Hosts View - Agent History Tab 194
Hosts View - YARA Rules Tab 196

Introduction to Endpoint Investigation

NetWitness Investigate provides data analysis capabilities in NetWitness, so that analysts can analyze packet, log, endpoint, and UEBA data, and identify possible internal or external threats to security and the IP infrastructure. This guide helps analysts perform investigations of endpoint data using NetWitness Investigate.

Note: In Version 11.1 and later, the Hosts and Files views provide a view into endpoint data. Earlier versions offer access to endpoint data using a standalone NetWitness Endpoint server.

For more information, see the *NetWitness Endpoint Quick Start Guide*, the *NetWitness Investigate Quick Start Guide*, and the *NetWitness Investigate User Guide*.

Endpoint Metadata

Endpoint metadata is generated when hosts are scanned and when there are real-time activities on the hosts. You can view the following categories of sessions when metadata forwarding is enabled:

Operating System	Scan Categories & Real-time events	Tracking Categories

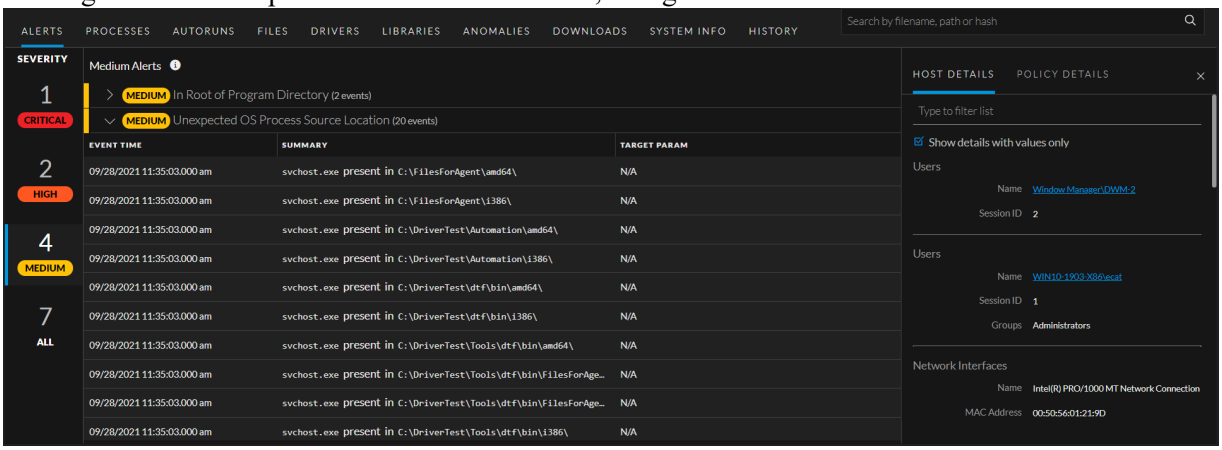
Windows	file, service, dll, process, task, autorun, machine, kernel hook, image hook, registry discrepancies, suspicious threads and removable device(USB) detection	• Process event - Reports any process related activities, such as `openprocess`, `openosprocess`, `createprocess`, `createremotethread`, `openbrowserprocess`.
		• File event - Reports any file related activities by an executable, such as `readdocument`, `writetoexecutable`, `renameexecutable`, `selfdeleteexecutable`, `openphysicaldrive`.
		• Registry event - Reports activities that result in registry creation or modification, such as `modifyservicesimagepath`, `modifyfirewallpolicy`, `createservicesimagepath`, `createsecuritycenterconfiguration`, `modifybadcertificatewarningsetting`, `Modifies Startup Folder Location`, `Modifies Winlogon Registry Settings`, `Registers Time Provider Dll`, `Registers Port Monitor Dll`, `Registers Netsh helper Dll`, `Registers AppInit Dll`, `Registers AppCert Dll`,
		• System event - Reports connection of removable devices(USB devices), IP change and boot events such as, `removableDeviceConnected`, `removableDeviceDisconnected`
		• Network event - TCP/UDP and incoming/outgoing.
		  • Reports outbound and inbound network connections on all supported Windows platforms.
		  • Reports IPv4 and IPv6 connections.
		• Console event (for Windows 8 and later) - User input that is entered into a console application, such as `cmd.exe`, `powershell.exe`, is captured and reported with the context `console.local`.
		Commands executed by `cmd.exe`, `powershell.exe` as a result of inter-process communication through anonymous pipes are captured and reported with the context `console.remote`.

Operating System	Scan Categories & Real-time events	Tracking Categories
		For example, `Get-Item -Path Registry::HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion`.
Linux	file, autrorun, loaded library, systemd, process, cron, initd, and machine	• Process event - Reports process related activities such as `createprocess`. • File event - Reports any file related activities by an executable, such as `writetoexecutable`.

Mac	file, daemon, process, task, dylib, autorun, and machine	• Process event - Reports any process related activities, such as `openprocess`, `createprocess`, `openosprocess`, `openbrowserprocess`, `allocateremotememory`, `createremotethread`.
		• File event - Reports any file related activities by an executable, such as `writetoexecutable`, `renameexecutable`, `createautorun`, `deleteexecutable`, `selfdeleteexecutable`, `writetoplist`, `writetosudoers`, `createbrowserextension`.
		• Network event - TCP/UDP and incoming/outgoing.
		  • Reports outbound and inbound network connections on all supported Mac operating system.
		  • Reports IPv4 and IPv6 connections.

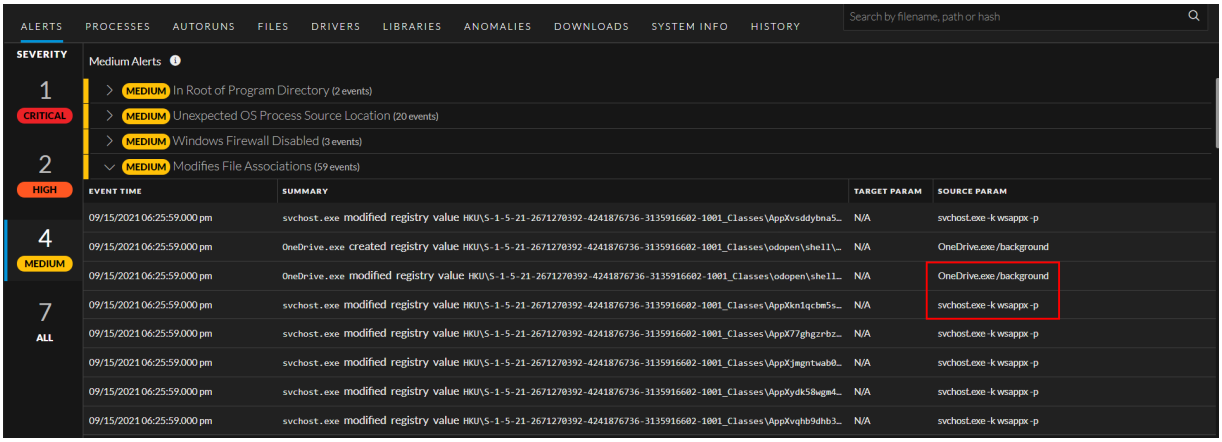
For more information on metadata, meta keys, meta values, and meta entities, see the *NetWitness Investigate User Guide*.

Risk Score



Analysts can use the risk score to begin an investigation on hosts and files. NetWitness uses a proprietary algorithm to calculate the risk scores ranging from 0 to 100. A subset of alerts associated with hosts and files contribute to the risk score calculation. Analysts can review critical and high alerts associated with a risk score to identify strong evidence of malicious activity and take required action.

Note: If you have an Insights agent, you can view the risk score for files but not for hosts. To view the risk score for hosts, upgrade to the Advanced agent. For more information, see the *NetWitness Endpoint Configuration Guide*.



The following factors contribute to the risk score:

- **Distinct Alerts.** Any host or file activities that are suspicious or malicious generate alerts. Only the distinct alerts are used for risk score calculation.
- **Severity of Alerts.** Severity of alerts, such as critical, high, and medium.

  This figure is an example of a host with 1 Critical, 2 High and 4 Medium distinct alerts.

  All the distinct alert shown in the above example can be for the same file or different files. For example, Modifies File Associations alert is triggered for files, such as `svchost.exe` and `OneDrive.exe`.

  This figure is an example of a file with the Critical alert. The file can have a same alert name being triggered by two different hosts as shown below.

The risk score is reset when you perform any of the following actions:

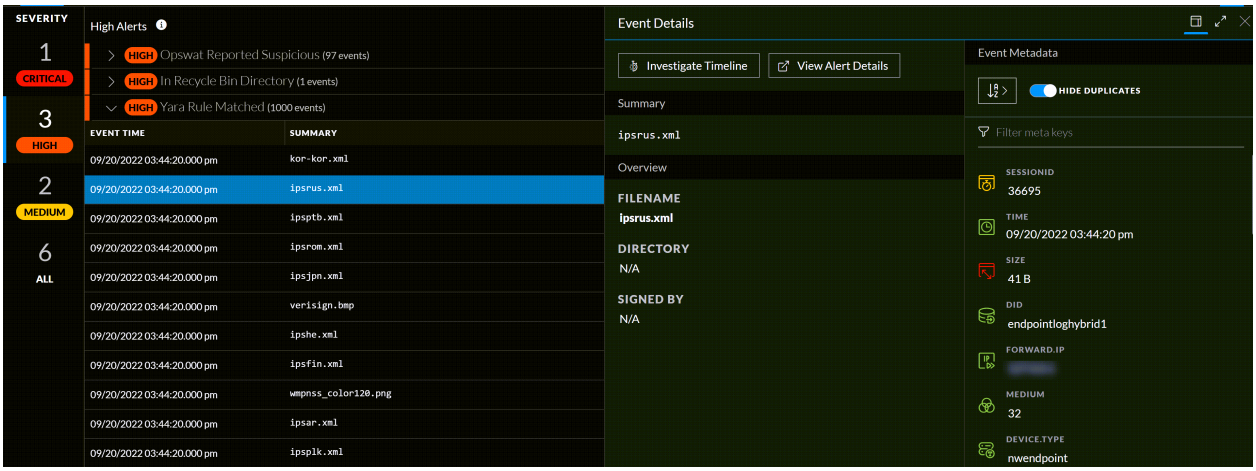
- Whitelist or blacklist a file after investigation. The risk score of a file is set to 0 on whitelisting and set to 100 on blacklisting.
- If the alerts or events triggered by the host or files on the host are false positive, you make changes to the Endpoint Application rules or ESA rules and reset the risk score.

Besides the above factors, the risk score is reset when a file no longer matches Yara rules in the subsequent scans

Note: When you whitelist a file or reset the risk score, the alerts that contributed to the risk score are not shown in the Host Details tab.

The host risk score depends on the risk score of all the files on the host. When you change the file status or reset the file risk score, the host risk score is recalculated. For example, the score for all the hosts on which a blacklisted file is present is recalculated and becomes 100. If the host is not found to be infected, you can reset the host risk score. This deletes the alerts contributed to the risk score and does not impact the global file score. For more information on changing the file status, see Changing File Status or Remediate.

Note: For the risk score calculation, the ESA Correlation server must be configured with an Endpoint Concentrator. The application rules are automatically deployed on installation. For an upgrade, you must deploy the application rules from RSA Live. For more information, see the *NetWitness Endpoint Configuration Guide*.



Note: For the accurate risk score calculation, the default multi-valued meta keys are required on the ESA Correlation service. For more information, see "Configure Meta Keys as Arrays in ESA Correlation Rule Values" section in the *ESA Configuration Guide*.

Severity of Alerts

The following table depicts the risk score range based on the associated alert severity:

Severity	Color	Risk Score Range
Critical	Red	100
High	Orange	70-99
Medium	Yellow	31-69
Low	Green	0-30

The following is an example of alerts contributing to the risk score:

In the above example, there are three distinct High alerts. For each alert type, associated events are displayed. The details of the events are displayed with the metadata information. For more information on severity alerts and metadata information, see Analyze Hosts Using the Risk Score and Analyze Files Using the Risk Score.

Global and Local Risk Score

Analysts can get better context on file activities on hosts using the global risk score and the local risk score of a file.

Global Risk Score - The global risk score is an aggregate of all suspicious and malicious activities performed by the file across all hosts. This score indicates the potential threat posed by the file across the NetWitness Platform.

Local Risk Score - The local risk score is calculated on suspicious or malicious activities performed by the file on a specific host. The local risk score is used for the host risk score calculation.

For more information on the global and local risk score, see Investigating Files and Investigating Hosts.

Automated Incident Creation Based on Risk Score

By default, a threshold is set for the risk score to control the generation of incidents and alerts in NetWitness Respond. For more information on configuring the threshold limit, see the *NetWitness Respond Configuration Guide*.

File Reputation

The File Reputation service available on RSA Live checks the reputation of every file hash against an extensive database of known file hashes updated in real-time. The file reputation is displayed on the Investigate and Respond views.

The reputations for a file hash are:

Reputation	Description
Malicious	File hash is labeled as malicious.
Suspicious	File hash is suspected to be malicious.
Unknown	File hash is not known.
Known	File hash information is known to the file reputation service and does not have any previous bad record.
Known Good	File hash information is known good, such as files signed by Microsoft or RSA.
Invalid	File hash format is invalid.

The suspicious or malicious files are available for further analysis in the **Investigate > Navigate** view and **Investigate > Events** view. For more information on the file reputation service, see the *Live Services Management Guide*.

Note: The File Reputation service supports maximum of 10 million files for a reputation of file hash.

File Status

To help analysts triage and focus on their investigation, NetWitness provides capabilities to manage suspect and legitimate files. For example, you can whitelist files that are legitimate (such as security products), or blacklist files based on known threats and investigation.

A file can be classified as follows:

- Blacklist: File that is marked suspicious, such as when ransomware is found by scan.
- Graylist: File that is marked for a later review.

- Whitelist: File that is legitimate and is not to be considered for risk scoring.
- Neutral: Default status.

For more information, see Changing File Status or Remediate.

Remediation

If a file is malicious or infected, you can block the file to prevent future execution on any host. Remediation helps to:

- Stop or reduce the spread of identified malware, such as viruses, trojans, rootkits, worms, spyware, and adware.
- Identify attempted breach points to aid in deeper analysis; all events are time-stamped allowing analysts to trace backward to identify the entry point.
- Remove unwanted software, such as adware, which can potentially mask real malware.
- Stop all actions possible by the loader.

You can block files with the following file extension: EXE, COM, SYS, DLL, SCR, OCX, BAT, PS1, VBS, VBE, and VB. For more information, see Changing File Status or Remediate.

Network Isolation

If you suspect that a host is potentially compromised with the threat still being active, you can isolate the host from the network and safely investigate possible threats within the host. By isolating the host, you can control the spread of an attack and analyze the malware behavior. When a host is isolated, the connection to the following IP addresses are allowed:

- Endpoint Server, Relay Server, DNS, DHCP, Gateways, 0.0.0.0, 255.255.255.255, and any other IP addresses that the agent connects with.
- Other IP addresses that you include in the exclusion list.

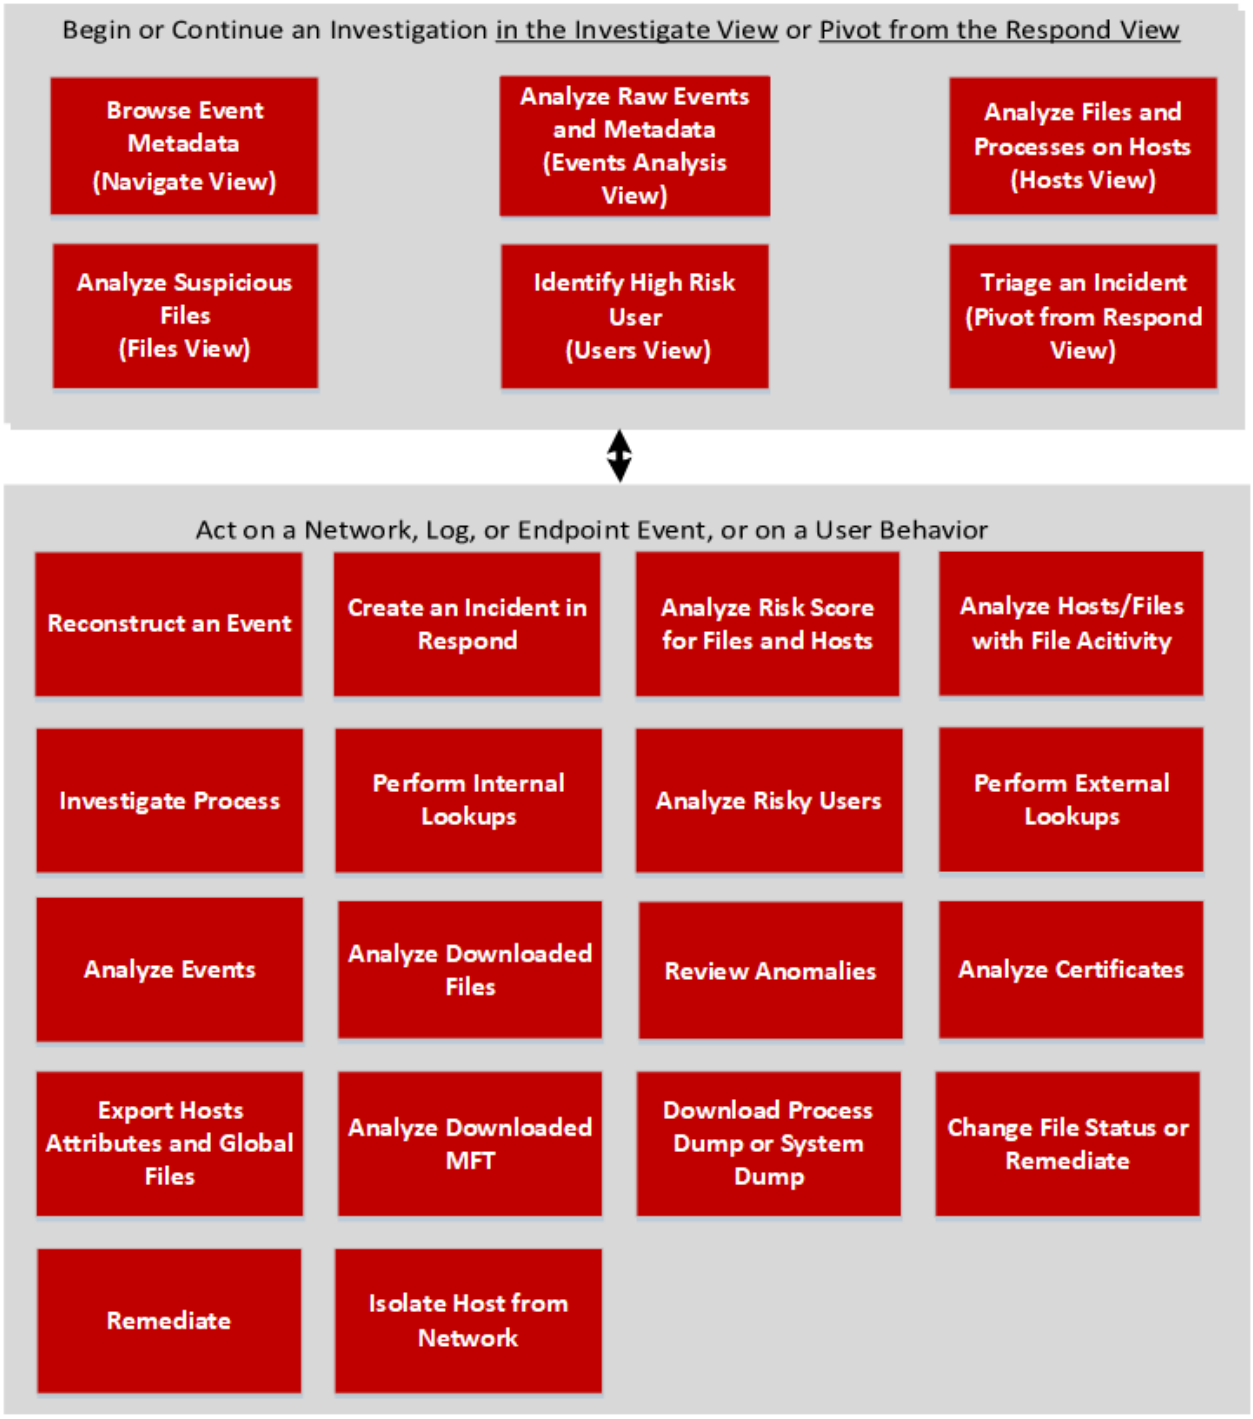
In the isolated state, all events are reported to the Endpoint Server retaining full visibility into activities on the host. You can continue investigation by requesting scans, downloading MFT, files, and so on. The following metadata is added to the network events:

- network.isolated - indicates that the host is isolated.
- network.connectallowed - indicates that the network connection is allowed as the IP address is included in the exclusion list.
- network.connectblocked - indicates that the network connection is blocked.

Note: If the agent is enabled for log or file collection, make sure that you add the Log Decoder IP addresses in the exclusion list while you isolate the host.

For more information, see Isolating Hosts from Network.

Focusing on Endpoint Analysis



This guide provides the information needed to conduct an investigation that is focused on endpoint data from configured hosts. Analysts who conduct analysis using Investigate need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in Roles and Permissions for Endpoint Analysts. For more information on roles and permissions, see the *System Security and User Management Guide*.

To hunt for information on hosts that have the agent running, begin the investigation in the Hosts view (**Hosts**). For every host, you can see processes, drivers, DLLs, files (executables), services, anomalies, and autoruns that are running, and information related to logged-in users. (See Investigating Hosts.)

You can begin the investigation on files in your deployment in the Files view (**Files**). (See Investigating Files.)

Note: To access the Hosts and Files views, you must have the `endpoint-server.filter.manage` permission.

Analysts use the Hosts and Files views to investigate or perform analysis on hosts or files using attributes such as IP address, host name, Mac address, risk score, and so on. This figure shows the high-level capabilities of an endpoint investigation. The top box are all the possible starting points, and the lower box shows the tasks that you can accomplish from different starting points.

Investigating Files

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Files view provides a holistic view of all files in your NetWitness platform. You can apply various filters, sort, and categorize files into different status to reduce the number of files for analysis and identify suspicious or malicious files.

Best Practices

The following are some best practices and tips that may help you investigate efficiently to identify and isolate threats or attacks:

- Whitelist all files signed by RSA, Microsoft, and any other known good vendors. Use the filters to list the files and change the status of all these files to whitelist. For more information, see Filter Files and Changing File Status or Remediate.

  Note: Some Microsoft signed files are restricted from whitelisting as there is a potential risk of them being used for malicious purposes. To view the list, see Files Restricted from Whitelisting.

- Change the status of certificate and the associated files automatically. For more information, see Analyze Certificates.
- Filter to exclude whitelisted, files with valid signature, known good files based on reputation status. For more information, see Filter Files.
- Lookup Google or VirusTotal with the filename or hash to get more information about a suspected file. For more information, see Launch an External Lookup for a File.
- Analyze the files using one or more of these indicators:

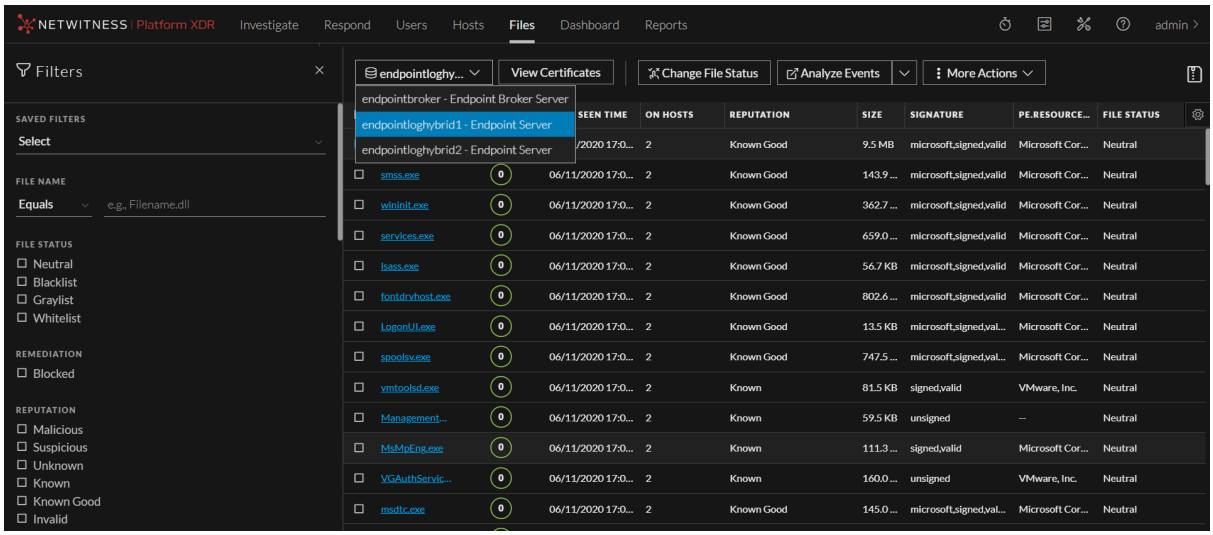
  a. Risk score - Displays the risk score for a file. Analysts can view the associated alerts and events for further investigation. For more information, see Analyze Files Using the Risk Score.

  b. On Hosts - Indicates the number of hosts on which a file exist. If a file is present on fewer hosts with a high risk score, it may require further investigation. You can also sort or filter using On Hosts column to narrow down the search during investigation. For more information, see Analyze Hosts with File Activity.

c. File status - To manage suspected and legitimate files, analysts can use the file status to manage. For more information on the various file status, see Changing File Status or Remediate.

d. Reputation status - Indicates the reputation of a file hash for analyst to narrow-down the files to investigate. For more information, see File Reputation.

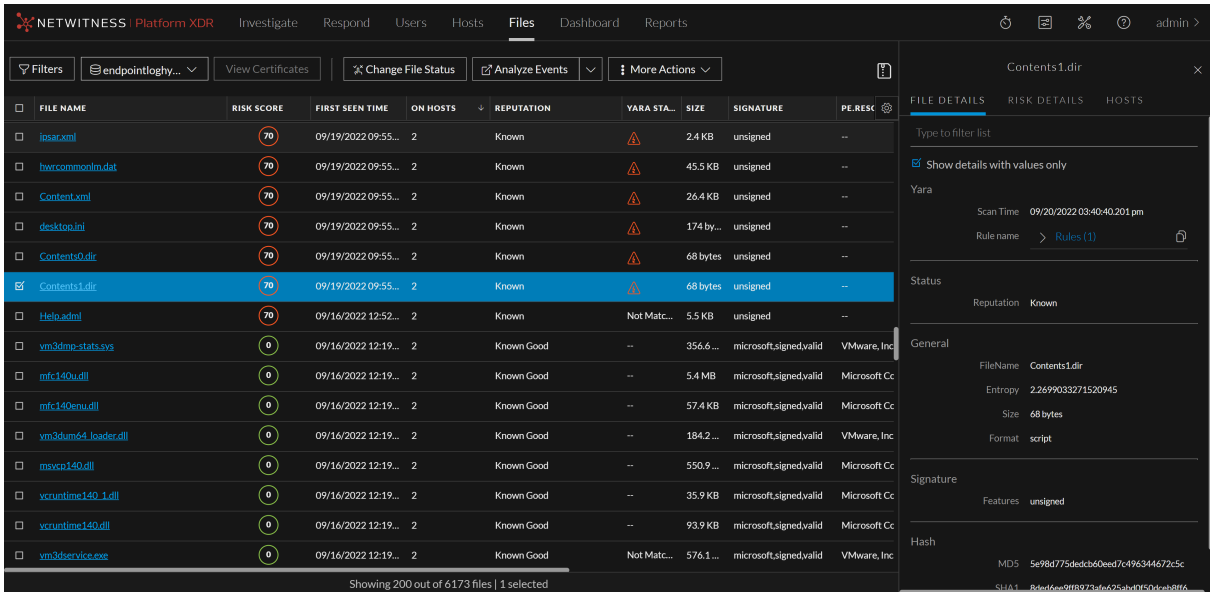
e. Signature - A valid signature on a file signed by a trusted vendor, such as Microsoft and Apple indicates that the file is not a risk. If a file is unsigned, it may be malicious, and needs investigation.



f. File name - Many trojans write random file names when dropping their payloads to prevent an easy search across the hosts in the network based on the filename. For example, if a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

- Investigate a particular file name or hash by pivoting to Navigate or Events view to view context, file activity on different hosts, and any file transfers across the network through packet data. For more information, see Analyzing Events.
- Investigate files using a rule-based detection technique. YARA helps to identify threats effectively using easy-to-create malware descriptions called YARA rules. For more information, see Analyze Files Using YARA.
- Download suspicious files to the server for deeper analysis. For more information, see Analyzing Downloaded Files.
- Change the status of the file (blacklist or graylist), and block an infected or malicious file. For more information, see Changing File Status or Remediate.

View Files



You can view all files present on a specific Endpoint server or consolidated list of all files on multiple Endpoint servers using the Endpoint Broker for analysis. To view files:

1. Go to **Files**.
2. Select one of the following:

- **Endpoint Broker Server** to view all files across all Endpoint servers.
- **Endpoint Server** to view files on a specific Endpoint server.

3. Select the file that you want to analyze.
4. Click a row to view the following details:

- **File Details** displays the file information. For more information, see Launch an External Lookup for a File.
- **Risk Details** displays the distinct alerts associated with the risk score. For more information, see Analyze Files Using the Risk Score.
- **Hosts** displays the number of hosts on which file activities are present. For more information, see Analyze Hosts with File Activity.

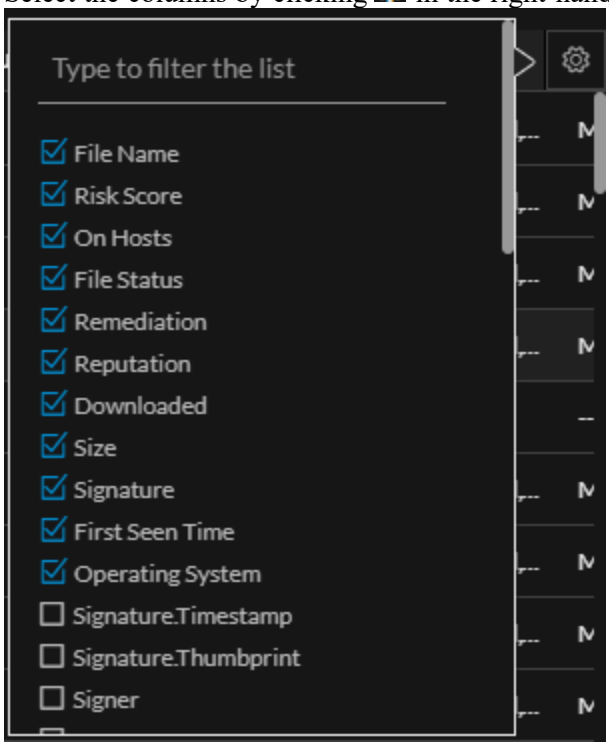
Filter Files

You can narrow down the investigation by filtering files using file name, on hosts, file status, risk score, remediation, reputation status, operating system, size, entropy, format, signature, company name, checksum (MD5 and SHA256), downloaded status, and YARA rules.

Note: While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Filename, MD5, SHA256, Operating System, First Seen Time, Format, File Status, On Host, and Reputation Status.

Select the parameters in the Filters tab. Click **Save** to save the search and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters list. To delete a filter, hover over the name and click .

Note: Special characters are not allowed in the filter name except underscore (_) and hyphen (-) while saving the filter.



For example, to filter the files based on file reputation, select the reputation status in the Filter panel.

Note: For the file size, 1 KB is calculated as 1024 bytes. For example, if the actual size of the file is 8421 bytes, the UI will display it as 8.2 KB instead of 8.22 KB. It is recommended to search using the bytes format when using the `Equals` operator.

Add and Sort Columns in the Table

By default, the Files view displays a few columns, and files are sorted based on the risk score. To add or remove columns:

1. Go to **Files**.
2. Select the columns by clicking in the right-hand corner.

3. Scroll down or enter the keyword to search and select the required columns.
4. To sort the column in ascending or descending order, click the arrow on the column header.

Analyze Files Using the Risk Score

Based on the Alert severity, the files can be analyzed using the following options:

- **View Alert Details**: This option allows you to analyze the files associated with **Critical** and **High** alerts. For more information, see Investigating a Process.
- **Analyze Process Tree**: This option allows you to analyze the files associated with **Medium** alerts. For more information, see Investigating a Process.

To analyze files associated with Critical and High alerts using the risk score:

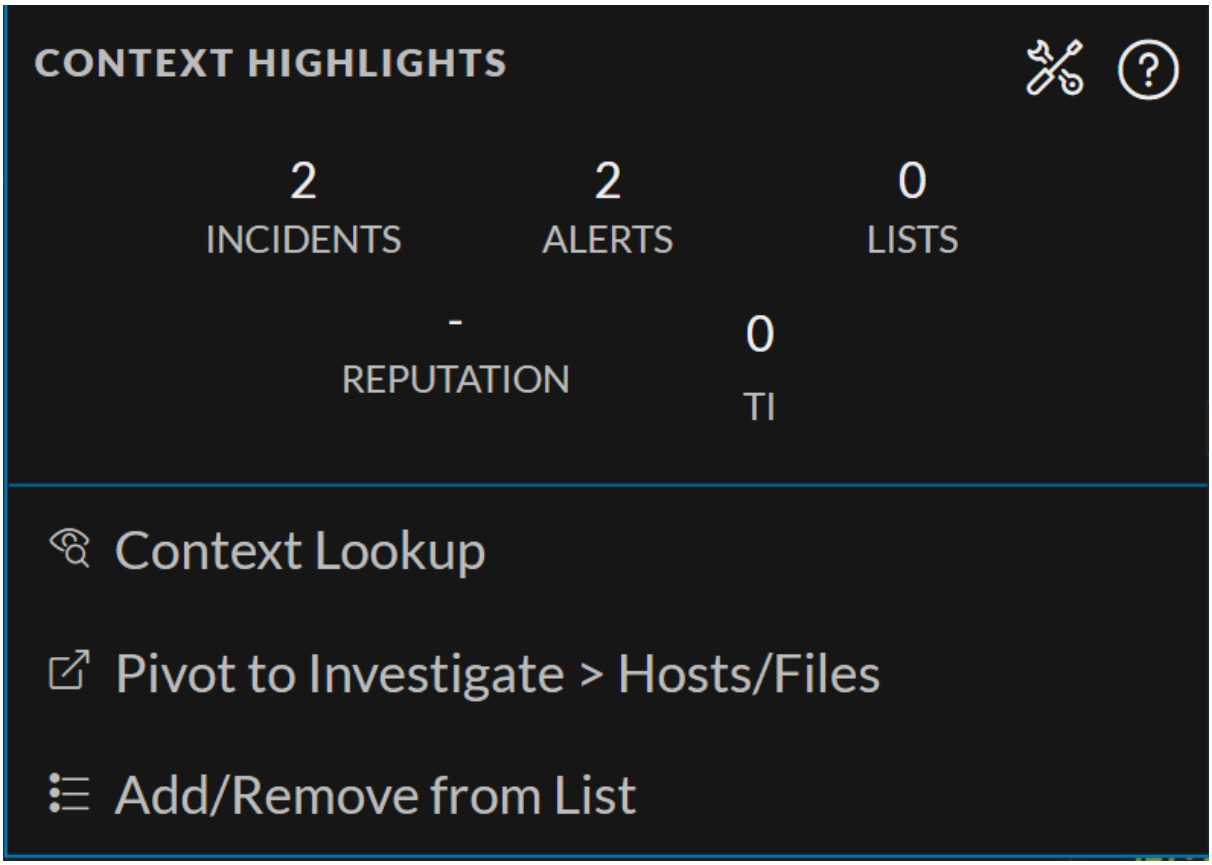
1. Go to **Files**.

   The **Files** view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the files.
3. Select the file and do any of the following.
   - Click a row to view the risk associated with the file in the **Risk Details** panel.
   - Click the filename to view the associated alerts and events.

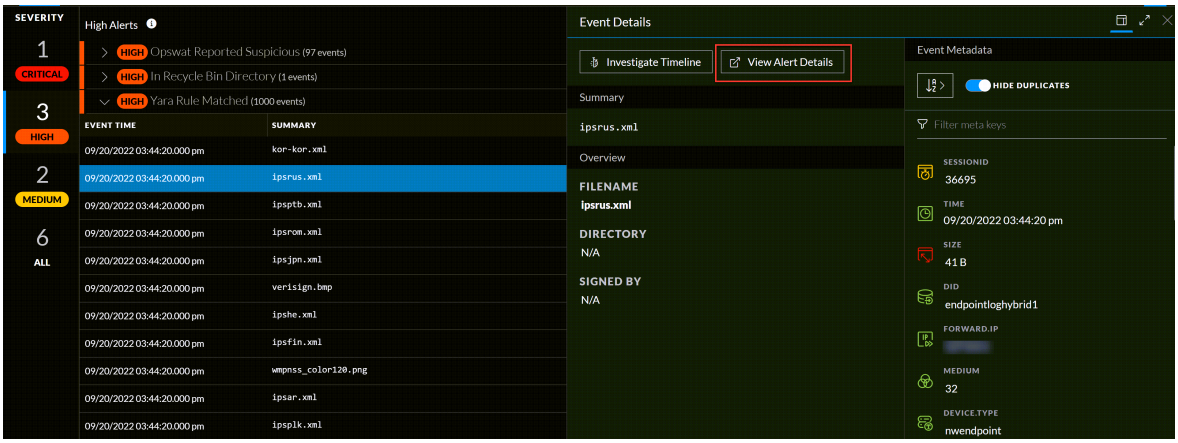
The **Alerts** tab is displayed.

4. In the **Alerts** > **Severity** panel, click the alert severity, such as **Critical** or **High**.
   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.

   Note: For each alert, only the latest 1000 events are displayed.



6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.



7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

   Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Files** view to view context lookup for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **View Alert Details** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.

To analyze files associated with Medium alerts using the risk score:

1. Go to **Files**.

   The **Files** view is displayed.

2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the files.

3. Select the file and do any of the following.

   - Click a row to view the risk associated with the file in the **Risk Details** panel.
   - Click the filename to view the associated alerts and events.

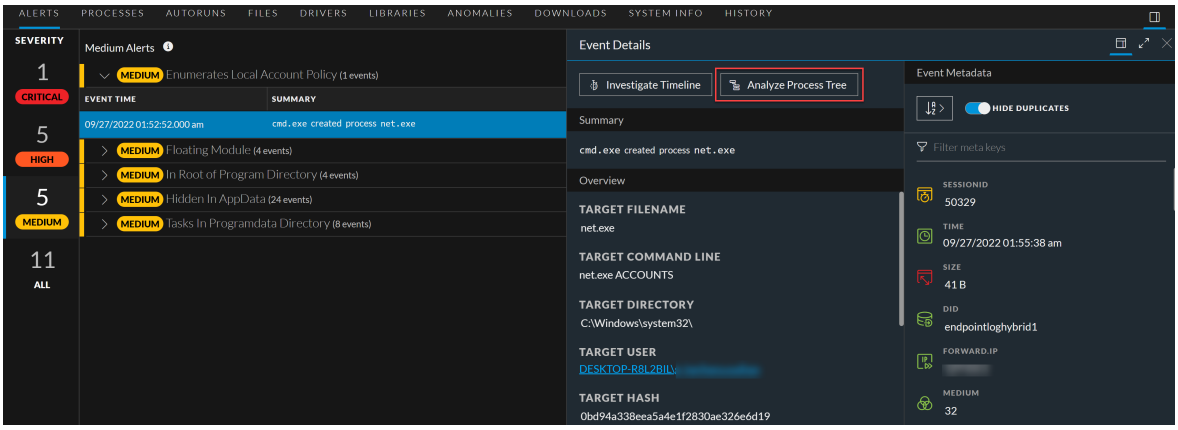
     The **Alerts** tab is displayed.

4. In the **Alerts** > **Severity** panel, click the **Medium** alert severity.
   The list of distinct alerts is displayed along with the total number of events associated with the alert.

5. Click an alert to view the associated events.

   Note: For each alert, only the latest 1000 events are displayed.

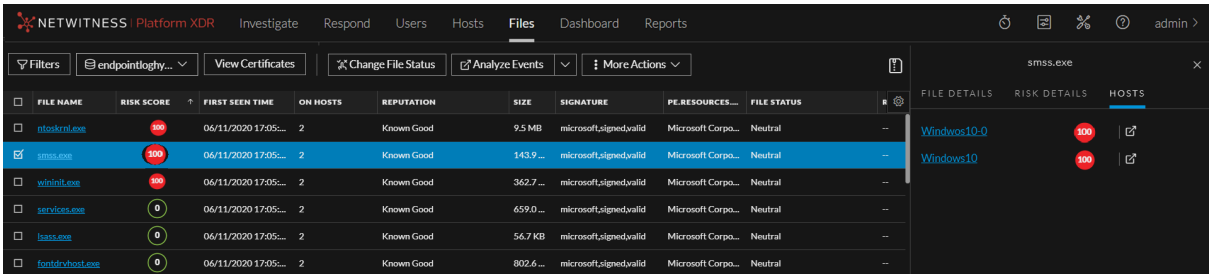
6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.



7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **Analyze Process Tree** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.



Analyze Hosts with File Activity

To view the list of hosts on which a file exist, do the following:

Note: By default, the system detects the best data source for the On Hosts aggregation. To change the data source, in the Explore view, modify the investigate service ID under `endpoint/investigate`.

1. In the **Files** tab, click the row for the file you want to analyze.
2. In the right panel, click the **Hosts** tab. The list of hosts along with the risk score are displayed.

3. Click the host name to open the host details.
4. Click  to analyze events on the host in the Events view. For more information, see Analyzing Events.

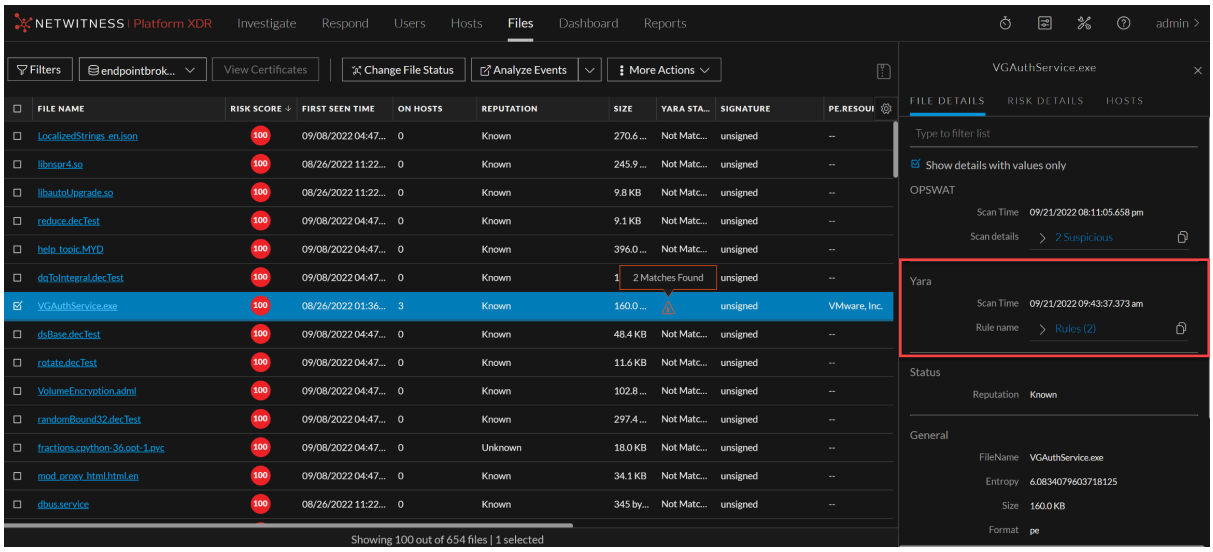
Analyze Files Using YARA

YARA helps analysts with rule-based detection capabilities in identifying and classifying malware. You can easily create malware descriptions using YARA rules. YARA scans can be performed at the Endpoint server level and Endpoint agent level.

Analyze Files at the Endpoint Server Level

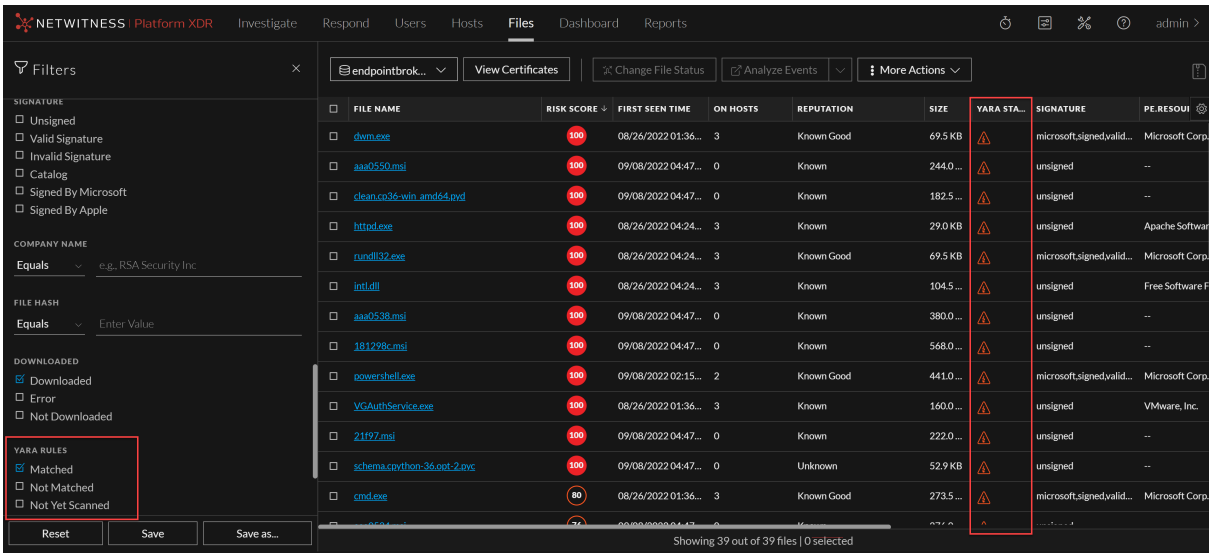
Administrators must enable and configure YARA on the Endpoint server. To learn more about enabling and configuring YARA, refer to NetWitness Endpoint Configuration Guide.

Files must be downloaded to the Endpoint server and YARA scans the downloaded files automatically. The scan results are displayed under **YARA STATUS** on the **Files** tab.



To analyze the scanned files,

1. Go to **Files**.
2. Select the Endpoint server from the server drop-down , to view files.
3. Select a file that is downloaded to the Endpoint server and do any of the following:
   - Click a row to view the YARA scan details associated with the file in the **File Details** panel.
   - If any file matches one or more YARA rules, the **File Details** panel displays the matching rule names besides scan time.
   - **YARA STATUS** field displays the status of the YARA scan. Following are the available statuses and their definitions



- **Matched** - The file matches with one or more YARA rules
- **Not Matched** - The file does not match with any of the YARA rules
- **Not Yet Scanned** - There is no scan performed for this file. Files will be scanned automatically once they have been downloaded. After the scan YARA status will be updated to either Matched or Not Matched

Note: When a file matches with a YARA rule, high severity alerts are triggered and, the file's risk score is updated. In the subsequent scans, If the same file doesn't match with a YARA rule, the risk score will be reset.

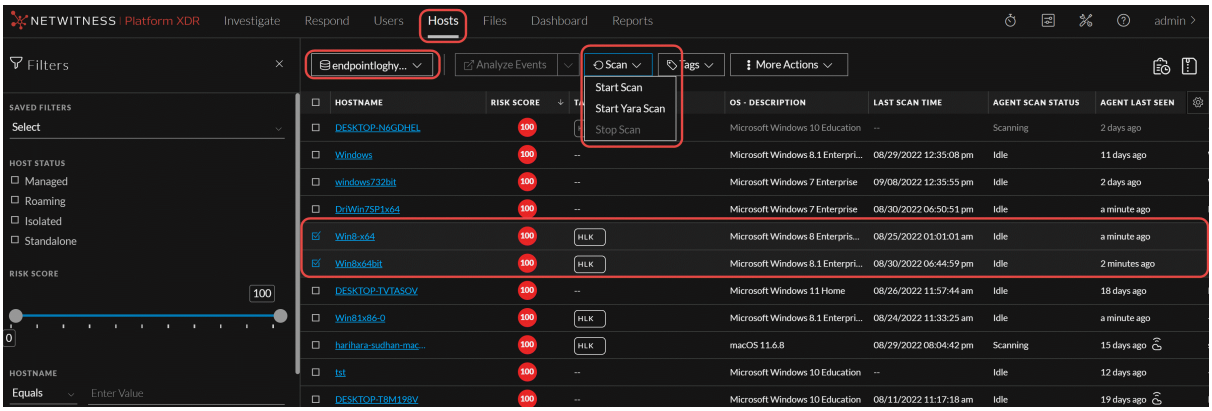
Note: If a downloaded file has an error, it will not be scanned by YARA and, the **Downloaded** column will display the file download status as **Error**.

4. On the **Filters** pane, scroll to the **YARA RULES** section. This section provides options to filter the files based on YARA scan status:
   - Select **Matched** to view the files that match YARA rules.
   - You can also view the files that do not match YARA rules or not yet scanned against YARA rules, by selecting **Not Matched** or **Not Yet Scanned** from the **YARA RULES** section.

For more information on investigating with YARA, see *NetWitness Investigate User Guide.*

Yara Scan at the Endpoint Agent Level

NetWitness Platform XDR allows you to quickly perform YARA scan at the Endpoint Agent level. A snapshot of the YARA scan shall be available on the Endpoint server with the details such as:



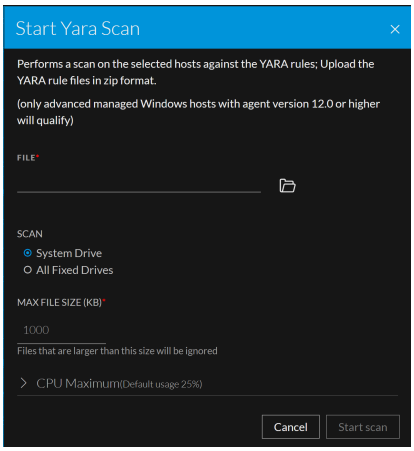
- List of files matching the YARA rules.
- List of YARA rules ran during the scan and the YARA rules status such as Loaded or Failed to load.

  Note: To perform Yara scan at the Endpoint agent level, the agent version must be higher than or equal to 12.1. This is applicable for the Advanced mode Windows Agents.

- YARA version associated with the agent.

To initiate YARA scan on the Endpoint Agent,

1. Click **Hosts**.
2. Select the Endpoint server from the server drop-down, to view hosts.
3. Select one or multiple hosts and click **Scan** > **Start Yara Scan**.



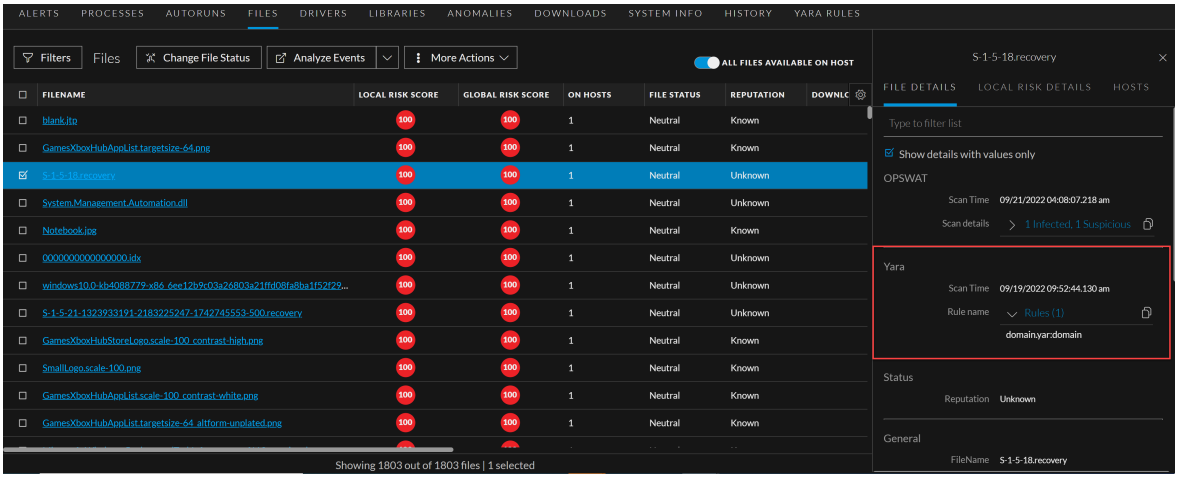
4. On **Start Yara Scan** pop-up,

   a. Click  and upload the YARA rule zip file.

   b. Select **System Drive** (Default selection) or **All Fixed Drives**.

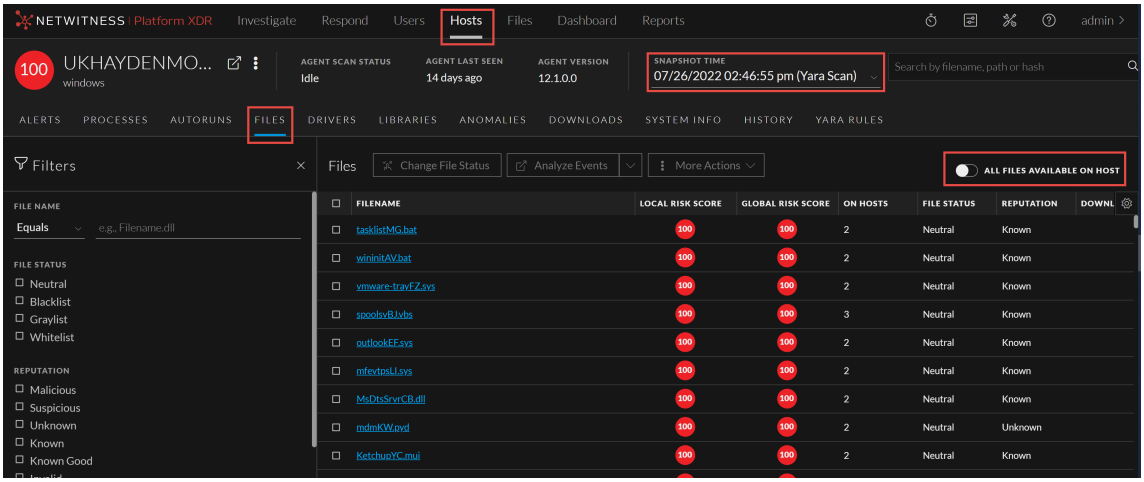
   c. Enter the Max File Size in Kilo Bites (KB).

   d. Select CPU Maximum.



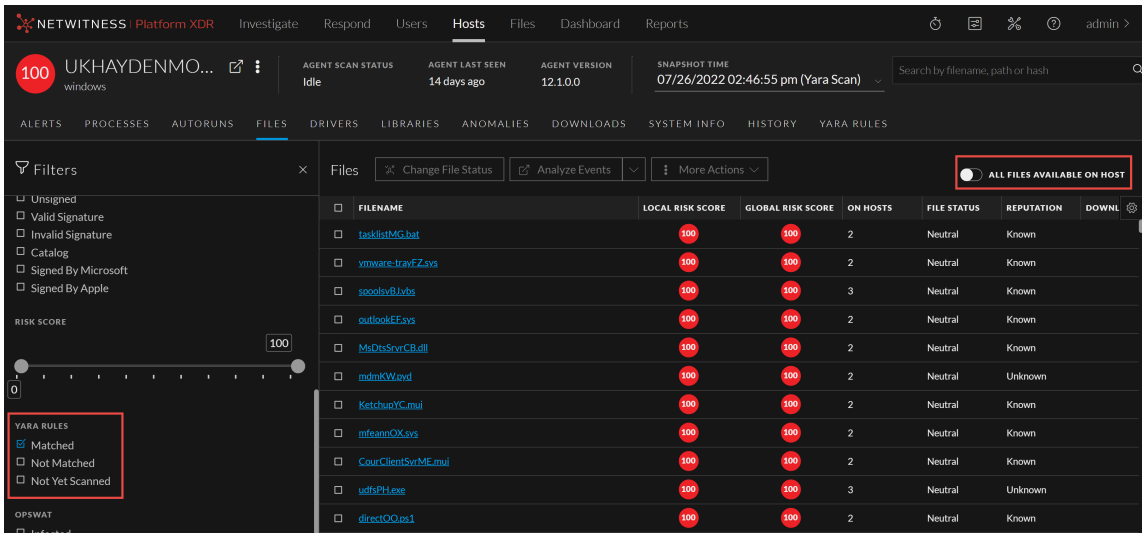
5. Click **Start scan**. See the command status In the **Host** > **History** tab.

To analyze the scanned hosts and files:

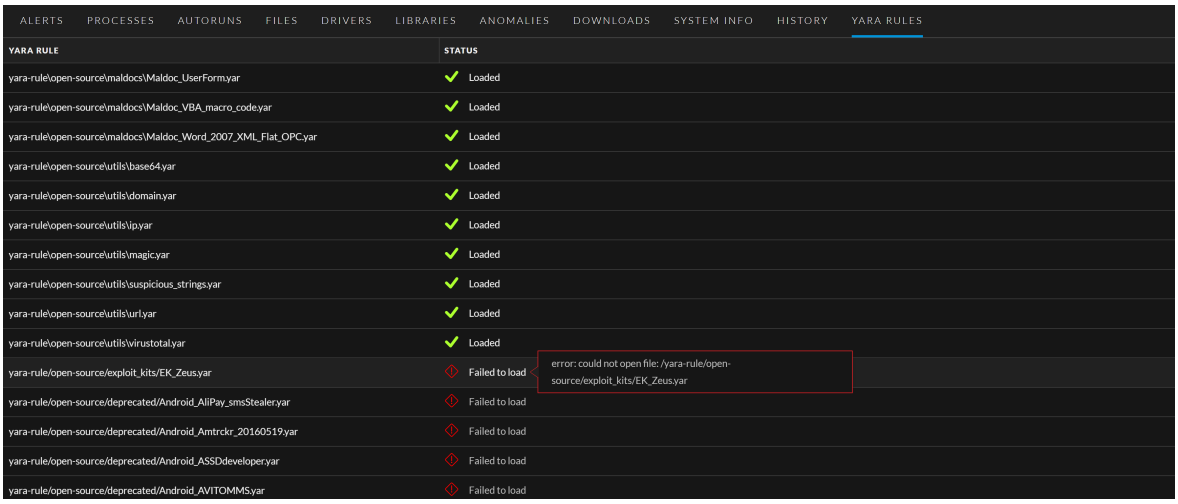


1. Log in to the NetWitness Platform XDR.
2. Click **Hosts**.
3. Select the Endpoint server from the server drop-down to view hosts.
4. Select the **Host** and **YARA Snapshot Time**, and do any of the following:
   - In the Host details view, click **Files** and select a row to view the YARA scan details associated with the file in the **Details** panel.

If any file matches with one or more YARA rules, the **Details** panel displays the matching rule names besides scan time.



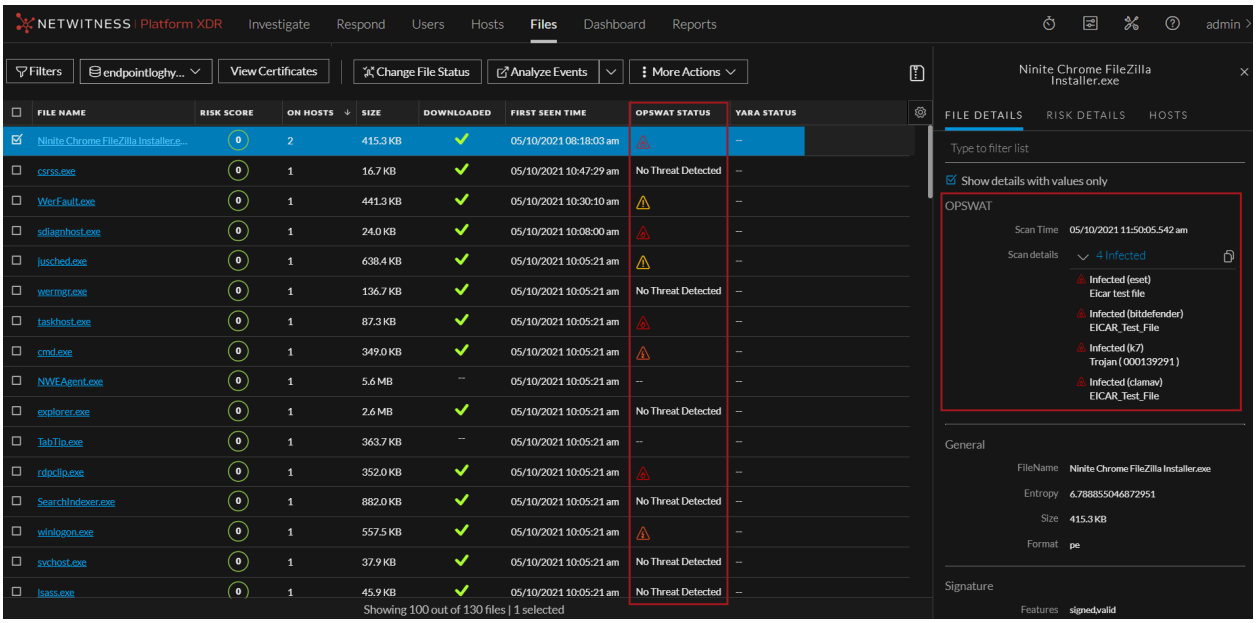
- Toggle the **All Files Available on Host** to view all the files irrespective of the snapshot selected.



Note: When a file matches with a YARA rule, high severity alerts are triggered and the file's risk score is updated.

- On the **Filters** pane, scroll to the **YARA Rules** section. This section provides options to filter the files based on YARA scan status: Select **Matched** to view the files that match YARA rules.
  - You can also view the files that do not match YARA rules or not yet scanned against YARA rules, by selecting **Not Matched** or **Not Yet Scanned** from the YARA rules section.

- In the Host details view, click the **YARA Rules** tab to know if the YARA rules used for the scan are successfully loaded or failed to load. If any of the YARA rules are failed to load, hover over  icon (Failed to load) to know the reason for failure.



- In the Host details view, click the **History** tab to view the command history.

Analyze Files Using OPSWAT

OPSWAT (MetaDefender Core) provides advanced malware detection capabilities by scanning files with multiple anti-malware engines simultaneously. Administrators need to enable and configure OPSWAT on the Endpoint server. To learn more about enabling and configuring OPSWAT, see *NetWitness Endpoint Configuration Guide*.

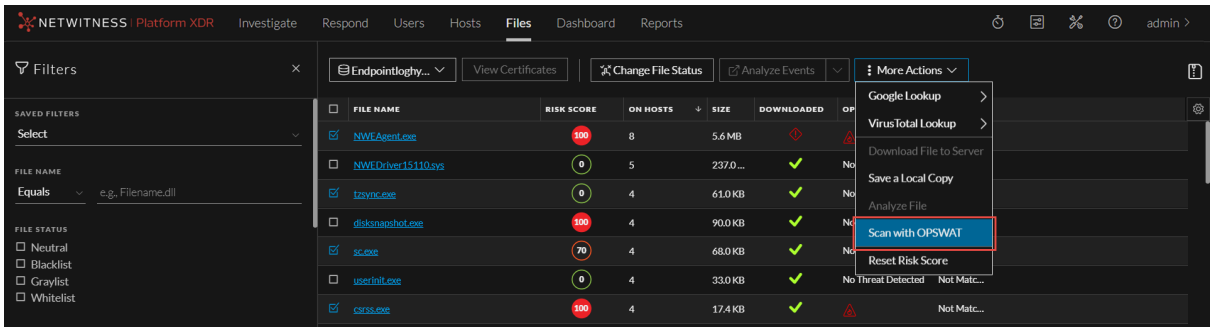
All downloaded files (executable) will automatically be sent to OPSWAT server for scanning once OPSWAT is enabled and configured on the endpoint servers.

Scan files with OPSWAT

Downloaded files are automatically sent to the OPSWAT server for scanning. However, you can also initiate the scan manually using options under the**More Actions** menu. Executable files with the following file extensions, ***pe***, ***script***, ***macro***, and ***elf*** are supported by this feature. The maximum file size limit is set to 10MB by default. You can increase or decrease it if required.

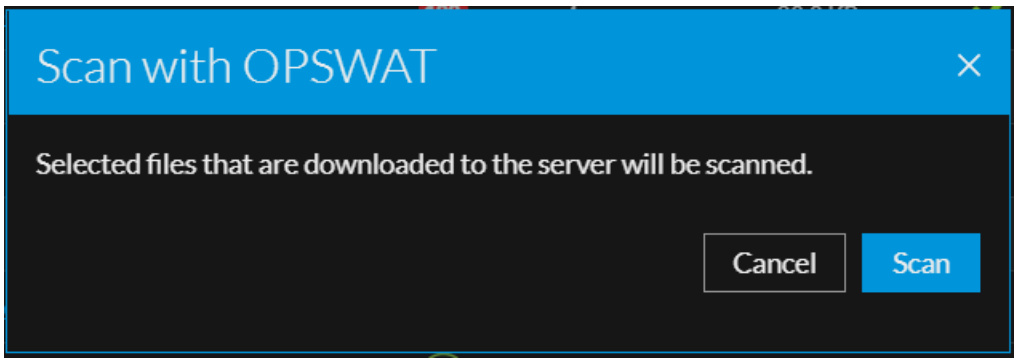
Automatic scan:

The endpoint server will automatically send all (executable) downloaded files to the OPSWAT server. The scan results will be displayed under the**OPSWAT STATUS** column on the**Files** tab.



Manual Scan:

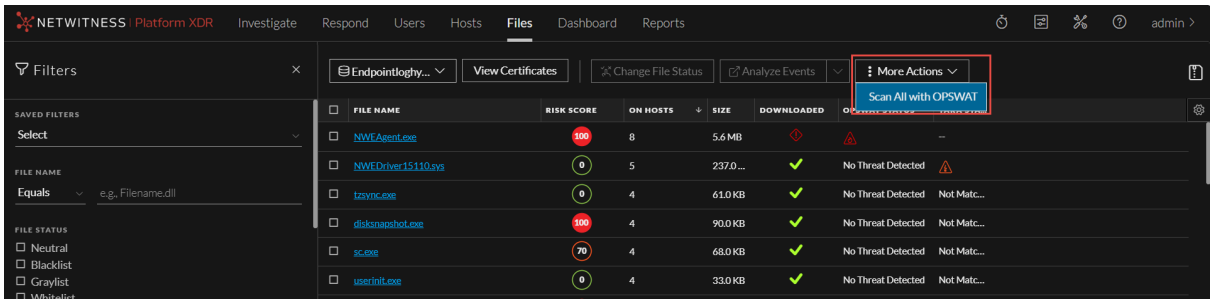
You can also manually initiate an OPSWAT scan using the options under the**More Actions** menu on the **Files** tab.



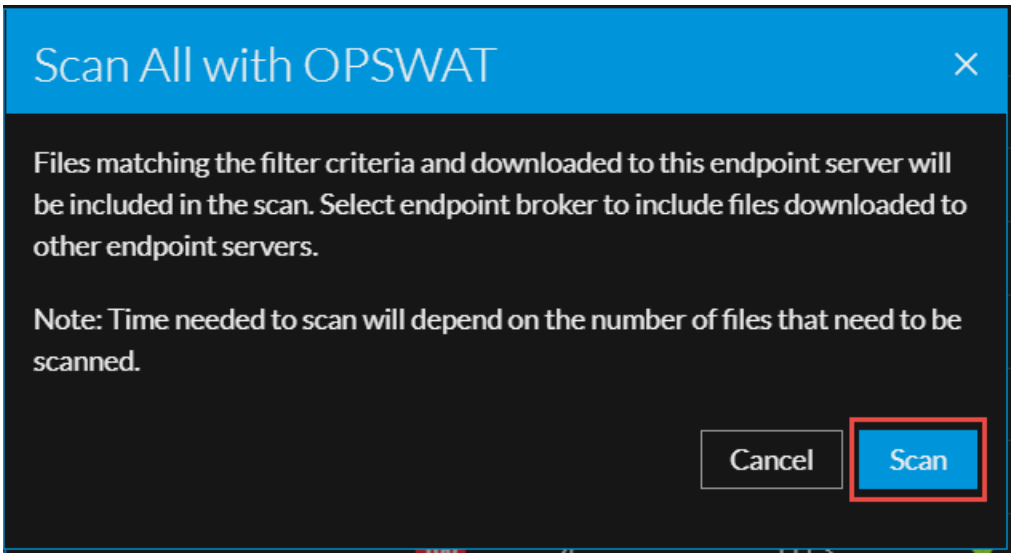
The **More Actions** menu provides the following options:

Manual Scan - Scan selected files

1. Select the files that need to be sent to the OPSWAT server for scanning.
2. Select **More Actions > Scan with OPSWAT**.



3. Click **Scan** on the confirmation pop-up.



Manual Scan - Scan all files

1. Select **More Actions > Scan All with OPSWAT**.

2. Click **Scan** on the confirmation pop-up.

View OPSWAT Scan Results

The scan results will be displayed under the**OPSWAT STATUS** column on the**Files** tab as follows:

 - File is infected

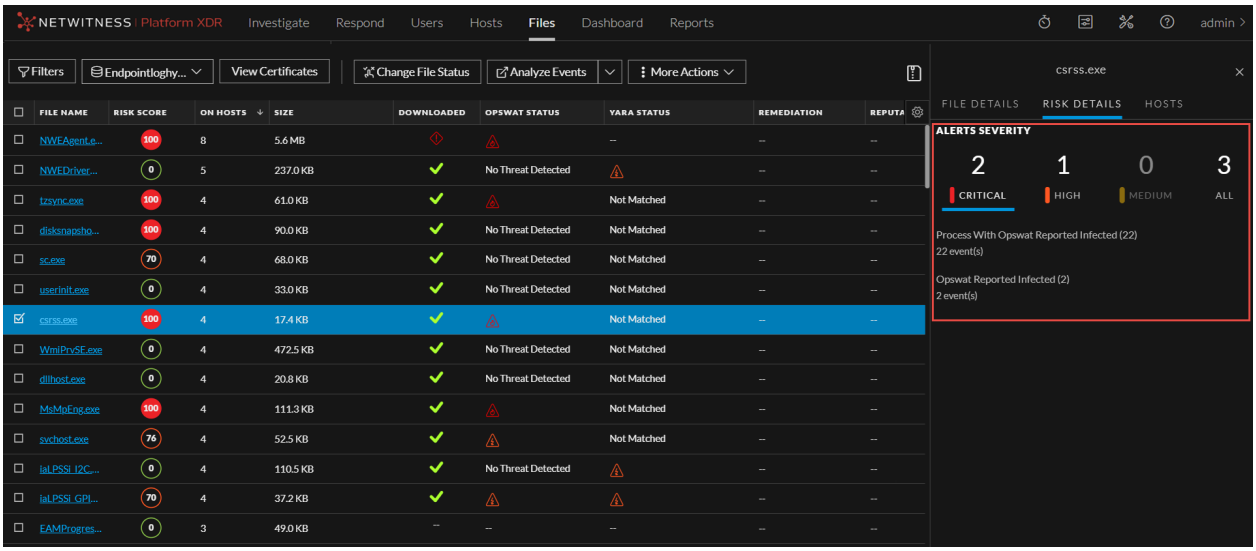
 - Suspicious file

 - Scan failed; see troubleshooting section for more information.

 - The file is clean as of the last scanned time.

 - Not yet scanned.

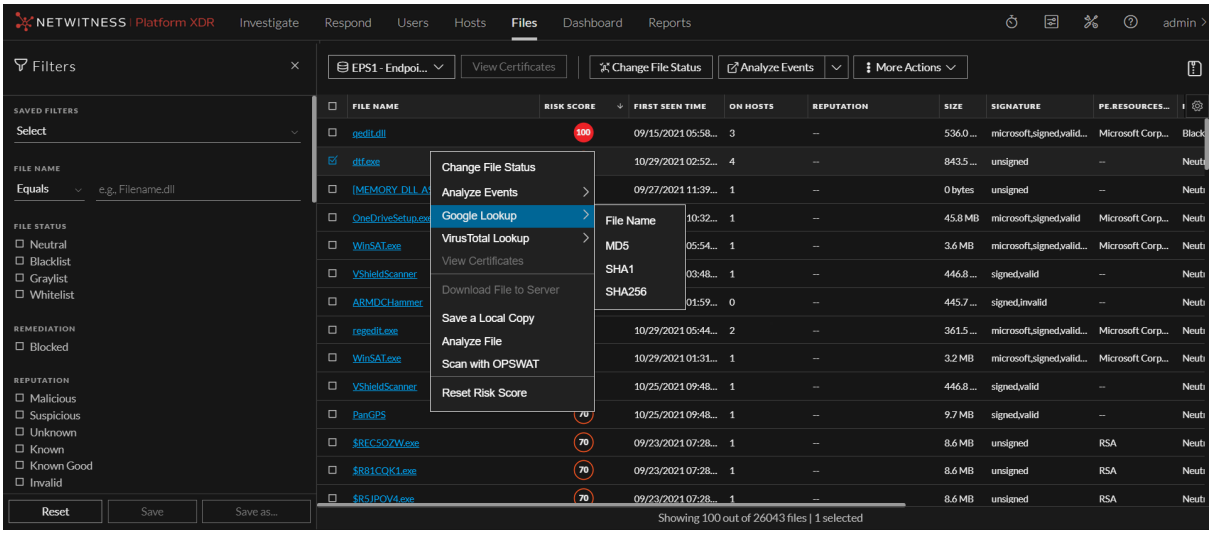
Click on a file to view scan results under the**FILE DETAILS** panel.



- **Scan Time**: States the last scanned time.
- **Scan details**: States whether a file is infected or suspicious or no threat detected, names of anti-malware engines that identified the threat.

Alerts and Impact on Risk scores

Alerts: Critical alerts will be triggered when OPSWAT finds a file as infected, and High severity alerts when a file is found suspicious.



Risk score: If a file is found infected or suspicious by OPSWAT, the risk score of that file and the corresponding host will be increased.

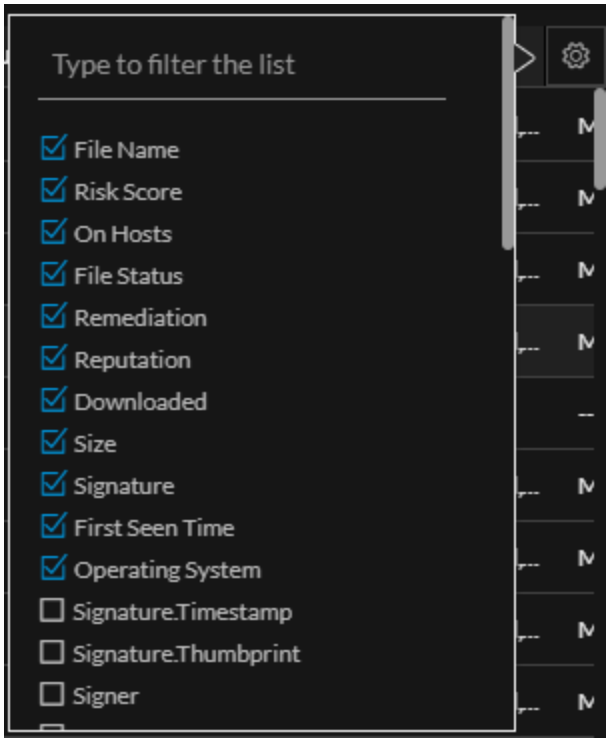
Launch an External Lookup for a File

While analyzing a file, you can search Google or VirusTotal with the filename or hash to get more information about the file. To launch the search:

1. Go to **Files**.
2. View the details of the file name and hash from the table MD5, SHA1, and SHA256 columns, or view the details in the File Details tab on the right panel.
3. Select one or more files, and right-click or in the **More Actions** drop-down list in the toolbar, do the following:

   a. Select **Google Lookup** and perform a search on the filename, MD5, SHA1, or SHA256.

   b. Select **VirusTotal Lookup** and perform a search on MD5, SHA1, or SHA256.



Note: To open files in multiple tabs, make sure you enable the pops-up in the browser.

Set Files Preference

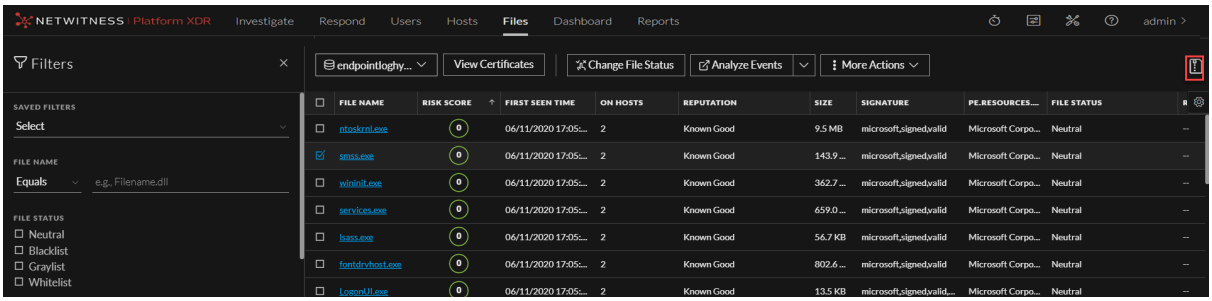
By default, the Files view displays a few columns and the files are sorted based on the risk score. If you want to view specific columns and sort data on a specific field:

1. Go to **Files**.

2. Select the columns by clicking in the right-hand corner. The following example shows the drop-down list displayed while adding columns:

3. Sort the data on the required column.

Note: The selections you make here become your default view every time you log in to the Files view.



Export Global Files

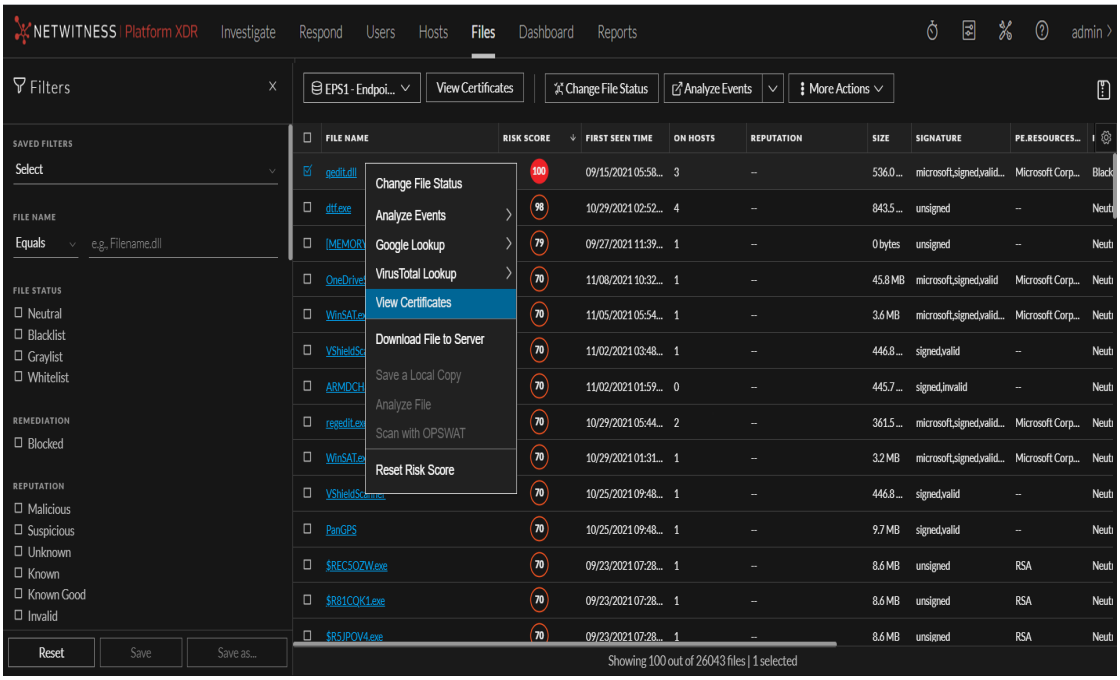
To extract the list of global files to a comma-separated values (csv) file:

Note: While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. You can export up to 100k files at a time.

1. Go to **Files**.
2. Filter the files by selecting the required filter option.
3. Add columns by clicking in the right-hand corner.

4. Click  to export the files to a csv file.

You can either save or open the CSV file.



Analyze Certificates

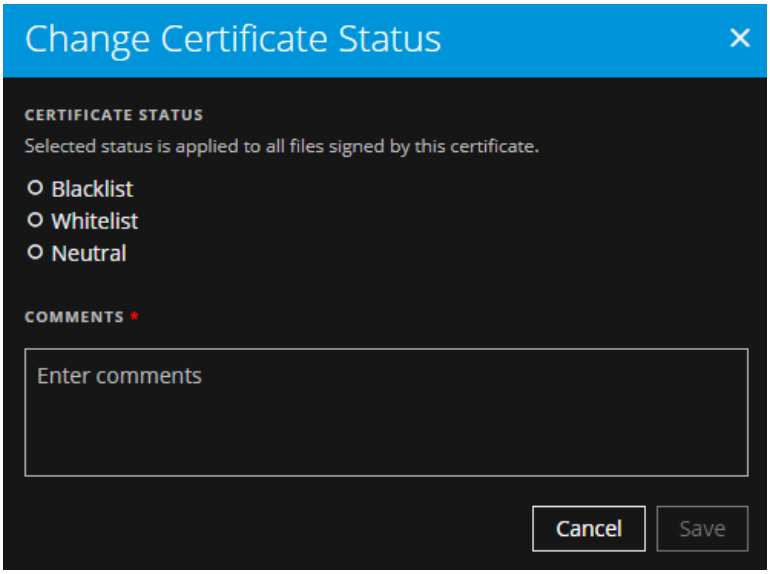
Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Certificates view provides a list of code-signing certificates reported by hosts found in your deployment and their associated properties. You can select the certificates under a specific Endpoint server.

To view the certificates in an Endpoint server:

1. Go to **Files**.
2. From the drop-down menu, select the Endpoint server to view certificates present on that server. To view a consolidated list of certificates, select the Endpoint Broker server.
3. Select a file and do one of the following:

- Right-click and select **View Certificates** from the context menu.
- Click **View Certificates** in the toolbar.



Change the Certificate Status

You can assign a Whitelist status to the certificate signed by certain trusted vendors and this status can be automatically applied to all files that is signed by this certificate. If you consider abc a trusted vendor, you can set the status for the certificates signed by abc as Whitelist.

Similarly, you can also set the certificate status as Blacklist or Neutral. If a company's certificate is stolen or compromised, you can blacklist this certificate and remediate.

To change the certificate status:

1. Select a certificate, and click **Change Certificate Status**.

2. In the Change Certificate Status dialog, select a status - Blacklist, Whitelist, or Neutral.

   Note: If you have manually updated a file status in the Files or Hosts view, changing the status in the Certificate view does not impact the file status as the manual update takes precedence. For example, if you have whitelisted the file vmci.sys that is signed by VMware, Inc. in the Files or Hosts view, and you have blacklisted VMware, Inc. in the Certificate view, the file vmci.sys remains Whitelisted though the certificate is blacklisted.

3. Add a comment and click **Save**.
4. Click **< Files** to go to the Files view.

Note: In a multi-server environment, changing the status of a certificate in one endpoint server updates the respective files in other endpoint servers. For example, if a certificate status is set to Blacklist on one endpoint server, all files signed by this certificate are set to Blacklisted on all endpoint servers.

Filter Certificates

You can filter certificates on status, signature, friendly name, and thumb print.

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters list. To delete a filter, hover over the name, and click .

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Manage Blocked File Hashes

Blocked File Hashes view **Files** > **Manage** > **Blocked File Hashes** allows administrators and analysts to perform the following actions.

- View already blocked File Hashes in the deployment.
- Add new File Hash and block it.
- Delete and unblock the Blocked File Hashes.
- Import and block multiple File Hashes using the CSV file.

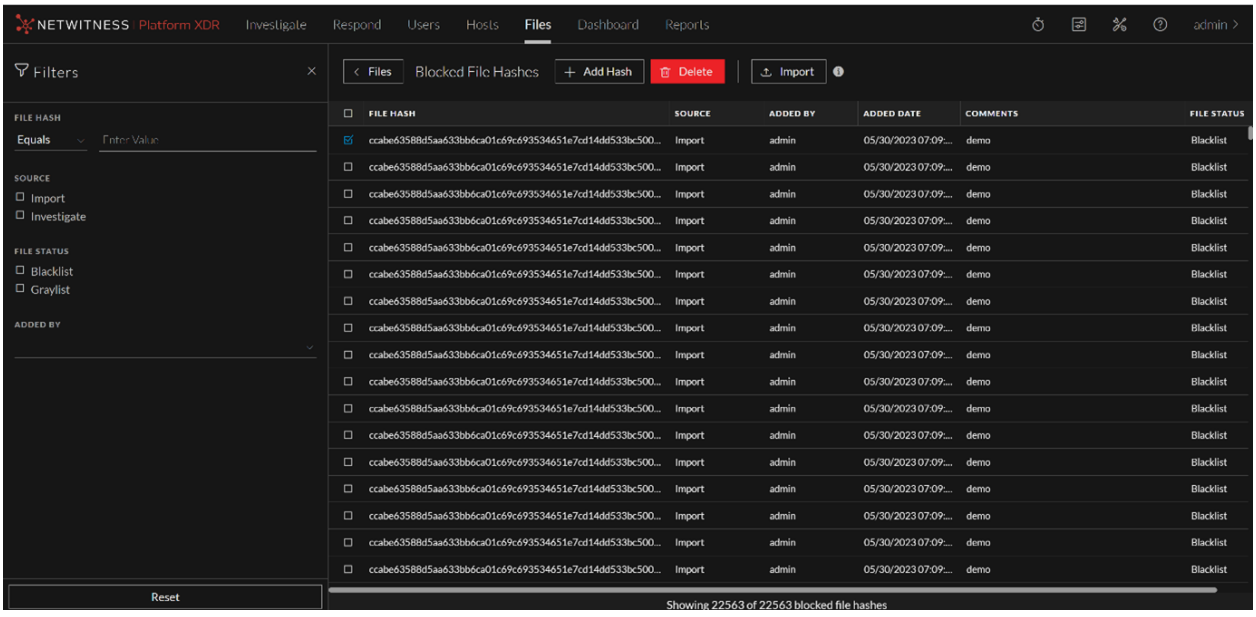
You can block up to a maximum of 50,000 file hashes.

IMPORTANT:
- Enter only valid SHA256 hashes; otherwise, the blocking functionality might break.
- Do not block any file hashes signed by RSA, Microsoft, and Apple. It might make your Endpoints unresponsive.
- If the number of already blocked File Hashes is 0, and you import more than 50K File Hashes, only the first 50K File Hashes are blocked.

Note: Analysts must have the **contexthub-server.datasource.read** permission to access the **Blocked File Hashes** view.

Toolbar Actions

The table below lists the toolbar actions available in the **Blocked File Hashes** view.



Option	Description
+ Add Hash	Select this option to block a single File Hash.
Delete	Select this option to delete the blocked File Hashes.
Import	Select this option to import and block multiple File Hashes.
< Files	Select this option to return to the **Files** view.

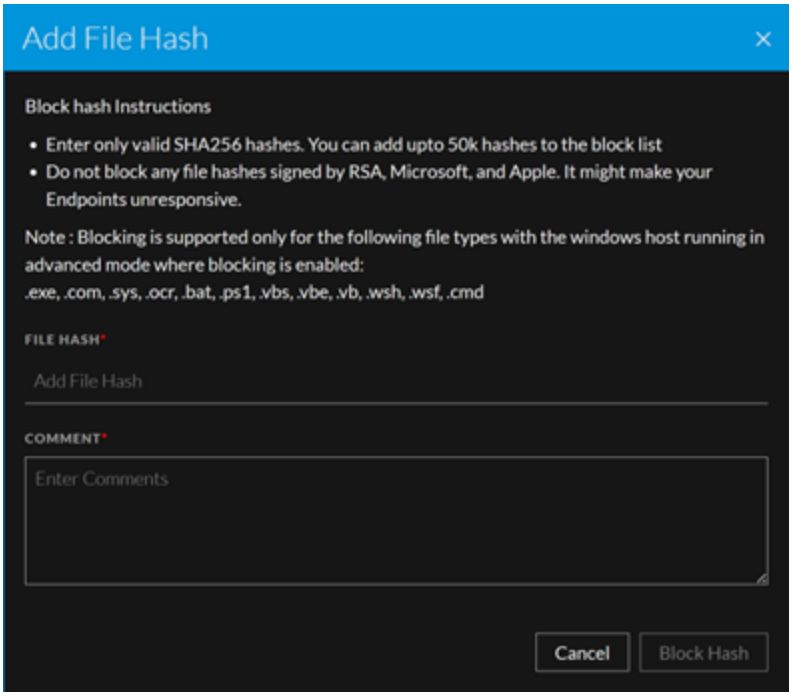
View Blocked File Hashes

You can view the File Hashes already blocked as part of NetWitness deployment in the **Blocked File Hashes** view.

To view the Blocked File Hashes:

1. Go to **Files** > **Manage** > **Blocked File Hashes**.
   The **Blocked File Hashes** view is displayed.

2. View the list of Blocked File Hashes in the **File Hash** column.



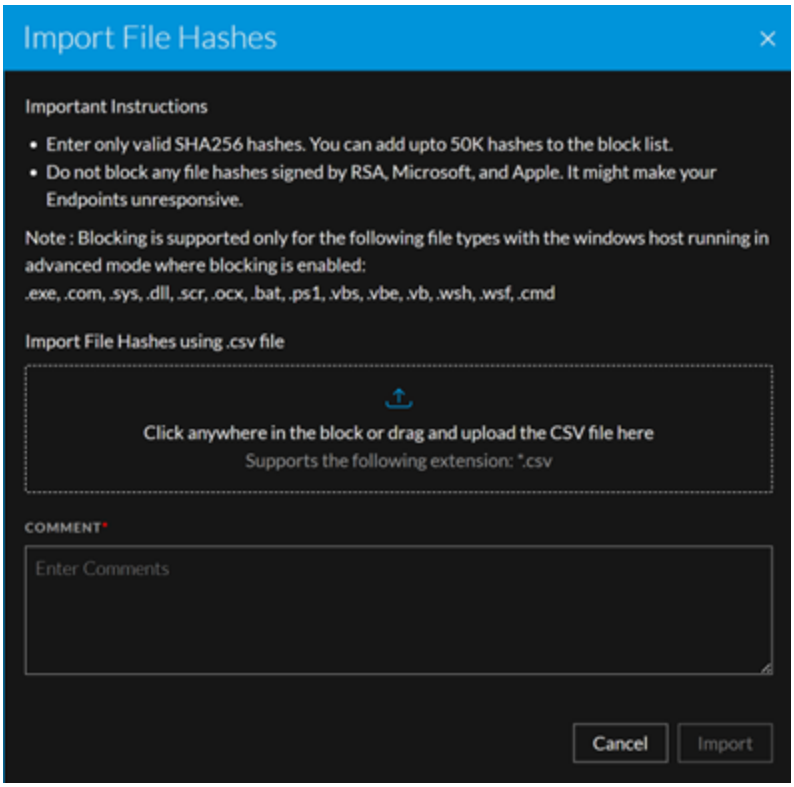
Add File Hash

You can add a new File Hash to the list of blocked hashes using the **Add Hash** option in the **Blocked File Hashes** view.

To block a new File Hash:

1. Go to **Files** > **Manage** > **Blocked File Hashes** > **Add Hash**.

   The **Add File Hash** dialog is displayed.



2. Enter the **File Hash**.
3. Specify the reason for blocking the new File Hash in the **Comment** section.
4. Click **Block Hash**.

Import File Hashes

You can import and block the File Hashes in bulk using the **Import** option in the **Blocked File Hashes** view.

To import the File Hashes:

1. Go to **Files** > **Manage** > **Blocked File Hashes** > **Import**.
   The **Import File Hashes** dialog is displayed.

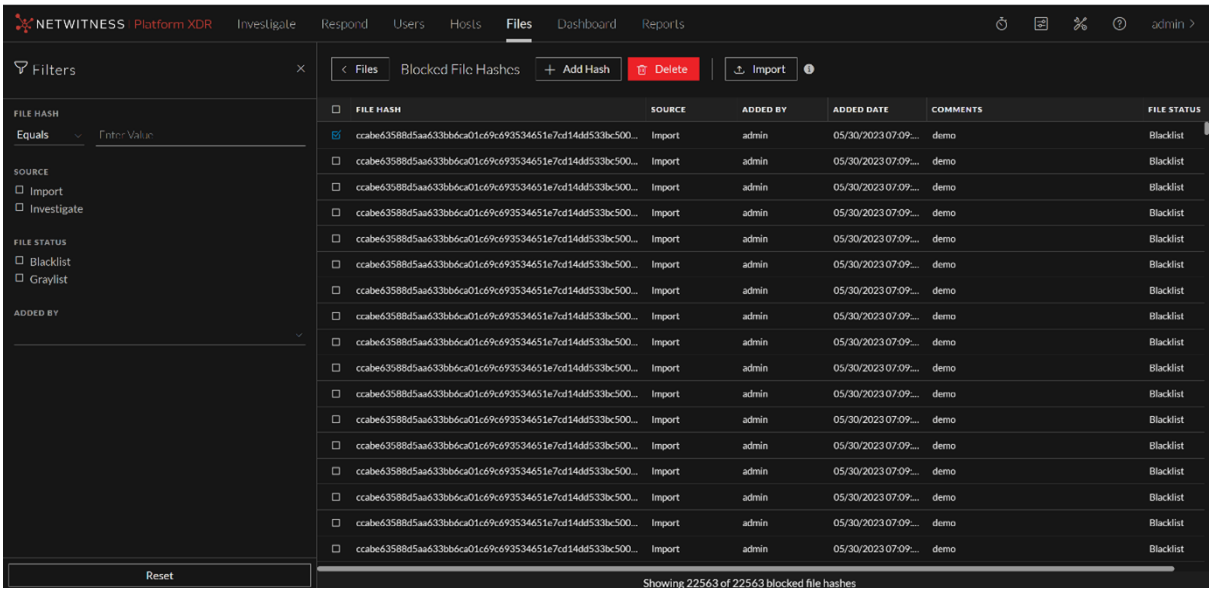
2. Under **Import File Hashes using .csv file**, do one of the following.
   - Click the block to upload the CSV file.
   - Drag and upload the CSV file in the block.
3. Specify the reason for blocking the File Hashes in the **Comment** section.
4. Click **Import**.

Note: Only the unique file hashes are imported during the Import process. If you import the .csv file with few existing blocked file hashes, the Blocked File Hashes List view is updated to reflect the corresponding changes. The duplicate file hashes are not accounted for the change in the total count of blocked file hashes.

Note: While updating the CSV file, make sure you enter each file hash value in separate rows under a single column and then upload the CSV file to block the file hashes. Refer the following figure.

	A	B	C	D	E	F	G
1	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2116						
2	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2117						
3	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2118						
4	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2116						
5	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2117						
6	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2118						
7	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2119						
8	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2120						
9	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2121						
10	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2122						

Note: Analysts must have the **contexthub-server.datasource.manage** permission to import the file hashes.



Delete File Hash

You can delete and unblock a blocked File Hash using the **Delete** option in the **Blocked File Hashes** view.

To delete a blocked File Hash:

1. Go to **Files** > **Manage** > **Blocked File Hashes**.

   The **Blocked File Hashes** view is displayed.

2. Select the blocked File Hash and click **Delete**.

The **Delete Hash** confirmation dialog is displayed.

3. Click **Delete**.

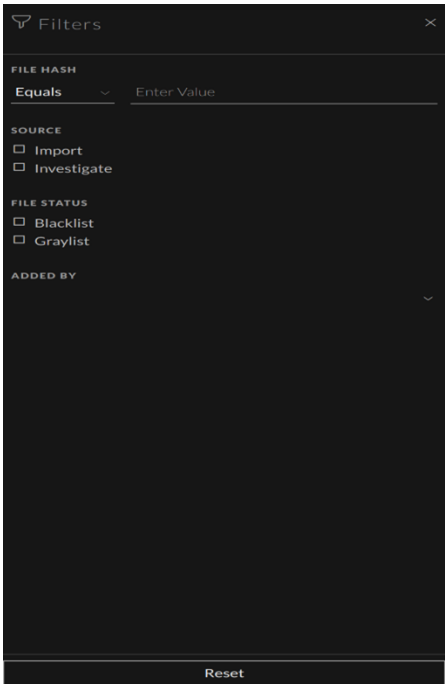
Blocked File Hashes List View

The Blocked File Hashes List view consists of a Filters panel and the Blocked File Hashes List.

Blocked File Hashes List

The Blocked File Hashes List displays all the Blocked File Hashes in the NetWitness Platform XDR.

The following table describes the columns in the Blocked File Hashes List.



Columns	Description
	Allows you to select the required Blocked File Hash.
File Hash	Displays the list of Blocked File Hashes
Source	Displays the Source used for blocking the File Hashes. For Example: **Import** **Note:** When you upgrade to 12.3 or later versions from the versions older than 12.0, the **Source** column displays **Investigate** for all the File Hashes blocked in the previous deployment using the **Import** option. The **Source** column displays **Import** only for the File Hashes you block using the **Import** option in NetWitness Platform XDR 12.3 or later versions. If you upgrade to 12.3 or later versions from 12.0 or later versions, the **Source** column displays **Import** for the File Hashes blocked in the previous deployment and the current deployment using the **Import** option.
Added By	Displays the name of the administrator or the analyst who blocked the File Hashes.
Added Date	Displays the date on which the File Hashes are blocked. For Example: 03/20/2023 10:00:00AM
Comment	Displays the comment provided by the administrator or the analyst while blocking the File Hashes.
File Status	Displays the file status of the Blocked File Hashes. For Example: **Blacklisted**.

Filter Blocked File Hashes

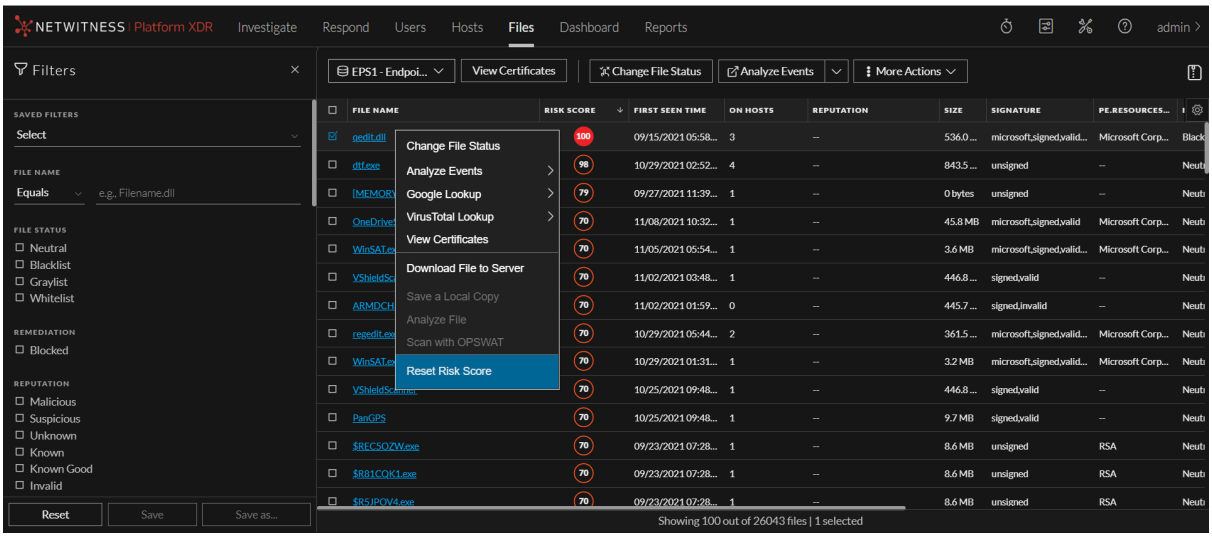
You can filter the Blocked File Hashes based on the following parameters.

- Value of the File Hash
- Source used for blocking the File Hashes

- File status of the Blocked File Hashes
- User who blocked the File Hashes

Click **Reset** to remove the filters applied.

Resetting Risk Score of Files



You can reset the risk score for a file in these situations:

- If the alerts or events triggered by the host or a file are considered to be false positive, you can make required changes to the Endpoint Application rules or ESA rules.
- After you take required action on a malicious file.

When you reset the risk score, the risk calculation for the file is deleted and score is set to 0. The risk score on all the hosts on which this file exists is recalculated. You can reset the risk score for a single file or multiple files.

To reset the risk score of a file:

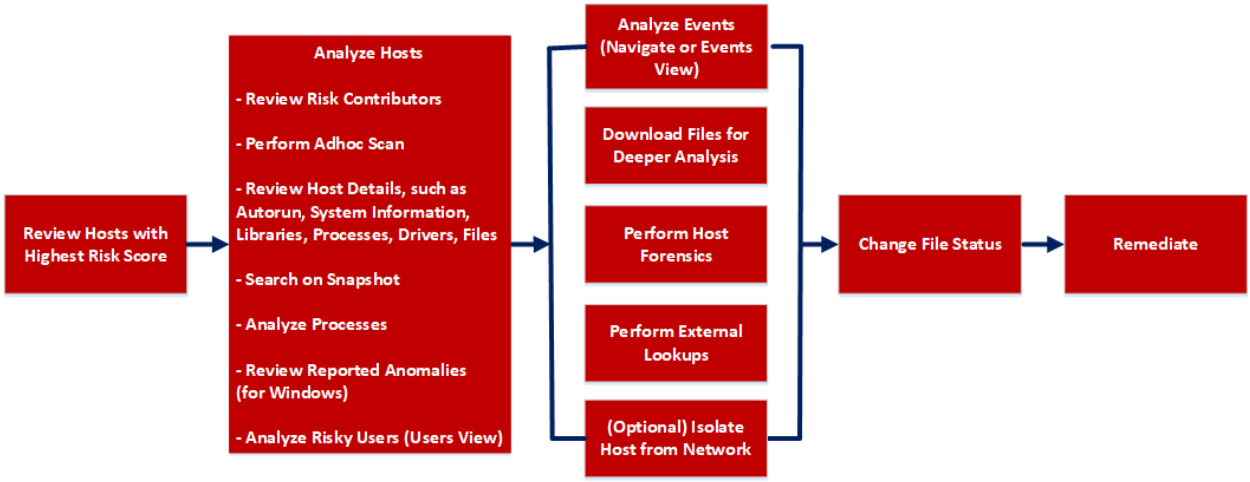
1. Go to **Files**.
2. Select the Endpoint Server or Endpoint Broker.
3. Select one or more files and do one of the following:

- Right-click and select **Reset Risk Score** from the context menu.
- Click **More Actions** > **Reset Risk Score** in the toolbar.

All the alerts associated with the score are deleted.

Note: You can select a maximum of 100 files to reset the score.

4. Refresh the page to view and confirm if the file's score is reset. This may take sometime for changes to take effect.



Investigating Hosts

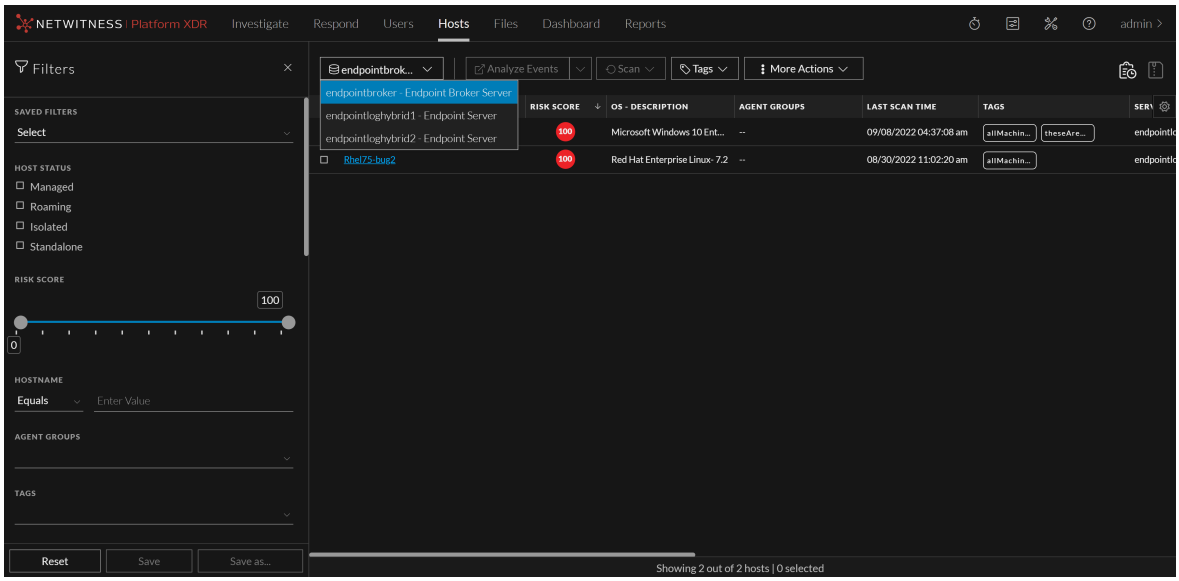
Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Hosts view allows you to investigate on a host, which includes scan details, tracking events related to alerts, anomalies, and process details.

Best Practices

The following are some best practices and tips that may help you investigate efficiently to identify and isolate threats or attacks:

- Review hosts with highest risk score and analyze the alerts contributing to the risk. Review the entities, such as file name, processes involved in the alerts. For more information, see Analyze Hosts Using the Risk Score.
- Review files or processes that created this suspected file, and check if any other files are accessed or created in the Events view. For more information, see Analyzing Events.
- Review hosts for rare files in the **On Hosts** column. If a file is present on 100 hosts, it can be legitimate. If a file is present on fewer hosts with a high risk score, it may be malicious and needs further investigation.
- Filter to exclude hosts on host status, risk score, hostname, and so on. For more information, see Filter Hosts.
- Search Google or VirusTotal with the file hash and review any reported activities. For more information, see Launch an External Lookup for a File.



- Review the processes, autoruns, files, libraries, drivers, and system information. For example,
  - Search for files in known malware locations. For example,
    - C:\Windows\.
    - C:\Users\<name>\AppData\<uncommon folder>.
    - C:\Users\<name>\AppData\Local\Temp.
    - C:\Windows\Temp\.
  - Search for a particular file name or hash and review the snapshot to check when the file was first seen.
  - Review any network connections established by the process, such as:
    - Domain or IP address.
    - Ports used (common (80 and 443) versus uncommon ports (8080 , 8888, and 3465)) and check if the ports are listening actively.
  - Check the file compile time. If the date is recent, it could be malicious.
  - Check the file creation time on the host.
- Review reported anomalies, such as suspicious threads, kernel hooks, image hooks, and registry discrepancies. For more information, see Analyze Anomalies.
- Launch Process Analysis to view the sequence of activities performed on the host by the file or process. For more information, see Analyze Processes.
- Download suspicious files to the server for deeper analysis. For more information, see Analyzing Downloaded Files.
- Download MFT, process, or system dump to the server for forensic investigation. For more information, see Performing Host Forensics.
- After investigation if a file is found to be malicious you change the status of the file (blacklist or graylist) and block infected or malicious file. For more information, see Changing File Status or Remediate.
- (Optional) If you suspect that a host is potentially compromised with the threat still being active, you can isolate the host from the network and safely investigate possible threats within the host. For more information, see Isolating Hosts from Network.

View Hosts

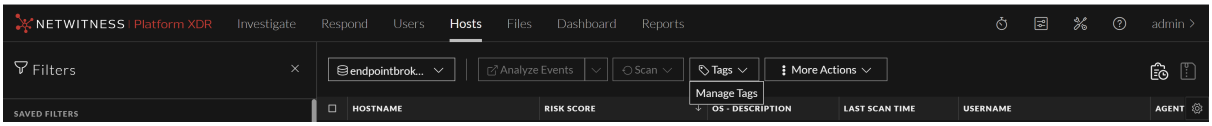
You can view all hosts present on a specific Endpoint server or consolidated list of all hosts on multiple Endpoint servers using the Endpoint Broker for analysis. By default, hosts are sorted based on the risk score. To view the hosts:

1. Go to **Hosts**.
2. Select from the following:

- **Endpoint Broker Server** to view all hosts across all Endpoint servers. When querying, the Endpoint Broker ignores Endpoint servers that are offline. If the Endpoint server is online but is not responding, the Endpoint Broker waits for 10 seconds, and ignores if it does not respond.
- **Endpoint Server** to view hosts on a specific Endpoint server.

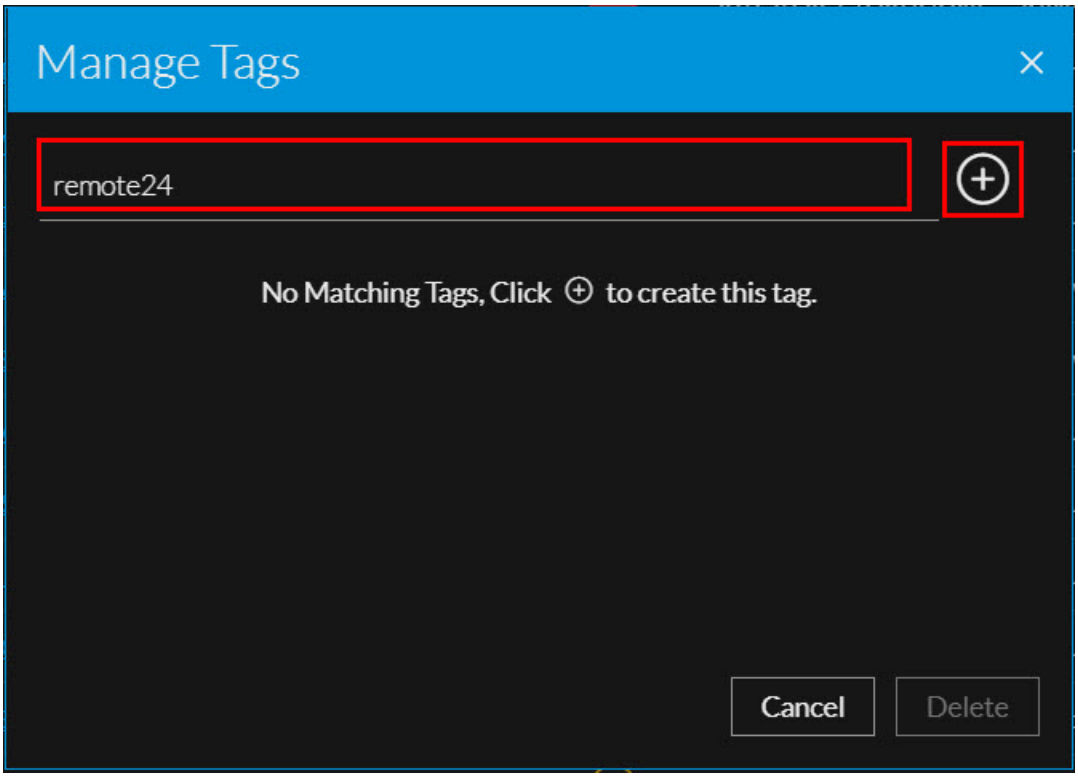
3. Select a host that you want to analyze.
4. Click a row to view the following details:
   - **Host Details** displays the host information such as Network Interfaces, operating system, hardware and others.
   - **Risk Details** displays the distinct alerts associated to the risk score and the alerts severity. Click **Critical**, **High**, **Medium**, or **All** to display all the alerts. For more information, see Analyzing Risky Users.
5. Click **Show next 100 hosts** to view other hosts.
6. Click the host name to investigate the scan results. For more information, see Analyze Host Details.

Manage Hosts Using Tags



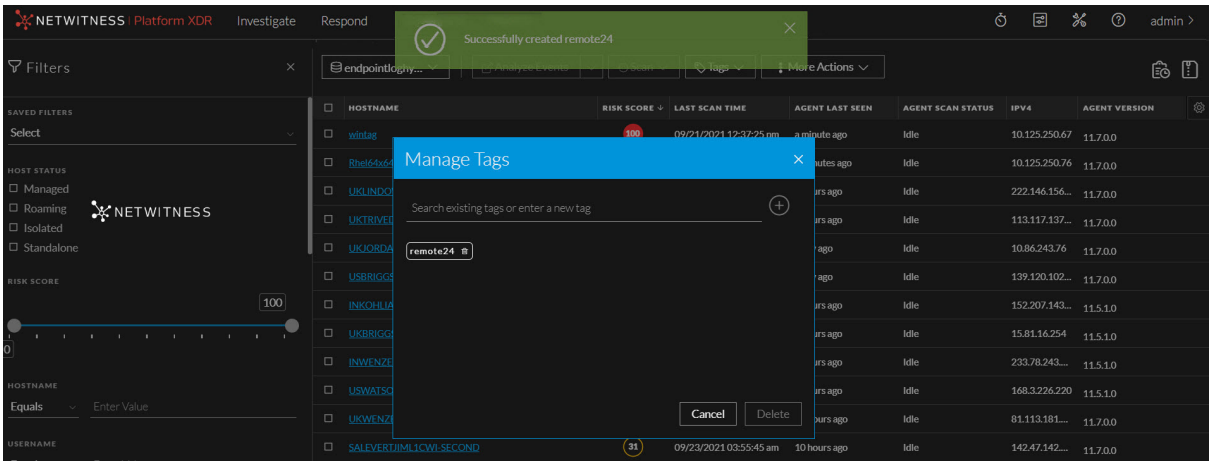
From version 11.7 and later, NetWitness Platform allows you to create Tags to manage the hosts effectively. Tags are custom texts that you can create and assign to hosts for identifying them. A tag can contain alphabets, numbers and special characters(Except \ **' , [ ] "** and **space**). You can use these tags to create host groups. You can also filter hosts by tags using the filters pane on the Hosts screen.

Manage Tags



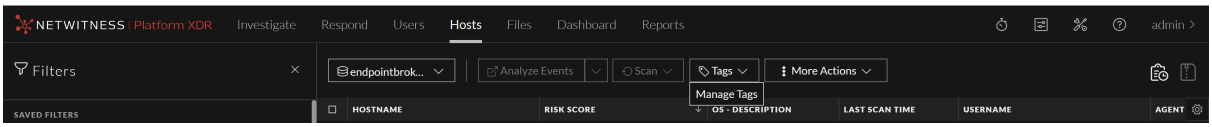
The Manage Tags option allows you to create and delete tags without selecting any hosts.

To Create Tags:

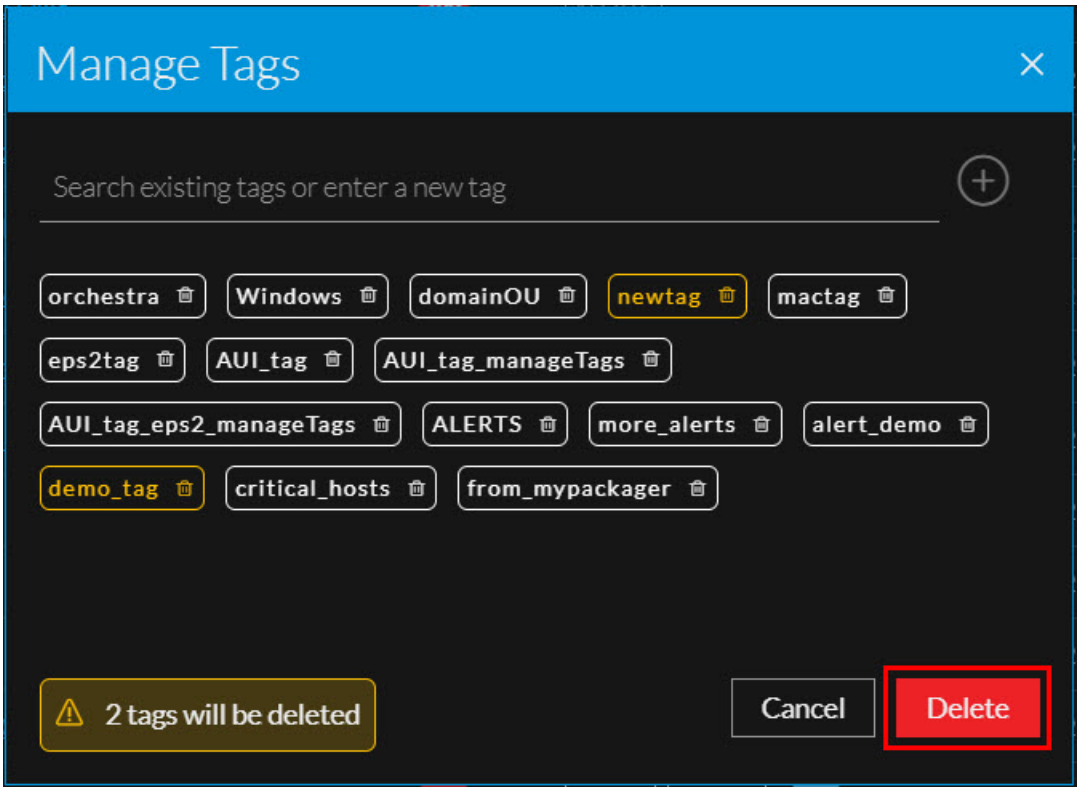


1. Click **Tags > Manage Tags** on the Hosts tab.

2. Enter a valid tag in the text field on the **Manage Tags** pop-up and click ⊕.

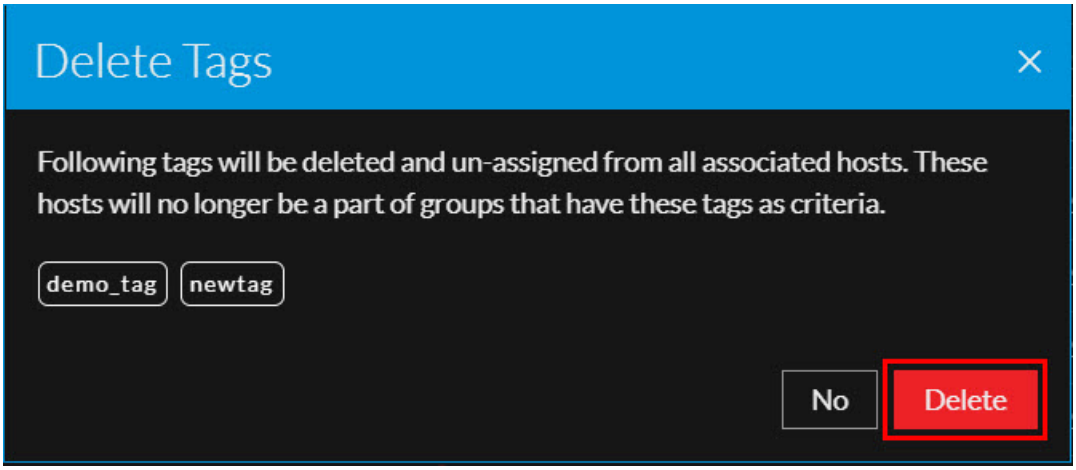


- The tag is created, and a success message will appear.



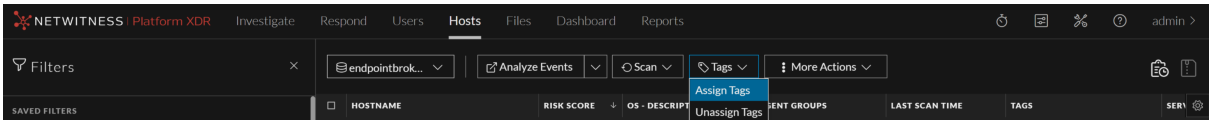
3. Repeat step 2 to create more tags.

To Delete Tags:



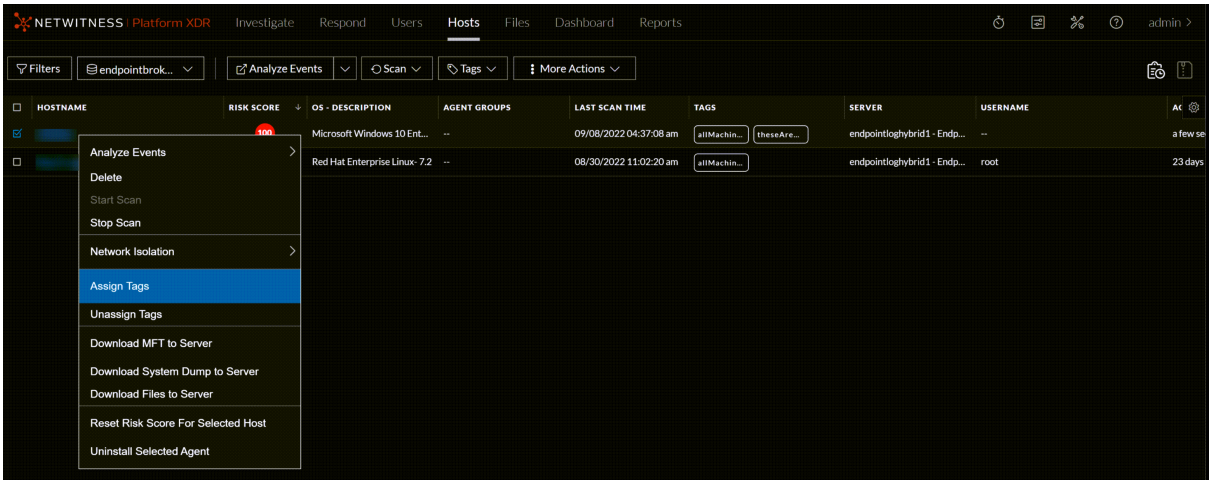
1. Click **Tags > Manage Tags** on the Hosts tab.

2. Select the tags that you want to delete and click **Delete** on the **Manage Tags** pop-up.



3. Click **Delete** on the **Delete Tags** confirmation pop-up.

Note: The tags you deleted will also be unassigned from all associated hosts. If the associated hosts are a part of groups created using these tags as one of the criteria, then the hosts will no longer be a part of those groups. Refer What happens next after unassigning or deleting tags from hosts? for more information.

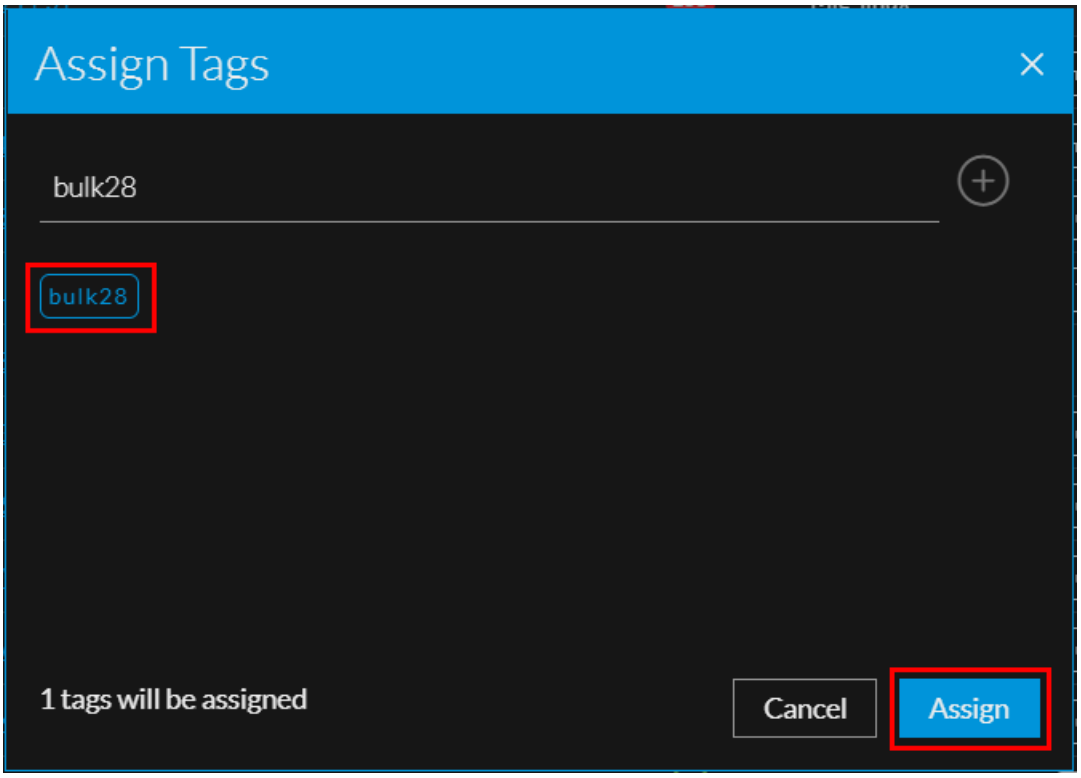


Assign tags

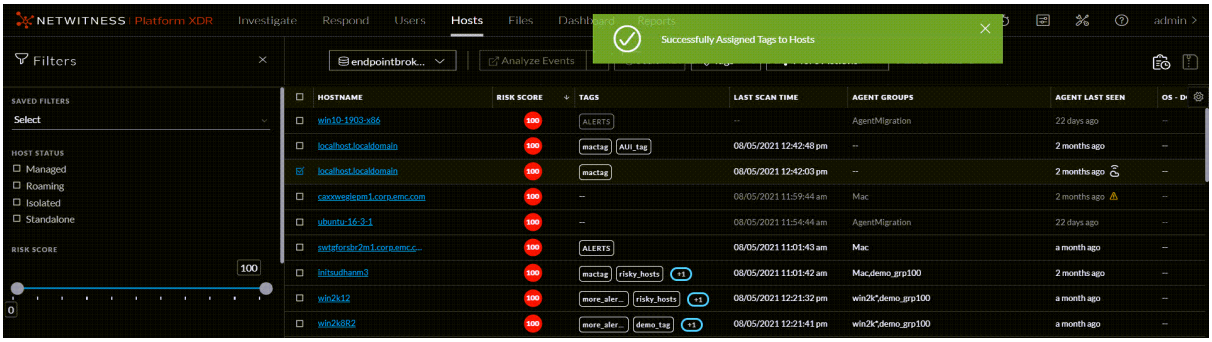
1. Select one or more hosts on the Hosts tab.
2. Do one of the following.
   - Select **Tags > Assign Tags** from the menu.

   - Select a host, right click and select **Assign Tags**.

     The **Assign Tags** pop-up will appear and shows all the existing tags.

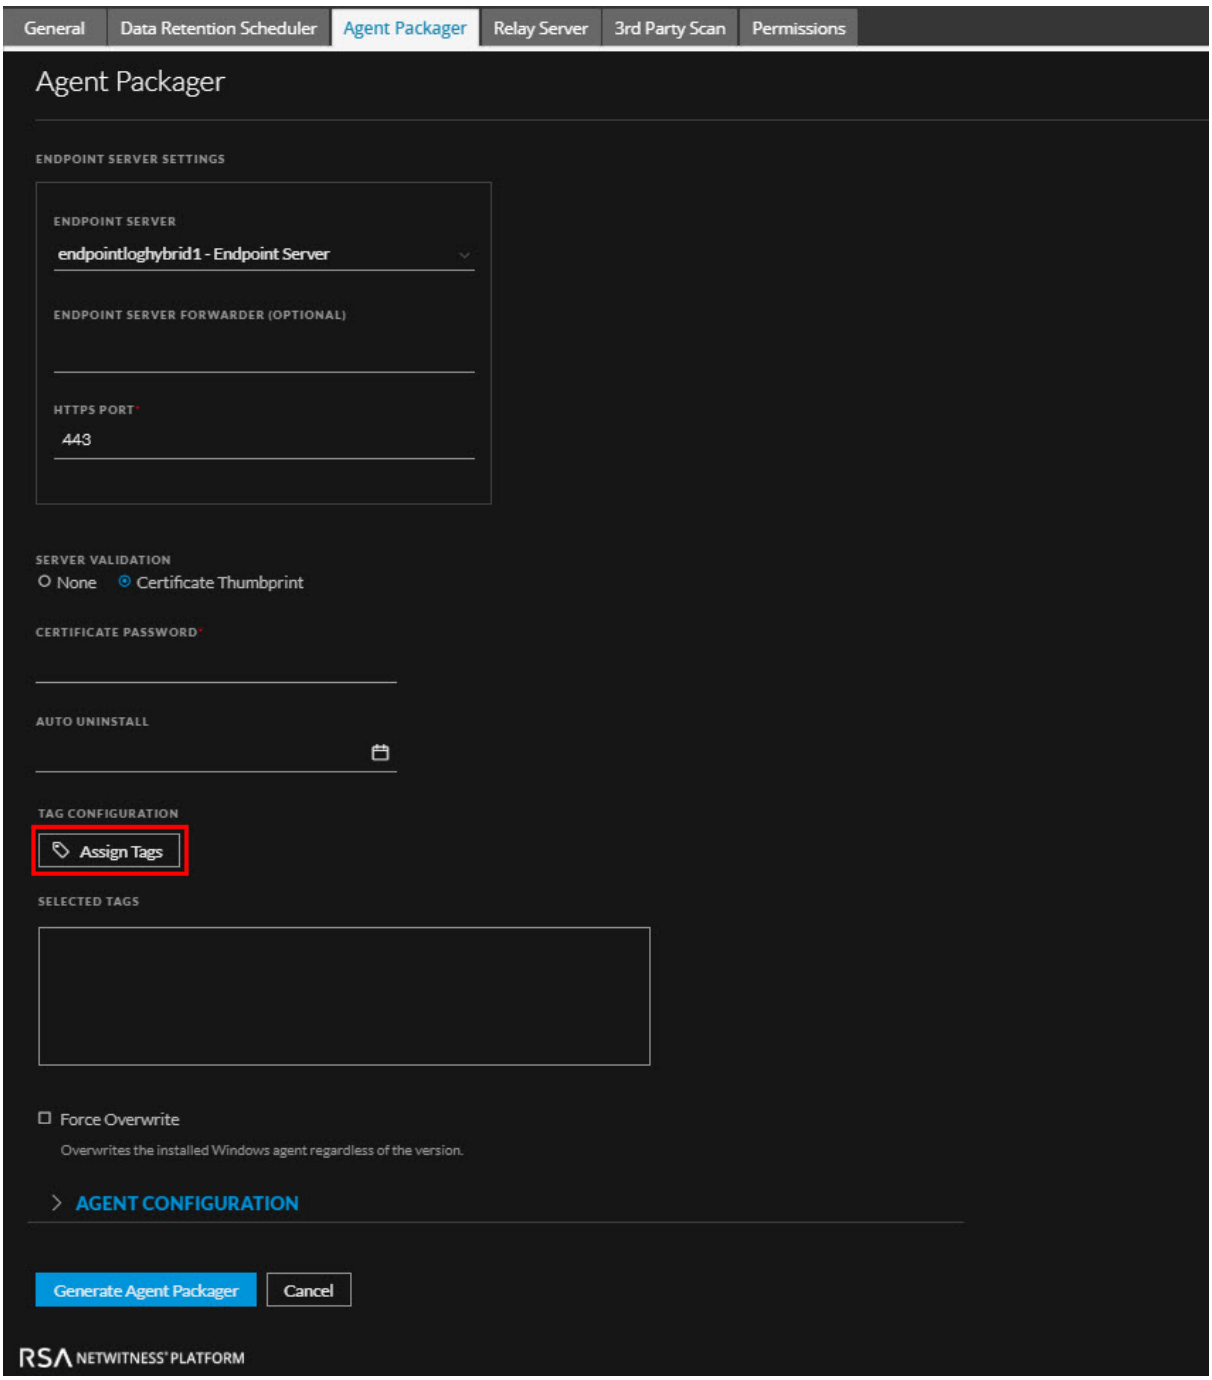


3. Do one of the following.

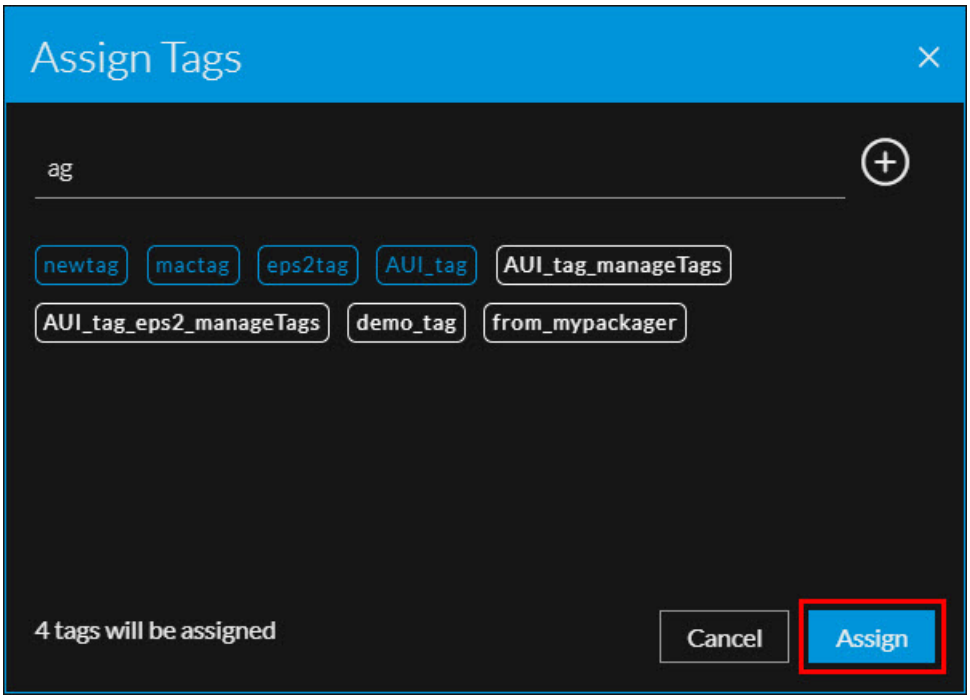


- Enter a valid tag and click  to create it. The newly created tag is selected by default.

- Search for an existing tag using the text field and select it if required.



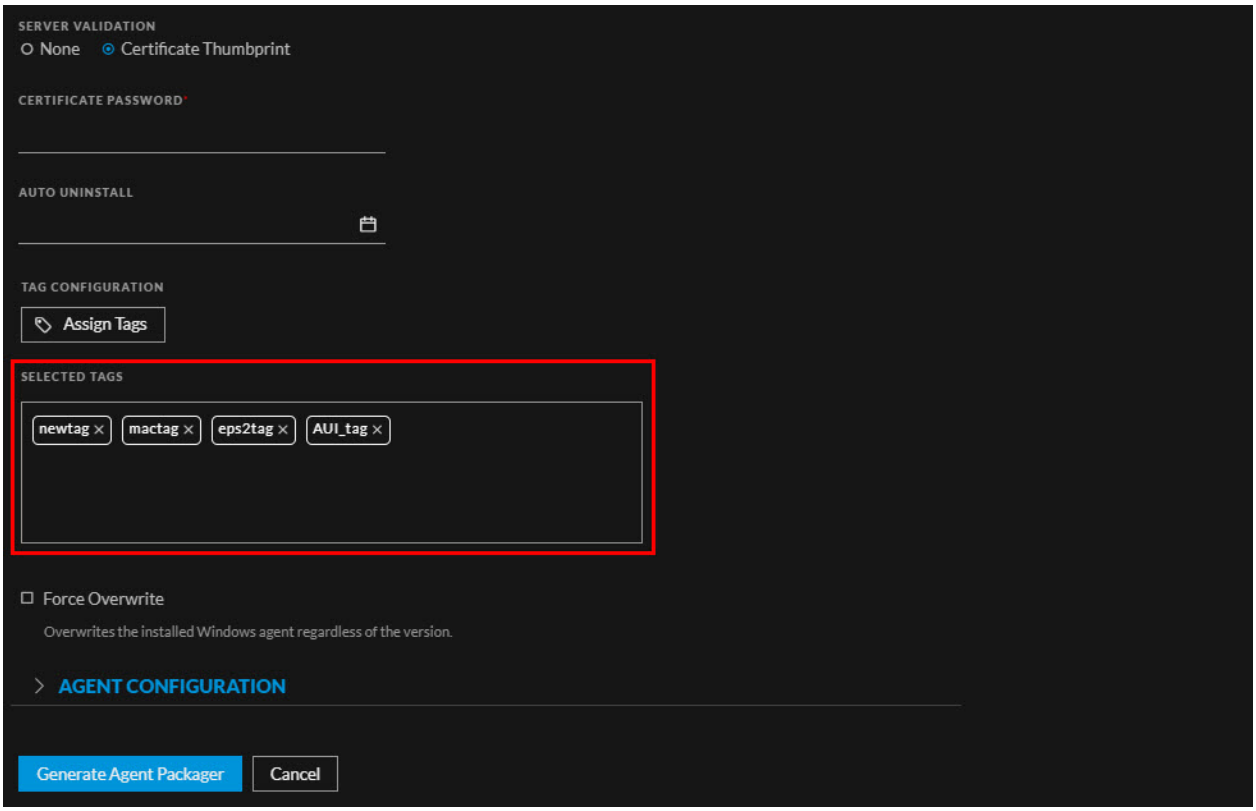
4. Click **Assign**. These tags will be assigned to the selected hosts.



Create and Assign Tags When Generating the Agent Packager

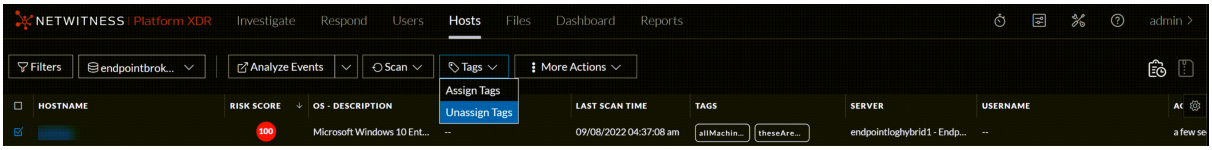
You can add tags to the hosts while installing the Endpoint agents. When generating the agent packager on the Agent Packager tab, you can either create new tags or select already existing tags. These tags will automatically be assigned to the host in which the agent will be installed.

1. Click **Assign Tags** under **TAG CONFIGURATION** on the **Agent Packager** tab.

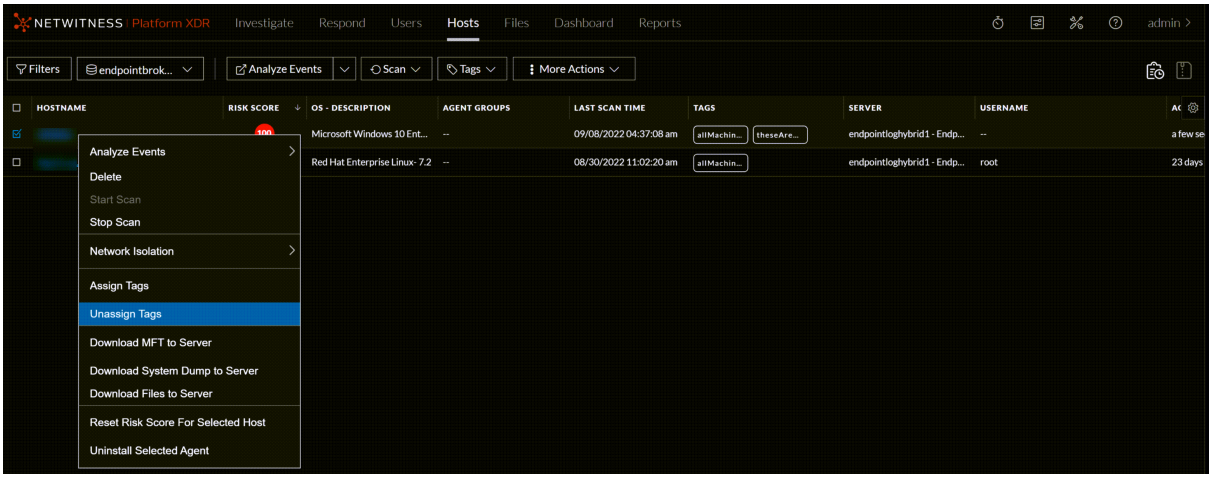


2. On the **Assign Tags** pop-up, do one of the following.
   - Search for an existing tag using the text field and click **Assign**.

- Enter a new tag in the text field and click  to add it to the selection. Click **Assign**.

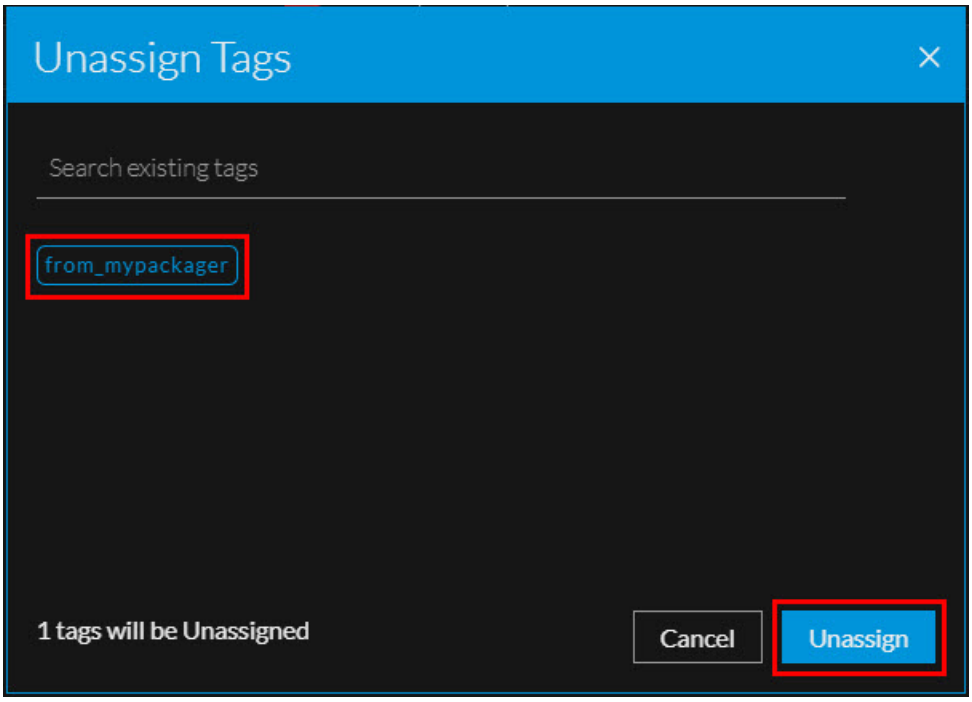


3. Assigned tags will appear under **SELECTED TAGS**.



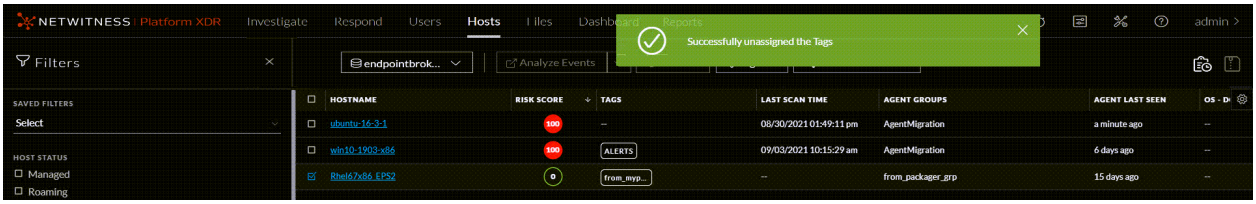
Note: The tags added while generating the Agent Packager are applicable only to the newly installed agents and not to the manually upgraded agents.

Unassign tags



1. Select one or more hosts on the **Hosts** tab.
2. Do one of the following.
   - Select **Tags > Unassign Tags** from the menu.

   - Right click a host and select **Unassign Tags**. The **Unassign Tags** pop-up will appear and show all the tag assigned to the selected hosts.



3. Search for the tags you want to unassign, select them and click **Unassign**.

4. Click **Unassign** on the confirmation pop-up.

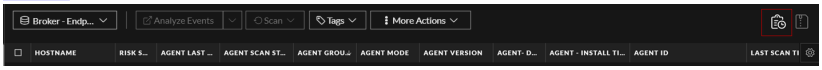
5. These tags will be Unassigned from the selected hosts.

What happens next after unassigning or deleting tags from hosts?

Unassigning/deleting tags from hosts will immediately initiate group & policy evaluation. For example, if a host is a part of the group created using only the unassigned/deleted tag as criteria, the host will no longer be a part of that group. Refer to the following scenarios to understand more.

Example Scenario 1: Assume you create a group with a couple of tags as grouping criteria, all the hosts with these tags assigned will be a part of the group. And, if you delete these two tags(or unassigning from the hosts), the hosts may no longer be a part of this group.

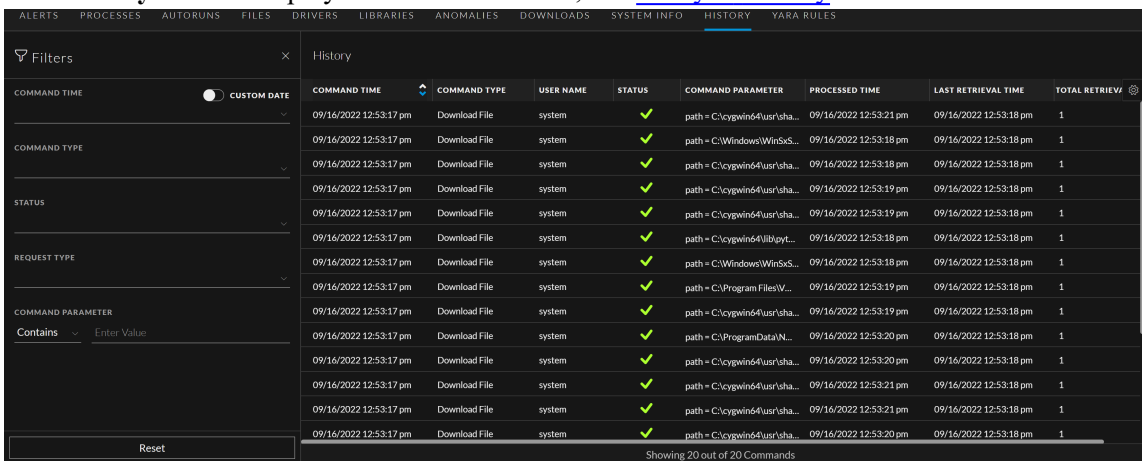
Example Scenario 2: Assume you create a group with a couple of tags and IP addresses as grouping criteria; all the hosts assigned with these tags and IP addresses will be a part of the group. And, if you delete(or unassigning from the hosts) the tags alone, the hosts may still be a part of this group as they are still grouped using the IP addresses.



View Agent History

You can view the list of commands issued to the agents (by the server or actions performed by any analyst) in the Host view and Host details. By default, commands are sorted based on the command time.

To view the commands:

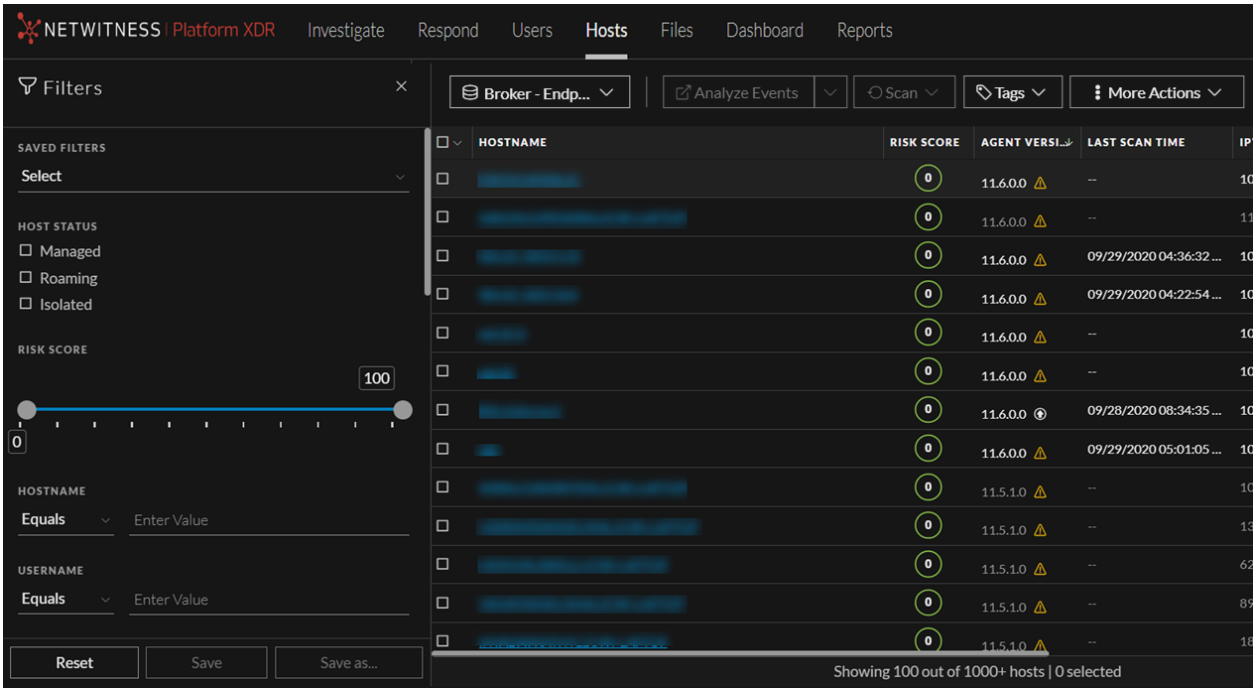


1. Go to **Hosts**.
2. Do any one of the following,

- To view all commands, click . You can also filter commands, for more information see Filter Hosts.

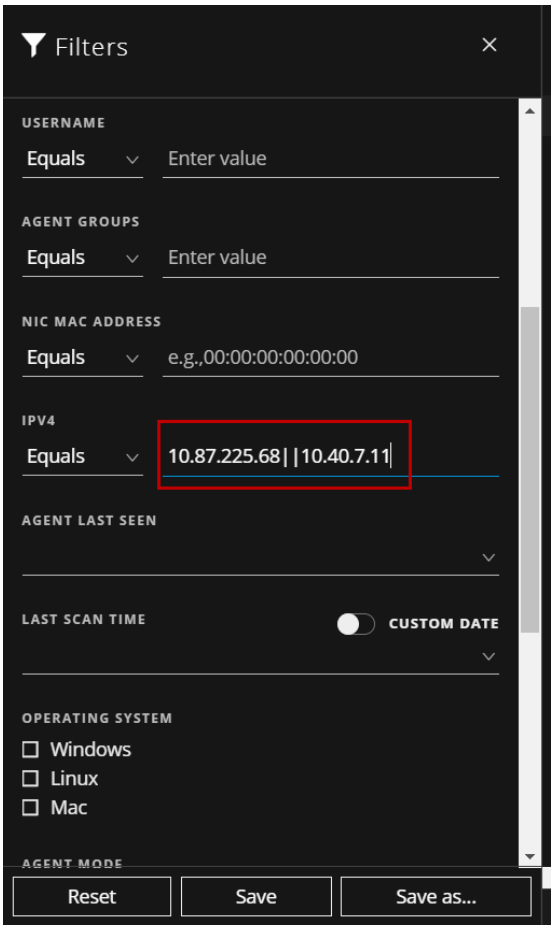
The Agent History view is displayed. For more details, see Analyze History.

- To view commands specific to a particular host:
  - Click the host for which you want to view the commands.
  - In the Host details view, click **History** tab. You can also filter commands, for more information see Filter Host Details.
    The **History** view is displayed. For more details, see Analyze History.



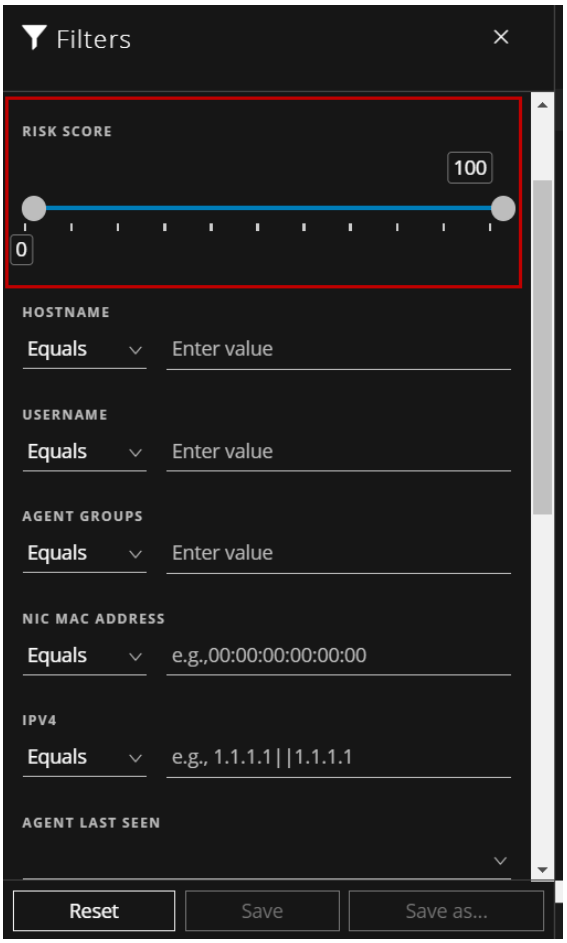
Filter Hosts

You can filter hosts on agent version, agent ID, agent mode, agent upgrade, agent last seen, last scan time, operating system, hostname, username, Mac address, risk score, IPV4, driver error code, security configurations, agent groups, and host status - managed, roaming, and isolated.



In the **Host** view > click , to filter the commands on command type, status, host name, request type, command parameter and command time. In the Command Time field, you can filter by custom date range.

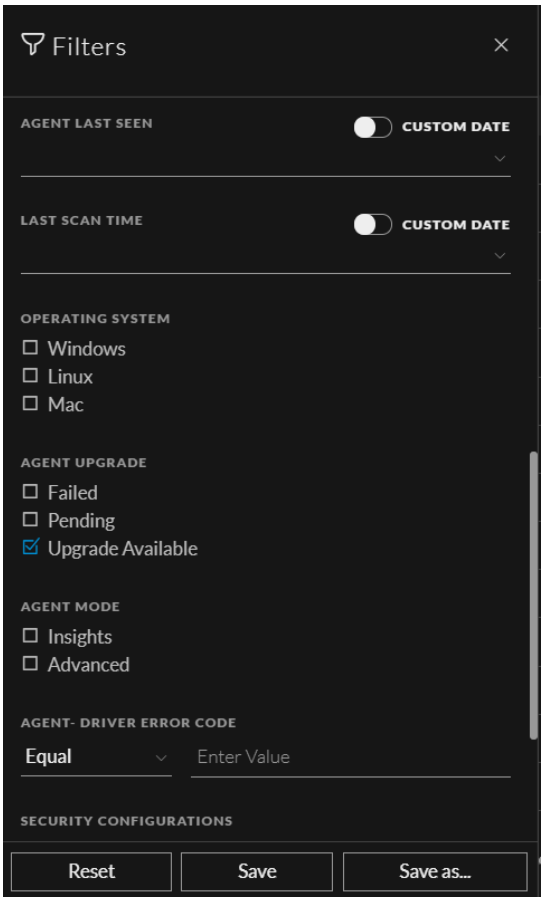
Note: While filtering on a large amount of data, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Hostname, IPv4, Operating System, Last Scan Time, and Risk Score.



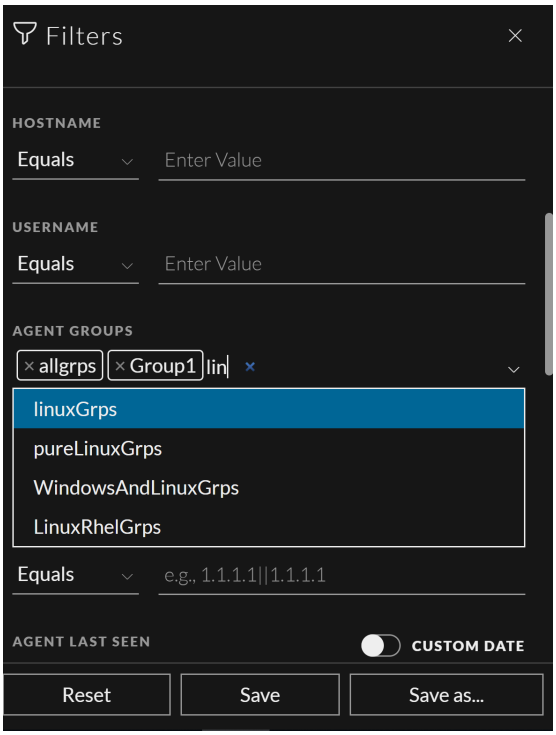
To search multiple values within a field, set the filter option to `Equals`, and use `||` as a separator.

For example, using `Equals` operator for multiple IPV4 values with a separator `||`.

To filter on the agent last seen or last scan time, select the option from the drop-down list. If you select 3 Hours ago for the Last Scan Time, the result displays hosts that were last scanned 3 hours ago or earlier.

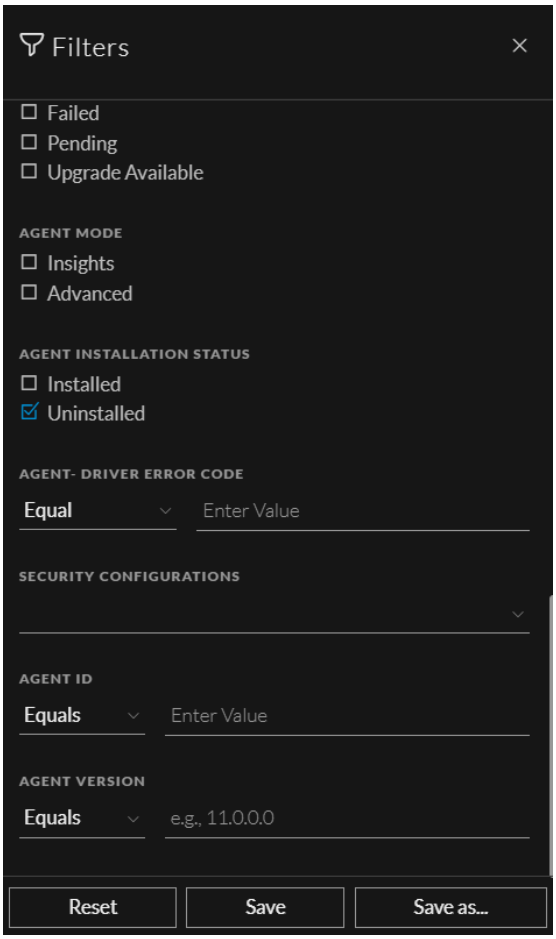


To filter on the risk score, use the slider to increase or decrease the values between 0 to 100.



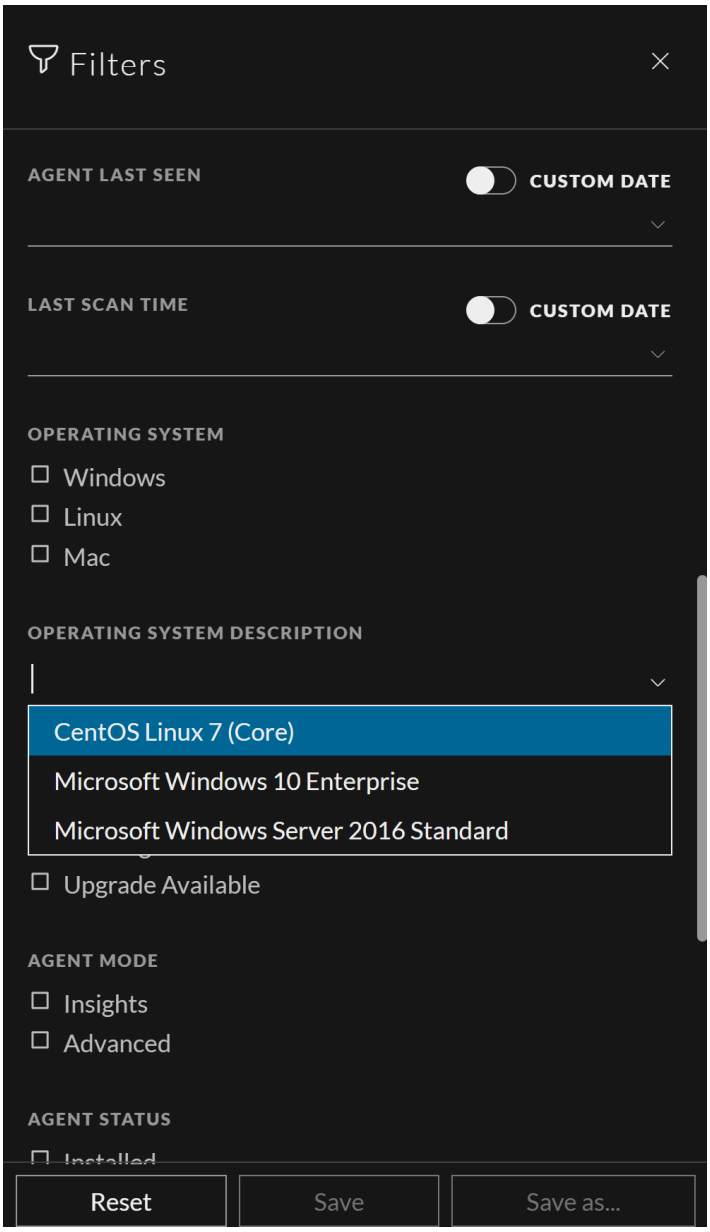
Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click 🗑.

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.



To filter the agents based on the upgrade status, select one of the upgrade statuses. For example, select the **Upgrade Available** checkbox to get the list of agents available for an upgrade.

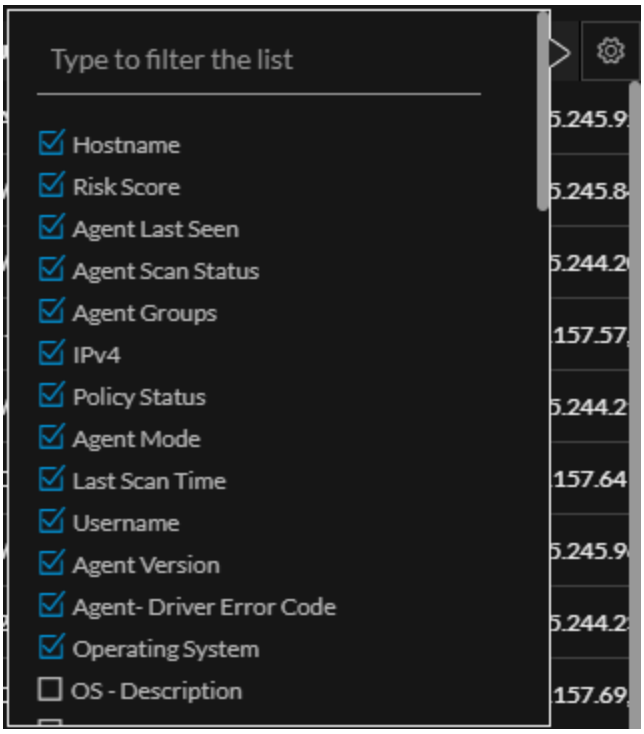
To filter the agents based on single or multiple agent groups, select a group from the drop-down list. You can also search the name of the groups from this list.



To filter the agents based on the installation status, select one of the installation statuses. For example, select the **Uninstalled** checkbox to get the list of agents for which the uninstall is initiated or successfully completed.

You can also filter the commands on command type, status, host name, request type, command parameter and command time (In which you can filter by custom date range), by clicking .

In 12.3 and later versions, you can filter the hosts on specific versions of Windows, Mac, and Linux using the **Operating System Description** field.



For Example: **CentOS Linux 7 (Core)**, **Microsoft Windows 10 Enterprise**, and **Microsoft Windows Server 2016 Standard**. Refer the following figure.

Adding and Sorting Columns in the Table

By default, the Hosts view displays a few columns and the hosts are sorted based on the risk score. To add or remove columns:

1. Go to **Hosts**.
2. Select the columns by clicking in the right-hand corner.

3. Scroll down or enter the keyword to search for the column.
4. Click the arrow on the column header to sort the column in ascending or descending order.

Scan Hosts

You may want to perform an on-demand scan if you want to get the latest snapshot of the host.

You can either choose to perform a quick scan or a full system scan.

Quick scan - Scans all executable files that are loaded in memory. Both Insights and Advanced agents support quick scan.

Full System Scan - Scans all fixed drives or the system drive You can perform a full system scan only on advanced agents that are in version 11.6 or later. Native executables are included in the full system scan, by default

When hosts are scanned, the Endpoint Agent retrieves the following data that can be used for investigation:

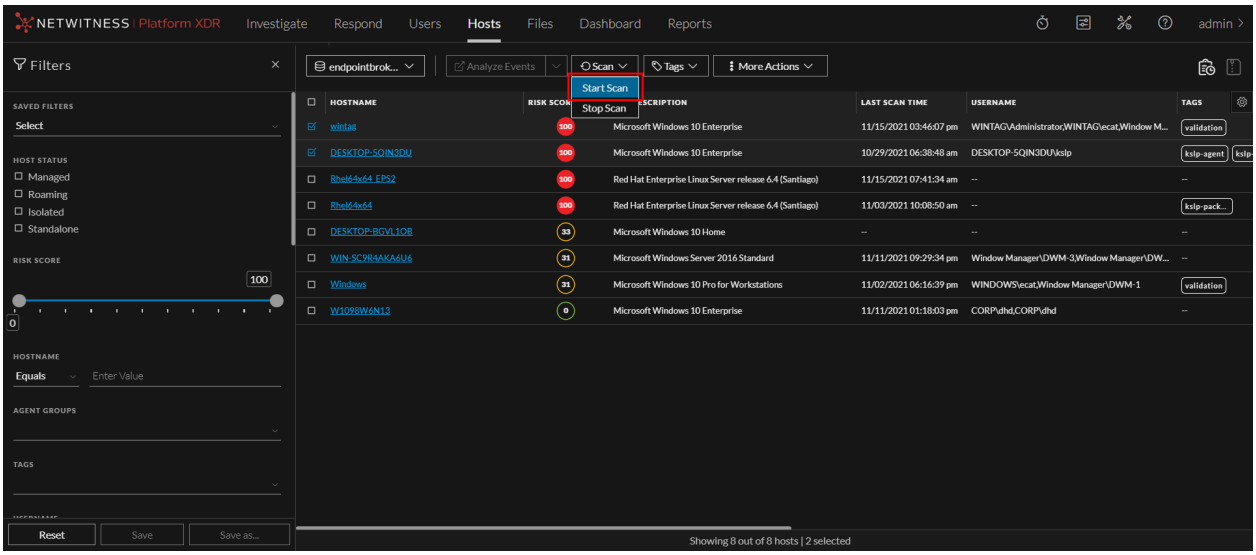
- Drivers, processes, DLLs, files (executables), services, autoruns, anomalies, host file entries, and scheduled tasks running on the host.
- System information such as network share, installed Windows patches, Windows tasks, logged-in users, bash history, and security products installed.

To perform a Quick Scan:

1. Go to **Hosts**.
2. Select one or more hosts (up to 100) at a time, and do one of the following:

- Click **Scan > Start Scan** from the menu (Or)
- Right-click and select **Start Scan** from the context menu

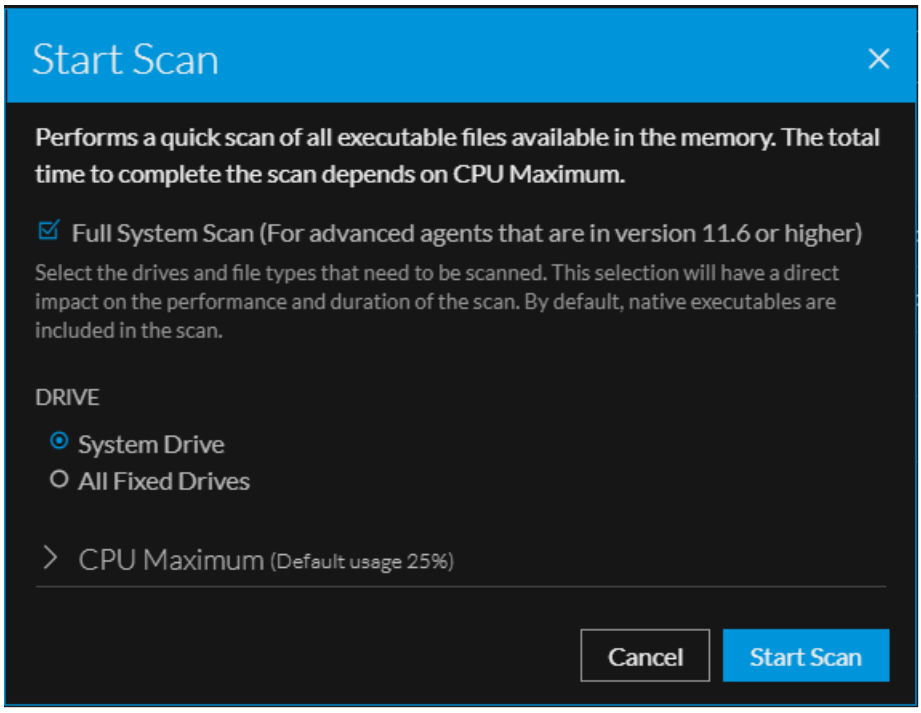
3. Click **Start Scan** on the pop-up. Quick scan is initiated for executable modules loaded in memory.



The following are the scan statuses:

Status	Description
Idle	No scan is in progress.
Scanning	Scan is in progress.
Pending	Scan request is sent to the server, and the agent will receive the request the next time it communicates with the server.
Cancel	Stop request is sent to the server, and the agent will receive the request the next time it communicates with the server.

Note: By default, the scan utilizes 25% of the CPU. You can click CPU Maximum and select a value from 5% to 100%. Increasing the CPU Maximum limit reduces the scan time but could lead to more CPU usage.



To perform a Full System Scan:

1. Go to **Hosts**.
2. Select one or more hosts (up to 100) at a time for an on-demand scan, and do one of the following:
   - Click **Scan > Start Scan** from the menu bar (Or)
   - Right-click and select **Start Scan** from the context menu

1. From the **Start Scan** pop-up, select **Full System Scan (Only on advanced agents that are 11.6 or higher.)**

2. Select **System Drive**(Default selection) or **All Fixed Drives**
3. Click **Start Scan** on the pop-up.

Note: An Endpoint server supports up to 10k Full System Scans in a rollover period.

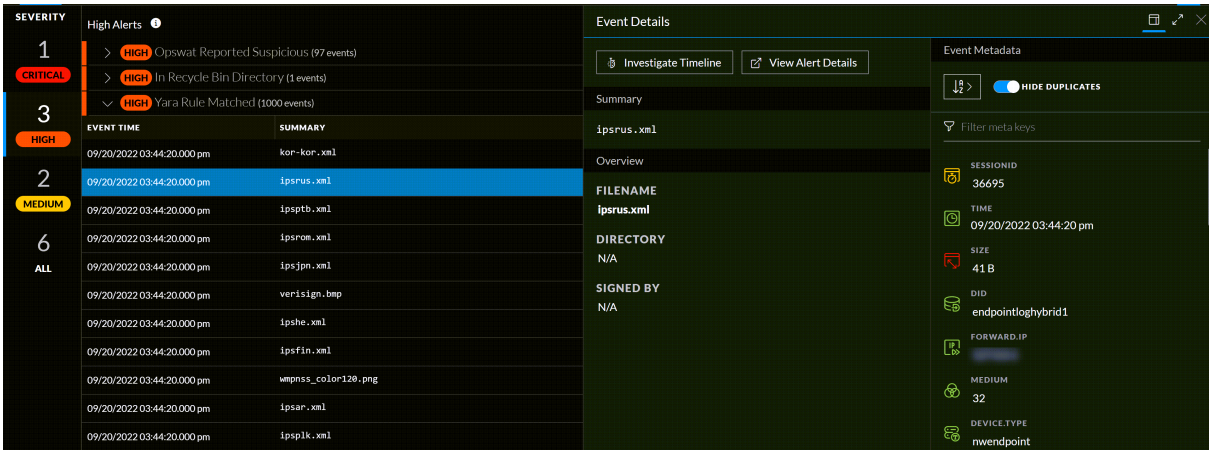
Analyze Hosts Using the Risk Score

You can investigate a host by analyzing the risk contributors such as alerts and events to look for suspicious or malicious activity.

Based on the severity of the alert triggered by the host, you can analyze the host using the following options:

- **View Alert Details**: This option allows you to analyze the host when Critical and High alerts are triggered. For more information, see Investigating a Process.
- **Analyze Process Tree**: This option allows you to analyze the host when Medium alerts are triggered. For more information, see Investigating a Process.

To analyze the hosts (which trigger Critical or High alerts) using the risk score:



1. Go to **Hosts**.

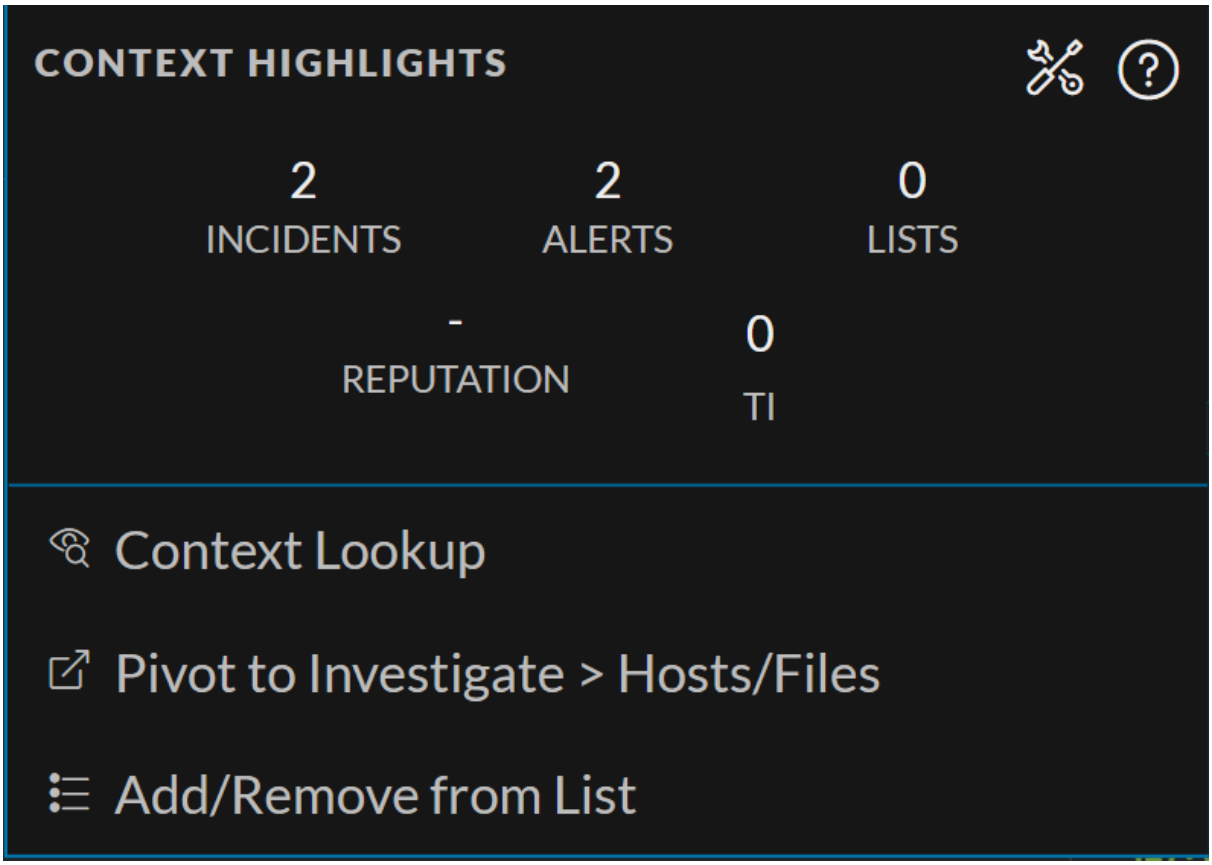
   The **Hosts** view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the hosts.

3. Select the host and do any of the following.
   - Click a row to view the risk associated with the host in the **Risk Details** panel.
   - Click the hostname to investigate the host.

     The **Alerts** tab is displayed.
4. In the **Alerts** > **Severity** panel, click the alert severity such as **Critical** or **High**.

   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.

Note: For each alert, only the latest 1000 events are displayed.



6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.

7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Hosts** view to view context lookups for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **View Alert Details** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.

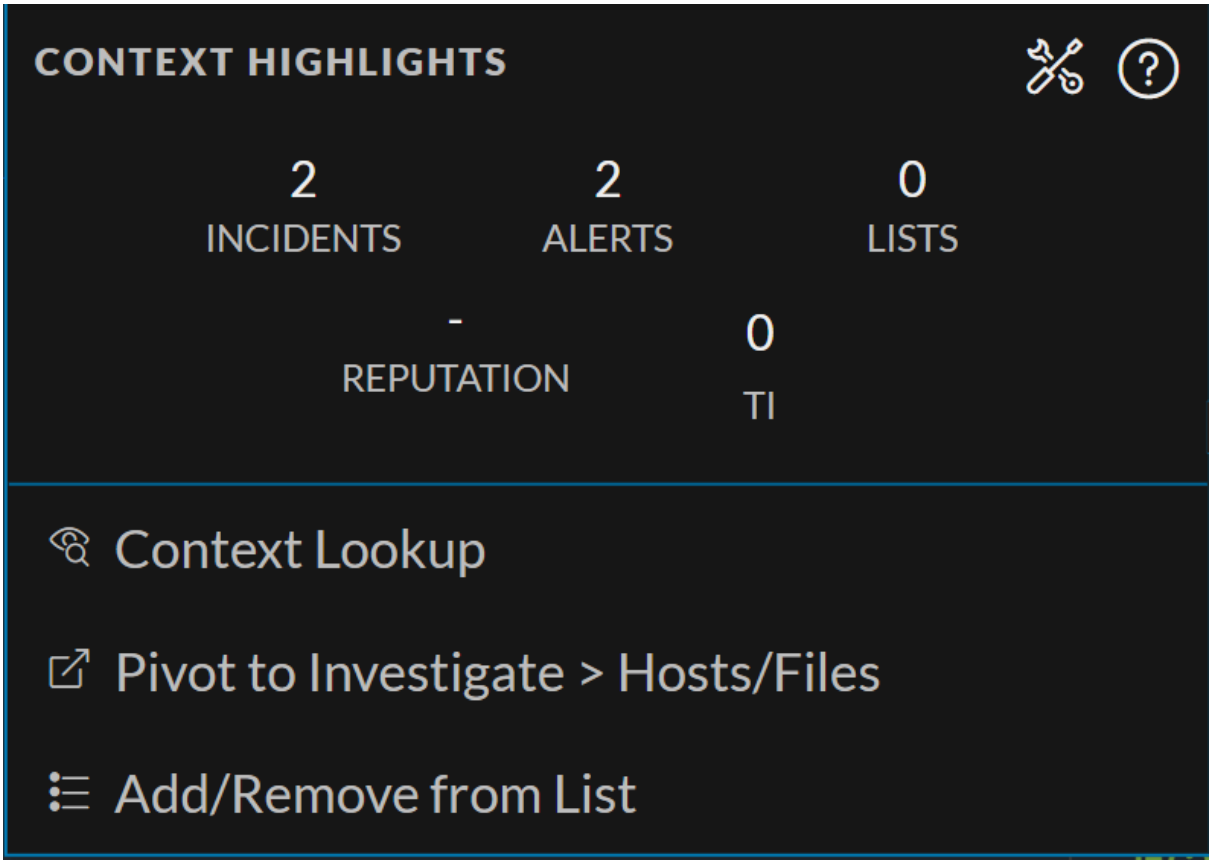
To analyze the hosts (which trigger Medium alerts) using the risk score:

1. Go to **Hosts**.

   The **Hosts** view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the hosts.
3. Select the host and do any of the following.
   - Click a row to view the risk associated with the host in the **Risk Details** panel.
   - Click the hostname to investigate the host.

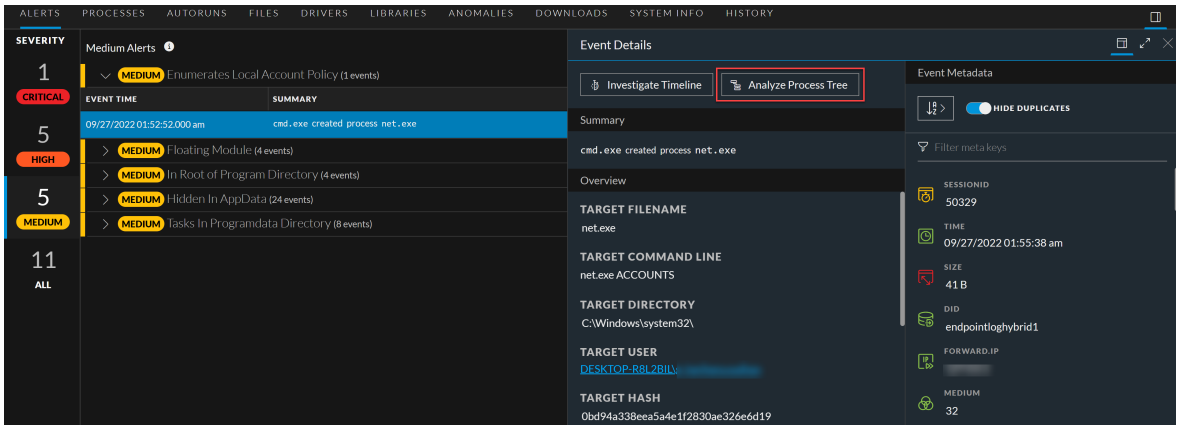
     The **Alerts** tab is displayed.
4. In the **Alerts** > **Severity** panel, click the **Medium** alert severity.

   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.



Note: For each alert, only the latest 1000 events are displayed.

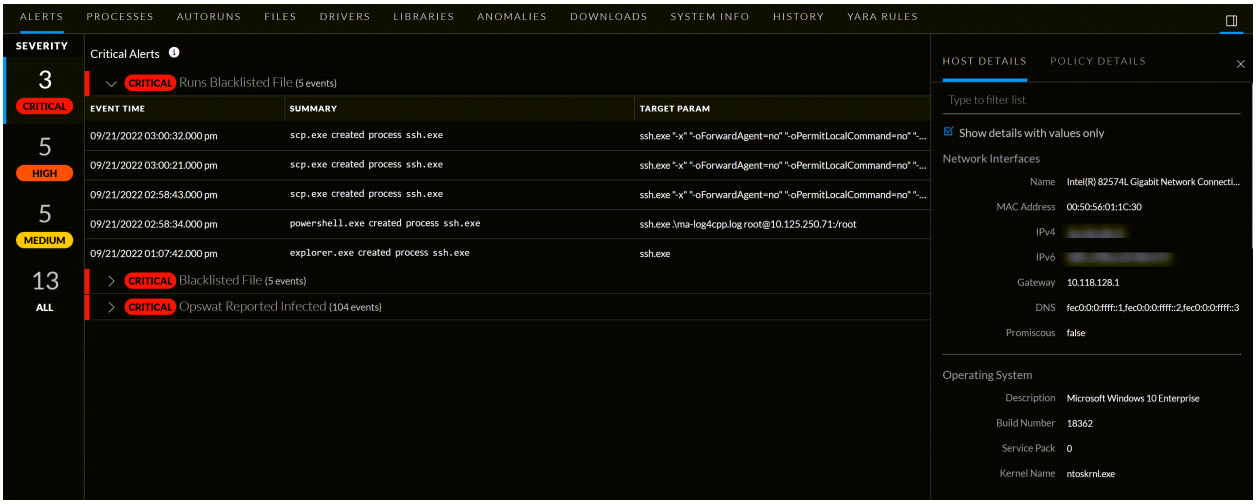
6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.



7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
    - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
    - To investigate a particular process, click **Analyze Process Tree** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.



Analyze Host Details

To look for suspicious files on a host, click the host name and view the details of the host, or start an on-demand scan to get the most recent information. On the right-hand panel, you can view the following:

- **Host Details** displays the host information, such as Network interface, operating system, hardware and others.
- **Policy Details** displays the complete resolved policy settings.

For more details, see Hosts View - Details Tab.

Filter Host Details

In the Processes, Autoruns, Files, Drivers, Libraries, and Anomalies tabs, you can filter the processes or files on file status, reputation, file or process name, signature, and risk score. Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click 🗑.

In the **Host** view > **Files** tab, you can filter the files available on host, and files deleted from host. The result of files deleted from host depends on the data retention policy configured in the **Endpoint Config** view > **Data Retention Scheduler** tab. By default, data retention policy is configured for 30 days, this means only 30 days of deleted files are stored in the Endpoint server. These filter options are disabled if **All Files Available on Host** toggle is disabled.

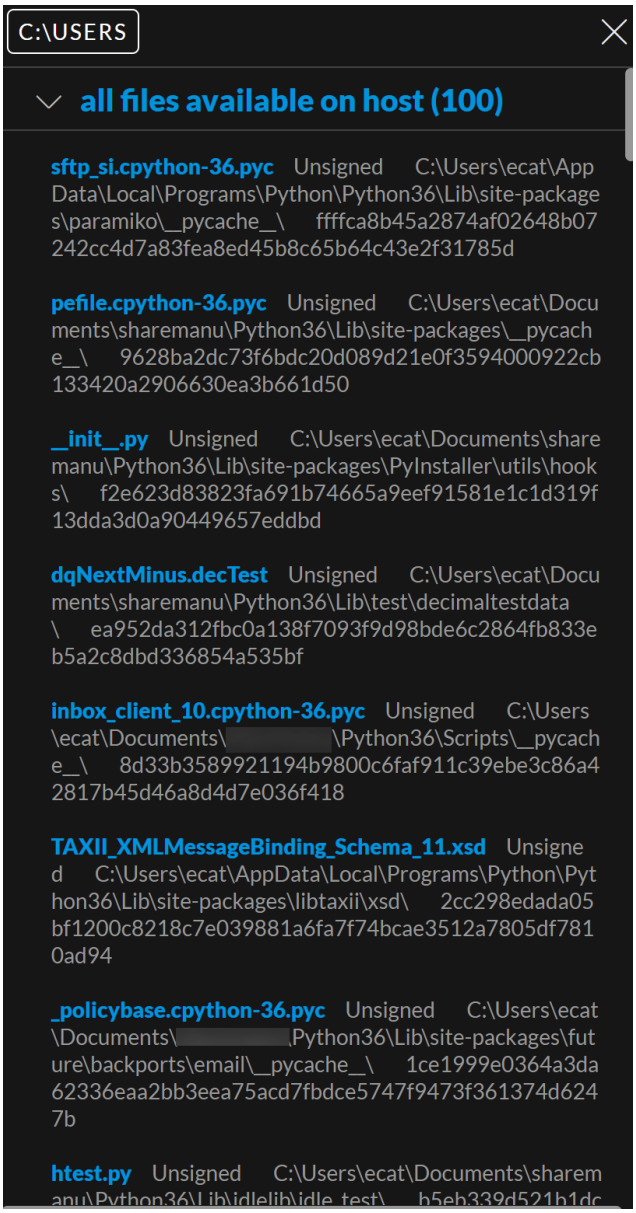
In the **Host** view > **History** tab, you can filter the commands on command type, status, host name, request type, command parameter and command time. In the Command Time field, you can filter by custom date range.

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters).The filter is added to the **Saved Filters** panel on the left. To delete a filter, hover over the filter name and click 🗑.

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Search Files on Host

To investigate a host or to check if it is infected with a known malware, you can search for occurrences of the file name, file path, or SHA-256 checksum.



Note: To search for a SHA-256 checksum, provide the entire hash string in the search box.

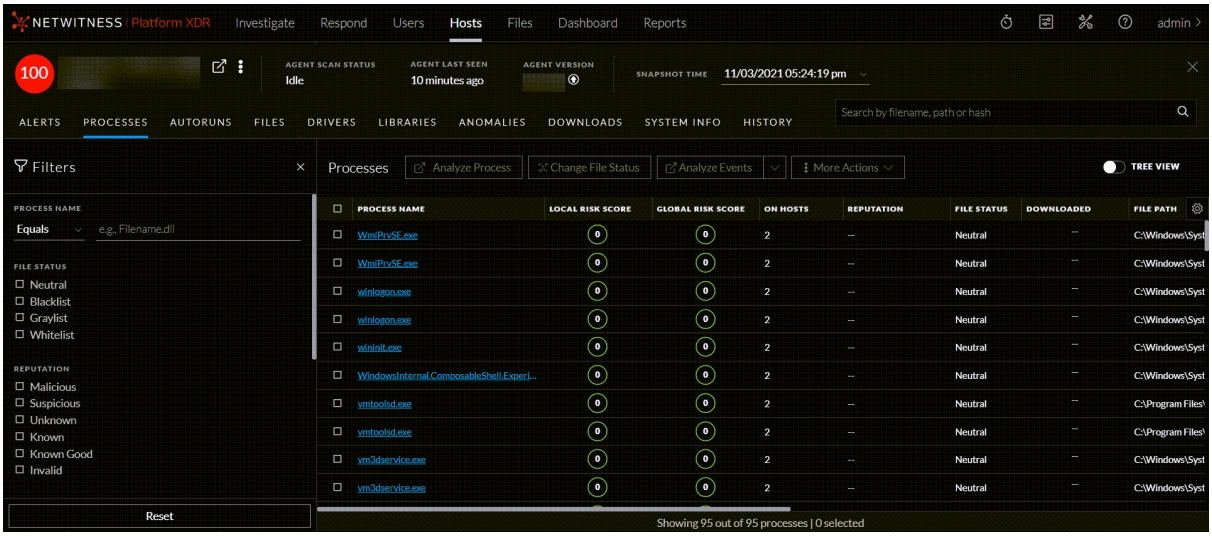
The result displays the matching files present on the host in **All Files Available on Host** category and in the respective **snapshot** category with the details, such as file name, signature information,and checksum. In addition, the **snapshot** category displays the system interaction, for example, ran as process, library, autorun, service, task, or driver. To view more details, click the **filename** or **system interaction** link.

Example, a user has clicked and executed a malicious attachment through a phishing email, and downloaded it to `C:\Users`. To investigate this file:

1. Go to **Hosts**.
2. Select the host that you want to investigate or select the Endpoint Broker server to investigate all the hosts.
3. In the **Alerts** tab, enter the file path `C:\Users` in the search box.

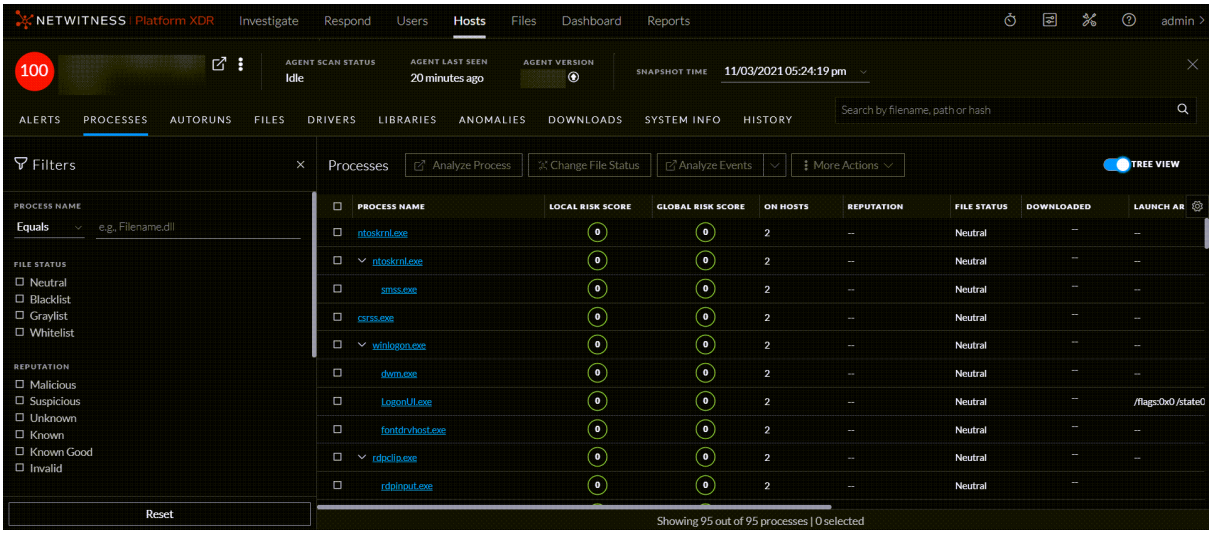
   The search displays a maximum of 100 results of the executables in this folder. In this example, there are some unsigned file that might be malicious. If the search is executed on an Endpoint Broker server, it queries all the Endpoint servers.

This file is run as a Process.



4. To view details of this file, click **Process** in the result.

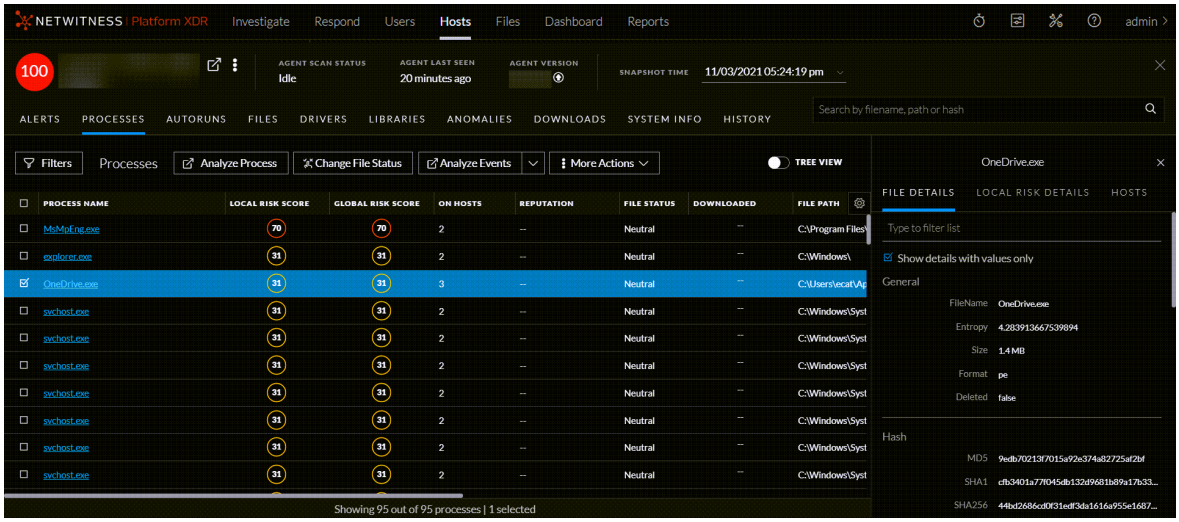
   This opens the **Process** tab where you can view the process details.



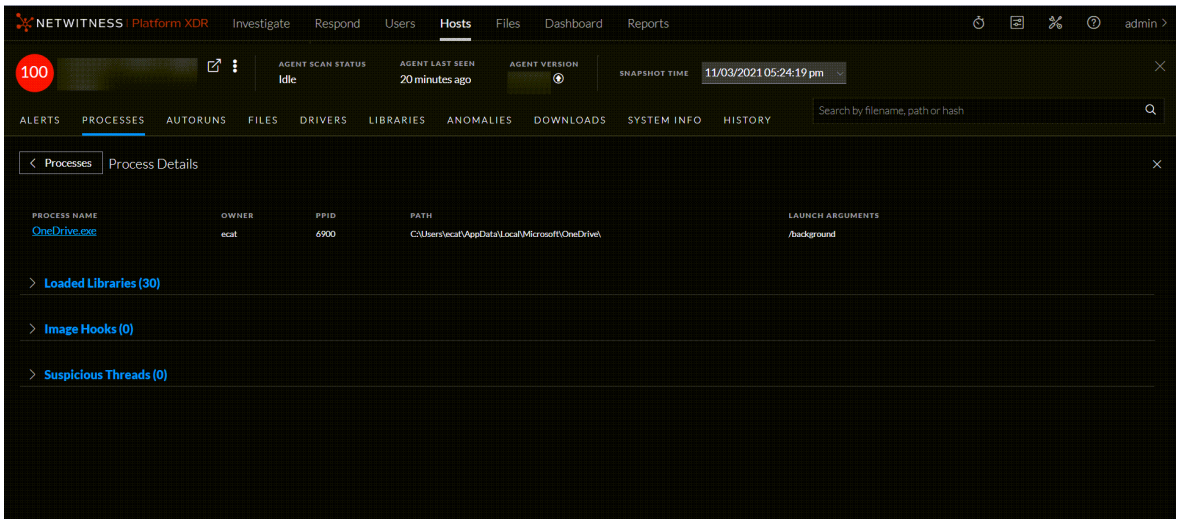
Analyze Processes

To analyze the process:

1. In the **Hosts** details, select the **Processes** tab.



To view the process tree, click the toggle switch. The following is an example of the tree view:



2. In the **Processes** Tab, do one of the following:

- Click a row to view the properties of a process in the right panel.

- Click the process name to view the process details of a specific process.

When reviewing processes, it is important to see the launch arguments. Even legitimate files can be used for malicious purposes, so it is important to view all of them to determine if there is any malicious activity.

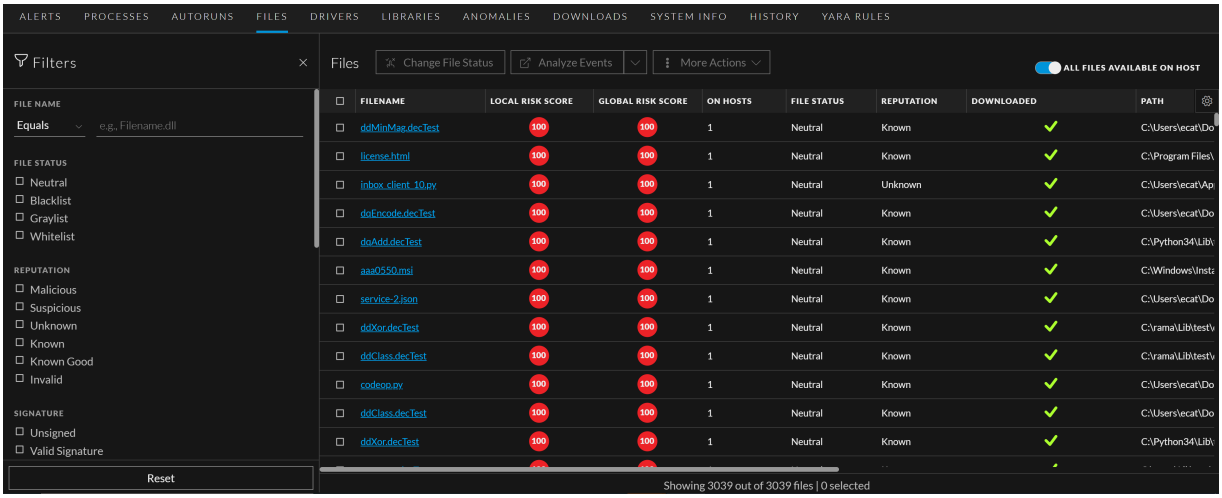
For example,

- `rundll32.exe` is a legitimate Windows executable that is categorized as a good file. However, an adversary may use this executable to load a malicious DLL. Therefore, when viewing processes, you must view the arguments of the `rundll32.exe` file.
- `LSASS.EXE` is a child to `WININIT.EXE`. It should not have child processes. Often malware use this executable to dump passwords or mimic to hide on a system (`lass.exe`, `lssass.exe`, `lsasss.exe`, and so on).
- Most legitimate user applications like Adobe and Web browsers do not spawn child processes like `cmd.exe`. If you encounter this, investigate the processes.

You can view the sequence of activities performed on the host by the file or process using the process analysis. For more information, see Investigating a Process.

Analyze Autoruns

In the Hosts details, select the **Autoruns** tab. You can view the autoruns, services, tasks, and cron jobs that are running for the selected host.



For example, in the Services tab, you can look for the file creation time. The compile time is found within each portable executable (PE) file in the PE header. The time stamp is rarely tampered with, even though an adversary can easily change it before deploying to a victim's endpoint. This time stamp can indicate if a new file is introduced. You can compare the time stamp of the file against the created time on the system to find the difference. If a file was compiled a few days ago, but the time stamp of this file on the system shows that it was created a few years ago, it indicates that the file is tampered.

Note: The Endpoint Broker queries the Hosts present across multiple Endpoint Servers for each Autorun and displays the total count of the hosts for the respective Autoruns in the **On Hosts** column in the **Hosts** > **Autoruns** Broker view.
For Example:
If an Autorun is running on 2 different hosts present across multiple Endpoint Servers, the **On Hosts** count of the Autorun is displayed as 2 in the **Hosts** > **Autoruns** Broker view.

Analyze Files

To analyze the files, you can do either one of the following based on your requirement.

- In the **Hosts** view, select the **Files** tab.
  You can view the list of all files (reported as part of scan and tracking) on the host including the deleted files.

- To view the files reported as part of scan snapshot, you must disable **All Files Available On Host** toggle and select the scan time from the **Snapshot** drop-down list.

Example for analyze files, many trojans write random filenames when dropping their payloads to prevent an easy search across the endpoints in the network based on the filename. If a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

Analyze Libraries

In the Hosts details, select the **Libraries** tab. You can view the list of libraries loaded at the time of scan.

For example, a file with high entropy gets flagged as packed. A packed file means that it is compressed to reduce its size (or to obfuscate malicious strings and configuration information).

Analyze Drivers

In the Hosts details, select the **Drivers** tab. You can view the list of drivers running on the host at the time of scan.

For example, using this panel, you can check if the file is signed or unsigned. A file that is signed by a trusted vendor such as Microsoft and Apple, with the term `valid`, indicates that it is a good file.

Analyze Anomalies

Note: This tab is available only for advanced agent.

In the Hosts details, select the **Anomalies** tab. You can view the following details for the selected host:

- Image hooks - Hooks found in executable images (user-mode or kernel-mode) - IAT, EAT, Inline, exceptionHandler.
- Kernel hooks - Hooks found on kernel objects (such as Driver Object [Pointers, IRP_MJ, SSDT, IDT, and so on]). This also includes filter devices.
- Suspicious threads - Threads whose starting address points to memory DLLs or floating code. The threads could be running with either user-mode or kernel-mode privileges. These threads could run malicious code inside a trusted application to execute their own code.
- Registry discrepancies - The Windows registry is a hierarchical database that stores configuration settings and options on Microsoft Windows operating systems. It contains settings for low-level operating system components and for applications running on the platform: the kernel, device drivers, services, SAM, user interface, and third party applications all use the registry. The discrepancies between low-level parsing with Win32 registry API are reported.

Note: Anomalies is applicable only for Windows hosts.

For example, hooking is used to intercept calls in a running application and to capture information related to the API invocations. Malicious programs can implant hooks in various system applications for different purposes, such as hiding files, directories, registry entries, intercepting users keystrokes to establish a stealthy communication channel with the attacker.

Analyze System Information

In the Hosts details, select the **System Information** tab. This panel lists the agent system information. For Windows operating system, the panel displays the host file entries and network shares of that host.

For example, malware might use host file entries to block antivirus updates.

Analyze History

In the Host details, select the **History** tab. This tab lists the commands along with the respective status and additional details.

When you review the history, look for the command status and retrieval count to check if the agent retrieved the commands.

Below are some examples:

- A file download command is issued, but the file is deleted on the host. In this case status of the command is failed as the file is not downloaded.
- The retrieval count increases, but the command is not processed. This happens when an analyst requests a large number of files (For example, MFT, system dump, or process dump), and the connection breaks when the agent uploads these files.
- If the agent command is not retrieved, the agent is either offline or busy processing other commands (For example, uploading a system dump). In this case, the status of the command shows pending.

To view more details, click the **Hostname** link highlighted in blue. The Hosts details view is displayed. In the case of MFT, download file, system dump, and process dump command types, **Downloads** tab is displayed with details such as file name, type, status, size, downloaded time and SHA256 of the file, when you click on the **Hostname** link.

Export Host Details or Files to JSON File

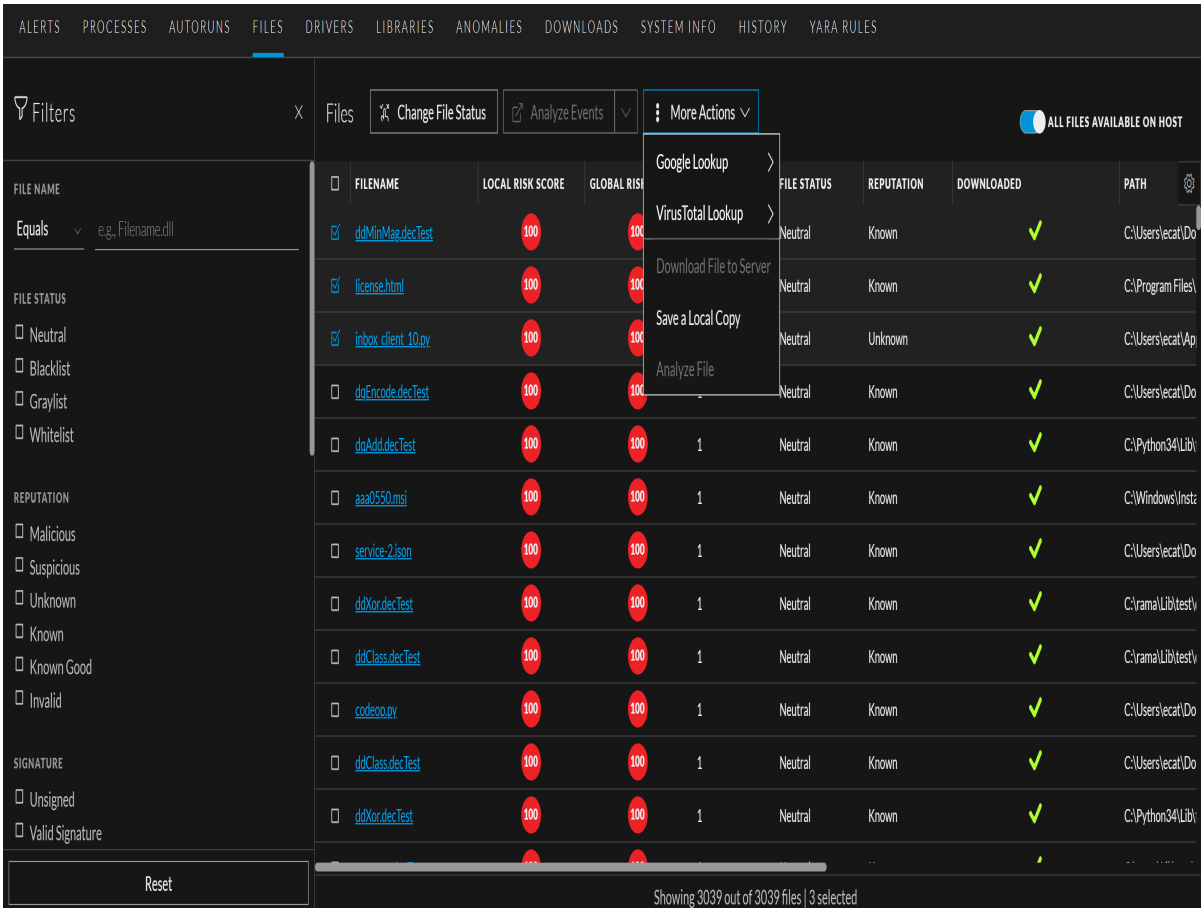
Note: Export Host details option is disabled if there is no snapshot time.

To export host details or files to JSON file:

1. Go to **Hosts**.
2. Select the hostname to open the host details.
3. Click  (**More**) beside the hostname and do any of the following:
   - To export the scan data categories for the host, select **Export Host Details**. This exports files such as:
     - allfiles.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported as part of scan and tracking.
     - fileContext.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported during the host scan.

- machinedetails.json - This file consists of the machine details, including hardware, operating system, interfaces, and so on, along with the agent details like version, policy details.

Note: If Endpoint Broker is selected and a host is communicated with multiple Endpoint servers, during the host details export, all files and details of the host are exported from the Endpoint server where the selected snapshot is stored.



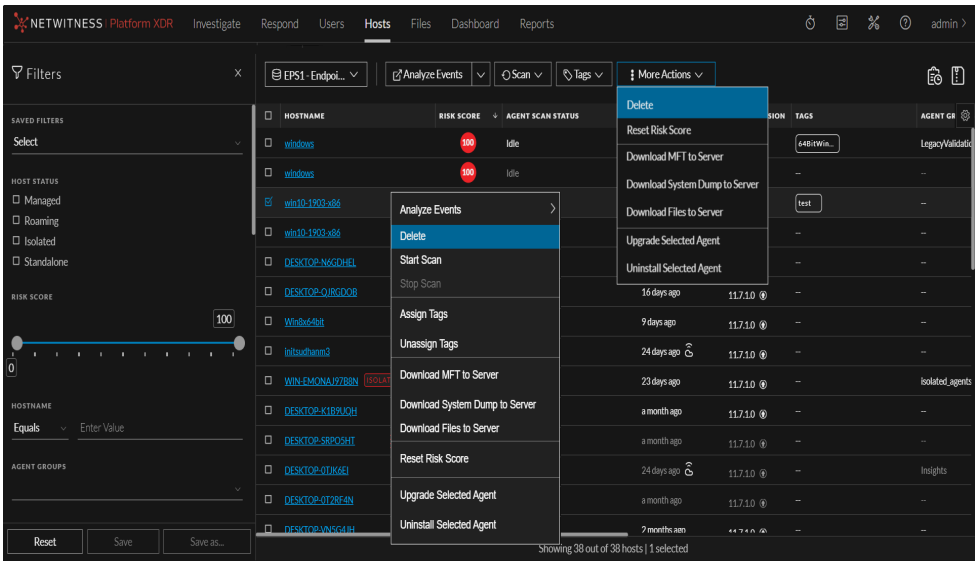
Note: allfiles.json file is exported irrespective of the selected snapshot.

- To export all the files available on the host, select **Export Files**. This exports:
  - allfiles.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported as part of scan and tracking.

Launch an External Lookup for a File

While analyzing a file, you can search Google or VirusTotal with the filename or hash to get more information about the file. To launch the search:

1. Go to **Hosts** > **Host Details** (Autorun, Files, Drivers, Libraries, or Anomalies tab).
2. Right-click one or more files, or in the **More Actions** drop-down list in the toolbar, do the following:



- Select **Google Lookup** to perform a search on the filename, MD5, SHA1, or SHA256.
- Select **VirusTotal Lookup** to perform a search on MD5, SHA1, or SHA256.

Note: To open files in multiple tabs, make sure you enable the pops-up in the browser.

Delete a Host

If the agent is uninstalled on a host or if you no longer require the host scan data, you can manually delete this host from the Hosts view. Deleting a host deletes all scan data associated with the host. To delete hosts:

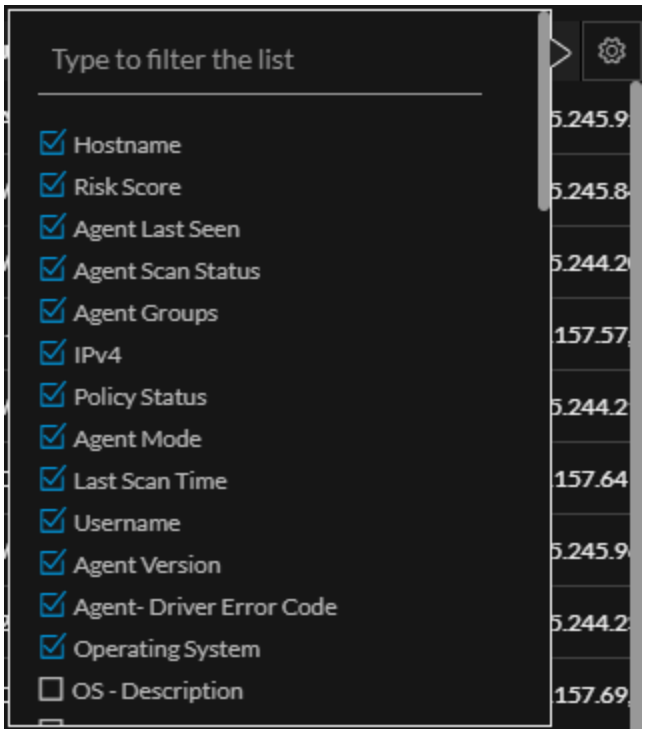
1. Go to **Hosts**.
2. Select the hosts that you want to delete from the Hosts view and do one of the following:

- Right-click and select **Delete** from the context menu.
- Click **More** drop-down list in the toolbar and select **Delete**.

Note: If you accidentally delete a host from the Hosts view, the Endpoint Server forbids all requests from this agent. The agent must be uninstalled manually from the host and reinstalled for it to appear on the Hosts view.

Deleting Hosts with Older Agent Versions

After upgrading the 11.1.x and 11.2.x agents to 11.3 or later, if you want to delete the hosts with older versions:



1. Go to **Hosts** view.
2. Filter the hosts based on the Agent version, and delete these hosts.

If you do not delete, the hosts are deleted based on the Data Retention Policy settings.

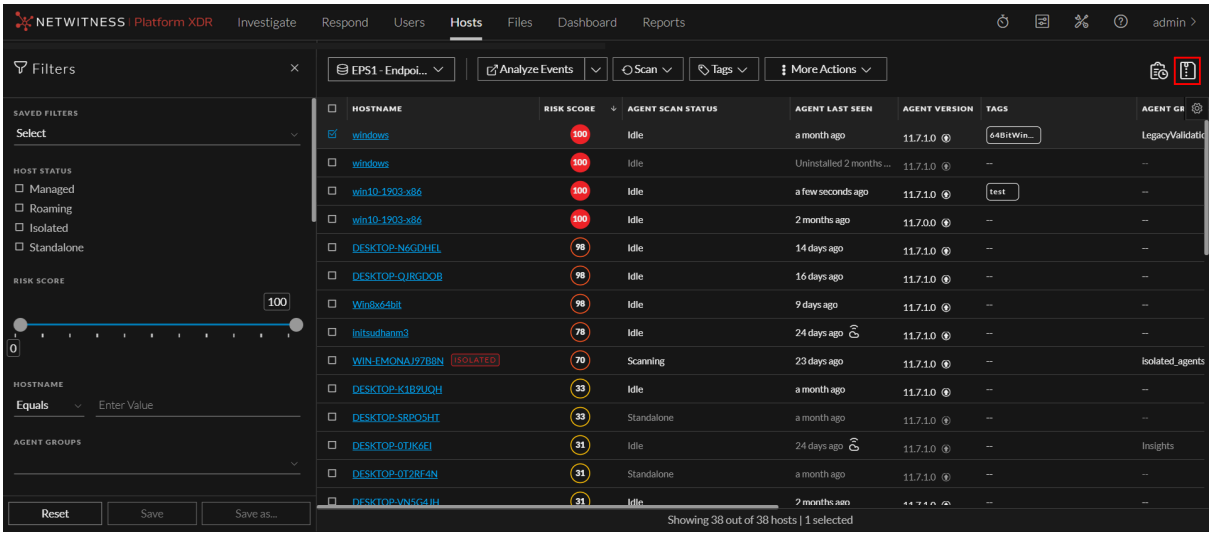
Set Hosts Preference

By default, the Hosts view displays a few columns and the hosts are sorted based on the risk score. If you want to view specific columns and sort data on a specific field:

1. Go to **Hosts**.
2. Select the columns by clicking in the right-hand corner. The following example shows the drop-down list displayed while adding columns:

3. Scroll down or enter the keyword to search for the column in the displayed list.
4. Sort the data on the required column.

Note: The selections you make here become your default view every time you log in to the Hosts view.



Export Host Attributes

You can export up to 100,000 host attributes at a time. To extract the host attributes to a csv file:

1. Go to **Hosts**.
2. Filter the hosts by selecting the required filter options.

3. Add columns by clicking in the right-hand corner.

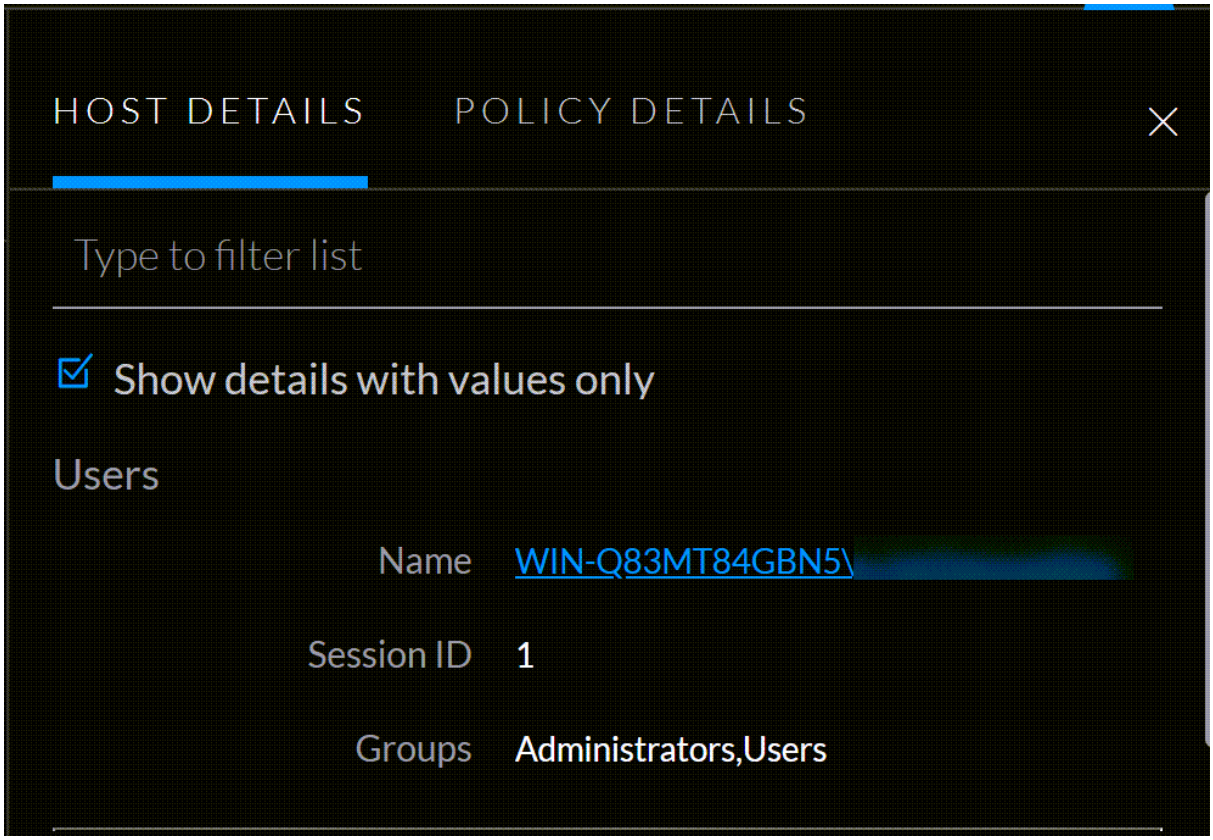
4. Click to export the host attributes to a csv file.

You can either save or open the csv file.

Migrate Hosts

Hosts can be migrated from one Endpoint server to another using groups and policy associated with the host. If a host is migrated, the Server column shows as **Migrated**. On all the tabs within the Hosts view, the message Host is migrated to <Server-name> is displayed. You view the host details by clicking the <Server-name>. The risk score of a migrated host is displayed on all Endpoint servers where it is present.

Note: Some of the actions are disabled for the migrated host on the selected server, such as start scan, start stop, analyze events, and others. If you want to perform the required action, select the Endpoint server to which the host is migrated.



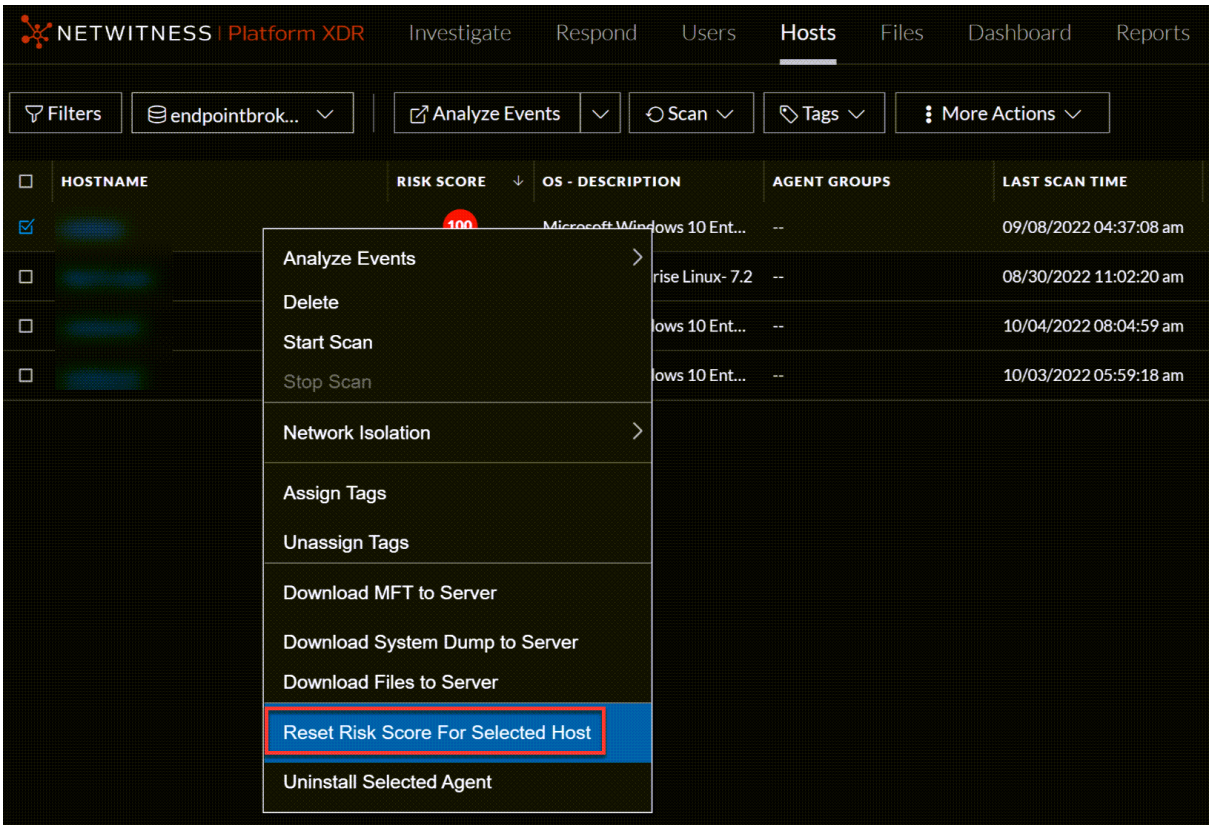
Note: To view only managed hosts, select the **Show Only Managed Agents** option in the Filters panel.

Analyzing Risky Users

If you have NetWitness UEBA installed, you can view the alerts associated with users logged in on the host. To analyze risky users:

1. Go to **Hosts**.
2. Click the host name you want to analyze.
3. In the **Host Details** panel, under the **Users** category, click the name.

This opens the **Entities** tab for investigation in a new tab.



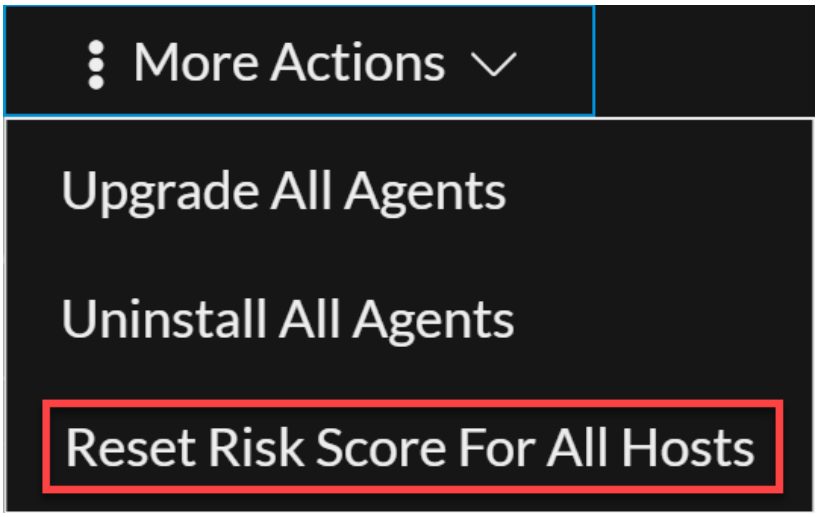
Resetting Risk Score of Hosts

You can reset the risk score for a host in these situations:

- If the alerts or events triggered by the host or files on the host are false positive, you can make changes to the Endpoint Application rules or ESA rules.
- After you take required action on the host for malicious file activities contributing to the risk score. When you reset the risk score, all the risk calculation for the host is deleted. When you reset the host's risk score, it does not change the file's risk score. You can reset the score for a single host or multiple hosts.

To reset the risk score of the selected host:

1. Go to **Hosts**.
2. Select the Endpoint Server or Endpoint Broker.
3. Select one or more hosts and do one of the following:



- Right-click and select **Reset Risk Score For Selected Host** from the context menu.
- Click **More Actions** > **Reset Risk Score For Selected Host** in the toolbar.

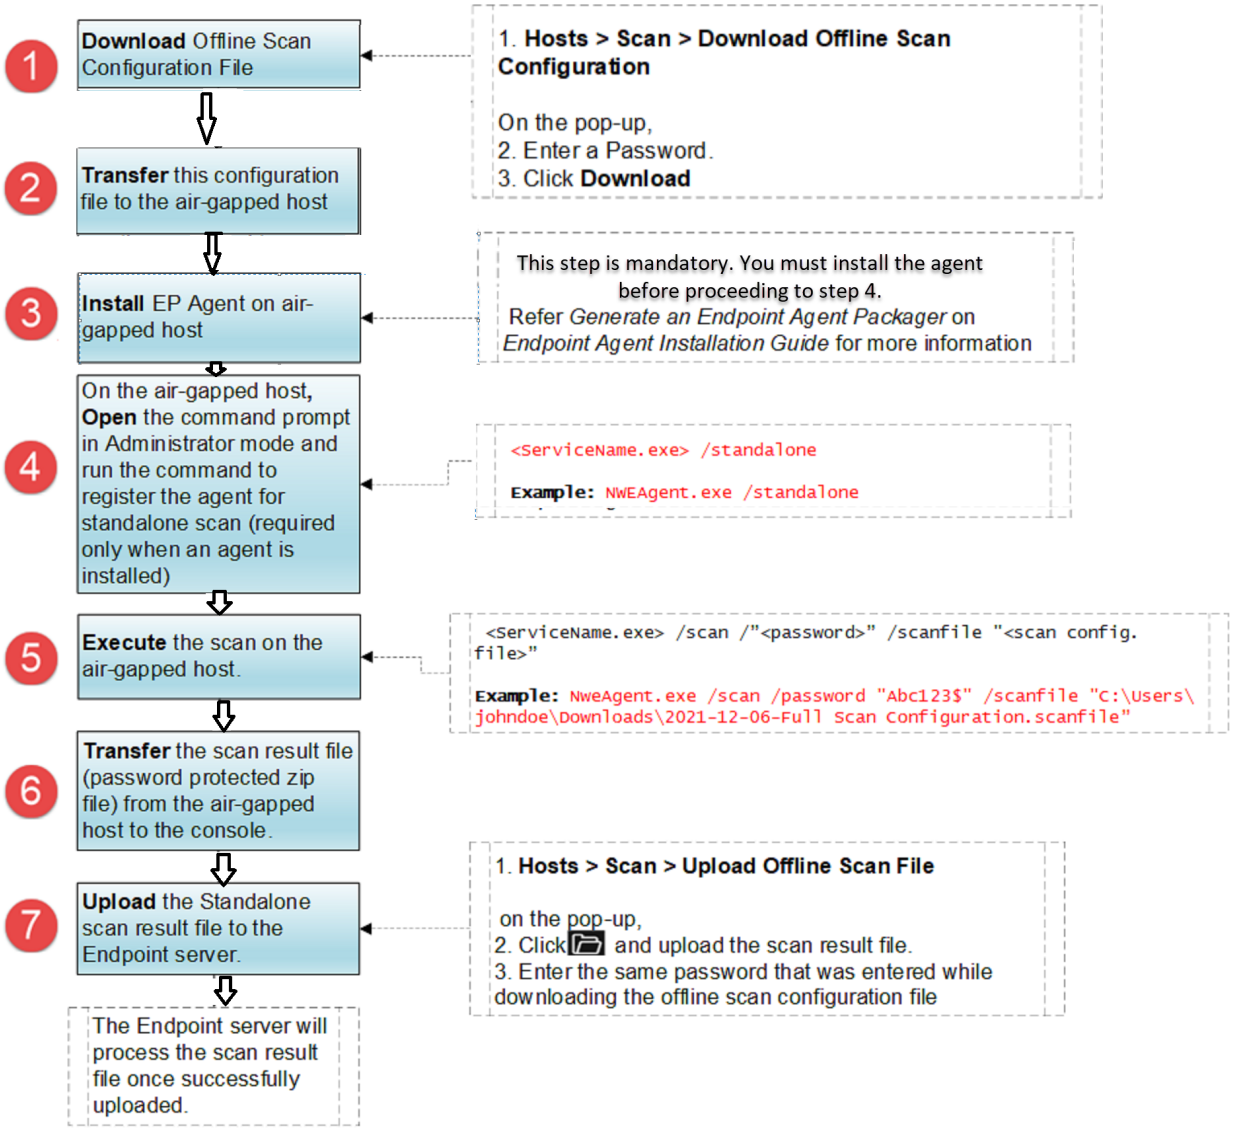
All the alerts associated with the score are deleted.

4. Refresh the page to view and confirm if the host's score is reset. This may take sometime for changes to take effect.

To reset the risk score of all the available hosts simultaneously:

1. Go to **Hosts**.
2. Click **More Actions** > **Reset Risk Score For All Hosts** in the toolbar.

All the alerts associated with the score are deleted.

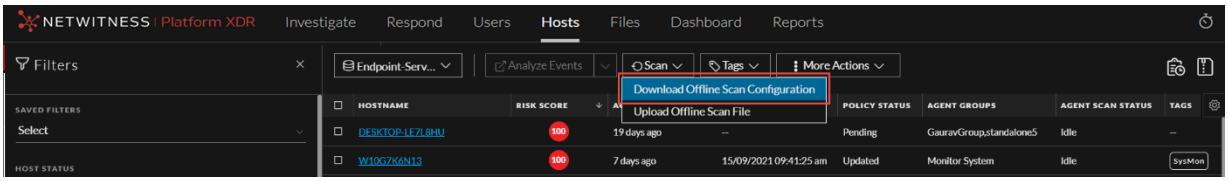


Standalone Scan on Air-gapped Windows Hosts

The Standalone scan feature allows administrators to run scans on the air-gapped Windows hosts that are disconnected from the network. Administrators can download the scan command once from UI and execute it on multiple hosts. For the best utilization of resources, NetWitness recommends running standalone scan every two weeks. Policies do not apply on air-gapped hosts, and features such as downloading MFT to the server, upgrading agents through UI, downloading a file to the server are not available for standalone agents.

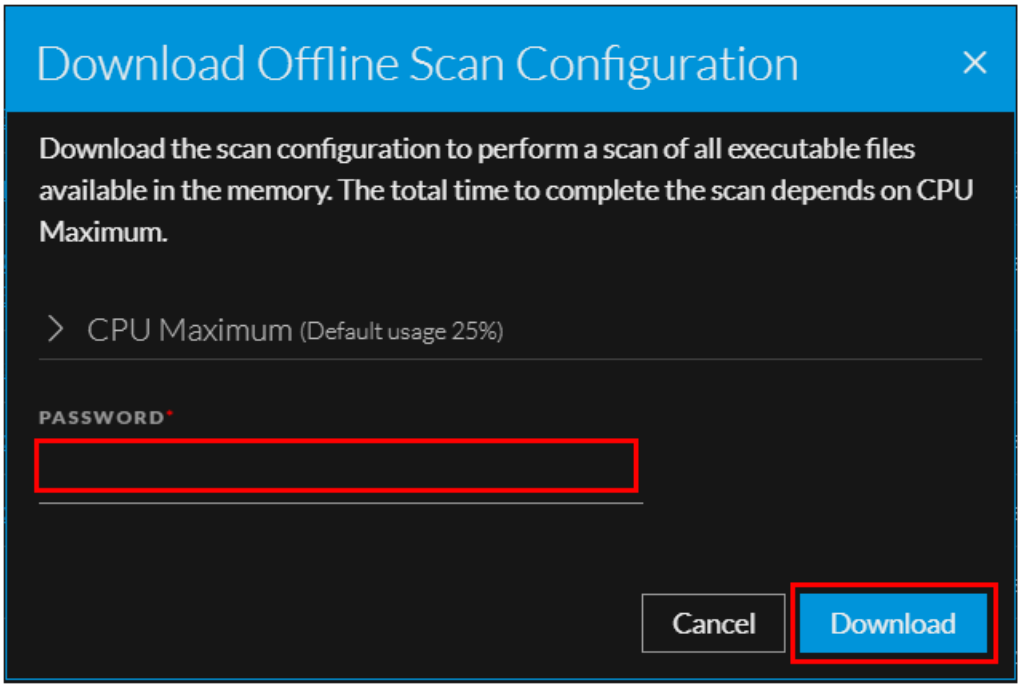
The scan process involves two files:

- **Offline Scan Configuration** - Contains the configuration information needed to run the scan.
- **Scan Results File** - This contains the results of the Scan, which you can upload using the **Scan > Upload Offline Scan File** option on the **Hosts** view. This file will be imported and processed by NetWitness.



Standalone scan workflow:

Note: Both Download Offline Scan Configuration and Upload Offline Scan File options are available only on the Endpoint server view. These options can't be accessed from Broker view.



Generate the scan configuration file

1. Click **Scan > Download Offline Scan Configuration** on the Hosts screen.

On the Download Offline Scan Configuration pop-up,

2. (Optional) **Select CPU Maximum**.
3. Enter a Password. (not more than 31 characters long)
4. Click **Download**.

5. Transfer the Offline Scan Configuration file to the air-gapped host.

Install Endpoint Agent and Register for Standalone Scan

1. Install the Endpoint Agent on the air-gapped host. Refer to *Endpoint Agent Installation Guide* for more information.
2. Register the agent for standalone scan (required only when an agent is installed)
   - Open command prompt in administrator mode and execute the following command:

     `ServiceName.exe /standalone`

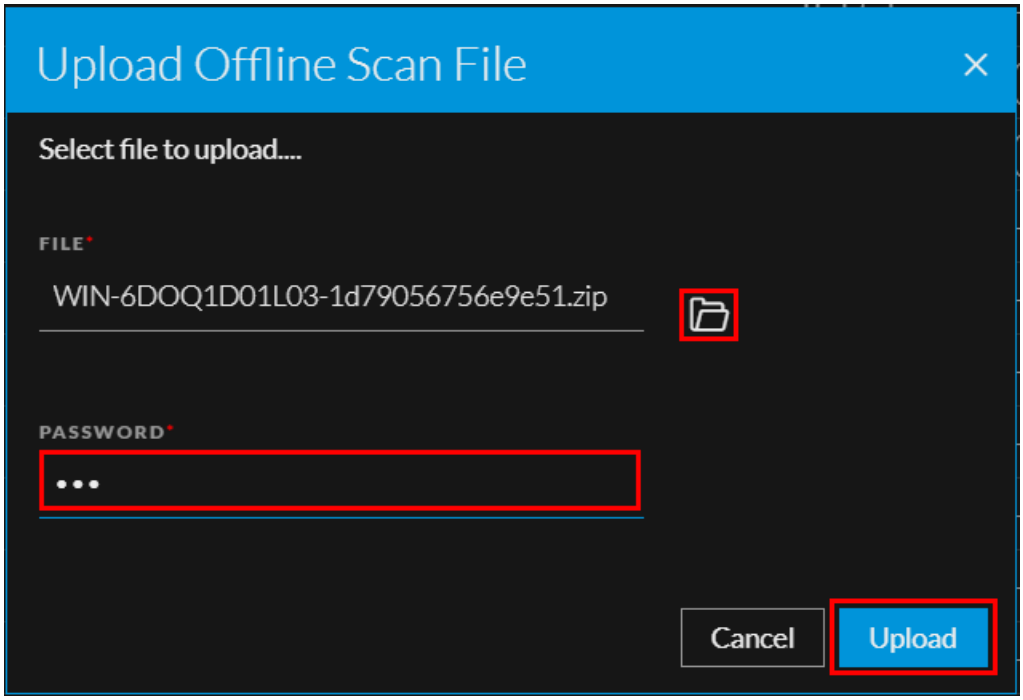
     Example: `NweAgent.exe /standalone`

Start a Standalone scan

1. Open the command prompt in Administrator mode, on the air-gapped host.

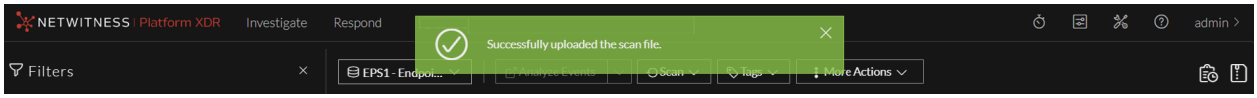
2. Execute the scan using the following command(syntax):

```
ServiceName.exe /scan /password ”<password>” /scanfile "<scan config. file>”
```



Example: `NweAgent.exe /scan /password "Abc123$" /scanfile "C:\Users\johndoe\Downloads\2021-12-06-Full Scan Configuration.scanfile"`

- `<password>` is the password entered while generating the Offline Scan Configuration File.
- `<scan config file>` is name of the scan configuration file with full path.



3. Wait until the scan is completed.
4. Transfer the scan result file(password protected .zip file) back to the machine to upload to the UI.

Upload the Standalone scan result file

1. Click **Scan > Upload Offline Scan File** on the Hosts screen.

2. Click  and upload the scan result file.
3. Enter the same password that was entered while downloading the offline scan configuration file.
4. The Endpoint server will process the scan result file once successfully uploaded.

Note: Standalone agents can only be upgraded manually using the Endpoint agent packager. Refer to *Generate an Endpoint Agent Packager* on *Endpoint Agent Installation Guide* for more information.

Investigating a Process

Note: The information in this topic applies to NetWitness Version 11.3 and later.

Analysts can perform process analysis to investigate a particular process behavior to:

- Understand the entire process event chain, process parent-child relationships, and all associated events in a timeline view.
- Analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, risk score, and file path.

The Analyze Process view provides a list of processes captured on hosts in a parent-child hierarchical format over a time range. The process tree is created from the tracking event type "Process event" where the action meta key is `createProcess`. The agent reports new events for the same createProcess if the following parameters change:

- Parent process filename
- Child process filename
- Launch arguments
- User name

If the above parameters do not change, the event is reported only once every eight hours.

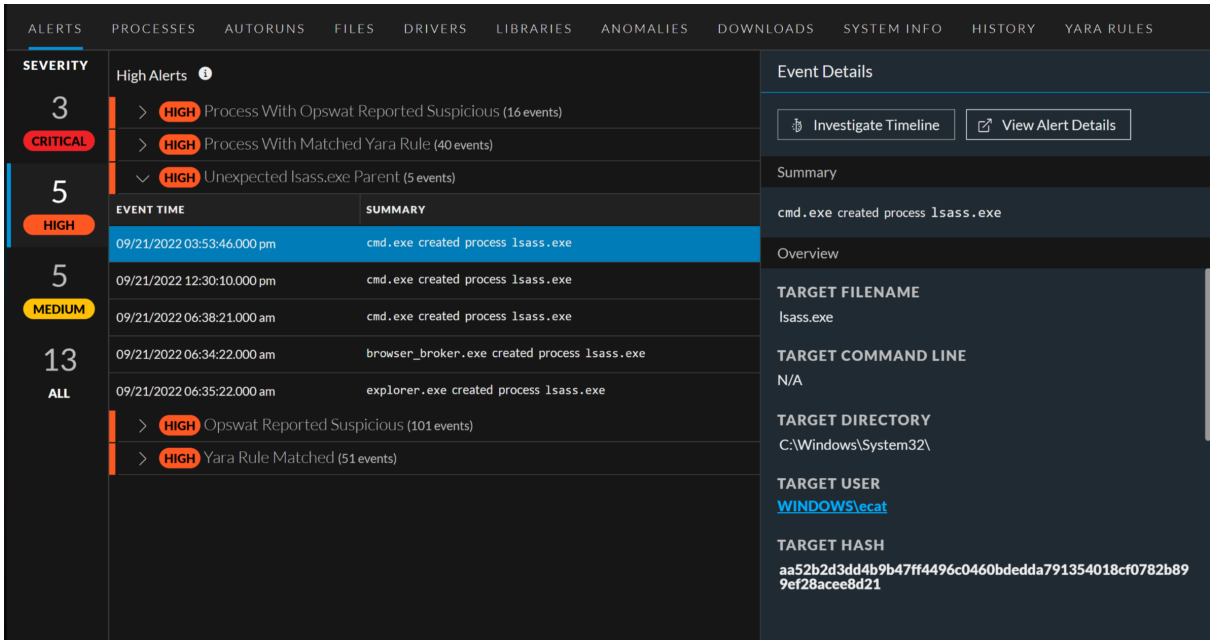
Best Practices

When reviewing a host for malicious activity, there are a few key things to review while looking for malicious processes.

- Process Name - When reviewing running processes on a host, check for the name of the program that looks suspicious. Sometimes malware uses random names, such as `wzuduje.exe`. In some cases, the names might be misleading such as `adob3.exe`, `scvhost.exe`, or `Microsoft.exe`. Being familiar with Windows processes and any type of internal tool that might be used throughout the environment, also helps you to identify potentially malicious or suspicious files.
- File Path - Similar to knowing normal and key Windows processes, knowing what path the processes originate from is a key to detect certain processes that imitate the legitimate process. For instance, if you see `svchost.exe` running on a system from `C:\Users\<username>\AppData\Roaming\adobe\` (which is a valid file path), and knowing that the legitimate Windows process originates from `C:\Windows\System32\`, you can determine that the `svchost.exe` file starting from the `C:\Users\<username>\AppData\Roaming\adobe\` directory is the suspicious one. To help determine further identification of a suspicious process, review the Autoruns tab to see if this process is running as an autorun, service, or task.
- File Signature - When a software package is created, it has a valid digital signature. The following are a few exceptions:
  - If a process that is running is not digitally signed, it does not automatically confirm that the file is malicious.

  - While files may have a valid signature, it does not mean that they are legitimate. There are instances of software identified as a Potentially Unwanted Program (PUP) or Adware, which can have a valid signing certificate.
- On Hosts - Indicates the number of hosts on which a file exist. If a file is present on fewer hosts with a high risk score, it may be malicious and needs further investigation.
- Reputation - Leveraging the reputation service is a way to find malicious processes.
- Analyze events - For further insight to a process, you can analyze console events, network events, file events, process events, and registry events.
  - Network events - Look for any suspicious domains to which the process is connecting. Sometimes malware creates legitimate connections to a known site, such as google.com, bing.com to hide its activity on the network. Look for connections to Dynamic DNS domains where a lot of known malicious activity resides. During analysis, consider uncommon processes making direct connections to an IP address or to a uncommon port number.
  - File and process events - Review process interactions that have occurred on the system with the suspected file. You can look for key events such as `writeToExecutable`, `renameExecutable`, and `createRemoteThread`, which indicate suspicious behavior.
- Leverage other methods
  - Look up with Google - You can search the file name or hash value against Google to determine if the file is malicious.
  - Look up with VirusTotal – You can search the hash value against the VirusTotal to determine if the file is malicious between multiple AV vendors.
  - Download file – Download and analyze a file to find indicators such as compile time, imported DLLs, section names, and performing string searches. Look for TLD values (.com, .net, .biz) or debug information of a compiled binary (.pdb), which can be easily changed or forged.
  - Time stamp values – Review modified, accessed, and created dates associated with the binary. Review how long a file has been residing on a host. While this value is correct most of the time, attackers can change the time stamp values of a file.

Analyze a Process

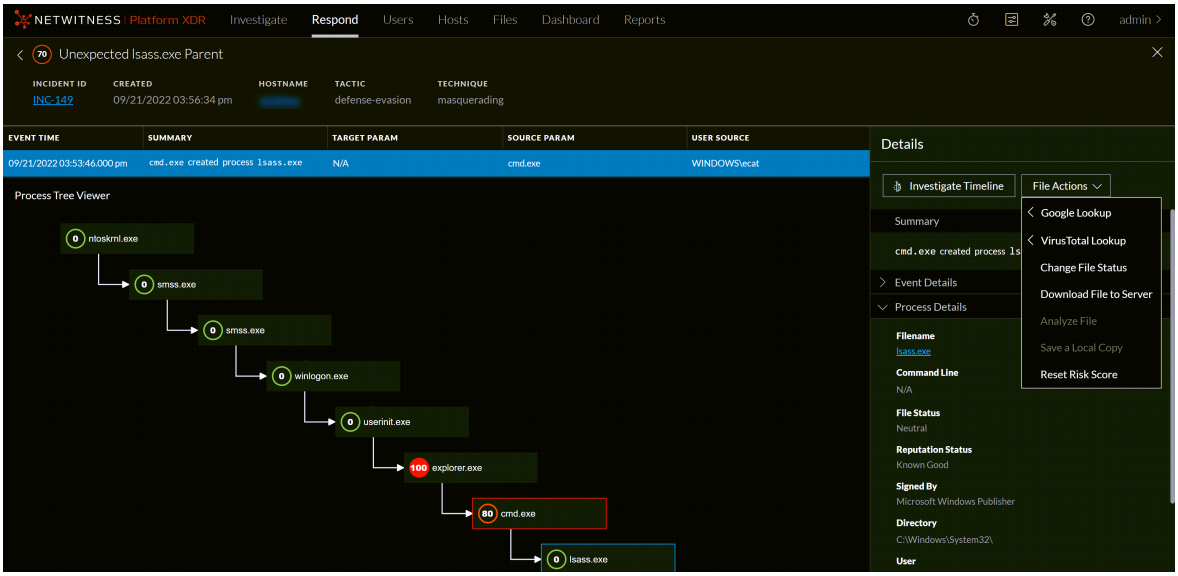


Based on the Alert severity, you can analyze the processes using two different options:

- **View Alert Details**: This option allows you to analyze the processes associated with **Critical** and **High** Alerts.
- **Analyze Process Tree**: This option allows you to analyze the processes associated with **Medium** Alerts.

To analyze the process associated with Critical and High Alerts:

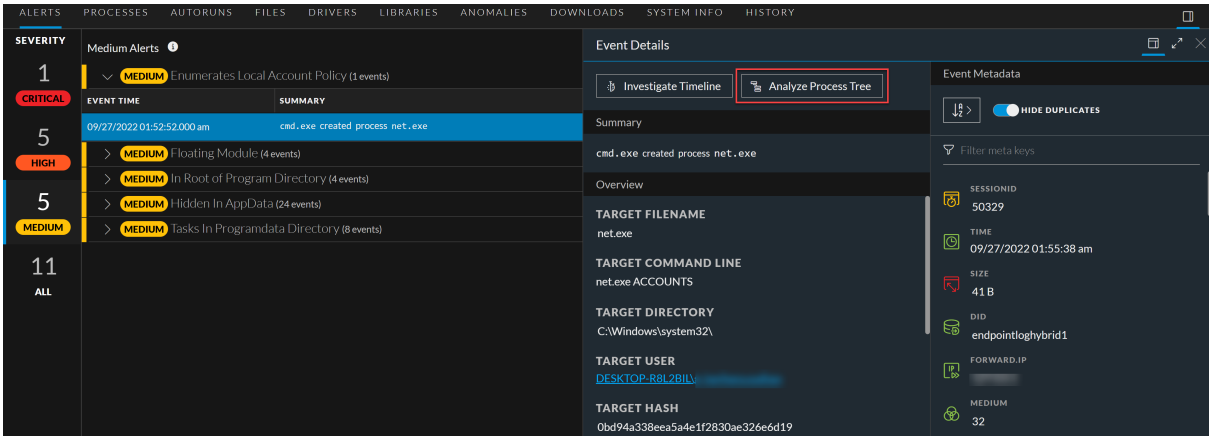
1. Go to **Hosts** and click on a host.
2. Click on an event associated with the **Critical** or **High** alert on the Host Details view. The **Event Details** panel appears.



3. Click **View Alert Details** to analyze the process activities of a file associated with the **Critical** or **High** Alerts.

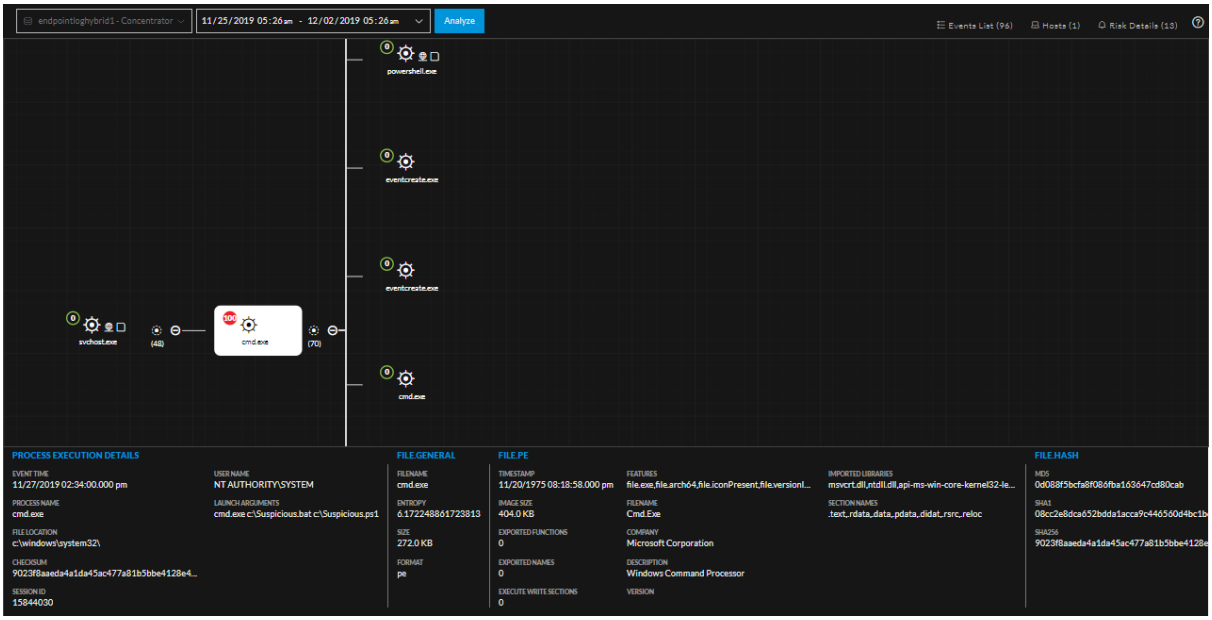
The **Process Tree Viewer** is displayed in the **Respond** service.

4. Select the process in the **Process Tree Viewer** and click **File Actions** in the **Details** panel to perform the following actions:
   - **Google Lookup**
   - **VirusTotal Lookup**
   - **Change File Status**
   - **Download File to Server**
   - **Analyze File**
   - **Save a Local Copy**



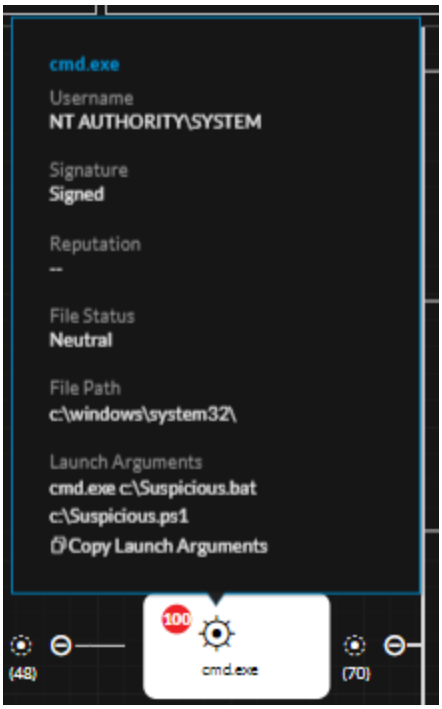
- **Reset Risk Score**

To analyze the process associated with Medium Alerts:



1. Go to **Hosts** and click on a host.
2. Click on an event associated with the **Medium** alert on the Host Details view. The **Event Details** panel appears.
3. To analyze the process activities of a file associated with the **Medium** Alerts, do one of the following:
   - In the **Event Details** panel, click **Analyze Process Tree**.
   - Select the **Processes** tab and do one of the following:
     - Right-click a process and select **Analyze Process** from the context menu.
     - Click **Analyze Process** in the toolbar.

   In the following example, the file `cmd.exe` has created process `net.exe`.

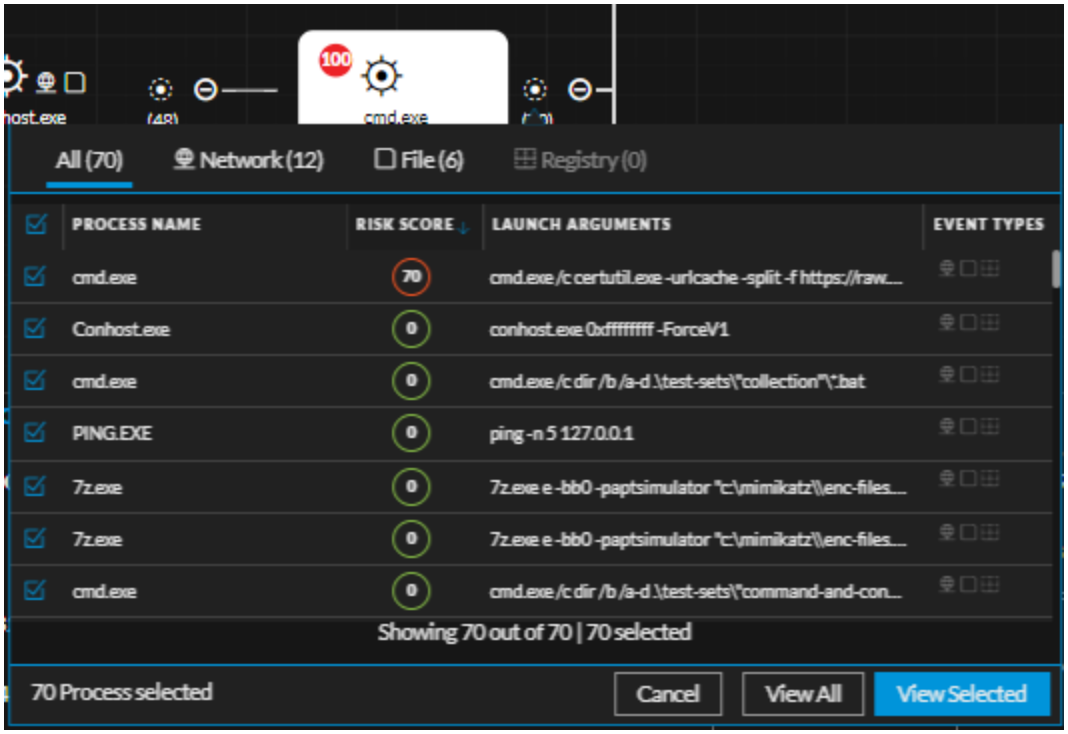


Clicking **Analyze Process** displays the process visualization. For each node, the process name, risk score, and type of activity the selected process has performed (network, file, or registry) are displayed. Optionally, you can change the time range to view data.

You can view the properties, such as process execution details, file properties of the selected process in the bottom of the view.

Note: No result is displayed in the process visualization view if there is no data for last seven days or if there is no `createprocess` event.

4. On the right side of the process visualization view:
   - Click **Events List** to view the associated events. You can also filter events based on the events category. For more information on filtering, see Analyze Events for a Process.
   - Click **Hosts** to view the hosts on which this file is present and the associated risk score. For more information, Analyze Hosts with File Activity.
   - Click **Risk Details** to view the list of distinct alerts, such as Critical, High, Medium, and All. For more information, see Analyze Hosts Using the Risk Score.
5. Hover over the process name to analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, and file path.

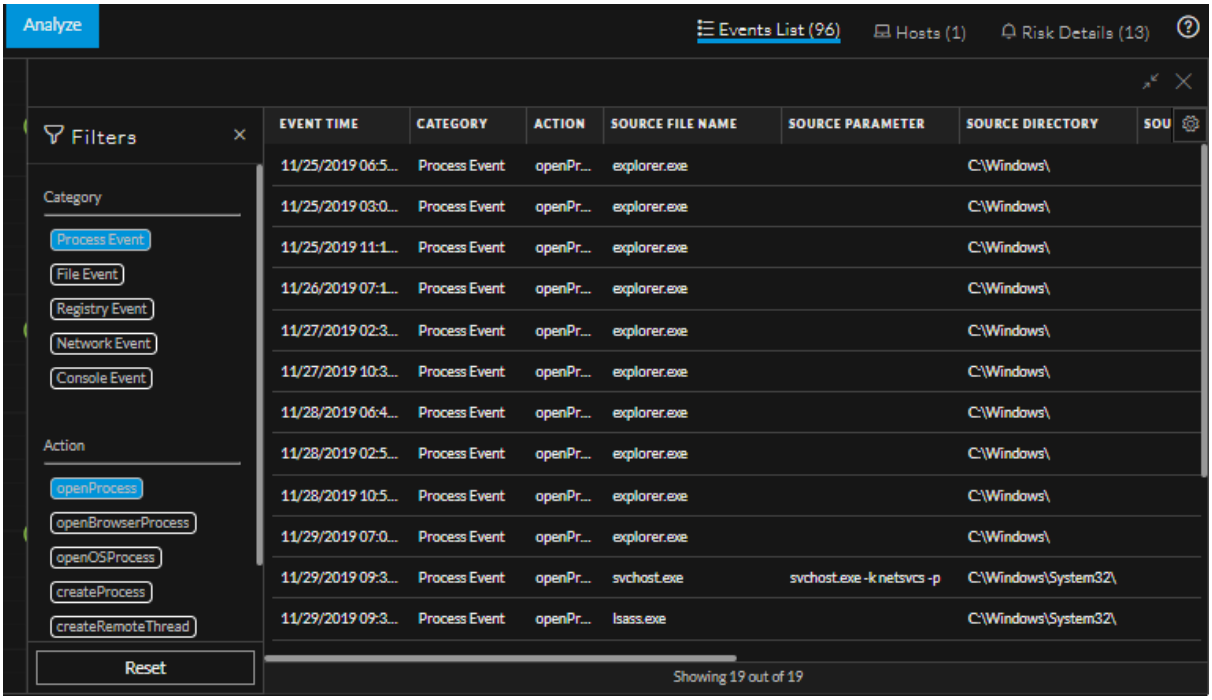


6. Click  to view the child processes. The Process selection dialog is displayed with the child processes associated with the process based on the risk score. You can filter the result on the event type by clicking icons on the top panel. When no matching event types are available, these filter options are disabled.

   Depending on the type of event, the icons are highlights in the Event Types column.

   a. Click **View All** to view all child processes or select the required processes and click **View selected**. The associated events and properties are displayed in the right panel.

b. Click  to change the process selection and click  to collapse the view.



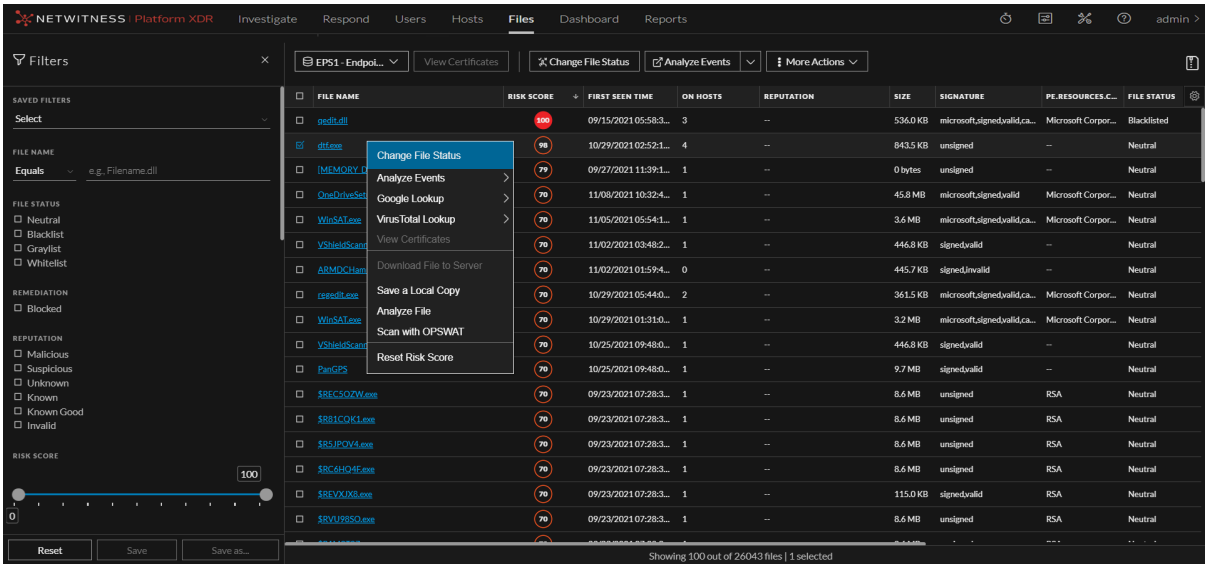
Analyze Events for a Process

To analyze events for the selected process:

1. Perform steps 1 to 3 in To analyze the process associated with Medium Alerts:.
2. In the process visualization, click the **Events** tab.
3. To narrow down the search to find any suspicious indicators, behaviors, or specific type of event, filter on a set of matched events based on a category - Process, File, Registry, Network Event, or Console Event (for Windows).

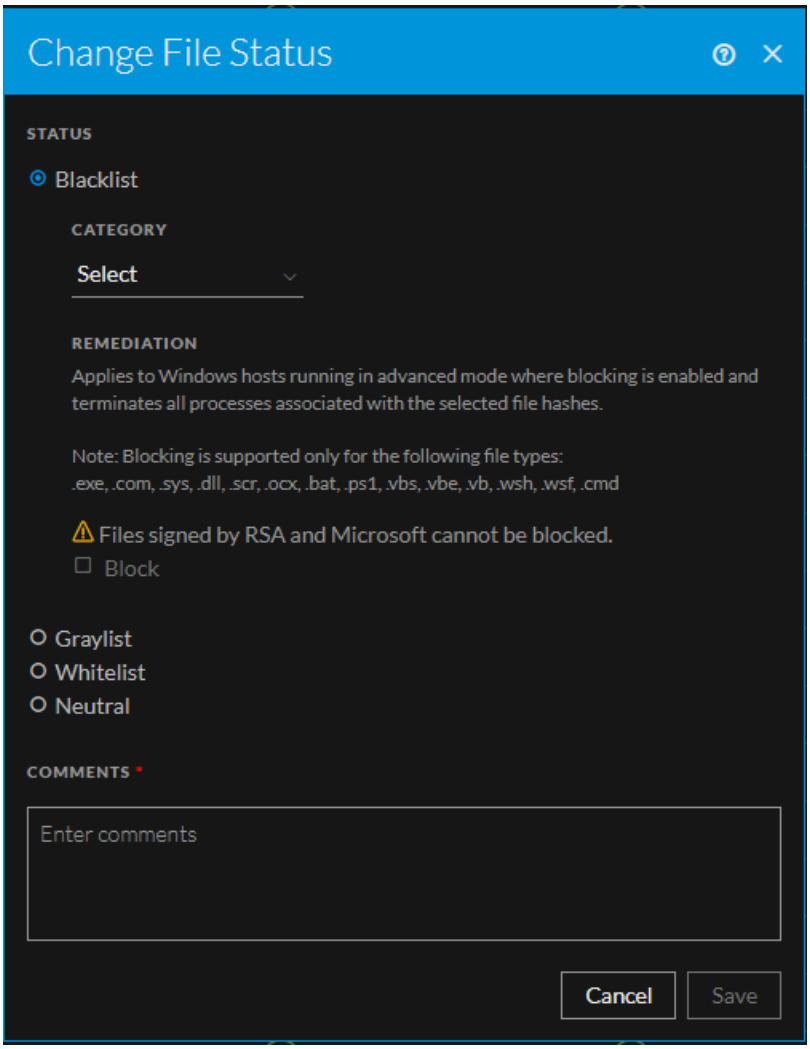
For example, to view only process events, select the **Process Event** category, and filter on action.

The result displays the sequence of activities involving this process for the selected filters.



Note: For the console events, the context for local and remote are available only if the data is sent from 11.4 or later agents.

Changing File Status or Remediate



Note: By default, the blocking option is disabled in the policy. To enable blocking, in the policy configuration, change the **Blocking** option to **Enabled** under Response Action Settings. For more information, see the *NetWitness Endpoint Configuration Guide*.

To change the status of a file:

1. Do one of the following:
   - Go to **Hosts** (Processes, Autoruns, Files, Drivers, Libraries, or Anomalies tab).
   - Go to **Files**.
2. Select one or more files and do one of the following:

   - Right-click and select **Change File Status** from the context menu.
   - Click **Change File Status** in the toolbar.
3. In the Change File Status dialog, select a status - **Blacklist**, **Whitelist**, **Graylist**, or **Neutral**.

Note: You cannot whitelist certain Microsoft files, such as `cscript.exe`, `wscript.exe`, `cmd.exe`, `bash.exe`, as there is a potential risk of them being used for malicious purposes. For more information, see Files Restricted from Whitelisting.

If you select Blacklist or Graylist, the following options are displayed:

a. **Category:** Select the appropriate category type: **Generic Malware**, **APT: Advanced Persistent Threats**, **Attacker Tool**, **Unidentified**, **Ransomware**.

Caution: Before blocking, make sure that you review the file because this may cause the system or software to be unusable.

b. **Remediate:** Select **Block** to block the file.

Note: Blocking is supported only for Windows hosts that are running in advanced mode. All PE files along with the following file extensions can be blocked.
.exe, *.com*, *.sys*, *.dll*, *.scr*, *.ocx*, *.bat*, *.ps1*, *.vbs*, *.vbe*, *.vb*, *.wsh*, *.wsf*, *.cmd*
You cannot block the following:.
- Memory DLL and floating code
- Files that are signed by Microsoft or RSA.
To delete a blocked file, users can log in to the host and execute the delete command using the elevated command prompt.

4. Add a comment and click **Save**.

You can change the status of only 100 files at a time. When the status is changed, it impacts the file status on all hosts on which the file is present. The status is sent as a session under the **File** category, and available for investigation. If the file is seen in subsequent scan or tracking, the corresponding sessions contain a meta value with the file status (except Neutral).

Import File Hashes using the Block Hash tool

The Block Hash tool allows you to import a set of file hashes which can be set to block state and change the file bias status (whitelist, blacklist, and graylist). The tool allows you to block the imported file hashes (suspicious, invalid, and malicious) and prevent them from opening or executing on the hosts. You can block up to a maximum of **50,000** file hashes using this tool.

Note: For more information on changing the file status or blocking the file, see Changing File Status or Remediate.

IMPORTANT:
- Enter only valid SHA256 hashes; otherwise, the blocking functionality might break.
- Do not block any file hashes signed by RSA, Microsoft, and Apple. It might make your Endpoints unresponsive.
- Make sure the number of hashes entered in the JSON file is less than the number of the available limit of hashes that can be blocked (the maximum limit is **50,000**).
For example: If 100 file hashes are already blocked as part of NetWitness deployment, you can only block 49,900 more file hashes using this tool.

JSON File Format

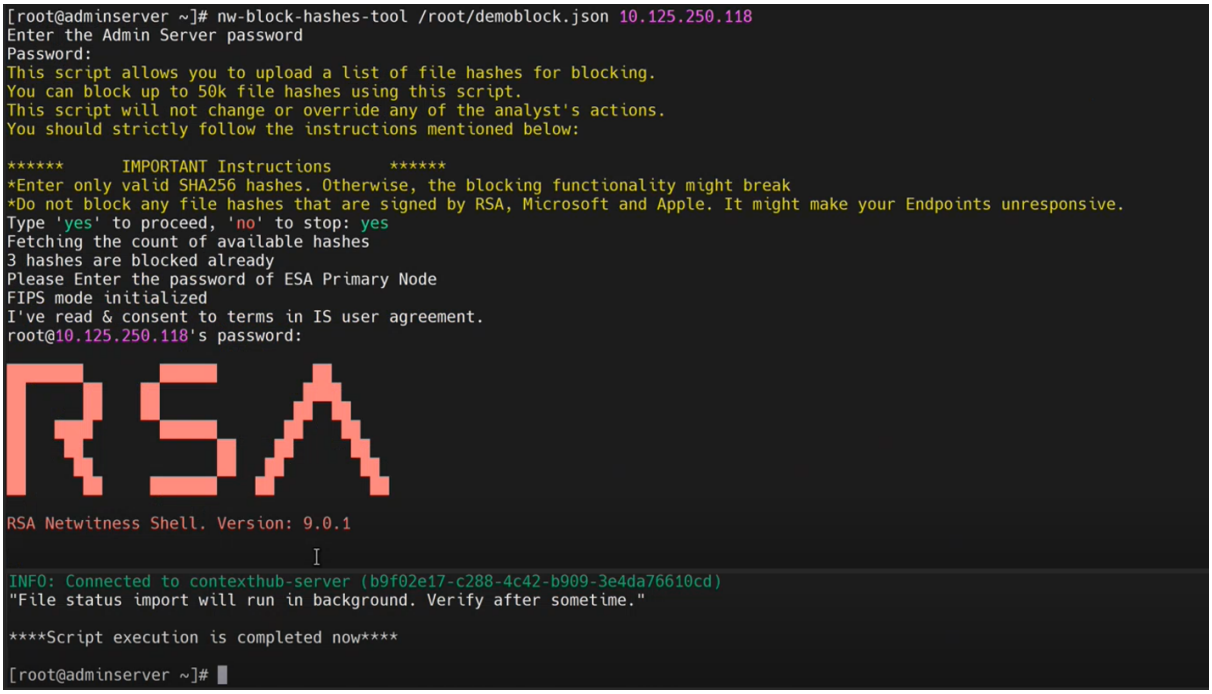
The example below describes the JSON file format for blocking and blacklisting the file hashes.

Sample demoblock.JSON:

```
[{
"checksums":
["1b30e463ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077886da2804","67fa30e4
63ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077dsbhb561","78vbba909e463ebe0
131dsdsdb66fce7d4aa43f3e1dsdsd49064d85dsdsman61n"],
"fileStatus": "Blacklist",
"comment”: "File blocking set through new tool",
"remediationAction": "Block"
}]
```

The example below describes the JSON file format only for blacklisting the file hashes.

Sample demoblock.JSON:



```
[{
"checksums":
["2b30e463ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077886da2800","97fa30e4
63ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077dsbhb500","38vbba909e463ebe0
131dsdsdb66fce7d4aa43f3e1dsdsd49064d85dsdsman68c"],
"fileStatus": "Blacklist",
"comment": "File status change set through new tool",
}]
```

To block the file hashes using the Block Hash tool:

1. SSH to node 0 and copy the JSON file (containing the file hashes to be blocked) stored in it.
2. Run the tool.

   `nw-block-hashes-tool <absolute path of json residing on node 0> <ESA node IP/hostname>`

   Note: Enter the JSON file path in `<absolute path of json residing on node 0>` and enter the ESA node IP in `<ESA node IP/hostname>`.
   For Example: `nw-block-hashes-tool /root/demoblock.json 10.125.250.118`.

3. Enter the Admin Server password.
4. Follow the instructions displayed on the screen. Enter any one of the following options when prompted.

- **yes**: Enter **yes** to proceed with the execution of the script.
- **no**: Enter **no** to stop the execution of the script.

> **Note:** At this stage, the tool validates the number of incoming file hashes through the JSON file and the number of existing file hashes already blocked in the deployment. If the total of the file hashes (incoming through JSON file and existing as blocked in the deployment) exceeds the maximum limit of **50,000**, the tool stops the execution, and it will not proceed further.

Files Restricted from Whitelisting

To view or update the files that are restricted from whitelisting, do the following:

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter your credentials.
3. Connect to the Endpoint Server using the following command:

   ```
   connect endpoint-server
   ```

4. Run the following commands to view the list of files:
   - `cd endpoint/file/status/restricted/get`
   - `invoke Whitelist`
5. Run the following commands to add files to the list:
   - `cd endpoint/file/status/restricted/get`
   - `invoke '{"id":"<filename>","restrictedStatus":["Whitelist"], "enable":true}`
6. Run the following commands to delete files from the list:
   - `cd endpoint/file/status/restricted/update`
   - `invoke '{"id":"<filename>","restrictedStatus":["Whitelist"], "enable":false}`

Analyzing Downloaded Files

To perform a deep analysis of suspicious files, you can manually or automatically download the file to the server.

Note: Saving or analyzing downloaded file works the same way irrespective of whether the file is downloaded manually or automatically.

Note: Downloaded files are stored in the Endpoint Server which may fill up the disk space. To utilize the storage efficiently without impacting the health of Endpoint Server, NetWitness recommends you to configure an external storage mount, so all the Endpoint Server can use the configured location to store the downloaded data.
By default, all files are downloaded to `/var/netwitness/endpoint-server/<files>/`. If you want to change the location, make sure that you have **endpoint-server.configuration.manage** permissions and do the following:
1. In the Explore view, go to **endpoint/download**,
2. In the base-path, provide the location of the directory.

Caution: By default, the status **File Download Disk Usage** stats in the **Health and Wellness** view shows unhealthy if the disk usage reaches 60% and the file download stops automatically when the disk usage is 70%. You can customize the warning or fatal thresholds in the  **> Services > Endpoint Server > view > Explore > rsa.endpoint.file-download-disk-thresholds.warning-percent** and **rsa.endpoint.file-download-disk-thresholds.fatal-percent** parameters respectively.

For the downloaded file, you can:

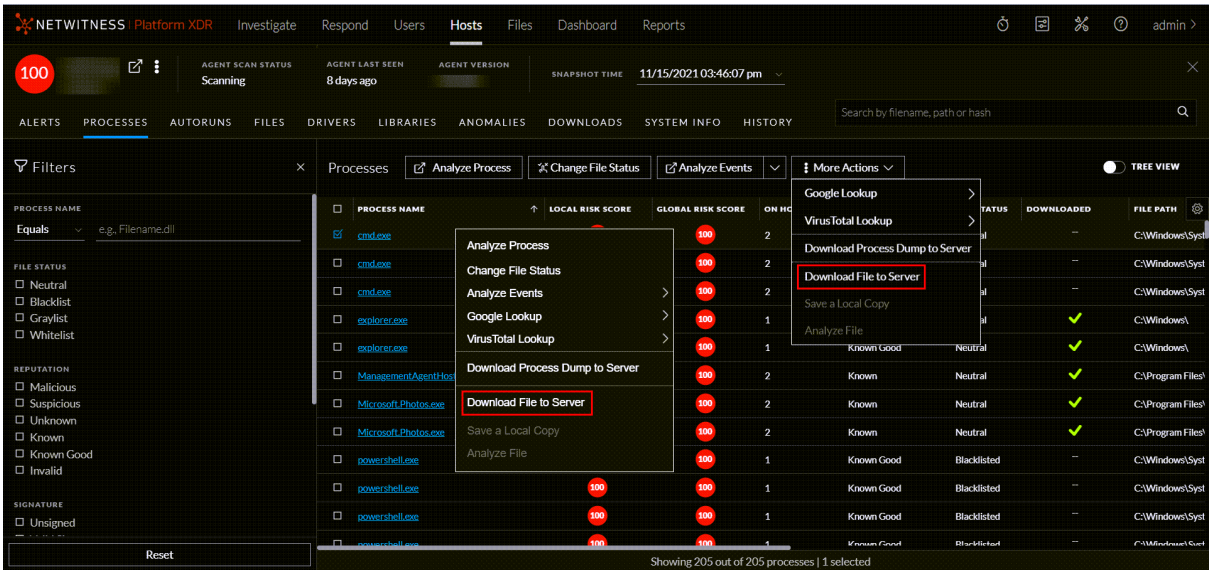
- Search for strings in the executable
- View text content for scripts
- View imported libraries and functions
- Save a local copy for further analysis

Download Files to Server

Downloading file to server is not supported for memory DLL and floating code.

Note: Downloading files may take significant time. Additional requests to the agent during download are queued and processed when the download is complete.

Automatic File Download

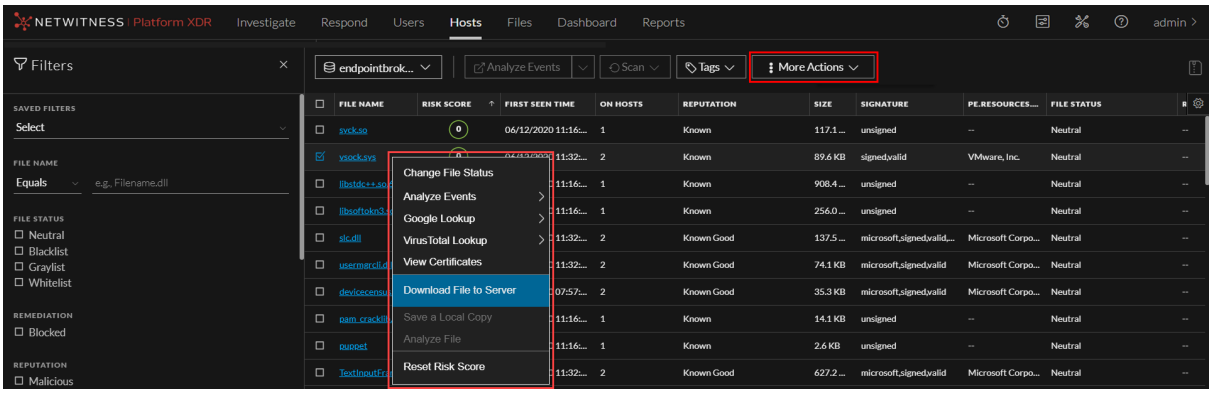


By default, the files that are unsigned and size lesser than or equal to 1 MB are downloaded automatically to the NetWitness Endpoint server. And, only single copy of each file is downloaded automatically. You can limit the volume of files to be downloaded in the  **> Endpoint Sources > Policies** tab, so the files matching certain criteria are only downloaded automatically. For more information on automatic file download settings, see "Create an EDR Policy" section in the *NetWitness Endpoint Configuration Guide*.

The status of the download is displayed in the **Files** tab > **Downloaded** column.

Manual File Download

To manually download files to the server from the Hosts view:



1. Go to **Hosts**.
2. Select the hostname to open the Host Details view.
3. In any of the Processes, Autoruns, Files, Drivers, Libraries, or Anomalies tabs, select the file, and do one of the following:

- Right-click and select **Download File to Server** from the context menu.
- Select **Download File to Server** from the **More Actions** drop-down list in the toolbar.

To download files to the server from the Files view:

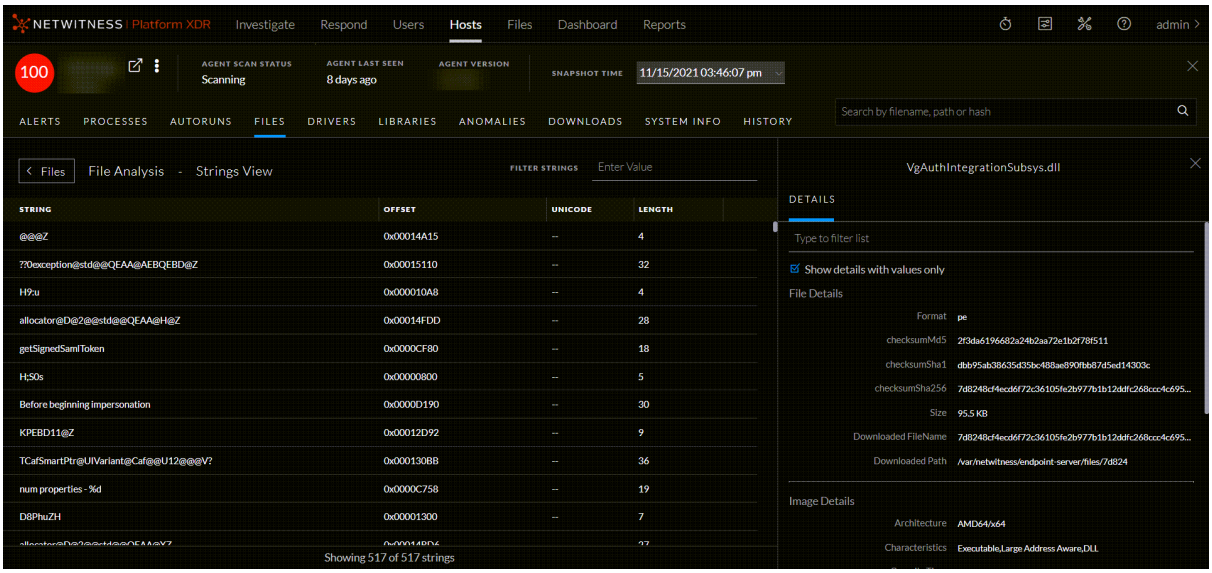
1. Go to **Files**.
2. Select the file and do one of the following:

- Right-click and select **Download File to Server** from the context menu.
- Select **Download File to Server** from the **More Actions** drop-down list in the toolbar.

The status of the download is displayed in the Downloaded column. The download statuses are Downloaded, Not downloaded, and Error.

