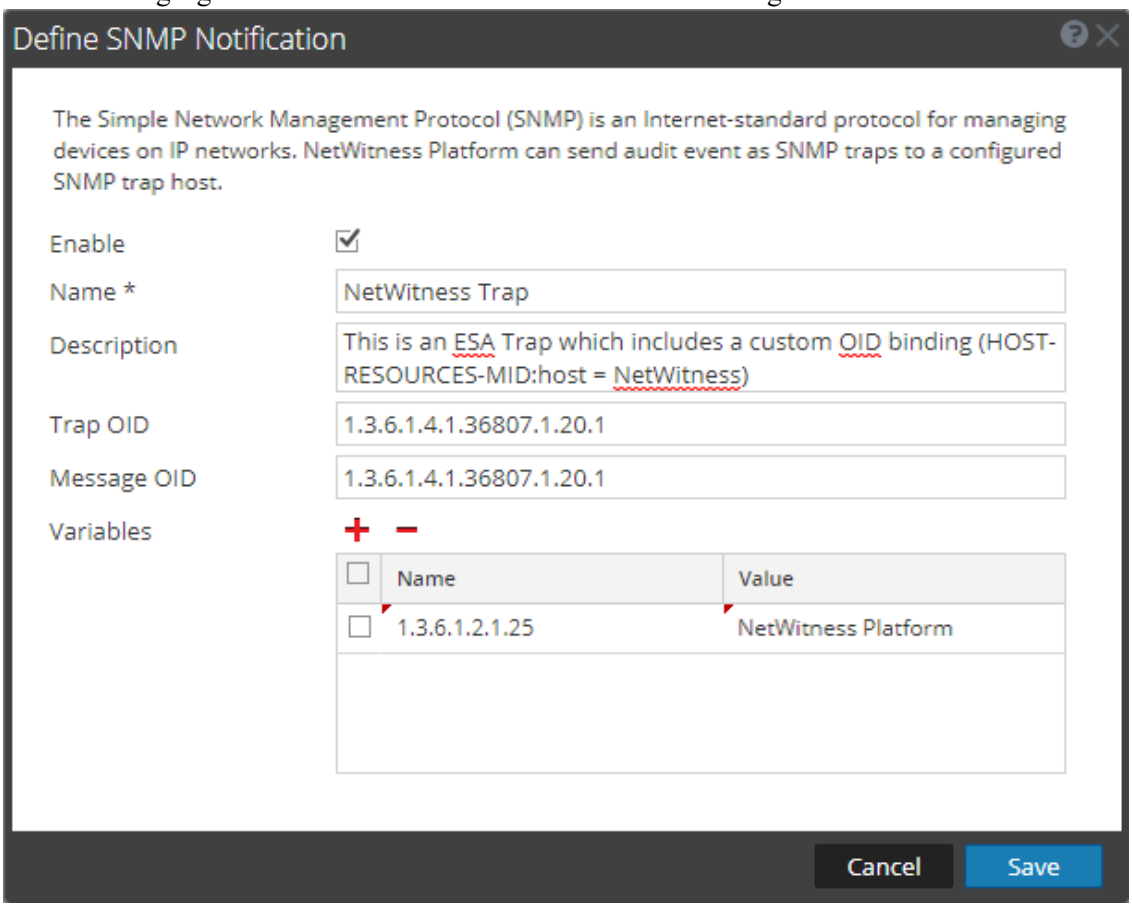
Features

There are four notification dialogs, which allow you to configure notification outputs.

Email

Email notifications enable you to define the destination email address to which you can send the alerts. It also enables you to add a custom description in the subject of the email and also to define multiple destination email addresses.

The following figure shows the Define Email Notification dialog.



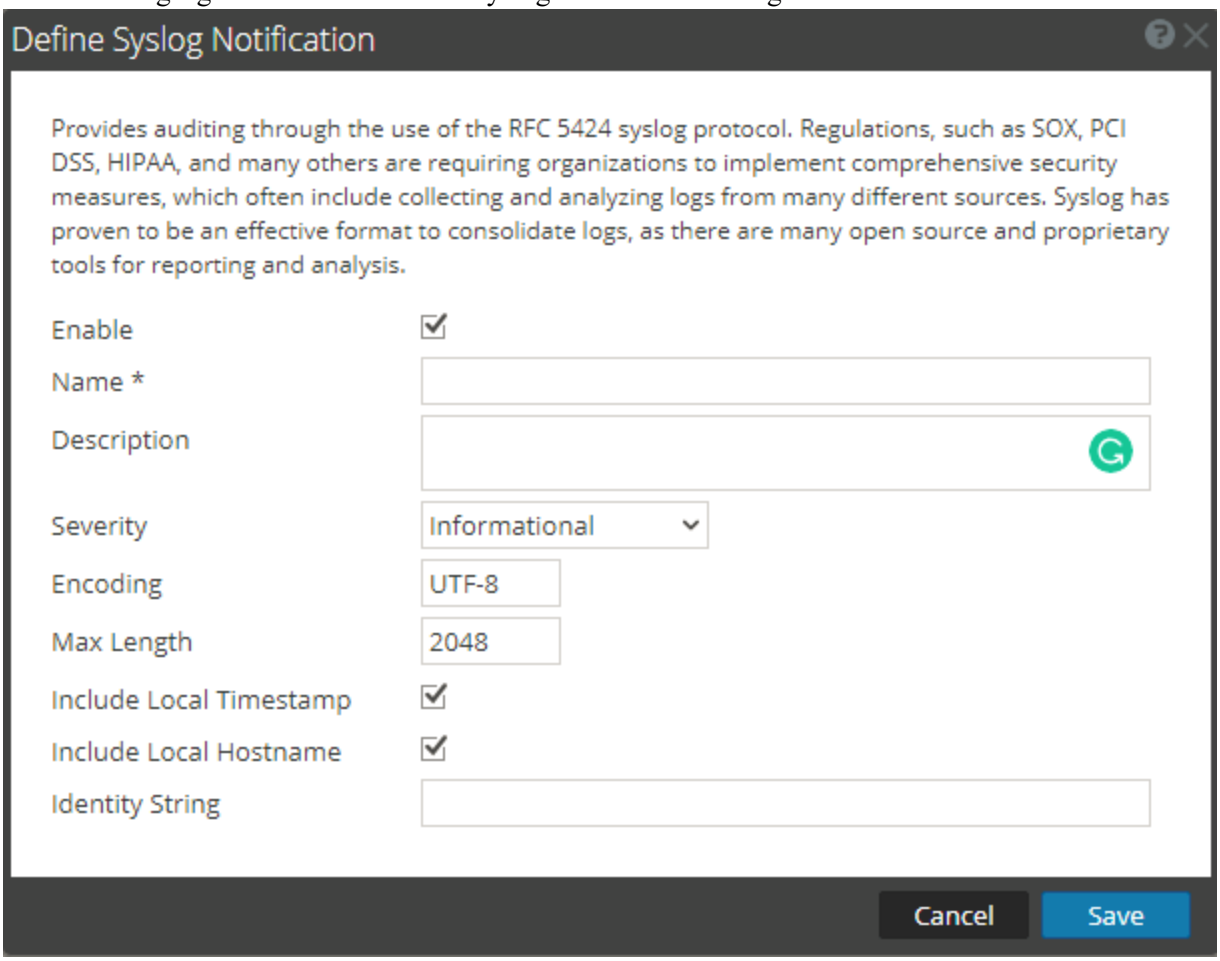
The following table lists the various parameters that you need to define for the email notifications.

Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
To Email Addresses	Describes the destination email address to which the alert needs to be sent. **Note:** You can define multiple email addresses.
Subject Template Type	Lists available templates for creating a subject. When you choose a template, the Subject field is automatically filled in with the code for your chosen template. Example, for New Health and Wellness, you must select **New Health & Wellness default email subject**.
Subject	Custom description about the triggered alert. This information is automatically filled in if you choose one of the predefined templates from the Subject Template Type drop-down menu. **Note:** To provide a custom subject, please refer to "Include the Default Email Subject Line" topic in the *System Maintenance Guide*.

SNMP

SNMP notifications enable you to define the SNMP settings to send alert notifications.

The following figure shows the Define SNMP Notification dialog.



The following table lists the various parameters that you need to define for the SNMP notifications.

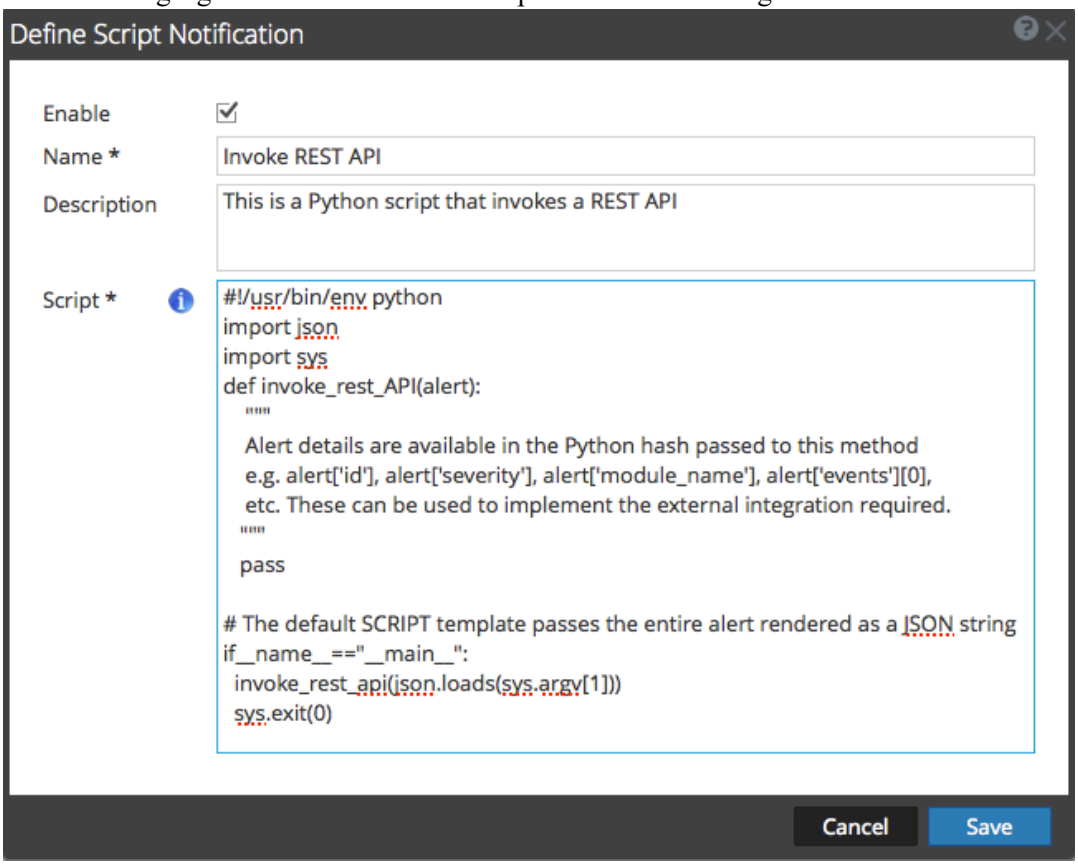
Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
Trap OID	The object ID for the SNMP trap on the trap host that receives the event. The default value is **1.3.6.1.4.1.36807.1.20.1**. This value is a hierarchical name that represents the system that generates the trap. 1.3.6.1.4.1 is the common prefix for all enterprises and 36807.1.20.1 identifies NetWitness.
Message OID	The message object identifier for the SNMP trap.
Variables	Additional information that should be included within the trap. It is a variable that is a name value pair.

Syslog

Syslog notifications enable you to define the Syslog settings to send alert notifications.

The following figure shows the Define Syslog Notification dialog.

The following table lists the various parameters that you need to define for the Syslog notifications.



Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
Severity	Defines the severity of the alert.
Encoding	Defines the encoding format. In some environments where no regular character sets are used (for example, Japanese characters), this field will help selecting the right encoding of the characters.
Max Length	The maximum length of a Syslog message in bytes. The default value is **2048**. Messages that exceed the maximum length are truncated when the **Truncate overly large syslog messages** checkbox is selected, which is found in Administration > System > Legacy Notifications. Legacy Notifications Configuration Panel provides additional information.

Parameter	Description
Include Local Timestamp	Select to include the local timestamp in messages.
Include Local Hostname	Select to include the local hostname in Syslog messages.
Identity String	An identity string to be prefixed to each Syslog alert. If the string is blank, no identity string is prefixed to the outgoing Syslog alerts. You can use this to identify the alerts from ESA.

Script

Script notifications enable you to define the Script that executes in response to the alert. You can use any script for ESA notifications.

The following figure shows the Define Script Notification dialog.

The following table lists the various parameters that you need to define for the Script notifications.

Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.

Parameter	Description
Description	A brief description about the notification.
Script	Defines the script.

Define Notification Template Dialog

In the Global Notifications panel, you can configure global notification settings for Notification Servers, Notification Outputs, and Notification Templates. On the Templates tab, you configure the templates for various notifications. The notification template defines the format and message fields of the notifications. You can select a default template or you can use the Define Template dialog to configure and edit templates.

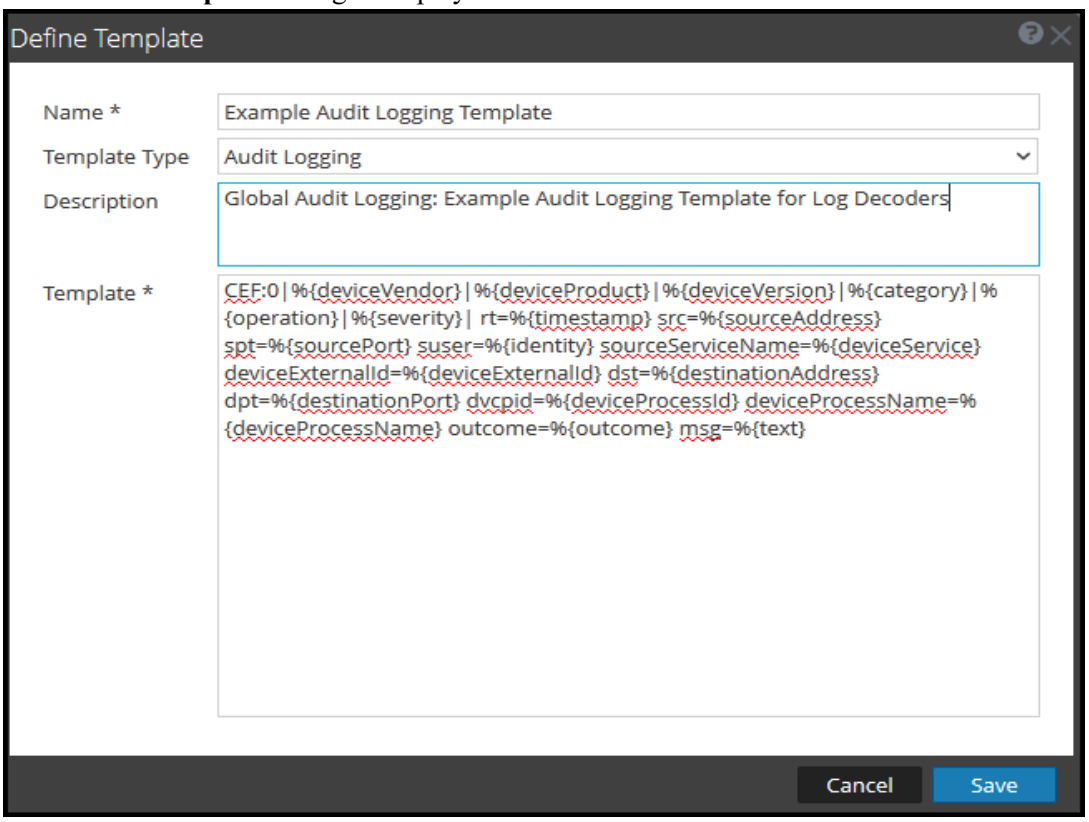
You can select a default template and use it or modify a default template based on your requirement. You can also use one of the following template types and create a template:

- Audit Logging
- Event Stream Analysis
- Event Source Monitoring
- Health Alarms
- New Health & Wellness Alarms.

These notification templates are created in an HTML, FreeMarker (FTL) format, a combination of both HTML and FTL, or Common Event Format (CEF) format:

- Email (SMTP) notification output type is created in both HTML and FTL formats.
- SNMP and Script notification output types are created in FTL format.
- Syslog notification output type is created in CEF format.

You need to have a good understanding of HTML, FTL, and CEF formats to successfully configure your own notification template. Click on the respective links to understand the specific formats.



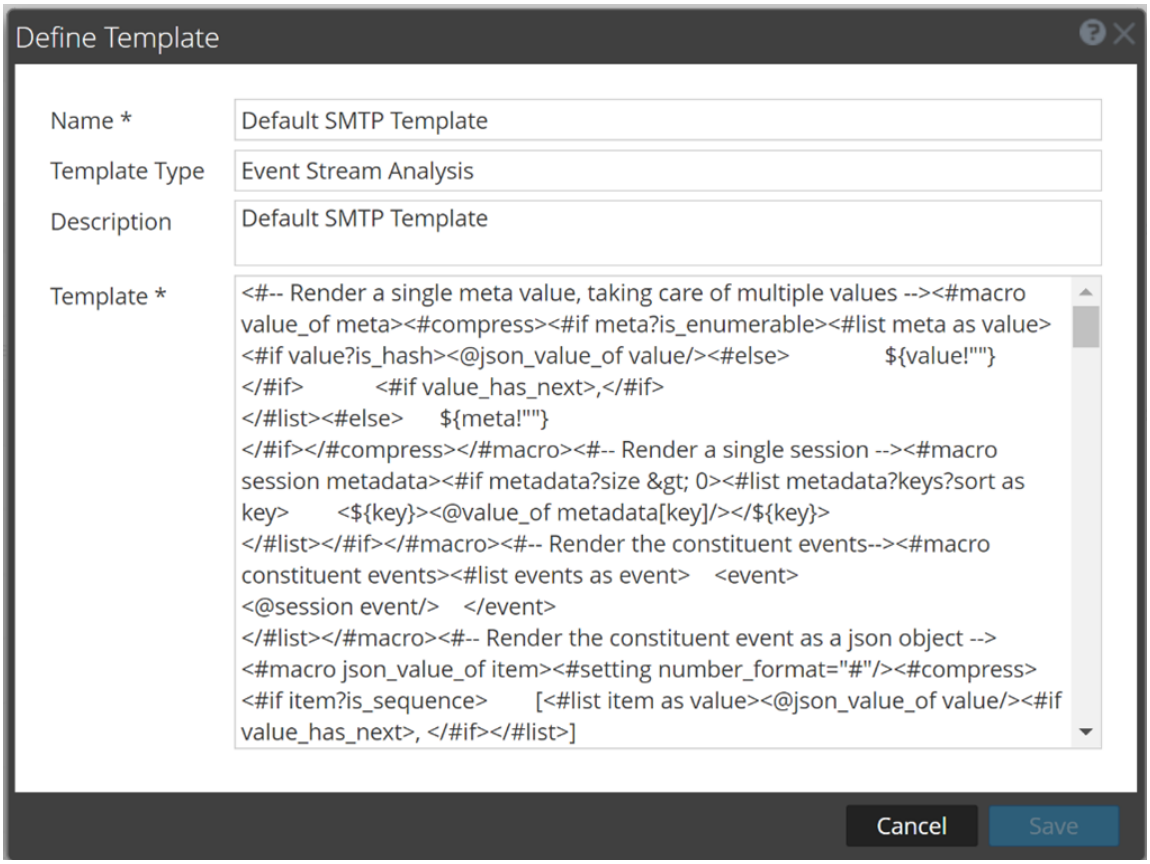
- HTML format, Introduction to HTML.
- FTL format, Overall structure - Apache FreeMarker Manual.
- CEF format, Freemarker Tips & Tricks in NetWitness.

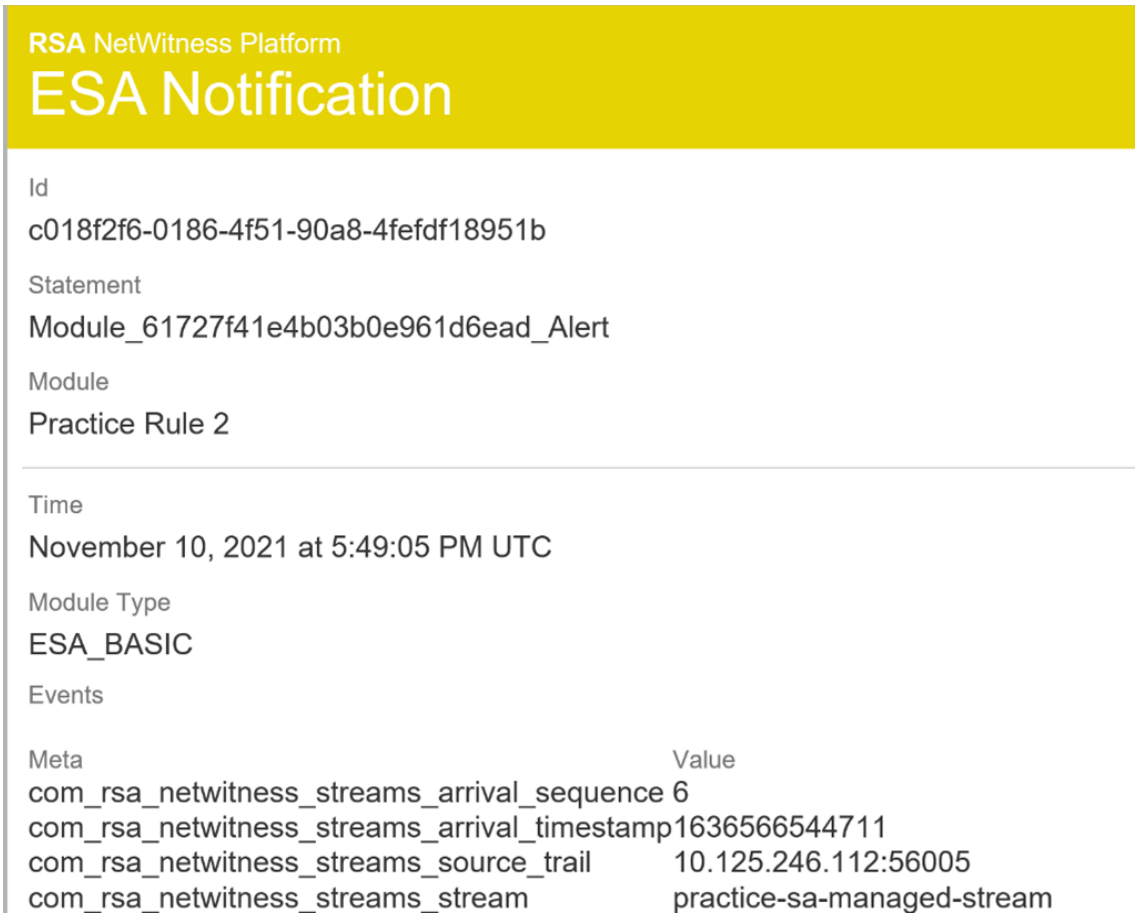
Procedures related to notification templates are described in Configure Templates for Notifications.

To access the Define Template dialog

1. Go to  **(Admin) > System**.
2. In the left navigation panel, select **Global Notifications > Template Tab**.
3. In the **Notifications Configurations** panel, click , or select a configuration and click  to modify.

The **Define Template** dialog is displayed.





The following table describes the features in the Define Template dialog.

Field	Description
Name	Type a unique name for the notification template.
Template Type	Select the type of template that you want to create: • **Audit Logging**: Use this template for Global Audit Logging. • **Event Stream Analysis**: Use this template type for ESA alert notifications. • **Event Source Monitoring**: Use this template type for ESM notifications. • **Health Alarms**: Use this template type for Health and Wellness notifications. • **New Health and Wellness Alarms**: Use this template type for New Health and Wellness notifications.
Description	Add a description for the template. For example, if you create a notification template for Log Decoders to use for Global Audit Logging, you could mention that information in the description.

Field	Description
Template	Specify mandatory **CEF:** prefix when you create a template in CEF format. Define a Template for Global Audit Logging provides instructions on how to define an audit logging template to use for Global Audit Logging. To define a template for Event Stream Analysis (ESA), see Define a Template for ESA Alert Notifications. **Note:** Use Key references available in default notification templates.

Below is an example of a defined SMTP (email) template and output.

Output Tab

In the **Global Notifications** panel, in the **Output** tab ((Admin) > **System** > **Global Notifications** > **Output**), you configure notification outputs. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

Notification Output configurations define email addresses and subject lines, SNMP trap OID settings, syslog output settings, and script code.

Notifications are the destinations configured for the alert notifications that are sent by ESA service. You can configure the following as destinations using the Output tab:

- Email
- SNMP
- Syslog
- Script

Note: You do not need to configure the Output tab for Global Audit Logging. For detailed steps, see Configure Global Audit Logging.

Workflow

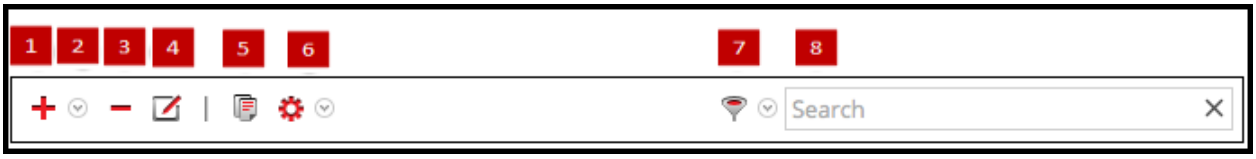
This workflow shows the necessary procedures to configure and verify the output for Global Notifications. You can perform the following:

- Configure the Email settings as notification.
- Configure SNMP settings as notification.
- Configure Syslog settings as notification.
- Configure a Script as notification.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Define notification outputs.	Configure Notification Outputs

Related Topics



- Notification Outputs Overview
- Configure Email as a Notification
- Configure Script as a Notification
- Configure SNMP as a Notification
- Configure Syslog as a Notification

Quick Look

The following example illustrates Global Notification Outputs configuration.

1	Selects a row for an action in the toolbar. Selecting the check box in the column title selects or deselects all rows in the grid.
2	Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled.
3	Identifies or labels the configuration.
4	Identifies the configuration output. The outputs are Email, SNMP, Syslog, and Script.
5	Describes the configuration.
6	Shows the date and time of the last configuration change.
7	Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

The Global Notifications panel toolbar is at the top of the Output tag and provides the following options:

1	Adds a notification output
2	Configures Email, SNMP, Syslog, and Script notification settings.
3	Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting > Delete.
4	Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting > **Edit**.
5	Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting > **Duplicate**.
6	Displays the following options:

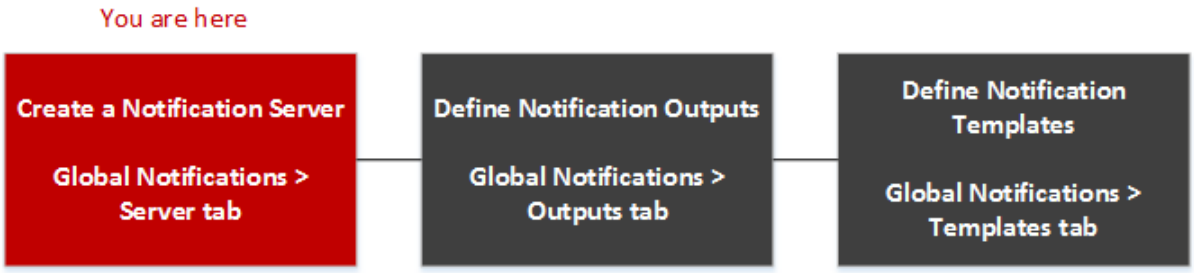
- **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration.
- **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations.
- **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting  > **Export**.

7 Filters by Email, SNMP, Syslog, or Script.

8 Searches configurations in the grid.

Servers Tab

Servers Tab describes the components of the **Global Notifications** > **Servers** tab. This tab enables you to configure notification servers. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.



Configure **Notification Servers** in the Servers tab. On the Servers tab, add the servers from which you want to receive notifications from the system. For Global Audit Logging, define Log Decoders as Syslog Notification Servers.

Event Stream Analysis can send notifications to users through email, SNMP, or Syslog when an alert is triggered on the ESA service. These alert notification senders are called Notification Servers. You can configure multiple notification settings and use them while defining an ESA rule, for example, you can configure multiple mail servers or Syslog servers and use the settings while defining an ESA rule.

Workflow

The workflow shows the necessary procedures to configure and verify the Servers for Global Notifications. You can perform the following:

- Configure the Email settings as a notification server.
- Configure SNMP settings as a notification server.
- Configure Syslog settings as a notification server.
- Configure a Script as a notification server.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Define notification Servers	Configure Notification Servers

Related Topics

Quick Look

The following example illustrates Global Notification Servers configuration.

1	Displays the Server Tab Panel.
2	Selects a row for an action in the toolbar. Selecting the checkbox in the column title selects or deselects all rows in the grid.
3	Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled.
4	Identifies or labels the configuration.
5	Identifies the configuration output. The outputs are Email, SNMP, Syslog, and Script.
6	Describes the configuration.
7	Shows the date and time of the last configuration change.
8	Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

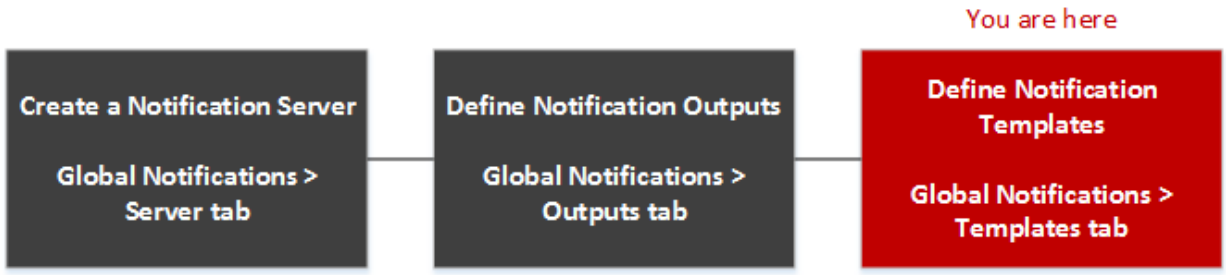
The Global Notifications panel toolbar is at the top of the Output tag and provides the following options:

1	Adds a notification output
2	Configures Email, SNMP, Syslog, and Script notification settings.
3	Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting > Delete.
4	Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting > **Edit**.
5	Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting > **Duplicate**.
6	Displays the following options: • **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration.

- **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations.
- **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting  > **Export**.

7 Filters by Email, SNMP, Syslog, or Script.

8 Searches configurations in the grid.



Templates Tab

The Notification Templates tab enables to configure notification templates. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond. Notification templates define the format and message fields of the notifications.

Select a default template or configure templates for Email, SNMP, Syslog, and Script, depending on the template type. For Event Stream Analysis (ESA) templates, configure Email, SNMP, Syslog, and Script. For Audit Logging templates, configure Syslog.

Event Stream Analysis templates are not specific to any type of alert notifications, that is, the same template can be used for all types of notifications.

Workflow

Quick look

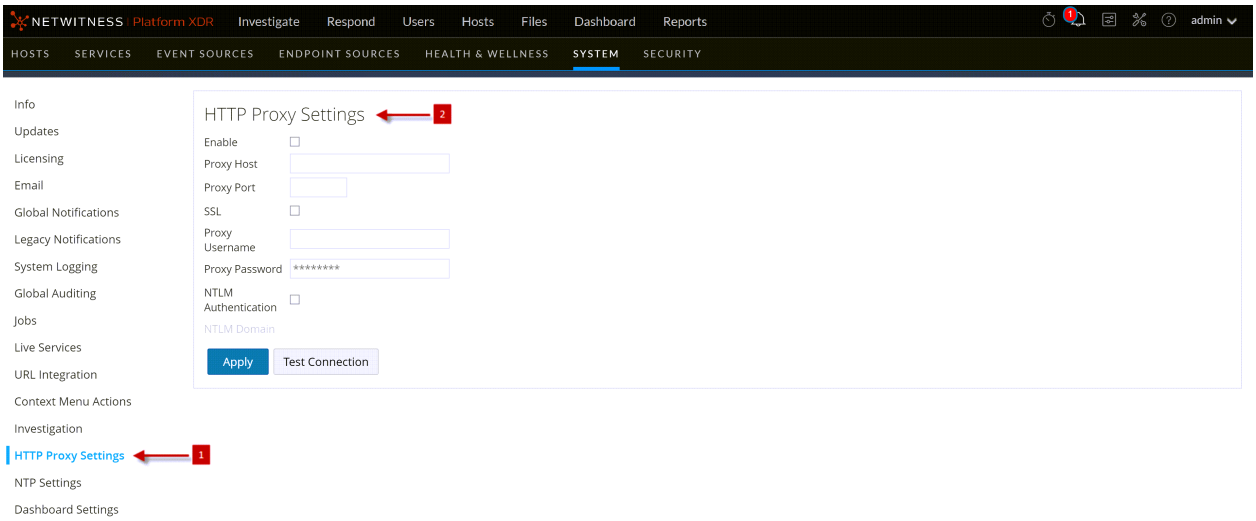
The following example illustrates Global Notification Templates Tab.

1. Selects a row for an action in the toolbar. Selecting the check box in the column title selects or deselects all rows in the grid.
2. Identifies or labels the templates
3. Choose a Template Type
4. Describes the templates
5. Provides an Actions menu  for the selected templates with actions that can be taken on the Templates. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

HTTP Proxy Settings Panel

HTTP Proxy Settings Panel introduces the proxy support features of the (Admin) > **System** > **HTTP Proxy Settings** panel.

Note: Proxy support is only for HTTP and HTTPS proxies and not SOCKS5.



The HTTP Proxy Settings panel provides a user interface for configuring a proxy for use across NetWitness modules and services. The Proxy Settings set up a proxy to be used wherever a proxy is needed in NetWitness. The settings in this panel override any proxy settings configured for an individual service such as Malware Analysis or Live.

Related topics

"Configure Proxy for NetWitness Platform XDR" in Additional Procedures

Quick Look

The following example illustrates an HTTP Proxy Settings Panel.

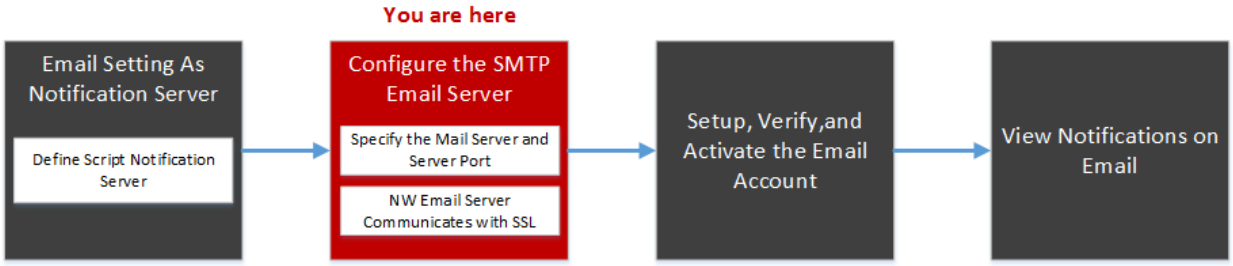
1 Displays the HTTP Proxy Settings Panel.
2 Allows the user to configure HTTP Proxy Sittings.

This table describes the features in the HTTP Proxy Settings section.

Feature	Description
Enable	Enable the system proxy configuration for use in NetWitness.
Proxy Host	The hostname for the proxy host.

Feature	Description
Proxy Port	The port used for communication on the proxy host.
SSL	(Optional) Enable communication using SSL.
Proxy Username	(Optional) The user name used to log on to the proxy host if the proxy requires authentication.
Proxy Password	(Optional) The user password used to log on to the proxy host if the proxy requires authentication.
NTLM Authentication	Use NT LAN Manager authentication and session security protocols.
NTLM Domain	The name of NTLM domain.
Apply	Applies any changes made, and they become effective immediately.

Email Configuration Panel



The Email Configuration Panel provides information about email configuration settings in the (Admin) > **System** > **Email Configuration** panel. NetWitness Platform XDR sends notifications to users vwith email about various system events. To be able to configure these email notifications, first configure the SMTP email server (See Configure Email Servers and Notification Accounts).

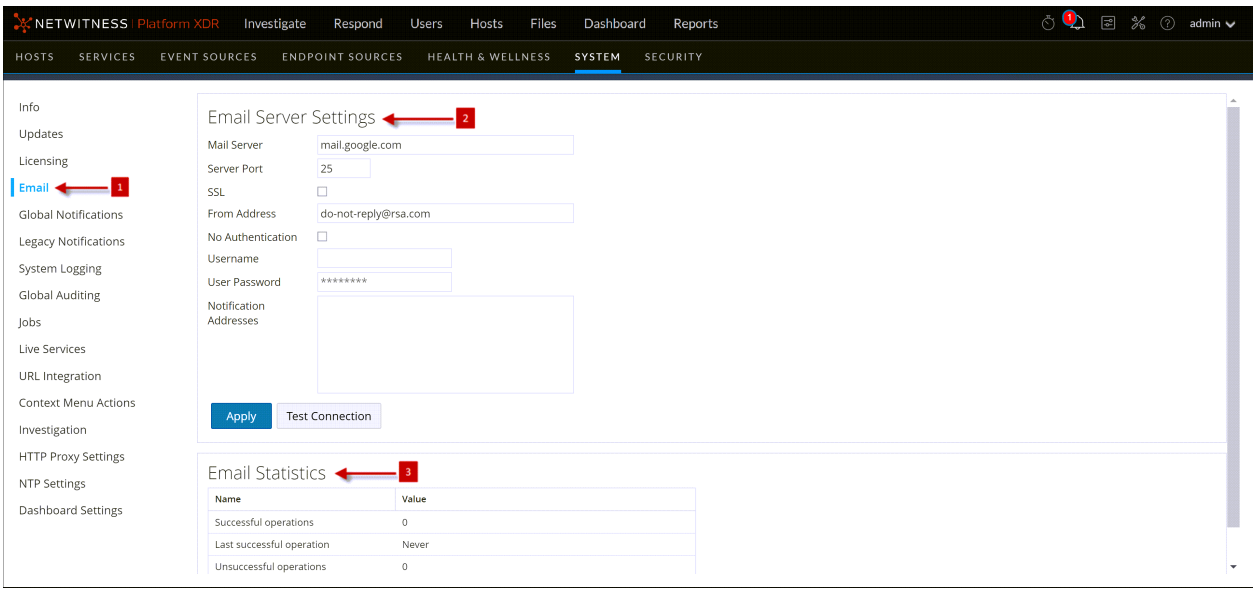
The Email Configuration panel provides a way to:

- Configure the email server.
- Set up an email account to receive notifications.
- View statistics on email operations.

Workflow

This workflow shows the necessary procedures to configure and verify Email Panel.

What do you want to do?



Role	I want to ...	Show me how
Administrator	Configure the SMTP Email Server	Configure Email Servers and Notification Accounts
Administrator	Email Setting as Notification Server	Configure the Email Settings as Notification Server
Administrator	Setup, Verify and Activate the Email Account	Receive Notification on Email

Related Topics

- Configure the Email Settings as Notification Server
- Configure Email as a Notification
- Configure Email Servers and Notification Accounts

Quick Look

The following example illustrates an Email configuration. The configuration defines how events are notified on Email.

1 Displays the Email Configuration Panel.
2 Allows the user to configure Email Server sittings.
3 Provides feedback on Email operations.

The **Email Configuration** panel has two sections: **Email Server Settings** and **Email Statistics**.

Email Server Settings

In the **Email Server Settings** section, you configure the following parameters.

Feature	Description
Mail server	The email server name. The default value is **mail.google.com**.
Server port	The server port used to send and receive emails. The default value is **25**.
Use SSL	The preference for SSL use in communications between the email server and NetWitness. The default value is to not use SSL (unchecked).
From address	The address that appears in all emails from NetWitness. The default from address for emails is **do-not-reply@rsa.com**.
Username	The username to access the email server. The default value is **blank**.
User password	The user password to access the email server. The default value is **blank**.

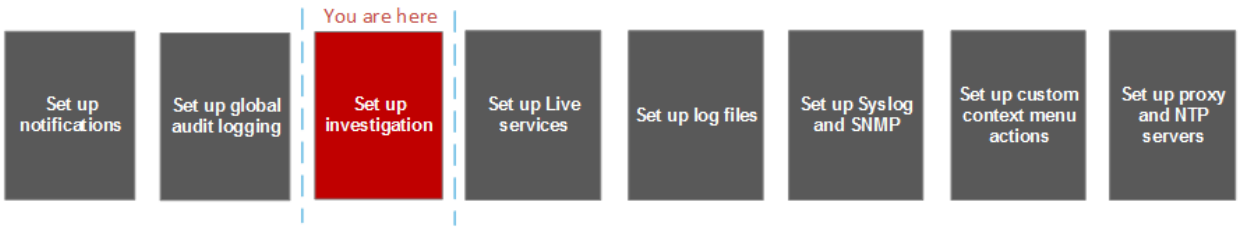
Feature	Description
Test connection	Tests the connection to the email server.
Apply	Applies the email configuration to this instance of NetWitness.

Email Statistics

The Email Statistics section provides feedback on the number of successful and failed email operations as well as the time of the last successful and unsuccessful email operation. For each statistic the name of the statistic and the value is displayed.

Investigation Configuration Panel

The (Admin) > **System** > Investigation Configuration panel provides the user interface for administrators to configure the system-wide settings that NetWitness Investigate uses when analyzing data and reconstructing an event.



The settings allow an administrator to manage application performance for Investigate. As analysts analyze and reconstruct sessions that they are investigating, performance can be affected by operations that involve loading, searching, visualizing, and reconstructing large amounts of data.

Note: Analysts can also set individual preferences for Investigate in the Profiles view and in the Navigate, Legacy Events, and Events views.

To access the Investigation Configuration panel:

1. Go to **(Admin) > System.**
2. In the options panel, select **Investigation**.

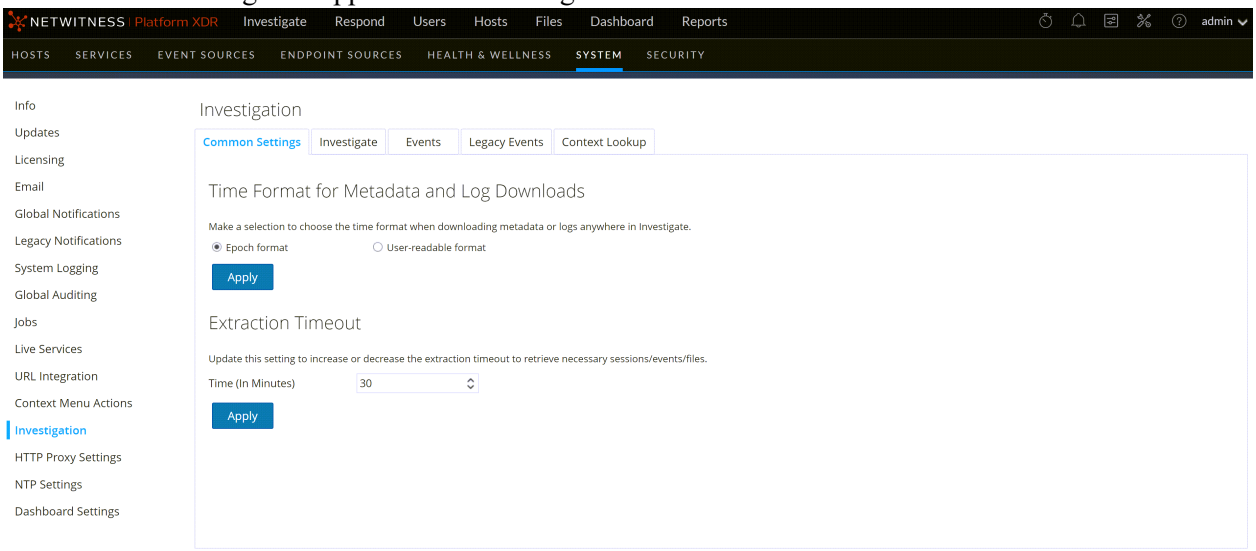
Workflow

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Navigate, Legacy Events, and Events view settings	Configure Investigation Settings
Administrator	Map Context Hub Meta Types	Configure Investigation Settings
Administrator	Clear reconstruction cache for services	Configure Investigation Settings

Related Topics

- Standard Procedures



Quick Look

The Investigation Configuration panel has four tabs: Common Settings (Version 11.5 and later), Navigate, Events, Legacy Events, and Context Lookup.

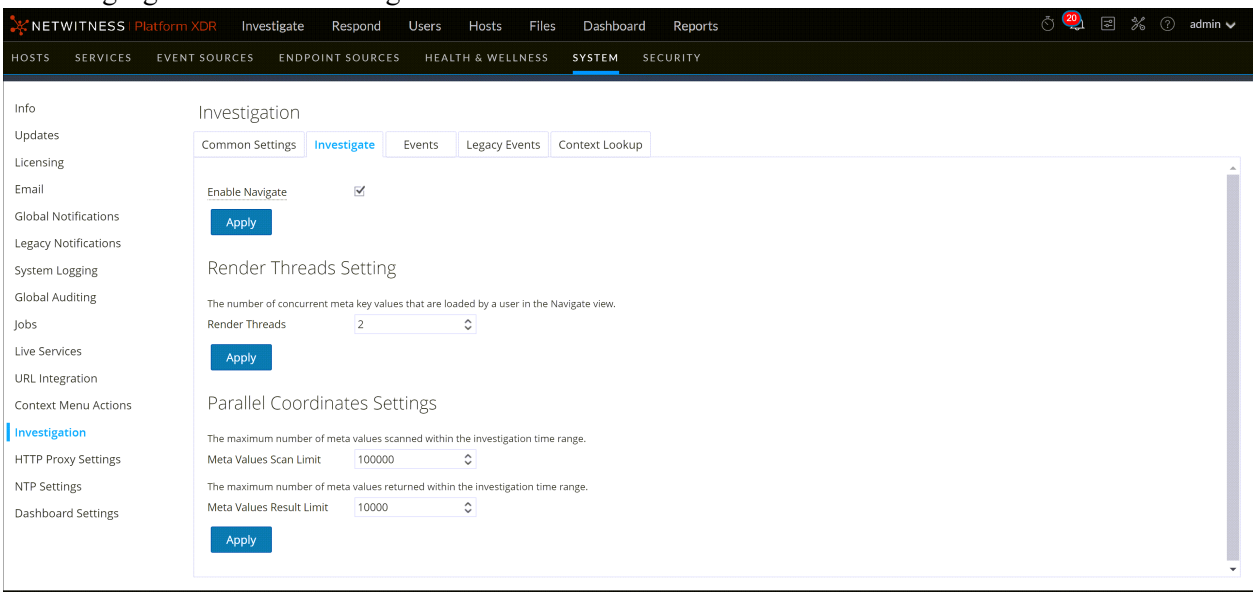
Though most fields in the tabs have a selection list with specific increments through the range of possible values, you can enter a value within the allowed range manually. An invalid entry is signaled by the field highlighted in red. When valid values are selected, clicking Apply in a given section puts the changes into effect immediately.

Common Settings Tab

The Common Settings tab applies to all Investigate views.

The following table describes the options in this tab.

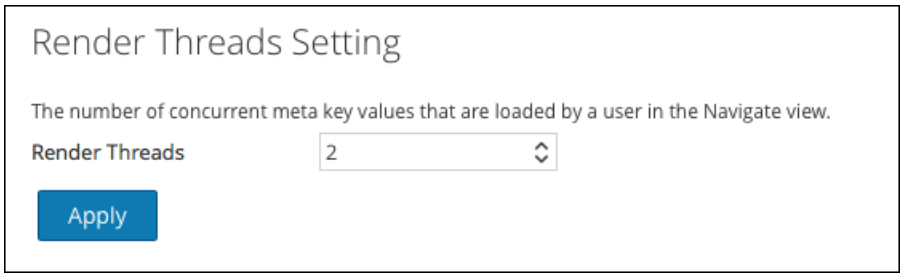
Parameter	Description
Time Format for Metadata and Log Downloads	
Epoch format	Use the Epoch format in downloads from Investigate (default value). These are Epoch representations of `2020-04-13 09:34AM`: • 12-hour representation = `61547519856000` • 24-hour representation = `61547519976000`



Parameter	Description

User-readable format	Use a user-readable time in downloads from Investigate. The downloads use a more understandable format that combines the user preference time zone, date format, and time format into an easily understood representation, which follows the industry standard ISO 8601 representation when possible.
	Examples of 12-Hour Format
	`04-13-2020T09:17:36AM-07:00`
	`13-04-2020T09:17:36AM-07:00`
	`2020-13-13T09:17:36AM-07:00`
	Examples of 24-Hour Format
	`04-13-2020T09:19:14-07:00`
	`13-04-2020T09:19:14-07:00`
	`2020-04-13T09:19:14-07:00`

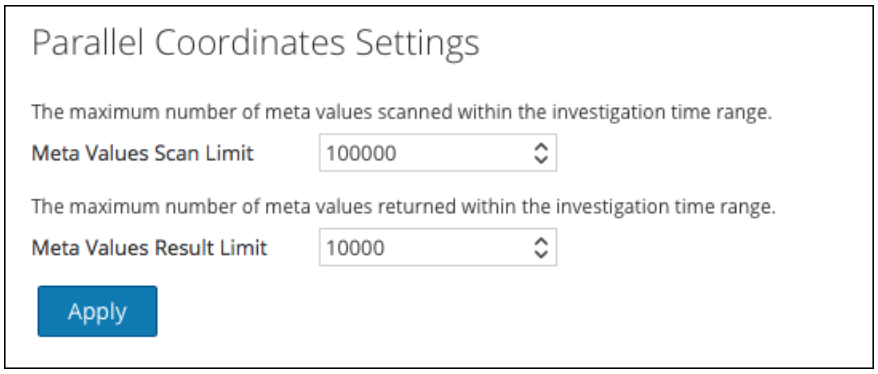
Extraction Timeout	
Time (In Minutes)	Use this to set the time limit before the session expires when downloading the logs from the service.



Investigate Tab

The Investigate tab has two sections: Render Threads Setting and Parallel Coordinates Settings. The following figure shows the Navigate tab.

Render Threads Setting

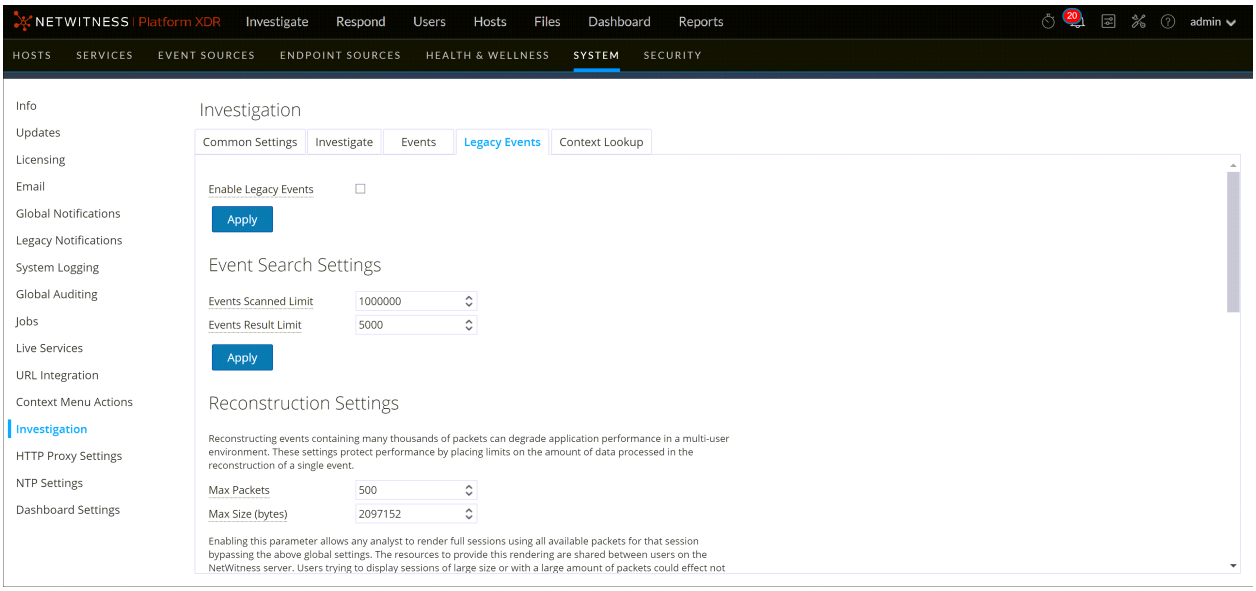


The Render Threads Setting is a selectable value between 1 and 20, which defines the number of concurrent (Values) loads in the Navigate view. The default value is 1.

Parallel Coordinates Settings

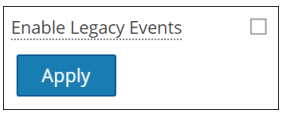
The Parallel Coordinates Settings apply to the Parallel Coordinates visualization in the Navigate view. There is a fixed limit on the amount of data that can be rendered as a parallel coordinates chart. In NetWitness the administrator can configure parallel coordinates limits here.

Note: For better performance, recommended settings are **Meta Values Scan Limit: 100000** and **Meta Values Result Limit: 1000-10000**.



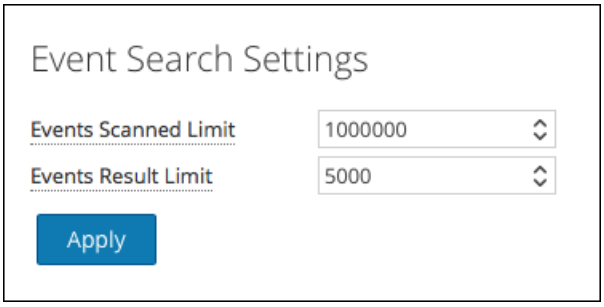
The following table describes the Parallel Coordinates Settings.

Parameter	Description
Meta Values Scan Limit	The maximum number of meta values scanned within the time range the analyst has selected in the Navigate view. Possible values are in the range of 1,000 to 10,000,000. The default value is 100,000.
Meta Values Result Limit	The maximum number of meta values returned within the time range the analyst has selected in the Navigate view. Possible values are in the range of 100 to 1,000,000,000. The default value is 10,000.



Legacy Events Tab

The Events tab provides configurable settings that affect the investigation of events. This tab has five sections: Enable Legacy Events, Event Search Settings, Reconstruction Settings, Web View Reconstruction Settings, and Reconstruction Cache Settings. The following figure shows the Events tab.

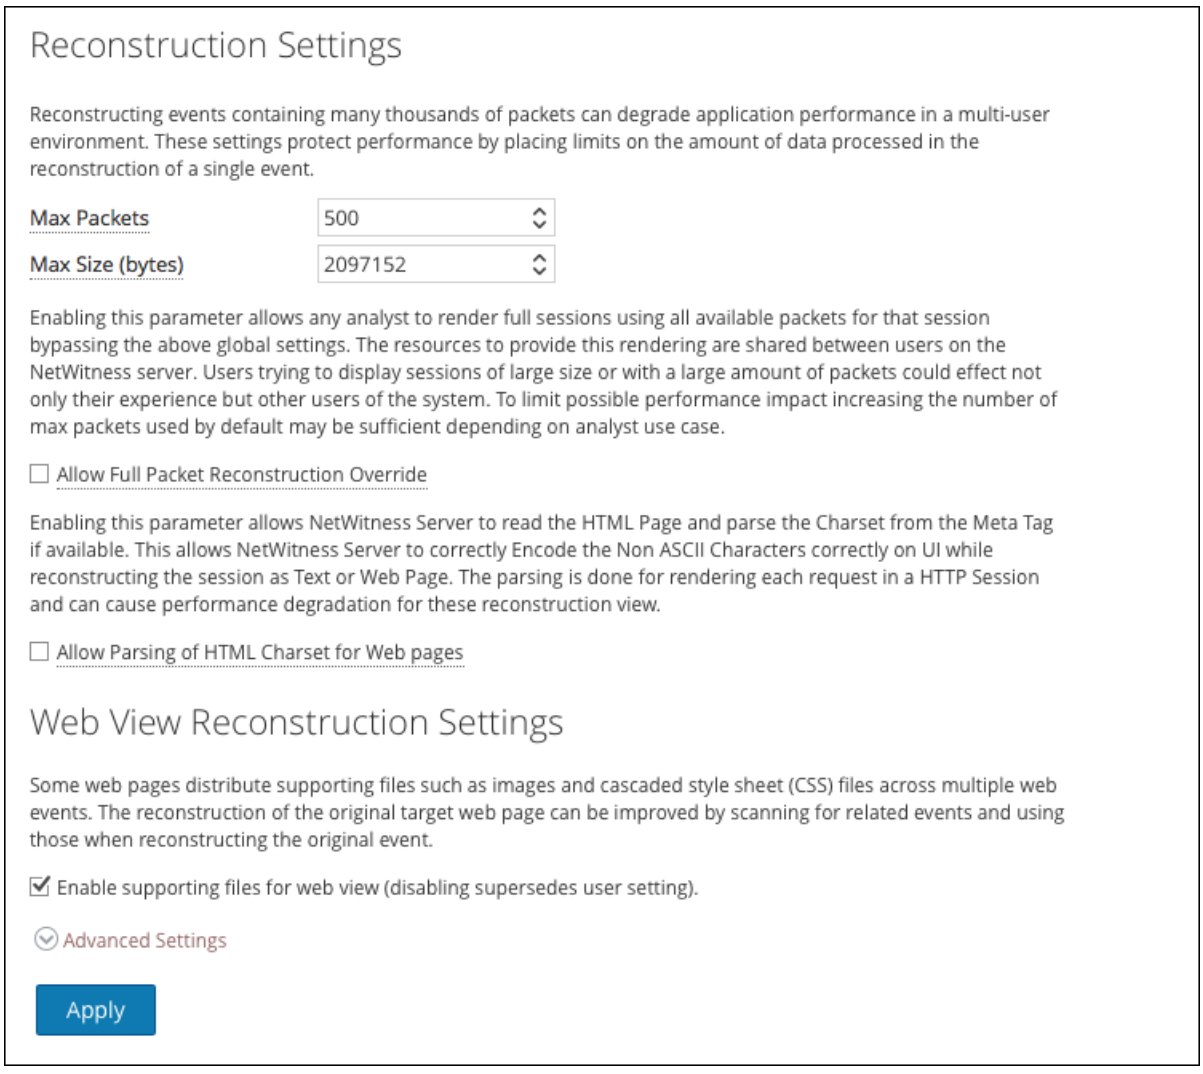


Enable Legacy Events

The Enable Legacy Events checkbox helps to enable and view the legacy events tab and view the classic events page on the UI. By default, this option is disabled.

Event Search Settings

The Event Search Settings help to limit the number of events scanned when searching in the Events view.



The following table describes the Event Search Settings.

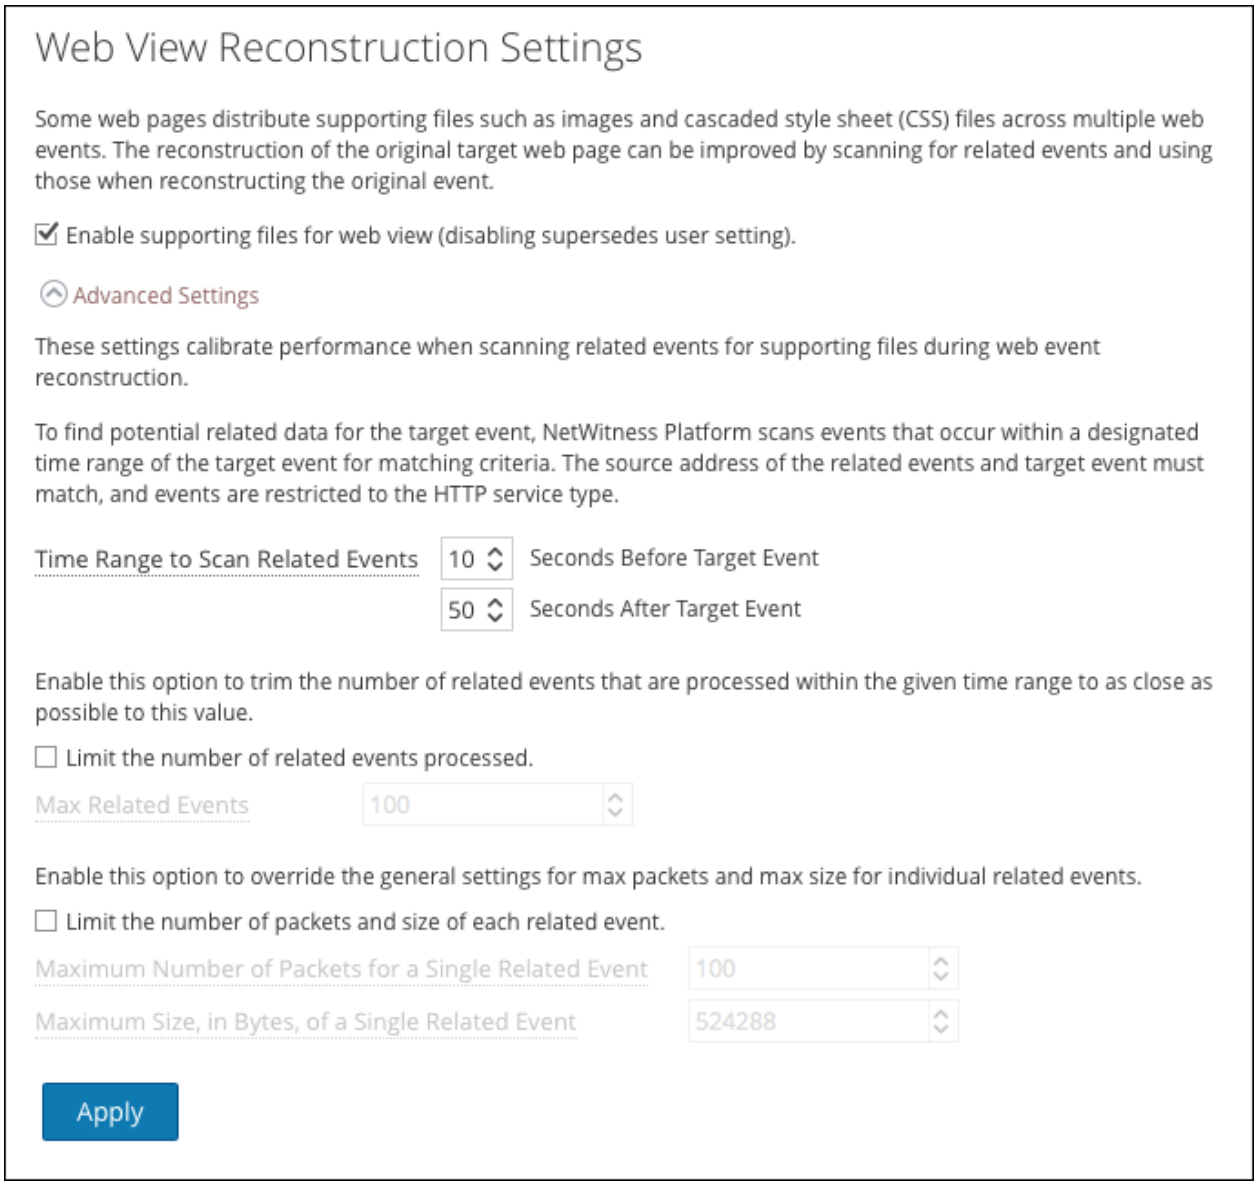
Parameter	Description
Events Scanned Limit	The maximum number of events to scan when searching in the Events view. The actual number of events scanned may be slightly greater than the limit set here.
Events Result Limit	The maximum number of results to return when searching in the Events view. The actual number of results returned may be slightly greater than the limit here.

Reconstruction Settings

As analysts reconstruct sessions that they are investigating, some events can be very large and contain many thousands of source packets. Reconstructing these sessions, especially in a multi-user environment, can degrade application performance. The Reconstruction Settings allow an administrator to limit the number of packets and the size of a single event during reconstruction.

Note: An override to the Reconstruction Settings section is configurable for web views (under Web View Reconstruction Settings).

The following table describes the Reconstruction Settings features.



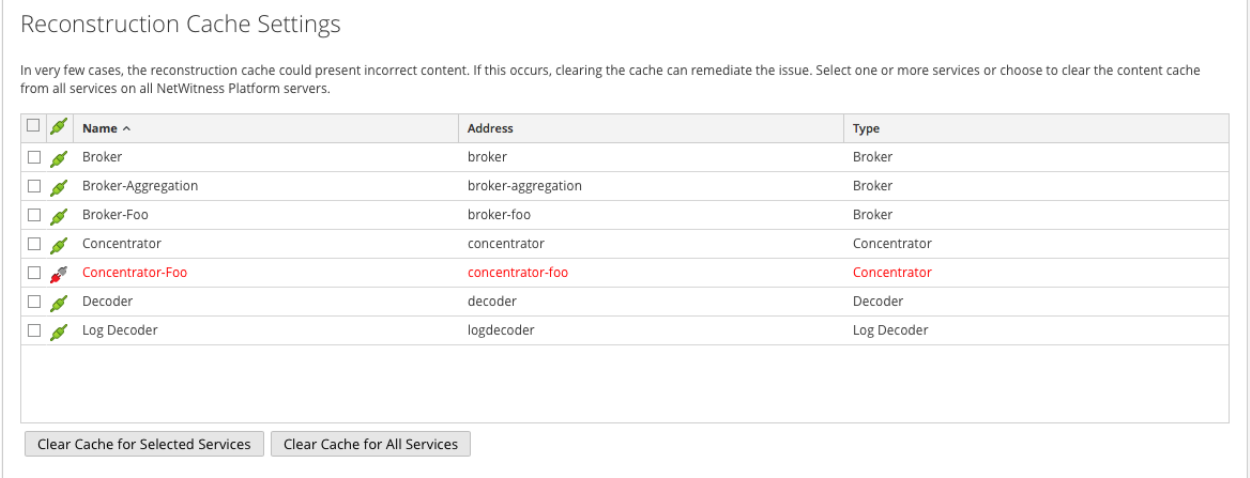
Parameter	Description
Maximum number of packets for a single event	This setting protects performance by placing a limit on the number of packets processed for a single event reconstruction. Possible values are in the range from 100 to 10,000 packets, using manual entry or increments of 100 from the selection list. The default value is 100 packets.
Maximum size, in bytes of a single event	This setting protects performance by placing a limit on the maximum size, in bytes, of a single event reconstruction. Possible values are in the range from 102,400 to 104,857,600 bytes, using manual entry or increments of 10,240 from the selection list. The default value is 2,097,152 bytes.
Allow Full Packet Reconstruction Override	When this checkbox is selected, the analysts is provided with a Use More Packets button in the Reconstruction Panel. This enables the NW Server to regenerate events using all the packets available in the Event.
Allow Parsing of HTML Charset for Web pages	This option allows the NetWitness Server to identify the web page encoding defined in the HTML meta tag instead of the HTTP header. The default setting is disabled.

Web View Reconstruction Settings

The Web View Reconstruction Settings allow an administrator to configure settings that improve the reconstruction of a web view by scanning and reconstructing related events that contain the same supporting files. When NetWitness is reconstructing a web view that spans multiple events, it is possible to improve the reconstruction of the target event by scanning and reconstructing related events that contain the same supporting files, such as images and cascaded style sheet (CSS) files.

- The only related events scanned are HTTP service type events with the same source address as the target event, and a time stamp within a specified time range before and after the target event.
- The maximum number of related events to scan is configurable.

Clicking on the Advanced Settings option displays all configurable settings in this section.



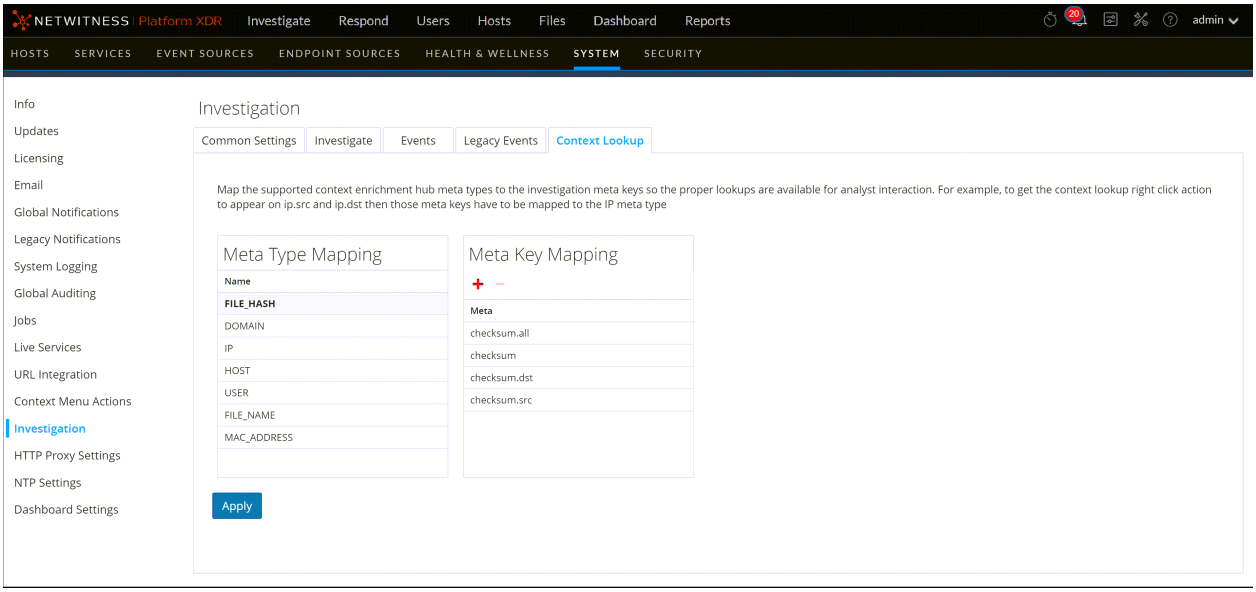
The following table describes the Web View Reconstruction Settings.

Parameter	Description
Enable supporting files for web view	This option determines how web views that have related data in other sessions are reconstructed. The default setting is enabled. When enabled, supporting files from related events can be used in the reconstruction of web views. Additional settings for calibrating the performance are enabled in this section, and Analysts have the option to enable CSS use in reconstructions. When disabled, supporting files from related events are not used and the setting for analysts to enable CSS use in reconstructions is disabled.

Parameter	Description
Time Range to Scan Related Events	Available when **Enable supporting files for web view** is checked. Configures the time range within which NetWitness scans related events that are of the service type HTTP and have the same source address as the target event. This is a value between 0 and 60. • Seconds Before Target Event • Seconds After Target Event
Limit the number of related events processed	Allows configuration of the maximum number of related events that NetWitness scans within the specified time range to discover supporting files for the target event. By default, this is disabled. When enabled, the Maximum Related Events field becomes active.
Max Related Events	When **Limit the number of events processed** is enabled, this field specifies the maximum number of related events that NetWitness scans within the specified time range to discover supporting files for the target event. This is a selectable value between 10 and 1,000, using an increment of 100. The default value is 100.
Limit the number of packets and size of each related event	Overrides the general settings for the maximum number of packets and maximum size (in bytes) for individual related events.
Maximum Number of Packets for a Single Related Event	Possible values are in the range from 100 to 10,000 packets, using increments of 100 from the selection list. The default value is 100 packets.
Maximum Size, in Bytes, of a Single Related Event	Possible values are in the range from 102,400 to 104,857,600 bytes, using increments of 10,240 from the selection list. The default value is 524,288 bytes.

Reconstruction Cache Settings

In some cases, the reconstruction cache can present incorrect content; for this reason NetWitness removes reconstructions that are older than a day from the cache. The cache is cleaned every day at midnight. Between the daily cache cleanings, certain actions may result in stale cache being used for a reconstruction, and if the need arises, administrators can manually clear cache for one or more services that are connected to the current NetWitness Server.



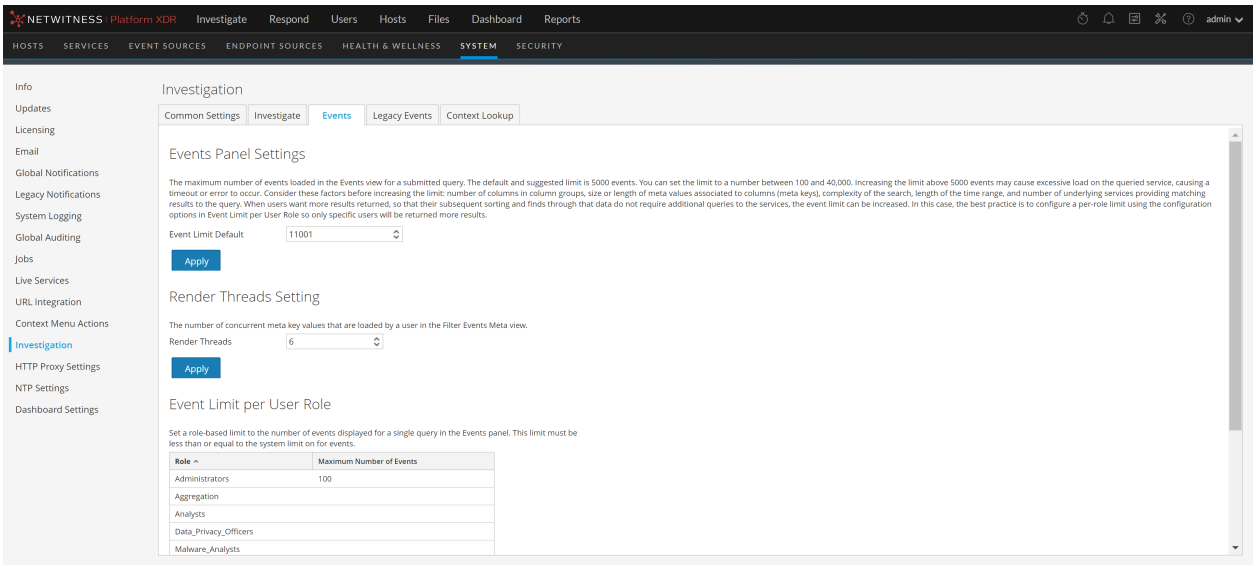
The following table describes the Reconstruction Cache Settings features.

Feature	Description
Selection box	Selection box in individual rows and in the title bar allow selection of one or more, or all services that need to have cache cleared manually.
Clear Cache for Selected Services	Clears the reconstruction cache for each selected service.
Clear Cache for All Services	Clears the reconstruction cache for all services.

Context Lookup Tab

Procedures associated with this panel are provided in "Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*. The following figure shows the Context Lookup tab.

The Context Lookup tab enables the administrator to configure the Investigate meta keys and meta type mapping. The administrator can add or remove meta keys found in Investigate to the list of meta types supported by Context Hub service. NetWitness Respond and Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.



Caution: For the Context Lookup to work correctly in the Respond and Investigate views, this is the best practice: When mapping meta keys in the (Admin) > SYSTEM > Investigation > Context Lookup tab, add only meta keys to the Meta Key Mappings. Do not add fields in the MongoDB. For example, `ip.address` is a meta key and `ip_address` is not a meta key (it is a field in the MongoDB).

The following table describes the features of the Context Lookup tab.

Feature	Description
	Adds a meta key to the selected meta type supported by Context Hub.
	Deletes the meta key from the selected meta type.
Apply	Saves the changes made to the Context Lookup tab.

Events Tab

The following figure shows the Event tab.

The Events tab provides configurable settings that affect the number of events displayed in the Events panel. This tab has three sections: Events Panel Settings, Render Threads Setting, and Event Limit per User Role.

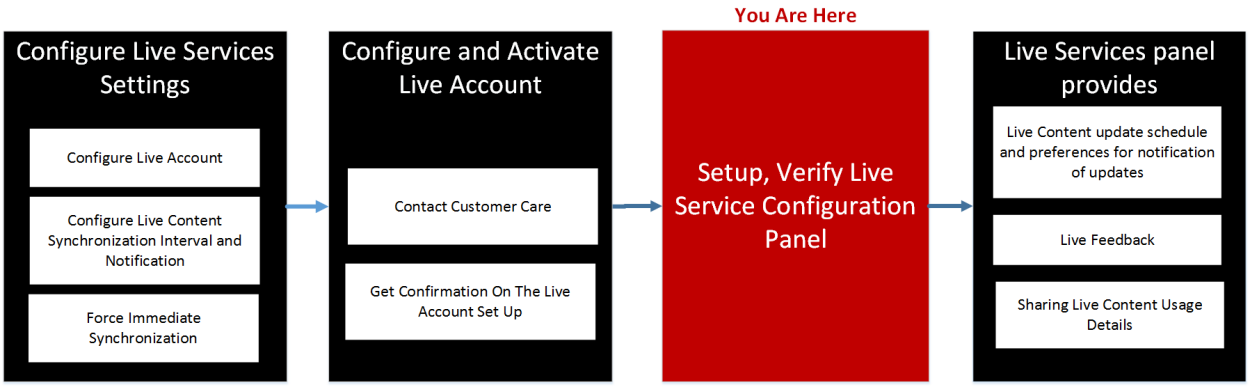
Feature	Description

Feature	Description
Event Limit Default	Specifies the maximum number of events loaded in the Events panel when a query is submitted. Possible values are integers between 100 and 40,000, and the default value is 5,000 events. If a query returns more events than the configured Event Limit Default, the Events panel title shows the analyst that more results are available but are not listed due to the limit. Increasing the limit may place additional load on the queried service; the ideal limit is determined by your environment.
Render Threads Setting	Specifies the maximum number of concurrent meta key values that are loaded by a single user in the Filter Events meta view. The default value is 1.
Event Limit Per User Role	Specifies the maximum number of events loaded for a single query for individual user roles. This limit must be less than or equal to the system events limit of 40,000, but it can be greater than the Event Limit Default.
Apply	Each setting has an Apply button, which saves the change. The change becomes effective immediately, and applies to any new queries submitted by users.

Live Services Configuration Panel

Live Services Configuration Panel introduces the features for setting up your Live account and the CMS server connection.

Live Account consists of two sections, namely RSA Live Status and Download Live Feedback Activity Log. **Sign In** by entering your Live Account credentials to access the Live Services. To activate your Live account for NetWitness, contact NetWitness Customer Support. When you have confirmation that your Live account has been set up, you can configure the CMS server connection as described in Configure Live Services Settings



The Live Services panel provides the user interface for:

- The Live account
- The Live Content update schedule and preferences for notification of updates
- Participation in Live Feedback
- Sharing Live Content Usage Details

For information on Live Feedback, see Live Feedback Overview

For information on Analyst Behaviors and Data Sharing, see the "NetWitness Feedback and Data Sharing topic in the *Live Services Management Guide*.

Live Services Quick Look

You access this view in the **(Admin)** > **System** > **Live Services**.

1 Displays the Live Services Configuration Panel.
2 Enter Live Account Credentials with the help of Customer Care.
3 Provides updates on Live Content.
4 Additional Live Services provide Live feedback.

Note: If you are not signed in with your Live Account credentials, a masked screen is displayed as shown here.

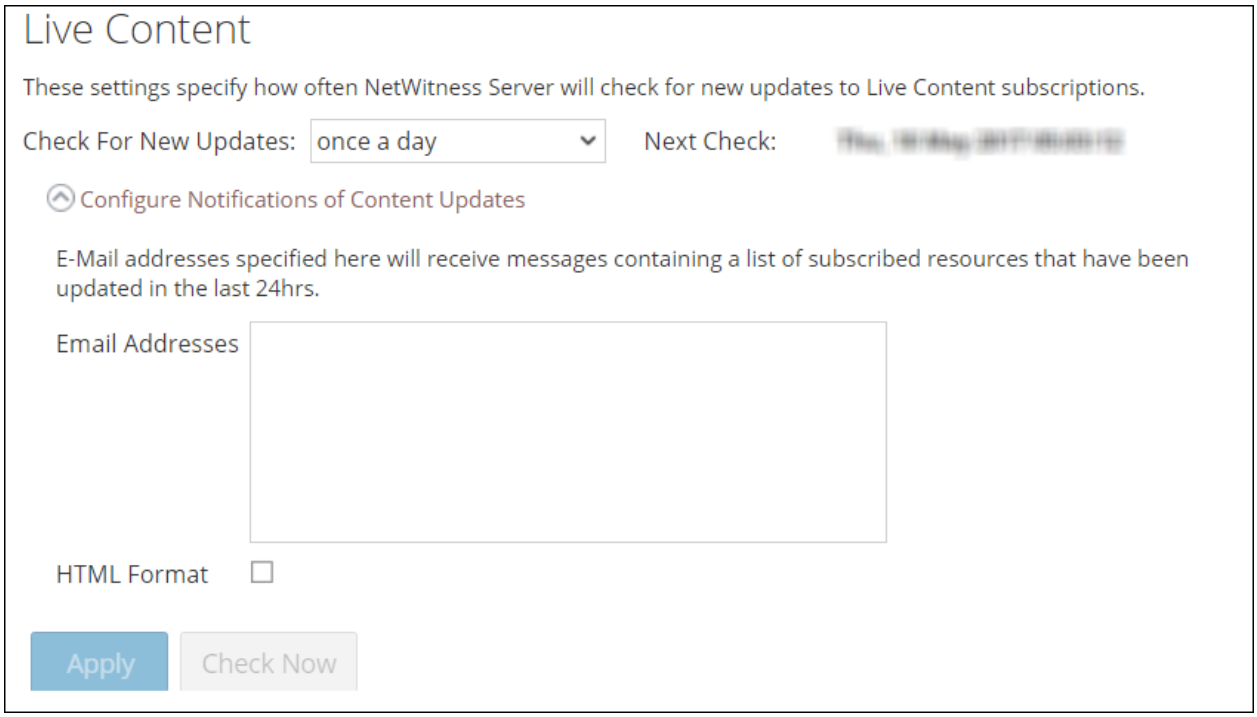
The Live Configuration panel has three sections: Live Account, Live Content, and Additional Live Services.

Live Account Section

In the **Live Account** section, you must enter the Live credentials. The information needed to set up the user's Live account consists of the Username, Password, and Live URL for the NetWitness Content Management System. This information is provided by Customer Care.

The following table describes the Live Account section features.

Feature	Description
Host	The Live URL for the Content Management System. The default value points to the NetWitness CMS at **cms.netwitness.com**.
Port	The communications port for Live to send requests to the Content Management System. The default value for this field is **443**, which is the communications port on the Content Management System.
SSL	Allows the user to communicate via SSL.
Username	The Live account user name as provided by NetWitness Customer Support.
Password	The Live account user password as provided by NetWitness Customer Support.
Test connection	Tests if the connection is successful or not.
Apply	Saves and applies the configuration.



The Live Account section provides an option to download and share the Live Feedback historical data by clicking Live Feedback Activity Log.

For more information about how to download historical data, see Upload Data to RSA for Live Feedback

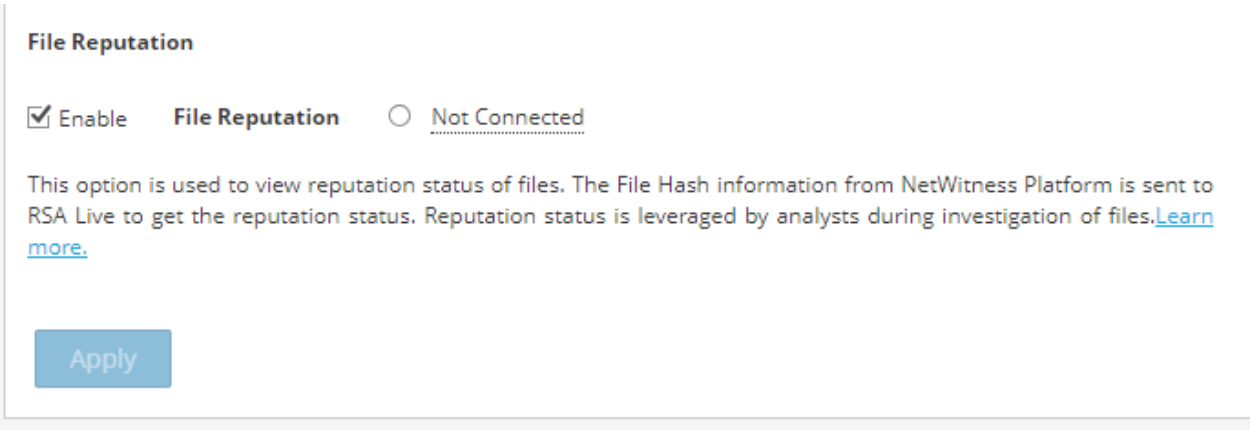
Live Content Section

You can configure the Live Content Synchronization interval and notification at which NetWitness checks for new updates to Live Content:

Use the **Check for New Updates** field to change the interval. Select an interval from the drop-down list. The default value for this setting is **once a day**.

The following table describes the Live Content features.

Feature	Description
Check for new updates	This setting dictates how often NetWitness checks for new updates to Live Subscriptions and synchronizes subscribed resources and tags: • once a day • twice a day • four times a day • every hour • every other hour • every half hour The default value for this setting is once a day.
Next Check	Displays the time and date of the next scheduled Live synchronization based on the configured interval for checking.
Email Addresses	Email addresses specified here receive messages containing a list of subscribed resources that have been updated in the last 24 hours.
HTML format	Specifies the format of email messages. • Set = HTML • Cleared = text
Check Now	Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness. **Caution:** Use this feature with caution because synchronization can cause a parser reload if a Lua Parser or Flex Parser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.
Apply	Applies the changed configuration to the subscription synchronization behavior. The changes become effective immediately. The **Next Live synchronization is scheduled for** field is updated if the time changed.



Force Immediate Synchronization

To force immediate synchronization, click **Check Now**. NetWitness checks for updates in subscribed resources.

Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness. One use for this is to see the immediate impact of a configuration change. For example, a new service has been added, or new resources have been toggled for automatic deployment. The scheduled synchronization could take place hours later if Live Services is set to synchronize a few times a day.

Caution: Synchronization can cause a parser reload if a Flex Parser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.

Additional Live Services

Note: Click on Learn more to know more about the data NetWitness is collecting. For more information, see Live Feedback Overview

The following tables describes the Additional Live Services features.

Feature	Description

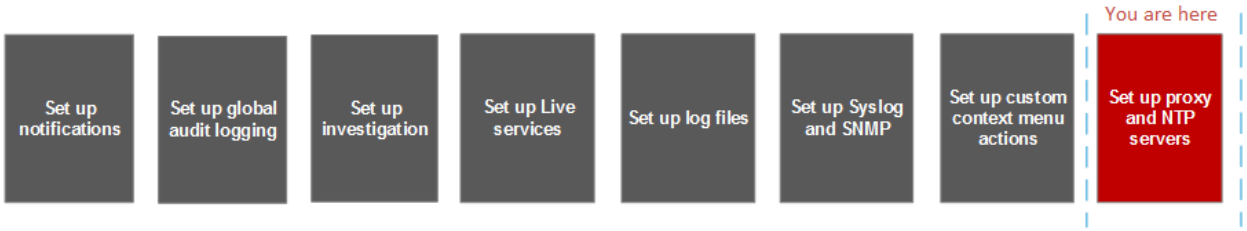
Live Feedback	Lists the types of data NetWitness is collecting:
	• Product Name
	• Product Version
	• Product Instance
	• Activation Key
	• Details of each Component such as:
	  • ID
	  • Name
	  • Version
	  • Instance ID
	• Metrics for each component

Additional Feedback Insights	Enables NetWitness to send anonymous, technical data about the content usage metrics to NetWitness. This option is enabled by default.

About Live Feedback Participation

Once you sign up for a Live account, Live Feedback automatically collects relevant information for further improvement and anonymously sends it to RSA. The shared data is protected in accordance with the applicable license agreement. For information on Live Feedback, see Live Feedback Overview. For information, see Configure Live Services Settings

If needed, you can manually download historical usage data and share it with RSA. For information on how to download historical usage data and share it with RSA, see Upload Data to RSA for Live Feedback.



NTP Settings Panel

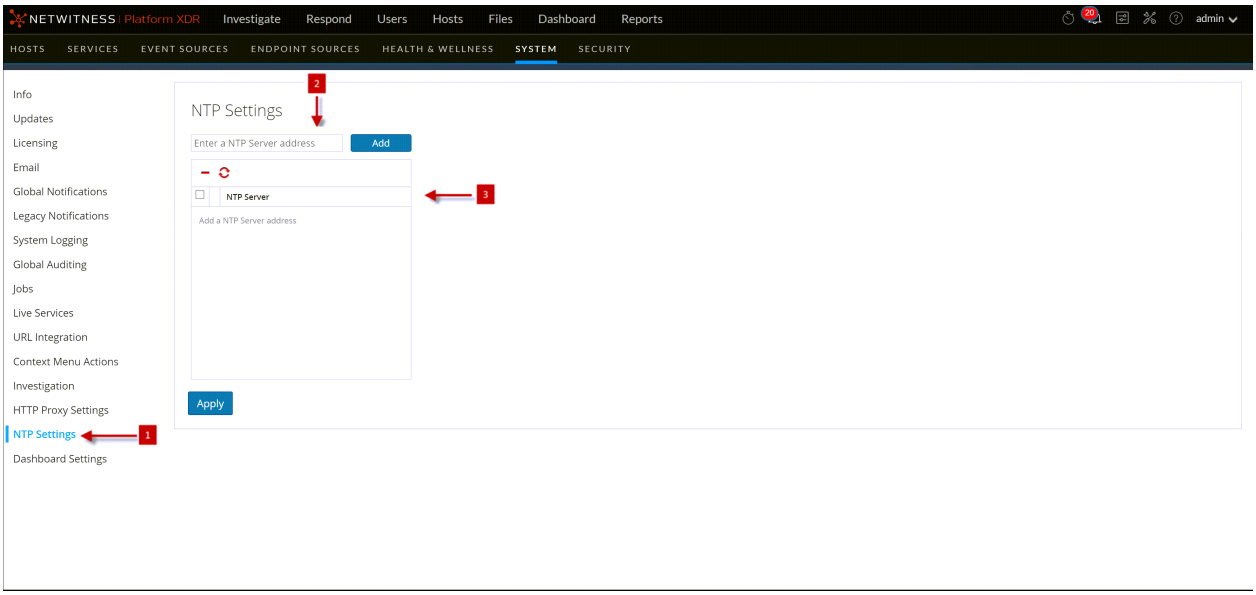
NTP setting panel is a protocol designed to synchronize the host machine clocks over a network. For more information on NTP see the home page (http://www.ntp.org/).

Note: NetWitness core hosts must be able to communicate with the NetWitness Server host with UDP port 123 for NTP time synchronization.

You use the **(Admin)** > **System** > **NTP Settings** view to configure one or more NTP servers. After you configure an NTP server, NetWitness uses NTP to synchronize the host machine clocks. You configure multiple NTP servers for Fail Over purposes.

Workflow

What you need to do?



Role	I want to ...	Show me how
Administrator	Add or Modify an NTP Server	Configure NTP Servers

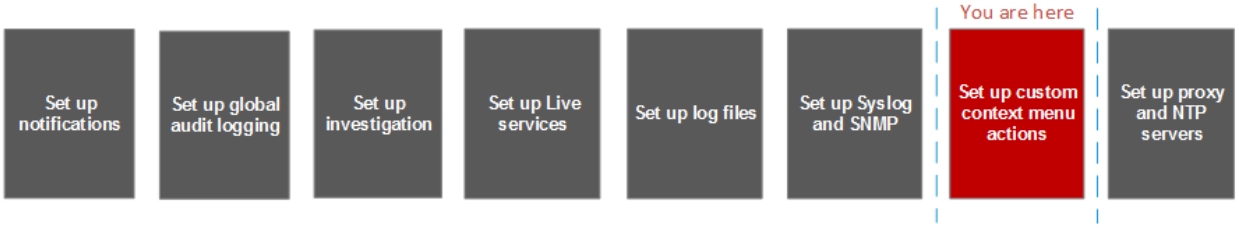
Related Topics

- Configure NTP Servers
- Troubleshoot Issues identified in the NTP Settings Panel or Log Files Messages

Quick Look

The following example illustrates an NTP setting panel. The panel defines how to add NTP server to NTP setting panel.

1 Displays the NTP setting panel.
2 Enter the NTP Server IP Address or hostname.
3 Click on an existing hostname.



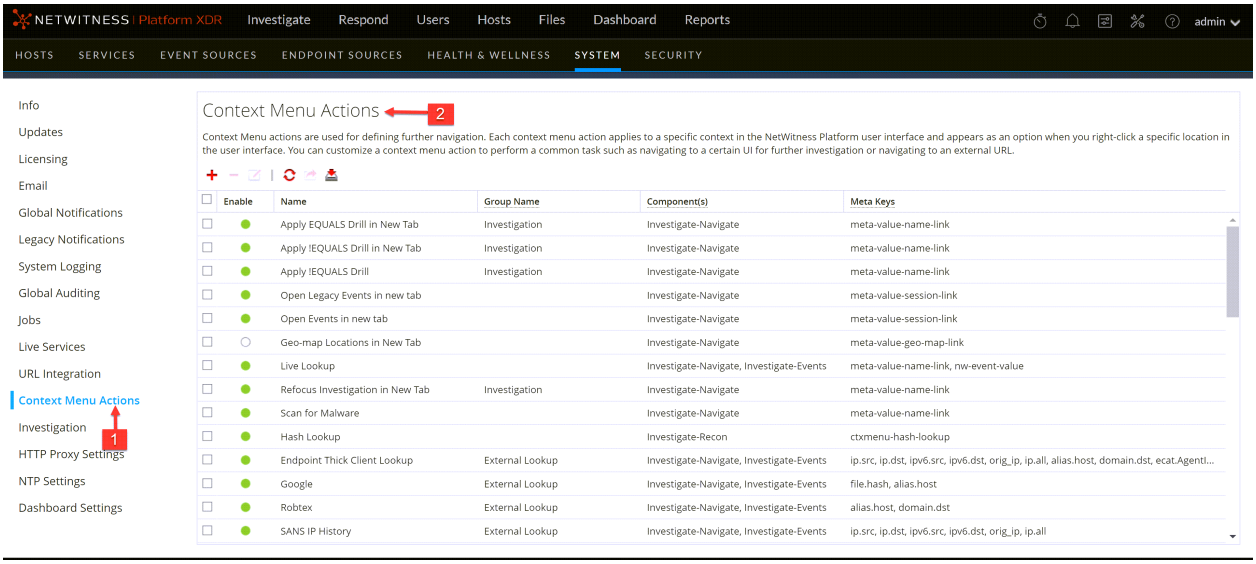
The following table describes the settings in the NTP Settings panel.

Setting	Description
Add	Enter the NTP Server IP Address or hostname to add the NTP server to NetWitness.
	Delete the selected NTP server.
	Synchronizes the selected NTP server.
	Selects the NTP server that you want to delete or synchronize.
NTP Server	NTP Server IP Address or hostname. If you click on an existing hostname, NetWitness makes the hostname editable and displays the following command buttons: • **Update** - Applies your edits. • **Cancel** - Cancels your edits.
Apply	Applies the NTP server settings and synchronizes host machine clocks to NTP.

Context Menu Actions Panel

In the Context Menu Actions panel, Administrators can view built-in context menu actions, and add, edit, or delete custom context menu actions that appear as options in a context menu.

Workflow



What do you want to do?

Role	I want to ...	Show me how
Administrator	Custom Context Menu Actions panel	Add Custom Context Menu Actions.

Quick Look

The following figure is an example of the Context Menu Actions panel.

1 Displays the Context Menu Actions Panel.
2 Toolbar allows you to Add, Edit, Delete Context Menu Actions.

The Context Menu Actions panel has a list and a toolbar. The following table describes the toolbar options and grid features.

Features	Description
	Displays the Context Menu Configuration dialog, in which you can create a new context action.
	Refreshes the list.
	Deletes the selected context actions. NetWitness does not request confirmation that you want to delete the action. The selected actions are immediately deleted with no opportunity to cancel.
	Displays the Edit Context Action dialog, in which you can edit an existing context action.
Visibility	Displays whether the context menu action is enabled or disabled.
Action Name	The name of the context menu action as it appears on the meta when a user right-clicks to initiate action.
Action Group	The action group under which this context menu action is grouped.
Component	The UI component to which the Action Name and Action Group belong.

Meta Keys	The names of the modules in which the context action is available. Currently all built-in context menu actions are for the Investigation module.
	When creating a context menu action, the parameter is `modules`.
	Here is a line of sample code:
	`"modules": [`
	`"investigation"`
	`],`

CSS Classes and Examples

CSS classes can be meta keys and non-meta keys.

Meta Key CSS Classes

One type of CSS class that you can add is meta keys. For meta keys that have a period, change the period to a dash when defining a CSS class. For example, the meta key `alias.host` becomes the CSS class `alias-host`. The meta key `ip.src` becomes the CSS class `ip-src`.

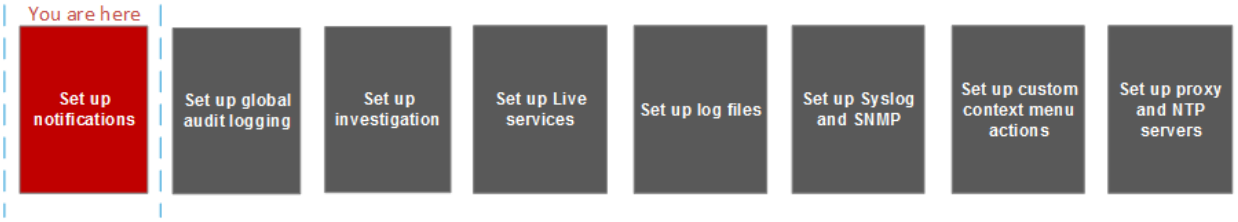
Non-Meta Key CSS Classes

Built-in non-meta key CSS Classes are also available. The classes in the following table define actions and the part of the user interface where the action is available.

CSS Class	Type	Description
meta-value-session-link	Action	Open on meta session count number
meta-value-name-link	Action	Open on meta value name
nw-event-value	Action	Use for reconstruction context actions on meta value
UAP.investigation.navigate.view. NavigationPanel	User interface	Applies to Navigate view
UAP.investigation.events.view. EventGrid	User interface	Applies to Event View
UAP.investigation.reconstruction.view. content.ReconstructedEventDataGrid	User interface	Applies to Event Reconstruction View

Example

This is a commented example of a context menu action to validate the user agent from the Client Application (client) meta key. The comments are removed automatically once applied in the Administration System view. The new menu item is displayed after restarting the browser.



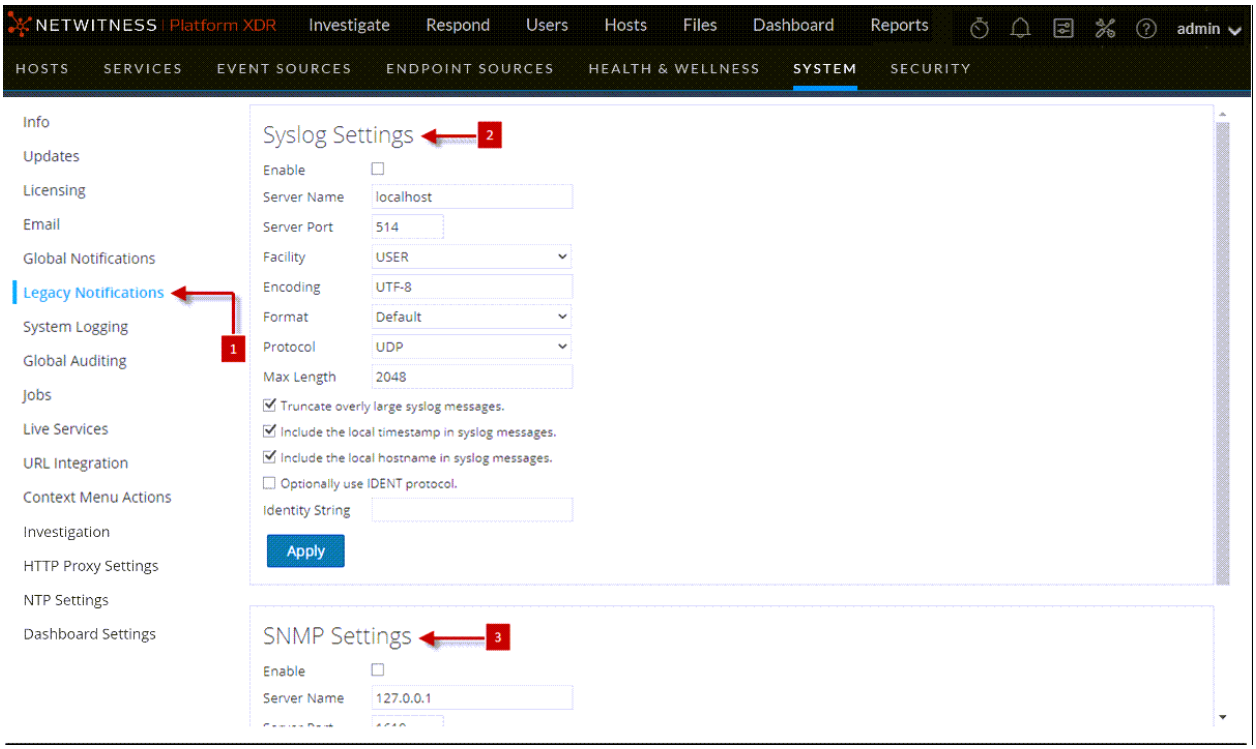
```
{
     "displayName": "User Agent String Lookup”, <!-- What name shows up in NW
UI -->
     "cssClasses": [
         “client”  <!-- What meta key to launch from -->
     ],
     "description": "",
     "type": "UAP.common.contextmenu.actions.URLContextAction",
     "version": "1",
     "modules": [
         "investigation"
     ],
     "local": "false",
     "groupName": "externalLookupGroup”, <!-- What group to show link in.
Remove line to show in main list -->
     "urlFormat": "http://www.useragentstring.com/?uas={0}&getText=all”, <!-- The {0}
gets replaced with whatever was right clicked on -->
     "disabled": "",
     "id": "UserAgentStringAction",
    "moduleClasses": [
         "UAP.investigation.navigate.view.NavigationPanel”, <-- Enabled in
Navigate pane-->
        “UAP.investigation.events.view.EventGrid” <-- Enabled in Event View
pane -->
     ],
     "openInNewTab": "true",
     "order": "15"
 }
```

Legacy Notifications Configuration Panel

The Legacy Notifications Configuration panel provides the ability to configure syslog and SNMP notification settings. These configurations are used for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Procedures related to these settings are described in Configure Syslog and SNMP Settings.

Workflow



What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Syslog Settings	Configure Syslog and SNMP Settings
Administrator	Configure SNMP Settings	Configure Syslog and SNMP Settings

Related Topics

- Configure Syslog and SNMP Settings

Quick Look

1	Displays the Legacy Notification Configuration Panel.
2	Allows the user to configure syslog notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.
3	Allows the user to configure SNMP notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

The Legacy Notifications Configuration Panel consists of two sections: Syslog Settings and SNMP Settings.

Syslog Settings

The following table describes the available options for configuring syslog notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Feature	Description
Enable	Enables the syslog settings configured here.
Server Name	Specifies the host where the target syslog process is running.
Server port	Specifies the port where the target syslog process is listening.

Feature	Description
Facility	Specifies the designated syslog facility to use for all outgoing messages. Possible values are KERN, USER, MAIL, DAEMON, AUTH, SYSLOG, LPR, NEWS, UUCP, CRON, AUTHPRIV, FTP, LOCAL1 through LOCAL7.
Encoding	Specifies the encoding to use for text in syslog messages, for example, UTF-8.
Format	Specifies the message format. Possible values are: Default, PCI DSS, or SEC.
Protocol	Specifies the communications protocol used when sending syslogs: UDP or TCP. By default, the UDP protocol is selected.
Max length	Specifies the maximum length in bytes of any syslog message. The default value is **2048**. Messages that exceed the maximum length are truncated when the **Truncate overly large syslog messages** checkbox is selected.
Truncate overly large syslog messages	When checked, any messages exceeding the maximum length are truncated.
Include the local timestamp in syslog messages	When checked, NetWitness includes the local timestamp in messages.
Include the local hostname in syslog messages	When checked, NetWitness includes the local hostname in syslog messages.
Optionally use IDENT protocol	When checked, NetWitness prepends the identity string to outgoing syslog alerts.
Identity string	This is an identity string to be prepended to each syslog alert. If the string is blank, no identity string is prepended to the outgoing syslog alerts. You can use this to identify the source of the alert. Users conventionally set it to the name of the program that sends the syslog message.
Apply	Applies the syslog configuration settings.

SNMP Settings

The following table describes the available options for configuring SNMP notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Feature	Description
Enable	Enables the SNMP settings configured here.
Server Name	Specifies the SNMP trap host.
Server port	Specifies the listening port on the SNMP trap host
SNMP version	Specifies the SNMP version, **v1** or **v2c**.

Feature	Description
Trap OID	Specifies the object ID for the SNMP trap on the trap host that receives the audit event. The default value is **0.0.0.0.0.1**.
Community	Specifies the community string used to authenticate on the SNMP trap host, the default value is **public**.
Enable	Enables SNMP notifications as configured here.
Apply	Applies the SNMP configuration settings.

System Maintenance

This guide tells administrators how to manage hosts and services in the network, maintain and monitor the network, run jobs, and tune performance after initial network setup.

The following diagram shows the different system maintenance tasks available to you.

The following topics describe these tasks:

- Review Best Practices
- Monitor Health and Wellness using NetWitness Platform UI
- Manage NetWitness Platform Updates
- Display System and Service Logs
- Maintain Queries Using URL Integration
- Configure FIPS Support
- Change Host Network Configuration
- DISA STIG
- Troubleshoot NetWitness Platform

Review Best Practices

Review the following best practices to maintain your NetWitness Platform deployment.

Safeguarding Assets with NetWitness Supplied Policies

The purpose of the NetWitness core policies delivered with NetWitness are for safeguarding your NetWitness domain assets immediately (before you configure rules specific to your environment and your security policy).

NetWitness recommends that you set up email notifications to the appropriate asset owners for these policies as soon as possible. This will notify them when performance and capacity thresholds are crossed so they can take action immediately.

NetWitness also recommends that you evaluate the core policies and disable a policy or change its service and group assignments according to your specific monitoring requirements.

Safeguarding Assets with Policies Based on Your Environment

NetWitness core policies are generic and may not provide sufficient monitoring coverage for your environment. NetWitness recommends that you gather issues over a period of time, that are not identified by the NetWitness core policies, and configure rules to help you prevent these issues.

Creating Rules and Notifications Judiciously

NetWitness recommends that you make sure that each rule and policy is necessary before you implement it, if possible. NetWitness also recommends that you review implemented policies on a regular basis for their validity. Invalid alarms and email notifications can adversely affect the focus of the asset owners.

Troubleshooting Issues

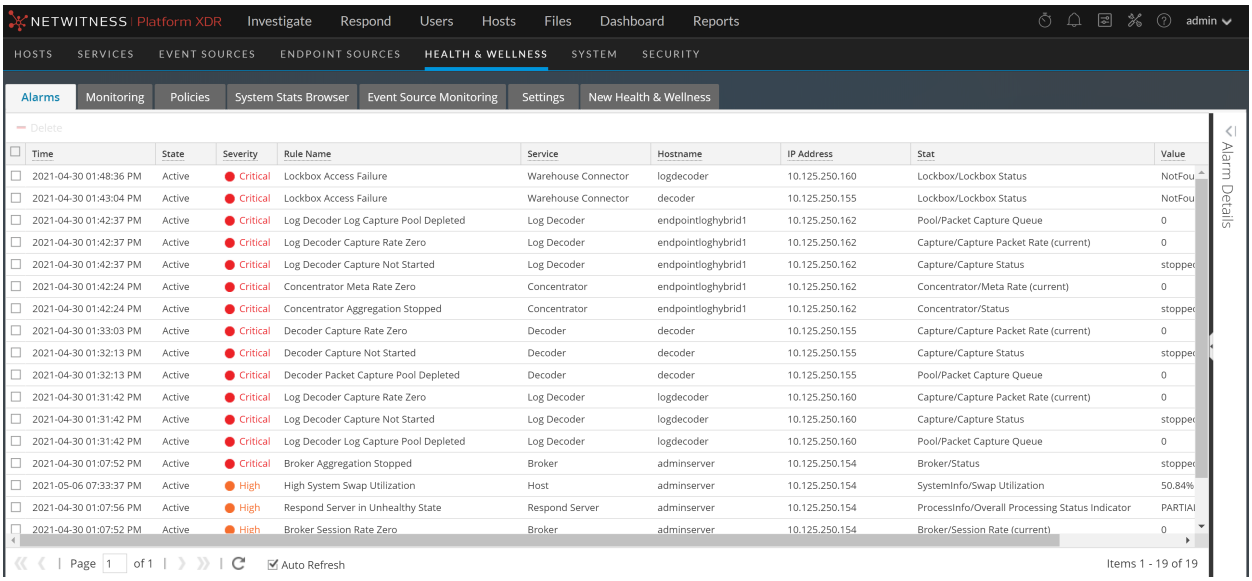
NetWitness recommends that you review Troubleshooting Health & Wellness and Troubleshoot NetWitness Platform when you receive error messages in the user interface and log files from hosts and services.

Monitor NetWitness Platform Health

Monitor the Health & Wellness of the NetWitness using any of the following:

- Monitor Health and Wellness using NetWitness Platform UI
- Monitor New Health and Wellness

Monitor Health and Wellness using NetWitness Platform UI



The Health & Wellness module of NetWitness enables you to:

- View the current health of all the hosts, all services running on the hosts, and various aspects of the health of your hosts.
- Monitor the hosts and services in your network environment.
- View details of various event sources configured with NetWitness.
- View system stats for the selected hosts by filtering the views as required.

You can also configure Archiver and Warehouse Connector monitoring, monitor host statistics, and work with system logs to monitor NetWitness.

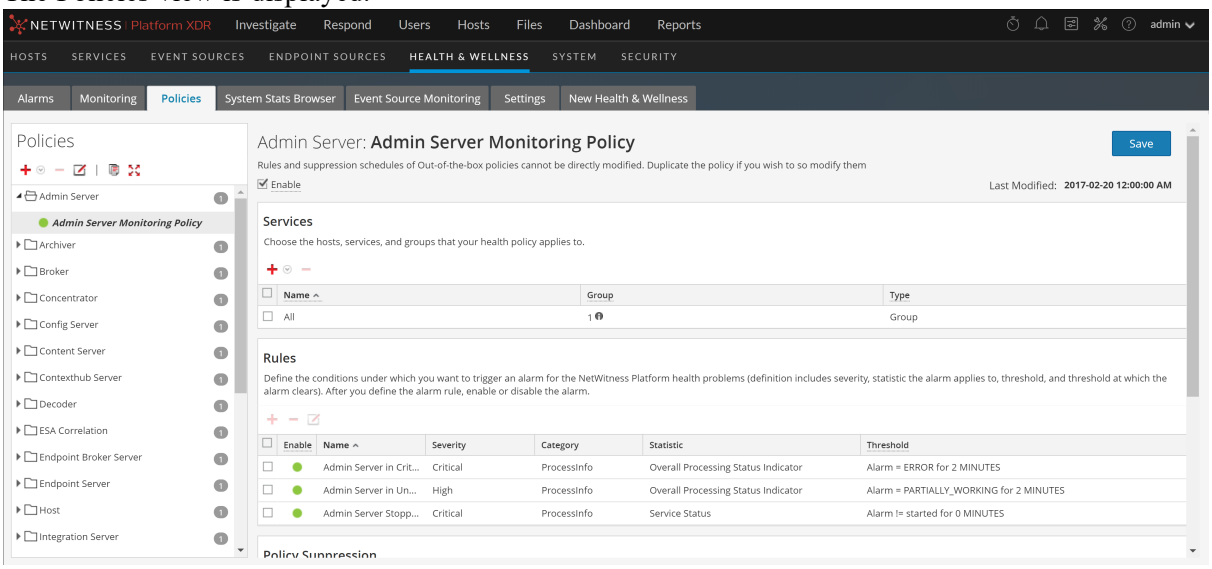
Note: All users have permission to view the entire Health and Wellness interface by default. The Administrator and the Operator roles are the only roles that can manage the Policies view by default. Refer to the "Role Permissions" topic in the *Security User Management Guide* for a complete list of the default permissions for the NetWitness Interface.

The following figure displays the Health & Wellness module of the NetWitness user interface.

Manage Policies

Policies are either user-defined or supplied by NetWitness. A policy defines:

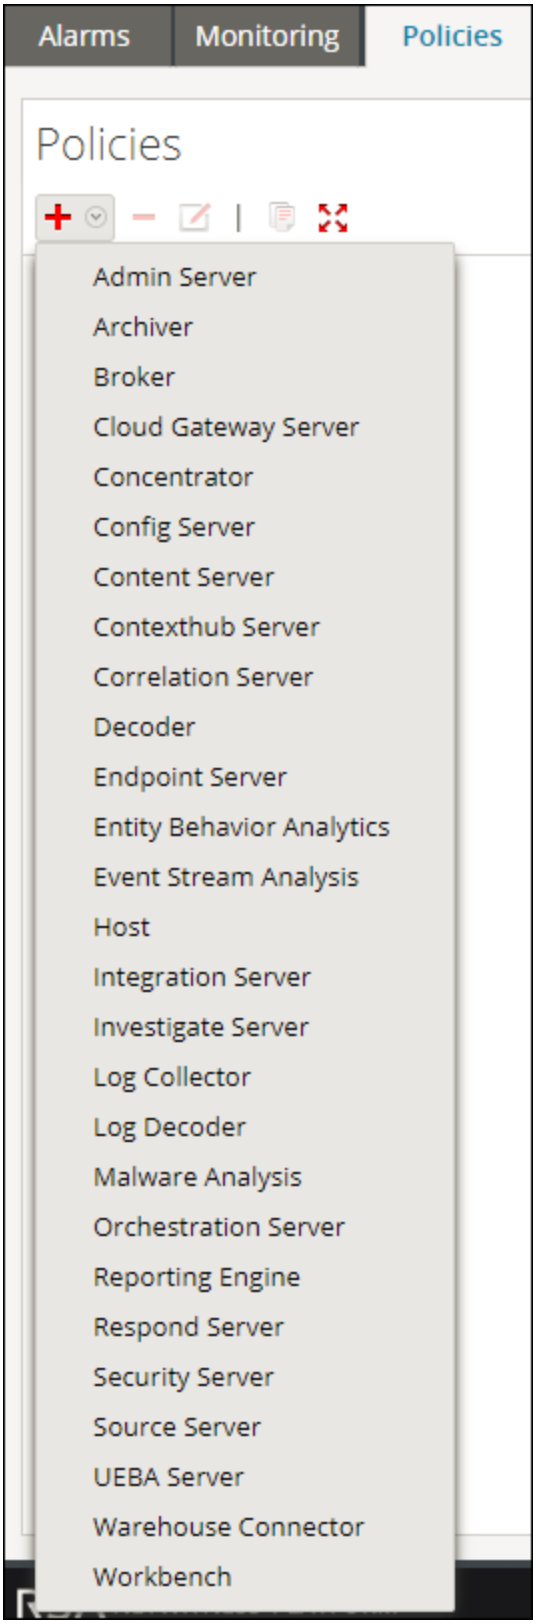
- Services and hosts to which the policy applies.
- Rules that specify statistical thresholds that govern alarms.
- When to suppress the policy.
- Who to notify when an alarm triggers and when to notify them.



For related reference topics, see NetWitness Platform Out-of-the-Box Policies

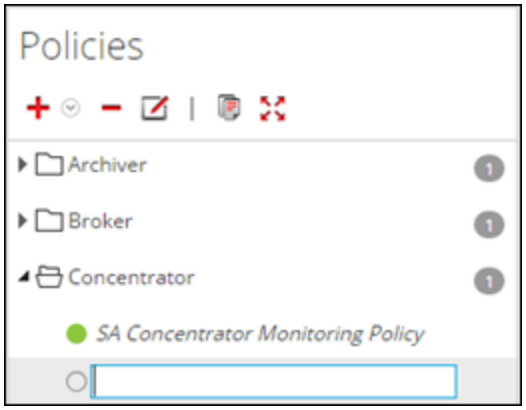
Note: You can now configure a policy to notify Public Key Infrastructure (PKI) certificate expiration status.

Add a Policy

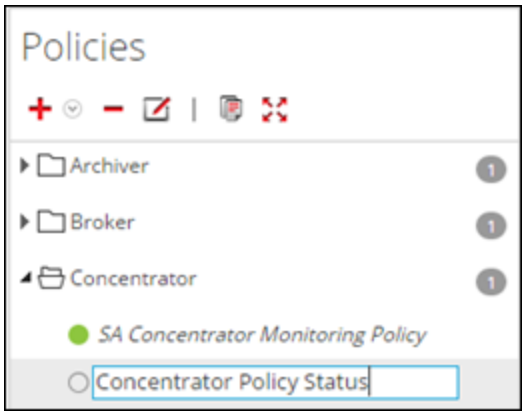


1. Go to **(Admin) > Health & Wellness.**
2. Click the **Policies** tab.

   The Policies view is displayed.



3. Click in the **Policies** panel.



A list of your hosts and services displays for which you can create health policies.

4. Select a host or service (for example, **Concentrator**).
   For a PKI policy, you must select a host (for example, Host).
   The host or service is displayed in the Policies panel with a blank Policy Detail panel.

5. Enter a name for the Policy (for example, **Concentrator Policy Status**) in the **Policies** panel.

   The name (for example, **Concentrator Policy Status**) is now displayed as the policy name in Policy Detail panel.

6. Create a Policy in the Policy Detail panel:

   a. Select the **Enable** checkbox.

   b. Add relevant services (in this example, any relevant Concentrator services) that you want to monitor for health statistics.
      For a PKI policy, you must select the LOCALHOST to monitor for health statistics.

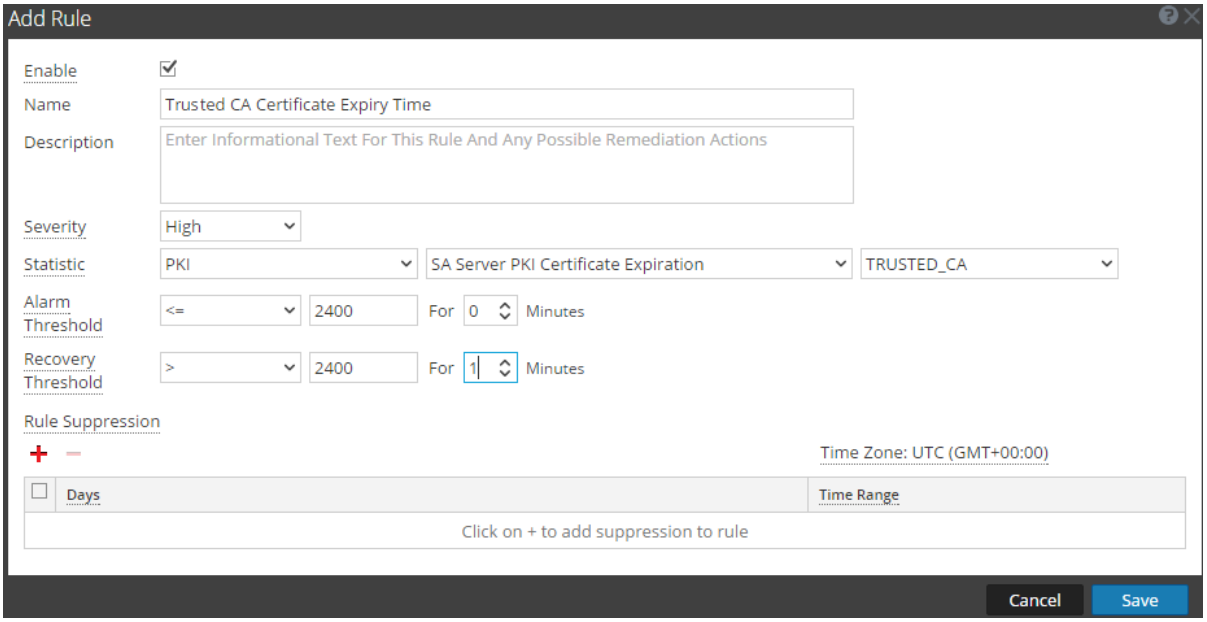
   c. Add rule conditions to configure the policy.

   d. Suppress enforcement of the policy for the time periods you want.

   e. Add any email notifications you want for the policy.

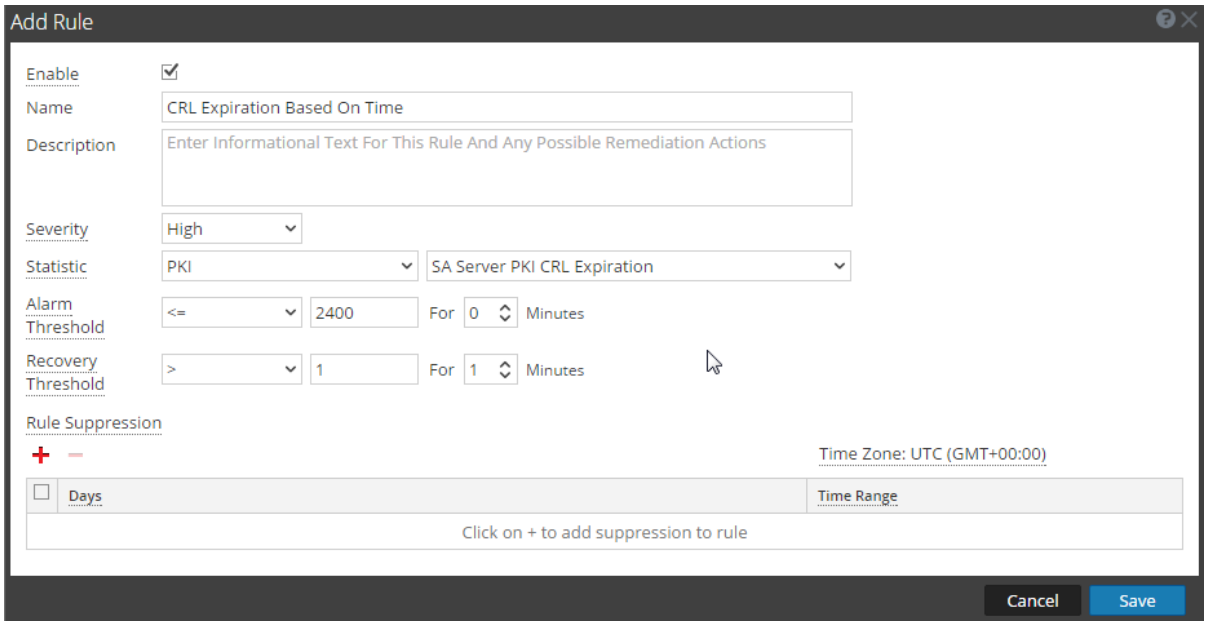
   f. Click **Save** in the Policy Detail panel.

      The Policy is added.

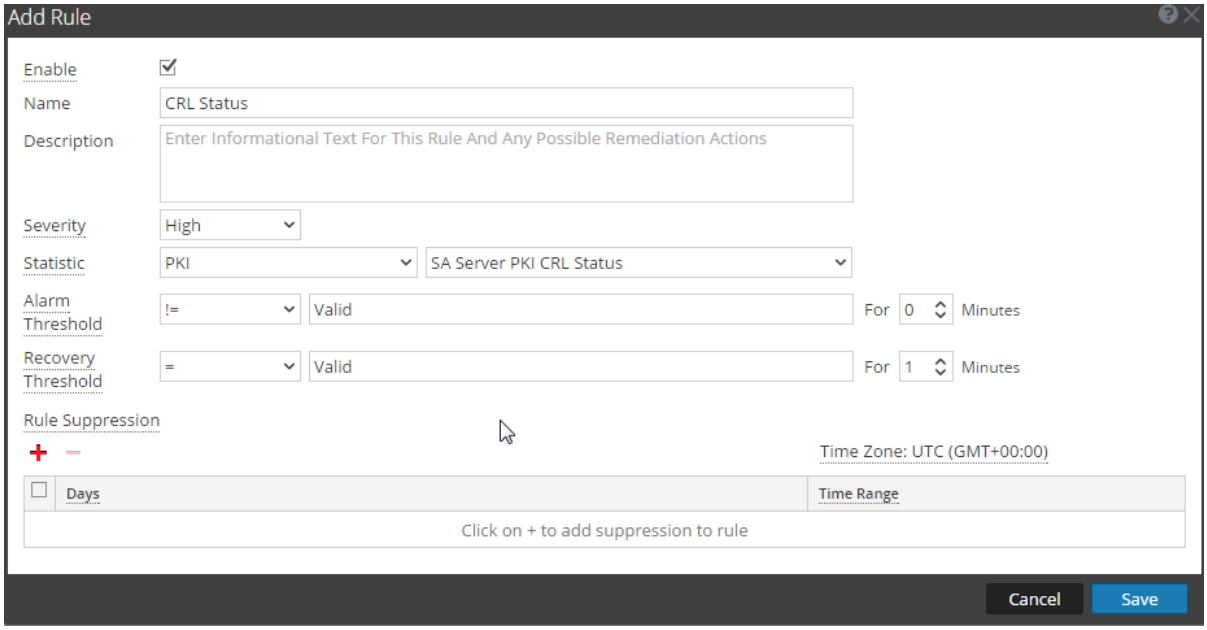


Add Policy Example

Below is a high-level example of configuring a PKI policy:



1. Add a new PKI policy.

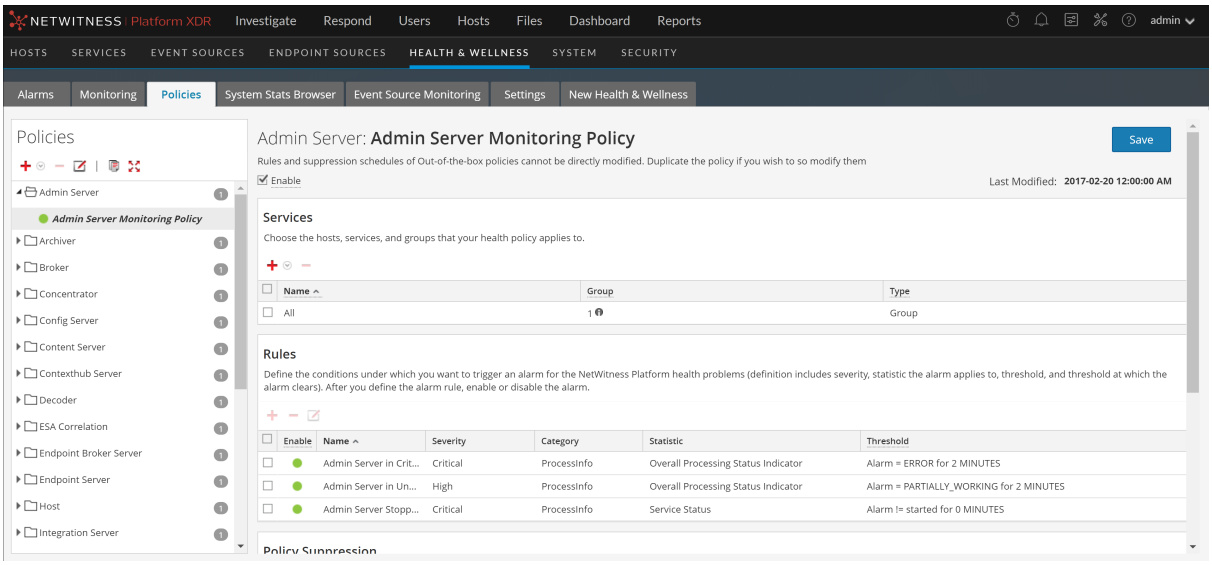


2. Add a Rule with Statistics:
   - For CA Expiration

   - For CRL Expiration

- For CRL Status

- For Server Certificate Expiration



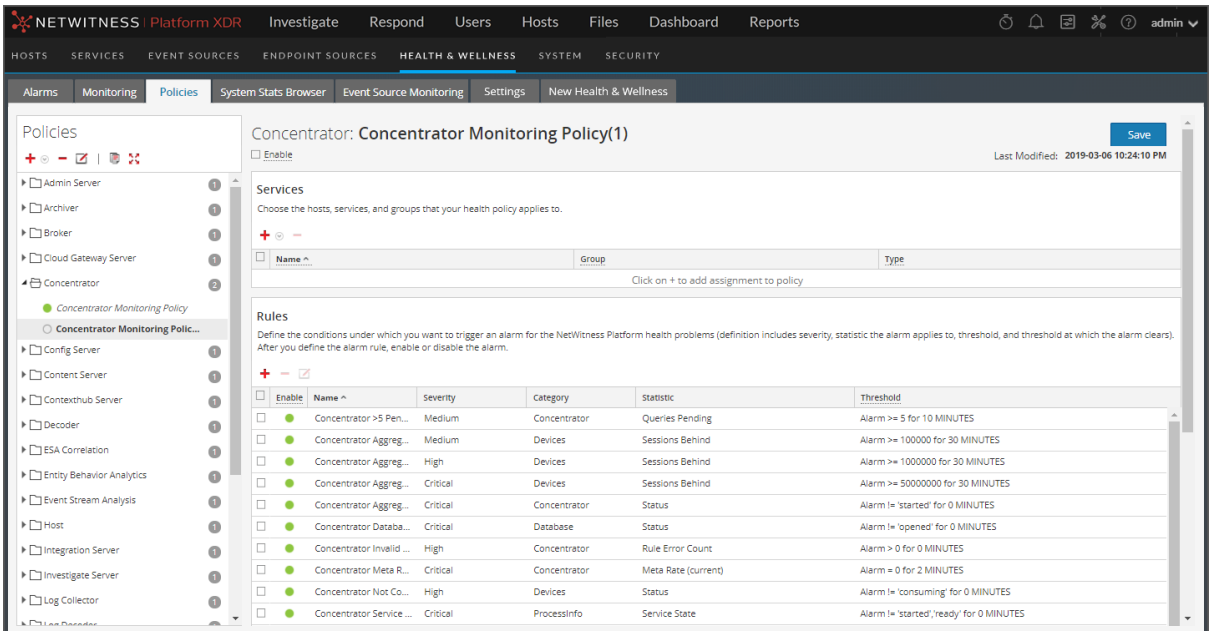
Edit a Policy

1. Go to **(Admin) > Health & Wellness.**
2. Click the **Policies** tab.

   The Policies view is displayed.
3. Select a policy (for example, **Concentrator Policy Status**) under a host or service.

   The Policy Detail is displayed.
4. Click .

   The policy name (for example, **Admin Server Monitoring Policy**) and policy detail panel become editable.



5. Make the required changes and click **Save** in the Policy Detail panel. You can:
   - Edit the policy name.
   - Enable or disable the policy.
   - Add or delete hosts and services in the policy.
   - Add, delete or modify rules in the policy.
   - Add, edit, or delete suppressions in the policy.
   - Add, edit, or delete notifications in the policy.

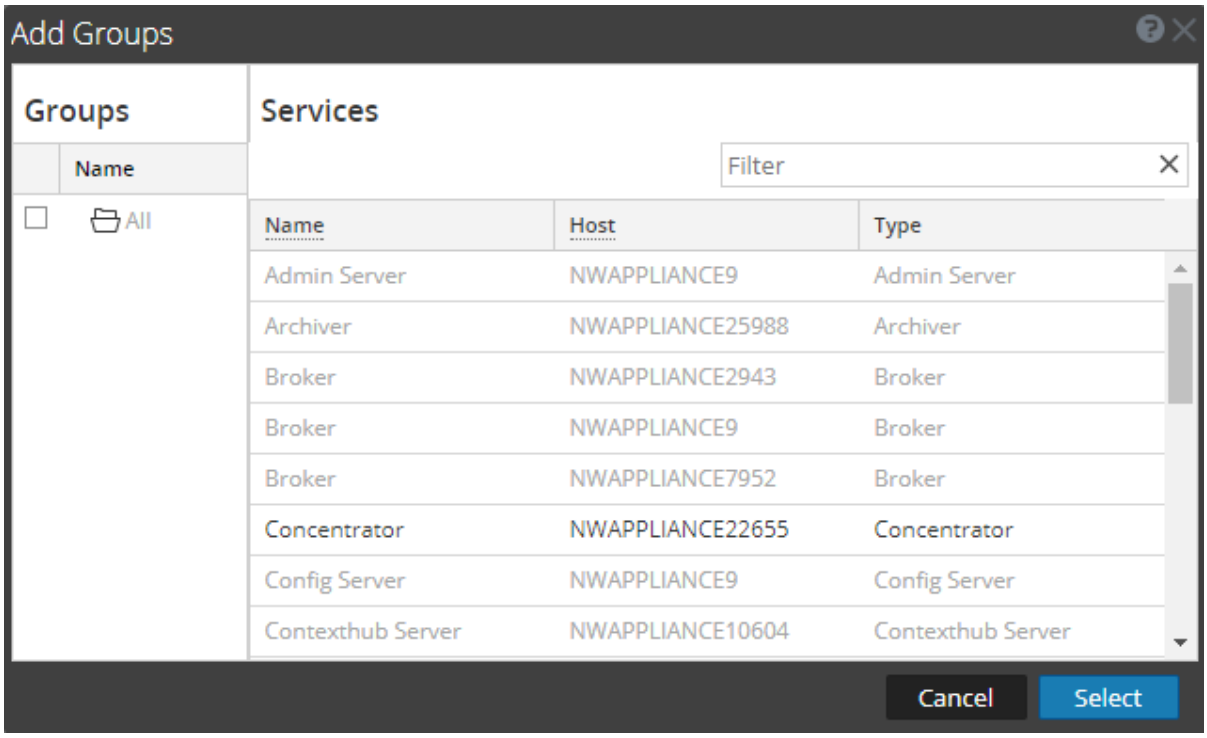
Note: Save applies the policy rules based on the selection of enable or disable. It also resets the rule condition timers for changed rules, and the entire policy.

Duplicate a Policy

1. Go to  **(Admin) > Health & Wellness**.
2. Click the **Policies** tab.
3. Select a policy (for example, **Concentrator Monitoring Policy**) under a host or service.
4. Click .NetWitness copies the policy and lists it with **(1)** appended to the original policy name.

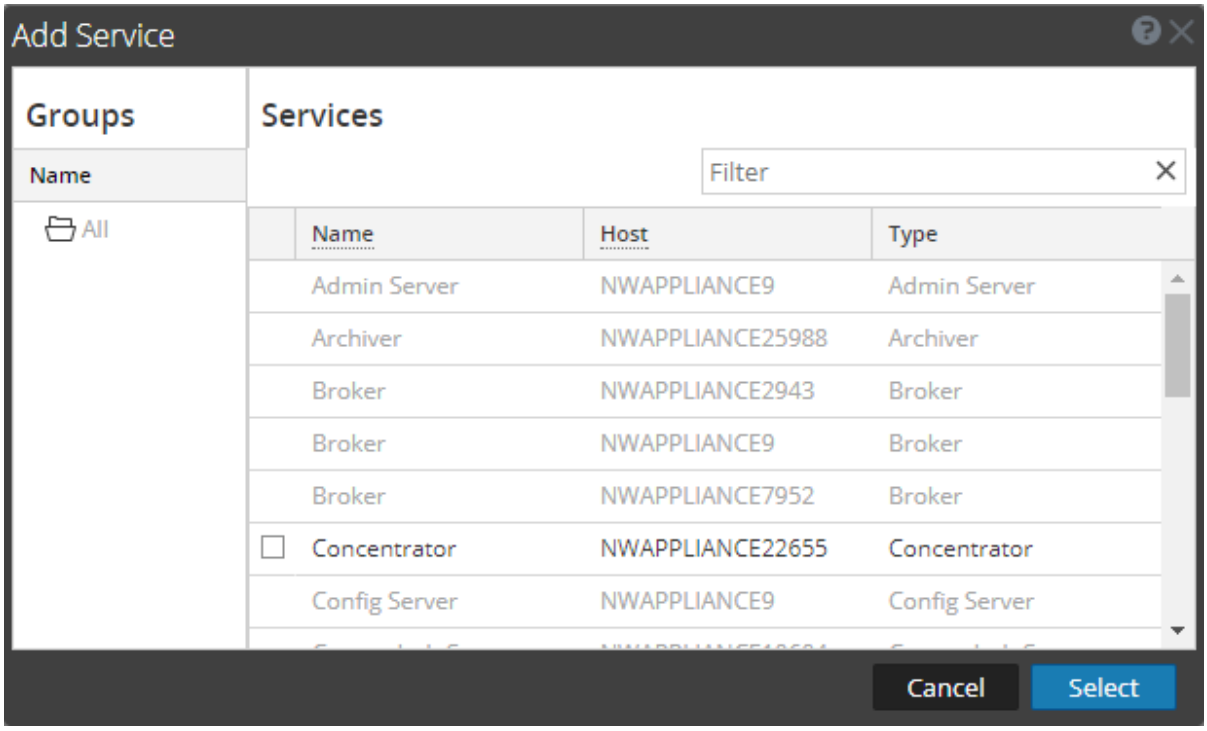
5. Click  and rename the Policy [for example, rename **Concentrator Monitoring Policy(1)**] to **New Concentrator Policy**.

> **Note:** A duplicated policy is disabled by default and the host and service assignments are not duplicated. Assign any relevant hosts and services to the duplicated policy before you use it to monitor health and wellness of the NetWitness infrastructure.



Assign Services or Groups

To assign hosts or services to a policy:



1. Go to  **(Admin) > Health & Wellness.**
2. Click the **Policies** tab.

   The Policies view is displayed.
3. Select a policy (for example, **First Policy**) under a host or service.

   The Policy Detail view is displayed.
4. Click  in the Services and Groups list toolbar.
5. Choose one of the following actions:
   - For hosts, select **Groups** or **Hosts** from the selection menu.
   - For services, select **Groups** or **Services** from the selection menu.
6. Depending on whether you are assigning services or groups, perform one of the following actions:
   - **Groups**, the **Groups** dialog is displayed from which you can select predefined groups of hosts or services.

- **Services**, the **Services** dialog is displayed from which you can select individual services.

7. Select the checkbox next to the groups or services you want to assign to the policy, click **Select** in the dialog, and click **Save** in the Policy Detail panel.

Note: Services are filtered for selection based on the type of policies. For example, you can only select Concentrator services for a Concentrator type of policy.

Remove Services or Groups

To remove a host or service from a policy:

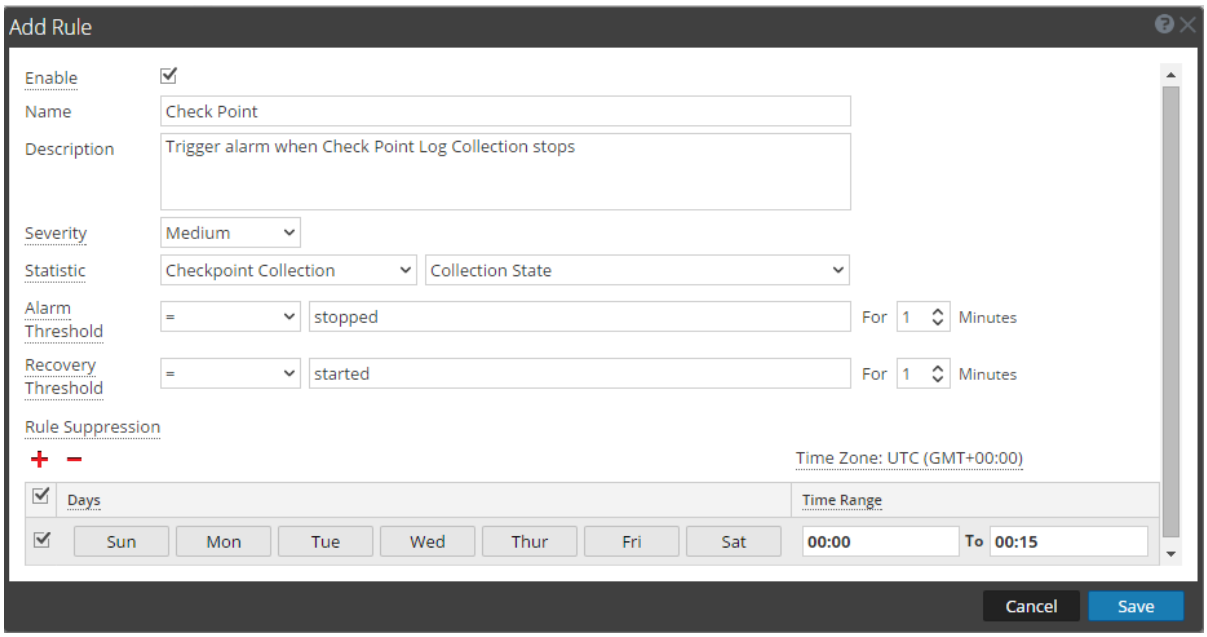
1. Go to **(Admin) > Health & Wellness**.
2. Click the **Policies** tab.

   The Policies view is displayed.
3. Select a policy under a service.

   The Policy Detail view is displayed.
4. Select a host or service.
5. Click .

   The host or service is removed from the policy.

Add or Edit a Rule



To add a rule to a policy:

1. Go to **(Admin) > Health & Wellness.**
2. Click the **Policies** tab.

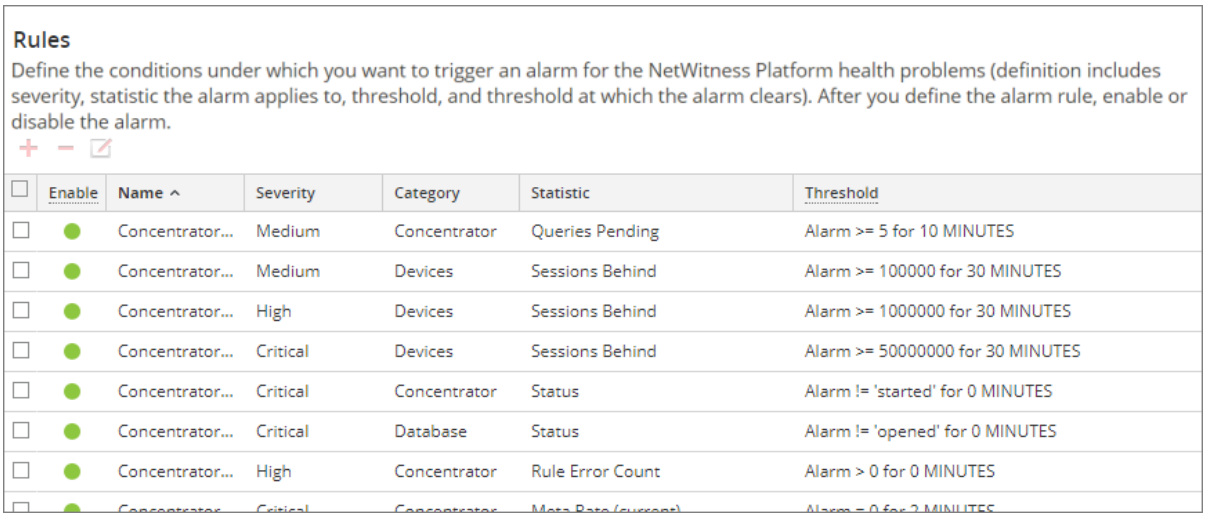
   The Policies view is displayed.
3. Select a policy (for example, **Checkpoint**) under a host or service.

   The Policy Detail view is displayed.
4. Depending on whether you are adding or editing rule, do the following:

   - To add a rule, click in the Rules list toolbar.
   - To edit a rule, select a rule from the Rules list and click .
5. Complete the dialog to define or update the rule.
6. Add a description as shown in the following example.

7. Click **OK**.

   The rule is added (or updated) to the policy.



Hide or Show Rule Conditions Columns

To hide or show rule conditions columns in the Rules panel:

1. Go to **(Admin) > Health & Wellness.**
2. Click **Policies** tab.

   The Policies view is displayed.
3. Select a policy under a service.

   The Policy Detail view is displayed.
4. Go to the **Rules** panel.

5. Click **v** to the right of **Category** , set **Columns**, and clear the **Static** and **Threshold** rule conditions.

   You can set or clear any Rules column to show or hide it.
   The **Rules** panel displays without the rule conditions.

Delete a Rule

To remove a host or service from a policy:

1. Go to **(Admin) > Health & Wellness.**
2. Click the **Policies** tab.
   The Policies view is displayed.
3. Select a policy under a service.
   The Policy Detail view is displayed.
4. Select a rule from the **Rules** list (for example, **Checkpoint**).
5. Click **-**.
   The rule is removed from the policy.

Suppress a Rule

1. Click the **Policies** tab.
   The Policies view is displayed.
2. Select a policy under a service.
   The Policy Detail view is displayed. You can specify rule suppressions time ranges when you initially add it or you can edit the rule and specify suppression time ranges.
3. Add or edit a rule.
4. In the **Rules Suppression** panel of the **Add** or **Edit Rule** dialog, specify the days and time ranges during which you want the rule suppressed.

Suppress a Policy

1. Add or edit a policy.
   The Policies view is displayed.
2. In the **Policy Suppression** panel:
   a. Select a time zone from the **Time Zone** drop-down list.
      This time zone applies to the entire policy (both policy suppression and rule suppression).
   b. Click  in the toolbar.
   c. Specify the days and time ranges during which you want the policy suppressed.

Add an Email Notification

To add an email notification to a policy:

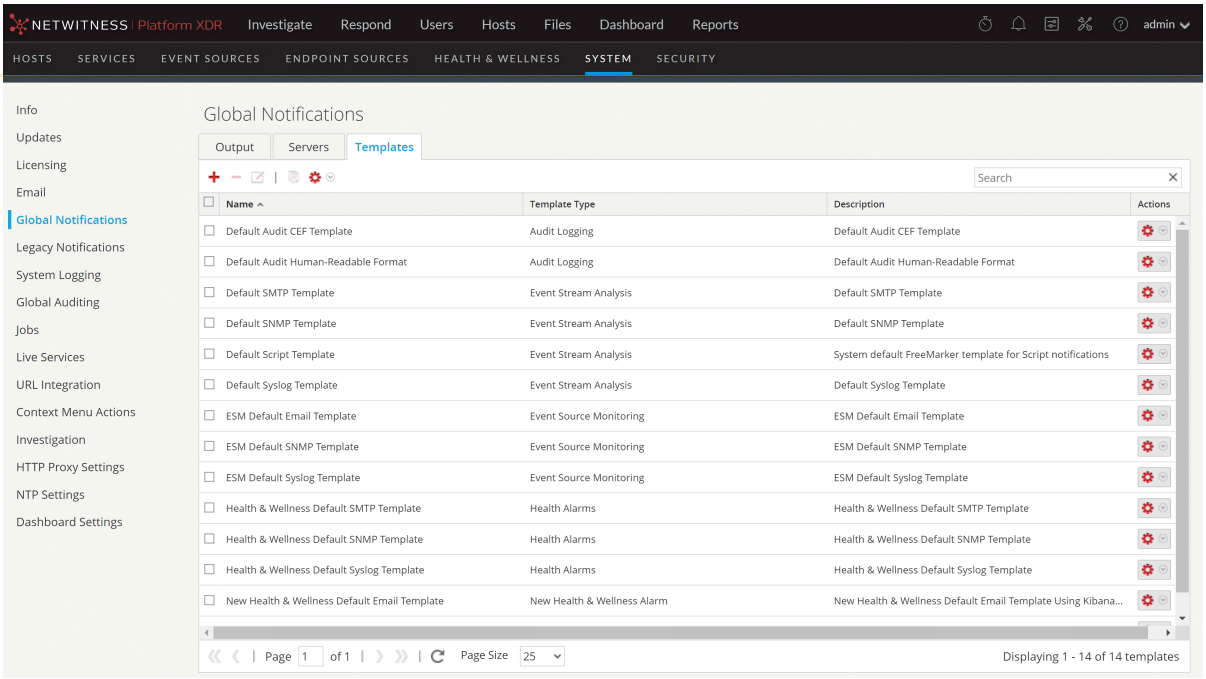
1. Add or edit a policy.
   The Policies view is displayed.
2. In the **Notification** panel:
   a. Click  in the toolbar.
      A blank EMAIL notification row is displayed.
   b. Select the email:
      - Notification types in the Recipient column (see "Configure Notification Outputs" in the *NetWitness System Configuration Guide* for the source of the values in this drop-down list).
      - Notification server in the Notification Server column (see 'Configure Notification Servers" in the *NetWitness System Configuration Guide* for the source of the values in this drop-down list).
      - Template server in the Template column (see "Configure Notification Templates" in the *NetWitness System Configuration Guide*for the source of the values in this drop-down list).

      Note: Refer to Include the Default Email Subject Line if you want to include the default Email subject line from the Health & Wellness template in your Health & Wellness Email notifications for specified recipients.

Delete an Email Notification

To add an email notification to a policy:

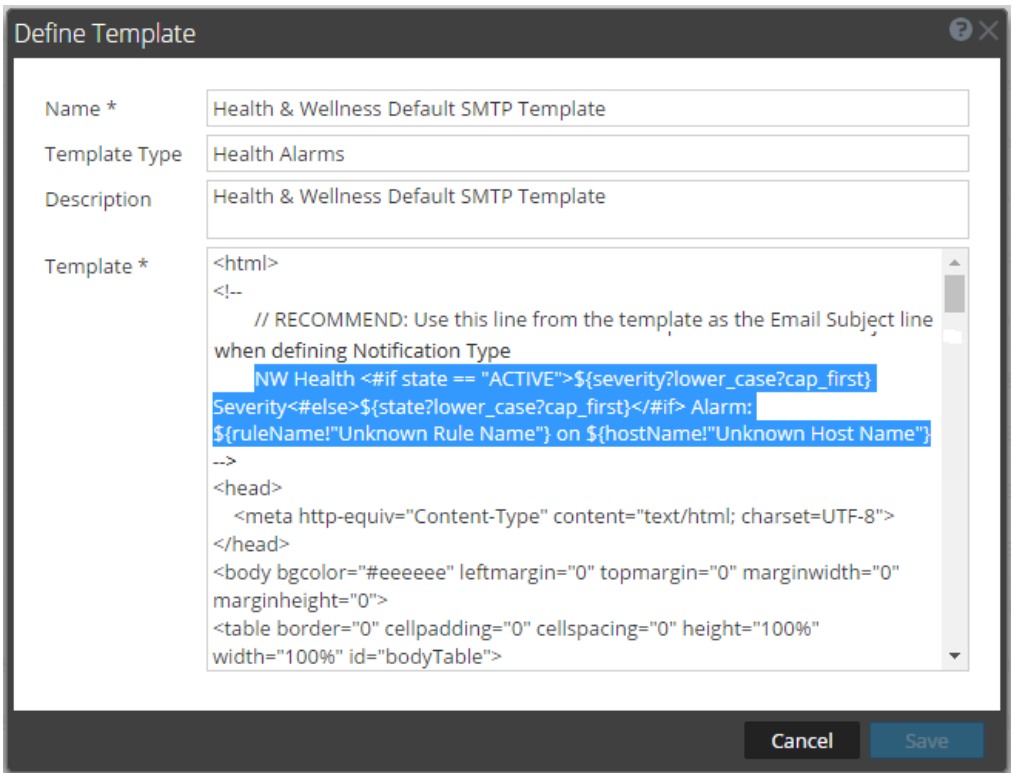
1. Add or edit a policy.
   The Policies view is displayed.
2. In the **Notification** panel:
   a. Select an email notification.
   b. Click .
      The notification is removed.



Include the Default Email Subject Line

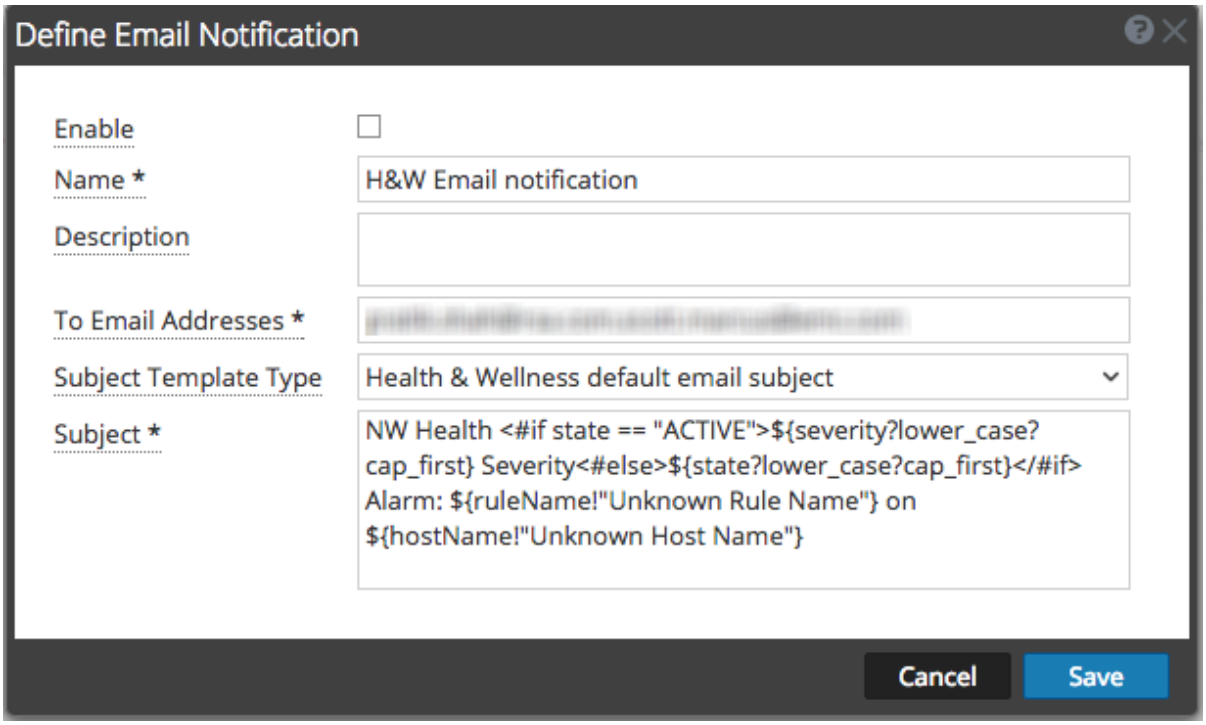
The emails generated by the notifications you set up for policies do not include the subject line from the Health & Wellness Default Email Notification templates. You need to specify the subject line in the do not include subject lines. This procedure shows you how to insert a subject line into the templates.

For related reference topics, see Policies View and NetWitness Platform Out-of-the-Box Policies.



To include the subject line from a Health & Wellness email template in your email notification:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Select a Health & Wellness Email Template (for example, **Health & Wellness Default SMTP Template**).



The Define Template dialog is displayed.

4. Click , then in the **Template** field, copy the Subject Line (Highlight the subject line and press Ctrl-C) into the buffer.

5. Click **Cancel** to close the Template.
6. Click the **Output** tab and select a notification (for example **Health & Wellness**).
7. Click .

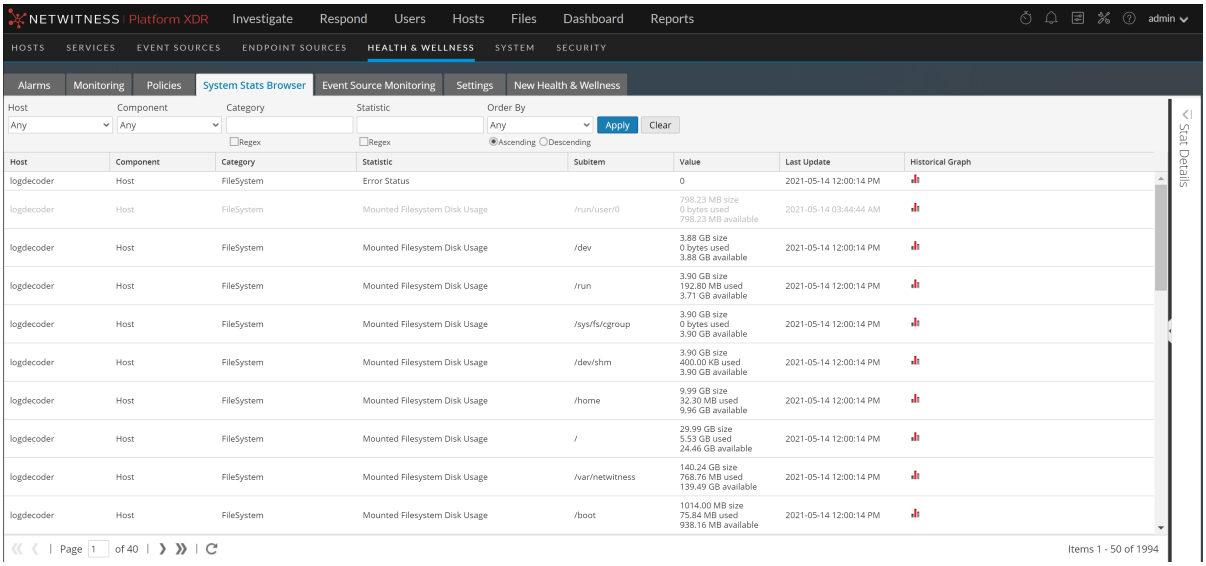
   The **Define Email Notification** dialog is displayed.
8. Replace the value in **Subject** field text box with the subject line that you have in the buffer (highlight the existing text and press Ctl-V).

Define Email Notification
Enable
Name *
H&W Email notification
Description
To Email Addresses *
Subject Template Type
Health & Wellness default email subject
Subject *
NW Health <#if state == "ACTIVE">${severity?lower_case?cap_first} Severity<#else>${state?lower_case?cap_first}</#if> Alarm: ${ruleName!"Unknown Rule Name"} on ${hostName!"Unknown Host Name"}
Cancel
Save

9. Click **Save**.

Monitor System Statistics

The System Stats Browser filters statistics by the selected host, component running on the host, statistical category, individual statistic, or any combination of host, component, category, and statistic. You can also choose the order in which to display this information.



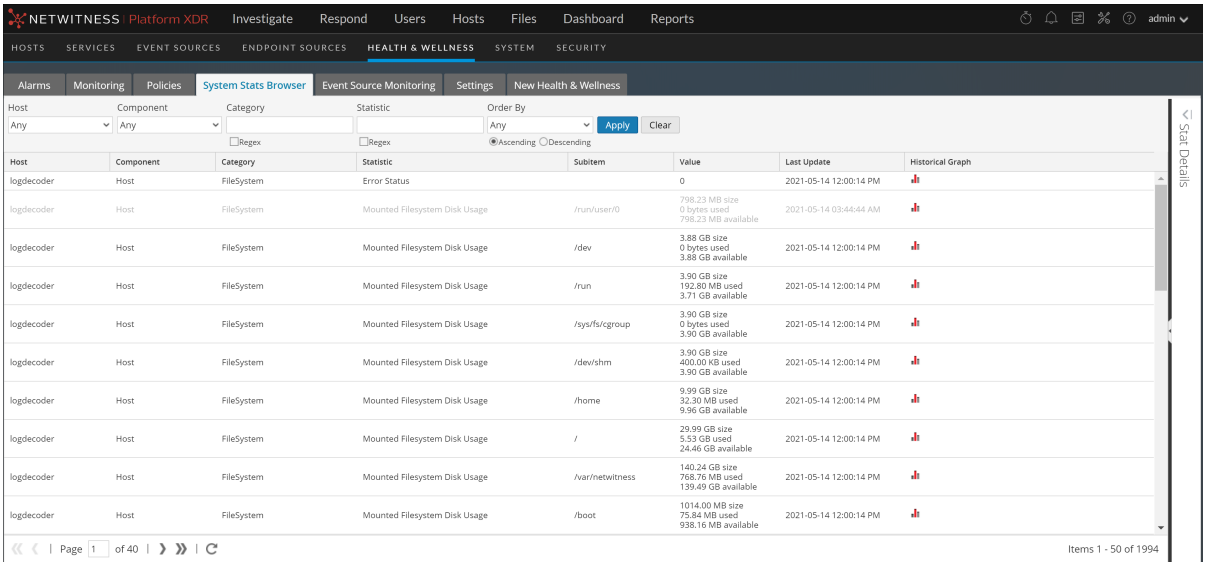
To access the System Stats browser:

1. Go to **(Admin)** > **Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

2. Click the **System Stats Browser** tab.

   The System Stats Browser tab is displayed.



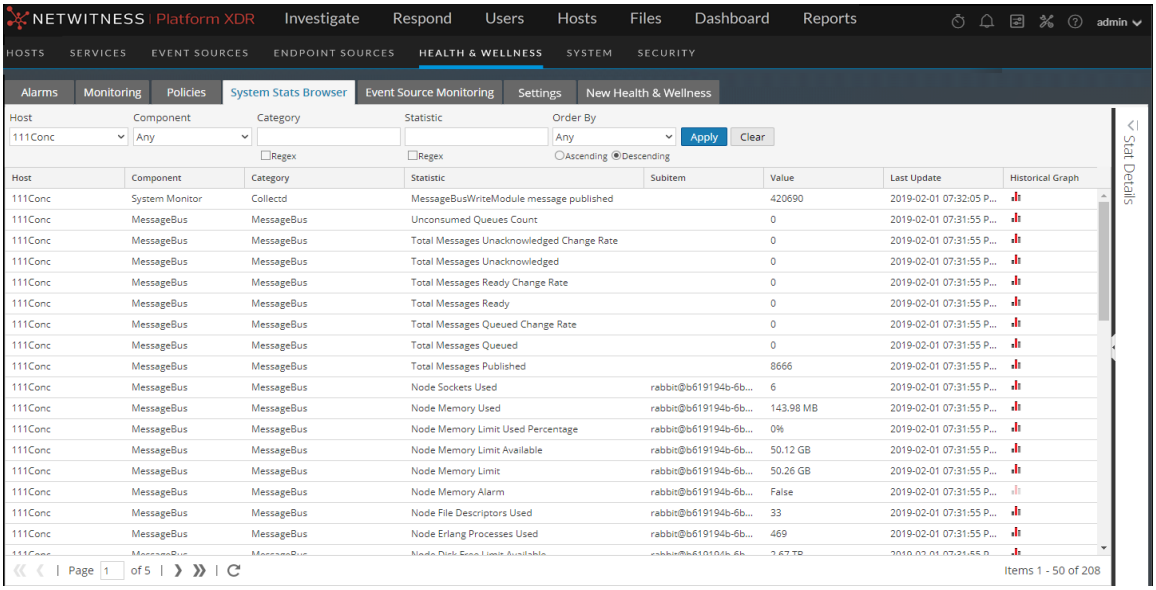
Filter System Statistics

You can filter system statistics to monitor:

- Statistics collected for a particular host
- Statistics collected for a particular component
- Statistics collected of a particular type or that belong to a certain category
- Statistics listed in an ordered way as per the selection chosen

To filter the list of system statistics:

1. Go to  **(Admin) > Health & Wellness**.
   The Health & Wellness view is displayed with the Alarms tab open.
2. Click **System Stats Browser**.
   The System Stats Browser tab is displayed.



Filter the list of system statistics in one of the following ways:

- To view system statistics for a particular host, select the host in the **Host** drop-down list.
  The system statistics for the selected host is displayed.
- To view system statistics for a particular component, select the component in the **Component** drop-down list.
  The system statistics for the selected component are displayed.
- To view system statistics for a particular category, type the category name in the **Category** field. Select **Regex** to enable the Regex filter. It performs a regular expression search against text and lists the specified category. If Regex is not selected, it supports globbing pattern matching.
  The System Stats for the selected category is displayed.
- To list statistics in a preferred order, you can set the order in the **OrderBy** column.

- To view a particular statistic across hosts, type the statistic name in the **Statistic** field. Select **Regex** to enable the Regex filter. It performs a regular expression search against text and lists the specified category. If Regex is not selected it supports globbing pattern matching. The information for the selected statistics is displayed.

  The following figure shows the System Stats Browser filtered by the 111Conc host listed in descending statistical category order.

3. To view the details for an individual statistic:

   a. Select a row to select a statistic.

   b. Click  .
   The Stat Details pane is displayed.

For details on various parameters in the **(Admin)** > **Health & Wellness** > **System Stats Browser** view, see System Stats Browser View

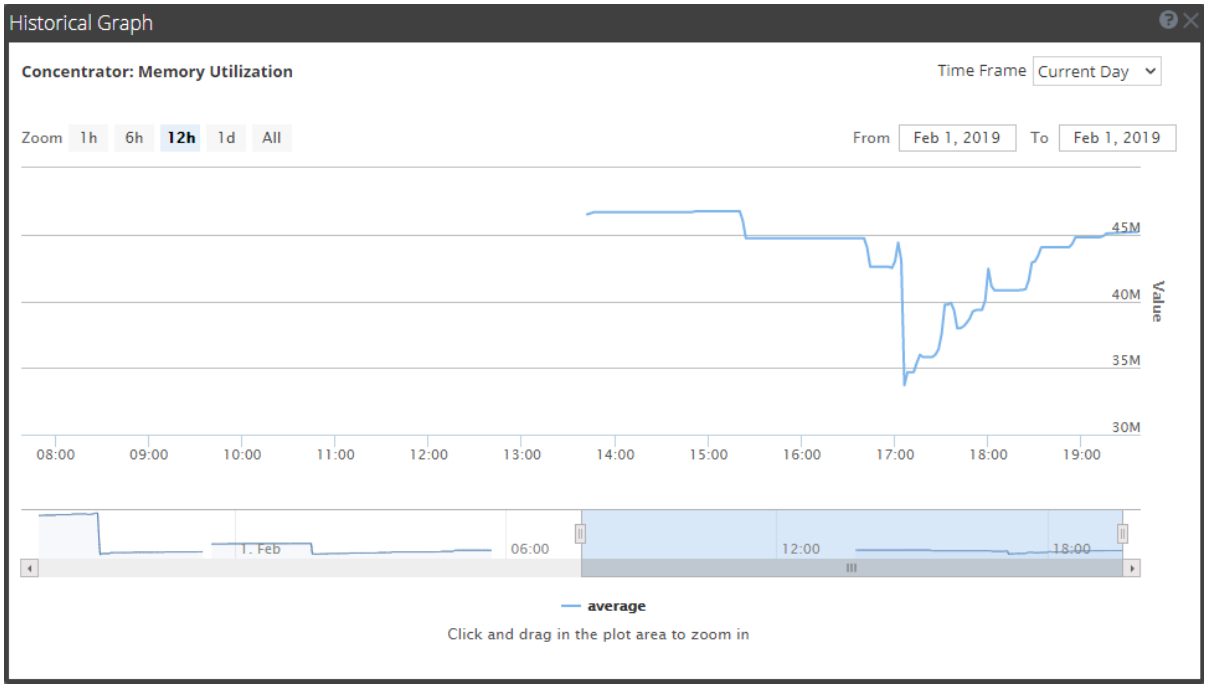
View Historical Graphs of System Statistics

The historical graph of the collected system stats gives you information about the variation of the stats over a selected time frame.

To view a historical graph:

1. Go to **(Admin) > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.



2. Click the **System Stats Browser** tab.

3. In the System Stats Browser tab, specify the filter criteria to display the statistics you want.

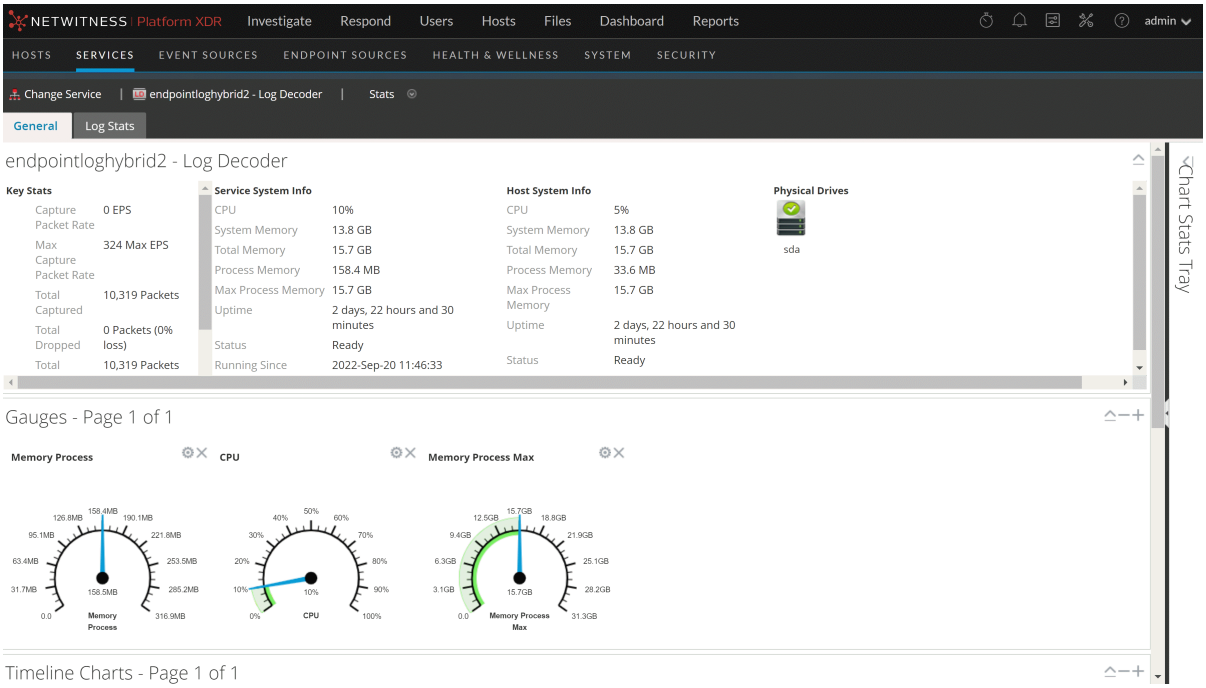
4. In the **Historical Graph** column, select .

   The Historical graph for the selected statistic is displayed.

   The figure below gives an example of the historical graph for the Memory Utilization statistic for a host.

   The graphical view is customized to display the statistics collected for the current day and the values are zoomed in for an interval of an hour (10.15 - 11.15 hrs). Hover over the graph to view the details at a particular instant. For example, in the figure it displays the memory utilization at 12.00 hrs.

Note: You can customize the graph view by selecting the Time Frame and Date range. You can zoom in using the zoom in value, time window, or by just clicking and dragging in the plot area. For details on the parameters to customize and zoom in functions, see Historical Graph for System Stats. Any break or gap in the chart line indicates that the service or host was down during that time.



Monitor Service Statistics

NetWitness provides a way to monitor the status and operations of a service. The Service Stats view displays key statistics, service system information, and host system information for a device. More than 80 statistics are available for viewing as gauges and in timeline charts. Only statistics for session size, sessions, and packets are viewable in historical timeline charts.

Although different statistics are available for different types of services, certain elements are common for any Core device.

To monitor service statistics in NetWitness:

1. Go to  **(Admin) > Services**.
   The Services view is displayed.
2. Select a service, and select **View > Stats** in the Actions column.

3. To customize the view, collapse or expand charts. For example, expand the Chart Stats Tray to see available charts, and then drag a section up or down to change the sequence. Or, drag the Gauges section to the top so that it is above the Summary Stats section.

Add Statistics to a Gauge or Chart

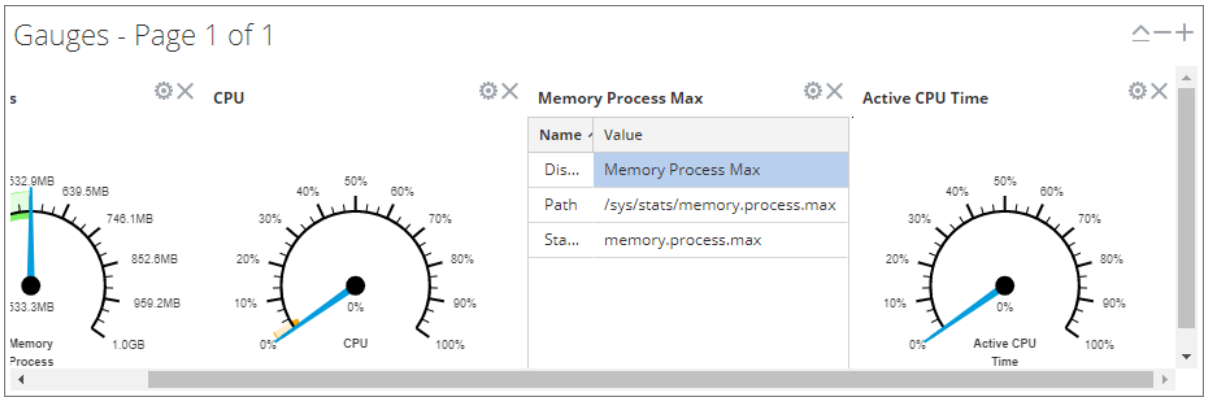
In the Services Stats view, you can customize the monitored statistics for individual services. The Chart Stats Tray lists all available statistics for the service. The number of statistics varies according to the type of service being monitored. Any statistic in the Chart Stats Tray can be displayed in a gauge or a timeline chart. Only statistics for session size, sessions, and packets are viewable in historical timeline charts.

Create a Gauge for a Statistic

To create a gauge for a statistic in the Services Stats view:

1. Go to **(Admin) > Services**.

   The Admin Services View is displayed.



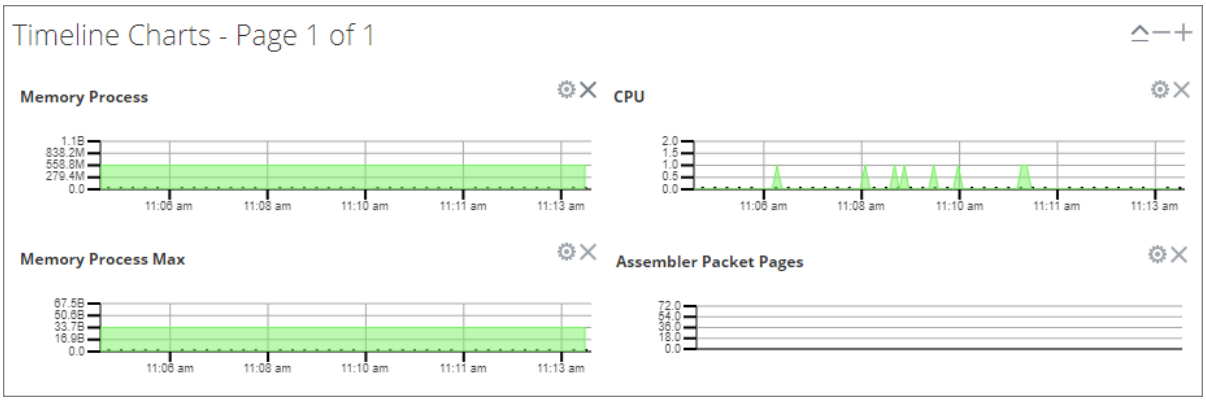
2. Select a service and select **View > Stats** in the Actions column.

   The Chart Stats Tray is displayed on the right side.

3. If the tray is collapsed, click to view the list of available statistics.

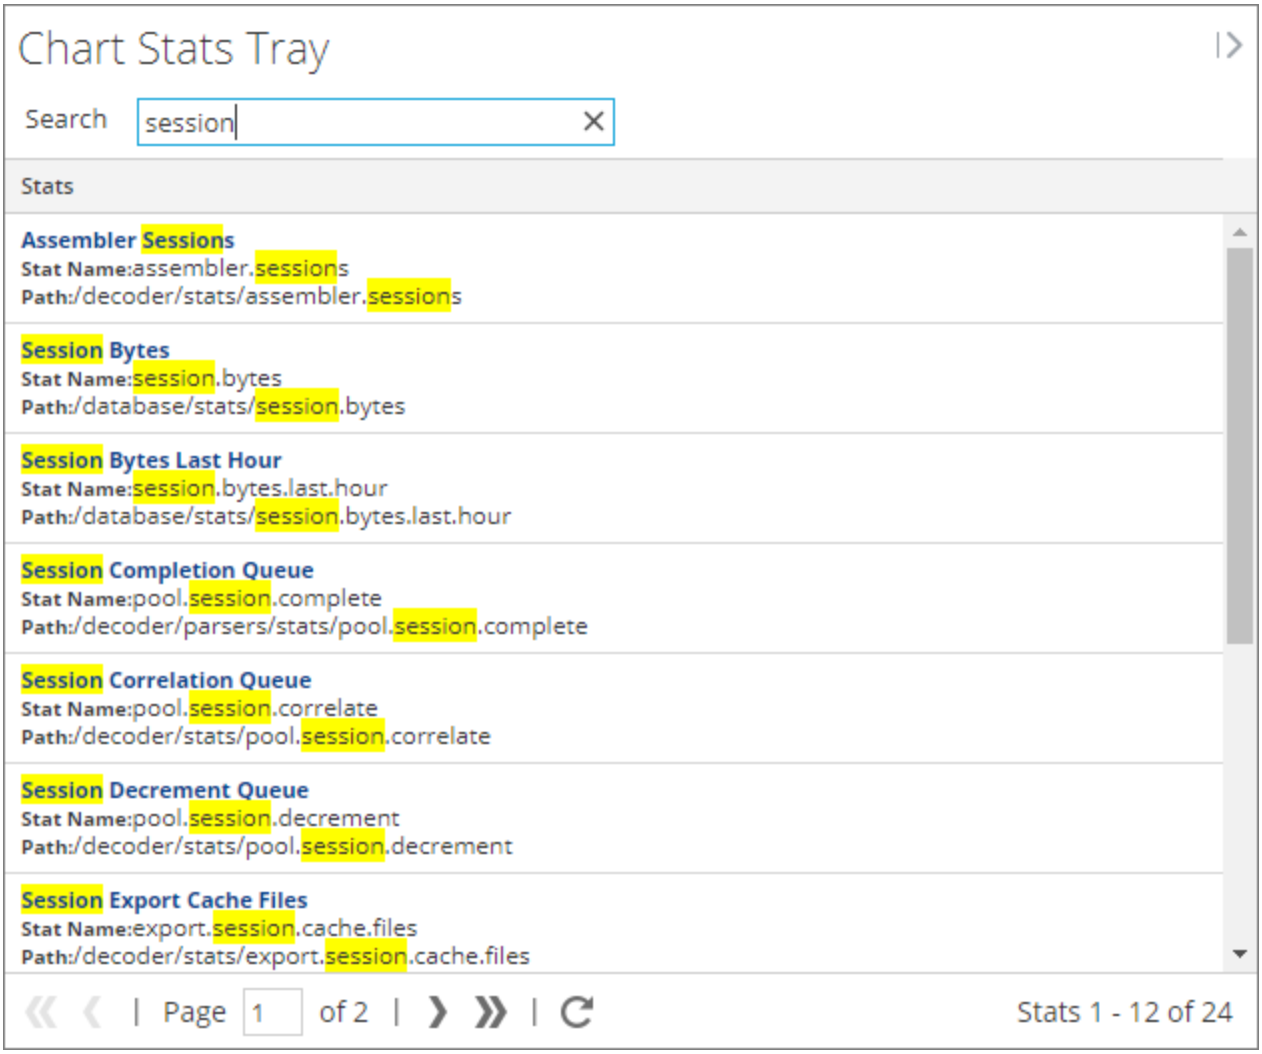
4. From the **Chart Stats Tray**, click on any statistic and drag it into the **Gauges** section.

   A gauge is created for the statistic. If there is no space for the gauge, a new page is created in the Gauges section and the gauge is added to the new page. In the example, the Active CPU Time chart was added to the Gauges section by dragging it from the Chart Stats Tray.



Create a Timeline Chart for a Statistic

To create a timeline for a statistic:

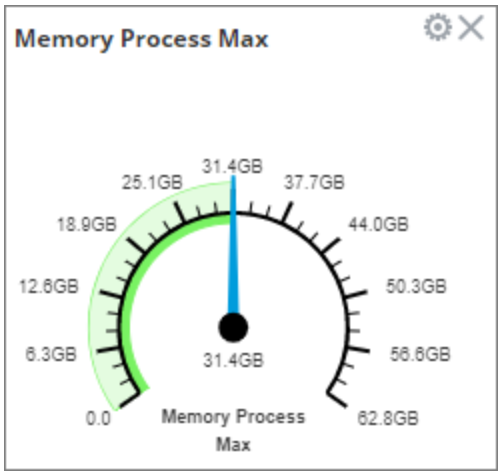


From the **Chart Stats Tray**, click on a statistic and drag it into the **Timeline Charts** or the **Historical Timeline Charts** section.

A timeline chart is created for the statistic. If there is no space for the chart, a new page is created in the Timeline Chart section and the chart is added to the new page. In the example, the Assembler Packet Pages chart was added to the Timeline Charts section by dragging it from the Chart Stats Tray.

Search for a Statistic in the Chart Stats Tray

To search for a statistic, type a search term; for example, **session**, in the Search field and press **Enter**. Statistics that match are displayed with the matching word highlighted.



Edit Properties of Statistics Gauges

The Gauges section of the Service Stats view presents statistics in the form of an analog gauge. The properties of each individual gauge are editable; all gauges have an editable title and some have additional editable properties.

Edit Properties of a Gauge

1. Go to **(Admin) > Services**
   The Admin Services view is displayed.
2. Select a service and select **View > Stats** in the Actions column.
   The Service Stats view includes the Gauges section.
3. Go to the gauge for which you want to edit properties (for example, **Memory Process**).

4. Click the Properties icon ( ) to display the parameter names and values.
5. To highlight the value of the **Display Name** field, double-click on the value; for example, **Memory Process**.

   Note: Clicking the other two values does nothing because the properties are not editable in the gauge.

6. Type a new value for the Display Name and click the **Properties** icon ( ).
   The new title replaces **Memory Process**.

Add Stats to the Gauges Section

You can add more gauges by dragging a statistic from the **Chart Stats Tray** into the **Gauges** section.

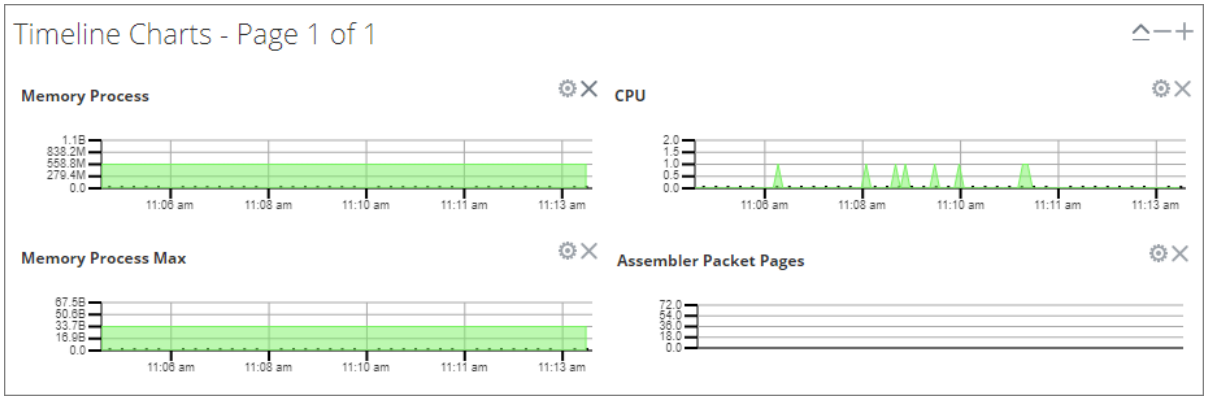
1. To expand the Chart Stats Tray, click .
2. Scroll down and select a statistic, for example, **Session Rate (maximum)**.