Save Downloaded Files

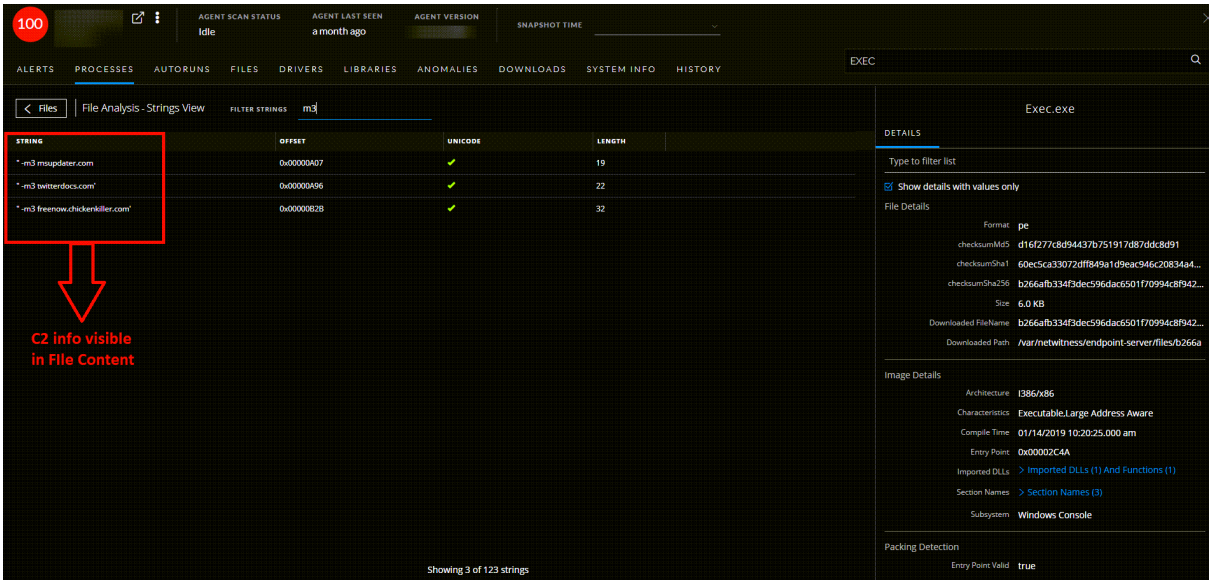
You can retrieve a downloaded file and save it to your local file system for further analysis. Downloaded files are stored in the server in the configured location. This option is enabled only if the file is downloaded to the server.



To save a file:

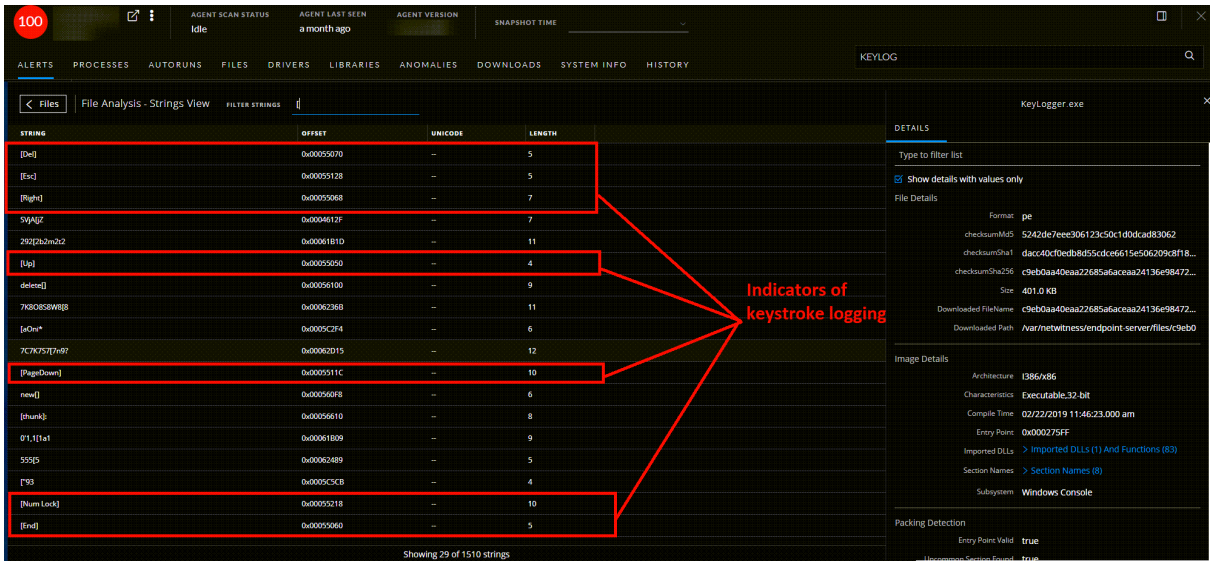
1. Go to **Hosts** or **Files** .
2. Right-click the file you want to save and select **Save a Local Copy**.
3. Browse the location and click **Save**.

Analyze Downloaded Files



You can use the **Analyze File** option to view detailed information about a downloaded file. This option is enabled only if the file is downloaded to the server. To analyze a file:

1. Go to **Hosts** or **Files**.
2. Right-click the downloaded file and select **Analyze File**. The File Analysis view opens and properties of the are is displayed in the right panel.



3. View strings in the file in the Strings view while analyzing an executable (such as `macho`, `pe`, `elf`). This view contains the string, offset in the binary, unicode, and the length of the string. You can search for or filter on a specific string value in the **Filter String** field.
4. View the text content of the file and look for any suspicious behavior in the script file.

   For example, if the file contains C2 information in the form of domain names or IP addresses, it is highly suspicious.

If you see unprintable keyboard keys listed within the file, such as: [F1], [F2]…[Page Up], [Enter], [ESC], and so on, that may be indicative of a keystroke logger.

Performing Host Forensics

Note: The information in this topic applies to NetWitness Version 11.4 and later.

You can perform the following forensic investigation on a host:

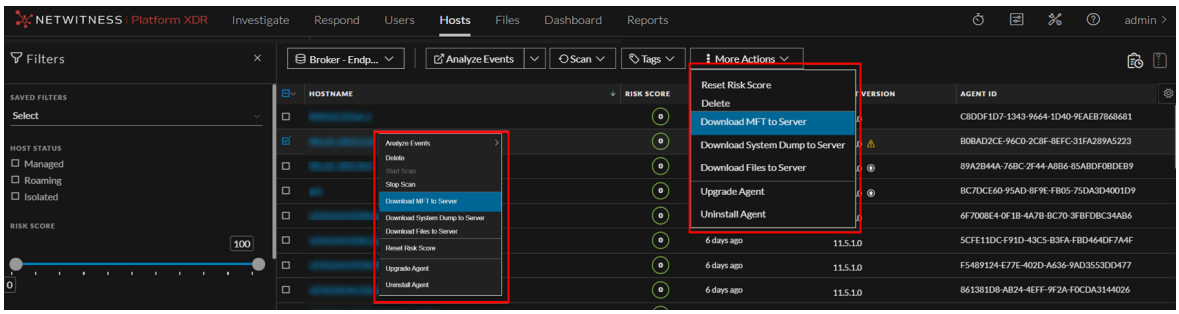
- Master File Table (MFT)
- System Dump
- Process Dump

Note: This is applicable only for Windows agent (in Advanced mode) with NetWitness Platform version 11.4. Downloading system dump files may take significant time. Additional requests to the agent during system dump download are queued and processed when the download is complete. MFT, system dump, and process dump downloads are not supported for agents communicating through Relay server.

Note: MFT, system dump, and process dump are stored in the Endpoint Server which may fill up the disk space. For large deployments, to utilize the storage efficiently without impacting the health of Endpoint Server, NetWitness recommends you to configure an external storage mount, so all the Endpoint Server can use the configured location to store the downloaded data.
By default, all files are downloaded to `/var/netwitness/endpoint-server/<file type>/`, where `<file type>` is MFT, system dump, or process dump. If you want to change the location, make sure that you have endpoint-server.configuration.manage permissions and do the following:
1. In the Explore view, go to **endpoint/download**.
2. In the base-path, provide the location of the directory.

Download Master File Table

Master File Table contains metadata of every file on the host. It keeps track of information, such as filename, size, timestamps, permissions, and location of the file on the host. It consists of two sets of timestamps - Standard Information ($SI) and File Name ($FN). Each set has the following timestamps - creation, access, update, and modification.

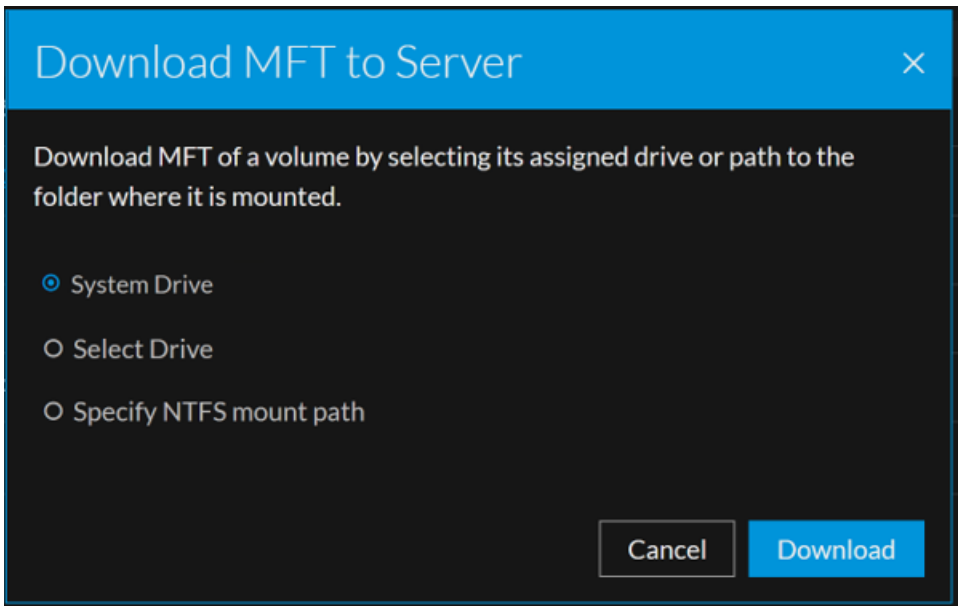


Time stomping is a technique that modifies the timestamps for a file (creation, access, update, and modification time) to mimic files that are in the same folder, making it difficult to identify suspicious files on a host. To perform forensic investigation of a suspicious file, you can download and analyze the MFT, and focus on files that are time stomped. For more information, see Analyze Downloaded MFT.

During MFT analysis, you can also search for suspicious filenames, and also files that were created before or after a known malicious event. You can also download files from the MFT viewer for further analysis.

Download MFT to Server

To download MFT to the server from the Hosts view:



1. Go to **Hosts** and do one the following:
   - Select one or more hosts and select **Download MFT to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar.

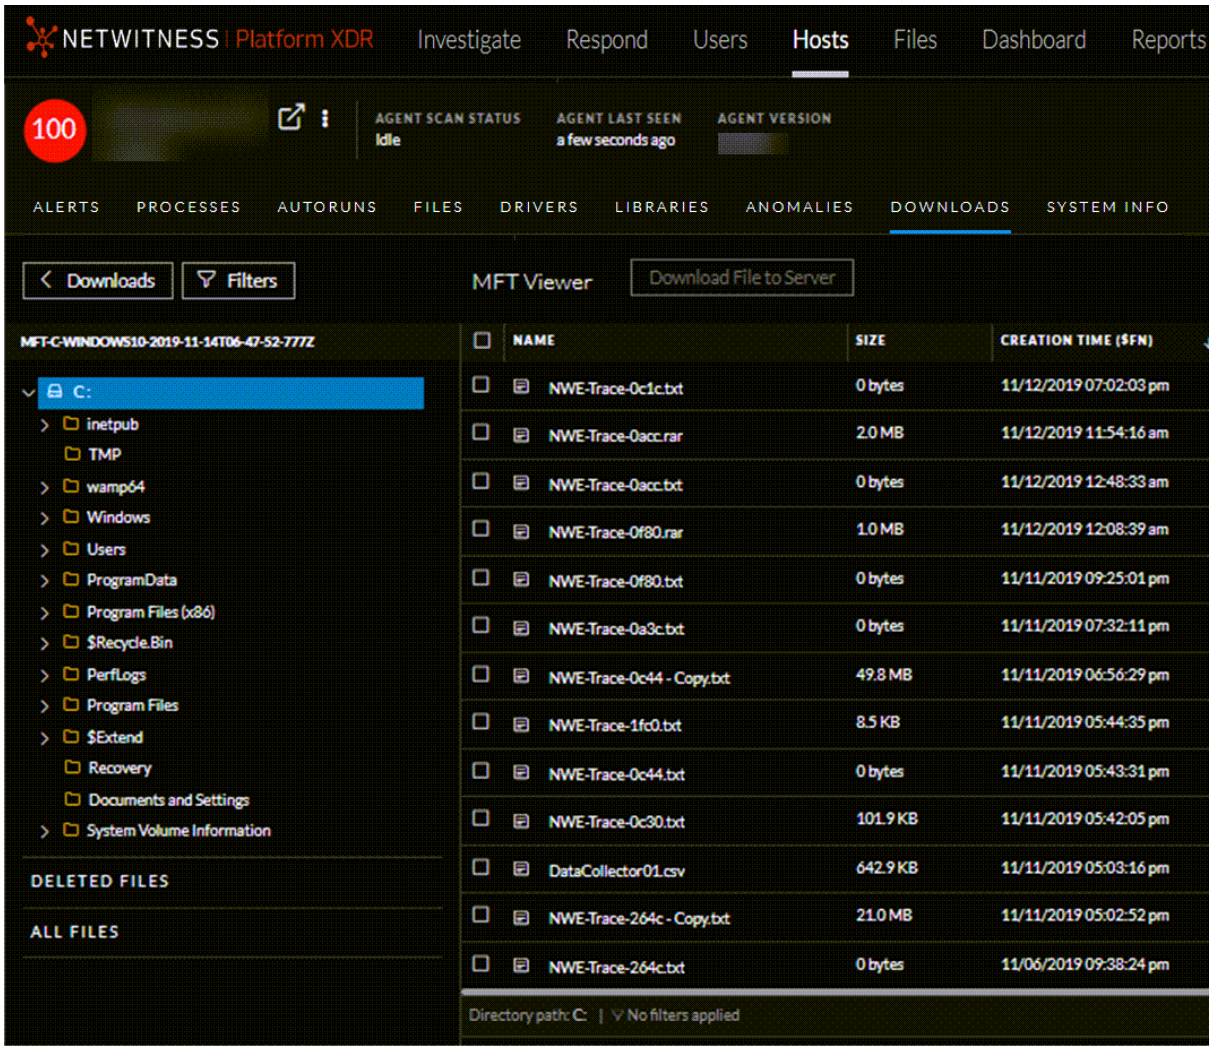
   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Download MFT to Server**.

2. In the **Download MFT to Server** dialog, select one of the following:
   - **System Drive** - to download MFT to the system drive.
   - **Select Drive** - to download MFT on assigned drive.
     You can select any drive from the **Drive** drop-down list. By default the selected drive is C.
   - **Specify NTFS mount path** - to download MFT on the path to the folder where it is mounted

   Click **Download**.

3. View details of the downloaded MFT in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

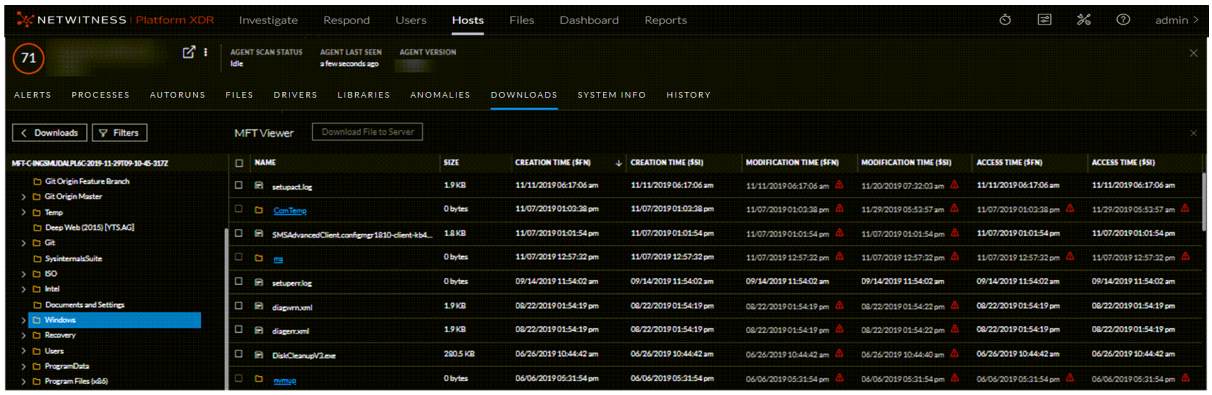
Analyze Downloaded MFT



You can use the MFT viewer to begin analysis where you can search for files based on file name, time stamps, and identify files that are timestomped.

View MFT

To view the content of the downloaded MFT:

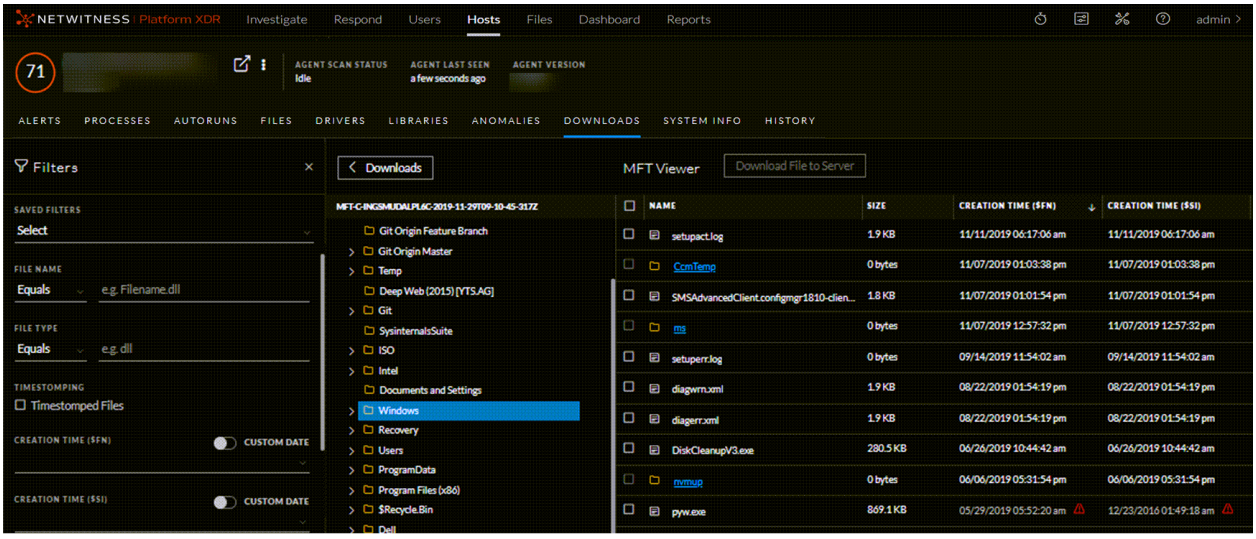


1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Click the file name. The MFT viewer is displayed.

   All available files are displayed in a tree view similar to the Windows Explorer in the All Files folder. The Deleted Files folder contains a sequential list of all deleted files.

4. Click ▶ to view the folder structure. Click the row to view the folder content.

   The details of the MFT is displayed in the table. By default, the table is sorted on the creation time ($FN). If the $SI and $FN timestamps are different, the columns are highlighted in red (⚠) indicating that it is time stomped.



5. Select one or more files and click **Download File to Server** on the toolbar to download files to the server.

> **Note:** Downloading a folder is not supported and hence the option is grayed out for folders.

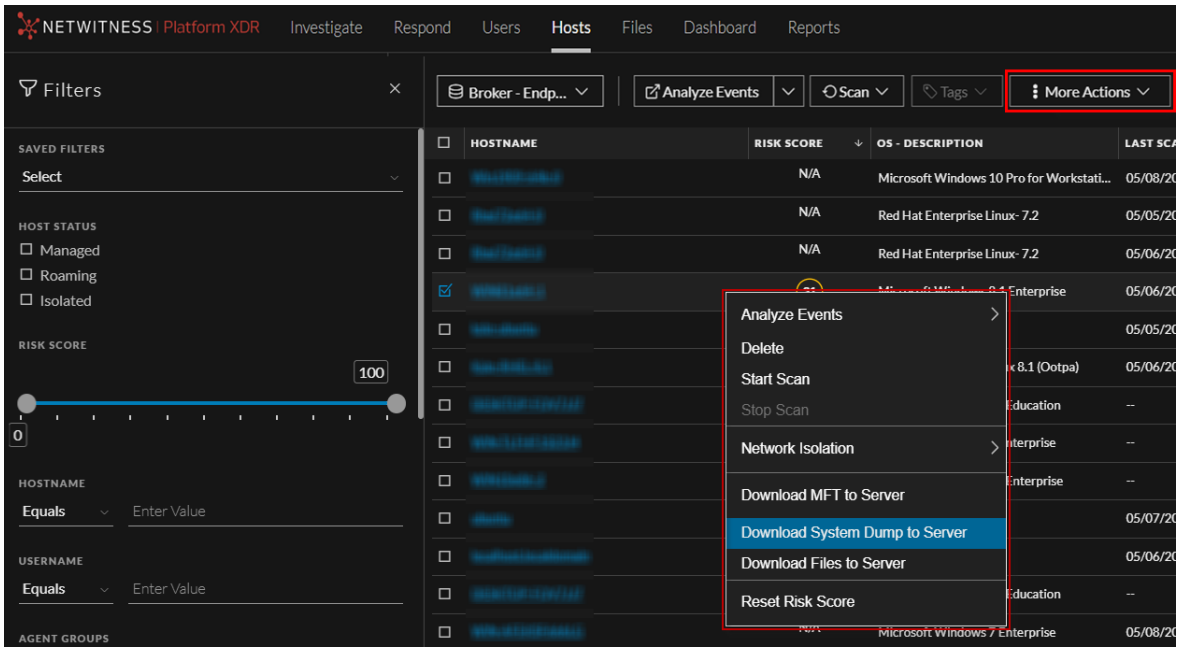
Filter MFT

You can filter files on file name, creation time ($FN), creation time ($SI), access time ($FN), access time ($SI), update time ($FN), update time ($SI), modified time ($FN), and modified time ($SI).

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click .

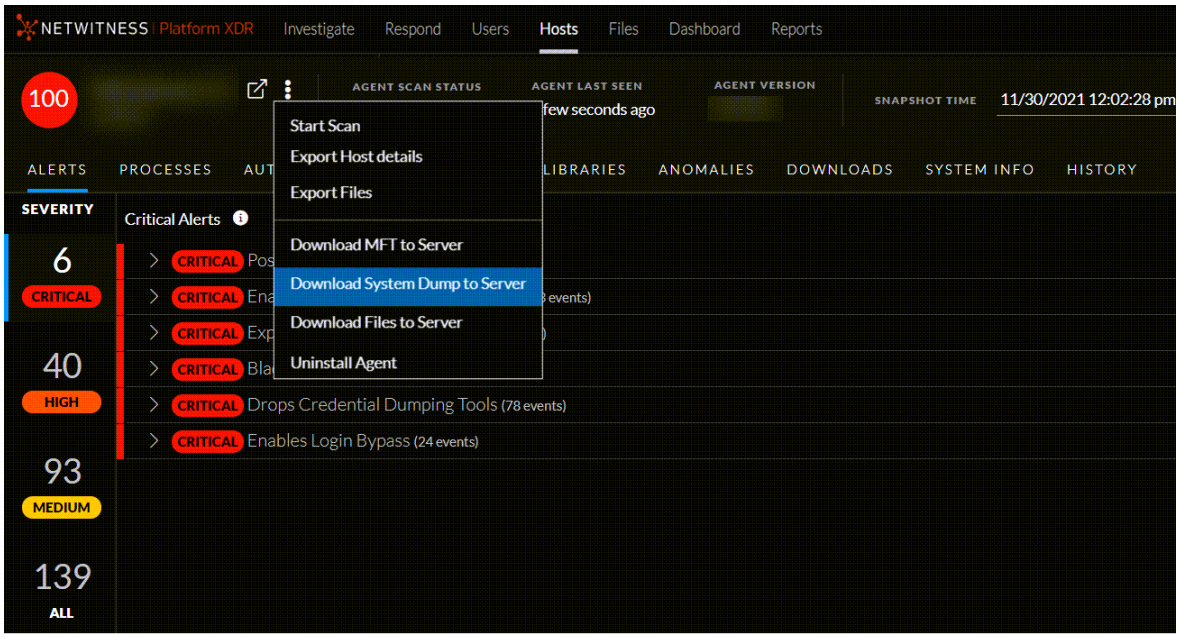
> **Note:** Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

To filter, save, and delete MFT, see Filter Downloaded Files, Save Downloaded File, and Delete Downloaded Files.



System and Process Memory Dump

To perform forensic investigation during an incident response, you can request a memory dump of a host or a process running on the host. You can analyze these dumps using third-party tools, such as Volatility, Rekall.



Download System Dump to Server

To download system dump to the server from the Hosts view:

1. Go to **Hosts** and do one the following:
   - Select a host and select **Download System Dump to Server** from the right-click context menu, or from the **More** drop-down list in the toolbar.

- Select the hostname to open the host details and select **Download System Dump to Server** from the **More** option besides the hostname.

2. View the details of the downloaded system dump in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

Remote Shell

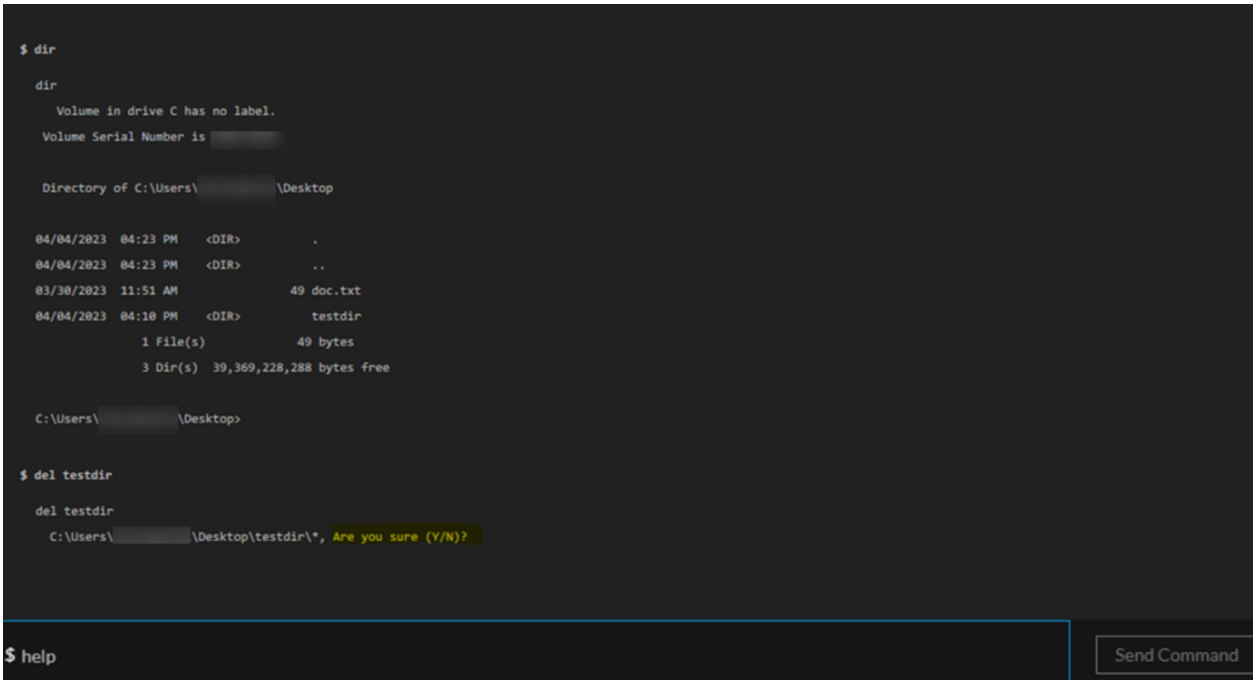
From version 12.3 or later, **NetWitness Remote Shell** feature (**Hosts** > Select the hostname > click  **(More)** beside the hostname > **Remote Shell**) allows you to access the agents installed on your Windows machine remotely and execute a list of commands to perform certain actions such as deleting the files, changing the directories, terminating specific processes, and executing the processes on the remote host.

Warning:
- Use **NetWitness Remote Shell** feature with utmost caution to avoid the potential for negative impact on the system. NetWitness Platform XDR is not responsible for any damages, loss of data, or other consequences that may arise after using **NetWitness Remote Shell** feature.

- If you are an administrator, NetWitness recommends you to add roles and assign the role permissions only for the selected users in the **Security** > **Roles** view to avoid any damages to the system.

Note:
- **NetWitness Remote Shell** feature can be used only if Windows Advanced mode Agents are installed on the machine. The agent version must be 12.3 or higher to access the **NetWitness Remote Shell** feature.

- **NetWitness Remote Shell** feature supports connection with the agents that communicate through the relay servers (RAR). To access the **NetWitness Remote Shell** feature for the agent that communicates through the relay servers (RAR), you must download the latest relay packager from the Endpoint Server (EPS) and install it on the existing relay server.
For more information, see https://community.netwitness.com/t5/netwitness-platform-online/optional-installing-and-configuring-relay-server/ta-p/669551.



List of Supported Commands

The following table provides information about the list of supported commands displayed in the **NetWitness Remote Shell** console.

Supported Commands	Description
help	View the list of available commands
cd	Change the current working directory
del	Delete a file
rmdir	Delete a folder
dir	List the contents of a directory
mkdir	Create a new directory
tasklist	List all the active processes on the computer
taskkill	Terminate a process
call	Execute a process on the remote computer

Supported Commands	Description
reg	View or modify Windows registry settings

Note:
- You must use only the silent commands to perform the required actions.
- You must end the session and re-connect if you run any command that requires user inputs. Refer the following figure.

Example Scenarios

Example 1: If you want to delete a specific file that exists in different subfolders, you must run the following command.

```
del /s /q <full_file_path>
```

Here,

- **del** refers to delete.

- **/s** refers to the deletion of the file from all the subfolders.

- **/q** refers to quiet or silent mode execution.

- **<full_file_path>** refers to the location where the file exists.

Example 2: If you want to terminate a specific process running on your Windows machine, you must run the following commands.

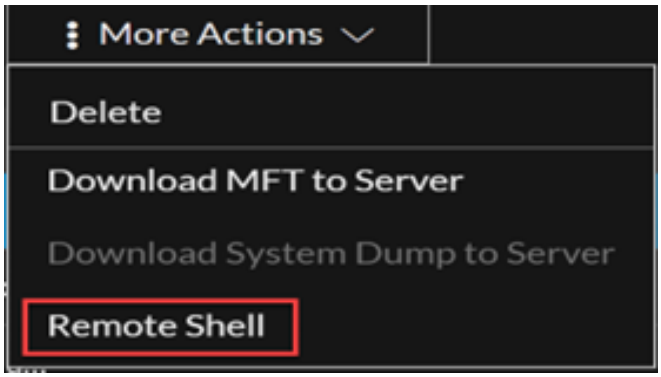
```
taskkill /f /im <process-name>
taskkill /f /pid <process-id>
```

Here,

- **taskkill** refers to terminate.

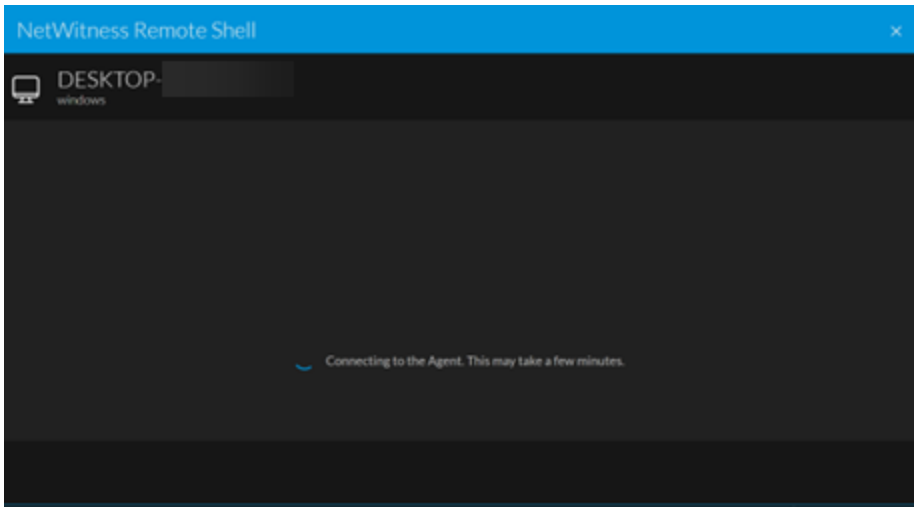
- **/f** refers to force shutdown.
- **/im** refers to image name.
- **<process-name>** refers to the specific process.
- **<process-id>** refers to the specific process ID.
- **/pid** refers to process ID.

Example 3: If you want to delete a specific registry, you must run the following command.



```
reg delete /f <keyname> [/v ]
```

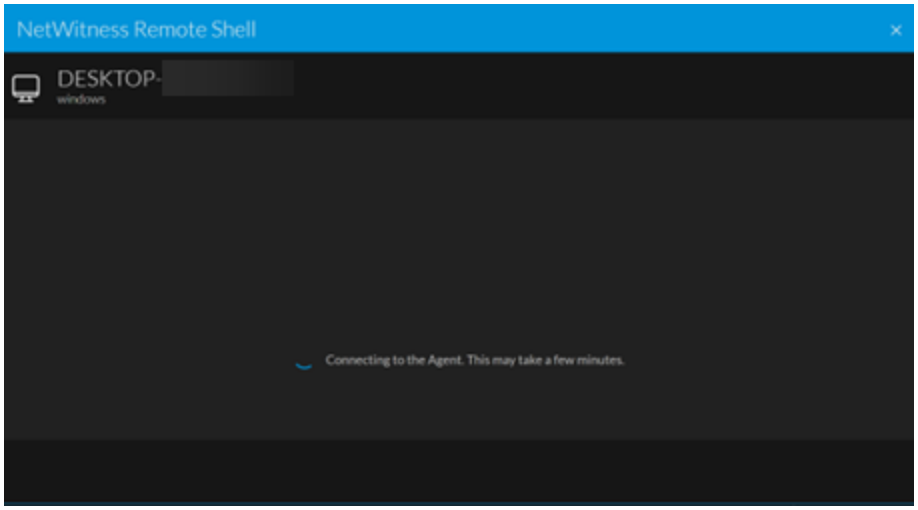
Here,



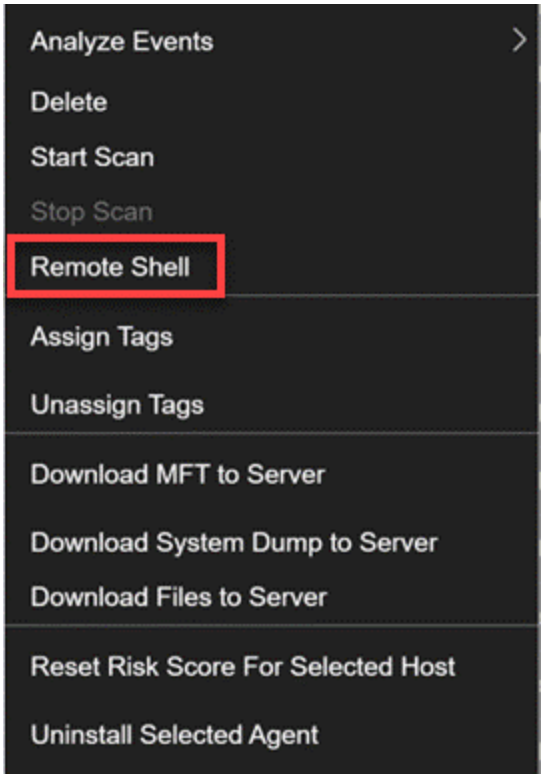
- **reg delete** refers to deleting a registry key.
- **/f** refers to deleting the existing registry subkey or entry without asking for the confirmation.
- **<keyname>** refers to the registry key name.
- **[/v]** refers to deleting a specific entry under the subkey.

To execute commands using NetWitness Remote Shell:

1. Go to **Hosts**. Do one of the following.
   - Click a row in the **Hosts** list view and go to **More Actions** > **Remote Shell**.

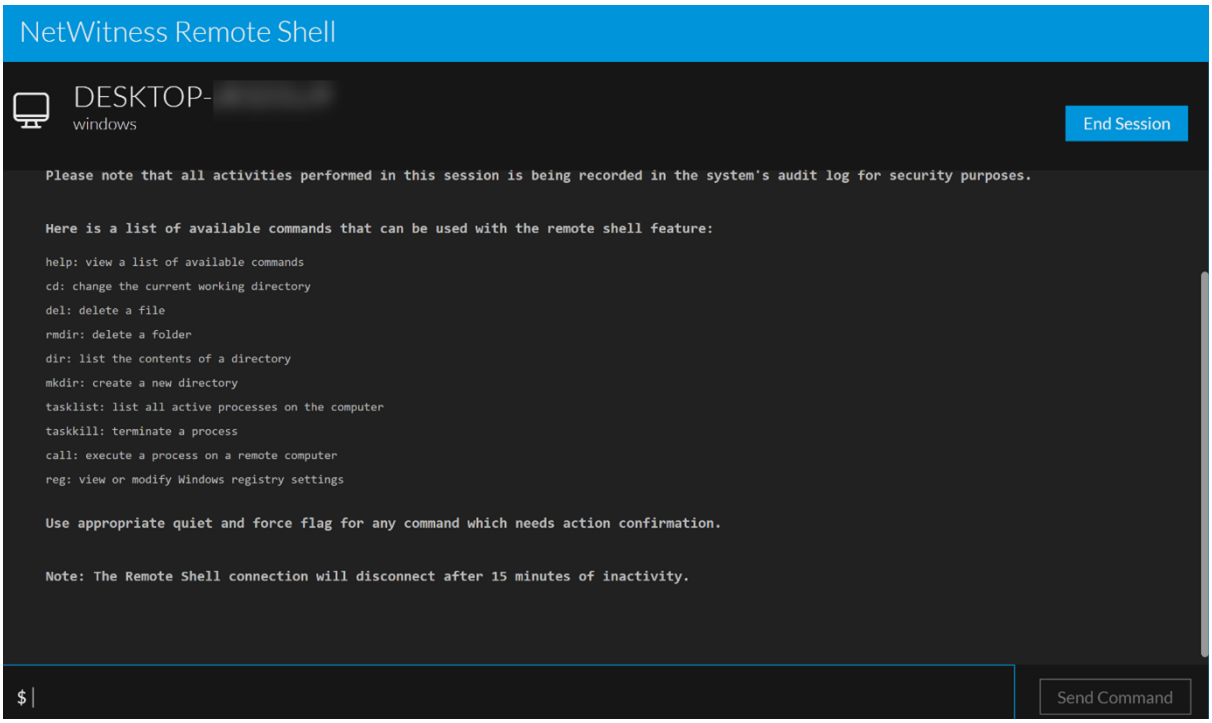


The **NetWitness Remote Shell** window is displayed.



- Click the Hostname and click (More) beside the hostname in the Host Details view to select **Remote Shell**.

  The **NetWitness Remote Shell** window is displayed.



- Right-click a row in the **Hosts** list view and select **Remote Shell**.

  The **NetWitness Remote Shell** window is displayed.

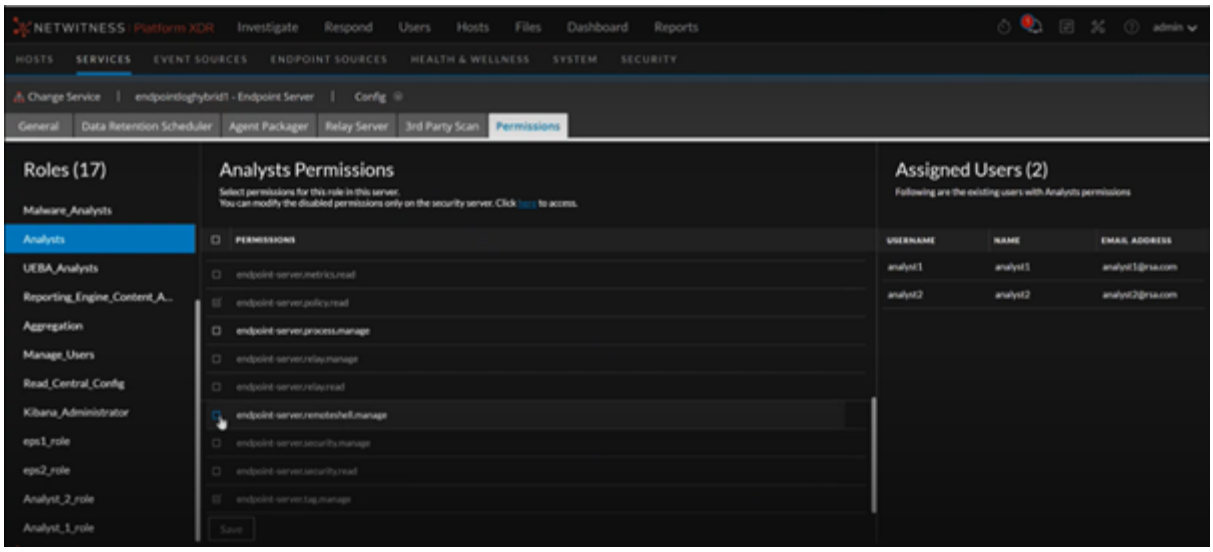
2. Enter the commands once the Agent is connected.

3. Click **Send Command** or press the **Enter** key.
4. Click **End Session** in the **NetWitness Remote Shell** window once the required action is performed.

   The confirmation window is displayed.
5. Click **End Session** to close the **NetWitness Remote Shell** window.

RBAC Permissions for Remote Shell

Users with Analysts and other roles must have the **endpoint-server.remoteshell.manage** permission to view and access **the NetWitness Remote Shell** feature. Administrators can assign the **endpoint-server.remoteshell.manage** role permission to a specific user or to a specific role. The existing roles must be duplicated in the **Security** > **Roles** view and the new users must be assigned to the duplicated roles to assign the **endpoint-server.remoteshell.manage** role permission only to the specific new users.



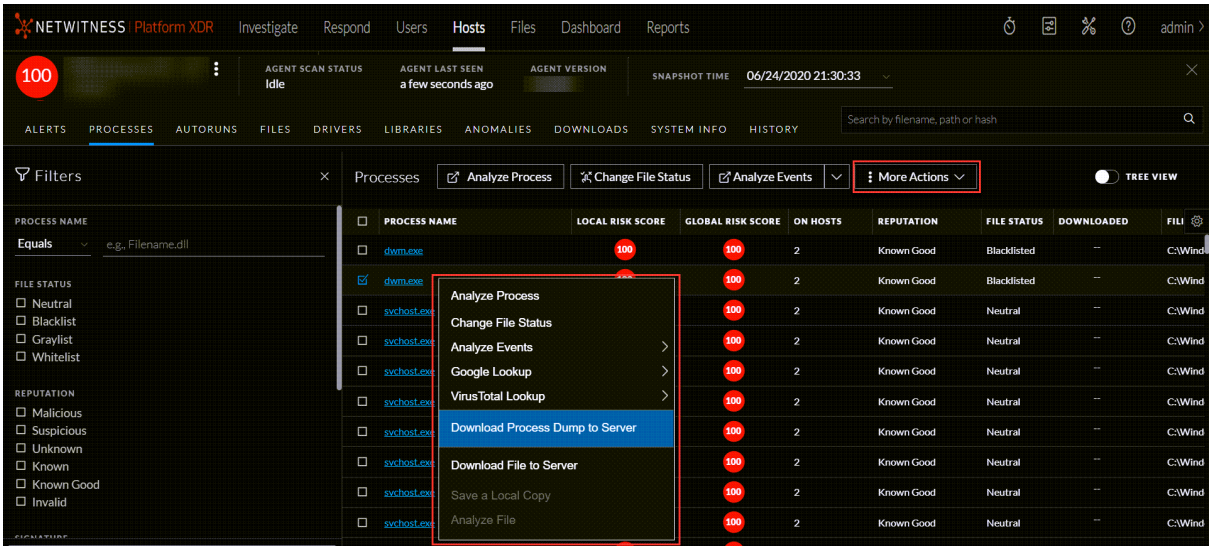
You must go to **(Admin)** > **Services** > select the Endpoint Server Service > **View** > **Config** > **Permissions** view to assign the **endpoint-server.remoteshell.manage** permission to the specific users. For more information on duplicating a role, adding a role and assigning permissions, and editing the role permissions, see **System Security and User Management Guide for 12.3**.

Administrators can configure the RBAC Permission at Endpoint Server level. You can allow the users assigned to a specific role to view and access the **NetWitness Remote Shell** feature on any specific Endpoint Server. When you allow the user to view and access the **NetWitness Remote Shell** feature only on a specific Endpoint Server such as EPS1, the user cannot view or access the **NetWitness Remote Shell** feature on any other Endpoint Servers such as EPS2 and EPS3. If the user has the access to the **NetWitness Remote Shell** feature on one of the Endpoint Servers such as EPS1, the user can view the **NetWitness Remote Shell** feature enabled in the **Endpoint Broker Server** view for all the agents. In this case, the user can access the feature and connect with the remote agent from the **Broker** view, if the selected remote agent is present only in EPS 1 and not in any other Endpoint Servers such as EPS2 and EPS3. If the user attempts to connect with the remote agent which is present only in EPS2, the **NetWitness Remote Shell** console screen keeps loading. This happens since the user can access the feature only on EPS1 and not on EPS 2.

Note: If you configure the **endpoint-server.remoteshell.manage** permission at the role level in the **Security** > **Roles** view, the users assigned to the role can access the **NetWitness Remote Shell** feature on any Endpoint Servers such as EPS 1, EPS 2, and EPS 3.
For more information on Configuring the RBAC permissions at the role level, see **(Optional) Add a Role and Assign Permissions** section in the **System Security and User Management Guide for 12.3**.

To configure Remote Shell RBAC permission to the specific users at the endpoint server level:

1. Go to  (Admin) > **Services**.
2. In the **Services** view, select the required Endpoint Server service.
3. Click  and select **View** > **Config**.
4. Go to **Permissions** tab.
5. Select the role you duplicated in the **Security** > **Roles** view from the **Roles** panel on the left.
6. Select the permission **endpoint-server.remoteshell.manage** from the **Permissions** section.



7. Click **Save**.

For more information on configuring the permissions at the Endpoint Server level, see Manage Role Permissions at Endpoint Server Level.

Download Process Dump to Server

To download process dump to the server:

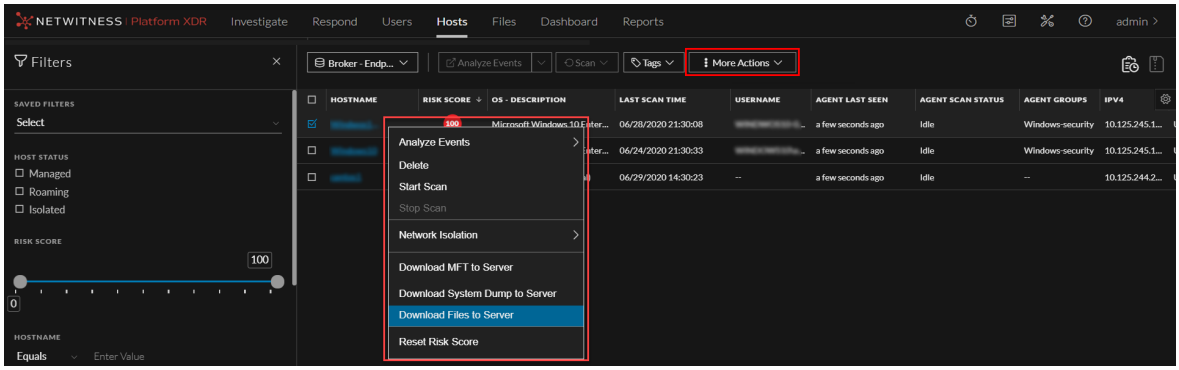
1. Go to **Hosts**.
2. Select the hostname to open the host details.
3. In the Processes, Libraries, or Anomalies tab, select **Download Process Dump to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar.

4. View the details of the download process dump in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

To filter, save, and delete system dump or process dump, see Filter Downloaded Files, Save Downloaded File, and Delete Downloaded Files.

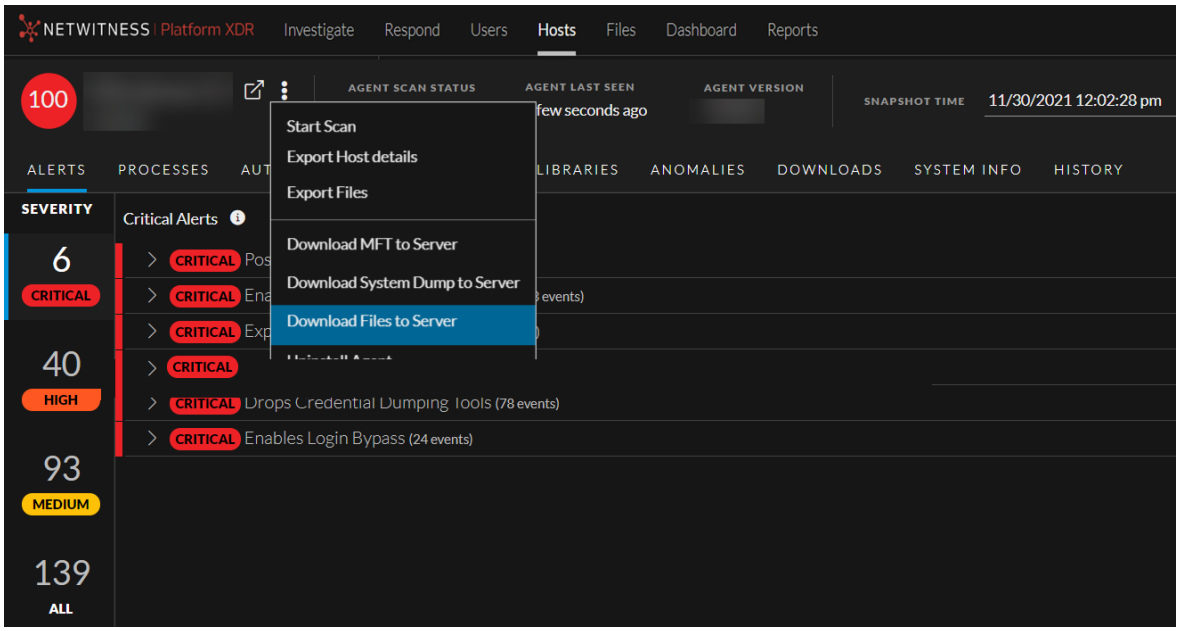
The following are some errors you might encounter during system and process dump download:

Issue	Explanation
Parameter is incorrect.	The process for which the dump is requested might be running with a different process ID.
Element not found	The process for which the dump is requested is no longer active.
java.io.IOException:Unable to unwrap data, invalid status [CLOSED]	Connection to the agent is interrupted.
java.net.SocketTimeoutException	The network is slow or the system is down.
One or more arguments are not correct	Agent might be in the Insight mode or driver is not running.



Download Files Using Full Path or Wildcard

You can manually download files that help in investigations by either providing full path of the file or using wildcard.



Note: This is applicable only for agents in Advanced mode with NetWitness Platform version 11.5 and later.

To download files to the server:

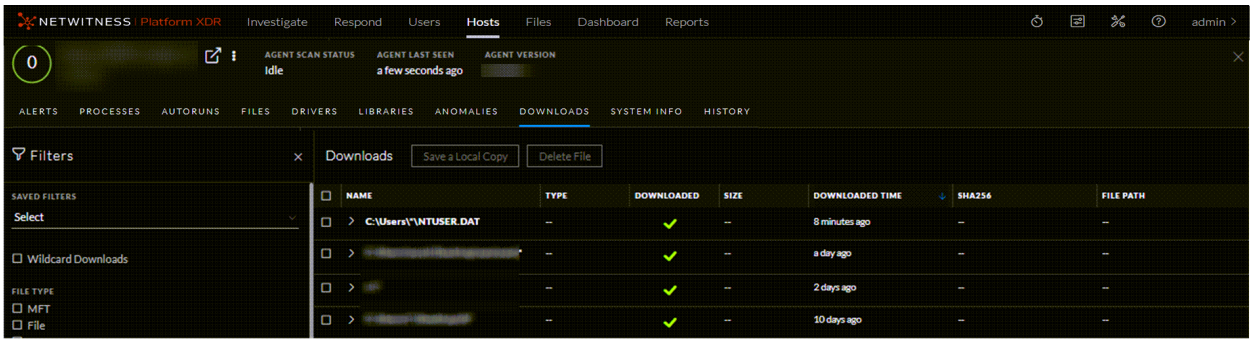
1. Go to **Hosts** and do one of the following:
   - Select one or more hosts from the same operating system, and select **Download Files to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar. You can download files from only top 100 selected hosts at a time.

   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Download Files to Server**.

2. In the **Download Files to Server** dialog, enter the full path where the files may be present or search using wildcard. For wild card search, you can use a maximum of two `*`, one at a folder level and the other at a file level.

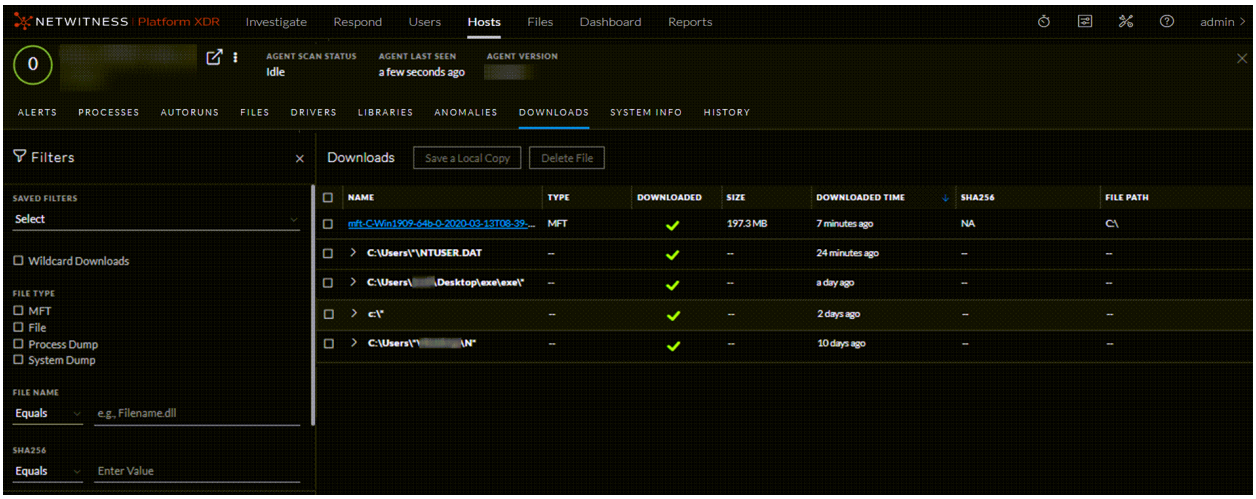
   For example, to retrieve the registry hive, you can enter the full path, `C:\Windows\System32\config\SYSTEM`.

   If you want to retrieve user settings and configuration preferences for all users, download all files using the wildcard `C:\Users\*\NTUSER.DAT`.



3. For wildcard search, enter the number of files to download and size of the file. By default, the number of files is set to 10 and file size is set to 100 MB. For example, if the maximum number of files is set to 10 and file size is set to 10 MB, first 10 files within 10 MB are downloaded.

   Note: You can set a limit to the Maximum Number of Files field on the explore page of the Endpoint server (**> [Endpoint server] > explore > endpoint/command > max-file-count**). By default, the limit is set to 100, and you can change it to any value between 100 - 1000 in each Endpoint server. In broker view, if the Endpoint servers have different max-file-count, the lesser value will be taken as the limit.

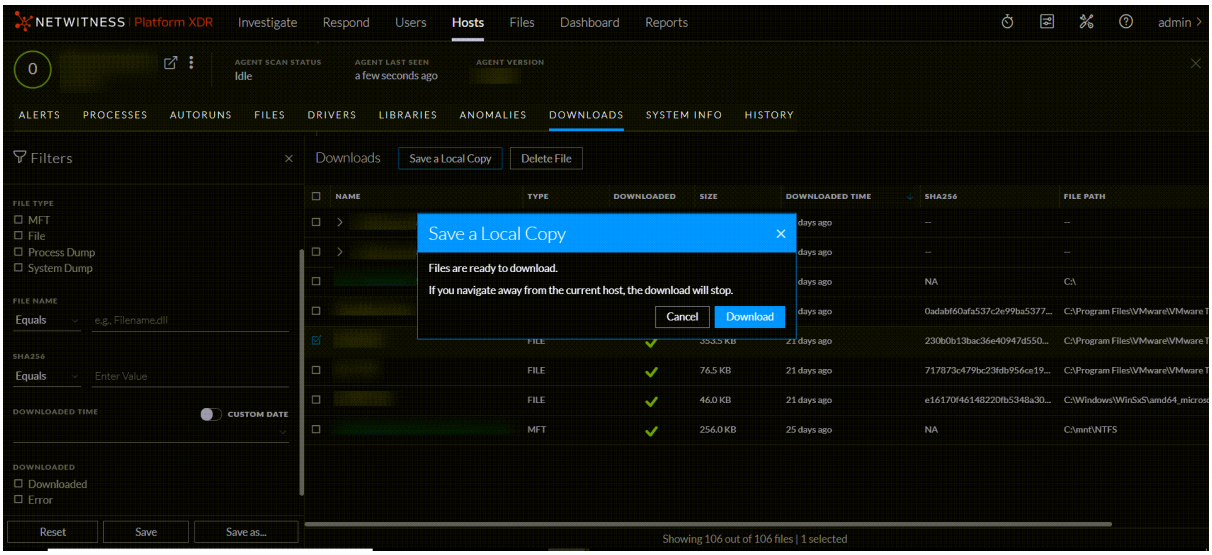


4. Click **Download**.

All files downloaded as a part of wildcard search are grouped together based on the search criteria. For example, all files downloaded using `C:\Users\*\NTUSER.DAT` are grouped, and you can click to expand and view all files under this group. You can sort the groups on the downloaded time and view the status of the download in the **Downloaded** column.

Filter Downloaded Files

You can filter the downloaded files on wildcard downloads, file type, file name, SHA256 (for files), and downloaded time. In the Downloaded Time field, you can also filter by custom date.



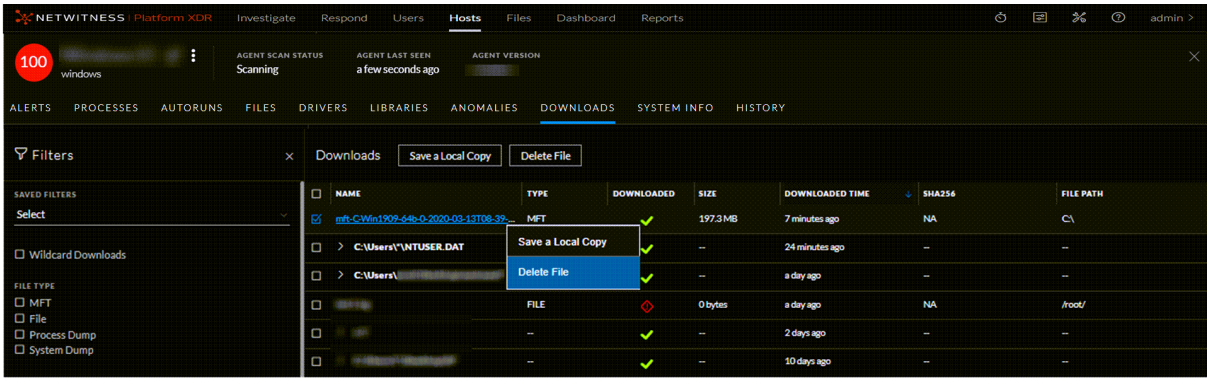
Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click .

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Save Downloaded File

You can retrieve the downloaded file and save it to your local file system for further analysis. To save the file:

1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Right-click the file you want to save and select **Save a Local Copy** from the context menu or from the toolbar.



4. In the **Save a Local Copy** dialog, click **Download**.

Note: For wildcard downloads, select a file from the group that are downloaded successfully to save a local copy. You cannot save multiple files in the group at a time or save files with errors.

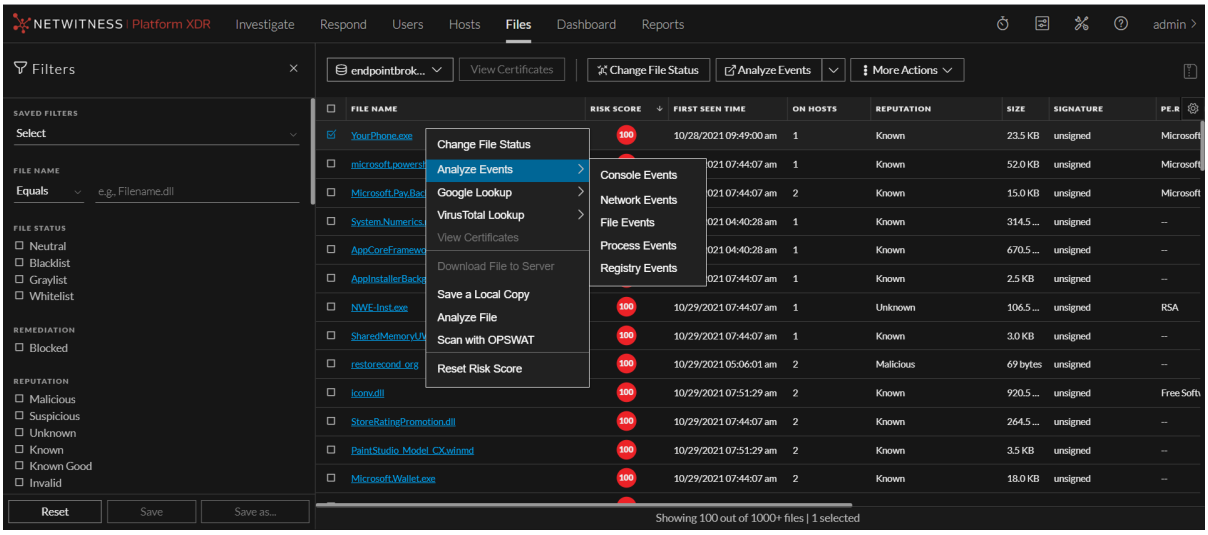
Delete Downloaded Files

If you want to delete the downloaded file from the server:

1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Right-click one or more files you want to delete, and select **Delete File** from the context menu or from the toolbar.

Note: For wildcard downloads, you can select the group to delete all files that are downloaded.

Analyzing Events



If you need to investigate a particular host, IP address, username, filename, or hash to look for related activity across a time range, you can pivot to Navigate view to get the entire context of the activity. By default, the time range is set to 7 days. You can change the time range.

Note: By default, the system detects the best data source to pivot to Navigate view. To change the data source, modify the investigate service ID under endpoint or investigate in the Explore view.

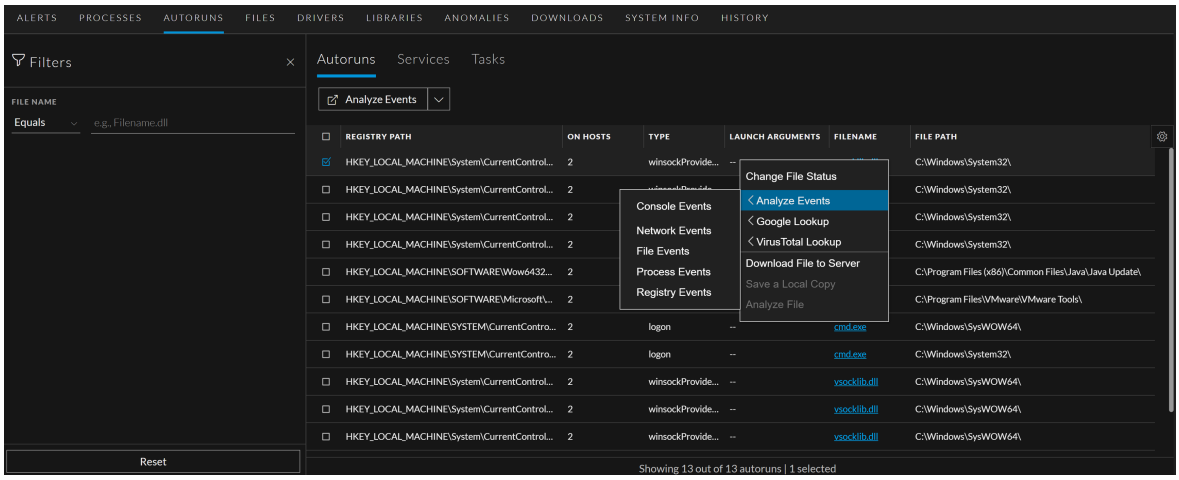
Analyze Events from Files View

To investigate a particular filename or hash (SHA256 and MD5):

1. Go to **Files**.
2. Select the file you want to analyze and do one of the following:
   - Right-click and select **Analyze Events** from the context menu.
   - Click **Analyze Events** in the toolbar.

This opens the Navigate view with data related to the file. For more information on analyzing events in the Navigate and Events views, see the *NetWitness Investigate User Guide*.

Note: If the values are not indexed, the results take time to load. For more information, see Troubleshooting NetWitness Endpoint.



Analyze Events from Hosts View

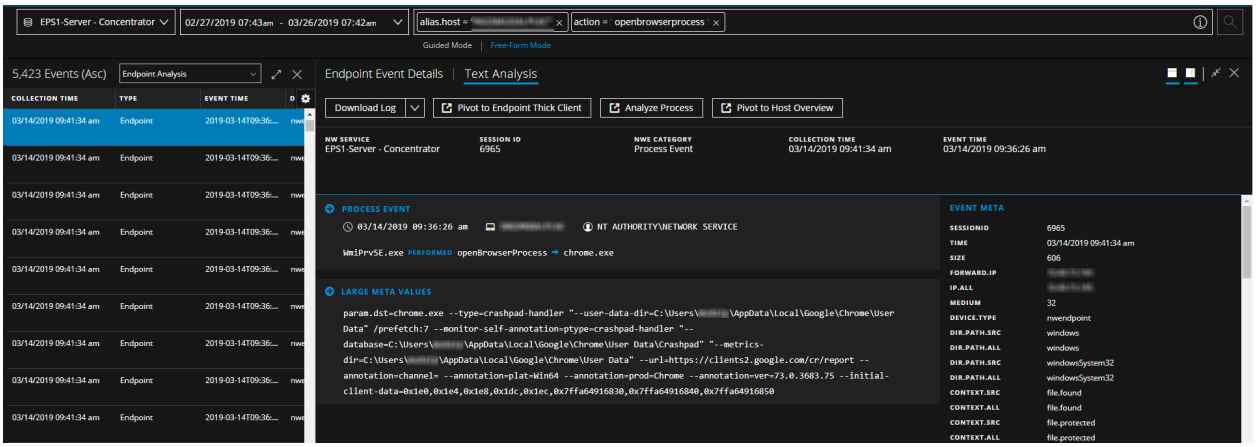
To investigate a particular host, IP address (IPV4), or username:

1. Go to **Hosts**.
2. Do one of the following:

- Right-click a host, select **Analyze Events** from the right-click context menu or in the toolbar, and select a specific event type (such as network events, file events) that you want to view.
- Select the hostname to open the host details. Right-click a file or in the toolbar, select **Analyze Events**, and select a specific event type that you want to view.

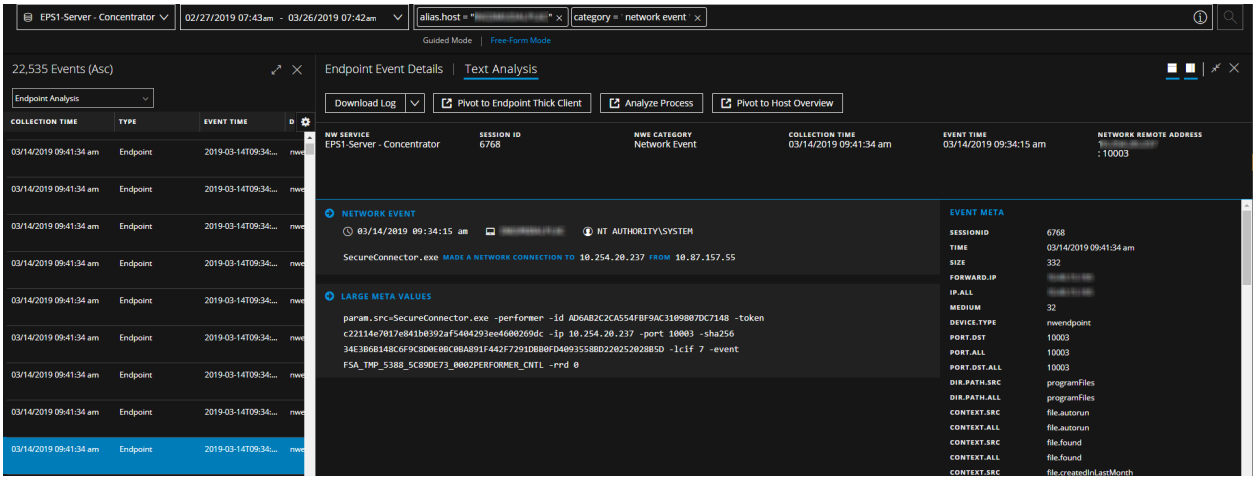
  The following figure is an example of the **Autoruns** tab.

  This opens the Navigate view with data related to the file.



For more information on analyzing events in the Navigate and Events views, see the *NetWitness Investigate User Guide*.

Text Analysis for an Endpoint Event

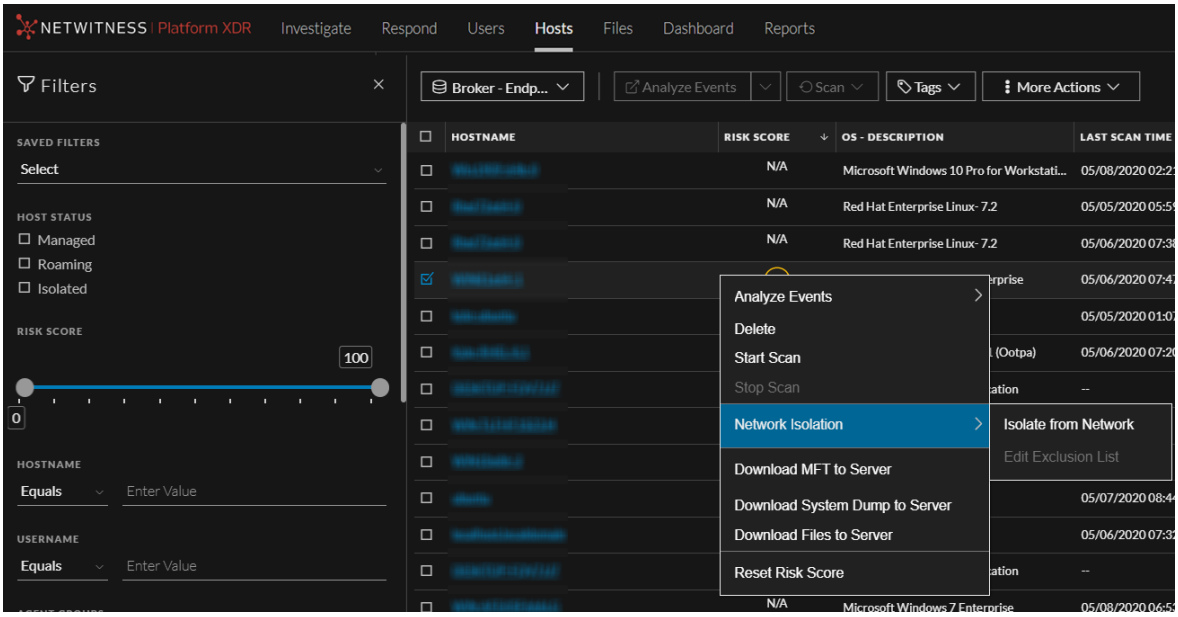


You can view all Endpoint events in their original text format in the Events view Event List panel. When you click an event in the Event list panel, the adjacent panel shows the Text Analysis. Pagination controls add flexibility when paging through the reconstructed text of an event. The Text Analysis displays the following:

- Event Header, which provides summary information about the event. (Version 11.5 and Later) The event header includes host name, process, and user name details in addition to other event details if the selected Endpoint event contains these metadata.
- Options for exporting - log, csv, xml, and json formats.
- Option to pivot to the Endpoint Thick Client to analyze the meta value.
- Option to analyze process details associated with the event.
- Option to view the host details for further analysis.

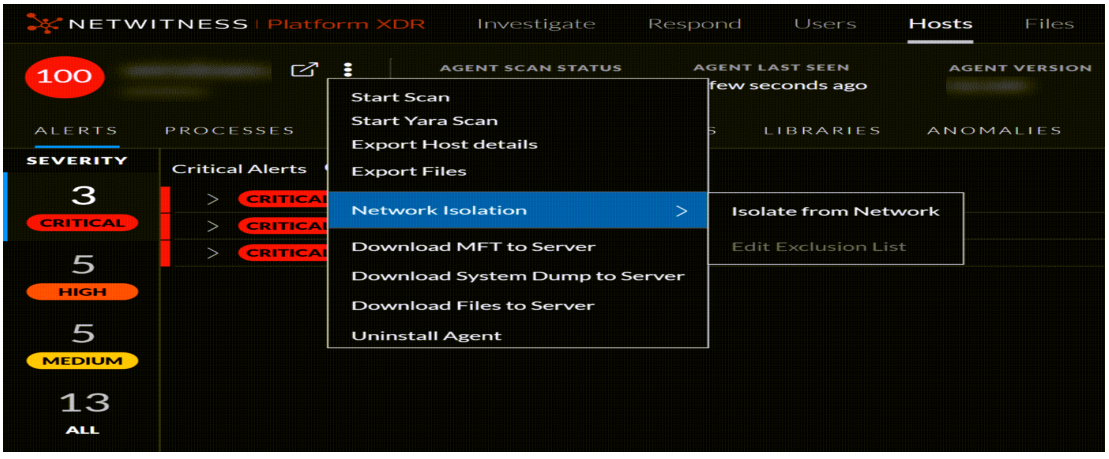
Below is an example of the Process event for Endpoint. The text in the Text Analysis panel explains that a source process `WmiPrvSE.exe` opened a browser process named `chrome.exe`. In the events, if there is a meta value that exceeds 255 characters, the value is displayed in the Large Meta Values panel.

Below is an example of the Network event:



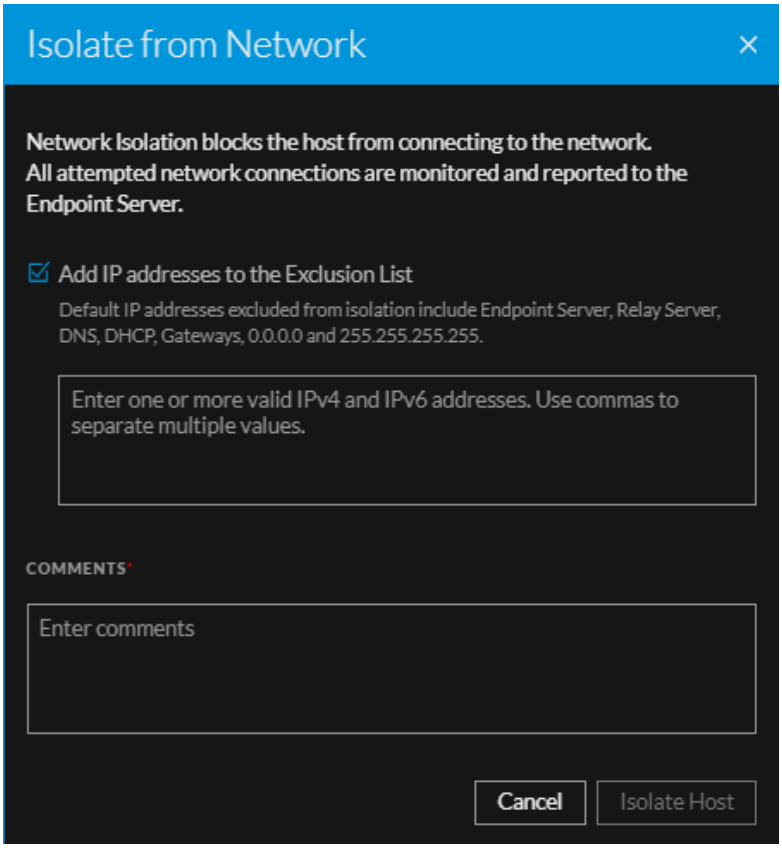
For more information on Events view, see the *NetWitness Investigate User Guide*.

Isolating Hosts from Network



Note: By default, the network isolation option is disabled in the policy, and you cannot view options mentioned in this section. To enable network isolation, in the policy configuration, select **Enabled** in the **Network Isolation** option under Response Action Settings. For more information, see the *NetWitness Endpoint Configuration Guide*.

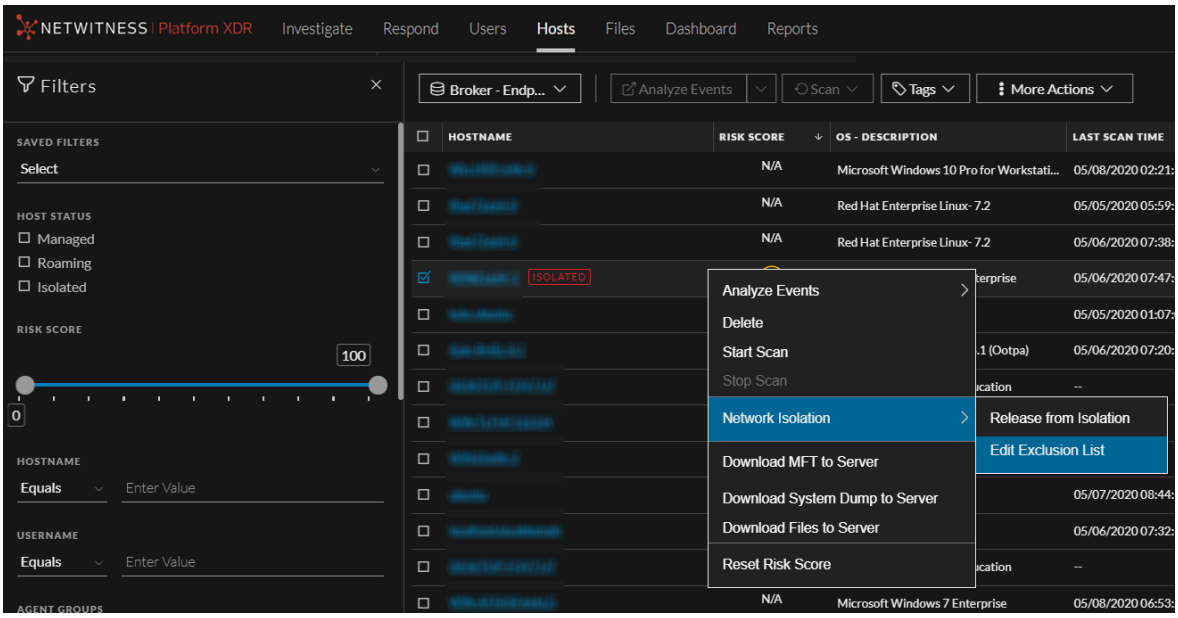
To isolate a host from the network:



1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Isolate from Network** from the right-click context menu, or from the **More** drop-down list in the toolbar.

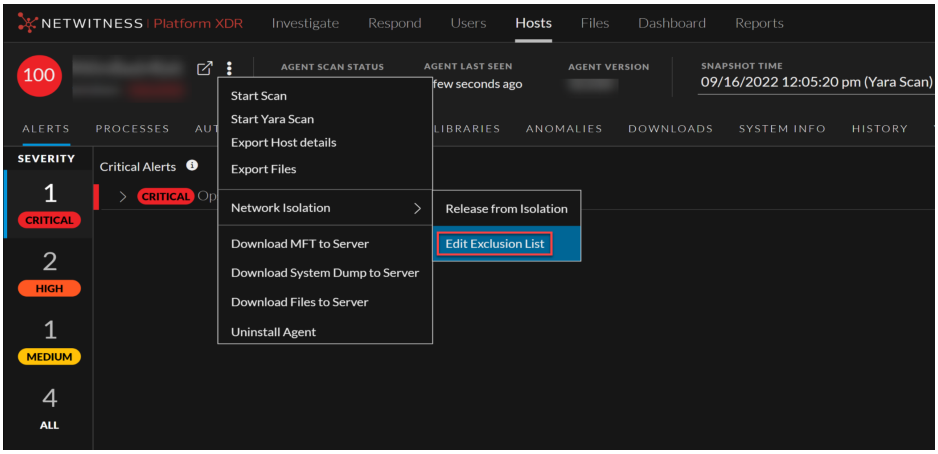
   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Isolate from Network**.

2. In the Isolate from Network dialog, by default, a set of IP addresses are excluded from isolation. For more information, see Network Isolation. To add IP addresses to the list, select the **Add your IPs to Exclusion List** checkbox. You can enter up to 100 IP addresses separated by comma.



3. Enter comments.
4. Click **Isolate Host**.

Note: When a host is isolated, the connection to the following IP addresses are allowed:
- Endpoint Server, Relay Server, DNS, DHCP, Gateways, 0.0.0.0, 255.255.255.255, and any other IP addresses that the agent connects with.
- Other IP addresses that you include in the exclusion list.

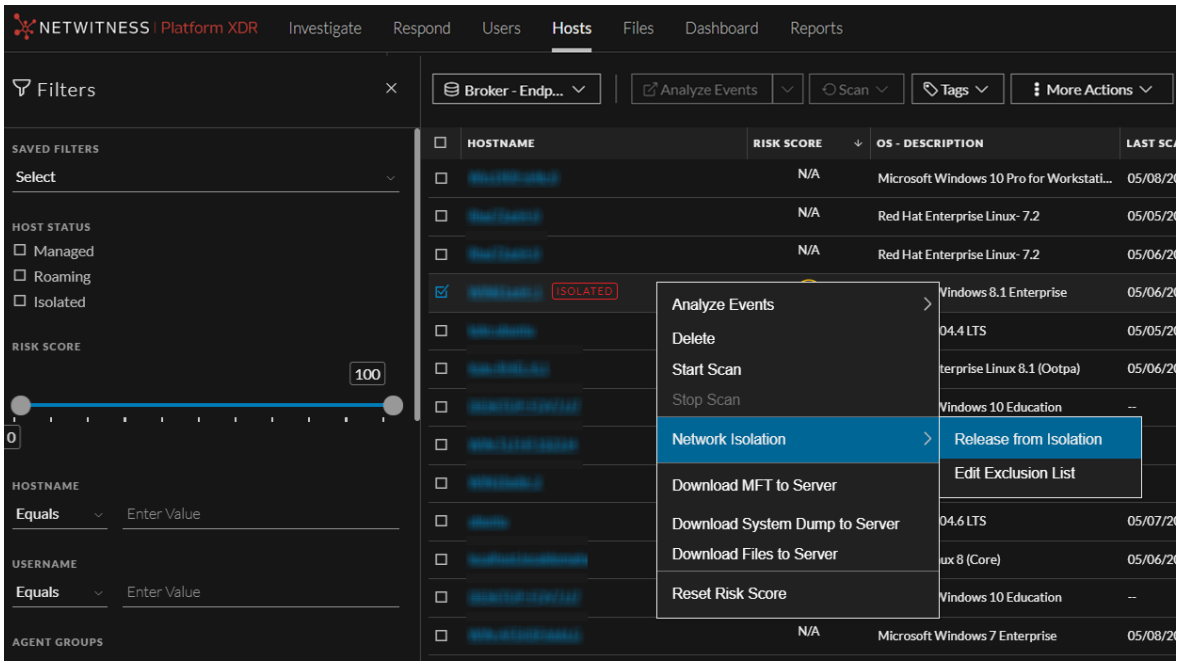


Edit Exclusion List

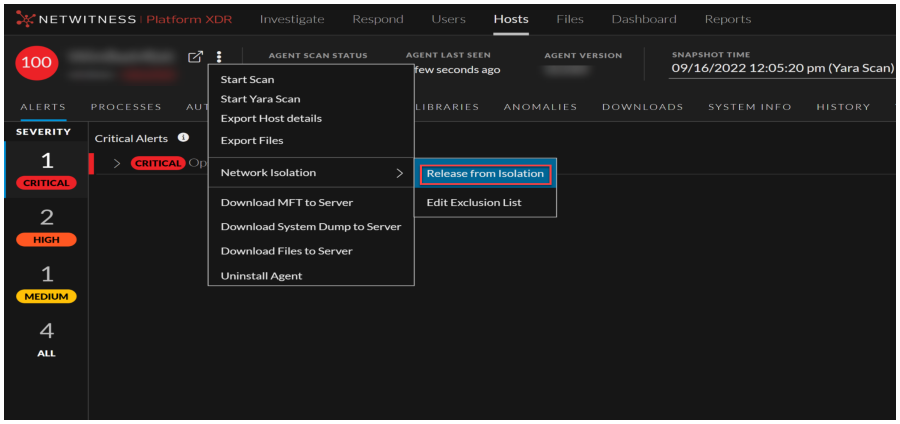
To edit the exclusion list:

1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Edit Exclusion List** from the right-click context menu, or from the **More** drop-down list in the toolbar.

- Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Edit Exclusion List**.



2. Add or modify the IP addresses in the list.
3. Enter comments and click **Save**.



Release Isolated Hosts

Releasing the isolated host restores the network connection and removes IP addresses added to the Exclusion list. To release the host from isolation:

1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Release from Isolation** from the right-click context menu, or from the **More** drop-down list in the toolbar.

- Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Release from Isolation**.

2. Enter comments and click **Release Host**.

NetWitness Endpoint with Third-Party Antivirus Products

If you want the NetWitness Endpoint agent to coexist with any of the security products, make sure to whitelist the agent. For more information, see the respective third-party product documentation.

Troubleshooting NetWitness Endpoint

This section provides information about possible issues when using NetWitness Endpoint.

General Issues

Issue	Some of the hosts or files data are not displayed when Endpoint Broker is selected for querying.
Solution	The Endpoint Broker aggregates data from all Endpoint Servers, which responds within 10 seconds. You must increase the query timeout value to see the result of Endpoint server that is online. Perform the following: 1. Go to  **(Admin) > Endpoint Broker** service. 2. Click  > **View** > **Explore**. 3. Click **endpoint/broker** node. 4. In the **query-timeout** field increase the value, for example, 30 seconds.

Issue	The Endpoint Agent is unable to communicate with the Endpoint Server. The connection may not be established due to any of the following issues: • UDP • HTTPS • Firewall

Solution	• To verify the UDP or HTTPS connection, you must verify the connection between Windows Endpoint Agent and Endpoint Server:
	1. Go to System32 folder using the following command:
	`cd C:\Windows\System32`
	2. Execute the following command:
	`<Agent Service name>.exe /testnet`
	For example, `NWEAgent.exe /testnet`
	• If the issue is with the firewall, check the incoming and outgoing firewall rules.

Issue	The Endpoint Agent is unable to communicate with the Log Decoder. The connection may not be established due to any of the following issues: • UDP • TCP • TLS

Solution	• Firewall

	• To verify the UDP, TCP, and TLS connection, you must verify the connection between Windows Endpoint Agent and the Log Decoder:
	1. Go to System32 folder using the following command:
	`cd C:\Windows\System32`
	2. Execute the following command:
	`<Agent Service name>.exe /testlognet`
	For example, `NWEAgent.exe /testlognet`
	• If the issue is with the firewall, check the incoming and outgoing firewall rules.

Multi-server Issue

Issue	Agent is not communicating with the Endpoint Server after migration.
Solution	Check the Nginx logs of the Endpoint Server to which the agent has migrated, and if the agent is communicating with error code 403, that means the certificate of the first Endpoint Server and second Endpoint Server are different. This is because during the installation of second Endpoint Server, the certificate of first Endpoint Server is not copied to the second Endpoint Server. Reinstall the second Endpoint Server by copying the certificate of first Endpoint Server, and reinstall the agent. For more information, see the *Physical Host Installation Guide*.

Hosts View Issues

Message	`An error has occurred. The Endpoint Server may be offline or inaccessible.`
Issue	When attempting to access the Hosts or Files view, the view opens with the message.
Explanation	Endpoint Server or Nginx Server is not running. Check the status of the Endpoint Server under  **(Admin) > Services** or check if the Endpoint Server host IP address is registered with the Admin Server. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*. If the service is not running, start the Endpoint Server.

Issue	Hosts view shows 'No Results Found.' error in the following scenario: • Host A belongs to Endpoint server A and does not exist in Endpoint server B. • Endpoint server B is selected in Hosts view. • In a new window/tab, open the Host details page (of Host A) • Navigate to Hosts view using **[*Host Name*] > Actions > Pivot to Investigate**

	> Hosts/Files `Endpoint server B is selected by default, and the page shows 'No results found.' error.`
Explanation	This is expected behavior. The Endpoint server that is selected first is considered to be current /active throughout the session.
Workaround	Ensure the correct Endpoint server is selected, and `Pivot to Investigate > Hosts/Files` will behave normally.

Issue	For MFT download: 1. The request fails with file not found error for drives/mount paths created on the machine after agent is installed. 2. Incorrect MFT is downloaded for the provided NTFS mount path.
Solution	Make sure that the agent version is 11.6 or later.

Files View Issues

Issue	Unable to analyze events from **Hosts** and **Files** view.
Explanation	Other than Broker or Concentrator, if any aggregation service, such as Archiver, is aggregating data from the Log Decoder that is configured for metadata forwarding from any Endpoint server, clicking **Analyze Events** from **Hosts** and **Files** view for this Endpoint server may not work. To resolve this issue: **Note:** To get the investigate-service-id: 1) Go to **(Admin) > Services > Concentrator** service. 2) Click > **View** > **Explore** tab. 3) Expand the **sys/stats** node list. 4) In the UUID filed, copy the value. 1. Go to **(Admin) > Services > Endpoint Server** service. 2. Click > **View** > **Explore** tab. 3. In the **endpoint/investigate** field, specify the **investigate-service-id**.

Policy Issue

Issue	Policy status in the Policy Details panel is not updated or shows Policy Unavailable/Permission Required.
Explanation	**Policy Unavailable** - Hosts belong to previous versions, such as NetWitness Platform 11.1 or 11.2, where a policy is not applied.

	Permission Required - If you do not have permissions, see the "Role Permissions" topic in the *System Security and User Management Guide*.

Issue	Policy Status shows error.
Explanation	Policy may have wrong configurations. Check the error description, logs in Endpoint server, and audit logs for details. Contact your system administrator with the error details.

Driver Issue

Issue	While loading the driver on the host, an error is encountered.
Explanation	Check the driver error code in the **Agent-Driver Error Code** column under **Hosts** view. Contact your system administrator with the error code.

Download Issue

Issue	Downloads (Files, MFT, System/Process dumps, etc.) fail at times.
Explanation	Downloads fail when there is not sufficient disk space on the Endpoint Server.
Workaround	Clean up some disk space and try downloading again. We recommend you keep sufficient disk space before initiating any download.

File Reputation Service Issue

Issue	When you configure RSA Live for the first time and the File Reputation service is not connected.
Solution	You must manually enable the File Reputation service. To enable the File Reputation service: 1. Go to  **(Admin) > System > Live Services**. 2. In the **Additional Live Services** section, select the enable File Reputation check box. 3. Click **Apply**.

Risk Scoring for Hosts or Files Issue

Issue	NetWitness Endpoint takes a long time to process risk scoring for Hosts or Files.

Solution	Check the backlog of alerts for risk scoring. 1. SSH to the ESA Primary appliance. 2. Execute the following command: `mongo respond-server --authenticationDatabase admin -u deploy_admin -p <deploy_admin_password> --eval 'db.staging.find({"$or":[{state:"STAGED"},{state :"WORKING"}]}).count()' --quiet` The backlog count is displayed. If the backlog count is 1 million or greater, you must disable the risk scoring and Endpoint ESA alerts. 3. To disable risk scoring: a. Go to **(Admin) > Services > Respond** service. b. Click > **View** > **Explore**. c. Expand the **respond/scheduled/jobs** node list. d. In the **risk-scoring-enabled** field, set the value to **false**. 4. To disable Endpoint ESA alerts: a. To disable NetWitness Endpoint ESA alerts generation for severity; Critical, High and Medium. i. Go to **(Configure) > ESA Rules**. The Configure view is displayed with the Rules tab open. ii. In the **Options** panel, under Deployments, select the Endpoint deployment to delete. A confirmation dialog is displayed. iii. Click **Yes**. b. To disable only Medium severity NetWitness Endpoint ESA alerts: i. Go to **(Admin) > ESA Correlation** service (on which Endpoint deployment is added). ii. Click > **View** > **Explore**. iii. Expand the **correction/alert** node list. iv. In the **transient-enabled** field, set the value to **false**.

Endpoint Broker/Server Issue

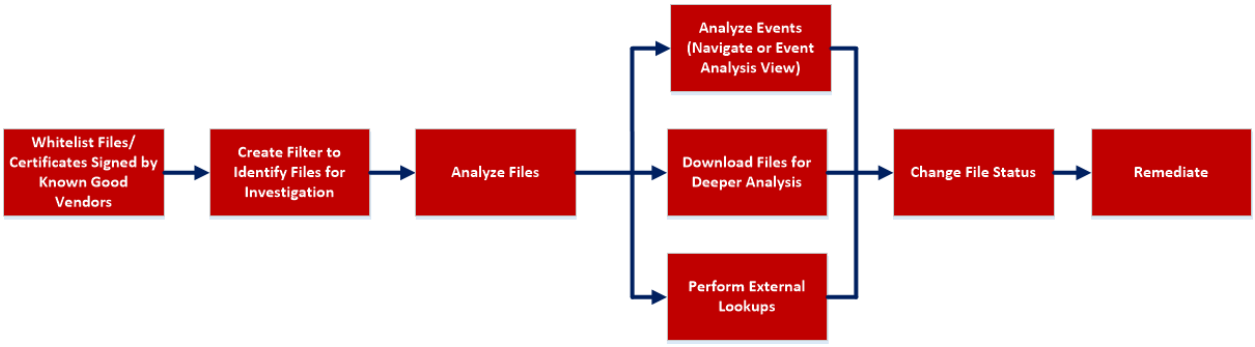
Issue	User have access to one Endpoint server and unable to access the other.
Explanation	Reach out to the administrator and check if you have access to that endpoint servers. Request for access if required.

Issue	In the Endpoint Server Broker view, the user can scan hosts that belong to a particular Endpoint server but cannot scan hosts that belong to another Endpoint server.
Explanation	User may not have access to that endpoint server. Check with the Administrator to see if the user has access.

NetWitness Endpoint Reference Materials

This section is intended to help you understand the purpose and application of NetWitness **Investigate** > **Hosts** view and **Files** view. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.

- Files View
- Hosts View
- Hosts View - Details Tab
- Hosts View - Process Tab
- Hosts View - Autoruns Tab
- Hosts View - Files Tab
- Hosts View - Drivers Tab
- Hosts View - Libraries Tab
- Hosts View - Anomalies Tab
- Hosts View - Downloads Tab
- Hosts View - System Information Tab
- Hosts View - Agent History Tab
- Hosts View - YARA Rules Tab



Files View

Note: The information in this topic applies to NetWitness Version 11.1 and later.

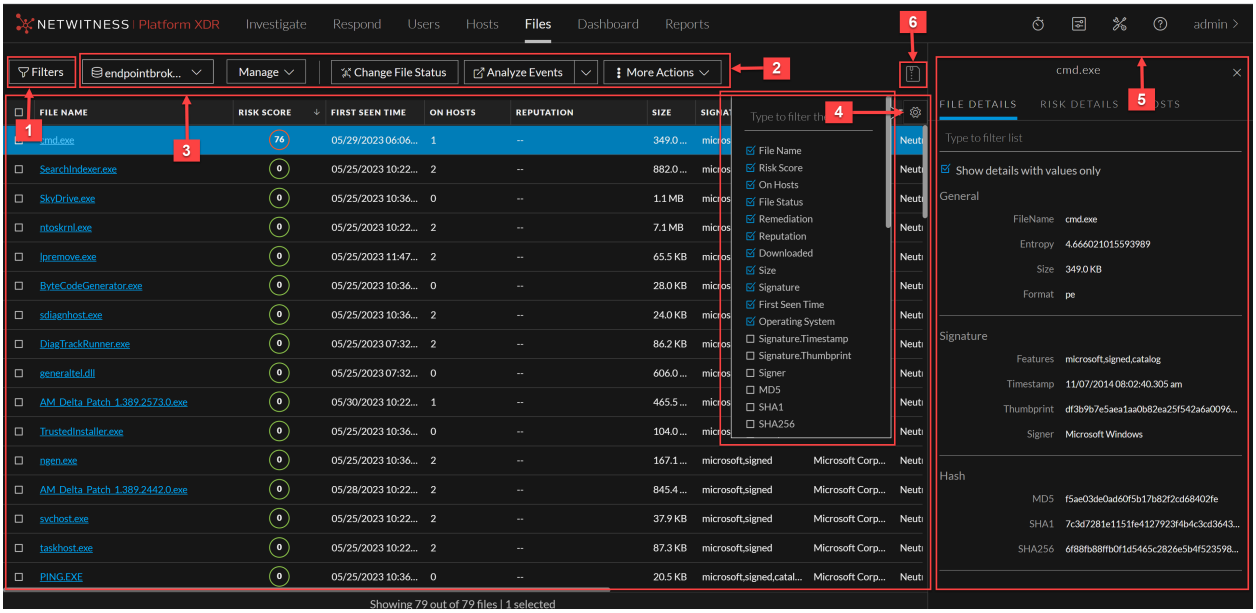
The Files view provides a holistic view of all files in your deployment. To access this view, go to **Files**. By default, the Files view displays 100 files. To display more files, click **Load More** at the bottom of the page.

You can either view files specific to an Endpoint server or view all files from multiple Endpoint servers by selecting the Endpoint Broker.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	whitelist files and certificates signed by known good vendors*	Analyze Certificates
Threat Hunter	create filter to identify files for investigation*	Filter Files
Threat Hunter	analyze files*	Investigating Files
Threat Hunter	analyze events*	Analyzing Events
Threat Hunter	download files for deeper analysis*	Analyzing Downloaded Files
Threat Hunter	perform external lookups*	Launch an External Lookup for a File
Threat Hunter	change file status or remediate*	Changing File Status or Remediate



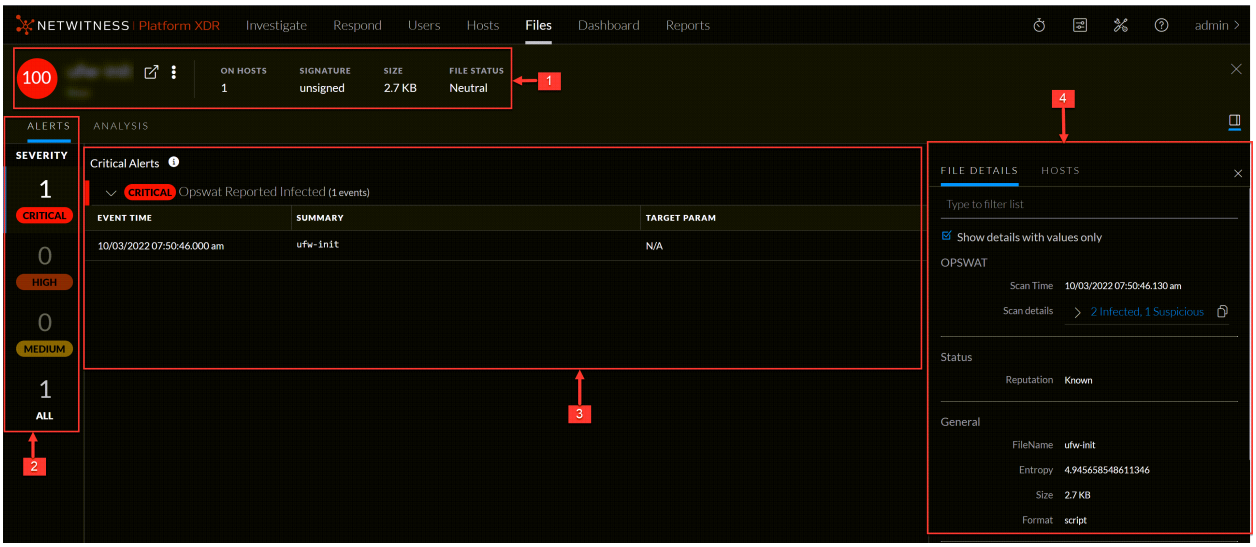
*You can perform this task in the current view

Related Topics

- Focusing on Endpoint Analysis
- Investigating Hosts
- Analyzing Downloaded Files
- Analyzing Events
- Analyze Certificates
- Manage Blocked File Hashes
- Changing File Status or Remediate

Quick Look

Below is an example of the Files view:

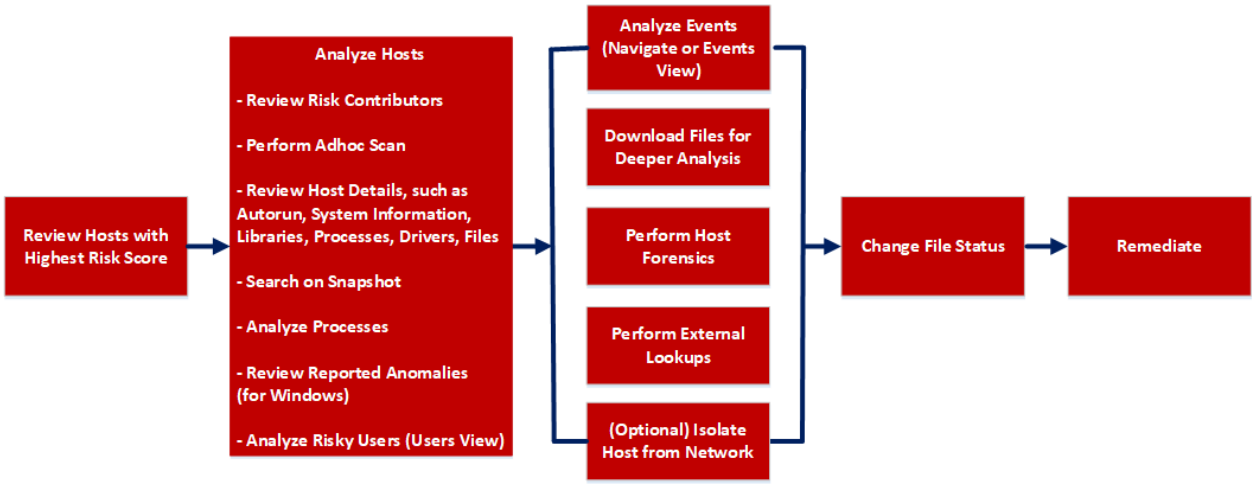


1 **Filter Files**. You can filter the files by selecting the options in the Filters panel and create filters. For more information, see Filter Files.

2	**Actions in the toolbar:** **Server drop-down list** - You can select the Endpoint server or Endpoint Broker server to view the hosts. **Manage** - You can select any of the following drop-down options in the Manage drop-down list. • **Certificates** - Allows you to view a list of code-signing certificates reported by hosts found in your deployment and their associated properties. For more information, see Analyze Certificates. • **Blocked File Hashes** - Allows you to add or import new file hashes and manage the existing blocked file hashes. **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected files to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More Actions** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. • Reset risk score. **Note:** You can perform the above actions from the right-click context menu.
3	**Sort Columns.** Lets you sort on column titles.
4	**Settings Menu.** You can set Files view preferences by selecting columns from the Settings menu. For more information, see Set Files Preference.
5	**Show/Hide File Properties Panel.** Click a row to show or hide the File Properties panel. It displays the following tabs: **File Details** - Displays the file information. **Risk details** - Displays the distinct alerts associated with the risk score. **Hosts** - Displays the top 100 hosts based on the risk score on which the file is present. For more information, see Analyze Hosts with File Activity.
6	**Export to CSV** - Extracts global files to a CSV file. For more information, see Export Global Files.

File Details View

To access this view, go to **Files**, and select a file. Below is an example of the File Details view:



1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More** - Provides options to perform external lookups. **On Hosts** - Indicates the number of hosts on which a file exist. **Signature** - Provides signatory information. **Size** - Size of the file. **File Status** - Status of the file. For example, `Neutral`.
2	**Alerts Severity** tab - Displays list of distinct alerts, such as Critical, High, Medium and All, along with the total number of events associated with the alert. **Analysis** tab - Provides detailed information about a downloaded file. For more information, see Analyzing Downloaded Files.
3	Displays events for an alert and metadata associated with a specific event.
4	**Show/Hide File Properties Panel.** Click a row to show or hide the File Properties panel. It displays the following tabs: **File Details** - Displays the file information. **Hosts** - Displays the hosts on which file activities are present. For more information, see Analyze Hosts with File Activity.

Hosts View

Note: The information in this topic applies to NetWitness Version 11.1 and later.

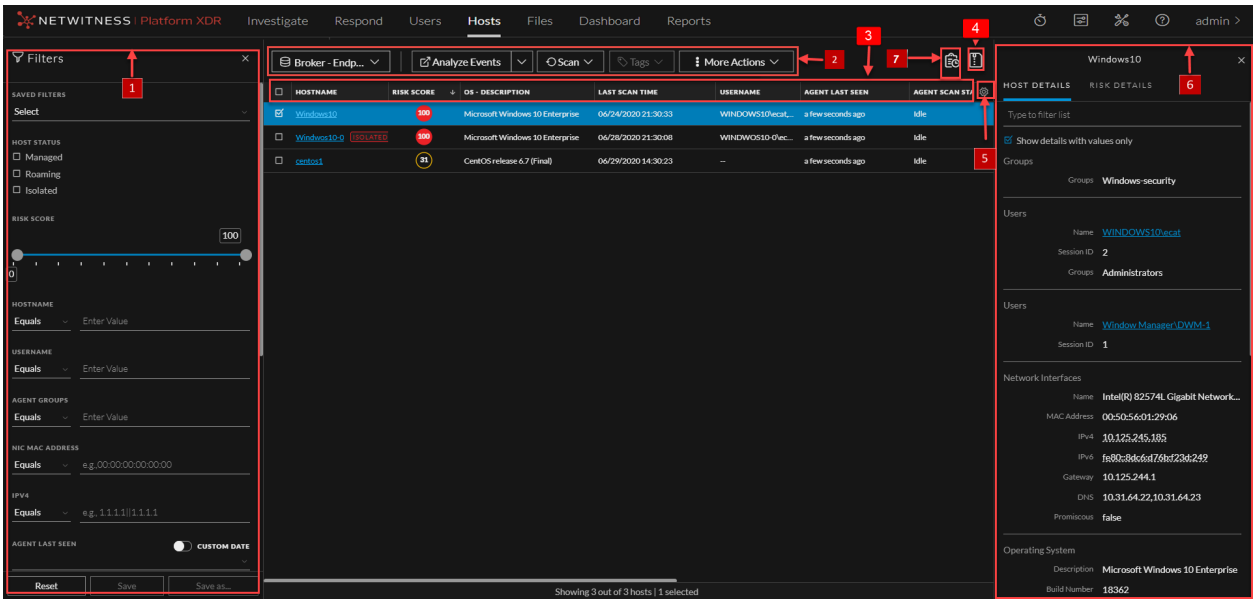
The Hosts view provides a list of all hosts with an Endpoint agent installed. To access this view, go to **Hosts**. By default, hosts are sorted based on the risk score.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	review hosts with highest risk score*	Analyze Hosts Using the Risk Score
Threat Hunter	analyze hosts*	Investigating Hosts
Threat Hunter	perform adhoc scan*	Scan Hosts
Threat Hunter	review host details*	Analyze Host Details
Threat Hunter	search on snapshot*	Search Files on Host
Threat Hunter	analyze processes*	Investigating a Process
Threat Hunter	review reported anomalies*	Analyze Anomalies

User Role	I want to ...	Show me how
Threat Hunter	analyze risky users*	Analyzing Risky Users
Threat Hunter	analyze events*	Analyzing Events
Threat Hunter	download files for deeper analysis*	Analyzing Downloaded Files
Threat Hunter	perform external lookups*	Launch an External Lookup for a File
Threat Hunter	change file status or remediate*	Changing File Status or Remediate
Threat Hunter	filter files*	Filter Host Details
Threat Hunter	isolate host from network*	Isolating Hosts from Network
Threat Hunter	download MFT*, system dump*, or process dump	Performing Host Forensics



*You can perform this task in the current view.

Quick Look

Below is an example of the Hosts view:

1 **Filter Hosts**.You can filter the hosts by selecting the options in the Filters panel and create filters. For more information, see Filter Hosts.

2 **Actions in the toolbar:**

Server drop-down list - You can select the Endpoint server or Endpoint Broker server to view the hosts.

Analyze Events - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.

Start Scan - Starts a scan for the selected hosts.

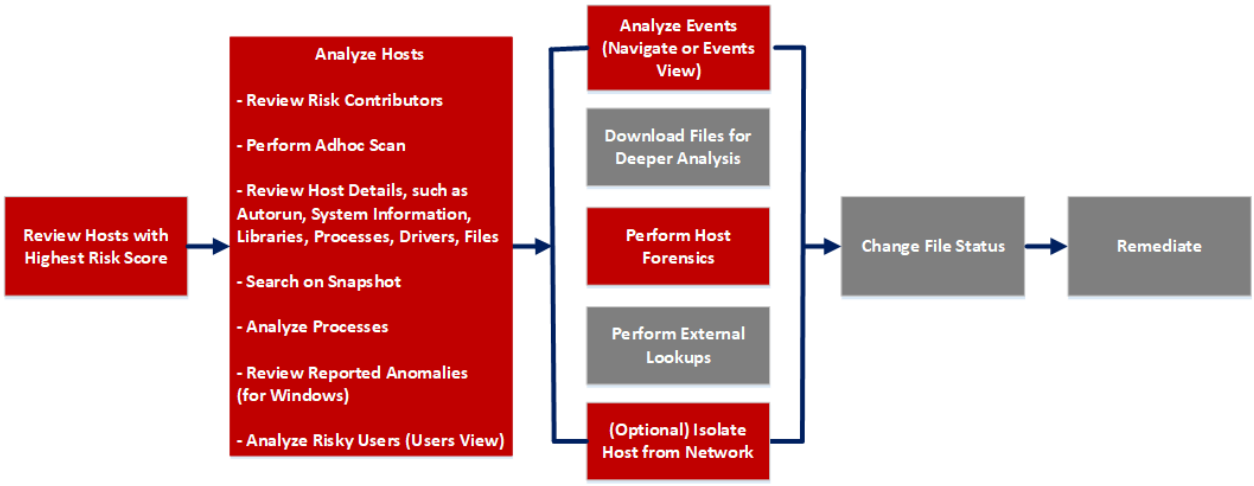
Stop Scan - Stops a scan for the selected hosts.

More Actions - Provides options to:

- Reset risk score.
- Delete - Lets you delete hosts manually from the user interface. After deletion, the Endpoint server does not process any request from this host. For more information, see Delete a Host.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

Note: You can perform the above actions from the right-click context menu.

3 **Sort Columns**. Lets you sort on column titles.



4	**Export to CSV** - Extracts host attributes to a CSV file. For more information, see Export Host Attributes.
5	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.
6	**Show/Hide Host Properties Panel.** Click a row to show or hide the Host Properties panel. It displays the following tabs: **Host details** - Displays the host information such as Network Interfaces, operating system, hardware and others. **Risk details** - Displays the distinct alerts associated with the risk score.
7	**View Agent History** - Displays the list of commands issued to the agent. For more information, see View Agent History.

Hosts View - Details Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Details tab provides details of the selected host. To access this view, go to **Hosts** view, and select a host.

Workflow

Quick Look

Below is an example of the Details tab:

1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts. **Agent Last Seen** - Time when the agent last communicated with the Endpoint server. **Agent Version** - Version of the agent. For example, `11.3.0.0`. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More** - Provides options to: • Start a scan for the selected hosts. For more information, see Scan Hosts. • Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes. • Isolation host from the network. For more information, see Isolating Hosts from Network. • Download MFT to the server. For more information, see Performing Host Forensics. • Download System Dump to the server. For more information, see System and Process Memory Dump. • Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics. **Snapshot Time** - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.

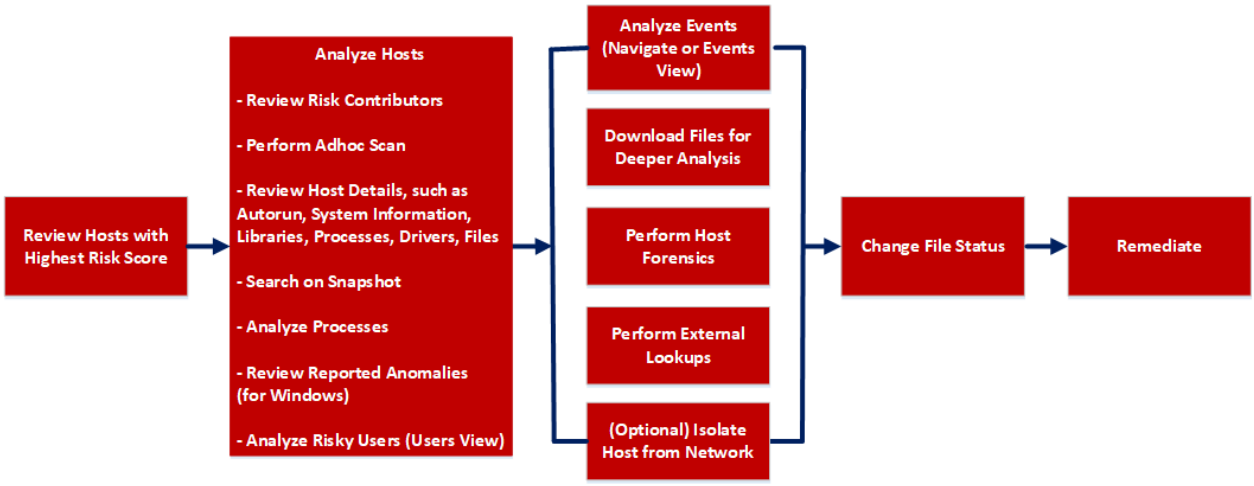
2	Search files on host. Lets you search the files on the host (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
3	**Show/Hide Right Panel** - Displays host and policy details panel.
4	**Host Details Panel** - Displays all properties of the selected host. It is grouped as follows: **Groups** - Groups on which the host is added on. **User** - Information related to the user. **Network Interfaces** - Network adapter information, such as Mac Address, Gateway. **Operating System** - Operating system version and build information. **Agent** - Agent-related information, such as agent ID, driver error code, install time, and agent mode. **Hardware** - Information related to the architecture. **Locale** - Time zone and language that is local to the host.

5 **Policy Details Panel** - Displays the following:

- Policy Status -
  - Updated - Host has the latest policy.
  - Pending - Policy is resolved but the latest policy is not updated on the host. When the host communicates with the Endpoint server next time, the latest policy is applied if there are no errors.
  - Unavailable - Hosts that belong to previous versions, such as NetWitness Platform 11.1 or 11.2, or the source server is not installed.
  - Error - Problem applying the latest policy along with the error description.
- Blocked Hashes Status -
  - Updated - Host has the latest blocked hashes.
  - Pending - Hashes are blocked but the latest hashes are not updated on the host. When the host communicates with the Endpoint server next time, the latest hashes are applied if there are no errors.
- Evaluated Time - Time when the Endpoint server evaluated the policy.
- Relay Server. Displays the Relay Server details.
  - Server - Host name or IP address of the Relay Server.
  - Port - Port number.
  - HTTP Beacon Interval - HTTP beacon interval value in minutes.
- Complete resolved policy settings. For more information, see "Managing Policies" in the *NetWitness Endpoint Configuration Guide*.

Note: The values that are not set in the policy are not displayed.

6 **Alerts Severity** - Displays list of distinct alerts, such as Critical, High, Medium and All, along with the total number of events associated with the alert.



7 Displays events for an alert and metadata associated with a specific event. For more information, see Analyze Hosts Using the Risk Score.

Hosts View - Process Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Process panel provides a list of processes running on the host. To access this tab, select a host from the **Hosts** view and click the **Process** tab.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	review hosts with highest risk score*	Analyze Hosts Using the Risk Score

Quick Look

Below is an example of the Process tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

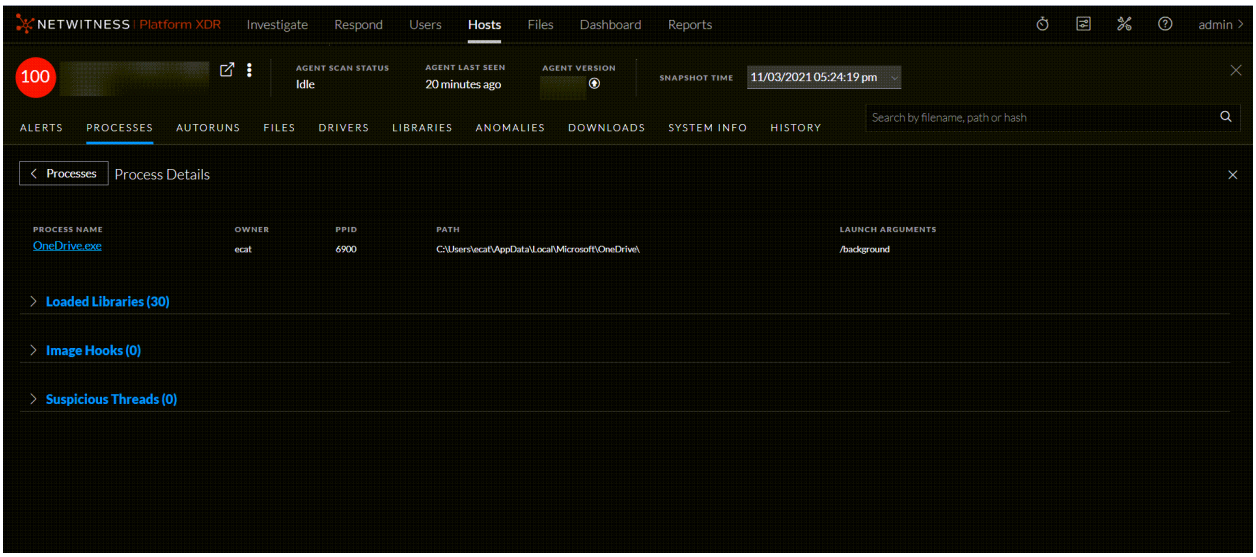
Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

More - Provides options to:



- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

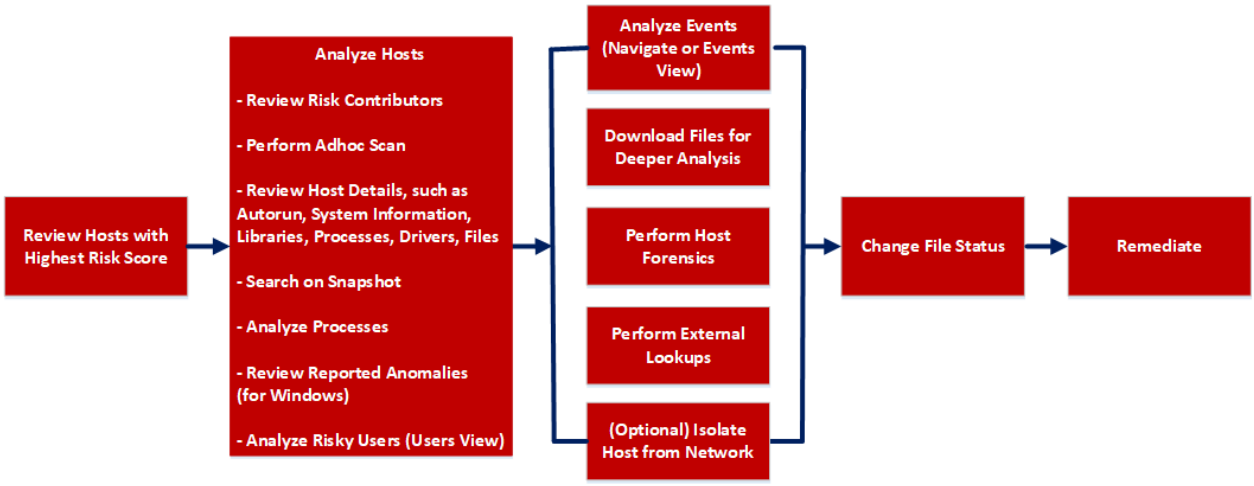
Snapshot Time - Lists scanned time stamps. To view the scan history, you select the snapshot time from the drop-down menu.

2	**Actions in the toolbar:** **Analyze Process** - Lets you perform process analysis to investigate a particular process behavior, and understand the entire process event chain, process parent-child relationships, and all associated events. For more information, see Investigating a Process. **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected file to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. • Download process dump to server. **Note:** You can perform some of the above actions from the right-click context menu.
3	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
4	**Toggle.** Lets you toggle between List view and Tree view.
5	**Process panel** - Displays process information, such as process name, local risk score, global risk score, On Hosts, reputation status, file status, and others.
6	**Show/Hide Right Panel** - Displays the following properties of a process in the right panel: • **Details** - Displays all properties of the selected process. It is grouped as follows: **General** - General information about the file, such as file name, entropy, size, and format. **Signature** - Provides signatory information. **Hash** - Hash type of the file (MD5, SHA1, and SHA256). **Time** - Time when the file was created, modified, or accessed. **Location** - Location of the file. **Process** - Details of the process, such as image size and PID. **Image** - Image details loaded by the process. • **Local Risk Details** - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All. • **Hosts** - Displays the top 100 hosts based on the risk score on which the file is present.
7	**Filter Files**. You can filter processes by selecting the options in the Filters panel and create filters. For more information, see Filter Host Details.
8	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

Process Details

Clicking the process name displays the process details of a specific process as shown in the following figure:

Field	Description
Process Name	Name of the process. For example, `server.exe`.
PID	ID of the process. For example, `492`.
Path	Path of the file associated with the process on the disk. For example, `C:\Windows\System32`.
Launch Arguments	Command line arguments passed to the process when it is launched. For example, `-k LocalServiceNoNetwork`.



- List of loaded libraries for the selected process, such as DLLs (for Windows), Dylibs (for Mac), or .SO (for Linux).
- List of autoruns (if configured).
- List of image hooks and suspicious threads (for Windows).

Hosts View - Autoruns Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Autoruns panel provides a list of autoruns, services, tasks, and cron jobs running on the host. To access this tab, select a host from the **Hosts** view and click the **Autoruns** tab.

For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More Actions** - Provides options to: • Perform external lookups. • Download process dump to server. • Download files to server, save a local copy, and analyze files for deeper analysis. **Note:** You can perform some of the above actions from the right-click context menu.
3	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
4	**Details Panel** - Displays the following tabs: • **Autoruns** - Files that are executed at start-up. • **Services** - Files that are running as a service for the selected host. • **Tasks/Cron jobs** - Files that are configured to run as scheduled tasks along with the trigger.
5	**Show/Hide Right Panel** - Displays the following properties in the right panel: • **Details** - Displays all properties of the selected process. It is grouped as follows: **General** - General information about the file, such as file name, entropy, size, and format. **Signature** - Provides signatory information. **Hash** - Hash type of the file (MD5, SHA1, and SHA256). **Time** - Time when the file was created, modified, or accessed. **Location** - Location of the file. **Autoruns/Services/Tasks** - Details related to autrouns, services, or tasks. • **Local Risk Details** - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All. • **Hosts** -Displays the top 100 hosts based on the risk score on which the file is present.
6	Clicking a filename lets you navigate to the Files view for further analysis.
7	**Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. For more information, see Filter Host Details.
8	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

Hosts View - Files Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Files tab displays all files on the host including the files deleted within last 30 days. To access this tab, select a host from the **Hosts** view and click the **Files** tab. By default, it displays 100 files. To display more files, click **Load More** at the bottom of the page.

Workflow

What do you want to do?

User Role	I want to ...	Show me how

- Isolating Hosts from Network

Quick Look

Below is an example of the Files tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

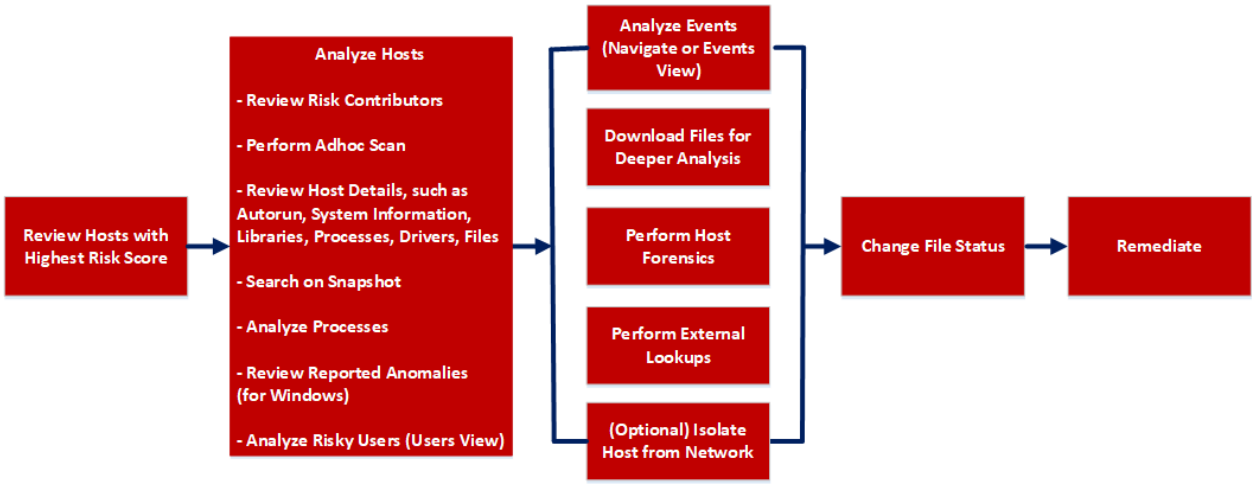
Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

More - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

Snapshot Time - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.



2	**Actions in the toolbar:** **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected file to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More Actions** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. **Note:** You can perform some of the above actions from the right-click context menu.
3	Search files on host. Lets you search the files on the host (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
4	**All Files Available on Host** - Lists all files (reported as part of scan and tracking) on the host. By default, **All Files Available on Host** toggle is enabled for Windows and Mac.
5	**Details Panel** - Displays information, such as filename, local risk score, global risk score, on hosts, reputation status, file status, package details and others.
6	**Show/Hide Right Panel** - Displays the following properties in the right panel: • Details - Displays all properties of the selected process. It is grouped as follows: **General** - General information about the file, such as file name, entropy, size, and format. **Signature** - Provides signatory information. **Hash** - Hash type of the file (MD5, SHA1, and SHA256). **Time** - Time when the file was created, modified, or accessed. **Location** - Location of the file. • Local Risk Details - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All. • Hosts - Displays the top 100 hosts based on the risk score on which the file is present.
7	Clicking a filename lets you navigate to the Files view for further analysis.
8	**Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. **Note:** In the **Deleted** column, a trash icon appears next to the deleted file. The **Deleted** column is not displayed if you disable **All Files Available On Host**. For more information, see Filter Host Details.
9	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

Hosts View - Drivers Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Drivers tab lists the drivers running on the hosts at the time of scan. To access this tab, select a host from the **Hosts** view and click the **Drivers** tab.

Image Hooks

Image hooks found in executable image are displayed in the following columns.

Columns	Description
Type	Type of the hook . Possible values are - inline, iat, eat, or exception Handler.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Signature	Provides signatory information.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Hooked Process	Process in which hooks are placed.
Hooked Filename	Name of the file that was modified by the hook.
Hooked Symbol	Symbol in which the hook is performed.

Kernel Hooks

Hooks found on kernel objects are displayed in the following columns.

Category	Description
Type	Type of kernel object which was modified. Possible values are: objectInitializer,basicObjectPointer, majorFunction, invalidObject, fastIO, notifyRoutine, attachedDevice, device, miniPort, sdt, sysEnter, or type.idt.
Driver name	Name of the driver which placed the hooks.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.

Category	Description
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Signature	Provides signatory information.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Object Function	Name of the object function hooked into.
Hooked File Name	Name of the file that was modified by the hook.

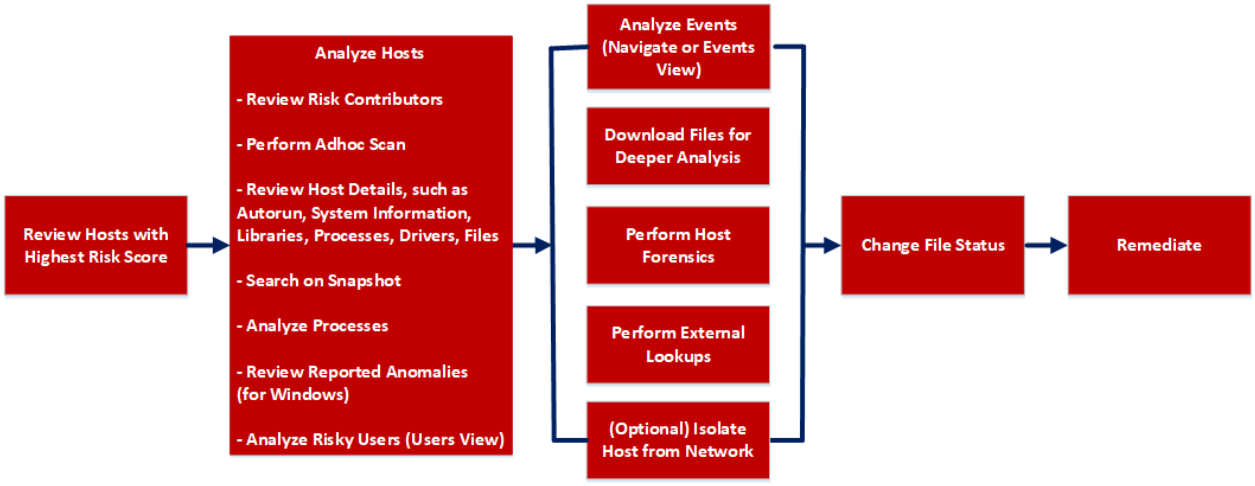
Suspicious Threads

Threads whose service table was hooked are displayed in the following columns.

Category	Description
Start Address	Start Address - Start address of the thread.
DLL Name	Name of the DLL.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Process	File name and PID of the process in which thread is running.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Signature	Provides signatory information.
Thread ID	ID of the running thread.
Thread Environment Block	Address of the thread environment block.

Registry Discrepancies

Configuration settings and options on Microsoft Windows operating systems that are stored are displayed in the following columns.



Category	Description
Hive	Name of the registry hive when possible, otherwise it displays the hive ID. Possible values are: `hkeyClassesRoot`, `hkeyCurrentUser`, `hkeyLocalMachine`, `hkeyUsers`, or `hkeyPerformanceData`.
Reason	Type of registry discrepancy. Possible values are: notFound, embeddedNull, accessDenied, parentIsHidden, or dataMismatch.
Registry Path	Registry path that is affected. The value is separated by a @ character.
Raw Type	Value type found in the low-level parsing.
Raw Data	Value data extracted from the low-level parsing.
API Type	Value type from the Win32 registry API.
API Data	Value data from the Win32 registry API.

Hosts View - Downloads Tab

Note: The information in this topic applies to NetWitness Version 11.4 and later.

The Downloads tab provides information about all downloads (MFT, files, system dump, and process dump) performed on the host. To access this tab, select a host from the **Hosts** view and click the **Downloads** tab.

Workflow

What do you want to do?

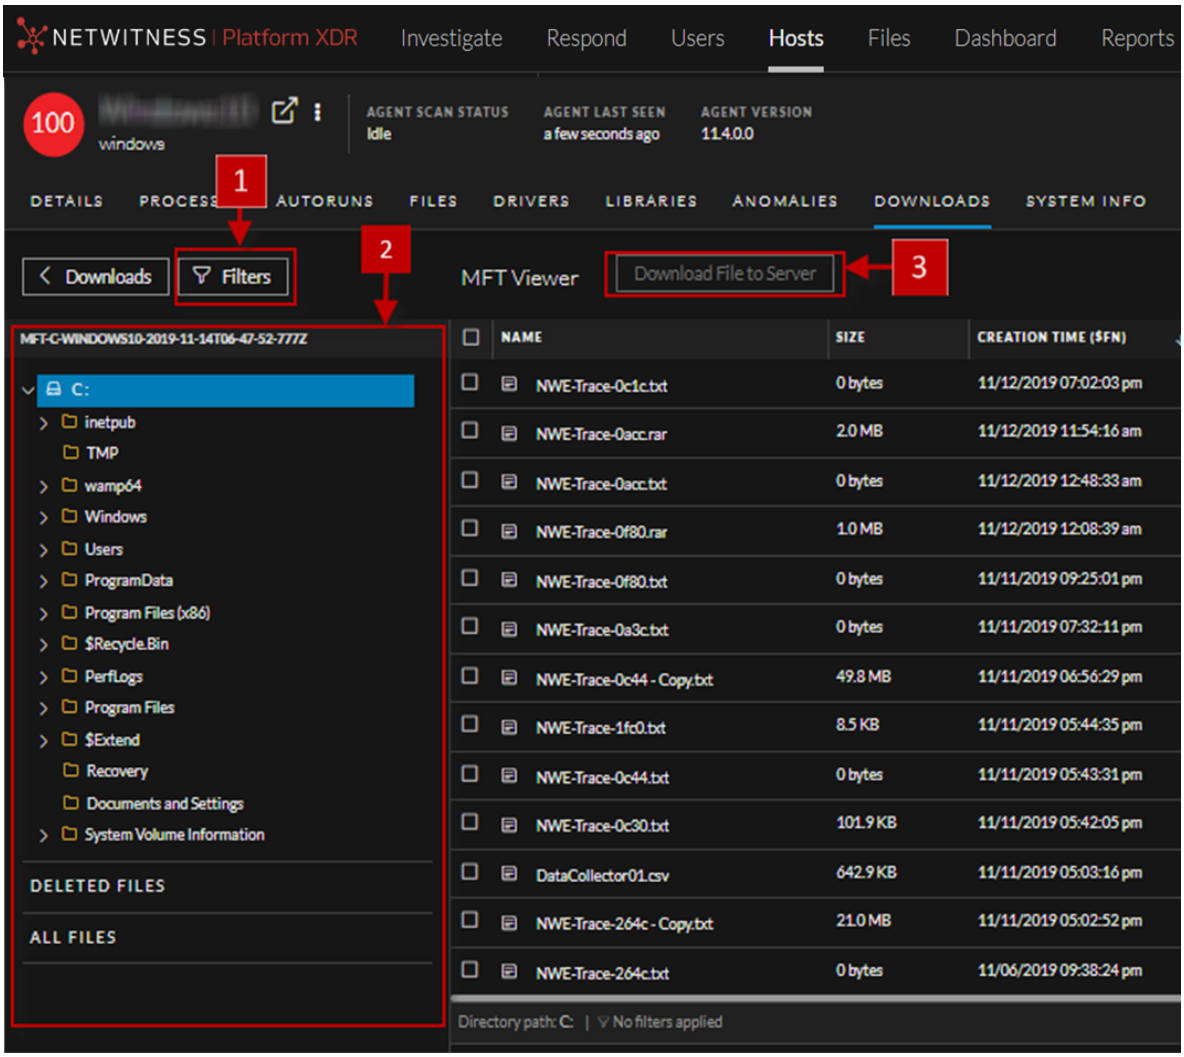
Quick Look

Below is an example of the Downloads tab:

1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts. **Agent Last Seen** - Time when the agent last communicated with the Endpoint server. **Agent Version** - Version of the agent. For example, `11.3.0.0`. **More** - Provides options to: • Start a scan for the selected hosts. For more information, see Scan Hosts. • Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes. • Isolation host from the network. For more information, see Isolating Hosts from Network. • Download MFT to the server. For more information, see Performing Host Forensics. • Download files to the server. For more information, see Download Files Using Full Path or Wildcard. • Download System Dump to the server. For more information, see System and Process Memory Dump. • Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.
2	**Filter Files**. You can filter downloaded files by selecting the options in the Filters panel and create filters. For more information, see Performing Host Forensics.
3	**Actions in the toolbar:** **Save a Local Copy** - Lets you retrieve the downloaded MFT and save it to your local file system for further analysis. **Delete File** - Deletes the downloaded MFT from the server. For more information, see Performing Host Forensics.
4	**View MFT Details**. Click the filename to view the MFT details. For more information, see MFT Viewer.

The table displays the following information:



Column	Description
File Name	Name of the file that is downloaded. For example, `VGAuthService.exe`.
Type	Type of file downloaded - MFT, file, memory dump.

Column	Description
Downloaded	Status of the download:  - Download successful  - Processing the downloaded file  - Errors including download failed  - Errors downloading one or more files in the group.
Size	Size of the downloaded file.
Downloaded Time	Time when the MFT was downloaded.
SHA256	SHA256 of the file. **Note:** This is applicable only for files.

MFT Viewer

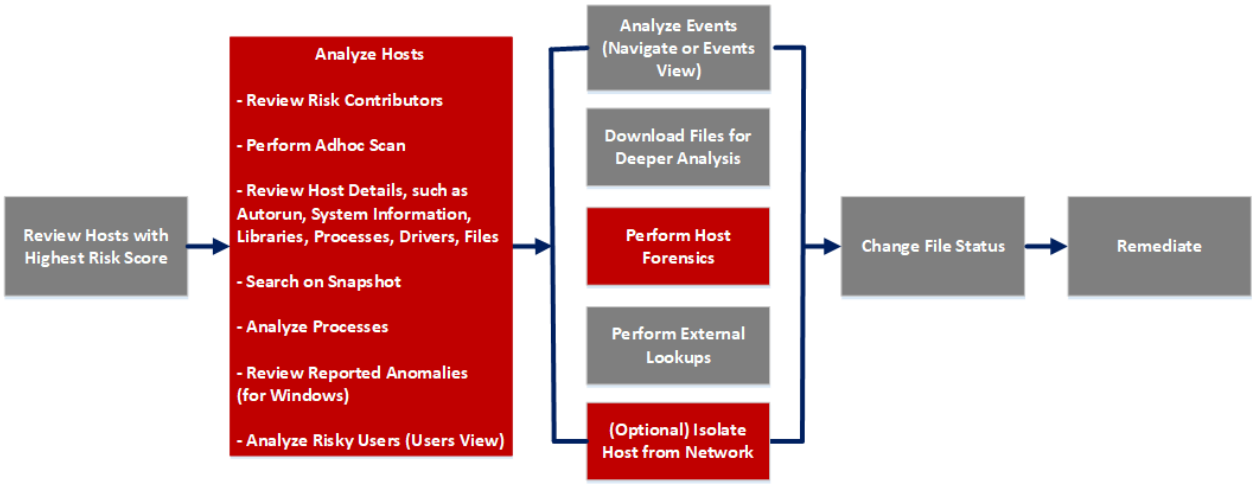
You can analyze the downloaded MFT using the MFT Viewer. For more information, see Analyze Downloaded MFT.

Below is an example of the MFT Viewer:

1. **Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. For more information, see Filter MFT.
2. **Folder Details**. Lets you view the content of the MFT.
3. **Download File to Server**. Downloads files to the server.

The table displays the following information:

Column	Description
Name	Name of the file. For example, `dtf.exe`.
Size	Size of the file.
Creation Time ($FN)	File Name ($FN) creation time.
Creation Time ($SI)	Standard Information ($SI) creation time.



Column	Description
Modification time ($FN)	$FN modified time.
Modification time ($SI)	$SI modified time.
Access time ($FN)	$FN access time.
Access time ($SI)	$SI access time.
Update time ($FN)	$FN updated time.
Update time ($SI)	$SI updated time.
Full Path	Path of the file.
Allocated Size	File size on the disk.
Archive	Indicates if a file is archived.
Compressed	Indicates if a file is compressed.
Encrypted	Indicates if a file is encrypted.
Hidden	Indicates if a file is hidden.
Directory	Indicates if it is a directory.
Extension	Type of the file. For example, exe, pdf, txt.

Hosts View - System Information Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

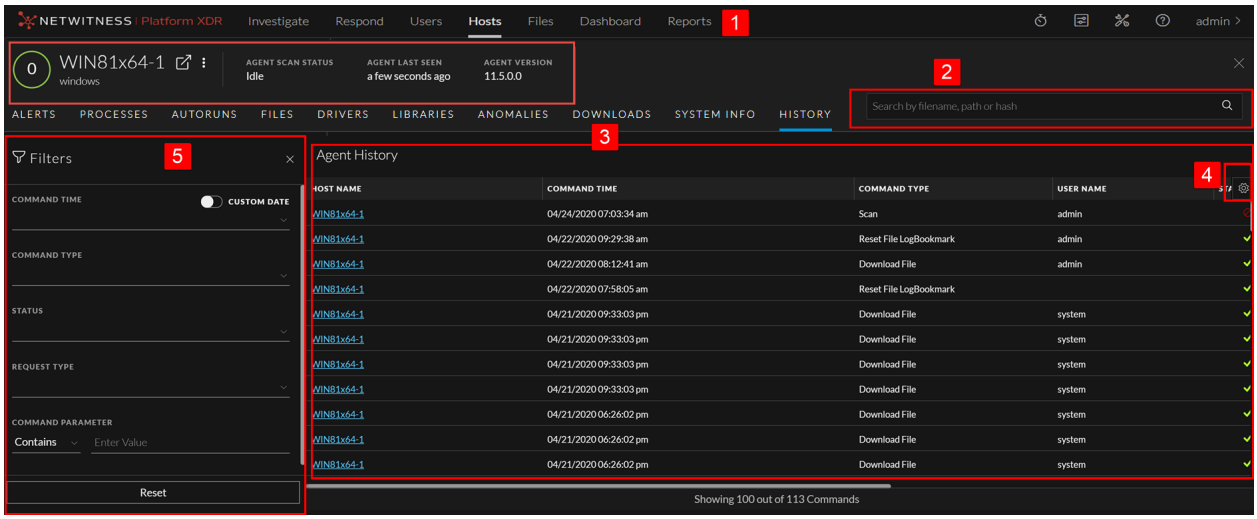
For example, `11.3.0.0`. **More** - Provides options to: • Start a scan for the selected hosts. For more information, see Scan Hosts. • Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes. • Isolation host from the network. For more information, see Isolating Hosts from Network. • Download MFT to the server. For more information, see Performing Host Forensics. • Download System Dump to the server. For more information, see System and Process Memory Dump. • Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics. **Snapshot Time** - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.
2	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
3	**System Information Panel** - See System Information Panel.

System Information Panel

The System Information panel displays the following tabs:

Tabs	Description
Host File Entries	All network redirections written in the host file. For example, IP Address - `10.10.10.3` and DNS Name - `localhost,localhost.localdomain,localhost4,localhost4.localdomain4`
Network Shares	Network name of the shared resource (for Windows only). For example, Name - `Admin$`, Description - `Remote Admin`, Path - `C:\`, Permissions - `None`, Type - `disk, special`, Max Users - `4294967295`, Current Users - `0`.



Tabs	Description
Security Products	Installed security products (for Windows only). For example, Display Name - `Windows Defender`, Instance - `D68DDC3A-831F-4FAE-9E44-DA132C1ACF46`, Features - `Enabled`, Type - `antiVirus`.
Windows Patches	List of patches applied by Windows update (for Windows only). For example, `KB2959936`.
Security Configuration	Security configuration details on the host. For example, firewall disabled or enabled, smart screen filter disabled or enabled. This field is only applicable for Windows and Mac.

Hosts View - Agent History Tab

The Agent History tab lists the commands along with the respective status and additional details.

Quick Look

Below is an example of the Agent History tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

More - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

2 **Search files on host**. Lets you search the files on the host (file name, file path, and SHA-256 checksum).

3 **Details Panel**- Displays information, such as:

- **Command Time** - Command issued time.
- **Command Type** - Type of the command (Identity, scan, stop scan, download file, MFT, process dump, system dump, start isolation, update isolation exclusion list, stop isolation, reset file logbookmark, and download multiple files, agent upgrade, and uninstall agent) issued.
- **User Name** - User who issued the command. For example, Analyst, System.
- **Status** - Status (success, pending, expired, failed, or cancelled) of the command issued.

Note: If the command's status is expired, it means that the agent is unable to process the command even after five retries.

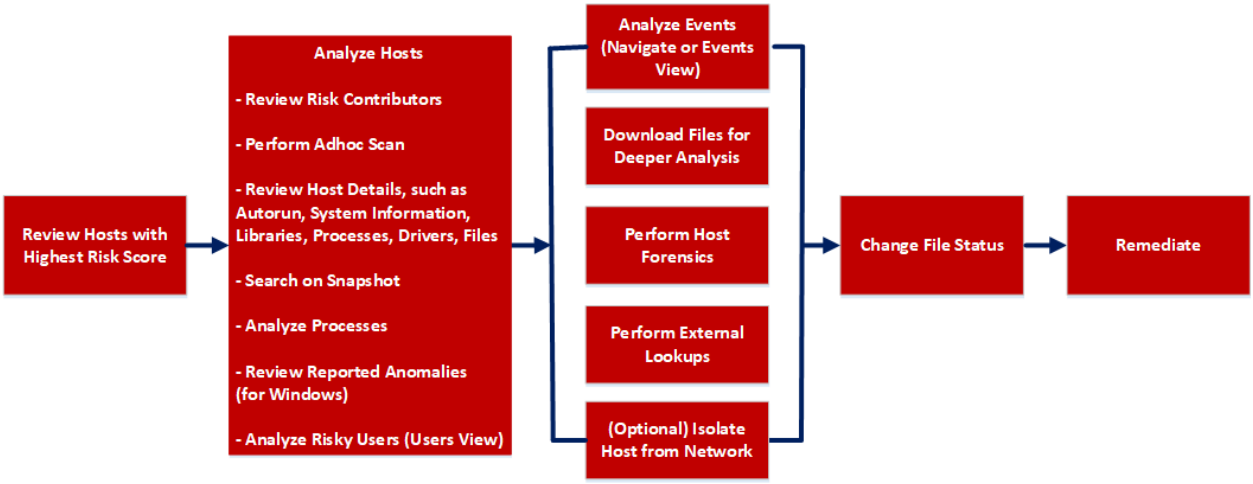
- **Command Parameter** - Parameters associated with the command. For example, Command parameter for command type Download File is `path = C:\Windows\System32\ | filename = cmd.exe | hash = 6f88fb88ffb0f1d5465c2826e5b4f523598b1b8378377c8378ffebc171bad18b`

Note: Command types such as identity, scan, stop scan, stop isolation, system dump do not contain any associated command parameters.

- **Processed Time** - Time at which the command is completed, pending, expired, failed, or cancelled.
- **Last Retrieval time** - Last time when the command is issued to the agent.
- **Total Retrieval** - The number of times the command is issued to the agent.

Note: After you upgrade to NetWitness version 11.5, the commands executed in the previous versions are displayed automatically. The fields such as last retrieval time, total retrieval, and user do not contain any values. For system generated commands, the user field value shows as system.

4 **Filter Files**. You can filter commands by selecting the options in the Filters panel. For more information, see Filter Host Details.



5 **Settings Menu.** You can set History view preferences by selecting columns from the Settings menu.

Hosts View - YARA Rules Tab

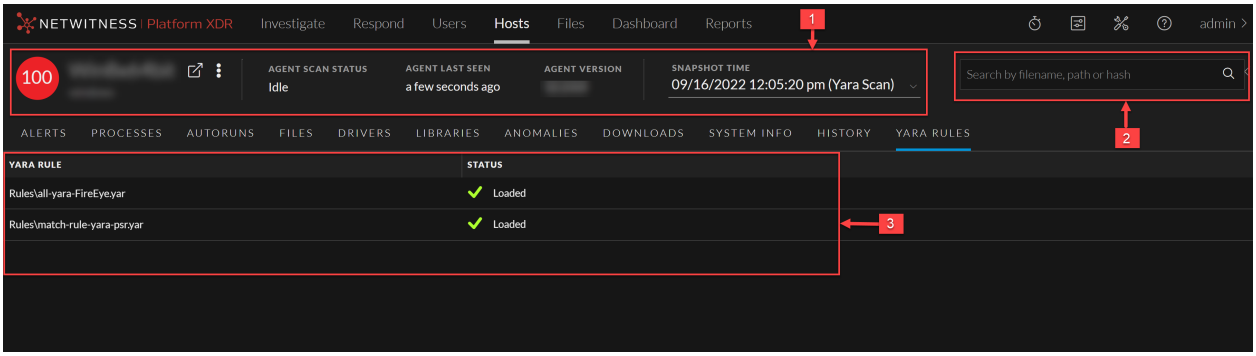
Note: The information in this topic applies to NetWitness Version 12.0 and later.

The **YARA Rules** tab lists the various YARA rules used for the scan and their status. To access this tab, select a host from the **Hosts** view and click the **YARA Rules** tab.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	review hosts with highest risk score	Analyze Hosts Using the Risk Score
Threat Hunter	analyze hosts*	Investigating Hosts
Threat Hunter	perform adhoc scan*	Scan Hosts
Threat Hunter	review host details	Analyze Host Details
Threat Hunter	search on snapshot*	Search Files on Host
Threat Hunter	analyze processes	Investigating a Process
Threat Hunter	review reported anomalies	Analyze Anomalies
Threat Hunter	analyze risky users	Analyzing Risky Users
Threat Hunter	analyze events	Analyzing Events
Threat Hunter	download files for deeper analysis	Analyzing Downloaded Files
Threat Hunter	perform external lookups	Launch an External Lookup for a File
Threat Hunter	change file status or remediate	Changing File Status or Remediate
Threat Hunter	isolate host from network*	Isolating Hosts from Network
Threat Hunter	download MFT, system dump, or process dump*	Performing Host Forensics



*You can perform this task in the current view.

Getting Started with ESA

This topic covers quick start topics for NetWitness Event Stream Analysis (ESA) to help you get started in using ESA. The following topics are designed to assist you in working with ESA Correlation Rules.

- Best Practices helps you to understand how to best set up, deploy, and create rules.
- Troubleshoot ESA helps you to troubleshoot different aspects of ESA, including rule writing and deployment.
- View Memory Metrics for Rules helps you to work with memory metrics to understand memory usage for ESA services.

In NetWitness version 11.5 and later, There are only two services that can run on an ESA host:

- **ESA Correlation (ESA Correlation rules):** Creates alerts from ESA rules.
- **Contexthub Server (Context Hub):** Runs only on an ESA primary host. Contexthub Server provides enrichment lookup capability in the Respond and Investigate views. For information, see the *Context Hub Configuration Guide*.

Note: The Event Stream Analytics Server (ESA Analytics) service is not supported in NetWitness Platform version 11.5 and later.

The first service is the ESA Correlation service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live.

In NetWitness 11.3 and later, the ESA Correlation service replaces the Event Stream Analysis service and is also known as ESA Correlation Server. The ESA Correlation service provides the same services as the Event Stream Analysis service with the added benefit of enabling you to specify different data sources for your ESA correlation rules. Like the Event Stream Analysis service, the ESA Correlation service installs on the ESA Primary and ESA Secondary host types.

The second service is the Contexthub Server service, which provides enrichment lookup capabilities in the Respond and Investigate views. It runs only on an ESA Primary host. For information, see the *Context Hub Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

IMPORTANT: The NetWitness server (Admin server), ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

How ESA Generates Alerts

The ESA Correlation service runs rules that specify criteria for problem behavior or threatening events in your network. When ESA detects a threat that matches rule criteria, it generates an alert.

To generate alerts, ESA performs the following functions:

1. Gathers data
2. Runs ESA rules against the data
3. Captures events that meet rule criteria
4. Generates alerts for those captured events

Data Source Configuration Changes

In NetWitness version 11.3 and later, the ESA Correlation service enables you to specify different data sources for different sets of rules. Instead of adding data sources, such as Concentrators, to the entire ESA Correlation service, you can specify different data sources for each ESA rule deployment. An ESA rule deployment includes an ESA Correlation service with its associated data sources and a set of ESA rules. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment. For more detailed information, see Deploy Rules to Run on ESA.

An Endpoint Risk Scoring Rules Bundle is available in NetWitness Platform

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

The ESA Correlation service can process endpoint risk scoring rules, which generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Best Practices

Best practices provide guidelines to help you write and manage rules, deploy rules, and maintain system health for your ESA services.

Understand Event Stream Analysis Rule Types

The ESA Correlation service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators. However, when working with Event Stream Analysis, you should be aware of the factors that affect resource usage in order to create effective rules.

Each event that is received by ESA is evaluated to determine if it may trigger a rule. There are three types of rules that can be deployed in order to determine what the ESA engine should do with the incoming event. Each of these rule types have different impacts on system resource utilization. All three rule types may be created via the Rule Builder, Advanced Event Processing Language (EPL) rules, or downloaded via RSA Live. The table below lists the rule type and the impact this rule may have on system resources.

Rule Type	Description
Simple Filter Rule	This rule has no correlation to other events. At ingestion time, this rule is evaluated against a set of conditions, and if those conditions are met an alert is generated. If no conditions match, the event is quickly released by the engine to free up memory usage. These rules do not take up memory since the events are not retained beyond the initial evaluation. The memory resource usage does not increase as more simple filter rules are deployed. However, if the filter condition is too generic, it is possible that this rule can generate too many alerts, which will strain the system resources for the storage and retrieval of these alerts. For example, you might write a rule to generate an alert when HTTP network activity arrives over a non-standard HTTP port.
Event Window Rule	This rule evaluates a set of events over a time period for specific conditions. At ingestion time, the rule is evaluated against a set of conditions. If those conditions are met, the event is retained in memory for a specific amount of time. After the specified time passes, the events are removed from the time window if the number of events collected does not meet the threshold to trigger an alert. The memory consumption of such rules is highly dependent on the incoming event rate (traffic), the amount of data per event, and the time length specified in the event window. Each matching event is retained in memory until the time window has passed, so the longer the time window, the greater the potential volume. For example, you might write a rule that generates an alert if a user has five failed login attempts within a ten minute time frame.

Rule Type	Description
Followed By Rule	This rule evaluates a chain of incoming events to determine if the sequence of events matches a particular condition. At ingestion time, the rule is evaluated against a set of conditions. If the conditions are met, one of two actions occurs: • If this is the first event of the sequence, a new event thread is started, and the event is retained as the head of the sequence. • If the event belongs to an existing event thread, it is added to that sequence. In both cases, the event is retained in memory. The amount of resource usage is particularly sensitive to the customer environment for this type of rule. If the filter condition generates many event threads, resources are consumed for each new thread (in addition to the event). Additionally, if the end of the event thread is never met (that is, an alert is never generated), then the entire event is saved in memory indefinitely. For example, you might write a rule to generate an alert when a user fails to log in to a server, then performs a successful login, and then creates a new account.

Note: ESA sends alerts to NetWitness Respond for processing and the alerts are eventually stored in a database. If your rule creates too many alerts, it can slow down another part of the system.

When writing and deploying rules, you should be aware that rule memory usage and alert generation consume system resources. The sections below are designed to help you keep your usage at a healthy level and monitor for problems if systems are becoming overloaded.

Best Practices for Writing Rules

These are general guidelines for writing rules.

- **Create alerts for actionable events**. The purpose of an alert should be to notify you of an event that requires immediate and specific action. For events that do not require action, or only require you to have awareness of the event, you can create a report.
- **Validate your ESA rules within the Rule Builder or Advanced EPL Rule Builder before you deploy them**. To prevent errors in your rules and confirm that they generate the expected alerts, you can test the rule logic with JSON data within the rule builders. This capability is available in NetWitness Platform version 11.5 and later. For more information, see Validate an ESA Rule and Validate an Advanced EPL Rule .
- **Configure new rules as trial rules so you can observe how they react in your environment**. If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded.
- **Configure Alert notifications only after your rule testing and tuning is complete**. This can help ensure you do not get flooded with notifications if a rule behaves differently than you expect.

- **Rules need to be specific so that you limit resource usage**. Use the following guidelines to limit usage:
  - Make the filters on the rule exclude all but the necessary events for the rule to fire accurately.
  - Make the size of your windows (window time for correlation) as small as possible.
  - Limit the events that you include in the window: For example, if you only want to see IDS events, ensure that you only include those events in your time window.
- **Add Memory Thresholds to ESA rules that use memory**. For example, if a rule contains windows or pattern matching, configure a memory threshold for that rule. If the rule goes over the allotted memory threshold, it gets disabled individually and an error is displayed for that rule on the  **(Configure) > ESA Rules > Services** tab. This capability is available in NetWitness Platform version 11.5 and later.
- **Rules need to be tuned to an alert level that is manageable**. If you are flooded with alerts, then the purpose and of an alert is lost. For example, maybe you want to know about encrypted traffic to other countries. But, you could limit the list to countries that are known risks. This limits the volume of alerts to a level you can manage.

For more best practice information for writing ESA rules, see ESA Rule Writing Best Practices.

Best Practices for Working with RSA Live Rules

These are guidelines for RSA Live Rules.

- **Deploy RSA Live rules in small batches**. Not every rule is suited to every environment. The best way to ensure your RSA Live rules are successful is to deploy them in small batches so you can test them in your environment. If you deploy small batches, it's much easier to tell if a particular rule has an issue.
- **Read the rule descriptions provided with RSA Live rules**. ESA rules are not “one size fits all.” Not all rules will work in your environment. The rule descriptions tell you which parameters you will need to modify to successfully deploy a rule in your environment.
- **Set your parameters**. RSA Live rules have parameters that need to be modified. If you do not modify your parameters, the rule may not work or it may exhaust your memory.
- **Deploy new rules as trial rules so you can observe how they react in your environment.** If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded. For more details, see Working with Trial Rules.

Best Practices for Deploying Rules

These are general guidelines for deploying rules.

- **Deploy rules in small batches so you can observe how they react in your environment.** Not all environments are the same, and a rule will need to be tuned for memory usage, alert volume, and

effective detection of events.

- **Test rules before you configure alert notifications**. Configure Alert notifications only after your rule testing and tuning is complete. This can help ensure you do not get flooded with alerts if a rule behaves differently than you expect.
- **Monitor system health as a part of your deployment process**. When you deploy rules, monitor your system's health as a part of your deployment process. You can view total memory usage for your ESA in the Health and Wellness tab. For more information, see "View Detailed Statistics in Health and Wellness" in Troubleshoot ESA.

Best Practices for System Health

These are general guidelines for system health.

- **Set up new rules as trial rules**. A common issue is that new rules may cause memory issues. To prevent this, you can set up new rules as trial rules. If the configured memory threshold is met, all trial rules are disabled to prevent the system from running out of memory. For more information about trial rules, see Working with Trial Rules.
- **Set up thresholds in Health & Wellness to alert you if memory usage is too high**. There are metrics in NetWitness Health & Wellness that track memory usage. You can set up alerts and notifications to send you an email if those thresholds are crossed. For more information about the memory statistics you can view, see View Memory Metrics for Rules.
- **Monitor memory metrics for each rule in Health & Wellness**. For each rule, you can view the estimated memory usage in Health & Wellness. You can use this information to ensure that rules do not use too much memory. For more information about the memory statistics you can view, see View Memory Metrics for Rules.

Troubleshoot ESA

This section describes common issues that may occur while using ESA, and it suggests common solutions to these problems.

Troubleshoot ESA Correlation Services

Problem	Possible Causes	Solutions
On the NetWitness Platform Dashboard, the ESA service appears in red to indicate it is offline. In the **(Configure) > ESA Rules** view, the following message appears: "The Service is either offline or not reachable."	Several	When an ESA Correlation service is offline, there are many possible causes. However, a common issue is that you have created a rule that uses excessive memory and causes the ESA service to fail. To troubleshoot this problem, see Steps to Troubleshoot Memory Issues with an ESA Service Offline. Other common causes might be that your firewall is blocking the connection between the ESA and NetWitness Platform, or the ESA Correlation service machine may be down. To bring up ESA Services: Go to **(Admin) > Services**, select your ESA service, and then select **> Start**. If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.

Problem	Possible Causes	Solutions
On the NetWitness Platform Dashboard, the ESA service appears in red to indicate it is offline. In the **(Configure) > ESA Rules** view, the following message appears: "The Service is either offline or not reachable.	Configuration issues	If your system has been recently upgraded, you may have made a configuration error. Go to **(Admin) > Services**, select your ESA service and then select **> Edit**. In the Edit Service dialog, click **Test Connection**. If the connection fails, you likely have a configuration error. Attempt to fix your configuration error and try again.
Suddenly, an ESA Correlation service is completely unresponsive and appears to have crashed. The ESA Correlation Log file shows a Too Many Open Files error.	Connectivity issues	The most likely cause for this error is a connectivity issue between the ESA Correlation service and a data source used in an ESA rule deployment, such as a Concentrator or Decoder. 1. Restart the ESA Correlation service. 2. Go to **(Admin) > Services**, select your ESA service and then select **> Restart**. 3. Check the connectivity from ESA to the data source. Look for connection errors in the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`. For example: `Error: com.rsa.netwitness.streams.RecordStreamException: admin@<ip address>:56005:: com.rsa.netwitness.streams.RecordStreamException: connect::com.rsa.asoc.transport.nw.session.NextgenException: Failed to connect to <ip address>:56005` If there are network connectivity issues, fix the issues and then restart the ESA Correlation service again to see if it fixes the problem. If you have a data source with intermittent connectivity, you should remove it from the ESA rule deployment.

Troubleshoot RSA Live Rules for ESA

Problem	Possible Causes	Solutions
I imported a group of rules from RSA Live, and now my ESA service is crashing. Why?	You may not have configured the parameters for the RSA Live rule to tune it for your environment.	Each rule in RSA Live has a description that includes the parameters you must configure and prerequisites for your environment. Review this description to see if the rule is appropriate for your environment. To ensure that you deploy rules safely in your environment, configure new rules as trial rules to test them in your environment. Trial rules add a safeguard for testing new rules. For details on this, see Deploy Rules as Trial Rules.

I imported a group of rules from RSA Live, and while the rules deployed without errors, they were later disabled.	Not all RSA Live rules are meant for every environment. You may not have the correct meta in your ESA for the rule to run.	You can verify that a rule was disabled by going to  **(Configure) > ESA Rules > Services > Deployed Rule Stats**. If the rule is disabled, the green icon does not display next to the rule.
		If a rule deployed correctly but was disabled, check the logs for exceptions related to the rule. Specifically, check to see if the rules were disabled due to missing meta. To do this, go to the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.
		Then, search for a message similar to the following:
		`"Property named '<meta_name>' is not valid in any stream"`
		For example, you might see:
		`Failed to validate filter expression '(medium=1 and streams=2 or medium=3...(238 chars)': Property named 'tcp_flags_seen' is not valid in any stream`
		If a similar message displays, you may need to add a custom meta key to the Log Decoder or Concentrator. To do this, follow these instructions: "Create Custom Meta Keys Using Custom Feed" in the *Decoder and Log Decoder Configuration Guide*.

Troubleshoot ESA Rules

Problem	Possible Causes	Solutions
I have an ESA rule that is not getting deployed and is not creating alerts.	A meta key that the rule uses is a string array type, but it shows as a string type on ESA.	Check to see if any string array meta keys that the rule uses are configured as string array types on ESA. Go to  **(Configure) > ESA Rules > Settings** tab (Meta Key References). • If it shows `string[]`, it is configured as a string array type on ESA. This is fine. • If it shows `string` without the brackets, it is configured as a string type and you need to fix it on ESA. In the ESA Correlation service Explore view, go to `correlation/stream`. Add string array meta keys to the **multi-valued** list to allow them to be used as an array in ESA rules. Go back to the Meta Key References and click the refresh icon (). Verify that the meta keys with a string array type show a value of `.string[]`. For additional details, see "Configure Meta Keys as Arrays in ESA Correlation Rules" in the *ESA Configuration Guide*.
I set up notifications for a rule, but we are not receiving them. The `correlation-server.log` file does not show any errors. Why?	Correlation-server successfully sent the notification messages to integration-server, but when integration-server tried to send the notifications to their destination, it failed.	When troubleshooting notifications, check both the ESA Correlation service log files (`/var/log/netwitness/correlation-server/correlation-server.log`) AND the Integration-Server log files on the NetWitness Server (`/var/log/netwitness/integration-server/integration-server.log`). For an example, see Integration-Server SMTP Notification Error Example. **Note:** For any notification-related troubleshooting, check the `integration-server log` file in addition to the log file of the service creating the notification.

Problem	Possible Causes	Solutions
I created a rule with an enrichment, added an SMTP notification, and deployed my rule. We are not receiving SMTP notifications. Why?	You do not have a template that met the criteria to parse the events.	Check the ESA Correlation service log files to see if the SMTP notification failed: `/var/log/netwitness/correlation-server/correlation-server.log`. For more details on the notification error, check the Integration-Server log file on the NetWitness Server (also known as Node 0, Admin server, or NWServer): `/var/log/netwitness/integration-server/integration-server.log`. If you use an ESA rule that has an enrichment, such as a Context Hub list, you must create a custom template. You can duplicate a default template and adjust it for your enrichment. See SMTP Notification Error Example below for a notification error example. For information on creating a custom ESA template, see "Define a Template for ESA Alert Notifications" in the *System Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
I created a custom rule (via the Rule Builder or Advanced EPL), and my rule is not firing. Why?	You may have connectivity issues.	Check the Offered Rate statistic on the  **(Configure) > ESA Rules > Services** tab. Select the ESA service and then look at the statistics on the tab for the Deployment. If the Offered Rate is zero, then the ESA service is not receiving data from Concentrators. Check the ESA Correlation log files for connectivity issues: `/var/log/netwitness/correlation-server/correlation-server.log`. If the offered rate is not zero, the meta key name and type used in the rule likely doesn't match the meta key present in events. Check to see if the meta key name and type used in the rule is valid by searching for the meta key name in  **(Configure) > ESA Rules > Settings** tab (Meta Key References).

Problem	Possible Causes	Solutions
I created a custom rule (via the Rule Builder or Advanced EPL), and my rule is not firing. Why?	There may be a problem with the rule.	**If a specific rule is not firing**, go to **(Configure) > ESA Rules > Services** to see if the rule was disabled. In the **Deployed Rule Stats** section, a rule that is disabled displays a clear enabled button (instead of the green enabled button). You can also check Events Matched field. Go to **(Configure) > ESA Rules > Services**. From there, you can see the number of events that were matched in the **Events Matched** column. If no events matched, check the logic of your rule for errors. For example, check the syntax for uppercase and lowercase errors, and check the time window. If the rule still doesn't fire, consider simplifying the logic of the rule to see if it fires when there is less complexity.
After a recent upgrade, I am not seeing alerts and I am seeing disabled rules.	There may be a problem with the ESA rule deployment.	Deploy the ESA rule deployments again. Create a Deployment steps in the Live Services Management Guide provides more information on deploying rules using the ESA Correlation service. If this does not resolve the issue, check the ESA Correlation log files for more information: `/var/log/netwitness/correlation-server/correlation-server.log`.
After an update or upgrade to 11.3.0.2 or later, if I try to make an adjustment to some rules, I get an error when trying to save them.	The Ignore Case option may be selected for a meta key that does not contain alphabetic values, such as IP address.	In NetWitness Platform 11.3.0.2 and later, the Ignore Case option has been removed from the ESA Rule Builder - Build a Statement dialog for meta keys that do not contain text values. Adding Ignore Case on meta keys which do not contain alphabetic values causes additional processing to occur for no added benefit. In the ESA Rule Builder - Build a Statement dialog, check to see if you have any meta keys that do not contain alphabetic characters, for example, ip_src and ip_dst. If you do, clear the **Ignore Case** checkbox for those meta keys and try to save the rule again.

Problem	Possible Causes	Solutions
After an upgrade to 11.3.0.2 or later, I see a warning message in the ESA Correlation service log file showing a difference between the multi-valued and default-multi-valued parameter meta key values. Why?	You do not have the required meta keys on ESA Correlation that the Endpoint, UEBA, and Live content rules need to work.	If you want to use the latest Endpoint, UEBA, and Live content rules, add the necessary meta keys to the `multi-valued` and `single-valued` parameter fields. For detailed information and instructions, see "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*. For example warning messages, see Example ESA Correlation Server Warning Message for Missing Meta Keys.
Meta keys marked as sensitive for data privacy are still included in notifications and alerts for some rules.	In ESA rules that do not select every piece of meta from the session (that is, using **`select *`**), you may see that data privacy (if enabled) and the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view does not work.	The following steps apply to all released versions of NetWitness 11.3 and later. In 11.4 and later, you do not need to follow these steps for data privacy. However, you need to follow these steps if you want to enable the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view. 1. Add the ESA generated `event_source_id` meta key to the `index-concentrator-custom.xml` file. 2. Add the `event_source_id` meta key to the SELECT statement within any ESA rule that does not select every piece of metadata from the session. 3. After the Concentrator changes take effect, redeploy the ESA rule deployment that contains the ESA rule. To do this, see Update any ESA Rule that Selects Only Certain Meta Keys from the Session to Include event_source_id. For NetWitness 11.4 and later, to resolve the data privacy issue, see How to Remove Sensitive Meta Keys Globally from All Alerts.

Problem	Possible Causes	Solutions
The **Pivot to Investigate > Navigate** link does not work in a context tooltip accessed from Respond.	In ESA rules that do not select every piece of meta from the session (that is, using `select *`), you may see that data privacy (if enabled) and the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view does not work.	For NetWitness 11.3 and later (including 11.4), see Update any ESA Rule that Selects Only Certain Meta Keys from the Session to Include event_source_id.
I added a data source filter to the data sources in my ESA rule deployment. It was working fine and then all of a sudden, I stopped receiving alerts.	If there are any adjustments to an application rule on the Decoders that are mapped to the data sources used in your data source filter, the filter does not work for that rule since the application rule used in the filter no longer exists.	The optional data source filter is available in NetWitness 11.5 and later. If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed.
I added a data source filter to the data sources in my ESA rule deployment and I see an "Invalid header size" error while communicating with Core services in the ESA Correlation log file.	You are filtering out a large portion of the traffic and less sessions match the aggregation criteria.	In the Explore view node list for an ESA Correlation service, select **correlation > stream**. Decrease the `max-sessions` parameter from 10,000 to a lower session count and restart the ESA Correlation service. For step-by-step instructions, see .
I created a rule using a Context Hub list and it was working properly, but suddenly, the rule stopped firing and ESA is not processing any rules.	If a Context Hub list that is used by ESA Correlation is renamed or deleted, ESA will not be able to access the list and may halt processing for all rules.	Do not rename or delete a Context Hub list that is used in a deployed ESA rule. ESA Correlation will also not be able to access a Context Hub list if you delete it and then add it again with the same name while the rule is deployed. If you rename a Context Hub list or recreate the Context Hub list with the same name, update the ESA rules that use that Context Hub list, and then redeploy the ESA rule deployments that contain those rules.

SMTP Notification Error Example

The following SMTP notification error example is an excerpt from a `correlation-server.log` file, which shows an error message for sending notifications with unsupported templates. In this example, there is a rule that is configured with the GeoIP enrichment, which has a hash table as one of its fields (the GeoIPLookup meta). Because the default SMTP template is only designed to deal with metas that are either singular values or arrays that contain only singular values, such as `"ip.src":"1.1.1.1"` and `"action":["fw:inbound-network-traffic"]`, sending the email notification fails due to the array containing a hash table.

```
FTL stack trace ("~" means nesting-related):

- Failed at: ${value!""} [in template "smtp.ftl" in macro "value_of" at line
1, column 152]

- Reached through: @value_of metadata[key] [in template "smtp.ftl" at line 85,
column 141]

----

...

For "${...}" content: Expected a string or something automatically convertible
to string (number, date or boolean), or "template output" , but this has
evaluated to an extended_hash (LinkedHashMap wrapped into
f.t.DefaultMapAdapter):

==> value!"" [in template "smtp.ftl" at line 1, column 154]
```

Integration-Server SMTP Notification Error Example

The following SMTP notification error example is an excerpt from an `integration-server.log` file, which shows a failure when the Integration-server attempts to send an email notification to the email notification server. In this case, you should check the email notification server configuration in the Global Notifications settings (**(Admin) > System > Global Notifications > Servers** tab).

```
2019-10-09 18:53:42,015 [-SMTP-5c45c867e4b03b89a49b78ba] WARN
Notification|SMTP dispatch failed (Reason: Sending the email to the following
server failed : email.server.com:25)

2019-10-09 18:53:42,100 [-SMTP-5c45c867e4b03b89a49b78ba] WARN
SystemOperation|Failed to forward ResolvedNotification
{server=5c45c867e4b03b89a49b78ba, destination=5c45c854e4b03b89a49b78b9,
content-length=30681}

java.lang.IllegalArgumentException: org.apache.commons.mail.EmailException:
Sending the email to the following server failed : email.server.com:25
```

Example ESA Correlation Server Warning Message for Missing Meta Keys

If you see a warning message in the ESA Correlation server error logs for missing multi-valued meta keys, there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, and the new Endpoint, UEBA, and Live content rules will not work. The same is true for missing single-valued meta keys. Completing the "Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules" procedure in the *ESA Configuration Guide* should fix the issue.

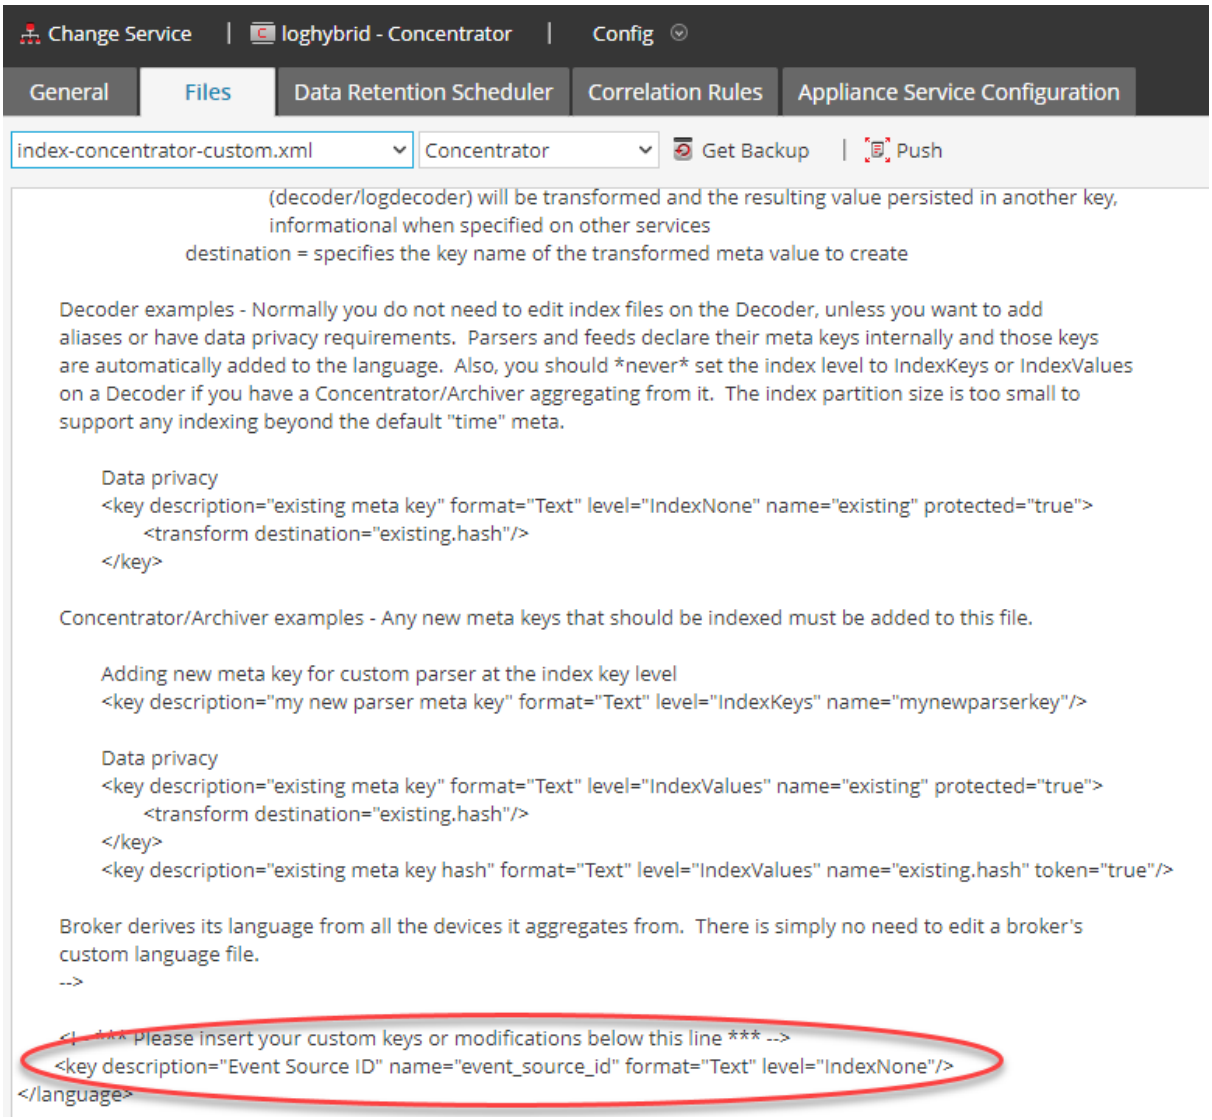
Multi-Valued Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[alert, alert_id,
browserprint, cert_thumbprint, checksum, checksum_all, checksum_dst,
checksum_src, client_all, content, context, context_all, context_dst,
context_src, dir_path, dir_path_dst, dir_path_src, directory,
directory_all, directory_dst, directory_src, email_dst, email_src,
feed_category, feed_desc, feed_name, file_cat, file_cat_dst, file_cat_
src, filename_dst, filename_src, filter, function, host_all, host_dst,
host_orig, host_src, host_state, ip_orig, ipv6_orig, OS, param, param_
dst, param_src, registry_key, registry_value, risk, risk_info, risk_
suspicious, risk_warning, threat_category, threat_desc, threat_source,
user_agent] are still MISSING from multi-valued
```

Single Value Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[accesses, context_
target, file_attributes, logon_type_desc, packets] are still MISSING
from single-valued
```

Update any ESA Rule that Selects Only Certain Meta Keys from the Session to Include event_source_id



In ESA rules that do not select every piece of meta from the session (that is, using **`select *`**), you may see that data privacy (if enabled) and the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view does not work.

The following steps apply to all released versions of NetWitness 11.3 and later. In 11.4 and later, you do not need to follow these steps for data privacy, instead, see How to Remove Sensitive Meta Keys Globally from All Alerts. However, you need to follow these steps if you want to enable the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view.

Note: Do not use any Esper keyword as custom meta keys since this causes an error while creating an ESA Rule. For Esper keywords, see Reserved keywords.

1. Update the **`index-concentrator-custom.xml`** file to include the ESA generated **`event_source_id`** meta key. If you do not add the meta key, ESA cannot recognize it and the rule will fail to deploy.
   The following figure shows the file configured for the custom meta key "**`Event Source ID`**" with index settings of "**`IndexNone`**" with a format of "**`Text`**".

   <key description="Event Source ID" name="event_source_id" format="Text" level="IndexNone"/>

To save and deploy the new setting on the NetWitness host, select the **Apply** button. To force the change, restart the Concentrator service or you can wait until the next polling interval for the change to be recognized.

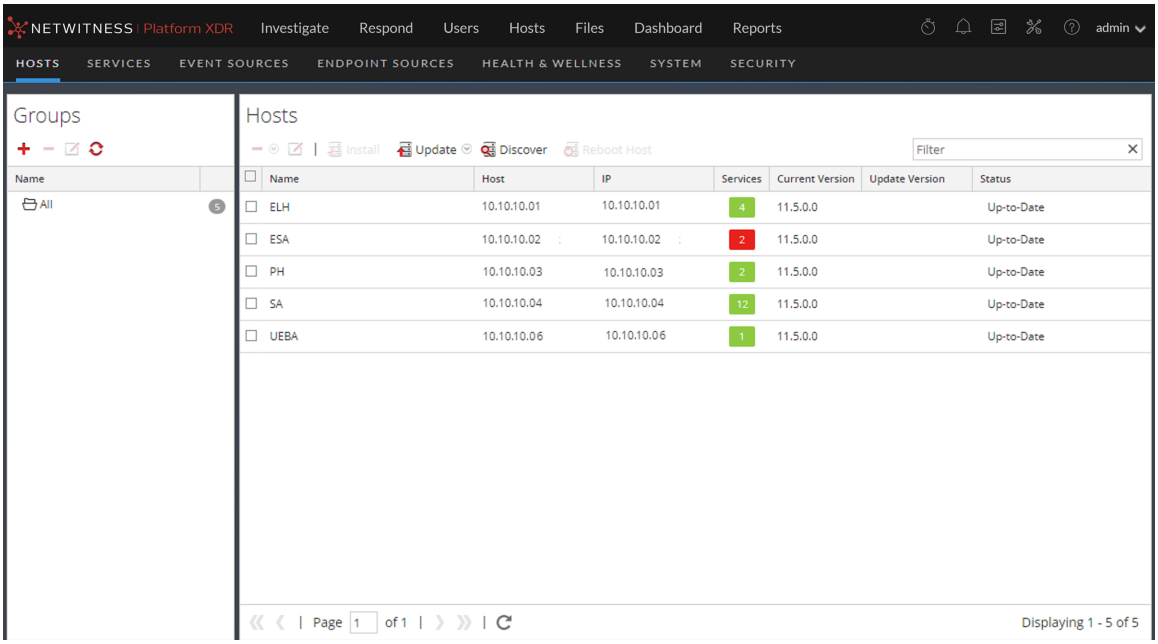
The XML file can also be deployed to other NetWitness hosts by clicking the **Push** button and selecting the destination NetWitness host. Only deploy the XML file to a NetWitness host that runs that service (that is, other Concentrators).

2. Update any ESA rule that selects only certain meta from the session to include the ESA generated **`event_source_id`** meta key. Add the **`event_source_id`** meta key to the **`SELECT`** statement. See the following example rule.

Example Rule with event_source_id

```
@RSAAlert
SELECT user_dst, reference_id, hostname, event_source_id FROM
Event(
```

```
device_class='Windows Hosts',
reference_id IN ('4624' , '4625'),
user_dst IS NOT NULL,
user_dst NOT LIKE '%$',
user_dst NOT IN ('ANONYMOUS LOGON','SYSTEM')
)
.win:time_batch(10 Minutes)
GROUP BY user_dst
HAVING COUNT(distinct hostname) >= 15;
```



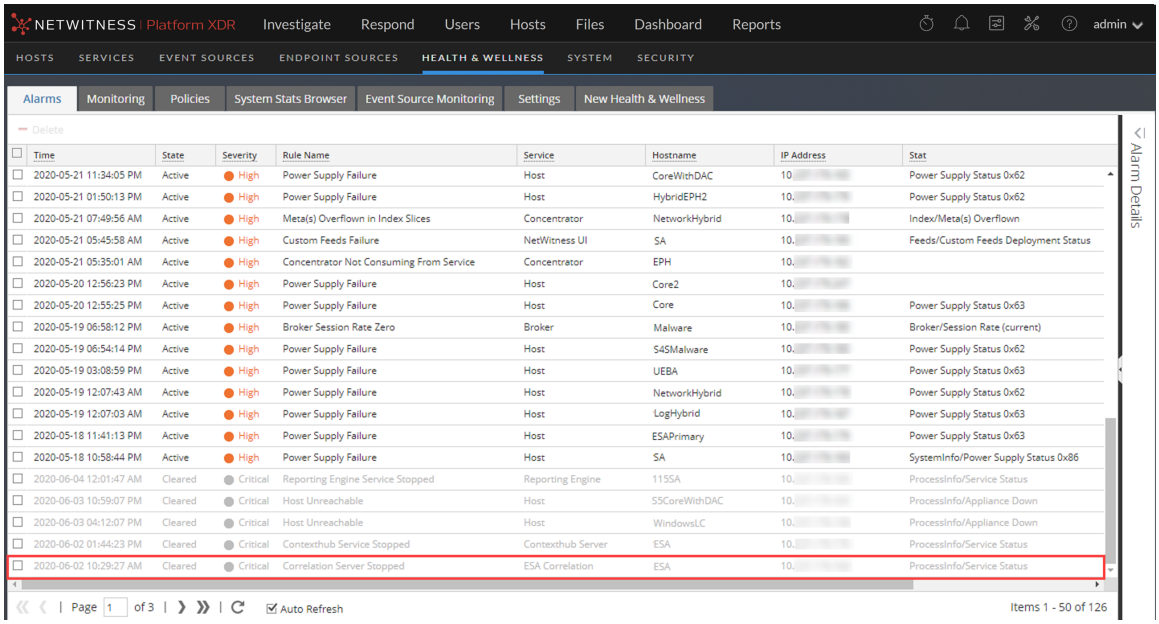
3. After the Concentrator changes takes effect, redeploy the ESA rule deployment that contains the ESA rule.

For additional information, see How ESA Handles Sensitive Data. For information on the stragegy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

Steps to Troubleshoot Memory Issues with an ESA Service Offline

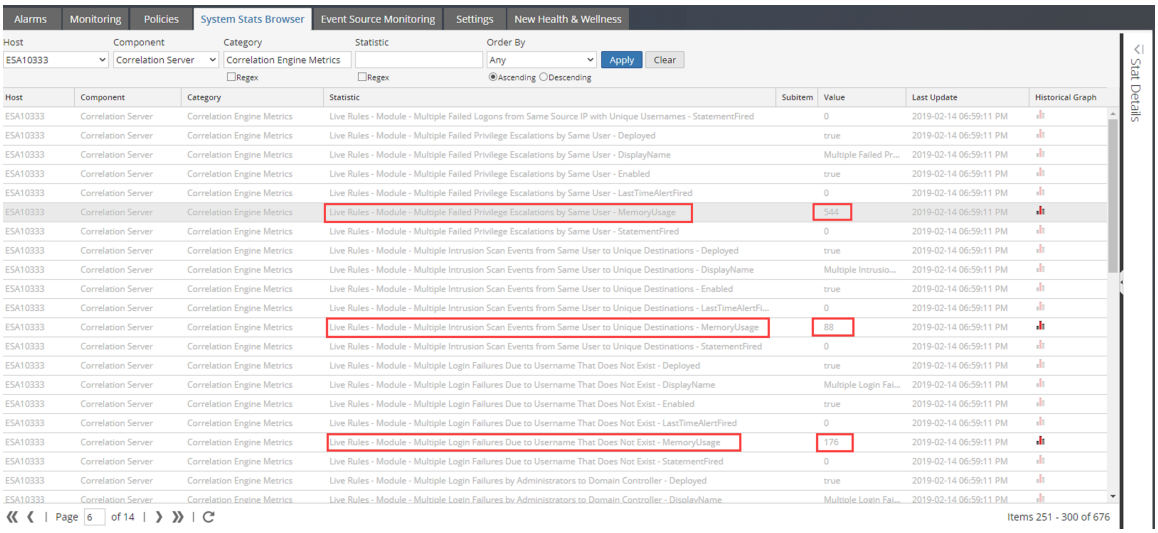
Step 1: Verify that your Host Is Running

The first step to troubleshooting is to ensure that your host is running. To do this, go to  **(Admin) > Hosts**. If the host is down, the system parameters will not display (updating host information can sometimes be delayed), the **Services** display in red, and you may see an error message.



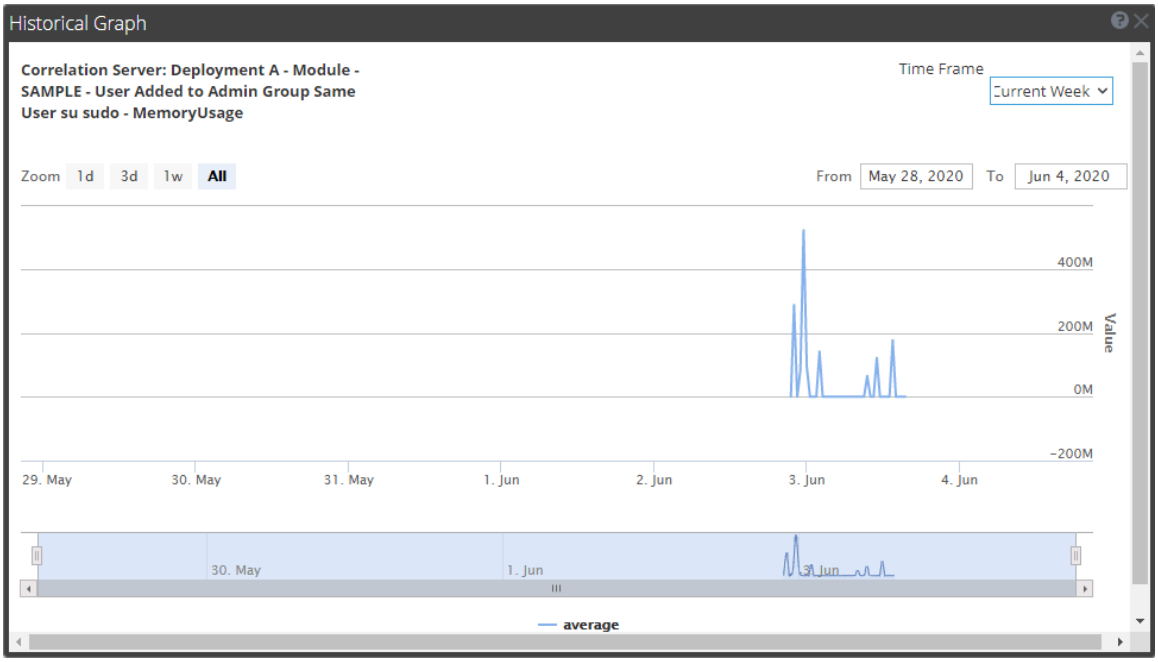
If your host is down, contact your NetWitness Administrator to restart it. Otherwise, go to Step 2.

Step 2: View Detailed Statistics in Health & Wellness



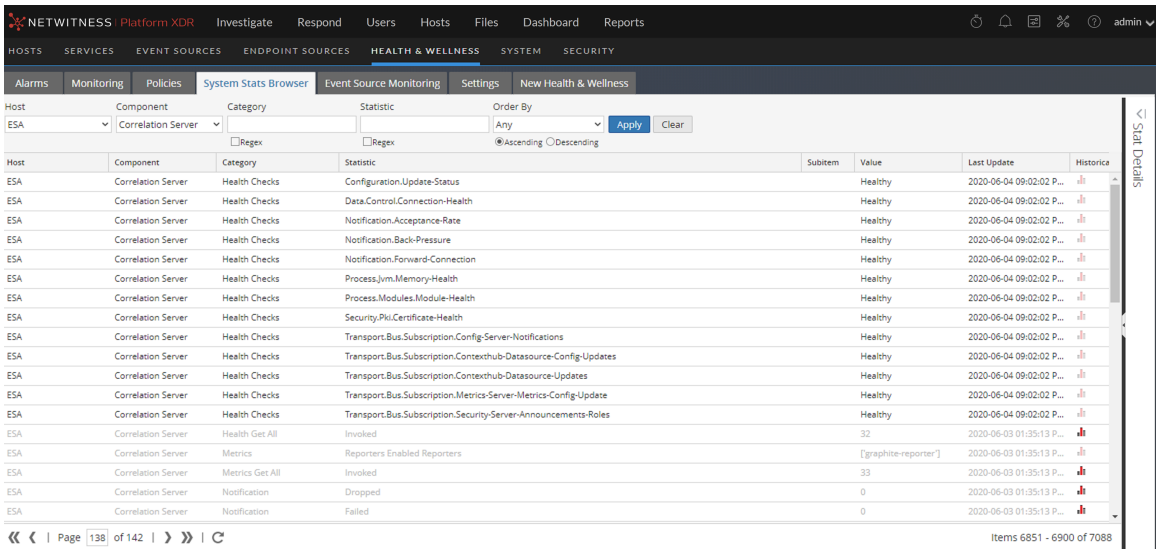
If your ESA service is down, you can go to Health & Wellness and view the **last known metrics** to see where potential issues are occurring. The most common problem is that your ESA service is exceeding memory thresholds, which causes it to stop or fail. In NetWitness 11.5 and later, see also View Health Statistics and Trends for ESA Correlation in New Health & Wellness.

1. Go to **(Admin) > Health & Wellness > Alarms** to see if the ESA triggered any alarms. Look for the following alarms for ESA Correlation:
   - Correlation Server in Critical State
   - Correlation Server in Unhealthy State
   - Correlation Server Stopped



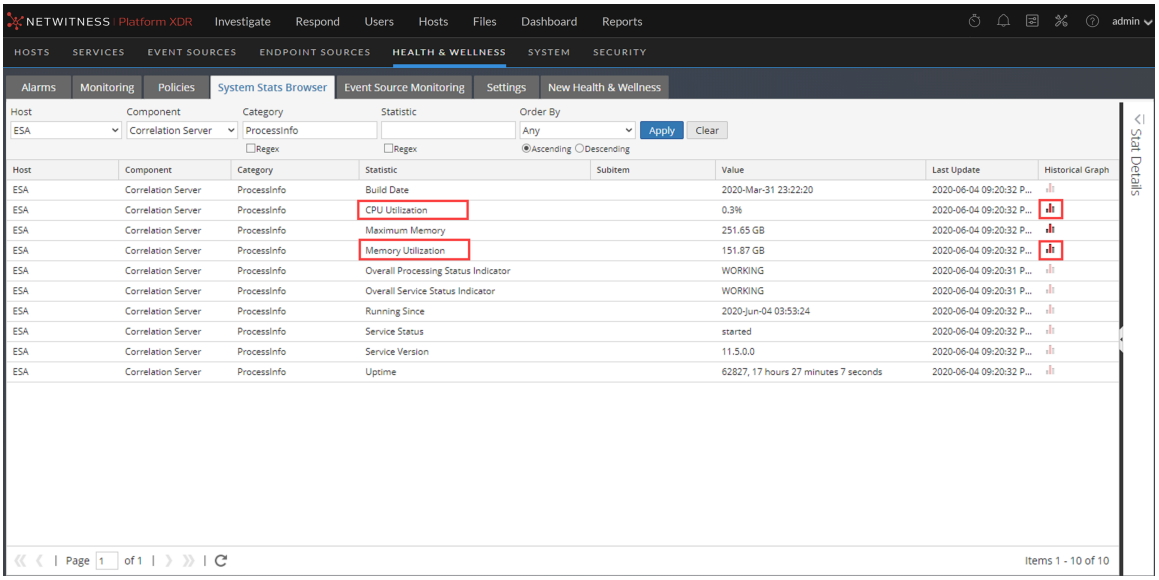
2. Go to **(Admin) > Health & Wellness > System Stats Browser** to see the memory metrics for each rule's performance. To view the metrics, enter the following and click **Apply**:

Host	Component	Category
<your host>	Correlation Server	Correlation Engine Metrics



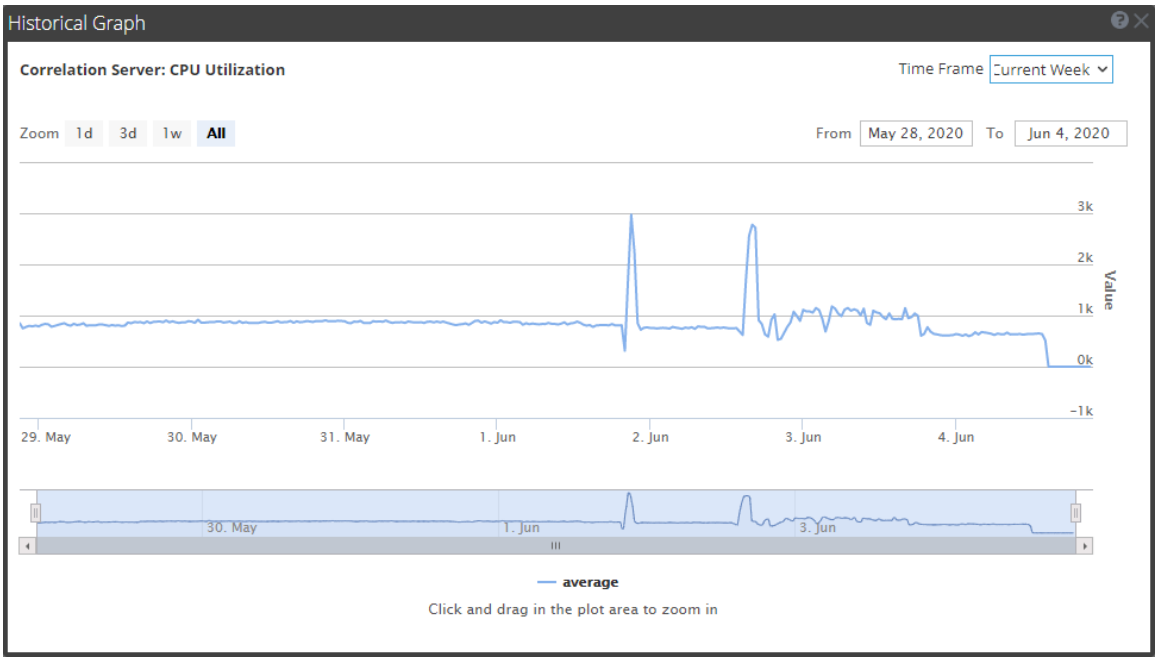
The name of the rule is in the **Statistic** column and the memory usage in bytes is in the **Value** column.

3. Click  to view a historical view of memory usage for the rule in the **Historical Graph** column.



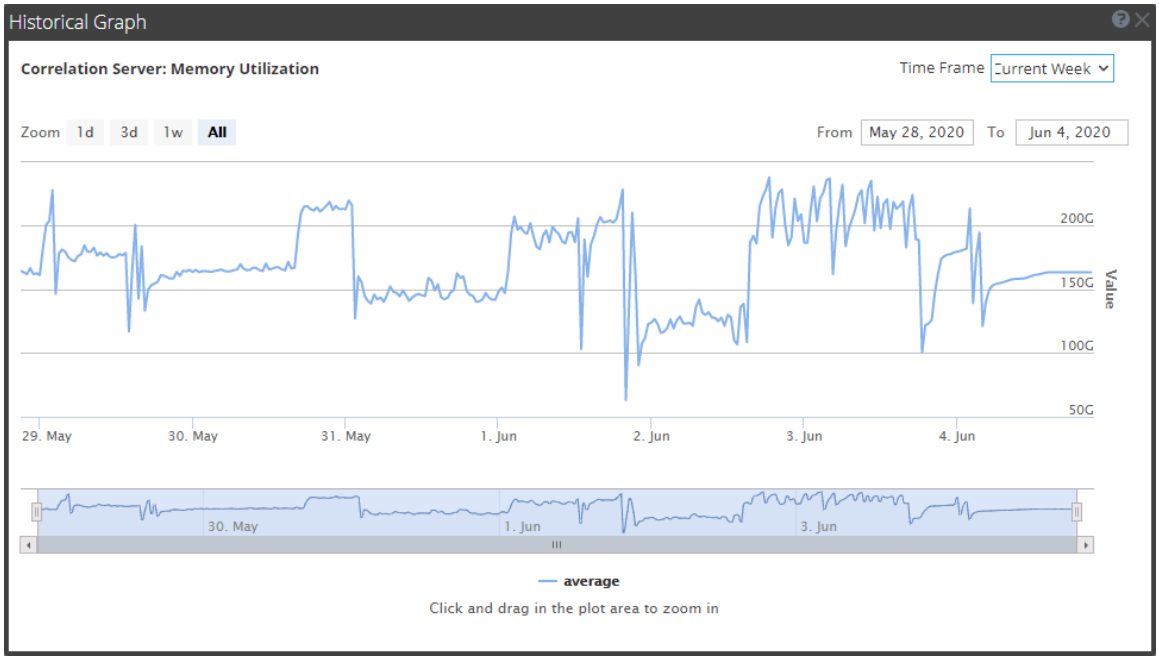
4. In the **System Stats Browser**, you can also see details of your ESA Correlation service performance.

Select your host, and use the following filters to view the following statistics:



Host	Component	Category	Statistic	Example
<your host>	Host	SystemInfo	CPU Utilization	49.74%
<your host>	Host	SystemInfo	Memory Utilization	72.87%
<your host>	Host	SystemInfo	Used Memory	183.14 GB
<your host>	Host	SystemInfo	Total Memory	251.65 GB
<your host>	Host	SystemInfo	Uptime	289546, 3 days 8 hours 25 minutes 46 seconds
<your host>	Correlation Server	Process jvm	Memory Total Max	163 GB
<your host>	Correlation Server	Process jvm	Memory Total Used	13.50 GB
<your host>	Correlation Server	ProcessInfo	CPU Utilization	0.3%
<your host>	Correlation Server	ProcessInfo	Maximum Memory	251.65 GB
<your host>	Correlation Server	ProcessInfo	Memory Utilization	151.87 GB

The following figure shows the location of the ESA Correlation service CPU and Memory Utilization statistics.



5. Click  to view a historical view of CPU and memory utilization.

   The following figure shows the historical graph of **CPU utilization**.

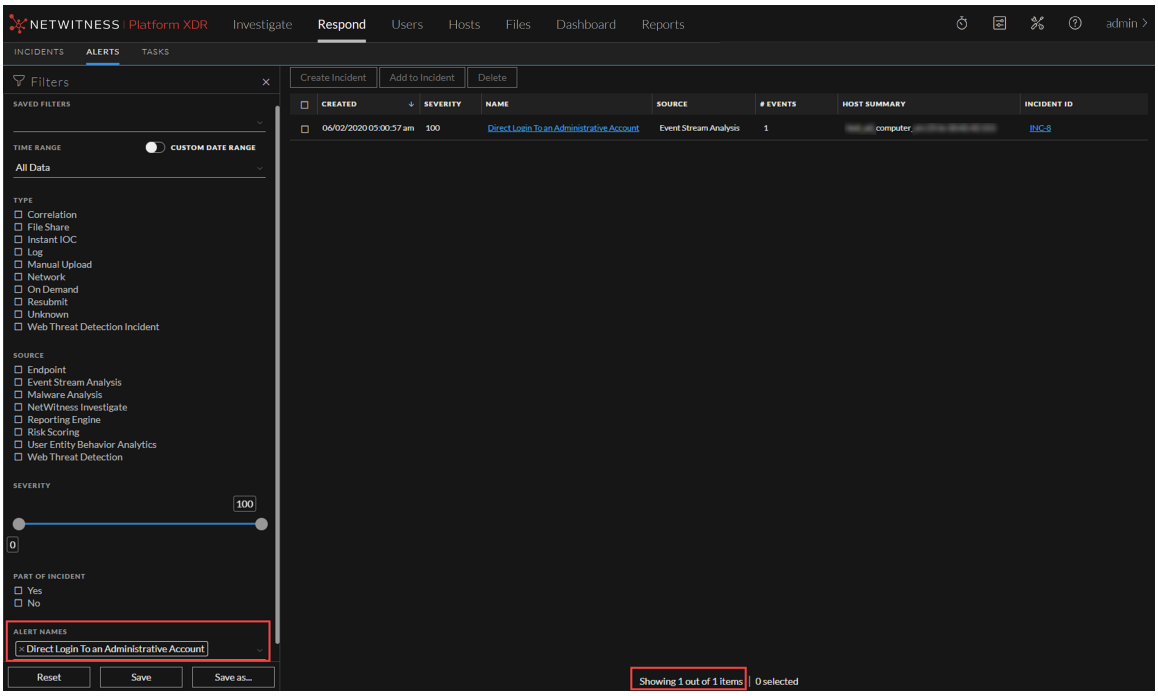
The following figure shows the historical graph of **Memory Utilization**.

If you are having a problem with memory or CPU utilization, continue to step 3.

Step 3: Bring up your ESA Services

1. Go to **(Admin) > Services**, select your ESA service, and then select **> Start**.
2. Return to the ESA Service to troubleshoot which rules have created memory issues.

If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.

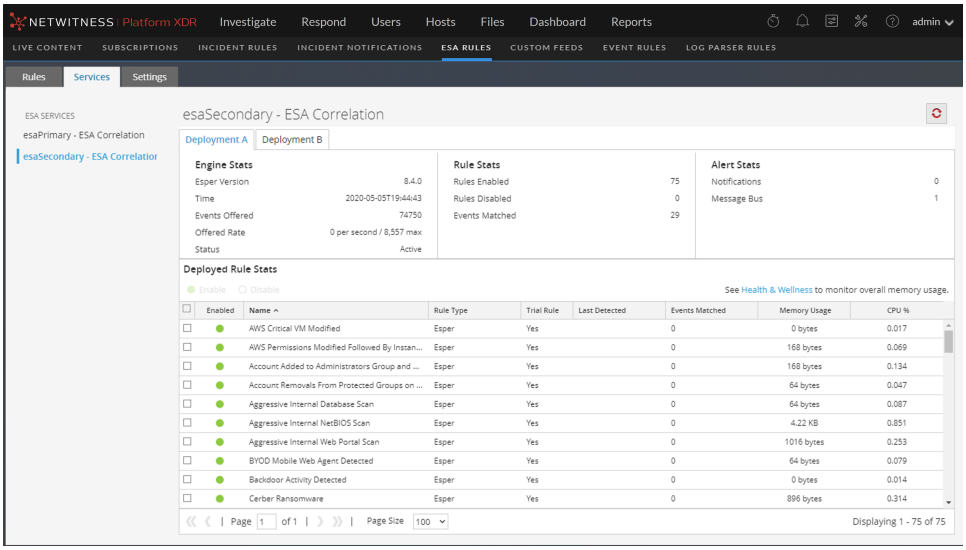


If you are able to start your ESA service without a shutdown, continue to step 4.

Step 4: Check the Alerts and Events Volume

After you are able to restart your ESA service without an immediate shutdown, you can review the stats for your rules to see which rules are consuming too many resources. Sometimes, ESA services fail because a rule is generating too many alerts or a rule is matching too many events. Check for both of these issues if you have determined that memory usage is causing your ESA service to shut down.

View Alert Summaries



Rules that generate a high volume of alerts can overwhelm the system and cause it to fail or restart. To view the alert summaries, go to **Respond > Alerts**. In the **Filters** panel on the left, in the **Alert Names** section, select the alert name for the rule. The number of alerts with that name appears at the bottom of the Alerts list results. If the number is significantly high for a particular rule, you need to disable the rule and rewrite it to be more efficient.

To clear your filter, click **Reset**.

View Events Matched

Sometimes a rule matches too many events, which can use up excessive memory. This typically occurs if you create a large event window where a great number of events accumulate without triggering an alert. This is a problem because each event is stored in memory while the rule waits for the alert to trigger. To check for this issue, go to **(Configure) > ESA Rules > Services**. From there, you can see the number of events that were matched in the **Events Matched** column for the deployment. If a high number of events were matched for a given rule, you can investigate the rule further to see if you can make it more efficient.

Step 5: Disable and Repair the Rule that Caused Issues

Once you have determined the rules that need to be rewritten, disable them and rewrite rules so that they don't generate such a high volume of alerts or events. For pointers on how to write more efficient rules, see Best Practices.

Disable Rules

1. To disable rules, go to **(Configure) > ESA Rules > Services**, and select the rules you want to disable in the **Deployed Rules Stats** field.
2. Select **Disable** to disable the rules.

Edit Rules

1. To repair the rules, go to **(Configure) > ESA Rules > Rules tab > Rule Library**.
2. For each rule that you repair, do the following:
   a. Select the rule to edit and then select **> Edit**.
   b. Edit the rule to be more efficient. For instructions on creating rules, see Add Rules to the Rule Library
   c. When you are satisfied with your rule, you can save the rule as a trial rule to ensure that any memory issues do not affect ESA services performance. To do this, follow the steps listed in Working with Trial Rules.

Deploy Rules

To deploy rules, see topic Create a Deployment in the *Live Services Management Guide*.

Verify that the Rules are Enabled

After you deploy the ESA rules, they should automatically show as enabled. If not, you can enable the rules.

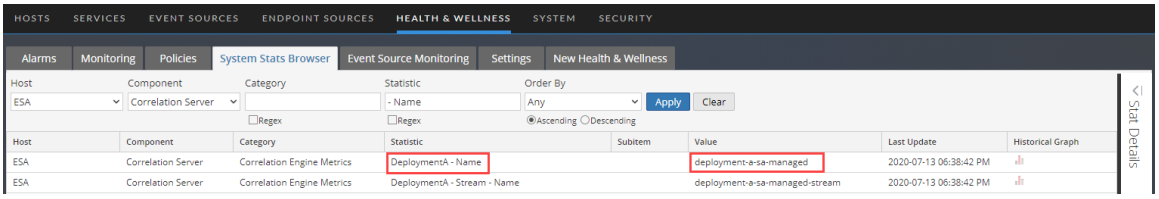
1. Go to **(Configure) > ESA Rules > Services** tab, and select the ESA service in the options panel.
2. On the deployment tab for the deployment that contains the rules, in the Deployed Rule Stats section, look at the status of the rules in the Enable column. Enabled rules show a green circle. If the rules show a white circle, you can enable the rules.
3. To enable rules, select the rules you want to enable and select **Enable** above the table.

(Optional) Check the ESA Correlation Log Files for More Information

Once you verify that your services are down and some potential causes for the system going down, check to see if the service is stopping and restarting in a loop. To do this, go to the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.

ESA Rule Troubleshooting with Nw-Shell

Note: This procedure applies to NetWitness Platform 11.3 and later versions.



The ESA Correlation service replaces the Event Stream Analysis service in NetWitness version 11.3 and later. As a result of this change, some settings are no longer available in the user interface. In addition to the standard troubleshooting methods available, you can use the **nw-shell** utility to perform advanced troubleshooting of the ESA Correlation service and rules. For detailed information on the nw-shell utility, see the *NetWitness Shell User Guide*.

- Find Your Engine Name for Nw-Shell
- Connect to an ESA Correlation Server
- View the Contents of a Named Window
- See the Method Input and Output

Find Your Engine Name for Nw-Shell

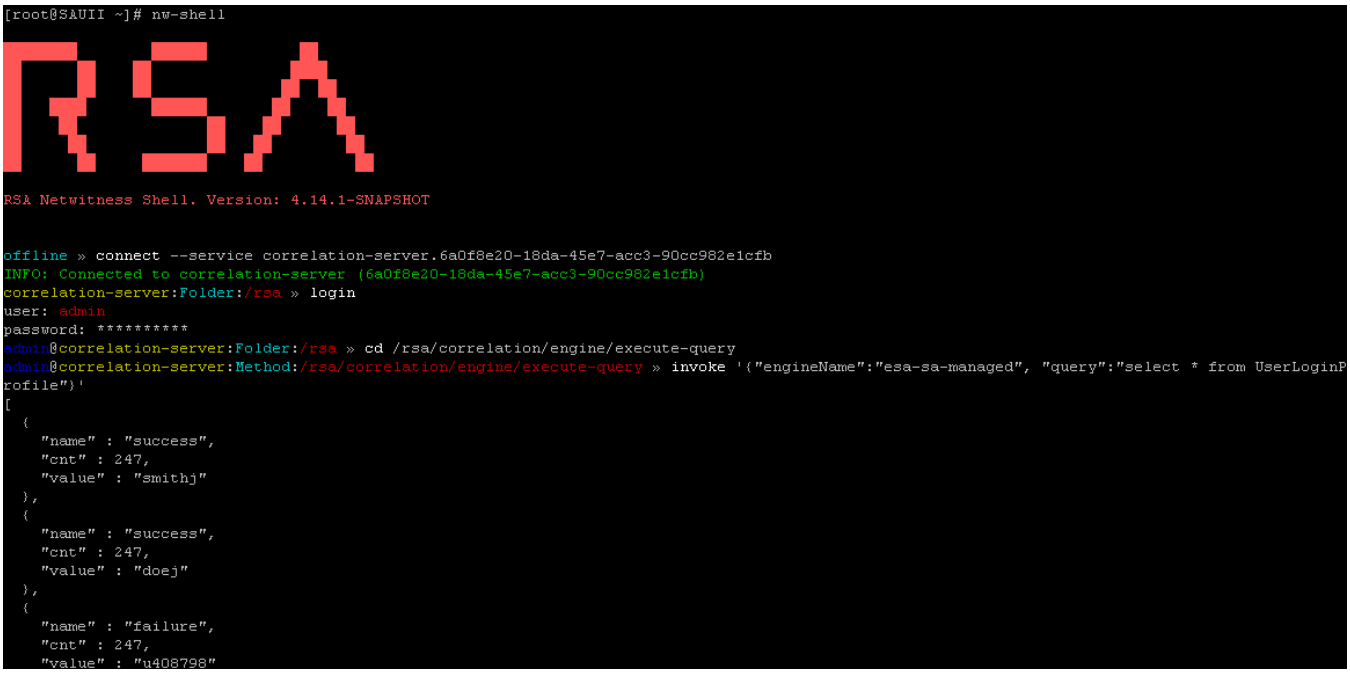
Follow these steps to find your engine name using your ESA rule deployment name. Your engine name is required for ESA Nw-Shell troubleshooting. Locate the names of each deployment that you plan to troubleshoot.

1. In the NetWitness UI, go to **(Admin) > Health & Wellness > System Stats Browser**.
2. In the System Stats Browser, use the following filters and then click **Apply**.
   a. **Host**: Select your ESA host.
   b. **Component**: Select **Correlation Server**.
   c. **Statistic**: Type **- Name** (put a space between the dash and name).
3. In the **Statistic** column, locate your deployment followed by **- Name**. The name in the **Value** field is `YOUR ENGINE NAME`.

In the above example, the deployment name is DeploymentA and the engine name is `deployment-a-sa-managed`.

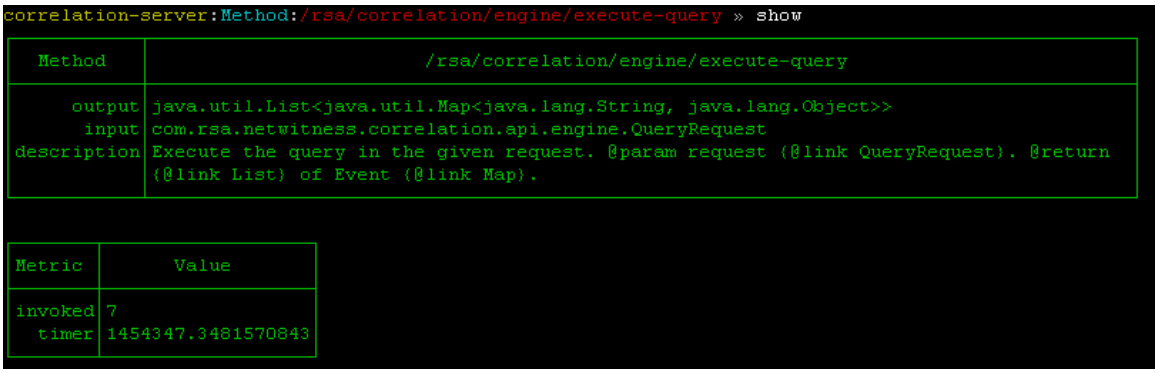
Connect to an ESA Correlation Server

1. Log in to nw-shell:
   a. Connect via SSH to the NW server (head unit).
   b. After logging in and getting the command prompt, type `nw-shell`.
2. Connect to ESA:
   a. Go to your ESA physical host and type the command:
   `cat /etc/netwitness/correlation-server/service-id`
   b. Go back to the NW server and nw-shell and connect to the correlation server:
   `connect --service correlation-server.ID`
3. Log in to ESA with the admin user credentials.
   a. Type `login`.
   b. Enter the username and password of the admin user.



View the Contents of a Named Window

Use the execute-query method to view the contents of a named window.



1. After you are connected to the ESA correlation service and authenticated, type:
   `cd /rsa/correlation/engine/execute-query`
2. Type `invoke '{"engineName":"<YOUR ENGINE NAME>", "query":"<YOUR QUERY>"}`
   - Where `<YOUR ENGINE NAME>` = the engine name that you located in Find Your Engine Name for Nw-Shell.
   - Where `<YOUR QUERY>` = the select statement into the named window.

Example: `invoke '{"engineName":"esa-sa-managed", "query":"select * from UserLoginProfile"}'`

See the Method Input and Output

Type `show` at the command line to see the input and output expected. All method invocation must be prefaced by `invoke`.

Obtain Correlation Server Metrics for ESA Rule Deployment Troubleshooting Using Nw-Shell

Note: This procedure is available in NetWitness Platform version 11.4.1 and later.

You can use Nw-Shell to view ESA Correlation Server metrics for each of your ESA rule deployments. These metrics show the number of sessions behind for the deployment data sources as well as the memory usage for the rules in the deployment.

1. Find the engine name to use for Nw-Shell. See Find Your Engine Name for Nw-Shell.
2. Connect to an ESA Correlation Server. See Connect to an ESA Correlation Server.
3. After you are connected to the ESA correlation service and authenticated, type:
   `cd /rsa/correlation/service/stats/get-condensed-metrics`
4. Type `invoke '<YOUR ENGINE NAME>'`
   Where `<YOUR ENGINE NAME>` is the engine name that you located in Find Your Engine Name for Nw-Shell.

Here is an example of the metrics output that you can obtain for your ESA rule deployment:

```
{
  "engineName" : "esa",
  "eventsOffered" : 1650,
  "maxEventsRate" : 2.337019271237945,
  "eventsRate" : {
    "count" : 1650,
    "oneSecRate" : 0.02129597415982235,
    "meanRate" : 0.05795554387594279,
    "oneMinuteRate" : 0.15485195471608212,
    "fiveMinuteRate" : 0.12419048320215775,
    "fifteenMinuteRate" : 0.11923922260543295
  },
  "streamMetrics" : {
    "pollingRate" : {
      "count" : 30100,
      "meanRate" : 1.0572440914676082,
      "oneMinuteRate" : 1.1497867142612552,
      "fiveMinuteRate" : 1.1213207743063618,
      "fifteenMinuteRate" : 1.1178158863433476
    },

      "alertsFired" : 0
    }
  ]
}
```

View Memory Metrics for Rules

This topic tells ESA rule writers how to view memory metrics for an ESA Correlation service and its associated ESA rules. You can see estimated memory usage for each rule running on a server, and you can use this information to modify your rule statements and conditions if they use too much memory.

Rules can sometimes consume more memory than you expect, causing ESA to slow down or stop. To see approximately how much memory a rule is using, you can view estimated memory usage for each rule in the Health & Wellness System Stats browser (you need permissions to access this module). You can use this information to modify your rules to be more efficient.

At a high level, you need to complete the following steps to use memory metrics to troubleshoot memory usage for rules:

1. Ensure you have the correct permissions to view the Health & Wellness module. For information on roles and permissions, see ESA Permissions.
2. View the memory statistics in Health & Wellness.
3. (Recommended) Configure Health & Wellness ESA policies to send an email if memory thresholds are exceeded. See "Manage Policies" in the *System Maintenance Guide* for instructions on sending email notifications.
4. Use the memory metrics data to modify rules to be more efficient, if necessary.

Note: You can also view memory metrics for ESA rules in the  **(Configure) > ESA Rules > Services** tab. See View Stats for an ESA Service.

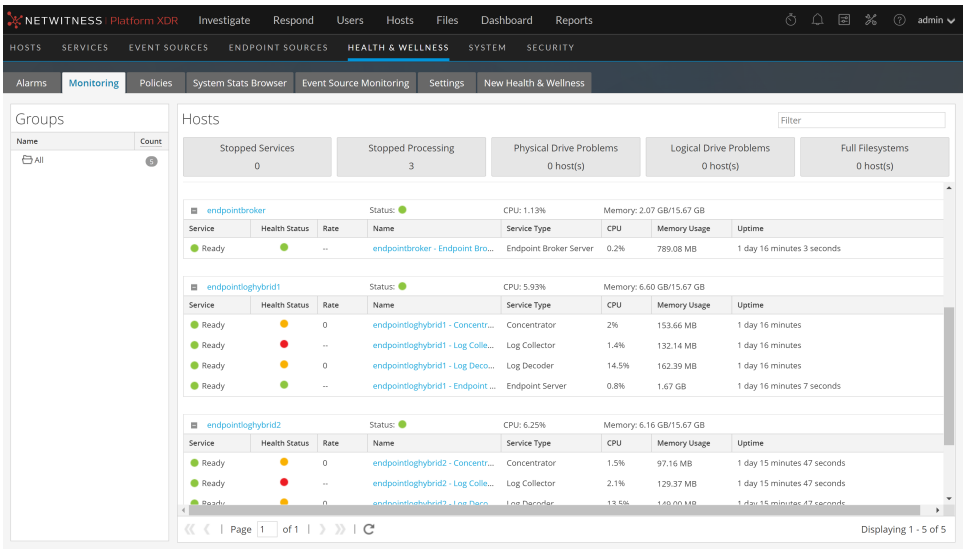
Prerequisites

The following are requirements for using memory metrics:

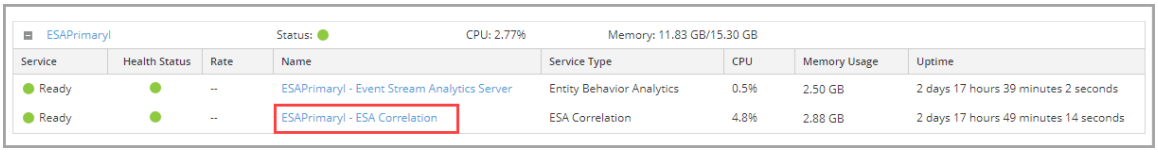
- You must have the appropriate permissions to view Health & Wellness statistics.
- (Recommended) Configure the ESA Health & Wellness policy to send an email when memory thresholds are exceeded.

Note: Memory Metrics is always on for the ESA Correlation service; you do not have to enable it.

View Health Statistics and Trends for ESA Correlation in New Health & Wellness

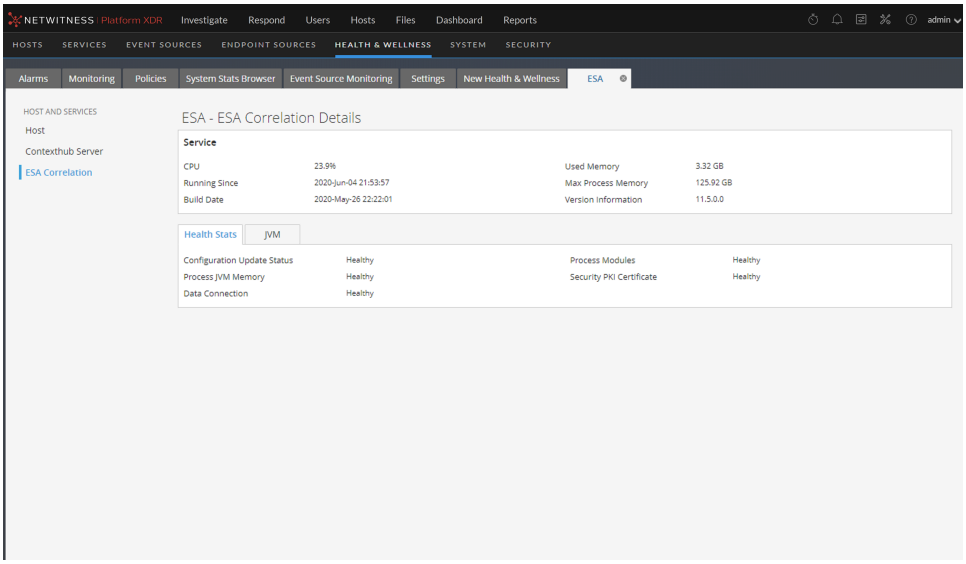


In NetWitness version 11.5 and later, New Health & Wellness provides improved and intuitive dashboards, monitors, and visualizations. The ESA Correlation Overview dashboard provides health statistics and trends on ESA rule deployments.

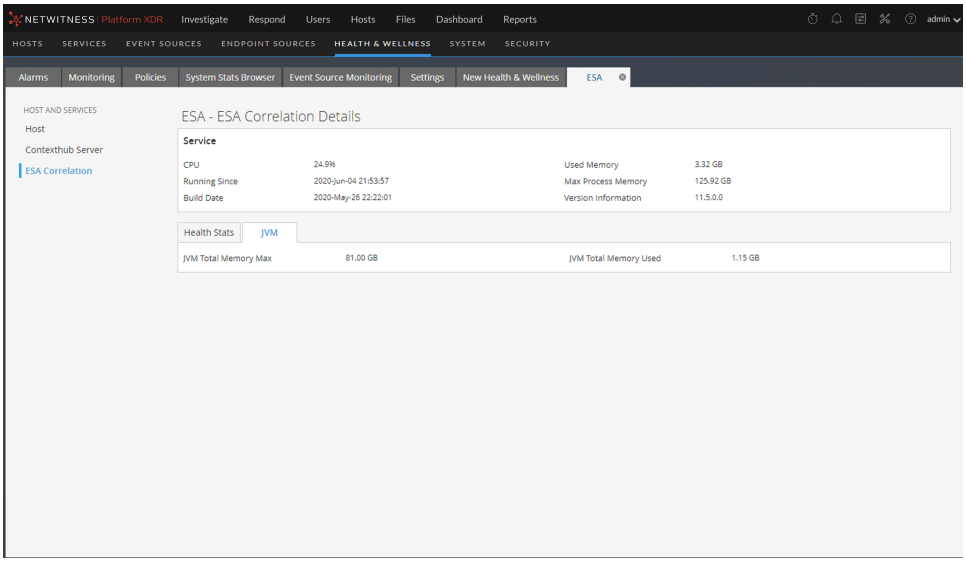


For more information, see "Monitor New Health and Wellness" and "Appendix A: New Health and Wellness Dashboards / ESA Correlation Overview Dashboard" in the *System Maintenance Guide*.

View Memory Metrics for an ESA Correlation Service in Health & Wellness



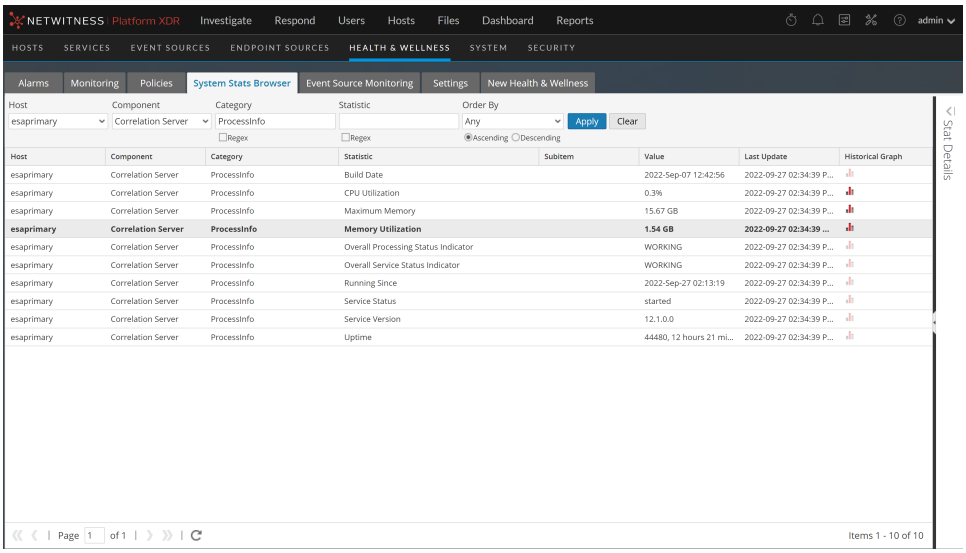
1. Go to **(Admin) > Health & Wellness > Monitoring** tab.



2. Locate your host and click the link in the **Name** field for your ESA Correlation service, for example, ESA- ESA Correlation.

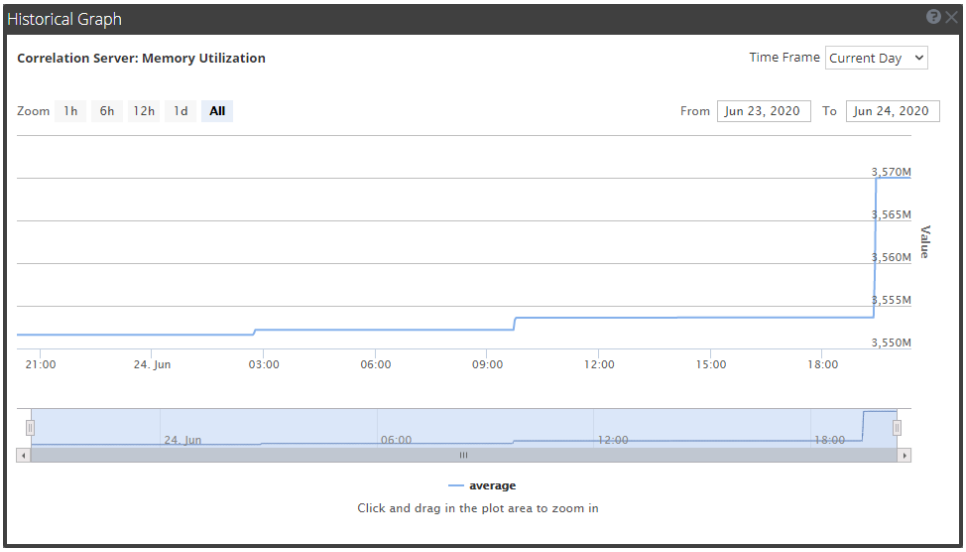
3. On the tab for your ESA host, click the **Health Stats** tab.
   You can view the health status of the ESA Correlation service.

4. Click the **JVM** tab.
   You can view the JVM total memory used by the selected ESA Correlation service.



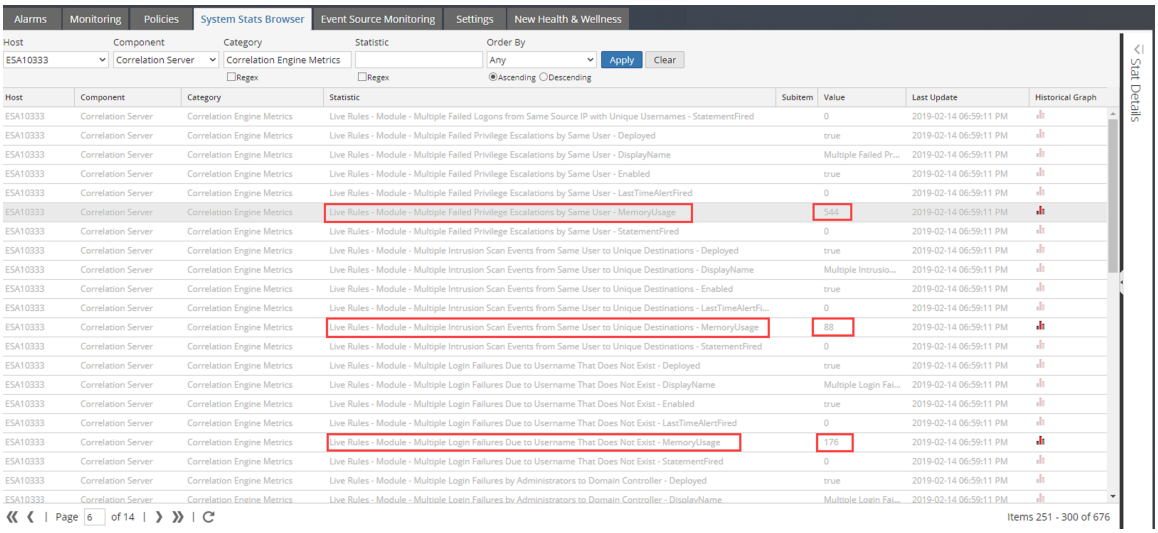
Note: You can also view memory metrics for the ESA Correlation service in the **(Configure) > ESA Rules > Services** tab. See View Stats for an ESA Service.

View Memory Metrics for an ESA Correlation Service and its ESA Rules



1. Go to  **(Admin) > Health & Wellness > System Stats Browser**.
2. To view memory metrics for an ESA Correlation service, in the **Host** field, select your ESA host. Select **Correlation Server** for **Component**, enter **ProcessInfo** for **Category**, and then click **Apply**.

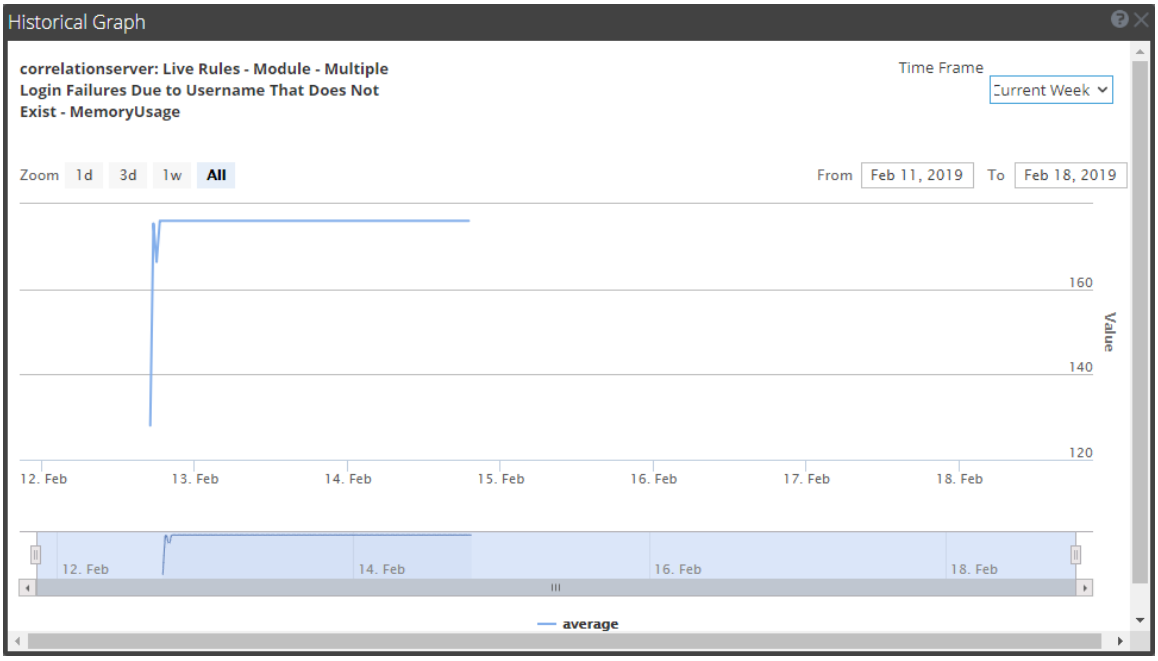
Host	Component	Category
<your host>	Correlation Server	ProcessInfo



The **Memory Utilization** statistic shows the total memory in use by the ESA Correlation service.

3. To view the historical memory usage for the ESA Correlation service, click the **Historical Graph** icon.

4. To view the memory metrics for individual rules, in the **Category** field, enter **Correlation Engine Metrics** and click **Apply**.



Host	Component	Category
<your host>	Correlation Server	Correlation Engine Metrics

The name of the rule is in the **Statistic** column appended with **MemoryUsage** and the memory usage in bytes is in the **Value** column.

Note: The **Last Update** field reflects when Health & Wellness polls ESA. However, the Memory Metrics is not synchronized with the Health & Wellness polling. For example, if the memory threshold is exceeded on 2/10/19 at 12 p.m., but Health & Wellness polls at 2/10/19 at 12:10 p.m., the **Last Update** field will display a timestamp of 2/10/19 12:10 p.m.

5. Click  to view a historical view of memory usage for the rule in the **Historical Graph** column.

Note: You can also view memory metrics for ESA rules in the  **(Configure) > ESA Rules > Services** tab. See View Stats for an ESA Service.

How ESA Handles Sensitive Data

This topic explains how ESA treats sensitive data, such as usernames or IP address, that it receives from Core services. The Data Privacy Officer (DPO) role can identify meta keys that contain sensitive data and should display obfuscated data. ESA does not display or store sensitive meta. Consequently, ESA will not pass sensitive data to NetWitness Respond.

Optionally, ESA can add an obfuscated version of the sensitive data to an event. For example, the DPO identifies `user_dst` as sensitive. ESA can add an obfuscated version, such as `user_dst_hash`, to an event. The obfuscated meta is not sensitive, so ESA will display and store it the same way as any other non-sensitive meta.

For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

This topic explains the following:

- How ESA treats sensitive data it receives from Core services
- How to prevent sensitive data leaks in an Advanced EPL rule
- How to remove sensitive meta keys from global alerts

How ESA Treats Sensitive Data from Core Services

When ESA receives sensitive data from Core services, ESA passes on only the obfuscated version of the data. ESA does not store or show sensitive data.

The following features are impacted:

- Outputs – ESA does not forward sensitive data to outputs, which include alerts, notifications, and MongoDB storage.
- Advanced EPL rules – If an EPL statement creates an alias for a sensitive meta key, sensitive data will leak. This topic illustrates how this happens so you can avoid it.
- Enrichments – If a sensitive meta key is used in the join condition, sensitive data will leak. This topic illustrates how this happens so you can avoid it.

Advanced EPL Rule

If an EPL query statement renames a sensitive meta key, the data will not be protected.

ESA identifies a sensitive meta key by the name:

- `ip_src` is the sensitive meta key.
- `ip_src_hash` is the non-sensitive, obfuscated version.

To support data privacy, the sensitive meta key must not be renamed in an EPL query. If a sensitive meta key is renamed, the data will no longer be protected.

For example, in a rule such as select `ip_src as ip_alias...`, `ip_alias` contains the sensitive data but it is not protected because ESA only knows about `ip_src`, not `ip_alias`. In this case, IP addresses would not be obfuscated. Real values would be displayed.

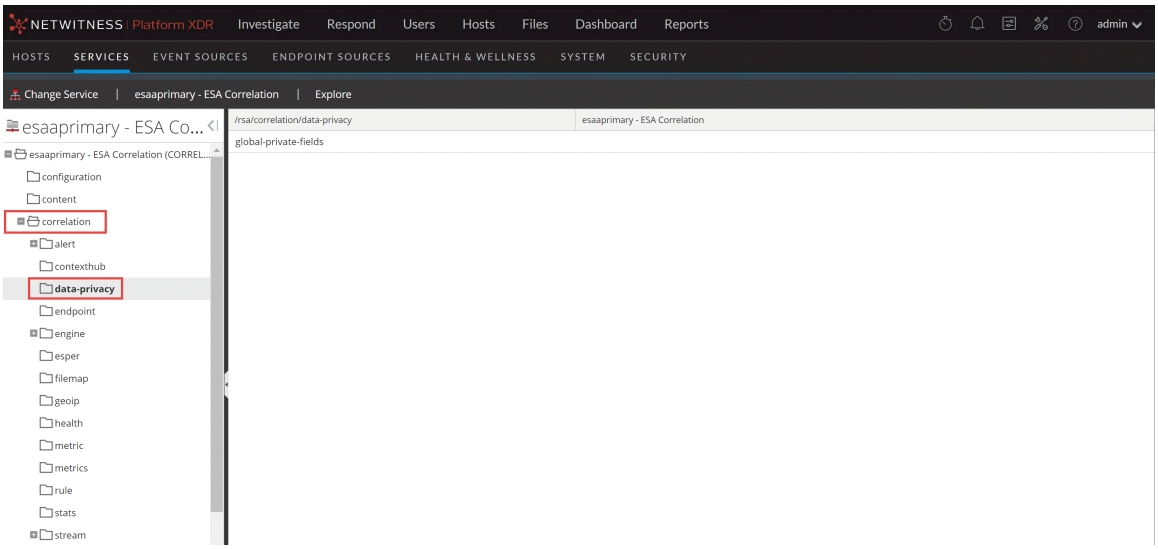
Enrichment Source

When a sensitive meta key is used in a join condition, sensitive data can be displayed.

The enrichment database, which is the other part of the join condition, has one column that matches the sensitive meta key. This cross reference is to actual values not obscured values. Consequently, actual values are displayed.

In the following example, both parts of the join condition are highlighted.

- `ip_src` contains sensitive data.
- `ipv4` will be added to the alert and exposed as non-sensitive data.



Because the `ipv4` value is the same as the `ip_src` value, `ipv4` contains and displays sensitive data.

How to Remove Sensitive Meta Keys Globally from All Alerts

Note: This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.4 and later versions.

For data privacy reasons, it may be necessary to remove some sensitive meta keys from the alert output globally, regardless of the data source. In the ESA Correlation service, you can set the **`global-private-fields`** parameter to remove the meta keys from all alert output.

1. Go to **(Admin) > Services**, and in the Services view, select an ESA Correlation service and then select **> View > Explore**.
2. In the Explore view node list for the ESA Correlation service, select **correlation > data-privacy**.
3. In the **`global-private-fields`** parameter, add the sensitive meta keys that you want removed from all alerts.

The changes are effective immediately.

For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

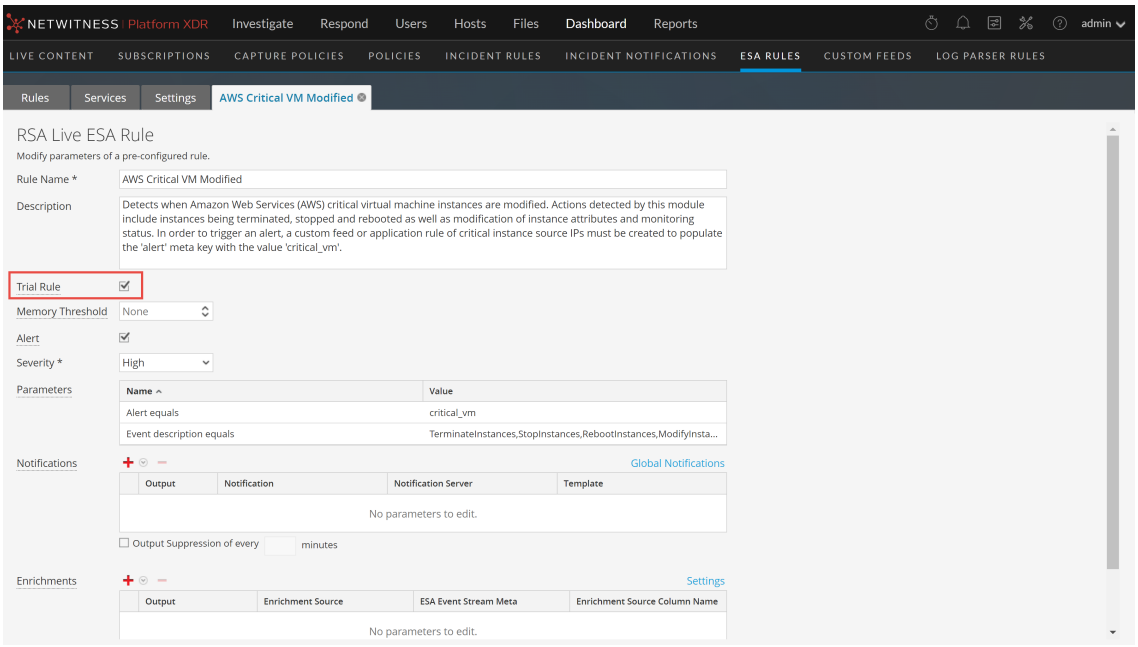
ESA Rule Types

This topic describes each type of ESA rule, when to use them and the permissions each role has with them. The following table lists each type, describes it, and explains when to use it.

Rule Type	Description	When to Use
RSA Live ESA	RSA Live has a catalog of ESA rules that are available to modify to run in your network.	RSA Live ESA rules are available to leverage rules that are already built. Modify the configurable parameters to customize to meet your requirements.
Rule Builder	In the rule builder, you define rule criteria in an easy-to-use interface.	Use the rule builder to create your first rules. You choose many of the rule conditions from lists.
Advanced EPL	With the Event Processing Language (EPL), you define rule criteria by writing a query.	Use advanced EPL rules to define rule criteria in the EPL syntax.
Endpoint Rule Bundle	An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. The rules in this bundle only apply to NetWitness Endpoint.	If you have NetWitness Endpoint, you can configure risk scoring to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Sample Rules

Sample Rule Builder rules come with NetWitness and appear in the Rule Library. Use sample rules to get comfortable working with rules before creating your own. You can safely edit and deploy these sample rules.



Endpoint Risk Scoring Rules Bundle

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. These rules appear in the Rule Library with the sample rules. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

Trial Rules Mode

For any type of rule, you can select the Trial Rule setting as an additional safeguard. Trial rules get disabled if they exceed a memory threshold set by the administrator. Run a rule in trial mode to monitor memory usage and to disable the rule automatically if it uses more memory than the threshold allows.

The following figure shows the Trial Rule setting in the Rule Builder.

ESA Permissions

This topic lists all ESA permissions and shows which permissions are assigned to each pre-configured NetWitness role. User access is restricted based on roles and permissions assigned to roles.

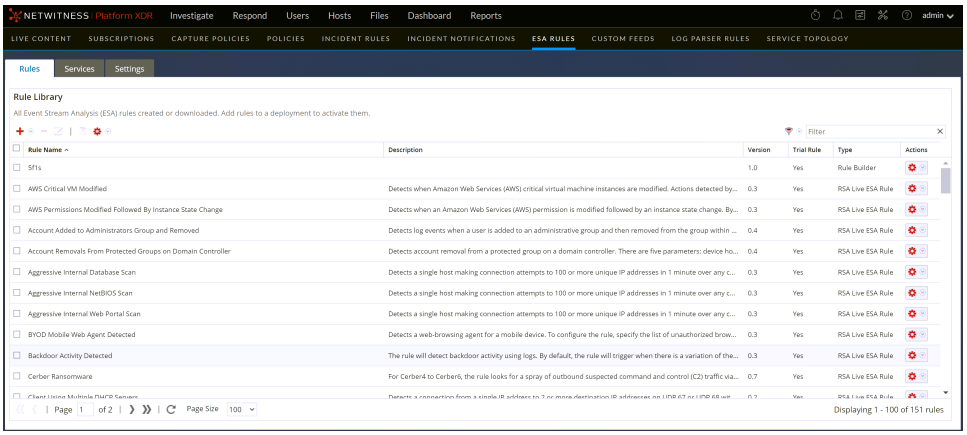
- Administrators
- Operators
- Analyst
- Security Operations Center (SOC) Managers
- Malware Analysts (MA)
- Data Privacy Officer

There are four permissions for ESA:

- **Access Alerting Module**: Is required for any permission
- **View Rules**: Allows view-only permission for rules in the Rule Library

- **View Alerts**: Allows view-only permission for alerts ESA generates
- **Manage Rules**:Allows you to view, create, edit, and delete rules

The following table lists permissions for ESA and the roles to which they are assigned. Use this table to see how each role can work with rules and alerts.



Permission	Administrators	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Alerting Module	Yes	Yes	Yes	Yes		Yes
View Rules	Yes	Yes		Yes		Yes
View Alerts	Yes		Yes	Yes		Yes
Manage Rules	Yes	Yes		Yes		Yes

For more information on roles and permissions, see the *System Security and User Management Guide*.

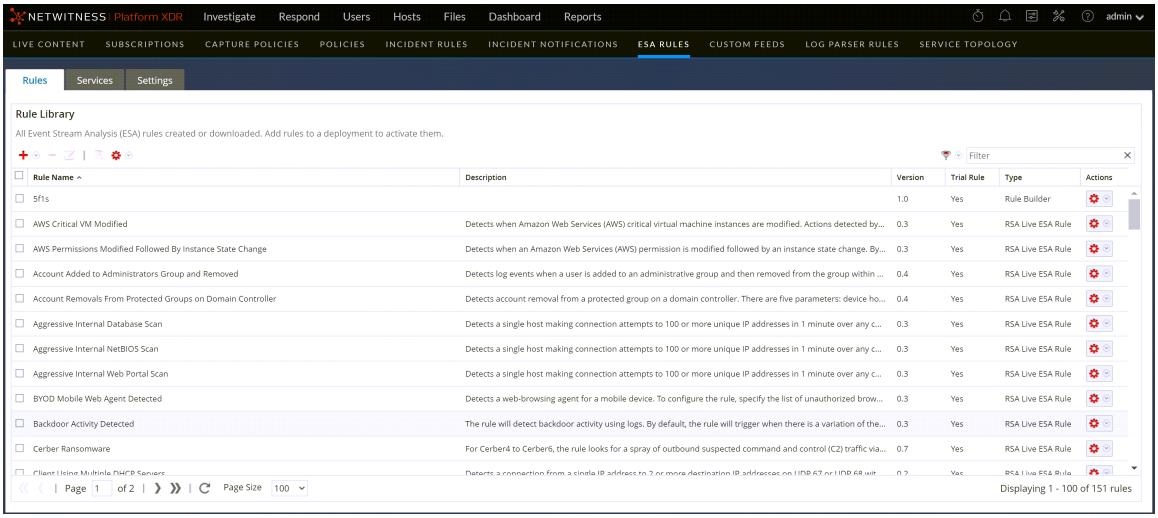
Practice with Sample Rules

NetWitness comes with sample rules so analysts can become familiar with how rules look before they create their own rules. Use the sample rules to become familiar with the Rule Builder and to practice editing and deploying a rule.

Sample rules are installed in the Rule Library, which contains every rule you download or create. The following figure shows sample rules in the Rule Library.

These are the available sample rules:

- SAMPLE - Blacklist - From inside countries that are not the US, Non SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE - Non SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE - P2P Software as Detected by an Intrusion Detection Device

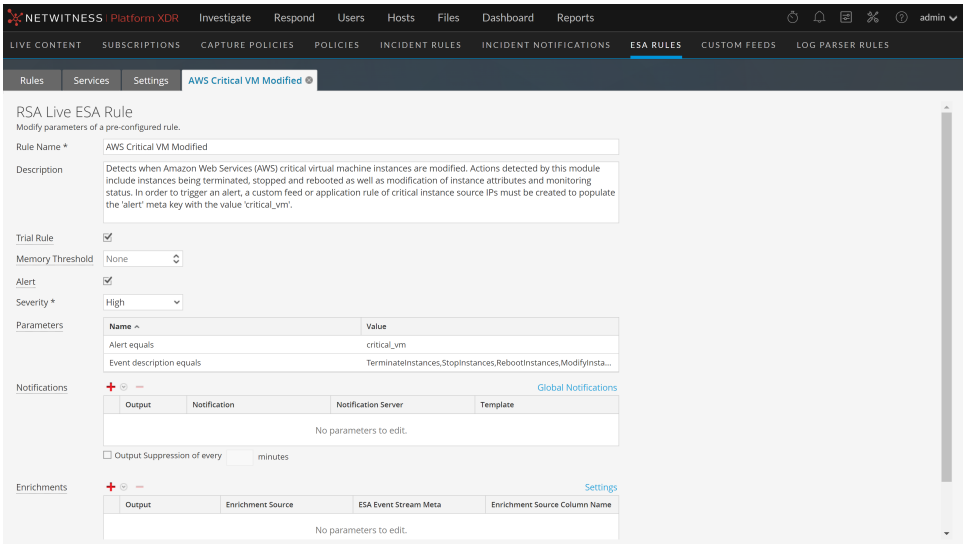


- SAMPLE - User Added to Admin Group Same User su Sudo
- SAMPLE - Whitelist - From outside of Germany, P2P Software as Detected by an Intrusion Detection Device.

Each name begins with SAMPLE to distinguish the rules that are installed with NetWitness from the rules you download and create.

Rule Library

The Rule Library shows the following information for a rule:



- **Name** summarizes the data or events the rule collects.
- **Description** explains the rule in more detail, although only the beginning shows in the Rule Library.
- **Trial Rule** indicates if trial mode is enabled or disabled for the rule.
- **Type** shows the origin of the rule, built in Rule Builder or Advanced EPL, downloaded from RSA Live, or Endpoint Rule Bundle.

Practice with Sample Rules

1. Go to **(Configure) > ESA Rules**.
   The ESA Rules view is displayed with the Rules tab open.

2. In the **Rule Library**, double-click a sample rule or select a sample rule and click . The rule is opened in Rule Builder.

3. To practice with a sample rule, refer to the following topics for detailed descriptions and procedures:
   - To familiarize yourself with the Rule Builder user interface, see Rule Builder Tab for a description of each field.
   - To learn how to edit a rule, see Add a Rule Builder Rule for a step-by-step procedure.
   - To deploy sample rule, see Deploy Rules to Run on ESA to learn how to associate the rule with an ESA service.

After you practice with sample rules, you will be able to download, create, and deploy your own rules.

Working with Trial Rules

The ESA Correlation service is capable of processing large volumes of disparate event data from Concentrators. However, when working with ESA Correlation rules, it is possible to create rules that use excessive memory. This can slow your ESA service or even cause it to shut down unexpectedly. To ensure that rules do not use excessive memory, you can enable them as trial rules. You should disable the trial rule setting only after testing the new rule in your environment during times of both normal and peak network traffic.

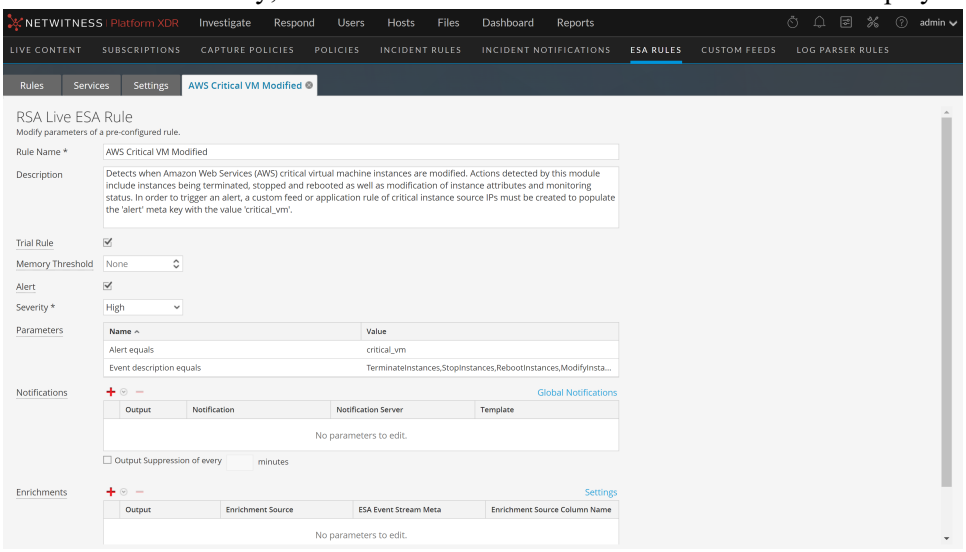
You can set a global threshold of the percentage of memory that trial rules may use. If that configured memory threshold is exceeded, all trial rules are disabled automatically. To configure the memory threshold, see "Change Memory Threshold for All Trial Rules" in the *ESA Configuration Guide*.

For suggestions on creating more efficient rules, see "Best Practices for Writing Rules" in Best Practices.

By default, new rules and RSA Live rules that you import are configured as trial rules. As a best practice, when you edit an existing rule, select the Trial Rule option, which allows you to deploy the rule with an added safeguard.

Note: Run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.

Deploy Rules as Trial Rules



This topic explains to administrators how to enable trial rules when creating new rules or editing rules. Trial rules are automatically disabled if a specified total JVM memory utilization threshold is exceeded.

In NetWitness 11.4 and later, ESA trial rules no longer change status after an upgrade or deployment.

For example, if you change the status of a trial rule to disabled ((Configure) > ESA Rules > Services tab) and redeploy the ESA rule deployment ((Configure) > **ESA Rules** > **Rules** tab), the trial rule remains disabled.

1. Go to **(Configure) > ESA Rules**.
   The Configure ESA Rules view is displayed with the Rules tab open.

2. From the Rule Library, choose to add or edit a rule. The rule builder is displayed in a new tab.

3. To make a new or existing rule a trial rule, select the **Trial Rule** checkbox.
4. Add the rule conditions or modify the rule as needed. For instructions on editing rules, see Add Rules to the Rule Library.
5. Click **Save**.
6. Ensure that trial rules are enabled for your ESA and that you are satisfied with the thresholds configured for trial rules.
   The memory threshold is set in the configuration file. To configure it, see "Change Memory Threshold for All Trial Rules" in the *ESA Configuration Guide*.
   - The threshold is configured per ESA and is a percentage of Java Virtual Memory.
   - The configuration parameter, `fatal-percentage`, has a default value of 90.
7. Optionally, you can set up the policies in Health and Wellness to send you an email notification if the total JVM memory utilization threshold is exceeded.

The next time you deploy the rule, it runs in trial rule mode.

Note: If a trial rule is disabled, you will need to go to the **(Configure) > ESA Rules > Services** tab to re-enable the trial rules. For more instructions on re-enabling trial rules on a service, see View ESA Stats and Alerts.

Add Rules to the Rule Library

This topic explains how to add each type of rule to the rule library. You must add a rule to the Rule Library before you can deploy it. Permission to manage rules is required for all tasks in this section. To add rules, you can download them from ESA Live, create a rule via the Rule Builder, or write advanced EPL rules.

For more details on each of these procedures, see:

- Working with RSA Live ESA Rules
- Add a Rule Builder Rule
- Add an Advanced EPL Rule

In addition to deploying a rule, you can edit, duplicate, import, export, and remove a rule in the Rule Library. For details on these procedures, see Working with RulesWorking with Rules

Note: Analysts must have appropriate permissions to view the ESA rules under (**CONFIGURE**) > **ESA Rules** and (**CONFIGURE**) > **Policies** pages. For more information, see the **Source-server** section in the "Role Permissions" topic in the *System Security and User Management Guide*.

Working with RSA Live ESA Rules

This topic explains working with configurable RSA ESA rules from the NetWitness Live Content Management System so you can customize them to meet your needs.

RSA Live contains a catalog of rules. Each rule has configurable parameters so you can customize the rule for your environment. If RSA Live has a rule to detect events that you want to detect in your network, download the rule to save time. You can edit the configurable parameters and save the rule in your Rule Library. For detailed information about each rule, including whether the rule is for logs, packets, or both, see "RSA ESA Rules" at the following link:
https://community.netwitness.com/t5/netwitness-platform-threat/rules/ta-p/677884

This is an example of how each RSA Live ESA rule is described on RSA Live:

Rule Name	Description
Logins across Multiple Servers	Detects logins from the same user across 3 or more separate servers within 5 minutes. The time window and number of unique destinations are configurable.

As the name shows, the rule looks for logins across multiple servers. The description explains the rule criteria in more detail and specifies which parameters you modify.

Note: When a rule description includes a configurable parameter, the default setting for the parameter is used. In the example rule, the description states 5 minutes. However, the time window is configurable so 5 is the default number of minutes.

Prerequisites

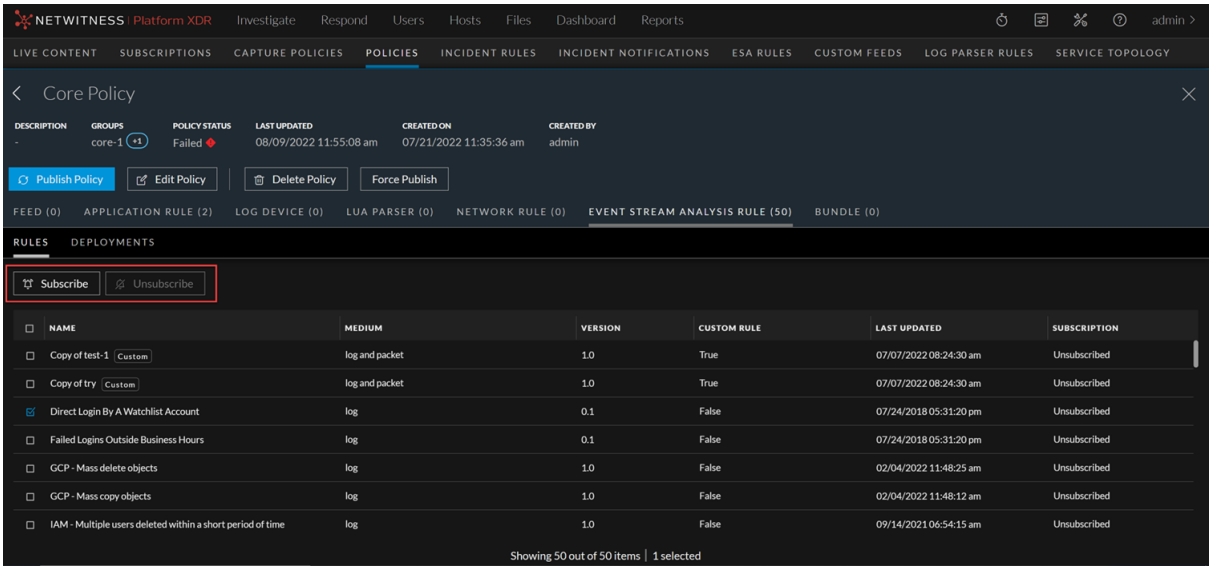
These are the prerequisites for working with configurable Live ESA rules;

- Have permission to manage rules.
- Create a Live Account. See the *Live Services Management Guide* for details.
- Set up Live on NetWitness. See the *Live Services Management Guide* for details.
- Update your meta keys. See "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*

Subscribe and Unsubscribe Live ESA Rules

You can subscribe and unsubscribe live ESA rules from the **Configure** > **Policies** page.

To Subscribe the Live ESA rules



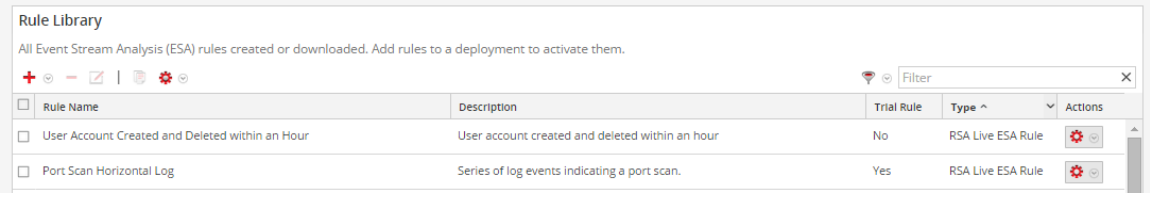
1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.

3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.

4. Click **Event Stream Analysis Rule** > **Rules**.

5. Click one or more Live ESA rules and click **Subscribe**.



Note: ESA Rules cannot be manually deployed via Live Services. By default, all the ESA rules from Live are available in the ESA Rule library, if live is configured.

Customize an RSA Live ESA Rule

This topic explains how to configure parameters in an RSA Live ESA rule. When you download an RSA Live ESA rule, the rule appears in the Rule Library which includes the following columns:

- Rule Name
- Description
- Trial Rule
- Type
- Actions

The type is RSA Live ESA Rule.

Prerequisites

- Administrator, Operator, SOC Manager, or DPO role permissions are required.
- Rules must be downloaded to the Rule Library.

Configure Parameters for an RSA Live ESA Rule

1. Go to  **(Configure) > ESA Rules > Rules** tab.
2. In the **Rule Library**, double-click an RSA Live ESA Rule or select the rule and click .
   The RSA Live ESA Rule tab is displayed.
3. (Optional) Change the following fields:
   - Rule Name
   - Description
   - Trial Rule (Enabled by default. NetWitness recommends you run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.)
   - Alert (This option applies to 11.3 and later.) Select Alert to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
   - Severity
   - Notifications
   - Enrichments
4. To configure the rule for your environment, in the **Parameters** section replace the default in the **Value** Column.

5. Click **Save**.

Add a Rule Builder Rule

Each ESA rule is designed to detect something in your network and to generate an alert for it:

- User activity that is not allowed, such as attempting to download software that is not sanctioned
- Suspicious behavior, such as mass audit clearing
- Known malicious threats, such as worm propagation or a password-cracking tool

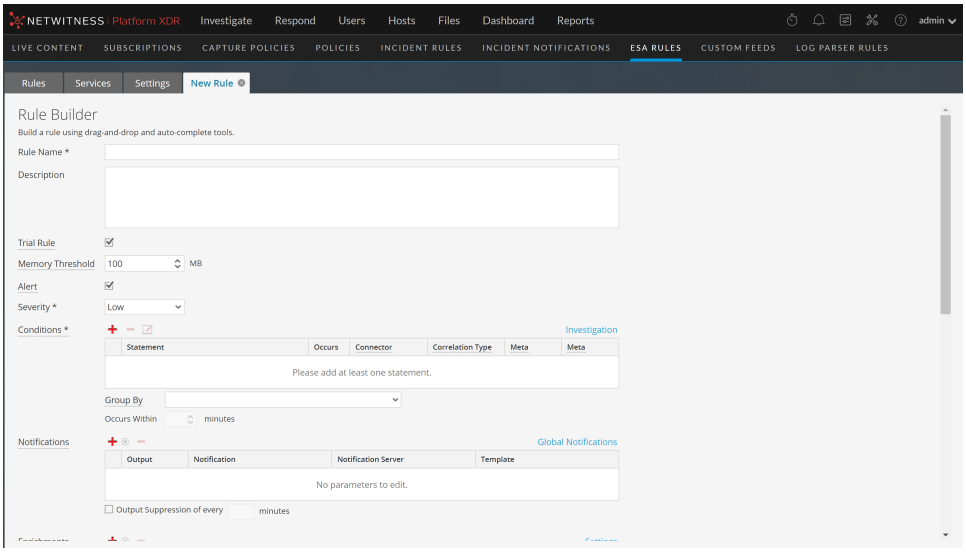
There are two methods to design a rule in ESA:

- **Rule Builder** is an easy-to-use interface. You provide a meta key and value, then select choices from lists to complete the criteria.
- **Advanced EPL** allows you to write queries in the Event Processing Language. You must know EPL syntax.

If you know EPL, you can use either method. If you do not know EPL, you should use Rule Builder. These topics explain the Rule Builder.

Step 1. Name and Describe the Rule

This topic provides instructions to identify a rule, indicate if it is a trial rule and assign a severity level. When you add a new rule, the first information to provide is a unique name and description of what the rule detects. After you save the rule, this information is displayed in the Rule Library.



Prerequisites

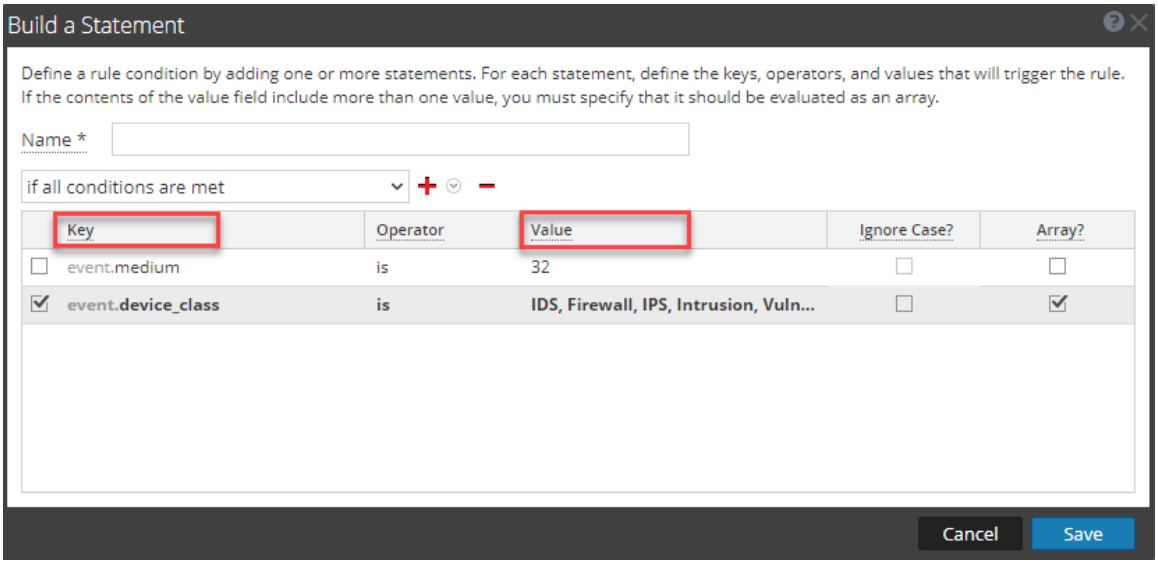
You must have permission to manage rules. See ESA Permissions.

Name and Describe a Rule

1. Go to  **(Configure) > ESA Rules > Rules** tab.

2. In the **Rule Library**, select  **> Rule Builder**.
   The New Rule tab is displayed.

3. Type a unique, descriptive name in the **Rule Name** field.
   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.
4. In the **Description** field, explain which events the rule detects.
   The beginning of this description will appear in the Rule Library.
5. By default, new rules are configured as a Trial Rule. A trial rule automatically disables the rule if all trial rules collectively exceed the memory threshold. If you are editing an existing rule, you can select **Trial Rule** to safely test the rule edits.
   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Working with Trial Rules.
6. (This option applies to 11.5 and later.) Enter a **Memory Threshold** for a rule that uses memory, such as a rule that contains windows or pattern matching. If the configured memory threshold is exceeded, the rule gets disabled individually and an error is displayed for that rule on the  (Configure) > ESA Rules > Services tab. The Memory Threshold option works for trial rules and non-trial rules. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.
7. (This option applies to 11.3 and later.) Select **Alert** to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
8. For **Severity**, classify the rule as Low, Medium, High or Critical.



Step 2. Build a Rule Statement

This topic provides instructions to define rule criteria in Rule Builder by adding statements. A statement is a logical grouping of rule criteria in the Rule Builder. You add statements to define what a rule detects.

Example

The following graphic shows an example of a Rule Builder statement.

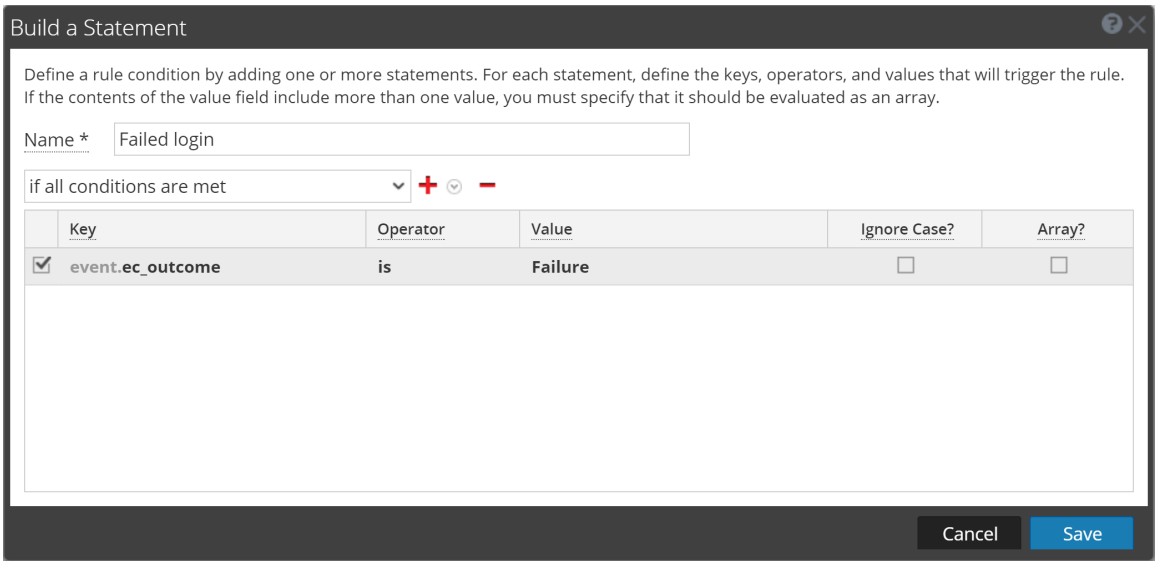
Every statement contains a key and value. Then, you build logic around the pair by selecting an option in each other field.

Prerequisites

To build a rule statement, you must know the meta key and the meta value.

For a complete list of meta keys, go to **(Configure) > ESA Rules > Settings > Meta Key References**.

Meta entities are not currently supported, such as:



```
fullname.all
eth.all
ip.all
ipv6.all
port.src.all
port.dst.all
dir.path.all
org.all
geoip.all
port.all
```

```
domain.all
email.all
filename.all
directory.all
checksum.all
param.all
context.all
attack.all
analysis.all

Caution: If you add meta entities to your rule, they cannot get data from the data sources, so they do not trigger alerts.

Build a Rule Statement

1. Go to  **(Configure) > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library**, click  **> Rule Builder** or edit an existing Rule Builder rule.
   The Rule Builder view is displayed.
3. In the **Conditions** section, click .
   The Build Statement dialog is displayed.

4. **Name** the statement. Be clear and specific. The statement name will appear in the Rule Builder.
5. From the drop-down list, select which circumstances the rule requires:
   - if **all conditions** are met
   - if **one of these conditions** are met
6. Specify the criteria for the statement:
   a. For **Key,** type the name of the **Meta Key**.
   b. For **Operator** specify the relationship between the meta key and the value you will provide for it. The operator that you use depends on the metadata type.
   The choices are: is, is not, is not null, is greater than (>), is greater than or equal to (>=), is less than (<), is less than or equal to (<=), is one of (For array type meta), is not one of (For array type meta), contains, not contains, begins with, ends with
   c. Type the **Value** for the meta key.
   Do not add quotes around a value. Separate multiple values with a comma.
   d. The **Ignore Case?** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN." (For best rule performance, only use the **Ignore Case** option when necessary.)
   e. The **Array?** field indicates if the contents of the Value field represent one or more than one value.
   Select the Array checkbox if you entered multiple, comma-separated values in the **Value** field. For example, "ec_activity is Logon, Logoff" requires you to select the Array checkbox.
7. To use another meta key in the statement, click , select **Add Meta Condition** and repeat step 6.
8. To add a whitelist, click  and select **Add Whitelist Condition**.

9. To add a blacklist, click  and select **Add a Blacklist Condition**.
10. To save the statement, click **Save**.

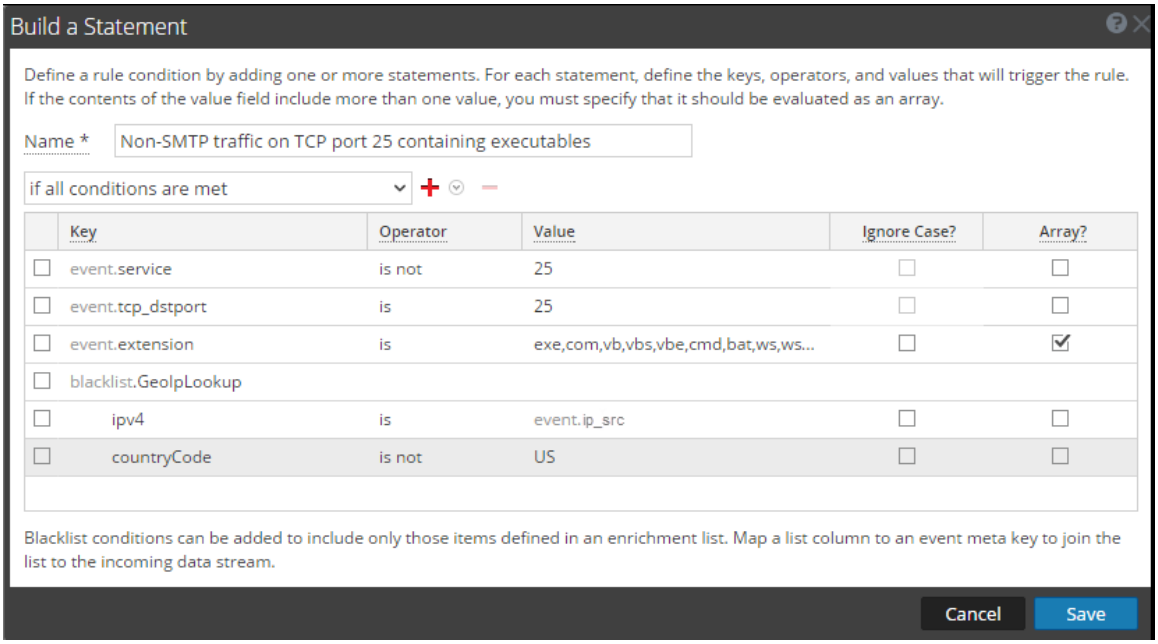
To Add a Whitelist

You use a whitelist to ensure that specified entities are excluded from triggering the rule. Whitelists can be based on geographic location, in-memory enrichment, or Context Hub list sources. For example, if you want to create a rule that only triggers for IP addresses outside of the US, you can create a whitelist of US IP addresses.

1. After you add a meta condition, click  and select **Add Whitelist Condition**.
2. In the **EnterWhitelist Name** field, select an enrichment source. Any in-memory enrichment, Context Hub list, or a named window in Esper can be used as the source for a whitelist.
3. For the subcondition:
   a. If you used a GeoIP source for the whitelist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter *ipv4 is ip_src* to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the whitelist, you might want to add a subcondition to specify the geographic region to exclude from the rule results. For example, to specify that the country code must be USA, enter "*CountryCode is US*".
   b. If you used a Context Hub list for the whitelist, select a column name from the list, then select an operator and enter the meta value for the corresponding value field.

Note: An *Entity* is a specified piece of meta, such as IP address, MAC address, user, host, domain, file name, or file hash.

To Add a Blacklist

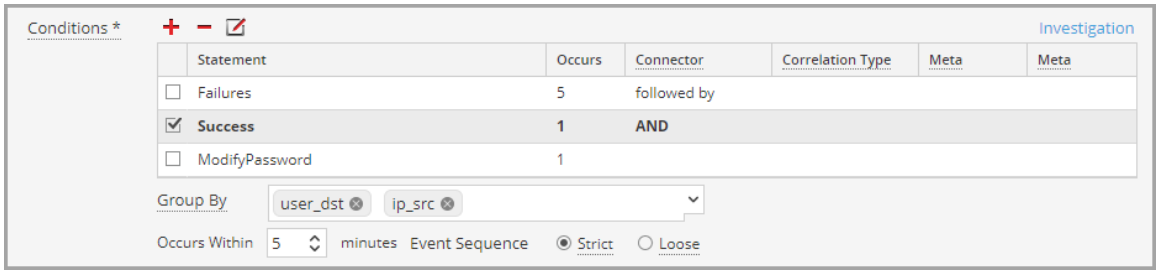


You use a blacklist to ensure that specified entities trigger the rule. Blacklists can be based on geographic location, in-memory enrichment, or Context Hub list sources. For example, you can specify that the rule only includes results from Germany.

1. After you add a meta condition, click  and select **Add Blacklist Condition**.
2. In the **Enter Blacklist Name** field, select an enrichment source. Any in-memory enrichment, Context Hub list, or a named window in Esper can be used as the source for a blacklist.
3. For the subcondition:
   a. If you used a GeoIP source for the blacklist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter ipv4 is ip_src to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the blacklist, you might want to add a subcondition to specify the geographic region to include in the rule results. For example, to specify that the rule only includes results for Germany, enter "*CountryCode is DE*".

b. If you used a Context Hub list for the blacklist, select a column name from the list, then select an operator and enter the meta value for the corresponding value field.

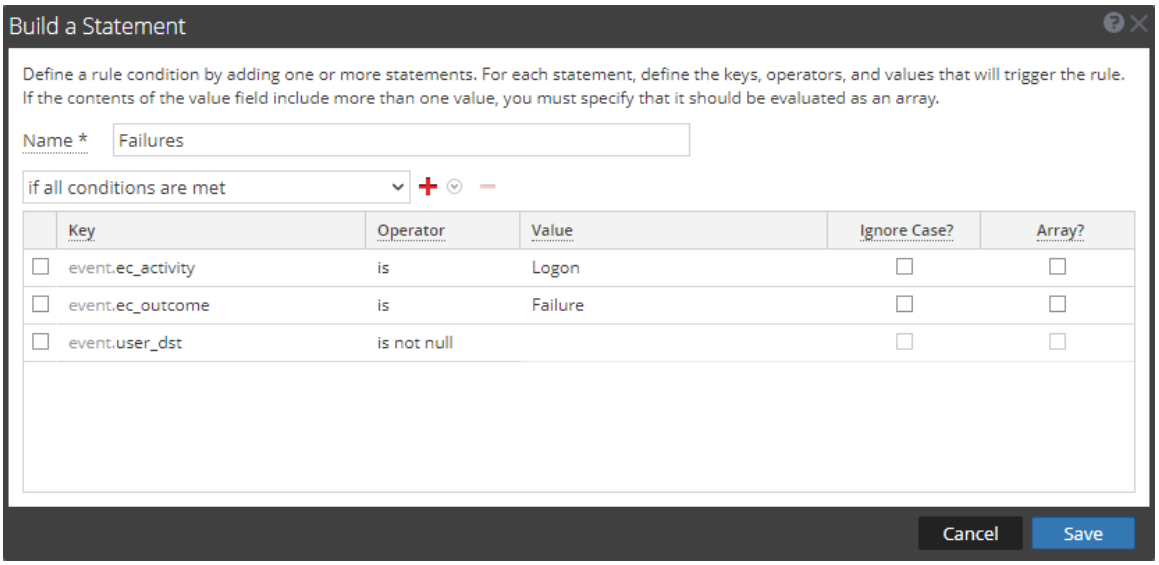
Example: Blacklist



The following statement shows a blacklist statement for a rule that monitors for non-SMTP traffic on TCP destination port 25 containing an executable from countries that are outside of the United States.

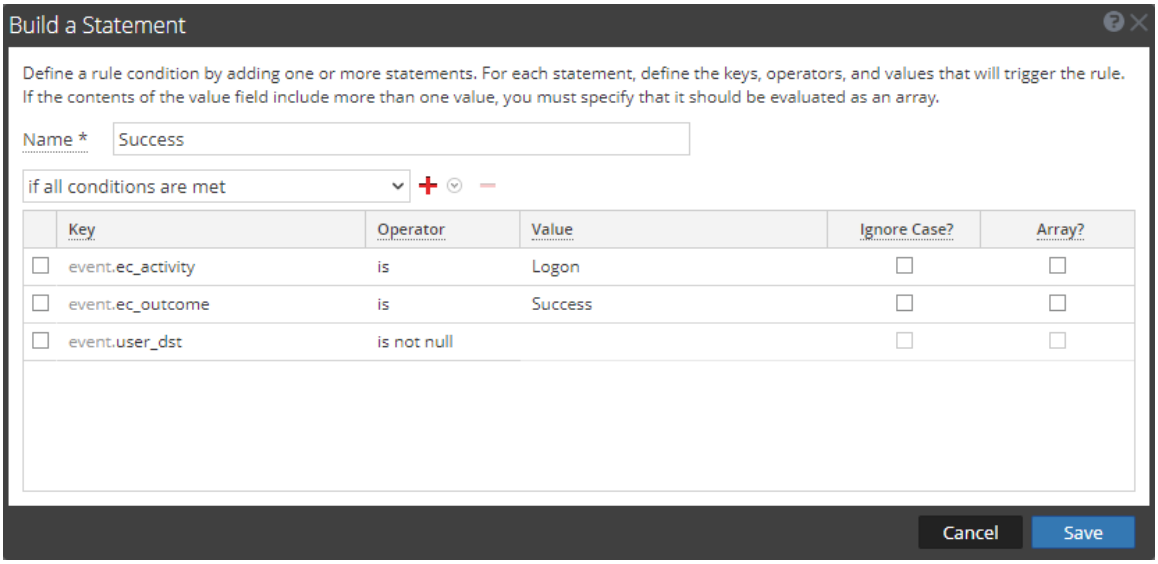
Statement	Description
service is not 25	The traffic is not SMTP traffic.
tcp_dstport is 25	The traffic is running on TCP port 25.
extension is exe, com,vb,vbs,vbe,cmd,bat,ws,wsf,src,sh	The file extension is an executable.
GeoIpLookup	The blacklist is based on a GeoIPLookup source.
ipv4 is ip_src	The GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database.
countryCode is not US	When looking up the IP address Event.ip_src in the GeoIP database, the record it returns does not contain "US" in the countryCode field.

Example: Strict Pattern Matching and Using the *Is Not Null* Operator



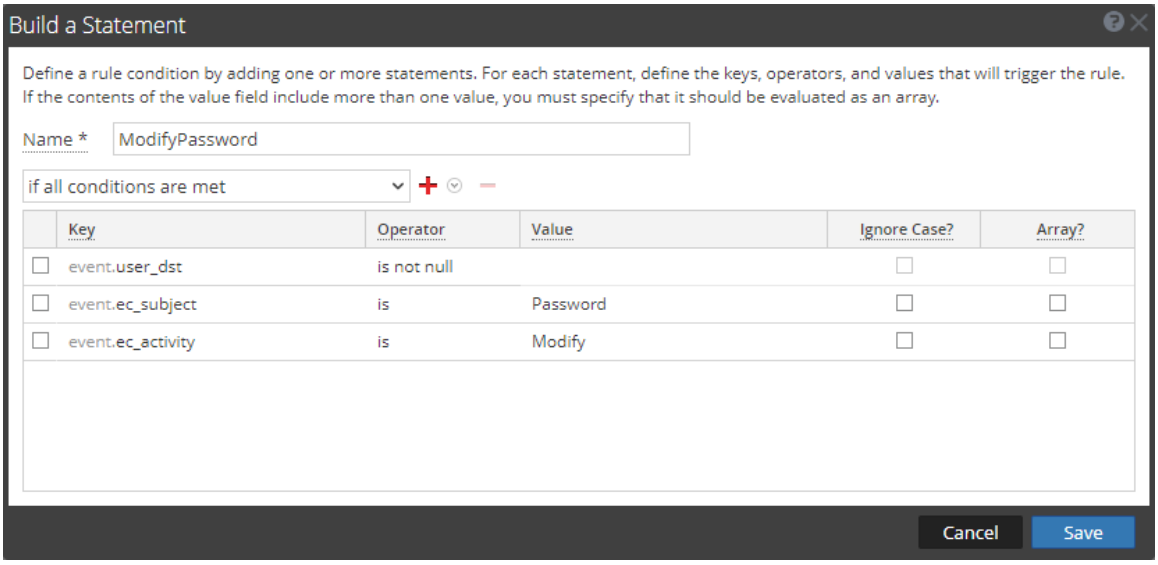
The following example uses the ability to exclude null values and create a strict pattern match to ensure that it returns the expected rule results. The following conditions make up the rule:

Rule Condition	Description
Failures	This condition searches for five failed logins with a "followed by" connector, meaning that the condition (Failures) must be followed by the next condition (Success).
Success	This condition searches for one successful login.
ModifyPassword	This condition searches for an instance where the password is modified.
GroupBy: user_dst, ip_src	The GroupBy field ensures that all the previous conditions are grouped by the user_dst meta (the user destination account) and ip_src. This is important to the construction of the rule because the rule attempts to find a case where a user has attempted to log into the same destination account multiple times, finally logged in successfully, and then changed the password. Grouping by ip_src ensures that the user logged in from the same machine attempted to log into an account multiple times. The rule may give unexpected results if you do not group the results.
Occurs within 5 minutes	The time window for the events to occur is five minutes. If the events occur outside of this time window, the rule does not trigger.
Event Sequence: Strict	The event sequence is configured for a strict pattern match. This means that the pattern must match exactly as it is specified with no intervening events. Strict pattern matching allows you to ensure that the Esper engine only generates alerts for rules that exactly match the pattern you want to find. For example, a common rule might be to search for five failed logins followed by a successful login. If you select a loose pattern match, this rule will trigger if there are any number of successful logins between the failed logins. Since the point of the rule is to find frequent *and* sequential login attempts, a strict match is required to ensure that you get the results you expect.



Note: Each of these conditions is explained in further detail in the sections below.

For each condition, a statement is built in the Rule Builder. The following statement makes up the Failures condition:

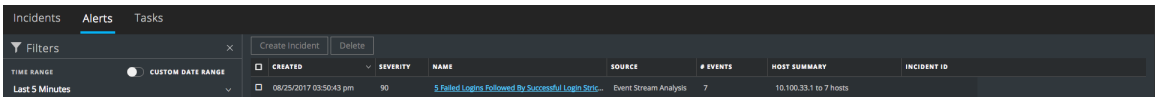


Rule Statement	Description
ec-activity is Logon	Identifies activity that attempts to log on to a system. The **Ignore Case** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. You may want to use this field if you are unsure what case may be used when logging a particular event. For best rule performance, only use the **Ignore Case** option when necessary.
ec_outcome is Failure	Identifies activity outcome logged as "failure."
user_dst is not null	Ensures that the condition is only true if user_dst is populated. The **is not null** operator allows you to ensure that a field returns a value. You may want to use this field when a rule depends on a particular field returning a value. For example, you want to create a rule that identifies the same user attempting to log into the same destination account multiple times (potentially a password-guessing attack). If the field that represents the user destination account is empty, you don't want the rule to trigger. To ensure the field contains a value, you use the **is not null** operator.

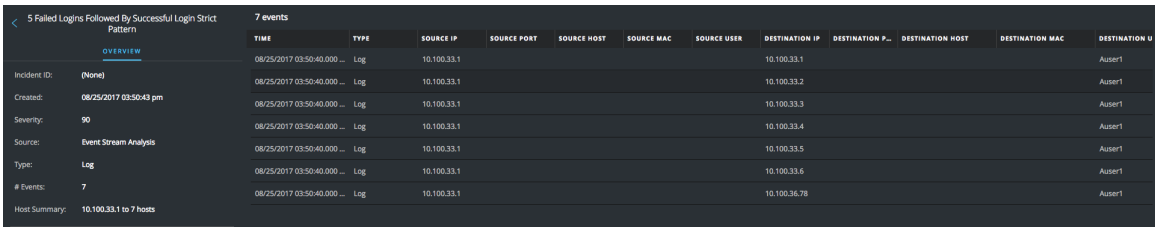
The following statement makes up the Success condition:

Rule Statement	Description
ec_activity is Logon	Identifies logon activity.
ec_outcome is Success	Identifies a logon that is successful.
user_dst is not null	Ensures that user destination account field must be populated for the condition to be true.

The following statement makes up the ModifyPassword condition:

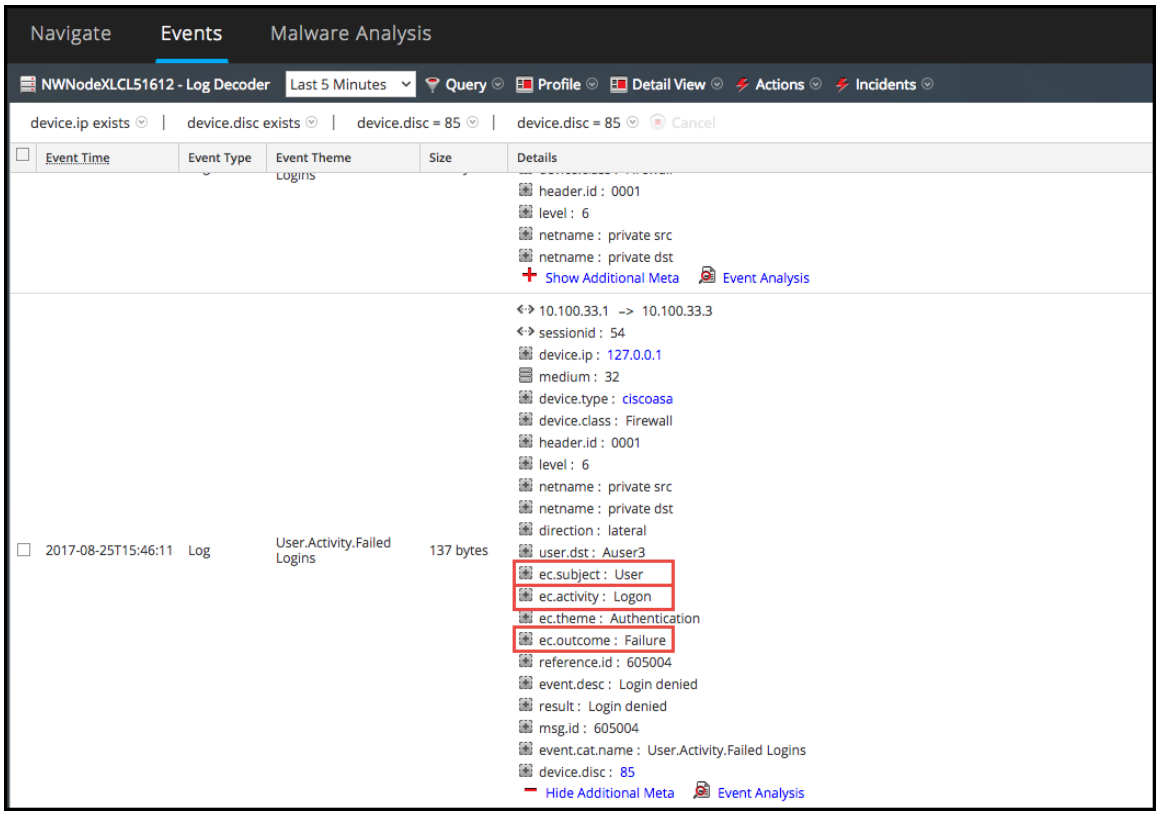


Rule Statement	Description
user_dst is not null	Ensures the user destination account field must be populated for the condition to be true.
ec_subject is Password	Identifies a subject of Password.
ec_activity is Modify	Identifies activity where the password was modified.



Example Results

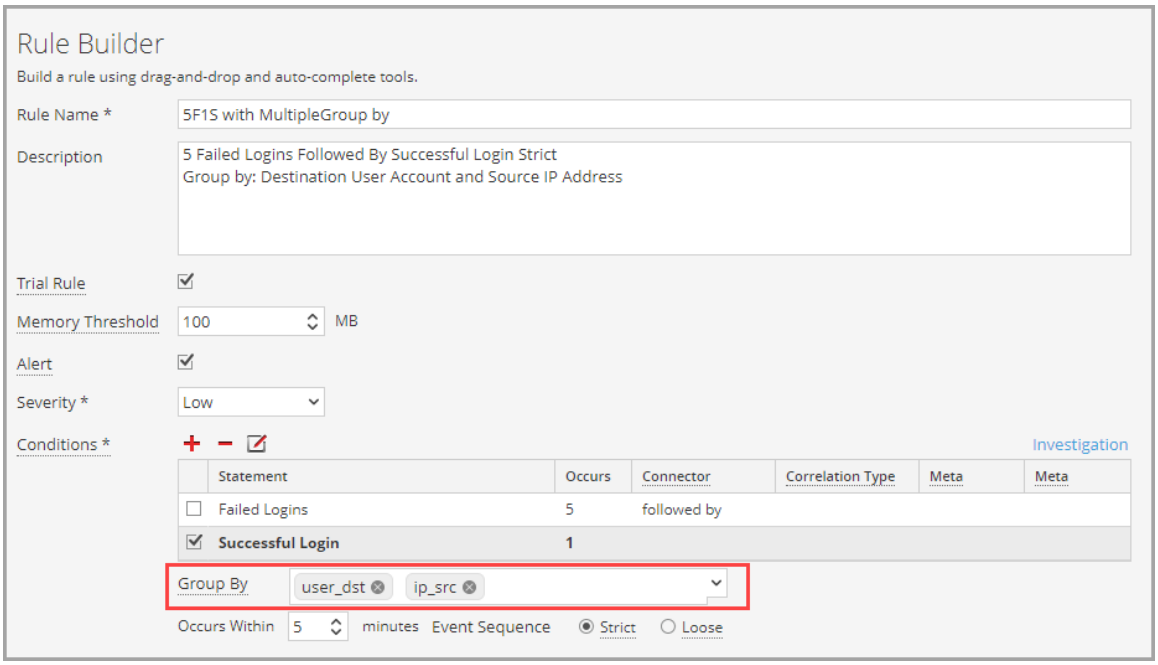
When the alert fires for the above example rule, you can see that the rule triggered for seven events, and that each event contains a user. You can also see that the events follow a strict pattern: five failed login events, followed by a successful login event, followed by a modification to the account.



The following figure shows the alert in the Respond Alerts List view.

The next figure shows the events in the alert in the Respond Alert Details view.

Drilling down into the Investigation view by clicking on the source for one of the events, you can see the case for each of the string values.

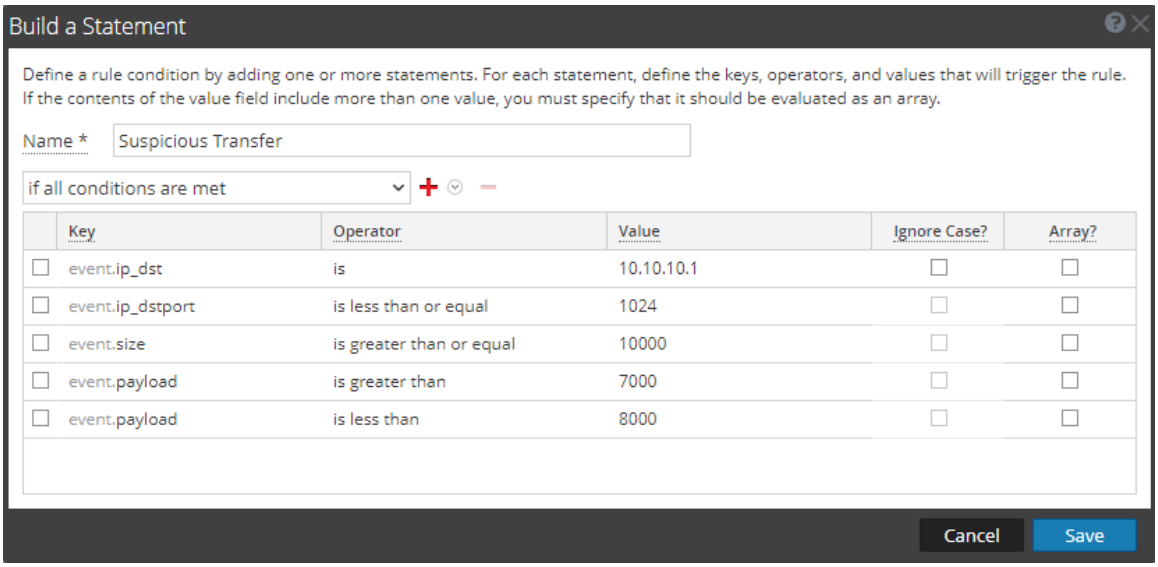


Example: Grouping the Rule Results

The **Group By** field allows you to group and filter rule results. For example, suppose that there are three user accounts; Joe, Jane, and John and you use the **Group By** meta, user_dst. The result will show events grouped under the accounts for Joe, Jane, and John.

You can also group by multiple keys, which can further filter rule results. For example, you might want to group by user destination account and machine to see if a user logged into the same destination account from the same machine attempts to log into an account multiple times. To do this, you might group by user_dst and ip_src.

The following example shows a rule grouped by user_dst and ip_src.

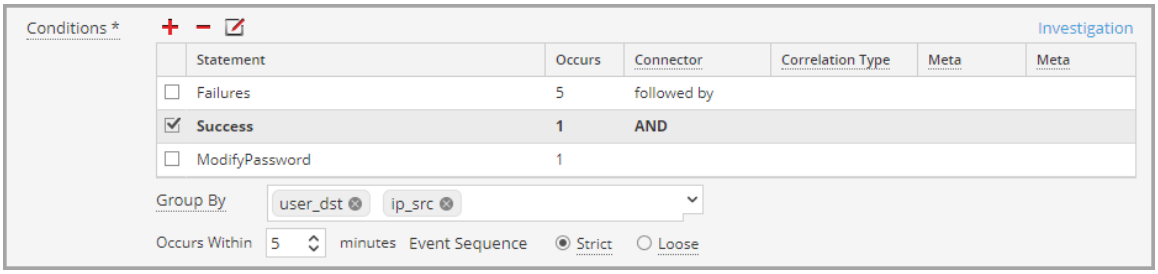


Rule Condition	Description
Failed Logins	Identifies five failed login attempts (must be followed by the next condition; that is, the five failed logins must be followed by a successful login).
Successful Login	Identifies one successful login.
Group By: user_dst and ip_src	Groups the rule results by user_dst (user destination account) and ip_src (IP address of the machine that the user is logging in from). This allows the rule to look for a user logged in from the same machine to the same destination account, resulting in a much more targeted rule result.
Occurs within 5 minutes with a strict pattern match	The events must occur within five minutes, and the pattern matching is strict, meaning it must follow the pattern exactly for the rule to trigger.

Example: Working with Numeric Operators

Numeric operators allow you to write rules against numeric values, such as specifying that a value is greater than, less than, or equal to a specific value. This is useful particularly for cases where you might want to specify a numeric threshold, that is, *payload is greater than 7000*.

The following example attempts to identify a data transfer to a particular destination through the common ports where the transfer size is high and the payload is in a suspicious range.



Rule Statement	Description
ip_dst is 10.10.10.1	The destination port is 10.10.10.1.
ip_dstport is greater than or equal to 1024	The destination port is in a commonly used port range, 1024 or greater.
size is greater than or equal to 10000	The size of the transfer is 10000 or greater, which is a suspiciously large transfer.
payload is greater than 7000	The payload is between 7000 and 8000, which is a suspiciously large payload.
payload is less than 8000	The payload is between 7000 and 8000, which is a suspiciously large payload.

Step 3. Add Conditions to a Rule Statement

This topic provides instructions to add conditions, such as specifying a certain time frame, to a rule statement. When you build a statement, you specify what a rule detects. You add conditions to make further stipulations, such as how many times or when the criteria must occur.

Example

The following graphic shows an example of the conditions for Rule Builder statements. Combined, the statements and conditions comprise the rule criteria.

This rule detects 5 failed logon attempts followed by one successful logon, which could be the sign that someone has hacked into user account. This is the criteria for the rule:

A. 5 failed logons are required.

B. 1 successful logon must follow the failures

C. A password was changed.

D. All events must occur within 5 minutes.

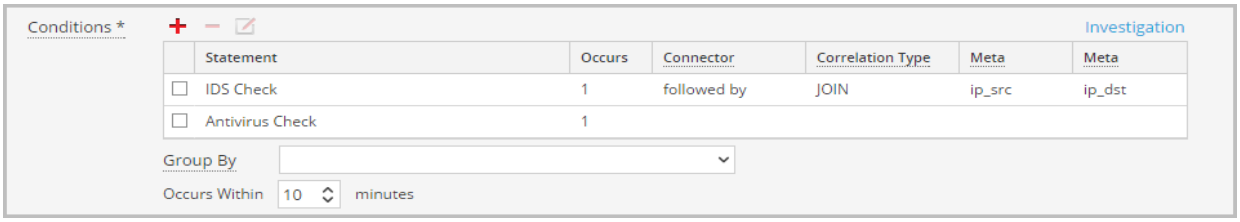
E. Group alerts by user (user_dst), because steps A and B must be performed on the same user destination account. Also, group by machine (ip_src) to ensure that the user logged in from the same machine attempts to log into an account multiple times.

F. The match is a strict pattern, meaning that the pattern must match exactly with no intervening events.

Add Conditions to a Rule Statement

1. In the **Conditions** section, select a statement and click .
2. For **Occurs**, enter a value to specify how many occurrences are required to meet the rule criteria.
3. If you have multiple statements, in the **Connector** field select a logical operator to join one statement to another:
   - followed by
   - not followed by

- AND
- OR



4. **Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert. See the examples below for a use case where two meta from different sources are joined.
5. If events must happen within a specific timeframe, enter a number of minutes in the **Occurs Within** field.
6. Choose whether the pattern must follow a **Strict** match or a **Loose** match. If you specify a strict match, this means that the pattern must occur in the exact sequence you specified with no additional events occurring in between.

   For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.
7. Choose the fields to group by from the dropdown list. The **Group by** field allows you to group and evaluate the incoming events.
   For example, in the rule that detects 5 failed logon attempts followed by 1 successful attempt, the user must be the same, so user_dst is the **Group By** meta key. You can also group by multiple keys. Using the previous example, you might want to group by user and machine to ensure that the same user logged in from the same machine attempts to log in to an account multiple times. To do this, you might group by user_dst and ip_src.

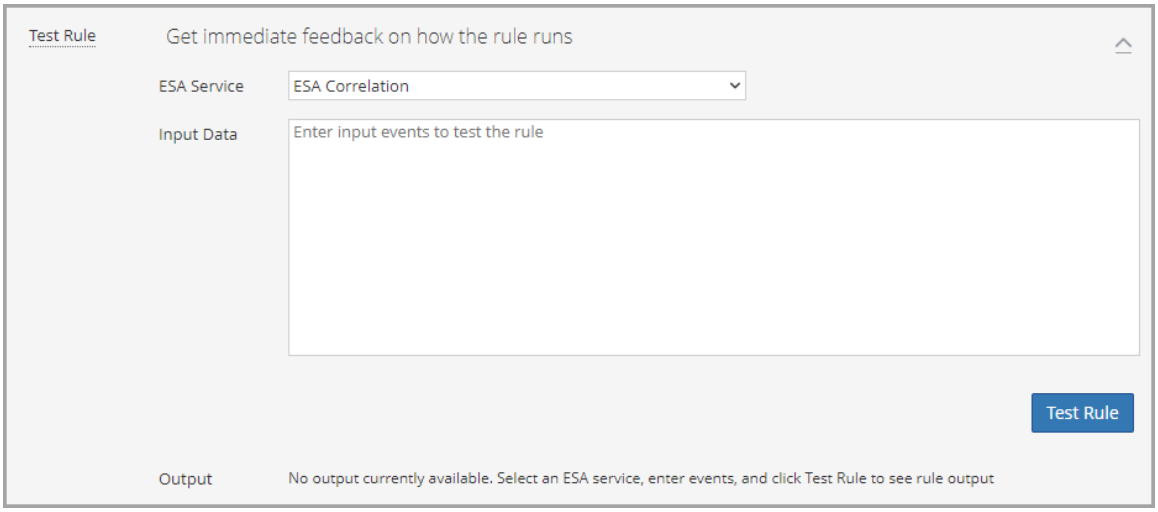
Example

The following graphic shows an example of the conditions for a rule that allow you to evaluate the same entities across multiple devices so you can accomplish complex use cases. For example, you can create a rule that triggers if an IDS (Intrusion Detection System) alert is followed by an AV(Anti-virus) alert for the same workstation. The work station key is not the same between the two (IDS & AV) sources, so you can perform a JOIN in order to evaluate the different entities.

In the IDS alert, the workstation is identified by the source IP address from the IDS alert, and would be compared to the destination IP address from the AV alert.

This is the criteria for the rule:

A. An IDS alert occurs.



B. The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.

C. An Antivirus alert follows the IDS alert.

Validate an ESA Rule

You can confirm that an ESA rule generates the expected alerts by testing the rule logic using JSON input data. You can view the alerts in the output, but this test does not send any alert notifications.

1. If you are not already in the rule, go to **(Configure) > ESA Rules > Rules** tab and in the **Rule Library**, open the ESA rule that you want to test.
2. Scroll down to the **Test Rule** section.

3. In the **ESA Service** field, select the ESA Correlation service to process the rule. Use the same ESA Correlation service that you plan to use in the ESA rule deployment that contains the rule.
4. In the **Input Data** field, enter the input events to test the rule. Download the events from the Investigate view in JSON format, copy the events, and paste them in this field. You can do this from the Investigate > Navigate view or the Investigate > Events view.

   To download the events from the Investigate > Navigate view:

   a. In the main menu, go to **Investigate > Navigate** in a new tab, select a data source, and click **Navigate**.

   b. In the Navigate view, click **Load Values** and click a meta value to filter the events.

c. Save the events as meta in the JSON file format [Save Events > Meta > (name the file) > Export Meta Format: choose JSON].

d. In the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

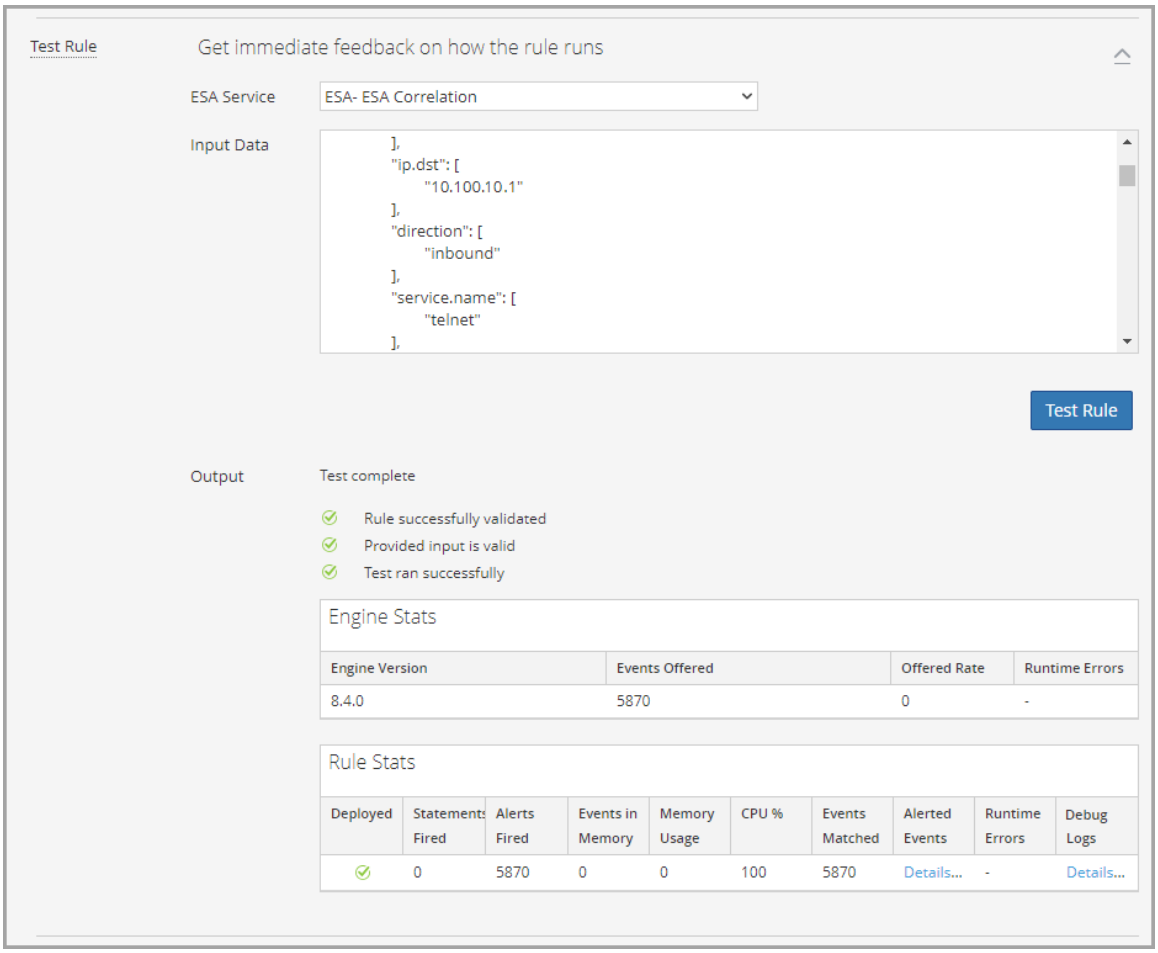
e. In the Jobs panel, download your extracted meta, for example: **`investigation-2020-May-19-08-30-20.json`**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

To download the events from the Investigate > Events view:

a. In the main menu, go to **Investigate > Events** in a new tab.

b. In the Events view, enter a query for the ESA rule test.



c. Select the events to use and in the **Download** or **Download All** menu, select **Visible Meta as JSON** or **All Meta as JSON**, depending on the size of your selection.

d. In the main menu, go to **Dashboards** and in the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

e. In the Jobs panel, download your extracted meta, for example: **Concentrator_ALL_EVENTS_ALL_META.json**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

5. Click **Test Rule**. The **Output** field shows the output of your rule and you can determine if the results meet your requirements.

The following table describes the test rule output **Engine Stats**.

Field	Description
Engine Version	Esper version running on the ESA service
Events Offered	Number of events processed by the ESA service since the last service start
Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment.

The following table describes the test rule output **Rule Stats**.

Field	Description
Deployed	A green checkmark indicates that the rule is deployed on the selected ESA service.

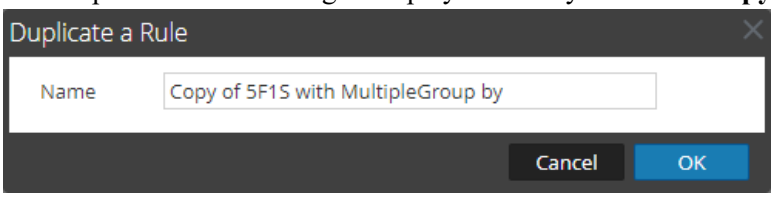
Field	Description
Statements Fired	The number of statements that fired the alerts
Alerts Fired	The number of alerts generated from the test data
Events in Memory	The number of events placed in memory by the rule
Memory Usage	The total amount of memory used by the rule
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each.
Events Matched	The number of events that matched the rule
Alerted Events	If applicable, this field can contain a link to events that caused an alert.
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the rule.
Debug Logs	This field contains a link to Esper debug (audit) logs.

Working with Rules

This topic discusses additional procedures you can perform on rules. You may want to perform any of the following procedures:

- Edit, Duplicate or Delete a Rule
- Filter or Search for Rules
- Import or Export Rules

Edit, Duplicate or Delete a Rule



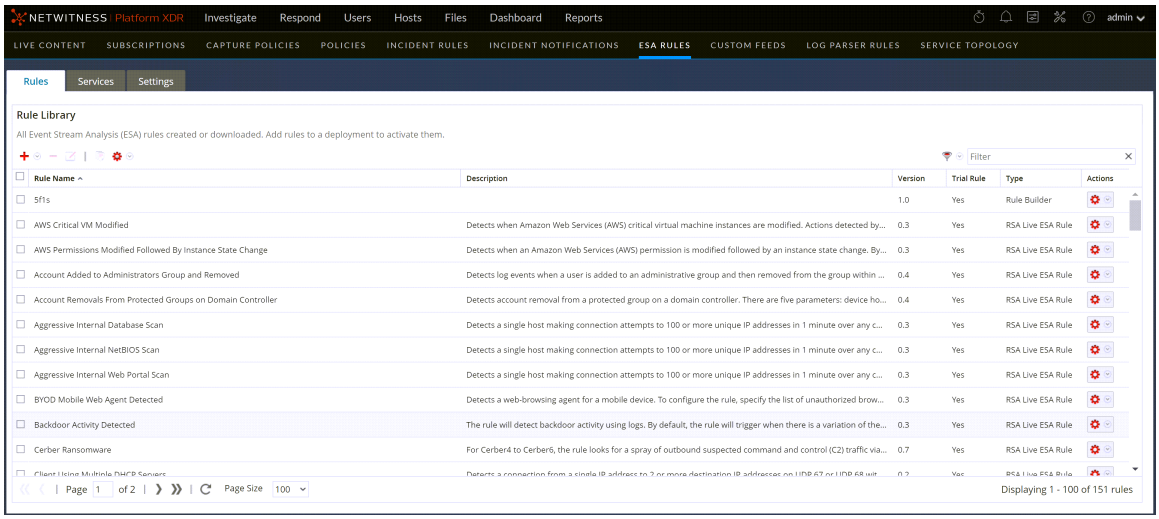
This topic provides instructions to edit, duplicate, or delete an Event Stream Analysis (ESA) rule. When you edit a rule, ESA applies the updated criteria going forward. No changes are made to previously generated alerts.

Edit a Rule

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the **Rule Library**, select the rule you want to edit and click .
   Depending on the rule type, the respective rule tab is displayed.
3. Modify the required parameters.
4. Click **Save**.

Duplicate a Rule

1. In the **Rule Library**, select the rule you want to duplicate and click .
2. The Duplicate a Rule dialog is displayed. The system adds **Copy of** in front of the rule name.



3. In the **Name** field, type a unique name for the duplicate rule and click **OK**.

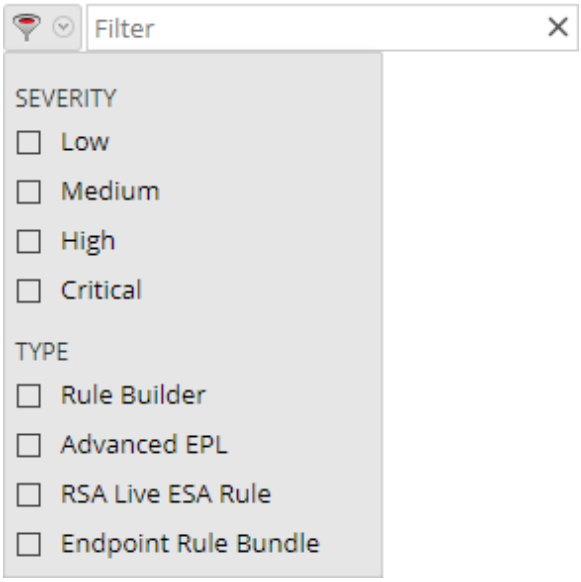
A duplicate rule with the new name is added to the Rule Library.

Delete a Rule

1. Go to **(Configure) > ESA Rules > Rules**.
   The Rules tab is displayed.

2. In the Rule Library, select one or more rules and click .
   A warning dialog is displayed.
3. Click **Yes**.
   A confirmation message that the rule is deleted successfully is displayed and the selected rule is deleted from the Rule Library.

Filter or Search for Rules



This topic shows analysts how to specify the type of rules that display in the Rule Library.

Prerequisites

Make sure that you understand the Rule Library view components. For more information, see Rule Library Panel.

Filter Rules

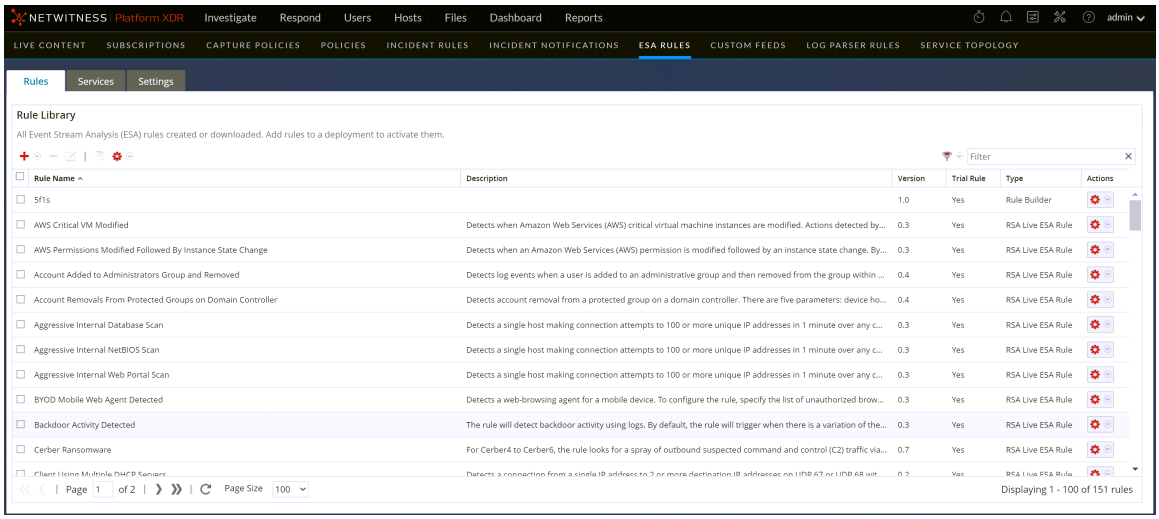
1. Go to **(Configure) > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library** panel toolbar, click and select the severity and type of rules that you would like to appear in the Rule Library list. The following figure shows the Filter drop-down list.

The selected rule types appear in the list.

Search for Rules

1. Go to **(Configure) > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library** panel toolbar, type a rule name in the Filter field.
   The Rule Library panel lists the rules that match the names entered in the Filter field.

Import or Export Rules



The topic provides instructions to import ESA rules from a NetWitness instance and to export ESA rules to your hard drive so you can keep a local copy.

If you exported a rule in an earlier version of NetWitness, the following conditions apply when you import the rule in version 10.5 or later:

- Exported in version 10.3 – You cannot import rules to version 10.5 or later.
- Exported in version 10.4 – You can import rules to version 10.5 or later.

Import ESA Rules

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.

2. In the **Rules Library** toolbar, select > **Import**.
   The Import ESA Rules dialog is displayed.

3. Click **Browse** to browse and select the file containing the ESA rules.
4. Click **Import**.

Export ESA Rules

1. Select an ESA rule or multiple rules and select > **Export** in the Rule Library toolbar.
   A warning dialog is displayed.
2. Click **Yes**.
   The Export Rules dialog is displayed.
3. In the **Enter File Name** field, type a filename for the file with the ESA rules and click **Export**.
   The file is exported as a binary file to your machine.

Note: The binary file cannot be edited.

Choose How to be Notified of Alerts

This topic explains the different notification methods and how to add a notification method to a rule. Administrator, SOC Manager or DPO role permissions are required for all tasks in this section.

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- Syslog
- Script

To configure a notification, you configure these components:

- **Notification Server**: The notification server is the source of the notifications. After you configure a notification server, you can add it to a rule. When the rule triggers an alert, the rule will use that server to send alert notifications.
- **Notifications**: These are the outputs (destinations) of the notifications, which can be email, script, and Syslog. When you design a rule, you can specify the notification for an alert.
- **Templates**: The message format of an alert notification is defined in a template.

If you use an ESA rule that has an enrichment, such as a Context Hub list, you must create a custom template. You can duplicate a default template and adjust it for your enrichment. For more information, see Troubleshoot ESA Rules. For information on creating a custom template, see see "Configure Meta Keys as Arrays in ESA Correlation Rules" in the *System Configuration Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

Alert suppression and alert rate regulation are two features that Event Stream Analysis provides. Alert suppression ensures that multiple emails are not sent out for the same alert. For example, consider a rule to detect failed user logins. If you set the alert suppression to three minutes, you will see only the alerts generated in that time frame. This is fewer than the number of alerts you would see without alert suppression. Some alerts can be duplicates. With alert suppression, emails are not sent for duplicate alerts. This ensures the inbox is not flooded with redundant alert notifications.

Alert rate regulation is a preventive measure to ensure that alerts from misconstrued rules do not flood the system. This ensures that ESA does not send more than the configured limit of emails within one minute.

Notification servers, notifications, and templates are configured in the Administration System view. For more information, see "Configure Notification Servers", "Configure Notification Outputs", and "Configure Templates for Notifications" in the *System Configuration Guide.*

Notification Methods

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- Syslog
- Script

Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

Email Notifications

ESA Correlation can send notifications to users through email about various system events.

To configure these email notifications, you need to:

- Configure the SMTP email server as an output provider. For instructions, see "Configure the Email Settings as Notification Server" in the *System Configuration Guide*.
- Set up an email account to receive notifications. For instructions, see "Configure Email as a Notification" in the *System Configuration Guide*.
- Configure a template for email notification. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Syslog

Event Stream Analysis can send events and consolidate logs in Syslog format to a Syslog server.

To configure these Syslog notifications, you need to:

- Configure Syslog server settings as an output provider. For instructions, see "Configure a Syslog Notification Server" in the *System Configuration Guide*.
- Configure Syslog message format as an output action. For instructions, see "Configure Syslog as a Notification" in the *System Configuration Guide.*
- Configure a template for Syslog. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Script Alerter

Apart from the alert notifications ESA allows users to run scripts in response to ESA alerts.

Scripts enable you to do custom integration with applications that exist in your environment. For example, if you want to open an incident ticket from an application when a specific alert is triggered, Script Alerter lets you write a script that calls the application API and has ESA invoke it when the specific ESA rule is triggered. You can configure a FreeMarker template to define what details you want to extract from the output of the ESA rule and pass it as command line arguments to the script.

To use the Script Alert, you need to:

- Configure the user identity and other details that are required to execute the script. For instructions, see "Configure Script as a Notification Server" in the *System Configuration Guide*.

- Define the Script. For instructions, see "Configure Script as a Notification" in the *System Configuration Guide*.
- Configure a template for the script. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Add Notification Method to a Rule

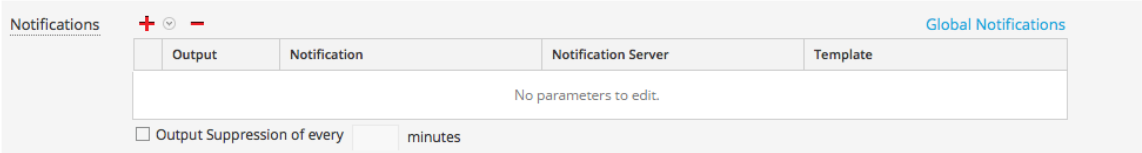
This topic tells administrators how to add a notification, such as email, to a rule. ESA uses the notification method when it generates an alert for an event that meets rule criteria.

You add a notification to a rule so ESA can let you know when a rule triggers an alert. Although the notification fields are not required, it is a best practice to add a notification to a rule.

When you add a notification method to a rule, you select the following information:

- Output
- Notification
- Notification Server
- Template

Prerequisites

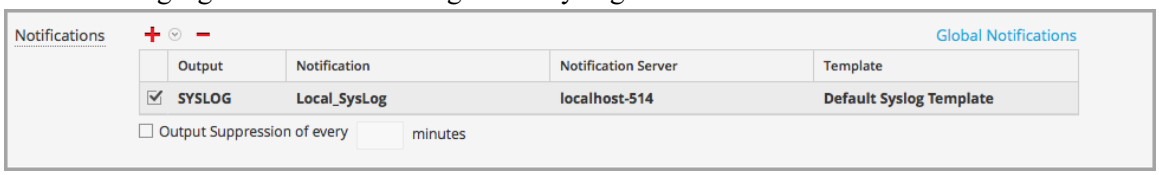


- Your role must have permission to manage rules.
- The rule must exist.
- The notification method must be configured with a supported server and template:

  Go to **(Admin) > System > Global Notifications**.

  For detailed procedures, see the *System Configuration Guide.*

Add a Notification Method to a Rule

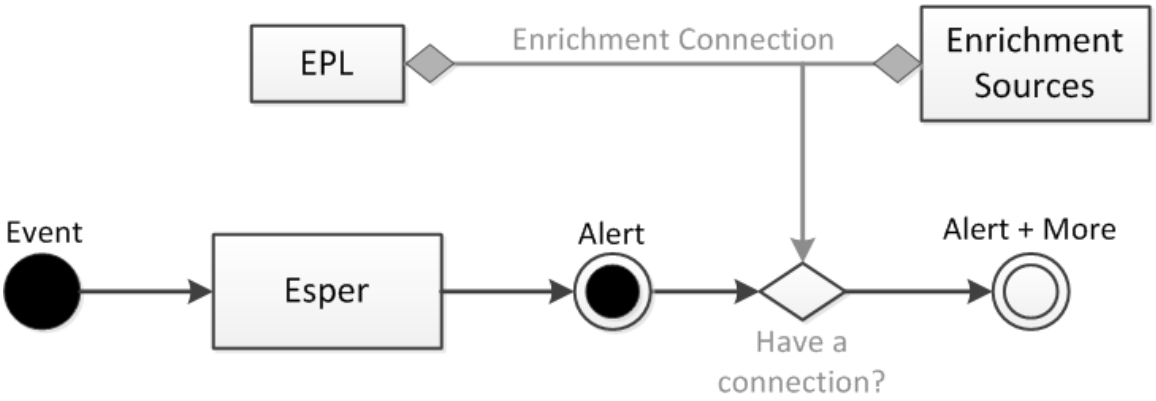


1. Go to **(Configure) > ESA Rules > Rules** tab.
2. In the **Rule Library**, click to add a new rule or select an existing rule and click .
   Depending on the rule type, the Rule Builder or Advanced EPL tab is displayed.
   The Notifications section is the same for both tabs.

3. Click and select the **Output** for the alert:

- Email
- SNMP (This option is not supported in NetWitness 11.3 and later.)
- Syslog
- Script

4. Double-click the **Notification** field and select the name of a previously configured output.
   For example, Level 1 Analyst could be the name of an email notification that goes to the L1-Analysts email distribution group.
5. Double-click the **Notification Server** field and select the server that sends the notification.
6. Double-click the **Template** field and select a format for the alert.
   The following figure shows the settings for a Syslog notification.



7. If you want to specify frequency, select **Output Suppression**, then enter the number of **minutes**.
8. If you want to add another notification, repeat steps 3-7.
9. Click **Save**.
   When ESA generates an alert for an event that matches the rule criteria, you will be notified of the alert via each notification method added to the rule.

Add a Data Enrichment Source

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Enrichments provide the ability to include contextual information into correlation logic and alert output. Without enrichments, all information included in an ESA alert is from a Core service. With enrichments, you can request for look ups into a variety of sources and include the results into the outgoing alerts. The following figure illustrates the enrichment feature.

Enrichment configuration is made up of two logical units:

- Enrichment Sources – These are data stores of contextual information.
- Enrichment Connections – These act as connectors between alert meta and source columns.

ESA allows you to make connections between Event Processing Language (EPL) statements and enrichment sources. Once the connections are established, the system joins the selected fields from the alert output with the information in the sources and uses the matching data to enrich the alert that is sent out. ESA can connect with the following sources:

- Esper Named Windows
- MaxMindGeoIP Database

Note: The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

Example Rule with Enrichments

The following example rule illustrates how ESA enrichments can enhance alerts.

```
@RSAAlert @Name("simple") SELECT * FROM Event(ec_theme='Login Failure')
```

This rule generates an alert for every logon failure and thus if the following (simplified) event stream is received at ESA:

sessionid	ec_ theme	username	ip_src	ip_dst	host_dst
1	Login Success	dshrute	23.xx.23x.16		
2	Login Failure	jhalpert	23.xx.23x.16	31.1x.x9.1x8	www.facebook.com

An alert without an enrichment with the following constituent `events` might be generated in response to the second session:

```
{
     "events": [
          {
               "username": "jhalpert",
               "host_dst": "www.facebook.com",
               "ip_dst": "31.1x.x9.1x8",
               "sessionid": 2,
               "ec_theme": "Login Failure",
               "esa_time": 1406148964130,
               "ip_src": "23.xx.23x.16"
          }
     ]
 }
```

The JSON output shows all the information available for inclusion into an ESA notification using an appropriate FreeMarker template. For instance, the template expression `${events[0].username}` would evalute to `jhalpert`.

With enrichments, the same deployment, with the same event stream, can generate the alert shown below.

```
{"events": [
     {
          "username": "jhalpert",
          "host_dst": "www.facebook.com",
          "GeoIpLookup": [
          {
               "city": "Cambridge",
               "longitude": -71,
               "countryCode": "US",
               "areaCode": 617,
               "metroCode": 506,
               "region": "MA",
               "dmaCode": 506,
               "ipv4Obj": "/23.xx.23x.16",
               "countryName": "United States",
               "postalCode": "02142",
               "ipv4": "23.xx.23x.16",
               "latitude": 42,
               "organization": "Verizon Business"
          }
     ],
     "orgchart": [
          {
               "supervisor": "mscott",
               "name": "James Halpert",
               "extension": 3692,
               "location": "Scranton",
```

```
            "department": "Sales",
            "id": "jhalpert"
        }
    ],
    "ip_dst": "31.1x.x9.1x8",
    "sessionid": 2,
    "LoginRegister": [
        {
            "username": "dshrute",
            "ip_src": "23.xx.23x.16"
        }
    ],
    "ec_theme": "Login Failure",
    "esa_time": 1406155218912,
    "ip_src": "23.xx.23x.16"
    }
]}
```

The system pulls contextual data to make the alert more meaningful.

To include the name of the supervisor and the name of the user with the last successful login in the ESA notification, this example includes the following template expressions: `${events[0]["orgchart"][0].supervisor}` gives the name of the supervisor of the employee in the alert and `${events[0]["LoginRegister"][0].username}` gives the name of the user with the last successful logon from the same `ip_src` (using a stream based Named Window).

Enrichment Sources

This topic explains options for adding an external data source to provide additional information in alerts. Enrichment sources provide additional information in alerts. For example, an in-memory table can provide a full name, title, office location, and employee number if a user matches rule criteria. The following types of enrichment sources are available:

- Context Hub List (Preferred)
- In-Memory Table (Ad hoc only)
- GeoIP

Note: Database, Database Connection, Warehouse Analytics, and Recurring In-Memory Tables as enrichment sources are not supported for the ESA Correlation service in NetWitness 11.3 and later.

It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources. You can share Context Hub List enrichment sources across the NetWitness. You can only use the In-Memory Table with ESA. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources.

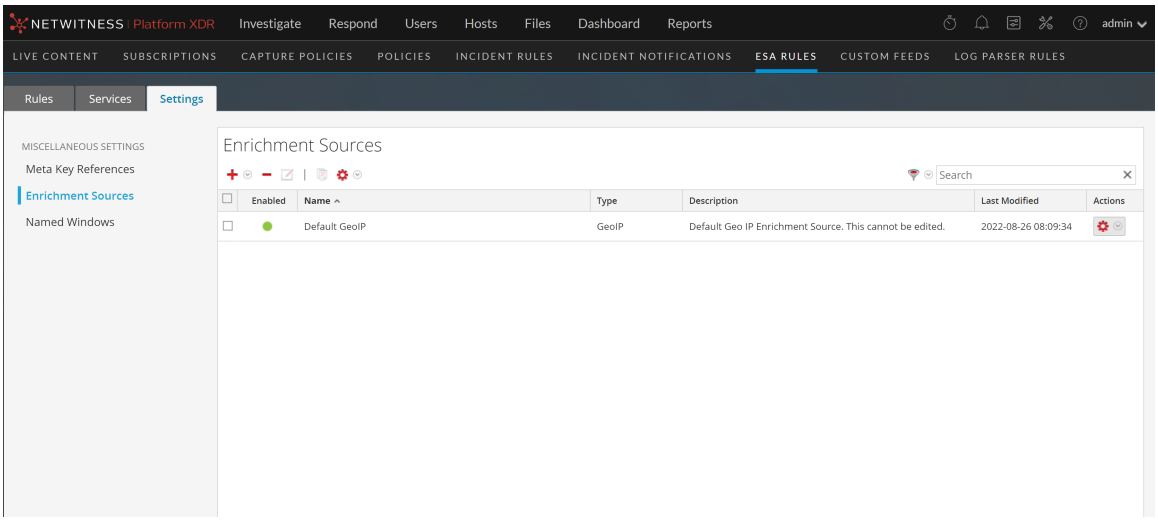
Note: The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

Configure a Context Hub List as an Enrichment Source

This topic provides instructions on how to configure a Context Hub list as an enrichment source for ESA. Once a Context Hub list is added as an enrichment source, analysts can use the configured list as a statement condition when creating an ESA rule. Any changes made to the list from within Context Hub are automatically reflected in the enrichment source in real-time. For example, you could create a list of IP addresses in Context Hub and then use that list as either a blacklist or whitelist as part of a correlation rule condition. Any subsequent changes made to the IP list in Context Hub will be reflected in the enrichment source in real-time, to ensure the correlation rule operates with a constantly updating set of information.

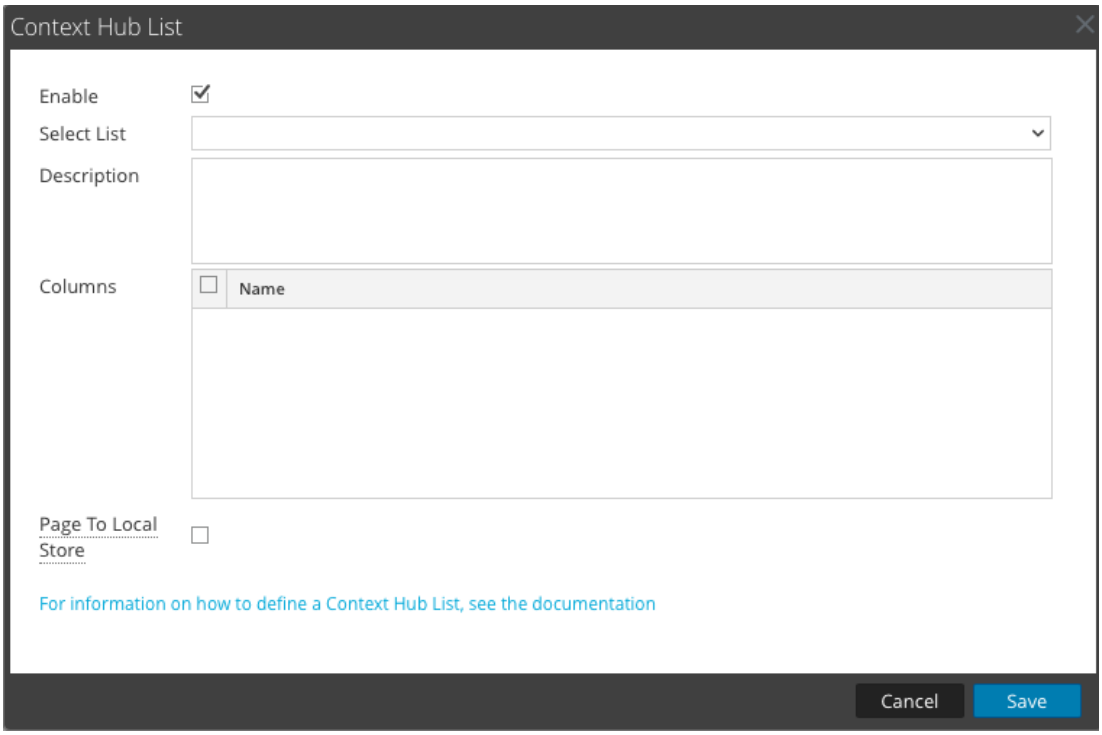
Prerequisites

Before configuring a Context Hub list as an enrichment source, the list must first be created as a data source in Context Hub. Any list created in Context Hub is supported and the lists may contain string or numeric values, including IP addresses. For information on creating a list as a data source in Context Hub, see the *NetWitness Context Hub Configuration Guide*.



Caution: When creating a Context Hub list for use as an enrichment source, the list name and its field names cannot include any spaces or special characters, or start with a number. If you do not follow this naming convention, when you attempt to add the list as an enrichment source in ESA, an error message will be displayed and you will not be allowed to add the list.

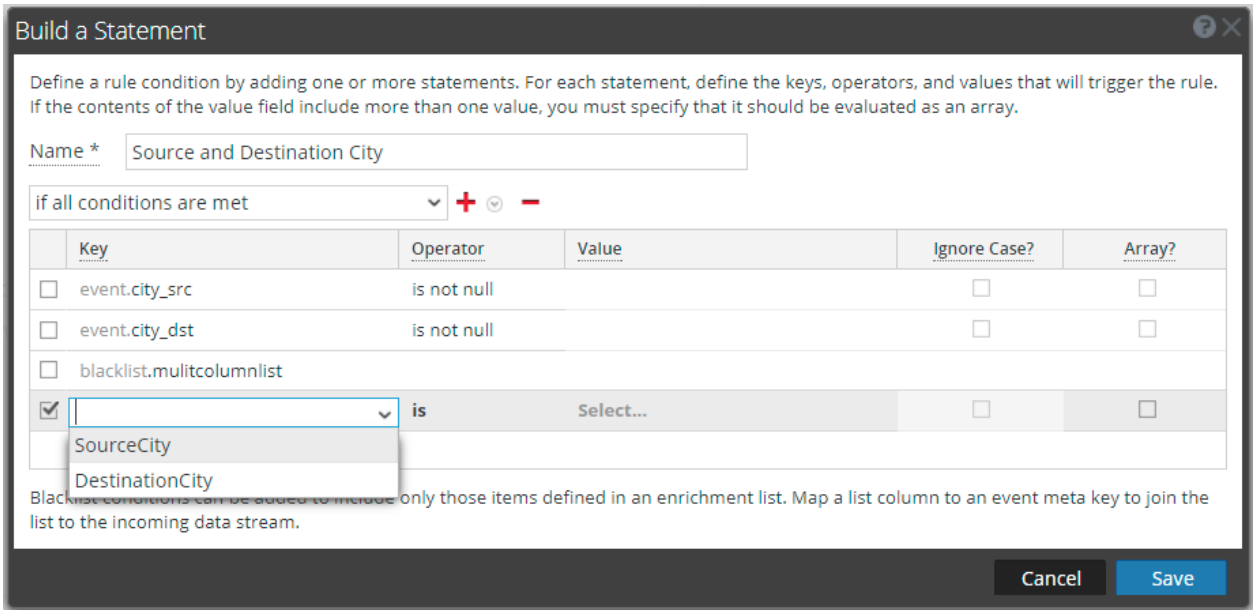
IMPORTANT: If you rename a Context Hub list or recreate the Context Hub list with the same name, update the ESA rules that use that Context Hub list, and then redeploy the ESA rule deployments that contain those rules.



Configure a Context Hub List as an Enrichment Source

1. Go to  **(Configure) > ESA Rules > Settings** tab.
2. In the options panel, select **Enrichment Sources**.

   The Enrichment Sources panel is displayed.



3. From the  drop-down menu, select **Context Hub**.

4. Select **Enable** to enrich alerts with a Context Hub list. This is selected by default. If disabled, the alerts will not be enriched with the configured Context Hub list.
5. Select the desired Context Hub list from the **Select List** drop-down menu of pre-configured lists.
6. (Optional) In the **Description** field, type a brief description about the selected Context Hub list. The text entered here is displayed on the Enrichment Sources panel.
7. In the **Columns** field, all columns included in the selected Context Hub list are listed. Click to enable or disable the columns in the list that you wish to include when using this list as an enrichment source in an alert.

8. (Optional) Click to enable the **Page To Local Store** option. This option is useful if you have a very large list and performance is affected. If this is the case, enabling this option will write a copy of the Context Hub list to the local disk to improve performance.
9. Click **Save**.
   The Context Hub list is configured. You can now add it to an ESA rule as part of a condition statement as either a blacklist or a whitelist condition.

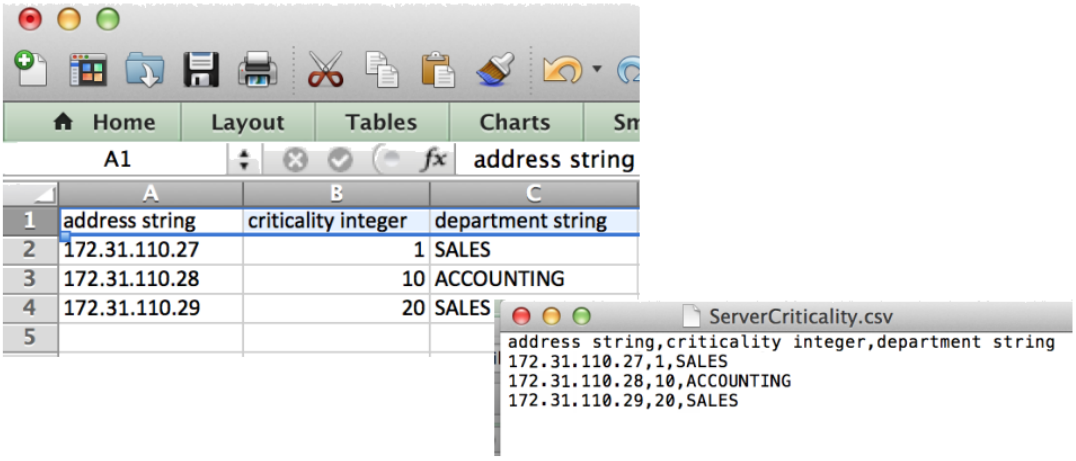
The following figure illustrates adding a Context Hub list as part of a condition statement. In this example, a context Hub list named "multicolumnlist" was added as a blacklist condition. The list contains two columns, SourceCity and DestinationCity. The next step would be to select one of the column names as the subcondition and then specify the operator and enter the meta value for the corresponding value field.

For complete details for adding a whitelist or blacklist to a condition statement, see Step 2. Build a Rule Statement.

To add a Context Hub list as a condition to an existing rule, select to edit the desired rule in the Rule Library, then add a condition in the Conditions section and select to add a whitelist or blacklist condition to the new condition statement.

Configure an In-Memory Table as an Enrichment Source

This topic provides instructions on how to configure an in-memory table. When you configure an in-memory table, you upload a .CSV file as an input to the table. You can associate this table with a rule as an enrichment source. When the associated rule generates an alert, ESA will enrich the alert with relevant information from the in-memory table.



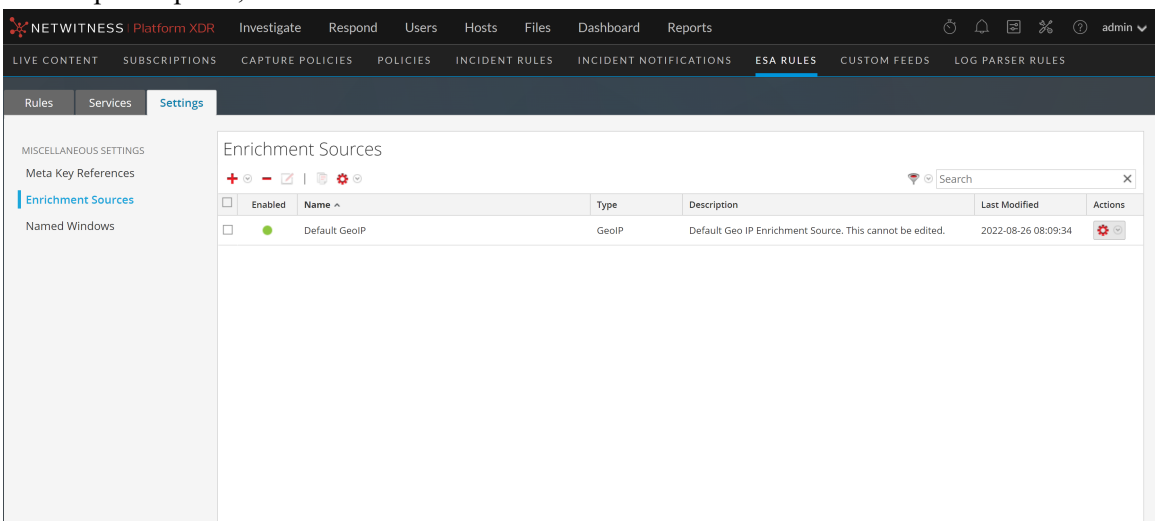
For example, a rule could be configured to detect when a user tries to download freeware and to identify the person by user ID in the alert. The alert could be enriched with additional information from an in-memory table that contains details such as full name, title, office location and employee number.

Note: It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

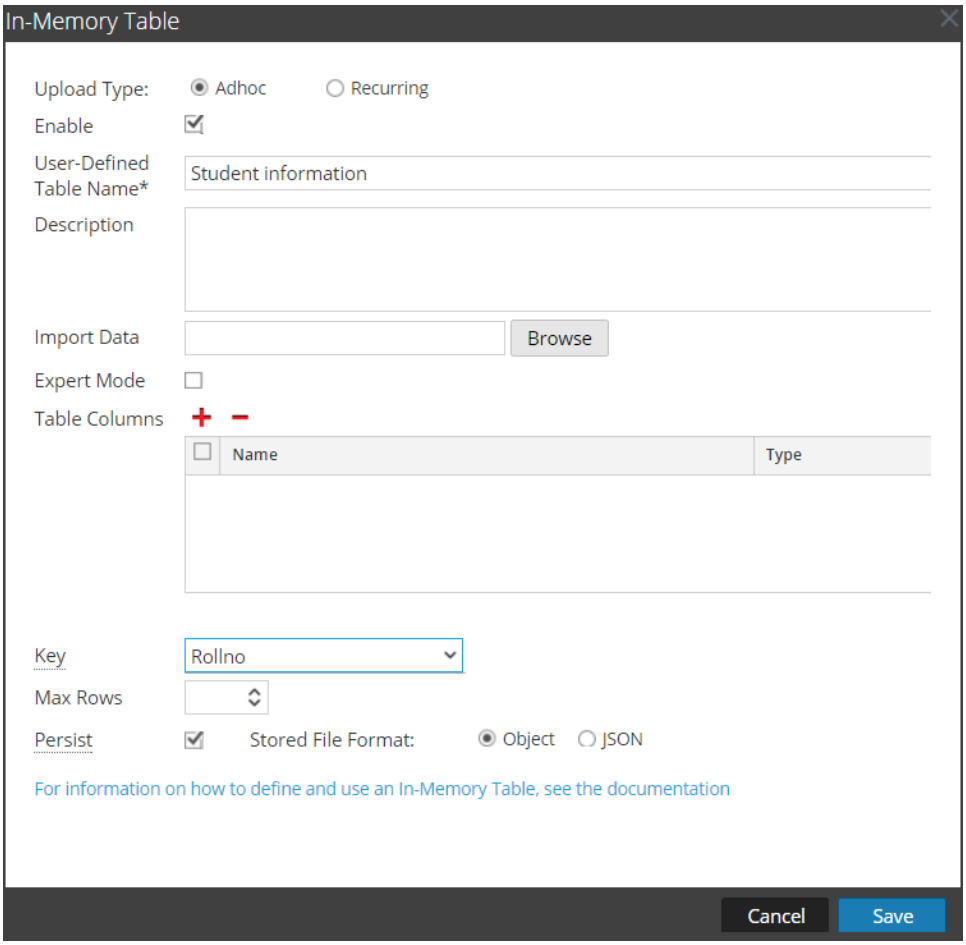
Prerequisites

- The column name in the .CSV file cannot have whitespace characters.
  For example *Last_Name* is correct, and *Last Name* is incorrect.
- The .CSV file must begin with a header line that defines fields and types.
  For example, *address string* would define the header field as *address*, and the type as *string*.

The following shows a valid .CSV file represented as a .CSV and as a table.



Configure an Ad hoc In-Memory Table



Note: It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

1. Go to **(Configure) > ESA Rules**.
   The Configure view is displayed with the ESA Rules tab open.
2. Click the **Settings** tab.

3. In the options panel, select **Enrichment Sources**.

4. In the **Enrichment Sources** section, click  > **In-Memory Table**.

5. Describe the in-memory table:
   a. Select **Ad hoc**.
   b. By default, **Enable** is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
   If you add an in-memory table to a rule but do not want alerts to be enriched, deselect the checkbox.
   c. In the **User-Defined Table Name** field, type a name, such as Student Information, for the in-memory table configuration.

   Note: Do not use any Esper keyword as **User-Defined Table Name** since this causes an error while using this enrichment in the ESA Rule. For Esper keywords, see Reserved keywords.

   d. If you want to explain what the enrichment adds to an alert, type a **Description** such as:
   When an alert is grouped by Rollno, this enrichment adds student information, such as name and marks.
6. In the **Import Data** field, select the .CSV file that will feed data to the in-memory table.
7. If you want to write an EPL query to define an advanced in-memory table configuration, select **Expert Mode**.
   The Table Columns are replaced by a **Query** field.
8. In the **Table Columns** section, click + to add columns to the in-memory table.
9. If a valid file is selected in the Import Data field, the columns populate automatically.

Note: If you selected Expert mode, a Query field is displayed instead of Table Columns.

10. In the **Key** drop-down menu, select the field to use as the default key to join incoming events with the in-memory table when using a CSV-based in-memory table as an enrichment. By default, the first column is selected. You can also later modify the key when you open the in-memory table in enrichment sources.
11. In **Max Rows** drop-down menu, select the number of maximum number of rows that can reside in the in-memory table at a particular instance.
12. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
13. In **Stored File Format** field, do one of the following:
    - Select **Object**, if you want to store the file in a binary format.
    - Select **JSON**, if you want to store the file in a text format.
    By default, **Object** is selected.
14. Click **Save**.
    The adhoc in-memory table is configured. You can add it to a rule as an enrichment or part of the rule condition. See Add an Enrichment to a Rule.

When you add an in-memory table, you can add it to a rule as an enrichment or as a part of the rule condition. For example, the following rule uses an in-memory table as a part of the rule condition to create a whitelist, and it also uses an in-memory table of details in the user_dst file to enrich the alert that is displayed.

The rule shows the in-memory table as a whitelist rule condition:

Next, the alert is enriched with the User_list in-memory table:

Therefore, the user_dst in-memory table is used to create a whitelist, and it is also used to enrich the data in the alert if the alert is triggered.

Add a Recurring In-Memory Table

Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

It is preferable to use Context Hub List enrichment sources for ESA rules instead of In-Memory Table enrichment sources. You can share Context Hub List enrichment sources across the NetWitness Platform. You can only use the In-Memory Table with ESA.

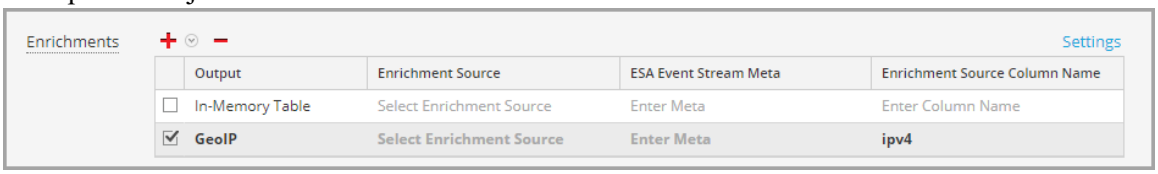
Note: Database, Database Connection, Warehouse Analytics, and Recurring In-Memory Tables as enrichment sources are not supported for the ESA Correlation service in NetWitness 11.3 and later.

Add an Enrichment to a Rule

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Adding an enrichment to a rule allows you to request for look ups into a variety of sources and include the results in the outgoing alerts, giving you a more detailed alert. This procedure requires role permissions for Administrator, DPO, and SOC Manager.

Note: This procedure does not apply to adding a Context Hub list as an enrichment to a condition statement in an existing rule. For information see Configure a Context Hub List as an Enrichment Source.



To add an enrichment to a rule:

1. Go to **(Configure) > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   - Double-click a rule.
   - Select a rule and click in the **Rule Library** toolbar.

   The Rule Builder panel is displayed in a new NetWitness tab.
3. In the **Enrichments** section, click and select any of the following enrichment types:
   - In-Memory Table
   - GeoIP

   Note: If you use a GeoIP source, ipv4 is automatically populated, and is not editable.

   The enrichment types that you have selected are displayed in the table.
4. For the added enrichment type, perform the following:
   - In the **Output** column, select the type that you have configured.
   - In the **Enrichment Source** drop-down list, select the enrichment source defined.
   - In the **ESA Event Stream Meta** field, type the event stream meta key whose value will be used as one operand of join condition.

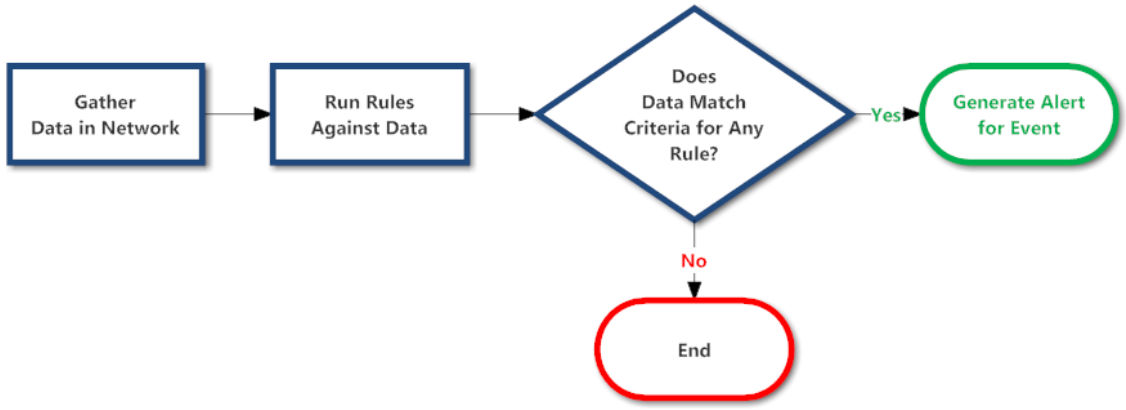
   - In the **Enrichment Source Column Name** field, type the enrichment source column name whose value will be used as another operand of the join condition.
5. Select **Debug**. This adds an @Audit('stream') annotation to the rule. This is useful when debugging the Esper rules.
6. Click **Show Syntax** to test if the defined ESA rule is valid.
7. Click **Save**.

For details on parameters and their descriptions, see Rule Builder Tab.

Deploy Rules to Run on ESA

This section explains how an ESA Rule Deployment works and how to set up a deployment to run a group of ESA rules. Administrator, SOC Manager, or Data Privacy Officer role permissions are required for all procedures in this section.

To create an ESA rule deployment, you need to perform the steps described in Managing ESA Rules, Data Sources and Deployments



How an ESA Rule Deployment Works

An ESA rule deployment consists of an ESA service, one or more data sources, and a set of ESA rules. When you deploy rules, the ESA service runs them to detect suspicious or undesirable activity in your network. Each ESA rule detects a different event, such as when a user account is created and deleted within one hour.

The ESA service performs the following functions:

1. Gathers **data** in your network
2. Runs ESA **rules** against the data
3. Applies rule **criteria** to data
4. Generates an **alert** for the captured event

The following graphic shows this workflow:

In addition, you may want to perform other steps on your deployment, such as replacing an ESA service, changing a data source, editing or deleting a rule from the deployment, renaming or deleting the deployment, or showing updates to the deployment. For descriptions of these procedures, Managing ESA Rules, Data Sources and Deployments.

Managing ESA Rules, Data Sources and Deployments

From 12.1 and later versions, the ESA deployments are managed by policies and groups on the **(Configure)** > **Policies** page.

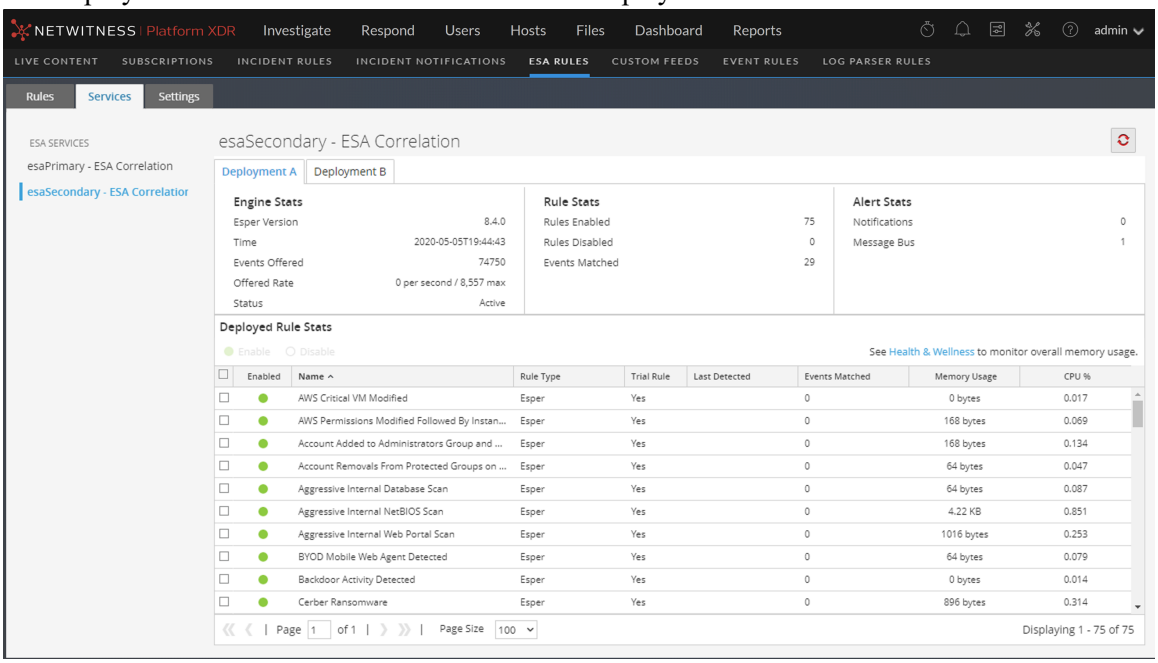
If you want to create any new ESA rules, add new data sources or perform any new ESA deployments, see the following sections in the Live Services Management guide:

- To view, add, edit, or delete data sources, see section "Manage ESA Datasources".
- To add, edit or delete an ESA rule, see the following topics, "Create an ESA Rule", "Edit, Duplicate or Delete a Rule", and "Delete an ESA Rule".
- To view, create, edit, remove, deploy or stop a deployment, see section "Manage Deployments".

View ESA Stats and Alerts

When ESA generates alerts, you can view details about how the rules performed, such as statistics on the engine, rule, and alert, and you can also view information on which rules are enabled or disabled. For instructions on viewing ESA stats, see View Stats for an ESA Service

When your ESA generates alerts, you can view the results in the Respond Alerts List view. This enables you to see trends and understand both the volume and frequency of alerts. For instructions on viewing alerts, see View a Summary of Alerts



View Stats for an ESA Service

This topic describes how to view the deployment statistics (stats) for an ESA Correlation service. This procedure is useful when you are attempting to determine the effectiveness of a rule or troubleshoot an ESA rule deployment.

Caution: When you modify and re-deploy an ESA rule deployment, all of the stats are removed from that deployment. The generated alerts are not removed from NetWitness Respond.

View ESA Stats

1. Go to **(Configure) > ESA Rules > Services** tab.
2. From the **ESA Services** list on the left, select a service.
   The deployment stats for the selected service are displayed.

3. (This option applies to NetWitness version 11.3 and later.) In the Deployment view under the ESA Correlation service name, select the tab of the deployment you would like to view. For example,

select the Deployment A tab to view the stats for deployment A. Select the Deployment B tab to view the status for deployment B.

4. Review the following sections of ESA stats.
   For a complete description of each statistic in each section, see Services Tab.
   - **Engine Stats**
   - **Rule Stats**
   - **Alert Stats**
5. In the **Deployed Rule Stats**, review details about the rules deployed on the ESA.
   For a complete description of each column in each section, see Services Tab.
   - If the rule is enabled or disabled
   - What the rule name is
   - The type of rule
   - If the rule is running in Trial Rule mode
   - Last detected
   - Events matched
   - The amount of memory used by the rule
   - The percentage of the deployment CPU used by the rule (available in NetWitness version 11.5 and later)
6. To monitor overall memory usage and health of your ESA Correlation service, click **Health & Wellness**.

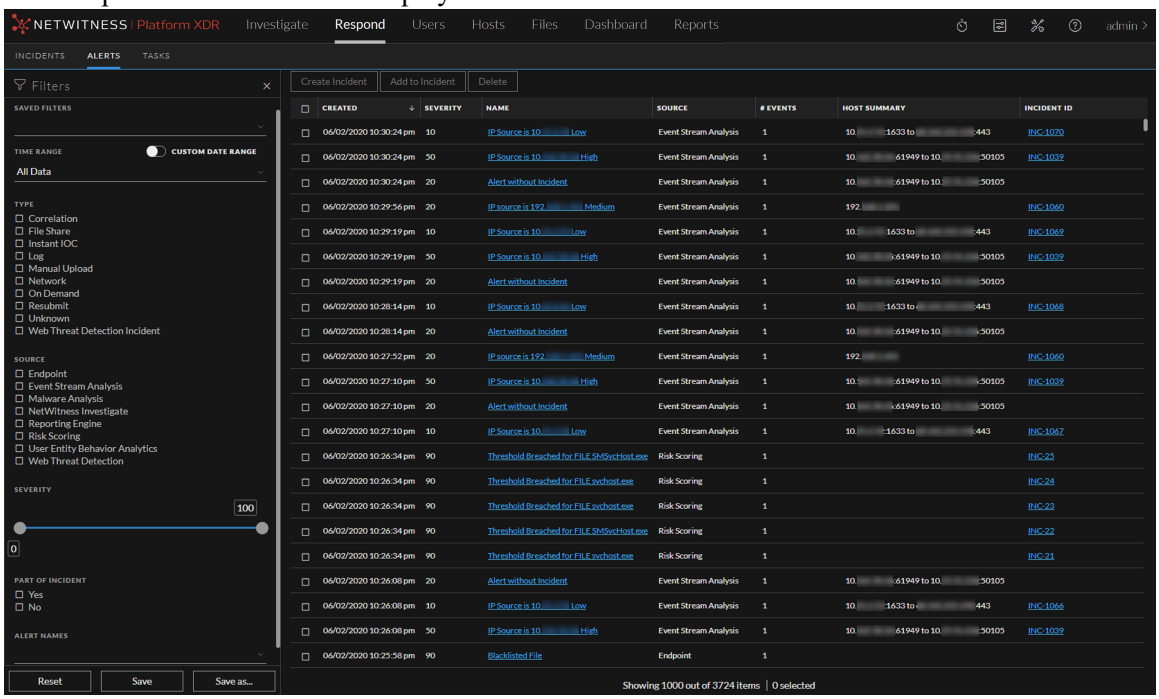
Enable or Disable Rules

1. In the **Deployed Rule Stats** panel, select a rule from the grid.
2. Click Enable to enable the rule, or click Disable to disable the rule.
   The Services tab is refreshed to show the changes, which take effect immediately.

Refresh the Statistics

The Services tab does not update statistics automatically unless you enable or disable a rule. To ensure you view current statistics:

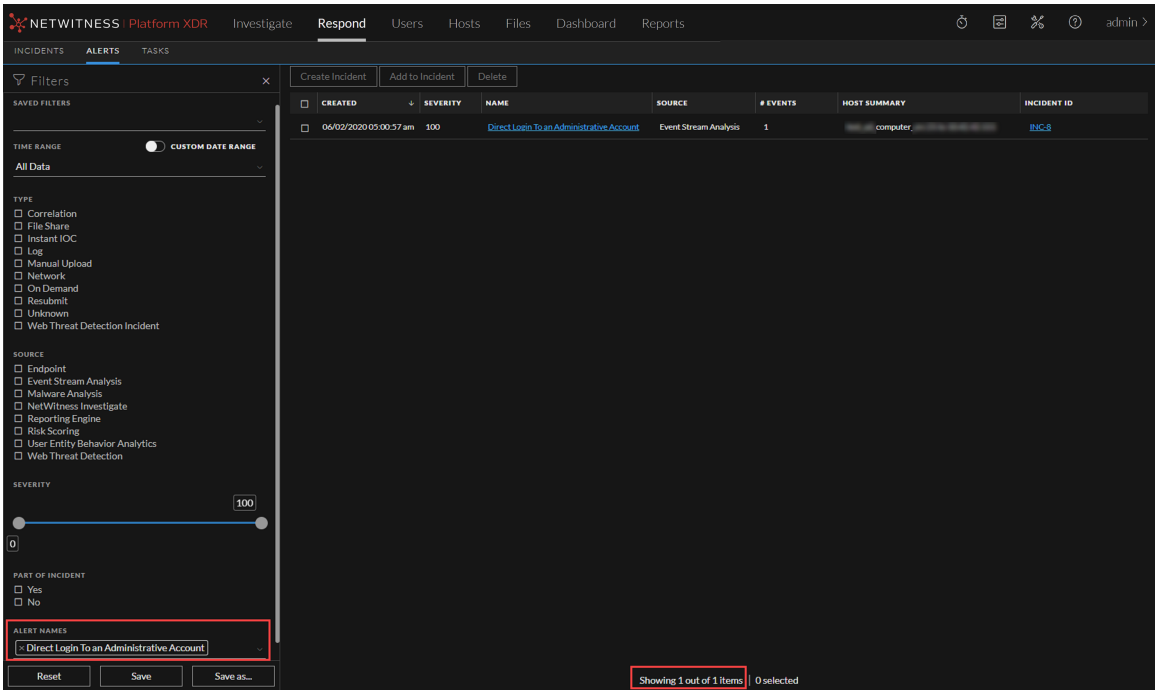
1. Click in the upper right corner to refresh the information.
2. View the updated information.



View a Summary of Alerts

In the Repond view, you can browse through various alerts from multiple sources. You can filter the alerts list to show only alerts of interest, such as by Alert Name, alert source, and a specific time range from the following sources:

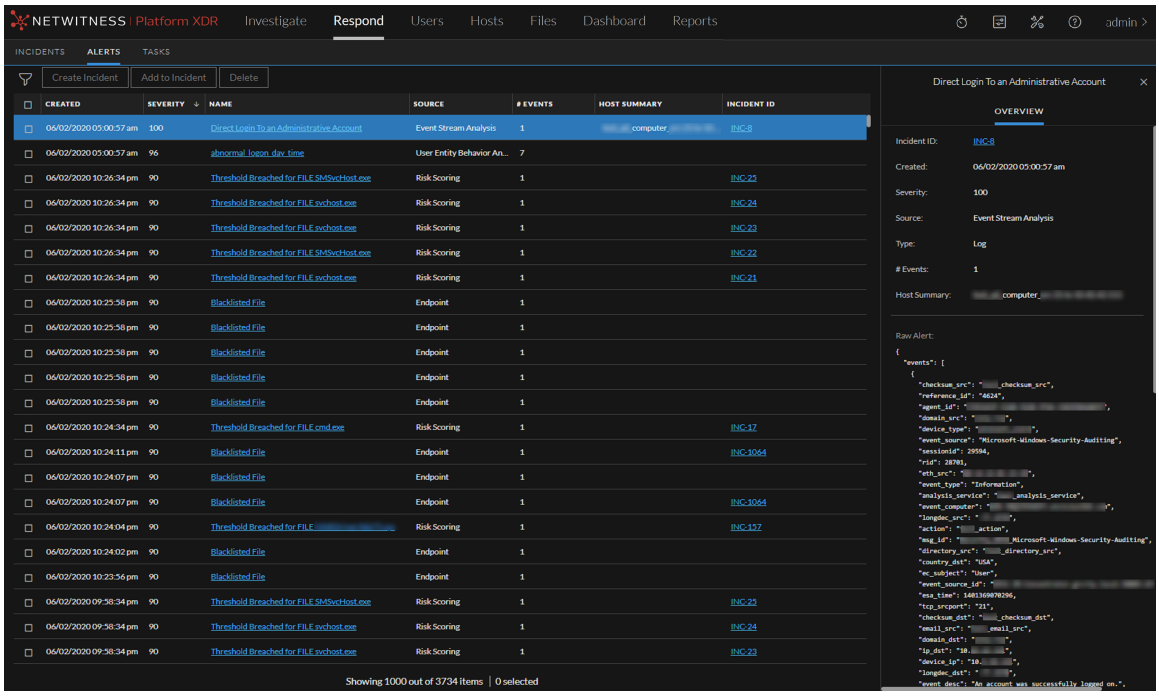
1. Detect AI
2. Endpoint
3. Event Stream Analysis
4. Malware Analysis
5. NetWitness Investigate
6. Reporting Engine
7. Risk Scoring
8. User Entity Behavior Analysis
9. Web Threat Detection



Perform the following steps to use the functionalities provided in the Respond view.

1. Go to **Respond > Alerts**.
   The Respond Alerts List view displays a list of all NetWitness alerts.

2. In the **Filters** panel on the left, you can filter the alerts list to view specific alerts for a specific time frame. For example, in the Alert Names section, you can select an alert for an ESA rule, such as



Direct Login to an Administrative Account, and leave the Time Frame set to Last Hour.
The alerts list to the right shows a list of alerts that match your filter selection along with a count of the alerts at the bottom of the alerts list.

The alerts list shows information about each of the alerts.

- **Created**: Displays the date and time when the alert was created in the source system.
- **Severity**: Displays the level of severity of the alert. The values are from 1 to 100.
- **Name**: Displays a basic description of the alert.
- **Source**: Displays the original source of the alert.
- **# of Events**: Indicates the number of events contained within an alert.
- **Host Summary**: Displays details of the host, like the host name from where the alert was triggered.
- **Incident ID**: Shows the incident ID of the alert. If there is no incident ID, the alert does not belong to an incident.

3. You can click an alert in the list to open an **Overview** panel on the right where you can view raw alert metadata.

For more information about filtering alerts and viewing alert details, see the *NetWitness Respond User Guide*.

Add an Advanced EPL Rule

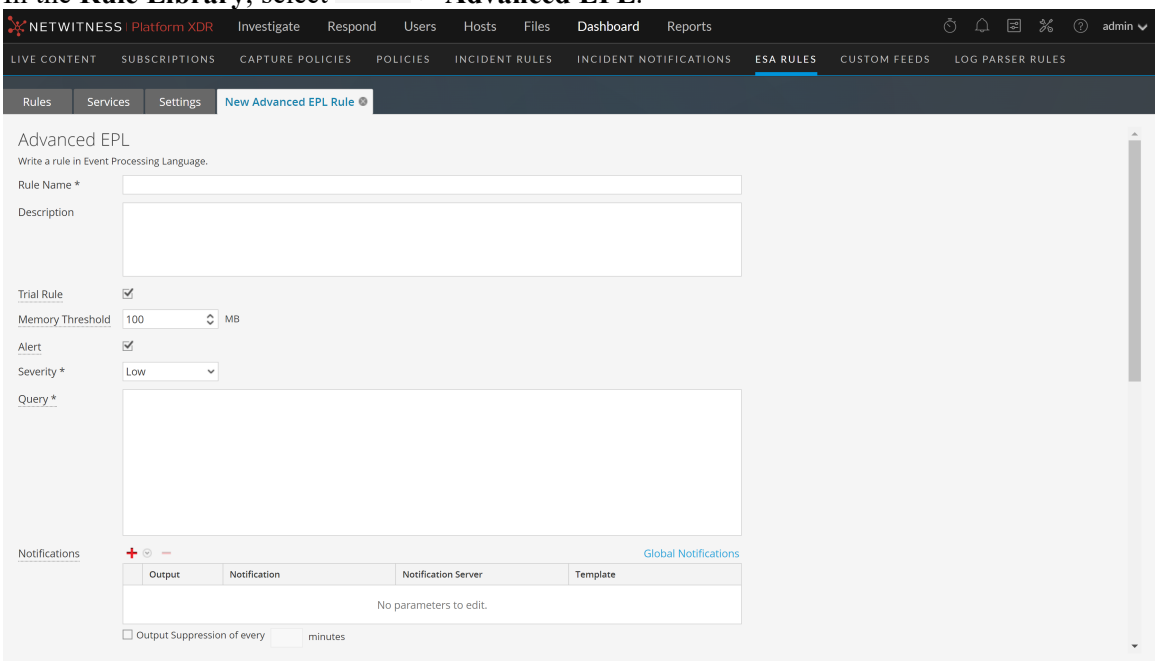
This topic provides instructions to define rule criteria by writing an EPL query. EPL is a declarative language for handling high-frequency time-based event data. It is used to express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events.

Write an advanced EPL rule when rule criteria is more complex than what you can specify in Rule Builder.

It is outside the scope of this guide to explain EPL syntax.

- For EPL Documentation, see http://www.espertech.com/esper/esper-documentation/
- For the EPL Online Tool, see http://esper-epl-tryout.appspot.com/epltryout/mainform.html

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.



Prerequisites

The following are prerequisites for adding an advanced rule:

- You must know Event Processing Language (EPL).
- You must understand ESA Annotations to mark which EPL statements are linked to generating alerts.

Add an Advanced EPL Rule

1. Go to **(Configure) > ESA Rules**.
2. In the **Rule Library**, select **> Advanced EPL**.

3. Type a unique, descriptive name in the **Rule Name** field.

   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.

4. In the **Description** field, explain which events the rule detects.

   The beginning of this description will appear in the Rule Library

5. Select **Trial Rule** to automatically disable the rule if all trial rules collectively exceed the memory threshold.

   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Working with Trial Rules.

6. (This option applies to 11.5 and later.) Enter a **Memory Threshold** for a rule that uses memory, such as a rule that contains windows or pattern matching. If the configured memory threshold is exceeded, the rule gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab. The Memory Threshold option works for trial rules and non-trial rules. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.

7. (This option applies to 11.3 and later.) Select **Alert** to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.

8. For **Severity**, classify the rule as Low, Medium, High or Critical.

9. To define rule criteria, write a **Query** in EPL.

   Note: For all meta key names, use an underscore not a period. For example, `ec_outcome` is correct but `ec.outcome` is not.

   Supported meta entities:

S. No	Supported Meta Entities	Description
1	fullname_all	
2	eth_all	
3	ip_all	Combines all the IPv4 meta keys.
4	ipv6_all	Combines all the IPv6 meta keys.
5	port_src_all	
6	port_dst_all	
7	dir_path_all	
8	org_all	
9	geoip_all	
10	port_all	
11	domain_all	
12	email_all	
13	filename_all	
14	directory_all	
15	checksum_all	
16	param_all	
17	context_all	
18	attack_all	
19	analysis_all	
20	compromise_all	
21	inv_all	
22	outcome_all	
23	ec_all	
24	user_all	
25	host_all	

26	client_all

10. For dynamic statement name generation in ESA, you must enclose the meta keys in curly brackets and include this annotation in the syntax:

    ```
    @Name("RIG {ip_src} {alias_host} {ec_activity}")
    ```

    where,

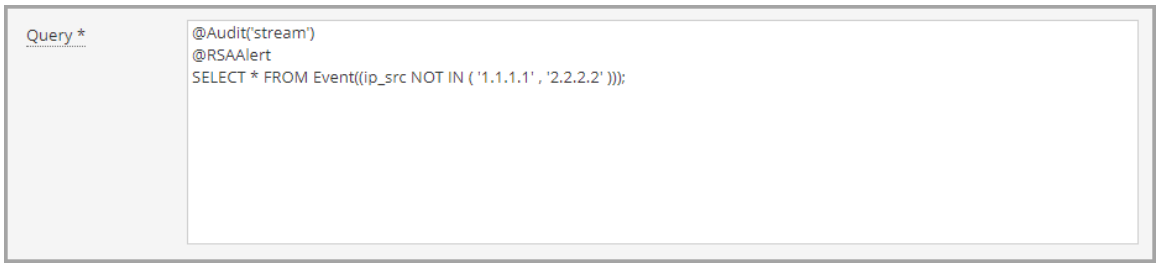
    - RIG is the static part of the statement name
    - {ip_src}, {alias_host}, {ec_activity} is the dynamic part of the statement name

    Note: If any of the metas in the dynamic part of the statement name has a null value, it is displayed as a static text.

    If a rule should generate an alert, include this ESA annotation in the syntax:

    ```
    @RSAAlert
    ```

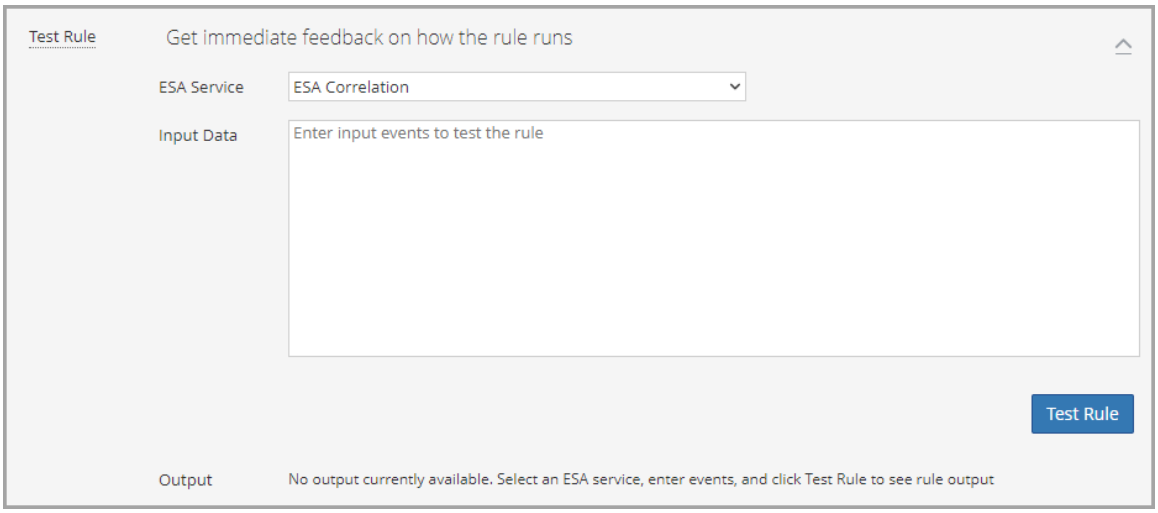
    For more information on ESA Annotations, see ESA Annotations.



Validate an Advanced EPL Rule

You can confirm that an ESA rule generates the expected alerts by testing the rule logic using JSON input data. You can view the alerts in the output, but this test does not send any alert notifications.

If you want to view all of the debug information, include an `@Audit('stream')` annotation to your rule query and view the Debug Log in the test output. To enable auditing you require to add `@Audit` to the rule and set the logging level for the Esper audit package to INFO. This can be done by creating `correlation-server.yml` file under `/etc/netwitness/correlation-server` with this content and restarting the correlation-server service with systemctl restart rsa-nw-correlation-server:



```
logging:
   level:
     com.espertech.esper.audit: INFO
```

The following basic example query contains the `@Audit('stream')` annotation and queries for events that do not have a source IP of 1.1.1.1 or 2.2.2.2.

1. If you are not already in the rule, go to **(Configure) > ESA Rules > Rules** tab and in the **Rule Library**, open the ESA rule that you want to test.

2. Scroll down to the **Test Rule** section.

3. In the **ESA Service** field, select the ESA Correlation service to process the rule. Use the same ESA Correlation service that you plan to use in the ESA rule deployment that contains the rule.
4. In the **Input Data** field, enter the input events to test the rule. Download the events from the Investigate view in JSON format, copy the events, and paste them in this field. You can do this from the Investigate > Navigate view or the Investigate > Events view.

   To download the events from the Investigate > Navigate view:

   a. In the main menu, go to **Investigate > Navigate** in a new tab, select a data source, and click **Navigate**.
   b. In the Navigate view, click **Load Values** and click a meta value to filter the events.
   c. Save the events as meta in the JSON file format [Save Events > Meta > (name the file) > Export Meta Format: choose JSON].
   d. In the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.
   e. In the Jobs panel, download your extracted meta, for example: **`investigation-2020-May-19-08-30-20.json`**.
   f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

   To download the events from the Investigate > Events view:

   a. In the main menu, go to **Investigate > Events** in a new tab.
   b. In the Events view, enter a query for the ESA rule test.
   c. Select the events to use and in the **Download** or **Download All** menu, select **Visible Meta as JSON** or **All Meta as JSON**, depending on the size of your selection.

d. In the main menu, go to **Dashboards** and in the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

e. In the Jobs panel, download your extracted meta, for example: **Concentrator_ALL_EVENTS_ALL_META.json**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

5. Click **Test Rule**. The **Output** field shows the output of your rule and you can determine if the results meet your requirements.

Note: If you are testing any Rule that has meta key defined as type 'short', the Test Rule will not generate alert for the event.

The following table describes the test rule output **Engine Stats**.

Field	Description
Engine Version	Esper version running on the ESA service

Field	Description
Events Offered	Number of events processed by the ESA service since the last service start
Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment.

The following table describes the test rule output **Rule Stats**.

Field	Description
Deployed	A green checkmark indicates that the rule is deployed on the selected ESA service.
Statements Fired	The number of statements that fired the alerts
Alerts Fired	The number of alerts generated from the test data
Events in Memory	The number of events placed in memory by the rule
Memory Usage	The total amount of memory used by the rule
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each.
Events Matched	The number of events that matched the rule
Alerted Events	If applicable, this field can contain a link to events that caused an alert.
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the rule.
Debug Logs	This field contains a link to Esper debug (audit) logs.

Event Processing Language (EPL)

This topic describes Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. ESA uses Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. It is used for express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events. It can perform, but is not limited to, the following functions:

- Filter Event
- Alert Suppression
- Compute percentages or rations
- Average, count, min and max for a given time window
- Correlate events arriving in multiple stream
- Correlate events that arrive out of order
- On-Off Windows
- Followed-by and Not Followed-by support
- Regex filter support

Databases require explicit querying to return meaningful data and are not suited to push data as it changes. The developer must implement the temporal and aggregation logic himself. By contrast, the EPL engine provides a higher abstraction and intelligence and can be thought of as a database turned upside-down. Instead of storing the data and running queries against stored data, EPL allows applications to store queries and continuously run the data through. Response from the EPL engine is real-time when conditions occur that match user defined queries.

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

Advanced ESA rules require correct character case, but in the Investigate Navigate view all characters are converted to lowercase. However, the meta may not be lowercase despite appearances in the Investigate Navigate view. To ensure you are using the correct case, you can make a strict pattern match for better performance.

Strict Pattern Match Example

```
@RSAAlert(oneInSeconds=0)
SELECT * FROM Event(
     (medium IN ( 1 ) AND
     filetype IN ( 'pdf' , 'windows_executable' , 'x86 pe' , 'windows
executable' ))
     ).win:time(5 Minutes)
MATCH_RECOGNIZE (
     MEASURES E1 as e1_data , E2 as e2_data
     PATTERN (E1 E2)
     DEFINE
          E1 as (E1.filetype IN ('pdf')),
          E2 as (E2.filetype IN ( 'pdf' , 'windows_executable' , 'x86 pe' ,
'windows executable' ))
```

```
);
```

Caution: Care should be taken to only add the case-insensitive *toLowerCase()* function on meta keys as needed. The *toLowerCase()* function can cause significant performance decreases. Consider checking the Investigate Events view or the Event Analysis view to see the real character case for meta fields and avoid unnecessary usage of the function.

For the purposes of online help, basic statements are used to illustrate how to set up ESA; however, for more information about writing EPL statements, the http://www.espertech.com site provides tutorials and examples.

Note: In NetWitness version 11.5, ESA Correlation supports Esper version 8.4.0. In version 11.4, ESA Correlation supports Esper version 8.2.0 and in version 11.3, ESA Correlation supports Esper version 7.1.0.

ESA Annotations

This topic describes annotations that NetWitness provides to use in advanced EPL rules.

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

@RSAContext Annotation (11.5 and later)

The @RSAContext annotation can be used in advanced rules to dynamically add or remove data from a Context Hub list after the rule fires. For example, you can create a rule that automatically adds an IP address to a blacklist and removes it from a whitelist.

You can update a single-column or a multi-column Context Hub list. The @RSAContext annotation also performs error handling when the Context Hub list cannot be reached.

Prerequisites

Before deploying a rule using the @RSAContext annotation, the list must exist in Context Hub. For information on creating a Context Hub list, see the *Context Hub Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

IMPORTANT: If you rename a Context Hub list or recreate the Context Hub list with the same name, update the ESA rules that use that Context Hub list, and then redeploy the ESA rule deployments that contain those rules.

Single-Column Context Hub Lists

The @RSAContext annotation uses the following format for a single column Context Hub list:

```
@RSAContext (list="<single_column_list>", action=<DELETE_ENTRY or ADD_ENTRY>,
onError = <STOP_ALL_RULE_PROCESSING_AND_WAIT or IGNORE_ERROR_AND_CONTINUE>,
fields={"LIST=<meta_key>"})
```

The @RSA Context parameters for a **single-column** Context Hub List are described in the following table.

Parameter	Description
`list`	Where `<single_column_list>` is the name of the single-column Context Hub list (whitelist or blacklist).
`action`	You can add an entry to or remove an entry from the list: • `DELETE_ENTRY` - Removes an entry from the list. • `ADD_ENTRY` - Adds an entry to the list. You can only have one action per `@RSAContext` entry.

Parameter	Description
onError	Identifies how to handle errors, for example, when the Context Hub list is not available or is full. You can choose one of the following options: • STOP_ALL_RULE_PROCESSING_AND_WAIT: If any error occurs with the selected actions on the Context Hub list, stop all rule processing including data aggregation and retry indefinitely until the actions are successfully executed. Halting processing for one Context Hub list results in halting processing for all Context Hub lists. Select this option if it is important to update a Context Hub list before processing any more rules. For example, you may have a blacklist that must be updated before continuing rule processing. • IGNORE_ERROR_AND_CONTINUE: If any error occurs with the selected actions on the Context Hub list, ignore the error and the @RSAContext entry, and continue processing. If it is not a Context Hub error, assume that the error occurs before reaching Context Hub, and retry until the actions are successfully executed. Select this option if continuing rule processing is more important than updating the Context Hub list.
fields	Maps a meta key value to the column in the Context Hub list. Single-column lists always show LIST= in capital letters.

The first example deletes a source IP address from an IP whitelist. However, if the list is not available, the source IP address is not removed from the list and processing is continued.

```
@RSAContext (list="ip_whitelist", action=DELETE_ENTRY, onError = IGNORE_ERROR_
AND_CONTINUE, fields={"LIST=ip_src"})
```

The second example adds a source IP address to an IP blacklist. However, if the list is not available, all rule processing stops including data aggregation, and the ESA Correlation service retries indefinitely until the entry is added to the specified Context Hub list.

```
@RSAContext (list="ip_blacklist", action=ADD_ENTRY, onError = STOP_ALL_RULE_
PROCESSING_AND_WAIT, fields={"LIST=ip_src"})
```

Multi-Column Context Hub Lists

The @RSAContext annotation uses the following format for a multi-column Context Hub list:

```
@RSAContext (list="<multi_column_list>", action=<DELETE_ENTRY or ADD_ENTRY>,
onError = <STOP_ALL_RULE_PROCESSING_AND_WAIT or IGNORE_ERROR_AND_CONTINUE>,
fields={"<column1>=<meta_key1 or constant value1>",<column2>=<meta_key2 or
constant value2>",<column n>=<meta_key n or constant value n>",})
```

The @RSA Context parameters for a **multi-column** Context Hub List are described in the following table.

Parameter	Description
list	Where <multi_column_list> is the name of the multi-column Context Hub list.
action	You can add an entry to or remove an entry from the list: • DELETE_ENTRY - Removes an entry from the list. • ADD_ENTRY - Adds an entry to the list. You can only have one action per @RSAContext entry.
onError	Identifies how to handle errors, for example, when the Context Hub list is not available or is full. You can choose one of the following options: • STOP_ALL_RULE_PROCESSING_AND_WAIT: If any error occurs with the selected actions on the Context Hub list, stop all rule processing including data aggregation and retry indefinitely until the actions are successfully executed. Halting processing for one Context Hub list results in halting processing for all Context Hub lists. Select this option if it is important to update a Context Hub list before processing any more rules. For example, you may have a blacklist that must be updated before continuing rule processing. • IGNORE_ERROR_AND_CONTINUE: If any error occurs with the selected actions on the Context Hub list, ignore the error and the @RSAContext entry, and continue processing. If it is not a Context Hub error, assume that the error occurs before reaching Context Hub, and retry until the actions are successfully executed. Select this option if continuing rule processing is more important than updating the Context Hub list.
fields	Maps a meta key values or constant values to the columns in the Context Hub list. Multi-column lists show the names of each column in the fields parameter.*

The first example deletes a user and the associated source and destination IP addresses from a multi-column IP whitelist. However, if the list is not available, the specified fields are not removed from the list and processing is continued.

```
@RSAContext (list="MultColumn_whitelist", action=DELETE_ENTRY, onError =
IGNORE_ERROR_AND_CONTINUE, fields={"source=ip_src","destination=ip_
dst","user='smith'"})
```

The second example adds a user and the associated source and destination IP addresses to a multi-column IP blacklist. However, if the list is not available, all rule processing stops including data aggregation, and the ESA Correlation service retries indefinitely until the entry is added to the specified Context Hub list.

```
@RSAContext (list="MultColumn_blacklist", action=ADD_ENTRY, onError = STOP_
ALL_RULE_PROCESSING_AND_WAIT, fields={"source=ip_src","destination=ip_
dst","user='smith'"})
```

Automatic Context Hub List Updates

When using the @RSAContext annotation in your rules, string array meta keys (shown as `string[]` in the Meta Key References on the ESA Rules > Settings tab) are inserted and removed as separate lines in the Context Hub list. This enables lookups in the Investigate and Respond views.

Single Column Context Hub List Update Example

A single column Context Hub list has one column with the string array meta key `alias_host`. If the rule using that list fires and `alias_host` has three values (Google, Yahoo, and Dell), ESA Correlation adds three rows to the Context Hub list:

Google
Yahoo
Dell

Multi-Column Context Hub List Update Example

A multi-column Context Hub list has three columns. If the rule using that list fires and the meta keys have the following values:

- `username` (string array) with values Aimee and Chris
- `ip_dst` (string) with value 10.10.10.10
- `alias_host` (string array) with values Dell, Google, and Yahoo

ESA Correlation adds six rows to the Context Hub list:

Aimee, 10.10.10.10, Dell
Aimee, 10.10.10.10, Google
Aimee, 10.10.10.10, Yahoo
Chris, 10.10.10.10, Dell
Chris, 10.10.10.10, Google
Chris, 10.10.10.10, Yahoo

@RSAAlert Annotation

The @RSAAlert annotation is used to mark which EPL statements are linked to generating alert notifications. It is designed to work with the alert notification suppression feature in the Rule Builder user interface.

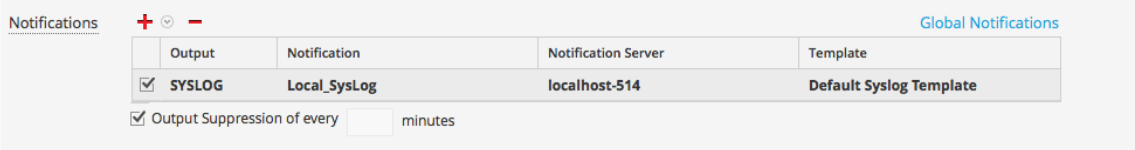
The @RSAAlert annotation can be useful when working with alert notifications, especially if you want to filter notifications, such as sending one notification for each user that triggers an alert.

For example, suppose you want to generate alert notifications for login failures. You could add the following statement:

*@RSAAlert select * from event(msg_id="login_fail")*

Event number	Message ID	username	src_IP	Time
1	login_fail	alice	1.2.3.4	10:00
2	login_fail	alice	1.2.3.4	10:01
3	login_fail	alice	6.7.8.9	10:01
4	login_fail	bob	1.2.3.4	10:01
5	login_fail	alice	1.2.3.4	10:03

For the above statement, five alert notifications are generated.



However, suppose you wanted to modify the statement to generate one alert for each separate username. You can use the *identifier* attribute. For example, the statement *@RSAAlert(identifier={"username"}) SELECT* FROM Event(msg_id="login_fail")* generates one notification for the first alert for "bob" and one for the first alert for "alice." Subsequent alerts for "bob" and "alice" are ignored.

You can further distinguish the users by adding details via the identifier variable. For example, you can distinguish by user and IP address using the following statement: *@RSAAlert(identifier={"username", "src_ip"}) SELECT* FROM Event(msg_id="login_fail")*. Then, you would see notifications generated by user name and IP address (one alert for "alice" at 1.2.3.4, another alert for "alice" at 6.7.8.9, and an alert for "bob" at 1.2.3.4).

To use identifiers with Alert Notification Suppression:

The @RSAAlert annotation is designed to work with the alert notification suppression feature in the Rule Builder user interface. To do this:

1. Create a rule in the Rule Builder user interface, and select the alert suppression feature when configuring notifications.

2. Copy the code from the Rule Builder rule into a new advanced rule.
3. Configure the advanced rule to include identifiers (as described above) and save the advanced rule.
4. Delete the original rule builder rule.

@RSAPersist Annotation

The @RSAPersist annotation is used to mark a named window as an ESA managed window for persistence. By marking the named window as an ESA managed window, ESA periodically writes the contents of the window to disk and restores them back if the window is undeployed and redeployed. The systems take a snapshot just before the ESA rule deployment is undeployed and the window is removed. Conversely, it restores the window contents from the snapshot just after the deployment is redeployed. This ensures that the contents of the window are not lost if the deployment state is altered or if the ESA service goes down.

For example, consider a named window, `DHCPTracker` that holds a mapping from IP addresses to each assigned hostname.You can annotate the statement with the @RSAPersist annotation as:

```
@RSAPersist
 create window DHCPTracker.std:unique(ip_src) as (ip_src string, alias_
host string);
 insert into DHCPTracker select IP as ip_src, HostName as alias_host from
DHCPAssignment(ID=32);
```

Note: All windows definitions are not suitable for persistence. `@RSAPersist` annotation must be used with care. If the window has timed-records or if it depends on time based constraints it is very likely that the reverted snapshots will not restore it to the correct state. Also, any changes to the window definition will invalidate the snapshots and reset the window to a blank state. The system does not do any semantic analysis to determine if the changes to the window definition are conflicting or not. Note that other parts of a deployment (that is, other than the particular CREATE WINDOW call that defines the window) may change, without invalidating the snapshots.

Caution: (This caution applies only to NetWitness Platform versions 11.3.x, 11.4.x, and 11.5.0.0.) To avoid data being overwritten, if you have a rule with a named window, do not disable and re-enable it. Instead, undeploy and redeploy the ESA rule deployment that contains the rule.

IMPORTANT: The @RSAPersist annotation suggests avoiding the use of 'Event' as a data type when keeping all windows, as 'Event' is already declared as the schema. Please refer to examples of valid and invalid syntax scenarios.

Invalid Examples:

1. `@RSAAlert`
2. `@RSAPersist`
3. `create window datas#keepall(evt Event);`
4.
5. `Insert into datas SELECT * FROM Event;`

1. `@RSAAlert`
2. `@RSAPersist`
3. `CREATE WINDOW demo_keepall.win:keepall (evt1 Event);`

4. `INSERT INTO demo_keepall`
5. `SELECT * FROM Event`
6. `WHERE user_dst = ANY('User35','User31');`
7. `SELECT * FROM demo_keepall;`

Valid Examples:

1. `@RSAAlert`
2. `@RSAPersist`
3. `create window datatest#keepall(evt String);`
4. `Insert into datatest SELECT * FROM Event;`

1. `@RSAAlert`
2. `@RSAPersist`
3. `CREATE WINDOW demo_keepall.win:keepall (evt1 java.util.Collection);`
4. `INSERT INTO demo_keepall`
5. `SELECT * FROM Event`
6. `WHERE user_dst = ANY('User35','User31');`
7. `SELECT * FROM demo_keepall;`

Note: When using rules with named windows and enrichment windows, it is essential to ensure no differing or missing column types in the window definition. It is also advisable to avoid using keywords like 'Event' and 'Schema' as column names in the window definition. Additionally, if a rule attempts to define the same window twice, it is expected that runtime exceptions will occur.

@UsesEnrichment (10.6.1.1 and later)

The @UsesEnrichment can be used in advanced EPL rules to reference enrichments. In order to synchronize enrichments with ESA, all enrichment dependencies in EPL rules must be referenced with the @UsesEnrichment annotation.

The @UsesEnrichment annotation uses the following format:

```
@UsesEnrichment(name= '<enrichment_name>')
```

For example, the following EPL references a whitelist enrichment:

```
@UsesEnrichment(name = 'Whitelist')
@RSAAlert
SELECT * FROM Event(ip_src NOT IN (SELECT ip_address FROM Whitelist))
```

@Name

The @Name is the statement name defined in ESA advanced rules. It is used to dynamically generate statement names in ESA alerts. The statement name of only an alert triggering statement is displayed. This annotation has meta keys enclosed in curly brackets.

Note: Dynamic-name-enabled option allows you to disable dynamic alert name generation.

The @Name annotation uses the following format:

```
@Name("<static_part_of_statement_name> {meta_key1} {meta_key2}…")
```

For example, the following EPL references meta keys *ip_src* and *user_name* whose values will be dynamically generated.

@Name(“Login Event to {ip_src} by {user_name}”)

Note: You can specify any number of meta keys in the statement for dynamic statement name generation.
The length of individual meta key is limited to 64, after which the value is truncated and appended with “…”.
The length of the dynamic generation of statement name is limited to 128, after which the value is truncated to 128 and appended with “…”. All the remaining values post truncation will be treated as static values.

@Audit Annotation

Add the `@Audit('stream')` annotation to your ESA rules to print alerts to the ESA logs for troubleshooting. This is useful when debugging the Esper rules. The @Audit('stream') annotation provides debug information for the next statement in the rule. For example:

```
@Audit('stream')
@RSAAlert
SELECT * FROM Event((ip_src NOT IN ( '1.1.1.1' , '2.2.2.2' )));
```

In the above example, `@RSAAlert` is only necessary if the statement needs to send an alert to the Respond view.

In NetWitness Platform 11.5 and later, you can test rules in the rule builders. If you add the `@Audit ('stream')` annotation to an advanced EPL rule, you can view the Debug Log in the test output. For more information, see Validate an Advanced EPL Rule .

Example Advanced EPL Rules

Following are the examples of Advanced ESA rules. Each example has multiple ways of implementing the same use-case.

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

Example #1:

Create a user account and delete the same user account in 300s. User information is stored in user_src meta.

EPL #1:

Rule Name	CreateAndDelete Useraccount1
Rule Description	Create a user account followed by an action to delete the same user account in 300 seconds.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event(ec_subject='User'`
	`  AND ec_outcome='Success'`
	`  AND user_src is NOT NULL`
	`  AND ec_activity IN ('Create', 'Delete')`
	`  ).win:time(300 seconds)`
	`match_recognize (partition by user_src`
	`   measures C as c, D as d`
	`   pattern (C D)`
	`  define`
	`   C as C.ec_activity='Create' ,`
	`   D as D.ec_activity='Delete');`

Note	• Filter events needed for pattern in given time frame. Filter conditions should be such that only required events are passed to match recognize function. In this case, they are create and delete user account Events. That is, Event(ec_subject='User' AND ec_outcome='Success' AND user_src is NOT NULL AND ec_activity IN ('Create', 'Delete') • Partition by creates buckets. In this case, Esper creates buckets per value of user_src. And hence value of user_src is common between both events. • Define the pattern you want. Right now it is set to Create Followed by Delete. You can do multiple creates followed by delete (C+ D). Pattern is very similar to regular expression. • Most efficient use case. • The ‘loose’ pattern match of (C+ D) will result in decreased performance. Unless you need to include all C events within the generated alert, keep the strict pattern match of (C D). See the Esper documentation for more details.

EPL #2:

Rule Name	CreateAndDeleteUseraccount2
Rule Description	Create a user account followed by an action to delete the same user account in 300 seconds.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * from pattern[every (a= Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create'))`
	`->`
	`( Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create') AND user_src = a.user_src)`
	`) )where timer:within(300 Sec) ];`

Note	• Lets say same user is created twice and deleted once in that order. Then the above pattern will fire 2 alerts. • A thread is created for every User creation. • There is no way to control threads. It is important to have time bounds and preferably small intervals. • If you do not need every first event to start a new thread and match with the subsequent second event, then add suppression syntax of @SuppressOverlappingMatches after the pattern keyword. See the Esper documentation for more details.

Example #2:

Detect pattern where user created followed by login by same user and user is deleted in end. In case of windows logs user info is stored in either user_dst or user_src depending on event.

user_src(create) = user_dst(Login) = user_src(Delete)

EPL #3:

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event(ec_subject='User'`
	`and ec_activity in ('Create','Logon','Delete')`
	`and ec_theme in ('UserGroup', 'Authentication')`
	`and ec_outcome='Success'`
	`).win:time(300 seconds)`
	`match_recognize (measures C as c, L as l, D as d`
	`pattern (C L D)`
	`define`
	`C as C.ec_activity = 'Create',`

	L as L.ec_activity = 'Logon' AND L.user_dst = C.user_src, D as D.ec_activity = 'Delete' AND D.user_src = C.user_src);
Note	• Since user_src/user_dst is not common across all events we can't use partition. It will be 1 single bucket running 1 pattern at a time. For example, for user 1 and 2 if the stream of events are C1C2L1D1, C1L1C2D1, there will be no alert because C1 thread got reset by C2. Alert will be fired only if C1L1D1 are in order and no other event either from same user or other user falls in between. • Another solution would be to use Named Window and merge user_dst and user_src into single column and then run match recognize. (EPL #3). • Pattern can also be used. You might get more alerts than expected. (EPL #4).

EPL #4: Using NamedWindows and match recognize

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.
Rule Code	@Name('NormalizedWindow') create window FilteredEvents.win:time (300 sec) (user String, ecactivity string, sessionid Long); @Name('UsersrcEvents') Insert into FilteredEvents select user_src as user, ec_activity as ecactivity, sessionid from Event(ec_subject='User' and ec_activity in ('Create','Delete') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_src is not null); @Name('UsrdstEvents') Insert into FilteredEvents select user_dst as user, ec_activity as ecactivity, sessionid from Event(ec_subject='User' and ec_activity in (Logon') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_dst is not null); @Name('Pattern') @RSAAlert(oneInSeconds=0, identifiers={"user"}) select * from FilteredEvents match_recognize (partition by user measures C as c, L as l, D as d pattern (C L+D) define C as C.ecactivity= 'Create', L as L.ecactivity= 'Logon', D as D.ecactivity='Delete');

EPL #5: Using Every @RSAAlert(identifiers={"user_src"})

Rule Name	CreateUserLoginandDeleteUser

Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.
Rule Code	`SELECT a.time as time,a.ip_src as ip_src,a.user_dst as user_dst,a.ip_dst as ip_dst,a.alias_host as alias_host from pattern [every (a=Event (ec_subject='User' and ec_activity='Create' and ec_theme='UserGroup' and ec_outcome='Success') -> (Event(ec_subject='User' and ec_activity='Logon' and ec_theme='Authentication' and user_src=a.user_dst) -> b=Event(ec_subject='User' and ec_activity='Delete' and ec_theme='UserGroup' and user_dst=a.user_dst))) where timer:within(300 sec)];`

Example #3:

Excessive login failures from same sourceIP.

EPL #6: @RSAAlert(identifiers={"ip_src"})

Rule Name	ExcessLoginFailure
Rule Description	The same user tried logging in from the same Source IP and faced login failures.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event ( ip_src IS NOT NULL AND ec_activity ='Logon'`
	`AND ec_outcome = 'Failure').win:time_batch(300 seconds) GROUP BY`
	`ip_src HAVING COUNT(*) = 10;`

Note	• Uses time _batch: Looks at events in batches(tumbling window). Every event matching the filter criteria will be kept for the specified time window. • "GROUP BY" clause aggregates events within the data window by ip_src and HAVING clause instructs a count of 10 events with the same ip_src must occur within the time window. • One of the issues with tumbling windows is that events occurring towards the end of the batch might not lead to an alert. In the below sequence of events at t=301 even though 10 login failures occurred for the same login in the last 300 secs, there will be no alert because the batch of events was dropped at t=300.

Time t	Login Failures for Specific Users	Alert	Time Batch
0	0	0	1
295	6	0	1
299	3	0	1
301	1	0	2
420	6	0	2
550	3	0	2
600	0	0	3

	720 6 0 3 850 3 0 3 900 1 1 3 ends and 4 begins • Above problem can be resolved using win:time windows (EPL#7)instead of win:time_length_batch windows. • Outer group by is to control events when time elapses. Say you have 9 events at end of 60 secs, Esper engine will push those 9 events to listener. Group by and count will restrict it since count is not equal to 10. • Time and count can be modified as needed.

EPL #7: @RSAAlert(identifiers={"ip_src"})

Rule Name	ExcessLoginFailure
Rule Description	The same user tried logging in from the same Source IP and faced login failures.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event ( ip_src IS NOT NULL AND ec_activity ='Logon'`
	`AND ec_outcome = 'Failure').win:time(300 seconds) GROUP BY ip_src HAVING COUNT(*) = 10;`

Note	• This is a sliding window and hence after an alert is fired for a set of events they can be used for another alert as well until time has passed. • If 10 events were involved in causing the alert only the last event will appear. • Events are not removed from the time window. You could use output rate limiting. See the Esper documentation for more details.

Example #4:

Multiple failed logins from multiple different users from same source to same destination, a single user from multiple different sources to same destination.

EPL #8: using time_batch

Rule Name	MultiplefailedLogins
Rule Description	There are multiple failed logins for the following cases: - From multiple users from same source to same destination. - Single user from multiple sources to the same destination.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event (`
	`ec_activity='Logon'`
	`AND ec_outcome='Failure'`

	AND ip_src IS NOT NULL AND ip_dst IS NOT NULL AND user_dst IS NOT NULL) .win:time_batch(300 seconds) group by ip_src,ip_dst having count(distinct user_dst) >= 5;
Note	• ip.dst and ip.src are common across all events. • user_dst is unique for all events. • Alert is fired when there are at least 5 different users try to login from same ip.src and ip.dst combination.

Example #5:

No Log traffic from a device in a given timeframe.

EPL #9: using timer:interval

Rule Name	NoLogTraffic
Rule Description	There is no log traffic observed from a device in a given time frame.
Rule Code	SELECT * FROM pattern [every a = Event(device_ip IN ('10.0.0.0','10.0.0.1') AND medium = 32) -> (timer:interval (3600 seconds) AND NOT Event(device_ip = a.device_ip AND device_type = a.device_type AND medium = 32))];
Note	• Rule only detects sudden loss of traffic. It won't alert if there is no traffic to begin with. You need at least 1 event for rule to alert. • List of device ip address or device hostnames as input. Only these systems will be tracked. • Time input is required. Alert is fired when time interval between events exceeds input time.

Example #6:

Multiple Failed Logins NOT followed by a Lockout event by the same user.

EPL #10: using timer and Lockout

Rule Name	FailedloginswoLockout
Rule	There are multiple failed logins that are not followed by Lockout event by the same

Description	user.

Rule Code	`SELECT * FROM pattern [every-distinct(a.user_dst, a.device_ip, 1 msec) (a= Event(ec_activity='Logon' and ec_outcome='Failure' and user_dst IS NOT NULL) -> [2]( Event ( device_ip =a.device_ip and ec_activity='Logon' and ec_outcome='Failure' and user_dst=a.user_dst)`
	`AND NOT Event( ( ec_activity='Logon' and ec_outcome='Success' and device_ip = a.device_ip and user_dst=a.user_dst) or (ec_activity='Lockout' and device_ip = a.device_ip and user_dst=a.user_dst))))`
	`where timer:within(60 seconds) -> (timer:interval(30 seconds) and not Event(device_ip=a.device_ip and user_dst=a.user_dst and ec_activity='Lockout')) ];`

Note	• Above query detects the absence of a Lockout Event after the occurrence of 2 failed logins from same user. • The occurrence of the multiple failed logins are timed and are assumed to occur within a certain period of time. Also, in-practice the Lockout event is assumed to occur within a short time after the occurrence of the last failed login event because the threshold value of Failed logins per user is set in a given domain. • In current query, every distinct will suppress new thread for combination of user and device for 1 millisec. • Time allowed for 3 failed logins is 60 secs since 1st failed attempt. Wait period for lockout event to occur is 30 secs

Example #7:

Custom functions to perform LIKE and REGEX operations for ARRAY elements.

EPL #11: @RSAAlert(oneInSeconds=0)

Rule Name	MatchLikeRegex
Rule Description	There are custom functions to perform LIKE and REGEX comparisons of array meta keys.

Rule Code	`SELECT * FROM pattern[`
	`e1=Event(matchLike(alias_host, "10.0.0.%")) AND`
	`e2=Event(matchRegex(alias_host, "10\.0\.0\.1[0-9][0-9]"))`
	`where timer:within(5 Minutes)];`

Note:
1. "**.**" in meta keys should be replaced with ("_").
2. All patterns should be time bound.
3. Use appropriate tags in front of statements, for example:

```
@RSAPersist:
@RSAAlert:
```

For additional details you can refer to:

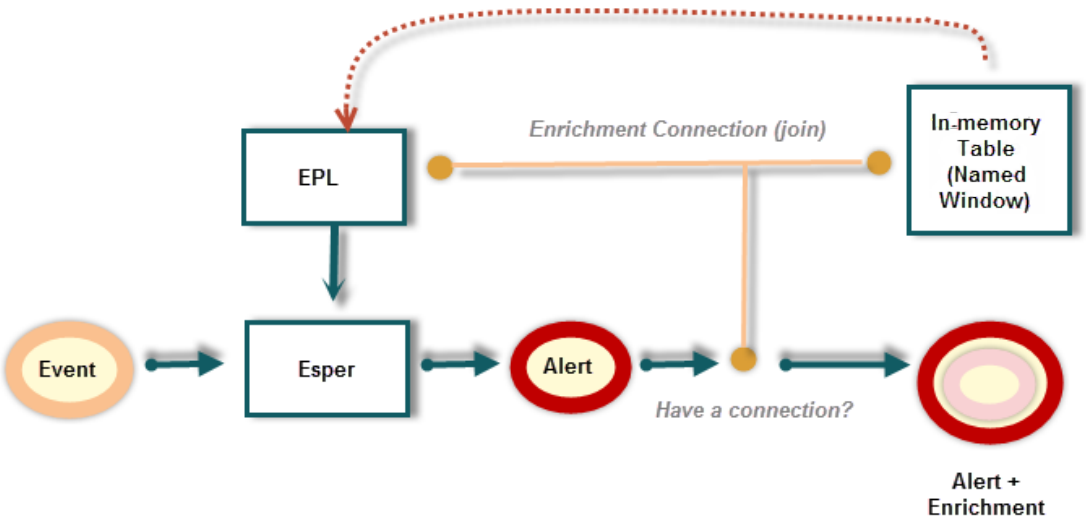
- EPL Online Tool: http://esper-epl-tryout.appspot.com/epltryout/mainform.html

Configure an In-Memory Table Using an EPL Query



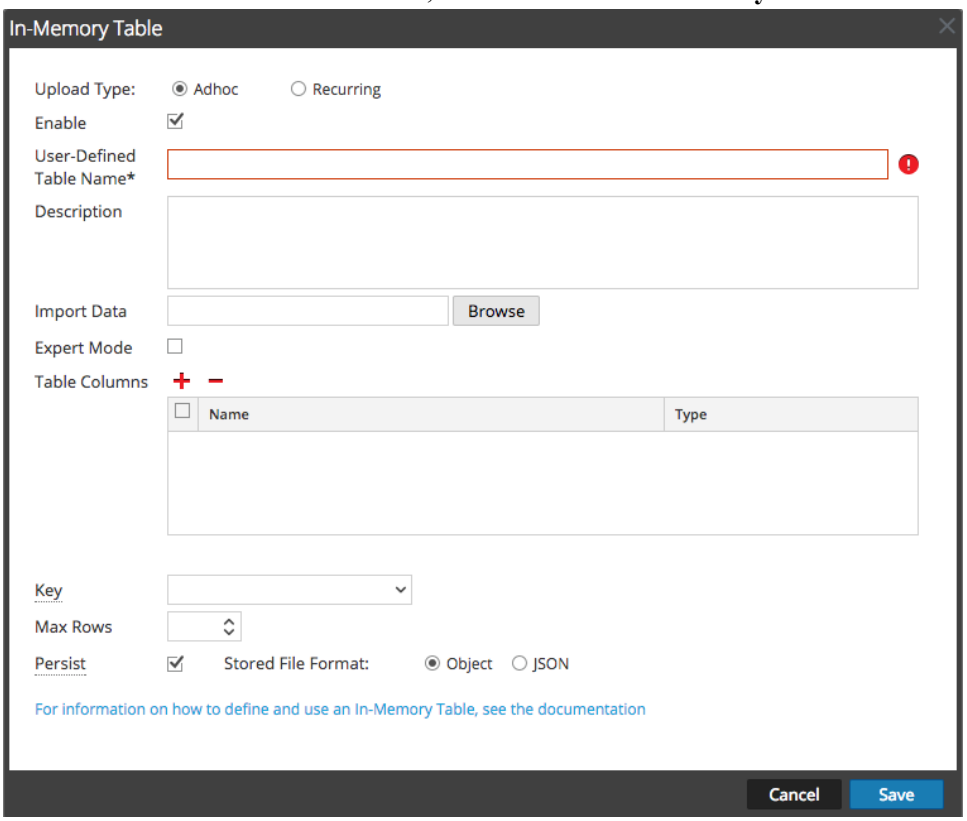
Note: It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

When you use an In-Memory Table configuration in expert mode, you can create an enrichment source or named window based on an Esper query. This allows you to have more control over the content and create more dynamic content. When you do this, an EPL query constructs the named window to capture interesting states from the event stream.

Workflow

The following shows the workflow for creating a query using a named window:

1. The event is sent to the Esper Engine.
2. An EPL query is generated.
3. An alert is triggered.
4. The query checks to see if there is a connection between the event and the Named Window.
5. If there is a connection, the query that populates the Named Window is run and populated.
6. The content from the Named Window is added to the alert content and sent or displayed (depending on your settings).



Prerequisites

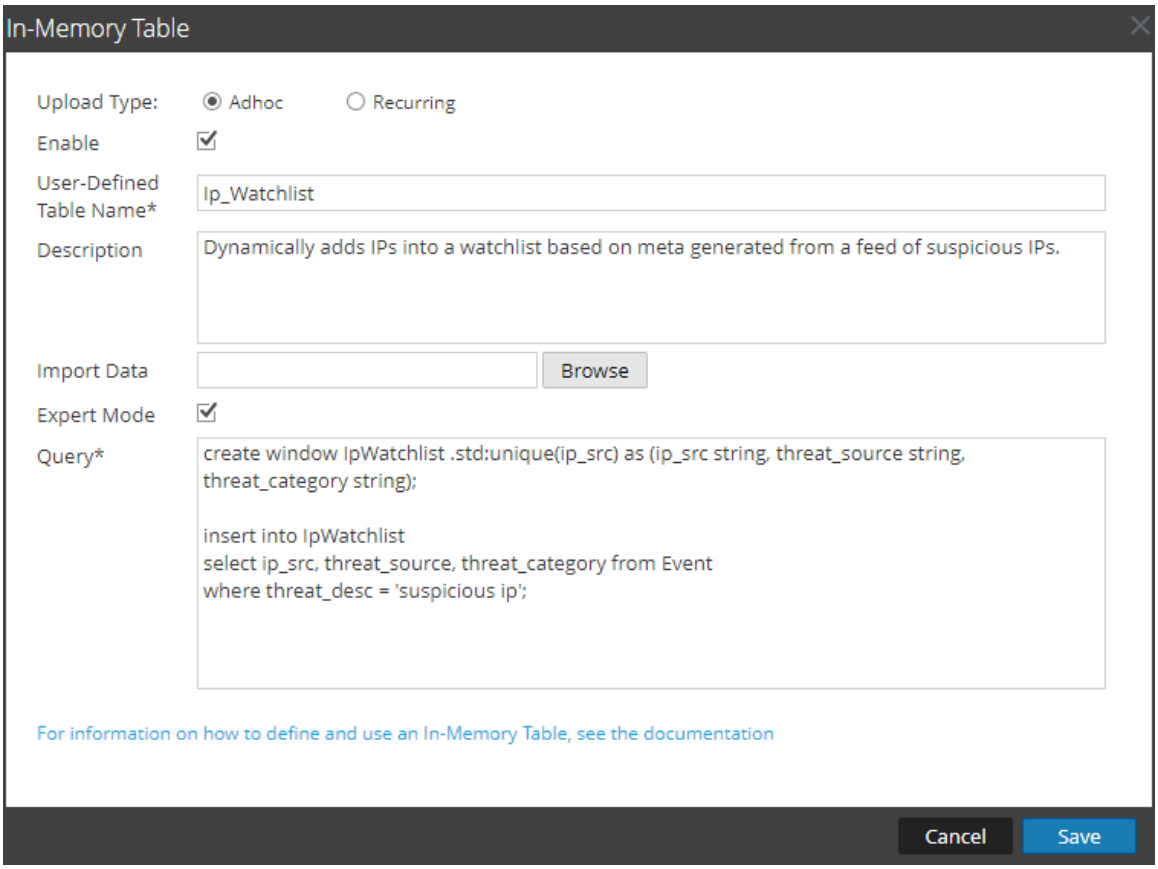
- The meta used in the EPL statement must exist in the data.
- You must create well-formed EPL statements.

Procedure

Note: It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules.

1. Go to **(Configure) > ESA Rules**.
   The Configure view is displayed with the Rules tab open.
2. Click the **Settings** tab.
3. In the options panel, select **Enrichment Sources**.
4. In the **Enrichment Sources** section, click > **In-Memory Table**.

5. Select **Adhoc**.
   By default, Enable is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
6. In the **User-Defined Table Name** field, type a descriptive name to describe the in-memory table.
7. If you want to explain what the enrichment adds to an alert, enter information in the **Description** field.
   This description displays when you view the list of enrichments from the Enrichment Sources view, so it's a good idea to enter a thorough description as a best practice. Doing this allows other users to understand the content of the enrichment without opening it to examine its contents.
8. Select **Expert Mode** to define an advanced in-memory table configuration by writing an EPL query. The Table Columns are replaced by a **Query** field.
9. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
10. Enter the EPL query in the **Query** field. The query should be well-formed, and it's a good idea to test it before entering it in the field.
11. Click **Save**.



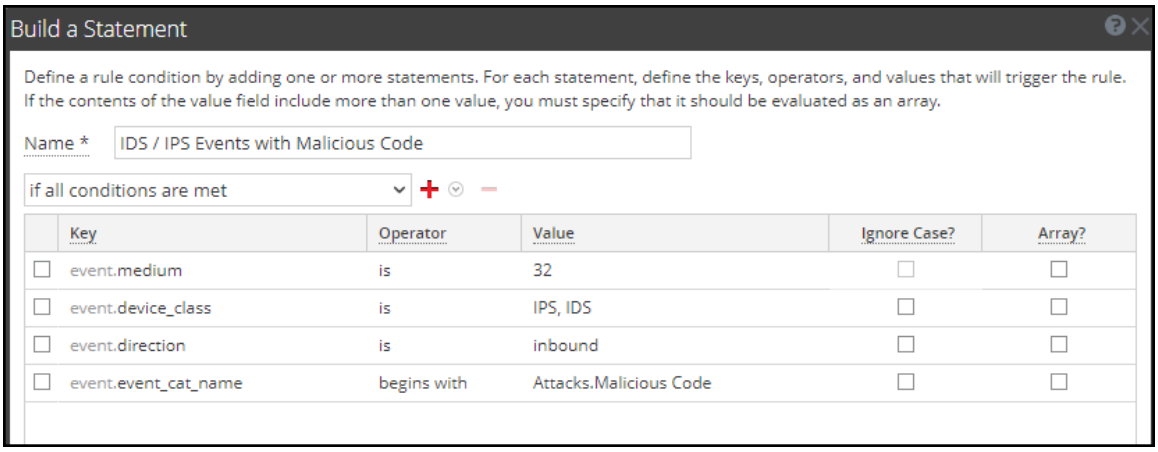
Example

For example, you want to know when an IPS or IDS is giving five or more inbound events with an event identified with malicious code. Additionally, you would like to know when the source IP of those events has been identified as suspicious by other sources. This information helps to more quickly triage the event and determine whether the alert is a true positive.

Step 1: Create the Enrichment

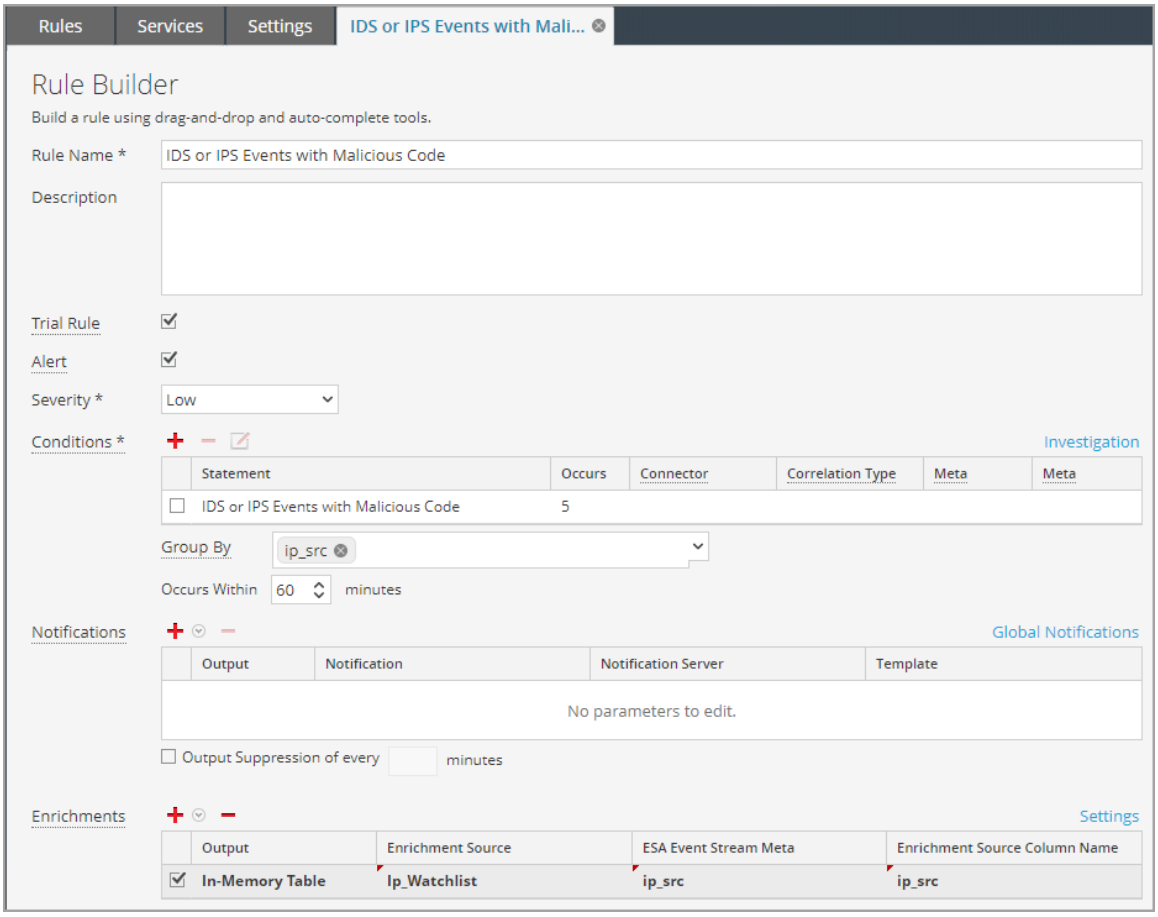
In this example, this enrichment is a watchlist of IPs that have been identified as suspicious by third party sources or by internal staff. The meta of `threat_desc equal to 'suspicious ip'` is generated when a match to a feed occurs. This meta can be matched and output based on a log, packet, or endpoint event.

The enrichment should look like the following:



Parameters	Description
Upload Type	Adhoc
IP_Watchlist	IP_Watchlist
Description	Dynamically populated whitelist based on a feed of IPs that are considered suspicious.
Expert Mode	Selected

Query	`create window IpWatchlist .std:unique(ip_src) as (ip_src string, threat_source string, threat_category string);`
	`insert into IpWatchlist`
	`select ip_src, threat_source, threat_category from Event`
	`where threat_desc = 'suspicious ip';`



Step 2: Create Your Rule

First, you need to create your ESA Correlation rule. This example rule looks for inbound IPS or IDS log events with the `event_cat_name` beginning with `Attacks.Malicious Code`. If five or more events for the same `ip_src` occur within 60 minutes, then an alert will be triggered. If an `ip_src` from the Enrichment equals the `ip_src` from the alert, then that alert will be enriched with additional meta. In this case, the analyst would see the values for `threat_source` and `threat_category` in the raw alert. `Threat_category` would indicate the type of malware and `threat_source` would indicate the entity that has reported the ip as suspicious. The analyst could use this information to do additional research or escalate to the next tier for creation of a possible incident.

Rule Statement

Rule Logic with Enrichment Added

ESA Alert References

In Event Stream Analysis (ESA), you configure and deploy ESA rules to get alerted about potential network threats.

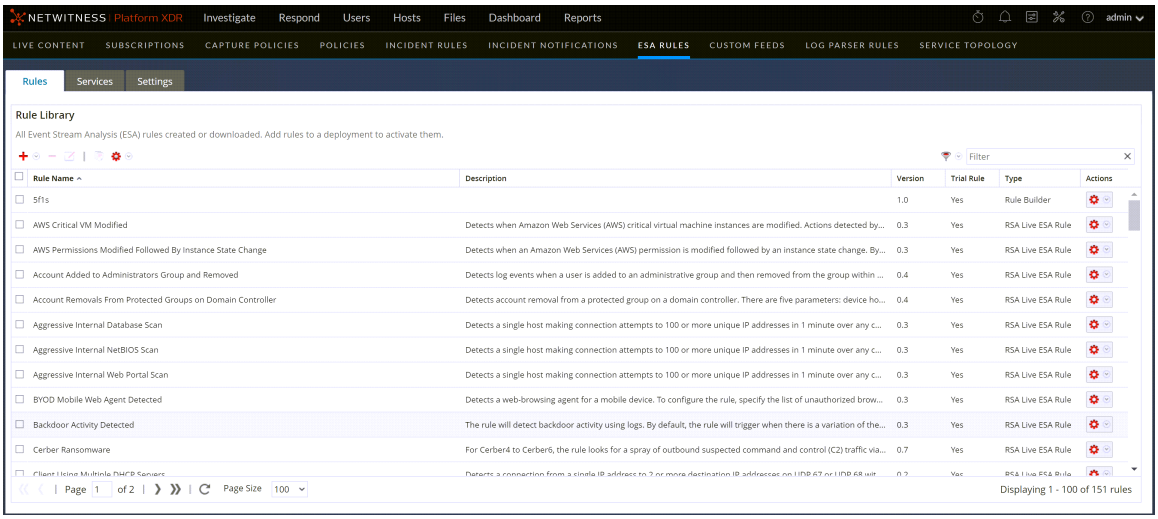
These topics explain the user interface for ESA Correlation rules.

- Rules Tab
- Rule Library Panel
- Rule Builder Tab
- Build a Statement Dialog
- Advanced EPL Rule Tab
- Rule Syntax Dialog
- Services Tab
- Settings Tab

Rules Tab

The Rules tab enables you to view and configure ESA rules.

What do you want to do?



Role	I want to ...	Show me how
Content Expert	View types of rules	ESA Rule Types
Content Expert	Deploy Trial Rules	Working with Trial Rules
Content Expert	Create a rule	Add Rules to the Rule Library

Related Topics

Getting Started with ESA

Quick Look

The Rules tab is displayed when you go to **(Configure) > ESA Rules**.
The following figure shows the Rules tab.

The Rules tab is divided into two sections:

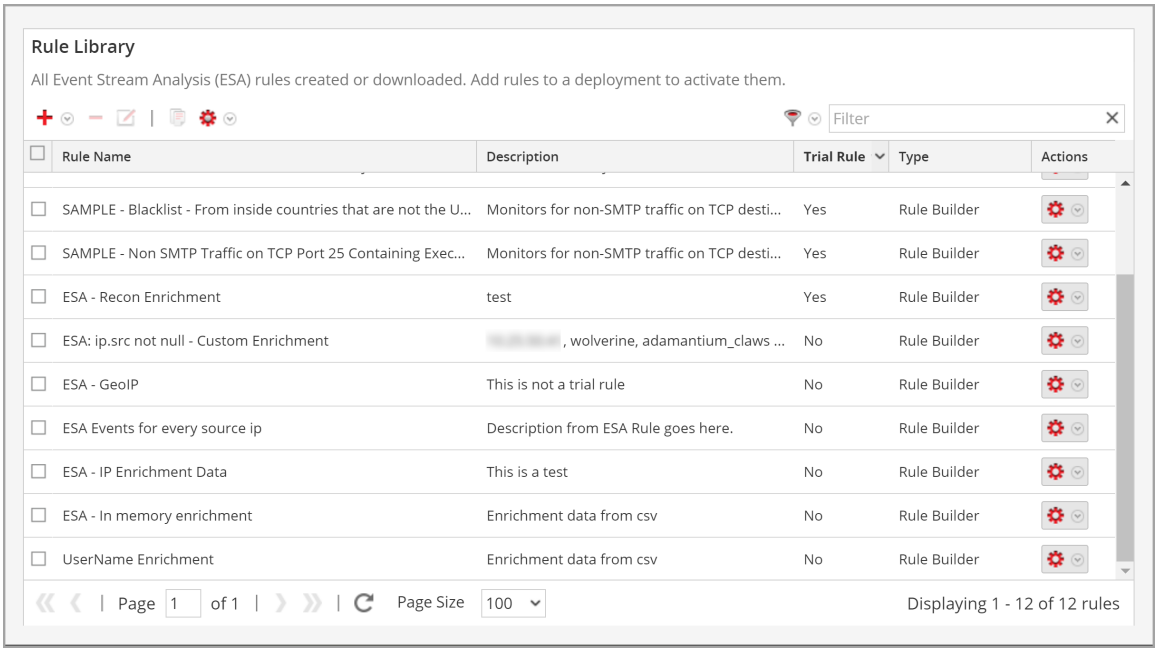
- Rules Tab Options Panel
- Rule Library Panel

Rule Library Panel

The Rule Library panel allows you to manage rules.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Add an ESA rule.	Add a Rule Builder Rule
Content Expert	Edit, duplicate, or delete an ESA rule.	Edit, Duplicate or Delete a Rule
Content Expert	Import or export ESA rules.	Import or Export Rules
Content Expert	Filter the ESA rules list.	Filter or Search for Rules



Related Topics

- Add an Advanced EPL Rule

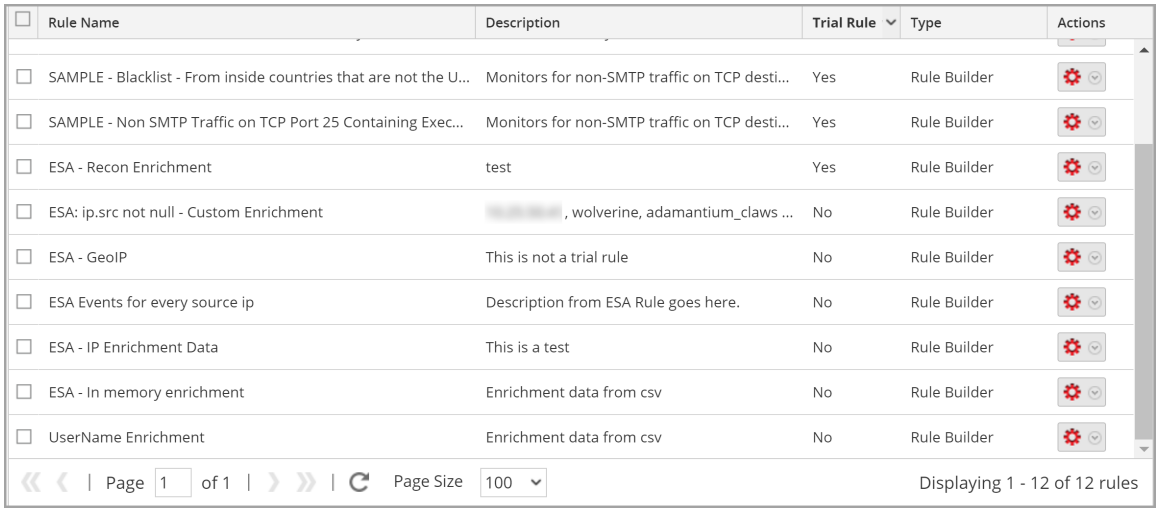
Quick Look

To access this view, go to **(Configure) > ESA Rules**. The Rules tab is displayed and the Rule Library panel is on the right.

The following figure shows the Rule Library panel.

The Rule Library panel includes the following components:

- Rule Library toolbar
- Rule Library list

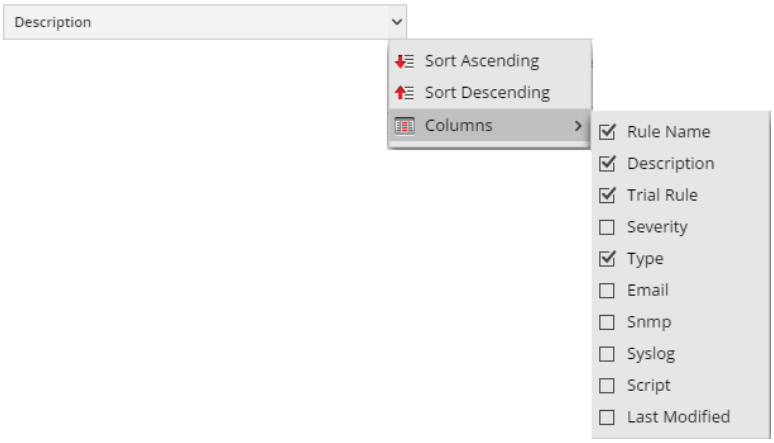


Rule Library Toolbar

The Rule Library toolbar allows you to add, delete, edit, duplicate, filter, export, and import ESA rules. The following figure shows the icons for these actions.

Rule Library List

The following figure shows the Rule Library list.



The Rule Library list shows all of the ESA rules. The following table lists the columns in the Rule Library list and their description.

Column	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Type	The type of rule. For more information, see ESA Rule Types.
Actions ( )	Menu to delete, edit, duplicate, or export the selected rule.
Severity	Threat level of alert triggered by the rule.
Email	Indicates whether an alert notification for the rule is sent by email. This column is not visible by default.

Column	Description
SNMP	Indicates whether an alert notification for the rule is sent using SNMP. This column is not visible by default. (ESA SNMP notifications are not supported in NetWitness version 11.3 and later.)
Syslog	Indicates whether an alert notification for the rule is sent using Syslog. This column is not visible by default.
Script	Indicates whether an alert notification for the rule executes a script. This column is not visible by default.
Last Modified	The date and time when the ESA rule was last modified. This column is not visible by default.

To display columns which aren't visible by default, hover over the title of a column and click the **v** on the right. This opens a drop-down menu in which you can sort the contents of the column or choose which columns you want to see in the Rule Library list.

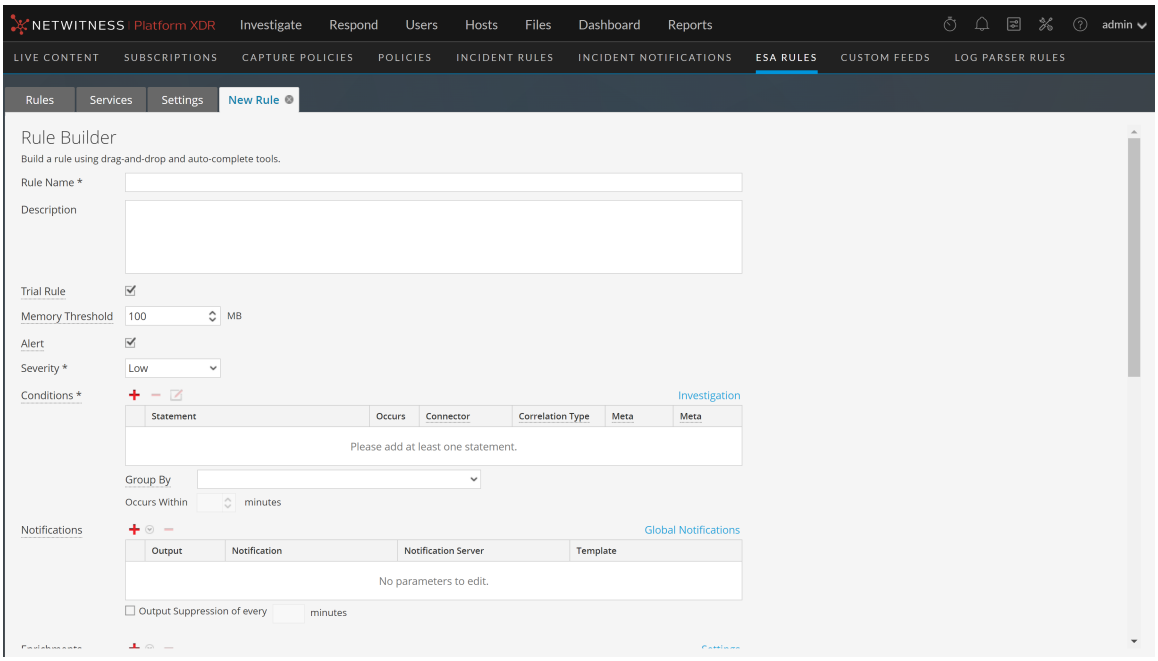
Rule Builder Tab

The Rule Builder tab enables you to define a Rule Builder rule.

What do you want to do?

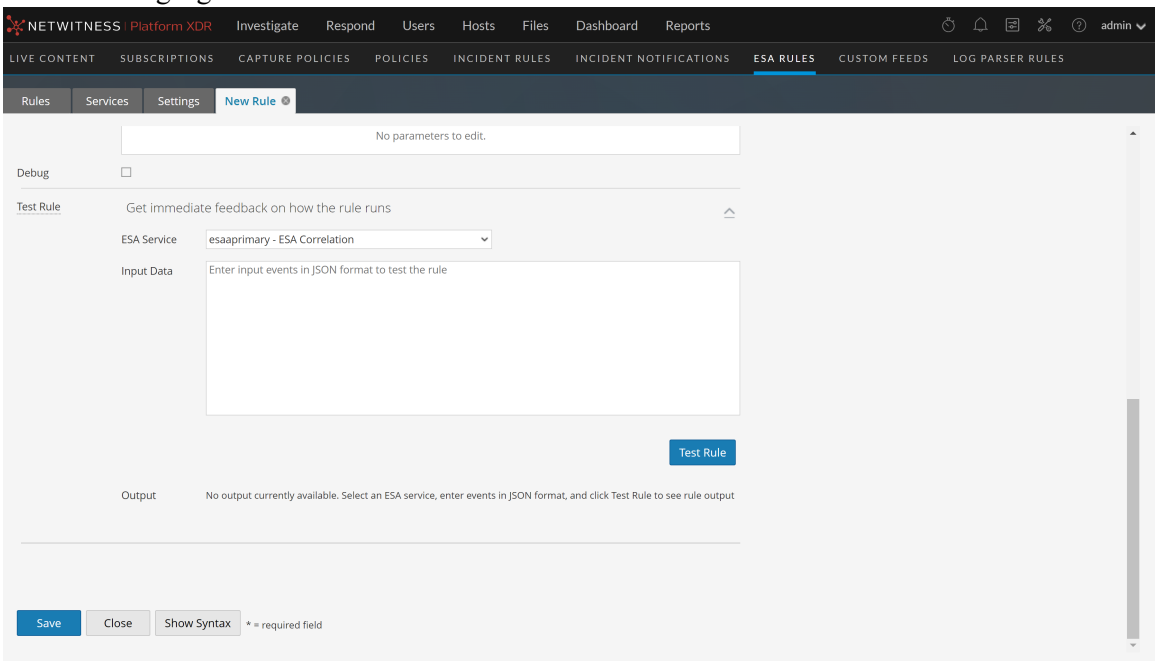
Role	I want to ...	Show me how
Content Expert	Define a Rule Builder rule.	Add a Rule Builder RuleStep 1. Name and Describe the Rule
Content Expert	Define rule criteria.	Step 2. Build a Rule Statement
Content Expert	Add conditions to the rule.	Step 3. Add Conditions to a Rule Statement
Content Expert	Test the ESA rule logic.	Validate an ESA Rule

Related Topics



- Add an Advanced EPL Rule

Quick Look



To access the Rule Builder tab:

1. Go to  **(Configure) > ESA Rules**.
   The Rules tab opens by default.
2. In the **Rule Library** toolbar, select  **> Rule Builder**.
   The Rule Builder tab is displayed.

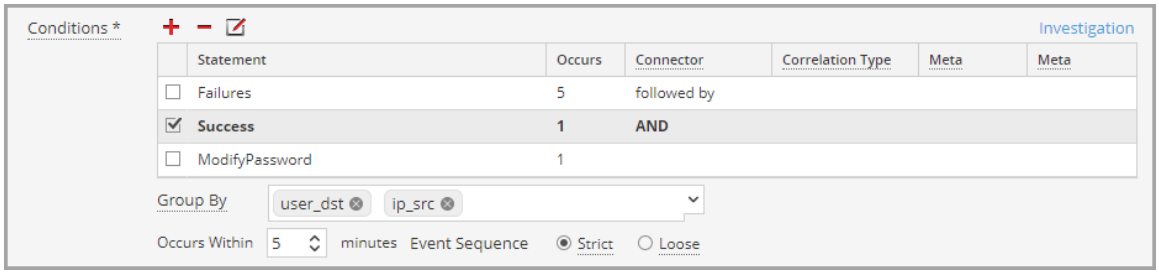
The following figure shows the Rule Builder tab.

The following figure shows the Rule Builder tab scrolled down with the Test Rule section in view.

The following table lists the parameters in the Rule Builder tab.

Field	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.

Field	Description
Memory Threshold	(This option applies to version 11.5 and later.) The maximum memory usage allowed for this rule in MB. Add Memory Thresholds to ESA rules that use memory. For example, if a rule contains windows or pattern matching, configure a memory threshold for that rule. If the configured memory threshold is exceeded, it gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.
Alert	(This option applies to version 11.3 and later.) When selected, the alert is sent to Respond. If the checkbox is cleared, an alert will not be sent to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
Severity	Threat level of alert triggered by the rule.



The Rule Builder includes the following components:

- Conditions Section
- Notifications Section
- Enrichments Section
- Debug Option
- Test Rule Section

Conditions Section

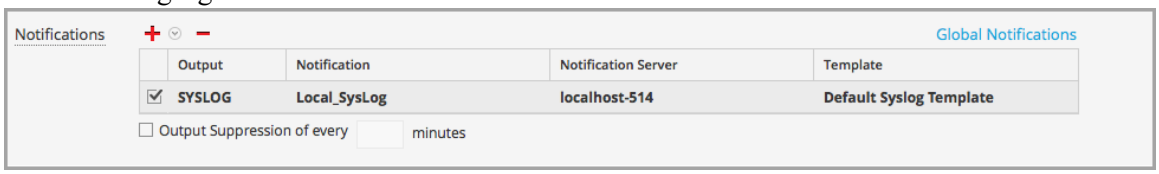
In the Conditions section of the Rule Builder tab, you define what the rule detects.

The following figure shows the Conditions section.

The following table lists the parameters of the Conditions section.

Parameter	Description
+	Add a statement.
−	Remove selected statement.
	Edit selected statement.

Parameter	Description
Statement	Logical group of conditions for one operation.
Occurs	Alert frequency if the condition is met. This specifies that there must be at least that many events that satisfy the criteria in order to trigger an alert. The time window in minutes binds the Occurs count.
Connector	Options to specify relationship among the statements: • followed by • not followed by • AND • OR The Connector joins two statements with AND, OR, followed by, or not followed by. When followed by is used, it specifies that there is a sequencing of those events. AND and OR build one large criteria. The followed by creates distinct criteria that occurs in sequence.
Correlation Type	**Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert.
Meta	Enter the meta condition if choosing a correlation type of SAME or JOIN (as described above).
Meta	Enter the second meta condition if choosing a correlation type of JOIN (as described above). For example, The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.
occurs within minutes	Time window within which the conditions must occur.
Event Sequence	Choose whether the pattern must follow a *strict* match or a *loose* match. If you specify a strict match, this means that the pattern must occur in the *exact* sequence you specified with no additional events occurring in between. For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.



Parameter	Description
Group By	Select the meta key by which to group results from the dropdown list. For example, suppose that there are three users; Joe, Jane, and John and you use the Group By meta, **user_dst** (user_dst is the meta field for the user destination account). The result will show events grouped under the user destination accounts, Joe, Jane, and John. You can also group by multiple keys. For example, you might want to group by user and machine to see if a user logged in from the same machine attempts to log into an account multiple times. To do this, you might group by user_dst and ip_src.

Notifications Section

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.

Parameter	Description
+	To add an alert notification type.
−	To delete the selected alert notification.
Output	Alert notification type. Options are: • Email • SNMP (This option is not supported in NetWitness version 11.3 and later.) • Syslog • Script
Notification	Name of previously configured output, such as an email distribution list.
Notification Server	Name of server that sends the output.
Template	Name of template for the alert notification.
Output Suppression of every	Option to specify alert frequency.
Minutes	Alert frequency in minutes.

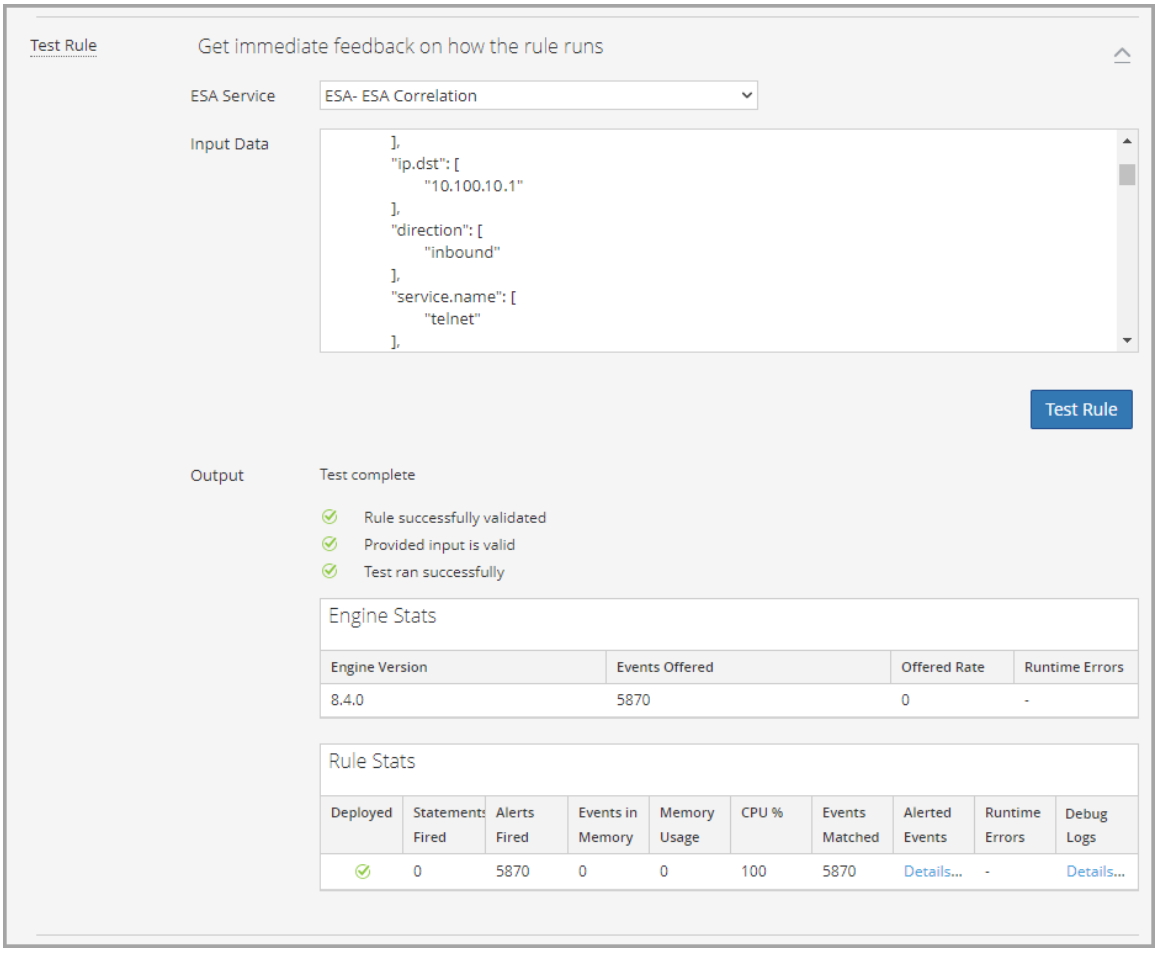
Enrichments Section

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.

The following figure shows the Enrichments section.

Parameter	Description
+	To add an enrichment.
−	To delete the selected enrichment.
Output	Enrichment source type. Options are: • In-Memory Table (Ad hoc only - Recurring In-Memory Tables are no longer supported in version 11.3 and later.) • GeoIP
Enrichment Source	Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table.
ESA Event Stream Meta	ESA meta key whose value will be used as one operand of join condition.
Enrichment Source Column Name	Enrichment source column name whose value will be used as the other operand of the join condition. For an in-memory table, If you configured a key when creating a .CSV-based enrichment, this column automatically populates with the selected key. However, you can change it if you like. For a GeoIP enrichment source, ipv4 is automatically selected.



Debug Option

Select the Debug option to print alerts to the ESA logs for troubleshooting. This adds an @Audit ('stream') annotation to the rule. This is useful when debugging the Esper rules.

Test Rule Section

Note: The Test Rule section is available in NetWitness Platform 11.5 and later.

In the Test Rule section, you can validate your ESA rule to determine if the rule logic is working as expected before deploying the rule.

Field	Description
ESA Service	Select the ESA Correlation service to process the rule.
Input Data	Enter the input events to test the rule. Download the events from the Investigate view in JSON format, copy the events, and paste them in this field.
Output Data	After you select an ESA Correlation service, input data, and click the Test Rule button, you can view the output of the rule here and verify that the rule is working according to your requirements. You can view the alerts in the output, but this test does not send any alert notifications.

The following table describes the test rule output **Engine Stats**.

Field	Description
Engine Version	Esper version running on the ESA service
Events Offered	Number of events processed by the ESA service since the last service start
Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment.

The following table describes the test rule output **Rule Stats**.

Field	Description
Deployed	A green checkmark indicates that the rule is deployed on the selected ESA service.
Statements Fired	The number of statements that fired the alerts
Alerts Fired	The number of alerts generated from the test data
Events in Memory	The number of events placed in memory by the rule
Memory Usage	The total amount of memory used by the rule
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each.
Events Matched	The number of events that matched the rule
Alerted Events	If applicable, this field can contain a link to events that caused an alert.
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the rule.
Debug Logs	This field contains a link to Esper debug (audit) logs.

Syntax

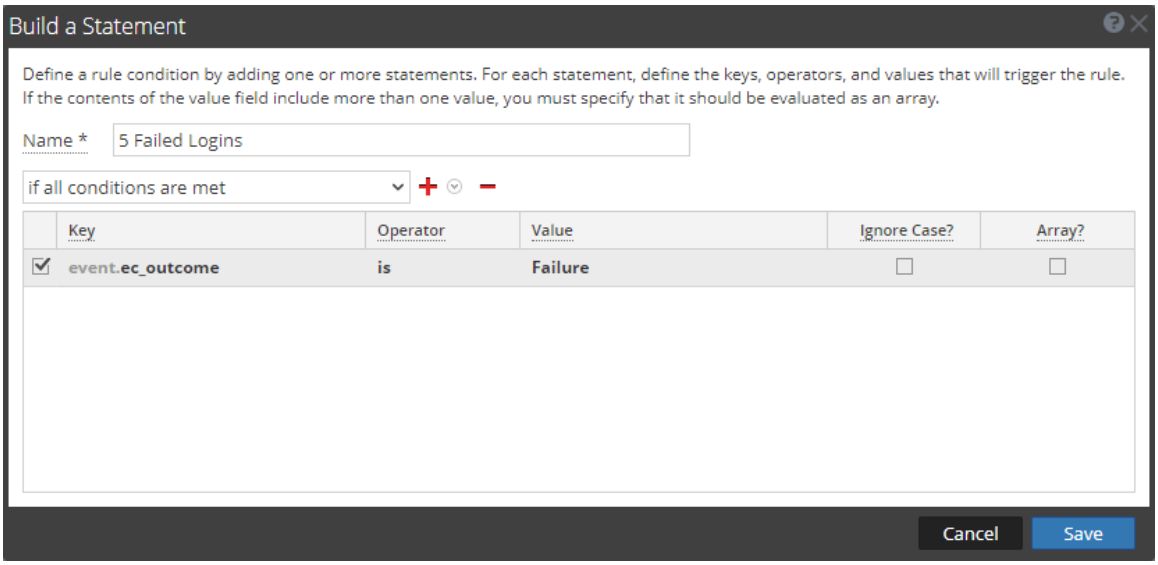
Click **Show Syntax** to view the EPL syntax of conditions, statements, and debugging parameters. It also provides a warning when the syntax is invalid. For more information, see Rule Syntax Dialog.

Build a Statement Dialog

The Build a Statement dialog allows you to construct a condition statement when creating a new Rule Builder rule.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Configure a rule statement.	Step 2. Build a Rule Statement
Content Expert	Add conditions to the rule.	Step 3. Add Conditions to a Rule Statement



Related Topics

- Add a Rule Builder Rule

Quick Look

To access the Build a Statement dialog:

1. Go to  **(Configure) > ESA Rules**.
   The Configure ESA Rules view is displayed with the Rules tab open.
2. In the **Rule Library** toolbar, select  **> Rule Builder**.
   A New Rule tab is displayed..
3. In the **Conditions** section, click .
   The Build a Statement dialog is displayed.

The following table describes the parameters in the Build a Statement dialog.

Parameter	Description
Name	Purpose of the statement.
Select	Conditions the rule requires. There are two options: • If all conditions are met • If any of these conditions are met
Key	Key for ESA to check in the rule statement.

Parameter	Description
Operator	Relationship between the meta key and value for the key: • is • is not • is not null • is greater than (>) • is greater than or equal to (>=) • is less than (<) • is less than or equal to (<=) • is one of (For array type meta) • is not one of (For array type meta) • contains • not contains • begins with • ends with
Value	Value for ESA to look for in the key.
Ignore Case?	This field is designed for use with string and array of string values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN."
Array?	Choice to indicate if contents of Value field represent one value or multiple values: • Select the box to indicate multiple values. • Clear the box to indicate one value.
	Add a statement. You can add a meta condition, whitelist condition, or blacklist condition.
	Delete selected statement.
Save	Add statement to the Conditions section of the Rule Builder tab.

The following table shows the operators you can use in the Rule Builder:

Operator	Required Value	Usage	Example	Meaning
is	Singular string value	The meta key is equal to the *value* field.	***user_dst*** is John Doe.	***user_dst*** is equal to the string *"John Doe"*.

Operator	Required Value	Usage	Example	Meaning
is	Array string value	The meta key is equal to one of the elements of the *value* field.	***user_dst*** is John, Doe, Smith.	***user_dst*** is equal either to the string *"John"* or to the string *"Doe"* or to the string *"Smith"* (Note, the spaces are stripped.).
is not	Singular string value	The meta key is not equal to the *value* field.	***size*** is not 200.	***size*** is not equal to the number 200 (size is a numeric value).
is not	Array string value	The meta key is not equal to any of the elements of the *value* field.	***size*** is not 200, 300, 400.	***size*** is equal neither to *200* nor to *300* nor to *400*.
is not null	N/A (looks for any value)	The meta key value is not null.	***user_dst*** is not null.	***user_dst*** is a meta that contains a value.
is greater than (>)	Number	The numeric value of the meta key is greater than the number in the *value* field.	***payload*** is greater than 7000.	***payload*** is a numeric value that is greater than 7000.
is greater than or equal to (>=)	Number	The numeric value of the meta key is greater than or equal to the number in the *value* field.	***payload*** is greater than or equal to 7000.	***payload*** is a numeric value that is greater than or equal to 7000.
is less than (<)	Number	The numeric value of the meta key is less than the number in the *value* field.	***ip_dstport*** is less than 1024.	***ip_dstport*** is a numeric value that is less than the numeric value 1024.
is less than or equal to (<=)	Number	The numeric value of the meta key is less than or equal to the number in the *value* field.	***ip_dstport*** is less than or equal to 1024.	***ip_dstport*** is a numeric value that is less than or equal to numeric value 1024.
is one of	Array string value	The meta key is one of the array string values in the *value* field.	***alias_host*** is one of Facebook, UTube, Instagram.	***alias_host*** is one of the array string values *Facebook, UTube, Instagram*.
is not one of	Array string value	The meta key is not one of the array string values in the *value* field.	***alias_host*** is not one of Facebook, UTube, Instagram.	***alias_host*** is not one of the array string values *Facebook, UTube, Instagram*.

Operator	Required Value	Usage	Example	Meaning
contains	String	The *value* field is a substring of the meta key. (This operator is only available for a string-valued meta key).	***ec_outcome*** contains failure.	***ec_outcome*** is a string that contains the substring *"failure"*.
not contains	String	The *value* field is not a substring of the meta key (This operator is only available for a string-valued meta key).	***ec_outcome*** not contains failure.	***ec_outcome*** is a string that does not contain the substring*"failure"*.
begins with	String	The *value* field is the beginning of the meta key (This operator is only available for a string-valued meta key).	***ip_dst*** begins with 127.0.	***ip_dst*** is a string that starts with *"127.0"*.
ends with	String	The *value* field is the end of the meta key (This operator is only available for a string-valued meta key).	***user_dst*** ends with son.	***user_dst*** is a string that ends in*"son"*.

Note: Terms in ***bold italics*** are Meta that may not exist in all customer environments.

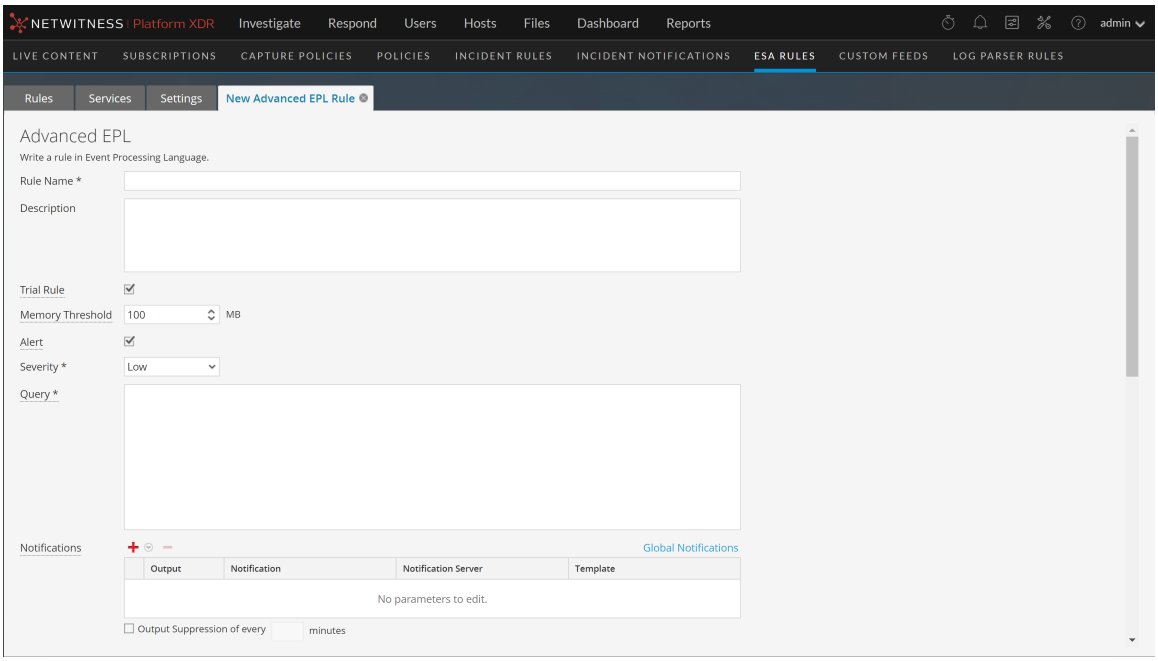
Advanced EPL Rule Tab

The Advanced EPL Rule tab enables you to define rule criteria with an Event Processing Language (EPL) query.

What do you want to do?

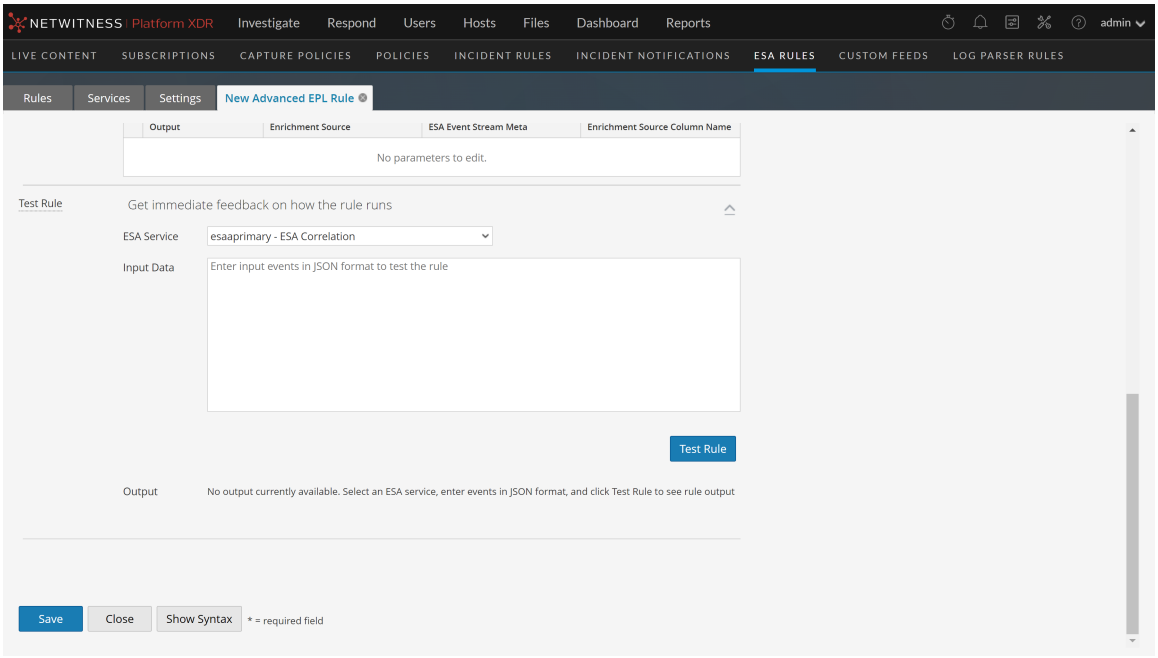
Role	I want to ...	Show me how
Content Expert	Define an Advanced EPL rule.	Add an Advanced EPL Rule
Content Expert	Test the Advanced EPL rule logic.	Validate an Advanced EPL Rule
Content Expert	See examples of an Advanced EPL Rule.	Example Advanced EPL Rules
Content Expert	See best practices for writing Advanced EPL Rules.	ESA Rule Writing Best Practices

Related Topics



- Add a Rule Builder Rule
- Enrichment Sources

Quick Look



To access the Advanced EPL Rule tab:

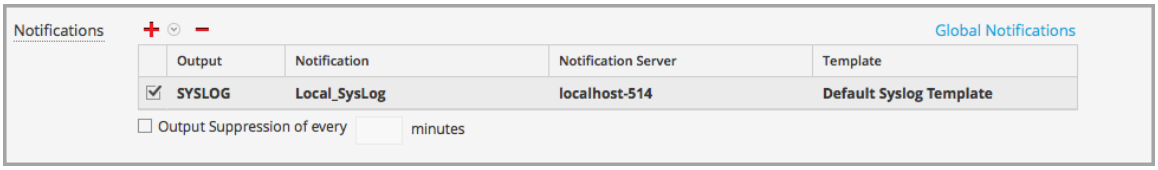
1. Go to **(Configure) > ESA Rules**.
   The Configure view is displayed with the Rules tab open by default.
2. In the **Rule Library** toolbar, select **> Advanced EPL**.
   The Advanced EPL Rule tab is displayed.

The following figure shows the Advanced EPL Rule tab.

The following figure shows the Advanced EPL Rule tab scrolled down with the Test Rule section in view.

The following table lists the parameters in the Advanced EPL Rule tab.

Parameters	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.



Parameters	Description
Trial Rule	Deployment mode to see if the rule runs efficiently.
Memory Threshold	(This option applies to version 11.5 and later.) The maximum memory usage allowed for this rule in MB. Add Memory Thresholds to ESA rules that use memory. For example, if a rule contains windows or pattern matching, configure a memory threshold for that rule. If the configured memory threshold is exceeded, it gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.
Alert	(This option applies to version 11.3 and Later.) When selected, the alert is sent to Respond. If the checkbox is cleared, an alert will not be sent to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
Severity	Threat level of alert triggered by the rule.
Query	EPL query that defines rule criteria.

Notifications Section

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.

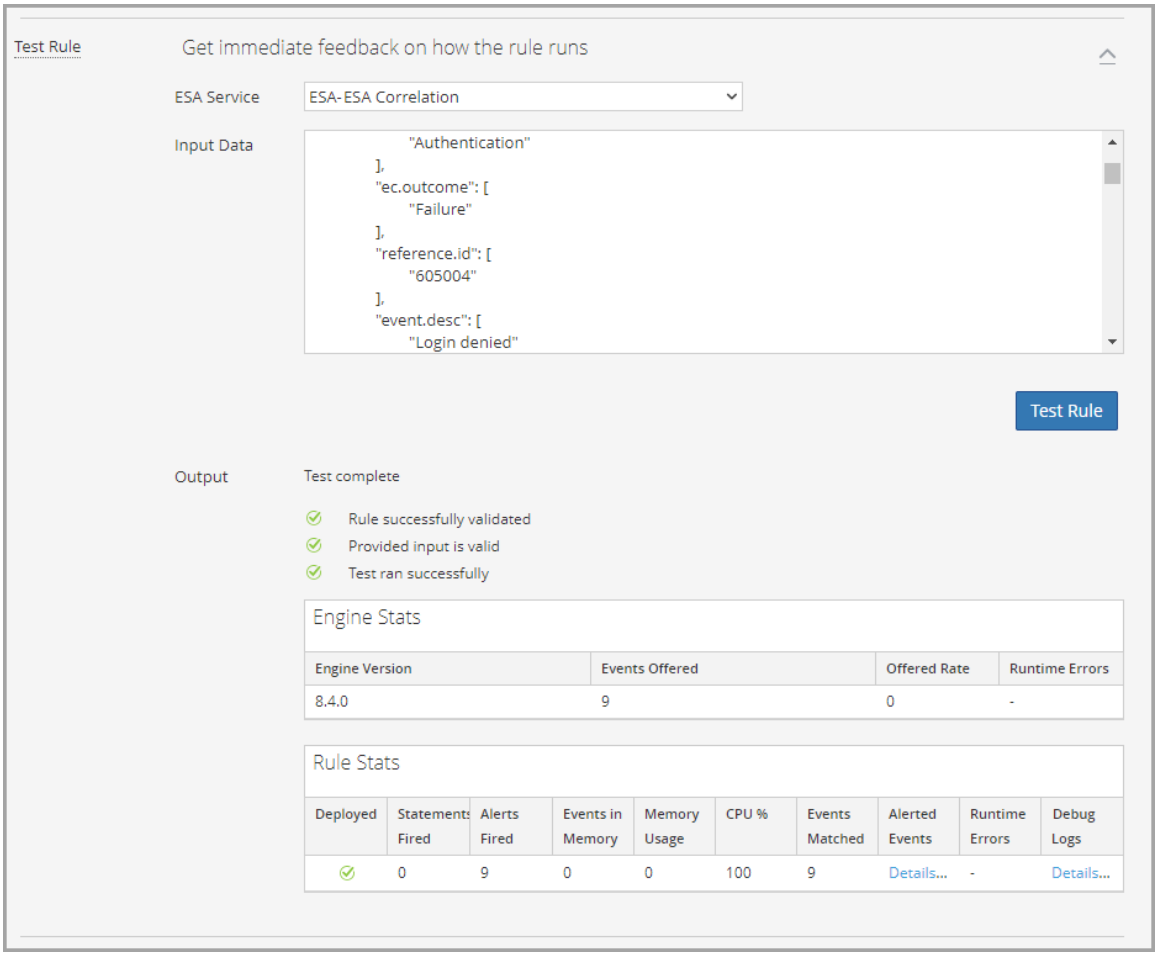
Parameter	Description
+	To add an alert notification type.
−	To delete the selected alert notification type.
Output	Alert notification type. Options are: • Email • SNMP (This option is not supported in NetWitness version 11.3 and later.) • Syslog • Script
Notification	Name of previously configured output, such as an email distribution list.

Parameter	Description
Notification Server	Name of server that sends the output.
Template	Name of template for the alert notification.
Output Suppression of every	Option to specify alert frequency.
Minutes	Alert frequency in minutes.

Enrichments Section

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.
The following figure shows the Enrichments section.



Parameter	Description
	To add an enrichment.
	To delete the selected enrichment.
Output	Enrichment source type. Options are: • In-Memory Table (Ad hoc only - Recurring In-Memory Tables are no longer supported in version 11.3 and later.) • GeoIP
Enrichment Source	Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table.
ESA Event Stream Meta	ESA meta key whose value will be used as one operand of join condition.
Enrichment Source Column Name	Enrichment source column name whose value will be used as the other operand of the join condition.

Test Rule Section

Note: The Test Rule section is available in NetWitness Platform 11.5 and later.

In the Test Rule section, you can validate your ESA rule to determine if the rule logic is working as expected before deploying the rule.

Field	Description
ESA Service	Select the ESA Correlation service to process the rule.
Input Data	Enter the input events to test the rule. You can download the events from the Investigate view in JSON format, copy the events, and paste them in this field.
Output Data	After you select an ESA Correlation service, input data, and click the Test Rule button, you can view the output of the rule here and verify that the rule is working according to your requirements. You can view the alerts in the output, but this test does not send any alert notifications. If you want to view all of the debug information for the test, include an `@Audit('stream')` annotation to your rule query.

The following table describes the test rule output **Engine Stats**.

Field	Description
Engine Version	Esper version running on the ESA service
Events Offered	Number of events processed by the ESA service since the last service start
Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment.

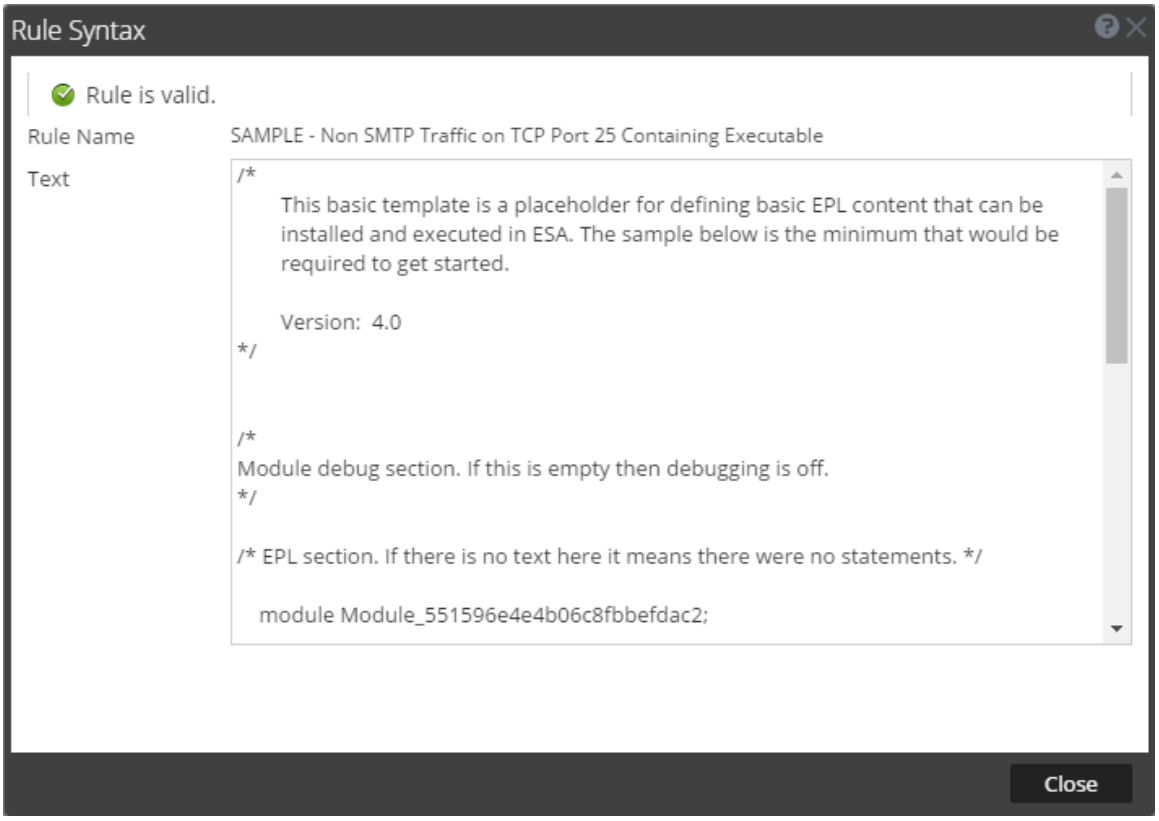
The following table describes the test rule output **Rule Stats**.

Field	Description
Deployed	A green checkmark indicates that the rule is deployed on the selected ESA service.
Statements Fired	The number of statements that fired the alerts
Alerts Fired	The number of alerts generated from the test data
Events in Memory	The number of events placed in memory by the rule
Memory Usage	The total amount of memory used by the rule
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each.
Events Matched	The number of events that matched the rule
Alerted Events	If applicable, this field can contain a link to events that caused an alert.
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the rule.
Debug Logs	This field contains a link to Esper debug (audit) logs.

Syntax

Click **Show Syntax** to view the EPL syntax of conditions, statements, and debugging parameters. It also provides a warning when the syntax is invalid. For more information, see Rule Syntax Dialog.

Rule Syntax Dialog



This topic describes the features of the Rule Syntax dialog. The Rule Syntax dialog displays the EPL syntax of conditions, statements, and debugging parameters, and provides a warning when the syntax is invalid.

Quick Look

To access this dialog:

1. Go to **(Configure) > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   a. Click and select **Advanced EPL** or **Rule Builder**.
   b. Double-click an existing rule.
   c. Select an existing rule and click in the **Rule Library** toolbar.
   d. In the row of an existing rule, select **> Edit**.
   The new or existing rule is displayed in a new tab, available to edit.
3. Click **Show Syntax** at the bottom of the tab.

The following figure shows an example of the Rule Syntax dialog showing a valid rule.

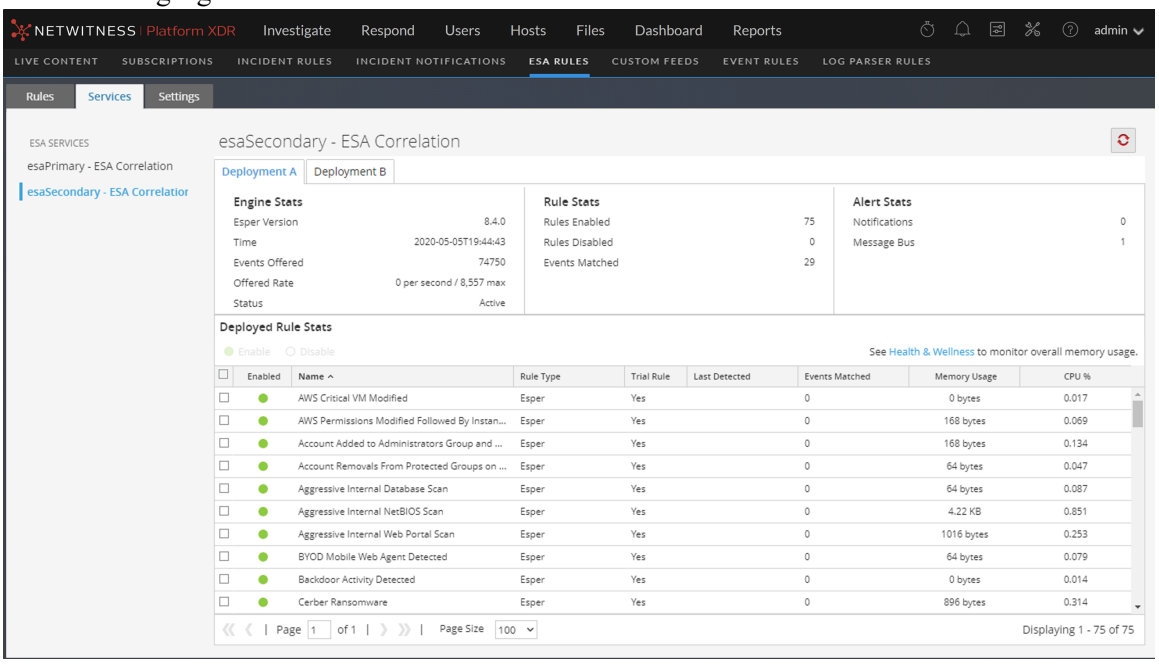
The following table describes the Rule Syntax dialog parameters.

Parameters	Description
Rule is valid or **Validation error in rule**	Indicates whether the rule syntax is valid or needs to be changed.
Rule Name	Displays the name of the rule.
Text	Displays the EPL syntax of conditions, statements, and debugging parameters if the rule is valid.

Services Tab

This topic provides an overview of the **(Configure) > ESA Rules > Services** tab. The Services tab shows the status of the deployments on each ESA service.

What do you want to do?



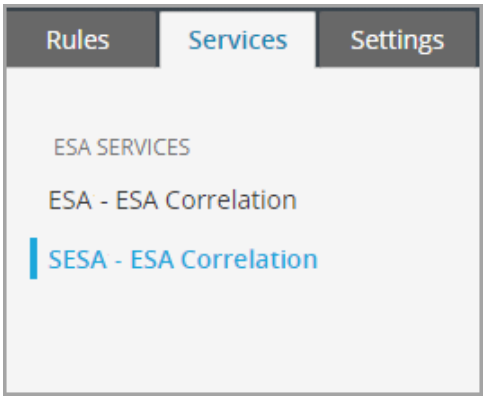
Role	I want to ...	Show me how
Content Expert	Troubleshoot Services Tab.	Troubleshoot ESA
Content Expert	View deployment Stats for an ESA Service.	View Stats for an ESA Service

Related Topics

- View a Summary of Alerts

Quick Look

The following figure shows the Services tab:



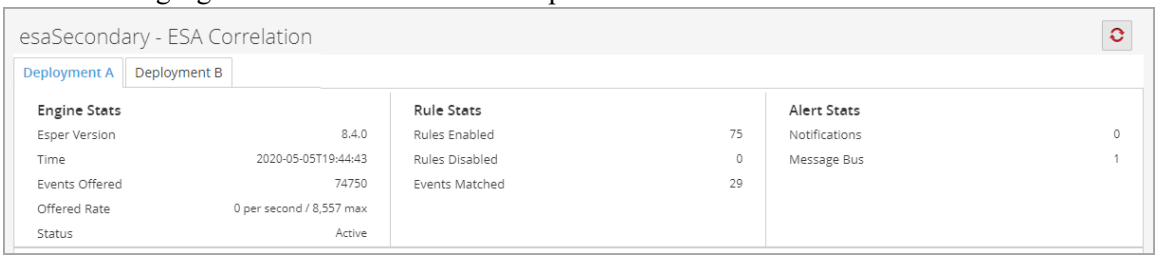
(This option is available in NetWitness version 11.3 and later.) If an ESA Correlation service has multiple deployments, under the service name, you will see a tab for each deployment. In the above example, there are two deployment tabs, Deployment A and Deployment B. Each tab displays information specific to that deployment.

The Services tab has the following sections:

- ESA Services panel (on the left)
- General Stats panel (top right)
- Deployed Rule Stats panel (bottom right)

ESA Services Panel

The ESA Services panel lists the name of each ESA service added to NetWitness.



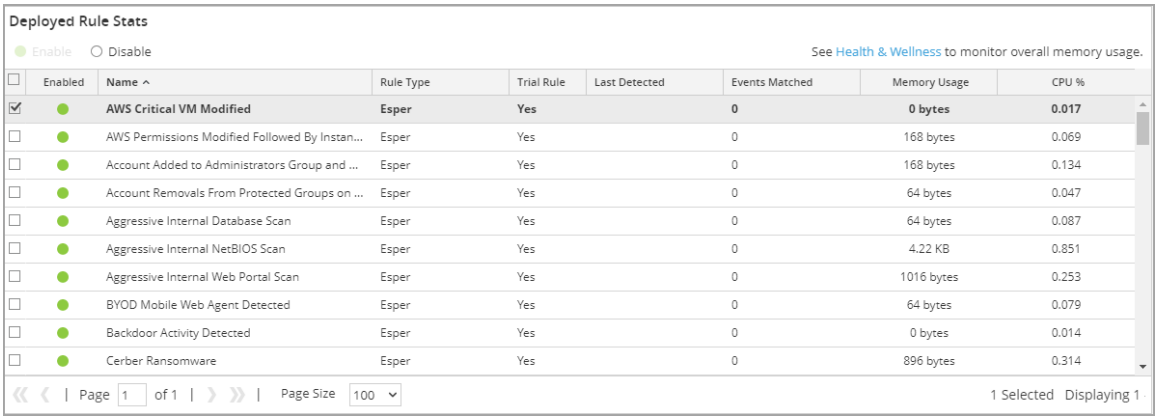
General Stats Panel

The General Stats panel provides information on the Esper engine, rules, and alerts.

The General Stats panel contains the following sections:

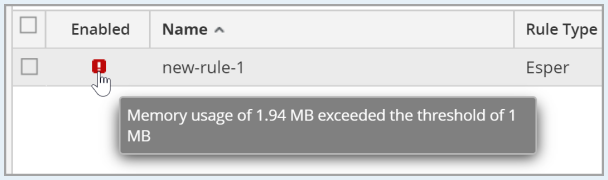
- Engine Stats
- Rule Stats
- Alert Stats

The following figure shows the General Stats panel.



The following table lists and describes the parameters in each section.

Sections	Parameter	Description
Engine Stats	Esper Version	Esper version running on the ESA service
	Time	Time when the last event was sent to Esper Engine
	Events Offered	Number of events processed by the ESA service since the last service start
	Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events.
	Status	Shows the status of the deployment. A status of **Active** means that the deployment is active. A status of **Inactive** means that there was probably an error starting the deployment. Check the error log file for more information: `/var/log/netwitness/correlation-server/correlation-server.log`.
Rule Stats	Rules Enabled	Number of rules enabled
	Rules Disabled	Number of rules disabled
	Events Matched	Total number of events matched to all rules on the ESA service
Alert Stats	Notifications	The total number of notifications sent by email, SNMP, syslog, or script for the deployment. (ESA SNMP notifications are not supported in NetWitness Platform version 11.3 and later.)
	Message Bus	The total number of alerts sent to Respond for the deployment



Deployed Rule Stats Panel

The Deployed Rule Stats panel provides details on the rules that are deployed on the ESA service.

The following figure shows the Deployed Rule Stats panel.

The table lists the various parameters in the view and their description.

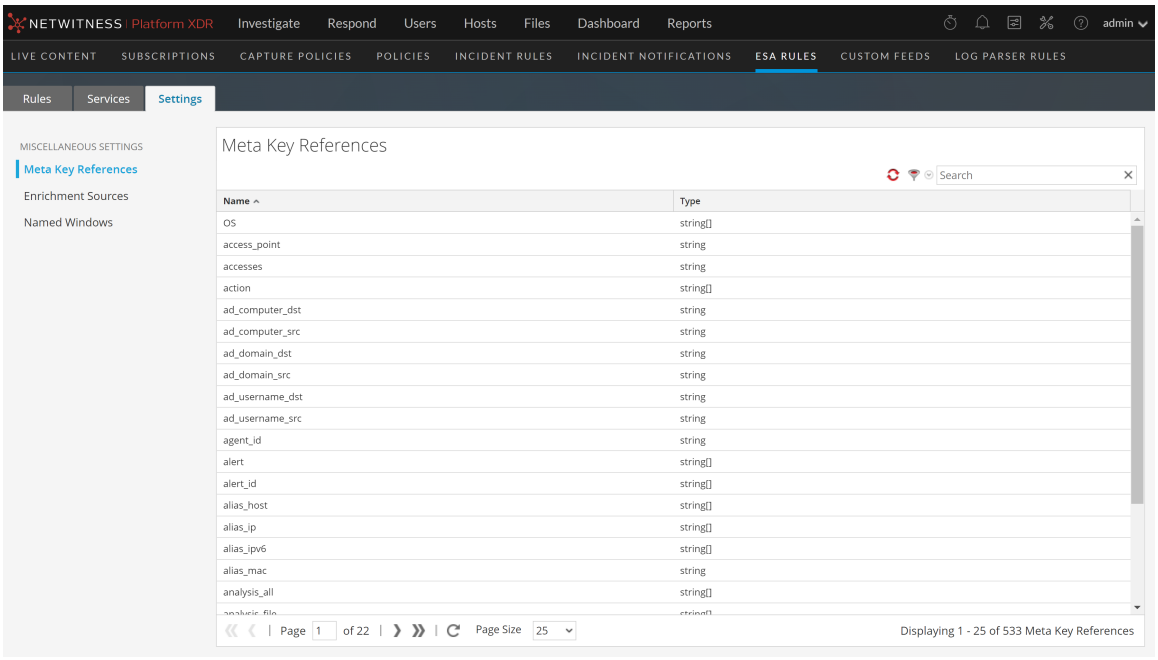
Parameters	Description
Enable	Enables a rule that was disabled.
Disable	Disables a rule that was enabled.
Health & Wellness link	Enables you to monitor overall memory usage and health of your ESA Correlation service.
Enabled	Indicates whether the rule is enabled or disabled. A green circle icon indicates that the rule is enabled. A white circle icon indicates that the rule is disabled. If a disabled rule has an error message, it shows in the Enabled field. Hover over the icon to view the error message tooltip. The following example shows that the rule was disabled because it exceeded the configured memory threshold for that rule. 
Name	Name of the ESA rule.
Rule Type	(This field applies to version 11.3 and later.) **Endpoint** indicates a rule from the Endpoint Risk Scoring Bundle and **Esper** indicates Esper-specific rules, such as Rule Builder and Advanced EPL rules.
Trial Rule	Indicates if the rule is running in trial rule mode.
Last Detected	The last time alert was triggered for the rule.
Events Matched	The total number of events that matched the rule.
Memory Usage	The total amount of memory used by the rule. **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show memory usage.
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each. (This field is available in version 11.5 and later.) **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show CPU usage.

Settings Tab

This topic describes the components of the **(Configure) > ESA Rules > Settings** tab. In the Settings tab, you can perform the following tasks:

- MetaKey References
- Viewing the List of Meta Entities
- Enabling Meta Entity in the ESA Correlation Server
- Building Rules with Custom Meta Entities
- Configure a data enrichment source
- View Named Windows

What do you want to do?



Role	I want to ...	Show me how
Content Expert	Configure an in-memory table as an enrichment source. (Recurring In-Memory Tables are no longer supported in version 11.3 and later.)	Configure an In-Memory Table as an Enrichment Source
Content Expert	Configure a Context Hub list as an enrichment source.	Configure a Context Hub List as an Enrichment Source

Related Topics

- Add a Data Enrichment Source
- Rule Builder Tab

Quick Look

The following figure shows the Meta Key References section in the Settings tab.

Meta Key References

The Meta Key References section lists each Meta key used by the ESA Correlation server and the type of value the key requires.

Meta key entities are configured to be a part of Event Schema. After you upgrade from NetWitness® Platform 11.5, or previous releases to NetWitness® Platform 11.6, you can enable the string [] meta keys entities. You can create rules and configure alerts based on the meta key entities that you select. You can also add meta entities to create rules. The meta entities retrieves data from the data sources to trigger alerts.

Note: Only the meta keys comprising of string [] are supported.

Viewing the List of Meta Entities

Perform the following steps to view the list of meta entities that are available in the system:

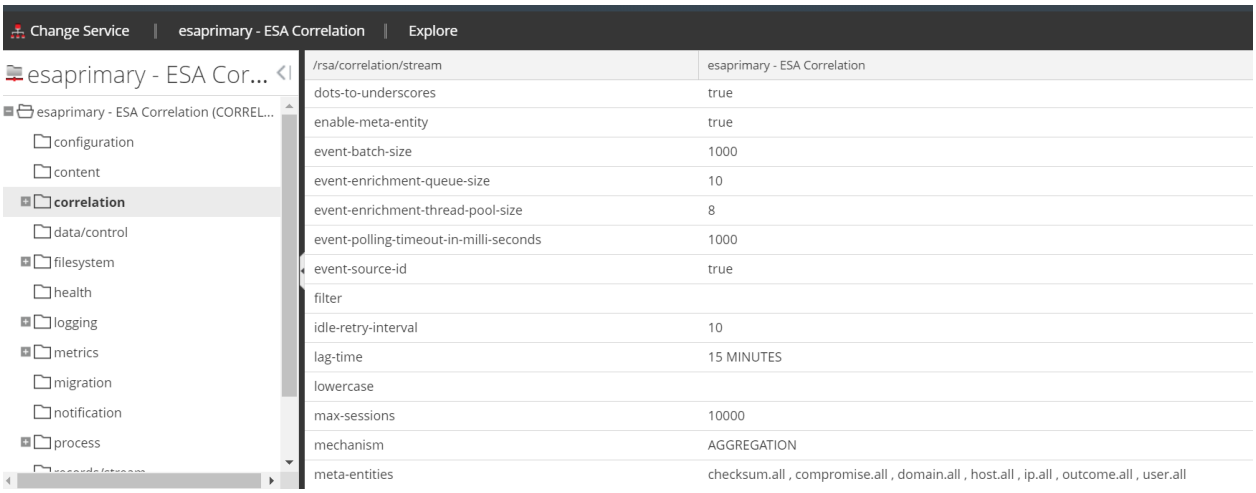
1. Go to (Configure) > **ESA RULES** > **Settings** > **Meta Key References**.

The Meta Key References page displays all the meta keys that are enabled.

2. Enter the name of the meta key in the Search text box to view specific meta entities.

Enabling Meta Entity in the ESA Correlation Server

After an upgrade to NetWitness 11.6 or later, you need to enable the meta entities in the ESA Correlation server to create rules and configure alerts based on the meta key entities.



To enable meta entities in the ESA Correlation server:

1. Click (Admin) **Admin** > **Services**.

2. In the Services view, select the ESA Correlation service.

3. Click the settings icon and go to **View** > **Explore**.

The ESA Correlation Configuration page lists all the services.

4. Click **enable-meta-entity** and set it to **true**.

Note: By default, **enable-meta-entity** is set to **false**. Ensure that you enable only the specific meta entitiy using which you want to build a rule. Enabling multiple meta entities affects the system performance.

5. Add custom meta entities by appending or editing the meta-entities field values under explore view.

In the Explore view node list for the ESA Correlation service, select **Correlation** > **Stream**.All the stream settings are listed. You can add custom meta entities to the list as per the requirement. Once you enable custom meta entities, you can view them under Meta Key References. Once you enable the custom meta key entities, the rules will start evaluating the meta key entities and start to evaluate and trigger alerts as per the configured conditions. For more information, see Viewing the List of Meta Entities

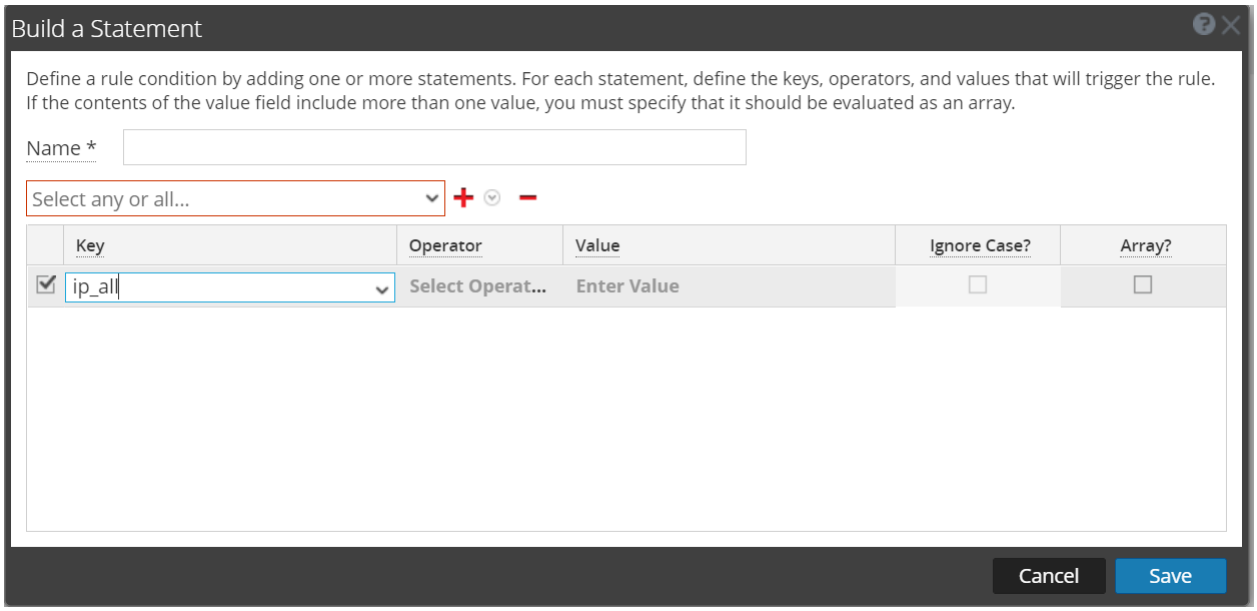
The following meta entities are listed in the ESA Correlation Configuration page:

- checksum.all
- compromise.all
- domain.all
- host.all
- ip.all
- outcome.all
- user.all

Meta Entity Usage Example

ip_all, and *host_all* are some of the examples of meta entities.

For example, the *ip_all* meta entity can be used to check for any malicious IPs. It combines all the IPv4 meta keys (*ip_src*,*alias_ip*, *ip_dst*, and *forward_ip*) and creates a string array to retrieve information and trigger alerts.



Note: You can add and enable custom meta entities (string arrays) to the list.

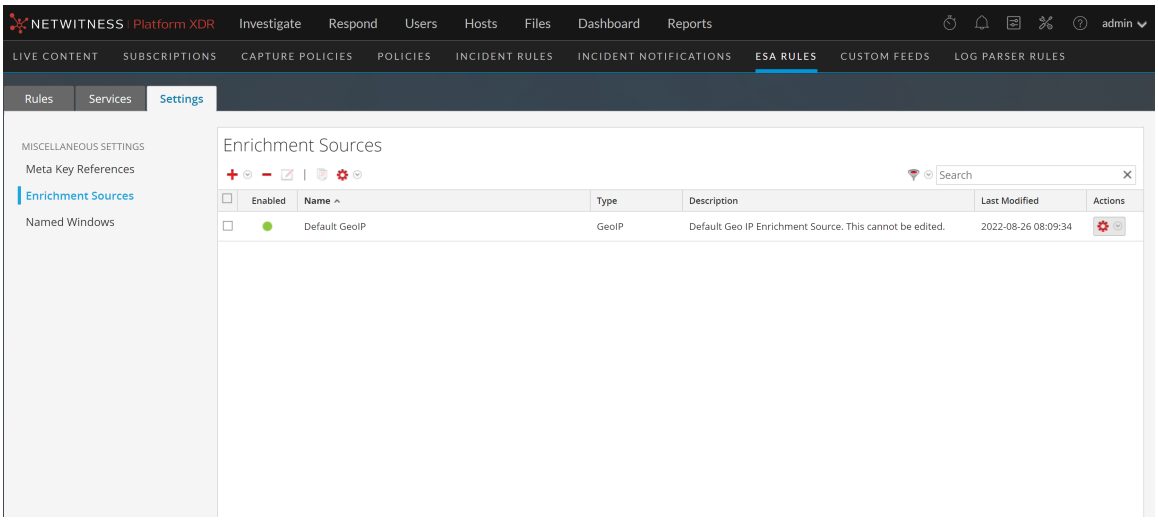
Building Rules with Custom Meta Entities

This topic provides instructions to define rule criteria in Rule Builder by adding statements. A statement is a logical grouping of rule criteria in the Rule Builder. You add statements to define what a rule detects.

The following graphic shows an example of a Rule Builder statement using meta entities.

Every statement contains a key and value. Then, you build logic around the pair by selecting an option in each other field.

Prerequisites



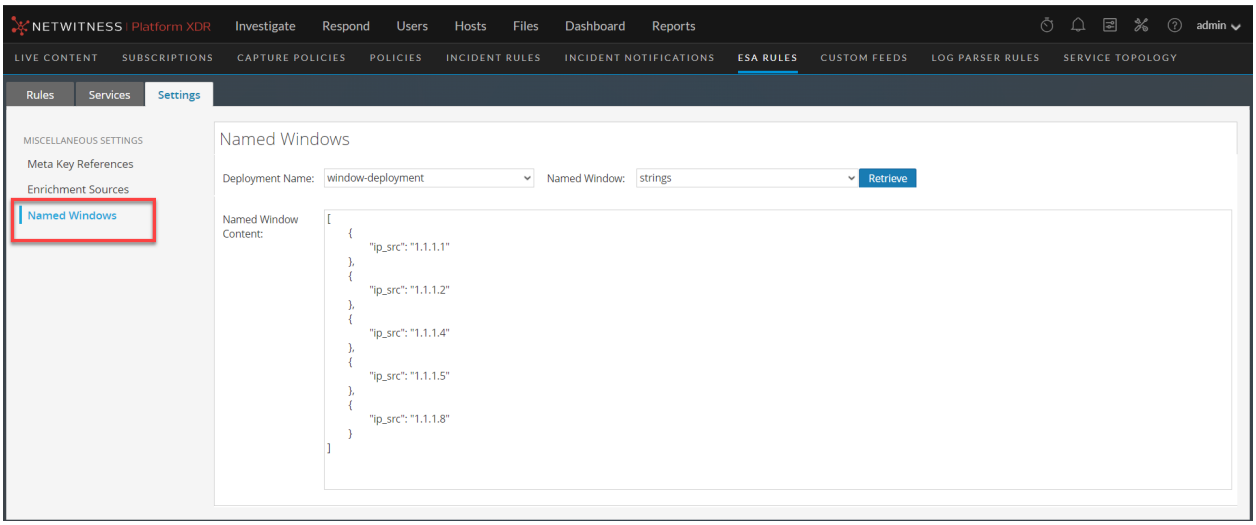
To build a rule statement, you must know the meta key and the meta value. For a complete list of meta keys, go to (Configure) > **ESA Rules** > **Settings** > **Meta Key References**.For more information about building rules with meta entities, see Rule Builder Tab.

Enrichment Sources

In the Enrichment Sources section, you can use the following external data sources:

- GeoIP
- In-Memory Table (Add hoc only - Recurring In-Memory Tables are no longer supported in version 11.3 and later.)
- Context Hub

The following figure shows the Enrichment Sources section in the Settings tab.



View Named Windows

The ESA Esper processing model is continuous, helps in storing the data from the consumed sessions in the form of named windows based on the deployed ESA rule.

From 12.0 and later, you can view the contents of the windows of a particular named window using the named window settings tab.

The following figure shows the Named Windows section in the Settings tab.

Perform the following steps to view the list of named windows that are available in the system:

1. Go to **Configure** > **ESA RULES** > **Settings** > **Named Windows**.
2. Select a deployment name from the **Deployment Name** drop-down list.
3. Select a named window from the **Named Window** drop-down list.
4. Click **Retrieve**.

Event Stream Analysis Overview

NetWitness Event Stream Analysis (ESA) provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators.

ESA's advanced Event Processing Language allows you to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams. Event Stream Analysis helps perform powerful incident detection and alerting.

The following diagram shows the high-level data workflow:

In NetWitness version 11.5 and later, There are only two services that can run on an ESA host:

- **ESA Correlation (ESA Correlation rules):** Creates alerts from ESA rules.
- **Contexthub Server (Context Hub):** Runs only on an ESA primary host. Contexthub Server provides enrichment lookup capability in the Respond and Investigate views. For information, see the *Context Hub Configuration Guide*.

Note: The Event Stream Analytics Server (ESA Analytics) service is not supported in NetWitness Platform version 11.5 and later.

The first service is the ESA Correlation service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live.

In NetWitness 11.3 and later, the ESA Correlation service replaces the Event Stream Analysis service and is also known as ESA Correlation Server. The ESA Correlation service provides the same services as the Event Stream Analysis service with the added benefit of enabling you to specify different data sources for your ESA correlation rules. Like the Event Stream Analysis service, the ESA Correlation service installs on the ESA Primary and ESA Secondary host types.

The second service is the Contexthub Server service, which provides enrichment lookup capabilities in the Respond and Investigate views. It runs only on an ESA Primary host. For information, see the *Context Hub Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

IMPORTANT: Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.5 and later. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

Upgrade Considerations for ESA Analytics

The Event Stream Analytics Server (ESA Analytics) service is not supported or available in NetWitness version 11.5 and later. The Whois Lookup Configuration and ESA Analytics Mapping panels are no longer in the user interface [(Admin) > **System**].

Note: Event Stream Analysis (ESA) is not end of life. ESA Correlation rules and the ESA Correlation service are supported. ESA Analytics, which is used for Automated Threat Detection, is different from ESA Correlation Rules and is EOL. In its place, you can use ESA Correlation as is offers more functional capabilities and better performance.

Configure ESA Correlation Rules

This topic provides high-level tasks to configure NetWitness Event Stream Analysis (ESA) Correlation Rules using the ESA Correlation service.

IMPORTANT: Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.5 and later. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

Data Source Configuration Changes

In NetWitness version 11.3 and later, the ESA Correlation service enables you to specify different data sources for different sets of rules. Instead of adding data sources, such as Concentrators, to the entire ESA Correlation service, you can specify different data sources for each ESA rule deployment. An ESA rule deployment includes an ESA Correlation service with its associated data sources and a set of ESA rules. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment. For more detailed information, see "Manage ESA Datasources" in Live Services Management Guide.

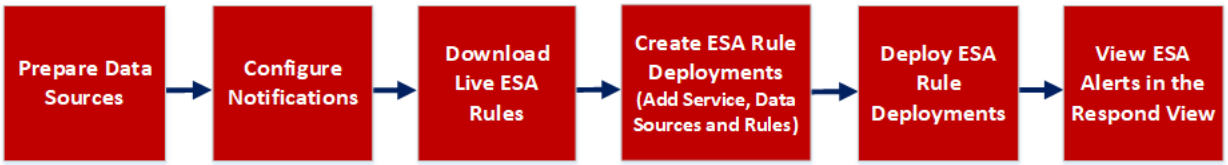
In NetWitness Platform 11.5 and later, you can add an optional data source filter to the data sources in your ESA rule deployments to improve performance. This allows your data sources to be filtered further so that only the data relevant to the deployment is forwarded to ESA. The filter is comprised of application rules, which are applied to the Decoders mapped to your selected data sources.

Caution: The data source filter is intended for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.

Using a data source filter can be performance intensive for data aggregation. A filter slows the event aggregation rate, but when you are filtering a large amount of traffic, it can have performance benefits on ESA Correlation server. However, if you use a complex filter and do not filter a large amount of traffic, the event aggregation rate may be lower than expected.

IMPORTANT: If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed.

For more information, see “Create a Deployment” topic in Live Services Management Guide.



Endpoint Risk Scoring Rules Bundle

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

The ESA Correlation service can process endpoint risk scoring rules, which generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see Deploy Endpoint Risk Scoring Rules on ESA. To configure NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

ESA Correlation Rules Configuration Workflow

The following diagram shows the high-level workflow for configuring ESA Correlation Rules with the ESA Correlation service.

ESA Rule Deployments are groups of ESA Rules processed by an ESA service to create alerts. In NetWitness 11.3 and later, the ESA Correlation service processes the ESA rules and creates alerts.

Before you can configure ESA Correlation Rules, install and configure the data sources (Concentrators) to use for the ESA rules. For example, you may have a Concentrator with HTTP packet data and another with Windows Log data. Next, configure the global notification methods that content experts can use for the ESA rules. For example, they may want to send an email notification when a rule creates an alert.

The NetWitness Live Content Management System (known as *Live*) is a valuable source of the latest internet security resources for NetWitness customers. RSA Live contains an extensive library of ESA rules to detect threats that you can use to save time. Download the rules for the events that you want to detect in your network to the ESA Rule Library and adjust them as needed for your network environment.

After you prepare your data sources and download Live ESA rules, you can create one or more ESA rule deployments. An ESA rule deployment contains an ESA service, one or more data sources, and a set of ESA rules. For example, you can create an ESA rule deployment that contains an ESA Correlation service, a Concentrator with HTTP packet data, and a set of ESA rules for HTTP packet data. When you are ready to have the ESA service run the rule set, you deploy the ESA rule deployment, which places the rules on ESA.

After you deploy an ESA rule deployment, verify that you can view the ESA alerts in the Respond view (**Respond** > **Alerts**).

Prerequisites

Make sure that you:

- Install the ESA Correlation service in your network environment.
- Install and configure one or more Concentrators in your network environment.
- Download or ensure that you have access to the Alerting with Correlation Rules User Guide for version 11.3 or later. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Procedure

The following table shows the high level tasks required to configure ESA Correlation Rules.

Tasks	Reference
1. Prepare data sources, such as Concentrators, to use for your ESA Correlation Rules.	Refer to Broker and Concentrator Configuration Guide.
2. Configure notifications for the ESA Correlation service.	Refer to Notification Methods.
3. Working with Event Stream Analysis rules using Live. Configure the Live ESA Rule parameters for your environment.	Refer to Working with RSA ESA Live Rules.
4. Create ESA rule deployments*: Choose ESA Rules and the appropriate ESA service to use in the ESA rule deployment.	Refer to **Create a Deployment** topic in Live Services Management Guide.
5. Deploy ESA rule deployments.*	Refer to **Create a Deployment** topic in Live Services Management Guide.
6. View ESA alerts in the Respond view.	Refer to the NetWitness Respond User Guide.

*ESA rule deployments are groups of ESA Rules that are processed by an ESA service, such as the ESA Correlation service in NetWitness version 11.3 and later.

For additional optional advanced ESA Correlation Rules configuration procedures, see Additional ESA Correlation Rules Procedures.

For more information on alerting with ESA Correlation rules best practices, creating rules, working with trial rules, adding data enrichment sources, viewing statistics for an ESA service, and troubleshooting, see the Alerting with ESA Correlation Rules User Guide.

ESA Correlation Health and Wellness Monitoring

In NetWitness version 11.5 and later, New Health and Wellness provides improved and intuitive dashboards, monitors, and visualizations. The ESA Correlation Overview dashboard provides health statistics and trends on ESA rule deployments.

For more information, see "Monitor New Health and Wellness" and "Appendix A: New Health and Wellness Dashboards / ESA Correlation Overview Dashboard" in the System Maintenance Guide.

Upgrade Considerations for ESA Hosts

Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.5 and later.

IMPORTANT: The NetWitness server (Admin server), ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

Trial Rule Status Changes

In NetWitness Platform 11.4 and later, ESA trial rules no longer change status after an upgrade or deployment. For example, if you change the status of a trial rule to disabled [(Configure) > **ESA Rules** > **Services** tab] and redeploy the ESA rule deployment [(Configure) > **ESA Rules** > **Rules** tab], the trial rule remains disabled. Previously, ESA trial rules could change status after an upgrade or when they were redeployed.

Upgrade Considerations for ESA Rule Deployments for version 12.1 and later

Before upgrading to the 12.1 version, NetWitness recommends that all the ESA deployments maintain an error-free state and remove any unused ESA deployments, as ESA deployments will be migrated to policies and groups after upgrading to the 12.1 version.

Note: Make sure that you plan the upgrade process so that correlation servers are upgraded immediately after the Admin Server is done. The deployments will not be accessible until the corresponding correlation servers are upgraded. This action will not affect the events and alerts processing by correlation servers.

IMPORTANT: If there is any need to import ESA Rules and Enrichments. NetWitness recommends importing those missing rules and enrichments before the upgrade.

The pre-upgrade and post-upgrade states of deployments are represented in the following table.

SINo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No

After upgrading to the 12.1 version, all the ESA deployments will be migrated to (**CONFIGURE**) > **Policies** page. Each deployment will be converted into a policy and group and will be available to manage only after the upgrade of the correlation server to the 12.1 version. Verify if all the ESA deployments are in a healthy state. For more information, see **View a Deployment** topic in the *Live Services Management Guide*.

Note: Analysts must have appropriate permissions to view the ESA rules under (**CONFIGURE**) > **ESA Rules** and (**CONFIGURE**) > **Policies** pages. For more information, see the **Source-server** section in the "Role Permissions" topic in the *System Security and User Management Guide*.

(Optional) Using the **Merge Policy** button, you can merge a policy having ESA content with a policy with no ESA content.. For more information, see "Merge Policy with ESA Content" topic in the *Live Services Management Guide*.

To support Endpoint and UEBA content as well as changes to ESA rules from Live, a data change from single-value (string) to multi-value (string array) is required for several meta keys within the ESA Correlation service. Some single-value meta keys are also required. See Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

Additional ESA Correlation Rules Procedures

This topic is a collection of individual procedures, which an Administrator may perform at any time and they are not required to complete the initial setup of ESA Correlation Rules.

Use this section when you are looking for instructions to perform a specific task after the initial setup of ESA.

- Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys
- Configure Advanced Settings for an ESA Correlation Service
  - Enable or Disable Sending ESA Rule Alerts to the Respond View
  - Enable ESA Correlation Service Debugging for All Rules
  - Configure Maximum Events per Alert for All Rules
  - Adjust Maximum Sessions for the ESA Data Source Filter
  - Configure Meta Keys as Arrays in ESA Correlation Rule Values
  - Remove Sensitive Meta Keys Globally from All Alerts for Data Privacy
- Configure Character Case for Advanced ESA Rules
- Deploy Endpoint Risk Scoring Rules on ESA
- Change Memory Threshold for ESA Rules
- Start, Stop, or Restart ESA Service
- View Audit Logs and Verify ESA Component Versions

Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys

Note: This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.3.0.2 and later versions.

To support Endpoint, UEBA, and RSA Live content, a data change from single-value (string) to multi-value (string array) is required for several meta keys within the ESA Correlation service for 11.3 and later. Additional string meta keys are required within the ESA Correlation service for 11.3.0.2 and later.

If the meta keys used for your ESA rules are different from the required default multi-value meta keys, your ESA rules continue to work, but you should update your ESA rules to use the required meta keys as soon as possible to ensure that your rules continue to deploy properly.

Note: On a new installation of ESA on 11.3.0.2 and later, no ESA rule adjustments are necessary.

The ESA Correlation service has the following multi-valued (string array) and single-valued (string) parameters:

- **`multi-valued`** - Shows the string array meta keys currently used for your ESA rules.
  - For an upgrade to NetWitness Platform 11.3.0.2 and later, it shows the existing string array meta keys before the upgrade. (This parameter is equivalent to the Event Stream Analysis service ArrayFieldNames parameter in NetWitness Platform versions 11.2 and earlier.)
  - For a new installation of NetWitness Platform 11.3.0.2 and later, it contains all the required string array meta keys for the latest version.
- **`single-valued`** - Shows the string meta keys currently used for your ESA rules.
  - For an upgrade to NetWitness Platform 11.3.0.2 and later from versions prior to 11.3, this parameter value is empty.
  - For a new installation of NetWitness Platform 11.3.0.2 and later, it contains all the required string meta keys for the latest version.
- **`default-multi-valued`** - Shows the required string array meta keys for the latest version.
  - For a new installation of NetWitness Platform 11.3.0.2 and later, this parameter value is empty.
- **`default-single-valued`** - Shows the required string meta keys for the latest version.
  - For a new installation of NetWitness Platform 11.3.0.2 and later, this parameter value is empty.

Note: If you have the same value in the `single-valued` and `multi-valued` parameter fields, the `single-valued` meta key value takes precedence over the `multi-valued` meta key value.

To use the latest Endpoint, UEBA, and Live content rules, you must update the **`multi-valued`** parameter on the ESA Correlation service to include all of the meta keys in the **`default-multi-valued`** field. You must also update the **`single-valued`** parameter field to include all of the meta keys in the **`default-single-valued`** field. To do this, follow the Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules procedure.

Caution: Any changes that you make to the `multi-valued` parameter may cause an error when you deploy your existing rules. You can update the `multi-valued` parameter, resync your meta keys, and update the ESA rules at your convenience. You may want to add a couple meta keys at a time to reduce the number of reported errors.

Note: If you are using multiple ESA Correlation services, the `multi-valued` and `single-valued` parameters should be the same on each ESA Correlation service.

In NetWitness Platform 11.3.0.2 and later, ESA automatically adjusts the operator in the rule statement when there is a change from string to string array, but you still may need to make manual adjustments to adjust for the string array changes.

To change the string type meta keys to string array type meta keys manually, see Configure Meta Keys as Arrays in ESA Correlation Rule Values.

To use the latest Endpoint, UEBA, and Live content rules, the following default **multi-valued** meta keys are required on the ESA Correlation service in NetWitness Platform version 11.3 and later:

```
action , alert , alert.id , alias.host , alias.ip , alias.ipv6 , analysis.file
, analysis.service , analysis.session , boc , browserprint , cert.thumbprint ,
checksum , checksum.all , checksum.dst , checksum.src , client.all , content ,
context , context.all , context.dst , context.src , dir.path , dir.path.dst ,
dir.path.src , directory , directory.all , directory.dst , directory.src ,
email , email.dst , email.src , eoc , feed.category , feed.desc , feed.name ,
file.cat , file.cat.dst , file.cat.src , filename.dst , filename.src , filter
, function , host.all , host.dst , host.orig , host.src , host.state ,
inv.category , inv.context , ioc , ip.orig , ipv6.orig , netname , OS , param
, param.dst , param.src , registry.key , registry.value , risk , risk.info ,
risk.suspicious , risk.warning , threat.category , threat.desc , threat.source
, user.agent , username
```

The following default **single-valued** meta keys are also required on the ESA Correlation service in NetWitness Platform 11.3.0.2 and later:

```
accesses , context.target , file.attributes , logon.type.desc , packets
```

If you used any meta keys in the ESA rule notification templates from the Required String Array or String Meta Keys list, update the templates with the meta key changes. See "Configure Global Notification Templates" in the *System Configuration Guide*.

Note: Advanced EPL rules may get disabled and are not automatically updated so they must be fixed manually.

For additional troubleshooting information, see “Troubleshoot ESA” in the *Alerting with ESA Correlation Rules User Guide*.

Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules

To use the latest Endpoint, UEBA, and Live content rules, you must update the **multi-valued** parameter field on the ESA Correlation service to include all of the meta keys in the **default-multi-valued** field. You must also update the **single-valued** parameter field to include all of the meta keys in the **default-single-valued** field.

Caution: Any changes that you make to the `multi-valued` parameter may cause an error when you deploy your existing rules. You can update the `multi-valued` parameter, resync your meta keys, and update the ESA rules at your convenience. You may want to add a couple meta keys at a time to reduce the number of reported errors.

Note: If you see a warning message in the ESA Correlation server error logs for missing multi-valued meta keys, there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, and the new Endpoint, UEBA, and Live content rules will not work. The same is true for missing single-valued meta keys. Completing this procedure should fix the issue. For example warning messages, see Example ESA Correlation Server Warning Message for Missing Meta Keys.

1. After an upgrade to 11.3.0.2 or later, go to  **(Admin) > Services**, and in the Services view, select an ESA Correlation service and then select  **> View > Explore**.
2. In the Explore view node list for the ESA Correlation service, select **correlation > stream**.

3. Compare the **multi-valued** parameter meta keys with the required **default-multi-valued** meta keys. Copy and paste the missing string array meta keys from the **default-multi-valued** parameter to the **multi-valued** parameter. (You may want to copy only a couple meta keys at one time to reduce the number of reported errors).
4. Copy and paste the string meta keys from the **default-single-valued** parameter to the **single-valued** parameter.
5. If you have multiple ESA Correlation services, make the same meta key changes on each ESA Correlation service.
6. Apply the changes on the ESA Correlation services:
   a. Go to  **(Configure) > ESA Rules** and click the **Settings** tab.
   b. In the Meta Key References, click the Meta Re-Sync (Refresh) icon ().
7. If you are using any of the **default-multi-valued** or **default-single-valued** meta keys in your ESA Advanced rules, update the rule syntax. See also Adjust Custom ESA Rule Builder and ESA Advanced Rules.
8. If you used any meta keys in the ESA rule notification templates from the **default-multi-valued** parameter list, update the templates with the meta key changes. See "Configure Global Notification Templates" in the *System Configuration Guide*.
9. Deploy your ESA rule deployments.
10. Check your rules for error messages in the ESA Rules section of the ESA rule Deployment or check the ESA Correlation error logs for errors.
    - (This option is available in NetWitness verson 11.3.0.2 and later.) To access the error messages in the ESA rule deployment, go to  **(Configure) > ESA Rules > Rules** tab, select a deployment in the options panel on the left, and go to the **ESA Rules** section. If the ESA rule status shows "Disabled" or shows the  icon in the Status column, you need to determine the issue to fix the rule. If a disabled rule has an error message, it shows  in the Status field. You can hover over the rule to view the error message tooltip without going to the error log.
    - To access the ESA Correlation service logs, you can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.

Adjust Custom ESA Rule Builder and ESA Advanced Rules

Update your ESA Rule Builder and ESA Advanced rules to work with the string and string array meta keys listed in the `default-multi-valued` and `default-single valued` parameter fields for the ESA Correlation service. You can add additional meta keys to the `multi-valued` and `single-valued` parameters.

For example, if you use ec.outcome as a single-valued meta key in your ESA rule as shown below:

```
@RSAAlert
SELECT * FROM Event((ec_outcome IN ( 'Success' )))
.win:time_length_batch(2 Minutes, 2)
```

```
HAVING COUNT(*) >= 2;
```

If you add ec.outcome to the **multi-valued** parameter field, you need to update your rule as shown below:

```
@RSAAlert
SELECT * FROM Event(( 'Success' = ANY( ec_outcome ) ))
.win:time_length_batch(2 Minutes, 2)
HAVING COUNT(*) >= 2;
```

For more information, see Configure Meta Keys as Arrays in ESA Correlation Rule Values.

Example ESA Correlation Server Warning Message for Missing Meta Keys

If you see a warning message in the ESA Correlation server error logs for missing multi-valued meta keys, there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, and the new Endpoint, UEBA, and Live content rules will not work. The same is true for missing single-valued meta keys. Completing the Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules procedure should fix the issue.

Multi-Valued Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[alert, alert_id,
browserprint, cert_thumbprint, checksum, checksum_all, checksum_dst,
checksum_src, client_all, content, context, context_all, context_dst,
context_src, dir_path, dir_path_dst, dir_path_src, directory,
directory_all, directory_dst, directory_src, email_dst, email_src,
feed_category, feed_desc, feed_name, file_cat, file_cat_dst, file_cat_
src, filename_dst, filename_src, filter, function, host_all, host_dst,
host_orig, host_src, host_state, ip_orig, ipv6_orig, OS, param, param_
dst, param_src, registry_key, registry_value, risk, risk_info, risk_
suspicious, risk_warning, threat_category, threat_desc, threat_source,
user_agent] are still MISSING from multi-valued
```

Single Value Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[accesses, context_
target, file_attributes, logon_type_desc, packets] are still MISSING
from single-valued
```

Configure Meta Keys on New ESA Hosts to Match Upgraded ESA Hosts in the Same NetWitness Platform Network

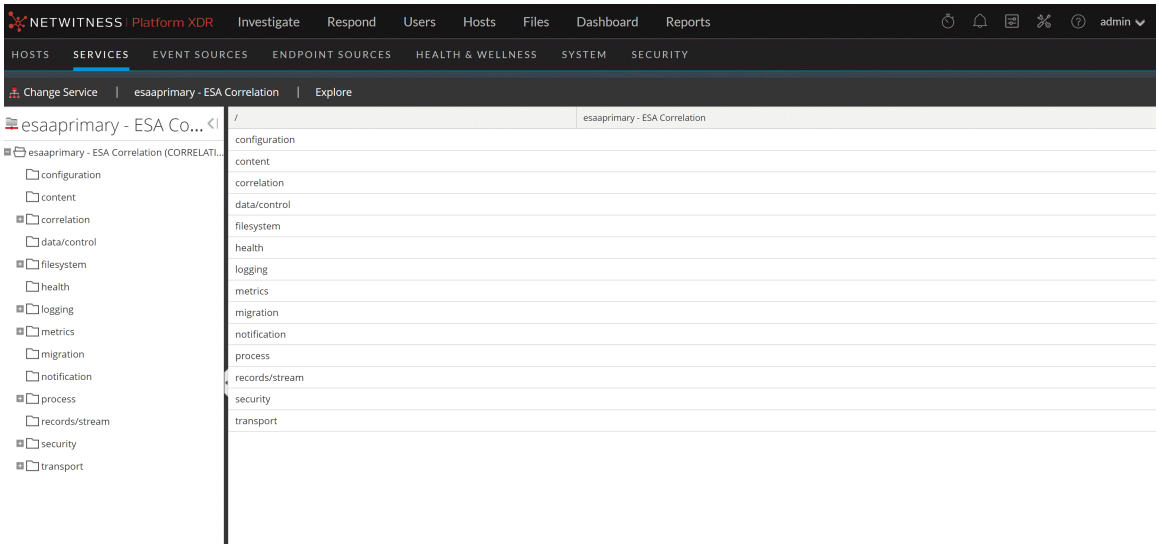
Note: If you are upgrading from version below 11.4.x.x, make sure that meta keys on new ESA hosts are updated to match upgraded ESA Hosts in the Same NetWitness Platform Network.

If you have one or more ESA hosts in a NetWitness Platform network, which were upgraded from a version before 11.3.0.2 to 11.6, and you add a new ESA host, you must configure the meta keys on the new ESA host to match the other ESA hosts. All ESA Correlation services on the same NetWitness Platform network must have the same Meta Key configurations.

1. For each ESA Correlation service on an upgraded ESA host and for the ESA Correlation service on the newly installed ESA host:
   a. Open a new tab, go to  **(Admin) > Services**, and in the Services view, select the ESA Correlation service and then select  **> View > Explore**.
   b. In the Explore view node list for the ESA Correlation service, select **correlation > stream**.
2. Ensure that the **`multi-valued`** and **`single-valued`** meta key values are the same on each of the upgraded ESA Correlation services.
3. Ensure that the **`multi-valued`** and **`single-valued`** meta key values on the newly installed ESA host are the same as those on the upgraded services.
4. To apply any changes on the ESA Correlation services, go to  **(Configure) > ESA Rules** and click the **Settings** tab. In the Meta Key References, click the **Meta Re-Sync (Refresh)** icon ().
5. If you updated the ESA Correlation services, redeploy the ESA rule deployments.

For more information, see Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

Configure Advanced Settings for an ESA Correlation Service



These procedures are optional and they apply only to ESA Correlation Rules.

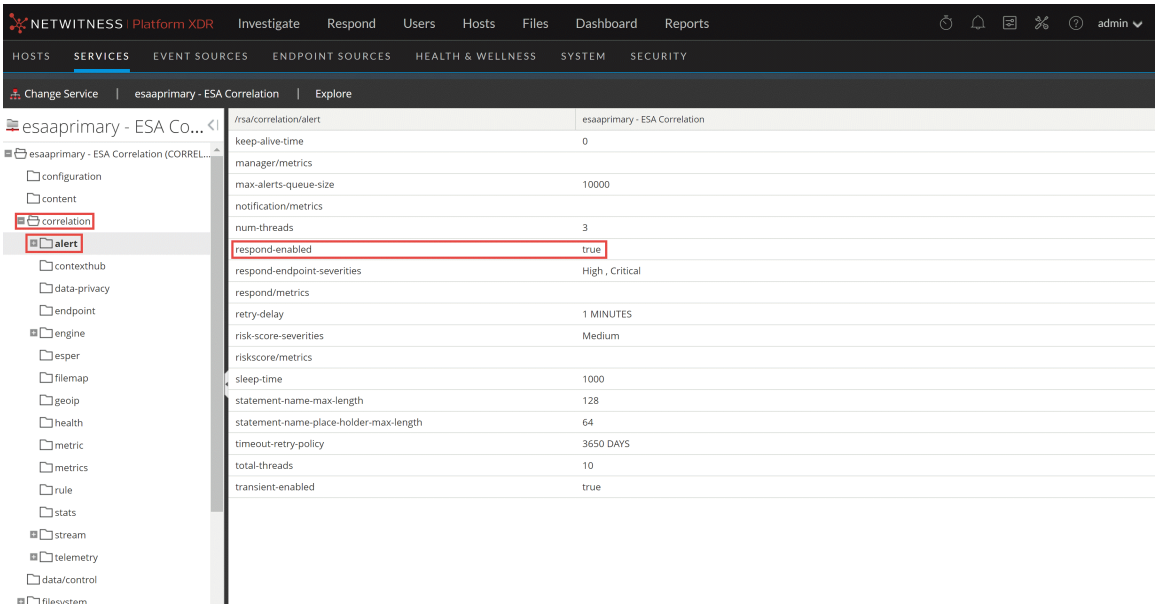
In the Explore view for an ESA Correlation service, you can manage sending ESA rule alerts to the Respond view, turn on debugging for all rules, configure the events to preserve for rules with multiple events, and configure meta keys as string array values on ESA.

- Enable or Disable Sending ESA Rule Alerts to the Respond View
- Enable ESA Correlation Service Debugging for All Rules
- Configure Maximum Events per Alert for All Rules
- Adjust Maximum Sessions for the ESA Data Source Filter
- Configure Meta Keys as Arrays in ESA Correlation Rule Values
- Remove Sensitive Meta Keys Globally from All Alerts for Data Privacy

Access Advanced Settings for an ESA Correlation Service

1. Go to  **(Admin) > Services**.
   The Services view is displayed.
2. In Services view, select an ESA Correlation service and then select  **> View > Explore**.
   The Explore view is displayed.

Enable or Disable Sending ESA Rule Alerts to the Respond View



ESA gathers data, runs ESA Correlation rules against the data, captures events that meet rule criteria, and creates alerts for those captured events. You can view those alerts in the Respond view.

Before an ESA Correlation rule alert can go to the Respond view, both of the following settings must be enabled:

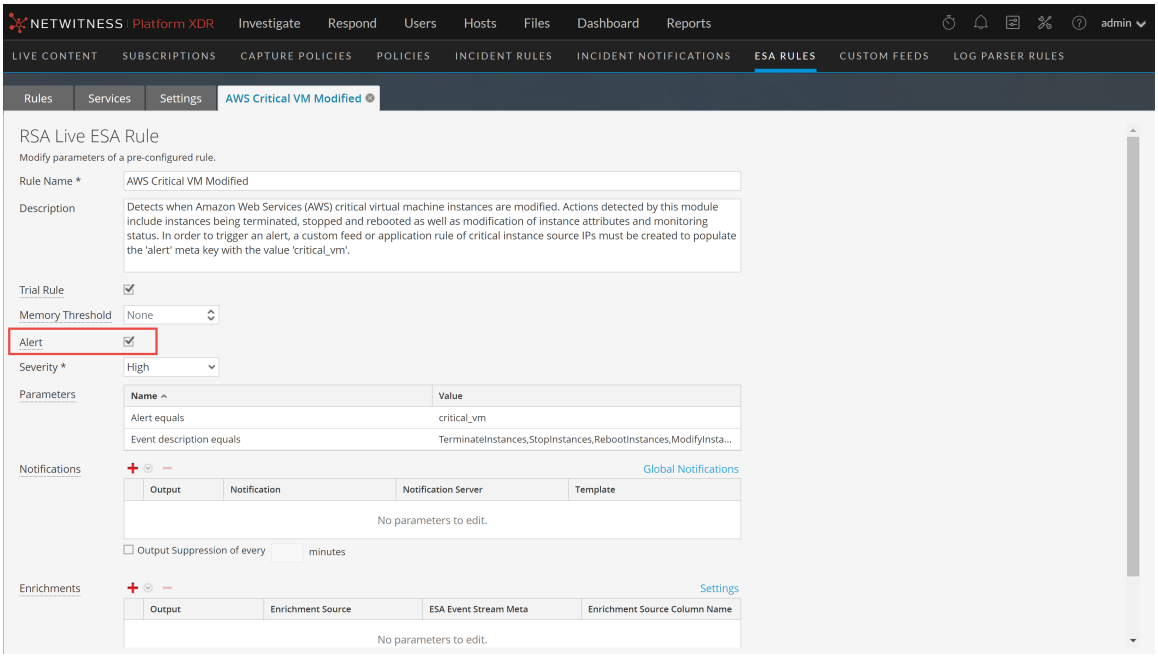
1. For all rules, the ESA Correlation service must have the `respond-enabled` parameter set to **true**. (The default is true.)
2. For an individual rule, the ESA Correlation rule must have the **Alert** option selected in the rule builder for that rule.

To enable or disable alert forwarding to the Respond view for ALL ESA Correlation rules:

1. In the Explore view node list for an ESA Correlation service, select **correlation > alert**.

2. To allow all ESA Correlation Rule alerts to go to the Respond view, set `respond-enabled` to **true**. Alerts for ESA rules that have the **Alert** option selected are visible in the Respond view.
3. To stop all ESA Correlation Rule alerts from going to the Respond view, set `respond-enabled` to **false**.
   ESA Correlation Rules do not go to the Respond view, even if you select the **Alert** option in the rule.

   The changes take effect immediately.



Note: The `respond-enabled` parameter is equivalent to the **Forward Alerts On Message Bus** option in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

To send or not send alerts to the Respond view for a single ESA Correlation rule:

Content experts managing the ESA Correlation rules can decide whether to send alerts to the Respond view for each rule.

1. Go to  **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.

2. In the **Rule Library**, select the rule you want to edit and click .
   Depending on the rule type, the respective rule tab is displayed.

   - To turn on Respond alerts for a rule, select the **Alert** checkbox.
   - To turn off Respond alerts for a rule, clear the **Alert** checkbox.

3. Click **Save**.

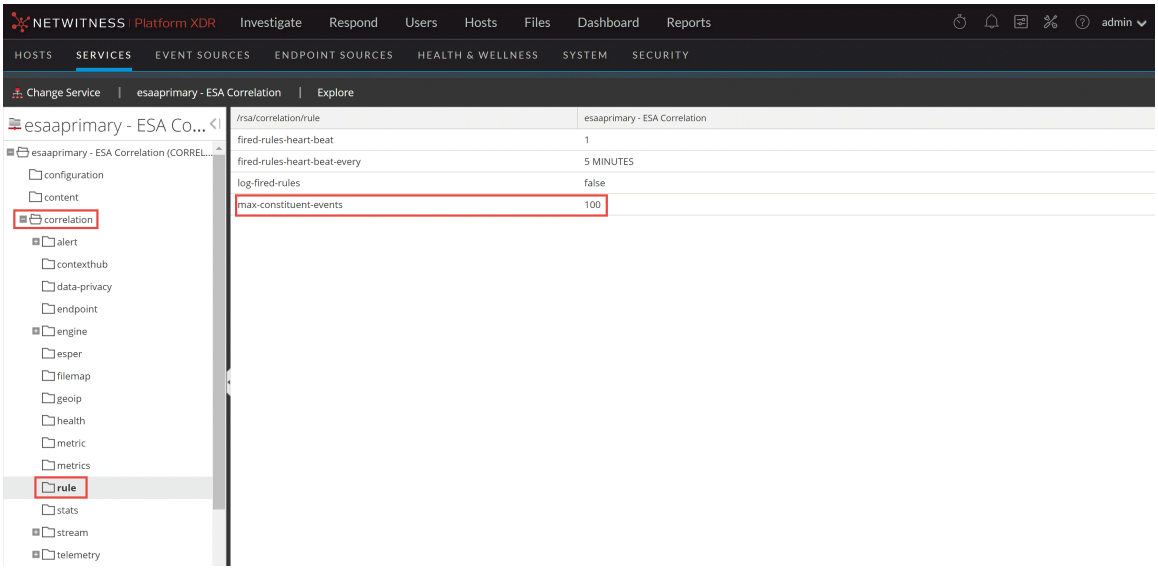
   For more information, see the *Alerting with ESA Correlation Rules User Guide*.

Enable ESA Correlation Service Debugging for All Rules

You can turn on debugging for all ESA rules to see if rules are creating (firing) alerts and data is being processed properly by the ESA Correlation service. This can also be helpful when writing or fixing global notification templates, such as syslog or email. You can see the actual content of an alert before sending the notification.

When you disable ESA Correlation service debugging for all rules, you can still turn on debugging for an individual rule at any time.

1. In the Explore view node list for an ESA Correlation service, select **correlation > rule**.



2. Set `log-fired-rules` to **true** to print alerts to the /var/log/netwitness/correlation-server/correlation-server.log for troubleshooting. This is the same as the Debug option in the rule builders for individual ESA rules except that this option enables debugging for all rules.
3. When you are ready to turn off debugging for all ESA rules, set `log-fired-rules` to **false**. The changes take effect immediately.

Note: The `log-fired-rules` parameter is equivalent to the **Debug Rules?** option in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

Configure Maximum Events per Alert for All Rules

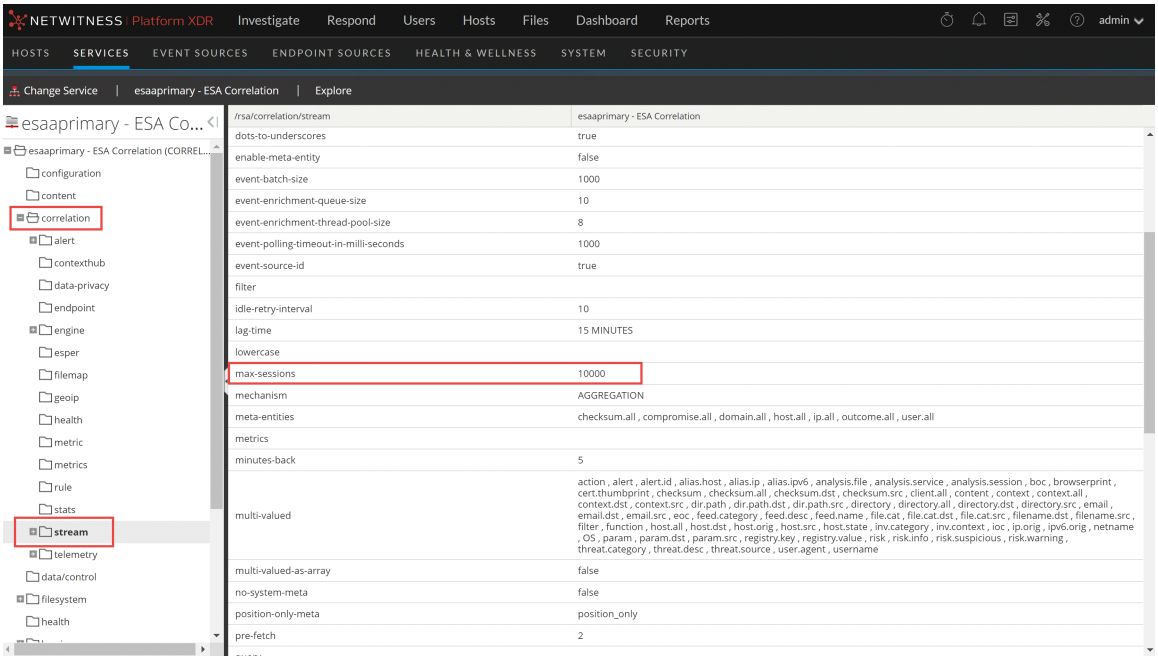
1. In the Explore view node list for an ESA Correlation service, select **correlation > rule**.

2. For rules that contain multiple events, in `max-constituent-events`, enter how many of the associated events to preserve. For example, if a rule fires an alert with 200 associated events and this parameter is set to 100, only the first 100 are preserved by ESA, the rest are dropped. The default value is **100**.
   The changes take effect immediately.

Note: The `max-constituent-events` parameter is equivalent to the **Max Constituent Events** option in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

Adjust Maximum Sessions for the ESA Data Source Filter

Note: This procedure applies only to NetWitness Platform version 11.5 and later.



In NetWitness Platform 11.5 and later, you can add an optional data source filter to the data sources in your ESA rule deployments to improve performance. This allows your data sources to be filtered further so that only the data relevant to the deployment is forwarded to ESA. The filter is comprised of application rules, which are applied to the Decoders mapped to your selected data sources.

Caution: The data source filter is intended for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.

Using a data source filter can be performance intensive for data aggregation. A filter slows the event aggregation rate, but when you are filtering a large amount of traffic, it can have performance benefits on ESA Correlation server. However, if you use a complex filter and do not filter a large amount of traffic, the event aggregation rate may be lower than expected.

When filtering out a large portion of the traffic, you may see an "Invalid header size" error while communicating with Core services in the ESA Correlation log file. (You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`). Lower the `max-sessions` parameter until you no longer see the error in the log. The more you filter out the traffic, the lower you should set the `max-sessions` parameter.

1. In the Explore view node list for an ESA Correlation service, select **correlation > stream**.

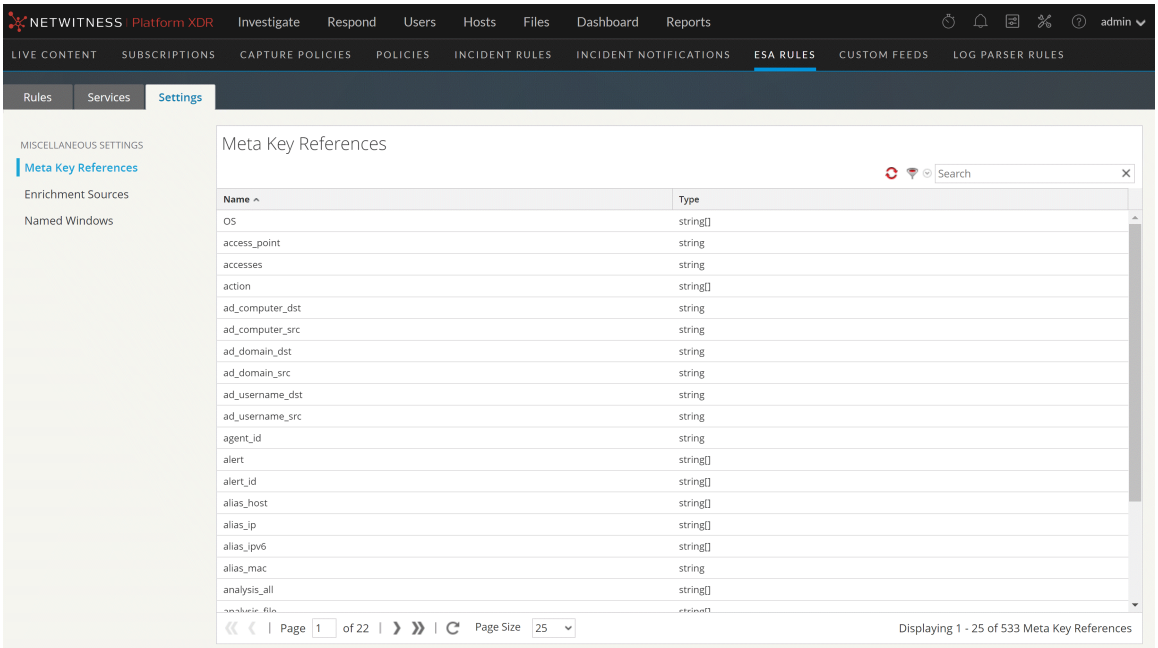
2. In `max-sessions`, lower the value until you no longer see the error in the ESA Correlation log file. The default value is **10000**.

3. Restart the ESA Correlation service. Go to **(Admin) > Services**, select the ESA Correlation service, and then select **> Restart**.

IMPORTANT: If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed.

For more information, see “(Optional) Add a Data Source Filter” in the *Alerting with ESA Correlation Rules User Guide*.

Configure Meta Keys as Arrays in ESA Correlation Rule Values



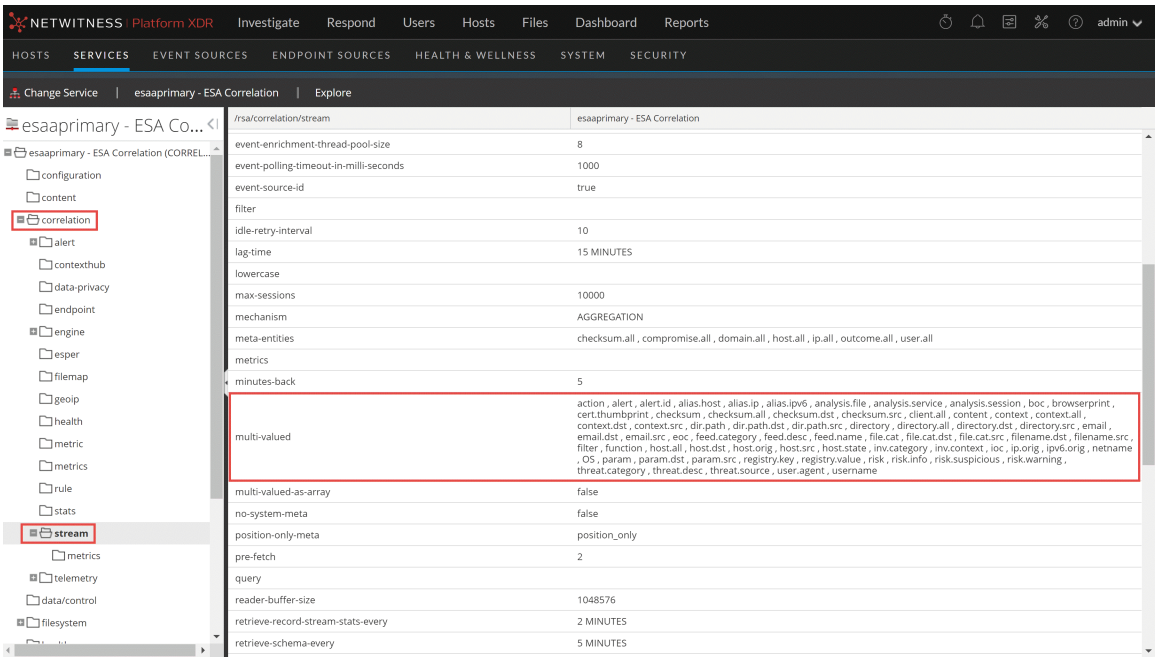
A common reason for an ESA rule to generate an error during deployment is because a meta key in the rule is a string array type, but it shows as a string type on ESA. To prevent or fix this issue, do the following:

- Determine if a Meta Key is a String Array Type on ESA
- Add the String Array Type Meta Key to ESA
- Verify that the String Array Type Meta Key is Configured Correctly on ESA

Caution: Changing string to string array type is not necessary for all fields. To support Endpoint, UEBA, and RSA Live content, specific string array (multi-value) and string (single-value) meta keys are required. See Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

Determine if a Meta Key is a String Array Type on ESA

1. Go to **(Configure) > ESA Rules** and click the **Settings** tab.



2. In the Meta Key References, for each meta key that is a string array type, locate the meta key in the Name field and then check the value.
   - If it shows `string[]`, it is configured as a string array type on ESA. This is fine.
   - If it shows `string` without the brackets, it is configured as a string type and you need to fix it on ESA. Go to Add the String Array Type Meta Key to ESA.

Caution: Changing string to string array type is not necessary for all fields. To support Endpoint, UEBA, and RSA Live content, specific string array (multi-value) and string (single-value) meta keys are required. See Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

Add the String Array Type Meta Key to ESA

Caution: Any changes that you make to the `multi-valued` parameter may cause an error when you deploy your existing rules. If you add a meta key to the `multi-valued` parameter field that you use in other ESA rules, ensure that those rules are using the string array syntax.

1. In the Explore view node list for an ESA Correlation service, select **correlation > stream**.
2. Add string array meta keys to the **`multi-valued`** list to allow them to be used as an array in ESA rules.

3. Verify the configuration on ESA. Go to Verify that the String Array Type Meta Key is Configured Correctly on ESA.

Note: The `multi-valued` parameter is equivalent to the `arrayFieldNames` parameter in the Event Stream Analysis service in NetWitness version 11.2 and earlier.

Verify that the String Array Type Meta Key is Configured Correctly on ESA

1. Go back to **(Configure) > ESA Rules** and click the **Settings** tab.
2. In the Meta Key References, click the Meta Re-Sync (Refresh) icon ( ).
3. Verify that the meta keys with a string array type show a value of `string[]`.

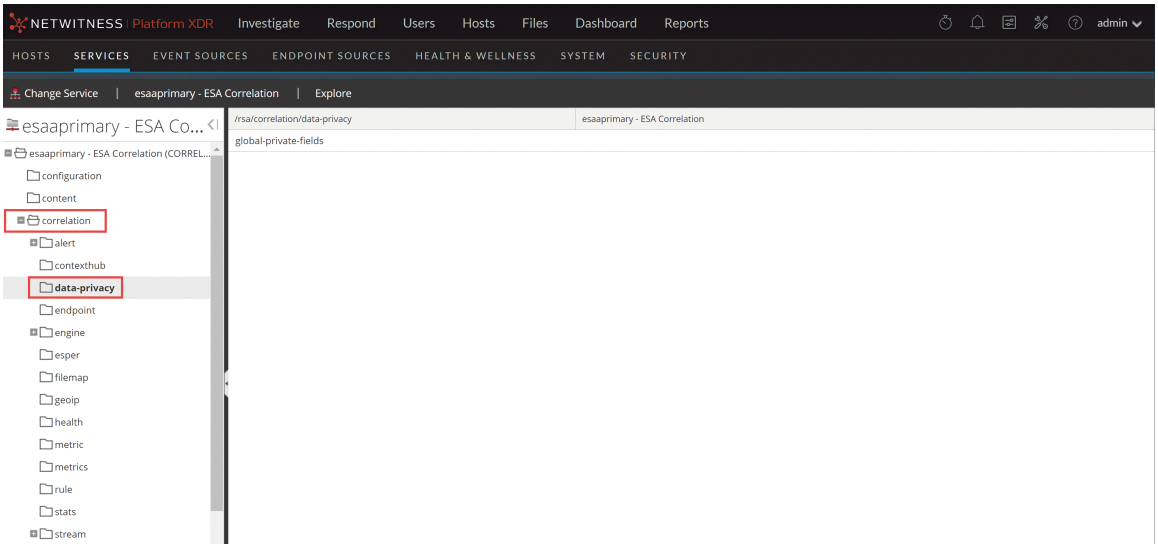
Required String Array Meta Keys on the ESA Correlation Service

To use the latest Endpoint, UEBA, and Live content rules, the following default **multi-valued** meta keys are required on the ESA Correlation service in NetWitness Platform version 11.3 and later:

```
action , alert , alert.id , alias.host , alias.ip , alias.ipv6 , analysis.file
, analysis.service , analysis.session , boc , browserprint , cert.thumbprint ,
checksum , checksum.all , checksum.dst , checksum.src , client.all , content ,
context , context.all , context.dst , context.src , dir.path , dir.path.dst ,
dir.path.src , directory , directory.all , directory.dst , directory.src ,
email , email.dst , email.src , eoc , feed.category , feed.desc , feed.name ,
file.cat , file.cat.dst , file.cat.src , filename.dst , filename.src , filter
, function , host.all , host.dst , host.orig , host.src , host.state ,
inv.category , inv.context , ioc , ip.orig , ipv6.orig , netname , OS , param
, param.dst , param.src , registry.key , registry.value , risk , risk.info ,
risk.suspicious , risk.warning , threat.category , threat.desc , threat.source
, user.agent , username
```

The following default **single-valued** meta keys are also required on the ESA Correlation service in NetWitness Platform 11.3.0.2 and later:

```
accesses , context.target , file.attributes , logon.type.desc , packets
```



Note: Check the `default-multi-valued` and `default-single-valued` parameters on your ESA Correlation service for the latest required fields. For more information, see Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

Remove Sensitive Meta Keys Globally from All Alerts for Data Privacy

Note: This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.4 and later versions.

For data privacy reasons, it may be necessary to remove some sensitive meta keys from the alert output globally, regardless of the data source. In the ESA Correlation service, you can set the **`global-private-fields`** parameter to remove the meta keys from all alert output.

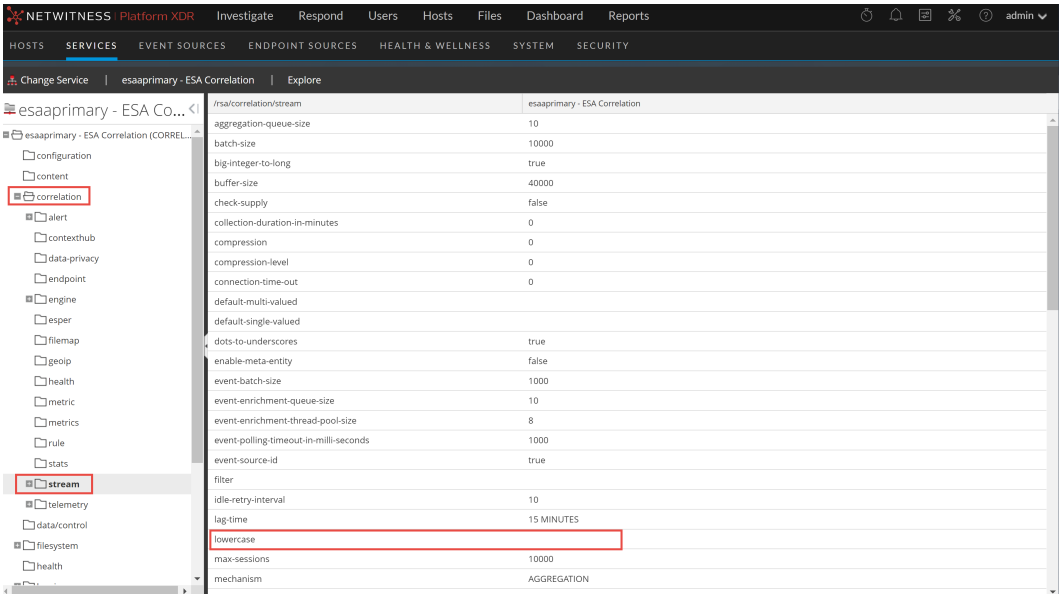
1. Go to  **(Admin) > Services**, and in the Services view, select an ESA Correlation service and then select  **> View > Explore**.
2. In the Explore view node list for the ESA Correlation service, select **correlation > data-privacy**.
3. In the **`global-private-fields`** parameter, add the sensitive meta keys that you want removed from all alerts.

The changes are effective immediately.

For more information, see "How ESA Handles Sensitive Data" in the *Alerting with ESA Correlation Rules Configuration Guide*. For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

Configure Character Case for Advanced ESA Rules

Note: This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.3.0.2 and later versions, however, it is not supported in version 11.3.1.0.



Advanced Event Processing Language (EPL) rules require correct character case, but in the Investigate Navigate view all characters are converted to lowercase. However, the meta keys may not be lowercase despite appearances in the Investigate Navigate view. To ensure you are using the correct case, you can use the `toLowerCase`() function. However, care should be taken to only add the case-insensitive `toLowerCase()` function on string and string array meta keys as needed. The `toLowerCase()` function can cause significant performance decreases. Consider checking the Investigate Events view or the Event Analysis view to see the real character case for meta fields and avoid unnecessary usage of the function. For more information, see "Event Process Language (EPL)" in the *Alerting with ESA Correlation Rules User Guide*.

You can optimize your rule performance by identifying the meta keys used most often in your environment. Instead of using the `toLowerCase()` function with the original meta key, replace the meta key throughout the rule with `<meta.key>_lower`. You can also use the special case-insensitive meta keys in your Rule Builder rules.
For example, you can configure ESA Correlation to use `filename_lower` (which is case insensitive) instead of using the original `filename` meta key. In your rule, replace `filename` with `filename_lower`.

To configure special case-insensitive meta keys to use in your ESA rules:

1. Go to  **(Configure) > ESA Rules > Rules** tab. In your ESA rule deployments, identify any ESA rules using the `toLowerCase()` function more than ten times for a particular string or string array meta key. Keep track of these ESA rules and meta keys.
2. Go to  **(Admin) > Services**, select an ESA Correlation service, and then select  **> View > Explore**.

3. In the Explore view node list, select **correlation > stream**.
   Notice that there is a **`lowercase`** parameter with empty values.

4. Update the **`lowercase`** parameter with the string or string array meta keys identified in step 1 using a comma separated list, for example: `protocol,alias.host,action,alert`

> **Note:** String and string array are the only data types supported for the ESA Correlation service **`lowercase`** parameter.
>
> Use NWDB format (decimal), NOT Esper format (underscore). Do not press **Enter** to commit or it will put in a return. Instead, click another parameter.

5. After you add all of the meta keys, validate the meta keys on ESA.

   a. Go to **(Configure) > ESA Rules > Settings tab > Meta Key References** and click the Meta Re-Sync (Refresh) icon ( ).

   b. Search for **`_lower`** or **`<meta key>_lower`**, for example: `protocol_lower`.

   - The meta keys with a string array type should show a value of `string[]`.
   - The meta keys with a string type should show a value of `string` (without the brackets).

6. Update all of your ESA rules that use `.toLowerCase` meta keys and replace them with `<meta key>_lower` (Example: filename_lower IN ('svchost.exe'))
7. Deploy the ESA rule deployment again.

> **Note:** If you remove a meta key from the `lowercase` parameter list and re-sync the meta key references, you also need to update the rules that use the corresponding lowercase meta key (`<meta.key>_lower`).

Deploy Endpoint Risk Scoring Rules on ESA

Endpoint Risk Scoring Rules only apply to NetWitness Endpoint.

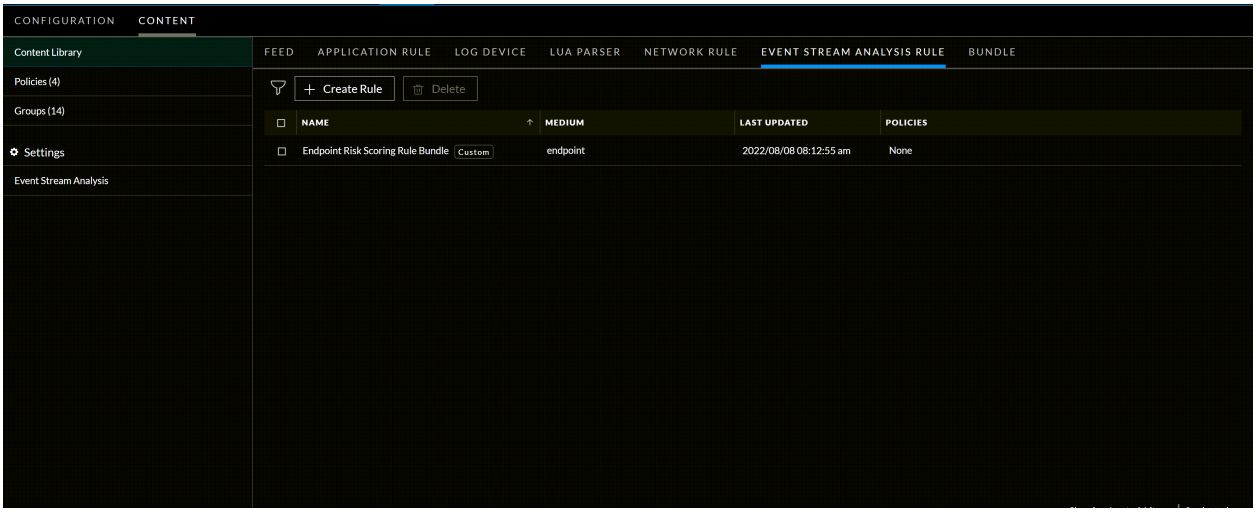
The ESA Correlation service processes and deploys endpoint risk scoring rules. These rules generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on Risk Scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. An *Endpoint Risk Scoring Rules Bundle* comes with NetWitness along with the sample ESA rules. The Endpoint Risk Scoring Bundle contains approximately 400 rules. You add this rule bundle to an ESA Rule Deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) during ESA Rule Deployment.

For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*. For more information about ESA rule deployments, see "Deploy Rules to Run on ESA" in the *Alerting with ESA Correlation Rules User Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Important Considerations when Deploying the Endpoint Risk Scoring Rules Bundle

- If you add the Endpoint Risk Scoring Bundle to an ESA rule deployment, the deployment should have data sources with endpoint data.
- An ESA rule deployment can have only one ESA Correlation service. You can, however, use the same ESA Correlation service in multiple deployments.
- If you have two ESA Correlation services with the same endpoint data sources, deploy the Endpoint Risk Scoring Rules Bundle on only one of them.



Deploy the Endpoint Risk Scoring Rules Bundle on ESA

Caution: Before you deploy the Endpoint risk scoring rules, update your meta keys. See Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys.

When you deploy the Endpoint Risk Scoring Rules Bundle in an ESA rule deployment, the ESA Correlation service gathers endpoint data in your network and runs endpoint risk scoring rules against the data. The goal is to capture events that match rule criteria, then generate alerts for the captured events.

The following procedure shows how to create an ESA rule deployment with the Endpoint Risk Scoring Rules Bundle and deploy it. If you already have an ESA rule deployment with endpoint data sources, you can add the Endpoint Risk Scoring Rules Bundle to the existing deployment.

The following figure shows the Endpoint Risk Scoring Bundle available in (Configure) > **Policies** > **Content Library** > **Event Stream Analysis Rule** page.

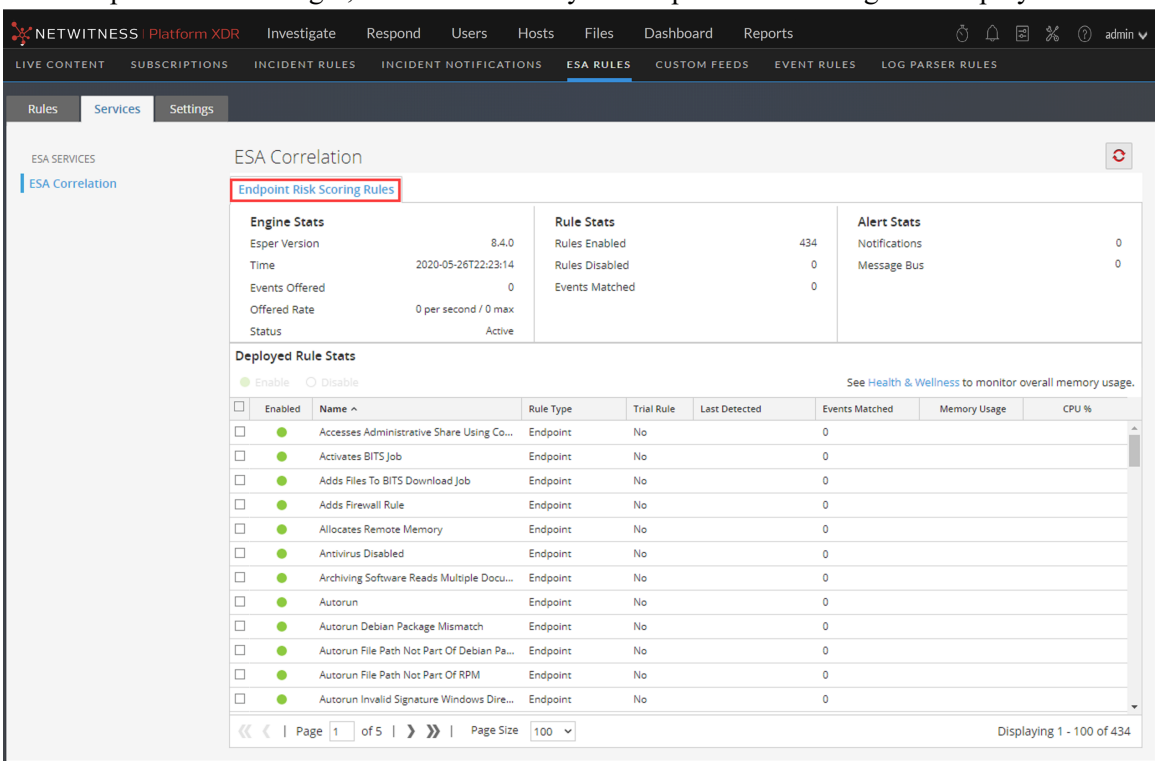
To create and deploy an ESA rule deployment with the Endpoint Risk Scoring Bundle

1. Go to **(Configure)** > **Policies**.
2. Add the endpoint data sources, for more information, see Add an ESA Datasource.
3. Create a deployment with Endpoint Risk Scoring Bundle. For more information, see Create a Deployment.

   You can now view information and statistics on the **(Configure) > ESA Rules > Services** tab. See View the Status of the Endpoint Risk Scoring Rules Deployment.

Change the Endpoint Risk Scoring Rule Bundle in a Deployment

You cannot edit or duplicate the Endpoint Risk Scoring Rules Bundle. After the bundle is deployed, you can enable and disable individual rules within the bundle. See Disable or Enable Individual Endpoint Risk Scoring Rules.

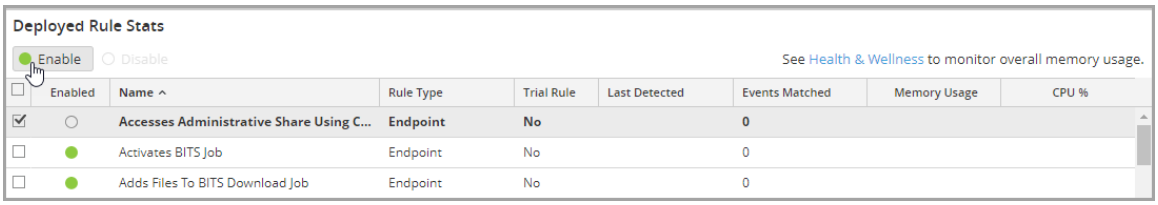


When you make changes to the ESA Rule Deployment containing the Endpoint Risk Scoring Rules Bundle, such as changing the endpoint data sources or changing compression levels, you must redeploy it for the changes to take effect. To redeploy, click the **Deploy Now** button for that deployment.

Caution: Deleting an ESA Rule Deployment with an Endpoint Risk Scoring Rule Bundle stops the Risk Scoring alerts that are used in risk scoring calculations to identify suspicious files and hosts.

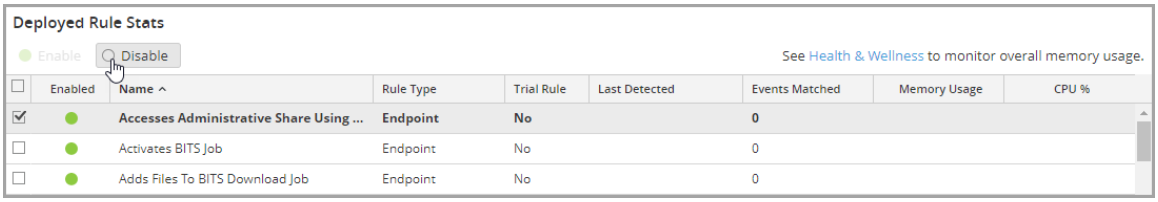
For more information about changing ESA rule deployments, see "Additional ESA Rule Deployment Procedures" in the *Alerting with ESA Correlation Rules User Guide*.

View the Status of the Endpoint Risk Scoring Rules Deployment



1. Go to the ESA Rules Services tab (**(Configure) > ESA Rules > Services**).
2. In the options panel on the left, select your ESA Correlation service.
   Your deployment name shows on a tab to the right, for example, Endpoint Risk Scoring Rules. If you see multiple tabs on the right, select the tab for your endpoint risk scoring rules deployment.

3. In the **Engine Stats**, **Rules Stats** and **Alert Status** sections, look at the statistics related to the deployment, such as Rules Enabled, Rules Disabled, and Events Matched, which show the total numbers for the deployment.
4. In the **Deployed Rules Stats** section, look at the following details for each Endpoint Risk Scoring Rule:
   - **Enable**: Indicates the enabled status. A green circle icon ● indicates that the rule is enabled. A white circle icon ○ indicates that the rule is disabled.
   - **Name**: Shows the name of the rule.
   - **Rule Type**: Endpoint indicates a rule from the Endpoint Risk Scoring Bundle and Esper indicates Esper-specific rules, such as Rule Builder and Advanced EPL rules.
   - **Last Detected**: Shows the last time an alert was triggered for the rule.
   - **Events Matched**: Shows the total number of events that matched the rule.



Disable or Enable Individual Endpoint Risk Scoring Rules

1. Go to the ESA Rules Services tab (**(Configure) > ESA Rules > Services**).
2. In the options panel on the left, select your ESA Correlation service.
   Your deployment name shows on a tab to the right, for example, Endpoint Risk Scoring Rules. If you see multiple tabs on the right, select the tab for your endpoint risk scoring rules deployment.
3. In the **Deployed Rules Stats** section, do one of the following:
   - To enable rules, select the rules that you want to enable in the rules list and click the **Enable** button above the list.

   The selected rules are enabled and a message shows that the rules enabled successfully.

   - To disable rules, select the rules that you want to disable in the rules list and click the **Disable** button above the list.

   The selected rules are disabled and a message shows that the rules disabled successfully.

Change Memory Threshold for ESA Rules

The following procedures pertain to setting memory thresholds for ESA rules to prevent them from using excessive memory.

Change Memory Threshold for All Trial Rules

This procedure is optional and applies only to ESA Correlation Rules.

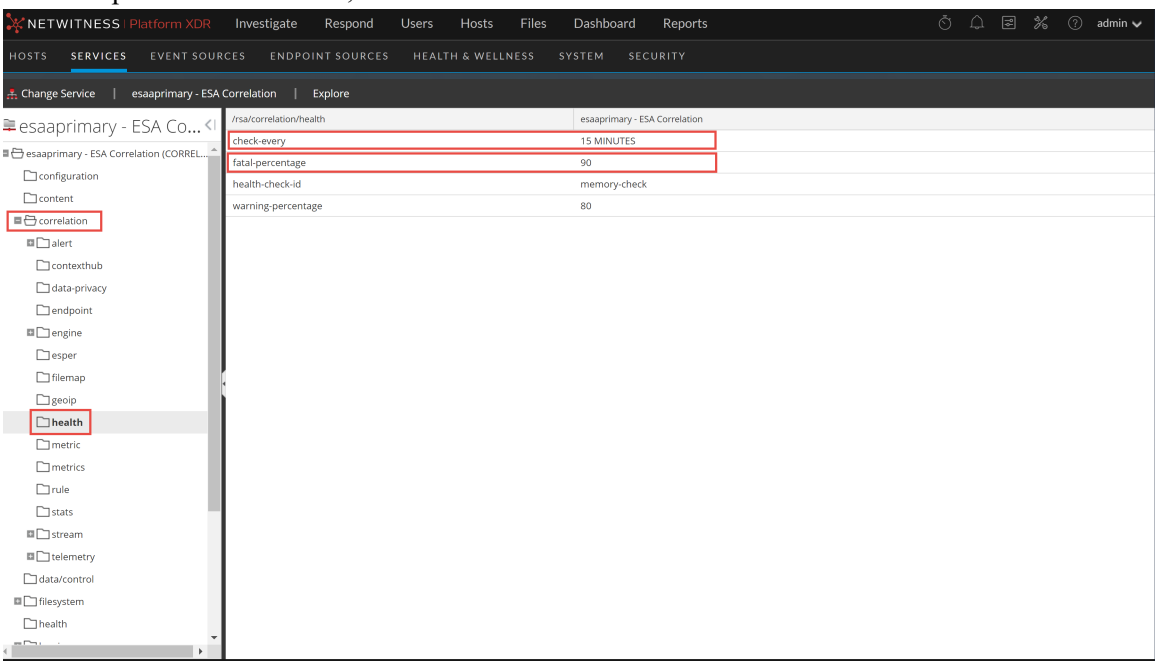
Administrators can increase or decrease the memory threshold for trial rules. Threshold refers to the ESA memory usage, which includes ESA base memory, trial rules, and non-trial rules. When the threshold is exceeded, all deployed trial rules on an ESA service are disabled.

You use trial rules to see if a rule runs efficiently and does not use excessive memory, which can impact performance or force the service to shut down.

By default, the memory threshold is 90, which is the percentage of Java Virtual Memory (JVM).

- The memory threshold is per ESA, not per rule.
- When the memory threshold is exceeded, all trial rules running on the ESA are automatically disabled.
- The ESA configuration has the following parameters for trial rules:
  - `fatal-percentage`: If memory rises above this percentage, ESA disables trial rules. For example, if fatal-percentage is set to 90, when memory rises above 90 percent, ESA disables trial rules.
  - `check-every`: This parameter determines how often ESA checks the fatal-percentage to disable trial rules.

For more information, see "Work with Trial Rules" in the *Alerting with ESA Correlation Rules User Guide*.



Prerequisites

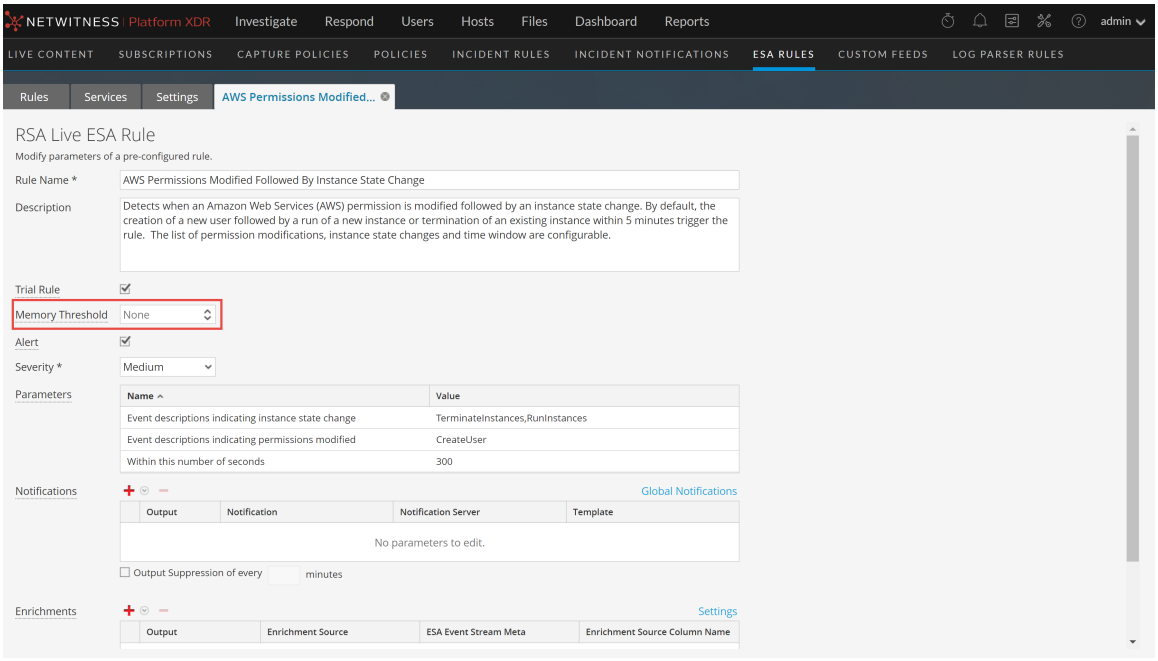
A role with administrative privileges must be assigned to you.

To change memory threshold for trial rules:

1. Log on to NetWitness as admin.
2. Go to  **(Admin) > Services**.
3. Select the ESA Correlation service and then select  **> View > Explore**.

4. In the Explore view node list, select **correlation > health**.

5. In the right panel, in `fatal-percentage`, type a percentage of JVM that trial rules on the ESA cannot exceed.
   The new memory threshold takes effect immediately.
6. If necessary, you can also adjust the `check-every` parameter, which determines how often ESA checks the fatal-percentage to disable trial rules. By default, ESA checks the fatal-percentage every 15 minutes.



Change Memory Threshold for Individual Trial Rules and Non-Trial Rules

Note: This option is available in NetWitness Platform version 11.5 and later.

In addition to setting a memory threshold for all trial rules, you can set a memory threshold individually for both trial rules and non-trial rules. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set. You should configure a memory threshold for rules that use memory, such as a rule that contains windows or pattern matching. If the configured memory threshold is exceeded, the rule gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab.

1. Go to **(Configure) > ESA Rules >Rules** tab.
2. In the **Rule Library**, select the rule you want to configure and click .
   The rule details are displayed.

3. In the **Memory Threshold** field, add the maximum memory usage allowed for this rule in MB. **100 MB** is the default for new rules.

4. Click **Save**.
5. When you are finished changing the memory thresholds for individual rules in an ESA rule deployment, redeploy the deployment.
   For more information, see the *Alerting with ESA Correlation Rules User Guide*.

Start, Stop, or Restart ESA Service

This topic provides instructions to start, stop, or restart the ESA Correlation service from the NetWitness user interface and from the command line. These procedures apply to ESA Correlation Rules.

Start the ESA Service

1. Log on to NetWitness as admin.
2. Go to **(Admin) > Services**.
3. Select the ESA Correlation service and then select **> Start**.

Stop the ESA Service

1. Log on to NetWitness as admin.
2. Go to **(Admin) > Services**.
3. Select the ESA Correlation service and then select **> Stop**.

Restart the ESA Service

1. Log on to NetWitness as admin.
2. Go to **(Admin) > Services**.
3. Select the ESA Correlation service and then select **> Restart**.

Start the ESA Service from the Command Line

1. Use ssh to connect to the ESA Correlation service and log in as the root user.
2. Type the following command and press **ENTER**:
   ```
   systemctl start rsa-nw-correlation-server
   ```

Stop the ESA Service from the Command Line

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press **ENTER**:
   ```
   systemctl stop rsa-nw-correlation-server
   ```

Restart the ESA Service from the Command Line

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press **ENTER**:
   `systemctl restart rsa-nw-correlation-server`

View Audit Logs and Verify ESA Component Versions

This topic provides details about audit logging and instructions to verify the versions of the ESA components installed. These procedures apply to ESA Correlation Rules.

View Audit Logs for Rules

Audit logging allows you to view details about rules that are created and changed in NetWitness. There are local audit logs in each of the services in NetWitness. When Global Audit Logging is configured, NetWitness audit logs collect in a centralized system that converts them into the required format and forwards them to an external syslog system.

For details on how to access your local audit logs, see "Local Audit Log Locations" in the *System Configuration Guide*. To set up Global Audit Logging, see "Configure Global Audit Logging" in the *System Configuration Guide*.

The following Syslog global audit log examples show create, update, remove rule, and delete deployment actions for the ESA Correlation service (correlation-server).