3. Drag the statistic to the **Gauges** section.
   The new gauge is displayed in the Gauges section.

Edit Properties of Timeline Charts

Timeline charts display statistics in a running timeline. The Service Stats view includes two types of timelines; current time and historical. You can drag any statistic available in the Chart Stats Tray to the Timeline Charts section. Only statistics for session size, sessions, and packets are viewable in historical timeline charts. The properties of an individual timeline chart are editable; all timeline charts have an editable title and some have additional editable properties.

To access the charts:



1. Go to **(Admin) > Services**.
2. Select a service and click **Stats**.

   The Services Stats view is displayed. The charts are in this view.

Edit Properties of a Timeline

To edit properties of a timeline chart:

1. Go to the timeline chart for which you want to edit properties (for example, **Memory Process**).

2. Click the **Properties** icon ( ) to display the parameter names and values.
3. Double-click on a value (for example, the **Display Name** field) to make the value editable.

   Note: Clicking the other two values does nothing because the properties are not editable in the chart.

4. Type a new value and click the **Properties** icon.

   The timeline chart is displayed with new values.

Edit Properties of a Historical Timeline

To edit properties of a historical timeline chart:

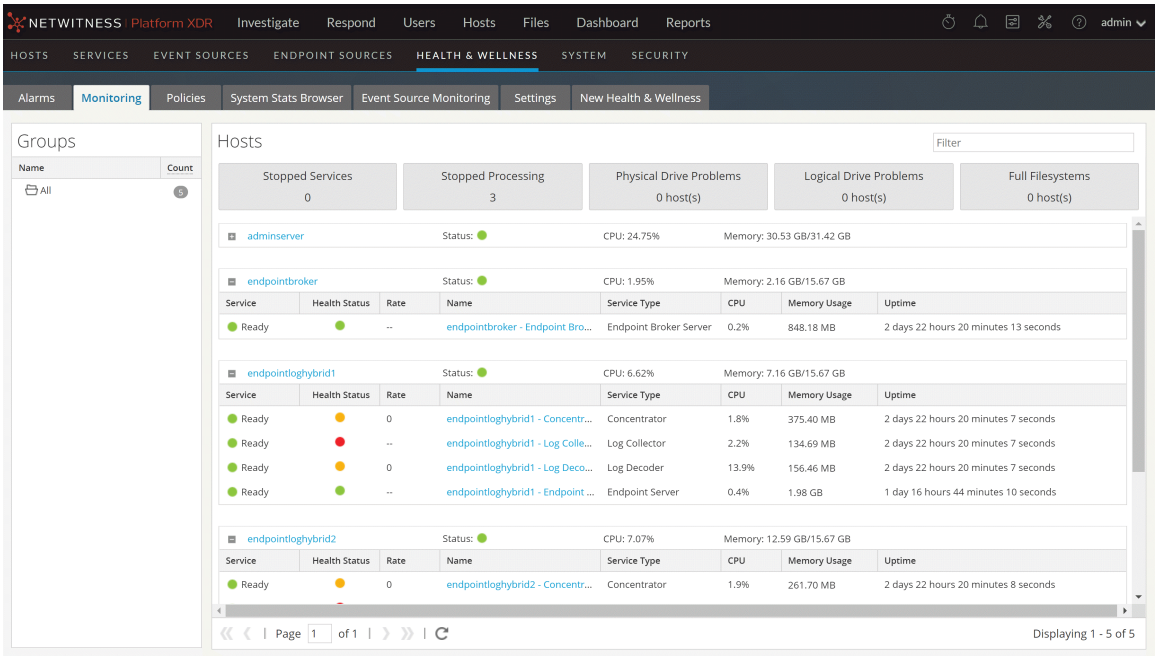
1. Go to Historical Timeline Charts.
2. Click the **Properties** icon ( ) to display the parameter names and values.

3. Click on a value (for example, **01/27/2019** for the **Begin Date** field) to make the value editable.
4. Type a new value.
5. Edit the **End Date** and **Display Name** if required.
6. Click the **Properties** icon ( ).
   The historical timeline is displayed with new values.

Note: To return the properties of the historical timeline chart back to the default so that the values dynamically update, remove the Begin Date and the End Date, place your cursor in the Begin Date field, and refresh your browser.

Add Stats to Timeline Charts

You can add timeline charts by dragging a statistic from the Chart Stats Tray into the Timelines section.



1. To expand the Chart Stats Tray, click .
2. Scroll down and select a statistic; for example, **Session Rate (maximum)**.
3. Drag the statistic to the **Timelines Section**.
   The new timeline is displayed in the Timelines section.

Monitor Hosts and Services

NetWitness provides a way to monitor the status of the hosts and services installed in your environment. You can view the current health of all the hosts, services running on the hosts, their CPU usage and memory consumption, and the host and service details.

To monitor hosts and services in NetWitness:

1. Go to  **(Admin) > Health & Wellness**.
   The Health & Wellness view is displayed with the Alarms tab open.
2. Select the **Monitoring** tab.
   A list of all hosts and their associated services that belong to the group **All** is displayed by default.
   The operational status, CPU usage, and memory usage for each host is displayed.

   A list of services installed on the host is shown below the host. If you cannot see the services, click ⊞ to the left of a host to display the services.
   The name, operating status, CPU usage, memory usage, and the time operating for each service is displayed.

Filter Hosts and Services in the Monitoring View

You can filter hosts and services in the monitoring view in one of the following ways:

- Hosts belonging to a particular group
- A specific host and its associated services
- Hosts whose services are stopped
- Hosts whose services have stopped processing or processing has been turned off
- Hosts that have physical drive problems
- Hosts that have logical drive problems
- Hosts that have full file systems

For the related reference topic, see Monitoring View.

To filter hosts and services:

1. Go to  **(Admin) > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open by default.
2. Select the **Monitoring** tab.
3. Filter the hosts and services in one of the following ways:
   - To view a list of hosts and their associated services belonging to a particular group, select the group in the Groups panel.

     All hosts and their associated services belonging to the specified group are displayed in the Hosts panel.

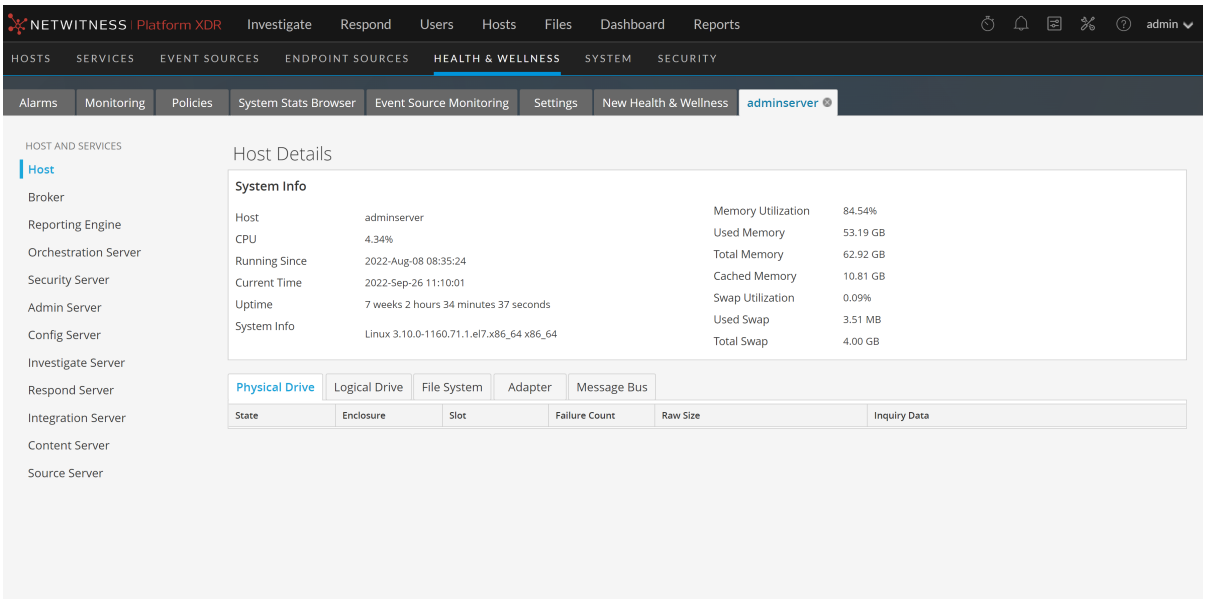
     Note: The grouping of hosts is derived from the groups created in the Admin Hosts view. All groups created in the Admin Hosts view are displayed here.

     For example, if you select the group **LC_Group** in the Groups panel, a list of all hosts that are part of the group are displayed.
   - To view a list of all services that have stopped processing, click **Stopped Processing** in the Hosts panel.

     A list of all the hosts that have at least one service with the status as stopped processing is displayed.

     Note: The buttons on the top display the system statistics for all of the hosts configured in NetWitness and does not change with the application of filters on the groups.

- In a similar way, you can filter the list of hosts and the associated services by choosing the appropriate filter:
  - Click **Stopped Services** to display a list of all stopped services.
  - Click **Physical Drive Problems** to display a list of host with physical drive problems.
  - Type the host name in the Filter box to display only the required host and the services running on the host.



Monitor Host Details

You can view the details of a host, its memory and CPU usage, system information, physical drive, logical drive, and file system details to investigate potential problems with the host.

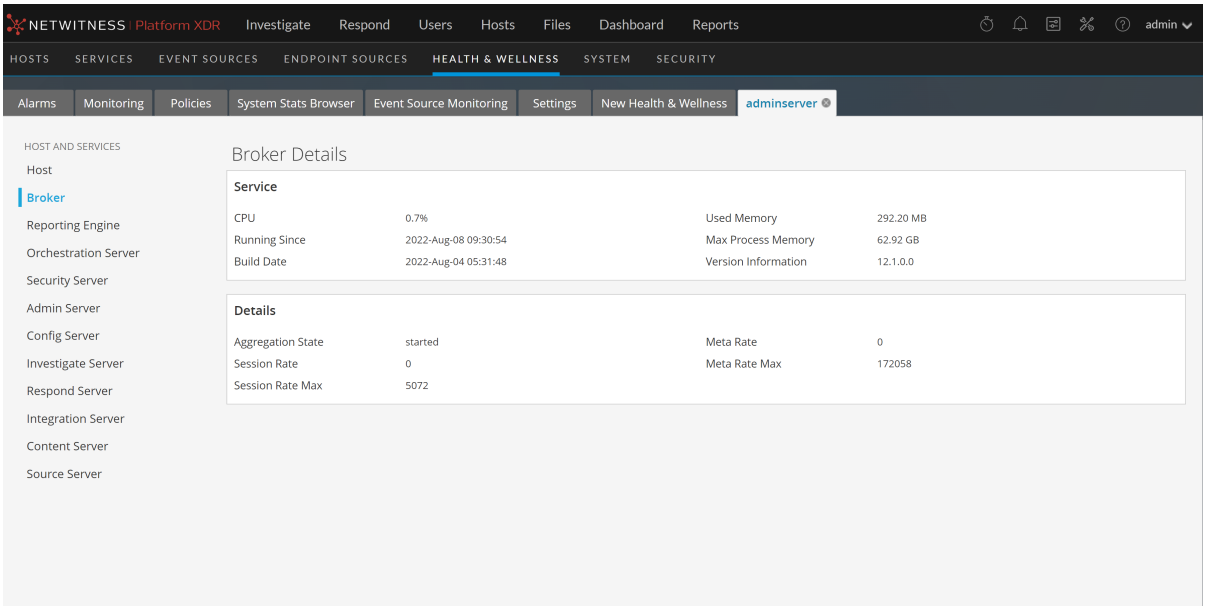
To view host details:

1. Go to  **(Admin) > Health & Wellness > Monitoring** tab.
2. Click a host in the **Hosts** panel.

   The Host Details view shows important system information about the selected host, such as memory utilization and file system usage.

Monitor Service Details

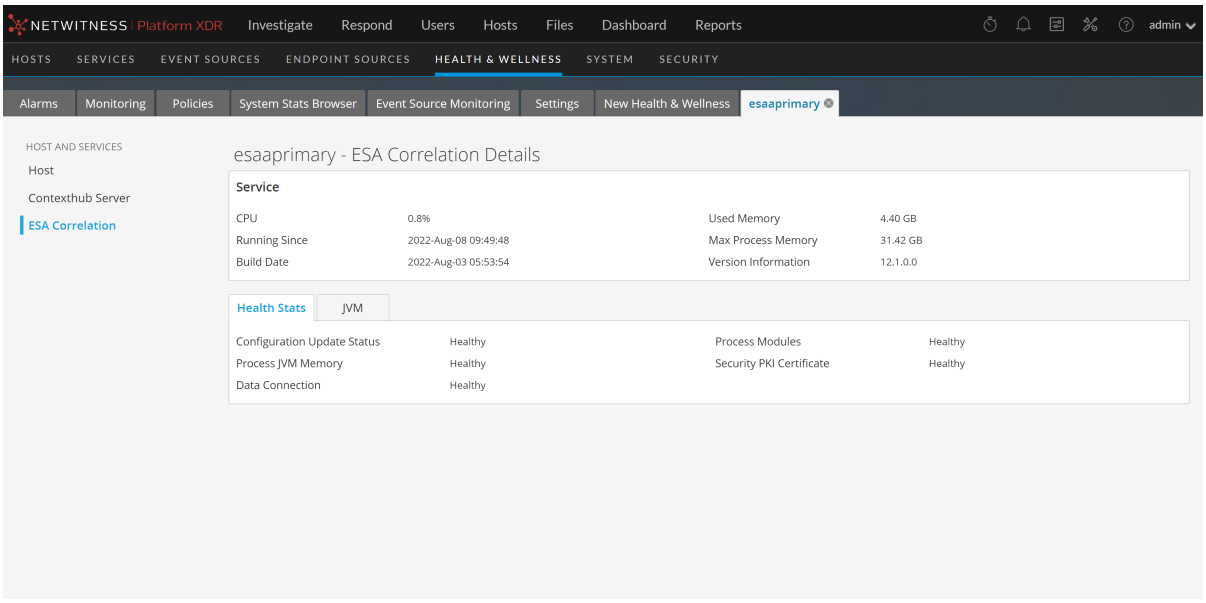
You can view the details of a service, its memory and CPU usage, system information, and various details depending on the service selected.



To view service details:

1. Go to **(Admin) > Health & Wellness > Monitoring** tab.

   The Hosts panel shows the services running on each host.



2. In the Hosts panel, click a service name link to get more information.

   The service details view shows the health status of the selected service. The Decoder service details include capture statistics and the Concentrator and Broker details include aggregation statistics.

   Many services, including the ESA Correlation service, have a **Health Stats** tab that provides information about the health status of the service. The **JVM tab** shows the total memory used by the selected service and the total memory capacity of the host. For more information, see Health Stats Tab and JVM Tab.

   For more information on the ESA Correlation service and ESA Rule memory usage, see the *Alerting with ESA Correlation Rules User Guide*.

The Malware Analysis service details view has **Service** information plus the **Event,** and **JVM** tabs that show additional statistics. The **Events** tab shows event processing statistics.

The Reporting Engine service details view has **Service** information plus the **Report** and **JVM** tabs that show additional statistics.

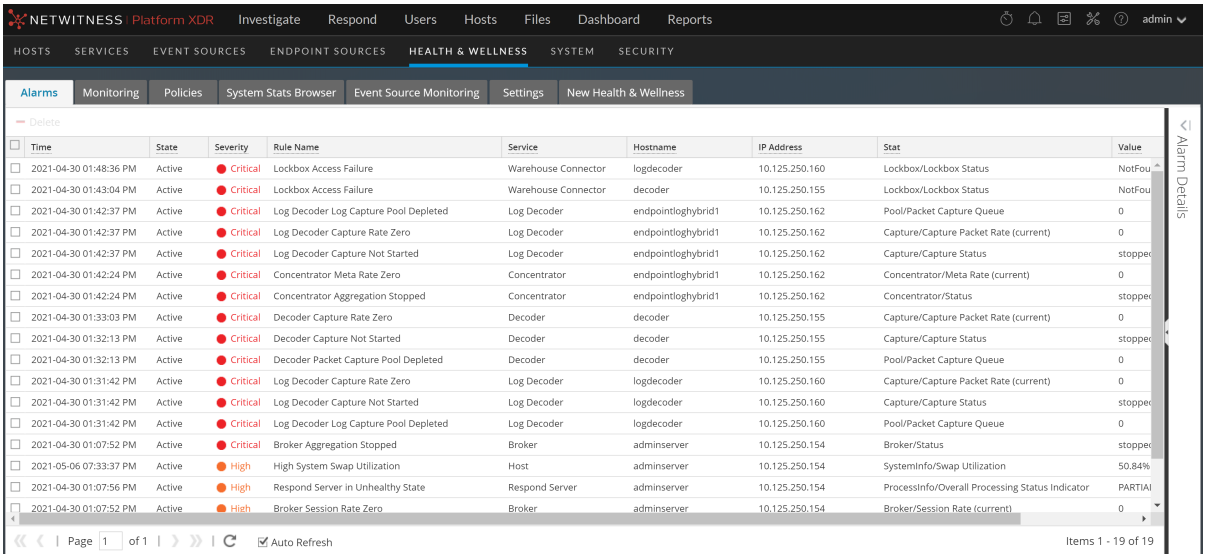
You can also view the details of other services by clicking the services listed in the options panel on the left.

Refer to Monitoring View for a detailed description of the Details view for each service.

Monitor Event Sources

Note: For NetWitness 11.4.1, this view has been deprecated. To manage Event Sources, use the  (Admin) > Event Sources view. For details, see "About Event Source Management" in the*NetWitness Event Source Management Guide*.

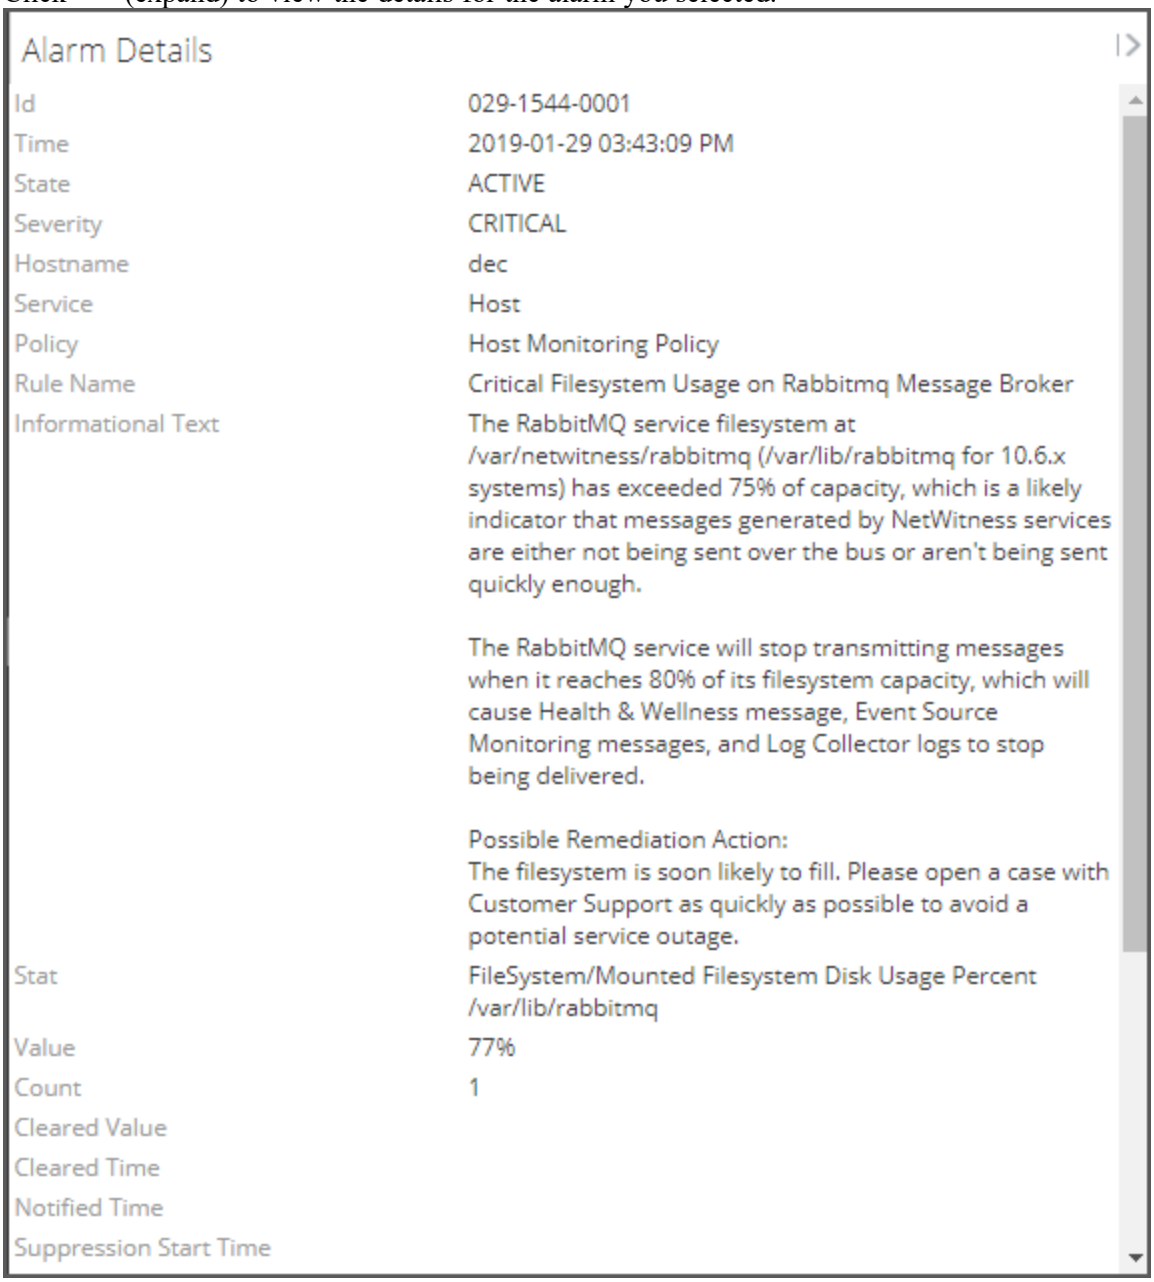
Monitor Alarms



You can set up alarms and monitor them in the Health and Wellness interface for the hosts and services in your NetWitness domain. Alarms display in the view as **Active** when the statistical thresholds for hosts and services have been crossed. Alarms are grayed out and change to the **Cleared** status when the clearing threshold has been crossed.

You set up the parameters for alarms in Manage Policies. For the related reference topic, see Health and Wellness View - Alarms View.

To monitor alarms:



1. Go to  **(Admin) > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open by default.

2. Click on the alarm for which you want to display details in the Details Panel.

3. Click (expand) to view the details for the alarm you selected.

Monitor Health and Wellness Using SNMP Alerts

You can monitor a NetWitness component to proactively send alerts, using Simple Network Management Protocol (SNMP) that is based on thresholds or system failures.

You can monitor the following for NetWitness components:

- CPU utilization that reaches a defined threshold.
- Memory utilization that reaches a defined threshold.
- Disk utilization that reaches a defined threshold.

SNMP Configuration

NetWitness Servers can be configured to send out SNMPv3 threshold traps and monitor traps. Threshold traps are sent in conjunction with node thresholds that are configured by the NetWitness Core applications. Monitor traps are sent by the SNMP daemon for the items indicated in the SNMP configuration file. You must set up the SNMP daemon on another service to receive SNMP traps from NetWitness. You can set up SNMP on NetWitness in the configuration setting for the NetWitness Server. For more information, see "Service Configuration Settings" in the *NetWitness Host and Services Getting Started Guide* for a specific type of host.

Thresholds

Thresholds can be set on any service statistics that can accept the `setLimit` message. You can retrieve current thresholds using the `getLimit` message. To set a limit, you can pass a low and high threshold value.

When the value of a statistic crosses either the low or high threshold, an SNMP trap is triggered, indicating that the threshold has been crossed. The trap is not triggered if the value is below the low and above the high value, but another trap is triggered if it crosses back into the normal range (above the low and below the high).

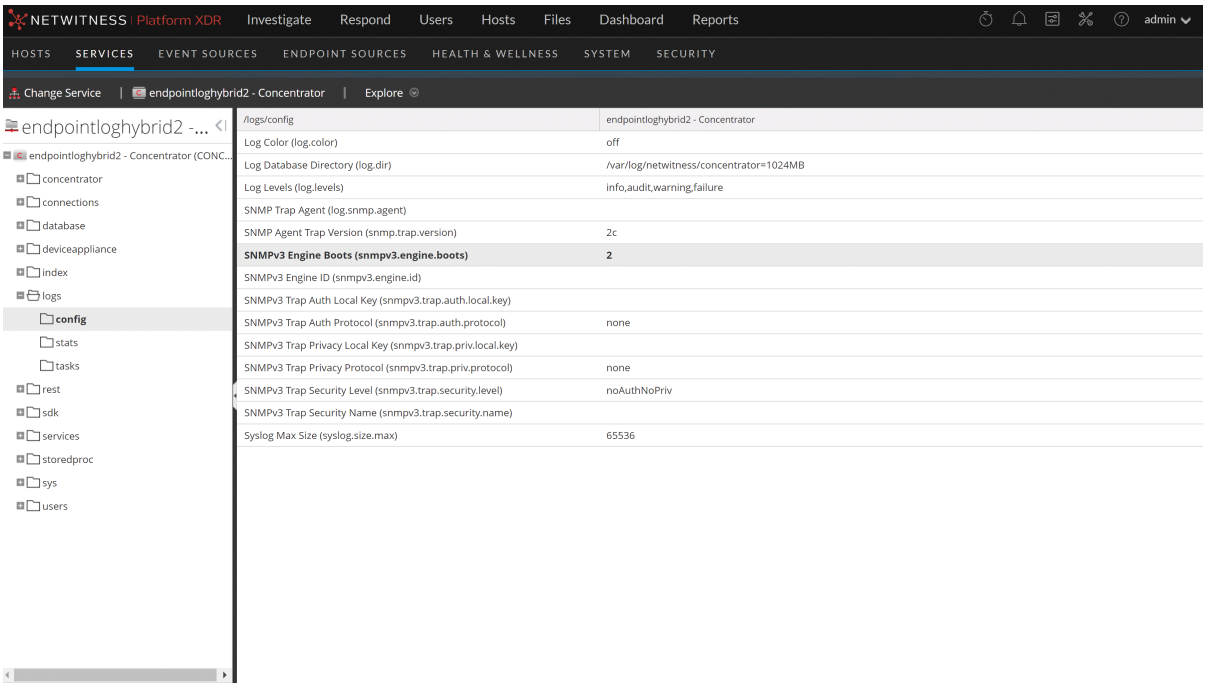
You must set the threshold for the service using the Service Explorer view or the REST API.

This example shows a sample threshold for monitoring CPU usage (below 10% or above 90%):

```
/sys/stats/cpu setLimit low=10 high=90
```

This example shows how the threshold is set using REST API:

```
http://<log decoder>:50102/sys/stats/cpu?msg=setLimit&low=10&high=90
```

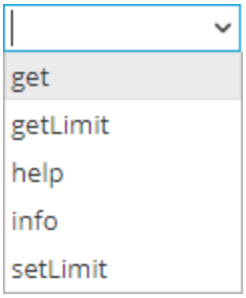


If the CPU usage spikes to 90% or higher, an SNMP trap is generated:

```
23435333 2018-Dec-16 11:08:35 Threshold warning path=/sys/stats/cpu old=77%
new=91
```

Configure SNMPv3 for a Host

1. Go to  **(Admin) > Services**.
   The Services view is displayed.
2. Select the service.
3. In the Actions column, select **View > Explore**.



4. In the nodes list, expand the list and select a configuration folder. For example, **logs** > **config**
5. Set the SNMPv3 configuration.

Set the Threshold for a Service

1. Go to  **(Admin) > Services**.
   The Services view is displayed.
2. Select the service.
3. In the Actions column, select **View > Explore**.
4. In the nodes list, expand the list and select a stat folder.
5. Select a stat, for example, CPU, and right-click.
6. From the drop-down menu, select **Properties.**

   The Properties panel is displayed. The Properties panel has a drop-down list of available messages for the parameter.

7. Select **setLimit**.
8. Specify the low and high values.

SNMP Traps for System Status

The threshold mechanism can also be used to monitor string-valued stats generated by Core services. There are two ways to monitor string-valued stats:

1. Generate a trap whenever the status value is NOT an expected value. For example, if you want monitor the stat `/broker/stats/status` and generate a trap whenever the value is not `started`, set the `high` limit on the stat to the expected value. You would use the `setLimit` message on `/broker/stats/status` as follows:
   ```
   setLimit high=started
   ```
2. Generate a trap whenever the status value matches an expected value. This is accomplished by using the `low` limit on the stat. For example, if you wanted generate a trap when the stat `/sys/stats/service.status` has the value `"Initialization Failure"`, you would use the `setLimit` message on `/sys/stats/service.status` as follows:
   ```
   setLimit low="Initialization Failure"
   ```

In both of these scenarios, it is possible to check for multiple values by using a comma-separated list of values to check for.

Troubleshooting Health & Wellness

Issues Common to All Hosts and Services

You may see the wrong statistics in the Health & Wellness interface if:

- Some or all the hosts and services are not provisioned and enabled correctly.
- You have a mixed-version deployment (that is, hosts updated to different NetWitness versions).
- Supporting services are not running.

Issues Identified by Messages in the Interface or Log Files

This section provides troubleshooting information for issues identified by messages NetWitness displayed in the Health & Wellness Interface or included in the Health & Wellness log files.

Message	User Interface: **Cannot connect to System Management Service** System Management Service (SMS) logs: `Caught an exception during connection recovery! java.io.IOException at com.rabbitmq.client.impl.AMQChannel.wrap (AMQChannel.java:106) at com.rabbitmq.client.impl.AMQChannel.wrap (AMQChannel.java:102) at com.rabbitmq.client.impl.AMQConnection.start(AMQConnection.java:346) at com.rabbitmq.client.impl.recovery. RecoveryAwareAMQConnectionFactory. newConnection (RecoveryAwareAMQConnectionFactory.java:36) at com.rabbitmq.client.impl.recovery. AutorecoveringConnection. recoverConnection(AutorecoveringConnection.java:388) at com.rabbitmq.client.impl.recovery. AutorecoveringConnection.beginAutomaticRecovery (AutorecoveringConnection.java:360) at com.rabbitmq.client.impl.recovery.AutorecoveringConnection. access$000(AutorecoveringConnection.java:48) at com.rabbitmq.client.impl.recovery. AutorecoveringConnection$1.shutdownCompleted (AutorecoveringConnection.java:345) at com.rabbitmq.client.impl.ShutdownNotifierComponent. notifyListeners(ShutdownNotifierComponent.java:75) at com.rabbitmq.client.impl.AMQConnection$MainLoop.run (AMQConnection.java:572) at java.lang.Thread.run(Thread.java:745) Caused by: com.rabbitmq.client.ShutdownSignalException: connection error at com.rabbitmq.utility.ValueOrException.getValue`

	(ValueOrException.java:67) at com.rabbitmq.utility.BlockingValueOrException. uninterruptibleGetValueBlockingValueOrException.java:33) at com.rabbitmq.client.impl.AMQChannel$BlockingRpcContinuation. getReply (AMQChannel.java:343) at com.rabbitmq.client.impl.AMQConnection.start (AMQConnection.java:292) ... 8 more Caused by: java.net.SocketException: Connection reset at java.net.SocketInputStream.read (SocketInputStream.java:189) at java.net.SocketInputStream.read (SocketInputStream.java:121) at java.io.BufferedInputStream.fill (BufferedInputStream.java:246) at java.io.BufferedInputStream.read (BufferedInputStream.java:265) at java.io.DataInputStream.readUnsignedByte (DataInputStream.java:288) at com.rabbitmq.client.impl.Frame.readFrom(Frame.java:95) at com.rabbitmq.client.impl.SocketFrameHandler.readFrame (SocketFrameHandler.java:139) at com.rabbitmq.client.impl.AMQConnection$MainLoop.run (AMQConnection.java:532)
Possible Cause	RabbitMQ service not running on the NetWitness Server.
Solution	Restart the RabbitMQ, SMS, and NetWitness services using the following commands. systemctl restart rabbitmq-server systemctl restart rsa-sms systemctl restart jetty

Message/ Problem	User Interface: **Cannot connect to System Management Service**
Cause	The System Management Service, RabbitMQ, or Mongo service is not running.
Solution	Run the following commands on NetWitness Server to make sure all these services are running. [root@nwserver ~]# systemctl status rsa-sms RSA NetWitness SMS :: Server is not running. [root@nwserver ~]# systemctl start rsa-sms Starting RSA NetWitness SMS :: Server... [root@nwserver ~]# systemctl status rsa-sms RSA NetWitness SMS :: Server is running (5687). [root@nwserver ~]# systemctl status mongod mongod (pid 2779) is running... systemctl status rabbitmq-server Status of node nw@localhost ... [{pid,2501}, {running_applications,

	[{rabbitmq_federation_management,"RabbitMQ Federation Management", "3.3.4"},

Message/ Problem	User Interface: **Cannot connect to System Management Service**
Possible Cause	`/var/lib/rabbitmq` partition usage is 70% or greater.
Solution	Contact Customer Care.

Message/ Problem	User Interface: **Host migration failed.**
Possible Cause	One or more NetWitness services may be in a **stopped** state.
Solution	Make sure that the following services are running then restart the NetWitness Server: Archiver, Broker, Concentrator, Decoder, Event Stream Analysis, Response Server, IPDB Extractor, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Warehouse Connector, Workbench.

Message/ Problem	User Interface: **Server Unavailable.**
Possible Cause	One or more NetWitness services may be in a **stopped** state.
Solution	Make sure that the following services are running then restart the NetWitness Server: Archiver, Broker, Concentrator, Decoder, Event Stream Analysis, Response Server, IPDB Extractor, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Warehouse Connector, Workbench.

Message/ Problem	User Interface: **Server Unavailable**

Possible Cause	System Management Service (SMS), RabbitMQ, or Mongo service is not running.

Solution 1	Run the following commands on NetWitness Server to make sure all these services are running.
	`[root@nwserver ~]# systemctl status rsa-sms`
	`RSA NetWitness SMS :: Server is not running.`
	`[root@nwserver ~]# systemctl start rsa-sms`
	`Starting RSA NetWitness SMS :: Server...`
	`[root@nwserver ~]# systemctl status rsa-sms`
	`RSA NetWitness SMS :: Server is running (5687).`
	`[root@nwserver ~]# systemctl status mongod`
	`mongod (pid 2779) is running...`
	`systemctl status rabbitmq-server`
	`Status of node nw@localhost ...`
	`[{pid,2501},`
	`{running_applications,`
	`[{rabbitmq_federation_management,"RabbitMQ Federation Management",`
	`"3.3.4"},`

Solution 2	Make sure `/var/lib/rabbitmq` partition is less than 75% full
Solution 3	Check NetWitness Server log files (`var/lib/netwitness/uax/logs/nw.log`) for any errors.

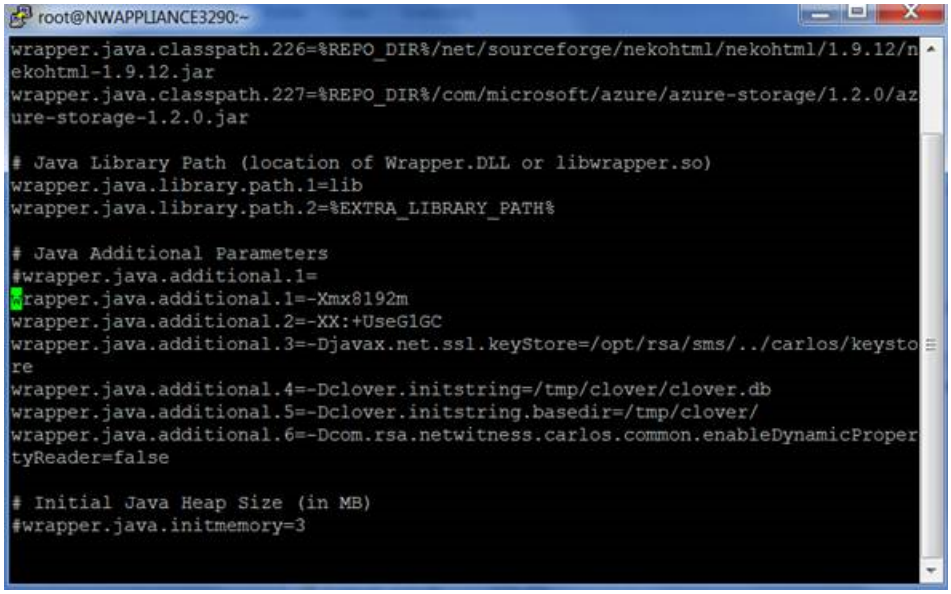
Message/ Problem	ContextHub stops and does not allow you to add or edit data sources and lists.
Possible Cause	The storage is full by 95% or above.
Solution 1	Increase the storage by updating the YML file, located at /etc/netwitness/contexthub-server/ contexthub-server.yml. For example, to increase storage from 120 to 150 GB, enter a value (in bytes) by editing the relevant parameter: `rsa.contexthub.data.disk-size: 161061273600`
Solution 2	Delete unwanted or unused large list.
Solution 3	Configure the TTL index for the list to automatically delete STIX and TAXI data and to clean up storage space.

Message/ Problem	Context Hub runs on a fixed memory and 50% is reserved for cache. When cache is 100% full, the cache response stops. For all new lookups the response will be slow.

Possible Cause	The cache is full by 50% or above.
Solution 1	By default, Context Hub cleans the cache every 30 minutes. Reduce the cache expiration time of data sources.
Solution 2	Disable cache for data sources.
Solution 3	Increase the RAM of the CH Java process by editing the `-Xmx` option available in the /etc/netwitness/contexthub-server/contexthub-server.conf file. In `JAVA_OPTS`, search for the `-Xmx` option. For example, edit the entry as follows: `-Xmx8G` where `8G` represents 8GB space. Then restart the ContextHub service. **Note:** The memory is less than the available system memory. Be aware that there are many other services running on the host.

Message/ Problem	List Data Source displays an unhealthy stats or status.
Possible Cause 1	Unable to: • access the data source • parse or read a CSV file • schema mismatched CSV
Possible Cause 2	Unable to authenticate when accessing the data source.
Solution 1	Make sure to save the csv file at correct location i.e/var/lib/netwitness/contexthub-server/data/ and verify the required read permissions.
Solution 2	Make sure the csv file schema specified while configuring the data source matches. If not, then either create a new data source with the new schema or edit the csv file to match the schema. For example, if you configure a List Data Source with a schema with column1, column2, and column3. And next time you update the csv file where the number of column increase or decrease or the order of the columns are changed. In this case there is a schema mismatch and the configured list data source will show “Unhealthy” in Health and Wellness stats.
Solution 3	Make sure the password is correct. To confirm edit the data source, enter the password and click test connection. For more information related the above solutions, see "Configure Lists as a Data Source" topic in the *Context Hub Configuration Guide*.

Issues Not Identified by the User Interface or Logs



This section provides troubleshooting information for issues that are not identified by messages NetWitness displays in the Health & Wellness Interface or includes in the Health & Wellness log files. For example, you may see incorrect statistical information in the Interface.

Problem	Incorrect statistics displayed in Health and Wellness interface.
Possible Cause	SMS service is not running. SMS service must be running on the NetWitness Server.
Solution	Restart SMS service.

Problem	NetWitness does not show the version to which you upgraded until you restart jettysrv (jeTTy server).
Possible Cause	When NetWitness checks a connection, it polls a service every 30 seconds to see if it is active. During that 30 seconds, if the service comes back up, it will not get the new version.
Solution	1. Manually stop the service. 2. Wait until you see that it is it offline. 3. Restart the service. NetWitness displays the correct version.

Problem	NetWitness Server does not display the **Service Unavailable** page.
Possible Cause	After you upgrade to NetWitness version 10.5, JDK 1.8 is not default version and this causes the jettysrv (jeTTy server) to fail to start. Without the jeTTy server, the NetWitness server cannot display the **Service Unavailable** page.
Solution	Restart jettysrv.

Problem	The SMS service is stopped and the following error is displayed in the log file: `java.lang.OutOfMemoryError: Java heap space`
Solution	You can use the following solution to increase the memory according to your needs. 1. Open /opt/rsa/sms/conf/wrapper.conf

2. Replace `wrapper.java.additional.1=-Xmx16g` with:
   `wrapper.java.additional.1=-Xmx20g`
3. Restart the SMS service:
   `systemctl start rsa-sms`

Monitor New Health and Wellness

NetWitness New Health and Wellness is an advanced monitoring and alerting system that provides insights on the operational state of the host and services in your deployment, and helps identify potential issues. NetWitness Platform is prepackaged with a third-party tool that renders interactive dashboards and visualizations.

New Health and Wellness provides:

- Dashboards with interactive visualization.
- Easy-to-create customized content.
- Alerts on your data and customize alert conditions.
- Ability to add alert notifications (for example, Email and Syslog notifications).
- Ability to suppress alert notifications for a time period as required.

New Health and Wellness provides default content, such as dashboards, visualizations, and monitors, to set up monitoring and alerting.

Please direct any New Health and Wellness feedback to nw.health.wellness.feedback@rsa.com.

Dashboard

The dashboard is a collection of intuitive visualizations for the administrator to monitor the health of the host and services, identify trends, track performance, and drill down to specific details.

After installation of the New Health and Wellness service, the following default dashboards are available to begin monitoring.

- Deployment Health Overview dashboard
- Hosts dashboard
- Logs dashboard
- Packets Overview dashboard
- Analysis dashboard
- Endpoint dashboard
- ESA Correlation Overview dashboard

For more information on the dashboards, see New Health and Wellness Dashboards .

Visualization

A visualization is a graphical representation of data in your deployment. You can create new visualizations or use the existing visualizations to build dashboards. Depending on the visualization you select the data is displayed in the dashboard.

Monitors

A monitor is a job that runs on a defined schedule, which queries Elasticsearch to evaluate the system health. You can define one or more triggers for a monitor and assign a severity level based on the threshold. When one or more trigger conditions are met, New Health and Wellness generates an alerts. You can create new monitors or customize the existing monitors based on your requirement.

Notifications

Notifications can be sent when health alerts are generated, for example, email and syslog notifications.

If you do not want to receive notifications, you can suppress them for a time period. For example, if you want to suppress low-severity alerts during weekends, you can do so by specifying a suppression policy.

After the suppression time period, the notifications will be sent for the alerts triggered during the suppression time.

Installing New Health and Wellness

You can deploy the New Health and Wellness feature on any one of the following, listed in the order of preferred deployment method with most preferred first:

- Standalone virtual host (Most preferred recommendation to ensure no performance impact on any other functionality of deployed nodes)
- Physical machine:
  - Broker
  - Admin Server
  - ESA

Installing New Health and Wellness enables all hosts and services in your deployment to start sending metrics for monitoring. For more information on installing New Health and Wellness, see the "Deployment Optional Setup Procedures" topic in the *Deployment Guide*.

Accessing New Health and Wellness Dashboards

After you deploy New Health and Wellness, you can access New Health and Wellness dashboards. By default, only Administrator can access New Health and Wellness dashboards. Other roles do not have permission to view New Health and Wellness dashboards.

To access New Health and Wellness dashboards:

1. Log in to NetWitness Platform.
2. Go to  **(Admin) > Health & Wellness.**
3. Click **New Health & Wellness**.
4. Click **Pivot to Dashboard**.

Note: To view dashboards, your browser must be configured to allow popups and redirects.

Configuring Notifications

You can choose to receive notifications of alert, when an alert (monitor) is triggered. You can configure the following types of notifications for the alerts.

- Email
- Syslog

To set up notifications, you must configure the following :

- **Notification Server**: This is the source of the notifications and must be configured to specify the Email or Syslog server settings.
- **Notifications Output**: This is the notification type, namely Email or Syslog. When you set up a notification, you must specify the notification output for an alert.
- **Templates**: The message format of an alert notification is defined using template. Default template is available for New Health and Wellness notifications or you can create new templates.

Adding Alert Notifications

To add notifications such as email or syslog, you must specify the notification details as follows:

- Output Type
- Recipient
- Notification Server
- Template

Note: You must ensure that the notification server and template is configured before you set up the notifications. You can use an existing server if required. For detailed procedures, see the *System Configuration Guide*.

To add a notification:

1. Go to  **(Admin) > Health & Wellness.**
2. Click **New Health & Wellness**.
3. Click **View Notifications Settings**.
4. Specify the following:
   - **Output Type -** Notification type such as Email or Syslog.
   - **Recipient** - Select the recipient based on the output type selected.
   - **Notification Server** - Select the server that will send the notification. If you want to add a new notification server, see "Configure Notification Servers" in the *System Configuration Guide*.
   - **Template** - Notification template such as Email or Syslog.
5. If you want to add another notification, click **Add Condition** and repeat step 4.

Note: You can specify a maximum of four conditions in the notification settings.

6. Click **Save**.

Suppressing Notifications

You can suppress notifications for a time period by specifying a suppression policy. For example, you do not want to receive notifications of low-severity alerts during peak hours or weekends. This ensures that notifications are not sent during the selected time period. The notifications triggered during this time period will be sent after the suppression period.

A suppression policy consists of condition that defines the day and time range for suppressing a notification.

Note: You can specify a maximum of seven conditions in the policy.

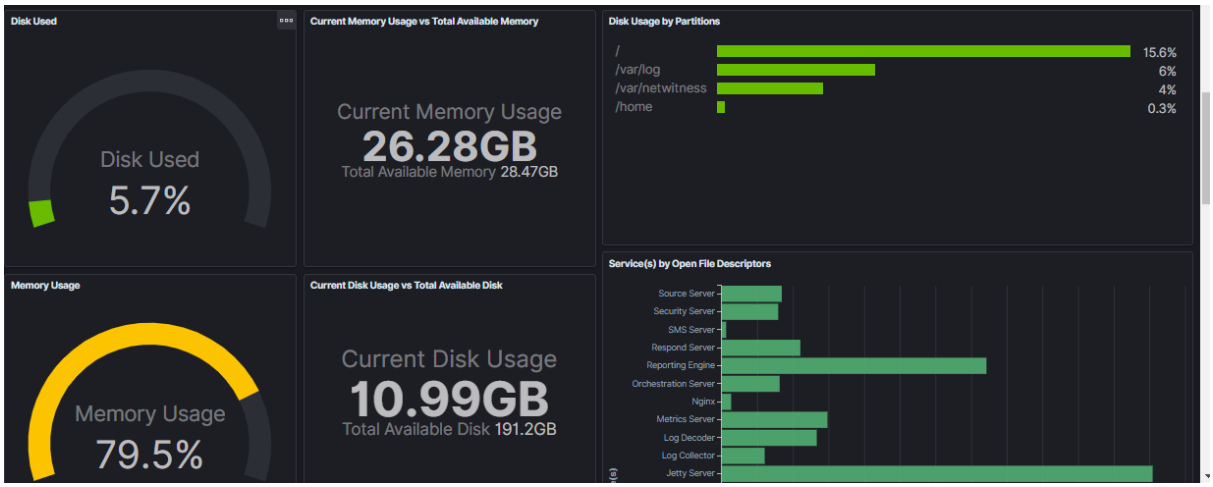
To suppress alert notification:

1. Go to  **(Admin) > Health & Wellness.**
2. Click **New Health & Wellness**.
3. In the **New Health & Wellness** tab, do anyone of the following:
   - Select the alert or alerts for which you want to apply a suppression policy.
   - Select all to apply a suppression policy to all alerts.
   - Filter alerts on **suppression applied**, **monitor name**, **trigger name**, and **severity** and apply the suppression policy.
4. Click **View Suppression Policy**.
   The policy suppression dialog is displayed.
5. Specify the days and time range during which you want to suppress the notification.

Note: Time range is based on the Time Zone configured in the User Preferences panel as described in "Setting User Preferences" in the *Getting Started Guide*.

6. To add an additional suppression policy, click **Add condition** and repeat step 5.

Note: The maximum number of suppression policy supported for an alert is seven, after which the **Add Condition** option is disabled.



7. Click **Save**.

Monitoring through Dashboards

For a thorough analysis of the health of NetWitness Platform hosts and services using the different dashboards, you can pivot to dashboard without any additional authentication. By default, the last 6 hours of data is displayed in the dashboard. For more information on the default dashboards, see New Health and Wellness Dashboards.

To monitor through the dashboard:

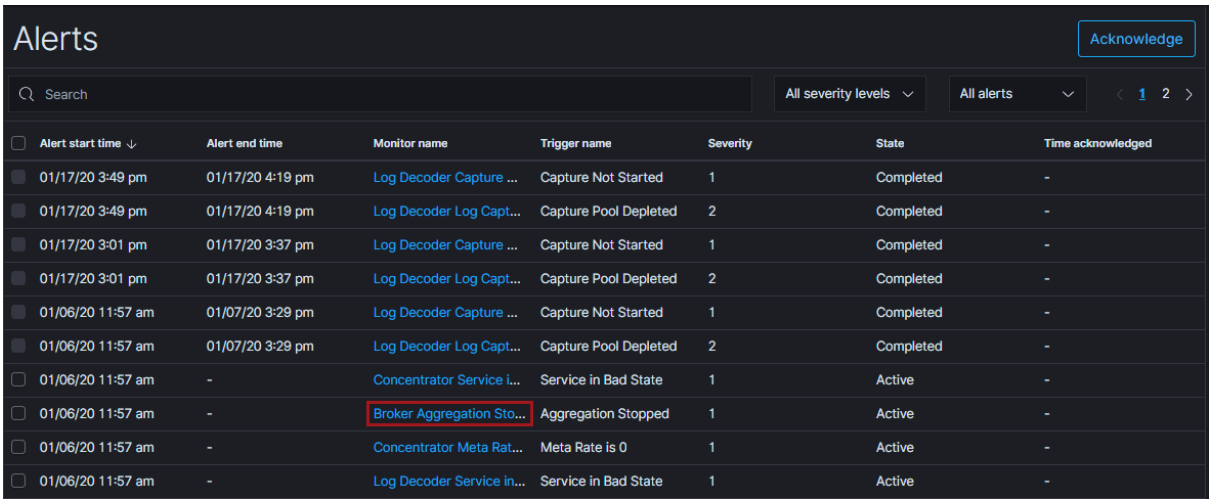
1. Go to **(Admin) > Health & Wellness**.
2. Click **New Health & Wellness**.
3. Click **Pivot to Dashboard**.
   The Deployment Health Overview dashboard is displayed.
4. Go to > **Dashboard** to view all the available dashboards.
5. Select the dashboard you want to view.
6. Click the dashboard link. For example, Hosts.
   Once the dashboard view is displayed you can look at the visualizations (charts, tables, and so on) to view current disk usage of hosts, incoming and outgoing traffic of the host, active queries on a service, and so on.

7. You can adjust the time range on the top right corner and apply filters to view the statistics.

Creating a Custom Dashboard

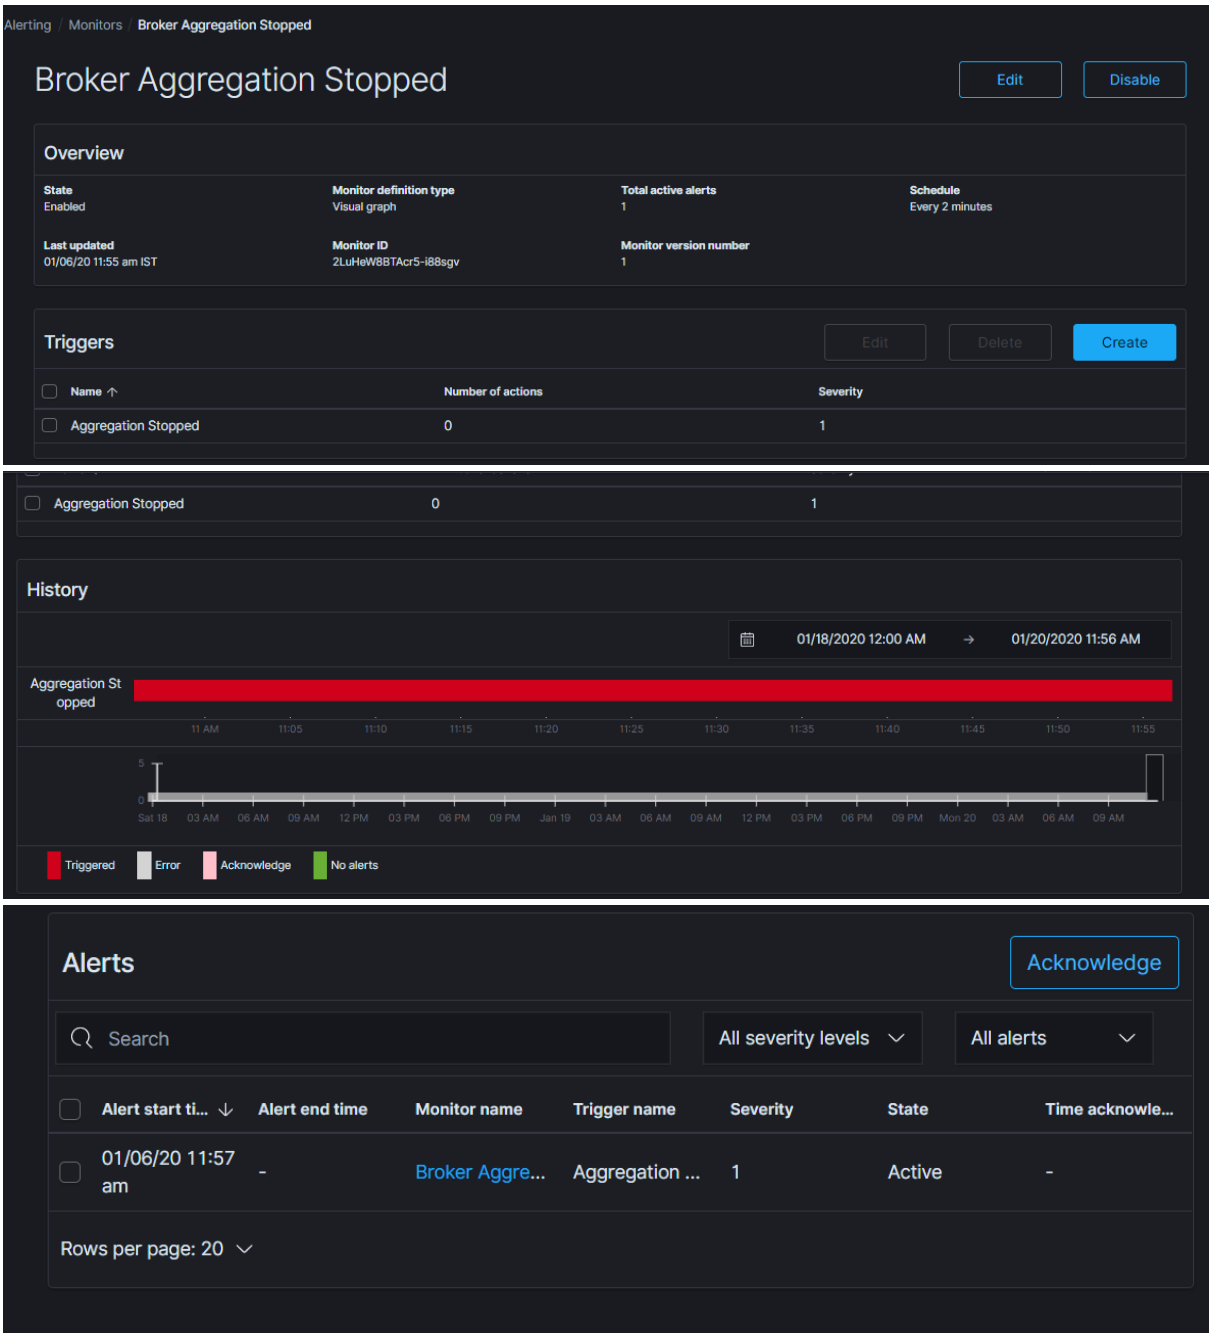
You can create a new dashboard by adding one or more existing visualizations or a new visualization.

To create a new dashboard:



1. Log in to NetWitness Platform.
2. Go to  **(Admin) > Health & Wellness.**
3. Click **New Health & Wellness**.
4. Click **Pivot to Dashboard**.
5. Go to  > **Kibana** > **Dashboard**.
6. In the **Dashboards** panel, click **Create dashboard**.
7. Click **Create new**.
8. Select a visualization that you want to add to the dashboard. For more information on Visualization, see "Visualize" topic in the Kibana 7.10.0 guide.
9. Click **Save**.

Monitoring through Alerts



You can monitor the health of NetWitness Platform hosts and services using the alerts.

To monitor using alerts:

1. Go to  **(Admin) > Health & Wellness.**
2. Click **New Health & Wellness**.
3. Go to  >**Open Distro for Elasticsearch** > **Alerting**.
   The alerts view summarizes the alerts generated over the period of time along with the trigger, severity (Critical, High, Medium or Low) and state of the alert.
4. To view the monitors and triggers associated with the alert, click the **Monitor name** link.

For example, if an alert is generated by the monitor name Broker Aggregation Stopped, you can view more details by clicking on the Broker Aggregation Stopped monitor link.

Creating Custom Monitors

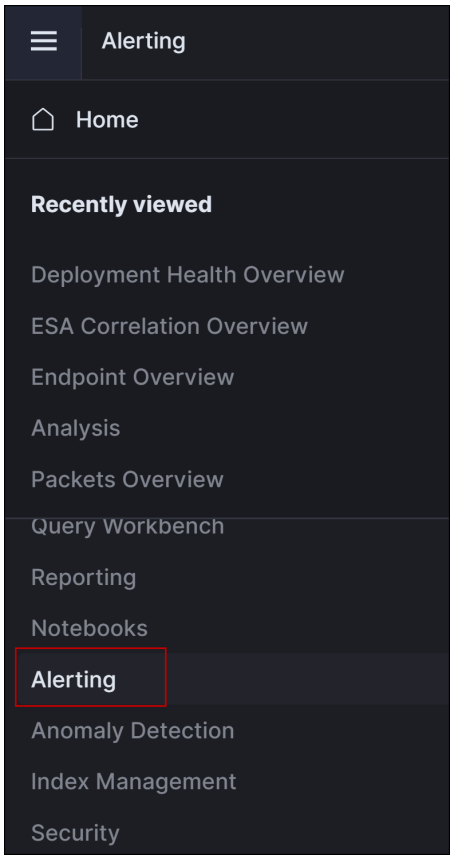
You can create a new monitor for the host and services and define a trigger.

To create monitors:

1. Log in to NetWitness Platform.
2. Go to  **(Admin) > Health & Wellness.**
3. Click **New Health & Wellness**.
4. Click **Pivot to Dashboard**.
5. Go to  > **Open Distro for Elasticsearch** > **Alerting**.
6. In the **Monitors** tab, click **Create monitors**.
7. In the **Create Monitors** section, specify the required details.
8. Click **Create**.

   After a monitor is created, you can add a trigger to this monitor.
9. In the **Create Trigger** view, provide the required details:
   a. **Trigger name** - Specify the name of the trigger.
   b. **Severity level** - Set the severity level from range 1–5. 1 is the highest severity and 5 is the lowest severity.
   c. **Trigger condition** - Set the trigger condition with the value. The options are IS ABOVE, IS BELOW, IS EQUAL. For example, IS ABOVE 200.
10. Click **Create** to save the trigger.

Note: After the specified duration, defined as **FOR THE LAST** in the **Define monitor** view, the alert state will change if the trigger condition is met. For more information, refer https://nw-corp.atlassian.net/browse/ASOCKB-65.



For more information on creating monitors, see "Alerting" in the Open Distro for Elasticsearch 1.12.0 guide.

Adding Custom Trigger to an Existing Monitor

You can add one or more triggers to an existing monitor and assign severity level.

To add trigger to an existing monitor:

1. Log in to NetWitness Platform.
2. Go to  **(Admin) > Health & Wellness.**
3. Click **New Health & Wellness**.
4. Click **Pivot to Dashboard**.
5. Go to  > **Open Distro for Elasticsearch** > **Alerting**.

6. In the **Monitor** section, click the **monitor** for which new trigger need be added.
7. In the **Triggers** section, select **Create**.
8. In the **Create Trigger** view, provide the required details:
   a. **Trigger name** – specify the name of the trigger.
   b. **Severity level** - Set the severity level from range 1-5. 1 is the highest severity and 5 is the lowest severity.

c. **Trigger condition** – Set the trigger condition with the value. The options are IS ABOVE, IS BELOW, IS EQUAL. For example, IS ABOVE 200.

9. Click **Create** to save the trigger.

Note: After the specified duration, defined as **FOR THE LAST** in the **Define monitor** view, the alert state will change if the trigger condition is met. For more information, refer https://nw-corp.atlassian.net/browse/ASOCKB-65.

Managing Dashboards and Alerts

You can modify the dashboards and alerts to monitor details of interest.

Modify a Dashboard

You can modify the dashboard to edit the visualization, delete visualization, customize the panel title, or change the positions of visualization. You can organize the visualization in the dashboard to display data of greatest interest on the top.

Note: Any changes to the visualization in a dashboard modifies the visualization content.

To modify a dashboard:

1. Go to  **(Admin) > Health & Wellness.**
2. Click **New Health & Wellness**.
3. Click **Pivot to Dashboard**.
4. Go to  > **Kibana** > **Dashboard**.
5. Click the dashboard link you want to modify. For example, Hosts overview.
6. Click **Edit** and make the necessary changes to the dashboard. For example, you can edit or delete visualization, customize panel.
7. Click **Save and return**.

Delete a Dashboard

Once the dashboard is deleted, you cannot monitor the details specific to the dashboard.

To delete a dashboard:

1. Go to  **(Admin) > Health & Wellness.**
2. Click **New Health & Wellness**.
3. Click **Pivot to Dashboard**.
4. Go to  > **Kibana** > **Dashboard**.
5. Select the check box of the dashboard you want to delete and click **Delete**.

You can delete one or more dashboards at a time.

Delete a Visualization

To delete a visualization:

1. Go to  **(Admin) > Health & Wellness.**
2. Click **New Health & Wellness**.
3. Click **Pivot to Dashboard**.
4. Go to  > **Kibana** > **Visualize**.
5. In the **Visualizations** view, select the visualizations you want to delete.
6. Click **Delete visualization**.

   You can delete one or more visualization at a time.

Modify an Existing Trigger

To modify an existing trigger:

1. Go to  **(Admin) > Health & Wellness.**
2. Click **New Health & Wellness** tab.
3. Click **Pivot to Dashboard**.
4. Go to  > **Open Distro for Elasticsearch** > **Alerting**.
5. In the **Dashboard** tab, select the monitor whose trigger is to be modified.
6. In the **Triggers** section, select the trigger you want to modify from list of Triggers and select **Edit**.
7. In the **Edit Trigger** view, make the necessary changes. You can change the Trigger name, severity level, Trigger condition.
8. Click **Update** to save the changes.

Managing Notifications

You can manage alert (monitor) notifications based on your requirement.

Modify a Notification

To modify a notification:

1. Log in to NetWitness Platform.
2. Go to  **(Admin) > Health & Wellness.**
3. Click **New Health & Wellness**.
4. Click **View Notifications Settings**.
5. Make the necessary changes.
6. Click **Save**.

Modify a Notification Suppression Policy

When you modify a suppression policy, you can change the day or time ranges. If you select multiple alerts to modify the policy, any changes would overwrite all the existing policies.

To modify suppression policy:

1. Go to  **(Admin) > Health & Wellness.**
2. Click **New Health & Wellness**.
3. Select one or multiple rows for which you to modify suppression policy.
4. Click **View Suppression Policy**.

Note: If you have selected multiple alerts to modify the suppression policy,
- Only policies that are common are displayed. Policy suppression settings would be empty if there is no common polices.
- If you edit the common policies, the changes would overwrite all the selected alert policies.

5. Make the necessary changes.
6. Click **Save**.

Advanced Configurations

Restore Default Content

This allows you to bring back all the default content such as dashboards, visualizations, monitors to its original or default state. This overwrites any changes made to the default content. For example, if you have deleted any dashboard or visualization and want to bring back the default content.

1. Log in to NetWitness Platform UI.
2. Click  (Configure) > **LIVE CONTENT**.
3. In the **Search Criteria** panel, select the **Resource Types** as:
   - Health and Wellness Dashboards
   - Health and Wellness Monitors
4. Click **Search**.
5. In the **Matching Resources** view, select the checkbox to the left of the resources that you want to deploy.
6. In the **Matching Resources** toolbar, click 

.
7. In the **Deployment Wizard** > **Resources** tab, click **Next**.
8. In the **Services** tab, select the Metrics Server service.
9. Click **Next**.
10. Click **Deploy**.
    The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.
11. Click **Close**.

Enable Services

This is used to enable all the services to start sending metrics for monitoring. For example, if you have disabled few services from sending metrics for monitoring and want to enable all those disabled services to start sending again.

1. SSH to the Admin Server.
2. Enter the following command:
   `nw-shell`
   The console window is displayed.

3. Connect to metrics-server using the following command:

   ```
   connect --service metrics-server
   ```

4. Enter the login command:
   ```
   login
   ```
5. Enter the admin username and password.
6. Navigate to the enable option using the following command:

   ```
   cd /rsa/metrics/elastic/enable-all
   ```

7. Execute the following command to enable all services:

   ```
   invoke
   ```

Disable Services

This is used to disable all the services to send metrics for monitoring. Once disabled, none of the services sends alerts to the Elasticsearch and the dashboards are not updated, and alerts will not be triggered.

1. SSH to the Admin Server.
2. Enter the following command:
   ```
   nw-shell
   ```
   The console window is displayed.

3. Connect to metrics-server using the following command:

   ```
   connect --service metrics-server
   ```

4. Enter the login command:
   ```
   login
   ```
5. Enter the admin username and password.
6. Navigate to Elasticsearch using the following command:

   ```
   cd /rsa/metrics/elastic/disable-all
   ```

7. Execute the following command to disable all services to stop writing to Elasticsearch:

   ```
   invoke
   ```

Note: This disables all services to send metrics to Elasticsearch but does not stop metric beat to send system level metrics to Elasticsearch. You need to manually stop metric beat on all hosts if you wish to stop using Health and Wellness.

Update an Interval

You can update a common interval for all the services to send data for monitoring. For example, if all the services are set to different intervals and you want to configure all the services to send data to elastic search on the same interval.

The interval can be set in seconds, minutes and hours.

1. SSH to the Admin Server.
2. Enter the following command:
   ```
   nw-shell
   ```
   The console window is displayed.

3. Connect to metrics-server using the following command:

   `connect --service metrics-server`

4. Enter the login command:
   `login`
5. Enter the admin username and password.
6. Navigate to the `update-interval` directory using the following command:

   `cd /rsa/metrics/elastic/update-interval`

7. Execute the following command to set a common interval for all the services:

   `invoke <interval>`

   For example, `invoke 30seconds`

Update the Default Configuration

By default, New Health and Wellness configurations are applied after the New Health and Wellness is enabled successfully. To change the configuration of a service, you need to update the existing configuration. After the configuration is updated, the service is notified of the changes.

To update the configuration, perform the following:

1. SSH to the Admin Server.
2. Enter the following command:
   `nw-shell`
   The console window is displayed.

3. Connect to the metrics-server using the following command:

   `connect --service metrics-server`

4. Enter the login command:

   `login`

5. Enter the admin username and password.
6. To get configuration of a service, execute following commands:
   a. `cd /rsa/metrics/elastic/get-config`
   b. `invoke <service-id>`

Note:
To get the service id for core services:
1) Go to **(Admin)** > Core service.
2) Click > **View** > **Explore**.
3) Expand the **sys/stats** node list.
4) In the **UUID** filed, copy the value.
To get the service id for launch services:
1) Go to **(Admin)** > Launch service.
2) Click > **View** > **Explore**.
3) Click the process node.
4) In the **service-id** field, copy the value.
To get the service id for Carlos services:
1) SSH to host in which the Carlos service is deployed.
2) Execute the following command:
For Reporting Engine:
`cat /var/netwitness/re-server/rsa/soc/reporting-engine/service-id`
For Legacy Web Server:
`cat /var/netwitness/uax/service-id`

Note: The core services are Archiver, Broker, Concentrator, Decoder, Log Decoder and; Carlos services are Reporting Engine, Legacy Web Server. All the other services that are not included in Core and Carlos services are part of launch services.

7. Copy the configuration and save it in a file.
   a. Copy the configuration from step 6 and exit from `nw-shell` using command:
      `exit`
   b. Create a file under `/root` in admin server, copy the configurations to the file and save it.

   For example, For the Reporting Engine service, create a file `reporting-engine.json` under `/root/` and copy the configurations obtained from step 6 and save.
8. To set configurations for a service:
   a. `cd /rsa/metrics/elastic/set-config`
   b. `invoke --file <absolute path of the path>`
      For example, `invoke --file /root/reporting-engine.json`

Configure the Data Retention Policy

You can configure the retention policy for monitors (alerts triggered) and metrics based on age and size.

By default, 90 days of data with 100 GB of size for monitors (alerts triggered) and 30 days of data with 100 GB of size for metrics are retained.

To change the configure for monitor (alerts triggered) retention:

1. SSH to the Admin Server.
2. Enter the following command:
   `nw-shell`
   The console window is displayed.

3. Connect to metrics-server using the following command:
   `connect --service metrics-server`

4. Enter the login command:
   `login`
5. Enter the admin username and password.
6. Go to alert-retention-threshold using command:
   `cd /rsa/metrics/elastic/data/retention/alert-retention-threshold`
7. Set the value between 1day to 90days using command:
   `set <number of days>`
   For example, `set 50days`
8. Exit from nw-shell using the command:
   `exit`
9. SSH to the host on which New Health and Wellness is installed.
10. Restart the metrics server on which New Health and Wellness is installed using the command:
    `service rsa-nw-metrics-server restart`

To change the configuration for metrics time threshold:

1. SSH to the Admin Server.
2. Enter the following command:
   `nw-shell`
   The console window is displayed.

3. Connect to metrics-server using the following command:
   `connect --service metrics-server`
4. Enter the login command:
   `login`
5. Enter the admin username and password.

6. Go to time-threshold using command:
   `cd /rsa/metrics/elastic/data/retention/time-threshold`
7. Set the value from **1day** to **90days** using command:
   `set <number of days>`
   For example, `set 40days`
8. Exit from `nw-shell` using the command:
   `exit`
9. SSH to the host on which New Health and Wellness is installed.
10. Restart the metrics server on which the New Health and Wellness is installed using the command:
    `service rsa-nw-metrics-server restart`

To change the size configuration:

1. SSH to the Admin Server.
2. Enter the following command:
   `nw-shell`
   The console window is displayed.

3. Connect to metrics-server using the following command:
   `connect --service metrics-server`
4. Enter the login command:
   `login`
5. Enter the admin username and password.
6. Go to allocated-size using command:
   `cd /rsa/metrics/elastic/data/retention/allocated-size`
7. Set the value using command:
   `set <size to be allocated>`

For example, `set 200GB`

8. Exit from nw-shell using the command:

   `exit`

9. SSH to the host on which New Health and Wellness is installed.
10. Restart the metrics server on which the New Health and Wellness is installed using the command:

    `service rsa-nw-metrics-server restart`

Note: Make sure the `/var/netwitness` partition on standalone New Health and Wellness has enough disk space. After you review your datastore configuration, you may determine that you need to add a new volume. For more information on adding a new volume, see "Add New Volume and Extend Existing File Systems" topic in the *Virtual Host Installation Guide*.

Backup and Restore New Health and Wellness

Perform the following steps in the order given:

1. Back up the Admin Server. For more information on the instructions, see "Disaster Recovery (Back Up and Restore)" topic in *Recovery Tool User Guide*.
2. At the root level, type the following command on the host on which New Health and Wellness is installed :

   ```
   nw-recovery-tool --export --dump-dir /var/netwitness/backup --category Search
   ```

   Note: Make sure that the Admin Server is restored, up and running successfully.
3. Restore the New Health and Wellness using the following command:

   ```
   nw-recovery-tool --import --dump-dir /var/netwitness/backup --category Search
   ```

   Note: Restore the search category (New Health and Wellness) on the same host on which New Health and Wellness is installed.
4. Reboot the Host on which search category (New Health and Wellness) is restored.
5. Restore the default content using RSA Live:
   a. Log in to NetWitness Platform UI.
   b. Click  (Configure) > **LIVE CONTENT**.
   c. In the **Search Criteria** panel, select the **Resource Types** as:
      - Health and Wellness Dashboards
      - Health and Wellness Monitors
   d. Click **Search**.
   e. In the **Matching Resources** view, select the checkbox to the left of the resources that you want to deploy.
   f. In the **Matching Resources** toolbar, click 

   .
   g. In the **Deployment Wizard** > **Resources** tab, click **Next**.
   h. In the **Services** tab, select the Metrics Server service.
   i. Click **Next**.
   j. Click **Deploy**.
   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.
   k. Click **Close**.

Troubleshooting New Health and Wellness

This topic describes how to troubleshoot New Health and Wellness issues.

Issue	An error ‘n of m shards failed’ or ‘unknown field in the index’ in the New Health and Wellness dashboards.
Resolution	Refresh the index patterns, perform the following: 1. Log in to NetWitness Platform. 2. Go to  **(Admin) > Health & Wellness.** 3. Click **New Health & Wellness**. 4. Click **Pivot to Dashboard**. 5. Go to  > **Stack Management** > **Index Patterns**. 6. Click **nw* index pattern**. 7. Click **Refresh** to refresh the index pattern on top right corner. **Note:** If the issue still persists, refresh other index patterns such as **nw-metricbeat*** or **nw-concentrator*** and so on.

Issue	Unable to send data to elastic search once disk usage reaches 85%.
Explanation	If the Elasticsearch disk usage reaches 85%, the saved objects (index patterns, dashboards, visualizations etc) becomes read-only mode. And, services does not write new metrics to Elasticsearch or allow to edit any saved objects.
Resolution	To change the indexes to write mode, execute the following command on the host in which Elasticsearch is installed: `curl -k --cert /etc/pki/nw/elastic/elasticsearch-cert.pem --key /etc/pki/nw/elastic/elasticsearch-key.pem -X PUT -H "Content-Type: application/json" -d '{"index.blocks.read_only_allow_delete": null }' https://localhost:9200/_all/_settings` **Note:** This command is supported only with certificates.

Issue	**New Health and Wellness** > **Pivot to Dashboard** fails due to time synchronization issue.
Explanation	Pivot to dashboard fails if there is no time synchronization between the NetWitness Server and the host on which New Health and Wellness is

Resolution	installed. You must synchronize the time and pivot to dashboard. To synchronize the time do one of the following: • Configure the NTP Server. For more information, see "Configure NTP Servers" in the *System Configuration Guide*. • Run the following commands on the host on which New Health and Wellness is installed 1. SSH to NetWitness host. 2. Run the following commands. ◦ `systemctl stop ntpd` ◦ `ntpdate nw-node-zero` ◦ `systemctl start ntpd`

Issue	NW Host High Swap Utilization monitor generates many false alerts.
Explanation	By default the set threshold is > 50 %, which might generate many false alerts on NW Host High Swap Utilization monitor for Linux hosts, which is considered normal. **Note:** On upgrade to 11.5.3.0 version or later, the monitor will be automatically deleted on the New Health & Wellness monitors view.
Resolution	On version 11.5.2.0 or lower, you can perform the following steps to delete the monitor: 1. Log in to the NetWitness Platform. 2. Go to **(missing or bad snippet)> Health & Wellness**. 3. Click **New Health & Wellness**. 4. Click **Pivot to Dashboard**. The **Deployment Health Overview** dashboard is displayed. 5. Go to  > **Open Distro for Elasticsearch** > **Alerting**. The Dashboards tab is displayed by default. 6. Click **Monitors** tab. 7. Select the NW Host High Swap Utilization monitor and click  > **Delete**. The monitor is deleted.

Appendices

This section is a collection of appendices for new health and wellness:

- New Health and Wellness Dashboards
- New Health and Wellness Monitors

New Health and Wellness Dashboards

This topic provides the list of default New Health and Wellness dashboards and associated visualizations and metrics.

Deployment Health Overview Dashboard

This dashboard provides the overall health of the NetWitness Platform hosts and services. The following table provides the information on default visualizations available on this dashboard.

Note: The parameters and metrics listed below are the default values. You can customize the parameters and metrics of any visualization based on your requirement. For example, you can customize a visualization to view the CPU utilization for all the core services or any particular service.

Visualization	Parameters and Metrics	Objective	Description
Alarms Summary	• Count of active alert • Alert severity	Provides the summary of active health alarms based on the severity.	Displays the active alarms grouped by severity (Critical, High, Medium, Low).
Offline Services	• Service name • Status Time • Refresh time 15 minutes	Identifies the list of unavailable services.	Displays the list of offline services.
Stopped Archiver Aggregation	• Count of archivers where aggregation is stopped • Refresh time 15 minutes	Identifies the number of Archivers where aggregation is stopped.	Displays the number of Archivers where aggregation is stopped. For more information, see Notifications.
Stopped Broker Aggregation	• Count of Brokers where aggregation is stopped • Refresh time 15 minutes	Identifies the number of Brokers where aggregation is stopped.	Displays the number of Brokers where aggregation is stopped. For more information, see Notifications.
Stopped Concentrator Aggregation	• Count of Concentrators where aggregation is stopped • Refresh time 15 minutes	Identifies the number of Concentrators where aggregation is stopped.	Displays the number of Concentrators where aggregation is stopped. For more information, see Notifications.

Visualization	Parameters and Metrics	Objective	Description
Stopped Decoder/Log Decoder Capture	• Count of Decoders or Log Decoders where capture is stopped • Refresh time 15 minutes	Identifies the number of Decoders or Log Decoders where capture is stopped.	Displays the number of Decoder or Log Decoder where capture is stopped. For more information, see Notifications.
Total vs Offline Services	• Total number of services • Count of offline services • Refresh time 15 minutes	Identifies the number of offline services versus total number of services.	Displays the total number of services and the number of services that are offline.
Stopped State Aggregation & Capture	• Services name • Host name • Service version	Provides the list of services where aggregation and capture are stopped.	Displays the list of services where aggregation and capture are stopped.
NetWitness Services Version Status	• Service version	Provides the status of NetWitness Platform service versions.	Displays the status of NetWitness Platform service versions.
NetWitness Services – Uptime Summary	• Service name • Host name • Running since	Provides an overview on the uptime of the services in the deployment.	Displays the list of services and their uptime.
Memory Utilization Trend	• Service name • Memory usage	Provides the memory utilization trend to detect any high utilizations and take necessary action.	Displays the memory utilization trend of the hosts.
Current CPU Usage	• Services name • CPU usage	Provides the CPU usage trend of the hosts to identify any high utilizations and take necessary action.	Displays the current CPU usage of the services.
Current Disk Usage	• Services name • Disk usage	Provides the disk utilization in the real time to identify any high utilizations and take necessary action.	Displays the current disk usage of the hosts.
Capture Rate for Log Decoders	• Service name • Capture rate	Provides the capture rate trend to identify any high values and take necessary action.	Displays the trend of Log Decoders capture rate.

Visualization	Parameters and Metrics	Objective	Description
Capture Rate for Network Decoders	• Service name • Capture rate	Provides the capture rate trend to identify any high values and take necessary action.	Displays the trend of Network Decoders capture rate.
Session Aggregation Rate and Trend for Concentrators	• Service name • Session aggregation rate	Provides an overview on the session rate of the Concentrators to identify any high values and take necessary action.	Displays the session aggregation rate and trend of Concentrator.
Retention Summary	• Service id • Service name • Running on host • Oldest meta file time • Oldest packet file time • Oldest session file time	Provides a quick view on the current retention of the Decoders, Concentrators and Archivers to check if the retention is lower than the configured retention.	Displays the oldest date for meta, session, packet present in decoders, logdecoders and concentrators
Total CPU Usage Trend for Services	• CPU usage • Service name	Provides the CPU usage trend of the services to detect the high utilization and take necessary action.	Displays the top 20 services where CPU usage is high.
Total Memory Usage Summary for Services	• Service name • Memory usage	Provides the memory usage summary of NetWitness Platform services to detect any high usage and take necessary actions.	Displays the top services that are utilizing the resident memories.

Hosts Dashboard

This dashboard provides the resource utilization and health of NetWitness hosts in your deployment. The following table provides information on default **Visualizations** available on this dashboard.

Visualization	Metrics	Objective	Description
Disk Used	• Disk usage	Provides the current disk usage of the hosts to detect the high utilization and take immediate action.	Displays the current disk usage of the host.

Visualization	Metrics	Objective	Description
Current Memory Usage vs Total Available	• Current memory usage • Total available memory	Provides the current memory usage versus total available memory to identify high usage and take necessary action.	Displays the current memory usage and total available memory of the host.
Current Disk Usage vs Total Available Disk	• Current disk usage • Total available disk	Provides the current disk usage versus total available disk to identify high usage and take necessary action.	Displays the current disk usage versus total available disk.
Disk Usage by Partitions	• Disk partition • Disk usage	Provides the disk usage by different partitions to identify high usage and take necessary action.	List of partitions and associated disk percentage.
Resident Memory Usage by Services	• Service name • Resident memory usage	Provides the resident memory usage per service to identify high usage and take necessary action.	Displays the resident memory usage of the service.
Memory Usage	Memory usage	Provides the current memory usage percentage of the hosts to identify high memory usage and take necessary action.	Displays the memory usage of the host.
CPU Usage	CPU usage	Provides the CPU usage percentage to identify high usage and take necessary action.	Displays the CPU usage of the host.
CPU Usage by Services	• Service name • CPU usage	Provides the CPU Percentage per service to detect high usage and take necessary action.	Displays the CPU usage of the service.
Interfaces by Incoming Traffic	Incoming traffic on interfaces	Provides the trend on interfaces incoming traffic to detect any deviation on time.	Display the incoming traffic interfaces.
Interfaces by Outgoing Traffic	Outgoing traffic on interfaces	Provides the trend on interfaces outgoing traffic to detect any deviation on time.	Display the interfaces outgoing traffic.
Services by Open File Descriptors	• Services • Open file descriptor	Provides the list of open file descriptor associate with a service.	Displays the list of open file descriptor associated with a service.

Visualization	Metrics	Objective	Description
TOP APPLIANCES BY DISK IO READ (Line) Vs WRITE (Bar)	• Service name • Disk IO Read • Disk IO Write	Provides the list of top appliances by disk IO read and write to detect any high usage and take necessary action.	Displays top appliances based on disk IO read and write usage.
Total Inbound Traffic for All Interfaces	• Count of inbound traffic on Interfaces • Total transferred traffic	Provides the total inbound traffic to detect any deviation on time.	Displays the current inbound traffic and total transferred traffic.
Total Outbound Traffic for All Interfaces	• Count of outbound traffic on Interfaces • Total transferred traffic	Provides the total outbound traffic to detect any deviation on time.	Display the current outbound traffic and total transferred traffic.

Logs Dashboard

This dashboard provides information on various NetWitness Platform logs. The following table provides information on default **Visualizations** available on this dashboard.

Visualization	Metrics	Objective	Description
Log Decoders by Capture Rate	• Service name • Capture Rate	Provides the capture rate of Log Decoders to detect high capture rate on time and take necessary action.	Displays the Log Decoders by capture rate.

Visualization	Metrics	Objective	Description
Log Decoders by Capture Packet Rate	• Service name • Capture Packet Rate	Provides the capture packet rate of Log Decoder to detect high capture packet rate on time and take necessary action.	Displays the Log Decoders by capture packet rate.
Log Decoders by CPU Percentage	• Service name • CPU usage	Identifies the Log Decoders by CPU usage to detect high usage and take necessary action.	Display the Log Decoders by CPU usage..
Log Decoders by Resident Memory Usage	• Service name • Resident Memory Usage	Identifies the Log Decoders by resident memory usage to detect high usage and take necessary action.	Display Log decoder by resident memory usage.
SDK Active Queries on Concentrators	• Service name • Count of active queries	Identifies the concentrators by SDK active queries.	Display concentrators by SDK active queries.
Concentrators Status	• Service running on host • Service type • Service version • Aggregation status • Average session rate • Max session rate • Active queries	Provides the concentrator status.	Display the list of concentrators and its status.

Visualization	Metrics	Objective	Description
Concentrator Session Aggregation Rate [Trend]	• Service name • Session rate	Provides the trend of Concentrator session aggregation rates to detect high session rates and take necessary action.	Displays Concentrator session aggregation rate.
SDK Active Queries on Brokers	• Service name • Count of Active Queries	Identifies the Brokers by SDK active queries.	Lists Brokers by SDK active queries.
Brokers Status	• Service running on host • Service type • Service version • Aggregation status • Average session rate • Max session rate • Active queries	Provides the Broker status.	Displays the list of Brokers and their status.

Packet Overview Dashboard

This dashboard provides information on NetWitness Platform network data. The following table provides information on default **Visualizations** available on this dashboard.

Visualization	Metrics	Objective	Description
Network Decoders by Capture Rate	• Service name • Capture rate	Identifies the capture rate of Network Decoder to detect high value and take necessary action.	Displays Network Decoders by capture rate.

Visualization	Metrics	Objective	Description
Network Decoders by Capture Drop	• Service name • Capture drop percentage	Identifies the capture drop rate of Network Decoders to detect drop rate and take necessary action.	Displays Network Decoders by capture drop.
Network Decoders by CPU Percentage	• Service name • CPU usage	Identifies the Network Decoders by CPU usage to detect high usage and take necessary action.	Displays Network Decoder by CPU used.
Network Decoders by Resident Memory Usage	• Service name • Resident memory usage	Identifies the Network Decoders by resident memory usage to detect high usage and take necessary action.	Displays Network Decoder by resident memory usage.
SDK Active Queries on Concentrators	• Service name • Count of active queries	Identifies the concentrators by SDK active queries.	Displays Concentrators by SDK active queries.
Concentrators Status	• Service running on host • Service type • Service version • Aggregation status • Average session rate • Max session rate • Active queries	Provides the Concentrator status.	Displays the list of Concentrators and their status.

Visualization	Metrics	Objective	Description
Concentrator Session Aggregation Rate [Trend]	• Service name • Session rate	Provides the trend of Concentrator session aggregation rate to detect high value and take necessary action.	Displays the trend of concentrator session aggregation rate.
SDK Active Queries on Brokers	• Service name • Count of active queries	Identifies the Brokers by SDK active queries.	Display the Broker by SDK active queries.
Brokers Status	• Service running on host • Service type • Service version • Aggregation status • Average session rate • Max session rate • Active queries	Provides the Broker status.	Displays the list of brokers and its status.

Analysis Dashboard

This dashboard provides details about Reporting Engines on Primary UI or Analyst UI. The following table provides the information on default **Visualizations** available on this dashboard.

Visualization	Metrics	Objective	Description
Reporting Engine Rule Query Executions	• Hostname • Failed rule executions • Cancelled rule execution • Active rule execution • Total rule execution	Provides the status of the queries executed by Reporting Engine to detect any deviations on time.	Displays the queries executed by Reporting Engine.

Visualization	Metrics	Objective	Description
Reporting Engine Reports Executions	• Hostname • Failed in last hour • Running more than one hour • Cancelled in last hour • Output actions failed in last hour	Provides the status of the reports executed by Reporting Engine to detect any deviations on time.	Displays the Reporting Engine reports.
Reporting Engine Alerts Execution	• Enabled alerts • Execution failed • Execution skipped in las 10 minutes • Running alerts • Output actions failed in last 10 minutes	Provides the status of the alerts generated by Reporting Engine to detect any deviations on time.	Displays the Reporting Engine alerts.
Reporting Engine Charts Executions	• Hostname • Enabled charts • Execution failed • Execution cancelled in last 10 minutes	Provides the status of the charts executed by Reporting Engine to detect deviations on time.	Displays Reporting Engine charts.
Reporting Engine Disk Usage	• Disk Used • Total disk space	Provides the disk usage by Reporting Engine to detect any deviations high usage and take necessary action.	Displays the disk used by Reporting Engine.
Unassigned Open Incidents	Count of unassigned open incidents	Identifies unassigned incidents to assist Administrator to take necessary action.	Displays the unassigned incidents.

Visualization	Metrics	Objective	Description
Incidents Sent to Archer	Count of incidents sent to archer	Provides statistics on the incidents sent to Archer to assist Administrator to take necessary action.	Displays the incidents sent Archers.

Endpoint Dashboard

This dashboard provides information on NetWitness Endpoints and agents installed on Endpoints. The following table provides information on default Visualizations available on this dashboard.

Visualization	Metrics	Objective	Description
Endpoint Server to Agent Communication Queued	• Service name • Count of queued request to Agent	Provides an overview of the queued agent communication to the Endpoint Server to identify any issues around the queued communication.	Displays the queued request to agent.
Endpoint Server to Agent Communication Rejected Count	• Service name • Count of rejected request to agent	Provides an overview of rejected agent communication to the Endpoint Server to identify any issues related to the rejected count.	Displays the rejected request to agent.
Endpoint Agent Overview	• Hostname • Total active agents • Active advanced • Active insights agents • Active advanced windows agents • Active advanced linux agents • Active advanced mac agents	Provides an overview of Endpoint Agents.	Displays list of agents and its details.

Visualization	Metrics	Objective	Description
Relay Servers Overview	• Hosts • Total relay servers • Agents communicated via relay server • Agents communicated in last two days via relay server	Provides an overview of the Relay Servers.	Displays the Relay server details.
Files Count by File Status	• Count of blacklisted files • Count of graylisted files • Count of netural file • Count of whitelisted files	Provides an overview of file status by count to assist an Administrator on the overall statistics of Endpoint actions on files.	Displays the file count of file statuses.
Files Count by Certificate Status	• Count of blacklisted certificates • Count of gray listed certificates • Count of neutral certificates • Count of whitelisted certificates	Provides an overview on certificate status to assist an Administrator to take necessary action.	Displays the count of certificate statuses.

Visualization	Metrics	Objective	Description
File Count by Reputation Status	• Count of unknown status • Count of suspicious status • Count of malicious status • Count of known good status • Count of known status • Count of invalid status	Provides an overview on the reputation status to assist an Administrator to take necessary action.	Displays the count of files reputation status.
Endpoint Hosts with Risk Score Greater than 90	Count of hosts with risk score greater than 90	Identifies the number of hosts with risk score higher than 90 for immediate attention.	Displays the count of hosts with risk score greater than 90.
Endpoint Files with Risk Score Greater than 90	Count of files with risk score greater than 90	Identifies the number of files with risk score higher than 90 for immediate attention.	Displays the count of files with risk score greater than 90.

ESA Correlation Overview Dashboard

This dashboard provides health statistics and trends on the ESA deployment. The following table provides the information on default **Visualizations** available on this dashboard.

You can choose the ESA host and Deployment name for the Dashboard view source using the filter.

Visualization	Metrics	Objective	Description
Sessions Behind by Sources	Count of sessions behind by sources.	Provides the session behind trend for the sources to take necessary actions when the session behind goes higher.	Displays the count of sessions behind by sources.
Sessions Rate by Sources	Count of sessions rate by sources.	Provides the session rate trend for the sources to take necessary actions when the session rate goes higher.	Displays the count of sessions rate by sources.
Top Rules by Memory	Memory used by rules.	Provides the memory usage per rule to identify the rule with high memory usage and take necessary action.	Displays the top rules based on memory usage.
Top Rules by CPU	CPU used by rules.	Provides the CPU usage per rule to identify the rule with high CPU usage and take necessary action.	Displays the top rules based on CPU usage.

Visualization	Metrics	Objective	Description
ESA Correlation Resident Memory Usage	Resident memory usage.	Provides resident memory usage trend to be able to detect high usage and take necessary action.	Displays the trend of ESA correlation resident memory usage.
ESA Correlation CPU Usage	CPU usage.	Provides CPU usage trend to detect high usage and take necessary action.	Displays the trend of ESA correlation CPU usage.
ESA CR - Event Rate by Deployments	Event rate of each ESA correlation deployment.	Identify the event rate by each deployment under ESA Correlation to detect high usage and take necessary action.	Displays the trend of ESA correlation event rate of each deployment.

Logstash Input Plugin Dashboard

The Logstash Input Plugin dashboard provides insight on Logstash event source and the NetWitness Input Plugin.

Prerequisites

- You must install the New Health and Wellness. For more information, see New Health and Wellness
- You must ensure to download the Logstash Input Plugin Dashboard from RSA Live. For more information, see Advanced Configurations

The following table provides the information on default **Visualizations** available on this dashboard.

Visualization	Metrics	Objective	Description
Logstash Inactive Pipelines	• Inactive pipeline • Total number of Pipeline	Provides the summary of inactive pipeline.	Displays the total number of inactive pipeline.
Logstash Inactive Sources	• Inactive sources • Total number of sources	Provides the summary of inactive sources.	Displays the total number of inactive sources.
Logstash Incoming Rate	• Incoming rate of Logstash event sources.	Provides the trend of incoming rate for Logstash event source.	Displays the trend of Logstash incoming rate.
Logstash Outgoing Rate	Outgoing rate of Logstash event sources.	Provides the trend of outgoing rate for Logstash event sources.	Displays the trend of Logstash outgoing rate.

Visualization	Metrics	Objective	Description
Logstash Data Persistence	Count of persisted Logstash event source.	Provides the trend of persisted Logstash event source to take necessary actions when the persisted data count goes higher.	Displays the trend of Logstash persisted data.
Logstash Pipelines status	• Inactive pipelines • Active pieplines • Total number of pipelines	Provides the status of Logstash pipeline.	Displays the status of Logstash pipeline.
Sources by Input event rate	• Input rate of sources	Provides the trend of source input rate to identify any high values and take necessary action.	Displays the trend of source input event rate.
Sources by Sessions behind	Logstash session behind	Provides the trend of Logstash session behind to identify any high values and take necessary action..	Displays the trend of Logstash session behind.
Events to consumer (Output Plugin)	Output event rate	Provides the trend of output event rate to identify any high values and take necessary action.	Displays the trend of Logstash output event rate.

Visualization	Metrics	Objective	Description
Logstash Service Uptime	• Service start time • Host name • Service name	Provides the time when the service is active.	Displays the time when the service is running.
Source Status	• Stream status • Source host • Service type • Service version • Logstash host • Average input event rate • Average source session rate • Average session behind	Provides overall status of the services. For example, stream status of the Decoder connected with the Logstash.	Displays the list of all services and its status.
Logstash Services by CPU Usage	• CPU usage • Service name	Provides the CPU usage trend of the Logstash services to identify any high utilizations and take necessary action.	Displays the CPU utilization trend of the Logstash services.
Logstash Service by Resident Memory Usage	• Resident memory usage • Service name	Provides the resident memory usage trend of the Logstash services to identify any high utilizations and take necessary action.	Displays the resident memory utilization trend of the Logstash services.

License Usage Dashboard

The License Usage Dashboard provides License usage statistics and trends on the Log Decoder, Packet Decoder, Endpoint, UEBA, and Malware services and at aggregated levels under throughput license. It provides an overview of the usage of all types of Throughput licenses in your deployment.

It helps you:

- Track daily license usage for individual hosts
- Track daily usage of Throughput licenses for all the hosts in your deployment
- Download license usage reports

Prerequisites

- You must install the New Health and Wellness. For more information, see New Health and Wellness
- You must ensure to download the License Usage Dashboard from RSA Live. For more information, see Advanced Configurations

IMPORTANT: The date shown in the user interface is set by the browser's time zone. The user's browser may be different from the time zone of the Admin server host. To make a date shown in the user interface to match the Admin server, change the time zone setting under Stack Management > Advanced Settings. If you update the time zone under Advanced settings, it affects other DateTime displays throughout the user interface.

The following table provides the information on default **Visualizations** available on this dashboard. You can choose any host and Deployment name for the Dashboard view source using the filter.

Visualization	Metrics	Objective	Description
Packets Analyzed	• Usage in bytes • Per day	Provides the packet data analyzed in bytes for Packet Decoder. Helps to track daily usage.	Displays the packet data analyzed daily in bytes.
Packets on Disk	• Usage in bytes • Per day	Provides the amount of data stored on the disk daily in bytes for the Packet Decoder. Helps to track daily usage.	Displays the amount of packet data usage on the disk daily in bytes.
Logs Processed	• Usage in bytes • Per day	Provides the Log data processed in bytes for Log Decoders. Helps to track daily usage.	Displays the Log data processed daily in bytes.
Users Analyzed	• Users Analyzed • Per day	Provides the number of users analyzed. Helps to track daily usage.	Displays the number of users analyzed daily.

Visualization	Metrics	Objective	Description
Files Analyzed	• Usage in bytes • Per day	Provides the files analyzed in bytes. Helps to track daily usage.	Displays the files analyzed daily in bytes.
Hosts Analyzed	• Hosts Analyzed • Per day	Provides the number of hosts analyzed. Helps to track daily usage.	Displays the number of hosts analyzed daily.
Aggregate Usage - Logs Processed	• Usage in bytes • Per day	Provides an aggregated log of data from all the log services under the throughput license. Helps to track daily usage, detect high value, and take necessary action.	Displays an aggregated log of data from all the log services daily.
Aggregate Usage - Packet Analyzed	• Usage in bytes • Per day	Provides an aggregated packet of data from all the packet services under the throughput license. Helps to track daily usage, detect high value, and take necessary action.	Displays an aggregated packet of data from all the packet services daily.

Visualization	Metrics	Objective	Description
Aggregate Usage - Packets on Disk	• Usage in bytes • Per day	Provides an aggregated packet data stored on the disk from all the packet services under the throughput license. Helps to track daily usage, detect high value, and take necessary action.	Displays an aggregated packet data stored on the disk from all the packet services daily.
Aggregate Usage - File Analyzed	• Usage in bytes • Per day	Provides an aggregated file usage in bytes from all the Malware services under throughput license. Helps to track daily usage, detect high value, and take necessary action.	Displays an aggregated file usage in bytes from all the Malware services daily.
Aggregate Usage - Host Analyzed	• Hosts analyzed • Per day	Provides an aggregated list of hosts from all the endpoint servers under the throughput license. Helps to track daily usage, detect high value, and take necessary action.	Displays an aggregated list of hosts from all the hosts daily.

Visualization	Metrics	Objective	Description
Aggregate Usage - User Analyzed	• Users analyzed • Per day	Provides an aggregated users from all the UEBA servers under the throughput license. Helps to track daily usage, detect high value, and take necessary action.	Displays an aggregated users from all the UEBA servers daily.

New Health and Wellness Monitors

This topic lists the default New Health and Wellness monitors.

Number	Monitor
1.	Respond Server Risk Scoring Unprocessed Alerts High Count
2.	Respond Server Risk Scoring Unprocessed Alert Older Than 24 Hours
3.	Respond Server Risk Scoring Transient Alerts Ignored High Count
4.	Reporting Engine Shared Task Critical Utilization
5.	Reporting Engine Schedule Task Pool Critical Utilization
6.	Reporting Engine Rule(s) Execution Failed
7.	Reporting Engine Report(s) Running > 1 hour
8.	Reporting Engine Report(s) Executions Failed
9.	Reporting Engine Chart(s) Execution Failed
10.	Reporting Engine Available Disk < 5%
11.	Reporting Engine Available Disk < 20%
12.	Reporting Engine Available Disk < 2%
13.	Reporting Engine Available Disk < 10%
14.	NW Offline Service
15.	NW Host High Swap Utilization
16.	NW Host Filesystem Disk Full
17.	NW Host Critical Memory Usage
18.	NW Host Critical Disk Usage
19.	NW Host Critical CPU Usage
20.	Log Decoder Service in Bad State
21.	Log Decoder Log Capture Pool Depleted
22.	Log Decoder Invalid Rules Detected
23.	Log Decoder Dropping > 5% of Logs
24.	Log Decoder Dropping > 10% of Logs
25.	Log Decoder Dropping > 1% of Logs
26.	Log Decoder Database(s) Not Open

Number	Monitor
27.	Log Decoder Capture Rate Zero
28.	Log Decoder Capture Not Started
29.	Endpoint Server to Agent - Incoming UDP Packets Requested
30.	Endpoint Server to Agent - Incoming UDP Packets Rejected
31.	Endpoint Server to Agent - Incoming UDP Packets Queued
32.	Endpoint Server to Agent - Incoming UDP Packets Dropped
33.	Endpoint Server to Agent - Incoming UDP Packets Delayed
34.	Endpoint Server - Machine Persistence Failed
35.	Endpoint Server - Inactive Machine Retention Failed
36.	ESA Correlation - Sessions Behind on Datasources
37.	ESA Correlation - ESA Rule High Memory Usage
38.	ESA Correlation - ESA Rule High CPU Usage
39.	ESA Correlation - ESA Rule Critical Memory Usage
40.	ESA Correlation - ESA Rule Critical CPU Usage
41.	Decoder Service in Bad State
42.	Decoder Packet Capture Pool Depleted
43.	Decoder Invalid Rules Detected
44.	Decoder Dropping > 5% of Packets
45.	Decoder Dropping > 10% of Packets
46.	Decoder Dropping > 1% of Packets
47.	Decoder Database(s) Not Open
48.	Decoder Capture Rate Zero
49.	Decoder Capture Not Started
50.	Contexthub Server Query Response Cache Usage > 80%
51.	Contexthub Server High Query Response Cache Usage
52.	Contexthub Server Database High Disk Usage
53.	Contexthub Server Database Critical Disk Usage
54.	Contexthub Server Critical Query Response Cache Usage
55.	Concentrator Service in Bad State

Number	Monitor
56.	Concentrator Meta Rate Zero
57.	Concentrator Individual Rule(s) Detected
58.	Concentrator Database(s) Not Open
59.	Concentrator Aggregation Stopped
60.	Concentrator > 5 Pending Queries
61.	Broker Session Rate Zero
62.	Broker Service in Bad State
63.	Broker Aggregation Stopped
64.	Broker > 5 Pending Queries
65.	Archiver Service in Bad State
66.	Archiver Aggregation Stopped
67.	Logstash offline
68.	Logstash Persisting data

Uninstall New Health and Wellness

To uninstall New Health and Wellness, perform the following:

1. Take a backup of NetWitness Server host. For more information, see “Disaster Recovery (Back Up and Restore)” topic in the *NetWitness Recovery Tool User Guide*.

   ```
   nw-recovery-tool --export --dump-dir /some/folder --category AdminServer --
   category Search
   ```

   Note: If New Health and Wellness is not installed on NetWitness Server, you must take a backup of the host on which New Health and Wellness is installed.

2. Make sure that the installation or upgrades are not in progress and stop the orchestration server on NetWitness Server host:

   ```
   systemctl stop rsa-nw-orchestration-server
   ```

3. Remove the New Health and Wellness service category (“Search") from the host:

   a. SSH to Admin server

   b. Fetch host details where New Health and Wellness is installed using the following command:
   ```
   mongo localhost/orchestration-server -u deploy_admin -p <deploy_admin-
   password> --authenticationDatabase admin --eval 'db.host.find({
   "installedServices": /.*Search.*/i })'
   ```

   Sample output

   ```
   { "_id" : "56f2a90b-1f03-d09a-fb71-42c2a93958a8", "hostname" :
   "10.10.10.11", "ipv4" : "10.10.10.11", "ipv4Public" : "", "displayName"
   : "adminserver", "version" : { "major" : 11, "minor" : 5, "servicePack"
   : 0, "patch" : 0, "snapshot" : false, "rawVersion" : "11.5.2.0" },
   "lastFailedRefreshAttempt" : NumberLong(0), "refreshAttemptDelayFactor"
   : 0, "thirdParty" : false, "installedServices" : [ "Search",
   "AdminServer" ], "meta" : { "node-zero" : true }, "_class" :
   "com.rsa.asoc.orchestration.host.HostEntity" }
   ```

   c. Remove the "Search" from the `installedServices`.

   IMPORTANT: Do not remove any other category names.

   d. Replace <LIST-OF-CATEGORIES-EXCEPT-SEARCH> with a comma-delimited AND double-quoted list of all the existing installed services found earlier EXCEPT "Search":
   ```
   mongo localhost/orchestration-server -u deploy_admin -p <deploy_admin-
   password> --authenticationDatabase admin --eval 'db.host.update({ "_id"
   : "<hw-node-uuid>" },{$set: {"installedServices" : [ <LIST-OF-
   CATEGORIES-EXCEPT-SEARCH> ]}})'
   ```

   Example
   ```
   mongo localhost/orchestration-server -u deploy_admin -p netwitness --
   authenticationDatabase admin --eval 'db.host.update({ "_id" : "56f2a90b-
   1f03-d09a-fb71-42c2a93958a8" },{$set: {"installedServices" : [
   "AdminServer" ]}})'
   ```

   Sample output

   ```
   MongoDB shell version v4.0.19
   ```

```
connecting to: mongodb://localhost:27017/orchestration-
server?authSource=admin&gssapiServiceName=mongodb

Implicit session: session { "id" : UUID("04e32380-347e-4b7d-a63e-
a094536d7242") }

MongoDB server version: 4.0.19

WriteResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
```

e. Make sure that the "Search" category is removed in the updated host record in the `installedServices` :

```
mongo localhost/orchestration-server -u deploy_admin -p <deploy_admin-
password> --authenticationDatabase admin --eval 'db.host.find({ "_id" :
"<hw-node-uuid>" })'
```

Example

```
mongo localhost/orchestration-server -u deploy_admin -p netwitness --
authenticationDatabase admin --eval 'db.host.find({ "_id" : "56f2a90b-
1f03-d09a-fb71-42c2a93958a8" })'
```

Note: Any inconsistencies can result in unrecoverable errors.

Sample output

```
{ "_id" : "56f2a90b-1f03-d09a-fb71-42c2a93958a8", "hostname" :
"10.10.10.11", "ipv4" : "10.10.10.11", "ipv4Public" : "", "displayName" :
"adminserver", "version" : { "major" : 11, "minor" : 5, "servicePack" : 0,
"patch" : 0, "snapshot" : false, "rawVersion" : "11.5.2.0" },
"lastFailedRefreshAttempt" : NumberLong(0), "refreshAttemptDelayFactor" :
0, "thirdParty" : false, "installedServices" : [ "AdminServer" ], "meta" :
{ "node-zero" : true }, "_class" :
"com.rsa.asoc.orchestration.host.HostEntity" }
```

4. Stop the New Health and Wellness services:

```
systemctl stop rsa-nw-metrics-server elasticsearch opendistro-performance-
analyzer kibana
```

5. Disable the New Health and Wellness services:

```
systemctl disable rsa-nw-metrics-server elasticsearch opendistro-performance-
analyzer kibana
```

6. Uninstall the New Health and Wellness packages using the command:

```
yum erase -y rsa-nw-metrics-server opendistroforelasticsearch
opendistroforelasticsearch-kibana
```

Note: `rsa-nw-shell` (installed with metrics server) is a shared package and should not be removed.

7. Remove the configuration folders or files:

- `/etc/netwitness/metrics-server`
- `/etc/netwitness/platform/elasticsearch`
- `/etc/netwitness/platform/nodeinfo/metrics-server`
- `/etc/netwitness/platform/nodeinfo/elasticsearch-open-distro`

- /etc/netwitness/platform/nodeinfo/kibana-open-distro
- /etc/systemd/system/rsa-nw-metrics-server.service.d
- /etc/systemd/system/elasticsearch.service.d
- /etc/pki/nw/service/bootstrap/metrics-server.completed
- /etc/pki/nw/service/rsa-nw-metrics-server-cert.pem
- /etc/pki/nw/service/rsa-nw-metrics-server.chain
- /etc/pki/nw/elastic
- /etc/pki/nw/kibana
- /var/log/netwitness/metrics-server
- /var/log/kibana
- /etc/collectd.d/rsa-metrics-server.conf
- /etc/logrotate.d/kibana
- /etc/elasticsearch
- /etc/kibana
- /var/lib/elasticsearch
- /var/lib/kibana
- /var/netwitness/elasticsearch

8. Start the orchestration Server on NetWitness Server:
   `systemctl start rsa-nw-orchestration-server`
9. Unregister the New Health and Wellness from the `installedService`:
   a. Find the service IDs for metrics-server, elasticsearch-open-distro, and kibana-open-distro

   Note: Make sure you look for service IDs for the correct host; do not unregister elastic or kibana on an UEBA host.

   ```
   orchestration-cli-client --list-services | grep <hw-node-IP-address>
   ```

   Sample output

   ```
   ID=50082d04-320c-4ce2-8379-00f38ae2d1df, NAME=metrics-server,
   HOST=192.168.1.2:7018, TLS=true

   ID=530ff46a-8793-4e8e-be9c-742193d1705a, NAME=elasticsearch-open-distro,
   HOST=192.168.1.2:9200, TLS=true

   ID=4bad6ea8-e3a4-46ab-a342-34356bea65bb, NAME=kibana-open-distro,
   HOST=192.168.1.2:5601, TLS=true

   ... (other services) ...
   ```

   b. Remove the service IDs returned above for metrics-server, elasticsearch-open-distro, and kibana-open-distro (associated with New Health new Wellness host):

   ```
   orchestration-cli-client --remove-service --id <metrics-server-service-id>
   ```

```
orchestration-cli-client --remove-service --id <elasticsearch-open-distro-service-id>

orchestration-cli-client --remove-service --id <kibana-open-distro-service-id>
```

c. Verify if the services are removed:

```
orchestration-cli-client --list-services | grep <hw-node-IP-address>
```

10. On all hosts, except for UEBA, stop and disable metricbeat:

```
systemctl stop metricbeat

systemctl disable metricbeat
```

Note: For NetWitness Platform without UEBA, you can stop and disable metricbeat on all hosts through salt:
`salt '*' cmd.run 'systemctl stop metricbeat && systemctl disable metricbeat'`

11. (Optional) - If you are not reinstalling New Health and Wellness (on same or other hosts), you can also remove metricbeat package and configuration:

a. Package to uninstall:
`metricbeat`

b. Service configurations to uninstall:

- `/etc/metricbeat`
- `/var/log/metricbeat`
- `mongo account`
- `systemd configuration`

12. Refresh the New Health and Wellness host:
`nw-manage --refresh-host --host-key <node-ip>`
Make sure that the New Health and Wellness service is not installed or running and metricbeat service is not active on the New Health and Wellness host.

13. If you are not reinstalling New Health and Wellness on another host, you must refresh UI hosts (NetWitness Server host and Analyst UI) to update NGNIX:

```
nw-manage --refresh-host --host-key <node-ip>
```

Note: After uninstalling New Health and Wellness, if you want to install New Health and Wellness again, see "New Health and Wellness" in the *Deployment Guide*.

Manage NetWitness Platform Updates

NetWitness issues NetWitness software version updates on a regular basis as it strives to continually improve the product. A software version update consists of a release, service pack, or patch (including security patch) and ancillary software on which the release, service pack, or patch depends. User guides are provided for each software version update release, which include detailed steps for installing the update. It is important that you download the update guide for the release from NetWitness Community (https://community.netwitness.com/) and follow the steps described there. Additional information is available in the "Apply Version Updates to a Host" topic in the *Hosts and Services Getting Started Guide* and in System Updates Panel - Settings Tab.

Reissue Certificates

Introduction

For a secure deployment, NetWitness has installed internal NetWitness-issued certificates such as CA Certificate and Service certificates .

The validity for NetWitness certificates are as follows:

- CA root certificate for 11.x deployment is valid for 10 years
- CA root certificate for 10.6.x deployment is valid for 5 years
- Service certificates are valid for 1000 days

> **Note:** The certificate expiration warning is triggered 30 days prior to expiration.

When these certificates are about to expire or have expired, you must renew and reissue the certificates as soon as possible to avoid any issues with your NetWitness deployment.

> **Note:** You can view the expiration details, by executing the `ca-expire-test-sh` script on the NetWitness Server. For more information, see Reissue root CA security certificates on NetWitness Platform 11.x and download the script.

CA Certificate Reissue

To renew the CA certificates, do the following:

- Before you upgrade from 10.6.x to 11.x, check the expiry and reissue those certificates. For more information, see the Reissue root CA security certificates on NetWitness Platform 11.x.
- If you are on 10.6.x , check the expiry and reissue all the certificates. For more information, see the Reissuing security certificates on NetWitness Platform 10.6.x.

> **Note:** If you have Windows Legacy Collectors (WLC) in your deployment, renew the CA certificate of the WLC after renewing the CA certificate of the NetWitness Admin Server.

Service Certificate Reissue

To renew the Service certificates, do the following:

- If your hosts are on NetWitness Platform 11.3 or later, you must use the `cert-reissue` script. For more information, see the Reissuing Service Certificate .
- If your hosts are on 11.1.x or 11.2.x, you must upgrade the NetWitness Platform to 11.3 or later and run the `cert-reissue` script.

Note: If you have a host that is decommissioned or plan to remove, do not renew the certificate for that host.

Reissuing Service Certificate

You can reissue service certificates in the following two ways.

- All at once
  Reboot NW Server host after the `cert-reissue --host-all` command completes.
- One at a time
  Reissue the NW Server host certificates first, restart the host, then reissue each component host.

IMPORTANT: If you are reissuing certificates for each host individually (one at a time), you must reissue the certificate for the NW Server host before you can reissue certificates for any other host.

When to Use the `--host-all` Argument

Use the `cert-reissue --host-all` command string if you have a large number of hosts. Make sure that:

- All your hosts are running 11.3.0.0 or later.
- All your hosts are online.
- The NW Server host run time services are running.

`cert-reissue` Arguments and Options for All Hosts

The following tables lists the argument you can use to reissue certificates for all hosts at one time. See Troubleshooting Cert-Reissue Command for additional options you can use with Customer Support to troubleshoot errors.

Arguments	Description
`--host-all`	Reissues certificates for all hosts at one time applying system health checks and restarts services. **Note:** If even one host is not online, this command fails. If you have numerous hosts in your deployment, make sure that all hosts are up and running.

Caution: Make sure you do not run this argument on a node or host that you plan to remove or decommission.

When to Use the Individual Host Argument (`--host-key <ID, IP, hostname or display name of host>`)

The `cert-reissue --host-key <ID, IP, hostname or display name of host>` command reissues a certificate for an individual host. You may want to reissue certificates for an individual host if you have a small number of hosts.

Make sure that:

- Each host is running 11.3.0.0 or later.
- Each host is online.
- The NW Server host run time services are running
- You reissue certificates for the NW Server host first.

Note: You must run the command for the NW Server host first and reboot that host before you run the command for each component host.

Reissuing Certificates for All Hosts Except Windows Legacy Collection (WLC) host

Use the `cert-reissue` command to reissue certificates for all hosts except the WLC host with the following procedures.

Running the Cert-Reissue Command for All Hosts

1. SSH to the NW Server host.
2. Submit the appropriate command string.
   `cert-reissue --host-all`

Running the Cert-Reissue Command for an Individual Host

1. SSH to the NW Server host.
2. Submit the appropriate command string:
   `cert-reissue --host-key <ID, IP, hostname or display name of host>`

Reissuing Certificates for a WLC Host

You must use the `wlc-cli-client` utility to reissue certificates for a WLC host (you cannot use the `cert-reissue` command). You also need to specify a number of WLC identification parameters with this utility.

Note: The certificates for a Windows Legacy Server host are stored in the following directories on the host.
`C:\ProgramData\netwitness\ng\logcollector_cert.pem`
`C:\ProgramData\netwitness\ng\logcollector_dh2048.pem`
Th validity period of WLC certificates can range from 2 to 20 years. If you rename or remove the files and restart **NwLogCollector** Service, NetWitness regenerates them.
`/ssl/truststore.pem` - is no longer used in 11.x
Every reissue of a certificate on the Windows Legacy server creates a new private key.

To reissue certificates on a WLC host.

1. SSH to the NW Server host.
2. Submit the following command string.
   ```
   wlc-cli-client --cert-renew --host 10.129.43.13 --port 50101 --use-ssl
   false --username <nwadmin service account> --password <'nwadmin service
   account password'> --ss-username <deploy_admin> --ss-password <'deploy_
   admin password'>
   ```

   Note: nwadmin service account is the WLC rest UI User and **'nwadmin service account password'** is the WLC rest UI password.

Successful Reissue Summary Report

When you run `cert-reissue --host-all` , the following summary report will be displayed if all hosts are online, all run time services are running, and all hosts on version 11.4.0.0 or higher.

```
+---------+--------------------+--------+-----------------------------------------------------+
|         | Host               | Status | Message                                             |
+---------+--------------------+--------+-----------------------------------------------------|
|<host-id>| <IP-address>       |Success |Cert reissue successful                              |
|<host-id>| <IP-address>       |Success |Cert reissue successful                              |
|<host-id>| <IP-address>       |Success |Cert reissue successful                              |
|<host-id>| <IP-address>       |Success |Cert reissue successful                              |
|<host-id>| <IP-address>       |Success |Cert reissue successful                              |
+---------+--------------------+--------+-----------------------------------------------------+
```

Unsuccessful Reissue Summary Reports

You must contact Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897) to troubleshoot problems. You know there is a problem if any `<host-id>` does not return a `Success`**Status**. `Success` indicates that certificates were reissued for a host. The following examples illustrate unsuccessful reissues.

Reissue Failed for Host and Aborted Command

The following three examples illustrate the failure of certificate reissuing for any hosts.

```
+---------+--------------------+--------+-----------------------------------------------------+
|         | Host               | Status | Message                                             |
+---------+--------------------+--------+-----------------------------------------------------|
|<host-id>| <IP-address>       |Failed! |failed to connect, is host online?                   |
|<host-id>| <IP-address>       |Failed! |service(s) down                                      |
|<host-id>| <IP-address>       |N/A     |[ Skipped... ]                                       |
|<host-id>| <IP-address>       |N/A     |[ Skipped... ]                                       |
|<host-id>| <IP-address>       |N/A     |[ Skipped... ]                                       |
+---------+--------------------+--------+-----------------------------------------------------+
```

```
+---------+--------------------+--------+-----------------------------------------------------+
|         | Host               | Status | Message                                             |
+---------+--------------------+--------+-----------------------------------------------------|
|<host-id>| <IP-address>       |Failed! |version <version-earlier-than-11.3.0.0> not supported|
|<host-id>| <IP-address>       |Failed! |version <version-earlier-than-11.3.0.0> not supported|

```

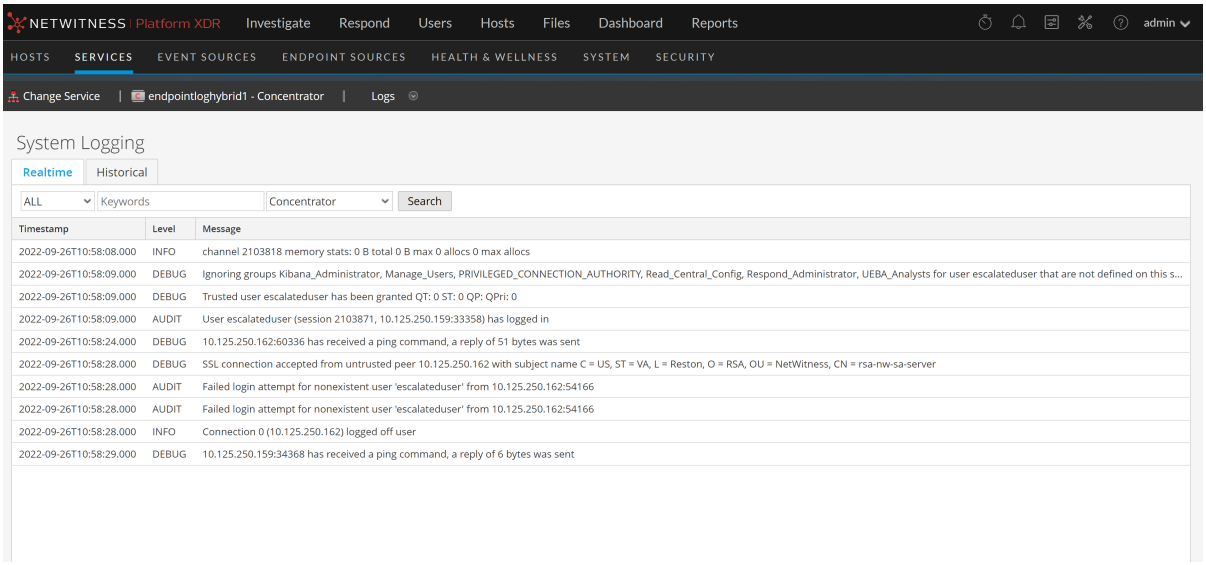
Display System and Service Logs

NetWitness provides views into system logs and service logs. When you view service logs, you can select messages for the service or host.

View System Logs

1. Go to  **(Admin) > System.**
2. In the options panel, select **System Logging**.



Display Service Logs

To display NetWitness service logs:

1. Go to  **(Admin) > Services**.
2. In the **Services** list, select a service.

3. In the **Actions** column, select **View > Logs**.

Filter Log Entries

To filter the results shown in the Realtime tab:

1. (Optional) For system and service logs, select a **Log Level** and a **Keyword**, or both. System logs have seven log levels. Service logs have only six log levels because they do not include the **TRACE** level. The default is **ALL** log entries.
2. (Optional) For service logs, select the Service: host or service.
3. Click **Filter**.

   The view is refreshed with the most recent 10 entries matching your filter. As new matching log entries become available, the view is updated to show those entries.

Show Details of a Log Entry

Each row of the Realtime tab Log list provides the summary information of a log entry. To view complete details:

1. Double-click a log entry.

   The **Log Message** dialog, which contains the Timestamp, Logger Name, Thread, Level and Message, is displayed.

2. After viewing, click **Close**.

Access Reporting Engine Log File

All Log Files

The Reporting Engine stores the following logs in the `rsasoc/rsa/soc/reporting-engine/log` directory:

- Current logs in the `reporting-engine.log` file.
- Backup copies of previous logs in the `reporting-engine.log.*` file.
- All UNIX script logs in the files that have the following syntax: `reporting-engine.sh_timestamp.log` (for example, `reporting-engine.sh_20120921.log`).

The Reporting Engine rarely writes command line error messages to the `rsasoc/nohup.out` file.

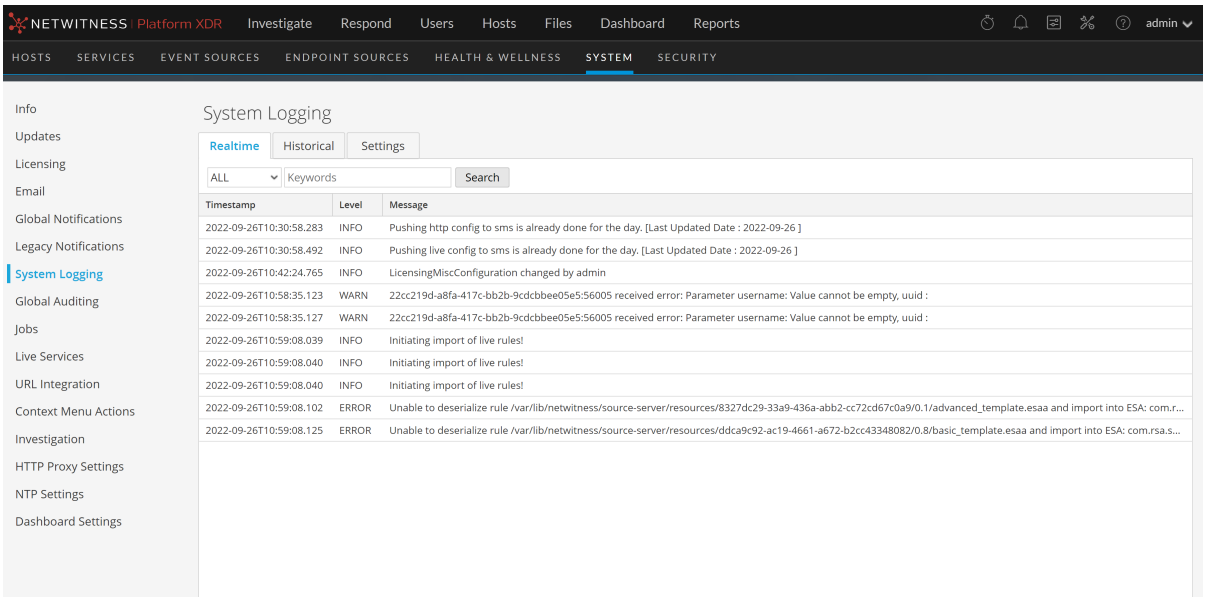
Upstart Logs

The Reporting Engine appends the log messages and output written by upstart daemon and the commands used to start the reporting-engine to the `/var/log/secure` directory.

An upstart log file is a system log file, which means that only the root user can read it. The Reporting Engine generates log files, retains backup copies of previous log files, stores UNIX script log files, and appends upstart log files to another directory.

Search and Export Historical Logs

NetWitness provides a searchable view of the NetWitness log or the service log in a paged format. When initially loaded, the grid shows the last page of the log entries for the system or the service. You can export logs from the current view.



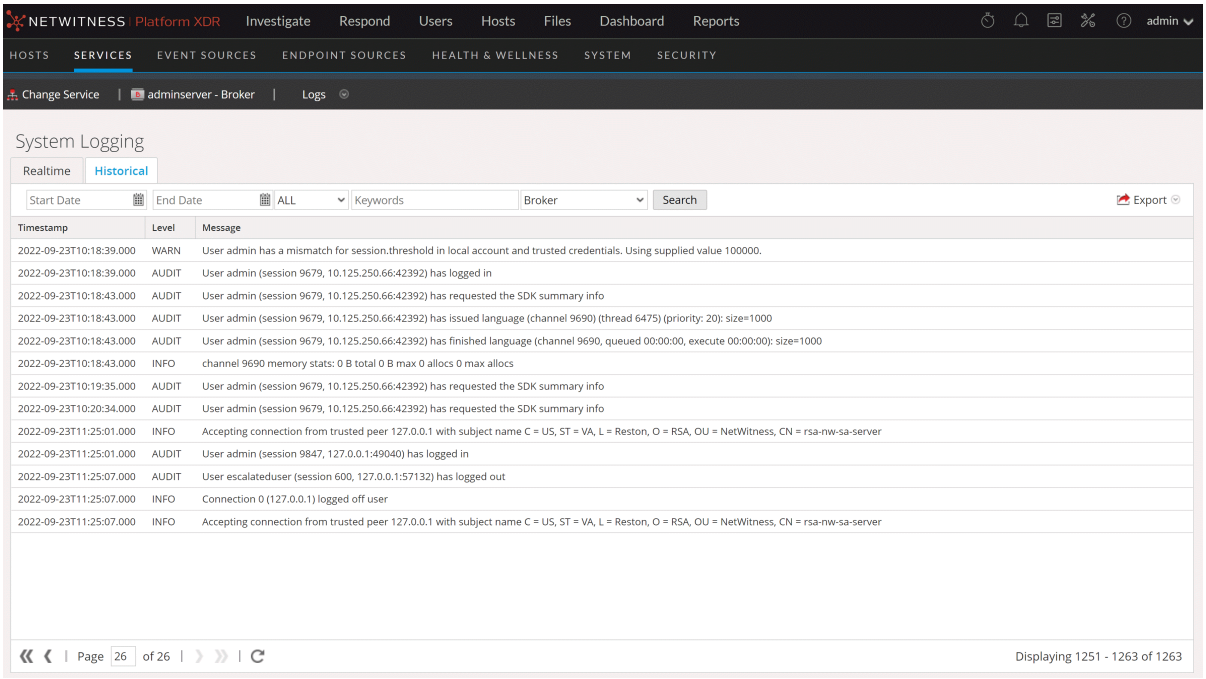
Display the Historical System Log

To display the historical log for the system:

1. Go to  **(Admin) > System.**
2. In the options panel, select **System Logging**.

   The System Logging panel is opened to the **Realtime** tab by default.
3. Click the **Historical** tab.

   A list of historical logs for the system is displayed.



Display a Historical Service Log

To display the historical log for services:

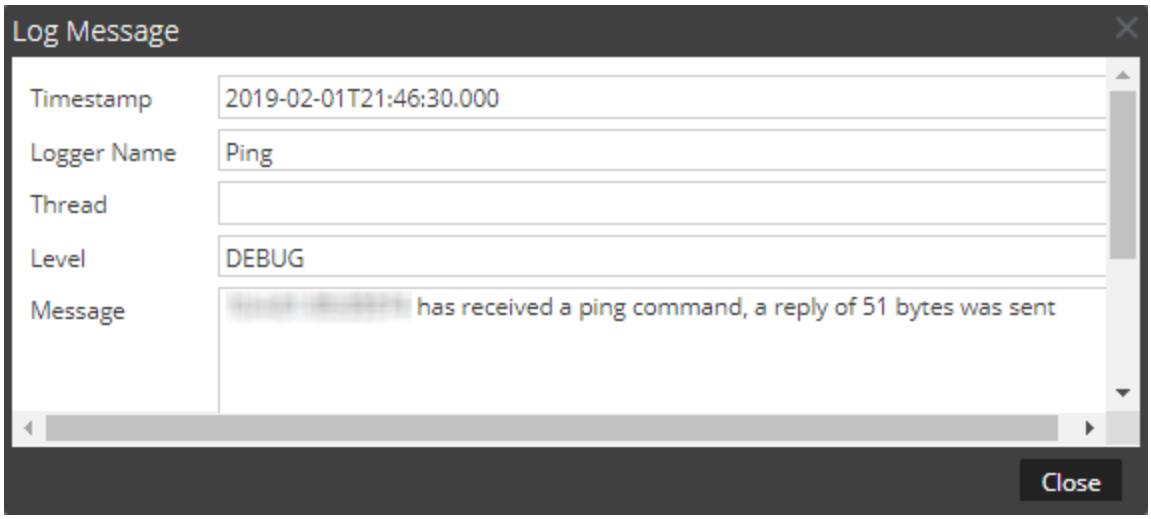
1. Select  **(Admin) > Services**.
2. Select a service.
3. In the **Actions** column, select **View > Logs**.

   The service logs view is displayed with the Realtime tab open.
4. Click the **Historical** tab.

A list of historical logs for the selected service is displayed.

Search Log Entries

To search the results shown in the **Historical** tab:



1. (Optional) Select a **Start Date** and **End Date**. Optionally, select a **Start Time** and **End Time**.
2. (Optional) For system and service logs, select a **Log Level** and a **Keyword**, or both. System logs have seven log levels. Service logs have only six log levels because they do not include the **TRACE** level. The default is **ALL** log entries.
3. (Optional) For service logs, select the Service: host or service.
4. Click **Search**.
   The view is refreshed with the most recent 10 entries matching your filter. As new matching log entries become available, the view is updated to show those entries.

Show Details of a Log Entry

Each row of the **Historical** tab Log grid provides the summary information of a log entry. To display all the details for a log message:

1. Double-click a log entry.

   The Log Message dialog, which contains the Timestamp, Logger Name, Thread, Level and Message, is displayed.

2. After viewing, click **Close**.

Page Through Log Entries

To peruse the different pages of the list, use the paging controls on the bottom of the grid as follows:

- Use the navigation buttons
- Manually type the page number you want to view, and press **ENTER**.

Export a Log File

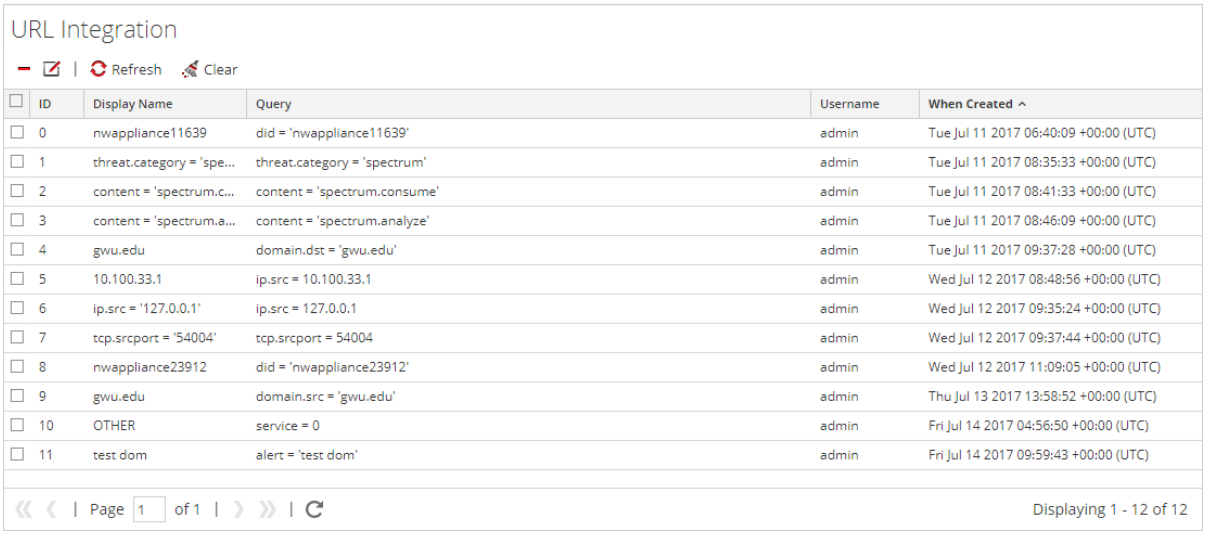
To export the logs in the current view:

Click **Export**, and select one of the drop-down options: **CSV Format** or **Tab Delimited**.
The file is downloaded with a filename that identifies the log type and the field delimiter. For example, a NetWitness system log exported with comma-separated values is named `UAP_log_export_CSV.txt`, and a host log exported with tab-separated values is named `APPLIANCE_log_export_TAB.txt`.

Maintain Queries Using URL Integration

A URL integration provides a way to represent the bread crumbs, or query path, you take when actively investigating a service in the Navigate view. You do not need to display and edit these objects often.

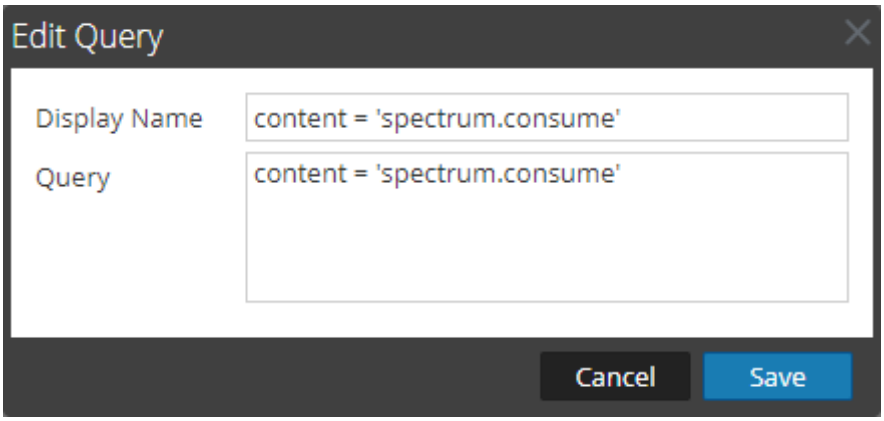
A URL integration maps a unique ID that is automatically created each time you click on a navigation link in the Navigation view to drill into data. When the drill-down completes, the URL reflects the query IDs for the current drill point. The Display Name is displayed in the bread crumb in the Navigate view.



The URL Integration panel provides a list of queries and allows users who have the proper permissions to modify this underlying source of data and analyze the query patterns of other users of the NetWitness system. Within the panel, you can:

- Refresh the list.
- Edit a query.
- Delete a query.
- Clear all queries in the list.

Caution: After a query has been removed from the system, any Investigation URLs that included the ID of that query will no longer function.



Edit a Query

1. Go to **(Admin) > System**.
2. In the options panel, select **URL Integration**.

3. Select the row in the grid and either double-click the row or click .

   The **Edit Query Dialog** is displayed.

4. Edit the **Display Name** and the **Query**, but do not leave either field blank.
5. To save the changes, click **Save**.

Delete a Query

Caution: After a query has been removed from the system, any Investigation URLs that included the ID of that query will no longer function.

To remove a query from NetWitness entirely:

1. Select the query.
2. Click −

   A dialog requests confirmation that you want to delete the query.
3. Click **Yes**.

Clear All Queries

To clear all queries from the list:

- Click Clear

  The entire list is cleared.

Use a Query in a URI

URL integration facilitates integrations with third-party products by allowing a search against the NetWitness architecture. By using a query in a URI, you can pivot directly from any product that allows custom links, into a specific drill point in the Investigation view in NetWitness.

The format for entering a URI using a URL-encoded query is:

```
http://<nw host:port>/investigation/<serviceId>/navigate/query/<encoded query>/date/<start date>/<enddate>
```

where

- <nw host: port> is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is only needed if access is configured over a non-standard port through a proxy.
- <serviceId> is the internal Service ID in the NetWitness instance for the service to query against. The service ID can be represented only as an integer. You can see the relevant service ID from the url when accessing the investigation view within NetWitness. This value will change based on the service being connected to for analysis.
- <encoded query> is the URL-encoded NetWitness query. The length of query is limited by the HTML URL limitations.
- <start date> and <end date> define the date range for the query. The format is <yyyy-mm-dd>T<hh:mm>. The start and end dates are required. Relative ranges (for example, Last Hour) are not supported in this version. All times are run as UTC.

For example:
http://localhost:9191/investigation/12/navigate/query/alias%20exists/date/2018-09-01T00:00/2018-10-31T00:00

Examples

These are query examples where the NetWitness Server is 192.168.1.10 and the serviceID is identified as 2.

All activity on 03/12/2018 between 5:00 and 6:00 AM with a hostname registered

- Custom Pivot: alias.host exists
- https://192.168.1.10/investigation/2...13-03-12T06:00

All activity on 3/12/2018 between 5:00 and 5:10 PM with http traffic to and from IP address 10.10.10.3

- Custom Pivot: service=80 && (ip.src=10.10.10.3 || ip.dst=10.0.3.3)
- Encoded Pivot Dissected:
  - service=80 => service&3D80
  - ip.src=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3
  - ip.dst=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3
  - https://192.168.1.10/investigation/2...13-03-12T17:10

Additional Notes

Some values may not need to be encoded as part of the query. For example, commonly the IP source (src) and destination (dst) is used for this integration point. If leveraging a third-party application for integration of this feature, it is possible to reference those without encoding applied.

Manage the deploy_admin Account

The depploy_admin account is used on every NetWitness host, and must be kept in sync between all hosts. Prior to 11.4.1, the process to change the deploy_admin account required administrators to log into every NetWitness host and run the /opt/rsa/saTools/bin/set-deploy-admin-password script on each system. Starting with 11.4.1, the deploy_admin password is centrally managed with the nw-manage script on the NW Server. nw-manage script execution updates the password on all NetWitness component hosts that use the deploy_admin account. The nw-manage script output displays the password update results for each host. If a NetWitness component host is down or unreachable for any reason, the nw-manage script provides an additional option to synchronize the deploy_admin password on the previously unresponsive host with the NW Server when that host becomes available again.

The following procedures describe how to change the deploy_admin password for all hosts in your environment, for hosts in a mixed version environment, and for hosts that are unavailable during the first attempt to change the deploy_admin password.

Change the deploy_admin Account Password

1. Log in to the NW Server host using SSH or the NwConsole.
2. Run the following command:
   nw-manage --update-deploy-admin-pw
   A prompt for the new password is displayed.
3. Enter the new password.

Change the deploy_admin Account Password in a Mixed Version Environment

If you are operating in a mixed version environment (for example, NW Server is on a newer version (greater than or equal to 11.4.1) and the NW component hosts are still on an older version of NetWitness (less than 11.4.1), the nw-manage script prompts you to run the /opt/rsa/saTools/bin/set-deploy-admin-password script on those older component hosts **first**. After the hosts on the older versions are updated, you rerun the nw-manage script on the NW Server with the --skip-version-checks argument.

1. On each component host that is on an older version, reset the deploy_admin password by running the following command:
   /opt/rsa/saTools/bin/set-deploy-admin-password
   This resets the deploy_admin password on all the component hosts with the older versions.
2. Log in to the NW Server host using SSH or the NwConsole and run the following command:
   nw-manage --update-deploy-admin-pw --skip-version-checks
   A prompt for the new password is displayed.
3. Enter the new password.

Change the deploy_admin Account Password for a Component Host that is Unavailable

If a component host is down or otherwise unreachable the first time you run the `nw-manage` script, it is identified as skipped in the `nw-manage --update-deploy-admin-pw` output. When the host is back online, its `deploy_admin` password must be synchronized with the NW Server.

To synchronize the previously unreachable host with the NW Server:

1. Log in to the NW Server host using SSH or the NwConsole.
2. Run the following command:
   ```
   nw-manage --sync-deploy-admin-pw --host-key <ID, IP, hostname or display name of host>
   ```

NW Server Host Secondary IP Configuration Management

Starting with 11.5, the NW Server has a new attribute, `secondary IP` that facilitates automated failover and IP address change management.

Note: For clarification, this attribute is simply another metadata host attribute that is specific to the NW Server; it does NOT describe, nor is it related to, a secondary network interface on the NW Server.

In the failover use case, the active NW Server has a `secondary IP` value that matches the standby server IP address. This `secondary IP` value is known to the other NetWitness hosts, and when the primary NW Server fails to respond in a timely fashion due to an IP address change of the active NW Server, or when there is a scheduled failover to the NW standby server, the other NetWitness hosts and services are configured to automatically attempt to connect to the secondary IP address, which in this case is the NW standby server.

The `secondary IP` attribute is also used for NW Server IP address change and for the NW standby server. The NW Server IP address change procedures automatically populate the secondary IP address of the NW Server to the new IP address and propagate that information to the other NetWitness hosts and services. Then, similar to the failover use case when NW Server's original IP address is no longer valid and the new IP address is active, the NetWitness hosts and services automatically switch to the new secondary IP address, which becomes the new NW Server IP address. If the NW standby server's IP address is changed, the `secondary IP` attribute on the NW Server needs to be updated with the new NW standby server IP address.

The `secondary IP` attribute is managed primarily with automated processes, but there are use cases that require manual management of the NW Server host `secondary IP` attribute, such as an IP address change of the NW standby server or a one-time registration during an NW standby server upgrade.

The `secondary IP` is managed using the `nw-manage` script on the NW Server:

- To add a secondary IP address to the NW Server host, run the following command:
  `nw-manage --add-nws-secondary-ip --ipv4 <secondary ip address>`
- To remove a secondary IP address from the NW Server host, run the following command:
  `nw-manage --remove-nws-secondary-ip --ipv4 <secondary ip address>`
- To view secondary IP addresses assigned to the NW Server host, run the following command:
  `nw-manage --get-nws-secondary-ip`

For information about changing IP addresses, see Change Host Network Configuration.

For information about failover procedures, see "Warm Standby NW Server Host" in the *Deployment Guide for NetWitness Platform*.

Change Host Network Configuration

This topic describes how to change the network configuration for NW Server and component hosts in your environment. **The instructions in this section assume that all the hosts in your environment are on version 11.7 or later**

Note: If your NW Server is referenced by other NW hosts that use a Network Address Translation (NAT) IP address, and you want to change the NAT IP address, you must remove the old NAT IP address and add the new NAT IP address using the instructions provided in NW Server Host Secondary IP Configuration Management.

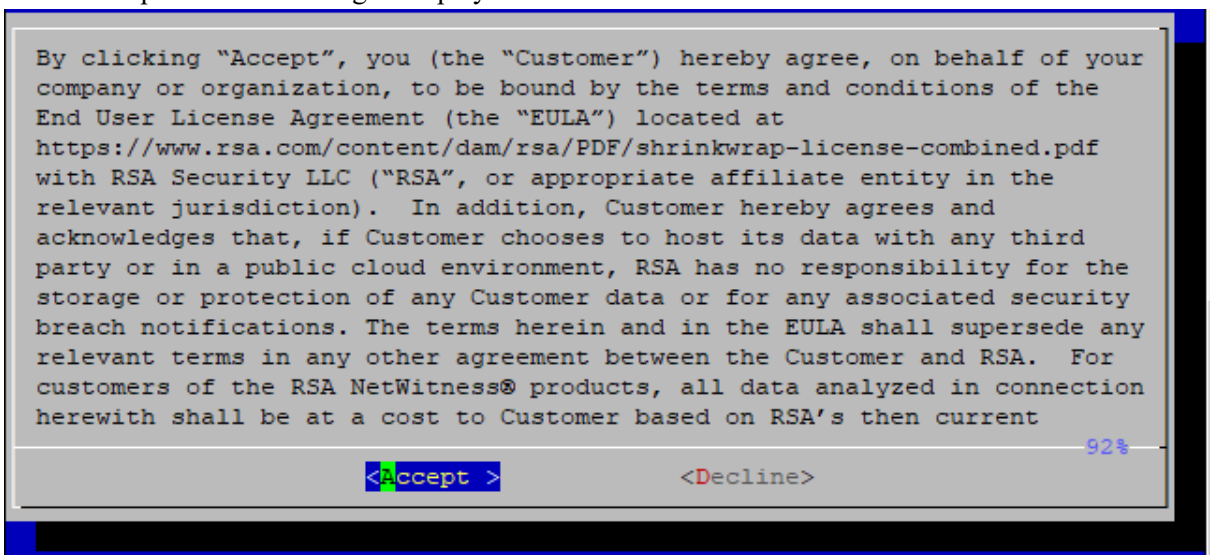
This section contains the following procedures:

- Change Host Network Configuration
- Change Network Configuration for Warm Standby (Secondary) Server
- Reconnecting Component Hosts with NW Server Hosts

Note: Changing IPv6 addresses is not supported in version 11.7 and later.

Change Host Network Configuration

Use this procedure to update the network configuration for any host type in your environment for version 11.7 or later.

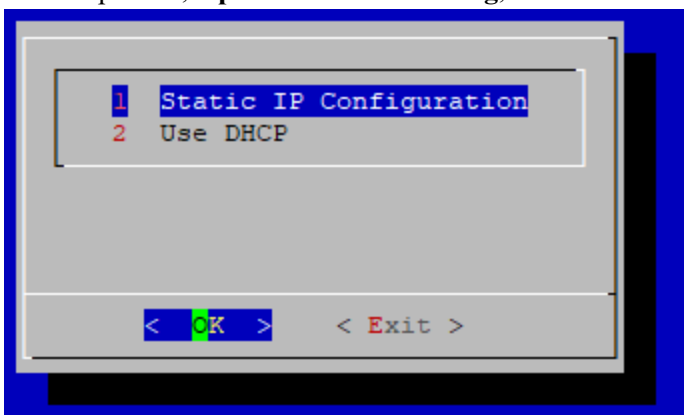


To change the network configuration of a host:

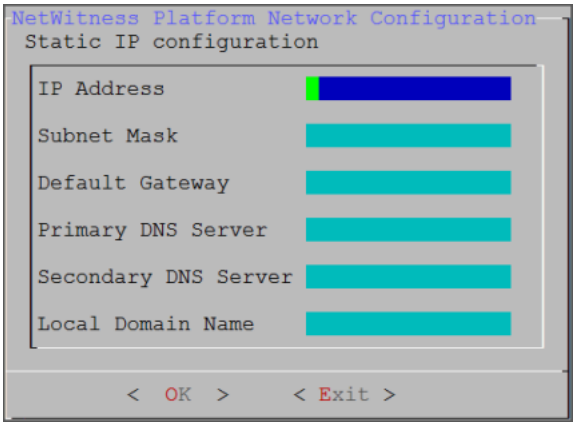
1. From the console, log in to the host for which you wish to change the network configuration.

   Note: If you are updating the IP address of your NW Server and you are using DHCP, run the following command before you go to step 2:
   ```
   nw-manage --add-nws-secondary-ip --ipv4 <new DHCP allocated ip address of NW Server>
   ```

2. Run the following command:
   ```
   nwsetup-tui
   ```



The nwsetup-tui license dialog is displayed.



3. Click Accept. The NetWitness Platform Update Configuration dialog is displayed:

4. Select option 2, **Update Network Config**, and click **OK**.

5. Select option 1, **Static IP Configuration**, and click **OK**.
   The NetWitness Platform Network Configuration Static IP configuration dialog is displayed.

6. Enter the new network and DNS configuration and click **OK**.
   The new network and DNS configuration is applied to the host.

   Note: While changing the IP address, the user interface may become temporarily unavailable while the update is in process. The user interface will come back up shortly.

Note: After upgrading the NW Server host or a component host to 11.7 or later version, review the contents of the `/etc/hosts.user` file for any obsolete host entries. The `/etc/hosts.user` file contains system and user-generated entries that are not managed by NetWitness Platform. However, entries from `/etc/hosts.user` are merged with NetWitness Platform-generated host mappings to create and update `/etc/hosts`. To avoid conflicts with NetWitness Platform-generated mappings, and to avoid generating connectivity errors resulting from an IP address change, NetWitness recommends that you remove any entries in `/etc/hosts.user` that include a non-loopback IP address of a NetWitness Platform host. After updating `/etc/hosts.user`, you must refresh the system by running the following command:

```
nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>
```

Note: While changing a host's IP address or during failover, component hosts can become disconnected from NW Server hosts. Follow these steps to reconnect a host system to its NW Server system.
1. Log in to the component host using SSH or the console.
2. Run the command `nw-manage --override-nws-ip --ipv4 <current IP address of the NW Server.`
When this command completes, the component host is reconnected to the NW Server at the specified IP address.

Note:

- Before performing failover, make sure that the `deploy_admin` password of the Standby NW server is not expired. You can verify this by logging in to the Standby NW server nw-shell.

```
nw-shell
offline » login
user: deploy_admin
password: <deploy_admin_password>
WARNING: Login failure: User credentials have expired (The following warning message confirms that your deploy_admin credentials have expired)
```

Next step, update the `deploy_admin` password using `nw-manage --update-deploy-admin-pw`
After the command is successfully executed, verify the `deploy_admin` password using `security-cli-client --quiet --get-config-prop --prop-hierarchy nw.security-client --prop-name platform.deployment.password`

- Before performing failover, make sure that your Standby NW server certificates are up to date.

Follow the steps in the sections that apply to your environment.

- SSO
- Reporting Engine
- UCF
- PAM
- ECAT
- RSA NetWitness Orchestrator (By Demisto)
- Audit Logging
- Health and Wellness
- Malware Analysis
- Windows Legacy Collection

SSO

Update Configuration for Single Sign-On

Note: You must disable SSO configurations ONLY when NW Server IP is changed.

When the host network is configured with a new IP address, the SSO configurations also must be updated.

To do this:

1. Disable the SSO configuration using `nw-shell` after failover from new IP.
   To resolve this issue you must disable SSO manually, using the following commands:
   a. SSH to `admin server node`.
   b. Connect to `nw-shell`.
   c. Connect to admin server service using the `connect --service admin-server` command.

d. Log in to admin server using the `login` command.

e. Enter the admin username and password.

f. Execute the following commands:

- `cd /rsa/security/authentication/web/saml/sso-enabled`
- `set false`
- `logout`
- `exit`
- `systemctl restart rsa-nw-admin-server`

2. Change the host IP address to the new IP.

3. Generate the new metadata and reupload it in ADFS. For more information, see the "Configure SAML 2.0 provider settings for portals" topic in the Microsoft documentation.

For more information, see the "Troubleshooting" topic in the *System Security and User Management Guide.*

Reporting Engine

Update Configuration for Reporting Engine

Note: You must update the Reporting Engine configurations ONLY when NW Server IP is changed.

When the host network is configured with a new IP address, you must update and verify the Reporting Engin configurations. The hostname for NetWitness configurations under the Output Actions must be updated with the new IP.

To manually configure the new IP, perform the following steps:

1. Log in to NetWitness Platform.
2. Navigate to  (Admin) > **Services > Reporting Engine > View > Config**.
3. Click the **Output Actions** tab.
4. Add the new IP address in the **Hostname** field.
5. Click **Apply**.

UCF

To enable UCF to communicate with NetWitness Platform:

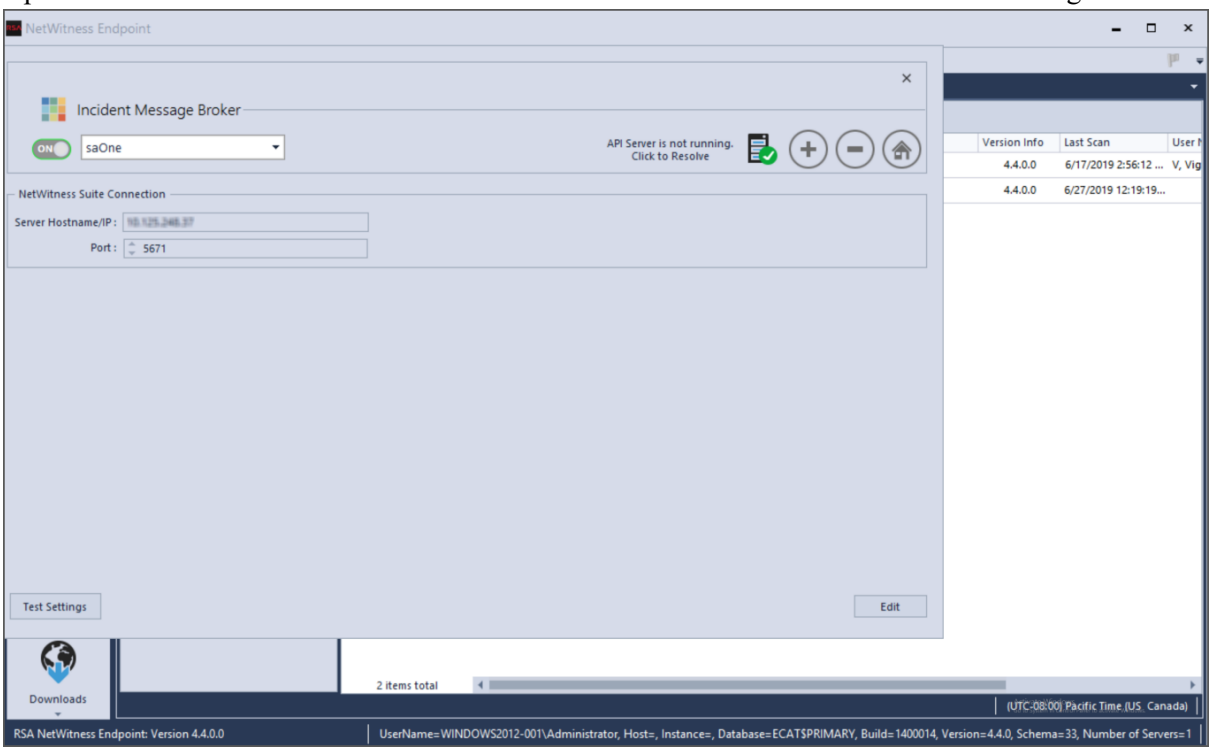
1. On the UCF server, execute the `runConnectionManager.bat` file (the same file that is used for adding connection details).
2. Select **Option #2, Edit endpoints**.
3. Select the NW Server connection from the options that are displayed.
4. When you are prompted for Host Address (the old IP address is shown in parentheses) enter the new IP address.

   Note: Do not change any other setting.

PAM

If you have PAM configured, after the failover, you must configure the system again using the instructions in the "Configure PAM Login Capability" topic in the *System Security and User Management Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

ECAT

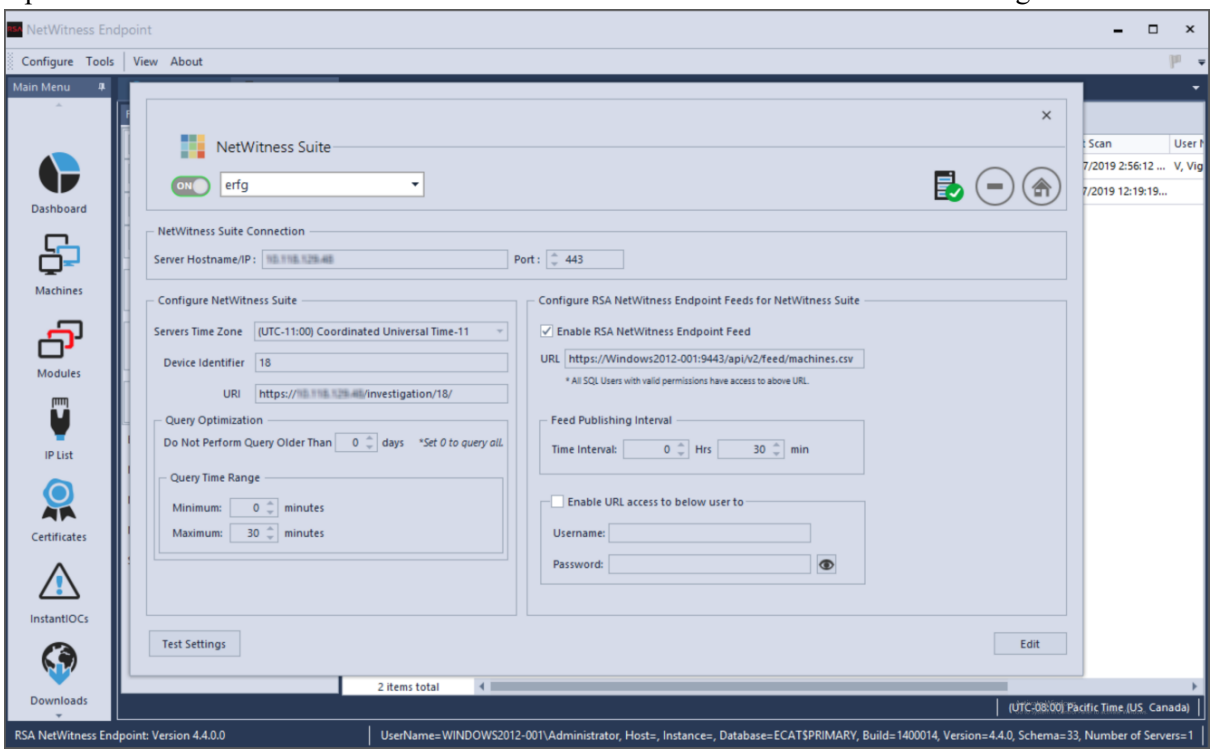


Update the following services:

- Incident Message Broker
- NetWitness Suite
- Syslog Server Settings

Incident Message Broker

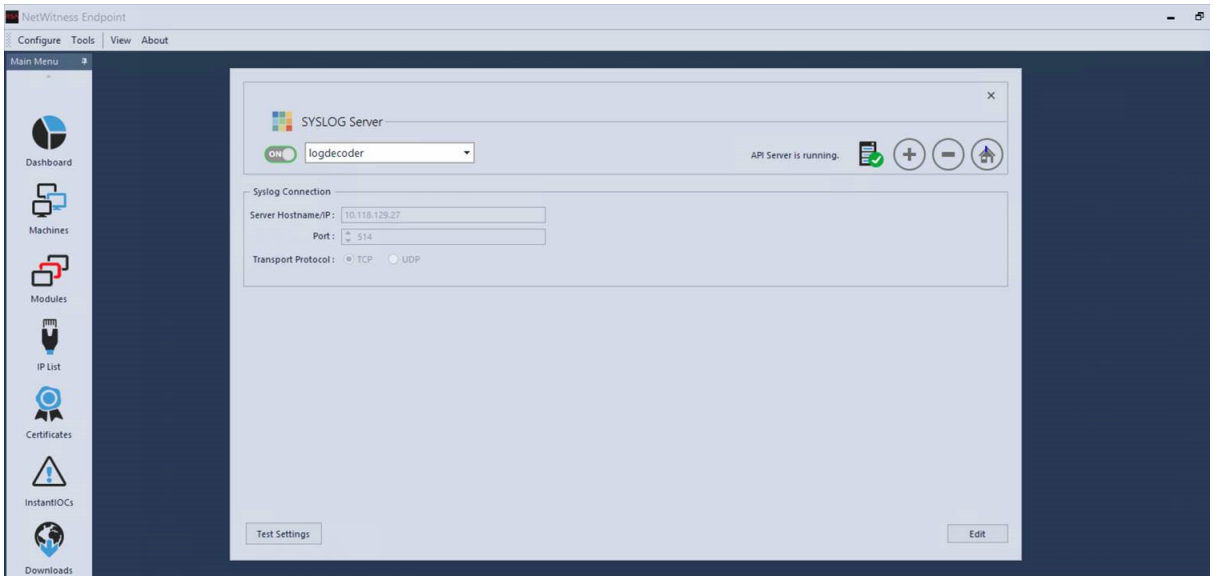
1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Monitoring and External Components Configuration** > **Incident Message Broker**.



2. Update the server Hostname and IP Address to the current active server and test the settings.

NetWitness Suite

1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Monitoring and External Components Configuration** > **Netwitness Suite**.

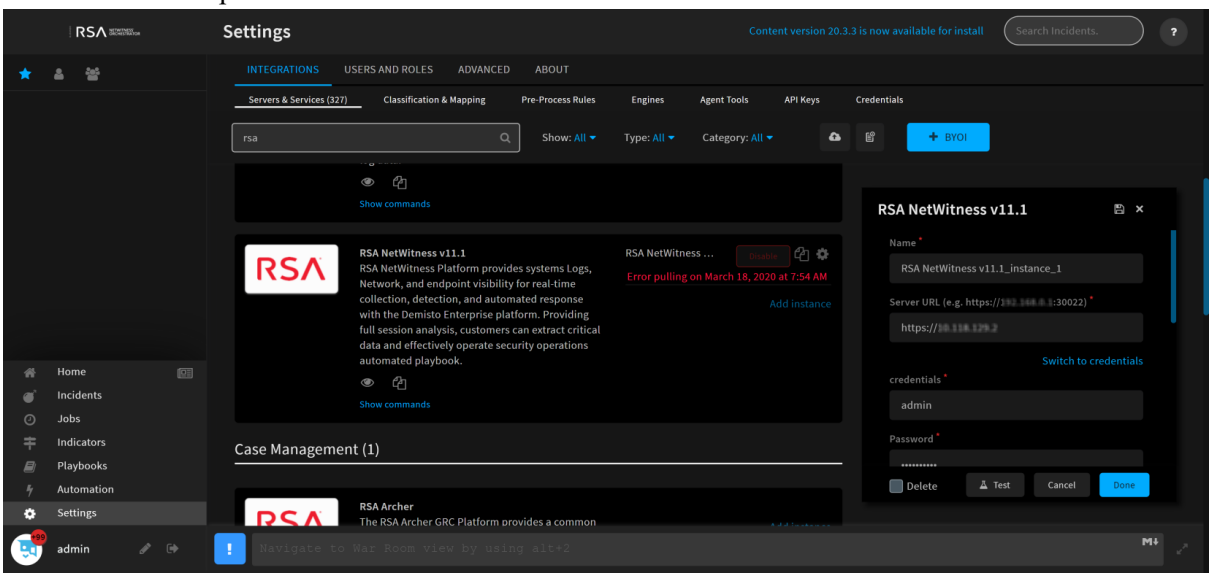


2. Update the server Hostname and IP address to the current active server and test settings.

Syslog Server Settings

If you are forwarding syslog messages to a NetWitness Platform Log Decoder, update the syslog server settings to point to the new IP address of the Log Decoder host.

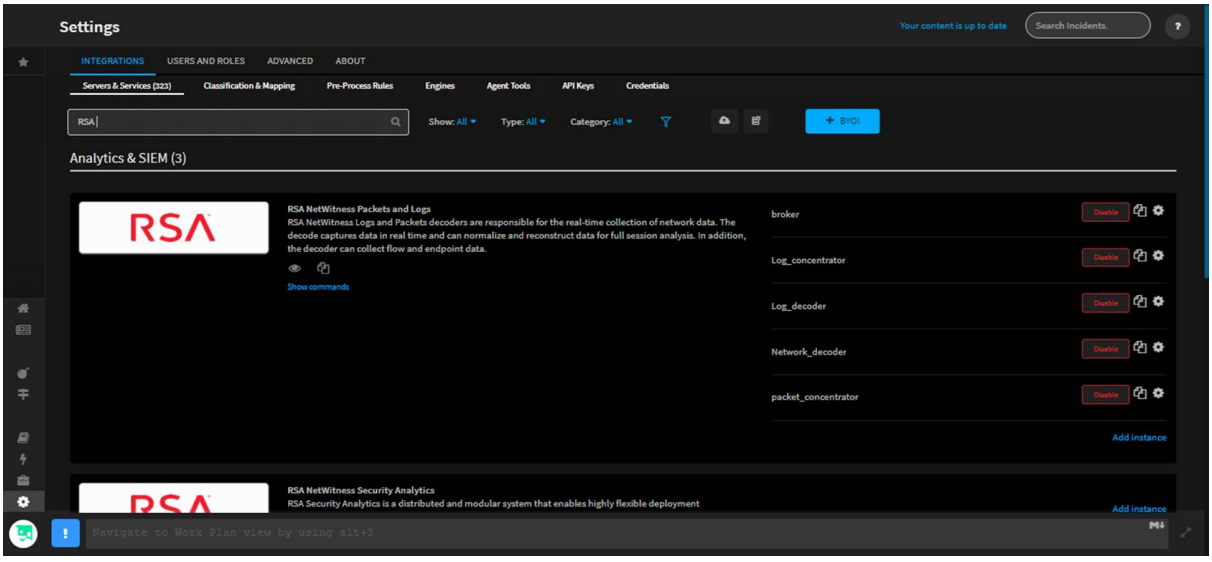
1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Syslog Server**.



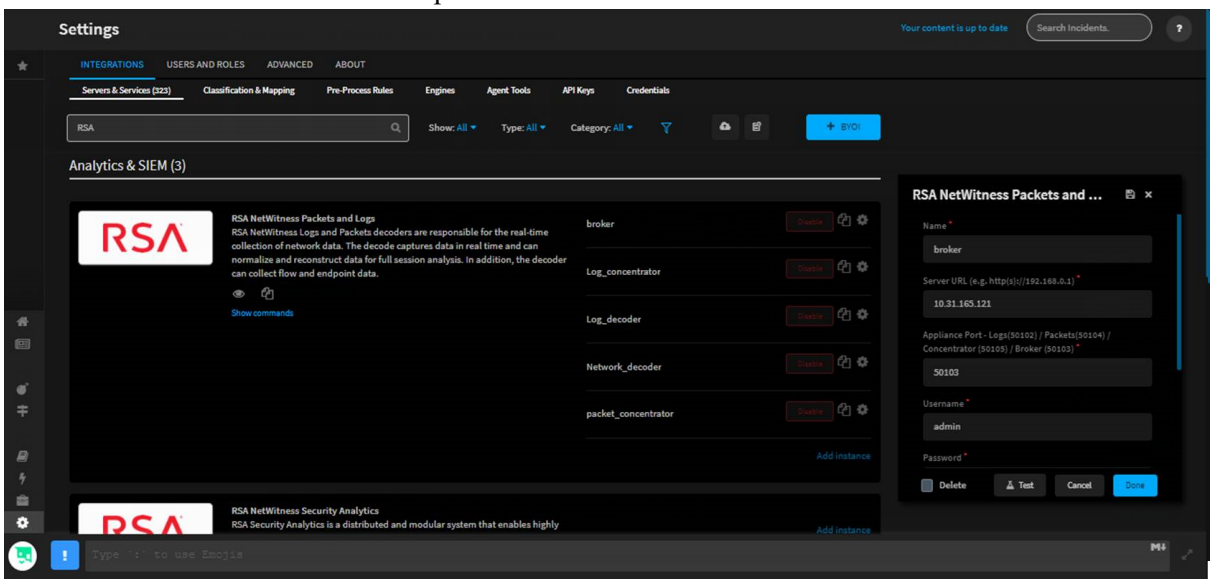
2. Select **logdecoder**, and in **Server Hostname/IP**, enter the new IP address of the Log Decoder host.

RSA NetWitness Orchestrator (By Demisto)

Update the Current Active NW Server to Fetch Respond Incidents and Alerts



1. Log in to Orchestrator and go to **Settings** > **server&services**.
2. Edit the RSA NetWitness V11.1 instance by updating the server URL to the current active NW Server to fetch respond incidents and alerts.



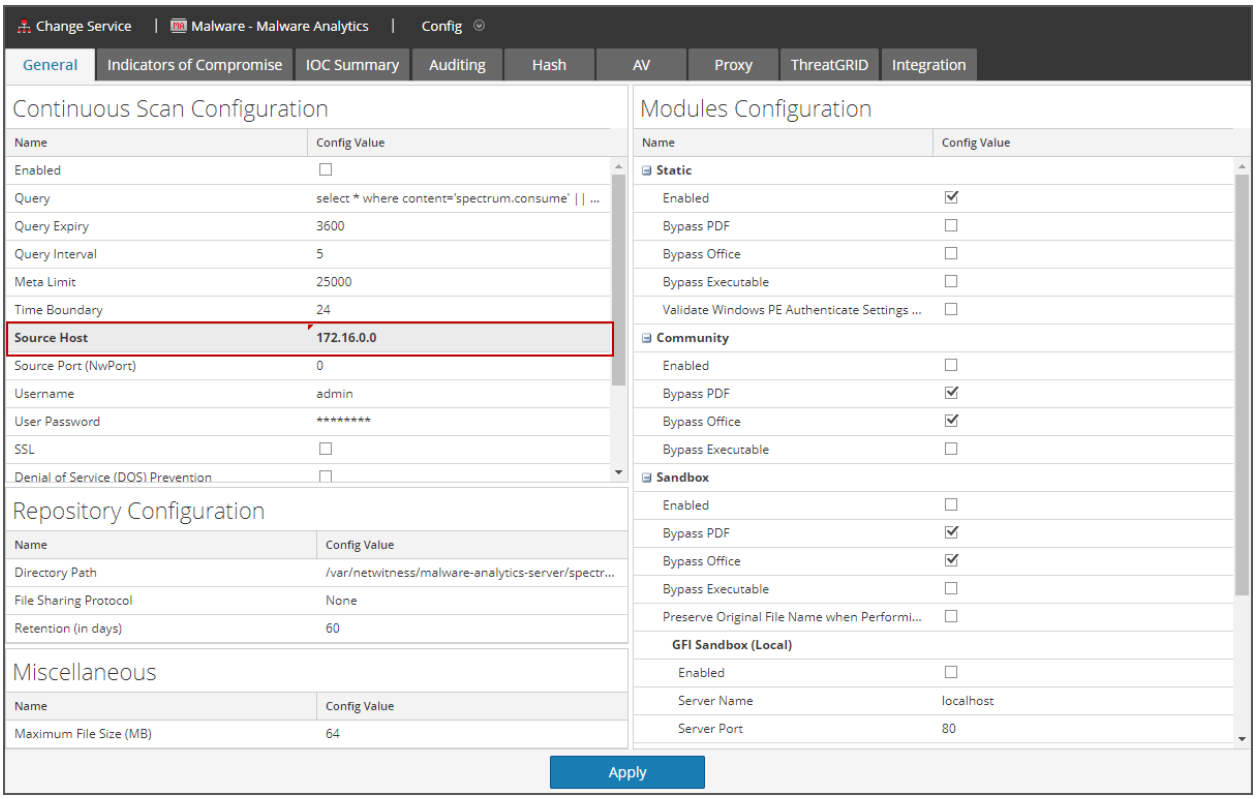
Update Component Hosts Acting as Data Sources

If you change the IP address of a component host, for example, a Concentrator, Network or Log Decoder, or Broker, that is acting as data source to the Orchestrator, update the following settings to point to the new IP address of the host.

1. Log in to Orchestrator and go to **Settings** > **server&services** and select the component host.

2. Enter the new IP address of the component host in **Server URL** and click **Done**.

Audit Logging



If you have changed the IP address of the NW Server, you must reconfigure audit logging. For instructions, see "Configure Global Audit Logging" in the *System Configuration Guide*.

Health and Wellness

If you have any Health and Wellness rules that contain IP addresses that have been changed, you must update those rules with the new IP addresses. For information about managing Health and Wellness rules, see "Monitor Health and Wellness using NetWitness Platform UI" in the *System Maintenance Guide*.

Malware Analysis

Source host IP address changes are not updated in the NetWitness user interface for Malware Analysis continuous scan configurations. You must manually update this configuration in the Malware Analysis Config view > **General** > **Continuous Scan Configuration** and update the source host IP address to the new host IP address.

Windows Legacy Collection

On occasion, you may need to change the IP address of your Windows Legacy Collector. You may also need to edit any Destination Groups that you have configured.

Change WLC IP Address

The following procedure describes how to change the IP address for your system.

1. Log onto the Windows Legacy Collector system and manually change the IP address on the system.
2. In the UI, confirm that the Log Collector service corresponding to the WLC system shows up in error (Red). It might take some time for it to reflect the changed status.
3. On the NetWitness Server, use the **nw-manage** utility to view the host information for the WLC using the following command:

   ```
   nw-manage --list-hosts
   ```

   Sample output from running the command is shown here:

   ```
   {
   "id" : "fdb8150c-e040-459e-8cc5-3c60ec2c65ae",
   "displayName" : "WLC-HOST-104",
   "hostname" : "10.101.216.102",
   "ipv4" : "10.101.216.102",
   "ipv4Public" : null
   } ]
   ```

   You use the value of **"id"** from your output in the following step.

4. Use the **nw-manage** utility to change the IP address of the WLC. For the **host-id** argument, use the value for the **"id"** that you noted from step 3. For the **ipv4** value, use the new IP Address to which you are changing.

   ```
   nw-manage --update-host --host-id "fdb8150c-e040-459e-8cc5-3c60ec2c65ae" --ipv4 10.101.216.105
   ```

5. After you see the message that the previous command ran successfully, go to the NetWitness Server UI and verify that the WLC service is running without any errors.

Edit Destination Groups For Log Collectors and VLCs

The Windows Legacy Collector is often configured with Destination Groups to forward events to Log Collectors or Virtual Log Collectors. If the IP address of any such Destination LC or VLC is changed, the Windows Legacy Collector can no longer forward events. To remediate this, you must edit the Destination groups for the WLC, making sure to select the new LC or VLC IP Address.

Change Network Configuration for Warm Standby (Secondary) Server

You can change the network configuration of a warm standby (secondary server) by following these steps:

1. Follow the steps described in Change Host Network Configuration to change the IP address on the secondary server.
2. Log in to the active NW Server and remove the previous secondary server IP address by running the following command:

   ```
   nw-manage --remove-nws-secondary-ip --ipv4 <previous standby server ip address>
   ```

3. On the active NW Server, add the new standby server secondary IP address value by running the following command:

   ```
   nw-manage --add-nws-secondary-ip --ipv4 <new standby server ip address>
   ```

4. Schedule the backup of the primary NW Server and the copying of backed-up data to the secondary NW Server. See step 18 in "Setup Secondary NW Server in Standby Role" in the *Deployment Guide for NetWitness Platform*.

For information about configuring warm standby servers, see "Warm Standby NW Server Host" in the *Deployment Guide for NetWitness Platform* and NW Server Host Secondary IP Configuration Management.

Reconnecting Component Hosts with NW Server Hosts

While changing a host's IP address or during failover, component hosts can become disconnected from NW Server hosts. Follow these steps to reconnect a host system to its NW Server system.

1. Log in to the component host using SSH or the console.
2. Run the following command:

   ```
   nw-manage --override-nws-ip --ipv4 <current IP address of the NW Server>
   ```

When this command completes, the component host is reconnected to the NW Server at the specified IP address.

Manage Custom Host Entries

If you have hosts in your environment that use custom entries, or if you want to use NAT IPv4 addresses for your hosts, this topic provides instructions for configuring these settings.

Manage Custom Host Entries in /etc/hosts

If you identify hosts in your environment that need custom entries, you can add custom entries for your hosts in the `/etc/hosts.user` file.

To add custom host entries:

1. From the console, log in to the host on which to define custom entries.
2. Add the custom entry to the `/etc/hosts.user` file.

To update or refresh a custom entry in `/etc/hosts`:

Run the following command:

```
nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>
```

Manage Public or NAT IPv4 Addresses for Hosts

To add or update public or Network Address Translation (NAT) IPv4 addresses for NW Hosts, run the following command:

```
nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <IP address>
```

Manage Custom Jetty Configuration

If you want to have custom jetty configurations or additional JAVA_OPTIONS that persist during the upgrade, this topic provides the instructions for configuring custom jetty settings.

To add custom jetty configuration

1. From SSH prompt, create a copy of jetty configuration as `jetty.user` using the below command.
   `$ cp /etc/default/jetty /etc/default/jetty.user`
2. Edit the `/etc/default/jetty.user` and remove all lines EXCEPT one of the `JAVA_OPTIONS` additional settings lines.
   For example, `JAVA_OPTIONS="${JAVA_OPTIONS} -Drsa.primary.host=true "`
3. Edit the line with the option (in this example increasing the max memory option from 8G to 24G):
   `JAVA_OPTIONS="${JAVA_OPTIONS} -Xmx24G "`
4. Make sure to use the `JAVA_OPTIONS="${JAVA_OPTIONS} "` format to EXTEND the `JAVA OPTIONS`.

5. REMOVE the `[ -f /etc/default/jetty.user ] && source /etc/default/jetty.user` file.
6. Save the file.
7. Restart the jetty service.
   `systemctl restart jetty`

Note: When you overwrite the jetty.user custom config file, ensure that all the jetty configurations (JAVA_OPTIONS) present in /etc/default/jetty are available in this file. If any jetty configuration (JAVA_OPTIONS) is not available in the jetty.user file, you must copy it to the file and then restart the jetty service.

Configure FIPS Support

NetWitness 11.x ships with FIPS-validated 140-2 Cryptographic Modules that support all cryptographic operations within NetWitness. NetWitness leverages two modules that support a level three design assurance:

- RSA BSAFE Crypto-J
- RSA OwB

Both modules have been certified with an operational environment comparable to the standard NetWitness configuration.

By default, the cryptographic modules enforce the usage of FIPS-certified cipher suites wherever possible. For exceptions, refer to the information below and to the release notes. For additional information about the FIPS modules, see https://csrc.nist.gov/publications/detail/fips/140/2/final.

The RSA BSAFE Crypto-J FIPS Certificate number is 3172, and OwB uses the CCME FIPS Module in FIPS-approved mode.

In 11.x, FIPS is enabled on all services except Log Collector. This includes Log Decoder and Decoder if they were FIPS-enabled in 10.6.x or any previous version. FIPS cannot be disabled on any services except for Log Collector, Log Decoder and Decoder.

Note: For a fresh installation of 11.x, by default, all core services will be FIPS enforced except Log Collector and Log Decoder. FIPS cannot be disabled on any services except for Log Collector, Log Decoder and Network Decoder.

Note: For upgrades to 11.x from previous versions, the following conditions apply for the Log Collector, Log Decoder and Decoder services:
- Log Collector is not FIPS enabled after upgrading to 11.x, even if FIPS was enabled in a previous version. You must enable FIPS support after upgrading to 11.x. See the instructions in FIPS support for Log Collectors.
- If FIPS was enabled for the Log Decoder and Network Decoder services in a prevous version, FIPS will also be enabled in 11.x. However, if Log Decoder and Network Decoder were NOT FIPS enabled in a previous version, they will not be enabled in 11.x, and you can manually enable FIPS for these services if required. See the instructions in FIPS support for Log Decoders and Decoders.

FIPS support for Log Collectors

To enable FIPS for Log Collectors:

1. Stop the Log Collector service.
2. Open the `/etc/systemd/system/nwlogcollector.service.d/nwlogcollector-opts-managed.conf` file.
3. Change the value of the following variable to **off** as described here:

   `Environment="OWB_ALLOW_NON_FIPS=on"`

   to

   `Environment="OWB_ALLOW_NON_FIPS=off"`
4. Reload the system daemon by running the following command:

   `systemctl daemon-reload`
5. Restart the Log Collector service.
6. Set the FIPS mode for the Log Collector service in the UI:

   Note: This step is not required if you are upgrading from 10.6.x to 11.x and FIPS was enabled in 10.6.x.

   a. Go to  (Admin) > **Services**.

   b. Select the Log Collector service and go to **View** > **Config**.

   c. In SSL FIPS Mode, select the checkbox under Config Value and click **Apply**.

FIPS support for Log Decoders and Decoders

To enable FIPS for Log Decoders and Decoders that did not have FIPS enabled in 10.6.x:

1. Go to  (Admin) > **Services** and select a Log Decoder or Network Decoder service.
2. Select **View** > **Config**, and in **System Configuration**, enable **SSL FIPS Mode** by selecting the check box in the **Config Value** column.

3. Restart the service.
4. Click **Apply**.

DISA STIG

Note: 11.3.1 feature - DISA STIG (Defense Information Systems Agency Security Technical Implementation Guide) support was introduced in NetWitness Platform 11.3.1. Versions 11.0.0.0 to 11.3.0.0 do not support DISA STIG.

NetWitness Platform version 11.3.1 supports all Audit Rules in the DISA STIG Control Group. The supported version for DISA STIG is Red Hat Enterprise Linux V3R2. NetWitness will expand its support of STIG rules in future NetWitness Platform versions.

This section includes the following topics.

How STIG Limits Account Access

NetWitness Passwords

Generate the OpenSCAP Report

Manage STIG Controls Script (`manage-stig-controls`)

Rules List

Exceptions to STIG Compliance

IMPORTANT: All rules are enabled by default except for **control goup 1-ssh-prevent-root** an **control group 3-fips-kernel**. You can enable or disable rules by control group using the `manage-stig-controls` script.

How STIG Limits Account Access

The STIG hardening RPM helps to lock down information, systems, and software, which might otherwise be vulnerable to a malicious computer attack by limiting account access to a system. For example, the STIG script:

- Ensures that the account password has a length, complexity, expiration period, and lockout period that are in accordance with DISA best practices.
- Applies auditing and logging of user actions on the host.

NetWitness Passwords

NetWitness Platform requires passwords that are STIG compliant.

Generate the OpenSCAP Report

Security Content Automation Protocol (SCAP) is a line of standards or rules managed by the National Institute of Standards and Technology (NIST). It was created to provide a standardized approach to maintaining the security of enterprise systems, such as automatically verifying the presence of patches, checking system security configuration settings, and examining systems for signs of compromise.

The OpenSCAP report evaluates your environment against the SCAP rules. The results are sent to the `HOSTNAME-ssg-results.(XML|HTML)` depending on the output format you select.