```

Each log contains the following parameters:

- **Time stamp**: Time the rule was modified. Example: `09-17-2018 08:54:21`
- **System Info**: Information about the system where the action was performed, such as IP address. Example: `10.0.0.0`
- **deviceVersion**: Version of your ESA service. Example: `11.3.0.0`
- **deviceService**: Example: `correlation-server`
- **action**: Examples: `create`, `update`, `remove`
- **Parameters**: Placeholder for the following keys:
  - **Epl Module Identifier (moduleIds)**: unique identifier for the rules. Example: `5b9fce314a5b1f5951babc2a, 5b9fce314a5b1f5951babc2b`
  - **enabled**: Shows if the rule is enabled or not. Example: `enabled=true`
  - **respondEnabled**: Shows if alerts from this rule can go to the Respond view. Example: `respondEnabled=true`
  - **trial**: Displays if the rule is configured as a trial rule or not. Example: `trial=false`
  - **EplStatements**: Displays the rule syntax. Example:

    ```
    eplStatements=[module GHmoduleId15;@Name('GHmoduleName15') @Description
    ('GHmoduleDesc15') @RSAAlert(oneInSeconds=0, identifiers=

    {"user_dst"}

    ) SELECT * FROM Event(ec_outcome in ('Success', 'Failure') AND ec_
    activity='Logon').win:time(5 min) match_recognize (measures F as f_array,
    S as s pattern (F F F F F+ S+) define F as F.ec_outcome= 'Failure', S as
    S.ec_outcome= 'Success');]
    ```

  - **identity**: Example: `admin`

ESA Audit Logs on NW Server (11.5 and Later)

In NetWitness Platform 11.5 and later, in addition to the audit logs available on ESA Correlation-server, new audit logs on the NW Server (SA_SERVER) show when users add, modify, filter, delete, export, and import ESA rules in the Rule Library. The NW Server audit logs also show when users add, modify, and deploy ESA rule deployments. Modifications to an ESA rule deployment include adding, deleting, or updating a rule in a deployment as well as adding a data source or an ESA Correlation service to a deployment.

Verify ESA Correlation Version

1. Use ssh to connect to the ESA Correlation service and log in as the root user.
2. Type the following command and press ENTER:
   ```
   rpm -qa | grep rsa-nw-correlation-server
   ```
   The ESA Correlation server version is displayed.

NetWitness Event Sources

Event sources are network sources that send information about events to the NetWitness. They can be physical devices, such as laptops, network switches or firewall, and virtual or cloud-based applications, such as VMware. For example:

- An Apache HTTP Server
- Amazon Web Services CloudTrail
- A Barracuda Web Application Firewall
- A connection to Dropbox
- An Oracle Database
- A VMware vCenter Server

You first configure all of your event sources so that they can communicate with the NetWitness. NetWitness provides configuration guides for many common event sources, using a variety of collection methods (such as Syslog or file collection). After you have your event sources configured, use the information in this guide to manage them going forward.

Event Source Management

The Event Sources module in NetWitness provides an easy way to manage event sources and configure alerting policies for your event sources.

Workflow

This workflow shows the overall process for managing event sources, and configure monitoring for them. It also shows where configuring alarms and alerts settings are located in the process.

Prerequisites

There are two permissions that affect Event Source Management:

- **View Event Sources** is needed for users to view event sources, their attributes, and their thresholds and policies.
- **Modify Event Sources** allows users to add, edit, and otherwise update event sources.

For details, see the following topics:

- The *Roles Tab* topic available in the **System Security and User Management** guide > **References** > **Administration Security View** > **Roles Tab**.
- The *Role Permissions* topic describes the built-in NetWitness system roles, which control access to the user interface. Available in the **System Security and User Management** guide > **How Role-Based Access Control Works**.
- The *Manage Users with Roles and Permissions* topic describes how to manage users in NetWitness, using roles and permissions. Available in the **System Security and User Management** guide > **Manage Users with Roles and Permissions**.

Automatic Mapping

Introduced in NetWitness version 11.1, the system maps incoming events to a type based on previous logs received from that address, reducing the mis-parsing of messages and reducing the number of items that need attention in the Discovery workflow. The User Interface (UI) indicates that an address has been auto-mapped in the Discovery workflow.

Navigate to Event Source Management

You can view the details about your existing event source groups by doing the following:

1. Go to  **(Admin) > Event Sources**.
2. Click any of the following:
   - The **Discovery** tab. Use this tab to review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified completely accurately.
   - The **Manage** tab. Use this tab to add, edit, and delete event source groups and view details for your existing event source groups.
   - The **Monitoring Policies** tab. Use this tab to view or edit your event source alerting configuration.

- The **Alarms** tab. Use this tab to see the details of the alarms that have been generated. Alarms are generated when event sources exceed or fall below their set thresholds.
- The **Settings** tab. Use this tab to view or change the behavior for automatic alerts.

Note: When the system receives logs from an event source that does not currently exist in the Event Source List, NetWitness adds the event source to the list. Additionally, if it matches the criteria for any existing group, it becomes part of that group.

How Alarms and Notifications Work

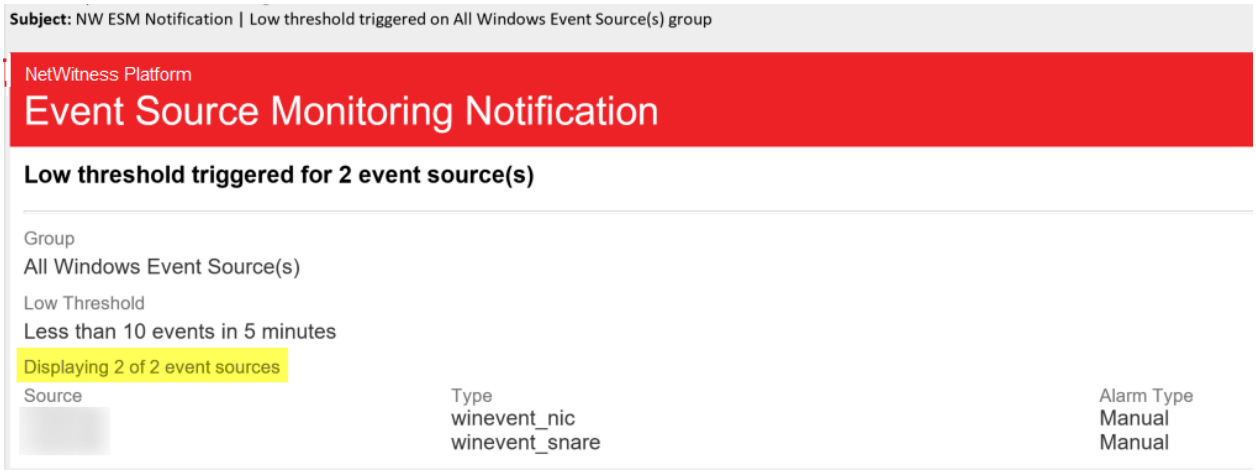
The Event Source module in NetWitness displays alarms and sends notifications based on alarms that are triggered.

For alarms, consider the following:

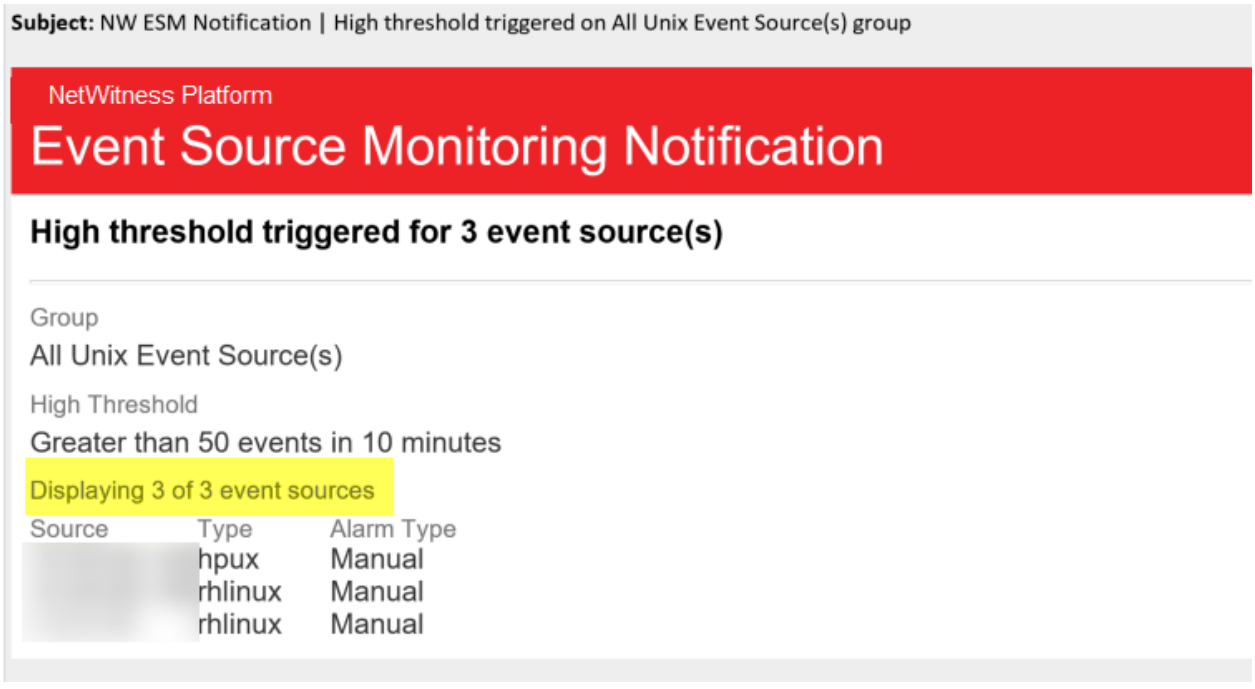
Alarms are of two types: **automatic** (triggered when baselines are exceeded or not met) and **manual** (configured using thresholds).

- **Automatic**: If you turn on automatic alerts, the system reports alarms for **all** event sources that go above or below their normal baselines by the required amount. You can specify the over / under percentage on the Settings Tab.
- **Manual**: The system sends an alert whenever an event source exceeds the thresholds in the policy for the associated groups.
- Alarms appear on the UI, in the Alarms Tab.

For notifications, consider the following:



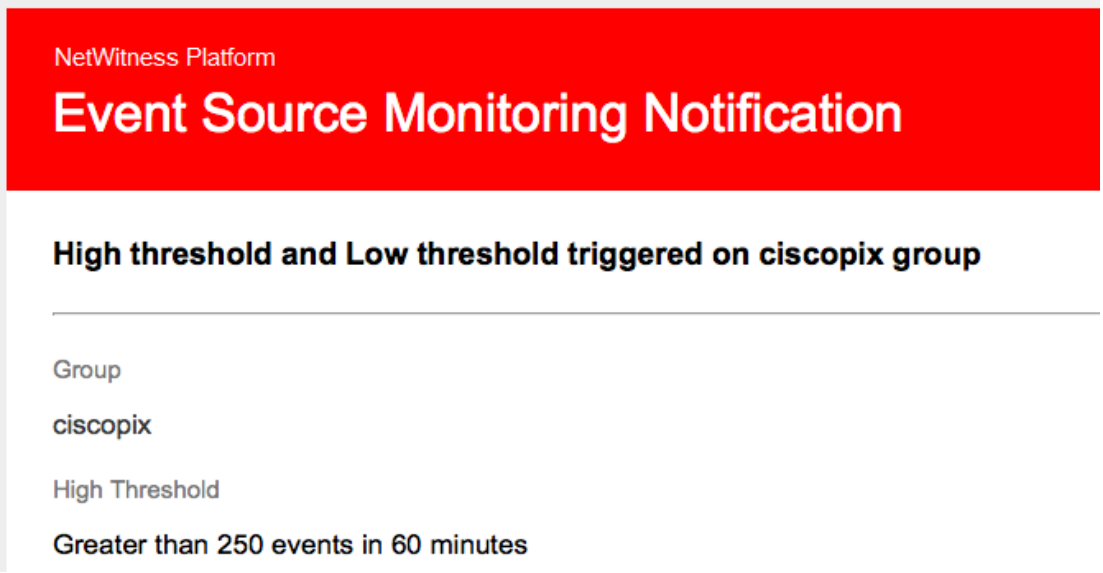
- To receive manual notifications (through email, SNMP or Syslog):
  - Specify a policy for an event source group.
  - Set a high or low (or both) threshold.
  - Enable the policy.
- To receive automatic (baseline) notifications:
  - Baseline alerting must be on. This is turned on by default.
  - You must enable notifications from automatic monitoring. See Configuring Automatic Alerting for details.
  - The event source that triggers the alarm must be in a group that has a policy enabled.
- If you have automatic alerting turned on, and you have configured a policy and threshold for a group:
  - If the event source goes outside its baseline, you see an automatic alert and receive a notification.
  - If the event source goes outside its thresholds, you see a manual alert and receive a notification.
  - If both occur (threshold and baseline exceeded or not met), you receive two alarms (visible on the Alarms tab) and a notification that indicates both alarms. That notification will list the event source that double alarmed twice; one listing indicating it was an automatic alarm.



Large Email Notifications

If you have set up email notifications, keep in mind that the email can grow very large, depending on the number of event sources in the notification.

If the number of event sources in the alarmed state exceeds 10,000, then the email notification contains the details for only the first 10,000 and a total count. This is to ensure that the email is successfully delivered.



The following examples show a low threshold triggered for two event source groups and a high threshold triggered for three event source groups.

High and Low Thresholds Both Triggered

Occasionally, both the high and low alarms are triggered for a particular event source group. The easiest way to see when this happens is to read the email header, which clearly states when both thresholds are triggered, as shown in this image:

In this example, the header states, "High threshold and Low threshold triggered on ciscopix group." To see the details for the low threshold event sources, you may need to scroll down past hundreds, or even thousands, of the high threshold event sources.

Automatic Alerting

This topic describes automatic alerts, which are based on baseline settings.

Note: Automatic alerting, and all of the parameters that determine its behavior, are currently in Beta testing.

You can set up policies and thresholds for your event source groups. You do this so that you receive notifications when the thresholds are not met. NetWitness also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

To trigger automatic alerts, you can use baseline values. This way, you do not need to set up numerous group thresholds and policies in order to receive alerts. Any anomalous amount of messages trigger alerts, without needing to do any configuration (except for turning on automatic alerting).

Note the following:

- After you begin collecting messages from an event source, it takes the system approximately a week to store a baseline value for that event source. After this initial period, the system alerts you when the number of messages for a period are above or below the baseline by a set amount. By default, this amount is 2 standard deviations above or below the baseline.

- Base your high and low deviation settings on how "regular" your event sources behave. That is, if you expect little or no variance in the number of messages that arrive for a given time (for example, 8 to 9 am on a weekday), then you can set a low value for the Deviation. Conversely, if you often see peaks and valleys, set the Deviation value higher.
- If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic alerting.

Common Scenarios for Monitoring Policies

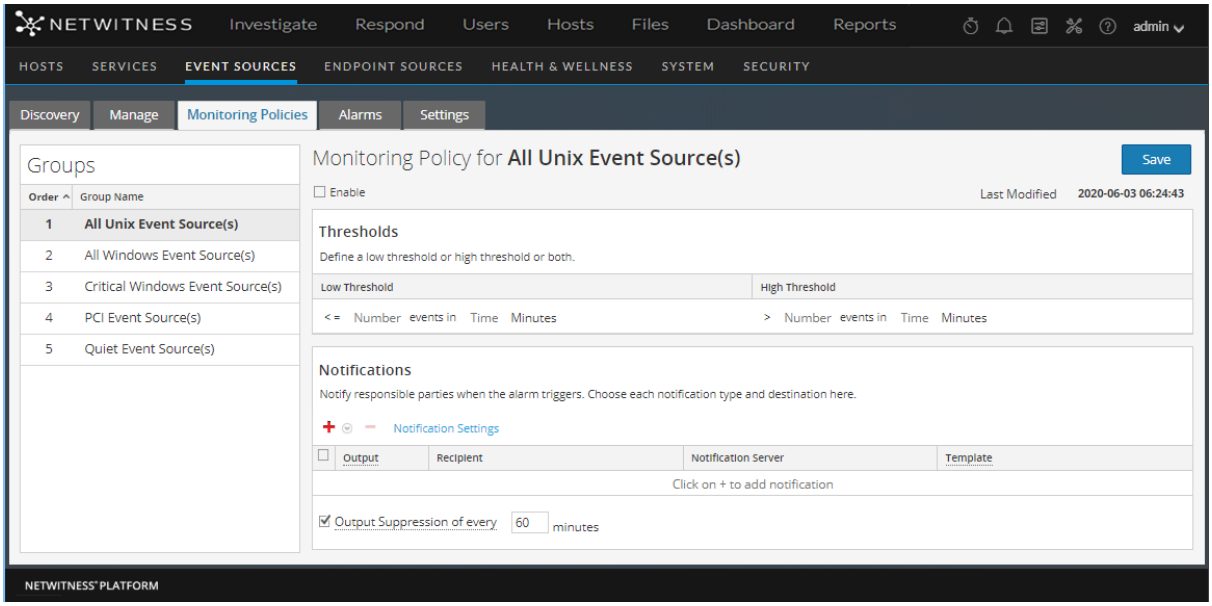
Typically, organizations monitor their event sources in "buckets" based on how critical the event sources are. One typical example is as follows:

- There is a group of PCI devices, and it is critical to know if any of these devices stop sending messages (or send too few messages) within a half hour.
- There is a group of Windows devices, and it is useful to know if any of these devices stop sending messages after four hours.
- There is a group of quiet devices that do not typically send a lot of messages, but you would like to know if they do not send anything for 24 hours.

Many organizations may have a network that resembles this example. You may have more or different categories, but this example is used to discuss this feature.

You may have dozens or even hundreds of event source groups, and still only have a few groups for which you need to set thresholds and alerts.

Note: If an Event Source is a member of multiple groups that have alerting configured, it will only alert on the first matching group in the ordered list. (The Monitor Policies tab presents an ordered list of your groups.)



Ordering the Groups

Note: To change the order of the groups, drag and drop a group to its new location. The higher a group is listed, the higher the precedence for that group's thresholds: NetWitness checks the thresholds in the order provided in this panel. Thus, your highest priority groups should be at the top of this list.

The first thing to keep in mind is how to order your groups on the Monitoring Policies page. Assuming that you have the three groups mentioned above, you should order them as follows:

1. Quiet event sources. Having this group first ensures that you will not get numerous false alerts.
2. High priority PCI event sources. The highest priority devices should be after the quiet devices
3. Windows event sources. The time range is longer (four hours versus a half hour) for these devices than for the PCI devices. Therefore, they should come after the PCI devices.
4. All event sources. Optionally, you could set thresholds for all devices as a catch-all. This ensures that your entire network is operating as expected. For the catch-all group, you do not need to specify any

thresholds—you can use automatic alerting to generate alarms for the event sources in this group.

In the figure above, note the following:

- The groups are ordered as discussed in the previous section.
- The threshold for PCI devices is to alert if the number of messages coming in to NetWitness is fewer than 10 messages in 30 minutes.
- A low threshold is defined, but not a high threshold. This is typical for many use cases.

After you have set up and ordered your groups and begun to receive alerts, you may need to adjust the order. Use these guidelines to help you adjust the ordering:

- If you receive more notifications than you need, you can move the group down in the order. Similarly, if you are getting too few notifications, move the group up towards the top.
- If you notice that one event source is creating more alerts than it should, you can move it to another group, or create a new group for that event source.

Managing Event Source Groups

Definitions

When dealing with event source groups in NetWitness, note the following:

- An **event source** is essentially the combination of values for all of its attributes.
- An **event source group** is the set of event sources that match a set of criteria that are defined for that group.

For example, you might have the following groups:

- A group named **Windows Devices**, consisting of all the event source types associated with Microsoft Windows event sources (`winevent_nic`, `winevent_er`, and `winevent_snare`).
- A group named **Low Priority Services**, consisting of all services where the Priority attribute has been set lower than 5.
- A group named **U.S. Sales Servers**, where you gather event sources located in the U.S.A. and having an Organization attribute of Sales, Finance, or Marketing.

Manage Tab Details

The Manage tab in the Event Source module provides an easy way to manage event sources. In this tab, you can:

- Set up event source groups in a consistent way.
- Work with event source attributes in a consistent, straightforward manner.
- Easily search through your entire set of event sources.
- Bulk edit and update your event sources and event source groups.

You can view the details about your event source groups by doing the following:

1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** panel to see the details for your existing event source groups.

Note: When the system receives logs from an event source that does not currently exist in the Event Source List, NetWitness automatically adds the event source to the list. Additionally, if it matches the criteria for any existing groups, it becomes part of that group.

Default Groups

NetWitness has several default groups. You can customize these as required and use them as templates for creating new groups.

The default groups are as follows:

- All Event Sources
- All Unix Event Sources
- All Windows Event Sources
- Critical Windows Event Sources
- PCI Event Sources
- Quiet Event Sources

You can edit any of these groups to investigate the rules that define the groups.

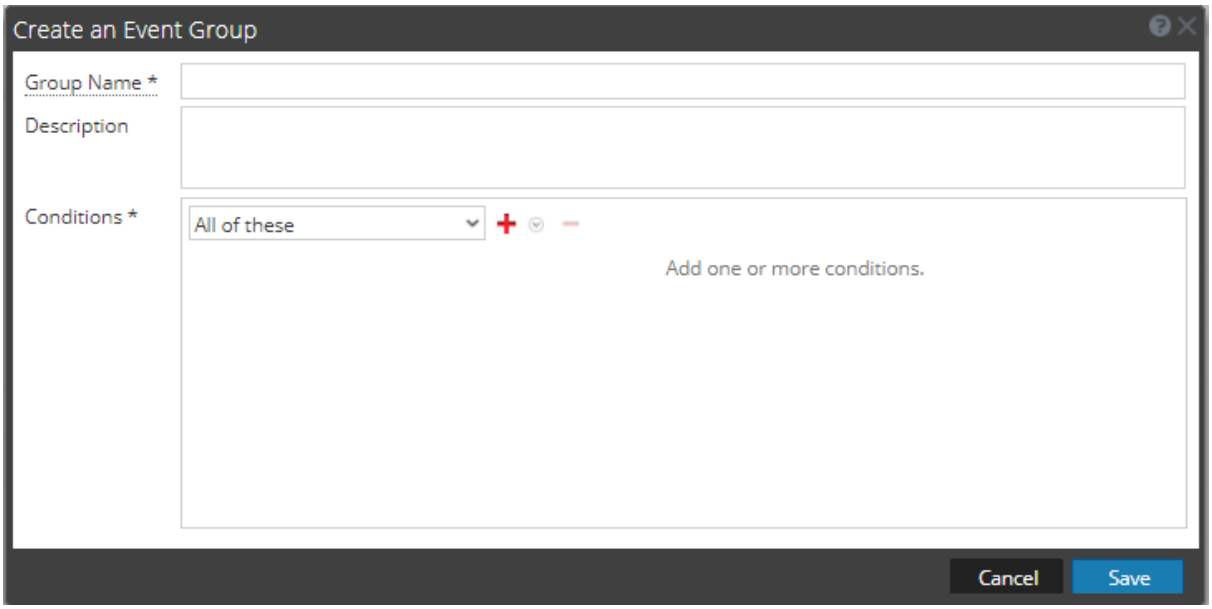
Note: You cannot edit or delete the **All** event source group.

Creating Event Source Groups

Administrators must receive notifications when event sources are no longer being collected by NetWitness. They need to be able to configure how long the event sources can be quiet (that is, not collect any log messages) before sending a notification based on different factors.

NetWitness provides event source groups so that you can group similarly important devices together. You can create groups based on attributes that you imported from your CMDB (configuration management database), or by manually choosing event sources to add to the group.

For example, these are some of the types of event source groups that you can create:



- PCI sources
- Windows Domain Controllers
- Quiet sources
- Finance Servers
- High Priority devices
- All Windows sources

Procedure

To create an Event Source group:

1. Go to  **(Admin) > Event Sources**.
2. In the **Manage** panel, click  .

   The Create an Event Group dialog is displayed.

3. Enter a Group Name.
4. Enter a Description.
5. Click + to add a condition. Continue adding conditions as necessary. For details on constructing conditions, see Create/Edit Group Form.
6. Click **Save**.

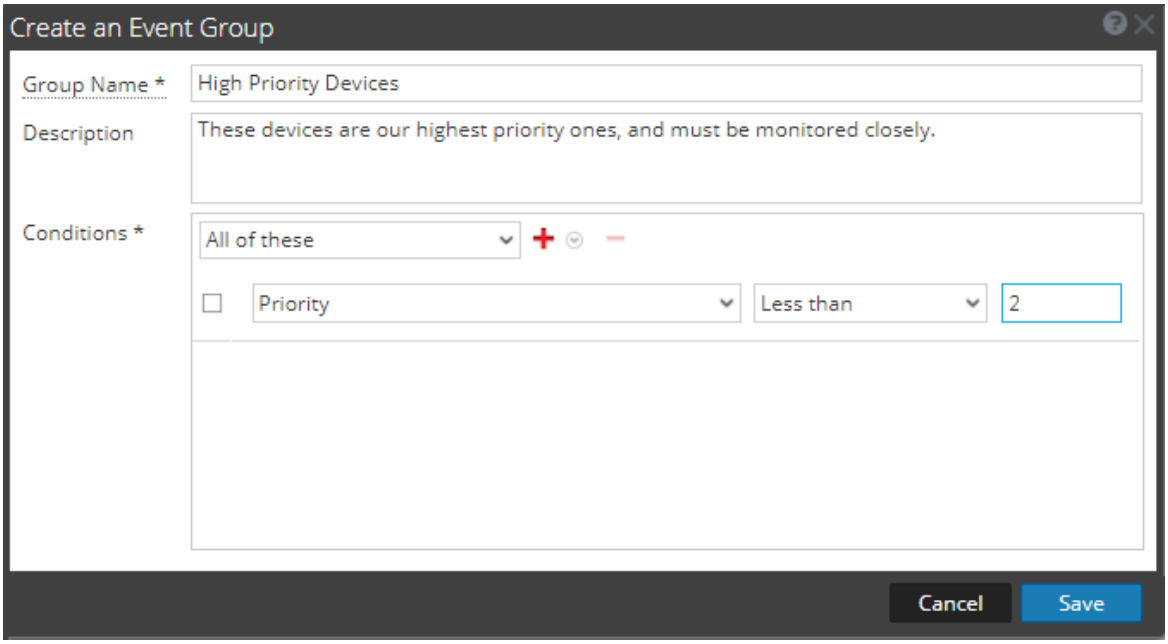
   The new group is listed in the **Manage** panel.

Examples

This section describes a simple example, and then discusses how to set up a more complex set of rules.

Simple Example

If you want to create an event source group that contains all of your high priority event sources, this example describes the necessary steps.



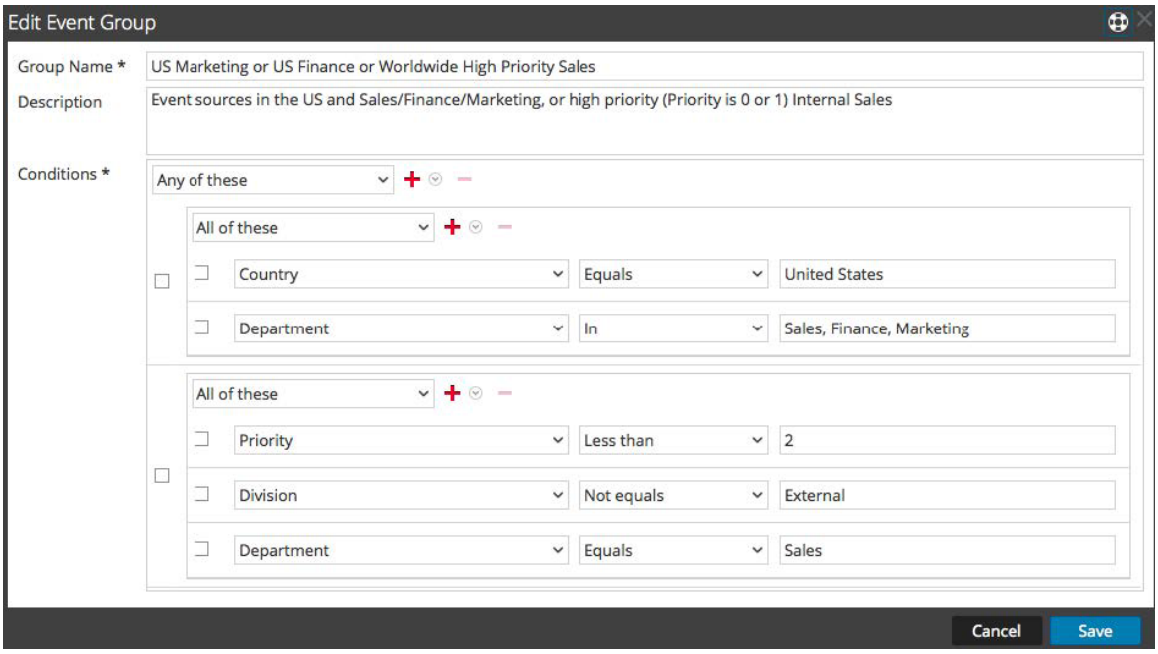
1. Go to **(Admin) > Event Sources**.
2. In the **Manage > Groups** panel, click + .
3. Enter **High Priority Devices** for the Group Name.
4. Enter a description, such as, "These devices are our highest priority ones, and must be monitored closely."
5. Leave **All of these** selected and click + to add a condition.
6. Select **Add condition** from the drop-down menu.

a. Select an Attribute: **Priority**.

b. Select an Operator: **Less than**.

c. Enter a value: **2**.

The following figure displays the updated Edit Event Group dialog.



7. Click **Save**.

Complex Example

In this example, you want to create a fairly complex rule: match event sources that are in the United States, and in either the Sales, Finance, or Marketing departments. Also, match worldwide internal, high priority Sales event sources. High Priority is assumed to be where the priority is 1 or 0. Logically, the definition is as follows:

```
(Country=United States AND (Dept.=Sales OR Dept.=Finance OR
Dept.=Marketing))
 OR
 (Priority < 2 AND Division != External AND Dept.=Sales)
```

The following figure is an example of the criteria for creating such an Event Source Group.

Creating Event Source Group Form

The Create Event Source Group form is displayed when you are creating or editing an Event Source Group.

Parameters

The following table describes the fields on the Create/Edit an Event Group form.

Field	Description
Group Name	This field is required, and appears throughout the NetWitness UI as the identifier for the group.
Description	An optional description to help describe the purpose or details for the group.
Tools 	The following items are available on the toolbar: • **Add (+)**: clicking the **Add** displays a menu where you can choose to add a condition or a group. • **Remove (−)**: removes the selected rule or group of rules from the list. When you add a new group, that has the effect of creating nested levels of conditions.
Conditions	Described below, in the **Rule Criteria** table.
Cancel / Save	**Cancel** and **Save** options are available in the form.

Rule Criteria

The rules that you specify determine the event sources that will become part of this event source group. A rule consists of the following:

- Grouping: how the rule interacts with other rules
- Attribute: which attribute the rule is matching against
- Operator: how the rule matches the attribute
- Value: the attribute value used for the rule

The following table provides details on these rule constructors.

Rule Constructor	Details
Grouping	You can group conditions, in order to create complex rules for an event source group. The following choices are available when grouping your rules: • **All of these**: logically equivalent to AND • **Any of these**: logically equivalent to OR • **None of these**: logically equivalent to NOT If you are creating a simple group, and specifying a single condition, you can leave the default value (**All of these**) selected.
Attribute	This contains a drop-down list, consisting of all event source attributes. The attributes are displayed by the section to which they belong. For example, all of the **Identification** attributes are displayed first, followed by the **Properties**, **Importance**, and so on.

Rule Constructor	Details

Operator	Choose from the following options:
	• **Equals**: matches the provided value
	• **Not equals**: returns event sources whose specified attribute not equal to the provided value
	• **In**: provide a list of values in comma separated format, and event sources that match any of the provided values are included. For example:
	`Where IP in 10.25.50.146, 10.25.50.248`
	This condition returns event sources that have either `10.25.50.146 or 10.25.50.248` as their IP attribute.
	• **Not in**: similar to **In**, except that it matches items whose attribute is not equal to any of the listed values.
	• **Like**: matches items that begin with the provided string. For example:
	`Where Event Source Type Like Apache`
	This condition returns event sources whose Event Source Type begins with `Apache`.
	• **Not like**: similar to **Like**, except that it matches items whose attribute does not begin with the provided string.
	• **Greater than**: matches items whose attribute is greater than the provided value. For example, if you specify Priority Greater than 5, the condition would match any item with a priority of 6 or higher.
	• **Less than**: similar to **Greater than**. Matches items whose attribute is less than the provided value.

Value	Enter a value or group of values. The value type depends on the attribute for the condition. For example, for IPv6, you need to specify a value in IPv6 format.

Acknowledging and Mapping Event Sources

In NetWitness version 11.1, NetWitness introduced Automatic Mapping. The system automatically maps incoming events to a type based on previous logs received from that address, reducing the number of items that need attention in the Discovery workflow. The UI indicates that an address has been auto-mapped in the Discovery workflow.

Acknowledge Event Source Types

The Discovery tab lets you review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified accurately. If the discovered event source types are correct, you can acknowledge to filter out that event source from the view by default. If incorrect, you can set the allowed event source types for a particular address so that future logs will parse against the correct parsers.

To acknowledge event sources:

1. Go to  **(Admin) > Event Sources**.

   The Discovery tab is displayed.
2. Select one or more event sources.
3. Click **Toggle Acknowledge**.

Note the following:

- After Event Sources are Acknowledged, they are no longer displayed in the Event Source Type(s) column.
- The **Toggle Acknowledge** button behaves as follows:
  - If the Acknowledged state for all of the selected event sources is the same, all values are toggled. That is, if you select only event sources with **Yes** in Acknowledged column, the value changes to **No** for all of them. Similarly if they all have **No** in the Acknowledged column, the value changes to **Yes** for all selected event sources.
  - If you select a multiple event sources, and the value for some is **Yes** and for other it is **No**, when you click **Toggle Acknowledge**, all of the values are set to **Yes** for the selected event sources.

Note: Acknowledged Event Sources are not displayed by default.

Manually Map Event Source Types

When discovered event source types are not completely accurate, you can manually map the parsers to obtain additional information.

To map one or more event sources:

1. Go to  **(Admin) > Event Sources**.

   The Discovery tab is displayed.
2. Select one or more event sources.
3. Click 

.

   The Manage Parser Mappings dialog box is displayed.

Note: For event sources that were created manually, the Manage Parser Mappings window has an empty Display Name in the Log Parsers column. To view the missing display names, close the Manage Parser Mappings dialog box, and then reopen it.

4. Add or remove parser mappings, and change the priority order, based on the needs of your organization. For more details, see Manage Parser Mappings .

Note: Discovery scores for the mapped Event Sources are listed in the Event Source Type(s) column from the lowest to highest discovery scores. Discovery scores range from 0 (least confident) to 100 (most confident).

Viewing Logs from Pre-11.0 Log Decoder

NetWitness 11.0 added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available. For more details, see Viewing Logs from Pre-11.0 Log Decoder.

Editing or Deleting Event Source Groups

You may occasionally need to remove an event source group. For example, if you close an office, and you had a group consisting of all the event sources in that office, you can remove the group, since none of those event sources will send information to NetWitness.

Similarly, you may need to change some of the conditions that are used to populate the group.

Note: You cannot edit the event source group name. After you create a group, that name exists as long as the group itself exists.

Edit an Event Source Group

1. Go to  **(Admin) > Event Sources**.
2. In the **Manage** panel, select an existing Event Source Group.
3. Click .

   The Edit Event Group dialog is displayed.
4. Modify any of the details, or add, edit or remove conditions as necessary.
5. Click **Save**.

Delete an Event Source Group

Note the following:

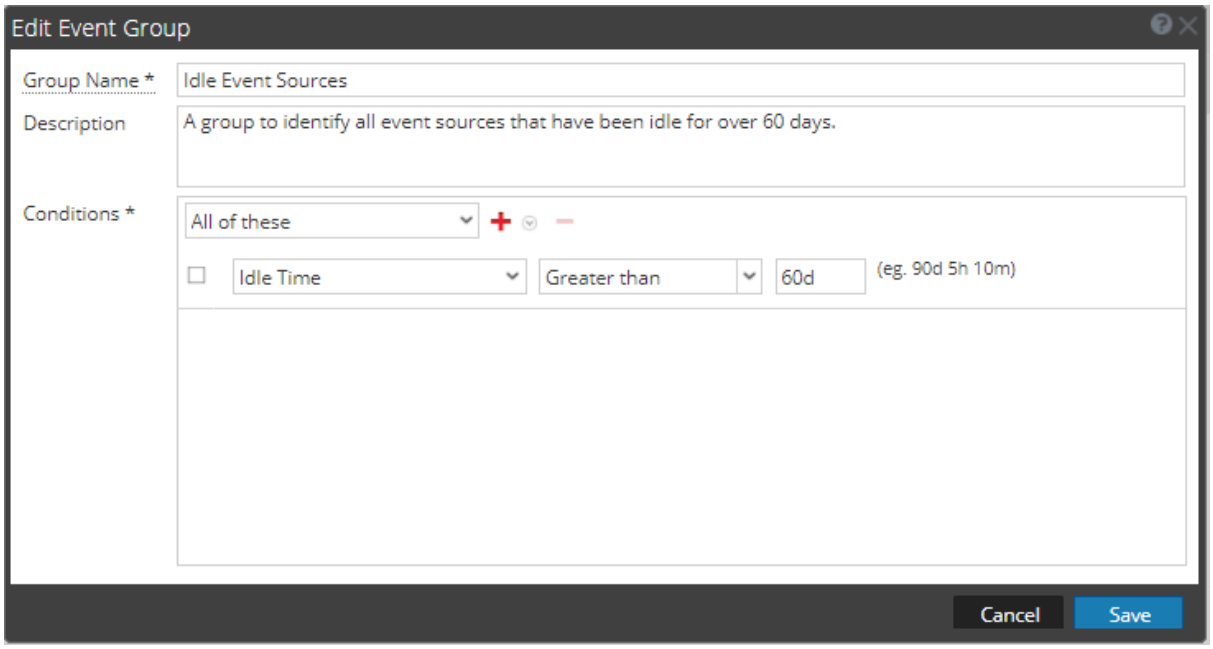
- You can delete any group except for the **All** group, which lists all configured event sources in the system.
- If you delete a group, the associated policy for that group also gets deleted automatically.
- If there are any event sources that belong **only** to the deleted group, they would no longer have a policy alarm associated with them. Remember that event sources can belong to multiple groups.
- Deleting a group has no effect on baseline alarms.

To delete an event source group:

1. Go to  **(Admin) > Event Sources**.
2. In the **Manage** panel, select an existing Event Source Group.
3. Click .

   A confirmation dialog is displayed.
4. Click **Yes** to delete the group.

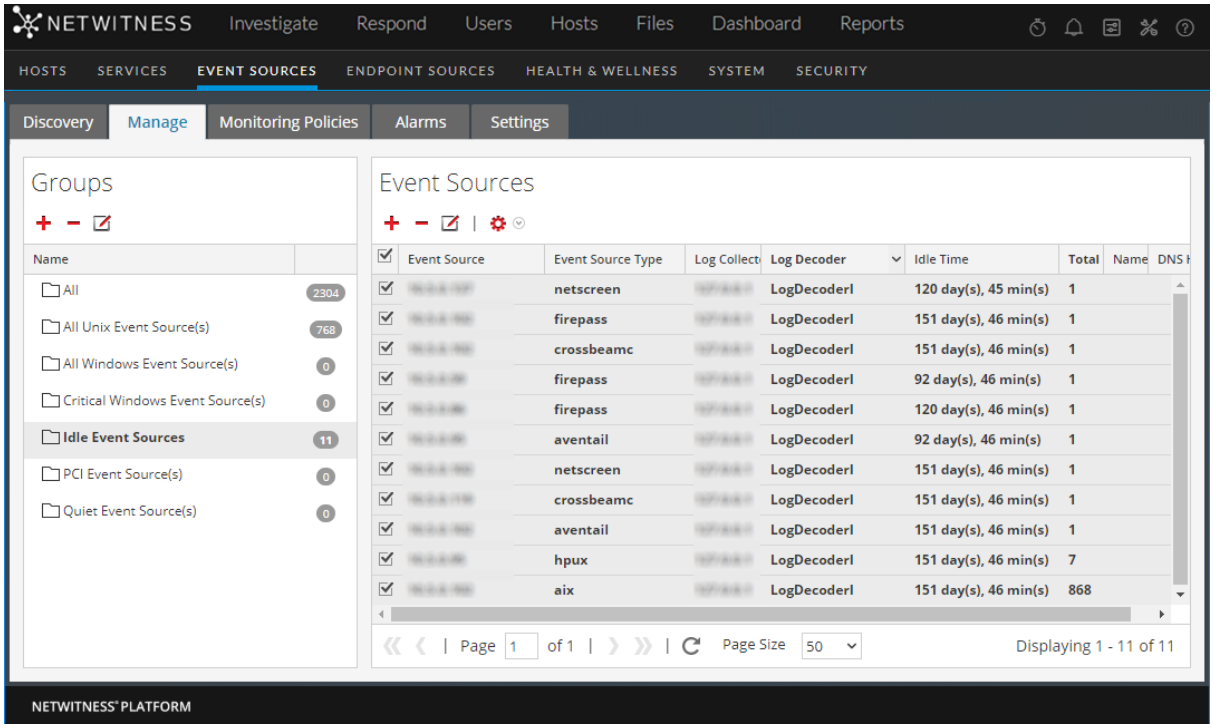
Removing Idle Event Sources



Periodically, you may want to update your set of event sources, and remove ones that are no longer being used. You can use the **Idle Time** parameter to do this.

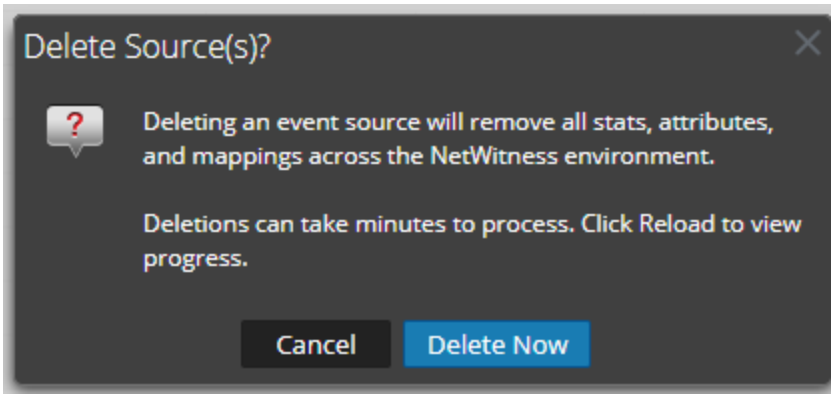
Note: The information in this topic applies to NetWitness Version 11.2 and later.

To remove idle event sources:



1. Go to  **(Admin) > Event Sources**.
2. In the **Manage** panel, click  .

   The Create an Event Group dialog is displayed.
3. Fill in the name and description as you like, and add a condition that uses the **Idle Time** parameter, as shown here:

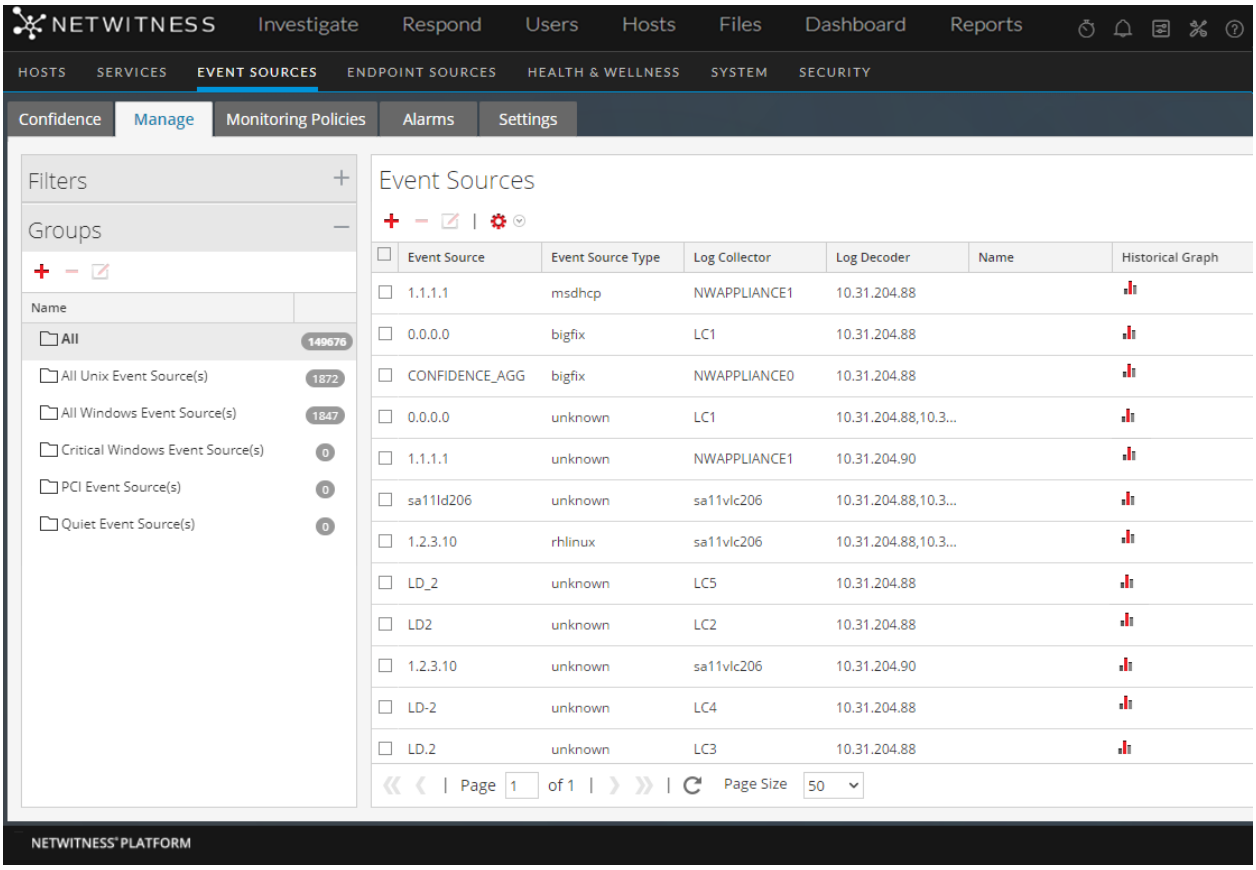


In this example, we have set the condition to identify event sources that have been idle for at least 60 days.

4. Save the new group, then select it in the Groups panel.
5. Select some or all event sources in the group. The following screen shows all event sources from this group selected.

6. In the Event Sources panel, click − to delete the selected, idle event sources.

A confirmation message appears:



7. Click Delete Now to confirm your intention to delete the selected event sources.

If, in the future, an event source that has been removed sends logs, a new event source will be created.

Creating an Event Source and Editing Attributes

You can organize your event sources into groups. You do this by entering values for various attributes for each event source. For example, for all of your high priority event sources, you could set the **Priority** to 1. You can see details about the available attributes on the Manage Event Source Tab.

The following figure shows an example of the Event Sources panel:

Event source attributes are a combination of auto-populated and user-entered information. When an event source sends log information to NetWitness, it is added to the list of event sources, and some basic information is auto-populated. At any time after that, users can add or edit details for other event source attributes.

Mandatory Attributes

The following identification attributes are handled specially: **IP**, **IPv6**, **Hostname**, **Event Source Type**, **Log Collector**, and **Log Decoder**. If you create an event source manually, you can enter these values. After you save the event source, these values can no longer be changed.

Event sources can also be auto-discovered; any event source that sends messages to the Log Decoder will be added to the list of event sources. If you edit the attributes for an auto-discovered event source, you cannot edit any of these fields.

Note that not all of these fields are mandatory. To uniquely identify an event source, the following information is required:

- IP or IPv6 or Hostname, and
- Event Source Type

Additionally, NetWitness uses a hierarchy for IP, IPv6, and Hostname. The order is as follows:

1. IP
2. IPv6
3. Hostname

If you enter event sources manually, then you need to keep this order in mind, otherwise, you may end up with duplicates when messages are received from the event sources that you manually added.

All other attributes (such as Priority, Country, Company, Vendor, and so on) are optional.

Create an Event Source

1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** tab.
3. In the **Event Sources** panel, click  to open the details screen, which contains all of the event source attributes.

   The Manage Event Source Tab is displayed.
4. Enter or change the values for any attributes.
5. Click **Save**.

Note: The Discovery Score is listed as **Unavailable** for manually-added event sources. The score remains as **Unavailable** until the event source begins sending information to the NetWitness

Update Attributes for an Event Source

1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** tab.
3. In the **Event Sources** panel, select an event source from the list.
4. In the **Event Sources** panel, click  to open the details screen, which contains all of the event source attributes.

   The Manage Event Source Tab is displayed.
5. Enter or change the values for any attributes, except for certain attributes that cannot be altered after you have entered them.
6. Click **Save**

Bulk Editing Event Source Attributes

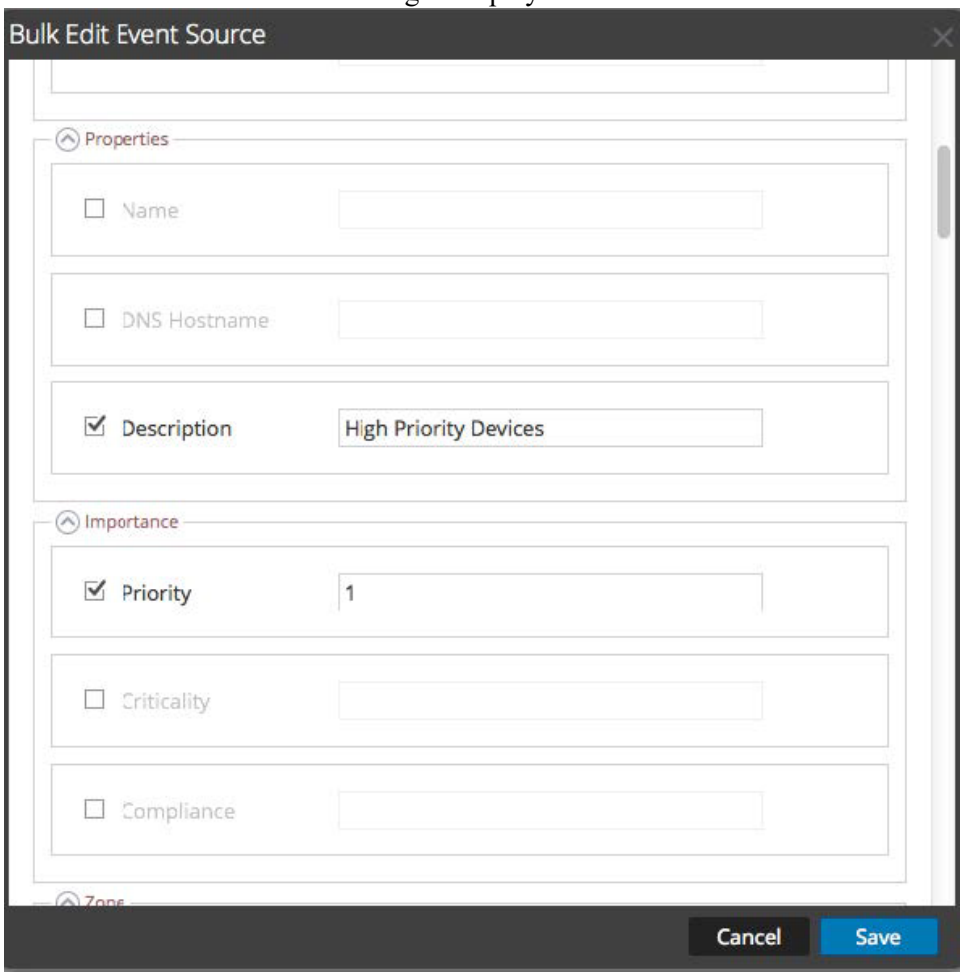
You can select multiple event sources, or an entire group, or even all event sources for bulk editing. For example, you might want to change the Priority or the Manager for a large number of your event sources.

Note: You cannot select individual event sources across displayed pages. For example, if you have a group with 225 event sources, and your Page Size is 50, you can only select event sources from the currently displayed 50 items.

If you want to edit items that span multiple pages, you can do the following:

- In the browser, increase the page size (the maximum is 500 entries on a single page). If your page size is small, you might be able to get all of your items on a single page.
- Create a new event source group that contains only the items that you want to bulk edit. Then, you can select all items for that group, rather than selecting individual items.
- Bulk edit incrementally. On the first page, select the items that you want to edit. Make your edits, then go to the next page and repeat the process, until you have made all of your changes.

Note: Mandatory fields cannot be edited; IP, IPv6, Hostname, Event Source Type, Log Collector, and Log Decoder.



To bulk edit attributes for Event Sources:

1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** tab.
3. Optionally, select an event source group.
4. In the **Event Sources** panel, select one or more event sources to edit.

Note: To select all event sources, select the box next to the **Actions** column in the last (far-right) column of the list table.

5. Select the **Edit** icon from the menu bar.

   The Bulk Edit Event Source dialog is displayed.

6. Enter values for any of the available attributes. In the screen shot above, the Name and Priority attributes have been updated.
7. When you have updated as many attributes as required, click **Save**.

Importing Event Sources

You can import event source attributes from a CSV-formatted file. To import information from a configuration management database (CMDB), a spreadsheet, or other type of file, first convert or save the information to a CSV file.

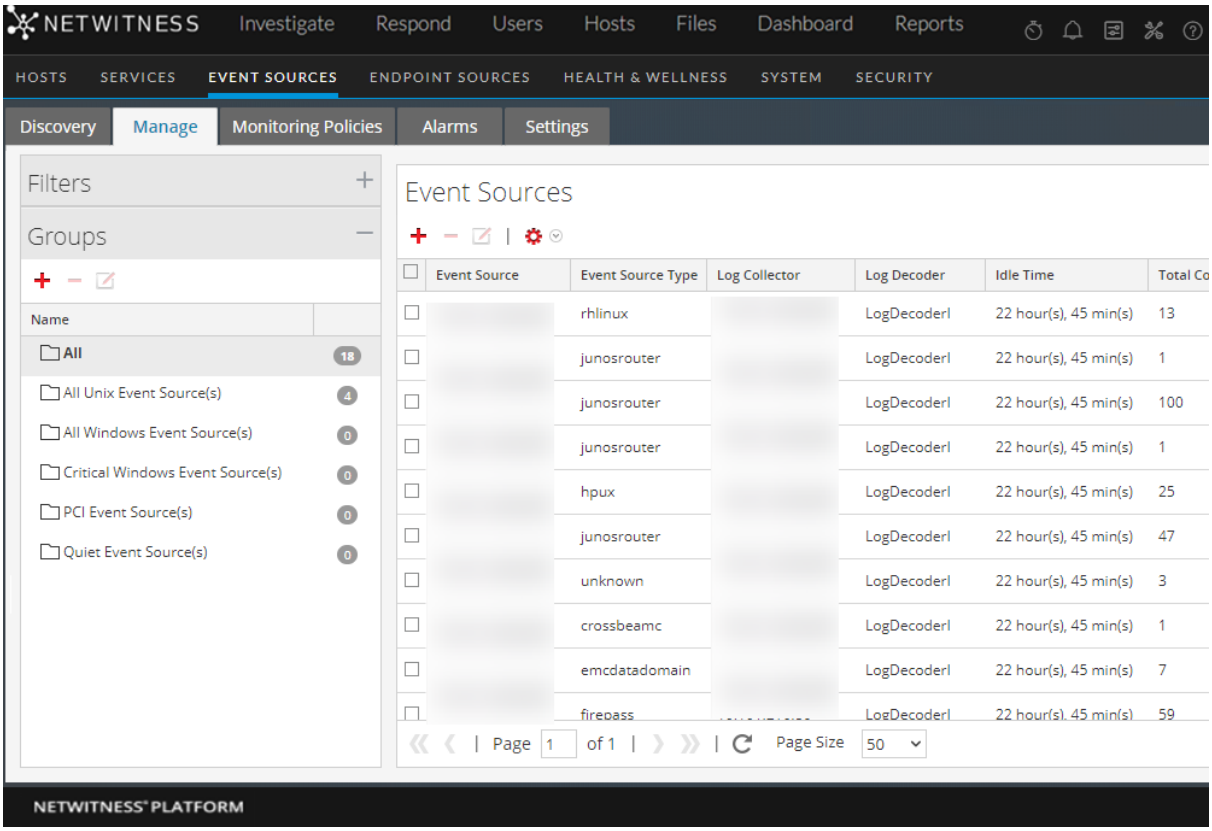
Note: The following identification attributes are handled specially: **IP**, **IPv6**, **Hostname**, **Event Source Type**, **Log Collector**, and **Log Decoder**. If you import an event source that includes a different value for any of these fields (when compared with the value in NetWitness), the original value in NetWitness will **not** be overwritten.

The imported attributes are associated with the matched Event Source and are available for use in rules to create Event Source Groups.

NetWitness treats the import file as the correct, complete record. This assumption leads to the following behaviors related to importing event source attributes:

- By default, when you import attributes, the system updates attributes for existing event sources only.
- If the event source exists in the import file, but not in NetWitness, the attributes for that event source are ignored. That is, NetWitness does **not** create a new event source for these attributes.
- If the event source exists in both the import file and NetWitness, values for that event source are overwritten.
- If an attribute is blank in the import file, it clears the corresponding attribute in NetWitness.
- If an attribute is not specified in the import file, then the corresponding attribute is ignored in NetWitness (that is, it is **not** cleared).

Note: There is a difference between a blank attribute vs. one that is not specified at all. If an attribute is specified but blank, the assumption is that it is meant to be blank, and NetWitness clears that attribute for the corresponding event source. However, if an attribute is not specified at all, it is assumed that no change is expected.



The above behaviors are the defaults—you can change the behavior as specified in the following procedure.

Import Event Source Attributes

To import Event Source attributes from a file:

1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.

3. From the Import/Export menu in the toolbar ( ), select **Import** (Import).
   The Import Event Sources dialog is displayed.

4. Navigate to the import file, and select the appropriate boxes:
   - **Default**: The default behavior is described above.
   - **Add only**: Imports an attribute only if the corresponding field in NetWitness is blank. Thus, no existing values will be overwritten.

- **Do not clear values**: Does not clear attribute values in NetWitness for items in the import file that are blank.
- **Add Unknown Sources**: Adds new event sources based on items in the import file.

Note: You can select multiple options.

5. Click **Import**.
6. Click **Yes** in the confirmation dialog to perform the import.

Troubleshooting the Import File

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

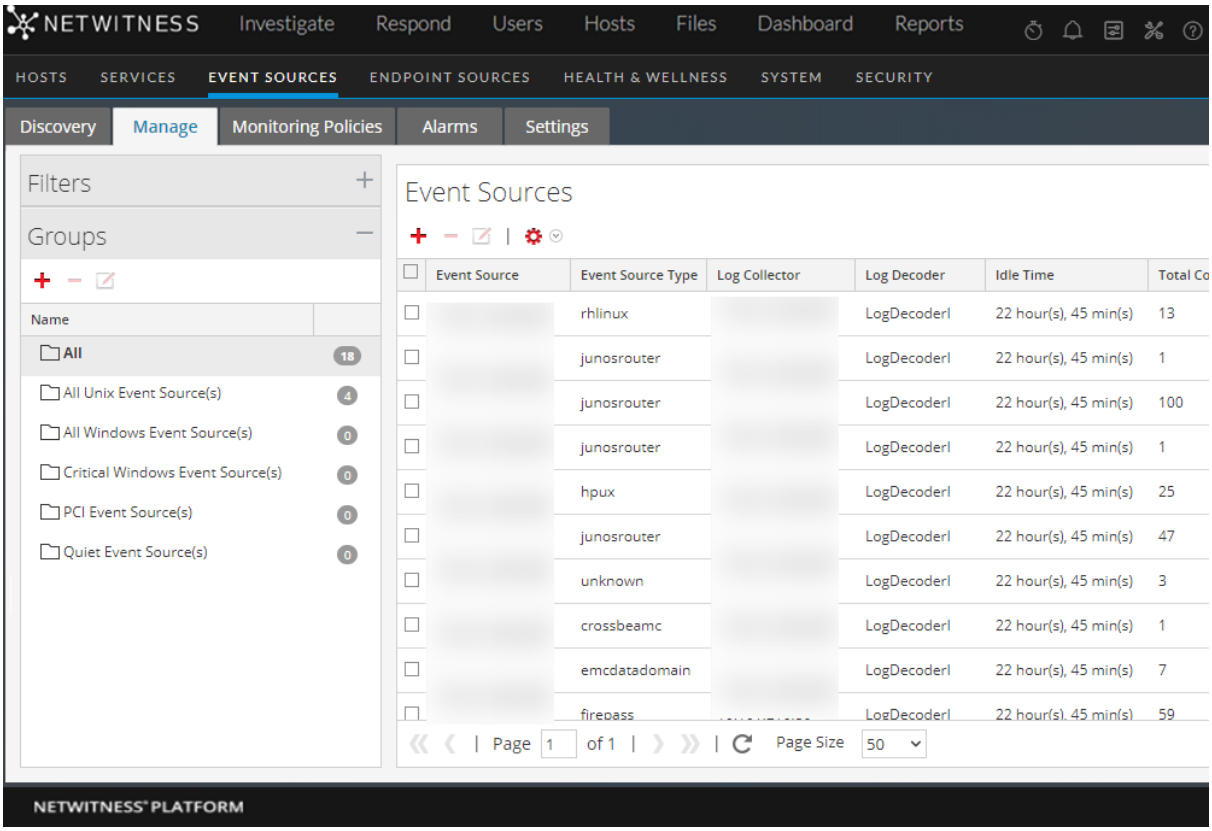
Check the following:

- If you are adding unknown sources, each line in the file must contain a combination of the required attributes:
  - IP or IPv6 or Hostname, and
  - Event Source Type
- The first line of the file must contain header names, and the names must match the names in NetWitness. To get a list of correct column names, you can export a single event source. Examine the exported CSV file: the first row of the file contains the correct set of attribute/column names.

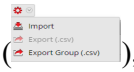
If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Exporting Event Sources

You can export all or some of your event sources, along with their corresponding attributes, to a CSV file.

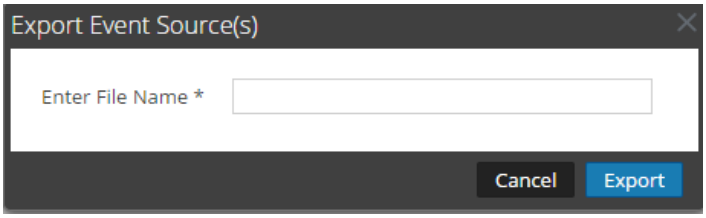


Note the following:



- The exported CSV includes all attribute columns.
- The exported CSV includes a header line at the top, listing each column name.
- You can export all entries in a group.
- You can export all entries (select the **All** group).
- You can select entries and export only those entries.

To export your Event Sources:



1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.

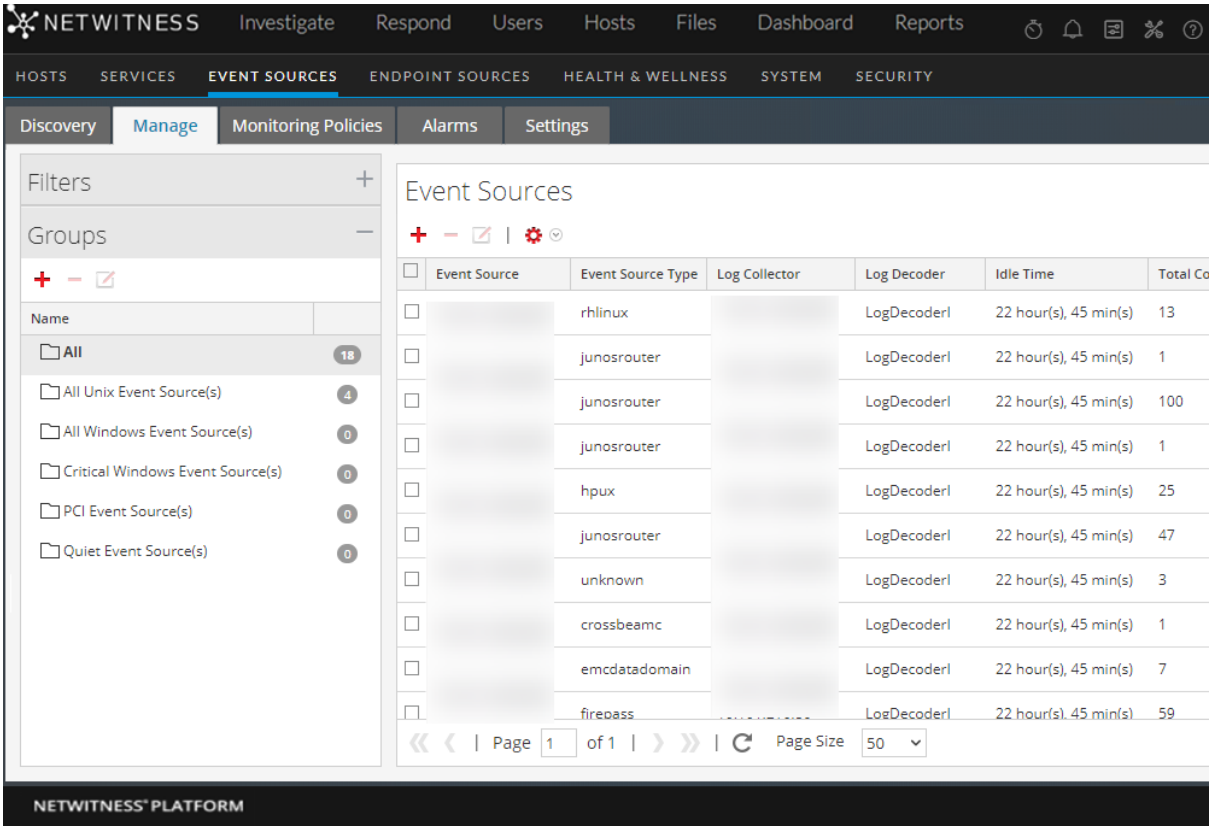
3. Select the group that contains the event sources to export.
4. Select as many event sources as you need. Alternatively, you can export the entire group: to export the entire group, you do not need to select any individual event sources.
5. From the Import/Export menu in the toolbar (), select **Export (.csv)** or **Export Group (.csv)**.

   The Export Event Sources dialog is displayed.

6. Enter a file name and click **Export**.

The event source attributes are saved to the file name you specified, in a CSV format.

Sorting Event Sources



The event sources panel displays attributes for the currently selected event source group. You can configure the list of attributes that are displayed, as well as sort the list on any of the displayed attributes.

Note: The entire list is sorted, not just the items displayed on the current page. (The navigation bar at the bottom of the page shows how many pages exist for this list of event sources.)

To sort your event sources:

1. Go to **(Admin) > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.

3. To sort a column, click  in the column header.

   The Sort Options drop-down menu is displayed.
4. Select the sort order that you want.

Monitoring Policies

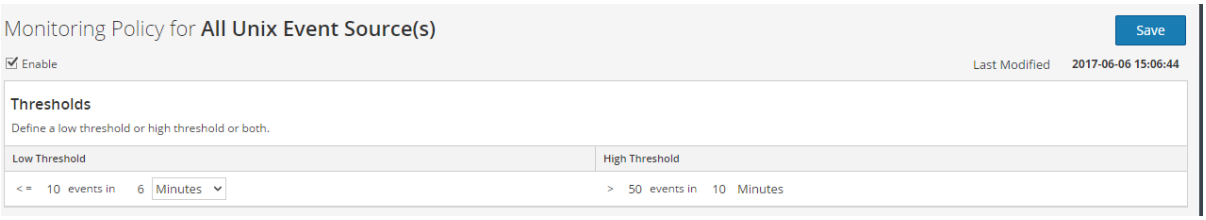
Use the Monitoring Policies view to manage alert configuration for your event source groups.

You can create policies that alert on event source groups, by setting thresholds and notifications:

- Thresholds set ranges for frequency of log messages. You can specify a low threshold, a high threshold, or both.
- Notifications describe how and where to send alerts when thresholds are not met.
- You combine thresholds and notifications to create alerts based on the frequency you specify.
- If automatic alerting is enabled (it is by default), you can create and enable a policy ***without*** setting any thresholds. If you then turn on automatic notifications, notifications will be sent whenever an event source in the group is above or below its baseline by the specified amount.

For example, let's say that you have created an event source group that consists of all your Windows event sources based in the United Kingdom. You could specify a policy that alerts you whenever fewer than 1000 events per 30 minutes arrive.

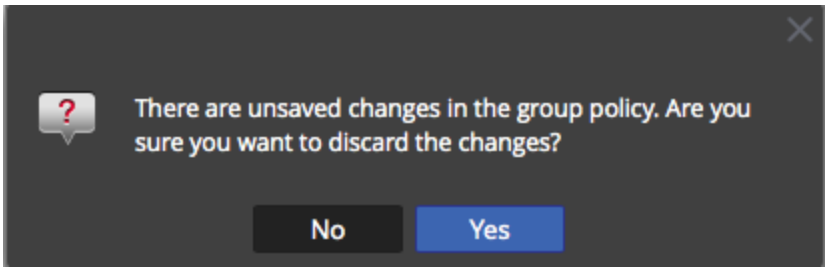
Note: In addition to, or instead of setting up monitoring policies for your event source groups, you can Configuring Automatic Alerting to view alarms when the number of messages for an event source are outside of the normal bounds.



Configuring Event Source Group Alerts

Each event source group can have its own alerting policy. This includes setting the thresholds for when to alert, and setting the notification type when an alert is triggered. This topic describes the steps involved in creating an alert policy for an event source group.

Create an Alert Policy for an Event Source Group

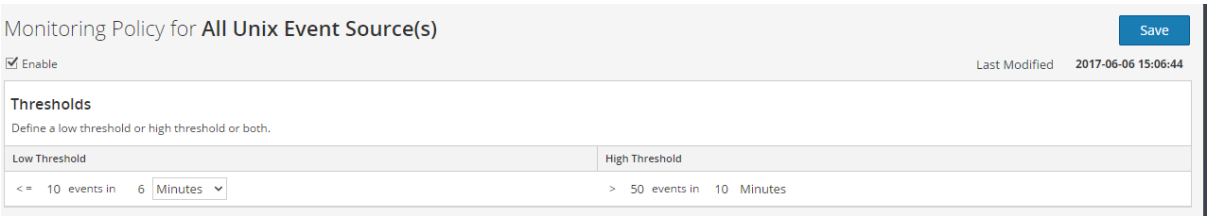


1. Go to  **(Admin) > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
4. Enter values for the Low Threshold and High Threshold fields.

   This is an example of alert thresholds.

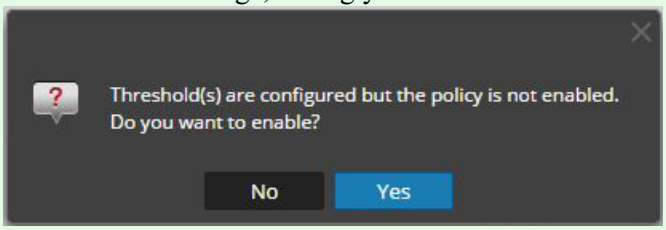
5. Select **Enable** and click **Save** to enable the alert policy that you have configured.

Note: If you make changes to a policy, and attempt to exit the page before you save your changes, an Unsaved Changes warning message is displayed:



Set and View the Thresholds for an Alert Policy

Every event source group is also an alert policy. Thresholds are part of an alert policy. You can set thresholds for each alert policy. For each policy, you can set a low threshold, a high threshold, or both. Additionally, you can enable a policy without setting any thresholds; this allows you to receive notifications based on automatic alerts. Automatic alerts are generated when the baseline for an event source is out of normal bounds.



If you configure longer policy duration for low threshold policy, it may result in increased memory (SMS Heap) usage. In order to avoid increased memory usage (For more information, see 'Troubleshooting Health & Wellness' in the *System Maintenance Guide*), make sure you optimize the policy filter to match the required Event Sources and also NetWitness recommends having a policy duration of < 3 days if 30 low threshold policies match 20K Event Sources. If there are < 10 low threshold policies, you can have < 7 days policy duration with each policy matching unique Event Sources.

1. Go to  **(Admin) > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
   Any thresholds set for the selected group are displayed in the **Thresholds** panel.

4. Edit the values in either the Low or High Threshold as follows:
   a. Enter the number of events for the threshold.
   b. Enter the number of minutes or hours for the threshold. The minimum value is 5 minutes.
5. Select **Enable** to enable alarms when thresholds are not met.

Note: If you configure a threshold and attempt to save the page without enabling it, you receive a confirmation message, asking you whether or not to enable the policy: ddd

For example, suppose you enter 10 and 30 for the values for the low threshold: `10 events in 30 minutes`, and 20 and 30 for the values for the high threshold: `20 events in 30 minutes`. This means that you expect between 10 to 20 events are logged in 30 minutes (for the selected event source group). That is, anything between the low and high threshold is considered normal, and does not trigger an alarm.

After you add a threshold for a policy, you cannot delete it. You can disable the policy, or set the low or high threshold to 0 events in 5 minutes. Five minutes is the minimum duration for a threshold.

Setting Up Notifications

This topic describes how to configure notifications for event source groups. Notifications are sent when thresholds are not met.

Notifications go hand-in-hand with Thresholds. Before you configure notifications, you should set up Thresholds for an event source group.

Note: After configuring the thresholds for an event source group, if you do not set any notifications, then even if an alarm is triggered, users are not notified. However, all alarms are visible on the Alarms Tab.

Prerequisites

Before you set up notifications for an event source group, you should review the available notification items:

- **Notification Servers:** These are the servers that you want to receive notifications from the system. For more details, see the **Notification Servers Overview** topic in the *System Configuration Guide*.
- **Notification Templates:** These are the available templates for each type of notification. For Event Source Management, default templates are supplied for Email (SMTP), SNMP, and Syslog. You can use these templates as supplied, or customize them if necessary. For more details, see the **Templates Overview** topic in the *Systems Configuration* Guide.
- **Notification Output:** The outputs contain the parameters for the notification type. For example, an email notification type contains the email addresses and subject for the notification. For more details, see the **Notification Outputs Overview** topic in the *Systems Configuration* Guide.

Add Notifications for an event source group

To add notifications for an event source group:

1. Go to  **(Admin) > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.

   Note: You should have already set a threshold for the group. If not, see Set and View the Thresholds for an Alert Policy to set a threshold, and then return to this procedure. Alternatively, if you have automatic alerting turned on, then you do not need to set thresholds for a policy. Automatic alarms generate notifications without the need to set thresholds.

4. In the Notifications panel, click , and from the drop-down menu, select the type of notification you want to add:
   - Email
   - SNMP
   - Syslog

   Note: Default ESM (Event Source Monitoring) templates are provided for each type of notification.

5. Enter values for the Notification, Notification Server, and Template fields.
   a. For Notification, select from the list, or add a suitable notification type in **Notifications**, and then select it here.
   b. For the Server, select one from the list, or add a suitable server in **Notifications**, and then select it here.
   c. For Template, select an available template, or create a suitable template in **Notifications**, and then select it here.

   Note: If you need to add or edit one of these items, click **Notification Settings**. A new browser window opens on the **Administration > System > Global Notifications** page. Use this page to view or update the available Notification items.

6. Optionally, you can limit the rate of notifications for a policy.
   a. Select **Output Suppression** to enable setting a limit.
   b. Enter a value, in minutes, for the suppression rate. For example, if you enter **30**, notifications for this policy are limited to one notification every 30 minutes.
   c. Click **Save**.

Here is an example of a monitoring policy that contains a threshold and notification for an event source group.

Disabling Notifications

Notifications are sent when thresholds are not met. Additionally, automatic notifications are sent when baselines are not met. However, you may determine that you no longer require notifications for the event sources in a particular group. In this case, you can disable notifications for the event source group.

Note: Even if you disable all notifications, the details for alarms are still visible on the Alarms Tab.

Prerequisites

You must have configured thresholds and notifications for an event source group, and enabled them. For automatic notifications, you must have selected **Enable Notifications From Automatic Monitoring** on the Alarms Tab

Disable Notifications

To disable notifications (both manual and automatic) for an event source group:

1. Go to **(Admin) > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
4. Click **Enable** to remove the check mark. Clearing this option means that notifications are not sent for

this event source group, even if thresholds are not met or exceeded.

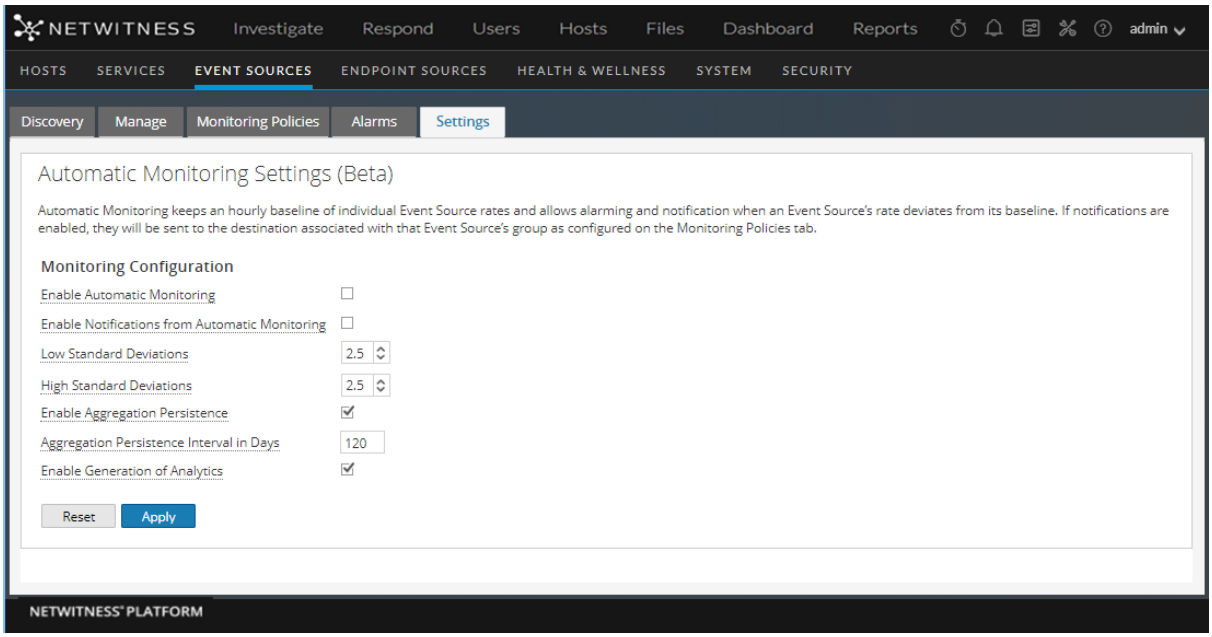
5. Additionally, you can remove all notifications. However, this is not required to stop the notifications.

Configuring Automatic Alerting

Note: Automatic alerting, and it settings, are currently in Beta testing.

Prerequisites

Before you set up notifications for an event source group, you should review the available notification items:



- **Notification Servers:** These are the servers that you want to receive notifications from the system. For more details, see the **Notification Servers Overview** topic in the *System Configuration Guide*.
- **Notification Templates:** These are the available templates for each type of notification. For Event Source Management, default templates are supplied for Email (SMTP), SNMP, and Syslog. You can use these templates as supplied, or customize them if necessary. For more details, see the **Templates Overview** topic in the *Systems Configuration* Guide.
- **Notification Output:** The outputs contain the parameters for the notification type. For example, an email notification type contains the email addresses and subject for the notification. For more details, see the **Notification Outputs Overview** topic in the *Systems Configuration* Guide.

Configure Automatic Alerting

To configure automatic alerting:

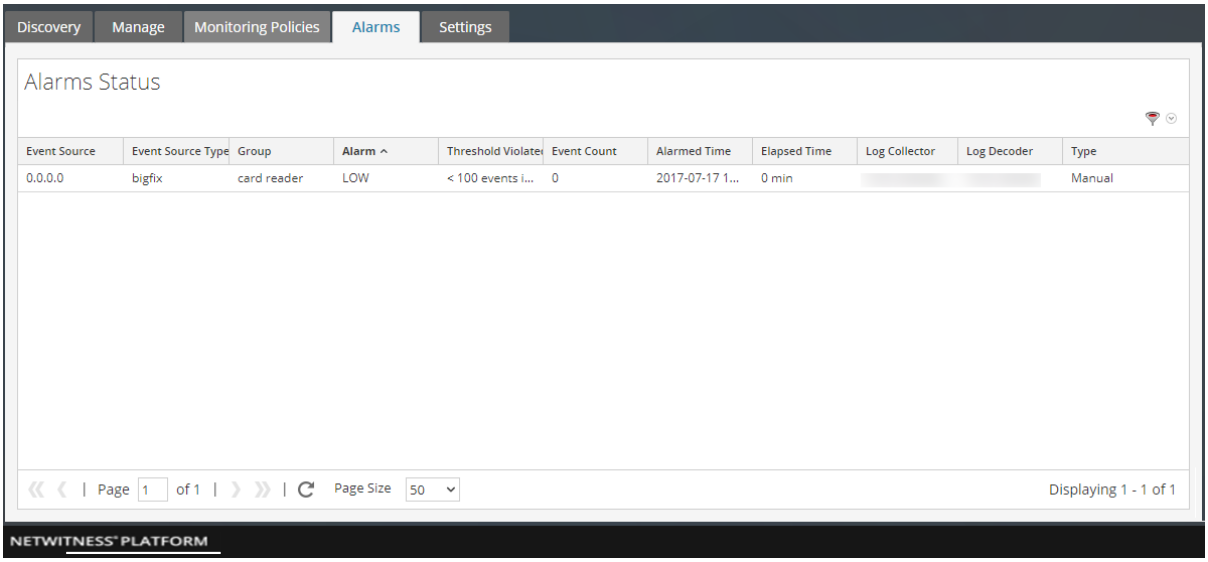
1. Go to  **(Admin) > Event Sources**.
2. Select the **Settings** tab.

   The Settings tab is displayed.

3. By default, automatic monitoring is turned on. To turn off automatic alerting, clear the **Enable Automatic Monitoring** option.
4. By default, notifications for automatic alerts is turned off. To turn on automatic notifications, select the **Enable Notifications From Automatic Monitoring** option.
5. Configure the parameters, based on your usage patterns:
   - **Low Standard Deviations**: standard deviations below which to receive alerts. Default is **2.5** (95% confidence).
   - **High Standard Deviations**: standard deviations above which to receive alerts. Default is **2.5** (95% confidence).

   Note: You can adjust the standard deviation settings in increments of 0.1 (one tenth) of a standard deviation.
6. Click **Save** to close the dialog and save your settings.

Viewing Event Source Alarms



This topic describes how to view alarms for your event source groups. After you have configured and set alerts, you can view all of the generated alarms in the **Alarms** tab of the **Event Sources** view.

Sort the Alarms Information

When you first access this view, the data is sorted by most recent alarm (the Alarmed time column). You can sort by any column.

1. Go to  **(Admin) > Event Sources**.
2. Mouse over a column that you want to sort.
3. Click the Select the **Alarms** tab.
4. Mouse over the column that you want sorted, and click the  icon.

   This is an example when you mouse over the Alarm column.

5. Select either **Sort Ascending** or **Sort Descending** to sort the column in the way you wish.

   The data is sorted across all pages.

Note: You can also sort by two columns. To do this, first sort by the secondary column, then sort by the primary column. For example, if you want to see all the HIGH alarms by their group order, first sort on **Group**, then sort on **Alarm**.

Filter Alarms by Type

You can also filter the alarms by their type: you can display only the Manual or Automatic (baseline) alarms. To filter by alarm type, select the filter icon on the right side of screen, in the heading area: 

Select either Automatic or Manual:

- If you select Automatic, only the alerts based on baselines are displayed.
- If you select Manual, only the alarms for which you have set thresholds are displayed.

Event Source Management References

The following topics contain reference information for Event Source Management:

- Discovery Tab
- Manage Tab
- Manage Event Source Tab
- Event Sources View
- Create/Edit Group Form
- Details View
- Historical Graph for System Stats
- Manage Parser Mappings
- Alarms Tab
- Monitoring Policies Tab
- Settings Tab

Discovery Tab

To access the Discovery tab, go to NetWitness  (Admin) > **Event Sources**. The Discovery tab is displayed.

The Discovery tab lets you review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified completely accurately. If the discovered event source types are correct, you can acknowledge to filter out that event source. If incorrect, you can set the allowed event source types for a particular address so that future logs will parse against the correct parsers.

Note: The following features apply to NetWitness version 11.1 and later:
- Acknowledging multiple event sources
- Filtering by event source type
- (for 11.2 and later) Mapping filter options include None, Auto, and Manual
- Mapping multiple event sources
- Searching for event sources on the Event Source Discovery page

NetWitness, version 11.2 and later, automatically maps incoming events to a type based on previous logs received from that address, reducing the mis-parsing of messages and reducing the number of items that need attention in the Discovery workflow. A value of **Auto** in the **Mapping Type** column indicates that an address has been auto-mapped.

Workflow

This workflow shows the overall process for configuring event sources.

What do you want to do?

Manage Parser Mappings

Details View

Quick Look

The following example displays a list of addresses and their discovered Event Source types. The Event Source types display the Event Sources that have been discovered.

This is an example of the tab.

1 Displays the Filters and Event Sources panels with the Discovery tab open.

2 Displays the Event Source Filter field with a drop-down menu that offers the following options:

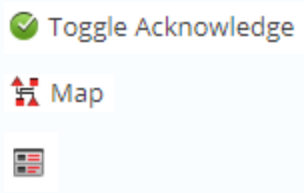
- Enter the full or partial address (IP, IPv6 or Hostname) of the source(s) you want to review. You can also enter multiple entries that are separated by commas.
  For example, **10.10.10.10,10.10.10.11,host1.company.com**
- **Exact:** Returns sources that completely match the search term.
  For example, **10.10.10.10** only returns **10.10.10.10**, not **10.10.10.101**.
- **Starts With:** Returns sources that start with the search term.
  For example,**10.10.10.** returns the whole **10.10.10.x subnet**.
- **Contains:** Returns sources that start with the search term.
  For example, **exch** returns all terms such as **us-exch-1.company.com**, or **lab21** returns all **hostx.lab21.company.com** terms.
- **Ends With:** Returns sources that end with the search term.
  For example, **lab21.company.com** returns all hosts.

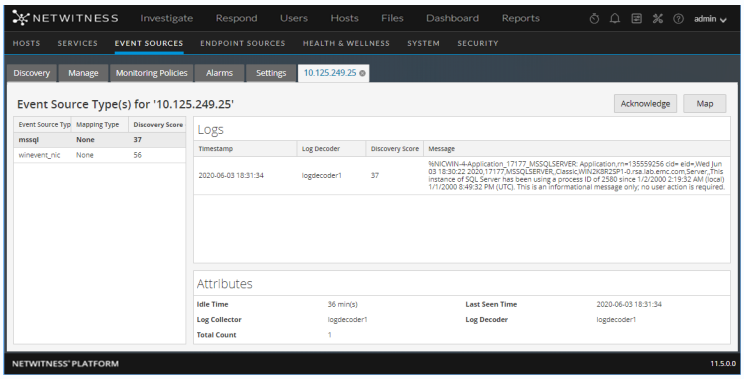
Note: When specifying the search string, you can use **. - :** (period, dash, colon).

3 The Event Source Type drop-down menu filters for addresses containing all of the selected event source types.

4
- Select the **Show Acknowledged** checkbox to display acknowledged Event Sources.
- Mapping filter options can include just one of the mapping types listed in the Filter Panel, or multiple Mapping Types can be selected.

Note: If no mapping filter options are selected, the default is to display **All**, **None**, **Manual**, and **Auto** mapping types.





5
- The **Apply** button uses all criteria that is set in all filters.
- The **Clear** button clears all filters from the panel.

6 Toggles the event sources between acknowledged and not acknowledged states.

7	Maps the selected event sources.
8	View Details button to view details of the selected Event Source.
9	Displays the addresses of the selected Event Sources.
10	Displays the discovery scores of the selected Event Sources.
11	Displays whether or not the selected Event Sources have been acknowledged.
12	Displays the selected Event Source Mapping type as Auto, Manual, or None. Any changes to the mapping are only displayed here.
13	Displays the host names of the Log Collectors where the Event Sources are located.
14	Displays the host names of the Log Decoders where the Event sources are located.
15	Displays the discovered Event Source Types and their associated discovery scores.

Toolbar and Features

The Discovery tab contains the following features:

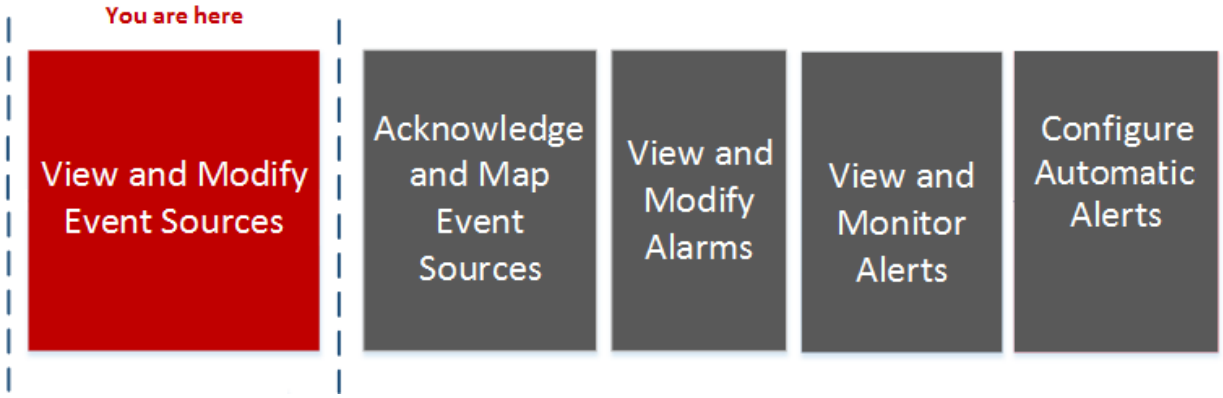
Field	Description
Tools 	The following items are available on the toolbar: • **Toggle Acknowledge**: Toggles the acknowledged state for the selected Event Source between **Yes** and **No**. • **Map**: Opens the Manage Parser Mappings dialog box, where you can map an event source to the correct log parser. • **View Details**: Provides details on the selected Event Source, as well as logs that have been received for this event source. For example: 
Event Source	The IP, IPv6, or Hostname of the Event Source.
Discovery Score	Displays the overall discovery score associated with that particular address. Higher scores indicate better confidence. Discovery scores range from 0 (least confident) to 100 (most confident).
Acknowledged	Selections are either **Yes** (you have acknowledged the Event Source) or **No** (you have not acknowledged the Event Source).

Field	Description
Mapping Type	Selections are **Manual** (you mapped the Event Source), **Auto** (the system automatically mapped the Event Source), or **None** (you have not mapped the Event Source). Auto mapping is content aware. When a log message is parsed to a high confidence header or message that has been tagged, an auto mapping will be set for that address and type. This auto-mapping is valid for 24 hours and will be renewed every time a log message matches a tagged header of a message. Log messages are first parsed against auto-mapped parsers, and only fall back to discovery if there is no match amongst the mapped parsers. Log messages that fall back to discovery can match the tagged headers or messages from other event sources: this results in multiple types being mapped. For example, an address could eventually be mapped to Windows, MS SQL, and Apache, and these parsers are evaluated first. If an event source is decommissioned, and its IP re-purposed, the 24-hour timer ages out the mappings for the decommissioned types. **Note:** This features applies to NetWitness version 11.2 and later.
Log Collector(s)	Log Collectors that have received logs from this Event Source address.
Log Decoder(s)	Log Decoders that have received logs from this Event Source address.
Event Source Type(s)	The parsed type(s) of the Event Source address and the corresponding Discovery Score for each type.

Note: Discovery Scores are only available for 11.0 and above Log Decoders. Discovery Scores for pre-11.0 Log Decoders display as Unavailable.

The following table describes the sorting order for discovery scores. To access the Sorting Order drop-down menu, click on the down arrow in the Event Sources column.

Field	Description
Sort Ascending	Sort the column by discovery score in ascending order.
Sort Descending	Sort the column by discovery score in descending order.
Columns	Used to hide or show one or more columns.



Manage Tab

The Manage tab organizes event sources into groups, and displays attributes for each event source.

To access this tab, go to (Admin) > **Event Sources** > **Manage**.

Workflow

This workflow shows the overall process for configuring event sources.

What do you want to do?

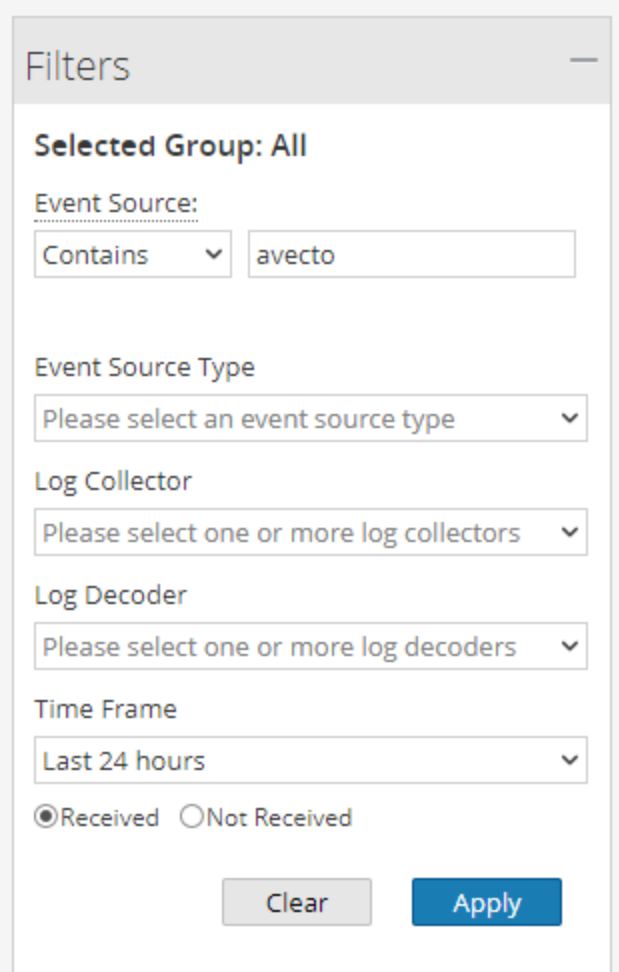
Related Topics

Creating Event Source Groups

Creating an Event Source and Editing Attributes

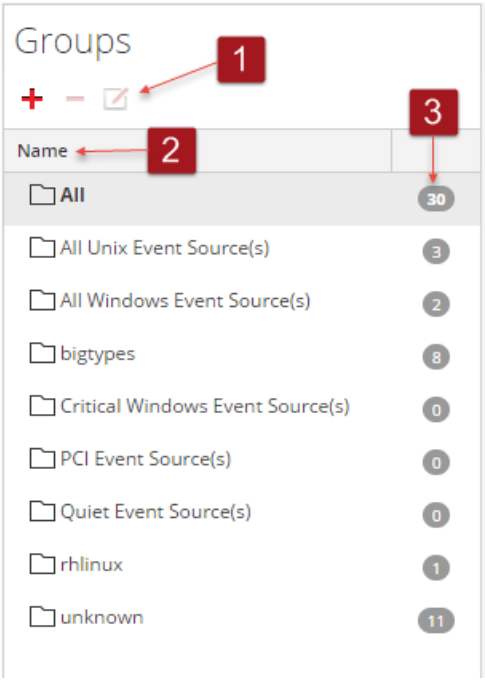


Quick Look

The Manage tab organizes event sources into groups, and displays attributes for each event source. The Manage tab consists of two panels, Groups and Event Sources.

Filter Panel

The Filter Panel provides options for filtering the set of event sources shown in the grid view. This is an example of the Filter Panel:

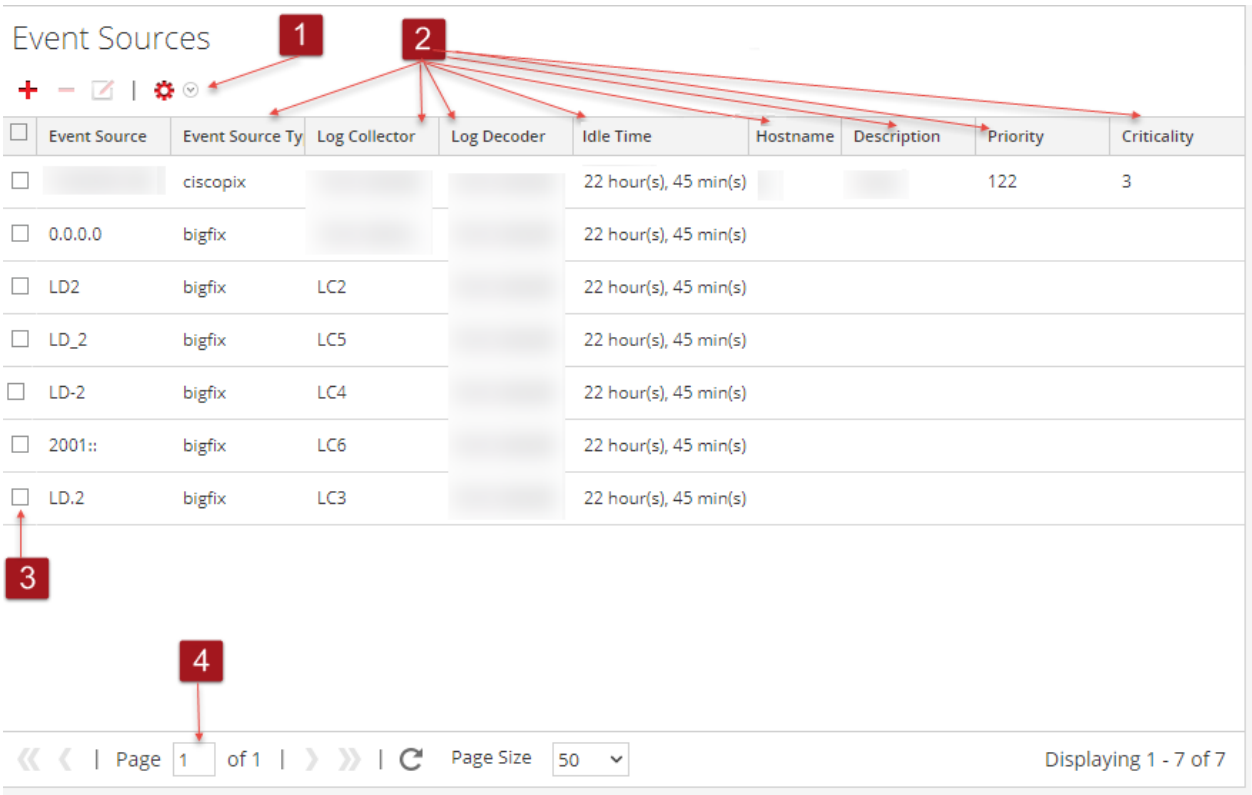


This panel provides the following options:

- You can filter on the event source name, using **Contains**, **Exact**, **Starts With**, or **Ends With**. Select one of these choices, then enter the corresponding string to match against.
- Select one or more Event Source Types to filter based on this value.
- To view event sources that send data to a particular Log Collector, select a Log Collector from the drop-down list.
- To view event sources that send data a particular Log Decoder, select a Log Decoder from the drop-down list.
- Select the time frame for when the events were collected. You can choose a value from 5 minutes to the previous 90 days, or all data that has been collected.
- Use the **Received** and **Not Received** radio buttons to filter the query results to contain only event sources that logs have been received from within the selected time, or query results to contain only event sources that logs have not been received from within the selected time.

After you complete the set of filters, click **Apply** to view the query results in the Event Sources grid.

Groups Panel



The Groups Panel lists the event source groups, as well as a count of the members for each group. To see all event sources, select **All** from the groups list. This is an example of the Groups panel.

1	Displays the standard NetWitness icons for adding, removing, or editing groups.
2	Lists the identifier for each group in the Name column. You can use the group names to quickly identify some of the criteria used to form the group. For example, if you create a group that consists of Windows event sources for the Sales organization, you could name the group **Windows Sales Sources**. **Note:** The event source group name is not editable. After you create a group, that name exists as long as the group itself.
3	The count for an event source group indicates the number of event sources in that group. That is, the number of event sources that match the criteria used to define the group. **Note:** The count is not dynamically updated when new event sources are added. Thus, you may need to refresh to see an updated group count.

Event Sources Panel

The Event Sources panel displays the attributes for the event sources in the selected group. Or, if All is selected in the Groups panel, the Event Sources panel lists all event sources.

1	The toolbar contains the following tools:
	• **Add**: manually add an event source
	• **Remove**: remove an event source
	• **Edit**: Update attributes for an existing event source
	• **Import / Export** menu: Displays a menu with the following options:
	  • **Import**: Import event sources from a Content Management Database (CMDB), spreadsheet, or other tool.
	  • **Export**: Export selected event sources and their attributes in CSV format.
	  • **Export Group**: Export the entire group that is currently selected.

2	Columnar display of attributes. You can choose which attributes to display.
3	Checkboxes: Select rows to use when performing tasks on multiple event sources, such as bulk editing.

4	Navigation Tools: At the bottom of the screen, there are items that help in navigating your group: • **Page *x* of *y***: indicates which page you are currently displaying, and how many total pages exist for this group. • **<<**, **<**, **>** and **>>**: click these icons to move between pages either one at a time (< and >) or to the first (<<) or last (>>) page. • **Page Size**: use this selector to choose your page size. • **Displaying *x* - *y* of *z***: quick check of which event sources are currently displayed out of the total number for the group.

Sorting

In the Event Sources panel, the list of items is presented in a sorted order. You can choose which column on which to sort. Note, however, that the sort order depends on capitalization.

For any string column, if the values contains a mix of lower case and upper case, the upper case appear in the list before the lower case values.

For example, assume the Event Source Type column contains the following entries: Netflow, APACHE, netwitnessspectrum, ciscoasa. The sort order would be as follows:

- APACHE
- Netflow
- ciscoasa
- netwitnessspectrum

Historical Graph for System Stats

Note: The information in this topic applies to NetWitness Version 11.4.1 and later.

Historical system statistics are available for each event source.

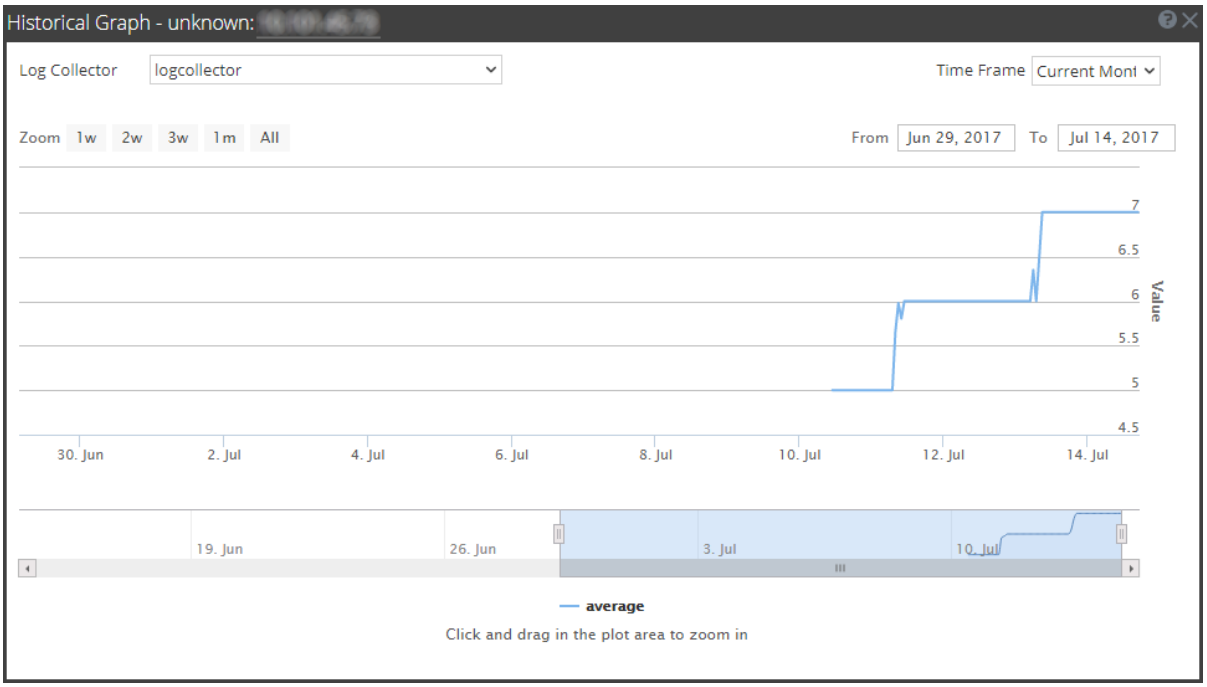
To access the Historical Graph for the System Stats:

1. Go to  **(Admin) > Event Sources**.
   The Event Sources view is displayed.
2. Click the **Manage** tab.
   The Event Sources Manage tab is displayed.
3. In the **Historical Graph** column, select the view chart icon () for any listed event source.
   The Historical graph for the selected event source is displayed. The figure displays event source

activity.

Parameters

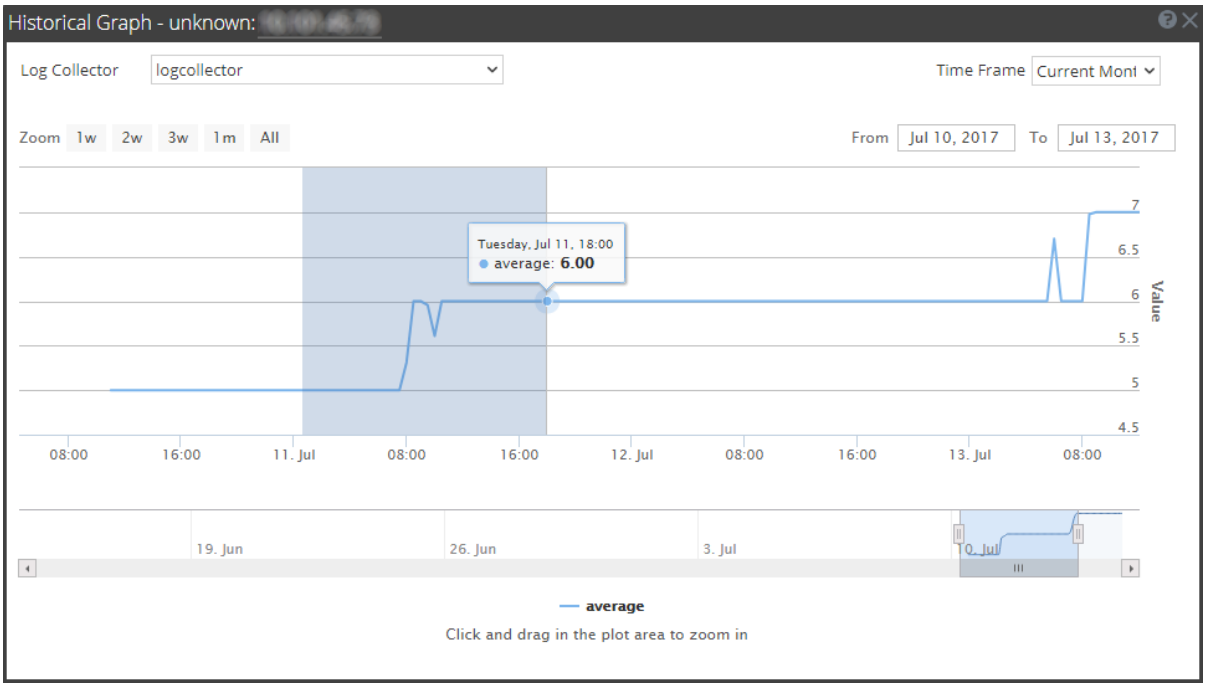
You can customize the graph view as required. The table lists the various parameters used to customize the historical graph view.



Parameter	Description
Log Collector	Select the Log Collector for which you want to view historical data. In some cases, the historical data for an event source may be spread across multiple Log Collectors.
Time Frame	Select the time frame for which you want to view the historical data. The available options are: **Current Day**, **Current Week**, **Current Month**, and **Current Year**.
From <date> To <date>	Select the date range for which you want to view the historical data.

You can zoom in for a detailed view of the data in the Historical graph.

Examples of Zooming In



You can select one of the values to view the historical data for the selected value. The figure below displays an example for the 6 hour frame selected for zoom in. The slider bar at the right bottom corner is also changed to a 6 hour window.

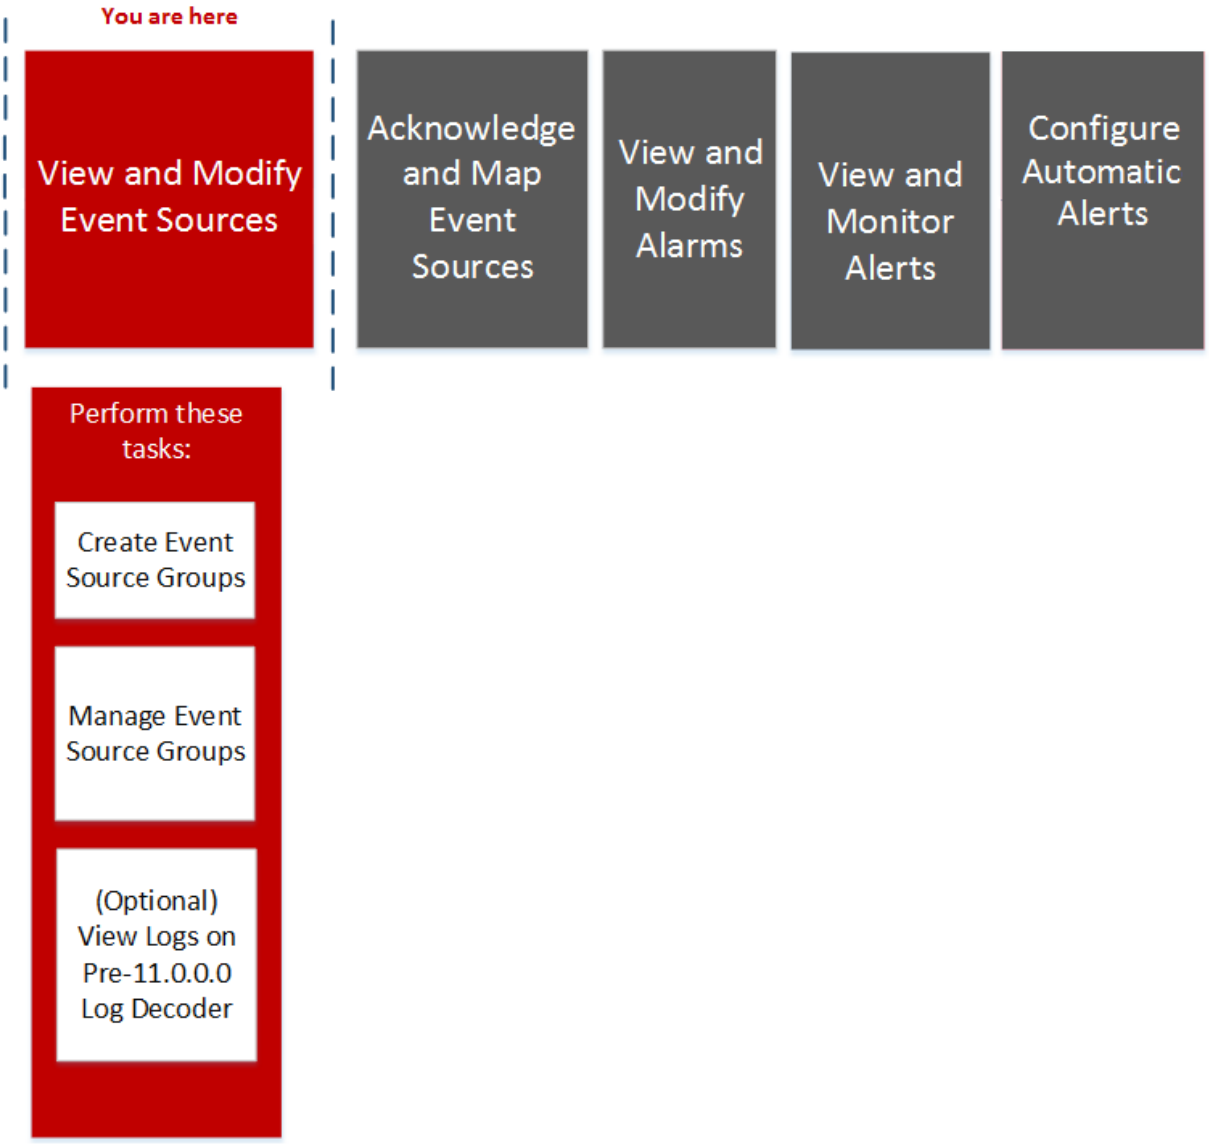
Alternatively, you can slide the bar in the right hand corner to zoom in to a required frame.

You can click and drag in the plot area to zoom in for a required frame of time.

The figure below displays an example of how the graph appears while you click and drag.

Manage Event Source Tab

The Manage Event Source screen has several integrated components that present different perspectives of an event source.



- Show Event Source Details
- Add attribute values to an event source
- Remove attribute values for an event source

To view the Manage Event Source screen for an event source:

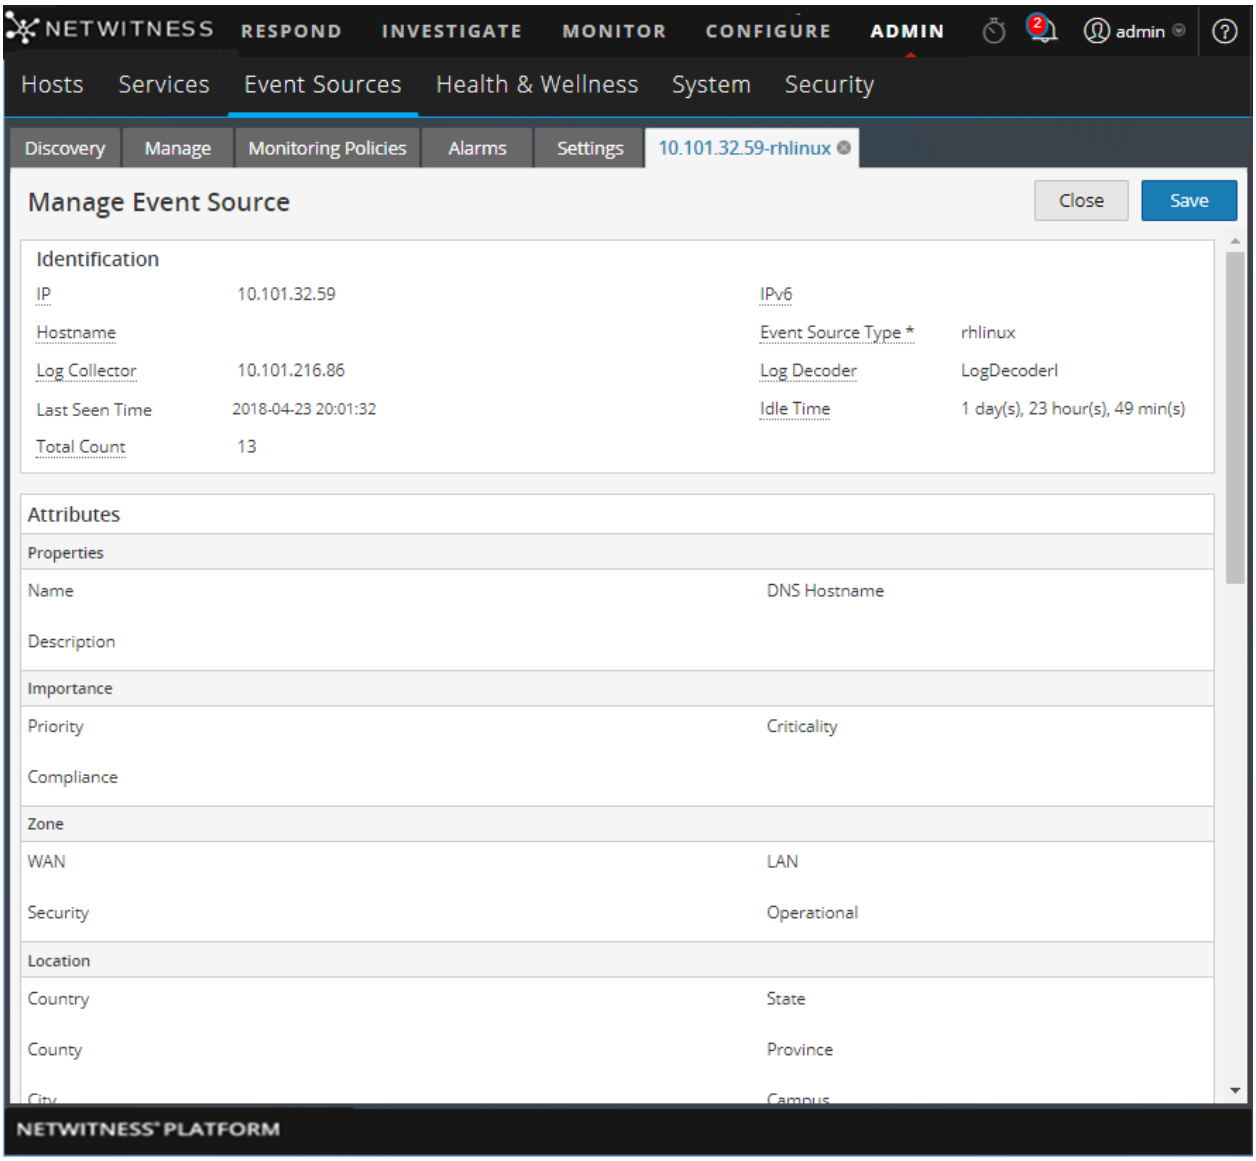
1. Go to  **(Admin) > Event Sources**.
2. Select the **Manage** tab.
3. From the Event Sources pane, select an event source from the list and click + .

Workflow

This workflow shows the end-to-process for modifying, acknowledging, mapping, and configuring event sources, along with viewing and configuring event source alarms and alerts.

What do you want to do?

Role	I want to...	Documentation
Administrator	Create an event source group that contains all the high priority event sources.	Creating Event Source Groups
Administrator	Edit event source attributes.	Creating an Event Source and Editing Attributes



Related Topics

Creating Event Source Groups

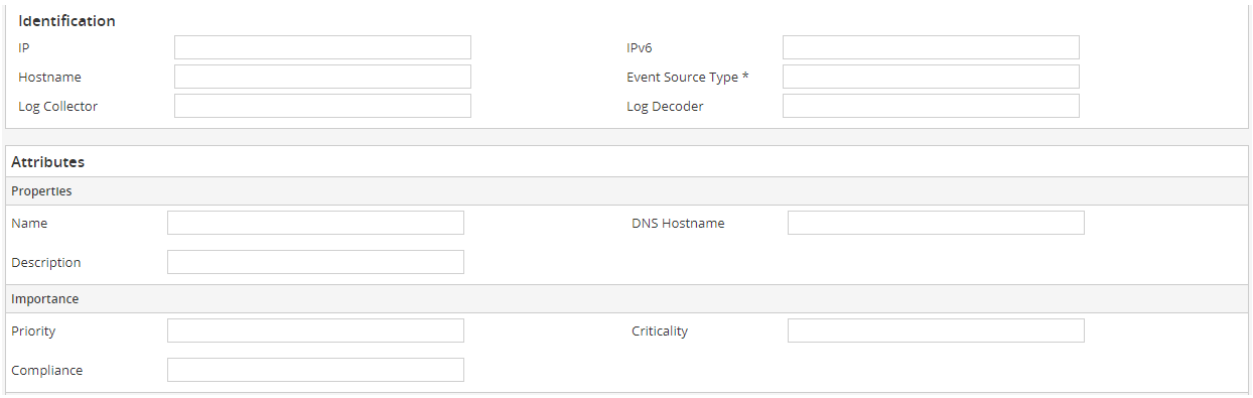
Creating an Event Source and Editing Attributes

Quick Look

This is an example of the Event Source tab:

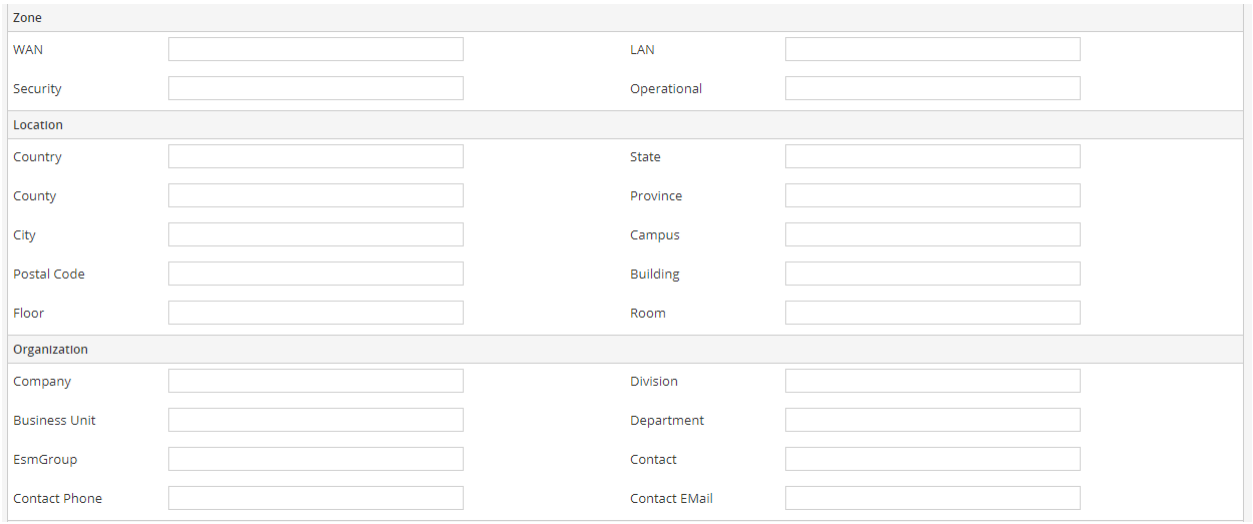
This table describes event source attribute categories.

Attribute Section	Description
Identification	These attributes are the main attributes that collectively identify an event source. You can only change these attributes when you are specifying the details for a new event source. For an existing event source, the attributes in this section are auto-populated, and cannot be changed while on this screen. Attributes available for a new event source: • IP • IPv6 • Hostname • Event Source Type • Log Collector • Log Decoder The following attributes are displayed when viewing the details for an existing event source: • Last Seen Time: this is the last time there was communication between NetWitness and the event source • Idle Time: this is the amount of time elapsed since the **Last Seen Time**. This time can be useful if you want to filter event sources that have been inactive for a certain duration. • Total Count: total count of all event sources for this **Event Source Type**.
Properties	These attributes provide the name and description. • Name • DNS Hostname • Description
Importance	These attributes can be used for grouping by priority. • Priority • Criticality • Compliance



Attribute Section	Description
Zone	These attributes can be used for grouping by zone. • WAN (Wide Area Network) • LAN (Local Area Network) • Security • Operational
Location	These attributes can be used to group by the physical or geographical location. • Country • State • County • Province • City • Campus • Postal Code • Building • Floor • Room
Organization	These attributes can be used to group by organization, and also to provide contact information. • Company • Division • Business Unit • Department • Group • Contact • Contact Phone • Contact Email
Owner	These attributes specify those responsible for the event source. • Manager • Primary Administrator • Backup Administrator

Attribute Section	Description
Physical	These attributes specify the physical properties for the event source. • Vendor • Serial Number • Asset Tag • Voltage • UPS Protected • Rack Height • Depth • BTU Output • Color
Function	These attributes can be used to group by function. • Primary Role • Sub Role 1 • Sub Role 2
System Information	These attributes specify system information. • Domain Name • System Name • Identifier • System Description
Custom	This section provides eight custom attributes, for any other attributes that your organization might need.

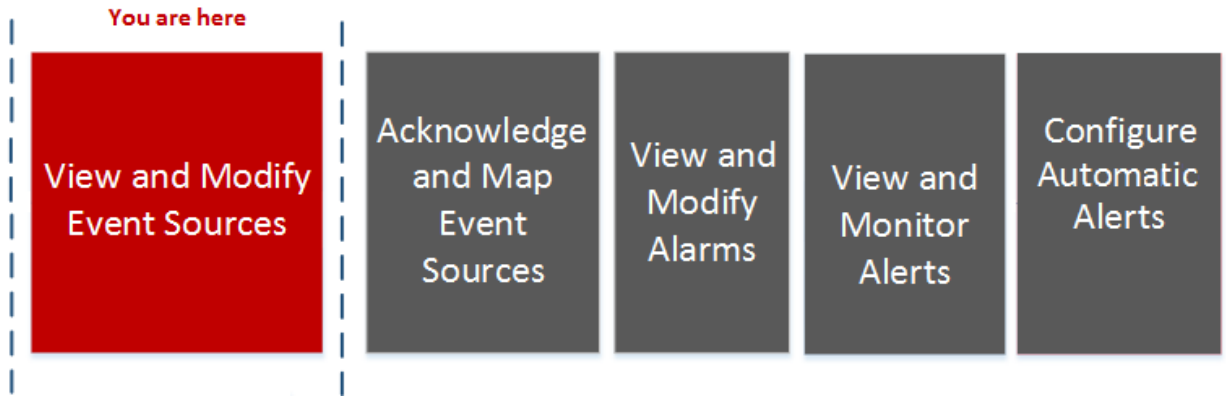


Features

The settings in the Manage Event Source tab are a combination of auto-populated and user-entered information. When an event source sends log information to NetWitness, it is added to the list of event sources, and some basic information is auto-populated. At any time after that, users can add or edit details for other event source attributes.

This figure shows an example of the **Identification**, **Properties**, and **Importance** sections.

This figure shows an example of the **Zone**, **Location**, and **Organization** sections.



Event Sources View

The Event Source Attributes panel has the following tabs.

To access this panel, go to **(Admin) > Event Sources**.

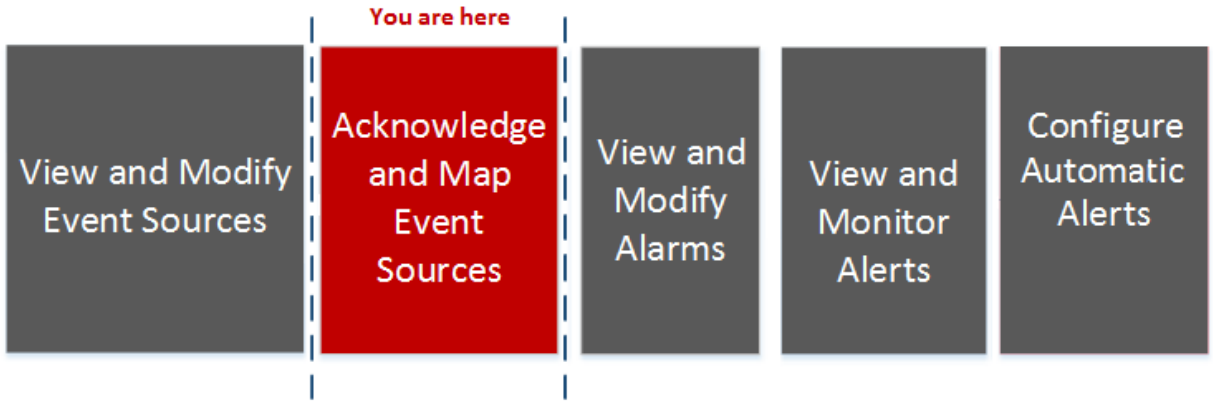
Viewing Logs from Pre-11.0 Log Decoder

Quick Look

The following example shows the discovery scores, event source types, logs, and attributes that correspond with the Event Source you selected in the Event Sources panel for a single Log Decoder.

Note: Device logs are only available for 11.0.0.0 and above Log Decoders.



1	Displays the address of the selected Event Source.
2	Displays the potential type of the selected Event Source.
3	Displays the selected Event Source Mapping Type as Auto-Mapped, Manually Mapped, or None. Any changes to the Event Source Mapping are only displayed here.
4	Displays the discovery score for the selected Event Source type from least confident (0) to most confident (100).
5	Displays timestamps for the last few logs that have been parsed to the selected Event Source Type.
6	Displays the address of the Log Decoder that is parsing event sources.
7	Displays the discovery score of the corresponding log.
8	Displays logs for the selected Event Source type.
9	Allows you to acknowledge that all the discovered Event Source types are correct.
10	Allows you to set the appropriate parsers for selected Event Source addresses.
11	Displays the Event Source Management attributes for the selected Event Source Type.

Manage Parser Mappings

The **Manage Parser Mappings** dialog allows you to map the appropriate parsers for selected Event Source addresses. From the **Details** view, select the **Map** button.

Related Topics

Viewing Logs from Pre-11.0 Log Decoder

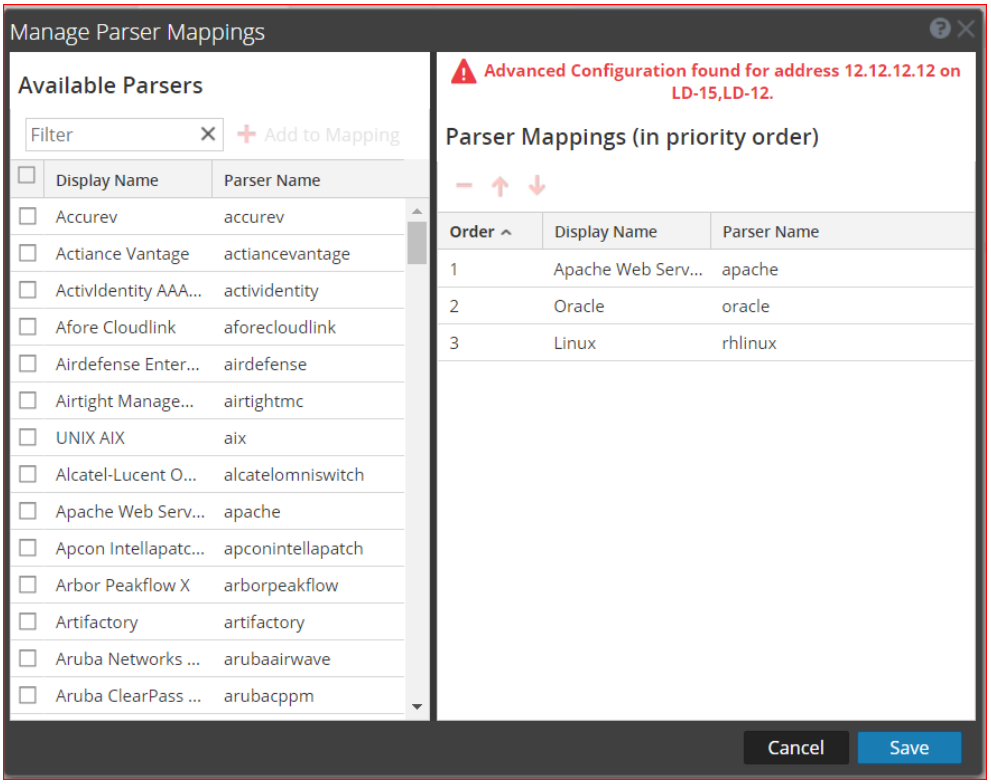
Quick Look

Note: For event sources that were created manually, the Manage Parser Mappings window has an empty Display Name in the Log Parsers column. To view the missing display names, close the Manage Parser Mappings dialog box, and then reopen it.

1	Displays all the available parsers that you can map based on the event sources that you selected from the **Discovery** view. Also displays the mappings that are already present in the Log Decoders for the selected event source or the parsers that have been discovered. To filter your available parsers, type the first few letters of the parser name that you want to map. Click the **Add to Mapping** button to add the parser to the parser mappings listed in the right panel. You need to select parsers before the **Add toMapping** button is enabled. Add the selected parser by clicking the **Add to Mapping** button in the right panel. You can rearrange the order of the parser mappings using the up and down arrow keys and you can also drag and drop selected parser mappings. You can select multiple mappings by pressing the **Ctrl** key.
2	Displays the names of the selected parsers that you want to map.
3	Displays the order of the selected parser mappings. You can delete parser mappings by selecting the minus sign ( ). Press the **Ctrl** key to select multiple mappings to perform group operations on them.

4 Click **Save** to save your mappings to all the Log Decoders. A pop-up message informs you that your mappings are successfully saved. When the window is closed, the banner on the **Details** tab is updated to reflect the status. If mapped, the text displayed is **Mapped**.
Click **Cancel** to return to the **Details** tab.

Best Practices



When mapping multiple device types from the same event source, assign the highest priority to the strictest log parser. Conversely, a log parser with generic headers should be lowest in priority. The CEF log parser is an example of a strict log parser.

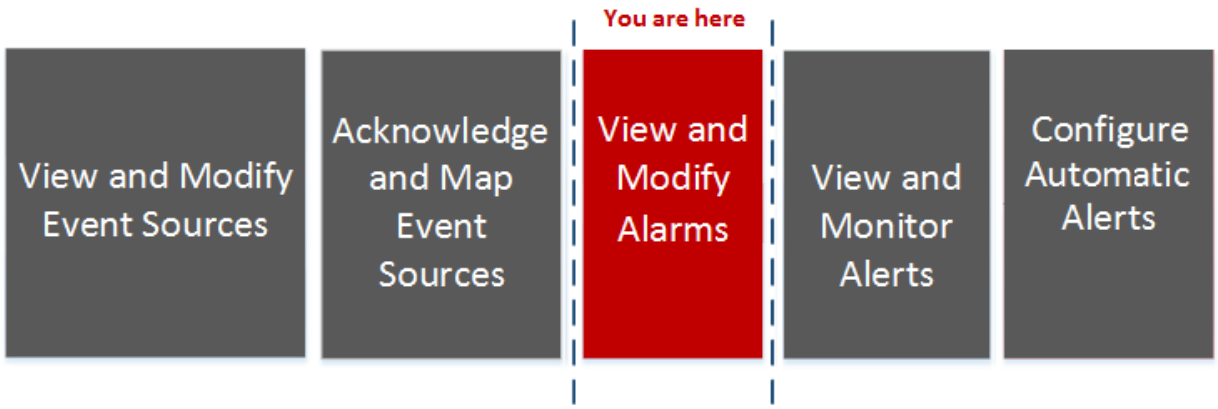
Advanced Configuration

Mapping configurations with the Log Collector are not displayed in the Parser Mappings window. If the mapping is saved, it is saved for the corresponding IP address, not for the corresponding Log Collector entry. If no mappings are found for the corresponding IP address, the discovered event source types are displayed in the Parser Mappings window.

If advanced Log Decoder configurations are discovered, a message similar to the one below displays in the Manage Parser Mappings dialog.

Note: If you want to edit the advanced configuration, you need to navigate to the Log Decoder service's parser mappings configuration.

Alarms Tab



From the Alarms tab you can view details of the alarms that have been generated.

The Alarms tab has one panel that displays Alarm status.

To access this tab, go to (Admin) > **Event Sources** > **Alarms**.

Workflow

This workflow shows the overall process for configuring event sources. It also shows where configuring alarms and alerts settings are located in the process.

What do you want to do?

Role	I want to...	Documentation

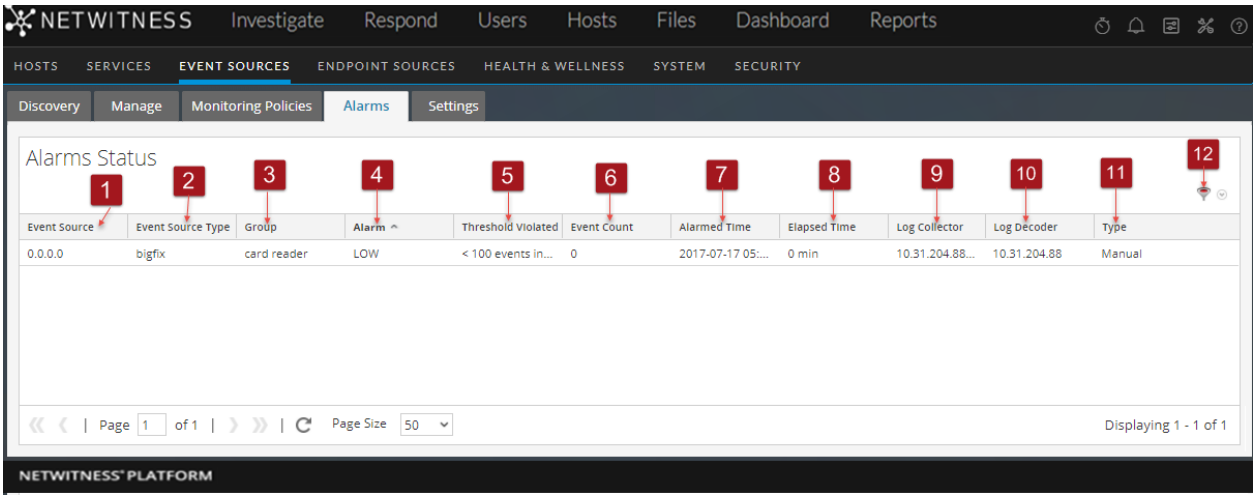
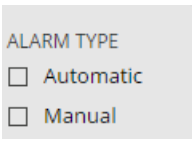
Administrator	Troubleshoot event source management.	ESM Troubleshooting & Appendix



*You can perform this task here.



Related Topics

Configuring Automatic Alerting

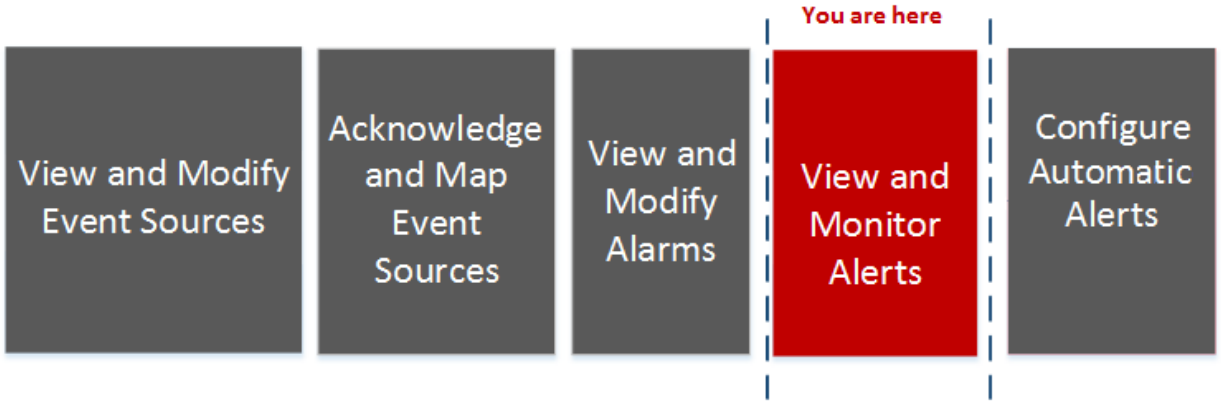
Quick Look

The Alarms tab presents the details for Event Sources that are currently in violation of a policy and threshold. Only Event Sources in violation of a policy appear in the list. After the event source returns to a normal state, the corresponding alarm disappears from the list.

1	Displays the IP, IPv6, or Hostname of the event source that is alarmed.
2	Displays the type of the alarmed event source. For example, **winevent_nic** (for Microsoft Windows) or **rhlinux** (for Linux).
3	Displays the event source group that contains the event source for which the alarm has been triggered.
4	Displays the type of threshold that was triggered: **High** or **Low**
5	Displays the conditions of the threshold that was triggered. For example: `5,000,000 events in 5 minutes`
6	Displays the number of events in the threshold time period causing the alarm.
7	Displays the initial time the event source went into an alarmed state. **Note:** When you first access this view, the data is sorted by this column (most recent alarm first).
8	Displays the elapsed time since the event source entered an alarmed state.
9	Displays the Log Collector last collecting from this event source.
10	Displays the Log Decoder last receiving from this event source.
11	Displays the alarm type. Alarm type is either **Manual** or **Automatic**: • **Manual**: these are alarms that violate the configured threshold policy. • **Automatic**: these are alarms that deviate from the baseline for the alarmed event source.
12	Select the **Filter** icon to display the **Filter** menu:  Select either **Automatic** or **Manual**: • If you select **Automatic**, only the alerts that are based on baselines are displayed.

- If you select **Manual**, only the alarms for which you have set thresholds are displayed.

Note: You can hide or show columns by right-clicking in the table header and choosing **Columns** from the drop-down menu. Select a column to display it, or clear the column to hide it.



Monitoring Policies Tab

The Monitoring Policies tab organizes thresholds by event source group.

To access this tab, go to (Admin) > **Event Sources** > **Monitoring Policies**.

Workflow

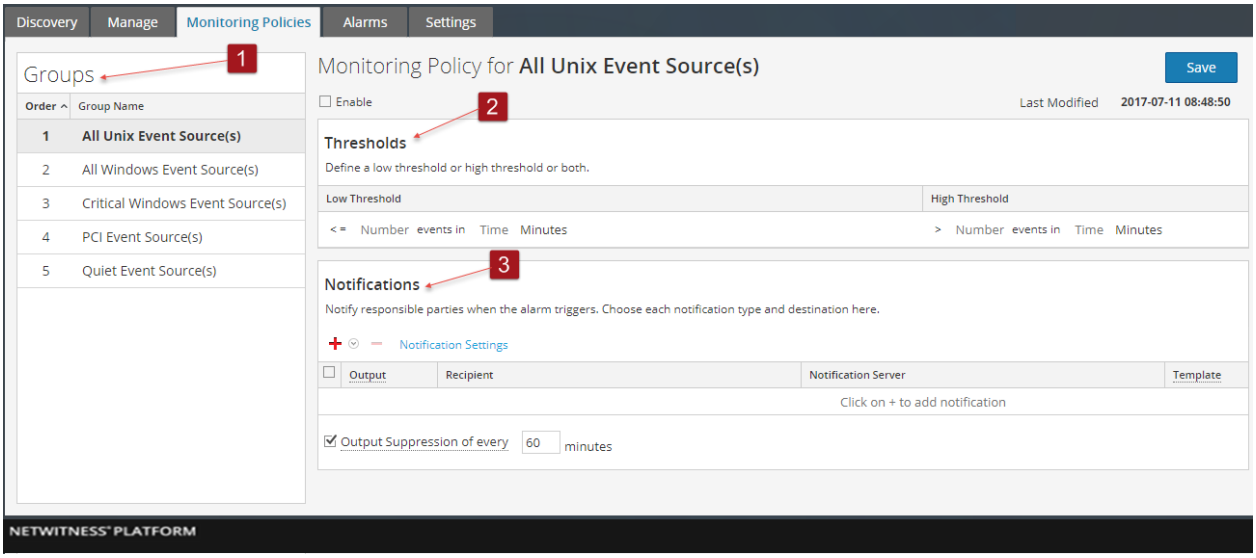
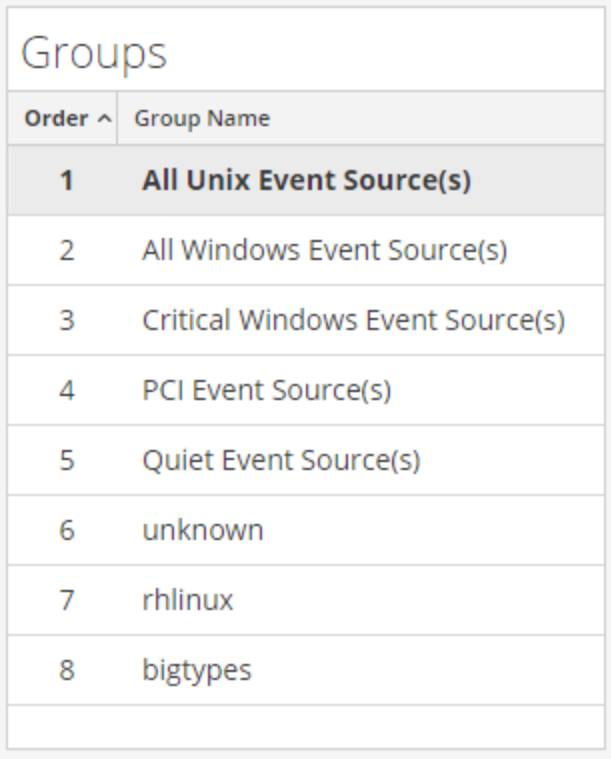
Setting Up Notifications



Disabling Notifications

Quick Look

The **Monitoring Policies** tab consists of three panels:



- Event Groups Panel
- Thresholds Panel
- Notifications Panel

This is an example of the **Monitoring Policies** tab.

1 Displays the Groups panel.
2 Displays the Thresholds panel.
3 Displays the Notifications panel.

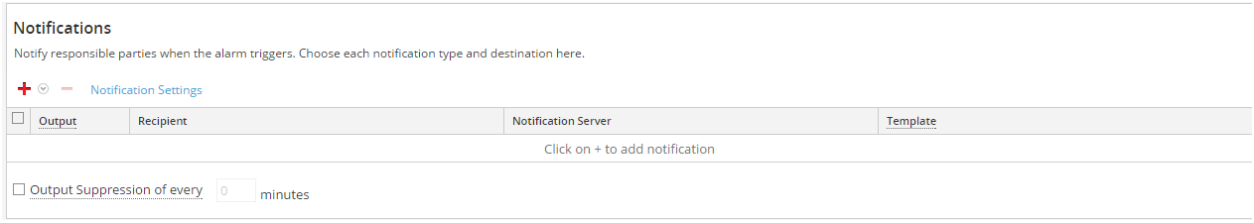
Event Groups Panel

The group selected in this panel determines which thresholds appear in the Thresholds panel. You can define a set of thresholds for each event source group. Notice that the groups are listed in a specific order:

- Drag and drop groups to change the specified order.
- The higher a group is listed, the higher the precedence for that group's thresholds: NetWitness checks the thresholds in the order provided in this panel. Thus, your highest priority groups should be at the top of this list

Thresholds Panel

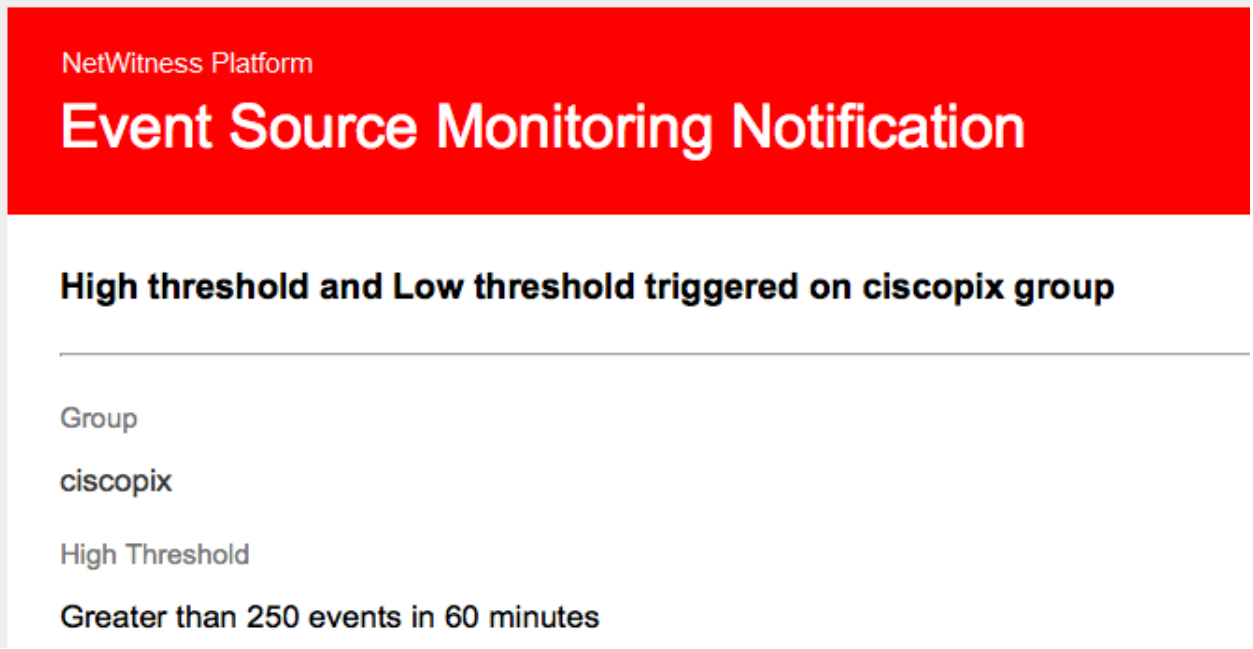
This is an example of the Thresholds panel for an event source group.



The Thresholds Panel contains the following features.

Feature	Description
Enable	The Enable checkbox designates whether or not the thresholds that you define for a group are enabled. If so, notifications are sent whenever the thresholds for that group are outside of the defined range. If not, then no monitoring of that event source group is occurring. **Note:** If you configure a threshold and attempt to save the page without enabling it, you receive a confirmation message, asking you whether or not to enable the policy. If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic notifications. See below for more details on the look of notifications.
Low number of events Low number of minutes or hours	This is the low end of the threshold. Enter the fewest number of events and the time range. If the event source group receives fewer messages than specified here, the threshold is not met, and notifications are sent.
High number of events High number of minutes or hours	Works similarly as for the low values: If more messages than specified here are received, the threshold is not met, and notifications are sent.
Last Modified date and time	This field indicates the last time and date that the thresholds were changed.
Save	Saves the changes you have made to the thresholds.

Notifications Panel



This is an example of the Notifications panel for an event source group.

The following table describes the fields on the Notifications panel

Field	Description
Tools + -	The following items are available on the toolbar: • **Add (+)**: clicking the **Add** presents a menu where you can choose the type of the notification • **Remove (-)**: removes the selected row from the list.
Notification Settings	Clicking this link opens a new browser tab, and takes you to the **Admin** > **System** > **Notifications** page in NetWitness.
Type	Displays the type of the notification that you have chosen. The available options are as follows: • Email • SNMP • Syslog
Notification	See the **Configure Notification Outputs** topic in the *System Configuration Guide* for more details.
Notification Server	See the **Configure Notification Servers** topic in the *System Configuration Guide* for more details
Template	For Event Source Management, NetWitness provides three out-of-the-box templates for notifications. You can use the following templates as delivered, or customize them based on the needs of your organization: • **Email template**: sends notifications to the specified email addresses. • **SNMP template**: sends notifications to the specified SNMP server • **Syslog** template: sends notifications to the specified Syslog server. See the **Configure /Templates for Notifications** topic in the *System Configuration Guide* for more details.
Output Suppression	Use this item to limit how often notifications are received for this policy, in case a lot of alerts are triggered in a short period of time.

The following are sample notifications, based on the supplied Templates.

- Email:

  For email notifications, the third column, **Alarm Type**, specifies whether the triggered alarm was based on a user threshold, or the baseline data being out of normal bounds. If you have automatic monitoring or notifications turned off, you will not receive any **Automatic** notifications. The same is true for Syslog and SNMP, except those notifications are formatted differently.

- SNMP trap:

```
11-11-2015 11:57:33 Local7.Debug 127.0.0.1 community=public,

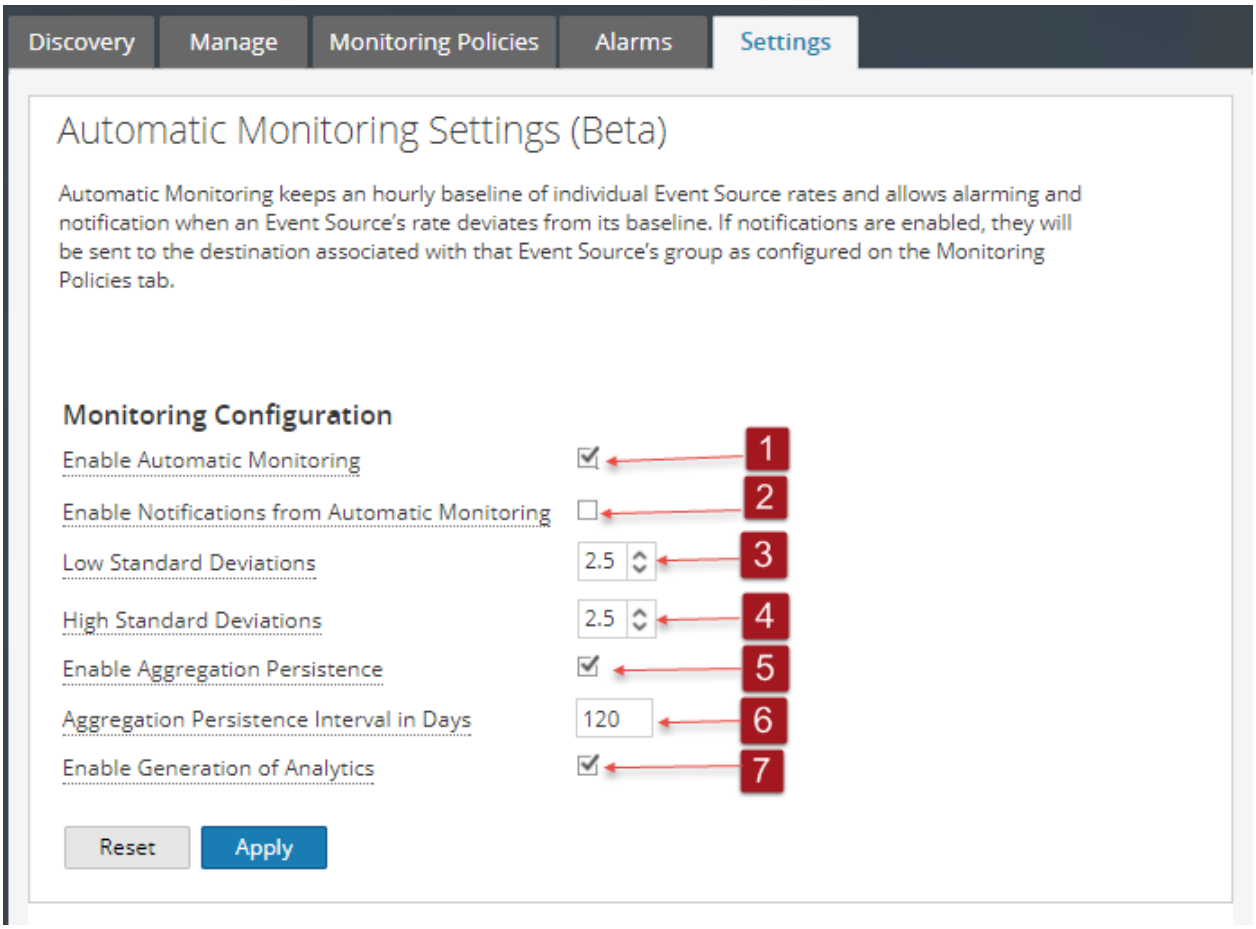
Automatic Alerting

Disabling Notifications

Quick Look

You can set up policies and thresholds for your event source groups. You do this so that you can receive notifications when the thresholds are not met. NetWitness also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

About Automatic Alerting



You can set up policies and thresholds for your event source groups. You do this so that you receive notifications when the thresholds are not met. NetWitness also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

To trigger automatic alerts, you can use baseline values. This way, you do not need to set up numerous group thresholds and policies in order to receive alerts. Any anomalous amount of messages trigger alerts, without needing to do any configuration (except for turning on automatic alerting).

Note the following:

- After you begin collecting messages from an event source, it takes the system approximately a week to store a baseline value for that event source. After this initial period, the system alerts you when the number of messages for a period are above or below the baseline by a set amount. By default, this amount is 2 standard deviations above or below the baseline.
- Base your high and low deviation settings on how "regular" your event sources behave. That is, if you expect little or no variance in the number of messages that arrive for a given time (for example, 8 to 9 am on a weekday), then you can set a low value for the Deviation. Conversely, if you often see peaks and valleys, set the Deviation value higher.
- If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic alerting.

Note: Automatic alerting, and it settings, are currently in Beta testing.

1	Determines whether automatic alerting is on or off. By default, this option is selected (automatic alerting turned on)
2	Determines whether notifications for automatic alerts are on or off. By default, this option is cleared (automatic notifications are not sent when automatic alerts are triggered)
3	The standard deviations below which to receive alerts. Default is **2.5** (95% confidence)
4	The standard deviations above which to receive alerts. Default is **2.5** (95% confidence)
5	When selected, this option stores event source counts per one-hour interval. The data that is collected is used to form the baseline values for each event source. • **Enabled (default)**: one count per hour per event source is stored in the underlying database. These one-hour counts (or aggregations) form the historical basis for computing the normal range for each event source. • **Disabled**: when the SMS Server is restarted, Event Source Monitoring will have no historical data with which to compute the normal range and the user will have to wait until enough data (about a week's worth) is collected to form a new basis for each event source
6	Controls how much historical data (see **Enable Aggregation Persistence**) to maintain for each event source. The default value of 120 days means roughly 4 months of history is kept and used when reconstructing the basis for each event source
7	When enabled, data about the behavior of the automatic alerting is stored to disk. The default value is **Enabled**. The data retained includes baseline value over time and the alerting history for each event source.

Note, however, the event source address and type is anonymized, so only your event rate information is revealed.

Since automatic alerting is a beta feature, this data is important to measure the efficacy of the feature. This can be disabled without affecting the automatic alerting functionality

8 The **Reset** option discards any unsaved changes for all settings on the page.

9 Click **Apply** to save any changes you made to the values on the page.

Features

The Settings tab contains the following features.

Feature	Description
Enable Automatic Monitoring	Determines whether automatic alerting is on or off. By default, this option is selected (automatic alerting turned on)
Enable Notifications From Automatic Monitoring	Determines whether notifications for automatic alerts are on or off. By default, this option is cleared (automatic notifications are not sent when automatic alerts are triggered)
Low Standard Deviations	The standard deviations below which to receive alerts. Default is **2.5** (95% confidence)
High Standard Deviations	The standard deviations above which to receive alerts. Default is **2.5** (95% confidence)
Enable Aggregation Persistence	When selected, this option stores event source counts per one-hour interval. The data that is collected is used to form the baseline values for each event source. • Enabled (default): one count per hour per event source is stored in the underlying database. These one-hour counts (or aggregations) form the historical basis for computing the normal range for each event source. • Disabled: when the SMS Server is restarted, Event Source Monitoring will have no historical data with which to compute the normal range and the user will have to wait until enough data (about a week's worth) is collected to form a new basis for each event source
Aggregation Persistence Interval in Days	Controls how much historical data (see **Enable Aggregation Persistence**) to maintain for each event source. The default value of 120 days means roughly 4 months of history is kept and used when reconstructing the basis for each event source

Feature	Description
Enable Generation of Analytics	When enabled, data about the behavior of the automatic alerting is stored to disk. The default value is **Enabled**. The data retained includes baseline value over time and the alerting history for each event source. Note, however, the event source address and type is anonymized, so only your event rate information is revealed. Since automatic alerting is a beta feature, this data is important to measure the efficacy of the feature. This can be disabled without affecting the automatic alerting functionality
Reset	This option discards any unsaved changes for all settings on the page.
Apply	Click **Apply** to save any changes you made to the values on the page.

ESM Troubleshooting & Appendix

Troubleshooting Topics:

- Alarms and Notifications Issues
- Duplicate Log Messages
- Troubleshooting Feeds
- Import File Issues
- Negative Policy Numbering

Appendix: Viewing Logs from Pre-11.0 Log Decoder

Alarms and Notifications Issues

This topic describes how to address problems you may encounter with alarms or notifications.

Alarms

If you are not seeing alarms that you expect to see, make sure that you have configured all the necessary items, as discussed below.

Automatic Alarms

To see automatic alarms appear on the Alarms screen, the **Enable Automatic Monitoring** option must be selected.

This option is on the **Settings** tab ((Admin) > Event Sources > Settings), and is selected by default. However, at some point someone may have cleared this option.

Manual Alarms

To see manual alarms appear on the Alarms screen, all of the following conditions must be met:

- The event source must be part of a Group.
- The Group must have a policy with either a low or high (or both) threshold defined.
- The Group Policy must be enabled.

Notifications

If you are seeing alarms, but are not receiving the expected notifications, make sure that you have configured all the necessary items, as discussed below.

Also, make sure that you have correctly configured the Notification Servers and Notification Outputs.

Much of the preliminary configuration for Notifications is done from **(Admin) > System > Global Notifications**. For details, see the **Global Notifications Panel** topic in the *System Configuration Guide*.

Automatic Notifications

To have the system send automatic notifications, all of the following conditions must be met:

- The **Enable Automatic Monitoring** option must be selected (this option is selected by default).
- The **Enable Notifications From Automatic Monitoring** option must be selected. This option is cleared by default, so you or someone in your organization must select it. Navigate to  (Admin) **> Event Sources > Settings** to see this option.
- The event source that triggered the alarm must be in a group that has a policy enabled: note that no thresholds need to be set for automatic notifications.
- The policy must at least one notification configured (either email, SNMP or Syslog).

Manual Notifications

To have the system send manual notifications (that is, a notification which says that a manual alarm was triggered):

- The event source that triggered the alarm must be in a group that has a group policy enabled.
- There must be a threshold set for the policy.
- At least one notification has been configured for the policy.

Duplicate Log Messages

It is possible that you are collecting messages from the same event source on two or more Log Collectors. This topic describes the problem and ways to troubleshoot the issue.

Details

If the ESM aggregator detects the same events for the same event source on multiple Log Collectors, you receive a warning similar to the following:

```
2015-03-17 15:25:29,221 [pool-1-thread-6] WARN
com.rsa.smc.esm.groups.events.listeners.EsmStatEventListener -
 192.0.2.21-apache had a previous event only 0 seconds ago; likely because it
exists on multiple log collectors
```

This warning message means the `192.0.2.22-apache` event source is being collected by multiple hosts. You can see the list of hosts in the Log Collector column in the **Manage** tab in the Administration > Event Sources view.

Clean Up Duplicate Messages

1. Stop collectd on NetWitness and Log Decoders:

   ```
   service collectd stop
   ```

2. Remove the ESM Aggregator persisted file on NetWitness:

   ```
   rm /var/lib/netwitness/collectd/ESMAggregator
   ```

3. Reset the Log Decoder.
   a. Navigate to the Log Decoder REST, at `http://<LD_IP_Address>:50102`.
   b. Click **decoder(*)** to view the properties for the decoder.
   c. In the Properties drop-down menu, select **reset**, then click **Send**.
4. In the Event Sources panel from the Event Sources Manage tab, select all event sources and then click − to remove them.
5. Start the collectd service:
   ```
   service collectd start
   ```

Troubleshooting Feeds

The purpose of the feed generator is to generate a mapping of an event source to the list of groups to which it belongs.

If you have an event source from which you are collecting messages, and yet it is not displayed in the correct event source groups, then this topic provides background and information to help you track down the problem.

Details

The ESM Feed maps multiple keys to single value. It maps the DeviceAddress, Forwarder, and DeviceType attributes to groupName.

The purpose of the ESM feed is to enrich event source Meta with the groupName collected on the Log Decoder.

How it Works

The feed generator is scheduled to update every minute. However, it is triggered only if there are any changes (create, update, or delete) in event sources or groups.

It generates a single feed file with event source to group mapping, and pushes the same feed to all of the Log Decoders that are connected to NetWitness.

After the feed file is uploaded on the Log Decoders, for any new events, it enriches events Meta data with groupName, and appends this groupName to logstats.

After the groupName is in logstats, the ESM Aggregator groups information and sends it to ESM. At this point, you should see the **Group Name** column under the **Event Source Monitoring** tab.

The entire process can take some time. Therefore, you may need to wait for several seconds after you add a new group or event source, before the Group name is displayed.

Note: If the event source type attribute changes when the feed is updated, NetWitness adds a new logstats entry, rather than updating the existing one. Thus, there will be two different logstats entries in logdecoder. Previously existing messages would have been listed under the previous type, and all new messages are logged for the new event source type.

Feed File

The format of the feed file is as follows:

```
DeviceAddress, Forwarder, DeviceType, GroupName
```

The `DeviceAddress` is either `ipv4, ipv6`, or `hostname`, depending on which of these have been defined for the event source.

The following is a sample of the feed file:

```
"12.12.12.12","d6","NETFLOW","grp1"
"12.12.12.12","ld4","netflow","grp1"
"12.12.12.12","d6","netfow","grp1"
"0:E:507:E6:D4DB:E:59C:A","10.25.50.243","apache","Apachegrp"
"1.2.3.4","LCC","apache","Apachegrp"
"10.100.33.234","LC1","apache","Apachegrp"
"10.25.50.248","10.25.50.242","apache","Apachegrp"
"10.25.50.251","10.25.50.241","apache","Apachegrp"
"10.25.50.252","10.25.50.255","apache","Apachegrp"
"10.25.50.253","10.25.50.251","apache","Apachegrp"
"10.25.50.254","10.25.50.230","apache","Apachegrp"
"10.25.50.255","10.25.50.254","apache","Apachegrp"
"13.13.13.13","LC1","apache","Apachegrp"
"AB:F255:9:8:6C88:EEC:44CE:7",,"apache","Apachegrp"
"Appliance1234",,"apache","Apachegrp"
"CB:F255:9:8:6C88:EEC:44CE:7","10.25.50.253","apache","Apachegrp"
```

Troubleshooting Feeds

You can check the following items to narrow down where the problem is occurring.

10.5 Log Decoders

Are your NetWitness Log Decoders at version 10.5 or later? If not, you need to upgrade them. For NetWitness version 10.6, feeds are sent only to version 10.5 and later Log Decoders.

Feed File Existence

Verify that the feeds ZIP archive exists in the following location:

```
/opt/rsa/sms/esmfeed.zip
```

Do not modify this file.

Group Meta Populated on LD

Verify that the group meta is populated on the Log Decoder. Navigate to the Log Decoder REST and check logstats:

```
http://LogDecoderIP:50102/decoder?msg=logStats&force-content-type=text/plain
```

This is a sample logstats file with group information:

```
device=apache forwarder=NWAPPLIANCE10304 source=1.2.3.4 count=338
lastSeenTime=2015-Feb-04 22:30:19 lastUpdatedTime=2015-Feb-04
22:30:19
groups=IP1234Group,apacheGroup
device=apachetomcat forwarder=NWAPPLIANCE10304 source=5.6.7.8
count=1301 lastSeenTime=2015-Feb-04 22:30:19 lastUpdatedTime=2015-
Feb-04 22:30:19
groups=AllOtherGroup,ApacheTomcatGroup
```

In the above text, the group information is bolded.

Device Group Meta on Concentrator

Verify that the **Device Group** meta exists on the Concentrator, and that events have values for the `device.group` field.

SMS Log File

Check the SMS log file in the following location to view informational and error messages:
`/opt/rsa/sms/logs/sms.log`

The following are example *informational* messages:

```
Feed generator triggered...
Created CSV feed file.
Created zip feed file.
Pushed ESM Feed to LogDeocder : <logdecoder IP>
```

The following are example *error* messages:

```
Error creating CSV File : <reason>Unable to push the ESM Feed:
Unable to create feed zip archive.
Failed to add Group in CSV: GroupName: <groupName> : Error: <error>
Unable to push the ESM Feed: CSV file is empty, make sure you have
al-least on group with at least one eventsource.
Unable to push the ESM Feed: No LogDecoders found.
Unable to push the ESM Feed: Unable to push feed file on LogDecoder-
<logdecoderIP>Unable to push the ESM Feed:
admin@<logdecoderIP>:50002/decoder/parsers received error: The zip
archive "/etc/netwitness/ng/upload/<esmfeedfileName>.zip" could not
be opened
Unable to push the ESM Feed: <reason>
```

Verify Logstats data is getting Read & Published by ESMReader & ESMAggregator

These are the steps to verify that logstats are collected by **collectd** and published to Event Source Management.

ESMReader

1. On Log Decoders add **debug "true"** flag in in **/etc/collectd.d/logdecoder-esm.conf**:

```
#
# Copyright (c) 2014 RSA The Security Division of EMC
#
<Plugin generic_cpp>    PluginModulePath "/usr/lib64/collectd"
    debug "true"

    <Module "NgEsmReader" "all">
        port      "56002"
        ssl       "yes"
        keypath   "/etc/pki/nw/node/node-key.pem"
        certpath  "/etc/pki/nw/node/node-cert.pem"
        interval  "600"
        query     "all"
        <stats>
        </stats>
    </Module>
    <Module "NgEsmReader" "update">
        port      "56002"
        ssl       "yes"
        keypath   "/etc/pki/nw/node/node-key.pem"
        certpath  "/etc/pki/nw/node/node-cert.pem"
        interval  "60"
        query     "update"
        <stats>
        </stats>
    </Module>
</Plugin>
```

2. Run the command:

```
collectd service restart
```

3. Run the following command:

   ```
   tail –f /var/log/messages | grep collectd
   ```

   Verify that ESMReader is reading logstats and there are no errors. If there are any read issues, you will see errors similar to the following:

   ```
   Apr 29 18:47:45 NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_all:
   error getting ESM data for field "groups" from logstat device=checkpointfw1
   forwarder=PSRTEST source=1.11.51.212. Reason: <reason>Apr 29 18:58:36
   NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_update: error getting
   ESM data for field "forwarder" from logstat device=apachetomcat
   source=10.31.204.240. Reason: <reason>
   ```

ESMAggregator

1. On NetWitness, uncomment the verbose flag in **/etc/collectd.d/ESMAggregator.conf**:

   ```
   # ESMAggregator module collectd.conf configuration file
   #
   # Copyright (c) 2014 RSA The Security Divsion of EMC
   #
   <Plugin generic_cpp>
   PluginModulePath "/usr/lib64/collectd"
   <Module "ESMAggregator">
           verbose 1
           interval "60"
           cache_save_interval "600"
           persistence_dir "/var/lib/netwitness/collectd"
   </Module>
   </Plugin>
   ```

2. Run the following:

   ```
   collectd service restart.
   ```

3. Run the following command:

   ```
   run “tail –f /var/log/messages | grep ESMA
   ```

   Look for ESMAggregator data and make sure your logstat entry is available in logs.

Sample output:

```
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[0]
logdecoder[0] = d4c6dcd4-6737-4838-a2f7-ba7e9a165aae

Configure JMX Feed Generator Job Interval

Although the feed generation job is scheduled to execute every minute by default, you can change this by using **jconsole**, if necessary.

To change the feed generator job interval:

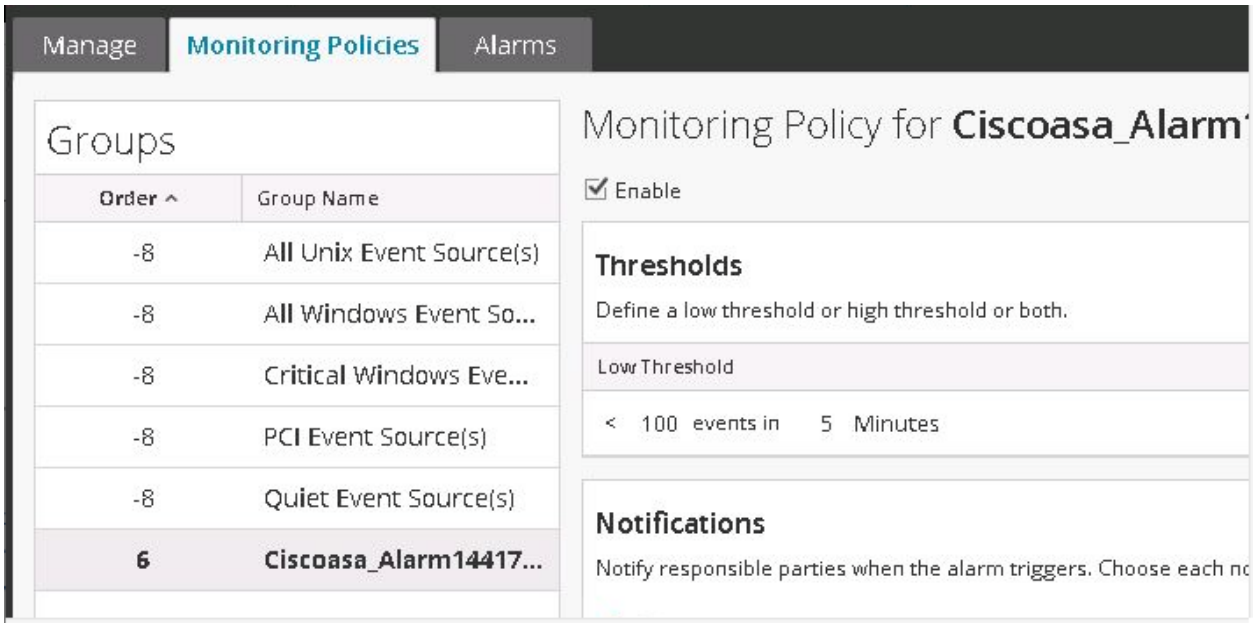
1. Open **jconsole** for the SMS service.
2. On the MBeans tab, navigate to **com.rsa.netwitness.sms** > **API** > **esmConfiguration** > **Attributes**.
3. Modify the value for the property **FeedGeneratorJobIntervalInMinutes**.
4. Go to **Operations** under the same navigation tree, an click **commit()**. This persists the new value in the corresponding json file under **/opt/rsa/sms/conf**, and uses the value if SMS is restarted.

Setting a new value reschedules the feed generator job for the new interval.

Import File Issues

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Check the following:



- If you are adding unknown sources, each line in the file must contain a combination of the required attributes:
  - IP or IPv6 or Hostname, and
  - Event Source Type
- The first line of the file must contain header names, and the names must match the names in NetWitness. To get a list of correct column names, you can export a single event source. Examine the exported CSV file: the first row of the file contains the correct set of attribute/column names.

Negative Policy Numbering

You may see negative numbers in the Order field in the Groups section of the Monitoring Polices tab. This topic describes a workaround to restore the correct numbering scheme for your policies.

Details

The following screen shows an example of the situation where the numbers of group policies become negative.

If you encounter this situation, drag and drop the top group (**All Unix Event Source(s)** in the above image) to after the last group (**Ciscoasa_Alarm14417**). This restores normal, ordinal numbering. You can then continue to drag and drop groups until you have them in their proper order for your organization.

Clean Up Duplicate Messages

1. Stop collectd on NetWitness and Log Decoders:

   ```
   Service collectd stop
   ```

2. Remove the ESM Aggregator persisted file on NetWitness:

   ```
   rm /var/lib/netwitness/collectd/ESMAggregator
   ```

3. Reset the Log Decoder.

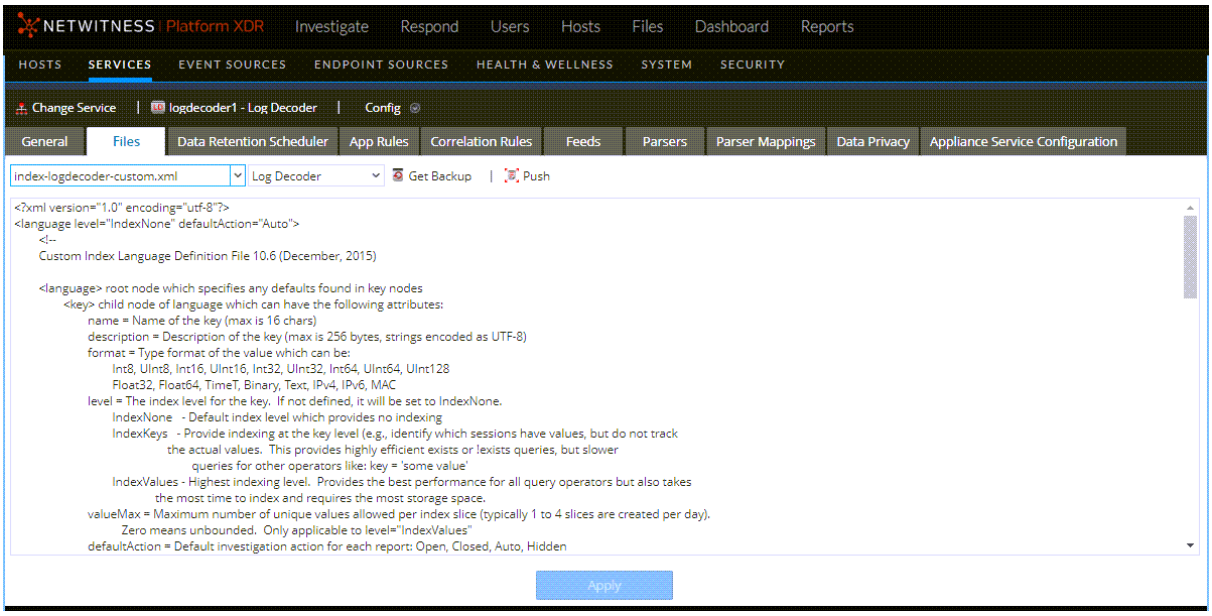
   a. Navigate to the Log Decoder REST, at `http://<LD_IP_Address>:50102`

   b. Click **decoder(*)** to view the properties for the decoder.

   c. In the Properties drop-down menu, select **reset**, then click **Send**.

4. In the Event Sources panel from the Event Sources Manage tab, select all event sources and then click − to remove them.

Viewing Logs from Pre-11.0 Log Decoder



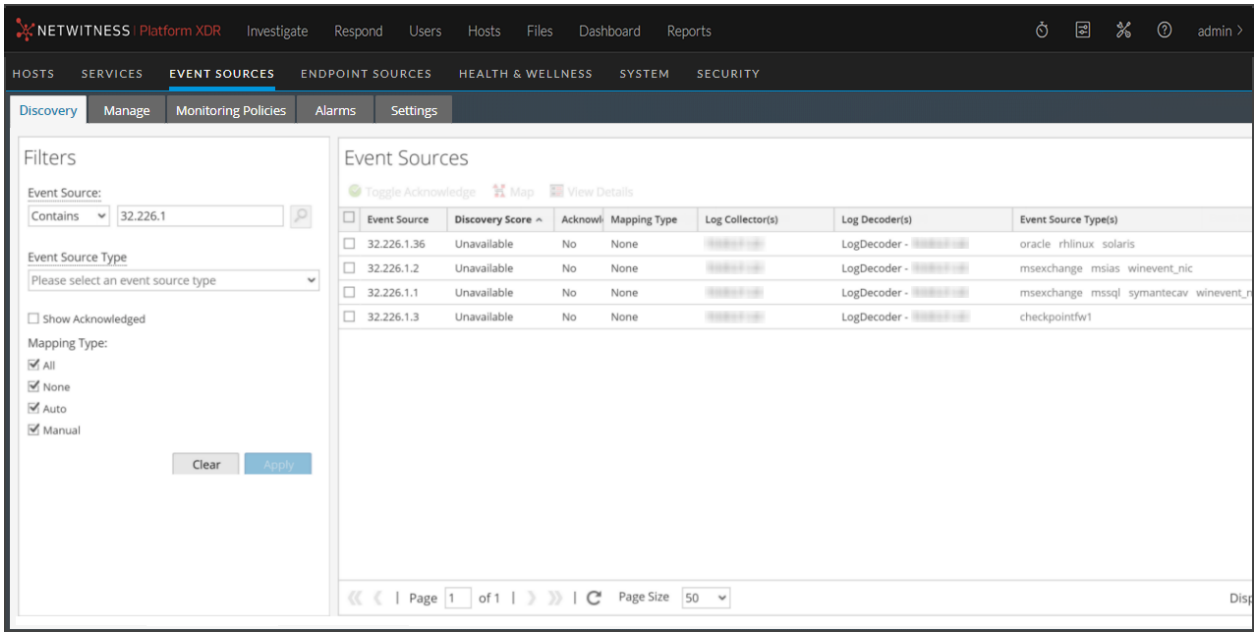
NetWitness 11.0 added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available.

To enable logs preview for a pre-11.0.0.0 Log Decoder, follow these steps on the Log Decoder:

1. Go to  **(Admin) > Services >** select a Log Decoder, then select  **> View > Config**.
2. Click **Files** tab, then select **index-logdecoder-custom.xml** from the drop-down menu.
3. Add the following three lines at the end of the file (before the closing language tag):

   ```
   <key description="Device IP" level="IndexValues" name="device.ip" format="IPv4"
   valueMax="100000" defaultAction="Open"/>
   <key description="Device IPv6" level="IndexValues" name="device.ipv6" format="IPv6"
   valueMax="100000" defaultAction="Open"/>
   <key description="Device Host" level="IndexValues" name="device.host" format="Text"
   valueMax="100000" defaultAction="Open"/>
   ```

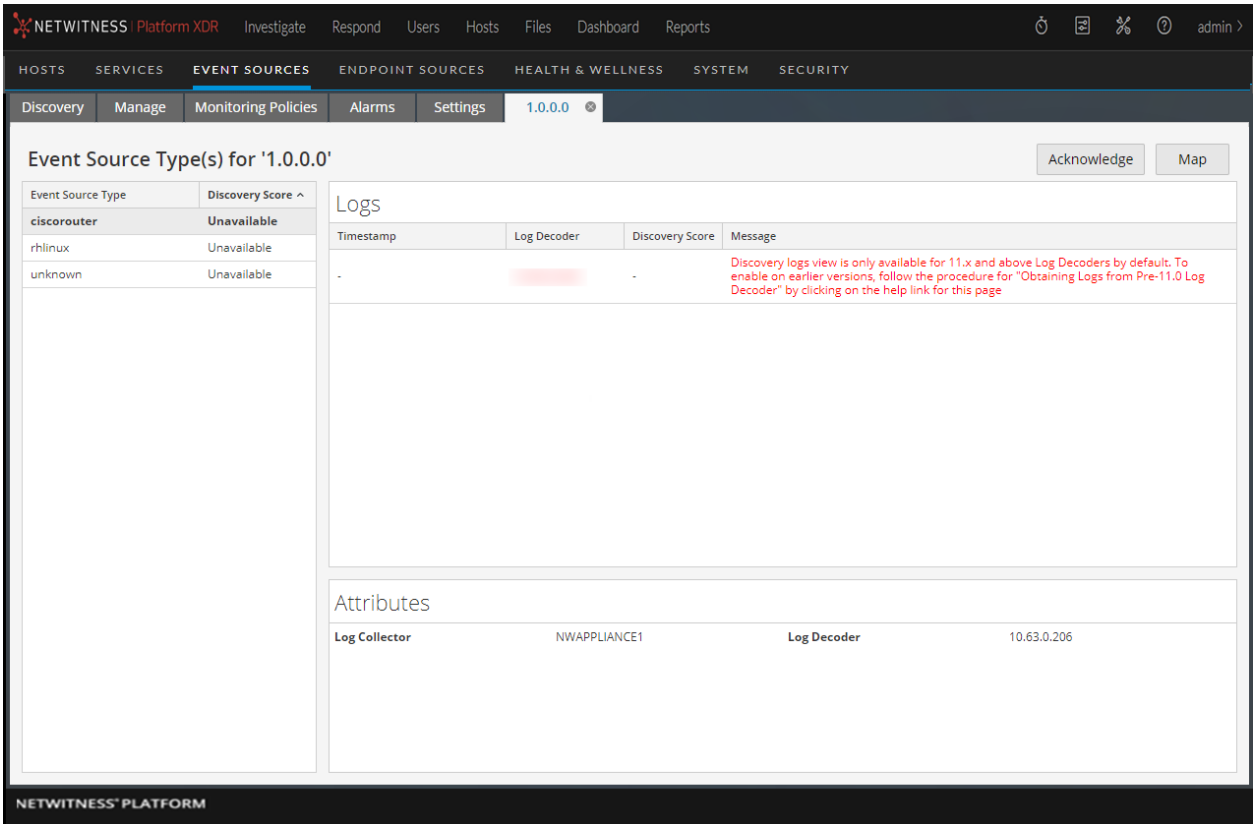
4. Click **Apply**.



5. Restart the Log Decoder as follows.

   Select **Log Decoder > Explore > sys > Properties > shutdown**

This is an example of the **index-logdecoder-custom.xml** file.



Note: Discovery Scores are only available for 11.0 and above Log Decoders. Discovery Scores for pre-11.0 Log Decoders display as Unavailable.

The following example displays the Discovery Score as **Unavailable** in the **Details** view for a pre-11.0 Log Decoder.

Note: Device logs are only available for 11.0 and above Log Decoders.

The following example shows the message that displays in the displays in the Logs panel for a pre-11.0 Log Decoder.

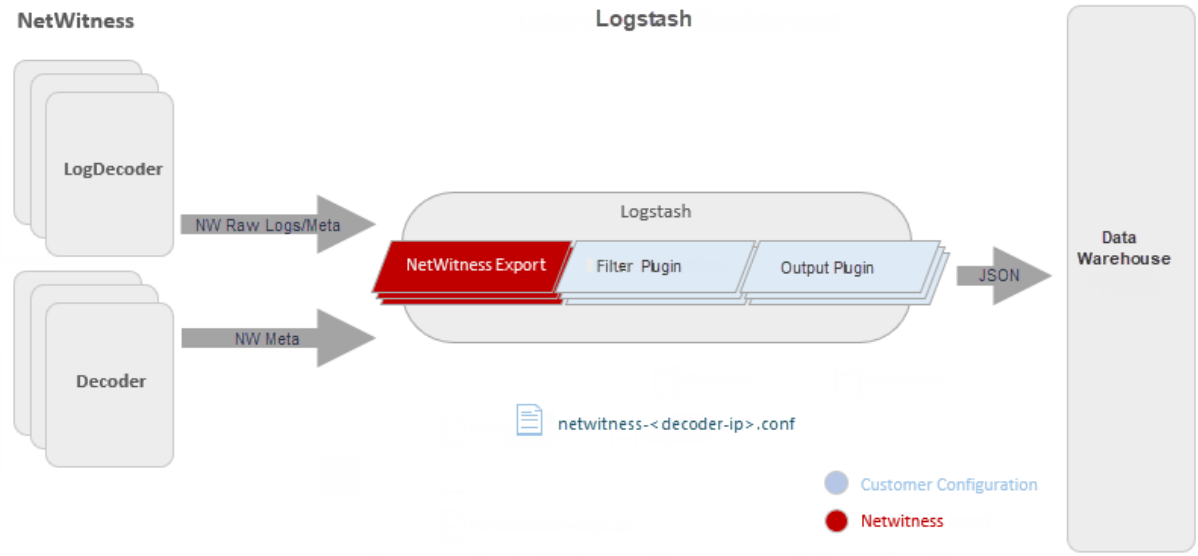
Overview

The NetWitness Export Connector is an input plugin for Logstash, used to export NetWitness Platform events and routes the data where you want, all in continuous, streaming fashion. Giving you the flexibility to unlock a variety of downstream use cases.



This plugin is installed on Logstash and integrates with NetWitness Decoders and Log Decoders. This plugin aggregates meta data and raw logs from the Decoder or Log Decoder and converts it to Logstash JSON object, which can easily integrate with numerous consumers such as Kafka, AWS S3, TCP, Elastic and others.

Install NetWitness Export Connector on the Logstash service. To activate the connector, restart the Logstash service.

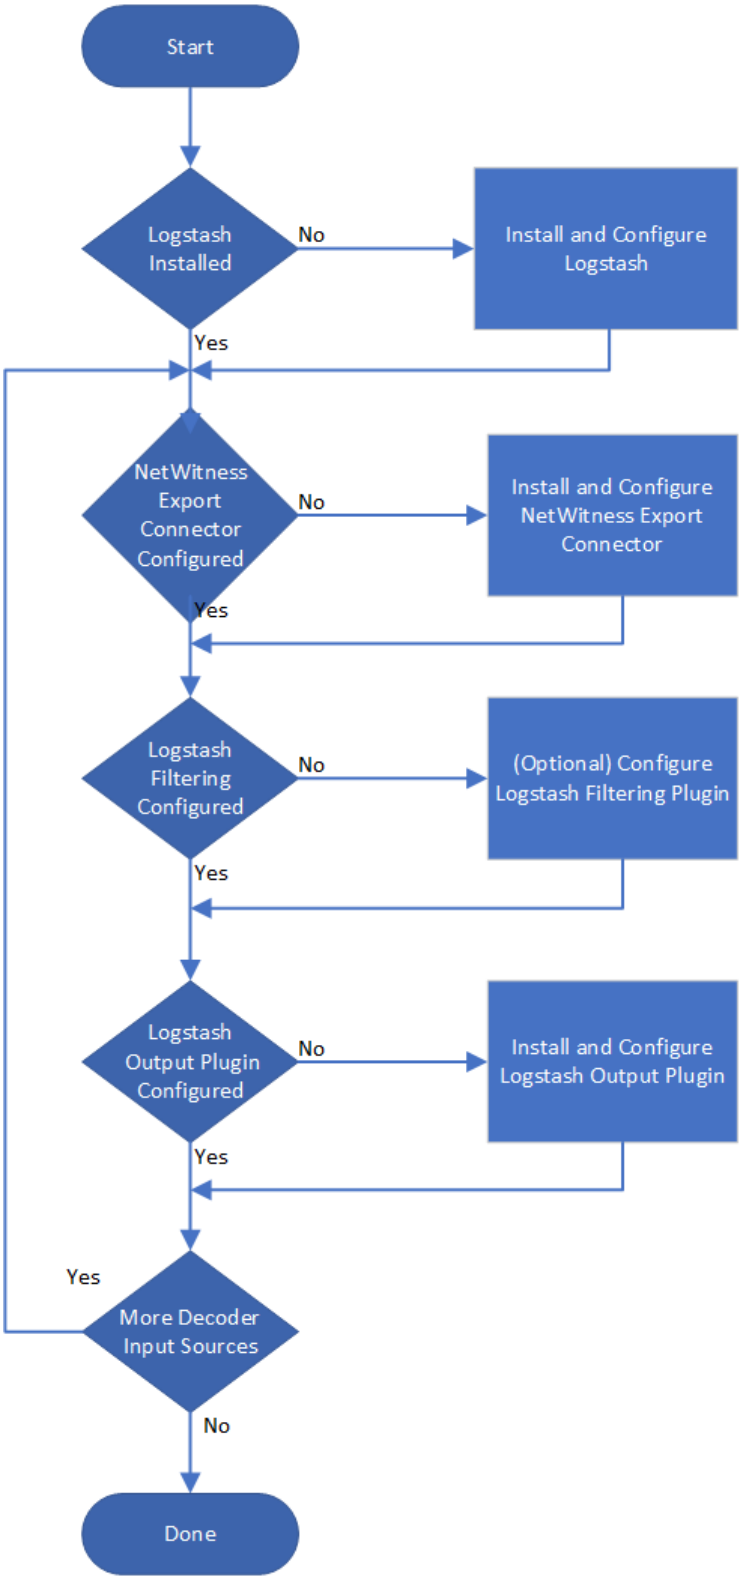
Note: From 11.6 onwards, the Logstash server is packaged and supported along with the NetWitness Log Collector or Virtual Log Collector (VLC) service to provide easy access to Logstash. This is referred to as Managed Logstash and it eliminates the need for a separate Logstash server outside of the NetWitness Platform. For more information, see "Configure Logstash Event Sources in NetWitness" in the *Log Collection Configuration Guide*.

Work Flow of NetWitness Export Connector

Following diagram shows how NetWitness Export Connector works.

There are of three plugins available that helps with export.

- Input plugin
- Filter plugin (optional)
- Output plugin



1. The Input plugin collects the events from the event sources. You must install the NetWitness Export Connector to collect events from Decoder or Log Decoder. The NetWitness Export Connector uses NetWitness API that collects the following data and forwards it as Logstash messages.
   - Meta data and raw log data from the Decoder
   - Meta data from Log Decoder

The data is then forwarded to the Filter plugin.

2. (Optional) The Filter plugin adds, removes, or modifies the received data and forwards it to the Output plugin. You can use the standard Logstash filter plugins to add, remove, or modify the data.
3. The Output plugin sends the processed event data to the data warehouse destinations. You can use the standard Logstash output plugins to send the data.

Configuration Process

The following flowchart describes the steps to configure NetWitness Export Connector.

VM Sizing Recommendations

It is recommended to install the Logstash and the NetWitness Export Connector in an independent VM (Virtual Machine) deployment. Following are the requirements for different variations of EPS (Events Per Second).

Total VM Memory: Set an additional 4GB memory for the JVM (Java Virtual Machine) memory mentioned in the following table for the respective EPS. For Example, for 5K EPS, the JVM memory required is 4GB, the total VM memory must be set to 8 GB.

JVM Memory: The Xms and Xmx for the Logstash service must be set to the same value as shown in the table. You can update the JVM settings for Logstash in the `/etc/logstash/jvm.options` file. For more information, see JVM Settings documentation.

For more info, https://www.elastic.co/guide/en/logstash/7.x/jvm-settings.html

vCPUs: The vCPUs values that are shown is required only for NetWitness Export Connector to be functional for respective EPS. It is recommended to add extra 4 CPUs for other OS (Operating System) services. The recommended vCPU specifications for all the EPS listed in the following tables are: Intel Xeon CPU @2.6 Ghz.

Note: The above recommendations is valid only if the VM instance is completely dedicated for Logstash deployment.
The resources consumption is dependent on cumulative EPS irrespective of number of sources. For Example, if you have three Decoders of 5000 EPS each, the cumulative EPS is 15000 as a result we can use the sizing option of 15000 EPS instead of 5000 EPS 3 times.

Log Decoder

- Metadata over SSL (~50 meta keys)

EPS	vCPUs	JVM Memory
5000	4	4 GB
10000	4	4 GB
15000	8	8 GB
20000	8	8 GB
25000	14	12 GB
30000	14	12 GB
60000	16	32 GB

- Metadata over SSL (~140 meta keys)

EPS	vCPUs	JVM Memory
5000	8	4 GB
10000	11	4 GB
15000	14	8 GB
20000	17	12 GB
25000	19	16 GB
30000	19	16 GB

- Meta data and raw logs over SSL (~50 meta keys)

EPS	vCPUs	JVM Memory
5000	4	4 GB
10000	8	4 GB
15000	10	8 GB
20000	12	12 GB
25000	15	24 GB
30000	18	24 GB
60000	23	48 GB

- Meta data and raw logs over SSL (~140 meta keys)

EPS	vCPUs	JVM Memory
5000	8	4 GB
10000	10	8 GB
15000	17	10 GB
20000	19	16 GB
25000	20	32 GB
30000	20	32 GB

Network Decoder

- Meta data over SSL

EPS	vCPUs	JVM Memory
500 Mbps	4	2 GB
1 Gbps	4	2 GB
1.5 Gbps	8	4 GB
2 Gbps	8	4 GB
3.4 Gbps	12	8 GB
6 Gbps (10G Decoder)	12	24 GB
8 Gbps	15	32 GB
9.4 Gbps	15	48 GB

Install Logstash

IMPORTANT: Ensure that you follow all the security-related best practices and guidelines outlined in the Logstash documentation to avoid any potential security risks.

The NetWitness Export Connector is an input plugin for Logstash. Hence, installation of Logstash is important for NetWitness Export Connector to work. For more information, see the Overview section.

You can install the open source version of Logstash (OSS) or the paid version (Elastic). The supported version is Logstash 7.6.2.

Information on released versions of Logstash is available at Logstash Reference.

Note: It is recommended to install the Logstash service in CentOS operating system for better results.

Do the following steps to Install the Logstash.

1. Install the service: Installing Logstash
2. After installation, set Logstash to run as a service: Running Logstash
3. Enable Logstash to start when the system boots up: https://www.unix.com/man-page/centos/1/systemctl/

If you are using CentOS, make a note of the following:

- Logstash logs are stored in `/var/log/logstash/logstash-plain.log`
- If you install Logstash using rpm install, make sure it installs as logstash user and folders get created with the same user and **not** the root user.

Troubleshooting

For Generic Troubleshooting Instructions for Logstash, see Logstash Troubleshooting.

Install NetWitness Export Connector

Note: From 11.6 onwards, the Logstash server is packaged and supported along with the NetWitness Log Collector or Virtual Log Collector (VLC) service to provide easy access to Logstash. This is referred to as Managed Logstash and it eliminates the need for a separate Logstash server outside of the NetWitness Platform. For more information, see "Configure Logstash Event Sources in NetWitness" in the *Log Collection Configuration Guide*.

Do the following steps to install NetWitness Export Connector .

1. Download the offline installer from RSA Link in the following location: NetWitness Export Connector Installer.
2. Copy the downloaded NetWitness ZIP archive to the system where Logstash runs.
3. Open a command prompt and run the following command to change directory to Logstash home.
   `cd /usr/share/logstash`
4. Check the status of the Logstash service by running the following command.
   `systemctl status logstash`
5. Stop the Logstash service by running the following command.
   `systemctl stop logstash`
6. Install the NetWitness Export Connector by running the following command.
   `bin/logstash-plugin install file:///<path-to-file>/netwitness-export-connector-x.x.x.zip`
7. Make sure that all the required configuration files (`netwitness-<decoder-ip>-input.conf`) are available in the following folder.
   `/etc/logstash/conf.d/`
8. Start the Logstash service by running the following command.
   `systemctl start logstash`

Configure NetWitness Export Connector

Note: Make sure you open the firewall of the Decoder or Log Decoder to establish connection with the Logstash. For more information, see "Network Architecture and Ports" in *Deployment Guide for RSA NetWitness*.

You must configure the Logstash configuration file to process the NetWitness events. Create a Logstash configuration file and add the NetWitness Export Connector plugin parameter settings for event processing. Save the file as `netwitness-<decoder-ip>-input.conf`. After adding the NetWitness Export Connector plugin parameter settings, place the configuration file in `/etc/logstash/conf.d/` location.

A Logstash configuration file can have three separate sections for each type of plugin that you want to add to the event processing pipeline. The first section is for Input plugin (NetWitness Export Connector), the second section is for Filter plugin (optional) and the third section is for Output plugin.

To configure the NetWitness Export Connector plugin, add the parameter settings in the first section the Logstash configuration file.

For multiple pipelines configuration, see Multiple Pipelines Configuration documentation.

The configuration of each NetWitness Export Connector plugin must consist of the plugin name followed by a block of parameter settings for that plugin. If the NetWitness Export Connector has multiple plugins with block of parameters, they are applied in the order of their appearance.

The following is an example of NetWitness Export Connector with one plugin instance with block of parameter settings which fetches data from a single decoder .

```
input {
 netwitness {
 host => "<host>" # Mandatory
 username => "<username>" # Mandatory
 password => "<password>" # Mandatory
 decoder_type => "logdecoder" # Mandatory
 }
}
```

The following is an example of NetWitness Export Connector with two plugin instances with block of parameter settings which fetches data from two different decoders. Each plugin in the configuration is applied in the order as shown.

```
input {
 netwitness {
 host => "<host>" # Mandatory
 username => "<username>" # Mandatory
 password => "<password>" # Mandatory
 decoder_type => "logdecoder" # Mandatory
 }
netwitness {
 host => "<host>" # Mandatory
 username => "<username>" # Mandatory
 password => "<password>" # Mandatory
 decoder_type => "logdecoder" # Mandatory
 }
}
```

Note: When configuring the Logstash, you may need to specify sensitive settings such as passwords. You can use the Logstash keystore to securely store secret values instead of file system permissions for using it in configuration settings. For more information, see Logstash keystore Documentation.

Following are the parameters accepted by NetWitness Export Connector.

Parameter	Description	Parameter Type	Default Value
host	IP address or hostname of the Decoder or Log Decoder (mandatory)	String	N/A
username	Username used to access the Decoder or Log Decoder (mandatory)	String	N/A
password	Password of the user (mandatory)	String	N/A
decoder_type	Accepts only 'decoder' or 'logdecoder' (mandatory)	String	N/A
ssl_enable	Enable SSL connection between the Decoders and the NetWitness Export Connector. For more information, see Configure SSL	Boolean	false
ssl_certificate_path	Path of the CA certificate that is used for SSL and Trusted Connections		/etc/pki/nw/trust/truststore.pem
ssl_certificate_password	Password of the certificate in use. Mandatory if SSL is enabled	String	N/A
ssl_client_certificate_path	Client's SSL certificate		/etc/pki/nw/node/node-cert.pem
ssl_version	Version of the SSL connection	String	TLSv1.2
plugin_metrics_enable	Enables metrics reporting to Elastic (New Health and Wellness), for more information see Health and Wellness	Boolean	false
elastic_host	IP address or hostname of the Elastic host. Mandatory if plugin metrics is enabled	String	N/A
elastic_port	Port number of the Elastic host	String	9200

Parameter	Description	Parameter Type	Default Value
elastic_username	The username that is used to access the Elastic host. Mandatory if plugin metrics is enabled	String	N/A
elastic_password	The password that is used to access the Elastic host. Mandatory if plugin metrics is enabled	String	N/A
meta_include	Aggregates only the meta keys that are added in this parameter setting. Accepts comma separated values (csv) format	String	nil
meta_exclude	Excludes the meta keys that are added in this parameter setting from aggregation. Accepts comma separated values (csv) format	String	nil
start_session	Session from which the aggregation starts. Setting the value to 0 starts the aggregation from `last.session.id` in the Decoder	Number	0
export_log	Includes the raw log with the meta in the session (applicable only for Log Decoder aggregation)	Boolean	false
aggregate_ sessions	Number of sessions ingested in a batch from the Decoders	Number	1000
aggregation_ interval	Time interval (in milliseconds) between two event cycles	Number	1000
prefetch_count	Controls the number of batches to be pulled into the buffer that is available for the plugin to collect	Number	2

Parameter	Description	Parameter Type	Default Value
compression	The number of bytes in each message before message is compressed. Setting the value to '0' does not allow compression. Ranges between 0 to 131071	Number	0
compression_ level	The level of compression. Ranges between 0 to 9 where 1 is fastest and 9 has the better compression. A value of 0 selects the best balance between speed and compression	Number	6
buffer_size	Controls the number of records that the stream in the buffer before it is ingested	Number	40000
position_ tracking_path	Path where the last consumed session id is stored. Default storage location is `/var/lib/logstash`. For more information, see Position tracking and start session	String	`/var/lib/logstash`
custom_meta_ config_path	Path to the custom multivalued meta configuration file. For more information, see Configuring Custom Multi-valued Meta	String	nil
Query	Takes any NetWitness Platform query as Input **Note:** Only Indexed meta key must be the part of the query. For example, select `* where device.type = 'rhlinux'`	String	Select *

Position tracking and start session

Position tracking or bookmarking is used to track the sessions that are aggregated by logstash and sent to the consumer. Position tracking initiates automatically and updates the tracking file every 60 seconds in the path mentioned in `position_tracking_path` parameter in the configuration file. The file consists of two parts `[sessionid,timestamp]`. Default location is `/var/lib/logstash`, if it is not mentioned in the configuration file.

The `start_session` parameter accepts a number (long: primitive datatype) and indicates which is the first `sessionid` the plugin should request from its corresponding source. if the `start_session` parameter is not mentioned in the configuration file or if the value is mentioned as 0, the first session requested by the plugin will be the `last.session.id + 1`, `last_session_id` as in the decoder's REST API `/database/stats/last.seesion.id`.

if the position tracking file exists for a source and `start_session` is not configured or the `start_session` is set as value 0, the plugin with initiate aggregation from the `sessionid` indicated in the position tracking file.

if the position tracking file exists for a source and the `start_session` is set as non-zero value, the `start_session` value will take precedence over the position tracking file. The plugin will request from the session mentioned in the `start_session` parameter onwards.

Configure SSL

Note: When configuring the Logstash, you may need to specify sensitive settings such as passwords. You can use the Logstash keystore to securely store secret values instead of file system permissions for using it in configuration settings. For more information, see Logstash keystore Documentation.

To support trusted connections, the Decoder or Log Decoder has two ports, an unencrypted non-SSL port and an encrypted SSL port. Trusted connections require the encrypted SSL port.

To establish trusted connection for the Decoder or Log Decoder with Logstash, add the following parameters in the Logstash Configuration file (`netwitness-<decoder-ip>-input.conf`) to enable the SSL mode.

Parameters	Settings	Parameter Type	Default Value
ssl_enable	Set the value to 'true' to enable SSL	Boolean	false
ssl_certificate_path	Enter the path of the Logstash keystore file. The keystore file must be in `.p12` format	String	N/A
ssl_certificate_password	Enter the password of the keystore	String	N/A

Certificate and Keystore

The NetWitness Export Connector must have a valid CA (Certificate Authority) certificate and a server certificate to establish a trusted connection with Decoders or Log Decoders.

Create a CA certificate

To create a CA certificate, do the following steps.

1. SSH to NW Logstash host.
2. Change the directory to /root by running the following command.
   `cd /root`
3. Create a private key of 2048 bits by running the following command.
   `openssl genrsa -out CA-key.pem 2048`
4. Create a CA certificate by running the following command.
   `openssl req -new -key CA-key.pem -x509 -days 1000 -out CA-cert.pem`

Create Certificate Signing Request (CSR) and Keystore

Do the following steps provided in this procedure to create a CSR for server and Keystore for the NetWitness Export Connector. You must submit the CSR to the Certificate Authority (CA) server to obtain a server certificate. Once the server certificate is created, do the following steps to package the private key and the signed certificate that must be uploaded to the Logstash keystore.

To create a CSR, do the following steps.

Note: You can skip till step 6 if you have PEM already available.

1. SSH to NW Logstash host.
2. Change the directory to /root by running the following command.
   `cd /root`
3. Create a private key of 2048 bits by running the following command.
   `openssl genrsa -out server-key.pem 2048`
4. Create a CSR by running the following command.
   `openssl req -new -key server-key.pem -out signingReq.csr`
5. Submit the CSR to the CA and get a signed server certificate by running the following command.
   `openssl x509 -req -days 1000 -in signingReq.csr -CA CA-cert.pem -CAkey CA-key.pem -CAcreateserial -out server-cert.pem`
6. Create a Keystore for the NetWitness Export Connector by running the following command.
   `- openssl pkcs12 -export -in server-cert.pem -inkey server-key.pem -certfile CA-cert.pem -out logstash-input-netwitness.p12`
7. Copy the `/etc/pki/nw/trust/truststore.pem` from the Decoder or Log Decoder to the Logstash host by running the following command.
   `scp /etc/pki/nw/trust/truststore.pem <logstash ssh username>@<logstash destination directory path>`
8. Import `truststore.pem` from the Decoder or Log Decoder to the Logstash keystore (`logstash-input-netwitness.p12`) by running the following command.

```
keytool -importcert -keystore logstash-input-netwitness.p12 -trustcacerts -
alias nw-inter -file truststore.pem -storetype PKCS12
```

Note: `truststore.pem` is same for all Decoders, if the Logstash is aggregating from same NetWitness setup. If the Logstash is aggregating from two different NetWitness setups, you must copy the `truststore.pem` for each Decoders.

9. Copy `logstash-input-netwitness.p12` file to the `/etc/logstash` directory by running the following command.
   ```
   cp logstash-input-netwitness.p12 /etc/logstash
   ```
10. Change the owner of `logstash-input-netwitness.p12` as Logstash by running the following command.
    ```
    chown logstash:logstash /etc/logstash/logstash-input-netwitness.p12
    ```

Note: You must use the same keystore "`logstash-input-netwitness.p12`" for all NetWitness hosts that is integrated with Logstash.

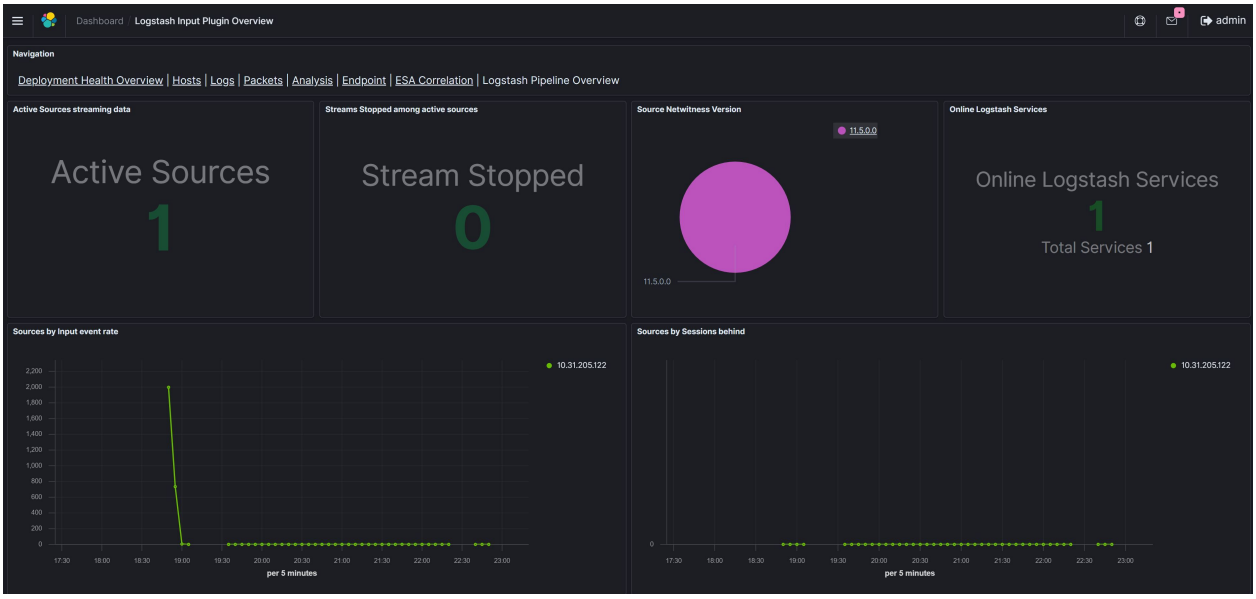
11. Connect to the Decoders to add the `server-cert.pem` to `trustpeer` and `caupload` APIs by running the following commands. You can also use to REST API port to connect.
    ```
    curl -X POST -d server-cert.pem http://<logdecoder or decoder
    IP>:<logdecoder or decoder REST port>/sys/trustpeer
    curl -X POST -d server-cert.pem http:// <logdecoder or decoder
    IP>:<logdecoder or decoder REST port>/sys/caupload
    ```

Note: If you are not able to use the REST API, follow the below steps to copy the certificates to `/sys peerCert` and `/sys caCert` APIs using NetWitness CLI .
1. SSH to Admin Server.
2. Type "help" for a list of commands or "man" for a list of manual pages.
3. Run the following command.
```
login localhost:50002 <username> <password>
```
3. Run the following commands.
```
send /sys peerCert op=add --file-data=/root/server-cert.pem
send /sys caCert op=add --file-data=/root/server-cert.pem
```

12. Restart the Logstash service running the following command.
    ```
    systemctl restart logstash
    ```

Note: If you are using an untrusted certificate, copy the `truststore.pem` file from the Decoder or Log Decoder and import it to `<JAVA_HOME>/lib/security/cacerts` for the Logstash service to trust the CA certificate of Decoder or Log Decoder. For example: `keytool -importcert -file </path/to/file/>truststore.pem -keystore /usr/java/jdk-X.Y.Z/lib/security/cacerts -alias nw-core-cert -storepass <password>`

Health and Wellness



Note: This feature is available only from NetWitness version 11.5 and later. For more information, see "Monitor New Health and Wellness" in *System Maintenance Guide for RSA NetWitness*.

You can monitor the operational state of the Logstash service and details of sources configured in the New Health & Wellness tab available in NetWitness user interface. The New Health & Wellness is built on Elastic and Kibana. The metrics from the Logstash instance is sent to the Elastic service and visualized using Kibana. The tab displays the Logstash service status and the NetWitness Export Connector sources in a dashboard view. The New Health & Wellness service is referred as Elastic host in this document.

The Logstash service sends metrics for every 30 seconds. These metrics are used to view the operational status of the Logstash service and the NetWitness Export Connector. There are two types of metrics that are available for monitoring the Logstash status.

- Plugin metrics - For monitoring the NetWitness Export Connector status.
- Host metrics - For monitoring Logstash service instance (appliance or Virtual Machine) health status such as IO stats, CPU, memory usage and others.

By default, the plugin metrics are available in Logstash. To collect the host metrics, you must install Metricbeat, a third party software used for collecting the host metrics. It is recommended to enable both the plugin metrics and host metrics to view all the dashlets in the dashboard.

Download and Install Dashboard.

You need to download and deploy the dashboards from live to view the Logstash service and the NetWitness Export Connector stats in Kibana. Do the following steps.

1. Log in to NetWitness Platform UI.
2. Click  **(Configure) > LIVE CONTENT**.
3. In the **Search Criteria** panel, select the **Resource Types** as:
   - Health and Wellness Dashboards
   - Health and Wellness Monitors
4. Click **Search**.
5. In the **Matching Resources** view, select the **Logstash Input Plugin Overview** dashboard to deploy.
6. In the **Matching Resources** toolbar, click .
7. In the **Deployment Wizard > Resources** tab, click **Next**.
8. In the **Services** tab, select the Metrics Server service.
9. Click **Next**.
10. Click **Deploy**.
    The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.
11. Click **Close**.

For more information, see Advanced Configuration section in "Monitor New Heath and Wellness" topic in the *System Maintenance Guide for RSA NetWitness*.

Create a User in New Health & Wellness (Kibana)

You must create user account in New Health & Wellness in NetWitness (Kibana), to send Logstash metrics to New Health & Wellness in NetWitness (Kibana). This user account is used in configuring the Logtstash plugin metrics and host metrics.

To create a user account in Kibana, do the following steps.

Note: This is applicable only for hosts or services that are not managed by NetWitness.

1. Go to  **(Admin) > HEALTH & WELLNESS > New Health & Wellness**.
   New Heath & Wellness panel view is displayed.
2. Click **Pivot to Dashboard**.
   Kibana Dashboard view is displayed in a new tab.
3. Click the Security icon  on the left.
   Kibana Security view is displayed.
4. In the Authentication Backends section, click **Internal User Database** and click the  icon to create new user.
5. Enter the username and the password in the respective columns.
6. In the Backend Roles section, click  and add `nwservice-role`, and then click **Submit**.
   Username is displayed in the Internal Database section.
7. Click the  icon to go back to Kibana Security view.
8. In the Permissions and Roles section, click **Role Mappings** and click **nwservice-role** to add the user name.
9. Click  and add newly created username, and then click **Submit**.

Enable the Logstash Plugin Metrics

To enable the Logstash plugin metrics, add the following parameters in the Logstash Configuration file (`netwitness-<decoder-ip>-input.conf`).

Parameter	Setting	Parameter Type	Default Value
plugin_metrics_ enable	Set the value to 'true' to enable the plugin metrics	Boolean	false

Parameter	Setting	Parameter Type	Default Value
elastic_host	Enter the IP address or hostname of the Elastic host or IP address of the New Health & Wellness service	String	N/A
elastic_port	Enter the port number of the Elastic host	String	9200
elastic_username	Enter the username that is used to access the Elastic host (user account created in Kibana, see Create a User in New Health & Wellness (Kibana))	String	N/A
elastic_password	Enter the password that is used to access the Elastic host	String	N/A

Enable the Logstash Host Metrics

Note: This is applicable only for hosts or services that are not orchestrated by NetWitness.

To enable the Logstash host metrics, follow the below steps.

1. Download Metricbeat software. For more information refer to Metricbeat.
   `curl -L -O https://artifacts.elastic.co/downloads/beats/metricbeat/metricbeat-oss-7.8.0-x86_64.rpm`
2. Install Metricbeat on the Logstash service by running the following command.
   `sudo rpm -ivh metricbeat-oss-7.8.0-x86_64.rpm`
3. Disable the default collection of Logstash monitoring metrics in the configuration file `logstash.yml` by changing `xpack.monitoring.enabled` parameter to `false`.
   `xpack.monitoring.enabled: false`

Note: Generally, the `x.pack.monitoring.enabled` parameter is commented. Remove the (#) character to activate it.

4. Enable the `logstash-xpack` module in Metricbeat to collect host status by running the following command.
   `metricbeat modules enable logstash-xpack`
5. In `/etc/metricbeat/modules.d/system.yml` file, add the following lines at the last and save it.

```
# Processors to parse process names of Netwitness Logstash Service.
- module: system
  period: 1m
  metricsets:
    - process
  processors:
    - add_fields:
        fields: {process.given.name: "logstash-service"} # Adding process
name to a new field
        when.contains:
          system.process.cmdline: "logstash-core.jar" # Condition on which
process name will be updated
```

Note: Use proper indentation while adding the lines. Refer an existing module in the `system.yml` file. If indentation is incorrect, the service may fail to start.

6. Configure the monitoring data to send metrics to Metricbeat. Follow the below steps.
   a. Update the `/etc/metricbeat/metricbeat.yml`file.
      - Replace the content in 'Elasticsearch output' section in `metricbeat.yml` with the following lines.

```
output.elasticsearch:
  # Array of hosts to connect to.
  hosts: ["<ELASTIC_HOST>:9200"]
  index: "nw-logstash-metricbeats-%{+yyyy.MM.dd}"

  # Protocol - either `http` (default) or `https`.
  protocol: "https"
  ilm:
    enabled: false
    check_exists: false
  # Authentication credentials - either API key or username/password.
  username: "<ElASTIC_USERNAME>"
  password: "<ElASTIC_PASSWORD>"
  ssl.verification_mode: none

setup.ilm.enabled: false
setup.template:
   enabled: false # Disabled so that metricbeat auto-creates the
template everyday based on incoming metrics.
   name: "nw-logstash-metricbeats-%{+yyyy.MM.dd}"
   pattern: "nw-logstash-metricbeats-%{+yyyy.MM.dd}"
```

   b. Update the `ELASTIC_HOST`, `ELASTIC_USERNAME` and `ELASTIC_PASSWORD` details in `metricbeat.yml` file.

7. Start the Metricbeat service by running the following command.

```
sudo service metricbeat start
```

For more information visit the official documentation of Metricbeat.

Configuring Custom Multi-valued Meta

Default multi-valued meta keys are `action, alias.host, alias.ip, alias.ipv6, email` and `username`, if the custom multi-valued path parameter is not set in Logstash configuration file (`netwitness-<decoder-ip>-input.conf`), then only default values are considered for multi-valued meta. Custom valued meta can be setup in generic (applicable for all the Netwitness Platform host where the json file is referenced) or specific to the Netwitness Platform host and can have custom multi-valued meta for multiple host in single json file. Both the `custom_multi_valued_meta_generic field` and `custom_multi_valued_meta_specific field` can be used in single file or at-least one 1 field must be set.

Note: Provide absolute path to the json file in the configuration (`netwitness-<decoder-ip>-input.conf`) and make sure Logstash user has access to this file. Meta name should be the same as the Netwitness Platform default name format. Do not use underscore format of the meta key.

For example, below shown is the json file which has both generic and specific field set in `custom_meta.json`

```
{
  "custom_multi_valued_meta_generic": [
    "meta.1,meta.2,meta.3"
  ],
  "custom_multi_valued_meta_specific": {
    "0.0.0.0": [
      "meta.4,meta.5,meta.6"
  ],
  "1.1.1.1": [
    "meta.4,meta.5,meta.7"
  ]
 }
}
```

In above example, the meta keys `meta.1, meta.2 and meta.3` are applied to all the NetWitness Platform host in the configuration file that has custom_meta_config path is set. The meta keys `meta.1, meta.2, meta.3, meta.4, meta.5, meta.6` are set as custom multi-valued meta for hosts `0.0.0.0` and the meta keys `meta.1, meta.2, meta.3, meta.4, meta.5, meta.7` are set as custom multi-valued meta keys for the host `1.1.1.1` along with default mutli-valued meta.

Configure Logstash Filter Plugin (optional)

You can configure the Logstash Filter plugin to add, remove, or modify the specific input events from the Log Decoder or Decoder. To configure the Filter plugin, add the Filter plugin parameter settings in the second section of the Logstash configuration file (`netwitness-<decoder-ip>-input.conf`). This plugin modifies the events based on the parameter settings. You can use the existing standard Logstash filter plugins for adding the parameter settings to the configuration file. For more information on existing Logstash standard filter plugins, see Filter Plugin Documentation.

The configuration of the plugin must consist of the plugin name followed by a block of parameter settings for that plugin. The following is an example of Logstash mutate filter plugin configuration parameters that remove specific meta keys.

```
filter
 {
 mutate {
 remove_field => ["ip_dst", "ip_addr"]
 }
}
```

Configure Logstash Output Plugin

You must configure the Logstash Output plugin to send the input events to a data warehouse destination. To configure the Output plugin, in the third section of the Logstash configuration file (`netwitness-<decoder-ip>-input.conf`), add the Output plugin parameter settings. You can use the existing Logstash standard output plugins for adding the parameter settings to the configuration file. For more information on existing Logstash standard output plugins, see Output Plugin Documentation.

The configuration of the plugin must consist of the plugin name followed by a block of parameter settings for that plugin. The following is an example of Logstash Output plugin configuration parameters.

```
output
{
 kafka {
 codec => json
 topic_id => "logstash"
 }
}
```

Performance tuning for Kafka and Kafka Output Plugin

Following are the output plugin parameters for Kafka and Kafka Broker.

Kafka Output Plugin:
Following parameters require change in value for each parameters to add additional throughput in the deployment.
`batch_size, buffer_memory, compression_type, send_buffer_bytes`
For more information, see Kafka output plugin documentation.

Kafka Broker:
Following parameters require change in value for each parameters to add additional throughput in the deployment.
`num.network.threads, num.io.threads, socket.receive.buffer.bytes, socket.request.max.bytes, message.max.bytes, replica.fetch.max.bytes`
For more information, see Kafka Broker Performance documentation.

Known Issues

Com-ponents	Title, Problem & Workaround	Found In / Exists In	Fixed Version	Track-ing Number
NetWitness Export Connector	**Title:** Position tracking is not updated properly when query is used to filter the sessions. **Problem:** Last `session.id` aggregated is not updated to the latest aggregated ID but is updated only to the last filtered session retrieved. For Example, If a decoder has 1000 sessions, and only first 800 sessions match the filter, the `last.session.id` in the position tracking shows 800 even though all 1000 sessions are processed. This does not cause any data loss but if the Logstash service is restarted, aggregation will begin from 801 `session.id`, processing the 200 sessions again. **Workaround:** None	netwitness-export-connector-1.0.0		ASOC-101795

Com-ponents	Title, Problem & Workaround	Found In / Exists In	Fixed Version	Track-ing Number
NetWitness Export Connector	**Title:** Consumer does not consume all the events after the Logstash service is restarted. **Problem:** While running at a high EPS or if there is a large session behind, the NetWitness Export Connector aggregates the sessions of the decoders. The Logstash pipeline sends to the output plugin which in turn sends it out to the consumer. At this point, if a Logstash service is stopped or restarted, the Logstash pipeline ensures the data is sent out of the output plugin to the consumer, however all the sessions are not consumed by the consumer. This leads to data loss on the consumer end even though Logstash has sent out all the data. **Workaround:** Update the `start_session` parameter in the Logstash configuration file (`netwitness-<decoder-ip>-input.conf`) by referring to the latest received `session.id` on Kafka or any other consumer used.	netwitness-export-connector-1.0.0	netwitness-export-connector-1.1.0	ASOC-102440
NetWitness Export Connector	**Title:** Position tracking not saved for some Decoder sources after sometime in a multiple sources configuration. **Problem:** When aggregating data from multiple sources in a single Logstash instance, after a period of time, the position tracking thread fails for some or all of the sources gradually and stops tracking the position (bookmarking) for those sources. **Workaround:** None	netwitness-export-connector-1.0.0	netwitness-export-connector-1.1.0	ASOC-102411

Com-ponents	Title, Problem & Workaround	Found In / Exists In	Fixed Version	Track-ing Number
NetWitness Export Connector	**Title:** Unable to start session aggregation from `first.session.id` of Decoder when it is not 1. **Problem:** If the Decoder has the `first.session.id` other than 1, which means the Decoder has data that has rolled over, the NetWitness Export Connector's `start_session` parameter will not start aggregation from that value, instead it would begin from the `last.session.id`. **Workaround:** Add 1 to the value to the `start_session` parameter and the aggregation would start as expected dropping the first session only. For example, if `first.session.id` on a Decoder is '1105000' add 1 to it and set the value of the `start_session` parameter as '1105001'.	netwitness-export-connector-1.0.0	netwitness-export-connector-1.1.0	ASOC-101951

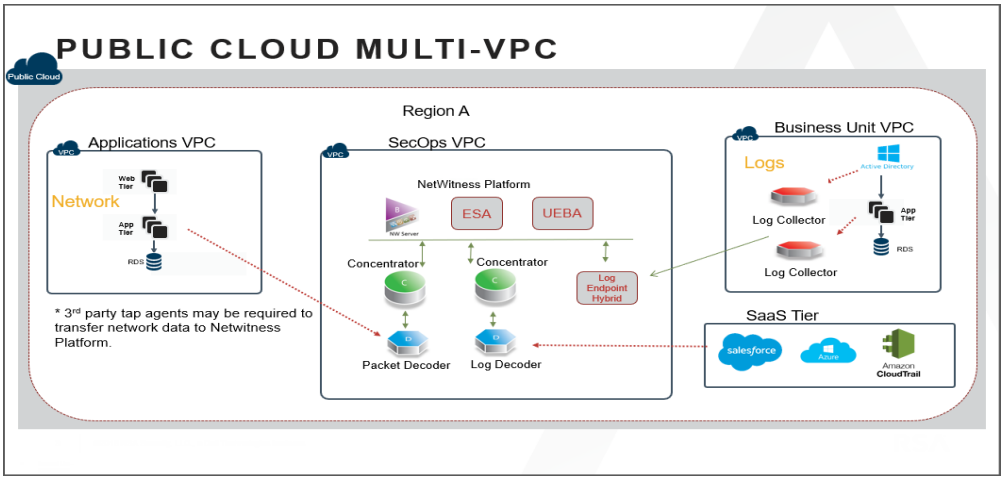
GCP Instance Configuration Recommendations **32**

Google Cloud Platform Installation Overview

Note: Google Cloud Platform is supported from version 11.4 and later.

Google Cloud Platform (GCP) instances have the same functionality as the NetWitness hardware and virtual hosts. NetWitness recommends that you perform the following tasks when you set up your GCP environment.

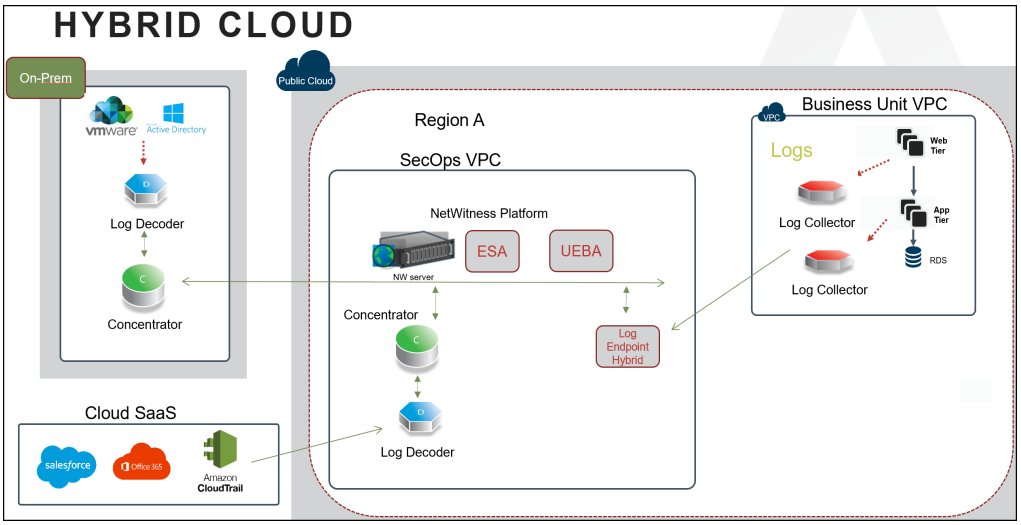
Before you can deploy NetWitness in GCP, you need to:



- Review the recommended compute and memory specifications needed for each NetWitness instance.
- Get familiar with the NetWitness Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see Storage Guide for NetWitness® Platform XDR 12.3.0.0.
- Make sure that you have a NetWitness Throughput license.

GCP Deployment Scenarios

The following diagrams illustrate some common GCP deployment scenarios.



NetWitness Full Stack VPC Visibility

This diagram shows all NetWitness components (full stack) deployed in GCP.

Hybrid Deployment

This diagram shows the Log Decoder and Concentrator deployed in GCP with all other NetWitness components deployed on premises.

GCP Deployment

This topic contains the rules and high-level tasks you must follow to deploy NetWitness components in the GCP.

Checklist

Step	Description
1	Prerequisites
2	Find NetWitness Platform XDR GCP Images
3	Establish gcloud Environment
4	Create an Instance using Google Cloud SDK Shell
5	Create a Firewall Rule
6	Connect to VM Instance using SSH
7	Installation Tasks
8	Configure Hosts (Instances) in NetWitness Platform XDR
9	Configure Packet Mirroring

Prerequisites

You need the following items before you begin the integration process:

- Access to GCP console.
- Google Cloud SDK Toolkit installed.
- Network routability (and proper GCP firewall rules) for the instances to transfer data to the NetWitness.

Find NetWitness Platform XDR GCP Images

There are two types of NetWitness GCP images. The following description guides you on which image is appropriate for your deployment:

- **Lite Image**: rsa-nw-12-3-0-0-20590-lite
  If you have an active NW Server or NetWitness software repository, use the Lite image. This image has a small footprint and does not contain the NetWitness software packages. When you set up NetWitness using the Lite image, it will require the IP address of the NW Server or NetWitness

software repository. This image is available publicly, and you can deploy it without needing to contact NetWitness Customer Support.

- **Full Image**: rsa-nw-12-3-0-0-20590-full
  For fresh or new deployments, where an NW Server is deployed for the first time, use the Full image. This image contains the entire NetWitness software library and other files required to complete the installation.
  To get access to the Full image, open an NetWitness Customer Support case (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897) to get granted the proper image permissions.

Note: For more information on GCP image deployment, see the blog post Running NetWitness in Google Cloud.

Establish gcloud Environment

1. Download and install the Google Cloud SDK Toolkit (https://cloud.google.com/sdk).
2. Run the following gcloud commands to log in and set the proper project:

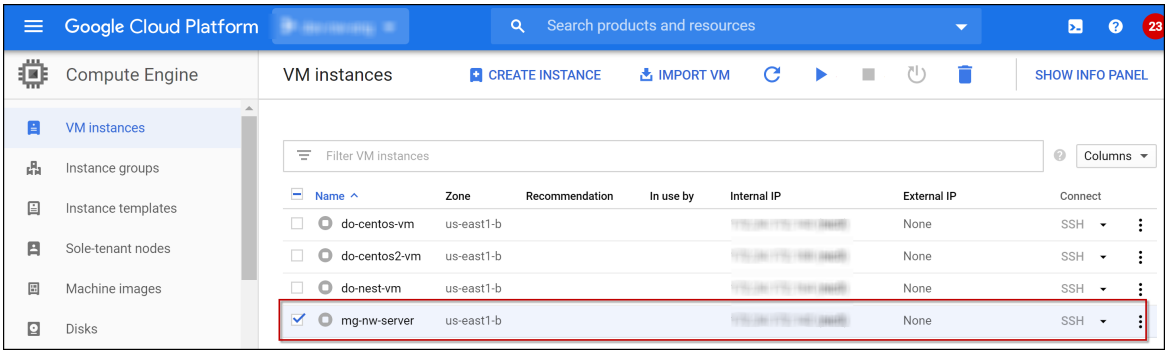
```
gcloud auth login
gcloud config set project <project name>
```

Create an Instance using Google Cloud SDK Shell

1. Determine what machine type is appropriate for selection. For more information, see GCP Instance Configuration Recommendations.
2. Using the image names listed under Find NetWitness Platform XDR GCP Images, create a GCP Instance by running the command:

```
gcloud compute instances create <instance name> --image <netwitness image name> --image-project <rsa project> --machine-type <machine type> --zone <gcp zone> --network <gcp project network> --subnet <gcp project subnet> --no-address
```

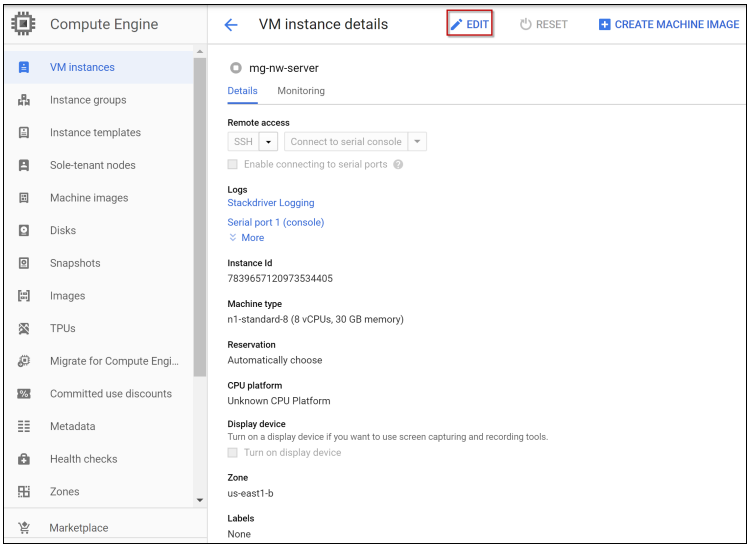
   For example:



```
gcloud compute instances create nw-server --image rsa-nw-12-3-0-0-20590-full --image-project gcp-nw-prod-images --machine-type n1-standard-8 --zone us-west1-c --network rsa-network --subnet rsa-subnet --no-address
```

   Note:
   - The network and subnet values may vary based on the setup.
   - The simple example is shown above, but there are many other options available. For more information, see the Quickstart: Creating a New Instance Using the Command Line section in the GCP documentation.

3. To modify the machine type, region, zone, or other configurations:



a. Go to **Google Cloud Platform > Compute Engine > VM Instance** view to find the VM Instance.

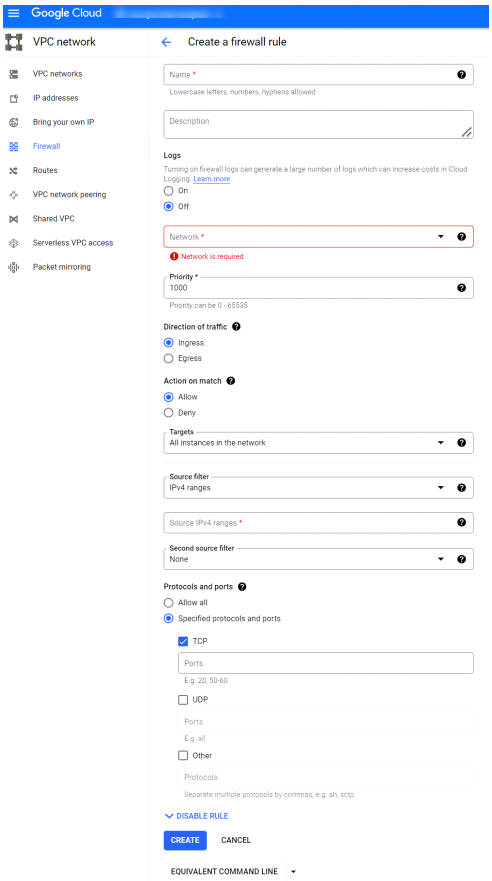
b. Select the instance and click STOP.

c. Click the Instance name (**mg-nw-server**).

d. Click EDIT to modify the settings according to your preference and click **Save**. The **VM instance details** view is displayed.

e. SSH to the newly-created instance using the default NetWitness credentials.

Create a Firewall Rule



Every VPC network has two implied firewall rules that permit outgoing connections and block incoming connections. These rules allow egress traffic to everywhere "Implied IPv4 allow egress rule" and block incoming traffic from everywhere "Implied IPv4 deny ingress rule". These rules are not shown in the Google Cloud console. Firewall rules that you create can override these implied rules.

To allow RDP and SSH access to all VM instances in your network, you must create a fire wall rule.

To create a firewall rule

1. Log in to the Google Cloud Console.
2. Click **Firewall rule**.
3. Click **Create firewall rule**.

   The Create a firewall rule view is displayed.

4. Fill in the details to configure a firewall rule:
   - **Name**: Enter a name for firewall rule.
   - **Description**: Enter the description for firewall rule.
   - **Logs**: By default, **Off** is selected.
   - **Network**: Select a network from the drop-down list.
   - **Priority**: Enter the priority range. Lower integers indicate higher priorities.

     Note: Priority range can be between 0 to 65536.
   - **Direction of traffic**: Select **Ingress**.
   - **Action on match**: Select **Allow**.
   - **Targets**: Select **All instances in the network** from the drop-down list.

- **Source filter**: Select **IPv4 ranges** from the drop-down list.
- **Source IPv4 ranges**: Enter **35.235.240.0/20**.
- **Second source filter**: Enter any secondary source filter if available.
- **Protocols and ports**: Select **specified protocols and ports** and select **TCP** and enter 22,3389 to allow both RDP and SSH.

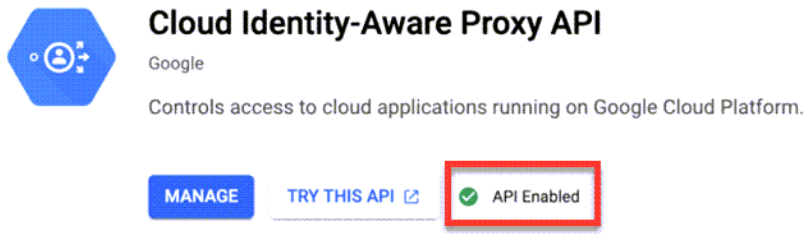
5. Click **Create**.

   Source IPv4 **35.235.240.0/20** range contains all IP addresses that IAP uses for TCP forwarding in GCP.

Connect to VM Instance using SSH

There are different ways to connect to the VM instance using SSH.

1. Method 1: SSH - Open in Browser Window
2. Method 2: SSH - Cloud Shell



Method 1: SSH - Open in Browser Window

Perform the following steps to access SSH - Open in Browser Window.

1. Log in to the Google Cloud Console.
2. Search **Identity-Aware Proxy** in the console.

   Note: To enable the Cloud Identity-Aware Proxy API, you must have **IAP-secured Tunnel User** and **Service Usage Admin** permissions.

3. Enable **Cloud Identity-Aware Proxy API**.

   This will enable the **SSH** button in the row of newly created VM instance.

4. Go to the **VM instances** page.
5. In the row of an instance, select **Open in browser window** from the **SSH** drop-down menu.

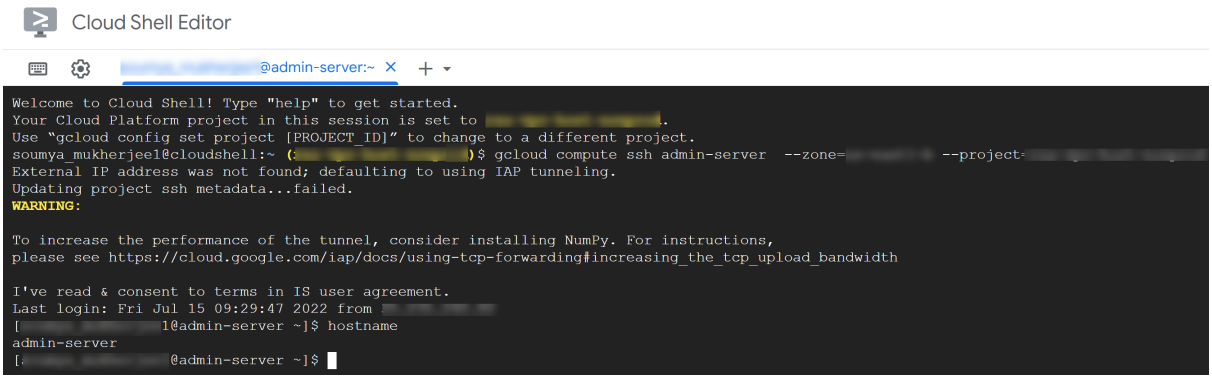
A new window opens and connects to the VM instance.

Method 2: SSH - Cloud Shell

Perform the following steps to access SSH - Cloud Shell.

1. Log in to the Google Cloud console page.
2. On the top right corner of the console, click **Activate Cloud Shell**.

   The cloud shell page is displayed.



3. Run the following command:

   ```
   - gcloud compute ssh <instance-name> --zone=<zone-name> --project=<project-name>
   ```

   A confirmation pop-up is displayed to Authorize Cloud Shell.

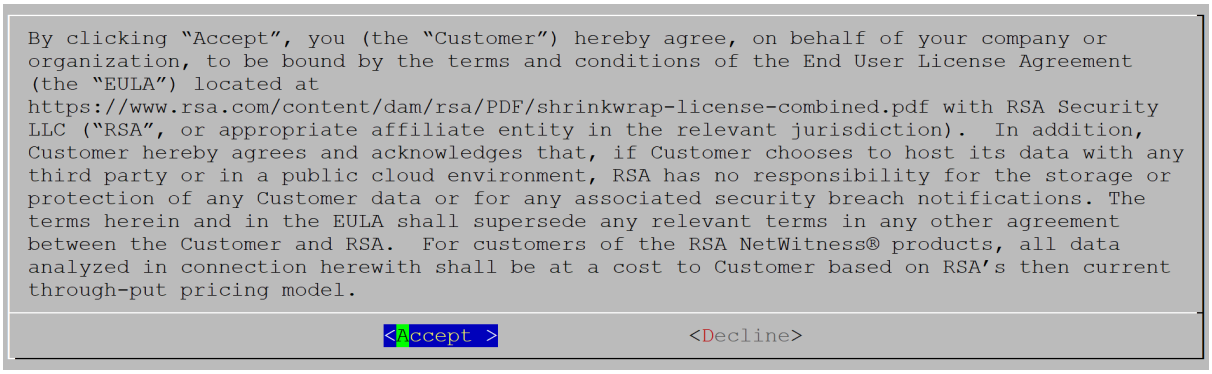
4. Click **Authorize**.

   This will connect to the VM instance through SSH.

Installation Tasks

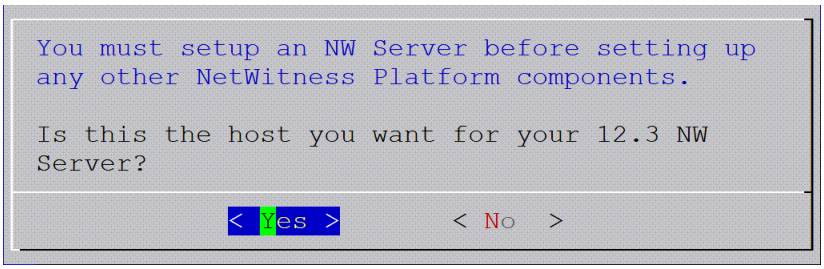
Before you begin the installation tasks make sure you open the firewall ports. For more information on the lists of all the ports in a deployment, see the Network Architecture and Ports topic in the *Deployment Guide for NetWitness Platform XDR 12.3*.

Caution: Do not proceed with the installation until the ports on your firewall are configured.



Tasks - Install 12.3 on the NetWitness Server (NW Server) Host and Component Hosts

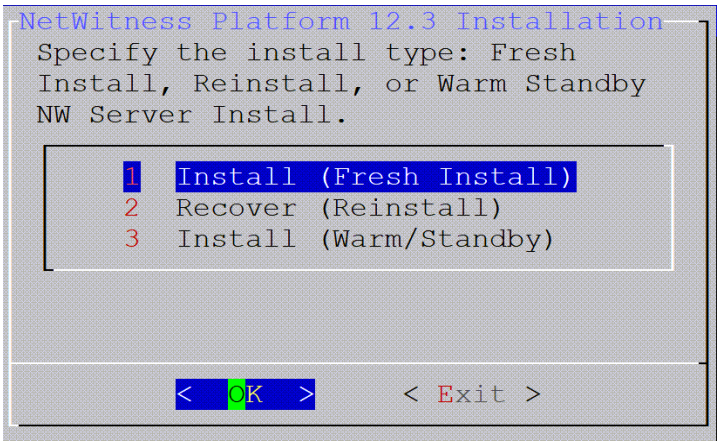
Complete the following steps to install 12.3 on NW Server host and other component hosts. Steps that are specific to the NW Server host or to component hosts are noted.



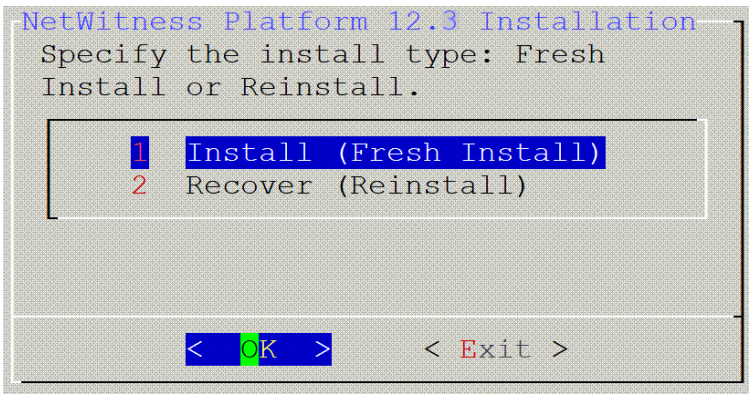
Caution: If you want to install the Endpoint Relay Server, do not run the nwsetup-tui script. Follow the instructions in (Optional) Installing and Configuring Relay Server in the *Endpoint Configuration Guide for NetWitness Platform XDR 12.3*.

1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host. This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

   Note: Use the following options to navigate the Setup prompts.
   1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
   3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "(Optional) Task 1 - Re-Configure DNS Servers Post 12.3" in the "Post Installation Tasks" section in this guide.
   If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 10 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 12.3 NW Server** prompt is displayed.



3. Tab to **Yes** and press **Enter** to install NW Server.
   Tab to **No** and press **Enter** to install Component Hosts.

   Caution: If you choose the wrong host for the NW Server and complete the setup, you must restart the setup program (step 2) and complete all the subsequent steps to correct this error.

4. The **Install** or **Recover** prompt is displayed.
   NetWitness Server Host prompt

   Component Hosts prompt

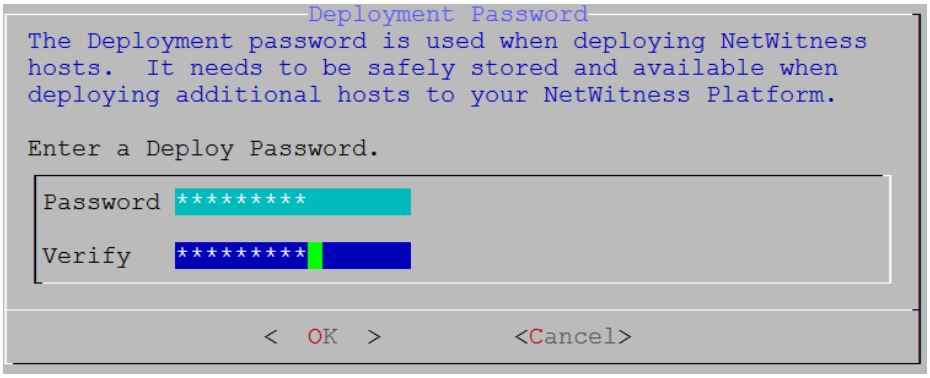
   Press **Enter**. By default, the **Install (Fresh Install)** option is selected.

5. The **System Host Name** prompt is displayed.

Press **Enter** if you want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

6. The **Master Password prompt** is displayed.

Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

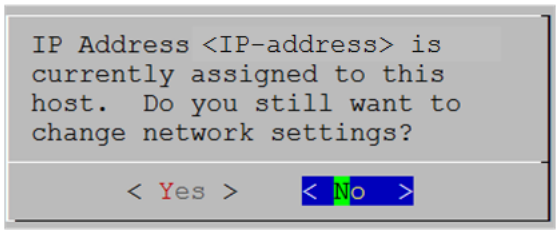


The following list of characters are supported for Master Password and Deployment Password:

- Symbols : ! @ # % ^ + ,
- Numbers :0-9
- Lowercase Characters : a-z
- Uppercase Characters : A-Z

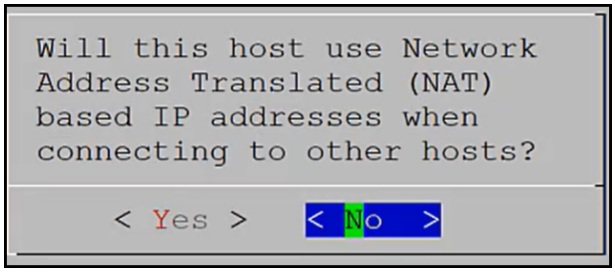
No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ ; : . < > -.

Caution: This step 6 is applicable only for NW Server Host.



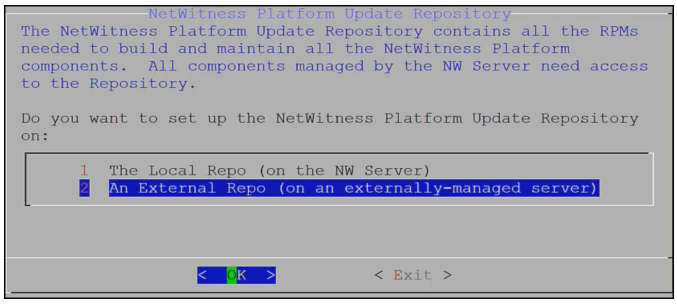
7. The **Deployment Password** prompt is displayed.

Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



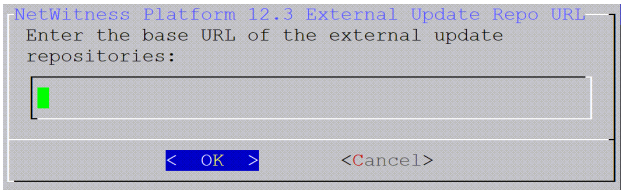
Caution: This step 7 is applicable for both NW Server and Component Hosts.

8. The setup program finds a valid IP address for this host and the following prompt is displayed.



Tab to **No** and press **Enter**, if you want to use this IP and avoid changing your network settings.

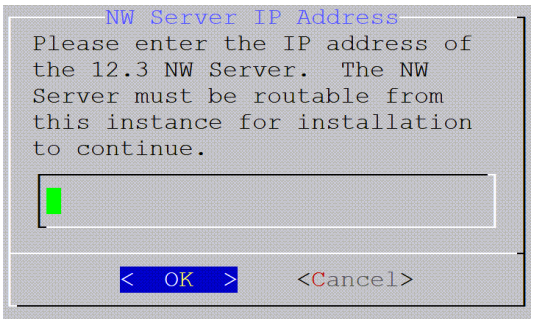
9. The Use Network Address Translation (NAT) prompt is displayed.



- For the NW Server, tab to **No** and press **Enter**.
- For Component Hosts, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

10. The **NetWitness Platform Update Repository** prompt is displayed.

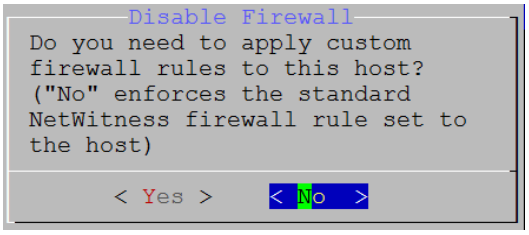
- For NW Server Host: Select **2 An External Repo (on an externally-managed server)**. Tab to **OK** and press **Enter**.
- For Component Hosts: Select **1 The Local Repo (on the NW Server)**. Tab to **OK** and press **Enter**.



11. The **NetWitness Platform 12.3 External Update Repo URL** prompt is displayed.

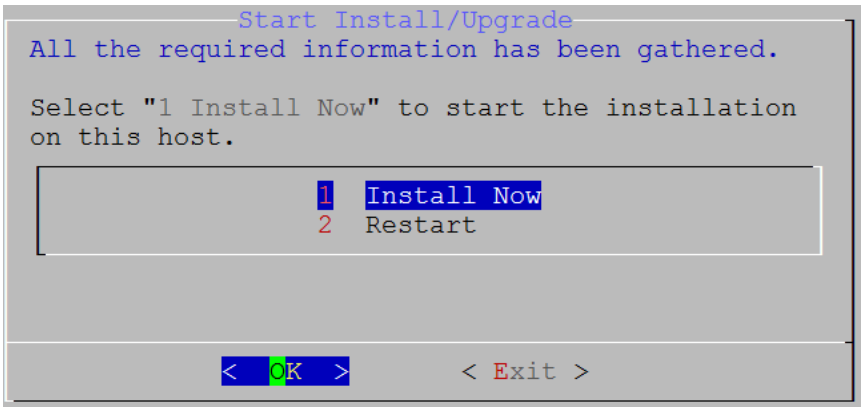
Enter the base URL of the NetWitness Platform external repo, tab to **OK** and press **Enter**.

Caution: This step 11 is applicable only for NW Server Host.



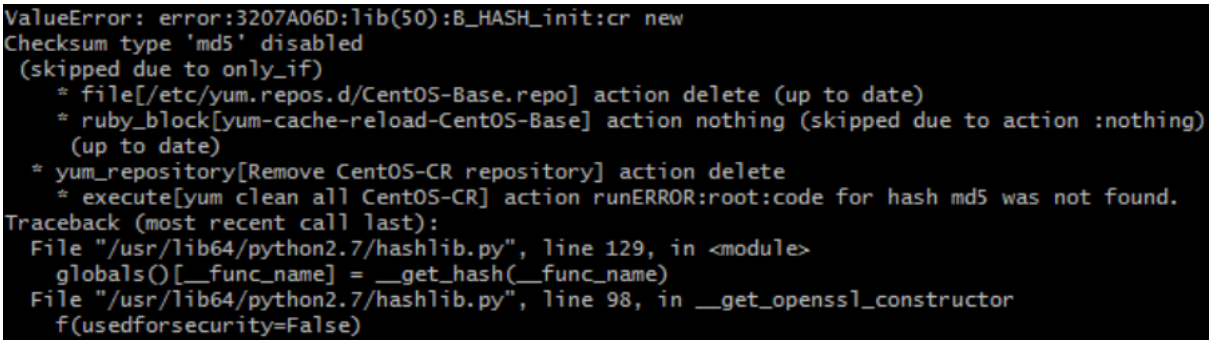
12. The **NW Server IP Address** prompt is displayed.

Enter the IP address of 12.3 NW Server host, tab to **OK** and press **Enter**.



Caution: This step 12 is applicable only for Component Hosts.

13. The **Disable Firewall** prompt is displayed.



Tab to **No** and press **Enter**.

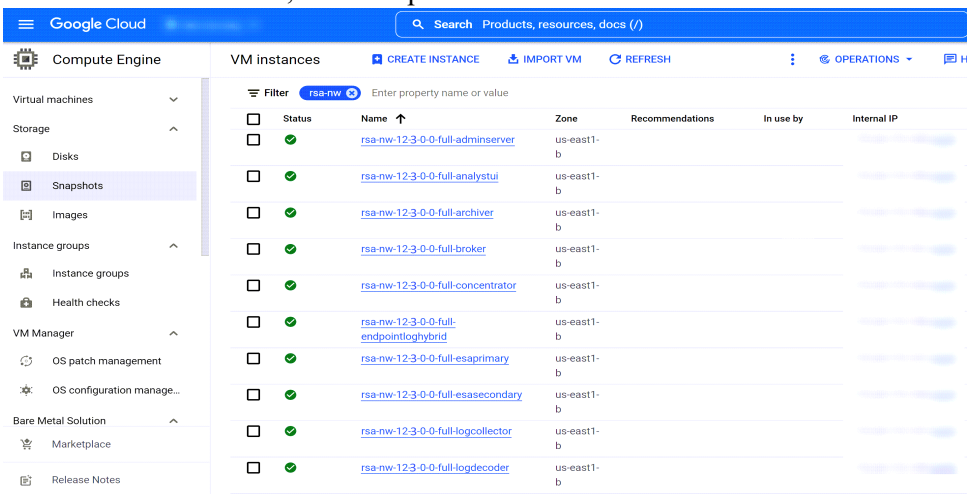
14. Press **Enter** to install 12.3 on the NW Server.
The **Start Install/Upgrade** prompt is displayed.

15. When **Installation complete** is displayed, you have installed the 12.3 NW Server on this host.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

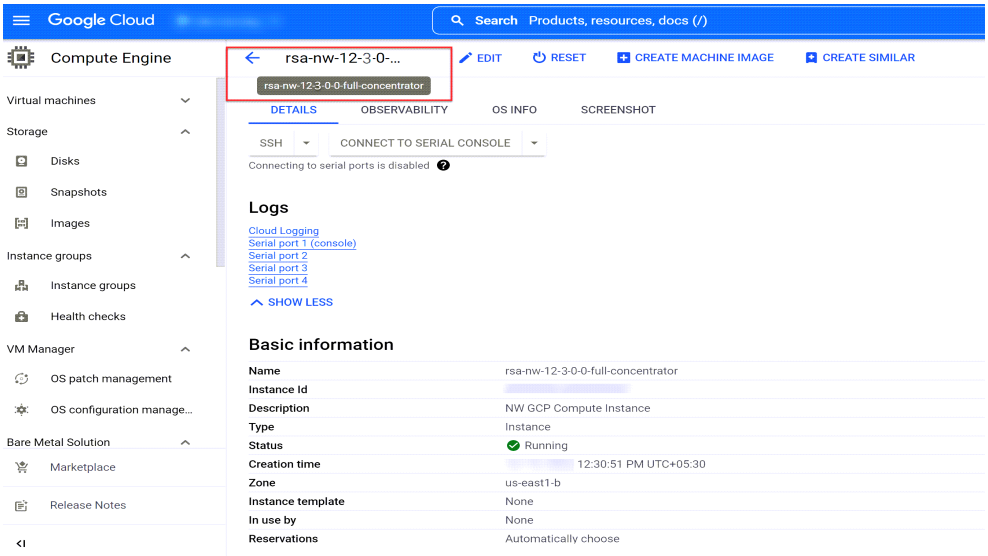
Note: If you want to perform a silent installation using CLI, see the Silent Installation Using CLI topic in the *Physical Host Installation Guide*.

Storage Configurations



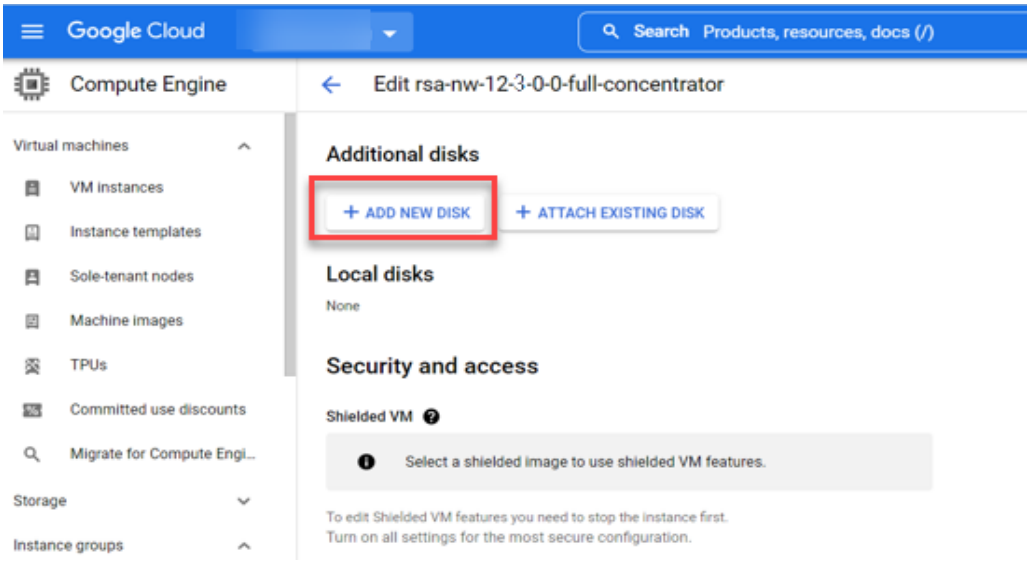
For storage allocations of all host types, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness® Platform XDR 12.3*.

Create a Disk

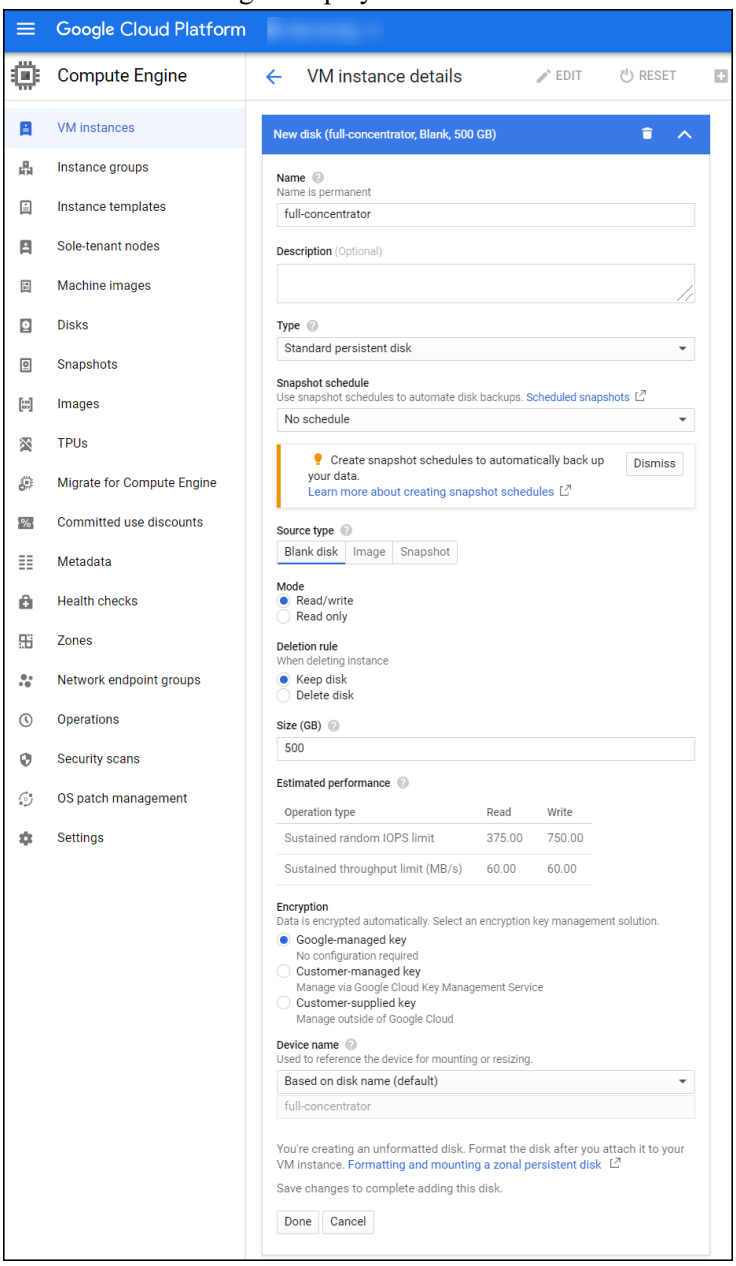


To understand which volumes are required to support the instance, see the Storage Requirements topic in the *Storage Guide for NetWitness® Platform XDR 12.3*.

To create a disk



1. Go to **Google Cloud Platform > Compute Engine > VM Instance** to identify the VM instance.
2. Click the instance name, for example **rsa-nw-12-3-0-0-full-concentrator**.



3. Click EDIT to make the required changes.
   The **VM instance details** view is displayed.

4. Under **Additional disks** (Optional), click + Add new disk to add a new disk.

5. The **New disk** dialog is displayed.

Enter values in the following fields:

a. **Name**: Enter a unique name.

b. (Optional) **Description**: Enter the required additional information.

c. **Type**: Select **Standard persistent disk** from the drop-down menu.

d. **Snapshot schedule**: By default, **No schedule** option is selected.

e. Under **Source type > Blank disk**.

- **Mode**: By default, **Read/write** option is selected.
- **Deletion rule**: By default, **Keep disk** option is selected.

f. **Size (GB)**: Enter the required size.

g. Under **Encryption**: By default, **Google-managed key** is selected.

h. **Device name**: By default, **Based on disk name (default)** is selected.

i. Click **Done**.

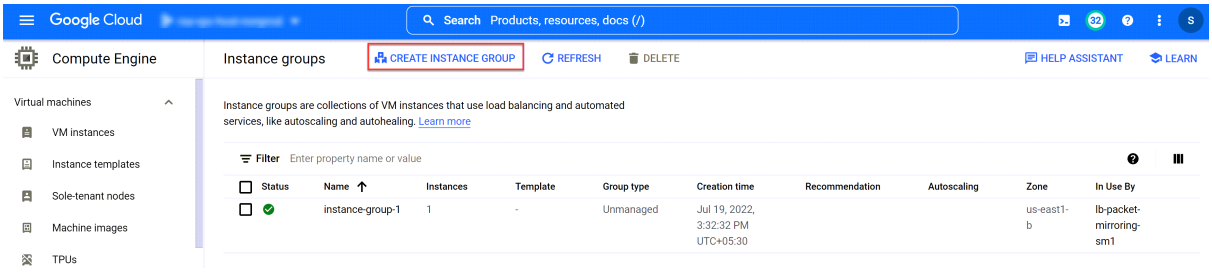
6. Click **Save**.

Note: To add another disk to the instance type, repeat steps 1 to 6.

Configure Hosts (Instances) in NetWitness Platform XDR

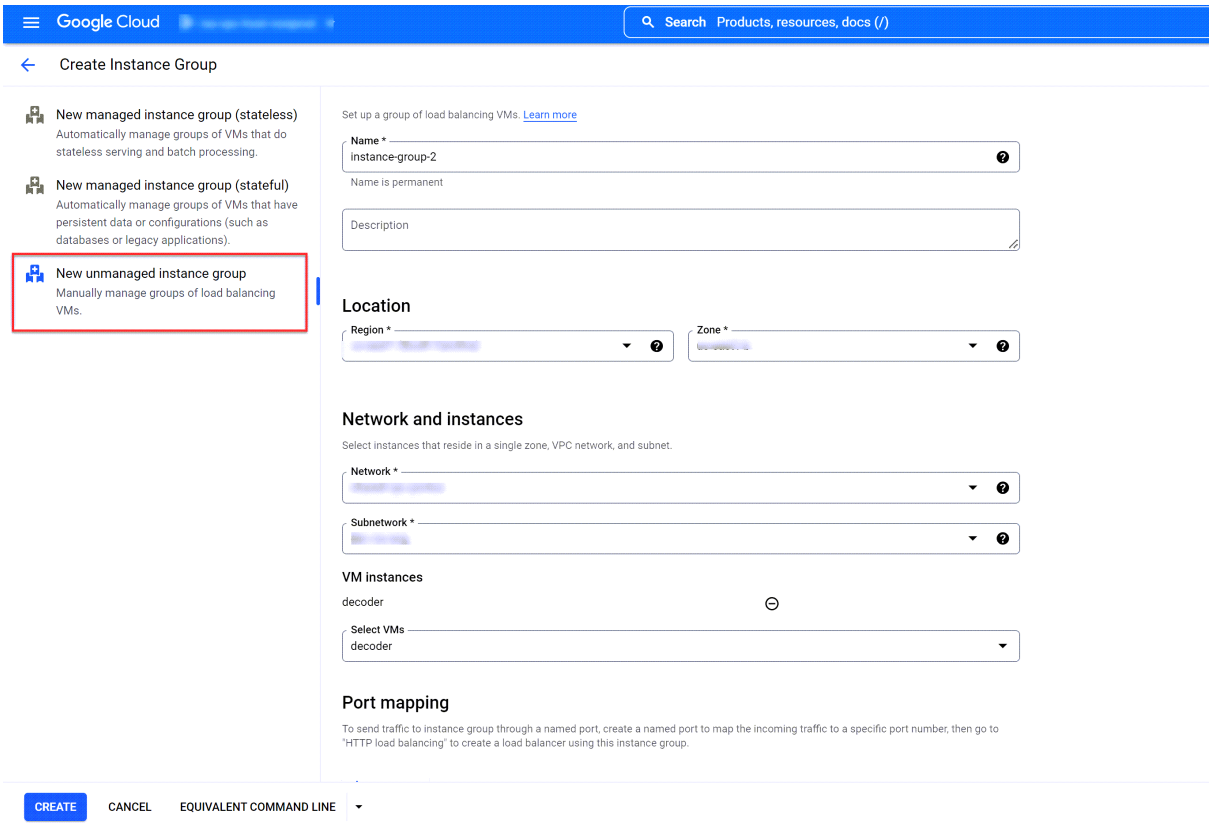
Configure individual hosts and services as described in NetWitness Host and Services Getting Started Guide. This guide also describes the procedures for applying updates and preparing for version upgrades.

Configure Packet Mirroring



You must complete the following tasks to create packet mirroring in GCP.

Task 1 - Create Instance Group
Task 2 - Create Packet Mirroring Policy
Task 3 - Create Load Balancer
Task 4 - Verify Packet Mirroring in GCP

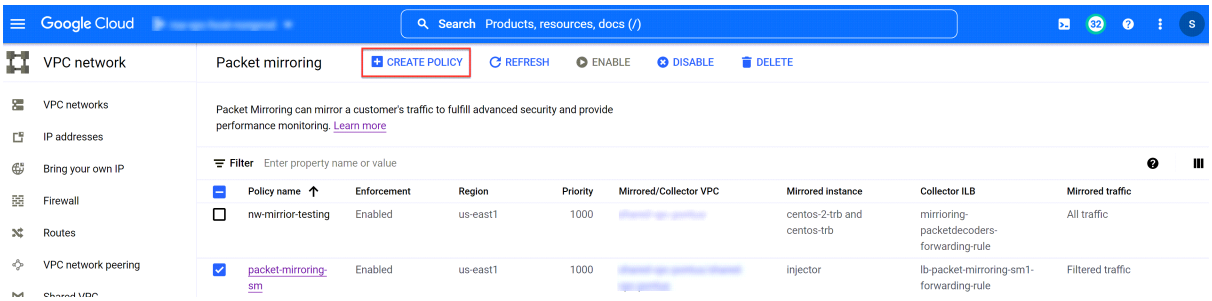


Task 1 - Create Instance Group

Complete the following steps to create the Instance group:

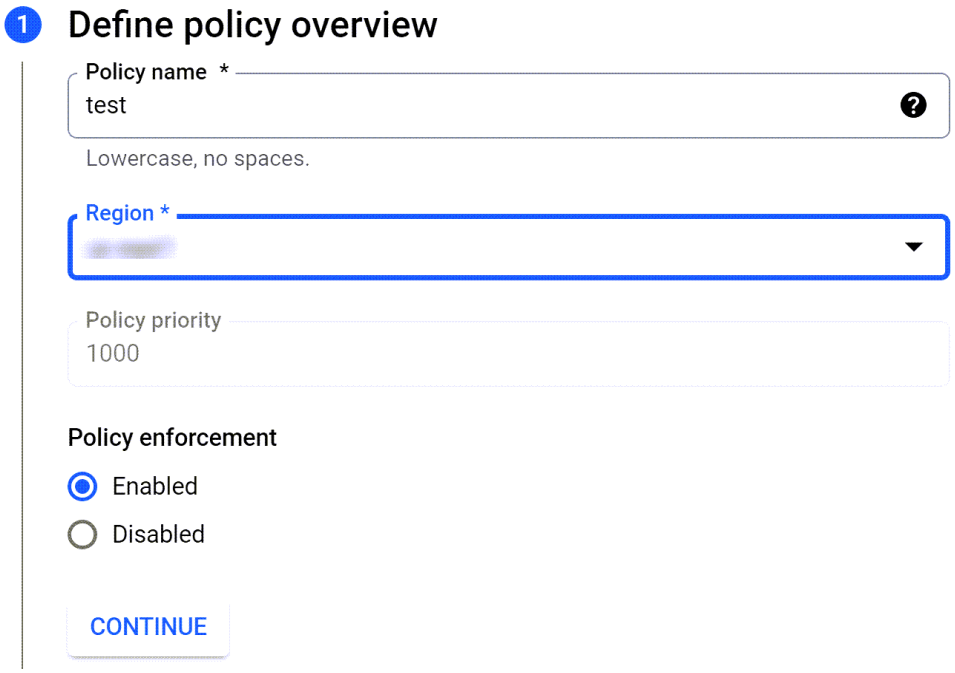
1. In the Google Cloud Console, go to the **Instance groups** page.
2. Click **Create Instance Group**.

3. Click **New Unmanaged Instance Group** from the left panel.



4. Fill in the details to configure the unmanaged instance group:
   - **Name**: Enter a name for the unmanaged instance group.
   - **Description**: Enter the description for instance group.
   - Under **Location**: Select a region from the **Region** drop-down list and select a zone from the **Zone** drop-down list.
   - **Network**: Select a network from the drop-down list.
   - **Subnetwork**: Select a subnetwork from the drop-down list.
   - **VM Instance**: Select the required decoder from the **Select VMs** drop-down list. The mirrored traffic will be sent to this VM instance.
   - **Port Mapping**: By default, the port is selected.
5. Click **Create**.

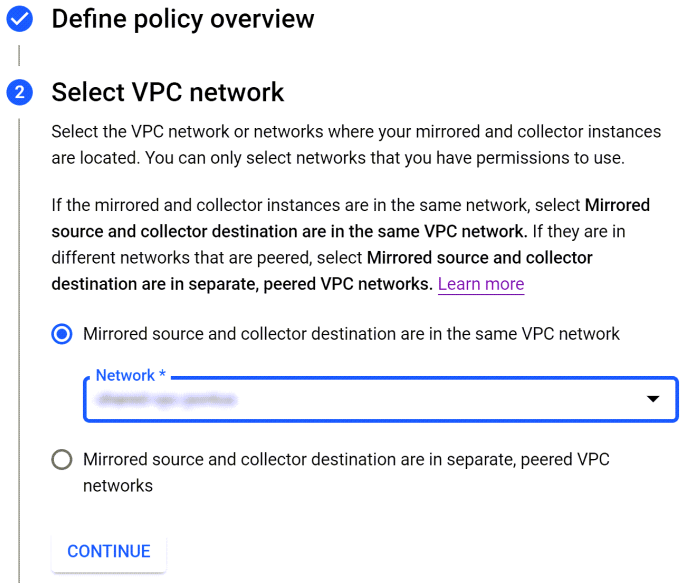
Task 2 - Create Packet Mirroring Policy



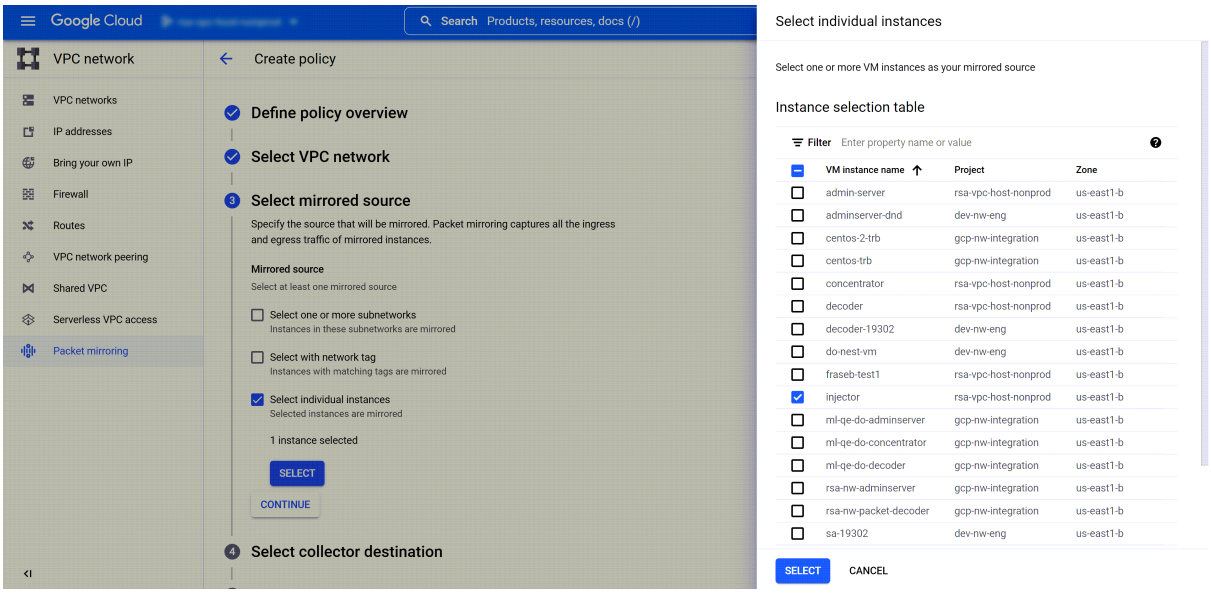
In the following procedure, Mirrored source and destination VM instances are in the same VPC network or subnetwork. You can also set both Mirrored source and destination VM instances on a different VPC network or subnetwork. For more information, see https://cloud.google.com/vpc/docs/using-packet-mirroring.

Complete the following steps to Create Packet Mirroring Policy.

1. In the Google Cloud console, go to the **Packet Mirroring** page.
2. Click **Create Policy**.



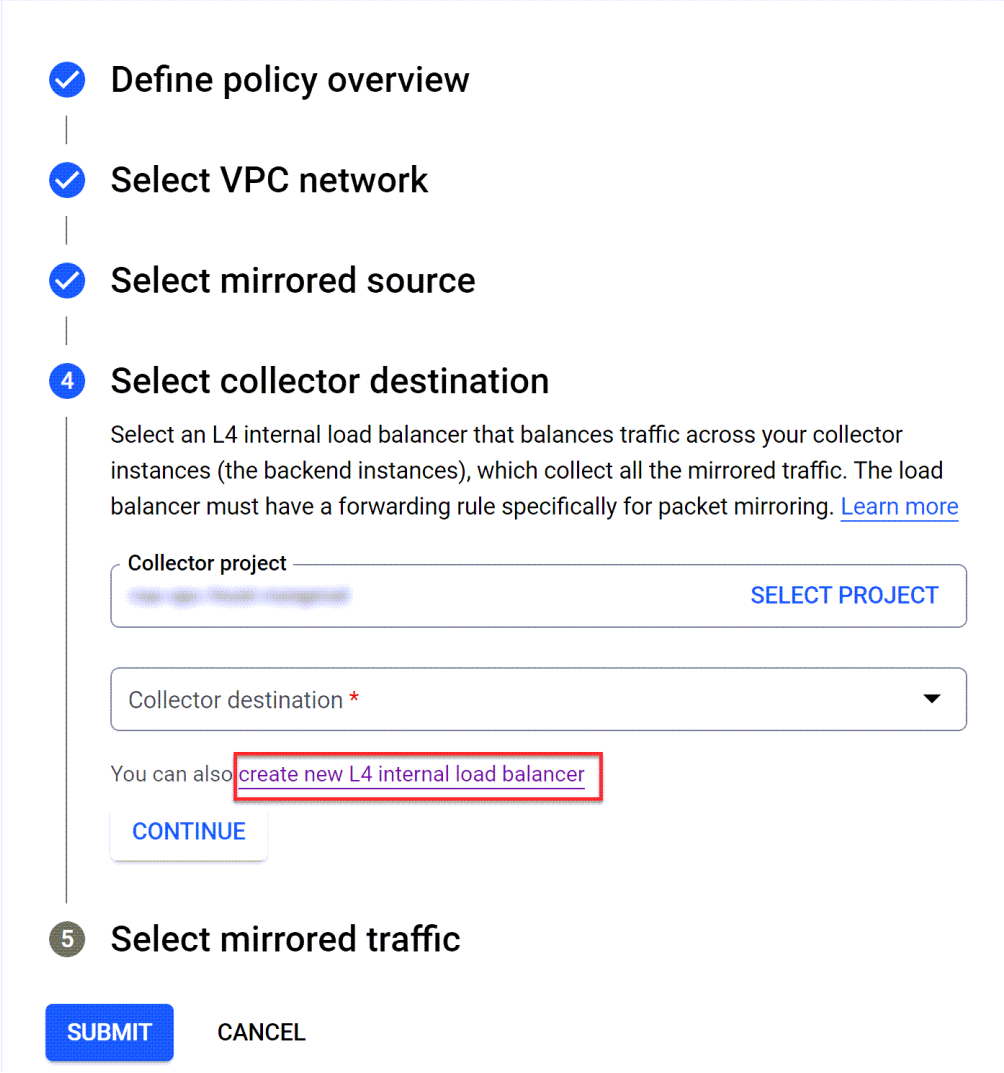
3. Under **Define policy overview**, enter the following details:



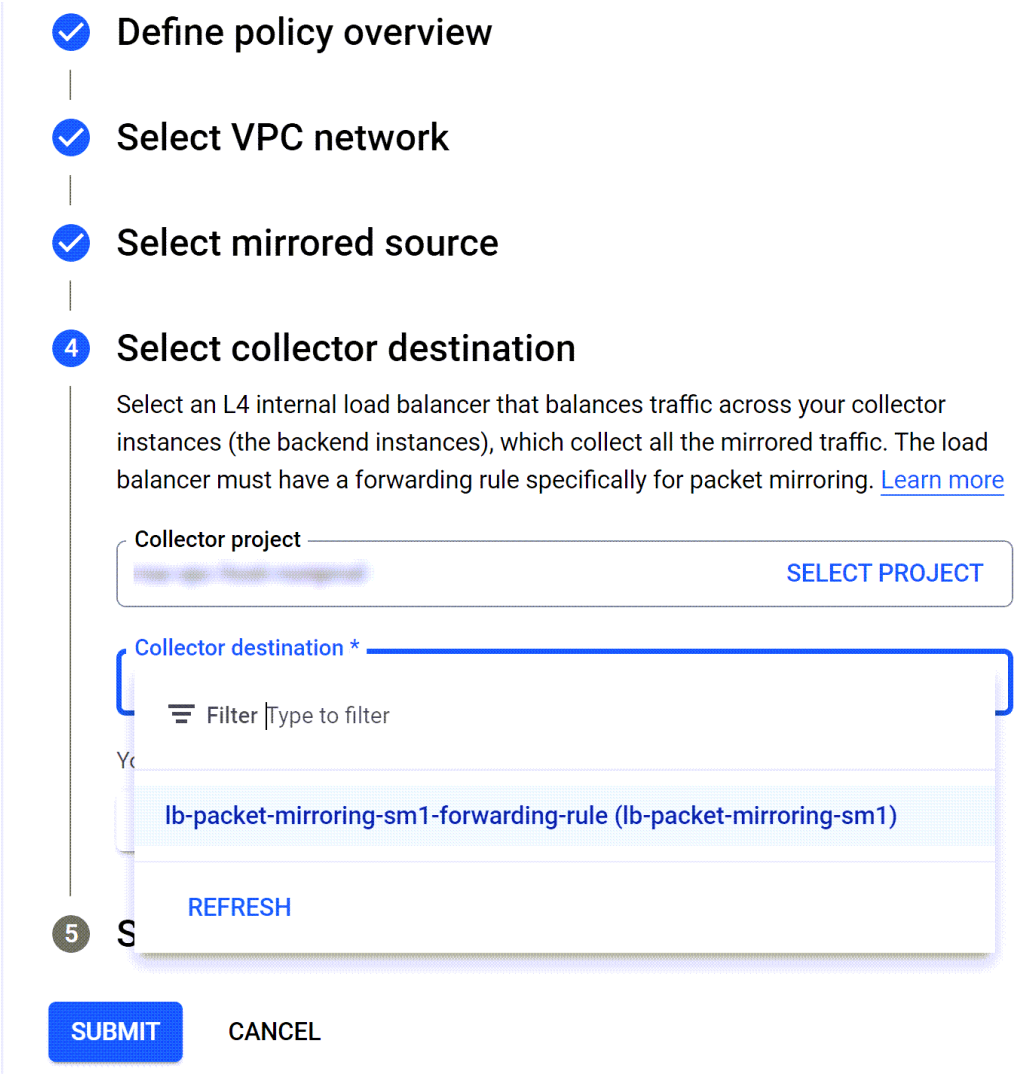
- **Name**: Enter a name for the policy.
- **Region**: Select the region from the drop-down list.
- Under **Policy enforcement**, select **Enabled** and click **Continue**.

4. Under **Select VPC network**, select **Mirrored source and collector destination are in the same VPC network**.

- Select the required network from the **Network** drop-down list.
- Click **Continue**.

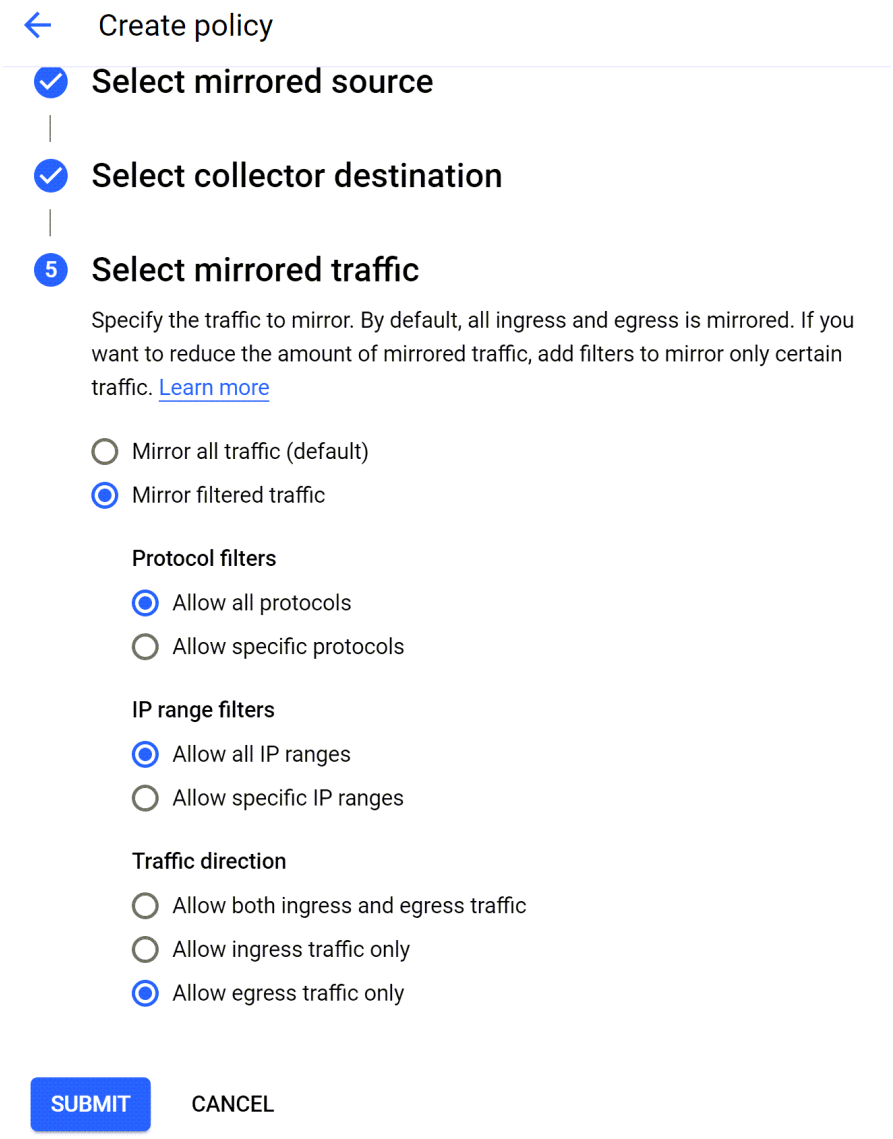


5. Under **Select mirrored source**, select **Select individual instances**.



Select the required instances from the **Instance selection table** and click **Continue**.

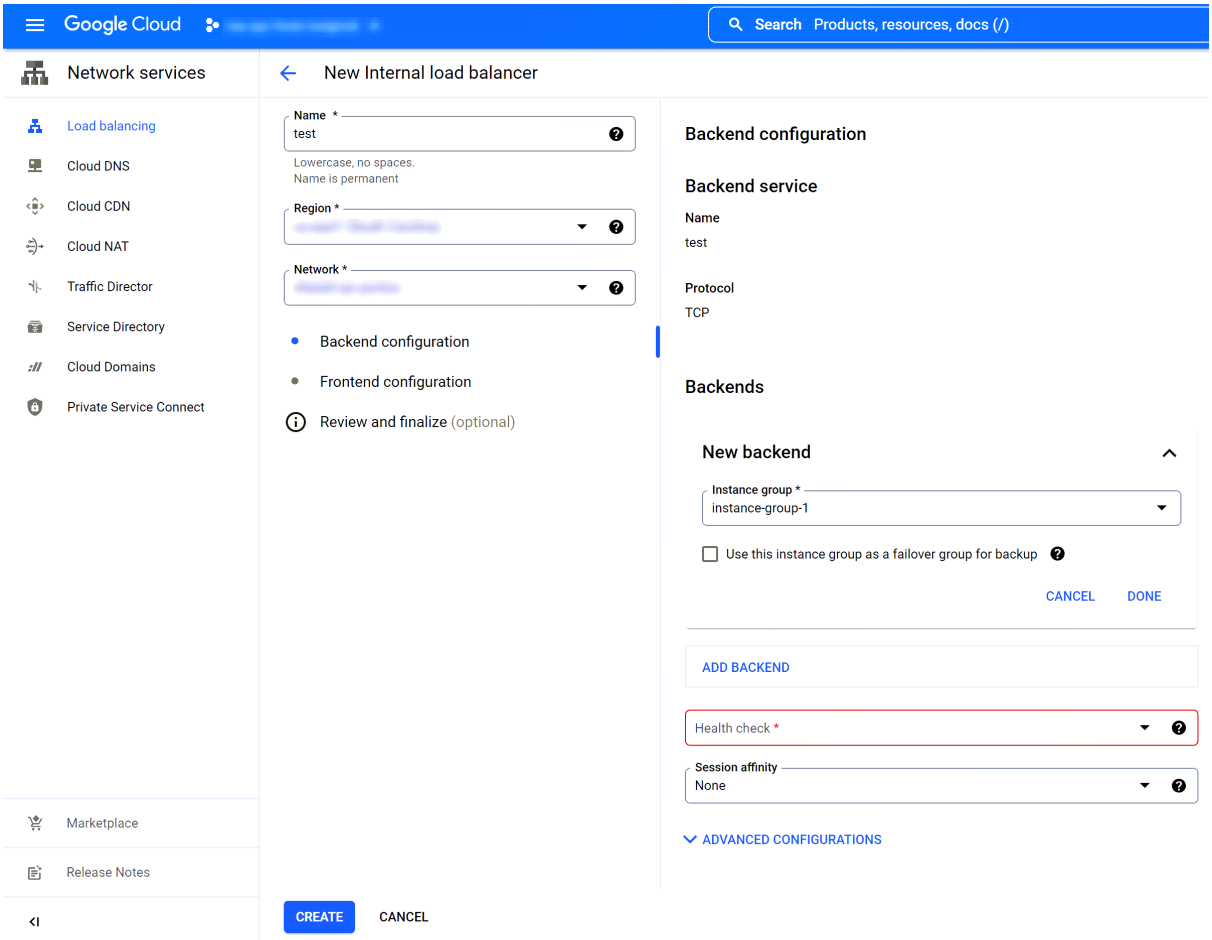
> **Note:** All traffic will be mirrored from this instance.



6. Under **Select collector destination**, click **create new L4 internal load balancer** and follow Task 3 - Create Load Balancer to complete configuration of load balancer.

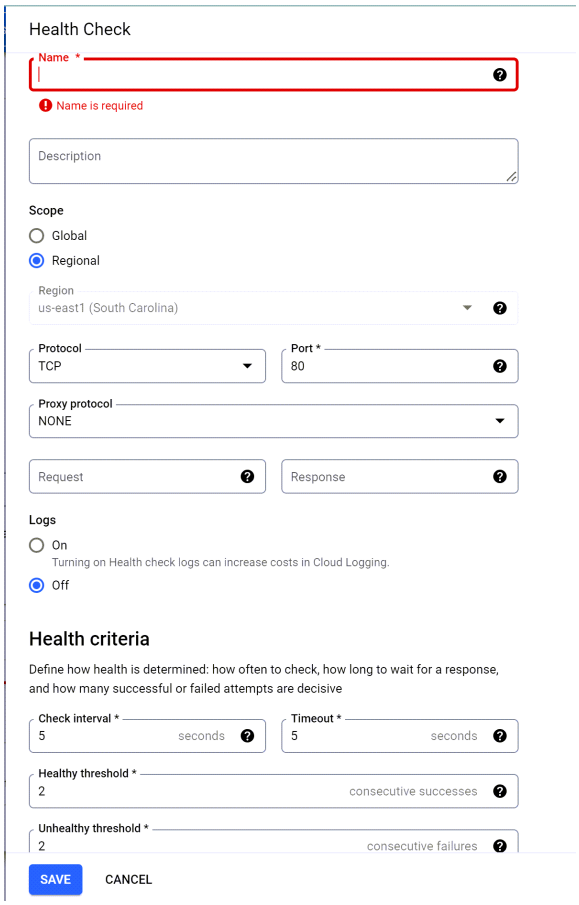
7. Once the load balancer is created, click **Refresh** in the **Collector destination** drop-down menu.

8. Select the newly created load balancer and **Continue**.
9. Do one of the following:
   - Select either both ingress (incoming) and egress (outgoing) traffic to be mirrored from the source VM instance by enabling **Mirror all traffic (default)** which is same as **Allow both ingress and egress traffic** under **Traffic direction**.
   - Select **Mirror filtered traffic** and select **Allow egress traffic only** to mirror only the outgoing traffic from the source VM instance and send them to decoder.
   - Select **Mirror filtered traffic** and select **Allow ingress traffic only** to mirror only the incoming traffic from from the source VM instance you want and send them to decoder.



10. Click **Submit**. The policy will be created successfully.

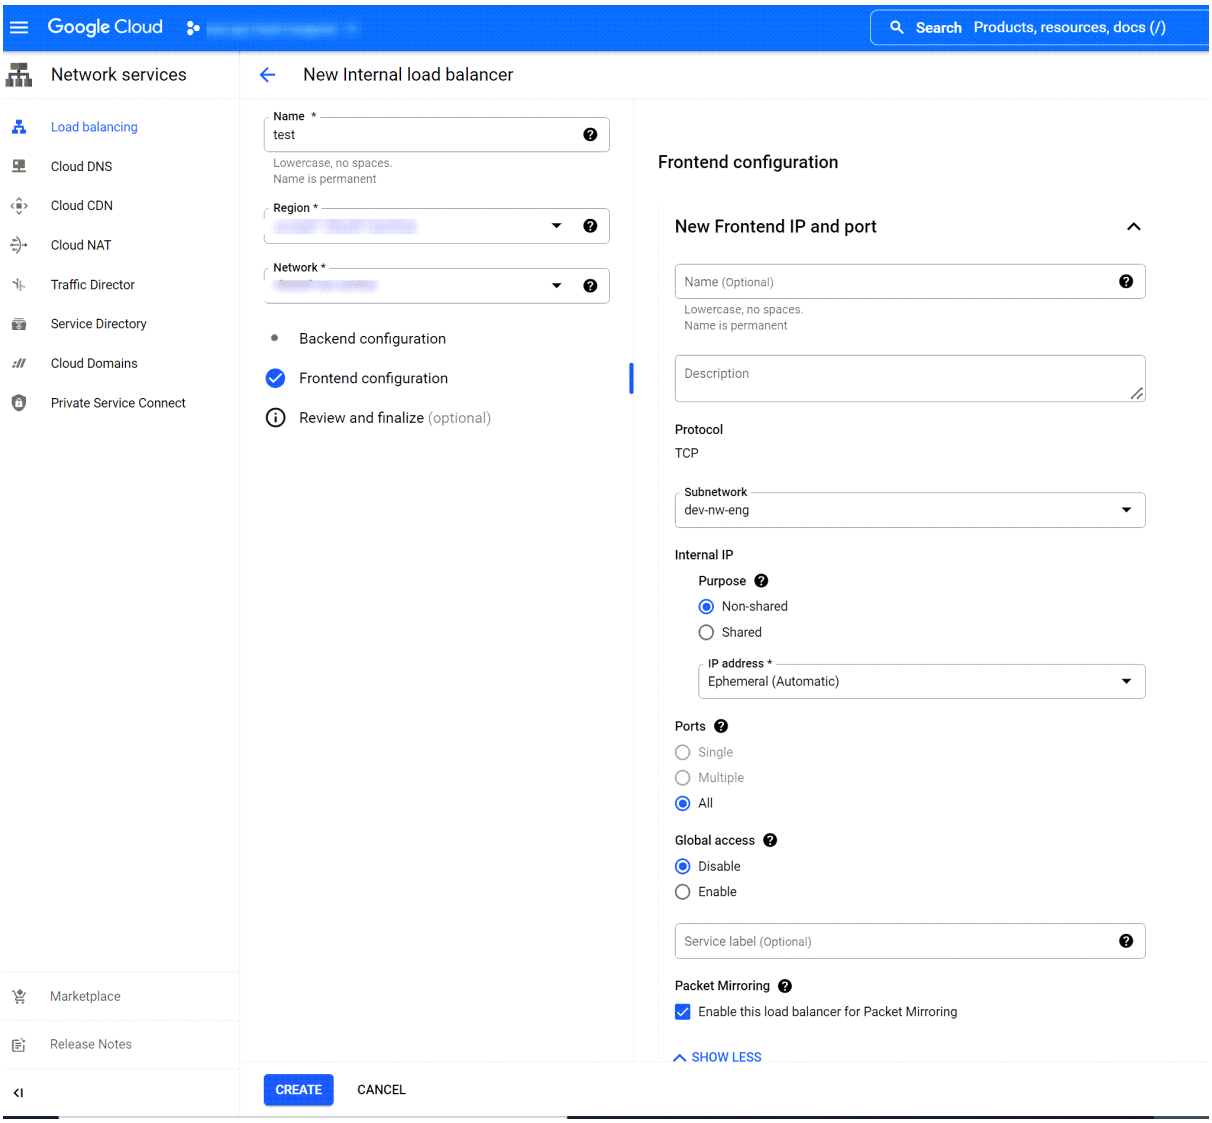
Task 3 - Create Load Balancer



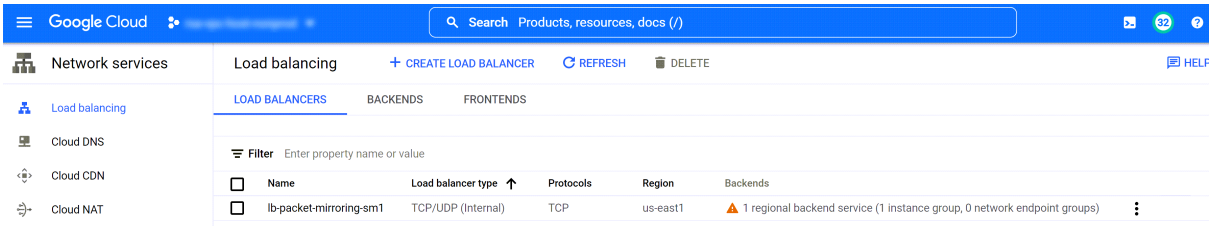
Complete the following steps to create the Load Balance:

1. Click **Load balancing**.
2. Click + **Create Load Balancers**.
3. Enter the following details to configure load balancer:
   - **Name**: Enter a name for the load balancer.
   - **Region**: Select a region from the drop-down list.
   - **Network**: Select a network from the drop-down list.

4. Click **Backend configuration**.



5. Under **New backend**, select the instance group created in Task 1 - Create Instance Group from the **Instance group** drop-down list.
6. Perform the following steps to create a Health Check:

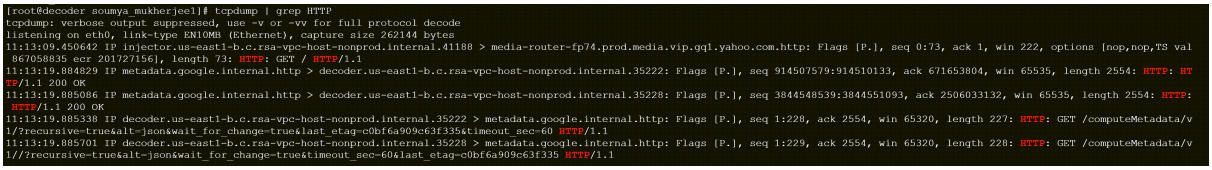


- **Name**: Enter a name for the health check.
- (Optional) **Description**: Enter the description for the health check.
- Under **Scope**: By default, **Regional** option is selected.
- **Region**: Select the region from the drop-down list.
- **Protocol**: Select the **TCP** protocol from the drop-down list.
- **Port**: Enter the port number **80**.
- **Proxy Protocol:** By default, **None** option is selected.
- **Logs**: By default, **Off** option is selected.
- Under **Health Criteria**, retain the default values.
- Click **Save**.

7. Click **Frontend Configuration**.
8. Under **New Frontend IP and port**, configure the following details:

- (Optional) **Name**: Enter a name.
- **Description**: Provide the description.
- Under **Protocol**, in the **TCP** section, select a **subnetwork** from the drop down list.
- Under **Internal IP**, in the **Purpose** section, by default **Non-shared** is selected.
- **IP address**: By default, **Epherneral (Automatic)** is selected.
- Under **Ports**, select **All** option.
- Under **Global Access**, by default **Disable** is selected.
- Under **Packet Mirroring**, select **Enable this load balancer for Packet Mirroring**.
- (Optional) Under **Review and Finalize**, review all the configured details.
- Click **Create**.

9. The Load Balancer will be created. The Health Check may show unhealthy status but it does not impact packet mirroring policy.



Task 4 - Verify Packet Mirroring in GCP

1. Go to the Packet Decoder service and click  > **View > Config** page and set the **Capture Interface Selected** parameter to the following value:
`packet_mmap_eth0 (bpf)`

2. SSH to the source mirrored instance.
3. Run the following command `curl <yahoo.com>` on source mirrored instance.
4. SSH to the Packet Decoder.
5. Run the following command `tcpdump` on Packet Decoder and verify if the traffic has been mirrored.

6. Log in to the NetWitness Platform XDR to verify on Packet Decoder.
7. Go to **Investigate** > **Events** and select **Concentrator** from query profile drop-down menu.
8. To verify, click search will filter out the domains name based on their configuration.

GCP Instance Configuration Recommendations

Note: These recommendations can be used as a baseline for 12.3.0.0 and adjusted as needed.

Instance compute, and memory utilization will vary depending on content applied, ingestion rates, and the number of running queries.

This topic contains the minimum GCP instance configuration settings recommended for the NetWitness virtual stack components.

- Compute Engine Instance:
  - Minimum instance type - **n2-standard-32** is the minimum instance type required for any NetWitness component image so that it can function.
  - Machine type adjustments - You must adjust machine types according to your ingestion rate, content and parsers, dashboard reports, scheduled reports, investigations, and active users.
    - All the components were integrated.
    - The Log stream includes a Log Decoder, Concentrator, and Archiver.
    - The Endpoint Hybrid stream includes an Endpoint Server, Concentrator, and Log Decoder.
    - Respond receives alerts from the Reporting Engine, and Event Stream Analysis.
    - The background load includes reports, charts, alerts, investigation, and respond.
- Persistent Disk (Storage)

  For performance recommendations, recommended storage allocation per NetWitness host, and input/output operations per second, see the "Storage Requirements" topic in the *Storage Guide for NetWitness® Platform XDR 12.3.0.0*.

  The following table displays the specification recommendations for NetWitness GCP instances.
- RAIDs were not configured because single SSD disks provided the required IO/s, and no scaling issues were found.

IMPORTANT: The recommended configurations can handle up to 15,000 requests per second (EPS). However, if your system is under a heavier load, you can increase the memory size to accommodate more requests.

Virtual Log Collector (VLC)

Compute Engine Instance			
EPS	**Machine Type**	**Virtual CPU's**	**Memory**
5,000	n2-standard-4	4	16 GB
10,000	n2-standard-4	4	16 GB

Compute Engine Instance			
EPS	Machine Type	Virtual CPU's	Memory
15,000	n2-standard-4	4	16 GB

Archiver

Compute Engine Instance			
EPS	Machine Type	Virtual CPU's	Memory
5,000	n2-standard-4	4	16 GB
10,000	n2-standard-4	4	16 GB
15,000	n2-standard-4	4	16 GB

Broker

Compute Engine Instance			
EPS	Machine Type	Virtual CPU's	Memory
5,000	n2-standard-4	4	16 GB
10,000	n2-standard-4	4	16 GB
15,000	n2-standard-4	4	16 GB

Log Concentrator

Compute Engine Instance			
EPS	Machine Type	Virtual CPU's	Memory
5,000	n2-standard-8	8	32 GB
10,000	n2-standard-8	8	32 GB
15,000	n2-standard-8	8	32 GB

Note: The memory can be increased to handle the query load on the concentrator. This includes queries on the **Investigate** page, alert generation rules, and more. You can also adjust the maximum number of concurrent queries that can be run on the concentrator, based on the load.

Event Stream Analysis (ESA)

Compute Engine Instance			
EPS	**Machine Type**	**Virtual CPU's**	**Memory**
9,000	n2-standard-8	8	32 GB
18,000	n2-standard-16	16	64 GB
30,000	n2-standard-32	32	128 GB

Log Decoder

Compute Engine Instance			
EPS	**Machine Type**	**Virtual CPU's**	**Memory**
5,000	n2-standard-8	8	32 GB
10,000	n2-standard-16	16	32 GB
15,000	n2-standard-32	32	32 GB

NetWitness Endpoint Hybrid

Compute Engine Instance			
Agents	**Machine Type**	**Virtual CPU's**	**Memory**
15,000 agents	n2-standard-48	48	192 GB

New Health and Wellness

Compute Engine Instance		
Machine Type	**Virtual CPU's**	**Memory**
n2-standard-4	4	16 GB

NetWitness Server and Co-Located Components

Compute Engine Instance		
Machine Type	**Virtual CPU's**	**Memory**
n2-standard-16	16	128 GB

Note: Extra memory is necessary for efficiently managing the workload of queries, including generating reports, charts, alerts, and lists on the Reporting Engine.

Analyst UI

Compute Engine Instance		
Machine Type	**Virtual CPU's**	**Memory**
n2-standard-8	8	32 GB

UEBA

Compute Engine Instance		
Machine Type	**Virtual CPU's**	**Memory**
n2-standard-16	16	64 GB

Hosts and Services Basics

This guide gives administrators the standard procedures for adding and configuring hosts and services in NetWitness. After introducing you to the basic purpose of hosts and services and how they function within the NetWitness network, this guide covers:

- Tasks you must complete to set up hosts and services in your network
- Additional procedures that you complete based on the long-term and daily, operational needs of your enterprise
- Reference topics that describe the user interface

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

What Is a Host?

A host is the machine on which a service runs and can be a physical or virtual machine. See the "NetWitness Detailed Host Deployment Diagram" in the *NetWitness Deployment Guide* for an illustration of how hosts are deployed.

What Is a Category?

A category assigns a service or services to a host when you install a host from the Hosts view. You choose a host **Category** in the **Install Services** dialog which is displayed when you select a host in the Hosts view and click 

. The following table lists each category and the services it installs. See the "NetWitness Detailed Host Deployment Diagram" in the *NetWitness Deployment Guide* for an illustration of how hosts are deployed.

Category	Services Installed
Analyst UI	Investigate Server, Broker, NetWitness UI, Reporting Engine, Respond Server
Archiver	Workbench and Archiver
Broker	Broker
Concentrator	Concentrator
Endpoint	Endpoint Server
Endpoint Broker	Endpoint Broker Server
Endpoint Log Hybrid	Log Collector, Log Decoder, Endpoint Server, and Concentrator
ESA Primary	Contexthub Server and ESA Correlation

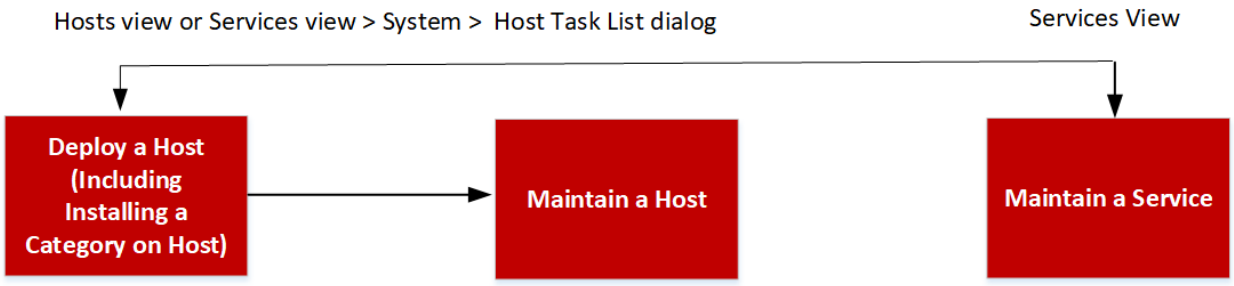
Category	Services Installed
ESA Secondary	ESA Correlation
Log Collector	Log Collector
Log Decoder	Log Collector and Log Decoder
Log Hybrid	Log Collector, Log Decoder, and Concentrator
Log Hybrid - Retention	Log Collector and Log Decoder (deployed on NetWitness Series 6 Hybrid hardware with Log Hybrid-Retention Optimization)
Malware Analysis	Malware Analysis and Broker
Network Decoder	Decoder (Packets)
Network Hybrid	Concentrator and Network Decoder
New Health and Wellness	Metrics Server
UEBA	UEBA
Warehouse Connector	Warehouse Connector

What Is a Service?

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host.

You must configure the following Core services first:

- Network Decoder
- Concentrator
- Broker
- Log Decoder



All the services are listed below and each service except the Log Collector has its own guide or shares a guide in the *Host and Services Configuration Guides* section of the NetWitness documentation page on NetWitness Community at https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation. The Log Collector has its own set of configuration guides to handle the configuration for all the supported event collection protocols. For Log Collector information, see *Log Collection Guides*.

You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data. For information about ports and a comprehensive list of ports for all services, see "Network Architecture and Ports" in the *Deployment Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

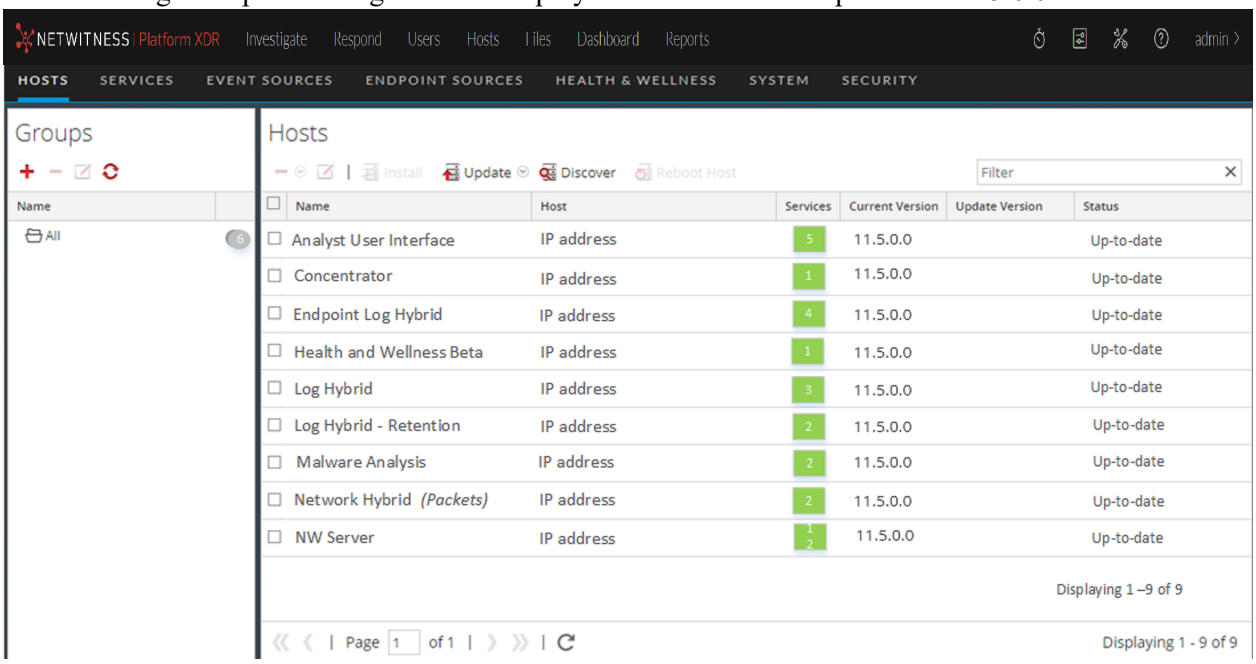
Setting Up a Host

You use the Hosts view to add a host to NetWitness. See Step 1. Deploy a Host for detailed instructions.

Maintaining Hosts

You use the main Hosts view (**(Admin) > Hosts**) to add, edit, delete, and perform other maintenance tasks for the hosts in your deployment. You use the Host Task List dialog to perform tasks relating to a host and its communications with the network. See Hosts and Services Maintenance Procedures for detailed instructions.

After initial implementation of NetWitness, the major task you perform from the Hosts view is updating your NetWitness deployment to a new version.



Update Version Naming Convention

You use the Hosts view to apply the latest version updates from your Hosts and Services Maintenance Procedures. You must understand the update version naming convention to know which version you want to apply to the host. The naming convention is ***major-release.minor-release.service-pack.patch***. For example, if you choose 11.6.1.2, you apply the following version to the host.

- 11 = major release
- 6 = minor release
- 1 = service pack
- 2 = patch

NetWitness supports multiple versions in your deployment. For more information, see Running in Mixed Mode. The NetWitness Server (NW Server Host) is updated first and all other hosts must have the same or earlier version as the NW Server Host.

The following example is a single version deployment with all hosts updated to 11.5.0.0.

Maintaining Services

You use the Services view (**(Admin) > Services**) to add, edit, delete, monitor, and perform other maintenance tasks for the services in your deployment. See Hosts and Services Procedures for detailed instructions.

Services Implemented with the NetWitness Server

The services in the following list are implemented when you deploy the NW Server to support:

- The expansion of physical and virtual deployment platforms and improvements to host and service maintenance.
- Content, Investigate, Respond, and Source functionality.

Caution: You do not need to configure these services to deploy NetWitness. recommends that you monitor the operating status of these services using Health-and-Wellness. Do not attempt to modify the parameters in the Explore view without contacting Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897).

Service	Purpose
Admin	The Administration (Admin) Server is the back-end service for administrative tasks in the NetWitness User Interface (UI). It abstracts authentication, global preferences management, and authorization support for the UI. The Admin server requires the Config server and the Security server to be online to perform its role.
Config	The Configuration (Config) Server stores and manages configuration sets. A configuration set is any logical configuration group that is managed independently. The Config server facilitates the sharing of properties among services, provides configuration backup and restore facilities, and tracks changes to properties.
Content	The Content server manages the NetWitness provided and user-created parser rules. For more information on parser management, search for "parsers" in NetWitness Community.
Integration	The Integration Server manages interactions with external systems. The service handles the following outbound or inbound channels. • REST API Gateway - gateway to external REST clients that assigns calls to the NetWitness Application Programming Interface (API). • Notifications Dispatcher - centralized dispatcher for all outbound notifications originating in the NetWitness deployment.
Investigate	The Investigate server supports Investigate and Malware Analysis functionality. For more information see the *NetWitness Investigate User Guide*.
Orchestration	The Orchestration server provisions, installs, and configures all services in your NetWitness deployment.
Respond	The Respond server supports Respond functionality. For more information see the *NetWitness Respond Configuration Guide*.

Service	Purpose
Security	The NetWitness Security Server (**Security server**) manages the security infrastructure of a NetWitness deployment. It handles the following security-related concerns. • Users and the authentication accounts • Role Based Access Control (RBAC) • Deployment PKI infrastructure A NetWitness deployment has users with authentication accounts. Independent of how you verify the identity of the analyst (for example, Active Directory), NetWitness must maintain the user state, which is not provided by all authentication providers (for example, last login time, failed login attempts, and roles). The concept of a user is separate from the identify associated with the user and the **Security server** maintains these as separate User and Account entities. In addition to the out-of-the-box local NetWitness accounts available to all NetWitness deployments, the server supports external authentication providers. The **Security server** also implements RBAC by managing Role and Permission entities. Permissions can be assigned to roles and roles to users. Together these enable a flexible authorization policy for the deployment. The server also manages generation of cryptographically secure tokens that encode the applicable authorization for a user. These tokens form the basis for deployment-wide authorization.
Source	The Source server is reserved for future use and will provide a centralized location to configure sources (for example, Endpoints and Log Sources).

Running in Mixed Mode

Mixed mode occurs when some services are updated to the latest version and some are still on older versions. This happens when you update the hosts in your deployment to the latest version in phases (or stagger the update).

Functionality Gaps Encountered During in Staggered Updates

If you stagger the update, you:

- May not have all the features operational until you update your entire deployment.
- Will not have service administrative features available until you update all the hosts in your deployment.
- May be without data capture for a period of time.

Examples of Staggered Updates

In the following examples, all the hosts are on 11.4.0.0 and you want to stagger the host updates to version 11.4.1.0.

Example 1. Multiple Network Decoders and Concentrators, Alternative 1

In this example, the 11.4.0.0 deployment includes one NW Server host, two Network Decoder hosts, two Concentrator hosts, one Archiver host, one Broker host, one Event Stream Analysis host, one Endpoint Log Hybrid host, and one Malware Analysis host.

You must complete Session 1 first and update the hosts in the order listed.

NetWitness recommends that you update the Sessions 2 and 3 hosts in the order listed.

Session 1: Update Essential Hosts

1. Update the NetWitness Server host.
2. Update the Event Stream Analysis host.
3. Update the Endpoint Log Hybrid host.
4. Update the Malware Analysis host.
5. Update the Broker host.

Session 2: Update Other Hosts

1. Update the two Network Decoder hosts.
2. Update the two Concentrator hosts and the Archiver host.

Session 3: Update Other Hosts

1. Update all other hosts.

Example 2. Multiple Network Decoders and Concentrators, Alternative 2

In this example, the 11.4.0.0 deployment includes one NW Server host, two Network Decoder hosts, two Concentrator hosts, one Broker host, one Event Stream Analysis host, one Endpoint Log Hybrid host and one Malware Analysis host.

You must complete Session 1 first and update the hosts in the order listed.

NetWitness recommends that you update the Sessions 2 and 3 hosts in the order listed.

Session 1: Update Essential Hosts

1. Update the NetWitness Server host.
2. Update the Event Stream Analysis host.
3. Update the Endpoint Log Hybrid host.
4. Update the Malware Analysis host.
5. Update the Broker host.

Session 2: Update Other Hosts

1. Update one Network Decoder host and one Concentrator host.

Note: It does not matter which of the Network Decoder hosts or which of the Concentrator hosts you update first.

Time elapses during which NetWitness processes a significant amount of data.

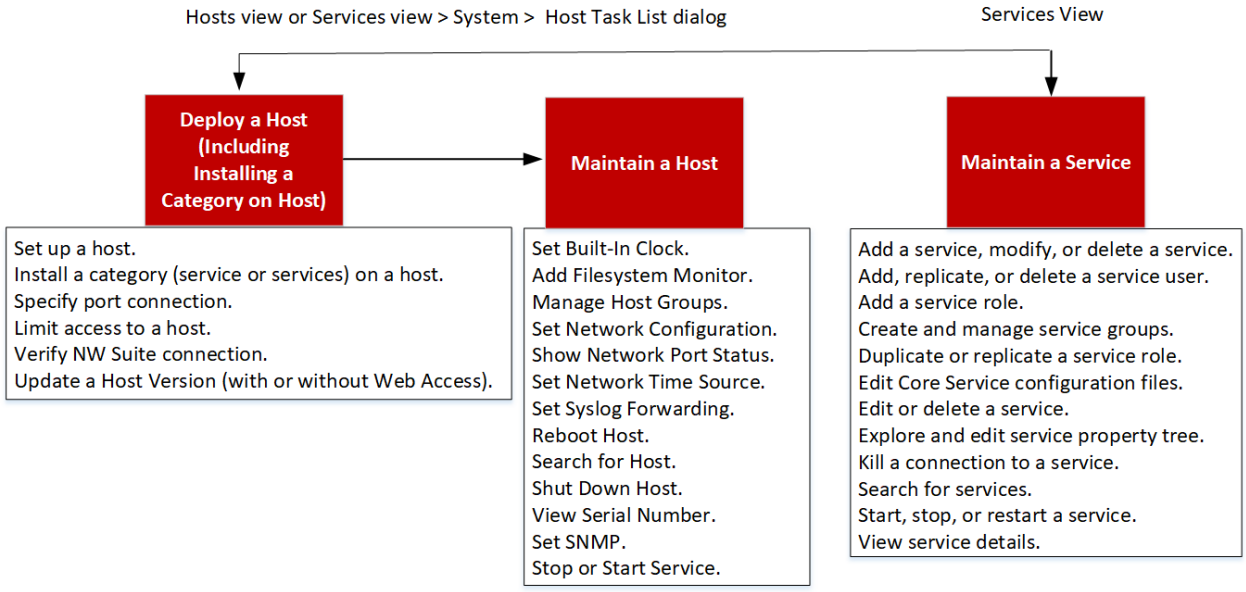
Session 3: Update Other Hosts

1. Update the second Network Decoder host and the second Concentrator host.
2. Update all Log Decoder hosts before you update Virtual Log Collectors.
3. Update all other hosts.

Example 3. Multiple Regions

In this example, the 11.4.0.0 deployment includes one NW Server host, one Event Stream Analysis host, one Endpoint Log Hybrid host, one Malware Analysis host. Additionally, there are two sites, each with two Network Decoders, two Concentrators, and one Broker, for a total of four Network Decoder hosts, four Concentrator hosts, and two Broker hosts.

Session 1: Update Essential Hosts and Site 1



1. Update the NW Server host.
2. Update the Event Stream Analysis host.
3. Update the Endpoint Log Hybrid host.
4. Update the Malware Analysis host.
5. Update one Broker host, two Network Decoder hosts, and two Concentrator hosts.

Session 2: Update Other Hosts and Site 2

1. Update the second Broker host.
2. Update the two remaining Network Decoder hosts.
3. Update the two remaining Concentrator hosts.
4. Update all the other hosts.

Hosts and Services Set Up Procedures

Every service requires a host. After you set up a host, you can assign services to and from this host to other hosts in your NetWitness deployment. This topic contains information about basic procedures. For additional procedures, see Hosts and Services Maintenance Procedures.

High-Level Task	Description
Set Up a Host	Complete the following tasks in the order shown to set up a host. Step 1. Deploy a Host Step 2. Install a Service on a Host Step 3. Review SSL Ports for Trusted Connections Step 4. Manage Access to a Service

Step 1. Deploy a Host

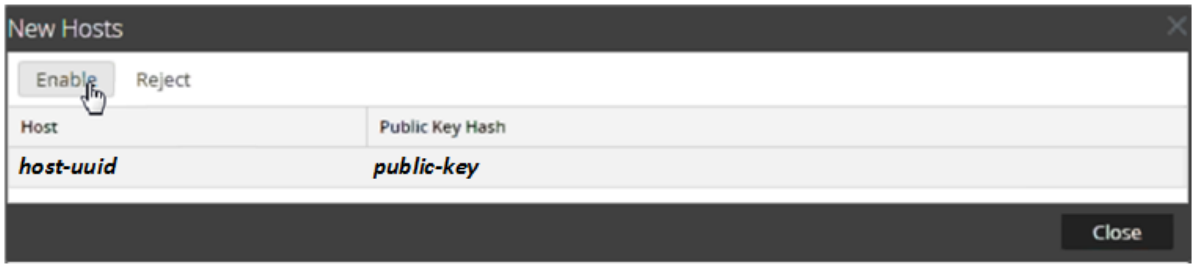
Caution: If you include "." in a host name, the host name must also include a valid domain name.

1. Deploy a host.

   You can deploy a physical host (NetWitness Appliance), virtual host on-prem, a virtual in AWS, a virtual host in Azure, or a virtual host on Google Cloud Platform. See the following guides for instructions on how to deploy hosts.

   - *Physical Host Installation Guide*
   - *Virtual Host Installation Guide*
   - *AWS Installation Guide*

- *Azure Installation Guide*
- *GCP Installation Guide*



2. Go to **(Admin) > Hosts**.

   The New Hosts dialog is displayed with the hosts that you deployed.

3. Select the hosts that you want to enable.

   The Enable menu option becomes active.

4. Click **Enable**.

5. Select the host you enabled.

   The host is displayed in the Hosts view. At this point, you can install a service on the host.

Step 2. Install a Service on a Host

Perform the following steps to install a service on a host.

1. In NetWitness, go to **(Admin) > Hosts**.

   The Hosts view is displayed.

2. Select the host on which you want to install the service (for example, **Event Stream Analysis**).

3. Click Install in the toolbar.

   The Install Services dialog is displayed.

4. Select a service from the **Category** drop-down list (for example, **ESA Primary**).

5. Click Install in the Install Services dialog.

6. A pop-up listing all the services already installed on this host is displayed. If there are no services installed, this pop-up will not be displayed.

7. Click **Yes** to install the new service.

Step 3. Review SSL Ports for Trusted Connections

To support trusted connections each core service has two ports, an unencrypted non-SSL port and an encrypted SSL port. Trusted connections require the encrypted SSL port.

Encrypted SSL Ports

By default, trusted connections are established with two settings:

- SSL is enabled.
- Core service is connected to an encrypted SSL port.

Each NetWitness Core service has two ports:

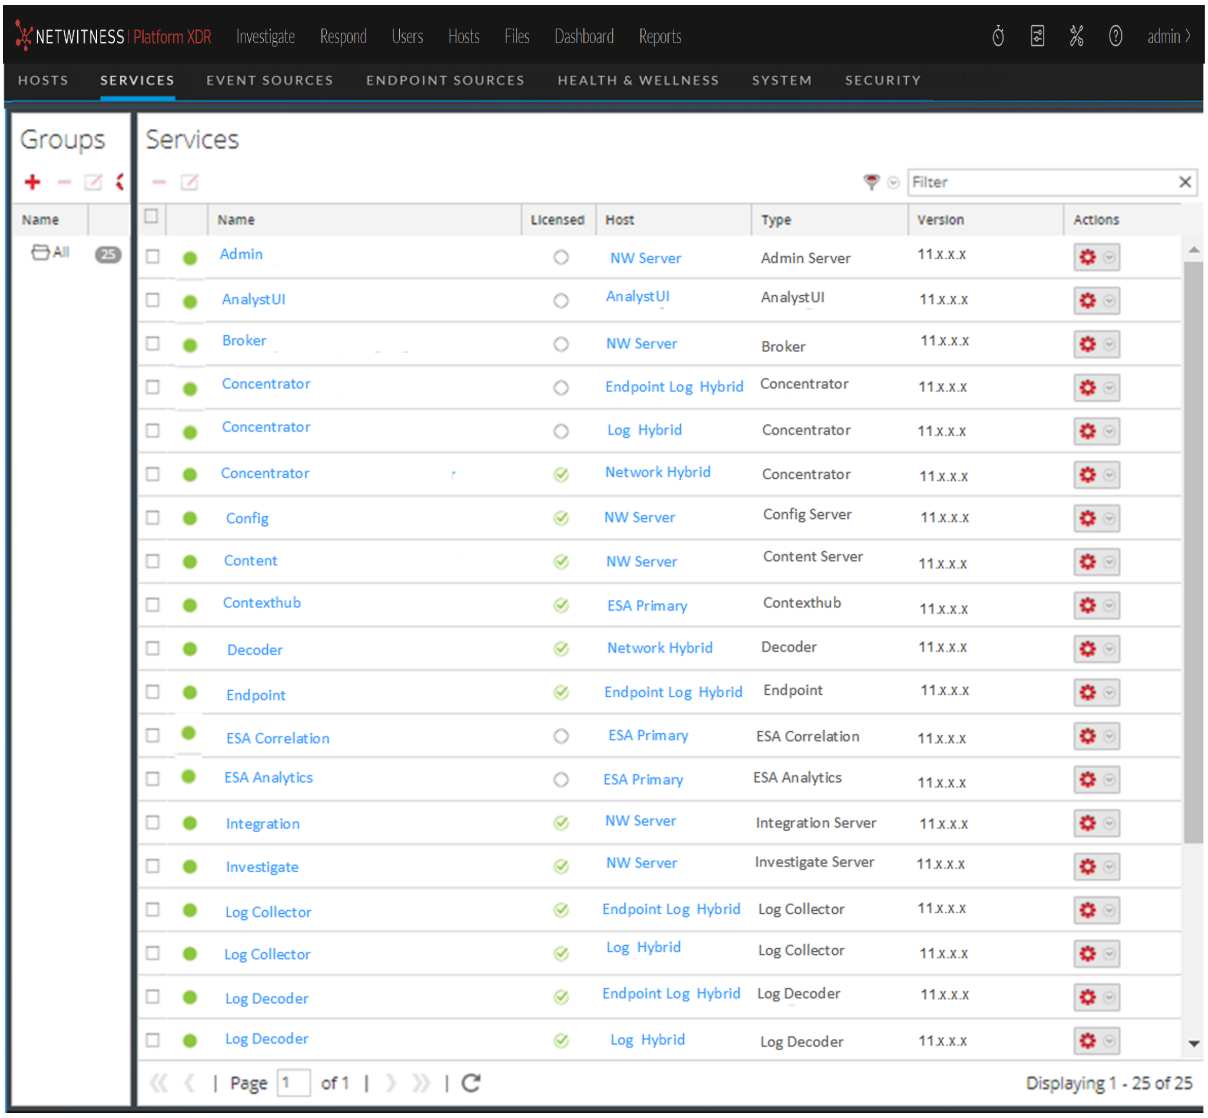
- Unencrypted non-SSL port
  Example: Archiver 50008
- Encrypted SSL port
  Example: Archiver 56008

The SSL port is the non-SSL port + 6000.

For information about ports and a comprehensive list of ports for all services, see "Network Architecture and Ports" in the *Deployment Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

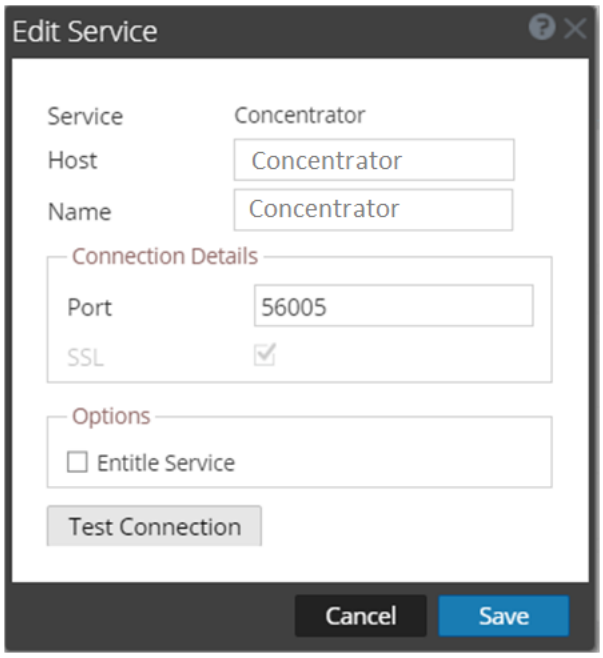
Step 4. Manage Access to a Service

In a trusted connection, a service explicitly trusts the NW Server to manage and authenticate users. With this trust, services in  **(Admin) > Services** no longer require credentials to be defined for every NetWitness Core service. Instead, users who have been authenticated by the server can access the service without entering another password.



Test a Trusted Connection

Prerequisites



1. The administrator must assign a role to the user.
   For more information, see "Add a User and Assign a Role" in the *System Security and User Management Guide*.
2. The user must:
   - Log in to NetWitness for the server to authenticate the user.
   - Have access to the service.

Procedure

1. In NetWitness, go to  **(Admin) > Services**.
   The Services view is displayed.

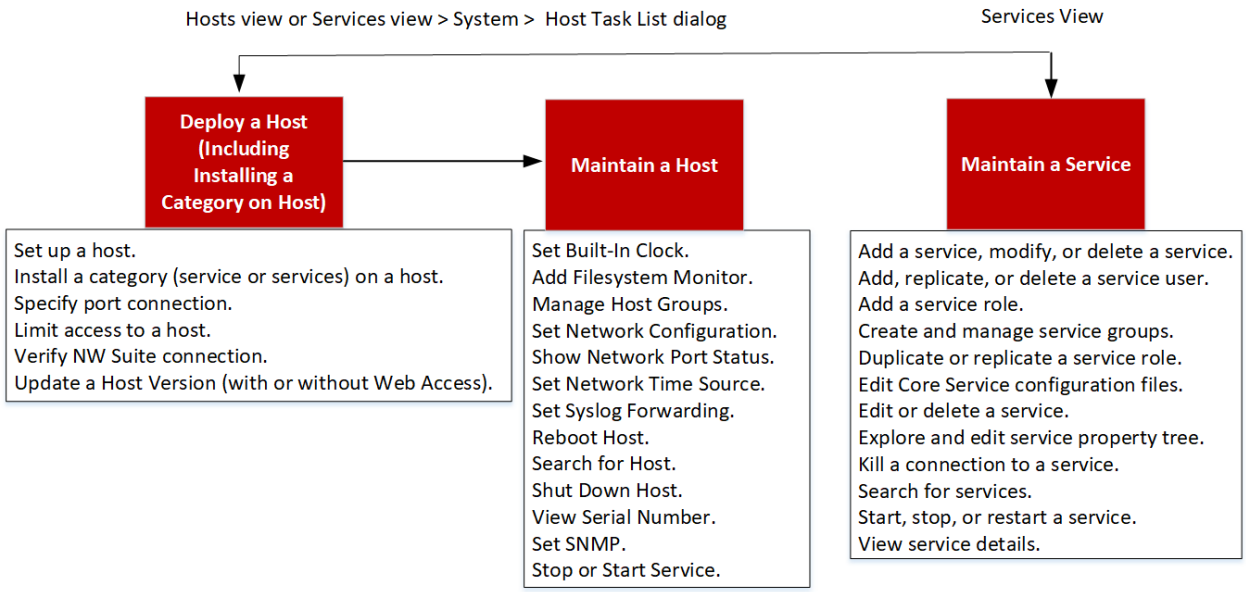
Displaying 1 - 25 of 25

2. Select the checkbox of the service (for example, a Concentrator) to test and click .
   The **Edit Service** dialog is displayed.

Note: The Options box will only display if the selected service is not licensed. A licensed service is denoted by a  in the Services view.

3. Remove the username to test the connection without credentials.
4. Click **Test Connection**.



The message `Test connection successful` confirms the trusted connection is established. The previously authenticated user can access the service without typing a username and password on the service.

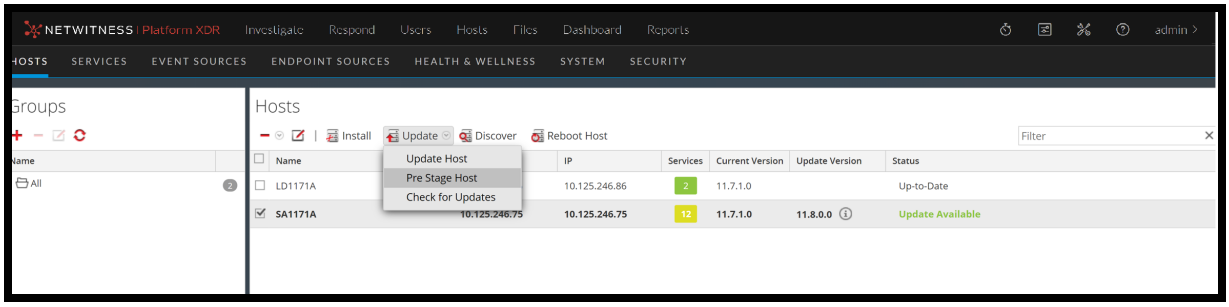
5. Click **Save**.

Hosts and Services Maintenance Procedures

Every service requires a host. After you set up a host, you can assign services to and from this host to other hosts in your NetWitness deployment.

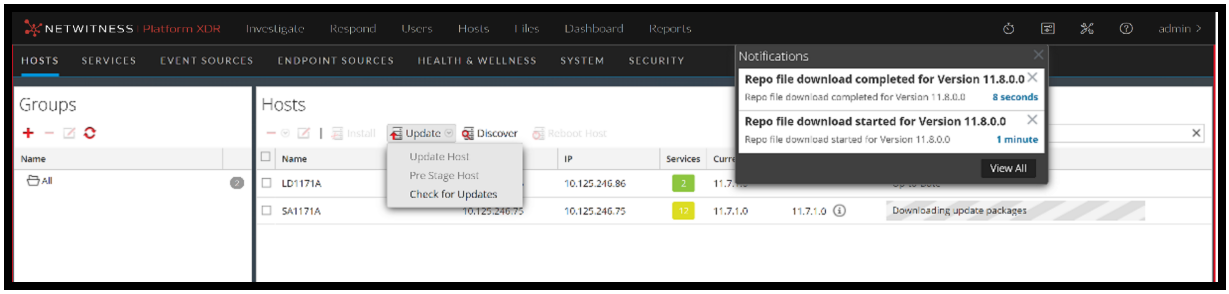
High-Level Task	Description
Maintain a Host - Basics	The following maintenance tasks are shown in alphabetical order. • Apply Version Upgrades to a Host • Create and Manage Host Groups • Search for Hosts • Set Network Time Source • Show Network Port Status • Show Serial Number • Shut Down Host • Stop and Start a Service on a Host

High-Level Task	Description
Maintain a Host from the Host Task List Dialog	You use the Host Task List dialog to manage tasks that relate to a host and its communications with the network. Several service and host configuration options are available for Core hosts. • Execute a Task From the Host Task List • Add and Delete a Filesystem Monitor • Reboot a Host • Set Host Built-In Clock • Set Network Time Source • Set SNMP • Set Syslog Forwarding • Show Network Port Status • Show Serial Number • Shut Down Host • Stop and Start a Service on a Host
Maintain a Service	The following procedures describe how to maintain services. • Add, Replicate, or Delete a Service User • Add a User Role to a Service • Change a Service User Password • Create and Manage Service Groups • Duplicate or Replicate a Service Role • Edit Core Service Configuration Files • Edit or Delete a Service • Explore and Edit Service Property Tree • Terminate a Connection to a Service • Search for Services • Start, Stop, or Restart a Service • View Topology Details • Services System View • Centralized Service Configuration via Policy



Apply Version Upgrades to a Host

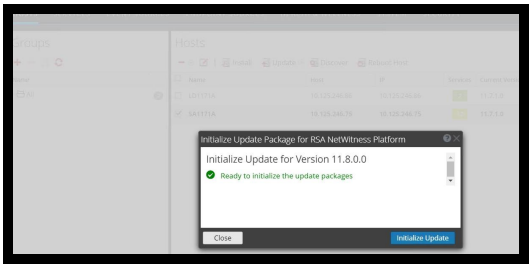
Upgrade guides are available for all supported versions of NetWitness. Refer to the upgrade guide for the latest version in the *Install and Upgrade* section of the NetWitness documentation page on NetWitness Link.



Pre-Stage Host

Note: The **Pre Stage Host** option is enabled for upgrade on the Admin Server. This option will be available after you upgrade to 11.7.1 and can be used to upgrade to versions later than 11.7.1.

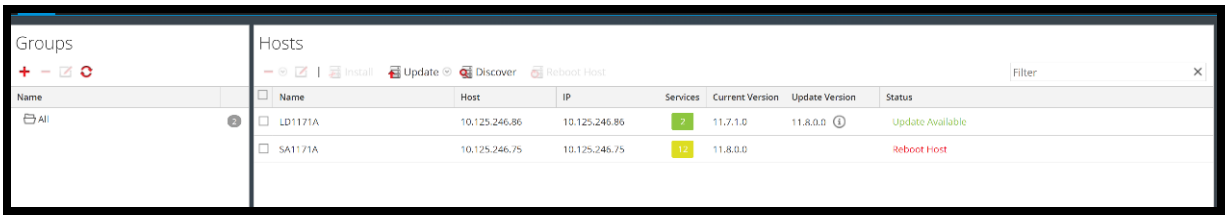
1. Go to  > Hosts.
2. Click **Update** > **Check for Updates**.
   All possible update versions will displayed in the Versions drop-down list.
3. Click **Update** > **Pre Stage Host** and select the version in the update version column.
   A confirmation message for downloading the files is displayed.



4. Click **Yes** to download the upgrade packages to the repo.
5. Verify the status of the download in the notifications tray as shown below.
   The **Pre Stage Host** and **Upgrade Host** will be disabled until pre stage is completed.

Note: The current version and the update version in the UI will be the same during the pre stage as it is not the actual update. This is because only the repo files are downloaded and no actual upgrade is done. The version will change only after upgrade.

6. If the download is successful, **Check for Updates** again to start the initialization.



7. Click on **Initialize Update**.
   The initialization of the package will take some time as the files are large and will need to be unzipped.

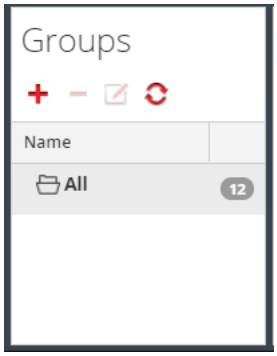
IMPORTANT: Pre Stage Repo preparation steps from 1 to 4 can be performed at any time. However, from steps 5 to 8 the upgrade process begins and you must NOT reboot the host or restart the jetty server during this time as it will corrupt the .ZIP files.

8. Check the status of initialization in the notifications tray.

9. After the initialization is completed successfully, click **Update** > **Update Host.**
   After the host is updated, you will be prompted to reboot the host.

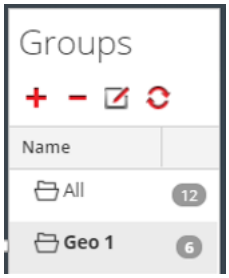
10. Set up the host and reboot the host.

Create and Manage Host Groups



The Hosts view provides options for creating and managing groups of hosts. The Groups panel toolbar includes options for creating, editing, and deleting host groups. Once groups are created, you can drag individual hosts from the Hosts panel into a group.

Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A host may belong to more than one group. Here are some examples of possible groupings:



- Group different categories to make it easier to configure and monitor all Brokers, Network Decoders, or Concentrators.
- Group hosts that are part of the same data flow; for example, a Broker, and all associated Concentrators and Network Decoders.
- Group hosts according to their geographic region and location within the region. If a major power outage occurs in a location, potentially affected hosts are easily identifiable.

Create a Group

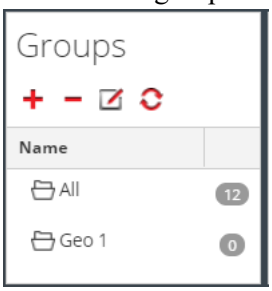
1. Select **(Admin) > Hosts**.
   The Hosts view is displayed.
2. In the **Groups** panel toolbar, click +.
   A field for the new group opens with a blinking cursor.

3. Type the name of the new group in the field (for example, `Geo 1`) and press **Enter**.
   The group is created as a folder in the tree. The number next to the group indicates the number of hosts in that group.

Change the Name of a Group

1. In the Hosts view **Groups** panel, double-click the group name, or select the group and click .
   The name field opens with a blinking cursor.
2. Type the new name of the group and press **Enter**.
   The name field closes and the new group name is displayed in the tree.

Add a Host to a Group



In the Hosts view **Hosts** panel, select a host and drag the host to a group folder in the Groups panel. The host is added to the group.

View the Hosts in a Group

To view the hosts in a group, click the group in the **Groups** panel.
The Hosts panel lists the hosts in that group.

Remove a Host from a Group

1. In the Hosts view **Groups** panel, select the group that contains the host that you want to remove. The hosts in that group appear in the Hosts panel.
2. In the **Hosts** panel, select one or more hosts that you want to remove from the group, and in the toolbar, select − > **Remove from Group**.
   The selected hosts are removed from the group, but are not removed from the NetWitness user interface. The number of hosts in the group, which is listed near the group name, decreases by the number of hosts removed from the group. The `All` group contains the hosts that were removed from the group.
   In the following example, the host group called `Geo 1` does not contain any hosts, because all the hosts in that group are removed.

Delete a Group

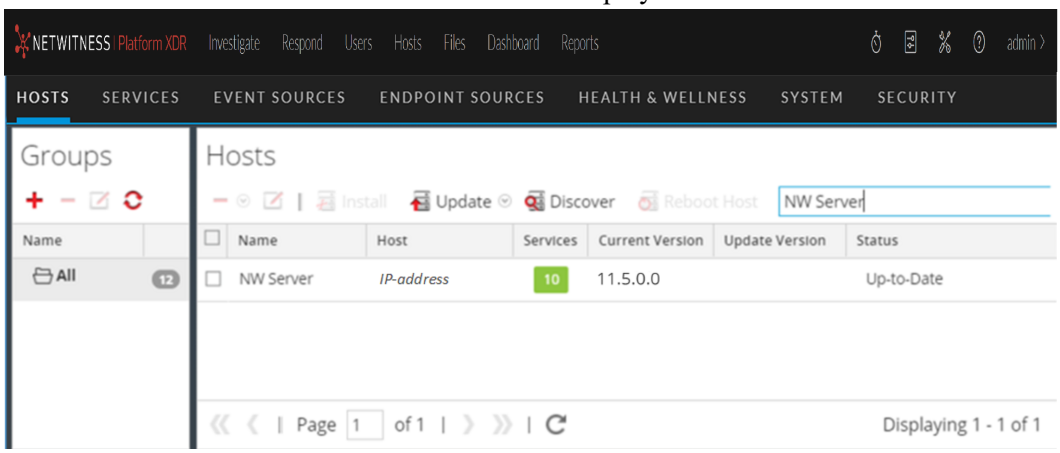
1. In the Hosts view **Groups** panel, select the group that you want to delete.
2. Click −.
   The selected group is removed from the Groups panel. The hosts that were in the group are not removed from the NetWitness user interface. The `All` group contains the hosts from the deleted group.

Search for Hosts

You can search for hosts from a list of hosts in the Hosts view. The Hosts view enables you quickly filter the list of hosts by Name and Host. It is possible to have numerous NetWitness hosts in use for various purposes. Instead of scrolling through the host list, you can quickly filter the host list to locate the hosts that you want to administer.

In the Services view, you can search for a service and quickly find the host that runs that service.

Search for a Host

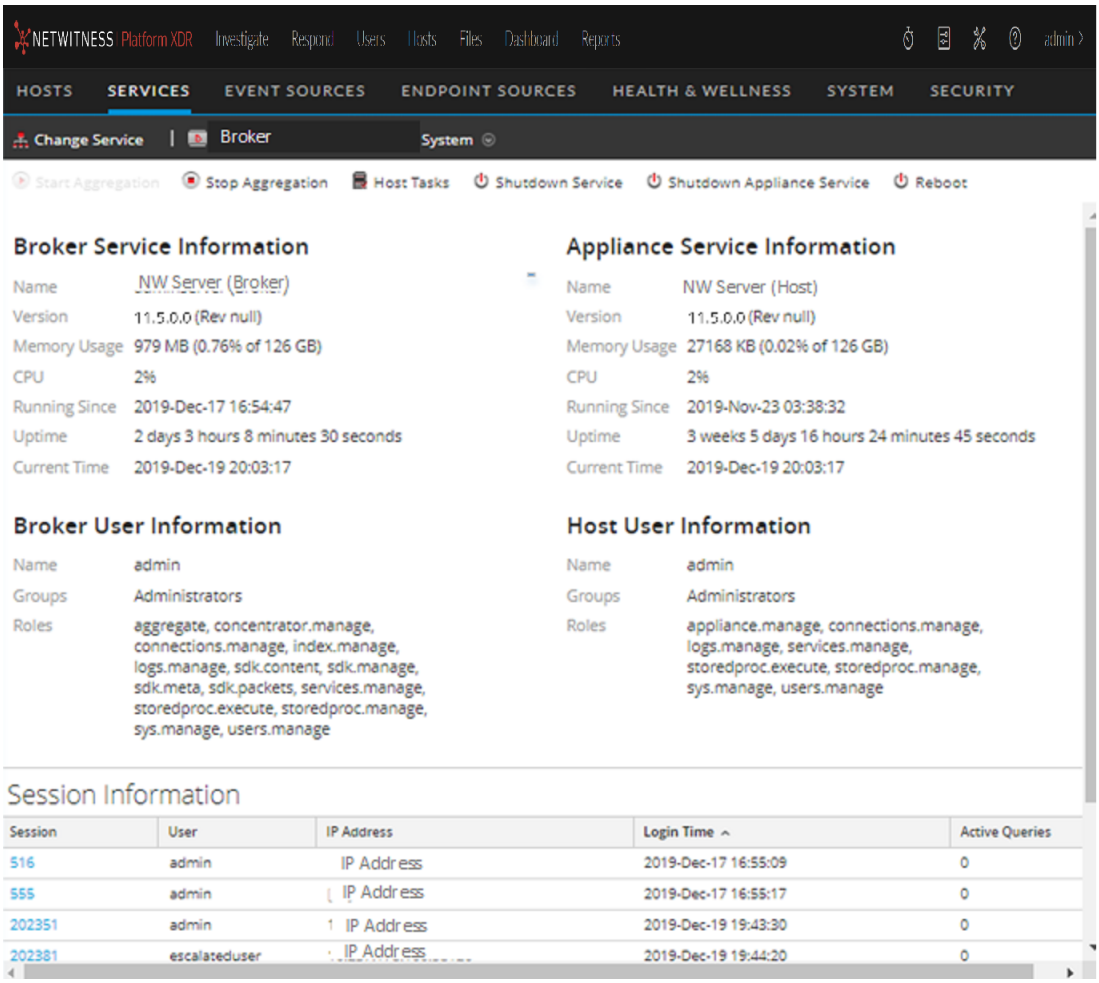


1. Select **(Admin) > Hosts**.
2. In the **Hosts** panel toolbar, type a host **Name** or **Hostname** in the **Filter** field.

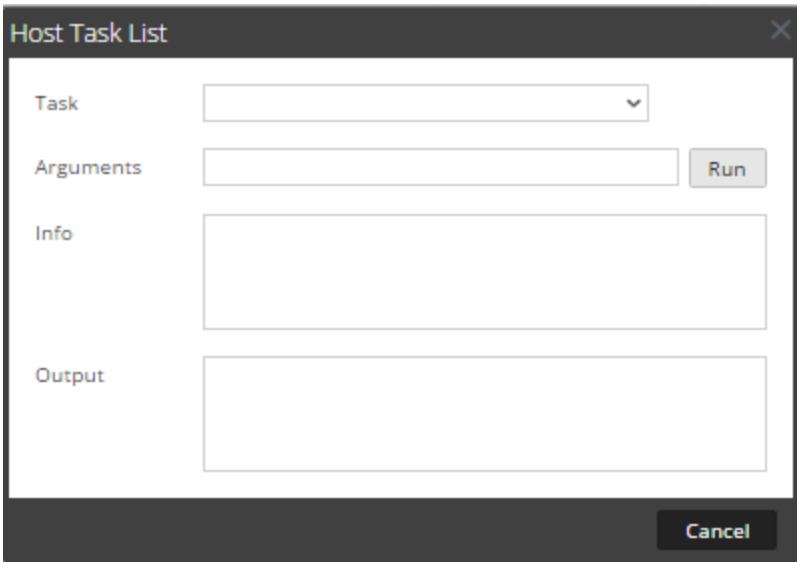
   The Hosts panel lists the hosts that match the names entered in the Filter field.

Find the Host that Runs a Service

1. Select **(Admin) > Services**.
2. In the **Services** view, select a service. The associated host is listed in the Host column for that service.
3. To administer the host in the Hosts view, click the link in the **Host** column for that service. The host associated with the selected service is displayed in the Hosts view.



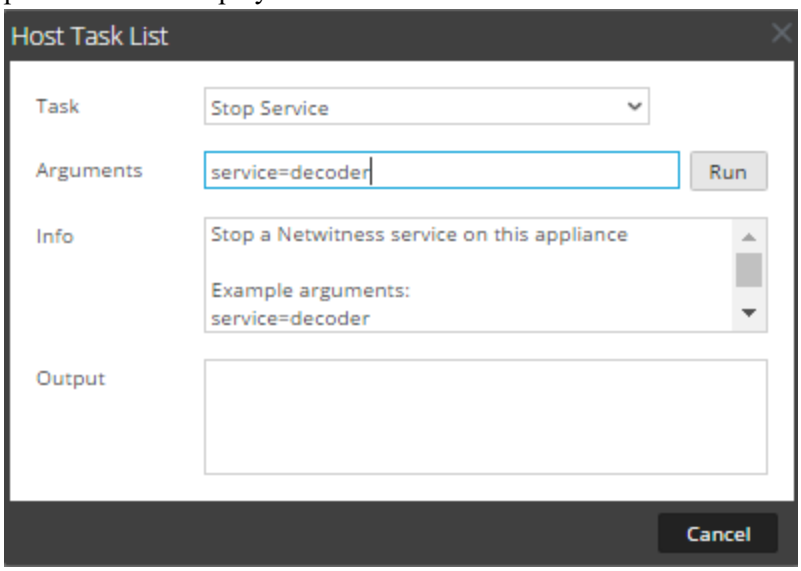
Execute a Task From the Host Task List



1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.

   Note: The Admin, Config, Orchestration, Security, Investigate, and Respond services do have access to the System view. They only have access to the Explore view.

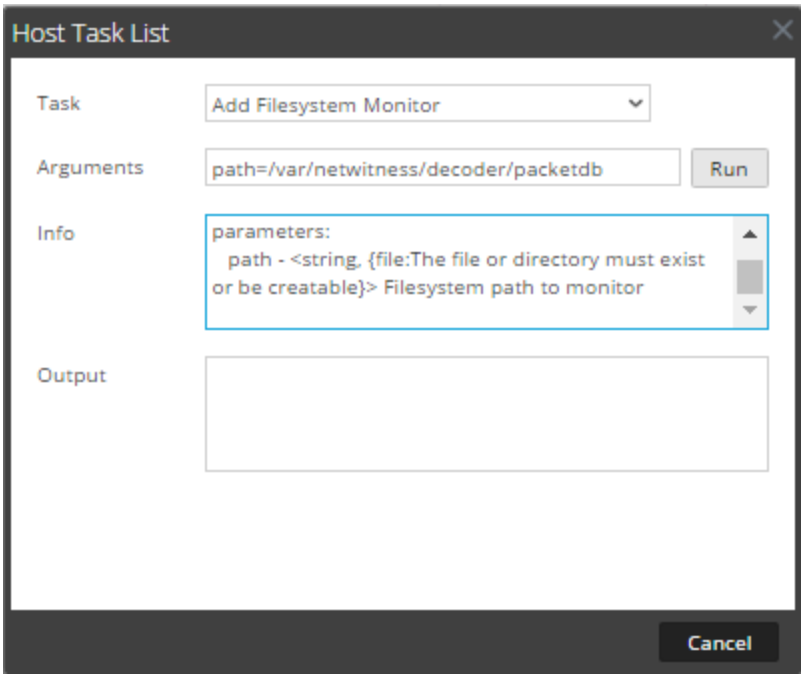
   The System view for the service is displayed below.



3. In the **Services System** view toolbar, click Host Tasks.

4. In the **Host Task List** dialog, click in the **Task** field to display a drop-down list of tasks that run on a host.

5. Select a task (for example, click **Stop Service**).
The task is displayed in the Task field. Task description, example arguments, security roles, and parameters are displayed in the Info area.

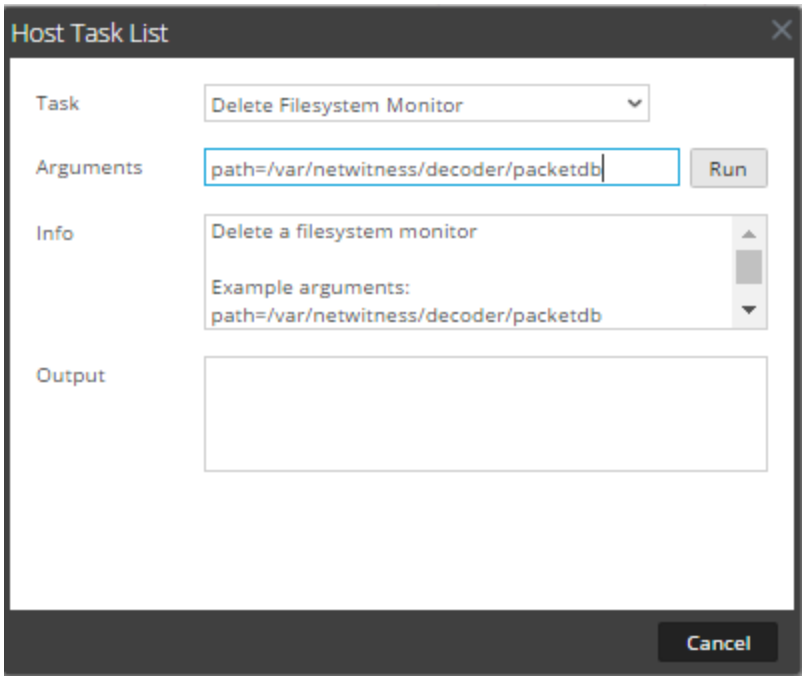


6. Type arguments if necessary and click **Run**.
The command executes and the result is displayed in the Output section.

Add and Delete a Filesystem Monitor

When you want a service to monitor traffic on a specific file system, you can select the service and then specify the path. NetWitness Platform adds a filesystem monitor. Once a file system monitor is added to a service, the service continues to monitor traffic on that path until the file system monitor is deleted.

Configure the Filesystem Monitor



1. Select  **(Admin) > Services**.
2. In the **Services** list, select a service and click  **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Add Filesystem Monitor**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.
5. To identify the file system to monitor, type the path in the **Arguments** field. For example:
   `path=/var/netwitness/decoder/packetdb`

6. Click **Run**.
   The result is displayed in the Output area. The service begins to monitor the file system and continues to monitor it until you delete the filesystem monitor.

Delete a Filesystem Monitor

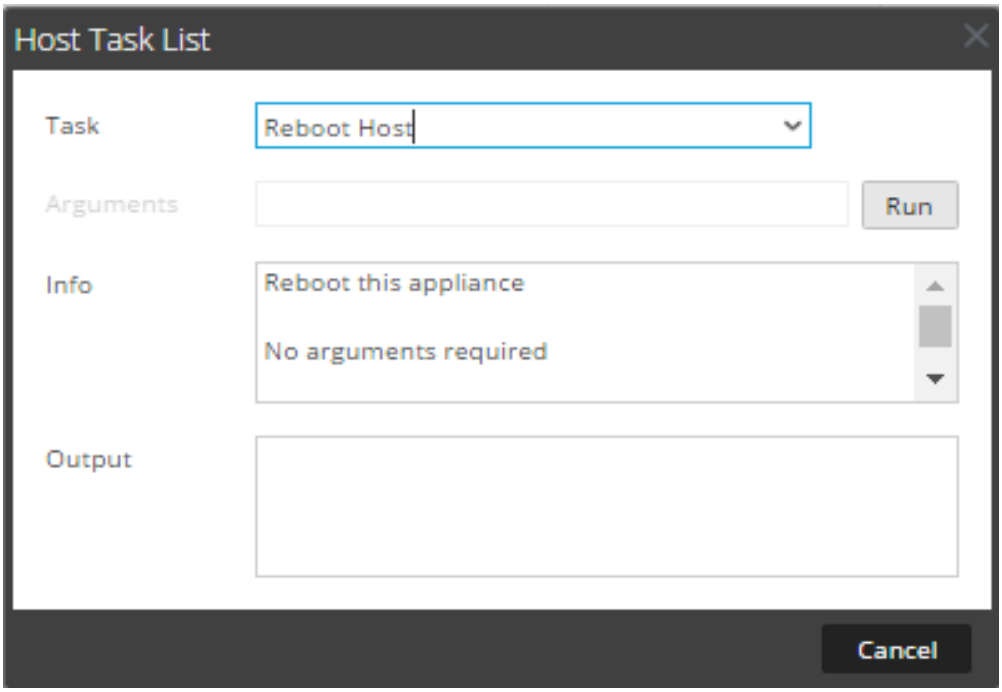
1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Delete Filesystem Monitor**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.
5. To identify the filesystem to stop monitoring, type the path in the **Arguments** field. For example:
   `path=/var/netwitness/decoder/packetdb`

6. Click **Run**.
   The result is displayed in the Output area. The service stops monitoring the file system.

Reboot a Host

Under certain conditions, you must reboot a host; for example, after installing a software upgrade. This procedure uses a Host Task List message to shut down and restart a host.

NetWitness Platform also offers other options for shutting down a host:



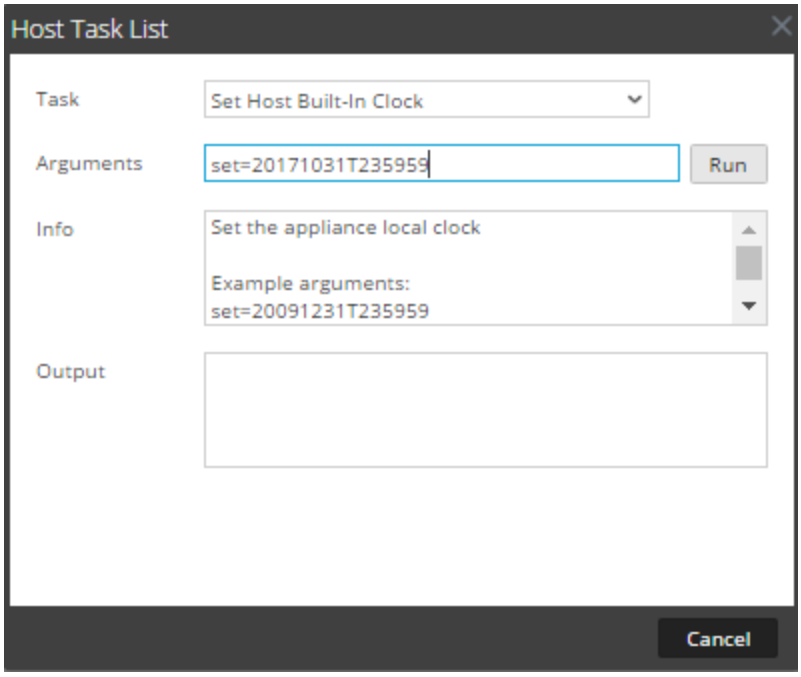
- To shut down and restart a host through an attached service, go to the Hosts view from a service in the Services view (see Search for Hosts) and then follow the Shut Down and Restart a Host from the Hosts View procedure below.
- To shut down the physical host without restarting, see Shut Down Host.

Shut Down and Restart a Host from the Hosts View

1. Select **(Admin) > Hosts**.
2. In the **Hosts** panel, select a host.
3. Select Reboot Host from the toolbar.

Shut Down and Restart a Host from the Host Task List

1. Select **(Admin) > Services**.
2. In the **Services** panel, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Reboot Host** in the **Task** field.
   No arguments are required.



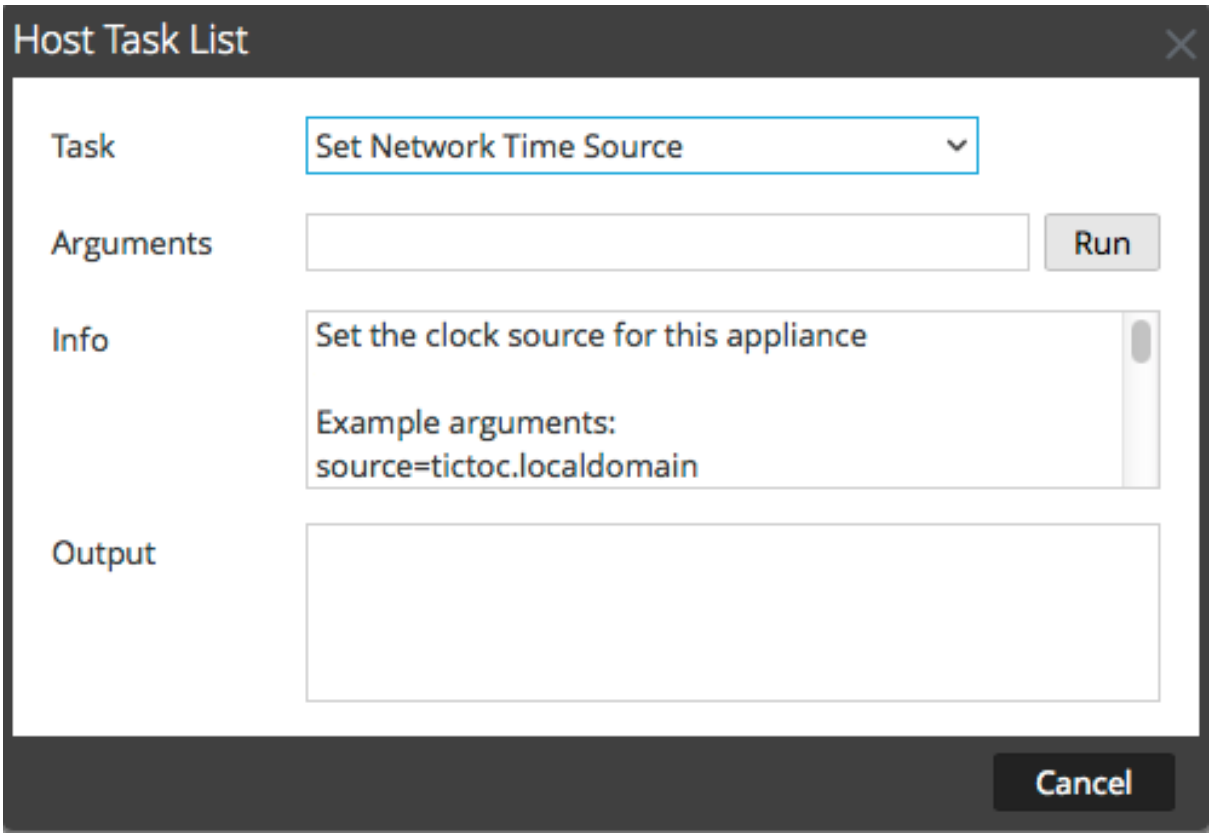
5. Click **Run**.
   The host is rebooted and the result is displayed in the Output area.

Set Host Built-In Clock

After a shutdown or battery failure, it may be necessary to set the local clock on a host. The Set Host Built-In Clock task resets the clock time.

Set the Time on the Local Clock

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Set Host Built-In Clock**.
   Help for the task is displayed in the Info area.
5. Enter the date and time arguments in the **Arguments** field.
   For example, to specify October 31, 2017 at 11:59:59 PM, type:
   `set=20171031T235959`



6. Click **Run**.
   The clock is set to the specified time and a message is displayed in the Output area.

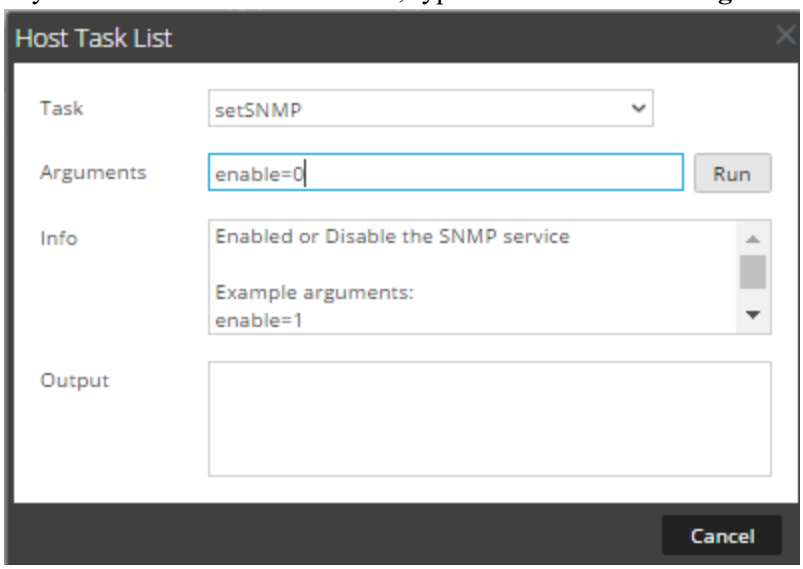
Set Network Time Source

When setting the clock source for a host, set the hostname or address of an Network Time Protocol (NTP) server to be the network clock source for the host. If the host is using a local clock source, you must specify **local** here to allow **Set the Local Clock Source** to be effective.

Specify the Network Clock Source

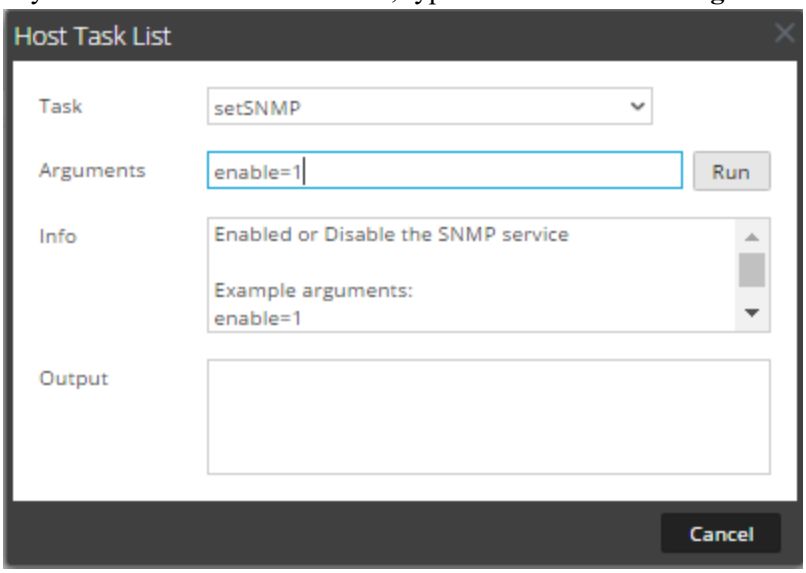
1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Set Network Time Source**.

5. Do one of the following:
   - Type the hostname or address of the NTP server to serve as the clock source for this host; for example: **`source=tictoc.localdomain`**
   - If you want to use the host clock as a clock source, type: **`source=local`**
6. Click **Run**.
   The clock source is set and a message is displayed in the Output area.



Note: If you specified a NTP clock source of **local**, the host clock serves as the clock source and the time is configured using Set Host Built-In Clock.

Set SNMP



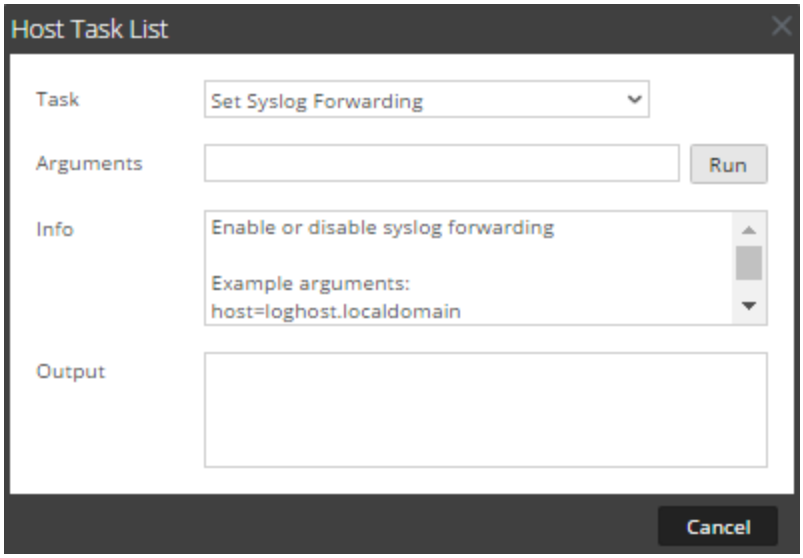
The Set SNMP task in the Host Task List enables or disables the SNMP service on a host. For a host to receive SNMP notifications, enable the SNMP service. If you are not using SNMP for NetWitness notifications, it is not necessary to enable the service.

Toggle SNMP Service on the Host

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View > System**.
   The System view for the service is displayed.
3. In the **Services System view** toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **setSNMP**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.
5. Do one of the following:
   - If you want to disable the service, type **`enable=0`** in the **Arguments** field.

- If you want to enable the service, type **`enable=1`** in the **Arguments** field.

6. Click **Run**.
   The result is displayed in the Output area.



Set Syslog Forwarding

You can configure Syslog forwarding to forward the operating system logs of your NetWitness Hosts to a remote syslog server. You can use the Set Syslog Forwarding task in the Host Task List to enable or disable syslog forwarding.

Set Up and Start Syslog Forwarding

1. Select  **(Admin) > Services**.
2. In the **Services** list, select a service and click  **> View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.

4. In the **Host Task List**, select **Set Syslog Forwarding**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.

5. In the **Arguments** field, do any one of the following.

   - To enable syslog forwarding, specify any one of the following formats:
     `host=<loghost>.<localdomain>` (for example, `host=syslogserver.local`).

     `host=<loghost>.<localdomain>:<port>` (for example, `host=syslogserver.local:514`).

     `host=<IP>` (for example, `host=10.31.244.244`).

     `host=<IP>:<port>` (for example, `host=10.31.244.244:514`).

     The following table lists the parameters used to enable syslog forwarding.

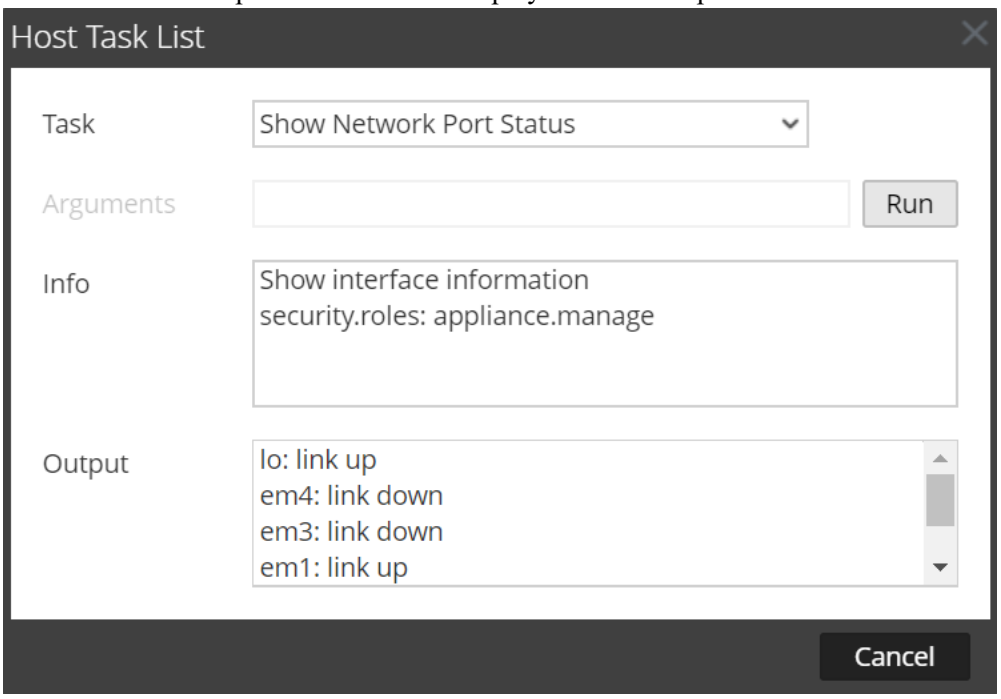
Parameter	Description
`loghost`	The host name of the remote syslog server.
`localdomain`	The domain of the remote syslog server.
`port`	IP address of the remote syslog server.
`IP`	The port number on which the remote syslog server receives a syslog messages.

   - To disable syslog forwarding, type **`host=disable`**.

6. Click **Run**.
   The result is displayed in the Output area.

Once syslog forwarding is enabled or disabled, the `/etc/rsyslog.conf` file is updated automatically to enable or disable syslog forwarding to the remote syslog destination and the syslog service is restarted.

If you enable syslog forwarding, the logs from the configured service are forwarded to the defined syslog server and continues forwarding until disabled.



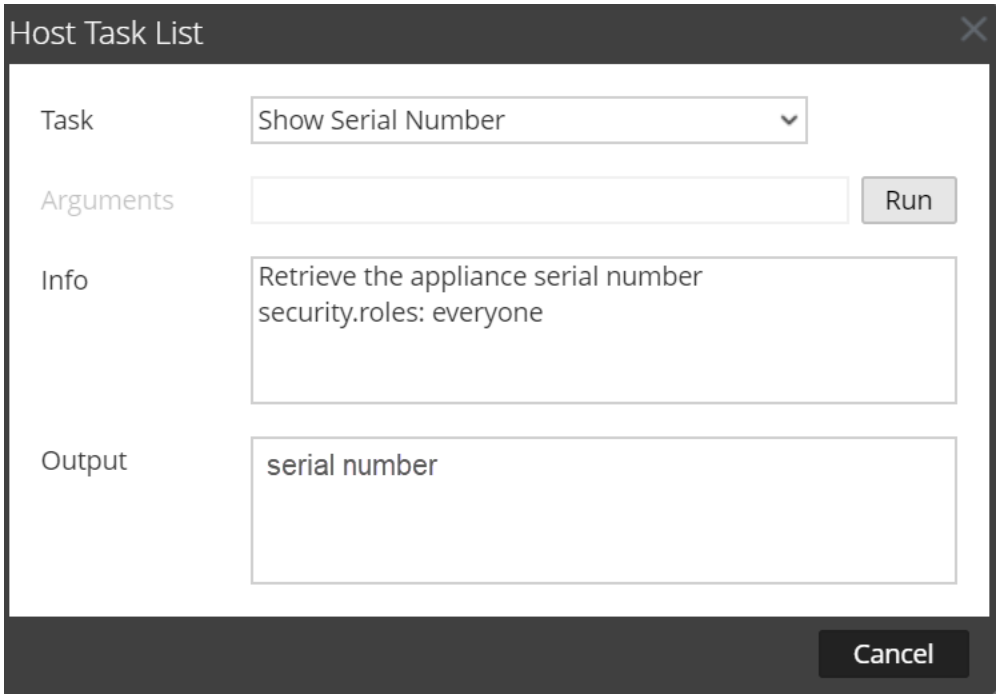
Note: You can now log in to the remote syslog server and verify if the messages are being received from the NetWitness services configured for syslog forwarding.

Show Network Port Status

The Show Network Port Status task in the Host Task List gives you the status of all configured ports on the host.

Display the Network Port Status

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and **> View> System**.
   The System view for the selected service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, click **Show Network Port Status**.
   The task is displayed in the Task field, and information about the task is displayed in the Info area.
5. No arguments are required for this task. Click **Run**.
   The status for each port on the host is displayed in the Output area.



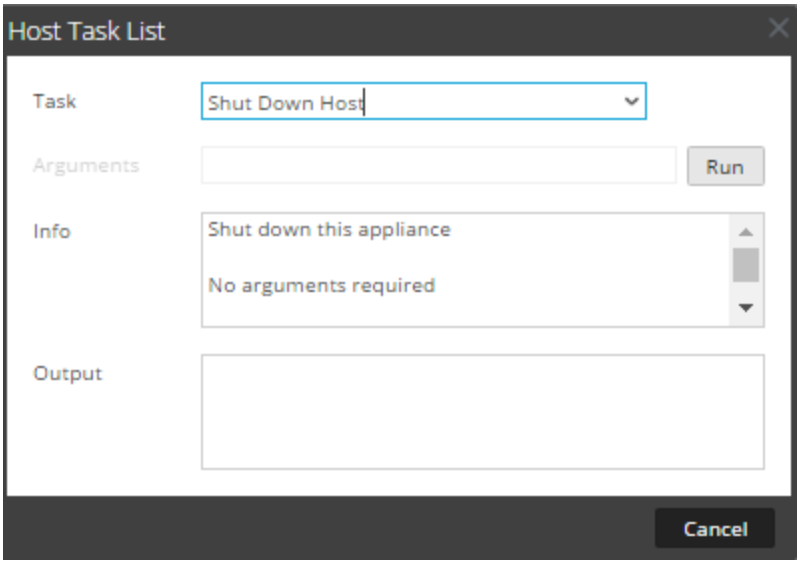
Show Serial Number

The Show Serial Number task in the Host Task List displays the serial number of a host.

Show the Serial Number

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View> System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Show Serial Number**.
   In the Info area, a brief explanation of the task and the task arguments is displayed.
5. No arguments are required for this task. Click **Run**.
   The serial number of the selected host is displayed in the Output area.

Shut Down Host



Under certain circumstances (for example, a hardware upgrade or an extended power outage that exceeds backup power capacity), it may be necessary to shut down a physical host. When you shut down a host, all services running on the host are stopped and the physical host turns off.

The physical host does not restart automatically. Use the power switch to restart the host. Once the physical host restarts, the host and services are configured to restart automatically.

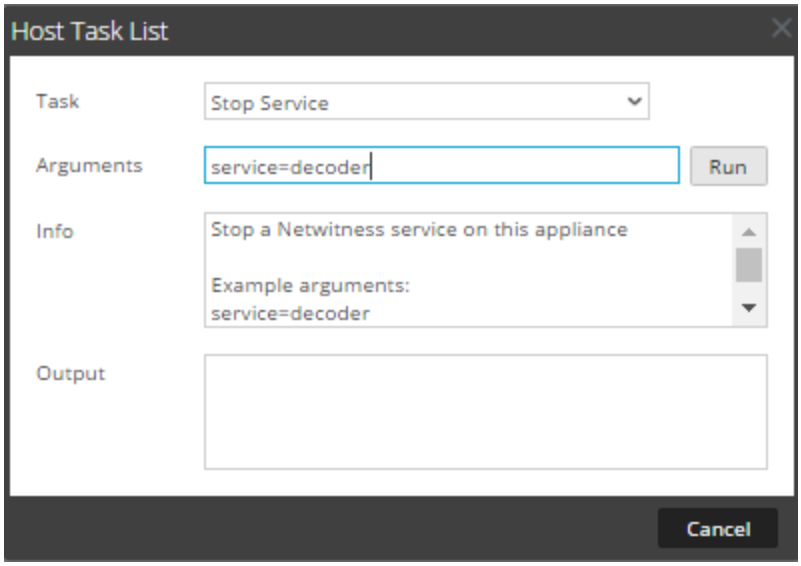
See Reboot a Host for how to start and stop a host without shutting down the host.

Shut Down the Host

1. In the **Host Task List**, select **Shut Down Host**.

2. To execute the task, click **Run**.
   The host shuts down, and the host turns off.

Stop and Start a Service on a Host



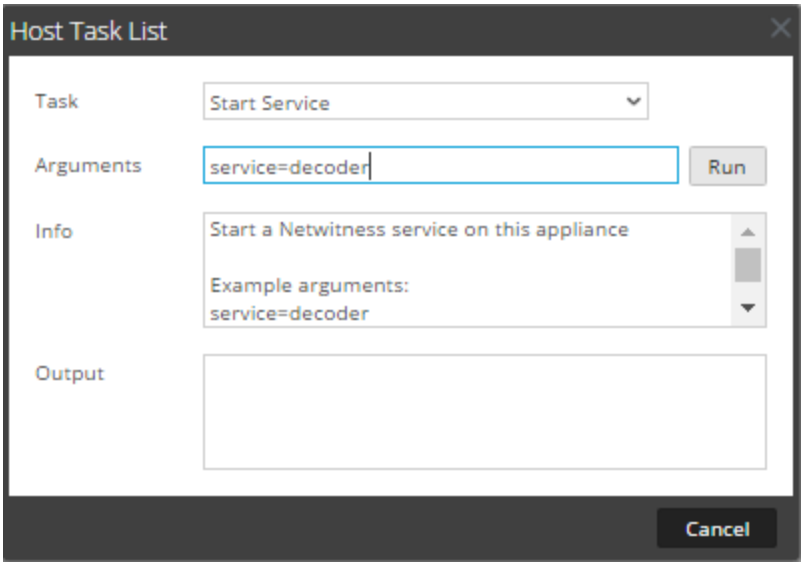
The Host Task List has two options for stopping and starting a service on a host. When you stop a service using the **Stop Service** message, all processes of the service are stopped and users connecting to the service are disconnected. Unless there is a problem with the service, it restarts automatically. This is the same as the **Shutdown Service** option in the Services System view.

If a service does not restart automatically after being stopped, you can restart it manually using the **Start Service** message.

Stop a Service on a Host

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View> System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Stop Service**.
   The task is displayed in the Task field, and information about the task is displayed in the Info area.

5. Specify the service (`decoder`, `concentrator`, `broker`, `logdecoder`, `logcollector`) to stop in the **Arguments** field; for example, **`service=decoder`**.



6. To execute the task, click **Run**.
   The service stops and the status is displayed in the Output area. All processes of the service are stopped and users connecting to the service are disconnected. Unless there is a problem with the service, it restarts automatically.

Start a Service on a Host

1. Select **(Admin) > Services**.
2. In the **Services** list, select a service and click **> View> System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Start Service**.
   The task is displayed in the Task field, and information about the task is displayed in the Info area.

5. Specify the service (`decoder`, `concentrator`, `broker`, `logdecoder`, `logcollector`) to stop in the **Arguments** field; for example, **`service=decoder`**.

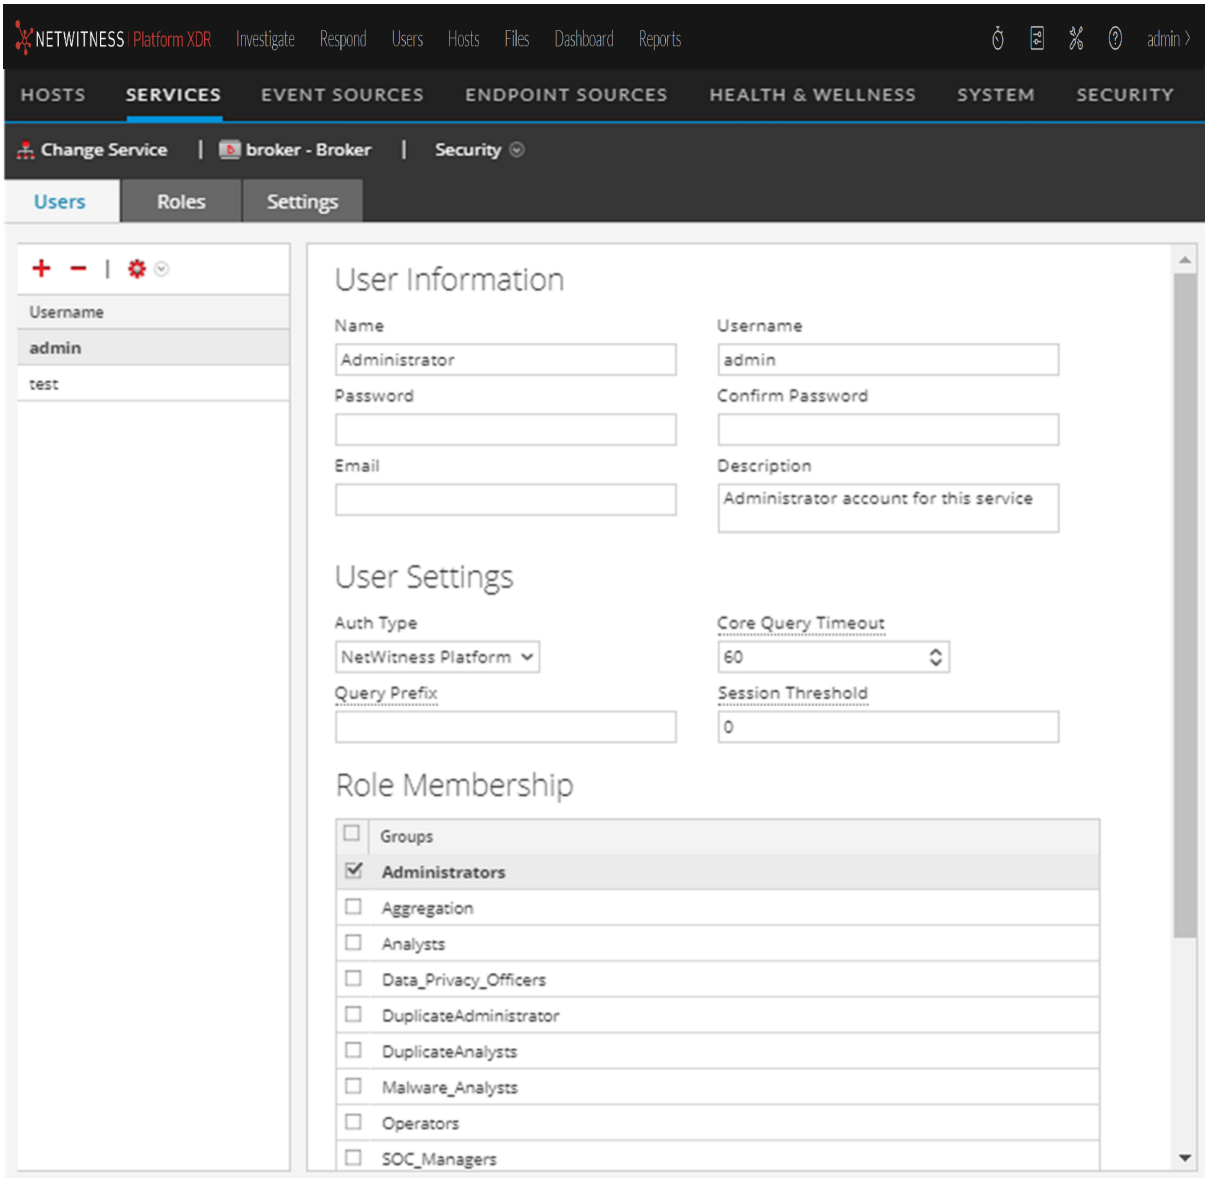
6. To execute the task, click **Run**.
   The service starts and the status is displayed on the Output area.

Add, Replicate, or Delete a Service User

You must add a user to a service for:

- Aggregation
- Accessing the service with the:
  - Thick client
  - REST API

Note: This topic does not apply to users who access services through the user interface on NetWitness Server. You must add those users to the system, not a service. For details, see the "Set Up a User" in *System Security and User Management Guide*.



For each service user, you can:

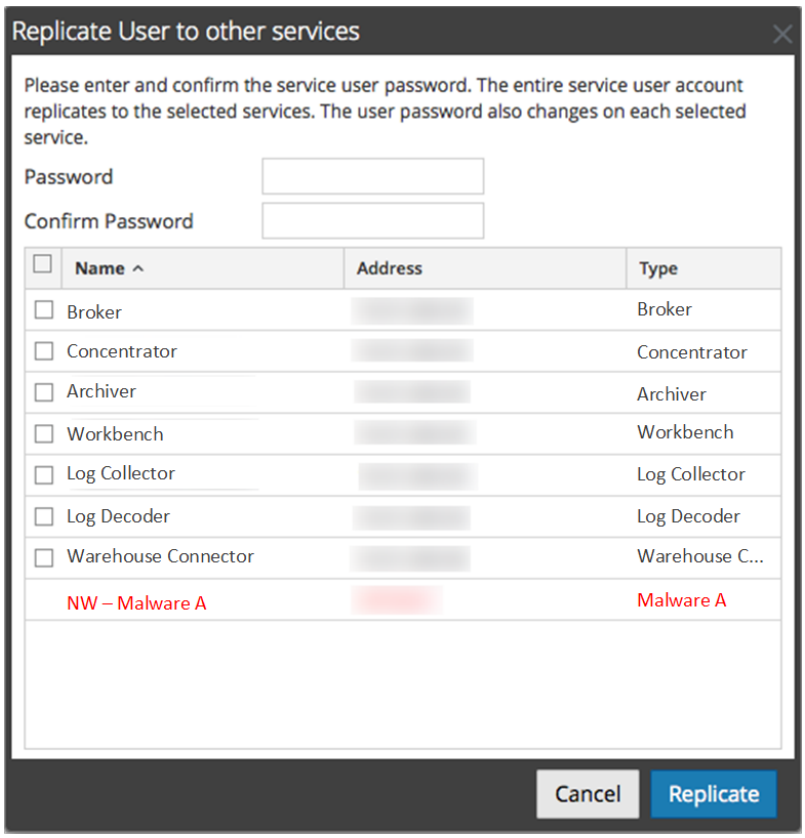
- Configure user authentication and query handling properties for the service
- Make the user a member of a role, which has a set of permissions the user receives
- Replicate the user account to other services
- Change the service user password on selected services

Change a Service User Password provides instructions for changing the service user password across services.

To navigate to the Services Security view:

1. In NetWitness, go to **(Admin) > Services**.
2. Select a service, then click **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.

Add a Service User



1. On the **Users** tab, click .
2. Type the user name to access the service, then press **Enter**.
   The User Information section displays the user name and the rest of the fields are available for editing.

3. Type the password for logging on to the service in the **Password** and **Confirm Password** fields.
4. (Optional) Provide additional information:
   - **Name** for logging on to NetWitness
   - **Email** address
   - **Description** of the user
5. In the User Settings section, select the following information:
   - **Authentication Type**
     - If NetWitness authenticates the user, select **NetWitness**.
     - If Active Directory or PAM is configured on NetWitness Server to authenticate the user, select **External**.
   - **Core Query Timeout** is the maximum number of minutes a user can run a query on the service. This field applies to NetWitness 10.5 and later service versions and does not appear for 10.4 and earlier versions.
6. (Optional) Specify additional query criteria:
   - **Query Prefix** filters queries. Type a prefix to restrict results the user sees.
   - **Session Threshold** controls how the service scans meta values to determine session counts. Any meta value with a session count that is above the threshold stops its determination of the true session count.
7. In the **Role Membership** section, select each role to assign to the user. When a user is a member of a role on a service, the user has the permissions assigned to the role.
8. To activate the new service user, click **Apply**.

Replicate a User to Other Services

Note: The **admin** user cannot be replicated to other services.

1. In the Users tab, select a user and click  **> Replicate**.
   The Replicate Users to Other Services dialog is displayed.

2. Enter and confirm the password.
3. Select each service to which you are replicating the user.
4. Click **Replicate**.

Delete a Service User

1. On the **Users** tab, select the **Username** and click −.
   NetWitness requests confirmation that you want to delete the selected user.
2. To confirm, click **Yes**.

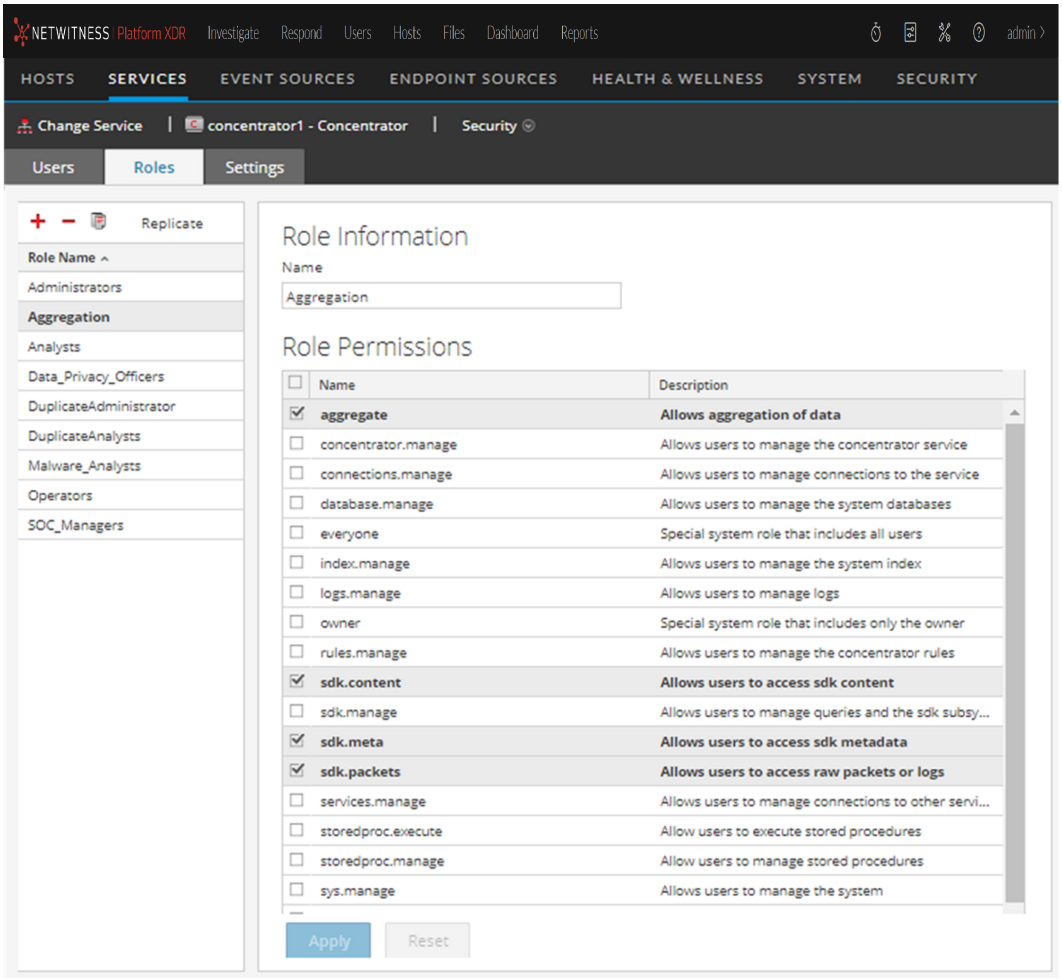
Add a User Role to a Service

There are pre-configured roles in NetWitness that are installed on the server and on each service. You can also add custom roles. The following table lists the pre-configured user roles and their permissions.

Role	Permission
Administrators	Full system access
Operators	Access to configurations but not to metadata and session content
Analysts	Access to metadata and session content but not to configurations

Role	Permission
SOC_Managers	Same access as Analysts and additional permissions to handle incidents
Malware_ Analysts	Access to malware events and to metadata and session content
Data_Privacy_ Officers	Access to metadata and session content and configuration options that manage obfuscation and viewing of sensitive data within the system (see *Data Privacy Management Guide*).

You must add a service role when you have added a:



- **Service** user or users that requires a new set of permissions.
- **Custom role on NetWitness Server** because trusted connections require that the same custom role exists both on the server and on each service the custom role will access. The names must be identical. For example, if you add a Junior Analysts role on the server then you must add a Junior Analysts role on each service the role will access. For more information, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

There is also a pre-configured **Aggregation** service role. Services Security View - Aggregation Role and Services Security View - Service User Roles and Permissions provide additional information.

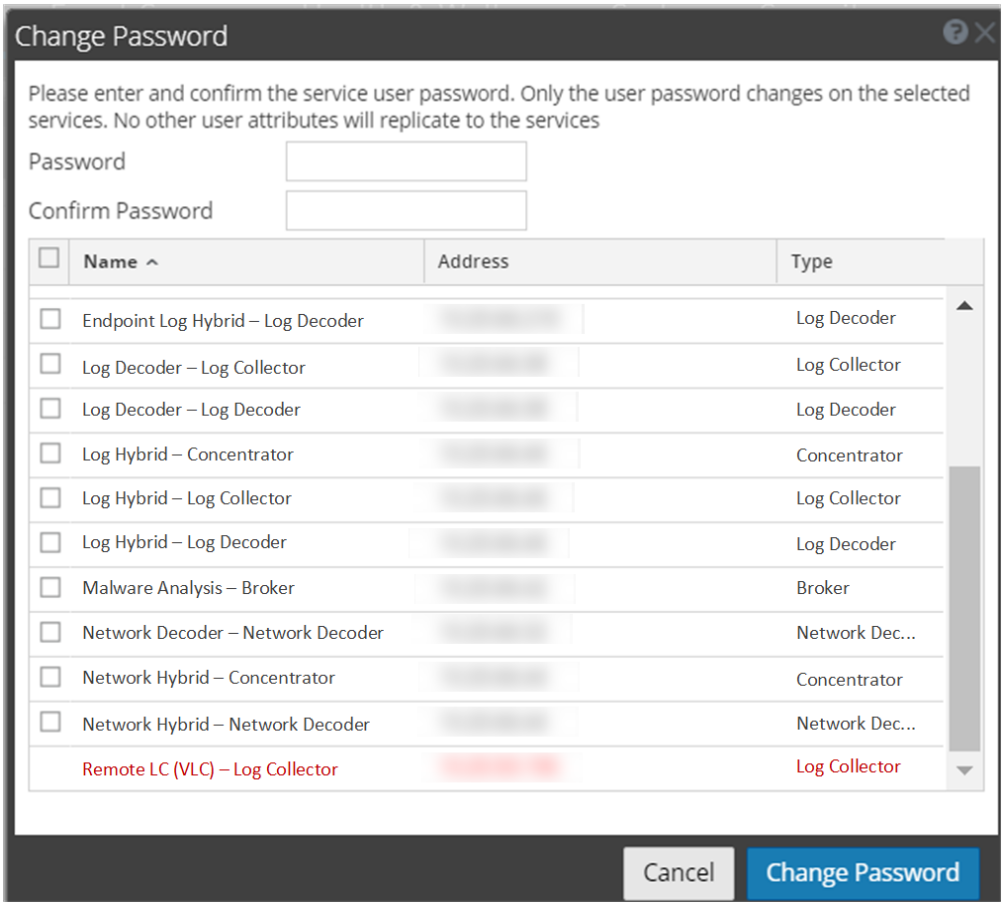
To add a service user role and assign permissions to it:

1. In NetWitness, go to  **(Admin) > Services**.
2. Select a service, then  **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.

3. Select the **Roles** tab and click .
   The Services Security view is displayed and five pre-configured roles are already listed.

4. Click , type the **Role Name** and press **Enter**.
   The Role Name is displayed above a list of **Role Permissions**.
5. Select each permission the role will have on the service.
6. Click **Apply**.

You can add service users to the role in the **Users** tab.



Change a Service User Password

This procedure allows administrators to change the password of a service user and replicate the new password to all Core services with that user account defined. It replicates only the password change to the Core services selected and does not replicate the entire user account. Administrators can also change the password of the **admin** account on the Core services.

Note: The Change Password option does not apply to external users.

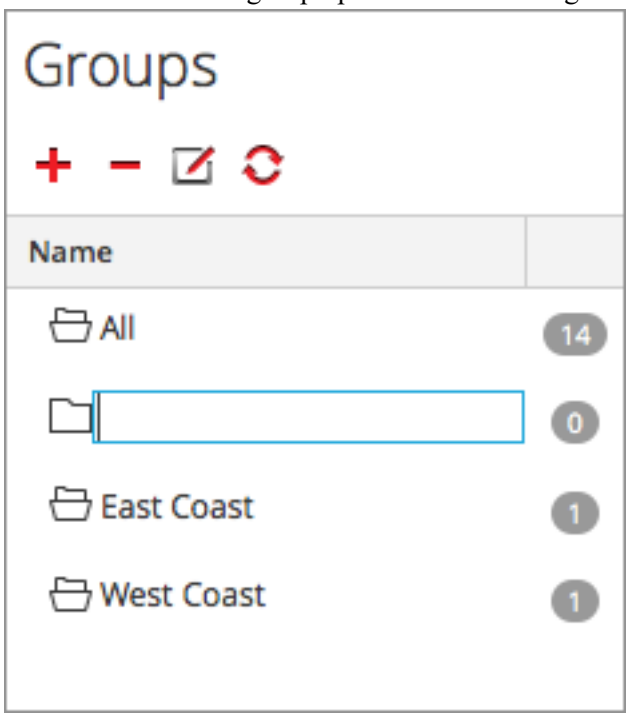
To change the password of a service user:

1. In NetWitness, go to **(Admin) > Services**.
   The Admin Services view is displayed.
2. Select a service, then click **> View > Security**.
   The Security view for the selected services is displayed.
3. In the **Users** tab, select a user and select **Change Password** from .
   The **Change Password** dialog is displayed.

4. Type a new password for the user and confirm the password.
5. Select the services where you want the user password to change.
6. Click **Change Password**.
   The status of the password change on the selected services is displayed.

IMPORTANT: If you change the admin password on a NetWitness service that is used as a Reporting Engine data source, you must remove and then re-add the service as a data source. For details, see "Configure the Data Sources" topic in the *Reporting Engine Configuration Guide for RSA NetWitness Platform 11.x Guide*.

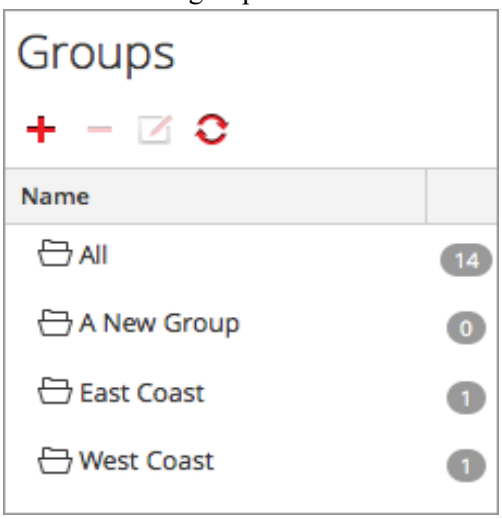
Create and Manage Service Groups



The Admin Services view provides options to create and manage groups of services. The Services list toolbar includes options to create, edit, and delete service groups. Once groups are created, you can drag individual services from the Services panel into a group.

Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A service may belong to more than one group. Here are some examples of possible groupings.

- Group different service types to make it easier to configure and monitor all Brokers, Network Decoders, or Concentrators.
- Group services that are part of the same data flow; for example, a Broker, and all associated Concentrators and Network Decoders.
- Group services according to their geographic region and location within the region. If a major power outage occurs in a location, potentially affected services are easily identifiable.



Create a Group

1. In NetWitness, go to  **(Admin) > Services**.
   The Admin Services view is displayed.
2. In the **Groups** panel toolbar, click .
   A field for the new group opens with a blinking cursor.

3. Type the name of the new group in the field (for example, **`A New Group`**) and press **Enter**.
   The group is created as a folder in the tree. The number next to the group indicates the number of

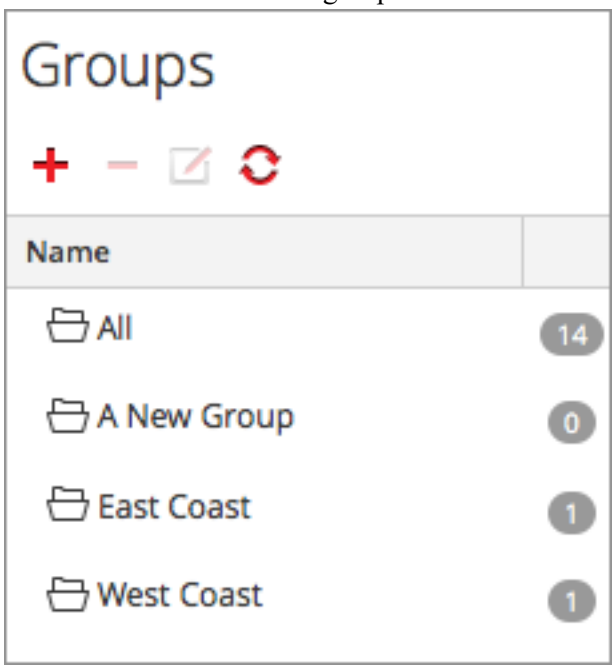
services in that group.

Change the Name of a Group

1. In the Services view **Groups** panel, double-click the group name or select the group and click . The name field opens with a blinking cursor.
2. Type the new name of the group and press **Enter**.
   The name field closes and the new group name is displayed in the tree.

Add a Service to a Group

In the Services view **Services** panel, select a service and drag the service to a group folder in the groups panel.
The service is added to the group.



View the Services in a Group

To view the services in a group, click the group in the **Groups** panel.

The Services panel lists the services in that group.

Remove a Service from a Group

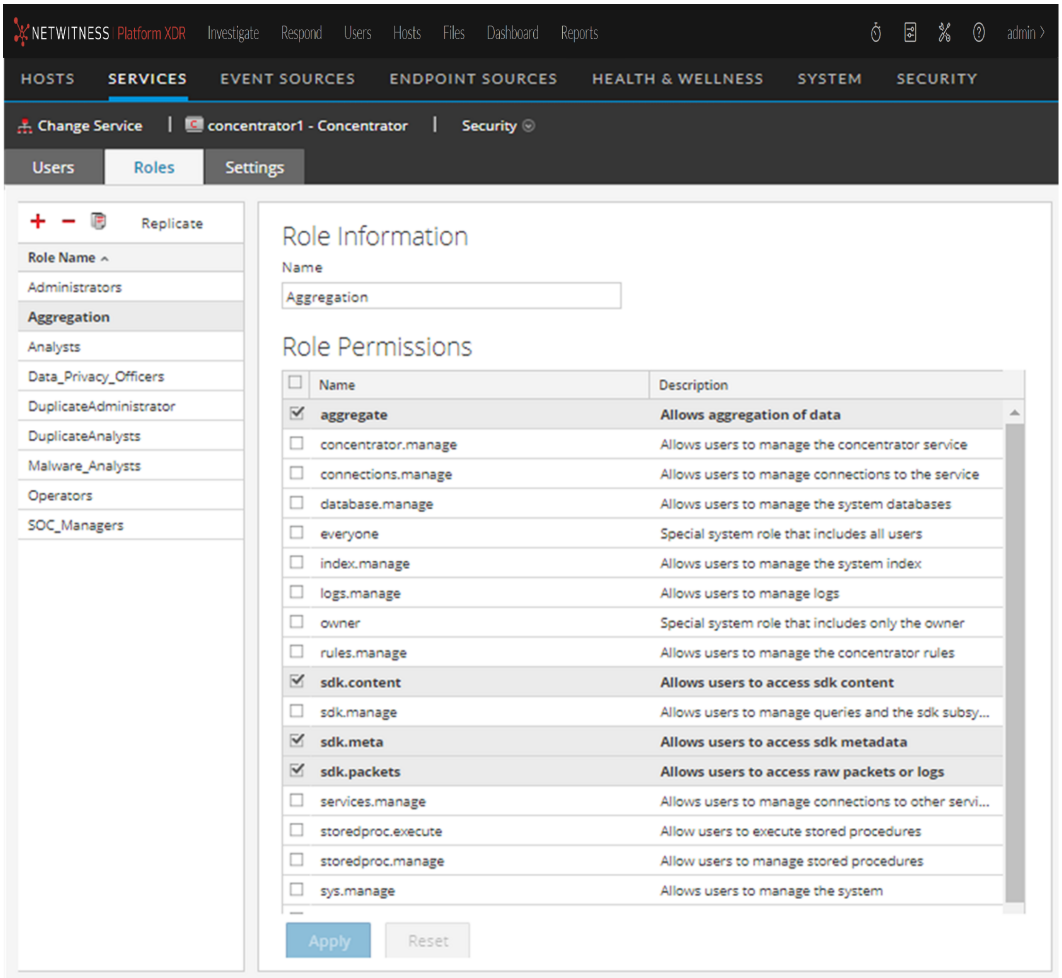
1. In the Services view **Groups** panel, select the group that contains the service that you want to remove. The services in that group appear in the Services panel.
2. In the **Services** panel, select one or more services that you want to remove from the group, and in the toolbar, select − > **Remove from Group**.
   The selected services are removed from the group, but are not removed from the NetWitness user interface. The number of services in the group, which is listed near the group name, decreases by the number of services removed from the group. The **All** group contains the services that are removed from the group.
   In the following example, the service group called **A New Group** does not contain any services, because the service in that group is removed.

Delete a Group

1. In the Services view **Groups** panel, select the group that you want to delete.
2. Click −.
   The selected group is removed from the Groups panel. The services that were in the group are not removed from the NetWitness user interface. The **All** group contains the services from the deleted group.

Duplicate or Replicate a Service Role

An efficient way to add a new service role is to duplicate a similar role, save it with a new name and revise the permissions that are already assigned. For example, you could duplicate the Analysts role. Then, save it as `JuniorAnalysts` and modify the permissions.



The quick way to add an existing role to other services is to replicate the role. For example, you could replicate the `JuniorAnalysts` role that exists on a Broker to a Concentrator and Log Decoder.

To navigate to the Services Security view:

1. In NetWitness, go to **(Admin) > Services**.
2. Select a service, then click **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.
3. Select the **Roles** tab.

Duplicate a Service Role

1. In the **Roles** tab, select the role you want to duplicate.

2. Click **> Duplicate Role.**
3. Type a new name and click **Apply**.

4. Select the new role.
5. In the **Role Permissions** section, select or deselect permissions to modify what the new role can do.

Replicate a Role

1. In the **Roles** tab, select the role you want to replicate and click **Replicate**.
2. In the **Replicate Role to Other Services** dialog, select each service on which to add the role.
3. Click **Replicate**.

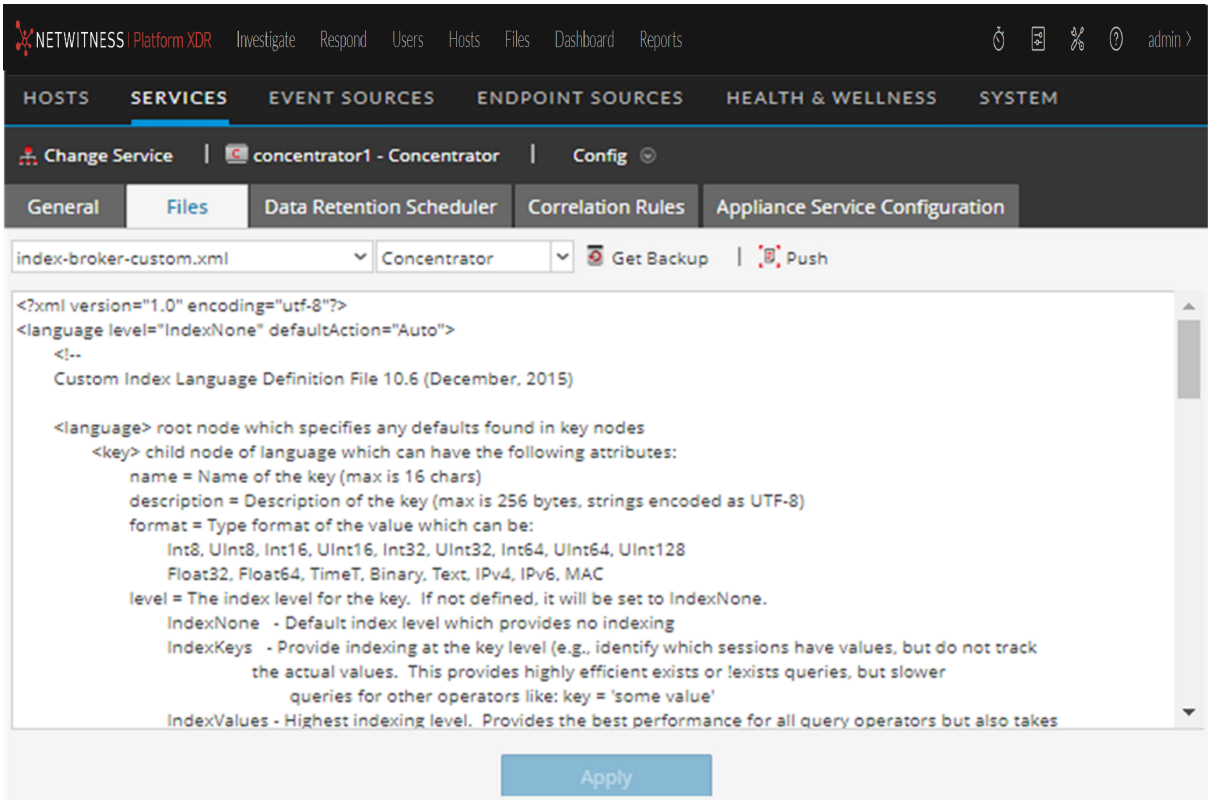
Edit Core Service Configuration Files

The service configuration files for Network Decoder, Log Decoder, Broker, Concentrator, Archiver, and Workbench services are editable as text files. In the Services Config view > Files tab, you can:

- View and edit a service configuration file that the NetWitness system is currently using.
- Retrieve and restore the latest backup of the file you are editing.
- Push the open file to other services.
- Save changes made to a file.

The files available to edit vary depending upon the type of service being configured. The files that are common to all Core services are the:

- The NetWitness file (`netwitness`). This is preconfigured and does not require editing.
- The service index file (`index-<service>`). This is preconfigured and may require editing.
  See Edit a Service Index File for more information.
- The scheduler file (`scheduler`). The scheduler service is optional and requires editing.
  See Configure the Task Scheduler for more information.
- The crash reporter file (`crashreporter`). The crash reporter service is optional and requires editing.
  See Enable the Crash Reporter Service for more information.
- The feed definitions file (`feed-definitions`). This file is optional and may require editing.
  See "Feed Definitions File" in the *Decoder Configuration Guide* for more information.



In addition, the Network Decoder has files that configure parsers, feed definitions, and a wireless LAN adapter. There is also the table mapping file provided by NetWitness, `table-map.xml`, which is an important part of the Log Decoder.

Note: The default values in these configuration files are good for the most common situations, however some editing is necessary for optional services, such as the crash reporter or scheduler. Only administrators with a good understanding of the networks and the factors that affect the way services collect and parse data should make changes to these files in the Files tab.

Edit a Service Configuration File

To edit a file:

1. In NetWitness, go to **(Admin) > Services**.
2. In the Services list, select a service.
3. Select **> View > Config**.
   The Service Config view is displayed with the General tab open.
4. Click the **Files** tab.
   cThe selected service, such as Concentrator, appears in the drop-down list on the right.
5. (Optional) To edit a file for the host instead of the service, select **Host** in the drop-down list.
6. Choose a file from the **Please Select A File To Edit** drop-down list.
   The file content is displayed in edit mode.

7. Edit the file and click **Apply**.

The current file is overwritten and a backup file is created. The changes go into effect after the service is restarted.

Revert to a Backup Version of a Service Configuration File

After you make changes to a configuration file, save the file, and restart the service, a backup file is available.

To revert to a backup of a configuration file:

1. Select a configuration file by completing steps 1-6 of Edit a Service Configuration File.
2. Click .
   The backup file opens in the text editor.
3. To revert to the backup version, click **Save**.

The changes go into effect after the service is restarted.

Push a Configuration File to Other Services

Once you have edited a service configuration file, you can push the same configuration to other services of the same type.

1. Select a configuration file by completing steps 1-6 of Edit a Service Configuration File.
2. Click .
   The Select Services dialog is displayed.
3. Select each service to push the configuration file on it. Each service must be the same type as the one you selected in the Services view.

   Caution: If you decide not to push the configuration file, click **Cancel**.
4. To push the configuration file to all selected services, click **OK**.

The configuration file is pushed to all selected services.

Edit a Service Index File

This topic provides important information and guidelines for configuring service custom index files, which are editable in the Service Config view > Files tab.

The index file, along with other configuration files, controls operation of each core service. Accessing the index file through the Service Config view in NetWitness opens the file in a text editor, where you can edit the file.

Note: Only administrators with a thorough and comprehensive understanding of Core service configuration are qualified to make changes to an index file, which is one of the central configuration files for the appliance service. Changes made should be consistent across all Core services. Invalid entries or a misconfigured file can prevent the system from starting and can require the assistance of NetWitness Support to bring the system back into a working state.

These are the index files:

- `index-broker.xml`, and `index-brokereustom.xml`
- `index-concentrator.xml`, and `index-concentrator-custom.xml`
- `index-decoder.xml`, and `index-decodereustom.xml`
- `index-logdecoder.xml`, and `index-logdecodereustom.xml`

- index-archiver.xml, and index-archiver-custom.xml
- index-workbench.xml, and index-workbench-custom.xml

Index and Custom Index Files

All customer-specific index changes are made in index-<service>-custom.xml. This file overrides any settings in index-<service>.xml, which is solely controlled by NetWitness.

The custom index file, index-<service>-custom.xml, allows creation of custom definitions or overrides of your own language keys that are not overwritten during the upgrade process.

- Keys that are defined in index-<service>-custom.xml replace the definitions found in index-<service>.xml.
- Keys that are added to index-<service>eustom.xml and not found in index-<service>.xml are added to the language as a new key.

Some common applications for editing the index file are:

- To add new custom meta keys to add new fields to the NetWitness user interface.
- To configure protected meta keys as part of a data privacy solution as described in the *Data Privacy Management Guide*.
- To adjust the NetWitness Core database query performance as described in the *NetWitness Core Database Tuning Guide*.

Caution: Never set the index level to IndexKeys or IndexValues on a Network Decoder if you have a Concentrator or Archiver aggregating from the Network Decoder. The index partition size is too small to support any indexing beyond the default time meta key.

Configure the Task Scheduler

Scheduler File

You can edit the scheduler file that in the Service Config view > Files tab. This file configures the built-in task scheduler for a service. The task scheduler can automatically send messages at predefined intervals or specific times of the day.

Scheduler Task Syntax

A task line in the scheduler file consists of the following syntax, where <Value> has no spaces:

```
<ParamName>=<Value>
```

If <Value> has any spaces, this is the syntax:

```
<ParamName>="<Value>"
```

In each task line, these guidelines apply:

- Parameter `time` or one of the interval parameters (`seconds`, `minutes` or `hours`) is required.
- Escape special characters with a `\` (backslash).

Task Line Parameters

The following task line parameters are accepted by the scheduler.

Syntax	Description
daysOfWeek: <string, optional, {enum-any:sun|mon|tue|wed|thu|fri|sat|all}>	The days of week to execute a task. The default value is all.
deleteOnFinish: <bool, optional>	Delete the task when it has successfully finished.
hours: <uint32, optional, {range:1 to 8760}>	The number of hours between executions.
logOutput: <string, optional>	Output the response to log using the specified module name.
minutes: <uint32, optional, {range:1 to 525948}>	The number of minutes between executions.
msg: <string>	The message to send the node.
params: <string, optional>	The parameters for the message.
pathname: <string>	The path of the node that receives the message.
seconds: <uint32, optional, {range:1 to 31556926}>	The number of seconds between executions.
time: <string>	The time of execution in HH::MM:SS format (local time of this server).
timesToRun: <uint32, optional>	How many times to run because service start, **0** = unlimited (default).

Messages

The following are the message strings to use in the Task Scheduler `msg` parameter.

Message	Description
addInter	Add a task to run at a defined interval. For example, this message runs the `/index save` command every 6 hours: `addInter hours=6 pathname=/index msg=save`

Message	Description
addMil	Add a task to run at a specific time of day or even day(s) of the week. For example, this message runs the `/index save` command at 1 AM every business day: `addMil time= 01:00:00 pathname=/index msg=save daysOfWeek=mon,tue,wed,thu,fri`
delSched	Deletes an existing scheduled task. The `id` parameter of the task must be retrieved from the print message.
print	Prints all scheduled tasks.
replace	Assign all scheduled tasks in one message, deleting any existing tasks.
save	Save node.

Sample Task Line

The following example task line in the `scheduler` file downloads the feeds package file (`feeds.zip`) to the selected Network Decoder every 120 minutes from the feeds host server:

```
minutes=120 pathname=/parsers msg=feed params="type\=wget
file\=http://feedshost/nwlive/feeds.zip"
```

Enable the Crash Reporter Service

The Crash Reporter is an optional service for NetWitness services. When activated for any of the Core services, the Crash Reporter automatically generates a package of information to be used for diagnosing and solving the problem that resulted in the service failure. The package is automatically sent to NetWitness for analysis. The results are forwarded to NetWitness Support for any further action.

The information package sent to NetWitness does not contain captured data. This information package consists of the following information:

- Stack trace
- Logs
- Configuration settings
- Software version
- CPU information
- Installed RPMs
- Disk geometry

The Crash Reporter crash analysis can be activated for any Core product.

The `crashreporter.cfg` File

One of the files available for editing in the Service Config view > Files tab is `crashreporter.cfg`, the Crash Reporter Client Server configuration file.

This file is used by the script that checks, updates, and builds crash reports on the host. The list of products to monitor can include Network Decoders, Concentrators, Brokers, and hosts.

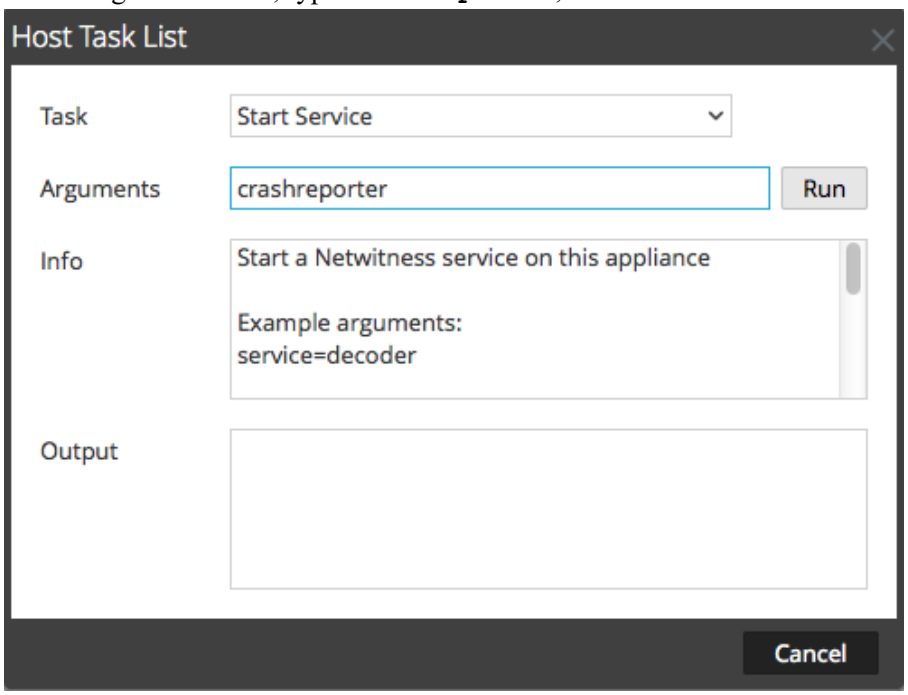
This table lists the settings for the `crashreporter.cfg` file.

Setting	Description
`applicationlist=decoder, concentrator, host`	Define the list of products to monitor.
`sitedir=/var/crashreporter`	Location of the site directory for the report.
`webdir=/usr/share/crashreporter/Web`	Location of the web directory.
`devdir=/var/crashreporter/Dev`	Location of the development directory.
`datadir=/var/crashreporter/data`	Location of the directory storing data files.
`perldir=/usr/share/crashreporter/perl`	Location of the Perl files.
`bindir=/usr/share/crashreporter/bin`	Location of the binary executables.
`libdir=/usr/share/crashreporter/lib`	Location of the binary libraries.
`cfgdir=/etc/crashreporter`	Location of the configuration files.
`logdir=/var/log/crashreporter`	Location of the log files.
`scriptdir=/usr/share/crashreporter/scripts`	Location of the directory containing scripts.
`workdir=/var/crashreporter/work`	Location of the process work directory.
`sqldir=/var/crashreporter/sql`	Location where created SQL files are placed.
`reportdir=/var/crashreporter/reports`	Location where temporary reports are created.
`packagedir=/var/crashreporter/packages`	Location of the created package files.
`gdbconfig=/etc/crashreporter/crashreporter.gdb`	Location of the `gdb` configuration file.
`corewaittime=30`	Define the number of seconds to wait after finding a core to determine if the core is still being written.
`cyclewaittime=10`	Define the number of minutes to wait between search cycles

Setting	Description
`deletecores=1`	Specify if the Core files should be deleted after report. 0 = No 1 = Yes **Note:** Until the Core file is deleted, it is reported each time crashreporter is restarted.
`deletereportdir=1`	Specify if the report directory should be deleted after the report. Useful to view ore reports on box. 0 = No 1 = Yes **Note:** If not deleted, the directory will be included in each subsequent package.
`debug=1`	Specify whether debugging messages are turned on or off in the `crashreporter` logging output. 0 = No 1 = Yes
`posturl=https://www.netwitnesslive.com/crash...ter/submit.php`	Define the webserver post URL.
`postpackages=0`	Specify if the packages should be posted to the webserver. 0 = No 1 = Yes
`deletepackages=1`	Specify if packages should be deleted after they are posted to webserver. 0 = No 1 = Yes

Configure the Crash Reporter Service

To configure the Crash Reporter service:



1. Select **(Admin) > Services**.
2. Select a service and click **> View > Config**.
3. Select the **Files** tab.
4. Edit `crashreporter.cfg`.

5. Click **Save**.
6. To display the Service System view, select **Config > System**.
7. To restart the service, click Shutdown Service.
   The service shuts down and restarts.

Start and Stop the Crash Reporter Service

To start the Crash Reporter Service:

1. Select **(Admin) > Services**.
2. Select a service and click **> View > System**.
3. In the toolbar, click Host Tasks.
   The Host Task List is displayed.
4. In the Task drop-down list, select **Start Service**.
5. In the Arguments field, type **`crashreporter`**, then click **Run**.

The Crash Reporter service is activated and remains active until you stop it.

To stop the Crash Reporter service, select **Stop Service** from the Task drop-down list.

Maintain the Table Map Files

The table mapping file provided by NetWitness, `table-map.xml`, is a very important part of the Log Decoder. It is a meta definition file which also maps the keys used in a log parser to the keys in the `metadb`.

Note: Do not edit the `table-map.xml` file. If you want to make changes to the table-map, make them in the `table-map-custom.xml` file. The latest `table-map.xml` file is available on Live Services, which NetWitness updates as required. If you make changes to the `table-map.xml` file, they can be overwritten during a content or service upgrade.

The table map and custom table map files have two purposes:

- To translate the variables used in the Log Parsers to NetWitness meta key names
- To tell the system which keys to move onto the Concentrator.

For example, look at the out-of-the-box Palo Alto log parser, and examine one of its meta keys: `stransaddr`. This key represents the source translated address. If we look in the `table-map.xml`file we can see that this variable is listed as `Transient`:

```
<mapping envisionName="stransaddr" nwName="stransaddr" flags="Transient"
format="Text" />
```

Because this variable is listed as, `Transient`, it never moved to the Concentrator. In fact, if you look at all the metadata that we parse from that log in the Concentrator, it is not listed as an available key.

Assume we change the value in the `table-map-custom.xml`file to the following:

```
<mapping envisionName="stransaddr" nwName="stransaddr" flags="None"
format="Text" />
```

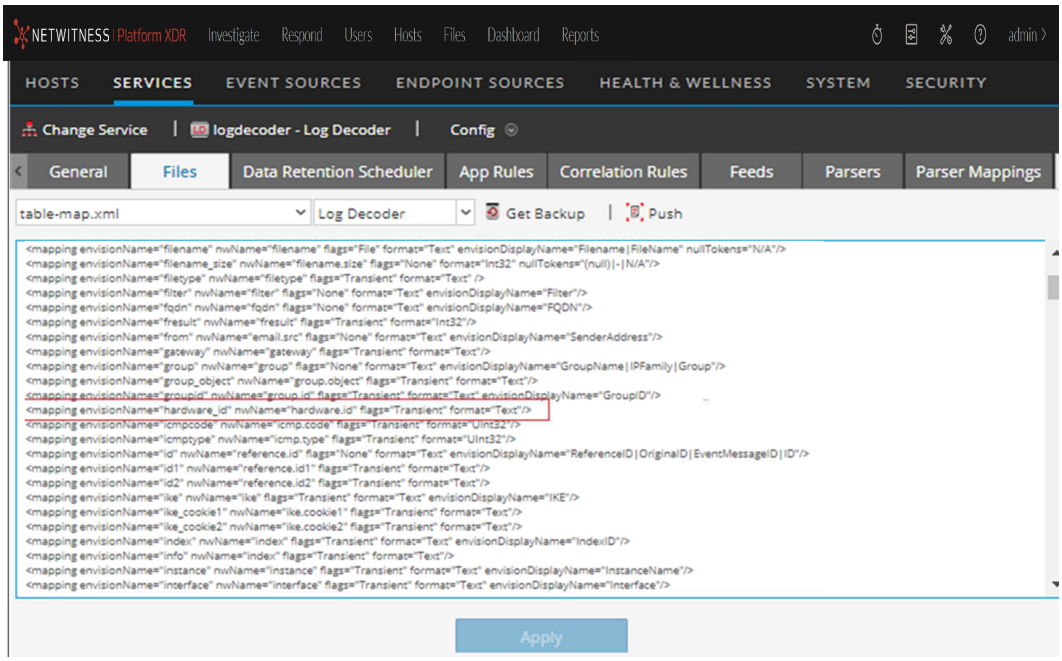
In this case, the key-value pair would get copied to the Concentrator, and from there you can choose whether or not to index it.

In the`table-map.xml`file, some meta keys are set to `Transient` and some are set to `None`. To store and index a specific meta key, the key must be set to `None`. To make changes to the mapping, you need to create a copy of the file named `table-map-custom.xml` on the Log Decoder and set the meta keys to `None`.

For meta key indexing:

- When a key is marked as `None` in the `table-map.xml` file in the Log Decoder, it is indexed.
- When a key is marked as `Transient` in the `table-map.xml` file in the Log Decoder, it is not indexed. To index the key, copy the entry to the `table-map-custom.xml` file and change the keyword `flags="Transient"` to `flags="None"`.
- If a key does not exist in the `table-map.xml`file, add an entry to the `table-map-custom.xml`file in the Log Decoder.

IMPORTANT: Do not update the **`table-map.xml`** file because an upgrade can overwrite it. Add all of the changes that you want to make to the **`table-map-custom.xml`**file.



Prerequisites

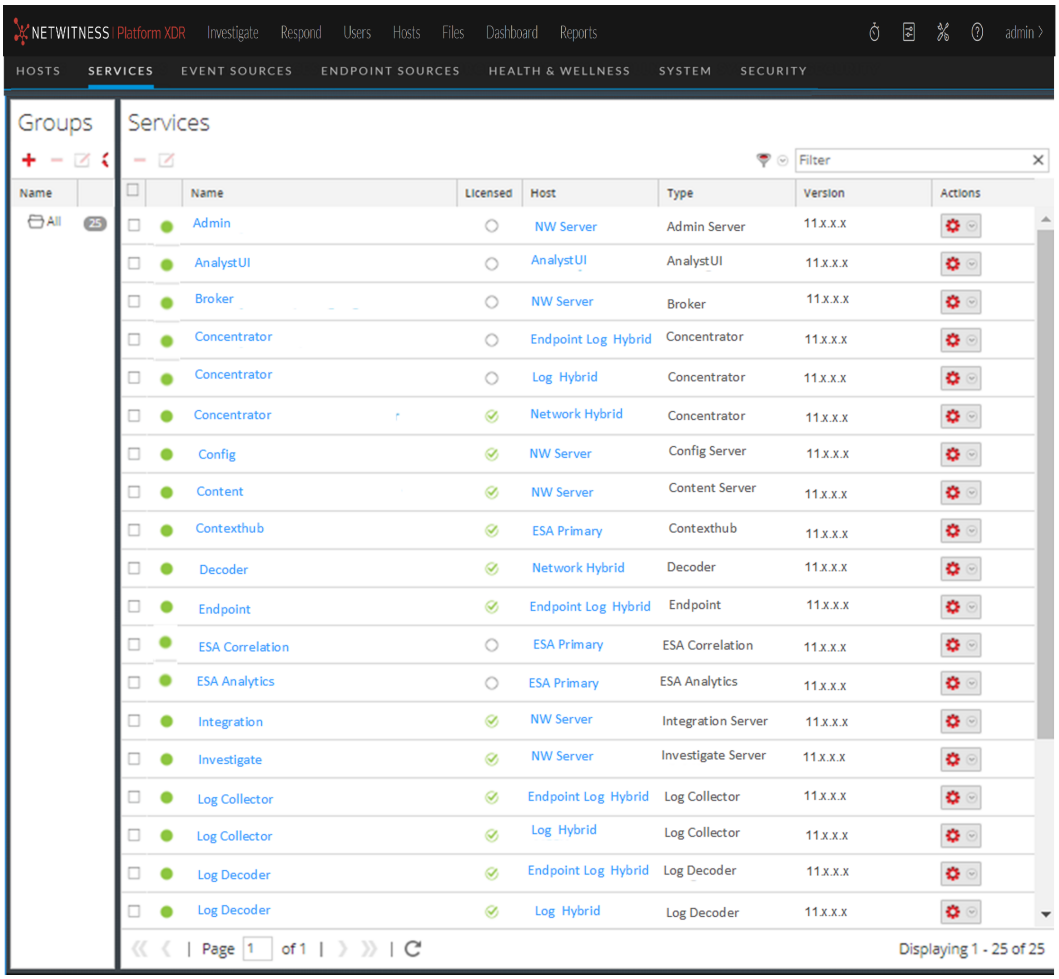
If you do not have a `table-map-custom.xml` file on the Log Decoder, create a copy of `table-map.xml` and rename it to `table-map-custom.xml`.

To verify and update the table mapping file:

1. Go to  **(Admin) > Services**.
2. In the Services list, select a Log Decoder and click  **> View > Config**.

3. Click the **Files** tab and select the **table-map.xml** file.

4. Verify that the `flags` keywords are set correctly to either `Transient` or `None`.
5. If you need to change an entry, do not change the `table-map.xml` file. Instead, copy the entry, select the `table-map-custom.xml` file, find the entry in the `table-map-custom.xml` file and change the `flags` keyword from `Transient` to `None`.
   For example, the following entry for the `hardware.id` meta key in the `table-map.xml` file is not indexed and the `flags` keyword shows as `Transient`:
   `<mapping envisionName="hardware_id" nwName="hardware.id"`
   `flags="Transient"``/>`
   To index the `hardware.id` meta key, change the flags keyword from `Transient` to `None` in the `table-map-custom.xml` file:
   `<mapping envisionName="hardware_id" nwName="hardware.id"` **`flags="None"`**`/>`
6. If an entry does not exist in the `table-map.xml` file, add an entry to the `table-map-custom.xml` file.
7. After making your changes to the `table-map-custom.xml` file, click **Apply**.

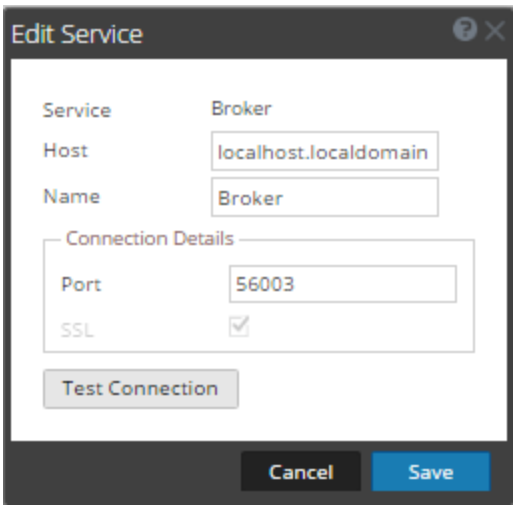


Caution: Before changing the table mapping files, carefully consider the effect of changing the index from `Transient` to `None` because it can impact the available storage and performance of the Log Decoder. For this reason, only certain meta keys are indexed out-of-the-box. Use the `table-map-custom.xml` file for different use cases.

Edit or Delete a Service

You can edit service settings, such as changing the host name or port number, or deleting a service that you no longer need.

Each of the following procedures starts in the Services view.



To navigate to the Services view, in NetWitness, go to **(Admin) > Services**.

Edit a Service

1. In the Services view, select a service and either click or > **Edit**.

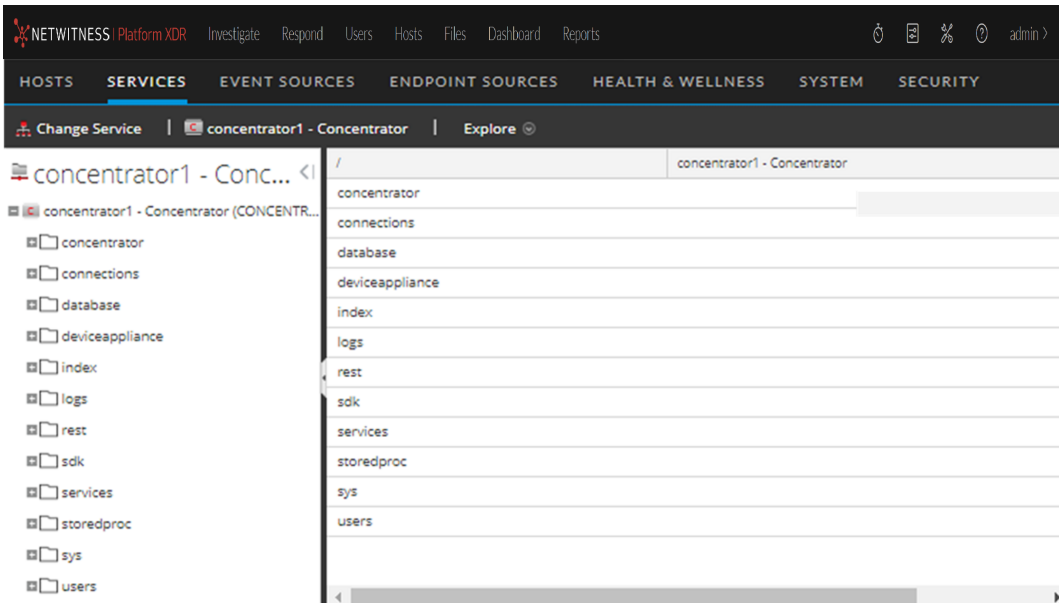
   The **Edit Service** dialog is displayed. It shows only the fields that apply to the selected service.

2. Edit the service details by changing any of the following fields:
   - **Name**
   - **Port** - Each Core service has two ports, SSL and non-SSL.
   - **SSL** - For trusted connections, you must use SSL.
   - **Username** and **Password** - Use these credentials to test the connection to a service.
     a. If you use a trusted connection, delete the username.
     If you do not use a trusted connection, type a username and password.
     b. Click **Test Connection**.
3. Click **Save**.

Delete a Service

1. In the Services view, select one or more services and either click − or > **Delete**.
2. A dialog requests confirmation. To delete the service, click **Yes**.

The deleted service is no longer available to the NetWitness modules.



Explore and Edit Service Property Tree

You have advanced access and control of service functionality in the Services Explore view, which consists of two parts. The Node list displays service functionality in a tree structure of folders. The Monitor panel displays properties of the folder or file selected in the Nodes list.

Each of the following procedures starts in the Explore view.

To navigate to the Explore view:

1. In NetWitness, go to **(Admin) > Services**.
2. Select a service, then select **> View > Explore**.
   The Explore view is displayed. The Node list is on the left and the Monitor panel is on the right.

Display or Edit a Service Property

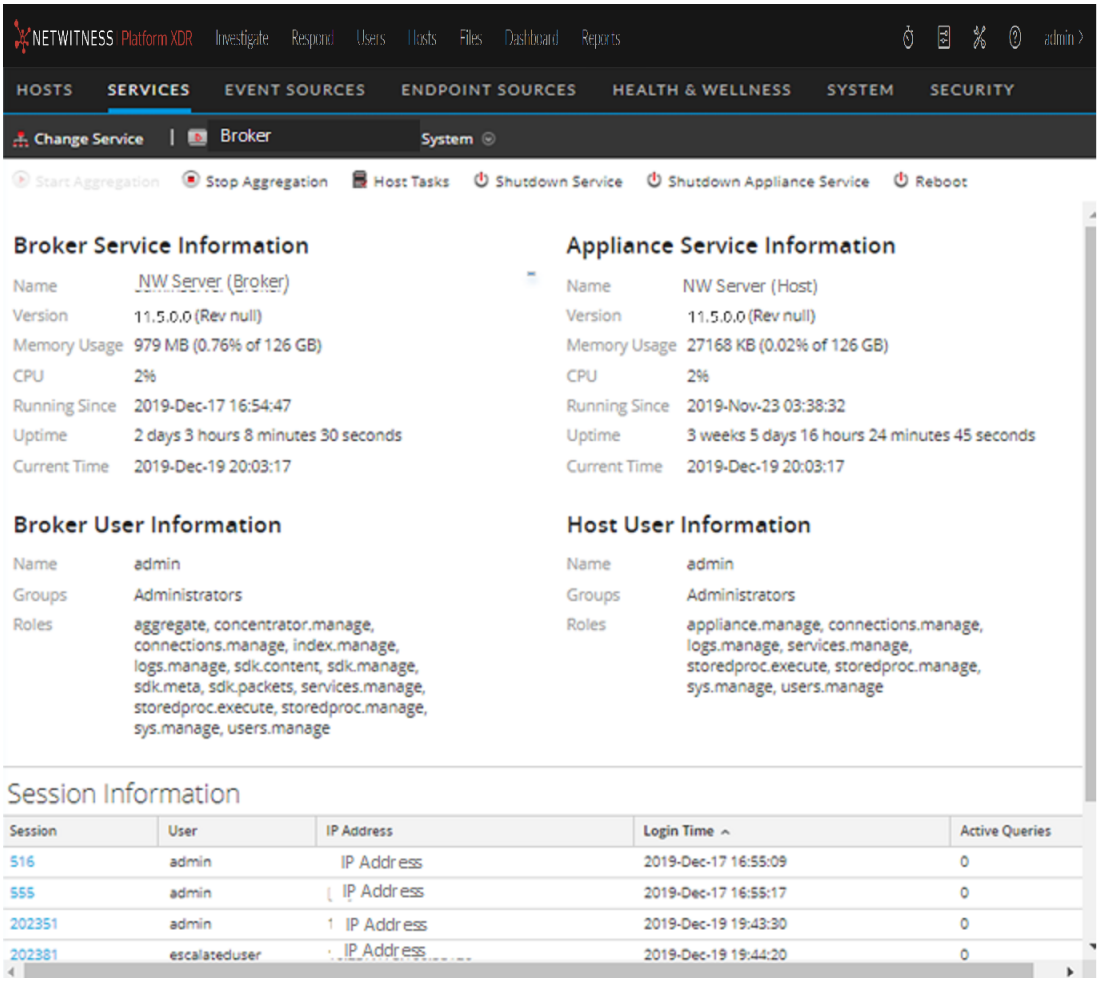
To display a service property:

1. Right-click a file in the Node list or Monitor panel.
2. Click **Properties**.

To edit the value of a service property:

1. In the **Monitor** panel, select an editable property value.
2. Type a new value.

Send a Message to a Node



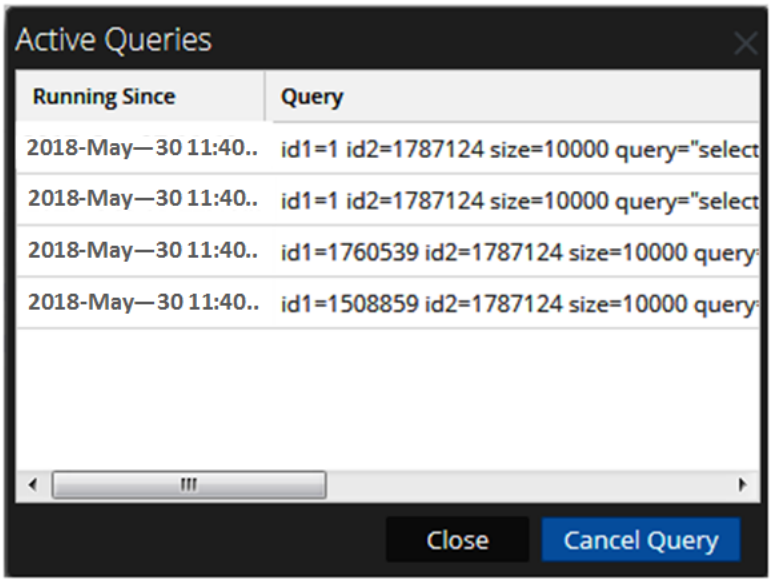
1. In the Properties dialog, select a message type from the drop-down list. Options vary according to the file selected in the Node list.
   A description of the selected message type is displayed in the **Message Help** field.
2. (Optional) If the message requires them, type the **Parameters**.
3. Click **Send**.
   The value or format is displayed in the Response Output field.

Terminate a Connection to a Service

You can view sessions that are running on a service in the Service System view. From within the list of sessions, you can terminate the session and the active queries in a session.

Terminate a Session on a Service

1. In NetWitness, go to **(Admin) > Services**.
   The Admin Services view is displayed.
2. Select a service, and select **> View > System**.
   The Services System view is displayed.



3. In the **Session Information** list at the bottom, click a session number from the Session column.
   The confirmation dialog is displayed.
4. Click **Yes**.

Terminate an Active Query in a Session

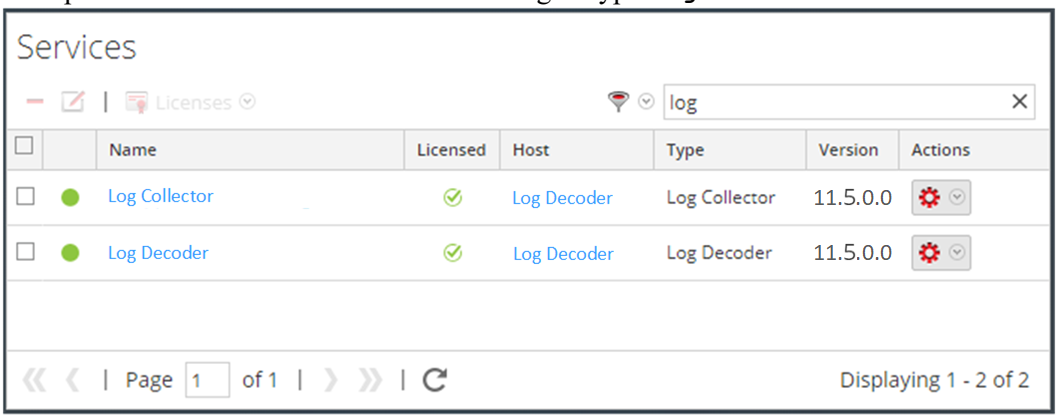
1. Scroll down to the **Sessions** list.
2. In the **Active Queries** column, click a non-zero count of active queries for a session. You cannot click on it if there are 0 active queries.

   The Active Queries dialog is displayed.

3. Select a query and click **Cancel Query**.

   The query stops and the Active Queries column is updated.

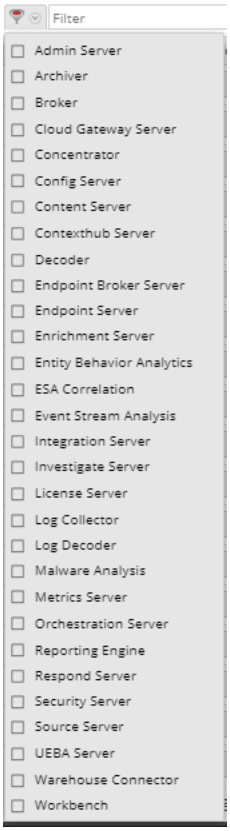
Search for Services



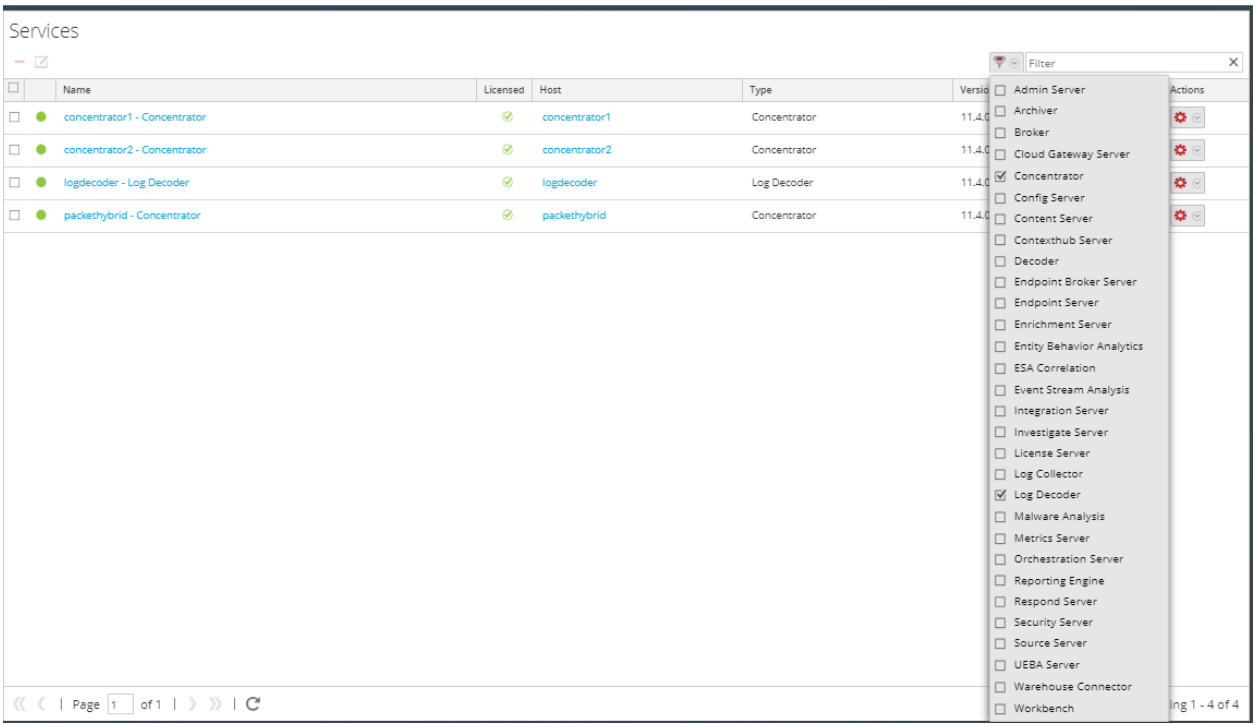
You can search for services from the list of services in the Services view. The Services view enables you to quickly filter the list of services by Name, Host, and Service Type. You can use the Filter drop-down menu and the Filter field separately or at the same time to filter the Services view.

Search for a Service

1. In NetWitness, go to  **(Admin) > Services**.
2. In the **Services** list toolbar, type a service **Name**, **Host**, or service **Type** in the **Filter** field.



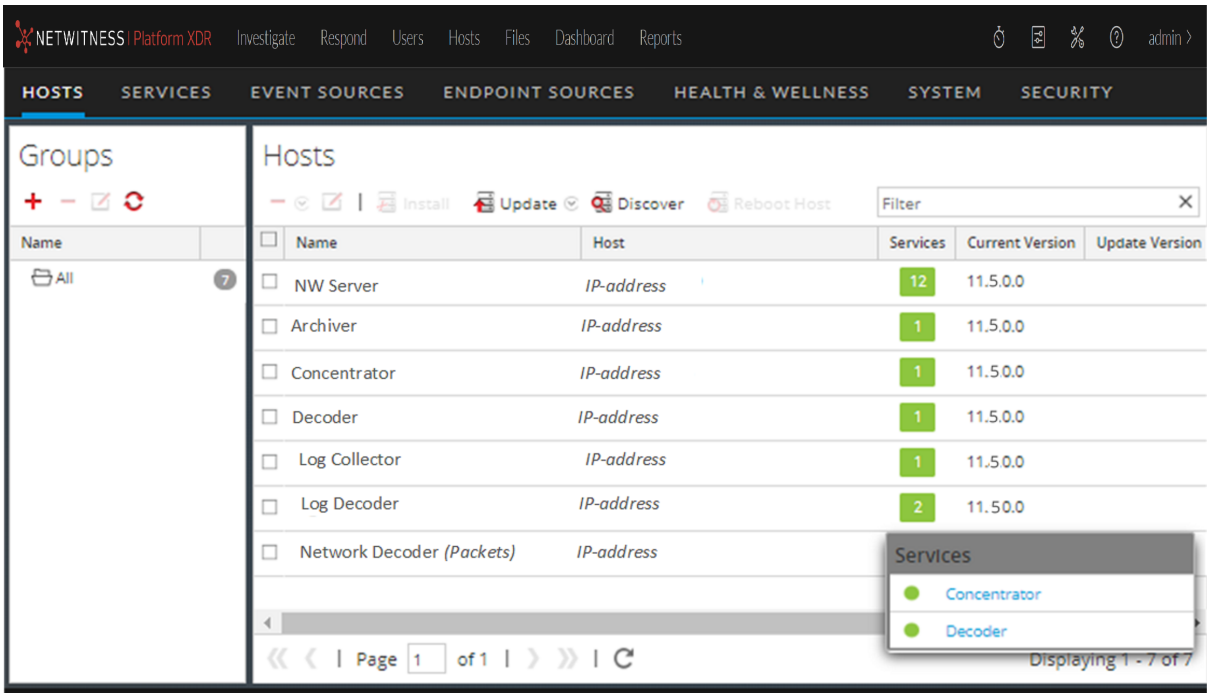
The Services panel lists the services that match the names entered in the Filter field. The following example shows the search results after starting to type **log** in the filter field.



Filter Services by Type

1. In NetWitness, go to **(Admin) > Services**.
2. In the Services view, click and select the service types that you want to appear in the Services view.

The selected service types appear in the Services view. The following example shows the Services view filtered for Concentrator and Log Decoder.



Find the Services on a Host

In addition to being able to locate the services for a host in the Services view, you can also quickly find the services that run on a host in the Hosts view.

1. In NetWitness, go to **(Admin) > Hosts**.
2. In the Hosts view, select a host and click the box that contains a number (the number of services) in the **Services** column.

   A list of the services on the selected host is displayed.

   In the following example, a list of two services on the selected host are listed after clicking the box containing the number 2.

3. You can click the service links to view the services in the Services view.

Start, Stop, or Restart a Service

These procedures apply to Core services only.

Each of the following procedures starts in the Services view. In NetWitness, go to **(Admin) > Services**.

Start a Service

1. Select a service and click > **Start**.

Stop a Service

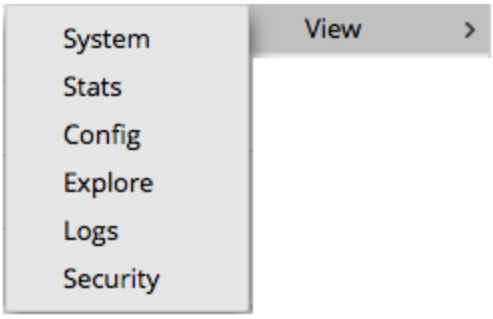
When you stop a service, all of its processes stop and active users are disconnected from it.

To stop a service:

1. Select a service and click > **Stop**.
2. A dialog requests confirmation. To stop the service, click **Yes**.

Restart a Service

Occasionally, you have to restart a service for changes to take effect. When you change a parameter that requires a restart, NetWitness displays a message.



To restart a service:

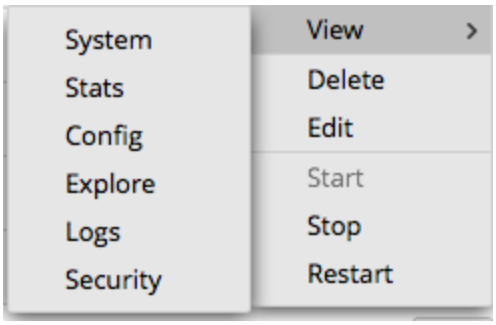
1. Select a service and click > **Restart**.
2. A dialog requests confirmation. To stop the service, click **Yes**.

The service stops, then restarts automatically.

View Service Details

You can view and edit information about services using options in the View menu for a service.

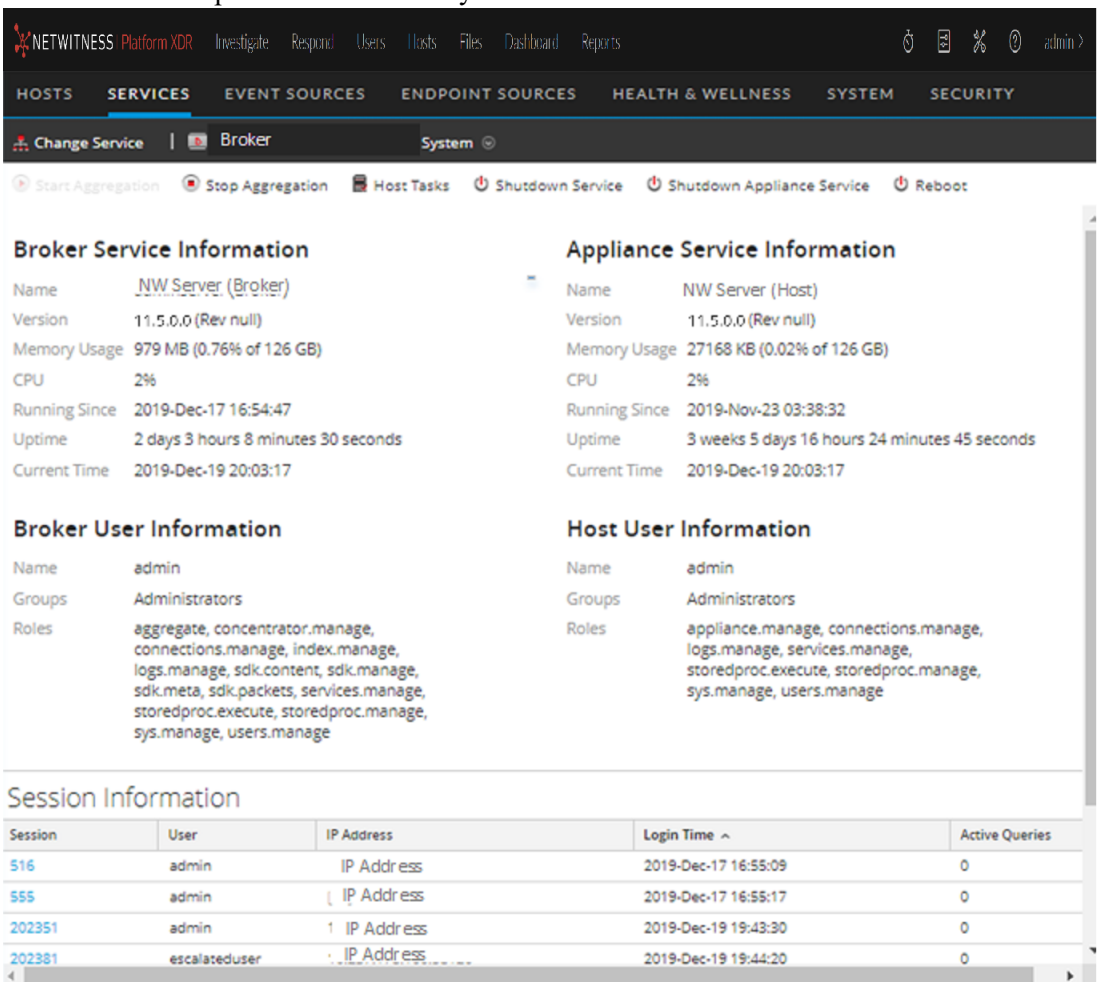
Purpose of Each Service View



Each view displays a functional piece of a service and is described in detail in its own section:

- Services System View shows a summary of service, appliance service, service user, host user, and session information.
- Services Stats View provides a way to monitor service operations and status.
- Services Config View is for configuring all aspects of a service.
- Services Explore View is for viewing and editing host and service configurations.
- System Logging Panel shows service logs that you can search.
- Services Security View is a way to add NetWitness Platform Core user accounts for aggregation, thick client users, and REST API users.

Access a Service View

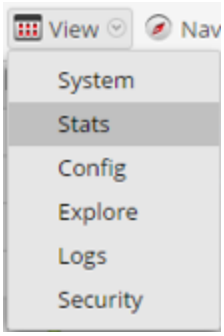


To access a view for a service:

1. In NetWitness, go to **(Admin) > Services**.
2. Select a service and click > **View**.
   The View menu is displayed.

3. From the options on the left, select a view.

   Below is an example of the Services System view for a Broker.



4. Use the toolbar to navigate:

   a. Click **Change Service** to select another service.
      The Administrate Service dialog is displayed.

   b. Select the checkbox to the left of the service that you want.

c. Select the view that you want for the service you selected in the View drop-down list.

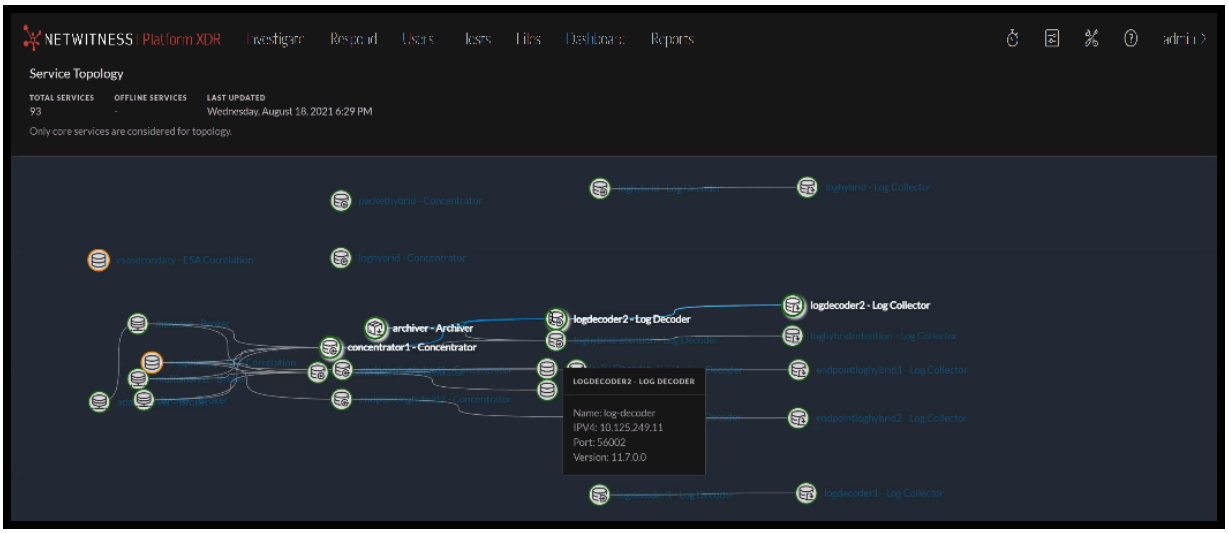
The new view (for example, Stats) is displayed for the service you selected.

View Topology Details

Note: This feature is supported in 11.7 and later.

Note: To view the **Service Topology Tab**, you must ensure this feature is enabled under **Admin Server** > **Explorer** > **Feature**> **service-topology-feature**.

Administrators and analysts can view all the NetWitness core services in a hierarchical layout depicting the collection and aggregation of the services in your deployment. This visualization displays the topology for Broker, Concentrator, Log Decoder, Packet Decoder, Hybrids, ESA and Log Collector and provides insights on which:



- Broker aggregates from the Concentrators.
- Concentrator aggregates from the Log Decoders.
- Log Decoder receives data from the Log Collectors.
- Log Collector sending data to other Log Collectors and vice-veNetWitness and the direction of the data flow.

Note: Services such as Reporting Engine, Malware Analysis, UEBA, Endpoint Server, Cloud Link Service, and Warehouse connector are not supported.

The topology is automatically refreshed once in 3 hours. You can click on any node to view the details.

To view the Topology:

1. Click > **Service Topology.**
2. Do one of the following:
   - Scroll horizontally to view the complete topology.
   - Click **Search** and enter the service name to locate a specific service. The specific service will be highlighted in blue color in the hierarchical layout.
3. Click on the node to view the details.
   For more information, see Services Topology View topic.

Centralized Service Configuration via Policy

Note: The information in this section applies to NetWitness Platform Version 11.7 and Later.

Centralized Service Configuration allows you to manage the configuration of services in your environment efficiently. The Decoder, Concentrator, and Log Decoder deployed in your environment may be large in number and geographically distributed. Managing common configurations across the services can be time consuming. With Centralized Service Configuration, you can centrally create a policy of common configuration settings and apply the policy to a set of groups.

Groups

A group is a set of services based on the service type Decoder, Concentrator, and Log Decoder. You can create a group and assign policy to it based on your requirement. For example, group all the 10G Decoder services or group services within a geographical area. For more information on creating groups, see Creating Groups and Policies.

Policies

A Policy is a set of service configurations that you can apply to a set of groups. This allows you to efficiently manage the service settings. Once you create a customized policy, you can assign it to a group.

Benefits of Centralized Service Configuration

- Apply customized settings in one step to any number of services
- Centrally restart all services within a group (when needed) to apply changes
- Indicates when an action is required, such as service restart, failed publication, or Out of Compliance services
- Clone policy to quickly create similar policies with minor changes

- Quickly revert changes to a policy in case of issues
- Groups of the same service type can be created based on similar hardware profiles or other criteria
- Add configuration items to policies in order to customize settings. Any settings which are not in the policy will be left as default
- (For version 11.7.1 and Later) Reconfigure 10G Network Decoders from the Policy UI. Administrators can quickly create 10G policies for each Decoder group based on the hardware profile
- (For version 11.7.1 and Later) Clone policy from an existing service, to save policy transition time for existing users

Creating Groups and Policies

Create a Group

You can create a group with one or more services and assign one policy to it. Atleast one service is required to publish a group.

To create a group:

1. Go to  (**CONFIGURE**) > **Policies**.
2. In the left panel, click **Groups**.
3. In the tool bar, click .
4. In the New Group panel, do the following:
   - Enter the name of the group.
   - Enter a description for the group.
   - Select the type of service for the group.
5. Click **Next**.
6. In the Define Group, click  to assign services to the group.

Note: A service is disabled if it is assigned to another group.

7. Click **Next**.
8. In the Assign Policies, click  to assign one policy to a group. Make sure that the policy and group is of same service type.
9. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.

     The Publish and Restart Services dialog is displayed only if some settings require a service restart for the changes to take effect. In the Publish and Restart Services dialog, do any one of the following:

- To publish and restart the services immediately, click **Publish & Restart**.
- To publish and restart the services later, click **Publish & Restart Later**. In this case you must restart the services manually.
- To cancel the restart dialog, click **Cancel**.

The settings that do not require restart will be applied immediately.

- Click **Save and Close** to save the settings.

Create a Policy

You can create a policy and assign it to one or more groups.

To create a policy:

1. Go to **(CONFIGURE)** > **Policies**.
2. Click **Policies**.
   The available policies are displayed.
3. Click + Create New to add a new policy.
4. In the New Policy panel, do the following:
   - Select the policy type from the drop-down list.
   - Enter a unique policy name.
   - Enter a description for the policy.
   - Select the service type for the policy from the drop-down list.
   - (For version 11.7.1 and Later) Select the service from which you want to clone the settings.
5. Click **Next**.
6. Do any one of the following:
   - Customize the settings for the policy based on your requirement, for example, in the Database setting, click and change the Policy value to sha256 or change the byte range to 10 MB.

     Note: (For version 11.7.1 and Later) If you have preferred to clone from existing service, the setting values are populated automatically from the selected service on customize settings section. You can also add or modify the settings based on your requirement.
   - (For version 11.7.1 and Later) To configure 10g Settings:
     - Click **10g Settings**.
     - Select the Decoder service to fetch the settings.
     - Click **Done**.
7. In the Group List, click to assign groups to the policy. The policy and group should be of same service type.

Note: A group is disabled if another policy of the same type is already assigned to this group.

8. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.

     The Publish and Restart Services dialog is displayed only if some settings require a service restart for the changes to take effect. In the Publish and Restart Services dialog, do any one of the following:

     - To publish and restart the services immediately, click **Publish & Restart Now**.
     - To publish and restart the services later, click **Publish & Restart Later**. In this case you must restart the services manually.
     - To cancel the restart dialog, click **Cancel**.

     The settings that do not require restart will be applied immediately.
   - Click **Save and Close** to save and return to the Policies view.

Managing Groups and Policies

View a Group

To view properties of the selected group:

1. Go to (**CONFIGURE**) > **Policies**.
2. Click **Groups**. The available groups are displayed.
3. Click a row to view details about the selected group in the right panel.

Delete a group

You can delete one or more groups. Once a group is deleted, the services and policies in the group will no longer displays the deleted group details.

To delete a group:

1. Go to (**CONFIGURE**) > **Policies**.
2. Click **Groups**. The available groups are displayed.
3. Select one or more groups and click **Delete**.

The confirmation message is displayed.

Edit a Group

You can edit the properties of the group at any point in time. The service type cannot be edited. The status of the updated group is unpublished if you change the service or policies in a group. If you just change the group name and description the status remains published (if it is already published).

To edit a group:

1. Go to  (**CONFIGURE**) > **Policies**.
2. Click **Groups**. The available groups are displayed.
3. Select a group and click **Edit**.

Note: You cannot edit the service type.

4. Make the required changes in the group.
5. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.
     The policy will be listed under the published category.
   - Click **Save and Close** to save the settings and return to the Groups view.

Filter Groups

The Filters Panel allows you to filter the list of displayed groups, based on the service type:

- Decoder
- Log Decoder
- Concentrator

Additionally, you can filter based on publication status or service status:

- **Published**: Groups that are published.
- **Unpublished**: Groups that are saved but not published.
- **Failed**: Groups that are failed to publish.
- **N/A**: Groups for which publication status is not applicable.
- **Service Require Restart**: The services associated with the group that require restart.

The Filters panel can be hidden or displayed:

- To display if hidden, click  in the toolbar.
- To hide, click  at the top-right of the panel.

Delete a Policy

To delete a policy:

1. Go to  (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Select one or more policies and in the **More Actions** drop-down list in the tool bar, click **Delete**.

The delete dialog is displayed.

Note: The services associated with this policy still require a restart if the restart is pending.

4. Click **Delete** to permanently delete the selected policies.

The deletion will take effect immediately.

Revert a Policy

You can revert a policy to the previously published version for a maximum of 5 times. Once a policy is reverted you cannot get back to the newer version and you must publish a policy.

Note: The revert is disabled if there is no previously published version.

To revert a policy:

1. Go to  (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Select a policy and in the **More Actions** drop-down list in the tool bar, click **Revert**.
   All changes made to policy will be discarded and reverted to the previously published version. You must publish the policy once it is reverted.

Note: If there are any missing settings in the previously published version, then a default value is set for those settings.

Clone a Policy

You can clone only one policy at a time. Once cloned, all the settings from the old policy is copied to the new policy.

To clone a policy:

1. Go to  (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Select a policy to clone and in the More actions drop-down list in the tool bar, click **Clone**.

The policy is cloned successfully.

Edit a Policy

You can edit the settings of the policies. The service type and policy type cannot be edited. Once the policy is edited the changes in the policy is reflected upon saving the policy. The updated settings are applied to the service if published.

After saving and before publishing the publication status of the changed policy is set to Unpublished if any settings is changed.

To edit a policy:

1. Go to  (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.

3. Select a policy and click **Edit**.
4. Make the required changes in policy.

Note: You cannot edit service type and policy type.

5. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.
     The policy will be listed under the published category.
   - Click **Save and Close** to save the settings and return to the Policies view.

View a Policy

To view a policy:

1. Go to  (**CONFIGURE**) > **Policies**.
2. Click **Policies**. The available policies are displayed.
3. Click a row to view details about the selected policy in the right panel.

Filter Policies

The Filters Panel allows you to filter the list of displayed policies, based on the policy status and service type:

- **Published**: Policies that are published.
- **Unpublished**: Policies that are saved but not published.
- **Failed**: Policies that are failed to publish.
- **N/A**: Policies for which publication status is not applicable.

The Filters panel can be hidden or displayed:

- To display if hidden, click  in the toolbar.
- To hide, click  at the top-right of the panel.

Hosts and Services Views References

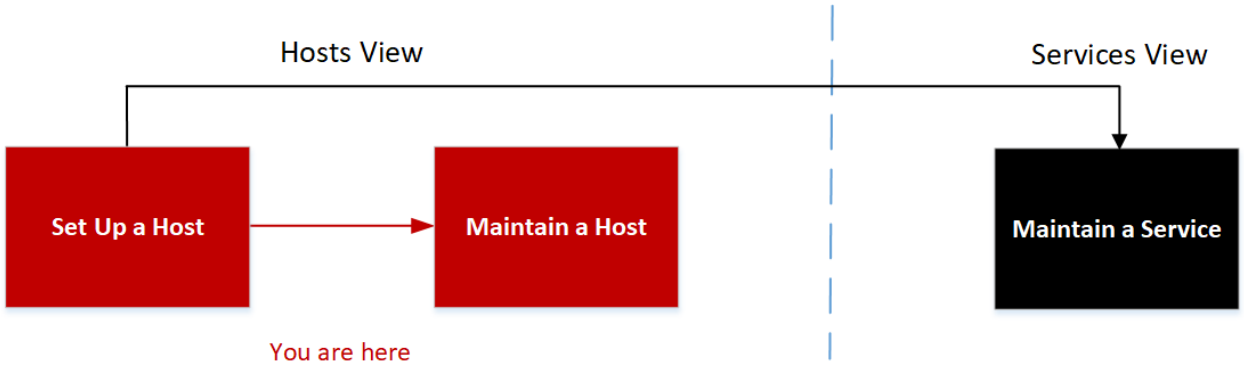
This topic is a reference for features in the NetWitness Admin user interface.

The Admin module pulls NetWitness Admin activities into a single view to monitor and manage hosts (appliances), services, tasks, and security.

Topics

- Hosts View
- Services View
- Services Config View
- Services Explore View
- Services Logs View
- Services Security View
- Services Stats View
- Services System View

Hosts View



You set up and maintain the physical or virtual machine on which NetWitness services run in the Hosts view.

IMPORTANT: For help with resolving errors you receive during version installation and update, see Troubleshooting Version Installations and Updates .

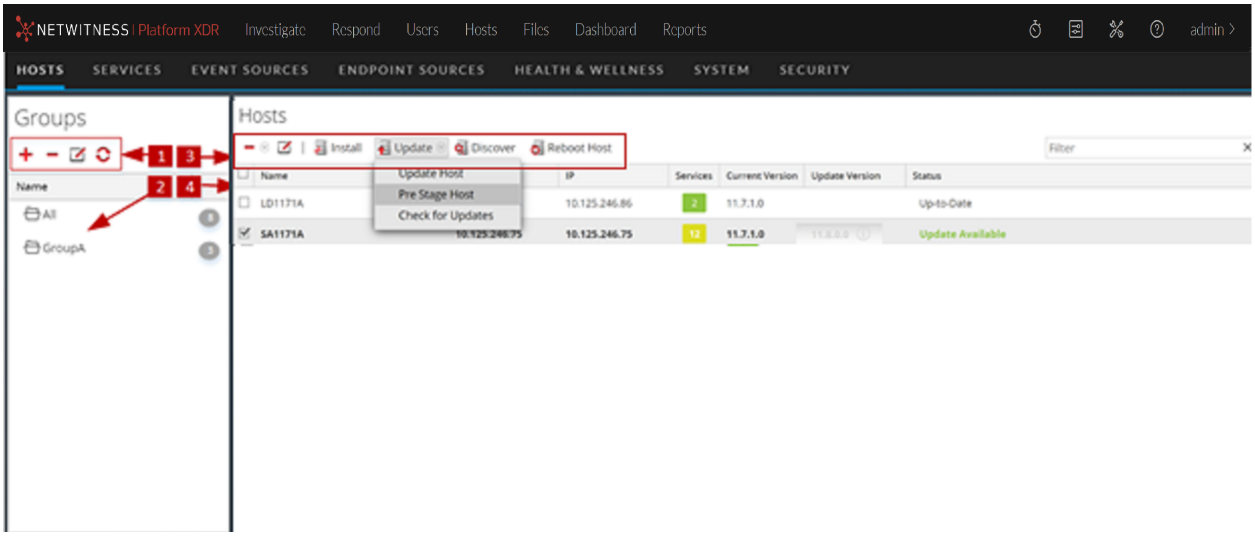
A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host. You must configure the Core services first. You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data.

Workflow

This workflow shows the procedures you complete to set up a host, maintain a host, and update the host with new NetWitness versions. Setting up a host is the first task in this workflow.The hosts with Core services are set up out-of-the-box. After that, you can set up additional hosts to enhance your NetWitness deployment. The other two tasks, maintaining a host and updating versions for a host, are performed when required and do not have a specific order of completion.

What do you want to do?

User Role	I want to...	Documentation
Administrator	set up a host.*	Setting Up a Host
Administrator	maintain a host.*	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services
Administrator	apply version updates to a host.*	Apply Version Upgrades to a Host



* You can perform these tasks in the current view.

Quick Look

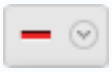
This is an example of the Hosts view.

1 Groups Panel Toolbar - Provides options to work with host groups in the list.
2 Groups Panel - Lists all host groups currently in your deployment.
3 Hosts List Toolbar - Provides options to work with the Hosts list.
4 Hosts List - Lists all hosts currently in your deployment.

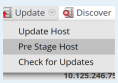
Groups Panel Toolbar

Feature	Description
+	Displays a new row in the Groups panel in which you enter the name of a new group.
−	Asks for confirmation that you want to delete the group. You can confirm or cancel the deletion.
✎	Opens the field for renaming the selected preexisting group. You can also double click on the group name in the Groups panel to rename the group. Changes take effect immediately.
↻	Refreshes the Groups panel to reflect the changes and goes back to the All group view. Changes take effect immediately.

Groups Panel



The Groups panel provides a logical way to organize hosts, such as by function, geography, or project. Once hosts are grouped, it is easier to perform operations on multiple hosts by interacting with each host in a group rather than individual hosts from an non-grouped list. You can drag a host from the Hosts list to add it to a group. A host may belong to more than one group.



Note: In NetWitness Live, groups can subscribe to resources while individual hosts cannot.

Column Title	Description
Name	The host groups are displayed in the Groups panel. The number next to each group name displays the number of hosts that added to the group.

Hosts List Toolbar

The Hosts list toolbar contains the tools that you use to maintain the hosts in your NetWitness deployment.

Feature	Description
	This drop-down list displays two options. • **Remove Host**: Deletes the selected host from both the host group and the Hosts list altogether. All related services will be removed as well. • **Remove From Group**: Removes the selected host from the host group. The Host will still be available in the Hosts list. Changes take effect immediately.
	Opens the Edit Host dialog in which you edit a host or service identification and basic communication settings. See Step 1. Deploy a Host for more information.
	Opens the Install Services dialog from which you can install a service on a deployed host. See Step 2. Install a Service on a Host for more information.

Feature	Description
	This drop-down list displays three options. • **Update Host**: Updates the selected hosts with the version you select in the Update Version column. • **Pre-Stage Host:** Pre-stage the upgrade repository by downloading the required packages without affecting the system. • **Check for Updates**: Checks the Local Update Repo for the latest updates available from NetWitness. Changes take effect immediately. See Apply Version Upgrades to a Host for more information.
	Most of the time, the Discovery function completes automatically and you do not need to click . For a fresh installation, click Discover to access the Provision dialog box so you can complete the provisioning phase. After the provisioning phase, NetWitness automatically discovers services running on the host and you do not need to click Discover.
	Restarts the host immediately.
	Entering a Name or Host here filters the list. This field allows you to quickly find a particular host.

Hosts List

Column	Description
☐	Select the host by clicking the corresponding checkbox in this column. To select all of the hosts, select the checkbox in the header.
Name	Displays the name of the host that was given when the host was installed. This column is organized in alphabetical order by default. Click the Name column title to view in reverse alphabetical order.
Host	Displays the IP address of each host.
Services	Displays the number of services added to the host.
Current Version	Displays the version that the host is currently on.
Update Version	Displays a drop-down list of versions that the user can upgrade to. See Apply Version Upgrades to a Host for more information.

Column	Description
Status	Displays whether or not the host is upgraded to the most current version. If the host is on the most current version, then the Status displays "Up-to-Date".

Services View

You set up and maintain the NetWitness services in the Services view. In the Services view, you can:

- Quickly search for and locate a specific service or type of service, such as Log Decoder or Warehouse Connector.
- Use shortcuts to get to administration tasks.
- Add, edit, and remove services.
- Sort services by name and host.
- Filter services by type, name, and host.
- Start, stop, and restart services.

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host. You must configure the following Core services first.

Services	Notes
NW Server

2 Groups Panel - Lists all service groups currently in your deployment.
3 Services List Toolbar - Provides options to work with the Services list.
4 Services List - Lists all services currently in your deployment.

Groups Panel Toolbar

Feature	Description
	Displays a new row in the Groups panel in which you enter the name of a new group.
	Asks for confirmation that you want to delete the group. You can confirm or cancel the deletion.
	Opens the field for renaming the selected preexisting group. You can also double click on the group name in the Groups panel to rename the group. Changes take effect immediately.
	Refreshes the Groups panel to reflect the changes and goes back to the All group view. Changes take effect immediately.

Groups Panel

The Groups panel provides a logical way to manage groups of services, such as by function, geography, or project. After you create a group, you can drag individual services from the Services panel into the group. A service may belong to more than one group.

Column Title	Description
Name	The service groups are displayed in the Groups panel. The number next to each group name displays the number of hosts that added to the group.

Services List Toolbar

This topic introduces the options in Services list toolbar to add, remove, edit, and get a license for services. You can also filter the services listed in the Services list.

To access the Admin Services view, in NetWitness, go to  **(Admin) > Services.** The Services list toolbar is at the top of the Services list in the Services view.

Feature	Description
	Adds a service for your deployment of NetWitness to manage. See Step 2. Install a Service on a Host.
	Deletes a service from your deployment of NetWitness. See Edit or Delete a Service.

Feature	Description
	Edits service identification and basic communication settings.
	Filters the services listed in Services view. In the Filter drop-down list, you can filter the services by one or more selected service types. In the Filter field, you can filter the services by Name and Host. You can use the Filter drop-down list and the Filter field at the same time to filter the services listed in the Services view.

Services List

Column	Description
	Select the service by clicking the corresponding checkbox in this column. To select all of the services, select the checkbox in the header.
Online/Offline Indicator	Displays  if the service is online. Displays  if the service is offline.
Name	Displays the name of the service that was given when the service was installed. This column is organized in alphabetical order by default. Click the Name column title to view in reverse alphabetical order.
Licensed	Displays  if the service is licensed. Displays  if the service is not licensed. If one or more services are not licensed, a red banner will appear at the top of the screen that will prompt you to fix this. 
Host	Displays the host name that the service belongs to.
Type	Displays the service type.
Version	Displays the version that the service is currently on.
Actions	Use drop-down list to: • Navigate to the different service views (System, Stats, Config, Explore, Logs, Security) See View Topology Details for more information. • Delete, edit, start, stop, and restart a service. See Start, Stop, or Restart a Service for more information.

Quick Look

The following list describes the features of the Add Service or Edit Service dialogs.

Field or Option	Description
Service	Displays the service type. You can add the following services: Archiver, Broker, Concentrator, Network Decoder, Event Stream Analysis, Incident Management, IPDB Extractor, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Warehouse Connector, and Workbench.
Host	Specifies the host on which the service resides.
Name	Specifies the name used to identify the service, for example, **Broker**. An understandable naming convention can make administrative tasks easier. Some administrators find it convenient to use the hostname or IP address (specified in the **Host** field) for the **Name** as well.
Port	Specifies the port used to communicate with this service. The default port, based on the selected service type in the **Service** field, is autofilled here. If you select **SSL** below, this port becomes an SSL port. If you do not select **SSL**, it becomes a non-SSL port. You can customize this port by opening a firewall for the port that you add. For information about ports, see "Network Architecture and Ports" in the *Deployment Guide*.
SSL	Indicates that NetWitness uses SSL for communications with this service.
Username	Specifies the username used to log in to this service. The default username is `admin`.
Password	Specifies the password used to log in to this service. The default password is `netwitness`.
Test Connection	Tests the connection of a service that you are adding.
Cancel	Closes the Add Service or Edit Service dialog. If you do not save the service before closing the dialog, the service is not added or edited.

Field or Option	Description
Save	Adds a new service or saves changes to existing service.

Services Config View

The Services Config view is one of the views available from the **(Admin) > Services >** . It provides a user interface for configuring all aspects of a Core service or NetWitness service.

The configuration options in the Services Config view are organized as tabs, with each tab providing a view of a set of related parameters. Unlike the Services Explore view, which offers direct access to all configuration files for a service, these tabs present the most commonly modified parameters of service configuration in a user-friendly view.

Due to configuration requirements for different services; each type of service has variations in available tabs and configuration parameters in this view. Individual topics describe configuration parameters that are specific to a host (Brokers, Concentrators, Network Decoders, Log Decoders, and Archivers) or service (for example, Reporting Engine, IPDB Extractor, Log Collector, and Warehouse Connector).

Workflow

What do you want to do?

User Role	I want to...	Documentation

Services Config View - Appliance Service Configuration Tab

The Appliance Service Configuration tab appears in the Services Config view for the Archiver, Broker, Concentrator, IPDB Extractor, Network Decoder, Log Collector, and Log Decoder services.

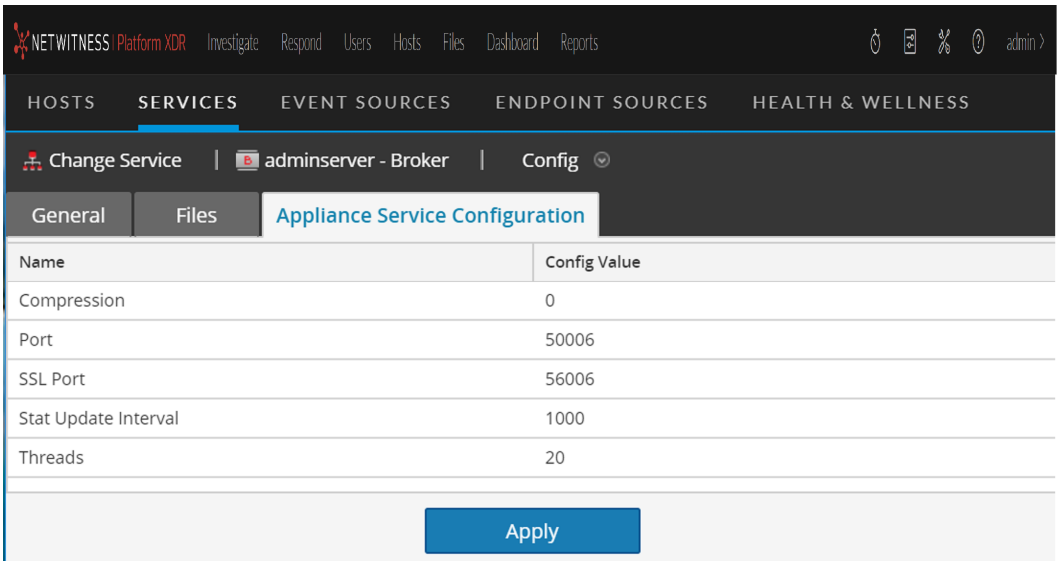
This topic lists and describes the available configuration parameters for the NetWitness Core Appliance service. The NetWitness Core Appliance service provides hardware monitoring on legacy NetWitness hardware.

Workflow

What do you want to do?

User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.*	Maintaining Services
Administrator	view or modify appliance service parameters.*	See "Services Config View - Appliance Service Configuration Tab" in the *Hosts and Services Getting Started Guide for Version 10.x*and prior.

User Role	I want to...	Documentation
Administrator	specify how long to retain database records.	See "Configure Data Retention" in the *Data Privacy Management Guide*. For information about the Data Retention tab for Archiver, see "Data Retention Tab - Archiver" in the *Archiver Configuration Guide*.
Administrator	edit `.xml` and `.lua` files.	Edit Core Service Configuration Files



* You can perform these tasks in the current view.

Quick Look

This is an example of the Appliance Service Configuration tab for a Broker.

The following list describes the configuration values for this tab.

Name	Description of Configuration Value	When Changes Take Effect
Compression	Compresses a message when it reaches the positive number (in bytes) that you specify.	The next time you connect to this service.
Port	Unencrypted listening port. **0** indicates that the port is disabled.	Upon restart of the service.
SSL FIPS Mode	One of the parameters you need to enable or disable Federal Information Processing Standards (FIPS). For detailed instructions, see "Activate or Deactivate FIPS" in the *System Maintenance Guide*.	Upon restart of the service.
SSL Port	SSL (Secure Sockets Layer) listening port. **0** indicates that the port is disabled. SSL is the standard security technology for establishing an encrypted link between a web server and a browser. This link ensures that all data passed between the web server and browsers remain private and integral.	Upon restart of the service.
Stat Update Interval	How often (in milliseconds) the system updates statistic nodes for monitoring Health and Wellness.	Immediately.
Threads	Threads in thread pool required to used to handle requests. The `Threads` parameter works with the `Polling Interval` parameter for event and log threads.	Immediately.

Services Config View - Data Retention Scheduler Tab

The Data Retention Scheduler tab appears in the Services Config view for the Network Decoder, Log Decoder, and Concentrator.

In the Data Retention Scheduler tab, you can define the criteria for removing database records from primary storage on Network Decoder, Log Decoder, and Concentrator services, and schedule the timing for checking the threshold.

Note: If additional customization is necessary, use the Scheduler under the Files tab in the Services Config view. For example, if you have storage available to save the RAW data versus the metadata, use `Capacity` as the threshold and to set different thresholds per database (metadata versus packet).

Workflow

What do you want to do?

Quick Look

The following figure illustrates the parameters in the Data Retention Scheduler tab for a Concentrator.

The Data Retention Scheduler tab has sections to specify Threshold settings and Run settings. The following table lists the parameters supported for data retention configuration.

Parameter	Description
Threshold	The threshold is based on the age of the data, the amount of time the data was stored or the date on which the data was stored. The date is from the database file, not from the actual session time. • **Duration**: The duration of time that data can be stored before removal. Specifies the number of days (365 maximum), hours (24 maximum), and minutes (60 maximum) that have elapsed since the time stamp on the data. • **Date**: The removal of data based on the date of the timestamp. Specifies the monthly date and time in the and fields.
Run	The schedule for running the job that checks rollover criteria. • **Interval**: Schedule the database check to occur at a regular interval. Specifies the hours and minutes between the scheduled checks. • **Date and Time**: Schedule the database check to occur at a regular day and time. Specifies the day from the drop-down list and the system clock time in `hh:mm:ss` format. Possible values for day are `Everyday`, `Weekdays`, `Weekends`, and `Custom`, where `Custom` allows you to select one or more specific days of the week.

Parameter	Description
Apply	Overwrites any previous schedule for this service and applies the new settings immediately. **Caution:** After you apply these settings, when the threshold is met the system deletes the old data from the database and you can no longer access it.
Reset	Resets the schedule to the last applied state.

Services Config View - Files Tab

The Files tab appears in the Services Config view for Archivers, Brokers, Concentrators, Log Decoders, and Network Decoders.

In the Files tab, you can edit service configuration files as text files. The files you can edit vary depending upon the type of service you are configuring. The following files are common to all Core services.

- The NetWitness file (`netwitness`)
- The service index file (`index-<service>`)
- The scheduler file (`scheduler`)
- The crash reporter file (`crashreporter`)
- The feed definitions file (`feed-definitions`)

In addition, the Decoder has files that configure parsers, feed definitions, and a wireless LAN adapter.

Note: The default values in the configuration files cover most common situations. You may need to edit configuration parameters and values for optional services, such as the crash reporter or scheduler. Do not change these values in the Files tab unless you understand networks and the factors that affect the way services collect and parse data.

More detail on the service configuration parameters is available in the Service Configuration Settings.

Quick Look

This is an example of the Files tab.

Files Tab Toolbar

The Files tab has a toolbar and an edit window. This is an example of the toolbar.

These are the features of the Files tab toolbar.

Feature	Description
File drop-down list	Displays a list of files that the system is currently using. When you select a file, the text of the file is displayed in the text edit window. In the text window, you can edit the file and save the changes, or create alternate files to use.
Service / **Host** drop-down list	Displays the service type and host. You can open a file from either the service or the host for editing.
Get Backup	Retrieves the latest backup of the current file, which can prove useful when you have made changes and want to go back to the previous version of the file. The backup does not replace the current file unless you click **Save**.
Push	Displays a dialog in which you can select services of the same type and push the currently viewed file to the services.
Apply	Overwrites the current file and creates a backup file.

Services Explore View

You can use the NetWitness Services Explore view (**(Admin) > Services**, **> View > Explore**) to display and edit both host and service configurations.

The Services Explore view offers advanced access and control of all NetWitness hosts and services. All services expose their functionality through a treelike series of nodes, similar to the Windows Explorer view of a Windows file system. Here you can:

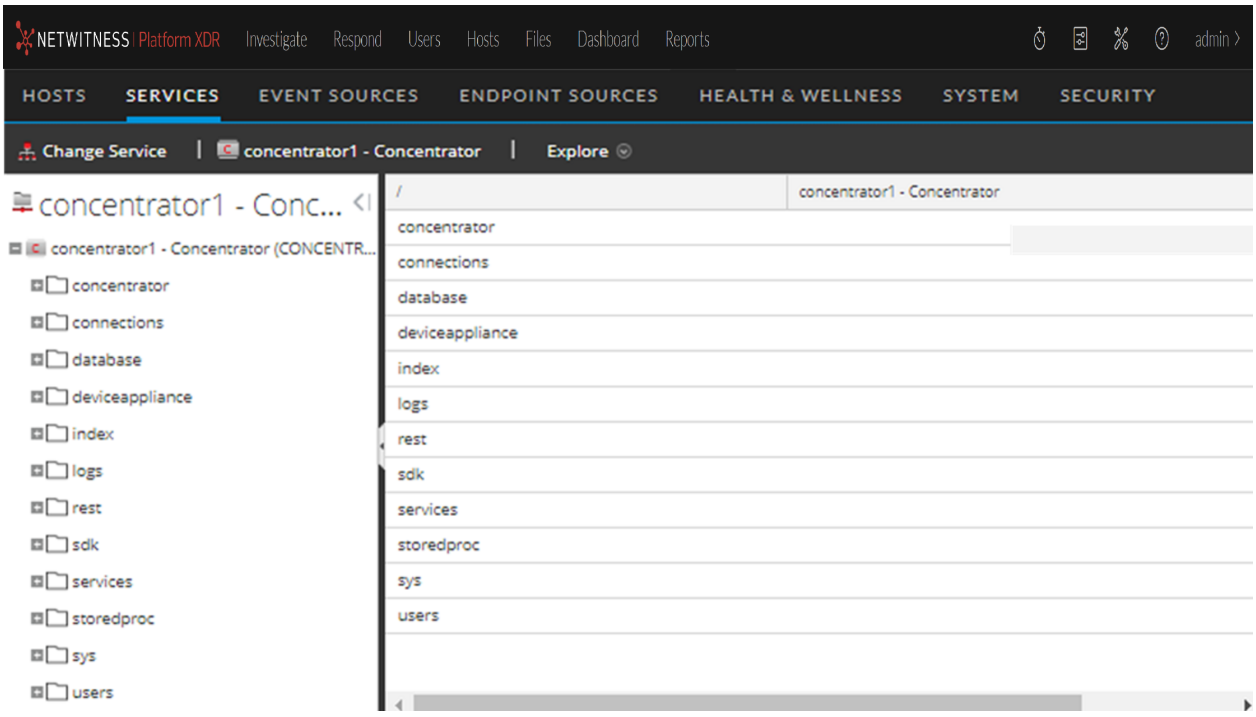
- View a directory tree showing common files for all selected services.
- Navigate down through the directory to a file.
- Open the same file for each service, and display the contents side by side.
- Select an entry in the file and edit the value.
- Apply a property value from one service to other services.

The Services Explore view can also display a Properties dialog, a simple interface for viewing properties of any node in the system and sending messages to the node.

Caution: A good understanding of the nodes and parameters is required when editing in this view. Incorrect settings can cause performance problems.

Workflow

What do you want to do?



User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts

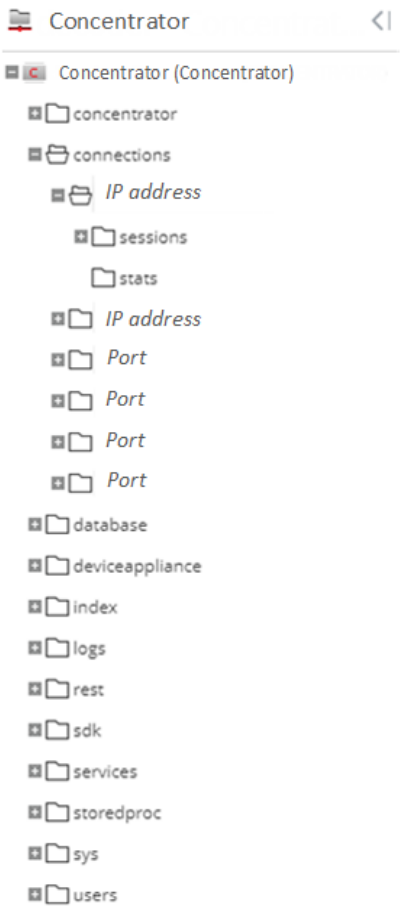
Quick Look



The Services Explore View has two main panels:

- The Node list
- The Monitor panel

You can right-click on a file to access the Properties for the file. See Services Explore View - Properties Dialog for more information.

The Node List

The Node list displays the services as a tree-like series of nodes and folders. The levels in the Node list expand and collapse to display the full hierarchy.

Each root folder is named based on the functionality it exposes. For instance, the `/connections` folder shows all connected IP addresses. Underneath each IP address or port in the list are two folders, `sessions` and `stats`.

- The `sessions` folder displays all authenticated user sessions originating from the IP/Port.
- The `stats` folder displays values, such as the number of messages sent or received, bytes sent or received, and other values set by the service. These are not editable.

Selecting any folder in the tree view displays its children in the Monitor panel. Every node in the tree is actively monitored, so when a statistic or configuration node changes value, it is immediately reflected in the tree and Monitor panel.

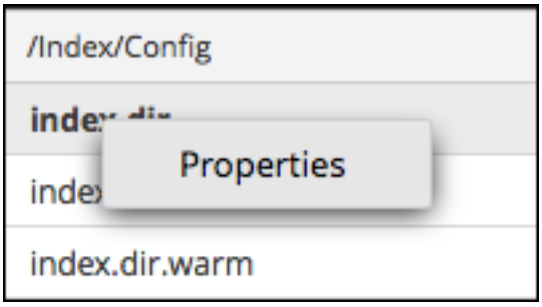
The Monitor Panel

The Monitor panel displays properties and values for a selected node (such as `index`) and a child folder (such as `config`). There are two ways to edit values:

- Click the value and type a new value
- Send a `set` message in the Properties dialog

/index/config	Concentrator
index.dir	/var/netwitness/concentrator/index=2.89 TB
index.dir.cold	
index.dir.warm	
index.slices.open	42
page.compression	huffhybrid
reindex.enable	true
save.session.count	auto

Topics



- View Topology Details

Services Explore View - Properties Dialog

You can use the Services Explore view > Properties dialog to perform the following tasks.

- Send messages to a system node
- Retrieve values for a property for multiple services
- Set values for a property for multiple services

Right-click any file in the Node list or Monitor panel to display the Properties context menu.

When you select `Properties` from the Node list or Monitor panel context menu, the Properties dialog opens below the Monitor panel. All nodes have support help that contains the following information.

- A description of the node
- The list of supported messages with a corresponding description
- Security roles needed to access the messages

The available messages vary according to the service and root folder. Many of these messages are also accessible as options with a NetWitness dashboard or view.

* You can perform these tasks in the current view.

Related Topics

- Services Explore View

The following example shows the Properties dialog with information in Message Help displayed.

The Properties dialog has the following features.

Feature	Description
Message drop-down list	Lists all available messages for the current node. Select a message from this drop-down list to send to the node.
Parameters input field	Type the message parameters in this field.
Send	Sends the message to the selected node.
Message Help	Displays help text for the current message.
Response Output	Displays the response to a message or output from a message.

Services Logs View

The Services Logs view provides the ability to view and search the logs for a specific service. The Services Logs view is identical to the System Logging panel (**(Admin) > System tab > System Logging**) with two exceptions:

- The Services Logs view has an additional filter to select messages for the service or host.
- The System Logging panel has an additional tab for Settings.

For a complete description of NetWitness logging features in the System Logging panel, see "Monitor Health and Wellness of NetWitness Platform" in the *System Maintenance Guide*.

Historical tab	This is a searchable view of the service log. For more information, see "System Logging - Historical Tab" in the *System Maintenance Guide*.

Services Security View

In NetWitness, each service has a separate configuration of users, roles, and role permissions, which are managed in the Services Security view.

To access service information and perform service operations through NetWitness, a user must belong to a role that has permissions on that service. For NetWitness version 10.4 or later Core services that utilize trusted connections, it is no longer necessary to create NetWitness Core user accounts for users that log on through the web client. You only need to create NetWitness Core user accounts for aggregation, thick client users, and REST API users.

Note: Only the default admin user in NetWitness is created by default on all services. As a prerequisite to managing service security, the default admin user account must be present in the Admin Services view. For every other user, you must configure access to each particular service through NetWitness.

Workflow

Quick Look

The Services Security view has three tabs: Users, Roles, and Settings.

Roles and Service Access

Primary considerations in configuring service security are defining the roles and assigning users to the roles. The Service Security view separates these two functions into the Users tab and the Roles tab.

- In the Users tab, you can add a user, edit user settings, change the user password, and edit the role membership of the user for a selected service. Although you select a single service in the Services Security view, you can apply the settings for one service to other services.
- In the Roles tab, you can create roles and assign permissions to the roles for a selected service.

Topics

- Services Security View - Users Tab
- Services Security View - Roles Tab
- Services Security View - Settings Tab

Services Security View - Users Tab

In the Services Security view Users tab, you can configure the following for a service:

- Add user accounts.
- Change service user passwords.
- Configure user authentication properties and query handling properties for the service.
- Specify the user role membership, which specifies the roles that the user belongs to on the selected service.

Note: For version 10.4 or later NetWitness Core services that utilize trusted connections, it is no longer necessary to create NetWitness Core user accounts for users that log on through the web client. You only need to create NetWitness Core user accounts for aggregation, thick client users, and REST API users.

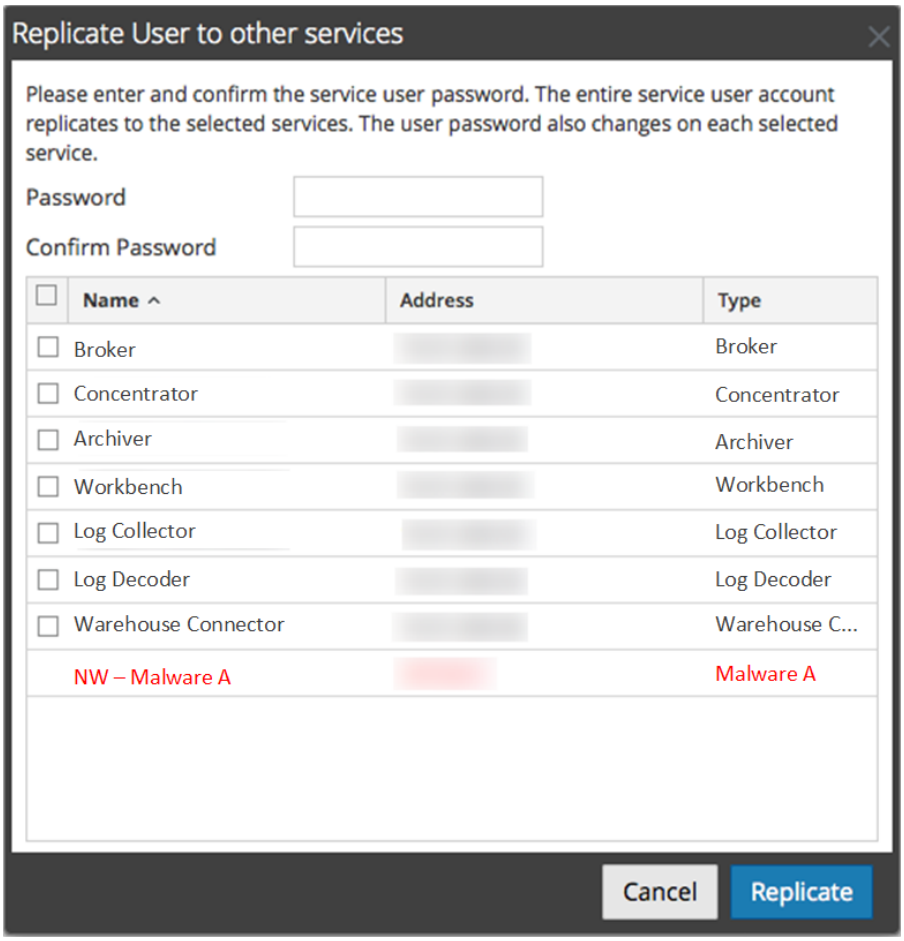
- Services Security View

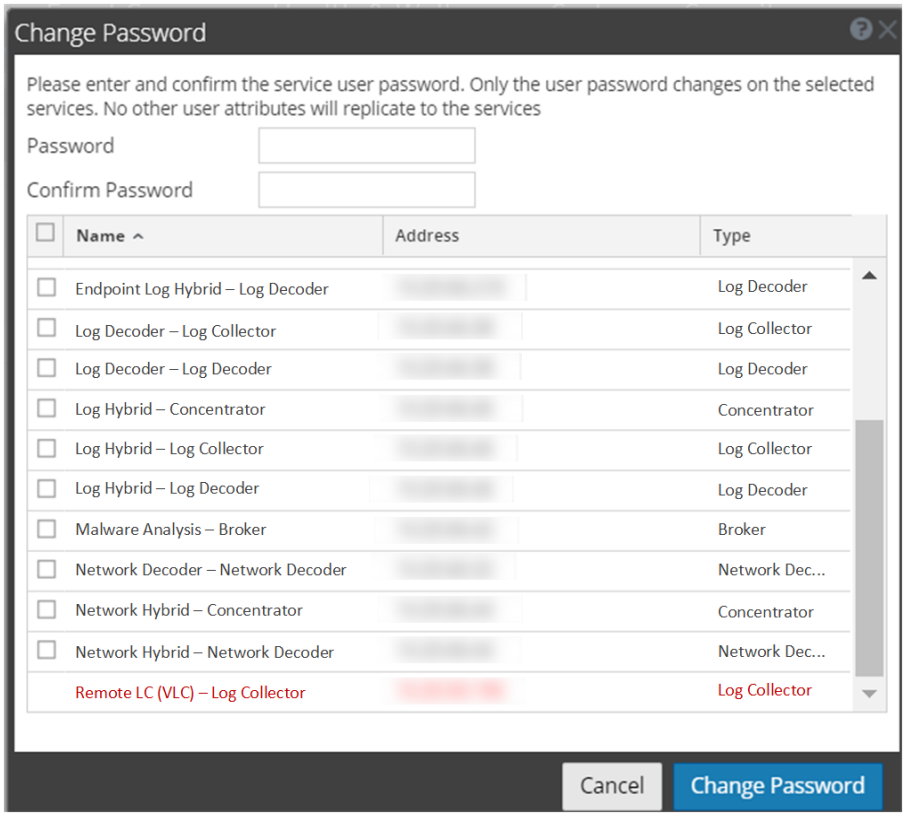
Quick Look

The Users tab has a User List panel on the left. Selecting a username from the panel makes the User Definition panel on the right available.



User List Panel

The User List panel has the following features.



Feature	Description
+	Adds a new user to the current service.
−	Deletes the selected users from the service.

Feature	Description
	Performs one of the following actions on the selected service user account: • **Replicate:** Replicates the entire service user account to selected services. • **Change Password:** Changes the password of a service user and replicates the new password to Core services with that user account defined. The Change Password option replicates only the password change to the Core services selected and does not replicate the entire user account.
Username	The usernames for all user accounts that access the service. The username must be one used to log on to NetWitness.

The following figure shows the "Replicate User to other services" dialog.

The following figure shows the **Change Password** dialog.

User Definition Panel

The User Definition panel has three sections:

- User Information identifies the user as created in the Admin Services Security view.
- User Settings define parameters that apply to this user's access to the service.
- Role Membership defines user roles to which the user belongs.

There are two buttons at the bottom of the panel:

- The **Apply** button saves the changes made in the User Definition panel, and they become effective immediately.
- If you have not saved changes in the User Definition panel, the **Reset** button resets all fields and settings to their values before editing.

User Information

The User Information section has the following features.

Field	Description
Name	The name of the user.
Username	The username that this user enters to log in to the service. This is the NetWitness username generated when the administrator added the user and the associated credentials in the Admin Services Security view.

Field	Description
Password (and **Confirm Password**)	The password that the user enters to log on to the service. This is the NetWitness password generated when the administrator added the user and the associated credentials in the **Administration Security** view. The NetWitness account password and the service password must match in order to allow the user to connect to the service through NetWitness.
Email	(Optional) The user's email address.
Description	(Optional) A general description field to describe this user.

User Settings

The User Settings section has the following features.

Field	Description
Auth Type	The authentication scheme for this user. The product line supports internal and external authentication. • **NetWitness Platform** specifies internal authentication, and is enabled by default. In this mode, all users must authenticate with the user account and passwords that are generated when the administrator uses the NetWitness Admin Services Security view to create the user and their associated credentials. • **External** specifies that authentication is enabled through the host interface with PAM (Pluggable Authentication Modules). For more information, see "Configure PAM Login Capability" in the *System Security and User Management Guide*.
Core Query Timeout	**Note:** This field was previously known as "SA Core Query Timeout" and does not appear for 10.4 and earlier service versions. NetWitness version 10.4 and earlier services use "Query Level" instead. Specifies the maximum number of minutes a user can run a query on the service. If this value is set to **0**, the query timeout is not enforced for the user on the service.
Query Prefix	(Optional) Restricts query results seen by the user by appending the query syntax to every query. For example, adding the query prefix `email != 'ceo@company.com'` prevents those email results from showing up in the sessions.
Session Threshold	(Optional) Controls the behavior of the application when scanning meta values to determine session counts. If any meta value has a session count that is above the set threshold, the determination of the true session count stops when the threshold is reached. If a threshold is set for a session, the Navigate view (INVESTIGATE > Navigate) shows that the threshold was reached and the percentage of query time used to reach the threshold.

Role Membership

The Role Membership section shows a list of all roles. The checkbox next to a role is selected for the roles that a user is a member of for the selected service.

Services Security View - Roles Tab

The Services Security view Roles tab enables you to create roles and assign permissions. Each role can have different permissions for different services. For example, the Analysts role can have different role permissions based on the selected service.

Before you can add users to roles, you need to define user roles, usually by function, and assign permissions to the roles.

Procedures related to this tab are described in Add a User Role to a Service.

Workflow

What do you want to do?

- Services Security View - Aggregation Role

Services Security View - Service User Roles and Permissions

The Services Security view Roles tab enables you to create service user roles and assign permissions. You can also use the pre-configured service user roles included with NetWitness to assign user permissions.

Related Topics

- Services Security View - Aggregation Role
- Services Security View - Roles Tab

Service User Roles

NetWitness has the following pre-configured service user roles.

Role	Assigned Permissions	Personnel/Account
Administrators	All permissions	NetWitness System Administrator

Aggregation	`aggregate`
	`sdk.content`
	`sdk.meta`
	`sdk.packets`
		You can use this role to create an Aggregation account.
		This role provides the minimum permissions necessary to perform aggregation of data. It is only available on NetWitness version 10.5 and later services.

Analysts, Malware_ Analysts, and SOC_ Managers	`sdk.meta`
	`sdk.content`
	`sdk.packets`
	`storedproc.execute`
		Users can use specific applications, run queries and view content for purposes of analysis.

Data_Privacy_ Officers	`sys.manage`
	`users.manage`
	`sdk.meta`
	`sdk.content`
	`sdk.packets`
	`sdk.manage`
	`logs.manage`
	`database.manage`
	`index.manage`
	`dpo.manage`
		Data Privacy Officer
		Data Privacy Officers have the `dpo.manage` permission on Network Decoders and Log Decoders.

Operators	`sys.manage`
	`services.manage`
	`connections.manage`
	`users.manage`
	`logs.manage`
	`parsers.manage`
	`rules.manage`
	`database.manage`
	`index.manage`
	`sdk.manage`
	`decoder.manage`
	`archiver.manage`
	`concentrator.manage`
	`storedproc.manage`
		Operators are responsible for the daily operation of the services.

Service User Permissions

There are many permissions that you can assign a service role in NetWitness. Users can have different permissions on each service, depending on their role assignments and the permissions selected for each role. This table describes the permissions that you can assign to a role.

Permission	Definition
sys.manage	Allows the user to edit the service configuration settings.
services.manage	Allows the user to manage connections to other services.
connections.manage	Allows the user to manage connections to the service.
users.manage	Allows the user to create individual users and user roles and specify user permissions.
aggregate	Allows the user to perform aggregation of data.
sdk.meta	Allows the user to run queries in the Investigation and Reporting applications and to view the metadata returned by the query.
sdk.content	Allows the user to access raw packets and logs from any client application (Investigations and Reporting).
sdk.packets	Allows users to access raw packets and logs from any client application.
appliance.manage	Allows the user to manage the appliance (host) tasks. This permission is required by the Appliance service.
decoder. manage	Allows the user to edit the configuration settings for the Network Decoder service.
concentrator.manage	Allows the user to edit the configuration settings for the Concentrator/Broker service.
logs.manage	Allows the user to view the service logs and edit the logging configuration settings for the specified service.
parsers.manage	Allows the user to manage all attributes under the parsers node.
rules.manage	Allows the user to add and delete all rules.
database.manage	Allows the user to set database locations, sizes, and the various configuration settings for the session, meta and/or packet/log databases.
index.manage	Allows the user to manage all index-related attributes.
sdk.manage	Allows the user to view and set all SDK configuration items.
storedproc.execute	Allows the user to execute a Lua stored procedure.
storedproc.manage	Allows the user to manage Lua stored procedures.
archiver.manage	Allows the user to modify the Archiver configuration.

Permission	Definition
dpo.manage	Allows the user to manage the transform configuration and the applicable keys.

Services Security View - Aggregation Role

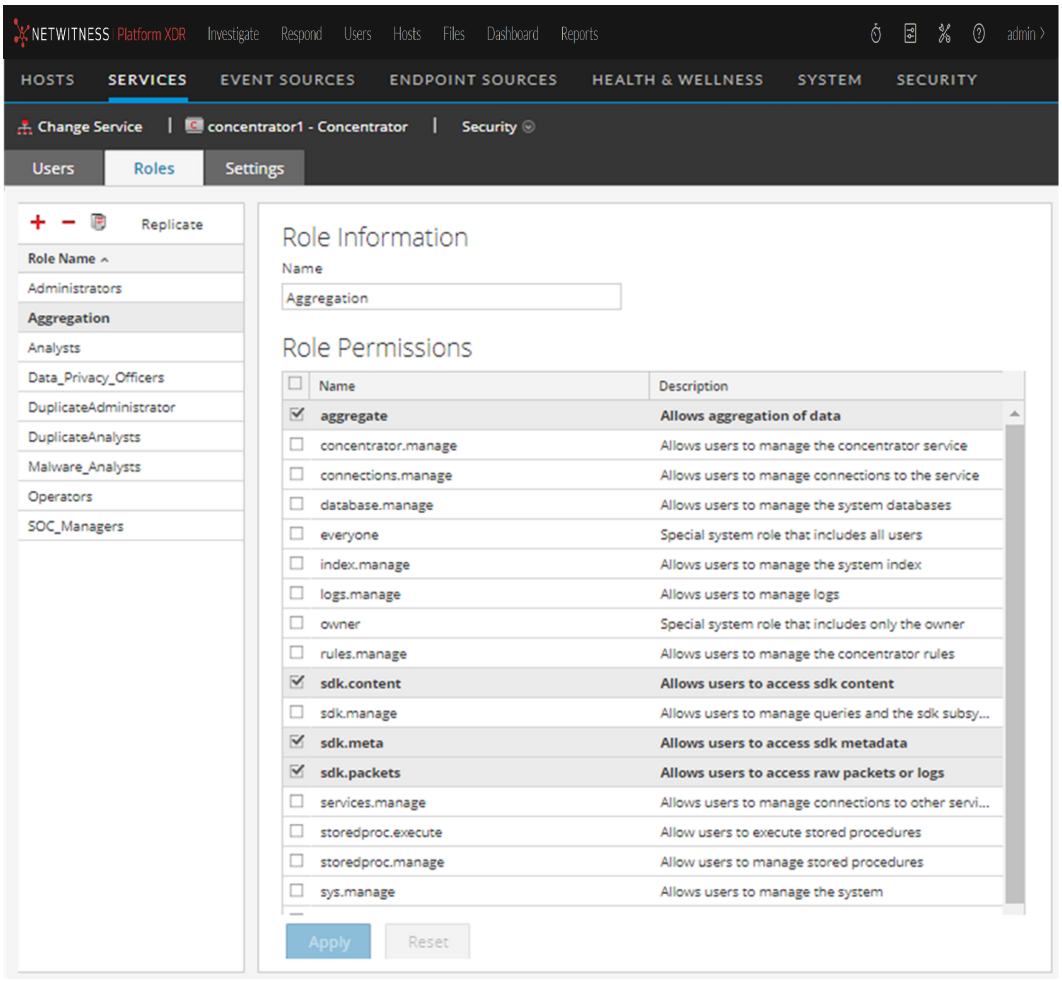
This topic describes the Aggregation role and permissions that allow service users to perform aggregation.

Related Topics

- Services Security View - Service User Roles and Permissions
- Services Security View - Roles Tab

The Aggregation role is a service user role intended only for aggregation of data. It has the minimum role permissions required to do aggregation:

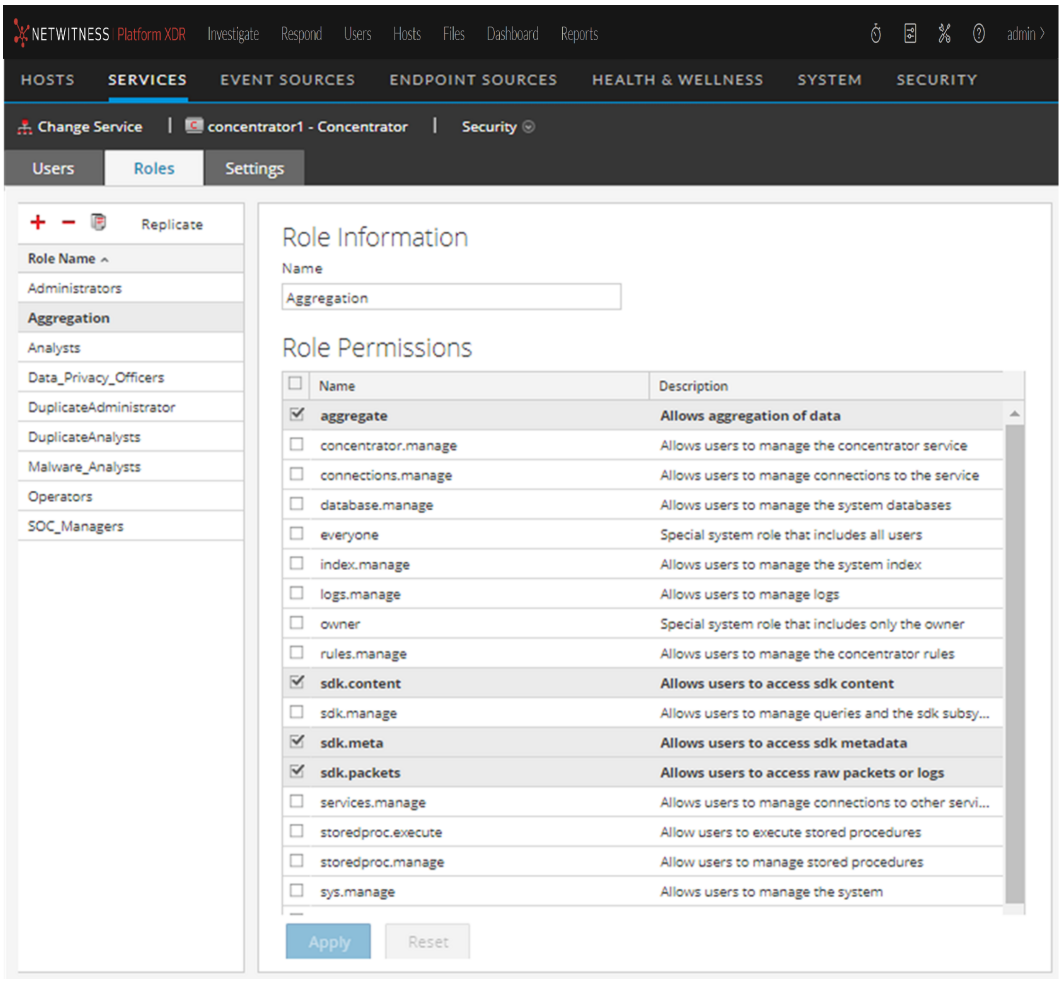
- aggregate
- sdk.meta
- sdk.packets
- sdk.content



The Aggregation role is available only on NetWitness version 10.5 and later services and it can be used for an aggregation account. Members of this role or service users with these permissions can perform aggregation on Network Decoders, Concentrators, Archivers, and Brokers. The aggregate permission allows service users to perform aggregation of sessions and metadata along with raw packets and logs.

You can still use the decoder.manage, concentrator.manage, and archiver.manage permissions, but the Aggregation role permissions allow aggregation only and prevent the other available operations.

You access the service roles from the **(Admin) > Services** (select a service) > > **View** > **Security** > **Roles** tab.



Procedures related to roles are described in Hosts and Services Maintenance Procedures. Services Security View - Service User Roles and Permissions provides detailed information on the pre-configured roles.

The following figure shows the permissions in the Aggregation role.

Services Security View - Settings Tab

In the Services Security view Settings tab, Administrators can enable and configure system roles that define permissions on a per meta key basis for individual Brokers, Concentrators, Network Decoders, and Log Decoders. Configuring this feature adds configurable meta keys to the Services Security view > Roles tab so that individual meta keys can be applied to specific roles on a specific service. The following figure illustrates this.

This configuration is generally part of a data privacy plan implemented to ensure that specific types of content consumed or aggregated by a service are kept secure by limiting visibility of the metadata and content to privileged users. See the *Data Privacy Management Guide* for more information.

Workflow

What do you want to do?

Quick Look

The Settings tab includes two features.

Feature	Description
SDK Meta Role Permissions field	Provides option for disabling or configuring meta key and content restrictions. The filtering options are described.
Apply button	Applies the selected configuration immediately. If not disabled, the meta keys are added to the Roles tab so they can be applied to specific roles.

SDK Meta Role Permissions Options

The following table lists the filtering options available in the SDK Meta Role Permissions selection list, and the numeric values used to disable (0) and the types of filtering (1 through 6).

Note: There is no need to know the numeric value unless configuring metadata and content visibility manually in the `system.roles` node.

`system.roles` Node Value	Settings Tab Option	Description
0	No Filtering (Disabled)	System roles that define permissions on a per meta key basis are disabled.
1	Whitelist metadata and content	Metadata and content for the specified SDK meta roles are white listed, or visible to users assigned the system role.
2	Whitelist only metadata	Metadata for the specified SDK meta roles is white listed, or visible to users assigned the system role.
3	Whitelist only content	Content for the specified SDK meta roles is white listed, or visible to users assigned the system role.
4	Blacklist metadata and content	Metadata and content for the specified SDK meta roles are black listed, or not visible to users assigned the system role.
5	Blacklist only metadata	Metadata for the specified SDK meta roles is black listed, or not visible to users assigned the system role.
6	Blacklist only content	Content for the specified SDK meta roles is black listed, or not visible to users assigned the system role.

Services Stats View

The Services Stats view provides a way to monitor the status and operations of a service. This view displays key statistics, service system information, and host system information for a service. In addition, more than 80 statistics are available for viewing as gauges and in timeline charts. In historical timeline charts, only statistics for session size, sessions, and packets are viewable.

Workflow

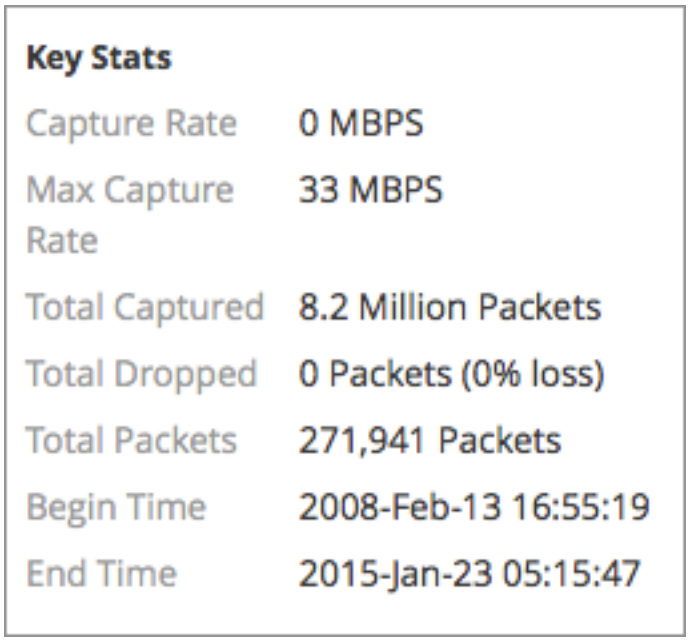
Quick Look

The following figure shows an example of the Services Stats view for a Network Decoder.

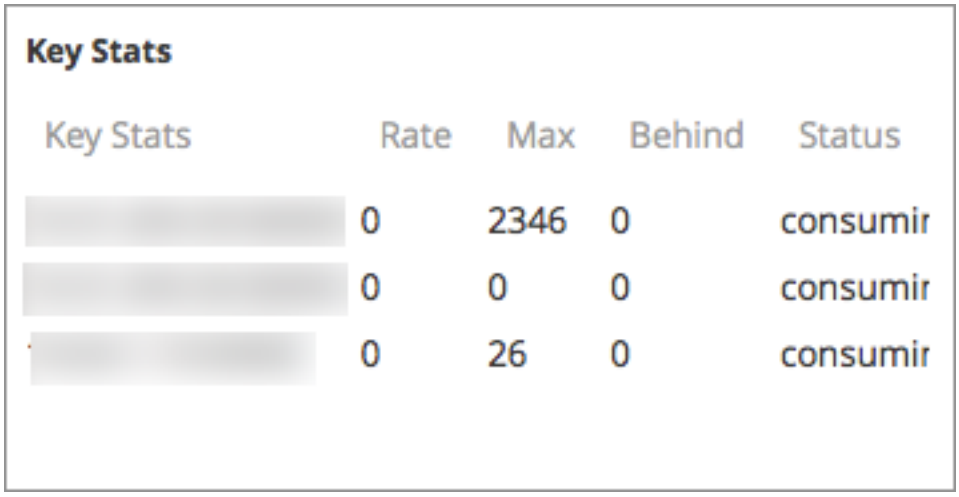
Although different statistics are available for different types of services, certain sections are common to the Services Stats view for any Core service:

- Summary Stats
- Gauges
- Timeline Charts
- Historical Timeline Charts
- Chart Stats Tray



Summary Stats Section

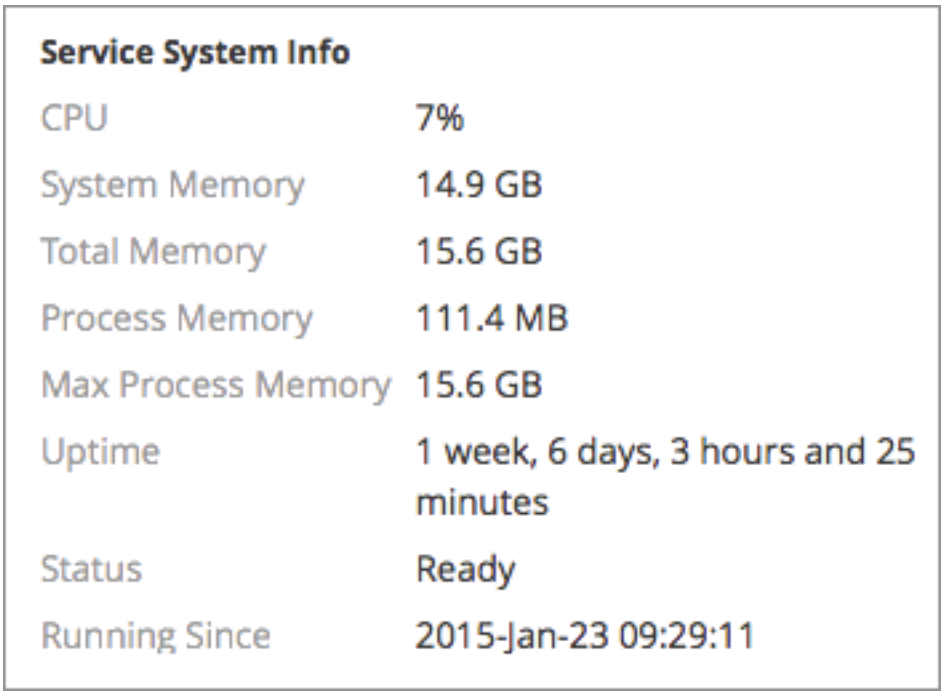
The Summary Stats section is at the top of the default view and has no editable fields. There are five panels in the Summary Stats section: Key Stats, Service System Info, Host System Info, Logical Drives, and Physical Drives. The **Key Stats** panel displays different statistics for different types of services. The remaining four panels in the Summary Stats section are the same for all types of services.



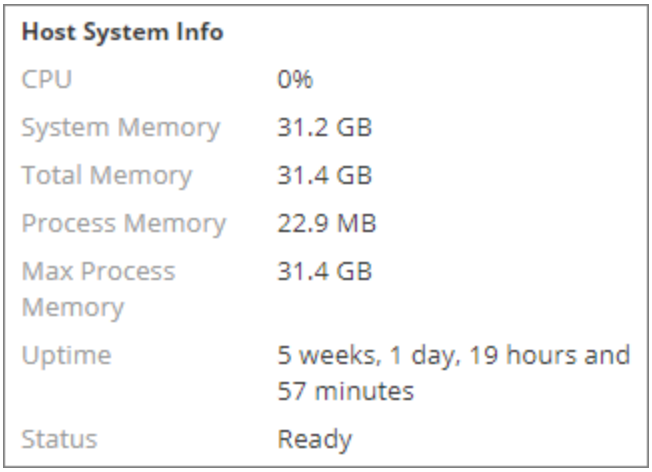
Key Stats

The Key Stats panel displays different statistics for different types of services.

- For a **Network Decoder** or **Log Decoder**, key statistics include capture statistics, such as capture rate, total packets or logs captured, total packets or logs dropped, the data capture begin time and end time.

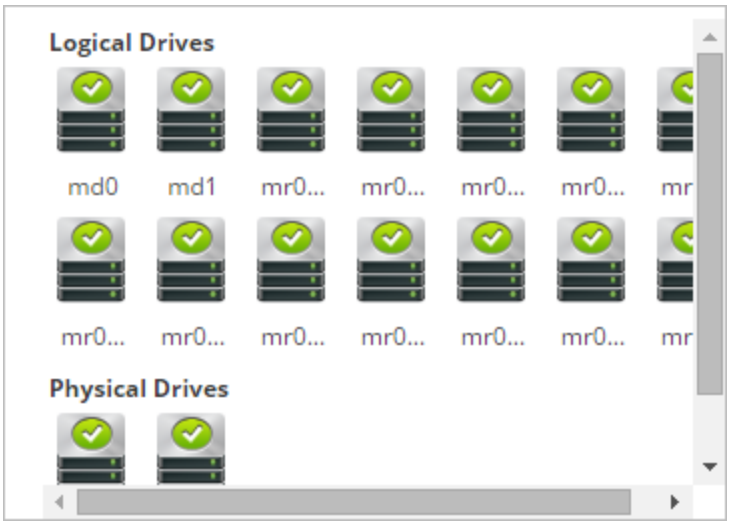


- A **Broker** or **Concentrator** aggregates data from multiple services. Therefore, the key statistics for all aggregate services are presented in a list. The columns in the list provide the service name, the capture rate, the maximum capture rate, the number of sessions behind (that need to be aggregated), and the service status.



Service System Info

The Service System Info panel includes the percentage of CPU used by the service, the memory usage statistics (system, total, process, and maximum process), service uptime, status, running since time, and the current time.



Host System Info

The Host System Info panel includes the percentage of CPU used by the host, the memory usage statistics (system, total, process, and maximum process), host uptime, status, running since time, and the current time.

Logical Drives and Physical Drives

The Logical Drives panel and Physical Drives panel are shown with an icon for the drive name and state. Drive types are used in the names and the drive status options are listed below.

Drive Types and Status

Drive Type	Description	Comments	Status Options
`sd`	SCSI block device	Directly connected SAS, SATA MegaRAID volumes.	Green: OK Red: FAIL
`ld`	MegaRAID Logical Volume	Defined in BIOS or with MegaCLI tool.	Green: OK Yellow: DEGRADED/BUILDING Red: FAIL
`pd`	MegaRAID Physical Disks	Not directly exposed to Linux.	Green: OK Red: FAIL
`md`	Linux software RAID Volume		Green: OK Yellow: DEGRADED/BUILDING Red: FAIL

Gauges

The Gauges section in the Services Stats view presents statistics in the form of analog gauges. See Services Stats View - Gauges for details on configuring gauges.

Timeline Charts

Timeline charts display the selected statistics in a running timeline with focus on the current time. This is the same for all types of services, and only the display name of the timeline is editable. See Services Stats View - Timeline Charts for details on configuring timelines.

Historical Timeline Charts

Historical timeline charts display statistics for session size, sessions, and packets in a historical timeline. This is the same for all types of services. Only the display name, begin date, and end date. See Services Stats View - Timeline Charts for details on configuring timelines.

Note: Historical timeline charts is being deprecated for Log Collector, Virtual Log Collector (VLC) and Windows Legacy Collector services.

Chart Stats Tray

The Chart Stats Tray lists all available statistics for the selected service type. Different services have different statistics to monitor. See Services Stats View - Chart Stats Tray for a detailed description.

Topics

- Services Stats View - Chart Stats Tray

Services Stats View - Chart Stats Tray

In the Services Stats view, the Chart Stats Tray provides a way to customize the monitored statistics for individual services. The Chart Stats Tray lists all available statistics for the service. The number of statistics varies according to the type of service being monitored. Any statistic in the Chart Stats Tray can be displayed in a gauge or a timeline chart. Only statistics for session size, sessions, and packets are viewable in historical timeline charts.

Workflow

What do you want to do?

User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services
Administrator	customize the monitored statistics for individual services.*	See the *System Maintenance Guide*.

Quick Look

The following example shows the Services Stats view for a Network Decoder. The Chart Stats Tray is collapsed.

To view the Chart Stats Tray, click on the  to expand the Chart Stats Tray.

The Chart Stats Tray has different statistics for different types of services. In the example above, 132 statistics are available for the Network Decoder. The following table describes features of the Chart Stats Tray.

Feature	Description
	Click to expand the panel horizontally.
	Click to collapse the panel horizontally.
	Type a search term in the field and press **RETURN**. Statistics that match are displayed with the matching word highlighted.
	Click to go to the first page.
	Click to go to the previous page.
	Type a page number in the Page field.
	Click to go to the next page.
	Click to go to the last page.

Feature	Description
	Click to refresh the view.
Stats 1 - 12 of 132	Displays the range of statistics being displayed. The total number statistics varies by service type.

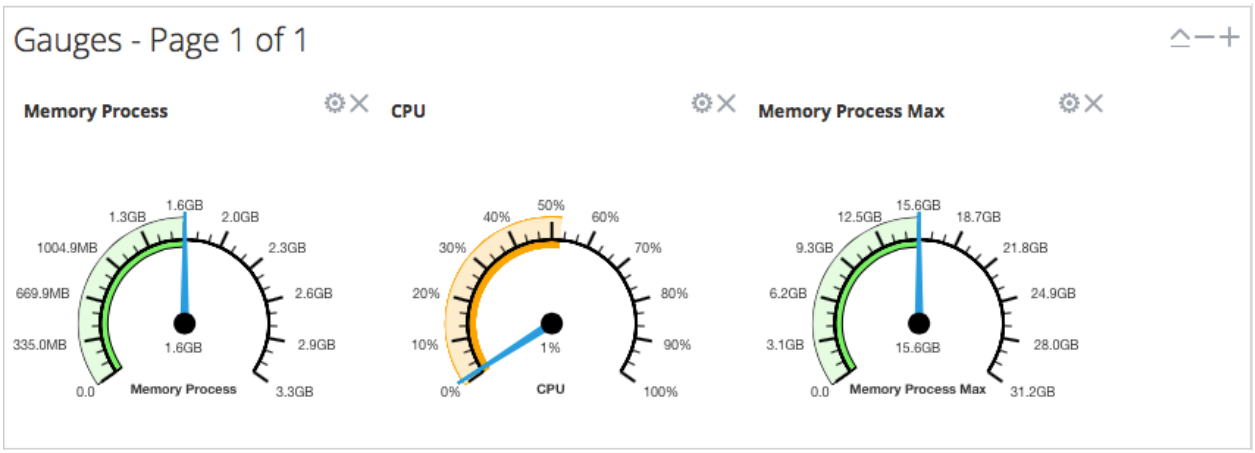
Services Stats View - Gauges

The Gauges section of the Services Stats view presents statistics in the form of an analog gauge. You can drag any statistic available in the Chart Stats Tray to the Gauges section. The properties of each individual gauge are editable; all gauges have an editable title and some have additional editable properties.

Workflow

What do you want to do?

User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services
Administrator	view statistics in the form of an analog gauge.*	See the *System Maintenance Guide*.



* You can perform these tasks in the current view.

Quick Look

The following figure shows the default gauges in the Services Stats view for a Log Decoder.

The default gauges show these statistics:

- Process memory use
- CPU use
- Maximum process memory use

The controls in the Gauges title bar and in each gauge are the standard dashlet controls. Dashlets are the parts that make up a dashboard.

- In the Gauges title bar (from left to right), you can collapse/expand, delete a page, add a page, page backward, and page forward.
- In each gauge, you can edit properties ( ) and delete ( ) the gauge.

Services Stats View - Timeline Charts

The Services Stats view Timeline Charts sections display statistics in a running timeline. The Services Stats view includes two types of timelines: current time and historical. You can drag any statistic available in the Chart Stats Tray to the Timeline Charts section or Historical Timeline Charts section. Only statistics for session size, sessions, and packets are viewable in historical timeline charts. The properties of an individual timeline chart are editable; all timeline charts have an editable title and some have additional editable properties.

Workflow

Quick Look

The following figure is an example of a current timeline showing the value and timestamp of a data point.

The following figure is an example of a historical timeline chart.

The default current timeline charts show these statistics:

- Memory Process
- CPU
- Memory Process Max

The historical time charts show these statistics:

- Sessions
- Packets
- Session Size

The controls in the Timeline Charts title bar and in each timeline are the standard dashlet controls. The Historical Timeline Charts title bar and timelines have the same controls.

- In the Timeline Charts title bar (from left to right), you can collapse/expand, delete a page, add a page, page backward, and page forward.
- In each timeline, you can edit Properties ( ) and delete ( ) the timeline.
- Hovering over a data point in the chart, displays the value and timestamp for the selected point.

Services System View

This topic introduces features in the Services System view using Decoders (Network Decoder and Log Decoder) as an example. See the appropriate configuration guides for other services (for example, the *NetWitness Broker and Concentrator Configuration Guide*) for details on their respective **(Admin) > Services > System** views.

A Log Decoder is a special type of Decoder, and is configured and managed in a similar way to a Network Decoder. Therefore, most of the information in this section refers to both types of Decoders. Differences for Log Decoders are noted. For more information on Decoders, see the *Decoder Configuration Guide*.

Workflow

What do you want to do?

User Role	I want to...	Documentation

Quick Look

The following figure shows an example of the Services System view for a Network Decoder.

The following figure shows the Services System view for a Log Decoder.

Services Info Toolbar

The following toolbars show the options specific to Log Decoders (top) and Network Decoders (bottom).

In addition to the common options in the Services System view toolbar, you can start and stop capture of packets or logs. The upload file options are different for the standard Network Decoder (packet capture file) and the Log Decoder (log file).

Action	Description
Upload Packet Capture File	Displays a dialog that provides a way to select a packet capture (`.pcap`) file for upload to the selected Network Decoder. For more information, see "Upload Packet Capture File" in the *Decoder Configuration Guide*. **Note:** This option does not apply to Log Decoders.
Upload Log File	Displays a dialog that provides a way to select a log (`.log`) file for upload to the selected Log Decoder. For more information, see "Upload Log File to a Log Decoder" in the *Decoder Configuration Guide*.
Start/Stop Capture	Starts packet capture on the selected Decoder. When packet capture is in progress, the option in the toolbar changes to Stop Capture, and the option to upload a file is unavailable.

Quick Look

The table below describes the Host Task List dialog features.

Field	Description
Task	An entry field in which you type or select a message for a Core host. When you click in this field a drop-down list of available host tasks is displayed.
Arguments	An entry field in which you enter the arguments, if any, for the message.
Run	Executes the task and arguments in the entry fields.
Info	Information about the message purpose and syntax.
Output	The output or result of an executed task.
Cancel	Closes the Host Task list dialog.

Host Task Selection List

These tasks are displayed as a drop-down list in the Task field. The available options are regulated by the security role required to execute the option.

Task	Description
Add Filesystem Monitor	Starts monitoring the storage services attached to the specified filesystem. See Add and Delete a Filesystem Monitor.

Task	Description
Delete Filesystem Monitor	Stops monitoring the storage services attached to the specified filesystem. See Add and Delete a Filesystem Monitor.
Reboot Host	Shuts down and restarts the host. See Reboot a Host.
Set Host Built-in Clock	Sets the local host clock. See Set Host Built-In Clock.
Set Host Hostname	This method of changing the hostname is deprecated in NetWitness 10.6. To edit a hostname, see Edit or Delete a Service.
Set Network Time Source	Sets the clock source for this host. See Set Network Time Source.
Set Syslog Forwarding	Enables or disables syslog forwarding from a remote server to the selected service. See Set Syslog Forwarding.
Show Network Port Status	Shows the network interface information for a host. See Show Network Port Status.
Show Serial Number	Gets the host serial number. See Show Serial Number.
Shut Down Host	Shuts down the physical host and the host remains off. See Shut Down Host.
Start Service	Starts a service on this host. See Stop and Start a Service on a Host.
Stop Service	Stops a service on this host. See Stop and Start a Service on a Host.
setSNMP	Enables or disables the SNMP service on a host. See Set SNMP.

Service Configuration Settings

This topic introduces the available service configuration settings for NetWitness Core services.

NetWitness Core services include Brokers, Concentrators, Network Decoders, Log Decoders, and Archivers. The service configuration parameters listed below constitute all viewable and configurable parameters. Some parameters are configurable in various parts of the NetWitness user interface while other parameters are viewable or configurable only on the Services Explore view.

Aggregation Configuration Parameters

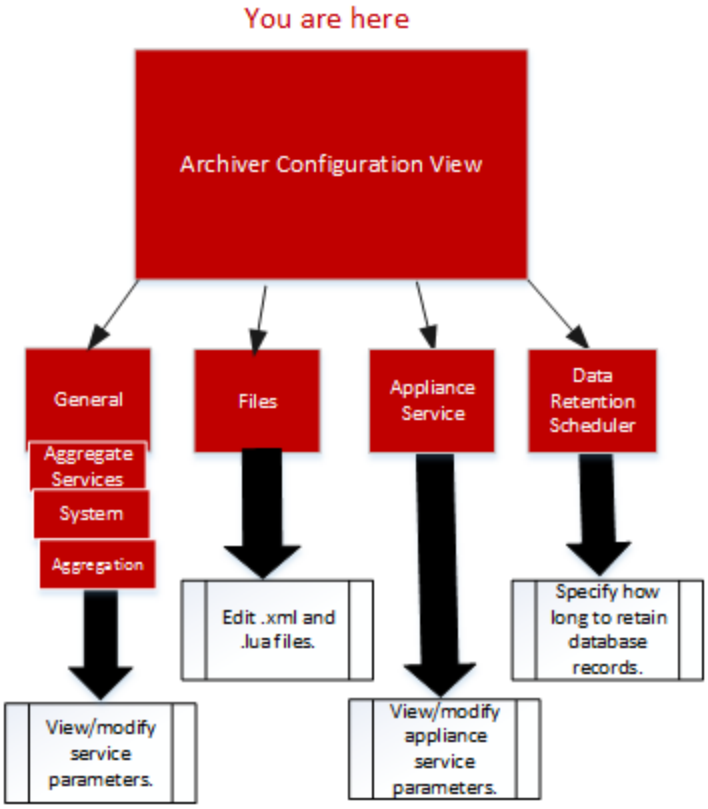
This table lists and describes the available configuration parameters that are common to services that perform aggregation, such as Concentrators and Archivers.

Configuration Path	/concentrator/config or /archiver/config
aggregate.autostart	Automatically restarts aggregation after a service restart, if enabled. Change takes effect immediately.
aggregate.buffer.size	Displays the size of the buffer (default unit is KB) used per round of aggregation. Larger buffers may improve aggregation performance but could impact query performance. Change takes effect after aggregation restart.
aggregate.crc	If enabled, all aggregation streams will be CRC validated. Change takes effect immediately.
aggregate.hours	Displays the maximum number of hours behind a service will be allowed to start aggregation. Change takes effect immediately.
aggregate.interval	Lists the minimum number of milliseconds before another round of aggregation is requested. Change takes effect immediately.
aggregate.meta.page.factor	Lists the allocated number meta pages per session used for aggregation. Change takes effect on service restart.
aggregate.meta.perpage	Lists the allocated number of meta stored on one page of data. Change takes effect on service restart.
aggregate.precache	Determines if the concentrator will precache the next round of aggregation for upstream services. Can improve aggregation performance but could impact query performance. Change takes effect immediately.
aggregate.sessions.max	Lists the number of sessions to aggregate on each round. Change takes effect after aggregation restart.
aggregate.sessions.perpage	Lists the number of sessions stored on one page of data. Change takes effect on service restart.

Configuration Path	/concentrator/config or /archiver/config
aggregate.time.window	Displays the maximum +/- time window, in seconds, that all services must be inside before another round of aggregation is requested. Zero turns off time window. Change takes effect immediately.
consume.mode	Determines if the concentrator can only aggregate locally or over a network, based on licensing restrictions. Change takes effect on service restart.
export.enabled	Allows export of session data, if enabled. Change takes effect on service restart.
export.expire.minutes	Lists the number of minutes before export cache files are expired and flushed. Change takes effect immediately.
export.format	Determines the file format used during data export. Change takes effect on service restart.
export.local.path	Displays the local location to cache exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.meta.fields	Determines which meta fields are exported. Comma-separated list of fields. * means all fields. * and field list means all fields except the listed fields. Just the field list means only those fields are included. Change takes effect immediately.
export.remote.path	Displays the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.rollup	Determines the rollup interval for export files. Change takes effect on service restart.
export.session.max	Displays the maximum sessions per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.size.max	Displays the maximum bytes per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.usage.max	Displays the maximum percentage of cache space used before stopping aggregation. Zero is no limit. Change takes effect immediately.
heartbeat.error	Lists the number of seconds to wait after a service error before attempting a service reconnect. Change takes effect immediately.
heartbeat.interval	Lists the number of milliseconds between heartbeat service checks. Change takes effect immediately.

Configuration Path	/concentrator/config or /archiver/config
heartbeat.next.attempt	Lists the number of seconds to wait before attempting a service reconnect. Change takes effect immediately.
heartbeat.no.response	Lists the number of seconds to wait before taking unresponsive service offline. Change takes effect immediately.

Appliance Service Configuration Parameters



The NetWitness Core Appliance service provides hardware monitoring on legacy NetWitness hardware. The list describes the Appliance Configuration parameters.

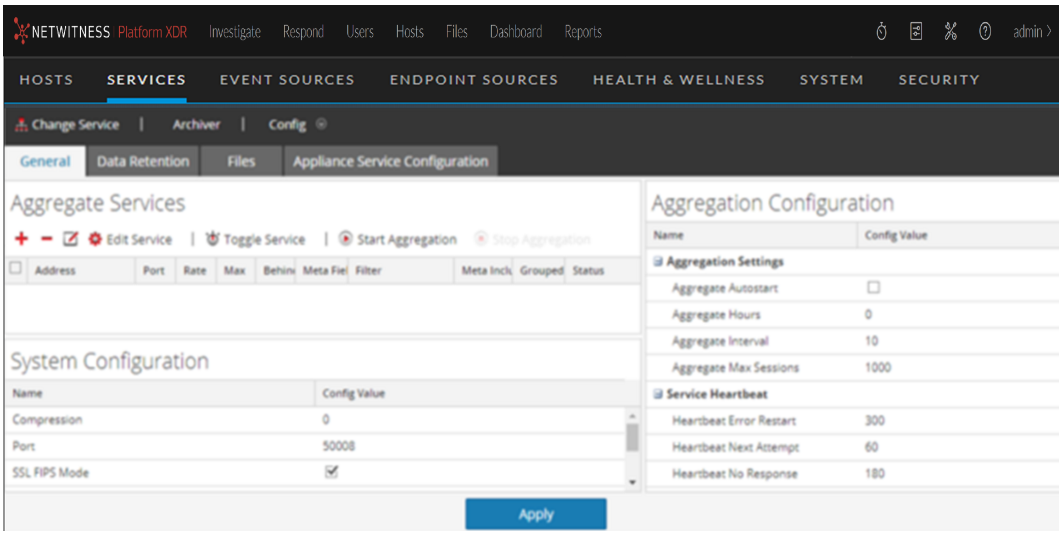
Appliance Parameter Field	Description
Logs	/logs/config refer to Core Service Logging Configuration Parameters
REST	/rest/config refer to REST Interface Configuration Parameters
Services	/services/<service name>/config refer to Core Service-to-Service Configuration Parameters
System	/sys/config refer to Core Service System Configuration Parameters

Archiver Service Configuration View

This topic lists and describes the available configuration settings for NetWitness Archivers.

Workflow

Role	I want to ...
Administrator	Configure Meta Filters for Aggregation. Refer to "(Optional) Configure Meta Filters for Aggregation" in the *NetWitness Archiver Configuration Guide* for instructions.
Administrator	Configure Group Aggregation. Refer to "Configure Group Aggregation" in the *NetWitness Deployment Guide* for instructions.



Quick Look

To access the Services Config view:

1. In **NetWitness**, select  **(Admin) > Services**.
   The Admin Services view is displayed.

2. Select an Archiver service and select  **>View > Config**.
   Services Config view for the Archiver service is displayed.

This is an example of the Services Config view for an Archiver.

Broker Service Configuration Parameters

The following list describes the Broker configuration parameters.