Disable Rules in OpenSCAP Report that Hang the Report

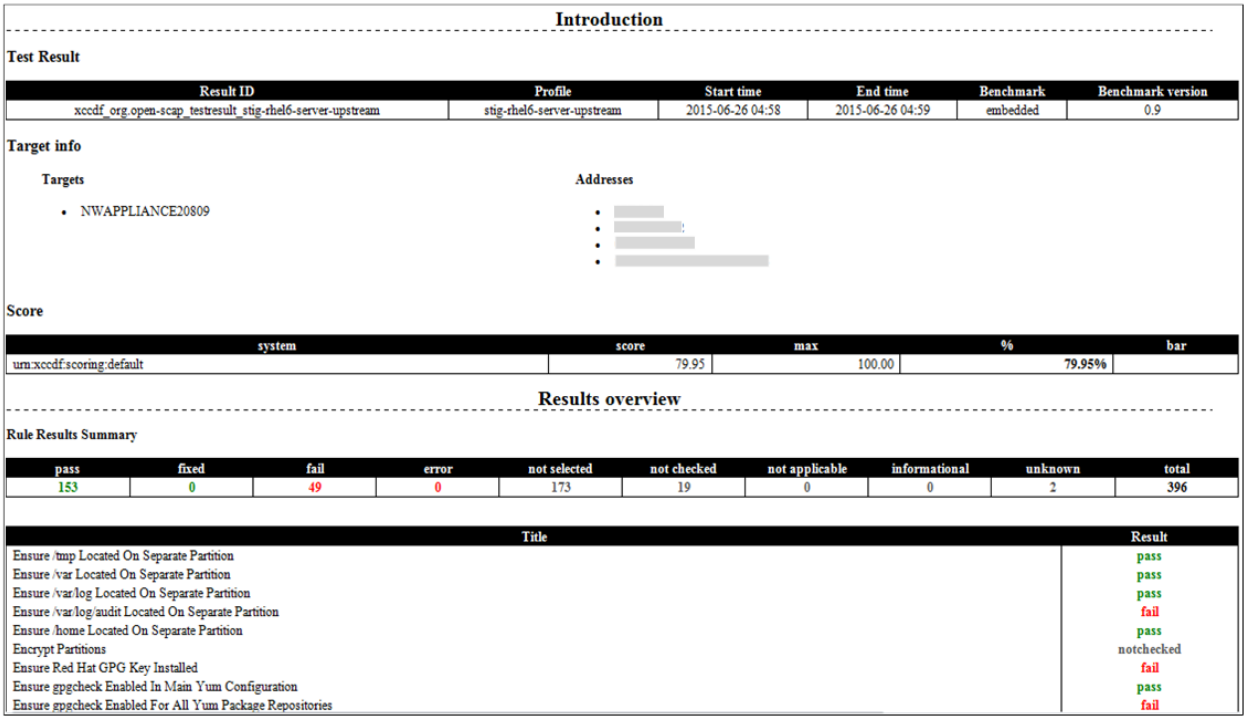
There may be STIG rules that you do not want to include in the OpenSCAP report because they make the report hang. Use the following command to disable items on the SCAP report:

```
sed -i 's/select idref="rule-id" selected="true"/select idref="rule-id"
selected="false"/g' /usr/share/xml/scap/ssg/content/ssg-rhel7-xccdf.xml
```

where `rule-id` is the Rule ID that you can replace with the Rule ID that may hang during a test.

For example, the report has a rule ID called `partition_for_audit` (shown as `Rule ID: partition_for_audit`). If you disable a rule, OpenSCAP does not check against that rule. This means that you need to check for compliance to the `partition_for_audit` rule manually.

Install OpenSCAP



You must

1. SSH to the host
2. Execute the following commands.

```
yum install scap-security-guide
```

Sample Report

The following report is a sample section from an OpenSCAP report.

Introduction

Test Result

Result ID	Profile	Start time	End time	Benchmark	Benchmark version
xccdf_org.open-scap_testresult_stig-rhel6-server-upstream	stig-rhel6-server-upstream	2015-06-26 04:58	2015-06-26 04:59	embedded	0.9

Targets

- NWAPPLIANCE20809

Addresses

- [redacted]

Score

system	score	max	%	bar
urn:xccdf:scoring:default	79.95	100.00	79.95%	

Results overview

Rule Results Summary

pass	fixed	fail	error	not selected	not checked	not applicable	informational	unknown	total
153	0	49	0	173	19	0	0	2	396

Title	Result
Ensure /tmp Located On Separate Partition	pass
Ensure /var Located On Separate Partition	pass
Ensure /var/log Located On Separate Partition	pass
Ensure /var/log/audit Located On Separate Partition	fail
Ensure /home Located On Separate Partition	pass
Encrypt Partitions	notchecked
Ensure Red Hat GPG Key Installed	fail
Ensure gpgcheck Enabled In Main Yum Configuration	pass
Ensure gpgcheck Enabled For All Yum Package Repositories	fail

Report Fields

Section	Field	Description
Introduction - Test Result	Result ID	The Extensible Configuration Checklist Description Format (XCCDF) identifier of the report results.
	Profile	XCCDF profile under which the report results are categorized.
	Start time	When the report started.
	End time	When the report ended.
	Benchmark	XCCDF benchmark
	Benchmark version	Version number of the benchmark.
Introduction - Score	system	XCCDF scoring method.
	score	Score attained after running the report.
	max	Highest score attainable.
	%	Score attained after running the report as a percentage.
	bar	Not Applicable.
Results overview - Rule Results Summary	pass	Passed rule check.
	fixed	Rule check that failed previously is now fixed.
	fail	Failed rule check.
	error	Could not perform rule check.
	not selected	This check was not applicable to your NetWitness Platform deployment.
	not checked	Rule could not be checked. There are several reasons why a rule cannot be checked. For example, the rule check requires a check engine not supported by the OpenSCAP report.
	not applicable	Rule check does not apply to your NetWitness Platform deployment.
	informational	Rule checks for informational purposes only (no action required for **fail**).
	unknown	Report was able to check the rule. Run steps manually as described in the report to check the rule.
	total	Total number of rules checked.

Section	Field	Description
Exceptions	Title	Name of rule being checked.
	Result	Valid values are **pass**, **fixed**, **fail**, **error**, **not selected**, **not checked**, **not applicable**, **informational**, or unknown. **Note:** Results values are defined the **Results overview - Rule Results Summary**.

Create the OpenSCAP Report

The following tasks show you how to create the OpenSCAP Report in HTML, XML, or both HTML and XML.

Create Report in HTML Only

To create an OpenSCAP report in HTML only:

1. SSH to the host.
2. Submit the following command:

   ```
   mkdir -p /opt/rsa/openscap
   ```

3. Submit the following command for report upgrades only:

   ```
   sed -i -r -e "s/<platform.*//g" /usr/share/xml/scap/ssg/content/ssg-rhel7-xccdf.xml
   ```

4. Submit the following command:

   ```
   oscap xccdf eval --profile "stig" --report /opt/rsa/openscap/`hostname`.html --cpe /usr/share/xml/scap/ssg/content/ssg-rhel7-cpe-dictionary.xml /usr/share/xml/scap/ssg/content/ssg-rhel7-xccdf.xml
   ```

5. Report will be available under following location:

   ```
   /opt/rsa/openscap/
   ```

Create Report in XML Only

To create an OpenSCAP report in xml only:

1. SSH to the host.
2. Submit the following command:

   ```
   mkdir -p /opt/rsa/openscap
   ```

3. Submit the following command for report upgrades only:

   ```
   sed -i -r -e "s/<platform.*//g" /usr/share/xml/scap/ssg/content/ssg-rhel7-xccdf.xml
   ```

4. Submit the following command:

```
oscap xccdf eval --profile "stig" --results
/opt/rsa/openscap/`hostname`.xml --cpe /usr/share/xml/scap/ssg/content/ssg-
rhel7-cpe-dictionary.xml /usr/share/xml/scap/ssg/content/ssg-rhel7-
xccdf.xml
```

5. Report will be available under following location:
   `/opt/rsa/openscap/`

Create Report in Both XML and HTML

To create an OpenSCAP report in both xml and html:

1. SSH to the host.
2. Submit the following command:
   ```
   mkdir -p /opt/rsa/openscap
   ```
3. Submit the following command for report upgrades only:
   ```
   sed -i -r -e "s/<platform.*//g" /usr/share/xml/scap/ssg/content/ssg-rhel7-
   xccdf.xml
   ```
4. Submit the following command:
   ```
   oscap xccdf eval --profile "stig" --results
   /opt/rsa/openscap/`hostname`.xml --report /opt/rsa/openscap/`hostname`.html
   --cpe /usr/share/xml/scap/ssg/content/ssg-rhel7-cpe-dictionary.xml
   /usr/share/xml/scap/ssg/content/ssg-rhel7-xccdf.xml
   ```
5. Report will be available under following location:
   `/opt/rsa/openscap/`

Manage STIG Controls Script (`manage-stig-controls`)

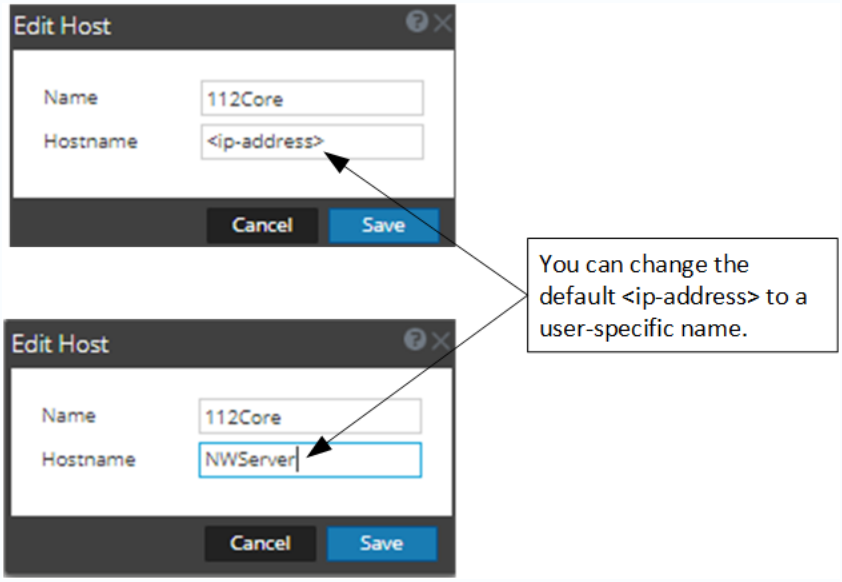
You can use the `manage-stig-controls` script and its arguments to enable or disable STIG Control groups for which you want to apply STIG configuration. You can specify all hosts or individual hosts as arguments and you can enable or disable all control groups or individual control groups. This script is available in /usr/bin/ directory.

To manage STIG controls for a host:

1. SSH to the NW Server host or use the Console from the NetWitness Platform User Interface.
2. Submit the `manage-stig-controls` script with the commands, control groups, and other arguments you want to apply.
3. Reboot the host.

Commands

Command	Description
`--enable-all-controls`	Enables all STIG controls. For example: `manage-stig-controls --enable-all-controls`



Command	Description
`--disable-all-controls`	Disables all STIG controls. For example: `manage-stig-controls --disable-all-controls`
`--enable-default-controls`	Enables all STIG Controls except ssh-prevent-root and fips-kernel. For example: `manage-stig-controls --enable-default-controls`
`--enable-control-groups <IDs>`	Enables (comma delimited) list of STIG Control GroupIDs. For example: `manage-stig-controls --enable-control-groups '1, 2, 3'`
`--disable-control-groups <IDs>`	Disables (comma delimited) list of STIG Control Group IDs For example: `manage-stig-controls --disable-control-groups '1, 2, 3'`

Control Groups

You use the ID as an argument for the control group or groups.

ID	Group	Description	Specified by Default
1	`ssh-prevent-root`	Prevent root login through SSH.	no
2	`ssh`	SSH STIG configuration.	yes
3	`fips-kernel`	FIPS Kernel configuration	no
4	`auth`	Authentication STIG configuration	yes
5	`audit`	Audit STIG configuration	yes
6	`packages`	RPM Package STIG configuration	yes
7	`services`	Services STIG configuration	yes

Other Arguments

Argument	Description
`--host-all`	Apply STIG configuration to all hosts. For example: `manage-stig-controls --host-all`
`--skip-health-checks`	Disable health checks for all hosts (not recommended). For example: `manage-stig-controls --skip-health-checks`
`--host-id <id>`	Apply STIG configuration for the host identified by `<id>` (host identification code). For example: `manage-stig-controls --host-id <id>`
`--host-name <display-name>`	Apply STIG configuration for host identified by `<display-name>`. `display-name` is the value shown under **Name** in the **(Admin)** > **Hosts** View in the NetWitness Platform Interface. For example: `manage-stig-controls --host-name <display-name>`
`--host-addr <Hostname-in UI>` or `--host-addr <hostname>`	Apply STIG configuration for the host identified by the value shown under **Hostname** in the **(Admin)** > **Hosts** > **Edit** dialog in the NetWitness Platform Interface. This value can be an ip-addres (default) or a user-specified name. For example: `manage-stig-controls --host-addr <hostname>` 
`-v, --verbose`	Enable verbose output. For example: `manage-stig-controls -v`

Rules List

The following table lists all the STIG rules with their:

- Control Group - you can use the Control Group ID as an argument in the manage-stig-controls script to expand on reduce the scope of rules checked. (1= ssh-prevent-root, 2 = ssh, 3 = fips-kernel, 4 = auth, 5 = audit, 6 = packages, 7 = services)
- Default Status - tells you if the rule is enabled or disabled by default.
- Passed or Exception status - tells you if the rule passed (that is, complies with STIG) or is an exception.

CCE Number	Rule Name	Control Group	Default Status	Passed/ Exception
CCE-26404-4	Ensure /var Located On Separate Partition	n/a	n/a	Exception
CCE-26631-2	Set Password Strength Minimum Different Characters	auth	enabled	Passed
CCE-26828-4	Disable DCCP Support	n/a	n/a	Passed
CCE-26884-7	Set Lockout Time For Failed Password Attempts	auth	enabled	Exception
CCE-26892-0	Set the GNOME3 Login Warning Banner Text	n/a	enabled	Passed
CCE-26923-3	Limit Password Reuse	n/a	enabled	Passed
CCE-26952-2	Configure Periodic Execution of AIDE	audit	enabled	Exception
CCE-26970-4	Enable GNOME3 Login Warning Banner	audit	enabled	Passed
CCE-26971-2	Ensure /var/log/audit Located On Separate Partition	audit	enabled	Exception
CCE-26989-4	Ensure gpgcheck Enabled In Main Yum Configuration	n/a	enabled	Passed
CCE-27002-5	Set Password Minimum Age	n/a	enabled	Passed
CCE-27051-2	Set Password Maximum Age	auth	enabled	Passed
CCE-27053-8	Set Password Hashing Algorithm in /etc/libuser.conf	n/a	enabled	Passed
CCE-27082-7	Set SSH Client Alive Count	ssh	disabled	Passed

CCE Number	Rule Name	Control Group	Default Status	Passed/ Exception
CCE-27096-7	Install AIDE	n/a	n/a	Exception
CCE-27127-0	Enable Randomized Layout of Virtual Address Space	n/a	enabled	Exception
CCE-27157-7	Verify File Hashes with RPM	n/a	n/a	Exception
CCE-27160-1	Set Password Retry Prompts Permitted Per-Session	n/a	enabled	Passed
CCE-27200-5	Set Password Strength Minimum Uppercase Characters	auth	enabled	Passed
CCE-27209-6	Verify and Correct File Permissions with RPM	n/a	n/a	Exception
CCE-27213-8	Record Events that Modify the System's Discretionary Access Controls - setxattr	audit	enabled	Passed
CCE-27214-6	Set Password Strength Minimum Digit Characters	auth	enabled	Passed
CCE-27218-7	Remove the X Windows Package Group	n/a	enabled	Passed
CCE-27275-7	Set Last Logon/Access Notification	n/a	enabled	Passed
CCE-27277-3	Disable Modprobe Loading of USB Storage Driver	services	enabled	Exception
CCE-27279-9	Configure SELinux Policy	n/a	enabled	Passed
CCE-27280-7	Record Events that Modify the System's Discretionary Access Controls - lsetxattr	audit	enabled	Passed
CCE-27286-4	Prevent Log In to Accounts With Empty Password	n/a	enabled	Passed
CCE-27287-2	Require Authentication for Single User Mode	n/a	enabled	Passed
CCE-27293-0	Set Password Minimum Length	auth	enabled	Passed
CCE-27295-5	Use Only FIPS 140-2 Validated Ciphers	n/a	enabled	Exception

CCE Number	Rule Name	Control Group	Default Status	Passed/ Exception
CCE-27297-1	Set Interval For Counting Failed Password Attempts	auth	enabled	Passed
CCE-27303-7	Modify the System Login Banner	ssh	enabled	Exception
CCE-27309-4	Set Boot Loader Password in grub2	n/a	enabled	Exception
CCE-27311-0	Verify Permissions on SSH Server Public *.pub Key Files	n/a	enabled	Passed
CCE-27314-4	Enable SSH Warning Banner	ssh	enabled	Passed
CCE-27320-1	Allow Only SSH Protocol 2	n/a	enabled	Passed
CCE-27326-8	Ensure No Device Files are Unlabeled by SELinux	n/a	enabled	Passed
CCE-27334-2	Ensure SELinux State is Enforcing	n/a	enabled	Exception
CCE-27339-1	Record Events that Modify the System's Discretionary Access Controls - chmod	audit	enabled	Passed
CCE-27342-5	Uninstall rsh-server Package	n/a	enabled	Passed
CCE-27343-3	Ensure Logs Sent To Remote Host	n/a	n/a	Passed
CCE-27345-8	Set Password Strength Minimum Lowercase Characters	auth	enabled	Passed
CCE-27349-0	Set Default firewalld Zone for Incoming Packets	n/a	n/a	Exception
CCE-27350-8	Set Deny For Failed Password Attempts	auth	enabled	Passed
CCE-27351-6	Install the screen Package	n/a	enabled	Passed
CCE-27353-2	Record Events that Modify the System's Discretionary Access Controls - fremovexattr	audit	enabled	Passed
CCE-27355-7	Set Account Expiration Following Inactivity	n/a	enabled	Passed

CCE Number	Rule Name	Control Group	Default Status	Passed/ Exception
CCE-27356-5	Record Events that Modify the System's Discretionary Access Controls - fchown	audit	enabled	Passed
CCE-27358-1	Deactivate Wireless Network Interfaces	n/a	enabled	Passed
CCE-27360-7	Set Password Strength Minimum Special Characters	auth	enabled	Passed
CCE-27363-1	Do Not Allow SSH Environment Options	ssh	enabled	Passed
CCE-27364-9	Record Events that Modify the System's Discretionary Access Controls - chown	audit	enabled	Passed
CCE-27367-2	Record Events that Modify the System's Discretionary Access Controls - removexattr	audit	enabled	Passed
CCE-27375-5	Configure auditd space_left Action on Low Disk Space	audit	enabled	Passed
CCE-27377-1	Disable SSH Support for .rhosts Files	n/a	enabled	Passed
CCE-27386-2	Ensure Default SNMP Password Is Not Used	n/a	n/a	Exception
CCE-27387-0	Record Events that Modify the System's Discretionary Access Controls - fchownat	audit	enabled	Passed
CCE-27388-8	Record Events that Modify the System's Discretionary Access Controls - fchmodat	audit	enabled	Passed
CCE-27389-6	Record Events that Modify the System's Discretionary Access Controls - fsetxattr	audit	enabled	Passed
CCE-27393-8	Record Events that Modify the System's Discretionary Access Controls - fchmod	audit	enabled	Passed
CCE-27394-6	Configure auditd mail_acct Action on Low Disk Space	audit	enabled	Passed

CCE Number	Rule Name	Control Group	Default Status	Passed/ Exception
CCE-27401-9	Uninstall telnet-server Package	n/a	enabled	Passed
CCE-27399-5	Uninstall ypserv Package	n/a	enabled	Passed
CCE-27407-6	Enable auditd Service	audit	enabled	Passed
CCE-27410-0	Record Events that Modify the System's Discretionary Access Controls - lremovexattr	audit	enabled	Passed
CCE-27413-4	Disable Host-Based Authentication	n/a	enabled	Passed
CCE-27433-2	Set SSH Idle Timeout Interval	ssh	enabled	Passed
CCE-27434-0	Configure Kernel Parameter for Accepting IPv4 Source-Routed Packets for All Interfaces	n/a	enabled	Passed
CCE-27437-3	Ensure auditd Collects Information on the Use of Privileged Commands	audit	enabled	Passed
CCE-27445-6	Disable SSH Root Login	n/a	n/a	Exception
CCE-27447-2	Ensure auditd Collects Information on Exporting to Media (successful)	audit	enabled	Passed
CCE-27455-5	Use Only FIPS 140-2 Validated MACs	n/a	enabled	Passed
CCE-27458-9	Mount Remote Filesystems with Kerberos Security	n/a	enabled	Passed
CCE-27461-3	Ensure auditd Collects System Administrator Actions	audit	enabled	Passed
CCE-27471-2	Disable SSH Access via Empty Passwords	n/a	enabled	Exception
CCE-27485-2	Verify Permissions on SSH Server Private *_key Key Files	n/a	n/a	Passed
CCE-27498-5	Disable the Automounter	n/a	enabled	Passed

CCE Number	Rule Name	Control Group	Default Status	Passed/ Exception
CCE-27503-2	All GIDs referenced in /etc/passwd must be defined in /etc/group	n/a	enabled	Passed
CCE-27511-5	Disable Ctrl-Alt-Del Reboot Activation	services	enabled	Passed
CCE-27512-3	Set Password Maximum Consecutive Repeating Characters	n/a	enabled	Passed
CCE-27557-8	Set Interactive Session Timeout	auth	disabled	Passed
CCE-80104-3	Disable GDM Automatic Login	n/a	enabled	Passed
CCE-80105-0	Disable GDM Guest Login	n/a	enabled	Passed
CCE-80108-4	Enable the GNOME3 Login Smartcard Authentication	n/a	enabled	Passed
CCE-80110-0	Set GNOME3 Screensaver Inactivity Timeout	n/a	enabled	Passed
CCE-80111-8	Enable GNOME3 Screensaver Idle Activation	n/a	enabled	Passed
CCE-80112-6	Enable GNOME3 Screensaver Lock After Idle Period	n/a	enabled	Passed
CCE-80127-4	Install McAfee Virus Scanning Software	n/a	n/a	Exception
CCE-80129-0	Virus Scanning Software Definitions Are Updated	n/a	n/a	Exception
CCE-80134-0	Ensure All Files Are Owned by a User	n/a	enabled	Passed
CCE-80135-7	Ensure All Files Are Owned by a Group	n/a	enabled	Passed
CCE-80136-5	Ensure All World-Writable Directories Are Owned by a System Account	n/a	enabled	Passed
CCE-80144-9	Ensure /home Located On Separate Partition	n/a	enabled	Passed
CCE-80148-0	Add nosuid Option to Removable Media Partitions	n/a	enabled	Passed

CCE Number	Rule Name	Control Group	Default Status	Passed/ Exception
CCE-80156-3	Disable Kernel Parameter for Sending ICMP Redirects for All Interfaces	n/a	n/a	Exception
CCE-80157-1	Disable Kernel Parameter for IP Forwarding	n/a	n/a	Exception
CCE-80158-9	Configure Kernel Parameter for Accepting ICMP Redirects for All Interfaces	n/a	n/a	Exception
CCE-80162-1	Configure Kernel Parameter for Accepting Source-Routed Packets By Default	n/a	enabled	Passed
CCE-80163-9	Configure Kernel Parameter for Accepting ICMP Redirects By Default	n/a	n/a	Exception
CCE-80165-4	Configure Kernel Parameter to Ignore ICMP Broadcast Echo Requests	n/a	n/a	Exception
CCE-80174-6	Ensure System is Not Acting as a Network Sniffer	n/a	enabled	Passed
CCE-80179-5	Configure Kernel Parameter for Accepting IPv6 Source-Routed Packets for All Interfaces	n/a	n/a	Exception
CCE-80192-8	Ensure rsyslog Does Not Accept Remote Messages Unless Acting As Log Server	n/a	enabled	Passed
CCE-80205-8	Ensure the Default Umask is Set Correctly in login.defs	n/a	enabled	Passed
CCE-80207-4	Enable Smart Card Login	n/a	n/a	Exception
CCE-80213-2	Uninstall tftp-server Package	n/a	enabled	Passed
CCE-80214-0	Ensure tftp Daemon Uses Secure Mode	n/a	enabled	Passed
CCE-80215-7	Install the OpenSSH Server Package	n/a	enabled	Passed
CCE-80216-5	Enable the OpenSSH Service	n/a	enabled	Passed
CCE-80220-7	Disable GSSAPI Authentication	ssh	enabled	Passed

CCE Number	Rule Name	Control Group	Default Status	Passed/ Exception
CCE-80221-5	Disable Kerberos Authentication	n/a	enabled	Passed
CCE-80222-3	Enable Use of Strict Mode Checking	n/a	enabled	Passed
CCE-80223-1	Enable Use of Privilege Separation	n/a	enabled	Passed
CCE-80224-9	Disable Compression Or Set Compression to delayed	n/a	enabled	Passed
CCE-80225-6	Print Last Log	n/a	enabled	Exception
CCE-80226-4	Enable Encrypted X11 Forwarding	n/a	n/a	Exception
CCE-80240-5	Mount Remote Filesystems with nosuid	n/a	enabled	Passed
CCE-80245-4	Uninstall vsftpd Package	n/a	enabled	Passed
CCE-80258-7	Disable KDump Kernel Crash Analyzer (kdump)	services	enabled	Passed
CCE-80346-0	Ensure YUM Removes Previous Package Versions	packages	enabled	Passed
CCE-80347-8	Ensure gpgcheck Enabled for Local Packages	packages	enabled	Passed
CCE-80348-6	Ensure gpgcheck Enabled for Repository Metadata	n/a	n/a	Exception
CCE-80350-2	Ensure Users Re-Authenticate for Privilege Escalation - sudo !authenticate	n/a	enabled	Passed
CCE-80351-0	Ensure Users Re-Authenticate for Privilege Escalation - sudo NOPASSWD	n/a	enabled	Passed
CCE-80352-8	Ensure the Logon Failure Delay is Set Correctly in login.defs	auth	enabled	Passed
CCE-80353-6	Configure the root Account for Failed Password Attempts	auth	enabled	Passed

CCE Number	Rule Name	Control Group	Default Status	Passed/ Exception
CCE-80354-4	Set the UEFI Boot Loader Password	fips-kernel	disabled	Passed
CCE-80359-3	Enable FIPS Mode in GRUB2	fips-kernel	disabled	Exception
CCE-80370-0	Set GNOME3 Screensaver Lock Delay After Activation Period	n/a	enabled	Passed
CCE-80371-8	Ensure Users Cannot Change GNOME3 Screensaver Settings	n/a	enabled	Passed
CCE-80372-6	Disable SSH Support for User Known Hosts	ssh	enabled	Passed
CCE-80373-4	Disable SSH Support for Rhosts RSA Authentication	audit	enabled	Passed
CCE-80374-2	Configure Notification of Post-AIDE Scan Details	n/a	n/a	Exception
CCE-80375-9	Configure AIDE to Verify Access Control Lists (ACLs)	n/a	n/a	Exception
CCE-80376-7	Configure AIDE to Verify Extended Attributes	n/a	n/a	Exception
CCE-80377-5	Configure AIDE to Use FIPS 140-2 for Validating Hashes	n/a	n/a	Exception
CCE-80378-3	Verify User Who Owns /etc/cron.allow file	n/a	enabled	Passed
CCE-80379-1	Verify Group Who Owns /etc/cron.allow file	n/a	enabled	Passed
CCE-80380-9	Ensure cron Is Logging To Rsyslog	n/a	enabled	Passed
CCE-80381-7	Shutdown System When Auditing Failures Occur	audit	enabled	Passed
CCE-80382-5	Record Attempts to Alter Logon and Logout Events - tallylog	audit	enabled	Passed
CCE-80383-3	Record Attempts to Alter Logon and Logout Events - faillock	n/a	n/a	Passed

CCE-82038-1	Set Password Hashing Algorithm in /etc/libuser.conf	n/a	enabled	Passed
CCE-82041-5	Limit the Number of Concurrent Login Sessions Allowed Per User	auth	enabled	Passed
CCE-82043-1	Set PAM's Password Hashing Algorithm	n/a	enabled	Passed

CCE Number	Rule Name	Control Group	Default Status	Passed/ Exception
CCE-82045-6	Set Password Strength Minimum Different Categories	audit	enabled	Passed
CCE-82050-6	Set Password Hashing Algorithm in /etc/login.defs	n/a	enabled	Passed
CCE-82053-0	Ensure /tmp Located On Separate Partition	n/a	n/a	Exception
CCE-82054-8	Verify Only Root Has UID 0	n/a	enabled	Passed
CCE-82353-4	Ensure /var Located On Separate Partition	n/a	n/a	Exception

Exceptions to STIG Compliance

This topic contains:

- Rule exceptions that are the responsibility of the customer to resolve.
- Rule exceptions that are "Not a Finding" which means that they do not apply to NetWitness Platform. NetWitness has verified that the system meets these requirements.
- Rules to be supported in future release.

Key to Elements in Exception Descriptions

CCE Number

The Common Configuration Enumeration (CCE), assigns unique entries (also called CCE numbers) to configuration guidance statements and configuration controls to improve workflow by facilitating fast and accurate correlation of configuration issues present in disparate domains. In this way, it is similar to other comparable data standards such as the **Common Vulnerability and Exposure (CVE®) List** (http://cve.mitre.org/cve), which assigns identifiers to publicly known system vulnerabilities. The OpenSCAP report lists exceptions by CCE number.

This sections lists the exceptions you can receive when you run the OpenSCAP report. The ID or Common Configuration Enumeration (CCE) number in the table is the identification number for the exception from the OpenSCAP report.

Control Group ID

Number that identifies the control group you specify in the manage-stig-controls script to enable or disable the rule.

ID	Group	Description	Specified by Default
1	`ssh-prevent-root`	Prevent root login through SSH.	no
2	`ssh`	SSH STIG configuration.	yes
3	`fips-kernel`	FIPS Kernel configuration	no
4	`auth`	Authentication STIG configuration	yes
5	`audit`	Audit STIG configuration	yes
6	`packages`	RPM Package STIG configuration	yes
7	`services`	Services STIG configuration	yes

Check

Describes what the rule checks to identify exceptions to DISA STIG compliance.

Comments

Provides insight on why you would receive this exception. This section includes one of the following comments that describes the exception:

- **Customer Responsibility** - You are responsible to make sure the system meets this requirement.
- **Not a Finding** - Exception does not apply to NetWitness Platform. NetWitness has verified that the system meets this requirement.
- **Future Feature** - NetWitness Platform does not meet this requirement. NetWitness plans to fix this in a future release of NetWitness Platform.

Customer Responsibility Exceptions

CCE-26952-2 Configure Periodic Execution of AIDE (Control Group = audit)

Check	At a minimum, configure AIDE to run a weekly scan and at most, daily. To implement a daily execution of AIDE at 4:05am using cron, add the following line to the `/etc/crontab` file:
	`05 4 * * * root /usr/sbin/aide --check`
	To implement a weekly execution of AIDE at 4:05am using cron, add the following line to the `/etc/crontab` file:
	`05 4 * * 0 root /usr/sbin/aide --check`
	AIDE can be executed periodically through other means; this is merely one example. The usage of cron's special time codes, such as `@daily` and `@weekly` is acceptable.

Comments	**Customer Responsibility.** NetWitness Platform does not provide AIDE because it has a negative impact on performance. If you must install it, run as infrequently as possible to adhere to your security policy.

CCE-27096-7 Install AIDE (Control Group = n/a)

Check	Install the AIDE package with the following command: `$ sudo yum install aid`
Comments	**Customer Responsibility.** NetWitness Platform does not provide AIDE because it has a negative impact on performance. If you must install it, run as infrequently possible to adhere to your security policy.

CCE-27218-7 Remove the X Windows Package Group

Check	The Rule CCE-27218-7 "Remove the X Windows Package Group" is an exception for Log Collector and Log Decoder services.
Comments	**Customer Responsibility.**Log Collector plugin collection framework uses SELinux sandbox technology that has a direct dependency on the given rpm. Removing of the rpm will lead to loss of plugin collection functionality in Log Collector service.

CCE-27295-5 Use Only FIPS 140-2 Validated Ciphers (Control Group = n/a)

Check	Limit the ciphers to those algorithms which are FIPS-approved. Counter (CTR) mode is also preferred over cipher-block chaining (CBC) mode. The following line in `/etc/ssh/sshd_config` demonstrates use of FIPS 140-2 validated ciphers:
	`Ciphers aes128-ctr,aes192-ctr,aes256-ctr`
	The following ciphers are FIPS 140-2 certified on RHEL 7:
	`- aes128-ctr - aes192-ctr - aes256-ctr - aes128-cbc - aes192-cbc - aes256-cbc - 3des-cbc - rijndael-cbc@lysator.liu.se`
	Any combination of the above ciphers will pass this check. Official FIPS 140-2 paperwork for RHEL7 can be found at http://csrc.nist.gov/groups/STM/cmvp/documents/140-1/140sp/140sp2630.pdf.

Comments	Testing approach results in failed test, but the ciphers defined meet the STIG Rule definition. You can check cipher under this file: `/etc/ssh/sshd_config`

CCE-27334-2 Ensure SELinux State is Enforcing

Check	Ensure SELinux State is Enforcing.
Comments	SELinux state is default it is set to 'permissive' by default for all the NetWitness Platform hosts instead of 'Enforcing' due to performance impact.

CCE-27445-6 Disable SSH Root Login (Control Group = ssh-prevent-root)

Check	The root user should never be allowed to login to a system directly over a network.
Comments	**Customer Responsibility.** Disable root login through SSH by adding or editing the following line in the `/etc/ssh/sshd_config` file: `PermitRootLoginNetWitness`.

CCE-80127-4 Install McAfee Virus Scanning Software (Control Group = n/a)

Check	Install McAfee VirusScan Enterprise for Linux antivirus software which is provided for DoD systems and uses signatures to search for the presence of viruses on the filesystem.
Comments	**Customer Responsibility.** Install virus scanning software. NetWitness does not provide this software.

CCE-80129-0 Virus Scanning Software Definitions Are Updated (Control Group = n/a)

Check	Make sure that virus definition files are no older than 7 days or their last release.
Comments	**Customer Responsibility.** NetWitness does not provide this software.

CCE-80207-4 Enable Smart Card Login (Control Group = n/a)

Check	For guidance on enabling SSH to authenticate against a Common Access Card (CAC), consult documentation at: https://access.redhat.com/documentation/en-US/Red_Hat_Enterprise_Linux/7/html/System-Level_Authentication_Guide/smartcards.html#authconfig-smartcards https://access.redhat.com/solutions/82273
Comments	**Customer Responsibility.** The NetWitness Platform supports username/certificate for authentication to shell. If you want to configure a smart card log in, you must do this outside of NetWitness NetWitness.

CCE-80359-3 Enable FIPS Mode in GRUB2 (Control Group = fips-kernel)

Check	To ensure FIPS mode is enabled, install the `dracut-fips` package and rebuild `initramfs` by running the following commands:
	`$ sudo yum install dracut-fips dracut -f`
	After the `dracut` command has been run, add the `fips=1` argument to the default GRUB 2 command line for the Linux operating system in the `/etc/default/grub` file as shown in the following example:
	`GRUB_CMDLINE_LINUX='crashkernel=auto rd.lvm.lv=VolGroup/LogVol06 rd.lvm.lv=VolGroup/lv_swap rhgb quiet rd.shell=0 fips=1'`
	Finally, rebuild the `grub.cfg` file by using the `grub2-mkconfig -o` command as follows (On BIOS-based machines, issue the following command as root):
	`~]# grub2-mkconfig -o /boot/grub2/grub.cfg`
	On UEFI-based machines, issue the following command as root:
	`~]# grub2-mkconfig -o /boot/efi/EFI/redhat/grub.cfg`

Comments	**Customer Responsibility.** NetWitness Platform does not enabled by default. You can enable FIPS by following the procedures in the Configure FIPS Support.

CCE-80374-2 Configure Notification of Post-AIDE Scan Details (Control Group = n/a)

Check	AIDE should notify appropriate personnel of the details of a scan after the scan has been run. If AIDE has already been configured for periodic execution in the `/etc/crontab` file, append the following line to the existing AIDE line:
	`| /bin/mail -s '$(hostname) - AIDE Integrity Check' root@localhost`
	Otherwise, add the following line to the `/etc/crontab` file:
	`05 4 * * * root /usr/sbin/aide --check | /bin/mail -s '$(hostname) - AIDE Integrity Check' root@localhost`
	AIDE can be executed periodically through other means. This is just one example.

Comments	**Customer Responsibility.** NetWitness Platform does not provide AIDE because it has a negative impact on performance. If you must install it, run as infrequently possible to adhere to your security policy.

CCE-80375-9 Configure AIDE to Verify Access Control Lists (Control Group = n/a)

Check	By default, the `acl` option is added to the FIPSR ruleset in AIDE. If using a custom ruleset or the `acl` option is missing, add `acl` to the appropriate ruleset. For example, add `acl` to the following line in the `/etc/aide.conf` file: `FIPSR = p+i+n+u+g+s+m+c+acl+selinux+xattrs+sha256` AIDE rules can be configured in multiple ways; this is merely one example that is already configured by default.
Comments	**Customer Responsibility.** NetWitness Platform does not provide AIDE because it has a negative impact on performance. If you must install it, run as infrequently possible to adhere to your security policy.

CCE-80376-7 Configure AIDE to Verify Extended Attributes (Control Group = n/a)

Check	By default, the `xattrs` option is added to the FIPSR ruleset in AIDE. If using a custom ruleset or the `xattrs` option is missing, add `xattrs` to the appropriate ruleset. For example, add xattrs to the following line in the `/etc/aide.conf` file: `FIPSR = p+i+n+u+g+s+m+c+acl+selinux+xattrs+sha256` AIDE rules can be configured in multiple ways. This is just one example that is already configured by default.
Comments	**Customer Responsibility.** NetWitness Platform does not provide AIDE because it has a negative impact on performance. If you must install it, run as infrequently possible to adhere to your security policy.

CCE-80377-5 Configure AIDE to Use FIPS 140-2 for Validating Hashes (Control Group = n/a)

Check	By default, the `sha512` option is added to the `ORMAL` ruleset in AIDE. If using a custom `ruleset` or the `sha512` option is missing, add `sha512` to the appropriate ruleset. For example, add `sha512` to the following line in the `/etc/aide.conf` file:`ORMAL = FIPSR+sha512` AIDE rules can be configured in multiple ways; this is merely one example that is already configured by default.
Comments	**Customer Responsibility.** NetWitness Platform does not provide AIDE because it has a negative impact on performance. If you must install it, run as infrequently possible to adhere to your security policy.

CCE-80519-2 Install Smart Card Packages For Multi-Factor Authentication (Control Group = n/a)

Check	Configure the operating system to implement multifactor authentication by installing the required packages with the following command: `$ sudo yum install esc pam_pkcs11 authconfig-gtk`

Comments	**Customer Responsibility.** The NetWitness Platform supports username/certificate for authentication to shell. If you want to configure a smart card log in, you must do this outside of NetWitness NetWitness.

Exceptions That Are Not a Finding

The following exceptions do not apply to NetWitness Platform. NetWitness has verified that the system meets these requirements.

CCE-26404-4 Ensure /var Located On Separate Partition (Control Group = n/a)

Check	The `/var` directory is used by daemons and other system services to store frequently-changing data. Ensure that `/var` has its own partition or logical volume at installation time, or migrate it using LVM.
Comments	**Not a Finding.**NetWitness software is installed in `/var/netwitness` by default and has a separate partition on `/var/netwitness`.

CCE-26828-4 Set GNOME Login Inactivity timeout (Control Group = n/a)

Check	Verify that the GNOME Login Inactivity Timeout is set on the host (The graphical desktop environment must set the idle timeout to no more than 15 minutes.).
Comments	**Not a Finding.** NetWitness Platform does not use Gnome Graphical User Interface (GUI) Desktop.

CCE-26884-7 Set Lockout Time For Failed Password Attempts (Control Group = auth)

Check	To configure the system to lock out accounts after a number of incorrect login attempts and require an administrator to unlock the account using `pam_faillock.so`, modify the content of both `/etc/pam.d/system-auth` and `/etc/pam.d/password-auth` by adding the following line immediately before the `pam_unix.so` statement in the `AUTH` section:
	`auth required pam_faillock.so preauth silent deny= unlock_time= fail_interval=`
	Add the following line immediately after the `pam_unix.so` statement in the `AUTH` section:
	`auth [default=die] pam_faillock.so authfail deny= unlock_time= fail_interval=`
	Add the following line immediately before the `pam_unix.so` statement in the `ACCOUNT` section:
	`account required pam_faillock.s`

Comments	**Not a Finding.** `root_unlock_time` is set to `600` seconds.

CCE-26971-2 Ensure `/var/log/audit` Located On Separate Partition (Control Group = audit)

Check	Audit logs are stored in the `/var/log/audit` directory. Ensure that it has its own partition or logical volume at installation time, or migrate it later using LVM. Make absolutely certain that it is large enough to store all audit logs that will be created by the auditing daemon.
Comments	**Not a Finding.**NetWitness Platform has the `/var/log` directory as a separate partition.

CCE-27127-0 Enable Randomized Layout of Virtual Address Space (Control Group = n/a)

Check	To set the runtime status of the `kernel.randomize_va_space` kernel parameter, run the following command:
	`$ sudo sysctl -w kernel.randomize_va_space=2`
	If this is not the system default value, add the following line to the `/etc/sysctl.conf` file:
	`kernel.randomize_va_space = 2`

Comments	**Not a Finding.** Value of `/proc/sys/kernel/randomize_va_space` is already `2`.

CCE-27157-7 Verify File Hashes with RPM (Control Group = n/a)

Check	Without cryptographic integrity protections, system executables and files can be altered by unauthorized users without detection. The RPM package management system can check the hashes of installed software packages, including many that are important to system security. To verify that the cryptographic hash of system files and commands match vendor values, run the following command to list which files on the system with hashes that differ from what is expected by the RPM database:
	`$ rpm -Va | grep '^..5' A 'c'`
	in the second column indicates that a file is a configuration file, which may appropriately be expected to change. If the file was not expected to change, investigate the cause of the change using audit logs or other means. The package can then be reinstalled to restore the file. Run the following command to determine which package owns the file:
	`$ rpm -qf`
	The package can be reinstalled from a yum repository using the command:
	`FILENAME $ sudo yum reinstall`
	Alternatively, the package can be reinstalled from trusted media using the command:
	`PACKAGENAME $ sudo rpm -Uvh PACKAGENAME`

Comments	**Not a Finding.** Only mismatched files not marked as config files in rpms are Commercial Off the Shelf (COTS) product based that cannot be updated. Most File Hash/RPM combinations are in sync. Any discrepancies are COTS products that cannot be updated.

CCE-27339-1 Record Events that Modify the System's Discretionary Access Controls - chmod

Check	Verify that the host records events that modify the system's discretionary access controls - `chown`.

Comments	**Not a Finding.** Make sure that you have the correct `chown` configuration on the host. The following settings are the correct configuration.
	`[root@localhost nwadmin]# grep chown /etc/audit/*`
	`/etc/audit/audit.rules:-a exit,always -F arch=b64 -S chown -S chmod -S fchmod -S fchmodat -S fchown -S fchownat -S fremovexattr -S fsetxattr -S lchown -S lremovexattr -S lremovexattr -S lsetxattr -S removexattr -S setxattr -F auid>=500 -F auid!=4294967295 -k perm_mod`
	`/etc/audit/audit.rules:-a exit,always -F arch=b32 -S chown -S fchmod -S fchmodat -S fchown -S fchownat -S fremovexattr -S fsetxattr -S lchown -S lremovexattr -S lremovexattr -S lsetxattr -S removexattr -S setxattr -F auid>=500 -F auid!=4294967295 -k perm_mod`

CCE-27209-6 Verify and Correct File Permissions with RPM (Control Group = n/a)

Rule Name	

Check	The RPM package management system can check file access permissions of installed software packages, including many that are important to system security. Verify that the file permissions of system files and commands match vendor values. Check the file permissions with the following command:
	`$ sudo rpm -Va | grep '^.M'`
	Output indicates files that do not match vendor defaults. After locating a file with incorrect permissions, run the following command to determine which package owns it:
	`$ rpm -qf FILENAME`
	Next, run the following command to reset its permissions to the correct values:
	`$ sudo rpm --quiet --setperms PACKAGENAME`

Comments	**Not a Finding.** The file permissions do not match the rpm, they are configured to be stricter during configuration management.

CCE-27303-7 (Control ID = 2) Modify the System Login Banner (Control Group = ssh)

Check	To configure the system login banner edit the `/etc/issue` file. Replace the default text with a message compliant with the local site policy or a legal disclaimer. The DoD required text is either: " You are accessing a U.S. Government (USG) Information System (IS) that is provided for USG-authorized use only. By using this IS (which includes any device attached to this IS), you consent to the following conditions: • The USG routinely intercepts and monitors communications on this IS for purposes including, but not limited to, penetration testing, COMSEC monitoring, network operations and defense, personnel misconduct (PM), law enforcement (LE), and counterintelligence (CI) investigations. • At any time, the USG may inspect and seize data stored on this IS. • Communications using, or data stored on, this IS are not private, are subject to routine monitoring, interception, and search, and may be disclosed or used for any USG-authorized purpose. • This IS includes security measures (e.g., authentication and access controls) to protect USG interests -- not for your personal benefit or privacy. -Notwithstanding the above, using this IS does not constitute consent to PM, LE or CI investigative searching or monitoring of the content of privileged communications, or work product, related to personal representation or services by attorneys, psychotherapists, or clergy, and their assistants. Such communications and work product are private and confidential. See User Agreement for details." or " I've read & consent to terms in IS user agreem't."
Comments	**Not a Finding.** The login banner is displayed but does not hyphenate "agreem't"

CCE-27311-0 Very Permissions on SHH Server *.pub Key Files (Control Group = na)

Check	
Comments	**Not a Finding.** All public keys are set to with permissions 640 in the `/etc/ssh/` directory.

CCE-27314-4 Enable SSH Warning Banner (Control Group = na)

Check	
Comments	**Not a Finding.** The required configuration exists in the `etc/ssh/sshd_conf` file.

CCE-27349-0 Set Default `firewalld` Zone for Incoming Packets (Control Group = n/a)

Check	To set the default zone to drop for the built-in default zone which processes incoming IPv4 and IPv6 packets, modify the following line in the `/etc/firewalld/firewalld.conf` file to be: `DefaultZone=drop`
Comments	**Not a Finding.** NetWitness Platform `firewalld`service is disabled because it uses IP Tables, not FirewallD.

CCE-27386-2 Ensure Default SNMP Password Is Not Used (Control Group = n/a)

Check	Edit `/etc/snmp/snmpd.conf` file by removing or changing the default community strings of public and private. After the default community strings have been changed, restart the SNMP service: `$ sudo service snmpd restart`
Comments	**Not a Finding.** NetWitness Platform does not use `snmp`, and the `snmpd` service not enabled.

CCE-27455-5 Use Only FIPS 140-2 Validated MACs (Control Group = na)

Check	
Comments	**Not a Finding.** The following configuration exists in `/etc/ssh/sshd_config` file: `MACs hmac-sha1,hmac-sha2-256,hmac-sha2-512`

CCE-27471-2 Disable SSH Access via Empty Passwords (Control Group = n/a)

Check	Explicitly disallow SSH login from accounts with empty passwords, add or correct the following line in the `/etc/ssh/sshd_config` file.
Comments	**Not a Finding.** NetWitness Platform sets the **permitemptypasswords** parameter to **no** by default. This should pass the DISA STIG rule check.

CCE-27485-2 Very Permissions on SHH Server Private *.key Key Files (Control Group = na)

Check	
Comments	**Not a Finding.** All private keys are set to with permissions 640 in the `/etc/ssh/` directory.

CCE-80156-3 Disable Kernel Parameter for Sending ICMP Redirects for All Interfaces (Control Group = n/a)

Check	To set the runtime status of the `t.ipv4.conf.all.send_redirects` kernel parameter, run the following command:
	`$ sudo sysctl -w net.ipv4.conf.all.send_redirects=0`
	If this is not the system default value, add the following line to the `/etc/sysctl.conf` file:
	`t.ipv4.conf.all.send_redirects = 0`

Comments	**Not a Finding.** NetWitness Platform does not accept incoming Internet Control Message Protocol (ICMP) traffic.

CCE-80157-1 Disable Kernel Parameter for IP Forwarding (Control Group = n/a)

Check	To set the runtime status of the `t.ipv4.ip_forward` kernel parameter, run the following command:
	`$ sudo sysctl -w net.ipv4.ip_forward=0`
	If this is not the system default value, add the following line to the `/etc/sysctl.conf` file:
	`t.ipv4.ip_forward = 0`

Comments	**Not a Finding.** NetWitness Platform only uses FIPS certified MACs (for example, `MACs hmac-sha1,hmac-sha2-256,hmac-sha2-512`).

CCE-80158-9 Configure Kernel Parameter for Accepting ICMP Redirects for All Interfaces (Control Group = n/a)

Check	To set the runtime status of the `t.ipv4.conf.all.accept_redirects` kernel parameter, run the following command:
	`$ sudo sysctl -w net.ipv4.conf.all.accept_redirects=0`
	If this is not the system default value, add the following line to the `/etc/sysctl.conf` file:
	`t.ipv4.conf.all.accept_redirects = 0`

Comments	**Not a Finding** NetWitness Platform does not accept incoming Internet Control Message Protocol (ICMP) traffic.

CCE-80163-9 Configure Kernel Parameter for Accepting ICMP Redirects By Default (Control Group = n/a)

Check	To set the runtime status of the `t.ipv4.conf.default.accept_redirects` kernel parameter, run the following command:
	`$ sudo sysctl -w net.ipv4.conf.default.accept_redirects=0`
	If this is not the system default value, add the following line to the `/etc/sysctl.conf` file:
	`t.ipv4.conf.default.accept_redirects = 0`

Comments	**Not a Finding** NetWitness Platform does not accept incoming Internet Control Message Protocol (ICMP) traffic.

CCE-80165-4 Configure Kernel Parameter to Ignore ICMP Broadcast Echo Requests (Control Group = n/a)

Rule Name	

Check	To set the runtime status of the `t.ipv4.icmp_echo_ignore_broadcasts` kernel parameter, run the following command:
	`$ sudo sysctl -w net.ipv4.icmp_echo_ignore_broadcasts=1`
	If this is not the system default value, add the following line to the `/etc/sysctl.conf` file:
	`t.ipv4.icmp_echo_ignore_broadcasts = 1`

Comments	**Not a Finding**NetWitness Platform does not accept incoming Internet Control Message Protocol (ICMP) traffic.

CCE-80225-6 Print Last Log (Control Group = n/a)

Check	When enabled, SSH will display the date and time of the last successful account log in. To enable `LastLog` in SSH, add or correct the following line in the `/etc/ssh/sshd_config` file: `PrintLastLog yes`
Comments	**Not a Finding.** NetWitness Platform sets `printlastlog` to `yes` by default.

CCE-80226-4 Enable Encrypted X11 Forwarding (Control Group = n/a)

Check	Enable Encrypted X11 Forwarding - By default, remote X11 connections are not encrypted when initiated by users. SSH has the capability to encrypt remote X11 connections when SSH's `X11Forwarding` option is enabled. To enable X11 Forwarding, add or correct the following line in the `/etc/ssh/sshd_config` file: `X11Forwarding yes`
Comments	**Not a Finding.**NetWitness Platform does not have X11 installed or running.

CCE-80348-6 Ensure gpgcheck Enabled for Repository Metadata (Control Group = n/a)

Check	Verify the operating system prevents the installation of patches, service packs, device drivers, or operating system components of local packages without verification of the repository metadata. Check that yum verifies the repository metadata prior to install with the following command. This should be configured by `setting repo_ gpgcheck` to `1` in `/etc/yum.conf`.
Comments	**Not a Finding.** .NetWitness Platform rpm signing procedures do not support signing the repo metadata

CCE-80383-3 Record Attempts to ALter Logon Events - failock (Control Group = na)

Check	
Comments	**Not a Finding.** The required rules are configured in the `/etc/audit/rules.d/nw-stig.rules` file.

CCE-80399-9 Ensure auditd Collects Information on the Use of Privileged Commands - userhelper (Control Group = na)

Check	
Comments	**Not a Finding.** The required rules are configured in the `/etc/audit/rules.d/nw-stig.rules` file.

CCE-80437-7 Configure PAM in SSSD Services (Control Group = n/a)

Check	SSSD should be configured to run SSSD pam services. To configure SSSD to known SSH hosts, add pam to services under the `[sssd]` section in `/etc/sssd/sssd.conf` file. For example: `[sssd] services = sudo, autofs, pam`
Comments	**Not a Finding.** NetWitness Platform does not currently support Multi-Factor authentication. As a result, SSSD service is not installed on a NetWitness Host.

CCE-80438-5 Configure Multiple DNS Servers in `/etc/resolv.conf` (Control Group = n/a)

Check	Multiple Domain Name System (DNS) Servers should be configured in the `/etc/resolv.conf` file. This provides redundant name resolution services in the event that a domain server crashes. To configure the system to contain as least 2 DNS servers, add a corresponding `nameserver` entry in `ip_address /etc/resolv.conf` file for each DNS server where `ip_address` is the IP address of a valid DNS server. For example: `search example.com nameserver 192.168.0.1 nameserver 192.168.0.2`
Comments	**Not a Finding.** NetWitness Platform orchestrates and configures an internal DNS server that all NetWitness hosts use for name resolution. You can configure external DNS servers, but it is dependent on your environment.

CCE-80439-3 Configure Time Service Maxpoll Interval (Control Group = na)

Check	
Comments	**Not a Finding.** The required `maxpoll 10` value is set in the `/etc/ntp.conf` file.

CCE-80447-6 Configure the Firewalld Ports (Control Group = n/a)

Check	Configure the `firewalld` ports to allow approved services to have access to the system. To configure `firewalld` to open ports, run the following command:
	`$ sudo firewall-cmd --permanent --add-port= or port_number/tcp $ sudo firewall-cmd --permanent --add-port=`
	Run the command list above for each of the ports listed below: <ports>
	To configure `service_nam firewalld` to allow access, run the following command(s):
	`firewall-cmd --permanent --add-service=ssh`

Comments	**Not a Finding.** NetWitness Platform `firewalld` service is disabled because it uses IP Tables, not FirewallD.

CCE-80515-0 Configure SSSD LDAP Backend Client CA Certificate Location (Control Group = n/a)

Check	Configure SSSD to implement cryptography to protect the integrity of LDAP remote access sessions. By setting the `ldap_tls_cacertdir` option in `/etc/sssd/sssd.conf` to point to the path for the X.509 certificates used for peer authentication. `ldap_tls_cacertdir /path/to/tls/cacert`
Comments	**Not a Finding.** NetWitness Platform does not currently support Multi-Factor authentication. As a result, SSSD service is not installed on a NetWitness Host.

CCE-80545-7 Verify and Correct Ownership with RPM (Control Group = n/a)

Check	The RPM package management system can check file ownership permissions of installed software packages, including many that are important to system security. After locating a file with incorrect permissions, which can be found with `rpm -Va | grep '^.....\(U|.G\)'`
	Run the following command to determine which package owns it:
	`$ rpm -qf`
	Next, run the following command to reset its permissions to the correct values:
	`FILENAME $ sudo rpm --setugids PACKAGENAME`

Comments	**Not a Finding.**Files/Directories with ownership differing from the rpm are generally COTS based and have been changed from root ownership to a specified COTS related account.

CCE-80546-5 Configure SSSD LDAP Backend to Use TLS For All Transactions (Control Group = n/a)

Check	This check verifies that RHEL7 implements cryptography to protect the integrity of remote LDAP authentication sessions. To determine if LDAP is being used for authentication, use the following command:
	`$ sudo grep -i useldapauth /etc/sysconfig/authconfig If USELDAPAUTH=yes`
	To check if LDAP is configured to use TLS, use the following command:
	`$ sudo grep -i ldap_id_use_start_tls /etc/sssd/sssd.conf`

Comments	**Not a Finding.**NetWitness Platform does not currently support Multi-Factor authentication. As a result, the SSSD service is not installed on a NetWitness Host.

CCE-80998-8 Verify firewall Enabled

Check	Verify the operating system enabled an application firewall. Check to see if "firewalld" is installed with the following command:
	`yum list installed firewalld`
	`firewalld-0.3.9-11.el7.noarch.rpm`
	If the "firewalld" package is not installed, ask the System Administrator if another firewall application (such as iptables) is installed.
	If an application firewall is not installed, this is a finding.
	Check to see if the firewall is loaded and active with the following command:
	`systemctl status firewalld`
	`firewalld.service - firewalld - dynamic firewall daemon`
	Loaded: loaded (/usr/lib/systemd/system/firewalld.service; enabled)
	Active: active (running) since Tue 2014-06-17 11:14:49 CEST; 5 days ago
	If "firewalld" does not show a status of "loaded" and "active", this is a finding.
	Check the state of the firewall:
	`firewall-cmd --state`
	`running`
	If "firewalld" does not show a state of "running", this is a finding.

Comments	**Not a Finding.** NetWitness Platform firewalldservice is disabled because it uses IP Tables, not FirewallD.

CCE-82035-7 Ensure /var/log/audit Located On Separate Partition

Check	Determine if the operating system is configured to have the "/var/log/audit" path is on a separate file system.
	`grep /var/log/audit /etc/fstab`
	If no result is returned, or the operating system is not configured to have "/var/log/audit" on a separate file system, this is a finding.
	Verify that "/var/log/audit" is mounted on a separate file system:
	`mount | grep "/var/log/audit"`
	If no result is returned, or "/var/log/audit" is not on a separate file system, this is a finding.

Comments	**Not a Finding**. NetWitness Platform has the /var/log directory as a separate partition.

CCE-82053-0 Ensure /tmp Located On Separate Partition

Check	Verify that a separate file system/partition has been created for "/tmp". Check that a file system/partition has been created for "/tmp" with the following command:
	`systemctl is-enabled tmp.mount`
	`enabled`
	If the "tmp.mount" service is not enabled, check to see if "/tmp" is defined in the fstab with a device and mount point:
	`grep -i /tmp /etc/fstab`
	UUID=a411dc99-f2a1-4c87-9e05-184977be8539 /tmp ext4 rw,relatime,discard,data=ordered,nosuid,noexec, 0 0
	If "tmp.mount" service is not enabled or the "/tmp" directory is not defined in the fstab with a device and mount point, this is a finding.

Comments	**Future Feature** - NetWitness Platform does not meet this requirement. NetWitness plans to fix this in a future release of NetWitness Platform.

CCE-82353-4 Ensure /var Located On Separate Partition

Check	Verify that a separate file system/partition has been created for "/var". Check that a file system/partition has been created for "/var" with the following command: `grep /var /etc/fstab` UUID=c274f65f /var ext4 noatime,nobarrier 1 2 If a separate entry for "/var" is not in use, this is a finding.
Comments	**Not a Finding.** Hardware is dedicated for NetWitness, and NetWitness software is installed in /var/netwitness by default and a separate partition is on /var/netwitness.

Rules Supported in a Future Release

The following checks for non-compliance to STIG rules are not supported in NetWitness Platform and will be added in a future release.

CCE-27277-3 Disable Modprobe Loading of USB Storage Driver (Control Group = services)

Check	To prevent USB storage devices from being used, configure the kernel module loading system to prevent automatic loading of the USB storage driver. To configure the system to prevent the usb-storage kernel module from being loaded, add the following line to a file in the `/etc/modprobe.d` directory : `install usb-storage /bin/true` This will prevent the `modprobe` program from loading the usb-storage module, but will not prevent an administrator (or another program) from using the `insmod` program to load the module manually.
Comments	**Future Feature.**

CCE-27309-4 Set Boot Loader Password in `grub2` (Control Group = fips-kernel)

Check	The `grub2` boot loader should have a superuser account and password protection enabled to protect boot-time settings. To do so, select a superuser account name and password and and modify the `/etc/grub.d/01_users` configuration file with the new account name. Because plain text passwords are a security risk, generate a hash for the password by running the following command:
	`$ grub2-setpassword`
	When prompted, enter the password that was selected.
	NOTE: It is recommended not to use common administrator account names like root, admin, or administrator for the `grub2` superuser account. Change the superuser to a different username (The default is 'root').
	`$ sed -i s/root/bootuser/g /etc/grub.d/01_users`
	To meet FISMA Moderate, the bootloader superuser account and password MUST differ from the root account and password. Once the superuser account and password have been added, update the `grub.cfg` file by running:
	`grub2-mkconfig -o /boot/grub2/grub.cfg`
	NOTE: Do NOT manually add the superuser account and password to the `grub.cfg` file as the `grub2-mkconfig` command overwrites this file.

Comments	**Future Feature.**

CCE-80179-5 Configure Kernel Parameter for Accepting IPv6 Source-Routed Packets for All Interfaces

Check	To set the runtime status of the `t.ipv6.conf.all.accept_source_route` kernel parameter, run the following command:
	`$ sudo sysctl -w net.ipv6.conf.all.accept_source_route=0`
	If this is not the system default value, add the following line to the `/etc/sysctl.conf` file:
	`t.ipv6.conf.all.accept_source_route = 0`

Comments	**Future Feature.**

CCE-80660-4 Record Any Attempts to Run setfiles (Control Group = audit)

Check	At a minimum, the audit system should collect any execution attempt of the setfiles command for all users and root. If the auditd daemon is configured to use the augenrules program to read audit rules during daemon startup (the default), add the following lines to a file with `.rules` in `/etc/audit/rules.d: -a always,exit -F path=/usr/sbin/setfiles -F perm=x -F auid>=1000 -F auid!=429496729as a suffix 5 -F key=privileged-priv_change`. If the `auditd` daemon is configured to use the `auditctl` utility to read audit rules during daemon startup, add the following lines to `/etc/audit/audit.rules` file: `-a always,exit -F path=/usr/sbin/setfiles -F perm=x -F auid>=1000 -F auid!=4294967295 -F key=privileged-priv_chang`
Comments	**Future Feature.**

CCE-80661-2 Ensure `auditd` Collects Information on Kernel Module Loading - `create_module` (Control Group = audit)

Check	To capture kernel module loading events, use following line, setting ARCH to either b32 for 32-bit system, or having two lines for both b32 and b64 in case your system is 64-bit: `-a always,exit -F arch=` The place where you add the line depends on the way `ARCH -S create_module -F key=modules auditd` daemon is configured. If it is configured to use the augenrules program (the default), add the line to a file with the `.rules` suffix in the `/etc/audit/rules.d` directory. If the `auditd` daemon is configured to use the `auditctl` utility, add the line to the `/etc/audit/audit.rules`file .
Comments	**Future Feature.**

Troubleshoot NetWitness Platform

For information about troubleshooting NetWitness, see the following topics:

- Debugging Information
- Error Notification
- Miscellaneous Tips
- NwLogPlayer: see the *Log Parser Customization Guide* for details.
- Troubleshoot Feeds

Debugging Information

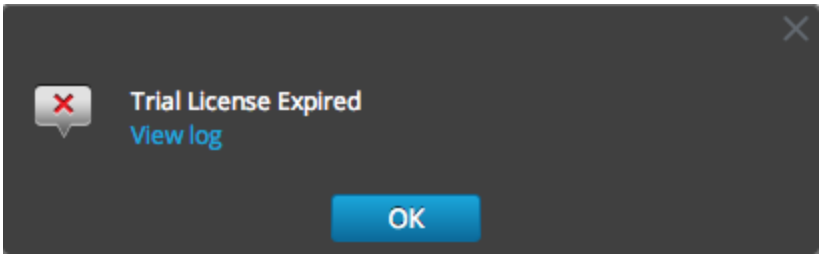
NetWitness Log Files

The following files contain NetWitness log information.

Component	File
rabbitmq	/var/log/rabbitmq/nw@localhost.log /var/log/rabbitmq/nw@localhost-sasl.log
collectd	/var/log/messages
nwlogcollector	/var/log/messages
nwlogdecoder	/var/log/messages
sms	/opt/rsa/sms/wrapper.log
sms	/opt/rsa/sms/logs/sms.log
sms	/opt/rsa/sms/logs/audit/audit.log
NetWitness	/var/lib/netwitness/uax/logs/nw.log
NetWitness	/var/lib/netwitness/uax/logs/audit/audit.log
NetWitness	/opt/rsa/jetty9/logs

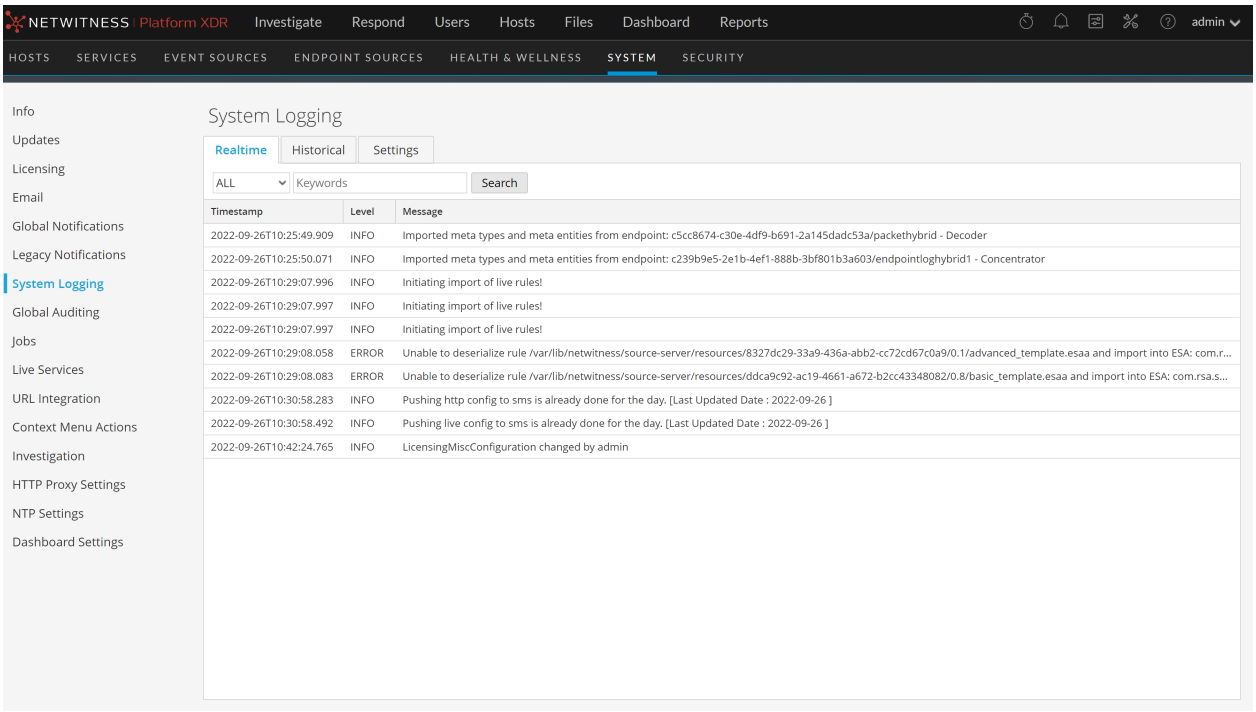
Files of Interest

The following files are used in key NetWitness components, and can be useful when trying to track down miscellaneous issues.



Component	File	Description
rabbit	/etc/rabbitmq/rabbitmq.config	RabbitMQ configuration file. This configuration file partially drives the behavior of RabbitMQ, particularly around network/SSL settings.
rabbit	/etc/rabbitmq/rabbitmq-env.conf	RabbitMQ environment configuration file. This file specifies the RabbitMQ node name and location of the enabled plugins file.

Component	File	Description
rabbit	/etc/rabbitmq/rsa_enabled_plugins	This file specifies the list of enabled plugins in RabbitMQ. This file is managed by the RabbitMQ server, with the `rabbitmq-plugins` command. This file overrides the `/etc/rabbitmq/enabled_plugins` path to work around issues with upgrading the Log Collector from early versions.
rabbit	/etc/rabbitmq/ssl/truststore.pem	The RabbitMQ trust store. This file contains a sequence of PEM-encoded X.509 certificates, represented trust CAs. Any clients that connect to RabbitMQ and present a certificate that is signed by a CA in this list is considered a trusted client.
rabbit	/var/log/rabbitmq/mnesia/nw@localhost	The RabbitMQ Mnesia directory. Mnesia is the Erlang/OTP database technology, for storing Erlang objects persistently. RabbitMQ uses this technology for storing information such as the current set of policies, persistent exchanges and queues, and so forth. Importantly, the `msg_store_persistent` and `msg_store_transient` directories are where RabbitMQ stores messages that have been spooled to disk, for example, if messages are published as persistent messages, or have paged off to disk due to memory limitations. Keep a close eye on this directory if disk or memory alarms have tripped in RabbitMQ. **Caution:** Do not delete these files manually. Use RabbitMQ tools to purge or delete queues. Modifying these files manually may render your RabbitMQ instance inoperable.



Error Notification

NetWitness has a set of error message types associated with different components and operations. NetWitness displays feedback in the form of a simple error notification and a log entry.

When an error notification dialog is displayed, you have two options: simply acknowledge the message or view the system log for more information.

If you want to view the system log for more information when an error notification is displayed, click **View log**. The log opens in the **(Admin)** > **System** view with a list of messages. Timestamp and message level are also listed.

Miscellaneous Tips

Audit Log Messages

It can be useful to see which user actions result in which log message types in the `/var/log/messages` file.

The event categories spreadsheet included in the log parser package in the NetWitness Parser v2.0.zip archive lists the event categories and the event parser lines to help with building reports, alerts, and queries.

NwConsole for Health & Wellness

RSA has added the command option `logParse` in NwConsole. This command option supports log parsing, a convenient way to check a log parser without setting up the full system to perform log parsing. For more information about the `logParse` command, at the command line, type `help logParse`.

Thick Client Error: remote content device entry not found

The remote content device entry was not found error can be generated for a correlation rule applied to a Concentrator. In NetWitness Investigate, if you click the `correlation-rule-name` meta value in the Alert meta key, you do not get session information.

Instead of using correlation rules on Decoders and Concentrators, use ESA rules. The ESA rules **do** record the correlation sessions that match the ESA rule.

View Example Parsers

Since Flex and Lua parsers are encrypted when they are delivered by Live, you cannot easily view their contents.

However, some plain text examples are available here: https://www.dell.com/support/home/en-us.

Configure WinRM Event Sources

The following Inside Dell article has a video that walks through the process of setting up Windows RM (Remote Management) collection: https://inside.dell.com/docs/DOC-122732.

Additionally, it contains two scripts that are shortcuts for procedures described in the "Windows Event Source Configuration Guide."

Troubleshoot Feeds

Overview

The purpose of the feed generator is to generate a mapping of an event source to the list of groups to which it belongs.

If you have an event source from which you are collecting messages, and it is not displayed in the correct event source groups, this topic provides background and information to help you track down the problem.

Details

The ESM Feed maps multiple keys to single value. It maps the DeviceAddress, Forwarder, and DeviceType attributes to groupName.

The purpose of the ESM feed is to enrich event source meta with the groupName collected on the Log Decoder.

How it Works

The feed generator is scheduled to update every minute. However, it is triggered only if there are any changes (create, update, or delete) in event sources or groups.

It generates a single feed file with event-source-to-group mapping, and pushes the same feed to all of the Log Decoders that are connected to NetWitness.

Once the feed file is uploaded on the Log Decoders, for any new events, it enriches events meta data with groupName, and appends this groupName to logstats.

Once the groupName is in logstats, the ESM Aggregator groups information and sends it to ESM. At this point, you should see the **Group Name** column under the **Event Source Monitoring** tab.

The entire process can take some time. Therefore, you may need to wait for several seconds after you add a new group or event source, before the Group name is displayed.

Note: If the event source type attribute changes when the feed is updated, NetWitness adds a new logstats entry rather than updating the existing one. Thus, there will be two different logstats entries in `logdecoder`. Previously existing messages would have been listed under the previous type, and all new messages are logged for the new event source type.

Feed File

The format of the feed file is as follows:

```
DeviceAddress, Forwarder, DeviceType, GroupName
```

The `DeviceAddress` is either `ipv4, ipv6`, or `hostname`, depending on which of these have been defined for the event source.

The following is a sample of the feed file:

```
"12.12.12.12","d6","NETFLOW","grp1"
"12.12.12.12","ld4","netflow","grp1"
"12.12.12.12","d6","netfow","grp1"
"0:E:507:E6:D4DB:E:59C:A","10.25.50.243","apache","Apachegrp"
"1.2.3.4","LCC","apache","Apachegrp"
"10.100.33.234","LC1","apache","Apachegrp"
"10.25.50.248","10.25.50.242","apache","Apachegrp"
"10.25.50.251","10.25.50.241","apache","Apachegrp"
"10.25.50.252","10.25.50.255","apache","Apachegrp"
"10.25.50.253","10.25.50.251","apache","Apachegrp"
"10.25.50.254","10.25.50.230","apache","Apachegrp"
"10.25.50.255","10.25.50.254","apache","Apachegrp"
"13.13.13.13","LC1","apache","Apachegrp"
"AB:F255:9:8:6C88:EEC:44CE:7",,"apache","Apachegrp"
"Appliance1234",,"apache","Apachegrp"
"CB:F255:9:8:6C88:EEC:44CE:7","10.25.50.253","apache","Apachegrp"
```

Troubleshooting

You can check the following items to narrow down where the problem is occurring.

Feed File Existence

Verify that the feeds ZIP archive exists in the following location:

`/opt/rsa/sms/esmfeed.zip`

Do not modify this file.

Group Meta Populated on LD

Verify that the group meta is populated on the Log Decoder. Navigate to the Log Decoder REST and check logstats:

`http://LogDecoderIP:50102/decoder?msg=logStats&force-content-type=text/plain`

This is a sample logstats file with group information:

```
device=apache  forwarder=NWAPPLIANCE10304  source=1.2.3.4  count=338
lastSeenTime=2015-Feb-04 22:30:19  lastUpdatedTime=2015-Feb-04 22:30:19
groups=IP1234Group,apacheGroup
device=apachetomcat  forwarder=NWAPPLIANCE10304  source=5.6.7.8  count=1301
```

```
lastSeenTime=2015-Feb-04 22:30:19  lastUpdatedTime=2015-Feb-04 22:30:19
groups=AllOtherGroup,ApacheTomcatGroup
```

In the above text, the group information is **bold**.

Device Group Meta on Concentrator

Verify that the **Device Group** meta data exists on the Concentrator, and that events have values for the `device.group` field.

SMS Log File

Check the SMS log file in the following location to view informational and error messages: `/opt/rsa/sms/logs/sms.log`

The following are examples informational messages:

```
Feed generator triggered...
Created CSV feed file.
Created zip feed file.
Pushed ESM Feed to LogDeocder : <logdecoder IP>
```

The following are examples of error messages:

```
Error creating CSV File : <reason>Unable to push the ESM Feed: Unable to
create feed zip archive.
Failed to add Group in CSV: GroupName: <groupName> : Error: <error>
Unable to push the ESM Feed: CSV file is empty, make sure you have al-least on
group with al-least one eventsource.
Unable to push the ESM Feed: No LogDecoders found.
```

```
Unable to push the ESM Feed: Unable to push feed file on LogDecoder-
<logdecoderIP>Unable to push the ESM Feed:
admin@<logdecoderIP>:50002/decoder/parsers received error: The zip archive
"/etc/netwitness/ng/upload/<esmfeedfileName>.zip" could not be opened
Unable to push the ESM Feed: <reason>
```

Verify Logstats Data is Getting Read and Published by ESMReader and ESMAggregator

These are the steps to verify that logstats are collected by `collectd` and published to Event Source Management.

ESMReader

1. On LogDecoders add the **debug "true"** flag in **/etc/collectd.d/NwLogDecoder_ESM.conf**:

```
#
# Copyright (c) 2014 RSA The Security Division of EMC
#
<Plugin generic_cpp> PluginModulePath "/usr/lib64/collectd"
    debug "true"
    <Module "NgEsmReader" "all"> port "56002"
        ssl       "yes"
        keypath   "/var/lib/puppet/ssl/private_keys/d4c6dcd4-6737-4838-
a2f7-ba7e9a165aae.pem"
        certpath  "/var/lib/puppet/ssl/certs/d4c6dcd4-6737-4838-a2f7-
ba7e9a165aae.pem"
        interval  "600"
        query     "all"
        <stats></stats></Module><Module "NgEsmReader" "update"> port
"56002" ssl "yes"
        keypath   "/var/lib/puppet/ssl/private_keys/d4c6dcd4-6737-4838-
a2f7-ba7e9a165aae.pem"
        certpath  "/var/lib/puppet/ssl/certs/d4c6dcd4-6737-4838-a2f7-
ba7e9a165aae.pem"
        interval  "60"
        query     "update"
        <stats></stats></Module></Plugin>
```

2. Run the command:
   `collectd service restart`
3. Run the following command:
   `tail –f /var/log/messages | grep collectd`
   Verify that ESMReader is reading logstats and there are no errors. If there are any read issues, you will see errors similar to the following:

```
Apr 29 18:47:45 NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_all:
error getting ESM data for field "groups" from logstat device=checkpointfw1
forwarder=PSRTEST source=1.11.51.212. Reason: <reason>Apr 29 18:58:36
NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_update: error getting ESM
data for field "forwarder" from logstat device=apachetomcat
source=10.31.204.240. Reason: <reason>
```

ESMAggregator

1. On NetWitness, uncomment the verbose flag in **/etc/collectd.d/ESMAggregator.conf**:

```
# ESMAggregator module collectd.conf configuration file
#
# Copyright (c) 2014 RSA The Security Divsion of EMC
#

<Plugin generic_cpp>    PluginModulePath "/usr/lib64/collectd"

<Module "ESMAggregator">
        verbose 1
        interval "60"
        cache_save_interval "600"
        persistence_dir "/var/lib/netwitness/collectd"
</Module>    </Plugin>
```

2. Run the following command:
   `collectd service restart.`
3. Run the following command:
   `run “tail –f /var/log/messages | grep ESMA`
   Look for for ESMAggregator data and make sure your logstat entry is available in logs.

Sample output:

```
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[0]
logdecoder[0] = d4c6dcd4-6737-4838-a2f7-ba7e9a165aae
```

```

value of 1752 for NWAPPLIANCE15788/cacheflowelff/esm_counter-3.3.3.3
aggregated from 1 log
```

Configure JMX Feed Generator Job Interval

Although the feed generation job is scheduled to execute every minute by default, you can change this by using `jconsole`.

To change the feed generator job interval:

1. Open **jconsole** for the SMS service.
2. On the MBeans tab, navigate to **com.rsa.netwitness.sms** > **API** > **esmConfiguration** > **Attributes**.
3. Modify the value for the property **FeedGeneratorJobIntervalInMinutes**.

4. Go to **Operations** under the same navigation tree, an click **commit()**. This persists the new value in the corresponding json file under **/opt/rsa/sms/conf**, and uses the value if SMS is restarted.

Setting a new value reschedules the feed generator job for the new interval.

Troubleshooting Cert-Reissue Command

You must contact Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897) to troubleshoot problems. You know there is a problem if any `<host-id>` does not return a `Success`**Status**. `Success` indicates that certificates were reissued for a host.

Argument Options Used for Troubleshooting

You use the following argument options with `cert-reissue --host-all` to troubleshoot problems.

You can run `cert-reissue --host-all<arguments>` multiple times without an adverse effect.

Note: Use the following Argument Options with caution. They force the `cert-reissue` command to execute for all the hosts.

Argument Option	Description
`--skip-health-checks`	Reissues certificates for all hosts at one time without applying system health checks (force Reissue). This means that the command does not: • verify that all hosts are online line. • verify that all services are running. **Use case:** You have numerous hosts and you know that a small minority of them will fail. This updates all the hosts that conform to the checking rules and you can reissue certificates for the others subsequently with the help of Customer Support.
`--skip-version-checks`	Do not verify that hosts are running version 11.4.0.0 or later. **Use Case:** You have numerous hosts and your know that some of them are not updated to 11.4 or later. This reissues certificates for all the hosts that are at 11.4 or later and you can reissue certificates for the others subsequently with the help of Customer Support.
`--ignore-trigger-errors`	Ignore any errors that trigger failures. This option forces the cert reissue process to continue disregarding the errors instead of aborting or failing the cert reissue command quickly. When a cert reissue for a host succeeds, the reissued certificates on that host are not provisioned to other dependent hosts (referred to as trusts). In this case, the: • host with reissued certificates is reported as “Partial.” • the hosts with trusts that failed to update are listed separately in the summary table to tell you that these hosts may require a refresh using the new `--refresh-trusts-only` option.

Argument Option	Description
`--refresh-trusts-only`	Refreshes trusts exclusively for host identified by `<id>` (does not reissue certificates for that host).

Problems and How to Troubleshoot Them

This section describes solutions to problems that you may encounter when running the cert-reissue command to reissue certificates with suggested causes and solutions.

Status	Failed!
Error Message	... 2019-02-06 13:34:39.646 INFO 8540 --- [main] c.r.n.i.o.client.OrchestrationClient : Checking host connections... ... 2019-02-06 13:34:57.861 ERROR 8540 --- [main] c.r.n.i.o.client.HostValidator : Host '192.168.200.99' (nw-platform-esa-primary) verification failed! ... 2019-02-06 13:34:57.862 INFO 8540 --- [main] c.r.n.i.o.client.OrchestrationClient : Checking status of services... 2019-02-06 13:35:57.931 ERROR 8540 --- [main] c.r.n.i.o.client.HostValidator : Service 'nw-platform-node-zero - Investigate Server' not available! ... +---------+--------------------+--------+--+ | | Host | Status | Message | +---------+--------------------+--------+--+ |<host-id>| <IP-address> |Failed! |failed to connect, is host online? | |<host-id>| <IP-address> |Failed! |service(s) down | |<host-id>| <IP-address> |N/A |[Skipped...] | |<host-id>| <IP-address> |N/A |[Skipped...] | |<host-id>| <IP-address> |N/A |[Skipped...] | +---------+--------------------+--------+--+
Cause	`cert-reissue --host-all` failed because one or more hosts are offline or one or more run time services are unreachable. You can force this command to run in spite of this error by specifying the `--skip-health-checks` option, that is: `cert-reissue --host-all--skip-health-checks`
Solution	1. Bring appropriate hosts back online or make sure the NW Server hosts run time services are running. 2. Run `cert-reissue` for the hosts affected.

Status	Failed!
Error Message	... 2019-02-06 13:34:39.643 ERROR 8540 --- [main] c.r.n.i.o.client.HostValidator : Host '192.168.200.102' (nw-platform-decoder) version '11.2.0.0' not supported, minimum required version: 11.3.0.0 2019-02-06 13:34:39.644 ERROR 8540 --- [main] c.r.n.i.o.client.HostValidator : Host '192.168.200.101' (nw-platform-concentrator) version '11.2.0.0' not supported, minimum required version: 11.3.0.0 ... +---------+--------------------+--------+---+ | | Host | Status | Message | +---------+--------------------+--------+---+ |<host-id>| <IP-address> |Failed! |version <version-earlier-than-11.3.0.0> not supported| |<host-id>| <IP-address> |Failed! |version <version-earlier-than-11.3.0.0> not supported| |<host-id>| <IP-address> |N/A |[Skipped...] | |<host-id>| <IP-address> |N/A |[Skipped...] | |<host-id>| <IP-address> |N/A |[Skipped...] | +---------+--------------------+--------+---+
Cause	`cert-reissue -host-all` command string failed because one or more hosts are running a version earlier than 11.4.0.0 **Note:** You can force the reissue of certificates for the remaining hosts using the `-skip-version-checks` argument.
Solution	Update the host to 11.4 or later and run `cert-reissue` for that host again.

Status	Partial
Error Message	... 2019-02-06 02:27:09.078 ERROR 20647 --- [main] c.r.n.i.o.client.OrchestrationClient : Trigger failed for host '<IP-address>' (nw-platform-decoder) 2019-02-06 02:27:09.079 ERROR 20647 --- [main] c.r.n.i.o.client.OrchestrationClient : Trigger failed for host '<IP-address>' (nw-platform-concentrator) ... 2019-02-06 02:27:09.118 WARN 20647 --- [main] c.r.n.i.o.client.OrchestrationClient : One or more host(s) may require manual refresh due to failed triggers: +---------+--------------------+ | | Host | +---------+--------------------+ |<host-id>| <IP-address> | |<host-id>| <IP-address> | +---------+--------------------+ ... +---------+--------------------+--------+---+ | | Host | Status | Message | +---------+--------------------+--------+---+ |<host-id>| <IP-address> |Partial |Reissue completed, triggers failed | |<host-id>| <IP-address> |N/A |[Skipped…] | |<host-id>| <IP-address> |N/A |[Skipped...] | |<host-id>| <IP-address> |N/A |[Skipped...] | |<host-id>| <IP-address> |N/A |[Skipped...] | +---------+--------------------+--------+---+
Cause	`cert-reissue` command completed on NW Server host however one or more triggers failed. This aborted the `cert-reissue` command for other hosts.
Solution	Address all the errors and run the `cert-reissue --host-all<arguments>` command string again.

Status	Partial
Error Message	... 2019-02-06 14:18:03.208 ERROR 17800 --- [main] c.r.n.i.o.client.OrchestrationClient : Trigger failed for host '192.168.200.82' (nw-platform-node-x) ... ... 2019-02-06 14:29:05.200 WARN 17800 --- [main] c.r.n.i.o.client.OrchestrationClient : One or more host(s) may require manual refresh due to failed triggers: +---------+--------------------+ | | Host | +---------+--------------------+ |<host-id>| <IP-address> | +---------+--------------------+ ... +---------+--------------------+--------+---+ | | Host | Status | Message | +---------+--------------------+--------+---+ |<host-id>| <IP-address> |Failed! |Cert reissue failed! | |<host-id>| <IP-address> |Partial |Reissue completed, triggers failed | |<host-id>| <IP-address> |Success | Cert reissue successful | |<host-id>| <IP-address> |Success | Cert reissue successful | |<host-id>| <IP-address> |Success | Cert reissue successful | +---------+--------------------+--------+---+
Cause	One or more hosts did not pass system health checks. In addition, one or more of the unhealthy hosts are running core services, which will result in the NW Server host `cert-reissue` to fail (because of failed triggers explained above). By disabling health checks and trigger errors, you can continue the process and reissue certificates for the remaining hosts. The NW Server host **Status** is reported as `Partial` because the `cert-reissue` command completed for the NW Server but downstream triggers failed for other hosts.
Solution	Manually refresh the failed core hosts (to synchronize trust peers). Submit the following command string to reissue certificates for healthy hosts. `cert-reissue --host-all --skip-health-checks --ignore-trigger-errors`

References

This section describes the NetWitness user interface views in which you can perform system maintenance tasks. You use this interface to:

- Monitor and maintain services (settings, statistics, command and message syntax, REST API, NetWitness Console utility, and protocols supported in NetWitness).
- Display the current NetWitness version and license status.
- Manage your Local Update Repository from which you apply software version updates to hosts.

The following topics describe each interface in detail:

- Health and Wellness View
  - Health and Wellness View - Alarms View
  - Event Source Monitoring View
  - Health and Wellness Historical Graphs
    - Historical Graph View for Events Collected from an Event Source
    - Historical Graph for System Stats
  - Health and Wellness Settings View - Archiver
  - Health and Wellness Settings View - Event Sources
  - Health and Wellness Settings View - Warehouse Connector
  - Monitoring View
  - Policies View
  - System Stats Browser View
- New Health & Wellness Tab
- System View - System Info Panel
- System Updates Panel - Settings Tab
- System Logging - Settings View
- System Logging - Realtime Tab
- System Logging - Historical Tab

Health and Wellness View

The Health and Wellness settings allow you to set and view alarms, monitor events, and view policies and system statistics. For more details on each of these, see the following topics:

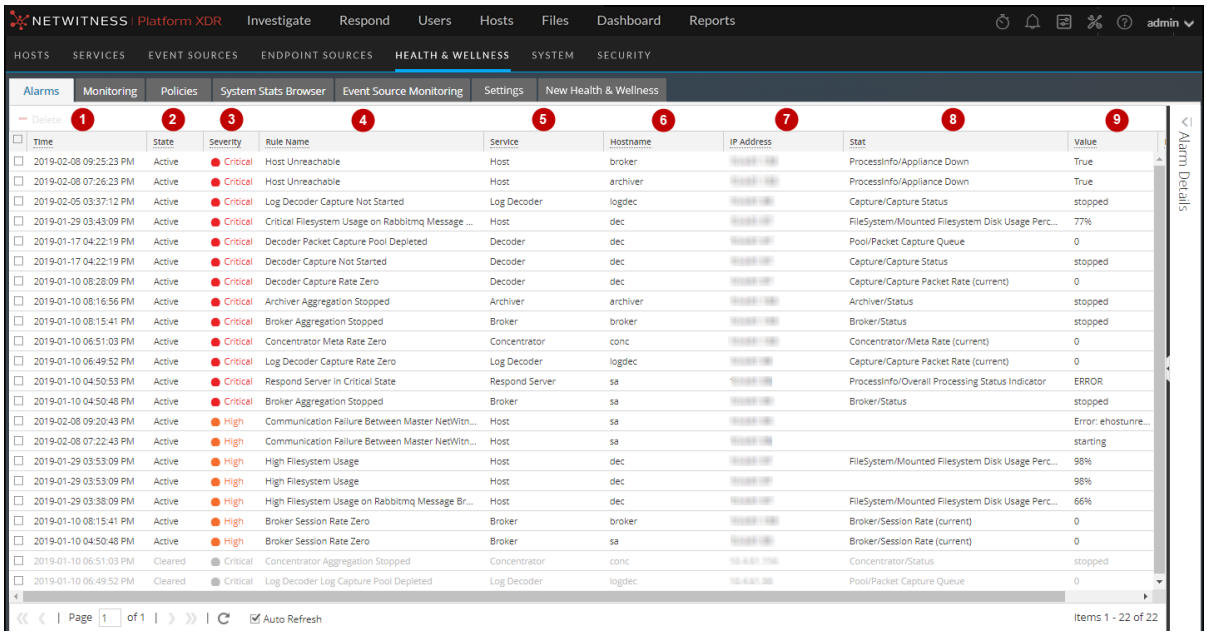
- Health and Wellness View - Alarms View
- Event Source Monitoring View
- Health and Wellness Historical Graphs
- Health and Wellness Settings View - Archiver
- Health and Wellness Settings View - Event Sources
- Health and Wellness Settings View - Warehouse Connector
- Monitoring View
- Policies View
- System Stats Browser View

Health and Wellness View - Alarms View

You can monitor hosts and services to determine when user-defined limitations have been reached by viewing all the active alarms. Policy rules, that you define or assign to hosts and services, in the **Policies tab** trigger these alarms. You can:

- View all the alarms that are currently active for all your systems and services
- Select an alarm and view its details

What do you want to do?

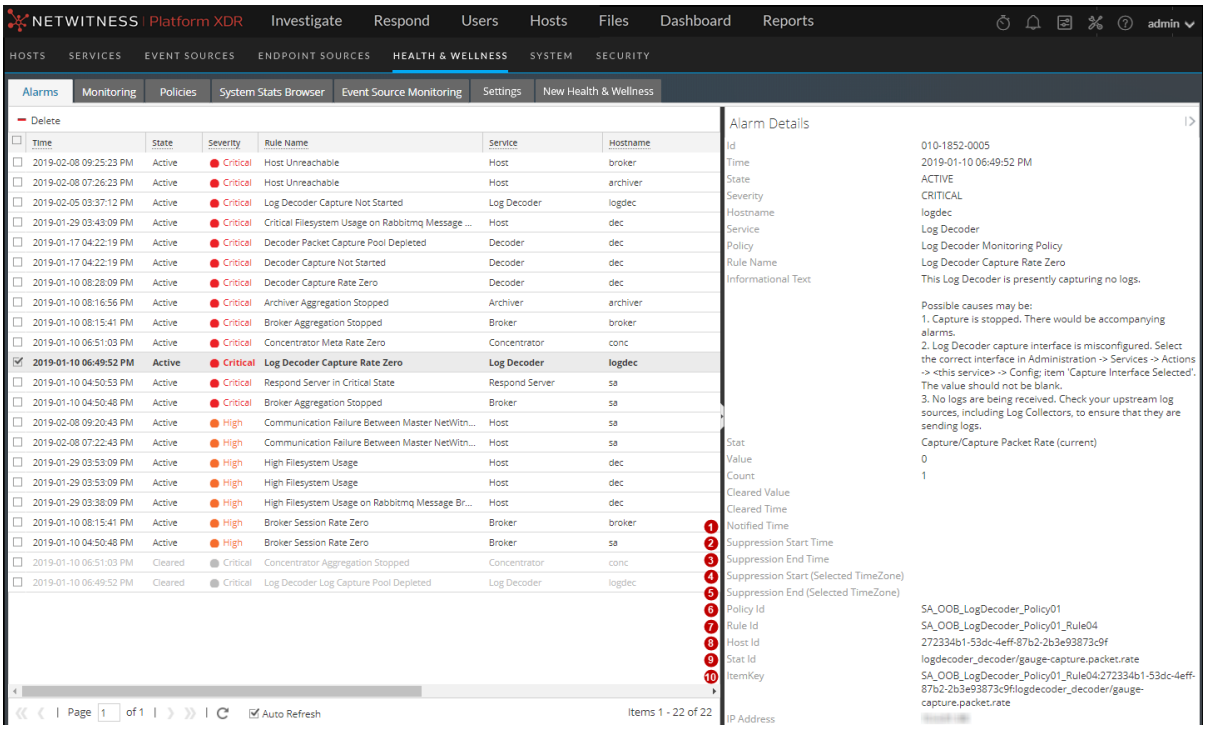


Role	I want to ...	Show me how
Administrator	View the alarm status of NetWitness Servers and services.	Monitor Alarms
Administrator	View detailed information about a specific alarm.	Monitor Alarms

Related Topics

Manage Policies

Quick Look



The required permission to access this view is **Manage services**. To access the Alarms view, go to  **(Admin)** > **Health & Wellness**. The Health & Wellness view opens with the Alarms tab displayed. The Alarms tab contains an alarms list and an Alarm Details panel.

1	Time when the alarm was triggered.
2	Status of the alarm: • **Active** - the statistical threshold was crossed triggering the alarm. • **Cleared** - the clearing threshold was crossed and the alarm is no longer active.
3	Severity assigned to this alarm: • **Critical** • **High** • **Medium** • **Low**
4	Name of the rule that triggers the alarm.
5	Service defined in the rule.
6	Host on which the alarm is triggered.
7	Statistic selected in the rule that triggers the alarm.
8	Value of the statistic that triggered the alarm.
9	Identification number of the alarm.

Note: NetWitness sorts the alarms in time order. You can sort the relevant parameters in ascending or descending order.

This figure shows the Alarms tab with the Alarm Details panel expanded.

Alarm Details Panel

The Alarm Details panel displays information for the alarm selected in the Alarms list. It contains all the information in the Alarms list plus the following fields.

1. Alarm Notified time
2. Suppression start time
3. Suppression end time
4. Suppression start (selected time zone)
5. Suppression end (selected time zone)
6. The Policy ID
7. The Rule ID
8. The Host ID
9. The Stat ID
10. Item key

Event Source Monitoring View

Note: For NetWitness 11.3.1, this view has been deprecated: this functionality is now available in the **(Admin) > Event Sources > Discovery** view. To manage Event Sources, see "About Event Source Management" in the *NetWitness Event Source Management Guide*.

Health and Wellness Historical Graphs

Configuring Archiver monitoring enables you to automatically generate notifications when critical thresholds concerning Archiver aggregation and storage have been met. The Historical Graph view provides a visualization of historical data.

Note: Historical graphs are not available for non-numeric statistics, and is indicated by a greyed-out icon.

See the following topics for more details:

- Historical Graph View for Events Collected from an Event Source
- Historical Graph for System Stats

Historical Graph View for Events Collected from an Event Source

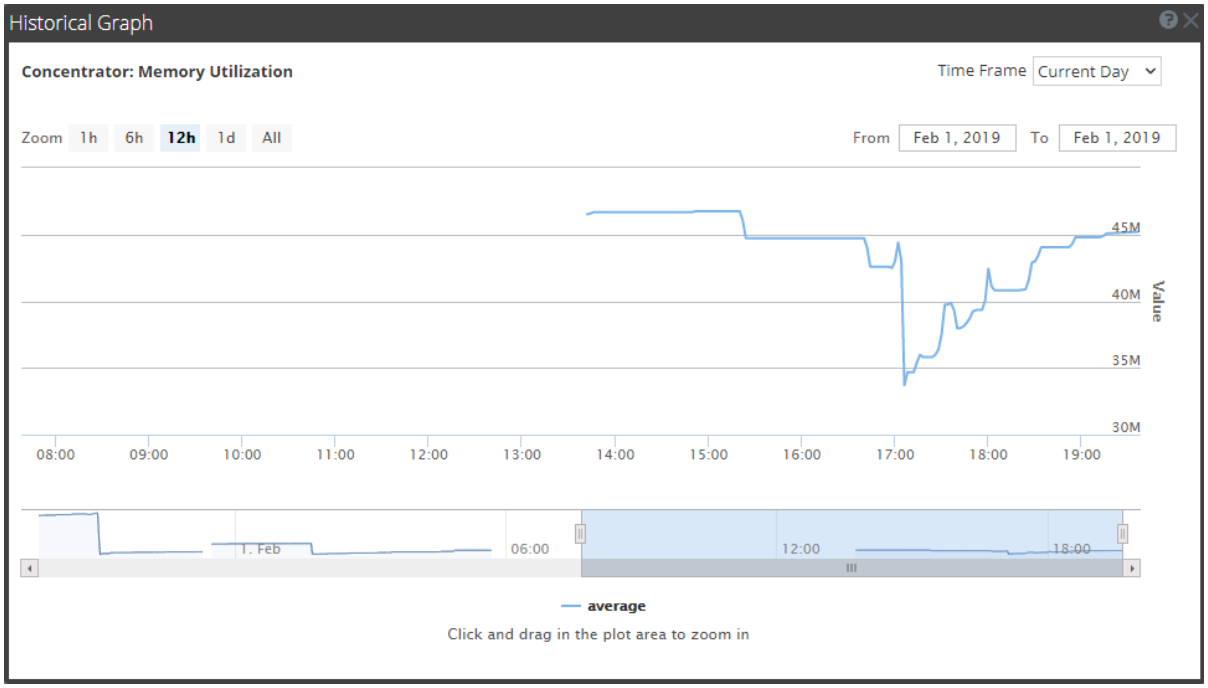
Note: For NetWitness 11.4.1, this view has been deprecated. To manage Event Sources, use the  (Admin) > Event Sources view. For details, see "About Event Source Management" in the*NetWitness Event Source Management Guide*.

Historical Graph for System Stats

To access the Historical Graph for the System Stats:

1. Go to **(Admin) > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.



2. Click the **System Stats Browser** tab.

   The System Stats Browser tab is displayed.

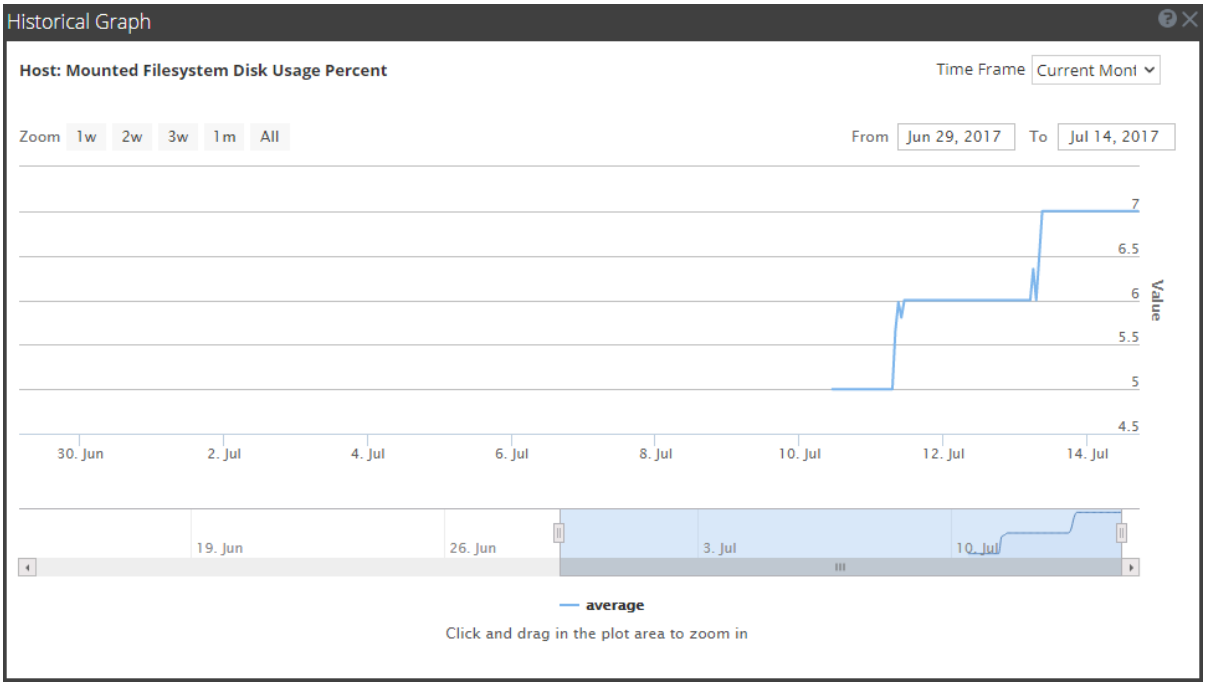
3. In the **Historical Graph** column, select .

   The Historical graph for the selected statistic for a host is displayed.

   The figure displays the system stats view for the Memory Utilization statistics.

Parameters

You can customize the graph view as required. The table lists the various parameters used to customize the historical graph view.



Parameter	Description
Time Frame	Select the time frame for which you want to view the historical data. The available options are: **Current Day**, **Current Week**, **Current Month**, and **Current Year**.
From <date> To <date>	Select the date range for which you want to view the historical data,

You can zoom in for a detailed view of the data in the Historical graph.

Zoom in function 1 and 2:

You can select one of the values to view the historical data for the selected value. The figure below displays an example for the 6h frame selected for zoom in. The slider bar at the right bottom corner is also changed to a 6h window.

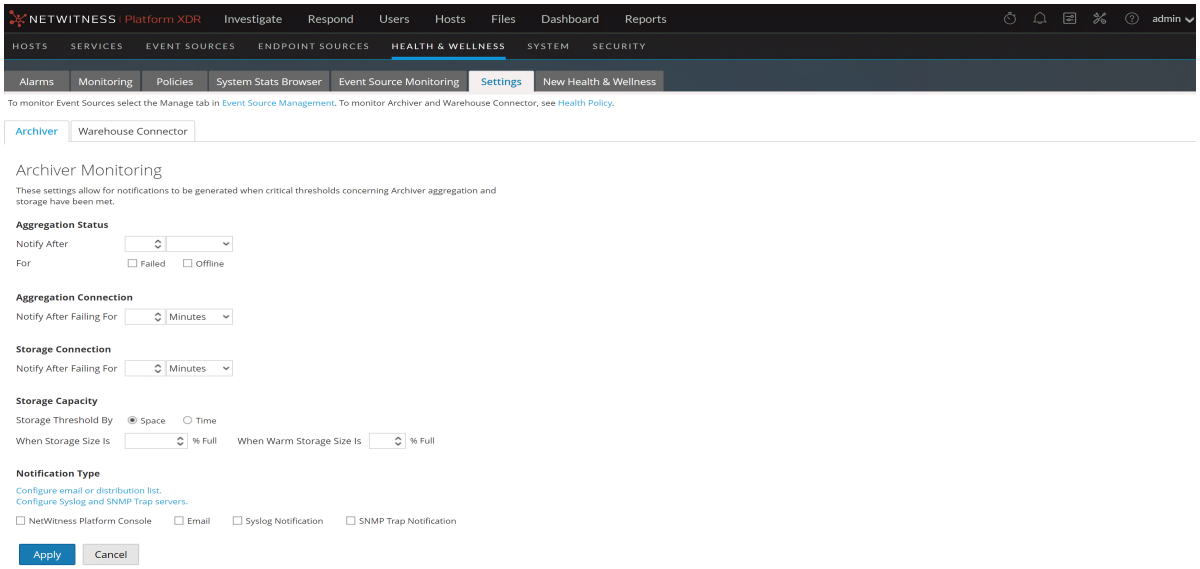
Alternatively, you can slide the bar in the right hand corner to zoom in to a required frame.

Zoom in function 3:

You can click and drag in the plot area to zoom in for a required frame of time.

The figure below displays an example of how the graph appears while you click and drag.

Health and Wellness Settings View - Archiver



To access the Archiver Monitoring view:

1. Go to  **(Admin) > Health & Wellness**.
2. Select **Settings > Archiver**.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Monitor service details of Archiver	Monitor Service Details

Quick Look

1	Displays Archiver Monitoring Panel
2	Configures Archiver Monitoring Panel to automatically receive notification

Features

The following table lists the parameters required to configure Archiver to automatically generate notification when critical thresholds are reached.

Parameter	Value	Description
Aggregation Status	Notify After	Number of minutes or hours after which you are notified of aggregation status
	For	Failed - If enabled, you are notified when the Archiver aggregation status is failed for the defined number of minutes or hours. Offline - If enabled, you are notified when the Archiver aggregation status is offline for the defined number of minutes or hours.
Aggregation Connection	Notify After Failing for	Number of minutes or hours after which you receive notification if the Archiver aggregation connection fails.
Storage Connection	Notify After Failing for	Number of minutes or hours after which you receive notification if the Archiver storage connection fails.
Storage Capacity	Storage Threshold By	Select **Space** if you want to receive a notification when the Archiver storage capacity exceeds the percentage defined in the **When Storage Size Is** field. Select **Time** if you want to receive a notification when the files stored in the Archiver exceeds the defined number of days in the **When Oldest Storage File Is** field.
	When Storage Size Is	Enter the percentage of used storage to trigger a notification.
	When Warm Storage Size Is	Enter the percentage of used storage on the warm server to trigger a notification.
Notification Type	Configure email or distribution list	Click to configure email so that you can receive notifications in NetWitness.
	Configure Syslog and SNMP Trap servers	Click to configure audit logs.
	NW Console, Email, Syslog Notification, SNMP Trap Notification	Enable NW Console to get notifications on the NetWitness UI notification toolbar. Enable Email to get email notifications. Enable Syslog Notification to generate syslog events. Enable SNMP Trap Notification to get audit events as SNMP traps.

Health and Wellness Settings View - Event Sources

Note: For NetWitness 11.4.1, this view has been deprecated. To manage Event Sources, use the  (Admin) > Event Sources view. For details, see "About Event Source Management" in the*NetWitness Event Source Management Guide*.

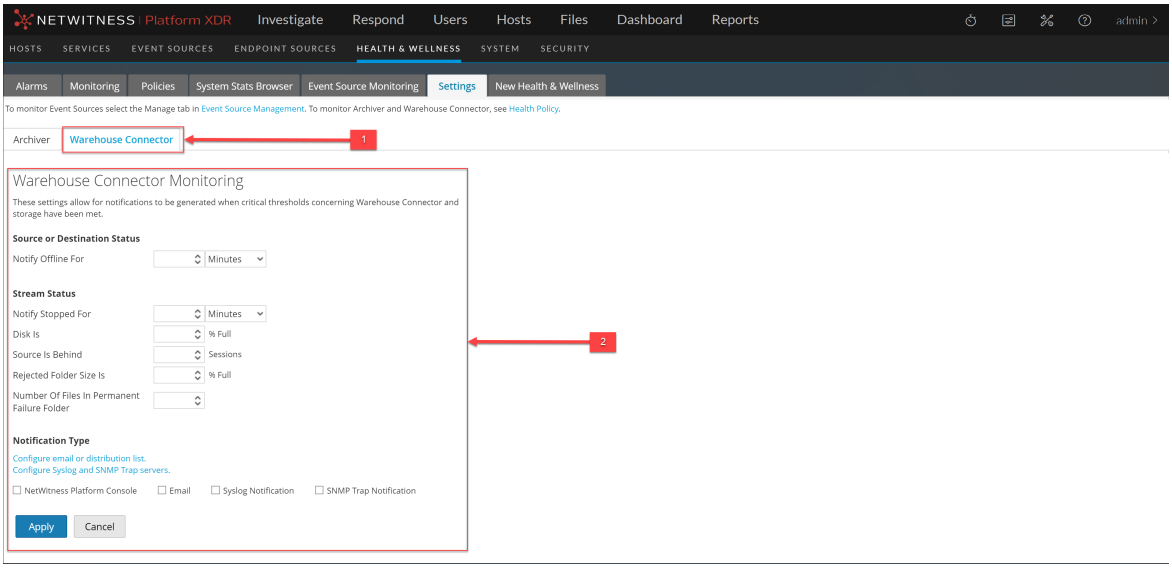
Health and Wellness Settings View - Warehouse Connector

Configuring the Warehouse Connector monitoring enables you to automatically generate notification when critical thresholds concerning Warehouse Connector and storage have been met.

Access the Warehouse Connector Monitoring view

1. Go to  **(Admin) > Health & Wellness**.
2. Select **Settings > Warehouse Connector**.

What do you want to do?



Role	I want to ...	Show me how
Administrator	View the details of Warehouse connector	Warehouse Connector Details View

Related topics

Monitor Service Details

Quick Look

The Warehouse Connector Monitoring view is displayed.

1 Displays the Warehouse Connector Monitoring view panel.
2 Allows you to configure Warehouse Connector Monitoring parameters.

Warehouse Connector Monitoring parameters

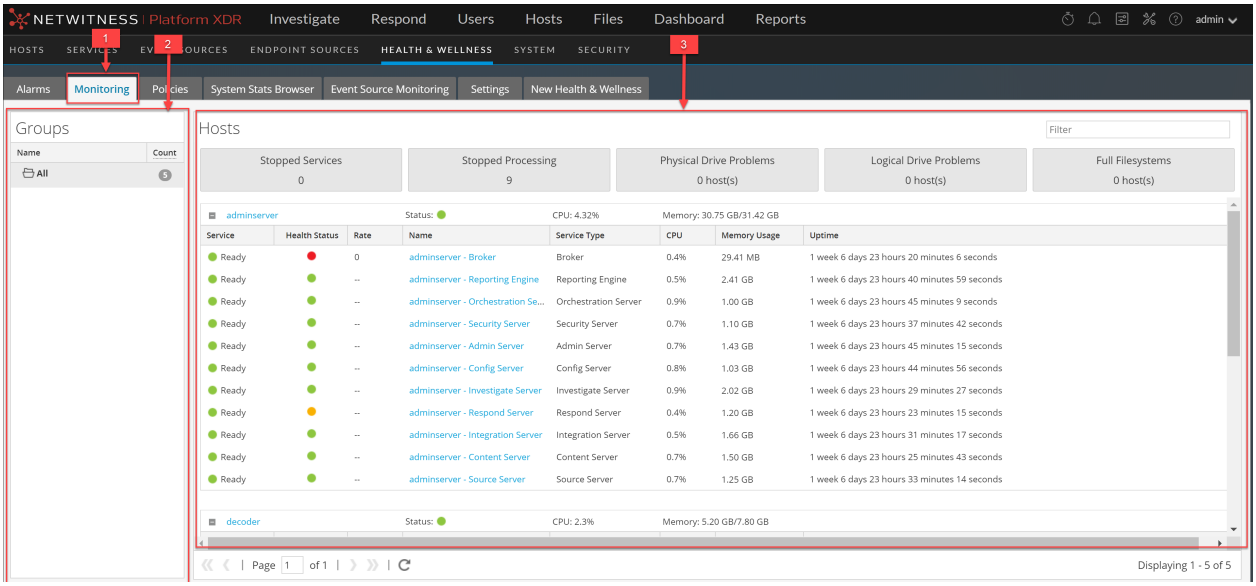
The following table lists the parameters required to configure the Warehouse Connector to automatically generate notification when critical thresholds are reached.

Parameter	Value	Description
Source or Destination Status	Notify Offline For	Number of minutes or hours after which you receive a notification if the source or destination connection fails.
Stream Status	Notify Stopped For	Number of minutes or hours after which you receive a notification when the Stream goes offline.
	Disk Is	The limit on the percentage of disk usage after which you would like to receive a notification.
	Source Is Behind	Number of sessions after which a notification is raised if the source goes behind the defined number of sessions.
	Rejected Folder Size Is	Limit on the percentage of folder usage after which you receive a notification.
	Number Of Files in Permanent Failure Folder	Limit on the number of files in the permanent failure folder after which you receive a notification.
Notification Type	Configure email or distribution list	Click to configure email so that you can receive notifications in NetWitness.
	Configure Syslog and SNMP Trap servers	Click to configure audit logs.
	NW Console, Email, Syslog Notification, SNMP Trap Notification	Enable NW Console to get notifications on the NetWitness UI notification toolbar. Enable Email to get email notifications. Enable Syslog Notification to generate syslog events. Enable SNMP Trap Notification to get audit events as SNMP traps.

Monitoring View

NetWitness provides detailed statistics and other information about the host and the individual NetWitness services in Details views. You can view the current health of all the hosts and the services running on the hosts in the Monitoring view.

What do you want to do?



Role	I want to ...	Show me how
Administrator	View and Perform Procedures	Monitor Hosts and Services

Quick Look

To access this view:

1. Go to **(Admin) > Health & Wellness**.
2. Click the **Monitoring** tab.

The Monitoring view is displayed.

1 The Monitoring tab shows health statistics for the NetWitness Platform hosts and services.
2 The Group panel enables you to view statistics for a selected group.
3 The Hosts panel displays operational statistics.

Groups Panel

The Groups panel lists all of the groups of hosts available. When you select a group, the associated content is displayed in the Hosts panel.

Note: If the total host count in the Groups panel is lower than the actual number of hosts displayed in the Hosts panel, refer to the Troubleshooting Health & Wellness topic for possible causes of this issue and recommended solutions.

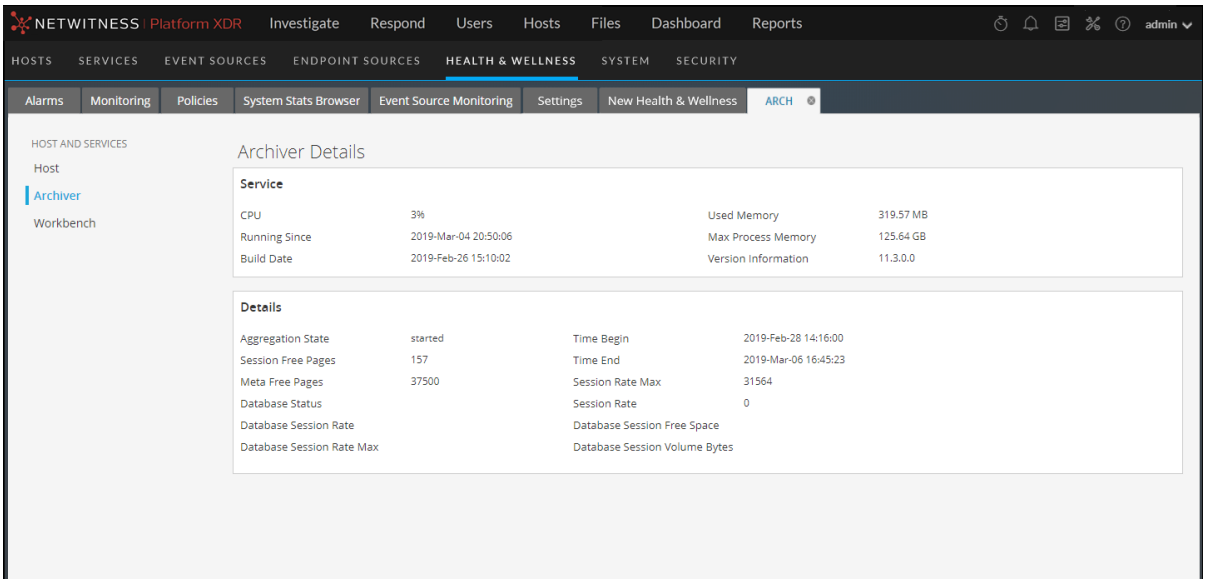
Hosts Panel

The Hosts panel displays operational statistics for hosts and the services running on each host.

Parameter	Description
Filter	Type a host name or a service name in the Filter field to display the corresponding hosts and services in the Host panel.
Stopped Services	Click **Stopped Services** to display a list of all stopped services. It also displays the host on which the service is installed.
Stopped Processing	Click **Stopped Processing** to display a list of all the hosts that have services installed on them that are in the stopped processing status.
Physical drive Problems <#> host(s)	Click to view the hosts that have physical drive problems.
Logical Drive Problems <#> host(s)	Click to view the hosts that have logical drive problems.
Full Filesystems <#> host(s)	Click to view the hosts that have full file systems.

Note: The summary information in the boxes at the top displays the System Statistics for all of the hosts configured in NetWitness and does not change with the application of filters on the groups.

Below the boxes at the top of the Hosts panel is a list of hosts, the services installed on them, and information regarding the hosts and services.



Parameter	Description
Host Name	Displays the host name. If a host has services installed that are not in view, you will see a ⊞ prefixed to the host name. Click ⊞ to view all the services installed on the host.
Status	Displays the status of the Host. ● - The host is active and running. ● - The host is stopped or yet to start processing.
CPU	Displays the current CPU usage of the host.
Memory	Displays the Memory used by the host.

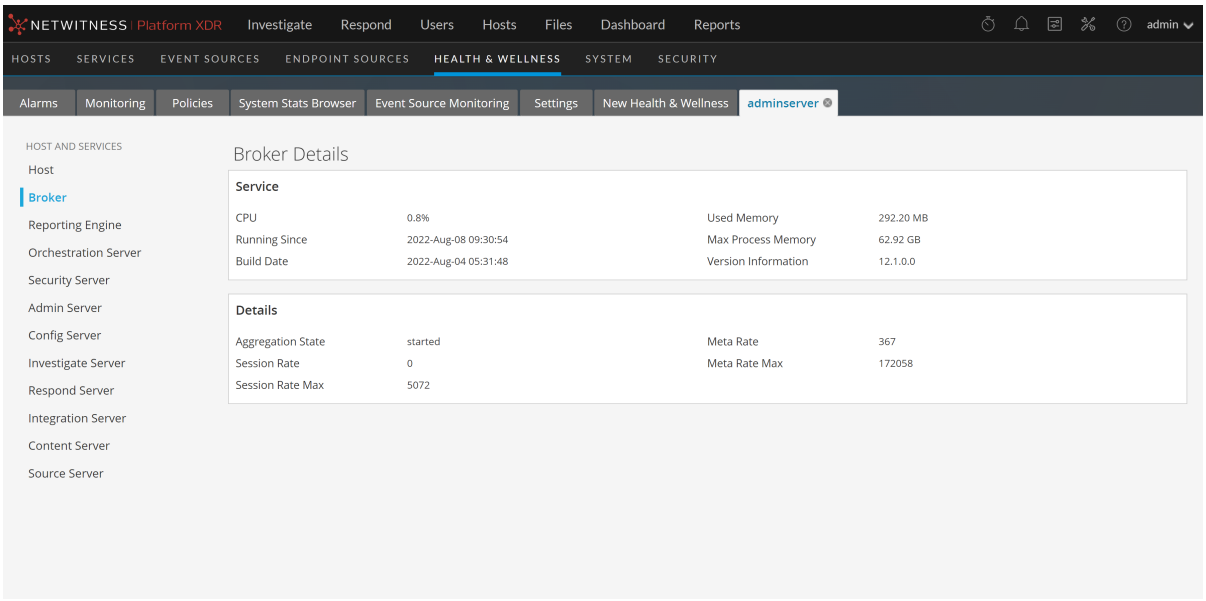
When you click ⊞ prefixed to the host name, a list of all the services installed on the host is displayed. The table below describes parameters displayed for a service and their description.

Parameter	Description
Service	Displays the status of the service. ● Ready - The service is active and running. ● Stopped - The service is stopped or yet to start processing.
Health Status	Displays the processing status of the service.  - The process is running and the data is being processed at a rate greater than zero. ● - The processing is stopped. ● - The processing is turned on but the data is not being processed.
Rate	Shows the rate at which data is being processed.
Name	Name of the service in the format `<host> - <service>`. Click the link in the Name field to get additional service details.
Service Type	Name of the type of service.
CPU	Shows the current CPU usage of the service.
Memory Usage	Displays the Memory used by the service.
Uptime	Displays the time for which the service has been running.

Archiver Details View

The Archiver Details view provides information about the Archiver. The following figure shows the Archiver details.

For the related procedure, see Monitor Service Details



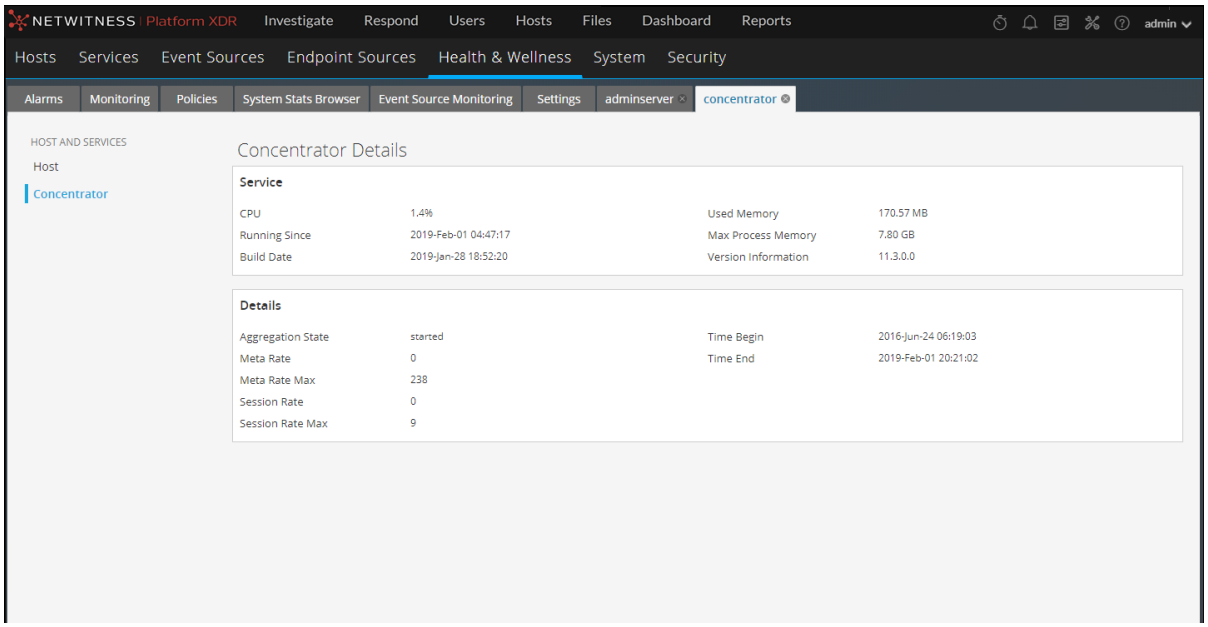
This section displays the current generic statistics for the service.

Statistic	Description
Aggregation State	State of data aggregation.
Time Begin	Time (UTC) when the first session was tracked by the index.
Session Free Pages	Session pages available for aggregation.
Time End	Time (UTC) when the last session was tracked by the index.
Meta Free Pages	Pages available for aggregation.
Session Rate Max	Maximum sessions per second rate.

Statistic	Description
Database Status	Status of databases. Valid values are: • `closed` - not available for QUERY and UPDATE (databases are being initialized). This value is seldom seen. • `opened` - available for QUERY and UPDATE. • `failure` - failed to open. This can happen for any number of reasons. You can check this if CAPTURE fails to start or if queries fail to return data. This is normally caused by database corruption.
Session Rate	Sessions per second rate.
Database Session Rate	Per second rate at which the service is writing sessions to the database.
Database Session Free Space	Amount of session free space available for aggregation.
Database Session Rate Max	Maximum per second rate at which the service is writing sessions to the database.
Database Session Volume Bytes	Number of session bytes in the database.

Broker Details View

The Broker Details view provides information about the Broker. The following figure shows the Broker details.



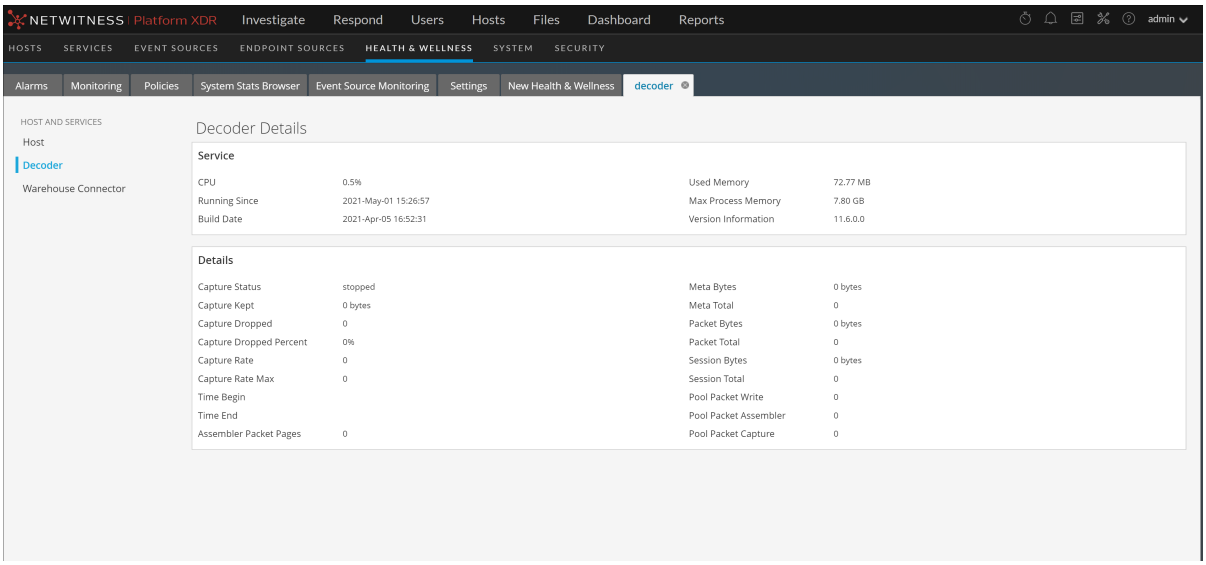
For the related procedure, see Monitor Service Details.

This section displays the current generic statistics for the service.

Statistic	Description
Aggregation State	State of data aggregation.
Meta Rate	Metadata objects per second rate.
Session Rate	Sessions per second rate.
Meta Rate Max	Maximum metadata objects per second rate.
Session Rate Max	Maximum sessions per second rate.

Concentrator Details View

The Concentrator Details view provides information about the Concentrator. The following figure shows the Concentrator details.



For the related procedure, see Monitor Service Details

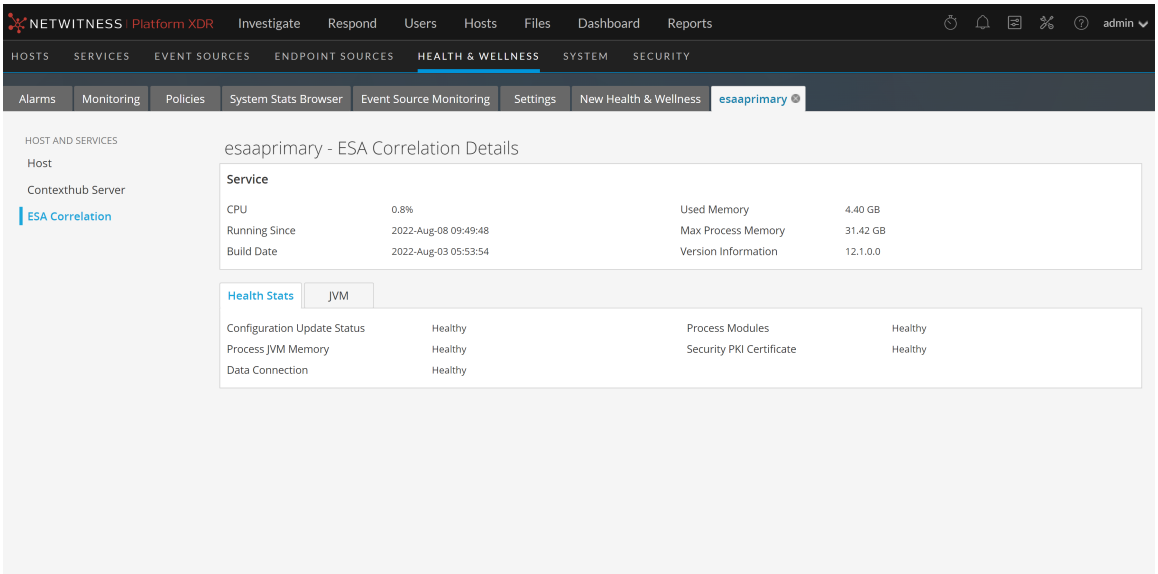
The section displays the current generic statistics for the service.

Statistic	Description
Aggregation State	State of data aggregation.
Time Begin	Time (UTC) when the first session was tracked by the index.
Meta Rate	Metadata objects per second rate.
Time End	Time (UTC) when the last session was tracked by the index.
Meta Rate Max	Maximum metadata objects per second rate.
Session Rate	Sessions per second rate.
Session Rate Max	Maximum sessions per second rate.

Decoder Details View

The Decoder Details view provides information about the Decoder. The following figure shows the Decoder details.

For the related procedure, see Monitor Service Details.



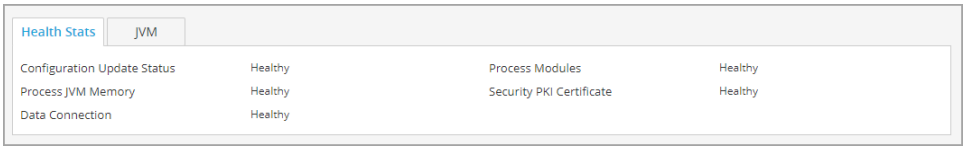
This section displays the current generic statistics for the service.

Statistic	Description
Capture Status	Status of data capture. Valid values are: • `starting` - Starting data capture (not capturing data yet). • `started` - Capturing data. • `stopping` - Stopping data capture (received request to stop data capture, but not have not stopped capturing data yet). • `stopped` - Not capturing data. • `disabled` - Not configured as a Decoder service.
Meta Bytes	Number of meta bytes in the database.
Capture Kept	Number of packets kept during capture.
Meta Total	Amount of metadata in the database.
Capture Dropped	Number of packets reported by the network card as dropped. After the service stops capturing data, the rate is reset to zero.
Packet Bytes	Number of packet bytes in the database.

Statistic	Description
Capture Dropped Percent	Packets reported by the network card as dropped as a percentage.
Packet Total	Number of packet objects held in the packet database. The total decreases when the database rolls files off due to size constraints. After the service stops capturing data, the number is not reset.
Capture Rate	Megabits per second rate at which the service is capturing data. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, rate is reset to zero.
Session Bytes	Number of session bytes in the database.
Capture Rate Max	Maximum megabits per second rate at which the service is capturing data. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, displays the maximum rate during data capture.
Session Total	Number of sessions held in the session database. This value shrinks when the database rolls files off due to size constraints. After the service stops capturing data, the number is not reset.
Time Begin	Time when first packet was captured (time when the first packet was stored in the packet database). This time increases as packets are rolled out of the packet database.
Pool Packet Write	Number of packet pages currently in the PCS pipeline that need to be written to the database.
Time End	Time when the last packet was captured (time when packet was written to the database). The time increases as new packets are captured.
Pool Packet Assembler	Number of pool packet pages waiting to be assembled.
Assembler Packet Pages	Number of packet pages waiting to be assembled.
Pool Packet Capture	Number of packet pages available for capture.

ESA Correlation Details View

The ESA Correlation Details view provides information for the ESA Correlation service. The following figure shows the ESA Correlation service details.



For the related procedure, see Monitor Service Details.

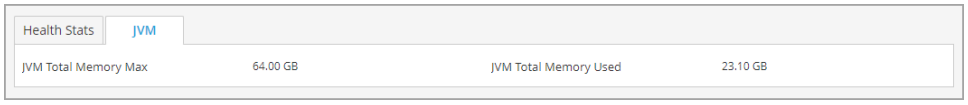
Many services, including the ESA Correlation service, have Health Stats and Java Virtual Machine (JVM) tabs. The Health Stats tab provides information about the health status of the service. The JVM tab shows the total memory used by the selected service and the total memory capacity of the host.

For more information on the ESA Correlation service and ESA Rule memory usage, see the *Alerting with ESA Correlation Rules User Guide*.

Health Stats Tab

The Health Stats tab provides information about the health status of the selected service.

The services on this tab can show one of three states:



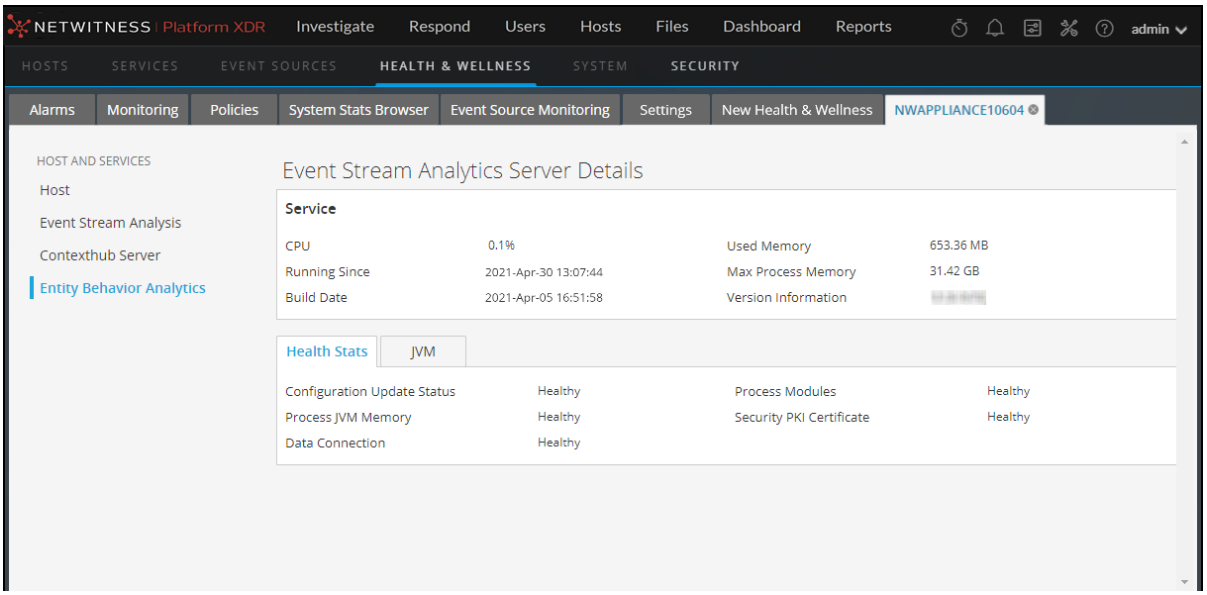
- `Healthy`: The service is healthy.
- `Unhealthy`: The service is mostly functional, but it needs attention to mitigate potential down time.
- `Fatal`: Action needs to be taken to restore the service.

Statistic	Description
Configuration Update Status	Indicates whether the service requires a restart for configuration changes to take effect. If the Configuration Update Status shows as Unhealthy, restart the service.

Statistic	Description
Process JVM Memory	Indicates the memory usage status. An Unhealthy status occurs when heap memory usage is greater than or equal to 80%. A Fatal status occurs when heap memory usage is greater than or equal to 95%. If the service is using too much memory, you can add more memory or move services to other hosts. For more details on memory usage, go to the JVM tab.
Data Connection	Indicates the health of the database connection of the service to MongoDB.
Process Modules	Indicates the health of the service. If a service is starting up, it shows as Unhealthy since its health is not yet determined. A service is Healthy if it is up and running properly. A service shows as Fatal if it is running in upgrade mode or if the service is running in safe or degraded mode.
Security PKI Certificate	Indicates the service certificate health. It shows as Healthy if a given X509 certificate is self-signed.

JVM Tab

The JVM tab shows the total memory used by the selected service and the total memory capacity of the host.

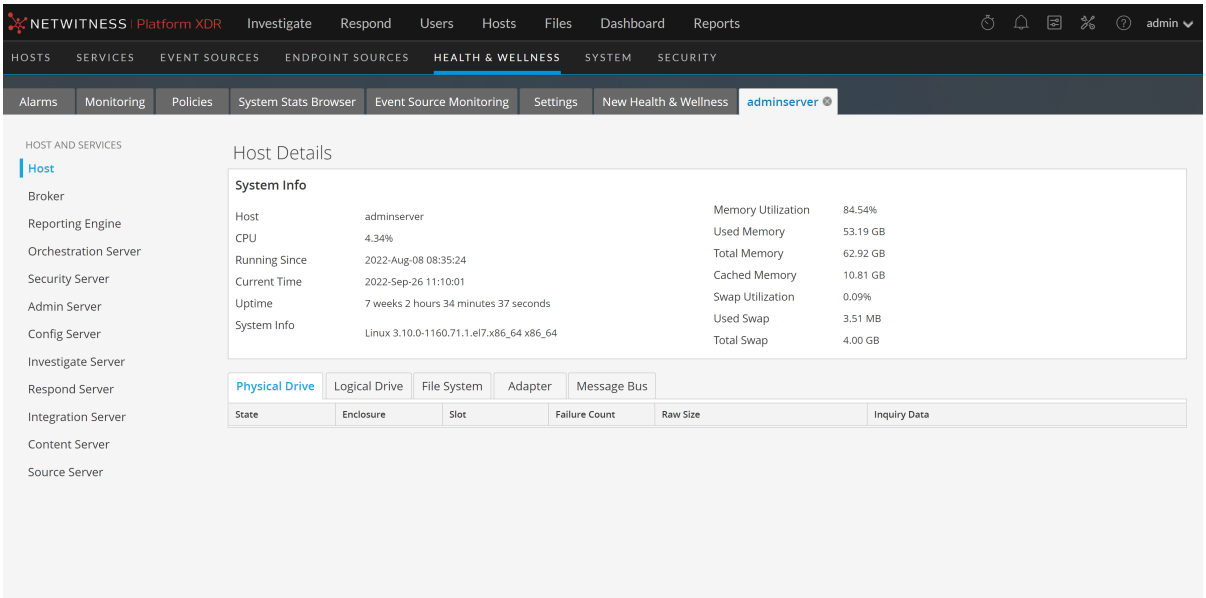


Statistic	Description
JVM Total Memory Max	Shows the total memory capacity for the entire host.
JVM Total Memory Used	Shows the total memory used by all services and processes on the host.

ESA Analytics Details View

The ESA Analytics Details view provides health status information about the selected ESA Analytics service. ESA Analytics services process the data for automated threat detection. It is important that you address any item that shows a status other than healthy, so that data processing is not interrupted and critical events are not missed.

The following figure shows the ESA Analytics Details view.



For the related procedure, see Monitor Service Details.

Many services, including the ESA Analytics service, have **Health Stats** and Java Virtual Machine (**JVM**) tabs. The **Health Stats** tab provides information about the health status of the service. The **JVM tab** shows the total memory used by the selected service and the total memory capacity of the host. For more information, see Health Stats Tab and JVM Tab.

For more information on ESA Analytics, see the *Automated Threat Detection Guide* and the *ESA Configuration Guide*.

Host Details View

The Host Details view provides information about a host, as shown in the following figure.

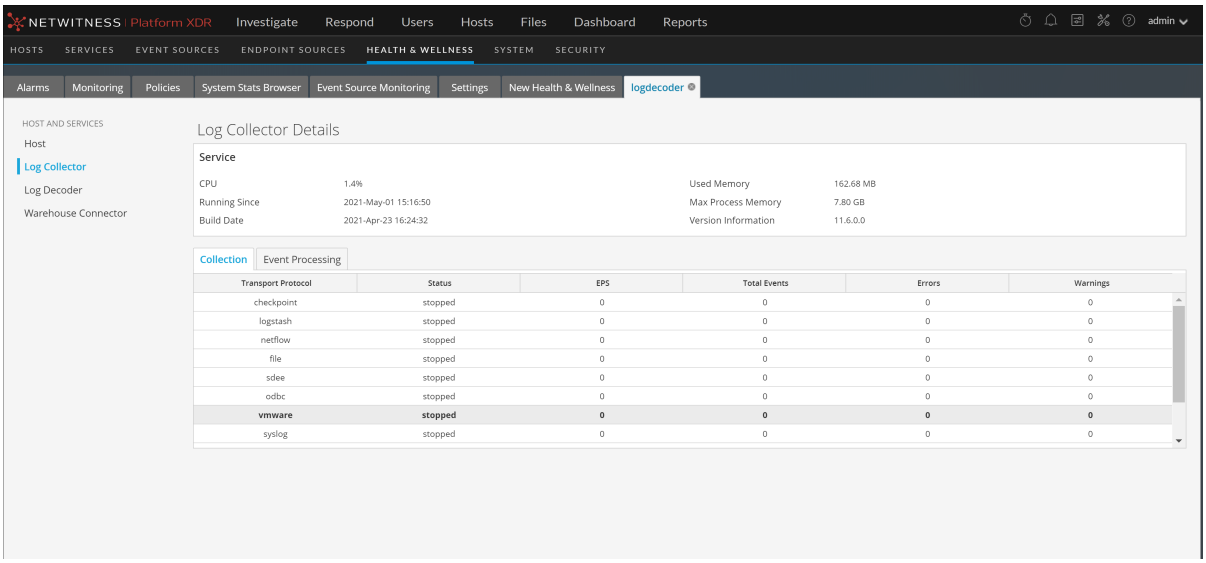
The options panel on the left displays the host and the services installed on the host. You can click on a host or service to view the statistics and other pertinent information for that host or service.

The Details panel displays information that is specific to the host and provides additional information regarding the hardware of the host.

For the related procedure, see Monitor Service Details

The top section displays the current performance, capacity, and historical statistics for the host.

Parameter	Description
Host	Hostname.
CPU	Current CPU usage of the host.
Running Since	Time when the host was started.
Current Time	Current time on the host
Uptime	Time for which the host has been active.
System Info	OS version installed on the host.
Memory Utilization	Percentage of memory utilized by the host.
Used Memory	Memory used in GB.
Total Memory	Capacity of the memory installed on the system.
Cached Memory	Memory that is cached to disk in GB.



Parameter	Description
Swap Utilization	Percentage of system swap in use.
Used Swap	Swap used in GB.
Total Swap	Capacity of the swap installed on the system.

The lower section displays the current generic statistics for the host in the tabs described in the following table.

Tab	Description
Physical Drive	Type of physical drive, its usage and additional information of the physical drive on the host.
Logical Drive	Logical drive on the host.
File System	File system information, the size, current usage, and available capacity on the host.
Adapter	Adapter used on the host.
Message Bus	Publish In Rate - rate at which incoming messages are published to the message bus queue. Total Messages Queued - number of messages in the message queue. Memory Used - amount of memory used by the message bus (in bytes). Disk Free - free disk space available for the message bus (in bytes). Memory Limit - system memory limit. If the memory usage exceeds this value, this trips the Memory Alarm and NetWitness stops accepting messages. Disk Free Limit - limit of free disk space available for the message bus. If the available disk space falls below this value, this trips the Disk Free Alarm and NetWitness stops accepting messages. Memory Limit Available - Amount of memory available to this message broker (in bytes) before the Memory Used Alarm is tripped. Disk Limit Available - Amount of free disk space available to this message broker (in bytes) before the Disk Free Limit alarm is tripped. Disk Free Alarm - True or False. True indicates that the available disk space is below the value set in Disk Free Limit and NetWitness has stopped accepting messages. Memory Alarm - True or False. True indicates that the available memory is below the value set in Memory Limit and NetWitness has stopped accepting messages.

Log Collector Details View

The Log Collector Details view provides information for the Log Collector. The following figure depicts the Log Collector Details.

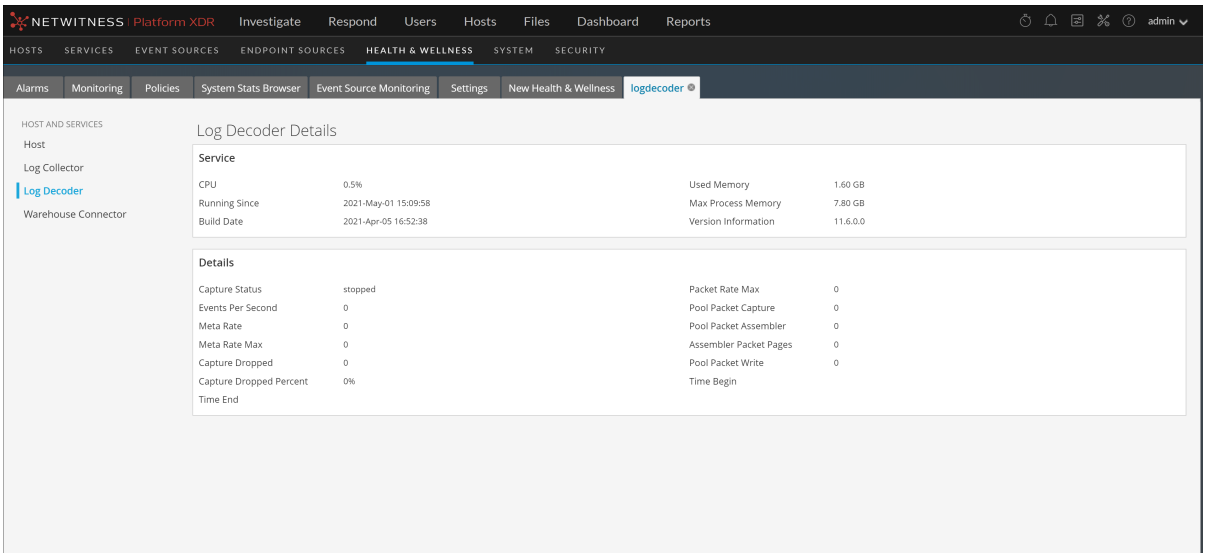
For the related procedure, see Monitor Service Details.

The lower section consists of the Collection and Event Processing tabs that display generic statistics for the service.

Collection Tab

Displays the event collection statistics for each Log Collection protocol you have implemented in NetWitness (see "Log Collection Getting Started Guide" in the Log Collection Guides).

Event Processing Tab



Displays statistics for the NetWitness internal event processing protocol (that is, the Log Decoder) for Log Collection.

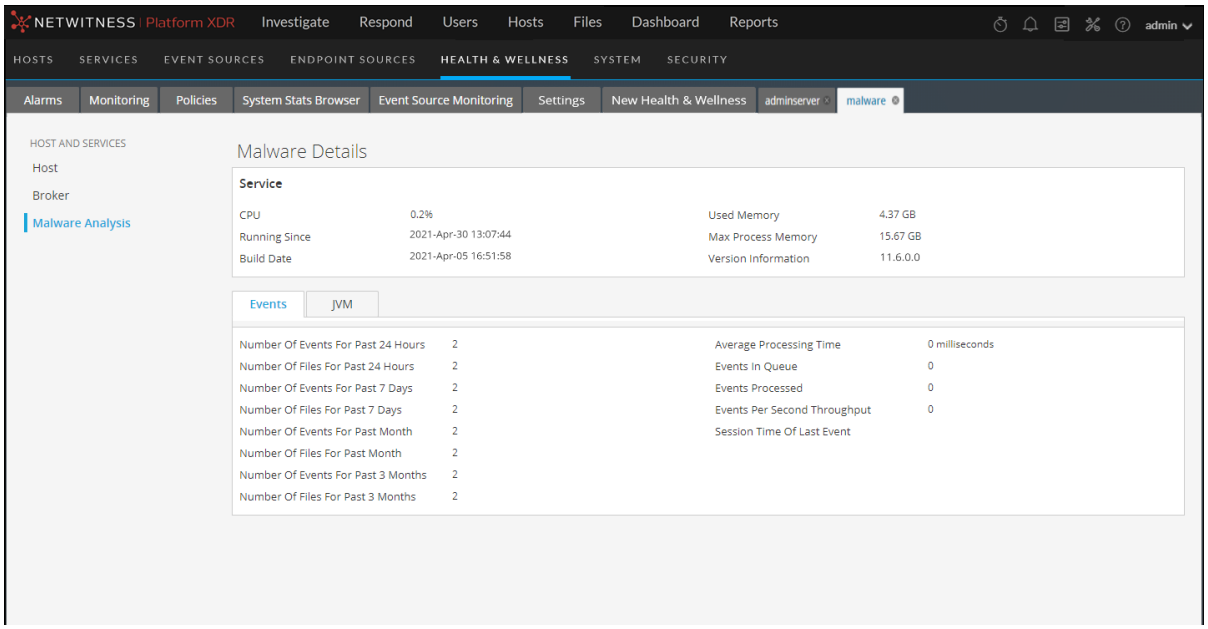
Parameter	Description
Transport Protocol	NetWitness protocol use for Log Collections (that is, the Log Decoder).

Parameter	Description
Status	Status of the Log Decoder. Valid values are: • `starting` - Starting data capture (not capturing data yet). • `started` - Capturing data. • `stopping` - Stopping data capture (received request to stop data capture, but not have not stopped capturing data yet). • `stopped` - Not capturing data. • `disabled` - Not configured as a Decoder service.
EPS	Rate (events per second) at which this the Log Decoder is processing events from the Log Collector.
Total Events	Total events processed by the Log Decoder.
Errors	Number of errors encountered.
Warnings	Number of warnings encountered.
Byte Rate	Current throughput in bytes per second.

Log Decoder Details View

The Log Decoder Details view provides information for the Log Decoder. The following figure shows the Log Decoder Details.

For the related procedure, see Monitor Service Details.



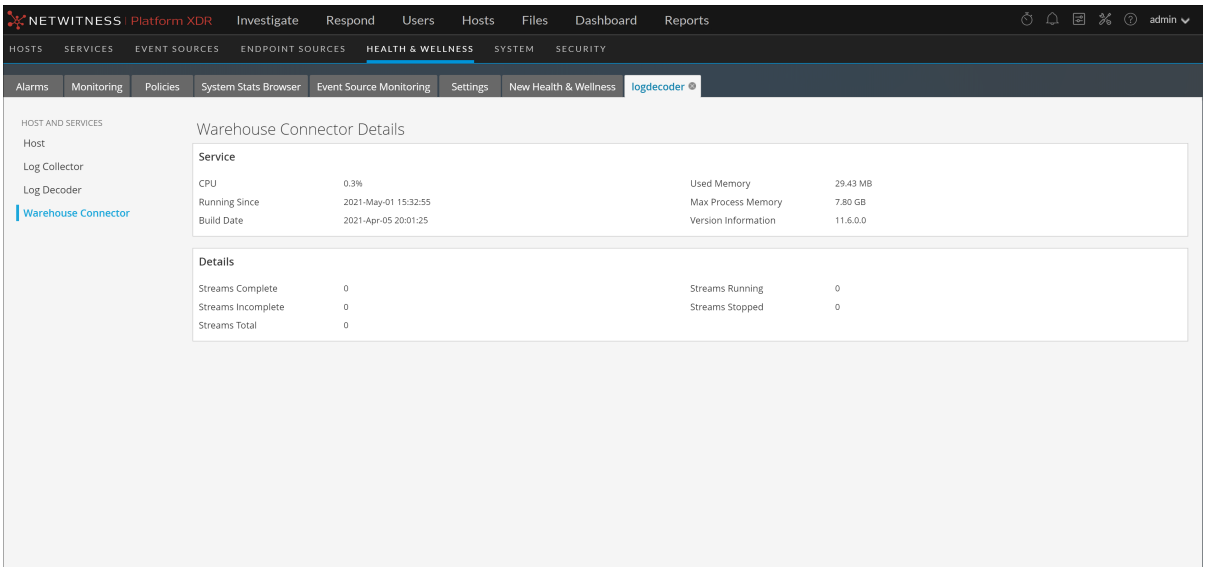
This section displays the current generic statistics for the service.

Statistic	Description
Capture Status	Status of data capture. Valid values are: • `starting` - Starting data capture (not capturing data yet). • `started` - Capturing data. • `stopping` - Stopping data capture (received request to stop data capture, but not have not stopped capturing data yet). • `stopped` - Not capturing data. • `disabled` - Not configured as a Log Decoder service.
Packet Rate Max	Maximum per second rate at which the service is writing packets to the database. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, displays the maximum rate during data capture.
Events Per Second	Rate (events per second) at which the Log Decoder is processing events from the Log Collector.
Pool Packet Capture	Number of packet pages available for capture.
Meta Rate	Per second rate at which the service is writing metadata objects to the database. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, rate is reset to zero.

Statistic	Description
Pool Packet Assembler	Number of packet pages waiting to be assembled.
Meta Rate Max	Maximum per second rate at which the service is writing metadata objects to the database. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, displays the maximum rate reached during data capture.
Assembler Packet Pages	Number of packet pages waiting to be assembled.
Capture Dropped	Number of packets reported by the network card as dropped. After the service stops capturing data, rate is reset to zero.
Pool Packet Write	Number of packet pages in the PCS pipeline that need to be written to the database.
Capture Dropped Percent	Packets reported by the network card as dropped as a percentage.
Time Begin	Time when first packet was captured (time when the first packet was stored in the packet database). This time increases as packets are rolled out of the packet database.
Time End	Time when the last packet was captured (time when packet was written to the database). The time increases as new packets are captured.

Malware Details View

The Malware Details view provides information for Malware Analysis. The following figure shows the Malware Details.



For the related procedure, see Monitor Service Details.

Displays the following event-related statistical information for the Malware Analysis service.

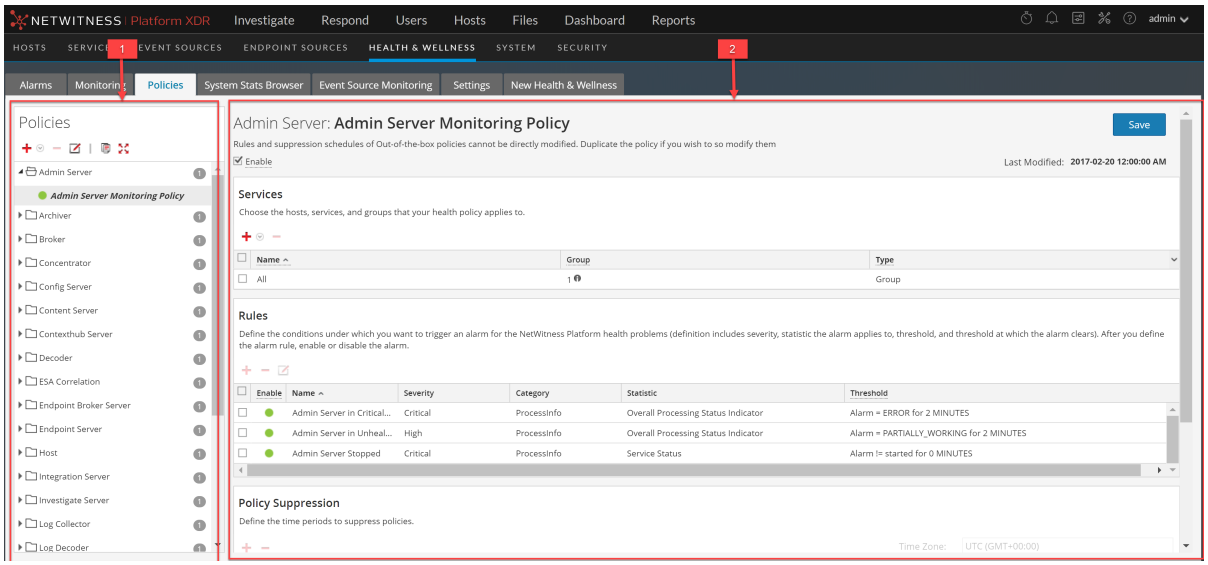
- Number of events for the past 24 hours
- Average processing time
- Number of files for the past 24 hours
- Events in queue
- Number of events for the past 7 days
- Events processed
- Number of events for the past 7 days
- Events per second throughput
- Number of events for the past month
- Session time of the last event
- Number of files for the past month
- Number of events for the past 3 months
- Number of files for the past 3 months

Warehouse Connector Details View

The Warehouse Connector Details tab provides information for the Warehouse Connector, such as the date it was built, CPU, and version information. The following figure shows the Warehouse Connector Details.

For the related procedure, see Monitor Service Details.

Policies View



The required permission to access this view is **Manage services**.

What do you want to do?

Role	I want to ...	Show me how
Administrator	View the policies NetWitness Server and Services	Manage Policies
Administrator	Add, Edit, Duplicate, and Delete Policies	Manage Policies

Quick Look

The figure depicts the Policies view.

1 Policies Panel
2 Policy Detail Panel

1. Go to  **(Admin) > Health & Wellness**.
2. Click the **Policies** tab.

Policies Panel

In the Policies panel, you can add or delete policies for hosts and services in this panel.

Feature	Description
	Displays available service types to create a new policy. Select one so that you can define a policy or policies for it.

Feature	Description
	Deletes the selected policy from the Policies panel. You can only delete one policy at a time.
	Allows you to change the name of the policy.
	Creates a copy of the selected policy. For example, if you select **First Policy** and click , NetWitness creates a copy of this policy and names it First Policy (1).
	Expands the list of policies under the services and hosts in the Policies panel.
	Contracts the list of policies under the services and hosts in the Policies panel.
	List of: • Services and hosts for which you have defined policies. • NetWitness standard policies that you can apply to hosts and services.

Policy Detail Panel

The Policy Detail panel displays the policy selected from the Policies panel.

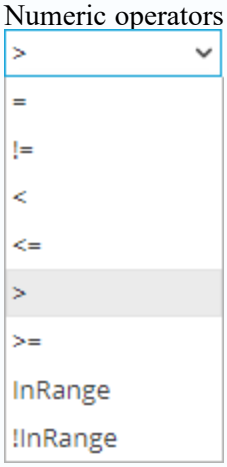
Feature	Description
Save	Saves any changes you made in this panel.
Policy Type	Displays the type of policy you selected.
Modified Date	Displays the last date this policy was modified.
 Enable	Enables or disables the policy.
Services	
	Displays menu in which you select: • **Groups** to display the Groups dialog from which you select service groups to this policy. • **Service/Host** to display the Services/Hosts dialog from which you select services to add to this policy. If the policy type is Host, the menu displays Host (and not Service). You can select services based on policy type.
	Deletes the selected service or group from this policy.
Rules	
	Displays the Add Rule dialog in which you define a rule for this policy.

Feature	Description
	Deletes the selected rule from this policy.
	Displays the Edit Rule dialog for the selected rule.
Policy Suppression	
	Adds a policy suppression timeframe row.
	Deletes the selected policy suppression timeframe row.
Time Zone	Selects the time zone for the Policy from the drop-down list. This time zone applies to both Policy Suppression and Rule Suppression.
	Selects the checkbox to select a policy suppression timeframe row.
Days	Days of the week that you want to suppress the policy according to the time range specified. Click on the day of the week that you want to suppress the policy. You can select any combination of days including all days.
Time Range	Time range during which the policy is suppressed for the days selected.
Notification	
	Adds an EMAIL notification row.
	Deletes the selected policy suppression timeframe row.
Notification Settings	Opens the Notification Servers view in which you can define the Email notification settings.
	Selects a policy suppression time frame row.
Output	The type of notification defined on the Global Notifications page. Can be email, SNMP, Syslog, or Script.
Recipient	The name of the person receiving the notification.
Notification Server	Selects the EMAIL notification server. See "Configure Notification Servers" in the *System Configuration Guide* for the source of the values in this drop-down list.
Template	Selects the Template for this EMAIL notification. NetWitness provides the Health & Wellness Default SMTP Template and the alarms template. See" Configure Notification Templates"in the *System Configuration Guide* for the source of the other values in this drop-down list. **Note:** Refer to Include the Default Email Subject Line if you want to include the default Email subject line from the Health & Wellness template in your Health & Wellness Email notifications for specified recipients.

Groups dialog

Feature	Description
Groups panel	
Name	Displays the service groups you have defined. You can select: • **All** to display all your services in the Services panel. • A group to display the services in comprise that group in the Services panel.
Services panel	
Name	Displays the name of the service.
Host	Displays the host on which the service is running.
Type	Displays the type of service.

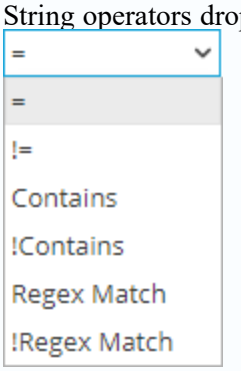
Rules Dialog



Feature	Description
☐ Enable	Enables or disables the rule for this policy.
Name	Describes the name of the rule.
Description	Describes the rule. Include the following information in this field. • Informational description - purpose of the rule and what problem it monitors. • Remediation - steps to take to resolve the condition that triggers the alarm for this rule.
Severity	Defines the severity of the rule. Valid values are: • Critical • High • Medium • Low

Feature	Description
Statistic	Defines the statistics you want to check with this rule. You can select: • Statistical category from the left drop-down list. • Statistic from the right drop-down list. **Note:** For Public Key Infrastructure (PKI) policy, select PKI in the category and statistics as any one of the following: - NetWitness Server PKI Certificate Expiration - Displays the time left before the certificate expires. - NetWitness Server PKI CRL Expiration - Displays the time left before the Certificate Revocation List (CRL) expires. - NetWitness Server PKI CRL Status - Displays the current status of the CRL. Refer to the System Stats Browser View for examples of the statistics you may want to check with a rule.
Alarm Threshold	Defines he threshold of the rule that triggers the policy alarm: • Amount **Note:** For CRL expiry the supported format is ddddhhmm, for example: - 10000 represents 1 day - 2359 represents 23 hours and 59 minutes - 10023 represents 1 day and 23 minutes - 3650100 represents 365 days and 1 hour • Time in minutes
Recovery	Defines when to clear the threshold of the rule: • Operator • Amount • Time in minutes
Rule Suppression	
	Adds a rule suppression timeframe row.
	Deletes the selected rule suppression time frame row.
	Selects a rule suppression time frame row.
Time Zone: *time-zone*	Displays the Policy time zone. You select the time zone for a policy in the Policy Suppression panel.
Days	Defines days of the week that you want to suppress the rule according to the time range specified. Click on the day of the week that you want to suppress the rule. You can select any combination of days including all days.
Time Range	Defines the time range during which the rule is suppressed for the days selected.

Threshold Operators

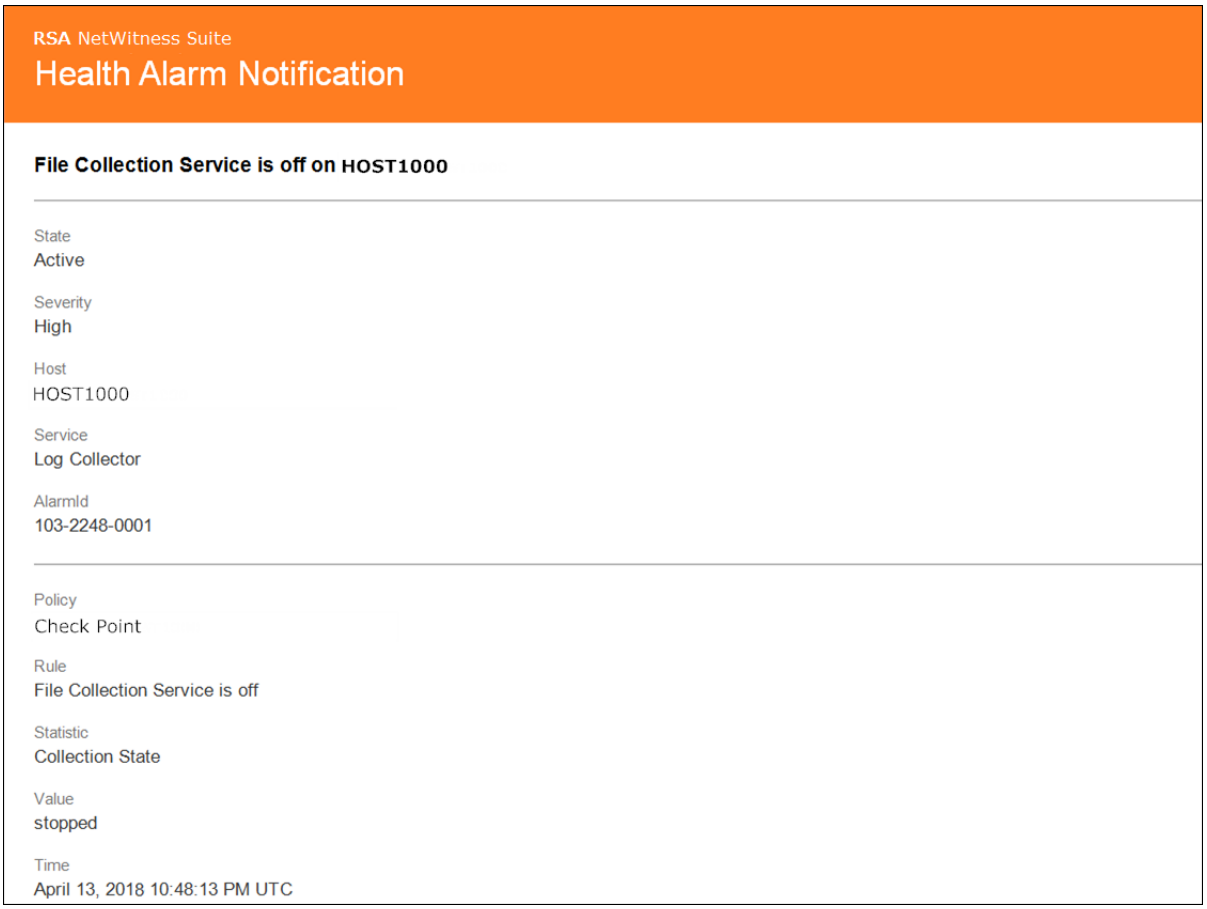


The **Alarm Threshold** and **Recovery Threshold** fields in the Rules dialog prompt you for either numeric or string operators based on the statistic criteria you specify.

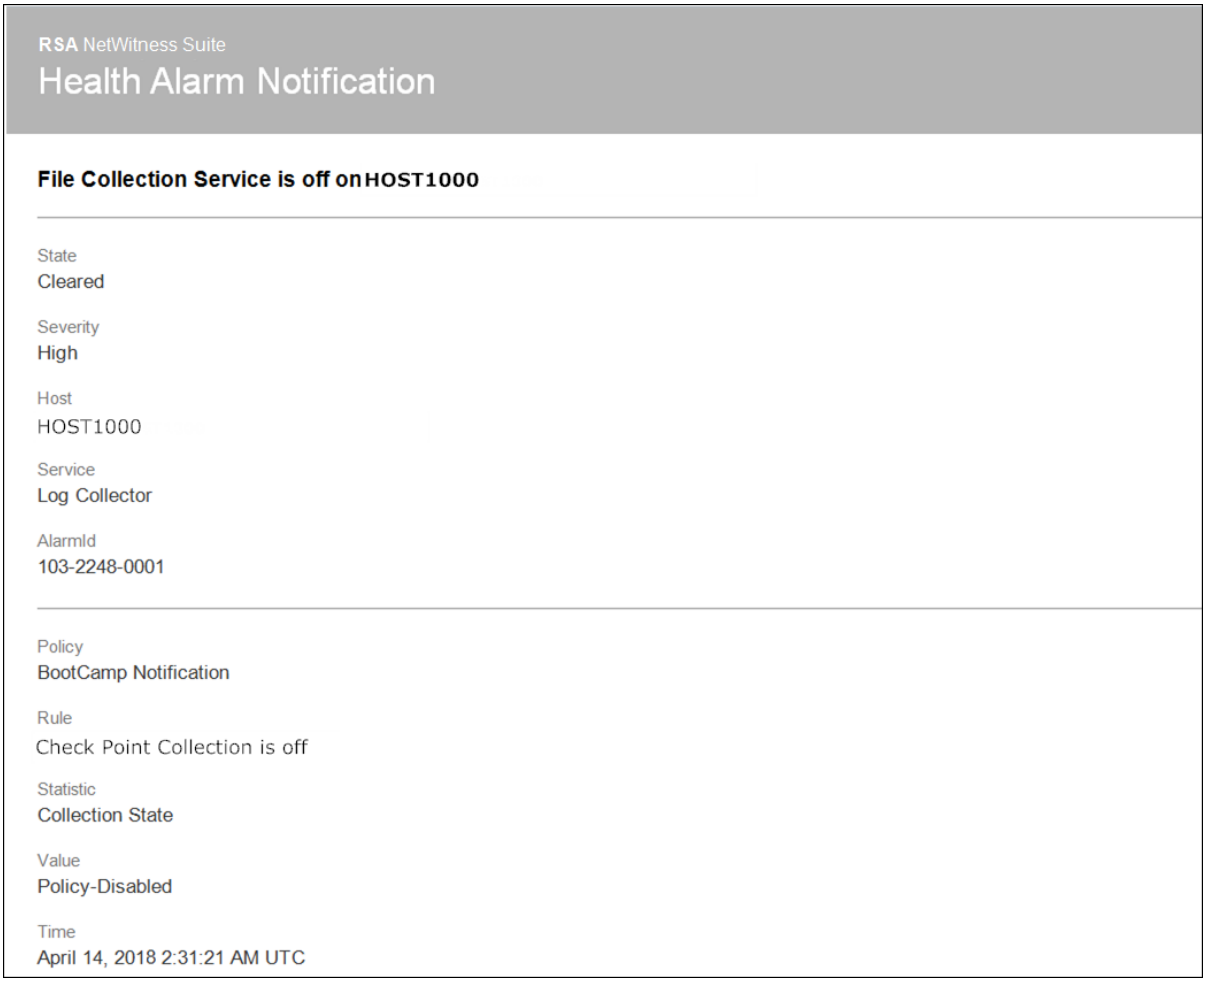
Numeric operators drop-down menu:

=
!=
<
<=
>
>=
InRange
!InRange

String operators drop-down menu:



=
!=
Contains
!Contains
Regex Match
!Regex Match



Health & Wellness Email Templates

Note: Please refer to Include the Default Email Subject Line if you want to include the default Email subject line from the Health & Wellness template in your Health & Wellness Email notifications for specified recipients.

Health & Wellness Default SMTP Template

Alarms Template

NetWitness Platform Out-of-the-Box Policies

The following table lists the NetWitness Out-of-the-Box Policies with the rules defined for each policy.

You can perform the following tasks on any of these policies:

- Change service and group assignments.
- Disable or enable policies.

You cannot perform the following tasks on any of these policies:

- Delete them.
- Edit Policy names.

Note: Additional information about the Out-of-the-Box Policies can be found in the User Interface under
Health & Wellness > Policies.

Policy Name	Rule Name	Alarm Triggered
	Communication Failure Between Master NetWitness Server Host and a Remote Host	Host is down, Network is down, Message Broker is Down, or Invalid or missing security certificates for 10 minutes or more.

Policy Name	Rule Name	Alarm Triggered
NetWitness Server Monitoring Policy	Critical Usage on Rabbitmq Message Broker Filesystem	For `var/lib/rabbitmq`, Mounted Filesystem Disk Usage goes over 75%.
	Filesystem is Full	Overall Mounted Filesystem Disk Usage reaches 100%.
	High Filesystem Usage	Overall Mounted Filesystem Disk Usage goes over 95%.
	High System Swap Utilization	Swap Utilization goes under 5 % for 5 minutes or more.
	High Usage on Rabbitmq Message Broker Filesystem	Mounted Filesystem Disk Usage for `var/lib/rabbitmq` goes over 60%.
	Host Unreachable	Host down.
	LogCollector Event Processor Exchange Bindings Status	Issue with Log Collection Message Broker Queues for 10 minutes or more.
	LogCollector Event Processor Queue with No Bindings	Issue with Log Collection Message Broker Queues for 10 minutes or more.
	LogCollector Event Processor Queue with No Consumers	Issue with Log Collection Message Broker Queues for 10 minutes or more.
	Power Supply Failure	Host not receiving power.
	RAID Logical Drive Degraded	For Raid Logical Drive, Drive State equals Degraded or Partially Degraded.
	RAID Logical Drive Failed	For Raid Logical Drive, Logical Drive State equals Offline, Failed, or Unknown.
	RAID Logical Drive Rebuilding	For Raid Logical Drive, Logical Drive State equals Rebuild.
	RAID Physical Drive Failed	For Raid Physical Drive, Physical Drive State does not equal Online, Online Spun Up, or Hotspare.
	RAID Physical Drive Failure Predicted	For Raid Physical Drive, Physical Drive Predictive Failure Count is greater than 1.
	RAID Physical Drive Rebuilding	For Raid Physical Drive, Physical Drive State equals Rebuild.
	RAID Physical Drive Unconfigured	For Raid Physical Drive, Physical Drive State contains Unconfigured (good).
	SD Card Failure	SD Card Status does not equal ok.

Policy Name	Rule Name	Alarm Triggered
NetWitness Archiver Monitoring Policy	Archiver Aggregation Stopped	Archiver Status does not equal started.
	Archiver Database(s) Not Open	Database Status does not equal opened.
	Archiver Not Consuming From Service	Devices Status does not equal consuming.
	Archiver Service in Bad State	Service State does not equal started or ready.
	Archiver Service Stopped	Server Status does not equal started.
NetWitness Broker Monitoring Policy	Broker >5 Pending Queries	Queries Pending greater than or equal to 5 for 10 minutes or more.
	Broker Aggregation Stopped	Broker Status does not equal started.
	Broker Not Consuming From Service	Devices Status does not equal consuming.
	Broker Service in Bad State	Service State does not equal started or ready.
	Broker Service Stopped	Server Status does not equal started.
	Broker Session Rate Zero	Session Rate (current) equals 0 for 2 minutes or more.
NetWitness Concentrator Monitoring Policy	Concentrator >5 Pending Queries	Queries Pending greater than or equal to 5 for 10 minutes or more.
	Concentrator Aggregation Behind >100K Sessions	Devices Sessions Behind is greater than or equal to 100000 for 1 minute or more.
	Concentrator Aggregation Behind >1M Sessions	Devices Sessions Behind is greater than or equal to 1000000 for 1 minute or more.
	Concentrator Aggregation Behind >50M Sessions	Devices Sessions Behind is greater than or equal to 50000000 for 1 minute or more.
	Concentrator Aggregation Stopped	Broker Status does not equal started.
	Concentrator Database(s) Not Open	Database Status does not equal opened.
	Concentrator Meta Rate Zero	Concentrator Meta Rate (current) equals 0 for 2 minutes or more.
	Concentrator Not Consuming From Service	Devices Status does not equal consuming.
	Concentrator Service in Bad State	Service State does not equal started or ready.
	Concentrator Service Stopped	Server Status does not equal started.

Policy Name	Rule Name	Alarm Triggered
NetWitness Decoder Monitoring Policy	Decoder Capture Not Started	Capture Status does not equal started.
	Decoder Capture Rate Zero	Capture Rate (current) equals 0 for 2 minutes or more.
	Decoder Database Not Open	Database Status does not equal opened.
	Decoder Dropping >1% of Packets	Capture Packets Percent Dropped (current) is greater than or equal to 1%.
	Decoder Dropping >10% of Packets	Capture Packets Percent Dropped (current) is greater than or equal to 10%.
	Decoder Dropping >5% of Packets	Capture Packets Percent Dropped (current) is greater than or equal to 5%.
	Decoder Packet Capture Pool Depleted	Packet Capture Queue equals 0 for 2 minutes or more.
	Decoder Service in Bad State	Service State does not equal started or ready.
	Decoder Service Stopped	Server Status does not equal started.
NetWitness Event Steam Analysis Monitoring Policy	ESA Overall Memory Utilization > 85%	Total ESA Memory Usage % is greater than or equal to 85 %.
	ESA Overall Memory Utilization > 95%	Total ESA Memory Usage % is greater than or equal to 95 %.
	ESA Service Stopped	Server Status does not equal started.
	ESA Trial Rules Disabled	Trial Rules Status does not equal enabled.
NetWitness IPDB Extractor Monitoring Policy	IPDB Extractor Service in Bad State	Service State does not equal started or ready.
	IPDB Extractor Service Stopped	Server Status does not equal started.
NetWitness Incident Management Monitoring Policy	Incident Management Service Stopped	Server Status does not equal started.

Policy Name	Rule Name	Alarm Triggered
NetWitness Log Collector Monitoring Policy	Log Collector Service Stopped	Server Status does not equal started.
	Log Decoder Event Queue > 50% Full	Number of events currently in the queue is using 50% or more of the queue.
	Log Decoder Event Queue > 80% Full	Number of events currently in the queue is using 80% or more of the queue.
	Log Collector Service in Bad State	Service State does not equal started or ready.
NetWitness Log Decoder Monitoring Policy	Decoder Dropping>10% of Packets	Capture Packets Percent Dropped (current) is greater than or equal to 10%
	Log Capture Not Started	Capture Status does not equal started.
	Log Decoder Capture Rate Zero	Capture Rate (current) equals 0 for 2 minutes or more.
	Log Decoder Database Not Open	Database Status does not equal opened.
	Log Decoder Dropping >1% of Logs	Capture Packets Percent Dropped (current) is greater than or equal to 1%.
	Log Decoder Dropping >5% of Logs	Capture Packets Percent Dropped (current) is greater than or equal to 5%.
	Log Decoder Packet Capture Pool Depleted	Packet Capture Queue equals 0 for 2 minutes or more.
	Log Decoder Service Stopped	Server Status does not equal started.
	Log Decoder Service in Bad State	Service State does not equal started or ready.
NetWitness Malware Analysis Monitoring Policy	Malware Analysis Service Stopped	Server Status does not equal started.

Policy Name	Rule Name	Alarm Triggered
NetWitness Reporting Engine Monitoring Policy	Reporting Engine Alerts Critical Utilization	Alerts Utilization is greater than or equal to 10 for 5 minutes or more.
	Reporting Engine Available Disk <10%	Available disk space is less than 10%.
	Reporting Engine Available Disk <5%	Available disk space is less than or equal to 5%.
	Reporting Engine Charts Critical Utilization	Charts Utilization is greater than or equal to 10 for 5 minutes or more.
	Reporting Engine Rules Critical Utilization	Rules Utilization is greater than or equal to 10 for 5 minutes or more.
	Reporting Engine Schedule Task Pool Critical Utilization	Schedule Task Pool Utilization is greater than or equal to 10 for 15 minutes or more.
	Reporting Engine Service Stopped	Server Status does not equal started.
	Reporting Engine Shared Task Critical Utilization	Shared Task Pool Utilization is greater than or equal to 10 for 5 minutes or more.
NetWitness Warehouse Connector Monitoring Policy	Warehouse Connector Service in Bad State	Service State does not equal started or ready.
	Warehouse Connector Service Stopped	Server Status does not equal started.
	Warehouse Connector Stream Behind	Stream Behind is greater than or equal to 2000000.
	Warehouse Connector Stream Disk Utilization > 75%	Stream Disk Usage (Pending Destination Load) is greater than or equal to 75.
	Warehouse Connector Stream in Bad State	Stream Status does not equal consuming or online for 10 minutes r more.
	Warehouse Connector Stream Permanently Rejected Files > 300	Number of files in the permanently rejected files is greater than or equal to 300.
	Warehouse Connector Stream Permanently Rejected Folder > 75% Full	Rejected folder usage is greater than or equal to 75%.
NetWitness Workbench Monitoring Policy	Workbench Service in Bad State	Service State does not equal started or ready.
	Workbench Service Stopped	Server Status does not equal started.

System Stats Browser View

NetWitness provides a way to monitor the status and operations of hosts and services. The System Stats Browser tab displays key statistics, service system information, and host system information for a host or service.

You can customize the stats view depending on the parameter you select to filter the data.

To access the System Stats Browser view:

1. Go to  **(Admin) > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.
2. Click the **System Stats Browser** tab.

What do you want to do?

Monitor Service Statistics

Filter System Statistics

Quick Look

The System Stats Browser view is displayed.

1 Displays System Stats Browser View

2 Toolbar used to filter and customize the System Stats Browser View

Note: Historical graphs are enabled, and can be displayed, for statistics with numeric values. However, historical graphs are disabled for statistics with string values, for example, Health checks (Healthy), and are displayed as gray in the UI.

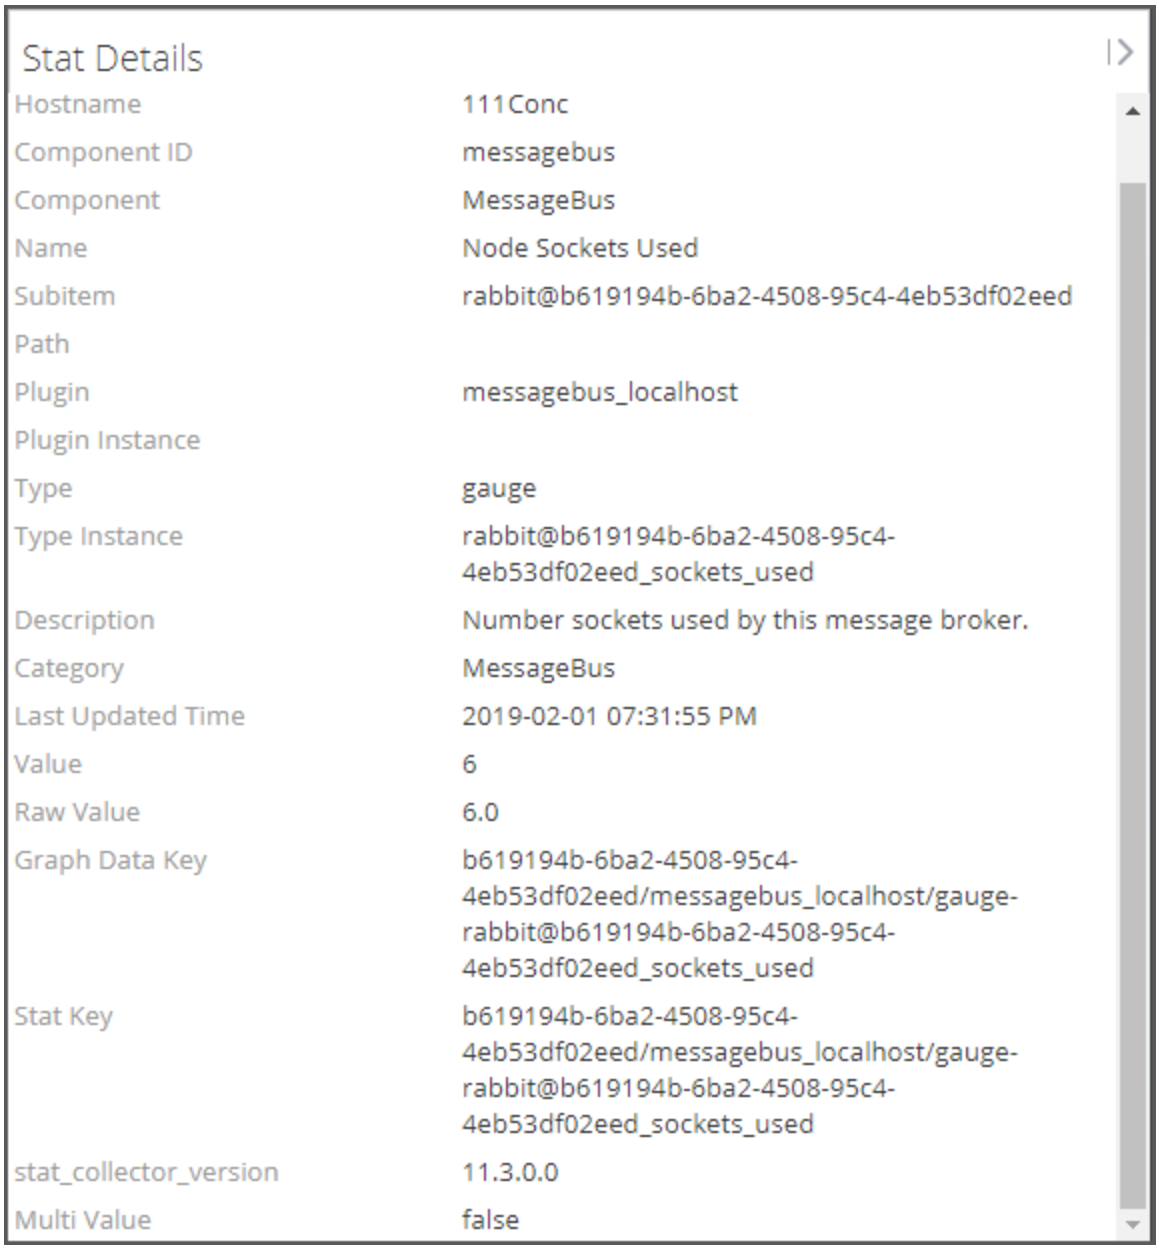
Filters

This table lists the various parameters you can use to filter and customize the System Stats view.

Parameter	Description
Host	Select a host from the drop-down menu to display the stats of the selected host. Select **Any** to list all the available hosts.
Component	Select a component from the drop-down menu to display the stats for the selected component. Select **Any** to list out all the components on a selected host.
Category	Type the category to display the stats for the required category. Select Regex to enable Regex filter. It performs a regular expression search against text and lists out the specified category. If Regex is not selected it supports globbing pattern matching.
Statistic	Type the statistic to display the required statistic on all the hosts or components. Select Regex to enable Regex filter. This performs a regular expression search against text and lists out the specified category. If Regex is not selected it supports globbing pattern matching.
Order By	Select the order in which the list needs to be filtered. Select Ascending to filter the list it in an ascending order.

Commands

Command	Action
Apply	Click to apply the filters chosen and display the list accordingly.
Clear	Click to clear the chosen filters.



System Stats View Display

Displays statistics, service system information, and host system information for a host or service.

Access Stats Details

Select one of the stats and click **Stats Details** on the right hand side of the panel.

The Stats details panel opens with details of the selected stats.

New Health & Wellness Tab

In New Health & Wellness tab, you can filter alerts (monitors) and add the notifications which sends a notification message when an alert is triggered, suppress the notification for a time period and pivot to New Health and Wellness dashboards.

To access this view:

1. Go to  **(Admin) > Health & Wellness**.
2. Click the **New Health & Wellness** tab.

The figure depicts the New Health & Wellness view.

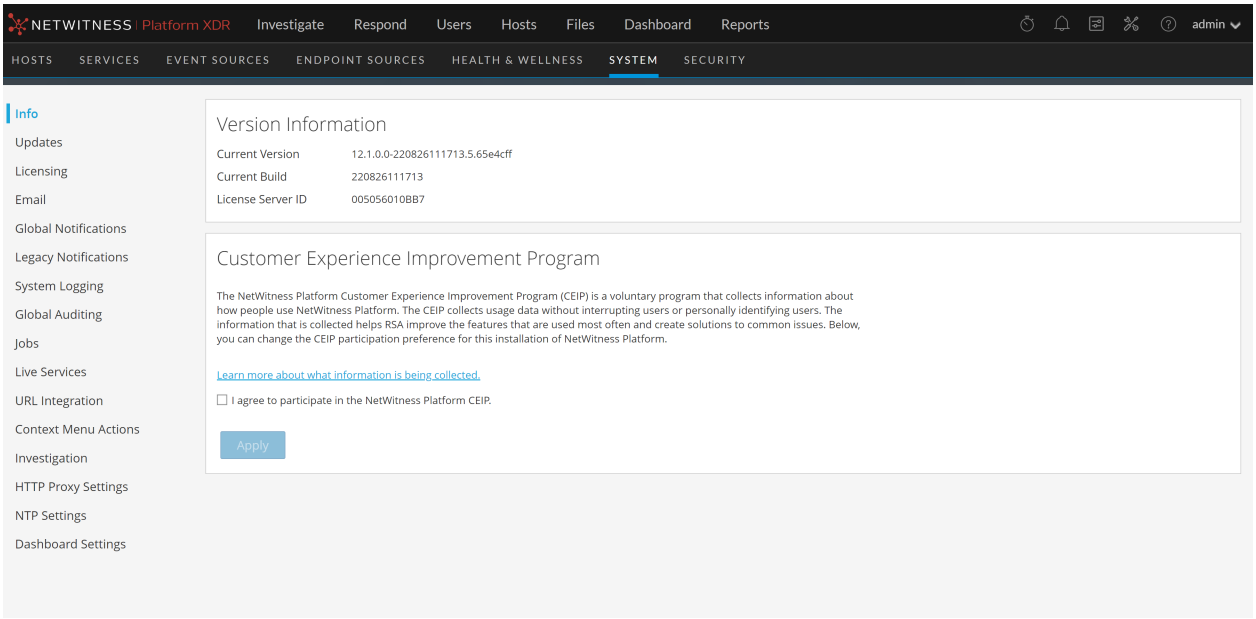
Managing Notifications

Quick Look

1 **Notification Panel**: You can view the list of alerts (monitors) along with the trigger name, severity and suppression.

Monitor Name - Name of the monitor.

	Trigger Name - Name of the trigger. **Severity** - Severity assigned to the alert. The options are Critical, High, Medium, and Low. **Suppression** - Indicates whether suppression policy is applied or not. Green tick indicates suppression policy is applied.
2	**Filters Alerts**. You can filter alerts on Suppression Applied, Monitor Name, Trigger Name, and Severity. To reset filters, click **Reset**.
3	**Pivot to Dashboard**. You can view New Health and Wellness Dashboards. For more information, see Accessing New Health and Wellness Dashboards.
4	**View Notification Settings**. You can define notification settings which sends a notification message when an alert is triggered. For more information, see Adding Alert Notifications.
5	**View Suppression Policy**. You can suppress notifications for a time period by specifying a suppression policy. For more information, see Suppressing Notifications.



System View - System Info Panel

This topic describes the System Information panel, which displays information about the system version and license status.

The required role to access this view is **Manage System Settings**.

To access this view, do one of the following:

- Go to  **(Admin) > System**.
  The System Information panel is displayed by default.
- When you receive a notification that a new version of NetWitness is available in the Notifications tray, click **View**.

The Version Information section displays version information about the version of NetWitness that is currently installed. The following table describes the features of the Version Information section.

Name	Description
Current Version	Displays the version of NetWitness that is currently running. The format of the version is *major-relase.minor-release.stability-id.build-number*. Possible values for the *stability-id* are: • 1 - Development • 2 - Alpha • 3 - Beta • 4 - RC • 5 - Gold

Name	Description
Current Build	Identifies the current build revision for use in troubleshooting situations.
License Server ID	Each client host is shipped with the Local Licensing Server (LLS) installed to manage host licenses. This field indicates whether the LLS is installed for this instance of NetWitness. • When the LLS is installed, the Licensing Server ID is displayed. • **Unknown** indicates that the LLS is not installed.
License Status	Indicates whether or not the license is enabled. If the license is: • Enabled, **Enabled** is displayed in this field and there is a **Disable** button to the right so you can disable it. • Disabled, **Disabled** is displayed in this field and there is an **Enable** button to the right so you can enable it.

System Updates Panel - Settings Tab

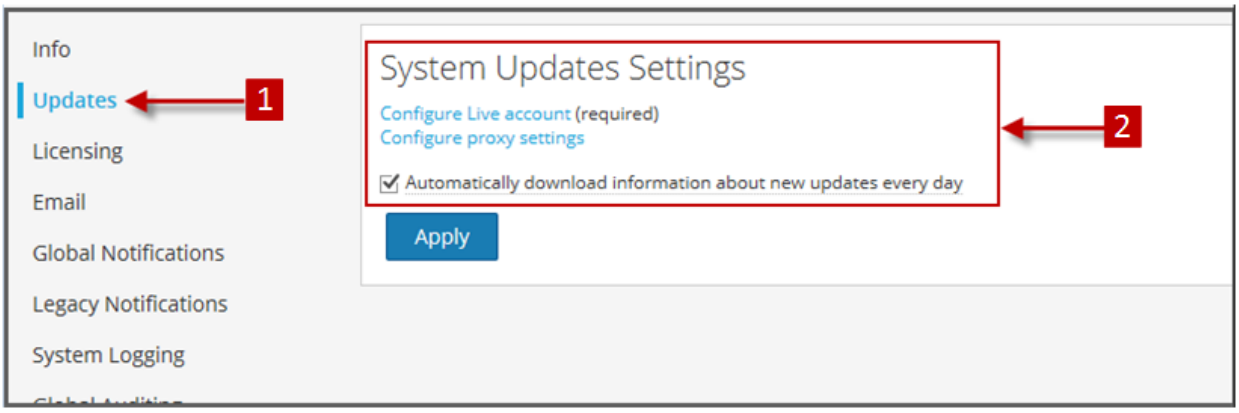
System Updates Settings tab describes the interface you use to set up a connection to Live Update Repository. These settings ensure that the NetWitness can reach the Live Update Repository and synchronize it with your Local Update Repository.

The required permission to access this view is **Apply System Updates**.

To access this view:

1. Go to  **(Admin) > System**.
2. Select **Updates**.

What do you want to do?



Role	I want to ...	Show me how
Administrator	Automatically download updates	Enable automatic synchronization with the NetWitness update repository.

Related Topics

Manage NetWitness Platform Updates

Quick Look

The System Updates Settings panel is displayed.

1 Displays System Update Setting Tab
2 Configure Account and Setting for Automatic Updates

Features

This table describes the features in the System Updates Settings panel.

Feature	Description
Configure Live account	Displays the **(Admin)** > **System** > **Live Services** panel in which you can configure your Live Account credentials if they are not configured.
Configure proxy settings	Displays the **(Admin)** > **System** > **HTTP Proxy Settings** panel in which you can configure an HTTP proxy if it is not configured.
Automatically download information about new updates every day	Select to enable automatic synchronization with the NetWitness update repository. If there are new updates available, information will automatically be displayed in the **(Admin)** > **HOSTS** panel.
Apply	Applies the settings in this tab.

System Logging - Settings View

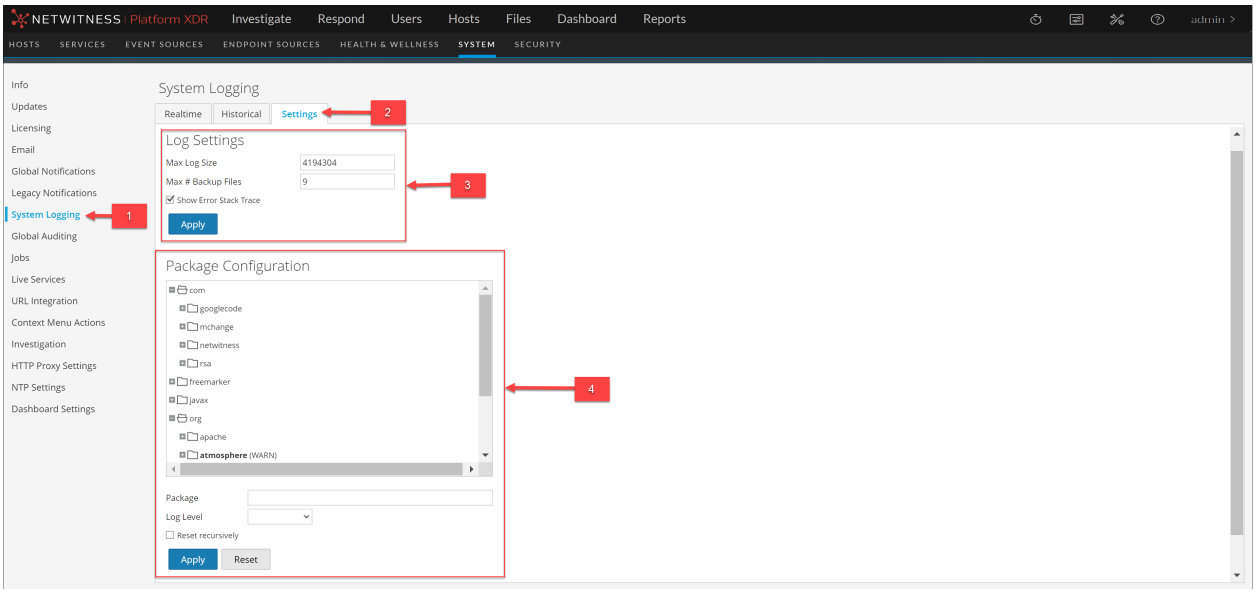
The NetWitness Settings view in the System Logging panel configures the size of the log files, the number of backup log files maintained, as well as the default logging levels for the packages within NetWitness. The "Configure Log File Settings" topic in the *System Configuration Guide* provides detailed procedures.

To access the Settings tab:

1. Go to **(Admin) > System.**
2. In the options panel, select **System Logging**.

   The System Logging panel opens to the Realtime tab by default.
3. Click the **Settings** tab.

What do you want to do?



Role	I want to ...	Show me how
Administrator	Configure the size of the Log files	See the "Configure Log File Settings" topic in the *System Configuration Guide*

Related Topics

System Logging - Historical Tab

System Logging - Realtime Tab

Quick Look

1 Displays System Logging Panel
2 Displays Settings Tab
3 Configure Log Settings
4 Configure Packages

Features

The Settings tab has two sections: Log Settings and Package Configuration.

Log Settings

The Log Settings section configures the size of the NetWitness log files and the number of backup logs that NetWitness maintains.

Feature	Description
Max Log Size	Configures the maximum size in bytes of each log file. The minimum value for this setting is **4096**.
Max # Backup Files	Specifies how many backup log files are maintained. The minimum value for this setting is **0**. When the maximum number of log files is attained, and a new backup file is made, the oldest backup is discarded.
 Show Error Stack Trace	Displays ERROR, STACK, and TRACE log messages.
Apply	Puts the settings into effect immediately for all future logs.

Package Configuration

The Package Configuration section shows the NetWitness packages in a tree structure.

Feature	Description
Package tree	Contains all the packages used within NetWitness. You can drill down into the tree to view the log levels of each package. The **root** logging level represents the default log level for all packages that are not explicitly set. The root level is set to **INFO**
Package field	The name of the selected package when you select a package in the **Package** tree.
Log Level	If the selected package has a log level explicitly set, the value is displayed in the **Log Level** field.
 Reset recursively	Resets the log recursively.

Feature	Description
Apply	Puts settings into effect immediately for all future logs.
Reset	Resets the selected package to the log level of **root**.

System Logging - Realtime Tab

This topic describes the features of the System Logging > Realtime tab and the Services Logs view > Realtime tab.

The Realtime tab is a view of the NetWitness log or a service log. When it is initially loaded, the view contains the last 10 log entries. As new entries become available, the view is updated with those entries.

To access the Realtime tab:

1. Go to  **(Admin) > System.**
2. In the options panel, select **System Logging**.
   The System Logging panel opens to the **Realtime** tab by default.

What do you want to do?

Role	I want to ...	Show me how
Administrator	See details of Log entry	Display System and Service Logs

Quick Look

The following is an example of the **Realtime** tab in the System Logging panel.

1 Displays System Logging Panel
2 Displays Realtime Tab

The following is an example of the Realtime tab in the Services Logs view, which is similar.

Features

The Realtime tab has a toolbar with input fields to allow filtering of the entries, and below the toolbar is a grid containing the log entries.

Toolbar

Feature	Description
Log Level drop-down 	Selects the log level for entries to display in the grid. The **Log Level** drop-down shows the available log levels for the system or the service. • System logs have seven log levels. • Service logs have only six log levels because they do not include the **TRACE** level. • The default is **ALL** log entries.
Keywords field	Specifies a keyword to use when filtering entries. This field is the same for system and service log filtering.
Service field (Service Logs only)	Specifies the service type to use when filtering service log entries. Possible values are the host or the service.
Search button	Click to activate filtering based on the log level, keyword, and service selections.

Log Grid Columns

Column	Description
Timestamp	This is the timestamp for the entry.
Level	This is the log level for the message.
Message	This is the text of the log entry.

System Logging - Historical Tab

The Historical tab provides a searchable view of a NetWitness log or a service log in a paged format. When initially loaded, the grid shows the last page of the log entries for the system or the system.

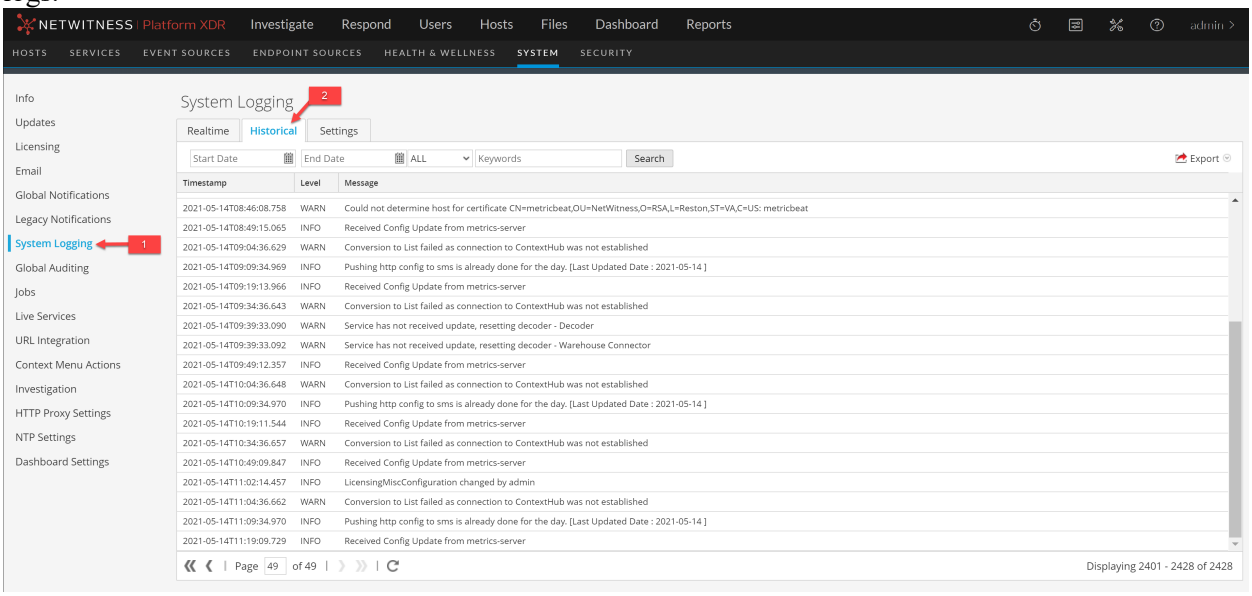
To access the Historical tab:

1. Go to **(Admin) > System.**
2. In the options panel, select **System Logging**.

   The System Logging panel opens to the **Realtime** tab by default.
3. Click the **Historical** tab.

What do you want to do?

Role	I want to ...	Show me how
Administrator	View the Historical Graph	Historical Graph for System Stats

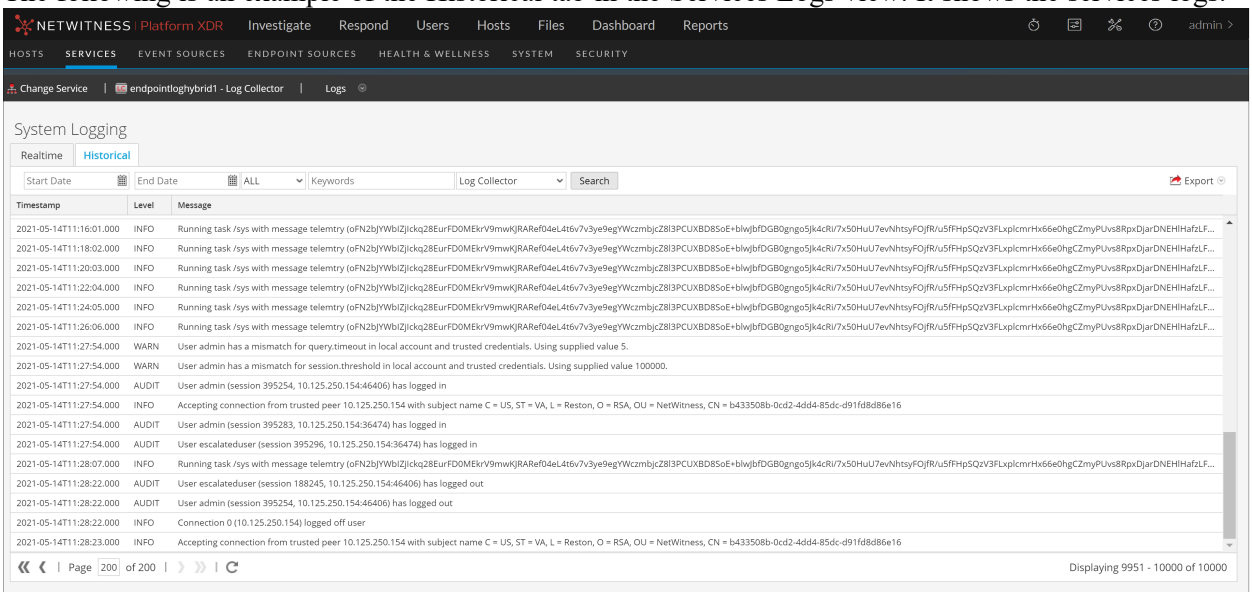


Related Topics

System Logging - Realtime Tab

System Logging - Settings View

Quick Look



The following is an example of the **Historical** tab in the System Logging panel. It shows the NetWitness logs.

1 Displays System Logging Tab

2 Displays Historical Tab

The following is an example of the Historical tab in the Services Logs view. It shows the services logs.

Features

The Historical tab has a toolbar with input fields to allow filtering of the entries, a grid containing the log entries, and paging tools.

Feature	Description
Start Date and End Date	The Start Date and End Date range search options limit the log entries to a point in time. When used, you must provide both a start and end date. The times are optional. The date range is validated to assure that the end date is not before the start date.
Log Level drop-down 	Selects the log level for entries to display in the grid. The Log Level drop-down shows the available log levels for the system or the service. • System logs have seven log levels. • Service logs have only six log levels because they do not include the TRACE level. • The default is ALL log entries.
Keyword field	Specifies a keyword to use when filtering entries. This field is the same for system and service log filtering.
Service field (Service Logs only)	Specifies the service type to use when filtering service log entries. Possible values are the host or the service.
Search button	Click to activate a search based on the start and end date, log level, keyword, and service selections.

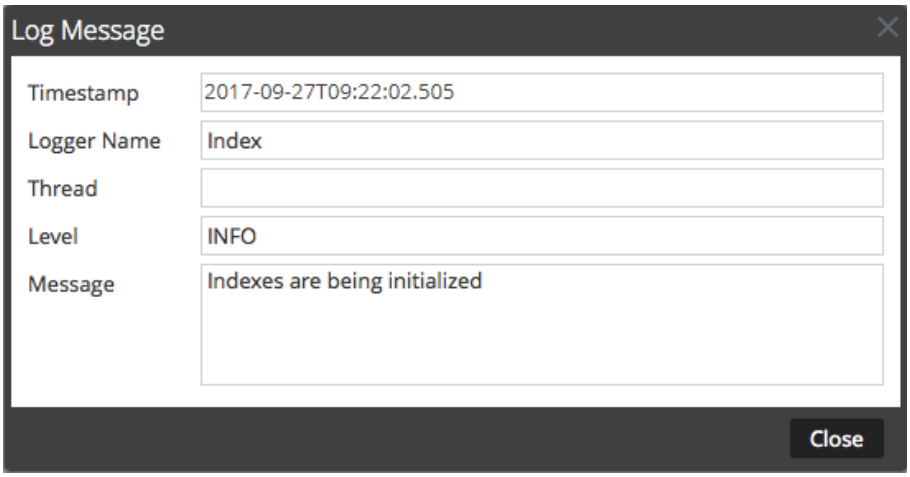
Feature	Description
Export	Click to export the currently viewed grid entries to a text file. You can select either comma-separated or tab-separated format for the entries in the file.

Column	Description
Timestamp	This is the timestamp for the entry.
Level	This is the log level for the message.
Message	This is the text of the log entry.

The paging tools below the grid provide a way to navigate through the pages of log entries.

Search Log Entries

To search the results shown in the Historical tab:



1. (Optional) Select a **Start Date** and **End Date**. Optionally, select a **Start Time** and **End Time**.
2. (Optional) For system and service logs, select a **Log Level** and a **Keyword**, or both.
3. (Optional) For service logs, select the **Service**: host or service.
4. Click **Search**.
   The view is refreshed with the most recent 10 entries matching your filter. As new matching log entries become available, the view is updated to show those entries.

Show Details of a Log Entry

Each row of the Historical tab Log grid provides the summary information of a log entry. To view complete details:

1. Double-click a log entry.

   The Log Message dialog, which contains the Timestamp, Logger Name, Thread, Level and Message, is displayed.

2. When finished viewing, click **Close**.

Page Through the Entries

To view the different pages of the grid, use the paging controls on the bottom of the grid as follows:

- Use the navigation buttons
- Manually enter the page you want to view, and press **ENTER**.

Export

To export the logs in the current view:

Click **Export**, and select one of the drop-down options, **CSV Format** or **Tab Delimited**.
The file is downloaded with a filename that identifies the log type and the field delimiter. For example, a NetWitness system log exported with comma-separated values is named `UAP_log_export_CSV.txt`, and an appliance log exported with tab-separated values is named `APPLIANCE_log_export_TAB.txt`.

Introduction

NetWitness® UEBA configuration is designed for analysts to perform analytics for leveraged data collected from netwitness logs and networks to perform UEBA analytics.

Note: Mixed mode is not supported for UEBA in NetWitness Platform. The NetWitness server, and UEBA must all be installed and configured on the same NetWitness Platform version.

UEBA Supported Sources by Schema

Authentication Schema

- Windows Logon and Authentication Activity in Version 11.2 - Supported Event IDs: 4624, 4625, 4769, 4648 (device.type=winevent_snare|winevent_nic)
- RSASecurID Token in Version 11.3.1 - device.type = 'rsaacesrv' ec.activity = 'Logon'
- RedHat Linux in Version 11.3.1- device.type = 'rhlinux'
- Windows Remote Management in Version 11.3.2 - Supported Event IDs: 4624,4625,4769,4648 (device.type=windows)
- VPN Logs and in Version 11.5 - event.type = 'vpn' ec.activity = 'logon'

Note: NetWitness has tested and verified the functionality of Juniper VPN under the Authentication schema of UEBA. For any VPN to be considered under the Authentication module, the following metadata must be present in the respective VPN vendor's logs:
(event.type = 'vpn' && country.src exists && user.src exists && ec.activity = 'logon')

- Azure AD Logs in Version 11.5 - device.type = 'microsoft_azure_signin_events'

Note: Make sure you have configured the Azure Monitor plugin in your deployment. This enables UEBA to run a query for Azure AD log events for monitoring purposes in the correct format. For more information on how to configure the Azure Monitor plugin, see the *Azure Monitor Event Source Configuration Guide*.

File Schema

- Windows File Servers in Version 11.2 - Supported Event IDs: 4663,4660,4670,5145 (device.type=winevent_snare|winevent_nic)
- device.type=windows in Version 11.3.1

Active Directory Schema

- Windows Active Directory in Version 11.2 - Supported Event IDs: 4741,4742,4733,4734,4740,4794,5376,5377,5136,4764,4743,4739,4727,4728,4754,4756,4757,4758,4720,4722,4723,4724,4725,4726,4738,4767,4717,4729,4730,4731,4732 (device.type=winevent_snare|winevent_nic)
- device.type=windows in Version 11.3.1

Endpoint Process Schema

- Endpoint Process in Version 11.3 - Category = 'Process Event'

Endpoint Registry Schema

- Endpoint Registry in Version 11.3 - Category = 'Registry Event'

Packet Schema

- TLS in Version 11.4 - Service 443 (direction='outbound')

Note: The TLS Packet requires adding the hunting package and enabling the JA3 features as described in Add required features for UEBA Packets Schema.

UEBA Configuration

This topic provides the high-level tasks required to configure UEBA.

IMPORTANT: Changing the UEBA start-date or the UEBA processed schemas requires a re-run of the UEBA system as well as cleanup of the UEBA databases. In order to avoid deleting the information in the UI, you can use the reset_presidio.py script as described in reset-presidio script, it will keep the data in the UI (e.g. Alerts, Indicators, Entities and Scores).

Note: To configure a single UEBA server, see "Task 3. Install and Configure NetWitness UEBA" under Installation Tasks topic in the *UEBA Standalone Installation Guide*.

Configure Multiple UEBA Servers

NetWitness Platform XDR now supports installing multiple servers of UEBA in your environment.

Before using this feature, ensure that you meet the following requirements:

The multiple UEBA deployments are independent, with one supporting Logs & Endpoint models and the other dedicated exclusively to Network (TLS) models. Customers with a different use case will need to contact the NetWitness Customer Support team.

Multi-UEBA can use used for the following scenario:

- Multi-UEBA can only be used if there is no need for correlation between the data consumed by both UEBA servers, such as one server for Logs and Endpoint and one server for Network.

IMPORTANT: NetWitness recommends that you configure Authentication, File, Active Directory, Process, and Registry schemas on one UEBA server and TLS schema on another UEBA server for better data processing.

Prerequisites

Ensure that the NetWitness Platform XDR and Hosts (UEBA) are in version 12.3 or later.

Procedure

1. Follow the install instructions for installing multiple UEBA servers. For example, UEBA-Server-1 and UEBA-Server-2. For more information, see "Task 3. Install and Configure NetWitness UEBA" under Installation Tasks topic in the *UEBA Standalone Installation Guide*.

   Note: You can configure multiple UEBA servers in your environment. NetWitness has installed and verified up to three UEBA servers.

2. Follow the ueba-server-config script to set up data schemas on the installed UEBA server 1 and UEBA server 2. For more information, see ueba-server-config script.

Best Practices to Add and Remove Schemas for Multiple UEBA Servers

If you are planning to install multiple UEBA servers in your environment. Consider that you have all six schemas configured in the 12.2 or an earlier version of the UEBA server.

NetWitness recommends that the TLS schema (Network data) must be configured on the new UEBA Server first, and then the existing UEBA server containing all schemas must be reset and re-configured with the five schemas Authentication, File, Active Directory, Process, and Registry (Logs and Endpoint data). For more information on configuration, see ueba-server-config script. You need to reset the start date as well and ensure you set the start date one month back from the current date. For more information, see reset-presidio script.

ueba-server-config script

The `ueba-server-config` script is usually used to configure and run the UEBA component after the deployment. Also, it can be used to update the UEBA configuration during run time.

IMPORTANT: If you change the start-time or the processing schemas, you must re-run UEBA. All script arguments (except the boolean arguments) are mandatory and must be filled.

For more information on the script parameters, see the *NetWitness Standalone Installation Guide for Version 12.3*.

To run the script use the following command `/opt/rsa/saTools/bin/ueba-server-config --help`

Argument	Variable	Description
`-u`	`<user>`	User name of the credentials for the Broker or Concentrator instance that you are using as a data source.
`-p`	`<password>`	Password of the credentials for the Broker or Concentrator instance that you are using as a data source. The following special characters are supported in a password. `!"#$%&()*+,-:;<=>?@[\]^_`\{\|}` If you want to include a special character or special characters, you must delimit the password with an apostrophe sign, for example: `sh /opt/rsa/saTools/bin/ueba-server-config -u brokeruser -p '!"UHfz?@ExMn#$' -h 10.64.153.104 -t 2018-08-01T00:00:00Z -s 'AUTHENTICATION FILE ACTIVE_DIRECTORY TLS PROCESS REGISTRY' -o broker -v`
`-h`	`<host>`	IP address of the Broker or Concentrator used as the data source. Currently, only one data source is supported.
`-o`	`<type>`	Data source host type (`broker` or `concentrator`).

Argument	Variable	Description
-t	<startTime>	Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, 2018-08-15T00:00:00Z). **Note:** The script interprets the time you enter as UTC (Coordinated Universal Time) and it does not adjust the time to your local time zone.
-s	<schemas>	Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, AUTHENTICATION FILE ACTIVE_DIRECTORY PROCESS REGISTRY TLS).
-v		verbose mode.
-e	<argument>	Boolean Argument. This enables the UEBA indicator forwarder to Respond. **Note:** If your NetWitness deployment includes an active Respond server, you can transfer NetWitness UEBA indicators to the Respond server and create incidents by enabling the indicator forwarder, from this data. For more information on how to enable the NetWitness UEBA incidents aggregation, see Enable User Entity Behavior Analytics Incident Rule.

Note: The TLS packet requires adding the hunting package and enabling the JA3 features. For more information, see Add Features for UEBA Packet Schema.

reset-presidio script

IMPORTANT: The reset_presidio.py script deletes the UEBA back-end databases and can also delete the front-end database that is present in the UI.

The reset_presidio.py script is used to re-run the UEBA system as well as to update the UEBA start-date and the processing schemas easily without having to provide all the other parameters required by the ueba-server-config script. This script re-runs the UEBA while it deletes the backed data (models, aggregations, etc.). To delete the front-end data (UI entities and alerts, etc.) use the clean option. If you don't specify a date, the script will set the default start date, a 28 days earlier than the current date. NetWitness recommends that the UEBA start date is set to 28 days earlier than the current date. For UEBA systems that intend to process TLS data, you must verify that the start date is set to no later than 14 days earlier than the current date.

Note: UEBA requires to process 28 days of data before the alerts can be created.
- If you choose a start date that is less than 28 days before the current date, for example 10 days earlier from the current date, you will have to wait for another 18 days from the current date to see alerts in your UEBA system (if created).
- If you choose a start date that is greater than 27 days, it's recommended to delete the front-end database as well (use the -c) to avoid duplicate alerts.

To run the script, load the Airflow virtual environment variables as follows:

```
source /etc/sysconfig/airflow
source $AIRFLOW_VENV/bin/activate
OWB_ALLOW_NON_FIPS=on python
/var/netwitness/presidio/airflow/venv/lib/python2.7/site-packages/presidio_
workflows-1.0-py2.7.egg/presidio/utils/airflow/reset_presidio.py --help
deactivate
```

Argument	Variable	Description
-h, --help		Script Help
-c, --clean	<argument>	If true, clean any existing data in Elasticsearch DB (as Alerts, Indicators, Entities, etc), all data will be deleted form the UEBA UI
-s	<schema>	Reconfigure the UEBA engine array of schemas (e.g. [AUTHENTICATION FILE ACTIVE_DIRECTORY PROCESS REGISTRY TLS])
-d	<date>	Reconfigure the UEBA engine to start from midnight UTC of this date. If not set, by default reset the start date to 27 days before the current system day, at midnight UTC, to avoid duplicate alerts in the UEBA UI, in case you didn't cleaned the elasticsearch data (-c) (e.g. 2010-12-31)

Add a Schema without Rerunning the UEBA

Note: Adding a schema without rerunning the UEBA system is supported on NetWitness NetWitness Platform 11.5.1 and later.

To add a new UEBA schema without rerunning the UEBA system, run the following command on the UEBA host.

```
curl -X PATCH http://localhost:8881/configuration -H 'content-type:
application/json' -d '{"operations":
[{"op":"add","path":"/dataPipeline/schemas/-","value":"<SCHEMA>"}]}'
```

Where `<SCHEMA>` string can be replaced with any one of the following schemas:

- AUTHENTICATION
- FILE
- ACTIVE_DIRECTORY
- PROCESS
- REGISTRY
- TLS

UEBA Indicator Forwarder

Note: The UEBA Indicator Forwarder is supported by the UEBA from version 11.3 and later. If your NetWitness environment includes an active respond server, you can transfer the UEBA indicators to the respond server and to the correlation server in order to create Incidents. For more information, see Enable User Entity Behavior Analytics Incident Rule.

Run the following command to activate the UEBA Indicator Forwarder:

```
curl -X PATCH http://localhost:8881/configuration -H 'content-type:
application/json' -d '{"operations":
[{"op":"replace","path":"/outputForwarding/enableForwarding","value":true}]}'
```

To deactivate the UEBA indicator forwarder, change the “value":true at the request body to be “value":false.

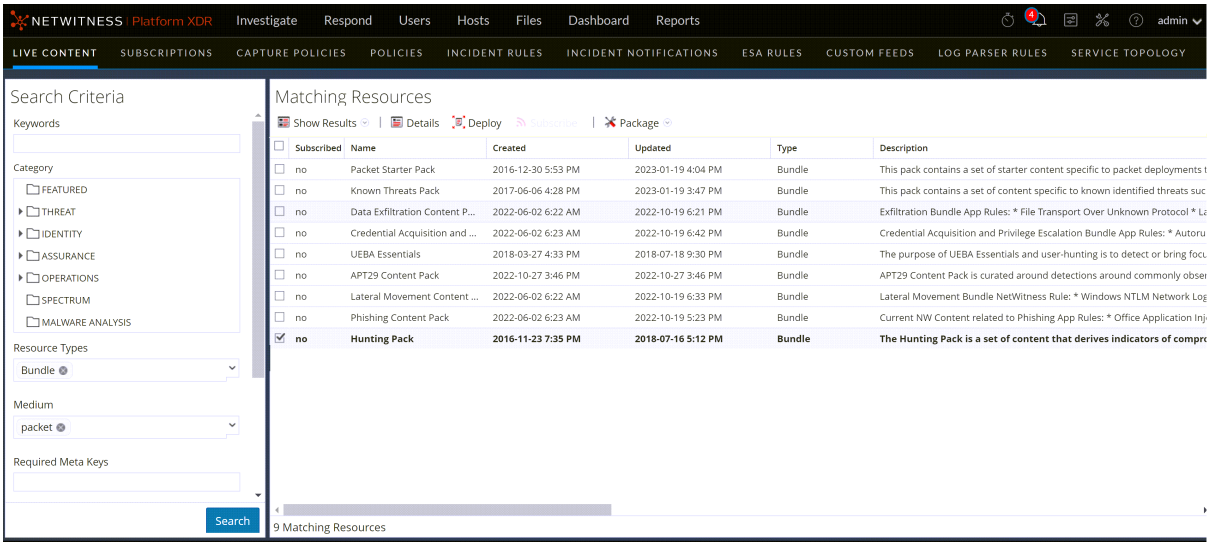
Update Data Source Details

In order to update the details of the data source you must use the `ueba-server-config` script. For more information, see ueba-server-config script.

Note: From 12.3 version or later, if you change the data source using the ueba-server-config script, UEBA will use the previously configured start date by default. To change the UEBA start date, use the reset-presidio script.

The data sources details are:

- Data Source type (Broker / Concentrator).
- Data Source username.
- Data Source password.
- Data Source host.



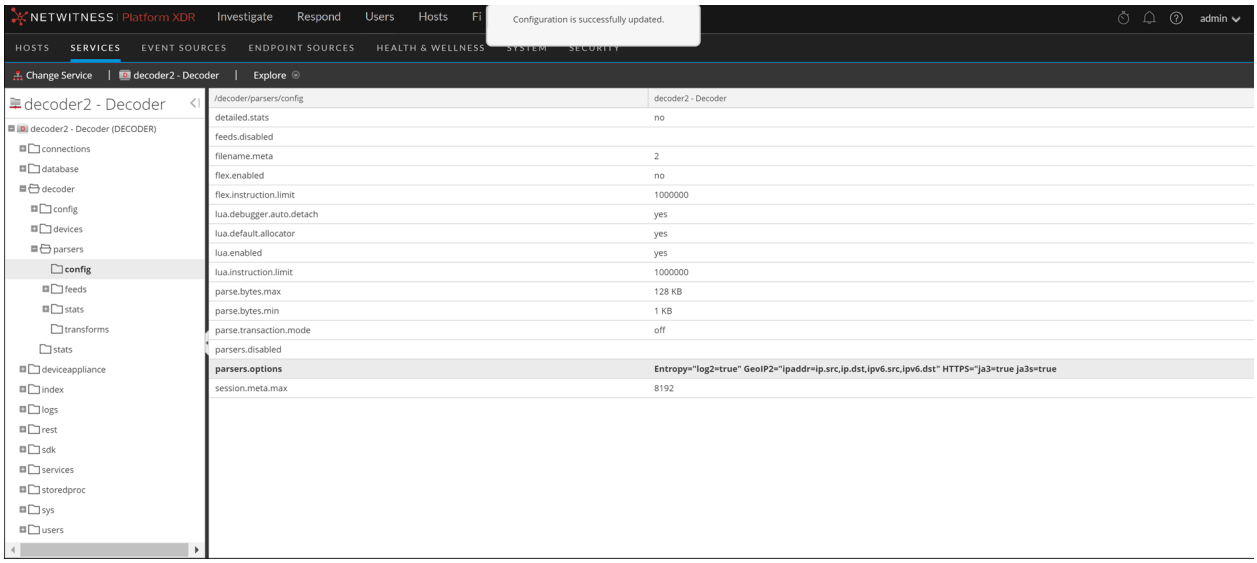
Add Features for UEBA Packet Schema

Add the Hunting Pack:

In NetWitness Platform XDR, add the hunting pack or verify it it’s available:

1. Log in to NetWitness Platform XDR.
2. Navigate to  **(Admin)** and select **Admin Server**.

3. Click and select **Configure** > **Live Content**.



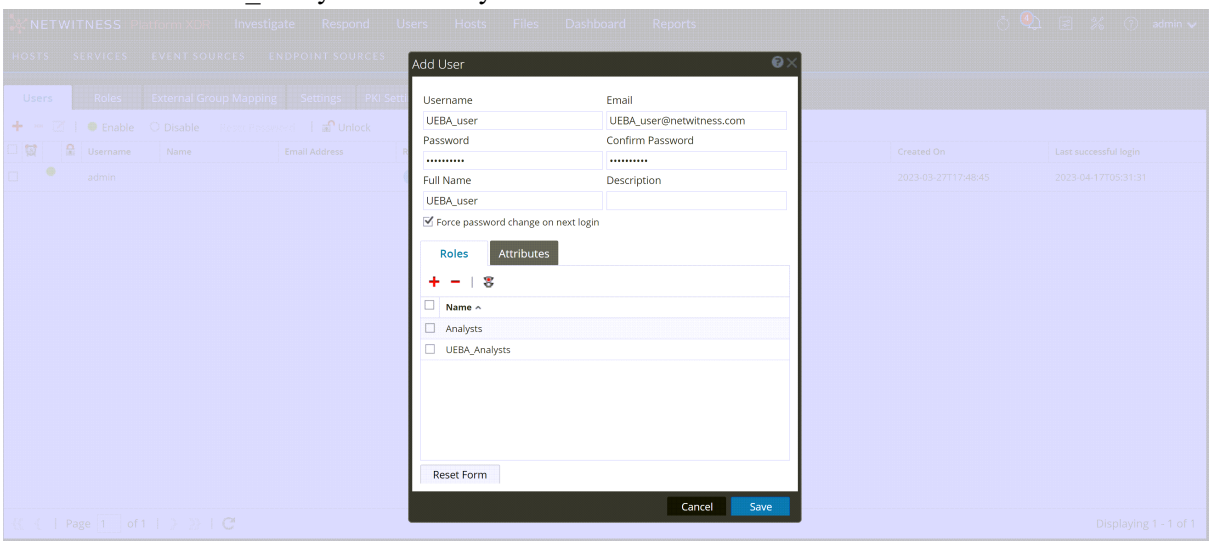
4. On the left menu, select the following:
   a. Bundle under Resources Type.
   b. Packet under Medium
5. Click **Search**.
   A list of matching resources is displayed.
6. Select **Hunting Pack** from the list and click **Deploy**.
   The hunting pack is added.

Add JA3 and JA3s:

The JA3 and JA3s fields are supported by the Network Decoder in 11.3.1 and later. Verify that your Network Decoder is upgraded to one of these versions.

To add JA3 and Ja3s:

1. Log in to NetWitness Platform XDR.
2. Go to (Admin) > **Services** and select Decoder.
3. Navigate to `/decoder/parsers/config/parsers.options`.
4. Add `HTTPS="ja3=true ja3s=true`.

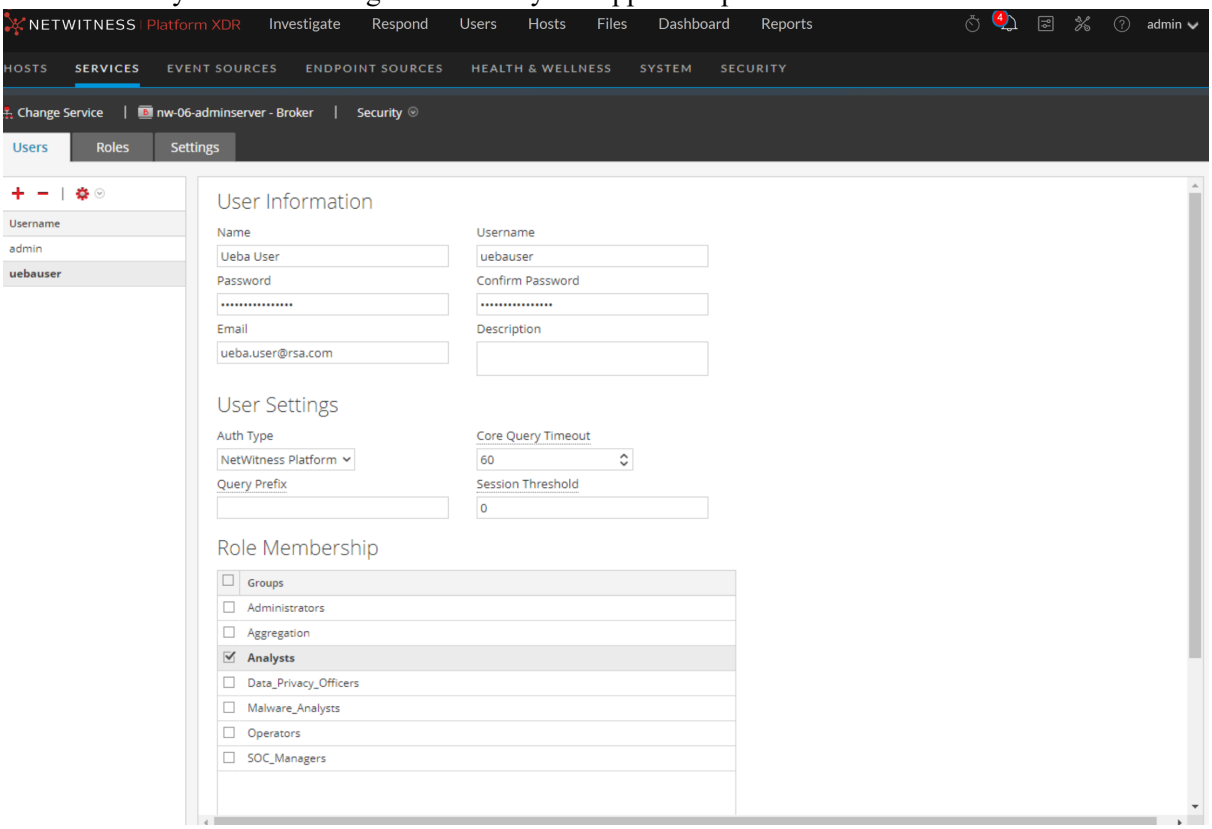


The JA3 and JA3s fields are configured.

Assign User Access to UEBA

To create a user with privileges to access the UEBA pages (Users tab) on the Netwitness UI do the following:

1. Navigate to (Admin) > **Security**.
2. Create a new UEBA_Analysts and Analysts user roles.

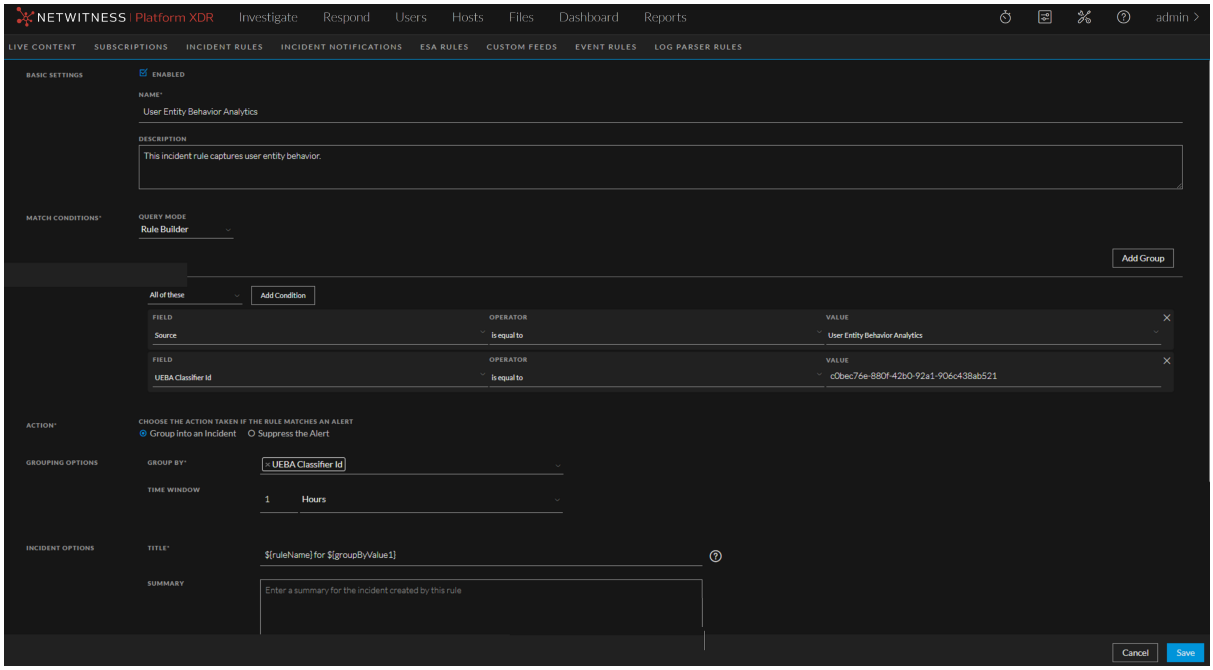


For more information, see the "Manage Users with Roles and Permissions" topic in the *System Security and User Management Guide*.

Create an Analysts Role

In order to fetch data from the data source (Broker / Concentrator), you need to create a user using the Analysts role in the data source service.

1. Navigate to the security tab at the data source service page.
2. Go to the (Admin) > **Services** > **Security**.
3. Create an analyst user and assign it to the any of supported special characters.



Enable User Entity Behavior Analytics Incident Rule

In order to aggregate the UEBA indicators under Incident rule, follow the instructions below:

Enable the UEBA Forwarding process as described in Enable UEBA Indicator Forwarder.

1. Go to (Configure) **> Incident Rules**.
2. Select the **User Entity Behavior Analytics** rule.

3. Select the enable check box and click **Save**.

Enable or Disable Modeled Behaviors for Users

The UEBA Modeled Behaviors functionality is enabled by default from version 11.5.1.

To disable perform the following:

1. SSH to the UEBA server.

   Edit and add the parameter `entity.profile.enabled=false` in the file`/etc/netwitness/presidio/configserver/configurations/presidio-uiconf.properties` .

2. Run the command to restart the presidio-ui.

   ```
   systemctl restart presidio-ui
   ```

   Note: To enable, remove the parameter `entity.profile.enabled=false` from the file and restart the presidio-ui using the step 2.

   Once you have enabled or disabled the Modeled Behaviors, you can verify from NetWitness Platform XDR UI.

   ### To verify, perform the following:

   a. Log into NetWitness Platform and click **Users**.

   b. In the **Overview** tab, under **Top Risky Users** panel, click on a username.

   c. Click the **Modeled Behaviors** tab.
   For more information, see "View Modeled Behaviors" topic in the *UEBA User Guide for NetWitness Platform XDR 12.3*.

Removal of Packetbeat Service

From the 12.3 version or later, the Packbeat service has been removed from UEBA to improve memory usage and performance. This allows other services in UEBA to utilize the resources more efficiently, reducing the load on the system.

Learning Period Per Scale

Learning Period Per Scale for 12.3

Physical Machine (SERIES 6 ESA (DELL R640) SPECIFICATIONS)

Supported Scale	Existing NetWitness customer (historical data available)	Learning Period Alerts will be generated when the learning period is complete
100,000 users with 35 million Log and Endpoint events + 30 million Network events per day	Yes	**Fresh Installation of 12.3** Up to 6 days with 28 days of historical data
	Yes	**Upgrade from 11.7.x, 12.1.x, 12.2.x to 12.3** UEBA reset is not required. • If learning period is already completed, data will be processed for alert generation immediately. • If learning period is completed only for N days, then it will take 28-N days to complete the learning period before generating alerts.
	Yes	**Upgrade from 11.7.x, 12.1.x, 12.2.x to 12.3 with schemas updated (Addition or removal of schemas configured on UEBA)** UEBA reset is required. **Historical data is available for N days**: • N > 28 days: Up to 6 days with 28 days of historical data. • N < 28 days: It will take 28-N days to complete the learning period before generating alerts. **Historical data is not available** 28 days to complete the learning period before generating alerts.

Supported Scale	Existing NetWitness customer (historical data available)	Learning Period Alerts will be generated when the learning period is complete
100,000 users with 35 million Log and Endpoint events + 30 million Network events per day	No	**Fresh installation of 12.3** 28 days to complete the learning period before generating alerts.

Virtual Machine

CPU	Memory	Reserved Memory Allocation	Disk Requirements for /var/netwitness Partition	Read IOPS	Write IOPS
32 cores	128GB	64GB	• Storage: 1.5 TB • Provisioning: Thick	500MB	500MB

IMPORTANT: The **/var/netwitness** partition must be mounted on a **1.5 TB** Thick-provisoned disk for storage usage.

Note: NetWitness recommends you to deploy UEBA on a virtual host, only if your log collection volume is low. If you have a moderate to high log collection volume, NetWitness recommends you to deploy UEBA on the physical host as described in the "NetWitness UEBA Host Hardware Specifications" topic of the *Physical Host Installation Guide*. Contact NetWitness Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897) for advice on choosing which host, virtual or physical, to use for UEBA.

Supported Scale	Existing NetWitness customer (historical data available)	Learning Period Alerts will be generated when the learning period is complete
100,000 users with 30 million Log and Endpoint events + 15 million Network events per day	Yes	**Fresh Installation of 12.3** Up to 7 days with 28 days of historical data
	Yes	**Upgrade from 11.7.x, 12.1.x, 12.2.x to 12.3** UEBA reset is not required. • If learning period is already completed, data will be processed for alert generation immediately. • If learning period is completed only for N days, then it will take 28-N days to complete the learning period before generating alerts .
	Yes	**Upgrade from 11.7.x, 12.1.x, 12.2.x to 12.3 with schemas updated (Addition or removal of schemas configured on UEBA)** UEBA reset is required. **Historical data is available for N days**: • N > 28 days: Up to 7 days with 28 days of historical data. • N < 28 days: It will take 28-N days to complete the learning period before generating alerts. **Historical data is not available** 28 days to complete the learning period before generating alerts.
100,000 users with 30 million Log and Endpoint events + 15 million Network events per day	No	**Fresh installation of 12.3** 28 days to complete the learning period before generating alerts.

Note: Network events per day refers to number of events consumed by UEBA per day.

Learning Period Per Scale for 12.3 Multiple UEBA Servers

Physical Machine (SERIES 6 ESA (DELL R640) SPECIFICATIONS)

Note: There are two UEBA servers, one is configured with Log and Endpoint data, while the other is configured with Network (TLS) data.

Supported Scale	Existing NetWitness customer (historical data available)	Learning Period Alerts will be generated when the learning period is complete
UEBA Server 1: 100,000 users with 100 million Log and Endpoint events per day **UEBA Server 2**: 50 million Network events per day	Yes	**Fresh Installation of 12.3** Up to 8 days with 28 days of historical data
	Yes	**Note:** An additional UEBA server must be installed to configure TLS schema on a separate UEBA server. For example, if you are planning to upgrade from 11.7.1: **Before upgrade**: **UEBA Server 1** is configured with Log, Endpoint, and TLS data. **After upgrade**: • Add another **UEBA Server 2** and configure it with TLS schema. • Reconfigure **UEBA Server 1** with only Log and Endpoint data followed by UEBA reset. For more information, see Best Practices to Add and Remove Schemas for Multiple UEBA Servers. **Upgrade from 11.7.x, 12.1.x, 12.2.x to 12.3 with schemas updated (Addition or removal of schemas configured on UEBA)** UEBA reset is required.

Supported Scale	Existing NetWitness customer (historical data available)	Learning Period Alerts will be generated when the learning period is complete
UEBA Server 1: 100,000 users with 100 million Log and Endpoint events per day **UEBA Server 2**: 50 million Network events per day	Yes	**Historical data is available for N days**: • N > 28 days: Up to 8 days with 28 days of historical data. • N < 28 days: It will take 28-N days to complete the learning period before generating alerts. **Historical data is not available** 28 days to complete the learning period before generating alerts.
UEBA Server 1: 100,000 users with 100 million Log and Endpoint events per day **UEBA Server 2**: 50 million Network events per day	No	**Fresh installation of 12.3** 28 days to complete the learning period before generating alerts.

Learning Period Per Scale (from 11.5.1 version to 12.2.0.1)

Note: For all supported scales, when historical data is not available, the learning period is 28 days.

Physical Machine

SERIES 5 (DELL R630) SPECIFICATIONS

Supported Scale for existing NetWitness customers (historical data is available)	Learning Period Alerts will be generated when the learning period is complete
Logs and Endpoint data for 100,000 users with 30 million events per day + 20 million network events per day.	**11.5.1 Installation** Up to 4 days with 28 days of historical data.
	11.5.1 Upgrade from 11.4.x No learning period. • UEBA rerun is not required.
	11.5.1 Upgrade from 11.3.x or prior versions Up to 4 days with 28 days of historical data. • UEBA rerun is required.
	11.5.1 Upgrade with schema removal Up to 4 days with 28 days of historical data. • UEBA rerun is required
Logs and Endpoint data for 100,000 users with 30 million events per day + 60 million network events per day.	**11.5.1 Installation** Up to 14 days with 14 days of historical data.
	11.5.1 Upgrade from 11.4.x No learning period. • UEBA rerun is not required.
	11.5.1 Upgrade from 11.3.x or prior versions Up to 14 days with 14 days of historical data. • UEBA rerun is required. **Note:** This scenario is impacted by ASOC-101686 known issue. For more information, see *NetWitness Release Notes for 11.5.*
	11.5.1 Upgrade with schema removal Up to 14 days with 14 days of historical data. • UEBA rerun is required. **Note:** This scenario is impacted by ASOC-101686 known issue. For more information, see *NetWitness Release Notes for 11.5.*

Virtual Machine

If there is not historical data, then the learning period will be 28 days.

CPU	Memory	Read IOPS	Write IOPS
16 cores	64GB	500MB	500MB

Note: NetWitness recommends you to deploy UEBA on a virtual host, only if your log collection volume is low. If you have a moderate to high log collection volume, NetWitness recommends you to deploy UEBA on the physical host as described in the " NetWitness UEBA Host Hardware Specifications" topic of the *Physical Host Installation Guide*. Contact Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897) for advice on choosing which host, virtual or physical, to use for UEBA.

Supported Scale for existing NetWitness customers (historical data is available)	Learning Period Alerts will be generated when the learning period is complete
Logs and Endpoint data for up to 100,000 users with 30 million events per day (no network data).	**11.5.1 Installation** Up to 4 days with 28 days of historical data.
	11.5.1 Upgrade from 11.4.x No learning period. • UEBA rerun is not required.
	11.5.1 Upgrade from 11.3.x or prior versions Up to 4 days with 28 days of historical data. • UEBA rerun is required.
	11.5.1 Upgrade with schema removal Up to 4 days with 28 days of historical data. • UEBA rerun is required

Supported Scale for existing NetWitness customers (historical data is available)	Learning Period Alerts will be generated when the learning period is complete
Logs and Endpoint data for up to 100,000 users with 30 million events per day + 20 million network events per day.	**11.5.1 Installation** Up to 14 days with 14 days of historical data. **11.5.1 Upgrade from 11.4.x** No learning period. • UEBA rerun is not required. **11.5.1 Upgrade from 11.3.x or prior versions** Up to 14 days with 14 days of historical data. • UEBA rerun is required. **Note:** This scenario is impacted by ASOC-101686 known issue. For more information, see *NetWitness Release Notes for 11.5.* **11.5.1 Upgrade with schema removal** Up to 14 days with 14 days of historical data. • UEBA rerun is required. **Note:** This scenario is impacted by ASOC-101686 known issue. For more information, see *NetWitness Release Notes for 11.5.*

Note: Network events per day refers to number of events consumed by UEBA per day. To determine the scale of network events for existing customers, see Troubleshooting UEBA Configurations.

Learning Period Per Scale for 11.5

Physical Machine

SERIES 5 (DELL R630) SPECIFICATIONS

Supported Scale	Existing NetWitness customer (historical data available)	Learning Period Alerts will be generated when the learning period is complete
Logs and Endpoint data for 100,000 users with 30 million events per day + 20 million network events per day.	Yes	**11.5 Installation** Up to 4 days with 28 days of historical data.
	Yes	**11.5 Upgrade from 11.4.x with no schema changes** No learning period. • UEBA rerun is not required.
	Yes	**11.5 Upgrade from 11.3.x or prior versions with no schema changes** Up to 4 days with 28 days of historical data. • UEBA rerun is required.
	Yes	**11.5 Upgrade with schema changes** Up to 4 days with 28 days of historical data. • UEBA rerun is required

Supported Scale	Existing NetWitness customer (historical data available)	Learning Period Alerts will be generated when the learning period is complete
Logs and Endpoint data for 100,000 users with 30 million events per day + 60 million network events per day.	Yes	**11.5 Installation** Up to 14 days with 14 days of historical data.
	Yes	**11.5 Upgrade from 11.4.x with no schema changes** No learning period. • UEBA rerun is not required.
	Yes	**11.5 Upgrade from 11.3.x or prior versions with no schema changes** Up to 14 days with 14 days of historical data. • UEBA rerun is required. **Note:** This scenario is impacted by ASOC-101686 known issue. For more information, see *NetWitness Release Notes for 11.5.*
	Yes	**11.5 Upgrade with schema changes** Up to 14 days with 14 days of historical data. • UEBA rerun is required. **Note:** This scenario is impacted by ASOC-101686 known issue. For more information, see *NetWitness Release Notes for 11.5.*
Logs and Endpoint data for up to 100,000 users with 30 million events per day + 60 million network events per day.	No	**11.5 Installation** 28 days

		11.5 Upgrade from 11.3.x or prior versions with no schema changes Up to 14 days with 14 days of historical data. • UEBA rerun is required. **Note:** This scenario is impacted by ASOC-101686 known issue. For more information, see *NetWitness Release Notes for 11.5.*
		11.5 Upgrade with schema changes Up to 14 days with 14 days of historical data. • UEBA rerun is required. **Note:** This scenario is impacted by ASOC-101686 known issue. For more information, see *NetWitness Release Notes for 11.5.*
Logs and Endpoint data for up to 100,000 users with 30 million events per day + 20 million network events per day.	No	**11.5 Installation** 28 days

Note: Network events per day refers to number of events consumed by UEBA per day. To determine the scale of network events for existing customers, see Troubleshooting UEBA Configurations.

Troubleshooting UEBA Configurations

This section provides information about possible issues when using NetWitness UEBA.

Task Failure Issues in Airflow

Problem	The `userId_output_entities` task fails when the username contains a backslash.
Cause	When events with usernames containing a backslash character is passed through UEBA, then the `userId_output_entities` task fails.
Solution	To resolve this issue contact the customer success to obtain the relevant files and execute the following steps: • Stop airflow-scheduler service. • Remove all MongoDB documents in the "aggr", "accm" and "input" collections that contains `context.userId` with hashtag. These documents can be located using the FindCollecionsContainsBackslash.js script. • Replace the `/var/netwitness/presidio/flume/conf/adapter/transformers/authentication.json` file with the updated authentication .json. • Restart the airflow-scheduler service. • Validate that the next run of the `userId_output_entities` task is completed successfully.

Problem	The `AUTHENTICATION_userId_build_feature_historical_data` task fails when the username contains a hashtag.
Cause	When events with usernames containing a hashtag character is passed through UEBA, then the `AUTHENTICATION_userId_build_feature_historical_data` task fails.
Solution	To resolve these issue contact the customer success to obtain the relevant files and execute the following steps: • Stop airflow-scheduler service. • Remove all MongoDB documents in the "aggr", "accm" and "input" collections that contains `context.userId` with hashtag. These documents can be located using the FindCollecionsContainsHashtagContextUserId.js script. • Replace the `/var/netwitness/presidio/flume/conf/adapter/transformers/authentication.json` file with the updated authentication .json. • Restart the airflow-scheduler service.

	• Validate that the next run of `AUTHENTICATION_userId_build_feature_historical_data` task is completed successfully.

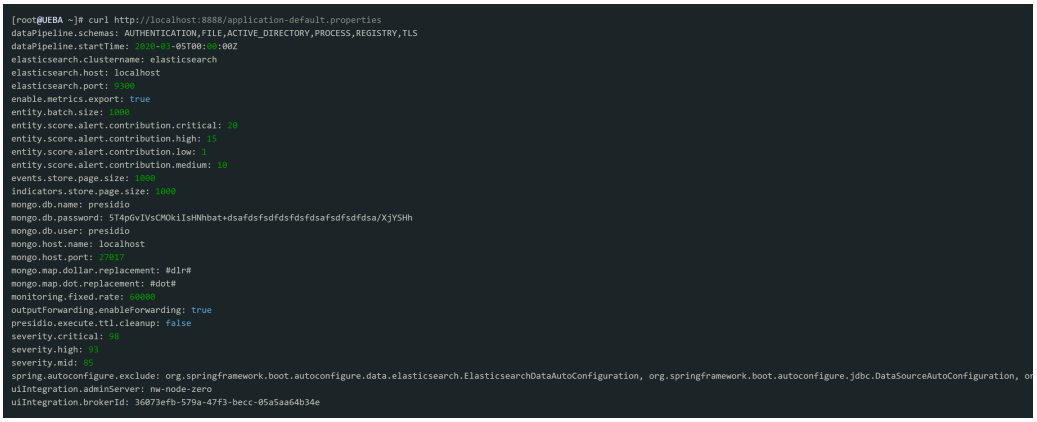
Problem	The task `output_forwarding_task` fails in Airflow UI for `userId_hourly_ueba_flow` DAG due to Elasticsearch 'too many clauses' exception.
Cause	The `output_forwarding_task` task in the `userId_hourly_ueba_flow` DAG fails in the Airflow UI. The failure is caused by an Elasticsearch exception with the following message: `"caused_by":{"type":"too_many_clauses","reason":"maxClauseCount is set to 1024"}`. The too_many_clauses error occurs when the number of clauses in an Elasticsearch query exceeds the maximum limit set by the system. In this case, the maximum number of clauses was set to 1024. The `output_forwarding_task` exceeded this limit, which caused the failure.

Solution	To increase the max clause count value, execute the following steps:
	1. SSH to UEBA server.
	2. Open the `/etc/elasticsearch/elasticsearch.yml` file.
	3. Update the `max clause count` parameter value:
	`indices.query.bool.max_clause_count: 1500`
	4. Restart the elasticsearch service using the following command:
	`systemctl restart elasticsearch`
	Note: After restarting, the task may fail and will be automatically retried.

MongoDB I/O Operations Slowness Issue

Problem	Increased execution time for DAGs with Mongo I/O Operations.
Cause	Some of the DAGs in the system experienced increased execution time due to slow MongoDB Input/Output (I/O) operations.

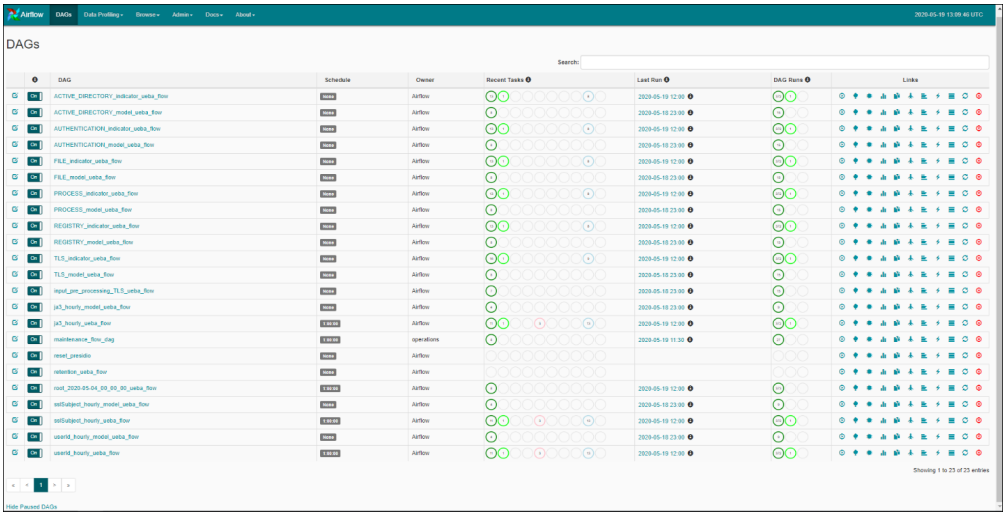
Solution	To increase the MongoDB cache size in the MongoDB config file, execute the following steps:
	1. SSH to UEBA server.
	2. Open the `/etc/mongod.conf` file.
	3. Update the `internalQueryMaxBlockingSortMemoryUsageBytes` value to 1GB (1053554432 bytes).
	`internalQueryMaxBlockingSortMemoryUsageBytes: 1053554432`
	4. Restart the Mongod service using the following command:
	`systemctl restart mongod`
	Note: After restarting, the task may fail and will be automatically retried.

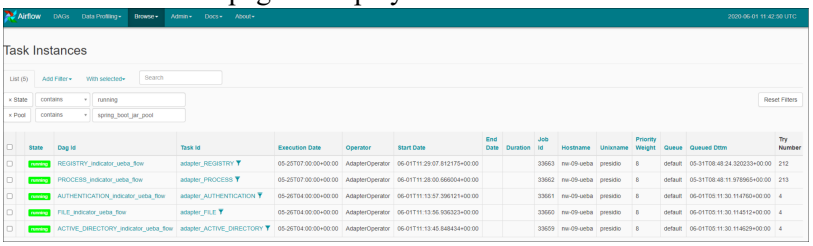


User Interface Inaccessible

Problem	The User Interface is not accessible.
Cause	You have more than one NetWitness UEBA service existing in your NetWitness deployment and you can only have NetWitness UEBA service in your deployment.

Solution	Complete the following steps to remove the extra NetWitness UEBA service.
	1. SSH to NW Server and run the following commands to query the list of installed NetWitness UEBA services.
	`# orchestration-cli-client --list-services|grep presidio-airflow`
	`... Service: ID=7e682892-b913-4dee-ac84-ca2438e522bf, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	`... Service: ID=3ba35fbe-7220-4e26-a2ad-9e14ab5e9e15, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	2. From the list of services, determine which instance of the `presidio-airflow` service should be removed (by looking at the host addresses).
	3. Run the following command to remove the extra service from Orchestration (use the matching service ID from the list of services):
	`# orchestration-cli-client --remove-service --id <ID-for-presidio-airflow-form-previous-output>`
	Note: Run the following command to update NW Server to restore NGINX:
	`# orchestration-cli-client --update-admin-node`
	4. Log in to NetWitness, go to  **(Admin) > Hosts**, and remove the extra NetWitness UEBA host.





Get UEBA Configuration Parameters

Issue	How to get UEBA configuration parameters?
Explanation	In order to get the UEBA configuration main parameters, run the `curl`

	`http://localhost:8888/application-default.properties` command from the UEBA machine.  The main parameters which will be returned are the following: • uiIntegration.brokerId: The Service ID of the NW data source (Broker / Concentrator) • dataPipeline.schemas: List of schemas processed by the UEBA • dataPipeline.startTime: The date the UEBA started consuming data from the NW data source • outputForwarding.enableForwarding: The UEBA Forwarder status
Resolution	See the resolution for these statistics in the Troubleshooting UEBA Configurations section.

Check UEBA Progress Status using Airflow

Issue	How to check UEBA progress status using Airflow?

Resolution	1. Navigate to- https://<UEBA-host-name>/admin. Enter the admin username and the deploy-admin password. The following image is of the Airflow home page that shows the system is working as expected.  2. Make sure that no red or yellow circles appear in the main page: • red circle indicates that a task has failed. • yellow circle indicates that a task has failed and is “awaiting” for a retry. If a “failed” or “up-for-retry” task appears, investigate what is the root cause of the problem. 3. Make sure the system continues to run. 4. Tap the **Browse** button and select **Task Instance**. 5. Add the following filters: **State** = `running` and **Pool** = `spring_boot_jar_pool`. The Task Instance page is displayed.  The **Execution Date** column shows the current time window for each running task. Make sure the execution date is greater than the UEBA start-date and that new tasks have an updated date are added to the table.

Check if data is received on the UEBA by Kibana

Issue	How to check if data is received on the UEBA by Kibana:

Explanation	Navigate to- https://<UEBA-host-name>/kibana. Enter the admin username and password: To check that the data is flowing to the UEBA go to the Adapter Dashboard: Tap the Dashboard tab in the left menu Tap Adapter Dashboard at the right menu Select the relevant time range at the top bar The charts on this dashboard will present you the data that already fetched by the UEBA. 

Scaling Limitation Issue

When installed on a Virtual Machine, UEBA can process up to 20 million network events per day. Based on this limitation, you may encounter the following issues.

Issue	How to determine the scale of network events currently available, to know if it exceeds the UEBA limitation.
Solution	To know the network data limit, perform the following : • Run the query on the Broker or Concentrator that connects to UEBA using NetWitness UI: `service=443 && direction='outbound' && analysis.service!='quic' && ip.src exists && ip.dst exists && tcp.srcport!=443` Calculate the total number of events for the selected days (including weekdays with standard workload). If the average is above 20 million per day then it indicates that UEBA's supported scale is exceeded.

Issue	Can UEBA for Packets be used if UEBA's supported scale is exceeded?
Solution	You must create or choose a Broker that is connected to a subset of Concentrators that does not exceed the supported limit. To know the network data limit, perform the following : • Run the query on the Concentrator that connects to UEBA using NetWitness UI: `service=443 && direction='outbound' && analysis.service!='quic' && ip.src exists && ip.dst exists && tcp.srcport!=443`

	Calculate the total number of events for the selected days (including weekdays with standard workload). If the average is above 20 million per day then it indicates that UEBA's supported scale is exceeded.

Note: The Broker must query all the available and needed data needed such as logs, endpoint and network (packets). UEBA packets models are based on the whole environment. Hence, make sure that the data parsed from the subset of Concentrators is consistent.

UEBA Policy Issue

Issue	After you create a rule under UEBA policy, duplicate values are displayed in the Statistics drop-down.

Solution	To remove the duplicate values, perform the following:
	1. Log in to MongoDB using following command:`mongo admin -u deploy_admin -p {Enter the password}`
	2. Run the following command on MongoDB:
	`use sms;`
	`db.getCollection('sms_statdefinition').find({componentId :"presidioairflow"})`
	`db.getCollection('sms_statdefinition').deleteMany ({componentId :"presidioairflow"})`

Troubleshoot Using Kibana

Issue	After you deploy NetWitness UEBA, the connection between the NetWitness and NetWitness UEBA is successful but there are very few or no events in the **Users** > **OVERVIEW** tab. 1. Log in to **Kibana**. 2. Go to **Table of Content** > **Dashboards** > **Adapter Dashboard**. 3. Adjust the **Time Range** on the top-right corner of the page and review the following: • If the new events are flowing. • In the **Saved Events Per Schema** graph, see the number of successful events per schema per hour. • In the **Total Events vs. Success Events** graph, see the total number of events and number of successful events. The number of successful events should be more every hour. For example, in an environment with 1000 users or more, there should be thousands of authentication and file access events and more than 10 Active Directory events. If there are very few events, there is likely an issue with Windows auditing.

Solution	You must identify the missing events and reconfigure the Windows auditing. 1. Go to **INVESTIGATE** > **Navigate**. 2. Filter by **devide.type= device.type "winevent_snare"** or **"winevent_nic"**. 3. Review the events using **reference.id** meta key to identify the missing events. 4. Reconfigure the Windows auditing. For more information, see **NetWitness UEBA Windows Audit Policy** topic.

Issue	The historical load is complete and the events are coming from Adapter dashboard but no alerts are displayed in the **Users** > **OVERVIEW** tab.
Solution	1. Go to **Kibana** > **Table of content** > **Scoring and model cache**. 2. Adjust the **Time Range** from the top-right corner of the page, and see if the events are scored.

Issue	The historical load is complete but no alerts are displayed in the **Users** tab.
Solution	1. Go to **Kibana** > **Dashboard** > **Overview**. 2. Adjust the **Time Range** from the top-right corner of the page, and see how many users are analyzed and if any anomalies are found.

Troubleshoot Using Airflow

Issue	After you start running the UEBA it is not possible to remove a data source during the run process else the process stops.
Solution	You must either continue the process till it completes or remove the required data source from UEBA and rerun the process.

Issue	After you deploy UEBA and if there are no events displayed in the **Kibana** > **Table of content** > **Adapter** dashboard and Airflow has already processed the hours but there are no events. This is due to some communication issue.
Solution	You must check the logs and resolve the issue. 1. Log in to **Airflow**. 2. Go to **Admin** > **REST API Plugin**. 3. In the **Failed Tasks Logs**, click **execute**. A zip file is downloaded. 4. Unzip the file and open the log file to view and resolve the error.

	5. In the **DAGs** > **reset_presidio**, click **Trigger Dag**. This deletes all the data and compute all the alert from the beginning. **Note:** During initial installation, if the hours are processed successfully but there are no events, you must click reset_presidio after fixing the data in the Broker. Do not reset if there are alerts.

Troubleshoot Using Elasticsearch Migration Tool

Issue	If you upgrade the UEBA host from 12.0 and older versions to 12.3 without performing Elasticsearch data backup (using the Elasticsearch migration tool), the data such as Users, Entities, Alerts, and Indicators will be lost. **Note:** This is not applicable if you are upgrading the UEBA host from 12.1, 12.2 to 12.3.

Solution	If you fail to perform Elasticsearch data backup and lose all the data after upgrading the UEBA host from 12.0 or older versions to 12.2, follow these steps to recover the lost data.
	1. Go to `/var/netwitness/` after upgrading the UEBA host to 12.3.
	2. Copy `backup-elasticsearch-xxxx` (mandatory) and `backup-elasticsearch-recover-xxxx` (If it is available) directories to `/var/netwitness/` in your UEBA lab (on version 12.0 or older versions).
	Note:
	- If you do not have a UEBA lab setup for version 12.0 or older versions, contact NetWitness.
	- NetWitness requires your permission to copy the directories to `/var/netwitness/` in NetWitness UEBA lab for recovering the lost data.
	3. Rename the `backup-elasticsearch-xxxx` directory as `elasticsearch`. Run the following command.
	`cd /var/netwitness`
	`rm -r elasticsearch`
	`mv backup-elasticsearch-xxxx elasticsearch`
	`chown -R elasticsearch:elasticsearch elasticsearch`
	`systemctl start elasticsearch`
	4. Rename the `backup-elasticsearch-recover-xxxx` directory as `elasticsearch-recover`. Run the following command.
	IMPORTANT: If `backup-elasticsearch-recover-xxxx` directory is not available, do not run the below command.
	`cd /var/netwitness`
	`rm -r elasticsearch-recover`

```
mv backup-elasticsearch-recover-xxxx elasticsearch
chown -R root:elasticsearch elasticsearch-recover
systemctl start elasticsearch
```

5. Restart the Elasticsearch 5.5.0. Run the following command.

   ```
   systemctl restart elasticsearch.service
   ```

6. Follow the steps provided in the Elasticsearch migration tool guide to export Elasticsearch presidio data. For more information, see the *Upgrade Preparation Tasks* section in the NetWitness Upgrade guide for 12.3.

   Note: ueba_es_migration_tool (Elasticsearch migration tool) allows you to migrate presidio Elasticsearch data from Elasticsearch version 5.5.0 to 7.17.6 while upgrading the UEBA host to 12.3 from 12.0 and older versions. This tool contains `elk-migration-script.sh` script file and `presidio-elk-migration-1.0.0.jar` file and it can be downloaded from UEBA Elasticsearch Migration Tool.

7. Once the Elasticsearch presidio data Export operation is completed, copy the backup directories to your UEBA host.
8. **Import** Elasticsearch presidio data. For more information, see *Post Upgrade Tasks* topic in the NetWitness Upgrade guide for 12.3.

What is NetWitness UEBA?

NetWitness UEBA (User and Entity Behavior Analytics) is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all users and entities in your network environment. NetWitness UEBA is used for following reasons:

- Detecting malicious and rogue users
- Pinpointing high-risk behaviors
- Discovering attacks
- Investigating emerging security threats
- Identify potential attacker activity

About this Guide

This guide provides end-to-end instructions to configure NetWitness UEBA and to use UEBA features.

Getting Started

The following tasks can be performed in any sequence.

Description	References
	
View information about product updates, improvements, and known issues.	Release Notes
Understand NetWitness UEBA	*NetWitness UEBA User Guide*

Setup and Installation

You can setup and install NetWitness UEBA by performing Standalone Installation and Fresh Installation.

Standalone Installation

The following tasks must be performed in the following sequence.

Description	References
	
Review the supported hardware.	"System Requirement" topic in *UEBA Standalone Installation Guide*
Review the UEBA deployment.	"NetWitness UEBA Standalone Installation " topic in *UEBA Standalone Installation Guide*
Configure the ports on your firewall.	"NetWitness UEBA Standalone Installation " topic in *UEBA Standalone Installation Guide*
Install NetWitness Server host.	"Installation Tasks" topic in *UEBA Standalone Installation Guide*
Install 12.3 Log Hybrid Host.	"Installation Tasks" topic in *UEBA Standalone Installation Guide*
Install and Configure NetWitness UEBA.	"Installation Tasks" topic in *UEBA Standalone Installation Guide*
Assign the UEBA_Analysts and Analysts roles to the UEBA users.	"Role Permissions" in the *System Security and User Management Guide*

Fresh Installation

The following tasks needs to be performed in the following sequence.

Description	References
	
Review the supported hardware.	"Supported Hardware" in the *Physical Host Installation Guide*
Review the UEBA architecture.	"NetWitness Platform Network Architecture Diagram" topic in the *Deployment Guide*
Configure the ports on your firewall.	"Network Architecture and Ports" topic in the *Deployment Guide*

Description	References
Install NetWitness Server host and other components.	"Task 1 - Install 12.3 on the NetWitness Server (NW Server) Host" and "Task 2 - Install 12.3 on Other Component Hosts" in the *Physical Host Installation Guide* "Install NetWitness Platform Virtual Host in Virtual Environment" in the *Virtual Host Installation Guide*
Install UEBA.	"NetWitness® UEBA" in the *Physical Host Installation Guide*
Assign the UEBA_Analysts and Analysts roles to the UEBA users.	"Role Permissions" in the *System Security and User Management Guide*

Update

The following tasks must be performed in the following sequence.

Description	References
	
Deploy the Endpoint Pack from Live, which contains File Category Lua Parser for the UEBA integration with Endpoint.	During deployment, you must specify Endpoint Log Hybrid Log Decoder service. In case of multiple Endpoint servers, select all the Endpoint Log Hybrid Log Decoder services
Enable Endpoint data sources such as Process and Registry to generate alerts in UEBA.	"**ueba-server-config script**" in the *UEBA Configuration Guide*
Enable UEBA indicator forwarder to transfer the UEBA indicators to the NetWitness Respond server and to the correlation server to create an incidents.	"**ueba-server-config script**" in the *UEBA Configuration Guide*
After you update to NetWitness XDR Platform 12.3 the Broker or Concentrator UUID changes. You must update the NetWitness Platform core services, and update the Broker or Concentrator UUID.	"**ueba-server-config script**" in the *UEBA Configuration Guide*
Update Airflow Configuration.	"**ueba-server-config script**" in the *UEBA Configuration Guide*
Restart the Airflow scheduler service after the presidio_ upgrade DAG is successful.	"**reset-presidio script**" in the *UEBA Configuration Guide*

Investigation

The following tasks can be performed in any sequence.

Description	References
	
Investigate high risk users.	"Investigate High-Risk Users" topic in the *NetWitness UEBA User Guide*
Investigate top alerts.	"Investigate Top Alerts" topic in the *NetWitness UEBA User Guide*

Monitoring

The following tasks can be performed in any sequence.

Description	References
	
Review NetWitness UEBA metrics in Health and Wellness.	"View NetWitness UEBA Metrics in Health and Wellness" topic in the *NetWitness UEBA User Guide*
Monitor Health and Wellness of UEBA.	"Monitor Health and Wellness of UEBA" topic in the *NetWitness UEBA User Guide*

Getting Help with NetWitness Platform XDR

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Create a Post** fields in NetWitness Community portal to find specific information here: https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions

- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Use these links to access documentation that is not related to a particular version of the software:

- Hardware setup guides: https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation
- Documentation support for features such as feeds, parsers, application rules, and reports: https://community.netwitness.com/t5/threat-intelligence/ct-p/threat-intelligence.

Introduction **4**

NetWitness UEBA Standalone Installation **5**

System Requirements **6**

Physical Host Hardware Specifications 6

Virtual Host Specifications 7

Installation Media 8

Installation Tasks **9**

For Physical Hosts: 9

Task 1. Install 12.3 on the NetWitness Server Host 9

Task 2. Install 12.3 Log Hybrid Host 9

Task 3. Install and Configure NetWitness® UEBA 9

Configure NetWitness UEBA 11

Enable Access Permission for the NetWitness UEBA User Interface 14

For Virtual Hosts: 14

Task 1. Install 12.3 on the NetWitness Server Host 14

Task 2. Install 12.3 Log Hybrid Host 15

Task 3. Install and Configure NetWitness® UEBA 15

Post Installation Task **16**

Set a user with privileges to access the UEBA pages 16

Introduction

NetWitness® UEBA standalone installation is designed to support other security tools such as Security Information and Event Management (SIEM). It allows users of a third-party SIEM solutions to leverage NetWitness for UEBA.

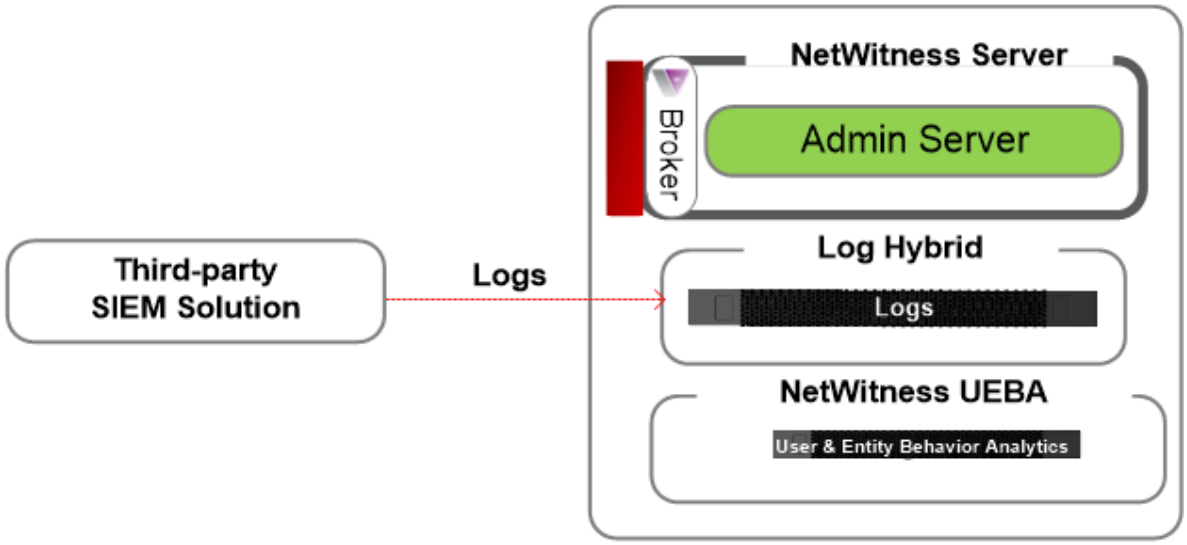
NetWitness® UEBA standalone installation includes:

1. NetWitness Admin Server
2. NetWitness Log Hybrid
3. NetWitness UEBA

Note: NetWitness® UEBA standalone installation supports up to 100,000 users on a single running instance. If you have more than 100,000 users, contact Customer Support.

Windows Log Sources

NetWitness UEBA standalone installation natively supports the following Windows log sources:



- Windows Active Directory
- Windows Logon and Authentication Activity
- Windows File Servers
- Windows Remote Management

For more information, see the "NetWitness UEBA Use Cases for Windows Logs" topic in the *NetWitness UEBA User Guide*.

NetWitness UEBA Standalone Installation

This section contains a high-level UEBA standalone installation diagram and a list of NetWitness UEBA ports.

The following diagram illustrates the NetWitness UEBA standalone installation.

Note:

- UEBA connects to the Broker or Log Hybrid host.
- To configure the Log Hybrid for logs from a third-party SIEM, contact your RSA Account Manager.

UEBA Host and Service Ports

Source Host	Destination Host	Destination Ports	Comments
UEBA Server	NW Server	TCP 443	NetWitness Update Repository
UEBA Server	NW Server	TCP 56003 (SSL), 50003 (Non-SSL), 50103 (REST)	Broker Application Ports
UEBA Server	NW Server	TCP 56005 (SSL), 50005 (Non-SSL), 50105 (REST)	Log Hybrid, Concentrator Application Ports
Admin Workstation	UEBA Server	443	UEBA Monitoring
Admin Workstation	UEBA Server	22	SSH

System Requirements

You can run the NetWitness® UEBA standalone installation as follows:

- NetWitness Physical Hosts (software running on hardware supplied by NetWitness)
  - Install physical hosts and connect to the network as described in the NetWitness® Platform Hardware Setup Guides and the *NetWitness® Platform Physical Host Installation Guide 12.3 version*.
  - Set up licensing for NetWitness Platform as described in the *NetWitness® Platform Licensing Guide*.
- On-Premises (On-Prem) Virtual Hosts (Software Only provided by Netwitness)

Physical Host Hardware Specifications

You must install the NetWitness UEBA host on the S5 (Dell R630 appliance) hardware.

SERIES 5 (DELL R630) SPECIFICATIONS

Specification	Capacity
Model	Dell PowerEdge R630xl
Processor Type	Intel Xeon E5 -2680v3
Processor Speed Cache Number of Cores Number of Processors Number of Threads	2.5 GHz 30MB 12 2 24
Total Memory	256GB
Internal Disk Controller	Dell PERC H730
External Disk Controller	Dell PERC H830
SAN Connectivity (HBA) - Optional	N/A
Remote Management Card	iDRAC8 Enterprise
Drives	Total - 6 Drives 2 x 1TB, 2.5" HDD 4 x 2TB, 2.5" HDD
Chassis	1U
Weight	18.4 kg (40.5 lbs)

Specification	Capacity
NIC Card*	On Board 2 x 10 Gb Copper 2 x 10 Gb & 2 x 1Gb Copper (Other options are available)
Dimensions	H: 4.28 cm (1.68 in.) x W: 48.23 cm (18.98 in.) x D: 75.51 cm (29.72 in.)
Power	1100W Redundant
BTU/hr	4100 BTU/hr (max)
Amps (Spec)	1100W / 220VAC = 5A
Actual Amp Draw (Post Startup)	2.1 Amps
Events Per Second (EPS)	100K EPS
Throughput	N/A

* NIC Card options are available for swap with on-board daughter card or add on.

Virtual Host Specifications

Following is the recommended system requirements for a UEBA virtual host.

CPU	Memory	Reserved Memory Allocation	Disk Requirements for /var/netwitness Partition	Read IOPS	Write IOPS
32 cores	128GB	64GB	• Storage: 1.5 TB • Provisioning: Thick	500MB	500MB

IMPORTANT: The **/var/netwitness** partition must be mounted on a **1.5 TB** Thick-provisoned disk for storage usage.

Note: NetWitness recommends that you only deploy UEBA on a virtual host if your log collection volume is low. If you have a moderate to high log collection volume, NetWitness recommends that you deploy UEBA on the physical host.

Installation Media

Installation media are in the form of OVA packages, which are available for download and installation from Download Central. As part of your order fulfillment, NetWitness gives you access to the OVA.

Installation Tasks

This topic contains the tasks you must complete to install NetWitness UEBA standalone installation.

Note: Download or make sure you have access to the *Physical Host Installation Guide* for Version 12.3 before beginning the tasks. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

For Physical Hosts:

You need to complete the following tasks in the order shown below.

Task 1. Install 12.3 on the NetWitness Server Host

Task 2. Install 12.3 Log Hybrid Host

Task 3. Install and Configure NetWitness® UEBA

Task 1. Install 12.3 on the NetWitness Server Host

For the NetWitness Server (NW Server), this task:

- Creates a base image.
- Sets up the 12.3 NW Server host.

For more information on how to install the NetWitness Server host, see "Install 12.3 on the NetWitness Server (NW Server) Host" section in the *Physical Host Installation Guide for Version 12.3*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Task 2. Install 12.3 Log Hybrid Host

For a non-NW Server host, this task:

- Creates a base image.
- Sets up the 12.3 non-NW Server host or Log Hybrid.

For more information on how to install the Log Hybrid host, see "Task 2 - Install 12.3 on Other Component Hosts" section in the *Physical Host Installation Guide for Version 12.3*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Task 3. Install and Configure NetWitness® UEBA

To set up NetWitness UEBA, you must install and configure the NetWitness UEBA service.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

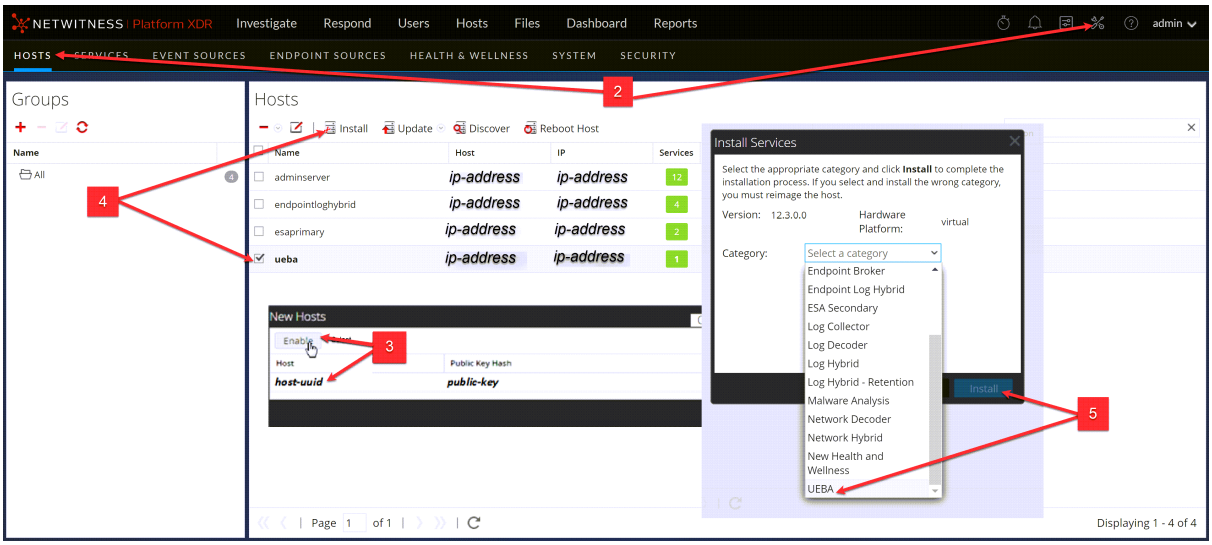
1. Complete steps 1 - 14 under "Task 2 - Install 12.3 on Other Component Hosts" in "Installation Tasks" of the *NetWitness Platform Physical Host Installation Guide for Version 12.3*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy_admin password. Make sure that you record this password and store it in a safe location.

2. Log in to the NetWitness Platform XDR and go to **(Admin) > Hosts**.

   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.



3. Select the host in the **New Hosts** dialog and click **Enable**.

   The New Hosts dialog closes and the host is displayed in the Hosts view.

4. Select that host in the **Hosts** view (for example, **UEBA**) and click Install.

   The Install Services dialog is displayed.

5. Select the **UEBA** Host Type and click **Install**.

6. Make sure that the UEBA service is running.
7. Complete licensing requirements for NetWitness UEBA.

   See the *NetWitness Platform 12.3 Licensing Management Guide* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

   Note: NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is used based on the number of users. The Out-of-the-Box Trial License is a 90-day trial license. In case of UEBA licenses, the 90-day trial period begins from the time the UEBA service deployed on the NetWitness Platform product.

Configure NetWitness UEBA

To start running UEBA:

1. Define the following parameters: data schemas, data source (NetWitness Broker or Concentrator) and start date.

   a. Define UEBA schemas:
   Choose schemas from the following list:

   AUTHENTICATION, FILE, ACTIVE_DIRECTORY, PROCESS, REGISTRY and TLS.

   Note: The TLS packet requires adding the hunting package and enabling the JA3 feature. For more information regarding events that each schema contains, see the *NetWitness UEBA Configuration Guide*.

   b. Define the data source:
   If your deployment has multiple Concentrators, we recommend that you assign a Broker at the top of your deployment hierarchy for the NetWitness UEBA data source.

   c. Define the UEBA start-date:

   Note: The selected start date must contain events from all configured schemas.

   NetWitness recommends that the UEBA start date is set to 28 days earlier than the current date. For UEBA systems that intend to process TLS data, you must make sure that the start date is set to no later than 14 days earlier than the current date.

2. . Create a user account for the data source (Broker or Concentrator) to authenticate to the data.

   a. Log in to the NetWitness Platform XDR.

   b. Go to  (Admin) **> Services**.

   c. Locate the data source service (Broker or Concentrator).
   Select that service, and select **(Actions)** > **View** > **Security**.

   d. Create a new user and assign the “Analysts” role to that user.

The following example shows a user account created for a Broker.

3. SSH to the NetWitness UEBA server host.
4. (For Virtual Machines Only) Set the appropriate parallelism value:
   If the UEBA system runs on VM, update the airflow parallelism value to be 64 by running the following command:
   ```
   sed -i "s|parallelism = 256|parallelism = 64|g"
   /var/netwitness/presidio/airflow/airflow.cfg
   ```
5. Submit the following commands with the above parameters that you already defined.
   ```
   /opt/rsa/saTools/bin/ueba-server-config -u <user> -p <password> -h <host> -
   o <type> -t <startTime> -s <schemas> -v -e <argument>
   ```
   Where:

Argument	Variable	Description
`-u`	`<user>`	User name of the credentials for the Broker or Concentrator instance that you are using as a data source.

Argument	Variable	Description
-p	<password>	Password of the credentials for the Broker or Concentrator instance that you are using as a data source. The following special characters are supported in a password. !"#$%&()*+,-:;<=>?@[\]^_`\{\|} If you want to include a special character or special characters, you must delimit the password with an apostrophe sign, for example: sh /opt/rsa/saTools/bin/ueba-server-config -u brokeruser -p **'!"UHfz?@ExMn#$'** -h 10.64.153.104 -t 2018-08-01T00:00:00Z -s 'AUTHENTICATION FILE ACTIVE_DIRECTORY TLS PROCESS REGISTRY' -o broker -v
-h	<host>	IP address of the Broker or Concentrator used as the data source. Currently, only one data source is supported.
-o	<type>	Data source host type (broker or concentrator).
-t	<startTime>	Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, 2018-08-15T00:00:00Z). **Note:** The script interprets the time you enter as UTC (Coordinated Universal Time) and it does not adjust the time to your local time zone.
-s	<schemas>	Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, AUTHENTICATION FILE ACTIVE_ DIRECTORY PROCESS REGISTRY TLS).
-v		**verbose mode**.
-e	<argument>	Boolean Argument. This enables the UEBA indicator forwarder to Respond. **Note:** If your NetWitness deployment includes an active Respond server, you can transfer NetWitness UEBA indicators to the Respond server and create incidents by enabling the indicator forwarder, from this data. For more information on how to enable the NetWitness UEBA incidents aggregation, see Installation Tasks.

6. Set the appropriate "Boot Jar Pools" slots:

   - **Physical Appliance**: Update the `spring_boot_jar_pool`" slots to be 18.
   - **Virtual Appliance**: If the UEBA system is running on VM, update the `spring_boot_jar_pool` and the `retention_spring_boot_jar_pool` slots values to 5.
     To update the “Spring Boot Jar Pools” slots, Go to the Airflow main page, tap the “Admin” tab at the top bar and tap “Pools”.

   a. To access the Airflow UI, go to `https://<UEBA_host>/admin` and enter the credentials.

   • User: admin

   • Password: The environment deploy admin password.

   b. Click on the pencil mark of the polls to update the slot values.

Enable Access Permission for the NetWitness UEBA User Interface

After you install NetWitness UEBA standalone 12.3, you need to assign the UEBA_Analysts and Analysts roles to the UEBA users. For more information, see 'Assign User Access to UEBA' topic in the *NetWitness UEBA Configuration Guide*. After this configuration, UEBA users can access the **Investigate** > **Users** view.

Note: To complete NetWitness UEBA configuration according to the needs of your organization, See the *NetWitness UEBA Configuration Guide*.

For Virtual Hosts:

You must complete the following tasks in the order shown below.

Task 1. Install 12.3 on the NetWitness Server Host

Task 2. Install 12.3 Log Hybrid Host

Task 3. Install and Configure NetWitness® UEBA

Task 1. Install 12.3 on the NetWitness Server Host

On the host you have deployed for the NetWitness Server (NW Server), this task installs:

- The 12.3.0.0 NW Server environmental platform.
- The NW Admin Server.
- A repository with the RPM files required to install the other functional components or services.

For more information on how to install the NetWitness Server host, see "Task 1- Install 12.3.0.0 on the NW Server Host" section in the *Virtual Host Installation Guide for Version 12.3*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Task 2. Install 12.3 Log Hybrid Host

Complete the following tasks on a non-NW Server host:

- Install the 12.3.0.0 environmental platform.
- Apply the 12.3.0.0 RPM files to the service from the NW Server Update Repository.

Note: You must install the Log Hybrid host.

For more information on how to install the non-NetWitness Server host, see "Task 3 - Install 12.3 for on Other Component Hosts" section in the *Virtual Host Installation Guide for Version 12.3*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues..

Task 3. Install and Configure NetWitness® UEBA

Prerequisite: Increase Memory for Virtual Deployment

Virtual Machines are deployed with approximately 104 GB in the storage mount by default. To install NetWitness UEBA, you must increase the storage space in your virtual environment to at least 800 GB.

To set up NetWitness UEBA, you must install and configure the NetWitness UEBA service.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. Complete steps 1 - 15 for Virtual Hosts under "Task 3 - Install 12.3 on Other Component Hosts" in "Installation Tasks" of the *NetWitness Platform Virtual Host Installation Guide for Version 12.3*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy admin password. Make sure that you record this password and store it in a safe location.

2. Complete steps 2 - 9 under Task 3. Install and Configure NetWitness® UEBA.

Post Installation Task

Set a user with privileges to access the UEBA pages

After you install NetWitness UEBA standalone 12.3, you need to assign the **UEBA_Analysts** and **Analysts** roles to the UEBA users. For more information, see *NetWitness UEBA Configuration Guide*.

Introduction

NetWitness User and Entity Behavior Analytics (UEBA) is an advanced analytics solution that empowers enterprise SOC managers and analysts to discover, investigate, and monitor risky behaviors across entities namely Users and Network (packets) in your environment.

NetWitness UEBA enables analyst to:

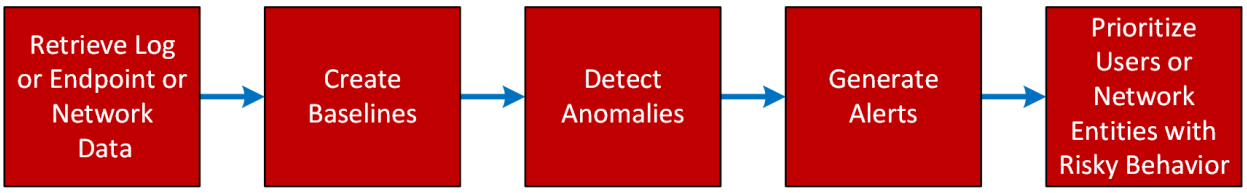
- Detect
  - malicious and rogue users
  - abnormal network traffic
- Identify high-risk behaviors
- Discover attacks
- Investigate emerging security threats
- Identify potential attacker's activity

This guide provides information and instructions for using the NetWitness UEBA functionalities and capabilities. It describes the key investigation methodologies, the main system capabilities, common use cases, and step-by-step instructions for the recommended workflow strategies.

Users

UEBA helps to analyze all users in your organization using logs and endpoint data for user activities, which is retrieved and parsed from the NetWitness Database (NWDB).

Network



Note: Network entities are supported on NetWitness Platform 11.4 and later.

UEBA helps to analyze malicious outbound traffic masked within a legitimate HTTPS session. It can detect various network abnormalities, such as abnormal outbound traffic volume sent to a specific port, domain, organization or SSL Subject. The network (packet) data is retrieved and parsed from the NWDB into the new TLS data source, which supports two new entities: JA3 and SSL Subject. These entities validate the false negatives and true positives, and detect abnormal network traffic for JA3 and SSL Subject fingerprints.

- **JA3** - JA3 is a method of creating client-side SSL/TLS fingerprints to identify the client application initiating the session. The JA3 fingerprints perform JA3-signature-based analysis and detect abnormal network traffic, such as abnormal number of bytes sent over HTTPS.
- **SSL Subject** - The subject field of the certificate identifies the entity associated with the public key stored in the subject public key field, which is the entity for which the certificate was issued.

How NetWitness UEBA Works

NetWitness UEBA uses analytics to detect anomalies in the log and endpoint or network data to derive behavioral results from them. The following diagram displays the basic workflow:

The following table provides a brief description of each step.

Step	Description	More Information
1. Retrieve Log and Endpoint or Network Data	NetWitness UEBA retrieves logs or endpoint or network data from the NWDB and uses the data to create analytic results.	See Retrieve Data
2. Create Baselines	Baselines are derived from detailed analysis of normal user or network entity behavior, and are used as a basis for comparison to user or network entity behavior over time.	See Create Baselines
3. Detect Anomalies	An anomaly is a deviation of a user or network entity from the normal baseline behavior. NetWitness UEBA performs statistical analysis to compare each new activity to the baseline. User or network entity activities that deviate from expected baseline values are scored accordingly to reflect the severity of the deviation.	See Detect Anomalies
4. Generate Alerts	All the anomalies found in step 3 are grouped into hourly batches. Each batch is scored based on the uniqueness of its indicators. If the indicator composition is unique compared to a user or network entity's historic hourly batch compositions, it is likely that this batch is transformed into an alert.	See Generate Indicators and Generate Alerts
5. Prioritize User or Network Entities with Risky Behavior	NetWitness UEBA prioritizes the potential risk from a user or network entity by using a simplified additive scoring formula. Each alert is assigned a severity that increases a user or network entity's score by a predefined number of points. User or network entity with high scores either have multiple alerts, or alerts of high levels of severity associated with them.	See Prioritize User or Network Entity with Risky Behavior

Retrieve Data

NetWitness UEBA connects to a Concentrator service to retrieve log and endpoint data for the user entity or network data for the network entities. In case of multiple Concentrators, the NetWitness UEBA server connects to a Broker service. You can use the Broker service that is available on the NetWitness Platform Admin server if you do not have an exclusive Broker in your deployment. During NetWitness UEBA installation, the administrator specifies the IP address of the Broker service. For more information, see the "(Optional) Task 2 - Install NetWitness UEBA" topic in the *NetWitness Platform 11.5 Physical Host Installation Guide*

Note: In 11.4 and later, and when installed on a virtual machine, UEBA can process up to 20 million network events per day. For more information to resolve these issues, see the 'Troubleshooting UEBA Configurations' topic in the *UEBA Configuration Guide*.

Create Baselines

NetWitness UEBA uses machine learning to analyze multiple aspects of a user or network entity behavior within a stream of log and endpoint or network data and gradually builds a multi-dimensional baseline of typical behavior for each user or network entity.

Behavioral baselines are also created on a global level to describe common activities observed throughout the network. For example, if a working hour is abnormal for a user entity, but is not abnormal for the organization, the false-positive reduction algorithms decrease the impact on the alert score. Models are updated frequently and are constantly improving as time goes on.

Note: NetWitness UEBA requires 28 days of historical log and endpoint data for users and network data for network entities to create a proper baseline for all entities in your network. However, NetWitness recommends that you configure NetWitness UEBA to start baselining your data two months before the deployment date `<today-60days>`. The first 28 days are used for model training and are not scored. The remaining 32 days are leveraged to improve and update the model, and are also scored to provide initial value.

Note: For version 11.2 or later, there is limited support for environments with multiple domains. Distinct username values that are registered under different domains are normalized, and combined into one modeled entity. As a result, different users, who share the same username in different domains, will incorrectly be attributed to a single normalized entity.

Create Baselines for Users

NetWitness UEBA analyzes user actions to build a multi-dimensional baseline that reflects the typical behavior of the user. For example, the baseline can include information about the hours in which a user typically logs on.

Create Baselines for Network

NetWitness UEBA analyzes the network traffic pattern of JA3 or SSL Subject within a stream of network data to create a multi-dimensional baseline. For example, the baseline can be the allowed limit of data sent from an application or specific port that is connected to an application.

Detect Anomalies

The data is parsed hourly, to detect abnormal behavior. After establishing a behavioral baseline for all entities in your environment, each incoming event is compared to the baseline, to determine abnormalities. Based on the deviation the event is scored. The score is high if the deviation is strong and vice-versa. If anomalies are detected, they are turned into indicators that can be viewed on the user interface (UI).

For example, if a user's normal working hours are 9:00 AM to 5:00 PM, a new activity at 6:00 PM or 7:00 PM is not a strong deviation, and is probably not scored as an anomaly. However, an authentication at midnight is a strong deviation and is scored as an anomaly.

For example, in an organization, when a session is authenticated into a website for a SSL handshake, and communicates to five different ports or domains, it is not a strong deviation, and is probably not scored as an anomaly. But if the website communicates to an abnormal port or domain, it is a strong deviation. This indicates an abnormal behavior and is scored as an anomaly and triggers an alert.

Generate Indicators

If anomalies are detected, they are turned into indicators. NetWitness UEBA uses indicators to define validated anomalous activities. Indicators represent anomalies found in either a single event or multiple events batched over time.

User Indicators

User behavior or abnormal user activities, such as suspicious user logons, brute-force password attacks, unusual user changes, and abnormal file access are anomalous activities. Every anomalous activity is associated to an indicator. For more information, see Indicators for Users

Network Indicators

Network behavior or abnormal network traffic that contribute to data exfiltration or phishing, are examples of anomalous activities. Every anomalous activity is associated to an indicator. For more information, see Indicators for Network Entities.

Generate Alerts

All anomalies that are found are grouped into hourly batches by the user or network entity name. Each batch is scored based on the uniqueness of the composition of its indicators. If a composition is unique compared to the user or network entity's history, it is likely that this batch is transformed into an alert, and the anomalies into indicators. A high-scored batch of anomalies becomes an alert that contains valid indicators of compromise.

An abnormal activity by itself, even if it happens hundreds of times a day in a large corporate environment, does not necessarily reflect an account compromise. However, an abnormal behavior that occurs with a lot of other abnormal behaviors can indicate that the account is compromised and is an indication that additional analysis is required.

For example, if the following combination of one or more abnormal user or network behaviors occur, an alert is triggered.

Users

- Authentication from an abnormal computer.
- Multiple authentication attempts identified in a short time frame.
- Multiple files are deleted by this user from the corporate file share.
- Download or transfer files larger that the allowed limits.

Network

- Abnormal destination port for source netname.
- Abnormal organization for source netname.
- Abnormal traffic volume sent to organization.
- Abnormal traffic volume sent to port.

Note: The NetWitness UEBA User Interface can initially appear as empty because alerts are not generated until the baselines are established. If there is no historical audit data when NetWitness UEBA is enabled, the system starts generating the baselines from the time it is deployed, and requires 28 full days to elapse before generating new alerts. If historical audit data is processed when NetWitness UEBA is enabled, alerts appear after the historical data is processed, usually within two to four days.

Prioritize User or Network Entity with Risky Behavior

The entities scores are a primary tool for incident prioritization. The entities score is based on a simple additive calculation of an entity's alerts. Alerts and analyst feedback are the only factors in the entities score calculation, with the impact on the scores determined by their levels of severity. A unified color code is used for entities and alert scores:

Severity	Color	Score
Critical	Red	+20
High	Orange	+15
Medium	Yellow	+10
Low	Green	+1

Supported Sources

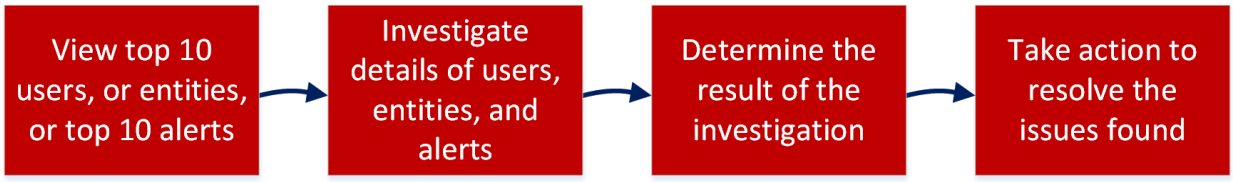
Log Sources

NetWitness UEBA natively supports the following data sources:

- Windows Active Directory in Version 11.2
- Windows Logon and Authentication Activity in Version 11.2
- Windows File Servers in Version 11.2
- Windows Remote Management in Version 11.3.2
- NetWitness Endpoint Process in Version 11.3
- NetWitness Endpoint Registry in Version 11.3
- SecurID Token in Version 11.3.1
- RedHat Linux in Version 11.3.1
- VPN Logs in Version 11.5
- Azure Active Directory Logs in Version 11.5

Network Sources

- TLS in Version 11.4



Recommended Workflows

To use NetWitness UEBA more effectively, there are two workflows - Detection and Forensic workflow.

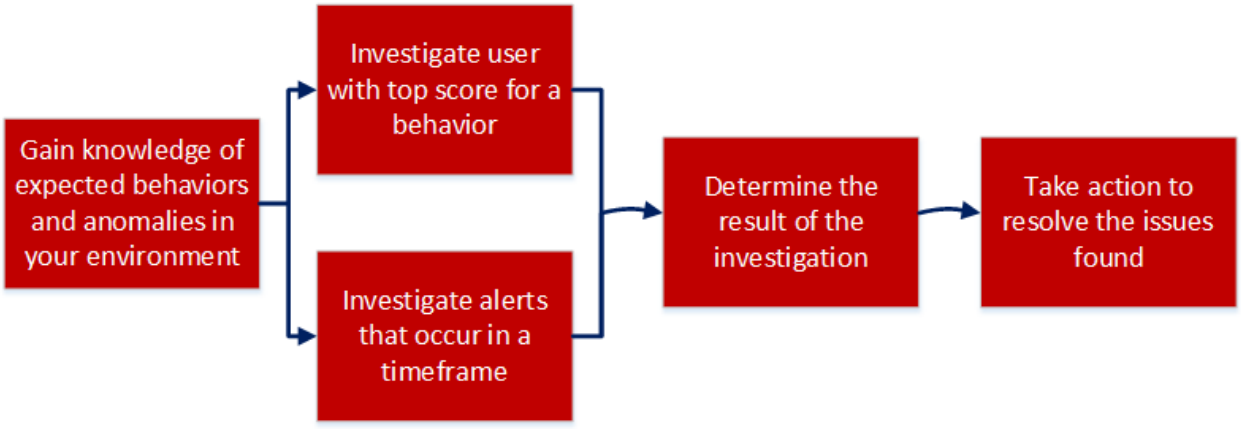
Detection Workflow

The detection workflow gives you an overview of the health of your environment, and then focuses on investigating the top high-risk users, entities, and alerts that are displayed in the Overview tab.

The following flowchart illustrates the steps to follow for detecting suspicious behavior in your environment.

The following table describes each step in the workflow.

Step	Description	Instructions
View top ten users, or entities, or top 10 alerts,	In the Overview tab, note the users and network entity with the risky behaviors and the top most critical alerts.	Investigate High-Risk User or Network Entity and Investigate Top Alerts
Investigate details of users, entities, and alerts	Drill-down into detailed information about risky user or entity behaviors and critical alerts to determine the cause of these actions and how to resolve them.	Investigate High-Risk User or Network Entity and Investigate Events
Determine the result of the investigation	Analyze the summary information provided in the UI from the previous steps and identify focus areas on to resolve the issues.	Identify High-Risk User or Network Entity and Investigate Events
Take action to resolve the issues found	Target specific user or entity behaviors and events to address, and use results of this investigation to improve and sharpen future investigations.	Take Action on High-Risk User or Network Entity



Forensic Workflow

The forensic workflow is recommended when you have an understanding of the typical user or entity behaviors and anomalies in your environment, and helps you focus on specific forensic information that is based on a user or entity behavior, or a specific time frame in which suspicious events occurred.

Using forensics information, analysts may determine actions and behaviors that the attacker is likely to attempt using the following questions:

- What fundamental techniques and behaviors are common across all intrusions?
- What evidence do these techniques leave behind?
- What do attackers do?
- What are normal behaviors of my accounts and entities?
- Which are my sensitive machines and where are they located?

The following flowchart illustrates how to perform investigation on forensic information that is based on a specific user or entity behavior, or a specific time frame in which suspicious events occurred.

The following table describes each step in the workflow.

Step	Description	Instructions
Gain knowledge of expected behaviors and anomalies in your environment	Establish a baseline of normal behaviors, expected anomalies, and unexpected anomalies, to focus on anomalies that are significant for your environment.	Retrieve Data, Detect Anomalies, and Generate Alerts.
Investigate a user or network entity with top score for a specific behavior	Select a user or network entity with a high score for a specific behavior and gather detailed information.	Investigate High-Risk User or Network Entity and Investigate Events.
Investigate alerts that occur in a specific time frame	Determine a time frame of interest, and in the Alerts tab, select that time frame to see detailed information about alerts that occurred during that period.	Investigate Events

Step	Description	Instructions
Determine the result of the investigation	Based on your knowledge of expected user or network entity behavior, focus on the indicators that are displayed during the specified time period and determine if the anomalies that were discovered need to be resolved.	Investigate Events and Identify High-Risk Entities
Take action to resolve the issues found	Target specific user or network entity behaviors and events to address, and use the results of this investigation to improve and sharpen future investigations.	Take Action on High-Risk User or Network Entity

NetWitness UEBA Use Cases

NetWitness UEBA focuses on providing advanced detection capabilities to guard enterprises from insider threats. These could either be compromised trusted users or network entity within a network, or alternatively, an external attacker malicious taking advantage of credentials acquired by using advanced account takeover techniques.

Identity theft typically begins with the theft of credentials, which are then used to obtain unauthorized access to resources and to gain control over the network. Attackers may also exploit compromised non-admin users to obtain access to resources for which they have administrative rights, and then escalate those privileges.

NetWitness UEBA helps you separate possibly malicious activity from the otherwise abnormal, but not risky, user or network entity actions.

Use Case for Users

An attacker who uses stolen credentials may trigger suspicious network events while accessing resources. Detecting illicit credential use is possible, but requires that you separate attacker activity from the high volume of legitimate events. The following use cases define certain risk types, and the corresponding system capabilities used for their detection. You can review the use cases, represented by their alert type and description, to gain an initial understanding of the related risky behavior of each use case. Using NetWitness UEBA, you can then drill down into the indicators that reflect the possibly risky user activities to learn more. For more information about NetWitness UEBA-supported indicators, see Indicators for Users. When anomalies are detected, they are compared to the baseline and compiled into hourly alerts. For more information on types of alerts for Users, see Alert Types for a User .

Use Case for Network Entities

UEBA can detect malicious traffic masked within a legitimate HTTPS session. Based on this alert analysis, the analyst can drill down to the indicators and determine if the activity was normal or not. For more information about NetWitness UEBA-supported entity indicators, see Indicators for Network Entities. For example, the analyst can detect if there was any abnormal number of bytes sent to a port or a domain. If this type of events or a combination of such events are detected an alert is triggered. For more information on types of alerts for network entity, see Alert Types for Network Entities.

Alert Types

Alert Types for a User

Alert Type	Description
Mass Changes to Groups	An abnormal number of changes are made to groups. Investigate which elements are changed, and decide if the changes were legitimate or possibly the result of risky or malicious behavior. This activity is associated with the **Multiple Group Membership Changes** indicator.
Multiple Failed Logons	In traditional password cracking attempts, the attacker tries to obtain a password through guesswork or by employing other low-tech methods to gain initial access. The attacker risks getting caught or being locked out by explicitly attempting to authenticate; but with some prior knowledge of the victim's password history, may be able to successfully authenticate. Look for additional abnormal indications that the account owner is not the one attempting to access this account. This activity is usually associated with the **Multiple Failed Authentications** indicator.
User Login to Abnormal Host	Attackers often need to reacquire credentials and perform other sensitive activities, like using remote access. Tracing the access chain backwards may lead to the discovery of other computers involved in possibly risky activity. If an attacker's presence is limited to a single compromised host or to many compromised hosts, that activity can be associated with the **Abnormal Host** indicator.
Data Exfiltration	Data exfiltration is the unauthorized copying, transfer, or retrieval of data from a computer or server. Data exfiltration is a malicious activity performed through various techniques, typically by cyber criminals over the Internet or other network. This activity can be associated with the **Excessive Number of File Rename Events**, **Excessive Number of Files Moved from File System**, and **Excessive Number of Files Moved to File System** indicators.
Mass File Rename	Ransomware is a type of malware that encrypts desktop and system files, making them inaccessible. Some ransom ware, for example, Locky, encrypts and renames files as part of their initial execution. Use this indication of mass-file-renaming to determine if your file system is infected with ransomware. This activity can be associated with the **Multiple File Rename Events** indicator.

Alert Type	Description
Snooping User	Snooping is unauthorized access to another person's or company's data. Snooping can be as simple as the casual observance of an e-mail on others computer, or watching what someone else is typing. More sophisticated snooping uses software programs to remotely monitor activity on a computer or network device. This activity can be associated with the **Multiple File Access Events**, **Multiple Failed File Access Events**, **Multiple File Open Events**, and **Multiple Folder Open Events** indicators.
Multiple Logons by User	All authentication activity, malicious or not, appears as normal logons. Therefore, administrators should monitor unexpected authorized activity. The key is that attackers use these stolen credentials for unauthorized access, which may provide an opportunity for detection. When an account is used for unusual activities, for example, authenticating an unusual amount of times, the account may have been compromised. This activity can be associated with the **Multiple Successful Authentications** indicator.
User Logged into Multiple Hosts	Attackers typically need to reacquire credentials periodically. This is because their key chain of stolen credentials naturally degrades over time, due to password changes and resets. Therefore, attackers frequently maintain a foothold in the compromised organization by installing backdoors and maintaining credentials from many computers in the environment. This activity can be associated with the **Logged onto Multiple Hosts** indicator.
Mass Permission Changes	Some credential theft techniques, for example, Pass-the-Hash, use an iterative, two-stage process. First, an attacker obtains elevated read-write permission to privileged areas of volatile memory and file systems, which are typically accessible only to system-level processes on at least one computer. Second, the attacker attempts to increase access to other computers on the network. Investigate if abnormal permission changes have taken place on the file systems to ensure that they were not compromised by an attacker. This activity can be associated with the **Multiple File Access Permission Changes**, **Multiple Failed File Access Permission Changes**, and **Abnormal File Access Permission Change** indicators.
Abnormal Active Directory (AD) Changes	If an attacker gains highly-privileged access to an Active Directory domain or domain controller, that access can be leveraged to access, control, or even destroy the entire forest. If a single domain controller is compromised and an attacker modifies the AD database, those modifications replicate to every other domain controller in the domain, and depending on the partition in which the modifications are made, the forest as well. Investigate abnormal changes conducted by admins and non-admins in AD to determine if they represent a possible true compromise to the domain. This activity can be associated with the **Abnormal Active Directory Change**, **Multiple Account Management Changes**, **Multiple User Account Management Changes**, and **Multiple Failed Account Management Changes** indicators.

Alert Type	Description
Sensitive User Status Changes	A domain or enterprise administrator account has the default ability to exercise control over all resources in a domain, regardless of whether it operates with malicious or benign intent. This control includes the ability to create and change accounts; read, write, or delete data; install or alter applications; and erase operating systems. Some of these activities trigger organically as part of the account's natural life cycle. Investigate these security sensitive user account changes, and determine if it is compromised. This activity can be associated with the **User Account Enabled**, **User Account Disabled**, **User Account Unlocked**, **User Account Type Changed**, **User Account Locked**, **User Password Never Expires Option Changed**, **User Password Changed by Non-Owner**, and **User Password Change** indicators.
Abnormal File Access	Monitor for abnormal file access to prevent improper access to confidential files and theft of sensitive data. By selectively monitoring file views, modifications and deletions, you can detect possibly unauthorized changes to sensitive files, whether caused by an attack or a change management error. This activity can be associated with the **Abnormal File Access Event** and **Multiple File Delete Events** indicators.
Non-Standard Hours	All authentication activity, malicious or not, appears as normal logons. Therefore, administrators should monitor unexpected authorized activity. The key is that attackers use these stolen credentials for unauthorized access, which may provide an opportunity for detection. When an account is being used for unusual activities, for example, authenticating an unusual number of times, the account may have been compromised. Use the indication of an abnormal activity time to determine if the account is taken over by an external actor. This activity can be associated with the **Abnormal File Access Time**, **Abnormal VPN Logon Time** **Abnormal Azure AD Logon Time**, **Abnormal Active Directory Change Time**, and **Abnormal Logon Time** indicators.
Credential Dumping	Credential dumping is the process of obtaining account login and password information, in the form of a hash or a clear text password, from the operating system and software. Credentials can then be used to perform lateral movement and access restricted information. This activity can be associated with the **Abnormal Process Created a Remote Thread in LSASS** indicator.

Alert Type	Description
Discovery & Reconnaissance	Discovery consists of techniques that allow the adversary to gain knowledge about the system and internal network. When attackers gain access to a new system, they must orient themselves to what they now have control of and what benefits operating from that system give to their current objective or overall goals during the intrusion. The operating system provides many native tools that aid in this post-compromise information-gathering phase. This activity can be associated with the **Abnormal Reconnaissance Tool Execute , Multiple Distinct Reconnaissance Tools Executed, Multiple Reconnaissance Tool Activities Executed** and **User Executed a Reconnaissance Tool Multiple Times** indicators.
PowerShell & Scripting	PowerShell is a powerful interactive command-line interface and scripting environment included in the Windows operating system. Attackers can use PowerShell to perform a number of actions, including discovery of information and execution of code. Examples include the Start-Process cmdlet which can be used to run an executable and the Invoke-Command cmdlet which runs a command locally or on a remote computer. This activity can be associated with the **User Ran an Abnormal Process to Execute a Scripting Tool, Abnormal Process Executed a Scripting Tool, Scripting Tool Triggered an Abnormal Application, User Ran a Scripting Tool that Triggered an Abnormal Application, User Ran a Scripting Tool to Open an Abnormal Process** and **Scripting Tool Opened an Abnormal Process** indicators.
Registry Run Keys & Start Folder	Adding an entry to the "run keys" in the Registry or startup folder will cause the program referenced to be executed when a user logs in. The program will be executed under the context of the user and will have the account's associated permissions level. Attackers can use these configuration locations to execute malware, such as remote access tools, to maintain persistence through system reboots. Attackers may also use Masquerading to make the Registry entries look as if they are associated with legitimate programs. Adding an entry to the "run keys" in the Registry or startup folder will cause the program referenced to be executed when a user logs in. These programs will be executed under the context of the user and will have the account's associated permissions level. This activity can be associated with the **Abnormal Process Modified a Registry Key Group** indicator.
Multiple Failed Authentications - External Access	As organizations increase their reliance on external authentication infrastructures, attackers may attempt to leverage these infrastructures to their advantage. Brute force techniques as well as more traditional password cracking methods like guesswork can be utilized to gain initial access. These activities can be associated with the **Multiple Failed Azure AD Authentications** and **Multiple Failed VPN Authentications** indicators.

Alert Type	Description
Abnormal Country	As organizations increase their reliance on external authentication infrastructures, attackers may attempt to leverage these infrastructures to their advantage. When devices or accounts are compromised as well as when credentials are wrongly shared, attackers may utilize them to gain initial access from an abnormal location. These activities can be associated with the **Abnormal Azure AD Logon Country** and **Abnormal VPN Logon Country** indicators.
Snooping User - Cloud Service Account	Snooping is unauthorized access to company data or data belonging to another person. Snooping can be as simple as the casual observance of an email on another person's computer. More sophisticated snooping uses software programs to remotely monitor activity on a computer or a cloud service account. This activity can be associated with the **Azure AD - Logon Attempts to Multiple Applications** indicator.
Abnormal Remote Application	Attackers may leverage compromised account details or devices to access remote applications that genuine end users do not frequently access to collect and even exfiltrate sensitive information. This activity can be associated with the **Azure AD - Abnormal Application** indicator.
Process Injection	Process injection is a method of executing arbitrary code in the address space of a separate live process. Running code in the context of another process may allow access to the process's memory, system/network resources, and possibly elevated privileges. Execution via process injection may also evade detection from security products since the execution is masked under a legitimate process. This activity can be associated with the **Abnormal Process Created a Remote Thread in a Windows Process** indicator.

Alert Types for Network Entities

Alert Type	Description
Phishing	Phishing is the fraudulent attempt to obtain sensitive information such as usernames, passwords and credit card details by disguising oneself as a trustworthy entity in an electronic communication. This activity can be associated with **Abnormal Country for SSL Subject**, and **Abnormal SSL Subject for JA3.** indicators.
Data Exfiltration	Data exfiltration is the unauthorized copying, transfer, or retrieval of data from a computer or server. Data Exfiltration is a malicious activity performed through various techniques, typically by cyber criminals over the Internet or other network. This activity can be associated with **Abnormal Traffic Volume Sent to Domain** and **Abnormal Traffic Volume Sent from JA3** indicators.

Alert Type	Description
Command & Control (C&C)	Command and control infrastructure can be leveraged by attackers as a communication channel between a compromised asset within the impacted network and an attacker-controlled server. Attackers may attempt to mask this malicious communication within regular network traffic; consequently, this activity can be associated with numerous network indicators such as **Abnormal Destination Port for JA3** and **High Number of IPs Contact a New SSL Subject**.

NetWitness UEBA Indicators

Indicators for Users

The following tables list indicators that display when a potentially malicious activity is detected for users.

Windows File Servers

Indicator	Alert Type	Description	
Abnormal File Access Time	Non-Standard Hours	A user has accessed a file at an abnormal time.	
Abnormal File Access Permission Change	Mass Permission Changes	A user changed multiple share permissions.	
Abnormal File Access Event	Abnormal File Access	A user has accessed a file abnormally.	
Multiple File Access Permission Changes	Mass Permission Changes	A user changed multiple file share permissions.	
Multiple File Access Events	Snooping User	A user accessed multiple file events.	
Multiple Failed File Access Events	Snooping User	A user failed multiple times to access a file.	
Multiple File Open Events	Snooping User	A user opened multiple files.	
Multiple Folder Open Events	Snooping User	A user opened multiple folders.	
Multiple File Delete Events	Abnormal File Access	A user deleted multiple files.	
Multiple Failed File Access Permission Changes	Mass Permission Changes	A user failed multiple attempts to change file access permissions	

Active Directory

Indicator	Alert Type	Description
Abnormal Active Directory Change Time	Non-Standard Hours	A user made Active Directory changes at an abnormal time.
Abnormal Active Directory Object Change	Abnormal AD Changes	A user made Active Directory attribute changes abnormally.
Multiple Group Membership Changes	Mass Changes to Groups	A user made multiple changes to groups successfully.
Multiple Active Directory Object Changes	Abnormal AD Changes	A user made multiple Active Directory changes successfully.
Multiple User Account Changes	Abnormal AD Changes	A user made multiple sensitive Active Directory changes successfully.
Multiple Failed Account Changes	Abnormal AD Changes	A user failed to make multiple Active Directory changes.
Admin Password Changed	Admin Password Change	The password of an admin was changed.
User Account Enabled	Sensitive User Status Changes	An account of a user was enabled.
User Account Disabled	Sensitive User Status Changes	An account of a user was disabled.
User Account Unlocked	Sensitive User Status Changes	An account of a user was unlocked.
User Account Type Changed	Sensitive User Status Changes	The type of user was changed.
User Account Locked	Sensitive User Status Changes	An account of a user was locked.
User Password Reset	Sensitive User Status Changes	The password of a user was reset.
User Password Never Expires Option Changed	Sensitive User Status Changes	The password policy of a user was changed.

Logon Activity

Indicator	Alert Type	Description
Abnormal Remote Computer	Abnormal Computer Access	A user accessed a remote computer abnormally.

Indicator	Alert Type	Description
Abnormal Logon Time	Non-Standard Hours	A user logged on at an abnormal time.
Abnormal Computer	User Login to Abnormal Host	A user attempted to access a computer abnormally.
Multiple Successful Authentications	Multiple Logons by User	A user logged on multiple times.
Multiple Failed Authentications	Multiple Failed Logons	A user failed multiple authentication attempts.
Logon Attempts to Multiple Source Computers	User Logged into Multiple Hosts	A user attempted to log on from multiple computers.
Abnormal VPN Logon Time	Non-Standard Hours	A user logged on to VPN at an abnormal time.
Abnormal Azure AD Logon Time	Non-Standard Hours	A user logged on to Azure AD at an abnormal time.
Multiple Failed Azure AD Authentications	Multiple Failed Authentications	A user failed multiple times to authenticate into Azure AD.
Multiple Failed VPN Authentications	Multiple Failed Authentications	A user failed multiple times to authenticate for VPN access.
Abnormal Azure AD Logon Country	Abnormal Logon Country	A user attempted to access Azure AD from an abnormal country.
Abnormal VPN Logon Country*	Abnormal Logon Country	A user attempted to establish VPN access from an abnormal country.
Azure AD - Abnormal Application	Abnormal Remote Application	A user attempted to log on to abnormal number of applications through Azure AD.
Azure AD - Logon Attempts to Multiple Applications	Snooping User	A user attempted to log on to multiple applications through Azure AD.

Note: *For Abnormal VPN Logon Country, it is recommended to dynamically update the GeoIP repository to obtain optimal results.

Process

Indicator	Alert Type	Description
Abnormal Process Created a Remote Thread in LSASS	Credential Dumping	An abnormal process was created into the LSASS process.
Abnormal Reconnaissance Tool Executed	Discovery and Reconnaissance	An abnormal process was executed.

Indicator	Alert Type	Description
Abnormal Process Executed a Scripting Tool	PowerShell and Scripting	An abnormal process executed a scripting tool.
Abnormal Process Executed a Scripting Tool	PowerShell and Scripting	An abnormal process was triggered by a scripting tool.
Scripting Tool Triggered an Abnormal Application	PowerShell and Scripting	An abnormal process was opened by a scripting tool.
Abnormal Process Created a Remote Thread in a Windows	PowerShell and Scripting	An abnormal process was injected into a known windows process .
Multiple Distinct Reconnaissance Tools Executed	Discovery and Reconnaissance	Multiple reconnaissance tools were executed in an hour.
Multiple Reconnaissance Tool Activities Executed	Discovery and Reconnaissance	Multiple reconnaissance tool activities were executed in an hour.
User Ran an Abnormal Process to Execute a Scripting Tool	PowerShell / Scripting	An abnormal process executed a scripting tool.
User Ran a Scripting Tool that Triggered an Abnormal Application	PowerShell / Scripting	A scripting tool was executed that triggered an abnormal application.
User Ran a Scripting Tool to Open an Abnormal Process	PowerShell / Scripting	A scripting tool was executed to open an abnormal process.

Registry

Indicator	Alert Type	Description
Abnormal Process Modified a Registry Key Group	Registry Run Keys	An abnormal process modified a service key registry.

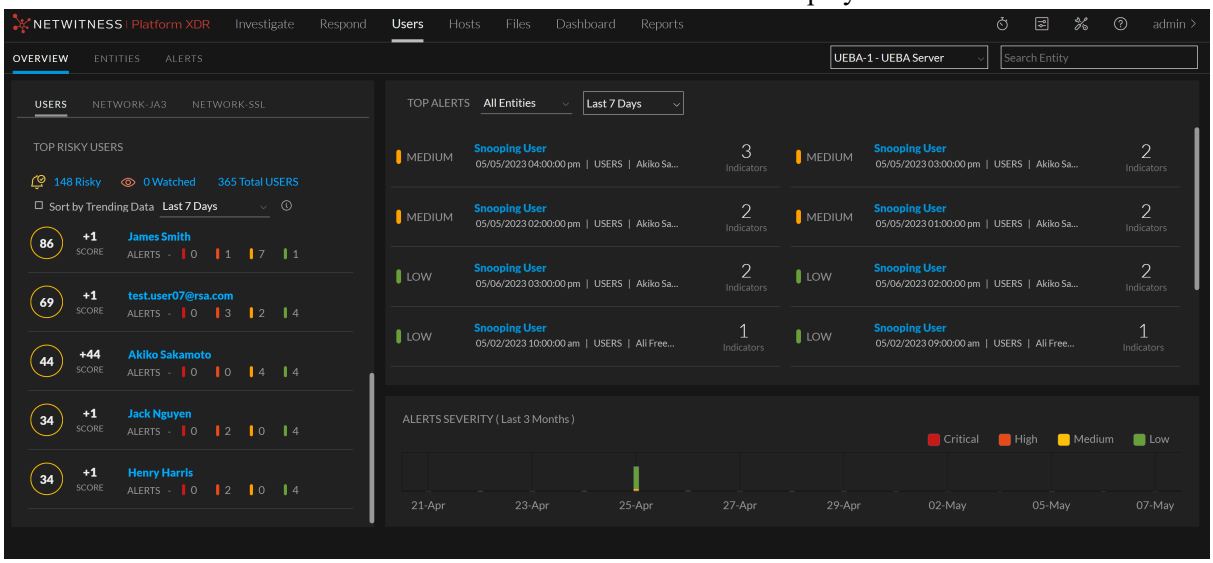
Indicators for Network Entities

The following tables list indicators that display when a potentially malicious activity is detected for JA3 and SSL Subject entities.

Note: Indicators are for JA3, and in some instances the JA3 hash can be mapped to more than one client application.

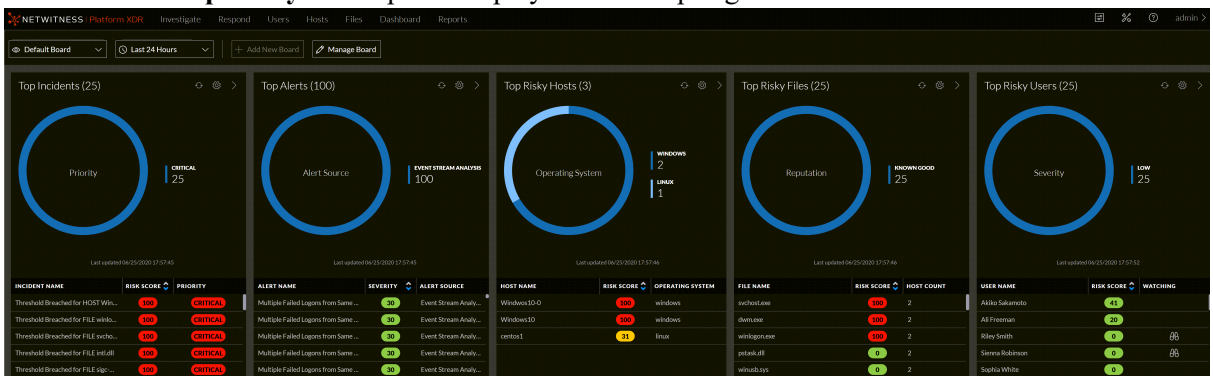
Indicator	Entity Type	Alert Type	Description
Abnormal Traffic Volume Sent from IP to SSL Subject	SSL Subject	Data exfiltration	An IP address in the organization sent an unexpectedly high amount of data to an SSL Subject.
Abnormal Traffic Volume Sent from IP to Domain	SSL Subject	Data exfiltration	An IP address in the organization sent an unexpectedly high amount of data to a domain and SSL Subject.
Abnormal Traffic Volume Sent from IP to Organization	SSL Subject	Data exfiltration	An IP address in the organization sent an unexpectedly high amount of data to an organization and SSL Subject.
Abnormal Traffic Volume Sent from IP to Port	SSL Subject	Data exfiltration	An IP address in the organization sent an unexpectedly high amount of data to a port and SSL Subject.
Abnormal Traffic Volume Sent to SSL Subject	SSL Subject	Data exfiltration	An unexpectedly high amount of data was sent to an SSL Subject.
Abnormal Traffic Volume Sent to Domain	SSL Subject	Data exfiltration	An unexpectedly high amount of data was sent to a domain and SSL Subject.
Abnormal Traffic Volume Sent to Port	SSL Subject	Data exfiltration	An unexpectedly high amount of data was sent to a port and SSL Subject.
Abnormal Traffic Volume Sent to Organization	SSL Subject	Data exfiltration	An unexpectedly high amount of data was sent to an organization and SSL Subject.
Abnormal Traffic Volume Sent from JA3	JA3	Data exfiltration	Abnormal number of bytes sent from JA3 .
High Number of IPs Use JA3	JA3	C&C	An abnormally high number of IPs use JA3.
Abnormal SSL Subject for Source Netname	SSL Subject and JA3	Phishing	A source netname contacted an abnormal SSL Subject.
Abnormal Domain for Source Netname	SSL Subject and JA3	Phishing	A source netname contacted an abnormal domain
Abnormal Destination Port for Source Netname	SSL Subject and JA3	C&C	A source netname contacted an abnormal destination port.
Abnormal Organization for Source Netname	SSL Subject and JA3	Phishing	A source netname contacted an abnormal organization.
Abnormal Country for SSL Subject	SSL Subject and JA3	Phishing	An SSL Subject was contacted with an abnormal destination country.
Abnormal Destination Port for SSL Subject	SSL Subject and JA3	C&C	An SSL Subject was contacted through an abnormal destination port.

Indicator	Entity Type	Alert Type	Description
Abnormal Time for SSL Subject	SSL Subject and JA3	Non-Standard Hours	An SSL Subject was contacted at an abnormal time.
Abnormal Destination Port for Domain	SSL Subject and JA3	C&C	A domain was accessed through an abnormal destination port.
Abnormal Destination Port for Organization	SSL Subject and JA3	C&C	An organization was accessed through an abnormal destination port.
Abnormal Time for JA3	SSL Subject and JA3	Non-Standard Hours	JA3 was used at an abnormal time.
Abnormal JA3 for Source Netname	SSL Subject and JA3	C&C	A source netname utilized an abnormal client application.
Abnormal SSL Subject for JA3	SSL Subject and JA3	Phishing	JA3 contacted an abnormal SSL Subject.
Abnormal Domain for JA3	SSL Subject and JA3	Phishing	JA3 contacted an abnormal domain.
Abnormal Destination Port for JA3	SSL Subject and JA3	C&C	JA3 contacted an abnormal destination port.
High Number of IPs Contact a New SSL Subject	SSL Subject	C&C	High number of IPs contacted SSL Subject.
High Number of IPs Contact a New Domain	SSL Subject	C&C	High number of IPs contacted a new domain.
High Number of IPs Contact a New Organization	SSL Subject	C&C	High number of IPs contacted a new organization.
High Number of IPs Contact a New Port	SSL Subject	C&C	High number of IPs contacted a new port.
Abnormal Traffic Volume Sent from an IP to a New SSL Subject	SSL Subject	Data Exfiltration	Abnormal number of bytes sent from an IPs to an SSL Subject.
Abnormal Traffic Volume Sent from an IP to a New Domain	SSL Subject	Data Exfiltration	Abnormal number of bytes were sent an IP to a domain.
Abnormal Traffic Volume Sent from an IP to a New Port	SSL Subject	Data Exfiltration	Abnormal number of bytes were sent from an IP to a port.



Indicator	Entity Type	Alert Type	Description
Abnormal Traffic Volume Sent from an IP to a New Organization	SSL Subject	Data Exfiltration	Abnormal number of bytes were sent from an IP to an organization.
Abnormal Traffic Volume Sent to a New SSL Subject	SSL Subject	Data Exfiltration	Abnormal number of bytes were sent to a SSL Subject.
Abnormal Traffic Volume Sent to a New Domain	SSL Subject	Data Exfiltration	Abnormal number of bytes were sent to a new domain.
Abnormal Traffic Volume Sent to a New Port	SSL Subject	Data Exfiltration	Abnormal number of bytes were sent to a new port.
Abnormal Traffic Volume Sent to a New Organization	SSL Subject	Data Exfiltration	Abnormal number of bytes were sent to an organization for an SSL Subject.
Abnormal Traffic Volume Sent to a New JA3	JA3	Data Exfiltration	Abnormal number of bytes were sent to a JA3.

Access NetWitness UEBA



Note: To access the NetWitness UEBA service and **Users** tab, you must be assigned to either the UEBA_Analyst role or Administrators role. For information about how to assign these roles, see the "How Role-Based Access Control Works" topic in the *System Security and User Maintenance Guide*

To access NetWitness UEBA, log in to NetWitness Platform XDR and do one of the following:

1. Go to **Users** > **Overview** to view the NetWitness UEBA feature displayed.

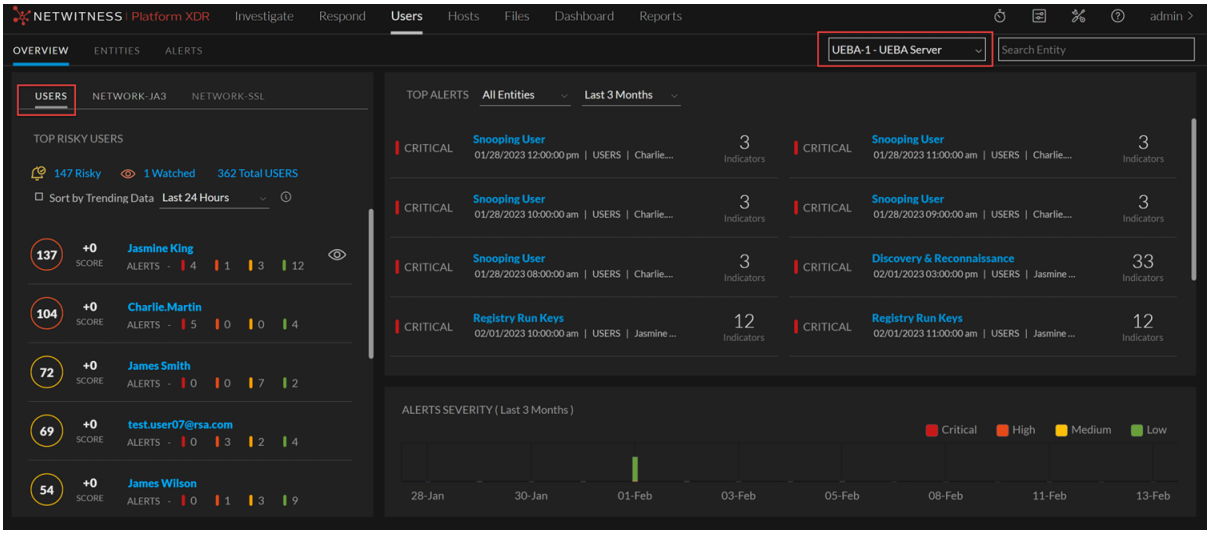
2. Click ❯ in the **Top Risky Users** panel displayed on the Springboard to view the **Users** tab.

You can choose a dark or a light theme for the view. For more information, see the "Choose the Appearance of NetWitness" topic in the *NetWitness Getting Started Guide*.

View Data from Multiple UEBA Servers

From NetWitness Platform XDR 12.3 or later, administrators can configure multiple UEBA servers in their environment. Using this enhancement, analysts can select data based on the multi-UEBA configuration option available and view only the related users, network entities, and alerts for the particular UEBA servers in the UI for further analysis and investigation.

To view the UEBA servers on UI



1. Log in to the NetWitness Platform XDR.
2. Click **Users** > **Overview**.
3. Select the UEBA Server from the drop-down list before the **Search Entity** option.

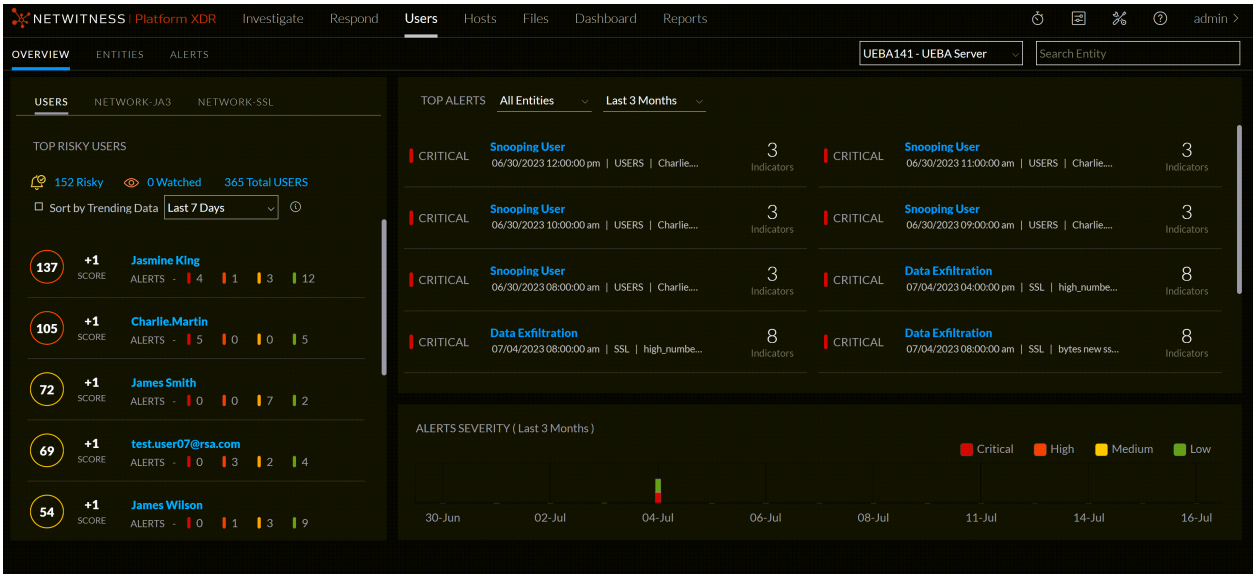
   Based on the UEBA Server selection, the data is loaded.

   For example, The first UEBA server (UEBA-1- UEBA Server) is configured with Logs and Endpoint data. The second UEBA server (UEBA-2- UEBA Server) is configured with Network data, and based on your selection in the drop-down menu, data is retrieved and shown on the UI.

Note: You can configure multiple UEBA servers in your environment. NetWitness has installed and verified up to three UEBA servers.

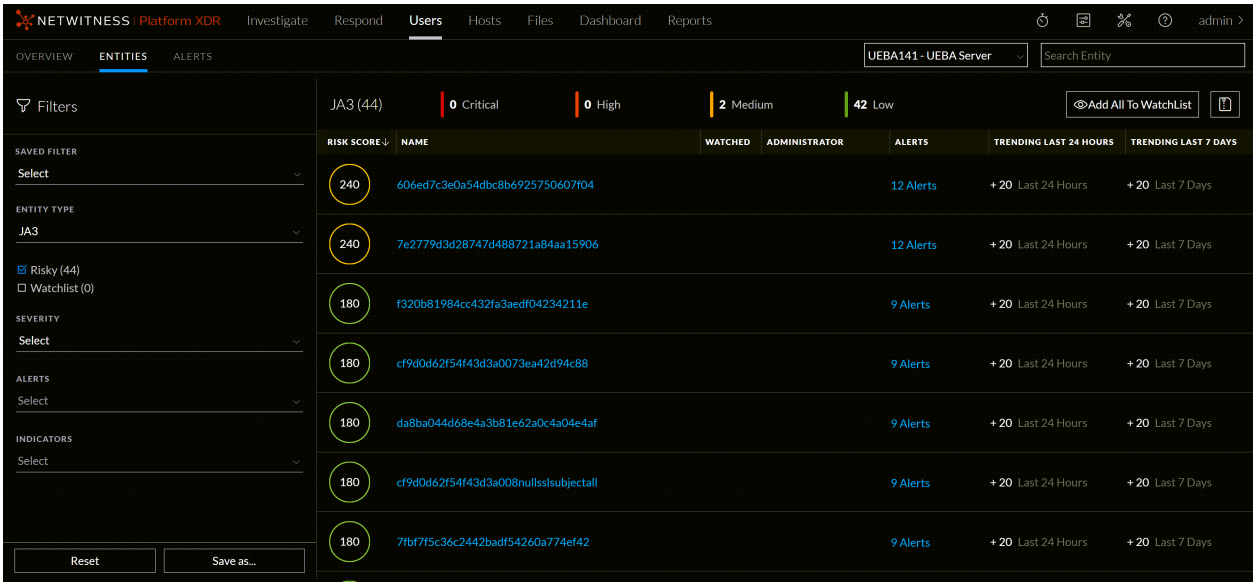
UEBA Server-1 with Logs and Endpoint Data

UEBA Server-2 with Network Data



UEBA Licensing

You must also ensure that you have NetWitness UEBA licensing configured. For information about NetWitness UEBA licensing, see the "User and Entity Behavior Analytics License" topic in the *Licensing Management Guide*.



Investigate High-Risk Entities

An entity score is built based on the alert score and the alert severity. Using the entity score, you can identify entities that require immediate attention, perform deeper investigation, and take required action. You can identify high-risk entities from either the **Overview** tab or the **Entities** tab.

The following figure is an example of top 10 High-Risk entities in the **Overview** tab.

The following figure is an example of all the risky entities in your environment in the **Entities** tab.

The following is a high-level process to investigate high-risk entities in your environment.

1. Identify high-risk entities. You can identify high-risk users using the following ways:
   - The **Overview** tab shows the top ten risky entities in your environment. From the listed entities identify the entities with a critical severity or entity score more than 100.
   - The **Entities** tab shows all the risky entities in your environment, you can sort by Risk Score (default), Trending Data Last Day or Last Week (marked with +), Name, Alerts. Identify how many entities are marked Critical, High and Medium or based on the forensic investigation, identify malicious entity behavior and build use-case driven target entity lists using behavioral filters. Additionally, you can also use different types of filters (Risky or Watchlist) to identify targeted group of high-risk entities.

   Note: The investigation should mostly focus on Critical, High and Medium severities. Low scoring users are not typically worth much investigation.

   Hover over the number of alerts associated with the risky entities to quickly see what the alerts are and determine if there is a good mix.

   For more information, see the Identify High-Risk Entities topic.
2. In the **User Profile** view, investigate the alerts and indicators of the user.
   a. Review the list of alerts associated with the user and the alert score for each alert, sorted by severity.
   b. Expand the alert names to identify a threat narrative. The strongest contributing indicator determines the alert's name that suggests why this hour is flagged.
   c. Use the alert flow timeline to understand the abnormal activities.
   d. Review each indicator associated with the alert to see the details about the indicator, including the timeline in which the anomaly occurred. Also, you can further investigate the incident using external resources such as SIEM, network forensics, directly reaching out to the user or a managing director and so on.

   For more information, see the Begin an Investigation of High-Risk Entity topic.
3. On completion of the investigation, you can record your observation as follows:
   a. Specify if an alert is not a risk.
   b. Save the behavioral profile for the use case found in your environment.
   c. If you want to keep a track of user activity, you can add users to the watchlist, and watch user profile.

   For more information, see the Take Action on High-Risk Users topic.

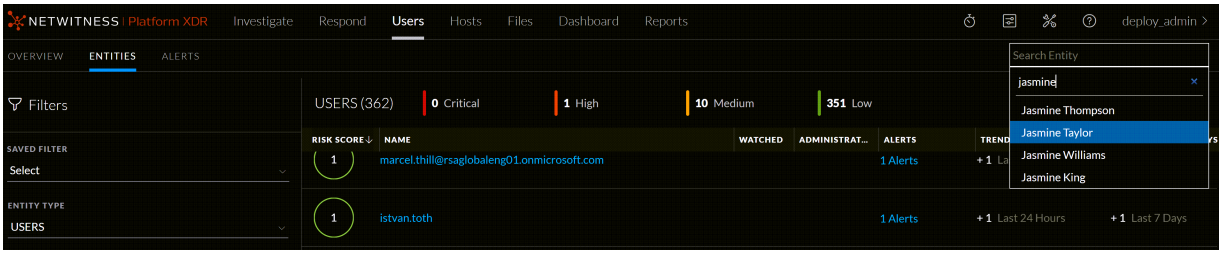
Search for an Entity

This topic describes how to search for entities on the **Users** > **Entities** page by entering a search pattern and display the search results in order of relevance.

To search for an Entity

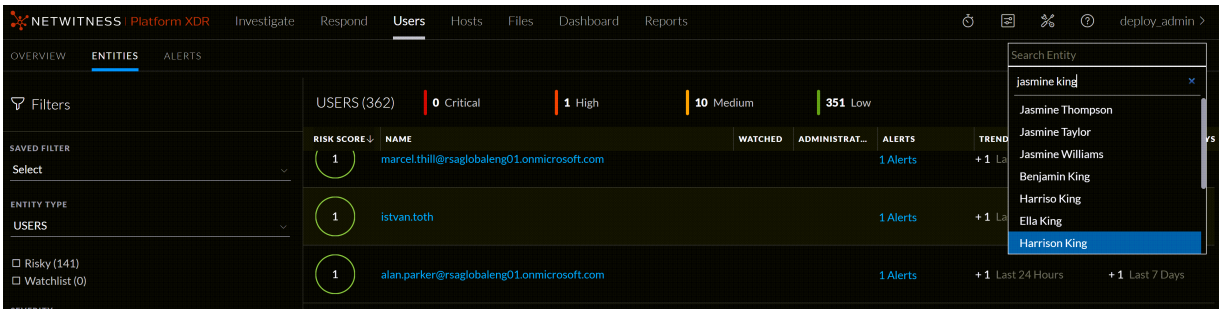
1. Log in to NetWitness Platform XDR and click **Users**.

   The Overview tab is displayed.



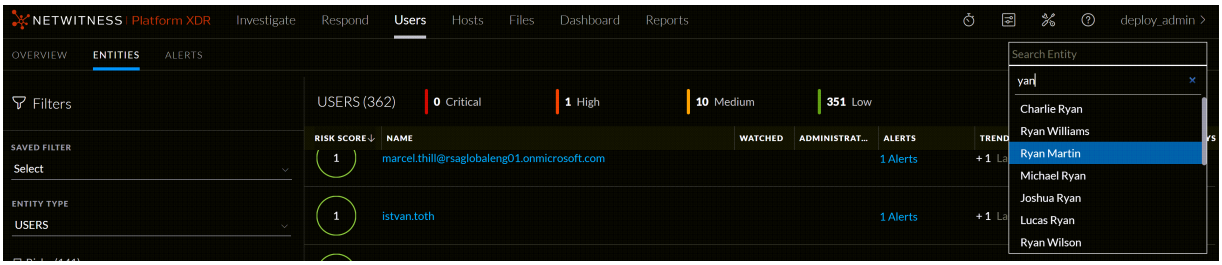
2. Click the **Entities** tab

3. On the **Search** bar, enter the entity name to be searched.



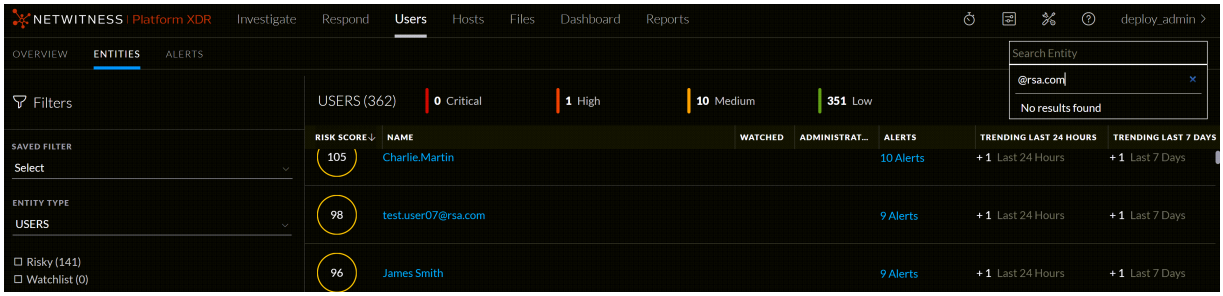
Supported search for an Entity

NetWitness UEBA allows you to use several different characters while searching for the entity:

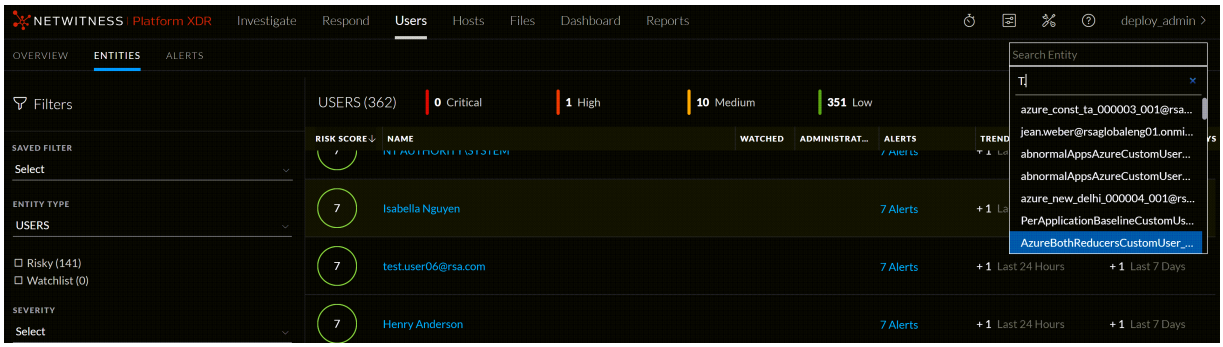


- It supports the following characters such as Numbers (0-9), Underscores (_), and periods (.).
- Searching for entities supports both uppercase (A-Z) and lowercase (a-z) letters, for example, “charlie” and “Charlie” and “CHARLIE“.
- If you search for "Jasmine" as the entity name for “Jasmine King”, a list of all the names that include the word "Jasmine" will be displayed.

- When you look up the name "Jasmine King" in the search, the results will show all the names that contain both "Jasmine" and "King," which will include "Jasmine King" as well.



- When you use substrings to search for an entity name, such as "yan," the list will show names that include those substrings, like "Charlie Ryan or Ryan Williams".



Unsupported search for an Entity

- Following special characters are supported:
  - Semicolon {;}
  - Colon {:}
  - Close parenthesis {)}
  - Close bracket {]}
  - at sign {@}
  - forward slash {/}
  - Back slash {/}

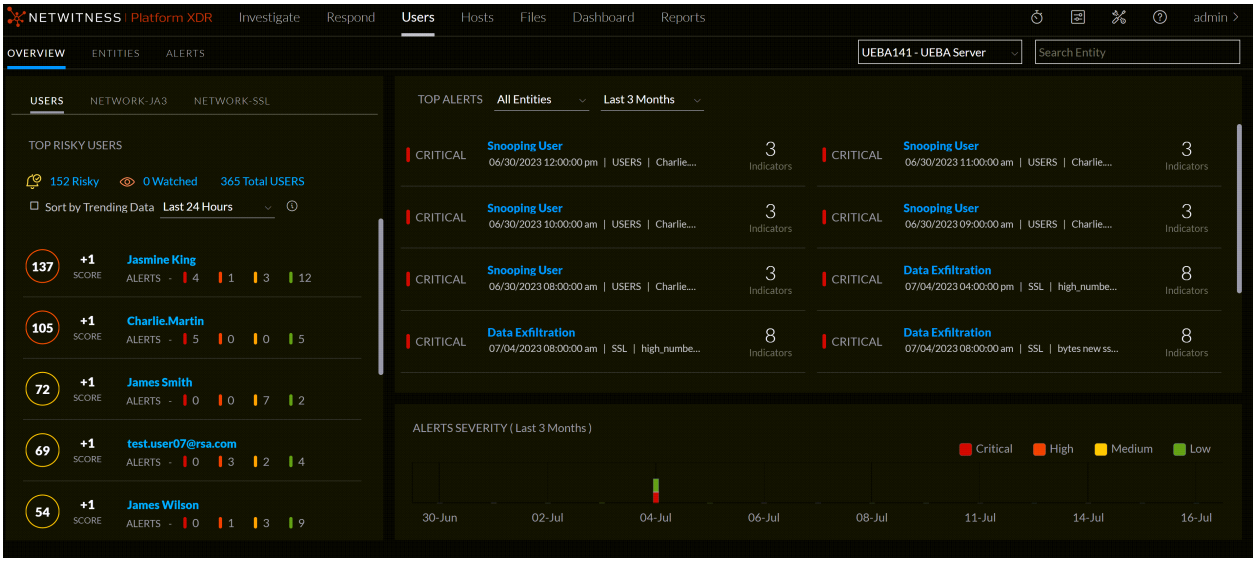
  For example, if you looking for an entity email address, you can enter the "first name" and "last name" to fetch the email address.

- Entities that end with a period (.) are not supported.

Identify High-Risk Entities

You can identify high-risk user in your environment in the following ways:

- View top five high-risk entities
- View all the high-risk entities



- View users of a specific group
- View users and other entities based on forensic investigation

View Top Ten Risky Entities

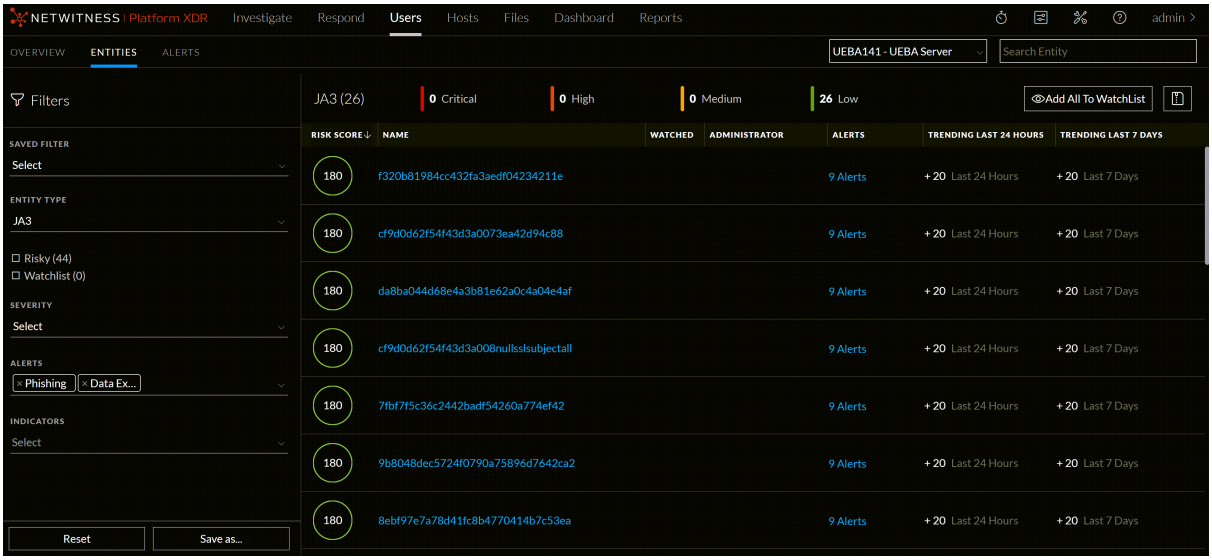
In the **Overview** tab, you can view the list of top five high-risk entities in your environment along with the risky score.

To view the top risky entities:

Log in to **NetWitness** and go to **Users** > **Entities**.
The Overview tab is displayed with the high-risk users displayed in the High Risk Users tab, and high-risk SSL and hight-risk JA3 are displayed under the Network tab.

View All High-Risk Entities

In the **Network** tab, you can view the list of all the high risk users in your environment along with the user score and total number of alerts associated with the users.



To view all high-risk users

1. Log into **NetWitness** Platform XDR and go to **Users**.

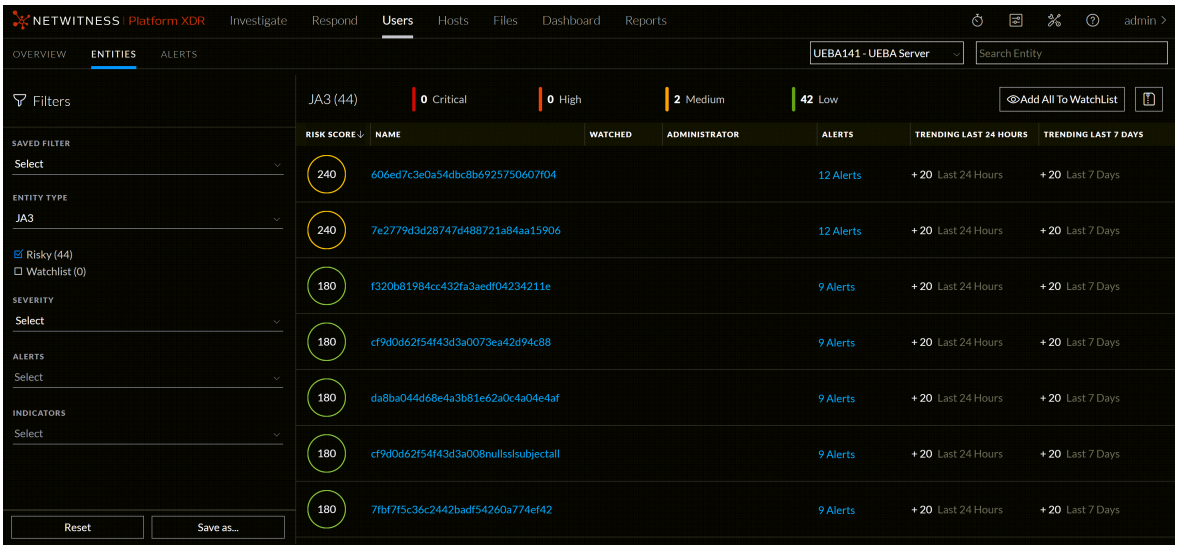
   The Overview tab is displayed.

2. Click **Entities** tab.

The list of all high-risk entities are displayed.

View Entities of Specific Group

In the **Network** tab, you can use different types of filters to identify targeted group of high-risk entity.



To view users of specific group:

1. Log in to **NetWitness** Platform XDR and go to **Users**.

   The Overview tab is displayed.

2. Click the **ENTITIES** tab.
3. In the **Filters** panel, do any of the following:

   - **Risky Entities**: To view all the risky entities in your environment, select **Risky**. By default, risky entities along with their risky score are displayed.

- **Watchlist**: To view the list of entities that you added to the watchlist to monitor for specific changes, select **Watchlist**.

Note: You can view users of one or more group by selecting one or more filters. For example, if you want to view the list of admin users who are risky users, select the **Admin Users** and **Risky Users** filters.

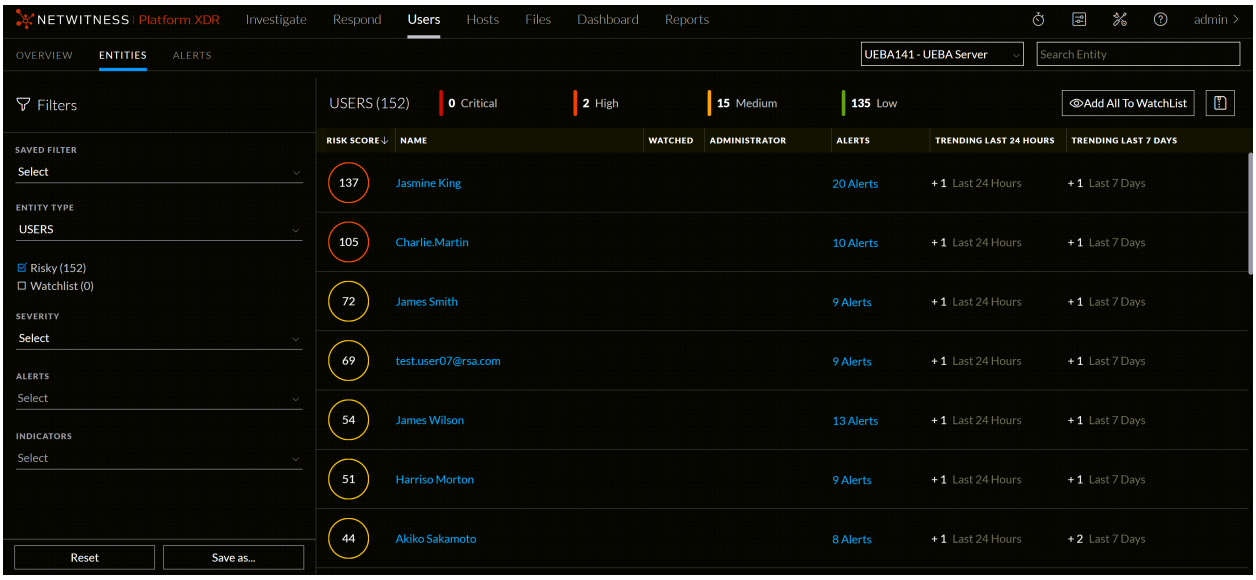
View Entity Based on Forensic Investigation

In the **ENTITIES** tab, you can use Alert Types and Indicators which are behavioral filters to view high-risk users based on forensic investigation. For more information on forensic investigation, see *Forensic Workflow* in the Introduction topic.

To view users based on specific forensic investigation:

1. Log into **NetWitness** Platform XDR and go to **Users**.

   The Overview tab is displayed.



2. Click **ENTITIES** tab.
3. To create a behavioral filter using alert types, select one or more alerts in the **ALERTS** drop-down list.
4. To create a behavioral filter using indicators, select one or more indicators in the **INDICATORS** drop-down list.
5. To filter the result for JA3 entity, select JA3 from the **ENTITY TYPE** drop-down list.

Note: You can select combination of one or more alert types and indicators to create a behavioral filter based on your requirement. For example, to monitor abnormal access to confidential files and theft of sensitive data, you can create a behavioral filter with Alert Types = **Data Exfiltration** and Indicators = **Abnormal JA3 for Source Netname (3 JA3)**.

To save these behavioral filters as favorites for future investigation, click **Save as...**.

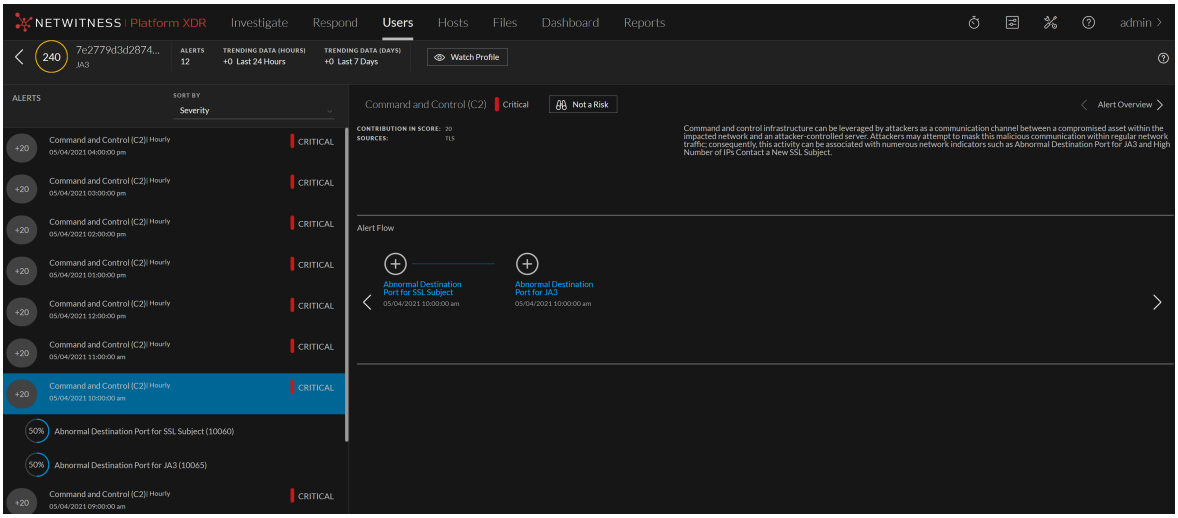
To delete the filters click **Reset Filters**.

Similarly, you can view the results for the SSL entity based on forensic investigation.

Begin an Investigation of High-Risk Entity

After identifying the high-risk entities, you can begin the investigation of high-risk entities.

To investigate high-risk entities:



1. Log in to the **NetWitness** Platform XDR and click **Users**.

   In the **Overview** tab, select **ENTITIES** tab, select an entity from the **NETWORK** drop-down to investigate. For example, if you select **Network** > **JA3**, all the JA3 high-risk entities will be displayed. Also, can sort the results by selecting the **Sort by Trending Data** checkbox. If you select this option, the data will be sorted by the Entity score (marked with +) that changed in the past 24 hours or in the past one week. By default, the result is sorted by the Entity risk score.

2. To further investigate the alert of the entity, click an alert in the **High Risk JA3** panel. The following information is displayed:

   - The alert name
   - The timeframe of the alert (Hourly or Daily)
   - The severity level icon
   - The contribution to the entity score value (for example, 20)
   - The data sources for the alert (for example, TLS)
     The middle panel is the Alert Flow panel. This panel provides a timeline of events that are related to the formation of the alert. The timeline of events can help to determine if the alert is an actual

risk.

3. To investigate the indicators associated with an alert for an entity, in the **High Risk** panel, select an alert and then select an indicator. The following information is displayed:

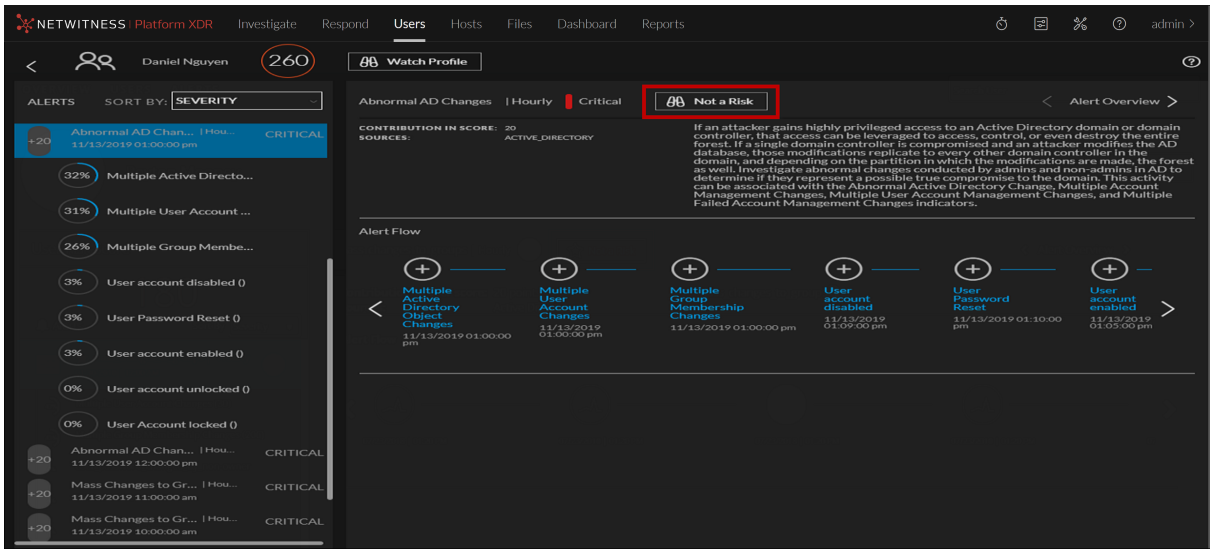
   - The indicator name and a description of the indicator type
   - Contribution to Alert
   - The anomaly values
   - The data source of the events found in the indicator
     The central panel display changes depending on which indicator is selected.

Note: You can investigate a high risk SSL entity using the above procedure.

For more information on how to read the indicator charts, see Reading an Indicator Chart topic.

Take Action on High-Risk Users

After investigation, you can take action on the risky users to reduce or prevent further damage caused by malicious attackers in your organization. You can take any of the following actions:



- Specify if the alert is not risky
- Save the behavioral profile for the use case found in your environment
- Add users to the watchlist, and the watch user profile, if you want to keep a track of the user activity

Specify that an alert is not risky.

If and alert is not a risk, you can mark it so that the user score for the user is automatically reduced.