Broker Parameter Field	Description
Broker	`/broker/config` refer to Aggregation Configuration Parameters
`aggregate.interval.behind`	Minimum number of milliseconds before another round of aggregation is requested when the broker is behind. Change takes effect immediately.
Database	`/database/config` refer to "Database Configuration Nodes" in the *NetWitness Core Services Database Tuning Guide*.
Index	`/index/config`
`index.dir`	The directory where the broker device mapping files are stored. Change takes effect on service restart.
`language.filename`	The index language specification (XML) that is loaded on startup. Change requires service restart.
Logs	`/logs/config` refer to Core Service Logging Configuration Parameters
REST	`/rest/config` refer to REST Interface Configuration Parameters
SDK	`/sdk/config` refer to "SDK Configuration Nodes" in the *NetWitness Core Services Database Tuning Guide* and NetWitness Platform Core Service system.roles Modes
Services	`/services/<service name>/config` refer to Core Service-to-Service Configuration Parameters

Broker Parameter Field	Description
System	`/sys/config` refer to Core Service System Configuration Parameters

Concentrator Service Configuration Parameters

The following list describes the Concentrator configuration parameters.

Concentrator Parameter Field	Description
Concentrator	`/concentrator/config` refer to Aggregation Configuration Parameters
Database	`/database/config` refer to "Database Configuration Nodes" in the *NetWitness Core Database Tuning Guide*.
Index	`/index/config` refer to "Index Configuration Nodes" in the *NetWitness Core Database Tuning Guide*.
Logs	`/logs/config` refer to Core Service Logging Configuration Parameters
REST	`/rest/config` refer to REST Interface Configuration Parameters
SDK	`/sdk/config` refer to "SDK Configuration Nodes" in the *NetWitness Core Database Tuning Guide*and NetWitness Platform Core Service system.roles Modes
Services	`/services/<service name>/config` refer to Core Service-to-Service Configuration Parameters
System	`/sys/config` refer to Core Service System Configuration Parameters

Core Service Logging Configuration Parameters

The following table describes the logging configuration parameters for all NetWitness Core services. Logging configuration is the same for all Core services.

Logs Configuration Folder	/logs/config
`log.dir`	Displays the directory where the log database is stored. Optional assigned max size (`=#`) is in MBs. Change takes effect on service restart.
`log.levels`	Controls what types of log messages are stored (comma separated). Module specific settings are defined like this: `<Module>=[debug|info|audit|warning|failure|all|none]`. Change takes effect immediately.

Logs Configuration Folder	/logs/config
log.snmp.agent	Sets a remote SNMP Trap Receiving agent.
snmp.trap.version	Sets the SNMP version (2c or 3) to be used for gets and traps.
snmpv3.engine.boots	Displays the SNMPv3 engine boots count. This field auto-increments on startup and should not normally need to be set by the user.
snmpv3.engine.id	Sets the SNMPv3 engine ID, which is 10-64 hexadecimal digit number optionally preceded by 0x. You can add suffix values at the end of the engine ID for each of the SA Core services running on the same host. For example, if the generated Engine ID for the SA Core host is 0x1234512345, you can set the Engine ID for the Decoder service as 0x123451234501 and set 0x123451234504 for the Appliance service.
snmpv3.trap.auth.local.key	Sets the SNMPv3 Trap Authentication Local Key, which is a 16 or 20 hexadecimal digit number (depending on which authentication protocol is used) preceded by 0x. For MD5, the key is 16 hexadecimal digits, while SHA uses 20 hexadecimal digits. You can use any desired algorithm to generate the local keys. It is recommended that a generation method involving randomness be used as opposed to selecting key values manually.
snmpv3.trap.auth.protocol	Displays the SNMPv3 Trap Authentication Protocol (none, MD5 or SHA).
snmpv3.trap.priv.local.key	Sets the SNMPv3 Trap Privacy Local Key, which is a 16 hexadecimal digit number preceded by 0x.
snmpv3.trap.priv.protocol	Displays the SNMPv3 Trap Privacy Protocol (none or AES).
snmpv3.trap.security.level	Displays the SNMPv3 Trap Security Level, which indicates whether authentication and privacy are used or not. Possible values are noAuthNoPriv, authNoPriv, or authPriv.
snmpv3.trap.security.name	Sets the SNMPv3 Trap Security Name used during SNMPv3 trap authentication.
syslog.size.max	Displays the maximum size of a log sent to syslog (some syslog daemons have issues with very large messages). Zero means no limit. Change takes effect immediately.

Core Service-to-Service Configuration Parameters

This topic lists and describes the configuration parameters that control how a Core service connects to another Core service. For example, when a Concentrator connects to a Network Decoder, the connection parameters are controlled by these settings.

Whenever a Core service establishes a connection to another Core service, the service that acts as the **client** creates a new sub-folder in the `/services` folder of the configuration tree. The name of the sub-folder corresponds to the name of the service and has the form `host:port`. For example, the service connection folder for a Concentrator connection to a Network Decoder could be `/services/reston-va-decoder:50004`. Inside each service connection folder, there is a `config` sub-folder that holds configurable parameters.

The following list describes the Service Configuration parameters:

Services	/services/host:port/config
allow.nonssl.to.ssl	Allows a non-SSL connection to connect to a SSL service, when set to true. Otherwise, if `false`, non-secure to secure connections will be denied. Change takes effect immediately.
compression	Displays a config node that determines if data is compressed before sending. A positive value determines the number of bytes that need to be sent before it will be compressed. Zero means no compression.
crc.checksum	Displays a config node that determines if data streams are validated with a CRC checksum. A positive value determines the number of bytes that need to be sent before it will be CRC validated. Zero means no CRC validation.
ssl	Displays a config node that enables or disables SSL encryption on the connection.

Core Service System Configuration Parameters

The following list describes the System configuration parameters that are common to all NetWitness Core services.

System Configuration Folder	/sys/config
compression	Displays the minimum amount of bytes before a message is compressed, when set to a positive value. Zero means no compression for any message. Change takes effect on subsequent connections.
crc.checksum	Displays the minimum bytes before a message is sent over the network with a CRC checksum (to be validated by the client), when set to a positive value. Zero means no CRC checksum validation with any message. Change takes effect on subsequent connections.
drives	Displays drives to monitor for usage stats. Change takes effect on service restart.
port	Displays the port this service will listen on. Change takes effect on service restart.
scheduler	Displays the folder for scheduled tasks.

System Configuration Folder	/sys/config
service.name.override	Displays an optional service name used by upstream services for aggregation in lieu of hostname.
ssl	Encrypts all traffic using SSL, if enabled. Change takes effect on service restart.
stat.compression	Compresses stats as they are written to the database, if enabled. Change takes effect on service restart.
stat.dir	Displays the directory where the historical stats database is stored (separate multiple dirs with semicolon). Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
stat.exclude	Lists stat pathnames to be excluded from the stat database. The following wildcards are permitted: ? match any single character * match zero or more characters to delimiter / ** match zero or more characters including delimiter. Change takes effect immediately.
stat.interval	Determines how often (in milliseconds) statistic nodes are updated in the system. Change takes effect immediately.
threads	Lists the number of threads in the thread pool to handle incoming requests. Change takes effect immediately.

Decoder Configuration Parameters

The following list describes the configuration parameters that are identical on both Network Decoder and Log Decoder services.

Configuration Path	<service>/config
aggregate.buffer.size	Displays the size of the buffer (default unit is KB) used per round of aggregation. Larger buffers may improve aggregation performance but could impact capture performance. Change takes effect after capture restart.
aggregate.precache	Determines if the decoder will pre-cache the next round of aggregation for upstream services. Can improve aggregation performance but could impact capture performance. Change takes effect immediately.
assembler.pool.ratio	Displays the percentage of pool pages that assembler manages and uses for the assembly process. Change takes effect on service restart.

Configuration Path	<service>/config
assembler.session.flush	Flushes sessions either when they are complete, or when they are parsed. Change takes effect on service restart.
assembler.session.pool	Lists the number of entries in the session pool. Change takes effect on service restart.
assembler.size.max	Lists the maximum size that a session will obtain. A setting of 0 removes the session size limit. Change takes effect immediately.
assembler.size.min	Lists the minimum size that a session must be before persisting. Change takes effect immediately.
assembler.timeout.packet	Lists the number of seconds before packets are timed out. Change takes effect immediately.
assembler.timeout.session	Lists the number of seconds before sessions are timed out. Change takes effect immediately.
assembler.voting.weights	Displays the weights used to determine which session stream is marked client and server. Change takes effect immediately.
capture.autostart	Determines if capture begins automatically when the service starts. Change takes effect on service restart.
capture.buffer.size	Displays capture memory buffer allocation size (default unit is MB). Change takes effect on service restart.
capture.device.params	Displays capture service specific parameters. Change takes effect on service restart. The parameters understood by this field are specific to the currently selected capture device. If any of the parameters are not recognized by the current capture device, they are ignored. On Log Decoders, there is only the Log Events capture device. It accepts some optional parameters. • use-envision-time: If this is set to 1, the time metadata for each event will be imported from the Log Collector stream. If this is 0 or not set, the imported event time will be stored in the event.time meta. • port: This parameter can be set to a numeric value to override the default syslog port listener, 514.
capture.selected	Displays current capture service and interface. Change takes effect immediately.
export.expire.minutes	Lists the number of minutes before export cache files are expired and flushed. Change takes effect immediately.
export.packet.enabled	Allows export of packet data, if enabled. Change takes effect on service restart.

Configuration Path	<service>/config
export.packet.local.path	Displays the local location to cache packet exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.packet.max	Displays the maximum packets per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.packet.remote.path	Lists the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.packet.size.max	Displays the packet maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.rollup	Determines the rollup interval for export files. Change takes effect on service restart.
export.session.enabled	Allows export of session data, if enabled. Change takes effect on service restart.
export.session.format	Determines the file format used during session export. Change takes effect on service restart.
export.session.local.path	Displays the local location to cache session exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.session.max	Displays the maximum sessions per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.session.meta.fields	Determines which meta fields are exported. Comma-separated list of fields. * means all fields. * plus field list means all fields BUT listed fields. Just field list means only those fields are included. Change takes effect immediately.
export.session.remote.path	Displays the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.session.size.max	Lists the session maximum bytes per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.usage.max	Lists the session maximum bytes per exported file. For export file types that cache, this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
parse.threads	Lists the number of parse threads to use for session parsing. Zero means let server decide. Change takes effect on service restart.

Configuration Path	<service>/config
pool.packet.page.size	Displays the size of a packet page (default is KB). Change takes effect on service restart.
pool.packet.pages	Lists the number of packet pages decoder will allocate and use. Change takes effect on service restart.
pool.session.page.size	Displays the size of a session page (default is KB). Change takes effect on service restart.
pool.session.pages	Lists the number of session pages decoder will allocate and use. Change takes effect on service restart.

Network Decoder Service Configuration Parameters

This topic lists and describes the available configuration parameters for NetWitness Network Decoders.

Decoder Parameter Field	Description
Decoder	/decoder/config refer to Decoder Configuration Parameters.
Database	/database/config refer to "Database Configuration Nodes" in the *NetWitness Core Database Tuning Guide*.
Index	/index/config refer to "Index Configuration Nodes" in the *NetWitness Core Database Tuning Guide*.
Logs	/logs/config refer to Core Service Logging Configuration Parameters.
REST	/rest/config refer to REST Interface Configuration Parameters.
SDK	/sdk/config refer to "SDK Configuration Nodes" in the *NetWitness Core Database Tuning Guide* and NetWitness Platform Core Service system.roles Modes.
System	/sys/config refer to Core Service System Configuration Parameters.

Log Decoder Service Configuration Parameters

This topic lists and describes the available configuration parameters for Log Decoder configuration settings.

Log Decoder Setting Field	Description
Database	/database/config refer to "Database Configuration Nodes" in the *NetWitness Core Database Tuning Guide*.

Log Decoder Setting Field	Description
Decoder	`/decoder/config` refer to Decoder Configuration Parameters.
Index	`/index/config` refer to "Index Configuration Nodes" in the *NetWitness Core Database Tuning Guide.*
Logs	`/logs/config` refer to Core Service Logging Configuration Parameters.
REST	`/rest/config` refer to REST Interface Configuration Parameters.
SDK	`/sdk/config` refer to "SDK Configuration Nodes" in the *NetWitness Core Database Tuning Guide*and NetWitness Platform Core Service system.roles Modes.
System	`/sys/config` refer to Core Service System Configuration Parameters.

Log Tokenizer Configuration Settings

The Log Decoder has a set of configuration items that control how the automatic log tokenizer creates meta items from unparsed logs. The log tokenizer is implemented as a set of built-in parsers that each scan for a subset of recognizable tokens. The functionality of each of these native parsers is shown in the table below. These word items form a full-text index when they are fed to the indexing engine on the Concentrator and Archiver. By manipulating the parsers.disabled configuration entry, you can control which Log Tokenizers are enabled.

Parser Name	Description	Configuration Parameters
Log Tokens	Scans for runs of consecutive characters to produce 'word' meta items.	`token.device.types`, `token.char.classes`, `token.max.length`, `token.min.length`, `token.unicode`
IPSCAN	Scans for text that appears to be an IPv4 address to produce `ip.addr` meta items.	`token.device.types`
IPV6SCAN	Scans for text that appears to be an IPv6 address to produce `ipv6` meta items.	`token.device.types`
URLSCAN	Scans for text that appears to be a URL to produce `alias.host`, `filename`, `username`, and `password` meta items.	`token.device.types`
DOMAINSCAN	Scans for text that appears to be a domain name to produce `alias.host`, `tld`, `cctld`, and `sld` meta items.	`token.device.types`

Parser Name	Description	Configuration Parameters
EMAILSCAN	Scans for text that appears to be an email address to produce `email` and `username` meta items.	`token.device.types`
SYSLOGTIMESTAMPSCAN	Scans for text that appears to be syslog-format timestamps. Syslog is missing the year and time zone. When such text is located, it is normalized into UTC time to create `event.time` meta items.	`token.device.types`
INTERNETTIMESTAMPSCAN	Scans for text that appears to be RFC 3339-format timestamps to create `event.time` meta items.	`token.device.types`

Log Tokenizer Configuration Parameters.

Log Decoder Parser Setting Field	Description
`token.device.types`	The set of device types that will be scanned for raw text tokens. By default, this is set to `unknown`, which means only logs that were not parsed will be scanned for raw text. You can add additional log types here to enrich parsed logs with text token information. If this field is empty, then log tokenization is disabled.
`token.char.classes`	This field controls the type of tokens that are generated. It can be any combination of the values `alpha`, `digit`, `space`, and `punct`. The default value is `alpha`. • `alpha`: Tokens may contain alphabetic characters • `digit`: Tokens may contain numbers • `space`: Tokens may contain spaces and tabs • `punct`: Tokens may contain punctuation marks
`token.max.length`	This field puts a limit on the length of the tokens. The default value is **5** characters. The maximum length setting allows the Log Decoder to limit the space needed to store the word metadata. Using longer tokens requires more meta database space, but may provide slightly faster raw text searches. Using shorter tokens causes the text query resolver to have to perform more reads from the raw logs during searches, but it has the effect of using much less space in the metadb and index.
`token.min.length`	This is the minimum length of a searchable text token. The minimum token length will correspond to the minimum number of characters a user may type into the search box in order to locate results. The recommended value is the default, **3**.

Log Decoder Parser Setting Field	Description
token.unicode	This boolean setting controls whether unicode classification rules are applied when classifying characters according to the token.char.classes setting. When this is set to true, each log is treated as a sequence of UTF-8 encoded code points and then classification is performed after the UTF-8 decoding is performed. When this is set to false, each log is treated as ASCII characters and only ASCII character classification is done. Unicode character classification requires more CPU resources on the Log Decoder. If you do not need non-English text indexing, you can disable this setting to reduce CPU utilization on the Log Decoder. The default is enabled.

REST Interface Configuration Parameters

The following list describes the available configuration parameters for the REST interface built in to all NetWitness Core Services.

REST Configuration Path	/rest/config
cache.dir	Displays the host directory to use for temporarily creating and storing files. Change takes effect on service restart.
cache.size	Displays the total maximum size (default unit is MB) of all files in the cache directory before the oldest are deleted. Change takes effect on service restart.
enabled	Switches to enable or disable REST services, **1** is on, **0** is off. Change takes effect on service restart.
port	Displays the port the REST service will listen on. Change takes effect on service restart.
ssl	Encrypts all REST traffic using SSL, if enabled. The default system means use setting from /sys/config/ssl. Change takes effect on service restart.

NetWitness Platform Core Service system.roles Modes

All NetWitness Platform Core services offer role-based authorization modes. This topic describes the modes that are available, and how they are configured within every service.

The configuration node /sdk/config/system.roles sets querying and viewing permissions for metadata and content on a per key basis. This parameter supports the data privacy management function and when enabled using one of the non-zero values helps a data privacy officer to control access to specific meta keys and content. This parameter is configurable in the NetWitness Platform user interface (see "Data Privacy Tab" in the *Data Privacy Management Guide* for details). When the value is edited, change takes effect immediately.

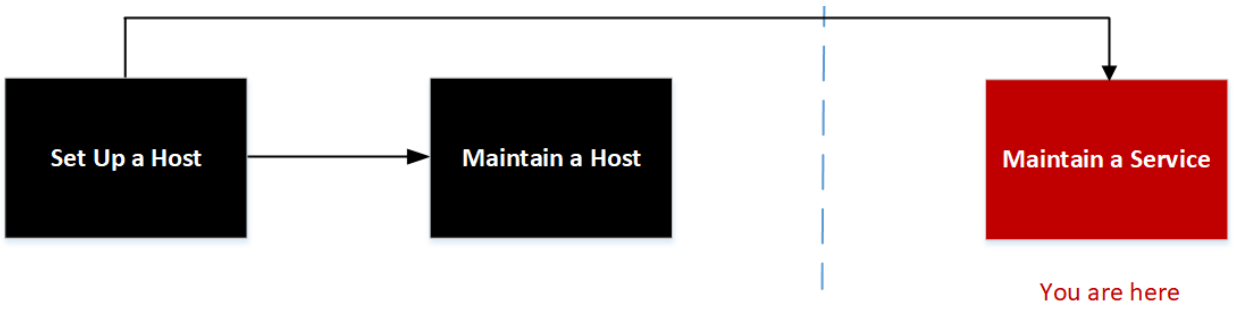
Zero means that service permissions based on SDK meta keys are disabled.

- 0 - disabled

When one of the non-zero values is specified, the data privacy officer can select a meta key to whitelist or blacklist the display of the associated metadata, content, or both, for a specific user role on a service.

- 1 - whitelist meta and content filtered
- 2 - whitelist meta filtered
- 3 - whitelist content filtered
- 4 - blacklist meta and content filtered
- 5 - blacklist meta filtered
- 6 - blacklist content filtered

Centralized Service Configuration via Policy Settings



This topic introduces the available centralized service configuration settings for Concentrators, Decoders and Log Decoders services.

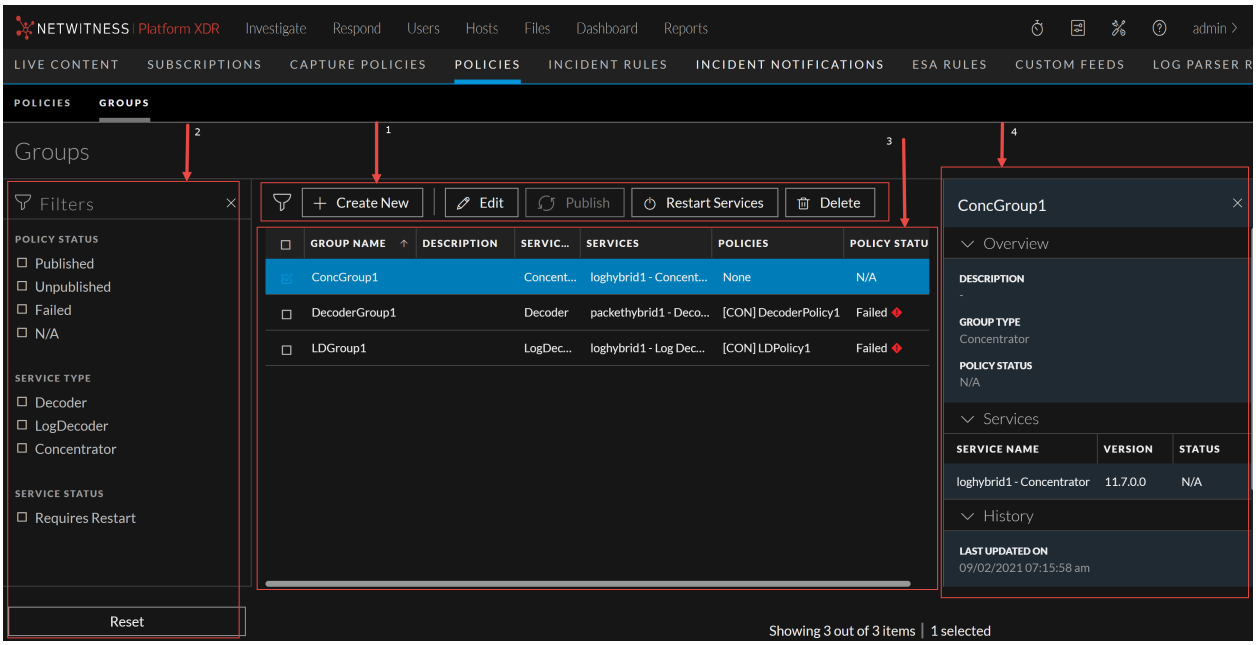
Centralized Service Configuration – Groups Tab

Note: The information in this topic applies to NetWitness Platform Version 11.7 and Later.

The  (**Configure**) > **Policies** view contains two tabs: **Groups** and **Policies**.

Workflow

What do you want to do?



User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services
Administrator	Centrally Create and Maintain Service Groups.*	Hosts and Services Maintenance Procedures

* You can perform these tasks in the current view.

Related Topics:

- Hosts and Services Set Up Procedures
- Hosts and Services Maintenance Procedures

Quick Look

Below is an example of the **Groups** tab:

The following table describes the Groups tab.

1	**Toolbar**
	• **Create New**- Lets you create a new group. For more information, see "Create a Group" in the Centralized Service Configuration via Policy.
	• **Edit** – Lets you edit the group. For more information, see "Managing Policies and Groups" in the Centralized Service Configuration via Policy.
	• **Publish** – Publishes selected groups.
	• **Restart Services** – Restarts the service associated with the selected group. This option is disable if:
	  ◦ There are no services in the group.
	  ◦ No service restart is required.
	• **Delete**- Deletes the selected groups.

2 **Filter Pane**

- **Filters**: You can filter groups based on Policy Type and Policy Status, Service Type and Service Status.

  To hide, click the  icon at the top-right of the panel. To display if hidden, click the  icon in the toolbar.

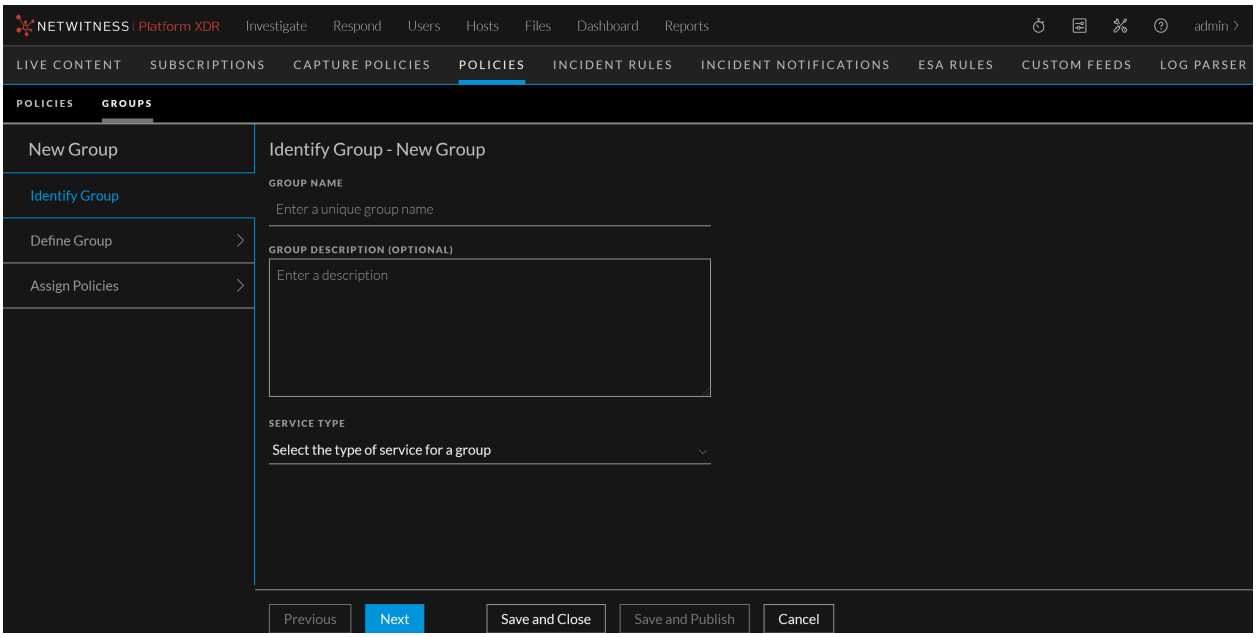
- **Reset**: Removes the currently applied filter criteria.

For more information, see "Filter Groups" in the Centralized Service Configuration via Policy.

3 **Group List Pane**

- **Group Name** – Name of the group.
- **Description** – Description of the group.
- **Service Type** – Displays the service type to which the group is applied.
- **Services** – Displays the service to the which the group is applied.
- **Policies** – Displays the policy to which the group is applied.
- **Policy Status** – Status of the policy. The values are: Published, Unpublished, Failed, N/A.

You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.



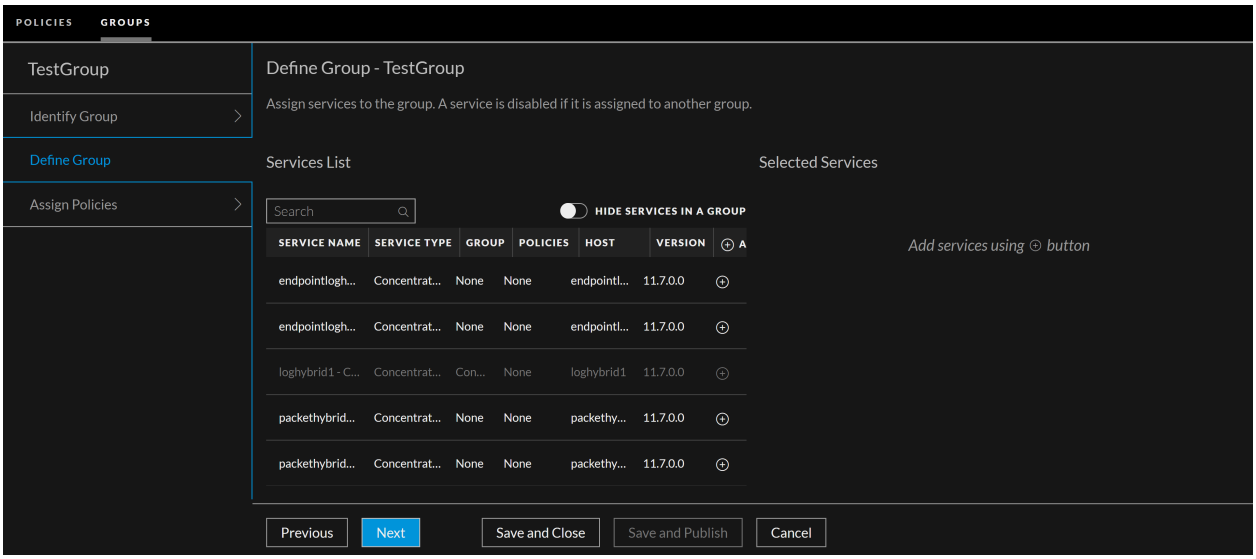
4 **Groups Details Panel**

Displays the properties of the selected group.

Note: Click the row to view the Properties panel for a group.

Create Group Dialog

Below is an example of the Create Group dialog.

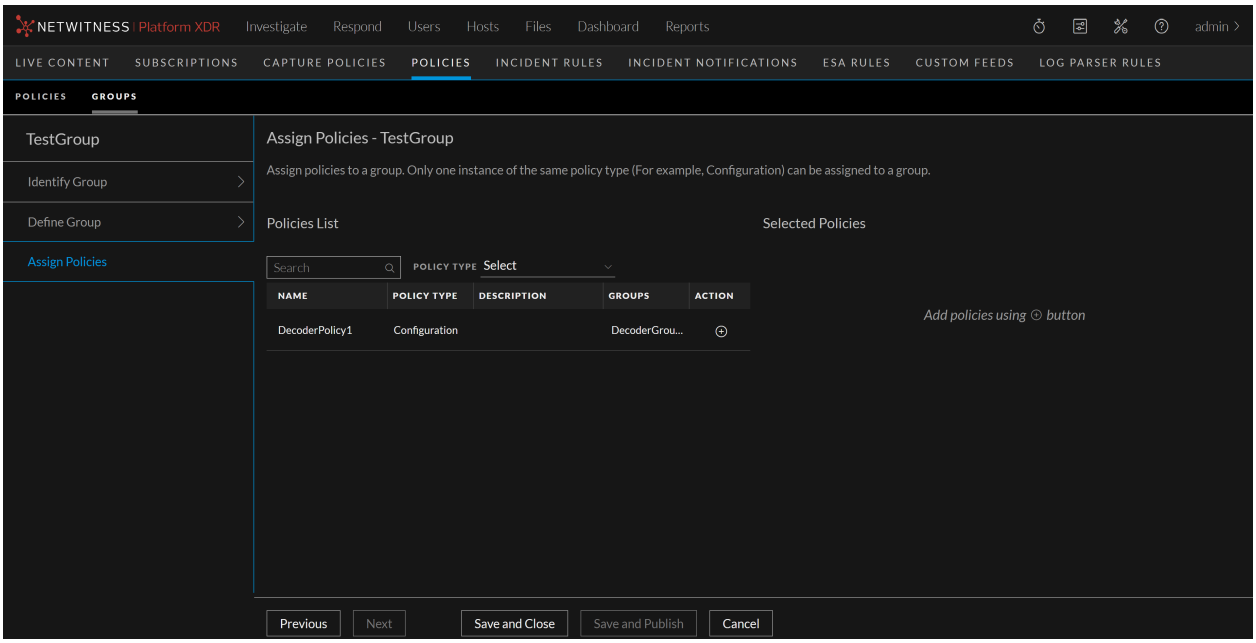


The table describes the information and options in the Create Group dialog.

Field	Description
Group Name	Name of the group. The name should be unique.
Group Description (Optional)	Description of the group. Description should not exceed 8000 characters.
Service Type	Select the type of service for a group. Available options are Log Decoder, Decoder, and Concentrator.
Save and Close	Saves the settings and closes the Create Group dialog.

Define Group Dialog

Below is an example of the define group dialog.



The table describes the information and options in the Define Group dialog.

Field	Description
Service List	Displays the list of services associated with the selected service type. The following describes services list: • **Service name** – Name of the service. • **Service type** – Displays the service type of the service. • **Group** – Name of the group. • **Policies** – Displays the policies associated with the service. • **Host** – Host name of the service. • **Version** – Service version. • **All** – Lets you to add services to the group. You can either click  to add all services or click  to add specific service.

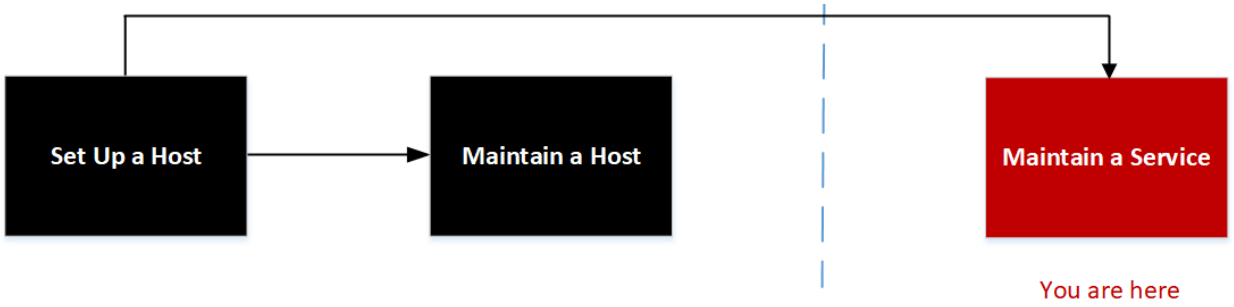
Field	Description
Hide Services in a Group	Displays the services that is not assigned to any group. By default, this option is disabled.
Selected Services	Displays the list of selected services for the group.
Save and Close	Saves the setting and closes the Define Group dialog.
Save and Publish	Saves and publishes the created group. **Note:** This option is disabled if you have not: - Assigned services - Assigned policies

Assign Policy Dailog

Below is an example of Assign Policy dialog.

The following table describes assign policy dialog:

Field	Description
Policies List	Displays the list of policies associated with the group. The following describes policies list: • **Name** – Name of the policy. • **Policy Type** – Displays the policy type. • **Description** – Description of the policy. • **Groups** – Groups associated with the policy. • **Action** - Click  to add policies to the group.
Policy Type	Select the policy type from the drop-down list.
Selected Policies	Displays the list of selected policies for the group.
Save and Close	Saves the settings and closes the Create Group dialog.



Field	Description
Save and Publish	Saves and publishes the created group. **Note:** This option is disabled if you have not: - Assigned services. - Assigned policies.

Centralized Service Configuration – Policies Tab

Note: The information in this topic applies to NetWitness Platform Version 11.7 and Later.

The  (**Configure**) > **Policies** view contains two tabs: **Groups** and **Policies**.

Workflow

Related Topics:

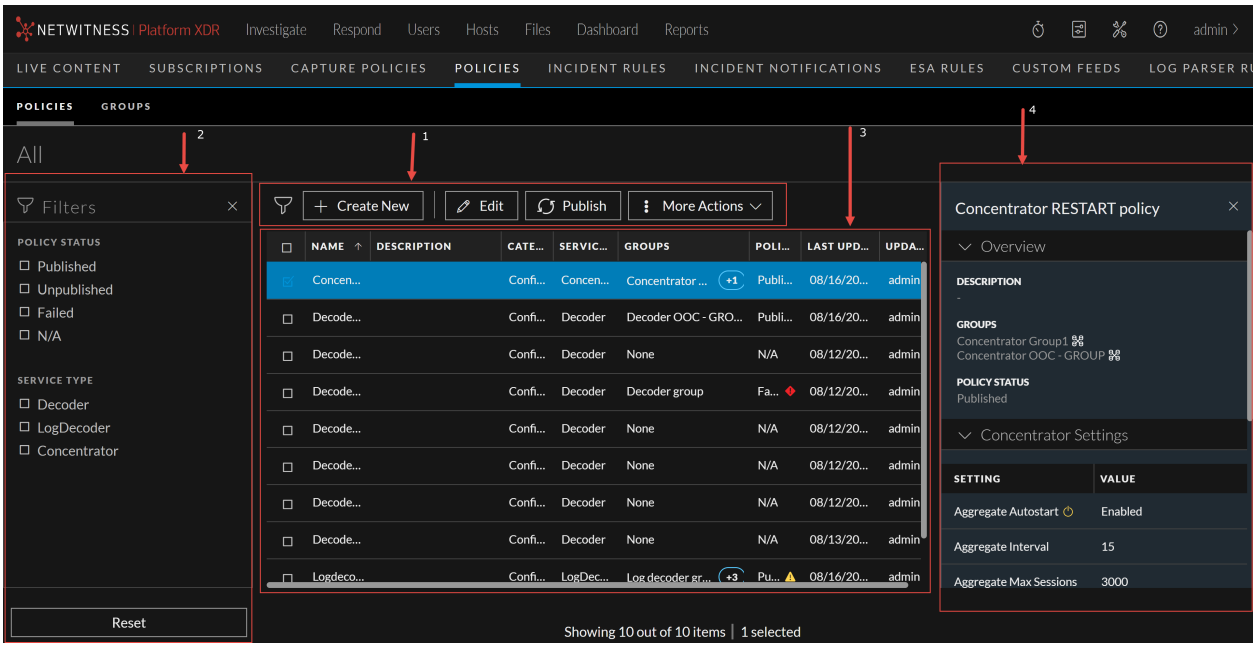
What do you want to do?



User Role	I want to...	Documentation
Administrator	set up a host.	Setting Up a Host
Administrator	maintain a host.	Maintaining Hosts
Administrator	maintain a service.	Maintaining Services

User Role	I want to...	Documentation
Administrator	Centrally Create and Maintain Service Policy.*	Hosts and Services Maintenance Procedures

* You can perform these tasks in the current view.

Quick Look

Below is an example of the **Policies** tab:

1 **Toolbar**

- **Create New**- Lets you create a new policy. For more information, see "Create a Policy" in the Centralized Service Configuration via Policy.
- **Edit** – Lets you edit the policy. For more information, see "Managing Policies and Groups" in the Centralized Service Configuration via Policy.
- **Publish** – Publishes the selected policy or policies.
- **More Actions**
  - **Assign to Group** -Lets you assign policy to a group.
  - **Clone** – Lets you clone a policy.
  - **Revert** – Lets you revert to previous policy settings. By default, the revert value is set to 5. You can customize the revert value in Explorer view.
  - **Delete** - Deletes the selected policy or policies permanently.

2 **Filter Pane**

- **Filters**: You can filter policies based on Policy Type and Policy Status and Service Type.

  To hide, click the  icon at the top-right of the panel. To display if hidden, click the  icon in the toolbar.

- **Reset**: Removes the currently applied filter criteria.

For more information, see "Filter Policies" in the Centralized Service Configuration via Policy.

3 **Policy List Pane**
Name – Name of the policy.

• **Description** – Description of the policy.

• **Category** – Type of policies applied.

• **Service Type** – Displays the service type to which the policy is applied.

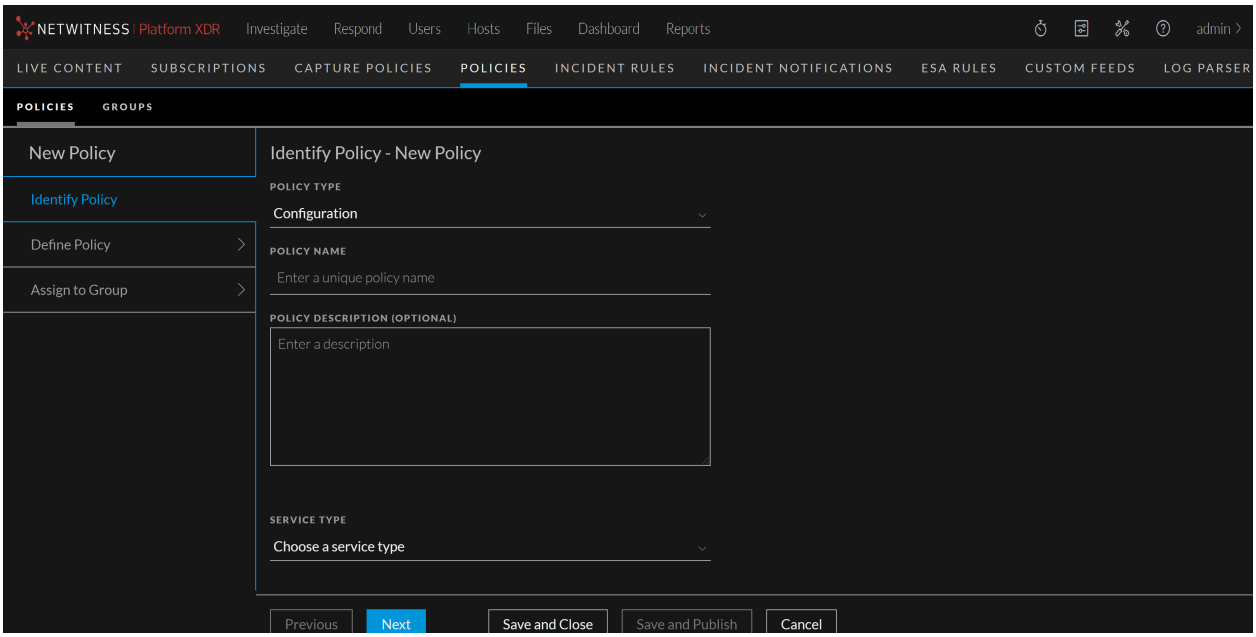
• **Groups** - Lists the group to which this policy is applied.

• **Policy Status** – Status of the policy. The values are: Published, Unpublished, Failed, N/A.

• **Last Updated** – Displays the time when the policy is updated.

• **Updated By** – The user who updated the policy.

You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.



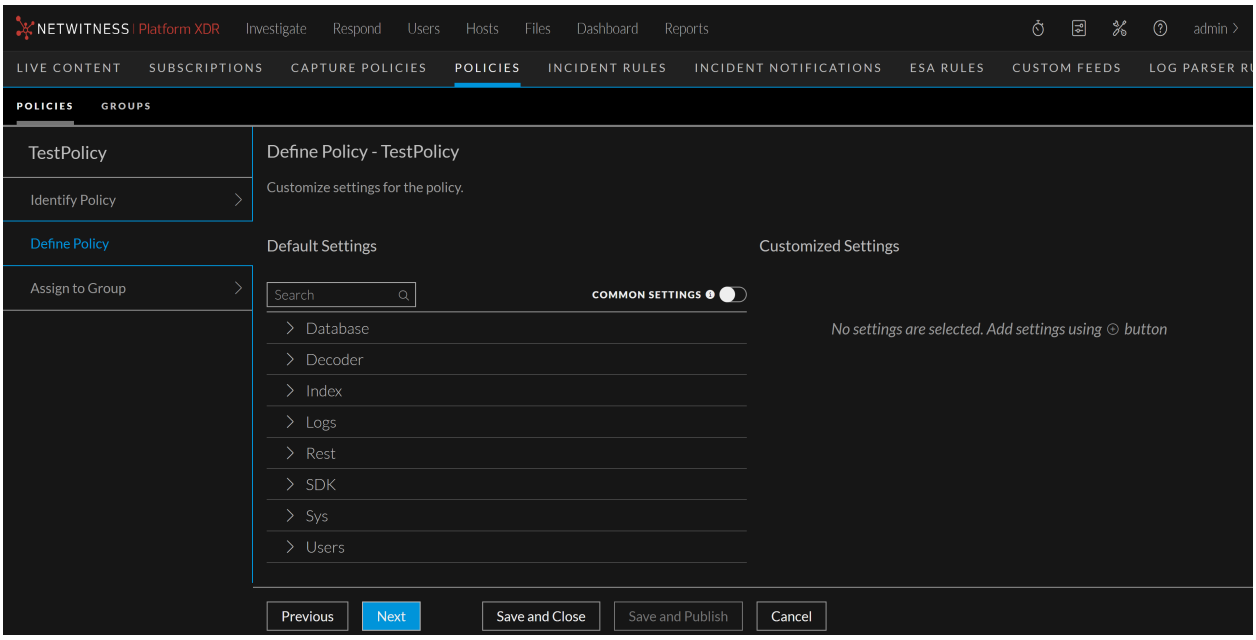
4 **Policy Details Pane**

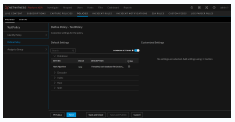
Displays the properties of the selected policy.

Note: Click the row to view the Properties panel for a policy.

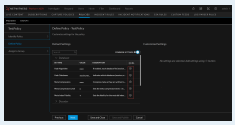
Create Policy

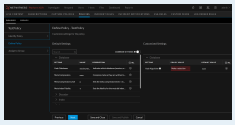
Below is an example of the Create Policy dialog.





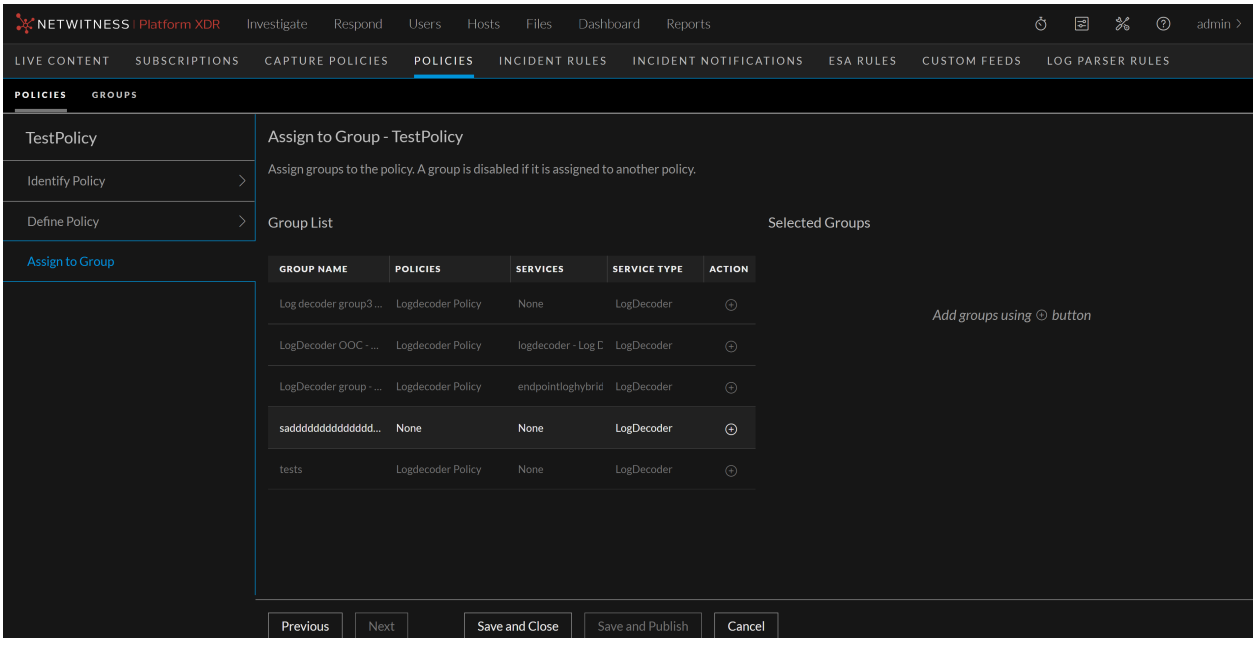
The table describes the information and options in the Create Policy dialog.





Field	Description
Policy Type	Displays the policy type.
Policy Name	Name of the policy. The name should be unique.
Policy Description (Optional)	Description of the policy. Description should not exceed 8000 characters.
Service Type	Displays the type of the service. Available options are Log Decoder, Decoder, and Concentrator.

Field	Description
(For version 11.7.1 and Later) Clone from Existing Service (Optional)	Displays the list of services based on the service type to clone those settings.
Save and Close	Saves the settings and closes the Create Policy dialog.



Define Policy Settings

Field	Description
Default Settings	Displays the settings of the service based on the category, for example, Database, Decoder and so on. Click to expand the setting category.  The following describes Default settings: • **Setting**- Name of the setting. • **Value**- The settings value. • **Description**- Description of the setting. • **All** – Lets you to select the settings for customization. You can either click  to customize all the settings value or click  on a specific setting
Common Settings	Displays the common settings of the service. By default, it is disabled.
(For version 11.7.1 and Later) 10g Settings	Fetches the 10g settings.

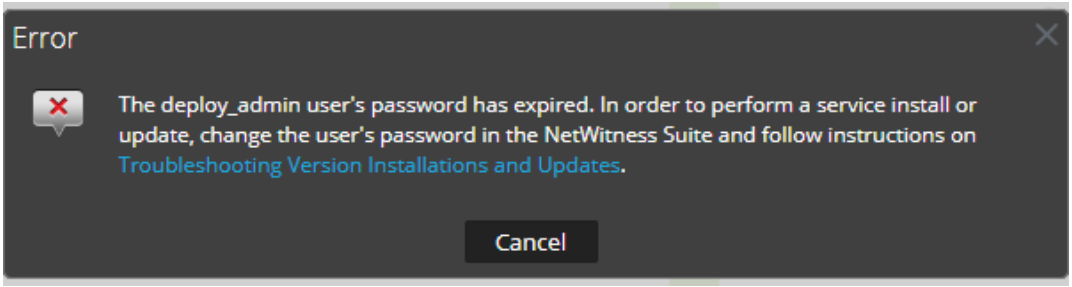
Field	Description
Customized Settings	Lists the selected settings for customization. Click  to add the setting.  Update the value based on your requirement. 

Assign to Group

Field	Description
Group List	Displays the list of group associated with the policy. A group is disabled if it is already assigned to another policy. • Group Name • Policies • Services • Service Type • Action
Selected Group	Lists the selected groups. Click  to add groups.
Save and Close	Saves the settings and closes the Assign to Group dialog.
Save and Publish	Saves and publishes the created policy. **Note:** This option is disabled if: - Policy settings are not customized. - Policy is not assigned to groups.

Troubleshooting Version Installations and Updates

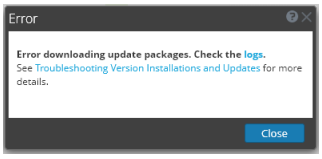
This section describes the error messages displayed in the Hosts view when it encounters problems updating host versions and installing services on hosts in the Hosts view. If you cannot resolve an update or installation issue using the following troubleshooting solutions, contact Customer Support.



Troubleshooting instructions for the following errors that may occur during the upgrade are described in this section.

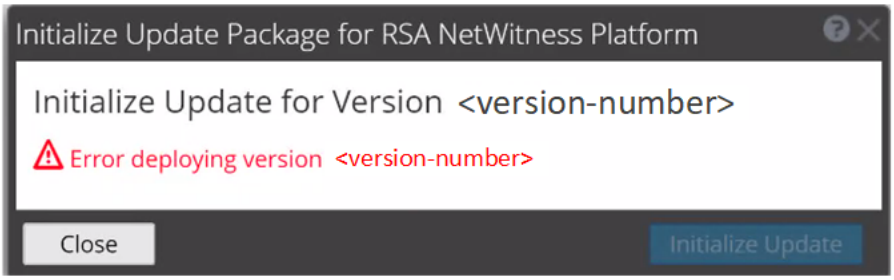
- deploy_admin Password Expired Error
- Downloading Error
- Error Deploying Version <version-number> Missing Update Packages
- Upgrade Failed Error
- External Repo Update Error
- Host Installation Failed Error
- Host Update Failed Error
- Missing Update Packages Error
- OpenSSL 1.1.x Error
- Patch Update to Non-NW Server Error
- Reboot Host After Update from Command Line Error
- Reporting Engine Restarts After Upgrade

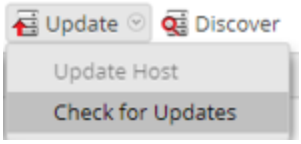
Troubleshooting instructions are also provided for errors for the following hosts and services that may occur during or after an upgrade.



- Log Collector Service
- NW Server
- Orchestration
- Reporting Engine
- Event Stream Analysis

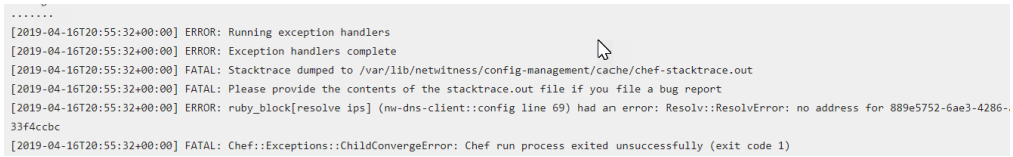
deploy_admin User Password Has Expired Error





Error Message	
Cause	The `deploy_admin` user password has expired.

Solution	Reset your `deploy_admin` password password.
	1. On the NW Server host only, run the following command.
	`nw-manage --update-deploy-admin-pw`
	`Please enter the new deploy_admin account password: <new-deploy-admin-password>`
	`Please confirm the new deploy_admin account password: <new-deploy-admin-password>`
	2. Review the output of the `nw-manage --update-deploy-admin-pw` command to verify the `deploy_admin` password was successfully updated on all hosts. If an NW host is down or fails for any reason as displayed by the output of the `nw-manage --update-deploy-admin-pw` command, run `nw-manage --sync-deploy-admin-pw --host-key <host-identifier>` to synchronize the password between the NW Server and the host that failed once the communication failure is resolved.
	3. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt.



Downloading Error

Error Message	
Problem	When you select an update version and click **Update** >**Update Host**, the download starts but fails to complete.
Cause	Version download files can be large and take a long time to download. If there are communication issues during the download it will fail.
Solution	1. Try to update again. 2. If it fails again with the same error, try to update using the offline methods as described in "Offline Method from Hosts View" or "Offline Method Using Command Line Interface" in the *Upgrade Guide for NetWitness Platform 11.6*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues. 3. If you are still not able to update, contact Customer Support.

Error Deploying Version <version-number> Missing Update Packages

Error Message	
Problem	Error deploying version <version-number> is displayed in the **Initialize Update Package for RSA NetWitness Platform** dialog after you click on **Initialize Update** if the update package is corrupted.
Solution	1. Click **Close** to close the dialog. 2. Remove the version folder from staging folder. 3. Make sure that the salt-master service is running. 4. Recopy the update package zip file to the staging folder. 5. In the Hosts view toolbar, select Check for Updates again.  6. Click **Initialize Update**. 7. Click **Update** > **Update Hosts** from the toolbar. 8. Click **Begin Update** from the **Update Available** dialog. After the host is updated, it prompts you to reboot the host. 9. Click **Reboot** from the toolbar.

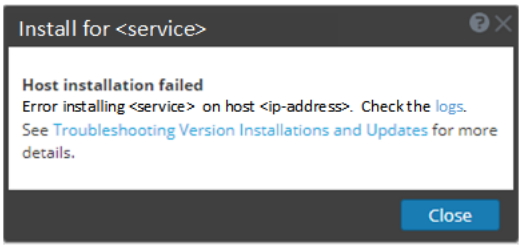
Upgrade Failed Error

Error Message	While updating/installing a device to version 11.2 or above, the following error can occur and be found in /var/log/netwitness/config-management/chef-solo.log: 

Cause	The reason can be because the target host is unable to communicate to the Admin Server on port 53 as it is attempting to use the dnsmasq service on the Admin Server to resolve, in this case, 889e5752-6ae3-4286-a944-c182 33f4ccbc. This is the salt minion id of the admin server. You can see this by running "cat /etc/salt/minion" on the Admin Server to compare. Example output:
	`[root@S5-NWAdmin ~]# cat /etc/salt/minion`
	`master: localhost`
	`hash_type: sha256`
	`log_level: info`
	`id: 889e5752-6ae3-4286-a944-c18233f4ccbc`

Solution	If possible, configure any firewalls between the target host and the Admin Server host to be able to communicate on port 53. If this is not possible, the workaround is to include the minion id in the /etc/host file on the component hosts and starting in the 11.4 release, modify the chef recipe not to overwrite this workaround.
Workaround	Refer to Install/Upgrade fails in RSA NetWitness Platform because Resolv::ResolvError: no address for a particular host KB Article.

Error Message	Received an error in the error log similar to the following when trying to update to version 11.6 : `FATAL: Chef::Exceptions::Package: yum_package[rsa-protobufs-rt] (rsa-audit::packages line 11) had an error: Chef::Exceptions::Package: No version specified, and no candidate version available for rsa-protobufs-rt`
Cause	Custom builds/rpms installed for certain components installed on hosts, such as in the case of installing Hotfixes.

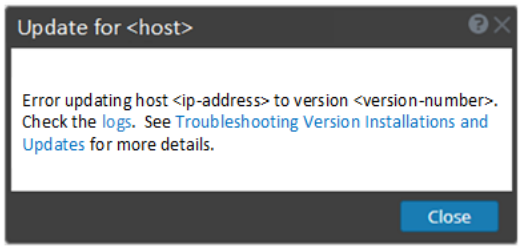


Solution	To resolve the issue, follow the below steps.
	1. SSH to Admin Server.
	2. Locate the component descriptor file by running the following command.
	`cd /etc/netwitness/component-descriptor/`
	3. Open the component descriptor file by running the following command.
	`vi nw-component-descriptor. json`
	4. Search for “packages” section for the component you have custom build/rpm. For example, below shown is the package details for “concentrator” host that has custom build/rpm.
	`“concentrator”: {`
	`“cookbook_name”: “rsa-concentrator”,`
	`“service_names”: [“rsa-nw-concentrator”],`
	`“family”: “launch”,`
	`“default_port”: xxxx, “description”: “Concentrator”,`
	`“packages”:[{ “name”: “rsa-nw-concentrator”,`
	`“version” : “11.6.0.0-2003001075220.5.cecf24b.e.17.centos”`
	`},`
	5. Delete the complete version details including (,) character in the packages section. For

	example, it should look like as shown below after you delete the version details.
	`"packages": [{`
	`"name": "rsa-nw-concentrator"`
	`},`
	Note: You must delete the version details for all the host that has custom builds/rpms in the component descriptor of the admin server.
	6. Run the upgrade process again.

External Repo Update Error

Error Message	Received an error similar to the following error when trying to update to a new version from the : `.Repository 'nw-rsa-base': Error parsing config: Error parsing "baseurl = 'https://nw-node-zero/nwrpmrepo /<version-number>/RSA'": URL must be http, ftp, file or https not ""`
Cause	There is an error the path you specified.
Solution	Make sure that: • the URL does exist on the NW Server host. • you used the correct path and remove any spaces from it.



Host Installation Failed Error

Error Message	
Problem	When you select a host and click **Install** the install service process fails.

Solution	1. Try to install the service again.
	Often this is all you need to do.
	2. If you still cannot install the service:
	a. Monitor the following logs on NW Server as it progresses (for example, submit the `tail -f` command string from the command line'):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`

	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error appears in one or more of these logs.
	b. Try to resolve the issue and reinstall the service.
	• Cause 1 - Entered the wrong `deploy_admin` password in the nwsetup-tui.
	Solution - Reset your `deploy_admin` password password.
	1. On the NW Server host and all other hosts on 11.x, run the following command.
	`/opt/rsa/saTools/bin/set-deploy-admin-password`
	2. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt.
	• Cause 2 -The `deploy_admin` password has expired.
	Solution - Reset your `deploy_admin` password password.
	1. On the NW Server host and all other hosts on 11.x, run the following command.
	`/opt/rsa/saTools/bin/set-deploy-admin-password`
	2. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt.
	3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support.

Host Update Failed Error

Error Message	
Problem	When you select an update version and click **Update** > **Update Host**, the download process is successful, but the update process fails.
Solution	1. Try to apply the version update to the host again. Often this is all you need to do. 2. If you still cannot apply the new version update:

a. Monitor the following logs on NW Server as it progresses (for example, run the `tail -f` command from the command line):
`/var/netwitness/uax/logs/sa.log`
`/var/log/netwitness/orchestration-server/orchestration-server.log`
`/var/log/netwitness/deployment-upgrade/chef-solo.log`
`/var/log/netwitness/config-management/chef-solo.log`
`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
The error appears in one or more of these logs.

b. Try to resolve the issue and reapply the version update.

- Cause 1 - `deploy_admin` password has expired.
  Solution - Reset your `deploy_admin` password .
  Complete the following steps to resolve Cause 1.

  1. In the NetWitness Suite menu, select  **(Admin) > Security > Users** tab.
  2. Select the `deploy_admin` and click **Reset Password**.
  3. (Conitional) If NetWitness Suite does not allow you to expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps.
     a. Reset `deploy_admin` to use a new password.
     b. On all non-NW Server hosts on 11.x , run the following command using the matching `deploy_admin` password from NW Server host.
     `/opt/rsa/saTools/bin/set-deploy-admin-password`

- Cause 2 -The `deploy_admin` password was changed on NW Server host but not changed on non-NW Server hosts.
  Complete the following step to resolve Cause 2.
  - On all non-NW Server hosts on 11.x , run the following command using the matching `deploy_admin` password from NW Server host.
    `/opt/rsa/saTools/bin/set-deploy-admin-password`

3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support.

Missing Update Packages Error

Error Message	**Initialize Update for Version xx.x.x.x** Missing the following update package(s) Download Packages from RSA Link

Problem	Missing the following update package(s) is displayed in the **Initialize Update Package for RSA NetWitness Platform** dialog when you are updating a host from the **Hosts** view offline and there are packages missing in the staging folder.
Solution	1. Click Download Packages from RSA Link in the **Initialize Update Package for RSA NetWitness Platform** dialog. The NetWitness Community page that contains the update files for the selected version is displayed. 2. Select the missing packages from the staging folder. The **Initialize Update Package for RSA NetWitness Platform** dialog is displayed telling you that it is ready to initialize the update packages.

OpenSSL 1.1.x

Error Message	The following example illustrates an ssh error that can occur when the ssh client is run from a host with OpenSSL 1.1.x installed: `$ ssh root@10.1.2.3` **`ssh_dispatch_run_fatal: Connection to 10.1.2.3 port 22: message authentication code incorrect`**

Problem	Advanced users who want to ssh to a NetWitness Platform host from a client that is using OpenSSL 1.1.x encounter this error because of incompatibility between CENTOS 7.x and OpenSSL 1.1.x. For example:
	`$ rpm -q openssl`
	`openssl-1.1.1-8.el8.x86_64`

Solution	Specify the compatible cipher list on the command line. For example:
	`$ ssh -oCiphers=aes128-ctr,aes192-ctr,aes256-ctr root@10.1.2.3`
	`I've read & consent to terms in IS user agreement.`
	`root@10.1.2.3's password:`
	`Last login: Mon Oct 21 19:03:23 2019`

Patch Update to Non-NW Server Error

Error Message	The `/var/log/netwitness/orchestration-server/orchestration-server.log` has an error similar to the following error: **`API|Failure /rsa/orchestration/task/update-config-management [counter=10 reason=IllegalArgumentException::Version '11.x.x.n' is not supported`**
Problem	After you update the NW Server host to a version, you must update all non-NW Server hosts to the same version. For example, if you update the NW Server from 11.4.0.0 to 11.6.0.0 , the only update path for the non-NW Server hosts is the same version (that is, 11.6.0.0). If you try to update any non-NW Server host to a different version (for example, from 11.4.0.0 to an 11.4.x.x) you will get this error.
Solution	You have two options:

	• Update the non-NW Server host to 11.6.0.0, or • Do not update the non-NW Server host (keep it at its current version)

Reboot Host After Update from Command Line Error

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Reporting Engine Restarts After Upgrade

Problem	In some cases, after you upgrade to 11.6 from versions of 11.x, such as 11.4, the Reporting Engine service attempts to restart continuously without success.
Cause	The database files for live charts, alert status, or report status may not be loaded successfully as the files may be corrupted.
Solution	To resolve the issue, do the following: 1. Check which database files are corrupted: Navigate to the file located at `/var/netwitness/reserver/rsa/soc/reporting-engine/logs/reporting-engine.log` and check the following blocks: • If the live charts db file is corrupted, the following logs are displayed: Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception: org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196] at org.h2.message.DbException.getJdbcSQLException(DbException.java:345) at org.h2.message.DbException.get(DbException.java:168) org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'chartSummaryDAOImpl': Invocation of init method failed; nested exception is com.rsa.soc.re.exception.ReportingException: java.sql.SQLException: Connections could not be acquired from the underlying database! • If the alert status db file is corrupted, the following logs are displayed:

Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception:

org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196]

at org.h2.message.DbException.getJdbcSQLException(DbException.java:345)

at org.h2.message.DbException.get(DbException.java:168)

org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertStatusHandler': Unsatisfied dependency expressed through field 'alertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertExecutionStatsDAOImpl': Unsatisfied dependency expressed through field 'persistedAlertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'persistedAlertExecutionStatsDAOImpl'

- If the report status db file is corrupted, the following logs are displayed:

```
org.h2.jdbc.JdbcSQLException: File corrupted while reading
record: null. Possible solution: use the recovery tool
[90030-196]
```

2. To resolve the live charts database file corruption, perform the following steps:
   a. Stop the Reporting Engine service.
   b. Move the `livechart.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/livecharts` folder to a temporary location.
   c. Restart the Reporting Engine service.

   Note: Some live charts data may be lost on performing the above steps.

   To resolve the alert status or report status database file corruption, perform the following steps:
   a. Stop the Reporting Engine service.
   b. Replace the corrupted db file with the latest `alertstatusmanager.mv.db` or `reportstatusmanager.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/archives` folder.
   c. Restart the Reporting Engine service.

   For more information, see the Knowledge Base article Reporting Engine restarts After upgrade to RSA NetWitness Platform 11.4.

Problem	After you upgrade to version 11.6, the Reporting Engine service does not restart.
Cause	The Reporting Engine service may not start due to any of the following reasons. - workspace.xml not updated. - Time is not converted properly in livechart h2 database. - JCR (Jackrabbit repository) is corrupted with primary key violation.
Solution	To resolve the issue, run the Reporting Engine Migration Recovery tool (`rsa-nw-re-migration-recovery.sh`) on the Admin Server where the Reporting Engine service is installed.

	Note: You can find the Reporting Engine Migration Recovery tool in the below location.
	`/opt/rsa/soc/reporting-engine-11.6.0.0-<Tag>/nwtools`
	1. SSH to Admin Server.
	2. Untar the RE (Reporting Engine) tool, run the following command.
	`tar -xvf rsa-nw-re-recovery-tool-bundle.tar`
	3. (Optional) If you want to untar the RE tool file in some other directory, you can create a directory and untar the RE tool. Run the following commands.
	`mkdir <NAME OF THE DIRECTORY>`
	`tar -xvf rsa-nw-re-recovery-tool-bundle.tar --directory <PATH OF THE DIRECTORY>`
	4. Run the script, run the following command.
	`./<PATH OF THE DIRECTORY>/rsa-nw-re-recovery-tool.sh`
	For more information, see the Knowledge Base article **Reporting Engine Migration Recovery Tool**.

Log Collector Service (`nwlogcollector`)

Log Collector installation logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness and configure the Lockbox as described in the "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	Decoder tries to start capture events but fails. `Aug 27 01:44:41 nwdecoder NwDecoder[8052]: [Decoder] [failure] The PF_RING driver is not installed.`

Solution	To resolve the issue, do the following steps,
	1. SSH to the Decoder host.
	2. Run the following commands.
	`yum reinstall pfring*`
	`systemctl restart nwdecoder`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 11.4.x.x or 11.5.x.x. to 11.6.0.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

Error Message	`<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [ ><existing-GB ] is less than the required space [ <required-GB> ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space.

Event Stream Analysis

Problem	After upgrading to version 11.6, the ESA correlation server does not aggregate events from the configured data sources.
Error Message	`Invalid username or password at com.rsa.netwitness.streams.base.RecordSourceSubscription.run (RecordSourceSubscription.java:173)`
Solution	To resolve the issue, do the following steps. In the NetWitness user interface,

1. Go to  **(Configure) > ESA Rules**.
   ESA Rules panel is displayed with **Rules** tab open.
2. In the Rules tab options panel, under Deployments, select a deployment.
3. In the **Data Sources** section, select the data source and click  in the toolbar.
4. In the **Edit Service** dialog, type the password for that data source.
5. Click the **Test Connection** button to make sure that it can communicate with the ESA service and then click **OK**.

Note: Do the above procedure for all the configured data sources.

6. After you finish making changes to the deployment, click **Deploy Now** to redeploy the ESA rule deployment.

What Is NetWitness® Investigate?

NetWitness audits and monitors all traffic on a network. One type of service--a Decoder--ingests, parses, and stores the packets, logs, and endpoint data traversing the network. The configured parsers and feeds on the Decoder create *metadata* that analysts can use to investigate the ingested logs and packets. Another type of service, called a Concentrator, indexes and stores the metadata. NetWitness Investigate provides the data analysis capabilities in NetWitness, so that analysts can analyze packet, log, and endpoint data, and identify possible internal or external threats to security and the IP infrastructure.

About This Guide

This guide provides end-to-end guidelines for all members of the SOC team to configure NetWitness Investigate and to investigate log and network events. End-to-end guidelines for investigating endpoints and user entity behavior using NetWitness Investigate are provided in separate documents:

- *NetWitness Endpoint Quick Start Guide*
- *NetWitness UEBA Quick Start Guide*

Getting Help with NetWitness Platform

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Create a Post** fields in NetWitness Community portal to find specific information here: https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Use these links to access documentation that is not related to a particular version of the software:

- Hardware setup guides: https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation
- Documentation for Content such as feeds, parsers, application rules, and reports: https://community.netwitness.com/t5/netwitness-platform-threat/tkb-p/netwitness-threat-intelligence.

Getting Started

The following tasks can be performed in any sequence and are for the entire SOC team.

Description	References
	
View information about product updates, improvements, and known issues	*Release Notes*
Understand how NetWitness Investigate works	"How NetWitness Investigate Works" in the *NetWitness Investigate User Guide*

Setup, Installation, or Upgrade

No special setup, installation, or upgrade tasks are required for Investigate; it is part of NetWitness Platform for Logs and Network. However, setup is required for several components with which NetWitness Investigate works if you plan to do this type of analysis. These tasks are for the Administrator, and the SOC Manager may want to understand the setup.

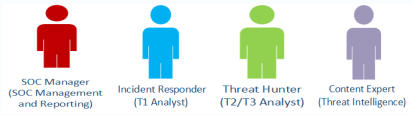
Description	References
	
Install and set up the Malware Analysis (standalone or service)	Malware Analysis Configuration Guide
Install and set up NetWitness Endpoint (standalone or service)	NetWitness Endpoint Quick Start Guide
Install and set up NetWitness UEBA (standalone or service)	NetWitness UEBA Quick Start Guide

System-Level Configuration

Administrators configure system-level preferences for NetWitness Investigate.The below-mentioned tasks are for the administrator, and the tasks can be performed in any sequence. SOC Managers should understand the possible configuration options.

Description	References
	
Configure role-based access control (RBAC) for analysts who will be using Investigate. These components have permissions related to investigate: investigate (Navigate view and Legacy Events view), investigate-server (Events view), Malware (Malware Analysis view), Endpoint-broker-server, and Endpoint-server.	"Role Permissions" in the System Security and User Management Guide
Configure Investigate to limit content available for different user roles (preQueries).	"Verify Query and Session Attributes per Role" in the System Security and User Management Guide
Configure default settings and limits for NetWitness Investigate on a system level.	"Configure Investigation Settings" in the System Configuration Guide

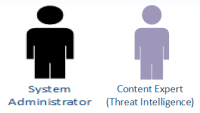
User Preference Configuration



The following tasks are for Threat Hunters, Content Experts, and Incident Responders, and SOC Managers. The tasks can be performed in any sequence.

Description	References
	
Configure Navigate view and Events view preferences.	"Configure the Navigate and Legacy Events View" in the *NetWitness Investigate User Guide*
Configure Event Analysis view preferences.	"Configure the Events View" in the *NetWitness Investigate User Guide*
Configure the Malware Analysis view preferences.	"Configure Malware Analysis" in the *Malware Analysis User Guide*

Investigation



Different types of investigation may be handled by analysts with different skill levels and goals.

- Incident Responders (T1 Analysts) typically pivot to Investigate from NetWitness Respond to find detailed information about an incident so that they can respond to and remediate incidents.
- Threat Hunters (T2/T3 Analysts) typically peruse events, metadata, and raw content so that they can recommend issues for remediation and remediate issues.
- Content Experts (Threat Intelligence) typically peruse events, metadata, raw content, user and host data, and UEBA data so that they can investigate new threat intelligence, evaluate and create new feeds, and create correlation rules to flag indicators of compromise.
- SOC Managers need to understand the use cases.

Description	References
	
Learn about practical use cases	"Sample Use Cases for NetWitness Investigate" in the *NetWitness Investigate User Guide*
Investigate metadata and raw events in logs and network traffic	"Beginning an Investigation" in the *NetWitness Investigate User Guide*
Investigate possible malware	Malware Analysis User Guide
Investigate endpoints	NetWitness Endpoint User Guide
Perform user and entity behavior analysis	NetWitness UEBA User Guide

Maintenance

The administrator can perform the following tasks in any sequence.

Description	References
	
Maintain the list of queries and analyze the query patterns of other users of the NetWitness Platform system.	"Maintaining Queries Using URL Integration" in the System Maintenance Guide

Description	References
Fine tune system-level configuration settings to improve performance or limit access to data.	"Verify Query and Session Attributes per Role" in the System Security and User Management Guide "Configure Investigation Settings" in the System Configuration Guide

How NetWitness Investigate Works

NetWitness Investigate provides analysts the means to analyze events that have been captured by NetWitness. Using Investigate, analysts can examine packet, log, and endpoint data, and identify possible internal or external threats in their environment. There are several different views available to analysts to gain different perspectives into the data in their environment. A key element that all the views have in common is metadata.

Metadata, Meta Keys, Meta Values, and Meta Entities

NetWitness audits and monitors all data communications in an environment. One type of service--a Decoder--ingests, parses, and stores the original packets captured on the network, logs forwarded by a device, and endpoint events seen by the endpoint agent. The configured rules, parsers, and feeds on the Decoder create *metadata* that analysts can use to investigate the ingested logs, packets, and endpoint data. Another type of service, called a Concentrator, indexes and stores the metadata, making it more efficient to search through all types of metadata.

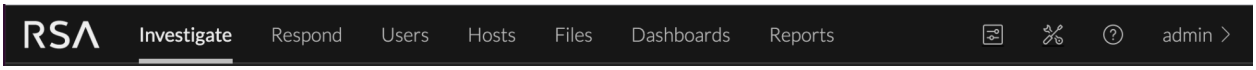
The metadata is created to give analysts valuable points of reference associated with the original data. This allows analysts to quickly get a sense of what has transpired without being required to examine every detail of an event. The metadata is in the form of a *meta key* and *meta values* for the key. For example, `ip.src` is a meta key, and an IP address (192.168.1.1) that is the source of the traffic is a meta value tagged as `ip.src`. When you view data in Investigate, you see the meta key `ip.src` and all of the IP addresses (meta values) that are tagged with that key. Some meta keys are built-in and others may be custom keys specific to your environment and defined by the administrator. All metadata, no matter the source of the data, is normalized into the Unified Data Model for NetWitness Platform XDR to keep similar metadata concepts grouped together into like meta keys (see https://community.netwitness.com/t5/netwitness-platform-unified-data/tkb-p/netwitness-udm).

Meta entities are available in Version 11.1 and later. A *meta entity* is an alias that groups together the results from other meta keys. Meta entities organize similar meta keys into a single, easier to use, meta type. For example, the default Core database language includes distinct meta keys for IP source and IP destination. One of the built-in meta entities named `ip.all` represents the combined set of all IP sources and destinations. Some meta entities are already included by default, and the administrator can create custom meta entities. Analysts can use a meta entity in a query, a meta group, a column group, and a query profile. Parallel coordinates visualizations do not support meta entities. Administrators can use meta entities to define a query prefix to apply to a user role and a user as described in the *System Security and User Management Guide*. The *Decoder Configuration Guide* provides additional information about creating meta entities and how they can be used in rules.

Note: Meta entities need to be configured on all upstream Concentrators. If any Concentrator does not have a meta entity configured, that meta entity will be empty when you query the Broker.

Analysts usually query the Broker or Concentrator to discover threats. The Concentrator handles queries, only going to the Decoder for raw logs or endpoint events or a full reconstruction of network events. ESA, Malware Analysis, and Reporting Engine also query the Concentrator, where they can quickly get all the pertinent metadata associated with an event and generate information about the event without having to query each Decoder. In some special cases, analysts may query a Decoder.

Triggers for an Investigation



These are a few examples of triggers for an investigation:

- You receive intelligence about a new active directory hack. Starting in the Events view, you use that intelligence to run a search across all of your raw Active Directory log data for the last 24 hours.
- You are asked by the SOC manager to find any Pokemon Go malware due to its popularity. Starting in the Navigate view, you craft a query to look for an HTTP session using a specific user agent related to the malware that your SOC manager found on a security blog.
- An incident responder escalates a ticket that shows some odd indicators related to a host. Starting in the Hosts view, you examine that host to find specific details.
- You are looking for the next zero day attack and start drilling into the network metadata in the Navigate view (or the Filter Events panel in the Events view) to find any abnormal automated sessions leaving the enterprise.
- You are asked by your SOC manager to find any information related to user `jarvis`, an employee who was just let go. Starting in the Users view you can filter for that username to make sure there is no longer any activity for that user and see if that user deviated from their typical behavior prior to being let go.
- A phishing attack detected has an associated attachment, and you want to know what devices in your environment have seen that file by searching for the file hash in the Files view.
- A malicious file has been automatically found in your environment, and you want to review the static and dynamic analysis done on that file along with how many systems it has been transmitted to or from. Starting in Investigate > Malware Analysis you can see the analysis results.

Workflow of an Investigation

Analysts can investigate data captured by NetWitness, and deep dive from information on a NetWitness dashboard, the Springboard (Version 11.5 and later), a NetWitness Respond incident or alert, a report created by the NetWitness Reporting Engine, or a third-party application. During the course of an investigation, analysts can move seamlessly between views: the Navigate view, the Events view, the Legacy Events view, the Hosts view, the Files view, the Users (Entities) view, and the Malware Analysis view. By default, the Navigate view and the Legacy Events view are disabled.

This figure illustrates the Version 11.5 menu, which is optimized for the analyst workflow with Users, Hosts, and Files moved to the top-level menu.

This figure illustrates the Version 12.0 menu, which is optimized with new NetWitness logo.

This figure illustrates the Version 12.1 menu, which is optimized with new NetWitness logo and renamed our product as NetWitness Platform XDR.

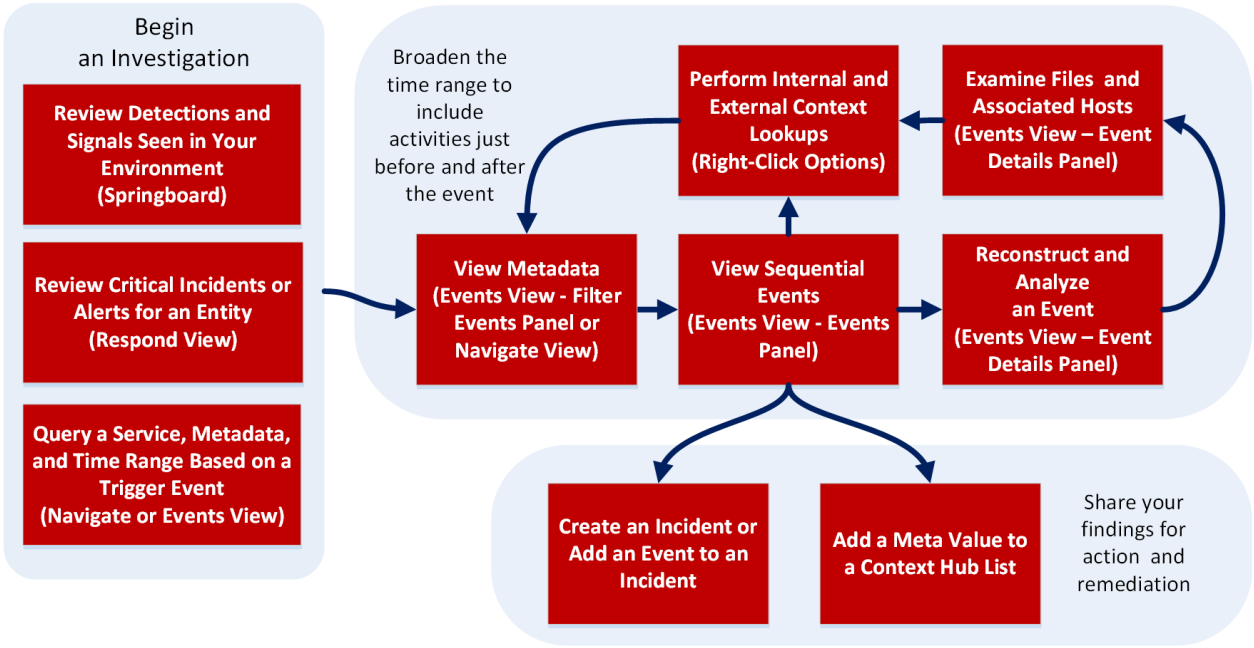
Note:
- The Files and Hosts views are available in Version 11.1 and later. Before Version 11.5, they were a submenu of Investigate.
- The Users view is available in Version 11.2 and later; in Version 11.4 it is labeled Entities view. Before Version 11.5, it was submenu of Investigate.
- By default, the Legacy Events view is disabled in Version 11.4, but can be enabled by an administrator as described in the *System Configuration Guide*.
- By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.
- Specific user roles and permissions are required for a user to conduct investigations and malware analysis in NetWitness. If you cannot see a view, the administrator may need to adjust the roles and permissions configured for you.

The views are closely integrated to reduce the need to jump from one view to another. Each use case determines the starting point for your investigation; every situation is unique in terms of the types of information you are attempting to find. Many investigations start in one view, and end in a different view as you learn something and then need to follow that result to a different line of questioning. Experienced analysts frequently begin an investigation in the Navigate view or the Events view. Less experienced analysts can begin in the Dashboard, Respond view, or the Springboard (Version 11.5 and later), in which clickable incidents and alerts link to detailed information and analyses in the different views.

Go to...	Focus
Navigate view	The Navigate view (Version 11.5 and earlier) works well for providing a high-level vantage point of what has been seen in your environment for a specific time range by showing meta keys and meta values for log, endpoint, and network events. After drilling into meta values, go to the Events view to see the raw event (See Filter Results in the Navigate View.)

Go to...	Focus
Events view	The Events view (default Investigate view) is the workflow for analysts interacting with events, presenting different facets of the same data in adjacent panels. In Version 11.6, there is no need to go to the Navigate view to drill into meta values as the Filter Events Panel in the Events view provides this functionality. (See Refining the Results Set, Reconstructing and Analyzing Events, and Downloading and Acting Upon Results.)

Go to...	Focus
Legacy Events view	The Legacy Events view was the original workflow for looking at event details in Version 11.0 to 11.3.x.x. The Legacy Events is replaced by the 11.4 and later Events view and it is hidden unless the administrator enables it. (See Refining the Results Set, Reconstructing and Analyzing Events, and Downloading and Acting Upon Results.)



Go to...	Focus
Hosts view	The Hosts view option was moved to the main menu in Version 11.5. Hosts on which the NetWitness Endpoint agents are running are listed. For every host, you can view processes, drivers, DLLs, files (executables), services, anomalies, and autoruns that are running, and information related to logged-in users. (See the *NetWitness Endpoint User Guide*.)
Files view	The Files view option was moved to the main menu in Version 11.5. Unique files in your deployment, such as PE, Macho, and ELF, are listed. For each file, you can view details such as file name, reputation status, file status, risk score, signature, checksum, and others. (See the *NetWitness Endpoint User Guide*.)

Go to...	Focus
Malware Analysis view	If you are running a Malware Analysis appliance, you can scan files and see results of four types of analysis: network, static, community, and sandbox. If a file is malware, you can go to the Hosts view to see which hosts downloaded the file. (See the *Malware Analysis User Guide*.)

Go to...	Focus
Users view	The Users view (labeled as the Entities view in Version 11.4) was moved to the main menu in Version 11.5. It provides visibility into risky user behaviors across your enterprise using NetWitness UEBA. You can view a list of high-risk users and a summary of the top alerts for risky behavior for your environment, and then select a user or an alert and view details about the risky behavior, and a timeline during which the behaviors occurred. NetWitness Platform XDR users assigned the Administrators or UEBA Analysts role have access to this view. (See the *NetWitness UEBA User Guide*.)

Focus on Metadata, Query, and Time

The following figure depicts the workflow for an investigation with focus on metadata, a query, and time range.

Analysts use Investigate to hunt for events that drive the incident response workflow and to do strategic analysis after another tool has generated an event. Beginning in the Navigate view, Events view, or Legacy Events view:

1. Start by executing a query on a service for a specific time range, filter results to get a subset of events, reconstruct or analyze an event, and repeat the process to reconstruct or analyze another event. Built-in query profiles, meta groups, and column groups provide a good starting point. For example, you can choose the RSA Email Analysis query profile to see only metadata that is useful when investigating email risks.
2. When an event bears a closer look, view the context around the event, and decide whether to create an incident or add the event to an incident. If you decide not to add the event to an incident, you can run another query to gain further insight, which starts again at the beginning of the workflow.
3. If you notice suspicious activity or files on a specific host in the network, gather additional information about the host and files found on the host in the Hosts and Files view, or in a standalone NetWitness Endpoint server.
4. If you find a file or event that potentially contains malware, do a Malware Analysis scan of the file or open Malware Analysis and start a scan of the service on which the event was seen.

Here is one simple use case: If there is a concern regarding suspicious traffic with certain countries, the Destination Country meta key reveals all destinations and the frequency of the contact. Drilling into those values yields the specifics of the traffic, such as the IP address of the originator and the recipient. Checking other metadata can expose the nature of attachments exchanged between the two IP addresses. When suspect IP addresses are identified, looking at the addresses in the Navigate view or Events view with a broader time range can provide clues about what happened before and after the event being investigated.

Another use case is to investigate an alert to discover a malicious insider in the network who is exfiltrating intellectual property or other sensitive data from a specific IP address. The investigation begins with this meta value: `Upload without change request followed by download alert`. Start in the Navigate view or Events view by filtering the values to the IP address during the time range in which the alert was generated. Alerts metadata shows risk indicators as meta values, and you can click on different meta values to filter the events list and then reconstruct the event. Next extract files and examine the files to understand what happened. With this information, you can filter on the same IP address and broaden the time range to see activities before and after the event.

Focus on Respond View Incidents and Alerts

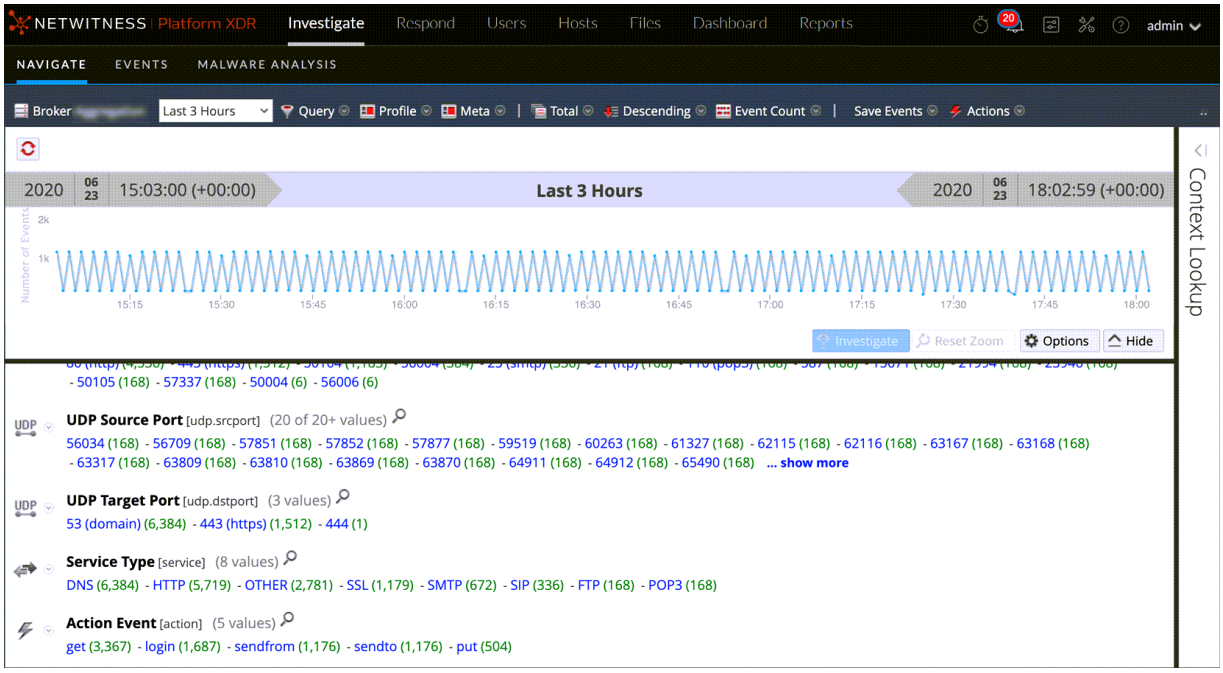
An analyst who is working on an incident or an alert in Respond can open the incident in Investigate to do a deeper analysis of the event or alert.

- The workflow to respond to an incident typically begins in the Respond view, where the analyst who is investigating an incident needs to gather intelligence about the incident in Investigate. Hover over an underlined entity in an incident or alert, such as an IP address, and select the action **Pivot to Investigate**. The Events view opens and is filtered for the selected entity. Defined meta keys are queried and the captured packets, logs, and endpoint events are displayed in the Events view.
- If you find events that are relevant to the incident, add the events to the incident in Respond. You can also create a new incident in Respond based on one or more events found in Investigate.
- From the Incident Details view Indicators panel in Respond, open the Events view to get a better understanding of an indicator event.

NetWitness Investigate Views

This section provides a brief description and example of the Navigate view, Events view, and Legacy Events view, as well as the context information, event details and reconstructions available in those views. Refer to the *Malware Analysis User Guide* for information about features and functions of the Malware Analysis view.

Navigate View



Note: By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.

The Navigate view provides the capability to drill into and query metadata for network, logs, and endpoint events on a Broker, Concentrator, or Decoder (though investigating a Decoder is not typical). For certain configured meta keys, such as IP address, or hostname, you can see additional context information around a value using the Context Hub. The Navigate view also provides a sequential visualization of the data in a timeline. This figure illustrates the Navigate view.

- Each meta key listed displays the top 20 values based on how many events have those values.
- Drilling into the meta values by successive left or right clicking of values applies each clicked value as an additional filter to your query. As you drill, the subset of metadata seen grows smaller based on

the filters you have applied. For example, if you filter to only show HTTP (service=80), all the remaining metadata presented will be what is contained inside those HTTP events.

- With a smaller set of refined results, you can go to the Events view to examine further event details, or perform other lookups inside or outside the platform to gain further insight.

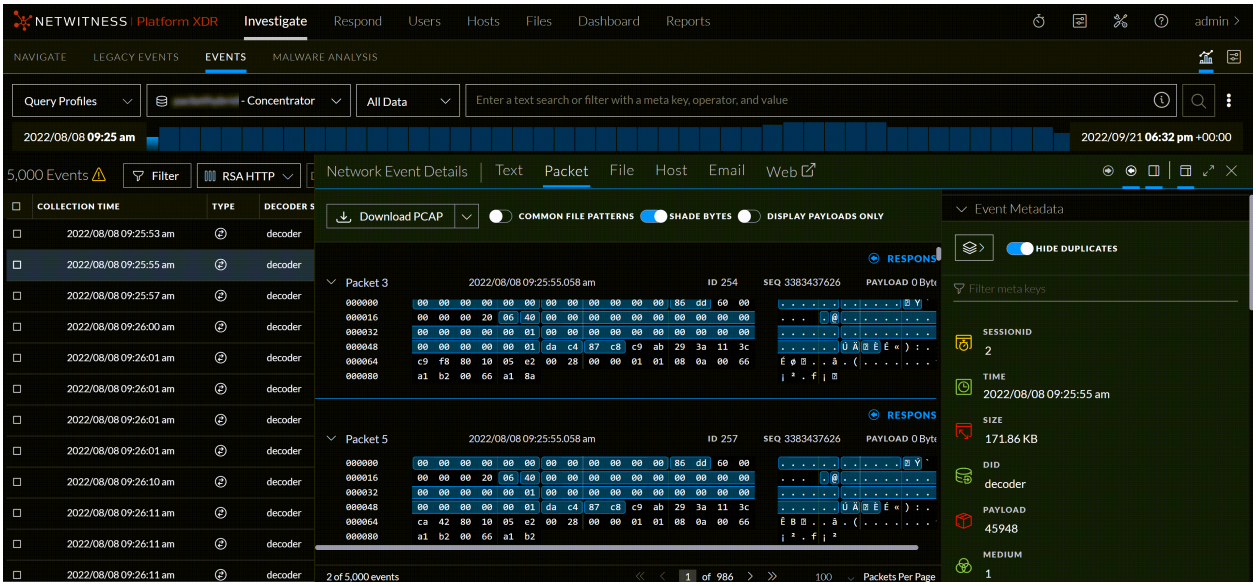
Events View

The Events provides the ability to view events sequentially, analyze raw event data and metadata, and (in Version 11.5) drill into metatdata as you can in the Navigate view.

- **In the Events panel**, Network, endpoint, and log events are listed in order by time. You can view the raw event, filter, sort, search, look at details and reconstructions, and download events. Clicking an event opens the Event Details panel for the event. Different reconstructions are available in the Events view (packets, text, files, email, and web) with helpful cues to identify points of interest, such as interesting bytes, file types, and encoded data.

- **In the Event Meta panel**, you can view related metadata for an event that is open in the Event Details panel. Analysts reviewing the metadata can change the order of the metadata to better track down what they are looking for. The items in the list of metadata can be grouped by the sequence they were generated or alphabetically.

- **In the Filter Events panel** (Version 11.5 beta feature), you can drill into meta values for the listed events with your actions reflected in the Events panel. When the Filter Events panel is expanded to the full width of the browser, you can drill into meta values to hunt for specific information before listing the events in the Events panel (comparable functionality to drilling into data in the Navigate view).
  (Version 11.5.1) In the Filter Events panel, the meta values result threshold is 100000. If results are



above the threshold, it is indicated using either ~ or >. For example, **(>100000)** indicates that the results are sorted based on count and are greater than the threshold. Similarly, **(~100000)** indicates that the results are sorted based on size and are greater than the threshold.

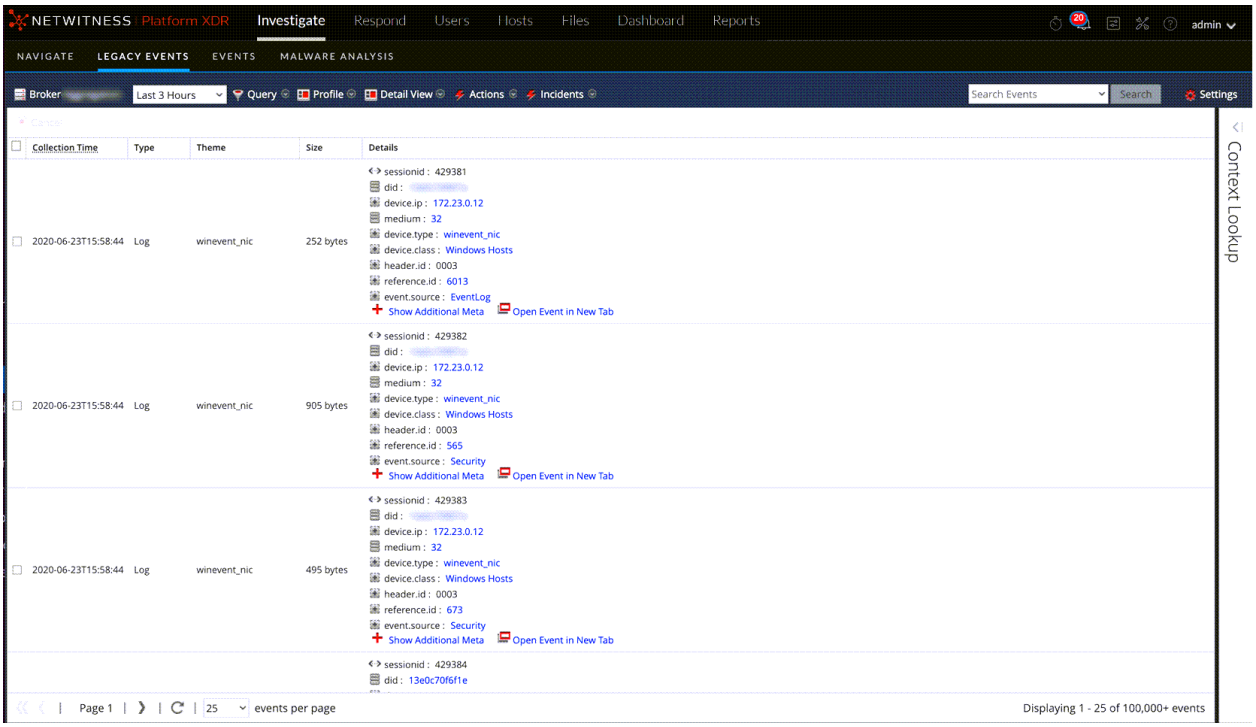
- **In the Event Details panel**, you can view details of a network, log, or endpoint event and safely reconstruct an event in a format similar to the original format. The tabs are Text, Packet, Files, Hosts, Users, Email, and Web.
- From various points in the Events view, you can pivot to standalone Endpoint, look up in Live, and do other internal lookups. External lookups allow you to search the internet for meta values with which you interacted, determine passive DNS information related to an IP address, check if a URL is blacklisted, and other third-party context integrations.
- (Version 11.5) If network data is enriched with endpoint data from an Endpoint deployment and the Endpoint Agent is configured for expanded network visibility, host information for network events is also displayed in the Events view in the header and in the Hosts tab.

  Note: For Expanded Network Visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide for NetWitness Platform*.

- For certain configured meta keys, such as IP address, or hostname, you can search for additional context information around a value using the Context Hub. The additional context may include incidents, alerts, Threat Intelligence, and other sources where the value was mentioned.
- You can export different types of data. When viewing files, you can export files in a zip archive to your local file system. When viewing email reconstructions, you can download attachments. You can download logs from the text reconstruction, and export packets from the packet reconstruction. You can download multiple events from the Events list.
- (Version 11.6) To view the download jobs, click . Unlike the  icon in the **Legacy Events** and **Navigate** page, it does not open the Jobs tray. It opens the Jobs page where all jobs are listed. To display the Jobs tray, go to **Investigate** > **Navigate** (Version 11.5 and earlier) or **Investigate** > **Legacy Events** (Version 11.3 and earlier), and click the  (Jobs) icon.

This figure is an example of the Events view with a network event selected in the Events list, analyzed in the middle panel, and related metadata in the right panel.

This figure illustrates the Events view with the Filter Events panel open on the left side to filter the results set by drilling into meta values.

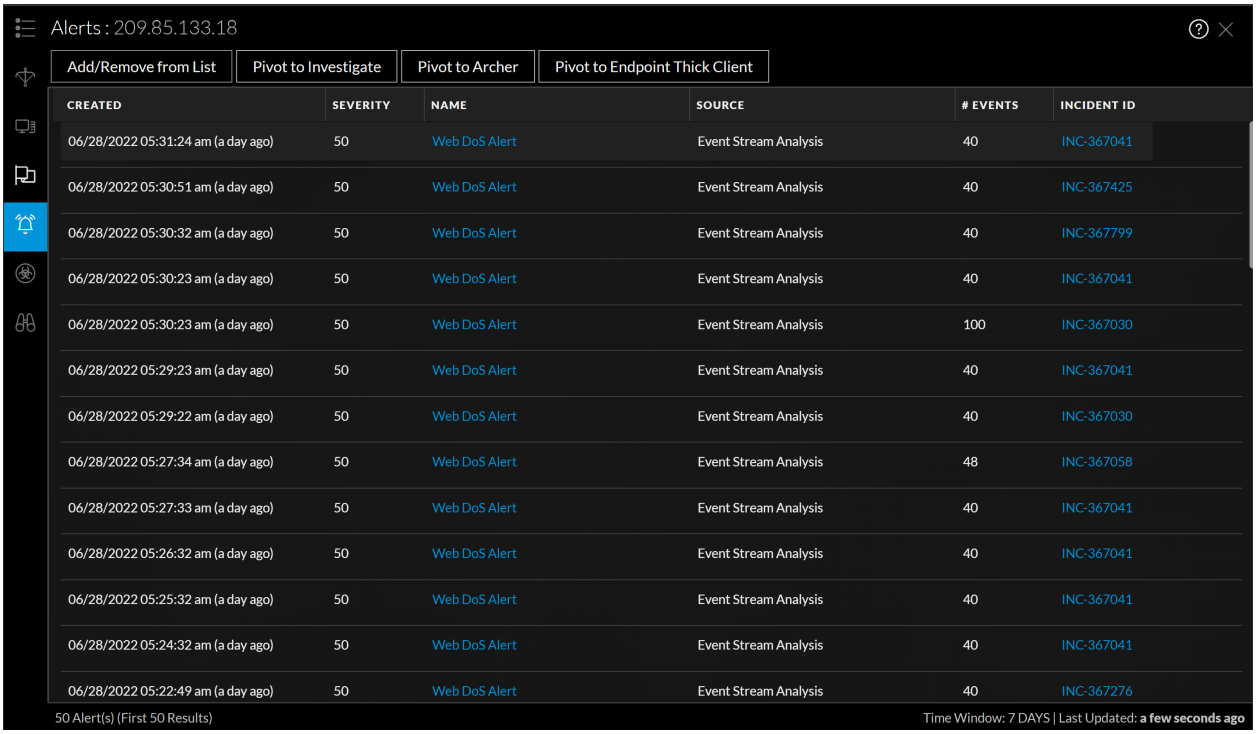


Legacy Events View

The Legacy Events view was the original user interface for analysts examining raw event data (11.0 to 11.3.x.x). The Legacy Events view is no longer needed in Version 11.4; it is hidden unless the administrator enables it as described under "Configure Investigation Settings" in the *System Configuration Guide*. When the Legacy Events view is enabled, both the Events view and the Legacy Events view are visible in the menu bar. The Legacy Events view provides a view of packet, log, and endpoint events in list form so that you can view events sequentially and reconstruct events safely.

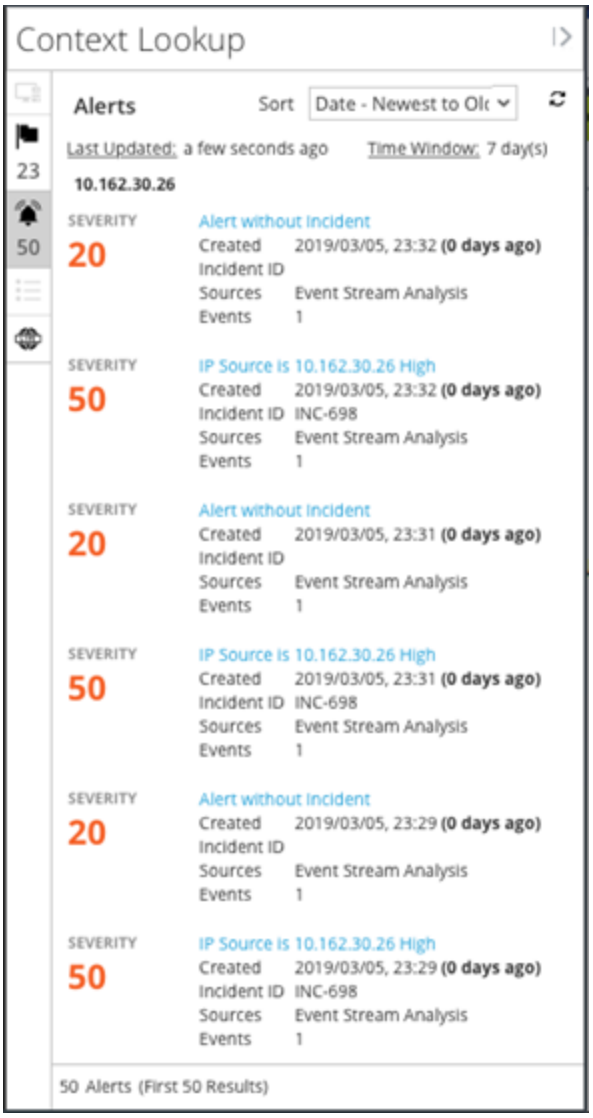
- You can open the Legacy Events view for a meta value that you see in the Navigate view.
- For analysts without sufficient privilege to navigate a service, the Legacy Events view is a standalone investigation view in which analysts can access a list of network, log, and endpoint events from a NetWitness Core service without having to drill down through metadata first.
- The Legacy Events view presents event information in three standard forms, a simple list of events, a detailed listing of events, and a log view.
- For certain configured meta keys, such as IP address, or hostname, you can see additional context information around a value using the Context Hub. The additional context may include incidents, alerts, and other sources where the value was mentioned.
- You can export events and associated files, and create an incident from an event.

This figure illustrates the Legacy Events view.



Contextual Information for an Event

In the Navigate view, Events view, and Legacy Events view, the Context Lookup panel shows details about elements associated with an event in the Context Hub for these meta types: IP Address, User, Host, Domain, MAC Address, Filename, and File hash. In addition, you can right-click all meta keys except time to see additional context.

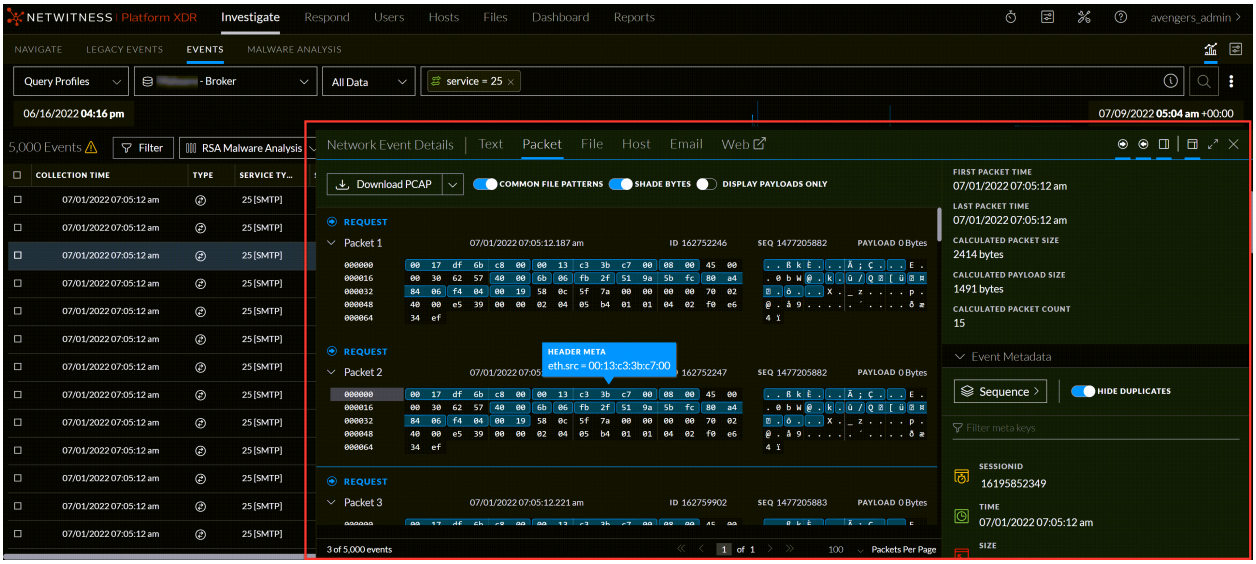


You can interact with the elements of an event to get further insight including related incidents, alerts, custom lists, Archer assets, active directory details, NetWitness Endpoint IIOCs, and STIX data sources (namely File, TAXII Server, and REST Server). (See Look Up Additional Context for Results.)

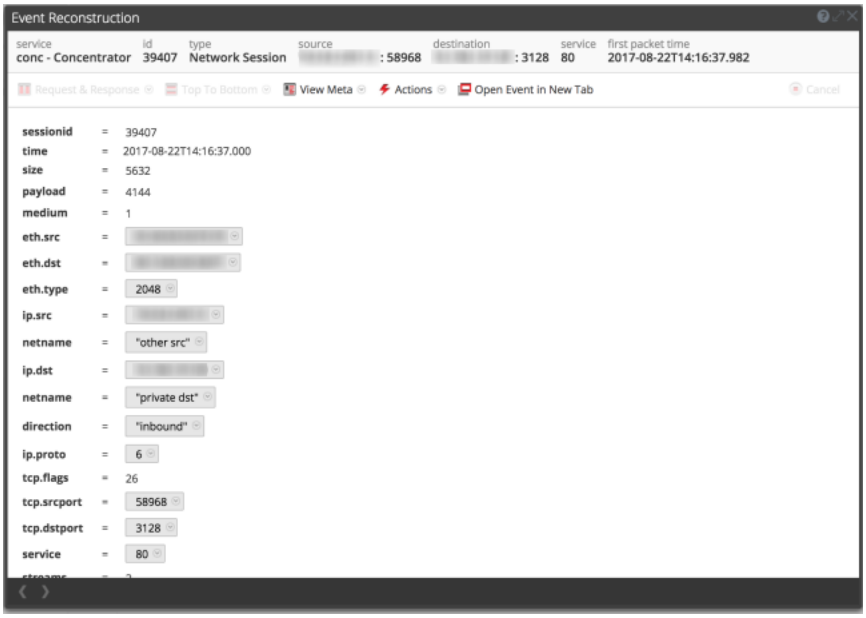
Note: Archer assets and active directory details are available in the Events view context lookup. Endpoint context lookup is available for NetWitness Endpoint 4.4.0.2 or later hosts, but not for the NetWitness Endpoint 11.1 or later hosts.

The following figure shows the Context Lookup panel, which opens to the right of the Events panel in the Events view.

The following figure shows the Context Lookup panel, which opens to the right of the Events list in the Legacy Events view.



Reconstruction and Event Analysis



When you discover an event that merits additional investigation, you can analyze it in a form that best suits the content of event. Some forms of analysis involve safely reconstructing the event in a form similar to its native form, for example, packets, text, email, and web content. The rendering of events restricts the use of dynamic or active code that may be contained in the event to limit adverse outcome to your system or browser. Using cache improves performance when viewing previously viewed events. Each analyst has a separate cache of reconstruction data, and you can only access reconstructed events in your own cache.

Some network events are enriched with host data if you have an Endpoint deployment and the Endpoint Agent is configured for expanded network visibility. For such an event, you can view the host details.

The Events view gives you the ability to interactively analyze an event, looking at raw data, meta keys, meta values. This figure is an example of a network event rendered as packets in the Events view.

The Event Reconstruction in the Legacy Events view presents the raw data and the meta keys and meta values for an event in a list form. This figure is an example of the Event Reconstruction.

Configuring NetWitness Investigate Views and Preferences

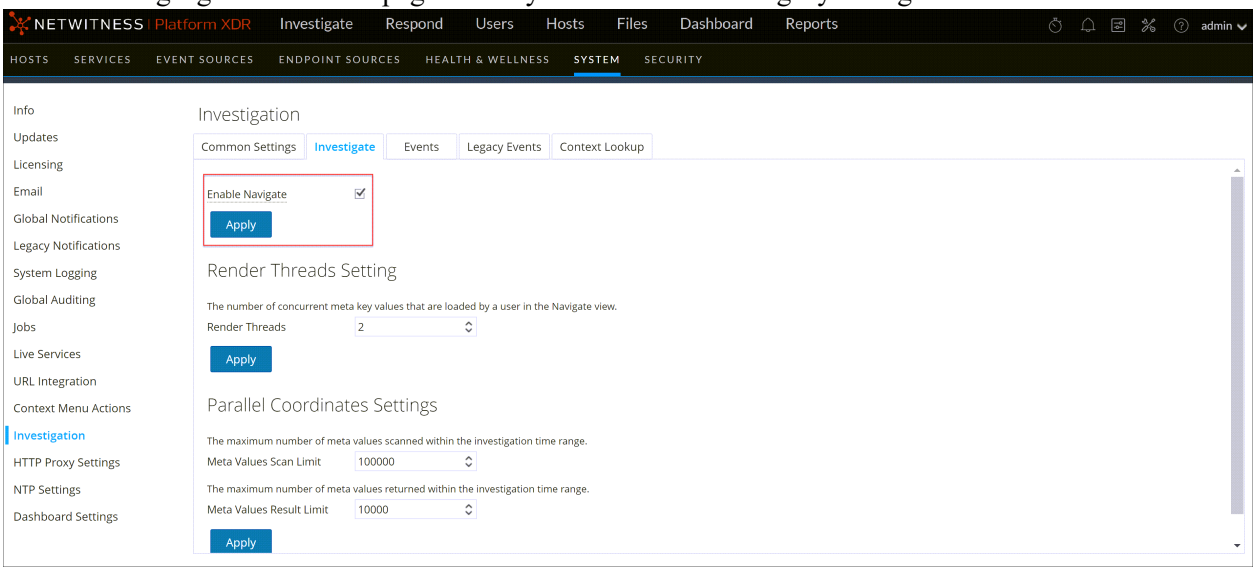
Analysts can configure some aspects of NetWitness Investigate views and behavior. You can customize the way that Investigate views appear, the types of information displayed, and factors that affect performance in returning results and reconstructing events. All configurable settings have default values that are effective in most deployments; however, analysts have the option to adjust these if necessary.

Analysts using Investigate need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in the *System Security and User Management Guide*.

These topics provide details:

- Configure the Navigate View and Legacy Events View
- Configure the Events View

Configure the Navigate View and Legacy Events View



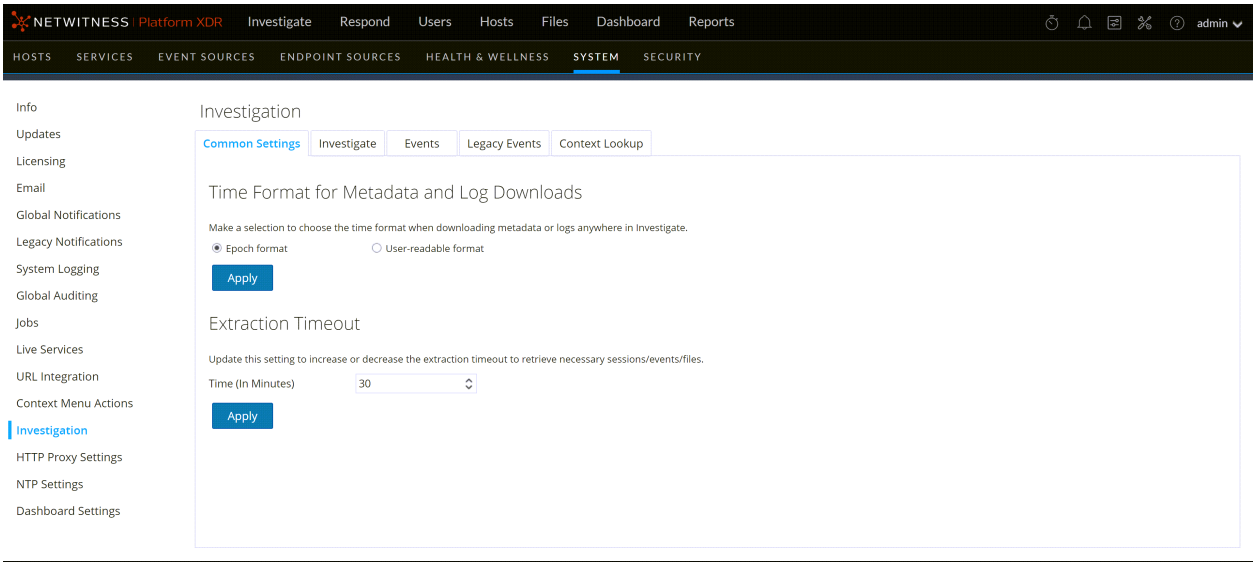
Analysts can set preferences that affect performance and behavior of NetWitness when using the Navigate view and Legacy Events view. Some of the same settings are available in two places in NetWitness, and changes made in either location are applied in the other view:

- Investigate view > Settings dialog for the Navigate view and the Legacy Events view.
- Profiles > Preferences panel > Investigation tab.
- Navigate view and Legacy Events view Search Options drop-down.

By default, the legacy Navigate view is disabled. To enable the Navigate tab in Investigate:

1. Go to  **(Admin)** > **System**.
2. In the left-hand panel, click **Investigation**.
3. In the **Investigation** window, select the **Investigate** tab.
4. Select the **Enable Navigate** checkbox.
5. Click **Apply**.

The following figure shows the page where you can enable the legacy Navigate view.

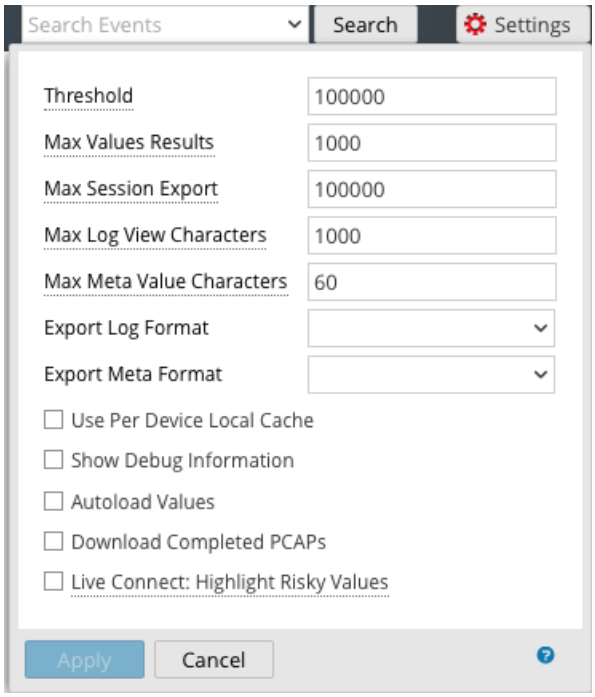


Configure Common Settings

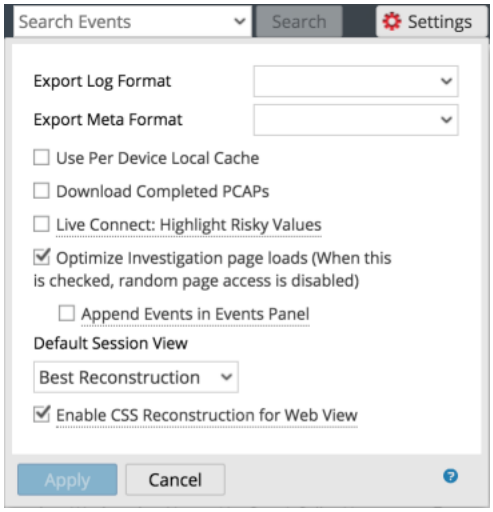
In version 11.5 and later, the **Common Settings** tab allows you to configure settings that apply to the Navigate view, the Events view, and the Legacy Events view. You can set the time format used when downloading metadata and logs, and extraction timeout settings.

By default, the time format for downloads is Epoch format, which shows the time as a numerical value representing the number of seconds from the Unix epoch, January 1, 1970. The resulting number requires a conversion to be understood. You can change the setting to get a more understandable format that combines the user preference time zone, date format, and time format into an easily understood representation, which follows the industry standard ISO 8601 representation when possible.

This setting applies to all 11.5 Investigate views.



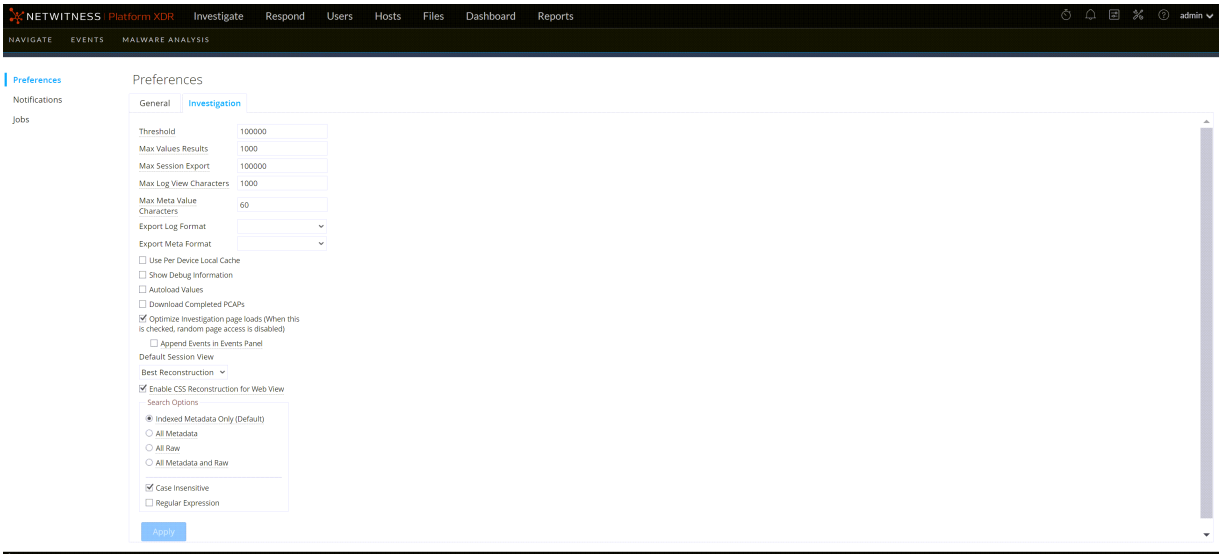
Go to  **(Admin) > System**, and in the options panel, select **Investigation**.
The Investigation Configuration panel is displayed.



Access the Navigate View and Legacy Events View Settings

To access the settings, do one of the following:

- In the **Navigate** view toolbar, select the **Settings** option.
  The Settings dialog for the Navigate view is displayed.



- In the **Legacy Events** view toolbar, select the **Settings** option.
  The Settings dialog for the Legacy Events view is displayed.

- In the top right corner of NetWitness, go to > , Profile, and in the **Preferences** panel click the **Investigation** tab.

The Investigation panel is displayed. The figure below illustrates the Investigation panel.

Calibrate Navigate View Value Loading Parameters

Several settings influence the performance of NetWitness when loading values in the Values panel. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations. To adjust these settings:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view.
2. Adjust the following parameters:
   - **Threshold:** Set the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The default value is **100000**.
   - **Max Values Results:** Set the maximum number of values to load in the Navigate view when the Max Results option is selected in the Meta Key Menu for an open Meta Key. The default value is **1000**.
   - **Max Session Export:** Specify the number of events that can be exported in a single PCAP or Log file.
   - **Max Log View Characters:** Set the maximum number of characters to be displayed on **Investigate > Events > Log Text**. The default value is **1000**.
   - **Max Meta Value characters:** Set the maximum number of characters in a meta value name displayed in the Navigate view Values panel. The default value is **60**.
   - **Show Debug Information:** If you want NetWitness to display the `where` clause beneath the breadcrumb in the Navigate view and the elapsed load time for each aggregated service on a Broker, check this option. The default value is **Off.**
   - **Append Events in Events Panel:** This option affects paging in the Events view and is described below under "Calibrate Events View Retrieval and Default Reconstruction."

- **Autoload Values:** If you want NetWitness to automatically load values for the selected service in the Navigate view, check this option. When not selected, NetWitness displays a **Load Values** button, allowing the opportunity to modify options. The default value is **Off**.

3. Click **Apply**.
   The settings become effective immediately and are visible the next time you load values.

Configure Navigate View and Legacy Events View Parameters

Several settings influence the performance of NetWitness when loading values in the Navigate view and the Legacy Events view. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations. You can set these parameters separately in the Navigate view and the Legacy Events view. When configured in one view, the setting does not automatically apply to the other view. To adjust these settings:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view or the Legacy Events view.
2. Adjust the following parameters:
   - **Live Connect: Highlight Risky Values:** If you want NetWitness to highlight and display only IP addresses that are considered as risky by NetWitness community, check this option. When not selected, NetWitness displays all IP addresses. By default, this option is not selected (**Off**).
   - **Use Per Device Local Cache:** You can specify the use of locally cached data from the selected service. By default, this option is not selected **(Off)**. When unchecked, Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If checked, Investigate uses the data from local cache.
   - **Download Completed PCAPs:** You can automate the downloading of extracted PCAPs in the Navigate view and Legacy Events view so that the browser downloads the extracted PCAP and opens it in the default application for opening PCAP files, such as Wireshark. By default, this option is not selected (**Off**). If you are going to enable this option, ensure that an application that can open PCAPs is installed on your local file system and that the application is set as the default application to handle PCAP file formats.
   - **Live Connect: Highlight Risky Values:** If this option is unchecked, all the meta values that have context available in Live Connect are highlighted in the Navigate view Values panel. If the option is checked, among the values that have context in Live Connect, only those values deemed Risky/Suspicious/Unsafe by the community are highlighted. By default this option is unchecked (**Off**).
3. Click **Apply**.
   The settings become effective immediately.

Configure the Default Log Export Format

You can export logs from the Navigate view and the Legacy Events view as Text, XML, comma-separated values (CSV), and JSON. There is no built-in default value for the log export format. If you do not select a format here, NetWitness displays a selection dialog when you invoke export of logs. To select the format for exported logs:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view or Legacy Events view.
2. Select one of the options from the **Export Log Format** drop-down menu.
3. Click **Apply**.
   The setting goes into effect immediately.

Configure the Default Meta Value Export Format

You can export meta values from the Navigate view and Legacy Events view as Text, CSV, tab-separated values (TSV), and JSON. There is no built-in default value for the meta value export format. If you do not select a format here, NetWitness displays a selection dialog when you invoke export of meta values. To select the format for exported meta values:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view or Legacy Eventsview.
2. Select one of the options from the **Export Meta Format** drop-down menu.
3. Click **Apply.**
   The setting goes into effect immediately.

Note: If you upgrade to version 11.5.2, the **Export Meta Format** preference is not retained and is reset to blank. You must re-configure this value after you upgrade to version 11.5.2.

Calibrate Legacy Events View Retrieval and Default Reconstruction

You can configure several parameters that control the how NetWitness retrieves events and reconstructs events in the Legacy Events view. To adjust these paramaters:

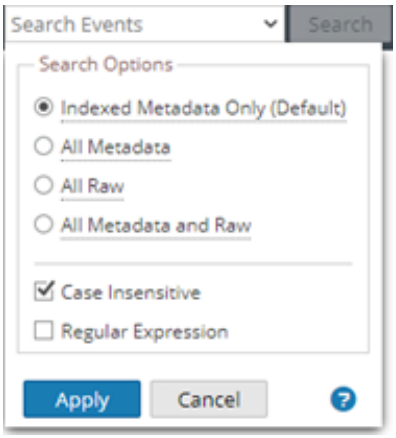
1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Legacy Events view.
2. Configure the following parameters.
   - **Optimize Investigation page loads**: Set a paging option. When optimized, results are returned as quickly as possible,and you cannot go to a specific page in the event list. Unchecking this box changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). The default value is **enabled**.
   - **Default Session View:** Selects the default reconstruction type for the initial reconstruction in the Legacy Events view. The default value is **Best Reconstruction** in which events are reconstructed using the reconstruction method most appropriate to the event.

3. Go to the **Preferences** panel > **Investigation** tab, or to the **Settings** dialog for the Navigate view (11.1) or the Legacy Events view (11.2 and later), and set the **Append Events in Events Panel** option. When this option is selected, the events displayed in the Events Panel are added incrementally. For example, each time you click the next page icon, the next increment of events is added, at first you see 1 to 25, then 1 to 50, then 1 to 75 and so on. This option is available only if the **Optimize Investigation Page Loads** option is enabled.
4. To activate the changes immediately, click **Apply**.

Enable or Disable Cascading Style Sheet Rendering in Web Content Reconstructions

Analysts can enable the use of cascading style sheets (CSS) when reconstructing web content. If enabled, the web reconstruction includes CSS styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for style sheets and images used in the target event. The option is enabled by default. Disable this option if there are problems viewing specific websites.

Note: The appearance of the reconstructed content may not match the original web page perfectly if related images and style sheets could not be found or were loaded from the web browser's cache. Also, any layout or styling that is performed dynamically through the client side javascript is not rendered in the reconstruction because all client side javascript is removed for security purposes.



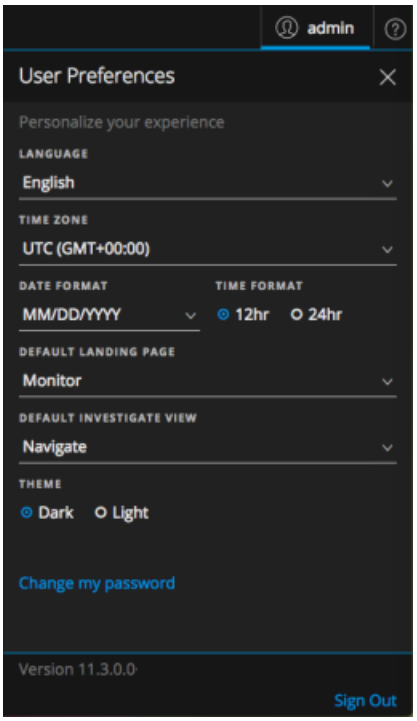
To enable or disable this option

1. Go to the **Preferences** panel > **Investigation** tab.
2. Select the **Enable CSS Reconstruction for Web View** checkbox.
3. Click **Apply**.
   The setting becomes effective immediately and is visible in the next web content reconstruction.

Configure Search Options

You can configure search options to apply when you type a search string in the Search field. Edit the Search Options in the Profile > Preferences panel > Investigation tab or in the Navigate and Legacy Events view Search Options drop-down menu. To configure search options:

1. Go to the Search Options.
   The following figure illustrates the Search Options drop-down menu for Version 11.2 and later.



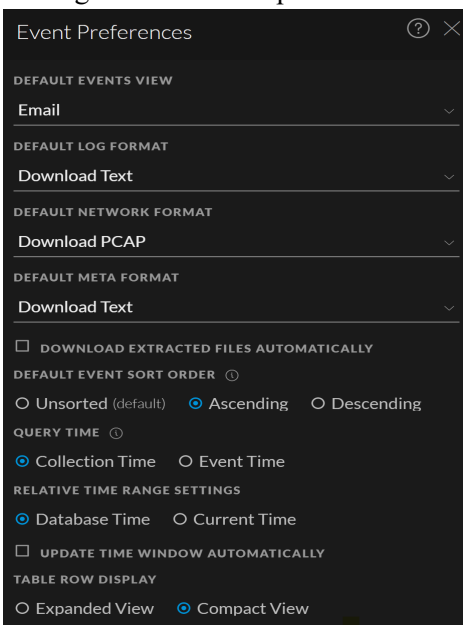
2. Select one or more search options to apply to the search. Search for Text Patterns in the Navigate and Legacy Events Views provides detailed information about each option.
3. To save the search settings, click **Apply**.
   The preferences are saved and effective immediately.

Configure the Events View

Analysts can set preferences that affect the behavior of NetWitness when using the **Investigate** > **Events** view. If the Events view is open; these two buttons give access to preferences dialogs: and . The User menu ( ) is focused on global user preferences such as time zone, while the Events preferences menu ( ) is focused on user preferences for behavior in the Events view. The rest of this section describes both sets of preferences.

Set the Default Investigate View

You can select the default view when you open Investigate: Navigate view, Events view, Hosts view, Files view, Entities view, or Malware Analysis view. The default Investigate view is set in the global User Preferences dialog (in the upper right corner of the NetWitness browser window, select). The global user preferences are described in detail in the *NetWitness Platform Getting Started Guide*.



Set User Preferences for the Events View

You can set your own preferences relevant to the Events view. The preferences selected persist per user and are available whenever the specific user logs in to the application.

To set default values for working in the Events view:

1. In the **Events** view, click .
   The Event Preferences dialog is displayed. Different versions of the dialog have some differences in

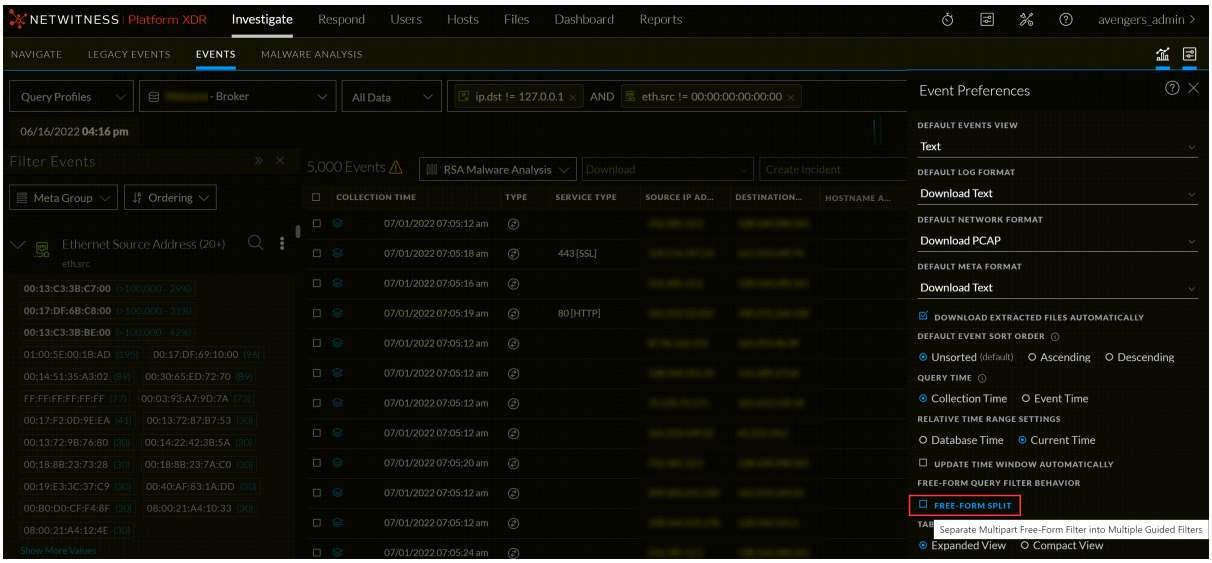
labeling and available options as shown in the following figure.

2. In the **Default Events View** field, select the default reconstruction type when you open an event in the Events panel: **Text**, **Packet**, **File**, (Version 11.5 and Later) **Host** or **Email** .
   If you have not selected a default analysis type, when you open an event, the default reconstruction type is the Packet analysis, except for log and endpoint events, which open to the Text analysis. If you select a default reconstruction type, the reconstruction type is the default reconstruction that you specified. In both cases, the default is the starting point, and if you change the type while you are working, the type you choose is used for the next reconstruction.
3. In the **Default Log Format** field, select the download format for exporting logs: **Download Log** (11.3) or **Download Text** (11.4), **Download XML**, **Download CSV**, or **Download JSON**. If you do not select a format here, the default download format is **Download Text**. These options are also available at the time of download in a drop-down menu.
4. In the **Default Packet Format** (11.3) or **Default Network Format** (11.4) field, select the default format for downloading packets. If you do not select a format here, the default download format is **Download PCAP**. These options are also available at the time of download in a drop-down menu:
   - **Download PCAP** to download the entire event as a packet capture (*.pcap) file
   - **Download All Payloads** (11.3) or **Download Payloads** (11.4) to download the payload as a *.payload file
   - **Download Request Payload** to download the request payload as a *.payload1 file
   - **Download Response Payload** to download the response payload as a *.payload2 file
5. (Version 11.4 and later) In the **Default Meta Format** field, select the download format for exporting metadata: **Download Text**, **Download CSV**, **Download TSV**, or **Download JSON**. If you do not select a format here, the default download format is **Download Text**.
6. (Version 11.5.1 and later) To change the preference for the time that is matched when you submit queries, select an option in the **Query Time** field.

- When **Collection Time** is selected, the time of an event reflects when it was received and stored into the system. This is the default setting.
- When **Event Time** is selected, the time of an event reflects the time at which the event actually occurred. A good case for using the event time is when investigating logs or endpoints and looking for events that occurred around the same time. Using Event Time filters out all network events.

Note: By default, the time range for a query is based on the time that the Decoder consumed the event, which is always not the same time that the event occured. To see the actual event time instead of the collection time in the Events view, select Event Time.

Note: When you query with the event time preference enabled, you must use the collection time column and time zone column. This is to help you differentiate if the events are listed in a sequential order or not. This scenario occurs because there is no global standard to follow while logging the event times, which results in different events from different sources being in different time zones.



7. (Version 11.5.1 and later) Under **Relative Time Range Settings**, choose either **Database Time** or **Current Time**. The Events view can display results based on the relative time range, Last 2 hours or Last 30 Days, for example. The time range can be relative to the time when the event was received and stored into the system or the current time zone's clock time. When you set the time format, your individual user preference is saved until changed again. The default setting for this preference is **Database Time**, which is the same time format used to display query results in the Navigate view and Legacy Events view.
   - When **Database Time** is selected, the time range is relative to the time of the last stored event.
   - When **Current Time** (labeled **Wall Clock Time** in Version 11.3 and earlier) is selected, the time range is relative to the current time in the timezone set in user preferences.

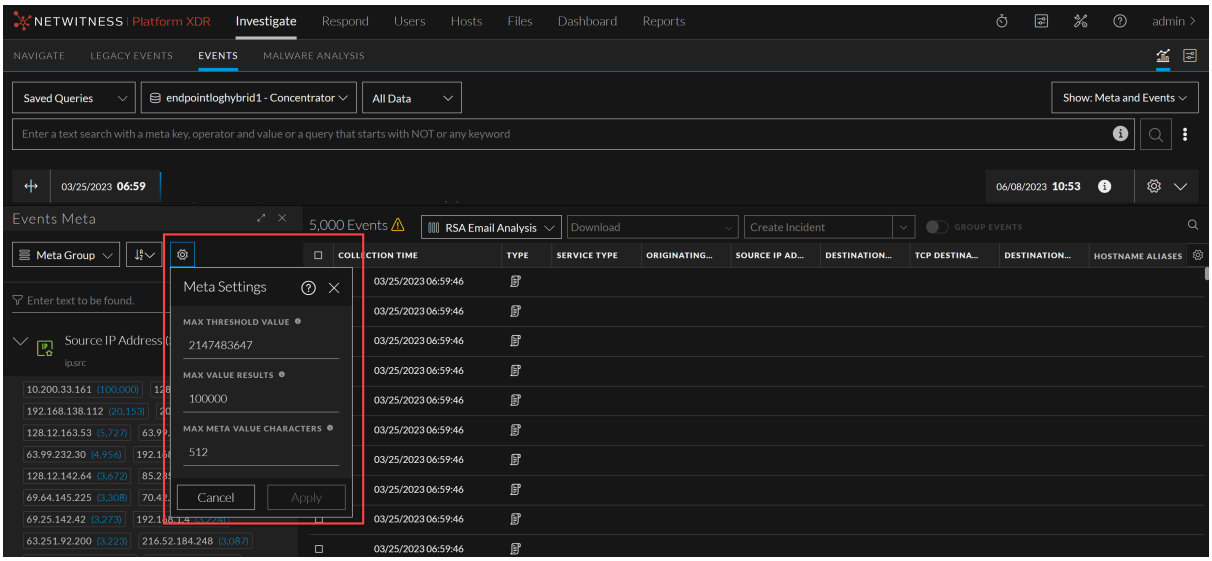
   Note: (Version 11.6) **Current Time** is the default for **Relative Time Range Settings**. In previous versions, **Database Time** was the default value. Make a note that this may cause time range mismatch between **Events View** (using **Current Time** as default) and **Navigate View** (using **Database Time** as default). This change does not affect the existing users and is applicable only to the new users.
8. (Version 11.4 and 11.5) Under **Time Format for Query**, choose either **Database Time** or **Current Time**. The Events view can display results based on the database time or the current clock time. When you set the time format, your individual user preference is saved until changed again. The default setting for this preference is **Database Time**, which is the same time format used to display query results in the Navigate view and Legacy Events view.
   - When **Database Time** is selected, the end time for a query is based on the time that the event was stored.
   - When **Current Time** (labeled **Wall Clock Time** in Version 11.3 and earlier) is selected, the query is executed with the current time in accordance with the timezone set in user preferences.

9. (Version 11.4 and later) To set the sort sequence by collection time for the events listed in the Events panel, select one option under **Default Event Sort Order**. After you have selected a preference, you can also interact with the table column headers to request the results again sorted differently as described in Use Columns and Column Groups in the Events List.

   - **Unsorted** (default for Version 11.4.1): To list events as processed by the Core services. Unsorted is faster because it streams back the events as soon as a match is found versus waiting for all Core services to respond and then displaying them in the chosen order.
   - **Ascending** (default for Version 11.4 and earlier): To put the events with the earliest collection time first in the list. The oldest events are displayed first if in ascending order.
   - **Descending**: To put the events with the latest collection time first in the list. The newest events are displayed first if in descending order. When investigating logs, you may want to change the sort sequence to see the latest collection time first.
     If results exceed the events limit, not all events can be loaded. The portion of returned events loaded in the Events panel matches the sort order preference: the oldest portion of events is loaded when Ascending order is selected, and newest portion of events is loaded when Descending order is selected. When Unsorted is selected, the oldest portion of events is matched and then listed unsorted. if you changed the sort order preference after events were loaded, you must refresh the view to apply the new sort order.

10. If you want all extracted files to be downloaded automatically, select the **Download extracted files automatically** checkbox. You can go to the Jobs queue to view the extracted files.
11. (Version 11.3 and later) To automatically update the time range window in the query bar when the service is polled (at one minute intervals) and sends fresh results, select the **Update Time Window Automatically** checkbox. When the time range is updated, the (Submit Query) button is activated and you can submit a query to get fresh results. To keep the time range window in the query bar synchronized with the current results, clear the checkbox (this is the default value
12. (Version 11.6 and later) If you have multiple rows of data and want to word wrap or unwrap the content of an event , choose either **Compact View** or **Expanded View**. Based on the selection you make the rows will appear compact or expanded.
13. (Version 11.7.1 and later) With the new preference, analysts can choose to split the free-form queries into multiple guided filters or a single free-form query. Analysts can switch the modes using the **Free Form Split** checkbox.

Configure Events View Meta Value Loading Parameters



From the 12.3 or later version, NetWitness introduces the new **Meta Settings** panel under the **Investigate** > **Events** view. This panel allows analysts to configure the number of sessions required for the specific meta key value within the Events view. However, several settings influence NetWitness performance when values are loaded into the Events view. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations.

Adjust Settings on the Events Meta Settings Panel

1. Log in to the NetWitness Platform XDR.

2. Click **Events Meta** >  **(Meta Settings)**.

   The Meta Settings dialog is displayed.

3. Modify the following parameters:
   - **Max Threshold Value**: Set the threshold for the maximum number of sessions loaded for a meta key value in the Events panel. A higher threshold allows accurate counts for a value and also causes longer load times. The Max Threshold Value should be between **1-2147483647**. The default value is **100,000**.
   - **Max Value Results**: Set the maximum number of values to load in the Events view when the Max Results option is selected in the Meta Key Menu for an open Meta Key. The Max Value Results should be between **100-100000**. The default value is **1000**.
   - **Max Meta Value Characters**: Set the maximum number of characters in a meta value name displayed in the Events Meta panel. The Max Meta Value Characters should be between **60-512**. The default value is **60**.
4. Click **Apply**.

   The settings become effective immediately and are visible the next time you load values.

Beginning an Investigation

Based on the question you are attempting to answer, NetWitness Investigate offers different starting points: Navigate view (Version 11.5 and earlier), Events view, Legacy Events view (Version 11.3 and earlier), Hosts view, Files view, Users (Entities) view, and Malware Analysis view.

Specific user roles and permissions are required for a user to conduct investigations in NetWitness. If you cannot perform a task or see a view, the administrator may need to adjust the roles and permissions configured for you.

Note:
- The Files and Hosts views are available in Version 11.1 and later (refer to the *NetWitness Endpoint Quick Start Guide* and *NetWitness Endpoint User Guide* for details). Before Version 11.5, these views were submenu of Investigate.
- The Users view is available in Version 11.2 and later (refer to the *NetWitness UEBA Quick Start Guide* and the *NetWitness UEBA User Guide* for details); in Version 11.4 it is labeled Entities view. Before Version 11.5, it was submenu of Investigate.
- By default, the Legacy Events view is disabled in Version 11.4, but can be enabled by an administrator as described in the *System Configuration Guide*.
- By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.
- Specific user roles and permissions are required for a user to conduct investigations and malware analysis in NetWitness. If you cannot see a view, the administrator may need to adjust the roles and permissions configured for you.
- The 11.4 Events view is the default view for investigating events. The default workflow for analysts interacting with events is optimized to limit the need to transition from one view to another. By combining capabilities that were previously in two distinct workflows, known as Event Analysis and Events, the analyst has a single workflow for analyzing events. With the new functionality added to the Events view, the Legacy Events view is no longer needed. By default the previous workflow is not in the Investigate menu, but an administrator can re-enable it as described in "Configure Investigation Settings" in the *System Configuration Guide*.

Focus on Metadata, Raw Events, and Event Analysis

To hunt for events that drive the incident response workflow and to do strategic analysis after another tool has generated an event, go to **Investigate > Navigate**, **Investigate > Events**, or **Investigate > Legacy Events**. You can investigate the metadata and raw events for a single Broker or Concentrator. In each of these views, you can execute a query and filter the results by narrowing the time range and querying metadata. These topics provide details about beginning an investigation:

- Begin an Investigation in the Events View
- Begin an Investigation in the Navigate or Legacy Events View

Focus on Hosts and Files

To hunt for information on hosts that have the Endpoint agent running, go to **Hosts** (Version 11.5) or **Investigate > Hosts** (Version 11.4). For every host, you can see processes, drivers, DLLs, files (executables), services, and autoruns that are running, and information related to logged-in users. To begin an investigation by looking at files in your deployment, go to **Investigate > Files**. (See the *NetWitness Endpoint User Guide* for detailed information.)

Focus on Risky User and Entity Behavior

To discover, investigate, and monitor risky behaviors across all users and entities in your network environment, go to **Users** (Version 11.5), **Investigate > Entities** (Version 11.4), or NetWitness UEBA (User and Entity Behavior Analytics) . In versions 11.3 and earlier, the menu option is **Investigate > Users**. You can detect malicious and rogue users, pinpoint, high-risk behaviors, discover attacks, and investigate emerging security threats. (See the *UEBA User Guide for NetWitness Platform XDR 12.1.0.0* for detailed information.)

Focus on Scanning Files for Malware

To scan files for potential malware, or set up a continuous scan of a service, go to **Investigate > Malware Analysis**. Scan results are expressed as four types of analysis: network, static, community, and sandbox with an indicator of compromise (IOC) rating. There are several other ways to begin working in Malware Analysis:

- You can begin Malware Analysis from the Malware Analysis dashlets in the Monitor view to quickly see the riskiest potential threats.
- You can right-click a meta key in the Navigate view, and select **Scan for Malware**.

See the *Malware Analysis User Guide* for detailed information.

Begin an Investigation in the Navigate or Legacy Events View

The Navigate view is the default view for Investigate unless you have selected a different view as your opening view. This user preference is set on the application level as described in Configuring NetWitness Investigate Views and Preferences. In the Navigate view and Legacy Events, you are hunting for events of interest based on a query. In the Navigate view you can also refine results by clicking on meta keys and meta values. When you find interesting events, you can take a closer look at the event in the other Investigate views.

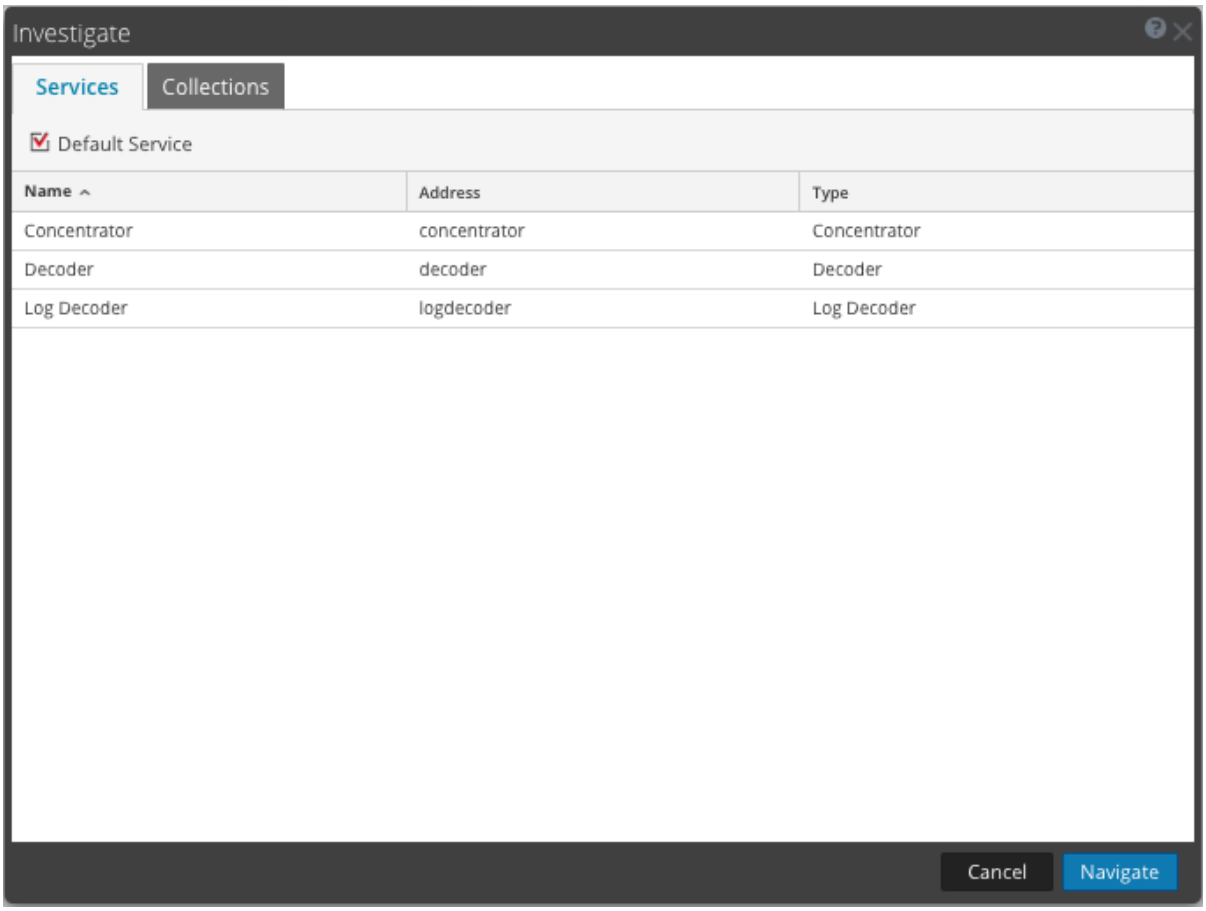
To begin an investigation in the Navigate view or Legacy Events view, a service must be specified.

- Investigate opens the Navigate view or the Legacy Events view with the user-specified default service selected.
- If no default service is currently specified and the service id is not in the URL, Investigate presents a dialog for selecting the service or collection to investigate.
- When a service is selected manually or by default in the Navigate view or Legacy Events view, you can change the service or collection to investigate by selecting the service name in the toolbar. Investigate presents the dialog for selecting the service to investigate.

Note: The Archiver service does not appear in the Navigate view to minimize user experience of slow performance when performing investigations. The Archiver is available in the Legacy Events view for log exports and enhanced search capabilities.

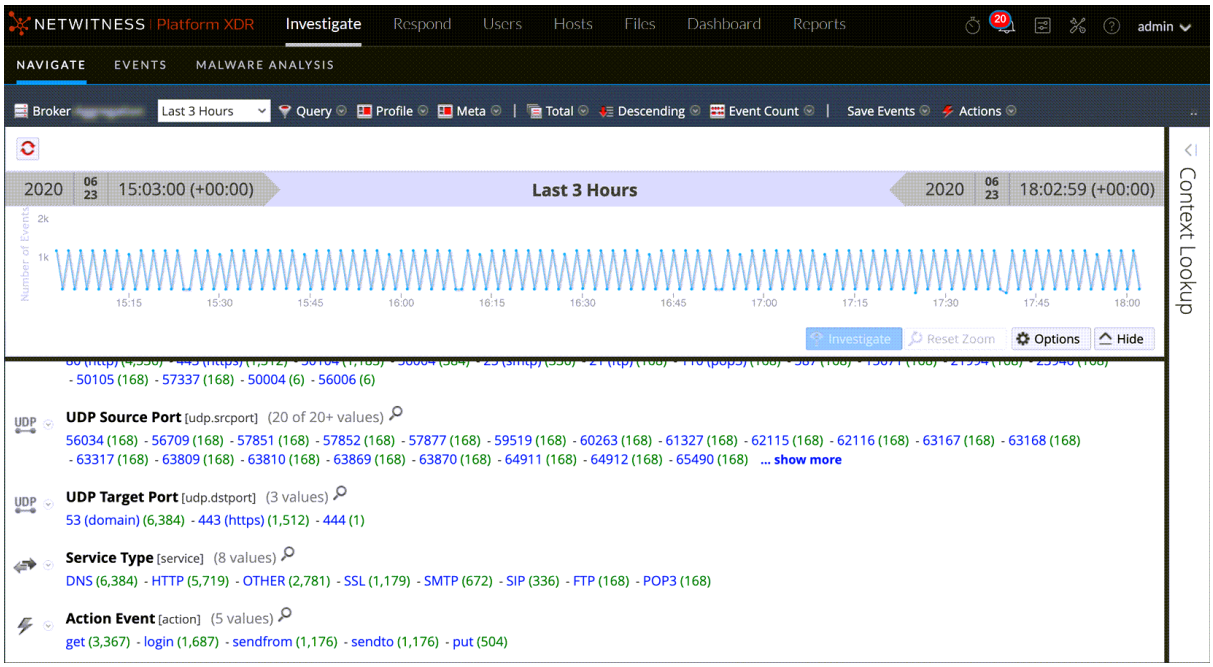
With a service or collection selected, Investigate is ready to load data for the service or collection. It is recommended that you also select a time range so that results load faster. Several settings in the Navigate view and Legacy Events view Settings dialog or the Profiles > Preferences panel > Investigations tab affect the loading process: Threshold, Max Values Results, Show Debug Information, Autoload Values, and Optimize Investigation page loads (see Configuring NetWitness Investigate Views and Preferences).

Note: In the Legacy Events view data loads automatically. If you specified Autoload Values in the Navigate view preferences, Investigate populates the data automatically. Otherwise, you must select Load Values. Investigate populates the metadata in the Navigate view Values panel and results become visible almost immediately.



The rest of this topic provides instructions for beginning the investigation of data on a service.

Note: Only users with the administrator role can create a collection, and only the creator of the collection is able to investigate a collection.

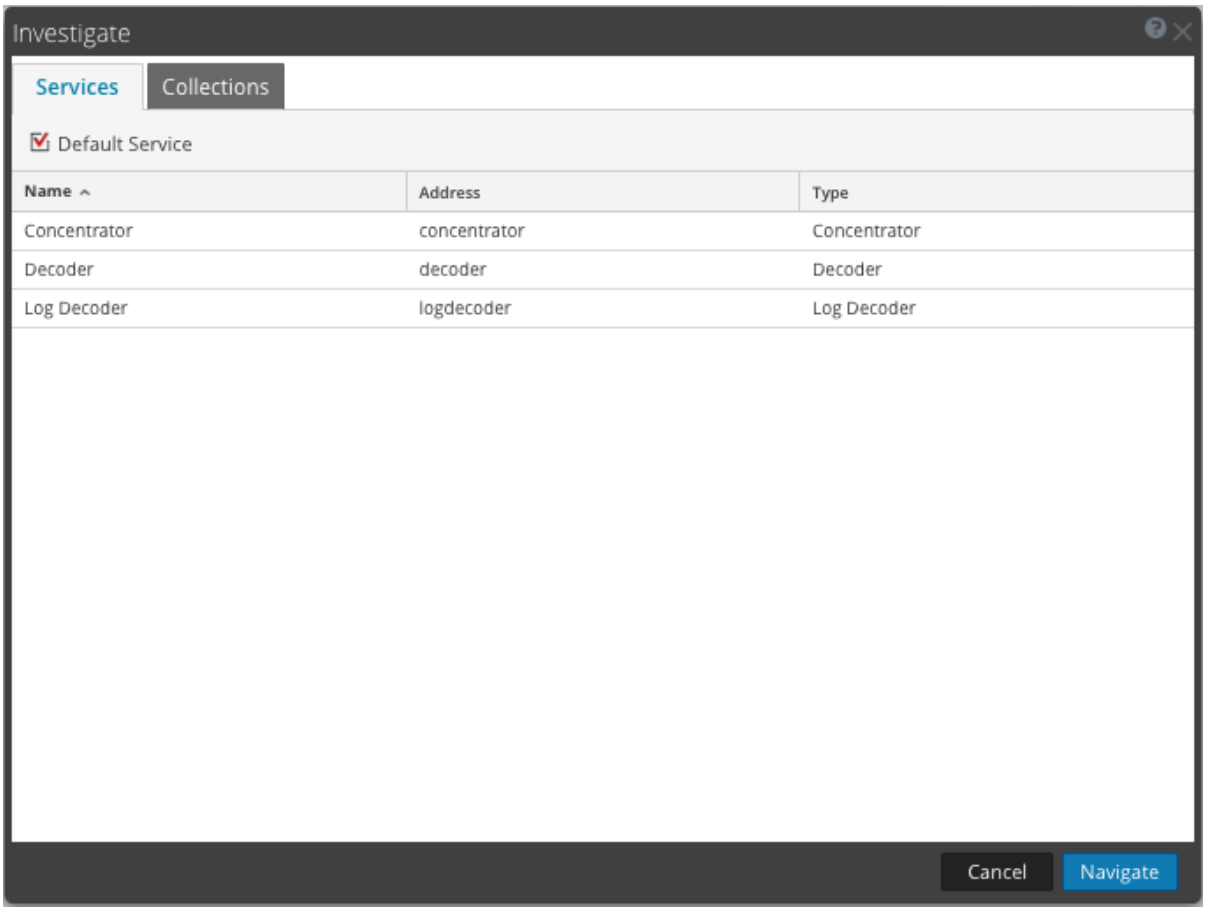


After loading data in the Navigate or the Legacy Events view, refine results, reconstruct and analyze events, then download and act upon results (see Refining the Results Set and Reconstructing and Analyzing Events and Downloading and Acting Upon Results).

Begin an Investigation (No Default Service)

1. Go to **Investigate > Navigate** or **Legacy Events**.
   The Investigate dialog is displayed.

2. Double-click a service or select a service, usually a Concentrator, and click **Navigate**.
   The data loads automatically in the Legacy Events view. If you are working in the Navigate view, the resulting panel displays the activity for the selected service, but the data is not loaded automatically.
3. (Recommended) Select a specific time range so that results load faster.
4. If you want to modify investigation options before loading, you can create or modify a custom profile, apply a different time range, create or apply a meta group, and perform a custom query as described Refining the Results Set. You can also modify options at any time during the investigation.
5. To load data in the Navigate view, click Load Values.
   The data for the selected service begins loading.



With the service selected and data loaded, you are ready to begin analyzing the data.

Set or Clear the Default Service

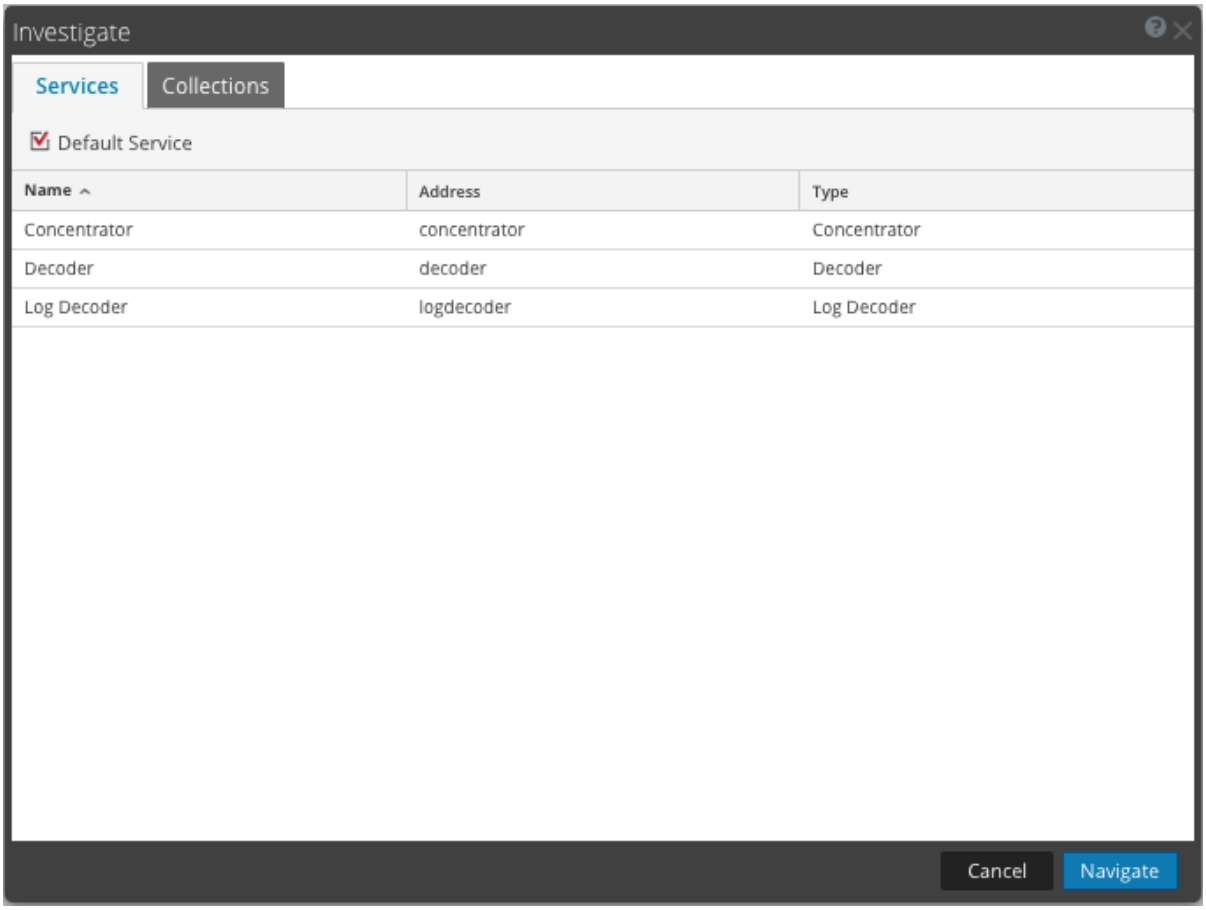
You can set the default service and clear the default service in the Investigate a Service dialog.

1. Click the service name in the toolbar.
   The Investigate dialog is displayed.

2. Select a service on the **Services** grid, and click Default Service.
   The service becomes the default, (indicated by **Default** in parentheses after the service name).

3. To clear the default service, select the default service in the grid, click Default Service, and click **Cancel** to close the dialog.
   No default service is set.

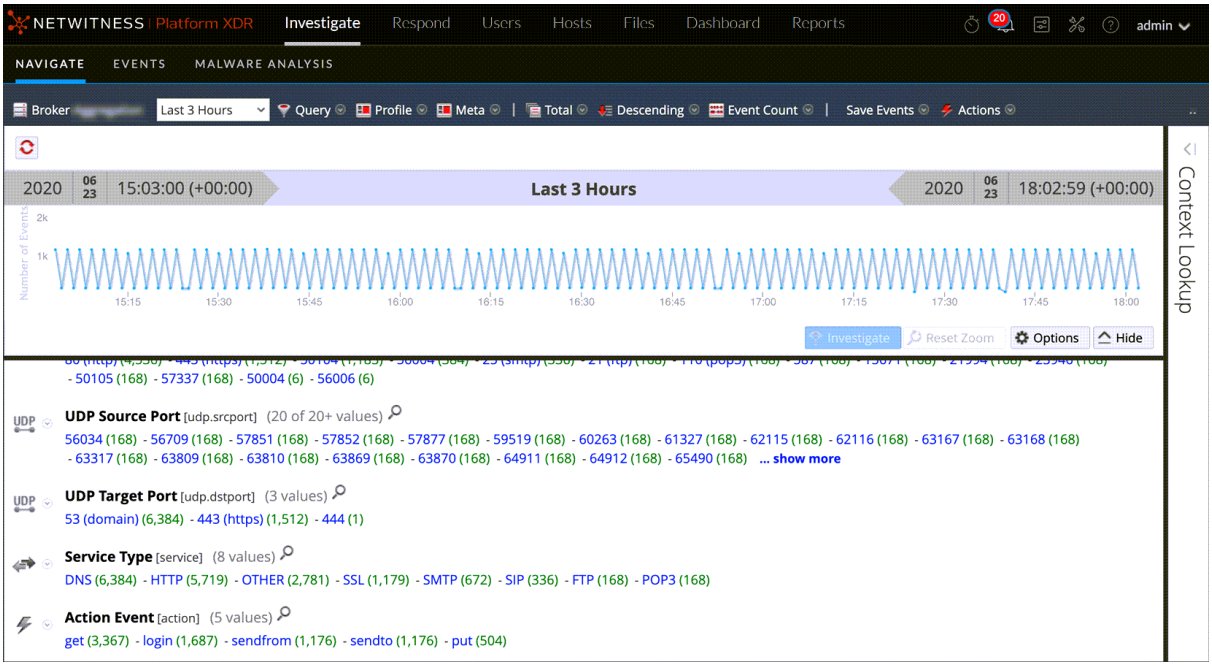
> **Note:** Clicking cancel does not cancel your selection of the default service. It closes the dialog without navigating to the currently selected service in the grid. Setting a default service that is different from the service currently being investigated, does not refresh the Navigate view. You must explicitly select and navigate to a different service.



Begin an Investigation (Default Service Specified)

1. Go to **Investigate > Navigate** or **Legacy Events**.
   If the Autoload Values setting is set to off, the Navigate view is displayed with the default service selected, and ready to load data. If the Autoload Values setting is on, the values are loaded as shown in Step 3. In the Legacy Events view, the data is loaded automatically.

2. If you want to modify investigation options in the Navigate view before loading, you can create or modify a custom profile, apply a different time range, create or apply a meta group, and perform a custom query.
3. When ready, click Load Values.
   The values for the service are loaded in accordance with the selected options. With the service selected and data loaded you are ready to begin analyzing the data.



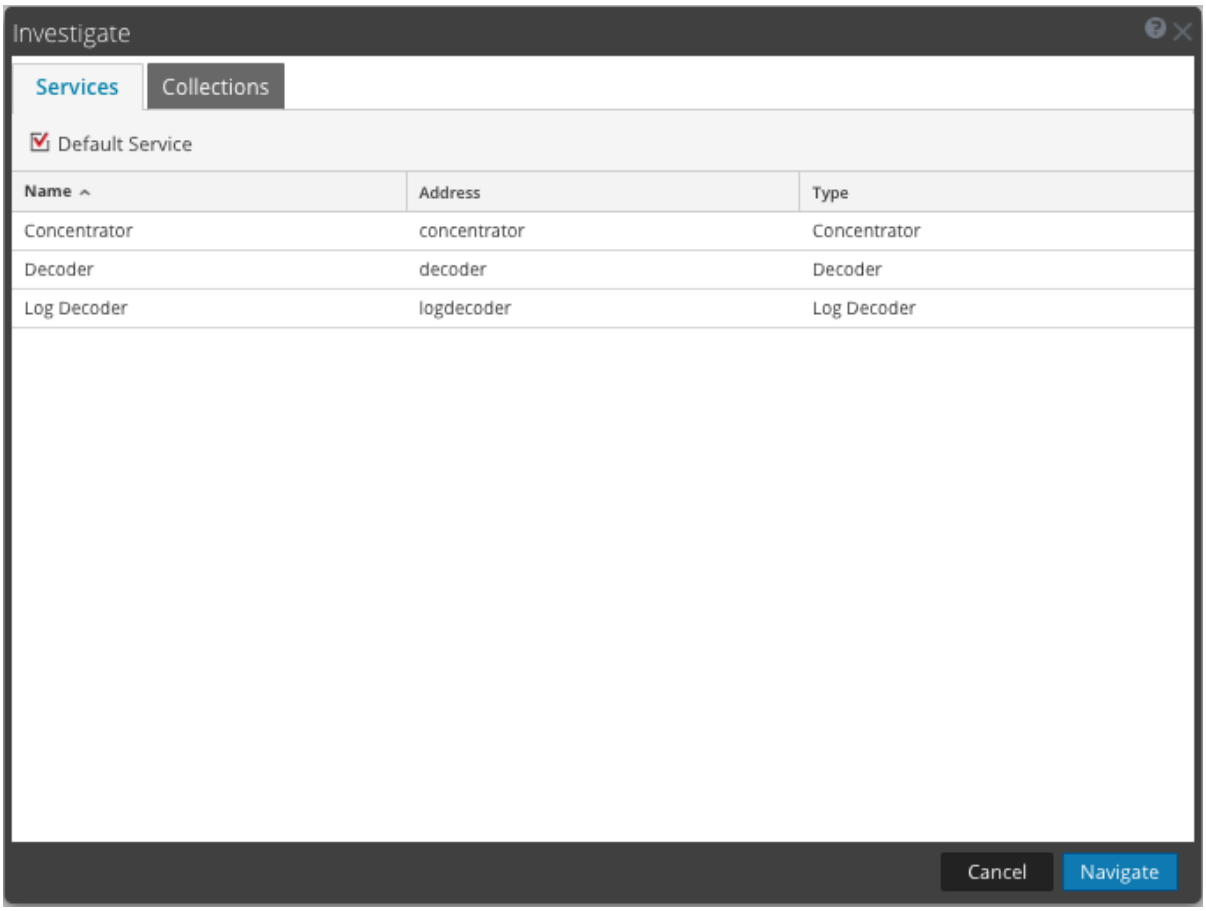
Change the Service or Collection to Investigate

1. In the Navigate view or the Legacy Events view, click the service name at the top of the options panel.
   The Investigate dialog is displayed.

2. Double-click a service or select a service and click **Navigate**. The resulting panel displays the activity for the selected service.
   If the Autoload Values setting is on, the values are loaded as shown in Step 3. Otherwise, the Navigate view is displayed with the default service selected, and data ready to load. In the Events view the data is loaded automatically.

3. When ready, click Load Values.
   The values for the service begin loading in accordance with the selected options.

   With the service selected and data loaded you are ready to begin analyzing the data.



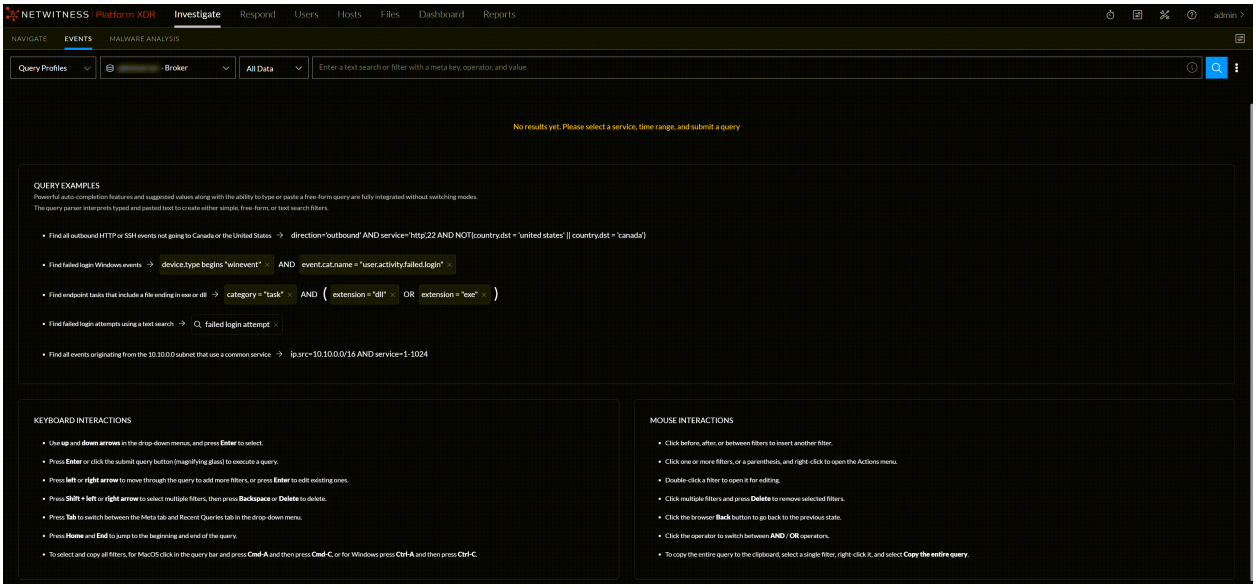
Investigate Workbench Restoration Collections

This procedure enables administrators to select content from an existing collection to reprocess for further investigation. This applies to Decoders that use Workbench services.

Note: Only a user with administrative privileges can create a collection, and you can view only those collections that you created.

To reprocess data for further investigation:

1. Go to **Investigate > Navigate** or **Legacy Events**.
   The Investigate dialog is displayed.

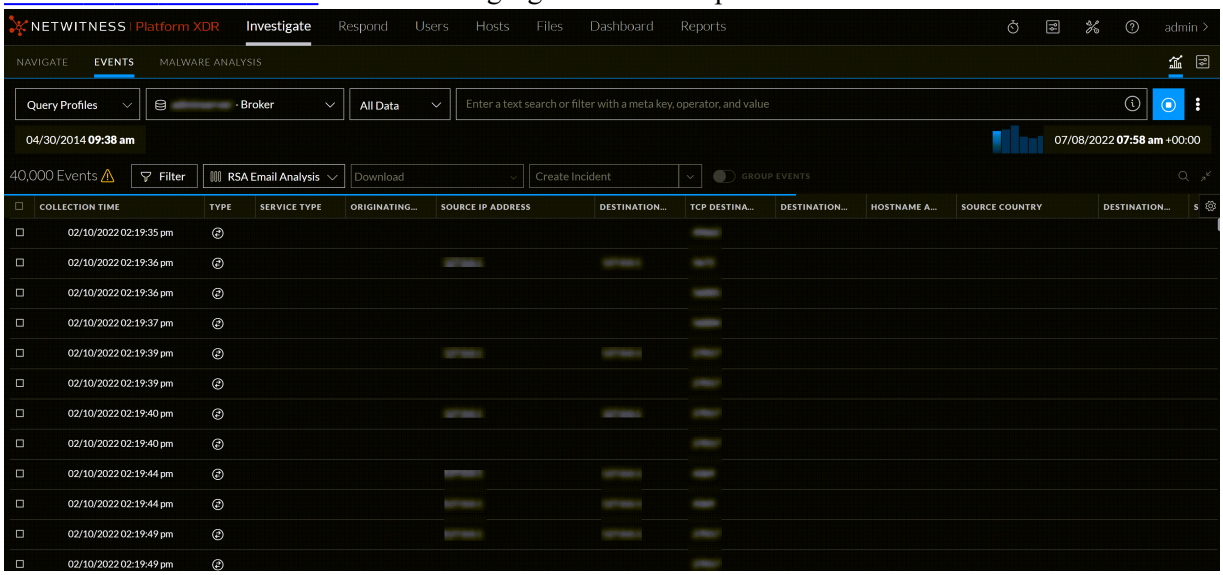


2. Select a workbench service and workbench name that you want to investigate.
3. Click **Navigate** to perform an investigation on the selected workbench service.
   Click **Cancel** to select a different workbench service to investigate.
   The Investigation view is displayed. With the collection selected and data loaded, you are ready to begin analyzing the data.

Begin an Investigation in the Events View

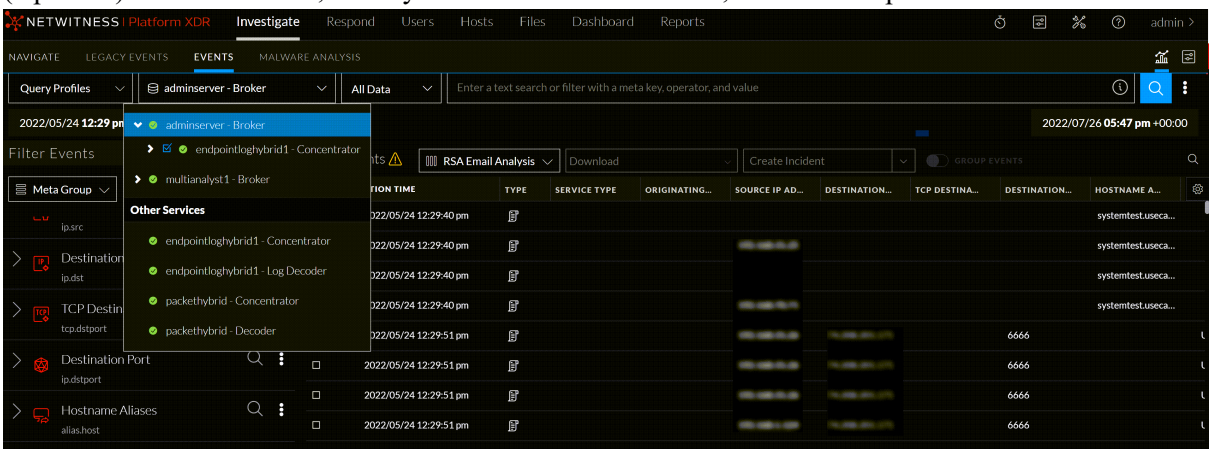
The Events view offers most of the features that are available in both the Navigate view and the Legacy Events view. Similar to the Navigate view, there is a view into meta keys and meta values for logs, endpoints, and packets. Like the Legacy Events view, an events list shows events listed in the order by time, and you can view the raw event, related metadata, and a reconstruction of an event. The Event reconstruction has some helpful cues to identify points of interest. See Reconstructing and Analyzing Events.

The following figure shows the initial Events view with some examples of queries and information about keyboard and mouse interaction. This figure depicts the initial view.



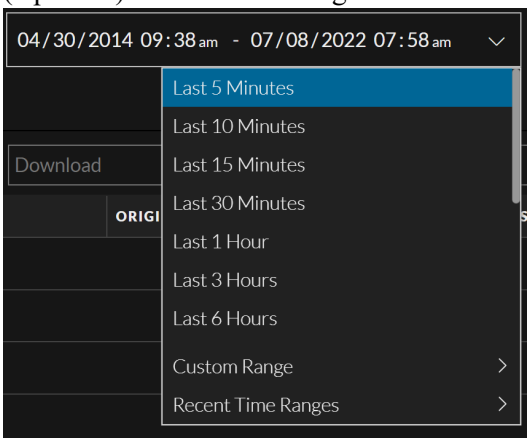
Access the Events View

Several ways to access the Events view are available in Version 11.1 and later.



- Go to **Investigate > Events** or select the **Investigate** option in the main menu if you have made the Events view your default Investigate view. The following procedure provides detailed steps.
- Hover over and click a count (the green number after a meta value) in the Navigate view. The Events view opens with the list of events for the selected drill point, and you can begin working as described in Analyze Events in the Events View.
- Hover over a count and control-click **Open Events in new tab**. The Events view opens in a new tab with the list of events for the selected drill point, and you can begin working as described in Analyze

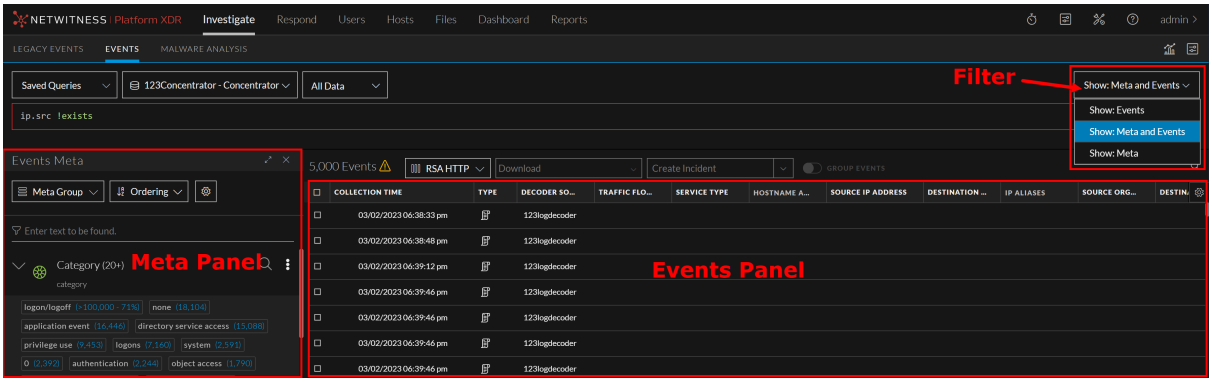
Events in the Events View. The following figure is an example of the list of events.



To begin an investigation in the Events view using direct access:

1. Go to **Investigate** > **Events**.
   The Events view opens with a service selected and no data displayed. A drop-down list offers a list of available services in alphabetical order. The **Select a service** field is populated with the first service in the list or the most recently selected service. By default the list of available services is retrieved every twelve hours and cached on the NetWitness server. If a service is added or removed from the NetWitness server before the next time to retrieve, the cache is updated with the latest list of services. An icon provides the status of the service.
   - and selected service name = The service is selected.
   - = Investigate is attempting to connect to the selected service.
   - = There was an error connecting to the selected service or there is no data in the selected service. In this state, the service selector control also turns red, and a tooltip explains why the connection attempt failed and advises you to choose another service.
2. (Optional) Select a service, usually a Broker or Concentrator, from the drop-down list.

The time range selector shows either the default time range of 24 hours, or the time range that you last selected for this service. The or Query Events button becomes active and you can create filters. If you launch a query without creating filters, the selected time is used.

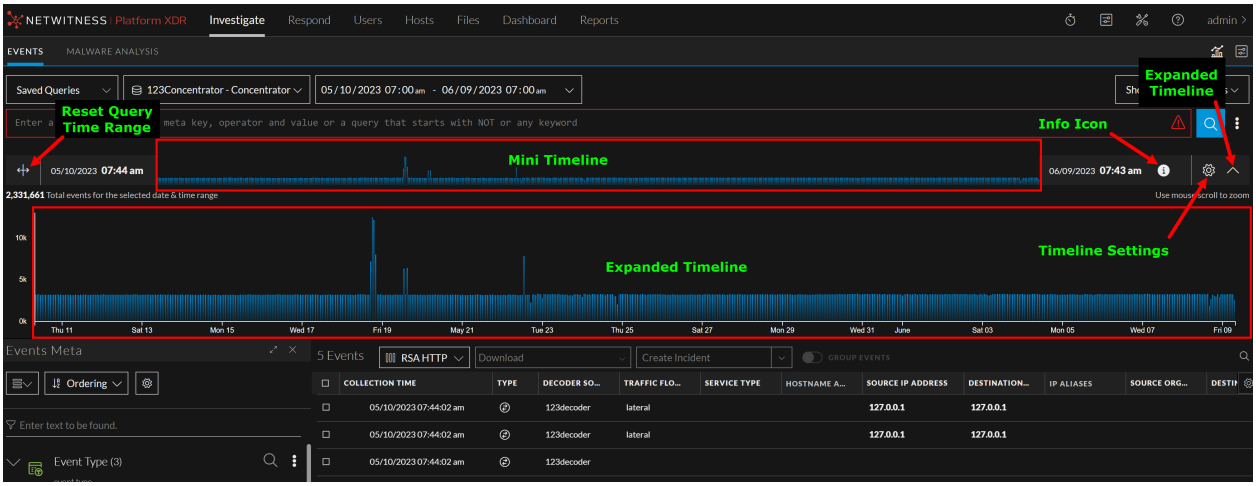


3. (Optional) Edit the time range as described in Filter Results in the Events View.

The selected time range is stored in your browser for this service; you can set different time ranges for different services.

4. Create a query that consists of one or more filters that contain a meta key, operator, and optional value. See Filter Results in the Events View for details on creating queries.
5. Select a **Query Results Panel** layout from the dropdown menu.

   For example, if you select, **Show: Meta and Events** option from the dropdown menu, the query results will be displayed in two separate panels, i.e., **Meta** and **Events**.



6. When ready to submit the query, click or **Query Events**.
   The Events view displays the data for the selected service, time range, and query, in accordance with permissions assigned to your role by the administrator. You are ready to begin analyzing the data. Refer to Examine Event Details in the Events View and Analyze Events in the Events View to learn how to work in the Events view.

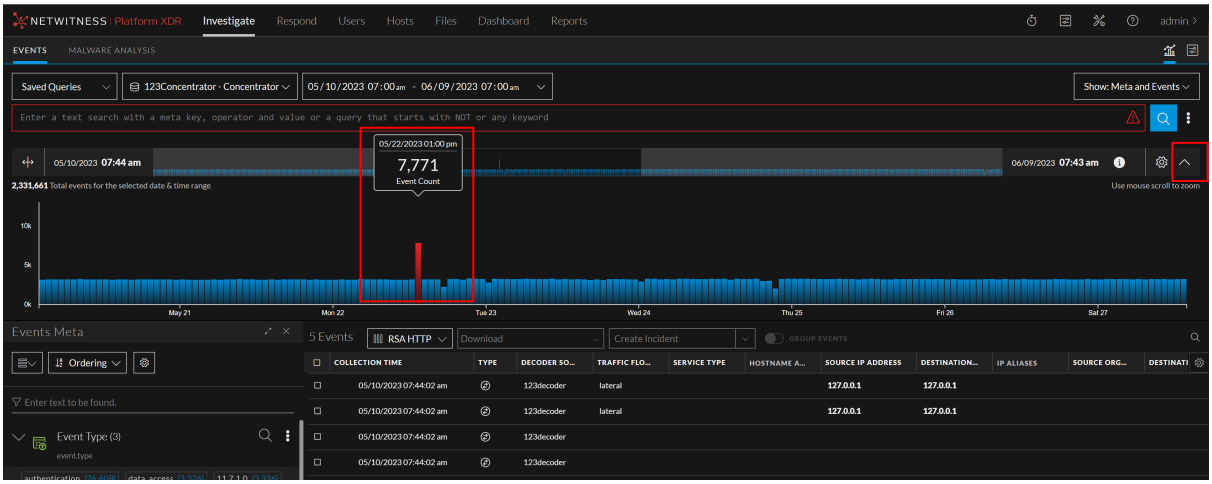
Investigate on Timeline

The timeline visualizes the events count that occurs at a specific instance. The timeline provides event counts so that you can see if the number of events increases drastically at a given point in time. The timeline displays activity for the specified service and time range as a bar chart. This allows analysts to detect significant spikes that could indicate anomalies. Using the visual representation, analysts can conduct a more detailed investigation of the events that occurred during that specific period.

The timeline on Events View has been improved so that users can interact with it and gain more insights. With the enhanced timeline, you can now expand the timeline, zoom into the interested zone in the timeline, change the axis settings, or reset the query to the original requested form.

Note: The Mini Timeline is still not interactive. You should expand the timeline to interact and perform certain actions on the timeline.

Users can perform the following actions on the Expanded Timeline:



Expand the Timeline

The Expand Timeline feature helps you interact with the event's result based on your search query. The expanded timeline view shows the total number of events for the selected date and time range. On the expanded timeline, X-axis shows the Time and the Y-axis shows either the Total number of events that occurred or the File Size recorded by the services at a specific time on the timeline.

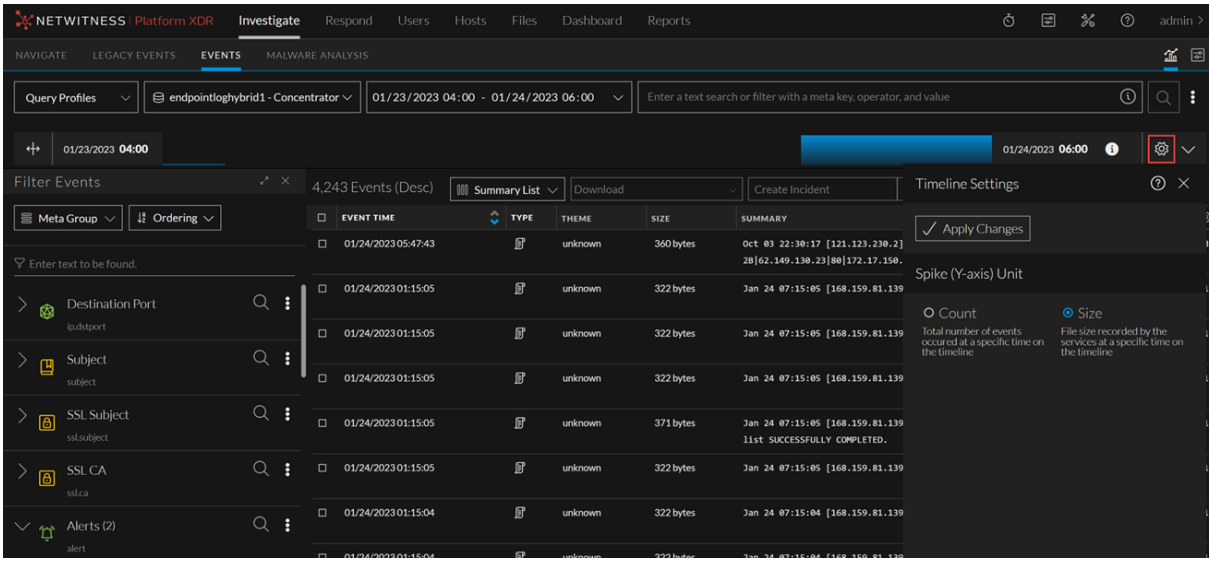
To Expand the Timeline:

1. Log in to the NetWitness Platform XDR.
2. Go to Investigate > Events.
3. Click  (Expand Timeline) to expand the timeline and see the specific or interested zone on the timeline.
4. Hover over any bar to know the event count and the time of the events created.

The bar is highlighted in red to indicate that the tooltip information associated with it.

Use Timeline Settings

Analysts can use the Timeline Settings option to change the Y-axis data dimension (Count or Size) and view the data presented on the timeline.



Click the  (**info**) button to the right of the Mini Timeline to know the representation of the timeline's event data (like what information is shown on the Y-axis).

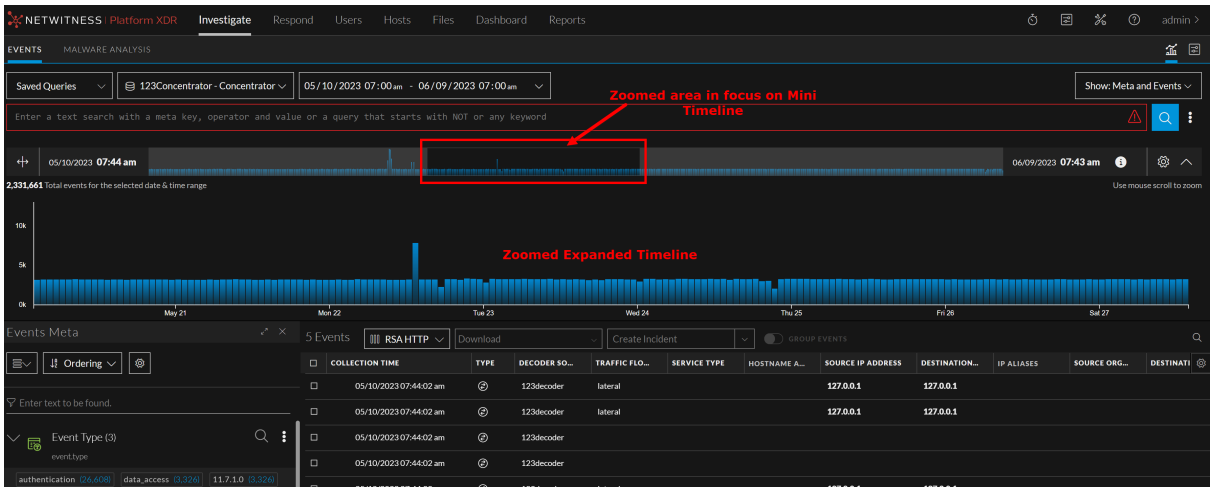
Note: To change the X-axis settings, you must change the Query Time options set within the Events Preferences panel. For more information on Query time, see Configure the Events View.

To change the Timeline Settings:

1. Click **Timeline Settings** ().

   The Timeline Settings dialog is displayed.

2. Select the Y-axis data dimension based on your preference:
   a. **Count**: Displays the total number of events that have occurred at a specific time on the timeline.
   b. **Size**: Displays the total size of the events recorded by services at a certain time on the timeline.
3. Click **Apply Changes**. The changes are reflected on the Timeline bar.
4. Click **X** to close the Timeline Settings.



Zoom the Timeline

The Zoom-in or Zoom-out feature within the timeline helps you focus on the events that occurred at a specific time from the query results.

To Zoom in or Zoom out the Timeline:

1. Place the cursor on the expanded timeline and use the scroll wheel on the mouse to zoom in or zoom out the timeline.

   The extent of the zoom-in area will be in focused mode on the Mini Timeline while the rest of the area is masked with transparent white color.

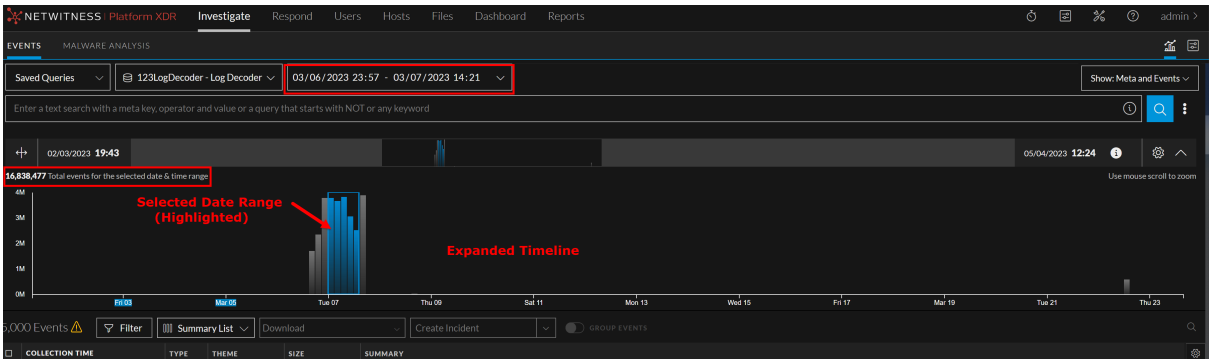
Pan the Timeline

The Pan feature within the timeline helps you move through the timeline while you are in zoomed mode, or a specific time range selection mode on the expanded timeline.

To Pan the Timeline:

1. Hover over any bar in the zoom-in area and **Right Click** + **drag right** or **left** to move through the timeline.

IMPORTANT: When you pan through the timeline, you will notice that the focus area will also change on the Mini Timeline and Expanded Timeline.



Time Range Selection

The Time Range Selection feature assists you in creating a new query depending on your selection of an interested area or focus area on the expanded timeline.

To Select Time Range on the Expanded Timeline:

1. While you are on the Expanded Timeline (with zoom-in or zoom-out mode), **Right Click** + **drag right** or **left** to select the date range of events that you want to focus on and analyze.

   The non-selected area on both Mini Timeline and Expanded Timeline are dimmed in Gray color. The events count of the selected date range will be displayed on the left side of the Expanded Timeline.

2. To modify the selection, you can click and drag the selection to the left or right. In addition, you can also click and drag the left or right ends of the selection box to increase or decrease the selected area.

   The Date Range of the query bar will be changed to reflect the selected date range of the events and the Search button will be highlighted to initiate the new query search.

3. If you further want to analyze the events in the selected time range, click the Search button to initiate a new query based on your selection of an interested area or focus area.

Reset the Query Time Range

The Reset Query Time Range feature helps in resetting the query to the originally requested state.

After an initial query, if you've zoomed or made a selection and want to get back to the original query state quickly, click the  (**Reset the Query Time Range**) button. This action will zoom out the timeline, remove any selections, and resets the Time Range on the query bar.

Refining the Results Set

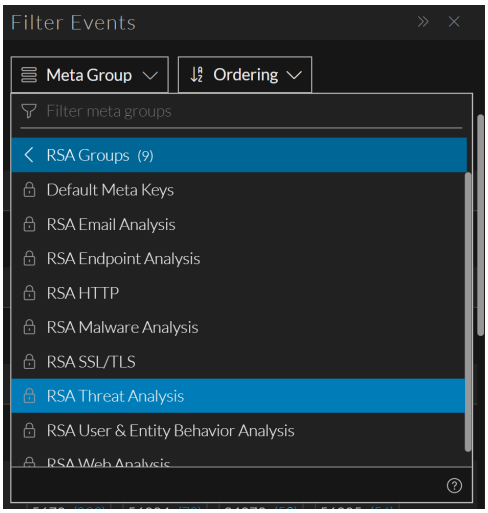
When conducting an investigation, results load faster and it is easier to find what you are looking for if you refine the results to get a smaller number of results. In addition, limiting the time range and submitting a good query gives you more relevant results to answer the question at hand. Use a combination of the methods described in the rest of this section to get the information you need quickly.

- Use Meta Groups to Focus on Relevant Meta Keys
- Use Columns and Column Groups in the Events List
- Use Query Profiles to Encapsulate Common Areas for Investigation
- Filter Results in the Events View
- Filter Results in the Navigate View
- Filter Results in the Legacy Events View
- Create a Query in the Navigate and Legacy Events Views
- Search for Text Patterns in the Navigate and Legacy Events Views
- View and Modify Queries Using URL Integration
- Create a Future Alert from Events View
- Generate Reports from Events View

Use Meta Groups to Focus on Relevant Meta Keys

A meta group combines selected meta keys and meta entities into a group to show only data in which the meta keys and meta entities were found. In the Navigate view and the Version 11.5 and later Events view, you can use meta groups to filter data displayed in the Navigate view (Values panel) and the Events view (Filter Events panel). The same shared meta groups are available for use in both views. Private meta groups created in the Events view are not available for use in the Navigate view or in query profiles in the Legacy Events view.

Note: In the Navigate view and Legacy Events view, you can manually add non-indexed meta keys (or keys that are not in the index at all) to a meta group or column group. The non-indexed meta keys are fully available (manageable and displayable) in the Navigate view and Legacy Events view, but only partially (displayable in the Filter Events panel) in the Events view. The Events view (Filter Events panel) can display data for non-indexed meta keys that are already included in a meta group, but you cannot add non-indexed meta keys while you are editing a meta group. The non-indexed meta keys in a column group do not display data in a column and new non-indexed meta keys cannot be added to a column group in Events view.



With a meta group in effect during an investigation, the information in the Values panel or the Filter Events panel shows only the meta keys in the selected group. When you open a Parallel Coordinates visualization in the Navigate view, the meta keys and meta entities in a group appear as axes from left to right. It may be useful to create two versions of each custom meta group; one for analysis of meta values and one for creating a parallel coordinates chart focusing on a smaller subset of the same use case.

A fresh installation of NetWitness includes built-in meta groups to help you find interesting data sets in Investigate. The built-in meta groups can be duplicated but cannot be edited or deleted. You can also create your own groups and edit a copy of a built-in group to create a custom group.

All groups in the Navigate view are shared and visible to all users of a service; you can export a group for import to any service, limited by the available meta keys for that service. In the Version 11.5 Events view Filter Events panel, you can create both shared and private custom meta groups; only the shared groups are visible and usable in the Navigate view.

Live Meta Groups

In 11.6 and later, NetWitness supports deploying the investigate content from live. The meta groups are categorized as RSA Groups (RSA Live content and RSA OOTB Groups), and Shared Groups. The content deployed from Live are marked by the live symbol (). The content is displayed in a folder structure. The groups are displayed as non-editable folders and sub-folders. The number inside **()** depicts the number of contents inside a folder and **>** symbol helps you to drill down inside the folder.

Built-In Meta Groups

NetWitness has built-in meta groups, prefixed with RSA, that are available immediately after installation. The built-in meta groups are useful to focus an investigation on common use cases and to support threat detection using the RSA Hunting Pack. You can copy these groups, give the copy a new name, then edit the copy. These are the built-in meta groups:

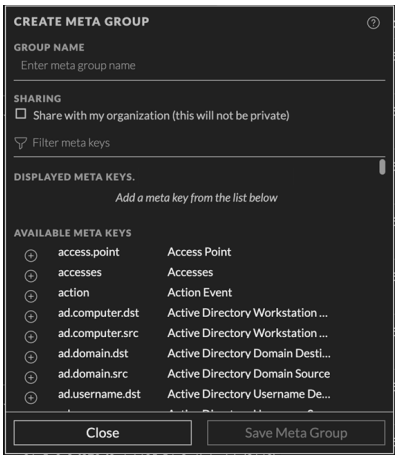
- RSA Email Analysis includes meta keys that outline email interactions.
- RSA Endpoint Analysis contains meta keys that provide insight on processes, files, users, and connections from NetWitness Endpoint (NWE) hosts.
- RSA Malware Analysis includes meta keys that mark indicators of compromise in files contained in events.
- RSA HTTP includes meta keys that provide insight into outbound web traffic.
- RSA SSL/TLS includes meta keys that focus on encrypted web traffic.
- RSA Threat Analysis includes meta keys that mark potential threats in the data set.
- RSA User & Entity Behavior Analysis includes meta keys that encompass all the meta keys to analyze user and entity behavior.
- RSA Web Analysis includes meta keys that mark anomalies in web traffic.

Default Meta Keys Group (Version 11.5 Events View)

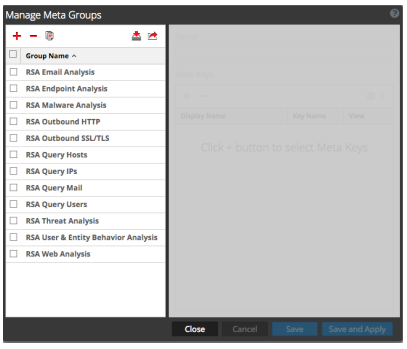
The Default Meta Keys meta group is a special type of built-in meta group that consists of all the meta keys for the currently selected service, returned in the order of appearance in the index file for the service. Unlike the other built-in meta groups, you cannot copy this group and you cannot see which keys are included when you view information in the Meta Group Details dialog; instead, a message in the Details dialog explains that the group includes all meta keys for the selected service The Default Meta Keys group is always at the top of the list in the Meta Groups menu.

The Default Meta Keys group is used to select meta keys shown in the Filter Events panel when no meta group has been selected and none exists in local storage. You can also select this group as you would any other group. When using the Default Meta Keys group in the Filter Events panel, only the first 30 meta keys with values are open and the remaining are closed.

Custom Meta Groups



You can create custom meta groups to support scenarios that you use frequently while working in Investigate. When an administrator adds custom meta groups manually by editing the custom index file for a service, the new meta groups become available to use in meta groups after the service is restarted. Custom meta groups can be shared or private . Shared meta groups are available globally within your organization in the Navigate view and in the Filter Events panel. If you edit a shared custom meta group, your changes are applied globally. If you delete a shared custom meta group, the group is deleted and no longer available for all analysts. The Navigate view supports only shared groups. When you create custom meta group in the Events view, you can choose to share it or you can keep it private (default); you cannot change a shared group to private or a private group to shared.



Note: Private custom meta groups created in the Events view are not visible or usable in the Navigate view.

Icons identify the group type in the Meta Groups menu. These are examples of each type of custom meta group with the edit icon displayed at the end of the row.

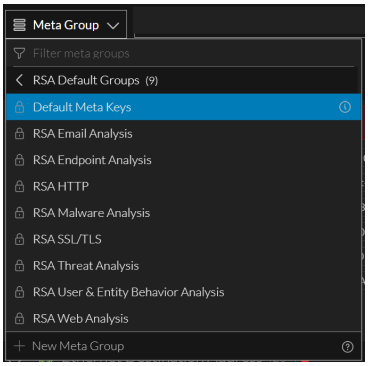
While the functionality of meta groups is similar in the Navigate view and the Events view, the user interface and some of the procedures are different. The following figures illustrate the (Events view) Create Meta Group dialog and the (Navigate view) Manage Meta Groups dialog.

Using options in the Events view Meta Groups menu (Version 11.5 and later) , you can:

- Select a meta group to apply.
- See the details of a meta group.
- Create, edit, and delete custom meta groups.
- Copy and edit the copy of a built-in or custom meta group.

Using options In the Navigate view Manage Meta Groups dialog, you can do all of the above as well as import and export a meta group.

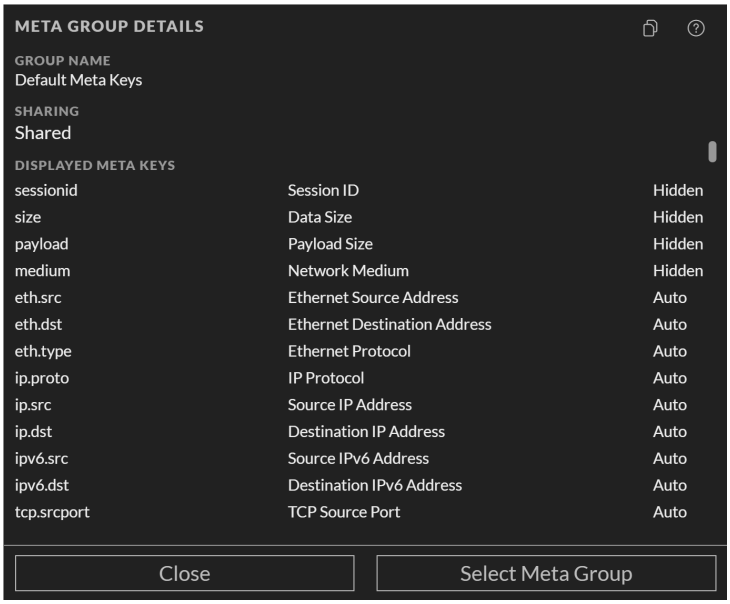
The rest of this topic provides instructions for working with meta groups in the 11.5 Events view and the Navigate view.



Work with Meta Groups in the Events View (Version 11.5 and Later)

After the upgrade to Version 11.5 or later, all of the existing meta groups -- both built-in and custom -- are available for filtering events in the Filter Events panel. The meta group selection persists between logins unless browser cache is cleared.

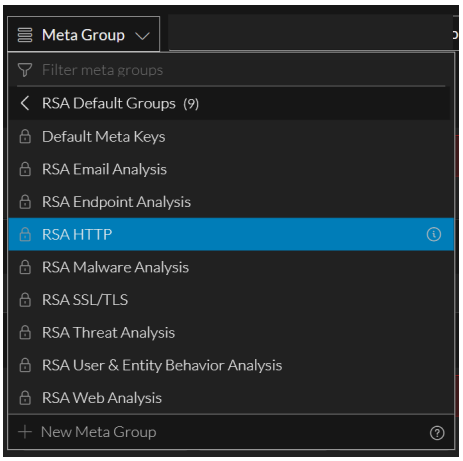
View the Meta Keys in a Meta Group



To view details of a meta group:

1. Go to **Investigate > Events** and click  to load events.
   The events for the default service and the default time range are loaded in the Events panel.
2. To display the Filter Events panel, click  above the Events panel.
   The Filter Events panel opens to the left of the Events panel.
3. To display the Meta Groups menu, click the Meta Groups menu title. The menu title is either Meta Group: Default Meta Keys or Meta Group: <currently selected meta group>. If this is your first visit after logging in, the Default Meta Key group is selected; any subsequent visits use the meta group selected in the previous session. If the selected meta group from the previous session is deleted, the Default Meta Keys group is selected when you log in. When opened, the menu displays a list of built-in meta groups (RSA), shared custom meta groups, and your private custom meta groups. Above the list, visibility options and a filter make it easier to find a particular meta group.

4. (Optional) To filter the listed meta groups by name, type some text in the **Filter Meta Groups** field. The list is updated to show only the group names that contain the exact text.



5. Hover over the meta group name and click the information icon ( ) to see which meta keys are included in the group.
   The figure on the left shows the columns for the RSA HTTP meta group. The figure on the right shows the columns for the Default Meta Keys meta group.

6. Do one of the following.
   a. To close the dialog, click **Close**.
   b. If you want to apply the meta group, click **Select Meta Group**.
      The dialog closes and the Filter Events panel is updated to reflect the meta keys in the selected meta group.

Select a Meta Group

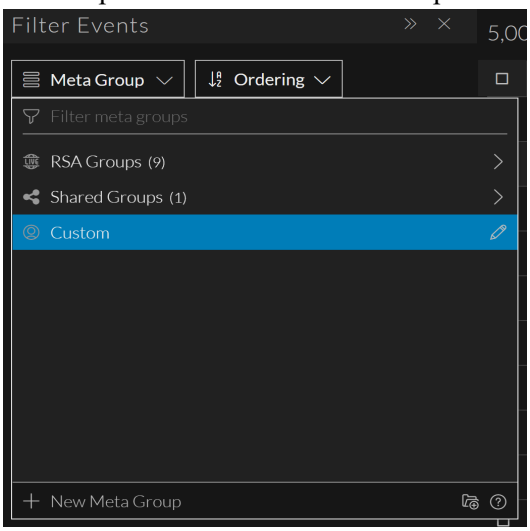
1. With the Filter Events panel open in the Version 11.5 Events view, click the **Meta Groups** menu title.
   The menu drops down to display a list of meta groups and folders with a filtering option and a New Meta Group option. The list is sorted alphabetically and the name of the selected meta group is displayed in the menu label. This figure shows the menu after RSA HTTP was highlighted, but not selected.

2. Do one of the following:
   a. If the highlighted group is the one you want to apply, press **ENTER**.
   b. Begin typing text in the **Filter Meta Groups** field to search for a meta group name. As you type, the list is filtered to show only the meta group names that contain that string.
   When you see the group that you want to apply, click it or use the down or up arrow to highlight it, then press **ENTER**.
   The Filter Events panel is refreshed to include only meta keys in the selected meta group, and the menu title includes the selected group name. Your selection persists when you navigate away from the Events view.

Note: If a meta key in a meta group is not part of the selected service, it does not appear in the Filter Events panel or in the Events panel.

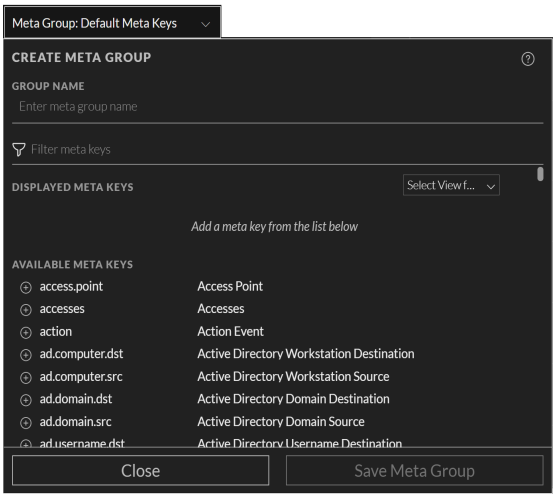
Create a Custom Meta Group

Custom meta groups must have a unique name up to 80 characters in length, and must have at least one meta key. If any other meta group has the name you type, whether shared or private, a message informs you that you need to use a different name. The Save Meta Group button is enabled when these criteria have been met. You can adjust the order of meta keys in a group by dragging keys in the Displayed Meta Keys list.



You can also set the initial view of each meta key: Open, Closed, Hidden, or Auto (the default setting).

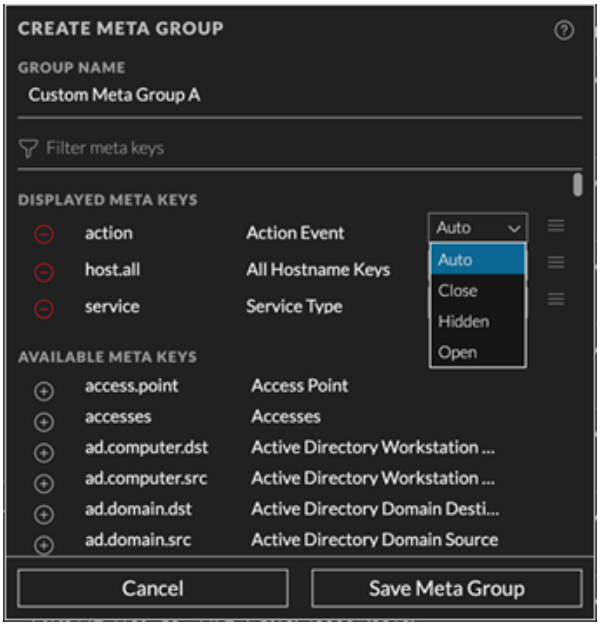
Note: You can also set the desired value for all meta keys at once. Make a note that changing the value of all meta keys might impact the performance.



- When set to Auto, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are Closed until opened manually. If you change the default view for a group of meta keys to Open and some of the meta keys are non-indexed, the non-indexed meta keys revert to Auto.
- Open meta keys are listed in the Filter Events panel, and the values are loaded.
- Closed meta keys are listed in the Filter Events panel, but the meta values are not loaded until you open the meta key.

- Hidden meta keys are not listed in the Filter Events panel at all. This is useful if you are using a single meta group for multiple purposes instead of creating several meta groups; you can turn off certain keys off without removing them from the meta group. You can also use the Hidden view when testing out some new keys or if you want to prepare a meta group with some new meta keys that are not yet available and would error out if in an Auto, Open, or Closed state.

1. With the Filter Events panel open in the 11.5 Events view, click the **Meta Groups** menu title.
   The menu drops down to display a list of meta groups and folders with the Filter Meta Groups field at the top and the + New Meta Group and Folder icon option at the bottom.



2. Select + **New Meta Group**.
   The Create Meta Group dialog is displayed.

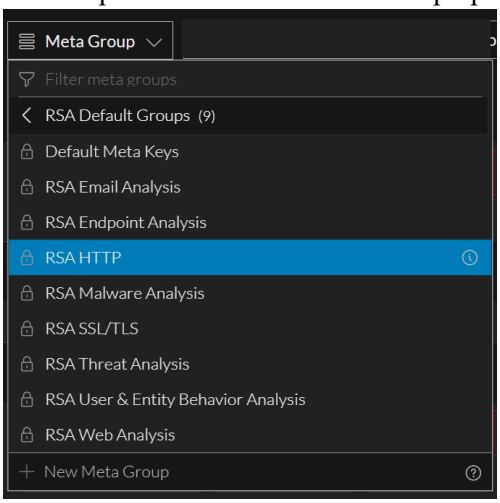
3. In the **Group Name** field, type a unique name (maximum length of 80 characters) for the new meta group, for example, **Custom Meta Group A**.
4. If you want to share the new meta group with your organization, set the **Share with my organization** option.

5. To add a meta key to the meta group, select and add each meta key as follows:
   a. Type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Available Meta Keys** list.
   b. When you see the meta key that you want to add, click the add icon that precedes the meta key name.
   The meta key is added to the end of the Displayed Meta Keys list. (This list is also filtered using the text you typed.) The maximum number of meta keys in a meta group is 500. If you attempt to add another meta key when 500 are already included in the Displayed Meta Keys list, a message advises you that the group has the maximum number of meta keys.

6. (Optional) Next to each meta key, choose the initial view for the meta key: **Open**, **Close**, **Hidden**, or **Auto**.
7. (Optional) To find and remove a meta key from the meta group, type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Displayed Meta Keys** list. When you see the meta key that you want to remove, click the remove icon ( ) that precedes the meta key name in the **Displayed Meta Keys** list.
   The meta key is moved back to the Available Meta Keys list.
8. (Optional) To change the order of the displayed meta keys in the Displayed Meta Keys list, place the cursor over the list order icon ( ). When the cursor changes to the drag and drop icon ( ), drag the meta key up or down in the list.
9. Do one of the following:
   a. To close the dialog without creating the custom meta group, click **Cancel**.
   b. To create the group, click **Save Meta Group**.
   The new meta group is saved. If the new group is shared, it becomes available for all analysts. If

it is private, only you can use the meta group. The buttons change to Done and Select Meta Group.

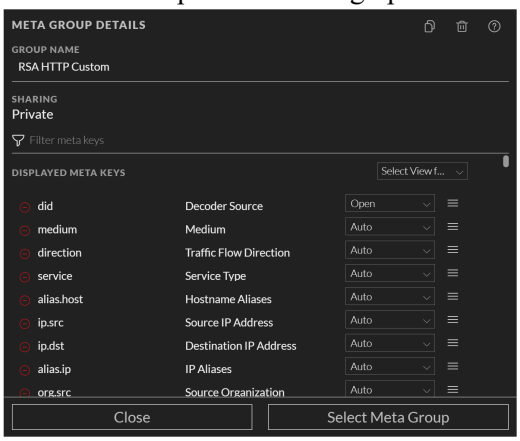
10. Do one of the following:
    a. To close the dialog, click **Done**.
    b. To close the dialog and select the new meta group, click **Select Meta Group**.
    The new group is added to the Meta Groups menu (in alphabetical order), and if you clicked Select Meta Group, the Filter Events panel is updated to show the meta keys and values in the new meta group.



Delete a Custom Meta Group

You can delete any custom meta group, shared or private, that is not currently applied in the Events list and not used in a query profile. When you click the Delete button, a confirmation message allows you to confirm or cancel the deletion. If a meta group is being used in a query profile, the Delete button is disabled and a message identifies the query profile in which the meta group is used. The built-in meta groups are read only, and cannot be deleted.

Caution: When you delete a shared meta group, the effect is global and the group is no longer available to any analyst.

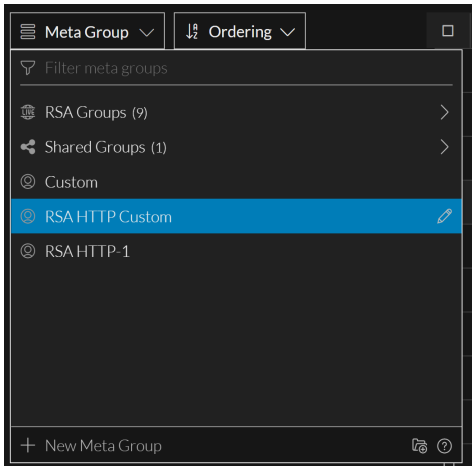


To delete a custom meta group

1. With the Filter Events panel open in the 11.6 Events view, click the **Meta Group** menu title.
   The menu drops down to display a list of meta groups and folders with the Filter Meta Groups field at the top and the + New Meta Group option at the bottom.

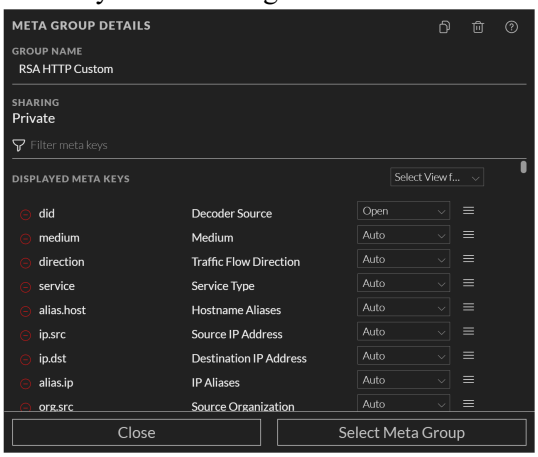
2. To delete a meta group, highlight a custom meta group and click the edit icon ( ) to the right of the name.

3. The Meta Group Details dialog opens with the details for the selected group displayed.



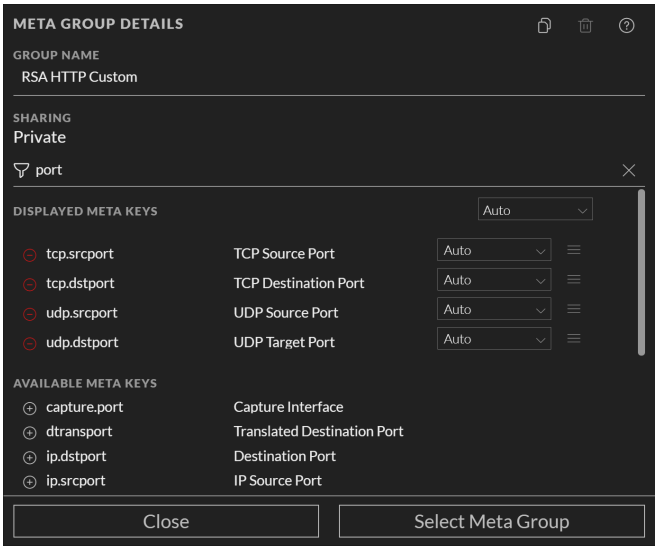
4. Click the delete group icon ( ).
   If the meta group is currently in effect, the following message is displayed: `This meta group cannot be deleted because it is currently active.`
   In Version 11.5, a confirmation message gives you the opportunity to confirm or cancel the deletion. Click **Cancel** or **Delete Meta Group**.
   The group is deleted and removed from the Meta Group menu. The meta group no longer appears anywhere for any analyst working in Investigate.

Edit a Custom Meta Group



You can edit a shared custom meta group, your own private meta group, a copy of a built-in meta group or a copy of live meta groups.

1. With the Filter Events panel open in the 11.5 Events view, click the **Meta Group** menu title and highlight the meta group that you want edit. This figure shows private column group RSA HTTP Custom highlighted with the edit icon is displayed to the right.



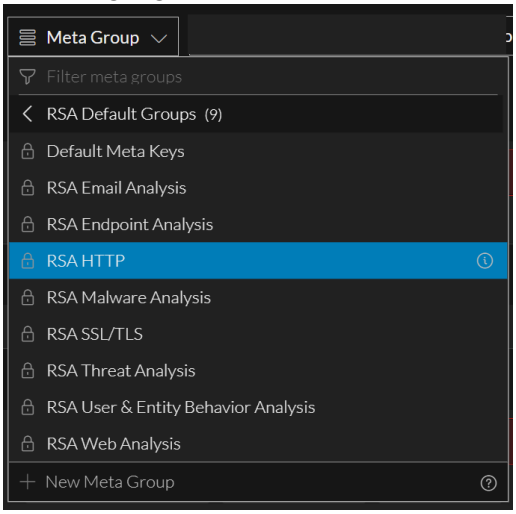
2. Click the edit icon ( ).
   The Meta Group Details dialog is displayed so that you can edit the location. You can add or delete

meta keys and rearrange the order of the meta keys in the list.

3. (Optional) In the **Group Name** field, edit the name and location of the meta group.
4. (Optional) To add a meta key to the meta group, select and add each meta key as follows:
   a. Type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Available Meta Keys** list. Or just scroll through the list to find the meta key. For example, type **port** in the **Filter meta keys** field.

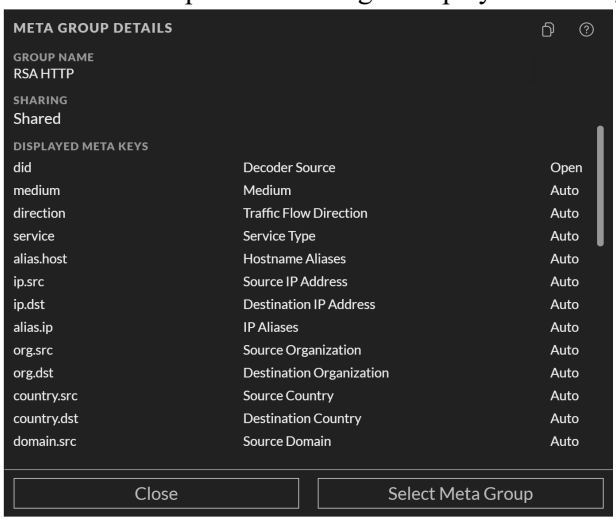
   b. When you see the meta key that you want to add, click the add icon  that precedes the meta key name.
5. (Optional) To find and remove a meta key from the meta group, type a text string in the **Filter meta keys** field to look for meta keys that contain that text in the **Displayed Meta Keys** list, or simply scroll through the list. When you see the meta key that you want to remove, click the remove icon () that precedes the meta key name in the **Displayed Meta Keys** list.
   The meta key is moved back to the Available Meta Keys list.

6. (Optional) To change the order of the displayed meta keys in the Displayed Meta Keys list, place the cursor over the list order icon ( ). When the cursor changes to the drag and drop icon ( ), drag the meta key up or down in the list.
7. Do one of the following:
   a. To close the dialog without saving the changes to the custom meta group, click **Reset**.
   b. To save the edits to the meta group, click **Update Meta Group**.
   The updated meta group is saved, and the dialog is closed.



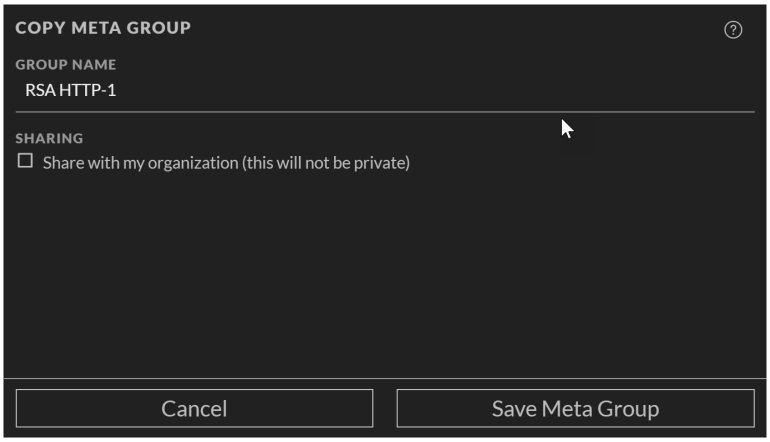
Copy a Meta Group (Version 11.5 and Later)

You can copy any meta group, built-in or custom, Live meta group, shared or private, as long as it does not have unsaved edits in progress. This is useful when you want a customized version of a built-in group. Also since you cannot change a custom group from private to shared or from shared to private, creating a copy allows you to select a different Sharing setting. When you copy a meta group, the same name is used with a number appended. For example, if you copy RSA HTTP twice, the first copy is named RSA HTTP-1, and a second copy is named RSA HTTP-2. After you copy the group, you can edit the copy to give it a new name and manage meta keys in the group.



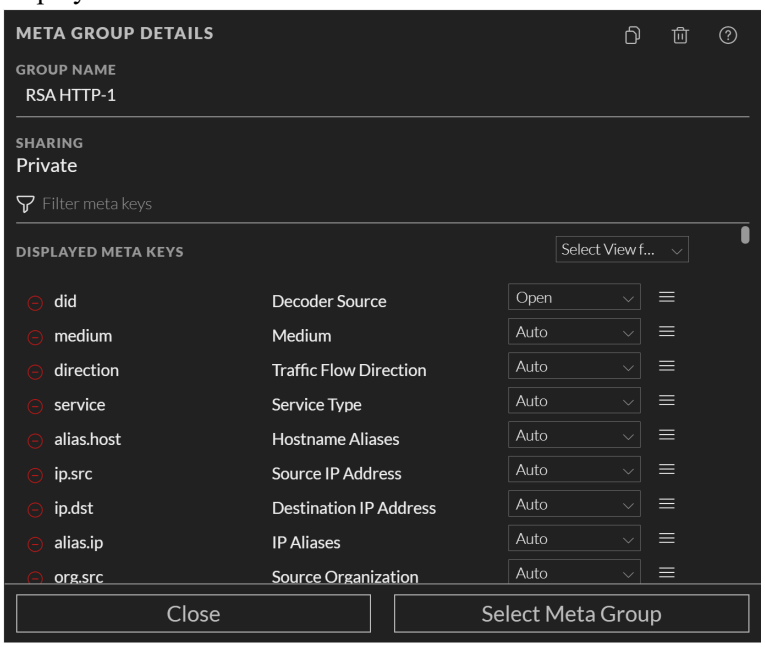
Note: Some meta groups created in the Legacy Events view may have more 500 meta keys, which is above the limit for meta groups in the Events view. If you copy a group with more than 500 meta keys, you must remove the excess meta keys when you edit the meta group.

To copy a meta group:

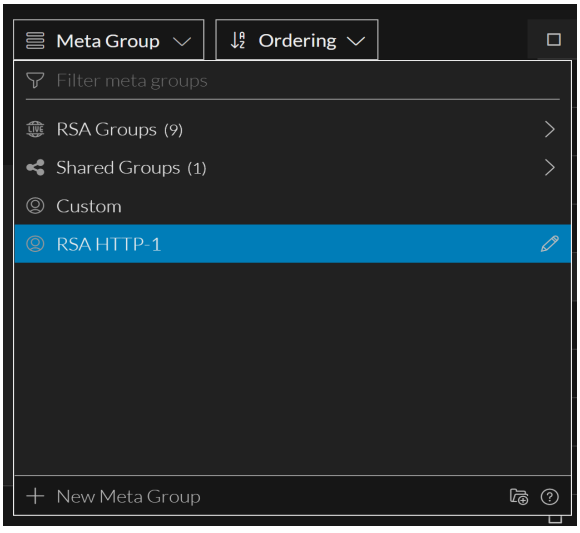


1. With the Filter Events panel open in the 11.6 Events view, click the **Meta Group** menu title.
   The menu drops down to display a list of meta groups and folders.
2. Highlight the meta group that you want copy.
   If you highlighted a built-in meta group, the information icon ( ) is displayed to the right. If you highlighted a custom meta group, the edit icon ( )is displayed to the right. This figure shows RSA HTTP highlighted.

3. Do one of the following:
   a. Click the information icon ( ).
   b. Click the edit icon ( ).
   The Meta Group Details dialog is displayed. This figure shows the dialog for a built-in group.

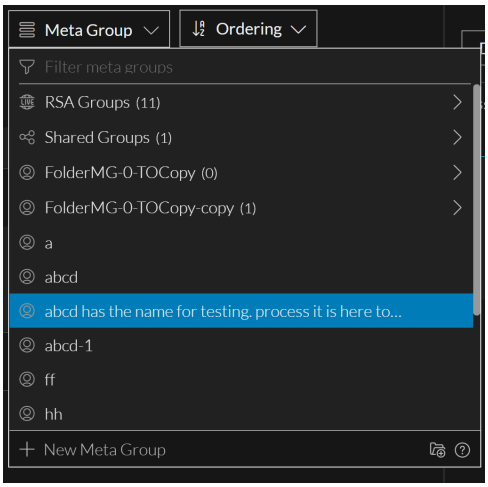


4. Click the Copy icon ( ).
   The Copy Meta Group dialog is displayed with a `-n` appended to the original meta group name.



5. (Optional) In the **Group Name** field, edit the name and location of the meta group.
6. Do one of the following:
   a. To close the dialog without copying the group, click **Cancel**.
   b. To save the copy of the meta group, click **Save Meta Group**.
   The copy of the meta group is saved, and the Meta Group Details dialog for the copied group is

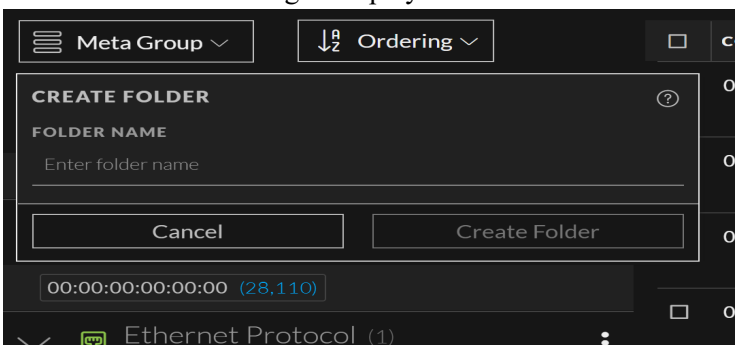
displayed.



7. Do one of the following:
   a. To close the dialog without editing, click **Close**.
   b. To close the dialog and select the copy of the meta group, click **Select Meta Group**.
   The group is added to the Meta Group menu. The figure below has a private copy of the RSA HTTP meta group.

Meta Group Folders

Users can create editable Shared and Private group folders. The contents of a private group folder and their contents are displayed outside RSA Groups and Shared group folders. For example, the below image shows private content below the Shared Groups folder.

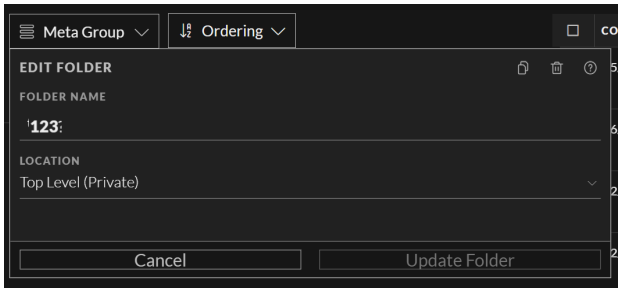


This section describes how to add, edit, import, export, copy, and delete custom meta groups and folders.

Create a Meta Group Folder

You can create meta group folders as shared and private folders. And, if the folder name already exists then you are prompted to provide a unique name.

1. With the Filter Events panel open in the Events view, click the Meta Groups menu title. The menu drops down to display a list of meta groups and folders.
2. Click .
   The Create Folder dialog is displayed.

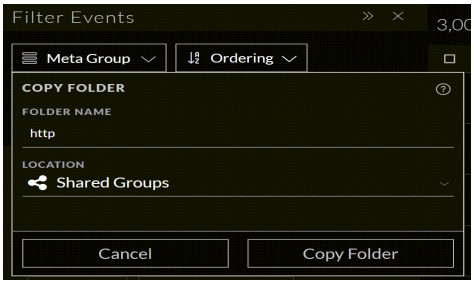


3. In the **Folder Name** field, type a unique name for the new meta group folder.
4. Click **Create Folder**.

Edit and Move Meta Group Folder

After you create a meta group folder you can edit or move it, however the folders inside RSA Groups (RSA Live content and RSA OOTB Groups) cannot be edited and moved. The folders inside private and shared folders can be edited and moved only within their respective groups. For example, you cannot move a shared folder into a private folder and vice-versa.

1. With the Filter Events panel open in the 11.6 Events view, click the Meta Group menu title and highlight the meta group that you want edit.

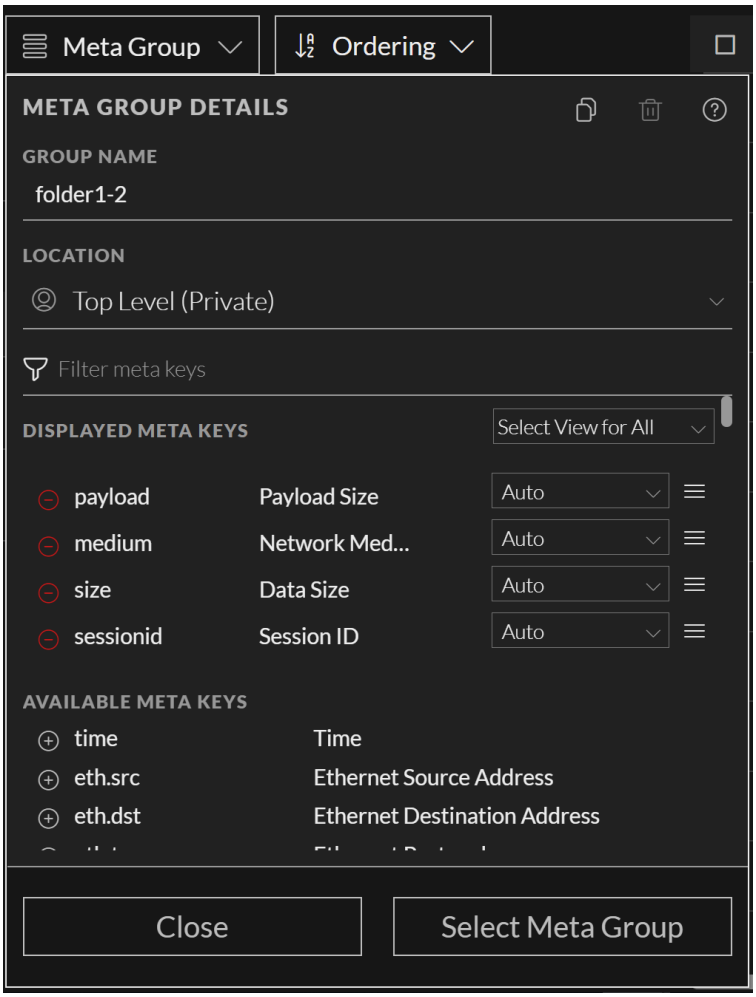


2. Click .
   The Edit Folder dialog is displayed.

3. In the **Folder Name** field, type a unique name for the meta group folder.
4. Select the location of the folder to be edited.
5. Click **Update Folder**.

Copy Meta Group Folder

Users can copy any type of meta group folders namely - RSA , Shared and Private. However, by default for RSA groups copy folder will create a copy in the private section (root level) but can change the location of the folder to a shared folder or any other private folder. The meta group can be copied by clicking the clone icon ( ). After copying, the meta group folders are displayed selected location (Shared or Private category). You can hover over on the copied item to view a tooltip that indicates the path from which the meta group has been copied. In case you need to search for a specific meta group, you can type the name of the meta group in the filter field ( ) at the folder level and the meta group will be filtered from the selected folder.



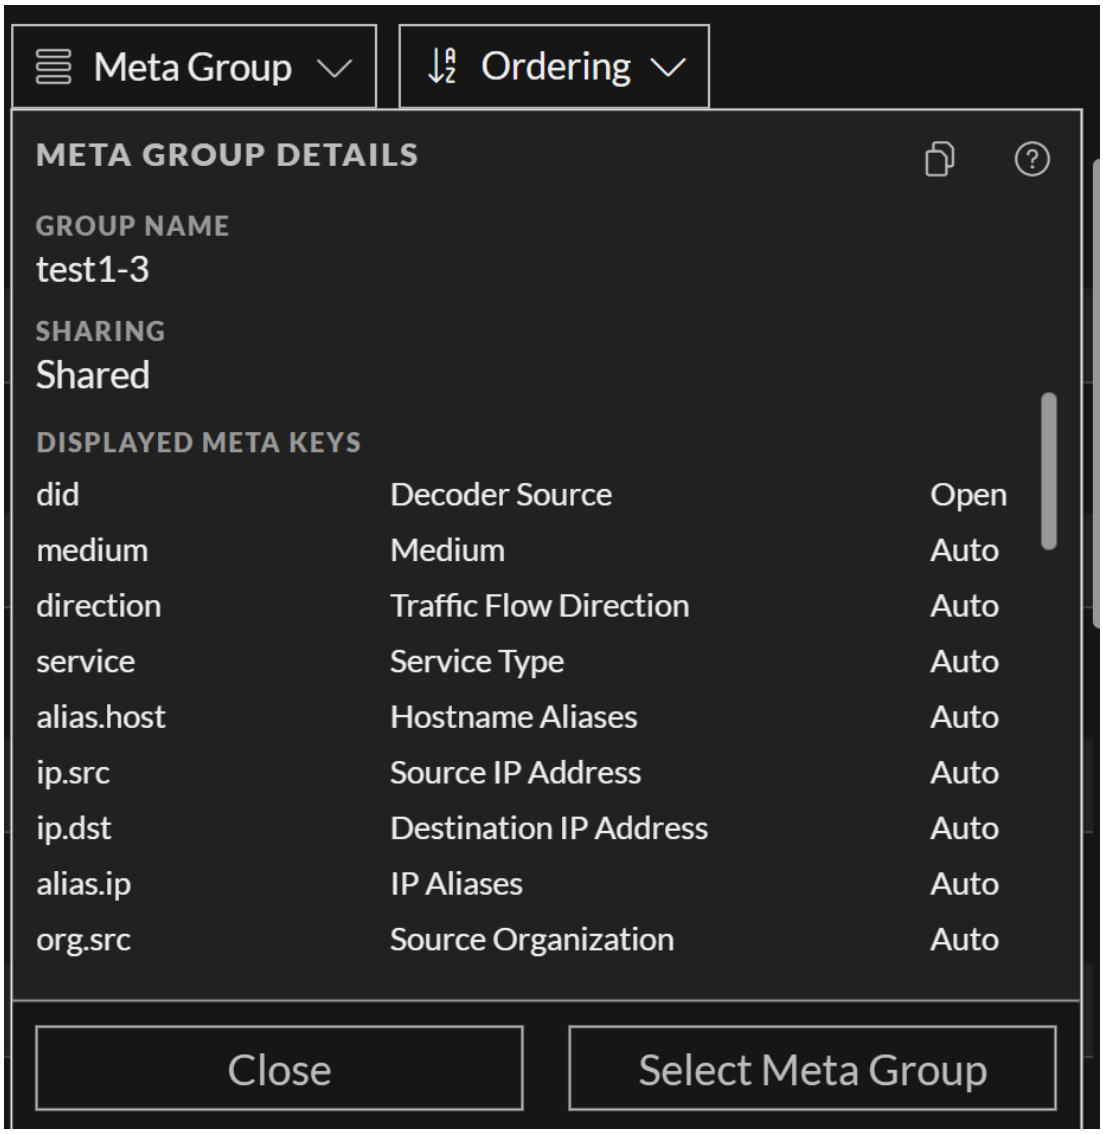
Copying Meta Group Private or Shared Folders

You can copy meta group folders from RSA groups to private and RSA groups to shared, private to shared, private to private, shared to shared and shared to private groups. When you copy a folder the content inside it gets copied except the sub-folders. When you copy a private folder into a shared folder, the folder and its content no longer remain private.

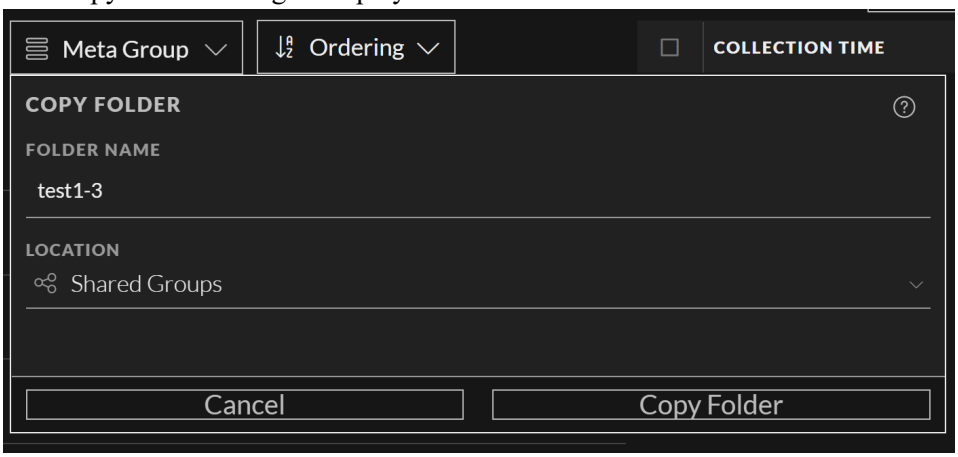
1. With the Filter Events panel open in the Events view, click the Meta Group menu title. The menu drops down to display a list of meta groups and folders.
2. Select a folder you want to copy.

3. Click edit and then click copy .

The Copy Folder dialog is displayed.



4. In the **Folder Name** field, type a unique name for the new meta group folder.
5. Select the location of the folder to be copied.
6. Click **Copy Folder**.

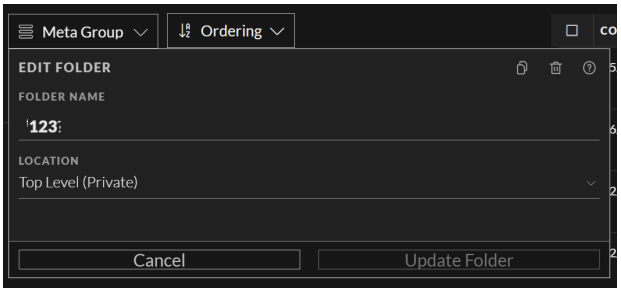


Copy Meta Group Folder Deployed from Live

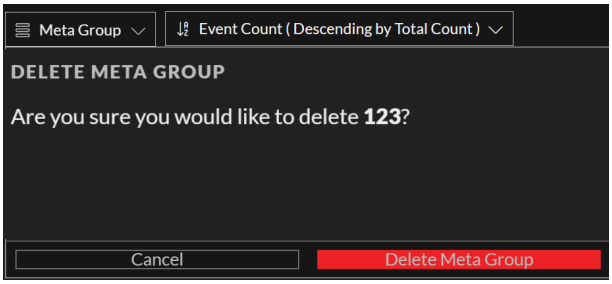
You can copy meta group folder deployed from Live located under RSA Groups category to any other location like Shared groups or to a private folder.

1. With the Filter Events panel open in the Events view, click Meta Group menu title. The menu drops down to display a list of meta groups and folders.
2. Click on RSA groups and select a Live Meta Group folder you want to copy.
3. Click  and the click copy .

The Copy Folder dialog is displayed.



4. Select the location of the folder to be copied.
5. Click **Copy Folder**.
   The folder and the first level contents are copied, sub-Folders are not copied. The copied Meta Group Folder and its contents are displayed as the original meta group name appended with a -n .

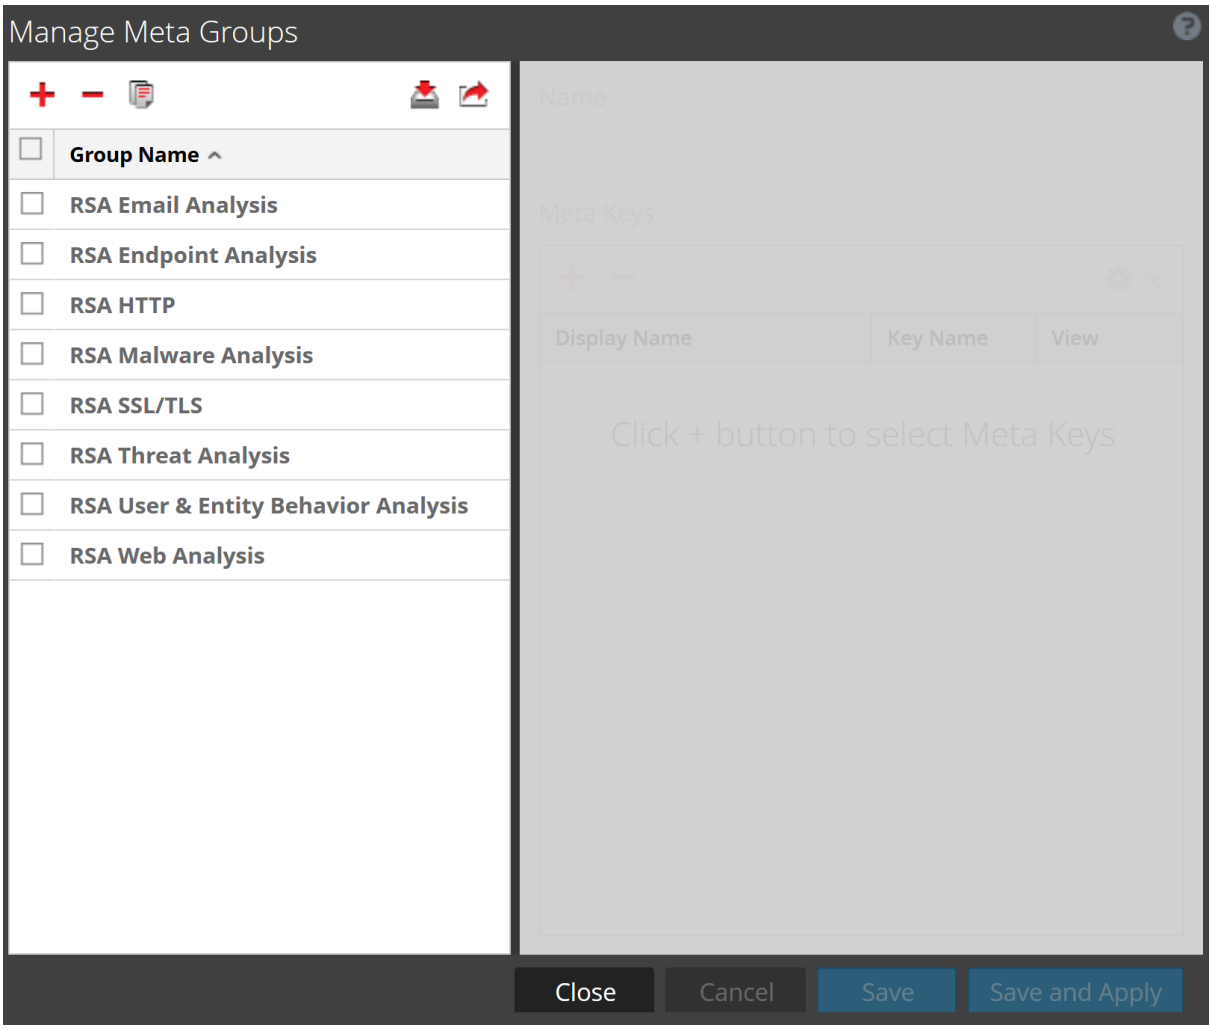


Delete Meta Group Folder

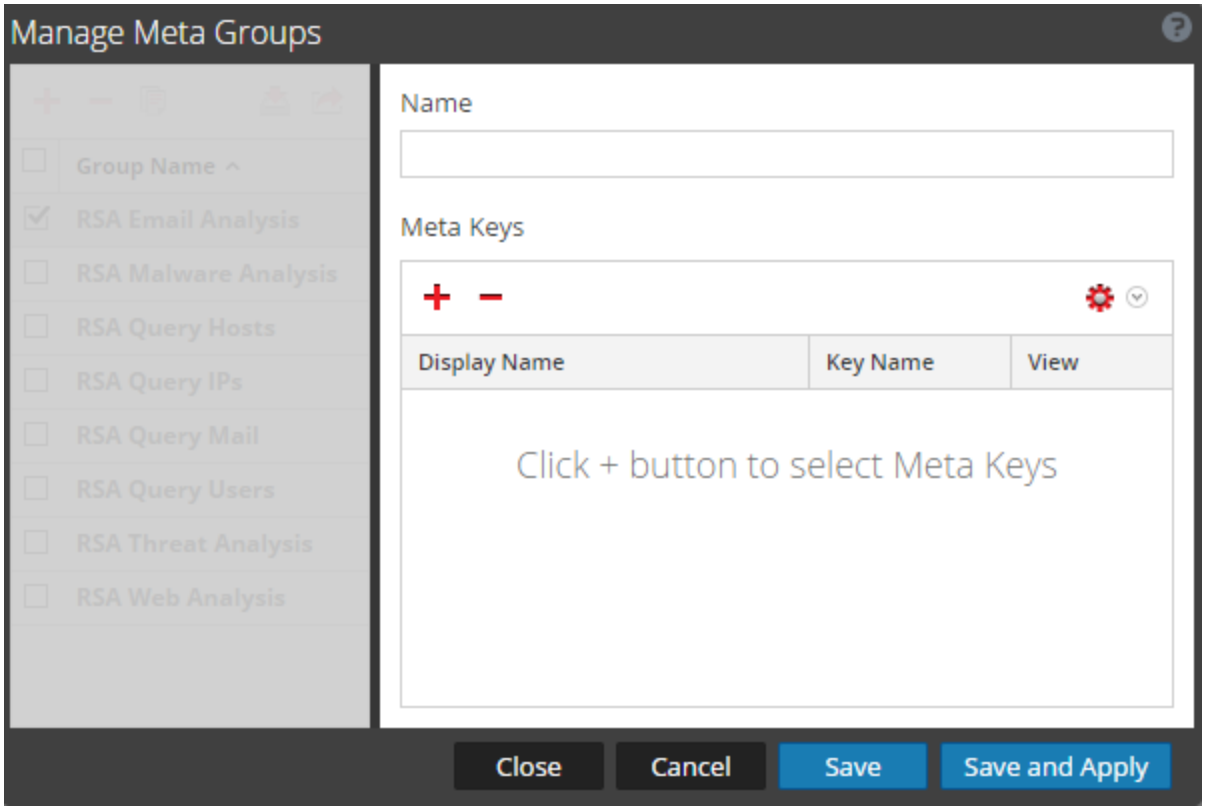
If you don't want to retain a folder you can delete it. However, once the folder is deleted it cannot be retrieved.

1. With the Filter Events panel open in the Events view, click the Meta Group menu title. The menu drops down to display a list of meta groups and folders.
2. Select a folder to be deleted.
3. Click edit .
   The Edit Folder dialog is displayed.

4. Click delete .
   A warning message is displayed to confirm the action.



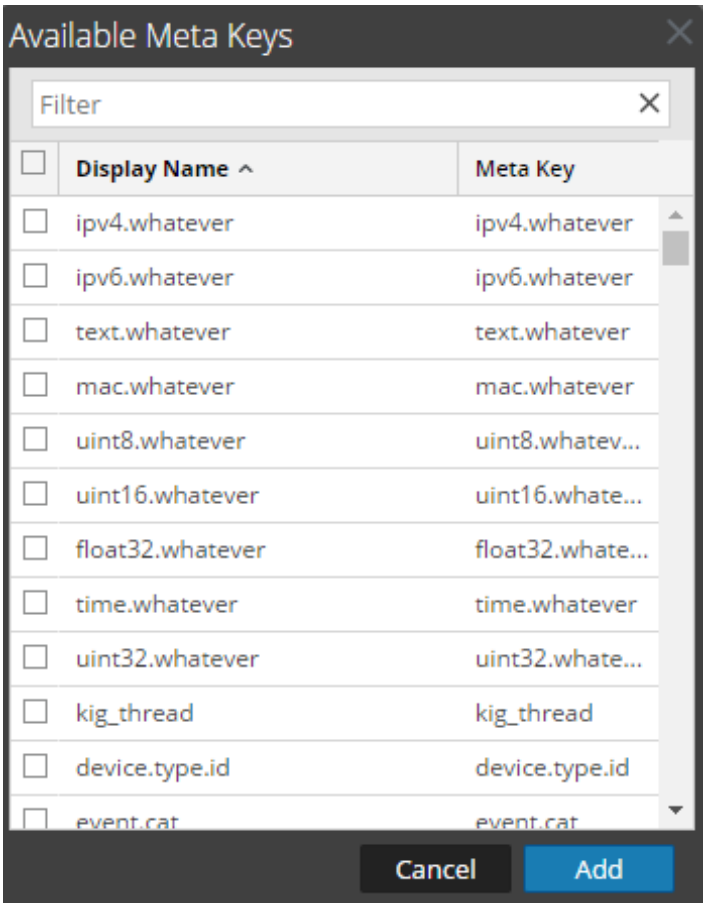
5. (Optional) Select the checkbox, if you want to delete the folder along with all the contents inside the selected folder.
   If you do not select the checkbox, then the content will be moved to the parent folder after the required folder is deleted.
6. Click **OK** to delete.



Work with Meta Groups in the Navigate View

Create a Meta Group and Add Meta Keys

1. While investigating a service in the **Navigate** view, select **Meta > Manage Meta Groups** in the toolbar.
   The Manage Meta Groups dialog is displayed. Initially only built-in groups are configured for a service and listed under Group Name. If other custom groups have been configured, they are also listed under Group Name.

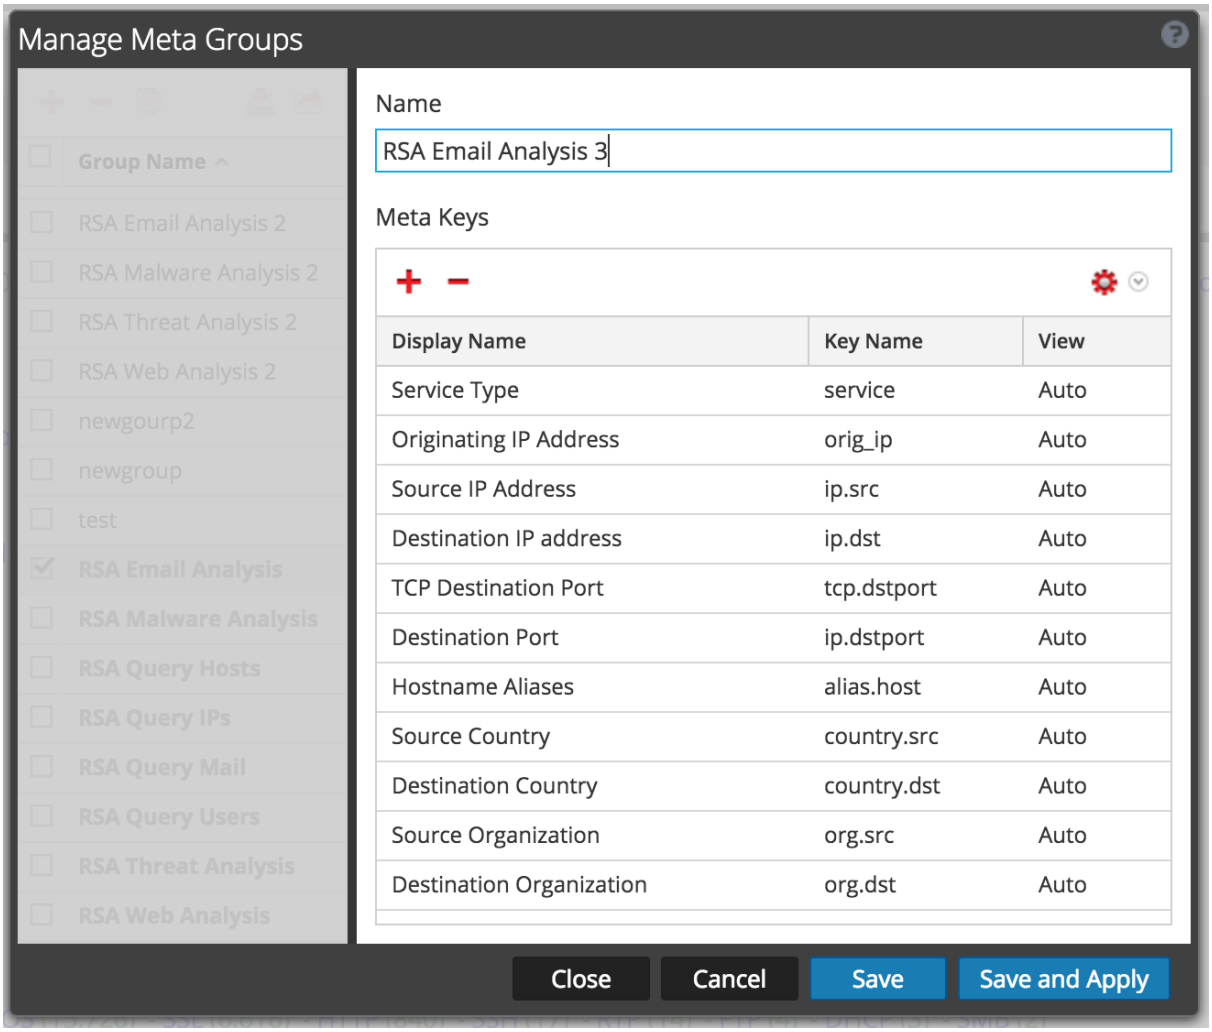


Manage Meta Groups
Group Name
RSA Email Analysis
RSA Endpoint Analysis
RSA HTTP
RSA Malware Analysis
RSA SSL/TLS
RSA Threat Analysis
RSA User & Entity Behavior Analysis
RSA Web Analysis
Name
Meta Keys
Display Name
Key Name
View
Click + button to select Meta Keys
Close
Cancel
Save
Save and Apply

2. In the toolbar at the top of the Meta Groups list, click +.
   The form to the right opens for editing.

3. Type a name for the new meta group in the **Name** field.

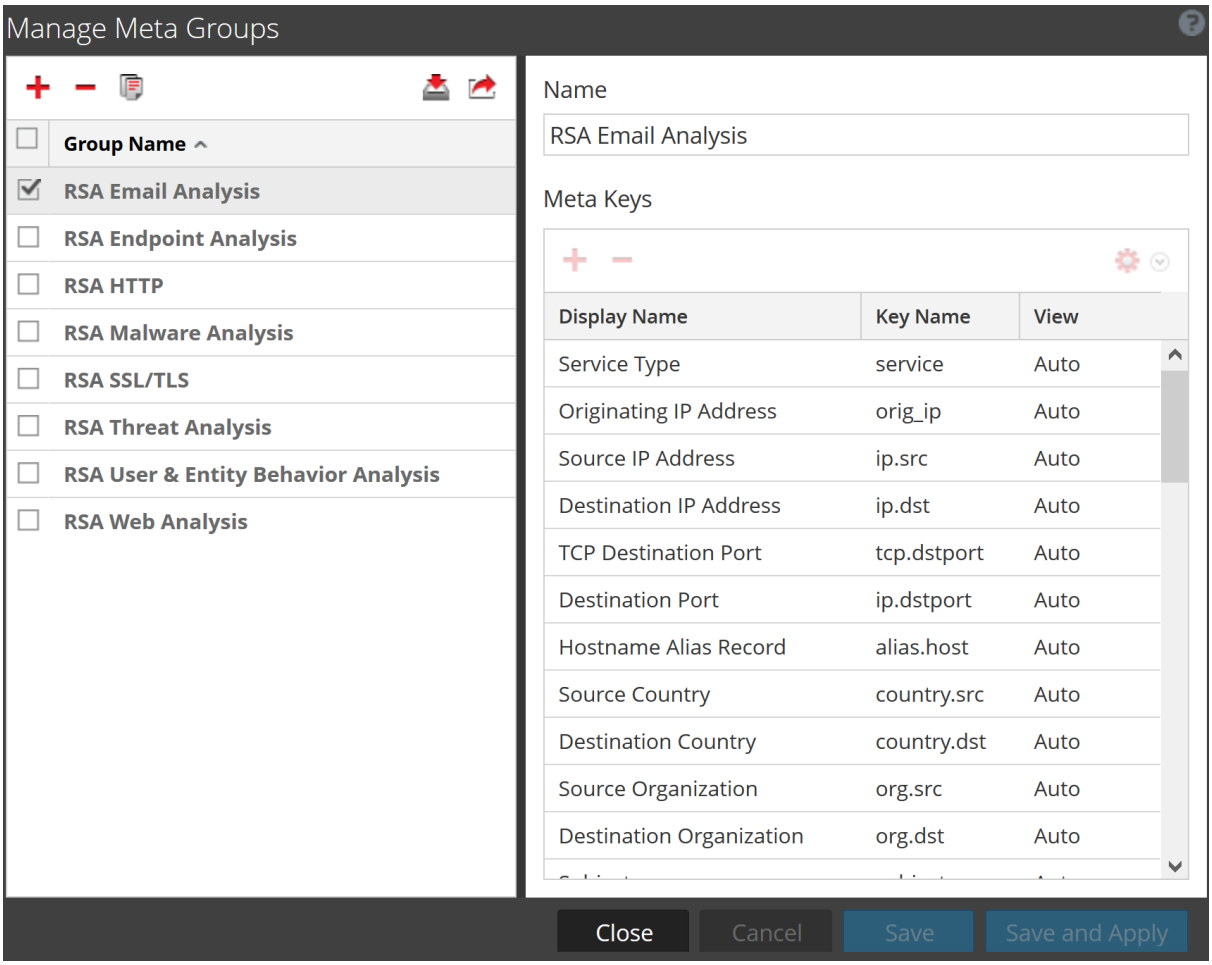
4. In the **Meta Keys** toolbar, click +.
   The Available Meta Keys dialog is displayed, with keys in alphabetical order.



5. To filter the list of meta keys, type a word or phrase in the **Filter** field and press **Enter**.
   The list displays matching meta keys based on a case-insensitive search. Delete the filter text and press **Enter** to remove the filter.
6. To select individual meta keys to include in the meta group, select the checkboxes. To select all meta keys, select the checkbox in the title bar and click **Add**.
   The selected meta keys are added to the meta keys list.
7. (Optional) If you want to change the order in which the meta keys load and are listed in an investigation, click and drag one or more meta keys to a new position.
8. To finish creating the meta group do one of the following:
   a. To save the meta group, click **Save**.
      The group is created and available for use.
   b. To save and apply the meta group to the current Investigation view, click **Save and Apply**.
      The group is created and applied immediately to the current Investigation view.
9. Click **Close**.

Copy and Edit a Meta Group

If you want to customize a built-in meta group, you need to duplicate the group and then edit the duplicate.



1. Select a built-in meta group from the Manage Meta Groups list and click .
   The form to the right opens for editing with all of the meta keys as they are in the built-in group.

2. Enter a name for the new group and continue editing as described in "Edit a Meta Group" below.

Edit a Custom Meta Group

1. Select a custom group from the **Meta Groups** list.
   The form to the right opens for editing.

2. (Optional) Edit the Name of the group.
3. (Optional) Add new meta keys, as described above in "Create a Meta Group and Add Meta Keys."
4. (Optional) To set the order for the keys, drag and drop one or more keys.
5. (Optional) To change the initial view of a meta key, click  and choose one of the possible views.
   When you modify the meta group, you cannot set the key to OPEN. If you change the default view for a group of meta keys to OPEN and some of the meta keys are non-indexed, the non-indexed meta keys revert to AUTO. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are CLOSED until opened manually.
   The value for the initial view is displayed in the View column.
6. To save, the changes, click **Save**.
7. To apply the changes to the current Navigate view, click **Save and Apply**.

Delete a Meta Group

1. In the **Meta Groups** list, select the group to be removed.
2. Click −.
   A confirmation dialog provides an opportunity to cancel or complete the request.
3. Click **Yes**.
   The meta group is deleted. When you close the window, if the deleted group was the currently applied meta group, it is removed and the default meta keys are used to build the view.

Export a Meta Group

User-defined meta groups are created on individual services. To make meta groups available to another service, you must export them to your local file system. To export one or more meta groups:

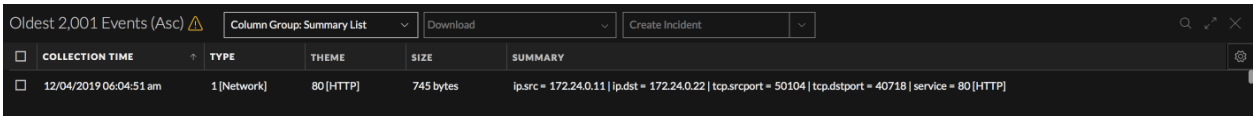
1. In the **Meta Groups** list, select one or more groups to be exported.
2. Click  .
   The selected groups are downloaded to your local file system as a **MetaGroups.jsn file**. Every download of meta groups has the same name with a numeral appended to avoid overwriting previous downloads.

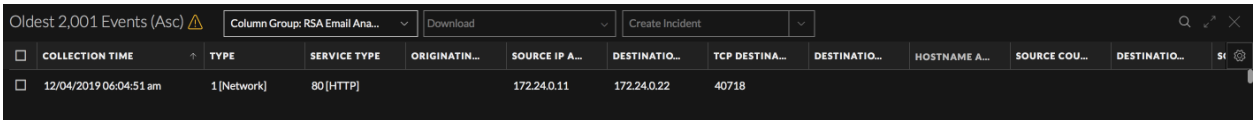
Import a Meta Group

To make user-defined meta groups from another service available to the currently investigated service, you must import the `MetaGroups.jsn` file from the local file system. When you import meta groups, an error message is displayed if any of the groups are already present. To import a group that is a duplicate, you must first delete the existing group. If you want to delete a meta group, it cannot be in use by a profile.

To import meta groups

1. In the **Meta Groups** list, select a file to import and click  .
   The selection dialog is displayed.

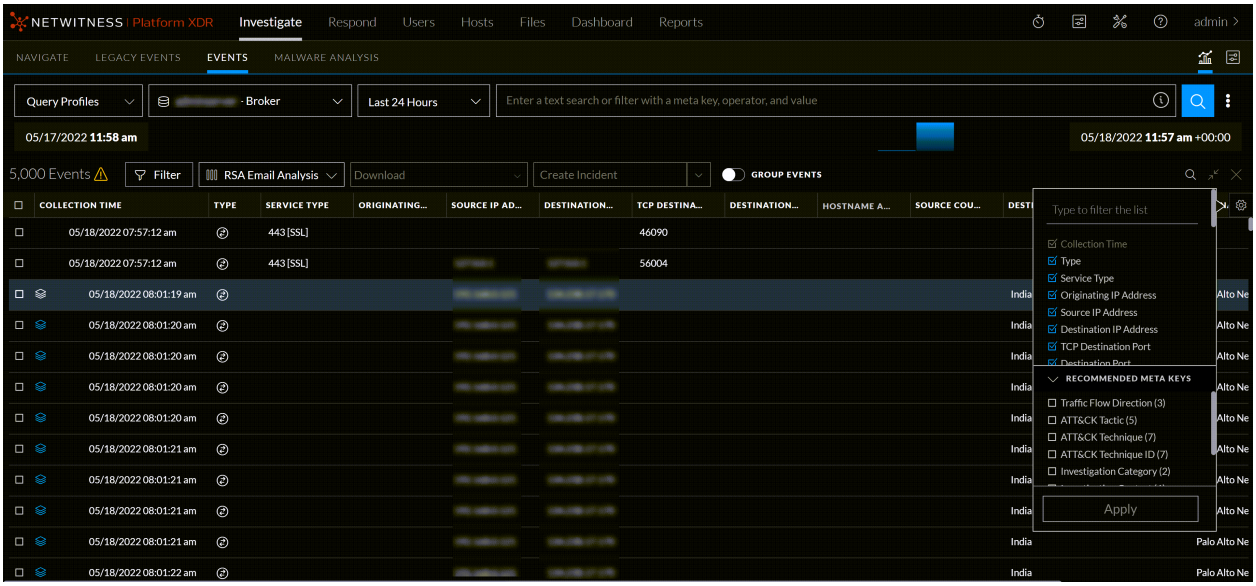




2. Click **Browse** and navigate to the directory on your local file system where the downloaded `MetaGroups.jsn` files are stored. Select a file and click **Open**.
   The filename is displayed in the Upload File field.

3. Click **Upload**.
   The upload process begins, and a message indicates that the upload was successful. The meta groups are added to Meta Group list. If the file is a duplicate of an existing meta group, a dialog tells you that the meta group already exists.

Use Columns and Column Groups in the Events List



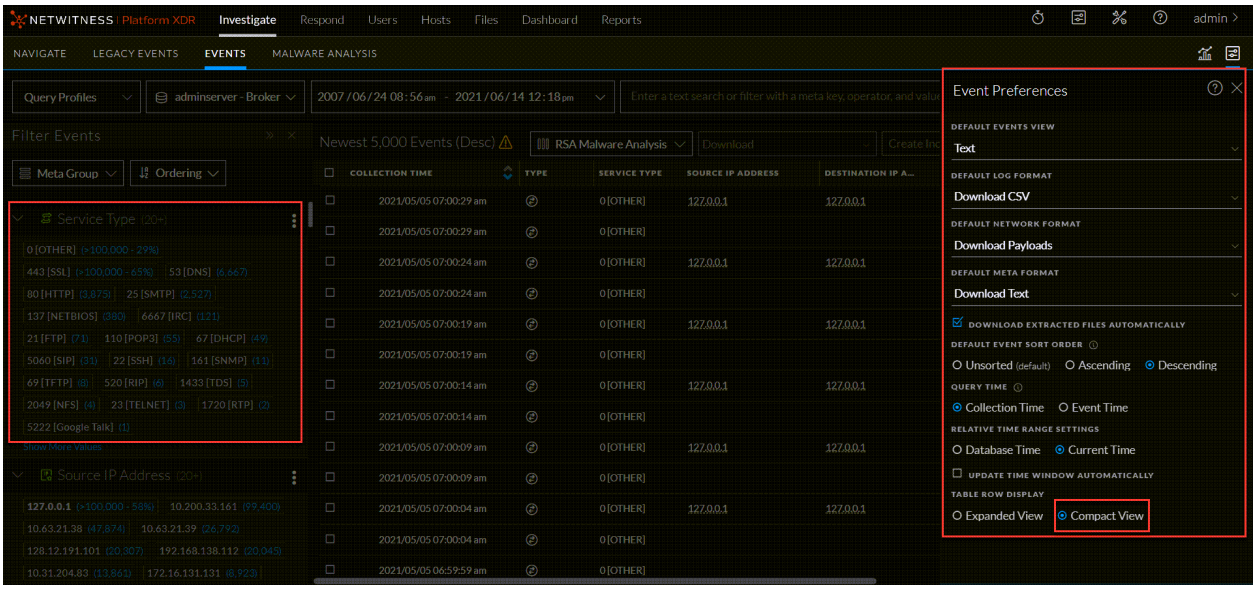
When the events list in Investigate is populated with events, each column lists the values returned for a meta key. Changing the meta keys displayed in the events list is a useful method of narrowing the focus of your investigation. For example, compare these two figures showing the same set of events with different columns. The first figure has five columns, **Collection Time**, **Type**, **Theme**, **Size**, and **Summary**. These are just the basic information, not specialized in any way. The second figure has many more columns that contain information useful when investigating email; you can scroll to the right to see the additional columns.

You can adjust the events list as you work, selecting different columns to be displayed, rearranging the order of the columns, changing the width of the columns, and choosing a column by which the list is sorted. Manual adjustments are easy to make if you know which meta keys are relevant. Manual adjustments apply only to the current session in Version 11.5; in Version 11.5.1, the column width is an exception. When you adjust the column width, it is preserved as a personal preference and is applied every time the column is used in the Events list, overriding any default column width.

In version 11.6, you can select additional columns with data for the meta keys that you are viewing. This will enable you to obtain all the relevant meta key information from the Filter Events panel however the recommendations can change based on the selected meta groups. The following figure displays the additional meta key information under the Recommended Meta Keys section.

To improve your ability to see relevant meta keys quickly when looking at events in the Legacy Events view and the Events view, you can change the set of meta keys displayed by applying a column group. A column group defines the meta keys or meta entities that are displayed as columns, the position of the column in the Events list, and the default width of the column. A column group must have at least one column. Column groups are useful in themselves, and they become even more useful when you combine them with meta groups and preQueries to define query profiles (see Use Query Profiles to Encapsulate Common Areas for Investigation).

The same column groups are shared between the Legacy Events view and the Events view. When importing a column group, the imported group is limited to the available meta keys for the service being investigated. Private column groups created in the Events view are not available in the Legacy Events view or for use in Query Profiles in the Navigate view.



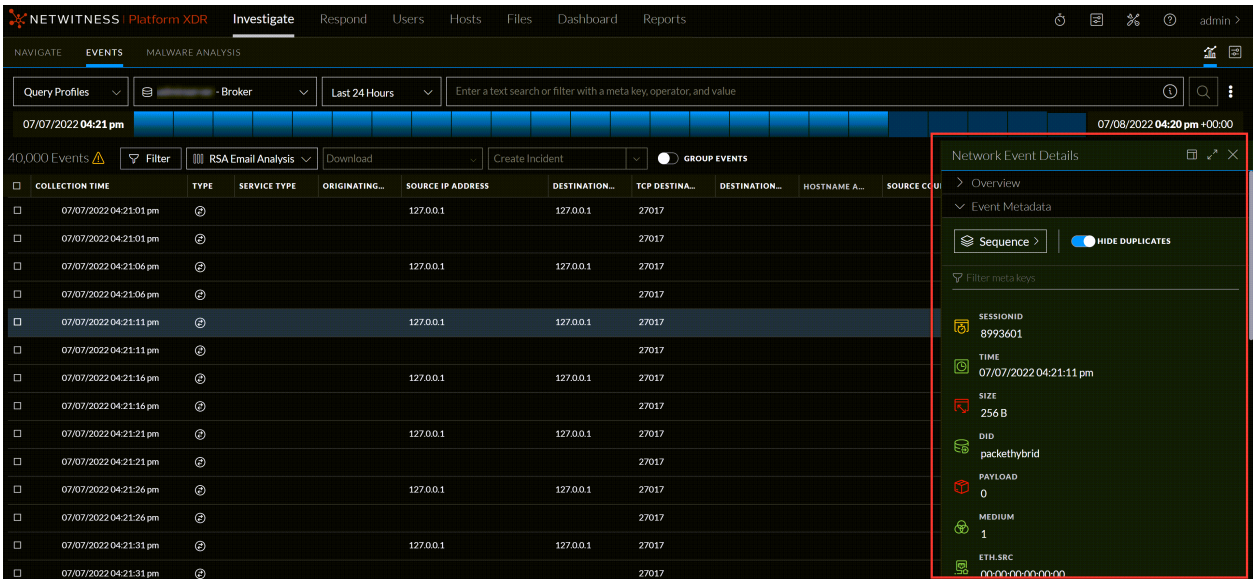
Note: In the Navigate view and Legacy Events view, you can manually add non-indexed meta keys (or keys that are not in the index at all) to a meta group or column group. The non-indexed meta keys are fully available (manageable and displayable) in the Navigate view and Legacy Events view, but only partially (displayable in the Filter Events panel) in the Events view. The Events view Filter Events panel can display data for non-indexed meta keys that are already included in a meta group, but you cannot add non-indexed meta keys while you are editing a meta group. The non-indexed meta keys in a column group do not display data in a column and new non-indexed meta keys cannot be added to a column group in Events view.

Large column groups can have a performance impact when loading data because the values for each meta key are loaded in the events list. To minimize impact on performance, the Events view has a fixed limit on the number of meta keys in a column group. The maximum number of meta keys in a column group is 40. (Because several default meta keys are included you may see a few more than 40 displayed on the screen.) Meta keys that are not in the selected column group are not loaded in the events list. By default we load all columns in the group, but only 15 are displayed by default.

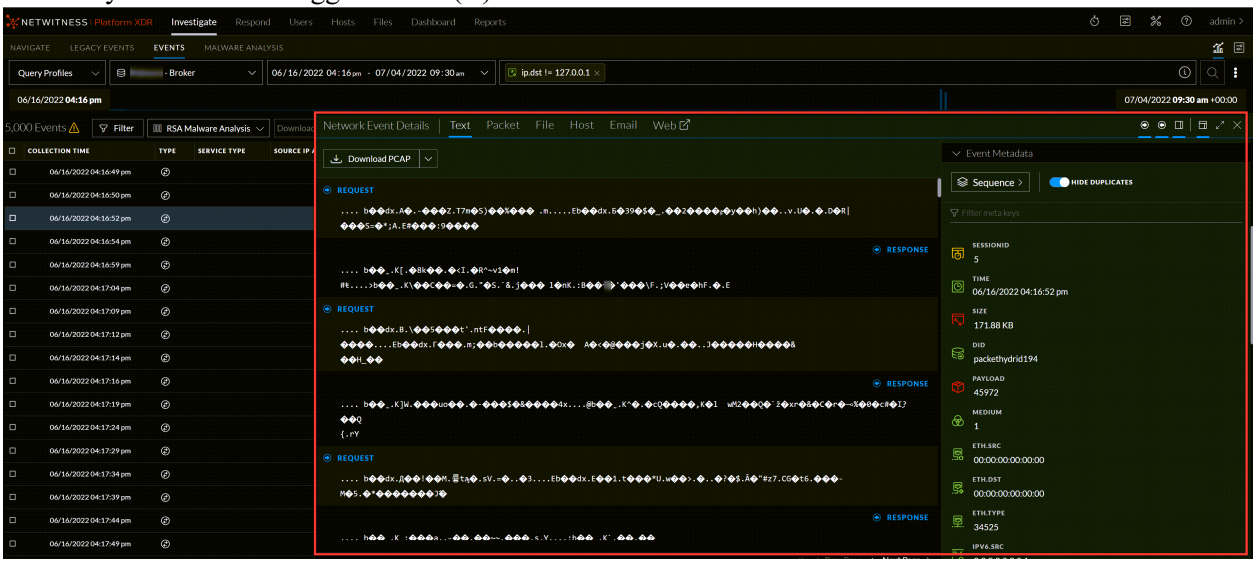
The Legacy Events view does not have a limit on the number of meta keys in a column group, and may have more than 40 meta keys in a column group. If you apply a column group with more than 40 meta keys that was created in the Legacy Events view, all columns are loaded in the Events view. If you copy a group with more than 40 columns, you must remove the excess columns when you edit the column group.

Note: All existing column groups, both built-in and custom, are available in the 11.4 Events view. The complete column group management functionality is available in the Legacy Events view, and all functionality except cloning, importing, and exporting column groups is available in the 11.4 Events view. In Version 11.5, cloning is also available in the Events view, but importing and exporting are not.

In 11.6.1, the **Investigate** > **Events Preferences** view has been added to make optimum use of the space to enable analysts to view maximum details related to the events they are analyzing.

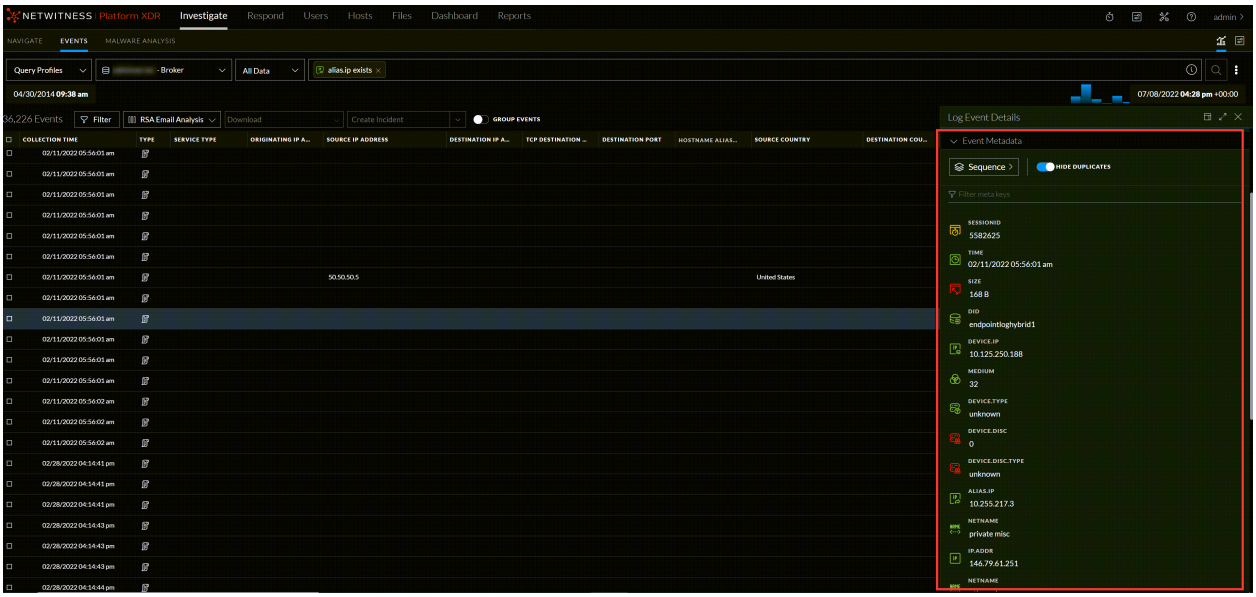


Additionally, an analyst can now view the time line details of an event by clicking the ▣ icon. When clicked the time line that displays the date and time range s displayed as shown in the image.

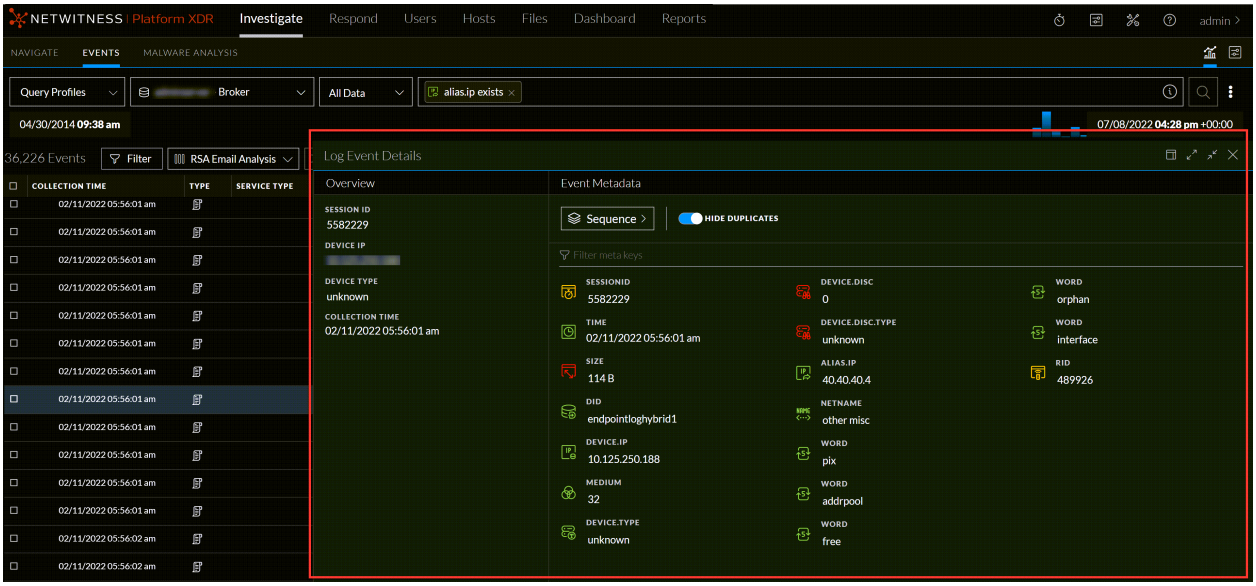


The **Investigate** > **Events** reconstruction panel has been modified to display an overlay that will contain an Overview tab and a Meta panel tab that can be expanded or collapsed. This will enable the analyst to view the headers and meta panel of the events optimally. The analysts can also toggle **Hide Duplicate Events** option and view only the relevant details of a selected event.

When an analyst navigates to this page the following view will be displayed.

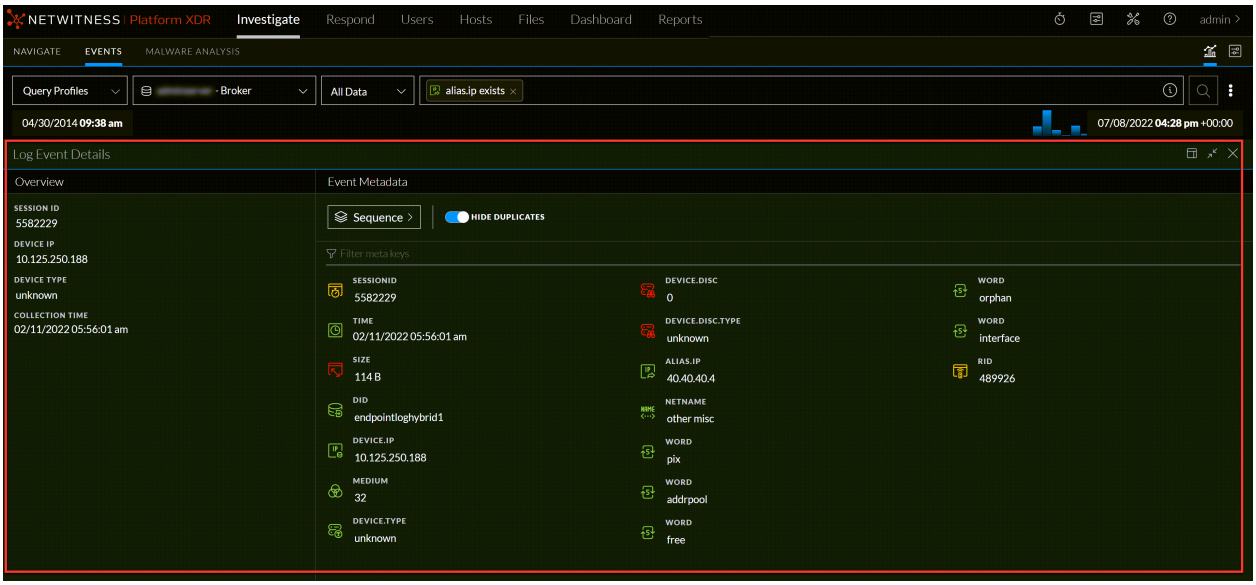


The analyst can use the toggle button ( ) to view the details related to the selected event.



The binocular icon is enabled only if an event payload is open for a search related to a selected event.

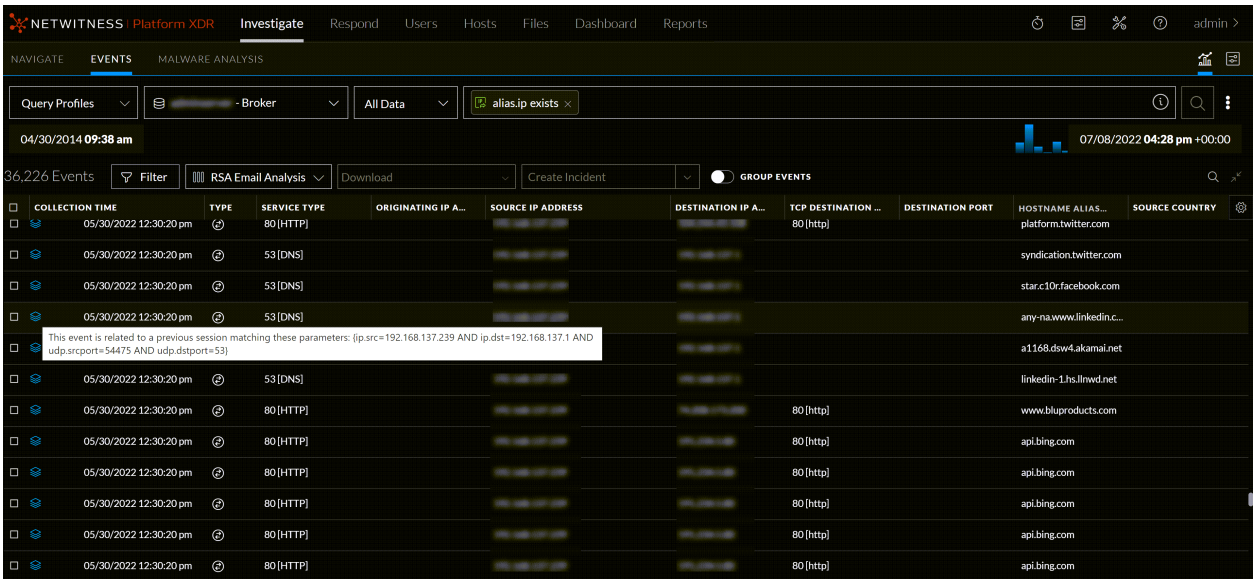
The Overview Tab displays all the headers related to a specific event and the Event Metadata Panel displays all the metadata related to the selected event.



In 11.7, when you open the meta panel to view the selected event details, all the available headers will be displayed. The meta panel contains Expand buttons (). When you click on an event, the meta panel is displayed. In case, there are no additional headers to display, an error related to the header error is displayed.

The analyst can use the expand option to broaden the meta panels in three different views. When the outward facing arrow is clicked, it expands all the details displayed under the Overview and Event Metadata panel are displayed.

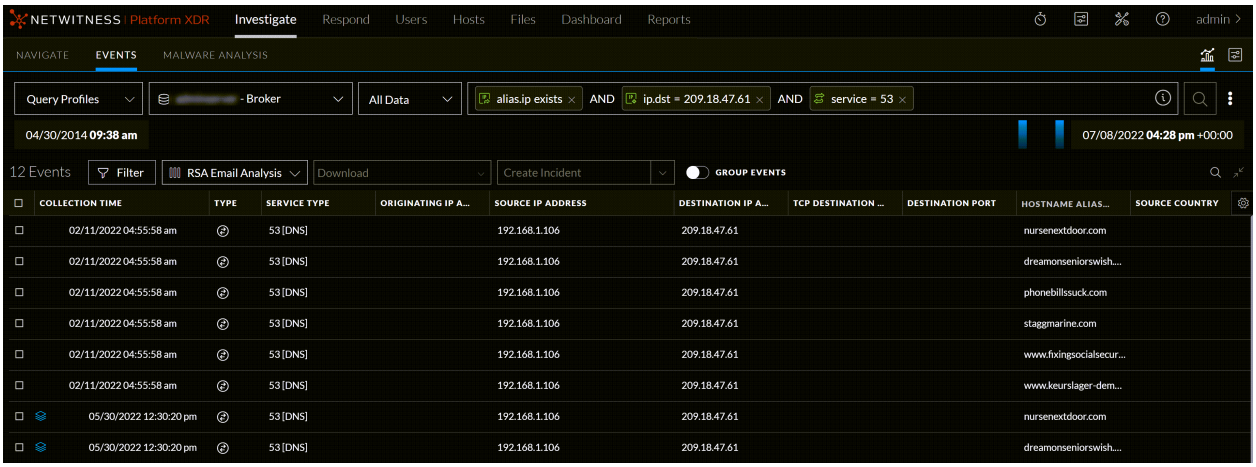
When clicked one more time, you can get an expanded view.



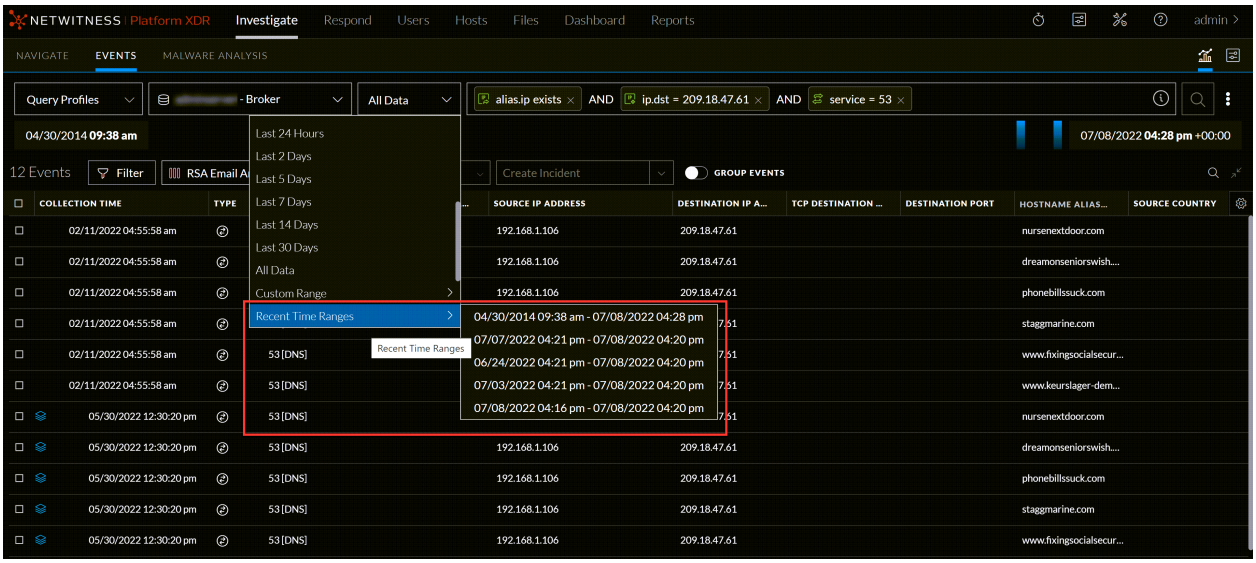
The analyst can revert the screen display by clicking the icon with the inward facing arrow , so that the window reverts to the earlier position. This helps the analyst to view the details of each event in an optimum manner.

The analysts can search for related sessions for a specific event as part of an investigation. The search for related sessions can be performed by navigating to the **Investigate** > **Events** page. You can click the icon and select either Find Related Sessions or Find Related Sessions in New Tab option from the drop-down.

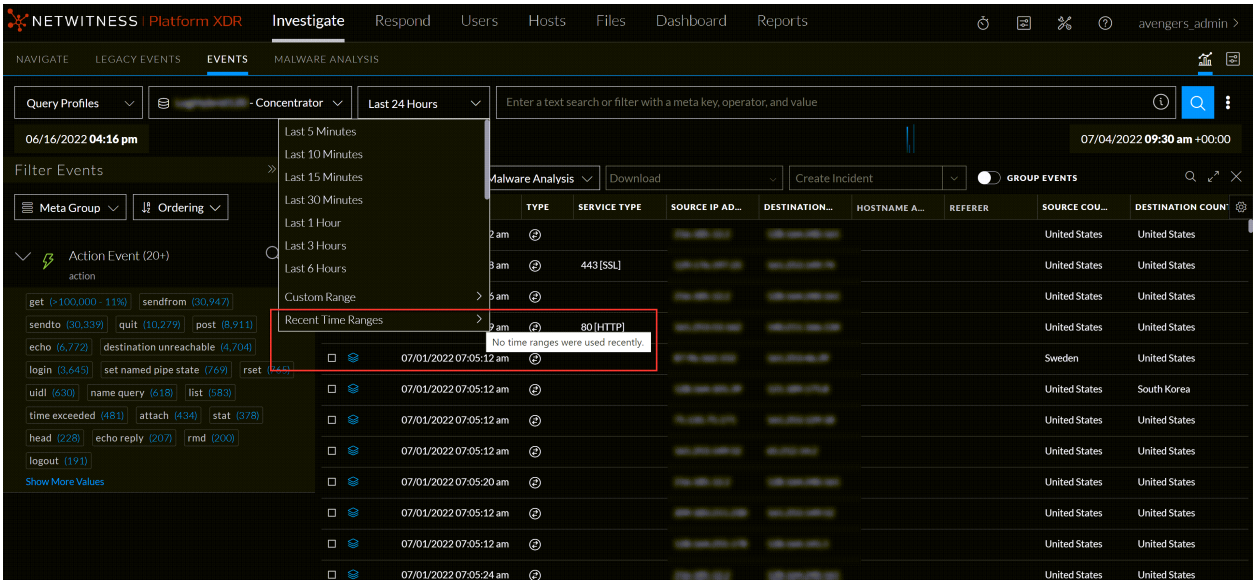
When you select the **Find Related Sessions** option, all the events that are matched by selected event's query will be displayed in the current window. And if you select the **Find Related Sessions in New Tab** option the results are displayed in a new tab. The analyst can further investigate on each of the related session.



The query is based on the information displayed in the hover over text of an event. For example, in the below image the event has two split sessions where one event is split into one another session.

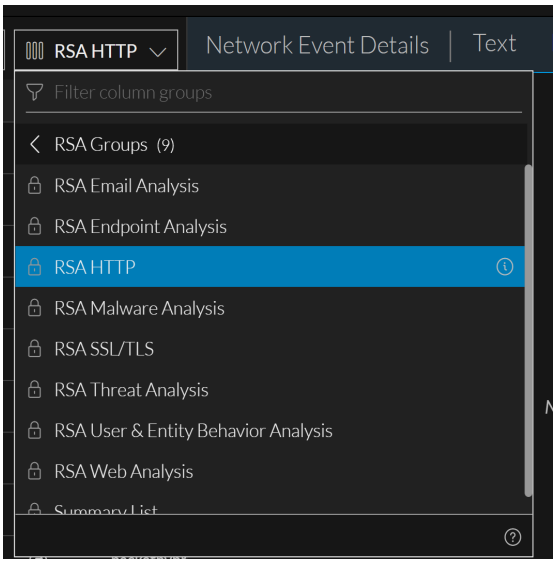


So, in this case when a search is done on these parameters, the related session for the following query is displayed.



The results are displayed in the following format:

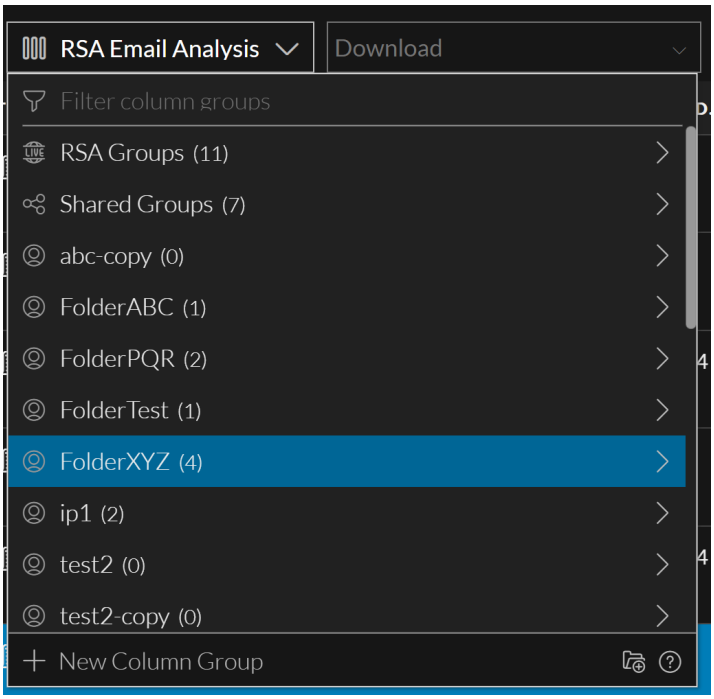
An analyst can view the last five time-ranges that were used recently, as the selection will be saved and displayed under the Recent Time Ranges section. The selection is saved separately for a user per service. For example, for Concentrator service, if you select Last 30 Days as the time-range, this will create an entry under the Recent Time Ranges section for Concentrator and when you select the same service in the next session, then the time range will be shown as below:

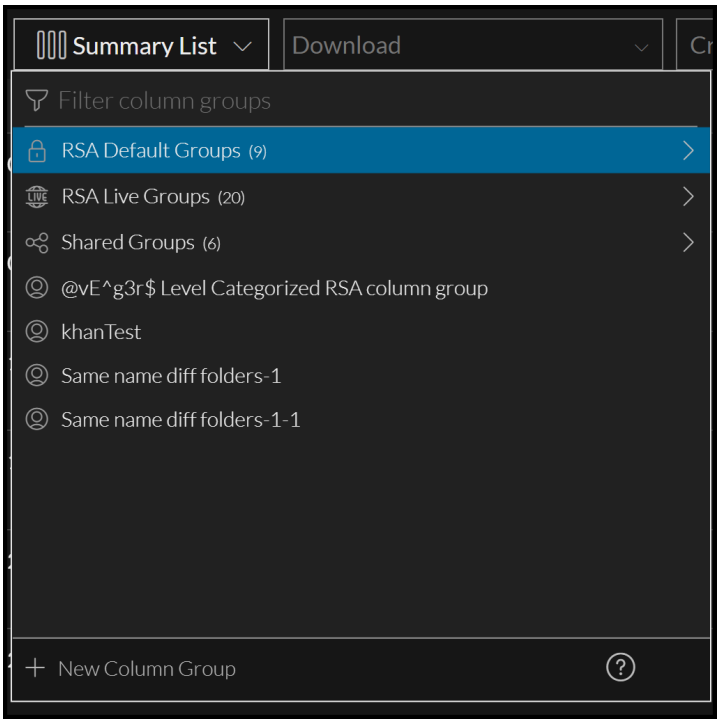


Now, if you select Concentrator service and if you have not viewed the details of the Concentrator recently, then the time range drop-down will not display any details as shown below:

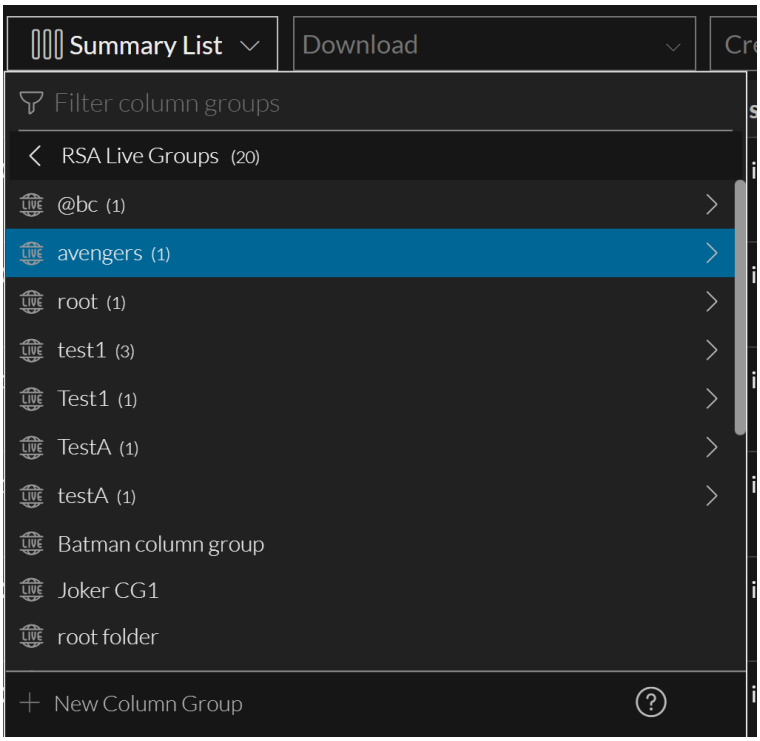
Built-In Column Groups

NetWitness Platform XDR has built-in column groups that include useful meta keys for specific types of investigation. The built-in groups cannot be edited or deleted, but you can create a copy of the group and edit the copy. The column groups are listed in alphabetical order in the Column Group menu in a way that makes built-in groups distinguishable from custom groups that you imported or created.

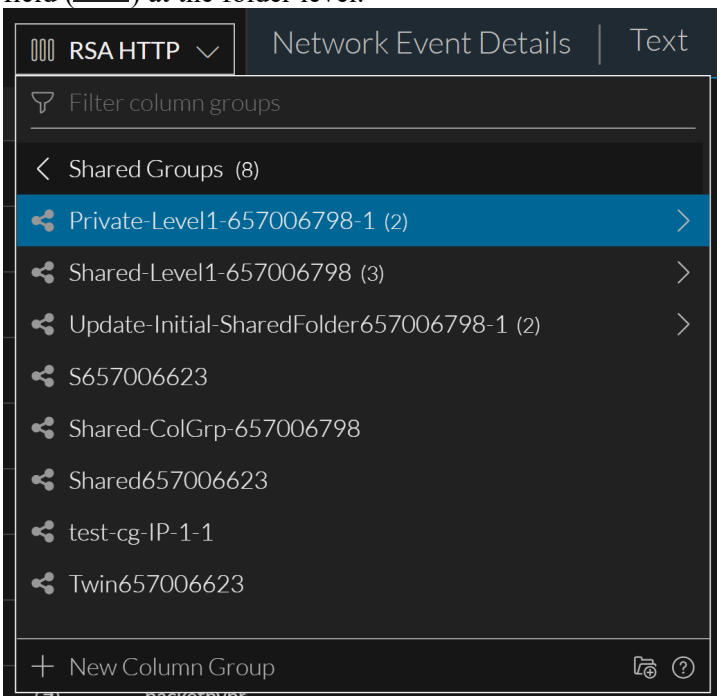




In the Legacy Events view, "RSA" precedes the name of built-in column groups. In the Events view (Version 11.4 and later), RSA precedes the name and the group is marked by the lock symbol ( ). This is an example of a selected built-in column group in the Column Groups menu. The information icon is displayed at the end of the row.



Live Column Groups



In 11.6 and later, NetWitness Platform XDR supports deploying the investigate content from live and are marked by the live symbol ( ) . The column groups are categorized as RSA Groups (RSA Live content and RSA OOTB Groups), and Shared Groups. The groups are displayed as non-editable folders and sub-folders except for Shared Groups that can be edited. All private content is displayed outside these groups. For example, the below image shows private content below the Shared Groups folder. The number inside () depicts the number of contents inside a folder and > symbol helps you to drill down inside the folder.

New Column Group

The column group can be copied by clicking the copy icon ( ). After copying, the copied column group is displayed under the selected location (Private folders or Shared groups). You can hover over on the cloned item to view a tool tip that displays the path from which the column group is cloned. In case you need to search for a specific column group, you can type the name of the column group in the filter field ( ) at the folder level.

These are the built-in column groups.

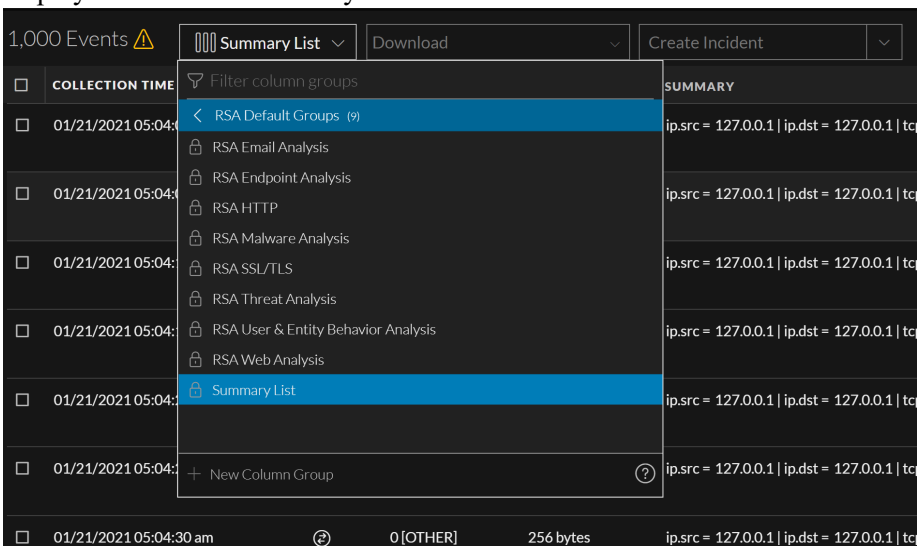
- **RSA Email Analysis**: Includes meta keys that are useful when investigating email-related metadata.
- **RSA Endpoint Analysis**: Includes meta keys that are useful when investigating endpoint-related metadata.
- **RSA Malware Analysis**: Includes meta keys that are useful when investigation potential malware.
- **RSA HTTP**: Includes meta keys that are useful when investigating HTTP related metadata.
- **RSA SSL/TLS**: Includes meta keys that are useful when investigating SSL/TTS analysis related metadata.
- **RSA Threat Analysis**: Includes meta keys that mark potential threats in the data set.
- **RSA User and Entity Behavior Analysis**: Includes meta keys that are useful when investigating UEBA data.
- **RSA Web Analysis**: Includes meta keys that mark anomalies in web traffic.
- **Summary List**: Includes meta keys that are useful in a general investigation. This is the default column group.

Custom Column Groups

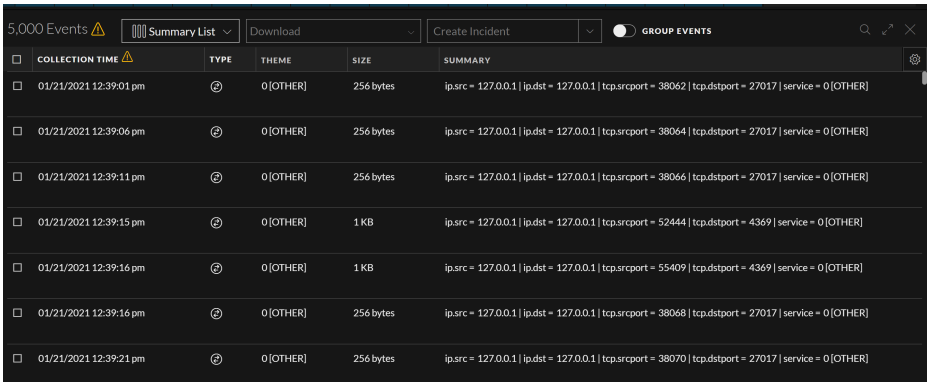
You can create custom column groups to support scenarios that you use frequently while working in Investigate. When an administrator adds custom meta groups manually by editing the custom index file for a service, the new meta groups become available to use in column groups after the service is restarted.

Custom column groups are shared globally within your organization in Version 11.4. If you edit a shared custom column group, your changes are applied globally. If you delete a shared custom column group, the group is deleted and no longer available for all analysts. In Version 11.5 and later, you can create shared column groups as before, and can also create private column groups. When you create a group in Version 11.5, you can choose to share it or you can keep it private (default); you cannot change a shared group to private or a private group to shared.

Note: Private column groups created in the Events view are not visible or usable in the Legacy Events view.

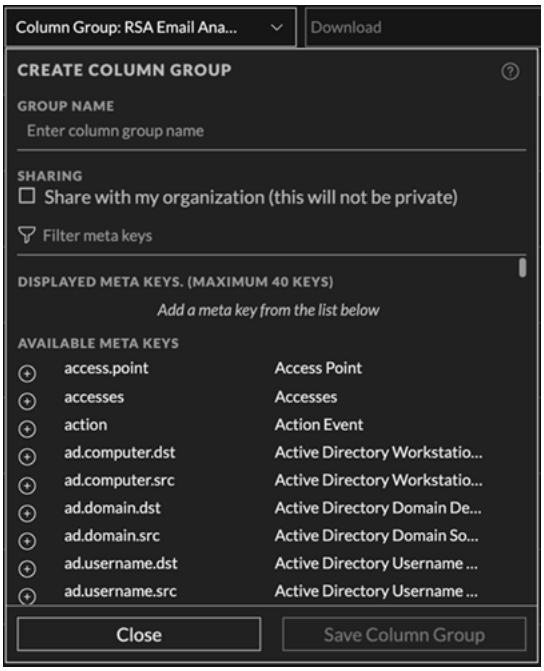


Icons identify the group type in the Column Group menu. These are examples of each type of custom column group with the edit icon displayed at the end of the row.

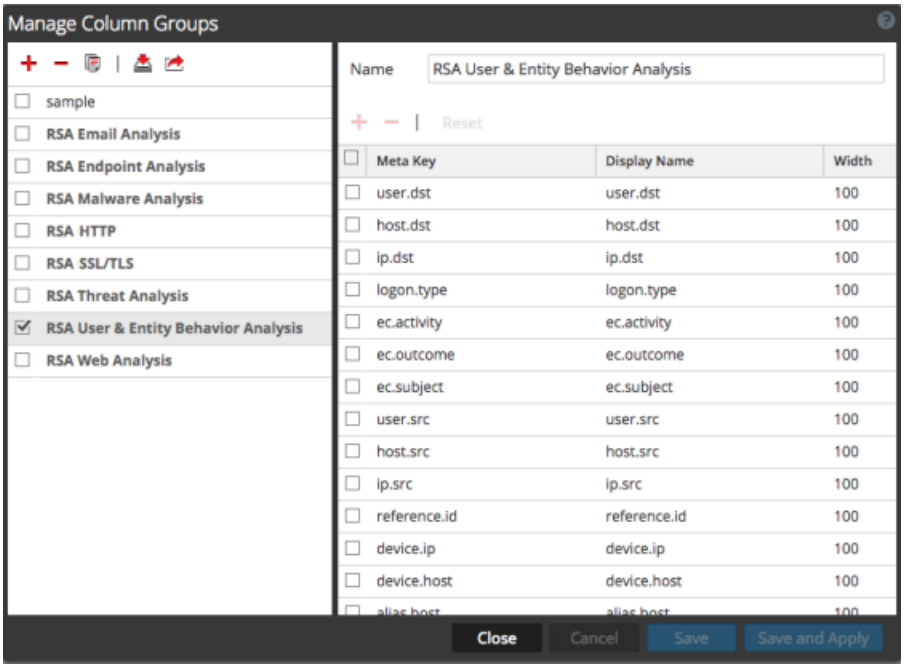


Filtering Folders

In case there are many folders, you can type the folder name and filter for a specific folder. The filtering is applicable to the current level folders and will not display folders available within a sub-folder. To search content within a sub-folder you need to navigate to the specific folder and filter.



Also, when you select a specific folder, the content of the selected folder is displayed and the filter field becomes empty and when you navigate back the last selected folder is displayed. In the following example, the folder selected is RSA Groups with the its content and the column group drop-down displays the filtered Summary List folder.



Dialogs for Managing Column Groups

While the functionality of column groups is similar in the Legacy Events view and the Events view, the user interface and some of the procedures are different. The following figures illustrate the (Events view) Create Column Group dialog and the (Legacy Events view) Manage Column Groups dialog. The Version 11.5 and later dialog includes a Sharing option.

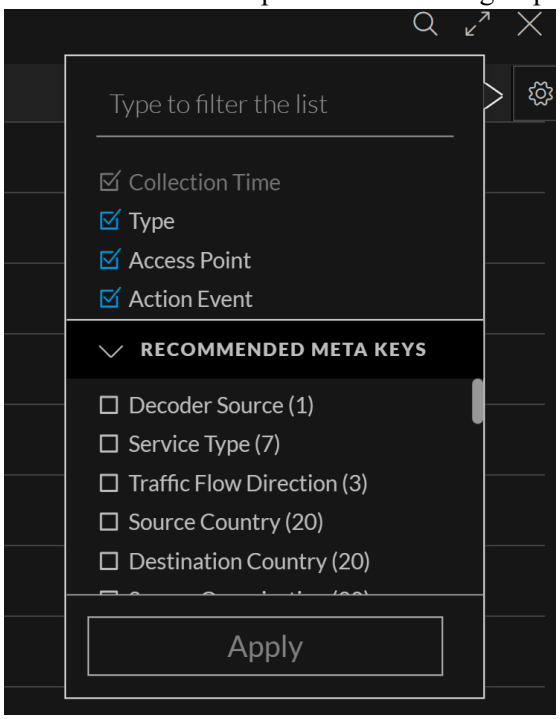
Using options in the Create Column Group dialog and the Column Group Details dialog, you can:

- See the details of a column group.
- Create, edit, and delete custom column groups.

Using options In the Manage Column Groups dialog, you can do all of above and these additional functions:

- Clone and edit the clone of a built-in or custom column group.
- Import and export a column group.

The rest of this topic provides instructions for working with column groups in the Version 11.4 and later Events view, the 11.3 and earlier Event Analysis view, and the Legacy Events view.



Work with Columns and Column Groups in the Events View

After the upgrade to Version 11.4, all of the existing column groups -- both built-in and custom -- are available for management in the Events view. Unless noted, the procedures in this section are for the Events view.

Manually Select Columns to Display and Adjust Column Order and Width

Note: The Column Selector was also available in the 11.3 Event Analysis view. If a column group includes a column for a meta key that your administrator has blacklisted (hidden), the data for that column cannot be displayed. The column is not available in the Column Selector and is not displayed in the Events panel.

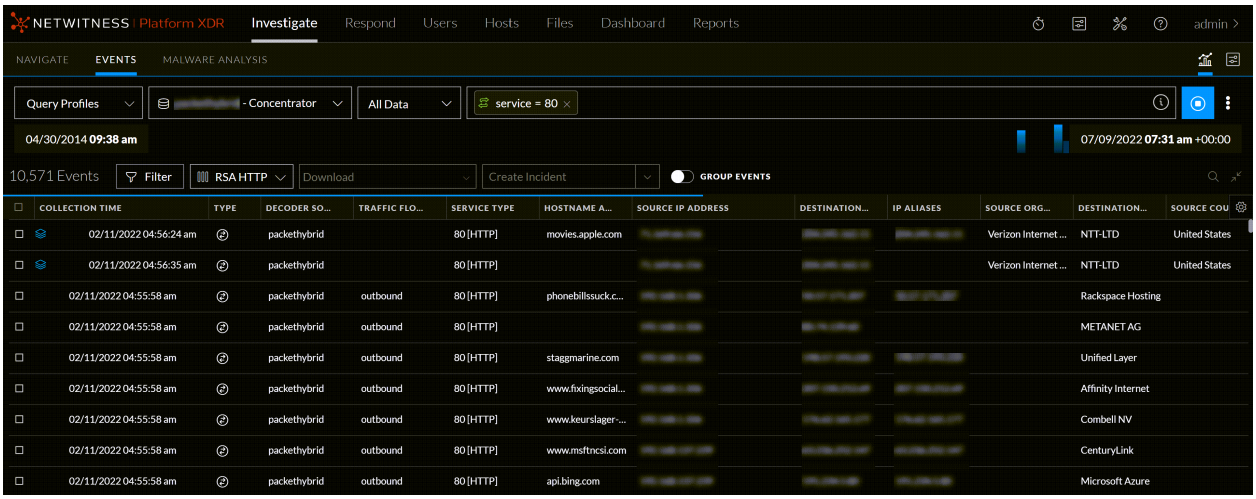
1. With the Events list open and a column group applied, click ⚙ to display the column selector.

2. Select the meta keys or enter the name of a meta key that you want to display in additional columns.
3. Deselect the meta keys that you do not want to display in a column.
   The data is redisplayed using the selected columns.
4. To change the width of the columns in the events list, hover the cursor over the column title and drag the column divider to the right or the left.

5. To rearrange the order of the columns across the top of the events list, hover the cursor over the column title and drag the column to the right or the left.
   The changes that you make in the events list are in effect during the current session and are not retained as part of the column group. The next time the column group is applied, the original composition and order of columns is applied.

Select a Column for Sorting Events in the Events Panel (Version 11.4)

Note: You can sort events in the Events panel after results have finished loading if all connected services are updated to 11.4. or later. Sorting by column is disabled when any connected service is running an earlier version of NetWitness Platform XDR. Version 11.4.1 has more visible sorting toggles in the column heads and the ability to view results without sorting, but otherwise it functions the same as in Version 11.4.



You can change the order of the events list in the Events panel based on the value for a meta key in the event. Each column title represents a meta key, and the column is populated by the values found for the meta key in the displayed events. In Version 11.4, the events in the Events panel are sorted using the method selected in the Event Preferences dialog: Ascending or Descending. If no sort method is selected, the default order is ascending (see Configure the Events View). In Version 11.4.1, the events in the Events panel are sorted only when the sort preference in the Event Preferences dialog is selected and is either Ascending or Descending. The events are not sorted if you do not have a sort preference selected under Events Preferences or if you selected Unsorted.

Sortability of a column is based on the definition of the meta key in the Broker and Concentrator index files. Columns for meta keys that are indexed by value are sortable. If the meta key is not indexed, is indexed by meta key, or has multiple values in the same event, it is not sortable.

- These are some examples of keys that are indexed by value and sortable: `time`, `eth.type`, `city.src`, `ip.src`, `ipv6.dst`, and `ipv6.src`.
- Meta entities are not sortable. For example, the meta entity `ipv6.all` is not sortable because it includes `ipv6.dst` and `ipv6.src`, and a single event has both `ipv6.dst` and `ipv6.src`.
- These are some examples of multiple value keys, which cannot be sorted: `filename`, `filetype`, and `attachment`. A single event can have more than one file and therefore more than one value for `filename`, `filetype`, and `attachment`.
- These are some examples of meta keys that cannot be sorted because they are not indexed or not indexed at the values level: `password`, `query`, and `size`.

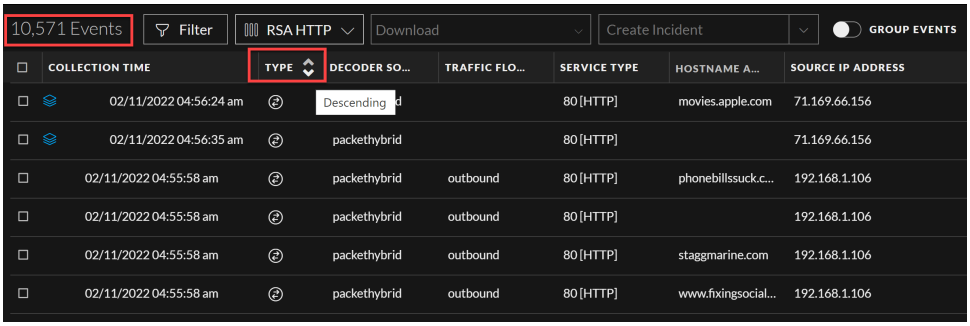
Sorting by Column (Version 11.4.1 and Later)

The initial view of the Events list with the sorting preference set to Unsorted and no column sorting has an event count in the title, with no indication of a sorting method applied to a column. If the event sorting preference is set to Ascending, the count label is "Oldest 1,000 Events." If the event sorting preference is set to Descending, the count label is "Newest 1,000 Events." In the figure below, the Ascending method is in effect, more than 2001 events matched the query, and only the oldest 2001 are displayed. Clicking the amber warning triangle displays an explanation. Refer to Configure the Events View for more information about the sorting preference.

When you move the mouse over a column title, sortable columns have a pair of arrows after the column title, one pointing up for ascending and one pointing down for descending ( ). You can choose one sort column and the direction of the sort. A blue up arrow ( ) indicates that ascending sort order is in effect; which means the earliest events or the lowest numbers, or the text strings beginning with an 'A' appear first. A blue down arrow ( ) indicates that descending sort order is in effect; which means the latest events or the highest numbers, or the text strings beginning with a 'Z' appear first.

- When a column has a blue arrow, you can click the white arrow to change the sort order. When you change the sort order, a blue progress bar is displayed in the Events list title bar to show progress. As sorting begins, there is a short segment on the left side of the window; as sorting progresses the blue color extends to the right across the entire title bar. The directional arrow does not change until the events are re-sorted in the chosen sort order.
- To change the column to unsorted, you can click the blue arrow. Both arrows are white now to show that the column is unsorted. This figure shows the Type column sorted in ascending order.

- If a column is not sortable, no arrow is displayed when you hover the mouse over the column title. Instead a tooltip explains why it is not sortable.



Sorting on a column is done on the client side without re-executing the query if the number of displayed results is less than the events limit set by the administrator. If there are more results that are not displayed because the number of results exceeded the events limit, a new query is submitted with the new sort order, and the same service, time range, and filters. The current results are removed, a spinner indicates progress, the Cancel button becomes available, the reconstruction closes, and progress is visible in the Query console.

Note: The re-sorting of events takes place in the browser when the number of results of the original query is less than the event display threshold.

To change the sort order or the sort column

1. Move the mouse over the column titles to find a sortable column.
   If a column is not sortable, a tooltip that explains the reason is displayed.

2. To sort the list based on a column, move the mouse over a sortable column and click one of the arrows ( ).
   The arrow turns blue and the events are reloaded in the selected order. If both arrows are white, the column is not being used to sort the events list. If one arrow is blue, the column is being used to sort the events list, and the sort order (Asc or Desc) is appended to the events count in the title bar. This figure shows a column sorted in ascending order. When a column is descending order, (Desc) is appended to the event count.

   a. Click a white arrow to sort the events list in that order.

   b. Click a blue arrow to return to unsorted order.

Sorting by Column (Version 11.4)

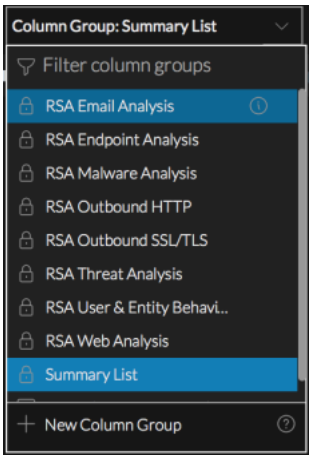
When you move the mouse over a column title, sortable columns have an up or down arrow (or) after the column title. You can choose one sort column and the direction of the sort. An up arrow indicates that Ascending sort order is in effect; which means the earliest events or the lowest numbers, or the text strings beginning with an 'A' appear first. A down arrow indicates that Descending sort order is in effect; which means the latest events or the highest numbers, or the text strings beginning with a 'Z' appear first. When you select a sort column, it is sorted in descending order by default, with events having a null value for the meta key first.

- A column that is being used to sort the events list has a bright white arrow indicating the direction that you can choose for sorting: click to change to Ascending or to change to Descending order. When you click to change to Ascending sort order, the directional arrow does not change until the events are re-sorted in ascending order. The same behavior applies when you click the to change to Descending order.
- If a sortable column is not being used to sort the events list, the arrow is dimmed. If a column is not sortable, no arrow is displayed when you hover the mouse over the column title. Instead a tooltip explains why it is not sortable.
- If you click the arrow on a different column, the column is sorted in the same order as the previously active sort column. You can select a different sort order if desired.

Sorting on a column is done on the client side without re-executing the query if the number of displayed results is less than the events limit set by the administrator. If there are more results that are not displayed because the number of results exceeded the events limit, a new query is submitted with the new sort order, and the same service, time range, and filters. The current results are removed, a spinner indicates progress, the Cancel button becomes available, the reconstruction closes, and progress is visible in the Query console.

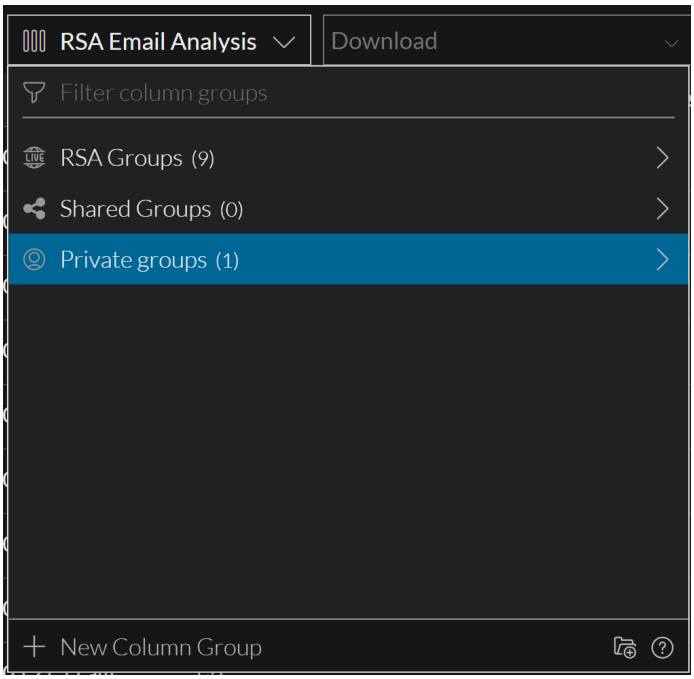
Note: The re-sorting of events takes place in the browser when the number of results of the original query is less than the event display threshold. If some of those events have the exact same time, they will not change order as you might expect when you reverse the sort order.

To change the sort order or the sort column:



1. Move the mouse over the column titles to find a sortable column.
   If a column is not sortable, a tooltip that explains the reason is displayed.
2. To sort the list based on a column:
   a. Move the mouse over a sortable column and click the arrow (or).
      The events are sorted in the correct sort order. If you hover over the column title, you can see that the arrow is no longer dimmed. A column that is being used to sort the events list has a bright white arrow that you can click to change the sorting direction.
   b. To change the sort order, click to change to Ascending or to change to Descending order.
      The direction of the arrow changes and the events are reloaded in the selected order.

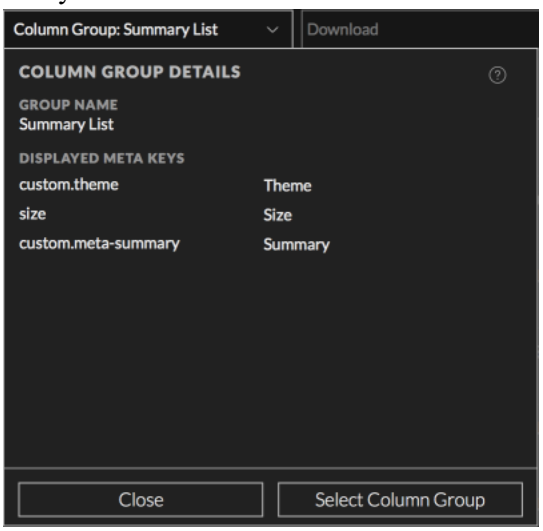
View the Meta Keys Included in a Column Group



To view details of a column group:

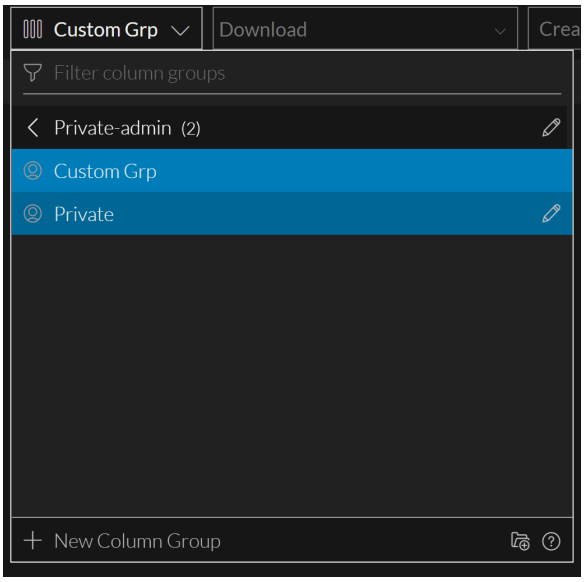
1. Go to **Investigate > Events** and click to load events.
   The events for the default service and the default time range are loaded in the Events panel. The Summary List column group or the column group from your last session is applied to the list.
2. To display the Column Groups menu, click the Column Groups menu title. The Column Group menu title includes the title of the currently selected column group. If this is your first visit after logging in, the Summary List group is selected; any subsequent visits use the column group selected in the previous session. When opened, the menu displays a list a list of built-in column groups (RSA), shared custom column groups, and your private custom column groups. The figure shows the Version 11.6 menu initially when Summary List is selected by default and all types of column groups are

visible: Private, Shared, and RSA.



3. (Optional) To control the types of column groups that are visible in the list, use any combination of the visibility options (blue = selected, black = not selected):
   Private = display private groups that only you can manage
   Shared = display shared groups that anyone in your organization can manage
   RSA = display built-in groups that only RSA can manage
   The visibility options work together with the Filter Column Groups field. If the visibility option is hiding built-in groups (which include "RSA" in the group name) and you search for a name that contains "RSA," the list is empty. The figure below shows private and shared visibility options selected.

4. Hover over the **Summary List** group and click the information icon ( ) to see which columns are included in the group.
   This figure shows the columns for the Summary List. The Collection Time and Type column are

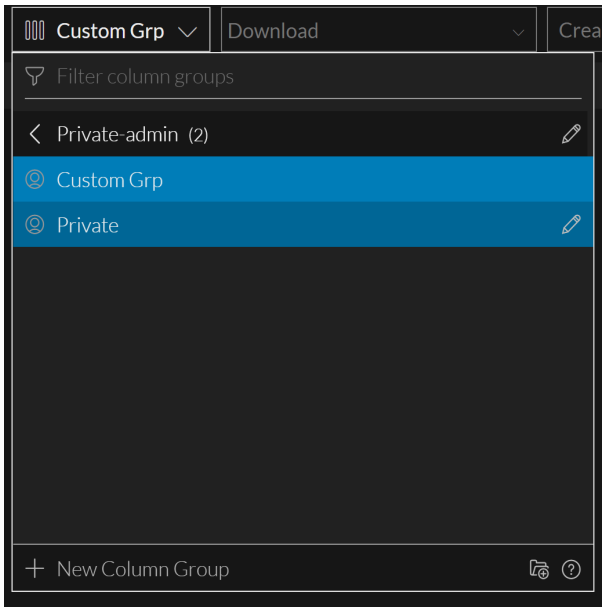


always the first two columns in the Events list, but are not listed in the Column Group Details dialog.

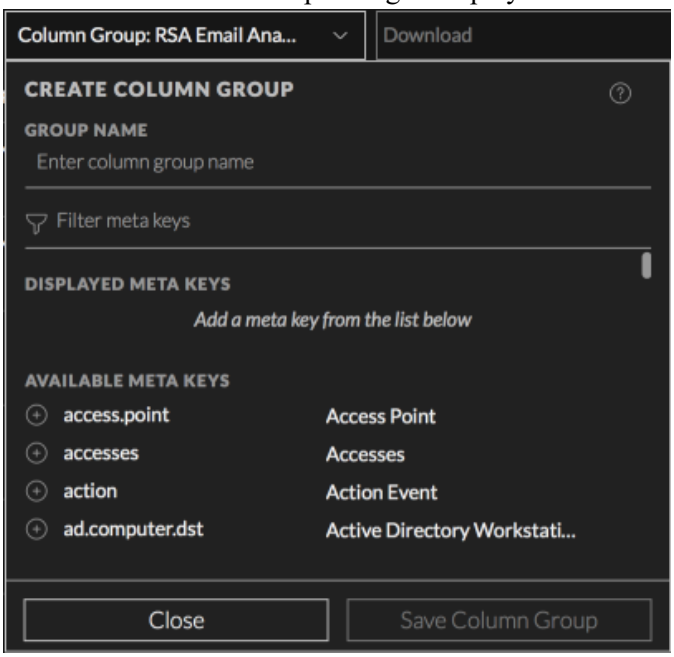
5. Do one of the following.
   a. To close the dialog, click **Close**.
   b. If you want to apply the column group, click **Select Column Group**.
      The dialog closes and the Events list is updated to reflect the selected column group.

Select a Column Group

1. With the Events panel open in the 11.4 or later Events view, click the **Column Group** menu title.
   The menu drops down to display a list of column groups with a filtering option and a New Column Group option. The list is sorted alphabetically and the selected column group is displayed in the menu label. The first option in the list is highlighted. The selected column group has a slightly different background color than the highlighted column group.
   The following figure shows the menu after RSA Endpoint Analysis was highlighted, but RSA Email Analysis is still selected.



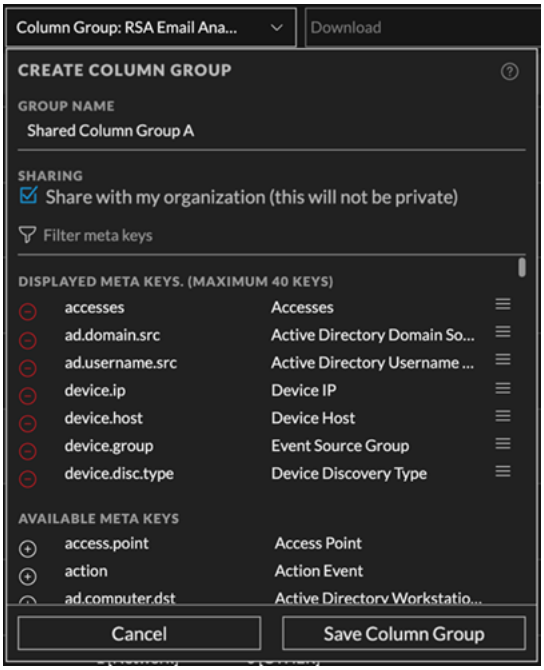
2. Do one of the following:
   a. If the highlighted group is the one you want to apply, press **ENTER**.
   b. (Version 11.5 and later) If you want to see only certain types of groups, use the visibility options (**Private**, **Shared**, and **RSA**) to hide one or two group types.
   c. Begin typing text in the **Filter column groups** field to search for a column group name. As you type, the list is filtered to show only the column group names that contain that string.
   When you see the group that you want to apply, click it or use the down or up arrow to highlight it, then press **ENTER**.
   The Events list is refreshed to include only columns in the selected column group, and the menu title includes the selected group name. Your selection persists when you navigate away from the Events view. The order of the columns in the Events list reflects the order of the meta keys in the column group. A column group may contain more columns that are only visible when you scroll to the right. For optimal viewing, the first 15 columns are displayed by default when you select a column group.



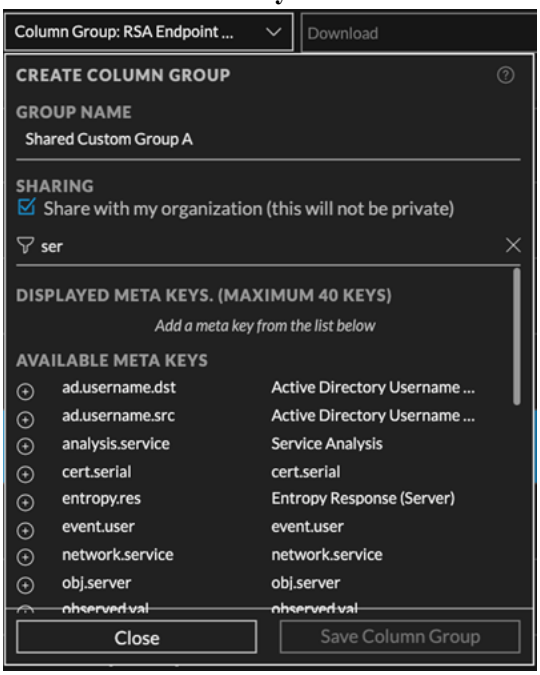
Note: If a meta key in a column group is not part of the selected service, it does not appear in the Filter Events panel or in the Events panel.

Create a Custom Column Group

1. Go to **Investigate > Events** and submit a query to load data in the Events panel.
2. In the Events panel toolbar, click the **Column Group** menu title.
   The menu drops down to display a list of column groups with the Visibility Options and Filter Column Groups field at the top and the **+ New Column Group** option at the bottom.

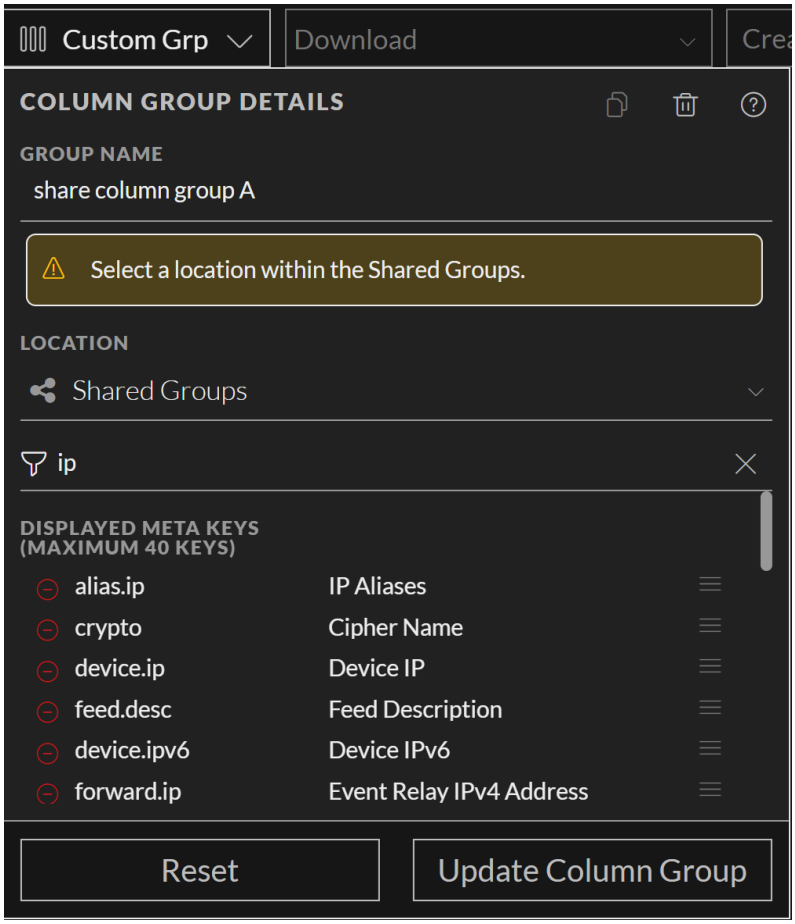


3. Select + **New Column Group**.
   The Create Column Group dialog is displayed. Version 11.5 includes the Sharing option.



4. In the **Group Name** field, type a unique name (maximum length of 256 characters) for the new column group, for example, **Custom Column Group A**.

5. (Version 11.5 and later) If you want to share the new column group with your organization, set the **Share with my organization** option.



6. To add a meta key to the column group, select and add each meta key as follows:

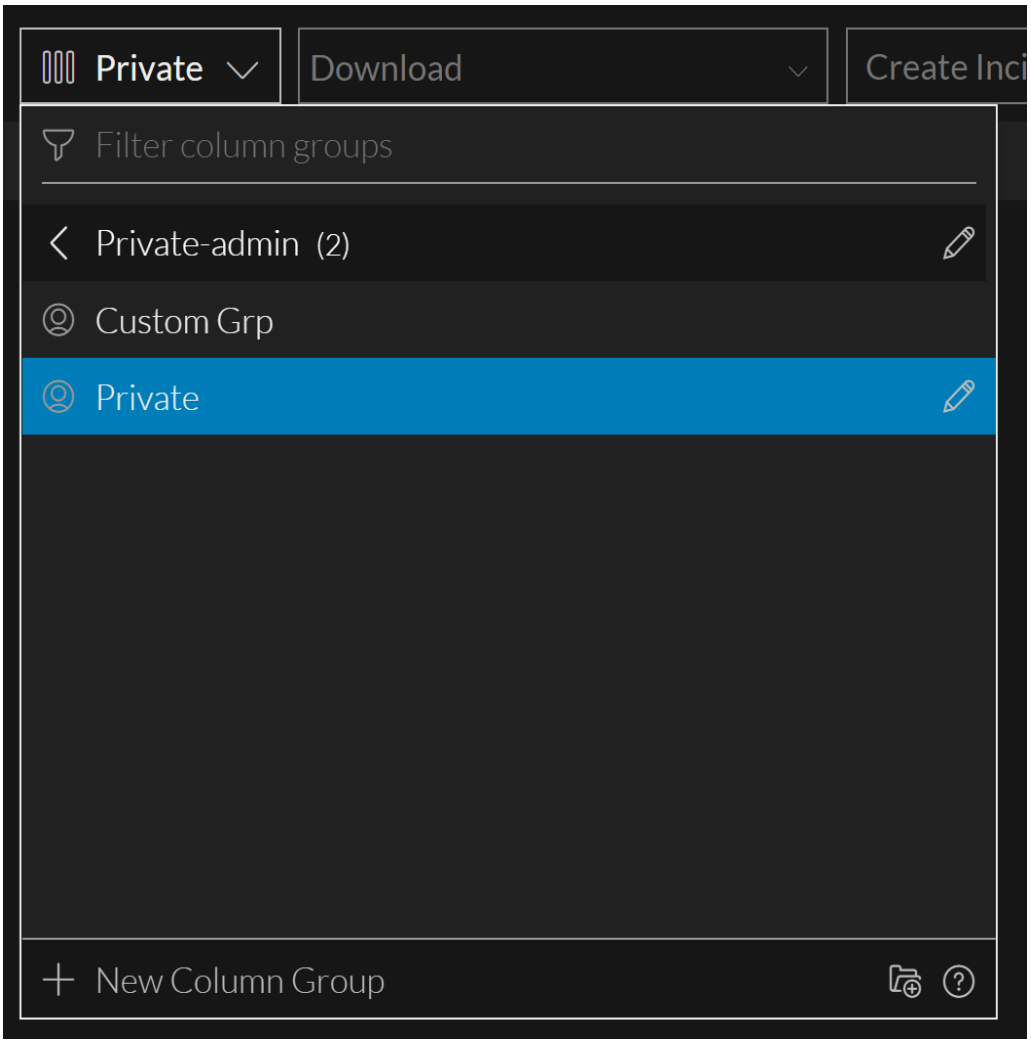
   a. Type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Available Meta Keys** list.

   b. When you see the meta key that you want to add, click the add icon  that precedes the meta key name.
   The meta key is added to the end of the Displayed Meta Keys list. (This list is also filtered using

the text you typed.) The maximum number of meta keys in a column group is 40. If you attempt to add another meta key when 40 are already included in the Displayed Meta Keys list, a message advises you that the group has the maximum number of meta keys.

7. (Optional) To find and remove a meta key from the column group, type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Displayed Meta Keys** list. When you see the column that you want to remove, click the remove icon ( ) that precedes the meta key name in the **Displayed Meta Keys** list.
   The meta key is moved back to the Available Meta Keys list.
8. (Optional) To change the order of the displayed meta keys in the Displayed Meta Keys list, place the cursor over the list order icon ( ). When the cursor changes to the drag and drop icon ( ), drag the meta key up or down in the list.
9. Do one of the following:
   a. To close the dialog without creating the custom column group, click **Cancel**.
   b. To create the group, click **Save Column Group**.
      The new column group is saved and becomes available for all analysts. The buttons change to Done and Select Column Group.

10. Do one of the following:
    a. To close the dialog, click **Done**.
    b. To close the dialog and select the new column group, click **Select Column Group**.
    The new group is added to the Column Groups menu (in alphabetical order), and if you clicked Select Column Group, the Events list is updated to show the columns in the new column group.

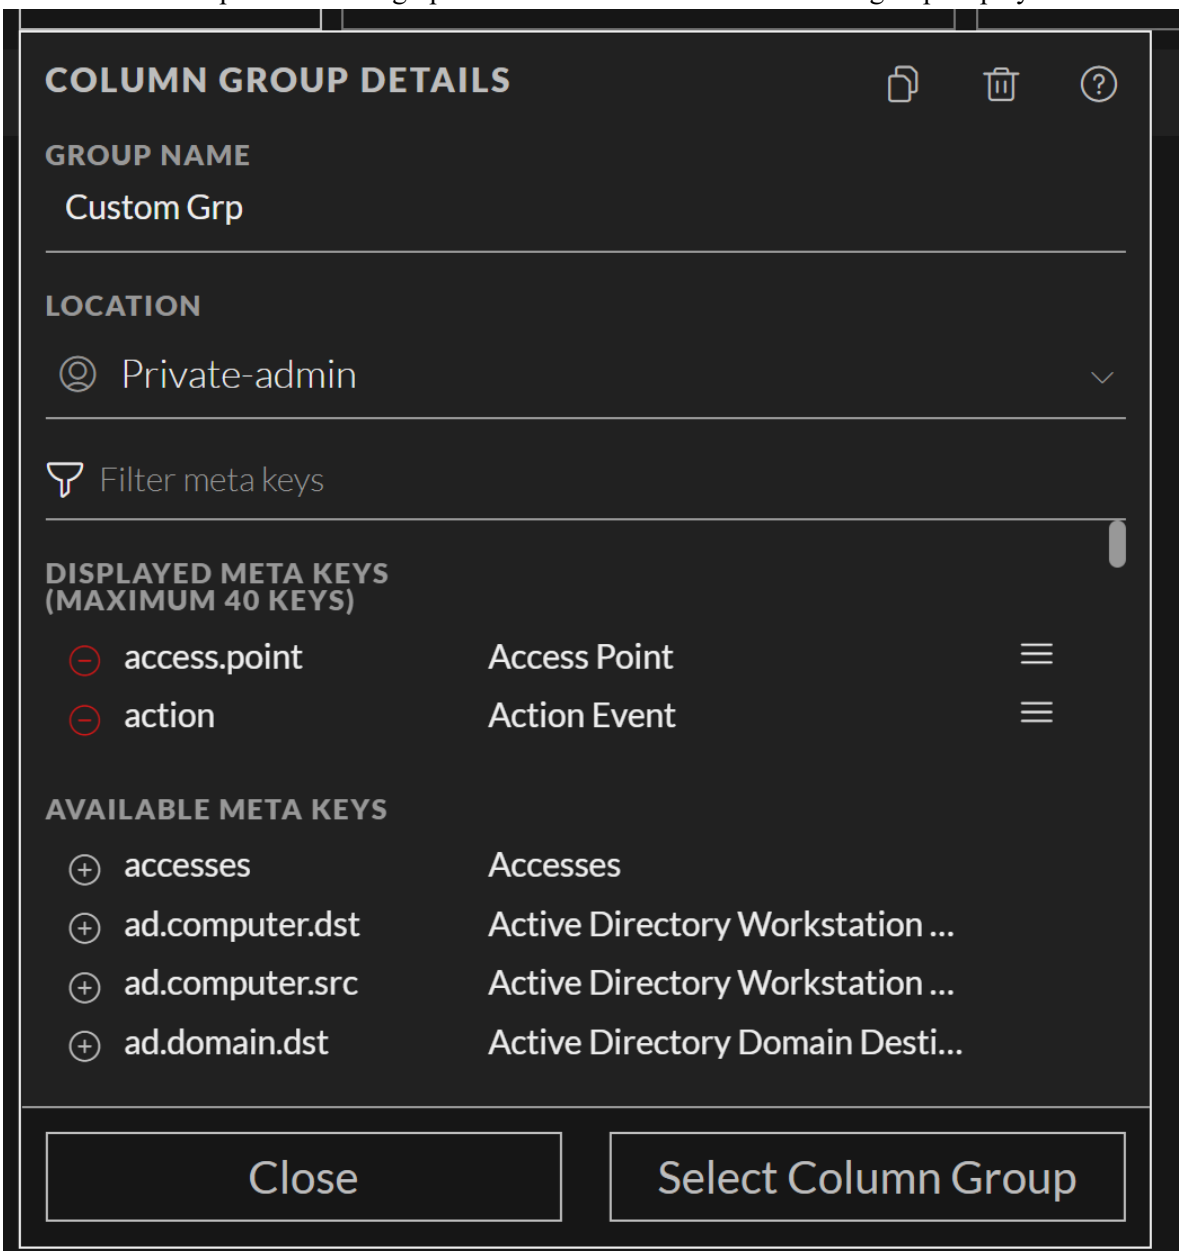


Delete a Custom Column Group

You can delete any custom column group that is not currently applied in the Events list and not part of a query profile. The built-in column groups are read only, and cannot be deleted. In Version 11.5 and later, a confirmation message allows you to confirm or cancel the deletion. When you delete a custom column group, it is removed from the Column Group menu.

Caution: When you delete a custom column group (Version 11.4) or a shared column group (Version 11.5), the effect is global and the group is no longer available to any analyst.

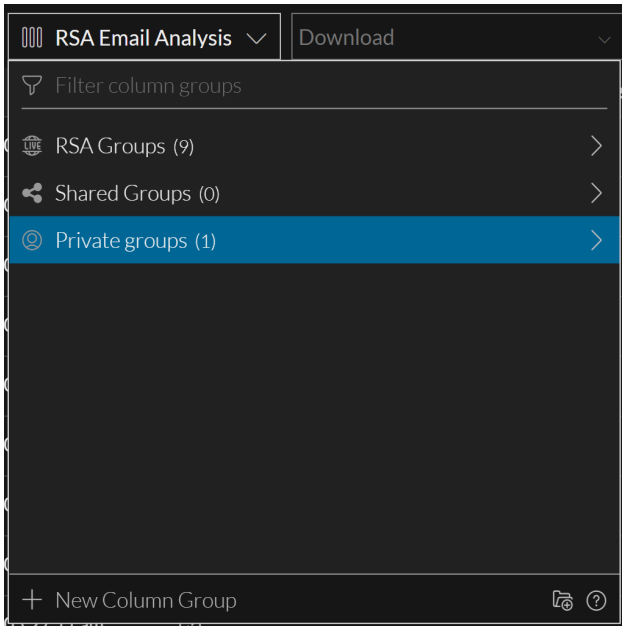
To delete a custom column group



1. Go to **Investigate > Events** and click  to load events.
   The events for the default service and the default time range are loaded in the Events panel. The Summary List column group or the column group from your last session is applied to the list. This figure shows the initial view with the Summary List column group selected. The label on the Column Group menu includes the name of the selected column group.

2. To delete a column group, highlight a custom column group as shown in the following figure and click the edit icon ( ) to the right of the name.

3. The Column Group Details dialog opens with the details for the selected group displayed.

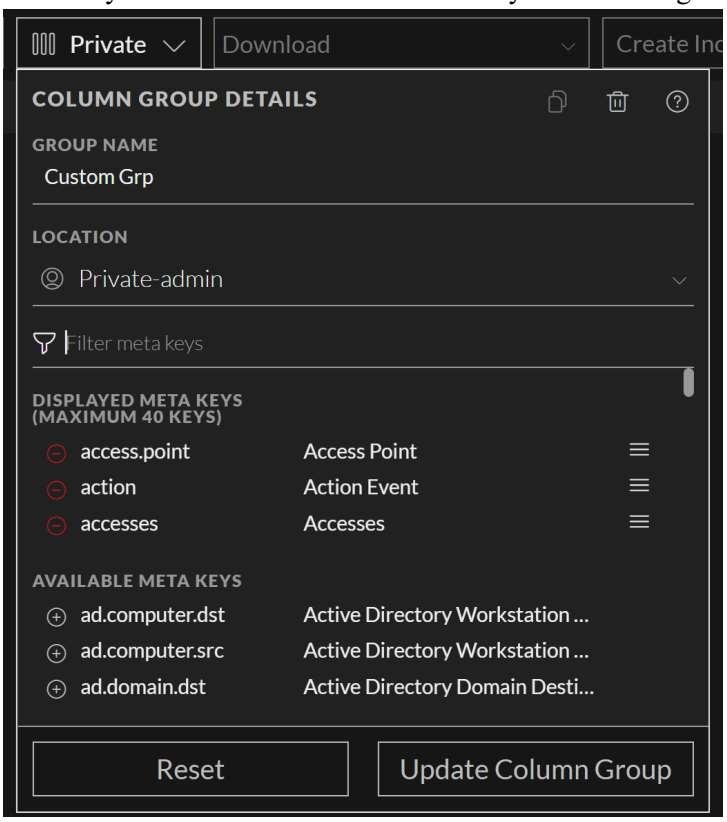


4. Click the delete group icon ( ).
   If the column group is currently in effect, the following message is displayed: `This column group cannot be deleted because it is currently active.`
   In Version 11.5, a confirmation message gives you the opportunity to confirm or cancel the deletion. Click **Cancel** or **Delete Column Group**.
   In Version 11.4, if the column group is not in effect and is not a built-in column group, there is no request for confirmation before the column is deleted.
   The group is deleted and removed from the Column Groups menu. The column group no longer appears anywhere for any analyst working in Investigate.

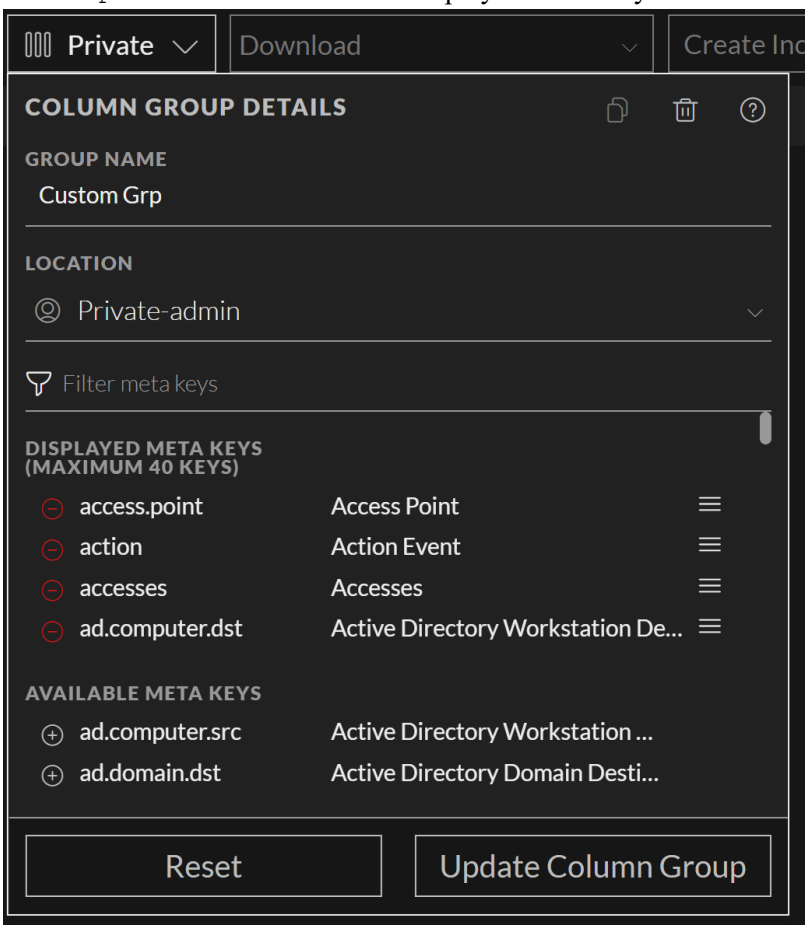
Edit a Custom Column Group

You can create a shared or private copy of any column group that is not open for editing. After you create the copy, you can edit the new group in the usual way.

1. Go to **Investigate> Events** and submit a query to load data in the Events panel.
2. In the Events panel toolbar, click the **Column Group** menu title.
   The menu drops down to display a list of column groups.



3. Highlight the column group that you want edit. This figure shows a custom column group highlighted, with the edit icon displayed to the right.



4. Click the edit icon ().
   The Column Group Details dialog is displayed so that you can edit the Group Name and Displayed

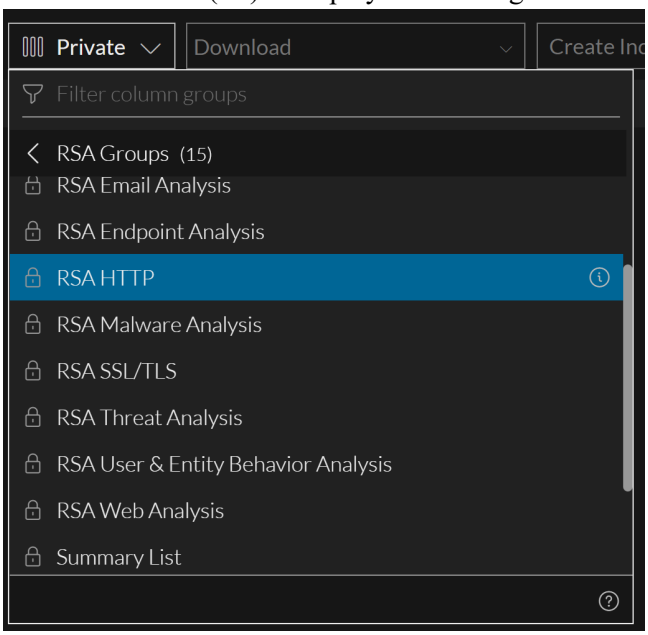
Meta Keys. You can add or delete meta keys and rearrange the order of the meta keys in the list.

5. (Optional) In the **Group Name** field, edit the name of the column group.
6. (Optional) To add a meta key to the column group, select and add each meta key as follows:
   a. Type a text string in the **Filter meta keys** field and look for meta keys that contain that text in the **Available Meta Keys** list. Or just scroll through the list to find the meta key.
   b. When you see the meta key that you want to add, click the add icon  that precedes the meta key name.
   The meta key is added to the end of the Displayed Meta Keys list. (This list is also filtered using the text you typed.) This figure shows the group name changed to Column Group C and

`ad.computer.dst` added to the Displayed Meta Keys list.

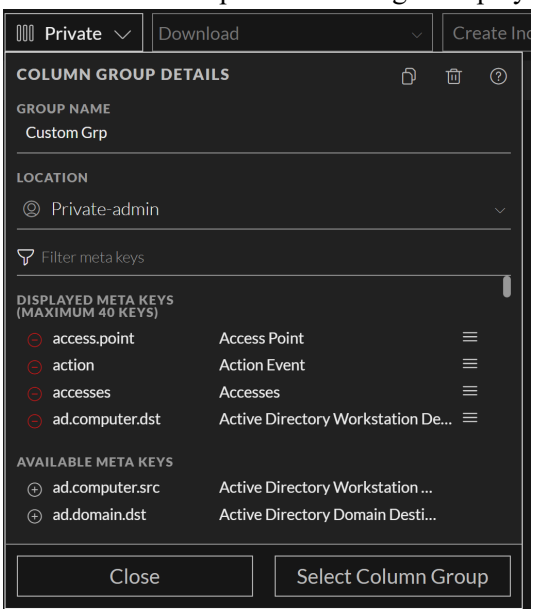
7. (Optional) To find and remove a meta key from the column group, type a text string in the **Filter meta keys** field to look for meta keys that contain that text in the **Displayed Meta Keys** list, or simply scroll through the list. When you see the column that you want to remove, click the remove icon ( ) that precedes the meta key name in the **Displayed Meta Keys** list.
   The meta key is moved back to the Available Meta Keys list.
8. (Optional) To change the order of the displayed meta keys in the Displayed Meta Keys list, place the cursor over the list order icon ( ). When the cursor changes to the drag and drop icon ( ), drag the meta key up or down in the list.
9. Do one of the following:
   a. To close the dialog without saving the changes to the custom column group, click **Reset**.
   b. To save the edits to the column group, click **Update Column Group**.
      The updated column group is saved globally for all analysts, and the buttons change to Done and Select Column Group.
10. Do one of the following:
    a. To close the dialog, click **Close**.

b. To close the dialog and select the updated column group, click **Select Column Group**.
The column group is updated, and if you clicked Select Column Group, the Events list is updated to show the columns in the new column group.



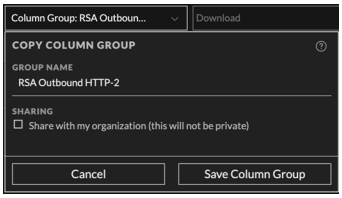
Create a Copy of a Column Group (Version 11.5 and Later)

You can copy any column group, built-in or custom, shared or private, as long as it does not have unsaved edits in progress. This is useful when you want a customized version of a built-in group. Also since you cannot change a custom group from private to shared or from shared to private, creating a copy allows you to select a different Sharing setting. When you create a copy of a column group, the same name is used with a number appended. For example, if you copy RSA HTTP, the first copy is named RSA HTTP-1, and a second copy of the same group is named RSA HTTP-2. After you create the copy, you can edit the new group to give it a new name and manage meta keys in the group.



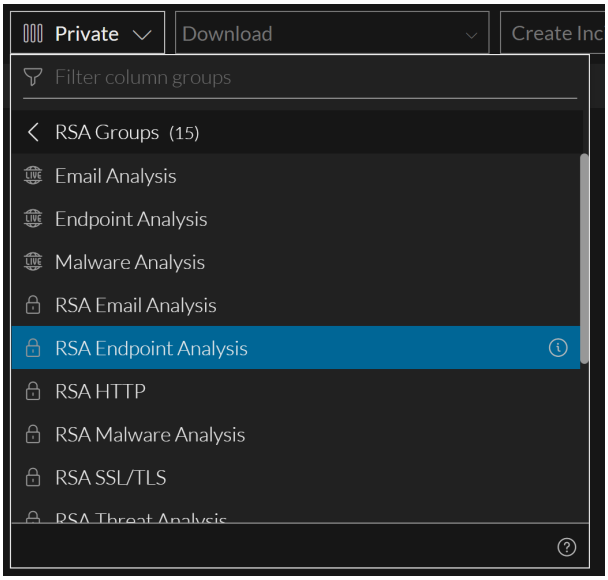
Note: Some column groups created in the Legacy Events view may have more the 40 columns, which is above the limit for column groups in the Events view. If you copy a group with more than 40 columns, you must remove the excess columns when you edit the column group.

To copy a column group:

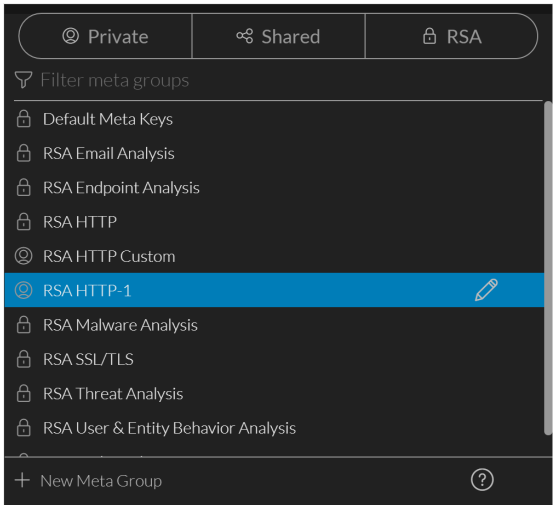


1. Go to **Investigate> Events** and submit a query to load data in the Events panel.
2. In the Events panel toolbar, click the **Column Group** menu title.
The menu drops down to display a list of column groups with the Filter Column Groups field at the top and the + New Column Group option at the bottom. The first group on the list is highlighted, and the selected group has a light blue background.
3. Highlight the column group that you want copy. This figure shows RSA HTTP highlighted. The information icon ( ) is displayed to the right.

4. Do one of the following:
   a. Click the information icon ( ).
   b. Click the edit icon ( ).
   The Column Group Details dialog is displayed. This figure shows the dialog for a built-in group.



5. Click the Copy icon ( ).
   The Copy Column Group dialog is displayed with a `-n` appended to the column group name. The following figure has -2 because it is the second copy of this column group.

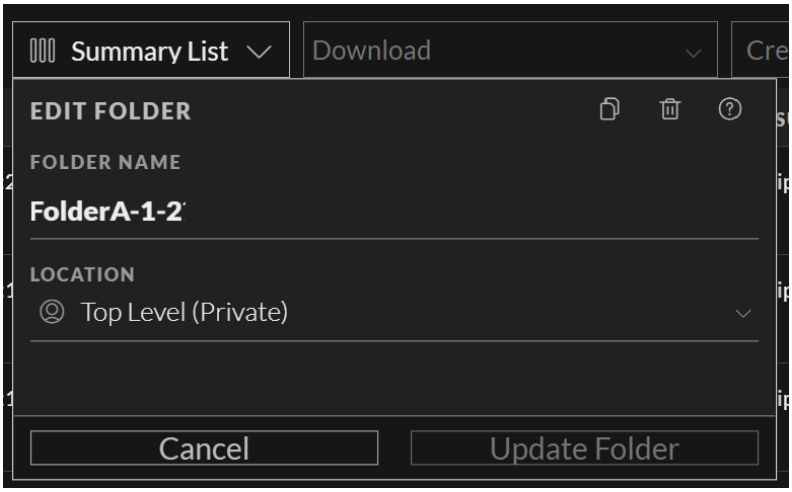


6. (Optional) In the **Group Name** field, edit the name of the column group.
7. If you want to share the new column group with your organization, set the **Share with my organization** option. By default the new group is private.
8. Do one of the following:
   a. To close the dialog without copying the group, click **Cancel**.
   b. To save the copy of the column group, click **Save Column Group**.
   The copy of the column group is saved, and the buttons change to Done and Select Column Group.
9. Do one of the following:
   a. To close the dialog, click **Close**.
   b. To close the dialog and select the copy of the column group, click **Select Column Group**.
   The column group is copied, and if you clicked Select Column Group, the Events list is updated

to show the columns in the copy of the column group. The figure below has two copies of the RSA HTTP column group, one shared and one private.

1. Do one of the following:
   a. To close the dialog without editing, click **Close**.
   b. To close the dialog and select the copy of the meta group, click **Select Meta Group**.
   The group is added to the Meta Group menu. The figure below has a private copy of the RSA HTTP meta group.

Create a Column Group Folder



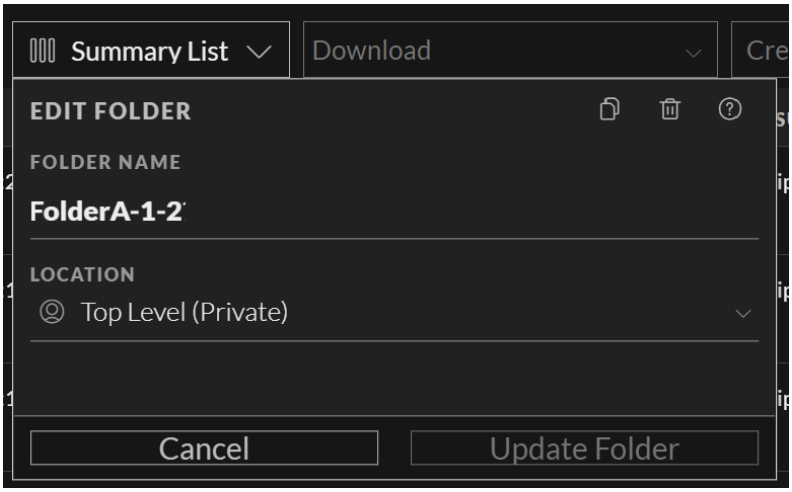
You can create custom column group folders which reside at the current level and are be added as a private or shared folder. And, if the folder name already exists then you are prompted to provide a unique name.

1. With the Filter Events panel open in the Events view, click the Column Groups menu title. The menu drops down to display a list of column groups and folders.
2. Click .
   The Create Folder dialog is displayed.
3. In the **Folder Name** field, type a unique name (maximum length of 255 characters) for the new meta group folder.
4. Click **Create Folder**.

Edit and Move Column Group Folder

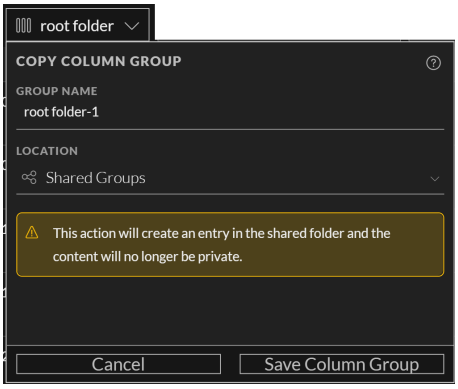
After you create a column group folder you can edit or move it, however the folders inside RSA Groups (RSA Live content and RSA OOTB Groups) cannot be edited and moved. The folders inside private and shared folders can be edited and moved only within their respective groups. For example, you cannot move a shared folder into a private folder and vice-versa.

1. With the Filter Events panel open in the Events view, click the Column Group menu title and highlight the column group that you want edit.
2. Click .
   The Edit Folder dialog is displayed.



3. In the **Folder Name** field, type a unique name for the column group folder.
4. Select the location of the folder to be edited.
5. Click **Update Folder**.

Copy Column Group Folder

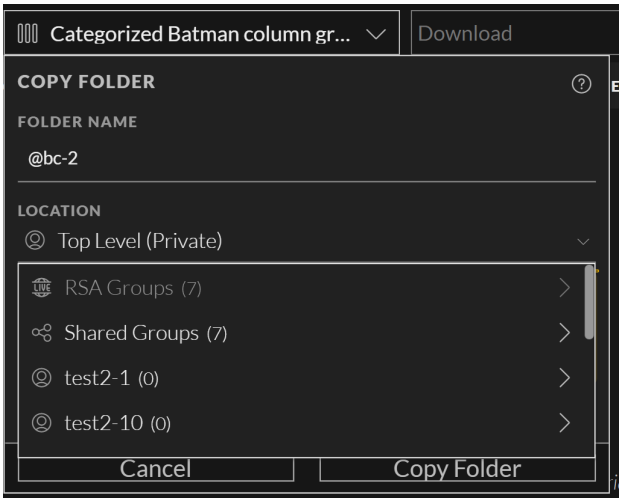


You can copy column group folders from private to shared, private to private, shared to shared and shared to private groups. When you copy a folder the content inside it gets copied. When you copy a private folder into a shared folder, the folder and its content no longer remain private.

1. With the Filter Events panel open in the Events view, click the Column Group menu title. The menu drops down to display a list of column groups and folders.

2. Select a folder you want to copy.
3. Click edit and the click copy .

The Copy Folder dialog is displayed.



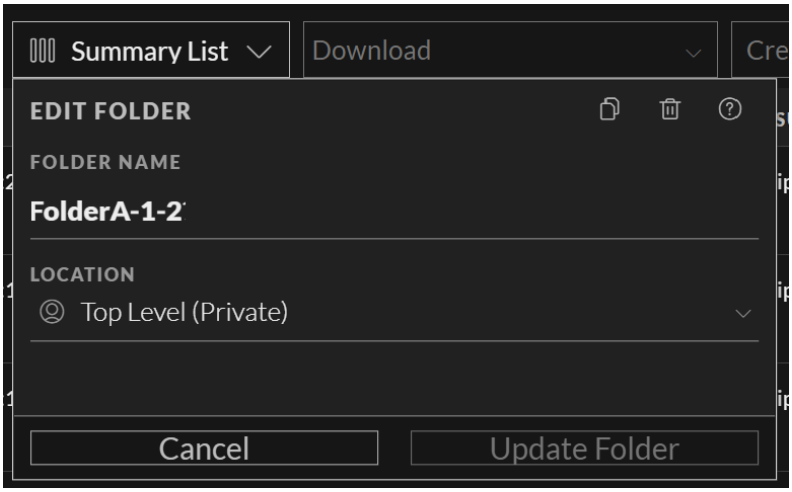
4. In the **Folder Name** field, type a unique name for the new meta group folder.
5. Select the location of the folder to be edited.
6. Click **Copy Folder**.

Copy Group Folder Deployed from Live

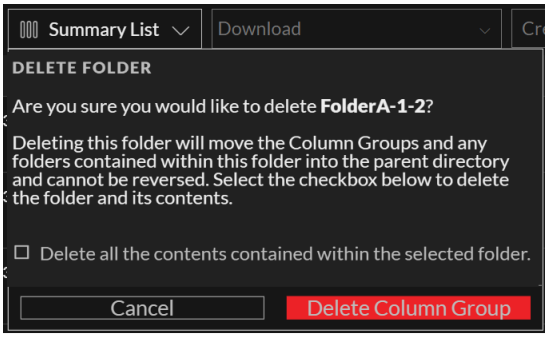
You can copy column group folder deployed from Live located under RSA Groups category to any other location like Shared groups or to a private folder.

1. With the Filter Events panel open in the Events view, click Column Group menu title. The menu drops down to display a list of column groups and folders.
2. Click on a Live Column Group folder you want to copy.

3. Click 
   The Copy Folder dialog is displayed.



4. Select the location of the folder to be copied.
5. Click **Copy Folder**.
   The folder is created with the original name of the folder and appended with the 'copy' in the end.



Delete Column Group Folder

If you don't want to retain a folder you can delete it. However, once the folder is deleted it cannot be retrieved.

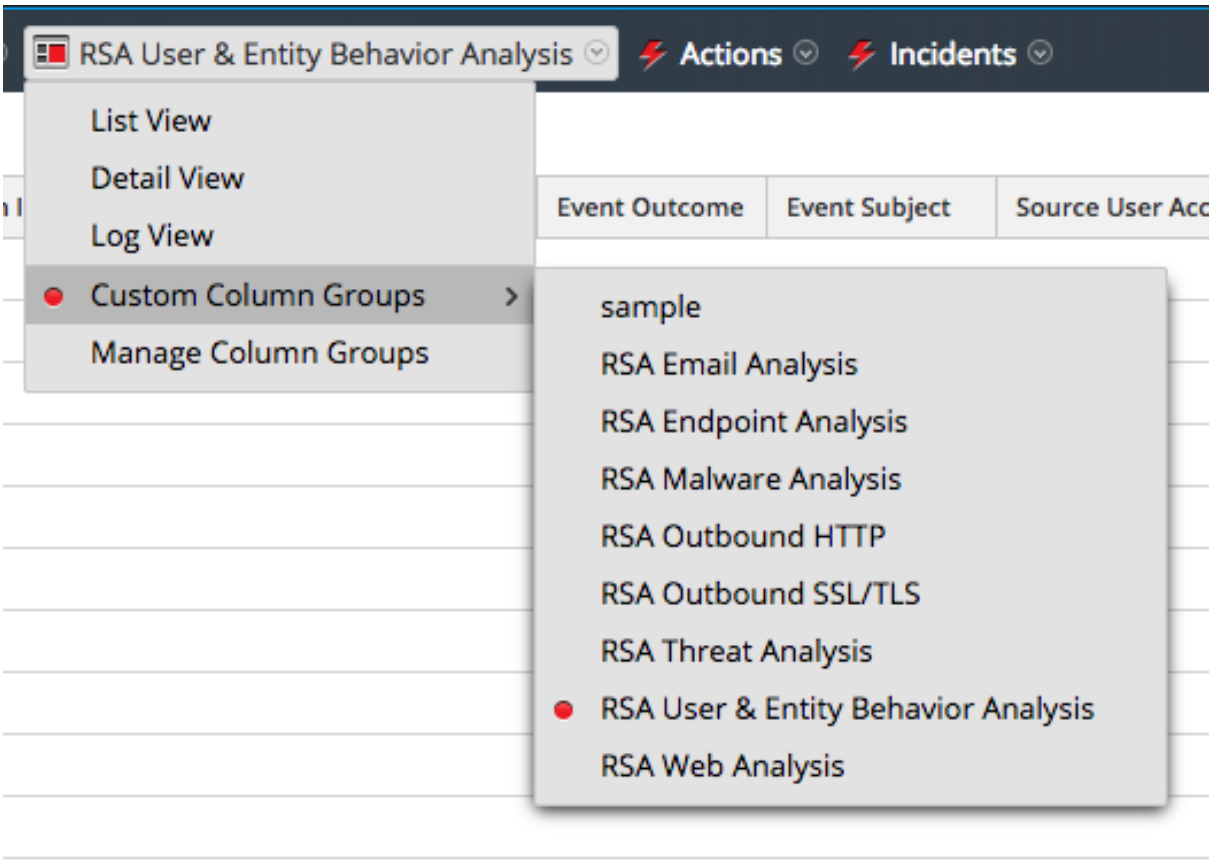
1. With the Filter Events panel open in the Events view, click the Column Group menu title. The menu drops down to display a list of column groups and folders.
2. Select a folder to be deleted.
3. Click edit .
   The Edit Folder dialog is displayed.

4. Click delete .
   A warning message is displayed to confirm the action.

5. (Optional) Select the checkbox, if you want to delete the folder along with all the contents inside the selected folder.
   If you do not select the checkbox, then the content will be moved to the parent folder after the required folder is deleted.
6. Click **OK** to delete.

Work with Column Groups in the Legacy Events View

This section includes procedures for working in the 11.4 Legacy Events view (and the 11.3 Events view). Three different forms of the events list with hard-coded columns are built in and labeled as follows: Detail View, List View, Log View. You can remove columns, rearrange the order, and change the width of a column. In addition the built-in or custom column groups are available; these give you more flexibility in choosing columns.

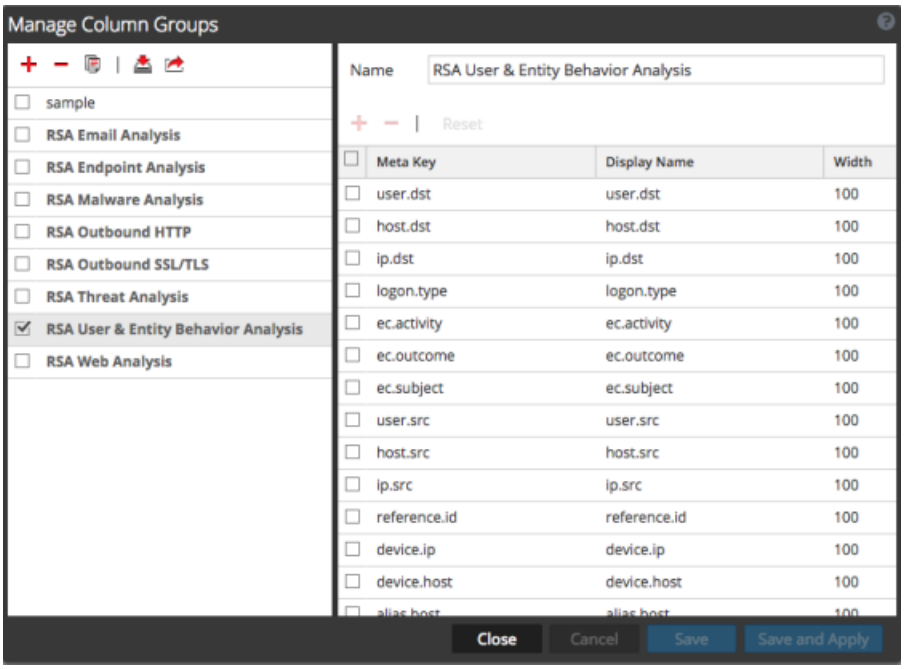


Column groups are shared globally, per service, across Investigate. Any changes you make to custom column groups are applied globally, affecting all analysts using the service. If you delete a column group, the column group is no longer available to anyone who is investigating the service.

Select a Column Group

Note: Investigate profiles can include custom column groups. If a custom column group is used in a profile and you are viewing events in the Legacy Events view using a custom column group, you cannot change the view type (Detail, List, or Log).

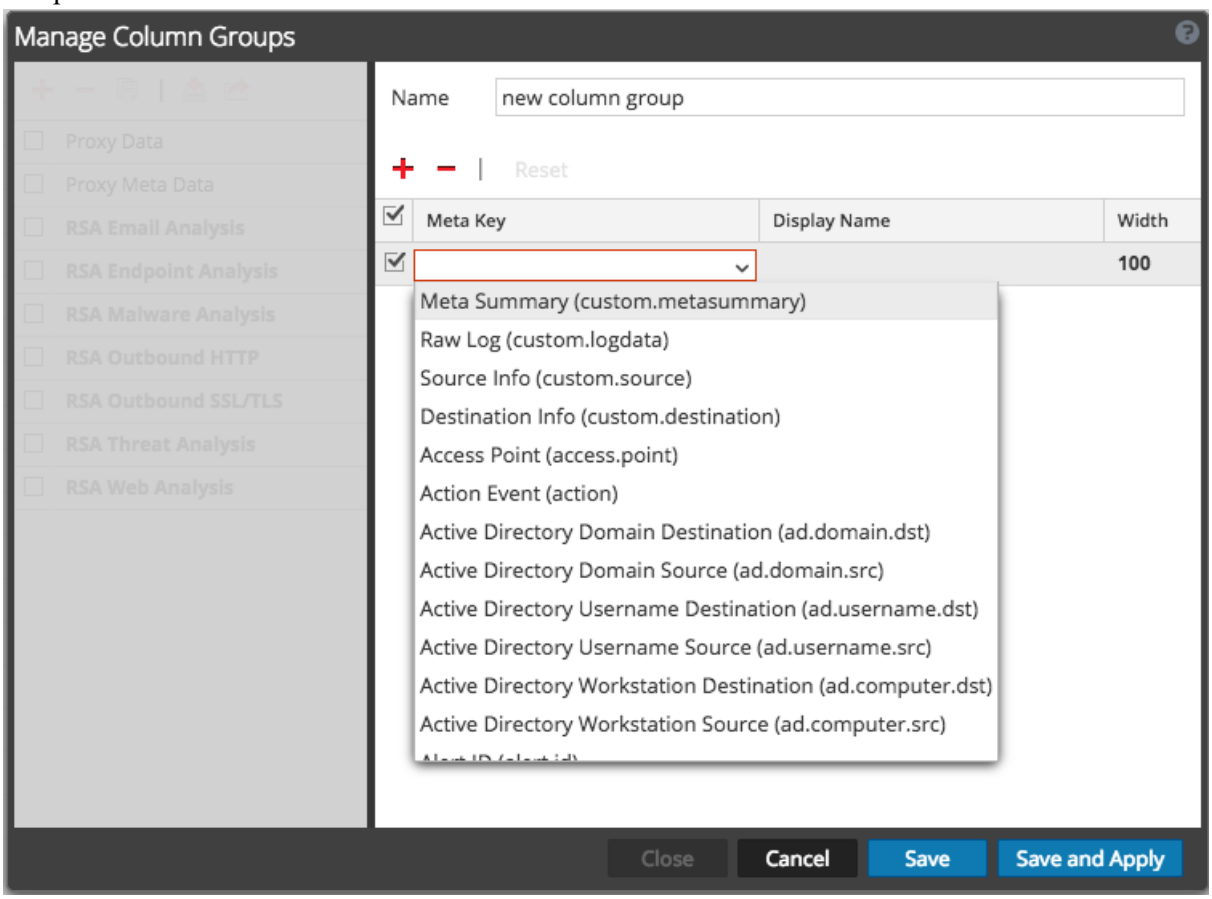
To select a column group:



1. With the Legacy Events view open, select **Custom Column Groups** in the **View** drop-down menu. The menu label reflects the selected option: Detail View, List View, Log View, or the currently selected column group.

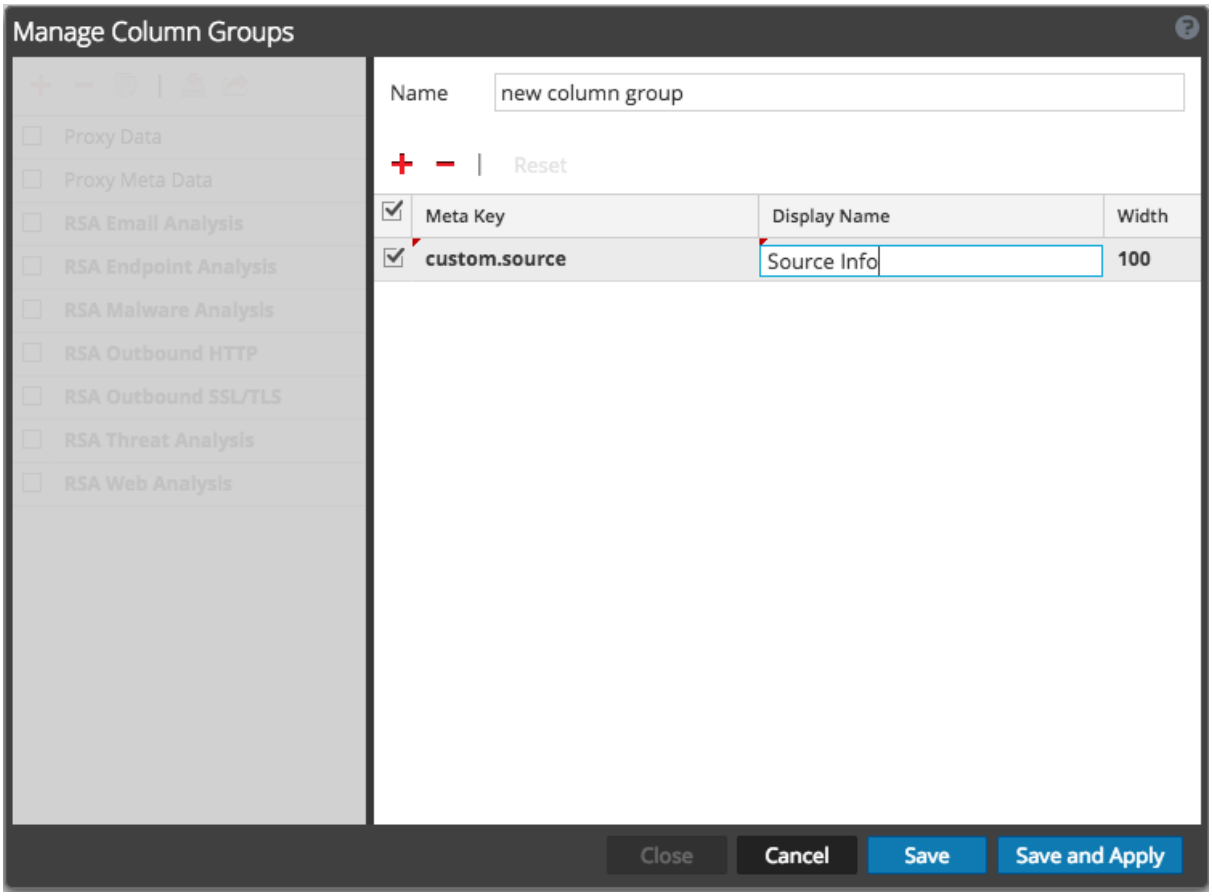
2. Select one of the column groups from the submenu.
   The Legacy Events view is refreshed to reflect the custom column group.

Create a Custom Column Group in the Legacy Events View



1. Go to **Investigate > Legacy Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.
   The Manage Column Groups dialog is displayed.

3. To add a new column group in the column group panel, click + and type the name of the new group in the resulting field.
   The column definition panel opens on the right with the group name filled in. You can edit the group name.

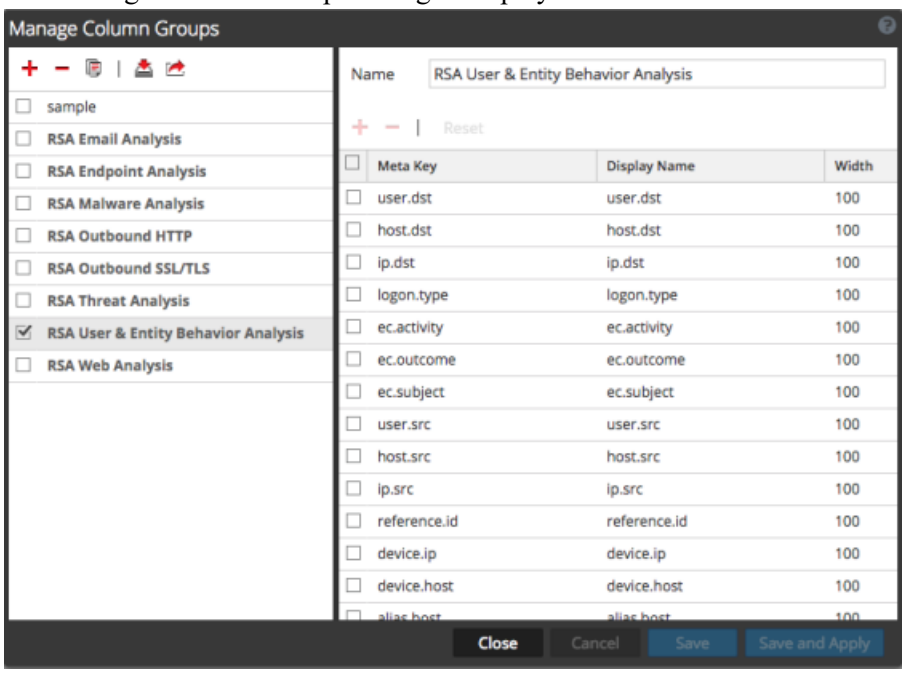


4. To add a column to the group, click +, and click in the empty **Meta Key** field to display the **Meta Key** drop-down list. Select a meta key field from the list, and repeat this step until the column set is

complete.

5. (Optional) To delete a meta key from the column group, click −.
6. (Optional) To rearrange the sequence in which the columns appear in the Events list, drag meta keys to the desired position.

7. (Optional) To set the default width for a column, click in the corresponding value in the **Width** column, and type a new column width.

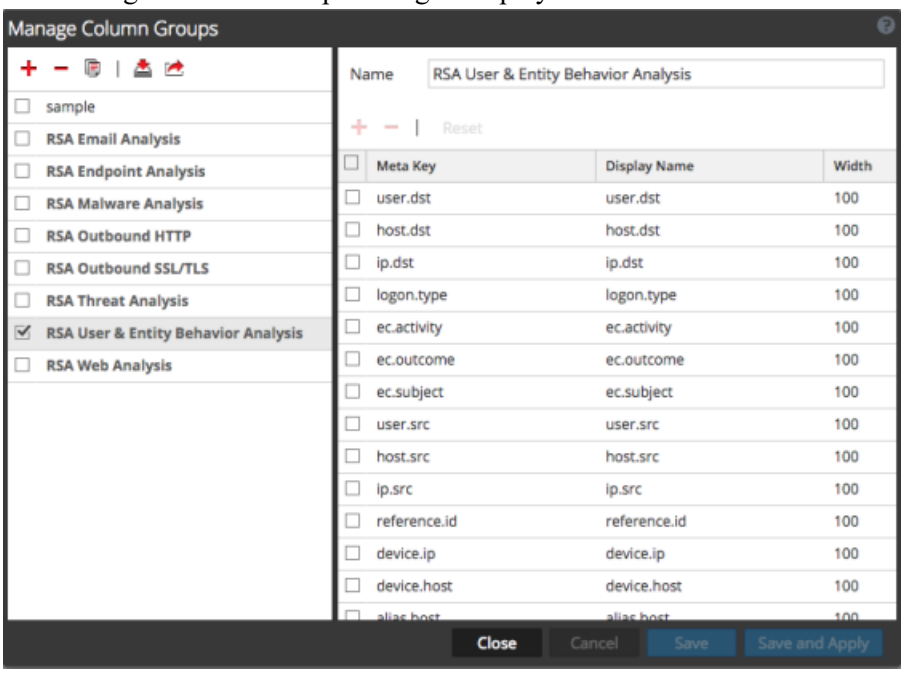


8. (Optional) To revert to the previous settings for the column group, and undo all of your changes, click **Cancel**.
9. When ready to save, do one of the following:
   a. To save the edited column group and refresh the Legacy Events view with the column group settings, click **Save and Apply**.
   b. To save the edited column group without refreshing the Legacy Events view, click **Save**.

Delete a Column Group (Legacy Events View)

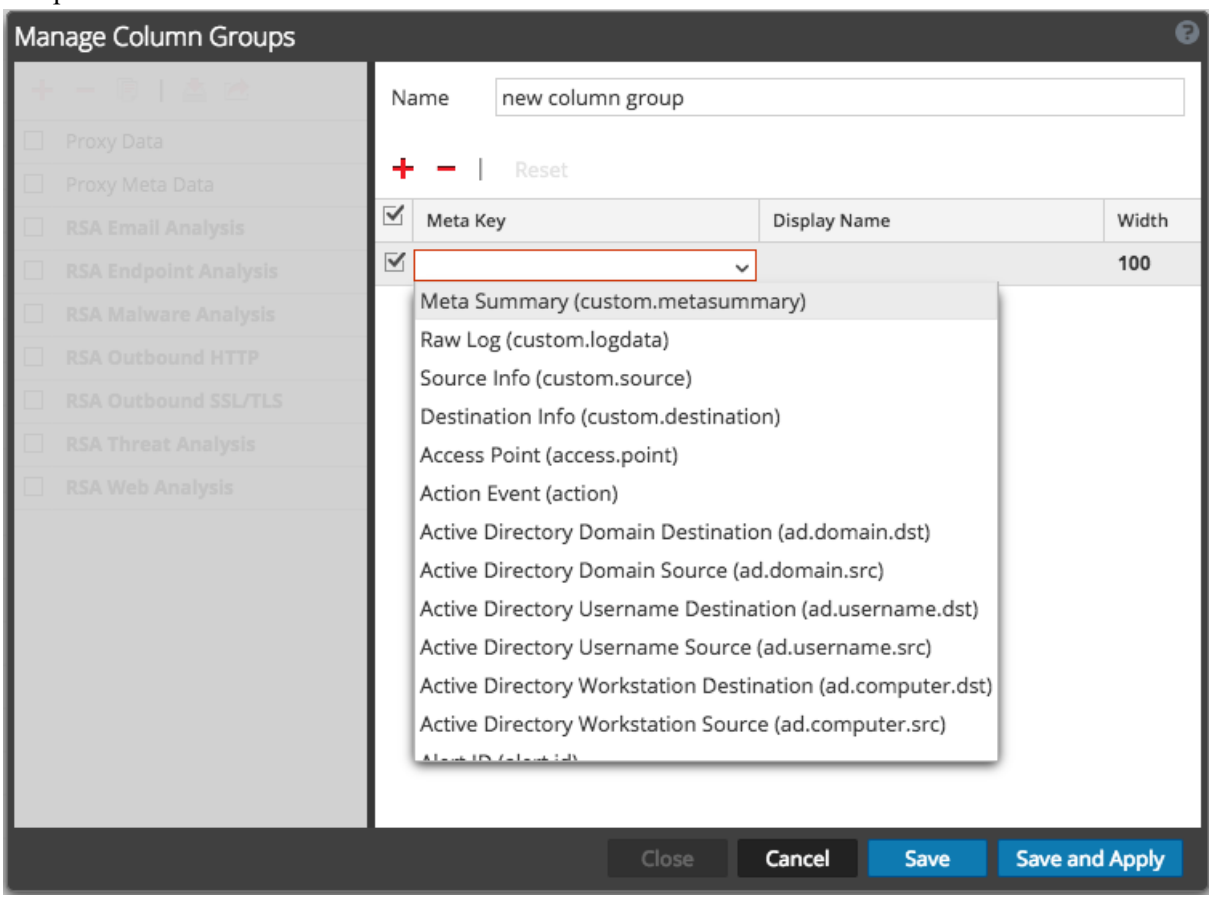
1. Go to **Investigate > Legacy Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.

The Manage Column Groups dialog is displayed.



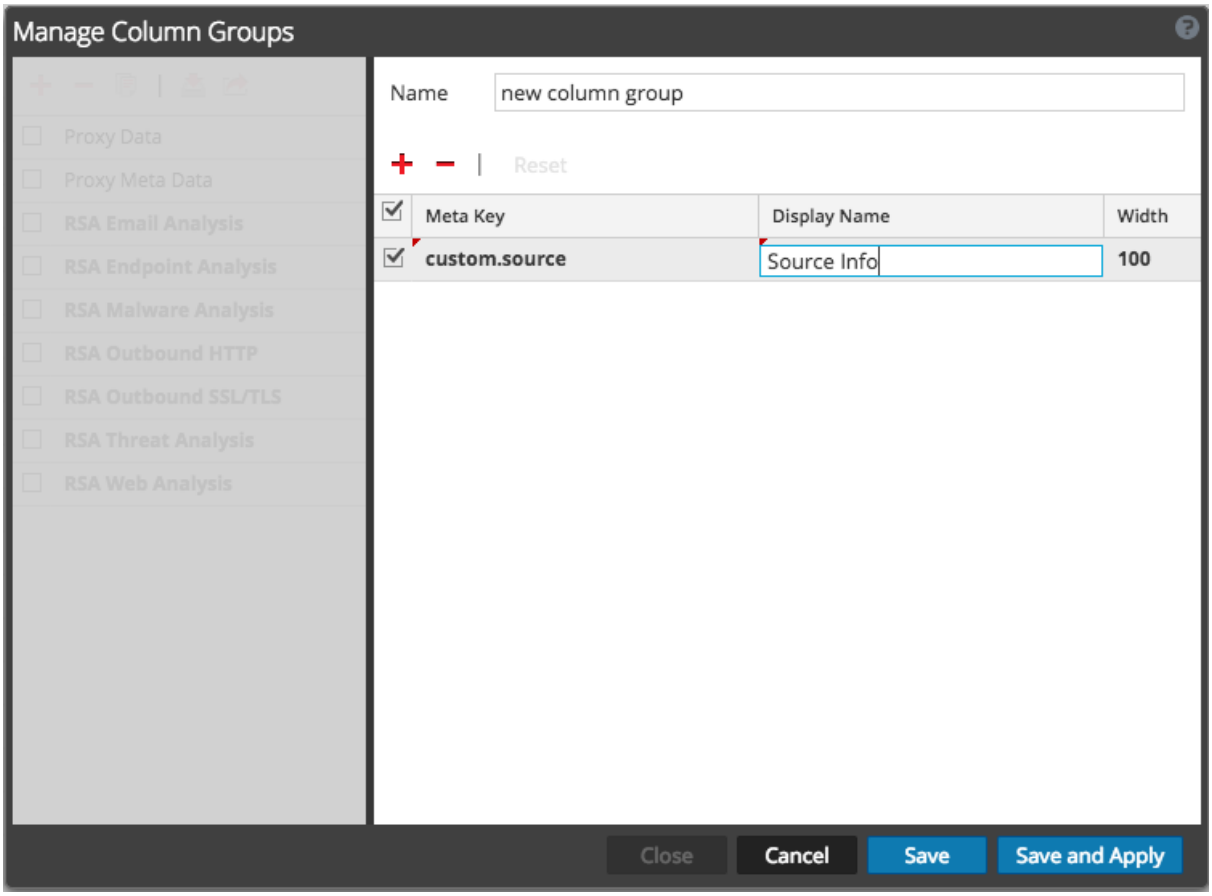
3. To delete a custom column group in the column group panel, select one or more custom column groups and click − in the toolbar.
   A confirmation request is displayed.
4. Do one of the following:
   a. To delete the column group and refresh the Legacy Events view, click **Yes**.
   b. If you decided not to delete the column group , click **No**.
      The selected column groups are deleted and no longer appear anywhere for this service in Investigate.

Edit a Column Group (Events View)



1. Go to **Investigate > Legacy Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.

The Manage Column Groups dialog is displayed.



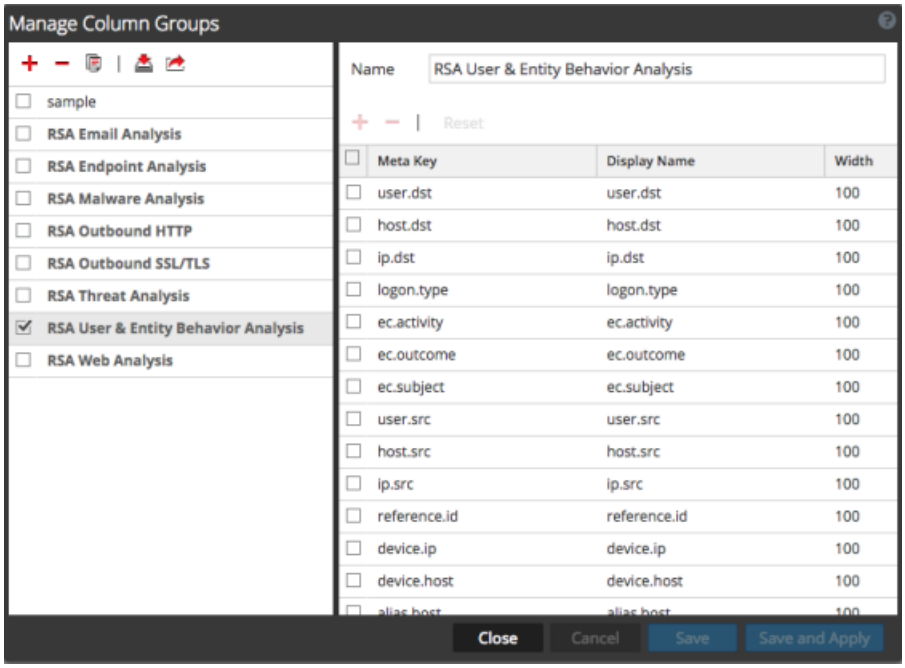
3. Do one of following:
   a. To edit a custom column group in the column group panel, select the checkbox before the name. The column definition panel opens on the right.
   b. To clone and edit a built-in column group or a custom column group, select the checkbox before the name and click the clone icon ( ).
   The column definition panel opens on the right.
4. (Conditional) If you are editing a clone of a group, type the new name of the group.
5. To add a column to the group, click , and click in the empty **Meta Key** field to display the **Meta Key** drop-down list. Select a meta key field from the list, and repeat this step until the column set is

complete.

6. (Optional) To delete a meta key from the column group, click −.
7. (Optional) To rearrange the sequence in which the columns appear in the Events list, drag meta keys to the desired position.

8. (Optional) To set the default width for a column, click in the corresponding value in the **Width** column, and type a new column width.

9. (Optional) To revert to the previous settings for the column group, and undo all of your changes, click **Cancel**.
10. When ready to save, do one of the following:
    a. To save the edited column group and refresh the Legacy Events view with the column group settings, click **Save and Apply**.
    b. To save the edited column group without refreshing the Legacy Events view, click **Save**.



Import and Export a Column Group (Legacy Events View)

You can export custom column groups for use by other members of your team, and other analysts can import column groups if you give them a copy of the exported file.

To export a column group

1. Go to **Investigate > Legacy Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group. Each of these views is a differently formatted events list, and each column represents one

meta key.
The Manage Column Groups dialog is displayed.

3. To export a column group, select the checkbox before the name and click the Export option ( ).
   The column group is exported to your local file system as a .jsn file, for example, `CustomColumnGroupsExport.jsn`. If you export another group, the next file is named `CustomColumnGroupsExport-2.jsn` to differentiate.
4. To import a column group that you have available on your local file system, click the Import option ( ).
   The Import Column Groups dialog is displayed.
5. Browse your local drive to find the column group (jsn file), and click **Upload**.
   The column group is added to the list. If it has the same name as an existing column group, a message is displayed and the column group is not imported.

Use Query Profiles to Encapsulate Common Areas for Investigation

Query profiles offer a quick and easy way to define a meta group, column group, and a limiting filter (pre-query condition) that you can apply in the Navigate view, the Events view, and the Legacy Events view. The same query profiles are shared between all views, and they are available in the Springboard (Version 11.5) for use in panels. Private query profiles created in the Events view are only available in the Events view for the analyst who created them.

Each query profile specifies a meta group, column group, and sometimes includes a pre-query condition appropriate for the type of investigation.

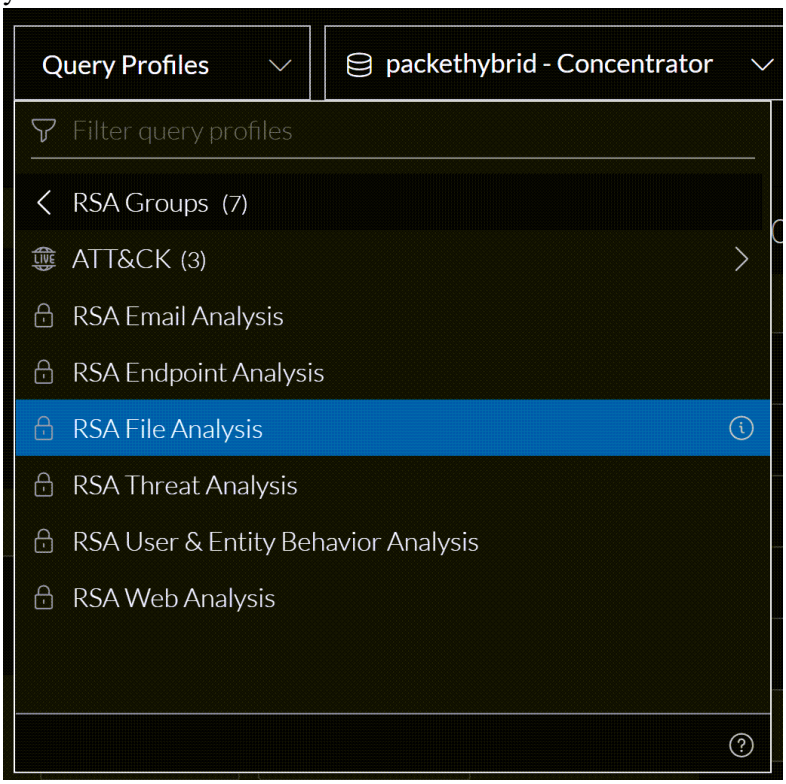
In a query profile:

- The meta group defines the meta keys that are queried (see Use Meta Groups to Focus on Relevant Meta Keys).
- The column group defines which meta keys from the meta group are displayed as columns in the Events list. (see Use Columns and Column Groups in the Events List).
- When the query profile is in effect, the optional pre-query conditions add a limiting filter in the query bar. You can edit or delete the limiting filter and then create additional filters for your query (see Filter Results in the Events View).

Built-In Query Profiles

You cannot edit or delete built-in profiles, but you can copy an existing profile and edit the copy in the Navigate view, the Legacy Events view, or the Events view. In the Navigate view, the built-in profile names begin with the RSA prefix and are grouped under Default Profiles. The Events view does not support grouping of query profiles. This figure is an example of a built-in query profile as listed in the Query Profiles menu.

NetWitness Platform XDR has these built-in profiles:



- RSA Email Analysis
- RSA Endpoint Analysis
- RSA File Analysis
- RSA Threat Analysis
- RSA User & Entity Behavior Analysis
- RSA Web Analysis
- Behaviors of Compromise
- Enablers of Compromise
- Indicators of Compromise

- MITRE ATT&CK tactics
- MITRE ATT&CK techniques

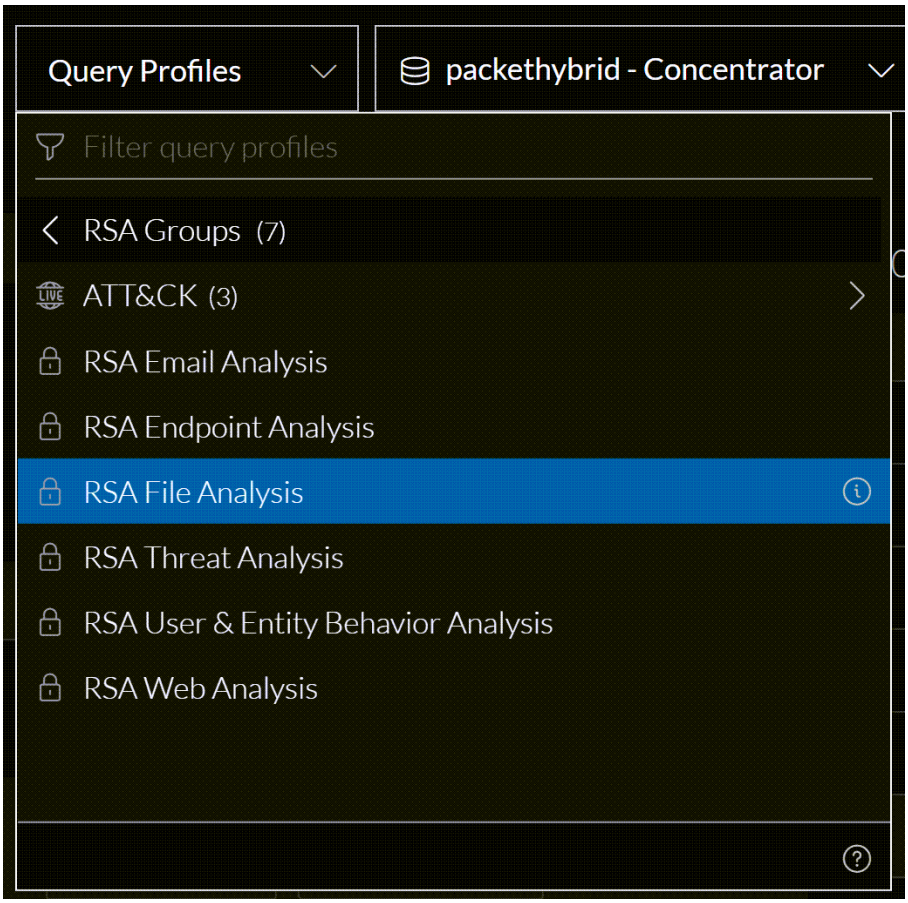
Built-in query profiles make it easy for you to query a specific area of interest; for example, selecting the built-in RSA Email Analysis query profile automatically specifies the meta group, and column group, and pre-query conditions that are most useful for investigating email activity. As you become familiar with the meta keys, you can create your own custom query profiles.

Live Query Profiles

In 11.6 and later, NetWitness supports deploying the investigate content from live and are marked by the live symbol (LIVE) under the query profiles group drop down. The query profiles are categorized as RSA Groups (RSA Live content and RSA OOTB Groups), and Shared Groups. The groups are displayed as non-editable folders and sub-folders except for Shared Groups that can be edited. All private content is displayed outside these groups. For example, the below image shows private content below the Shared Groups folder. The number inside () depicts the number of contents inside a folder and > symbol helps you to drill down inside the folder.

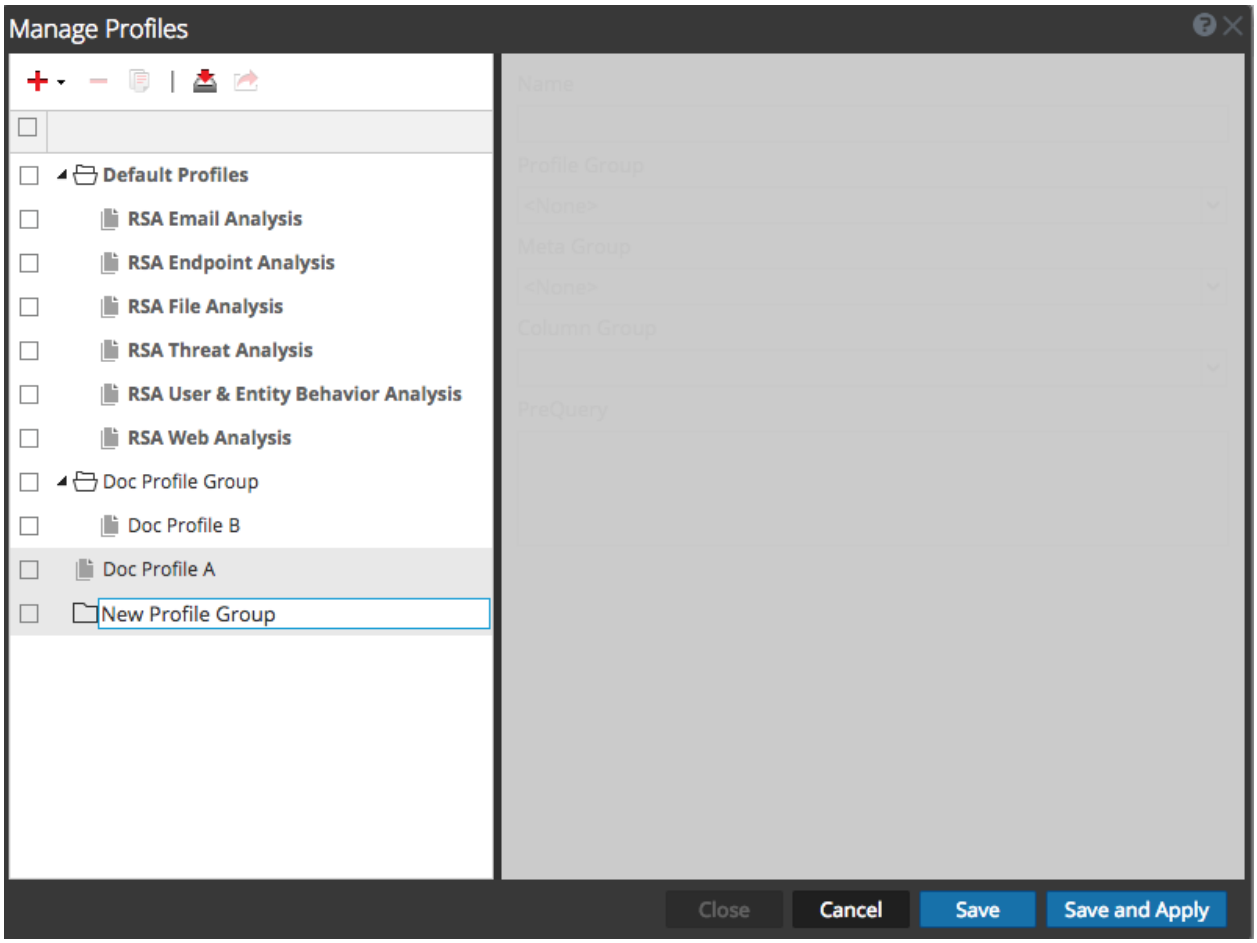
Custom Query Profiles

Custom query profiles are shared globally within your organization in Version 11.4. In Version 11.5 and later, you can create shared query profiles as before, and can also create private query profiles. If you edit a shared custom query profile, your changes are applied globally. If you delete a shared custom query profile, the profile is deleted and no longer available for all analysts.



Note: If a Springboard panel is using a query profile as a filter, the profile can be edited, but cannot be deleted in the Events view. However, nothing prevents deletion of the profile in the Navigate view or the Legacy Events view. In this case, Springboard panels that use the deleted query profile as a filter continue to work, but the filter is removed and unexpected results may be displayed in the panel. Refer to "Managing the Springboard" in the *NetWitness Platform Getting Started Guide* for details.

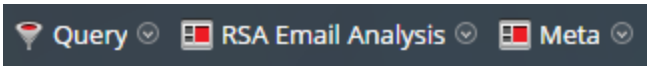
When you create a query profile in Version 11.5, you can choose to share it or you can keep it private (default); you cannot change a shared profile to private or a private profile to shared. Private query profiles are not visible or usable in the Navigate view, the Legacy Events view, or the Springboard. Icons identify the profile type in the Query Profile menu. These are examples of a shared and a private custom query profile as listed in the Query Profile menu, with the edit icon displayed at the end of the row.



Dialogs for Managing Query Profiles

The profiles are listed in alphabetical order in the Query Profiles menu in a way that makes built-in profiles distinguishable from custom profiles that you imported or created. While the functionality for managing query profiles is similar in the Navigate view, the Legacy Events view, and the Events view, the dialogs are different. The following figure illustrates the Query Profiles menu in the Version 11.5 Events view. This menu lists the same profiles that are available in the Navigate view and the Legacy Events view. You can create, copy, edit, delete, and apply profiles.

This is an example of the Manage Profiles dialog in the Navigate and Legacy Events views.



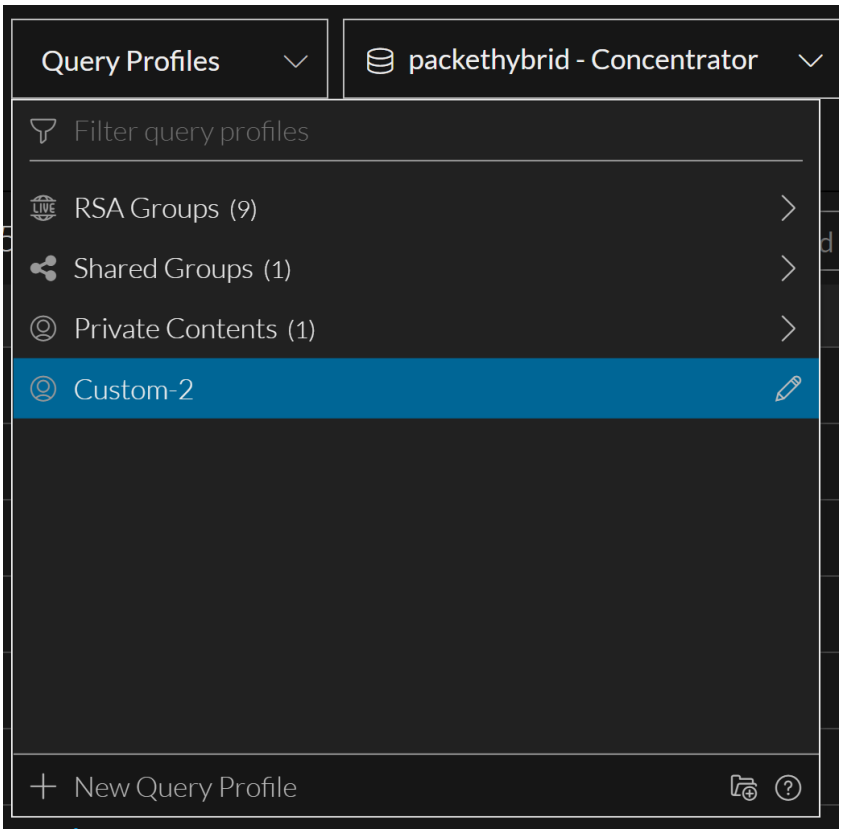
Note: Query profiles are available in the Navigate view, the Legacy Events view, and the Events view; in Version 11.4.1 and earlier, they are shared globally across users. If one user modifies or deletes a custom query profile it has an effect on what is available to the other users. In the Events view, use the Query Profiles menu to work with profiles. In the **Navigate** or **Legacy Events** view toolbar, select **Profile > Manage Profiles** to open the Manage Profiles dialog. In Version 11.5, custom profiles can be shared globally, but private custom profiles created in the Events view are not available in the Navigate view or the Legacy Events view.

From the Query Profiles menu (11.4 and later Events view):

- You can apply a query profile and use options in the menu to create (Create Query Profile dialog), copy, edit, and delete (Query Profile Details dialog) custom query profiles.
- Selecting a profile applies the meta group, column group, and pre-query condition, and these are visible in the Meta Group menu title, Column Group menu title, and the query bar.
- In Version 11.4, the Events view does not use meta groups or profile groups defined in other views. Version 11.5 allows you to use meta groups and to create private custom query profiles, in addition to the previously available shared custom query profiles.
- If a query profile created in the Legacy Events view uses the Log View, Detail View, or List View instead of a column group, the same profile in the Events view uses the Summary List column group.

From the Manage Profiles dialog (Navigate view and Legacy Events view):

- You can configure, add, delete, import, and export profiles and profile groups.
- You can organize your custom query profiles in profile groups (Version 11.2 and later). When upgrading to Version 11.4 from an earlier version, only profile groups that contain profiles are imported. The built-in query profiles are in the Default Profiles group, which cannot be edited. Analysts can create new query profile groups, which anyone can use.
- After creating profiles, you can edit a profile group to add profiles, remove profiles, or move profiles from one group to another. When you create a profile, it is not added to any profile group by default.
- Selecting a profile applies the meta group, column group, and pre-query condition, and the label of the Profile menu is replaced with the query profile name. The following figure illustrates the RSA Email Analysis query profile selected in the Navigate view or Legacy Events view.

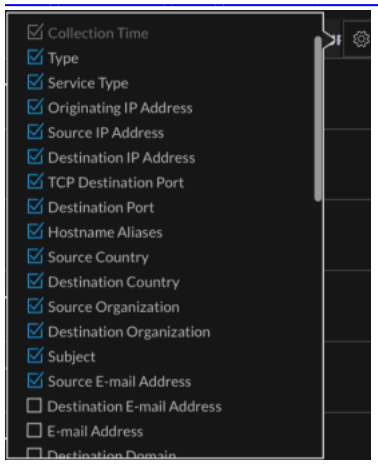


View Query Profile Details (Events View)

If you want to know which meta groups, column groups, and limiting filters (called pre-query conditions) define a query profile, you can view the details of the profile.

To view the details:

1. Go to **Investigate > Events** and click **Query Profiles** in the query bar.
   The Query Profiles menu opens with a list of available profiles. This menu displays a list a list of built-in query profiles (RSA), shared custom profiles, and your private custom profiles with visibility options and a filter field make it easier to find a particular query profile.



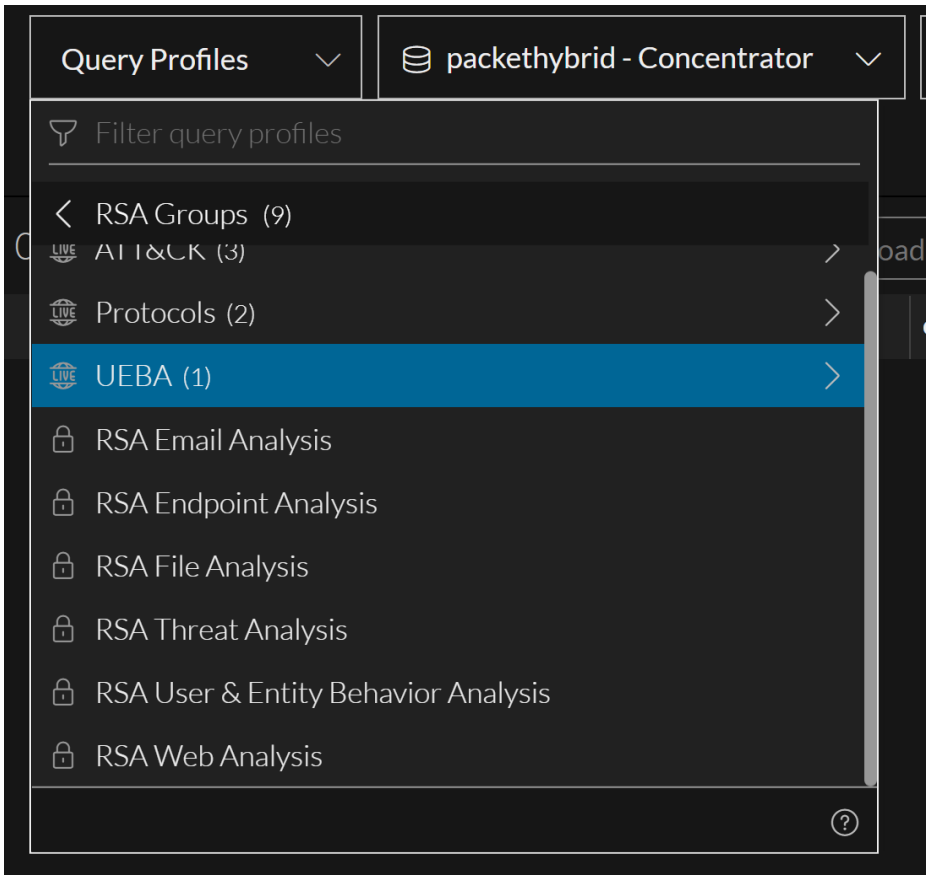
2. Hover over a query profile in the list and click the information icon ( ) to see the meta group, column group, and pre-query conditions configured for the profile.
   This figure shows the details for the RSA Email Analysis profile, one of the built-in profiles. In Version 11.5.1, an icon identifies the type of meta group and column group (shared, private, or RSA).

3. Do one of the following:
   a. To close the dialog, click **Close**.
   b. If you want to apply the profile, click **Select Query Profile**.
      The dialog closes. The Events list is updated to reflect the selected query profile. If the profile uses a different column group, the query is re-executed with the pre-query conditions and column group for the selected profile. If only the pre-query conditions are different, existing filters in the query bar are removed and the pre-query conditions (for example, this filter: `service=24,25,109,110,995,143,220,993`) is added in the query bar, but the query is not submitted. The first 15 columns in the associated column group are used in the Events list.
      i. (Optional) Create additional filters in the query bar before executing the query (see Filter Results in the Events View).
      

      ii. (Optional) If you want to select different columns from the associated column group before executing the query, click above the Events list on the right.
      The Column Selection list is displayed and you can choose up to 40 columns to display (see

Use Columns and Column Groups in the Events List.

Apply a Query Profile (Events View)

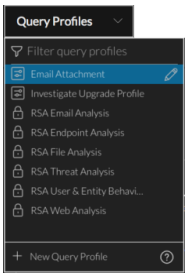


When a query profile is applied, there is no indication of it in the Query Profile menu, but you can see if a column group or meta group is in effect. If pre-query conditions are applied, the filters are visible at the beginning of the query bar as shown in this figure:

Note: If you do not see enough results or the right results in the Events view, an applied profile may be limiting results with pre-query conditions.

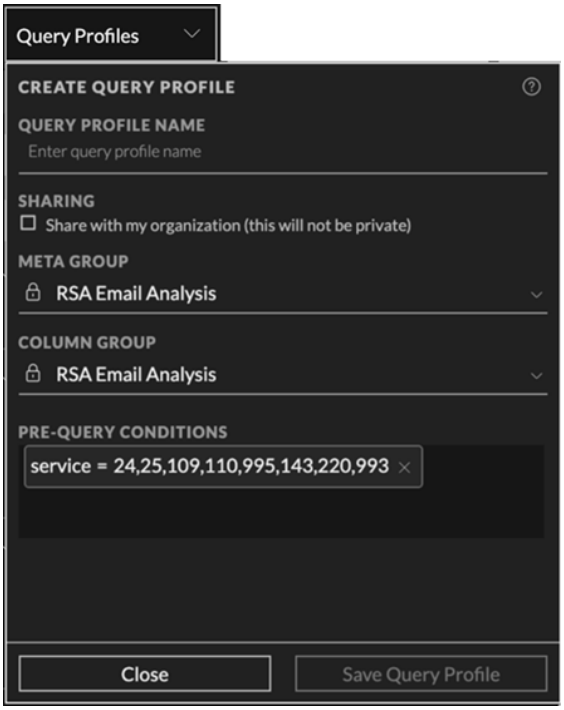
To apply a query profile:

1. Go to **Investigate > Events** and click **Query Profiles** in the query bar.
   The Query Profiles menu opens with a list of available profiles.



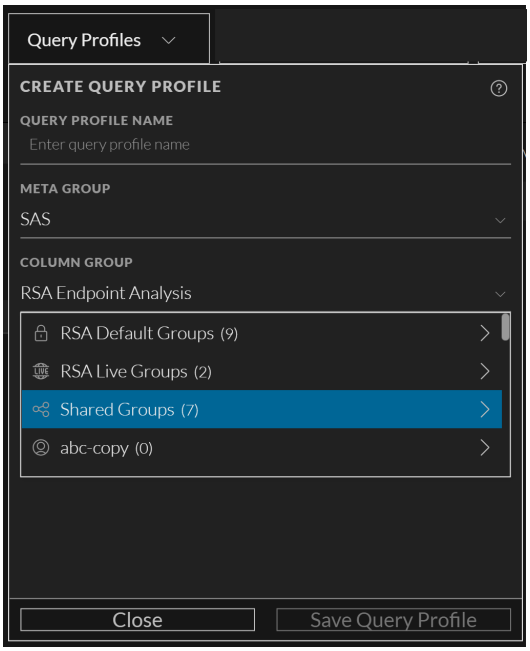
2. Use the Down and Up arrow keys or the mouse to highlight a profile.
3. Click the highlighted profile.
   The query profile settings are applied immediately. The Events list is updated to reflect the selected profile. If the profile uses a different column group the query is re-executed with the pre-query conditions and column group for the selected profile. If only the pre-query conditoins are different, existing filters in the query bar are removed and the pre-query conditions are added in the query bar. The button becomes active so that you can resubmit the query with the new pre-query conditions. You can add more filters as usual before or after resubmitting the query.

Create or Edit a Custom Query Profile (Events View)



To create or edit a custom query profile

1. Go to **Investigate > Events** and click **Query Profiles** in the query bar.
   The Query Profiles menu opens with a list of available profiles.



2. Do one of the following:

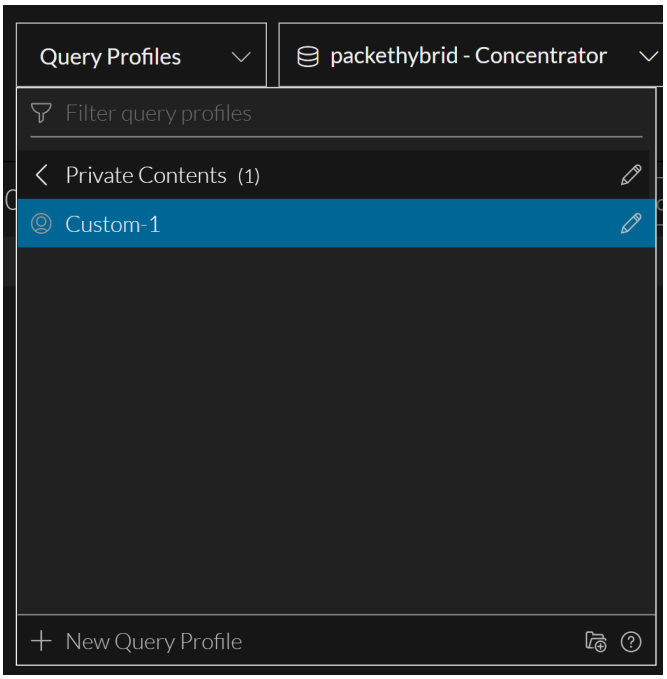
   a. To create a new query profile, click **+ New Query Profile**.
   The Create Query Profile dialog is displayed. The Create Query dialog shows a new empty profile that includes the currently selected meta group, column group, and filter that you have currently typed in the Query bar as a pre-query condition.

   In version 11.6, the meta groups and column groups are displayed in a drop-down in a folder structure.

b. To edit an existing query profile, highlight a custom query profile in the menu, and click the edit ( ) icon.
The Query Profile Details dialog is displayed. The Version 11.5.1 dialog (on the right) identifies the type of meta group and column group as shared, private, or RSA.

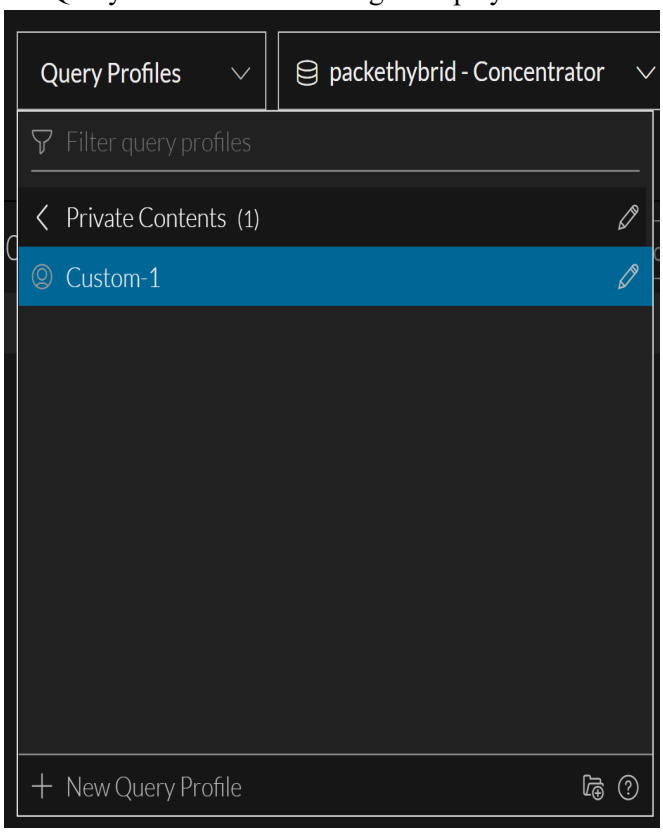
3. In the **Profile Name** field, type a unique profile name that has no more than 80 characters.
In the Create Query dialog, the Save Query Profile button is activated. In the Query Profile Details dialog, the Select Query Profile button is relabeled as Update Query Profile.

4. (Version 11.5 and later), do one of the following
   a. If you want to share the new query profile with your organization, set the **Share with my organization** option. You cannot change a query profile from shared to private after it is created.
   b. If you want to create a private query profile that only you can see and manage, leave the **Share with my organization** checkbox empty. You cannot change a query profile from private to shared after it is created.
5. (Version 11.5 and later) Select a meta group from the **Meta Group** drop-down list. If a shared group and a private group have the same name, the private group is listed before the shared group. In Version 11.5.1, an icon before the group name distinguishes private from shared.
6. Select a column group from the **Column Group** drop-down list. In Version 11.5, there can be shared or private groups and they can have the same name. In this case, the private group is listed before the shared group. In Version 11.5.1, an icon in front of the group name distinguishes private from shared.
7. In the **Pre-Query Conditions** field, check the default filters from the query bar and add or remove filters if you wish.
8. Click **Save Query Profile** or **Update Query Profile**.
   The new profile is saved or the edited profile is updated with your changes.
9. To close the dialog, click **Close**.



Delete a Custom Query Profile (Events View)

Built-in query profiles are read only, and cannot be deleted, but you can delete any custom query profile. A confirmation message allows you to confirm or cancel the deletion. When you delete a shared query profile, the effect is global and the profile is no longer available to any analyst.



Note: If a Springboard panel is using a query profile as a filter, the profile can be edited, but cannot be deleted in the Events view. However, nothing prevents deletion of the profile in the Navigate view or the Legacy Events view. In this case, Springboard panels that use the deleted query profile as a filter continue to work, but the filter is removed and unexpected results may be displayed in the panel. Refer to "Managing the Springboard" in the *NetWitness Platform Getting Started Guide* for details.

To delete a custom query profile

1. Go to **Investigate > Events** and click **Query Profiles** in the query bar.
   The Query Profiles menu opens with a list of available profiles.

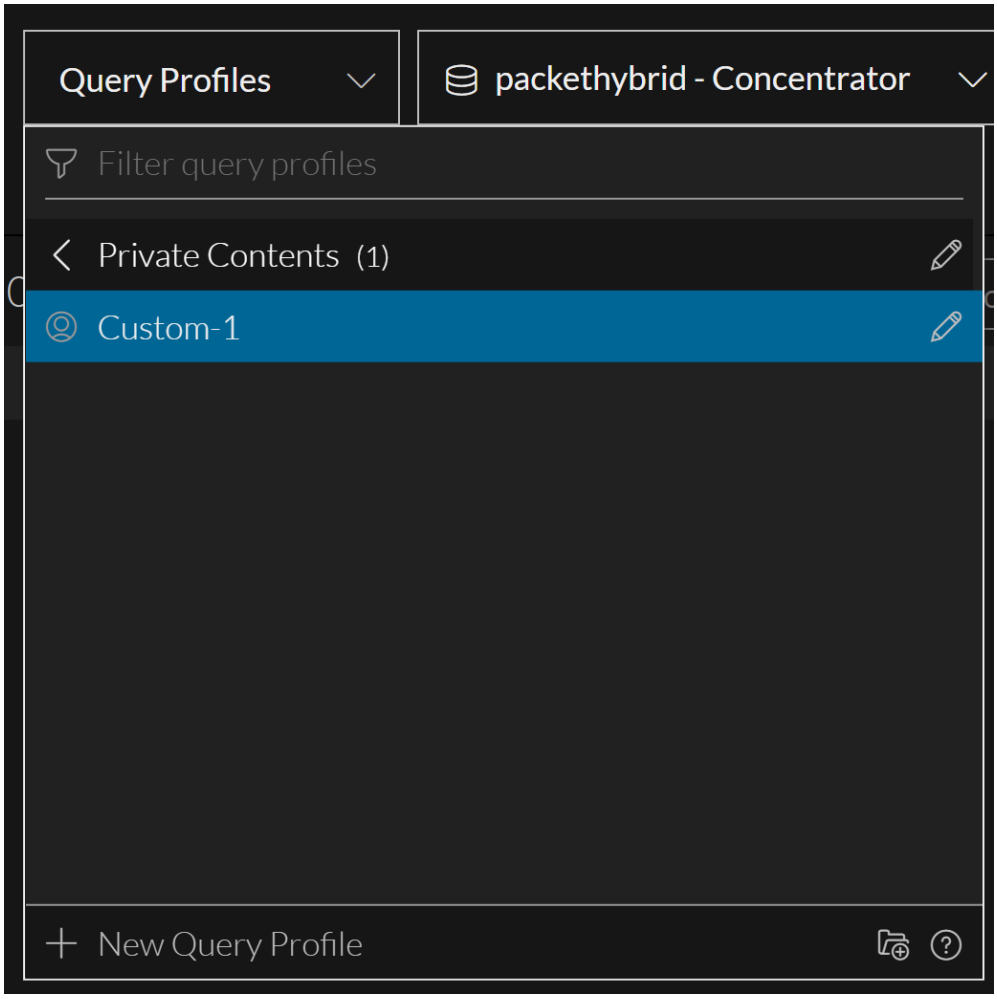
2. Highlight a custom query profile that you want to delete, and click the edit ( )icon.
   The Query Profile Details dialog is displayed.

3. Click the delete icon ( ).
   In Version 11.5, a confirmation message gives you the opportunity to confirm or cancel the deletion.

Click **Cancel** or **Delete Query Profile**.

In Version 11.4, if the query profile is not a built-in profile, there is no request for confirmation. The profile is deleted and removed from the Query Profiles menu. The profile no longer appears anywhere for any analyst working in Investigate.

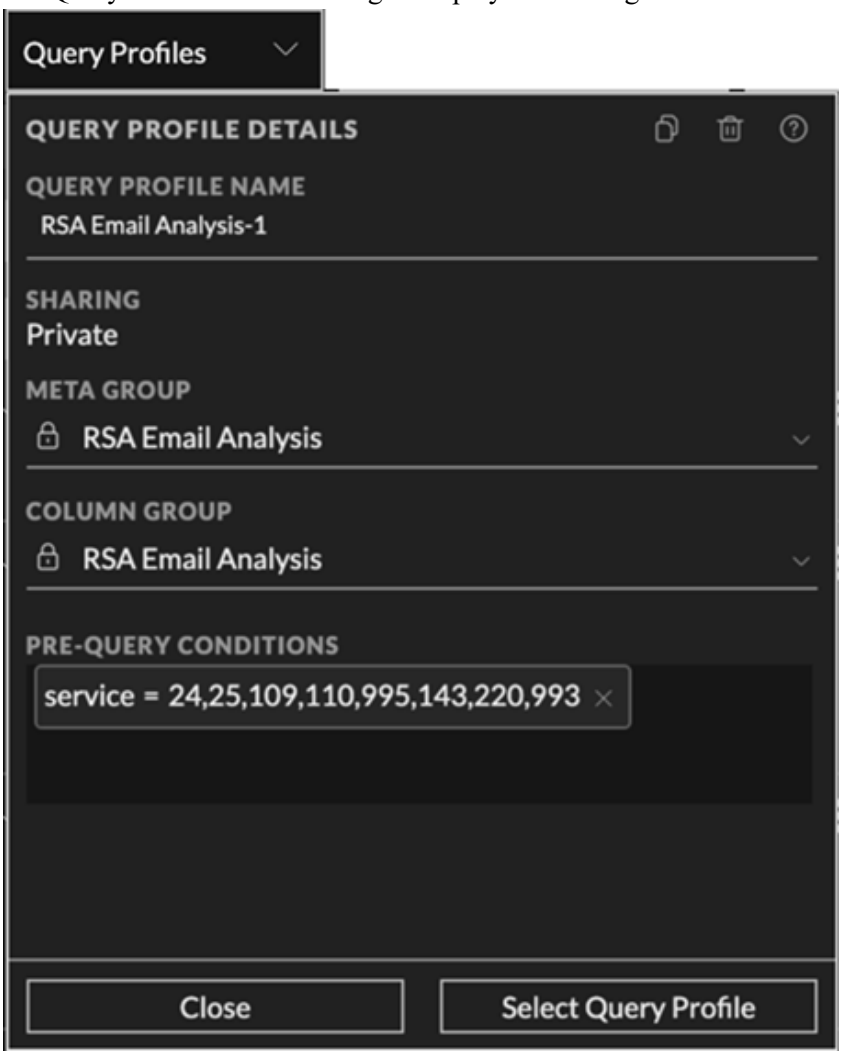
Copy a Query Profile



You can copy any query profile, built-in or custom, shared or private, as long as it does not have unsaved edits in progress. This is useful when you want a customized version of a built-in profile. Also since you cannot change a custom profile from private to shared or from shared to private, creating a copy allows you to select a different Sharing setting. When you copy a profile, the same name is used with a number appended. For example, if you copy RSA Email Analysis, the first copy is named RSA Email Analysis-1, and a second copy of the same profile is named RSA Email Analysis-2. After you create the copy, you can edit the new profile to give it a new name and edit the pre-query conditions, meta group, and column group in the profile.

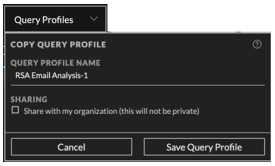
Note: If you are making a shared copy of a private query profile that uses a private meta group or column group, a message notifies you that a shared copy of the meta group or column group is being created and used in the query profile. It may take a little longer to copy the query profile when a private meta group or column group has to be copied.

To copy a query profile



1. Go to **Investigate > Events** and click **Query Profiles** in the query bar.
   The Query Profiles menu opens with a list of available profiles.

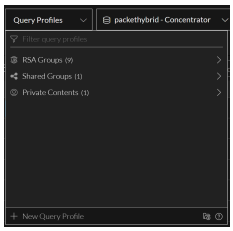
2. Highlight the query profile that you want copy. This figure shows RSA Email Analysis highlighted. The information icon ( ) is displayed to the right.



3. Do one of the following:
   a. Click the information icon ( ).
   b. For a custom profile, click the edit icon ( ).

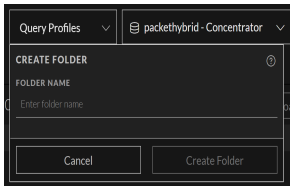
The Query Profile Details dialog is displayed. This figure shows the dialog for a built-in profile.

4. Click the Copy icon ( ).
   The Copy Query Profile dialog is displayed with a number appended to the profile name to create a unique name among all query profiles.



5. (Optional) In the **Query Profile Name** field, edit the name of the query profile.
6. If you want to share the new profile with your organization, set the **Share with my organization** option. By default the new profile is private. If the profile being copied has a private column group or meta group, a shared copy is created and used in the copy of the profile.

7. Do one of the following:
   a. To close the dialog without copying the profile, click **Cancel**.
   b. To save the clone of the query profile, click **Save Query Profile**.
      The clone is saved, and the Query Profile Details dialog for the cloned profile is displayed.
8. Do one of the following:
   a. To close the dialog, click **Close**.
   b. To close the dialog and select the new profile, click **Select Query Profile**.
      The clone is added to the Query Profiles menu.

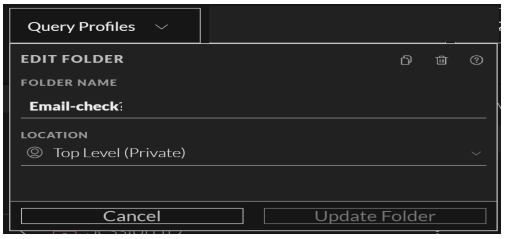


Create a Query Profile Folder

You can create query profiles folders which reside at the top level and are be added as a private or shared folders. And, if the folder name already exists then you are prompted to provide a unique name.

1. In the Events view, select the Query Profiles menu title. The menu drops down to display a list of meta groups and folders with the Filter Query Profiles field at the top and the  option at the bottom.

2. Click .
   The Create Folder dialog is displayed.



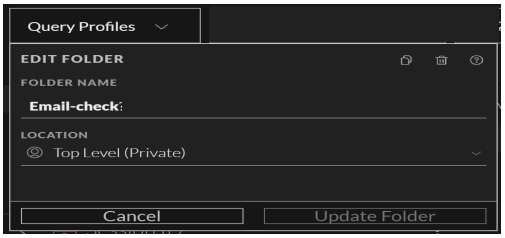
3. In the **Folder Name** field, type a unique name for the new query profile group folder.
4. Click **Create Folder**.

Edit and Move Query Profile Folder

After you create a query profile group folder you can edit or move it, however the folders inside RSA Groups (RSA Live content and RSA OOTB Groups) cannot be edited and moved. The folders inside private and shared folders can be edited and moved only within their respective groups. For example, you cannot move a shared folder into a private folder and vice-versa.

1. In the Events view, select the Query Profiles menu title that you want edit.

2. Click .
   The Edit Folder dialog is displayed.



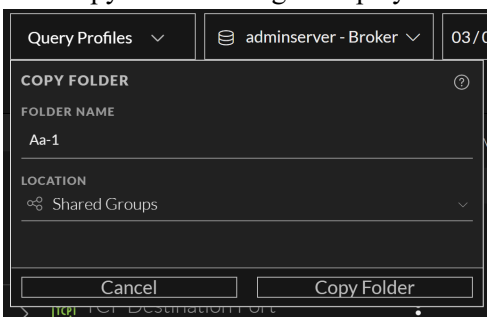
3. In the **Folder Name** field, type a unique name for the query profile folder.
4. Select the location of the folder to be edited.
5. Click **Update Folder**.

Copy Query Profile Folder

You can copy query profiles folder from private to shared, private to private, shared to shared and shared to private groups. When you copy a folder the content inside it gets copied except for the sub-folders. When you copy a private folder into a shared folder, the folder and its content no longer remain private.

1. In the Events view, click the Query Profiles menu title. The menu drops down to display a list of query profiles and folders.
2. Select a folder you want to copy.
3. Click edit and then click .

   The Copy Folder dialog is displayed.

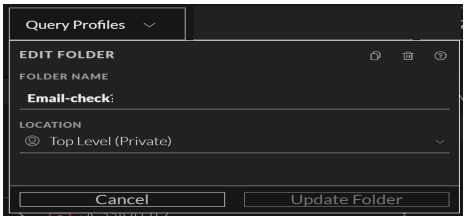


4. In the **Folder Name** field, type a unique name (maximum length of 80 characters) for the new query profile group and folder.
5. Select the location of the folder to be edited.
6. Click **Copy Folder**.

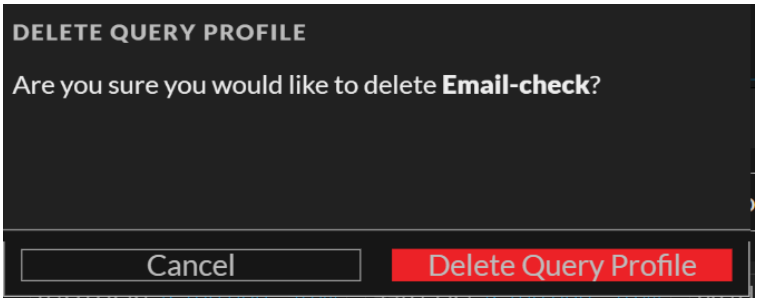
Copy Query Profiles Group Folder Deployed from Live

You can copy query profiles group folder deployed from Live located under RSA Groups category to any other location like Shared groups or to a private folder.

1. In the Events view, click Query Profiles Group menu title. The menu drops down to display a list of query profiles groups and folders.
2. Click on a Live Query Profiles Group folder you want to copy.
3. Click 
   The Copy Folder dialog is displayed.



4. Select the location of the folder to be copied.
5. Click **Copy Folder**.
   The folder is created with the original name of the folder and its contents are displayed as the original meta group name appended with a -n.



Delete Query Profile Folder

If you don't want to retain a folder you can delete it. However, once the folder is deleted it cannot be retrieved.

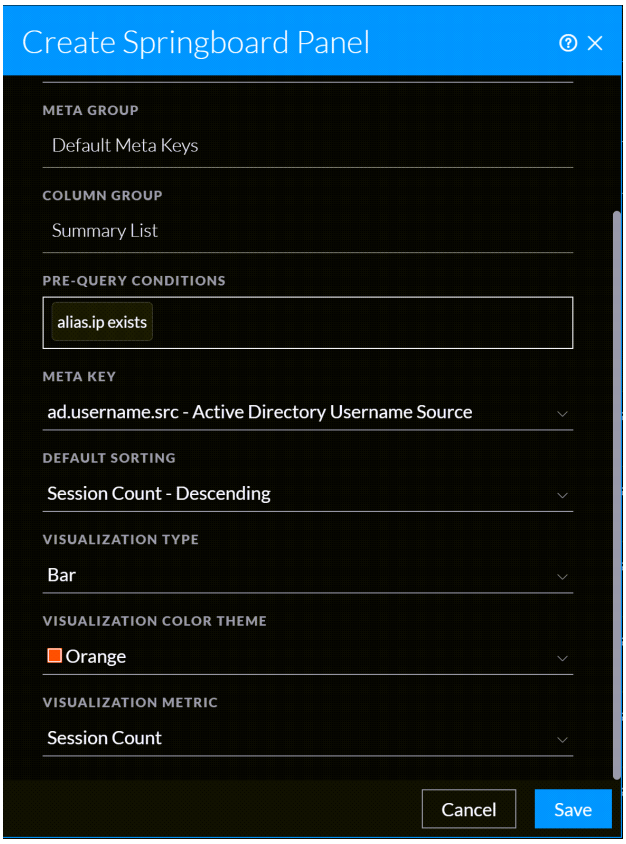
1. In the Events view, click the Query Profile menu title. The menu drops down to display a list of query profile groups and folders.
2. Select a folder to be deleted.
3. Click edit .
   The Edit Folder dialog is displayed.

4. Click delete .
   A warning message is displayed to confirm the action.

5. (Optional) Select the checkbox, if you want to delete the folder along with all the contents inside the selected folder.
   If you do not select the checkbox, then the content will be moved to the parent folder after the required folder is deleted.
6. Click **OK** to delete.

Add Springboard Panels from Events View

(From 12.0 and later) Administrators and Analysts can now create a Springboard panel from **Investigate** > **Events** view. Analysts can add any number of filters on the query bar and convert them into Springboard panels with important system indicators for threat hunting and investigation.



IMPORTANT: Ensure that you create a custom private board first in order to add the Springboard panel.

Note: From 12.3 version and later, analysts can create panels with different colors using the **Visualization Color Theme** option. It allows analysts to visualize their data more effectively and helps them perform analysis and investigations more efficiently.

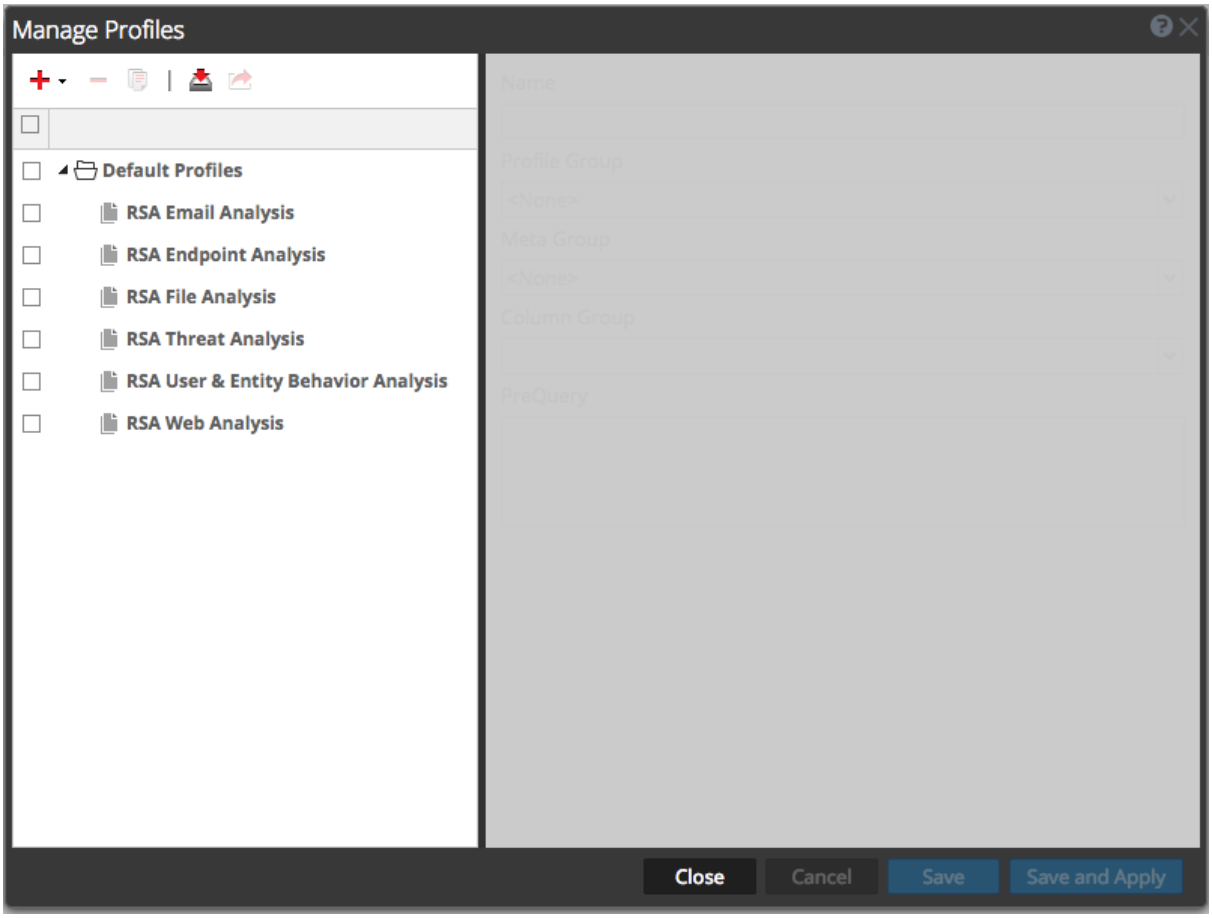
To add a Springboard panel from Events view

1. Go to **Investigate** > **Events**.
2. Create a query that consists of one or more filters that contain a meta key, operator, and optional value.
3. Click  > **Create Springboard Panel**.
   The Create Springboard Panel dialog is displayed.

4. Enter the following details:
   - **Name**: Enter a unique name for the panel. The name can include letters, numbers, spaces, and special characters, such as _ - ( ) [ ].

     Note: The query profile will be created with the same name as the Springboard panel.
   - **Meta Group**: It is selected by default.
   - **Column Group**: It is selected by default.
   - **Location**: It is the location where the query profile will be saved.
   - **Pre-Query Conditions**: Displayed based on the input criteria entered in the search query panel.
   - **Meta Key**: Select the appropriate meta key value from the drop-down list.
   - **Default Sorting**: Select the appropriate sorting from the drop-down list.
   - **Visualization Type**: Select the appropriate visualization type from the drop-down list.
   - **Visualization Color Theme**: Select the appropriate visualization color theme from the drop-down list.

     Note: The **Multiple** color option is available only for the Donut chart.
   - **Visualization Metric**: Select the appropriate visualization metric from the drop-down list.
5. Click **Save**.



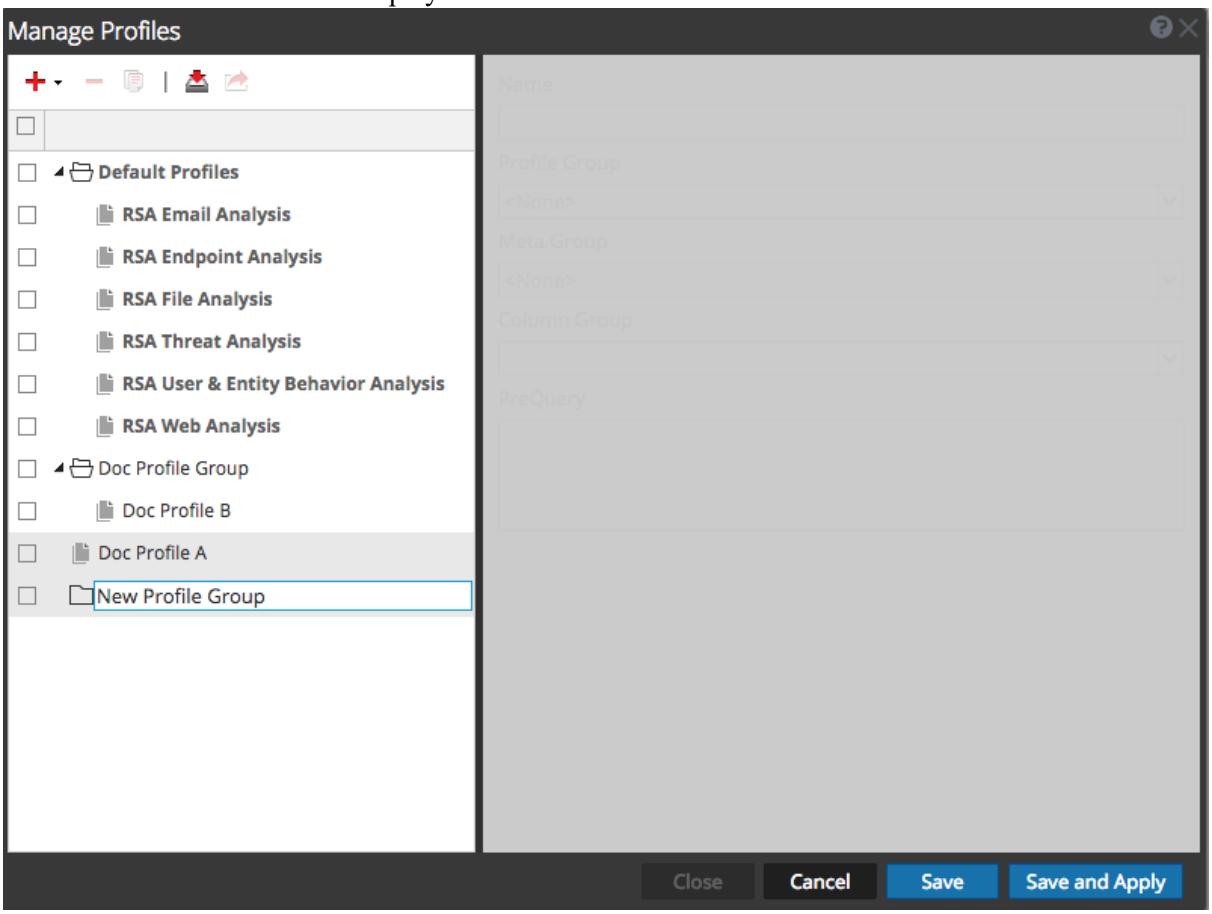
The panel will be added successfully to the custom private board in the Springboard.

Navigate to the Manage Profiles Dialog (Navigate and Legacy Events Views)

1. Go to **Investigate > Navigate** or **Legacy Events**. (If the **Investigate** dialog is displayed, select a service and click **Navigate**.)
2. In the toolbar, select **Profile > Manage Profiles**.

The Manage Profiles dialog is displayed.

Create, Edit, or Delete a Profile Group (Navigate or Legacy Events View)



You can create a custom profile group to organize different profiles. Once created, the only edit you can make directly to a profile group is to edit the name of the profile group. To add or remove a profile in a group, edit the profile and assign it to a different profile group as described in Create and Edit Profiles (Navigate or Legacy Events View).

Note: If you migrated profile groups from Version 11.3, empty groups were not migrated.

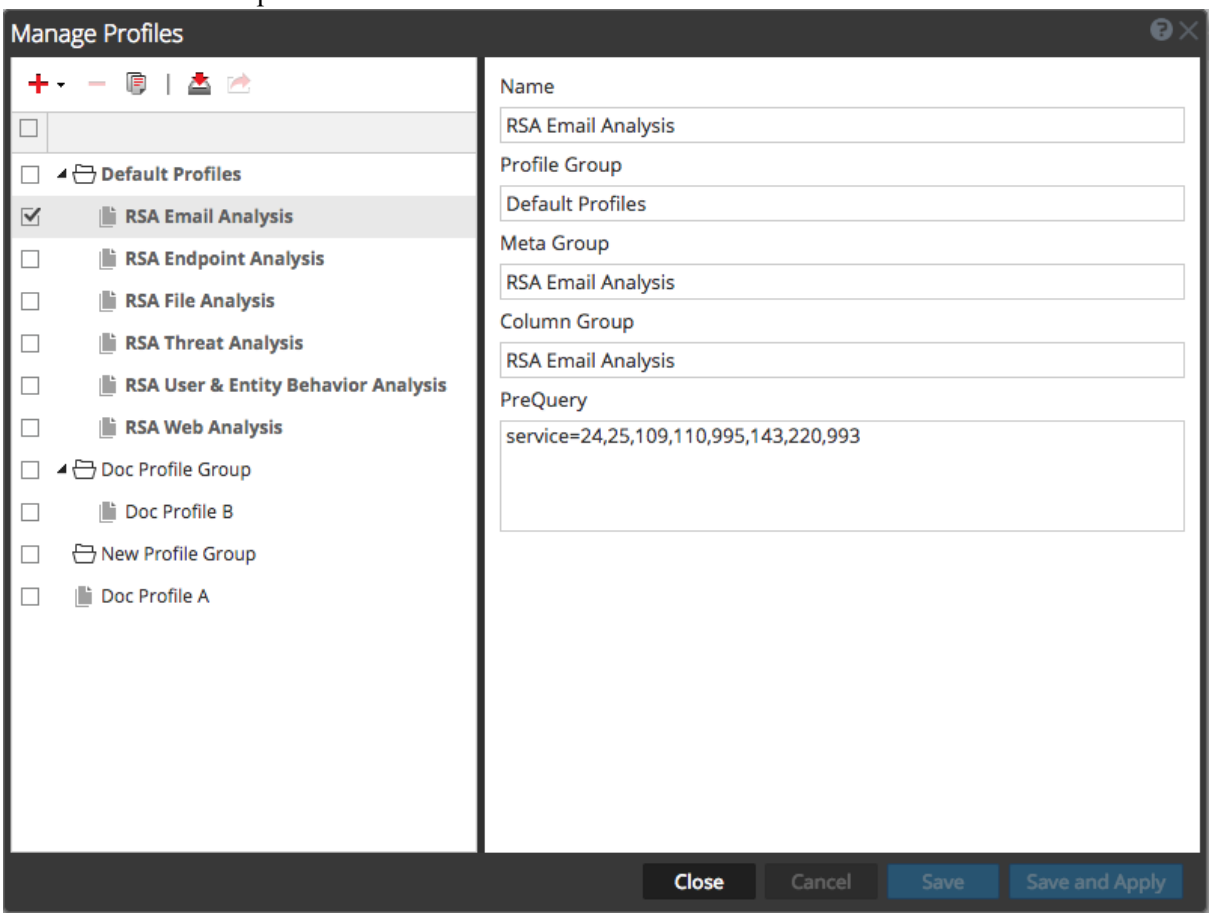
1. In the **Manage Profiles** dialog, do one of the following:
   - To select an existing profile group to edit, double-click the profile group.
   - To add a new profile group, click + and select **Add New Profile Group**.

   Note: If you want to edit one of the built-in profile groups, click to make an editable copy.

   A folder with a blank field is displayed at the bottom of the Profiles list in the left column.

2. To edit or enter the name of the profile group, double-click the Profile Group and type in the entry field. The name must be between 2 and 80 characters.

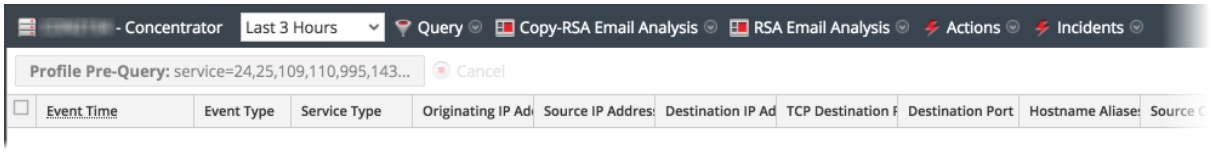
The profile group name is applied to a new profile group or to the profile group you edited. The profile group is now available when configuring a profile.



3. To delete a profile group do one of the following:
   - If you want to delete a profile group but keep the profiles, click the checkbox to select the group, uncheck the profiles in the group, and click delete.
   - If you want to delete a profile group and the profiles that the group contains, click the checkbox to select the group, and leave the profiles that you want to delete checked.
     A dialog asks for confirmation that you want to delete the group. If you left the mark in the checkbox next to the profiles, the group and the profiles in the group are deleted. If you unchecked the profiles, only the profile group is deleted and the profiles are moved out of the group and available to add to another profile group.

Create and Edit Profiles (Navigate or Legacy Events View)

1. In the **Manage Profiles** dialog, do one of the following:
   - To select an existing profile to edit, click the checkbox beside the name.
   - To add a new profile in Version 11.2 and later, click  or click the down arrow next to  and select **Add New Profile**.
   - To create a new profile in versions prior to 11.2, click .



Note: If you want to edit one of the built-in profiles, click  to create a copy, and edit the copy.

The definition of the profile is available to edit in the right panel. This figure illustrates the definition of one of the built-in profiles.

2. Edit or enter the profile name by typing in the **Name** field. The name must be between 2 and 80 characters.
3. (Optional for Version 11.2 and later) If you want to add the profile to a profile group, select a profile group from the **Profile Group** drop-down list.
   If you select a profile group, the profile is added to the group when you save the changes. If you do not select a profile group, the profile is not part of a group.
4. Select a meta group from the **Meta Group** drop-down list. You can add custom meta groups as described in Use Meta Groups to Focus on Relevant Meta Keys. Private meta groups created in the Events view are not available in the Navigate view.
5. Select a column group for the **Column Group** drop-down list. You can add custom column groups as described in Use Columns and Column Groups in the Events List. Private column groups created in the Events view are not available in the Navigate view.
6. Type queries to filter results in the **PreQuery** field. PreQuery follows the same syntax as the Query builder. The PreQuery in the figure uses a meta group called **service = 24,25,109,110,995,143,220,993**.
7. Click **Save** to save the profile without using it, or click **Save and Apply** to save the profile and use it immediately.
   If you click **Save and Apply**, a confirmation dialog is displayed before applying the selected profile.

For Version 11.2 and later, the PreQuery that you entered in the Manage Profiles dialog is displayed in the breadcrumb.

Delete a Profile (Navigate or Legacy Events View)

1. In the **Manage Profiles** dialog, select a profile by clicking the checkbox beside the name.

   Note: You cannot delete any of the built-in profiles.

2. Click −.
   A prompt requests confirmation that you want to delete the profile, and the profile is deleted. The option name in the toolbar reverts to **Profile** to show that no profile is in effect.

Change the Active Profile (Navigate or Legacy Events View)

If you do not see enough results or the right results in the Navigate or Events views, you may have an active profile that is applying a PreQuery. If you do not want to use any profiles, you can click **Deactivate Profile** in the **Profile** drop-down menu.

To use a different profile:

1. In the **Navigate** or **Legacy Events** view toolbar, open the **Profiles** drop-down menu.
2. Hover over the **Profile** option to display a drop-down list of available profiles.
3. Select the profile you want to use.
   The profile settings are applied immediately.

If you want to change the active profile from the Manage Profile dialog:

1. In the **Navigate** or **Legacy Events** view toolbar, select **Profiles > Manage Profiles**.
   The Manage Profiles dialog is displayed.
2. Select a profile from the left panel and click **Save and Apply**.
   A confirmation dialog is displayed.
3. Click **Yes**.
   The profile settings are applied immediately.

Import Profiles (Navigate or Legacy Events View)

In the Navigate view and the Legacy Events view, you can upload or import .jsn files that have been downloaded from another service. When profile groups are exported and then imported, the grouping of profiles is maintained.

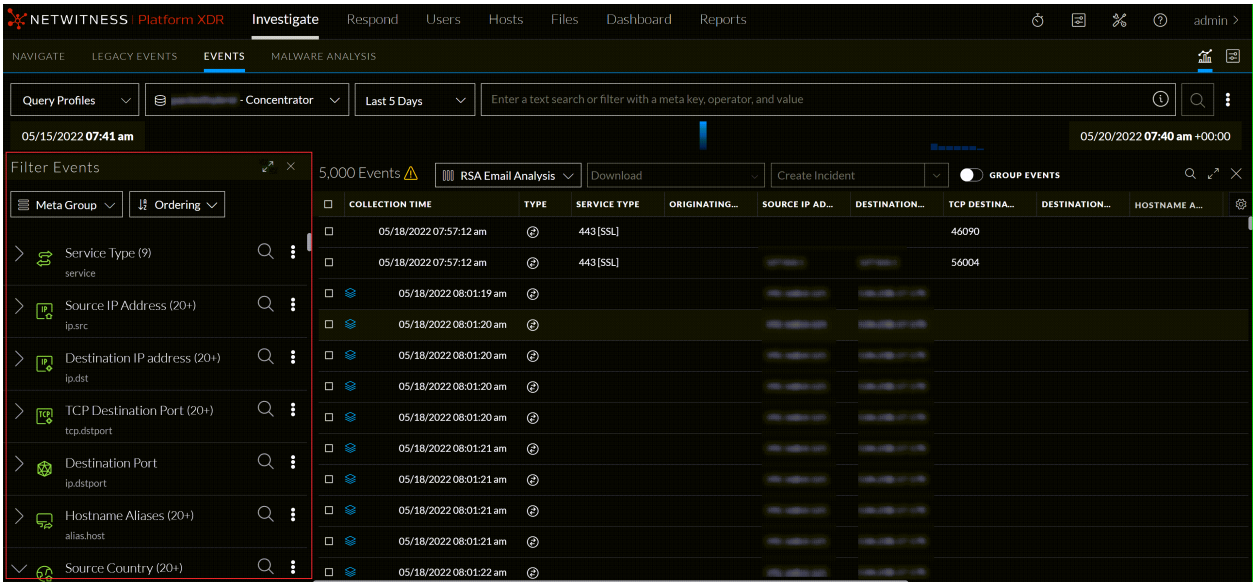
1. In the **Manage Profiles** dialog, click  in the left panel toolbar.
   The Profile Import dialog is displayed.

2. Click **Browse** or the **Upload File** field to select a file from your computer.
3. When the file is selected, click **Upload**.
   The profile is displayed in the left panel.

Download Profiles (Navigate or Legacy Events View)

In the Navigate view and the Legacy Events view, profiles are downloaded as .jsn files.

1. In the **Manage Profiles** dialog, select one or more profiles from the left panel.
2. In the left panel toolbar, click  .
   The download begins immediately.



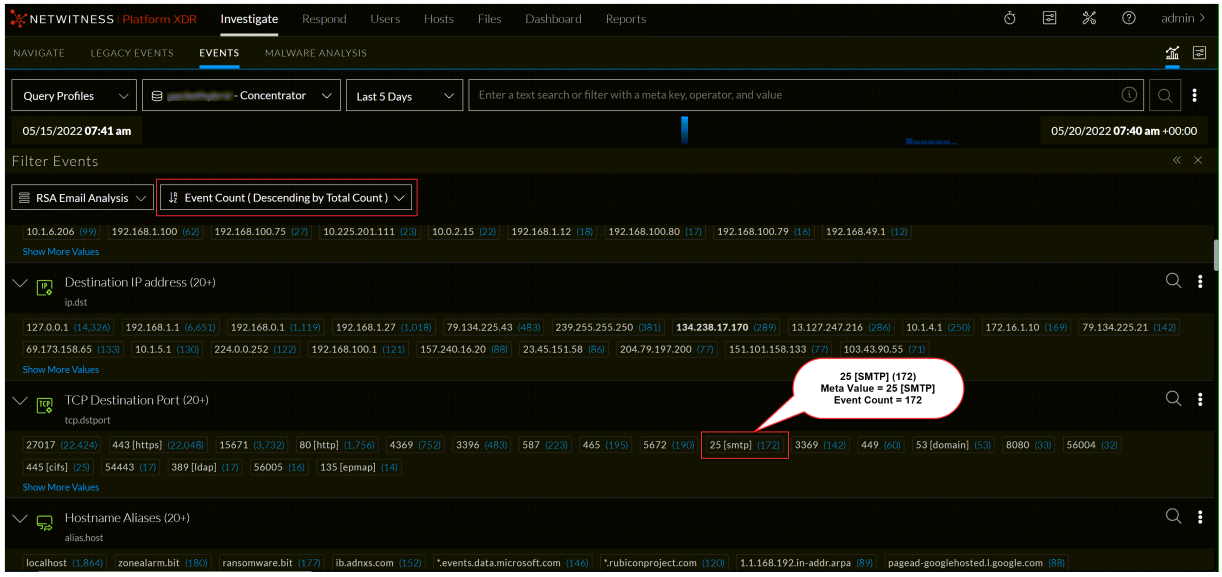
Drill into Metadata in the Events View

Note: This section applies to Version 11.5 and later. The feature is a beta feature that is enabled by default, and can be disabled by the system administrator as described in the *System Security and User Management Guide*.

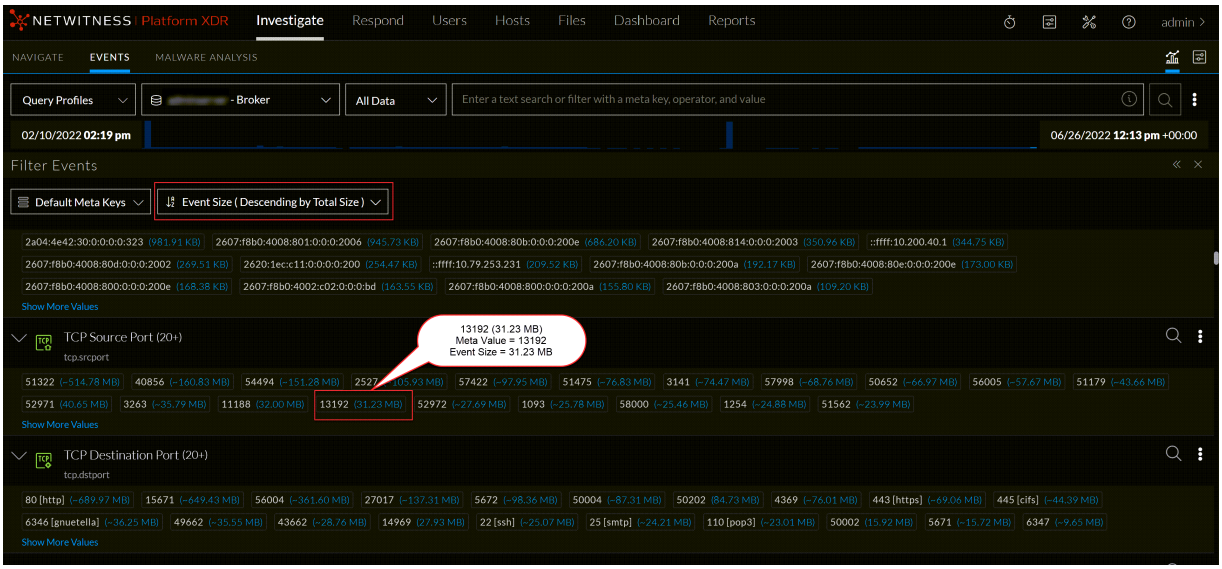
When working in the Events view, the focus of an investigation is the smallest possible set of relevant events in sequential order. You can reduce the number of visible events loaded in the Events view using query profiles, column groups, meta groups, and queries. However, it is more efficient to limit the data set using the metadata indexed on the Concentrator before looking at the actual events stored on the Decoder or Log Decoder.

In Version 11.4.x and earlier, it is best to start by looking at the meta keys and meta values indexed on the Concentrator and drill into the metadata in the Navigate view to find a relevant set of events, with each drill or query further limiting the data set. When you have a meaningful data set, or drill point, you can examine the details of the related events in sequential order in the Events view.

Beginning with Version 11.5, you can drill into the metadata in the Filter Events panel, without leaving the Events view. The list of meta keys and meta values shown is related to all events seen in the environment for the time range in the query. When you find the drill point of interest in the Filter Events panel, you can open the Events panel to see the sequential events. The set of events loaded in the Events view is smaller and loads faster. The flow of an investigation is smoother with less hopping between views. The following figure illustrates the panel, open to the left of the Events panel.



Note: There are two situations in which results in the Filter Events panel may not be as expected:
-In a mixed-mode environment with a Version 11.5 Broker and some Core services at NetWitness Platform Version 11.4 or earlier, a text filter is not supported in the Filter Events panel. If the query in the Events panel includes a text filter, the result set in the Events panel and Filter Events panel may be different.
-If the query in the Events view query builder has a logical `OR` or `&&`, the results in the Events view may be different from results for the same query in the Navigate view and Legacy Events view. In this situation, a set of parentheses automatically encloses the logical `OR` expression in the Navigate view and Legacy Events view, while parentheses have to be manually added in the Events view. If this occurs, you need to enclose the logical OR expression in an additional set of parentheses; select the two filters in the query bar, right-click one of them, and select **Wrap in parentheses** in the menu.

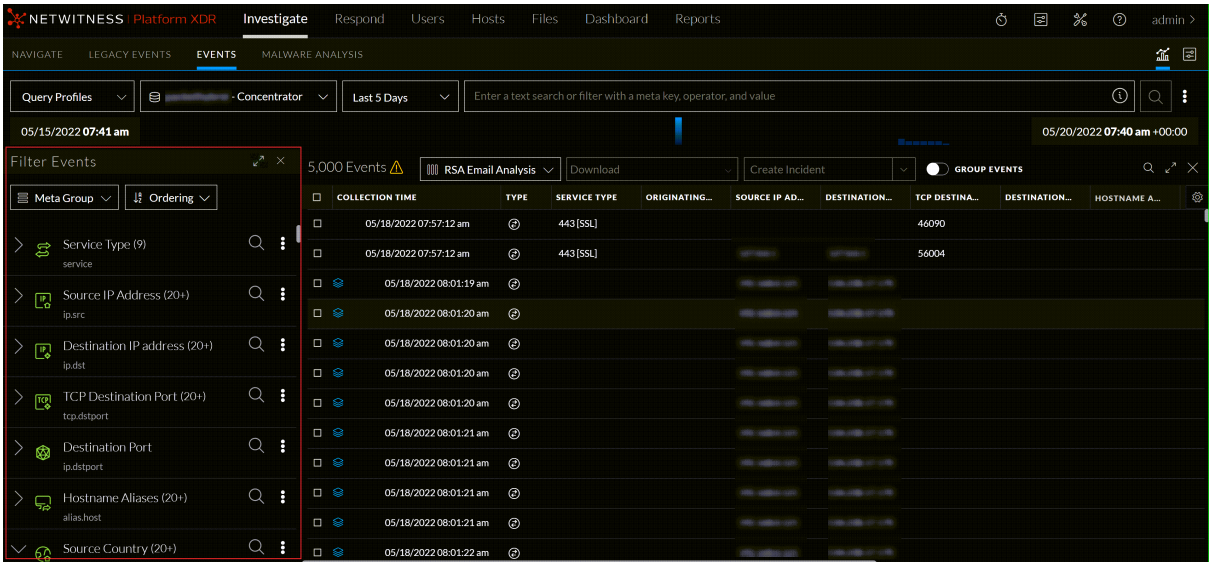


Note: (Version 11.5.1) In the Filter Events panel, the meta values result threshold is 100000. If results are above the threshold, it is indicated using either ~ or >. For example, **(>100000)** indicates that the results are sorted based on count and are greater than the threshold. Similarly, **(~100000)** indicates that the results are sorted based on size and are greater than the threshold.

Modes of Operation

The Filter Events panel has two modes of operation.

- The **narrowFilter Events panel** is part of a faceted search view into the data (shown above). Left- or right-clicking a meta value adds a new filter, automatically executes a new query, and displays matching events in the sequential list of events. When both panels are open, you can drill into the data in both the Filter Events panel and the Events panel . Each time you left-click a meta value in the Filter Events panel, an expression is appended to the query bar, and the query is executed by default. The query results show new metadata to filter by in the Filter Events panel and the resulting events that match the query in the Events panel. If you change the service or other query elements in the Events panel, you need to execute the query to reload the Filter Events panel.
- The **fully expanded Filter Events panel** uses the full width of the browser window to provide ample real estate to hunt through the metadata without the performance load of immediately submitting a query or viewing the sequential events. As you click a new meta value and drill into the meta values, each meta value is added to the query filter and executed in the Filter Events panel, so that the number of events seen is reduced. Because the Events panel is closed, the query in the Events panel is not updated and the query is not executed. When you collapse the Filter Events panel back to original size, the Events list opens and the query is executed. This is an example of the fully expanded panel.



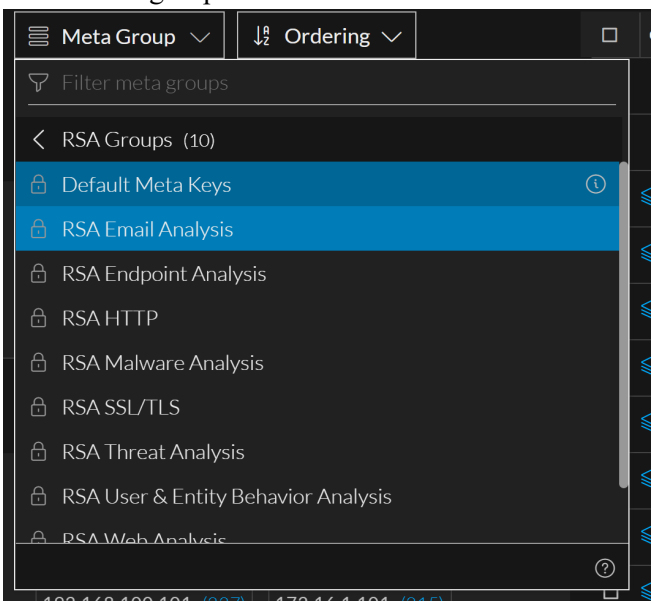
View Metadata in the Filter Events Panel

To view metadata in the Filter Events panel

1. Go to **Investigate > Events**, select a service to investigate, and select a time range.
2. (Optional) Select a column group or a query profile.
3. Click  to load events in the Events panel.
   A query is executed in the Events panel and matching events are listed,

4. Click the Filter button (Filter) in the Events panel.
   The Filter Events panel opens to the left of the Events panel.

Note: (Version 11.6) By default, the Filter Events panel is open in the Events view. The last used state of the panel (narrow or fully expanded) is saved throughout the session and across logins. Also, the Filter Events panel provides additional contrast between meta keys, meta values, and meta counts to improve readability.

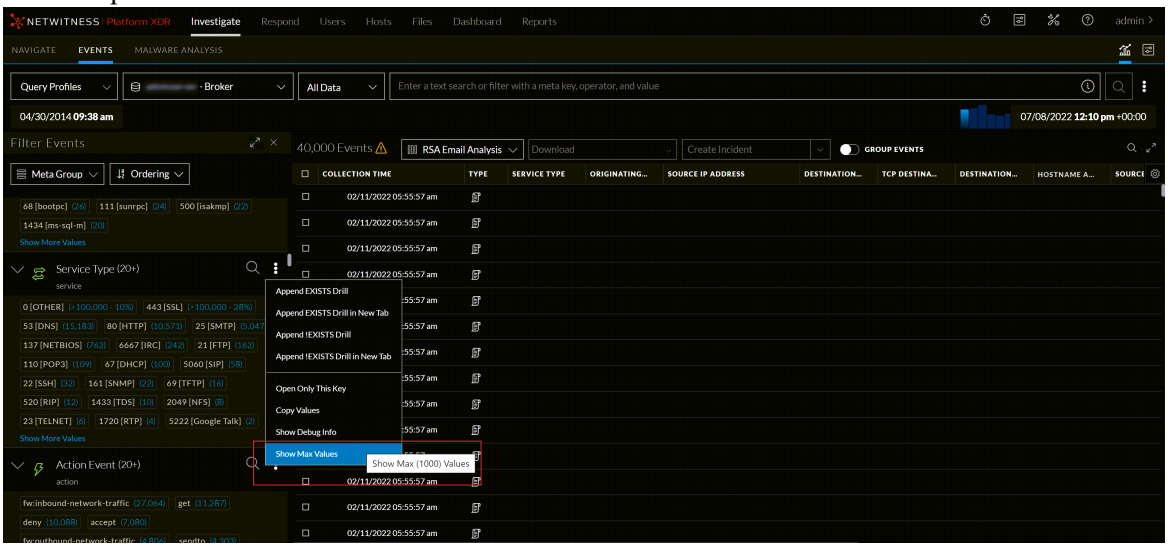


The Default Meta Keys meta group is in effect the first time you log in. If you selected a different meta group the last time you logged in, it remains in effect until browser cache is cleared. In Version 11.5.1, the meta group you selected previously is not stored in browser cache so it remains in effect until you change it. See Use Meta Groups to Focus on Relevant Meta Keys for details about meta groups. Based on the contents of the index file for the service, the Filter Events panel is populated with the first 25 meta keys that have at least one meta value and are open. When using the Default Meta Keys group in the Filter Events panel, only the first 30 meta keys with values are open and the remaining are closed. Closed meta keys may be listed, but they do not count toward the 25 or 30 meta keys total. Meta keys with no values are listed at the bottom of the panel. You can expand, collapse, and close the panel using the standard panel controls (, , and).

1. Do one of the following:

   a. To close the dialog without editing, click **Close**.

   b. To close the dialog and select the copy of the meta group, click **Select Meta Group**.
      The group is added to the Meta Group menu. The figure below has a private copy of the RSA

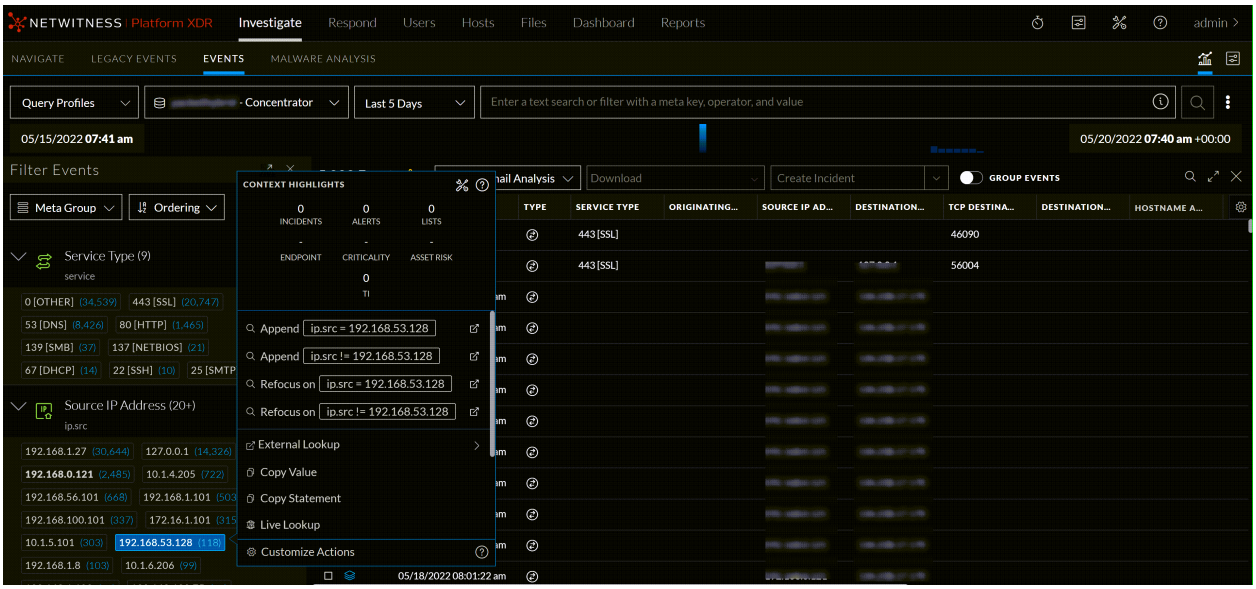


HTTP meta group.

Show Max Value of Meta Groups

In case all the values have not rendered and displayed, you can click Show Max Value to view all the values at once.

1. With the Filter Events panel open in the 11.6 Events view, click  and select the **Show Max Values** option.



2. The values that were not rendered earlier will begin to load and a maximum of 1000 results are displayed.

View the Context Lookup Panel in the Filter Events Panel

In the Filter Events panel, you can click a meta entity to open the context tooltip. The context tooltip is available only for the meta keys that are defined as an entity the Context Hub supports. The Context Hub service is pre-configured with default meta types and meta keys mapping. For information about mapping of the context hub meta values with investigation meta keys, see "Configure Meta Type Mapping for Context Hub" in the *Context Hub Configuration Guide*. The context tooltip includes the following two sections.

Context Highlights - The information in this section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, Endpoint, Criticality, Asset Risk, and Threat Intelligence (TI). Depending on your data, you may be able to click these items for more information.

You can also view other options like External Lookup, Copy Value, Copy Statement, Live Lookup, Context Lookup, Pivot to Investigate > Hosts/Files, Pivot to Endpoint Thick Client, Pivot to Archer, and Add/Remove from List.

Understand Visible Metadata

Each meta key has a list of meta values, with up to 20 values displayed by default. You can click **Show More Values** to incrementally add 20 meta values, up to a total of 1,000 meta values, which is a hard-coded limit to optimize performance. The meta key name and plain English name of each meta key found in the service, both populated and non-populated, are listed. For each meta value, you can see the number of events in the current results that contain the value (count) or the size of the events in the current results (size). For example, the following might be listed:

```
Action Event [action] (3)
get(3016) login (1346) put (501)
```

In this example, the meta key name is `action`, the English name is Action Event, and three meta values were found for this meta key. There were 3016 events containing `get`, 1346 events containing `login`, and 501 events containing `put`. The values are ordered so that the value with the largest count is listed first.

In the following example, the same meta key has the values ordered based on the event size in bytes. The smallest size is listed first:

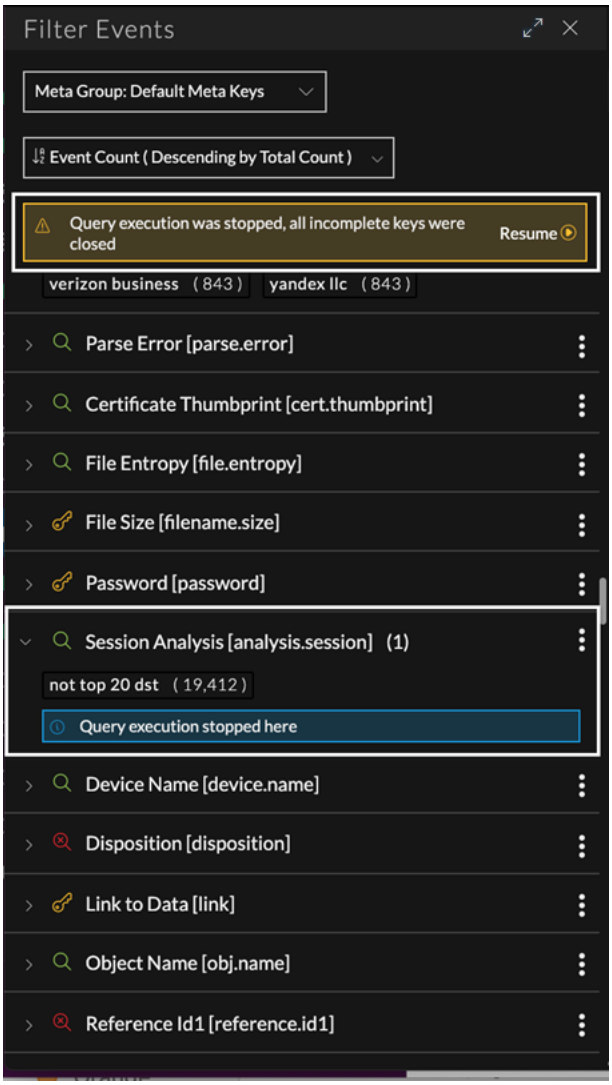
```
Action Event [action] (3)
login (13,034,588) put (21,848,760) get (1,409,079,256)
```

An icon before each meta key name identifies the indexing method for the key. The indexing method determines the types of interactions and queries possible using that meta key.

- This meta key is indexed by value: 

. The green color indicates that the all available interactions and queries are supported. You can see the available interactions in the context menu by right-clicking the meta value.
- This meta key is indexed by meta key: 

. The yellow color is a clue that a subset of available interactions is supported, and queries on this meta key may take longer than meta keys that are indexed by value. You can see the available interactions in the context menu by right-clicking the meta value.
- This meta key is not indexed: 



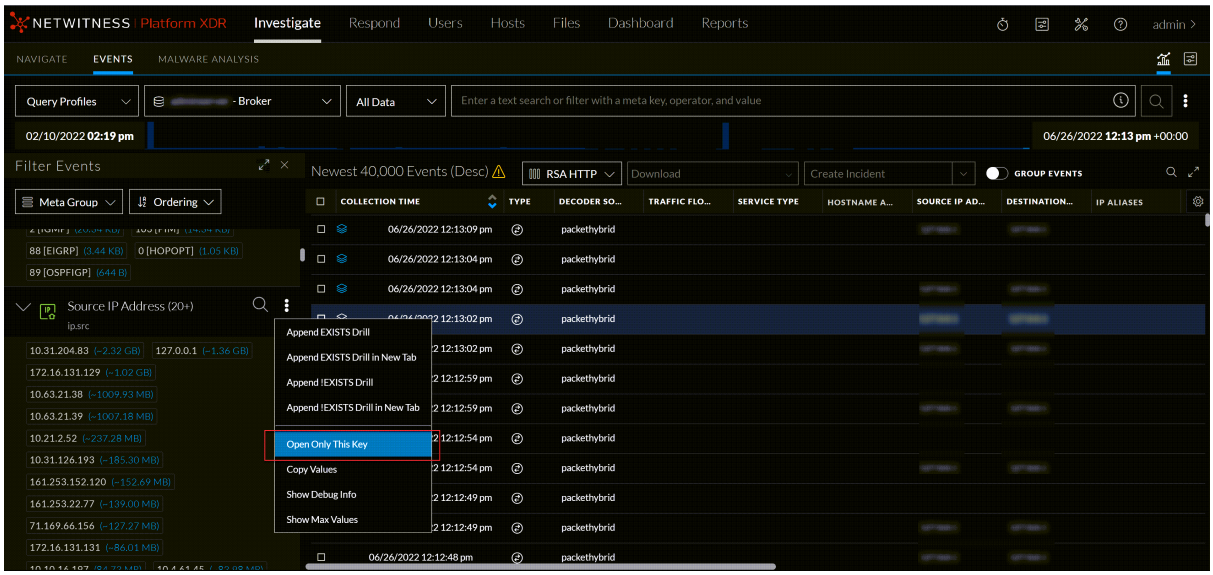
. Values for non-indexed meta keys cannot be used to query. If you want to query a meta key that is not indexed, your administrator needs to edit the index file for the service to index the meta key by value or meta key.
- For Version 11.5.1, a set of more than 200 meta key symbols replaces the three indexing method symbols to provide a visual indicator of the purpose of the meta key. The color of the meta key symbol identifies the indexing method using the same colors as before: green, yellow, and red. A tooltip also identifies the indexing method and provides a description of the icon. The icons are defined based on categories outlined in the Unified Data Model (https://community.netwitness.com/t5/netwitness-platform-unified-data/tkb-p/netwitness-udm). There is a generic icon for most categories that do not have specific meta keys and a default meta key icon to use when a new custom meta key is added.

If an error occurs while loading a meta key, the other meta keys load as usual and an error message is displayed in the meta key that did not load. When you execute a new query, some error messages disappear. Meta keys that have no values in the set of events are listed at the bottom of the panel.

Stop and Resume Metadata Loading

You can stop and resume loading of metadata in the Version 11.5.1 Filter Events panel as the meta keys and values are loading. When loading a lot of metadata this can save time because you do not have to wait for all data to load. If you stop loading and still need to see more metadata, you can resume loading, then stop again when you see the data you want.

1. While data is loading in the Filter Events panel, click the Stop button () in the query bar.
   Meta keys stop loading, and keys that did not finish loading are closed. A message above the meta keys list informs about the status, and you can scroll down to find the last meta key to finish loading. In this example, Session Analysis finished loading; all the meta keys below remain closed.



2. Do one of the following:
   a. To resume loading at the meta key where loading stopped, click **Resume**.
   b. If you want to review the values of specific meta keys that were not loaded, without resuming the query, click the meta key name to open any key.

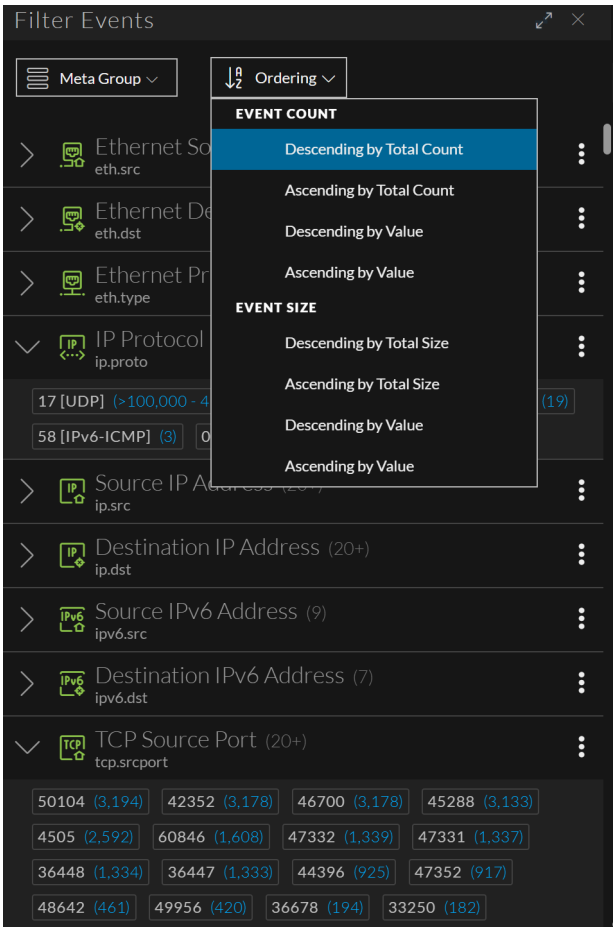
Close All Except One Meta Key

(Version 11.5.1 and Later) When the Filter Events panel is open, seeing many meta keys at the same time can be distracting.

To close all except one meta key

1. In the meta key row of an entry, click the Meta Key options button (⋮).
   The Meta Key options are displayed.

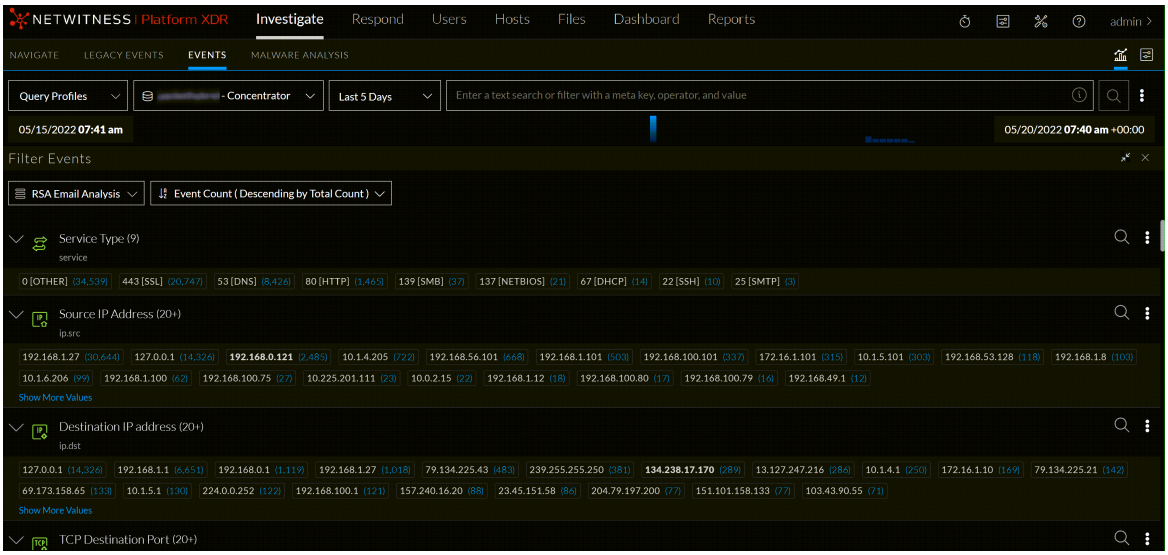
2. Select **Open Only This Key**.
   All except the current meta key close. If the selected key is closed, it opens and data is loaded, while all other keys close.



Set the Ordering Method for Meta Values

With the Filter Events panel open, you can look at two parameters for each value: the event count or the event size. Each meta key entry includes either the event count or the event size in parentheses after the value. In both cases, there are four options for ordering.

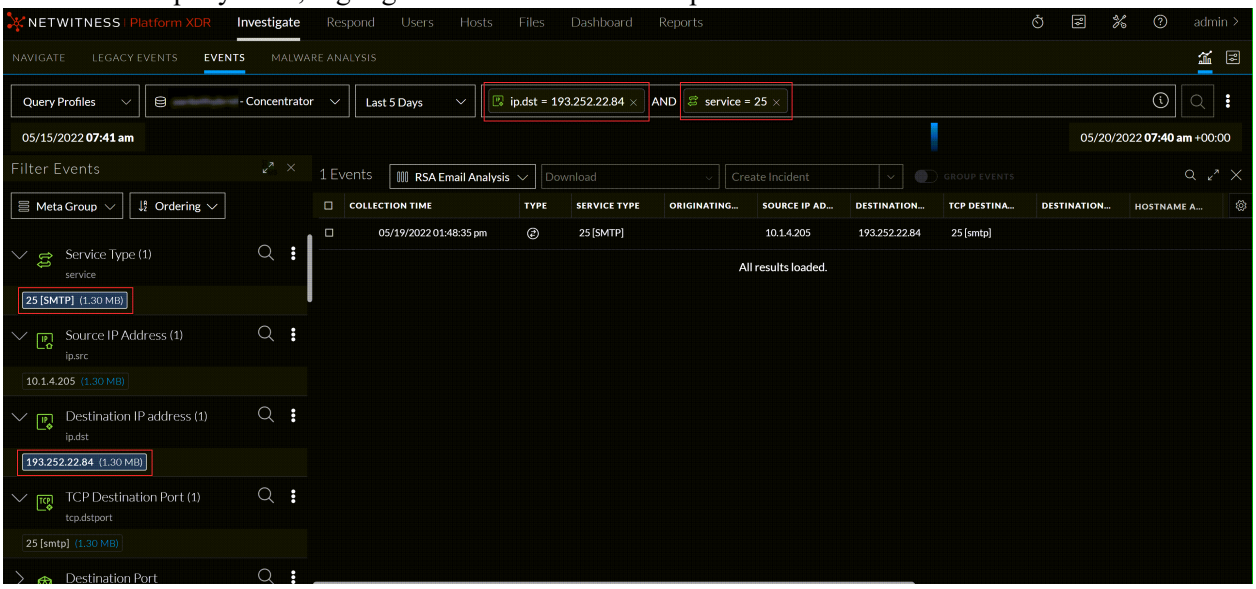
To use the ordering options



1. With the Filter Events panel open, click the ordering menu label, which is named according to the selected ordering option. This is an example of the menu label when ordering by event count in ascending order by total count: 

   .
   The Ordering menu is displayed. This figure shows the narrow version of the menu.

2. If you want to see the event count in parentheses after each value, select one of the following options. By default, the meta keys are displayed using the **Event Count** > **Descending by Total Count** method.
   a. To order by total count of events in which the value was found, select either **Descending by Total Count** or **Ascending by Total Count**.
   b. To order by the name of the value, select either **Ascending by Value** or **Descending by Value**.
3. If you want to see the size in bytes of the events in which the value was found, select one of the following options.
   a. To order by total size of events in which the value was found, select either **Descending by Total Size** or **Ascending by Total Size**.
   b. To order by the name of the value, select either **Ascending by Total Size** or **Descending by Total Size**.
   Under each meta key in the Filter Events panel, the values are ordered according to your



selection.

Drill into Meta Values

With the Filter Events panel open, you can drill into meta values to focus an investigation down to the smallest possible set of relevant events. Drilling in the fully expanded Filter Events panel adds filters to the query bar and refines the displayed metadata in the Filter Events panel, but does not execute the query in the Events panel. Drilling in the narrow panel, side by side with the Events panel, adds the filter to the query bar and executes the query in the Events panel and the Filter Events panel. This figure is an example of the fully expanded panel with some metadata loaded.

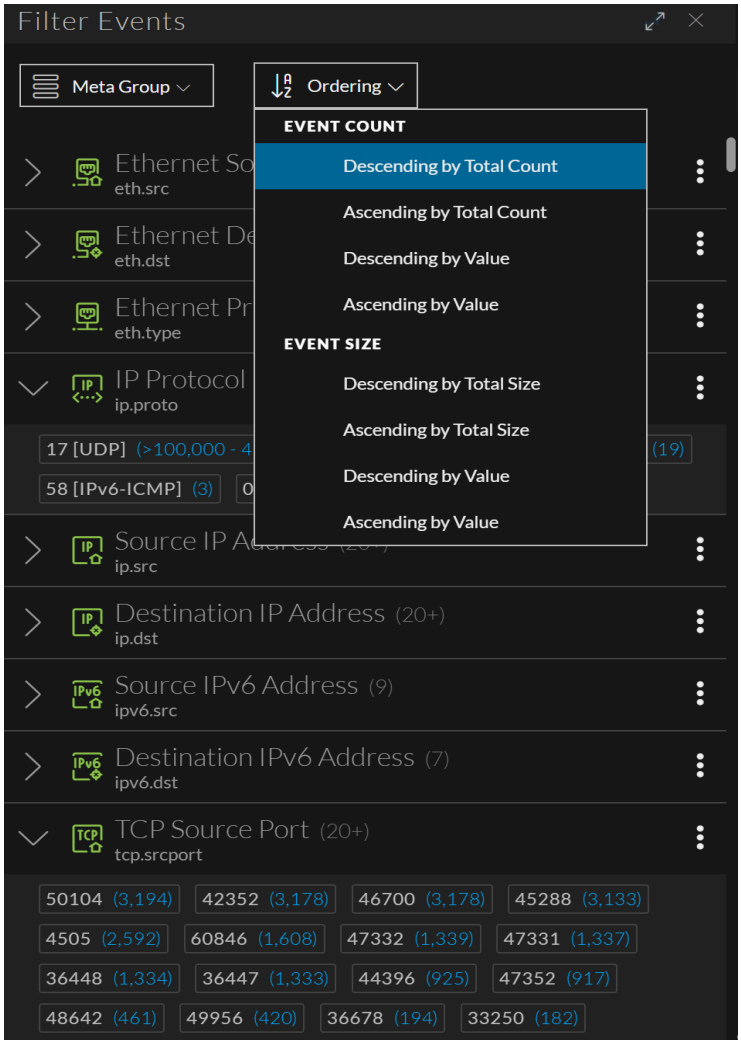
You can drill into metadata in the Filter Events panel to find relevant meta values. A simple query using the (=) operator highlights the meta value used in the Filter Events panel. This helps to associate the metadata with the filter added to the query. For example, the following figure shows the meta key value, related to the query filter, highlighted in the Filter Events panel.

To drill into meta values in the fully expanded Filter Events panel

1. Look for a meta value that is of interest, and click the value. Using the figure above as an example, to investigate the SMTP service type as opposed to other service types, click **25[SMTP]**.
   The other service types are filtered out of the metadata in the Filter Events panel, but the query is not executed in the Events panel.
2. Look for a meta value that is of interest, and do one of the following:
   a. Click the value. Using the figure above as an example, to investigate the SMTP service type as opposed to other service types, click **25[SMTP]**.
      The filter is added as the last filter in the query bar, and other service types are filtered out of the metadata in the Filter Events panel. With the Events panel closed, no query is executed there.
   b. (Version 11.5.1) Right-click the value and select **Add Filter - Do Not Run Query** in the drop-down menu.
      The filter is added as the last filter in the query bar, but no other service types are filtered out of the metadata in the Filter Events panel. With the Events panel closed, no query is executed there.
   c. (Version 11.5.1) Press **CTRL (Windows)** or **CMD (MacOS)** and click the value.
      The filter is added as the last filter in the query bar, but no other service types are filtered out of the metadata in the Filter Events panel. With the Events panel closed, no query is executed there.
3. Repeat step 1 with another meta value, for example, **writetoexecutable** in the **Action Event [action]** meta key. Continue drilling into values until you find a set of events (drill point) that you want to see in sequential order.
4. To view the sequential events for the drill point, click  to shrink the Filter Events panel.
   The Events panel opens to the right, and the query is executed in the Events panel so that you can see the raw events in sequential order.

To drill into meta values in the narrow Filter Events panel

1. Look for a meta value that is of interest, and click the value. Using the figure above as an example, to investigate the SMTP service type as opposed to other service types, click **25[SMTP]**.
   The filter is added as the last filter in the query bar, other service types are filtered out of the metadata in the Filter Events panel, and the query is executed in the Events panel.
2. Look for a meta value that is of interest, and do one of the following:
   a. Click the value. Using the figure above as an example, to investigate the SMTP service type as opposed to other service types, click **25[SMTP]**.
      The filter is added as the last filter in the query bar, and other service types are filtered out of the metadata in the Filter Events panel and the data set showing in the Events panel.
   b. Right-click the value and select **Add Filter - Do Not Run Query** in the drop-down menu.
      The filter is added as the last filter in the query bar, but no other service types are filtered out of the metadata in the Filter Events panel, and the query is not executed in the Events panel until you click the query button.

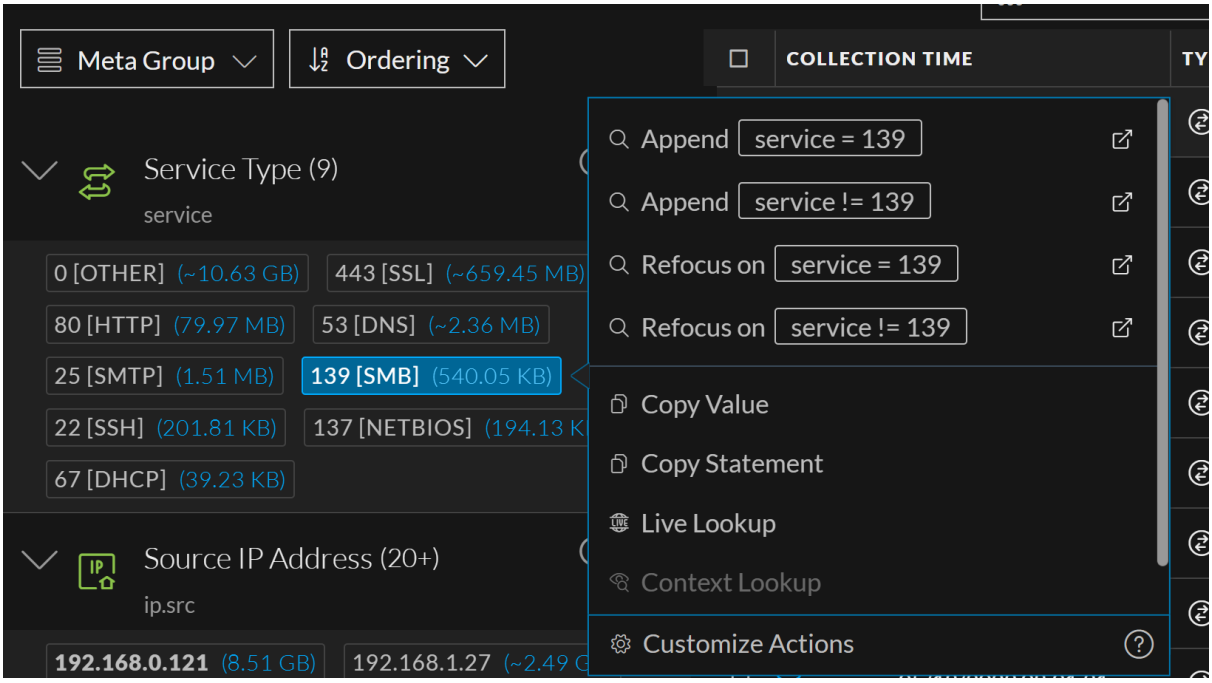


c. Press **CTRL (Windows)** or **CMD (MacOS)** and click the value.
The filter is added as the last filter in the query bar, but no other service types are filtered out of the metadata, and the query is not executed in the Events panel until you click the query button.

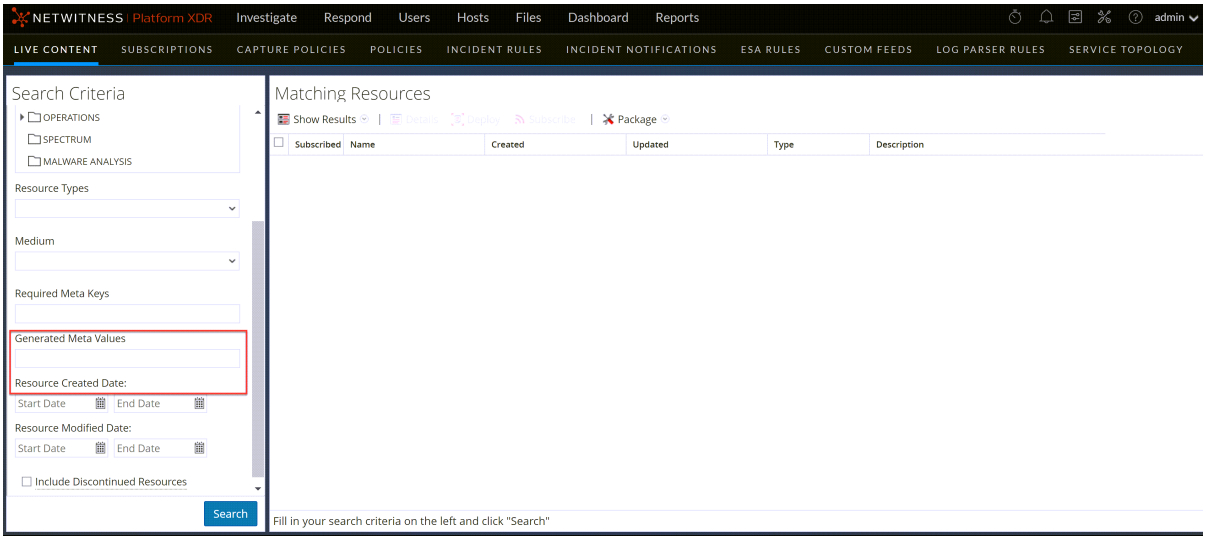
3. Continue clicking values to refine the set of events (drill point). As you refine the set of events, examine and reconstruct the raw events for the same set in the Events panel.

Copy the Meta Values for a Meta Key

To copy all of the visible meta values for a meta key



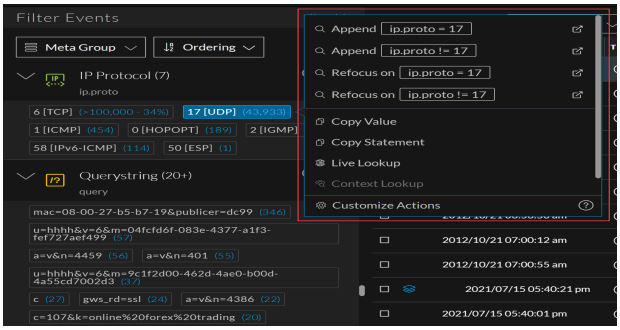
1. In the meta key row of an entry, click the Meta Key options button (⋮).
The Meta Key options are displayed. Currently the only option is Copy Values.



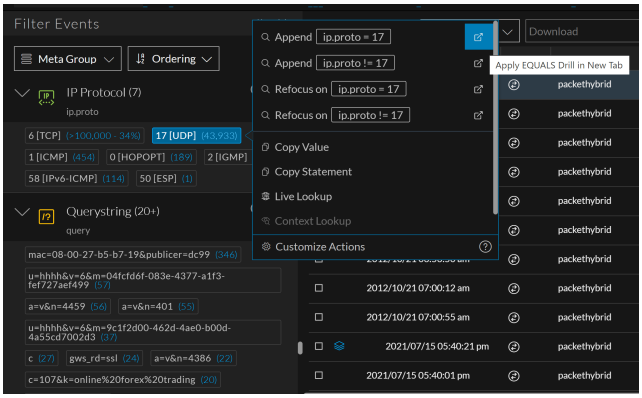
2. Click **Copy Values**.
A comma-separated list of the values is copied to your local clipboard. This is an example of the clipboard contents: `"get", "login", "put"`.

View a Selected Meta Value in Live

1. Left or right-click a meta value, for example **SMB**.
   The Meta Value drop-down menu is displayed.

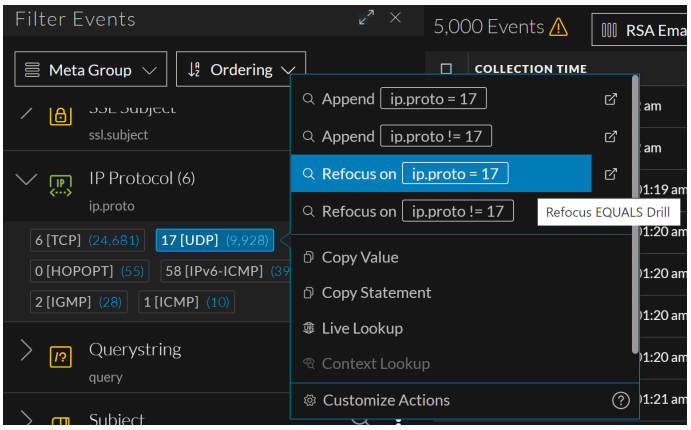


2. To look up the meta value, for example **success**, in Live, select **Live Lookup**.
   The Live Search view is displayed with the meta value entered in the Generated Meta Values field, and ready for a search.

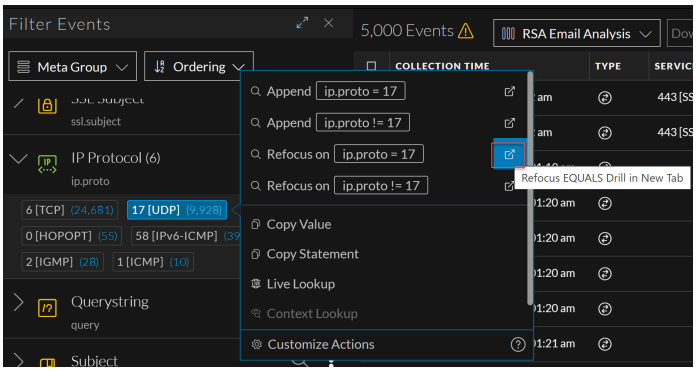


Append and Refocus the Investigation of a Meta Value in Unified Panel

For each value listed under a meta key, the focus is `<meta key> = <meta value>`. When you right-click a meta value, a context menu with different Append and refocus options is displayed. All of the append and refocus actions update the drill point in the Events panel, Filter Events panel and Meta Event panel.

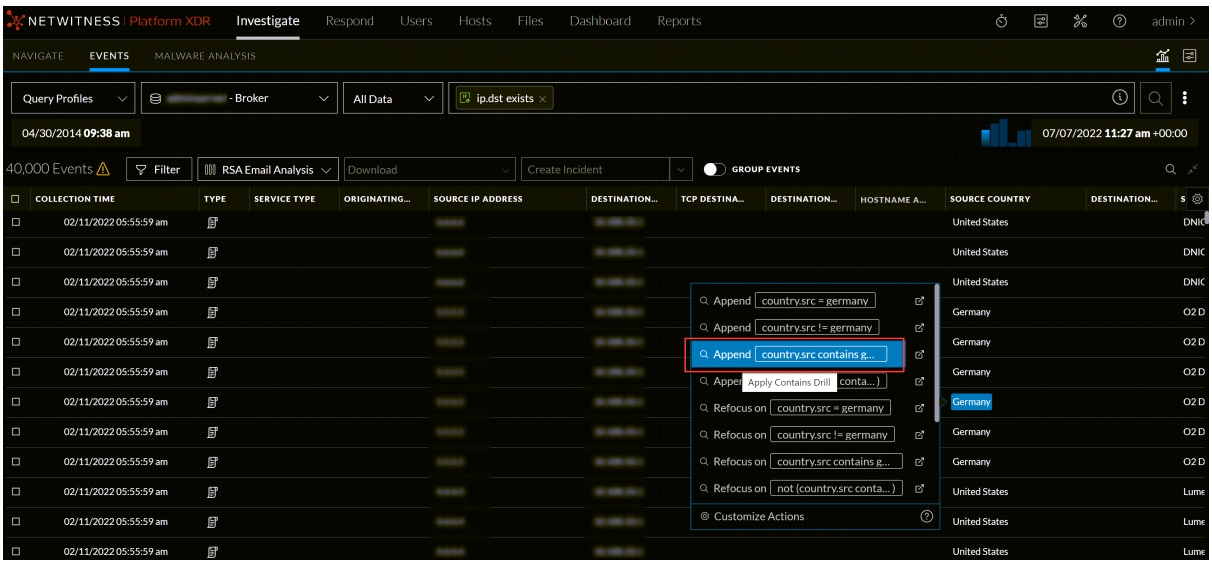


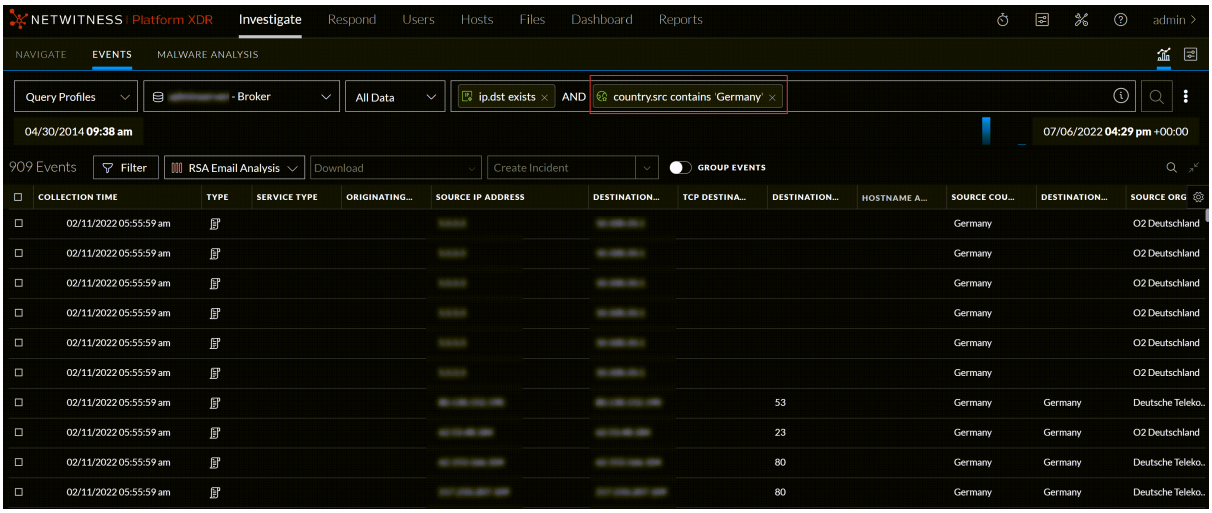
1. To append the key-value pair to the query with different operators (=, `!=`, `contains`), right-click a meta value (for example **UDP** in the figure below) and select one of the **Apply <operator> Drill** options.



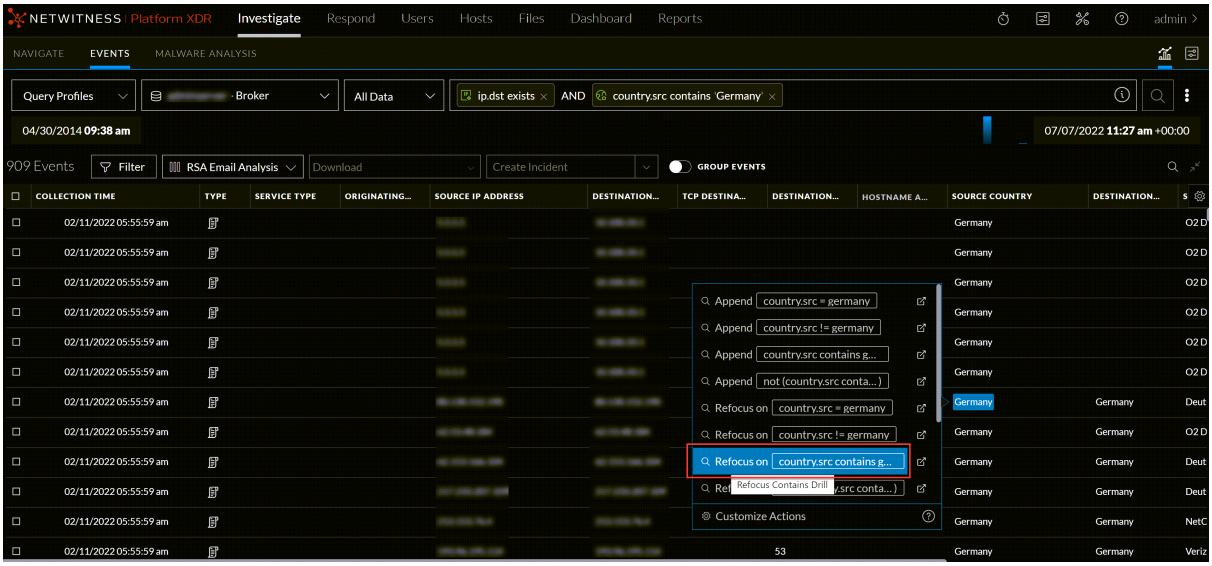
2. To append the key-value pair to the query or start the key-value pair over in a new browser tab, right-click a value and select one of the **Append New Tab** > **Append <operator> Drill in New Tab** or **Append <operator> Drill in New Tab** options.

3. To start the query over with the key-value pair and a different operator (=, `!=`, `contains`), right-click a value and select one of the **Refocus <operator> Drill** options.

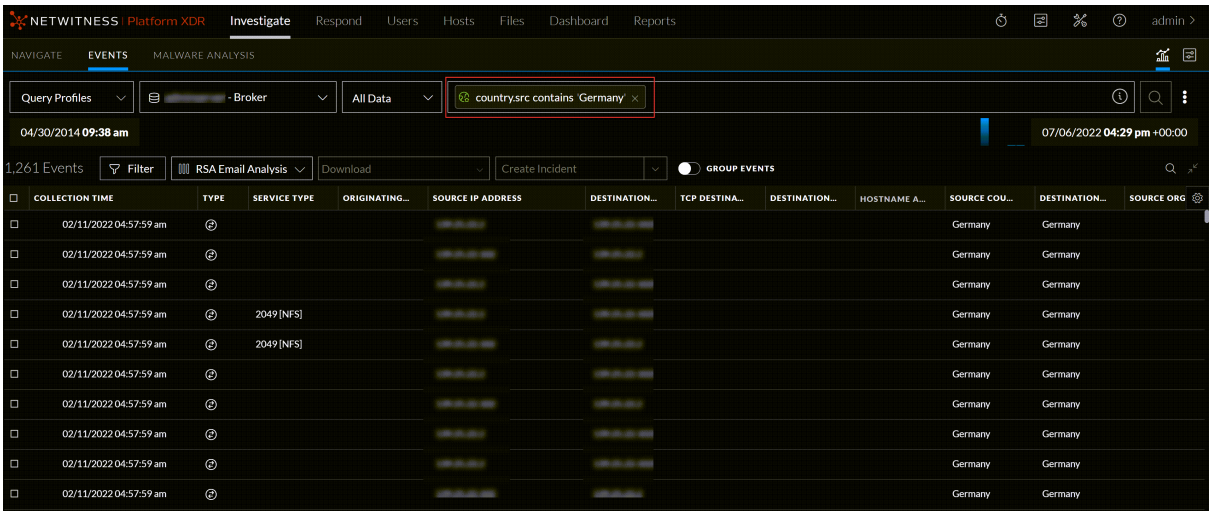




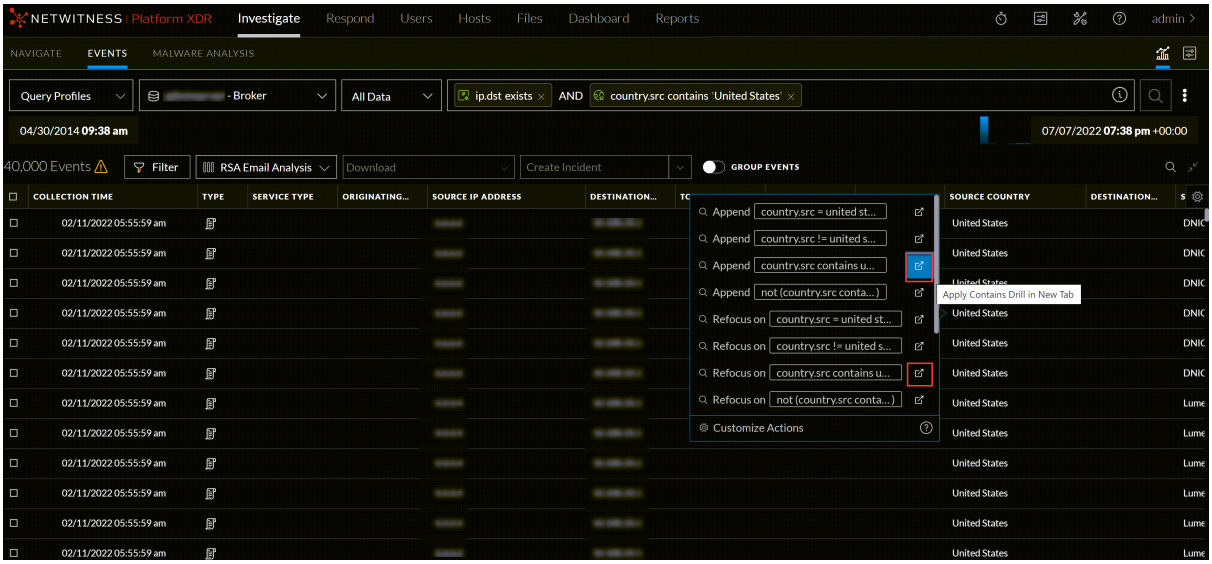
4. To append the key-value pair to the query or start the key-value pair over in a new browser tab, right-click a value and select one of the **Refocus New Tab** > **Refocus <operator> Drill in New Tab** or **Refocus <operator> Drill in New Tab** options.



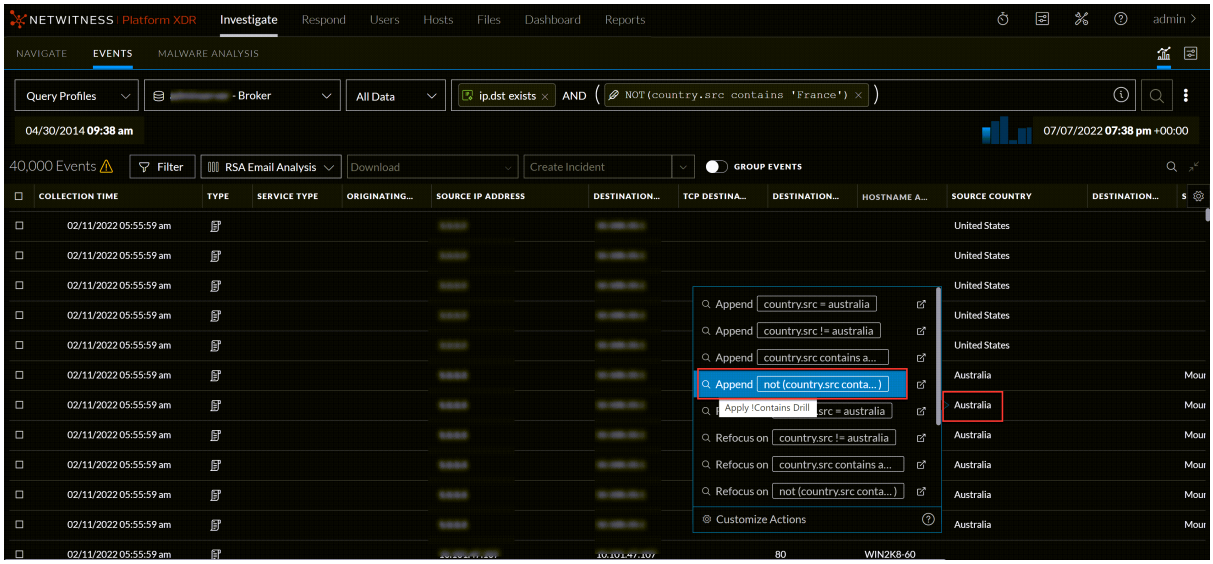
The drill is refocused according to your choice, and the new query is executed in the Events panel.



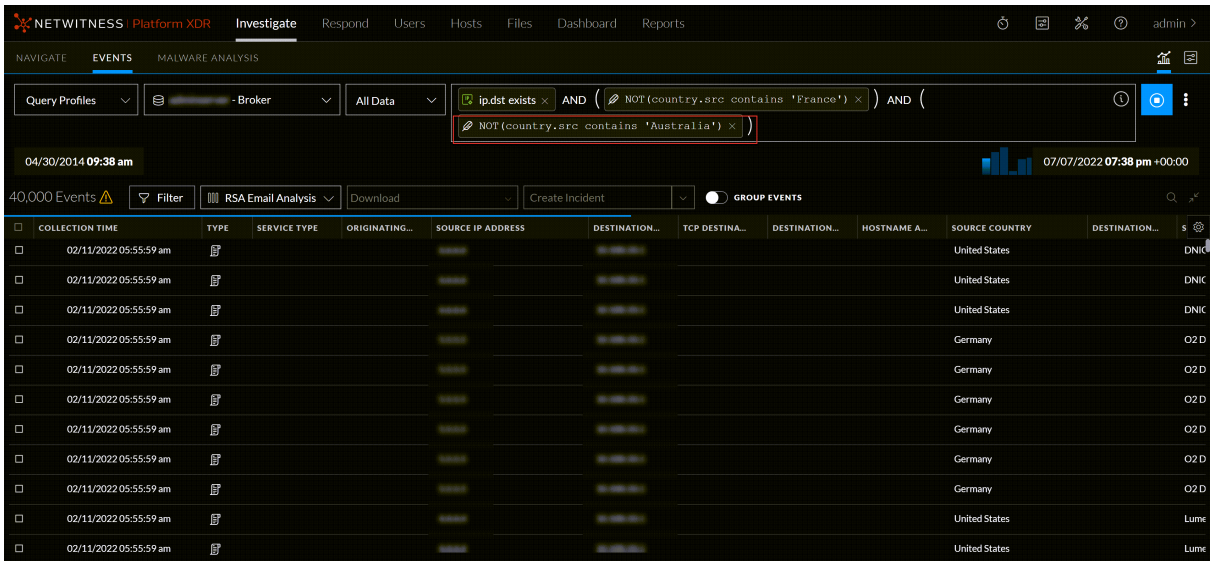
5. When you select a meta value using **Append** (*Meta* contains Meta value), the existing query is updated along with new query filters in the displayed search results.



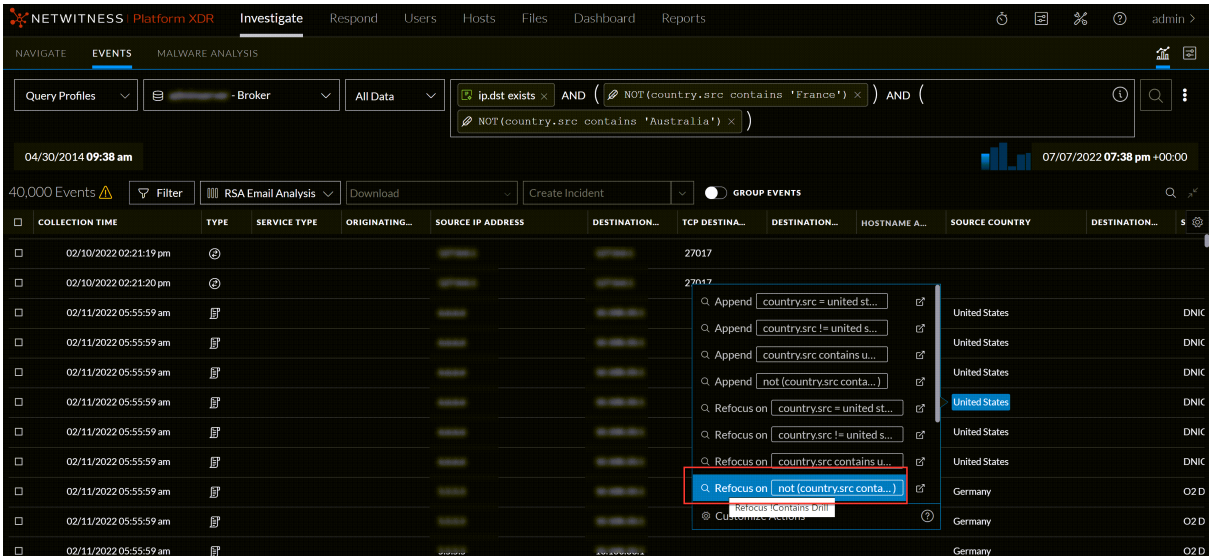
6. When you select a meta value using **Refocus** (*Meta* contains Meta value), the existing query is removed from the search result and the specified meta value results are displayed.



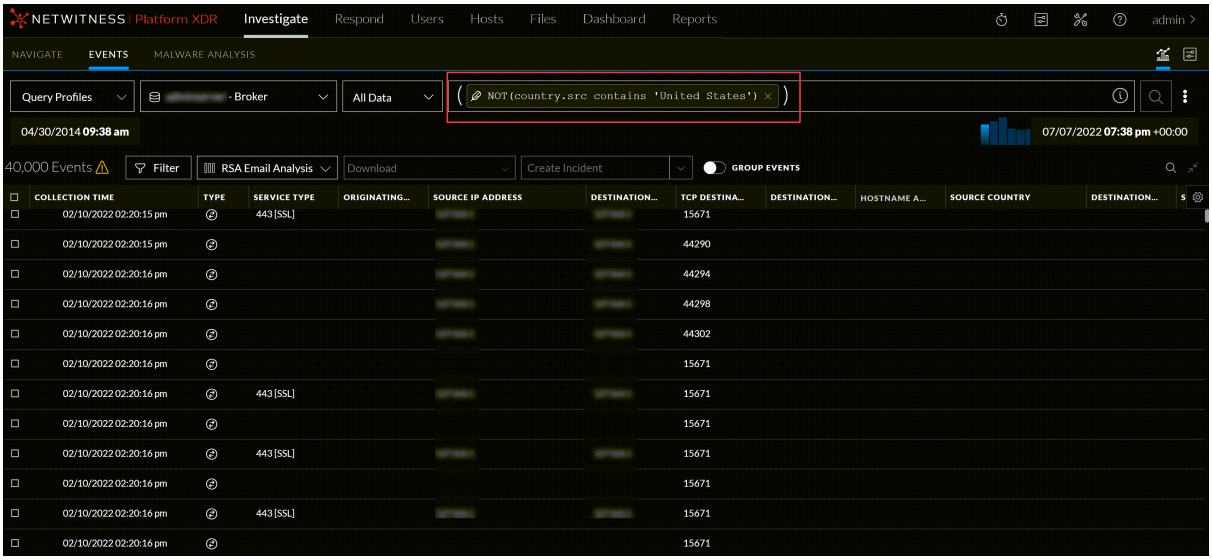
7. You can also Append and Refocus the meta values with Contains option using new tab option as shown below:



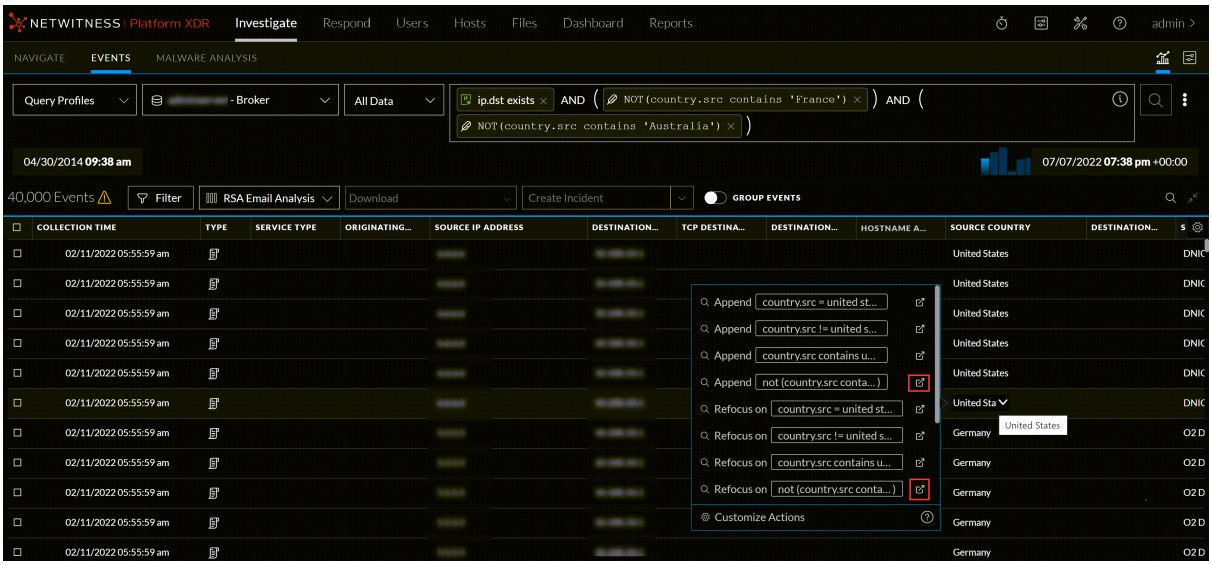
From 12.0 and later, Analysts can now exclude particular meta values while querying using the NOT (*meta* contains 'meta value') option available in the investigate unified panel. The specified meta value is removed from the query results when you use NOT(*meta* contains 'meta value') with **Append** or **Refocus** option on a specific meta value. This enhancement helps the analysts to view only the required data results in an optimized manner and conduct further investigation efficiently.



In the Events view, you can further investigate meta values in an event by left or right-clicking certain meta values and use the options in the drop-down menu.



1. When you select a meta value using **Append** NOT(*Meta* contains Meta value), the particular query is removed, and the new query filters will be appended, resulting in NOT containing meta values.



2. When you select a meta value using **Refocus** NOT(*Meta* contains 'Meta value'), the particular meta value is removed from the search query results.

3. You can also Append and Refocus the meta values with Not Contains option using new tab option as shown below:

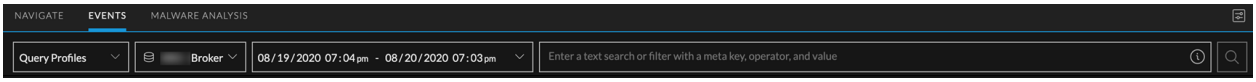
Filter Results in the Events View

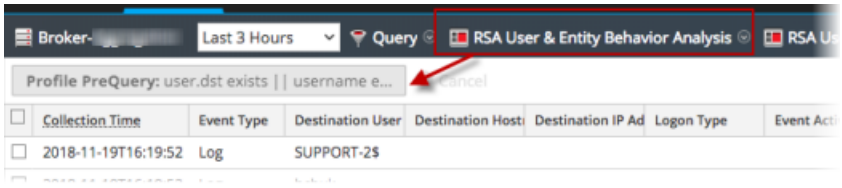
Filtering events in the Events view helps to narrow the focus of an investigation to a smaller, relevant set of events. You can filter events in the Events view using the Events Filter panel (Version 11.5 and later), the options in the query bar, and the options in the Events panel.

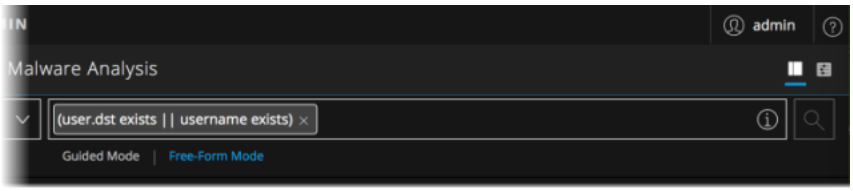


Initial Filter Using the Query Bar

When initially opening the Events view, the most basic filtering is to select a service, and time range and then query the service in the query bar. This returns a list of matching events in the Events panel. You can also select a query profile (Version 11.4 and later) and build a query to look for events that contain certain meta keys, meta values, and text in the query bar.

This figure illustrates the Version 11.4 and earlier query bar with the options to select a query profile, service, and time range to filter events and load them in the Events panel. Two modes are available Guided Mode and Free-Form Mode.

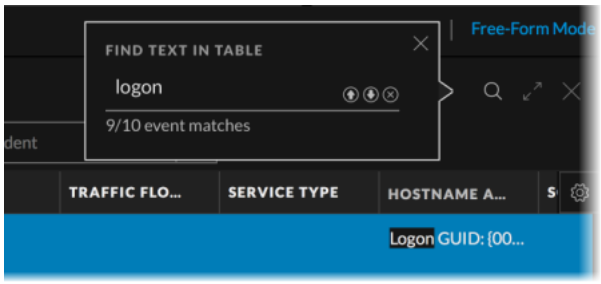




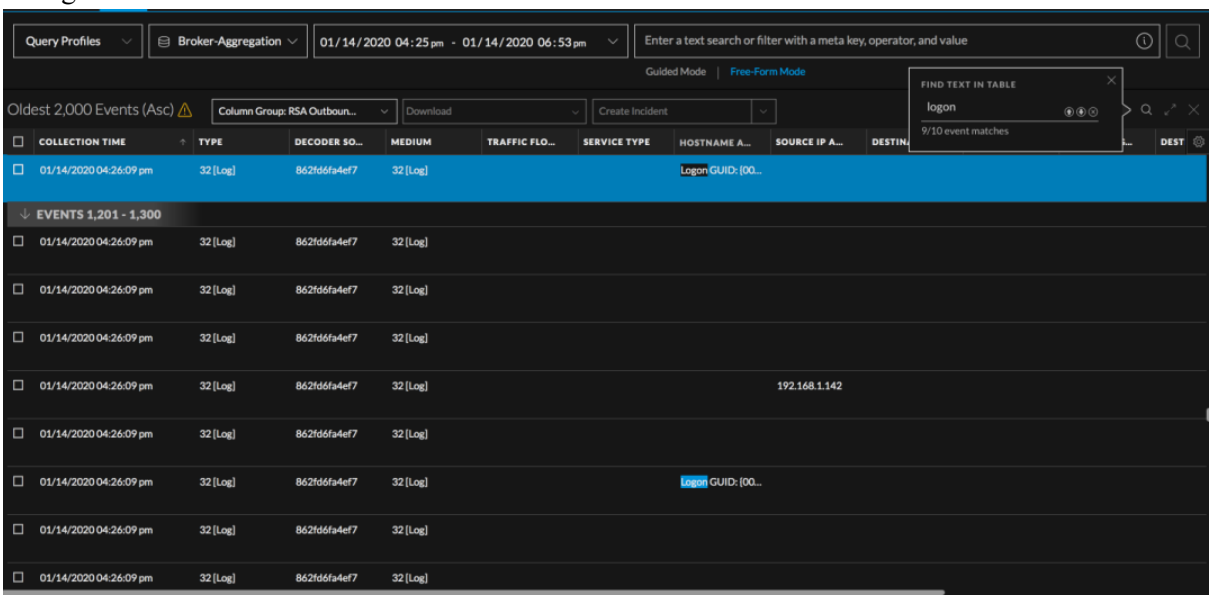
This figure illustrates the Version 11.4.1 and later query bar in which the Guided and Free-From Modes are no longer necessary. The simplified filter entry form allows you to use advanced auto-suggest options and also to enter a free-form query.

- The Query Profiles menu is available in Version 11.4 and later. You can encapsulate a query and a column group in a profile so that a useful combination of attributes is easily recalled and applied to a set of events in the Events panel (see Use Query Profiles to Encapsulate Common Areas for Investigation.)
- By default, the first service is automatically selected (unless you previously selected a service and the selected service is in browser cache). You can select a service as described in Begin an Investigation in the Events View
- If you do not select a time range, the default time range (24 hours) is used.
- The query builder field is an empty field to the right of the time range selector. This is where you build a query by creating filters. Clicking  submits the query and sends a request to the selected service to load the data. In Version 11.3 and later, clicking the  (**Query Console**) > **Current Query** tab, shows detailed status of the current query (see Filter Results in the Events View below).
- When you go to the Events view from the Legacy Events view or the Navigate view, the service, time range, and any filters that were selected in the Legacy Events view or Navigate view are displayed in the query bar. The service, time range, and individual filters can be modified.

- If a profile is selected in the Legacy Events view when you right-click or double-click an event and go to the Events view, the filters from the profile (preQuery) are added to the query builder field as an editable filter. The following figures show a preQuery in the Legacy Events view, and the same query added as the first filter in the Events view.



Find a Text String in the Events Panel



With the Events panel open, you can search for a text string in the list of events. This search is similar to the CTRL-F search in a browser window. The search scans all text in every row of the table, visible columns only, to find matching text and highlights the matches. Columns that are not displayed are not searched. The search function is disabled if the Summary column is part of the table.

1. With events loaded in the Events panel, click  on the right side of the toolbar.

2. In the **Find Text in Table** dialog, start typing a text string.
   After you type two characters, exact matches of the text string without regard to case are highlighted in the Events panel. As you type more text, highlighted events are further refined. The following figure is an example of the results found after entering "192.168" in the Find Text in Table dialog. The text string was found in 10 events. The first event is highlighted in blue with the text string within the event also highlighted. Icons are available for navigating the search results and closing the

dialog.

3. To navigate through the search results, click the up and down arrows.
   - To view the next event that contains the text string and navigate downward through the search results, click the down arrow. If you click the down arrow when viewing the last result, the first result is highlighted.
   - To view the immediately prior event that contains the text string and navigate upward through the search results, click the up arrow. If you click the up arrow while viewing the first result, the last result is highlighted.
4. To close the search dialog, click X or press the ESCAPE key. The dialog also closes if you open a reconstruction, select a new column group, or execute a new query.

Refining the Results in the Events Panel

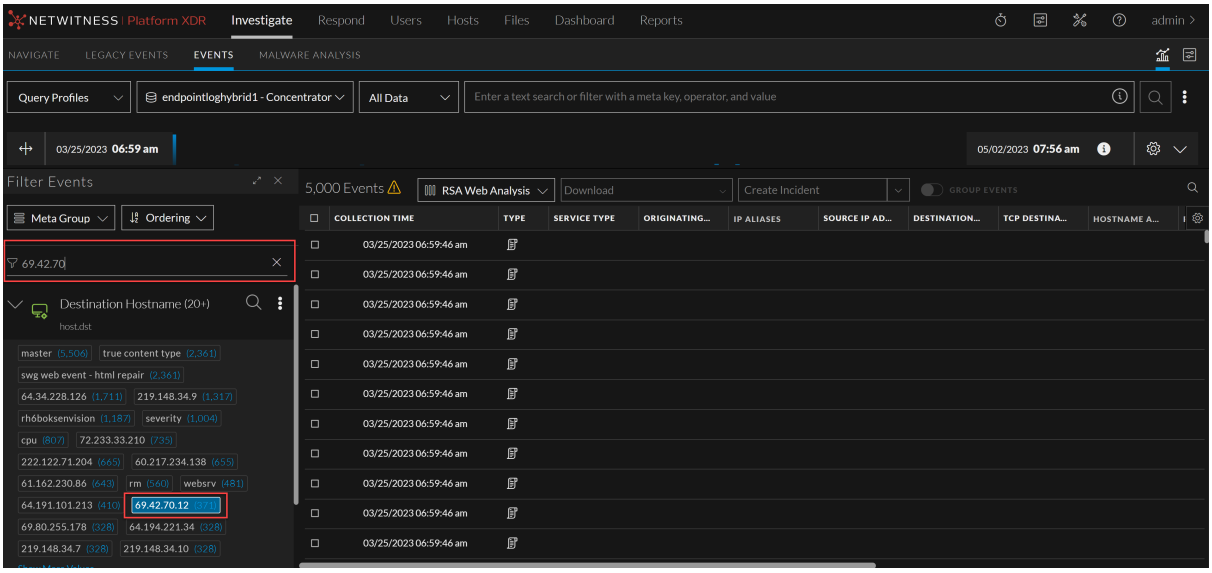
After the initial filter and query submission, you can continue to use the options in the query bar to refine results, with two added methods of filtering the results.

- In Version 11.4, you can use column groups to optimize the number or attributes (meta keys, meta groups, meta entities) you look at for a given event (see Use Columns and Column Groups in the Events List).
- In Version 11.5 and later, you can filter events by exploring meta keys and meta values in the results in the Filter Events panel, which is a Beta release feature. This allows you to pivot through the metadata as you can in the Navigate view, and offers the added convenience of immediately seeing the matching events in sequence in the Events panel based on your drill point. The administrator can enable or disable this feature as describe in the *System Configuration Guide*.

Filter Meta Information using Filter Events Panel

From version 12.3 and later, analysts can filter meta keys and meta values from the Filter Events panel using the newly added Filter option. This enhancement allows analysts to refine their search results by entering specific meta values or keys and helps analysts to investigate seamlessly rather than scrolling through a long list of metadata.

To Filter meta keys or meta values from the Filter Events Panel



1. Go to **Investigate** > **Events** and click  to load events.

   The events for the selected service and the selected time range are loaded in the Events panel.

2. To display the Filter Events panel, click **Filter** before the Events panel.

   The Filter Events panel opens to the left of the Events panel.

3. To filter the listed meta values or keys by name, type some text in the Filter field. The list is updated to show only the names that contain the exact text with the blue background highlighted.

Query Builder Concepts

In the query builder, you can reduce the number of events to an interesting set by creating three types of filters: simple, free-form, or text.

The basic syntax for each filter is as follows: `<meta key><operator><meta value>`. Here is an example: `direction = 'outbound'`.

In Version 11.4, when you type or paste a query in the query bar, the text is parsed into individual filters separated by the AND operator if the parsing engine determines that AND is needed. Earlier versions use only the AND operator between filters, and the logical operator is not visible.

- If you type `action = 'get' action = 'put'`, the result is two filters separated by AND.
- If you type `action = 'get' OR action = 'put'`, the result is two filters separated by OR.

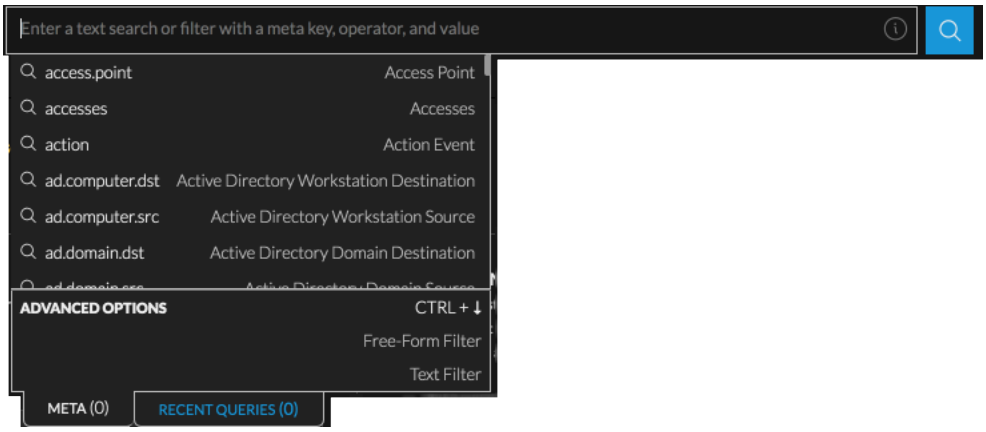
When typing or pasting a filter for `event.time`, use one of the following formats:

- `event.time = '2020-DEC-02 23:00:00'`
- `event.time = '2000-12-20 21:00:00.000'`
- `event.time = '2000-12-20 21:00:00'`

In Version 11.4, the parsing engine converts a longer string of text that you type or paste in the query bar into individual filters. Parts of the filter that are not parsable are converted to a free-form filter. In earlier versions, a long text string is added to the query bar as a single filter. Further enhancement in Version 11.4.1 provides the ability to keep typing text for any query, where you type a meta key and an operator or an operator and a value, as a free-from query. The free-from query is parsed as usual.

- If you type, `action = 'GET' OR action is 20 || action = 'PUT'` in the query bar the Free-Form option is used. Part of this text cannot be parsed so the result is three filters separated by OR. The following figures show the query bars of version 11.4 and version 11.6 respectively.

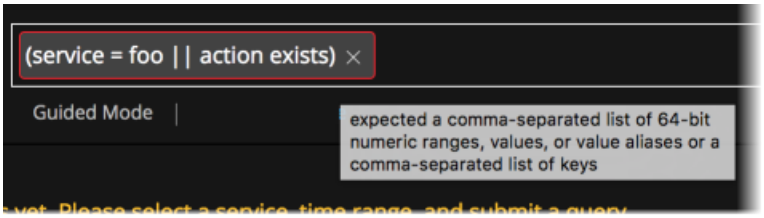
- In Version 11.4.1, If you type a meta key-operator-value sequence and you continue typing without pressing Enter, the Free-Form option is automatically used so that you can continue typing the query. For example, you can type `medium = 1 OR medium = 2` without pressing the Enter key before `OR`. The Free-Form option is highlighted while you type and when you press Enter at the end, a free-form filter is created in the query bar.
- Text filters (Version 11.4 and later) are text strings that do not contain spaces. You can search the data set for any exact match of indexed meta keys, not all meta keys. Here are some examples: `failed`, `login`, or `attempt`.



Note: In some cases, when you are typing a text filter that is close to matching a meta key and operator statement, the auto-suggest feature erroneously suggests a filter using the meta key and operator. The workaround is to begin typing the text and select Text Filter at the point where the auto-suggest feature turns the text into a meta key and operator. For example, there is meta key named `crypto`, and an operator named `contains`, and you want to create a text filter to search for `cryptocurrency`. As you type `c-r-y-p-t-o`, the next `c` in "currency" triggers the `contains` operator instead of continuing to type as a single word. To complete the text filter, right before typing that `c` in `currency`, which would trigger the `contain` operator, highlight the Text Filter option to let the system read the input as text filter.

In the query builder, each filter becomes an editable field. Filters line up from left to right, representing the sequence in which the filters were created. As more filters are added and exceed the length of a single line, they wrap to another line and the input area expands vertically so that all filters are visible without scrolling to the right.

Guided Mode vs. Free-Form Mode



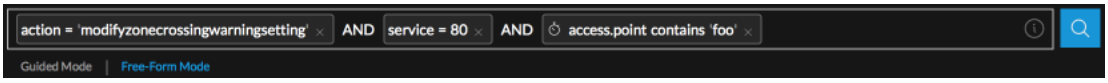
Note: Version 11.4 offered two modes for entering queries in the filter entry form: Guided Mode and Free-Form Mode. Beginning with Version 11.4.1, the powerful auto-completion features and suggested values of Guided Mode and the ability to type or paste a free-form query are fully integrated. References in this document that differentiate between Guided Mode and Free-Form Mode are for analysts using Version 11.4.0.x and earlier.

In Guided Mode, you are guided with suggestions for auto-completion that show valid meta keys and operators, and suggested values in the filter entry form. In version 11.4, you can type, paste, choose a recent query, or select from the drop-down menu. Earlier versions do not support pasting text and recent queries. This is an example of the 11.4 filter entry form.

As you create filters, the syntax of each filter is validated and invalid filters are marked by a red outline. If you hover the mouse over the filter, a message that explains the error is displayed.

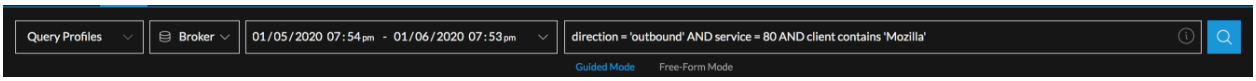
In Version 11.3 and later, free-form filters are validated on the server side, which may take additional time. If you submit the query before the server has returned filter validation results, the is replaced by a spinner. When server validation returns, a query with no invalid filters begins execution. If the query contains an invalid filter, execution is terminated and the invalid filter is outlined in red. This is an example of an invalid query.

In Free-Form Mode, you can type or paste a long text string. There is no auto-suggestion, and validation is performed on the server side when you submit the query. If an error is found, the query does not execute.



Note: The button has a different label in versions earlier than Version 11.3. It was previously named **Query Events**.

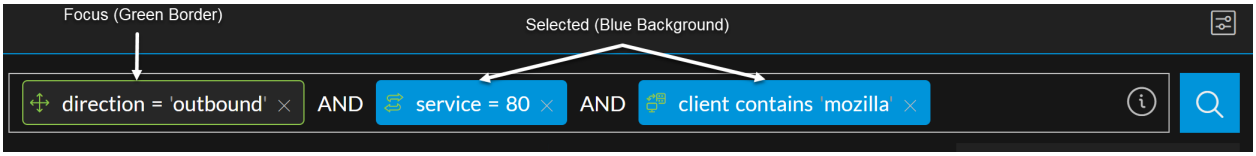
Clicking Guided Mode or Free-From Mode toggles between modes. If you selected Free-Form Mode the last time you logged in, this choice is stored in browser cache and is used until the browser cache is cleared.



- When you switch from Guided Mode to Free-Form Mode, filters that you created in Guided Mode are transformed to a text query in the Free-Form field.
- When you switch from Free-Form Mode to Guided Mode, the query you were typing is added to the query bar as individual simple filters, but it does not include auto-suggest options.

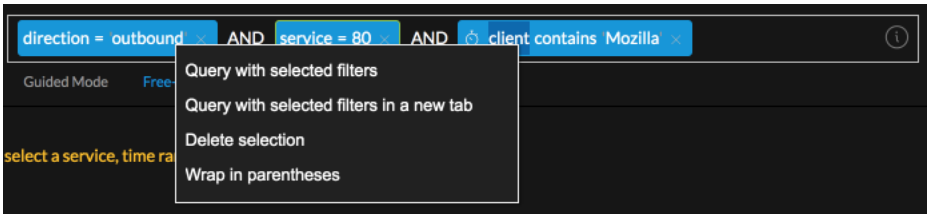
Note: Before Version 11.3, a Free-Form filter could not be edited in Guided Mode.

The following figure is an example of the query bar with the Guided Mode query builder with several filters.



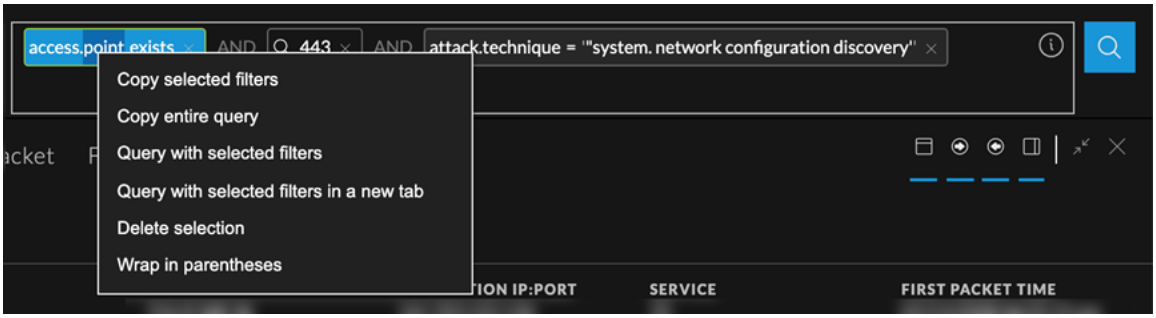
The following figure is an example of the Free-Form query builder in use.