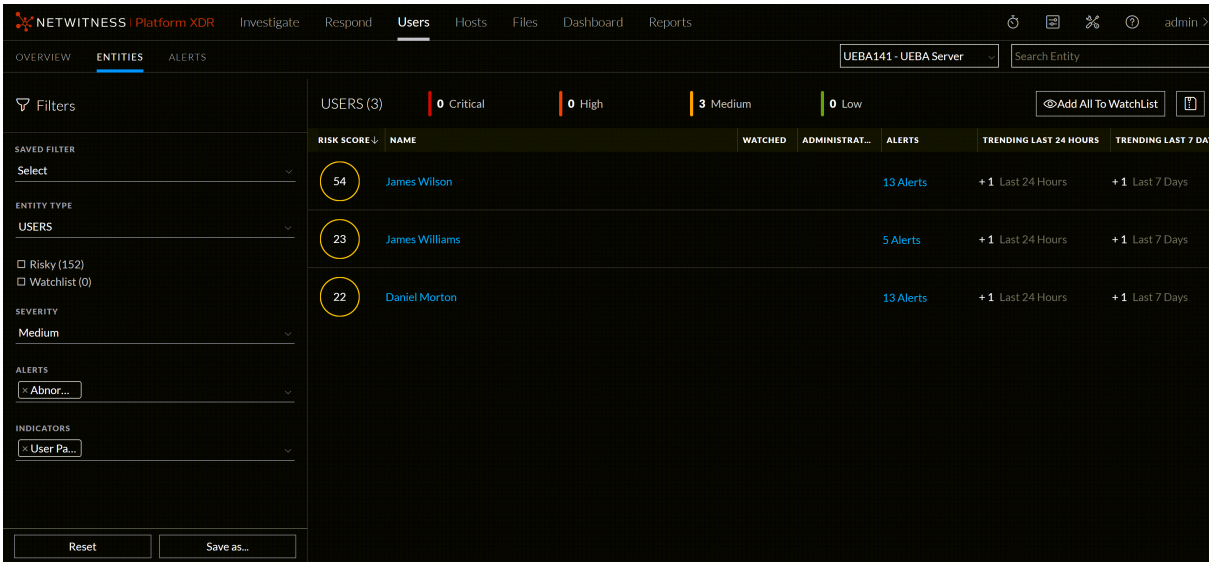
To specify if the alert is not risky:

1. Log into **NetWitness** and click **Users**.
2. Take action on the users from any of the following tabs:
   a. In the **OVERVIEW** tab, in the **High Risk Users** panel, select a user and click either on the username or on the user score.
   b. In the **ENTITIES** tab, select a user and click on the username.
   The User Profile view is displayed.
3. If the alert is not a risk, you can specify by clicking **Not a Risk**.

When an alert is marked as **Not a Risk**, the user score is reduced automatically.

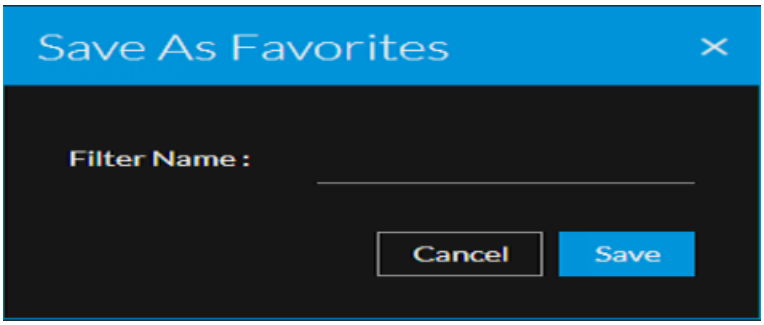
Save Behavioral Profile

The combination of the alert types and indicators you select during the forensics investigation is a behavioral profile. You can save the behavioral profile, so you can monitor this use case in future.



For example, if your organization is attacked and the attackers penetrated by brute forcing user accounts, you can select filters using the brute force alert type. This can be saved as favorite. You can proactively monitor for future brute force attempts. To do so, you can click the favorite to see if new users were subjected to this type of attack.

To save a behavioral profile:

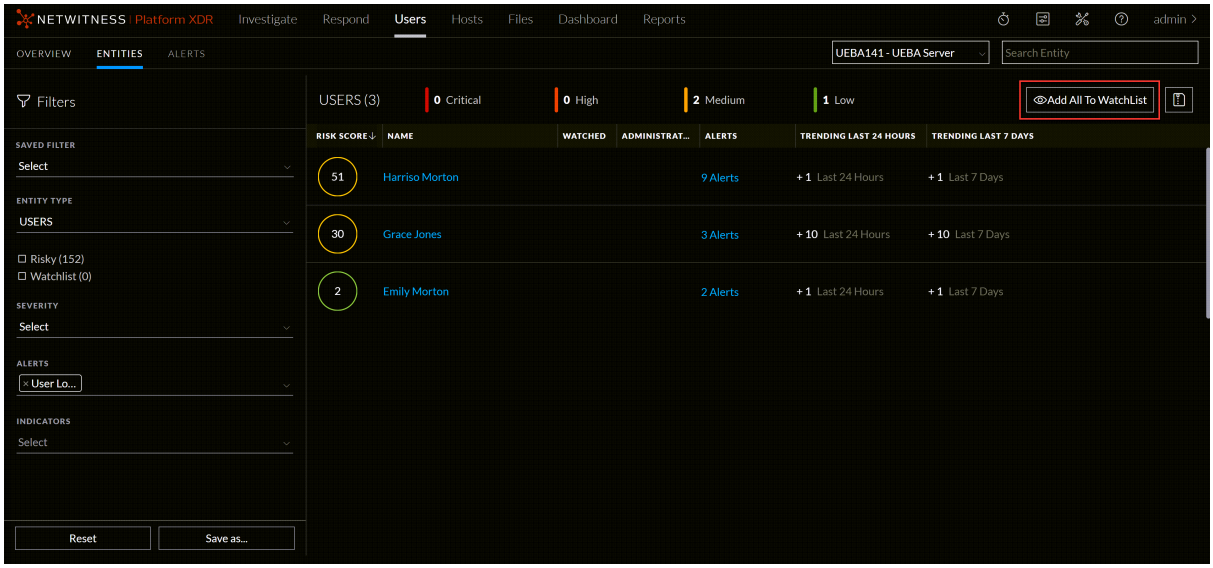


1. Log into **NetWitness** and click **Users**.

   The Overview tab is displayed.

2. Click the **Users** tab.
3. In the **Filters** panel, select the alert in the **Alert Type** drop-down and Indicators in the **Indicators** drop-down.
4. Click **Save to Favorites**.

5. In the **Save Filter** dialog, enter the name of the filter and click **OK**.



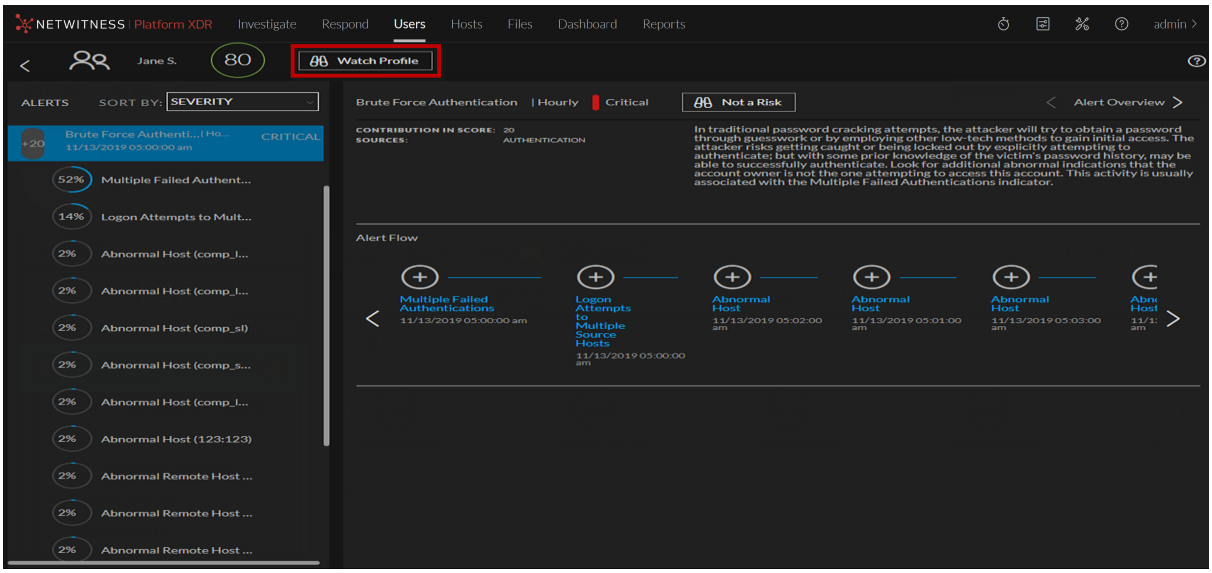
The behavioral profile is saved and displayed in the Favorites panel. You can click on the profile in the Favorites to monitor the users.

Add All Users to the Watchlist

If you want to keep track of users with recent activity but do not want to follow up with an immediate investigation, you can add the users to the watchlist and revisit over time to see if the risk score is elevated.

To add all users to the watchlist:

1. Log in to the **NetWitness** and click **Users**.
   The Overview tab is displayed.
2. Select the **Entities** tab.
3. Select the users of specific categories using filters.
4. Click **Add All to Watchlist**.



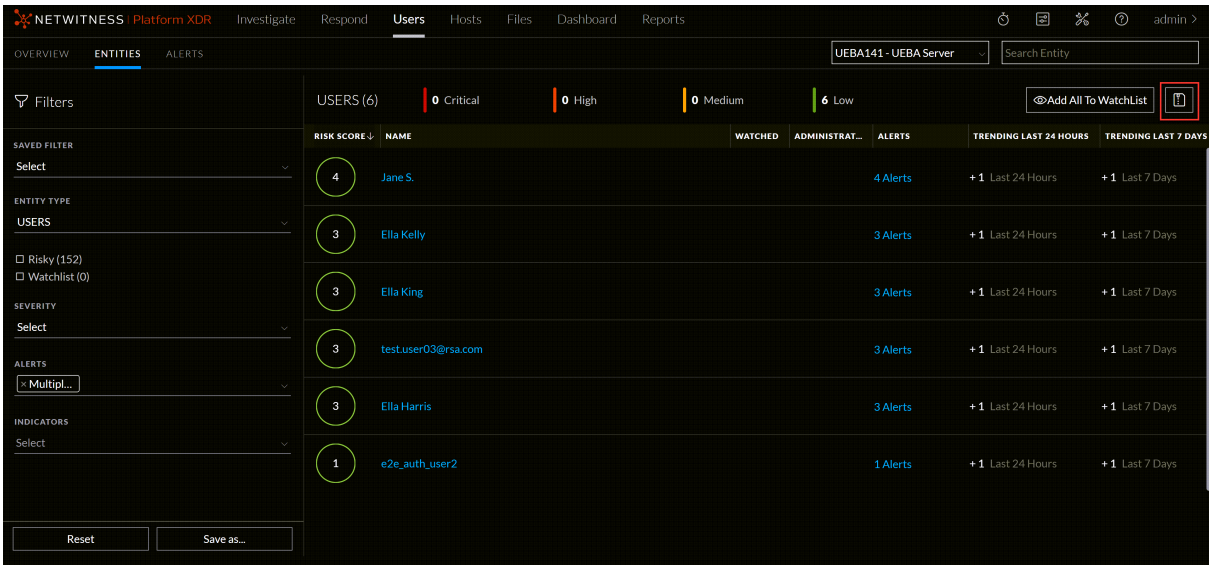
The list of users are added to the watchlist.

Watch Profile

The watch user profile is a list of users that you want to monitor for potential threats. The watch user profile marks a user so that the users can be quickly referenced on the dashboard. This is essentially a bookmark to monitor suspicious users.

To watch user profile:

1. Log into **NetWitness** and click **Users**. Do any of the following:
   a. In the **Overview** tab, under **High Risk Users** panel, select a user and click on either the username or the user score.
   b. In the **Users** tab, select a user and click the username.
   The User Profile view is displayed.
2. Click **Watch Profile** in the upper right corner of the User Profile.



The user is added to the watchlist.

Export a list of High-Risk Users

You can export a list of all users and their scores in a .csv file format. You can use this information to compare with other data analysis tools like tableau, powerbi, and zeppelin.

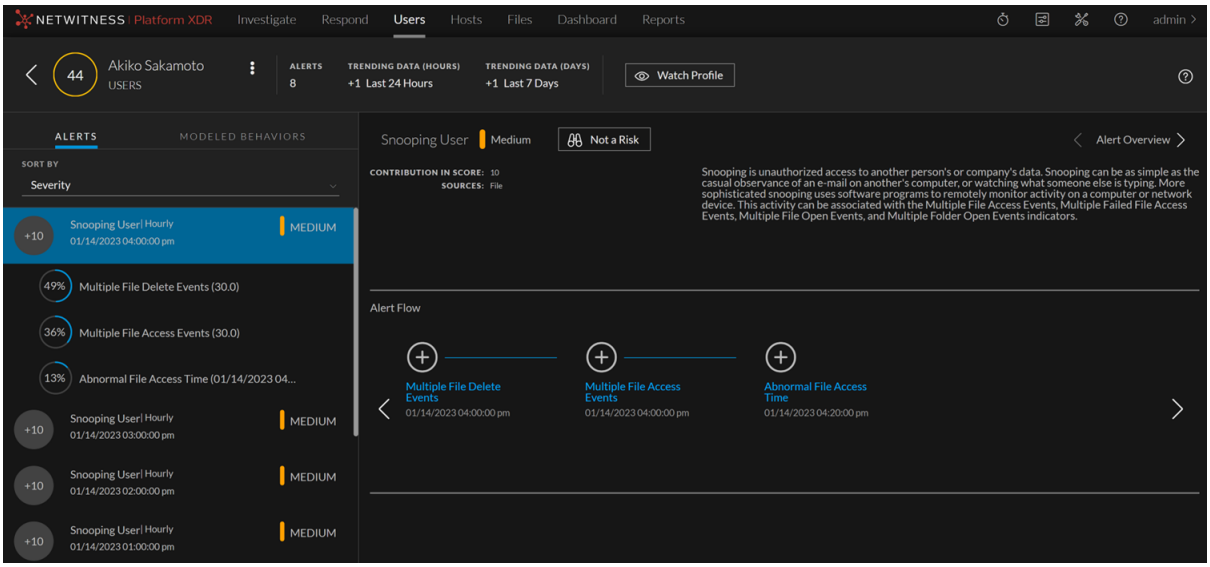
To export a list of high-risk users:

1. Click **Users**.
   The Overview tab is displayed.
2. Select the **Users** tab.
3. Click **Export**.

The list of all users and the associated user score is downloaded in the .csv file format.

View Contextual Information for Users

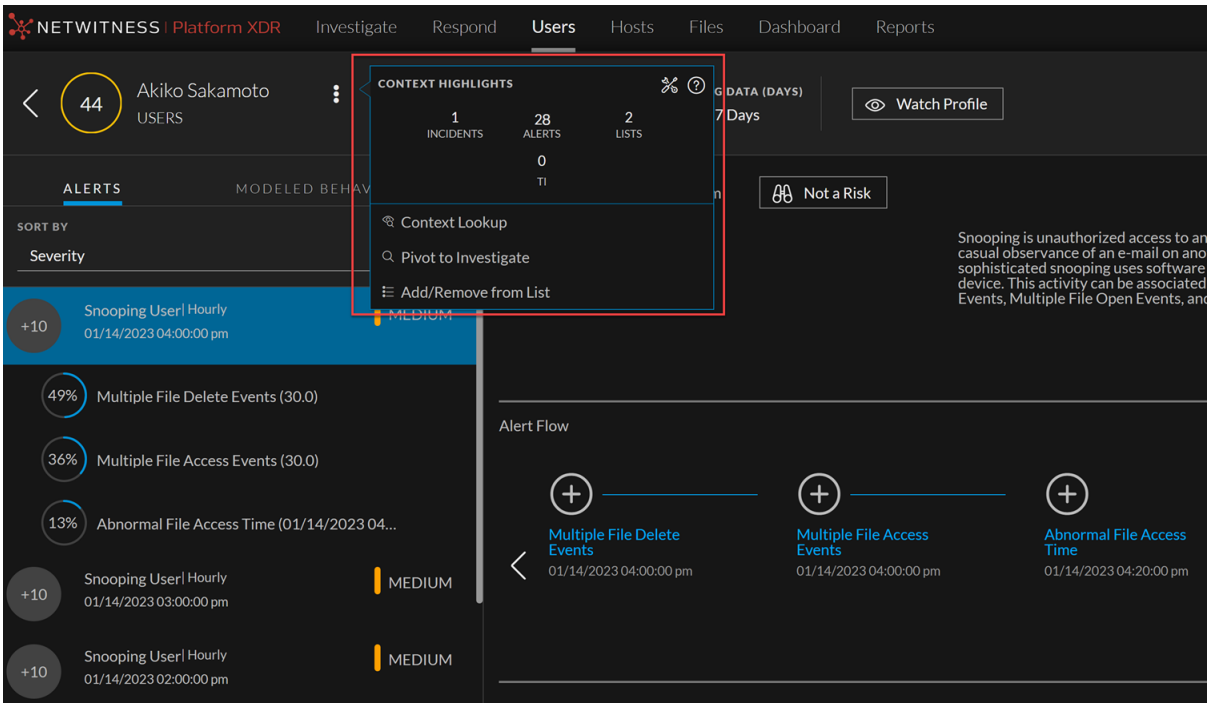
Analysts can view contextual information about users from the 12.3 version or later on the NetWitness Platform XDR **Users** page. This will enable analysts to make better decisions and take appropriate action during their analysis. A single page containing Users and contextual information helps analysts to prioritize and identify areas of interest. The Context Lookup panel displays contextual information for the selected users. The data available depends on the configured sources in the Context Hub.



Note: Contextual Information is not applicable to network entities.

Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Users** view to view context lookup for users and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

To view contextual information for users



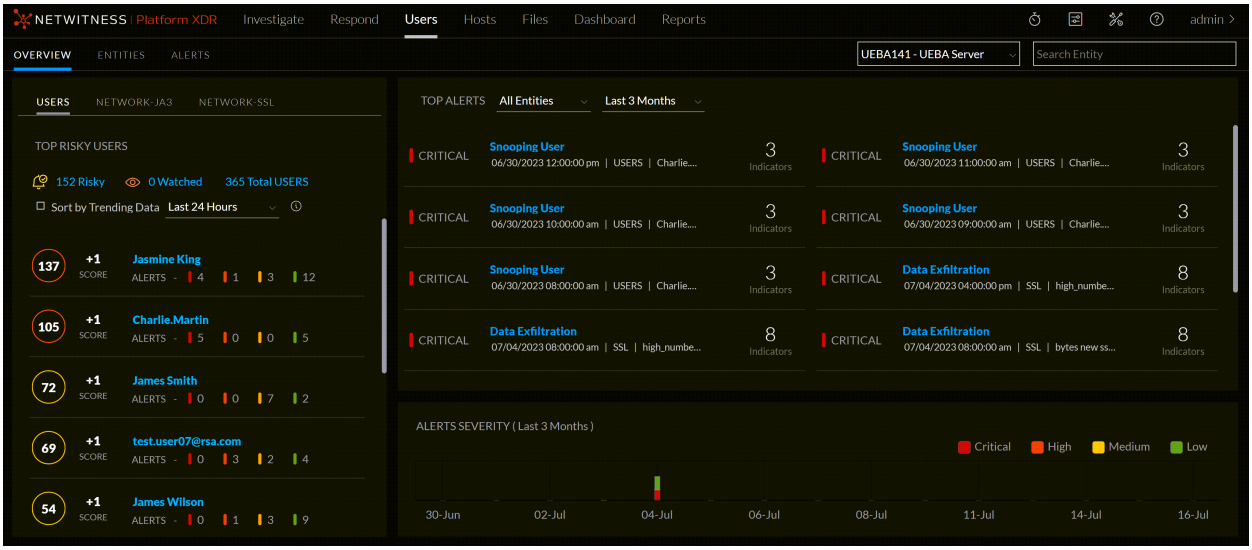
1. Log in to the NetWitness Platform XDR.
2. Go to **Users** > **Overview**.
3. Do one of the following:
   - In the **Overview** tab, under the **Top Risky Users** panel, click on a username.
   - In the **Entities** tab, click on a username.

   The User Profile view is displayed.

4. Click  after the username to open the user context panel.

   A Context Highlights dialog appears with a quick summary of the type of context data that is available for the selected user.

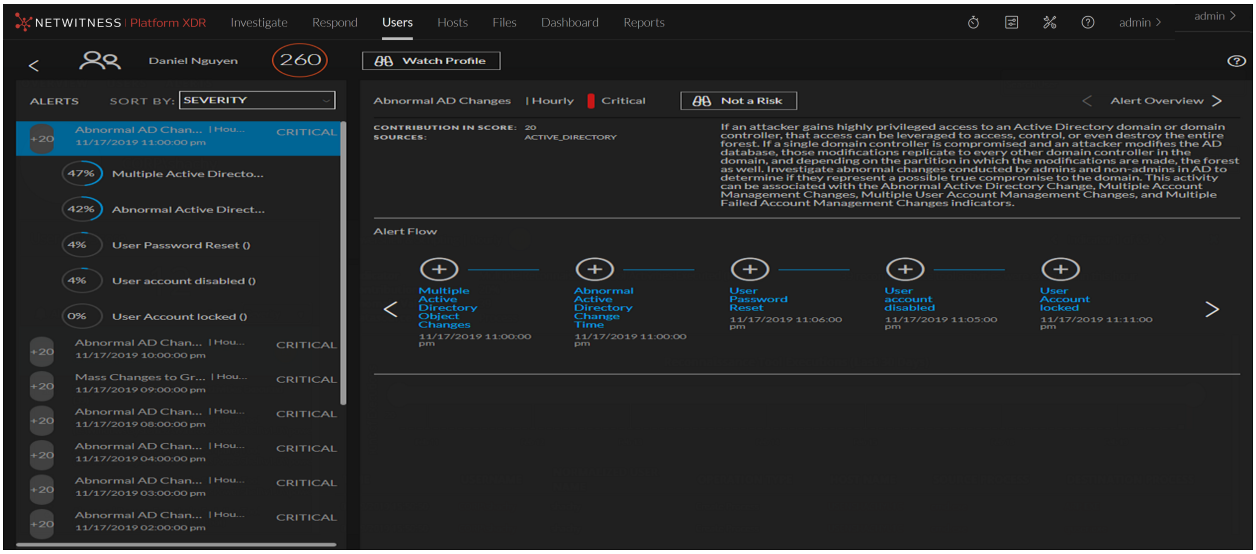
   The information in the **Context Highlights** section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, and Threat Intelligence (TI). Depending on your data, you may be able to click these items for more information. The above example shows that the user **Akiko Sakamoto** has 1 related Respond Incident, 28 Alerts, 2 Lists, and 0 incident for TI. For more information, see the *Context Hub Configuration Guide*.



The other available actions the analysts can perform are **Context Lookup**, **Add/Remove from List**, and **Pivot to Investigate**.

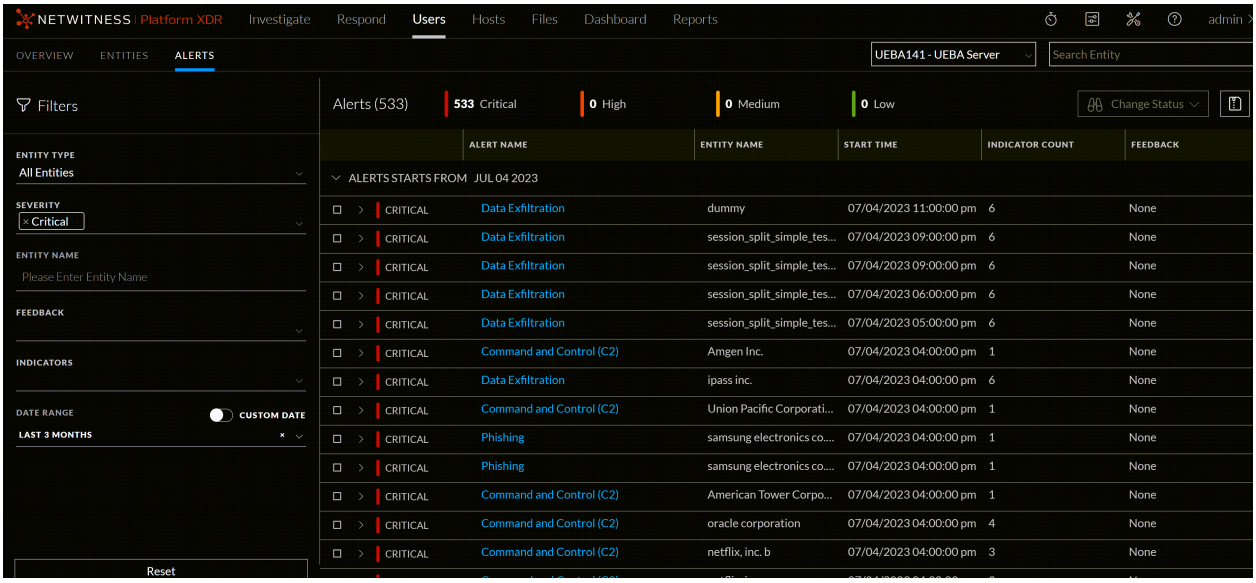
- **Context Lookup**: The Context Lookup panel opens from the right side of the browser window, and the Context Lookup panel for Active Directory displays all the related information, incidents, and alerts for a user. For more information on configuring the Active Directory as the data source, see "Configure Active Directory as a Data Source" topic in the *Context Hub Configuration Guide*.
- **Pivot to Investigate**: For a more thorough investigation of user activities and related events, click **Pivot to Investigate**, and the Events view opens, which enables you to perform a deeper dive investigation.
- **Add/Remove from List**: You can create custom lists and add users, which could be used to track users who have been identified as threats or to highlight accounts of particular interest. You can also remove users from the list. This ensures analyst focuses on real threats and reduce false positives that do not need further investigation.

Investigate Top Alerts



Anomalies that are found as incoming events are compared to the baseline and compiled into hourly alerts. Relatively strong deviations from the baseline, together with a unique composition of anomalies, are more likely to get a higher alert score.

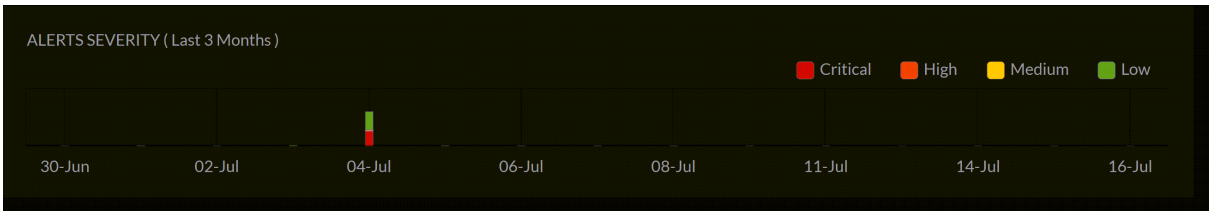
You can quickly view the most critical alerts in your environment, and start investigating them from either the Overview tab or the Alerts tab. The following figure is an example of top alerts in the Overview tab. The alerts are listed in order of severity and the number of users who generate the alerts.



To investigate an alert on this page, click an alert in the **Top Alerts** section.

The following figure shows details about the event that caused the alert, and the time frame in which it occurred.

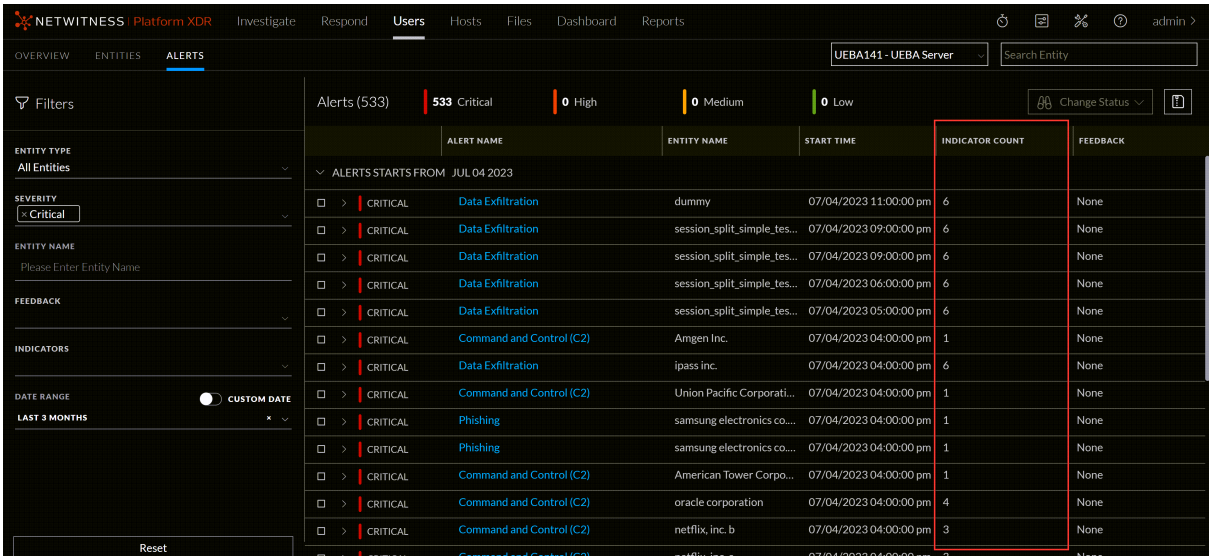
From the Alerts Severity panel at the bottom of the Overview tab, you can click on a bar in the graph to review top alerts in the ALERTS tab. The following figure shows the top alerts listed in the Alerts tab.



Investigating alerts is particularly useful when you want to focus on a timeframe in which you believe your systems were compromised. You can view forensic information based on a timeframe and gather detailed information about events that occurred during that time in the Alerts tab.

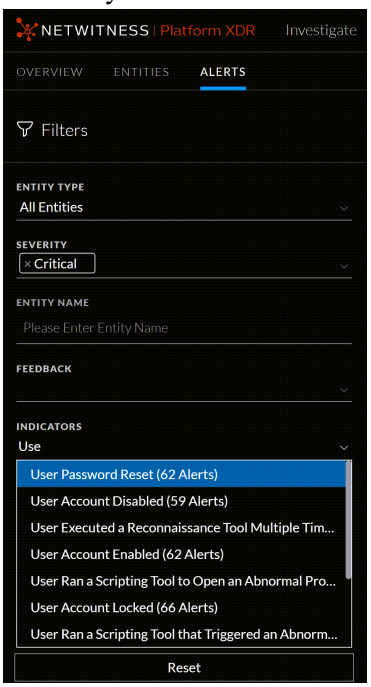
Begin an Investigation of Critical Alerts

You can begin your investigation of critical alerts in the following ways:



1. On the Overview tab, look at the ALL ALERTS.

Is there an even distribution of alerts or are there a few days when there was a noticeable spike? A spike could indicate something suspicious like malware. Make a note of those days so you can inspect the alerts (the bar from the chart links directly to the alerts for that specific day).



2. In the Alerts tab, you can view the indicator count:

To identify users with the highest number of alerts, more indicators help illustrate more insights and provide a more rigid timeline that you can follow.

3. Expand the top alerts in the list:
   - Look for alerts that have varied data sources. These show a broader pattern of behavior.
   - Look for a variety of different indicators.
   - Look for indicators with high numeric values, specifically for high values that are not indicative of a manual activity (for example, a user accessed 8,000 files).
4. Look for unique Windows event types that users do not typically change as these can indicate suspicious administrative activity.

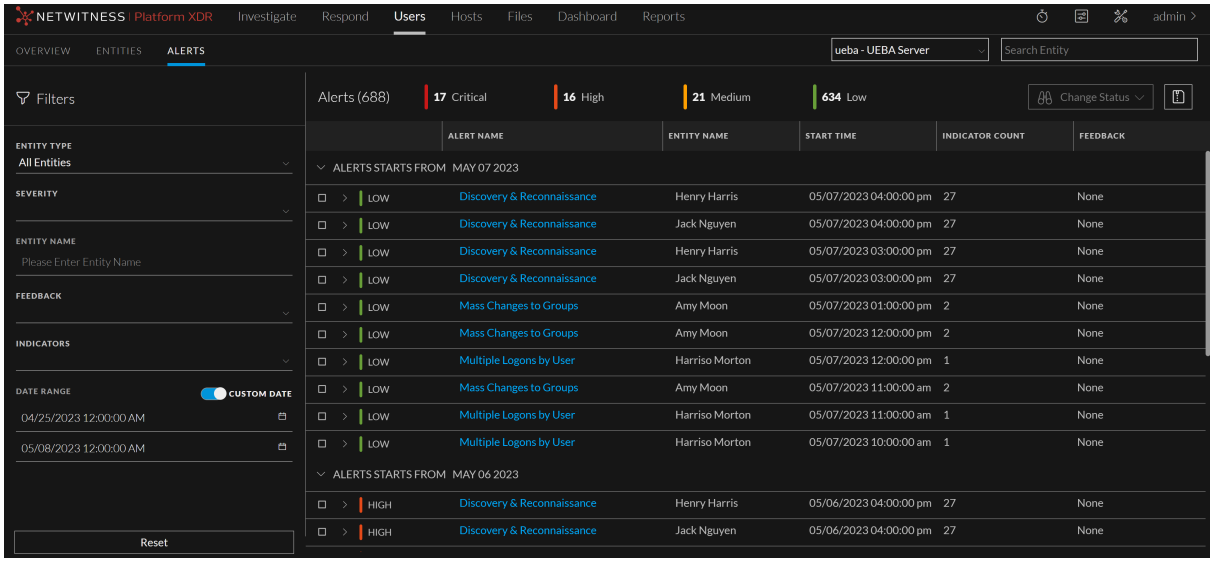
5. Search by indicators.

   The list shows the number of alerts raised that contain each indicator.

   - Look for the top volume indicators; filter by an indicator and review by user to find users who experienced the highest number of these indicators.
   - In general, you can ignore time-based alerts (for example, Abnormal Logon Time) as these are very common. However, they provide good context when combined with higher interest indicators.

6. Drill into more detail:
   - Leverage alert names to begin establishing a threat narrative. Use the strongest contributing indicator that usually determines the alert's name to begin explaining why this user is flagged.
   - Use the timeline to layout the activities found and try to understand the observed behaviors.
   - Follow up by reviewing each indicator and demonstrating the supporting information, in the form of graphs and events, that can help you verify an incident. Suggest possible next stages of investigation using external resources (for example, SIEM, network forensics, and directly reaching out to the user, or a managing director).
   - Conclude the investigation by prompting for feedback and leaving a comment.
7. Take action to address threats determined by the investigation of alerts. For more information, see Take Action on High-Risk User or Network Entity .

The following topics explain various ways to investigate alerts.



- Filter Alerts
- Investigate Events

- Manage Top Alerts
- View NetWitness UEBA Metrics in Health and Wellness

Filter Alerts

You can filter alerts displayed in the Alerts tab by entity type, severity, entity name, feedback, indicators, and date range.

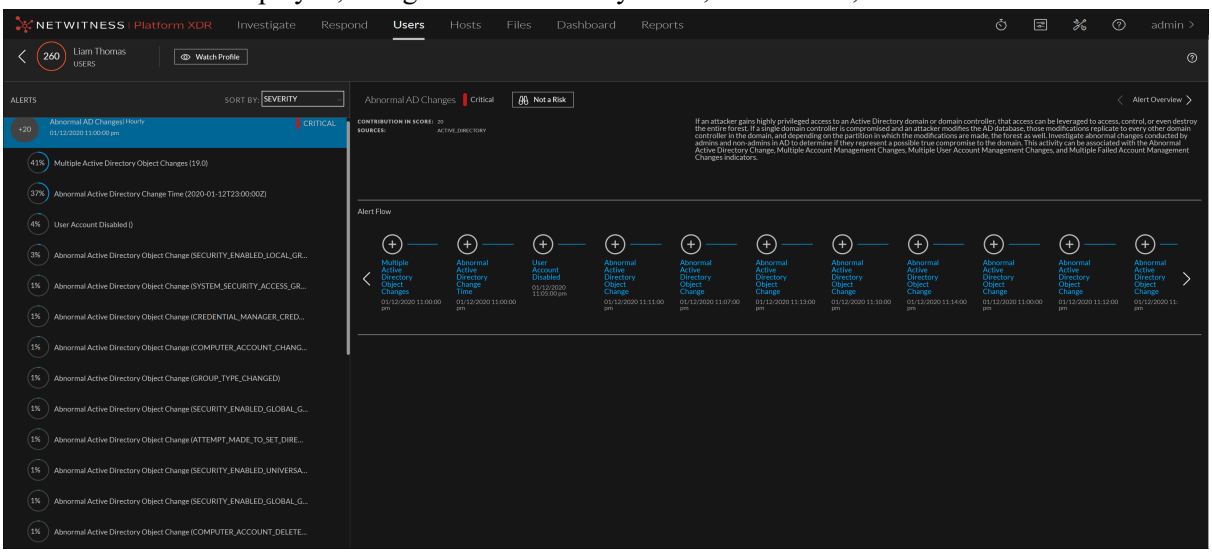
1. Go to **Users** > **Alerts**.
   The Alerts tab is displayed.

2. To filter by entity type, click the down arrow under **Entity Type**, and select any one option. The options are All Entities, Users, JA3, and SSL.
3. To filter by severity, click the down arrow under **Severity** in the **Alerts Filters** panel, and select any one option. The options are Critical, High, Medium, and Low.
4. To filter by entity name, enter the name under **Entity Name** text field. For example, Henry Harris.
5. To filter by feedback, click the down arrow under **Feedback**, and select any one option. The options are None, and Not a Risk.
6. To filter by indicators, click the down arrow under **Indicators**, and select any one option. For example, Multiple File Access Events (43 Alerts).
7. To filter by date range:
   - Click the down arrow under **Date Range** and select any one option. The Options are Last 24 Hours, Last 7 Days, Last 1 Month, and Last 3 Months.
   - Select **Custom Date** under **Date Range**. In the **Start Date**, select the start range date range, and in the **End Date** select the end range date that you want the investigate.

The alerts are displayed in the right panel according to the filter you selected. To reset filters, in the bottom of left panel, click **Reset**.

Investigate Events

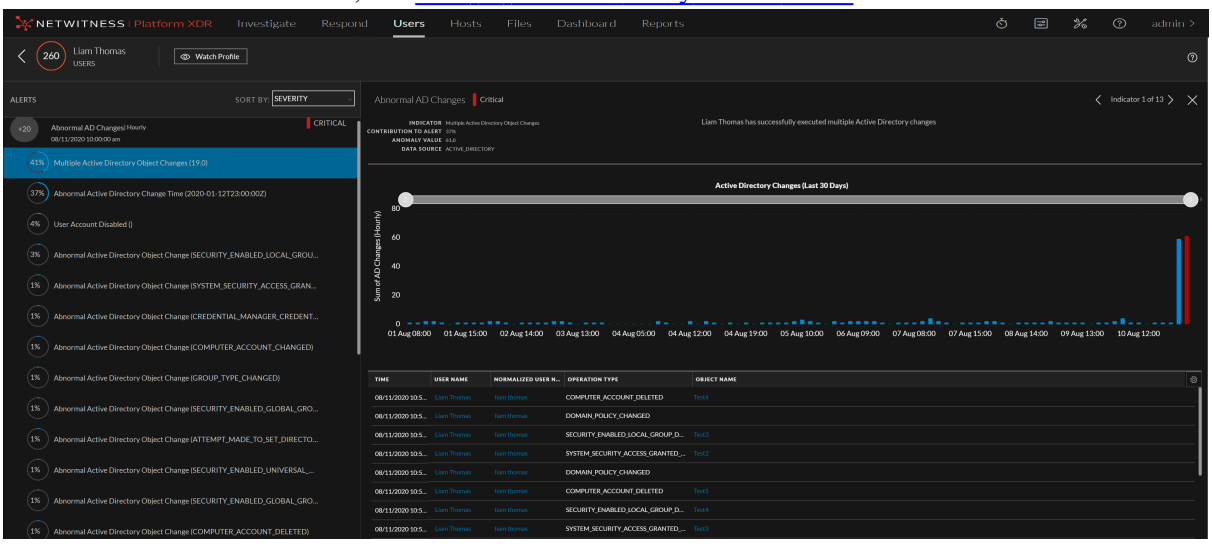
You can view all alerts and indicator associated with a user or network entity in the User Profile view.



In the events table, you can find all events contributed to the specific indicator for the specific user or network entity.

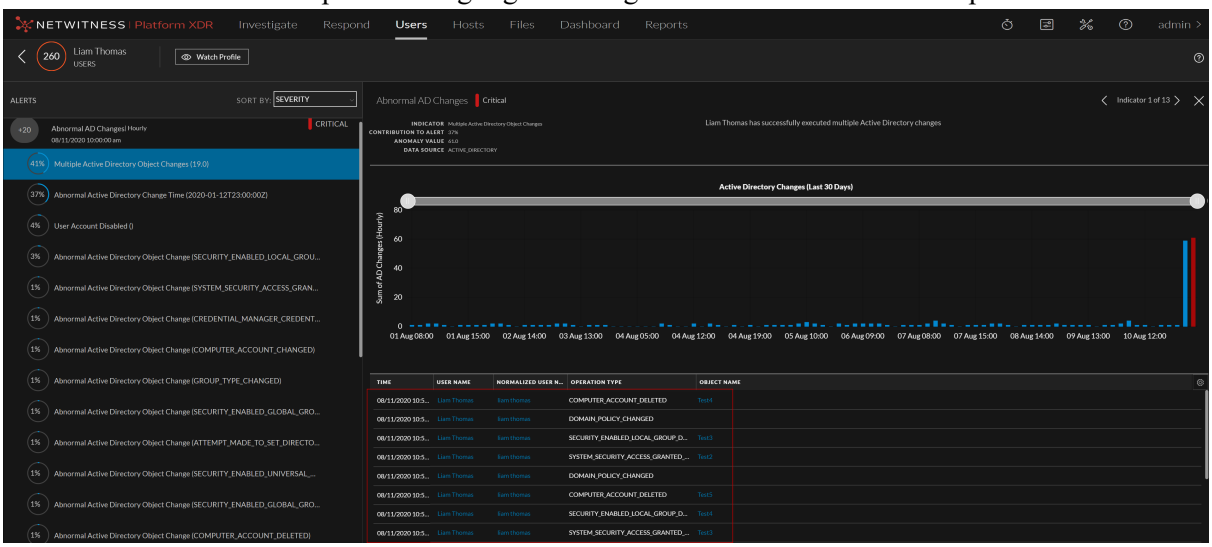
For example, you can further investigate on events by clicking on a username or a network entity that pivots to **Investigate** > **Events**. In the Events view, you can see the list of events that occurred on that day for the specific user or network entity. By default, the time range is set to one hour. You can change the time range.

In case of Endpoint Indicators, you can pivot to **Host Details** view and can have deeper insight about that host. And, pivot to **Analyze Process** view for detailed investigation on the process for that event for that week as the time range is set to seven days. By default, the time range is set to seven days however, it can be customized.



To view the events:

1. Go to **Users** > **Alerts**.
2. Under **Filters**, select the **Entity Type**.
   The indicators are displayed, along with the anomaly value, data source, and start time.



3. Click an alert name, and under **Alert Flow**, click the  icon.
   A graph is displayed that shows details about a specific indicator, including the timeline in which the anomaly occurred and the user associated with the indicator. The following figure shows an example of a graph. The type of graph can vary, depending on the type of analysis performed by NetWitness

UEBA. For more information, see User or Network Entity Profile View.

To pivot to the Events view:

1. Go to **Users** > **Alerts**, and select an alert or user or network entity.
   Indicators are displayed under the alert.
2. Select an indicator of interest.
   Values that can be used to pivot are highlighted in light blue at the bottom of the panel.

3. In the Events table, click the link highlighted in blue and pivot to the alert in the Events view.
   The Events view is displayed.
   For User events the username is a clickable pivot link. For JA3 and SSL Subject network entities events source IP, destination IP, destination country, destination organization, destination port, JA3 or SSL subject and source netname are the clickable pivot links.

For information about investigating items of interest in the Events view, see "Reconstructing and Analyzing Events" topic in the *NetWitness Investigate User Guide*.

To pivot to the Hosts Details view:

If you have NetWitness Endpoint installed, you can pivot to Hosts Details view for detailed information of the host.

1. Go to **Users** > **Alerts**, and select an alert or user or network entity.
   Indicators are displayed under the alert.
2. Select an indicator of interest.
   Details about the indicator are displayed in the right panel.
3. In the events table, click the events related to the host.
   The Host Details view is displayed.

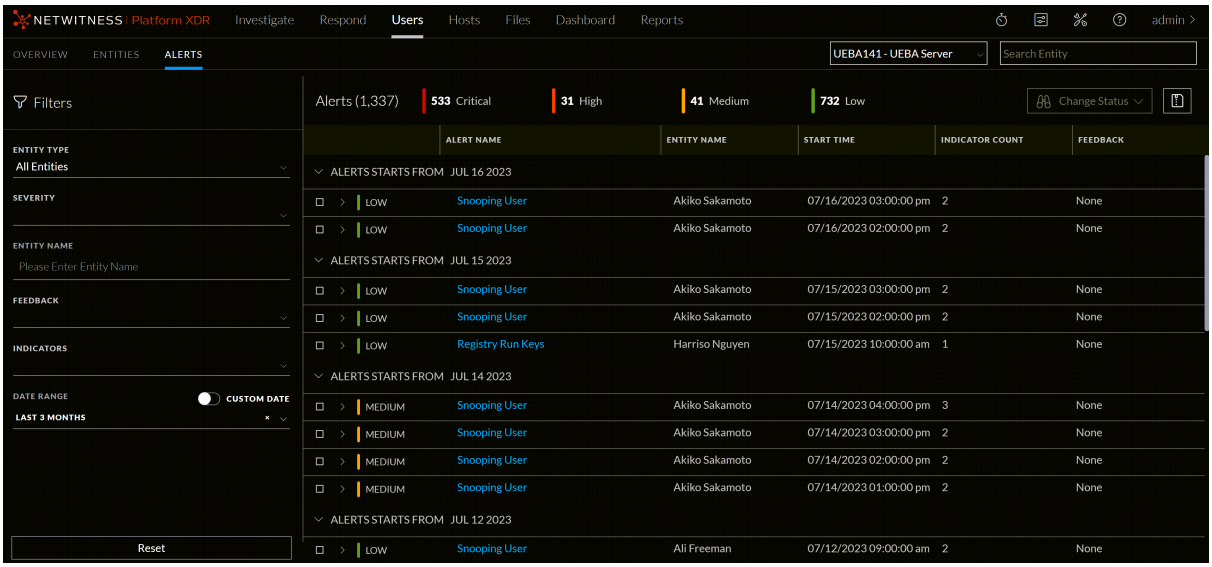
For information about investigating items of interest in the Hosts view, see "Investigating Hosts" topic in the *NetWitness Endpoint User Guide*.

To pivot to the Analyze Process view:

If you have NetWitness Endpoint installed, you can pivot to Analyze Process view for detailed information about the process.

1. Go to **Users** > **Alerts**, and select an alert or user or network entity.
2. Select an alert name. Indicators are displayed under the alert.
3. Select an indicator of interest.
   Details about the indicator are displayed in the right panel.
4. In the Events table, click the events related to the process.
   The Analyze process view is displayed.

For more information, see "Investigating a Process" topic in the *NetWitness Endpoint User Guide*.



For more information on how to read the indicator charts, see Reading an Indicator Chart topic.

Manage Top Alerts

You can export a list of all alerts to a .csv file format. You can use this information to compare the data from other sources in other data analysis tools like tableau, powerbi, and zeppelin.

To export alert data to a .csv file:

1. Go to **Users** > **Alerts**.
   The Alerts tab is displayed.

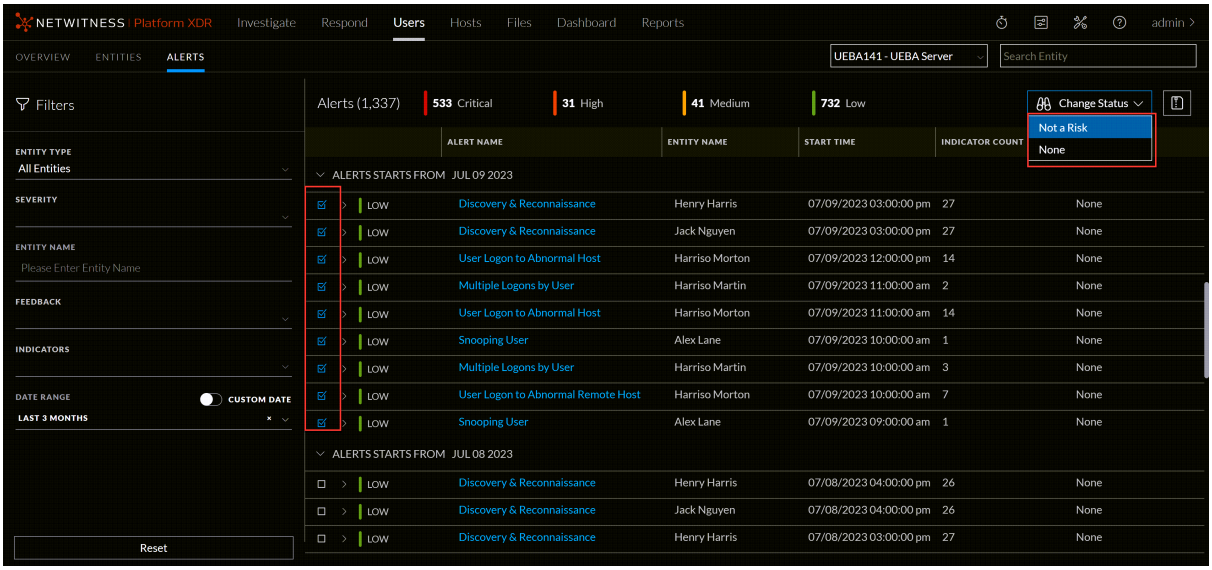
11	Multiple Logons by User	Matilda Robinson	Mar 05 20	6	Reviewed	No Feedback	Low

Set Alert Feedback Status



The analyst can mark alerts as **Not a Risk** or they can remove the **Not a Risk** feedback status by updating it to **None**. Also, multiple alerts grouped by date can be selected to perform this action.

To set an alert feedback status:

1. Go to **Users** > **Alerts**.
   The Alerts tab is displayed with a list of alerts.

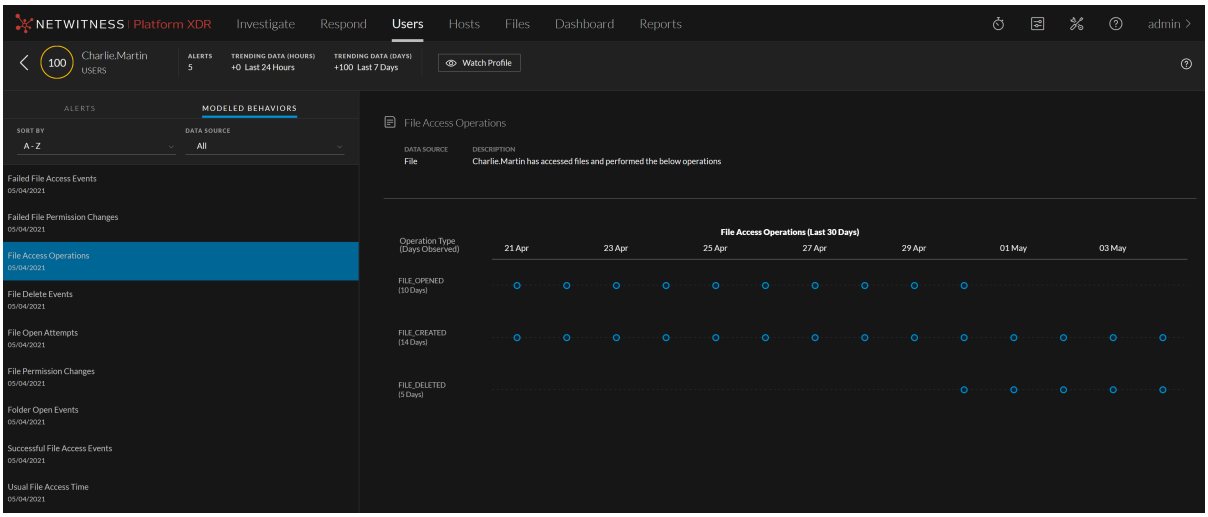
2. Select the checkbox and click Not a Risk to mark all the alerts as not risky.

A confirmation message is displayed to confirm the change.

3. Click **Update As Not as Risk**, to confirm the status or click **Cancel** if you don't want to continue with the update.

Note: All alerts that are marked as Not a Risk will not contribute to the entity's score.

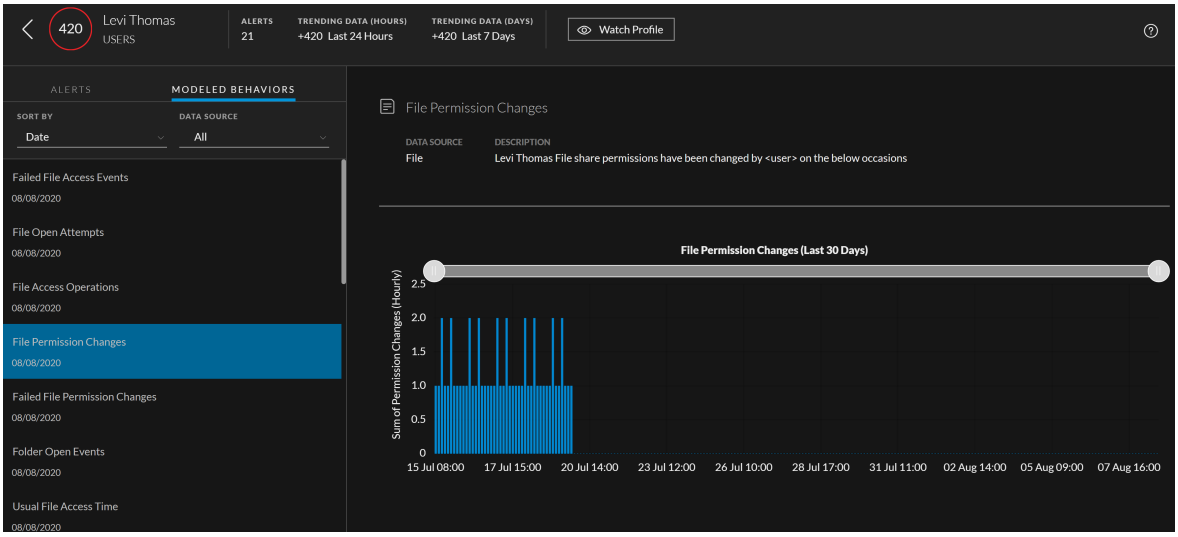
View Modeled Behaviors



(From 11.5.1 and later) NetWitness UEBA Modeled Behavior provides analysts with visibility into all the activities of a user. These modeled behaviors are based on the log data leveraged by UEBA and are available a day after the UEBA service is configured and running. UEBA monitors abnormal user behaviors to identify risky users and this requires data to be processed for a certain period of time. However, modeled behaviors reflect all the activities of the user within a day of the service configuration.

For example, if a user fails multiple times by logging in with incorrect credentials within an hour, analysts can view these behaviors as **Failed Authentications** for the user.

Note:
- Modeled Behaviors are not applicable to network entities.
- By default, the sorting and data source options are disabled when there is no data available.



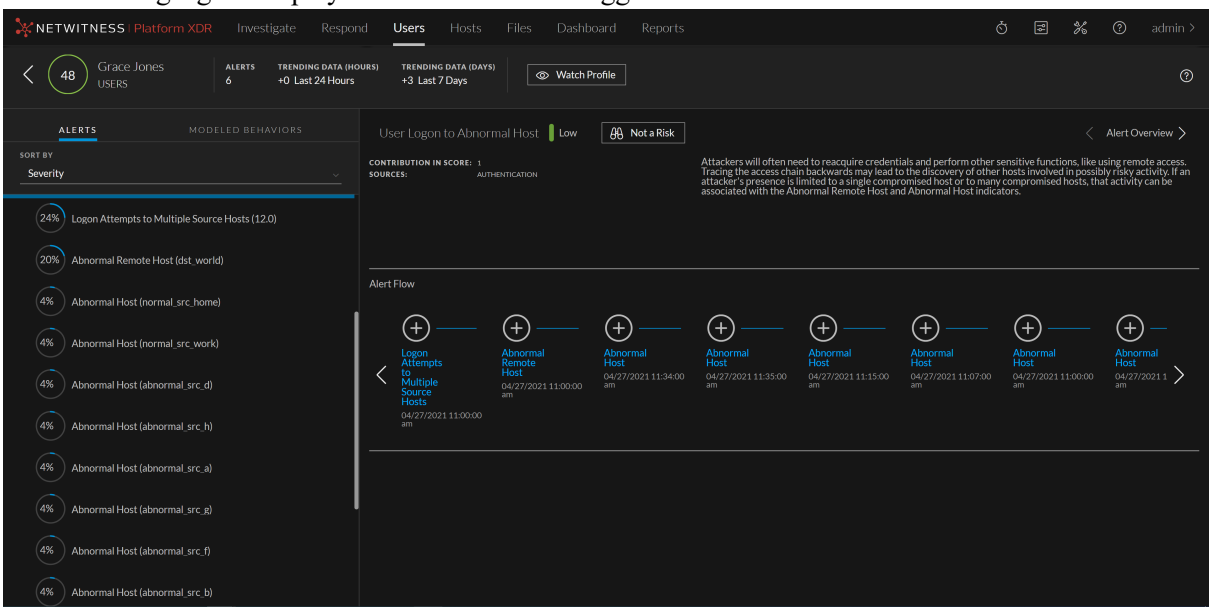
To view the Modeled Behaviors:

1. Log into NetWitness Platform and click **Users**.
2. Do one of the following:
   - In the **Overview** tab, under **Top Risky Users** panel, click on a username.
   - In the **Entities** tab, click on a username.
3. Click the **Modeled Behaviors** tab, to view the Modeled Behaviors highlighted with a blue line in the left panel. The results can be sorted by the date or in alphabetical order.

4. Select the data source from the drop-down according to your preference and filter the modeled behaviors:
   - Active Directory
   - File
   - Authentication

5. Based on the data source you provide, the following information is displayed on the right panel:
   - Data source name
   - Modeled Behavior description
   - A graph is displayed that contain details of a specific Modeled Behavior. You can view the modeled behaviors of a user for the last 30 days. The type of graph can vary, depending on the type of analysis performed by UEBA. The following figure is an example of a Modeled Behavior.

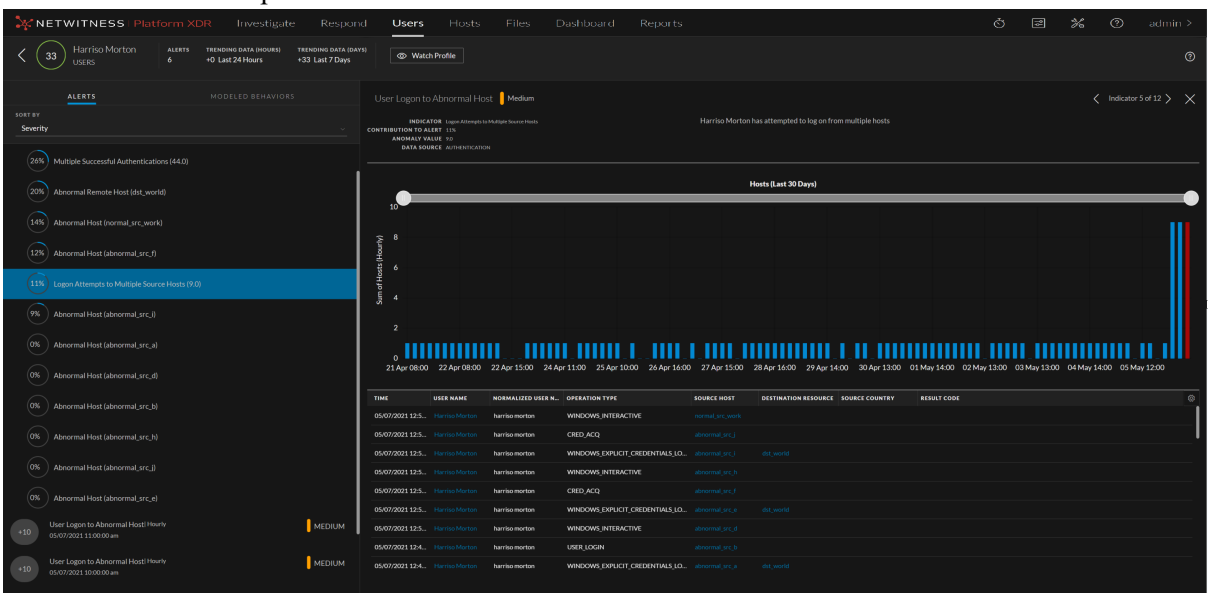
Reading an Indicator Chart



Note: In version 11.6 and later, the pie chart was replaced by the dotted chart.

An indicator chart is a pictorial illustration of the anomaly and baseline values of an entity that you want to further investigate.

The chart gives the Analyst a better insight of the indicator which in turn will help determine the next steps. The chart provides the analyst with the user's baseline values over time to better understand the context of the anomaly.

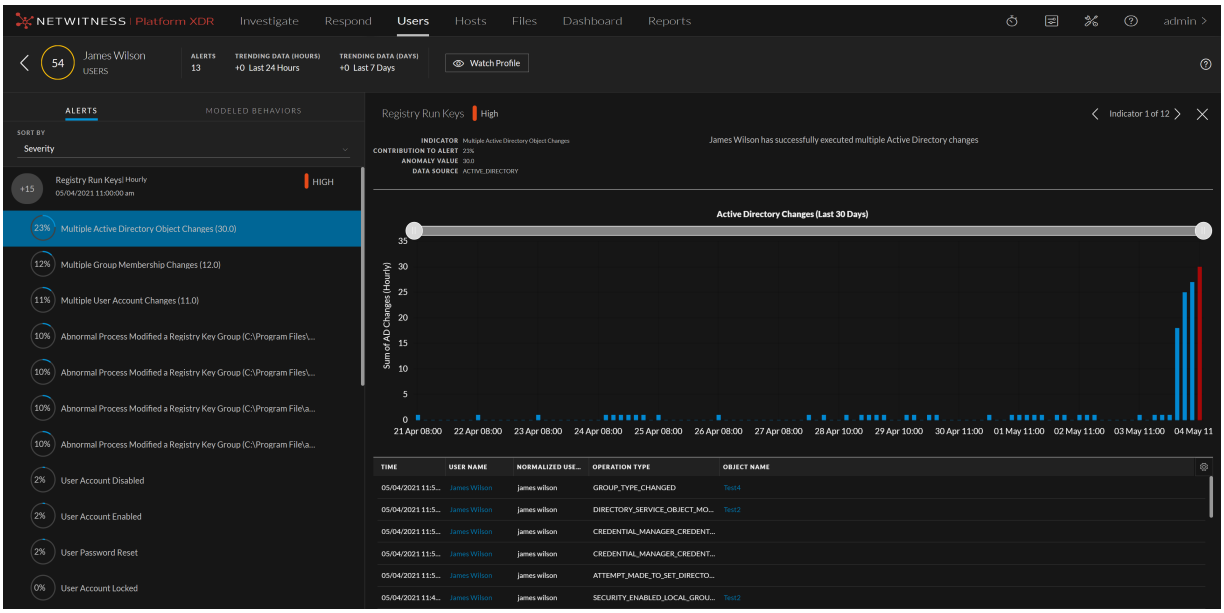


To view an indicator chart,

1. Log in to NetWitness Platform.
2. Navigate to **Users** > **Entities**.
3. Select the user you want to investigate.
   The following figure displays an alert for a user logged on to an abnormal host.

4. In the Alert Flow section, select the Logon Attempts to Multiple Source Hosts.

5. Click the + icon to expand and view the details.

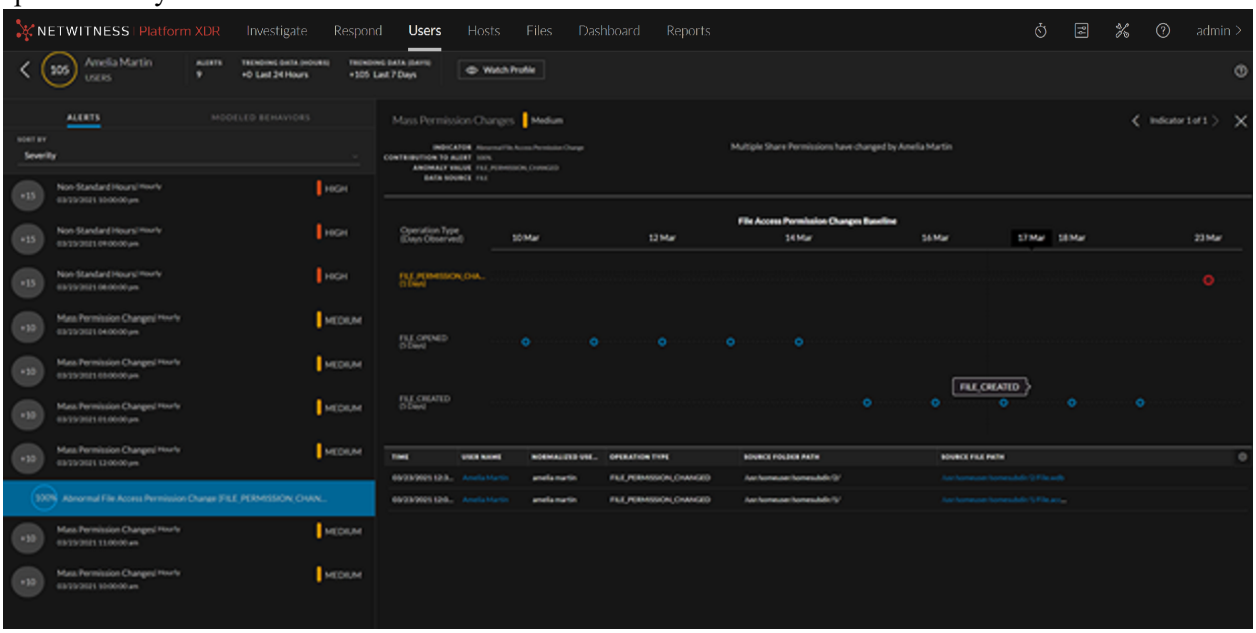


Types of Charts

There are three main types of charts currently available.

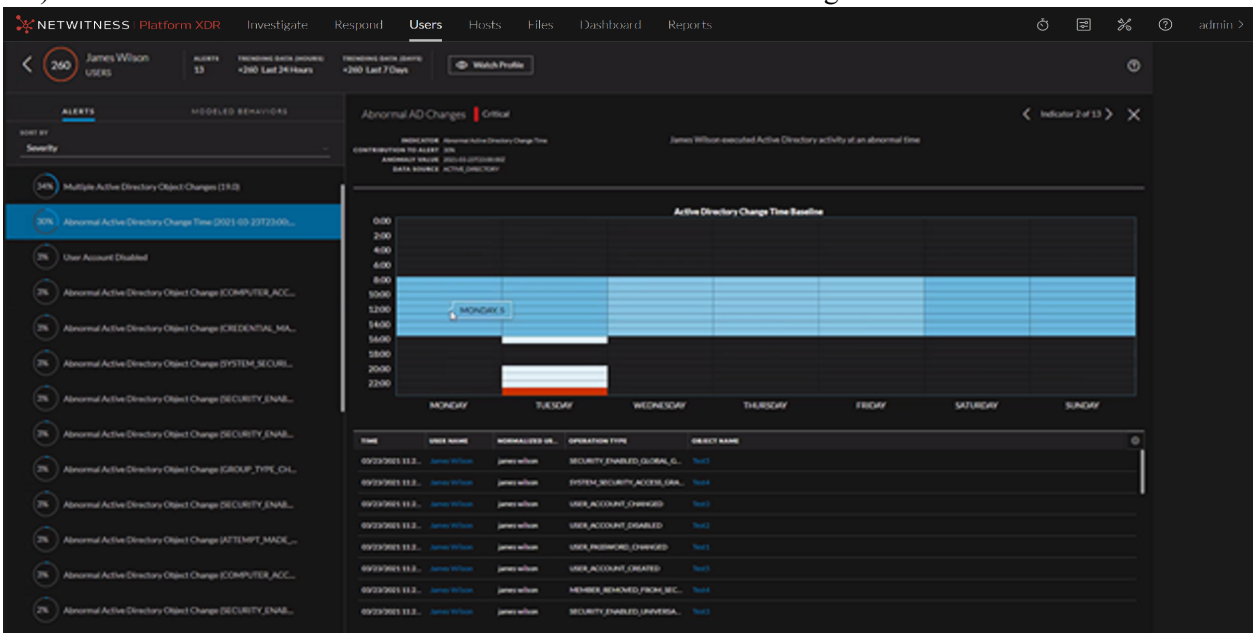
Continuous Bar Chart

In this type of an indicator chart, the bar color differentiates the behavior by displaying a blue bar and a red bar. For example, the following figure displays in a span of 30-days the number of Active Directory changes made on a daily basis which are displayed by blue bars and indicates the baseline behavior.



The red bar indicates that the user has accessed a high number of files in a specific hour.

Another variation in the visualization of the chart is where you see an additional series of grey bars that represents the baseline values of the model. In this case, if the blue bars series is displayed, it depicts the specific entity trend that the anomaly is also a part of.



Dotted Chart

In the dotted indicator chart, the anomaly is displayed on top of the graph indicated by yellow color text and red color circle. The chart provides the analyst with the user's baseline values over time to better understand the context of the anomaly. The additional values (apart from the anomaly value) depicted in the Y-axis, represent the baseline values and the total number of days they were observed for this specific entity.

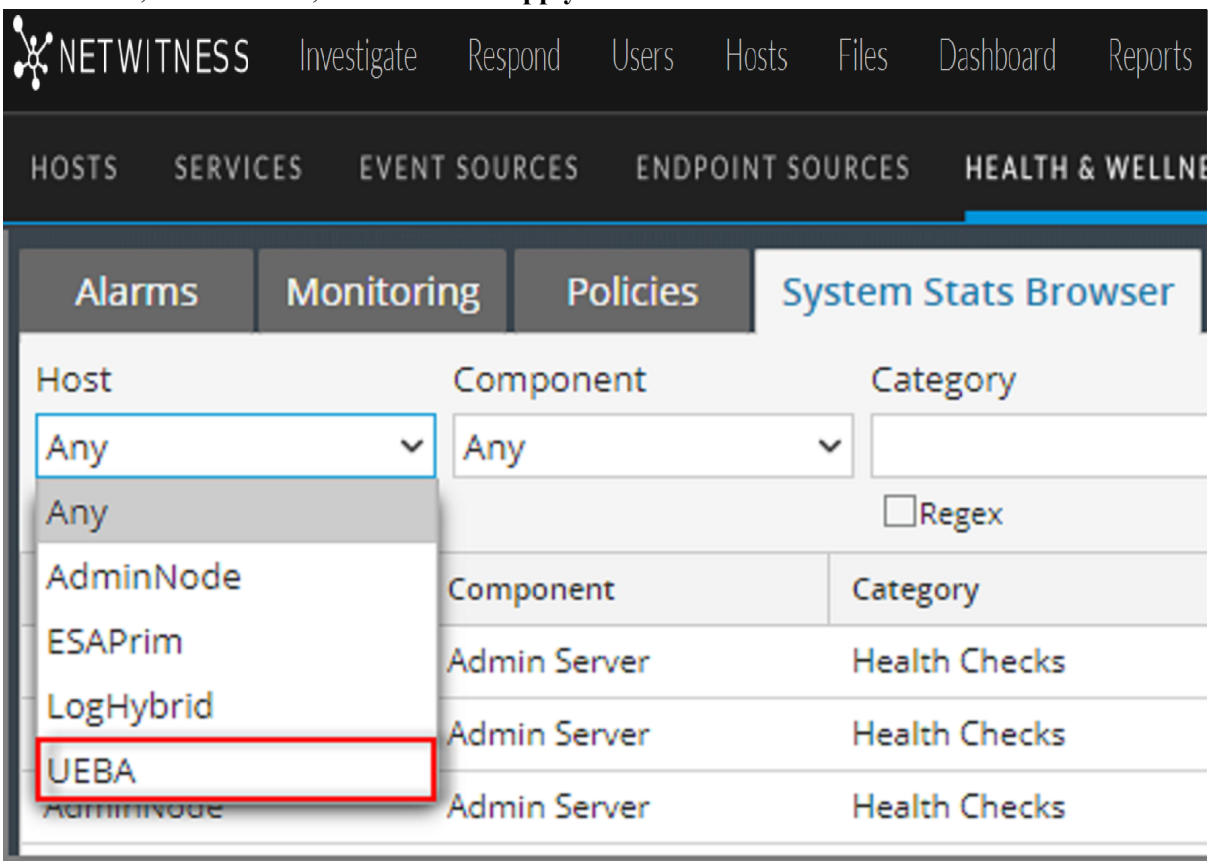
Time Chart

The time indicator chart displays the time the user has accessed a particular information. For example, in the following figure, the user has accessed Active Directory at an abnormal time over the past 30 days. The regular working hours of the user are the baseline values and the anomaly value (the hour marked in red) indicates that this is an abnormal time for this user to make changes in AD.

View NetWitness UEBA Metrics in Health and Wellness

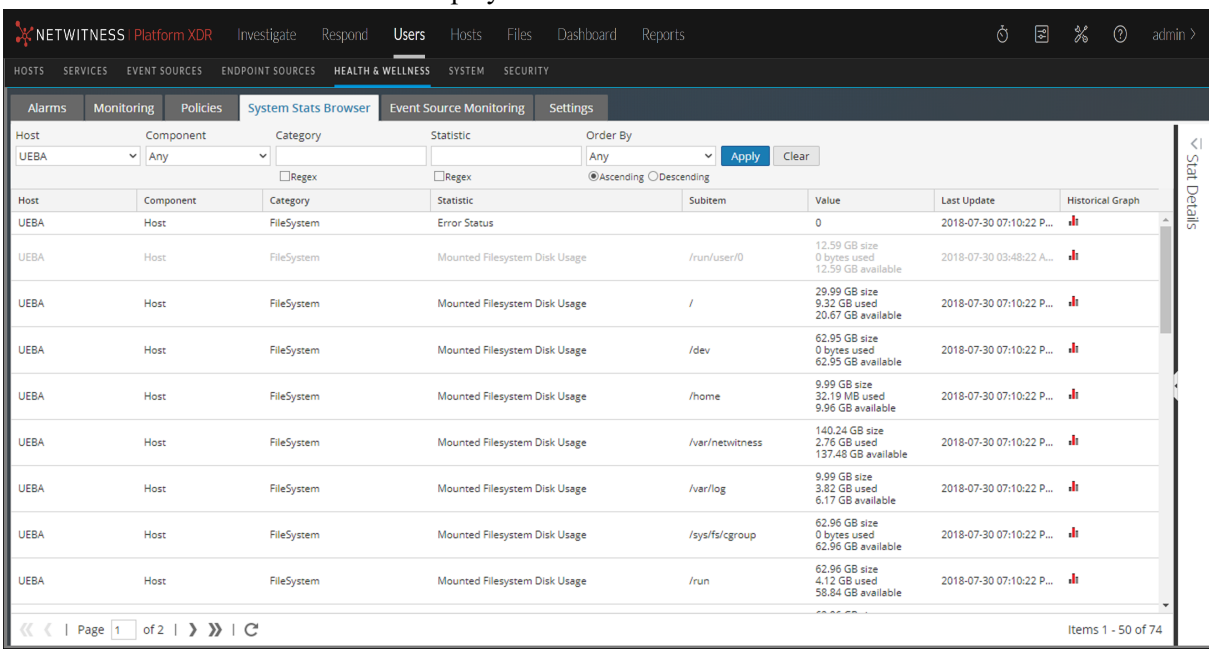
NetWitness UEBA sends metrics to the System Stats Browser tab in  **(Admin)** > **Health and Wellness**. Along with basic system usage information, metrics that are specific to NetWitness UEBA users, alerts, and events are provided.

Analysts can use these metrics in the following ways:



- Confirm that the currently procured license is in compliance with their license agreements, and by how much per day.
- Determine if the system is functioning as required.
- Actively monitor new events.
- Monitor the creation of new indicators and alerts.

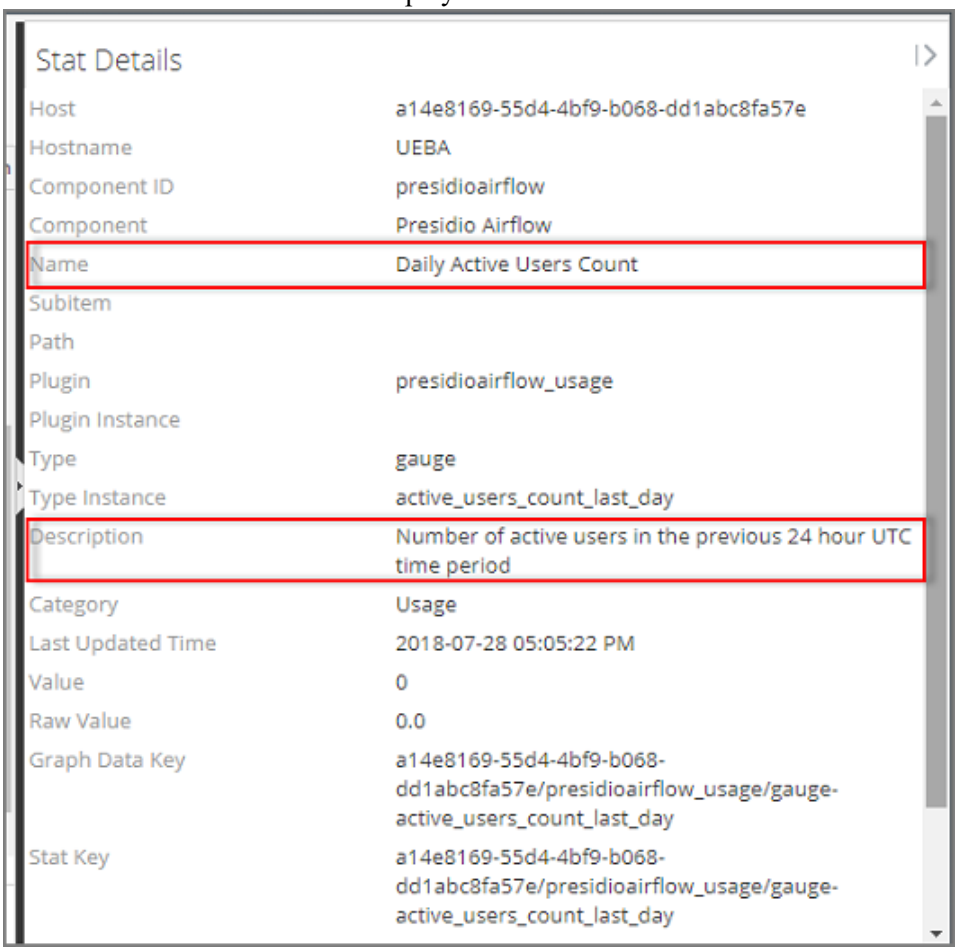
If these critical metrics are reported as "0", it may indicate a system malfunction.



To view NetWitness UEBA metrics in the System Stats Browser in Health and Wellness:

1. Go to  **(Admin)** > **Health & Wellness**.
2. Click the **System Stats Browser** tab.
   The System Stats Browser is displayed.

3. Under Host, select **UEBA**, and then click **Apply**.



Results for NetWitness UEBA are displayed.

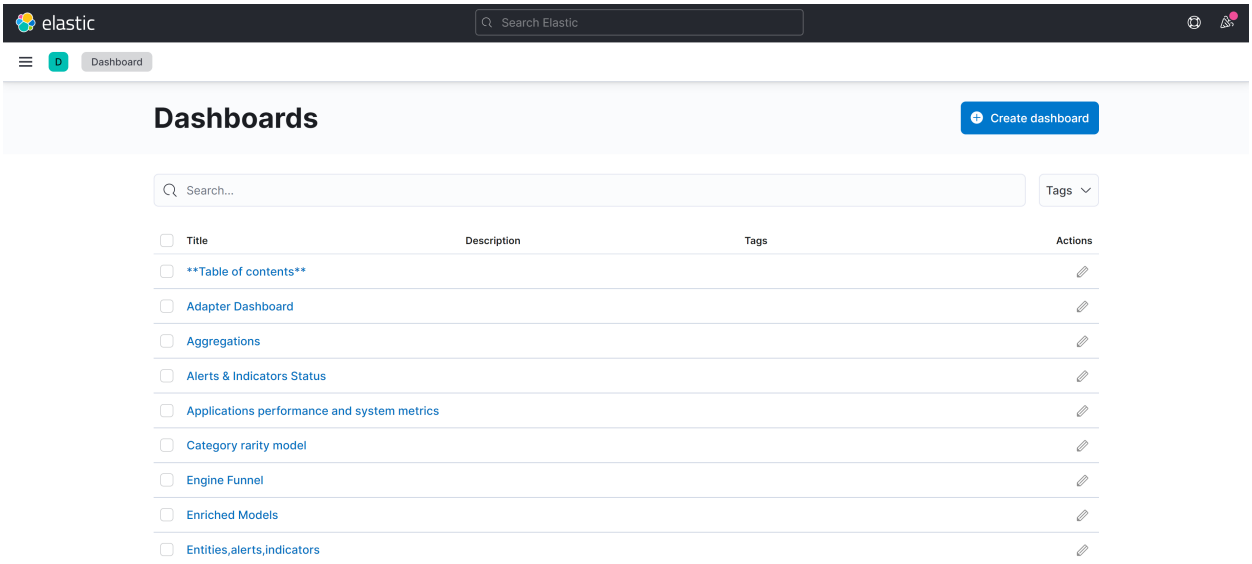
4. To view details for a statistic, click **Stat Details**.

The details of the statistics are displayed.

The **Name** and **Description** fields provide a summary of the metrics that are displayed.

For more information about Health and Wellness and System Stats Browser tab, see "Monitor System Statistics" topic in the *System Maintenance Guide*.

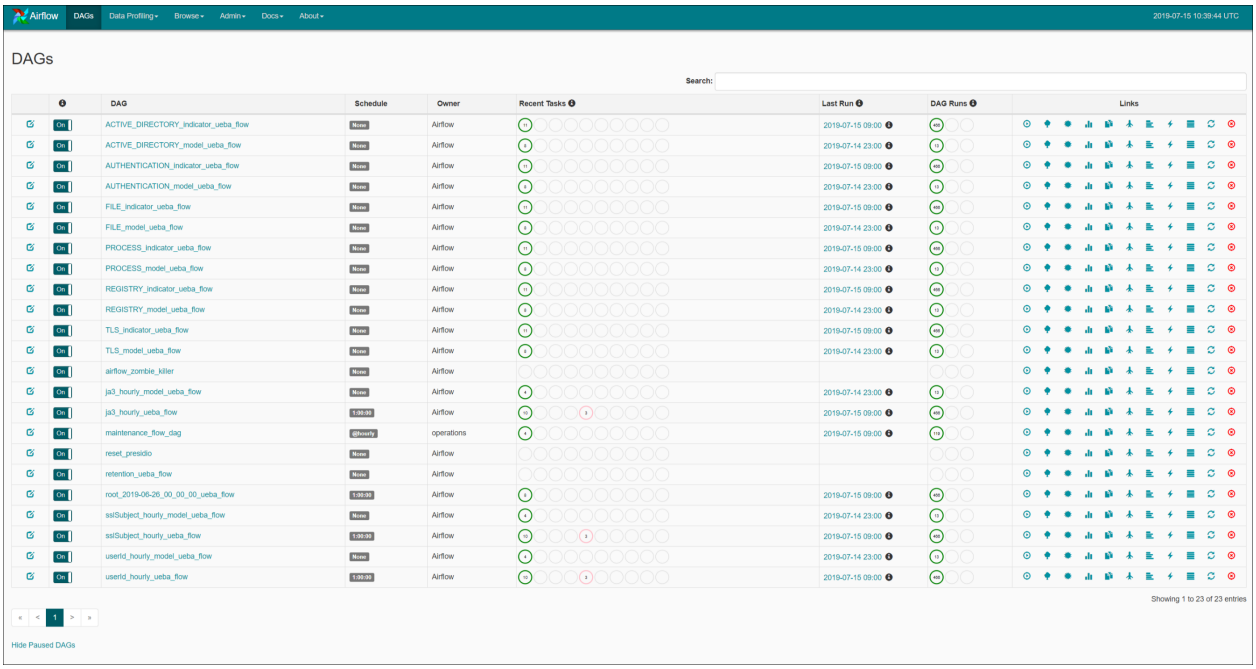
Monitor Health and Wellness of UEBA



You can view the status of UEBA host in the **Users** > **OVERVIEW** tab.

The UEBA system should generate at least one alert weekly. If the system stops generating the alerts for a period of seven days or more, advanced monitoring is required to monitor statistics about the total number of events versus successful events, total number of alerts generated, and so on.

Advanced monitoring is enabled through a third-party tools prepackaged in NetWitness: Kibana and Airflow.



Access Kibana

To access kibana, go to `https://<UEBA_host>/kibana/app/kibana#/`, enter user name and password and the Dashboard is displayed.

Access Airflow

To access Airflow, go to `https://<UEBA_host>/admin/`, enter user name and password and the DAGs view is displayed.

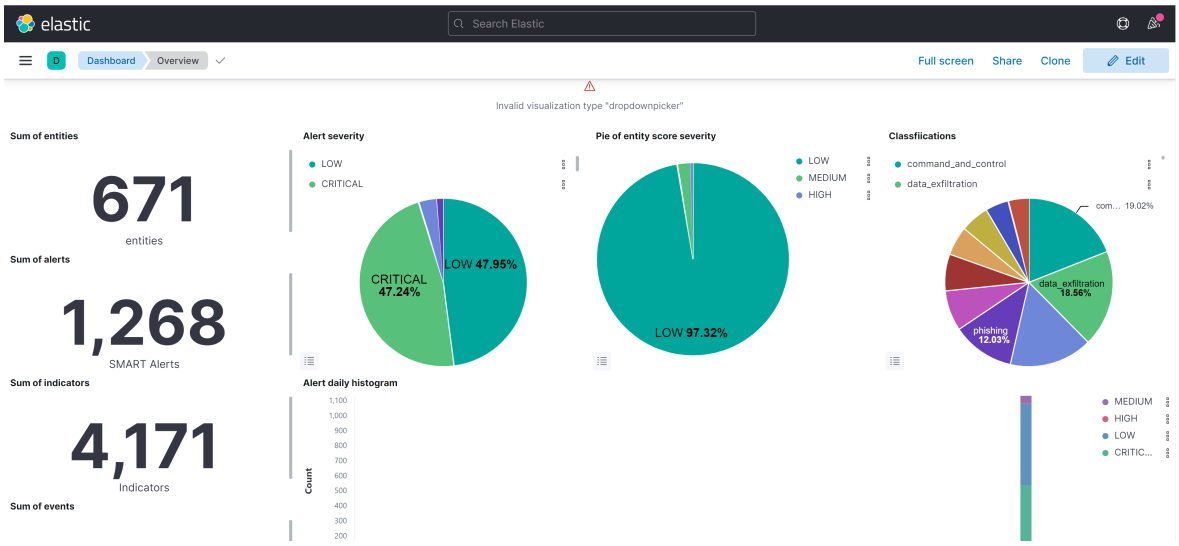
Note: The Kibana and Airflow web server user interface password is the same as the deploy_admin password. Make sure that you record this password and store it in a safe location.

Kibana

Kibana is an open source analytics and visualization platform. You can monitor the health of UEBA through various dashboards:

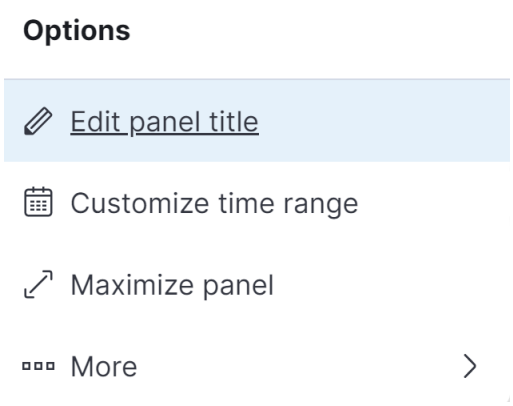
Overview Dashboard

The Overview dashboard provides the statistics over the analytics about the users, entities, alerts, and indicators, such as:

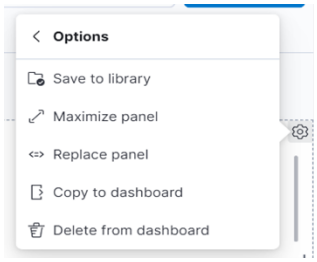


- The alerts type that are generated, and the alert severity distribution with the severity types (Low, Medium, High, Critical).
- Total number of active entities and how many alerts are generated for those entities.
- The number of indicators and events processed.
- The pie chart for entity score severity and distribution for the alerts classification.
- Alert daily histogram, which is the total number of alert per each severity triggered over time.

Configure Select Entity Type drop-down Filter



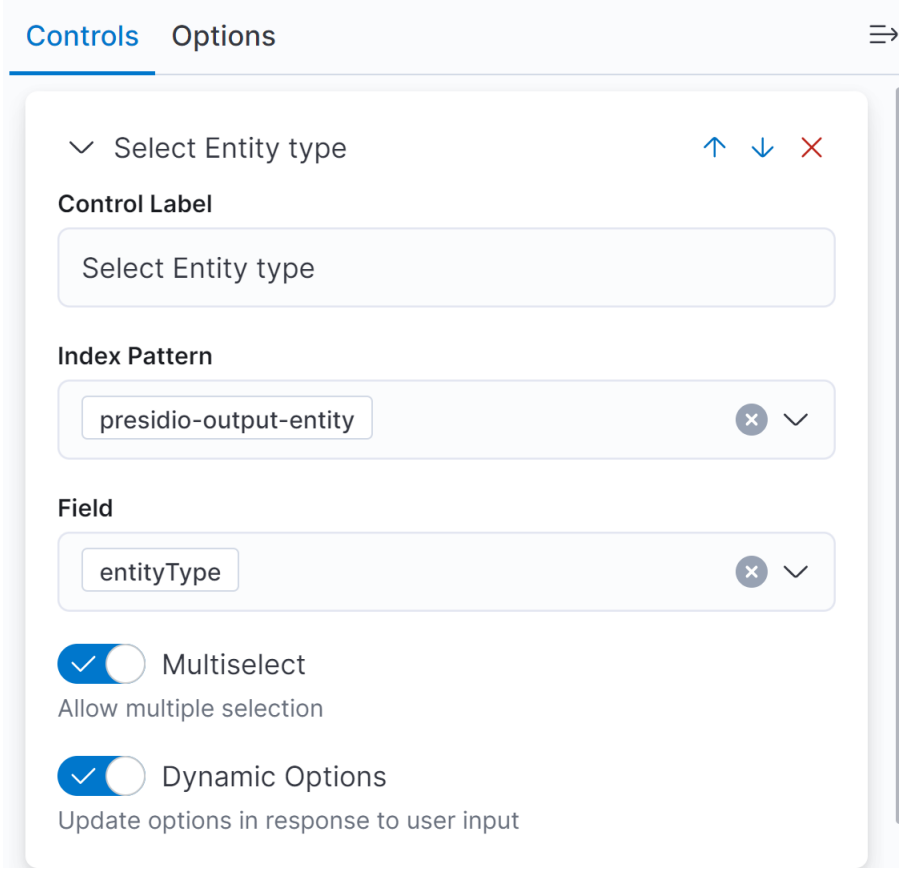
You can view the data for a specific entity after configuring and applying the **Select Entity Type** drop-down filter in **Kibana Dashboard** > **Overview**.



To configure Select Entity Type drop-down Filter:

1. Remove **Invalid visualization type "dropdownpicker"** panel. Do the following.
   - Go to Kibana, click **Dashboards** > **Overview**.

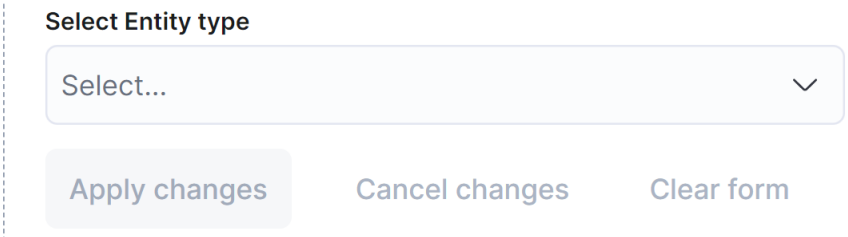
   - Click **Edit** and then click  on the **Invalid visualization type "dropdownpicker"** panel.
   - Click **More** > **Delete from dashboard** > **Save**.



2. Go to Kibana, click **Dashboards** > **Alerts & Indicators Status**.

   The **Alerts & Indicators Status** dashboard is displayed.

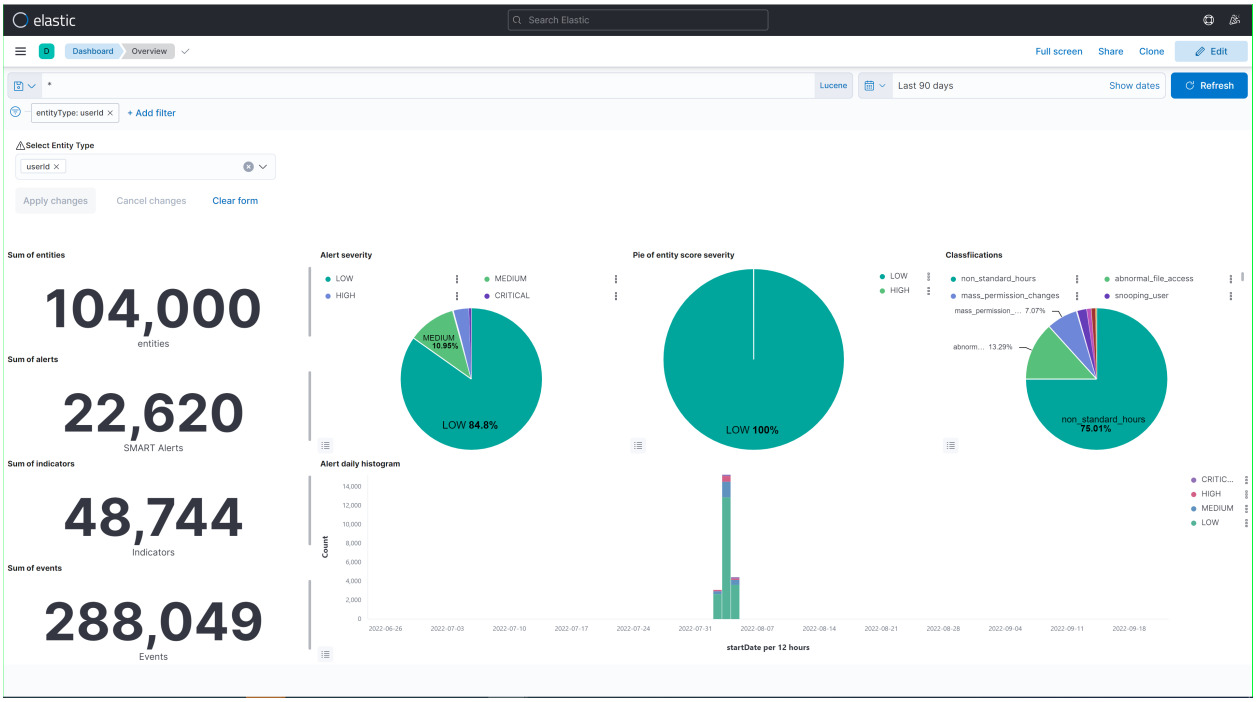
3. Click **Edit** > **All types** > **Controls** > **Options List** > 



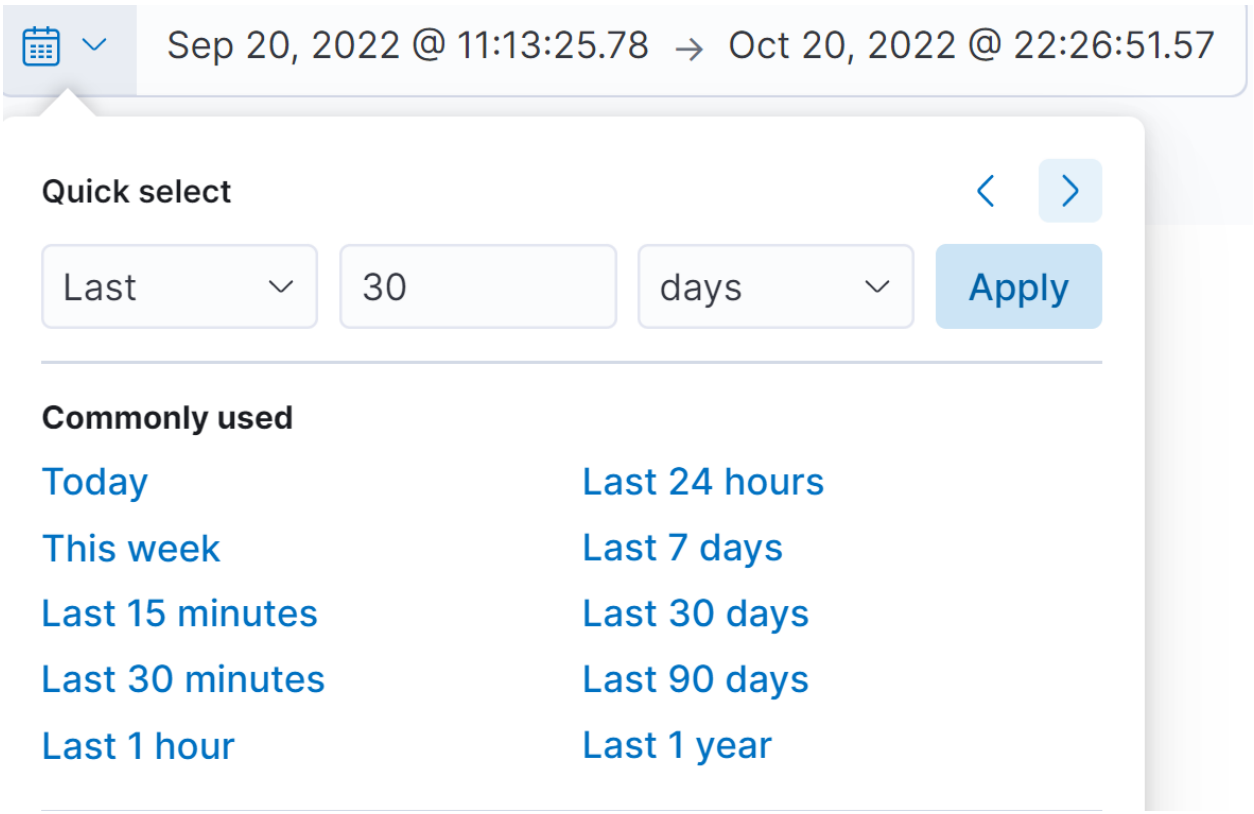
.
4. Enter **Select Entity Type** in the **Control Label** field.
5. Select **presidio-output-entity** option in the **Index Pattern** field.
6. Select **entityType** from the **Field** drop-down list.

7. Click **Update**.
8. Click **Save and return**.

9. The newly configured **Select Entity Type** drop-down panel is displayed at the bottom of the **Dashboard** > **Editing Alerts and Indicators Status** view. Drag and drop the panel to the top of the page. You can also maximize the panel.



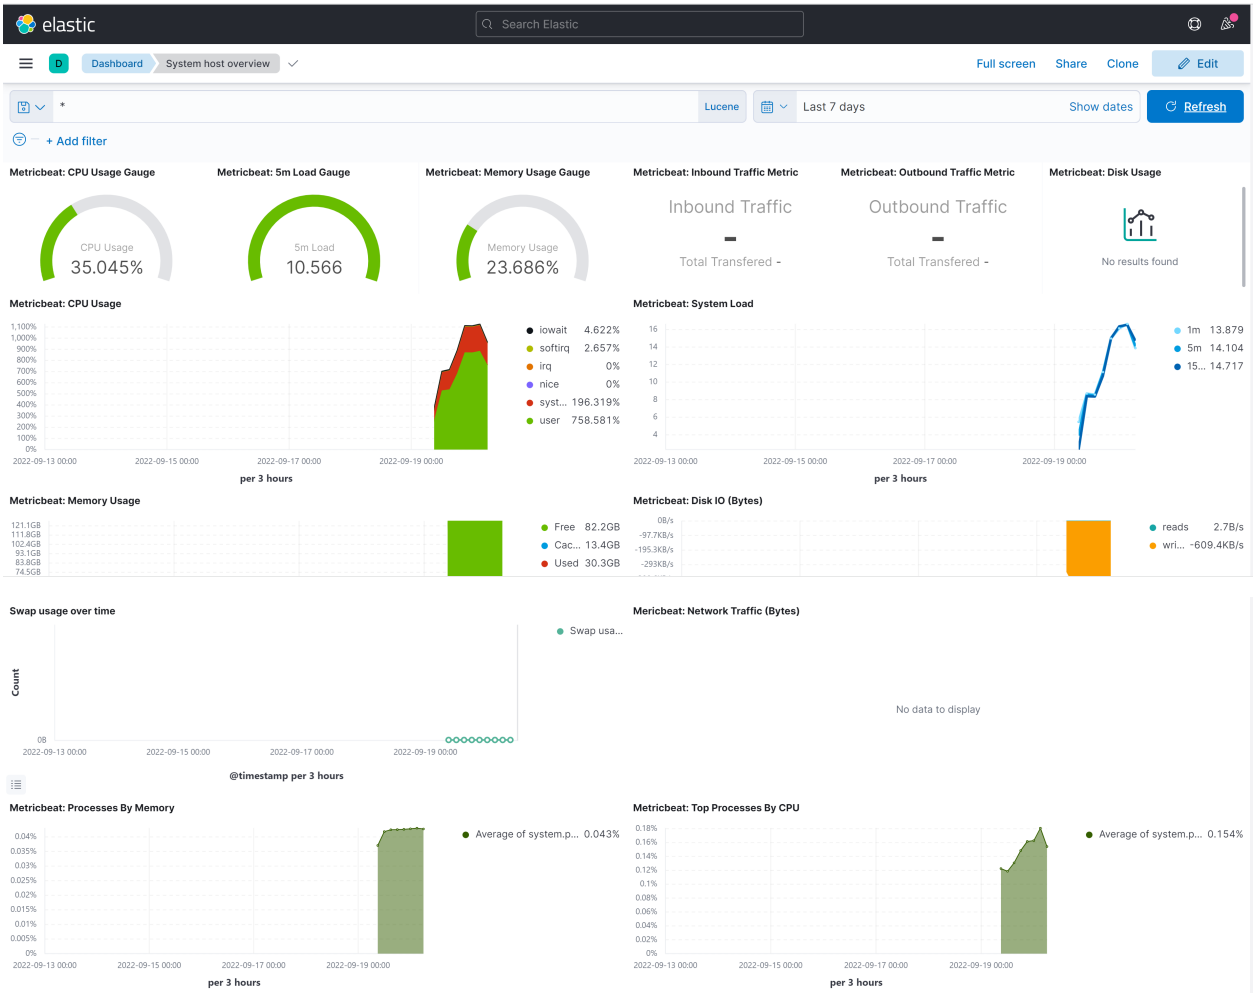
10. Click **Save**.
11. Click **Switch to view mode**.



To access the overview dashboard:

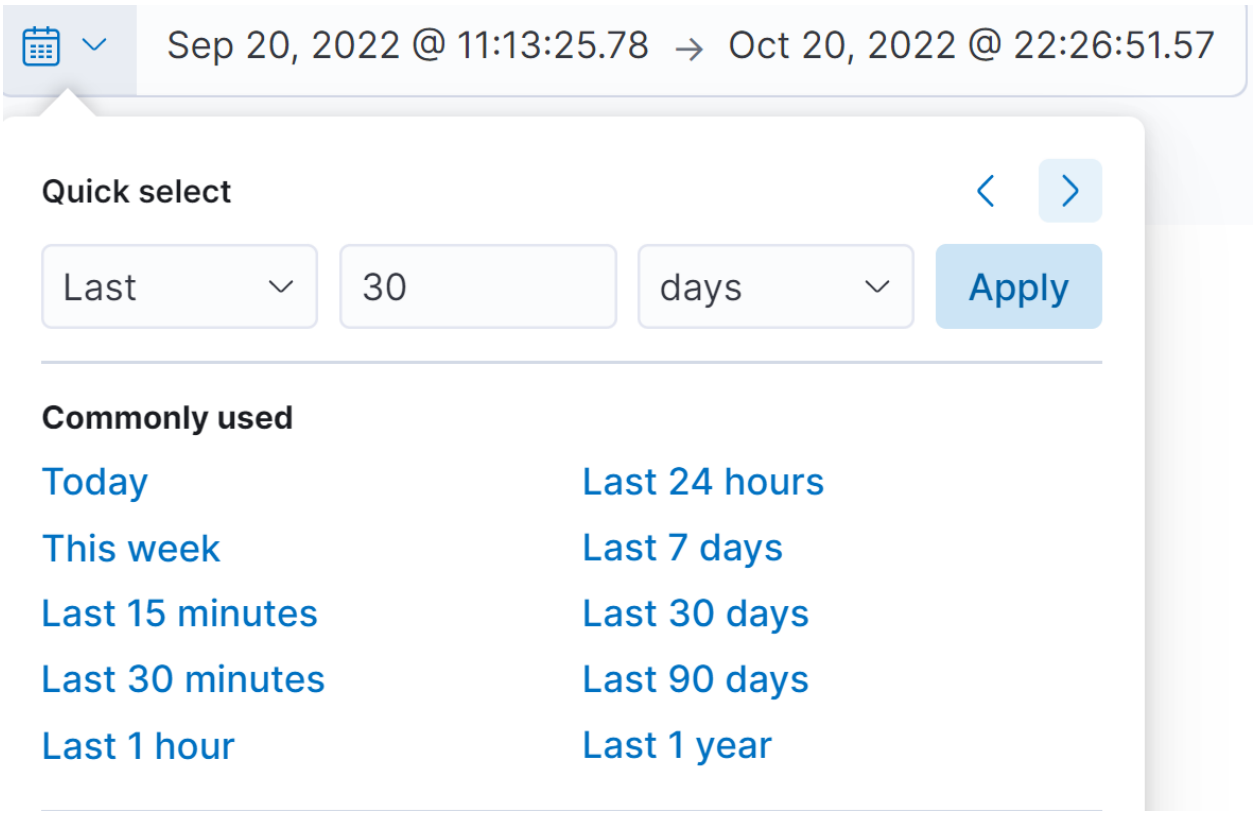
1. Go to Kibana, click **Dashboards** > **Overview**.
   The **Overview** dashboard is displayed with the aggregate results for all entities.

2. To view the data for a specific entity, select a value from the **Select Entity Type** drop-down. For example, ja3, sslSubject, or userid.
3. Adjust the time range on the top-right corner of the page based on your requirement to view the statistics.



System Host overview

The **System Host overview** dashboard monitors the performance and health of UEBA hosts, such as:



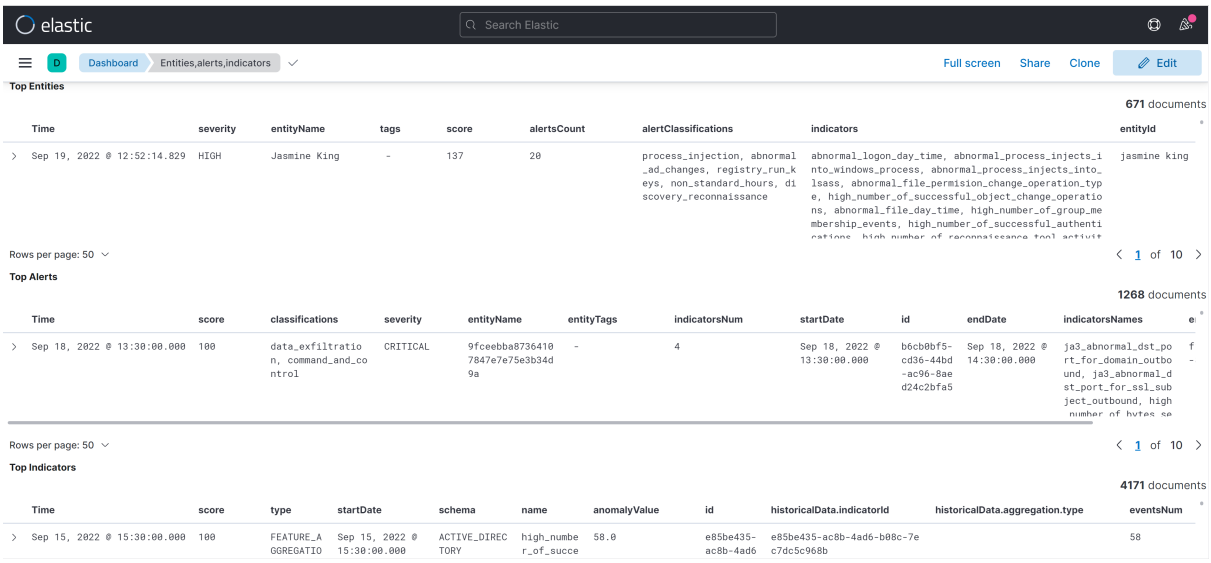
- CPU usage.
- Memory consumption, and network.
- Process consuming CPU and Memory, for example MongoDB.
- Statistics over the disk usage.
- Inbound data is the amount of data transferred by user to view the UEBA UI.
- Outbound data is the amount of data fetched by UEBA from Broker or Concentrator.

To access System Host overview dashboard

1. Go to Kibana, click **Dashboards** > **System host overview**.
   The **System host overview** dashboard is displayed.

2. Adjust the time range on the top-right corner of the page based on your requirement to view the statistics.

Note: During historical load, the system works in high parallelism. Due to that IO, CPU, and Memory is in high utilization. The pace would be 30 logical days four wall clock time. Once the UEBA server is online, the resource utilization reduces.

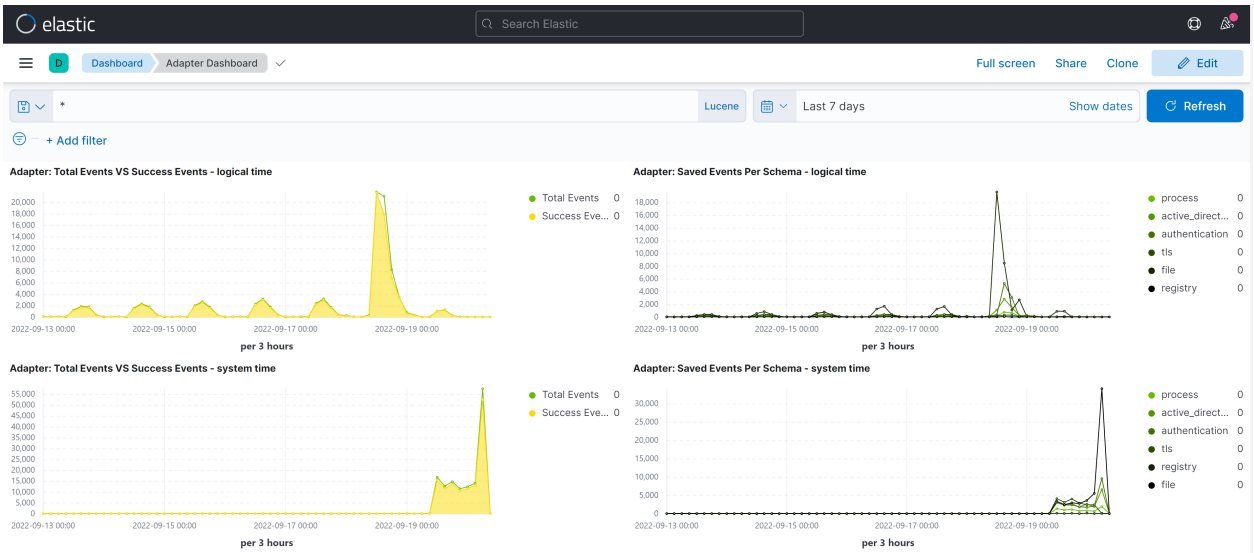


Adapter Dashboard

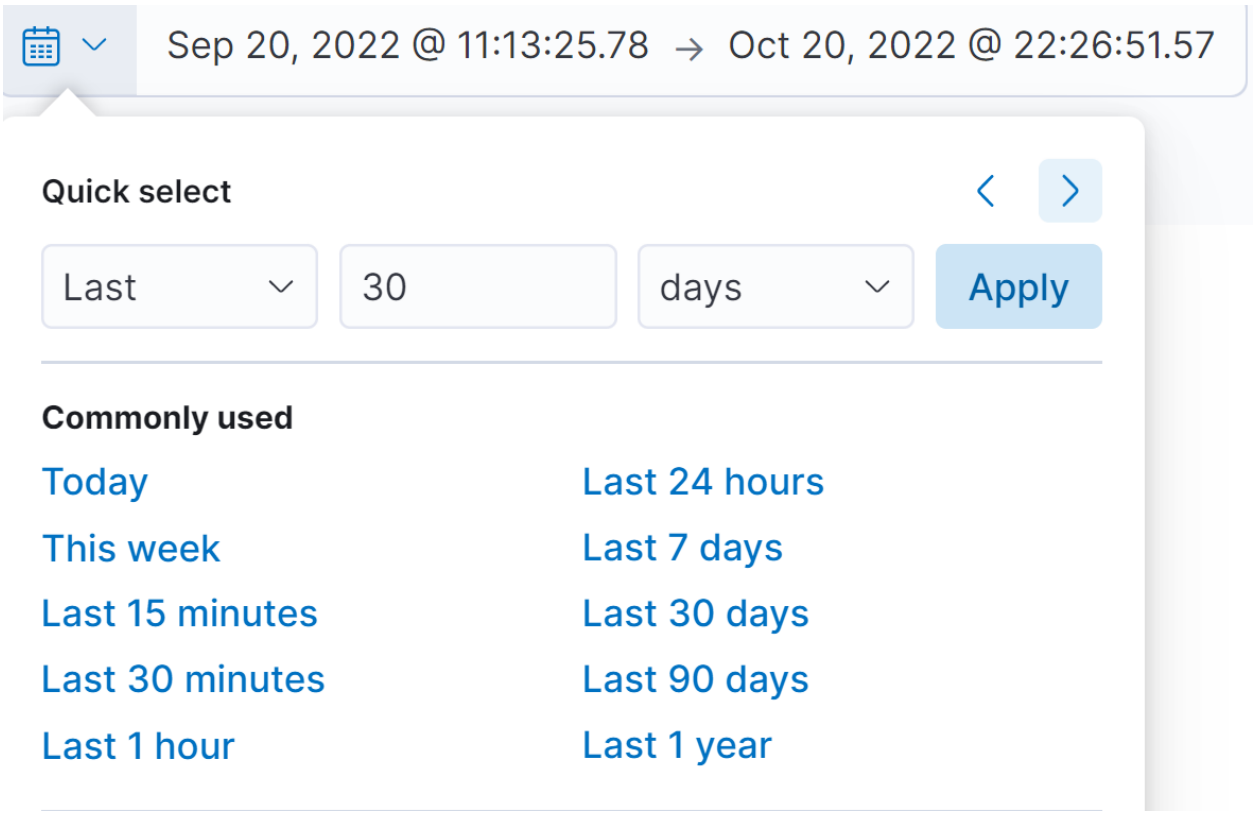
The **Adapter** dashboard is used to monitor the following:

- The failed events distribution.
- Total number of events versus successful events.
- Saved events per schema.

To access the entities, alerts and indicators:



1. Go to Kibana, click **Dashboards** > **Entities,alerts,indicators**.
   The **Entities,alerts,indicators** Dashboard is displayed with an aggregate data for all entities.

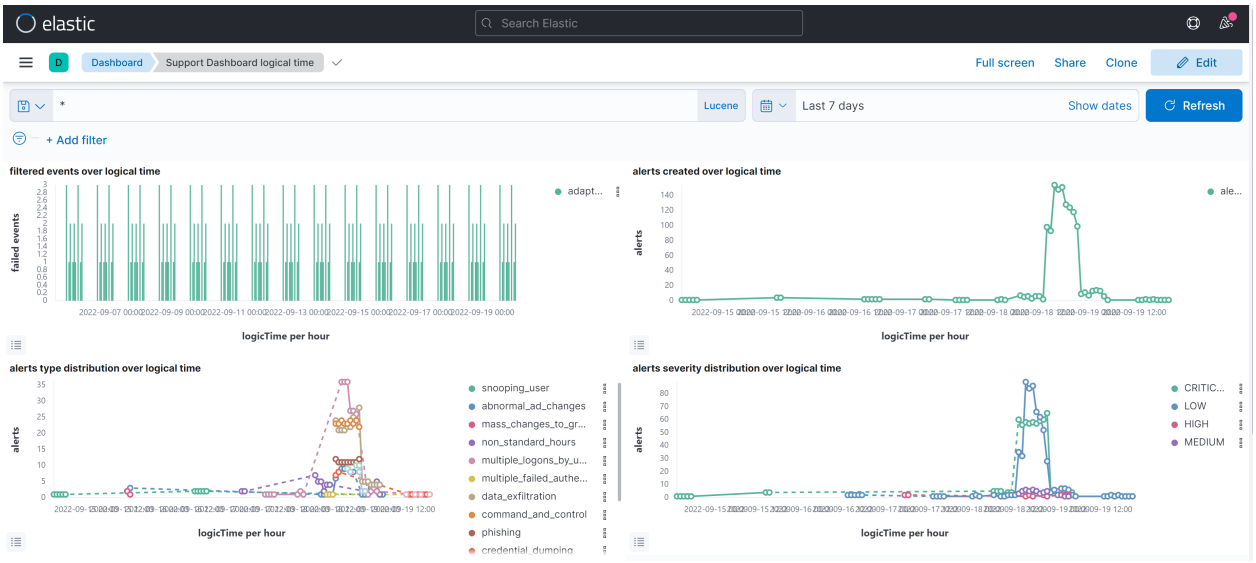


2. To view the data for a specific entity, select a value from the **Select Entity Type** drop-down. For example, ja3, sslSubject, or userid.

To access the adapter dashboard system Time:

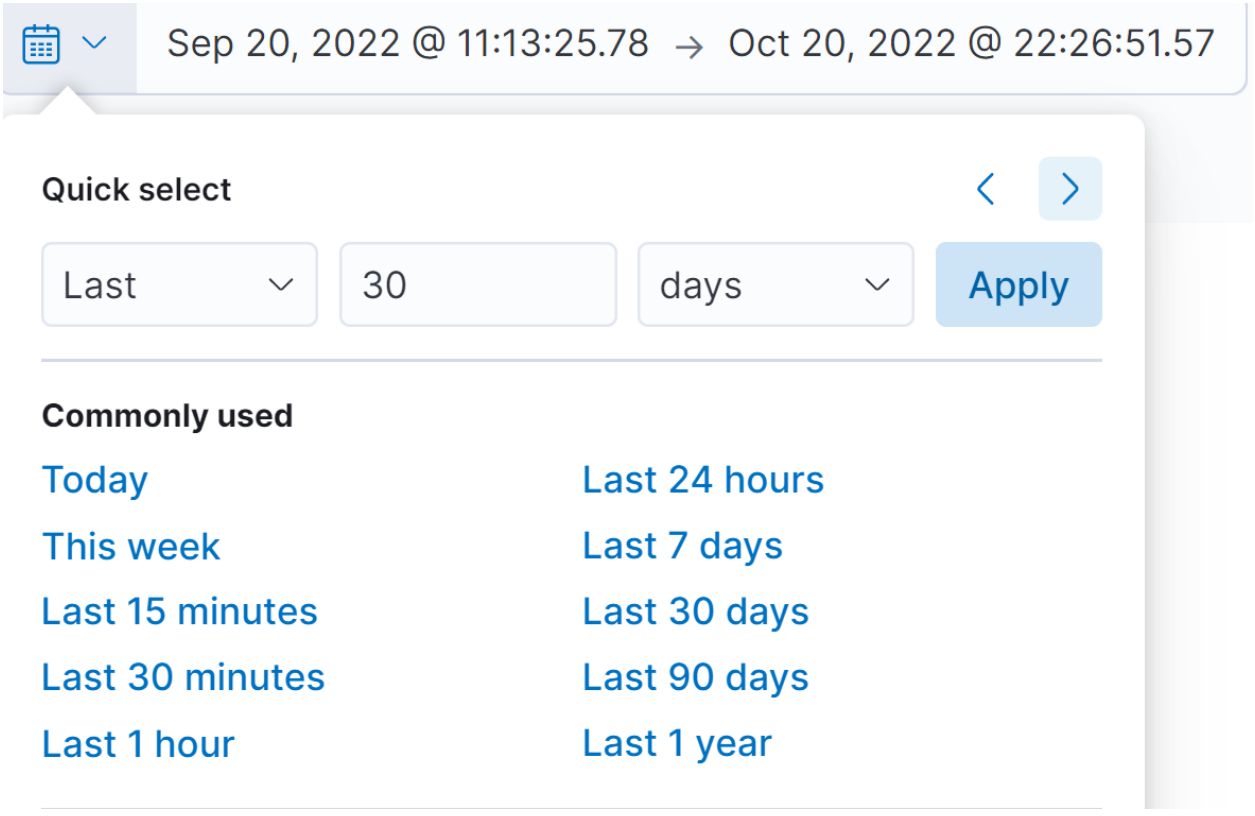
1. Go to Kibana, click **Dashboards** > **Adapter**.
   The **Adapter Dashboard** is displayed.

2. Adjust the time range on the top-right corner of the page based on your requirement to view the statistics.



Support Dashboard Logical Time

The **Support Dashboard Logical Time** provides the capability to detect events processed time, which is different from the system time, such as:

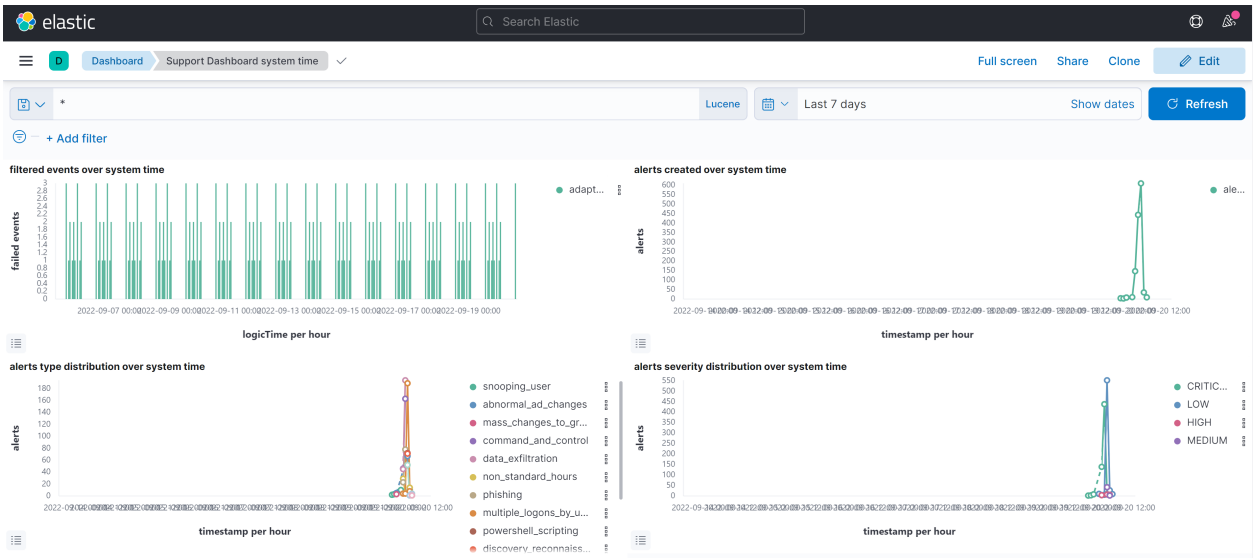


- The amount of filtered events over time per schema
- The total number of alerts generated
- The alert types distribution
- The events that are related to an alert

To access support dashboard logical time:

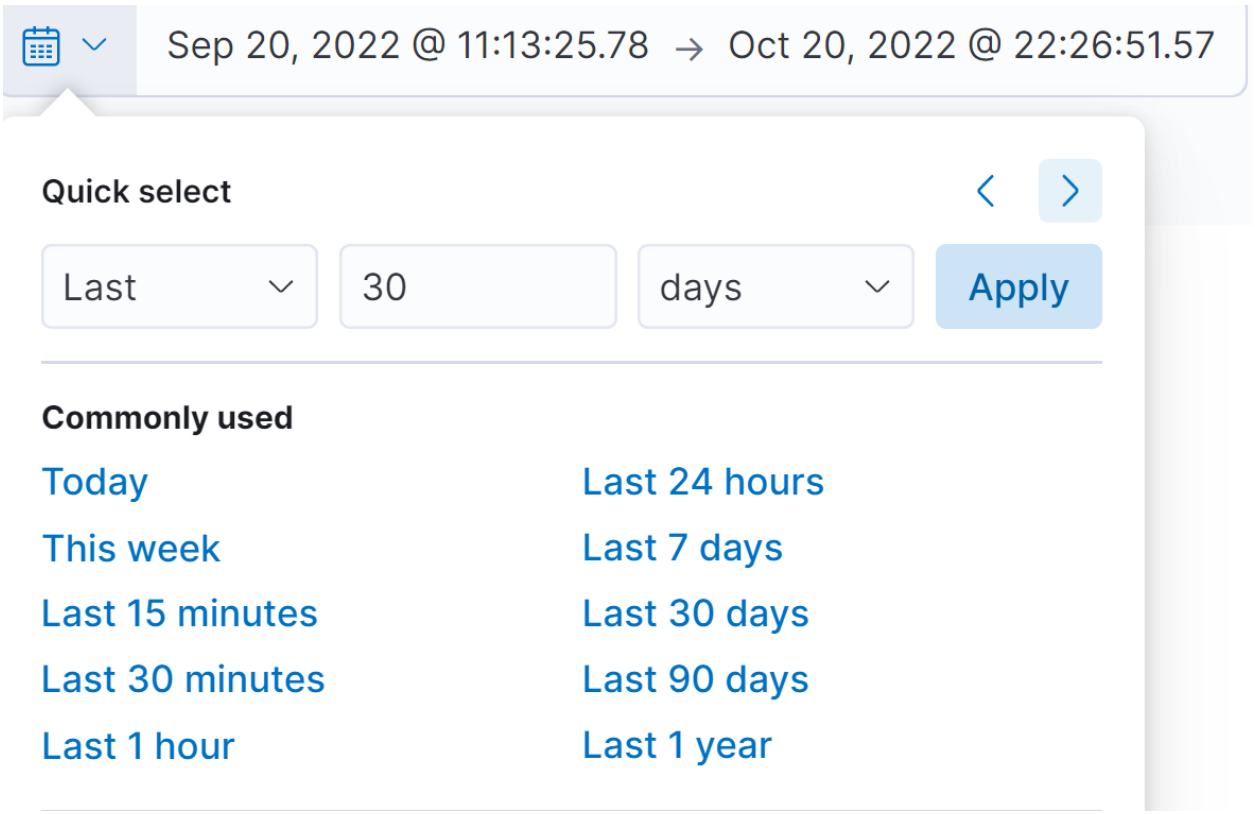
1. Go to Kibana, click **Dashboards** > **Support Dashboard logical time**.
   The **Support Dashboard logical time** is displayed.

2. Adjust the time range on the top-right corner of the page based on your requirement to view the statistics.



Support Dashboard System Time

The support dashboard system time allows you to monitor the system time when events are processed.

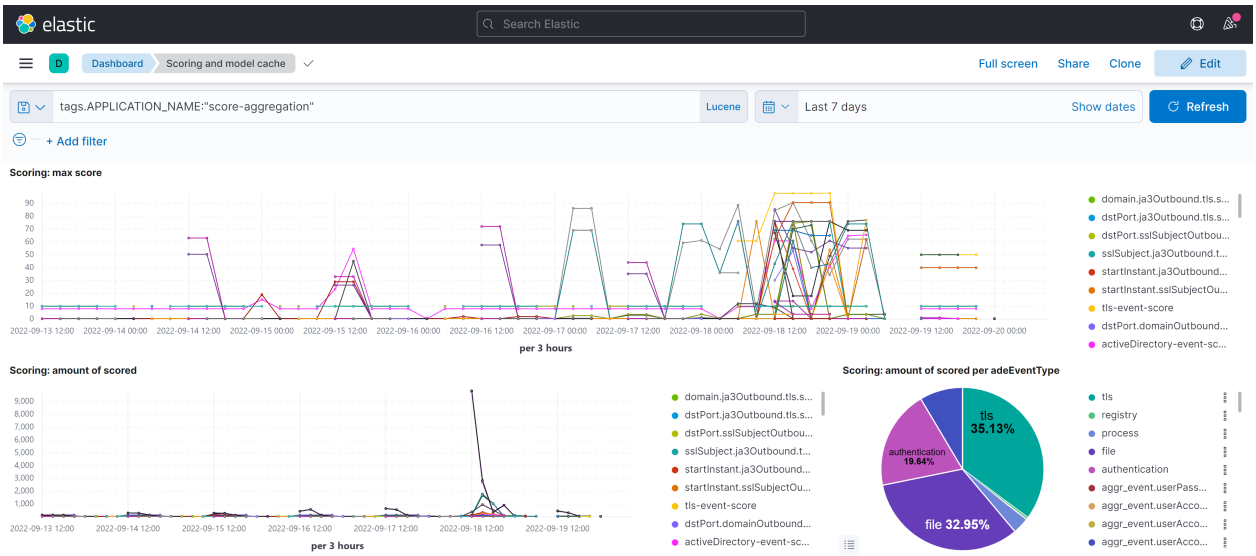


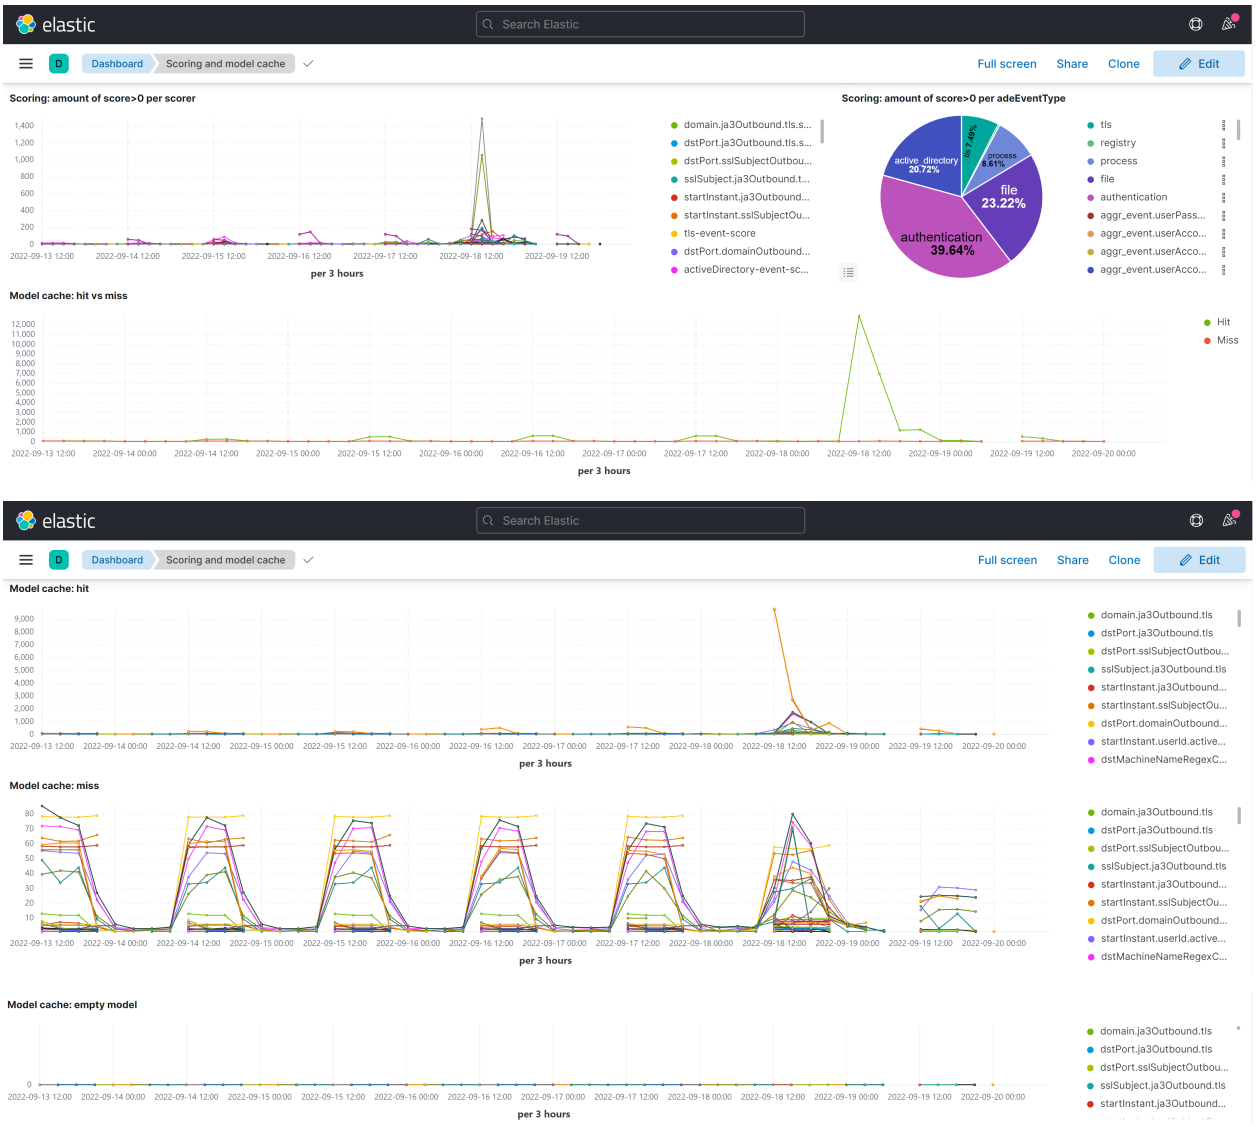
- The amount of filtered events over time per schema.
- The total number of alerts generated.
- The alert types distribution.
- The events that are related to an alert.

To access support dashboard system Time:

1. Go to Kibana, click **Dashboards** > **Support Dashboard system Time**.

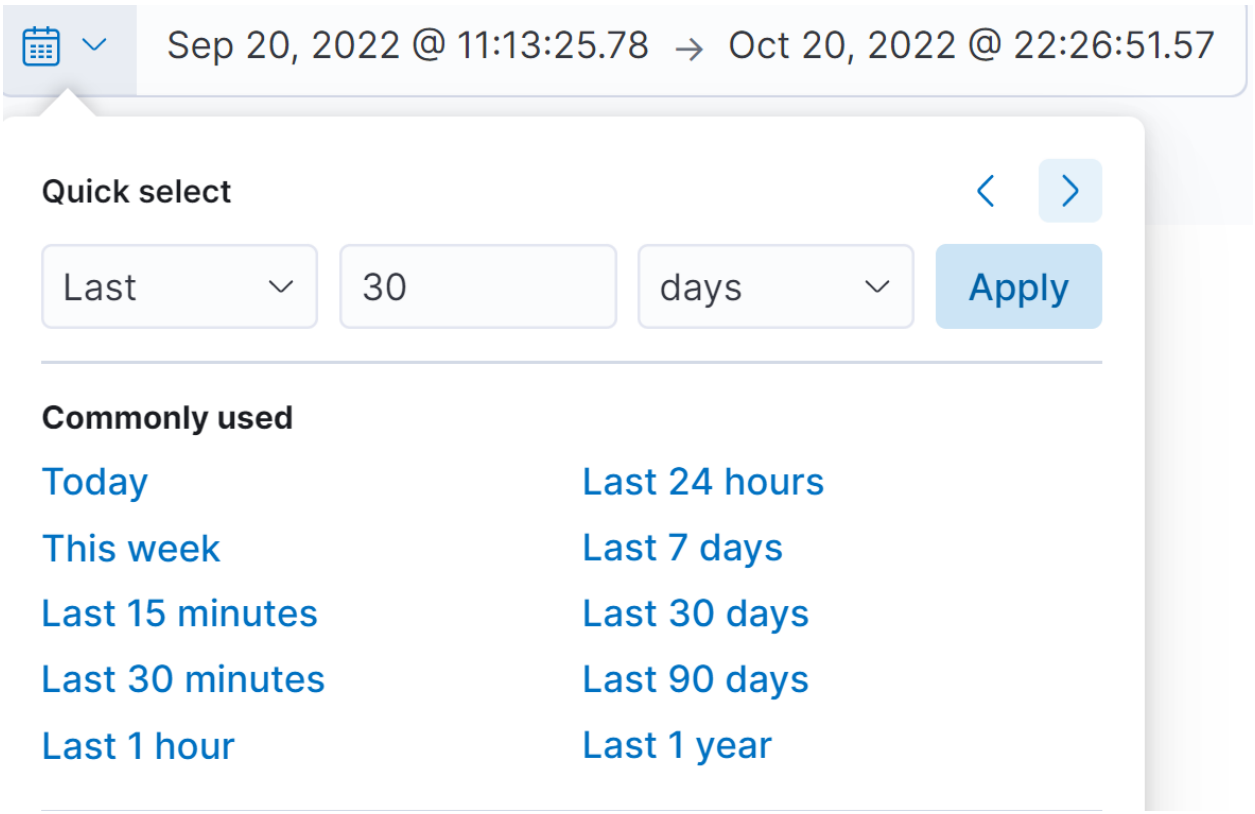
2. Adjust the time range on the top-right corner of the page to view the statistics.





Scoring and Model Cache

The Scoring and Model cache dashboard provides the capability to view events being scored.



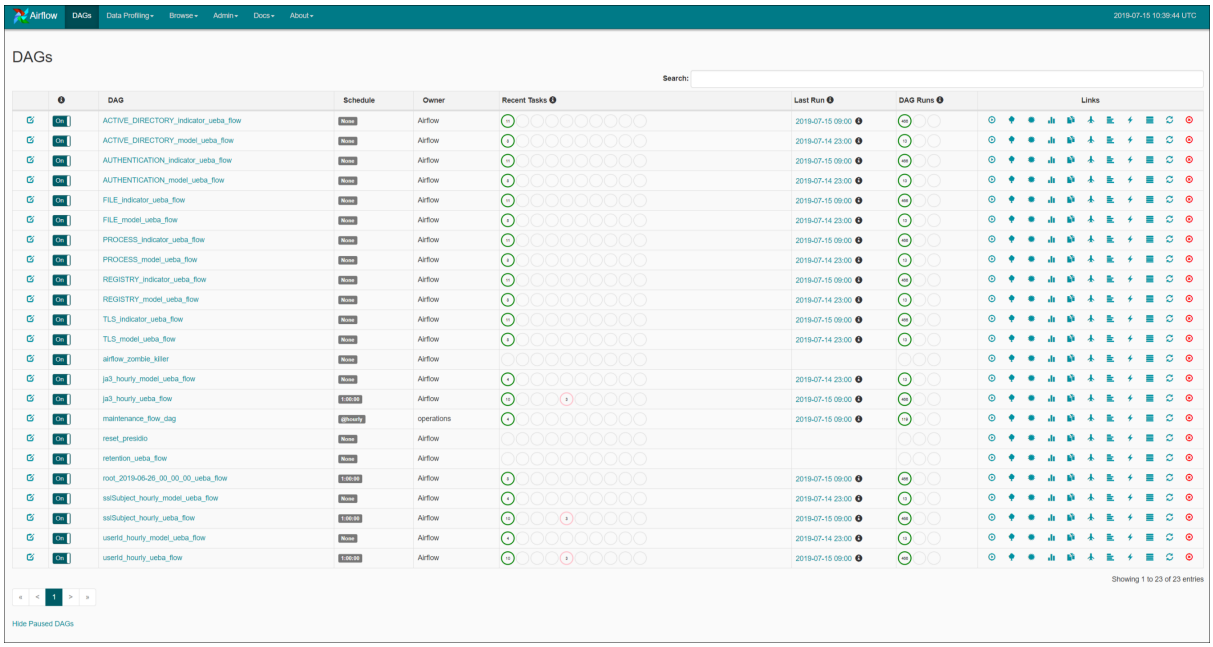
To access scoring and model cache dashboard:

1. Go to Kibana, click **Dashboards** > **Scoring and model Cache**.
   The **Scoring and model cache** dashboard is displayed.

2. Adjust the time range on the top-right corner of the page to view the statistics.

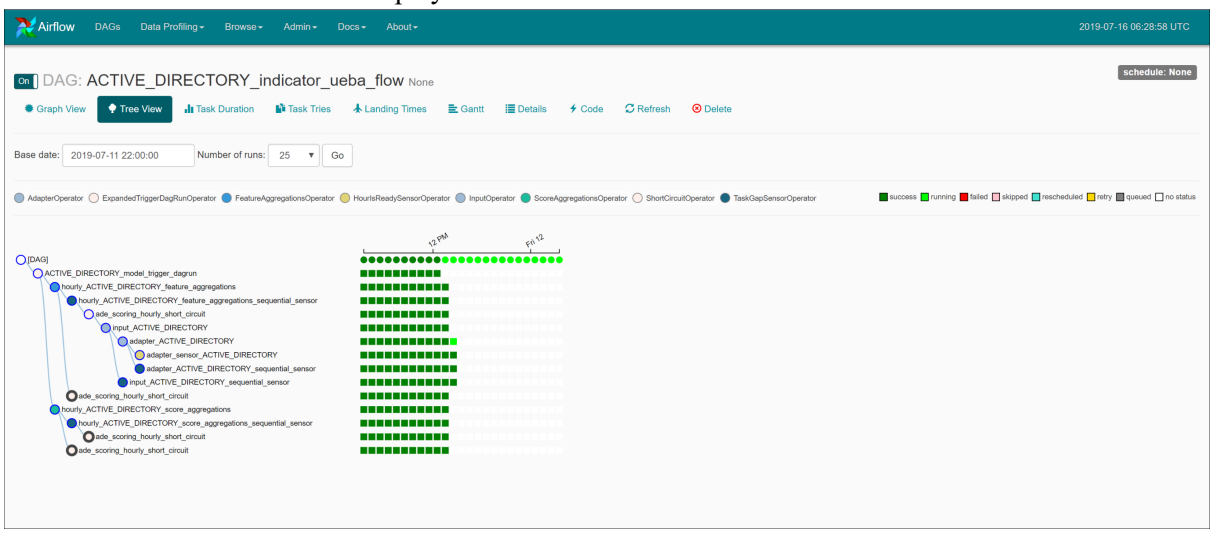
Airflow

Airflow is a tool for describing, executing, and monitoring the UEBA tasks. In Airflow, a DAG is a collection of all tasks you want to run, organized based on the schemas that reflects their relationships and dependencies. For example, schemas such as Active Directory, Authentication, File, Process, TLS and Registry. Each schema is divided into two:



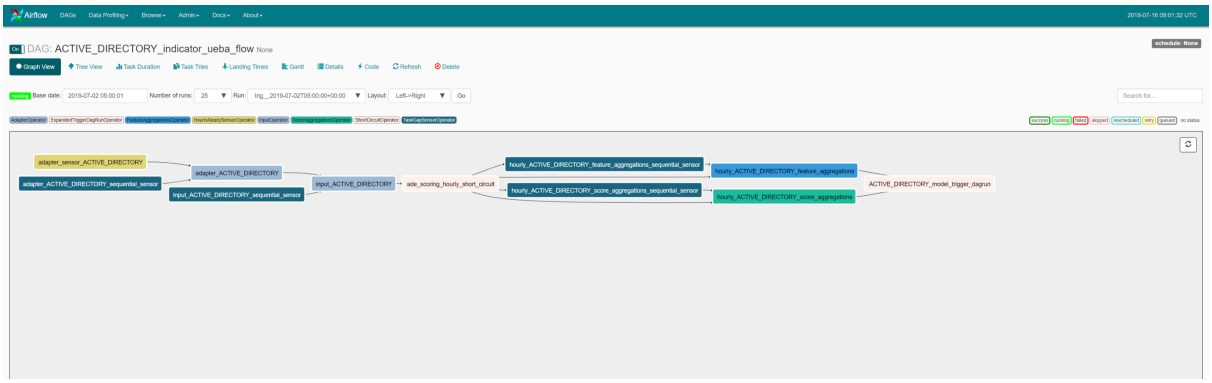
- Indicator DAG which is responsible to read events from broker and score the events based on the models.
- Model DAG which is responsible in building the models.

You can monitor the scheduled task by seeing how many tasks are successful, failed, or currently running.

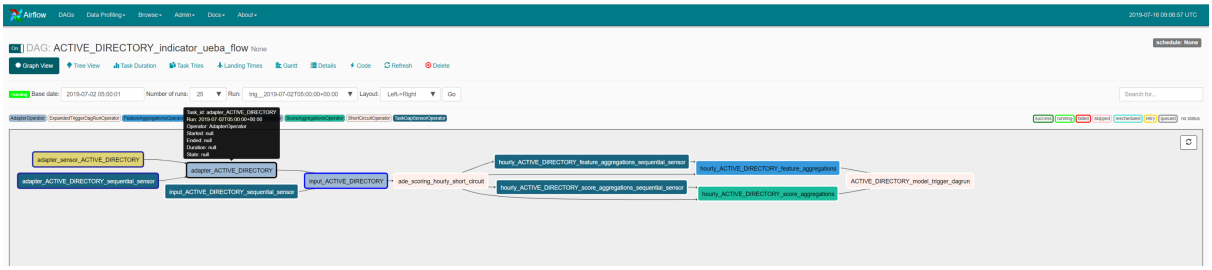


There are several DAGs and each DAG is a workflow.

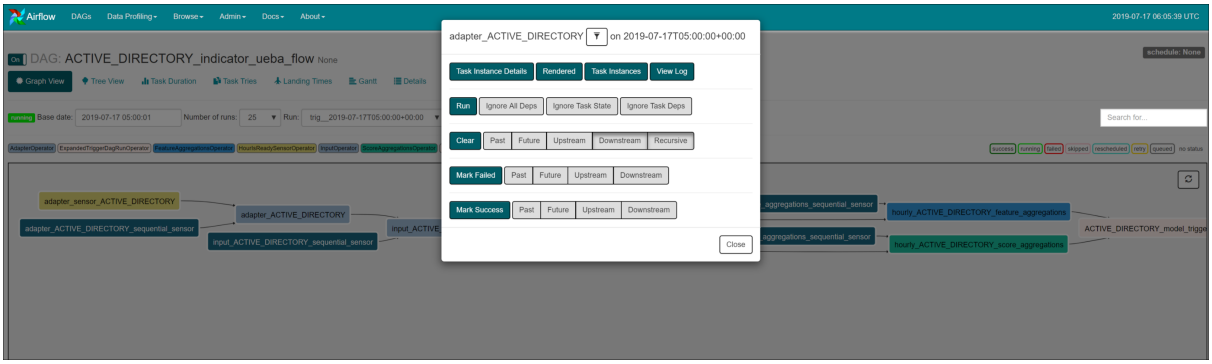
To monitor UEBA service tasks, perform the following:



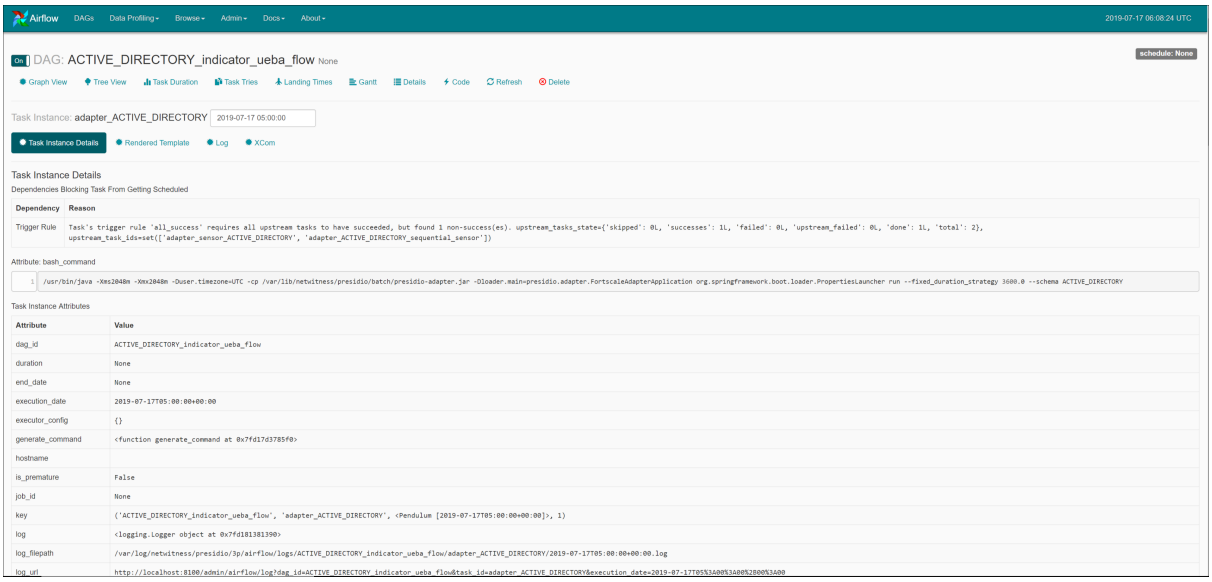
1. Go to **Airflow**.
   The DAGs view is displayed.



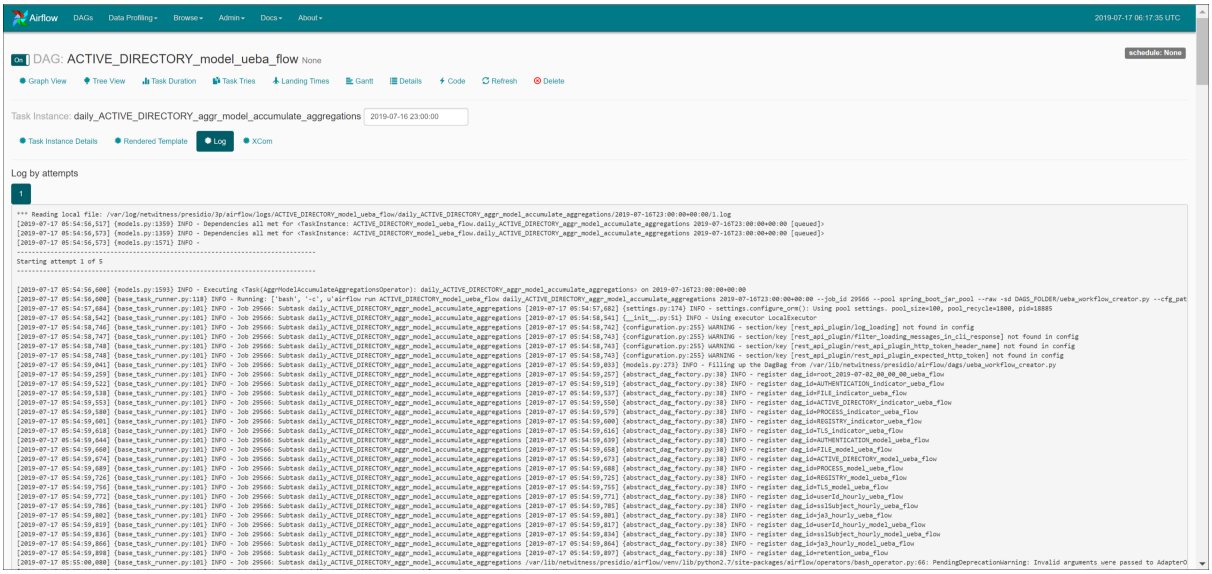
2. In the **DAG Runs** section, see the status of the tasks. For example, how many tasks are successful, failed or currently running.
3. To view the different tasks associated with the DAG, click **Tree view**.
   The Tree view of the DAG is displayed.



4. To view the DAG's dependencies and the current status of a specific task, in the DAG, click **Graph view**.



In the **Graph** view, hover over the task to see the status of the specific task.



For detailed information about the specific task, click **Task** and click **Task Instance Details.**

The Task Instance Details view is displayed.

To view the logs of the specific task, click **Log**.

Note: After you begin to run a DAG, schemas cannot be removed from UEBA, otherwise the process will stop. For more information see, 'Troubleshooting UEBA Configurations' topic in the *UEBA Configuration Guide*..

Reference

This section provides information about the NetWitness UEBA user interface.

Overview Tab

The Overview tab provides an initial view into the recent and most important user or network entity activities in the environment. Each panel shows either prioritized incidents for investigation or consolidated metrics reflecting potential risks to the enterprise.

Workflow

What do you want to do?

User Role	I want to ...	Documentation
UEBA Analyst	View top ten high-risk users or network entities.*	Identify High-Risk User or Network Entity
UEBA Analyst	View risky user or network entities, and watchlist or network entities.*	Identify High-Risk User or Network Entity
UEBA Analyst	View user based on alert type and indicator.	Identify High-Risk User or Network Entity
UEBA Analyst	Investigate alerts in my environment.	Investigate Top Alerts
UEBA Analyst	Begin an investigation of critical alerts.	Investigate Top Alerts
UEBA Analyst	Sort alerts to focus my investigation.	Filter Alerts
UEBA Analyst	Investigate threat indicators.	Investigate Events
UEBA Analyst	Export alert data.	Manage Top Alerts

Quick Look

The following figure shows the Overview tab.

The Overview tab consists of the following panels:

1 Top Risky User or Network entities panel
2 Top Alerts panel
3 Alerts Severity panel

Top Risky User or Network Entity Panel

The High Risk User or Network entities panel lists the top ten high-risk users or network entities along with the user or network entity score.

In this example, the following table describes the high risk users panel elements.

Name	Description
Risky	All user or network entities with a risk score greater than 0.
Watched	All user or network entities who are currently flagged as Watched.
Total Users	All user or network entities in the network.

Name	Description
User or Network entity name	The name of the user or network entity.
User or Network Entity Score	The score of the user or network entity, with the color indicating the severity of the score. • red indicates critical • orange represents a high risk • yellow indicates a medium risk • green represents a low risk

Top Alerts Panel

The Top Alerts panel displays a list of alerts for the associated user or network entity, severity, alert creation date, and number of indicators. The list consists of the top ten alerts in the Last 24 Hours, Last 7 days, Last 1 Month and Last 3 Months.

The following table describes the top alerts panel elements.

Name	Description
Severity Icon	The alert severity icon. The options are Critical, High, Medium, or Low.
Alert Name	The name of the alert.
Alert Creation Date	The date when an alert is generated.
Number of Indicators	The number of indicators associated with the alert.

Alerts Severity Panel

The Alert Severity panel graphically displays the number of alerts.

The following table describes alert severity panel elements.

Name	Description
Severity level	The severity is color coded, where red indicates a Critical alert, orange represents a High risk alert, yellow indicates a Medium risk alert, and green represents a Low risk alert. For example: 

Entities Tab

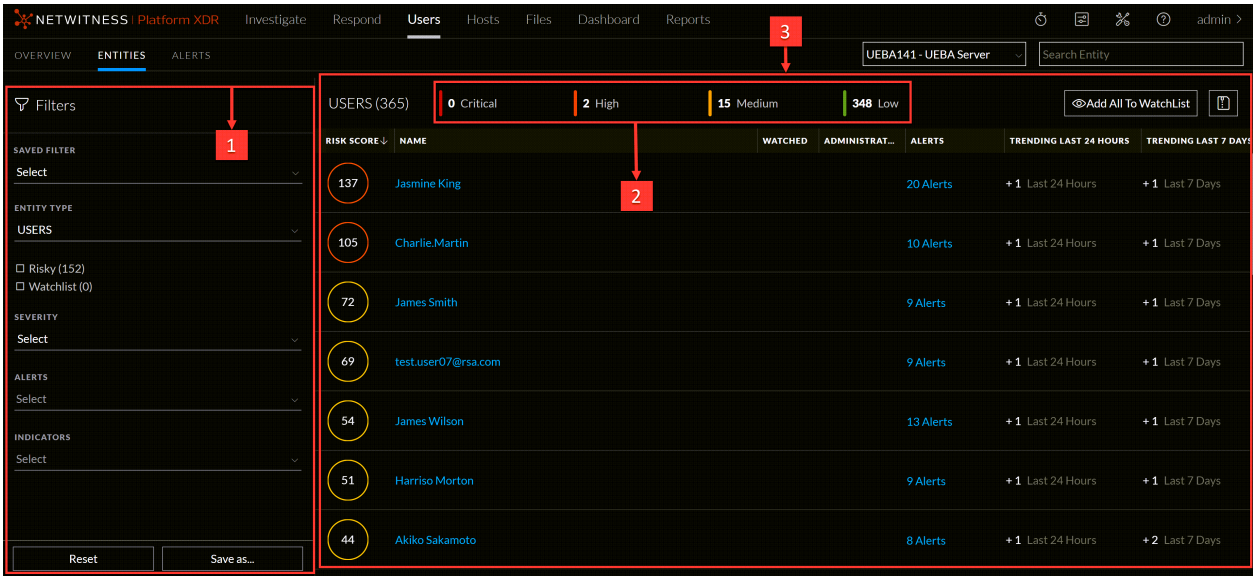
The Entities tab is a proactive threat hunting console. You can use behavioral filters to build use-case driven target lists, and to continuously monitor the environment for specific risky behavior patterns.

Workflow

What do you want to do?

User Role	I want to ...	Documentation
UEBA Analyst	View high-risk users or network entities*.	Identify High-Risk User or Network Entity
UEBA Analyst	View user or network entity based on alert type and indicator*.	Identify High-Risk User or Network Entity
UEBA Analyst	Begin an investigation of high-risk user or network entities.	Begin an Investigation of High-Risk User Or Network Entity
UEBA Analyst	Take action on high-risk users or network entities*.	Take Action on High-Risk User or Network Entity
UEBA Analyst	Export high-risk users or network entities*.	Export a list of High-Risk User or Network Entity
UEBA Analyst	Begin an investigation of critical alerts.	Investigate Top Alerts
UEBA Analyst	Investigate threat indicators.	Investigate Events

*You can complete the tasks here.



Related Topics

- Begin an Investigation of High-Risk User Or Network Entity
- Investigate Top Alerts

- Filter Alerts
- Investigate Events
- Export a list of High-Risk User or Network Entity

Quick Look

The following figure shows the Entities tab.

The Users tab consists of the following panels:

1 Filters panel
2 Risk Indicator Panel
3 User or Entity List panel

Filters Panel

The Filters panel lists two pre-defined filters, with the number of users associated with each in parentheses, and the list of behavioral profiles that are saved as favorites.

Filter Type	Description
Saved Filter	Previously saved behavioral filters.
Entity Type	Entity type such as Users, JA3, and SSL.
Risky User or Network Entities	All user or network entities with a risk score greater than 0.
Watchlist User or Network Entities	All user or network entities that are currently flagged as Watched.
Severity	Severity type, such as critical, high, medium and low.

Filter Type	Description
Alerts	Any of the existing alert types that describe the supported distinct use cases (Brute Force Attempt, Snooping User, Abnormal AD Change, Data Exfiltration).
Indicators	Any of the existing behavioral features modeled by NetWitness UEBA. This filter can also be used to target only alerts from a specific data source or application.
Reset	Reset the filter.
Save as	Save the filters as favorites.

Risk Indicator panel

The Risk indicator provides a severity-based breakdown of the target user or network entities.

The following table describes the risk indicator panel elements.

Color	Severity
Red	Critical
Orange	High
Yellow	Medium
Green	Low

Entities List Panel

The Entities List panel displays the list of all the user or network entities in your environment along with the user or network entity score and number of alerts associated with the user or network entity.

The following table describes the Entities List panel elements.

User Data	Description
Username or Network entity name	The name of the user or network entity.
Score	The user or the network entity.
Number of alerts	The total number of alerts generated for the user or network entity.
Sort by	The Sort by drop-down menu allows you to select the sorting method for the list. The options are: Risk Score, Name, Alerts, Trending last 24 hours, and Trending last 7 days.
Export	Export a list of all user or network entities and their scores in a .csv file format.
Add All to Watchlist	Adds all user or network entities in the filtered view to the watchlist.
Search Entity	Searches for a user name or a network entity that you typed, allows you to select it from the list that is displayed matching your entry.

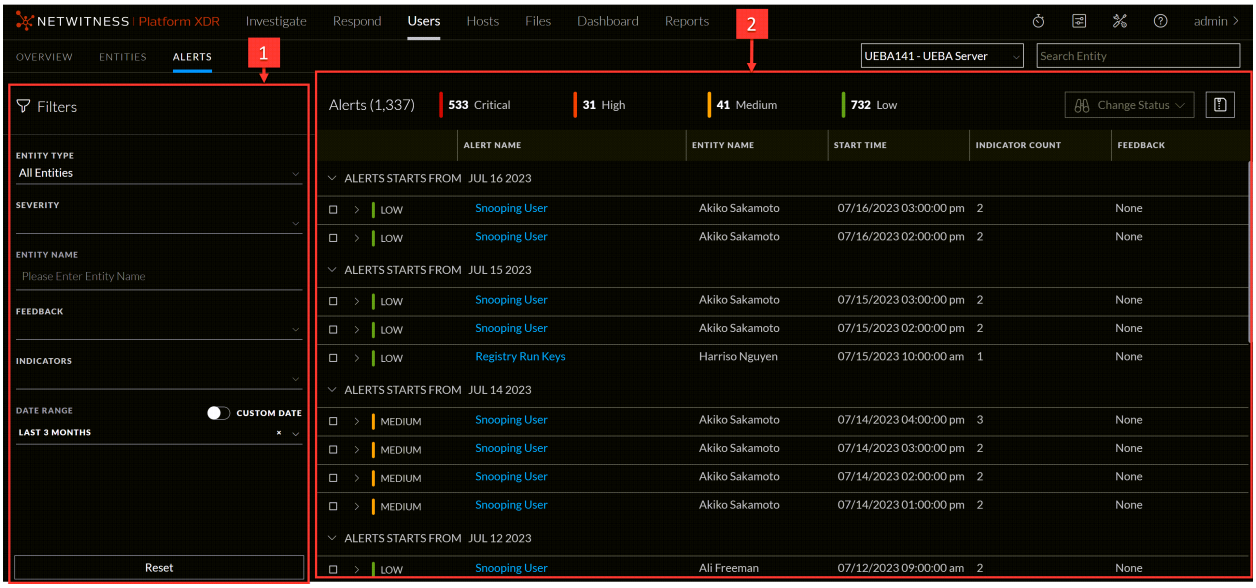
Alerts Tab

The Alerts tab displays details about all alerts in your environment. You can view forensic information about suspicious activity in your environment that is based on a specific timeframe.

Workflow

What do you want to do?

User Role	I want to ...	Documentation
UEBA Analyst	Investigate alerts in my environment*.	Investigate Top Alerts



User Role	I want to ...	Documentation
UEBA Analyst	Sort alerts to focus my investigation*.	Filter Alerts
UEBA Analyst	Investigate incidents based on threat indicators*.	Investigate Events
UEBA Analyst	Share alert data in spreadsheet format.	Manage Top Alerts

*You can complete the tasks here.

Related Topics

- Investigate Top Alerts
- Filter Alerts
- Investigate Events
- Manage Top Alerts

Quick Look

The Alerts tab consists of the following panels:

1 Filters panel
2 Alerts panel

Filters Panel

Use the filters panel to refine your investigation of alerts. The filters are automatically applied as you make your selections. You can reset all currently set filters by clicking **Reset**.

The following table describes the filters types.

Filter Name	Description	Options
Entity Type	Filters the list of alerts to include only alerts for a specific user name.	All Entities, Users, JA3, and SSL
Severity	Filters the list of alerts to include alerts for one or more severity levels.	Critical, High, Medium, or Low.
Entity Name	Enter an entity name to filter the alerts.	Examples of entity name are: • Alex Lane • James Wilson • James Smith • James Morton and so on.
Feedback	Filters the list of alerts to include alerts for one or more feedback types.	Select All, No Feedback, or Not a Risk.
Indicators	Filters the list of alerts to include alerts for one or more indicators.	Examples of indicators are: • Active Directory - Abnormal Logon Time • Authentication - Logged onto Multiple Computers • Multiple File Access Failures
Date Range	Filters the list of alerts to include alerts created during a specific time range.	Last 7 days, Last 2 weeks, Last 1 month, Last 3 months, Last 6 month or specified range.

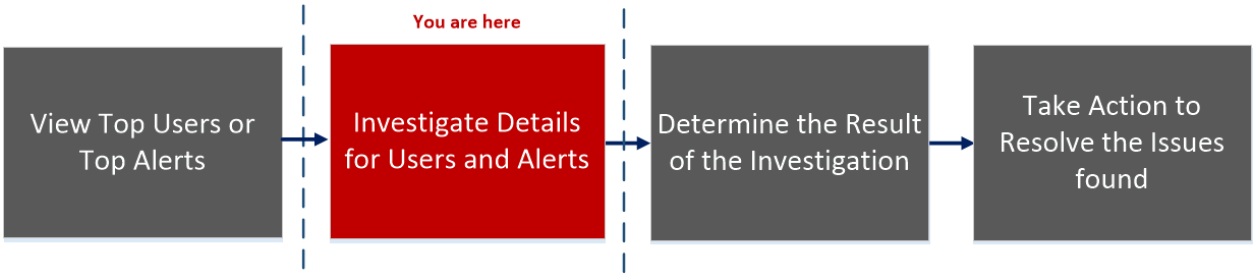
Alerts Panel

The Alerts panel displays the following information for each alert:

- Severity Icon: An icon next to the alert name that indicates the severity level of the alert.
- Alert Name: The name of the alert and the alert timeframe.
- Entity Name: The name of the entity that generated the alert.
- Start Time: The date and time when this alert was first detected.

- Indicator Count: The number of unique behavior anomalies (indicators) associated with the alert.
- Feedback: Indicates if a feedback value assigned for the alert.

At the beginning of each alert line is an arrow that expands the alert to display additional details. When you expand, the following fields are displayed:



- Indicator Name – The name of each unique indicator that is associated with the alert.
- Anomaly Value – The indicator's value, representing the deviation amount or value as it differs from the user's normal behavior.
- Data Source – The type of data where the indicator was found.
- Start Time – The date and time when this indicator was first detected.

The data that is currently displayed in the central pane can be exported to a .csv file by clicking **Export** at the top right of the pane.

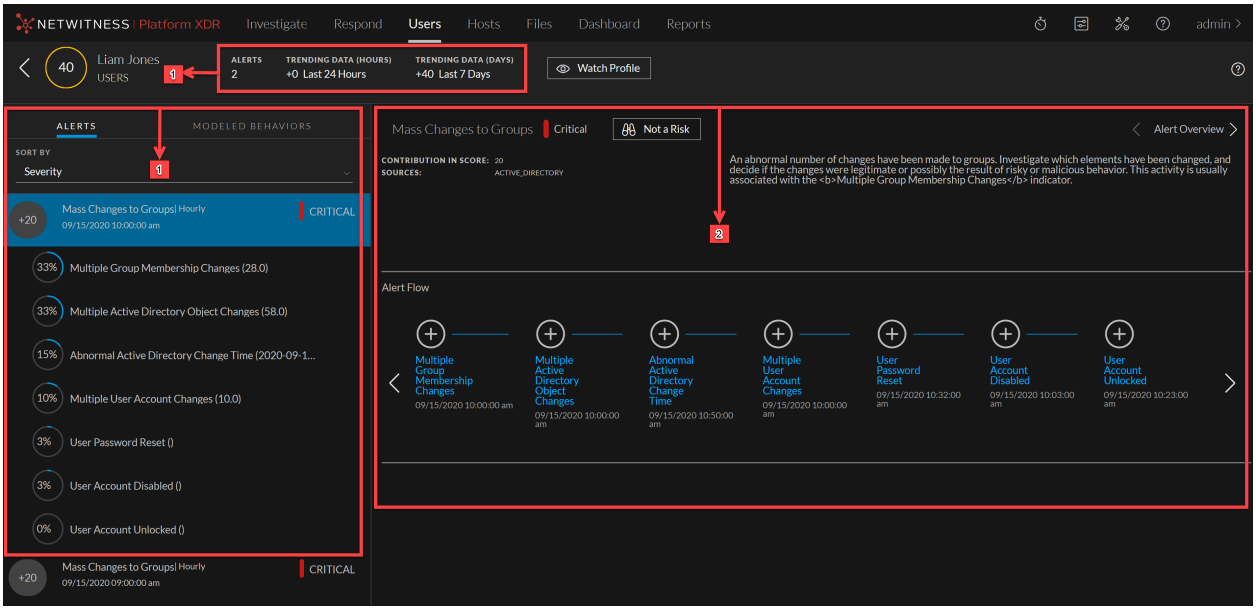
User or Network Entity Profile View

The **User Network Entity Profile** view provides detailed information about all alerts and related indicators of a user or network entity.

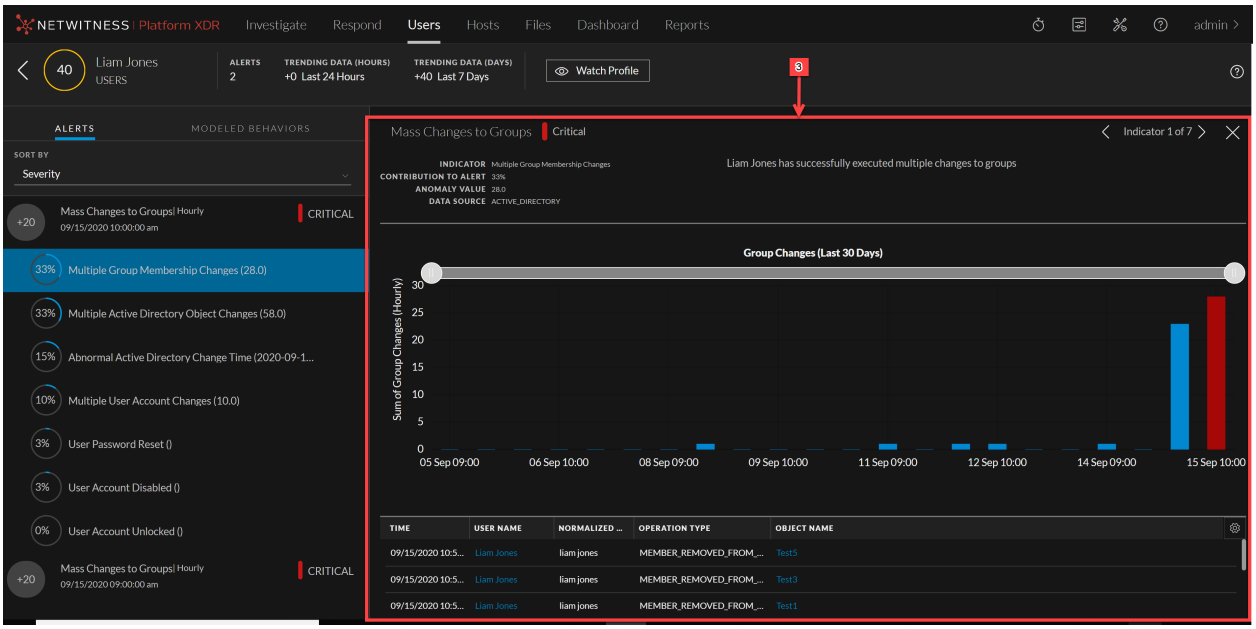
Workflow

What do you want to do?

User Role	I want to ...	Documentation
UEBA Analyst	View high-risk user or network entities*	Identify High-Risk User or Network Entity
UEBA Analyst	Begin an investigation of high-risk user or network entities*	Begin an Investigation of High-Risk User Or Network Entity
UEBA Analyst	Take action on high-risk user or network entities.	Take Action on High-Risk User or Network Entity



User Role	I want to ...	Documentation
UEBA Analyst	Export high-risk user or network entities.	Export a list of High-Risk User or Network Entity
UEBA Analyst	Begin an investigation of critical alerts*	Investigate Top Alerts
UEBA Analyst	Investigate threat indicators.	Investigate Events
UEBA Analyst	View Modeled Behaviors for users **Note:** From 11.5.1 version and later, Modeled Behaviors for users can be viewed.	View Modeled Behaviors



*You can complete the tasks here.

- Investigate Events
- Export a list of High-Risk User or Network Entity
- View Modeled Behaviors

Quick Look

The following figure shows the User Modeled Behaviors view.

The Users Profile consist of the following panels:

1. User Risk Score panel
2. Alerts Flow panel
3. Indicator panel
4. Modeled Behaviors panel

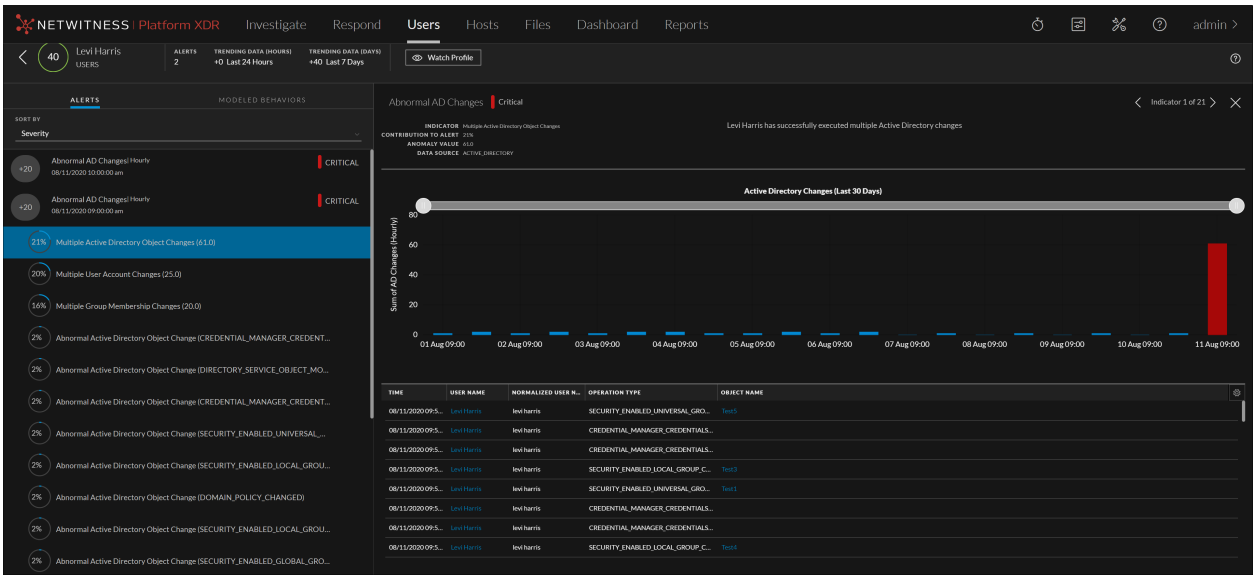
User or Network Entity Risk Score Panel

The User or Network Entity Risk Score panel contains the following information:

Name	Description
User Score	The user score of the user highlighted based on the severity.
Alerts	The total number of alerts generated for the user in the last 90 days.
Trending Data (Hours)	The trending data for last 24 hours shows the increase in the user's score in the last 24 hours.
Trending Data (Days)	The trending data for last 7 days shows the increase in the user's score in the last 7 days.
Alerts	The following information is displayed: • alert names • severity level icon • start date and time for the alert • timeframe of the alert (Hourly) • risk score of the alert (+20) • list of alert indicator names and the number of times the indicator events occurred.
Sort by	The alerts are sorted based on Severity and Date. By default, it is sorted by severity.

Alert Flow Panel

The Alert Flow panel displays the following information:



Name	Description
Alert name	The name of the alert.
Time frame	The timeframe of the alert (hourly).
Severity level	The severity of the alert.
Contribution in score	The contribution to the user score value (for example, +20).
Sources	The data sources for the alert (for example, Active Directory).
Tamerlane graph	The timeline of events that are related to the formation of the alert.

Indicator Panel

Click on a graph icon in the Alert Flow panel to open the Indicator panel. The following table describes the indicator panel elements:

Name	Description
Indicator	The name of the indicator with timeframe of the indicator in parentheses. For example, Multiple Group Membership Changes (Hourly).
Contribution to Alert	The alert contribution percentage.
Anomaly Value	The anomaly value.
Data source	The data source from where the alert is triggered.

In the Indicator panel the events table list events specific to the data sources.

- **Common events for User Entity**

The following tables list events specific to all the data sources.

Event Name	Description
Time	The date and time when an event is triggered.
Username	The name of user for whom an indicator is triggered.
Normalized user name	The name of user for whom an indicator is triggered.
Operation Type	The action performed by the user. For example, Member Added To Group.

Event Name	Description
Result	The status of the action performed by the user.

- **Windows File Servers**

The following tables list events specific to Windows file servers.

Event Name	Description
Source Folder Path	Absolute folder path of a file for which an event is triggered.
Source File Path	Absolute file path for which an event is triggered.

- **Active Directory**

The following tables list event specific to Active Directory.

Event Name	Description
Object Name	Object name defined in the Active Directory.

- **Logon Activity**

The following tables list events specific to Logon Activity.

Event Name	Description
Computer	Host name from where an event is triggered.

- **Process**

The following tables list events specific to Process.

Event Name	Description
Machine Name	Name of the host from where this event is triggered for the user.
Source Process	Process triggered by the event
Destination Process	Process triggered by source process.

- **Registry**

The following tables list events specific to Registry.

Event Name	Description
Machine Name	Name of the host from where this event is triggered for the user.
Process Directory	Absolute directory path of the process for which an event is triggered.
Process File Name	Process file name for which an event is triggered.
Registry Key Group	Type of registry key.
Registry Key	Registry key path.
Registry Value Name	Registry value name that is created or modified.
Operation Type	The action performed by the user. For example, Member Added To Group.

Network Entities

The following tables list events specific to JA3 and SSL Subject.

Event Name	Description
Source IP	The IP address from which network data is sent.
Destination IP	The IP address to which network data is sent.
Destination Country	The country name to which the network data is sent.
SSL	The SSL Subject.
Destination Organization	The organization name where the network data is sent.
Domain	The domain name to which the network data is sent.
JA3	The JA3 hash value.
Destination Port	The port number to which the network data is sent.
Source Netname	The name of the source netname.
Number of Bytes Sent	The number of bytes sent.
Destination ASN	
JA3S	The JA3S hash value.

Event Name	Description
Destination Netname	The name of the destination netname.
Number of Bytes Received	The number of bytes received.

Modeled Behaviors Panel

The Modeled Behaviors panel displays the following information:

Name	Description
Modeled Behaviors	The following information is displayed: • The data source names • The date of the user's last activity • Description of the Modeled Behaviors.
Data Source	The data source can be selected from the drop-down.
Sort by	The Modeled Behaviors are sorted based on date and alphabetical order. By default, it is sorted by alphabetical order.

Appendix: NetWitness UEBA Windows Audit Policy

To achieve maximum benefit from NetWitness UEBA, NetWitness recommends that you implement the Windows audit policies described here.

For a base set of policies to audit, see the "Windows Server 2016, Windows Server 2012 R2, Windows Server 2012, Windows Server 2008 R2, and Windows Server 2008 Audit Settings Recommendations" section of this article from Microsoft: Audit Policy Recommendations.

The policies under "Stronger Recommendation" are required, and the following policies, to ensure that all of the required Authentication and Active Directory events are audited:

- Audit Detailed File Share
- Audit File Share
- Audit File System

NetWitness recommends that you enable auditing for both success and failures.

The following Windows events must be audited:

For the Authentication models:

4624	4625	4769	4628

For the AD models:

4670	4717	4720	4722	4723	4724	4725	4726
4727	4728	4729	4730	4731	4732	4733	4734
4735	4737	4738	4739	4740	4741	4742	4743
4754	4755	4756	4757	4758	4764	4767	4794
5136	5376	5377					

For File Access Models:

4660	4663	4670	5145

Virtual Deployment Overview

This document provides instructions on the installation and configuration of NetWitness 11.7.0.0 hosts running in a virtual environment.

Virtual hosts have the same functionality as the NetWitness Azure, AWS, and hardware hosts. NetWitness recommends that you perform the following tasks when you set up your virtual environment.

Before you can deploy NetWitness in virtual environment, you need to:

IMPORTANT: Get familiar with the NetWitness Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see Storage Guide for NetWitness Platform 11.x.

- Review the recommended compute and memory specifications needed for each NetWitness instance.
- Make sure that you have a NetWitness Throughput license.
- Review of the network architecture and port usage.

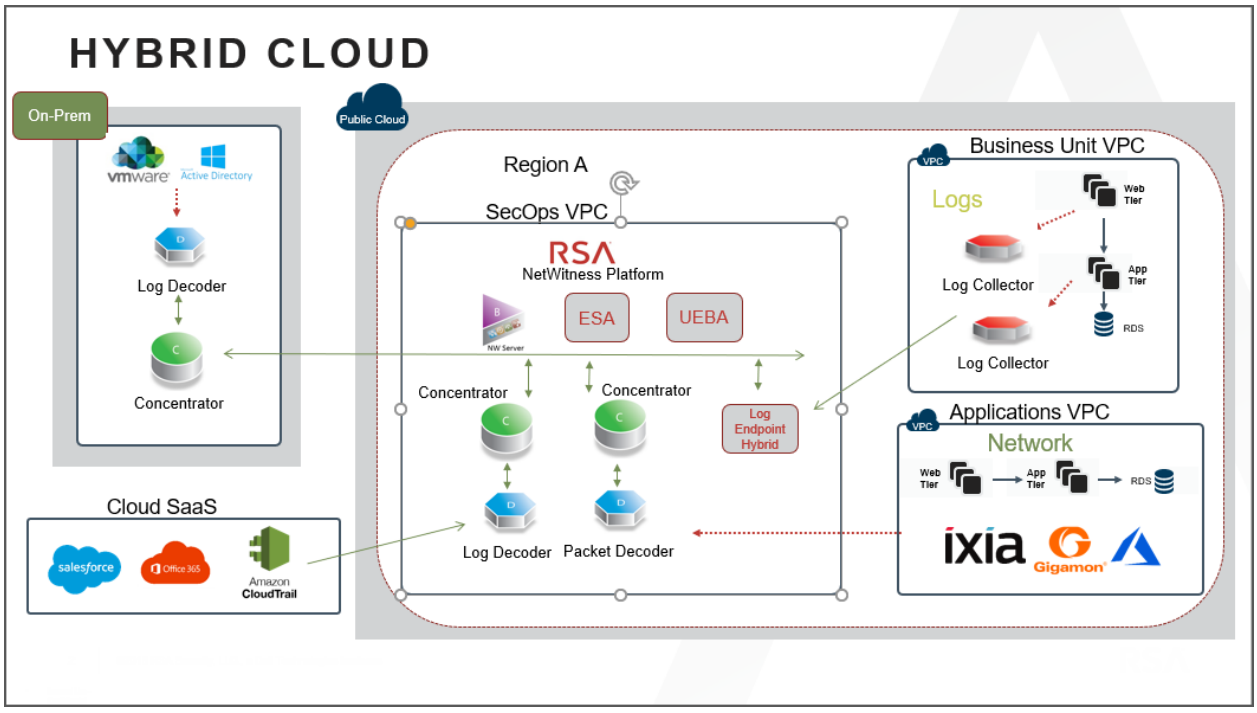
Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *Host and Services Getting Started Guide*.



NetWitness High-Level Deployment Diagram

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

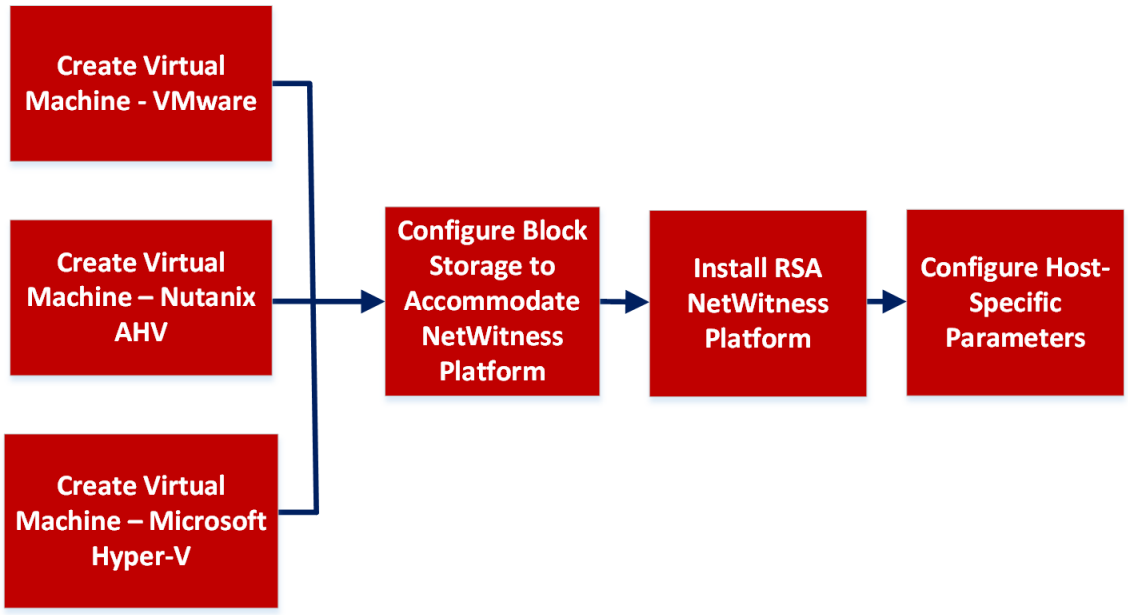
Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

For information on VMware concepts, refer to the VMware product documentation.

The virtual hosts are provided as an OVA. You need to deploy the OVA file as a virtual machine in your virtual infrastructure.

Installation Media

Installation media are in the form of OVA and VHDX packages, which are available for download and installation from Downloads (https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads). As part of your order fulfillment, NetWitness gives you access to the OVA and VHDX.



Note: Currently, NetWitness Platform does not support Network Attached Storage (NAS) for Virtual deployments.

Install NetWitness Platform Virtual Host in Virtual Environment

Complete the following procedures according to their numbered sequence to install NetWitness in a virtual environment.

Work Flow:

This figure shows the high-level workflow mandatory for installing NetWitness Platform virtual host.

Note: When you configure databases to accommodate NetWitness Platform, the default database space allocation after you deploy databases from OVA or VHDX will not be adequate to support the NetWitness deployment. You must expand the datastores after initial deployment to avoid any issues. For more information, see Step 2. Configure Block Storage to Accommodate NetWitness Platform.

IMPORTANT: Review the ***Network Architecture and Ports*** topic in the ***Deployment Guide*** in the NetWitness help so that you can configure NetWitness services and your firewalls. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

Prerequisites

Make sure that you have:

- A VMware ESX Server that meets the requirements described in the above section. Supported versions are 7.0, 6.7, 6.5, 6.0, and 5.5.
- Administrator rights to create the virtual machines on the VMware ESX Server.

Checklist

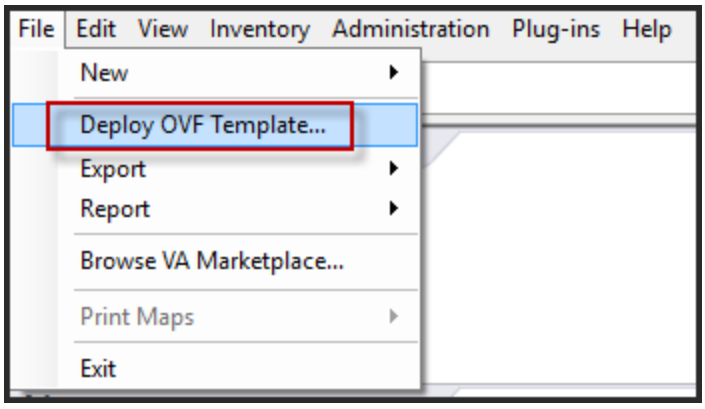
Step	Description	√
1.	Step 1a. Create Virtual Machine - VMware	
2.	Step 1b. Create Virtual Machine - Microsoft Hyper-V	
4.	Step 1c. Create Virtual Machine - Nutanix AHV	
3.	Step 2. Configure Block Storage to Accommodate NetWitness Platform	
5.	Step 3. Install NetWitness Platform	
6.	Step 4. Configure Host-Specific Parameters	
7.	Step 5. Post Installation Tasks	

Step 1a. Create Virtual Machine - VMware

Complete the following steps to deploy the OVA file on the vCenter Server or ESX Server using the vSphere client.

Prerequisites

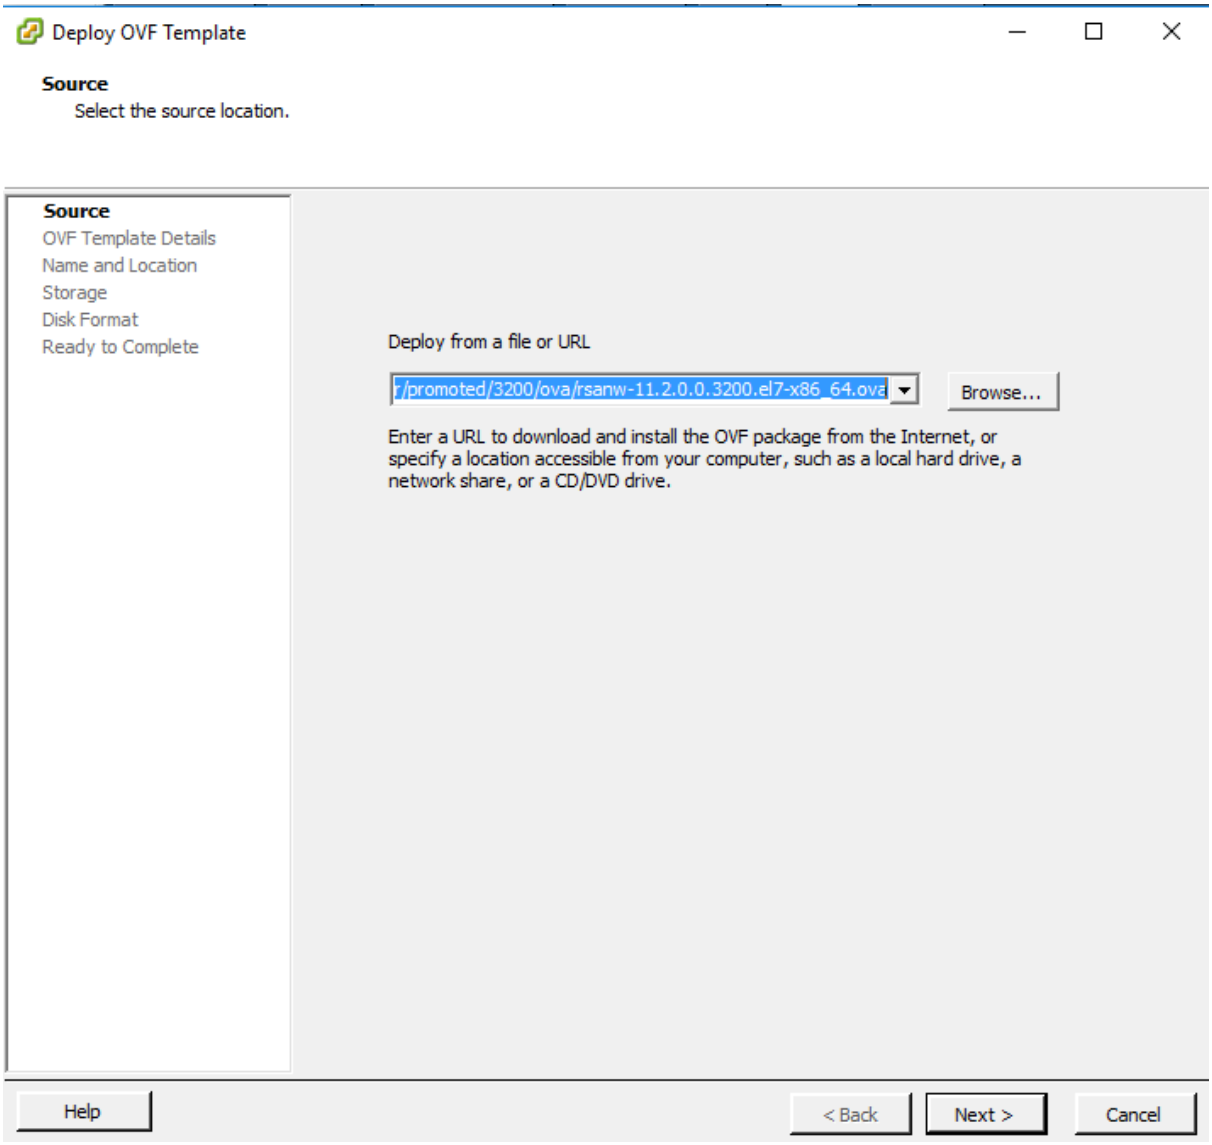
Make sure that you have:



- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.
- Password for virtual host access. The default username is `root` and the default password is `netwitness`.
- The NetWitness virtual host package file for example, rsanw-11.7.0.0.xxxx.el7-x86_64.ova. (You download this package from Download Central (https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads).)

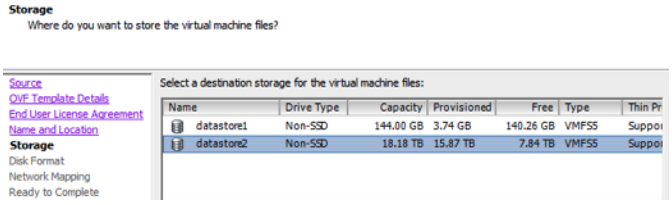
Procedure

Note: The following instructions illustrate an example of deploying an OVA host in the ESXi environment. The screens you see may be different from this example.



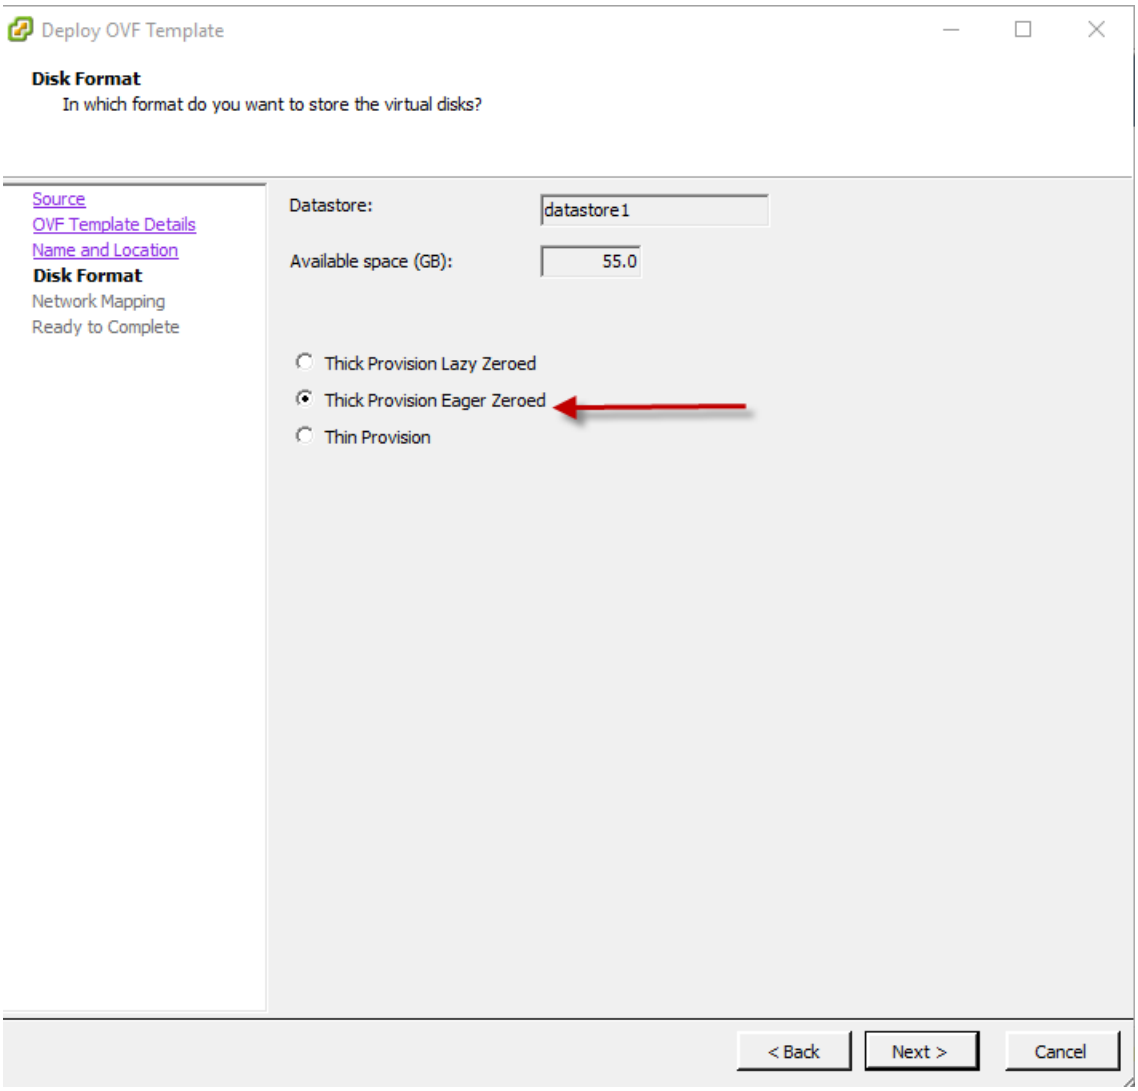
To deploy the OVA host:

1. Log on to the ESXi environment.
2. In the **File** drop-down, select **Deploy OVF Template**.



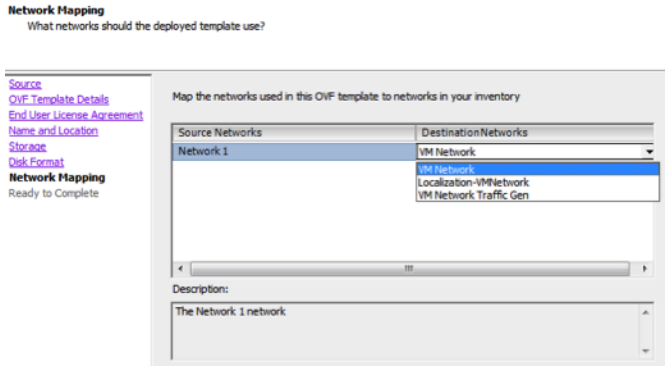
3. The Deploy OVF Template dialog is displayed. In the **Deploy OVF Template** dialog, select the OVF for the host that you want to deploy in the virtual environment (for example, **V11.7**

GOLD\\rsanw-11.7.0.0.xxxx.el7-x86_64.ova), and click **Next**.



4. The Name and Location dialog is displayed. The designated name does not reflect the server hostname. The name displayed is useful for inventory reference from within ESXi.
5. Make a note of the name, and click **Next**.

   Storage Options are displayed.



6. For Storage options, designate the datastore location for the virtual host and click **Next**.

Note: This location is for the host operating system (OS) exclusively. It does not have to be the same datastore needed to set up and configure additional volumes for the NetWitness databases on certain hosts (covered in the following sections).

7. Click **Next**.

   The Network Mapping options are displayed.

8. Select the **Network label** based on your requirement (For example, VM Network), and click **Next**.

Note: If you want to configure Network Mapping now, you can select options, but NetWitness recommends that you keep the default values and configure network mapping after you configure the OVA. You configure the OVA in Step 4: Configure Host-Specific Parameters.

A status window showing deployment status is displayed.

After the process is complete, the new OVA is presented in the designated resource pool visible on ESXi from within vSphere. At this point, the core virtual host is installed, but is still not configured.

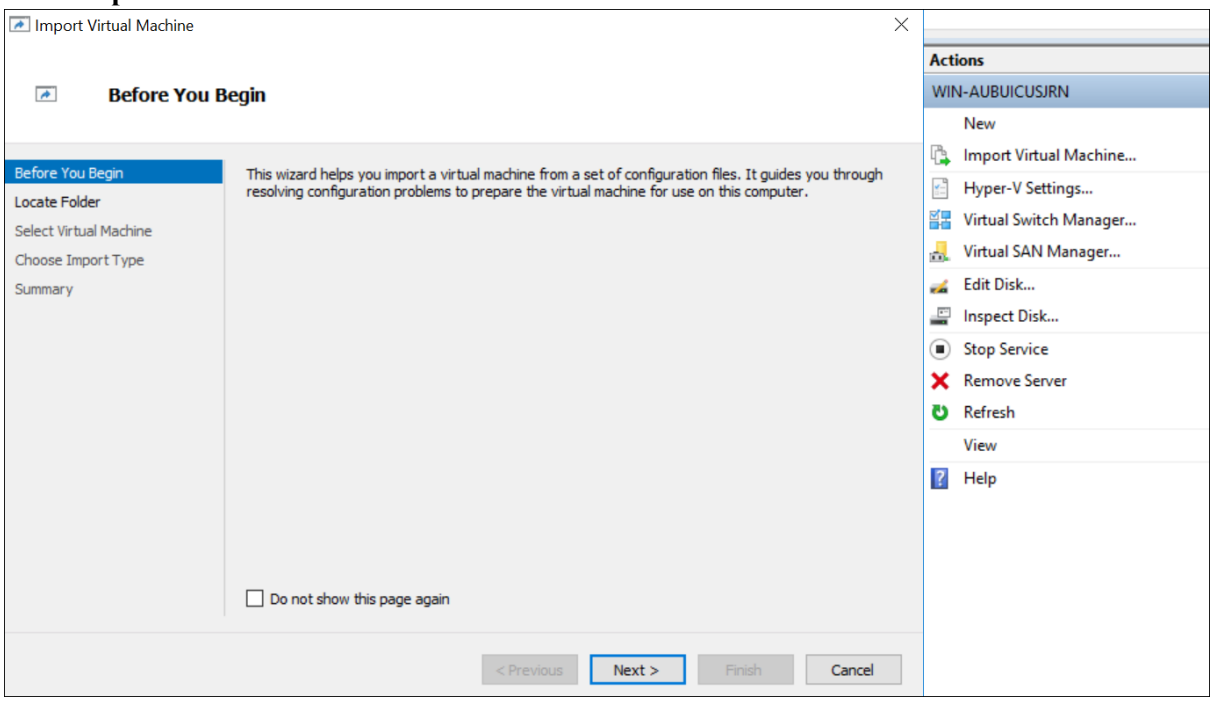
Step 1b. Create Virtual Machine - Microsoft Hyper-V

Complete the following steps according to their numbered sequence to deploy virtual host in Hyper-V.

Prerequisites

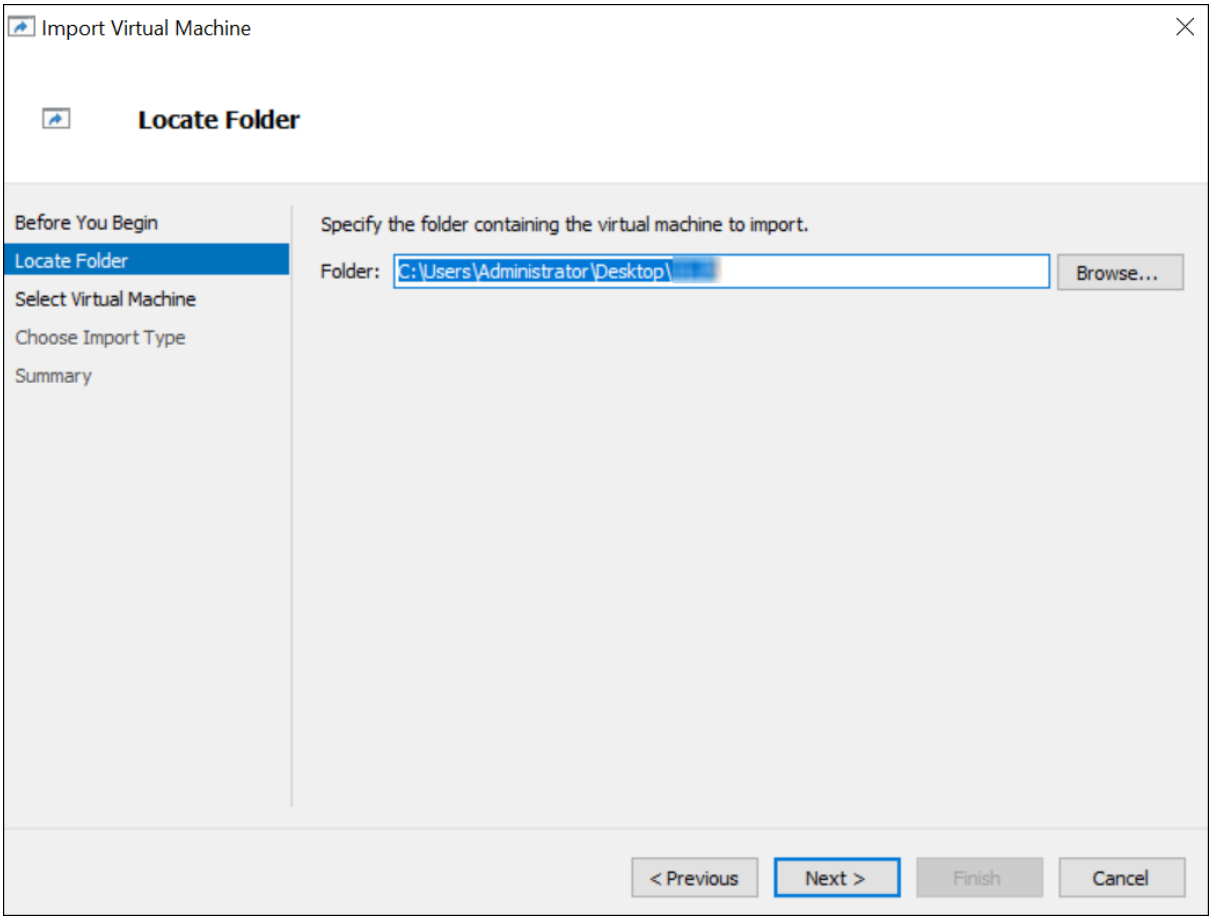
Make sure that you have:

- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.



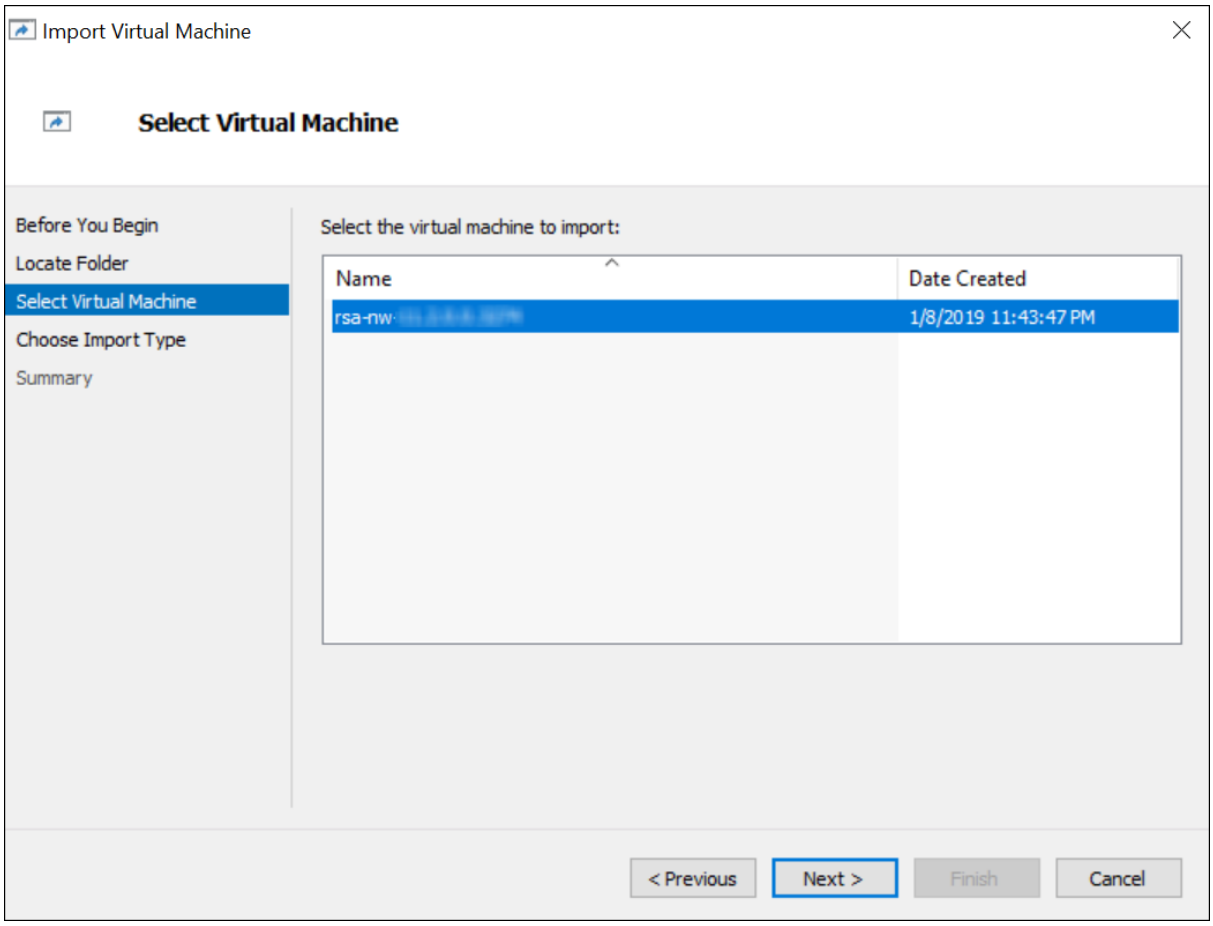
- Password for virtual host access. The default username is `root` and the default password is `netwitness`.
- The NetWitness virtual host package file for example, `rsa-nw-11.7.0.0.3274.zip`. (You download this package from Downloads https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads)

Procedure

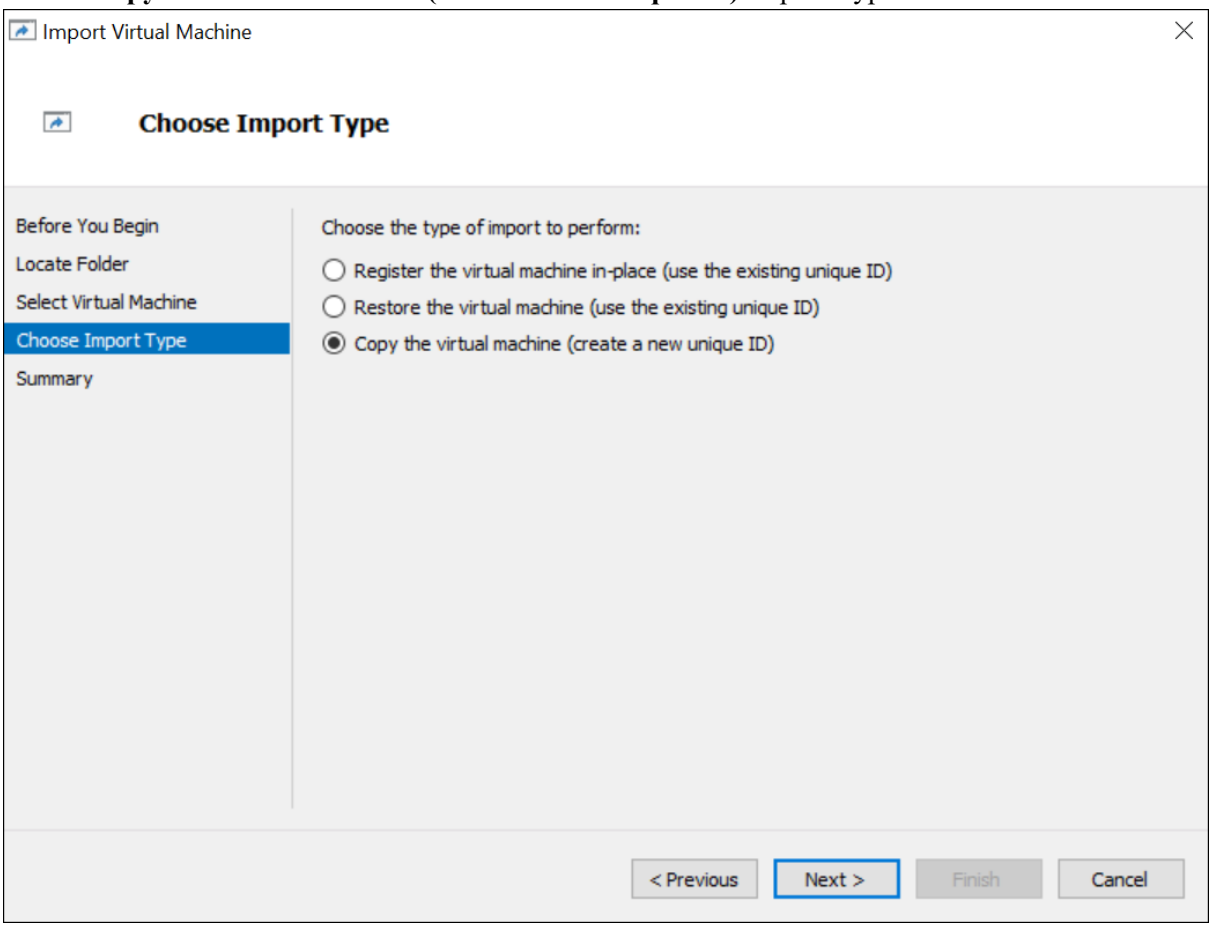


Note: The following instructions illustrate an example of deploying a VM in the Hyper-V environment. The screens you see may be different from this example.

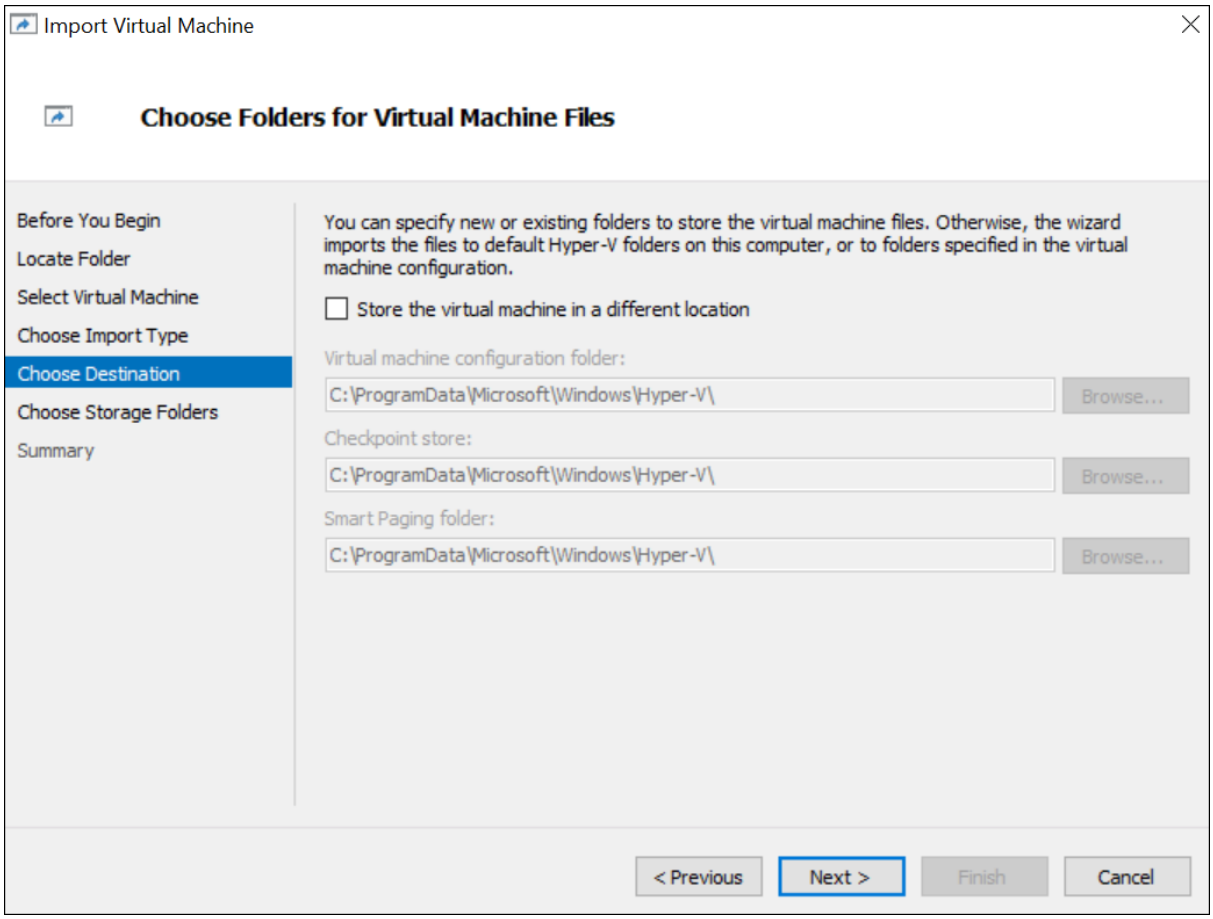
To deploy virtual host in Hyper-V.



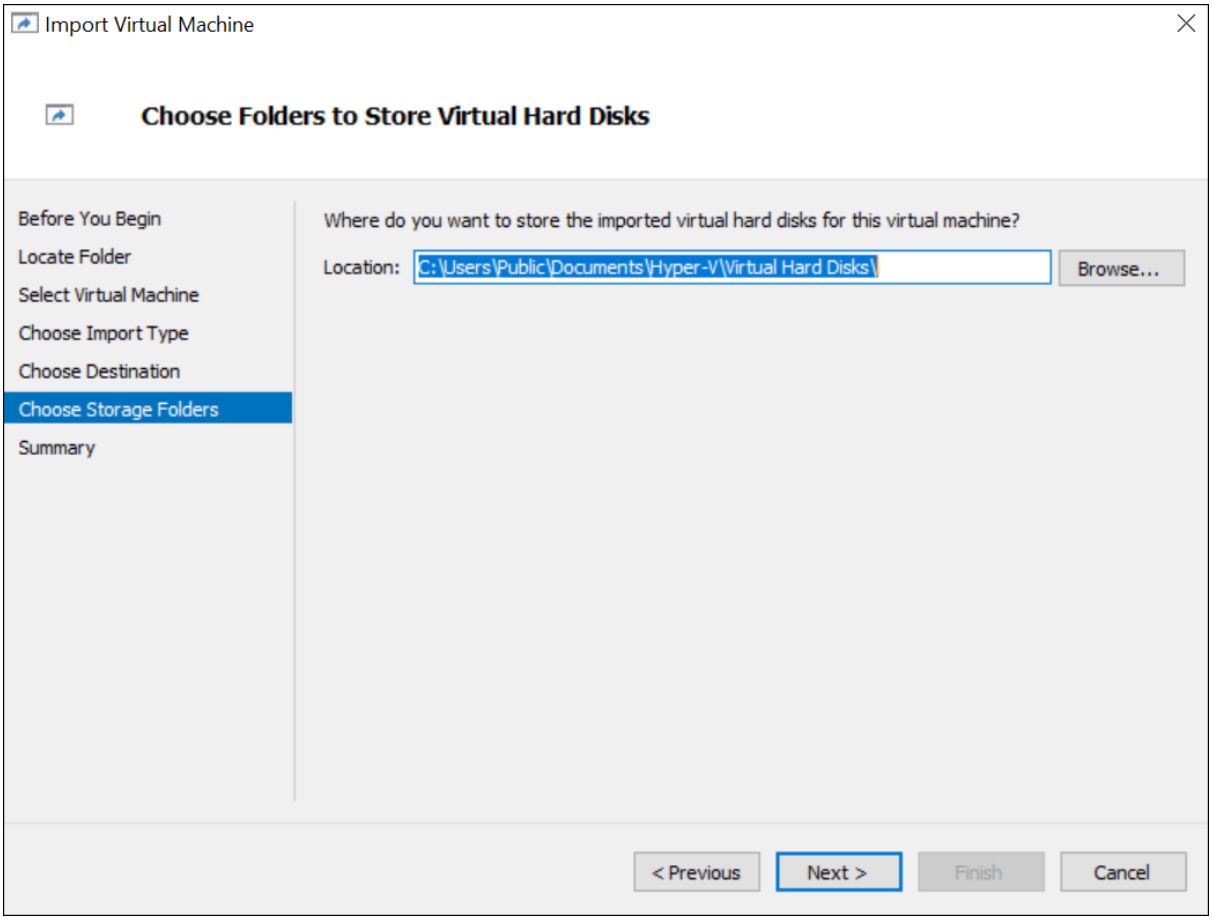
1. Log on to Hyper-V Manager.
2. Click **Import Virtual Machine** and Click **Next**.



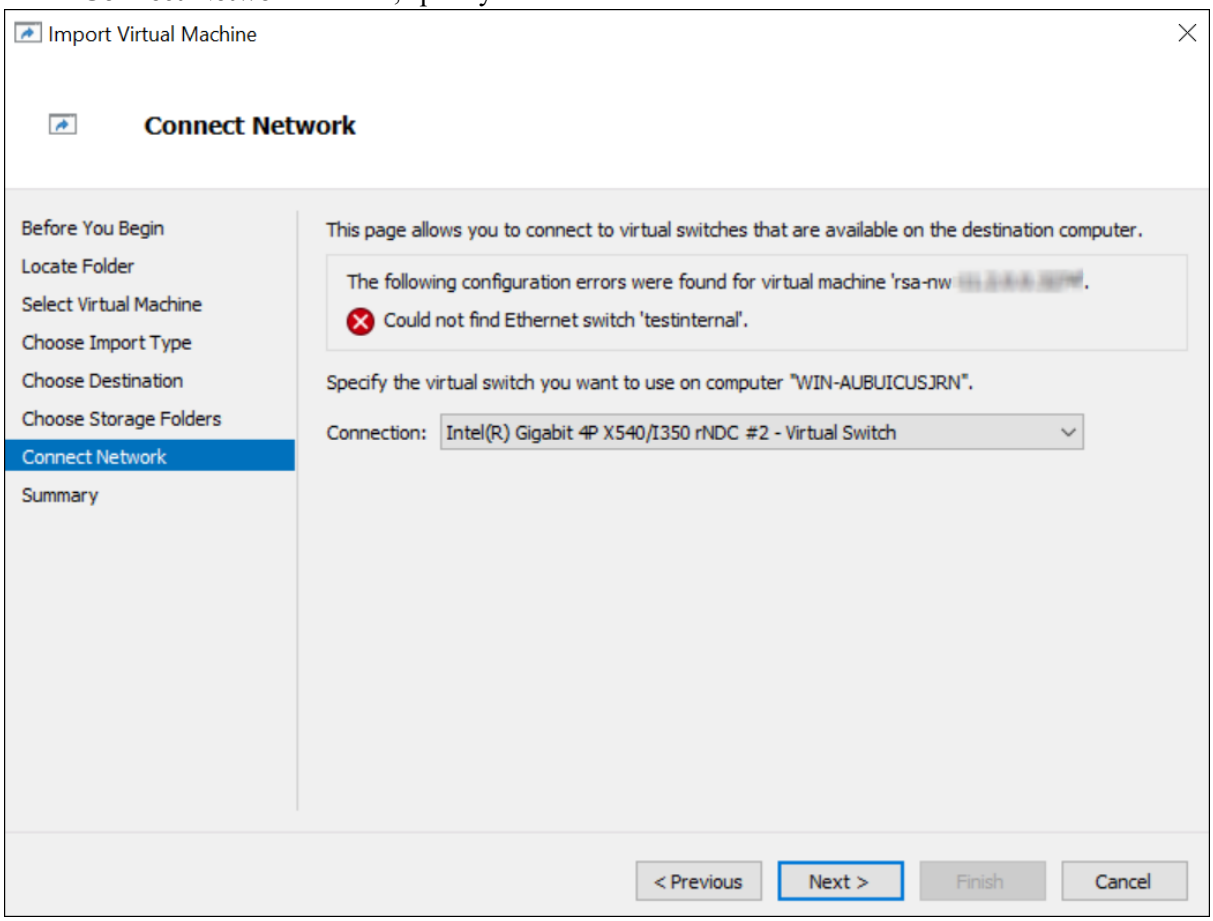
3. In the **Import Virtual Machine** dialog, specify the path where the zip file is extracted and Click **Next**.



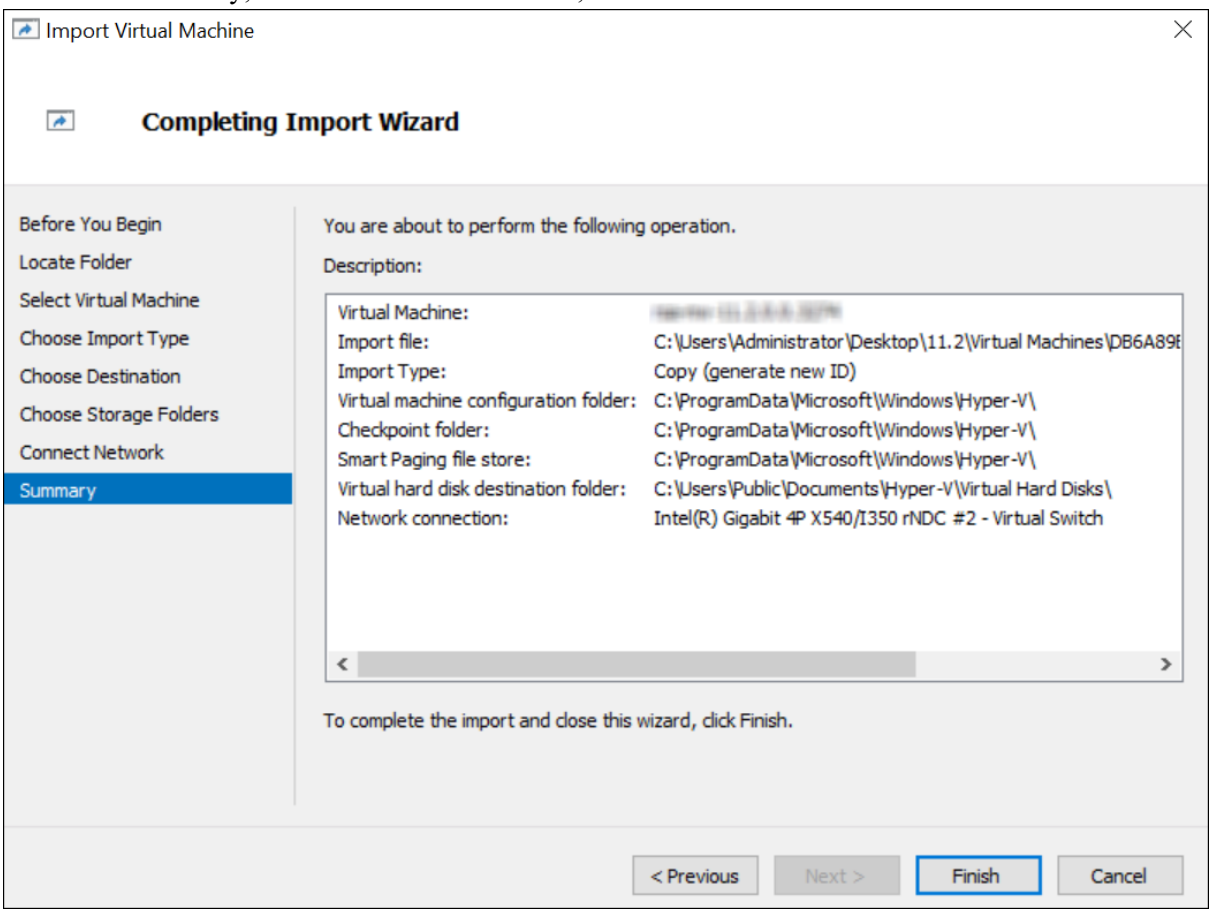
4. Select the Virtual Machine and Click **Next**.



5. Choose **copy the Virtual machine (create a new unique ID)** Import Type.



6. In the **Choose Destination** section, specify the new or existing folder to store the Virtual Machine files.



7. In the **Choose Storage Folder** section, specify the location where you want to store multiple Virtual Machine deployments.

8. In the **Connect Network** section, specify the Network name for the Virtual Machine to connect.

9. Check the Summary, if all the details are correct, click **Finish**.

Step 1c. Create Virtual Machine - Nutanix AHV

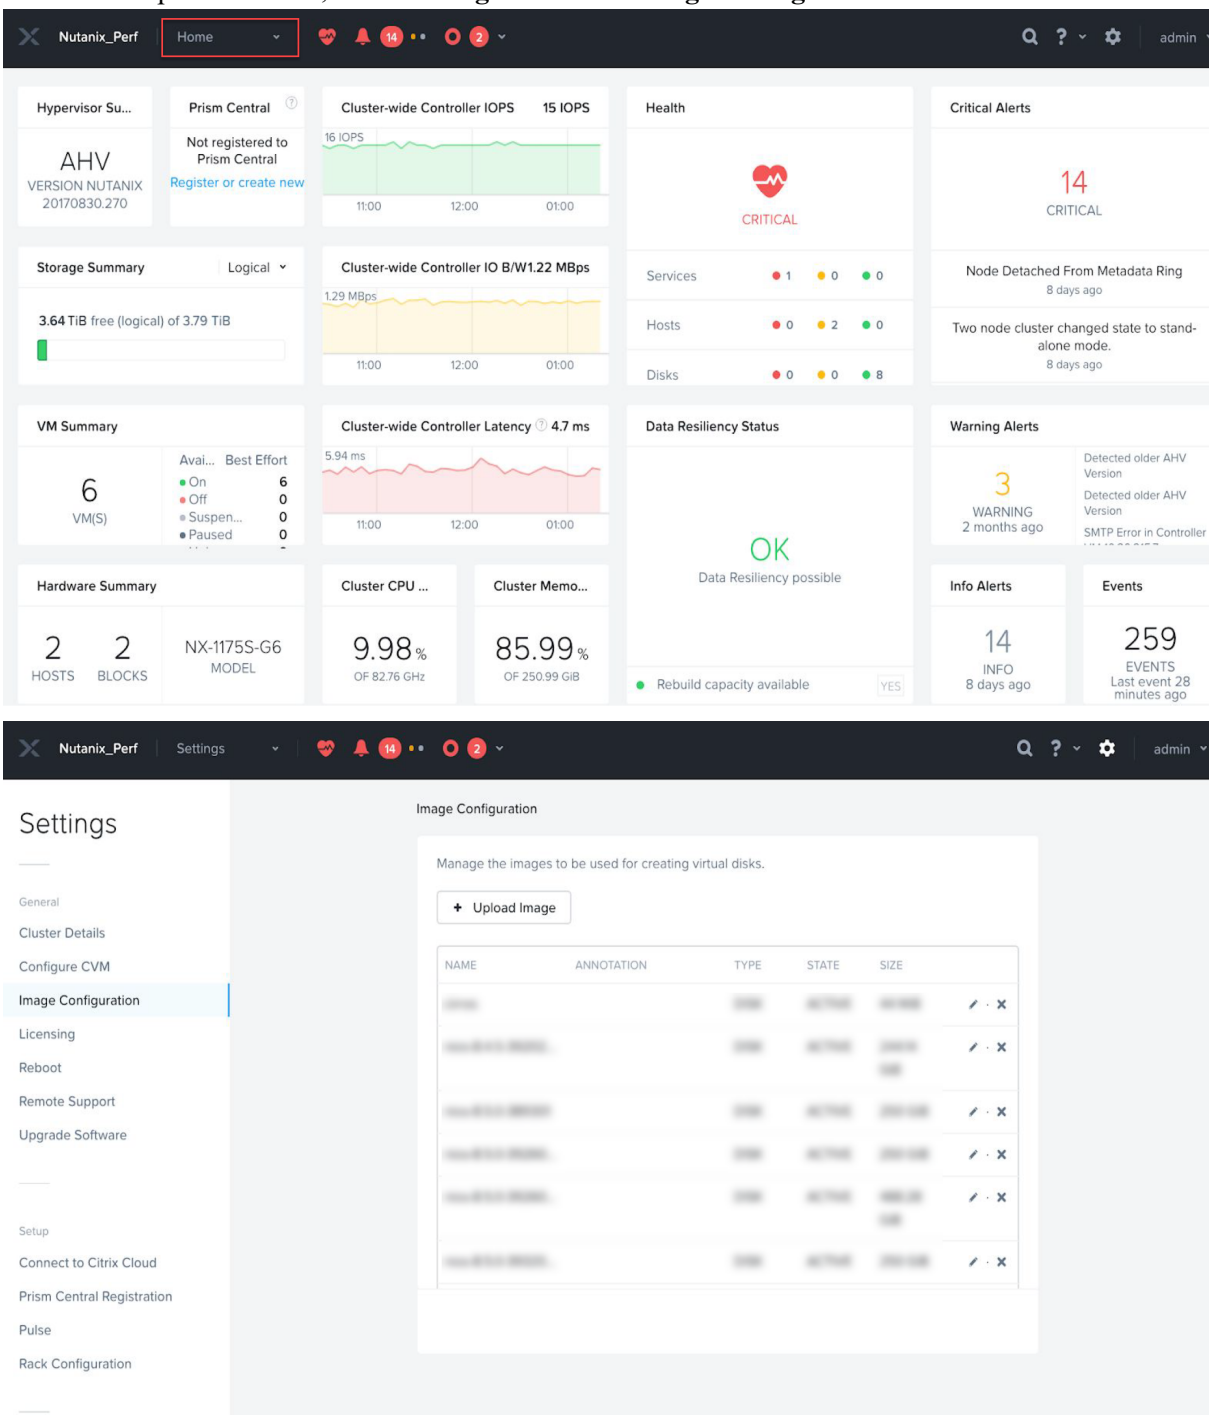
Nutanix AHV is an enterprise-ready hypervisor, offering integrated virtualization, app mobility, management, operational insights, and security. Complete the following steps according to their numbered sequence to deploy virtual host in Nutanix Acropolis Hypervisor (AHV).

Prerequisites

Make sure that you have:

- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.
- Password for virtual host access. The default username is `root` and the default password is `netwitness`.

- The NetWitness 11.5 or later ISO file which is available for download from Downloads (https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads).
- Administrative user account on Nutanix Prism.



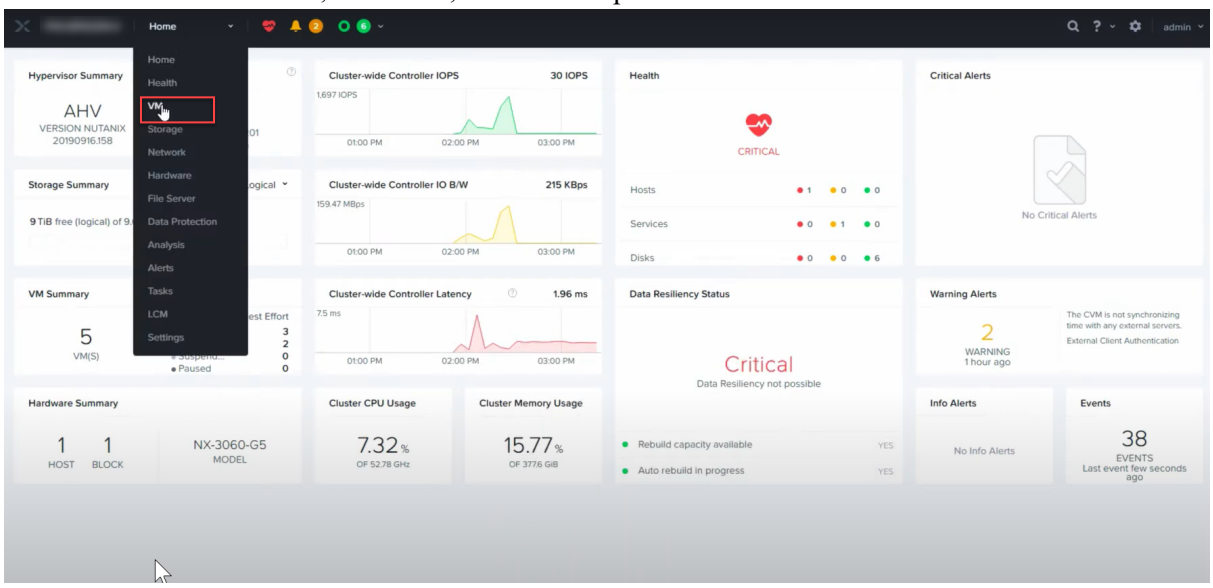
Procedure

Note: The following instructions illustrate an example of deploying a VM in the Nutanix AHV environment. The screens you see may be different from this example.

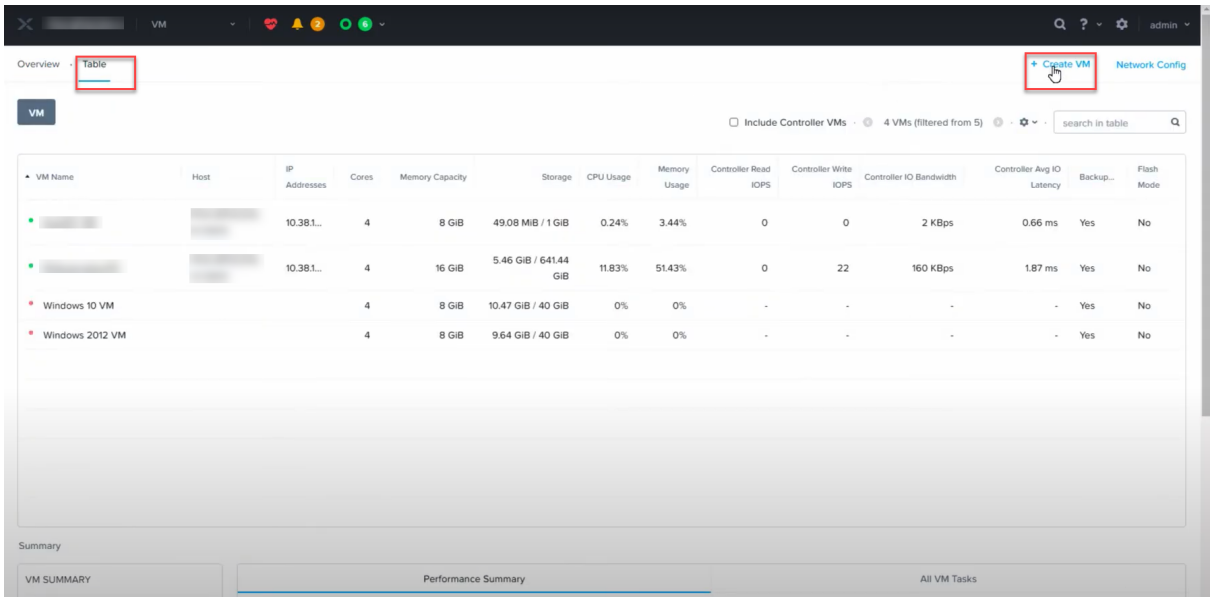
Create Image on Nutanix AHV

1. Log in to the Nutanix Prism GUI.

2. From the drop-down menu, click **Settings** and select **Image Configuration**.



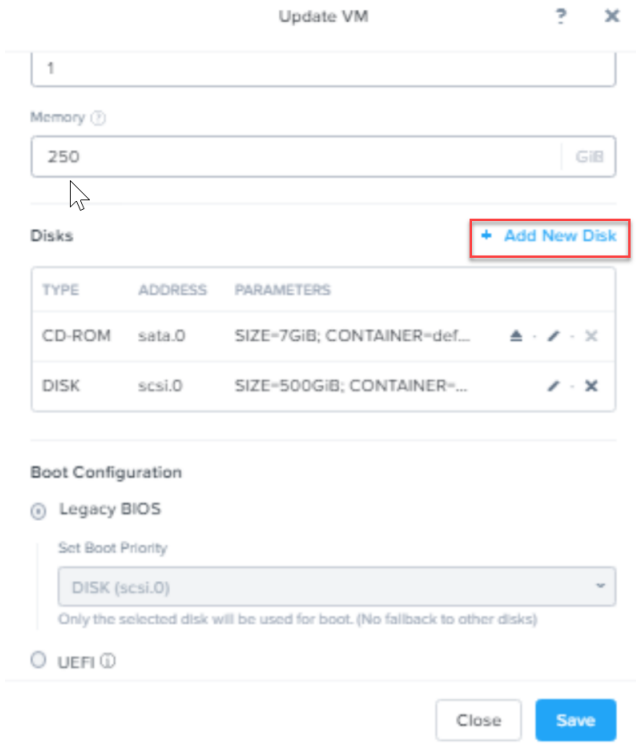
3. Click **Upload Image**.
4. In the **Create Image** dialog, select **Image Type** as **ISO**. Specify other details based on your requirements.
5. Select **Upload a file** and click **Choose File**.
6. Browse to the stored location of the NetWitness 11.5 or later ISO file and select it.

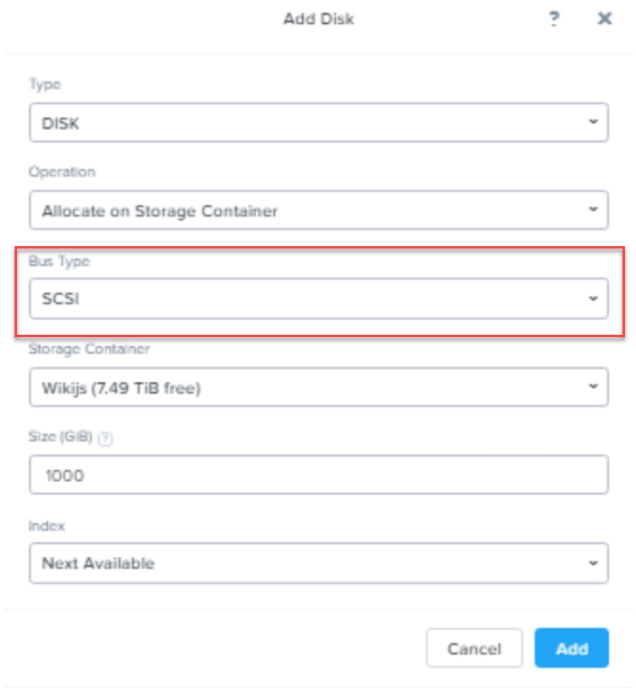


7. Click **Save**.

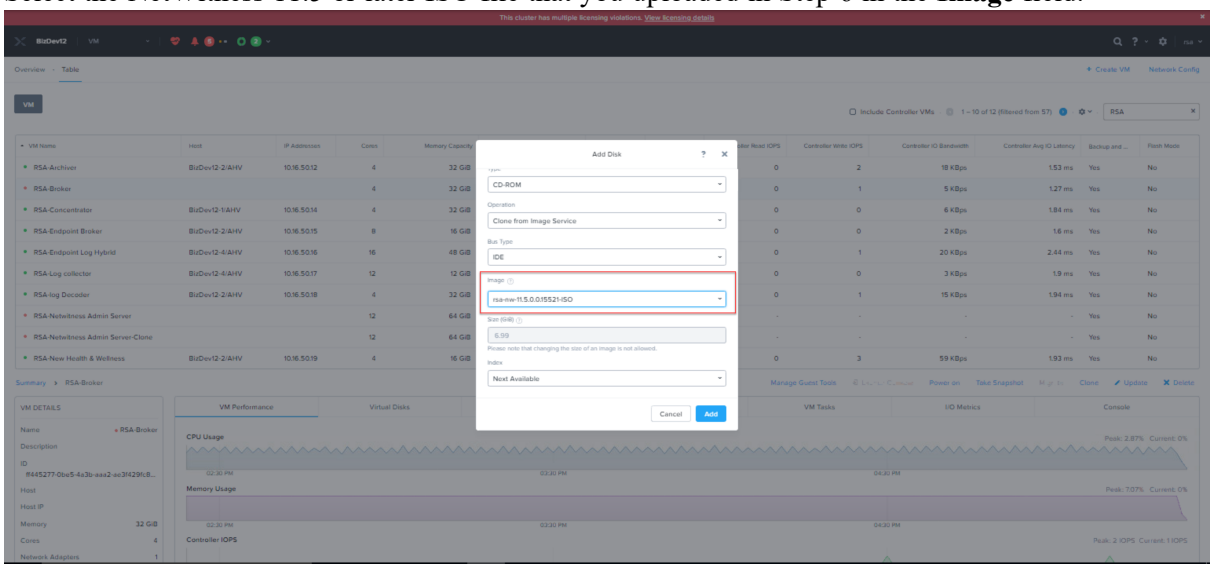
Create VM on Nutanix AHV

1. In the Nutanix Primis GUI, click **VM**, from the drop-down menu.





2. Go to the **Table** view and click **Create VM**.



3. In the **Create VM** dialog, enter the required details such as name, description, time zone, vCPU, cores per vCPU, etc. For more information, see Creating a VM (AHV) in the Prism Web Console Guide.

4. In the **Create VM** dialog, scroll down to the **Disks** section and click **Add New Disk**.

5. In the **Add Disk** dialog, do the following:
   a. Select **DISK** in the **Type** field and specify other details based on your requirement.
   b. Select **Allocate on Storage Container** in the **Operations** field.
   c. Select **SCSI** as **Bus Type**.
6. In the **Add Disk** dialog, select **CD-ROM** as the **Type**.
7. Select **Clone from Image Service** in the **Operations** field and **IDE** as **Bus Type**.
8. Select the NetWitness 11.5 or later ISO file that you uploaded in Step 6 in the **Image** field.

9. Select **Clone from Image Service** in the **Operations** field and **IDE** as **Bus Type**.
10. Click **Add** and enter other details such as adding network adapters, GPU, etc.
11. Click **Save**. You can now see your VM in the VM list.

IMPORTANT: Ensure that you eject the CD-ROM after installing the NetWitness Platform. Otherwise, every time you reboot the VM it will boot from CD-ROM.

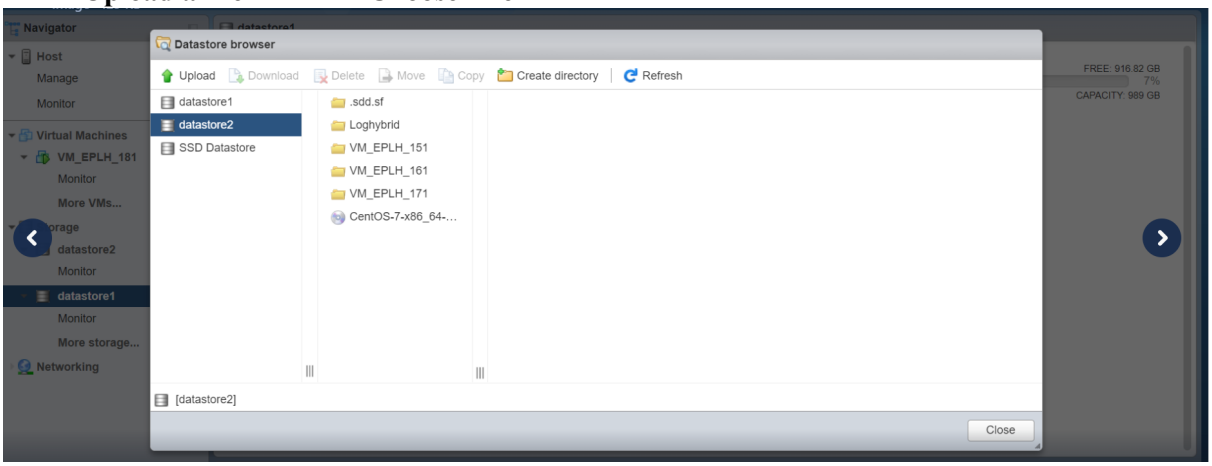
Step 1d. Create Virtual Machine in Esxi

Complete the following steps according to their numbered sequence to create the virtual machine in Esxi environment.

Prerequisites

Make sure that you have:

- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.

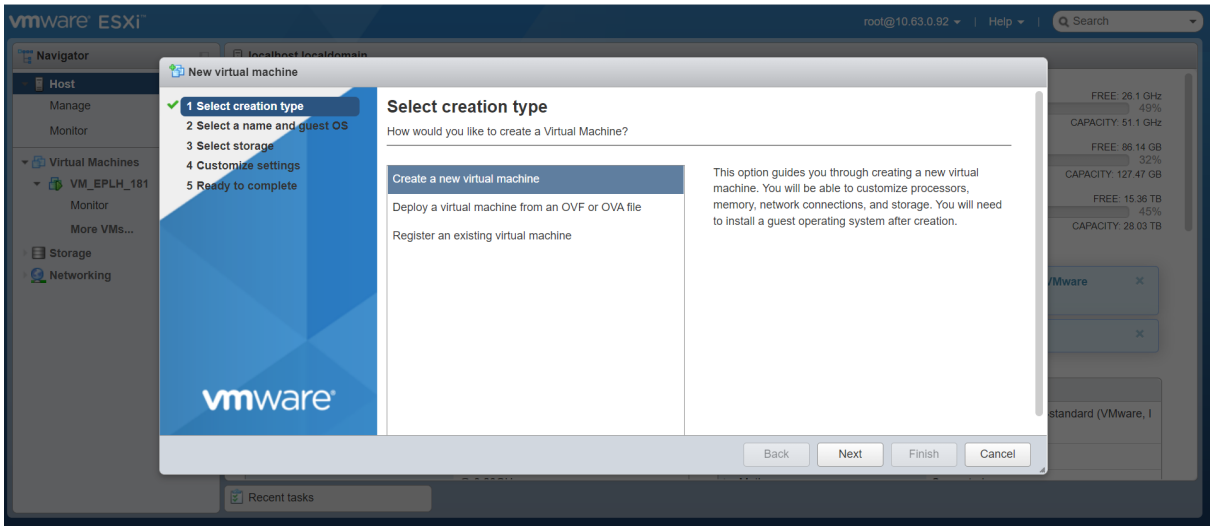


- DNS or host information.
- Password for virtual host access. The default username is `root` and the default password is `netwitness`.
- The NetWitness virtual host package file for example, `rsa-nw-11.7.0.0.3274.zip`. (You download this package from Downloads https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads)

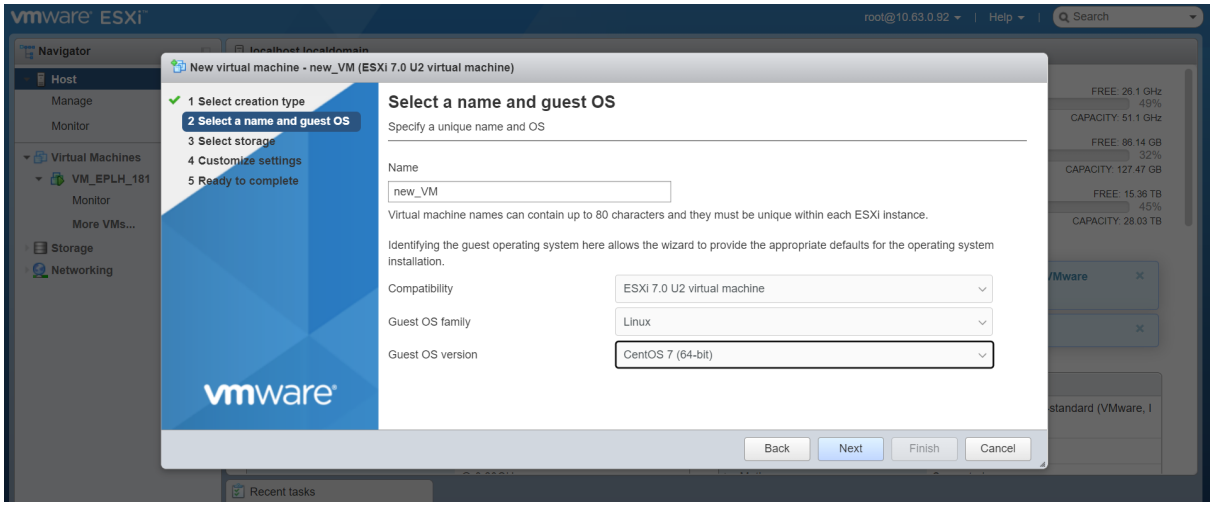
Procedure

Note: The following instructions illustrate an example of creating a VM in Esxi environment. The screens you see may be different from this example.

Create Image on Esxi

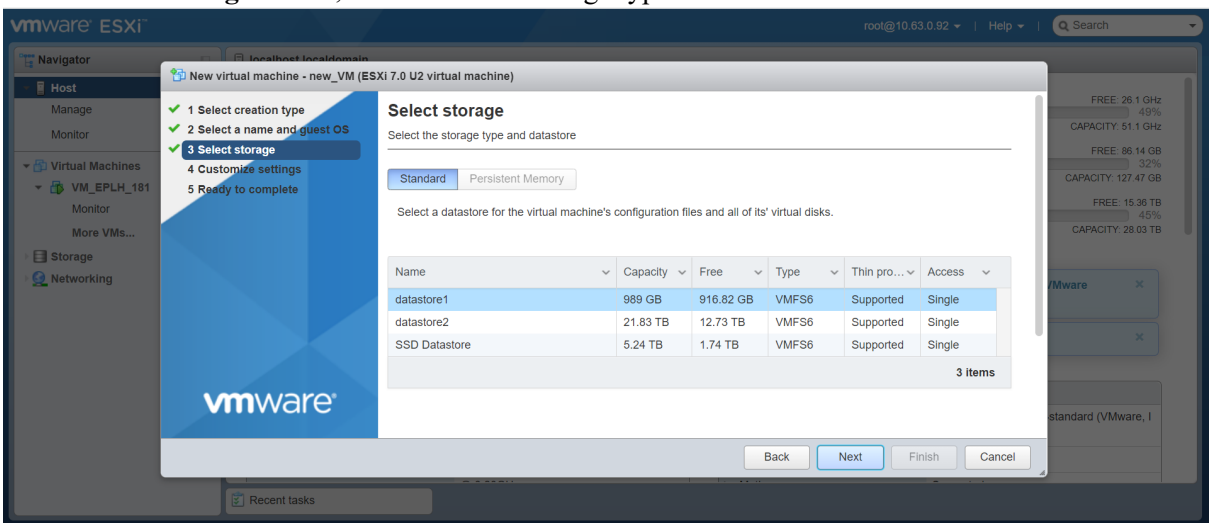


1. Log in to the Esxi GUI.
2. From the drop-down menu, click **Settings** and select **Image Configuration**.
3. Click **Upload Image**.
4. In the **Create Image** dialog, select **Image Type** as **ISO**. Specify other details based on your requirements.
5. Select **Upload a file** and click **Choose File**.

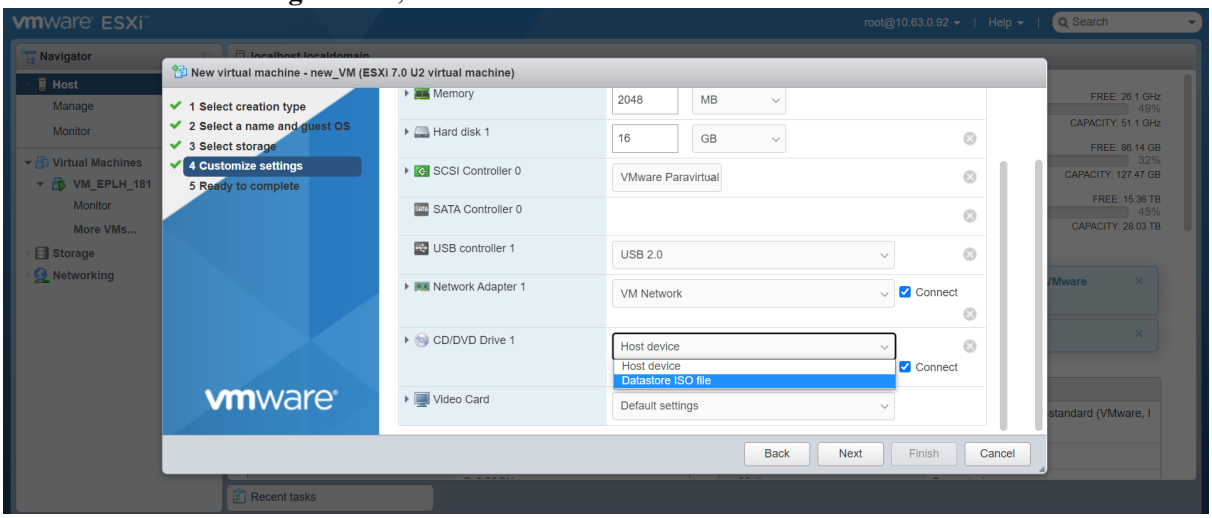


6. Browse to the stored location of the NetWitness 11.5 or later ISO file and select it.
7. Click **Save**.

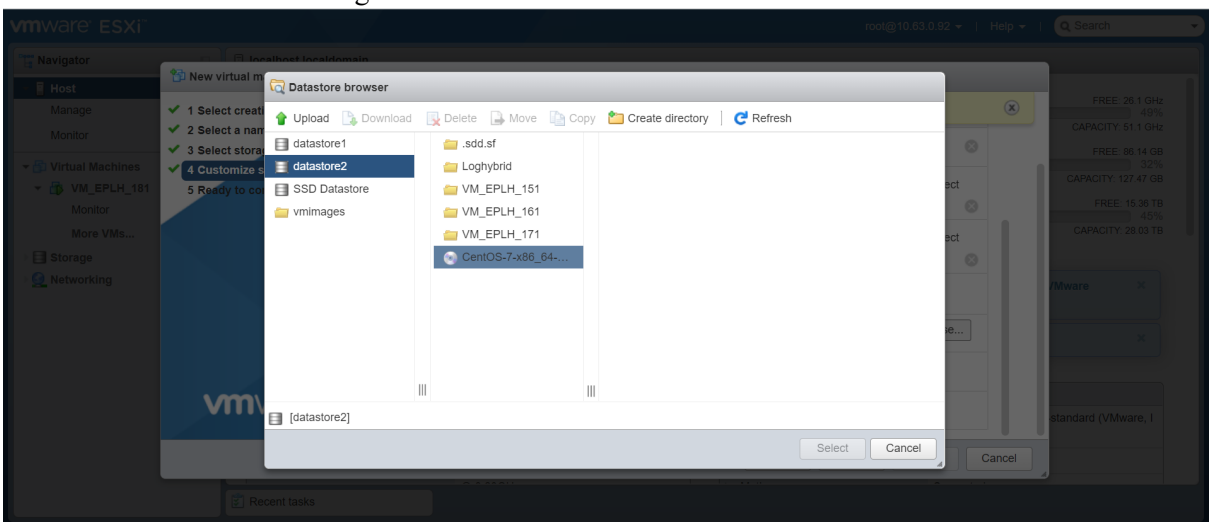
Create VM on Esxi



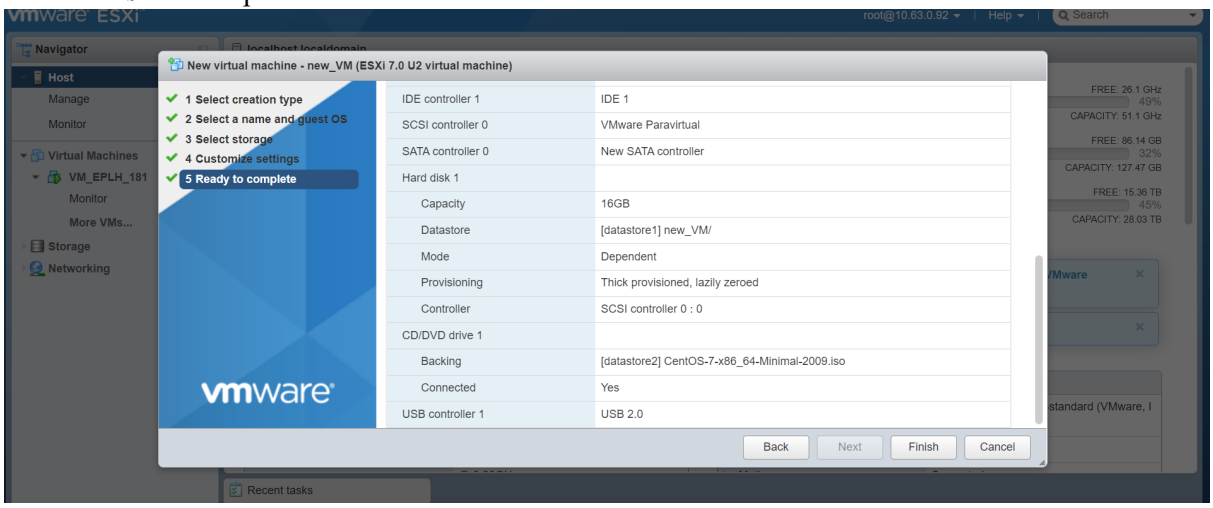
1. In the Esxi GUI, click **VM**, from the drop-down menu.
2. Go to the **Host** screen and click **Create a new virtual machine**



3. In the **Select a name and guest OS** screen, enter the required details such as name, compatibility, guest OS family, guest OS version and click **NEXT**.



4. In the **Select storage** screen, select the data storage type and click **Next**.



5. In the **Customize settings** screen, select **CD/DVD Drive 1** as **Datastore ISO file**.

6. Browse the mounted ISO image and click **Next**.

7. Click **Finish** to complete the installation.

Step 2. Configure Block Storage to Accommodate NetWitness Platform

When you deploy databases from OVA or VHDX, the initial database space allocation is not adequate for production environment. You need to add or expand the datastores volume after installation.

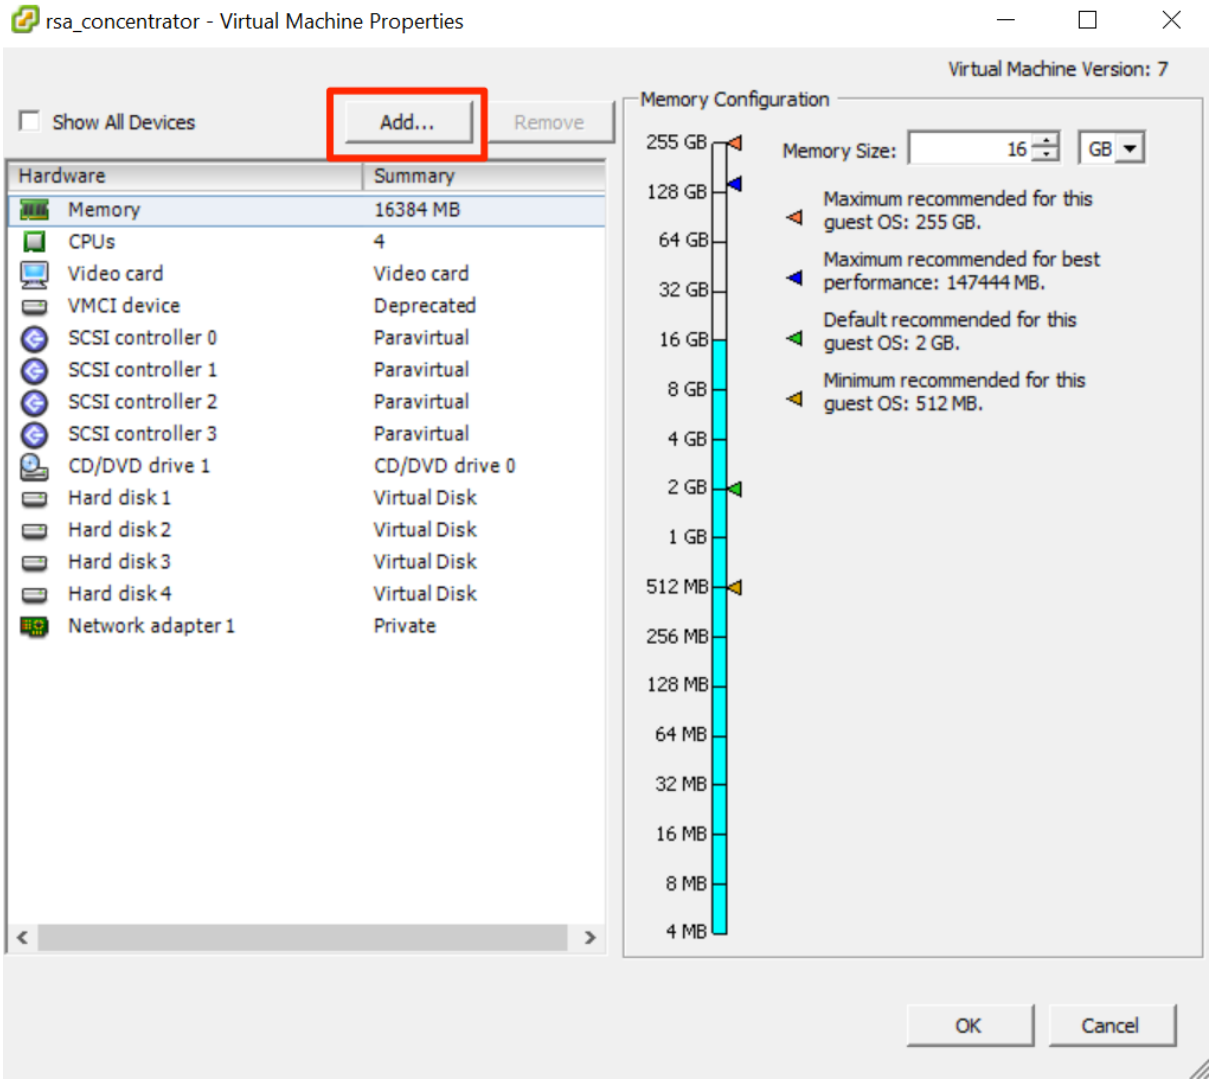
Task 1. Add New Disk

Get familiar with the NetWitness® Platform Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see Storage Guide for NetWitness Platform 11.x

Add New Disk

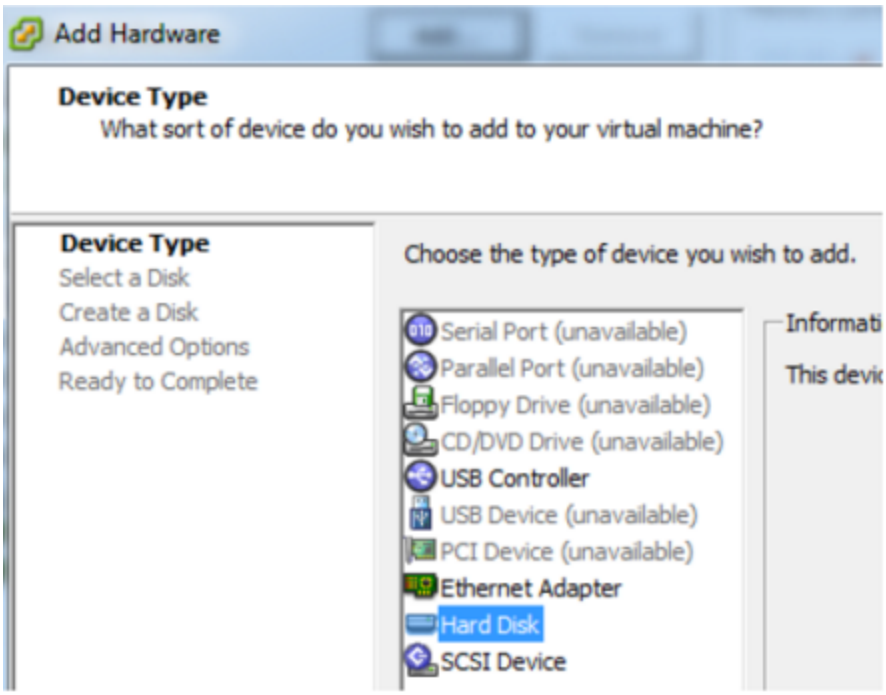
Add New Disk in VMware ESXi

Add New Disk in Hyper-V



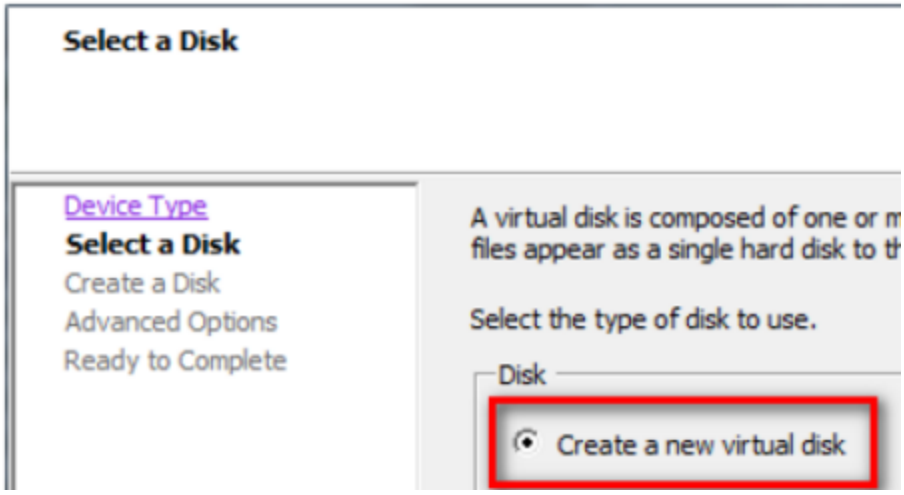
Add New Disk in Nutanix AHV

Add New Disk in VMware ESXi



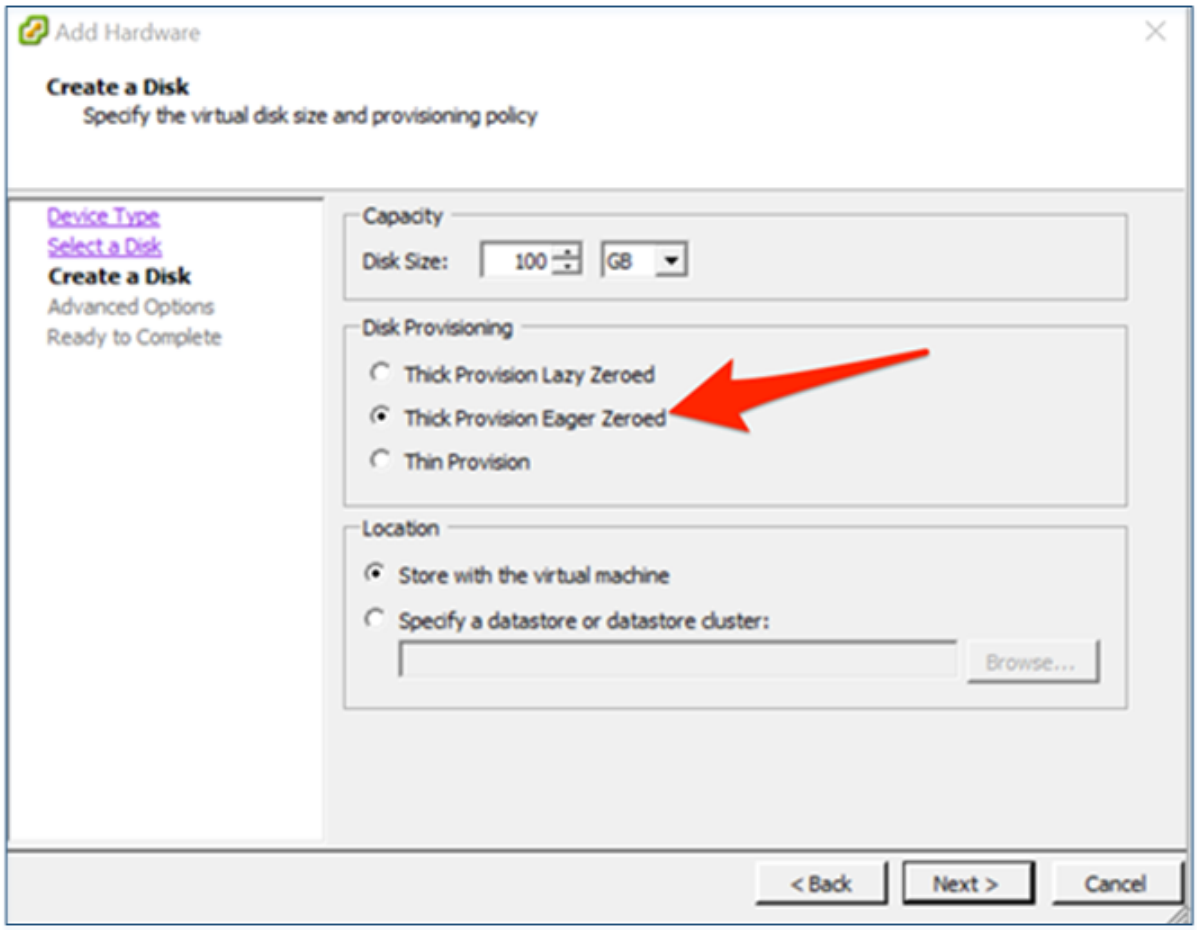
This procedure shows you how to add a new 100 GB disk on the same datastore.

Note: The procedure to add a disk on different datastore is similar to the procedure shown here.

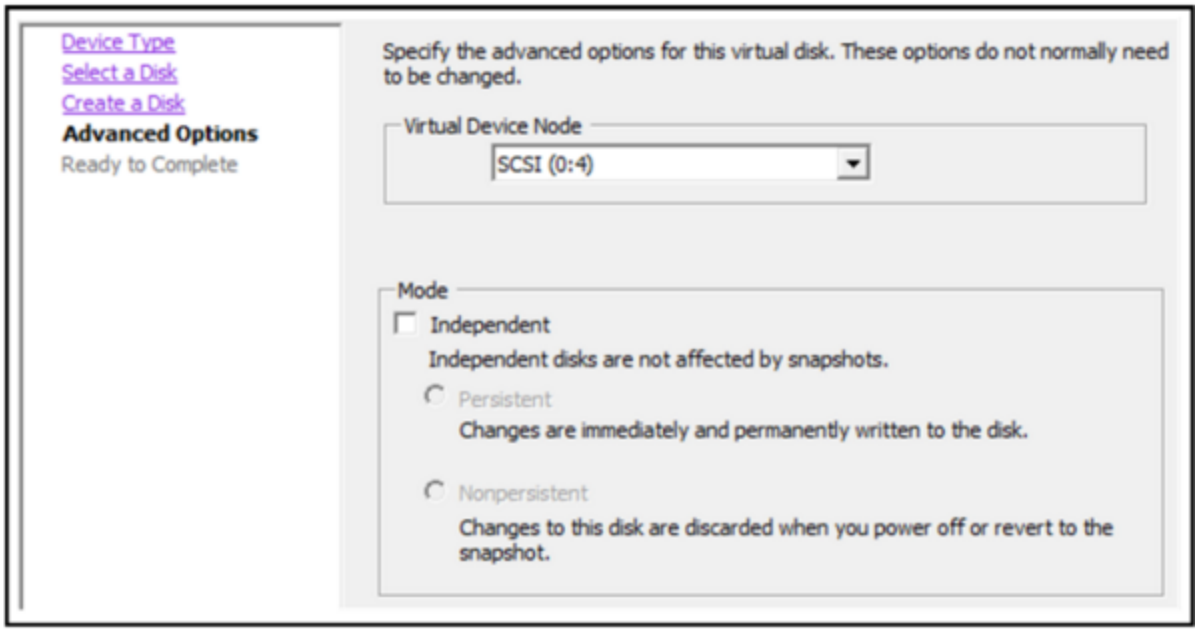


1. Shut down the machine, edit **Virtual Machine Properties**, click **Hardware** tab, and click **Add**.

2. Select **Hard Disk** as the device type.

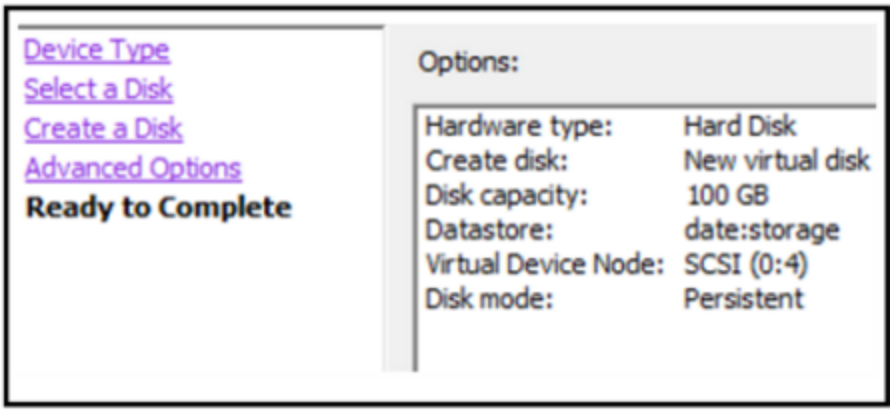


3. Select **Create a new virtual disk**.

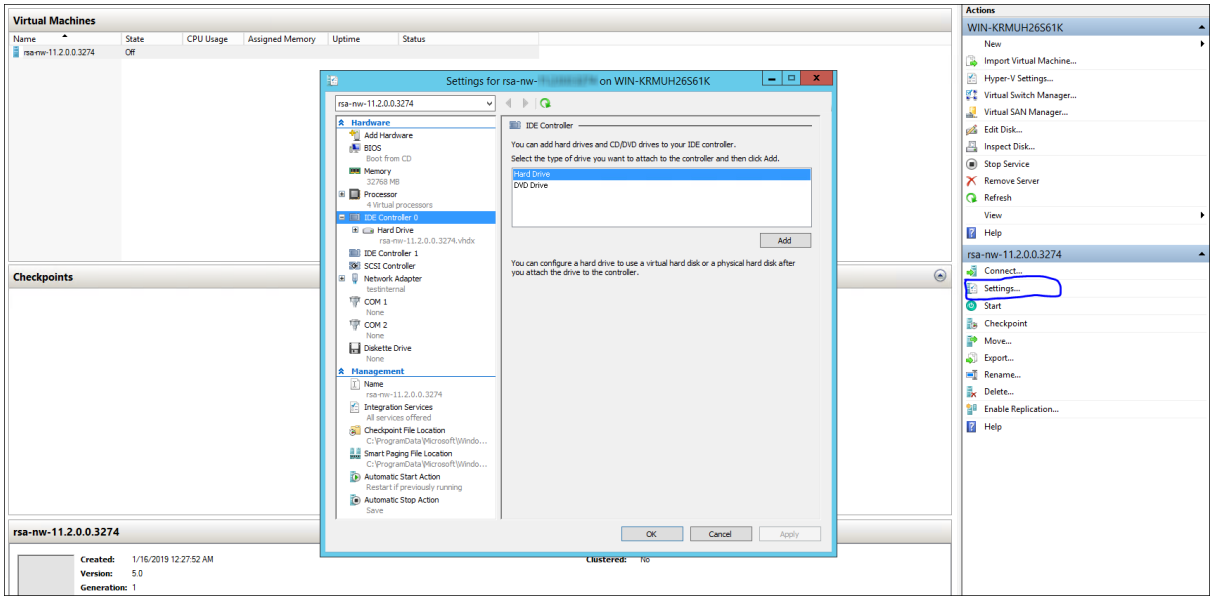


4. Choose the size of the new disk and where you want to create it (on the same datastore or a different datastore).

Note: Choose data provisioning based on your requirements

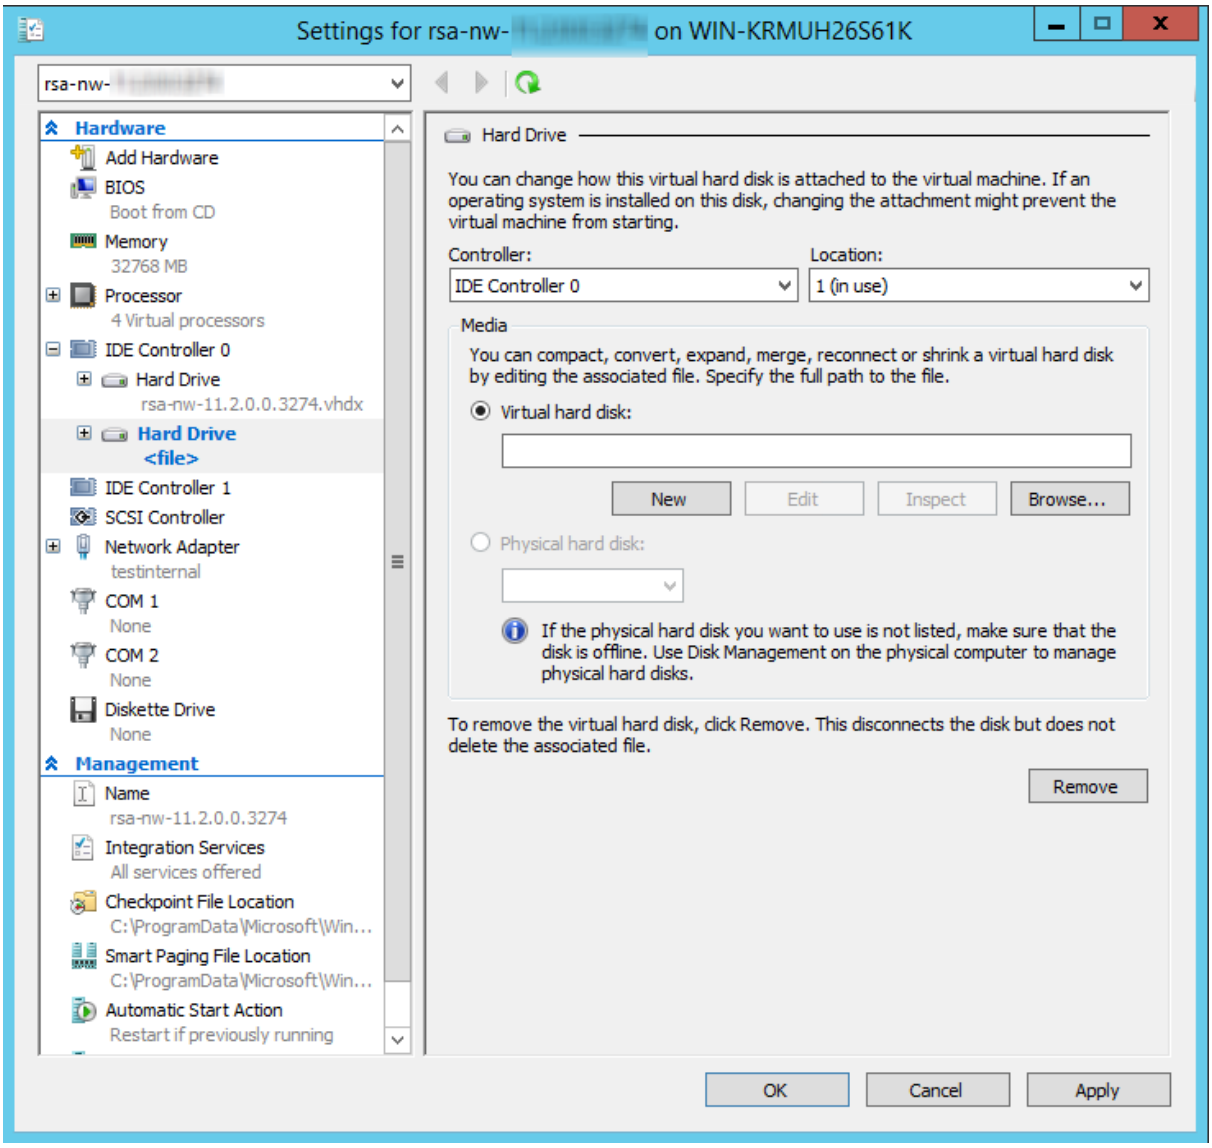


5. Approve the proposed Virtual Device Node.

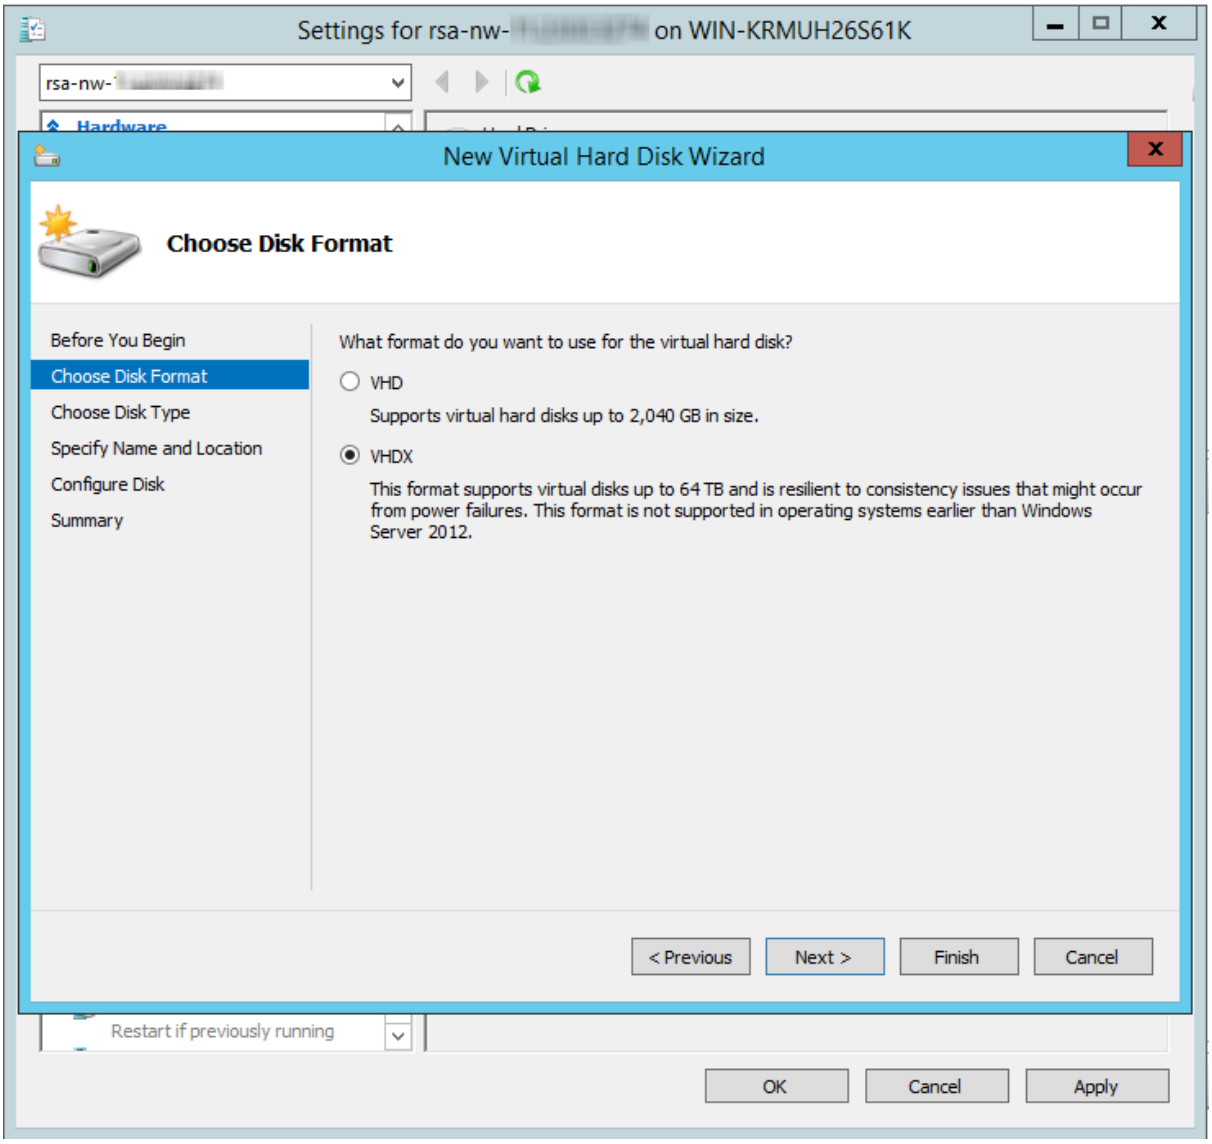


Note: The Virtual Device Node can vary, but it is pertinent to `/dev/sdX` mappings.

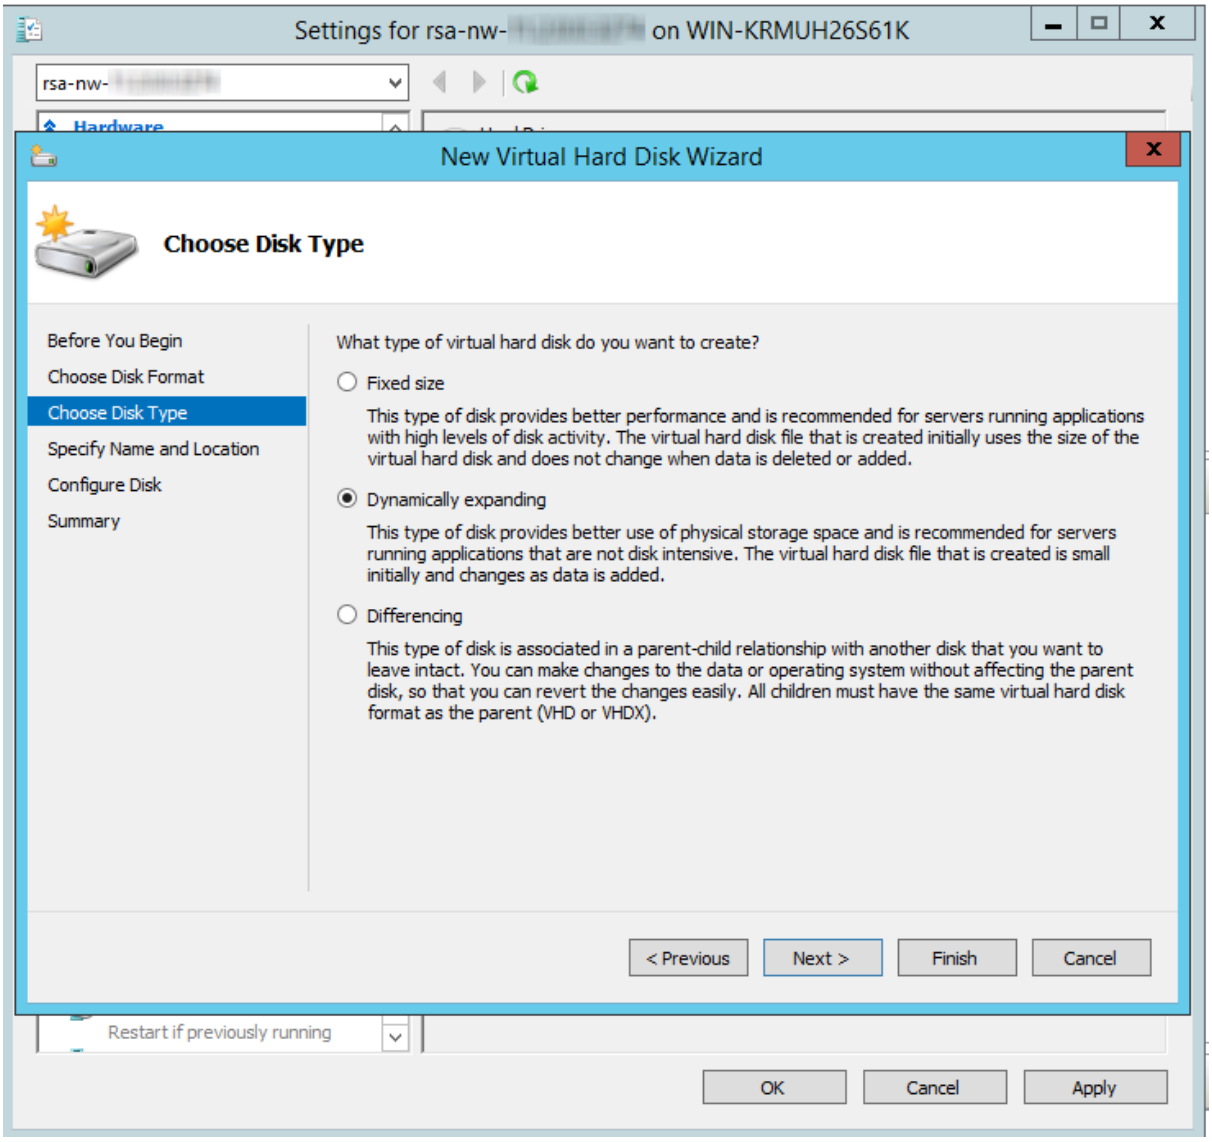
6. Confirm the settings.



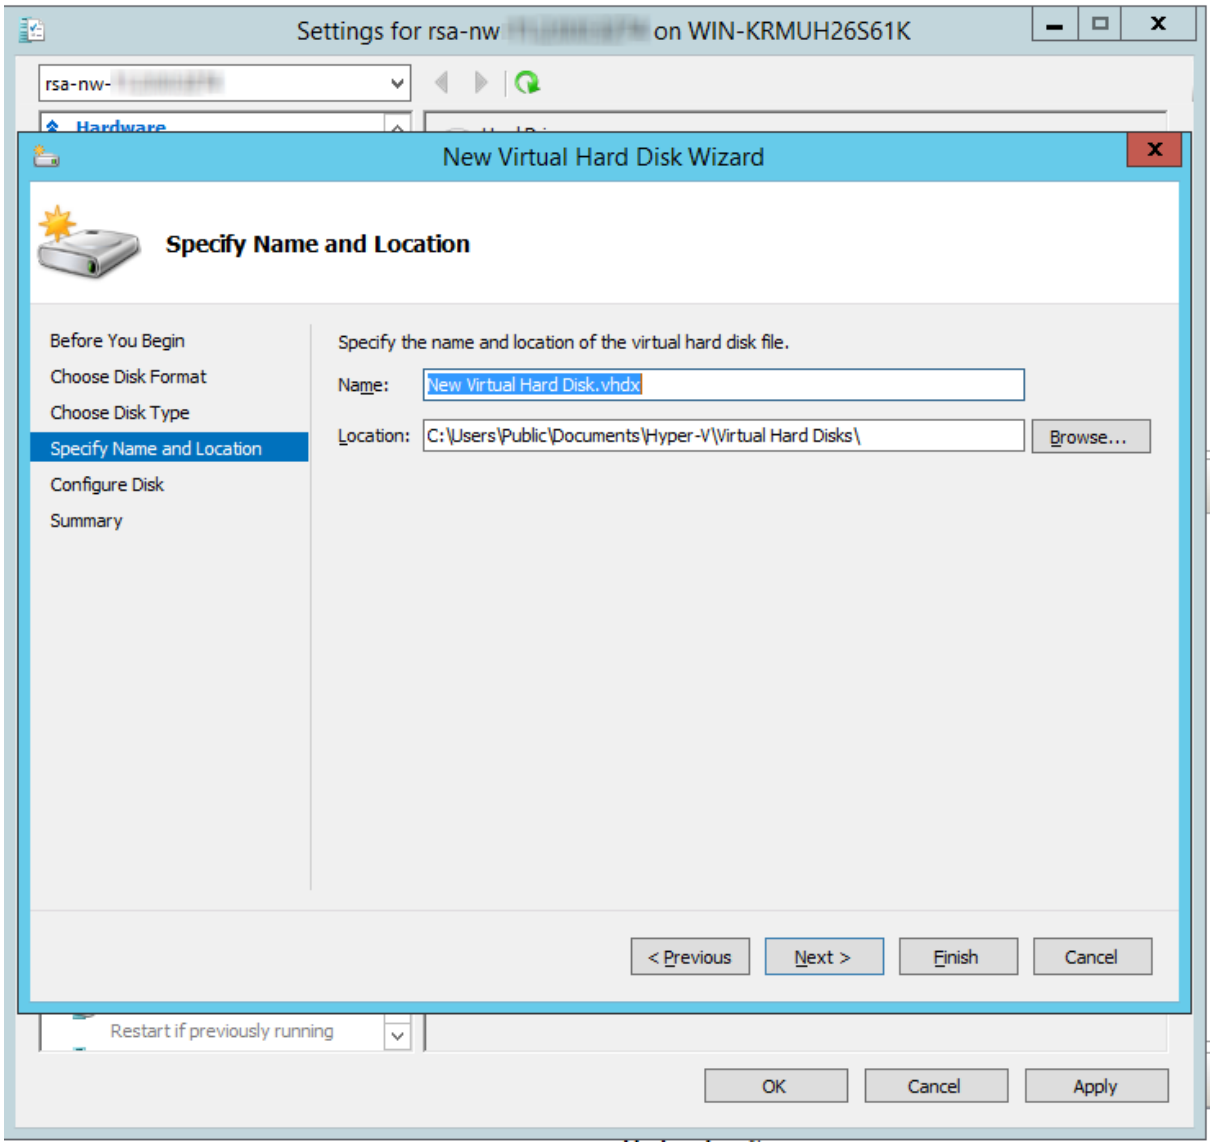
Add New Disk in Hyper-V



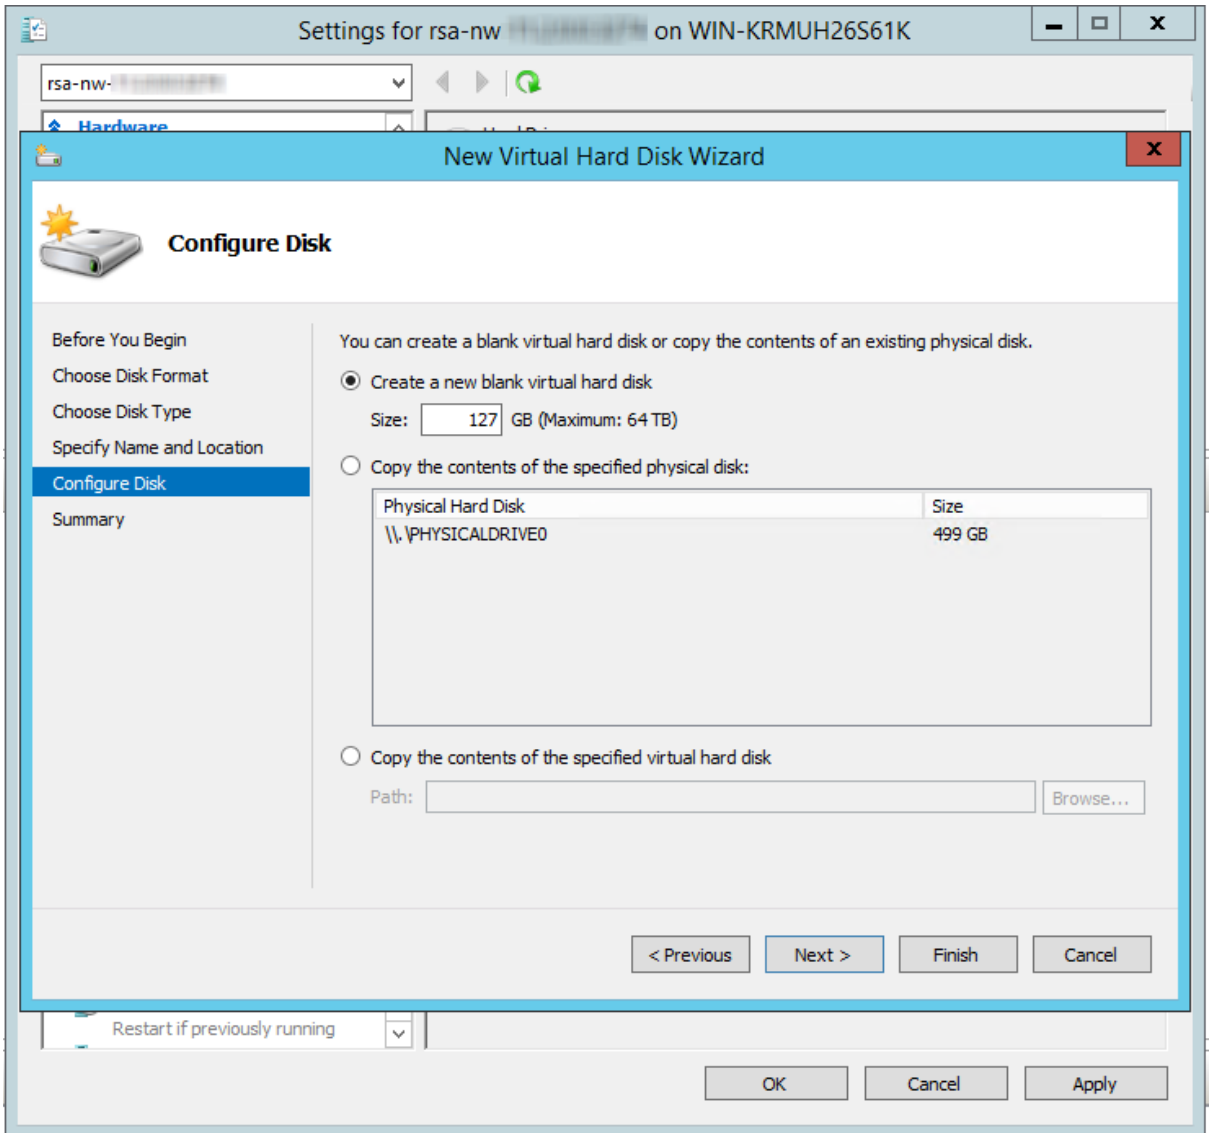
1. Shut down the VM and click **Settings and IDE Controller**, select the **Hard Drive** and click **Add**.



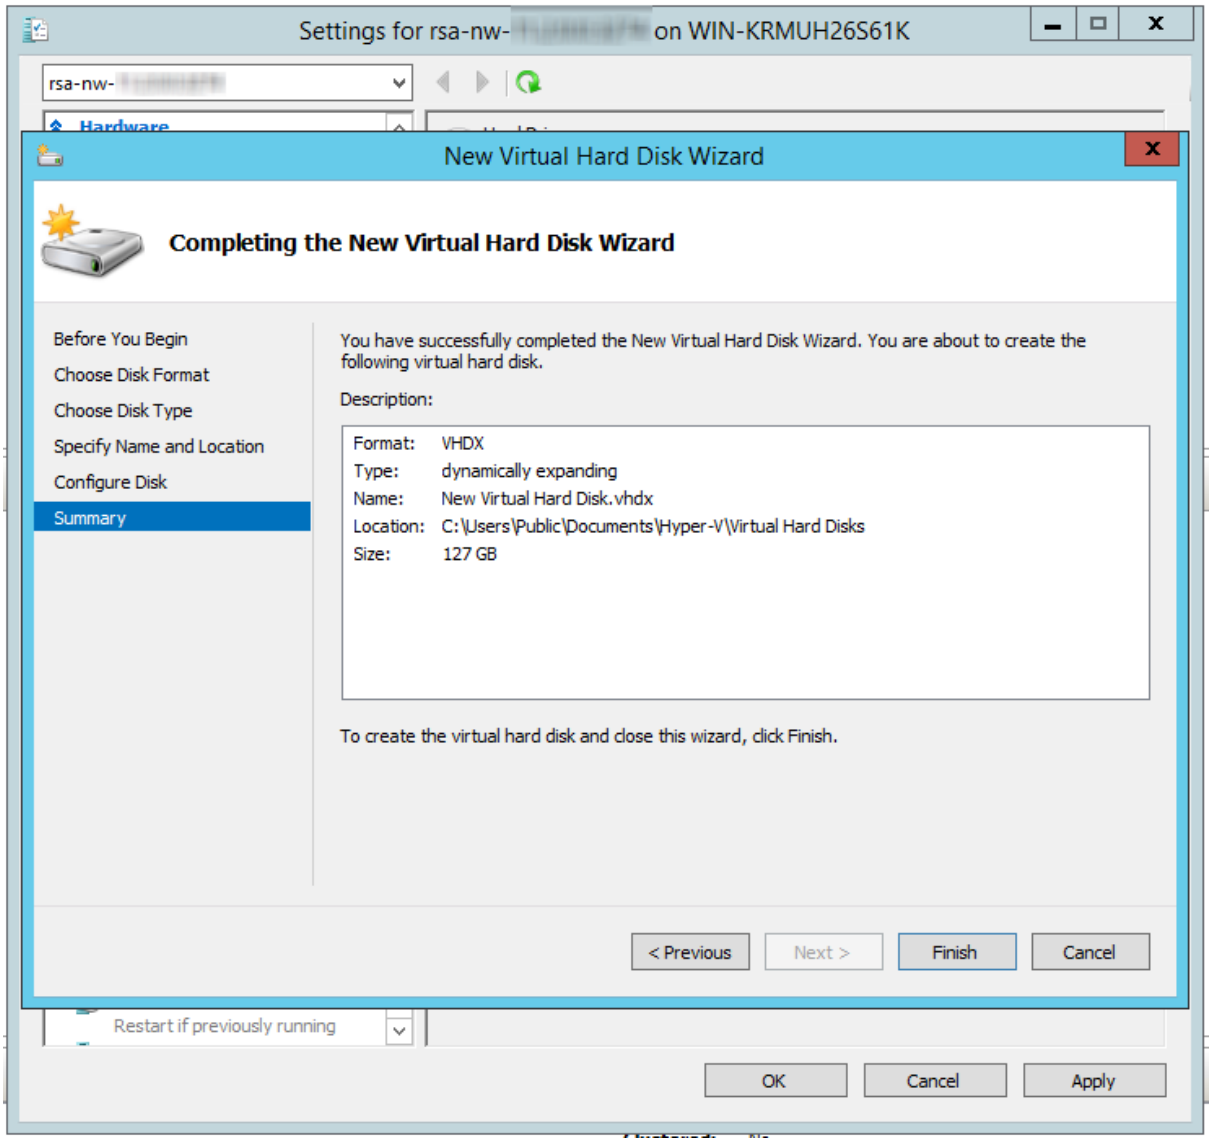
2. Select the New Virtual Hard disk.



3. Select **VHDX** as a disk format.



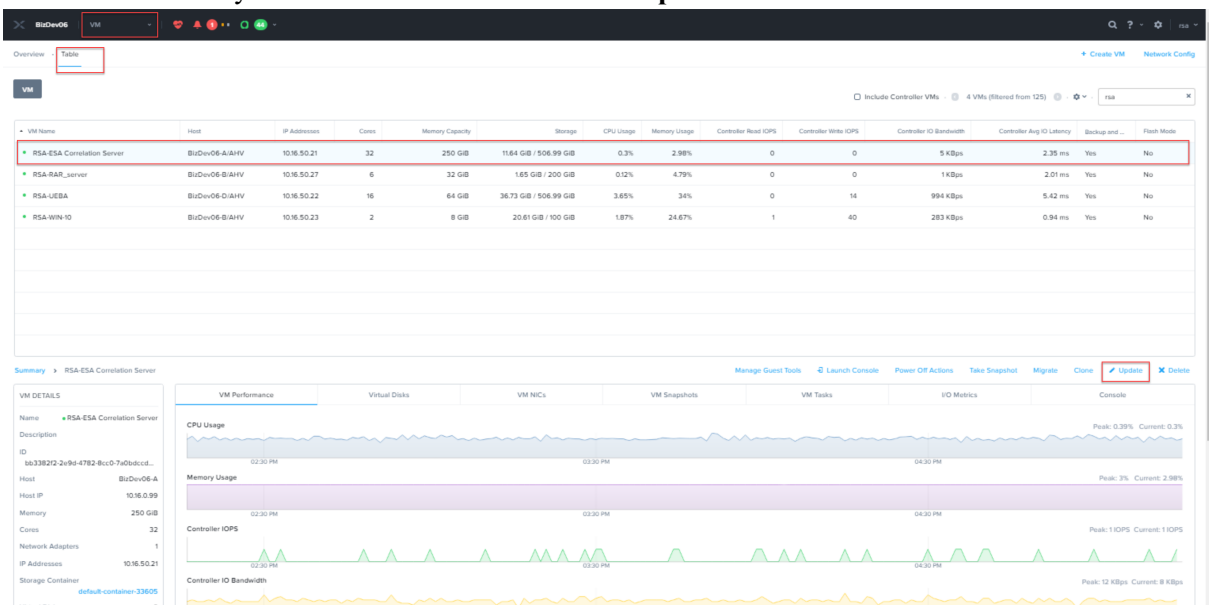
4. Select **Dynamically expanding** as a disk type.



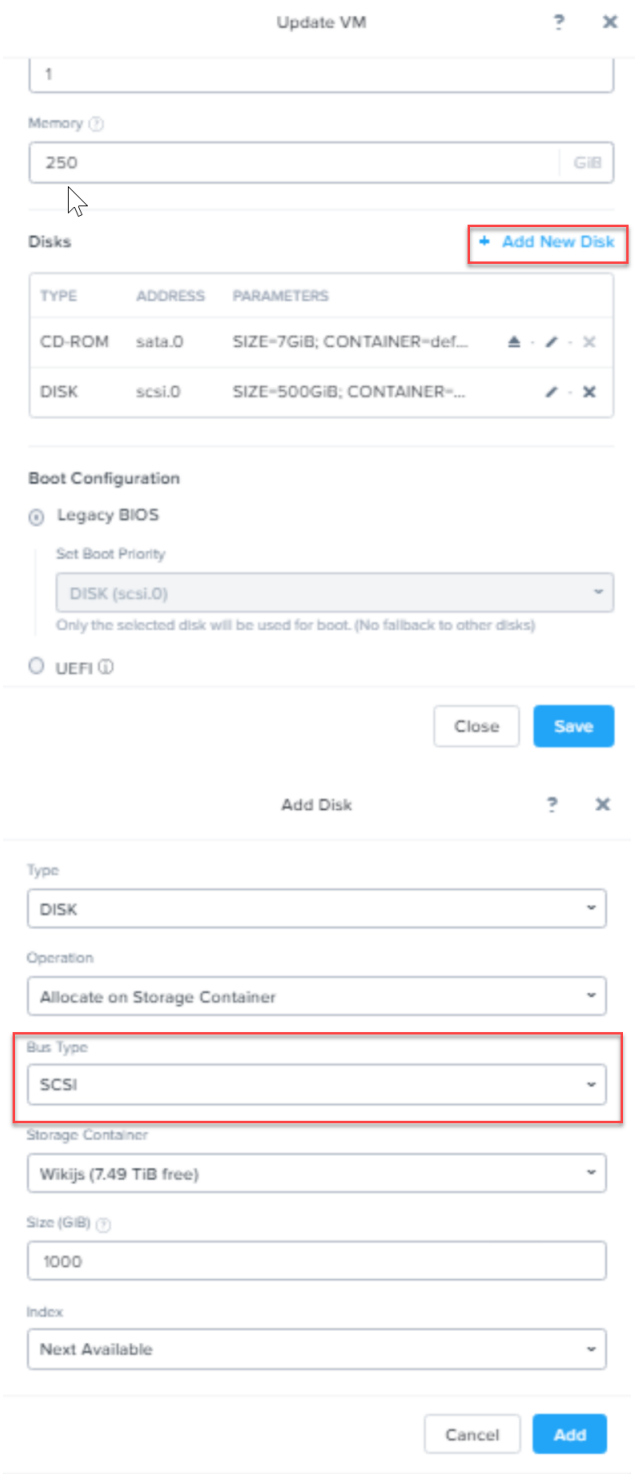
5. Specify the **Name** and **Location** of the virtual hard disk file.

6. Select **create a new blank virtual hard disk** and specify the size.

7. In the **Summary**, review the settings and click **Finish**.



Add New Disk in Nutanix AHV



Perform the following steps to add a new disk to your Nutanix AHV VM.

1. Log in to the Nutanix Prism GUI.
2. From the drop-down menu, click **VM** and select the **Table** view.

3. Select the VM that you want to add disk to and click **Update**.

4. In the **Update VM** dialog, scroll down to the **Disks** section and click **Add New Disk**.

5. In the **Add Disk** dialog, do the following:
   a. Select **DISK** in the **Type** field and specify other details based on your requirement.
   b. Select **Allocate on Storage Container** in the **Operations** field.

c. Select **SCSI** as **Bus Type**.

6. Click **Add**.
7. In the **Update VM** dialog, click **Save**.

Task 2. Add New Volume and Extend Existing File Systems

Following commands are commonly used for the file extension.

- `/dev/sdc` for extending `nw-home` or `/var/netwitness.`
- `/dev/sdd` for creating `/var/netwitness/xxxxxx`.
- `/dev/<>` for creating `/var/netwitness/xxxxxx/metadb`.
- `/dev/<>` for creating `/var/netwitness/xxxxx/sessiondb`.
- `/dev/sde` for creating `/var/netwitness/xxxxx/index`.

Note: The number of `/dev/<>` varies based on the retention days or the number of disks attached.

Admin Server

NetWitness recommended partition for AdminServer (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	2TB	SSD

Attach external disk for extension of `/var/netwitness/` (refer to the steps in attaching the disk) partition. Create an additional disk with suffix as `nwhome`.

Follow these steps:

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, for example if you attach one 2TB disk.
3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.
5. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome .`

or,

`lvextend -l +100%FREE /dev/netwitness_vg00/nwhome`.

6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

ESAPrimary/ESASecondary/Malware

NetWitness recommended partition for ESAPrimary/ESASecondary/Malware (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	6TB	HDD

Attach external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as nwhome.

Follow these steps:

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, for example, if you attach one 6TB disk.
3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.
5. `lvextend -L 5.9T /dev/netwitness_vg00/nwhome`.
6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

Log Collector

NetWitness recommends the following partition for the LogCollector (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	500GB	HDD

Attach an external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as `nwhome`.

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, for example if you attach one 500GB disk.
3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.
5. `lvextend -L 488G /dev/netwitness_vg00/nwhome`.
6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

Log Decoder

Virtual Drive Space Ratios

The following table provides optimal configurations for packet and log hosts.

Log Decoder			
Persistent Datastores		Cache Datastore	
PacketDB	SessionDB	Meta DB	Index

100% as calculated by Sizing & Scoping Calculator	1 GB per 1000 EPS of traffic sustained provides 8 hours cache	20 GB per 1000 EPS of traffic sustained provides 8 hours cache	0.5 GB per 1000 EPS of traffic sustained provides 4 hours cache

Extending File Systems

Follow the below instructions to extend the file systems.

Attach an external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as nwhome, attach other external disks for LogDecoder database partition. For extending `/var/netwitness` partition, follow these steps:

Note: No other partition should reside on this volume, only to be used for `/var/netwitness/`

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, suppose if you had add attach one 2TB disk.
3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.
5. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`.

or,

`lvextend -l +100%FREE /dev/netwitness_vg00/nwhome`.

6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

Other partitions are also required. Create the following partitions on the logdecodersmall volume group.

Folder	LVM	Volume Group
`/var/netwitness/logdecoder`	`decoroot`	`logdecodersmall`
`/var/netwitness/logdecoder/index`	`index`	`logdecodersmall`
/var/netwitness/logdecoder/metadb	metadb	logdecodersmall
`/var/netwitness/logdecoder/sessiondb`	`sessiondb`	`logdecodersmall`

Follow these steps to create the partitions mentioned in the table above:

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sdd`.
3. `vgcreate -s 32 logdecodersmall /dev/sdd`.
4. `lvcreate -L <disk_size> -n <lvm_name> logdecodersmall`.
5. `mkfs.xfs /dev/logdecodersmall/<lvm_name>`.
6. Repeat steps 4 and 5 for all the LVM's mentioned.

The following partition should be on volume group LogDecoder.

Folder	LVM	Volume Group
/var/netwitness/logdecoder/packetdb	packetdb	logdecoder

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sde`.
3. `vgcreate -s 32 logdecoder /dev/sde`.
4. `lvcreate -L <disk_size> -n packetdb logdecoder`.
5. `mkfs.xfs /dev/logdecoder/packetdb`.

NetWitness recommends below sizing partition for LogDecoder (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
/dev/netwitness_vg00/nwhome	/var/netwitness/	1TB	HDD
/dev/logdecodersmall/decoroot	/var/netwitness/logdecoder	10GB	HDD
/dev/logdecodersmall/index	/var/netwitness/logdecoder/index	30GB	HDD
/dev/logdecodersmall/metadb	/var/netwitness/logdecoder/metadb	3TB	HDD
/dev/logdecodersmall/sessiondb	/var/netwitness/logdecoder/sessiondb	370GB	HDD
/dev/logdecoder/packetdb	/var/netwitness/logdecoder/packetdb	18TB	HDD

Create each directory and mount the LVM on it in a serial manner, except /var/netwitness which will be already created.

Note: Create the folder `/var/netwitness/logdecoder` and mount on `/dev/logdecodersmall/decoroot` then create the other folders and mount them.

After that add the below entries in `/etc/fstab` in the same order and mount them using `mount -a`.

```
/dev/logdecodersmall/decoroot /var/netwitness/logdecoder xfs noatime,nosuid 1 2
/dev/logdecodersmall/index /var/netwitness/logdecoder/index xfs noatime,nosuid 1 2
/dev/logdecodersmall/metadb /var/netwitness/logdecoder/metadb xfs noatime,nosuid 1 2
/dev/logdecodersmall/sessiondb /var/netwitness/logdecoder/sessiondb xfs noatime,nosuid 1 2
/dev/logdecoder/packetdb /var/netwitness/logdecoder/packetdb xfs noatime,nosuid 1 2
```

Concentrator

Virtual Drive Space Ratios

The following table provides optimal configurations for packet and log hosts.

Concentrator		
Persistent Datastores	Cache Datastores	
Meta DB	SessionDB Index	Index
Calculated as 10% of the PacketDB required for a 1:1 retention ratio	30 GB per 1TB of PacketDB for standard multi protocol network deployments as seen at typical internet gateways	5% of the calculated MetaDB on the Concentrator. Preferred High Speed Spindles or SSD for fast access

Log Concentrator		
Persistent Datastores	Cache Datastores	
Meta DB	SessionDB Index	Index
Calculated as 100% of the PacketDB required for a 1:1 retention ratio	3 GB per 1000 EPS of sustained traffic per day of retention	5% of the calculated MetaDB on the Concentrator. Preferred High Speed Spindles or SSD for fast access

Extending File Systems

Attach external disk for extension of `/var/netwitness/` partition, Create an external disk with suffix as `nwhome`, attach other external disks for Concentrator database partition.

For extending `/var/netwitness` partition follow below steps:

Note: No other partition should reside on this volume, only to be used for `/var/netwitness/`.

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, for example if you attach one 2TB disk.
3. `pvcreate /dev/sdc` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.
5. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`.

or,

`lvextend -l +100%FREE /dev/netwitness_vg00/nwhome`.

6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

The following partitions are also required on volume group concentrator.

Folder	LVM	Volume Group
/var/netwitness/concentrator	root	concentrator
/var/netwitness/concentrator/sessiondb	sessiondb	concentrator
/var/netwitness/concentrator/metadb	metadb	concentrator

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sdd`.
3. `vgcreate -s 32 concentrator /dev/sdd`.
4. `lvcreate -L <disk_size> -n <lvm_name> concentrator`.
5. `mkfs.xfs /dev/concentrator/<lvm_name>`.
6. Repeat steps 4 and 5 for all the LVM's mentioned.

Below partition should be on volume group index.

Folder	LVM	Volume Group
/var/netwitness/concentrator/index	index	index

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sde`.
3. `vgcreate -s 32 index /dev/sde`.
4. `lvcreate -L <disk_size> -n index index`.
5. `mkfs.xfs /dev/index/index`.

NetWitness recommends below sizing partition for Concentrator (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
/dev/netwitness_vg00/nwhome	/var/netwitness/	1TB	HDD
/dev/concentrator/root	/var/netwitness/concentrator	10GB	HDD
/dev/concentrator/metadb	/var/netwitness/concentrator/metadb	3TB	HDD
/dev/concentrator/sessiondb	/var/netwitness/concentrator/sessiondb	370GB	HDD
/dev/index/index	/var/netwitness/concentrator/index	2TB	HDD

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness` which will be already created.

Note: Create the folder `/var/netwitness/concentrator` and mount on `/dev/concentrator/root` then create the other folders and mount them.

After that add the below entries in `/etc/fstab` in the same order.

```
/dev/concentrator/root /var/netwitness/concentrator xfs noatime,nosuid 1 2
/dev/concentrator/sessiondb /var/netwitness/concentrator/sessiondb xfs noatime,nosuid 1 2
/dev/concentrator/metadb /var/netwitness/concentrator/metadb xfs noatime,nosuid 1 2 2
/dev/index/index /var/netwitness/concentrator/index xfs noatime,nosuid 1 2
```

Archiver

The following partition is required for the Archiver volume group.

Folder	LVM	Volume Group
`/var/netwitness/archiver`	`archiver`	`archiver`

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sde`.
3. `vgcreate -s 32 archiver /dev/sde`.
4. `lvcreate -L <disk_size> -n archiver archiver`.
5. `mkfs.xfs /dev/archiver/archiver`.

Attach an external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as `nwhome`, attach other external disks for Archiver database partition.

For extending `/var/netwitness` partition follow these steps:

Note: No other partition should reside on this volume, only to be used for /var/netwitness.

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, suppose if you had add attach one 2TB disk.
3. `pvcreate /dev/sdc` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.
5. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`.

or,

`lvextend -l +100%FREE /dev/netwitness_vg00/nwhome.`

6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

NetWitness recommends the following sizing partition for the Archiver (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
/dev/netwitness_vg00/nwhome	/var/netwitness/	1TB	HDD
/dev/archiver/archiver	/var/netwitness/archiver	4TB	HDD

Create each directory and mount the LVM on it in a serial manner, except /var/netwitness which will be already created.

After that add the below entries in /etc/fstab in the same order.

```
/dev/archiver/archiver /var/netwitness/archiver xfs noatime,nosuid 1 2
```

Decoder

Virtual Drive Space Ratios

The following table provides optimal configurations for packet and log hosts.

Decoder			
Persistent Datastores		Cache Datstore	
PacketDB	SessionDB	Meta DB	Index
100% as calculated by Sizing & Scoping Calculator	6 GB per 100Mb/s of traffic sustained provides 4 hours cache	60 GB per 100Mb/s of traffic sustained provides 4 hours cache	3 GB per 100Mb/s of traffic sustained provides 4 hours cache

Extending File Systems

Attach an external disk for extension of /var/netwitness/ partition, create an external disk with suffix as nwhome, attach other external disks for decoder database partition. For extending /var/netwitness partition follow these steps:

Note: No other partition should reside on /var/netwitness/.

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute lsblk and get the physical volume name, suppose if you had add attach one 2TB disk.
3. pvcreate /dev/sdc.
4. vgextend netwitness_vg00 /dev/sdc.
5. lvextend -L 1.9T /dev/netwitness_vg00/nwhome.

or,

lvextend -l +100%FREE /dev/netwitness_vg00/nwhome.

6. xfs_growfs /dev/mapper/netwitness_vg00-nwhome.

The following four partitions should be on the decodersmall volume group.

Folder	LVM	Volume Group
/var/netwitness/decoder	decoroot	decodersmall
/var/netwitness/decoder/index	index	decodersmall
/var/netwitness/decoder/metadb	metadb	decodersmall
/var/netwitness/decoder/sessiondb	sessiondb	decodersmall

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sdd`.
3. `vgcreate -s 32 decodersmall /dev/sdd`.
4. `lvcreate -L <disk_size> -n <lvm_name> decodersmall`.
5. `mkfs.xfs /dev/decodersmall/<lvm_name>`.
6. Repeat steps 4 and 5 for all the LVM's mentioned

The following partition should be on the decoder volume group.

Folder	LVM	Volume Group
/var/netwitness/decoder/packetdb	packetdb	decoder

1. Execute `lsblk` and get the physical volume names from the output.
2. `pvcreate /dev/sde`.
3. `vgcreate -s 32 decoder /dev/sde`.
4. `lvcreate -L <disk_size> -n packetdb decoder`.
5. `mkfs.xfs /dev/decoder/packetdb`.

NetWitness recommends the following sizing partition for the Decoder (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
/dev/netwitness_vg00/nwhome	/var/netwitness/	1TB	HDD
/dev/decodersmall/decoroot	/var/netwitness/decoder	10GB	HDD
/dev/decodersmall/index	/var/netwitness/decoder/index	30GB	HDD
/dev/decodersmall/metadb	/var/netwitness/decoder/metadb	3TB	HDD
/dev/decodersmall/sessiondb	/var/netwitness/decoder/sessiondb	370GB	HDD
/dev/decoder/packetdb	/var/netwitness/decoder/packetdb	18TB	HDD

Create each directory and mount the LVM on it in serial manner, except /var/netwitness which will be already created.

Note: Create the folder `/var/netwitness/decoder` and mount on `/dev/decodersmall/decoroot` then create the other folders and mount them.

After that add the below entries in `/etc/fstab` in the same order and mount them using `mount -a`.

```
/dev/decodersmall/decoroot /var/netwitness/decoder xfs noatime,nosuid 1
2
/dev/decodersmall/index /var/netwitness/decoder/index xfs
noatime,nosuid 1 2
/dev/decodersmall/metadb /var/netwitness/decoder/metadb xfs
noatime,nosuid 1 2
/dev/decodersmall/sessiondb /var/netwitness/decoder/sessiondb xfs
noatime,nosuid 1 2
/dev/decoder/packetdb /var/netwitness/decoder/packetdb xfs
noatime,nosuid 1 2
```

Endpoint Log Hybrid

Virtual Drive Space Ratios

The following table provides optimal configurations for packet and log hosts.

EndPoint Log Decoder					
	MetaDB	PacketDB	SessionDB	Index	Total
Log Decoder	120 GB	26GB	6Gb	NA	152GB
Concentrator	206GB	NA	6GB	4GB	216GB
MongoDB	NA	NA	NA	NA	13GB (12 GB tracking data, 1 GB scan data)

Note: The above Endpoint Log Hybrid sizing guidelines are for 20 K agents and 20 K events per day per agent with an event size of 1500 bytes.
The same sizing guidelines are applicable for scan data with 20 K sessions per day per agent except MongoDB as mentioned above.

Extending File Systems

For Endpoint Server, attach external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as nwhome.

Follow these steps:

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.
2. Execute `lsblk` and get the physical volume name, for example, if you attach one 6TB disk.
3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`.
4. `vgextend netwitness_vg00 /dev/sdc`.

5. `lvextend -L 5.9T /dev/netwitness_vg00/nwhome`.

6. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`.

NetWitness recommended partition for Endpoint Server (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	6TB	HDD

For Mongo DB, attach external disk for extension of `/var/netwitness/mongo` partition, create an external disk with suffix as `nwhome`.

Follow these steps:

1. Ensure you have added a new disk. For more information, see Task 1. Add New Disk.

2. Execute `lsblk` and get the physical volume name, for example, if you attach one 6TB disk.

3. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc1`.

4. `vgextend hybrid /dev/sdc1`.

5. `lvextend -L 5.9T /dev/hybrid-vlmng`.

6. `xfs_growfs /dev/mapper/hybrid-vlmng`.

NetWitness recommended partition for Mongo DB (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/hybrid-vlmng`	`/var/netwitness/mongo`	6TB	HDD

For Log Decoder, Log Collector, and Concentrator see Log Decoder, Log Collector, and Concentrator.

UEBA

The following procedure attaches an external disk and extends the `/var/netwitness/` partition. You must use nwhome as the eternal disk suffix. This procedure illustrates how to add a 2TB disk.

Note: `/var/netwitness` is the only partition that can reside on this volume.

1. List the physical volume name.

`lsblk` (for example, `dev/mapper/sdc`).

2. Extend the `/var/netwitness/` partition.

```
pvcreate <pv_name>where pv_name is dev/mapper/sdc.
vgextend netwitness_vg00 /dev/mapper/sdc.
lvextend -L 1.9T /dev/mapper/netwitness_vg00/nwhome.
xfs_growfs /dev/mapper/netwitness_vg00-nwhome.
```

This partition is the NetWitness recommended partition for UEBA. You can change it based on retention days.

Task 3. Storage Configurations

For storage allocations of all host types, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness Platform*.

For more information on storage configurations using the REST API, see the "Configure Storage Using the REST API" topic in the *Storage Guide for NetWitness Platform*.

Step 3. Install NetWitness Platform

Complete the steps below to install NetWitness 12.1.

Note: Before installing the hosts make sure that the time on each host is synchronized with the time on the NetWitness Server.
To synchronize the time do one of the following:
- Configure the NTP Server. For more information, see"Configure NTP Servers" in the *System Configuration Guide*.
- Run the following commands on each hosts:
1. SSH to NW host.
2. Run the following commands.

```
systemctl stop ntpd
ntpdate nw-node-zero
systemctl start ndpd
```

This task installs:

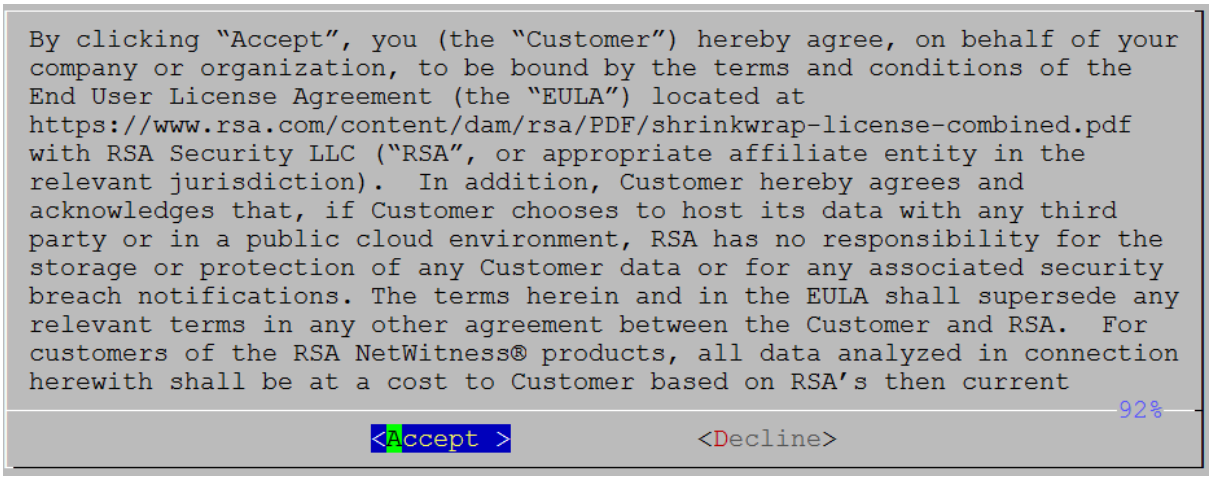
- The 12.1.0.0 NW Server environmental platform.
- The NW Server components (that is, Admin Server, Config Server, Orchestration Server, Integration Server, Broker, Investigate Server, Reporting Engine, Respond Server and Security server).
- A repository with the RPM files required to install the other functional components or services.

Prerequisites

Deploy your 12.1.0.0 environment:

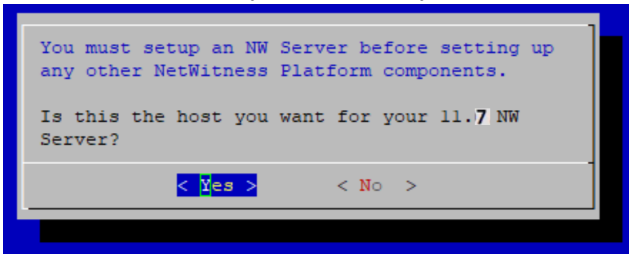
1. Add new VM.
2. Configure storage.
3. Set up firewalls.

Install NetWitness Platform



Caution: If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

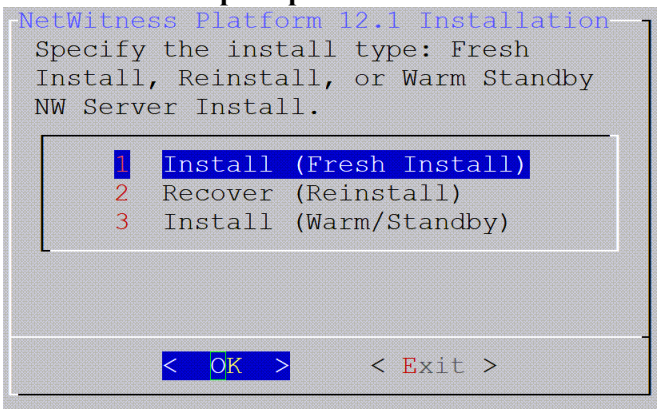
IMPORTANT: In NetWitness Platform version 11.6 or Later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.



1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

   Note: Use the following options to navigate the Setup prompts.
   1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
   3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
   If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 12.1 NW Server** prompt is displayed.

3. Tab to **Yes** and press **Enter** to install 12.1 on the NW Server.
   Tab to **No** and press **Enter** to install 12.1 on other component hosts.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

4. The **Install** prompt is displayed (**Recover** does not apply to the installation.).
   NW Server Host prompt:

   Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)

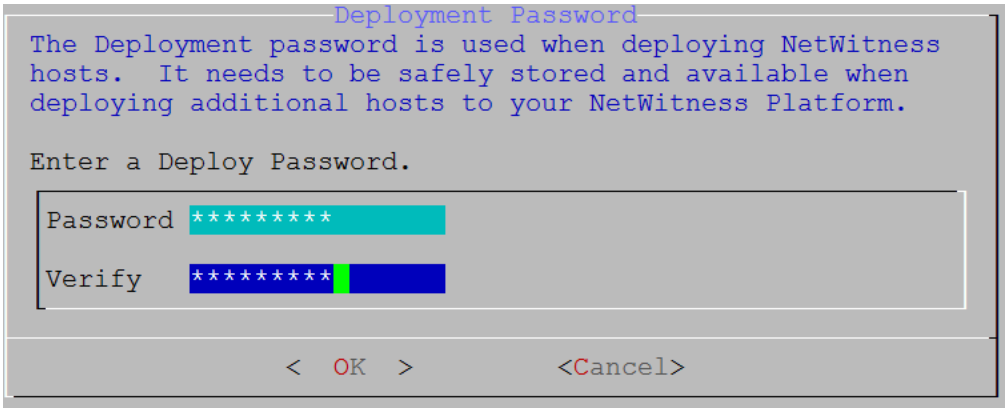
5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   NW Server prompt:

   Other Component Hosts prompt says <non-nwserver-host-name>

   Caution: If you include "." in a host name, the host name must also include a valid domain name.

   Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.

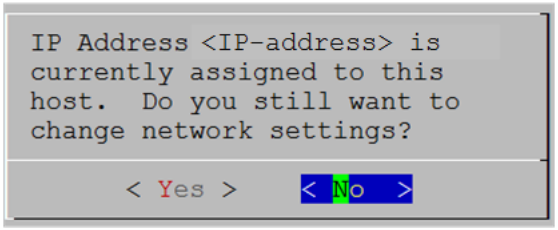


The following list of characters are supported for Master Password and Deployment Password:

- Symbols: **! @ # % ^ +**
- Numbers: **0-9**
- Lowercase Characters: **a-z**
- Uppercase Characters: **A-Z**

No ambiguous characters are supported for Master Password and Deployment Password. For example:
space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

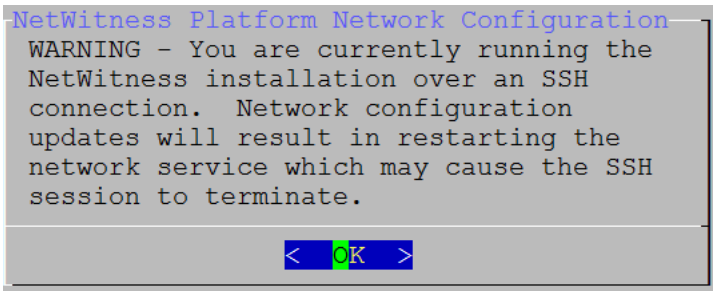
Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.

   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

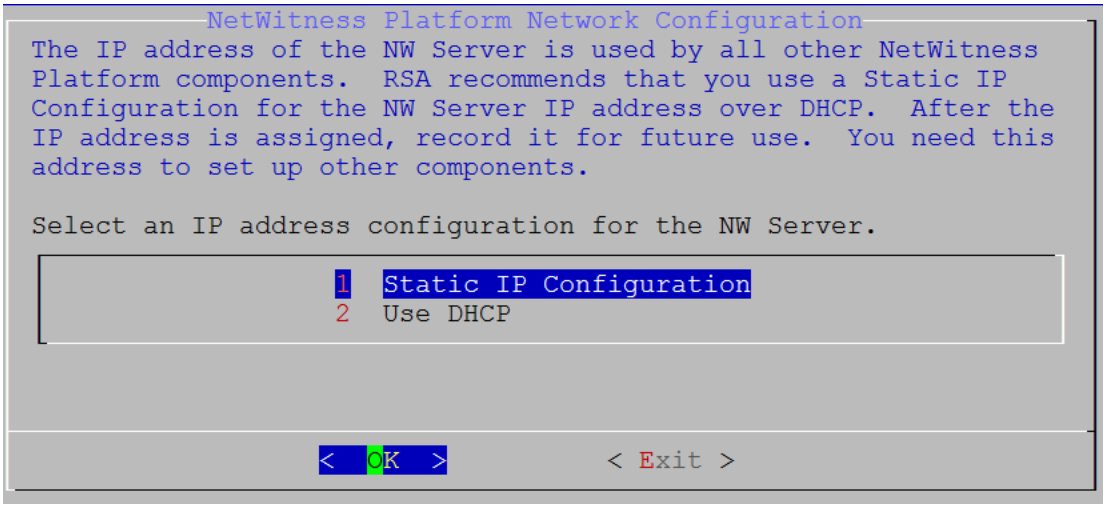
8. One of the following conditional prompts is displayed.



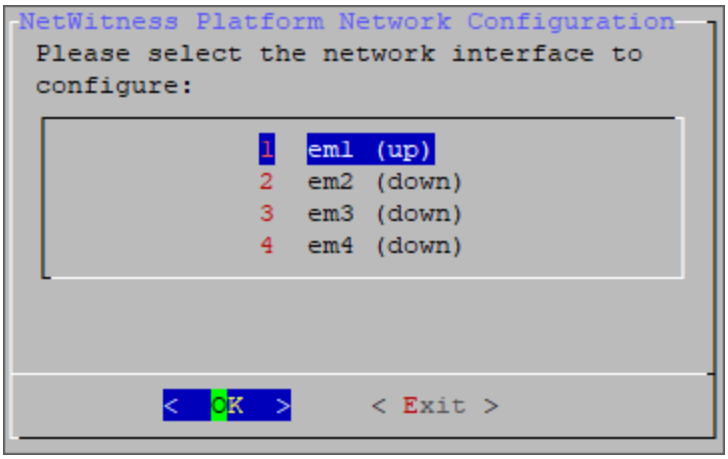
- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration on the host.

- If you are using an SSH connection, the following warning is displayed.

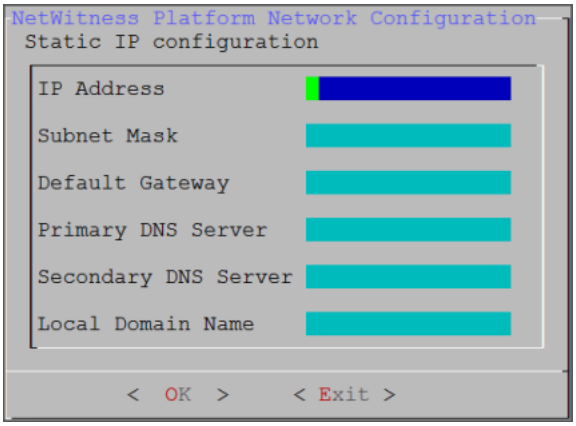


Note: If you connect directly from the host console, the following warning is not displayed.



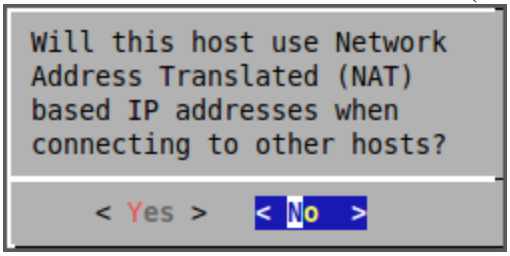
Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.
- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.



Caution: Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.

Tab to **OK** and press **Enter** to use **Static IP**.
If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
The **Network Configuration** prompt is displayed.



9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
   The following **Static IP Configuration** prompt is displayed.

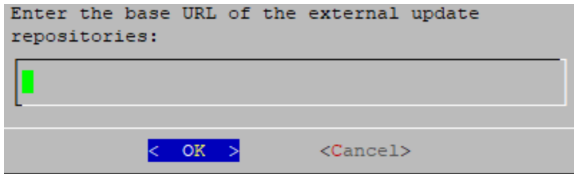
10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

11. The Use Network Address Translation (NAT) prompt is displayed.

    For the NW Server, tab to **No** and press **Enter**.
    For component hosts, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

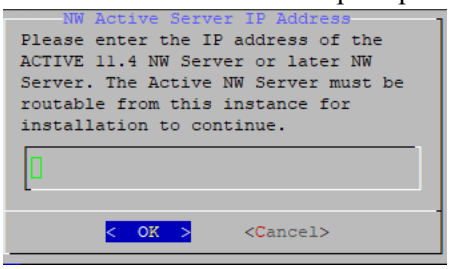
12. The **Update Repository** prompt is displayed.



For the NW Server:

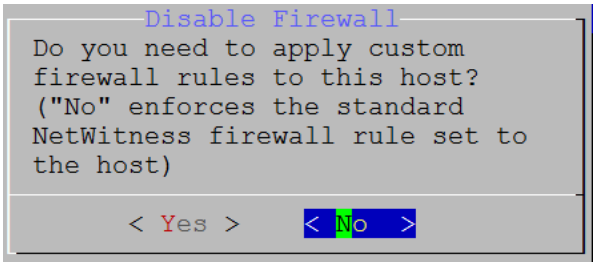
- Press **Enter** to choose the **Local Repo**.
- If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 12.1. If the program cannot find the attached media, you receive the following prompt.

- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to NetWitness updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

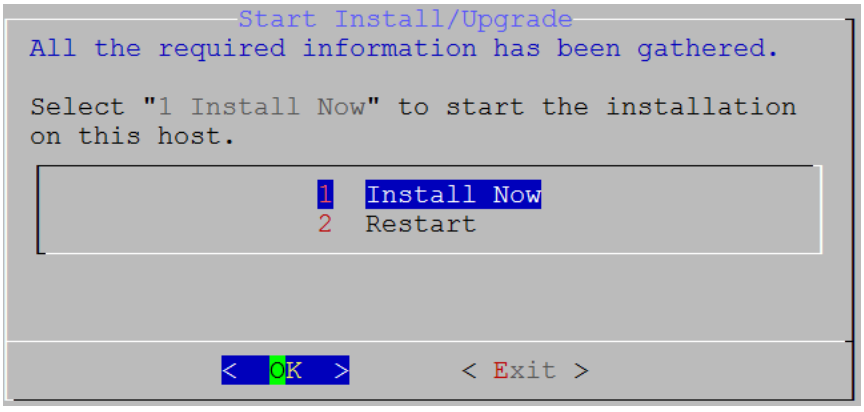
For component hosts:



- Select the same repo that you selected when you installed the NW Server host and follow the steps above.

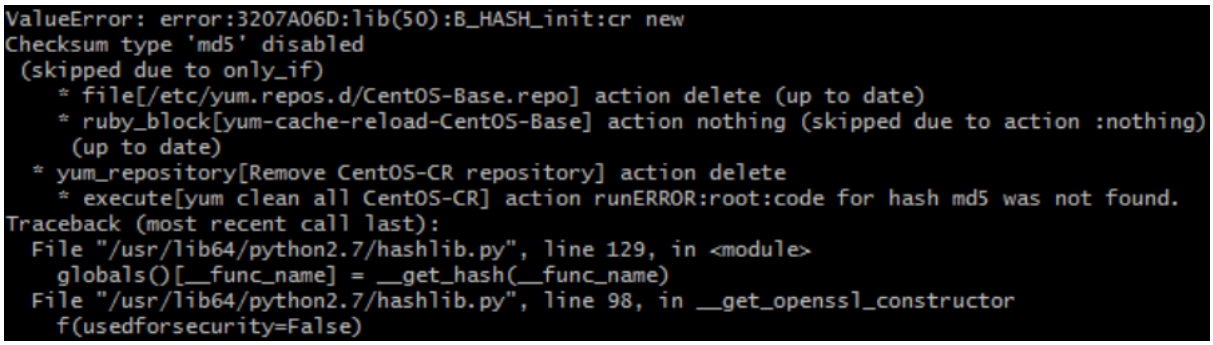
- The NW Server IP Address prompt is displayed.

  Type the NW Server IP address. Tab to **OK** and press **Enter**.



13. The Disable firewall prompt is displayed.

  Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
  To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
  If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.



14. The **Start Install** prompt is displayed.

15. Press **Enter** to install 12.1.
  When **Installation complete** is displayed, you have installed 12.1 on this host.

Note: Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
    `nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`

Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 12.1 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:
- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:

Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host.
    a. Log into NetWitness and go to (missing or bad snippet)> **Hosts**.
    The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

    Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    b. Select the host in the **New Hosts** dialog and click **Enable**.
    The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

    c. Select that host in the **Hosts** view and click .

The **Install Services** dialog is displayed.

d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.

Complete Licensing Requirements

Complete licensing requirements for installed services. See the *NetWitness Platform 12.1 Licensing Management Guide* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

(Optional) Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for NetWitness Platform 12.1* for instructions on how to set up a Warm Standby NW Server.

Step 4. Configure Host-Specific Parameters

Certain application-specific parameters are required to configure log ingest and packet capture in the Virtual Environment.

Configure Log Ingest in the Virtual Environment

Log ingest is easily accomplished by sending the logs to the IP address you have specified for the Decoder. The Decoder's management interface allows you to then select the proper interface to listen for traffic on if it has not already selected it by default.

Configure Packet Capture in the Virtual Environment

There are two options for capturing packets in a VMware environment. The first is setting your vSwitch in promiscuous mode and the second is to use a third-party Virtual Tap.

Set a vSwitch to Promiscuous Mode

The option of putting a switch whether virtual or physical into promiscuous mode, also described as a SPAN port (Cisco services) and port mirroring, is not without limitations. Whether virtual or physical, depending on the amount and type of traffic being copied, packet capture can easily lead to over subscription of the port, which equates to packet loss. Taps, being either physical or virtual, are designed and intended for loss less 100% capture of the intended traffic.

Promiscuous mode is disabled by default, and should not be turned on unless specifically required. Software running inside a virtual machine may be able to monitor any and all traffic moving across a vSwitch if it is allowed to enter promiscuous mode as well as causing packet loss due to over subscription of the port..

To configure a portgroup or virtual switch to allow promiscuous mode:

1. Log on to the ESXi/ESX host or vCenter Server using the vSphere Client.
2. Select the ESXi/ESX host in the inventory.

3. Select the **Configuration** tab.
4. In the **Hardware** section, click **Networking**.
5. Select **Properties** of the virtual switch for which you want to enable promiscuous mode.
6. Select the virtual switch or portgroup you want to modify, and click **Edit**.
7. Click the **Security** tab. In the **Promiscuous Mode** drop-down menu, select **Accept**.

Use of a Third-Party Virtual Tap

Installation methods of a virtual tap vary depending on the vendor. Please refer to the documentation from your vendor for installation instructions. Virtual taps are typically easy to integrate, and the user interface of the tap simplifies the selection and type of traffic to be copied.

Virtual taps encapsulate the captured traffic in a GRE tunnel. Depending on the type you choose, either of these scenarios may apply:

- An external host is required to terminate the tunnel, and the external host directs the traffic to the Decoder interface.
- The tunnel send traffic directly to the Decoder interface, where NetWitness handles the de-encapsulation of the traffic.

Step 5. Post Installation Tasks

This topic contains the tasks you complete after you install 12.1.

- Event Stream Analysis (ESA)
- NetWitness Endpoint
- NetWitness UEBA

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Event Stream Analysis (ESA)

Configure Meta Keys on New ESA Hosts to Match Upgraded ESA Hosts in the Same NetWitness Platform Network

If you have one or more ESA hosts in a NetWitness Platform network, which were upgraded from a version before 11.3.0.2 to 11.7, and you add a new ESA host, you must configure the meta keys on the new ESA host to match the other ESA hosts. All ESA Correlation services on the same NetWitness Platform network must have the same Meta Key configurations.

1. For each ESA Correlation service on an upgraded ESA host and for the ESA Correlation service on the newly installed ESA host:
   a. Open a new tab, go to (Admin) > **Services**, and in the Services view, select the ESA Correlation service and then select > **View** > **Explore**.
   b. In the Explore view node list for the ESA Correlation service, select **correlation** > **stream**.
2. Ensure that the **`multi-valued`** and **`single-valued`** meta key values are the same on each of the upgraded ESA Correlation services.
3. Ensure that the **`multi-valued`** and **`single-valued`** meta key values on the newly installed ESA host are the same as those on the upgraded services.
4. To apply any changes on the ESA Correlation services, go to **(Configure)** > **ESA Rules** and click the **Settings** tab. In the Meta Key References, click the **Meta Re-Sync (Refresh)** icon ( ).
5. If you updated the ESA Correlation services, redeploy the ESA rule deployments.

For more information, see "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*.

NetWitness Endpoint

The tasks in this section only apply to customers that use the NetWitness Endpoint component of NetWitness Platform.

Install Endpoint Log Hybrid

Depending on the number of agents and the location of the agents, you can choose to deploy a single Endpoint Log Hybrid host or multiple Endpoint Log Hybrid hosts. To deploy a host, you provision it and install a category on it.

- **Single Endpoint Log Hybrid host** - Deploy NetWitness Server host, Endpoint Log Hybrid host, and ESA host or hosts.
- **Multiple Endpoint Log Hybrid hosts** - Deploy NetWitness Server host, ESA host or hosts, Endpoint Log Hybrid hosts. For a consolidated view of all endpoint data from multiple Endpoint Log Hybrid hosts, install the Endpoint Broker.

  Note: NetWitness recommends that you co-locate the Endpoint Broker on the NetWitness Broker host. However, you can deploy the Endpoint Broker on a separate host or co-locate it on the Endpoint Log Hybrid.

  Note: You must plan to scale your ESA deployment to support multiple Endpoint Log Hybrid hosts.

Follow these steps to deploy an Endpoint Log Hybrid host.

Complete the following steps first:

- For a physical host, complete steps 1 - 16 in "Install NetWitness Platform" under Installation Tasks in the *Physical Host Installation Guide for NetWitness Platform*
- For a virtual host, complete steps 1 - 16 in "Step 4. Install NetWitness Platform" under Install NetWitness Platform Virtual Host in Virtual Environment in the *Virtual Host Installation Guide for NetWitness Platform*

Configuring Multiple Endpoint Log Hybrids

Follow these steps to install another Endpoint Log Hybrid.

Step 1: Install additional Endpoint Log Hybrid

- To install a physical host, complete steps 1 - 16 in "Install NetWitness Platform" under Installation Tasks in the *Physical Host Installation Guide for NetWitness Platform 12.1*
- To install a virtual host, complete steps 1 - 16 in "Step 4. Install NetWitness Platform" under Install NetWitness Platform Virtual Host in Virtual Environment in the *Virtual Host Installation Guide for NetWitness Platform 12.0*

Step 2: Setup the Endpoint Log Hybrid

1. Create a directory

   `mkdir -p /etc/pki/nw/nwe-ca.`

2. Copy the following certificates from the first Endpoint Log Hybrid to the secondary Endpoint Log Hybrid:

```
/etc/pki/nw/nwe-ca/nwerootca-cert.pem
/etc/pki/nw/nwe-ca/nwerootca-key.pem
```

Note: NetWitness recommends that you copy certificates from Endpoint Log Hybrid to secondary Endpoint Log Hybrid CentOS to Windows using the `SCP` command to avoid any corruption caused by Antivirus or third-party tools.

Step 3: Switch to the NetWitness UI and add Hosts

- See Add Hosts to the Endpoint Log Hybrid: for more information.

Add Hosts to the Endpoint Log Hybrid:

1. Log into NetWitness Platform and click  **(Admin) > Hosts**.

   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.

2. Select the host in the **New Hosts** dialog and click **Enable**.

   The New Hosts dialog closes and the host is displayed in the Hosts view.

3. Select that host in the **Hosts** view (for example, **Endpoint**) and click .

   The Install Services dialog is displayed.

4. Select the **Endpoint Log Hybrid** category and click **Install**.
5. Make sure that the Endpoint Log Hybrid service is running.
6. Configure Endpoint Meta forwarding.

   See the *Endpoint Configuration Guide* for instructions on how to configure Endpoint Meta forwarding.

7. Deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the ESA Configuration Guide.

   Note: The Endpoint IIOCs are available as OOTB Endpoint Application rules.

8. Review the default policies and create groups to manage your agents. See *Endpoint Configuration Guide*.

   Note: In 11.3 or later, agents can operate in Insights or Advanced mode depending on the policy configuration. The default policy enables the agent in an advanced mode. If you want to continue to use the Insights agent, before updating, review the policy, and make sure that the Agent mode is set to Insights.

9. Install the Endpoint Agent. You can install an Insights (free version) or an Advanced agent (licensed). See *Endpoint Agent Installation Guide* for detailed instructions on how to install the agent.

Note: You can migrate the Endpoint Agent from 4.4.0.x to 12.1. For more information, see the *NetWitness Endpoint 4.4.0.x to NetWitness Platform 12.1 Migration Guide*.

(Optional) Configure an Endpoint Service on an Existing Log Decoder Host

You can install an Endpoint service category on an existing Log Decoder host. For an overview of installing service categories on hosts, see "Hosts and Services Set Up Procedures" in the *Host and Services Getting Started Guide*. (missing or bad snippet)

- If you have an existing Endpoint Log Hybrid, you must copy certificates from that Endpoint Hybrid host to the Log Decoder before you install the Endpoint service category on the Log Decoder.
- If you do not have an Endpoint Log Hybrid host, you do not need to copy over the certificates before you install the Endpoint service category on the Log Decoder.

Do You Need to Install an Endpoint Service onto Separate Hardware

If you are only using NW Platform for collecting and analyzing logs, you can co-locate your Endpoint Server on the same physical hardware as your Log Decoder. For more information, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness Platform*.

If you exceed these guidelines, the amount of disk space usage and CPU might become so high as to create alarms for your Endpoint Server in Health and Wellness. If you notice this, and are running both log collection and EDR scans, you can use Throttling to control the amount of data coming into the Log Decoder.

If that doesn't help, NetWitness recommends that you move your Endpoint Server onto separate hardware from that used by your Log Decoder.

Install an Endpoint Service Category on an Existing Log Decoder

To install an Endpoint service category on an existing Log Decoder if you have an existing Endpoint Log Hybrid:

1. Create a directory `mkdir -p /etc/pki/nw/nwe-ca`.
2. Copy the following certificates from the first Endpoint Log Hybrid to the Log Decoder on which you are going to install the additional **Endpoint** service category.

   Note: NetWitness recommends that you copy certificates from Endpoint Log Hybrid to secondary Endpoint Log Hybrid using the `SCP` command to avoid any corruption caused by Antivirus or third-party tools.

   `/etc/pki/nw/nwe-ca/nwerootca-cert.pem`

   `/etc/pki/nw/nwe-ca/nwerootca-key.pem`

3. Log into NetWitness Platform and click  **(Admin) > Hosts**.
4. Select the Log Decoder host in the **Hosts** view and click .

   The Install Services dialog is displayed.
5. Select the **Endpoint** category and click **Install**.

To install an Endpoint service category on an existing Log Decoder if you do not have an existing Endpoint Log Hybrid:

1. Log into NetWitness Platform and click **(Admin) > Hosts**.
2. Select the Log Decoder host in the **Hosts** view and click Install.
   The Install Services dialog is displayed.
3. Select the **Endpoint** category and click **Install**.

NetWitness UEBA

The tasks in this section only apply to customers that use the UEBA component of NetWitness Platform.

Install UEBA

To set up NetWitness UEBA in NetWitness Platform 12.1, you must install and configure the NetWitness UEBA service.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. For:
   - A physical host, complete steps 1 - 16 in "Install NetWitness Platform" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform*.
   - A virtual host, complete steps 1 - 16 in "Step 4. Install NetWitness Platform" in the *Virtual Host Installation Guide for NetWitness Platform*.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy admin password. Make sure that you record this password and store it in a safe location.
2. Log into NetWitness Platform and go to **(Admin) > Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.
3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.
4. Select that host in the **Hosts** view (for example, **UEBA**) and click Install.
   The Install Services dialog is displayed.
5. Select the **UEBA** Host Type and click **Install**.
6. Make sure that the UEBA service is running.
7. Complete licensing requirements for NetWitness UEBA.
   See the *Licensing Management Guide* for more information.

Note: NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is used based on the number of users. The Out-of-the-Box Trial License is a 90-day trial license. In case of UEBA licenses, the 90-day trial period begins from the time the UEBA service deployed on the NetWitness Platform product.

Configure NetWitness UEBA

To start running UEBA:

1. Define the following parameters: data schemas, data source (NetWitness Broker or Concentrator) and start date.
   a. Define UEBA schemas:
   Choose schemas from the following list:

   AUTHENTICATION, FILE, ACTIVE_DIRECTORY, PROCESS, REGISTRY and TLS.

   Note: The TLS packet requires adding the hunting package and enabling the JA3 feature. For more information regarding events that each schema contains, see the *NetWitness UEBA Configuration Guide*.

   b. Define the data source:
   If your deployment has multiple Concentrators, we recommend that you assign a Broker at the top of your deployment hierarchy for the NetWitness UEBA data source.

   c. Define the UEBA start-date:

   Note: The selected start date must contain events from all configured schemas.

   NetWitness recommends that the UEBA start date is set to 28 days earlier than the current date. For UEBA systems that intend to process TLS data, you must make sure that the start date is set to no later than 14 days earlier than the current date.

2. . Create a user account for the data source (Broker or Concentrator) to authenticate to the data.
   a. Log into NetWitness Platform.
   b. Go to (missing or bad snippet) **> Services**.
   c. Locate the data source service (Broker or Concentrator).
   Select that service, and select (Actions) > **View** > **Security**.
   d. Create a new user and assign the “Analysts” role to that user.

The following example shows a user account created for a Broker.

3. SSH to the NetWitness UEBA server host.
4. Set the appropriate parallelism value:
   If the UEBA system runs on VM, update the airflow parallelism value to be 64 by running the following command:
   ```
   sed -i "s|parallelism = 256|parallelism = 64|g"
   /var/netwitness/presidio/airflow/airflow.cfg
   ```
5. Submit the following commands with the above parameters that you already defined.
   ```
   /opt/rsa/saTools/bin/ueba-server-config -u <user> -p <password> -h <host> -
   o <type> -t <startTime> -s <schemas> -v -e <argument>
   ```
   Where:

Argument	Variable	Description
`-u`	`<user>`	User name of the credentials for the Broker or Concentrator instance that you are using as a data source.

Argument	Variable	Description
-p	<password>	Password of the credentials for the Broker or Concentrator instance that you are using as a data source. The following special characters are supported in a password. !"#$%&()*+,-:;<=>?@[\]^_`\{\|} If you want to include a special character or special characters, you must delimit the password with an apostrophe sign, for example: sh /opt/rsa/saTools/bin/ueba-server-config -u brokeruser -p **'!"UHfz?@ExMn#$'** -h 10.64.153.104 -t 2018-08-01T00:00:00Z -s 'AUTHENTICATION FILE ACTIVE_DIRECTORY TLS PROCESS REGISTRY' -o broker -v
-h	<host>	IP address of the Broker or Concentrator used as the data source. Currently, only one data source is supported.
-o	<type>	Data source host type (broker or concentrator).
-t	<startTime>	Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, 2018-08-15T00:00:00Z). **Note:** The script interprets the time you enter as UTC (Coordinated Universal Time) and it does not adjust the time to your local time zone.
-s	<schemas>	Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, AUTHENTICATION FILE ACTIVE_ DIRECTORY PROCESS REGISTRY TLS).
-v		**verbose mode.**
-e	<argument>	Boolean Argument. This enables the UEBA indicator forwarder to Respond. **Note:** If your NetWitness deployment includes an active Respond server, you can transfer NetWitness UEBA indicators to the Respond server and create incidents by enabling the indicator forwarder, from this data. For more information on how to enable the NetWitness UEBA incidents aggregation, see Step 5. Post Installation Tasks.

6. If you are deploying a hot fix on 11.x.x.x version, you must do the following:
   a. Run the presidio-upgrade DAG.

b. Press the play sign next to the DAG and then click the trigger button.

7. Set the appropriate "Boot Jar Pools" slots:

- **Virtual Appliance**: If the UEBA system is running on VM and update the `spring_boot_jar_pool` and the `retention_spring_boot_jar_pool` slots values to 22.
  To update the “Spring Boot Jar Pools” slots, Go to the Airflow main page, tap the “Admin” tab at the top bar and tap “Pools”.

a. To access the Airflow UI, go to `https://<UEBA_host>/admin` and enter the credentials.
   User: admin
   Password: The environment deploy admin password

b. Click on the pencil mark of the polls to update the slot values.

Enable Access Permission for the NetWitness UEBA User Interface

After you install NetWitness UEBA 11.7, you need to assign the UEBA_Analysts and Analysts roles to the UEBA users. For more information, see 'Assign User Access to UEBA' topic in the *NetWitness UEBA Configuration Guide*. After this configuration, UEBA users can access the **Investigate** > **Users** view.

Note: To complete NetWitness UEBA configuration according to the needs of your organization, See the *NetWitness UEBA Configuration Guide*.

Deployment Options

NetWitness Platform has the following deployment options. See the *NetWitness Deployment Guide* for detailed instructions on how to deploy these options.

- **Analyst User Interface** - gives you access to a subset of features in the NetWitness Platform UI that you can set up in individual locations when you deploy NetWitness Platform in multiple locations. It is designed to reduce latency and improve the performance that can occur when accessing all functionality from the Primary User Interface on the NW Server Host (Primary UI).
- **Group Aggregation** - configures multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.
- **New Health and Wellness Search** - New Health and Wellness is an advanced monitoring and alerting system that provides insights on the operational state of the host and services in your deployment, and helps identify potential issues.
- **Second Endpoint Server** - deploys a second Endpoint Server.

Appendix A. Troubleshooting

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness creates log messages when it encounters these problems.

Note: If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Event Stream Analysis

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Command Line Interface (CLI)

Error Message	Command Line Interface (CLI) displays: "Orchestration failed." `Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log`
Cause	Entered the wrong `deploy_admin` password in `nwsetup-tui`.
Solution	Retrieve your `deploy_admin` password. 1. SSH to the NW Server host. `security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password` SSH to the host that failed. 2. Run the `nwsetup-tui` again using correct `deploy_admin` password.

Error Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health.AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service. `systemctl restart rsa-sms`

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Event Stream Analysis

For ESA Correlation troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.

Appendix B. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-firewall=false --ip-override=false --eula=true
   ```

Note: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click Install.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

Arguments

Argument	Description
`--help-install-opts`	Display all the arguments in this table.

Argument	Description
`--eula`	Accept or decline the End User License Agreement (EULA). Specify: • `true` (default) to accept the agreement • `false` to decline it and cancel the installation. For example: `--eula=true`
`--is-head`	Designate the host as the NW Server host or a component host. Specify: • `true` for NW Server host. • `false` for Component host. For example: `--is-head=true`
`--host-name`	Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname. For example: `--host-name=<hostname>`
`--master-pass`	Enter master password. For example: `--master-pass=<password>`
`--deploy-pass`	Enter deployment password. For example: `--deploy-pass=<password>`
`--iface-name`	Specify network interface. For example: `--iface-name=eth0`
`--ip-override`	Accept or override IP address found for this host or change the IP configuration found on the host. Specify: • `true` provide IP address. • `false` use IP address found on the host. For example: `--ip-override=false`
`--ip-type`	Select ip address configuration type. Specify: • `1` Static IP Configuration) • `2` DCHP For example: `--ip-type=1`
`--ip-addr`	For Static IP configuration, enter IP Address for static address. For example: `--ip-addr=<ip-address>`
`--ip-netmask`	For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>`

Argument	Description
`--ip-gateway`	For Static IP configuration, enter default gateway for static address. For example: `--ip-gateway=<default-gateway>`
`--ip-nameserver`	IP address assigned to DNS server. `--ip-nameserver=<ip-address>`
`--ip-nameserver-secondary`	Optional - IP address assigned to a secondary DNS server. For example: `--ip-nameserver-secondary=<ip-address>`
`--ip-domain`	For Static IP configuration, enter Local Domain Name for static address. For example: `--ip-domain=<default-gateway>`
`--repo-type`	Select type of update repository. Specify: • `1` Local repository • `2` External repository For example: `--repo-type=1`
`--repo-url`	For an external update repository, specify the url of the repository. For example: `--repo-url=<url>`
`--head-ip`	For a component host, specify IP Address of the NW Server. For example: `--head-ip=<ip-address>`
`--custom-firewall`	Disable default firewall configuration and use your custom configuration. Specify: • `true` use custom firewall configuration. • `false` use default firewall configuration. For example: `--custom-firewall=true`
`--use-nat`	Configure the host to use Network Address Translation (NAT) based IP addresses: • `true` use NAT IPs to connect to other hosts • `false` do not use NAT IPs to connect to other hosts (default) For example: `--use-nat=false`

Appendix C. Virtual Host Recommended System Requirements

The following tables list the vCPU, vRAM, and Read and Write IOPS recommended requirements for the virtual hosts based on the EPS or capture rate for each component.

- Storage allocation is covered in Step 3 “Configure Databases to Accommodate NetWitness”.
- vRAM and vCPU recommendations may vary depending on capture rates, configuration and content enabled.
- The recommendations were tested at ingest rates of up to 25,000 EPS for logs and two Gbps for packets, for non SSL.
- The vCPU specifications for all the components listed in the following tables are Intel Xeon CPU @2.59 Ghz.
- All ports are SSL tested at 15,000 EPS for logs and 1.5 Gbps for packets.

Note: The above recommended values might differ for 12.1.0.0 installation when you install and try the new features and enhancements.

IMPORTANT: The recommended configuration provided serves as a general reference and supports a standard deployment at the suggested data rates and specified architecture. However, the actual values may vary depending on the specific deployment and usage scenario.

Scenario One

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder, Concentrator, and Archiver.
- The Packet Stream included a Network Decoder and Concentrator.
- Additional Packet Stream included a Network Hybrid with query load.
- The background load included hourly and daily reports.
- Charts were configured.

Note: Intel x86 64-bit chip architecture is 2.599 GHz or greater speed per core.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	6 cores	32 GB	50	75
5,000	8 cores	32 GB	100	100

EPS	CPU	Memory	Read IOPS	Write IOPS
7,500	10 cores	32 GB	150	150

Network Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
50	4 cores	32 GB	50	150
100	4 cores	32 GB	50	250
250	4 cores	32 GB	50	350

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	4 cores	32 GB	300	1,800
5,000	4 cores	32 GB	400	2,350
7,500	6 cores	32 GB	500	4,500

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
50	4 cores	32 GB	50	1,350
100	4 cores	32 GB	100	1,700
250	4 cores	32 GB	150	2,100

Archiver

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	4 cores	32 GB	150	250
5,000	4 cores	32 GB	150	250
7,500	6 cores	32 GB	150	350

Event Stream Analysis

EPS	CPU	Memory	Read IOPS	Write IOPS
12000	8 cores	32 GB	40	40

Note: NetWitness recommends using Virtual Machine as a hybrid only for lower EPS rates. In case of high query load or high EPS, consider using Physical Appliance.

(For version 11.7.1 and Later) Log Hybrid

Rate (EPS)	vCPU	vRAM	Total IOPS	Read IOPS	Write IOPS
2500	10 Cores	48	2325	450 (Concentrator 400, Decoder 50)	1875 (Concentrator 1800, Decoder 75)
5000	12 Cores	64	3100	650 (Concentrator 500, Decoder 100)	2450 (Concentrator 2350, Decoder 100)

(For version 11.7.1 and Later) Network Hybrid

Mbps	CPU	Memory	Read IOPS	Write IOPS
50	8 cores	48 GB	350 (Concentrator 300, Decoder 50)	1650 (Concentrator 1500, Decoder 150)

Mbps	CPU	Memory	Read IOPS	Write IOPS
100	8 cores	64 GB	550 (Concentrator 500, Decoder 50)	1950 (Concentrator 1700, Decoder 250)
250	8 cores	64 GB	850 (Concentrator 800, Decoder 50)	2450 (Concentrator 2100, Decoder 350)

Scenario Two

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder, Concentrator, Warehouse Connector, and Archiver.
- The Packet Stream included a Network Decoder, Concentrator, and Warehouse Connector.
- Event Stream Analysis was aggregating at 90K EPS from three Hybrid Concentrators.
- Respond was receiving alerts from the Reporting Engine and Event Stream Analysis.
- The background load Included reports, charts, alerts, investigation, and Respond.
- Alerts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	16 cores	50 GB	300	50
15,000	20 cores	60 GB	550	100

Network Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	8 cores	40 GB	150	200
1,000	12 cores	50 GB	200	400
1,500	16 cores	75 GB	200	500

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	10 cores	50 GB	1,550 + 50	6,500
15,000	12 cores	60 GB	1,200 + 400	7,600

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	12 cores	50 GB	250	4,600
1,000	16 cores	50 GB	550	5,500
1,500	24 cores	75 GB	1,050	6,500

Warehouse Connector - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	8 cores	30 GB	50	50
15,000	10 cores	35 GB	50	50

Warehouse Connector - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	6 cores	32 GB	50	50
1,000	6 cores	32 GB	50	50
1,500	8 cores	40 GB	50	50

Archiver - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	12 cores	40 GB	1,300	700
15,000	14 cores	45 GB	1,200	900

ESA Correlation service with Context Hub

EPS	CPU	Memory	Read IOPS	Write IOPS
90,000	32 cores	250 GB	50	50

New Health and Wellness

Minimum memory for a standalone virtual host is 16 GB.

Each NetWitness platform host writes 150 MB of Health and Wellness Metrics data into Elasticsearch data per day. For example, if you have 45 NetWitness Platform hosts then 6.6 GB of metrics data is written to Elasticsearch per day.

CPU	Memory
4 cores	16 GB

NetWitness Server and Co-Located Components

The NetWitness Server, Jetty, Broker, Respond, and Reporting Engine are in the same location.

CPU	Memory	Read IOPS	Write IOPS
12 cores	64 GB	100	350

Analyst UI

The NetWitness UI and the Broker, Investigate, Respond, and Reporting Engine services are in the same location.

CPU	Memory	Read IOPS	Write IOPS
8 cores	32 GB	100	350

Scenario Three

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder and Concentrator.
- The Packet stream included a Network Decoder and the Concentrator.
- Event Stream Analysis was aggregating at 90K EPS from three Hybrid Concentrators.
- Respond was receiving alerts from the Reporting Engine and Event Stream Analysis.
- The background load included hourly and daily reports.
- Charts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
25,000	32 cores	75 GB	1050	150

Network Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
2,000	16 cores	75 GB	300	650

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
25,000	16 cores	75 GB	1,200 + 400	9,200

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
2,000	24 cores	75 GB	1250	7,050

Log Collector (Local and Remote)

The Remote Log Collector is a Log Collector service running on a remote host and the Remote Collector is deployed virtually.

EPS	CPU	Memory	Read IOPS	Write IOPS
15,000	8 cores	8 GB	50	50
30,000	8 cores	15 GB	100	100

Scenario Four

The requirements in these tables were calculated under the following conditions for Endpoint Log Hybrid.

- All the components were integrated.
- Endpoint Server is installed.
- The Log stream included a Log Decoder and Concentrator.

Endpoint Log Hybrid

The values provided below are qualified for NetWitness 12.3 for a dedicated Endpoint Log Hybrid with no other log sources configured.

Agents	CPU	Memory
<= 5K	16 core	32 GB

Agents	CPU	Memory
> 5K <= 10K	16 core	64 GB

Agents	CPU	Memory
> 10K <= 15K	32 core	96 GB

Considering the event size as 1KB, the rate of events per day per advanced agent is found to be 38K for the following test configurations.

- OPSWAT and YARA scan (with tracking events) on auto download of all the files < 1 MB.
- Auto scan on any new host.

If you have more than 15K agents in your virtual deployment, NetWitness recommends you to do one of the following:

- Scale resources such as CPU and RAM.
- Install a physical host (Series 6 Endpoint Log Hybrid).

For details on disk usage and storage, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness Platform 12.3*.

Endpoint Broker

Agents	CPU	RAM
50000	4 cores	16 GB

Log Collector (Local and Remote)

The Remote Log Collector is a Log Collector service running on a remote host and the Remote Collector is deployed virtually.

EPS	CPU	Memory	Read IOPS	Write IOPS
15,000	8 cores	8 GB	50	50
30,000	8 cores	15 GB	100	100

Legacy Windows Collectors Sizing Guidelines

Refer to the *Legacy Windows Collection Update & Installation* for sizing guidelines for the Legacy Windows Collector.

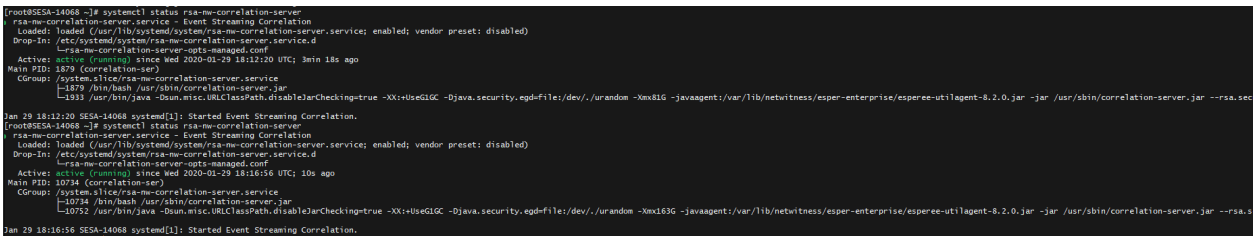
UEBA

CPU	Memory	Read IOPS	Write IOPS
16 cores	64 GB	500MB	500MB

Note: NetWitness recommends that you only deploy UEBA on a virtual host if your log collection volume is low. If you have a moderate to high log collection volume, NetWitness recommends that you deploy UEBA on the physical host described under "NetWitness UEBA Host Hardware Specifications" in the Physical Host Installation Guide. Contact Customer Support for advice on choosing which host, virtual or physical, to use for UEBA.

Appendix D. Update the Virtual ESA Host Memory

ESA current memory is allocated to 65% of the available memory on the host. (For example, with 128 GB available memory, ESA memory will be 81 GB.)



To Update the Memory of the Virtual ESA Host:

1. Power down the virtual machine host and update the virtual host memory from x GB to y GB. (Example: x = 128 GB and y = 256 GB).
2. Power on the virtual machine host.
3. Log in to NetWitness Platform and go to  **(Admin) > Hosts**.
4. Select the ESA host where the memory is updated and click .
   The Install Services dialog is displayed.
5. Select ESA Primary or ESA Secondary on the host, depending on the ESA host category, and click **Install**.
   After the installation completes, the memory settings update automatically.

To Check ESA Memory:

On your ESA host, run the following command:

```
systemctl status rsa-nw-correlation-server
```

Warehouse Connector Configuration

How Warehouse Connector Works

Warehouse Connector collects meta and events from Decoder and Log Decoder and writes them in AVRO format into a Hadoop-based distributed computing system. You can set up the Warehouse Connector as a service on existing Log Decoders or Decoders.

The Warehouse Connector contains the following components:

- Data Source
- Destination
- Data Stream

Data Source

Warehouse Connector collects data from the data source to store it in the destination. The supported data sources are Log Decoder and Decoder.

Destination

Destination is the Hadoop-based distributed computing system that collects, manages, and enables reporting on security data. The following are the supported destinations:

- NetWitness Warehouse (MapR) deployments
- HortonWorks Data Platform
- Any Hadoop-based distributed computing system that supports WebHDFS or NFS mounting of HDFS file systems.
  Example: Commercial MapR M5 Enterprise Edition for Apache Hadoop

Data Streams

A data stream is a logical connection between the data source and destination. You can have multiple streams for different subsets of data collected. You can setup streams to segregate data from multiple Decoder and Log Decoder services. You can create a stream with a single data source and destination or with multiple data sources and a single destination.

The Warehouse Connector:

- Aggregates session and raw log data from Decoders and Log Decoders.
- Transfers the aggregated data to supported destinations like Hadoop based deployments.
- Serializes the aggregated data that includes both schema and data into AVRO format.

Meta Filters

Meta filters enables you to filter the meta keys that should be written into the Warehouse. For more information, see Specify Meta Filters for a Stream.

Multi-Valued Meta Keys

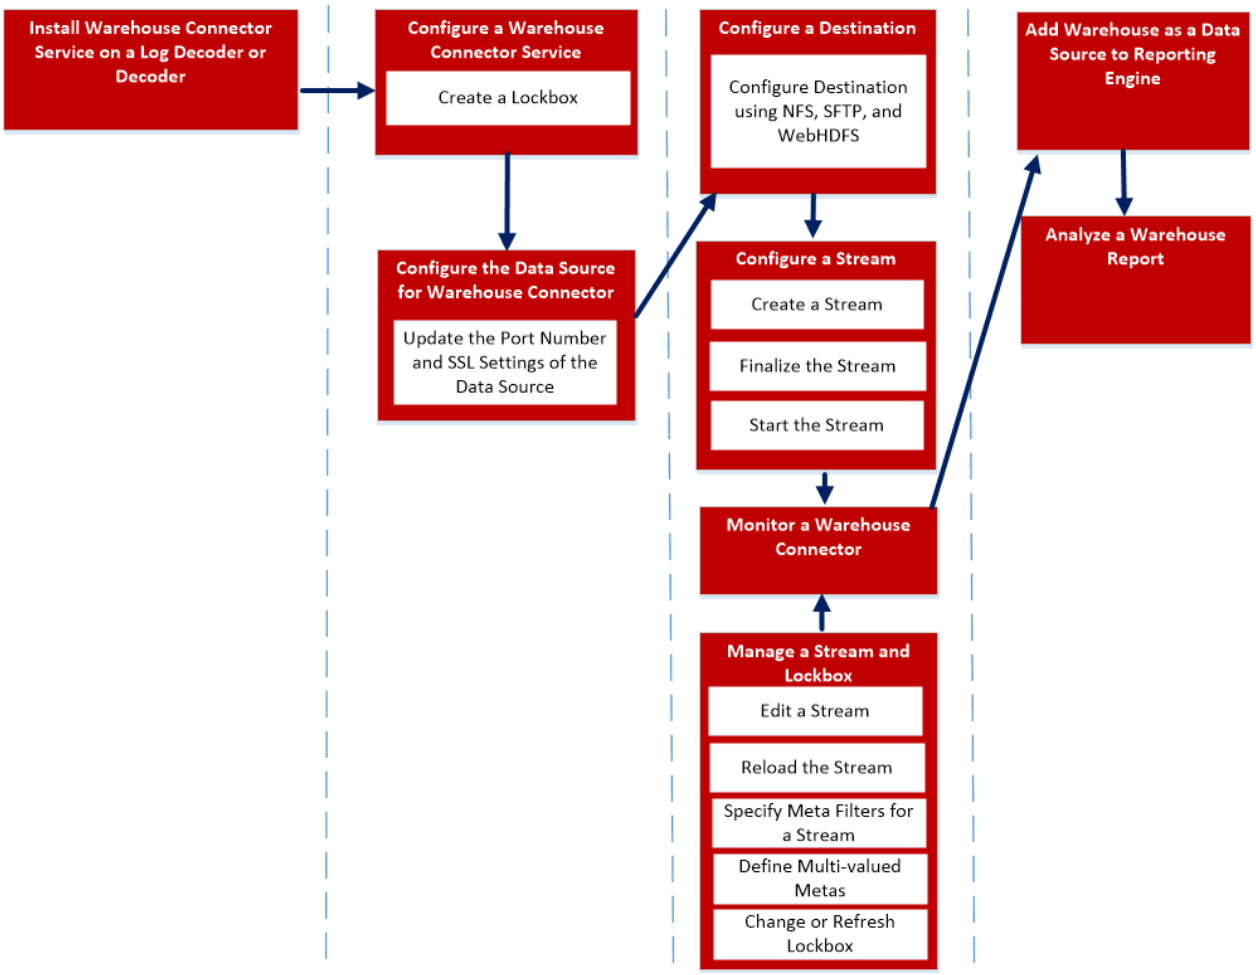
NetWitness Warehouse supports multi-valued meta keys. The multi-valued meta keys is the meta field with the array type. You can use the meta keys library to determine the meta fields of type array and write HIVE queries with the correct syntax for arrays. By default, the following meta keys are treated as multi-valued and are defined in the file, **multivalue-bootstrap.xml** located at **/etc/netwitness/ng** in the Warehouse Connector:

- alias.host
- action
- username
- alias.ip
- alias.ipv6
- email
- device.group
- event.class

Checksum Validation

You can validate the file integrity of the AVRO files that are transferred from the Warehouse Connector to the data destinations. You need to enable checksum validation option when you configure the Warehouse Connector.

Lockbox Support



Lockbox provides an encrypted file that Warehouse Connector uses to store and protect sensitive data. You need to create the lockbox by providing a lockbox password while configuring the Warehouse Connector for the first time.

Note: You can orchestrate Warehouse Connector on a Log Decoder or a Decoder appliance.

The following is an overview on how to install and configure the Warehouse Connector service on Log Decoder or Decoder.

- Configuring the Warehouse Connector service on NetWitness,
- Configuring data sources,
- Destinations,
- Streams for Warehouse Connector,
- Configuring alert notifications on NetWitness.

Note: RSA NetWitness Platform has added a Health & Wellness stat for Warehouse Connector to indicate the status of its Lockbox. Also, an out-of-the-box rule has been added so that a Health & Wellness alarm is raised when the Lockbox does not exist or cannot be opened.

To install and configure the Warehouse Connector service, perform the following:

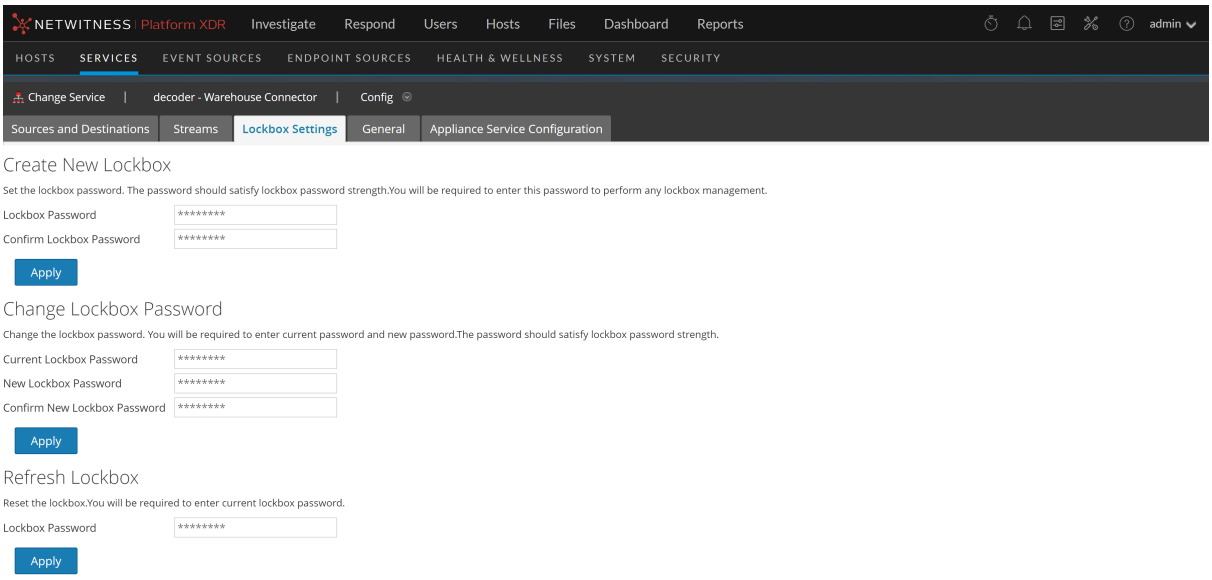
1. Install Warehouse Connector Service on a Log Decoder or Decoder or Hybrid
2. Configure a Warehouse Connector Service
3. Configure the Data Source for Warehouse Connector
4. Configure the Destination
5. Configure a Stream
6. Monitor a Warehouse Connector
7. Add Warehouse as a Data Source to Reporting Engine
8. Analyze a Warehouse Report
9. Manage a Stream

Install Warehouse Connector Service on a Log Decoder or Decoder or Hybrid

To install (fresh install) the Warehouse Connector service on a Log Decoder or Decoder or Hybrid:

1. Log in to NW Admin server
2. Enter the following command on NetWitness Server:
   `warehouse-installer --help`
   The command line interface (CLI) usage descriptions are displayed.
3. Install Warehouse Connector service by executing the following command:
   `warehouse-installer --host-key <ID, IP address, hostname or display name of Decoder, Log Decoder, or Hybrid host>`
4. Restart the Warehouse Connector using following command:
   `service nwwarehouseconnector restart`

The Warehouse Connector service is successfully installed on the Log Decoder or Decoder or Hybrid.



Note: If you have custom-defined host entries in `/etc/hosts`, make sure to have the same entires in `/etc/hosts.user`. Run the following command to ensure that the host names are updated in this installation:
`nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>`
For more information, see "Manage Custom Host Entries in /etc/hosts" in the *System Maintenance Guide*.

Configure a Warehouse Connector Service

You can configure the Warehouse Connector service using the following procedure.

To set the Lockbox password:

1. Log on to NetWitness.
2. Go to  **(Admin) > Services**.
3. In the Services view, select the added Warehouse Connector service, and select  **> View > Config**.
4. In the Services Config view of Warehouse Connector, click the **Lockbox Settings** tab.

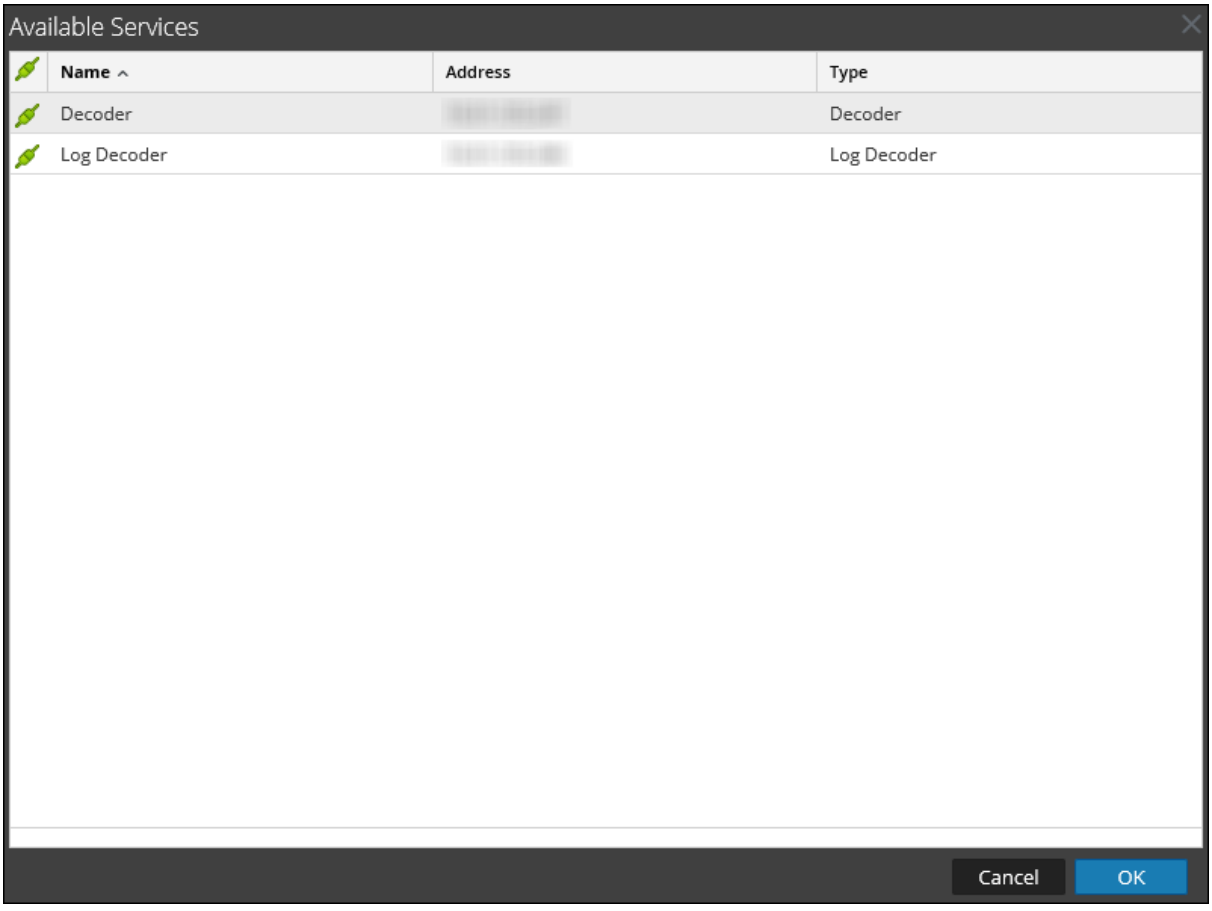
5. In the **Create New Lockbox** section, perform the following:
   a. In the **Lockbox Password** field, enter the new lockbox password.

      Note: The lockbox password must be at least eight characters in length and it must contain at least three of the following groups: one uppercase character [A-Z], one lowercase character [a-z], one numeral [0-9], and one special character.

   b. In the **Confirm Lockbox Password** field, enter the added lockbox password to confirm.
   c. Click **Apply**.

   The Lockbox password is set.

Configure the Data Source for Warehouse Connector



There are two procedures for configuring the data source for the Warehouse Connector:

1. First, you must configure the data source.
2. Then, you need to update the Port Number and SSL Settings for the Data Source.

Configure the Data Source

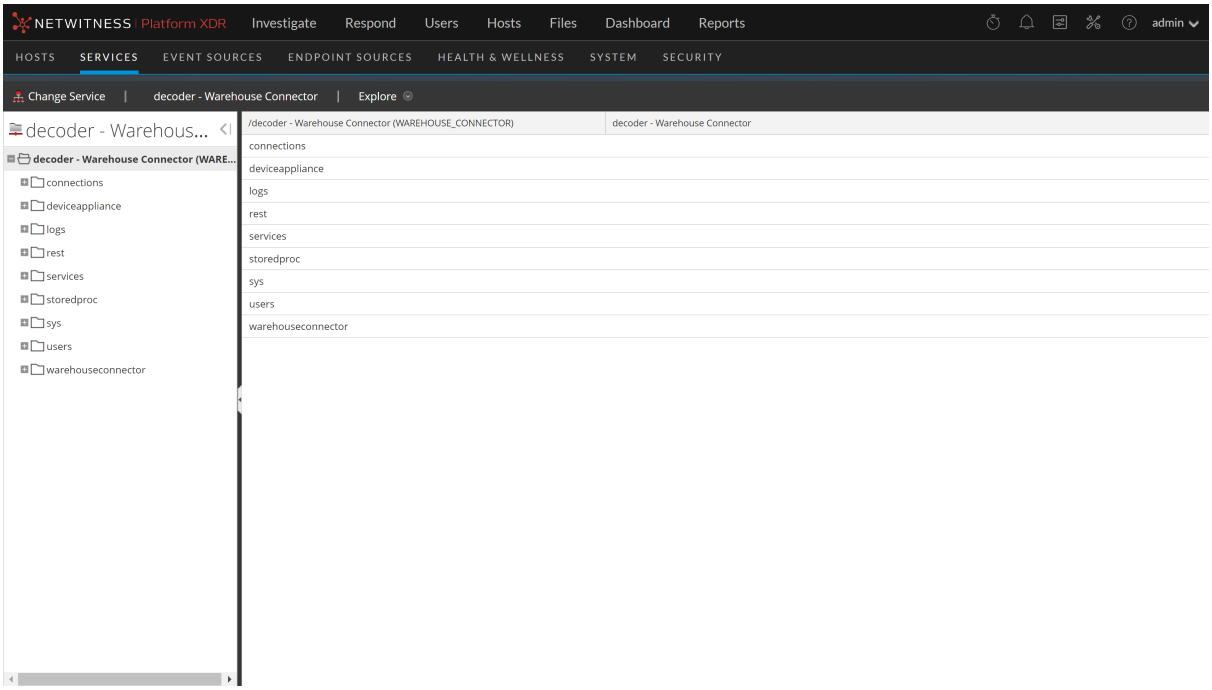
To configure the data source:

1. Log on to NetWitness.
2. Go to **(Admin) > Services**.
3. In the Services view, select the added Warehouse Connector service, and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
4. On the **Sources and Destinations** tab, in the **Source Configuration** section, click .

5. In the **Available Services** dialog, select the Log Decoder or Decoder services that you want to add as a source to the Warehouse Connector service and click **OK**.
   The selected Log Decoder and Decoder services are listed in the **Source Configuration** section.

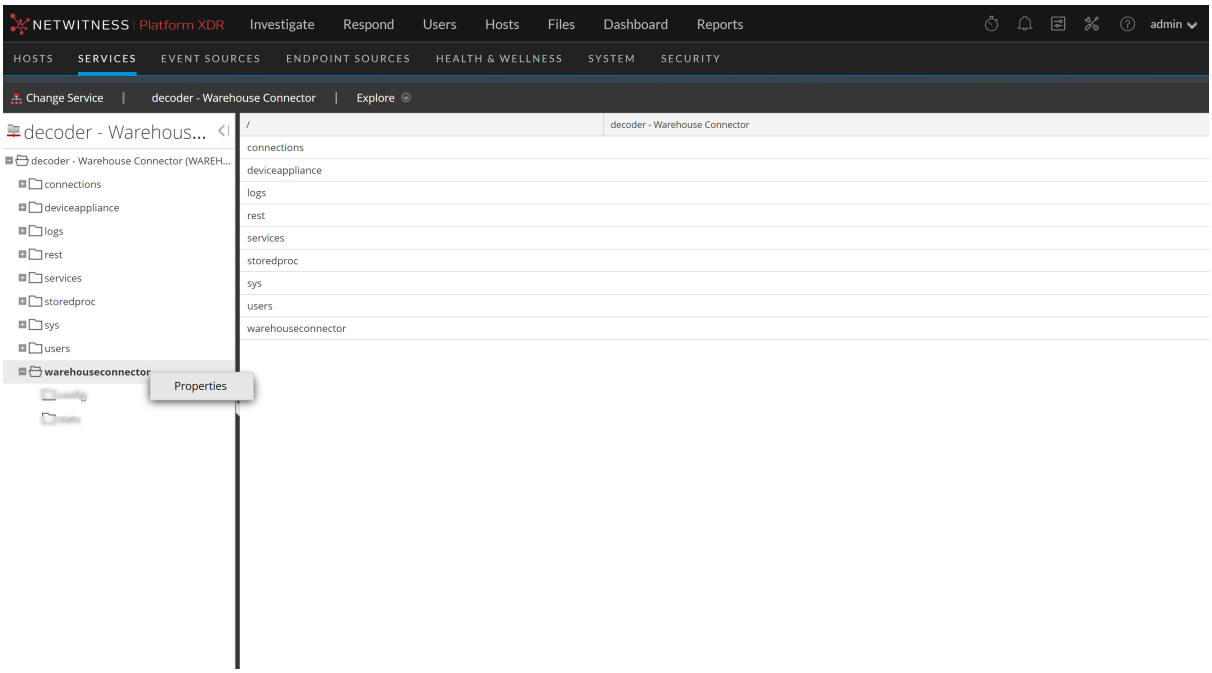
Update the Port Number and SSL Settings of the Data Source

If there is change to the port number or SSL settings of the Warehouse Connect data sources, you can update the changes in Explore view of the Warehouse Connector.



Make sure that:

- You have the changed port number or SSL settings of the data source.
- You have stopped the streams related to the data source that is updated with the port number or SSL settings.



To update the port number or SSL settings:

1. Log on to NetWitness.
2. Go to  **(Admin) > Services**.
3. In the Services view, select the added Warehouse Connector service and select  **> View > Explore**.

   The Service Explore view of Warehouse Connector is displayed.

4. Navigate to **warehouseconnector/sources**, right-click the source, and click **Properties**.
   The Properties of the source is displayed.

5. In the drop-down menu, select **update**. In the Parameters field, perform the following:
   - To update the port number of the source, enter `port=<new_source_portnumber>` and click **Send**.

   - To update the SSL settings of the source, enter `ssl=<new_ssl_settings>` and click **Send**.

     Note: You can also update the port number and ssl settings simultaneous by adding space between the parameters.

6. Restart the Warehouse Connector service.
7. Start the streams.

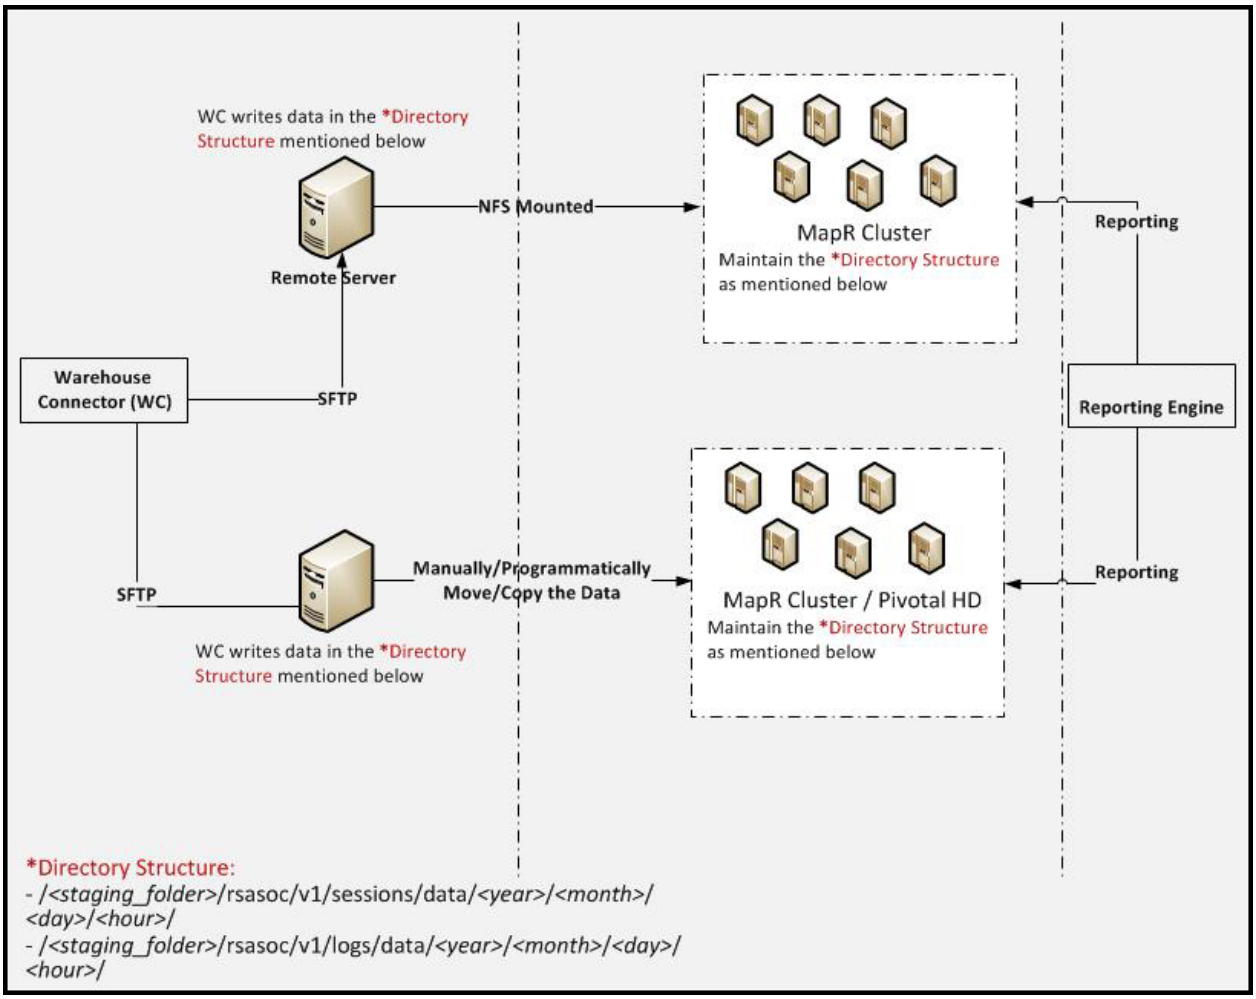
Configure the Destination

You can configure the destination using NFS, SFTP, and WebHDFS. Change the destination to which the Warehouse Connector service needs to write the collected data using NFS:

- NetWitness Warehouse (MapR) deployments
- Commercial MapR M5 Enterprise Edition for Apache Hadoop deployments

You can configure the Warehouse Connector to write to a remote destination using Secure File Transfer Protocol (SFTP). The remote destination can be a remote server that is NFS mounted to the MapR cluster or it can be a remote staging server.

By default, in the remote destination the Warehouse Connector writes data in the following directory structure:



- `/<staging_folder>/rsasoc/v1/sessions/data/<year>/<month>/<day>/<hour>/`
- `/<staging_folder>/rsasoc/v1/logs/data/<year>/<month>/<day>/<hour>/`
  Where <staging_folder> is the folder on the remote server where the Warehouse Connector writes the data.

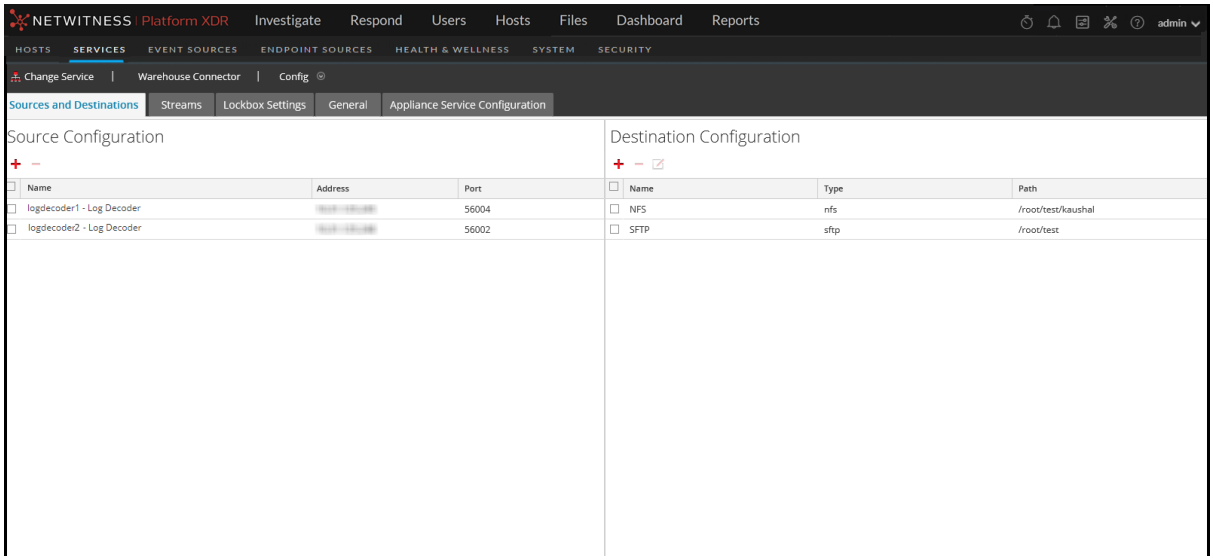
If you are using a remote staging server as the remote destination, you need to manually copy or move the directory structure to any of the following deployments:

- NetWitness Warehouse (MapR)
- Commercial MapR M5 Enterprise Edition for Apache Hadoop
- HortonWorks HD

To generate reports from the data written by Warehouse Connector, make sure that in your Hadoop deployment you maintain a similar directory structure that is created by Warehouse Connector in the remote destinations.

The following illustration describes how you can use SFTP to write data from Warehouse Connector to a remote destination.

You can configure the Warehouse Connector service to write the collected data to a Hadoop-based distributed computing system that supports WebHDFS.



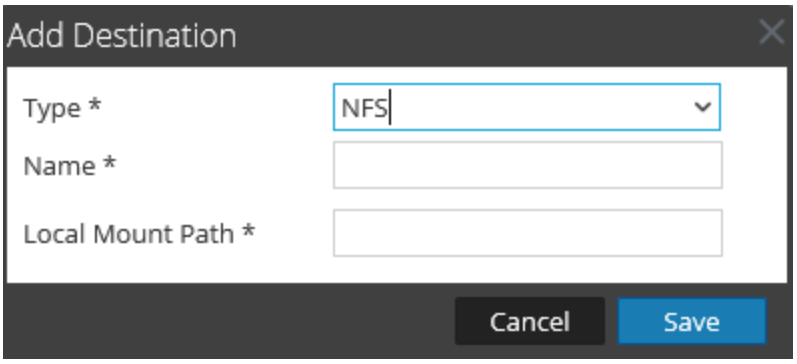
Configure the Destination Using NFS

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see "Add a Service to a Host" in the *Hosts and Services Getting Started Guide*.
- Set up NFS on Warehouse Connector. For more information on how to set up NFS on Warehouse Connector, see "Configure Warehouse Connector to Write to Warehouse" in the *Warehouse (MapR) Configuration Guide*.

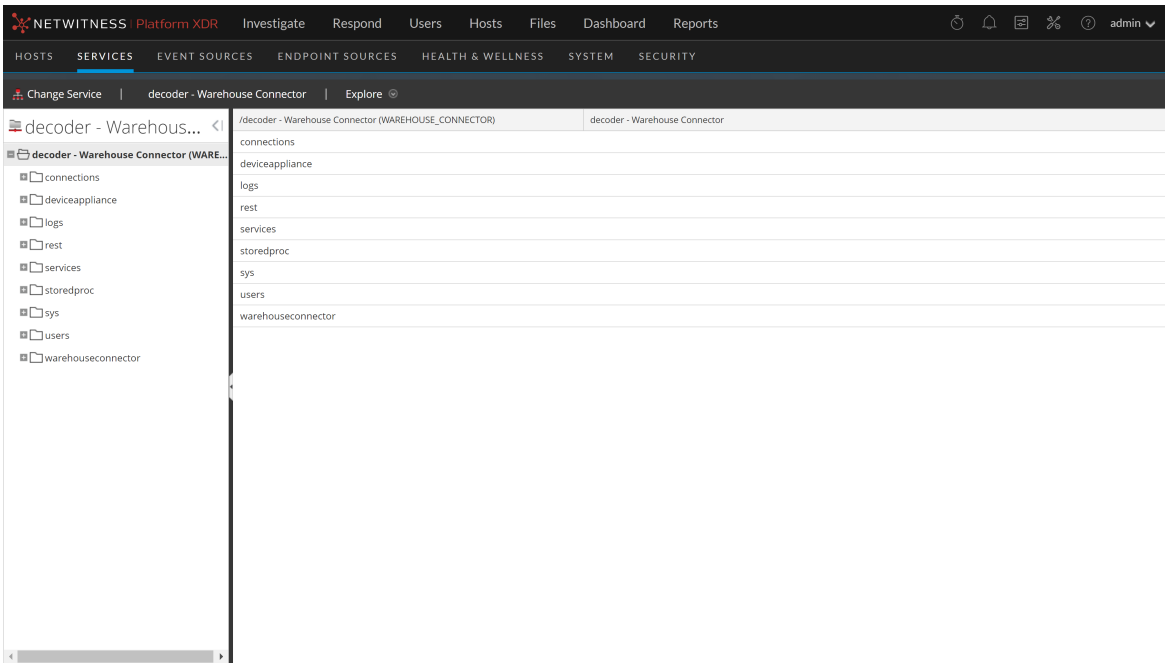
To configure the destination using NFS:

1. Log on to NetWitness.
2. Go to  **(Admin) > Services**.
3. In the Services view, select the Warehouse Connector service, and select  **> View > Config**.
   The Services Config View of Warehouse Connector is displayed.



4. On the **Sources and Destinations** tab, in the **Destination Configuration** section, click .
5. In the **Add Destination** dialog, from the **Type** drop-down list, select **NFS**.
6. In the **Name** field, enter a unique symbolic name for the destination.

   Note: The **Name** field does not support spaces or special characters except underscore (_).



7. In the **Local Mount Path** field, enter the locally mounted directory for HDFS where you want the Warehouse Connector to write the data. For example:
   If **/saw** is the local mount point for HDFS that you have configured while mounting the mapr NFS cluster on the host where you have installed the Warehouse Connector service to write to NetWitness Warehouse (MapR), create a directory named **Ionsaw01** under **/saw** and the corresponding Local Mount Path for the destination would be **/saw/Ionsaw01**.

   For more information, see "Mount the Warehouse on the Warehouse Connector" topic in the *Warehouse (MapR) Configuration Guide*.

   The **/saw** mount point implies to / as the root path for HDFS. The Warehouse Connector writes the data to **/Ionsaw01** in HDFS.

8. Click **Save**.
9. (Optional) If you want to enable checksum validation, perform the following:
   a. Go to **(Admin) > Services**.
   b. In the Services view, select the added Warehouse Connector service, and select **> View > Explore**.
      The Explore view of Warehouse Connector is displayed.

c. In the options panel, navigate to **warehouseconnector/destinations/nfs/config**. This is the name of the destination and is dynamic.

d. Set the parameter `isChecksumValidationRequired` to **1**.

e. Restart the respective stream.

Configure the Destination Using SFTP

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see the "Add a Service to a Host" in the *Hosts and Services Getting Started Guide*.
- For the SFTP destination type, the destination host should be listed in the **/root/.ssh/known_hosts** file used by the ssh service (for example, sshd) running on the Warehouse Connector.

Add Destination from Warehouse Connector Host

To add the destination host to the **/root/.ssh/known_hosts** file, from the Warehouse Connector host, initiate a secure connection to the destination host:

1. Log in to the Warehouse Connector.
2. Enter `ssh root@<SAWIP>` or `ssh username@<SAWIP>`.
3. Select **Yes** and enter the password.
4. Add the host key in the **/root/.ssh/known_hosts** file

> **Note:** After you upgrade Warehouse Connector to 11.0, you must make sure that the destination host is listed in the `/root/.ssh/known_hosts` file used by the SSH service (i.e. sshd) running on the Warehouse Connector. If you do not perform this action, the streams configured with SFTP in Warehouse Connector will not start.

- If you want to use SFTP to write data into the destination using SSH key-based access, you need to configure SSH key-based access between the Warehouse Connector and the Warehouse host or Hadoop node. For more information, see **Configure SSH Keys** below.

> **Note:** If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you generate the keys without setting the passphrase and do a key exchange between Warehouse Connector and the warehouse nodes.

Configure SSH Keys

To configure SSH key-based access between the Warehouse Connector and the Warehouse host or Hadoop node:

1. Generate SSH keys on the Warehouse Connector at the default location. Perform the following:
   a. SSH to the Warehouse Connector.
   b. Type the following command and press ENTER:

      ```
      $ OWB_FORCE_FIPS_MODE_OFF=1 ssh-keygen -t ecdsa -b 521
      ```

   c. The command prompts you to enter the file in which to save the generated key.

```
Enter file in which to save the key (/root/.ssh/id_ecdsa):
```

d. Enter the file in which you want to save the key and press ENTER.

The command prompts you to enter and confirm the passphrase.

> **Note:** If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you do not set the **passphrase**. Then, the below steps e, f, g, and h are not applicable.

```
Enter passphrase (empty for no passphrase):
 Enter same passphrase again:
```

The public key is generated and is saved in the location that you provided.

> **Note:** If the SSH key is not generated in the default location (`/root/.ssh/id_ecdsa`), you need to configure the destination for warehouse connector through Explore view. For more information, see To configure the destination through Explore view:.

e. Change the directory by entering the following command:

```
cd /root/.ssh/
```

f. Move the generated key to the below location:

```
mv ~/.ssh/id_ecdsa ~/.ssh/id_ecdsa.old
```

g. Type the following command and press ENTER:

```
$ OWB_FORCE_FIPS_MODE_OFF=1 openssl pkcs8 -topk8 -v2 des3 -in id_
ecdsa.old -out id_ecdsa
```

The command prompts you to enter and confirm the passphrase.

h. Enter the encryption passphrase.

i. Run the following command to change the file permission:

```
chmod 600 ~/.ssh/id_ecdsa
```

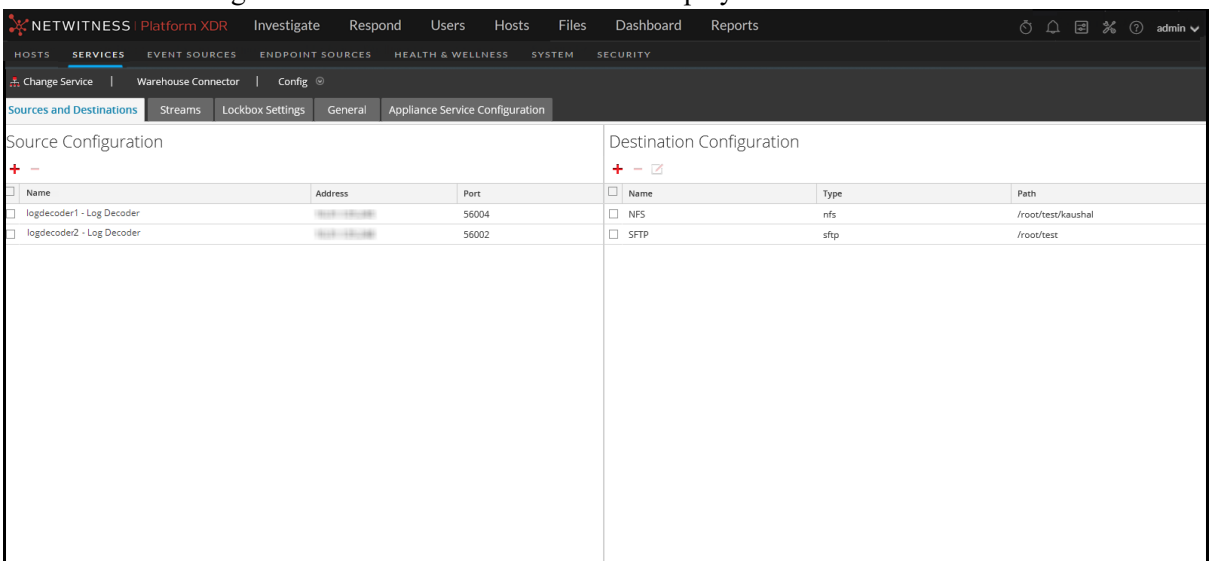
j. Copy the generated public key to append to the remote Warehouse host or Hadoop node.

```
ssh-copy-id -i ~/.ssh/id_ecdsa.pub root@<destination host ipaddress>
```

2. SSH to remote Warehouse host or Hadoop node as "`ssh '<user>@<ip address>`", if identity key file is at default location.
or
SSH to remote Warehouse host or Hadoop node as "`ssh '<user>@<ip address> -i <identity file path>`", If identity key file is not at default location.

3. Append the generated public key to the remote Warehouse host or Hadoop node's authorized keys list located at `~/.ssh/authorized_keys`.

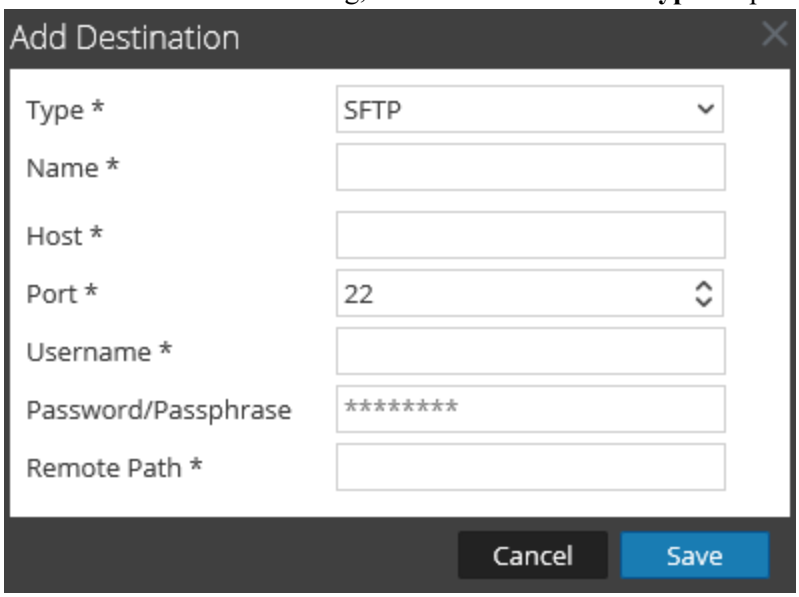
> **Note:** Make sure that you copy the public keys to the Hadoop node and while copying the public key ensure that you provide the login details of the user using which the WebHDFS destination would be added.



You can now securely communicate between Warehouse Connector and Warehouse nodes or Hadoop nodes.

Configure Warehouse Connector to use SFTP destination

Note: If the SSH key is not generated in the default location (`/root/.ssh/id_ecdsa`), you need to configure the destination through Explore view. For more information, see To configure the destination through Explore view:.



To configure the destination through User Interface:

1. Log on to NetWitness
2. Go to  **(Admin) > Services**.
3. In the Services view, select the added Warehouse Connector service, and select  **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.

4. On the **Sources and Destinations** tab, in the **Destination Configuration** section, click .

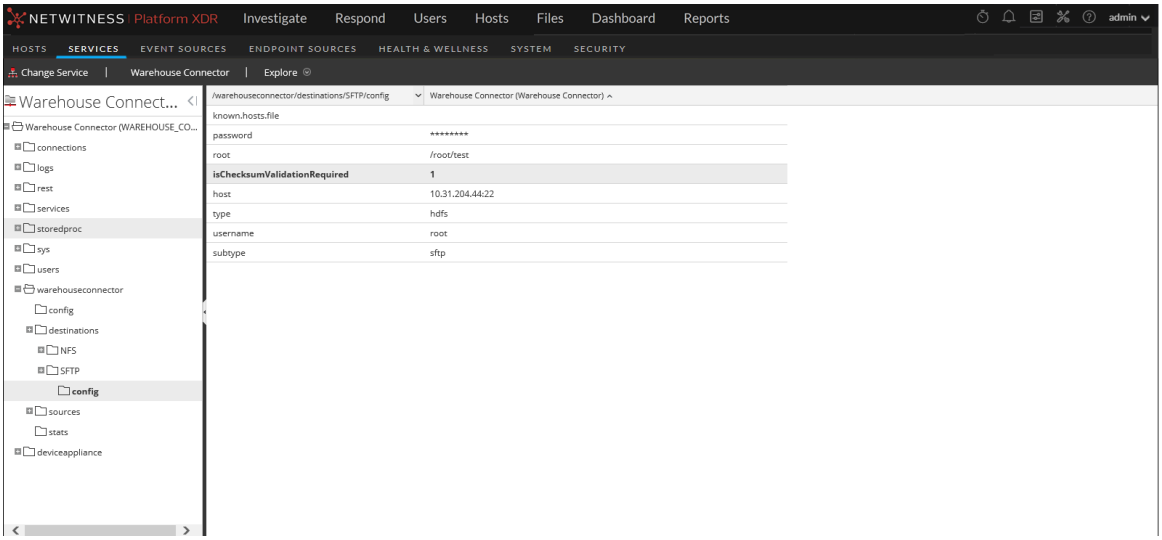
5. In the **Add Destination** dialog, select **SFTP** from the **Type** drop-down list.

6. In the **Name** field, enter a unique symbolic name for the destination.

   Note: The **Name** field does not support spaces or special characters except underscore (_).

7. In the **Host** field, enter the remote server IP address.
8. In the **Port** field, retain the default port, **22**.
9. In the **Username** field, enter the SSH username.

   Note: In the case of HortonWorks HD, ensure that the username is gpadmin and for password based access the password for gpadmin should be used. For passphrase-based access, the passphrase used to generate the keys for gpadmin user should be used.

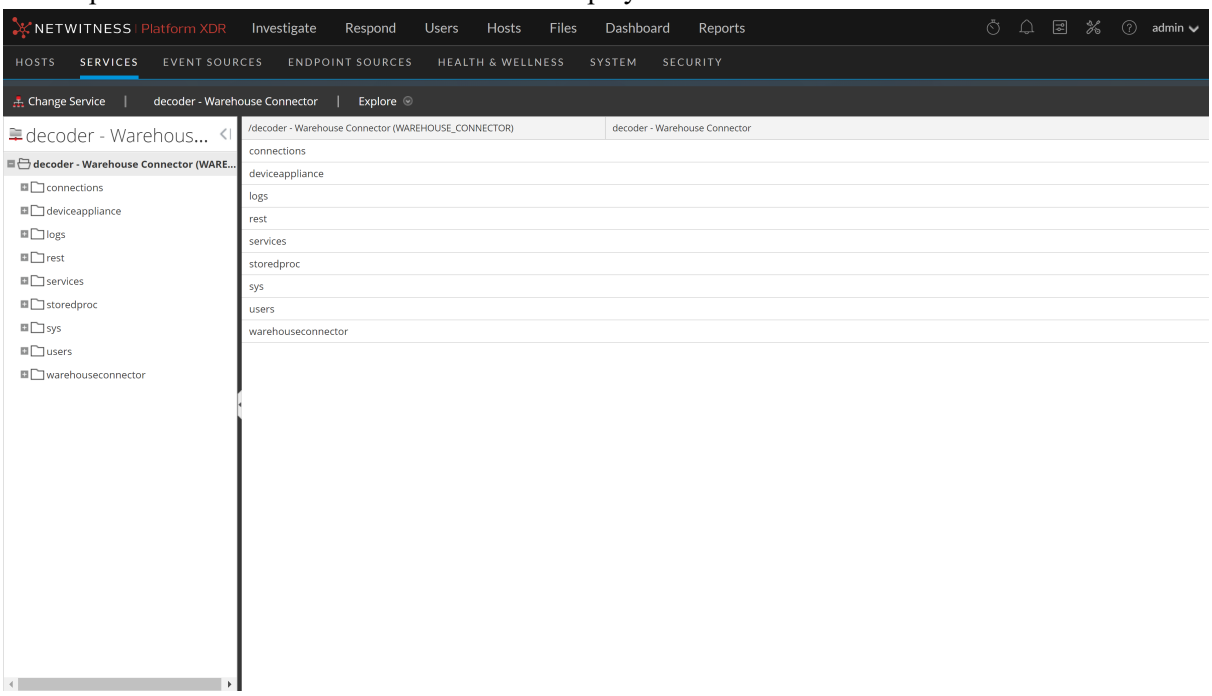


10. In the **Password/Passphrase** field, enter one of the following:
    - SSH password - If you are using SFTP to write data into the destination using password-based access.
    - SSH passphrase - If you are using SFTP to write data into the destination using SSH key-based access.
11. In the **Remote Path** field, enter the path of the directory present on the SFTP server.
12. Click **Save**.
13. (Optional) If you want to enable checksum validation, perform the following:
    a. Go to **(Admin) > Services**.
    b. In the Services view, select the added Warehouse Connector service, and select **> View > Explore**.

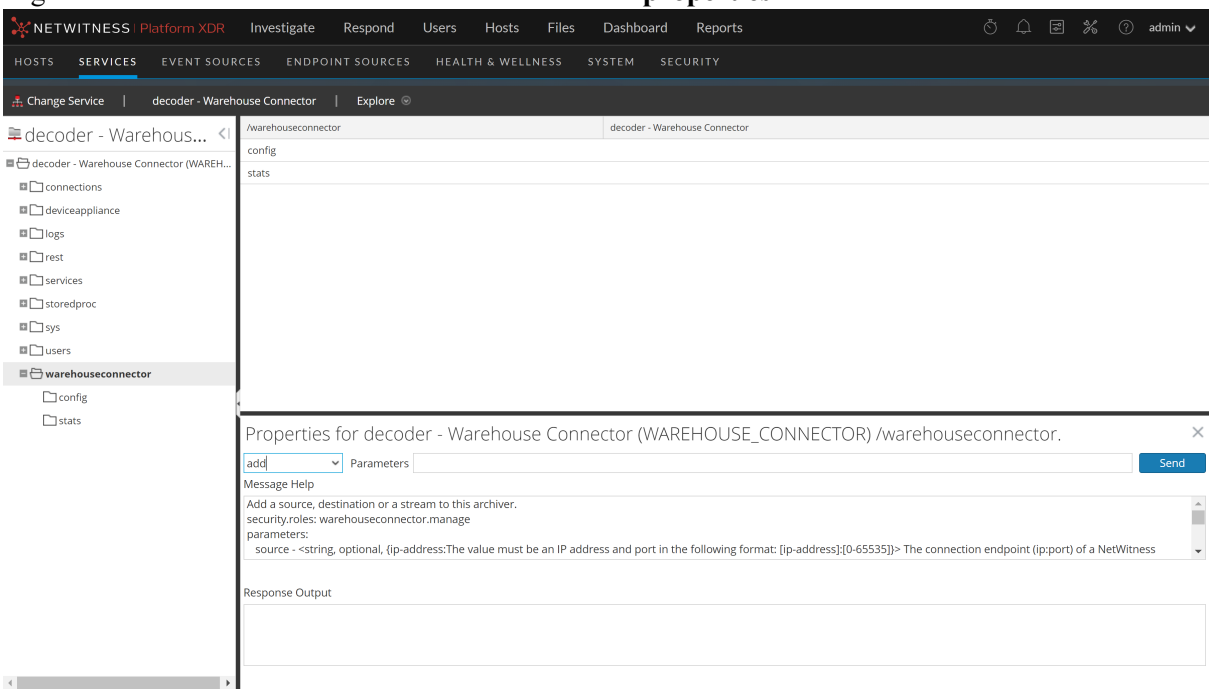
The Explore view of Warehouse Connector is displayed.

c. In the options panel, navigate to **warehouseconnector/destinations/sftp/config**.

d. Set the parameter `isChecksumValidationRequired` to **1**.



e. Restart the respective stream.



To configure the destination through Explore view:

1. Go to **(Admin) > Services**.
2. In the Services view, select the added Warehouse Connector service, and select **> View > Explore**.

The Explore view of Warehouse Connector is displayed.

3. Right click on "warehouseconnector" node and select **properties**.

4. Select "add" property and manually enter the below config parameters.

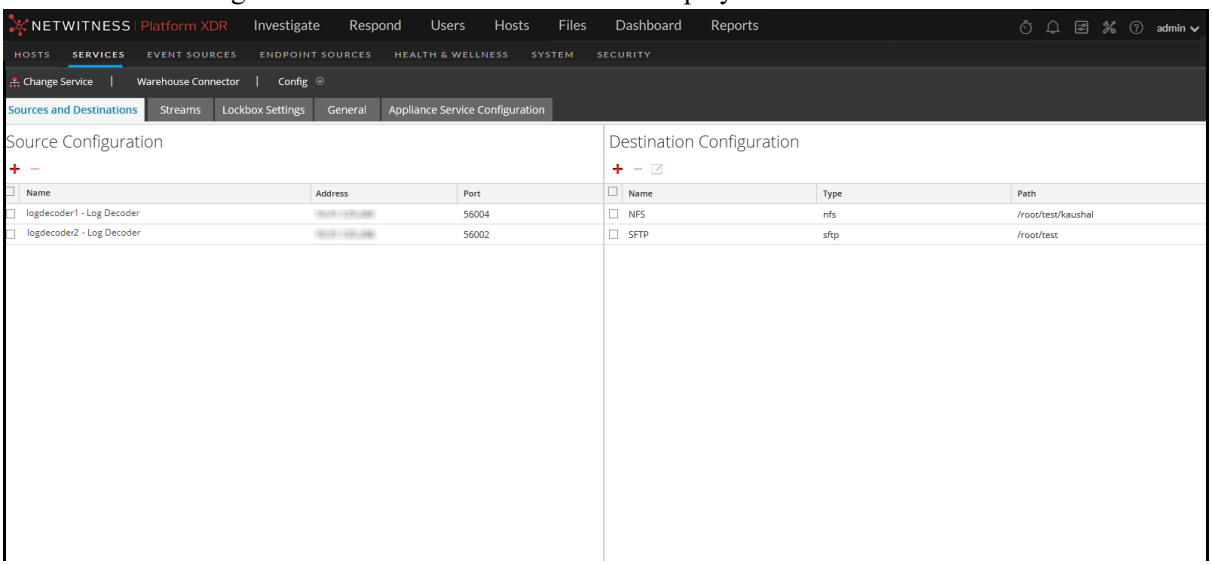
```
name=<destination name> destination=sftp://<destination path>
host=<destination host ipaddress:port> type=hdfs port=22
username=<username> password=<password> privKeyFile=<private key file path>
```

Aggregate Metas and Raw Logs for a Log Session

To aggregate raw logs and metas from Log Decoder into a single AVRO file instead of two folders.

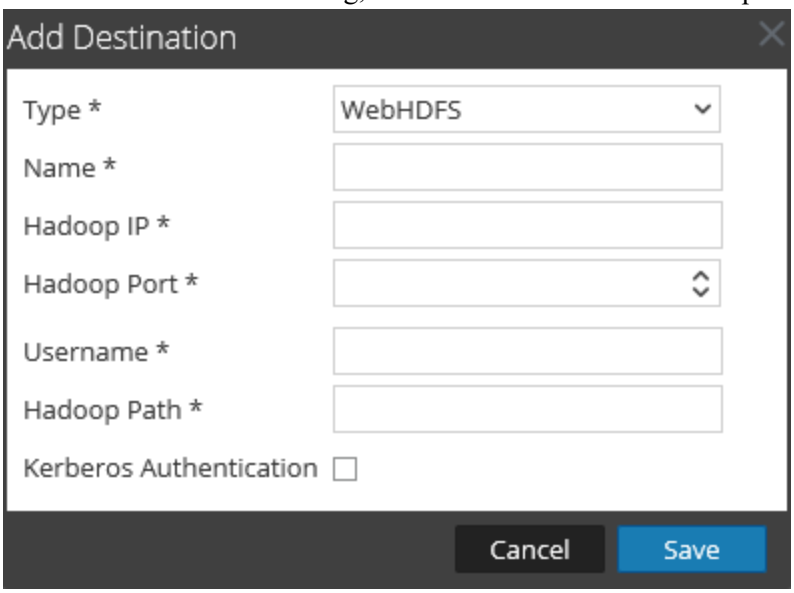
1. Go to **ADMIN** > **Services**.
2. Select a Warehouse Connector service and click  > **View** > **Explore**.
   The Explore view for the Warehouse Connector is displayed.
3. Open `warehouseconnector/streams/<stream name>/loader/config` and in the right pane, select the `export.logAndsession.avro.enabled` parameter.
4. Change the value to **yes**.
5. Restart the service.
6. Go to **ADMIN** > **Services**.
7. Select a Warehouse Connector service and click  > **View** > **Config**.
8. On the **Streams** tab, select the stream that you want to reload.
9. Click **Reload**.

Configure the Destination Using WebHDFS



Make sure that you have:

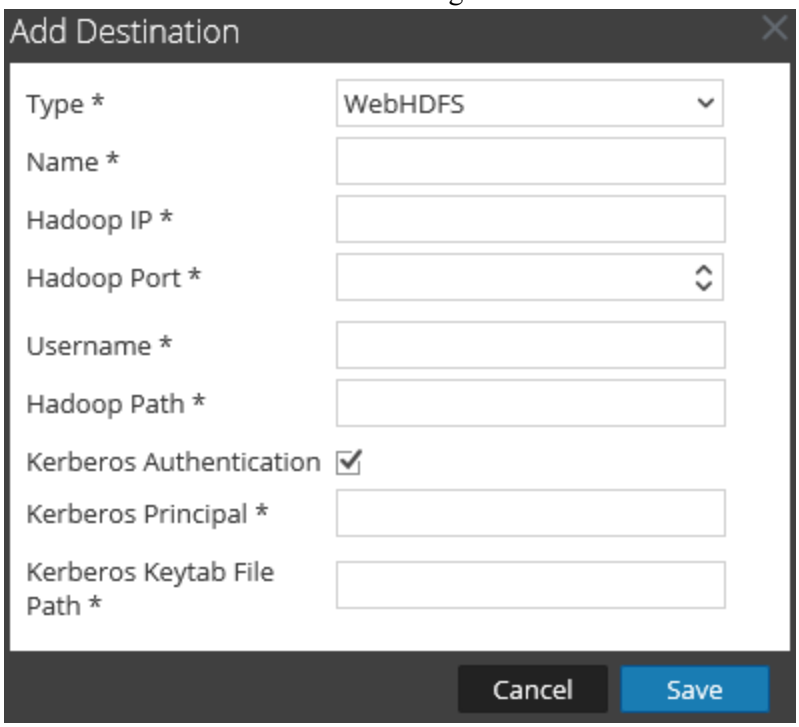
- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the hostname (or FQDN) and IP address of the warehouse nodes and Warehouse Connector to the DNS server. If the DNS server is not configured, add the hostname (or FQDN) and IP address of the warehouse nodes and Warehouse Connector to the file in the host on which the Warehouse Connector service is installed.
- If you want Kerberos authentication between the warehouse connector and the warehouse cluster, make sure that you perform the following:
  - Kerberos Key Distribution Center (KDC) Server is configured in your network environment and the Kerberos Keytab file is copied to the host on which you have installed Warehouse Connector.
  - Kerberos authentication is enabled in the warehouse cluster.
- If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you generate the keys without setting the passphrase and do a key exchange between the Warehouse Connector and the warehouse nodes. You need to configure SSH key-based access between the Warehouse Connector and the Warehouse host or hadoop node. For more information, see 'Configure SSH Keys' in Configure the Destination Using SFTP.



Configure Warehouse Connector to Write to SFTP destination

To configure the destination:

1. Log on to NetWitness.
2. Go to **(Admin) > Services**.
3. In the Services view, select the added Warehouse Connector service and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.



4. On the **Sources and Destinations** tab, in the **Destination Configuration** section, click .
5. In the **Add Destination** dialog, select **WebHDFS** from the drop-down list.

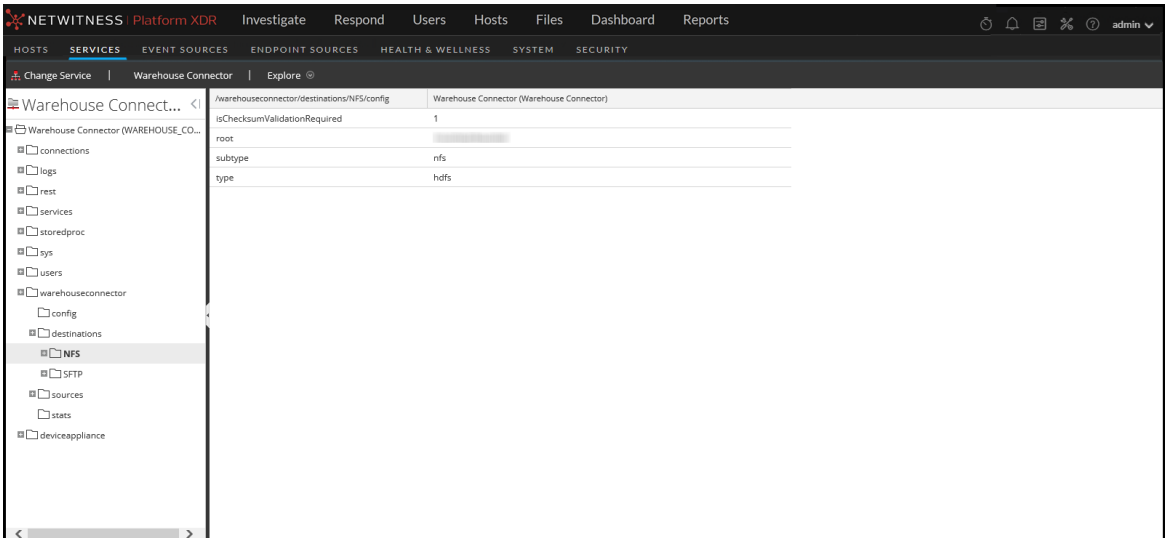
6. In the **Name** field, enter a unique symbolic name for the destination.

   Note: The **Name** field does not support spaces or special characters except underscore (_).

7. In the **Hadoop IP** field, enter the namenode IP address of the warehouse cluster.
8. In the **Hadoop Port** field, enter the base port that is used by the namenode web user interface.
9. In the **Username** field, enter the owner of the directory in the warehouse to which Warehouse Connector should write the data.
10. In the **Hadoop Path** field, enter the path of the directory in the warehouse to which Warehouse Connector should write the data.
11. Select the **Kerberos Authentication** checkbox, if you want the warehouse connector to securely communicate with the warehouse using Kerberos authentication.

   Perform the following:

   a. In the **Kerberos Principal** field, enter the KDC Principal used for Kerberos authentication.
   b. In the **Kerberos Keytab File Path** field, enter the path of the Kerberos Keytab file in the Warehouse Connector.



12. Click **Save**.
13. (Optional) If you want to enable checksum validation, perform the following:

   a. Go to **(Admin) > Services**.
   b. In the Services view, select the added Warehouse Connector service and select **> View > Explore**.
      The Explore view of Warehouse Connector is displayed.

c. In the options panel, navigate to **warehouseconnector/destinations/webhdfs/config**.

d. Set the parameter `isChecksumValidationRequired` to **1**.

e. Restart the respective stream.

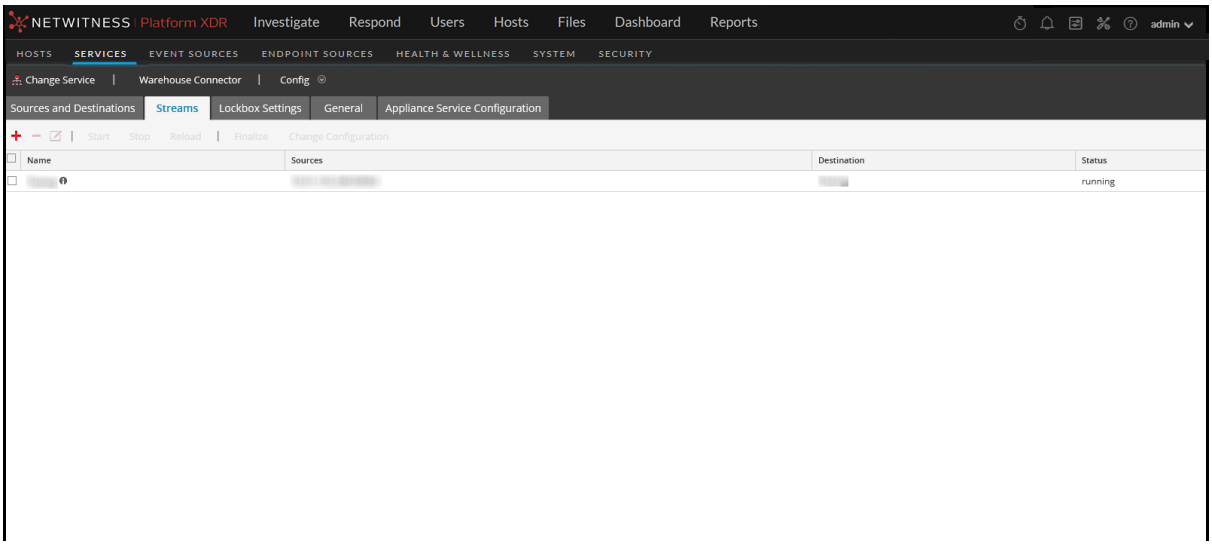
Configure a Stream

You can configure the data stream to define the data source and destination combinations.

Make sure that you have:

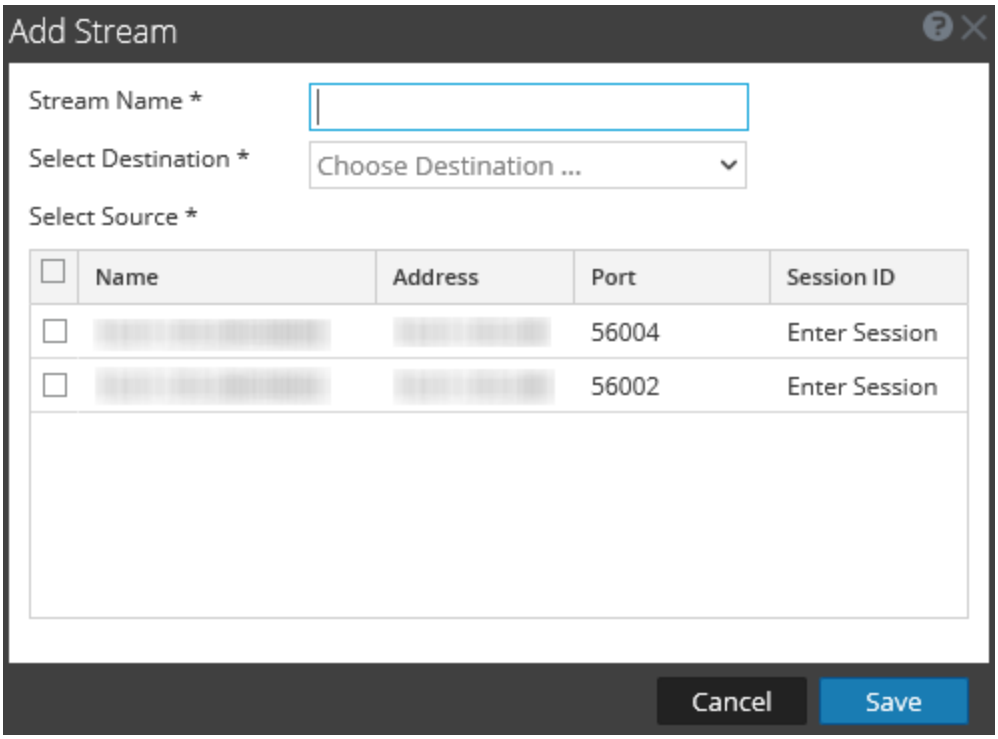
- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see "Add a Service to a Host" in the *Hosts and Services Getting Started Guide*.
- Configured the data source from which the Warehouse Connector service needs to collect data. For more information, see Configure the Data Source for Warehouse Connector.
- Configured the destination to which the Warehouse Connector service needs to write the collected data. For more information, see Configure the Destination.

To configure the stream:



1. Create a stream
2. Finalize the stream
3. Start the stream

Create a Stream



To create a stream:

1. Go to  **(Admin) > Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.

   The Services Config view of Warehouse Connector is displayed.
3. Click the **Streams** tab.

4. On the **Streams** tab, click .

5. In the **Add Stream** dialog, perform the following steps:

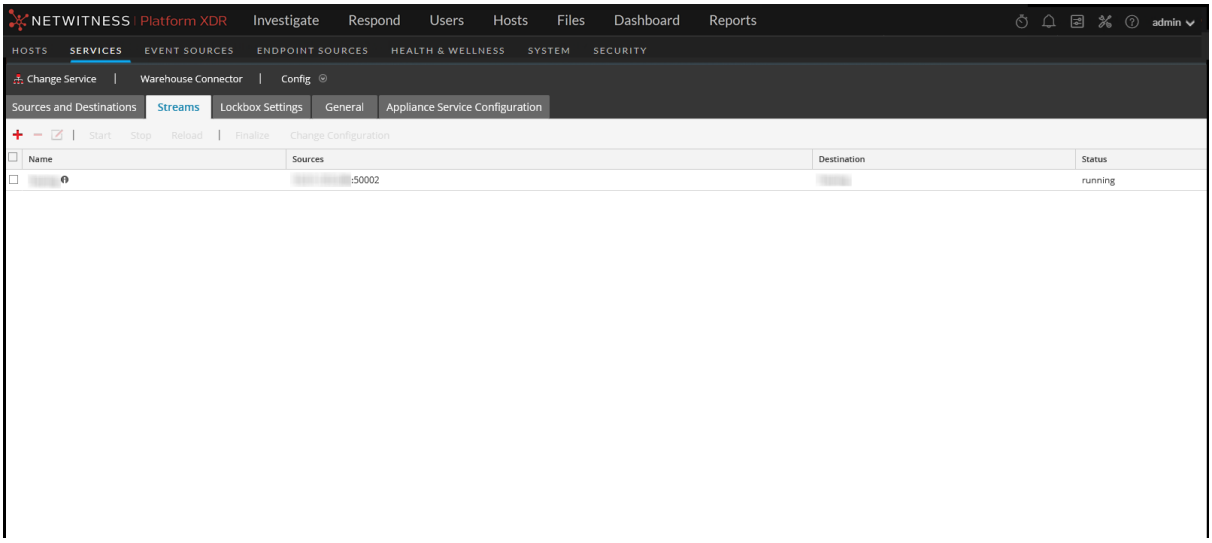
   a. In the **Stream Name** field, enter a name for the stream.

   Note: The **Stream Name** field does not support spaces or special characters except underscore (_).

   b. In the **Select Destination** drop-down menu, select a destination from the list of destinations added to the Warehouse Connector.

   c. In the **Select Source** field, select sources from the list of sources displayed.

d. In the **Session ID** column, enter the last session id.
If you provide any session id, the Warehouse Connector will start the aggregation from that session, whereas if this is left blank, the aggregation will start from the current session.



e. Click **Save**.

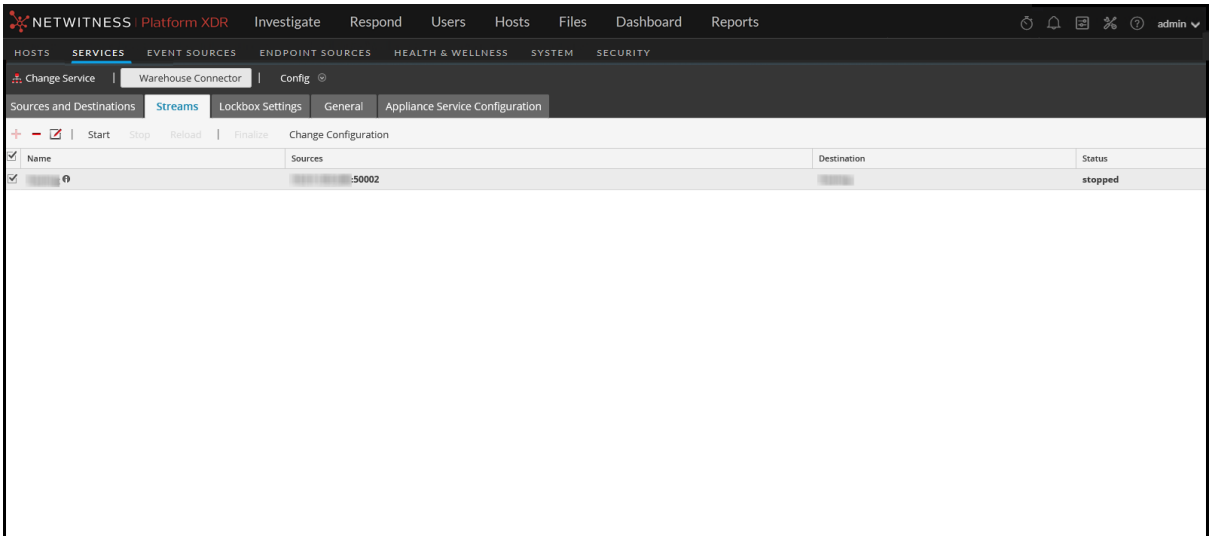
Finalize a Stream

To finalize the stream:

1. Go to  **(Admin) > Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.

   The Services Config view of Warehouse Connector is displayed.
3. On the **Streams** tab, select the stream that you have created.

4. Click **Finalize**.



Start a Stream

Note: If you have deployed a Warehouse Connector Virtual Appliance, make sure that you change the default value of the `Maximum Message Hold Count` parameter to 800000. For more information, see General Tab Settings.

To start the stream:

1. Go to  **(Admin) > Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.

   The Services Config view of Warehouse Connector is displayed.
3. On the **Streams** tab, select the stream that you have created.

4. Click **Start**.

Monitor a Warehouse Connector

By monitoring a Warehouse Connector, you can automatically generate notifications when critical thresholds concerning Warehouse Connector and its storage have been met.

To monitor a Warehouse Connector:

1. Go to  **(Admin) > Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
3. Click the **Streams** tab.
4. At the bottom of the **Streams** tab, click **To configure the alert mechanisms related to the Warehouse Connector navigate here**.
   The Warehouse Connector Monitoring view is displayed.

   This page is deprecated and will be removed in a future release.
5. In the **Source or Destination Status** section, select the number of minutes or hours in the **Notify Offline For** field.
   You will receive a notification if the source or destination connection fails for the defined number of minutes or hours.
6. In the **Stream Status** section, perform the following:
   a. In the **Notify Stopped For** field, define the number of minutes or hours after which you would like to receive a notification when the stream goes offline.
   b. In the **Disk Is** field, define the limit on the percentage of disk usage after which you would like to receive a notification.
   c. In the **Source is Behind** field, define the number of sessions. A notification is raised if the source goes behind the defined number of sessions.
   d. In the **Rejected Folder Size is** field, define the limit on the percentage of folder usage after which would like to receive a notification.
   e. In the **Number Of Files in Permanent Failure Folder** field, define the limit on the number of files in the permanent failure folder after which you would like to receive a notification.
7. In the **Notification Type** field, perform the following:
   a. Click **Configure email or distribution list** to configure email so that you can receive notifications in NetWitness. For more information, see the "Configure Email Server and Notification Account" topic in the *System Configuration* guide.
   b. Click **Configure Syslog and SNMP Trap servers** to configure audit logs. For more information, see the "Configure Syslog and SNMP Settings" topic in the *System Configuration* guide.
   c. Select the following notification mechanisms as per your requirement:

- **NetWitness Console** - To get notifications on the NetWitness UI notification toolbar.
- **Email** - To get email notifications.
- **Syslog Notification** - To generate syslog events.
- **SNMP Trap Notifications** - To get audit events as SNMP traps.

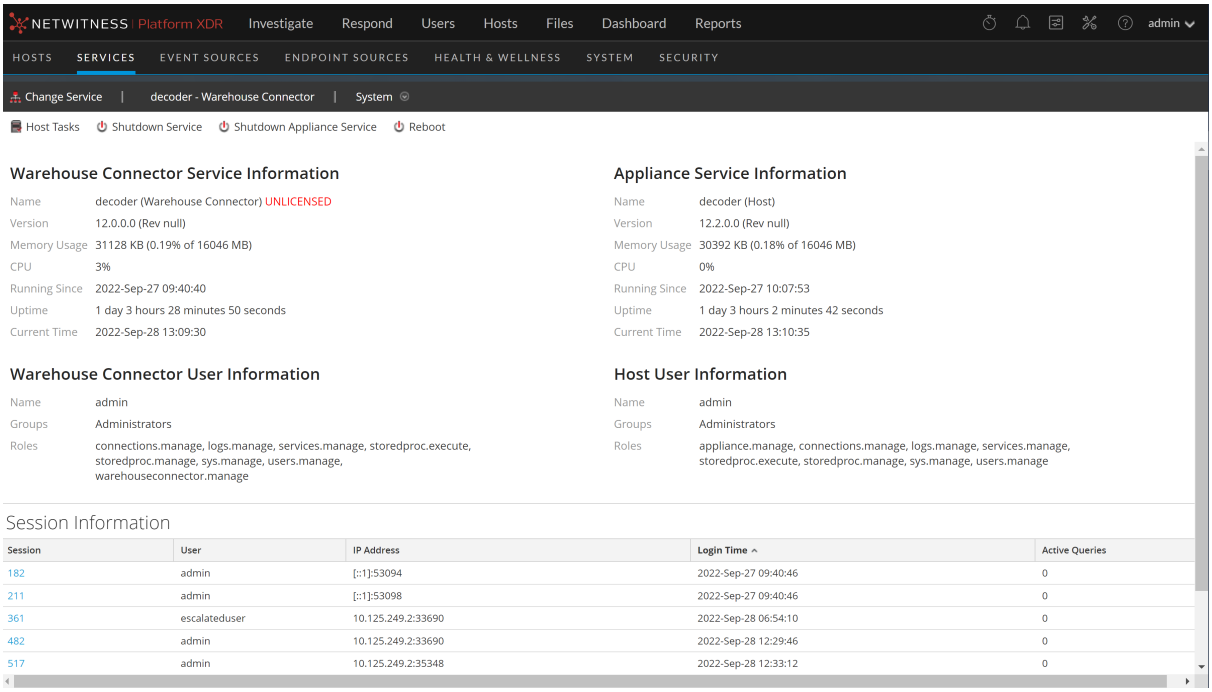
Add Warehouse as a Data Source to Reporting Engine

You must add Warehouse as a data source to Reporting Engine to make this data source available to report against this Reporting Engine. For more information, see "Add Warehouse as a Data Source to Reporting Engine" in the *Reporting Engine Configuration Guide*.

Analyze a Warehouse Report

The Warehouse modules provide analysts with reports of early indicators of compromise. The following Warehouse reports can be analyzed in NetWitness:

- Suspicious Domains report
- Suspicious DNS Activity report
- Host Profile report



For more information, see "Step 4. Analyze a Warehouse Report" in the *Warehouse Guide*.

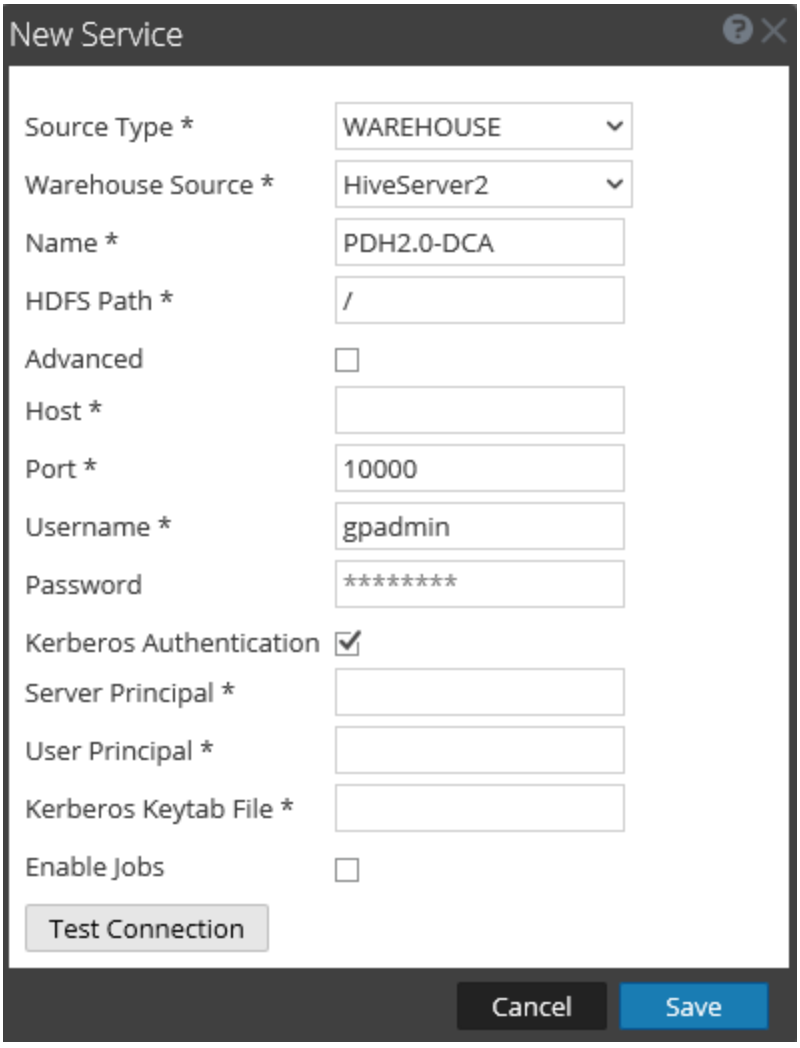
View the Warehouse Connector Service

While the information displayed in the Services System view is the same for all types of core services, several options in the toolbar are relevant only for Warehouse Connector.

To access this view:

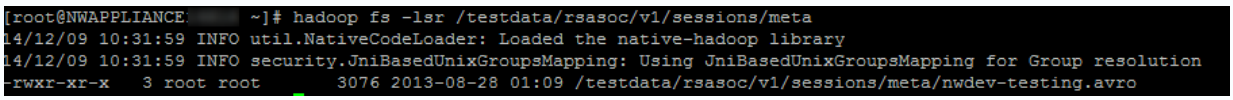
1. Go to **(Admin) > Services**.
2. In the Services view, select a Warehouse Connector and select **> View > System**.
   The Systems view for the selected Warehouse Connector is displayed.

The following is an example of toolbar options for Warehouse Connectors.



Host Tasks, Shutdown Service, Shutdown Appliance Service or (Shutdown Appliance), and Reboot are common to all services and are described in the *Hosts and Services Getting Started Guide*.

Troubleshoot the Warehouse Connector



The following information suggests the possible issues that NetWitness users may encounter when adding a Warehouse service to the Reporting Engine as a data source for reporting in NetWitness. Look for explanations and solutions in this section.

While adding a Warehouse service to the Reporting Engine as a data source for reporting, you may observe some of the errors listed in this document. Information is provided on how to troubleshoot the errors and add the data source successfully.

The following figure shows the New Service dialog.

For more information, see "Add Warehouse as a Data Source to Reporting Engine" in the *Reporting Engine Configuration Guide*.

Error	Possible Solutions
Could not open connection to HiveServer	• Ensure that the HiveServer2 is running on the Host. • Check if the port provided can be accessible from the Reporting Engine server.
No Schema found in HDFS path	Ensure that meta avro data file(s) are available in the HDFS path (**<HDFS Path>/rsasoc/v1/sessions/meta**) mentioned. The following figure shows an example of the command to check the files in hdfs.
	
Could not open connection to HiveServer, GSS initiate failed	GSS initiate failed errors will be observed only in the case of Kerberos enabled Hive. Ensure that the proper keytab file is provided and it should have read options for the rsasoc user (user on which the Reporting Engine Server runs). Ensure that the system time is synchronized between KDC, Hadoop (HortonWorks) server, and the Reporting Engine system.

Add SFTP Destination

To add SFTP destination to Warehouse Connector, you need to follow the below steps:

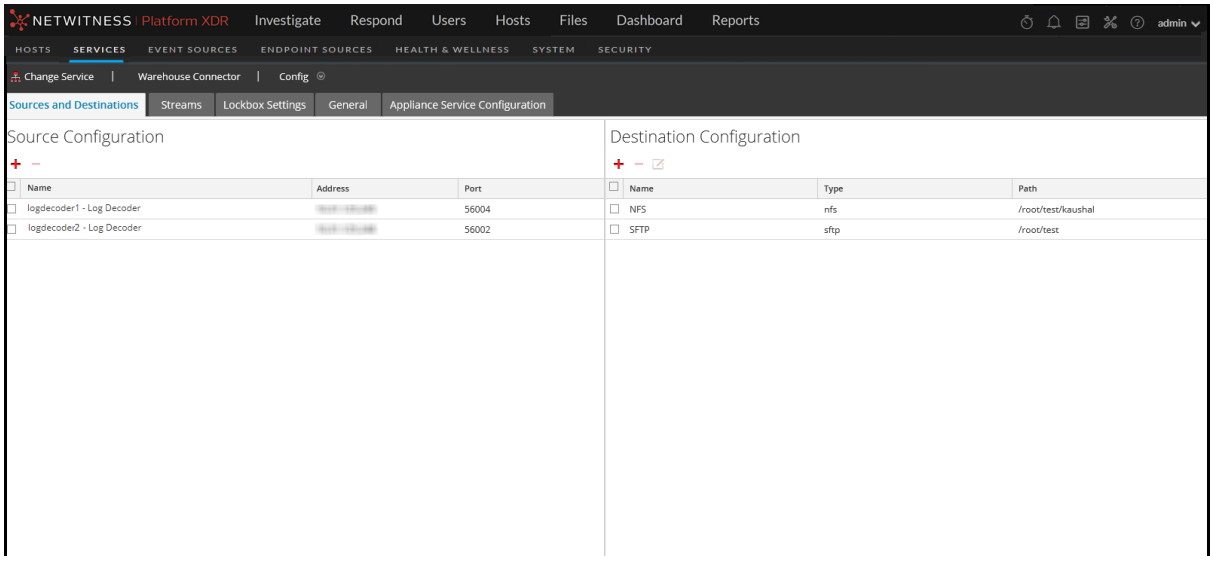
1. SSH to NetWitness Host and run the following command to edit `ssd_config` file:
   `vi/etc/ssh/sshd_config file`
2. Do not comment `HostKey/etc/ssh/ssh_host_rsa_key`
3. You must append `KexAlgorithms +diffie-hellman-group14-sha1,diffie-hellman-group-exchange-sha1`
4. Run the following command to restart NetWitness Host:
   `systemctl restart sshd`
5. On Warehouse Connector Host SSH to NetWitness Host and run the following command:
   `ssh -o "HostKeyAlgorithms ssh-rsa" root@<NWhost_IP>`
   For example, `ssh -o "HostKeyAlgorithms ssh-rsa" root@10.10.10.10`
6. Run the following curl command on Warehouse Connector Host to authenticate:
   `curl -vvvv sftp://root:netwitness@<NWhost_ip>:22/root/`
   For example, `curl -vvvv sftp://root:netwitness@<10.10.10.10>:22/root/`
7. You can now add SFTP Destination from UI.

Manage a Stream

You can manage a stream using the following procedures:

- Edit a Stream
- Reload the Stream
- Specify meta filters for a Stream
- Define multi-valued metas

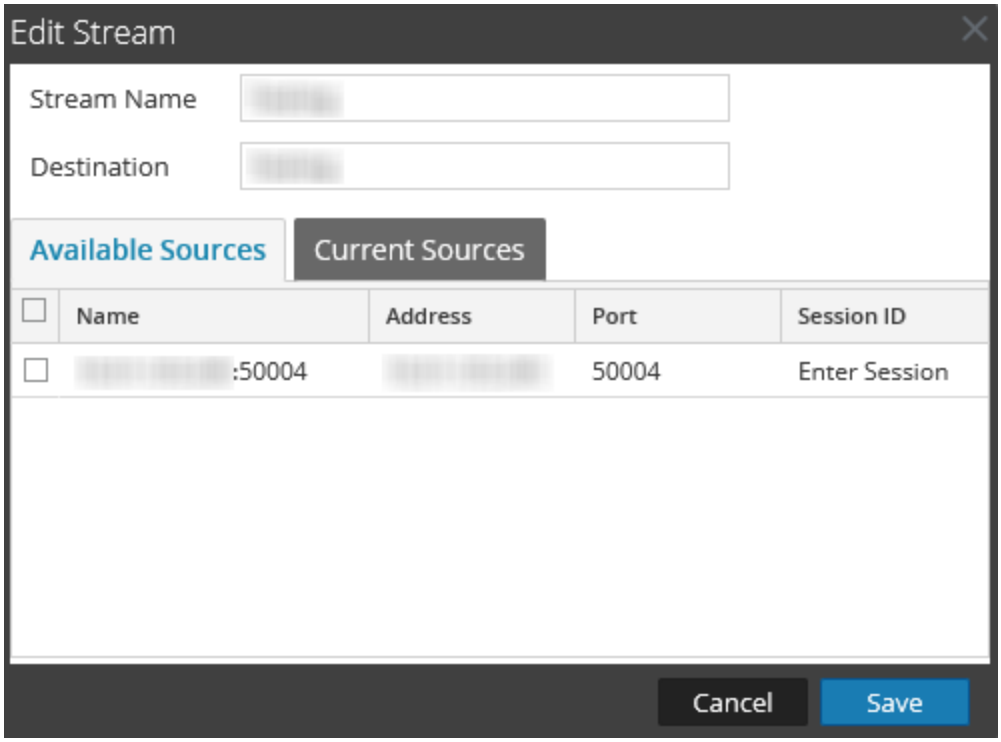
Edit a Stream



You can edit a stream to perform the following:

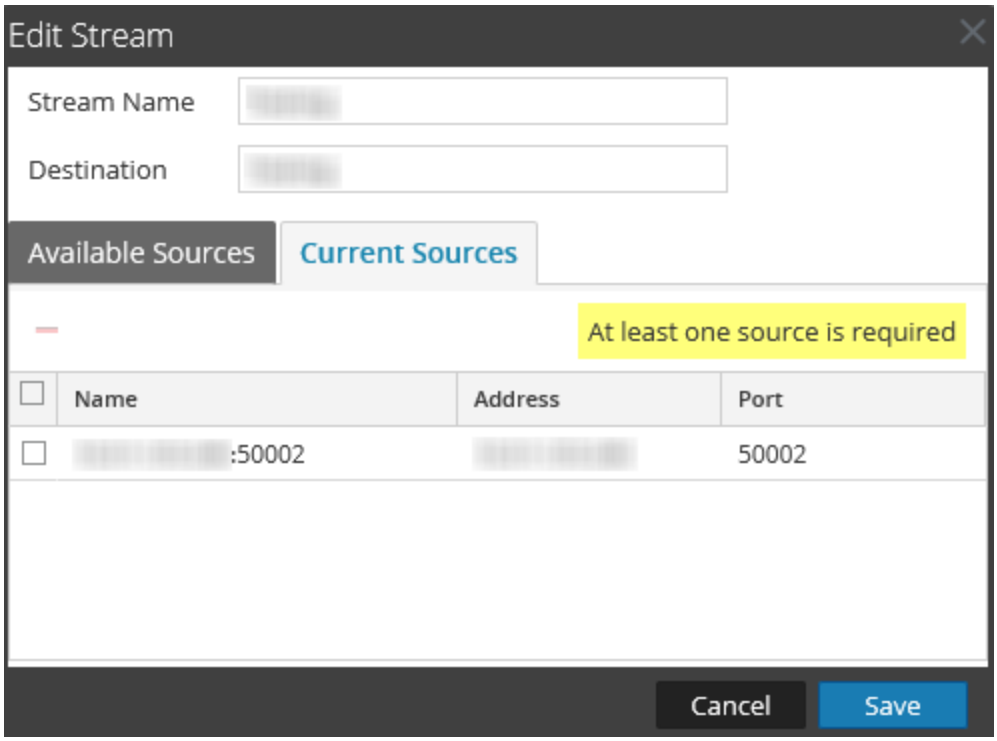
- Add data sources to the stream.
- Delete existing data sources from the stream.

To edit a stream:



1. Go to **(Admin) > Services**.
2. In the Services view, select the added Warehouse Connector service and select **> View > Config**.

   The Services Config view of Warehouse Connector is displayed.



3. On the **Streams** tab, click .
4. In the **Edit Stream** dialog, you can perform the following:

- On the **Available Sources** tab, you can select the available data sources to add to the stream and click **Save**.

- On the **Current Sources** tab, you can delete an existing data source from the stream. Select the data source and click − .

Reload the Stream

When you reload the stream, the Warehouse Connector updates the schema file for the stream. You must reload the stream when you add a new custom meta to the Log Decoder or Decoder.

To reload the stream:

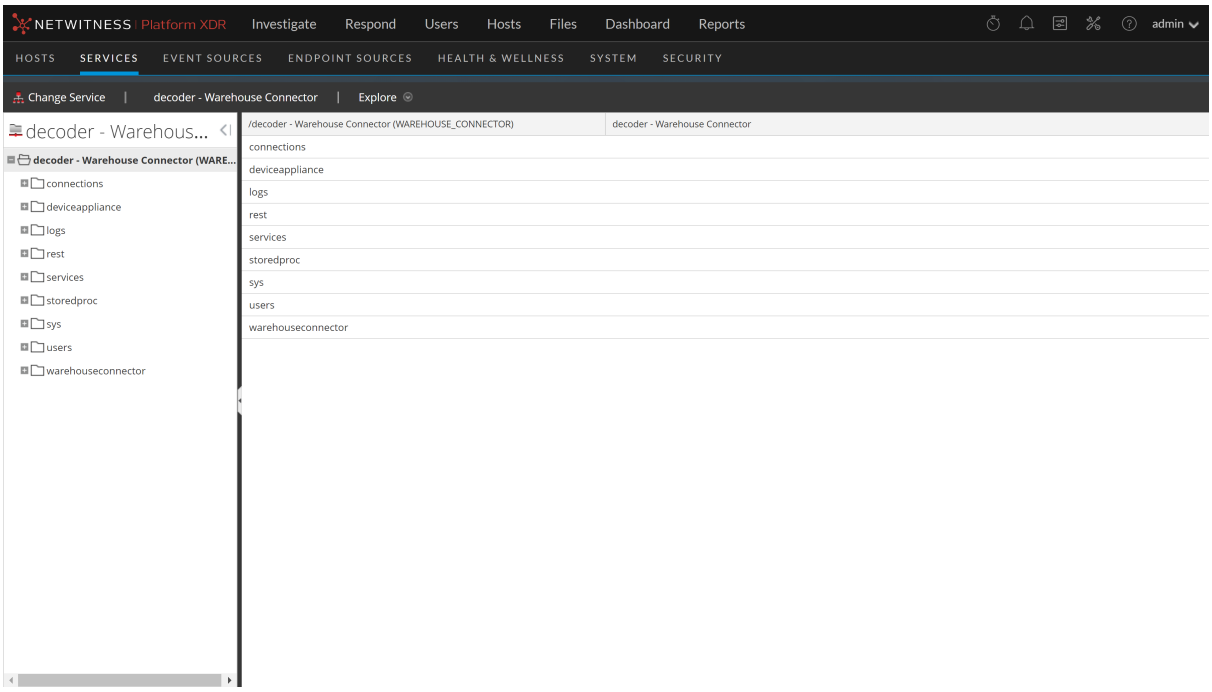
1. Go to **(Admin) > Services**.
2. In the Services view, select the added Warehouse Connector service and select **> View > Config**.

   The Services Config view of Warehouse Connector is displayed.
3. On the **Streams** tab, select the stream that you want to reload.
4. Click **Reload**.

Specify Meta Filters for a Stream

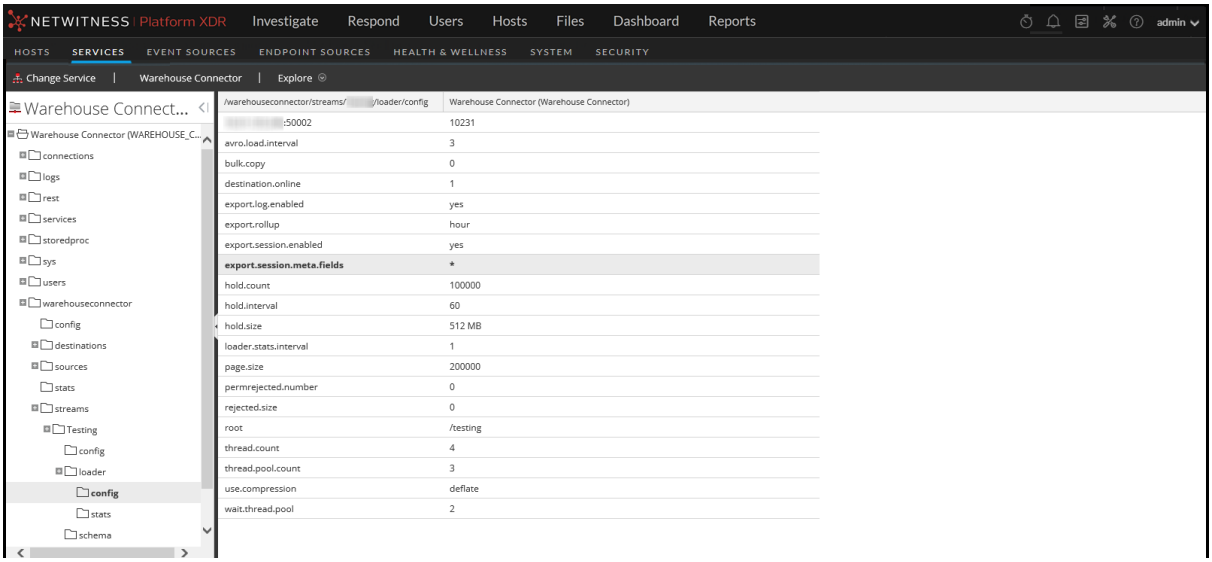
You need to specify the filter for each stream in the `export.session.meta.fields` parameter in the Explore view of the Warehouse Connector.

The following table lists the values that you can provide as a filter:



Values	Description
*	All the collected metas are written to SAW.
*, *meta1*, *meta2*	All the metas except the defined metas are written to SAW. For example, **Filter:**`*,ip.src` All the metas except `ip.src` is written to SAW.
meta1, meta2, meta3	Only the defined metas are written to SAW.

Note: By default, the following metas are written to Warehouse even if you specify them in the filter:
- ng_source
- unique_id
- time



To specify meta filters for a Stream:

1. Go to **(Admin) > Services**.
2. In the Services view, select a Warehouse Connector services and select **> View > Config**.

   The Explore view of the Warehouse Connector service is displayed.

3. In the options panel, select **warehouseconnector > streams > <stream_name> > loader > config**.
4. In the `export.session.meta.fields` parameter, enter the filter.

5. Restart the stream.

Define Multi-valued Metas

You can also define an existing meta or a custom meta to be treated as multi-valued meta.

To define multi-valued metas:

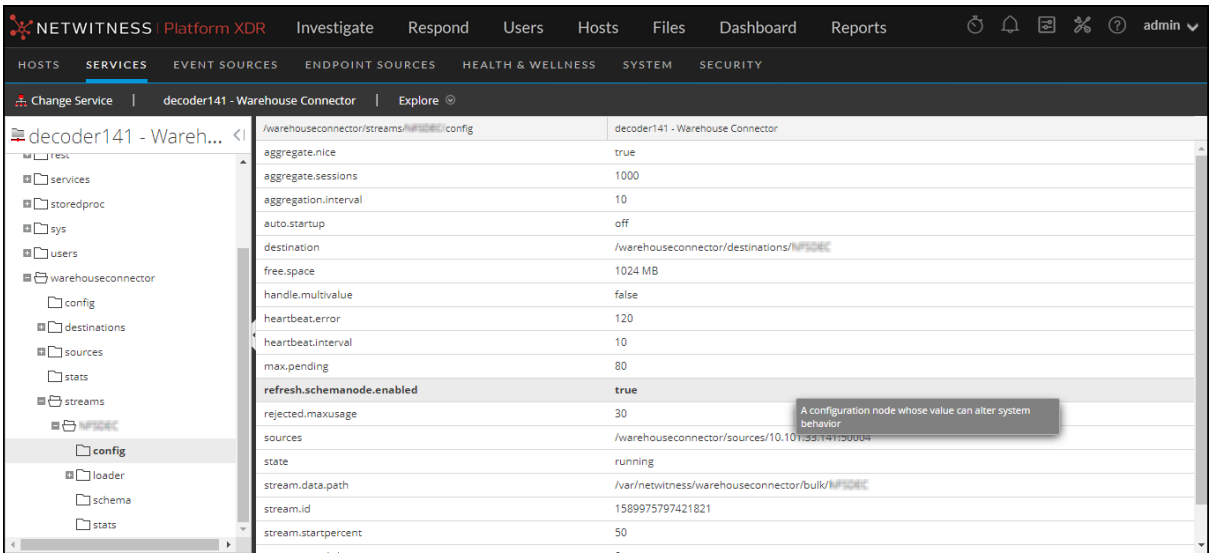
Caution: Defining an existing meta to be treated as multi-valued may change the data type of the meta and cause the associated reports to fail.

1. Create a new file with the filename **multivalue-users.xml** in the **/etc/netwitness/ng** directory.
2. Add the following entries:

```
<?xml version="1.0" encoding="utf-8"?>
<NetWitness>
   <MultiValueMetas>
      <Meta>NEWMETANAME</Meta>
   </MultiValueMetas>
</NetWitness>
```

   Where *NEWMETANAME* is the existing meta or a custom meta to be treated as multi-valued meta.

   Caution: Make sure that you do not add metas that are by default treated as non multi-value.



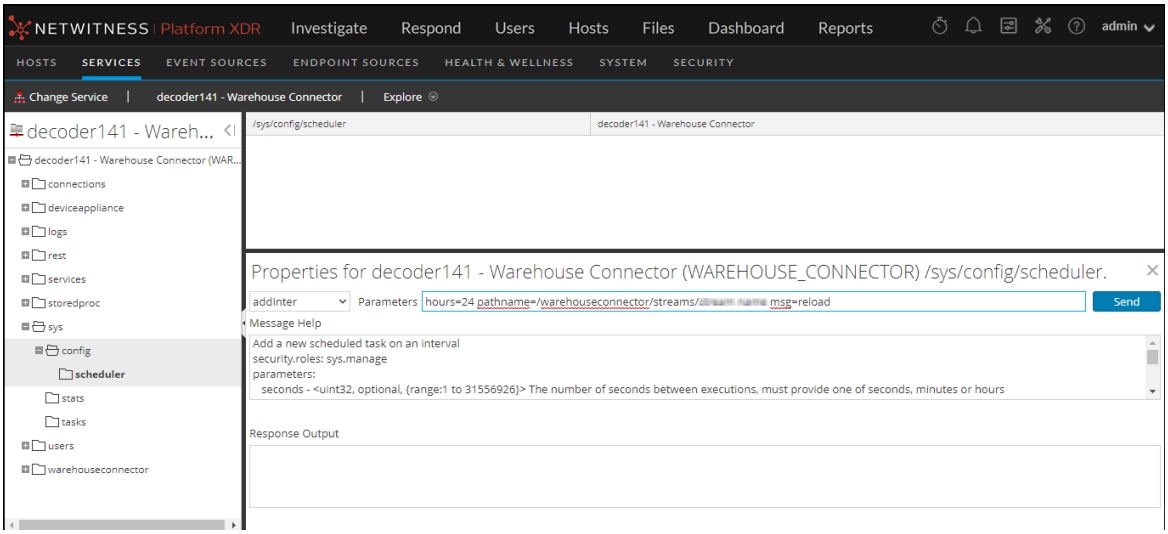
3. Restart the stream.

View the current schema

You can view the current schema that is used by warehouse connector for writing in AVRO files.

To view the current schema:

1. Go to **(Admin) > Services**.
2. In the Services view, select a Warehouse Connector services and select **> View > Explore**.
   The Explore view of the Warehouse Connector service is displayed.
3. In the options panel, select **warehouseconnector > streams > <stream_name> > config**.
4. Set the value for `refresh.schemanode.enabled` parameter to **true**. By default, this value is set to false.



5. Reload the stream. For more information see, Reload the Stream.
6. Restart the Warehouse Connector service.
7. Go to **(Admin) > Services**.

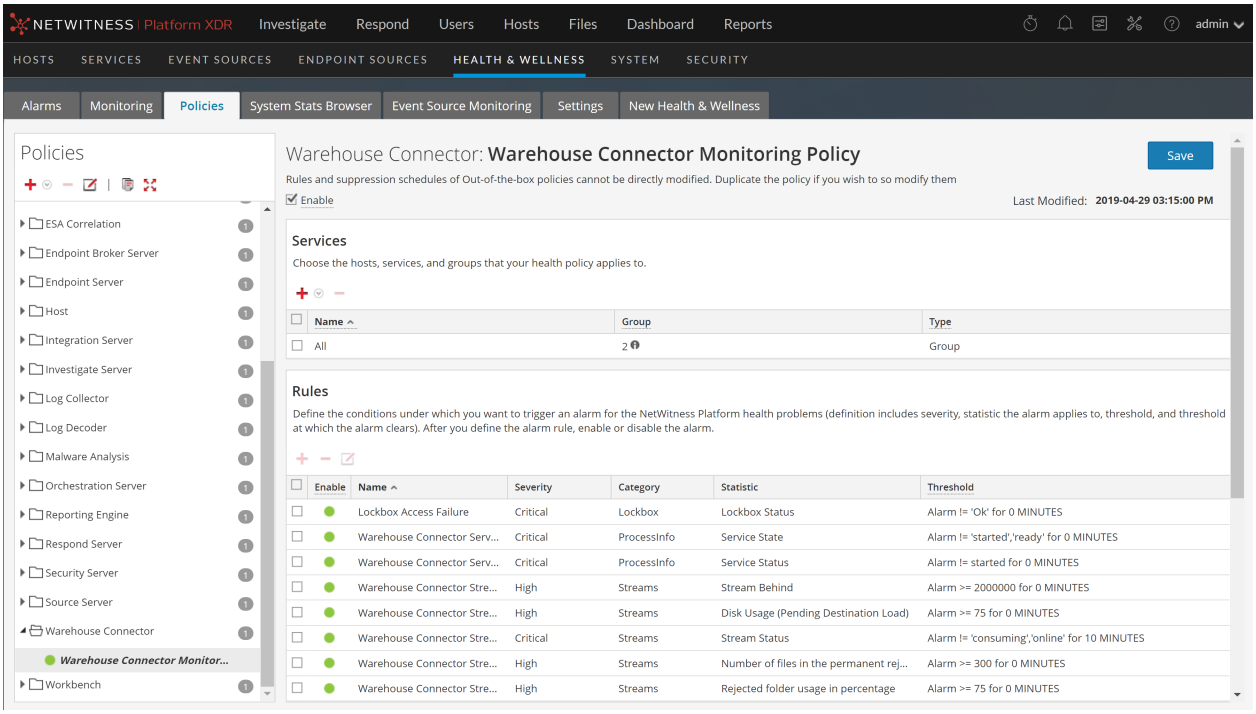
8. In the Services view, select a Warehouse Connector services and select  **> View > Explore**.
   The Explore view of the Warehouse Connector service is displayed.
9. In the options panel, select **warehouseconnector > streams > <stream_name> > schema**, to view the current schema.

Note: You must to reload the stream every time, before you want to view the current schema or you can add a scheduler to reload the stream automatically at regular intervals as mentioned in step 10.

10. (Optional) To reload the stream automatically at regular intervals, follow the below steps.
    a. Go to  **(Admin) > Services**.
    b. In the Services view, select a Warehouse Connector services and select  **> View > Explore**.
       The Explore view of the Warehouse Connector service is displayed.
    c. In options panel, select **warehouseconnector > sys > config > scheduler**. Right click and select **properties**.
    d. In the property drop down select `addInter` and in the **Parameters** text box, add "`hours=24 pathname=/warehouseconnector/streams/<stream name> msg=reload`".

Note: Standard time format used is hours. You can use seconds or minutes format in lieu of hours.

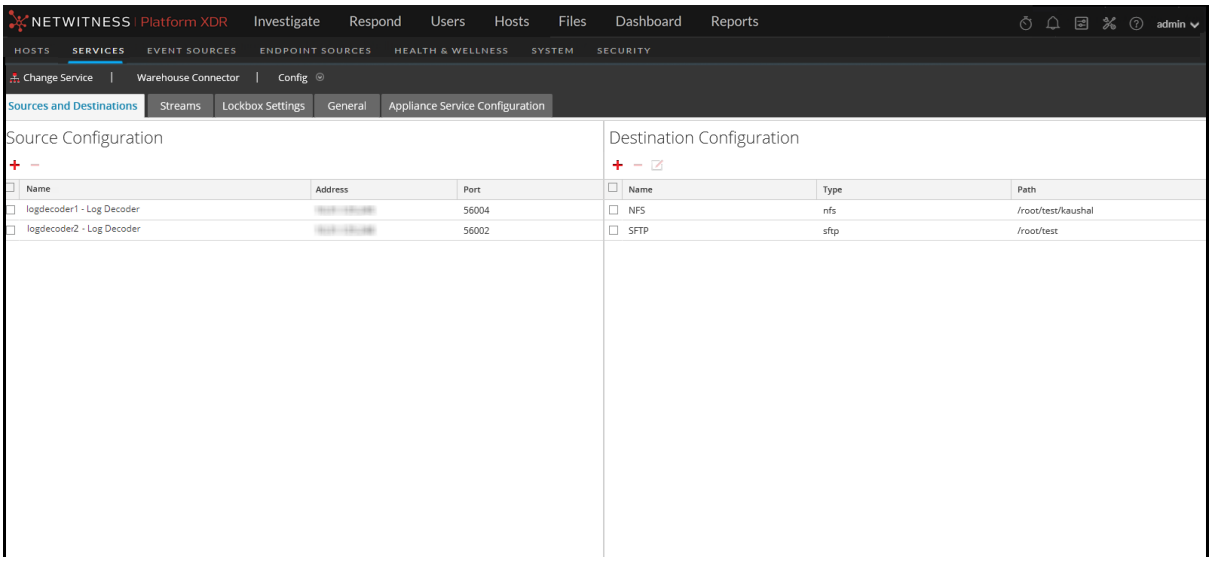
    e. Then click **Send**.



Manage a Lockbox

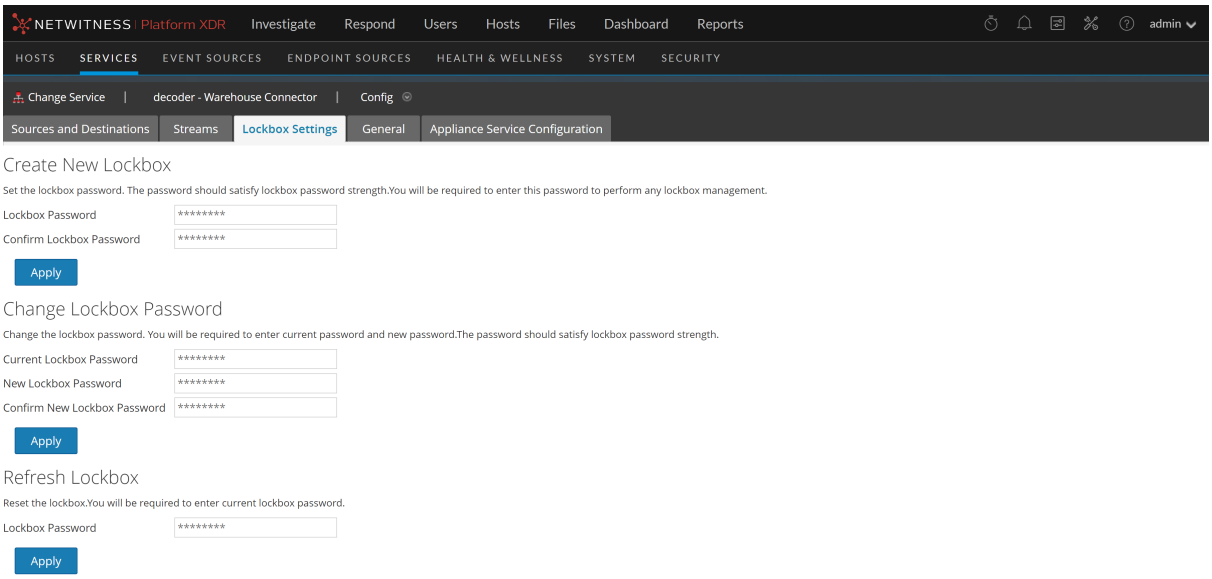
You can change the lockbox password, as well as refresh the lockbox.

Lockbox Status



Note: RSA NetWitness Platform has added a Health & Wellness stat for Warehouse Connector to indicate the status of its Lockbox. Also, an out-of-the-box rule has been added so that a Health & Wellness alarm is raised when the Lockbox does not exist or cannot be opened.

To see the rule details, go to **(Admin) > Health & Wellness > Policies > Warehouse Connector** and select **Warehouse Connector Monitoring Policy**.



To change the Lockbox password:

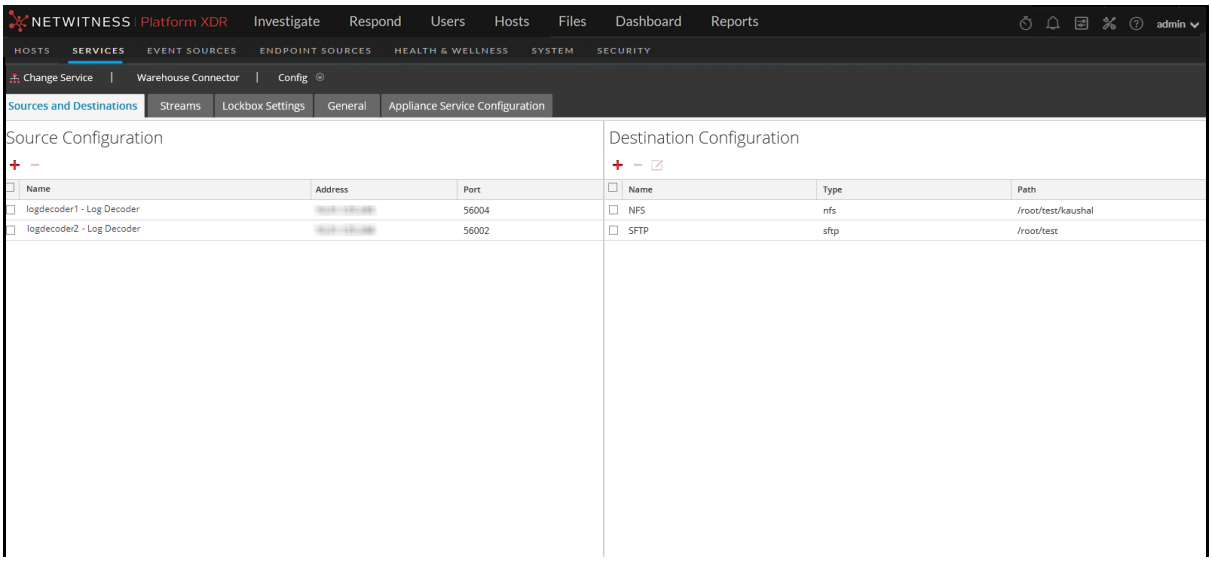
1. Log on to NetWitness.
2. Go to **(Admin) > Services**.
3. In the Services view, select a Warehouse Connector service, and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.

4. Click the **Lockbox Settings** tab.

5. In the **Change Lockbox Password** section, perform the following:
   a. In the **Current Lockbox Password** field, enter the current lockbox password.
   b. In the **New Lockbox Password** field, enter the new lockbox password.

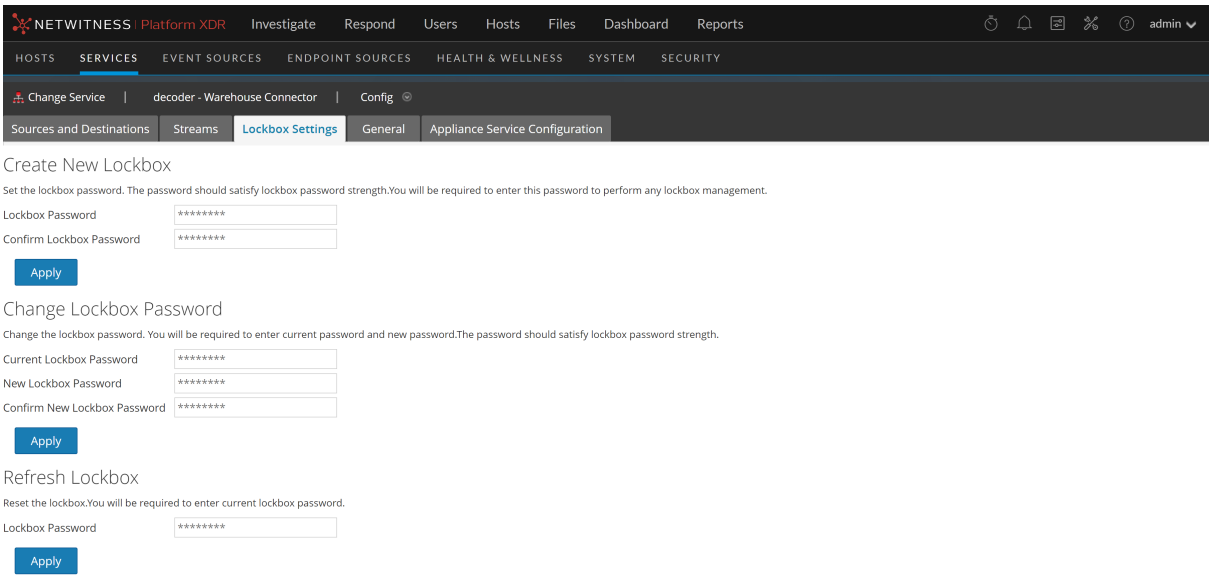
> **Note:** The lockbox password must be at least eight characters in length and it must contain at least three of the following groups: one uppercase character [A-Z], one lowercase character [a-z], one numeral [0-9], and one special character.

c. In the **Confirm New Lockbox Password** field, enter the new lockbox password to confirm.



d. Click **Apply**.

The Lockbox password is successfully changed.



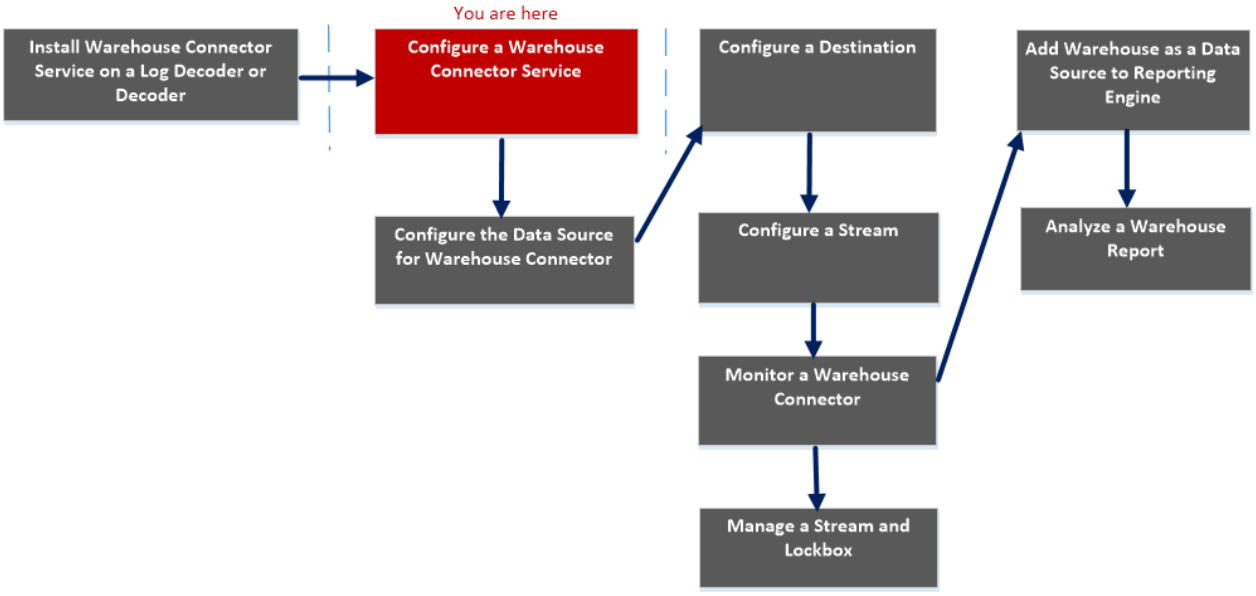
To refresh the Lockbox:

1. Log on to NetWitness.
2. Go to  **(Admin) > Services**.
3. In the Services view, select the added Warehouse Connector service, and select  **> View > Config**.

   The Services Config view of Warehouse Connector is displayed.

4. Click the **Lockbox Settings** tab.

5. In the **Refresh Lockbox** section, enter the current lockbox password in the **Lockbox Password** field.
6. Click **Apply**.
   The Lockbox is reset.



Warehouse Connector Configuration References

This section contains descriptions of the user interface as well as other reference information.

General Tab Settings

The General tab displays the general configuration settings for Warehouse Connector service.

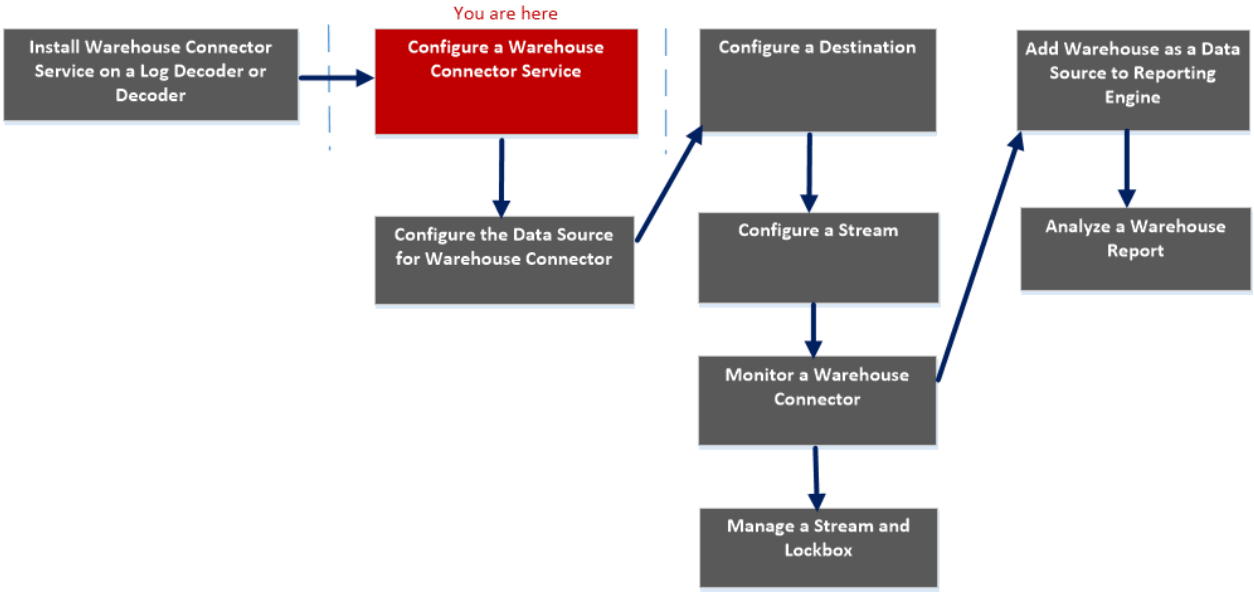
- Configure a Warehouse Connector Service

Quick Look

The following figure shows the General tab on the Warehouse Connector Services Config view.

The General tab displays the system configuration parameters for the Warehouse Connector service.

When you add a Warehouse Connector service, default values are in effect. NetWitness designed the default values to accommodate most environments and recommends that you do not modify these values because it may adversely affect performance.



The following table describes the System Configuration parameters:

Name	Config Value
Compression	Determines the minimum amount of bytes before a message is compressed. If set to zero, messages are not compressed.
Port	Determines the port used by the service. **Note:** If you change the port number, ensure that you restart the service.
SSL	If enabled, all the data transferred in the network will be encrypted using SSL.
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system.
Threads	Determines the number of threads in the thread pool to handle incoming requests.

Appliance Service Configuration Tab Settings

The Appliance Service Configuration tab displays the appliance configuration settings for Warehouse Connector service. For more information, see "Appliance Service Configuration" in the *Hosts and Services Getting Started Guide*.

Related topics

- Configure the Data Source for Warehouse Connector
- Configure the Destination

Quick Look

The following figure shows the Sources and Destinations tab on the Warehouse Connector Services Config view.

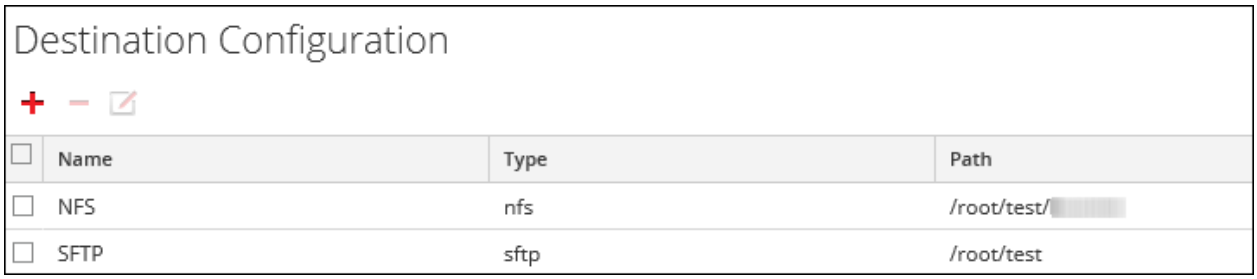
The Sources and Destinations tab includes the following two sections:

1 Source Configuration
2 Destination Configuration

Source Configuration

The Source Configuration section allows you to configure the data sources from which the Warehouse Connector service needs to collect data.

The following is an example of the Source Configuration section.

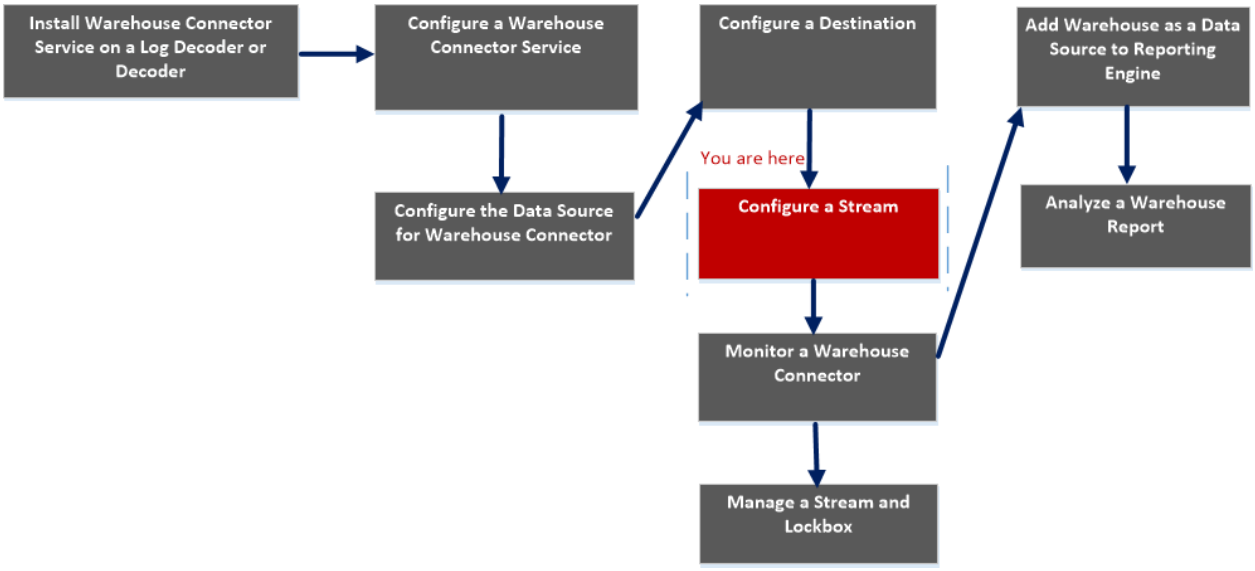


The Source Configuration section allows you to perform the following:

Features	Description
+	Add the data source.
−	Delete the data source.

Destination Configuration

The Destination Configuration section allows you to configure the destination to which the Warehouse Connector service needs to write the collected data.



The Destination Configuration section allows you to perform the following:

Features	Description
+	Add the destination.
−	Delete the destination.
	Edit the destination. **Note:** You can only edit the SFTP destination type.

Add Stream Dialog

You can configure and add a stream to a Warehouse Connector in this dialog

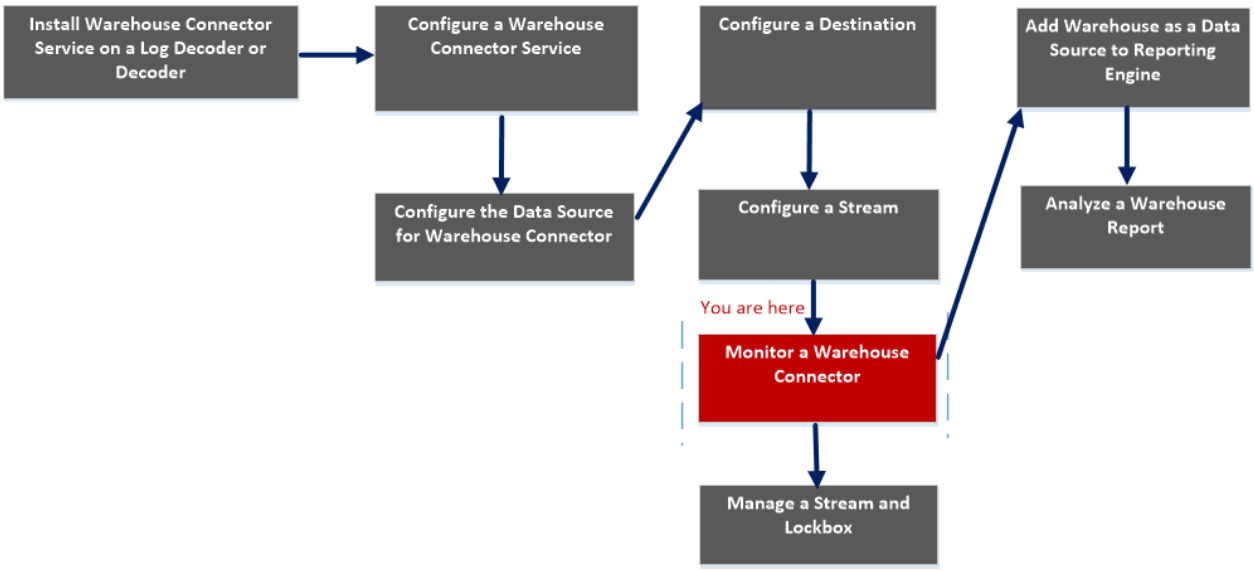
- Configure a Stream

Quick Look

The following figure is an example with the important features labeled.

1. Go to **(Admin) > Services**.
2. In the services view, select a Warehouse Connector service and select **>view>config**
3. In the **Streams** tab, click to view the add stream dialog.



The following table describes the fields in the Add Stream dialog:

Parameter	Description
Stream Name	Type the name of the stream. The stream name may only contain alphanumeric characters and underscores. It cannot exceed 20 characters in length.
Select Destination	Select a destination from the drop-down list.
Select Source	Select a source from the grid at the bottom section of the dialog.
Name	The name of the source.
Address	The address of the source.
Port	The port of the source.
Session ID	The session ID of the source.

Streams Configuration

The Streams tab for a Warehouse Connector in the Services Config view provides a way to manage stream configuration.

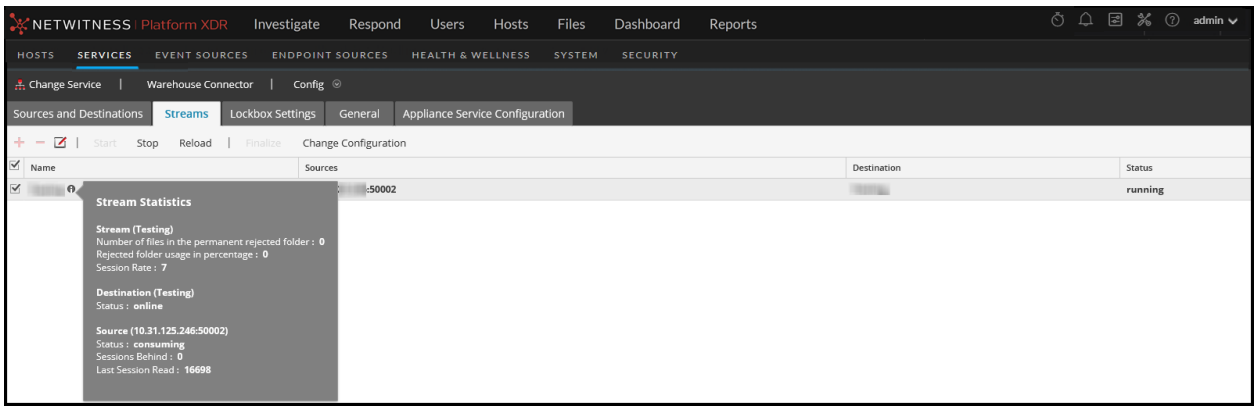
Configure a Stream

Quick Look

The following figure shows the Streams tab on the Warehouse Connector Services Config view.

The Streams tab allows you to perform the following:

Features	Description
+	Add a stream.
−	Delete a stream.



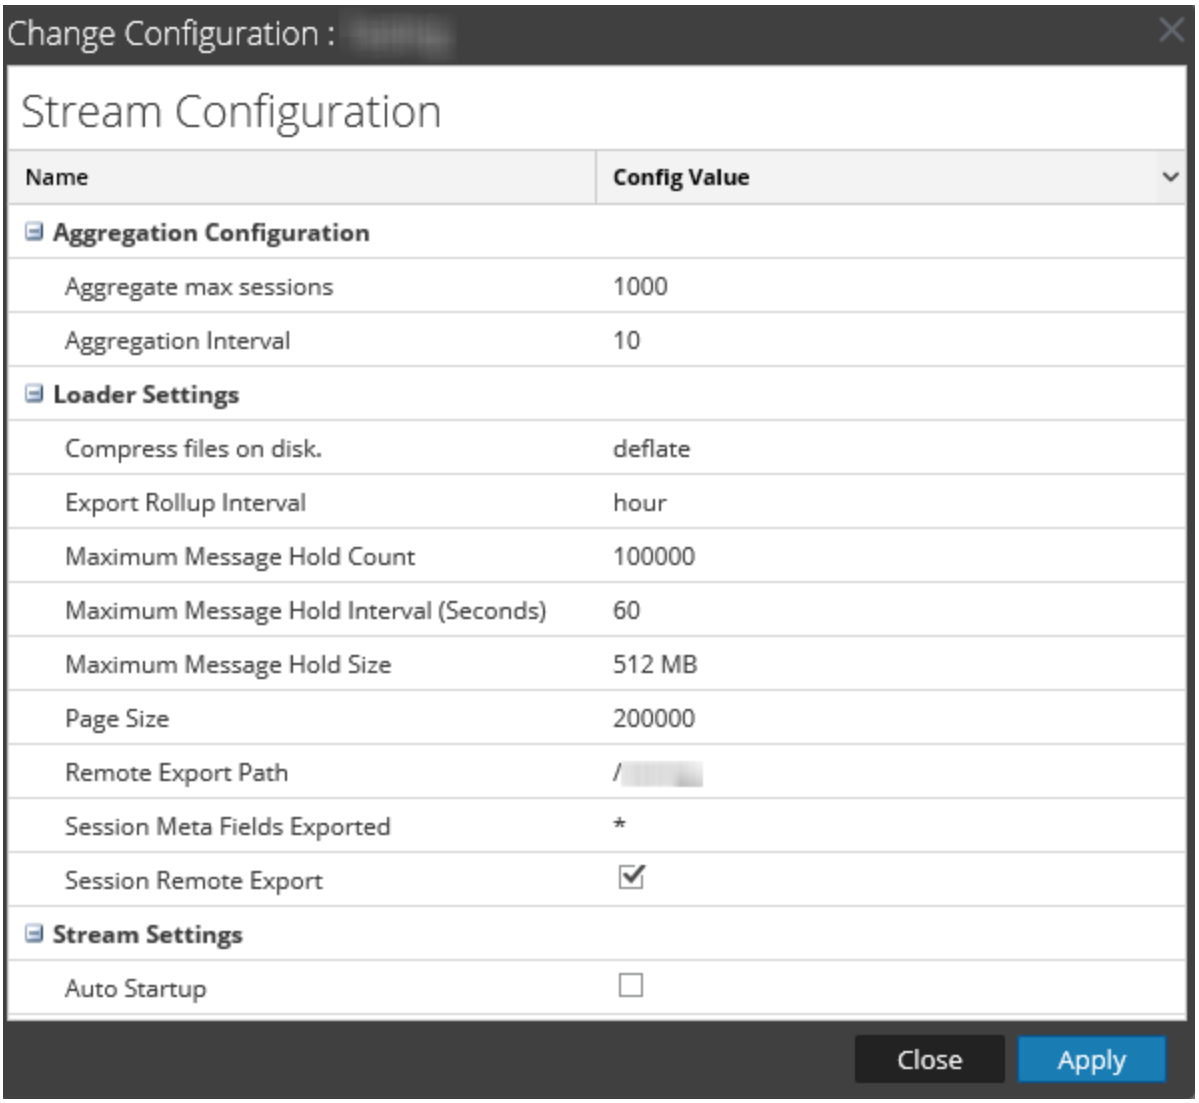
Features	Description
	Edit the stream.
Start	Start the stream.
Stop	Stop the stream.
Finalize	Finalize the stream.
Reload	Reload the stream. If you have added a new meta or if a new meta is added as part of content update to any of the sources, Log Decoder or Decoder, you need to reload the stream for the meta to be visible in the schema for the Reporting Engine. Reloading a stream does not have any impact on the data, but only the new meta list is fetched from the sources.

The following table describes the fields in the Streams tab:

Parameter	Description
Name	Name of the stream.
Sources	The sources associated with the stream.
Destination	The destinations associated with the stream.
Status	Status of the stream.

Stream Statistics

You can view the statistics of a configured stream. Click the  icon next to the name of the stream.



The following parameters are displayed in the Stream Statistics:

Section	Parameter	Description
Stream		

Section	Parameter	Description
	Number of files in the permanent rejected folder	Determines the number of files in the permanent rejected folder (named, **permfail**) in the Warehouse Connector. The permanent rejected folder contains the files that Warehouse Connector failed to write to the destination.
	Rejected folder usage in percentage	Determines the disk usage of the rejected folder.
	Session Rate	Determines the rate at which the session is processed by the Warehouse Connector for the source.
Destination		
	Status	Indicates the status of the destination.
Source		
	Status	Indicate the status of the source.
	Sessions Behind	Determines that number of sessions that needs to be processed by the Warehouse Connector.
	Last Session read	Determines the last session id processed by the Warehouse Connector.

Change Stream Configuration

You can change configuration of a stream in runtime. In the **Streams** tab, click **Change Configuration** to change the configuration of the selected stream.

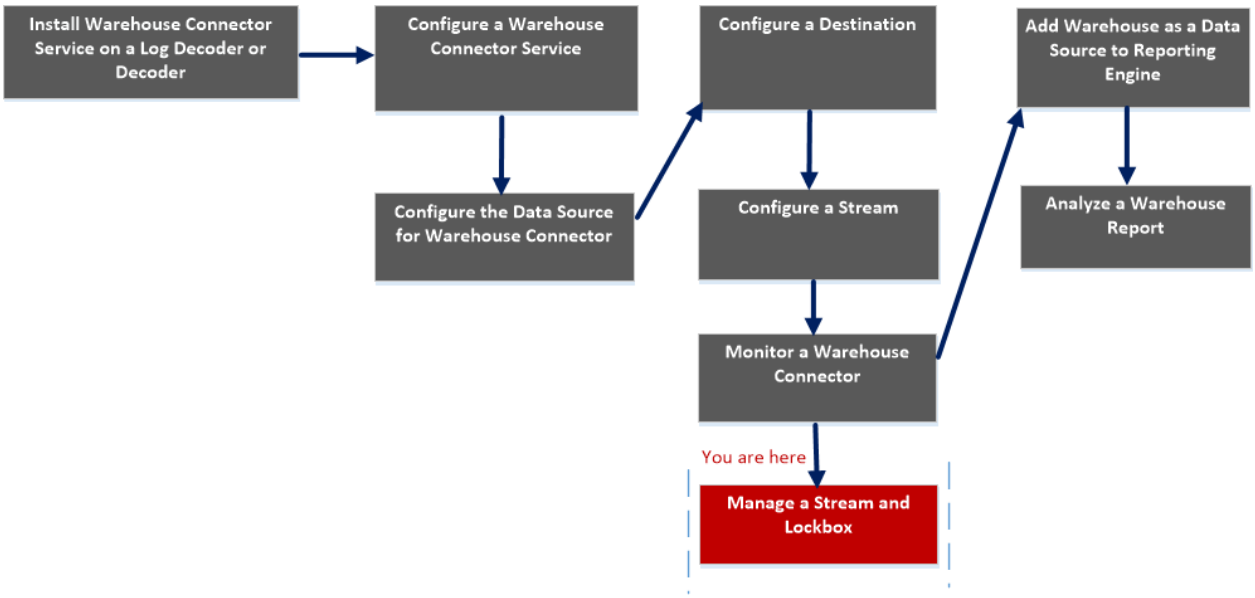
You can change the following parameters of the Stream Configuration:

Note: If you change the value of any parameter in stream configuration, make sure that you restart the stream.

After upgrading, if the values of Maximum Message Hold Count, Maximum Message Hold Interval and Maximum Message Hold Size are 3000000, 60 and 128 respectively, ensure that you assign the following values to the streams:

- Maximum Message Hold Count - 2400000
- Maximum Message Hold Interval - 600
- Maximum Message Hold Size - 512

You can assign these values by modifying the existing Stream configuration.



Parameter	Description
	Aggregation Configuration
Aggregate max sessions	Determines the maximum number of sessions in a response for an aggregation request from the Warehouse Connector to the source .
Aggregation Interval	Determines the time between the responses from the source.
	Loader Settings
Compress files on disk	Enable to compress files on disk. Supported values: • Deflate - Provides smaller compressed files and good performance while generating reports. • Off By default, the parameter is set to **deflate**.
Export Rollup Interval	Determines the roll-up interval for export files and also the directory structure the Warehouse Connector writes to the destination. For example: If the parameter is set to: **Value** — **Directory Structure** hour — /rsasoc/v1/[logs | sessions]/data/{year}/{month}/{day}/{hour} minute — /rsasoc/v1/[logs | sessions]/data/{year}/{month}/{day}/{hour}/{minute} day — /rsasoc/v1/[logs | sessions]/data/{year}/{month}/{day} If you change the value of the parameter, ensure that you restart the stream. Recommended value is **hour**.
Maximum Message Hold Count	Determines the maximum number of sessions to store in the memory before processing. **Note:** If you have deployed a Warehouse Connector Virtual Appliance, make sure that you change the default value of the parameter to 800000.
Maximum Message Hold Interval (Seconds)	Determines the maximum time (in seconds) to hold the sessions in memory before processing.
Maximum Message Hold Size	Determines the maximum size for the sessions to store in the memory before processing.
Remote Export Path	Determines the remote local mount point for HDFS (nfs://) and the location to export the data.

Parameter	Description
Page Size	Determines the maximum pages.
Stream Settings	
Auto Startup	Enable to automatically start the stream whenever the Warehouse connector process is restarted. By default, the parameter is set to **off**.

Lockbox Settings

The Lockbox Settings tab for a Warehouse Connector in the Services Config view provide a way to manage the lockbox settings.

NetWitness Legacy Windows Collection Update & Installation Instructions

NetWitness Legacy Windows collection collects event data from multiple Windows Event Source domains.

It supports collection from:

- Windows 2003 and earlier event sources
- NetApp ONTAP host evt files

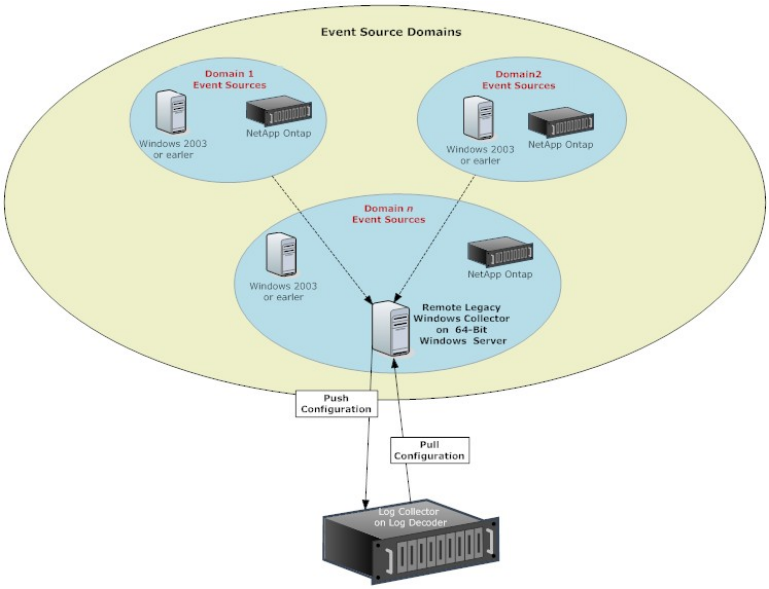
This document contains the following sections:

- Setup Requirements
- Update the NetWitness Legacy Windows Collector from 10.6.x to 12.0
- Fresh Install 12.0 Legacy Windows Collector
- Configure the Windows Server
- Change the Windows Legacy Collector IP Address
- Troubleshoot a Fresh or Upgrade Install
- (Optional) Backup and Restore Legacy Windows Collector
- Add a Windows Legacy Collector Host and Service in NetWitness Platform

Setup Requirements

This section provides the NetWitness Legacy Windows Collector Setup requirements.

Caution: If you are installing or updating to version 11.x, in order to use the Security Analytics Legacy Windows Collector with NetWitness, you need to first install the following windows updates:



• KB2919355
• KB2919442
• KB2999226
• KB3173424

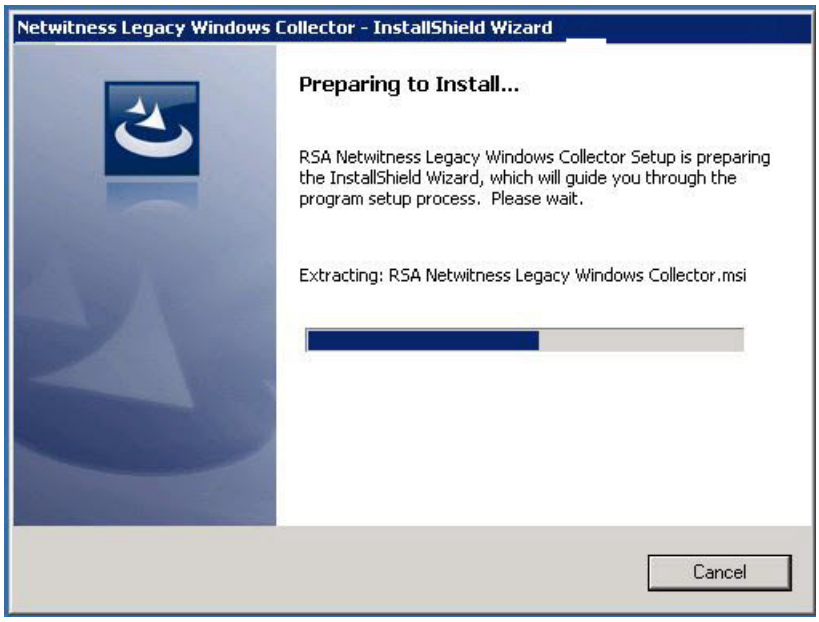
If these updates are not installed, you will get an error message, and the Legacy Windows Collector will not be installed.

To set up the NetWitness ® Platform Legacy Windows Collector, you need:

- Any of the following physical or virtual systems that can reach the Windows 2003 event source domains:
  - Windows 2008 R2 SP1 64-Bit Server,
  - Windows 2012 Server, or
  - Windows 2016 Server, or
  - Windows 2019 Server
- A minimum of 20% free disk space. For example, you need at least 20 GB of free space if your system drive is 100 GB in size.

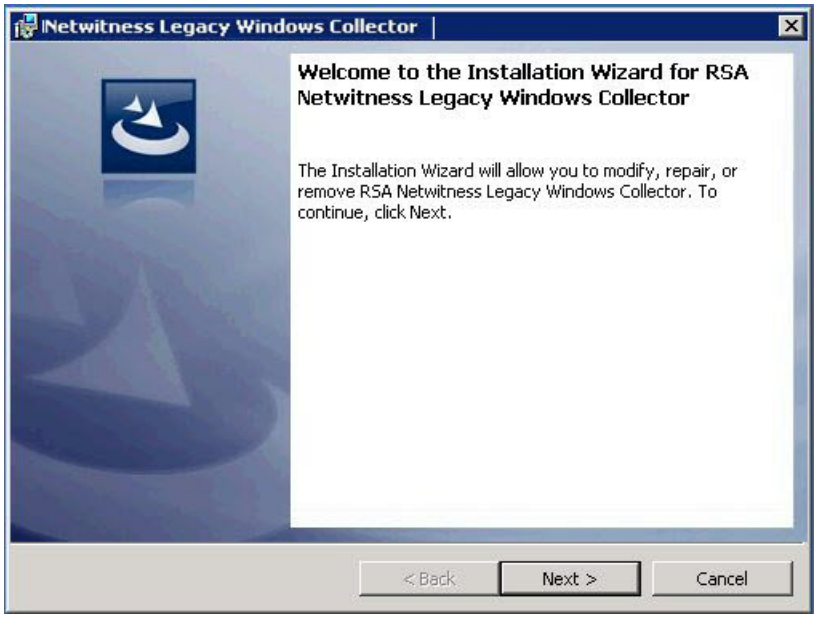
IMPORTANT: Do not install the Legacy Windows Collector on a domain controller.

- For NetWitness Platform 11.6 and Later (Upgrade and Fresh Install), you must download and install Visual studio 2019 x64 runtime before running the Windows Legacy Collector installer. You can download the Visual Studio 2019 x64 at https://support.microsoft.com/en-us/help/2977003/the-latest-supported-visual-c-downloads.



Update the NetWitness Legacy Windows Collector from 10.6.x to 12.0

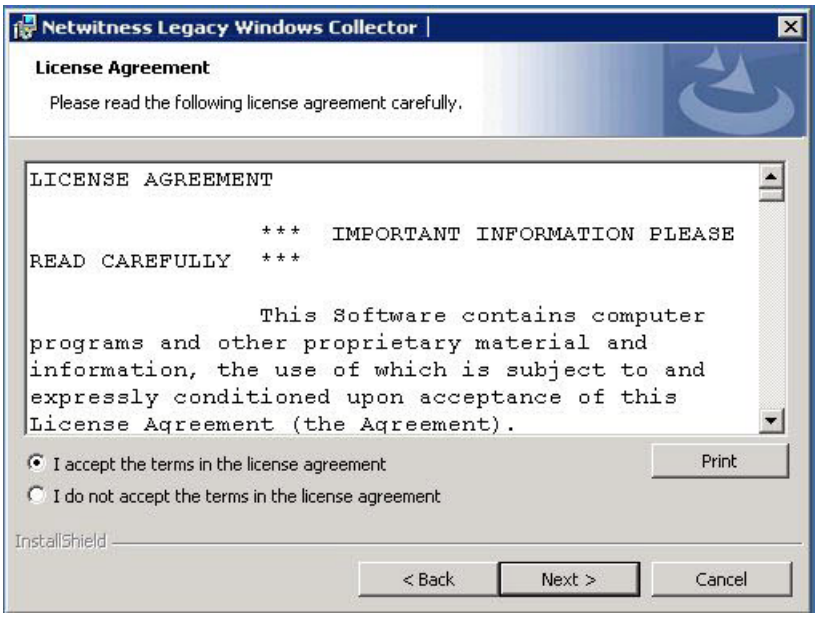
This section tells you how to update the NetWitness 10.6.x Legacy Windows Collector to 12.0



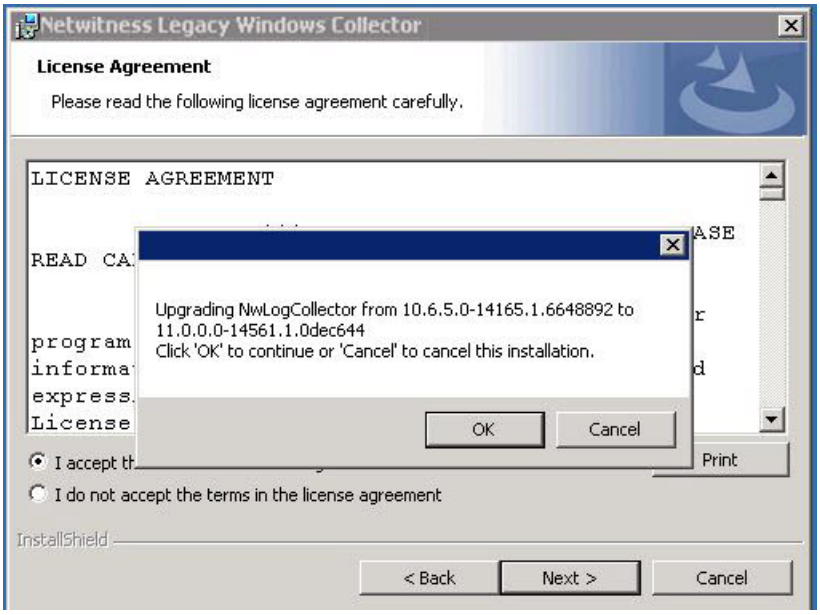
To update the NetWitness 10.6.x Legacy Windows Collector to 12.0 on a Windows 64-Bit server:

1. Depending on your version of NetWitness, navigate to one of the following URLs on NetWitness Community:
   - For NetWitness 11.6.1.1, go to https://community.netwitness.com//t5/netwitness-platform-downloads/rsa-netwitness-platform-11-6-1-1-patch-download/ta-p/643401 and click **NetWitness Platform 11.6.1.1 Upgrade Pack to download the ZIP archive**.
   - For NetWitness 11.6, go to https://community.netwitness.com/t5/netwitness-platform-downloads/rsa-netwitness-11-6-legacy-windows-collector-download/ta-p/606860 and click **NetWitness Logs & Network 11.6 Legacy Windows Collector** to download the ZIP archive.
   - For NetWitness 11.5, go to https://community.netwitness.com/t5/netwitness-platform-downloads/rsa-netwitness-11-5-legacy-windows-collector-download/ta-p/572571 and click **NetWitness Logs & Network 11.5 Legacy Windows Collector** to download the ZIP archive.
   - For NetWitness 11.4, go to https://community.netwitness.com/t5/netwitness-platform-downloads/rsa-netwitness-11-4-legacy-windows-collector-download/ta-p/565269 and click **NetWitness Logs & Packets 11.4 Legacy Windows Collector** to download the ZIP archive.
   - For NetWitness 11.3, go to https://community.netwitness.com/t5/netwitness-platform-downloads/rsa-netwitness-11-3-legacy-windows-collector-download/ta-p/556065 and click **NetWitness Logs & Packets 11.3 Legacy Windows Collector** to download the ZIP archive.
   - For NetWitness 11.2, go to https://community.netwitness.com/t5/netwitness-platform-downloads/rsa-netwitness-11-2-legacy-windows-collector-download/ta-p/526984 and click **NetWitness Logs & Packets 11.2 Legacy Windows Collector** to download the ZIP archive.
   - For NetWitness 11.1, go to https://community.netwitness.com/t5/netwitness-platform-downloads/rsa-netwitness-11-1-legacy-windows-collector-download/ta-p/551450 and click **NetWitness Logs & Packets 11.1 Legacy Windows Collector** to download the ZIP archive.
2. Unzip the downloaded file.
3. Log on to a Windows 2008, 201, 2016, or 2019 Server.
4. Copy **NWLegacyWindowsCollector-*version-number*.exe** to the Windows Server.
5. Right click on **NWLegacyWindowsCollector-*version-number*.exe** and select **Run As Administrator**.

   The Preparing to Install…. page of update installation wizard is displayed.

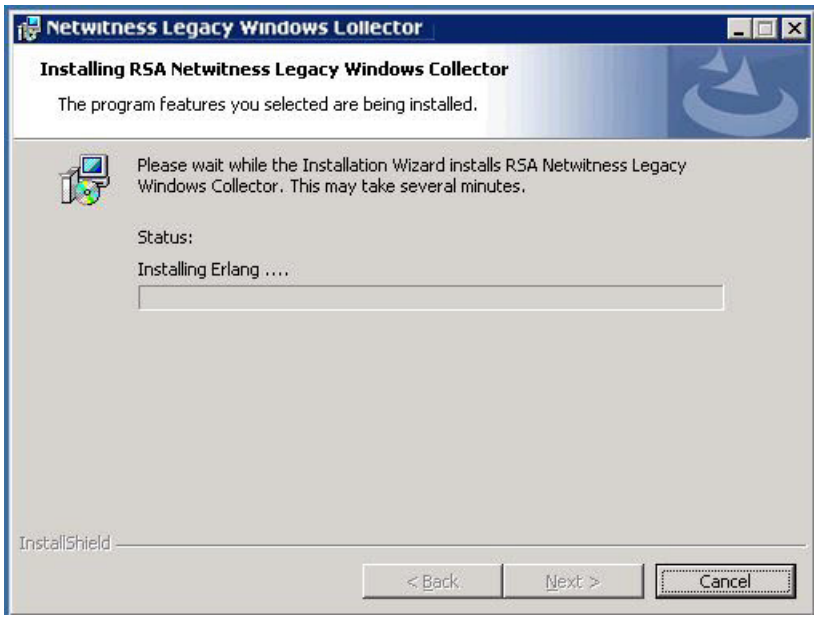


After the update installation program extracts NetWitness Legacy Windows Collector installation files, the **Welcome** page is displayed.



6. Click **Next**.

   The License Agreement page is displayed.

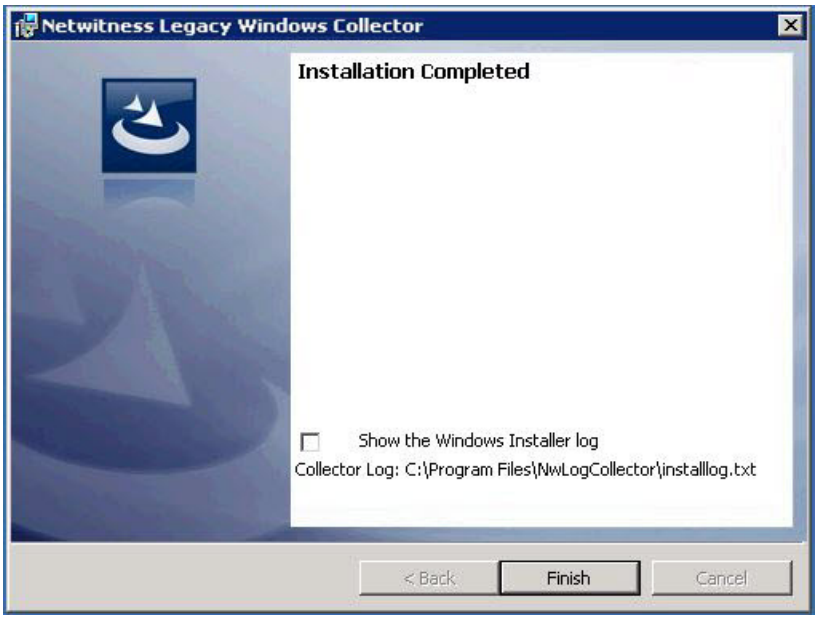


7. Read the License agreement carefully, select the **I accept the terms in the license agreement** radio button, and click **Next**.

   Before it starts the update, the wizard asks if you want to continue or cancel the installation of the update.

8. Click **OK** to continue installing the update.
9. Click Install.

   The Installation screens for the Legacy Windows Collector page is displayed.



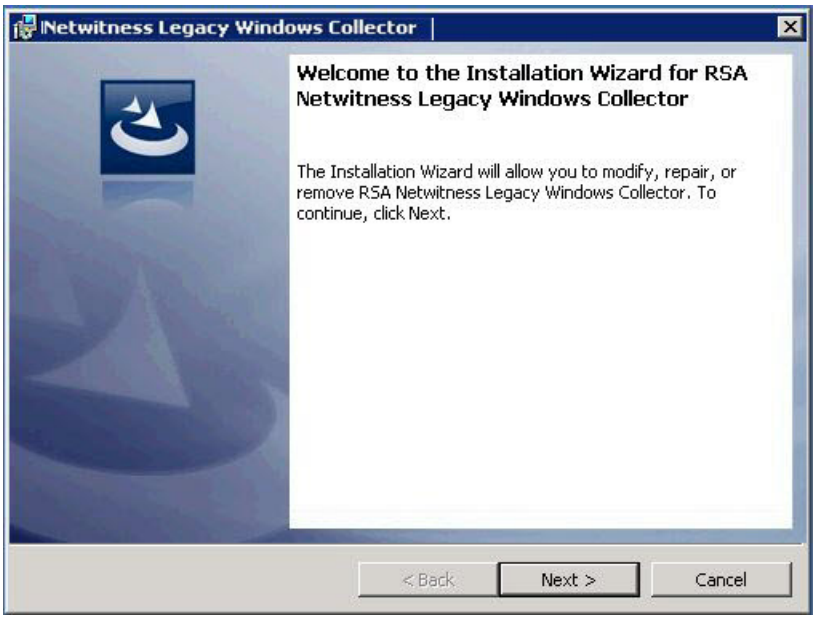
After the update installation completes, the **Next** button becomes active.

10. Click **Next**.

    The Installation Completed page is displayed.

11. (Optional) If you want to review a log of the update installation, select the **Show the Windows Installer** log checkbox.
12. Click **Finish**.
13. Reboot the machine.

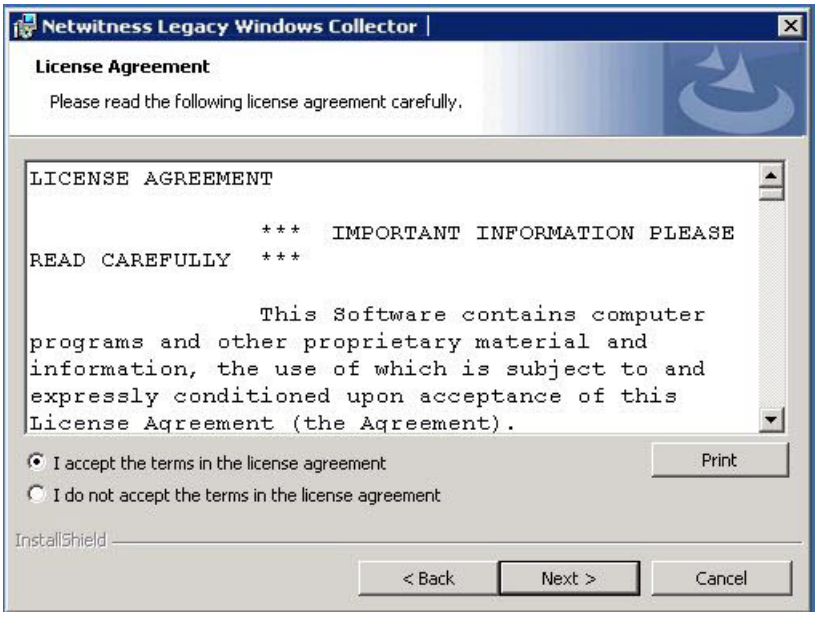
This completes the update of the Legacy Windows Collector to NetWitness 12.0.



Fresh Install 12.0 Legacy Windows Collector

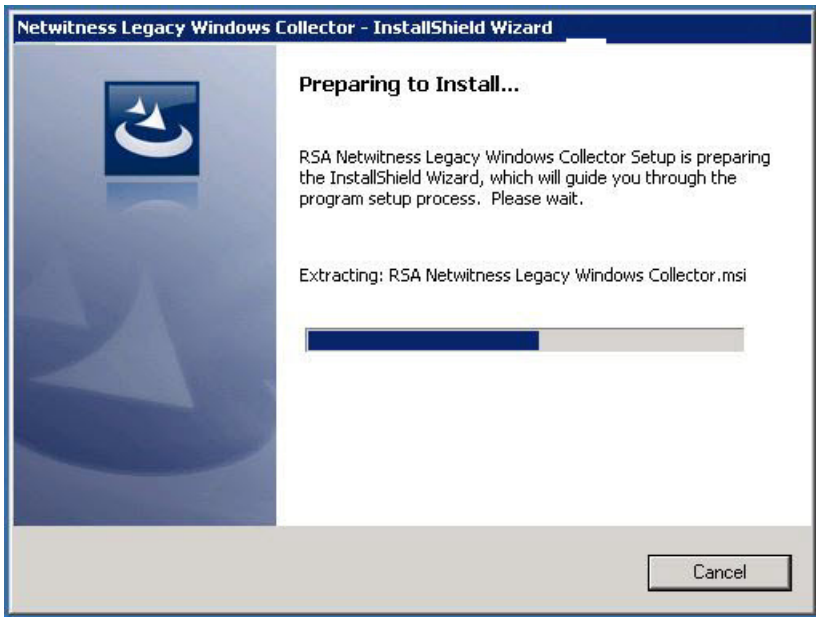
This section describes how to install the 12.0 Legacy Windows Collector on a Windows 2008, 2012, 2016, or 2019 64-Bit server

To install the NetWitness Legacy Windows Collector on a Windows 2008, 2012, 2016, or 2019 64-Bit server:



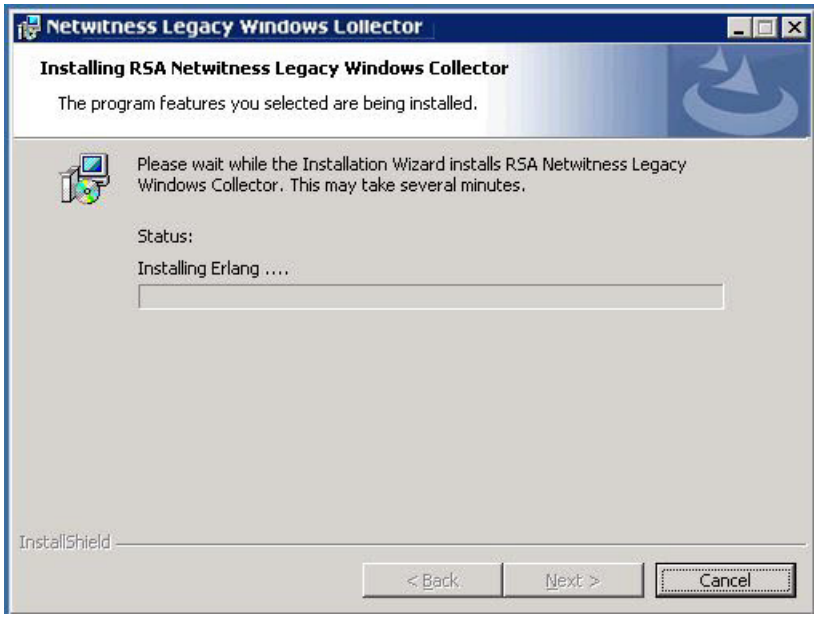
1. Depending on your version of NetWitness Platform, navigate to one of the following URLs on NetWitness Community:
   - For NetWitness 11.6.1.1 only, navigate to https://community.netwitness.com//t5/netwitness-platform-downloads/rsa-netwitness-platform-11-6-1-1-patch-download/ta-p/643401 on NetWitness Community. Click NetWitness Logs & Network 11.6.1.1 Legacy Windows Collector to download the ZIP archive.
   - For NetWitness 11.6, navigate to https://community.netwitness.com/t5/netwitness-platform-downloads/rsa-netwitness-11-6-legacy-windows-collector-download/ta-p/606860 on NetWitness Community. Click NetWitness Logs & Packets 11.6 - Legacy Windows Collector to download the ZIP archive.
   - For NetWitness 11.7, navigate to https://community.netwitness.com/t5/netwitness-platform-downloads/rsa-netwitness-11-7-legacy-windows-collector-download/ta-p/644208 on NetWitness link. Click NetWitness Platform 11.7 Legacy Windows Collector to download the ZIP archive.
   - For NetWitness 12.0, navigate to https://community.netwitness.com/t5/rsa-netwitness-platform-staged/netwitness-12-0-legacy-windows-collector-download/ta-p/684864 on NetWitness link. Click NetWitness Platform 12.0 Legacy Windows Collector to download the ZIP archive.
2. Unzip the downloaded file.
3. Copy the **NWLegacyWindowsCollector-*version-number*.exe** to the Windows Server.
4. Right click on the **NWLegacyWindowsCollector-*version-number*.exe** and select **Run As Administrator**.

   The **Welcome** page of installation wizard is displayed.



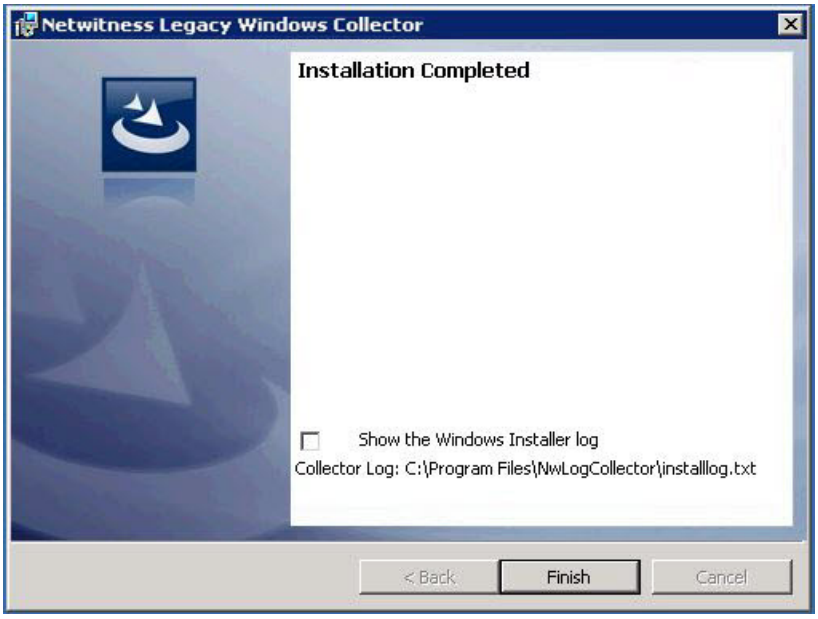
5. Click **Next**.

   The License Agreement page is displayed.



6. Read the License agreement carefully, select the **I accept the terms in the license agreement** radio button, and click **Next**.

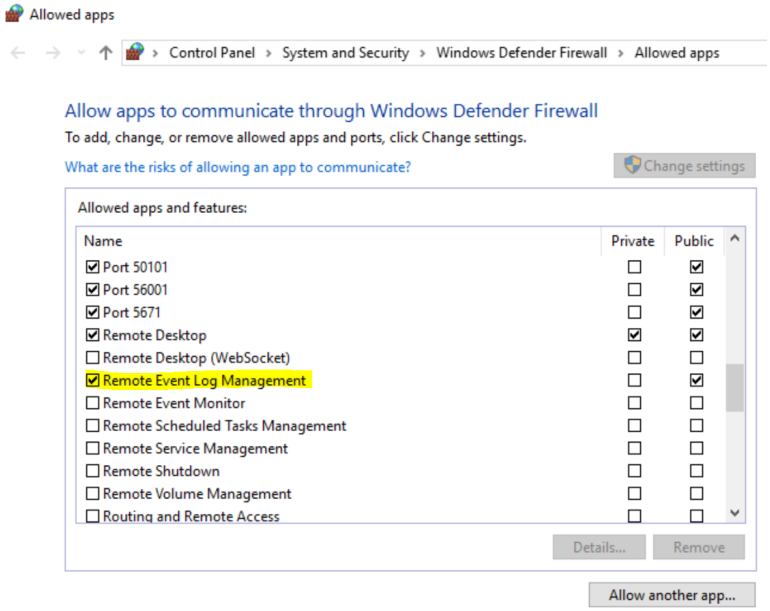
   The Ready to Install the Program page is displayed.



7. Click **Install**.

   The Installation screens for the Legacy Windows Collector page are displayed.

The Installation Completed page is displayed.



8. (Optional) If you want to review a log of the installation, select the **Show the Windows Installer** log checkbox.
9. Click **Finish**.
10. Reboot the machine.

This completes the installation of the 12.0 Legacy Windows Collector. Please refer to the **Windows Legacy and NetApp Collection Configuration Guide** on NetWitness Community for instructions on how to configure Legacy Windows collection in NetWitness.

Configure the Windows Server

For the NetWitness to communicate with the Windows Server, you need to allow Remote Event Log Management on the Windows Server.

1. On the Windows Server, in Services, start the Remote Registry Service.
2. In Firewall, enable Remote Event Log Management for your network, as shown below.

Change the Windows Legacy Collector IP Address

Note: The procedures in this section apply to NetWitness 11.5 and later only.

On occasion, you may need to change the IP address of your Windows Legacy Collector. You may also need to edit any Destination Groups that you have configured.

Change WLC IP Address

The following procedure describes how to change the IP address for your system.

1. Log onto the Windows Legacy Collector system and manually change the IP address on the system.
2. In the UI, confirm that the Log Collector service corresponding to the WLC system shows up in error (Red). It might take some time for it to reflect the changed status.
3. On the NetWitness Server, use the **nw-manage** utility to view the host information for the WLC using the following command:

   ```
   nw-manage --list-hosts
   ```

   Sample output from running the command is shown here:

   ```
   {
   "id" : "fdb8150c-e040-459e-8cc5-3c60ec2c65ae",
   "displayName" : "WLC-HOST-104",
   "hostname" : "10.101.216.102",
   "ipv4" : "10.101.216.102",
   "ipv4Public" : null
   } ]
   ```

   You use the value of **"id"** from your output in the following step.
4. Use the **nw-manage** utility to change the IP address of the WLC. For the **host-id** argument, use the value for the **"id"** that you noted from step 3. For the **ipv4** value, use the new IP Address to which you are changing.

   ```
   nw-manage --update-host --host-id "fdb8150c-e040-459e-8cc5-3c60ec2c65ae" --
   ipv4 10.101.216.105
   ```
5. After you see the message that the previous command ran successfully, go to the NetWitness Server UI and verify that the WLC service is running without any errors.

Edit Destination Groups For Log Collectors and VLCs

The Windows Legacy Collector is often configured with Destination Groups to forward events to Log Collectors or Virtual Log Collectors. If the IP address of any such Destination LC or VLC is changed, the Windows Legacy Collector can no longer forward events. To remediate this, you must edit the Destination groups for the WLC, making sure to select the new LC or VLC IP Address.

Troubleshoot a Fresh or Upgrade Install

Logs to Examine for Information

Refer to the following log files if you need to troubleshoot problems:

- `%systemDrive%\Netwitness\ng\logcollector\MessageBroker.log`
- `%systemDrive%\Program Files\NwLogCollector\installlog.txt`

Run `C:\Program Files\NwLogCollector\ziplogfiles.vbs` to generate the ***`hostname`***`_WLCversion_timestamp.zip` that contains all the log files and other information needed for troubleshooting.

Issues with the Lockbox

When you create a lockbox password on a new Windows Legacy Collector, you might see the following error:

```
failed to set secure storage password: failed to create lockbox: The Lockbox or cryptography library could not be found.
```

This can occur if you are running Windows Legacy Collector version 11.x.

If you encounter this issue, download and install both of the following redistributable packages:

- Visual C++ 2010: https://www.microsoft.com/en-us/download/details.aspx?id=14632
- Visual C++ 2012: https://www.microsoft.com/en-us/download/details.aspx?id=30679

(Optional) Backup and Restore Legacy Windows Collector

This section tells you how to upgrade from 10.6.4 to NetWitness 12.0 for the Legacy Windows Collector.

Note: You only need to do this if you are changing the Windows VM where you run the Windows Legacy Collector.

During upgrade to NetWitness 12.0, the backup script for the Windows Legacy Collector is invoked automatically, and creates the 10.6.4 configuration and run-time backups. After the 12.0 installation is completed, run the Restore script to restore the configuration and run-time files for the updated Windows Legacy Collection.

Restore the Windows Legacy Collection Backup after Upgrade

To restore the Windows Legacy Collection setup on a newly upgraded NetWitness 11 platform:

1. On the Windows Legacy Collector, open a command prompt window.
2. Navigate to **C:\Program Files\NwLogCollector**, where the scripts are stored.
3. Run the following commands for restoring a backup:
   - Backup configuration files: `WLC-Restore.bat "Config-bkup_`***`timestamp`***`.zip"`
   - Backup run-time files: `WLC-Restore.bat "Runtime-bkup_`***`timestamp`***`.zip"`
4. Once the restore is completed, set the lockbox SSV to use the password that you created during 10.6.4 setup.
   a. In the **Security Analytics** menu, select **Services**, then select your Windows Legacy Collector and choose **Explore**.
   b. From the left navigation pane, expand **logcollection > properties > crypto**.
   c. Run the following command: `op=setssv pw=`***`password_for_10.6.x_lockbox`***, and hit **Send**.

Revert Windows Legacy Collection from 12.0 Back to 10.6.4

To revert the Windows Legacy Collection setup from 12.0 back to 10.6.4:

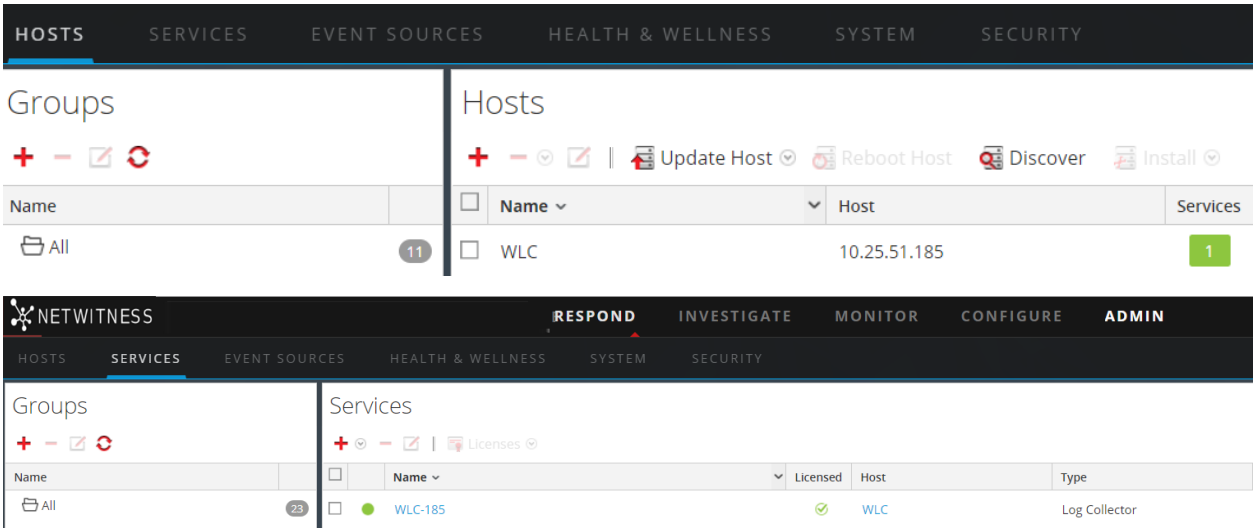
1. Uninstall the 12.0 Setup. Note the location of the backup folder created by the system during the uninstall procedure.

2. Install the 10.6.4 version of the Windows Legacy Collector.
3. Navigate to **C:\Program Files\NwLogCollector**, where the scripts are stored.
4. Run the Restore script from backup folder present in **C:\Program Files\NwLogCollector** to restore the configuration and run-time setup on the 10.6.4 Windows Legacy Collector.
   - Backup configuration files: `WLC-Restore.bat "Config-bkup_`***`timestamp`***`.zip"`
   - Backup run-time files: `WLC-Restore.bat "Runtime-bkup_`***`timestamp`***`.zip"`
5. Once the restore is completed, set the lockbox SSV to use the password that you created during 10.6.4 setup.
   a. In the **Security Analytics** menu, select **Services**, then select your Windows Legacy Collector and choose **Explore**.
   b. From the left navigation pane, expand **logcollection > properties > crypto**.
   c. Run the following command: `op=setssv pw=`***`password_for_10.6.x_lockbox`***, and hit **Send**.

Add a Windows Legacy Collector Host and Service in NetWitness Platform

For this version of the Windows Legacy Collector, NetWitness has provided a script that replaces the manual steps of adding a Windows Legacy Collector host and service in the NetWitness UI.

To create a Windows Legacy Collector Host and Service in NetWitness:



1. SSH to your NetWitness server.
2. Run the following command:

   ```
   wlc-cli-client --host-display-name hostDisplayName --service-display-name
   serviceDisplayName --host WLChostIPAddress --port 50101 --use-ssl false
   ```

   The parameters are explained below:

   - **--host-display-name**: the name for the host as it is displayed in the NetWitness Hosts page
   - ***--service-display-name***: the name for the host as it is displayed in the NetWitness Services page
   - **--host**: the IP address for the Windows Legacy Collector
   - **--port**: the port NetWitness uses to communicate with the Windows Legacy Collector. The recommended value is 50101.
3. You will be prompted to supply the following information:
   - **Windows Log Collector REST Username** and **Windows Log Collector REST Password**: you must supply admin credentials for the Windows Legacy Collector.
   - **Security Server Username** and **Security Server Password**: you must supply admin credentials for NetWitness.

After you complete this procedure, you should see the Windows Legacy Collector Host and Service as shown in the following screenshots.

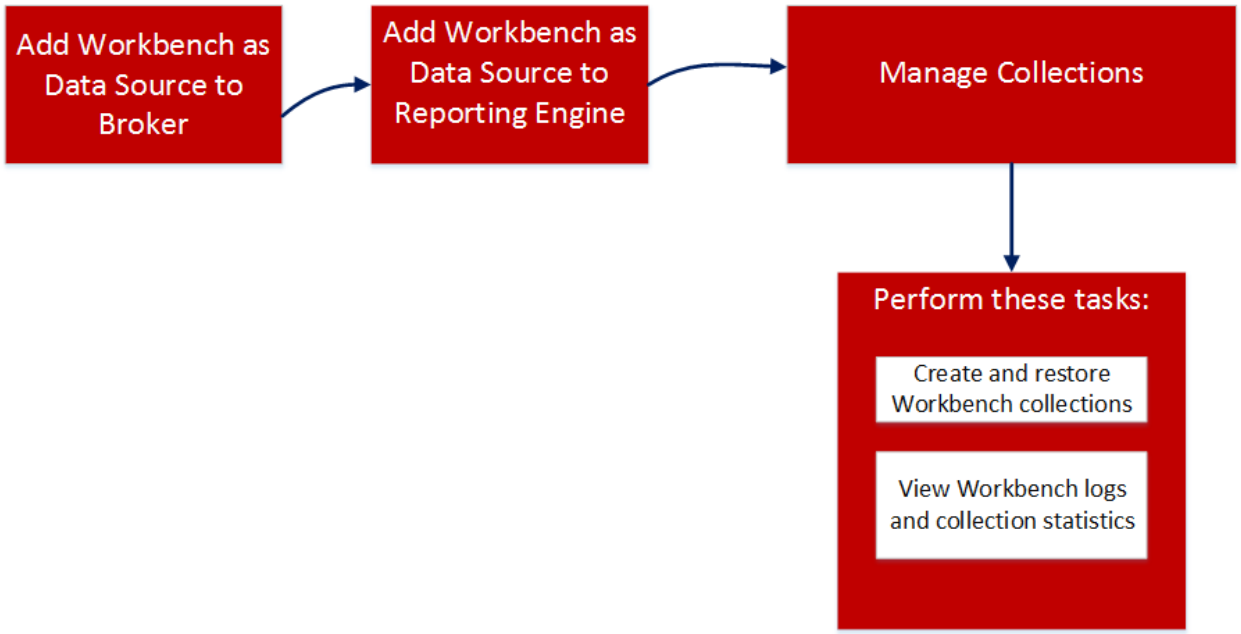
Workbench Configuration Panel 28
Troubleshooting **29**

Workbench Overview

NetWitness Workbench service allows collections to be created with restored data that was saved offline from an Archiver. Once the data is copied and saved into a collection, it can be analyzed from Investigation and Reporting.

The following diagram depicts the architecture of a NetWitness network that implements the Workbench.



Workbench Configuration Procedures

Note: While NetWitness 11.0 and later continues to support the Workbench, and some customers may have configured Workbench to handle restoring of data. The best practice for restoring data is to use the Archiver to configure archival and restoring of data. For more information, see *Archiver Configuration Guide*.

Workflow

These are the basic steps for configuring and managing a Workbench service.

1. Add a Workbench service as a data source to Broker (see Adding Workbench Service as a Data Source to Broker).
2. Add a Workbench service as a data source to Reporting Engine (see Adding Workbench as a Data Source to Reporting Engine
3. Manage collections on a Workbench service (see Managing Collections).
4. Investigate a Workbench (see Managing Collections).

Prerequisites

Before configuring the Workbench service, you must:

- Add the NetWitness workbench service to the host in your network environment. For more information, see Workbench Overview.

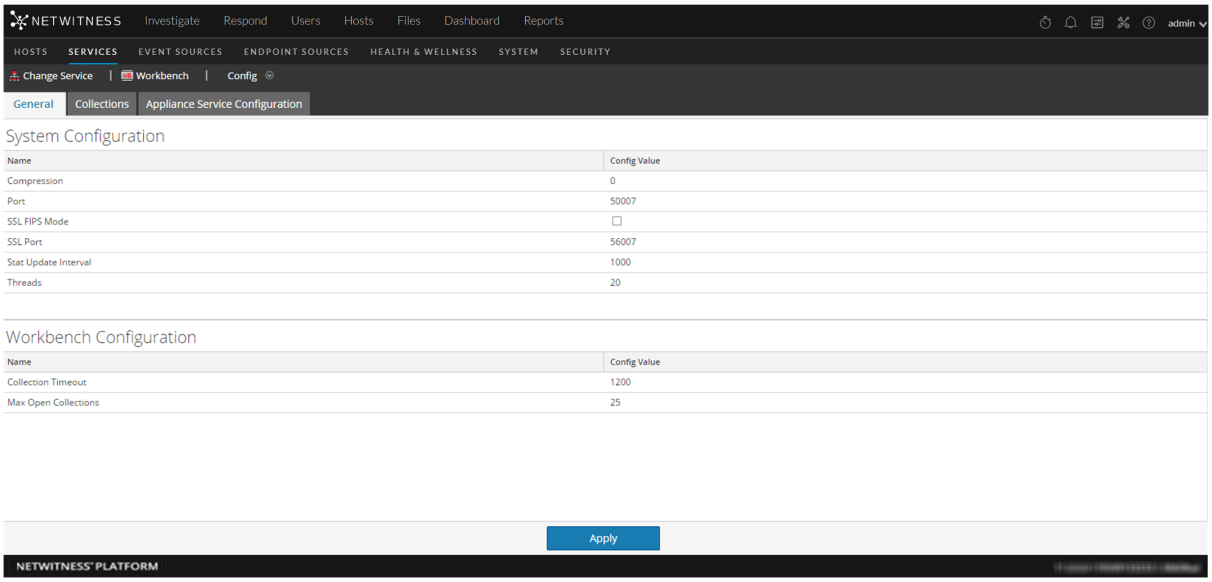
- Install the NetWitness Workbench host in your network environment. For more information, see *Host and Services Getting Started Guide*.

The steps to configure the Workbench service are:

1. Adding Workbench Service as a Data Source to Broker
2. Adding Workbench as a Data Source to Reporting Engine

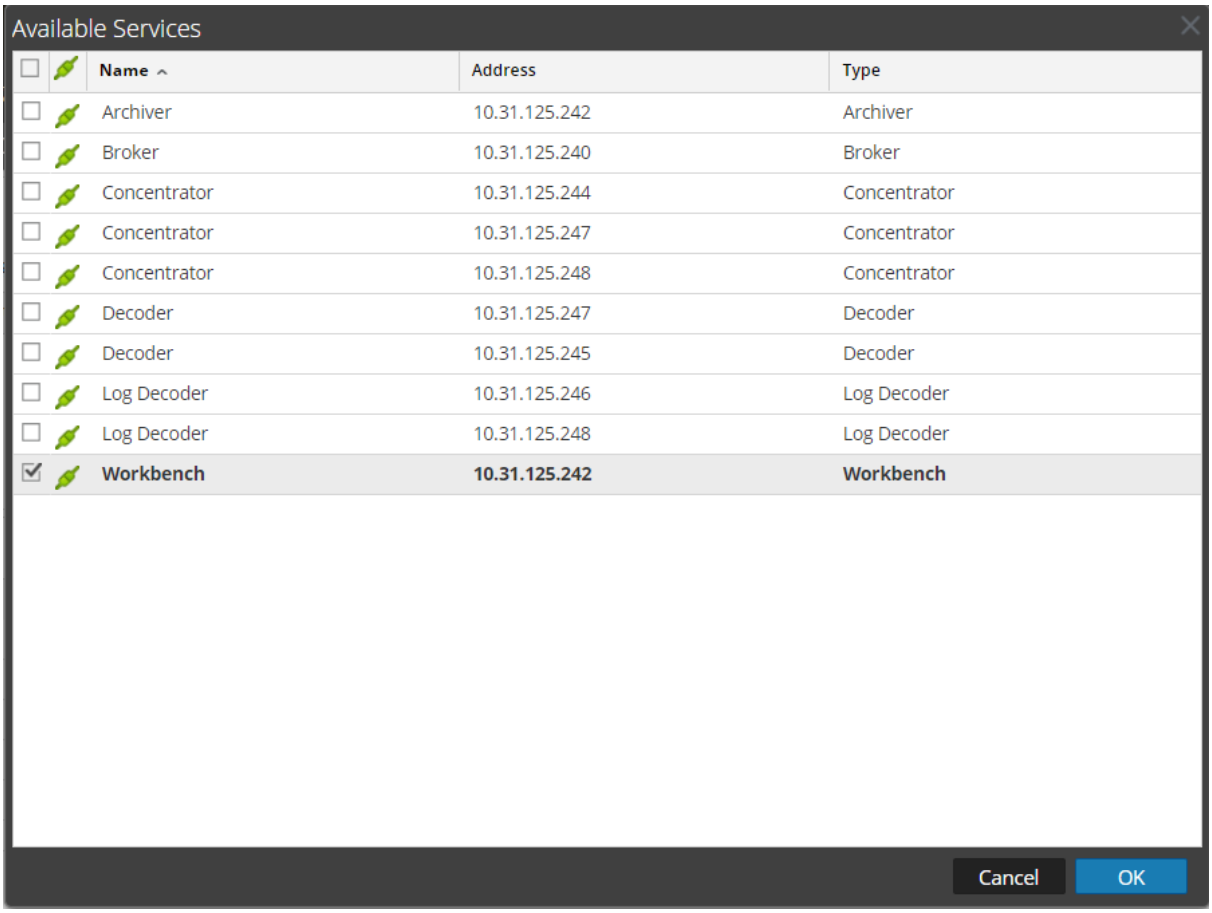
After configuration is complete, you can create and manage collections as described in Managing Collections.

Adding Workbench Service as a Data Source to Broker



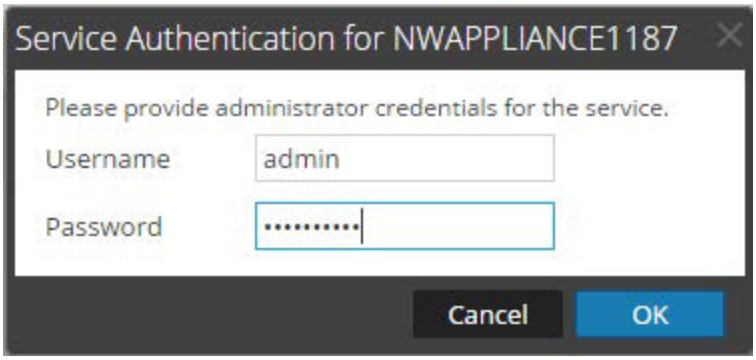
Prerequisites

Before adding the Workbench service, you must:



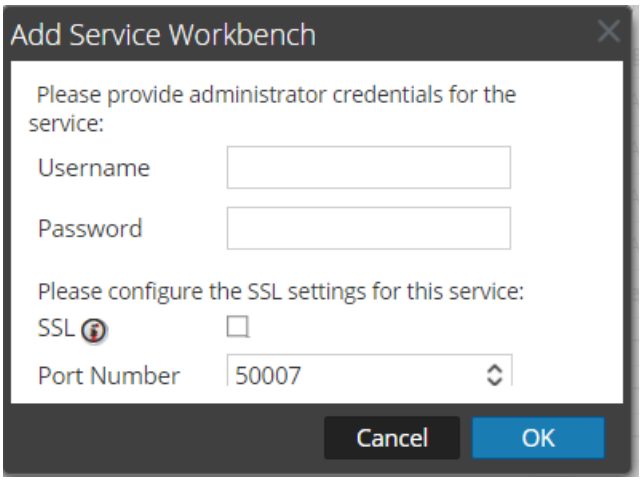
- Install the Workbench service on the Archiver appliance.
- Add a collection on the workbench service.

To add the Workbench service as a data source on the Broker:



1. Go to **(Admin) > Services**.
2. Select a **Broker** service, and select **> View > Config.**
   The Service Config view is displayed with General tab open.

3. In the Aggregate Services section, Click .
   The Available Services dialog is displayed.



4. Select the Workbench service and click **OK**.
5. If the Workbench service is using a Trust Model, a Service Authentication dialog for the selected service is displayed.

6. Type the username and password for admin credentials for the service and click **OK**.

   The Add Service Workbench dialog is displayed.

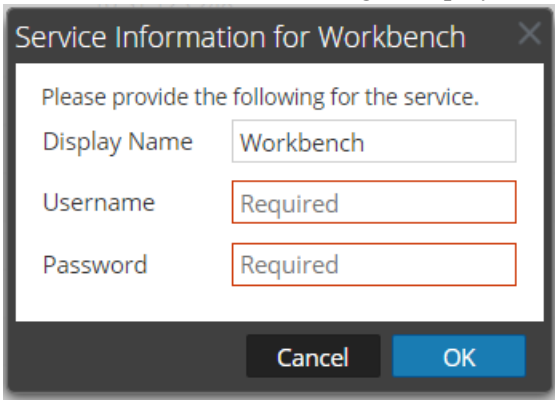
7. Type the username and password for admin credentials for the service and click **OK**.

   The workbench service is now added as a data source to the Broker and is listed in the NWDATA Sources list.

Note: You must perform this procedure for each collection.

Adding Workbench as a Data Source to Reporting Engine

Prerequisites



These are the tasks required before adding the Workbench as a data source to Reporting:

1. Add the Reporting Engine as a service to your NetWitness deployment.
2. Add the Workbench as a service to your NetWitness Archiver host (if not already installed).

Note: Adding Workbench collections as a data source to Reporting Engine depends on a trusted connection. If the Workbench is established with a trusted connection, you must manually add Workbenchcollections as a source to the Reporting Engine.

To associate the Workbench data source with the Reporting Engine:

1. Go to  **(Admin) > Services**.
2. Select a **Reporting Engine** in the Services panel. Select  **View > Config**.
   The Services Config view is displayed with General tab Open.
3. Click the **Sources** tab, click  in the toolbar and select **Available Services**.
   The Available Services dialog is displayed.
4. Select a Workbench service and Click **OK**.
   The Service Information dialog is displayed.

5. Enter User Name and Password.
   - Required if the Workbench service is Trusted.
   - Optional if the Workbench service is not trusted (added manually).
6. Click **OK**.

7. Select **Collection** in Add a Collection from Workbench dialog.
8. Click **OK**.

Result

You can now create reports on the data collected by the Workbench.

Managing Collections

An Administrator can create and delete Workbench collections and view Workbench statistics and logs. This topic provides all of these procedures and an example procedure for restoring a collection for Reporting and Investigation.

- Mount Archiver Directories
- Create a Collection
- Delete a Collection
- Investigate a Collection
- View Workbench Collection Statistics
- View Workbench Logs

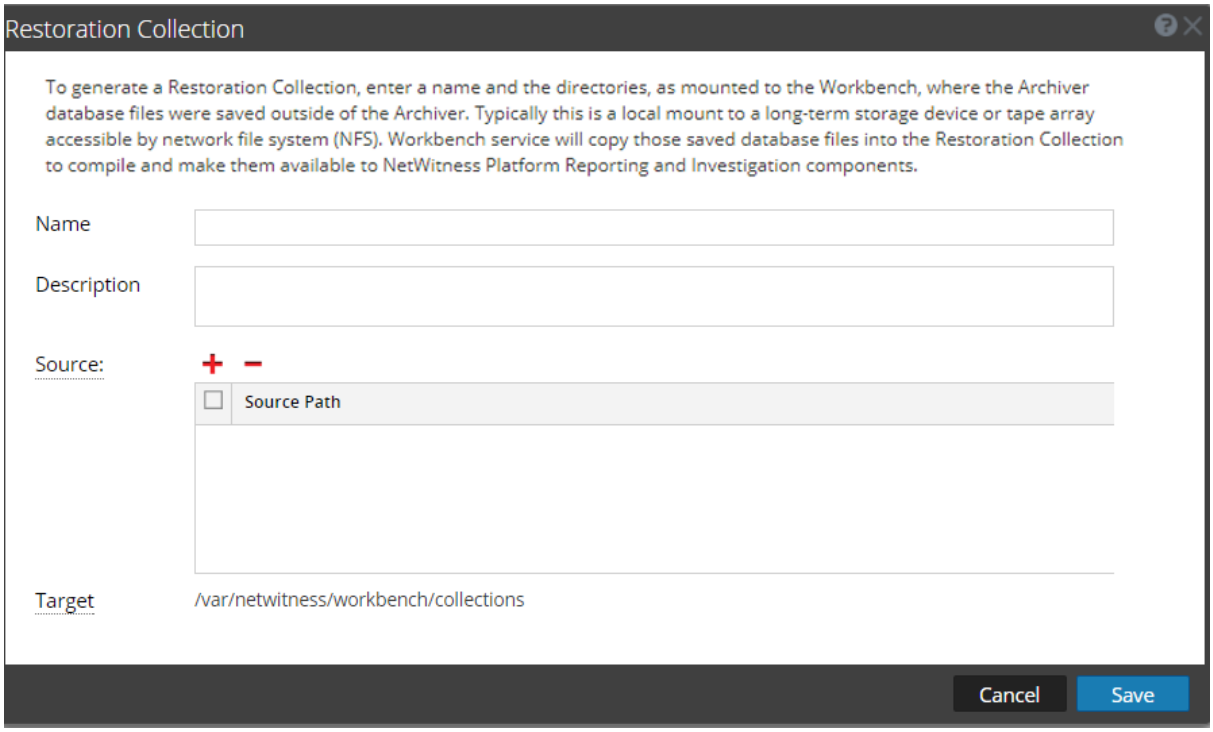
Mount Archiver Directories

If data is in offline storage or cold-tier storage, you need to mount the Archiver directories in order to restore the data for reporting and investigation purposes:

1. Go to  **(Admin) > Services**.
2. Select an **Archiver** from the Services panel and select  **> View > Explore**.
   The Explorer view for the Archiver is displayed
3. Right-click on the Database node in left-hand tree and select **properties** to open them in the right-hand panel.
4. Run the **manifest** command for a time range, for example, 2017-April-01 to 2017-April-10.
   The search returns all files that need to be restored for the selected query.

Create a Collection

Administrators can create collections of restored data from a backup or from an existing set of data.



Note: You can point the source path to the location of the database files and the restore command copies them to the workbench. You need to mount those directories to the Archiver (where the Workbench is installed) before a restoration collection can be created.

To create a collection using data restored from the backed up data or existing subset of data:

1. Go to  **(Admin) > Services.**
2. In the **Services** view, select a **Workbench**, then select  **> View > Config**.
   The Services Config view is displayed with the General tab open.

3. Click the **Collections** tab.
   The Collections panel is displayed.

4. Click  in the toolbar.
   The Restoration Collection dialog is displayed.

5. Provide the following information:

   - **Name:** Name of the Workbench collection that you want to restore.
   - **Source:** Location where the Archiver database files have been moved from cold storage.

   Note: Target is the location where the collection is created.

6. Click **Save** to restore the collection.

   Note: If the source path provided to create the restoration collection does not exist, the following error message is displayed:
   `The source path does not exist '/xxx/xxx/'.`

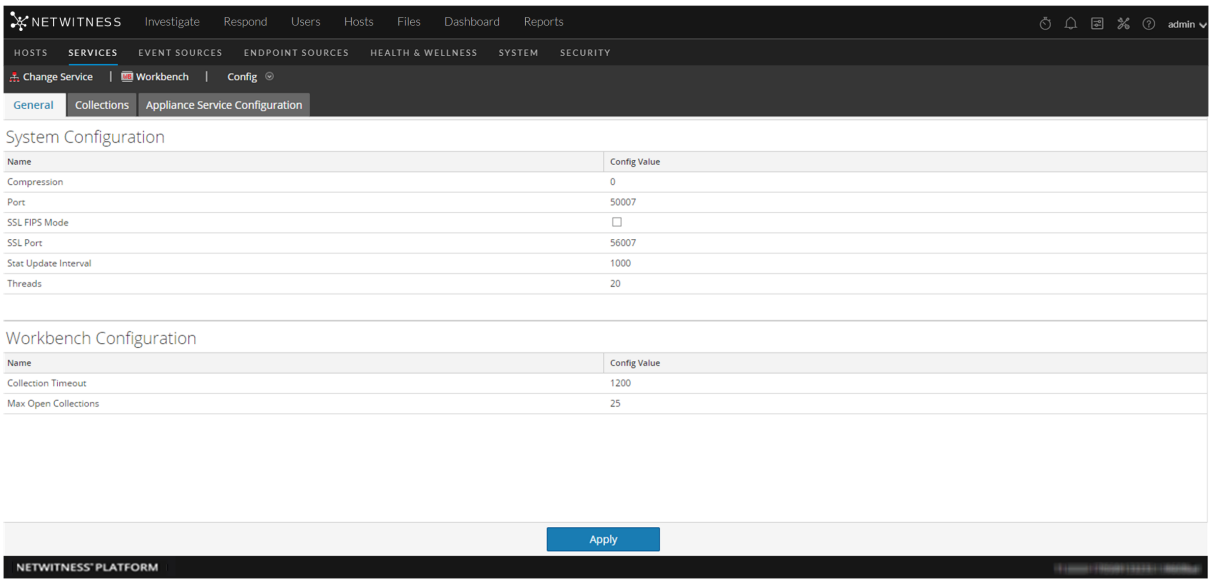
   If there is insufficient storage to restore your collection, the following error is displayed:
   `Error during disk space checking. Insufficient disk space in location '/xxx/xxx'.`

   The Schedule Job dialog is displayed with the following message:
   `Restoring data into a new collection. Check the jobs page for progress.`

7. Click the **Jobs** icon  in the NetWitness toolbar to expand the list of restoration collection jobs with their current status.

Note: Restoring a collection that is larger than 550 GB may take several hours to process.

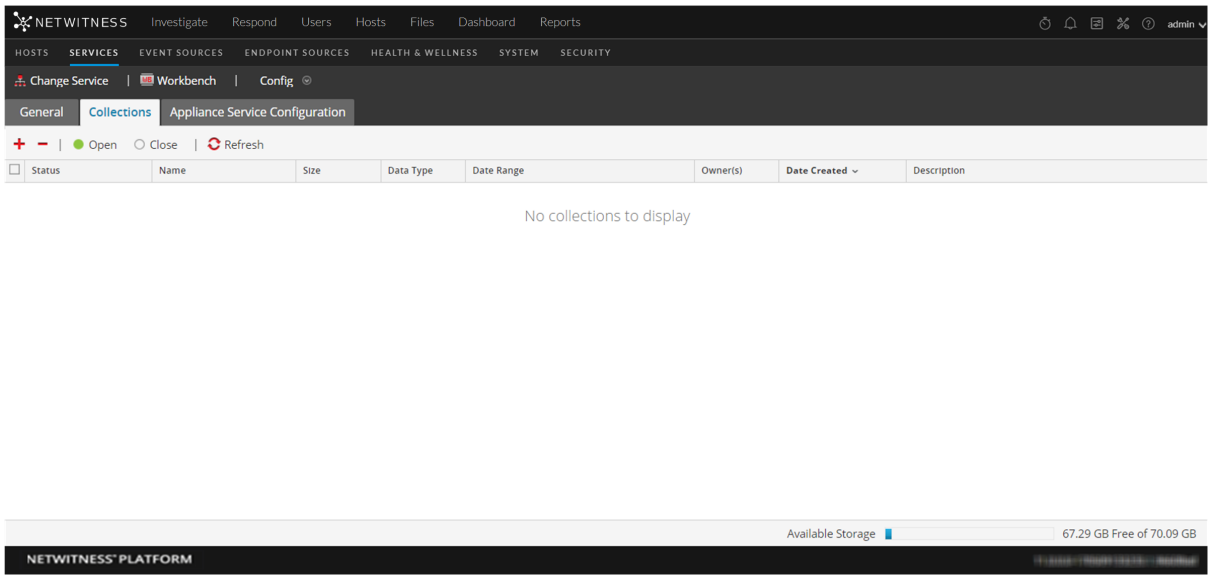
Delete a Collection



Administrators can delete collections from the Workbench service.

Perform the following steps to delete a collection:

1. Go to  **(Admin) > Services.**



2. From the **Services** view, select a **Workbench** and click  **> View > Config**.

   The Services Config view opens with the General tab displayed.

3. Select the **Collections** tab.

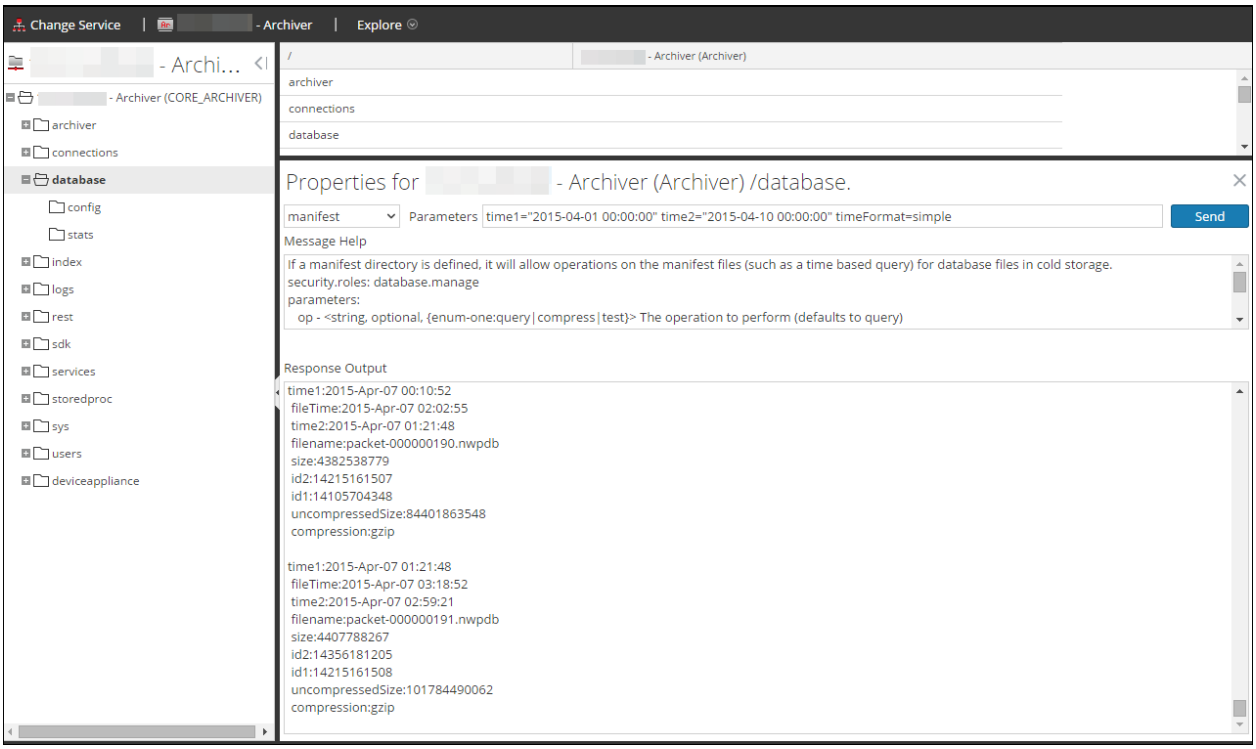
   The Collections panel is displayed.

4. In the Collections panel, select the collection that you want to delete.
5. Click from the toolbar.

   A warning dialog requests confirmation.
6. If you want to delete the collection, click **Yes**.

   The collection is removed from the Workbench service.

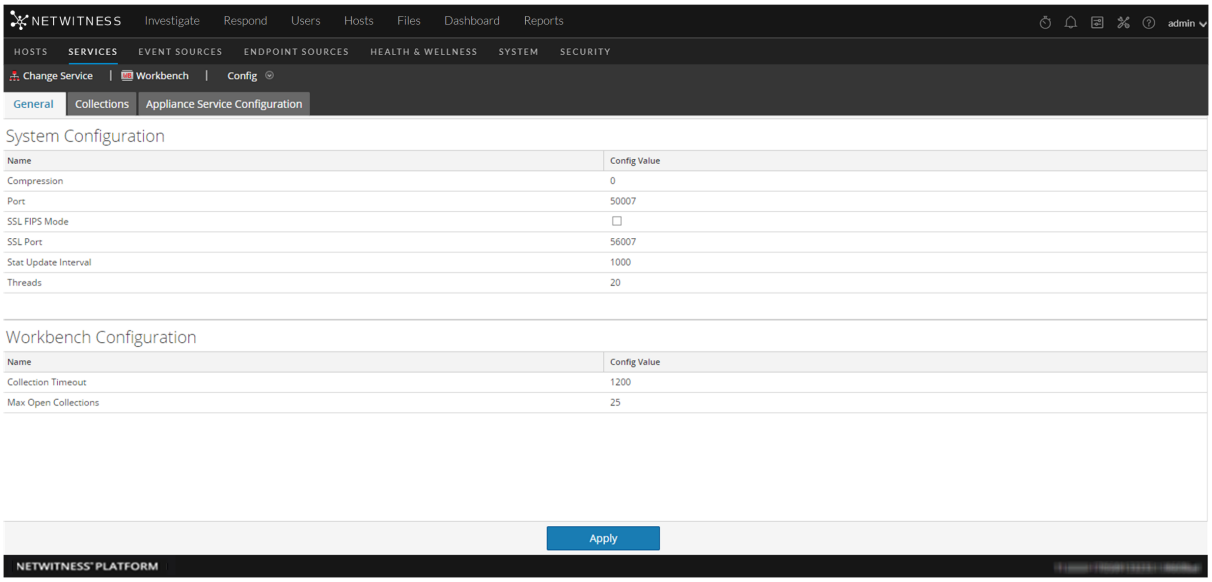
Example Procedure: How to Restore a Collection for Reporting and Investigation



The following steps illustrate how to restore data for reporting and investigation purposes that is in offline storage or cold-tier storage. In the following example, data is restored for the time range beginning on 2015-April-01 through 2015-April-10.

To restore data for reporting and investigation purposes:

1. Go to **(Admin) > Services**.
2. Select the **Archiver** from the **Services** panel and Click **> View > Explore**.
   The Explorer view for Archiver is displayed
3. Right click on Database node in left-hand tree and select **properties** to open them in the right-hand panel.
4. Run the **manifest** command for the selected time range 2015-April-01 to 2015-April-10.
   The search returns all files that need to be restored for your selected query.



Example Search:

```
time1="2015-04-01 00:00:00" time2="2015-04-10 00:00:00" timeFormat=simple
```

6. Go to **(Admin) > Services**.

7. In the **Services** view, select a **Workbench**, then select **> View > Config**.
   The Services Config view is displayed with the General tab open.

8. Select the **Collections tab.**

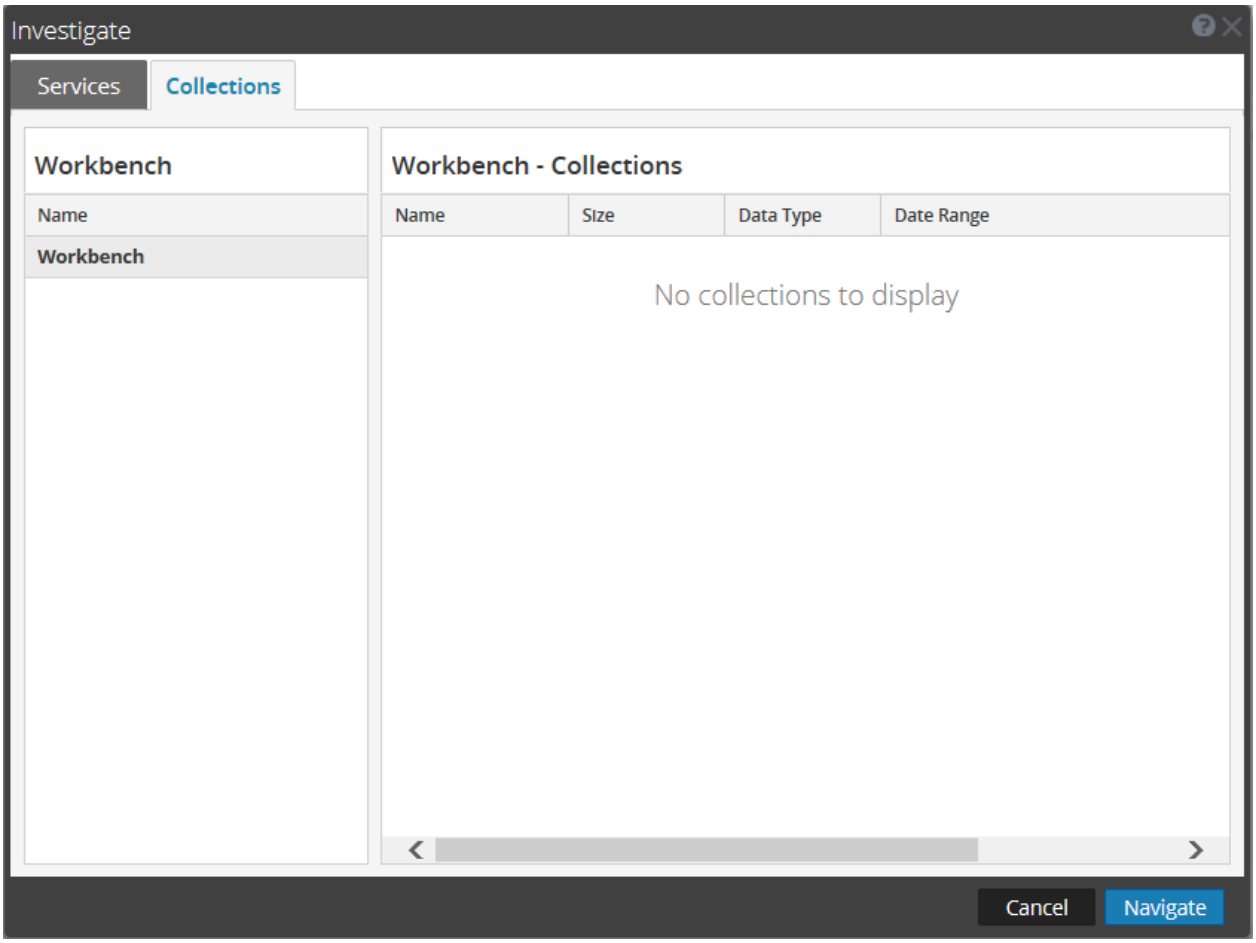
9. Create a restoration collection with the source path pointing to files listed in the manifest command output.

10. Save the collection.

    After successfully creating a collection, you can use this collection for reporting and investigation purposes.

Investigate a Collection

To perform an investigation on a workbench collection:



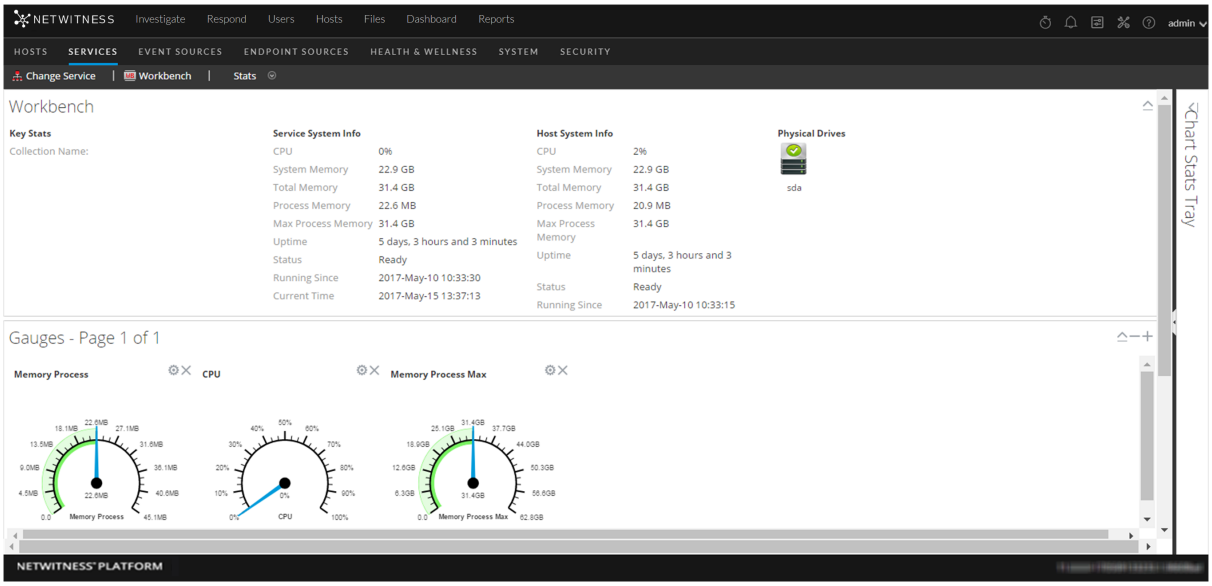
1. Select **Investigate**.

   The Investigate dialog is displayed.

2. Click the **Collections** tab in the Investigate dialog.
3. Select a Workbench service in the left panel.
4. Select the collection you want to investigate in the right panel.
5. Click **Navigate**.

The Navigate view is displayed showing data pertaining to the Workbench collection that you selected.

Note: For detailed information about using Investigation, see *Investigation and Malware Analysis Guide*.



View Workbench Collection Statistics

The same statistics available for other services are provided for the Workbench service. The Services Stats view displays key statistics and system information that pertain to your selected Workbench service. The information is displayed in several different sections within the Stats view: Workbench, Gauges, Timeline Charts and Chart Stats Tray. The Chart Stats Tray lists all available statistics for the Workbench. Any statistic in the Chart Stats Tray can be displayed in a gouge or a timeline chart.

Perform the following steps to view workbench statistics:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a **Workbench** , then select **> View > Stats**.

The Services Stats view is displayed.

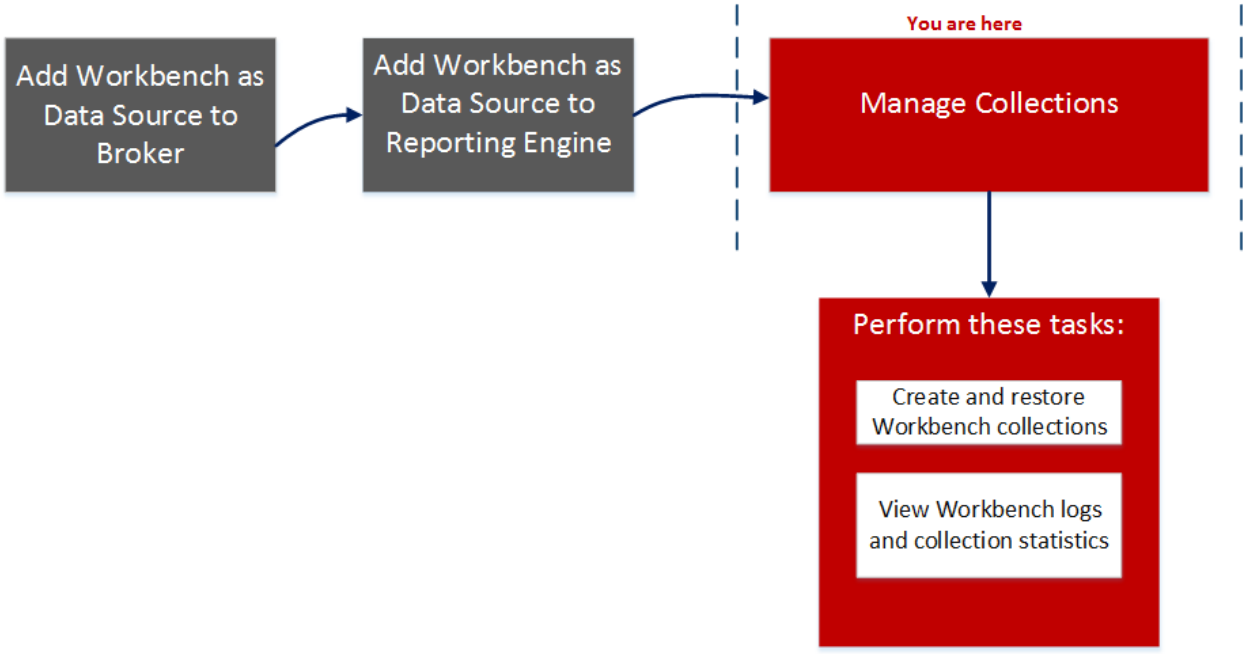
Note: For more information about Workbench statistics, see the *Host and Services Getting Started Guide*.

View Workbench Logs

Perform the following steps to view logs on a Workbench service:

1. Go to **(Admin) > Services.**
2. In the **Services** view, select a **Workbench**, then select **> View > Logs**.
   The Services Logs panel is displayed.

Note: For information about viewing and configuring audit logs, see the topic "Configure Global Audit Logging" in the *System Configuration Guide* .



Services Config View - Workbench

In the Services Config view for workbench, some of the parameters are the same as other NetWitness services, while others are specific to the Workbench service.

The Services Config view - Workbench ((Admin) > Services >, select a Workbench service and select View > Config) provides a way to configure a Workbench service.

Workflow

These are the basic steps for configuring and managing a Workbench service.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add Workbench as data source to Broker	Adding Workbench Service as a Data Source to Broker
Administrator	Add Workbench as a Data Source to Reporting Engine	Adding Workbench as a Data Source to Reporting Engine
Administrator	*Create or delete a collection	Managing Collections
Administrator	*View Workbench statistics and logs	Managing Collections

Role	I want to...	Show me how...
Administrator	View configuration information about appliances that are connected to the Workbench service.	Select the **Appliance Service Configuration** tab. The Appliance Service Configuration tab is the same for all NetWitness services. It provides configuration information about appliances that are connected to the Workbench service. For information on the **Appliance Service Configuration** tab, see **Appliance Service Configuration Tab** in the *Host and Services Getting Started Guide*.

- Workbench Configuration Procedures

Quick Look

The Collections tab has a toolbar and a panel that lists relevant information about the Workbench collections.

The following figure is an example of the Collections panel.

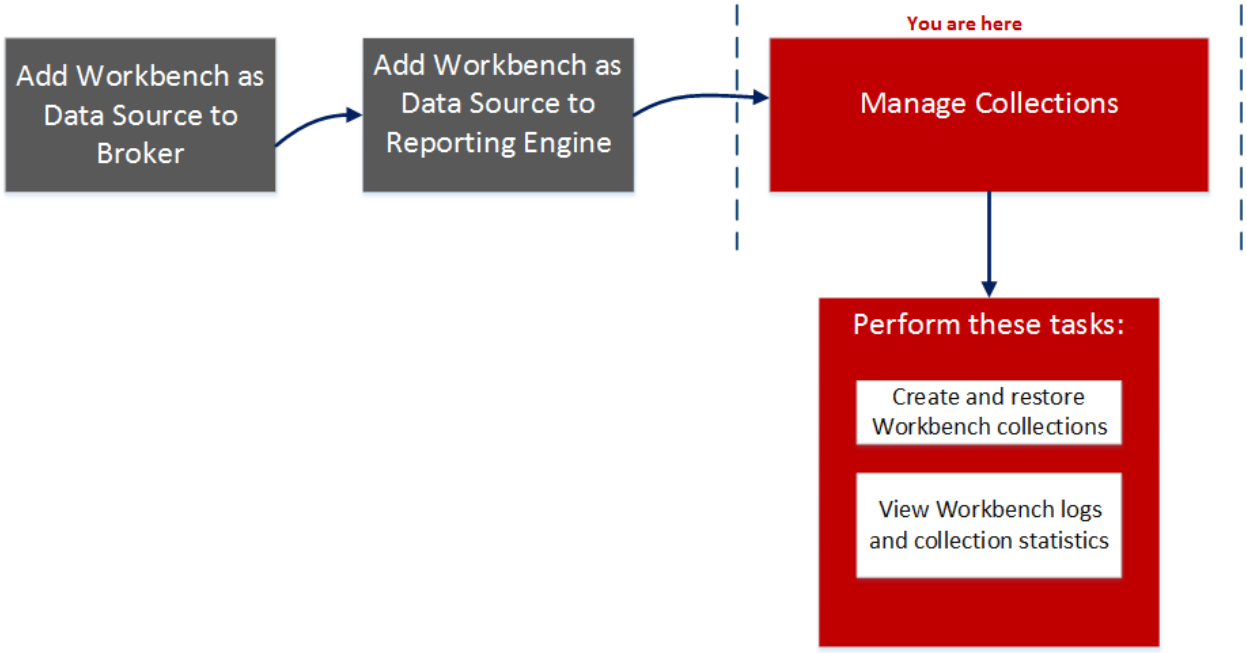
1 Status of the Restoration Collection:

- **Resorting Data** - Data restoration is in progress.
- **Closed** - Data is restored.

	• **Opening** - Data is being indexed. • **Ready** - Indexing is complete. • **Closing** - Collection is closing.
2	**Name**: Name of the file being restored.
3	**Size**: Collection size.
4	**Data Type**: Logs.
5	**Date Range**: Lists the range of dates when the collection is being restored.
6	**Owner**: Lists the Collection creator.
7	**Date Created**: Shows the date when the collection was created.
8	**Description**: Description of the Restoration collection.
9	**Available Storage Indicator**: Shows the available disk space, given in gigabytes (GB). The Workbench validates to ensure there is enough available space when attempting to create a restoration collection.

Toolbar

These are the toolbar options.



Parameter	Description
	Creates a new restoration collection.
	Deletes the selected Workbench collection.
Open and Close - Refers to the status of the restoration collection.	Open - Makes collection available for investigation and reporting. Close - Makes collection unavailable for investigation and reporting while preserving resources.
	Refreshes the list of Workbench collections.

Services Config View - General Tab

The General tab for the Workbench service provides a way to manage basic service configuration. To access the General tab, go to **(Admin) > Services >** select a service and select **> View > Config**.

Workflow

These are the basic steps for configuring and managing a Workbench service.

What do you want to do?

Role	I want to...	Show me how...
Administrator	*Create and restore Workbench service collections.	Managing Collections
Administrator	*View Workbench logs and collection statistics.	Managing Collections
Administrator	*Process Workbench collections.	Managing Collections

*You can perform this task here.

- Workbench Configuration Procedures

Quick Look

The General tab has two panels:

- System Configuration
- Workbench Configuration

The following figure is an example of the General tab.

System Configuration Panel

The System Configuration panel displays configuration parameters for the Workbench service. The following table describes the System Configuration panel features.

Parameter	Description
Compression	When set to a positive value, the minimum amount of bytes before a message is compressed. **0** means no compression for any message. Change takes effect on subsequent connections.
Port	The unencrypted port this service will listen on. **0** means disabled. Change takes effect on service restart.
SSL FIPS Mode	Determines whether the OpenSSL library will enter FIPS mode. Change takes effect on service restart.
SSL Port	The SSL port this service will listen on. **0** means disabled. Change takes effect on service restart.
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system. Change takes effect immediately.
Threads	The number of threads in the thread pool to handle incoming requests. Change takes effect immediately.

Workbench Configuration Panel

The Workbench Configuration panel displays configuration parameters for the Workbench collections. The following table describes the Workbench Configuration panel features.

Parameter	Description
Collection Timeout	The number of seconds before an idle collection is automatically closed.
Max Open Collections	The number of collections that can be open at once. A setting of 0 disables the limit.
Apply	Updates the modified configurations in the panel.

Troubleshooting

NetWitness notifies users of issues using pop-up notifications.

NetWitness Workbench returns the following types of error messages explained in the following table.

Problem	Possible Causes	Solutions

Unable to connect to workbench service from NetWitness **user interface Administration page.**	NetWitness service is not running.	Verify that your NetWitness service is running. Log in to your NetWitness Server and run the following command:
		`status nwworkbench`
		Firewall rules should allow connections from 50007, 50607 and 50107.
		Verify your connection by running the following command:
		`service iptables status`
		Verify that you are able to launch REST. Execute the following command for your appliance:
		`https://<IPAddress>:50107 service`
		If you are able to launch REST service for your appliance, you can confirm that there is no problem with the appliance. Navigate to the NetWitness side for further investigation as follows:
		• Enable debug mode and watch for sa.log errors located at:
		`/var/lib/netwitness/uax/logs`
		• Enable developer tools using the shortcut `Ctrl+Shift+I` for Chrome and verify the preview and response for the request.

Not able to view Appliance service configuration tab for workbench appliance running in SSL mode.		Enable SSL for appliance service and restart the appliance service.

Problem	Possible Causes	Solutions

The following error message is displayed when trying to load meta in order to create a report on a workbench collection: "Unable to fetch schema from data source when trying to load meta."		Load meta for the appliance from the NetWitness User Interface Rule library and watch for any errors in Reporting Engine log located at:
		`/home/rsasoc/rsa/soc/reporting-engine/logs`
		Launch REST for the device and watch for any error if you run the following query:
		`/sdk?msg=language&force-content-type=text/plain&expiry=600&size=10`

No results are displayed after running query from NetWitness User Interface via the Reporting Engine.		Run the query on the Reporting Engine and watch for `/var/log/messages` on the data source. Look for an exact query that matches the data source. **TIP**: Search for `[SDK-Query]` in log file. Copy the exact query and run from REST SDK to see if you get any results. `REST Query: /sdk?msg=query&force-contenttype=text/plain&expiry=600&query=select%20user.dst&size=10`
Workbench Available storage indicator in Workbench Collections Tab is not accurate.	Available storage indicator in the User Interface displays the default Collections directory shown below: `/VAR/NETWITNESS/WORKBENCH/COLLECTIONS`	None.
Unable to open new collections after opening existing collections.	There is a workbench configuration called “Max Open Collections” that is set to 25 by default. This configuration specifies the number of collections that can be open at the same time.	You can modify this number. A setting of zero disables the limit of maximum open collections.

Problem	Possible Causes	Solutions
Successfully opened a collection that got to Ready state. But after a while, the collection automatically changed to Closed state.	There is a workbench configuration called “collection.timeout” that is set to 1200 seconds by default. This configuration specifies the number of seconds before an idle collection is automatically closed. Maximum time allowed before timeout occurs is 86,400 seconds (24 hours).	A setting of zero disables the timeout.
Querying for a time range using `/database manifest` command returned blank output.	Blank output indicates that there are no **nwdb** files available for the time range.	None.
Created collection, but collection status is not available in Jobs, and collection is not displayed in workbench Collections tab.	You might be running in a mixed mode environment (for example, creating a collection on a 10.4.x version of workbench from a 10.5 NetWitness User Interface.	The collection is displayed in the workbench Collections tab after you reload the page.
Noticed blank Date Range and Date Created values for collections.	All collections display blank Date Range and blank Date Created values.	Date Range and Date Created values are displayed after upgrading to 10.5.
Discrepancy in behavior of adding workbench collections as a data source to Reporting Engine.	This behavior depends on whether you have a trusted connection or a non-trusted connection.	If your workbench service is established with a trusted connection, you should manually add workbench collections as a source to Reporting Engine. If your workbench service is not established with a trusted connection when the workbench restoration collection was created, it automatically sends a message to the Reporting Engine to add it as a source in the Reporting Engine.

Problem	Possible Causes	Solutions
Collection attributes (size, date range and date created) are not displayed.	Date range is not displayed for a collection if Jetty service is restarted while restoration is in process. Restoration collections created from an Explorer view display a blank Date Range. Any collections created on a 10.4 Workbench will display blank Date Range and blank Date Created values after upgrading to 10.5. In a mixed mode environment (10.5 NetWitness Server and 10.4.x workbench), size, date range, and date created are not displayed.	None.
Exception or blank page is displayed when drilling down on a workbench collection.	Collection closed because it exceeded the collection time out.	Investigate the collection from the beginning.
Empty collection is created.	Empty collection is displayed if restoration fails because Workbench service is restarted during collection creation.	None.
Service abruptly shuts down.		Run the service from command line and watch for any errors. For an example, run the command from the server console `/usr/sbin/NwWorkbench` for workbench.
REST request denied.		Verify user.agent.whitelist config located at `/rest/config/`. If non-blank, this should be a regex expression to match valid HTTP user agents. If the regex fails to match, all REST requests will be denied (see allow.missing.user.agent for the potential exception). If blank, all requests are allowed.
Queries with raw meta return blank values for Raw field.		Verify that you have a relevant **`packet db`**.

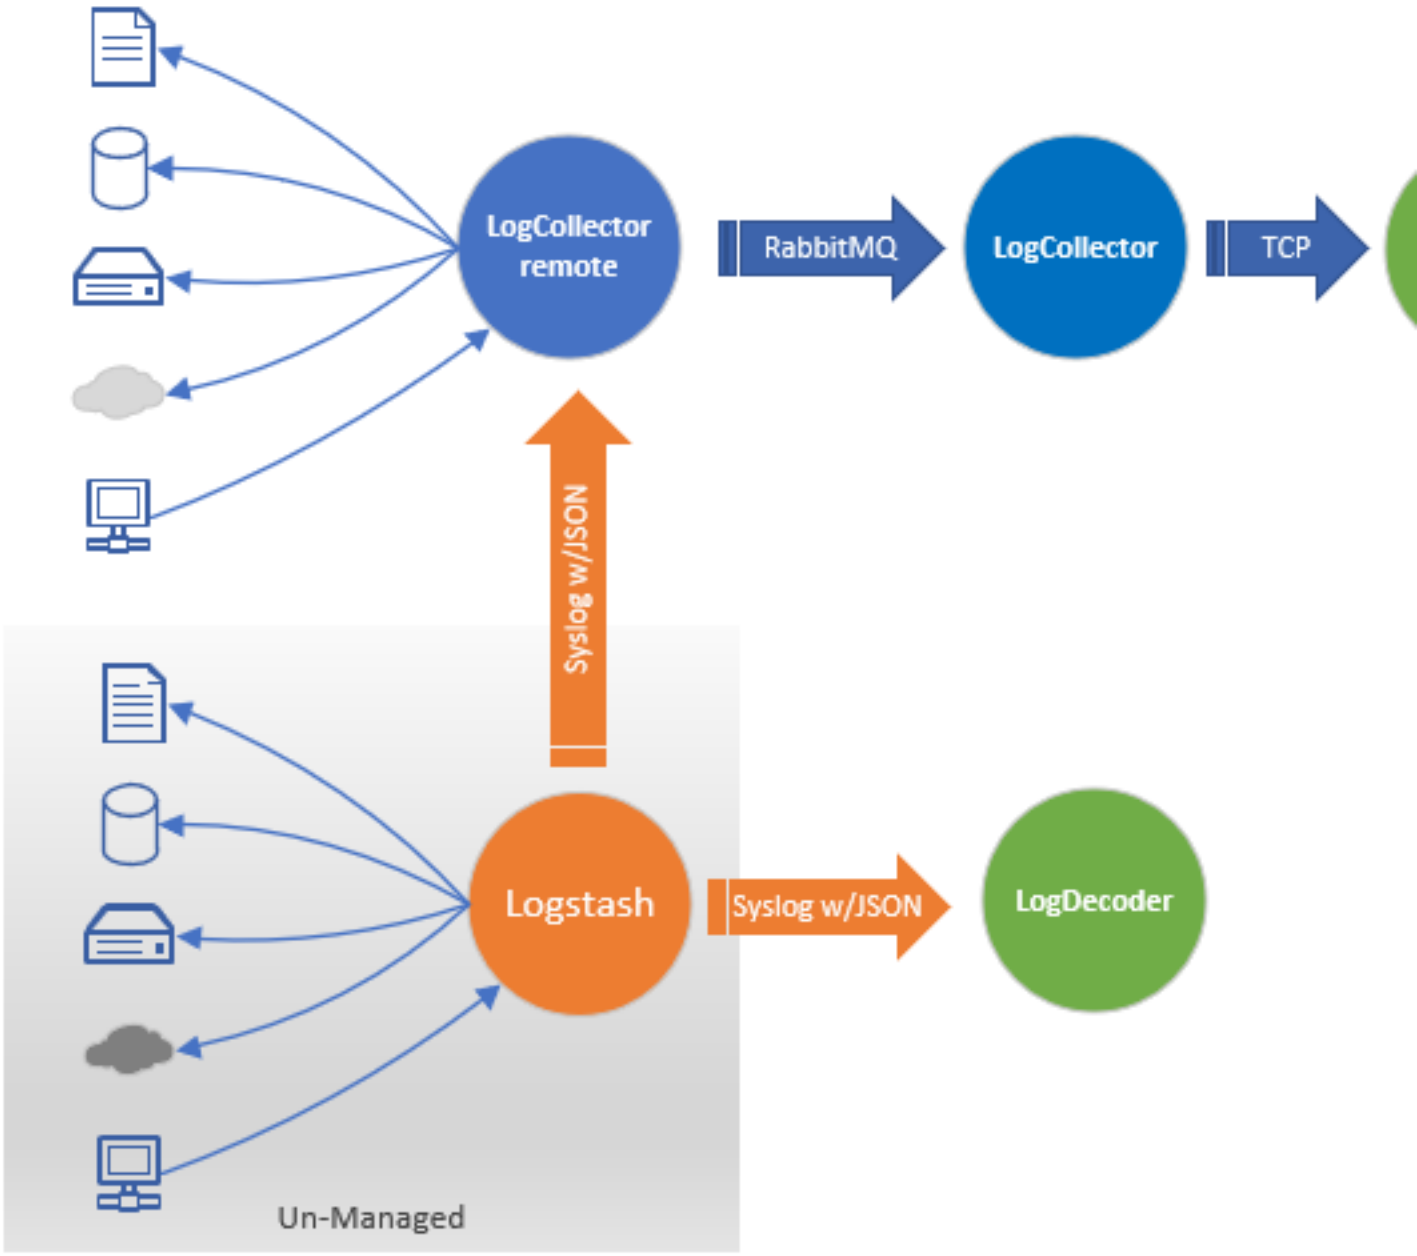
Overview

This document is intended to provide a general overview of Logstash and NetWitness integration. The intention is to provide enough implementation detail that users can have comfort using and troubleshooting these integrations on their own.

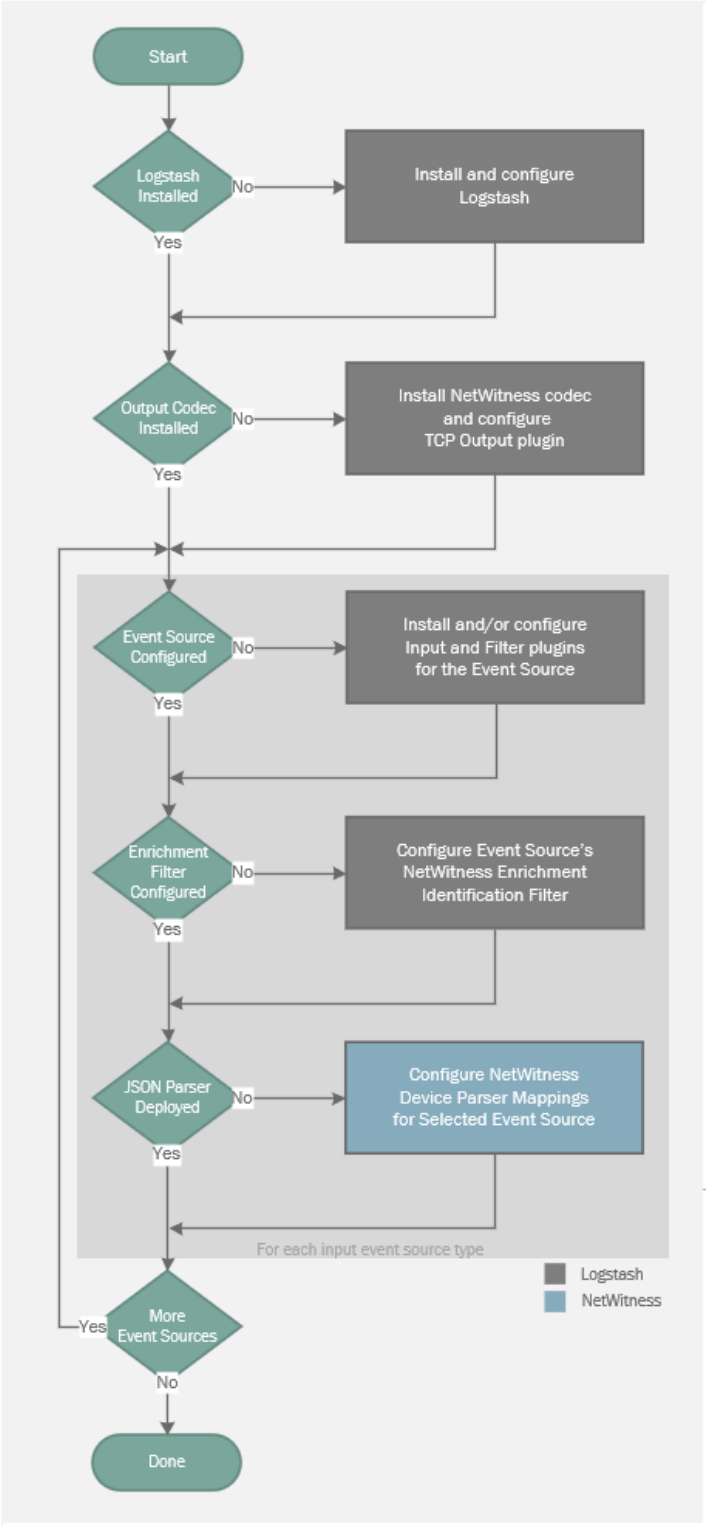
To describe Logstash, here is some introductory text from Logstash reference documentation:



> *Logstash is an open source data collection engine with real-time pipelining capabilities. Logstash can dynamically unify data from disparate sources and normalize the data into destinations of your choice…*

From a NetWitness standpoint, there are two basic use cases:

- For customers that have an event source for which NetWitness does not already provide an integration, or if you want a customized integration that is different from the one provided by NetWitness.
- For customers that already have an existing Logstash configuration, you can use Logstash to integrate as many of your event sources as you like. Integrating your event sources should be a matter of updating the destination for where you currently send the log information: either adding NetWitness as a destination, or changing your current output destination to NetWitness.



From 11.6 onwards, the Logstash server is packaged and supported along with the NetWitness Log Collector or Virtual Log Collector (VLC) service to provide easy access to Logstash. This is referred to as Managed Logstash and it eliminates the need for a separate Logstash server outside of the NetWitness Platform. For more information, see Configure Logstash Event Sources in NetWitness in the *Log Collection Configuration Guide*.

The following diagram displays a view of how Logstash integrates with the NetWitness.

LogCollector

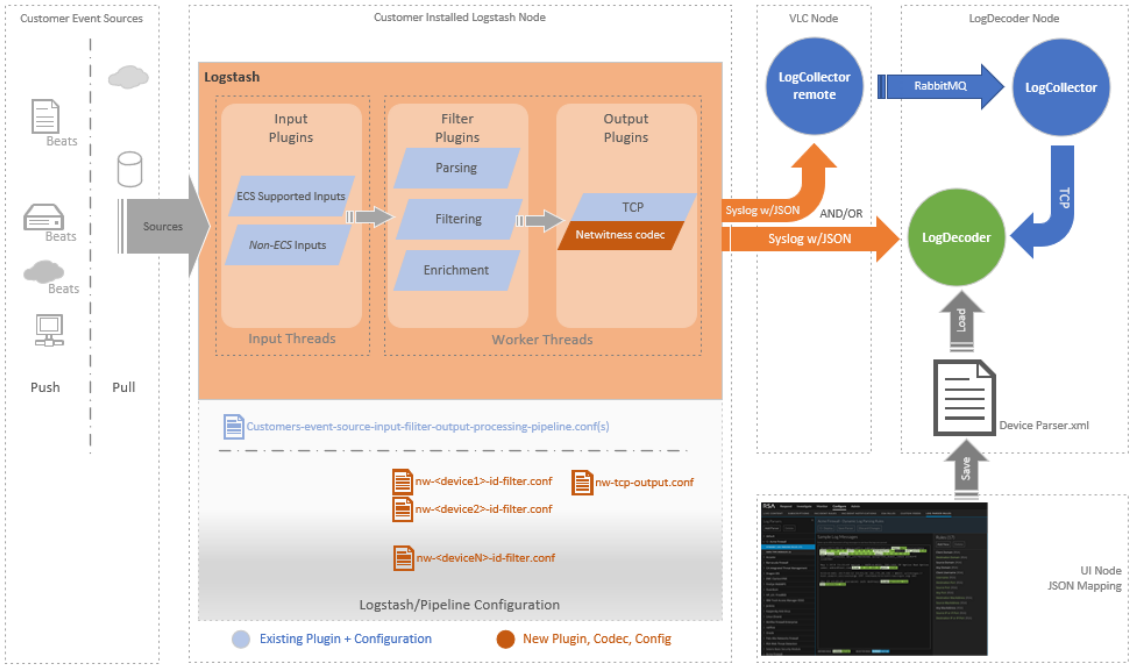
LogDecoder
Un-Managed



Configuration Process

The following flowchart describes the steps customers take to integrate Logstash with NetWitness, depending on their prior familiarity with and use of Logstash.

The following sequence describes the data flow from an event until it becomes NetWitness meta in a Log Decoder.

1. An event source generates events.
2. The collection plugin (for example a Beats plugin) collects events from the event source.
3. Logstash processes the data from the events.
4. A NetWitness codec encodes the Logstash-processed data into a format that can be consumed by NetWitness.
5. An output plugin sends the processed event data to the NetWitness.
6. A JSON parser populates meta from the processed event data.

Install Logstash

Skip this section if you already have Logstash installed and configured.

Please ensure that you follow all the security-related best practices and guidelines outlined in the Logstash documentation to avoid any potential security risks.

You can install either the free, open source version of Logstash (OSS) or the paid version (Elastic).

Information on released versions of Logstash is available at Logstash Reference. Links in the following steps show an example of installing current version of Logstash on Linux.

1. Install the service: Installing Logstash (OSS free version)
2. Based on your OS, after installation do one of the following:
    - Linux: set Logstash to run as a service: Running Logstash
    - Windows: see Running Logstash on Windows
3. Next, enable Logstash to start when the system boots up:
    - For CentOS, see https://www.unix.com/man-page/centos/1/systemctl/
    - For Debian, see https://wiki.debian.org/systemd/documentation

    Those are 2 examples: adjust instructions according to your particular Operating System.

For Generic Troubleshooting Instructions for Logstash, follow this link: Logstash Troubleshooting

If you are using CentOS, note the following:

- Logstash logs are stored in /var/log/logstash/logstash-plain.log
- If you install logstash using rpm install, make sure it installs as logstash user and folders get created with the same user: **not** the root user.

Install and Configure the NetWitness Codec

To forward Logstash events to the NetWitness in RFC-5424 format, you need to install the NetWitness codec on your system and refer to it in your output plugin configuration.

To install or update the codec:

The following procedure can be performed on either Linux or Windows: instructions that are specific to an OS are noted.

1. Download offline installer from NetWitness Link in the following location: NetWitness Codec Installer
2. Copy the downloaded NetWitness ZIP archive to the system where Logstash runs.
3. Open a command prompt and change directory to Logstash home:
    - On Linux: cd /usr/share/logstash.
    - On Windows: cd: ***logstash_directory***

      For example: cd: c:\Logstash\
4. Stop the logstash service, if it is running.
    - On Linux, run the following command:

      systemctl stop logstash
    - On Windows, open the Services window (you can search for it or find it from the Start menu), then locate the Logstash service in the list and click **Stop the service**.
5. Run the following command and check to see if **logstash-codec-netwitness** is listed.
    - On Linux:

      bin/logstash-plugin list
    - On Windows:

      .\bin\logstash-plugin list
6. If it is listed, delete it by running the following command:
    - On Linux:

      bin/logstash-plugin remove logstash-codec-netwitness
    - On Windows:

      .\bin\logstash-plugin remove logstash-codec-netwitess
7. To install the latest package, run the following command:

- On Linux:

  bin/logstash-plugin install file:///***<path-to-file>***/logstash-codec-netwitness-offline-**<version>**.zip

- On Windows:

  .\bin\logstash-plugin install file:///***<path-to-file>***/logstash-codec-netwitness-offline-**<version>**.zip

  Make sure to use forward slashes (/) as a separator between Windows subfolders for the path to the logstash installation package.

If the codec is installed correctly, you receive a confirmation message. The following is an example:

Installing file: /usr/share/logstash/logstash-codec-netwitness-offline-1.0.0.zip

Install successful

8. Below are default paths for logstash configurations. All output, filter, and input configuration files are under these folders.

   we would go over those configuration files in later sections.

   - For Linux: /etc/logstash/conf.d/
   - For Windows: ***logstash_directory***/config/

   For details on output files, see "Configure Logstash Output Plugins" on page 13. For details on input and filter plugins, see "Logstash Input and Filter plugins" on page 19.

9. Start the logstash service:

   - On Linux, run the following command:

     systemctl start logstash

   - On Windows, open the Services window (you can search for it or find it from the Start menu), then locate the Logstash service in the list and click **Start the service**.

Configure Logstash Output Plugins

Logstash TCP Output

In order to send the events from Logstash to NetWitness, we use the TCP output plugin: https://www.elastic.co/guide/en/logstash/current/plugins-outputs-tcp.html

The TCP output is configured with the NetWitness codec, which formats the outgoing events to be consumable by a NetWitness Log Decoder or Virtual Log Collector (VLC).

The following is an example of a properly configured output block using TCP & the NetWitness codec:

Output Block

```
output {
  tcp {
    id => "nw-output-tcp"
    host => "10.10.1.2" #IP or Hostname of destination Log Decoder or VLC
    port => 514
    codec => netwitness
  }
}
```

Logstash TLS Output

The output block can be further configured to allow for TLS communication between Logstash and NetWitness. An example of a properly configured output block using TLS and the NetWitness codec:

TLS Output Block

```
output {
  tcp {
    id => "nw-output-tcp"
    host => "10.10.1.2" #IP or Hostname of destination Log Decoder or VLC
    port => 6514
    ssl_enable => true
    codec => netwitness
  }
}
```

TLS with Log Decoder (or Virtual Log Collector) Verification

TLS can also be set up to verify the Log Decoder or Virtual Log Collector (VLC) to which it will be communicating. To do this, the Root and Intermediate CA certificates need to be obtained and stored in a truststore for Logstash.

1. On the Log Decoder (or VLC) to which you will be sending events, run the following command:

   cat /etc/pki/nw/ca/nwca-cert.pem /etc/pki/nw/ca/ssca-cert.pem > nw-truststore.pem
2. Copy the nw-truststore.pem file to the Logstash machine and store it in a known location.
3. Create a certificate for the Logstash machine using a self-signed CA or your own CA.
4. Store the cert and private key files in a location of your choosing.

   You need to specify the locations of these files in your TLS output block.

The following code snippet shows an example of a properly configured output block using TLS and the NetWitness codec

Output Block with Verification

```
output {
  tcp {
    id => "nw-output-tcp"
    host => "10.10.1.2" #IP or Hostname of destination Log Decoder or VLC
    port => 6514
    ssl_enable => true
    ssl_verify => true
    ssl_cacert => "/path/to/certs/nw-truststore.pem"
    ssl_key => "/path/to/certs/privkey.pem"
    ssl_cert => "/path/to/certs/cert.pem"
    codec => netwitness
  }
}
```

Configure the Event Source

If you have logstash already install and configured to collect events from desired event-sources you can skip this section.

As a starting point, view the list of input plugins here: Input Plugins. This is not meant to be an exhaustive list, just as a starting point to view some of the available input plugins.

The remainder of this section describes some examples.

Collect Apache File Logs

Typically, Apache logs are written to files on the disk, so to collect events from file you could use the **Filebeat** plugin.

To install and configure Filebeat, see the following websites:

1. Install the Filebeat service on Linux. Refer to the following link: Filebeat Installation
2. Configure Filebeat to collect from specific logs. Refer to the following link: Filebeat Configuration
3. Configure Filebeat to send the output to Logstash. Refer to the following link: Filebeat Logstash Output

Collect CentOS Audit Logs

To collect audit events from an operating system (for example CentOS), you could use the **Auditbeat** plugin.

To install and configure Auditbeat, see the following websites:

1. Install the Auditbeat service on Linux. Refer to the following link: Auditbeat Installation
2. Configure Auditbeat to collect from specific logs. Refer to the following link: Auditbeat Configuration
3. Configure Auditbeat to send the output to Logstash. Refer to the following link: Auditbeat Logstash Output

Configure Parameters for Filebeat or Auditbeat

For Filebeat or Auditbeat plugin, make sure to configure input and output parameters. Modify /etc/filebeats/filebeat.yml as shown below.

To enable file collection, modify the **Filebeat inputs** section as shown in the following image:

```
#========================== Filebeat inputs =============================

filebeat.inputs:

# Each - is an input. Most options can be set at the input level, so
# you can use different inputs for various configurations.
# Below are the input specific configurations.

- type: log

  # Change to true to enable this input configuration.
  enabled: true

  # Paths that should be crawled and fetched. Glob based paths.
  paths:
    - /var/log/*.log
    #- c:\programdata\elasticsearch\logs\*
```

Modify the Outputs as follows:

- Comment out settings in the **Elasticsearch Output** section
- Uncomment **Logstash output** settings and provide logstash IP and Port.

Below is an example of the sections after changes are made:

```
#================================ Outputs =====================================

# Configure what output to use when sending the data collected by the beat.

#-------------------------- Elasticsearch output ------------------------------
#output.elasticsearch:
  # Array of hosts to connect to.
  # hosts: ["localhost:9200"]

  # Optional protocol and basic auth credentials.
  #protocol: "https"
  #username: "elastic"
  #password: "changeme"

#----------------------------- Logstash output --------------------------------
output.logstash:
  # The Logstash hosts
  hosts: ["localhost:5044"]

  # Optional SSL. By default is off.
  # List of root certificates for HTTPS server verifications
  #ssl.certificate_authorities: ["/etc/pki/root/ca.pem"]

  # Certificate for SSL client authentication
  #ssl.certificate: "/etc/pki/client/cert.pem"

  # Client Certificate Key
  #ssl.key: "/etc/pki/client/cert.key"
```

Configure Logstash Filters to Add NetWitness Meta

In order for an event to be processed in the Log Decoder as a specific data type, you need to add some meta key information to the event in Logstash.

- [@metadata][nw_type] — NetWitness device parser content name
- [@metadata][nw_msgid] — NetWitness message pattern to parse message
- [@metadata][nw_source_host] — Originating event source's IP or host value

The value for nw_type *must* match the device parser name. It should be composed of lowercase characters, numbers, or underscore and be less than 29 characters in length.

Optionally, you can add the following meta key:

[@metadata][nw_collection_host] — Collection system identifier (**lc.cid**)

By default, the NetWitness codec sends the complete JSON event as payload to the NetWitness Log Decoder. If the NetWitness nw_type device parser type has a custom payload format and failover payload format, the NetWitness codec plugin must be configured to use them. Please see the "Configure the Event Source" on page 15 section for more details.

The following code snippet contains an example of adding the required meta:

Code to Populate NetWitness Meta

```
filter {
  if ![@metadata][nw_type] {
    if [agent][type] == "filebeat" {
      mutate {
        add_field => {
          "[@metadata][nw_type]" => "linux"
          "[@metadata][nw_msgid]" => "LOGSTASH001"
          "[@metadata][nw_source_host]" => "%{[host][hostname]}"
        }
      }
    }
  }
}
```

Advanced NetWitness Configuration

Grok Filter Plugin

You can use Grok to parse incoming logs and extract valuable meta information. For details, see Grok filter plugin: match. The meta extracted using grok is part of the full event package sent to NetWitness, where it can be mapped to NetWitness meta.

Resources:

- List of Grok patterns: https://github.com/logstash-plugins/logstash-patterns-core/tree/master/patterns
- Grok debugger: https://grokdebug.herokuapp.com/

Logstash Input and Filter plugins

See the following URLs:

- Input Plugins
- Filter Plugins

You can use the beats input plugin for Logstash to receive events from beats sources, including Filebeat & Auditbeat: Beats Input Plugin

You can use the drop filter plugin for Logstash to filter out unwanted logs being passed through Logstash: Drop Filter Plugin

Filter out unwanted logs

You can also filter out unwanted logs using the drop-event processor for Filebeat & Auditbeat.

- Examples for Filebeat:

  Filebeat Reference: Filtering and Enhancing Data

  Filebeat Reference: Drop Events

- Examples for Auditbeat:

  Auditbeat Reference: Filter and Enhance the Exported Data

  Auditbeat Reference: Drop Events

Configure heartbeat plugin to send test logs to NetWitness

The **Heartbeat** plugin can be used to send a test message to verify connectivity between logstash and NetWitness. For details, see the Heartbeat Plugin configuration guide: Heartbeat Input Plugin.

Example of Heartbeat Plugin

```
...

heartbeat {
  id => "sample_plugin"
  #interval => 60
  count => 3
  message => "sequence"
  add_field => {
  "[@metadata][nw_type]" => "logstash_testlog"
  "msg" => "This is test log from some eventsource"
}

...
```

Configure logstash to persist events in case of failure (Recommended)

By default, Logstash uses in-memory queues to buffer events. The size of these in-memory queues is not configurable. If there is a machine failure, or if the service is forcibly stopped, the contents of these queues are lost. To protect against data loss in these situations, Logstash supports persistent queues that are stored on disk and thus can survive failures. For details, see Logstash Persistent Queues.

NetWitness Codec Advanced Configuration

By default, the NetWitness codec sends the complete JSON event as payload to the NetWitness Log Decoder. If the NetWitness nw_type device parser type has a custom payload format, you must configure the NetWitness codec plugin to recognize this custom format.

The payload_format and payload_format_failover mappings use nw_type as the key. The payload_format mapping is searched first for the device type (nw_type). If the device type is not set, or no format is specified for nw_type, or the system fails to make all configured variable substitutions, the complete JSON output is used as the payload. If the primary format from the payload_format mapping fails, the payload_format_failover mapping is tried. If that also fails, the complete JSON output is used as the payload. You can use The format can use Logstash event field syntax for this custom configuration.

The following code snippet shows example of adding meta with custom payload formats.

Add meta with custom payload formats

```
output {
   if [@metadata][nw_type] { # Only targeted NetWitness items
   tcp {
```

```
        id => "netwitness-tcp-output-conf-output"
        host => "127.0.0.1"
        port => 514
        ssl_enable => false
        codec => netwitness {
           # Payload format mapping by nw_type.
           # If nw_type is absent or formatting fails,
           # JSON event is used as the payload
           payload_format => {
              "apache" => "%APACHE-4-%{verb}: %{message}"
           }
           # Failover format, if above format fails
           # If nw_type is absent or formatting fails,
           # JSON event is used as the payload
           payload_format_failover => {
              "apache" => "%APACHE-4: %{message}"  # When verb is missing
              }
           }
        }
     }
  }
```

Troubleshoot Installation Issues

If you encounter any issues during installation of Logstash, see Logstash Installation and Setup.

Configure NetWitness to Collect Events

You need to start capture on the Log Decoder to which your are sending your Logstash data.

To start or restart network capture on a Log Decoder:

1. Log in to **NetWitness** and click the **ADMIN** icon > **Services**.
   The Services view is displayed.
2. Select a **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

.

   If the toolbar is displaying the Stop Capture (

) icon, then capture has already been started.

By default, Log Decoders support events that are up to 32 KB in size. If your events are getting truncated on the Log Decoder, use the following procedure to change the event size:

1. Change LogDecoder REST config at **http://*LogDecoder_IP*:50102/-decoder/config**, where ***LogDecoder_IP*** is the IP address of your Log Decoder.
2. Set pool.packet.page.size to 64 KB.
3. Restart the Log Decoder: this is required after you change the pool.packet.page value.

If you are collecting events larger than 64 KB in size, follow instructions above in the "Filter out unwanted logs" on page 19 section. You can drop unwanted logs or fields for a specific event source, to reduce the size of the incoming data.

Linux Event Source Example

This section shows sample input, filters and output configuration to collect system and audit events from CentOS.

Input Plugin

An input plugin enables a specific source of events to be read by Logstash. The following code represents an example input plugin.

input-beats.conf

```
# Below input block collects events using beats plugins (e.g filebeats, auditbeats)
# Skip this block if it's already defined in another pipeline.
input {
    beats {
        port => 5044
    }
}
```

Make sure that port 5044 is open on the Logstash machine. As an example, if Logstash is on a CentOS system, run the following commands to open port 5044:

firewall-cmd --add-port=5044/tcp
firewall-cmd --add-port=5044/tcp --permanent
firewall-cmd --reload

Output Plugin

An output plugin sends event data to a particular destination. Outputs are the final stage in the event pipeline.

output-netwitness-tcp.conf

```
# Below is tcp output plugin with netwitness codec to tranform events in syslog and send
it to LogDecoder
# Only one of these configurations can be within the same pipeline.
output {
  #if [@metadata][nw_type] { # Only targeted Netwitness items
    tcp {
      id => "netwitness-tcp-output-conf-output"
      host => "10.10.100.100"  ## LogDecoder IP
      port => 514
      ssl_enable => false
      #ssl_verify => true
      #ssl_cacert => "/path/to/certs/nw-truststore.pem"
      #ssl_key => "/path/to/certs/privkey.pem"
      #ssl_cert => "/path/to/certs/cert.pem"
```

```
      codec => netwitness {
        # Payload format mapping by nw_type.
        # If nw_type is absent or formatting fails, JSON event is used as the payload
        payload_format => {
          "apache" => "%APACHE-4-%{verb}: %{message}"
        }
        # Failover format, if above format fails
        # If nw_type is absent or formatting fails, JSON event is used as the payload
        payload_format_failover => {
          "apache" => "%APACHE-4: %{message}"  # When verb is missing
        }
      }
    }
  #}
}
```

Filter Plugin

A filter plugin performs intermediary processing on an event. Below is a filter plugin configuration for system events collected from linux using the Filebeat plugin.

linux-system.conf

```
# Filters are often applied conditionally depending on the characteristics of the events.
# Requires these additional configurations within the same pipeline:
#   input-beats.conf
#   output-netwitness-tcp.conf

filter {
if ![@metadata][nw_type] {
  if [ecs][version] and [host][hostname] and [agent][type] == "filebeat" {
    if [event][module] == "system" {
      mutate {
        add_field => {
          "[@metadata][nw_type]" => "linux"
          "[@metadata][nw_msgid]" => "LOGSTASH001"
          "[@metadata][nw_source_host]" => "%{[host][hostname]}"
        }
      }
    }
  }
 }
}
```

Below is filter plugin configuration for audit events collected from linux using the Auditbeat plugin.

linux-audit.conf

```
filter {
    if ![@metadata][nw_type] { # Update Once
```

```
      if [ecs][version] and [host][hostname] and [agent][type] == "auditbeat" {
        if [event][module] == "audit" {
          mutate {
            add_field => {
              "[@metadata][nw_type]" => "linux"
              "[@metadata][nw_msgid]" => "LOGSTASH002"
              "[@metadata][nw_source_host]" => "%{[host][hostname]}"
            }
          }
        }
      }
    }
  }
```

Create a Pipeline

It is recommended to have one pipeline for each input type. For example, all beats collection should be in the same pipeline. To run collection as separate pipeline, create a directory and add above input, filters, and output configuration files to it.

Example Pipeline for Beats

```
/etc/logstash/pipeline1/
/etc/logstash/pipeline1/input-beats.conf
/etc/logstash/pipeline1/output-netwitness-tcp.conf
/etc/logstash/pipeline1/linux-system.conf
/etc/logstash/pipeline1/linux-audit.conf
```

Modify /etc/logstash/pipeline.yml and add the following entries:

Add to pipeline.yml

```
- pipeline.id: my-sample-pipeline-1
  path.config: "/etc/logstash/pipeline1/*.conf"
```

Build Custom JSON Parser

This section is intended for advanced programmers who want to build their own JSON parser. It describes how to build a Logstash parser for a sample device. We use the Linux device as an example throughout.

This chapter is optional: you do not need to build a custom JSON parser from scratch to input logs from Logstash to NetWitness.

Major sections in this document:

- Configure a filter by defining several required pieces of metadata.
- Examine a sample log message from the Linux device
- Walk through creating the parser, based on the sample log message
- View the parsed meta from the sample log message, as it appears on the Log Decoder

Sample JSON Log Received on Log Decoder

Let's examine a sample log and discuss its contents.

<13>1 - Centos7 linux - LOGSTASH001 [lc@36807 lc.ctime="1585886465037" lc.cid="Centos7" lc.ctype="logstash"] {"message": "msg='op=PAM:accounting grantors=pam_access,pam_unix,pam_localuser acct=root exe=/usr/sbin/crond hostname=? addr=? terminal=cron res=success'", "user":{ "email":"john.deaux@test.com", "username":"CORP\\deauxj" }, "host": { "name": "Centos7", "hostname": "Centos7", "containerized": false, "architecture": "x86_64", "id": "d1059ac783b24eb7bbde70a41fa572c9", "os": { "name": "CentOS Linux", "kernel": "3.10.0-1062.el7.x86_64", "version": "7 (Core)", "codename": "Core", "platform": "centos", "family": "redhat" } }, "@timestamp": "2020-04-03T04:01:05.037Z", "files": ["test1.log", "test2.log", "test3.log"],"machine_details" : { "1" : { "hostname" : "USXXLinux" }, "2" : { "hostname" : "USXXWindows" }}}

The first portion of the log is the RFC-5424 header:

<13>1 - **Centos7 linux** - **LOGSTASH001** [lc@36807 lc.ctime="1585886465037" lc.cid="Centos7" lc.ctype="logstash"]

This header contains the information that we used in setting our fields above:

- **nw_source_host**: Centos7 (Hostname)
- **nw_type**: linux (Device Type)
- **nw_msgid**: LOGSTASH001 (Message ID)

The remainder of the log is the JSON Payload.

JSON Payload

```
{
```

```
    "message": "msg='op=PAM:accounting grantors=pam_access,pam_unix,pam_localuser acct-
t=root exe=/usr/sbin/crond hostname=? addr=? terminal=cron res=success'",

    "user": {
        "email": "john.deaux@test.com",
        "username": "CORP\\deauxj"
    },

    "host": {
        "name": "Centos7",
        "hostname": "Centos7",
        "containerized": false,
        "architecture": "x86_64",
        "id": "d1059ac783b24eb7bbde70a41fa572c9",
        "os": {
            "name": "CentOS Linux",
            "kernel": "3.10.0-1062.el7.x86_64",
            "version": "7 (Core)",
            "codename": "Core",
            "platform": "centos",
            "family": "redhat"
        }
    },

    "@timestamp": "2020-04-03T04:01:05.037Z",

    "files": [
        "test1.log",
        "test2.log",
        "test3.log"
    ],

    "machine_details": {
        "1": { "hostname": "USXXLinux"},
        "2": { "hostname": "USXXWindows"}
    }

}
```

Create the JSON Parser for a Linux Device

Now that we have the sample log from the Linux device, we can construct a filter plugin for this device.

Initial Parser to Match Message ID and Device Type

The parser name should match the device type. We call this initial parser v20_linuxmsg.xml, which matches the message ID from the event. We set content to a variable, logstash_json_payload, which represents the JSON payload. We will parse the payload later in the process.

Message ID and Device Type Parsing

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<DEVICEMESSAGES
    name="linux"
    displayname="Linux"
    group="Unix">
    <VERSION device="2.0"/>

    <MESSAGE
        id1="LOGSTASH001"
        id2="LOGSTASH001"
        content="&lt;logstash_json_payload&gt;" />

    <!-- Additional logic to parse JSON payload -->

</DEVICEMESSAGES>
```

Map Payload Contents to Datatypes

We create datatypes to map each element from the payload to meta that can be saved to the NetWitness database.

The entire payload is assigned to the **FileBeatsEvent** datatype.

```
<VARTYPE name="logstash_json_payload" dataType="FileBeatsEvent"/>
```

The timestamp is parsed an assigned to the **InternetTime** datatype.

```
<DataType name="InternetTime"dateTime="%W-%M-%DT%H:%T:%S.%V%E" />
```

Parse the Message String

Using the parser above, we parse (using the FineParse type defined above) the message string from the log file.

"message": "msg='**op**=PAM:accounting grantors=pam_access,pam_unix,pam_localuser **acct**=\"root\"
exe=\"/usr/sbin/crond\" hostname=? addr=? terminal=cron **res**=success'",

The following code extracts the values from the string and saves them to meta keys:

- **op** is saved to **operation.id**
- **acct** is saved to **service.account**
- **res** is saved to **result**
- **exe** is saved to **process.src**

Note that he **search** flag is set to **true** to parse key/value pars regardless of their order in the string.

Extract Values: save to Meta

```
<DataType name="TagValParse" regex="(?: |^)(?:exe=(\S+)|acct=(\S+)|res=(\S+)|op=(\S+))"
```

```
search="true">
    <Capture index="1" meta="process.src" />
    <Capture index="2" meta="service.account" />
    <Capture index="3" meta="result" />
    <Capture index="4" meta="operation.id" />
</DataType>
```

The following code:

- Assigns the whole key as **message** and maps it to the **FineParse** type.
- The **FineParse** type is then mapped to **TagValParse** type.

```
<DataType name="FineParse" regex="msg='(.*)'">
    <Capture index="1" type="TagValParse" />
</DataType>

<DataType name="FileBeatsEvent" type="ElasticCommonSchemaSubset">
    <Capture key="/message" type="FineParse" meta="message"/>
    <Capture key="/user/email" meta="email"    />
    <Capture key="/user/username" type="DomainUser"/>
    <Capture key="/files/" meta="sourcefile" />
    <Capture key="/machine_details//hostname"   meta="host.dst"/>
</DataType>
```

Give the previous string and the code above, the output on the Log Decoder is as follows:

message: msg='op=PAM:accounting grantors=pam_access,pam_unix,pam_localuser acct=root exe=/usr/sbin/crond
  hostname=? addr=? terminal=cron res=success'
service.account: root
process.src: /usr/sbin/crond
result: success
operation.id: PAM:accounting

Parse an Array in JSON

In our sample JSON log file from earlier, one section contained an array object:

```
"files": [
  "test1.log",
  "test2.log",
  "test3.log"
]
```

To fetch all the values of an array, you need to define a capture key enclosed in forward slashes to fetch all values, for example **/files/**.

```
<DataType name="FileBeatsEvent" type="ElasticCommonSchemaSubset">
   <Capture key="/files/" meta="sourcefile" />
```

```
  </DataType>
```

Using the code above on the sample array, the following would be the output on the Log Decoder:

sourcefile: test1.log
sourcefile: test2.log
sourcefile: test3.log

Parse a Nested JSON Object

Let's look at an example nested object from our sample log file from earlier:

```
"host": {
  "name": "Centos7",
  "hostname": "Centos7",
  "containerized": false,
  "architecture": "x86_64",
  "id": "d1059ac783b24eb7bbde70a41fa572c9",
  "os": {
    "name": "CentOS Linux",
    "kernel": "3.10.0-1062.el7.x86_64",
    "version": "7 (Core)",
    "codename": "Core",
    "platform": "centos",
    "family": "redhat"
  }
}
```

To fetch nested values, you need to build a path that contains the keys from each nested level. For example, to fetch the OS name from our example, you use the following code:

```
  <DataType name="ElasticCommonSchemaSubset">
     <Capture key="/host/os/name"> meta="OS" />
  </DataType>
```

Using the code above on the sample nested object, the following would be the output on the Log Decoder:

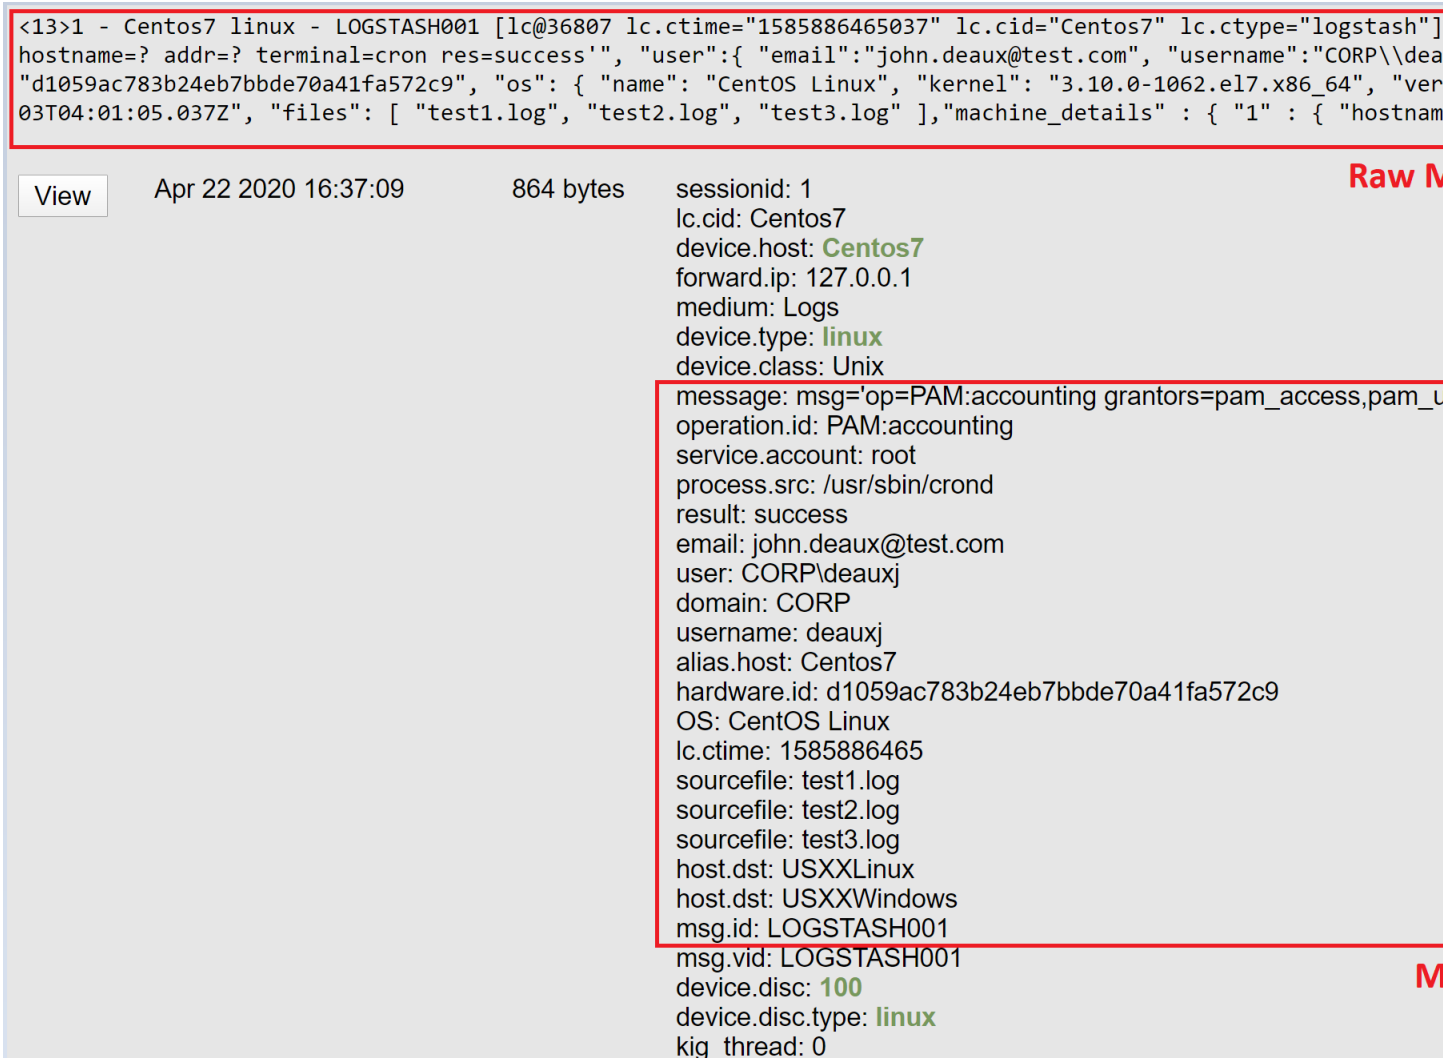
OS: CentOS Linux

Capture Data That Has Varying Parent Key

When capturing structured data types like JSON, instead of a numbered capture index, you can provide a field name path that uses the key attribute. For example, assume we want to capture the **hostname** from **machine_details** and ignore the indexed key:

```
"machine_details": {
  "1": { "hostname": "USXXLinux"},
  "2": { "hostname": "USXXWindows"}
}
```

To fetch the required values, which have a varying parent key name, we leave the parent key empty in the path:



```
<DataType name="FileBeatsEvent" type="ElasticCommonSchemaSubset">
   <Capture key="/machine_details//hostname">  meta="host.dst" />
</DataType>
```

Using the code above on the sample, the following would be the output on the Log Decoder:

host.dst: USXXLinux
host.dst: USXXWindows

The Parsed Example Event on the Log Decoder

Assuming the sample log message from the beginning of this document, and using the parser that we have built, the image below details the event as it would appear on the Log Decoder.

The following representation of the sample log has meta values highlighted.

<13>1 - Centos7 linux - **LOGSTASH001** [lc@36807 **lc.ctime="1585886465037"** lc.-cid="Centos7" lc.ctype="logstash"] {**"message":** "msg='**op=PAM:accounting** grantors=pam_access,pam_unix,pam_localuser **acct=root exe=/usr/sbin/crond** hostname=? addr=? terminal=cron **res=success**'", "user":{ **"email":"-john.deaux@test.com"**, **"username":"CORP\\deauxj"** }, "host": { "name": "Centos7", **"hostname": "Centos7"**, "containerized": false, "architecture": "x86_64", **"id": "d1059ac783b24eb7bbde70a41fa572c9"**, "os": { **"name": "CentOS Linux"**, "kernel": "3.10.0-1062.el7.x86_64", "version": "7 (Core)", "codename": "Core", "platform": "centos", "family": "redhat" } }, "@timestamp": "2020-04-03T04:01:05.037Z", "files": [**"test1.log", "test2.log", "test3.log"**],"machine_details" : { "1" : { **"hostname" : "USXXLinux"** }, "2" : { **"hostname" : "USXXWindows"** }} }

Example Parser Listing

The following code represents the complete parser, including the components we built earlier in this document.

Example Parser Listing

```
<?xml version="1.0" encoding="ISO-8859-1"?>

<DEVICEMESSAGES
   name="linux"
   displayname="Linux"
   group="Unix">
   <VERSION device="2.0" />

<MESSAGE

      id2="LOGSTASH001"
      content="&lt;logstash_json_payload&gt;" />

<VARTYPE name="logstash_json_payload" dataType=FileBeatsEvent"/>

<DataType name="InternetTime" dateTime="%W-%M-%DT%H:%T:%S.%V%E" />

<DataType name="CollectionTime" type="InternetTime" meta="lc.ctime"/>

<DataType name="ElasticCommonSchemaSubset" format="JSON">
   <Capture key="/@timestamp">     type="CollectionTime" />
   <Capture key="/host/hostname">  meta="alias.host" />
   <Capture key="/host/id">        meta="hardware.id" />
   <Capture key="/host/os/name">   meta="OS" />
</DataType>

<DataType name="DomainUser" regex="(?:(\w+)\\)?(\w+)">
   <Capture index="0" meta="user" />
   <Capture index="1" meta="domain" />
   <Capture index="2" meta="username" />
</DataType>

<DataType name="TagValParse" regex="(?: |^)(?:exe=(\S+)|acct=(\S+)|res=(\S+)|op=(\S+))"
search="true">
   <Capture index="1" meta="process.src" />
   <Capture index="2" meta="service.account" />
   <Capture index="3" meta="result" />
   <Capture index="4" meta="operation.id" />
</DataType>

<DataType name="FineParse" regex="msg='(.*)'">
   <Capture index="1" type="TagValParse" />
</DataType>

<DataType name="FileBeatsEvent" type="ElasticCommonSchemaSubset">
   <Capture key="/message" type="FineParse" meta="message"/>
   <Capture key="/user/email" meta="email" />
   <Capture key="/user/username" type="DomainUser"/>
   <Capture key="/files/" meta="sourcefile" />
   <Capture key="/machine_details//hostname" meta="host.dst" />
```

```
</DataType>

</DEVICEMESSAGES>
```

Deploy JSON parser

After you have built or changed a JSON parser, you need to upload it to the NetWitness Log Decoder.

1. SSH to the Log Decoder system.
2. Copy the custom parser file to the following folder:

   /etc/netwitness/ng/envision/etc/devices/***eventsource***

   where ***eventsource*** is the name of the event source. You may need to create the folder if it doesn't already exist.

   For example, we need to create **linux** folder under /etc/net-witness/ng/envision/etc/devices directory and copy the **v20_linuxmsg.xml** parser file to /etc/netwitness/ng/envision/etc/devices/linux directory.
3. To get the new parser loaded into memory, you need to reload the parsers on the Log Decoder.

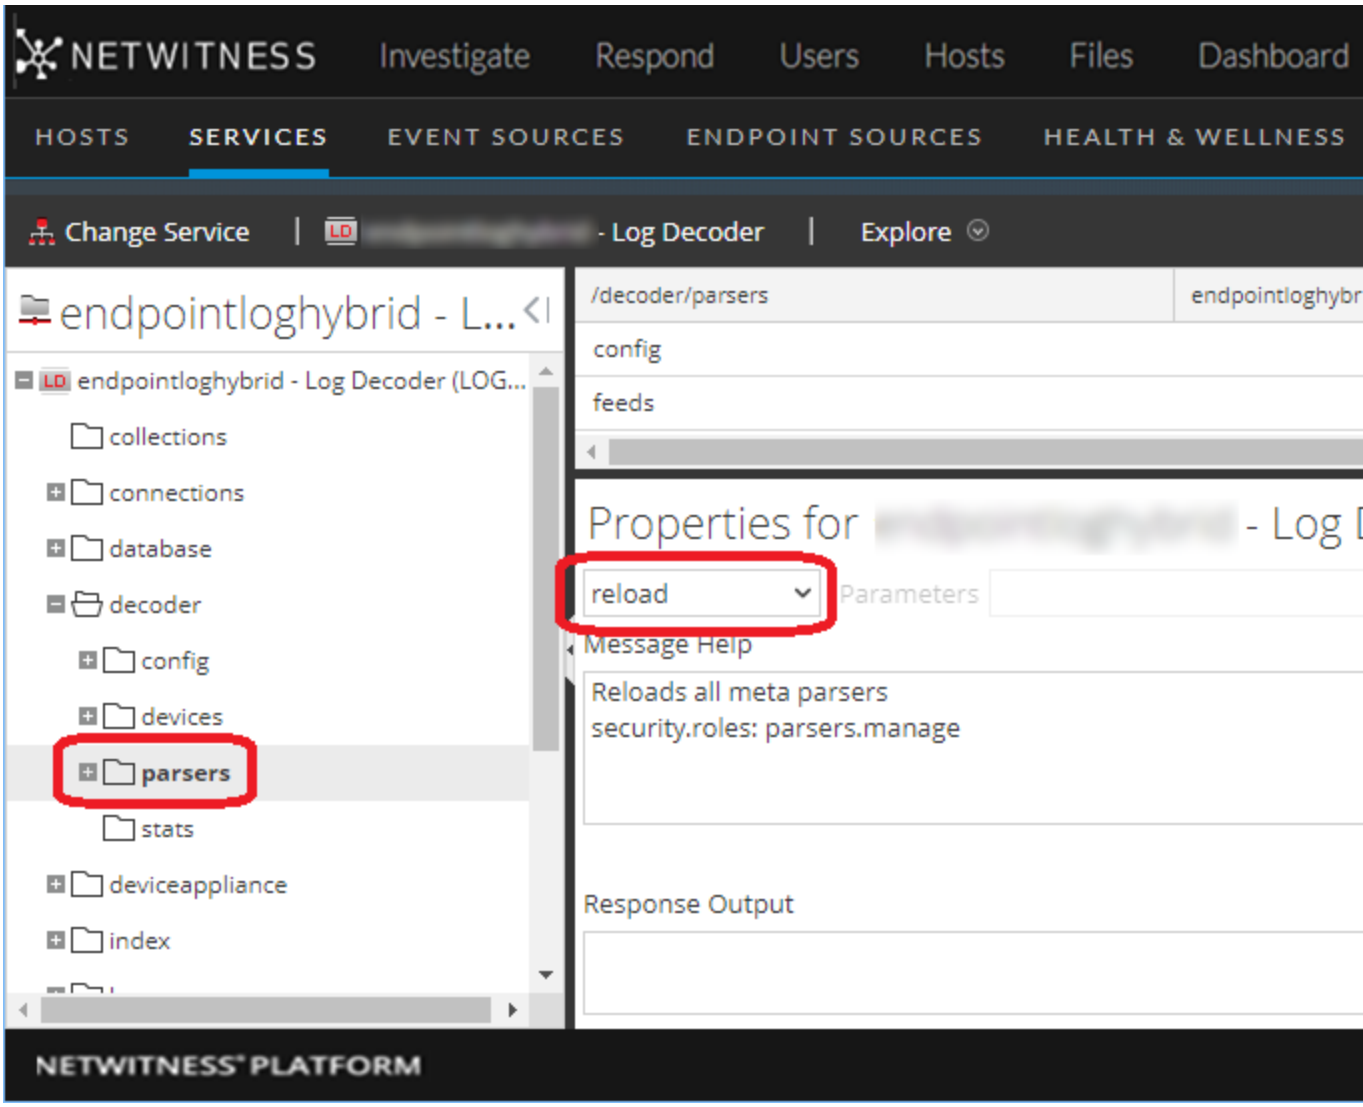
Reload Parsers from REST

From a browser, run the REST reload command by entering the following URL:

http://***<logdecoder_ip>***:50102/decoder/parsers?msg=reload

For example, if your Log Decoder IP address is **10.10.100.101**, use the following string:

http://10.10.100.101:50102/decoder/parsers?msg=reload



If the call is successful, you should see a REST response, "The parsers have been reloaded."

Reload Parsers from NetWitness UI

You can also reload your parsers from the UI as follows.

1. In the NetWitness UI, navigate to  (Admin) **> Services**.

   The Services view is displayed.
2. Select the Log Decoder to which your want to reload the parsers, and click **View > Explore**.
3. In the left pane, navigate to **decoder > parsers**.
4. Right-click **parsers** and select **Properties**.
5. From the drop-down menu in the Properties panel, select **reload**.

Overview

The NetWitness Platform API can be accessed using the same host and port as the NetWitness user interface.

Current Version

By default, all requests to the REST API will automatically use the latest version of the API available. To provide API stability, clients can specify the API version to use by adding the `NetWitness-Version` HTTP header:

```
NetWitness-Version: 1.0
```

Schema

All data is sent and received as JSON. Any resources containing fields without values will have those fields included with `null` as the value instead of being omitted.

Any fields containing timestamps or dates will be in ISO 8601 format:

```
YYYY-MM-DDTHH:MM:SS.SSSZ
```

HTTP Usage

The RSA NetWitness API tries to adhere as closely as possible to standard HTTP and REST conventions in its use of HTTP verbs and status codes.

HTTP Verbs

Verb	Usage
`GET`	Used to retrieve a resource.
`POST`	Used to create a new resource.
`PATCH`	Used to update an existing resource, including partial updates. Only fields that are modified should be included in the request.
`PUT`	Used to replace an existing resource.
`DELETE`	Used to delete an existing resource.

HTTP Status Codes

Status code	Usage
`200 OK`	The request completed successfully.

`201 Created`	A new resource has been created successfully. The resource's URI is available from the response's `Location` header.
`204 No Content`	An update to an existing resource has been applied successfully.
`400 Bad Request`	The request was malformed. The response body will include an error providing further information. See Error Response.
`401 Unauthorized`	Similar to `403 Forbidden`, but specifically for use when authentication is required and has failed or has not yet been provided. See Authentication and Authorization.
`403 Forbidden`	The request was valid, but the server is refusing the action. The user might not have the necessary permissions for a resource.
`404 Not Found`	The requested resource does not exist.
`500 Internal Server Error`	An unexpected error has occurred. The response body will include a message providing further information.

Case Sensitive

All URLs, request parameters and JSON fields are case sensitive.

Error Response

A common JSON structure is always returned for errors:

Path	Type	Description
`status`	`Number`	The HTTP status code returned.
`timestamp`	`String`	The timestamp of the request.
`errors[]`	`Array`	An array of errors for the given request.
`errors[].message`	`String`	A user-friendly error message explaining what went wrong.
`errors[].field`	`String`	The field or parameter containing the error.

```
{
  "status" : 400,
  "timestamp" : "2023-05-31T11:55:30.9797407",
  "errors" : [ {
    "message" : "Value must be less than or equal to \"10\"",
    "field" : "start"
  }, {
    "message" : "Invalid range"
  } ]
}
```

Pagination

A common JSON structure is always used for paginated results:

Path	Type	Description
`items`	`Array`	An array containing the requested resources.
`pageNumber`	`Number`	The requested page number.
`pageSize`	`Number`	The requested number of items to return in a single page.
`totalPages`	`Number`	The total number of pages available.
`totalItems`	`Number`	The total number of items available.
`hasNext`	`Boolean`	Indicates if there is a page containing results after this page.
`hasPrevious`	`Boolean`	Indicates if there is a page containing results before this page.

```
{
  "items" : [ ],
  "pageNumber" : 0,
  "pageSize" : 10,
  "totalPages" : 3,
  "totalItems" : 25,
  "hasNext" : true,
  "hasPrevious" : false
}
```

Authentication and Authorization

All requests must include the `NetWitness-Token` HTTP header containing a valid JSON Web Token (JWT):

```
NetWitness-Token:
eyJhbGciOiJSUzI1NiIsInR5cCI6IkpXVCJ9.eyJleHAiOjE1MTEyNDczODYyNjMsImlzcyI6InNlY3VyaXR5L
XNlcnZlci0zODA1NTA0OS0xZWMyLTQ0MDAtOTUwYS0zZTVkMmJiYTljMjIiLCJpYXQiOjE1MTEyMTEzODYyNjM
sImF1dGhvcml0aWVzIjpbIkFkbWluaXN0cmF0b3JzIl0sInVzZXJfbmFtZSI6ImFkbWluIn0.StBjg9ruIX4Fr
yfCX8qvrSBGZHF8DN3qHZM0Ei9-
thFndm1q_DLP_cnh8Fpm43fdKcs1ErcVRTqhaYvVULYmsF9ShUaSThpLts6zbJVEKlq3ldUGWWCY9bfVGRH3n5
KmWzITPi7xZ-
Rf_Kp2Sj8ecVAip3qDwha7TxYrReXefCnUj0UxgaaXjeZIFjwxFmK6NPZ7TAK9OcvcVhozaR8V92g1kUVP8_54
x7iZ2jL4JvDPaScWBjBTvVEffHNbX9_iLNoRmKqvDELSla6E_trkSREogCt6pZh709Qh70uoC3BsKwNQKbHNEO
U1tRPFaUFfRH7bCdp8v3Aeh3PTaKEuQA
```

The JSON Web Token is defined in RFC-7519. Tokens can be obtained using the methods outlined below.

In the remainder of this document, the token will be truncated to just `eyJ...AT` for brevity.

Obtaining a Token

A JSON Web Token can be obtained using the methods below.

Using a Username and Password

Users can retrieve an access token using their username and password credentials. Since the API gateway is secured using TLS, all credentials will be encrypted in transit.

```
POST /rest/api/auth/userpass
```

Request Parameters

Parameter	Description
`username`	The username of the account to authenticate.
`password`	The password of the account.

Response Fields

Path	Type	Description
`id`	`String`	The account identifier.
`roles`	`Array`	The roles assigned to the user.

Path	Type	Description
accessToken	String	A digitally signed access token that is acceptable as proof of authentication at any Launch service that trusts the public key of this service. The string holds a JSON web-token. See RFC-7519.
refreshToken	String	A digitally signed refresh token that can be used to refresh an expired access token. Refresh tokens have longer expiry periods and can be used by services to re-authenticate users without (storing and) presenting credentials.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/auth/userpass' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1' \
    -d 'username=ian&password=changeMe'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:59:21 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 106
```

```
{
  "id" : "ian",
  "roles" : [ "Analyst" ],
  "accessToken" : "eyJ...AT",
  "refreshToken" : "eyJ...AT"
}
```

Using a Refresh Token

Users can also retrieve an access token using a refresh token.

```
POST /rest/api/auth/token
```

Request Parameters

Parameter	Description
token	A refresh token.

Response Fields

Path	Type	Description
id	String	The account identifier.
roles	Array	The roles assigned to the user.
accessToken	String	A digitally signed access token that is acceptable as proof of authentication at any Launch service that trusts the public key of this service. The string holds a JSON web-token. See RFC-7519.
refreshToken	String	A digitally signed refresh token that can be used to refresh an expired access token. Refresh tokens have longer expiry periods and can be used by services to re-authenticate users without (storing and) presenting credentials.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/auth/token' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1' \
    -d
'token=eyJhbGciOiJSUzI1NiIsInR5cCI6IkpXVCJ9.eyJleHAiOjE2ODgxMjYzNjE5MjMsImlzcyI6InNlY3

Authorization

In order to make requests through the NetWitness Platform API, users must belong to roles that have the `integration-server.api.access` permission, as well as any underlying permissions required to fulfill the request.

Incident APIs

An Incident is a logically grouped set of alerts created automatically by the Incident Aggregation Engine and grouped by a specific criteria. An Incident, available in the Respond Interface, allows an Analyst to triage, investigate, and remediate these groups of alerts. Incidents can be moved between users, notated, and explored via the nodal graph. Incidents allow users to ensure they understand the full scope of an attack or event in their NW system and then take action.

Attributes

The incident resource is comprised of the following attributes:

Path	Type	Description
`id`	`String`	The unique identifier of the incident.
`title`	`String`	The title of the incident.
`summary`	`String`	The summary of the incident.
`priority`	`String`	The incident priority. See the valid values.
`riskScore`	`Number`	The incident risk score is calculated based on the associated alert's risk score. Risk score ranges from 0 (no risk) to 100 (highest risk).
`status`	`String`	The current status. See the valid values.
`alertCount`	`Number`	The number of alerts associated with an incident.
`averageAlertRiskScore`	`Number`	The average risk score of the alerts associated with the incident. Risk score ranges from 0 (no risk) to 100 (highest risk).
`sealed`	`Boolean`	Indicates if additional alerts can be associated with an incident. A `sealed` incident cannot be associated with additional alerts.
`totalRemediationTaskCount`	`Number`	The number of total remediation tasks for an incident.
`openRemediationTaskCount`	`Number`	The number of open remediation tasks for an incident.
`created`	`String`	The timestamp of when the incident is created.
`lastUpdated`	`String`	The timestamp of when the incident was last updated.
`lastUpdatedBy`	`String`	The NetWitness user identifier of the user who last updated the incident.
`assignee`	`String`	The NetWitness user identifier of the user currently working on the incident.
`sources`	`Array`	Unique set of sources for all of the alerts in an incident.

Path	Type	Description
ruleId	String	The unique identifier of the rule that created the incident.
firstAlertTime	String	The timestamp of the earliest occurring Alert in this incident.
categories	Array	The list of categories this incident is categorized under.
categories[].id	String	The unique category identifier.
categories[].parent	String	The parent name of the category.
categories[].name	String	The friendly name of the category.
journalEntries	Array	Set of notes about the incident investigation, also known as the JournalEntry.
journalEntries[].id	String	The unique journal entry identifier.
journalEntries[].author	String	The author of this entry.
journalEntries[].notes	String	Notes and observations about the incident.
journalEntries[].created	String	The timestamp of the journal entry created date.
journalEntries[].lastUpdated	String	The timestamp of the journal entry last updated date.
journalEntries[].milestone	String	Incident milestone classifier. See the valid values.
createdBy	String	The NetWitness user id or name of the rule that created the incident.
deletedAlertCount	Number	The number of alerts that are deleted from the incident.
eventCount	Number	The number of events associated with incident.
alertMeta	String	An object containing unique set of meta values, by type, across all alerts associated with this incident.
alertMeta.SourceIp	Array	Unique source IP addresses.
alertMeta.DestinationIp	Array	Unique destination IP addresses.

Incident Priority

The `priority` field can contain these values:

Value	Description
Low	Low Priority
Medium	Medium Priority
High	High Priority
Critical	Critical

Incident Status

The `status` field can contain these values:

Value	Description
`New`	New incident.
`Assigned`	Incident is assigned to a user.
`InProgress`	Incident response is in progress.
`RemediationRequested`	Remediation tasks have been requested.
`RemediationComplete`	Remediation tasks are complete.
`Closed`	Incident is closed.
`ClosedFalsePositive`	Incident is closed as it was created due to false positive.

Milestone

Each journal entry can contain a `milestone` consisting of these values:

Value	Description
`Reconnaissance`	Intruder is in the initial phase of the attack where targets and vulnerabilities are identified.
`Delivery`	Intruder transmitted malware to the target.
`Exploitation`	Malware code triggers, which takes action on target network to exploit vulnerability.
`Installation`	Malware weapon installs access point usable by intruder.
`CommandAndControl`	Malware enables intruder to have persistent access to target network.
`ActionOnObjective`	Intruder takes action to achieve their goals, such as data exfiltration, data destruction, or encryption for ransom.
`Containment`	Incident is contained.
`Eradication`	Necessary actions taken to eliminate components of incident and restore the system status.
`Closure`	Incident is addressed.

Requests

Get a Single Incident

A single incident can be retrieved using an incident's unique identifier.

```
GET /rest/api/incidents/{id}
```

Path Parameters

Parameter	Description
`id`	The unique identifier of the incident.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-100' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 12:00:35 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 1329
```

```

  }
}
```

Get Incidents by Date Range

Incidents can be retrieved by the date and time they were created.

```
GET /rest/api/incidents
```

The requested date range can be unbounded, by only supplying either the `since` or `until` parameter, or bounded, by providing both parameters.

Request Parameters

Parameter	Description
`pageNumber`	The requested page number.
`pageSize`	The maximum number of items to return in a single page.
`since`	A timestamp in ISO 8601 format (e.g., `1018-01-01T14:00:00.000Z`). Retrieve incidents created on and after this timestamp.
`until`	A timestamp in ISO 8601 format (e.g., `1018-01-01T14:00:00.000Z`). Retrieve incidents created on and before this timestamp.

All results will be returned using the paginated response payload sorted by the `created` date, in descending order.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents?since=2018-01-
01T04%3A00%3A00.000Z&until=2018-01-01T05%3A00%3A00.000Z&pageSize=100&pageNumber=0' -i
-X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 12:00:32 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 1560
```

```

}
```

Update an Incident

Currently an incident's `status` and `assignee` can be modified using the incidents endpoint.

```
PATCH /rest/api/incidents/{id}
```

The `assignee` field must include the unique identifier for a valid NetWitness user. The list of users can be found in the security section of the administration user interface.

Request Fields

Path	Type	Description
`status`	`String`	The current status. See the valid values.
`assignee`	`String`	The NetWitness user identifier of the user currently working on the incident.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-100' -i -X PATCH \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8' \
    -d '{"status":"InProgress"}'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 12:00:34 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 1330
```

```

  }
}
```

Remove an Incident

A single incident can be removed using the incident's unique identifier.

```
DELETE /rest/api/incidents/{id}
```

Path Parameters

Parameter	Description
id	The unique identifier of the incident.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-100' -i -X DELETE \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 204 No Content
Date: Wed, 31 May 2023 12:00:36 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Add a Journal Entry

A journal entry, or note, can be added to an existing incident.

```
POST /rest/api/incidents/{id}/journal
```

Path Parameters

Parameter	Description
id	The unique identifier of the incident.

Request Fields

Path	Type	Description
author	String	The NetWitness user id of the user creating the journal entry.
notes	String	Notes and observations about the incident.
milestone	String	The incident milestone classifier.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-100/journal' -i -X POST \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8' \
    -d '{"author":"duke","notes":"This incident is
contained.","milestone":"Containment"}'
```

Sample Response

```
HTTP/1.1 201 Created
Location: https://api.netwitness.local/rest/api/incidents/INC-100
Date: Wed, 31 May 2023 12:00:36 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Get an Incident's Alerts

All the alerts that are associated with an incident can be retrieved using the incident's unique identifier.

```
GET /rest/api/incidents/{id}/alerts
```

Path Parameters

Parameter	Description
id	The unique identifier of the incident.

Request Parameters

Parameter	Description
pageNumber	The requested page number.
pageSize	The maximum number of items to return in a single page.

Response Fields

Path	Type	Description
items	Array	An array containing the requested resources.
pageNumber	Number	The requested page number.

Path	Type	Description
pageSize	Number	The requested number of items to return in a single page.
totalPages	Number	The total number of pages available.
totalItems	Number	The total number of items available.
hasNext	Boolean	Indicates if there is a page containing results after this page.
hasPrevious	Boolean	Indicates if there is a page containing results before this page.
items[].id	String	The unique alert identifier.
items[].title	String	The title or name of the rule that created the alert.
items[].detail	String	The details of the alert. This can be the module name or meta that the module included.
items[].created	String	The timestamp of the alert created date.
items[].source	String	The source of this alert. For example, "Event Stream Analysis", "Malware Analysis", etc.
items[].riskScore	Number	The risk score of this alert, usually in the range 0 - 100.
items[].type	String	The type of alert, "Network", "Log", etc.
items[].events	Array	The events that make up this alert.
items[].events[].source	Object	The source of the event.
items[].events[].source.device	Object	The device contains the endpoint network information.
items[].events[].source.device.ipAddress	String	The IP address.
items[].events[].source.device.port	Number	The port.
items[].events[].source.device.macAddress	String	The ethernet MAC address.
items[].events[].source.device.dnsHostname	String	The DNS resolved hostname.
items[].events[].source.device.dnsDomain	String	The top-level domain from the DNS resolved hostname.
items[].events[].source.user	Object	The user contains the endpoint user information.
items[].events[].source.user.username	String	The unique username.
items[].events[].source.user.emailAddress	String	An email address.
items[].events[].source.user.adUsername	String	An Active Directory (AD) username.
items[].events[].source.user.adDomain	String	An Active Directory (AD) domain.

Path	Type	Description
items[].events[].destination	Object	The destination of the event.
items[].events[].destination.device	Object	The device contains the endpoint network information.
items[].events[].destination.device.ipAddress	String	The IP address.
items[].events[].destination.device.port	Number	The port.
items[].events[].destination.device.macAddress	String	The ethernet MAC address.
items[].events[].destination.device.dnsHostname	String	The DNS resolved hostname.
items[].events[].destination.device.dnsDomain	String	The top-level domain from the DNS resolved hostname.
items[].events[].destination.user	Object	The user contains the endpoint user information.
items[].events[].destination.user.username	String	The unique username.
items[].events[].destination.user.emailAddress	String	An email address.
items[].events[].destination.user.adUsername	String	An Active Directory (AD) username.
items[].events[].destination.user.adDomain	String	An Active Directory (AD) domain.
items[].events[].domain	String	The top-level domain or Windows domain.
items[].events[].eventSource	String	The source of the event. This may be a fully-qualified hostname with a port, or simple name.
items[].events[].eventSourceId	String	The unique identifier of the event on the source. For Network and Log events, this is the Nextgen Session ID.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-
100/alerts?pageSize=10&pageNumber=0' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK

Fetch incidents based on fields of the incident

The incidents can be fetched based on the specific fields of the incident by providing the name of the field, value of the field and the number of records to be fetched as arguments

```
GET /rest/api/incident/fetch
```

Request Body Parameters

Request Body Parameter	Type	Description
meta_name	String	Field of the incident document based on which the incident query to be made
meta_value	String	Value for the field of the incident document based on which the incident query to be made
numberOfRecords	String	Number of incident records to be fetched for the selected meta_key and meta_value pair

HTTP request

```
GET /rest/api/incident/fetch HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: text/plain; charset=ISO-8859-1
Host: api.netwitness.local
Content-Length: 68

{"meta_name":"priority","meta_value":"MEDIUM","numberOfRecords":"1"}
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incident/fetch' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: text/plain; charset=ISO-8859-1' \
    -d '{"meta_name":"priority","meta_value":"MEDIUM","numberOfRecords":"1"}'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 12:00:41 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 1523
```

Fetch alerts based on the criteria

The alerts can be fetched based on the specific fields of the alert by providing the name of the field, value of the field, the number of records and the fields of the alert that needs to be included in response

```
GET /rest/api/alert/fetch
```

Request Body Parameters

Request Body Parameter	Type	Description
meta_name	String	Field of the alert document based on which the incident query to be made
meta_value	String	Value for the field of the alert document based on which the incident query to be made
number_of_records	String	Number of alert records to be fetched for the selected meta_key and meta_value pair
includeFields	String	The fields from the alert document to be included for the selected meta_key and meta_value pair in case if fetching the entire alert is not preferred. By default, to fetch the entire alert, the includeFields will be having the value "null"

HTTP request

```
GET /rest/api/alert/fetch HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: text/plain; charset=ISO-8859-1
Host: api.netwitness.local
Content-Length: 110

{"meta_name":"alert.source","meta_value":"Event Stream
Analysis","numberOfRecords":"1","includeFields":"null"}
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/alert/fetch' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: text/plain; charset=ISO-8859-1' \
    -d '{"meta_name":"alert.source","meta_value":"Event Stream
Analysis","numberOfRecords":"1","includeFields":"null"}'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 12:00:41 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 6969
```

```

Persisting events in an alert

Persist all the events present in the alert using the alert's unique identifier.

```
POST /rest/api/alerts/persist/{id}
```

Path Parameters

Parameter	Description
id	The unique identifier of the alert.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/alerts/persist/59440ad7e4b0ff674d2cd85e'
-i -X POST \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 12:00:41 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 87
```

```
{
  "status" : "SUCCESS",
  "message" : "Persisted alert id 59440ad7e4b0ff674d2cd85e"
}
```

Suspending persist of events in an alert

Suspend all the events present in persist alert using the alert's unique identifier.

```
POST /rest/api/alerts/suspend-persist/{id}
```

Path Parameters

Parameter	Description
id	The unique identifier of the alert.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/alerts/suspend-
persist/59440ad7e4b0ff674d2cd85e' -i -X POST \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 12:00:41 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 99
```

```
{
  "status" : "SUCCESS",
  "message" : "Suspended persist for alert id 59440ad7e4b0ff674d2cd85e"
}
```

Persisting events in an incident

Persist all the events present in the incident using the incident's unique identifier.

```
POST /rest/api/incidents/persist/{id}
```

Path Parameters

Parameter	Description
id	The unique identifier of the incident.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/persist/INC-75287' -i -X POST
\
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 12:00:41 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 106
```

```
{
  "status" : "SUCCESS",
  "message" : "Task successfully submitted to persist incident id - INC-75287"
}
```

Suspending persist of events in an incident

Suspend all the events present in persist incident using the incident's unique identifier.

```
POST /rest/api/incidents/suspend-persist/{id}
```

Path Parameters

Parameter	Description
id	The unique identifier of the incident.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/suspend-persist/INC-75287' -i
-X POST \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 12:00:41 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 87
```

```
{
  "status" : "SUCCESS",
  "message" : "Suspended persist for incident id INC-75287"
}
```

Get Incident history

Fetch the entire history details of the incident using the incident's unique identifier.

```
POST /rest/api/incidents/history/{id}
```

Path Parameters

Parameter	Description
id	The unique identifier of the incident.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/history/INC-75287' -i -X POST
\
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 12:00:41 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 608
```

```

Get Incident Stats

IncidentStats can be retrieved by the date and time they were created. It contains day wise details of the overall MTTA, MTTD and MTTR as well as the count associated with each metric for that day.

```
GET /rest/api/incidents/stats
```

The requested date range can be unbounded, by only supplying either the `since` or `until` parameter, or bounded, by providing both parameters.

Request Parameters

Parameter	Description
`pageNumber`	The requested page number.
`pageSize`	The maximum number of items to return in a single page.
`since`	A date format (e.g., `2022-01-01`). Retrieve incidents stats created on and after this date.
`until`	A date format (e.g., `2022-01-31`). Retrieve incident stats created on and before this date.

All results will be returned using the paginated response payload sorted by the `created` date, in descending order.

Sample Request

```
$ curl
'https://api.netwitness.local/rest/api/incidents/stats?pageSize=100&pageNumber=0&since
=2022-05-01&until=2022-05-30' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 12:00:41 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 290
```

```
{
  "items" : [ {
    "date" : "28-May-22",
    "mtta" : 30,
    "mttaCount" : 3,
    "mttd" : 44,
    "mttdCount" : 1,
    "mttr" : 81,
    "mttrCount" : 1
  } ],
  "pageNumber" : 0,
  "pageSize" : 100,
  "totalPages" : 1,
  "totalItems" : 1,
  "hasNext" : false,
  "hasPrevious" : false
}
```

Get Incident User Stats

Incident User Stats can be retrieved by user and date range. It computes the MTTD values for the range of dates mentioned and responds with a consolidated list.

```
GET /rest/api/incidents/user-stats
```

The requested date range can be unbounded, by only supplying either the `since` or `until` parameter, or bounded, by providing both parameters.

Request Parameters

Parameter	Description
`username`	User for which the stats need to be retrieved
`since`	A date format (e.g., `2022-01-01`). Retrieve incidents stats created on and after this date.
`until`	A date format (e.g., `2022-01-31`). Retrieve incident stats created on and before this date.

All results will be returned based on the username input given.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/user-
stats?username=admin&since=2022-06-01&until=2022-06-30' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 12:00:41 GMT
Keep-Alive: timeout=60

  "incidentIds" : [ "INC-1", "INC-2" ]
}
```

Services Information

Get Service IDs of all Services

The following API lists all services with their service IDs.

The response resource is comprised of the following attributes:

Path	Type	Description
`[]`	`Array`	Array of service information.
`[].id`	`String`	Unique identifier of each service installed in the RSA NetWitness suite.
`[].name`	`String`	Name of the service. For example, endpoint-server.
`[].displayName`	`String`	Display name of the service.
`[].host`	`String`	Host details of the service.
`[].version`	`String`	Version of the service.

A list of all services can be retrieved using the following API:

```
GET /rest/api/services
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/services' -i -X GET \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:57:50 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 736
```

```
[ {

} ]
```

Endpoint APIs

Endpoint Log Hybrid collects and manages endpoint data from hosts. Using the APIs, analyst can:

- View list of host names with agent IDs from one or more Endpoint Servers.
- Retrieve host data, such as drivers, processes, DLLs, files (executables), services, autoruns, security information, anomalies, system configurations, and scripts found on the host.
- Filter hosts on indexed values and sort columns.
- Get list of snapshots and snapshot details for a host.
- Start or stop a scan.
- Get list of files from a specific Endpoint Server.
- Get alerts for a host or file.
- Download file/files to the server.
- Download system and process dump.
- Isolate host from the network.

Note: All endpoint APIs require a service ID to connect to the specific Endpoint Server.

Get Hosts

The Get Hosts API lists all hosts' information from a particular Endpoint Server. It provides a paged response with a standard paged response structure as mentioned in the 'Pagination' section.

The "items" field in paged response consists of individual host information.

Path	Type	Description
`items`	`Array`	An array containing the requested resources.
`pageNumber`	`Number`	The requested page number.
`pageSize`	`Number`	The requested number of items to return in a single page.
`totalPages`	`Number`	The total number of pages available.
`totalItems`	`Number`	The total number of items available.
`hasNext`	`Boolean`	Indicates if there is a page containing results after this page.
`hasPrevious`	`Boolean`	Indicates if there is a page containing results before this page.
`items[].agentId`	`String`	Agent ID of the host.
`items[].hostName`	`String`	Name of the host.
`items[].riskScore`	`Number`	Risk score of the host.
`items[].networkInterfaces`	`Array`	List of network interfaces with details, such as IP address and MAC address.

Path	Type	Description
items[].networkInterfaces[].name	String	Name of the network interface.
items[].networkInterfaces[].macAddress	String	MAC Address of the network interface.
items[].networkInterfaces[].ipv4	Array	List of IPV4 in the network interface.
items[].networkInterfaces[].ipv6	Array	List of IPV6 in the network interface.
items[].networkInterfaces[].networkIdv6	Array	List of network IDV6 in the network interface.
items[].networkInterfaces[].gateway	Array	List of gateway in the network interface.
items[].networkInterfaces[].dns	Array	List of DNS in the network interface.
items[].networkInterfaces[].promiscuous	String	Specifies if the network interface is in the promiscuous mode.
items[].lastSeenTime	String	Agent last seen time.

```
GET /rest/api/hosts?serviceId=<service-id>&&pageNumber=0&pageSize=100
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/hosts?serviceId=397eb905-a6a7-43a2-a8ed-
cd8636e98771&pageNumber=0&pageSize=1' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:57:51 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 691
```

```
{
  "items" : [ {
    "agentId" : "B27DDED7-6FFA-A9D3-6577-3DDE367B2820",
    "hostName" : "WIN-854PACLCQ07-VC",
    "riskScore" : 0,
    "networkInterfaces" : [ {
      "name" : "Intel(R) 82574L Gigabit Network Connection",
      "macAddress" : "00:50:56:01:1B:31",
      "ipv4" : [ "10.40.15.202" ],
      "ipv6" : [ "fe80::651d:c035:a19b:ea03%13" ],
      "networkIdv6" : [ "fe80::%13" ],
      "gateway" : [ "10.40.12.1" ],
      "dns" : [ "10.31.64.22", "10.31.64.23" ],
      "promiscuous" : false
    } ],
    "lastSeenTime" : "2019-01-28T09:25:02.484Z"
  } ],
  "pageNumber" : 0,
  "pageSize" : 1,
  "totalPages" : 2,
  "totalItems" : 2,
  "hasNext" : true,
  "hasPrevious" : false
}
```

Get Hosts with Filter

The following fields are supported for filtering and sorting on Get Hosts API - 'agentId', 'hostName', 'riskScore' and 'networkInterfaces.ipv4'.

Filter and sort are specified as a part of the request body.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/hosts?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771&pageNumber=0&pageSize=1' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"criteria":{"criteriaList":[{"criteriaList":[],"expressionList":[{"propertyName":"hostName","restrictionType":"LIKE","propertyValues":[{"value":"WIN-854PACLCQ07-VC","relative":false}]}],"predicateType":"AND"},{"criteriaList":[],"expressionList":[{"propertyName":"riskScore","restrictionType":"BETWEEN","propertyValues":[{"value":0,"relative":false},{"value":100,"relative":false}]}],"predicateType":"OR"}],"expressionList":[],"predicateType":"AND"},"sort":{"keys":["riskScore"],"descending":true}}'
```

HTTP request

```
GET /rest/api/hosts?serviceId=397eb905-a6a7-43a2-a8ed-
cd8636e98771&pageNumber=0&pageSize=1 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json
Host: api.netwitness.local
Content-Length: 498

{"criteria":{"criteriaList":[{"criteriaList":[],"expressionList":[{"propertyName":"hos
tName","restrictionType":"LIKE","propertyValues":[{"value":"WIN-854PACLCQ07-
VC","relative":false}]}],"predicateType":"AND"},{"criteriaList":[],"expressionList":[{
"propertyName":"riskScore","restrictionType":"BETWEEN","propertyValues":[{"value":0,"r
elative":false},{"value":100,"relative":false}]}],"predicateType":"OR"}],"expressionLi
st":[],"predicateType":"AND"},"sort":{"keys":["riskScore"],"descending":true}}
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:57:52 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 692
```

```
{
  "items" : [ {
    "agentId" : "B27DDED7-6FFA-A9D3-6577-3DDE367B2820",
    "hostName" : "WIN-854PACLCQ07-VC",
    "riskScore" : 0,
    "networkInterfaces" : [ {
      "name" : "Intel(R) 82574L Gigabit Network Connection",
      "macAddress" : "00:50:56:01:1B:31",
      "ipv4" : [ "10.40.15.202" ],
      "ipv6" : [ "fe80::651d:c035:a19b:ea03%13" ],
      "networkIdv6" : [ "fe80::%13" ],
      "gateway" : [ "10.40.12.1" ],
      "dns" : [ "10.31.64.22", "10.31.64.23" ],
      "promiscuous" : false
    } ],
    "lastSeenTime" : "2019-01-28T09:25:02.484Z"
  } ],
  "pageNumber" : 0,
  "pageSize" : 1,
  "totalPages" : 1,
  "totalItems" : 1,
  "hasNext" : false,
  "hasPrevious" : false
}
```

The following is an example for filter criteria in the request body:

```
{
  "criteria": {
    "criteriaList": [
      {
        "expressionList": [{ "propertyName": "agentId", "restrictionType":
"EQUAL","propertyValues": [{"value": "2F53FC2C-A737-B34B-6813-12E48379C15D"}]}]
      }
    ]
  }
}
```

The following are the supported 'restrictionType'

- Operators that require no value: IS_NULL, IS_NOT_NULL.
- Operators that require one value: LIKE, NOT_LIKE, EQUAL, NOT_EQUAL, LESS_THAN,LESS_THAN_OR_EQUAL_TO, GREATER_THAN, GREATER_THAN_OR_EQUAL_TO.
- Operators that require two value: BETWEEN, NOT_BETWEEN.
- Operators that uses multiple value: IN, NOT_IN.

The following are the supported 'predicateType' - AND, OR, NOT.

Get List of Snapshots for Host

This API provides a list of snapshots, which are IDs to fetch the snapshot details of the host.

```
GET /rest/api/host/<Host-Agent-Id>/snapshots?serviceId=<service-id>
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/snapshots?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:57:52 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 30
```

```
[ "2017-12-22T14:34:05.985Z" ]
```

Get Snapshot Details for the Host

This API provides snapshot details of the given host for the provided snapshot time.

Response Fields

Path	Type	Description
[]	Array	Array of scan snapshot for the agent.
[].machineOsType	String	Type of operating system (Windows, Mac, Linux).
[].hostName	String	Name of the host.
[].agentId	String	Agent ID of the host.
[].agentVersion	String	Version of the agent.
[].scanStartTime	String	Start time of the scan snapshot.
[].directory	String	Directory of the file.
[].fileName	String	Name of the file.

Path	Type	Description
[].owner.username	String	User name of the owner of the file.
[].owner.groupname	String	Group name of the owner of the file.
[].owner.uid	String	UID of the user name.
[].owner.gid	String	GID of the user name.
[].timeCreated	String	Time when file was created.
[].timeModified	String	Time when file was modified.
[].timeAccessed	String	Time when file was last accessed.
[].attributes	Array	List of file attributes.
[].accessMode	Number	Access mode of the file.
[].sameDirectoryFileCounts.nonExe	Number	Number of non-exe files in the same directory of the file.
[].sameDirectoryFileCounts.exe	Number	Number of exe files in the same directory of the file.
[].sameDirectoryFileCounts.subFolder	Number	Number of sub-folders in the same directory of the file.
[].sameDirectoryFileCounts.exeSameCompany	Number	Number of executables with the same company name in the same directory of the file.
[].sameDirectoryFileCounts.hiddenFiles	Number	Count of hidden files in the same directory of the file.
[].fileContext	Array	List of file context.
[].directoryContext	Array	List of directory context.
[].autorunContext	Array	List of autorun context.
[].networkContext	Array	List of network context.
[].kernelModeContext	Array	List of kernel mode context.
[].userModeContext	Array	List of user mode context.
[].processContext	Array	List of process context.
[].rpm.packageName	String	RPM package name to which the file belongs.
[].rpm.category	String	Category to which the rpm package belongs.
[].windows.processes[].eprocess	String	Identifier of the process.
[].windows.processes[].sessionId	Number	Session ID of the process.
[].windows.processes[].parentPath	String	Directory of the parent process.
[].windows.processes[].imageSize	Number	Size of the process image.
[].windows.processes[].integrityLevel	Number	Integrity level of the process.
[].windows.processes[].context	Array	List of process context.
[].windows.processes[].pid	Number	ID of the process.
[].windows.processes[].parentPid	Number	ID of the parent process.

Path	Type	Description
[].windows.processes[].imageBase	Number	Base address of the process.
[].windows.processes[].createUtcTime	String	Creation time of the process.
[].windows.processes[].owner	String	Name of the user.
[].windows.processes[].launchArguments	String	Launch arguments of the process.
[].windows.processes[].threadCount	Number	Number of threads running in the process.
[].windows.dlls[].createTime	String	Creation time of the process.
[].windows.dlls[].eprocess	String	Identity of the process.
[].windows.dlls[].imageSize	Number	Size of the DLL image in memory.
[].windows.threads[].processName	String	Name of the process.
[].windows.threads[].processTime	String	Creation time of the process.
[].windows.threads[].eprocess	String	Identifier of the process.
[].windows.threads[].pid	Number	PID of the process.
[].windows.threads[].ethread	String	Identifier of the thread.
[].windows.threads[].tid	Number	ID of the thread.
[].windows.threads[].teb	String	Address of thread environment block.
[].windows.threads[].startAddress	String	Start address of the thread in memory.
[].windows.threads[].state	Array	Thread state.
[].windows.threads[].behaviorKey	String	Floating behavior resolution of the thread.
[].windows.drivers[].windows.imageBase	Number	Base address of the driver image.
[].windows.drivers[].windows.imageSize	Number	Size of the driver image.
[].windows.services[].windows.serviceName	String	Service name as identified by the system.
[].windows.services[].displayName	String	Display name for the service.
[].windows.services[].description	String	Description of the service.
[].windows.services[].account	String	Name of the user the service executes as.
[].windows.services[].launchArguments	String	Launch arguments of the service.
[].windows.services[].windows.serviceMain	String	Service’s main.
[].windows.services[].hostingPid	Number	Service’s hosting process ID.

Path	Type	Description
[].windows.services[].state	String	Current state of the service.
[].windows.services[].win32ErrorCode	Number	Last Windows 32 error code from registry.
[].windows.services[].context	Array	List of service context.
[].windows.tasks[].name	String	Name of the task.
[].windows.tasks[].executeUser	String	Name of the user the task executes as.
[].windows.tasks[].creatorUser	String	Name of the user who created the task.
[].windows.tasks[].launchArguments	String	Launch arguments of the task.
[].windows.tasks[].status	Array	Status of the task.
[].windows.tasks[].lastRunTime	String	Time when the task was last run.
[].windows.tasks[].nextRunTime	String	Next scheduled time of the task.
[].windows.tasks[].triggerString	String	Textual trigger string of the task.
[].windows.autoruns[].type	String	Type of the autorun.
[].windows.autoruns[].registryPath	String	Registry path where autorun is located.
[].windows.autoruns[].launchArguments	String	Launch argument of the autorun.
[].windows.imageHooks[].process.pid	String	PID of the process in which hook was detected.
[].windows.imageHooks[].process.fileName	String	Filename of the process in which hook was detected.
[].windows.imageHooks[].process.createUtcTime	String	Creation time of the process in which hook was detected.
[].windows.imageHooks[].hookLocation.section	String	Name of the image section that was modified by the hook.
[].windows.imageHooks[].hookLocation.sectionBase	String	Base of the image section that was modified by the hook.
[].windows.imageHooks[].hookLocation.symbol	String	Closest symbol name to the memory location that was modified.
[].windows.imageHooks[].hookLocation.symbolOffset	Number	Closest symbol +/- offset to the hook location when relevant.
[].windows.imageHooks[].inlinePatch.originalBytes	String	Hexadecimal bytes which were replaced.
[].windows.imageHooks[].inlinePatch.originalAsm	Array	Array of decoded ASM instructions that were replaced.
[].windows.imageHooks[].inlinePatch.currentBytes	String	Hexadecimal bytes which have overwritten the original code.
[].windows.imageHooks[].inlinePatch.currentAsm	Array	Array of decoded ASM instructions that have overwritten the original code.

Path	Type	Description
[].windows.kernelHooks[].hookLocation.objectName	String	Name of the object that was hooked in kernel.
[].windows.kernelHooks[].hookLocation.objectFunction	String	Name of the object function that was hooked in kernel.
[].mac.processes[].priority	Number	Priority of the process.
[].mac.processes[].flags	Number	Process flags.
[].mac.processes[].nice	Number	Nice value of process.
[].mac.processes[].openFilesCount	Number	Number of open files by process at scan time.
[].mac.processes[].context	Array	Process context.
[].mac.processes[].pid	Number	ID of the process.
[].mac.processes[].parentPid	Number	ID of the parent process.
[].mac.processes[].imageBase	Number	Base address of the process.
[].mac.processes[].createUtcTime	String	Creation time of the process.
[].mac.processes[].owner	String	Name of the user.
[].mac.processes[].launchArguments	String	Launch arguments of the process.
[].mac.processes[].threadCount	Number	Number of threads running in the process.
[].mac.dylibs[].pid	Number	Process ID in dylib which is loaded.
[].mac.dylibs[].processName	String	Name of the process.
[].mac.dylibs[].imageBase	String	Base address of image in the process.
[].mac.drivers[].preLinked	Boolean	True if Kext bundle is prelinked.
[].mac.drivers[].numberOfReferences.	Number	Number of references.
[].mac.drivers[].dependencies	Array	List of kexts(name) the driver is linked against.
[].mac.drivers[].imageBase	String	Base address of the driver image.
[].mac.drivers[].imageSize	String	Size of the driver image.
[].mac.daemons[].name	String	Label of the daemon.
[].mac.daemons[].sessionName	String	Name of the session in which daemon runs.
[].mac.daemons[].user	String	Name of the user under which the daemon runs.
[].mac.daemons[].pid	Number	ID of the process.
[].mac.daemons[].onDemand	Boolean	True if daemon is configured to run on demand.
[].mac.daemons[].lastExitCode	Number	Last exit code.
[].mac.daemons[].timeout	Number	Time out value.
[].mac.daemons[].daemons.launchArguments	String	Launch argument of the daemon.
[].mac.daemons[].daemons.configFile	String	Full path of the configuration file used to configure this daemon.

Path	Type	Description
[].mac.tasks[].name	String	Name of the task.
[].mac.tasks[].cronJob	Boolean	True if the task is cron job, else launchd.
[].mac.tasks[].launchArguments	String	Launch argument of the task.
[].mac.tasks[].user	String	Name of the user under which this task will run.
[].mac.tasks[].triggerString	String	Trigger string of the task.
[].mac.tasks[].configFile	String	Full path of the configuration file used to configure this task.
[].mac.autoruns[].type	String	Type of autorun.
[].mac.autoruns[].user	String	Name of the user under which the autorun is run.
[].mac.autoruns[].name	String	Label of the autorun.
[].mac.autoruns[].detail	String	Details of the autorun.
[].linux.processes[].priority	Number	Priority of the process.
[].linux.processes[].uid	Number	UID of the user.
[].linux.processes[].environment	String	Environment variables.
[].linux.processes[].nice	Number	Nice value of the process.
[].linux.processes[].securityContext	String	Security context.
[].linux.processes[].pid	Number	ID of the process.
[].linux.processes[].parentPid	Number	ID of the parent process.
[].linux.processes[].imageBase	Number	Base address of the process.
[].linux.processes[].createUtcTime	String	Time of creation of the process.
[].linux.processes[].owner	String	Name of the user.
[].linux.processes[].launchArguments	String	Launch arguments of the process.
[].linux.processes[].threadCount	Number	Number of threads running in the process.
[].linux.loadedLibraries[].pid	String	Process ID in which library is loaded.
[].linux.loadedLibraries[].processName	String	Name of the process.
[].linux.loadedLibraries[].imageBase	String	Base address of image in the process.
[].linux.drivers[].numberOfInstances	Number	Number of instances loaded in memory.
[].linux.drivers[].loadState	String	Load state of the driver.
[].linux.drivers[].dependencies	Array	Dependent driver names.
[].linux.drivers[].author	String	Name of the author of driver.
[].linux.drivers[].description	String	Description of the driver.

Path	Type	Description
[].linux.drivers[].sourceVersion	String	Source version of the driver.
[].linux.drivers[].versionMagic	String	Version magic of the driver.
[].linux.initds[].initdHashSha256	String	Hash of the init-d script file.
[].linux.initds[].initdPaths	String	Path of the init-d script file.
[].linux.initds[].pid	Number	ID of the process.
[].linux.initds[].description	String	Description of the init-d.
[].linux.initds[].status	String	Status of the init-d.
[].linux.initds[].runLevels	Array	List of run levels in which the init-d is enabled.
[].linux.systemds[].systemdHashSha256	String	Hash value of the systemd script file.
[].linux.systemds[].systemdPaths	String	Path value of the systemd script file.
[].linux.systemds[].name	String	Name of the systemd.
[].linux.systemds[].description	String	Description of the systemd.
[].linux.systemds[].state	String	State of the systemd.
[].linux.systemds[].launchArguments	String	Launch argument of the systemd.
[].linux.systemds[].pid	Number	ID of the process.
[].linux.systemds[].triggeredBy	Array	Triggered by list of the systemd.
[].linux.systemds[].triggerStrings	Array	Trigger strings of the systemd.
[].linux.autoruns[].type	String	Type of autorun.
[].linux.autoruns[].label	String	Label of the autorun.
[].linux.autoruns[].comments	String	Comments of the autorun.
[].linux.crons[].user	String	User account under which cron job was created.
[].linux.crons[].triggerString	String	Trigger string that would launch the cron job.
[].linux.crons[].launchArguments	String	Launch arguments of the cron job.
firstFileName	String	First name of the file sent by the agent.
reputationStatus	String	Reputation status of the file.
globalRiskScore	String	Global risk score.
firstSeenTime	String	Time when the file was first seen by the Endpoint Server.
machineOsType	String	Type of operating system (Windows, Mac, Linux).
signature	Object	Signatory information of the file.
signature.timeStamp	String	Timestamp of the signature.
signature.thumbprint	String	Thumbprint of the certificate.
signature.context	Array	Context information of the certificate.
signature.signer	String	Signer information of the certificate.

Path	Type	Description
size	String	Size of the file.
checksumMd5	String	MD5 of the file.
checksumSha1	String	SHA1 of the file.
checksumSha256	String	SHA256 of the file.
pe	Object	PE information of the file. This is applicable for Windows files.
pe.timeStamp	String	Timestamp of the PE File.
pe.imageSize	String	Image size of the PE file.
pe.numberOfExportedFunctions	String	Number of exported function in the PE file.
pe.numberOfNamesExported	String	Number of names exported in the PE file.
pe.numberOfExecuteWriteSections	String	Number of execute write sections in the PE file.
pe.context	Array	Context information of the PE file.
pe.resources	Object	Resources of the PE file.
pe.resources.originalFileName	String	Original filename as per PE information.
pe.resources.company	String	Company name as per PE information.
pe.resources.description	String	Description of the file as per PE information.
pe.resources.version	String	Version of the file as per PE information.
pe.sectionNames	Array	List of section names in the PE file.
pe.importedLibraries	Array	List of imported libraries in the PE file.
elf	Object	ELF information of the file. This is applicable for Linux files.
elf.classType	String	Class type of the ELF file.
elf.data	String	Data of ELF file.
elf.entryPoint	String	Entry point for the ELF file.
elf.context	Array	Context information of ELF file.
elf.type	String	Type of ELF file.
elf.sectionNames	Array	List of section names in ELF file.
elf.importedLibraries	Array	List of imported libraries in ELF file.
macho	Object	Macho information of the file. This is applicable for Mac files.
macho.uuid	String	UUID of the Macho file.
macho.identifier	String	Identifier of the Macho file.
macho.minOsxVersion	String	Minimum OSx version for the Macho file.
macho.context	Array	Context information of the Macho file.
macho.flags	String	Flags of Macho file.
macho.numberOfLoadCommands	String	Number of load commands for the Macho file.
macho.version	String	Version of the Macho file.

Path	Type	Description
macho.sectionNames	Array	Section names in the Macho file.
macho.importedLibraries	Array	Imported libraries list in the Macho file.
entropy	String	Entropy of the file.
format	String	Format of the file.
fileStatus	String	Status of the file as assigned by the analyst. (Whitelist, Blacklist, Neutral, and Graylist).
remediationAction	String	Remediation action as assigned by the analyst. For example, Blocked.
[].localRiskScore	Number	File's score based on alerts triggered in the given agent.

```

To filter the snapshot details based on the category, the following fields can be provided as path parameter - PROCESSES, LOADED_LIBRARIES, SERVICES, AUTORUNS, TASKS, DRIVERS, THREADS, IMAGE_HOOKS, and KERNEL_HOOKS.

```
GET /rest/api/host/<Host-Agent-Id>/snapshots/2019-06-
17T04:24:14.608Z?serviceId=<service-id>&categories=PROCESSES
```

Get Files

This API lists all related information of files from a specific Endpoint Server. These information are specific to the unique file and does not include any host information.

It provides a paged response with a standard paged response structure as mentioned in the 'Pagination' section.

The "items" field in paged response consists of individual file information.

Path	Type	Description
items	Array	An array containing the requested resources.
pageNumber	Number	The requested page number.
pageSize	Number	The requested number of items to return in a single page.
totalPages	Number	The total number of pages available.
totalItems	Number	The total number of items available.
hasNext	Boolean	Indicates if there is a page containing results after this page.
hasPrevious	Boolean	Indicates if there is a page containing results before this page.
items[].firstFileName	String	First name of the file sent by the agent.
items[].reputationStatus	String	Reputation status of the file.
items[].globalRiskScore	String	Global risk score.
items[].firstSeenTime	String	Time when the file was first seen by the Endpoint Server.
items[].machineOsType	String	Type of operating system (Windows, Mac, Linux).
items[].signature	Object	Signatory information of the file.
items[].signature.timeStamp	String	Timestamp of the signature.
items[].signature.thumbprint	String	Thumbprint of the certificate.
items[].signature.context	Array	Context information of the certificate.
items[].signature.signer	String	Signer information of the certificate.
items[].size	String	Size of the file.
items[].checksumMd5	String	MD5 of the file.
items[].checksumSha1	String	SHA1 of the file.
items[].checksumSha256	String	SHA256 of the file.
items[].pe	Object	PE information of the file. This is applicable for Windows files.
items[].pe.timeStamp	String	Timestamp of the PE File.
items[].pe.imageSize	String	Image size of the PE file.
items[].pe.numberOfExportedFunctions	String	Number of exported function in the PE file.
items[].pe.numberOfNamesExported	String	Number of names exported in the PE file.
items[].pe.numberOfExecuteWriteSections	String	Number of execute write sections in the PE file.
items[].pe.context	Array	Context information of the PE file.
items[].pe.resources	Object	Resources of the PE file.
items[].pe.resources.originalFileName	String	Original filename as per PE information.

Path	Type	Description
items[].pe.resources.company	String	Company name as per PE information.
items[].pe.resources.description	String	Description of the file as per PE information.
items[].pe.resources.version	String	Version of the file as per PE information.
items[].pe.sectionNames	Array	List of section names in the PE file.
items[].pe.importedLibraries	Array	List of imported libraries in the PE file.
items[].elf	Object	ELF information of the file. This is applicable for Linux files.
items[].elf.classType	String	Class type of the ELF file.
items[].elf.data	String	Data of ELF file.
items[].elf.entryPoint	String	Entry point for the ELF file.
items[].elf.context	Array	Context information of ELF file.
items[].elf.type	String	Type of ELF file.
items[].elf.sectionNames	Array	List of section names in ELF file.
items[].elf.importedLibraries	Array	List of imported libraries in ELF file.
items[].macho	Object	Macho information of the file. This is applicable for Mac files.
items[].macho.uuid	String	UUID of the Macho file.
items[].macho.identifier	String	Identifier of the Macho file.
items[].macho.minOsxVersion	String	Minimum OSx version for the Macho file.
items[].macho.context	Array	Context information of the Macho file.
items[].macho.flags	String	Flags of Macho file.
items[].macho.numberOfLoadCommands	String	Number of load commands for the Macho file.
items[].macho.version	String	Version of the Macho file.
items[].macho.sectionNames	Array	Section names in the Macho file.
items[].macho.importedLibraries	Array	Imported libraries list in the Macho file.
items[].entropy	String	Entropy of the file.
items[].format	String	Format of the file.
items[].fileStatus	String	Status of the file as assigned by the analyst. (Whitelist, Blacklist, Neutral, and Graylist).
items[].remediationAction	String	Remediation action as assigned by the analyst. For example, Blocked.

Note: The following is a sample response with all fields populated. However, the response for pe, macho, and elf is generated based the operating system type. The fields without values will display as null.

```

Request Scan

This API starts a scan for the host with the specified agent ID.

```
POST /rest/api/host/{agentId}/scan?serviceId=<service-id>&scanType=<scanType>
```

Path Parameters

Parameter	Description
agentId	Unique identifier of the host.

Request Parameters

Parameter	Description
serviceId	Service ID of the Endpoint Server to be connected.
scanType	Type of scan command.
cpuMax	You can use cpuMax to specify the amount of CPU the agent can use to run the scan. You can choose a value from 5 to 100. If you do not specify a value, the agent uses the default 25% CPU for the scan

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/scan?serviceId=397eb905-a6a7-43a2-a8ed-
cd8636e98771&scanType=QUICK_SCAN&cpuMax=67' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1'
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:55 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Request Scan with given CPU Usage

This API starts a scan for the host with the specified agent ID and given CPU usage.

```
POST /rest/api/host/{agentId}/scan?serviceId=<service-
id>&scanType=<scanType>&cpuMax=<cpuMax>
```

Path Parameters

Snippet path-parameters not found for operation::endpoint-api-specification-it/request-scan-for-a-host-with-cpuMax/

Request Parameters

Snippet request-parameters not found for operation::endpoint-api-specification-it/request-scan-for-a-host-with-cpuMax/

Sample Request

Snippet curl-request not found for operation::endpoint-api-specification-it/request-scan-for-a-host-with-cpuMax/

Sample Response

Snippet http-response not found for operation::endpoint-api-specification-it/request-scan-for-a-host-with-cpuMax/

- cpuMax: Minimum value allowed is 5 and Maximum value allowed is 100.

Request Stop Scan

This API stops a scan for the host with the specified agent ID.

```
DELETE /rest/api/host/{agentId}/scan?serviceId=<service-id>&scanType=<scanType>
```

Path Parameters

Parameter	Description
`agentId`	Unique identifier of the host.

Request Parameters

Parameter	Description
`serviceId`	Service ID of the Endpoint Server to be connected.
`scanType`	Type of scan command.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/scan?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771&scanType=CANCEL_SCAN'
-i -X DELETE \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:55 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

Get Alerts for a Host

This API gets all alerts triggered for a given host. Alerts are categorized as 'Critical', 'High', 'Medium' and 'Low'. The response provides category level count of alerts triggered along with list of alerts.

Path	Type	Description
id	String	ID of the entity for which score needs to be queried. Agent ID in case of host and checksum in case of files.
distinctAlertCount	Object	Count of distinct Alert/category for the entity.
distinctAlertCount.critical	String	Number of critical alerts.
distinctAlertCount.high	String	Number of high alerts.
distinctAlertCount.medium	String	Number of medium alerts.
distinctAlertCount.low	String	Number of low alerts.
categorizedAlerts	String	Count of alert and events for a file/host, categorized by severity.

```
GET /rest/api/host/{agentId}/alerts?serviceId=<service-id>
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/alerts?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:57:55 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 855
```

```
{
  "id" : "B27DDED7-6FFA-A9D3-6577-3DDE367B2820",
  "distinctAlertCount" : {
    "critical" : 0,
    "high" : 4,
    "medium" : 2,
    "low" : 0
  },
  "categorizedAlerts" : {
    "High" : {
      "Possibly Renamed net.exe Detected" : {
        "alertCount" : 1,
        "eventCount" : 1
      },
      "Powershell Injects Remote Process" : {
        "alertCount" : 3,
        "eventCount" : 3
      },
      "Unexpected taskhostw.exe Parent" : {
        "alertCount" : 1,
        "eventCount" : 1
      },
      "Unexpected runtimebroker.exe Parent" : {
        "alertCount" : 1,
        "eventCount" : 1
      }
    },
    "Medium" : {
      "Performs Scripted File Transfer" : {
        "alertCount" : 1,

        "alertCount" : 1,
        "eventCount" : 1
      }
    }
  }
}
```

To filter alerts based on the category, add the alertCategory path parameter.

```
GET /rest/api/host/{agentId}/alerts?serviceId=<service-id>&alertCategory=Medium
```

Get Alerts for a File

This API gets all alerts triggered for a given file. Alerts are categorized as 'Critical', 'High', 'Medium' and 'Low'. The response provides category level count of alerts triggered along with list of alerts.

Only checksum supported are `sha256` and `md5`.

Path	Type	Description
`id`	`String`	ID of the entity for which score needs to be queried. Agent ID in case of host and checksum in case of files.
`distinctAlertCount`	`Object`	Count of distinct Alert/category for the entity.
`distinctAlertCount.critical`	`String`	Number of critical alerts.
`distinctAlertCount.high`	`String`	Number of high alerts.
`distinctAlertCount.medium`	`String`	Number of medium alerts.
`distinctAlertCount.low`	`String`	Number of low alerts.
`categorizedAlerts`	`String`	Count of alert and events for a file/host, categorized by severity.

```
GET /rest/api/file/{checksum}/alerts?serviceId=<service-id>
```

Sample Request

```
$ curl
'https://api.netwitness.local/rest/api/file/d1c79a36593f0d5f7d07502b963d97acc851dc0291
f4556ce8f110a58a48fda4/alerts?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771' -i -X
GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:57:55 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 569
```

```
{
  "id" : "d1c79a36593f0d5f7d07502b963d97acc851dc0291f4556ce8f110a58a48fda4",
  "distinctAlertCount" : {
    "critical" : 0,
    "high" : 2,
    "medium" : 1,
    "low" : 0
  },
  "categorizedAlerts" : {
    "High" : {
      "Possibly Renamed net.exe Detected" : {
        "alertCount" : 1,
        "eventCount" : 1
      },
      "Powershell Injects Remote Process" : {
        "alertCount" : 3,
        "eventCount" : 3
      }
    },
    "Medium" : {
      "Performs Scripted File Transfer" : {
        "alertCount" : 1,
        "eventCount" : 1
      }
    }
  }
}
```

To filter alerts based on the category, add the alertCategory path parameter.

```
GET /rest/api/file/{checksum}/alerts?serviceId=<service-id>&alertCategory=Medium
```

Request File Download to Server

This API initiates the file download to the Endpoint Server. The following are the fields in the request body:

- path: Full path where the files may be present.

```
POST /rest/api/host/{agentId}/download/download-file?serviceId=<service-id>
```

Path Parameters

Parameter	Description
agentId	Unique identifier of the host.

Request Parameters

Parameter	Description
serviceId	Service ID of the Endpoint Server to be connected.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/download/download-file?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771' -i
-X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"path":"C:\\Users\\sample\\test.exe"}'
```

HTTP request

```
POST /rest/api/host/B27DDED7-6FFA-A9D3-6577-3DDE367B2820/download/download-
file?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json
Host: api.netwitness.local
Content-Length: 38

{"path":"C:\\Users\\sample\\test.exe"}
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:56 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Request Multiple File Downloads to Server

This API initiates the multiple file downloads to the Endpoint Server matching the wildcard path. The following are the fields in the request body:

- path: Path where the files may be present using wildcard.
- countFiles: Maximum number of files returned by the host matching the wildcard path (default 10).

- maxFileSize: Maximum size of each file (in MB) (default 100 MB).

```
POST /rest/api/host/{agentId}/download/download-files?serviceId=<service-id>
```

Path Parameters

Parameter	Description
agentId	Unique identifier of the host.

Request Parameters

Parameter	Description
serviceId	Service ID of the Endpoint Server to be connected.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/download/download-files?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771'
-i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"path":"C:\\Users\\sample\\*","countFiles":3,"maxFileSize":150}'
```

HTTP request

```
POST /rest/api/host/B27DDED7-6FFA-A9D3-6577-3DDE367B2820/download/download-
files?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json
Host: api.netwitness.local
Content-Length: 64

{"path":"C:\\Users\\sample\\*","countFiles":3,"maxFileSize":150}
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:56 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

Request MFT Download

This API initiates the MFT download to the Endpoint Server.

```
POST /rest/api/host/{agentId}/download/mft?serviceId=<service-id>&path=<path>
```

Path Parameters

Parameter	Description
agentId	Unique identifier of the host.

Request Parameters

Parameter	Description
serviceId	Service ID of the Endpoint Server to be connected.
path	Drive or NTFS Mount path for which MFT is requested

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/download/mft?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771&path=E%3A%5C'
-i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1'
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:56 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

Request parameter "path" can be any valid windows drive or windows path. Below are the valid sample values

- C:\
- d:\

- E:\mountPath\NTFSmount
- f:\mount path\NTFS Mount

Note: MFT Download is not supported in Relay Mode

Request System Dump Download

This API initiates the download of the system dump to the Endpoint Server.

```
POST /rest/api/host/{agentId}/download/system-dump?serviceId=<service-id>
```

Path Parameters

Parameter	Description
agentId	Unique identifier of the host.

Request Parameters

Parameter	Description
serviceId	Service ID of the Endpoint Server to be connected.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/download/system-dump?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771' -i
-X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1'
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:56 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Note: System Dump Download is not supported in Relay Mode

Request Process Dump Download

This API initiates the download of the process dump to the Endpoint Server.

Process information are specified as a part of the request body.

```
POST /rest/api/host/{agentId}/download/process-dump?serviceId=<service-id>
```

Path Parameters

Parameter	Description
agentId	Unique identifier of the host.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/download/process-dump?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771' -i
-X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d
'{"processId":5744,"eprocess":"0xFFFFE10DC62C6440","fileName":"spoolsvX.bat","path":"E

e3ece1bf1347b386f8725783767e5c","processCreateUtcTime":1685534276796}'
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:56 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Request Network Isolation

This API isolates the host with the specified agent ID from the network.

```
POST /rest/api/host/{agentId}/isolation?serviceId=<service-id>
```

Path Parameters

Parameter	Description
agentId	Unique identifier of the host.

Request Parameters

Parameter	Description
serviceId	Service ID of the Endpoint Server to be connected.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/isolation?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d
'{"allowDnsOnlyBySystem":false,"exclusions":[{"ip":"10.125.0.1","v4":true}],"comment":
"Found malicious"}'
```

HTTP request

```
POST /rest/api/host/B27DDED7-6FFA-A9D3-6577-3DDE367B2820/isolation?serviceId=397eb905-
a6a7-43a2-a8ed-cd8636e98771 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json
Host: api.netwitness.local
Content-Length: 103

{"allowDnsOnlyBySystem":false,"exclusions":[{"ip":"10.125.0.1","v4":true}],"comment":"
Found malicious"}
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:56 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Update Network Isolation Exclusion List

This API updates the network isolation exclusion list for the host with the specified agent ID.

```
PATCH /rest/api/host/{agentId}/isolation?serviceId=<service-id>
```

Path Parameters

Parameter	Description
agentId	Unique identifier of the host.

Request Parameters

Parameter	Description
serviceId	Service ID of the Endpoint Server to be connected.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/isolation?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771' -i -X PATCH \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d
'{"allowDnsOnlyBySystem":false,"exclusions":[{"ip":"1.2.3.4","v4":true},{"ip":"10.125.
0.1","v4":true}],"comment":"Updating IP exclusions for network isolation"}'
```

HTTP request

```
PATCH /rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/isolation?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json
Host: api.netwitness.local
Content-Length: 159

{"allowDnsOnlyBySystem":false,"exclusions":[{"ip":"1.2.3.4","v4":true},{"ip":"10.125.0
.1","v4":true}],"comment":"Updating IP exclusions for network isolation"}
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:56 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Release from Network Isolation

This API restores the network connection and removes IP addresses added to the exclusion list for the host with the specified agent ID.

```
DELETE /rest/api/host/{agentId}/isolation?serviceId=<service-id>
```

Path Parameters

Parameter	Description
agentId	Unique identifier of the host.

Request Parameters

Parameter	Description
serviceId	Service ID of the Endpoint Server to be connected.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/isolation?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771' -i -X DELETE \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"allowDnsOnlyBySystem":false,"exclusions":null,"comment":"Release from
isolation"}'
```

HTTP request

```
DELETE /rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/isolation?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json
Host: api.netwitness.local
Content-Length: 83

{"allowDnsOnlyBySystem":false,"exclusions":null,"comment":"Release from isolation"}
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:56 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Request All tags from the Server

This API to fetch all the tags from the Endpoint Server.

```
GET /rest/api/host/tag/get-all?serviceId=<service-id>
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/tag/get-all?serviceId=397eb905-
a6a7-43a2-a8ed-cd8636e98771' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:57:56 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 59
```

```
{
  "tags" : [ "Tag1", "Tag2" ],
  "maxTagsAllowed" : 100
}
```

Create Tags for Endpoint Server.

This API is used to create tags in Endpoint Server.

```
POST /rest/api/host/tag/create-tags?serviceId=<service-id>
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/tag/create-tags?serviceId=397eb905-
a6a7-43a2-a8ed-cd8636e98771' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"tags":["Tag1","Tag2"]}'
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:56 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Delete Tags for Endpoint Server.

This API is used to delete tags in Endpoint Server.

```
DELETE /rest/api/host/tag/create-tags?serviceId=<service-id>
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/tag/delete-tags?serviceId=397eb905-
a6a7-43a2-a8ed-cd8636e98771' -i -X DELETE \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"tags":["Tag1","Tag2"]}'
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:57 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Assign Tags to the Host

This API is used to Assign Tags to the Host.

```
POST /rest/api/host/{agentId}/tag/assign-tags?serviceId=<service-id>
```

Path Parameters

Parameter	Description
agentId	Unique identifier of the host.

Request Parameters

Parameter	Description
serviceId	Service ID of the Endpoint Server to be connected.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/tag/assign-tags?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771' -i -X
POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"tags":["Tag1","Tag2"]}'
```

HTTP request

```
POST /rest/api/host/B27DDED7-6FFA-A9D3-6577-3DDE367B2820/tag/assign-
tags?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json
Host: api.netwitness.local
Content-Length: 24

{"tags":["Tag1","Tag2"]}
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:56 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```

```

Un-Assign Tags to the Host

This API is used to Un-Assign Tags to the Host.

```
DELETE /rest/api/host/{agentId}/tag/un-assign-tags?serviceId=<service-id>
```

Path Parameters

Parameter	Description
agentId	Unique identifier of the host.

Request Parameters

Parameter	Description
serviceId	Service ID of the Endpoint Server to be connected.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/tag/un-assign-tags?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771' -i -X
DELETE \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"tags":["Tag1","Tag2"]}'
```

HTTP request

```
DELETE /rest/api/host/B27DDED7-6FFA-A9D3-6577-3DDE367B2820/tag/un-assign-
tags?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json
Host: api.netwitness.local
Content-Length: 24

{"tags":["Tag1","Tag2"]}
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:57 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Request reset risk for host

This API initiates reset of risk for host.

```
POST /rest/api/host/{agentId}/risk/reset?serviceId=<service-id>
```

Path Parameters

Parameter	Description
`agentId`	Unique identifier of the host.

Request Parameters

Parameter	Description
serviceId	Service ID of the Endpoint Server to be connected.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/risk/reset?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1'
```

HTTP request

```
POST /rest/api/host/B27DDED7-6FFA-A9D3-6577-
3DDE367B2820/risk/reset?serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771 HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1
Host: api.netwitness.local

serviceId=397eb905-a6a7-43a2-a8ed-cd8636e98771
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:57 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```

```

Request reset risk for files

This API initiates reset of risk for files.

```
POST /rest/api/file/risk/reset
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/file/risk/reset' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"checksums":["checksum"]}'
```

HTTP request

```
POST /rest/api/file/risk/reset HTTP/1.1
Accept: application/json;charset=UTF-8
NetWitness-Token: eyJ...AT
Content-Type: application/json
Host: api.netwitness.local
Content-Length: 26

{"checksums":["checksum"]}
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:57:57 GMT

```

Request All Blocked Files.

This API to fetch all the blocked files.

It provides a paged response with a standard paged response structure as mentioned in the 'Pagination' section.

The "items" field in paged response consists of individual blocked file information.

Path	Type	Description
items	Array	An array containing the requested resources.
pageNumber	Number	The requested page number.
pageSize	Number	The requested number of items to return in a single page.

Path	Type	Description
totalPages	Number	The total number of pages available.
totalItems	Number	The total number of items available.
hasNext	Boolean	Indicates if there is a page containing results after this page.
hasPrevious	Boolean	Indicates if there is a page containing results before this page.

```
GET /rest/api/files/get-blocked-files
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/files/get-blocked-files' -i -X GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"pageNumber":0,"pageSize":10,"criteria":null}'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:57:57 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 144
```

```
{
  "items" : [ ],
  "pageNumber" : 0,
  "pageSize" : 10,
  "totalPages" : 1,
  "totalItems" : 0,
  "hasNext" : false,
  "hasPrevious" : false
}
```

Request All Blocked Files by Status

This API to fetch all the blocked files by status.

It provides a paged response with a standard paged response structure as mentioned in the

'Pagination' section.

The "items" field in paged response consists of individual blocked file information.

Path	Type	Description
items	Array	An array containing the requested resources.
pageNumber	Number	The requested page number.
pageSize	Number	The requested number of items to return in a single page.
totalPages	Number	The total number of pages available.
totalItems	Number	The total number of items available.
hasNext	Boolean	Indicates if there is a page containing results after this page.
hasPrevious	Boolean	Indicates if there is a page containing results before this page.

```
GET /rest/api/files/get-blocked-files-by-status
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/files/get-blocked-files-by-status' -i -X
GET \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"criteria":"Blacklist","pageNumber":0,"pageSize":10,"sort":null}'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:57:57 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 144
```

```
{
  "items" : [ ],
  "pageNumber" : 0,
  "pageSize" : 10,
  "totalPages" : 1,
  "totalItems" : 0,
  "hasNext" : false,
  "hasPrevious" : false
}
```

Request to Block Files

This API to block files.

```
POST /rest/api/files/block-files
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/files/block-files' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d
'{"fileStatus":"Blacklist","category":"Apt","comment":"comment","checksums":["checksum
"],"remediationAction":"Block"}'
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:57 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Request to Unblock Files

This API is used to Un-Block files.

```
DELETE /rest/api/files/un-block-files/{checksum}
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/files/un-block-files/570a0b9b-e7a3-4ce3-
bc4b-ec1e6e81d1d1' -i -X DELETE \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json'
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:57 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Request to Delete File Status

This API is used to delete file status.

```
DELETE /rest/api/files/delete-file-status
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/files/delete-file-status' -i -X DELETE \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"checksumList":["checksum"],"deleteCreatedByAnalyst":false}'
```

Sample Response

```
HTTP/1.1 200 OK
Date: Wed, 31 May 2023 11:57:57 GMT
Keep-Alive: timeout=60
Connection: keep-alive
```

```
```

Request to save whitelist alert behaviour.

This API to whitelist the alerts.

The following fields are mandatory for whitelisting the alerts.

- ruleName : Name of the whitelisting behaviour.
- comment : Comment supporting the whitelisting behaviour.
- rule : Map of Key-Value pairs defining the criteria of alerts to be whitelisted.

Note: Only endpoint alerts are eligible to be whitelisted.

```
POST /rest/api/alerts/save-whitelist
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/alerts/save-whitelist' -i -X POST \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8' \
    -d '{"ruleName":"knownAlert","count":0,"comment":"Blocked by
PRDP","rule":{"checksum_src":"1b30e463ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b0778
86da2804","user_src":"WINDOWS-TEST\\Administrator","agent_id":"78A0AE47-E80D-1820-
598A-C0D197C04B14","alertName":"Runs Blacklisted
File"},"genericMeta":{"alias_host":"Windows-
test","filename_src":"dtf3.exe"},"createdOn":0}'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:57:57 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 444
```

```
{
  "ruleName" : "knownAlert",
  "count" : 0,
  "comment" : "Blocked by PRDP",
  "rule" : {
    "checksum_src" : "
1b30e463ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077886da2804",

    "alias_host" : "Windows-test",
    "filename_src" : "dtf3.exe"
  },
  "createdOn" : 0
}
```

Request to delete whitelist behaviour.

This API to delete whitelist criteria.

```
DELETE /rest/api/alerts/delete-whitelist
```

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/alerts/delete-whitelist' -i -X DELETE \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Content-Type: application/json' \
    -d '{"whitelistAlertCriteriaList":["64627f1493ee136107f61305"]}'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Wed, 31 May 2023 11:57:57 GMT
Keep-Alive: timeout=60
Connection: keep-alive
Content-Length: 67
```

```
{
  "whitelistAlertCriteriaList" : [ "64627f1493ee136107f61305" ]
}
```

Request All whitelist behaviour.

This API to fetch all the whitelisted behaviours.

It provides a paged response with a standard paged response structure as mentioned in the 'Pagination' section.

The "items" field in paged response consists of individual whitelist criteria information.

Unresolved directive in endpoint.adoc - include::../../../target/generated-snippets/endpoint-api-specification-it/Get-paged-response-of-whitelist-behaviour/response-fields.adoc[]

```
GET /rest/api/alerts/get-whitelist
```

Sample Request

Snippet curl-request not found for operation::endpoint-api-specification-it/Get-paged-response-of-whitelist-behaviour/

Sample Response

Snippet http-response not found for operation::endpoint-api-specification-it/Get-paged-response-of-whitelist-behaviour/