Concepts for Editing Multiple Filters



As you work in the query builder, you can see when a filter has focus for editing (a green outline) and which filters are selected (blue background). This is useful because you can have multiple filters selected for right-click actions, but only one can be edited at a time. The figure below shows the green outline marking a filter that has focus and the blue background indicating that two filters are selected.

This figure illustrates the same set of filters with all filters selected (blue background) and one filter that has focus (blue background and green outline).



A right-click action from the drop-down menu applies to all selected filters as shown in this figure showing Version 11.4 options.

In Version 11.4.1, the menu has two new copy options as shown in the following figure. The options allow you to share the clipboard contents with other analysts or paste the contents to the query bar. You can:

- Select a single filter, right-click it, and then copy the entire query to the local clipboard.
- Select multiple filters, right-click one of them, then copy the selected filters.

These are a few basic concepts that explain how to work in the query builder:

- You can select multiple filters, but only one can have focus and the last selected filter is the one with active focus at any point in time.
- To select a filter and give it focus, click the filter. To deselect the filter and remove focus, click the filter again, press **Esc**, or click anywhere else on the page.
- To add a filter, click before or after an existing filter. To create a new filter before or after the filter in focus, press the right or left arrow key.
- To open a filter for editing, double-click the filter or click it and press **Enter**. To exit without saving changes and leave the filter in focus, press **Esc**.
- To delete a filter, click the filter and press **Delete** or click **X** on the filter.
- (Version 11.6) If a filter is awaiting user's input, it is highlighted with blue color .

- (Version 11.6) An invalid filter is highlighted with red color.

- You can hover over the filters in the query bar to display tooltip messages.

The Version 11.4 Query Builder

You can type; select meta keys, operators, and values from the drop-down menus; or paste a filter in the query bar. Added 11.4 features in the Guided Mode filter entry form are described in detail below.

Meta Keys Cached for Faster Loading

When the Events view opens, meta keys from all connected services are cached for faster data loading. These meta keys are available in user interface elements that have auto-suggest meta keys. (When you are building a column group or profile, if you are expecting to see a meta key and it is not displayed, select the service where the key was added to force a cache update. This usually occurs only when a meta key is not added to all concentrators.)

Text Filter

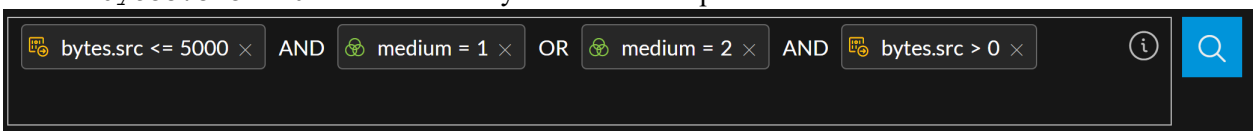
You can create a text filter to find a text string in the data set which is indicated with . You can use a text filter with no knowledge of meta keys that would contain the values. One text filter per query is supported. A text filter looks through indexed meta keys, not all meta keys.

Pasting Text Instead of Typing

When creating a filter, you can paste a meta key or value in the filter entry form. When you paste text into the filter entry form instead of typing the text, the text is parsed appropriately to create one or more filters. Any portion of the text that cannot be parsed is converted to a free-form filter.

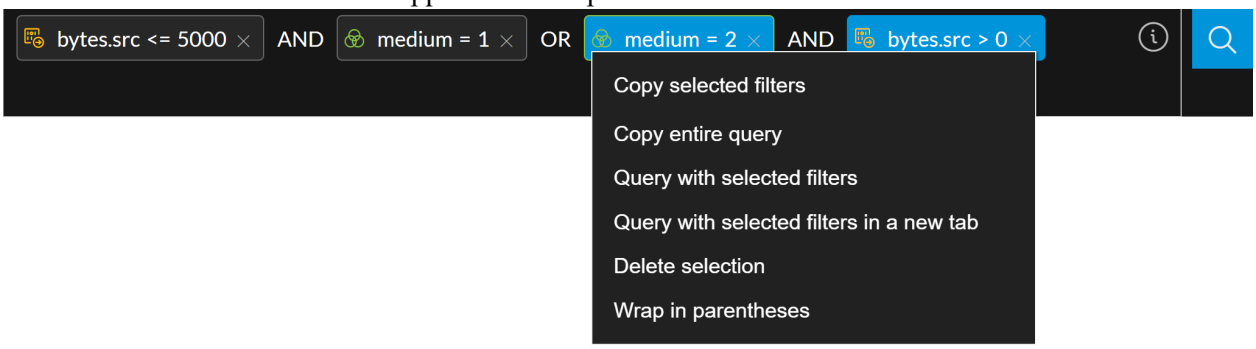
Select All Filters and Copy All Filters (Version 11.4.1)

While creating a filter in the Events view query bar, you can use keyboard commands to select all filters (Cmd-A for MacOS, Ctrl-A for Windows) and then copy the selection to the clipboard (Cmd-C for MacOS, Ctrl-C for Windows). The clipboard text is available to share with other analysts or to paste in the query bar using Cmd-V or Ctrl-V).



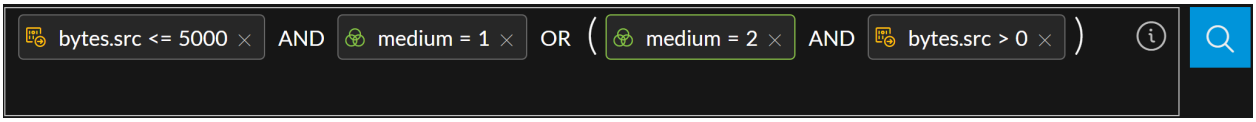
Use of Recent Queries

The filter entry form offers two methods of entering meta keys, operators, and values: the Meta tab and Recent Queries tab. The Meta tab is the same as the filter entry form for prior versions except that a count of matching results is given in the tab label and icons mark meta keys that are indexed by key, indexed by value, and not indexed. In the Recent Queries tab, up to 100 recent queries are displayed. The list is filtered as you type to show only queries that contain the typed text, and you can select a query from the list.



Use of Advanced Operators

Auto-suggest can parse the following advanced operators that you paste or type into the filter entry form: `<`, `>`, `<=`, `>=`, `OR`, `||`, `AND`, `&&`, `()`, `regex`, and `length`. The text is parsed as multiple filters. For example, if you type or paste `medium > 0 && medium <= 100`, the text is parsed as two simple filters with an explicit AND operator: `medium > 0 AND medium <= 100`. If you type or paste `bytes.src <= 5000 && medium = 1 || medium = 2 && bytes.src > 0`, four simple filters are created with `AND` and `OR` operators separating them: `bytes.src <= 5000 AND medium = 1 OR medium =`



`2 AND bytes.src > 0` to make as many valid filters as possible.

This filter is an example of a filter in which it would be useful to add parentheses. You can select `medium = 2` and `bytes.src > 0`, then right-click and select **Wrap in Parentheses** from the drop-down menu. Text filters are not supported inside parentheses.

The resulting query is `bytes.src <= 5000 AND medium = 1 OR (medium = 2 AND bytes.src > 0)`.

If you encounter errors while creating filters, look for tooltip messages and check the documentation.

Easy Use of AND/OR Operators

When you type `||` and `&&`, they are displayed as `OR` and `AND` in the query bar. You can change `OR` to `AND` and `AND` to `OR` by clicking the word. When you insert the cursor to add a filter, the `AND` operator is added before the cursor. When you delete a filter, orphaned `OR` and `AND` operators are removed. The operator for a text filter must be AND because text filters are always ANDed to a query.

Automatically Balanced Parentheses

When creating and editing filters in the query builder, parentheses pairs are automatically balanced as you type. If you type an open parenthesis in a filter that is open for editing or before a selected filter, the close parenthesis is added at the end of the filter. This works intuitively as you type so that you can add new filters on either side of the parenthesis and between parentheses when there are nested parentheses. Orphaned parentheses are automatically removed. If adding parentheses would create an invalid filter, the parentheses are not added. You can also right-click selected filters, and add parentheses using the Wrap in parentheses option. This option is only available when the result would be a valid filter.

Hints about Available Values

For properly indexed meta keys, the user interface provides hints about available values related to the time range of the query. Up to 100 suggested values are returned and, when you type text, the list of 100 values is filtered to include only relevant values. If no matching values are returned, a message advises "No suggestions found." (The suggested values are based solely on the time range; filters in the query do not filter the list of 100.)

CIDR Notation and Shorthand

When entering a value for an IP address in a filter, you can use CIDR notation to filter for addresses within a range.

The IPv4 CIDR block range is 0 to 32. For example `10.20.30.0/24` specifies `10.20.30.0` with a subnet mask of `255.255.255.0`, which will match an IP in the range `10.20.30.0` through `10.20.30.255`.

The IPv6 CIDR block range is 0 to 128, for example,
`1203.0fe1:fe82:b896:89b0:8a7c:99bf:323d/32` specifies
`1203:0fe1:0000:0000:0000:0000:0000:0000` through
`1203:0fe1:ffff:ffff:ffff:ffff:ffff:ffff`.

You can also use shorthand to remove groups of zeros or leading zeros in a group in IPv6 addresses, for example,

`1203:fe1::`

There must be no spaces between the IP address and the CIDR mask that you are using.

Ranges or Series of Values

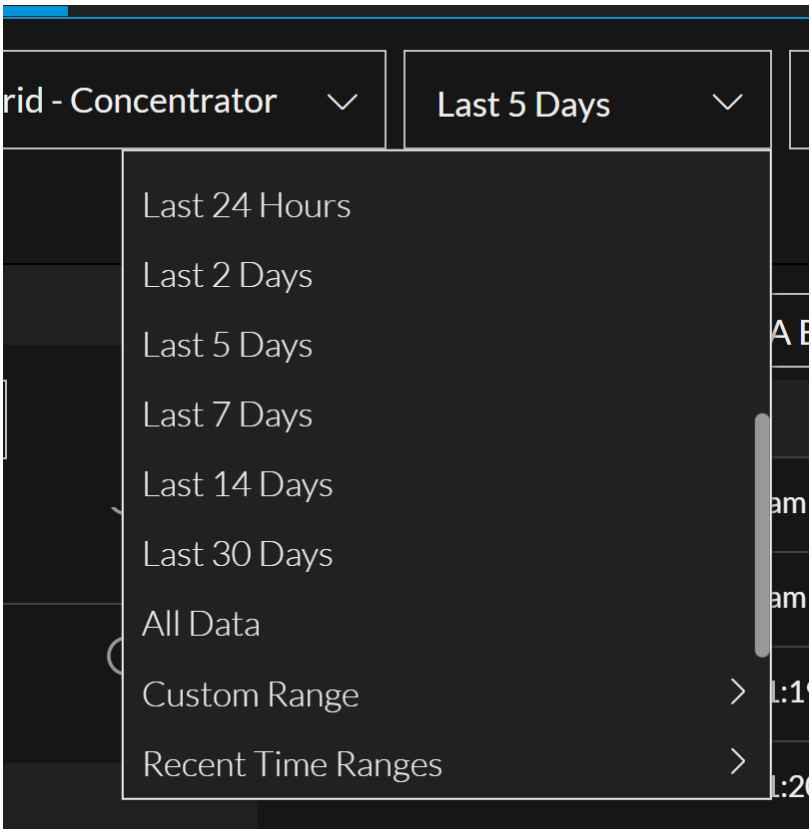
For meta keys that have numerical data, you can use a range of values, a series of values, or both to filter data. For example, this query has a comma-separated list, and two of the values in the series are ranges `src.port = 0-1023, 1024-1050, 65535`. If a comma is a part of a value, the value must be wrapped in quotes. For example, `get,post` is interpreted as two separate values, while `'get,post'` is interpreted as one value. A range of values must be a valid range of positive integers, separated by a dash (with our without a space before and after). The first number in the range must be smaller than the second. For example, `0-1023` and `0 - 1023` are valid ranges, but these are not valid ranges: `-10 - 50`, `50 - 10`, `50.8 - 60.2`, `50 - 70x`.

No Separating Space Required After Meta Key and Operator (Version 11.4.1)

Filters in the query bar need a space between the meta key and the operator, and between the operator and the value. Operators must be typed with a separating space in the filter entry form in order to use the auto-suggest functions for operators and values. To improve the user experience when typing a query, the filter entry form accepts operators typed with no separating space after the meta key. When you type an operator with no separating space, a value is auto-suggested as usual and a space is added between the meta key and the operator. When you type an operator and a value without a separating space, the space between them is automatically added.

Select a Time Range

The Time Range selector limits the events returned in the Events view to a specific time range. The time range is displayed in the format `Start Time - End Time`, showing the date, hours, and minutes in your current timezone based on timezone settings configured for your profile. In Version 11.3 and later, you can choose a time range relative to the current collection time or create a custom time range. The time and date format is based on preferences set for the Events view in the User Preferences dialog (select  **> Profile**).

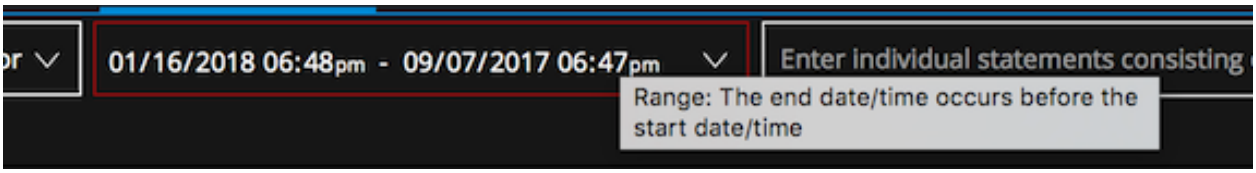


- By default, the date format is MM/DD/YYYY. You can change the format to DD/MM/YYYY, or YYYY/MM/DD in the User Preferences dialog.
- Start time and end time are in the format of HH:MM. Although seconds are not displayed, the value for start time always defaults to HH:MM:00 seconds, and the value for end time always defaults to HH:MM:59 seconds. As an example, a time range of 6:45 pm - 7:45 pm is interpreted as 06:45:00 - 07:45:59 pm.
- The default time range is the 24-hour clock; you can change it to 12-hour periods.

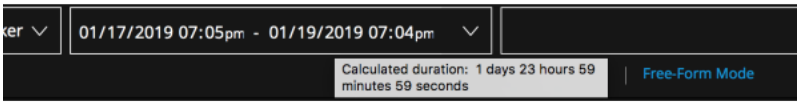
Note: By default, the time format for downloads is Epoch format, which shows the time as a numerical value representing the number of seconds from the Unix epoch, January 1, 1970. The resulting number requires a conversion to be understood. Your administrator can change the setting for time format in downloads to combine your user preference time zone, date format, and time format into an easily understood representation, which follows the industry standard ISO 8601 representation when possible. Given this time: `04/13/2020 09:17:36 am` with timezone US/Pacific `(GMT-7:00`, this is an example of the time on the 12-hour clock as it appears in the user interface: `04/13/2020 09:17:36 am`. In the download, Epoch format would represent the time as `61547519856000`. If your administrator set the time format for downloads to the easily readable representation, the same time would be represented as follows: `04-13-2020T09:17:36AM-07:00`.

The time format for a query is based on preferences set for the Events view in the Event Preferences dialog (select). The time format can be either database time or wall clock time. When Database Time is selected, the start and end time for a query is based on the time that the event was captured (collection time). When Wall Clock Time is selected, the query is executed using the end time based on the current browser time; the start time is calculated based on that end time and the time range. This and other Events view preferences are described in Configure the Events View.

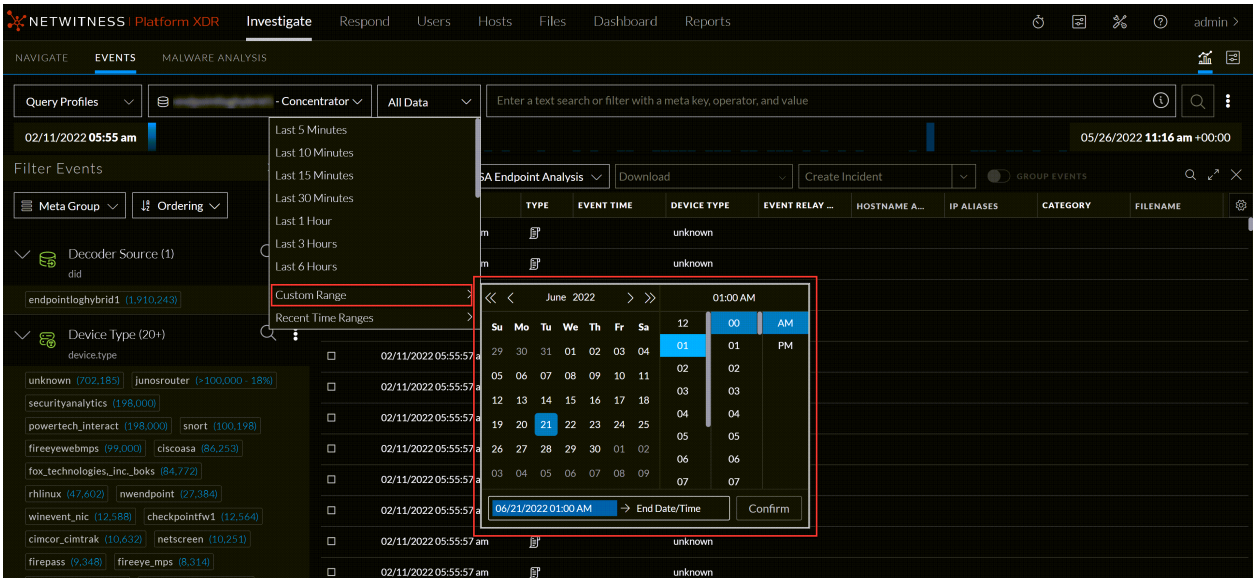
To edit the time range, do one of the following:



1. Click the drop-down arrow inside the **Time Range** selector and select a time range from the list. Options are in minutes, hours, days, or all data.

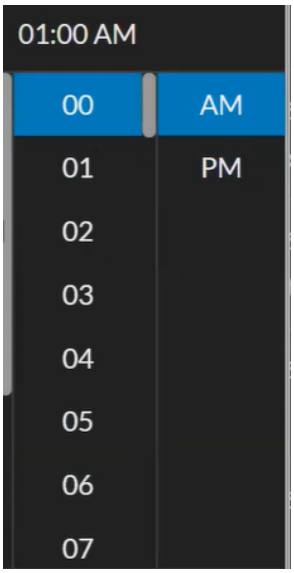


(Version 11.3 and later) Edit the time range directly by clicking the year, month, day, hour, or minute displayed in the query bar. When a value is highlighted, type a new value for either the start or end time. If your time format preferences are set to 12-hour periods, click **am** or **pm** to toggle between the two options.

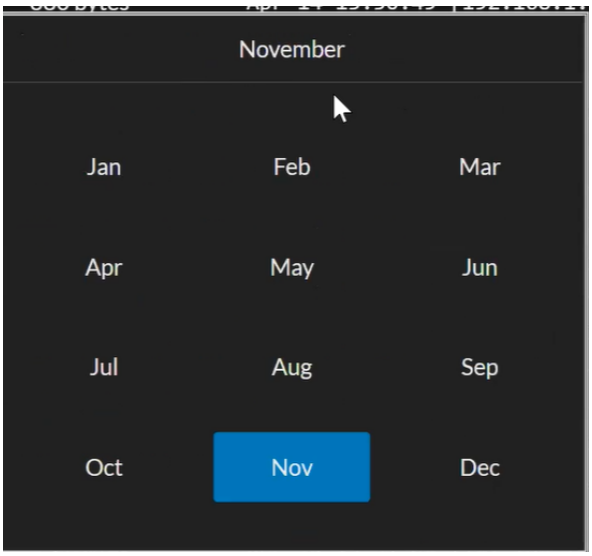


If the time range is invalid (for example, the start time is later than the end time), a red border appears around the Time Range selector. The button is disabled because the query is no longer possible, and a tool tip shows an error message explaining what you need to change. The following figure shows an invalid time range.

The selected time range is stored in your browser for the service being queried; you can set different time ranges for different services. A tool tip shows the calculated duration of the query. The following figure is an example of the tool tip.



In 12.0 and later, in addition to the existing options, the **Custom Range** option in Investigate Events view allows analyst to select a specific time, date, month, and year or a date range to run a query and filter events. On clicking the **Custom Range** option, a calendar view is displayed with a current day, time, and date details. This enhancement helps the analysts to select date and time quickly and avoid manual intervention therefore avoiding human errors (typos).



The analyst can use the following to navigate within the calendar:

- and to toggle between months.
- and to toggle between years.

- 

to select a specific time.
- 

to select the start date and time.
- 

to select the end date and time.
- 

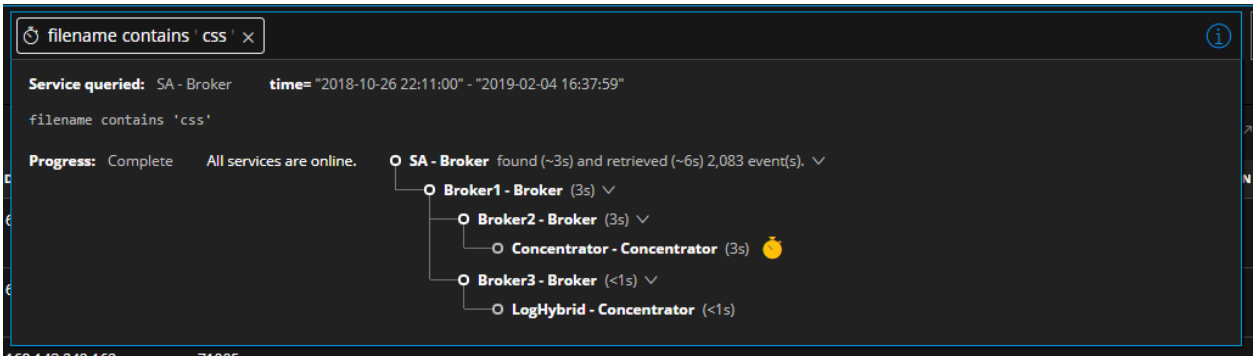
to select an year and the year range.
- Click **Confirm** to save the selection.

Submit a Query

The button on the right side of the query bar is active as needed to submit a query. In version 11.3 and earlier, when you click , all of the filters are ANDed to generate results and the button becomes inactive. In Version 11.4, because the query may contain other operators besides AND, the query is submitted as is. The button becomes active again in these conditions:

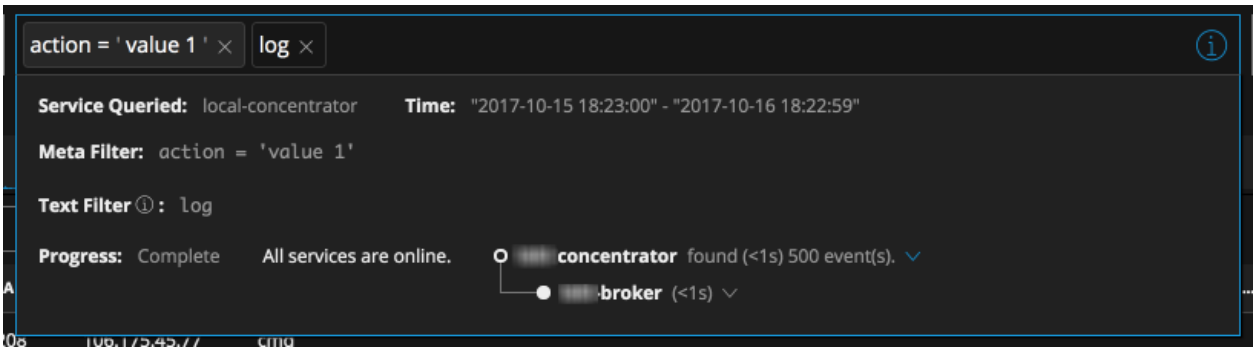
- If you change the service in the query bar or change the column group in the Events panel, a network call for data for a reconstruction in the Events panel continues to use the previous service, time range, and metadata filters until you submit the new query. The button becomes active as an indicator that the data in the view is stale.
- If more than a minute has passed and the original query's time range would no longer generate the same result set, the button becomes active as an indicator that results may be stale. In Version 11.3 and later, a setting in the Events view preferences determines this behavior by enabling or disabling the Update Relative Time Window Automatically option (see Configure the Events View.)

Cancel Execution of a Query



After you click to submit a query, the button changes to (the stop query option). The stop query option remains until all the events are loaded in the Events panel. To cancel the query, click .

If the query is canceled before all results have been returned, the following message is displayed at the end of results in the Events list: "Because the query was canceled, only partial results are displayed."

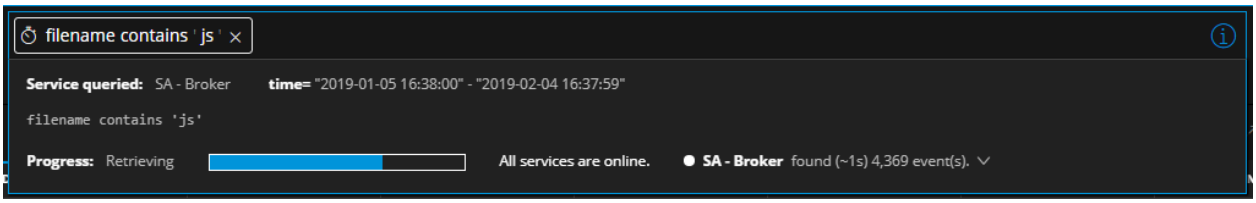


View Status of a Query

After a query is submitted, you can click **Query Console** icon ( ) > **Current Query** in the query bar to see which service, time range, and metadata was queried as well as real-time information about the status of the query and the services being queried. The time range displayed in the Query console always shows each date as **YYYY-MM-DD**. Here is an example range from the Query Console: `"2014-09-20 20:57:00"-"2018-11-02 18:57:59"`.)

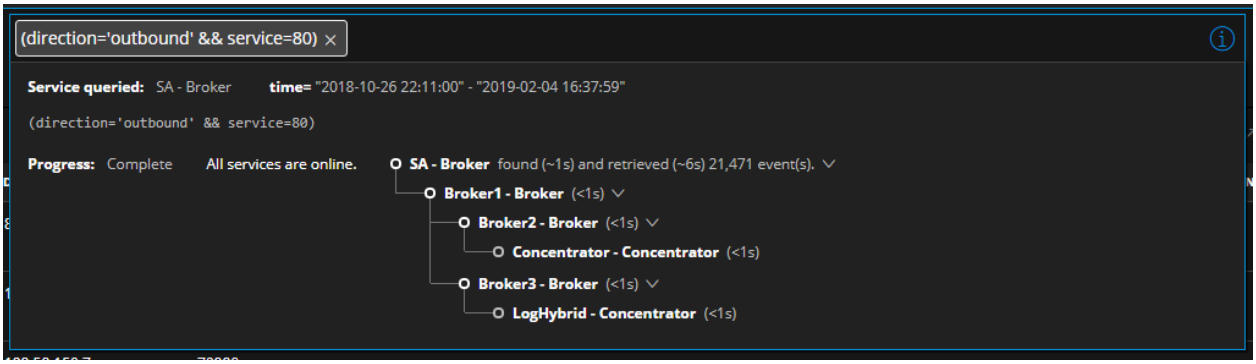
The following figure is an example of the Query Console for Version 11.3 when a query executes successfully and the slowest service is marked by an amber stopwatch.

The following figure is an example of the information in the Query Console for Version 11.4 after a query that includes a text filter executes. Notice that the query is shown in two fields, Meta Filter and Text Filter.



While a query is executing, a progress bar indicates the query's completion percentage at the bottom of the console. The status lets you know details about what is happening; for example, you can tell when the query is executing, queued, reading the index file for the queried service, retrieving events, and complete. All statuses and non-fatal messages are displayed as they come in, and the border color of the query bar changes to amber if a non-fatal error occurs.

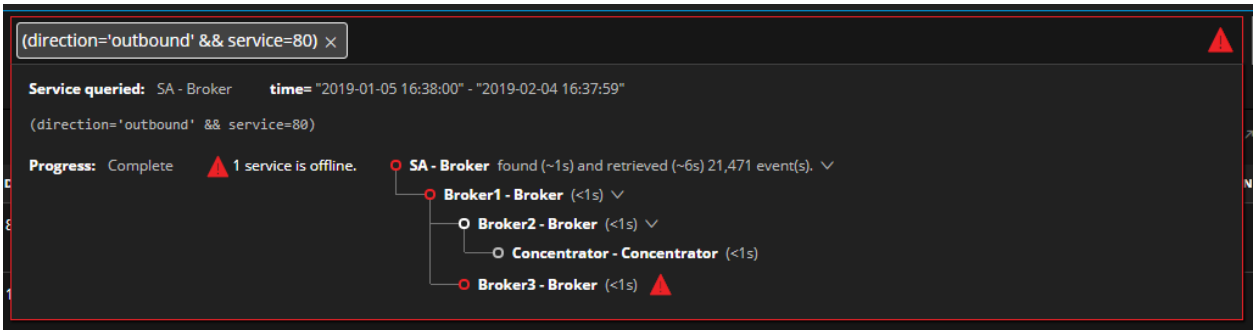
Icons provide additional information about individual services.



- An amber stopwatch marks the slowest service.
- An amber triangle indicates a warning was received.
- A red triangle shows that an error was received when trying to query the service.

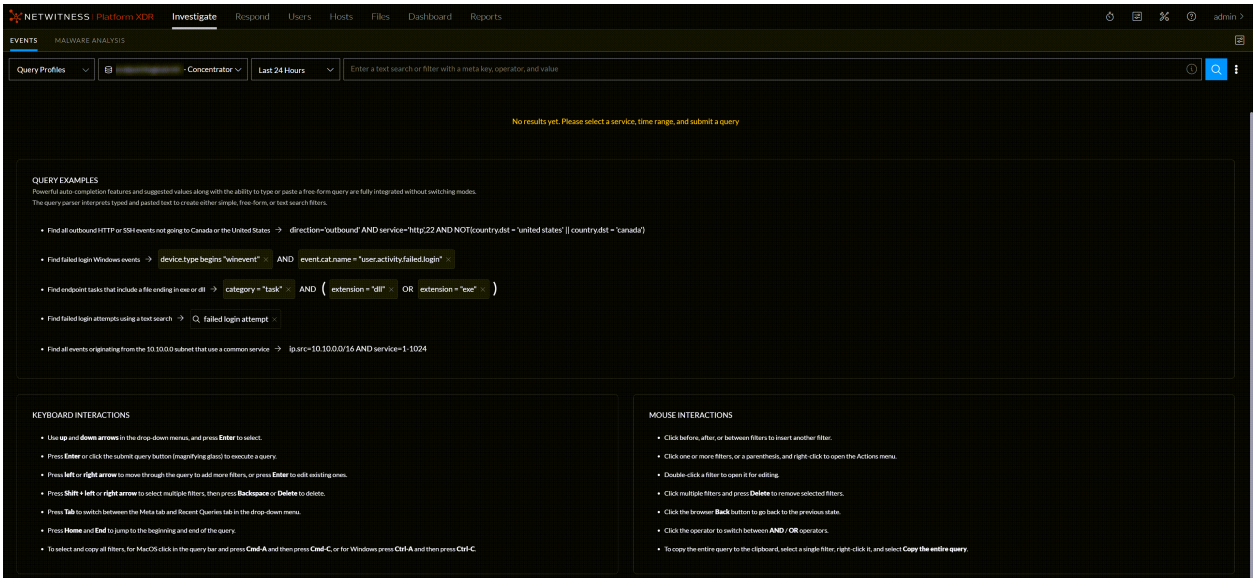
Executing and Reading the Index File to Find Events. The first stage of a query is complete when the queried services have found results. The query console provides a nested hierarchical listing of all the services being queried with indicators showing which are online or offline, and the time in seconds that the service took to find results.

Retrieving Events and Loading in the Events Panel. While the found events are being retrieved and loading in the Events panel, the progress bar shows a visual indicator and text description of what is happening. In the figure below, results were found and are being retrieved.



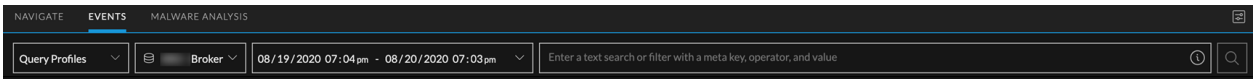
Request Complete. If there are no errors or warnings when loading is complete, the query console is outlined in blue and the button is disabled as an indicator that the data in the view is fresh. The following figure is an example of the query console for a completed query with no errors or warnings.

Errors and Warnings. A fatal error such as a syntax error in the query, or the queried service being offline, stops execution of the query. A red triangle is displayed in the upper right corner of the query console, and the console is outlined in red to indicate that the query failed. If the queried service is offline, only the queried service with no hierarchy of services is listed in the query console and marked by a red triangle.



A non-fatal error does not prevent a query from executing. The query is executed and events are loaded, but a red triangle is displayed in the upper right corner of the query console, and the console is outlined in red as a warning. The following figure shows the appearance of the query console when the queried service proxies to another service that is offline.

A warning does not prevent a query from executing. The query is executed and events are loaded, but an amber triangle is displayed in the upper right corner of the query console, and the console is outlined in amber.



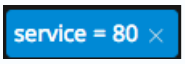
Build a Query in Guided Mode

Guided Mode is the easiest way to create a query with features to help analysts enter valid queries. The following figure illustrates the initial Events view with Guided Mode in effect in the query bar.

There is no longer a need to select Guided Mode because all Guided Mode features and more improvements are built in to Version 11.4.1. This figure depicts the query bar in Version 11.4.1.

Keyboard Actions to Use in Guided Mode

In Guided Mode, the query builder allows entry, editing, and deletion of filters using the key strokes without having to use a pointer. Although you can use the pointer, you have the option to keep your fingers on the keyboard. This table identifies the available keyboard actions in Guided Mode when the cursor is located in the query bar; these do not apply to the service selector and time range.



Action	Keyboard Entry
Copy all filters (Version 11.4.1 and later)	With the cursor in the query bar, but not in a filter being edited, and all filters selected, press **Ctrl-C** (Windows OS) or **Cmd-C** (MacOS).
Delete characters in a filter	Selected characters: With characters selected in the query bar, press **Delete** or **Backspace**. Previous character (Version 11.4 and later): With the cursor next to a character in the query bar, press **Backspace** (Windows OS) or **Delete** (MacOS). All characters (Version 11.4 and later): With the cursor in a filter, press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS).
Delete filters	Selected filters: With one or more filters selected do one of the following: • **Right-click > Delete selected filters** or **Delete selection** (11.4 and later). • Press **Delete**. • Press **Backspace**. Filter that has focus (Version 11.4 and later): With the cursor in a filter that has focus, press **Backspace** (Windows OS) or **Delete** (MacOS). The focused filter is deleted and focus moves to the left. Filter that has focus (Version 11.4 and later): With the cursor in a filter that has focus, press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS). The focused filter is deleted and the focus moves to the right.
Delete parentheses in a filter, do not delete the contents (Version 11.4 and later)	With a set of parentheses, but not the contents selected, press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS). The selected parentheses are deleted, but the contents of the parentheses remain.

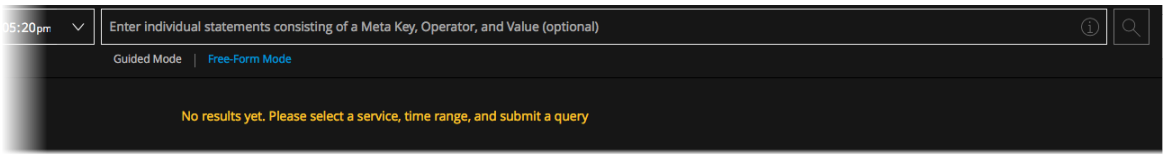
Action	Keyboard Entry
Delete parentheses and their contents in a filter (11.4 and later)	Selected parentheses: With a set of parentheses selected, do one of the following: • **Right-click > Delete selection**. • Press **Backspace** (Windows OS) or **Delete** (MacOS). The selected parentheses and contents are deleted and the focus moves to the left. • Press **Delete** (Windows OS) or **Fn + Delete** (MacOS). The selected parentheses and contents are deleted and the focus moves to the right.
Deselect all filters	With a filter selected, press **Esc**.
Edit a selected filter	With a single filter selected, press **Enter**.
Insert a new filter at the beginning of the query bar, and open for editing (Version 11.4 and later)	With a filter selected, press **Home** (Windows OS) or **Fn + Left Arrow** (MacOS).
Insert a new filter at the end of the query bar, and open for editing (Version 11.4 and later)	With a filter selected, press **End** (Windows OS) or **Fn + Right Arrow** (MacOS).
Insert a new filter to the immediate left of the selected filter, and open for editing	With a filter selected, press **Shift + Left Arrow**.
Insert a new filter to the immediate right of the selected filter, and open for editing.	With a filter selected, press **Shift + Right Arrow**.
Insert a new filter to the immediate left of the selected filter	With a filter selected, press the **Left Arrow**.
Insert a new filter to the immediate right of the selected filter	With a filter selected, press the **Right Arrow**.
Open a new tab with the selected filters	With filters selected, **right-click > Query with selected filters in a new tab**.
Query with the selected filters	With filters selected, **right-click > Query with selected filters**.

Action	Keyboard Entry
Query with content of parentheses (Version 11.4 and later)	With parentheses selected: • To query with the selected parentheses contents, select one side of a parentheses set and **right-click > Query with selected filters**. • To query with the selected parentheses contents in a new browser tab, select one side of a parentheses set and **right-click > Query with selected filters in new tab**.
Select all filters in the query bar (Version 11.4.1 and later)	With the cursor in the query bar, but not in a filter being edited, press **Ctrl-A** (Windows OS) or **Cmd-A** (MacOS).
Select all filters to the left of the current filter	(Version 11.3.x and earlier) With a filter selected, press **Shift + Up Arrow**. (Version 11.4 and later) With a filter selected, press **Shift + Right Arrow** twice.
Select all filters to the right of the current filter	(Version 11.3.x and earlier) With a filter selected, press **Shift + Down Arrow**. (Version 11.4 and later) With a filter selected, press **Shift + Right Arrow** twice.
Select the filter to the immediate left if one exists	With no filter selected, press the **Left Arrow** key.
Select the filter to the immediate right if one exists	With no filter selected, press the **Right Arrow** key.
Submit a query.	With focus on the query bar and no pending filters, press **Enter**.

Visual Feedback in Guided Mode

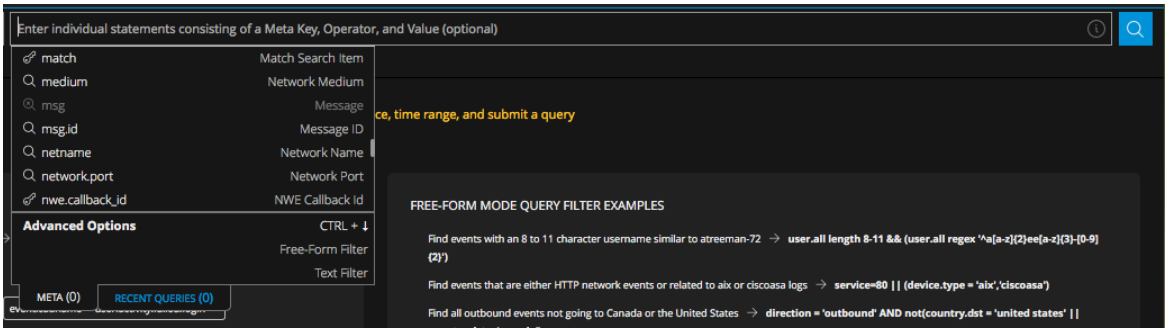
Guided Mode provides visual feedback during query construction. This table identifies and describes the possible feedback.

Feedback	Icon	Description
Blue background on a Filter		Indicates that a filter is selected.
Green circle between two filters	 	(Version 11.3 and earlier) A green circle indicates the location of the cursor between two existing filters. Clicking inserts a new filter at this location. (Version 11.4) A bold cursor indicates the insertion point.



Feedback	Icon	Description
Green filter outline		Marks the single filter that has focus and ready to edit. This is combined with the blue background, when multiple filters are selected and this filter has focus.
Red filter outline		Indicates that the filter is invalid. A tool tip that explains the error is displayed.
Index indicators in the Meta tab		(Version 11.4 and later) Indicate the index level of the meta keys in the Meta tab, which determines if you can use it in a filter:  This meta key is indexed by meta value and can be used in a filter.  This meta key is indexed by meta key, and can be used in a filter.  This meta key is not indexed, and not selectable for a filter. The `sessionID` meta key is a special case. Unlike other non-indexed meta keys, it is not configurable, but you can use it in a filter so it is marked by the key symbol. Supported operators are `exists`, `!exists`, `=`, and `!=`.

Feedback	Icon	Description
Query Events button		Used to submit a query, show the status of the query, and cancel a query. The button has three possible states:  Ready to submit a query using filters in the Query Builder.  Waiting for server validation to complete before executing the query.  The query is executing, click to cancel execution.
Slow Service icon		In the query console, marks the service that took the longest time to load results from the query.
Spinner in the Events list		Indicates that the query is currently being processed. The **Query Events** button is disabled while this occurs.
Stopwatch		(Version 11.5 or earlier) Indicates that the meta key/operator combination requires extra time to process. While the query is still executable, a more efficient meta key or operator is recommended.

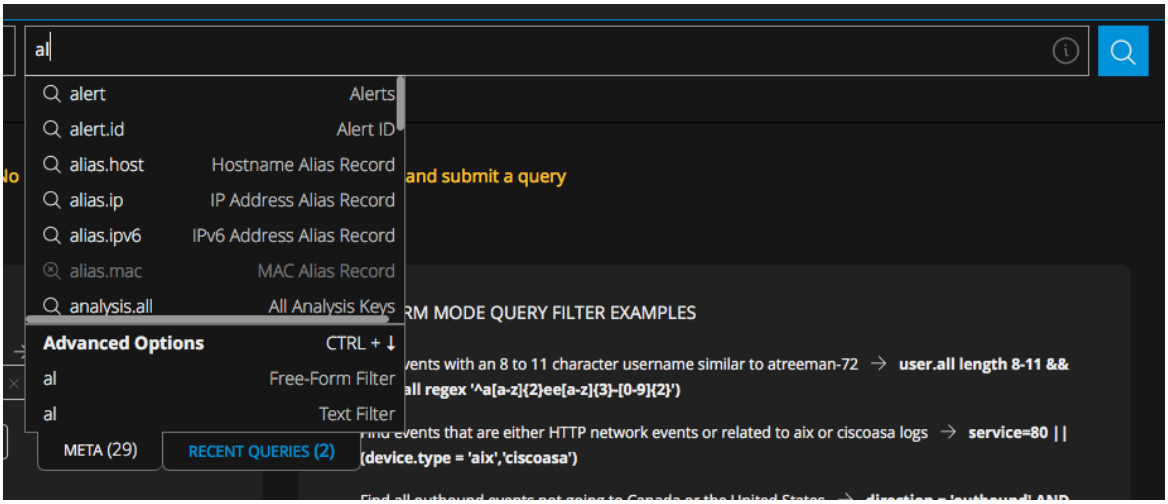


Add a Simple Filter in Guided Mode

To create a simple filter in Guided Mode:

1. Go to the **Events** view (Event Analysis view in Version 11.3 and earlier) and do one of the following:
   a. (Version 11.4.1 and later) Click in the query bar and when the filter entry form is displayed, select the Meta tab if it is not already selected.
   b. (Version 11.4 and later) Select **Guided Mode**, click in the query bar and when the filter entry form is displayed, select the Meta tab if it is not already selected.
   c. (Version 11.2 and later) Select **Guided Mode** and click in the query bar.
   d. (Version 11.1) Click in the empty query bar, or before or after an existing filter. This is an example of the empty query bar in Guided Mode before you begin entering a filter.

If the insertion point is between two filters, a green circle (Version 11.3 and earlier) or a bold cursor (Version 11.4 and later) marks the insertion point. If the insertion point is at the end of the query bar, the filter entry form opens with a blinking cursor at the entry point. A drop-down list displays the available meta keys passed from the service being investigated in alphabetical order. This figure shows the filter entry form from Version 11.4.



2. To select a meta key do one of the following:

   a. If there is only one option in the drop-down list, press **Enter**.

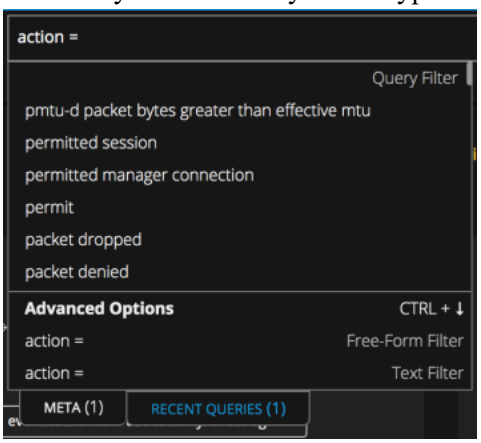
   b. If there are two or more options in the drop-down list, click a meta key or select a meta key using the up/down arrows, then press **Enter**.

   c. Start typing the meta key. As you type the meta key, the list is filtered to include only meta keys that contain the text you typed. The count next to the label on the Meta (0) tab increments to enumerate the indexed meta keys that match the typed text. Keys that are not indexed are disabled and not selectable and are not included in the count, for example, `alias.mac` in the figure below is not indexed and is dimmed. Click a meta key or select a meta key using the up/down arrow, then press **Enter**.

d. To select a highlighted meta key, press **Enter**.
The count on the Meta label changes to 1.

> **Note:** If no meta key in the drop-down list is selected, and the list has no meta keys to select, either the Free-Form Filter or the Text Filter option is highlighted based on the content already typed in the query bar.
> --If the text typed in the query bar includes some form of query syntax and other operators not yet supported by the user interface, the Free-Form Filter option is highlighted and you can create a free-form filter. In Version 11.3 and earlier, the `**`, `&&`, `||`, `()`, `AND`, `OR`, `comma`, `-`, `length`, and `regex` operators are not supported by the user interface. The Version 11.4 user interface supports these operators. If the Free-Form Filter is not highlighted, and the query bar has no text filter, the Text Filter is highlighted so you can create one.
> --If the first condition is true, and there is already one text filter, the Free-Form Filter option is highlighted so you can create a free-form filter.

e. If you want to edit or delete the meta key, press **Backspace** or **Delete**.
As you backspace and delete characters, the meta key drop-down list is filtered to include meta keys that contain those characters. To select a meta key, press **Enter**.
The meta key is added to the filter entry form, and a list of valid operators for the selected meta key is displayed. Operations that require more time to process are marked by a (stopwatch icon). This figure shows the stopwatch icon marking the `contains` operator.

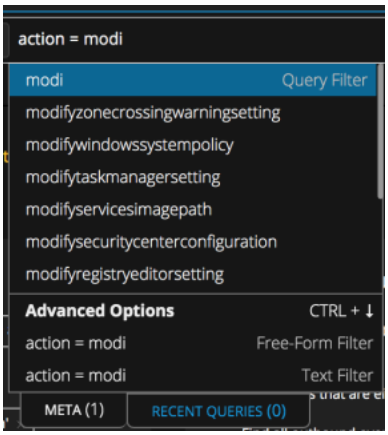


3. To select an operator, do one of the following:

   a. If there is only one option in the operators drop-down list, press **Enter** to select it.

   b. If there are two or more options in the operators drop-down list, click an operator or select one using the up/down arrows, then press **Enter**.

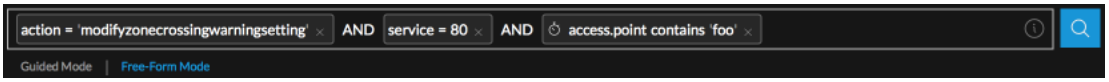
   c. Type the operator and press **Enter**. As you type, the operators drop-down list is filtered to show only operators that contain the typed text. Click an operator or select one using the up/down arrows, then press **Enter**.
   The operator is added to the filter entry form. In Version 11.4 and later, if the operator accepts a value, the suggested values drop-down list is displayed. Earlier versions leave the cursor in the



filter entry form so that you can type a value.

4. (Optional) If the selected operator in the filter entry form accepts a value, do one of the following:
   a. In Version 11.3 and earlier, type the value and press **Enter**.
   b. In Version 11.4 and later, paste a value that you have copied from somewhere and press **Enter**.
   c. In Version 11.4 and later, begin typing in the **Query Filter** field.
   As you type, the meta value drop-down list is filtered to return up to 100 properly indexed values that begin with the typed text. The suggested values are based solely on the time range; filters in the query do not filter the list of 100. The auto-suggest function looks for matches in all events in the current data set, not just the (up to 10,000) downloaded events. If nothing in the list matches exactly, the text you typed in the Query Filter field is highlighted and this message tells you that no suggestions were found. Some values, such as the integers for the `service` meta key, also display the definition of the service type.

   If there is an exact match, that value is highlighted. In the following example, there is no exact match for the typed text, modi.



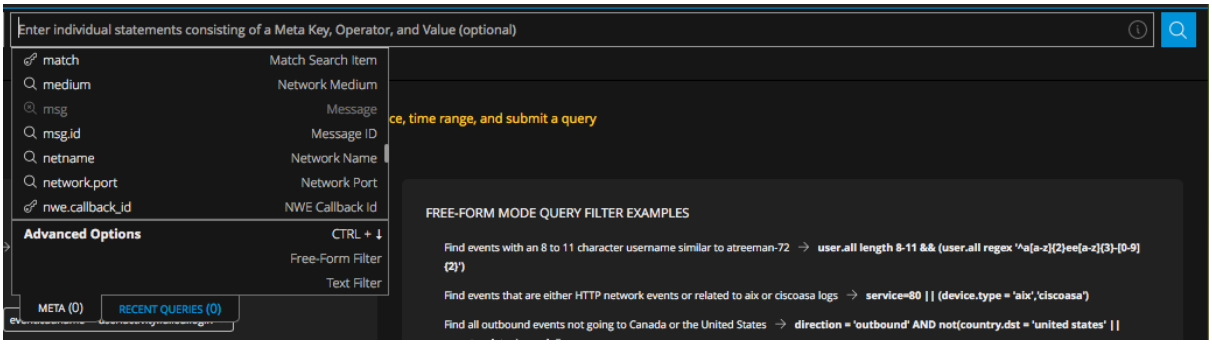
i. If the typed text is the value you want to use in the filter, press **Enter**.

ii. If you see the value that you want to query in the list and it is not highlighted, click the value or use the up/down arrows to highlight the value. Then press **Enter**.

iii. If you want to edit or delete the value, press **Backspace** or **Delete**.
As you backspace and delete a character, the meta value drop-down list is filtered to include values that begin with the remaining characters. To select a value, press **Enter**.
The value is added to the filter entry form.

5. To create the filter, press **Enter**. If you click anywhere outside the box before pressing **Enter**, the filter is not created.
The new filter is inserted, and the blinking cursor is refocused after the last filter, the meta keys drop-down list is displayed. If there is an error in the filter, it is outlined in red. You can hover over the filter to see a tool tip explaining the error. This figure shows a query being created with no errors.

6. If the filters have no errors, you are ready to execute the query in the query bar. Click .
The results are returned and loaded in the Events panel. The first 10,000 events that match the query begin loading in the Events panel. As the events are loaded, a status bar at the top tracks progress and you can scroll to the bottom of the list to see the completion status.

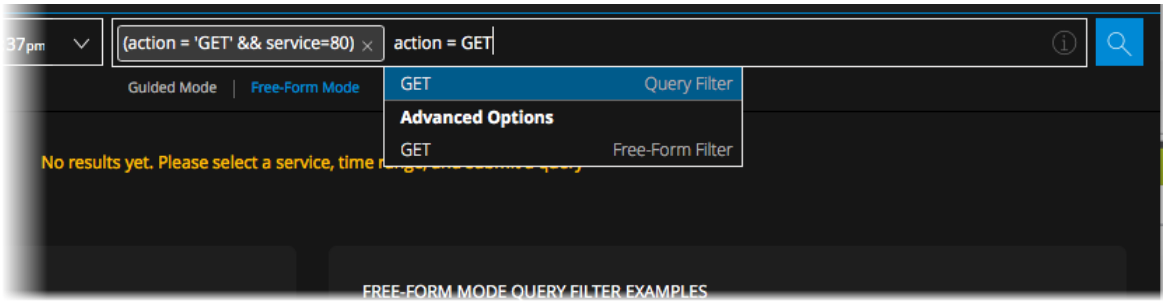


7. (Optional in Version 11.3 and later) If you want to see detailed status in the **Query Console** > **Current Query**, click the information icon .

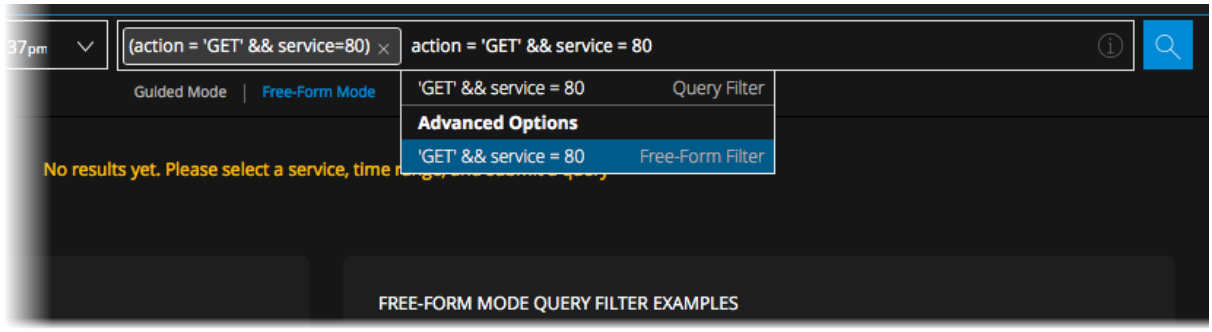
8. (Optional in Version 11.3 and later) If you want to cancel the query before it finishes executing, click .
The query stops executing and a notification that the query has been canceled is displayed.

Add a Free-Form Filter in Guided Mode (Version 11.3 and Later)

To filter the data displayed in the Events view using a free-form filter in Guided Mode:



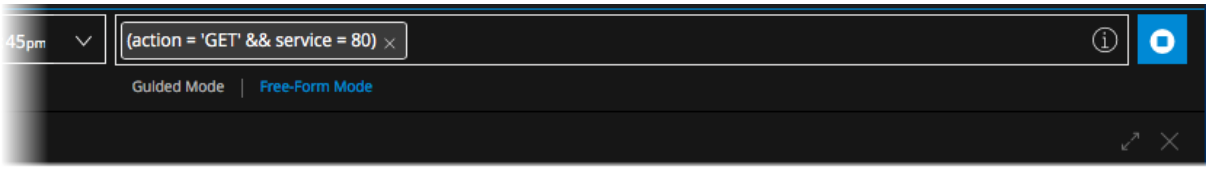
1. Go to the **Events** view, select **Guided Mode** below the query bar, and click in the query builder field. (For Version 11.4.1, simply click in the query builder field.)
   If the insertion point is between two filters, a green circle or a bold cursor marks the insertion point. If the insertion point is at the end of the query bar, the filter entry field opens with a blinking cursor at the entry point. A drop-down menu lists available meta keys passed from the service being investigated in alphabetical order.



2. Do one of the following:

   a. Place the cursor in the **Free-Form Filter** field and begin typing the query.

   b. Begin typing the filter beginning with a meta key or with an open parenthesis. When entering and editing filters in the query builder, parentheses pairs are automatically balanced. If you type an open parenthesis, the other part of the pair is added to the filter.
   When no matching meta keys or operators are available in the drop-down menu, the Free-Form Filter option becomes available, and the text you typed is available in the **Free-Form Filter** field.



3. Continue typing the entire expression and press **Enter**.
   (If you click anywhere outside the box before pressing **Enter**, the filter is not created.) This figure shows a free-form expression created by continuing to type after the value GET.

   The new filter is inserted, and the blinking cursor is refocused after the last filter, a new filter entry

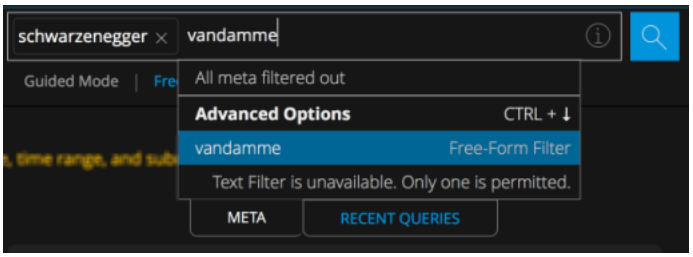
form is displayed. If there is an error in the filter, it is outlined in red. You can hover over the filter to see a tool tip explaining the error.

4. To execute the query, click . While the query is executing, the button changes to .

5. If you want to cancel the query before it finishes executing, click .

   If you do not cancel the query, you can click to view the status of query execution. When the query is finished executing, the Events panel displays appropriate results for the query.

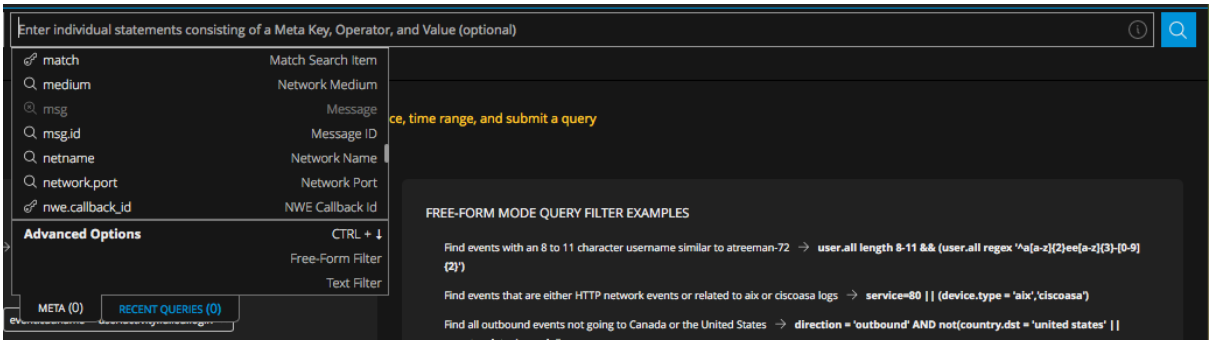
Add a Text Filter to Find a Value Anywhere in the Data Set



In Version 11.4 and later, the text filter allows you to find a specific value in the current data set (endpoint, logs, and network events). The text filter initiates a case-insensitive search against all the data for meta keys that are indexed by value. The text filter does not search for values that are indexed by meta key or not indexed so you not see all results. A message advises that `Results may be limited by a text filter, which matches only indexed meta keys. If you want to conduct a more exhaustive search against raw events, click here and choose the appropriate options in the Search Events drop-down menu.` Icons in the drop-down list indicate the index level of each meta key:

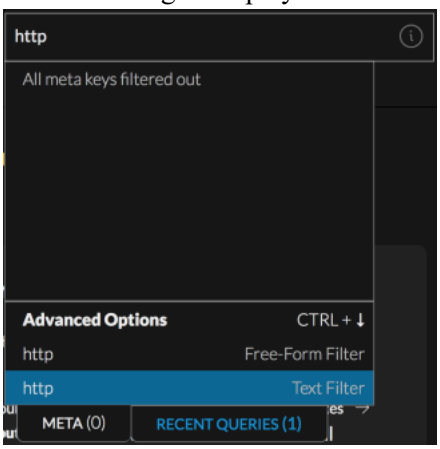
- filename.size - indexed by meta key
- filename.src - indexed by meta value
- float32.whatever - not indexed

Note: All services in the hierarchy being queried (Broker, Concentrators, and Decoders) must be at Version 11.3 or later. The text filter is not available in the drop-down menu when there are services below Version 11.3 in the hierarchy.

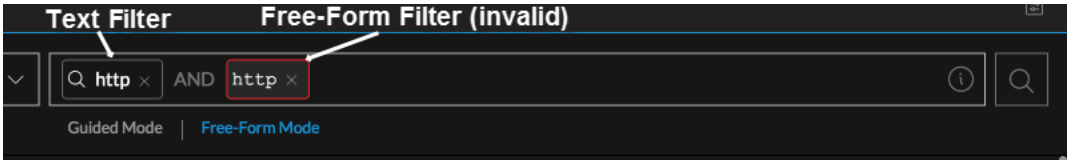


The text filter is useful when you have some idea of what you are looking for, but are not sure where to look (which meta key or service). As an example, if you are interested in looking for a file name, click in the query bar, type the complete text string, and click **Text Filter**. The text filter initiates a search against all the data in the index, within the services and time range being investigated, and returns exact matches to the text string.

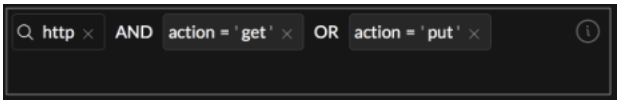
A query can include one text filter and any combination of simple and free-form filters. The operator for a text filter must be AND because it acts as a filter over the results of all the other filters in the entire query. If one text filter already exists in the query bar, the Text Filter option is disabled as shown in the figure below. Text filters are not supported inside parentheses.



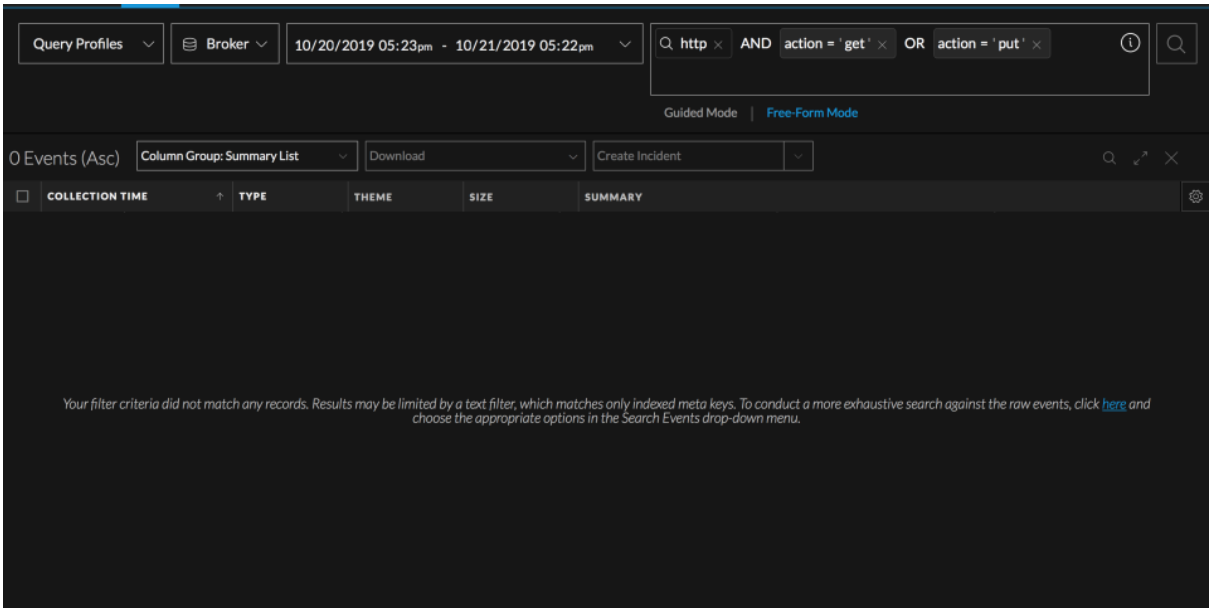
To create a text filter:



1. Go to the **Events** view and click in the query bar.
   The query entry form is displayed.

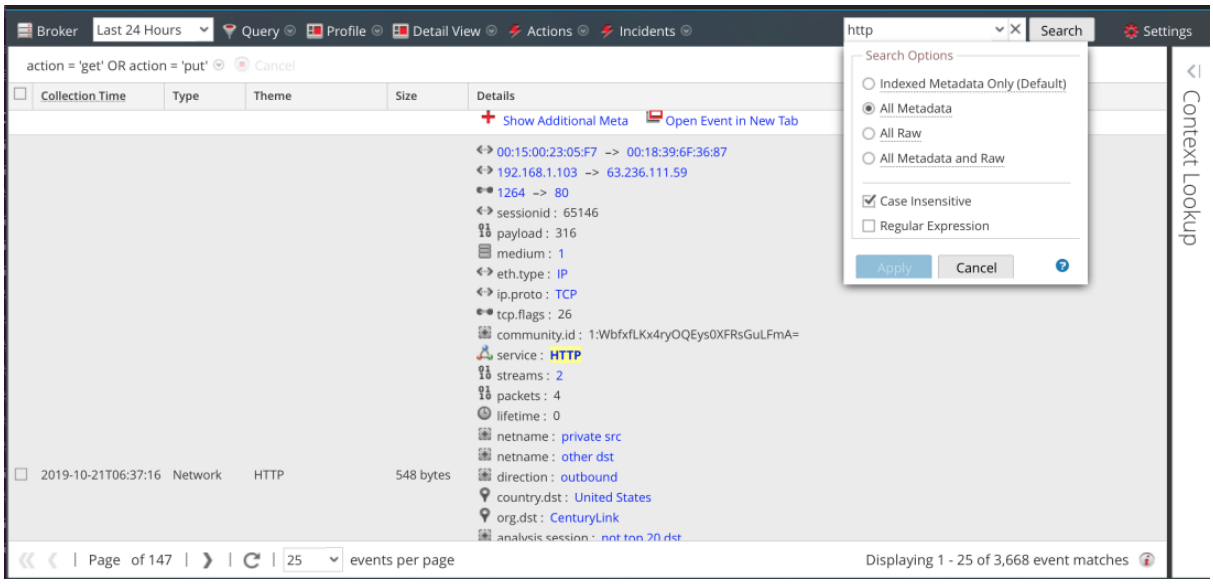


2. Type the text string that you want to find, for example, `http`.
   The text string is displayed in the meta key drop-down list under Advanced Options.

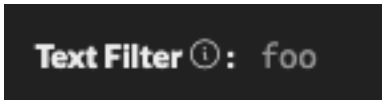


3. Click **Text Filter** under **Advanced Options**.
   The text filter is created in the query bar. The following figure illustrates the different appearance of a text search filter versus a free-form filter. The free-form filter is in a fixed-space font and outlined in red. The red outline indicates a syntax error because a valid expression is expected in a free-form filter. The text filter is marked by the search icon. No syntax requirements are applied to text search filters.

4. (Optional) Create additional simple or free-form filters in the query bar. There can be only one text filter in the query. This example was created by typing `http` as a text filter and then adding two more filters - `action = 'get' OR action = 'put'`



5. To submit the query, click .
   The results are displayed in the Events panel. This figure illustrates the Events panel with no results displayed and a message with instructions for improving results. Every time you use a text filter, this message is at the bottom of the results offering a link to expand your search.



6. Click the **here** link in the message.
   A new browser tab opens with the query results displayed in the Legacy Events view, where you have additional options to improve the search. This figure shows the results for the same query when

non-indexed metadata is included.

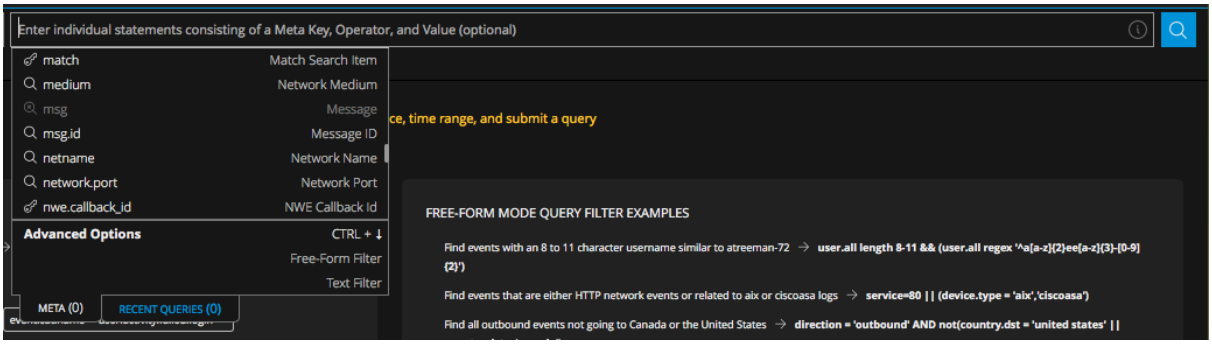
7. Click the Information icon in the query console to view the status of the query. This figure shows a text filter in the query console.

Select All Filters and Copy All Filters in the Query Bar (Version 11.4.1 and Later)

While creating a filter in the Events view query bar, you can use keyboard commands to select all filters (Ctrl-A for Windows OS, Cmd-A for MacOS) and then copy the selection to the local clipboard (Ctrl-C for Windows OS, Cmd-C for MacOS).

To select all filters and copy them to the clipboard:

1. In the **Events** view > **Events** panel, click on a focused pill or in the query entry form, and press **Ctrl-A** for Windows OS or **Cmd-A** for MacOS.
   All filters in the query bar are selected.
2. To copy the selected filters to the clipboard, type **Ctrl-C** for Windows OS or **Cmd-C** for MacOS.
   You can share the clipboard with other analysts or paste the contents in the query bar.



Paste Text in the Query Bar

(Version 11.4 and Later) While creating a filter in the Events view query bar, you can paste instead of typing the complete text of a filter that you have copied from somewhere else. You can paste the text into an empty query bar or next to an existing filter in the query bar. Depending on the text you typed, the query parsing engine parses the information that you pasted and creates a new filter, which can be a simple filter, a free-form filter, or a text filter.

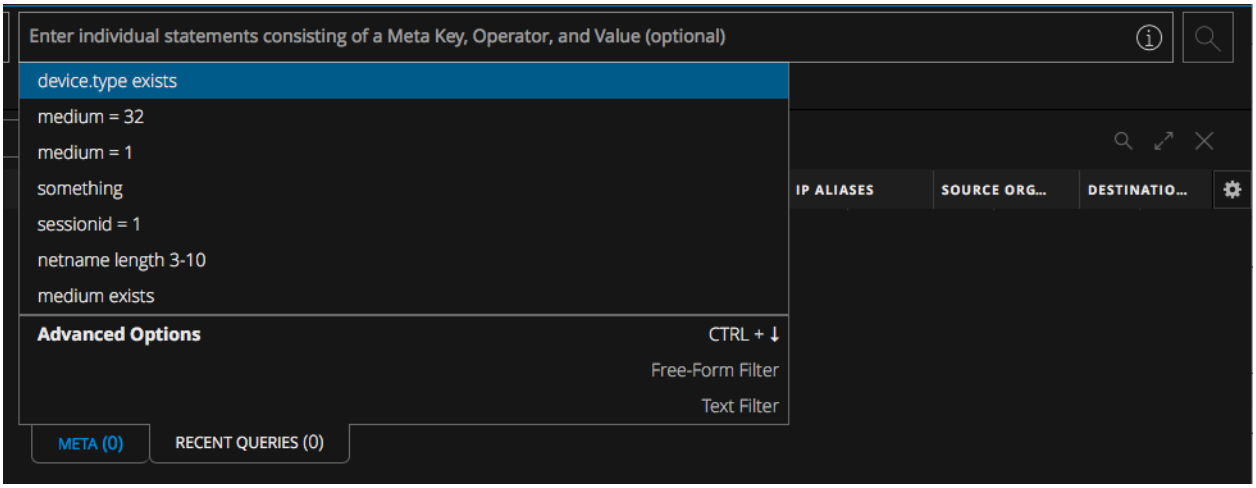
- A text string of this form is added as a new simple filter in the query bar: `<valid meta key> <valid operator> <optional value>`. This is an example: `alias.host contains 's'`.
- A text string of this form is added as two simple filters in the query bar: `<valid meta key> <valid operator> <optional value> && <valid meta key> <valid operator> <optional value>`. This is an example: `alias.host contains 's' && action exists`, which is converted to `alias.host contains 's' AND action exists`.
- A text string that contains unparsable text may be converted to a free-form filter. For example, using `NOT (device.ip = 10.10.10.10)` is unsupported for creation of a filter in Guided Mode, so this would be converted to a free-form filter. Free-form filters are validated by the server when they are submitted.
- Text that does not conform to the filter syntax is added as a free-form filter.

To create a filter by pasting text:

1. Go to the **Events** view > **Events** panel, select **Guided Mode** under the query bar, and click in the query bar. (For Version 11.4.1, simply click in the query bar.)
   The query entry form is displayed.

2. Type **Ctrl-V** (Windows OS), **Cmd-V** (MacOS), or **right-click** and **Paste** to paste text that you have copied into the clipboard from somewhere else. Do one of the following:

   a. If the text you pasted is a statement that can be parsed, one or more simple filters is created.
      If the text you pasted is a statement that cannot be parsed, a new free-form filter is created.
      If the text you pasted is not a statement and not a valid meta key, an invalid syntax error is displayed.
      If you pasted a valid meta key for a new filter you are building, the meta key is highlighted in the drop-down list, and you can continue creating a filter as usual by entering an operator and a value.
      After you select a valid meta key and a valid operator (for example, `city.dst =`) any text that you paste is treated as a text string if the meta key supports a text value, and one filter is created.
      If the meta key does not support a text value all of the text in the query bar is parsed as described in step a above.

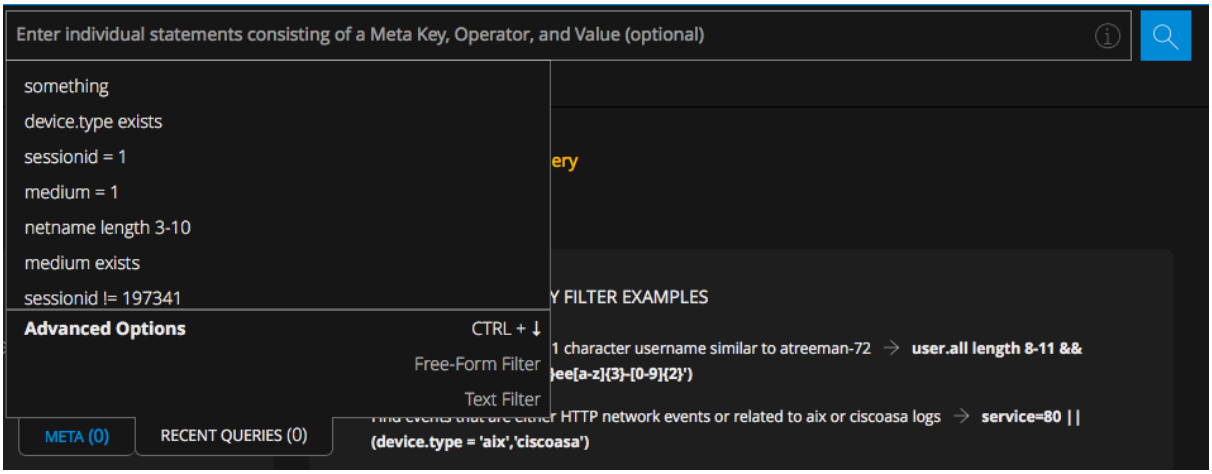


3. Add more filters in the query bar if you wish, and then submit the query.
   The query is executed.

Insert a Filter Based on a Recent Query

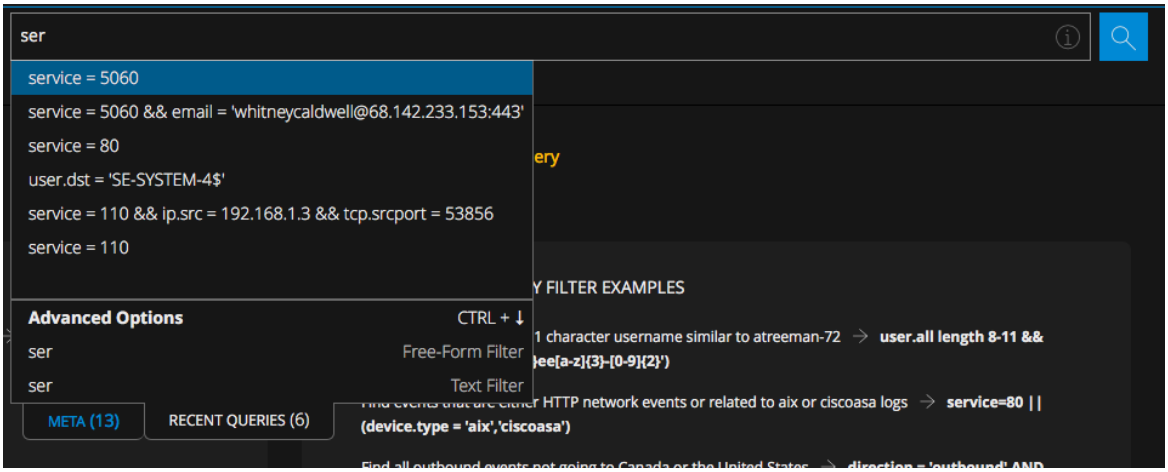
(Version 11.4 and Later) In the Guided Mode query bar, you can insert a filter based on a recent query. When the Recent Queries tab is opened and nothing has been typed in the query bar, up to 100 of your most recently executed queries are displayed in a scrollable list. The list is sorted to show the most recent at the top, and the Recent Query count is set to 0. When you begin typing, the list is filtered to display up to 100 queries from the query history database that contain matching text, even if the matches are not in the most recent 100 queries. The Recent Query count changes to reflect the number of matching queries as you type.

The top entry in the list is highlighted by default. To select a recent query, you can move the highlighting up and down in the list using the up and down arrow or by mouse-over of a recent query. As you type the list is filtered and the highlighting moves back to the top of the list. Clicking a query, or pressing Enter while a query is highlighted, creates a new filter with the text of the selected query.



Whenever you submit a query, the list is sorted to add that query, now the most recent, at the top.

To create a filter based on a recent query



1. Go to the **Events** view, select **Guided Mode** under the query bar, and click in the query bar. (For Version 11.4.1, simply click in the query bar.)
   The Meta Key drop-down list is displayed in the Meta tab.

2. Select the **Recent Queries** tab.
   The Recent Queries drop-down list is displayed with a count of 0.

3. To search for a recent query, do one of the following:

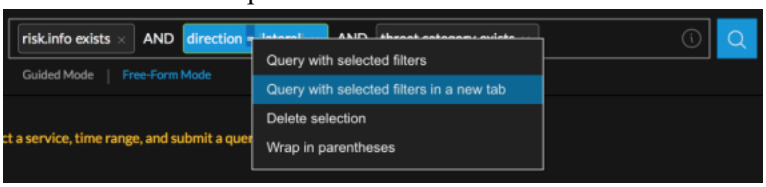
   a. Begin typing some text.
      As you type more characters or backspace to delete characters, the list is filtered to show recent queries that contain the text you typed. The count in the Recent Queries label increments to show the number of matching queries as you type.

   b. To select a query and add a new filter, continue to type and use the up and down arrows until the query you want to use as a new filter is highlighted.

   c. With a query highlighted, press **Enter** or simply click a query that you see in the list.
      The filter is added in the query bar.

4. Add more filters in the query bar if you wish, and then submit the query.
   The query is executed and the list is sorted to add that query, now the most recent, at the top.

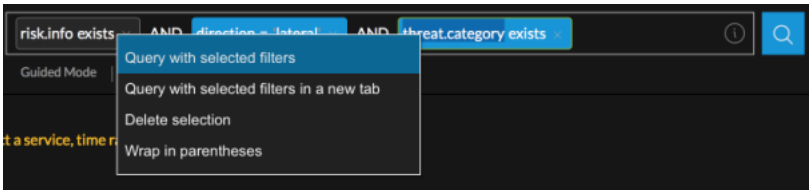
Edit a Filter in Guided Mode



With a query in the Guided Mode query bar, you can edit a filter. To edit a filter:

1. Double-click the filter, or click the filter and press **Enter**.
2. Edit the filter. When finished editing, press **Enter** to update the filter.
3. If you want to execute the query again, click .
   The Events panel displays results for the updated filter.

Query Using Selected Filters in Guided Mode



When you have one or more filters in the query bar in Guided Mode, you can refocus the query to include only selected filters, displaying results in the current browser tab or a new browser tab. Some filters include expressions with nested parentheses in Version 11.4, and you can refocus part of a filter that includes nested parentheses. To update the query using only selected filters, do one of the following:

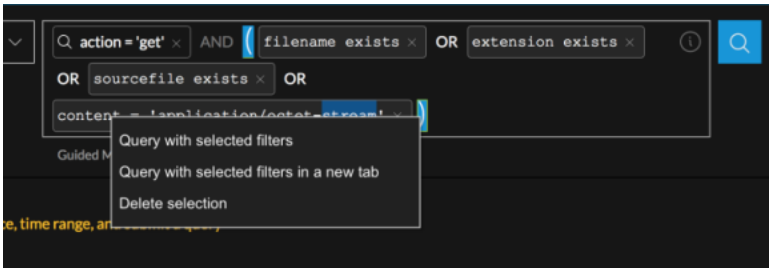
1. Using a query that includes one or more simple filters, for example a query has three filters: `risk.info exists`, `direction ='lateral'`, and `threat.category exists`.
   a. Select `direction = 'lateral'`, right-click the filter and select **Query with selected filters in a new tab** in the drop-down menu.

   A new tab opens with the results for the selected filter and the original query is left intact on the previous tab.

   b. To query the selected filters in the same tab, select `direction = "lateral"` and `threat.category exists`. Then right-click and select **Query with selected filters** in the drop-down menu.

   A query with only the selected filters is submitted and all remaining filters are removed.

2. (Version 11.4) For a query that includes a filter containing nested parentheses, for example: `action = 'get' AND (filename exists OR sourcefile exists OR content = 'application/octet-stream')`, do one of the following:



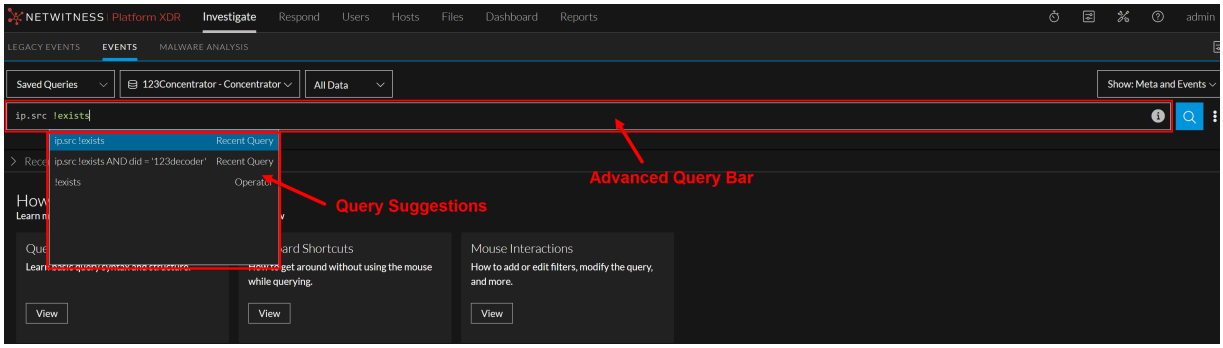
a. Select the close parenthesis after `'application/octet-stream'`, right-click, and select **Query with selected filters in a new tab**.
A new tab opens with results for `(filename exists OR sourcefile exists OR content = 'application/octet-stream')`.

b. Select the same, right-click, and select **Query with selected filters**.
The results for `(filename exists OR sourcefile exists OR content = 'application/octet-stream')` are displayed in the current tab.

Delete a Filter and Delete Text or Parentheses in a Filter in Guided Mode

Some keystroke editing features became available in Version 11.4; these are labeled in the steps.

1. To delete a filter, do any of the following:
   a. Click **X** in a filter.
   b. Select the filter and press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS).
   c. (Version 11.4 and later) Select the filter and press **Backspace** (Windows OS) or **Delete** (MacOS).
   d. Right-click one or more filters and select **Delete selected filters** or **Delete selection** (Version 11.4 and later) in the drop-down menu.
   The filter and the operator to the right or left of the filter is deleted, ensuring that no extraneous operators remain in the query bar.
2. (Version 11.4 and later) To delete characters in a filter or parentheses and contents in a filter, do any of the following:
   a. To delete the previous character: With the cursor next to a character in the query bar, press **Backspace** (Windows OS) or **Delete** (MacOS).
   b. To delete all characters: With the cursor in a filter, press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS).
   c. To delete the selected characters: With characters selected in the query bar, press **Delete** or **Backspace**.
   d. To delete parentheses, but not the characters inside the parentheses, select one of the parentheses and press **Delete** (Windows OS) or **Fn** + **Delete** (MacOS).
   e. To delete a set of parentheses and the contents, for example, `(filename exists OR sourcefile exists OR content = 'application/octet-stream')`, select the parenthesis after `get`, right-click, and select **Delete selection**.



Everything except `action = 'get'` is deleted.

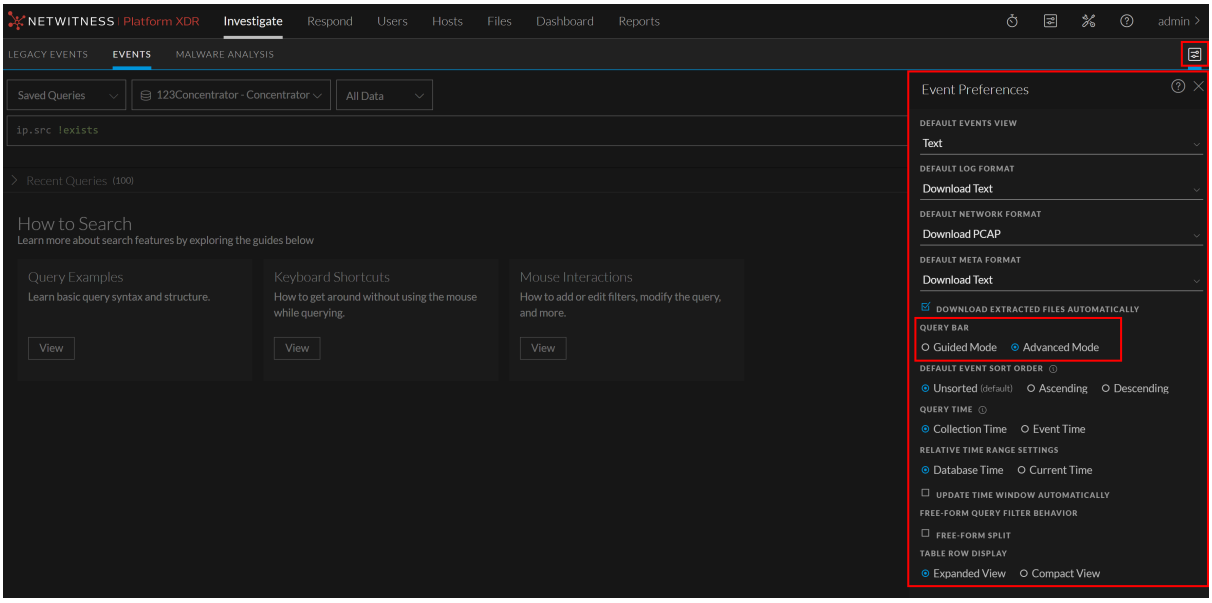
Create a Query in Advanced Mode

In addition to the Guided Mode query bar, NetWitness introduces the new Advanced Mode query bar in Version 12.3 to provide a seamless experience to the users while they write queries. Advanced Mode query bar provides a search bar with the ability to accept a query construction in text form just like an Integrated Development Environment (IDE), instead of the pill-based entry of Guided Mode.

Advanced users can now quickly construct a new query or modify the existing queries and get the list of matching events. While constructing queries, users can continue typing queries without pressing enter. Advanced Mode query bar also has other great features:

- **Syntax or error highlighting**: The syntax of each query is validated and a red outline marks invalid filters.
- **Auto suggestions**: Suggestions like a meta key, an alias for medium, an operator in a drop-down list to help in query construction.
- **Recent queries**: Displays recent queries.

To enable the advanced query bar:



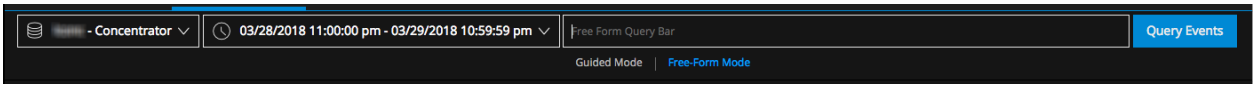
1. Go to **Investigate** and click ▣ (**Event Preferences**).

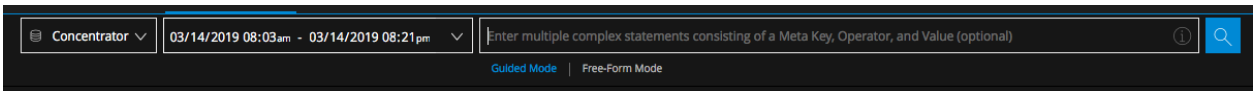
   The Event Preferences dialog is displayed.

2. Select **Advanced Mode** in the Event Preferences dialog.

   As you write or edit a query, the query bar provides suggestions. Press **Tab Key** or click on the

highlighted suggestion to select a suggestion.





Note: Advanced Query Bar may not correct as many errors as Guided Query Bar while typing a query.

Create a Query in the Free-Form Mode

Free-Form Mode is used in Version 11.2, 11.3, and 11.4, but no longer available in Version 11.4.1.

Free-form queries are most useful when you have a long text string saved that you want to paste, or if you have one in mind that you want to enter quickly, and you know the meta keys, valid operators, and valid syntax for entering values. The following figure illustrates the initial Events view with the empty Free-Form query builder field. The first example is Version 11.2 and the second example is Version 11.3.

The blinking cursor indicates that you can enter a query. You can enter free text here. As more expressions are added and they cannot be displayed in a single line, they wrap to another line and the input area expands vertically so that all filters are visible without scrolling to the right.

These are some examples of queries that you can enter in Free-Form mode:

To find events with an 8- to 11- character username similar to atreeman-72:

```
user.all length 8-11 && (user.all regex '^a[a-z]{2}ee[a-z]{3}-[0-9]{2}')
```

To find events that are either HTTP network events or related to aix or ciscoasa logs:

```
service=80 || (device.type = 'aix','ciscoasa')
```

To find all outbound events not going to Canada or the United States:

```
direction = 'outbound' AND not(country.dst = 'united states' || country.dst =
'canada')
```

If you have a submitted query in Guided Mode, the query is transformed into text when you click switch to Free-Form mode. This is an example of a query submitted in Guided Mode as two filters, `service = 80` and `direction = 'outbound'`, and then viewed in Free-Form mode.

The button on the right side of the query builder is visible as needed to input a query. The query is applied when you click . At that time the query is validated to show syntax and logic errors.

Operations that require more processing time are not highlighted as they are in Guided Mode, but this table provides a summary of expensive operations for reference.

Index Method	Non-Text Value	Text Value	Regular Operations	Expensive Operations
By Key	✓		`exists`, `!exists`	`eq`, `!eq`
By Key		✓	`exists`, `!exists`	`eq`, `!eq`, `begins`, `ends`, `contains`
By Value	✓		`exists`, `!exists`, `eq`, `!eq`	no expensive operators
By Value		✓	`exists`, `!exists`, `eq`, `!eq`, `begins`	`ends`, `contains`
By None	special case for `sessionid`		`exist`, `!exits`, `eq`, `!eq`	no expensive operators

Filter Results in the Navigate View

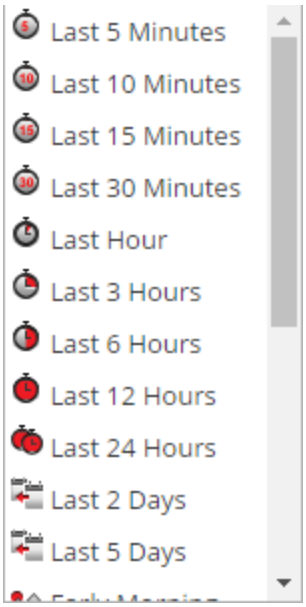
When conducting an investigation in the Navigate view, there are several methods available to refine the results displayed when meta key values are loaded in the Navigate view. The rest of this topic is focused on the basic methods of filtering data:

Note: By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.

- Set the Time Range
- Set the Quantification Method and Sort Sequence of Meta Key Results
- Manage and Apply Default Meta Keys in an Investigation
- Drill into Data in the Navigate View Time Chart
- Drill into Data in the Values Panel

Set the Time Range

When conducting an investigation in the Navigate view, the time range options limit the results returned. You can select:



- A time range relative to the collection- ranges relative to the collection are based on the last collection time for data.
- A time range relative to the calendar.
- A custom date range.
- All data.

The selected Date Range is shown in the Navigate view tool bar as the Time Range label. By default the label is **Last 3 Hours**. The Time Range displayed in the timeline banner shows the first and last timestamp for the date range being used for the metadata.

Note: Time range is based on the Time Zone configured in the Profile Preferences panel as described in "Setting User Preferences" in the *NetWitnessGetting Started Guide*.

To select a built-in time range

1. Click the **Time Range** option in the Navigate view toolbar. The default time range is for the **Last 3 Hours**, but a different value from the selection list, for example, **All Data** or **Last Hour,** may already be selected and used as the label in the options panel.
   The Time Range selection list is displayed.

2. Do one of the following:
   - If you want to see all data, select **All Data**.
   - If you want to set a time range in minutes, hours, or days that is relative to the collection, select a value such as **Last 10 minutes**, **Last 3 Hours**, or **Last 5 days**.
   - If you want to set a time range relative to today, select **Yesterday**, **This Week**(Version 11.1), **Last Week** (Version 11.1), **All Day**, or a part of the day such as **Early Morning**, **Morning**, **Afternoon**, or **Evening**.
   - If you want to set a unique date range, select **Custom** in the **Time Range** menu and follow the procedure below.
     The selected time range is applied to the current results in the Values panel.

To specify a custom time range

1. Select **Custom** in the **Time Range** menu.
   Date selection options are displayed in the toolbar.

2. Within the time **Start Date** and **End Date** fields, do the following to specify the date and time:
   a. Click a date from the calendar.
   b. (Optional) Select the time from the Hour and minute fields or click **Now**. The time selection defaults to the current time of day.

Note: The value for start time in seconds always defaults to :00, and the value for end time in seconds always defaults to :59. For example, if you are using time to drill down into an issue, the drill time is interpreted as "HH:MM:00 - HH:MM:59."

3. To apply the range, click **Go**.
   The selected time range is applied to the current results in the Values panel.

Set the Quantification Method and Sort Sequence of Meta Key Results

You can select the way results for each meta key are quantified and sequenced in the Navigate view.

Note: If meta entities (Version 11.1 and later) are used in meta groups, the results will show the top 20 values that matched any of the meta keys contained in the meta entity.

Each meta key section in the Navigate view contains an ordered list of values showing each meta key value (Value) and its count (Total). You can specify whether:

- The results in each meta key section are sorted based on Value or Total.
- The results are sorted in ascending or descending order.
- The values shown for each meta key are quantified by number of packets (Packet Count), number of sessions or logs (Quantify by Event Count) or by the size of events (Quantify by Event Size).

Note: If you have both a log decoder and a packet decoder for which you are viewing the metadata, the calculation of what is actually being counted is dependent on the type of key. If you select to Quantify by Packet Count and are looking at logs, the Navigate view output is the same output as if you had selected Quantify by Event Count (see Navigate View for details).

This image shows the `Event Type` meta key presented in order by **Total** in **Descending** order. The value with the greatest count of matches is presented first. The value `failure audit` has 71 matches and is listed first. The value `logon` has only one match and is presented last. The quantification method is **Event Count**.

This image shows the `Event Type` meta keys presented in order by **Value** in **Descending** order. The value names are presented in alphabetical order starting at the end of the alphabet. The value `success audit` is listed first. The value `connect` is presented last. The quantification method is **Event Count**.

To select the quantification method of meta key count and ordering of meta key results displayed in the Navigate view:

1. In the toolbar, select **Event Count**, **Event Size**, or **Packet Count** and choose one of the quantification options in the drop-down menu. The label for the menu displays the selected option.
   

   The current view is reloaded according to your selection.

2. In the toolbar, select **Total** or **Value** and choose one of the ordering methods in the drop-down menu. The label for the menu displays the selected option.

   The current view is reloaded according to your selection.

3. In the toolbar, select **Ascending** or **Descending** and choose one of the sort order options in the drop-down menu. The label for the menu displays the selected option.
   The current view is reloaded according to your selection.

Manage and Apply Default Meta Keys in an Investigation

When analysts are conducting an investigation of captured data in Investigate, a default set of meta keys is loaded and displayed in a default sequence in the Navigate view > Values panel. The default content and sequence is based on the meta keys for the service being investigated. Analysts can specify the meta keys to display during navigation by selecting the default meta keys or by selecting a user-defined group of meta keys, which provides great flexibility to define meta keys. This can help to drill down more directly to the desired data and to reduce the load time by preventing the loading of meta that is not of interest in the current investigation.

Note: In Version 11.1 and later, wherever meta keys are used, you can also use configured meta entities.

If no custom meta groups are in effect, the Navigate view is displayed with the meta key visibility specified in the Default Meta Keys dialog. To optimize loading of meta keys in the Navigate view > Values panel, NetWitness does not open non-indexed meta keys by default. When you open a non-indexed meta key in the Values view, NetWitness begins loading values for that meta key. If the load time is excessive, the load of the meta key times out with a message. Title, values, and counts for non-indexed meta keys are not drillable in the Values panel. Additional labeling in Investigation identifies the non-indexed meta keys.

To select the meta keys to apply to your investigation, you can:

- Select the default meta keys.
- Select a set of meta keys, called a meta group.

Note: Investigate has built-in meta groups and user-defined meta groups. Once created, user-defined meta groups can be edited, deleted, exported for use on other services, and imported to the service you are investigating. All of these procedures are provided in a separate topic: Use Meta Groups to Focus on Relevant Meta Keys.

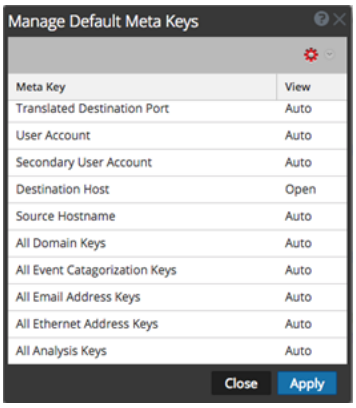
The Default Meta Keys dialog allows you to specify the default view and display sequence for meta keys during navigation in the Investigate > Navigate view for a specific service. For each key or for all keys, you can set the default view to:

- Hidden: Results for default meta key are hidden and are not available to load.
- Open: Results for default meta key are open with all values and counts displayed.
- Close: Results for default meta key are closed with only the meta name visible.

- Auto: The loading of default meta keys is controlled by the index level, which must be Indexed By Value.

When using the default meta keys, be aware that these can be modified for different services, and you may not be seeing the same set of default meta keys when navigating to a drill point on different services. If you do not see the expected data, you may need to change the initial view of the default meta keys.

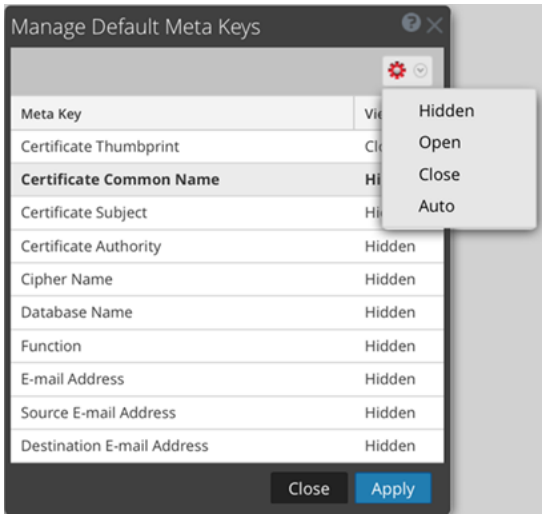
When you change the initial state of default meta keys from within the Navigate view, the change persists for that service. When new keys are added to the custom index file for a Core service (for example, `concentrator-custom-index.xml` or `decoder-custom-index.xml`), the new keys are added to the default meta keys list. The changes made in the Navigate view apply only to the current service.



To specify that the initial Navigate view opens using default meta keys

1. Go to **Investigate** > **Navigate**.
2. Select a service and select **Navigate**.
3. In the **Meta** menu, select **Use Default Meta Keys**.
   If an investigation is already in progress, the data is reloaded in the current view and an icon highlights the selected option. If no data is loaded yet, the default meta keys are used for the next load.

Configure Default Meta Keys



To configure the default view of default meta keys in the Navigate view:

1. In the **Navigate** view toolbar, select **Meta** > **Manage Default Meta Keys**.
   The Manage Default Meta Keys dialog is displayed with the list of available meta keys for the service.

2. (Optional) To change the order of the keys, select one or more keys, and drag the values up or down through the list of keys.
3. Do one of the following:
   - (Optional) To change the default view for all meta keys, make sure that no keys are selected and in the toolbar, select .

- (Optional) To change the default view for one or more keys, select the keys and in the toolbar, select .
  A drop-down menu of possible initial views for all default meta keys is displayed.

- (Optional) To revert to the default view for meta keys as specified in the service index file, make sure that no keys are selected and in the toolbar, select > **Auto**.
  When you modify the default view for a non-indexed meta key, you cannot set the key to OPEN. If you change the default view for a group of meta keys to OPEN and some of the meta keys are non-indexed, the non-indexed meta keys revert to AUTO. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are CLOSED until opened manually.

4. Select one of the views.
5. To save the changes, click **Apply**.
   The meta keys displayed in the Navigate view are set to your specifications. If the default meta keys are hidden, values for the meta keys are not shown in the investigation at all. If the default meta keys are closed, the values for the meta keys are not loaded by default, but you can load individual meta keys manually in the Navigate view.

Drill into Data in the Navigate View Time Chart

The Time Chart visualization allows analysts to visualize activity over time. You can zoom into the data by selecting a time window then selecting the Investigate option. You can then reset the navigation to the time range that was in effect before zooming.

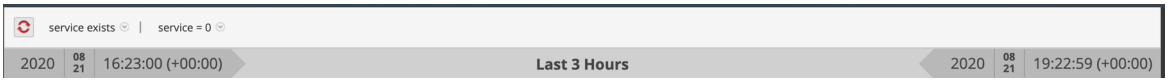
1. Go to **Investigate > Navigate**.
   The Time Chart for the current drill point and selected time range is displayed. You can hover over the time chart to display total number of events occurred at a specific time.

2. To highlight a period of time on the Time Chart, click over the desired time period and drag the mouse.
   The Time Chart is redrawn for the selected time range; however, the meta values are unchanged.
3. To drill into the data for the selected time range, click **Investigate**.
   The URL is updated to reflect the time range override, and the Investigation options panel is updated to reflect the custom time range. The Time Chart is redrawn and the meta values are loaded for the selected time range.
4. To reset the Time Chart to the original time range, click **Reset Zoom**.
   The URL is updated to reflect the original URL prior to zooming into the data, and the Investigation options panel is updated to reflect the time range selected before zoom. The Time Chart is redrawn for the selected time range and the meta values are loaded for that time range.

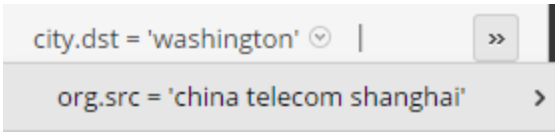
Drill into Data in the Values Panel

NetWitness displays the activity and values for the selected service in the Investigation > Navigate view. To investigate data, analysts drill into data by clicking on a meta key or a meta value, which is treaty as a query. In the Values panel, each query is added to the breadcrumb data in the Values panel. This results in a breadcrumb at the top with a crumb for each query. You can edit the breadcrumb to insert or remove a query.

To drill into a subset of the metadata



1. Begin an investigation so that metadata is displayed in the Navigate view.

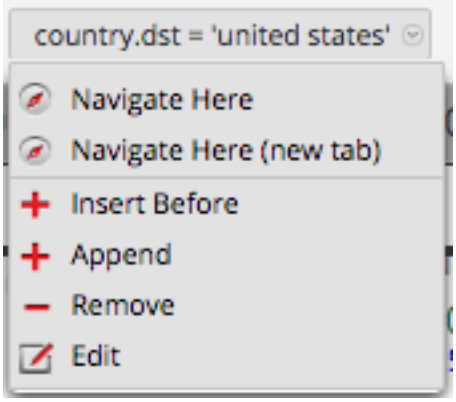


2. To drill down into the metadata, do any combination of the following:

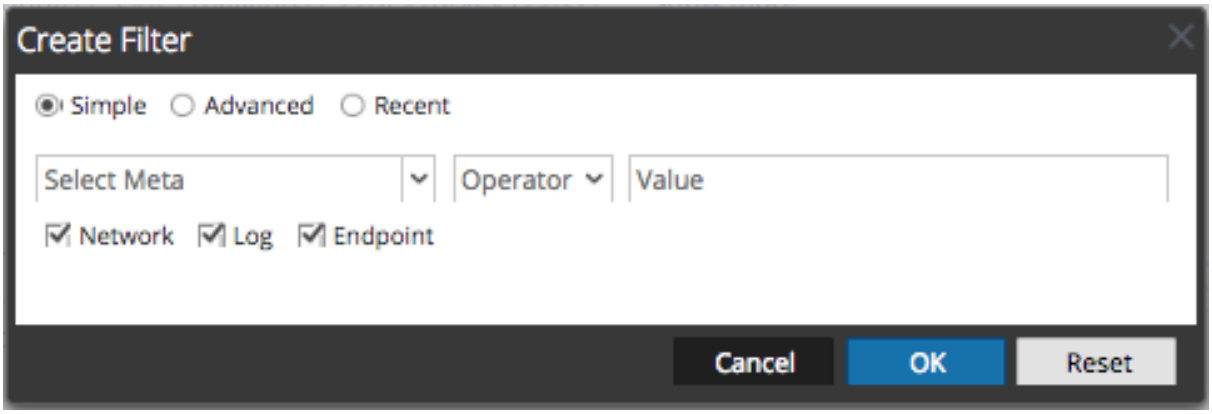
   a. Click a **meta key**, for example, **Service Type**.

   b. Click a **meta value**, the blue text in the results. For example, **OTHER**.
   Each time you click a meta key or meta value, the investigation query pivots to a narrowed focal point, or drill point, in the data. At each drill point, the Values panel is updated and the new drill point is displayed in the breadcrumb. Below is an example of the first breadcrumb.

   This is an example of a long breadcrumb that does not fit in the toolbar. The last query that fits is followed by a drop-down menu that lists additional queries. To select a drill point within the overflow, click the overflow icon and a query in the drop-down list.



To add a query in the breadcrumb

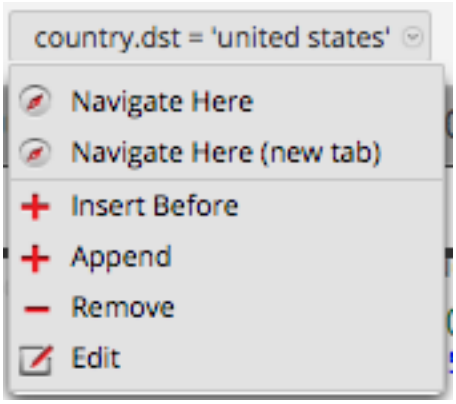


In the breadcrumb, you can click any of the crumbs to display the Query menu. You can insert a new query before a crumb, and append a new query to the end of breadcrumb. After each edit in the breadcrumb, NetWitness refreshes the results.

To add a query in the breadcrumb:

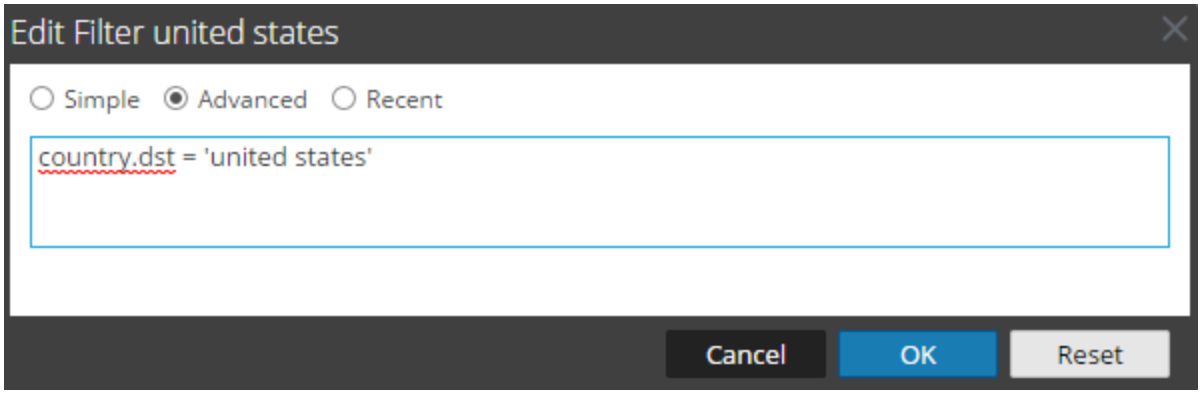
1. Click a crumb.
   The Breadcrumb menu is displayed.

2. To add a query in the breadcrumb, select **Append** or **Insert Before**.
   The Create Filter dialog is displayed.



3. Create the Query as described in Create a Query in the Navigate and Legacy Events Views.

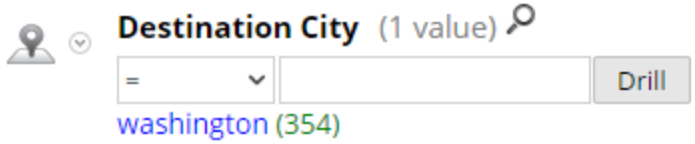
To edit a query in the breadcrumb:



In the breadcrumb, you can click any of the crumbs to display the Query menu. You can delete a crumb and edit a query in a crumb. After each edit in the breadcrumb, NetWitness refreshes the results.

To work with queries in the breadcrumb:

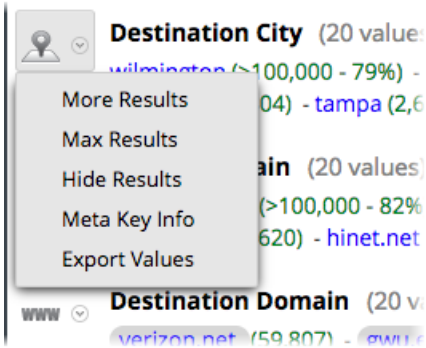
1. Click a crumb.
   The Breadcrumb menu is displayed.



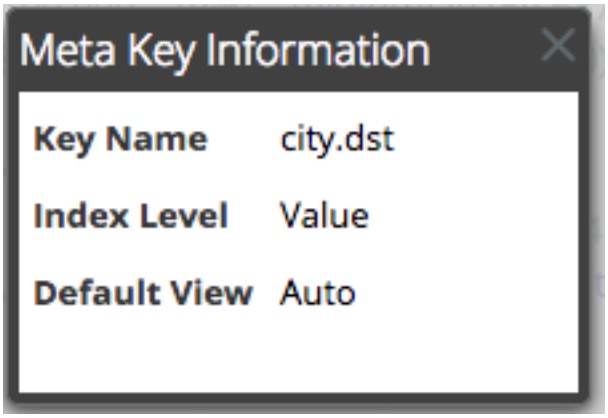
2. To edit a query in the breadcrumb, select **Edit**.
   The Create dialog is displayed with the selected query open for editing.

3. Edit the fields as described in Create a Query in the Navigate and Legacy Events Views.

To quick search within a meta key

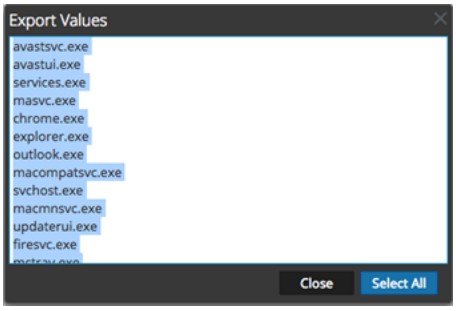


1. Move the mouse over a meta key section and click the magnifying glass.
   The Quick Search form, which contains a comparator and an optional operand for the search, is displayed.

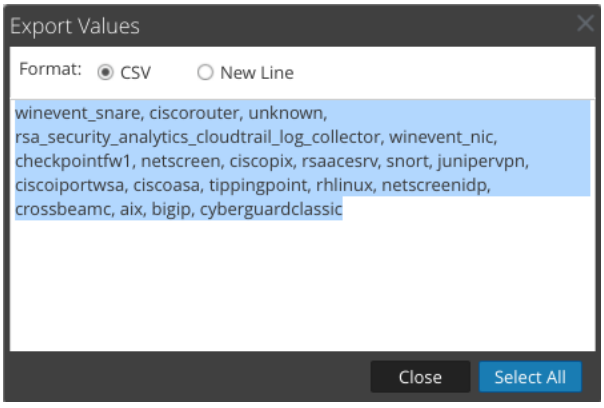


2. (Optional) If you want to close the search form, click the magnifying glass again.
3. Select the operation from the drop-down list on the left and type the text value to search for. Then click **Drill** to perform the execution.
   The metadata for that meta key is used to drill down in the current metadata.

To view meta key information and copy meta values for a meta key



1. To view the key name, index level set for displaying the meta key, and the default view set for the meta key, click the drop-down menu next to the meta key. This figure shows the drop-down menu for Version 11.1 and later.



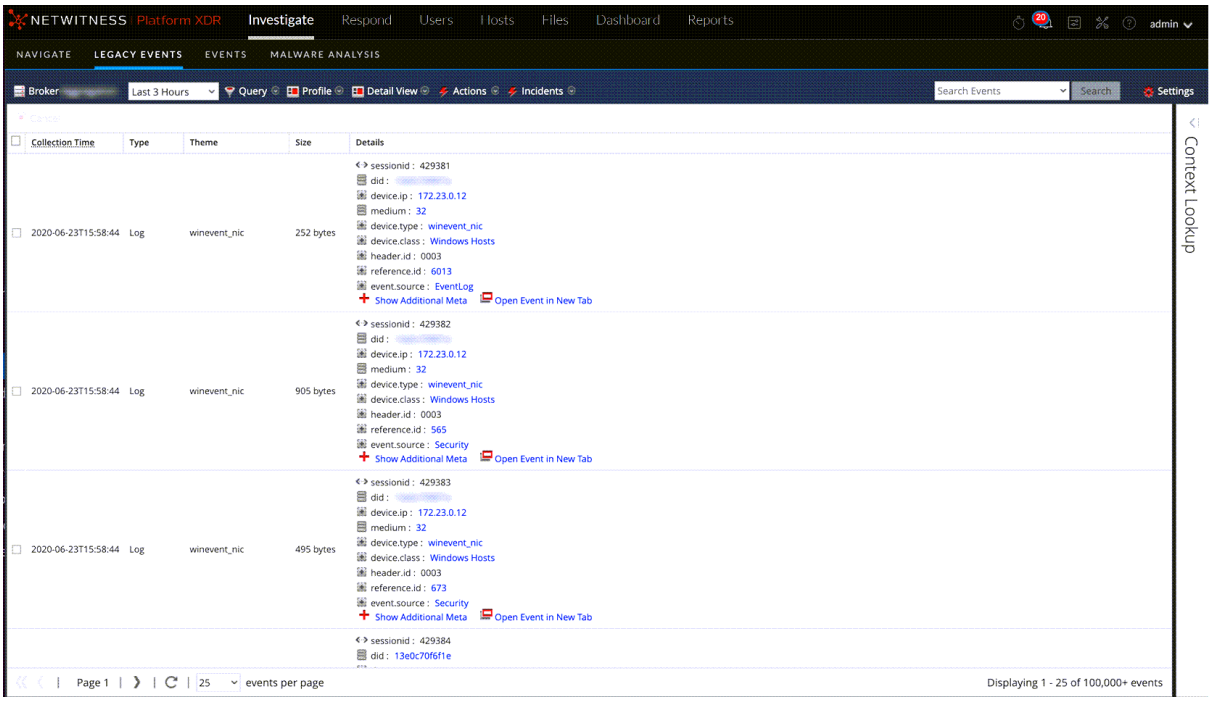
2. Select **Meta Key Info**.
   The Meta Key Info dialog is displayed.

3. When finished viewing, click ☒.
4. (Optional for Version 11.1 and later) To view meta values found for a meta key in a simple list that you can copy, click the drop-down menu next to the meta key.
   The Export Values dialog is displayed.
   The Version 11.1 dialog displays a list of values with one value per line.

   The Version 11.3 dialog allows you to select the method of separating values: either New Line or CSV.

5. Select the values that you want to copy, and click **Export Values**.
   The values are copied to the local clipboard and you can paste them into a file to save or share them.
6. To close the dialog, click **Close**.

7. (Optional) If you want to hide the results for the meta key in the current drill point, click the drop-down menu next to the meta key and click **Hide Results**.



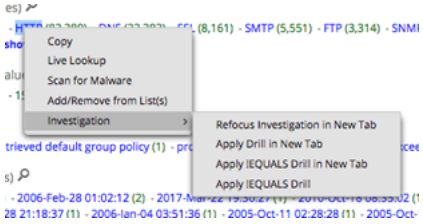
To display events associated with a meta value

The Legacy Events view provides additional details for an event in two different views: Events List and Detail View.

1. In the Navigate view, drill into metadata that is the focus of your investigation.
2. Click the count (the number in green) next to a blue meta value.
   The Events view corresponding to the current drill point is displayed.
   The operations that you can perform in the events view are described in Reconstructing and Analyzing Events.

To search for specific events associated with a meta value

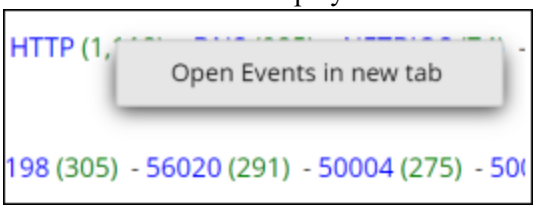
1. In the **Navigate** view, drill into metadata that is the focus of your investigation (click a meta value or add a query).
2. Type a search string in the Search box and press **Enter** or click **Search**.
   You can also select and set search mode preferences. See Search for Text Patterns in the Navigate and Legacy Events Views for detailed search information.
   The Events view opens in a new tab and shows the search results. If you do not see the search term highlighted, click **Show Additional Meta**. Your time range selection and drills (queries) carry forward to the Events view.



To view a selected meta value in RSA Live

1. In the Navigate view, drill into metadata that is the focus of your investigation.
2. Right-click a meta value (the text in blue).
   The Meta Value drop-down menu is displayed.
3. To look up the meta value in RSA Live, select **Live Lookup**.
   The Live Search view is displayed with the meta value entered in the Generated Meta Value(s) field, and ready for a search.

To refocus the investigation in a drill point:



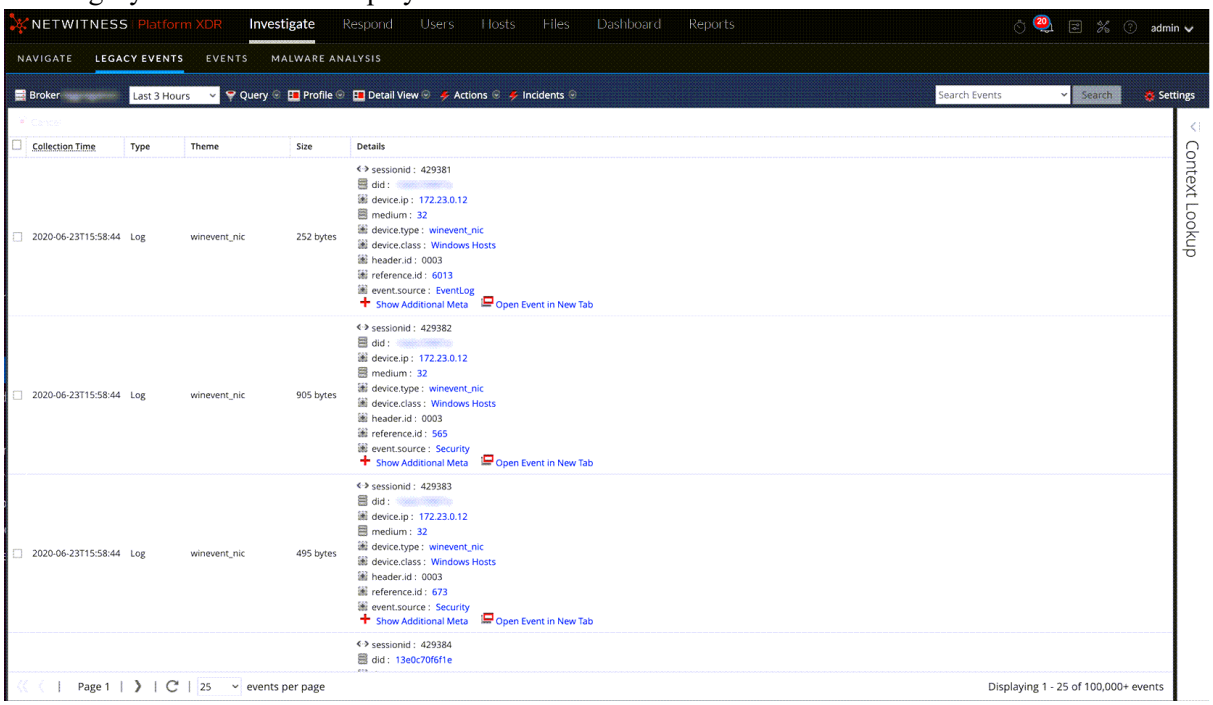
1. Right-click a meta value (the text in blue).
   The Meta Value drop-down menu is displayed.

2. Choose one of the refocus options.
   The drill is refocused according to your choice.

To look at a specific count in a new tab:

To view a count for a meta value in the Legacy Events view or the Events view, right-click a count for a meta value (the green number following the blue meta value).
The context menu is displayed.

Filter Results in the Legacy Events View



Analysts can filter events in the Legacy Events view by searching for events or selecting the service, setting the time range, and querying the metadata. If you opened the Legacy Events view from a Navigate view drill point, the view opens to the Detail view of events by default. Analysts who do not have permissions to use the Navigate view can query services directly from the Legacy Events view.

Note: When an Archiver is the currently selected service in the Legacy Events view and you are searching against a Broker or Concentrator, the search is slower than if searching against a Broker or Concentrator because the data on the Archiver is compressed and there is typically more data.

Filter Events Displayed in the Legacy Events View

To filter the data displayed in the Legacy Events view:

1. Go to **Investigate** > **Legacy Events**.
   The Legacy Events view is displayed.

2. To select a time range other than the default (**Last 3 Hours**), in the toolbar, click the time range field and select a value. For example, **Last Hour**.
   The Legacy Events view is refreshed with the selected time range.
3. Create a query as described in Create a Query in the Navigate and Legacy Events Views.
   The matching results for the query are displayed in the Detail View in the Legacy Events view. The breadcrumb reflects the query. In the breadcrumb, you can click any of the crumbs to display the Query menu. You can insert a new query before a crumb, and append a new query to the end of breadcrumb. After each edit in the breadcrumb, the results are refreshed.

Page Through Events in the Legacy Events View

Pagination controls allow more flexibility in paging through a list of Events in the List View, Logs View, or Details View. You can select the number of events to display per page, and your selection is saved across logins to the NetWitness application. When a control is unavailable, the control is dimmed; for example, when you are viewing page 1, the ❮ and ❮❮ controls are dimmed.

To use pagination controls:

1. With results displayed in the Legacy Events view, click the current number of events per page (**10**, **25**, **50**, **100**, or **200**), and select the new number of events per page from the drop-down menu.
2. To page forward or back, use the page control icons:
   Click ❯ to go to the next page.
   Click ❯❯ to go to the last page.
   Click ❮ to go the previous page.
   Click❮❮ to go to the first page.
3. To go to a specific page, type a page number in the page number field | 3 | Page 3 |.

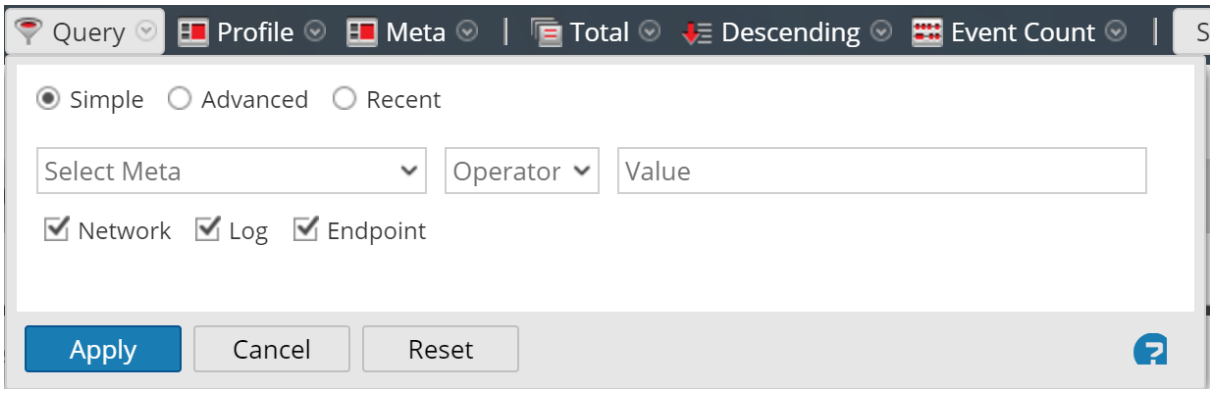
Create a Query in the Navigate and Legacy Events Views

In the Navigate view or the Legacy Events view, you can create a query using dialogs for that offer syntax help with drop-down lists of applicable meta keys or meta entities and operators.

When viewing the drop-down list, you can expand and collapse each meta group to view or hide the individual meta keys in that group. When you select a meta group, NetWitness generates the complex query equal to a query with all of the meta keys in that group ORed together. So if a meta group contains `ip.src` and `ip.dst`, the query generated is `ip.src = <value> OR ip.dst = <value>`. If the meta group contains meta keys that have different meta value types, the value input is disabled and the query uses `exists` statements. For example, a meta group that contains `ip.src`, `ip.dst`, and `alias.host` includes meta keys that have different value types; `ip.src` and `ip.dst` are ip addresses and `alias.host` is text. The generated query is `ip.src exists OR ip.dst exists OR alias.host exists`.

A basic query is in the following form:

```
<metakey> <operator> [<metavalue>]
```



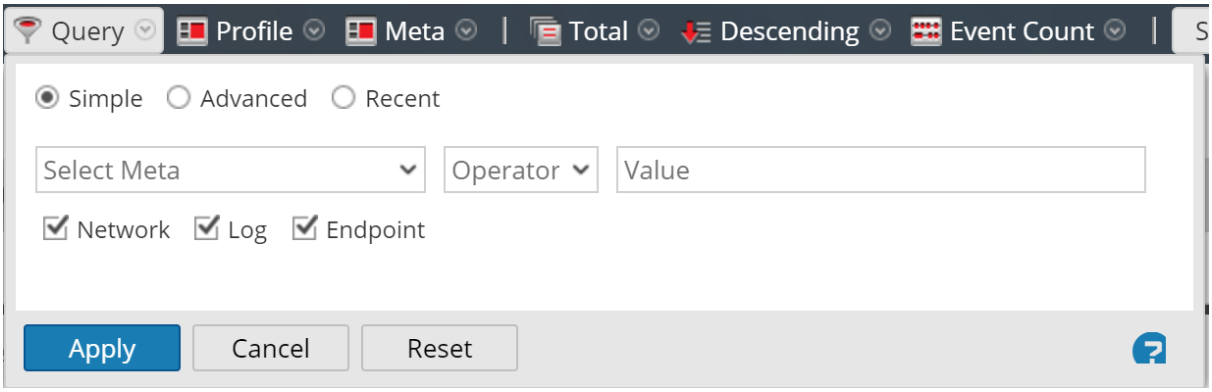
These are a few examples:

```
action exists
action = 'get'
alias.host = '10.25.55.115'
extension = 'exe'
orig_ip != "10.0.0.0" - "10.255.255.255"
```

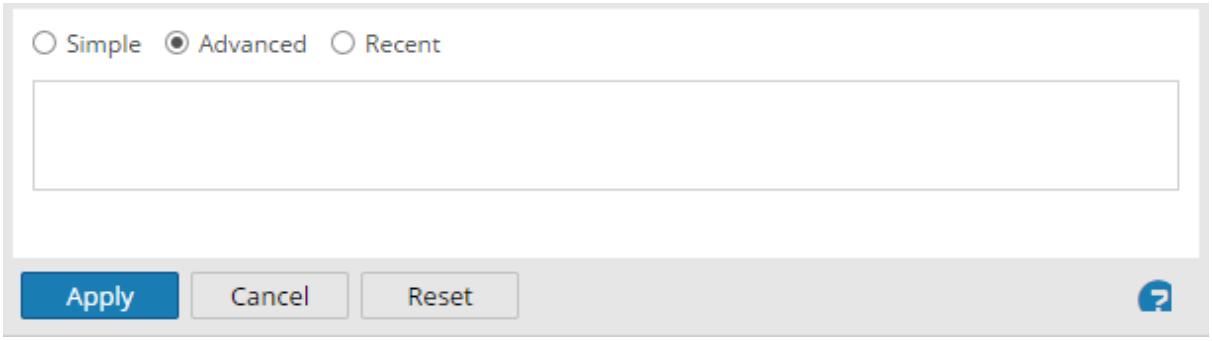
Create a Query Using the Basic Method

When you create a query using the basic method, drop-down lists of meta keys and operators are displayed.

1. In the **Navigate** view or the **Legacy Events** view toolbar, select **Query.**
   The Query dialog is displayed, with the Simple option selected.

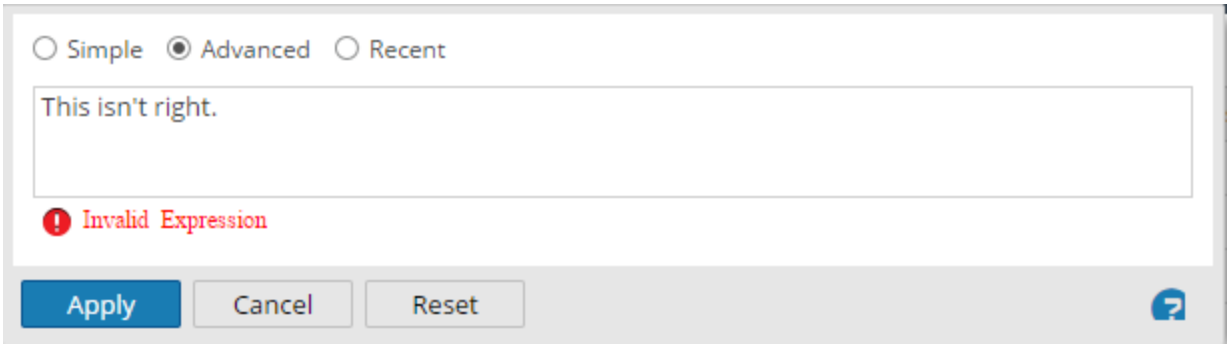


2. In the **Select Meta** field, click to display the drop-down list. The drop-down list has two sections: Meta Groups and All Meta.
3. Select a single meta key under **All Meta** or select a meta group under **Meta Groups**. You can also type in a meta key or meta group in the field.



4. In the **Operator** field, type an operator or click on the drop-down list to select a valid operator.
5. (Optional) If you selected an operator that requires a value, for example, =, in the third field type the value for the meta key.
6. In the Network, Log, and Endpoint checkboxes, choose the type of data to query. Do one of the following:
   a. To limit the query to packets select **Network** and de-select **Log** and **Endpoint**.
   b. To limit the query to logs, select **Log** and de-select **Network** and **Endpoint**.
   c. To limit the query to endpoint events, select **Endpoint** and de-select **Network** and **Log**.
   d. To apply the query to packets, logs, and endpoints, select **Network**, **Log**, and **Endpoint**.
7. Do one of the following:
   a. Click **Apply**.
   The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   b. Click **Cancel**.
   The window is closed and no changes are made to the view or current query.

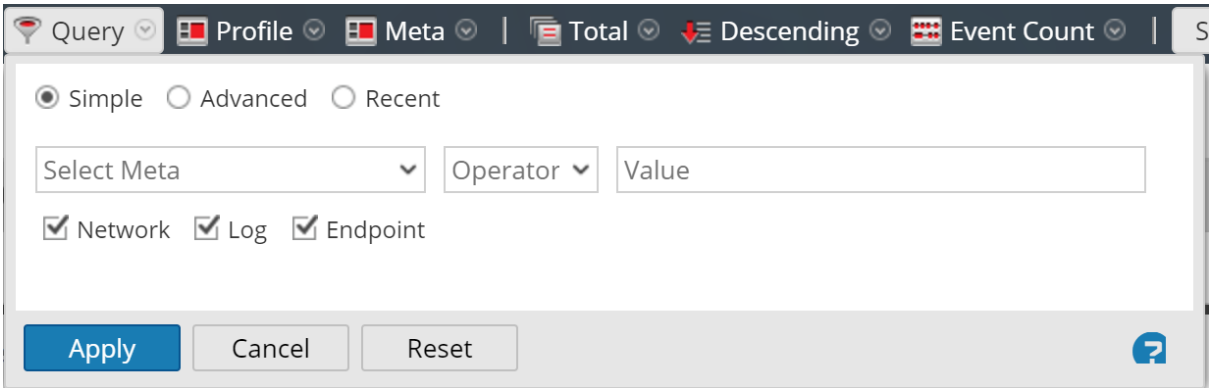
Create a Query Using the Advanced Method



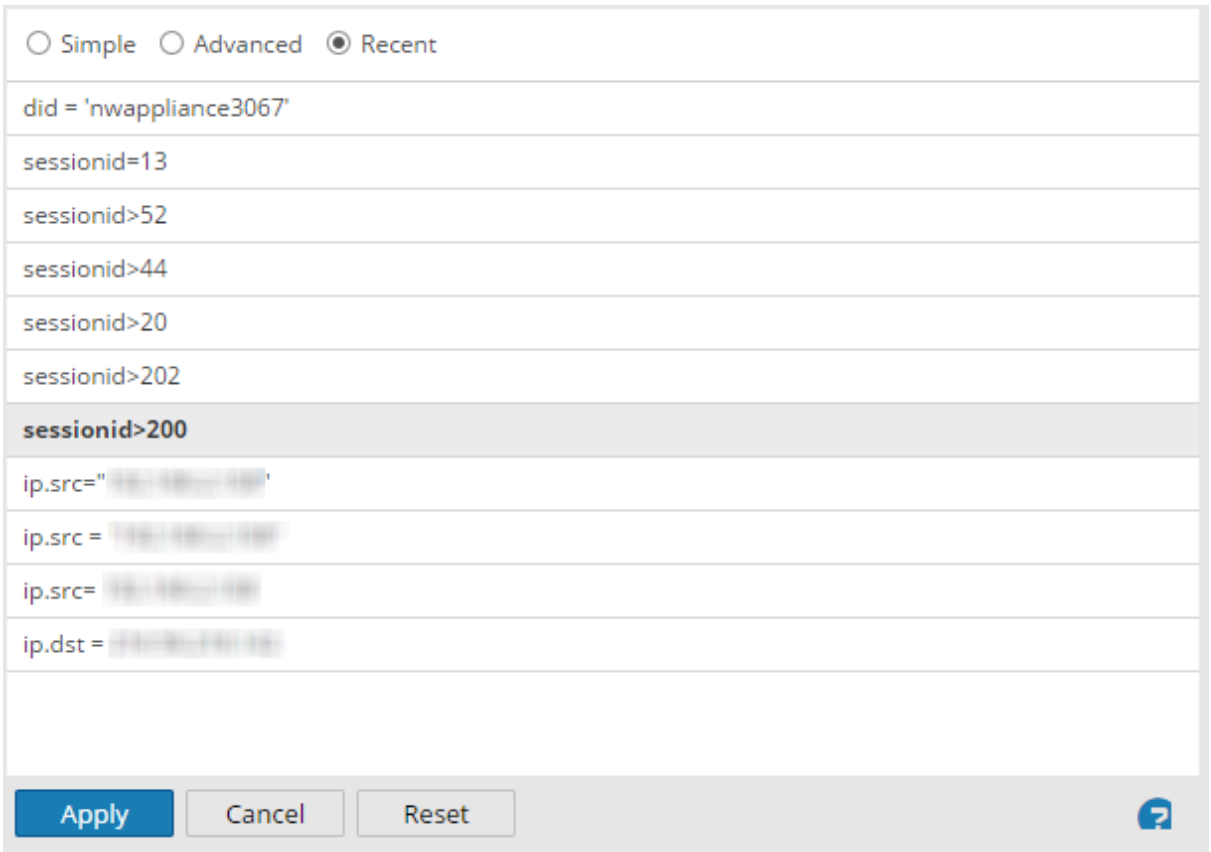
1. In the **Navigate** view or the **Legacy Events** view toolbar, select **Query.**
   The Query dialog is displayed.

2. Select **Advanced**.
   The advanced query field is displayed.

3. In the field, create a query, which can include the meta key, operator, and value. When you begin typing a meta key in the field a drop-down list of available meta keys for the selected service is displayed.
4. Select the meta key for your query.
   The display is updated. If the expression is not yet complete, the status indicates that the query is invalid.
5. Continue with an operator, from the drop-down list, then a value if necessary. The display is updated as you continue to enter the query. If you enter an operator, such as **exists** or **!exists**, which does not use the value field, the value field is disabled and the invalid status is cleared. If you enter an operator, such as =, which requires the value field, the invalid status remains until you enter a value. When the query is valid the invalid status is no longer displayed.



6. Do one of the following:
   - Click **Apply**.
     The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   - Click **Cancel**.
     The window is closed and no changes are made to the view or current query.



Apply a Recent Query

You can view recent queries and select one to apply to the current service being investigated. To select a recent query:

1. In the **Navigate view** or the Events view toolbar, select **Query.**
   The Query dialog is displayed, with the Simple option selected.

2. Select the **Recent** option.
   The list of recent queries is displayed in the bottom portion of the dialog.

3. In the list of recent queries, click to select a query.
4. Do one of the following:
   - Double-click a query.
   - Select a query and click **Apply**.
     The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   - Click **Cancel**.
     The window is closed and no changes are made to the view or current query.

Search for Text Patterns in the Navigate and Legacy Events Views

You can search for text patterns within the current set of events in the Navigate view, the Events view, and the Legacy Events view. This section provides information about searching in the Navigate view and the Legacy Events view.

You can perform a keyword text search or do regex (Regular Expression) matching. In the Navigate view, you can click a meta value, such as HTTP, to drill into the data and then enter a search string in the Search field to search for events within that subset of data. The search opens a tab in the Legacy Events view, brings your drill and time range forward, and shows your search results. You can also drill into the data using queries before starting a search. To execute the search, enter a search string in the Search box, and press **Enter** or click **Search**.

Note: By default search results are only for exact matches found in indexed data. Only meta values shown as blue links in the Events Detail view are indexed. The regex option must be selected if the value contains a space. To broaden the search change the options in the Search Events drop-down menu.

Keyword Text Search

The text search provides these capabilities:

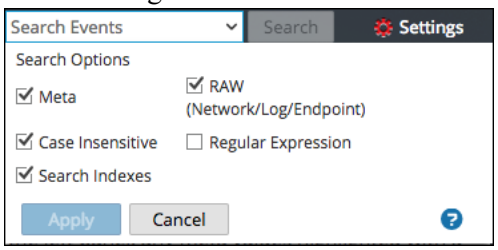
- Each white space delimited word is ANDed, so that every word must be found, but the order or location position in relation to the other words is irrelevant. For example, if you search on `Mark Albert`, both Mark and Albert must be found in the session, but they need not be together or in any specific order.
- The word OR is special. If you search `Mark OR Albert`, either Mark or Albert must be found in the session to match; both are not required.
- You can mix or match implicit ANDs and ORs together in the search string. The explicit OR has higher precedence than the implicit (whitespace) AND. The following examples make the same logical statement, which requires that both the terms cheese and dumplings be present in a match and one of toast or bread:

  ```
  cheese toast OR bread dumplings
  cheese AND (toast OR bread) AND dumplings
  ```

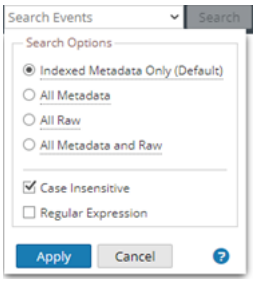
- You can exclude words from search results using the - operator. For example, searching for `cheese -toast` would return any result that has the word cheese, unless the word toast is also present.
- The keyword search can match metadata stored in the following patterns:
  - **IPv4 and IPv6 addresses**. Any term that can be recognized as an IP address is converted to the native metadata format so that it can be found in indexed metadata.
  - **IPv4 CIDR ranges**. You can use CIDR notation to locate IPv4 addresses within a range.

- **Timestamps**. Timestamps are matched against the native time metadata, and any additional time meta fields stored with the Time type.
- **Numbers**. The search function will attempt to automatically identify decimal search terms and match them against numeric meta data fields.

Options Controlling Search Behavior



To access the Search box and search options in the Navigate or Legacy Events view:



1. You can see the Search Events field in the toolbar.

> **Note:** If you cannot see the Search Events field in the toolbar, click ›› on the right side of the toolbar.

2. Click in the **Search Events** field to view the Search Options drop-down menu. In Version 11.2 and later, the menu options are slightly different. The first figure illustrates the menu for 11.1 and below; the second figure illustrates the menu for Version 11.2 and above.

The options selected in this box change how the search is executed. The default search mode is to search indexed metadata and raw data only.

> **Note:** Because the Index or Indexed Metadata Only (default) checkbox is selected by default, the search returns results based on data that is indexed. If you want to search for a complete set of metadata or raw data, select those checkboxes and clear the Index or Indexed Metadata Only (default) checkbox. This type of search takes longer, but it contains a more complete set of data.

The following table describes the Investigation search options.

Feature	Description
Indexed Metadata Only (default) checkbox (Version 11.2 and later) **Index** radio button (Version 11.1)	This search only returns results on indexed data. Searching the index is the fastest way to locate keywords within a large data set. The index search uses any relevant indexes present within your data collection. **Caution:** Substring matches are not located by index searches. If you require substring matches, clear this checkbox and use a non-index search mode.
All Metadata radio button (Version 11.2) **Meta** checkbox (Version 11.1)	Searches the metadata. Your keyword or regex pattern is matched against any parsed metadata.
All Raw radio button (Version 11.2 and later) **RAW** (Network/Log/Endpoint) checkbox (Version 11.1)	Searches the network, log, and endpoint event text. Every event is decoded and content is searched for matches on the keyword or regex pattern. If you select all data with no filters on an Archiver, execution time may be excessive and a warning may be displayed. **Caution:** Searching raw network sessions causes sessions to be decoded, which is very time intensive. You may want to disable raw searches when looking at network-only collections.
All Metadata and Raw radio button (Version 11.2)	Searches the metadata and the log or event text. This option is a combination of two options in Version 11.1: Meta and RAW (Network/Log/Endpoint), which you could select together. In Version 11.2, you can select only one radio button.
Case Insensitive	Ignores case when searching.
Regular Expression	Searches using a Perl regular expression, rather than text. By default executes a text search. To execute a regular expression search, select the Regular Expression option. **Caution:** - Regular expression searches can be very slow. - When combining regular expressions and index search options, the regular expression pattern is matched against unique index values instead of meta values. This produces results faster, but it is not an exhaustive search of all the metadata or raw data.
Apply	Sets the default search options to apply to a search in the Navigate and Legacy Events views. This also updates your Investigation preferences in your Profile (Profile > Preferences > Investigation tab). The preferences are saved and effective immediately. You can select search options to use for a particular search without changing your default search preferences.

Regular Expression Search Syntax

A regular expression search uses Perl regular expression syntax, which is documented in detail in http://perldoc.perl.org/perlre.html.

Raw Text Keyword Search

The Log Decoder has the capability to create a raw text index for unparsed log events. This functionality creates metadata items that form a full-text index on downstream services such as Concentrators and Archivers. When you enable the Search Indexes option in your search preferences, your search automatically uses the text index. Note that the text index produces meta items that have a coarse granularity. For example, the default text indexer configuration truncates text terms. By comparing the index matches against raw data, the search engine will find accurate results for your search. However, you can improve search times by disabling the raw search checkbox. If you do so, results will be returned faster, but you may see false positive hits in your search results.

Search Procedures

Search in the Navigate View

To search within the currently displayed data in the Navigate view:

1. Type a search string in the Search field and press **Enter** or click **Search**.
2. To clear the search box and return to the previous Navigate view with results unfiltered by the search, click the **X** in the search box.

Search in the Legacy Events View

To search within the currently displayed data in the Legacy Events view:

1. Type a search string in the Search box, and press **Enter** or click **Search**.
   The search results are displayed. Events that match the search criteria are displayed in the events list. In the Details view and List view, matches are highlighted in the Details column. In addition, when searching RAW, matches are highlighted in the Log view Logs column.
2. If you want to narrow the search, change the query and time.
3. If you want to stop the search and return to the Legacy Events view, click **Cancel**.
   Any results that are displayed remain.
4. To clear the search box and return to the normal Events view, click **X** in the search box.

View and Modify Queries Using URL Integration

NetWitness Investigate includes an External URL Integration that facilitates integration with third-party products by allowing a search against the NetWitness architecture. By using a query in a URI, you can pivot directly from any product that allows custom links, into a specific drill point in the Investigate view. This integration provides an internal presentation of the user's query.

URL Integration allows the user to identify the service either by the host id or by the service and port, as defined in NetWitness. If NetWitness is unable to resolve the service, the analyst is redirected to the Navigate view, showing the Service selection dialog. Once the service is selected, the Navigate view is loaded with the drill point, defined by the query.

Service Id Known

When the ID of the service to use for an investigation is known, the format for entering a URI using a URL-encoded query is:

```
http://<sa host:port>/investigation/<deviceId>/navigate/query/<encoded query>/date/<start date>/<enddate>
```

where

- `<sa host: port>` is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is needed only if access is configured over a non-standard port through a proxy.
- `<deviceId>` is the internal Service ID in the NetWitness instance for the service to query against. The service ID can be represented only as an integer. You can see the relevant service ID from the URL when accessing the Investigate view within NetWitness. This value changes based on the service being connected to for analysis.
- `<encoded query>` is the URL-encoded NetWitness query. The length of query is limited by the HTML URL limitations.
- `<start date>` and `<end date>` define the date range for the query. The format is `<yyyy-mm-dd>T<hh:mm:ss>Z`. The start and end dates are required. If no date is provided then the user defaults for that service are used. Relative ranges (for example, Last Hour) are not supported. All times are run as UTC.
  For example:
  `http://localhost:9191/investigation/12/navigate/query/alias%20exists/date/2012-09-01T00:00:00Z/2012-10-31T00:00:00Z`

Host and Port Known

When the host and port of the service to use for investigation is known, the format for entering a URI using a URL-encoded query is:

```
http://<sa host:port>/investigation/<device host:port>/navigate/query/<encoded query>/date/<start date>/<enddate>
```

where

- `<sa host: port>` is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is needed only if access is configured over a non-standard port through a proxy.
- `<device host:port>` is the host and port of a service defined in the NetWitness instance for the service to query against. NetWitness attempts to resolve the host and port as a service ID defined in NetWitness.
- `<encoded query>` is the URL-encoded NetWitness query. The length of query is limited by the HTML URL limitations.
- `<start date> and <end date>` define the date range for the query. The format is `<yyyy-mm-dd>T<hh:mm:ss>Z`. The start and end dates are required. If no date is provided then the user defaults for that service are used. Relative ranges (for example, Last Hour) are not supported in this version. All times are run as UTC.
  For example:
  `http://localhost:9191/investigation/concentrator:50105/navigate/query/alias%20exists/date/2012-09-01T00:00:00Z/2012-10-31T00:00:00Z`

Examples

These are query examples where the NetWitness Server is 192.168.1.10 and the deviceID is identified as 2.

All activity on 03/12/2013 between 5:00 and 6:00 AM with a hostname registered

- Custom Pivot: `alias.host exists`
- `https://192.168.1.10/investigation/2/navigate/query/alias%2Ehost%20exists/date/2013-03-12T05:00:00Z/2013-03-12T06:00:00Z`

All activity on 3/12/2013 between 5:00 and 5:10 PM with http traffic to and from IP address 10.10.10.3

- Custom Pivot: `service=80 && (ip.src=10.10.10.3 || ip.dst=10.0.3.3)`
- Encoded Pivot Dissected:
  - `service=80 => service&3D80`
  - `ip.src=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3`
  - `ip.dst=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3`
  - `https://192.168.1.10/investigation/2/navigate/query/service%3D80%20%26%26%20%28ip%2Esrc%3D10%2E10%2E10%2E3%20%7C%7C%20ip%2Edst%3D10%2E10%2E10%2E3%29/date/2013-03-12T17:00:00Z/2013-03-12T17:10:00Z`

Additional Notes

Some values may not need to be encoded as part of the query. For example, commonly the IP src and dst is used for this integration point. If leveraging a third-party application for integration of this feature, it is possible to reference those without encoding applied.

Create a Future Alert from Events View

From NetWitness Platform XDR 12.3 or later, Administrators can create an alert rule from the **Investigate** > **Events** page for any suspicious activity. You can create rules with a flexible query that covers a wide set of events and system information from your network, including suspected breach activities and misconfigured servers. Once the rule is applied to a matched policy with services (Decoders), it generates alerts whenever a match occurs and helps analysts with further investigation.

Workflow

As you identify specific activities (user's accounts, IP addresses, and domains, etc) that indicate a threat, you can create an application rule for the specified meta value that can alert you when the behavior is detected. Once the alert rule is created, the rule will be applied to matching policies with services (Decoders) managed by CCM. The rule begins to monitor the incoming data stream for any new matches in real-time. If any condition is matched for the specified meta value, an alert is generated on the **Respond** page, and you can drill down into each alert to view specific policy violations and take necessary action.

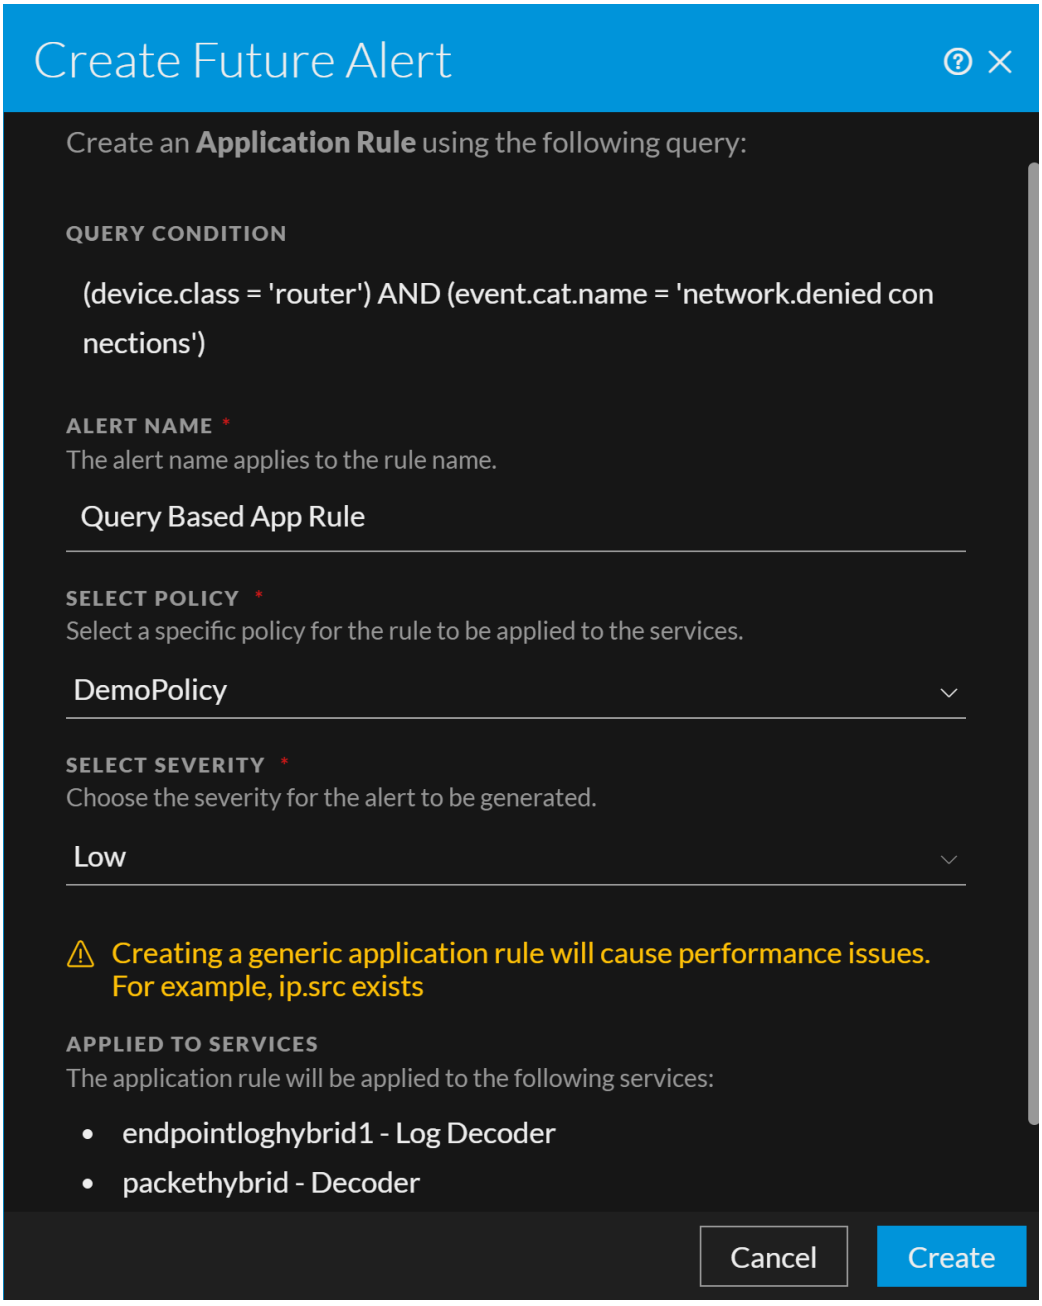
IMPORTANT: The **Create Future Alert** option will be enabled for users only if the Decoder services are managed by Policy-based Centralized Content Management and the user has the **investigate-server.alert.manage** permission enabled.

Prerequisites

- A query must be added before creating an alert rule.
- By default, only administrators are allowed to create alert rules. To enable access for analysts, they must contact their administrators.

Note: An administrator must enable **investigate-server.alert.manage** permission and **source-server.centralpolicy.manage** permission on the source server and **rules.manage** permission on the core devices to allow analysts to create the application rules.
For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

Note:
- You cannot create an alert rule with a free-format query or text query.
- You cannot create an alert rule using invalid queries.
- To ensure your rules raise alerts efficiently and do not overload your Alerts list on the Respond page or cause system performance issues, NetWitness recommends you not to create a generic application rule. For example, **ip.src exists**



To create an Alert rule

1. Log in to the NetWitness Platform XDR.
2. Go to **Investigate** > **Events**.
3. Create a query that consists of one or more filters that contain a meta key, operator, and optional value. For example, (***device.class = 'router') AND (event.cat.name = 'network.denied connections'***)

Note: If the rule's query condition is not defined in the search bar, the **Create Future Alert** option will be disabled.

4. Click  > **Create Future Alert**.

   The **Create Future Alert** dialog is displayed.

5. Specify a descriptive Name to identify the alert or leave the default name that is automatically populated using the format **Query Based App Rule**.

   It is helpful in finding a rule created by analysts among many rules.

Note: The same name is applied to the application rule, and the rule name must be unique.

6. Select a specific policy for the application rule from the drop-down list.

IMPORTANT: If the policy has no associated groups, services, or services not managed by CCM, then no policy will be available. In such cases, you must contact your administrators.

Note:
- The rule that generates this alert is added to a list of existing rules available in the Content Policies library.
- The application rule will be applied to the services that match the policy criteria and will be shown on the UI. This information helps you to identify for how many services the application rule is applied.

7. Select the severity for the alert to be generated from the drop-down menu. The options are listed below:
   - Low
   - Medium
   - High
   - Critical

   Note: Severity is selected by default as Low.

8. Click **Create**.

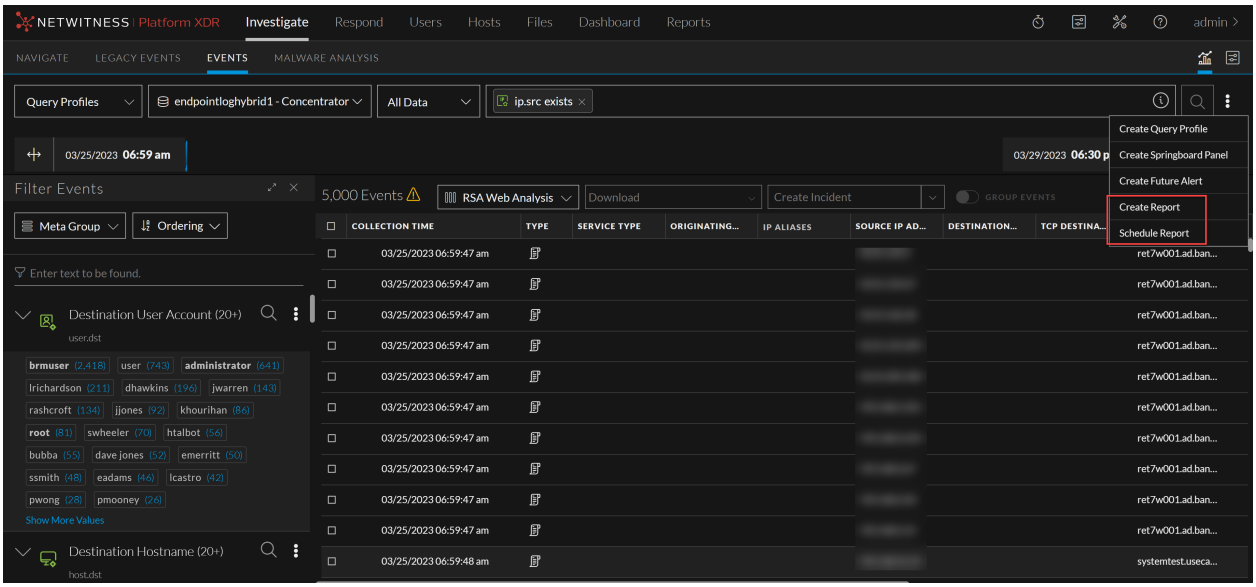
   The message is displayed that the rule is created successfully.

9. From the Success message, you can click the hyperlink "**click here**" to navigate to the policies page where the rule is applied.

Note: If you want to modify the same rule properties. Contact your administrators.

Generate Reports from Events View

From NetWitness Platform XDR 12.3 or later, administrators and analysts can directly create or schedule the reports from the **Investigate** > **Events** view. You can create a simple or complex report and configure its execution properties by scheduling a report. You can generate a report to capture details related to past, current, or predicted resource needs and schedule different time ranges to execute the same report. For example, depending on your requirement, you can schedule a report to run hourly, daily, weekly, or monthly.



For example, if you want to identify the Top Source Countries and Destination Countries, or top Threat and Risk trends that help monitor any changes to the normal categories or monitor the users and services that may potentially have malicious activities, etc.

The reports can be used for multiple purposes, such as:

- Checking and assessing network security status.

- Identifying network security issues, threats, and vulnerabilities.
- Monitoring security incidents and malware activity.

Note:
• If the administrator has not configured the time zone, the reports follow the UTC time zone by default.
• If the administrator configures the time zone under the User Preferences panel, the report follows the administrator's configured time zone. For more information, see Setting User Preferences in the *NetWitness Getting Started Guide*.
• By default, only administrators can create or schedule reports. Administrator must enable the appropriate permission for analysts to generate reports during the data source configuration. For more information, see Configure Data Source Permissions in the *NetWitness Reporting Configuration Guide*.
• A generated output report can contain up to 100 results in tabular format.
• Create and Schedule reports are available only for the users who have created them. Administrators can also give appropriate permissions to other roles to view the report under **Reports** > **Manage** > **Reports** > select the folder >  > **Permissions** > select the role > **Save**.
For more information, see Reports Permissions Dialog in the *NetWitness Reporting User Guide*.

For more information, see the following topics:

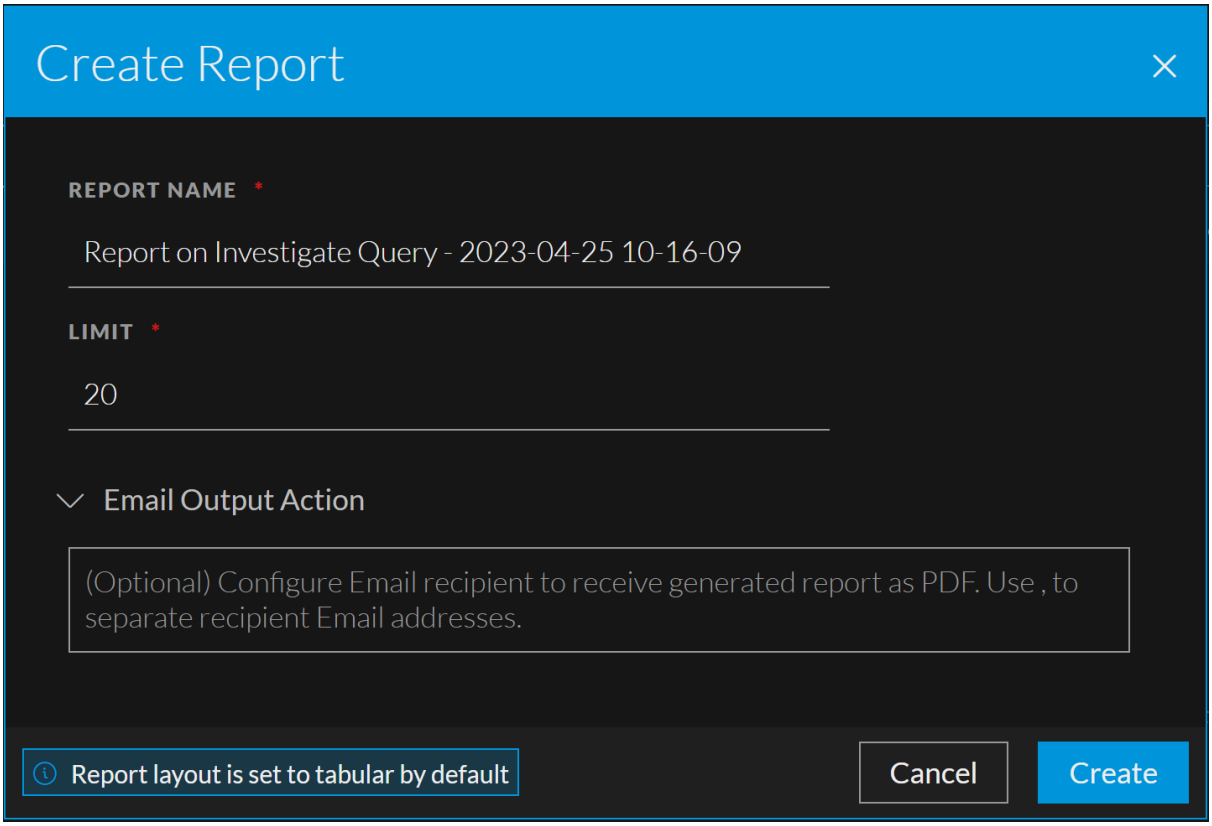
- Create a Report.
- Schedule a Report.

If you encounter any problems while generating the reports, see **Investigate Events Reporting Issues** section under Troubleshooting NetWitness Investigate.

Create a Report

The Create Report dialog enables you to create a report instantly. You must select a data source, time range, and a query on the filter to create a report.

Note: For Instant report generation, you can select the time range required from the **Time Range** drop-down list next to **Service** selection. For example, Last 30 Minutes.



To create a Report

1. Log in to the NetWitness Platform XDR.
2. Go to **Investigate** > **Events**.
3. Create a query that consists of one or more filters that contain a meta key, operator, and optional value.

   Note: Once the events are displayed, you can sort the events by ascending or descending order, and the report will be generated based on the limit configured.

4. Click  > **Create Report**.

   The **Create Report** dialog is displayed.

5. The default report name with a time stamp will be displayed initially. For example, **Report on Investigate Query - 2023-02-25 10-16-09**.

Note:
• You can customize the report name as per the requirement, and the name must be unique to create a report.
• The report name must not have special characters such as / \ : * ? ” < > |.

6. In the **Limit** field, by default, the number of records is **20**. Specify the number of records to be generated that range from 1 to 100.

IMPORTANT: Ensure that the SMTP mail server is configured in order to send reports to users.

7. (Optional) Click **Email Output Action** and enter the email address to which the generated report needs to be sent.

   You can enter multiple comma-separated valid email IDs. For example, **email1@example.com**,**email2@example.com**,**email3@example.com**.

8. Click **Create**.

   The success message is displayed on the screen.

Note: The time required for reports to be generated may vary based on the amount of data. Please wait for the requested report to be created.

9. To view the report, do one of the following:

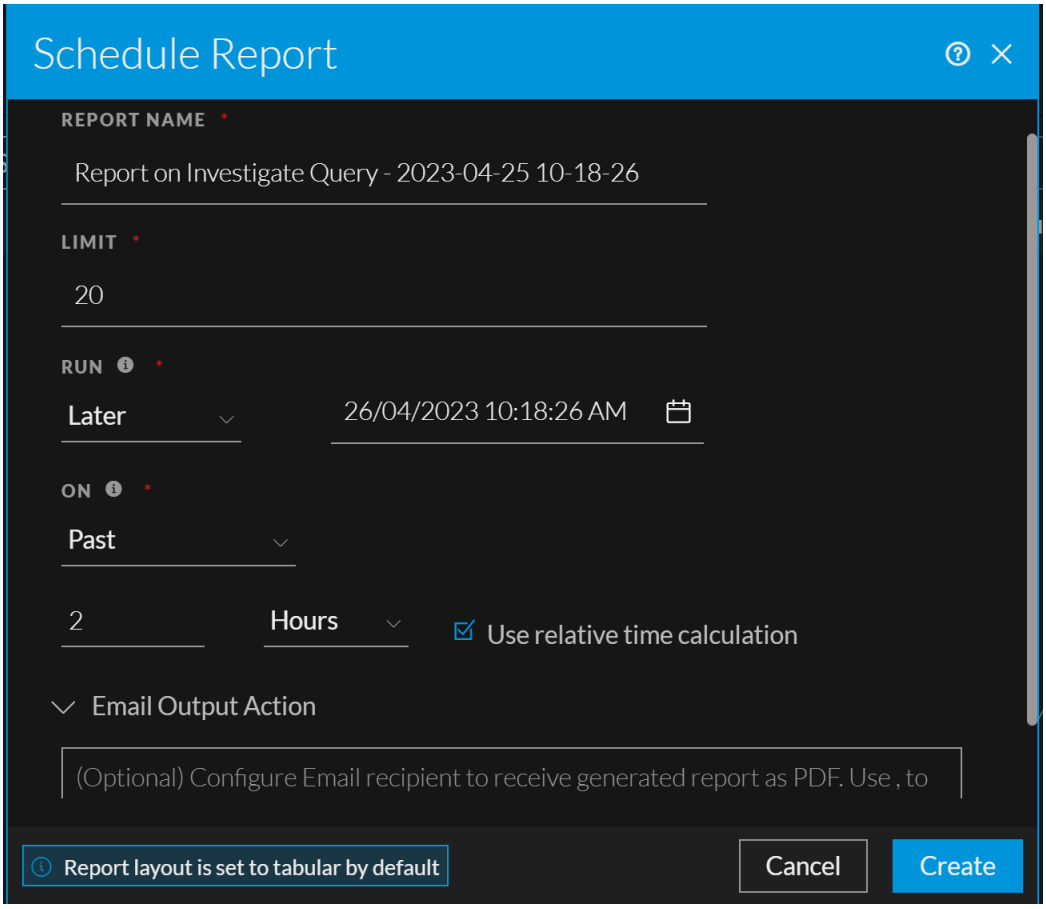
   - On the success message banner, click the hyperlink **click here** to directly open the report in the reports tab.
   - Go to **Reports** > **Manage** > **Reports** > **View All Reports**.

Note:
• You can download the report in a PDF or CSV file format for future and offline needs.
• When the report is generated, it is attached as a PDF to the email and sent to all users configured during the report creation process.

Schedule a Report

The Schedule Report dialog enables you to create a schedule for the report. Reports can be scheduled hourly, daily, weekly, or monthly. In order to schedule a report at a specific time or on a daily, weekly, or monthly basis, you must configure the scheduling options on the Schedule tab.

Note: The report will only include data from the selected time interval. You can change the interval starting with the next recurrence.



To create a Schedule Report

1. Log in to the NetWitness Platform XDR.
2. Go to **Investigate** > **Events**.
3. Create a query that consists of one or more filters that contain a meta key, operator, and optional value.

Note: Once the events are displayed, you can sort the events by ascending or descending order, and the report will be generated based on the limit configured.

4. Click  > **Schedule Report**.

   The **Schedule Report** dialog is displayed.

5. The default report name with a time stamp will be displayed initially. For example, **Report on Investigate Query - 2023-04-25 10-18-26**.

Note:
• You can customize the report name as per the requirement, and the name must be unique to schedule a report.
• The scheduling time will be displayed based on the user's time zone selected from admin User Preferences.
For more information, see Setting User Preferences in the *NetWitness Getting Started Guide*.
• The name must not have special characters such as / \ : * ? " < > |.
• If you schedule a report for a query filter, and the generated report contains a rule that did not return any values. In that case, it indicates that no data for that particular query is available.

6. In the **Limit** field, by default, the number of records is **20**. Specify the number of records to be generated that range from 1 to 100.
7. Specify the following parameters to configure the Schedule.

Depending on the type of run schedule, select one of the following:

Field	Description
Run	Time interval to use for running the scheduled job: • **Later**: If you select a **Later** run schedule, you must provide a value for the day and time in the respective field provided. • **Hourly**: If you select an **Hourly** run schedule, you must specify the minutes in the **At** Minute field. For example, if you schedule the report for 50 minutes, for every 50th minute, the report will be prepared. **Note:** A maximum of only 59 minutes can be selected. • **Daily**: If you select a **Daily** run schedule, you must enter a value in the **At** field. For example, if you schedule the report at 04:25, the report will be prepared at 04:25 AM every day. • **Weekly**: If you select a **Weekly** run schedule, you must enter a value in the **At** field and select the weekdays. **Note:** The report runs on the day of the week that the schedule begins. For example, if you schedule the report to first run on Monday, the report runs on Monday every week. • **Monthly**: If you select a **Monthly** run schedule, you must provide a value for the day and **At** field. For example, select 25 for the 25th day of the month. The report will be prepared on the 25th month of every month. **Note:** During the monthly report generation process, a message will appear if the day is greater than 28. This will notify the user that the report will be scheduled for the month containing that day.

Field	Description

ON	• **Past**: If you select the **Past** option, you can schedule the report based on **Hours**, **Days**, **Weeks**, **Months**, and **Years**. For example, if you want to schedule the report to start three days before the current date, do the following actions:
	  • Select **Past** in the **ON** field.
	  • Enter **3** in the field and select **Days** from the drop-down list.
	  This field appears only if you select **Later** in the **Run** field.
	  Note:
	  • This field appears if you select Later, Hourly, Daily, Weekly, and Monthly in the Run field.
	  • For Hourly, the maximum value allowed is 168 (24 hours x 7 days) which is counted as total hours.
	• **Range(specific)**: If you select Range(specific) option, you must provide the **From** and **To** values.
	  For example, if you want to schedule the report for a specific date and time range from 02/01/2023 12:00:00 AM to 02/15/2023 12:00:00 AM. The report runs for the data on the specified period.
	  Note: This field appears only if you select Later in the Run field.
	• **Range(generic)**: If you select **Range(generic)** option, you must provide the **From** and **To** values.
	  For example, if you want to schedule the report daily for a time range, from 04:00 to 10:00. The report runs for the data on the specified period.
	  Note: This field appears only if you select Later, Daily, Weekly, and Monthly in the Run field.

Field	Description
	Note: While scheduling a report, if you select the **Past** option or **Range(specific)/Range (generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.
Use relative time calculation	• By default, the **Use relative time calculation** option is enabled, and it uses the relative time duration to schedule a report. For example, if you schedule a report to run over the past 1 hour –1h for the relative time, the time is exactly 1 hour from when the report is run. If the current time is 3 P.M., the events that occurred in the past 60 minutes or between 2 P.M. and 3 P.M. today. • You can deselect the option and schedule a report. For example, if you schedule a report to run over the past 3 hours, it will take the past 3 hours, excluding the current time. If the current time is 6:30 P.M., the events occurred from when the report was scheduled or between 3 P.M. and 6 P.M. today.

IMPORTANT: Ensure that the SMTP mail server is configured in order to send reports to users.

8. (Optional) Click **Email Output Action** and enter the email address to which the generated report needs to be sent.

   You can enter multiple comma-separated valid email IDs. For example, **email1@example.com**,**email2@example.com**,**email3@example.com**.

9. Click **Create**.

   The success message is displayed on the screen.

   Note: The time required for reports to be generated may vary based on the amount of data. Please wait for the requested report to be created.

10. To view the report, do one of the following:

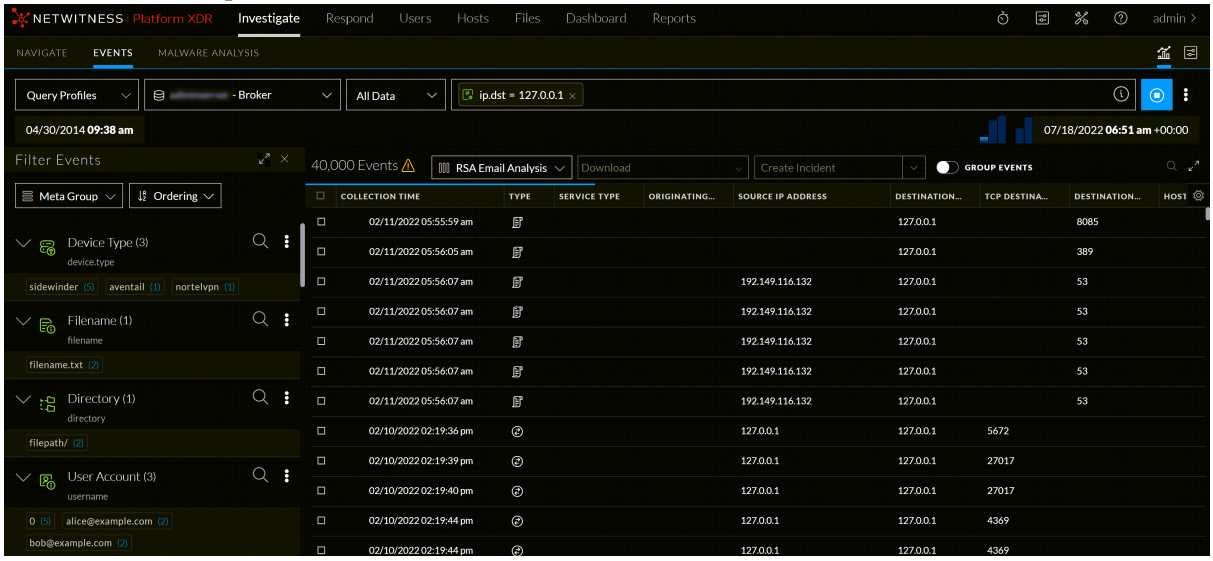
- On the success message banner, click the hyperlink **click here** to navigate to the reports tab and open the generated report.
- Go to **Reports** > **Manage** > **Reports** > **View All Reports**.

Note:
• You can download the report in a PDF or CSV file format for future and offline needs.
• When the report is generated, it is attached as a PDF to the email and sent to all users configured during the report creation process.

Reconstructing and Analyzing Events

Having refined events in the Navigate view or in the Events list as described in Refining the Results Set, your next step is to learn more about the events by reconstructing them, looking at attachments, and viewing additional context in third-party lookups or internal lookups.

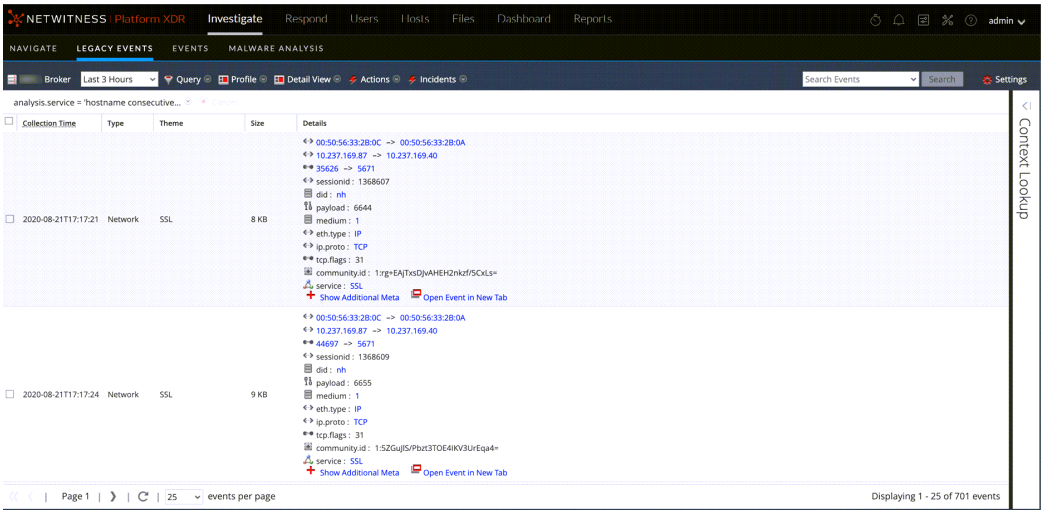
Reconstructions are done in the Events view or the Legacy Events view. If you are starting from the Navigate view, you need to go to the Events view or the Legacy Events view to see a reconstruction.



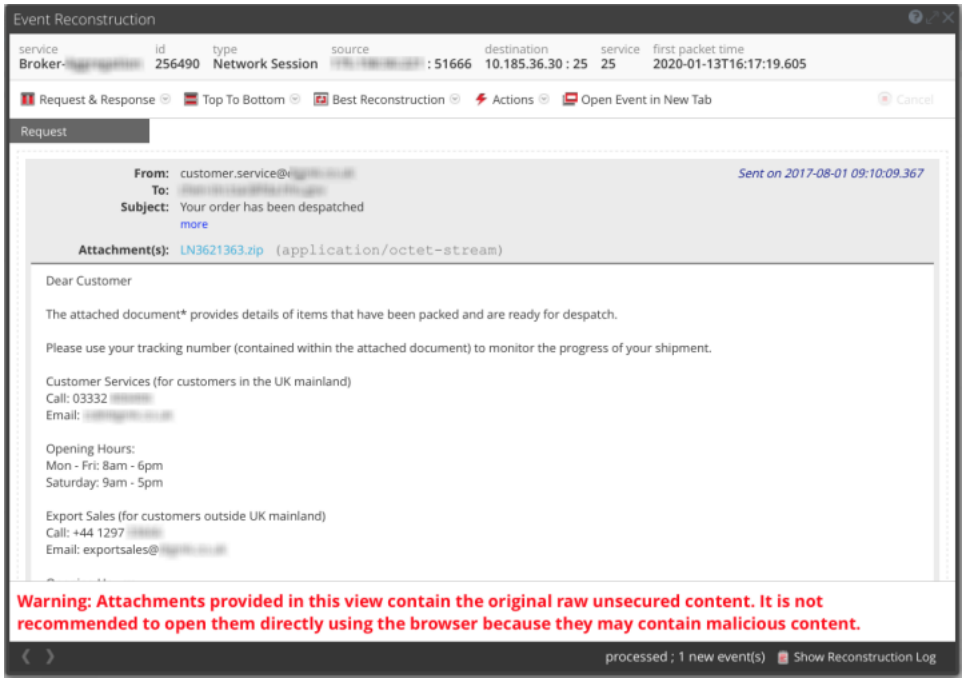
Note: The Legacy Events view is disabled by default. The administrator can enable the view as described in "Configure Investigation Settings" in the *System Configuration Guide*.

To display events in the Events view, do one of the following:

1. Go to **Investigate** > **Events**.
2. Go to **Investigate > Navigate** (Version 11.5 and earlier), right-click the meta count for a meta value (the meta count is in green text). When the context menu is displayed, select **Open Events in new tab**.



The Events view opens with a list of events for the selected meta value.



For detailed information about the types of reconstruction and analysis that you can use in this view, see Examine Event Details in the Events View.

To display an event in the Legacy Events view, do one of the following:

1. To open the Legacy Events view using the default query for the default service, go to **Investigate** > **Legacy Events**.(This option is available only if the administrator has enabled the view.)
2. To view events for a specific meta value in the Legacy Events view, go to **Investigate > Navigate** and when events are loaded in the Values panel, click a meta count (the meta count is in green text). You can also right-click the meta count for a meta value. When the context menu is displayed, click **Open Legacy Events in new tab**.
   The Legacy Events view displays the events for the selected meta value. The Legacy Events view provides three built-in presentations of event data: the Detail view, the List view, and the Log view. This figure is an example of the Detail view. You can use queries, the time range setting, and profiles to filter the events listed in the Legacy Events view. You can extract files, export events, export logs, and open the Event Reconstruction panel by double-clicking an event. See Downloading and Acting Upon Results for detailed information about these capabilities.
   NetWitness runs a default query on the last three hours for the default service (if one is set) or displays a dialog in which you can select a service and then runs the default query. The default query selects all events and the Events view displays events on the selected service, with the oldest events first.

3. To view a reconstruction of the first event in the list, double-click the event.
   The reconstruction opens in a pop-up window in front of the Events list.

Examine Event Details in the Events View

When you find an interesting session in the **Navigate** view or the **Events** view > **Filter Events** panel, you can see the list of sequential events for the session in the Events view > Events panel. Clicking an event in the list opens the Network Event Details panel for that type of event: Network Event Details, Log Event Details, or Endpoint Event Details. Within the Event Details panel, you can select a tab that shows an event reconstruction (text, packet, file, email, and web) or (Version 11.5 or later) the tab that shows host information for network events that are enriched with endpoint data.

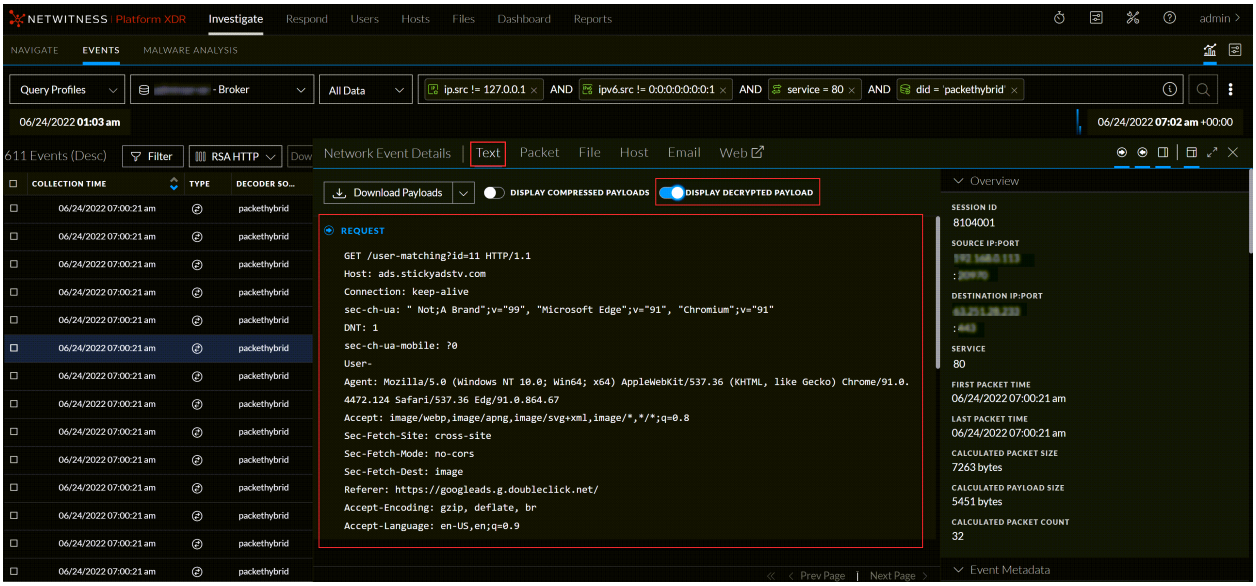
Note: (Version 11.5 or Later) For expanded network visibility of existing network events in your network (packet) deployment. Network events are enriched with endpoint data namely the host and process that triggered the network event and other details such as user name, risk score, reputation, and so on.
You can view endpoint data in the following ways:
- (Quick View) **Investigate** > **Events** - Event Summary Header
- (Detailed View) **Investigate** > **Events** > **Host**

For more information to enable expanded network visibility, see "Creating Groups and Policies" in the *Endpoint Configuration Guide*.

Note: For expanded network visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

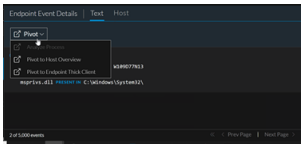
Event Details for Each Event Type

Within the Event Details panel, different tabs are available per event type as shown in the following table. Procedures for working in the Event Details panel are provided in Analyze Events in the Events View.



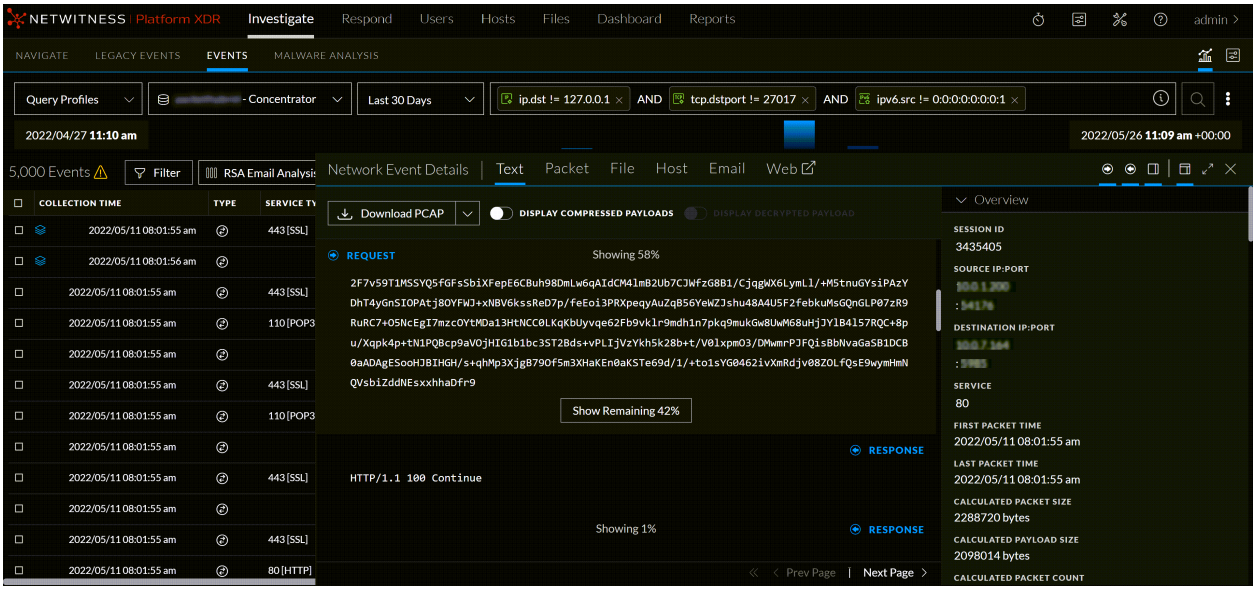
Action	Network Event	Log Event	Endpoint Event
View the text reconstruction (default unless last selected overrides)	✓	✓	✓
View the file reconstruction	✓		
(Version 11.5 or Later) View the host Information for an Endpoint Agent configured with expanded network visibility (see Host Information.	✓		
View the packet reconstruction	✓		
View the email reconstruction	✓		
View the web reconstruction in the Legacy Events view (see Reconstruct an Event in the Legacy Events View)	✓		

Each tab has settings to enhance your analysis. If you change a setting, the setting is preserved between browser refreshes and logins within the same browser. These are the preserved settings:

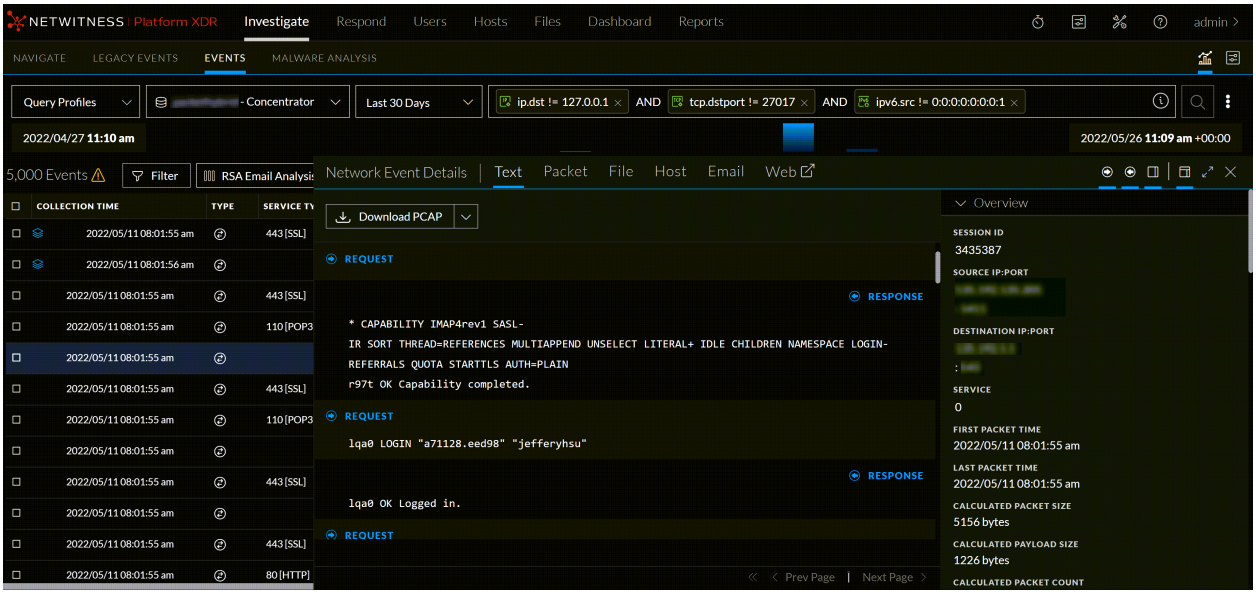


- The currently selected reconstruction: Text, Packet, File, (Version 11.5 and later) **Host**, or Email.
- Whether the Event Meta panel is open or closed.
- Whether the Event header is open or closed.
- Whether the Request or Response, or both are displayed.
- Whether packet payloads are displayed without the headers in the packet reconstruction.
- Whether shaded bytes are displayed in the packet reconstruction.
- Whether other common file types are highlighted in the packet reconstruction.
- The number of packets per page in the packet reconstruction.
- Whether compressed or uncompressed text is displayed in the text reconstruction.

Text Reconstruction

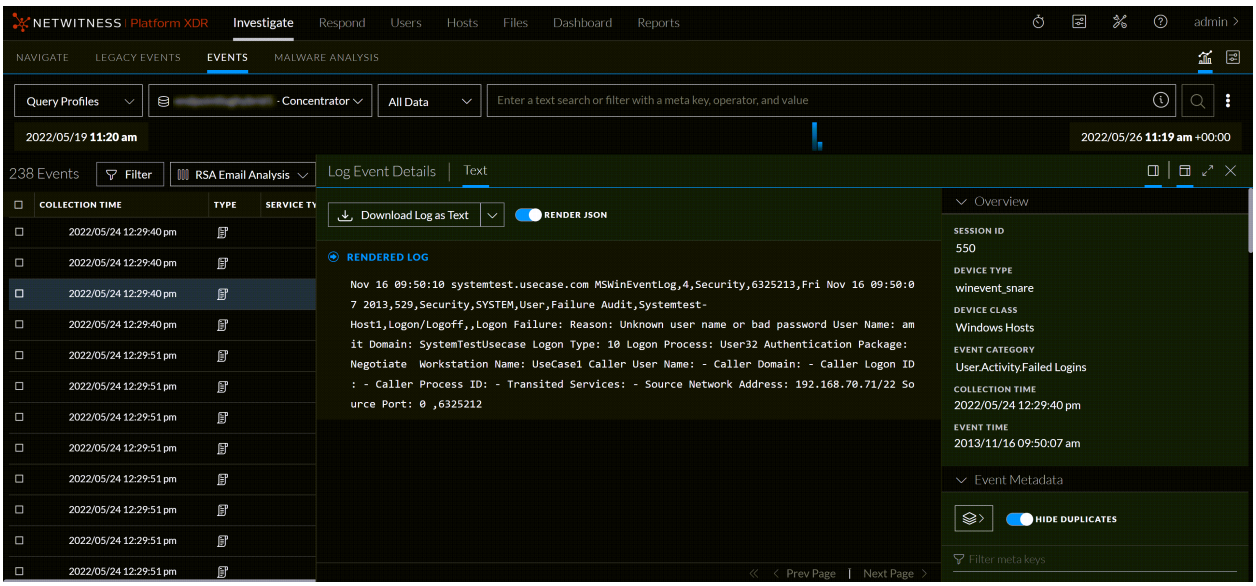


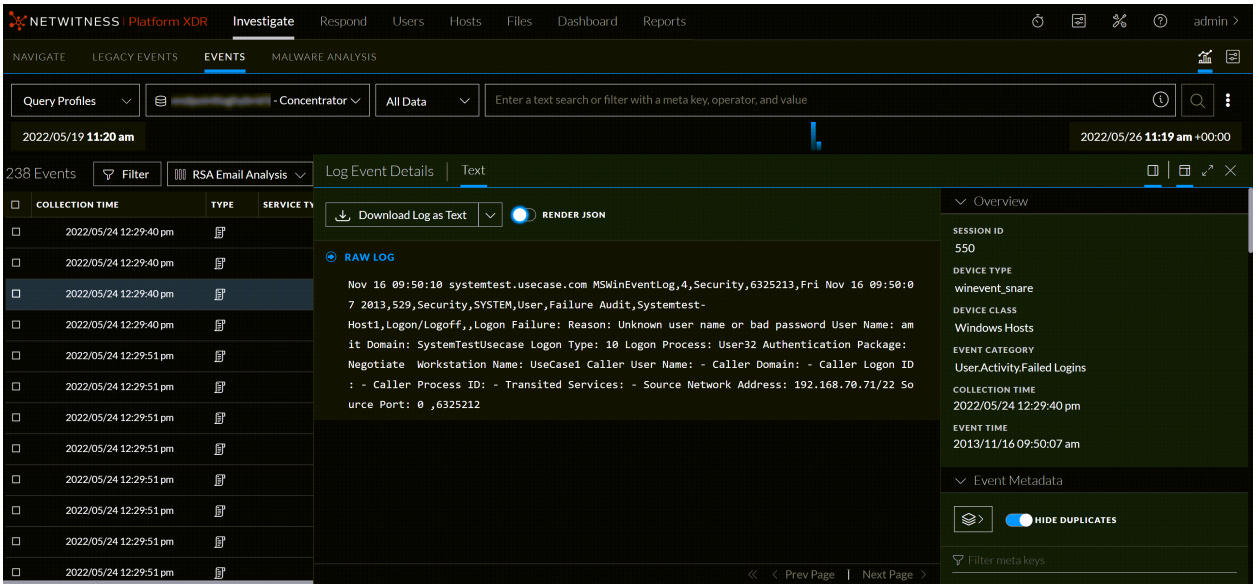
In 12.0 and later, analysts can directly view an encrypted data in a decrypted format by switching on a toggle option **Display Decrypted Payload**. However, the data can be displayed in the decrypted format only if a Decoder service in the **Events** > **Text** tab, has a TLS key available. This feature enables the analyst to focus on the important data in less time and perform investigations on the selected events with optimum accuracy and quality.



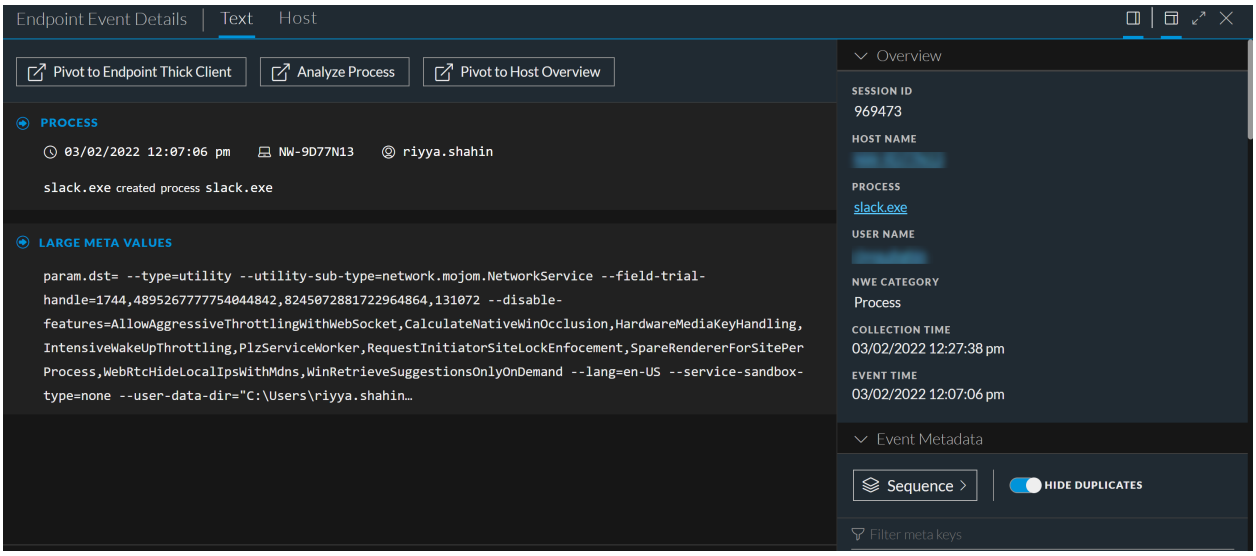
For Endpoint Events Details, the Pivot options available under Text analysis page has been replaced with a Pivot dropdown menu that contains the three options to perform further investigation.

You can view all types of events (network events, log events, and endpoint events) in their original text format in the Text tab. The text reconstruction for some network events can be quite large. To ensure the best rendering, an excessively large payload is truncated to fit. If a single reconstructed request or response in the reconstructed event exceeds the maximum number of bytes, the header indicates what percentage of bytes is shown. Pagination controls add flexibility when paging through the reconstructed text of an event. This figure illustrates a single response that has been truncated because it exceeds the maximum number of bytes.





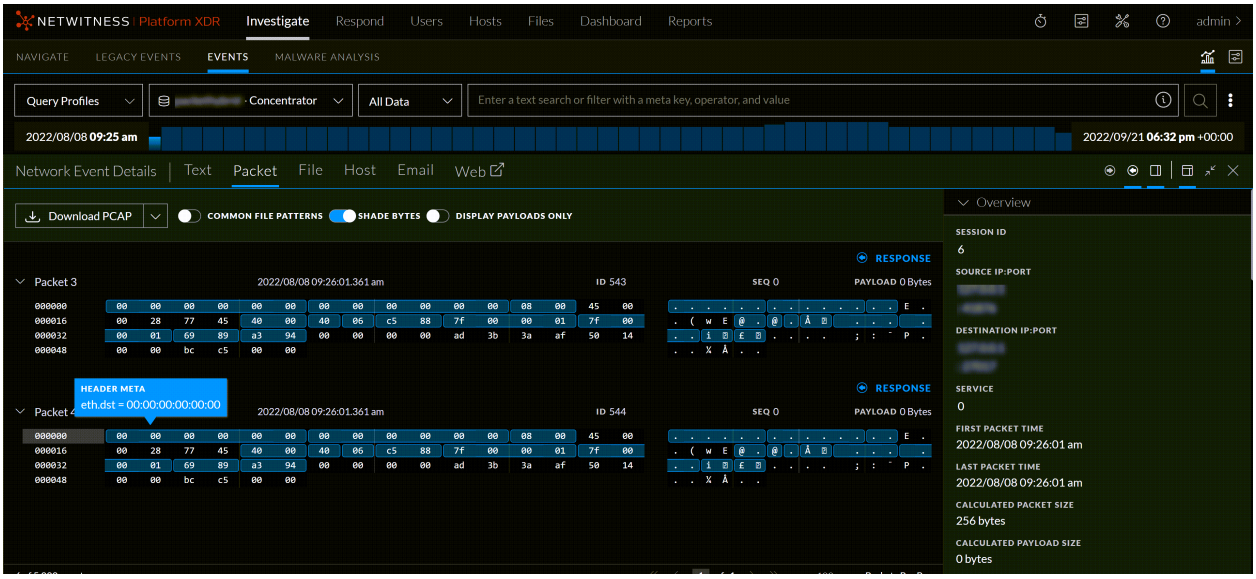
Note: Version 11.1 handles large payloads differently; the payload for a single event is limited to 2500 packets. When the packet limit is reached, a warning in the footer advises the limit has been reached and provides the total number of packets in the event. For Version 11.1, the Show More option is still available for messages that are truncated; however, the entire text of the message is not visible without downloading the raw payload.



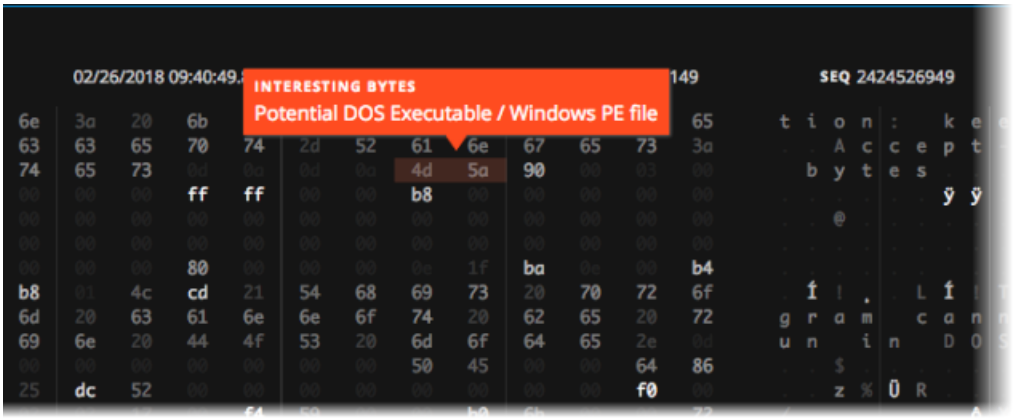
In the text reconstruction, network events, log events, and endpoint events are presented differently.

- For network events, the reconstruction provides the direction of the packet (Request or Response) and contents of each packet in text format. If you are reconstructing a network event, the text reconstruction is scrollable. When you scroll, the text identification information and the Request and Response labels remain visible rather than scrolling out of view.
- Log events and endpoint events have no request or response; only the raw event is displayed in the Text tab. Endpoint events include additional information relevant to an endpoint event.
- (Version 11.5.1) Log events that contain JSON snippets are rendered in an easily readable JSON tree view with nested indentations if the RenderJSON option is enabled.

For each type of event (network, log, or endpoint), there are differences in the Overview panel and the options for downloading the event. Below is an example of the text reconstruction for each type of event: a network event, a log event, and an endpoint event.



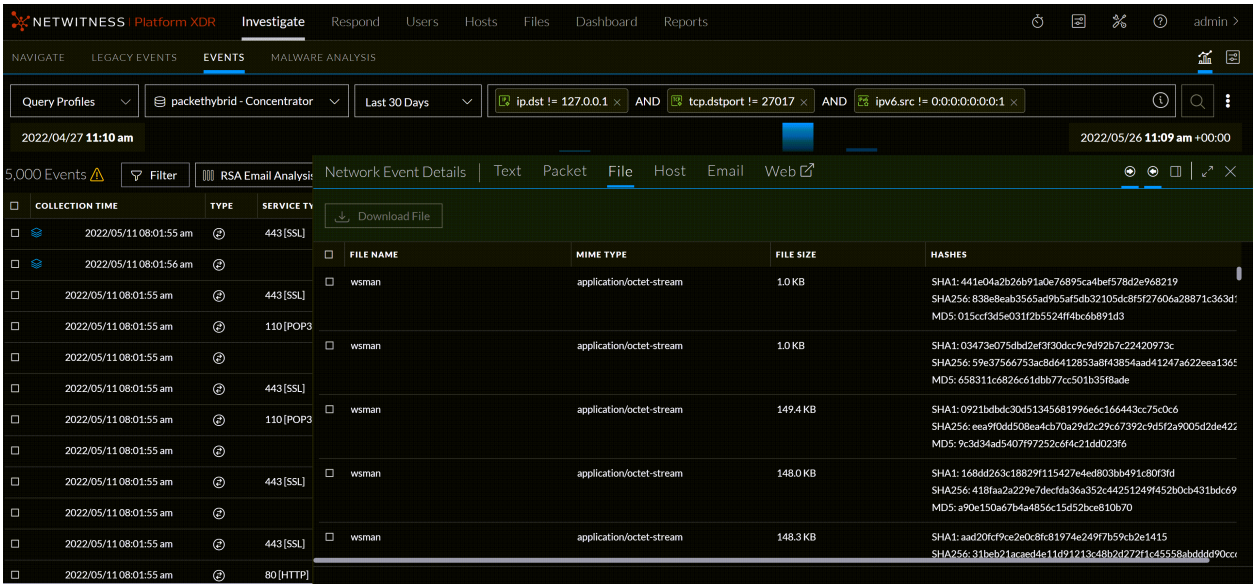
Note: The calculated packet count, calculated packet size, and calculated payload size in the Event header may be different than the same statistics in the Event Meta panel because the metadata is sometimes written before event parsing completes and may include packet duplicates.



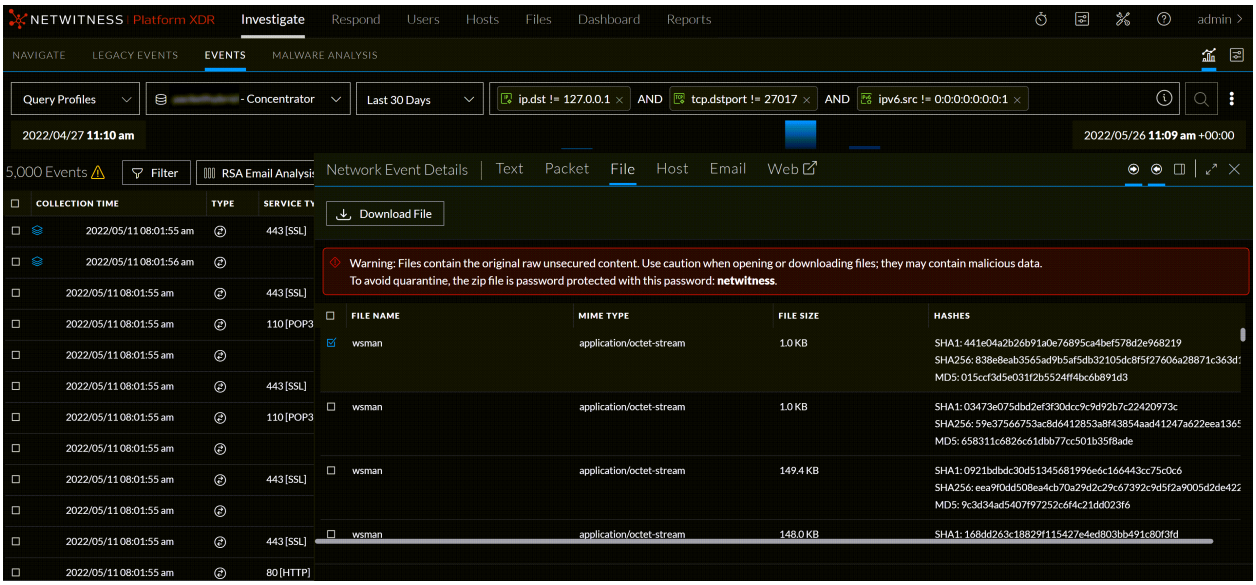
Packet Reconstruction

The packet reconstruction is for network events. The panel is scrollable, and the packet identification information and the Request and Response labels remain visible rather than scrolling out of view. In the Packet tab, the headings provide the direction of the packet (Request or Response), the packet number, the packet start time, the packet ID and the sequence, and the payload size. All packets begin with a header, and some packets have a footer. Pagination controls add flexibility when paging through packets.

The metadata in the hexadecimal and ASCII data is highlighted in blue; when you place the cursor over the highlighted metadata, the meta key/meta value information is displayed in a hover box.



Common file signatures are highlighted with an orange background. When you place the cursor over the highlighted text, the description of the file type is displayed in a hover box.



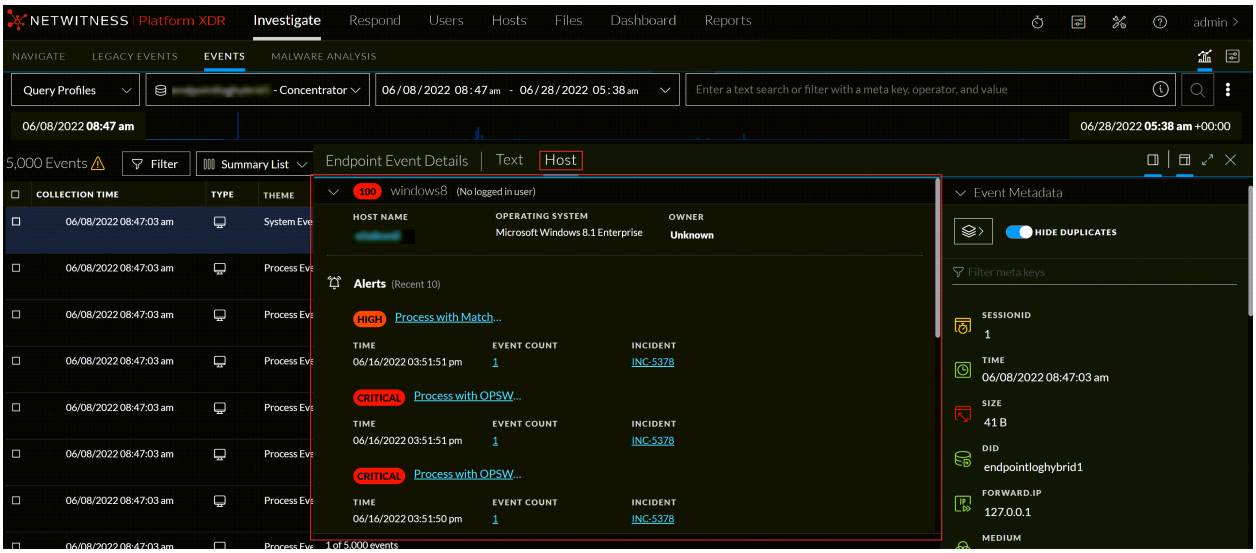
File Reconstruction

The file reconstruction shows a list of files associated with the selected network event. This is an example of the file reconstruction.

You can select one or more files, or all files, to export to your local file system. When files are selected, The Download File options becomes active and reflects the number of files selected.

Caution: Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

Host Information



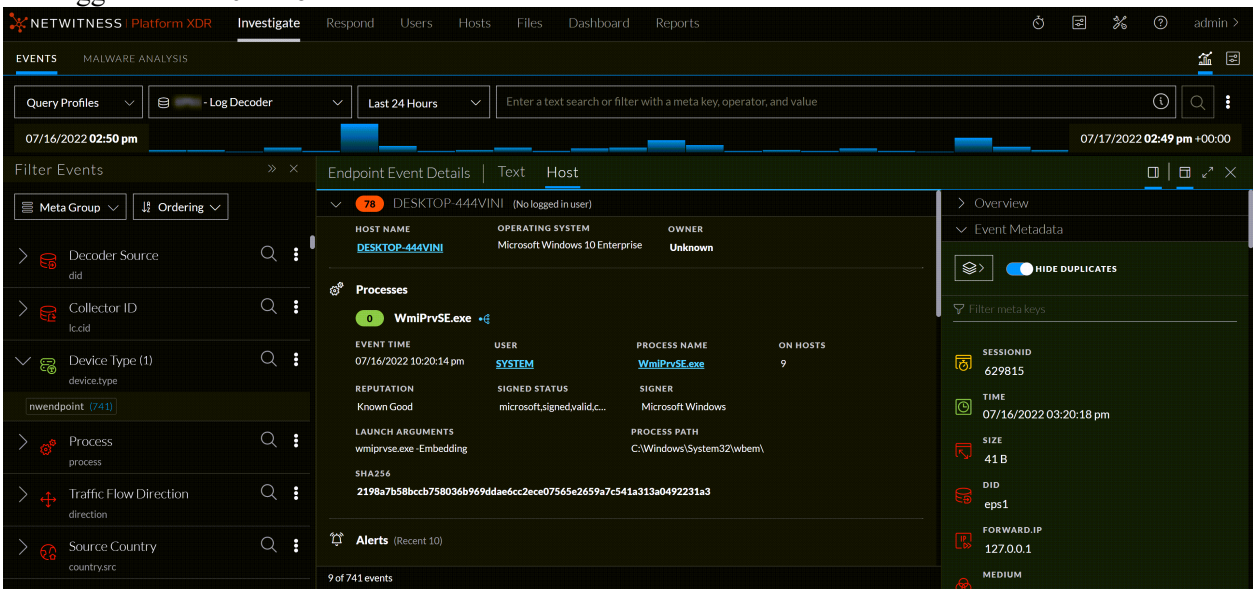
Host information is displayed for network and endpoint events with the endpoint data.

You can filter the events in the Events view using the Events Filter panel (version 11.5 and later). For more information, see Filter Results in the Events View.

Note: Endpoint data is displayed only if you have an Endpoint deployment, and the Endpoint agents are configured for expanded network visibility. For more information to enable expanded network visibility, see "Creating Groups and Policies" in the *Endpoint Configuration Guide*.

Note: For expanded network visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

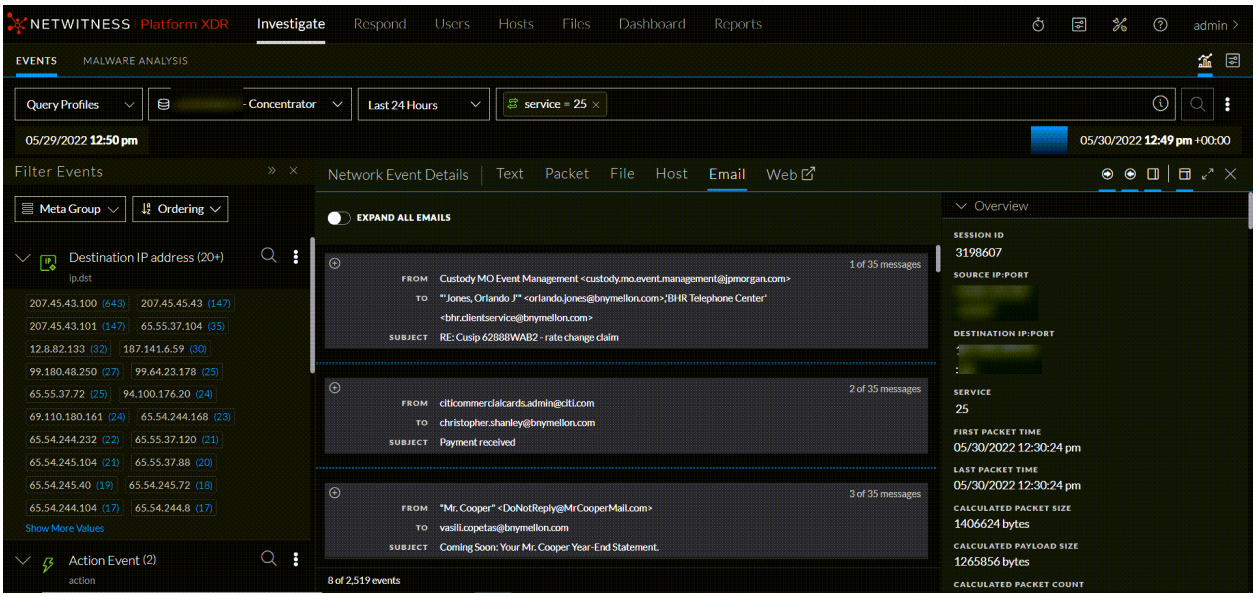
Below is the example of the host information.



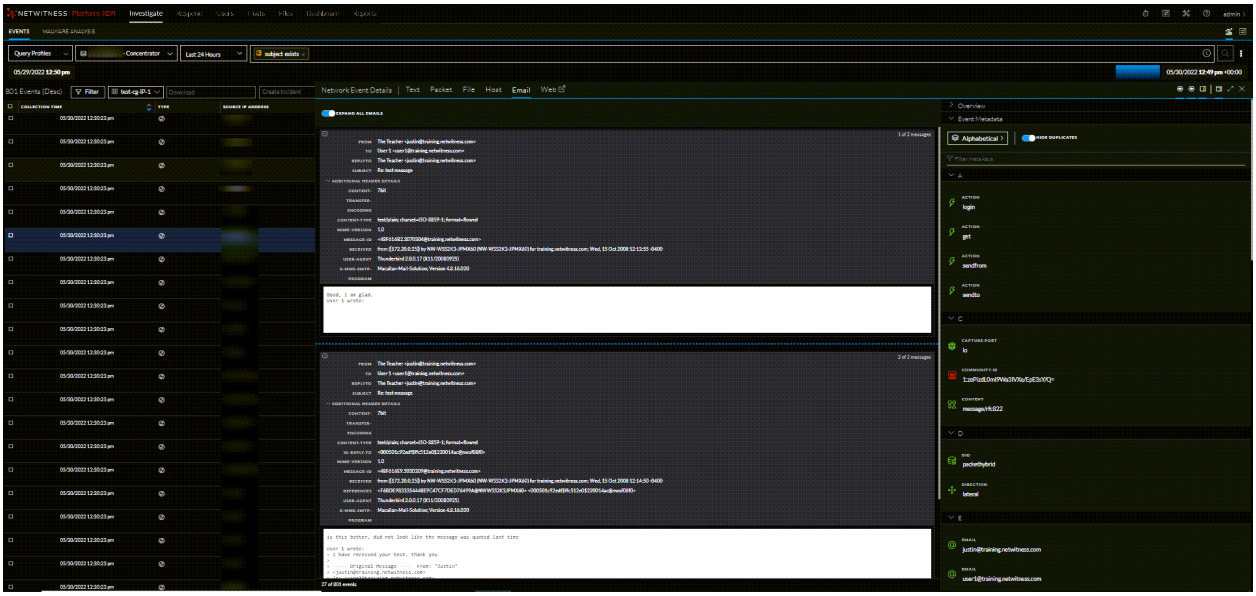
- The hosts with the closest matching process are listed in the order of event time.
- By default, the first host is expanded, and you can view additional information such as:
  - Host details – This provides details on the host's operating system and the owner (logged in user) associated with the host.
    - To investigate on the host name, click the **Host name** link highlighted in blue. For more information, see "Investigating Hosts" in the *NetWitness Endpoint User Guide*.
    - To investigate alerts associated with the user, click the **owner** link highlighted in blue. For more information, see "Investigate High-Risk Entities" in the *NetWitness UEBA User Guide*
  - Process details – This provides details like risk score, process name, reputation, event time, on hosts, signed status, process ID, signer, user, launch arguments, SHA256, and path.
    - Click to open the process tree. By default, the process tree will open the process details of last 14 days. The icon to open the process tree does not appear when the process tree is not available.
    - To investigate on the process, click the **process** link highlighted in blue. For more information, see "Investigating Files" in the *NetWitness Endpoint User Guide*.
    - To investigate alerts associated with the user, click the **user** link highlighted in blue. For more information, see "Investigate High-Risk Entities" in the *NetWitness UEBA User Guide*.
  - Alert details – It displays the recent ten alerts associated with the host. These alerts can be from endpoint, network, and log events. You can click **View All** to open the host details page. The host details page lists all the alerts that contribute to the risk score. You can click on the alert name to open the alert details. For information on how to review an alert, see “Reviewing Alerts” in the *Net Witness Respond User Guide*. This section provides the following details.
    - Severity – Displays the severity of the alert.
    - Time – Date and time when the alert was triggered.

- Event Count – It displays the number of events that triggered the alert. To view the events associated with the alert, click the **EVENT COUNT** link highlighted in blue. The **EVENT COUNT** link is available only when the events are from the same source.
- Incident – Lists the incidents associated with the respective alerts. To view the details and respond to an incident, click the **INCIDENT** link highlighted in blue. For more information, see "Responding to Incidents" in the *NetWitness Respond User Guide*.

You can hover over the meta values of the host name, process, user, owner, and SHA256 to view additional information about the specific metadata. For more information on context look up, see Look Up Additional Context for Results.



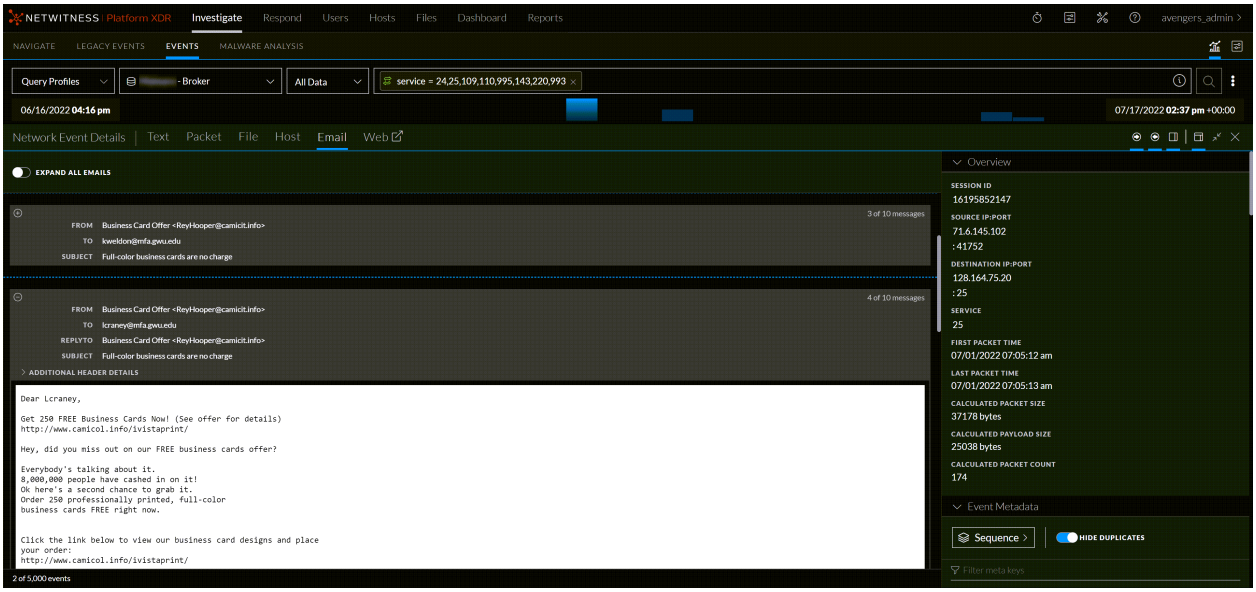
Below is an example of the Host Information tab with a single host, process, and user associated with the selected network event. The `WmiPreSV.exe` is the process associated with the host `DESKTOP-44VINI` and logged in user `unknown`.



Note: You may see multiple hosts and processes triggered for the selected network event; in such cases, the host from where the event is triggered first is listed first and then the other hosts where a similar event is triggered.
For example, if `10.63.0.240` IP address is assigned to Host1, and User1 is logged in to the machine and accessed `www.nyu.edu/` using Chrome. Meanwhile Host1 is powered off (within a span of 30 minutes), and the same IP address is assigned to Host2. The user logged in is User2 and accesses `www.nyu.edu/` using Internet Explorer. In this case, network events for the endpoint data are as follows:
- Hostname - `Host1`, `Host2`
- Process - `chrome.exe`, `iexplore.exe`
- User - `User1`, `User2`

Email Reconstruction

In 11.7 and later, if the analysts need to review all email contents in a single session, then they can click on the Expand All Emails toggle button by navigating to **Investigate** > **Events** > **Email** view.



When the Expand All Emails toggle button switched on, the email content is displayed in an expanded form.

When the Expand All Emails toggle button is switched off, the email content is displayed in a collapsed form. If there are no emails to display the toggle button is disabled.

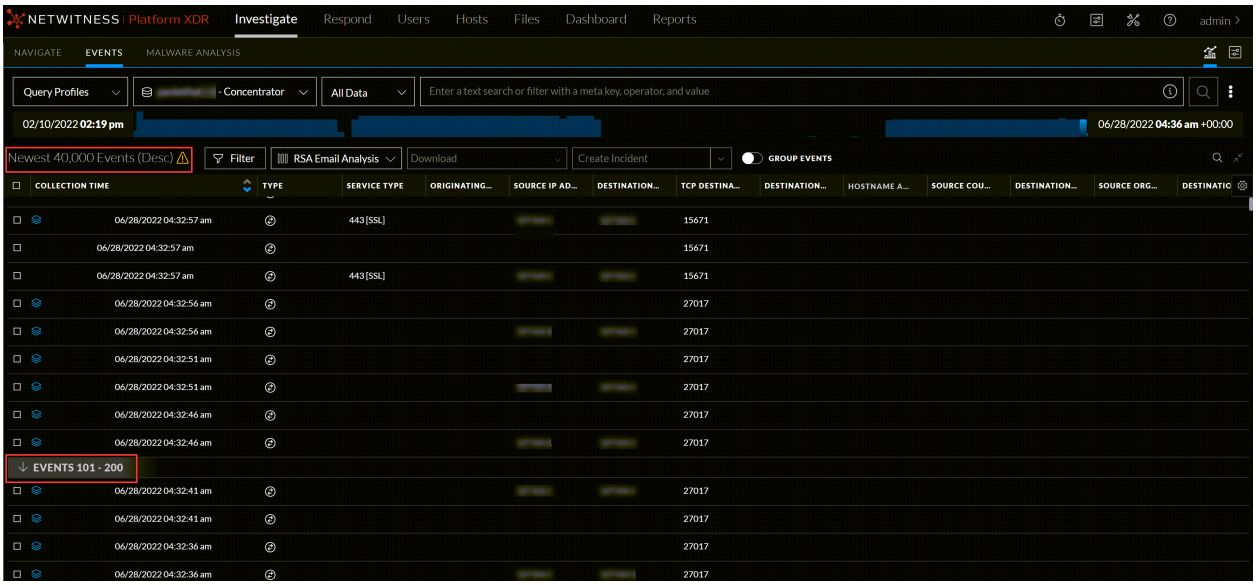
The email reconstruction shows a list of emails associated with the selected network event. This is an example of the email reconstruction.

- By default, a single email is expanded and multiple emails are collapsed.
- If an email contains attachments, you can download attachments as described in Download Data in the Events View.

  Caution: When you download and open attachments from an email, they may contain malicious data.

  An external link in an email cannot be accessed. Clicking an external link displays a **Link Address** pop-up window that provides the actual link.
- When an email body is too long, **Showing %** is displayed in the beginning of the email. To view the remaining content, click **Show Remaining %** at the bottom of the email.
- If an event contains a web email supported by the `alias.host` metadata of `mail.google.com`, `mail.live.com`, or `mail.yahoo.com`, a message is displayed with a link to view the reconstruction for the associated session in the Event Reconstruction page. If not, a "*No Email reconstruction is available for this event*" message is displayed.

Analyze Events in the Events View



Note: In Version 11.4, the Event Analysis view was renamed as the Events view, replacing the Legacy Events view as the default view analyzing events. Information regarding Events view features prior to version 11.4 also applies to the 11.3 and earlier Event Analysis view.
The Legacy Events view is disabled by default, but the administrator can enable it as described in "Configure Investigation Settings" in the *System Configuration Guide*.

After a query is submitted in the Events view, the Events panel opens with a list of sequential events. The events listed here meet two conditions:

- They match the submitted query.
- They include a value for one or more meta keys required by the selected column group. If you change the column group while viewing the Events list, the original query with the new column group is resubmitted. Unsubmitted query changes made to service, time range, or filter, are ignored.

How Results Are Loaded and Sorted

There is a configurable limit on the number of events that can be loaded; the default value is 5,000. Administrators can configure the limit as described in the *System Configuration Guide*. The events begin loading into the Events panel; a progress bar at the top of the list tracks progress while events are loaded. Events with the earliest collection time are loaded first and a row number indicator of the form " EVENTS xxx - xxx" is inserted in the list after every group of 100 events as shown in the following figure.

A spinner is displayed while the events are loaded. If that count is greater than or equal to the threshold, a message under the spinner advises that fact and directs you to the Query Console for more details. As data begins loading, the message is removed and the spinner remains until all events are loaded. When all events have loaded, one of these messages is added to the bottom of the list:

- "All events loaded."
- "Reached the 5,000 event limit. Consider refining your query."
- "Retrieved 4,000 of 5,000 events prior to query cancellation."

A message at the top of the list indicates the total number of events loaded, if the 5,000 event limit has been reached, and the sorting method in effect:

- The message when fewer than 5,000 events are listed is: "xx,xxx Events"
- The message when more than 5,000 events are listed is: "Oldest 10,000 Events (Asc)"

If the number of events that match the query exceeds the limit of 5,000 events, the newest or oldest 5,000 events in the time window are loaded in ascending order. The portion of events loaded is based on the sort order. For example, if 300,000 events match your query and the sort sequence is set to Ascending, the oldest 5,000 events are loaded by default. You can change this by changing the sort order to Descending and the newest 5,000 events are loaded. Ascending sort, which loads the oldest events first is usually the best setting for investigating network events. If you want to view the newest 5,000 events in the time window, you can change the Default Event Sort Order to Descending in the Event Preferences dialog.

The sorting method for the list is configured in the Event Preferences dialog (see Configure the Events View). Any change in the setting goes into effect the next time you submit a query. The Default Event Sort Order from the Events Preferences dialog is saved in the database and persists after logging out and logging back in.

- **Unsorted** (default for Version 11.4.1): To list events as processed by the Core services. Unsorted is faster because it streams back the events as soon as a match is found versus waiting for all Core services to respond and then displaying them in the chosen order.
- **Ascending** (default for Version 11.4 and earlier): To list the events with the earliest collection time first. The earliest collection time first is well suited to most investigations. When investigating logs, you may want to change the sort sequence to latest collection time first.
- **Descending**: To list the events with the latest collection time first. The latest collection time first is often useful for investigating logs.

Actions to Refine the Events List

When the results are loaded in the Events panel, you can take the actions to refine the list:

- Select a column for sorting events (Use Columns and Column Groups in the Events List).
- Select a set of meta keys (column group) that help with a specific type of investigation (Use Columns and Column Groups in the Events List).
- Apply a query profile (Use Query Profiles to Encapsulate Common Areas for Investigation).
- (Version 11.5) Filter events by pivoting through the metadata Drill into Metadata in the Events View.

Actions to Analyze Events

The rest of this section has procedures for working in the Events view and adjust reconstructions to bring interesting data into focus.

- You can download events and create an incident in Respond.
- Clicking an event in the Events panel opens the Event Details panel to a tab that shows an event reconstruction (text, packet, file, email, and web) or the tab that shows host information for network events that are enriched with endpoint data (Version 11.5).
- The Events panel and the Event Details panel can be open at the same time.
- Within the Packet tab and the Text tab, you can use additional features to adjust the way the reconstruction is displayed and bring interesting data into focus.

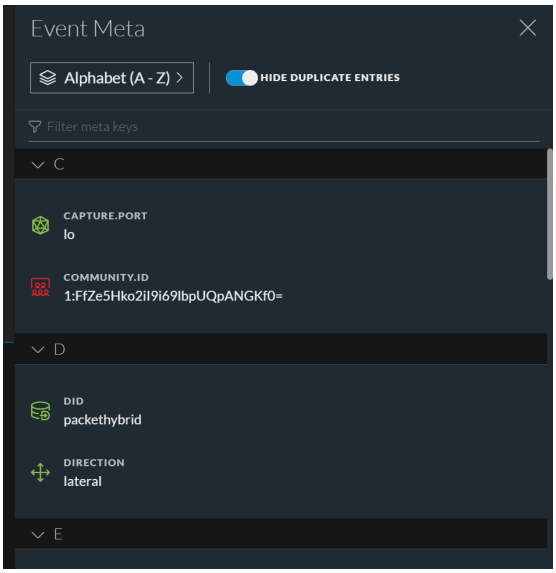
Select the Analysis Type for an Event

To select the analysis type for an event, with an event open in the Event Details panel, click one of the tabs: **Text**, **File**, **Host** , **Packet**, **Email**, or **Web**.

- If you chose **Hosts**, the host information from extended endpoint data is displayed.
- If you chose **File**, **Text**, **Packet**, or **Email**, the reconstruction is displayed.
- If you chose **Web**, the reconstruction of the single event opens in a new tab. This is the same reconstruction of a session used in the Legacy Events view (see Reconstruct an Event in the Legacy Events View).

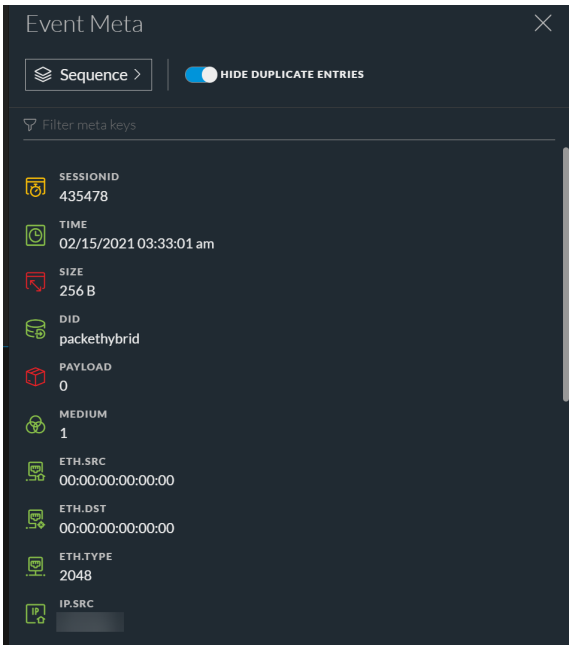
Note: The packet reconstruction is only available for network events.

Adjust the Display of Requests and Responses



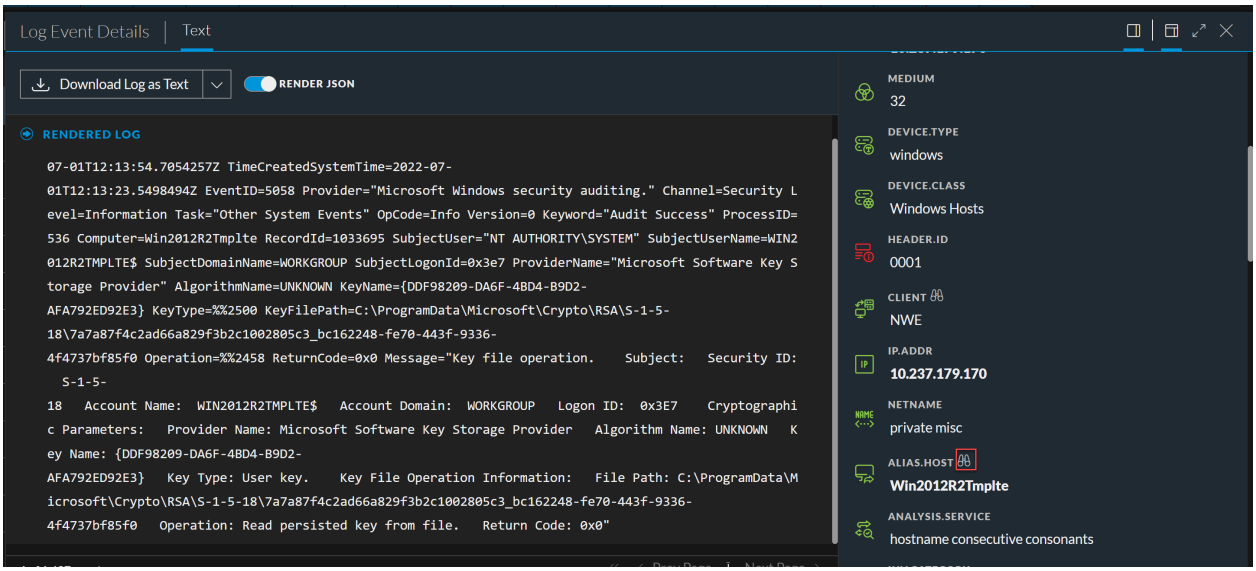
For analysis types that have requests and responses, you can select which side of the conversation to show, Request , Response , or both, click one or both of the direction icons. The reconstruction is refreshed with the selected information.

Note: If you do not see any data, you may have deselected both Request and Response. You must select one of the two to see data displayed.

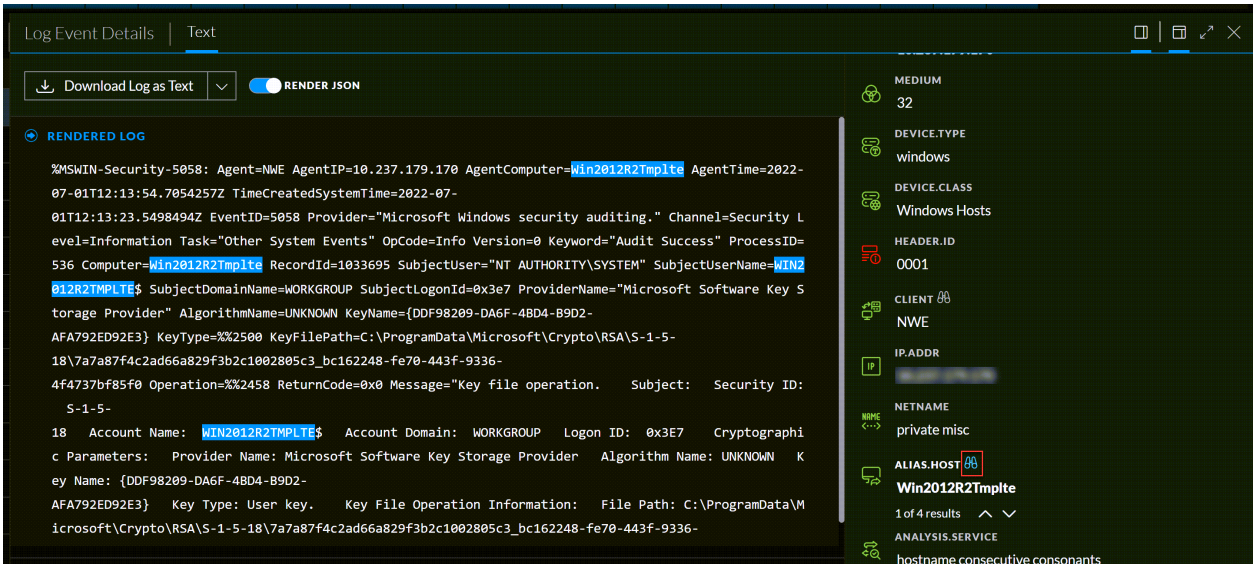


View Associated Metadata for an Event

When examining events in the Text tab, Packet tab, or Filetab, you can click  to show the associated metadata in an adjacent panel, the Event Meta panel. You can change the order of the metadata listed in the Event Meta panel to better find what you are looking for. Metadata can be organized by the sequence in which they were generated or alphabetically by meta key. This figure illustrates metadata organized as meta keys sorted alphabetically."



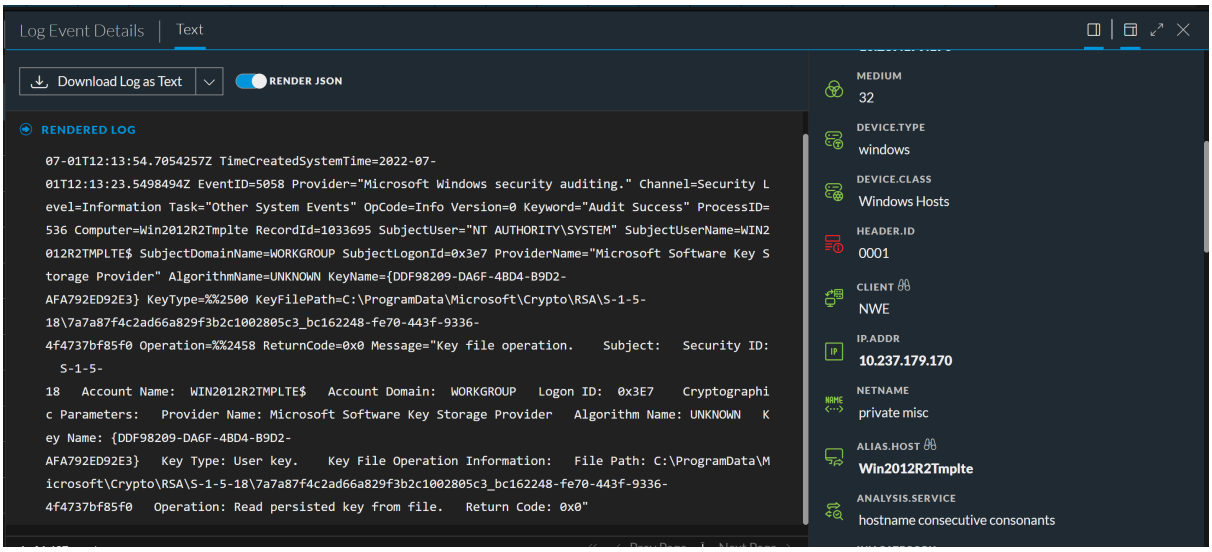
You can change the order of the metadata listed in the Event Meta panel to better find what you are looking for. Metadata can be organized by the sequence in which they were generated or alphabetically by meta key. This figure illustrates metadata organized as meta keys sorted alphabetically.



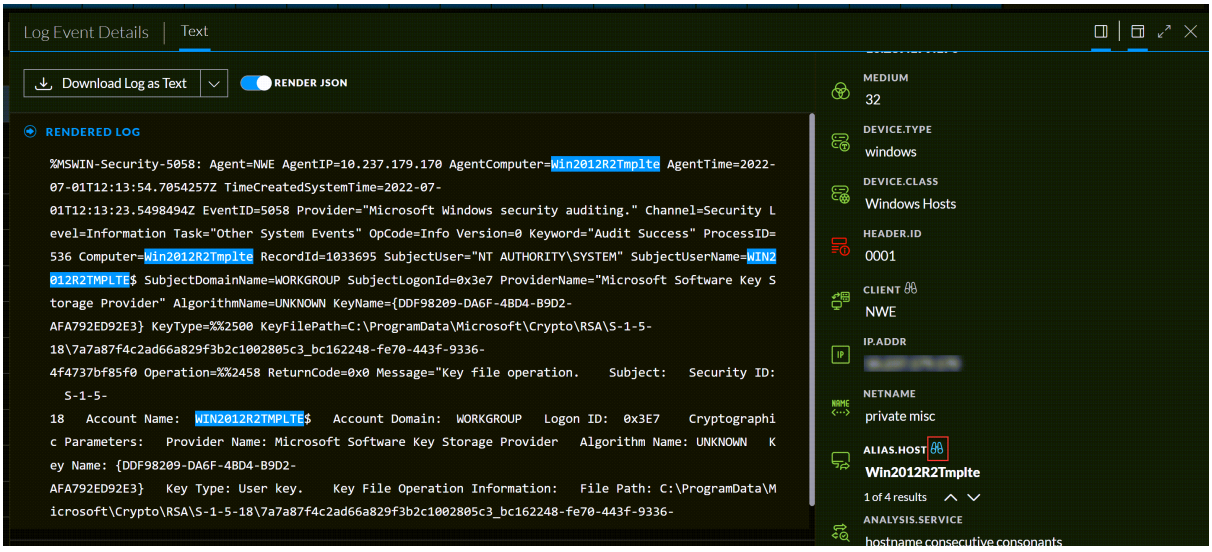
This figure illustrates the same metadata presented in the sequence in which it was generated.

From 12.0 and later, the meta key and meta value pairings now display a binocular icon while viewing a text reconstruction in the Event Meta panel, indicating the search option. This enhancement helps the analysts to visually see directly the indication (binocular icon) rather than going through the list of all metadata to figure out which ones may be searched. This figure is an example of binocular icon marking a searchable meta key.

Clicking the icon triggers a search for the meta key or meta value pair (case-insensitive) in the Text tab and each instance is highlighted. This is an example of binoculars with a blue background after clicking a searchable meta key/ meta value combination.



In the Event Meta panel, the highlighted row has a count of the results and up and down arrows that you can use to quickly find each result in the Text tab. You can view each highlighted location of the data that triggered generation of the meta key, going forward to view the next, and back to view the previous.



Only meta keys that have relevant values inside the RAW text are searchable. You can search only one meta key at a time. If the value is currently hidden due to truncation of a text entry with more than 3000 characters, the text entry is expanded to reveal the found meta value.

To search the raw text for meta values that triggered a meta key

1. Open a network event in the Text tab and click  to open the Event Meta panel.

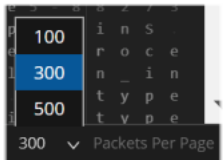
2. Search for the meta key/meta value pairs in the list until you see a binoculars icon next to a meta key.
3. To search for the value in the raw text, click a row that has the binoculars icon, indicating it is searchable.
   If no relevant occurrence of the value is in the text, the value that you are searching for is highlighted in the Event Meta panel and nothing is highlighted in the Text tab.
   If one or more relevant instances of the value is found in the Text tab, each occurrence is highlighted. The value that you are searching for is highlighted in the Event Meta panel and the up/down arrows for scrolling are visible.

4. To remove the highlighting, click the same meta key/meta value pair in the Event Meta panel, click a different meta key/meta value pair in the Event Meta panel, or close the Event Meta panel.
   The highlighting is removed from the raw text.

Note: When a meta value is more than 255 characters, you can hover over that meta key to view the complete value.

Show or Hide the Event Header

To hide the Event Header in the Packet tab, Text tab, or File tab, providing more vertical space for the data, click . Clicking the icon again shows the Event Header.



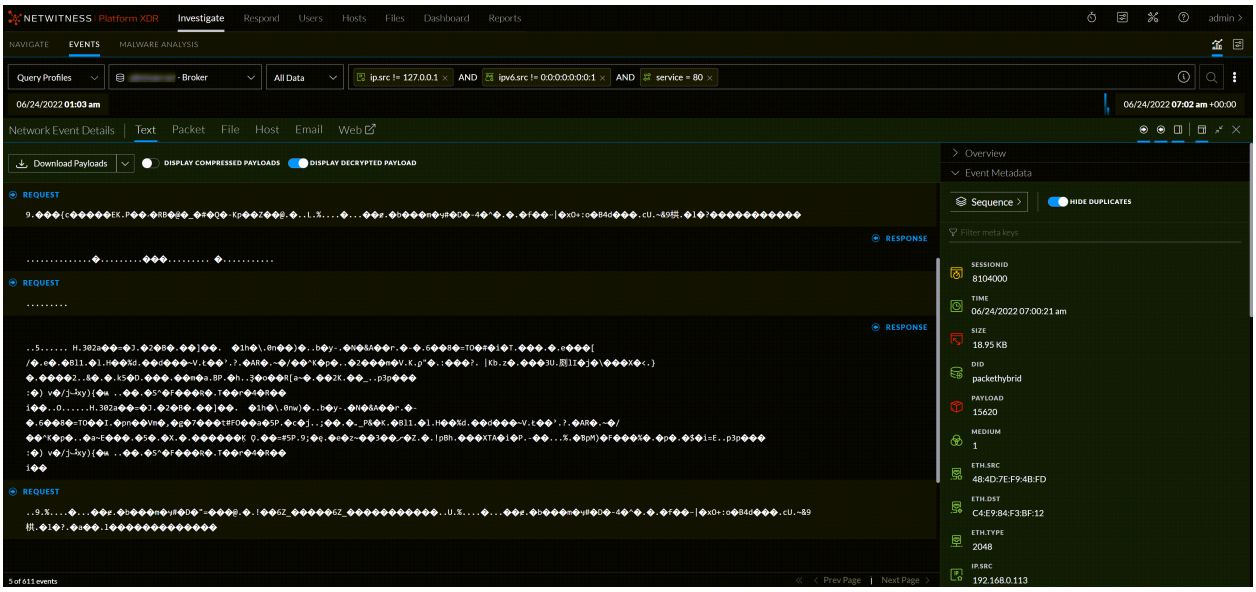
Page Through Events in the Packet and Text Tabs

Pagination controls allow more flexibility in paging through a list of packets or text. In the Packet tab, you can select the number of packets to display per page, and your selection is saved across logins to the NetWitness Platform XDR application. When a control is unavailable, the control is dimmed; for example, when you are viewing page 1, the  and  controls are dimmed.

Note: Pagination controls are available in Version 11.2 and later of the Text tab. When in the Text tab, you must navigate manually to the last page before the last page control icon is available.

To use pagination controls

1. With an event open in the Events view, click the current number of packets per page (**50, 100**, **300**, or **500**), and select the new number of packets per page from the drop-down menu.



2. To page forward or back, use the page control icons:
   Click  to go to the next page.
   Click  to go to the last page.
   Click to go the previous page.
   Click to go to the first page.

3. To go to a specific page, type a page number in the page number field .

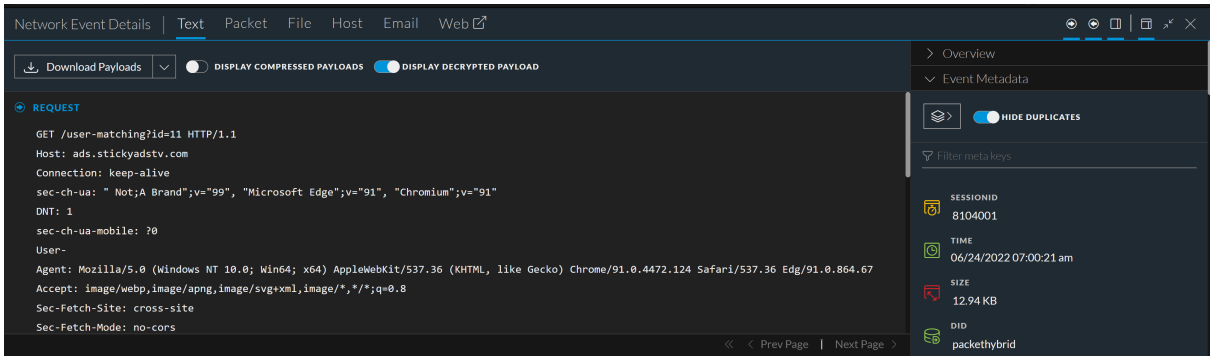
Expand Truncated Text Entries in the Text Tab

A reconstruction of a network event in the Text tab may include requests and responses of many hundred thousands of characters, and scrolling through a long entry that is not of interest can waste time. To save time, text entries that have more than 6000 characters are truncated to show only the first 2000 characters. This example shows an entry that has more than 2000 characters, and a message in the header indicates the percentage of total characters that is being displayed.

You can see that 46% of the characters (the first 2000) are displayed, and click **Show Remaining 54%** to reveal the rest of the entry.

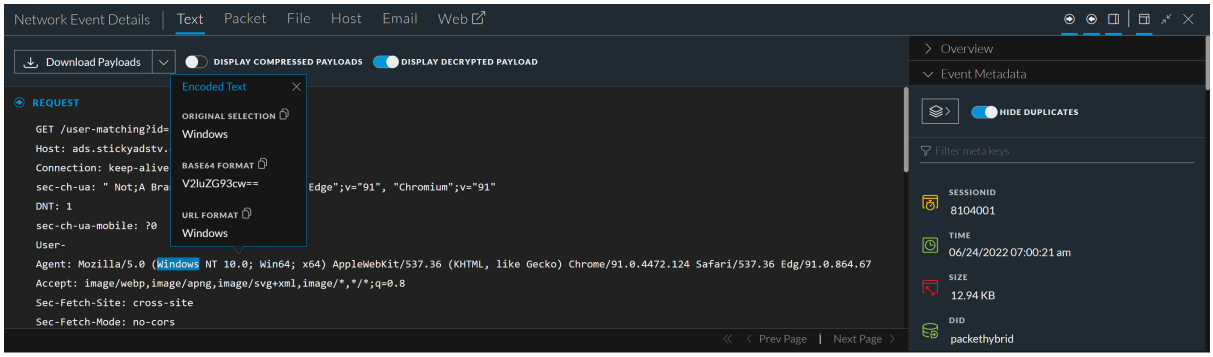
If you search for metadata seen in the Event Meta panel while text is truncated in the Text tab, the truncated text is searched. If the metadata exists inside hidden text, the text entry expands to reveal the text with the found metadata.

Perform URL and Base64 Encoding and Decoding in the Text Tab



If a network session being reconstructed in the Text tab contains Base64 or URL encoded strings, you can decode a string to better understand the session. If the session contains decoded strings for Base64 or URL, you can view a string in its encoded form in order to search for additional instances of the encoded text in other sessions.

When viewing any network session that contains encoded text in the Text tab, you can select a subset of the text within a single Request or Response to view in either encoded or decoded form. Depending on the content loaded on the Decoder, there may be additional metadata outlining that Base64 or URL encoded data is contained within the session.



To perform encoding and decoding in the Text tab

1. In the **Events view**, go to the Text reconstruction of a session that contains encoded or decoded content.

2. To view some decoded text in encoded form, drag to select the text within a Request or Response.
   A menu offers options to encode and decode.

3. Click **Encode Selected Text**.
   The encoded text is displayed in a hover box, which remains in place until you click ✕, select different text in the Text tab, close the Events panel, select another event for reconstruction, or switch to a different reconstruction view.

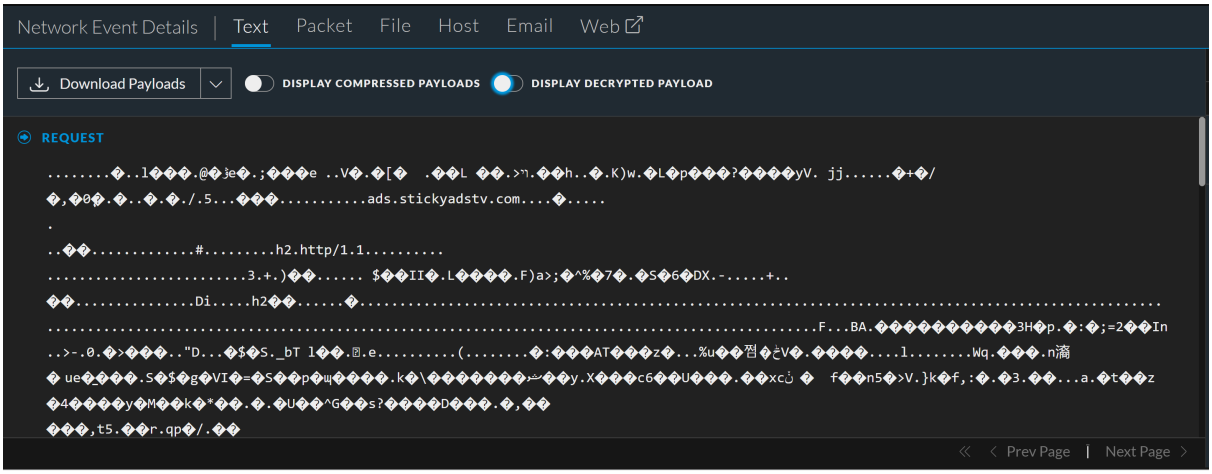
   When a longer text is selected, the hover box is scrollable and large enough to fit the entire selected text and the decoded text.

4. If the session contains encoded text that you want to see in decoded form, drag to select the text within a Request or Response.
   A menu offers options to encode and decode.

5. Click **Decode Selected Text.**
   The decoded text is displayed in a hover box, which remains in place until you click ✕, select different text in the Text tab, close the Events panel, select another event for reconstruction, or switch to a different tab in the Event Details panel.

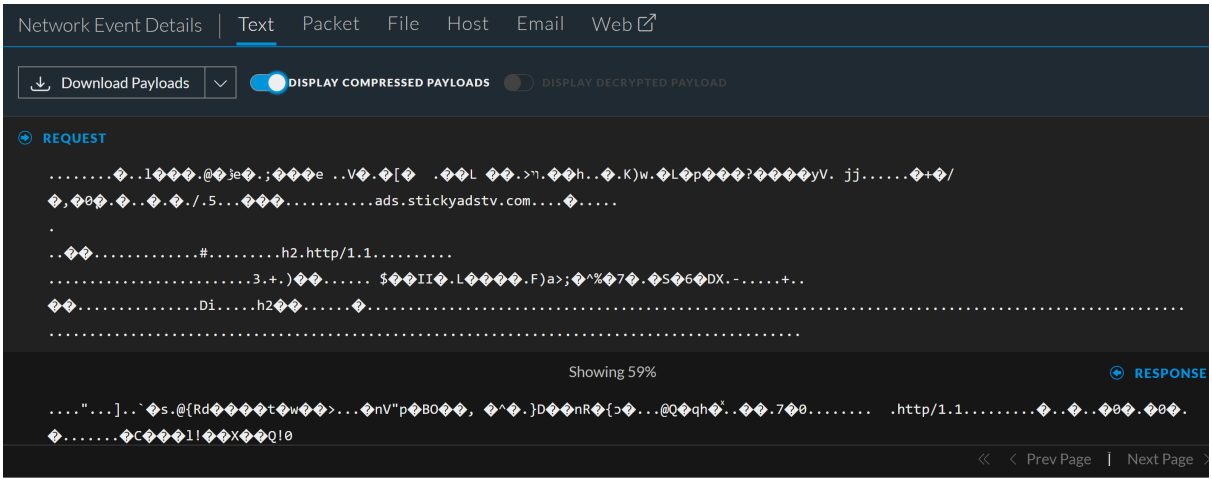
6. If you want to copy some text from the text reconstruction, do one of the following:
   a. Drag to select some text, right-click, and select **Copy Selected Text** from the pop-up menu.

   b. Drag to select some text, then select either **Decode Selected Text** or **Encode Selected Text**.
   Select the desired text and type **Control-C**.
   The selected text is copied to the clipboard and available to paste in a query.



7. When finished, click ✕ to close the hover box.

View Decompressed Text in an HTTP Network Session in the Text Tab

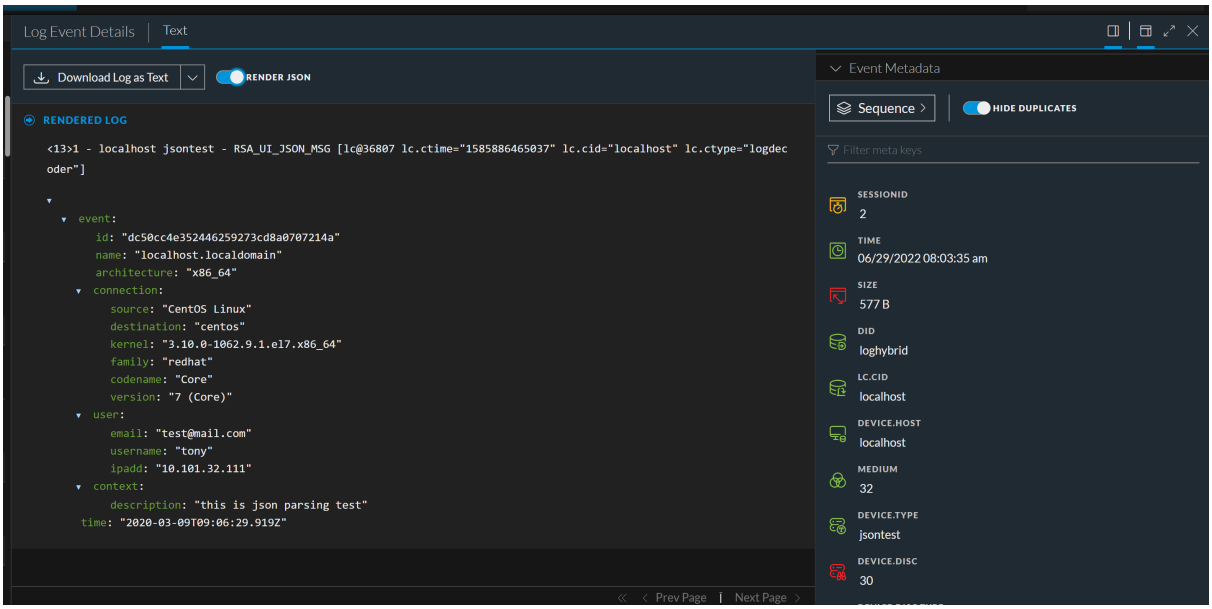


When the content of an HTTP network session is compressed and you are viewing the Text tab, NetWitness displays decompressed content by default. This helps you to determine if there are any patterns and view the readable characters. You can switch between a compressed and decompressed view of compressed text.

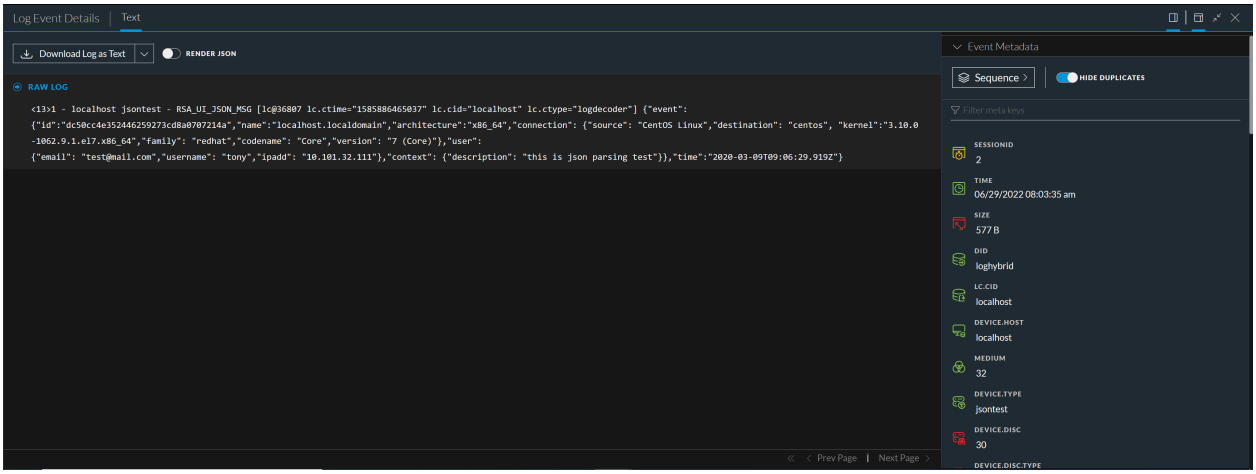
The toggle for changing between compressed and decompressed text is only displayed in the Text tab, and is enabled only if there is compressed text content.

1. Open the Text tab of an HTTP session that contains compressed content.
   By default the session is reconstructed with the text decompressed, and above the reconstruction, is the **Display Compressed Payloads** toggle switch.

2. To view the same text in its compressed form, click the toggle switch.
   The view changes so that the compressed text is no longer readable, and the switch indicates the Display Compressed Packets is on.



3. To return to the view of decompressed text, click the switch again.

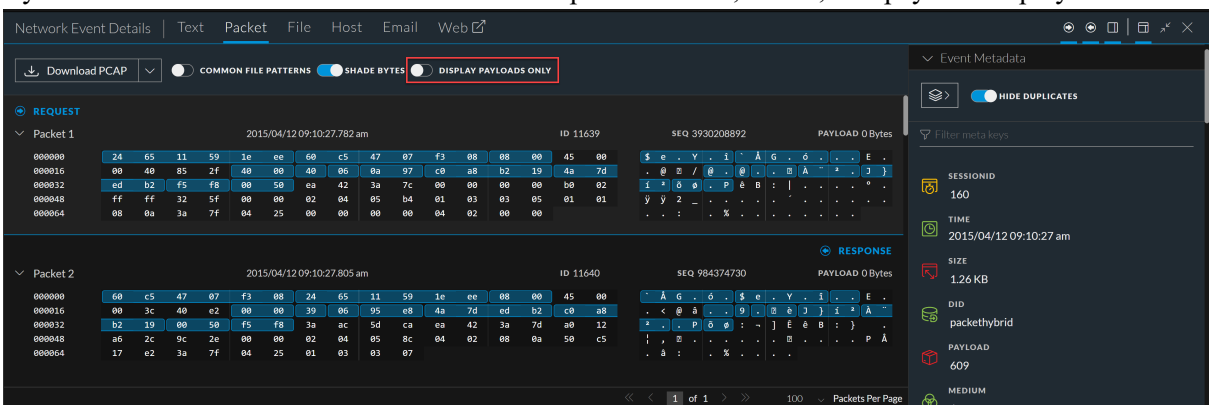


View a JSON String in Tree Format in the Text Tab

(From Version 11.5.1) You can view a text reconstruction of a log event in easy-to-read JSON format instead of the raw block format using the Render JSON toggle switch. By default, the switch is enabled, and JSON snippets in a log event are detected and displayed in fully expanded tree format. Invalid JSON snippets are presented as raw text. If you change the setting of the switch, your setting persists in local storage.

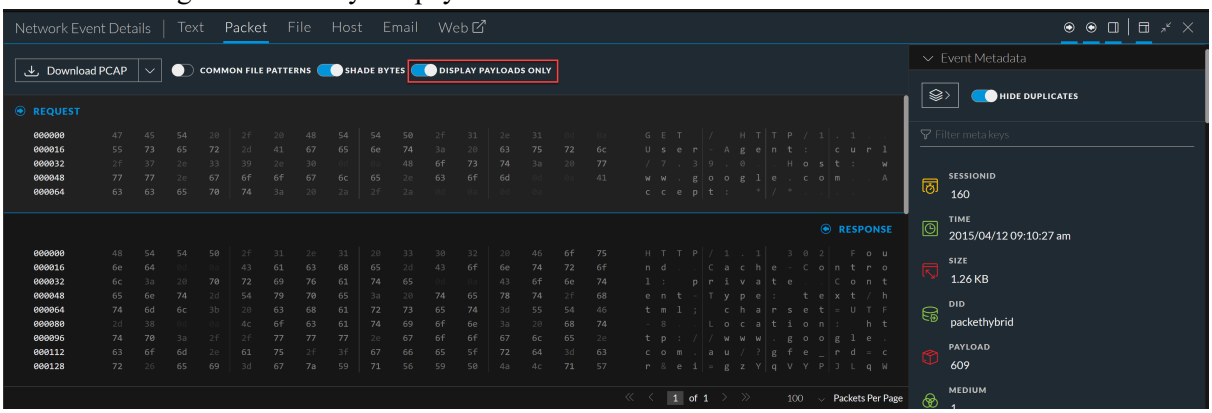
1. In the **Events** view, open a log event in Text tab.
   If the raw log contains JSON strings and the Render JSON switch is enabled, all JSON strings found are rendered in tree format.

2. If you prefer to see the log as raw text, click the Render JSON switch.
   The log is rendered as a single block of text without the nested indentation. The setting persists until you change it and will be in the same state when you log in again.



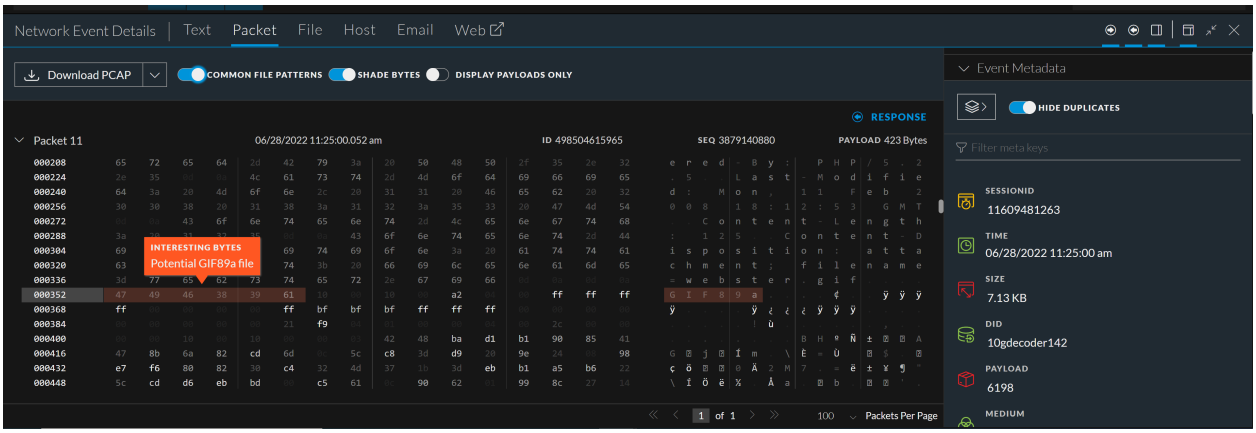
Use the Payload Only Option in the Packet Tab

When viewing a reconstruction of a network session in the Packet panel, you can hide the header and footer bytes. The view changes so that only the payload is visible and contiguous same-side packets are concatenated together to make the payload more readable and understandable. This setting persists until you change it or refresh the browser.



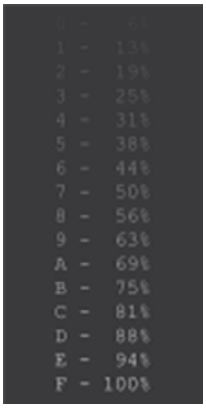
- With the Display Payloads Only option off, the number of packets, packet header, packet footer, and payload are displayed.
- With the Display Payloads Only option on, no packet header and footer bytes are displayed. Only the packet content of 16 hexadecimal bytes per line and the corresponding ASCII per line is displayed.

1. In the **Events** view, go to the Packet tab of a network session.
   By default the session is reconstructed with the packet header, footer, and payload displayed.



2. To change the view to show only the payload for each packet, click the **Display Payloads Only** toggle switch.

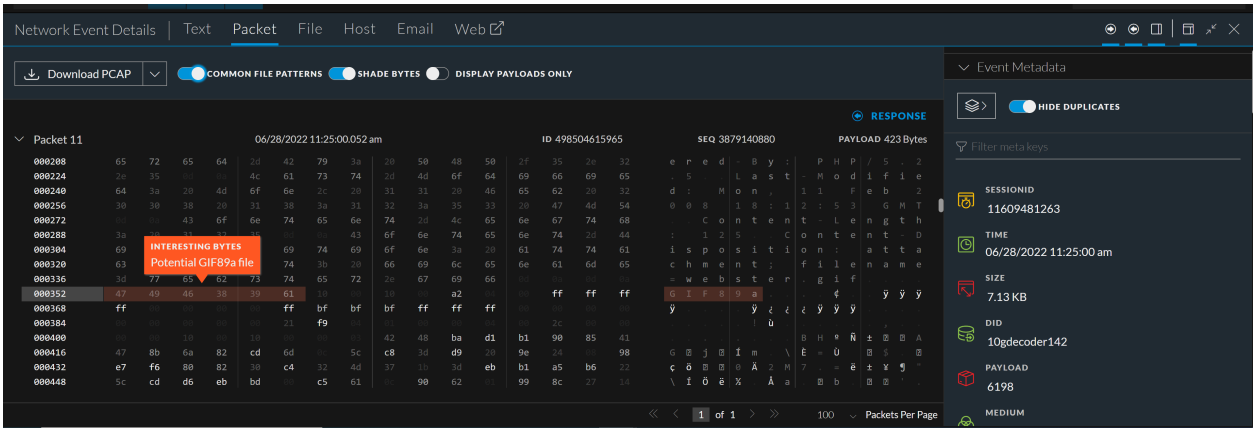
The view changes so that only the payload is visible.



View Highlighted Bytes in the Packet Tab

When you open a reconstruction in the Packet tab, the significant header bytes in each packet are highlighted in blue, and the payload bytes are distinguished using shading to help you understand the contents of the packet. This figure shows the default appearance of the packet reconstruction with highlighting and byte shading.

The Shade Bytes option adds shading to identify the different hexadecimal bytes (00 to FF) using degrees of highlighting. Bytes near the lower range are more transparent, and bytes near 255 are more opaque. Both hexadecimal and ASCII bytes are shaded. This is an example of the shading applied to each hexadecimal byte.



The Shade Bytes switch controls the shading of bytes. When you set Shade Bytes on or off, your setting persists until you change it or refresh the browser.

Highlight Common File Types in the Packet Tab

In the Packet tab, analysts can show or hide highlighting of certain common file types based on the file signature. When the Common File Patterns feature is turned on, the magic number bytes in the file signature are highlighted in the payload and you can hover over the highlighting to see the potential type of file. In this example, `42 4d` is highlighted in the hexadecimal payload and `BM` is highlighted in the ASCII payload. When you hover over the highlighted bytes, the potential file type associated with the magic number is provided in a hover box.

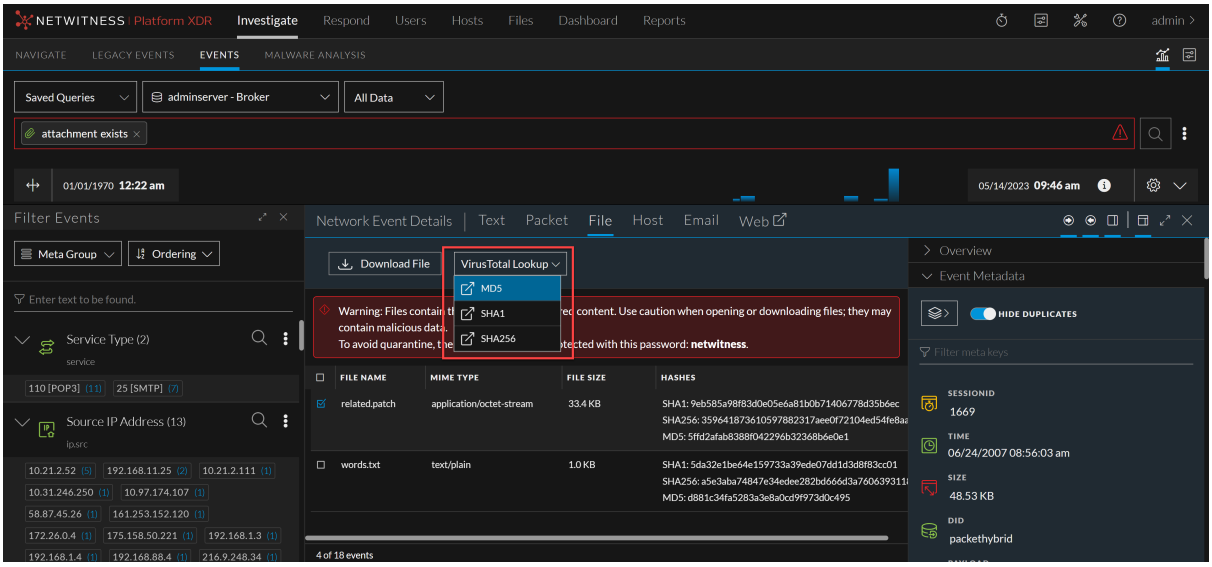
To view common file signatures in the Packet tab:

1. With a reconstruction open in the Packet tab, turn on the **Common File Patterns** option.
   If there is more than one highlight in view, all are shown.
2. To view the hover box, place the cursor over the highlighting.

These are the file types and corresponding magic numbers that are highlighted if present in the payload:

File Type	Hexadecimal Signature	ASCII Encoding
DOS Executable / Windows PE	4D 5A	MZ
Portable Network Graphics (PNG)	89 50 4E 47 0D 0A 1A 0A	PNG
JPEG	FF D8 FF	JPEG
JPEG/JFIF	4A 46 49 46	JFIF
JPEG/Exif	45 78 69 66	Exif
GIF	47 49 46 38 37 61	GIF87a
GIF	47 49 46 38 39 61	GIF89a
Non-portable Executable	5A 4D	ZM

File Type	Hexadecimal Signature	ASCII Encoding
BMP	42 4D	BM
PDF	25 50 44 46	%PDF
Old Office Document (doc, xls, ppt, msg, and other)	D0 CF 11 E0 A1 B1 1A E1	ÐÏ.à¡±.á
ZIP file formats and formats based on it, such as JAR, ODF, OOXML	50 4B	PK..
7-Zip File Format (7z)	37 7A BC AF 27 1C	7z¼¯'
Java Class File, Mach-O Fat Binary	CA FE BA BE	Êþº¾
Postscript	25 21 50 53	%!PS
Unix/Linux Shell script	23 21	#!
Executable and Linkable Format (ELF) executables	7F 45 4C 46	.ELF



Launch a VirusTotal Lookup for a File

(From Version 12.3 and later) In the Events view, while analyzing a file, you can search VirusTotal with hashes (MD5, SHA1, and SHA56) to get more information about the file. It helps determine if a file is malicious from multiple antivirus vendors.

To launch the search

1. Log in to the NetWitness Platform XDR.
2. Go to **Investigate** > **Events**.
3. In the **Events** view, go to the file reconstruction of an event that contains files.

4. Select a file and click the **VirusTotal Lookup** to perform a search on **MD5**, **SHA1**, or **SHA256**.

Note: You can only select one file at a time for VirusTotal Lookup.

Reconstruct an Event in the Legacy Events View

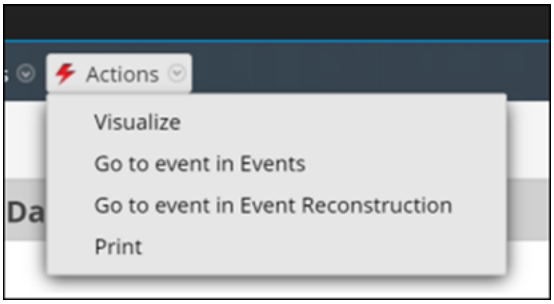
When viewing a list of events in Legacy Events view, you can safely create a reconstruction of the event in a readable form that matches the original. By default, the initial view of a reconstructed event is the most suitable format (Best Reconstruction); for example, web content is reconstructed as a web page; an IM conversation is displayed with both parts of the conversation. Each user can select a different default reconstruction in the Profile > Preferences view.

You can also open a reconstruction from the Navigate view if you know the Event ID of the event.

In the reconstruction, you can:

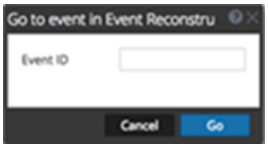
- Select event information to view. Possible values are: request data, response data, both request and response data.
- Select the reconstruction type: details, text, hex, packets, web, mail, or IM.
- Export raw logs.
- Export the event as a PCAP file.
- Extract any files available in the event.
- Extract all the meta data associated with the event.

  Caution: Be careful when clicking a link to a file in the Reconstruction. If your system has an application associated with the file, or the browser is capable of opening them, and the attachments are malicious, they can negatively affect your system.
- Display the event in a separate window or tab (depending on your browser configuration).
- If you are viewing the reconstruction as a preview in the current view, you can page forward to the next event and back to the previous using the navigation buttons in the bottom left corner.



Note: Reconstruction Settings and Reconstruction Cache Settings allow an administrator to manage application performance for Investigation (as described in the *System Configuration Guide*). When analysts reconstruct sessions, two situations can affect performance and results.
- Some large events contain many thousands of source packets. Reconstructing these sessions can degrade application performance.
- In some cases, the reconstruction cache can present incorrect content; for this reason, NetWitness cleans cache that is older than a day every 24 hours. Between the daily cache cleanings, certain actions my result in stale cache being used for a reconstruction, and if the need arises, administrators can manually clear cache for one or more services that are connected to the current NetWitness Server.

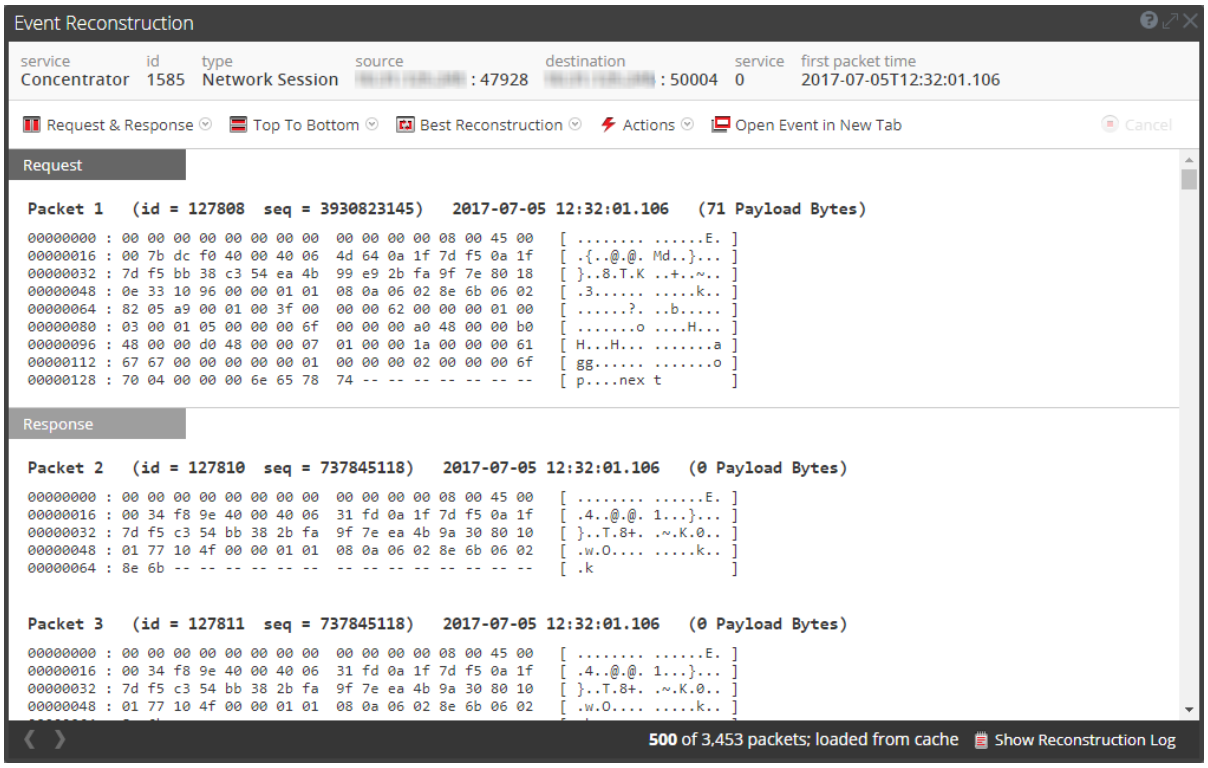
Reconstruct an Event Using an Event ID



You can reconstruct an event directly from the Navigate view given a known Event ID. You can use this option without executing a query as you usually do when beginning an investigation. A service and time range must be selected to be able to jump directly to an event using just its `eventid`.

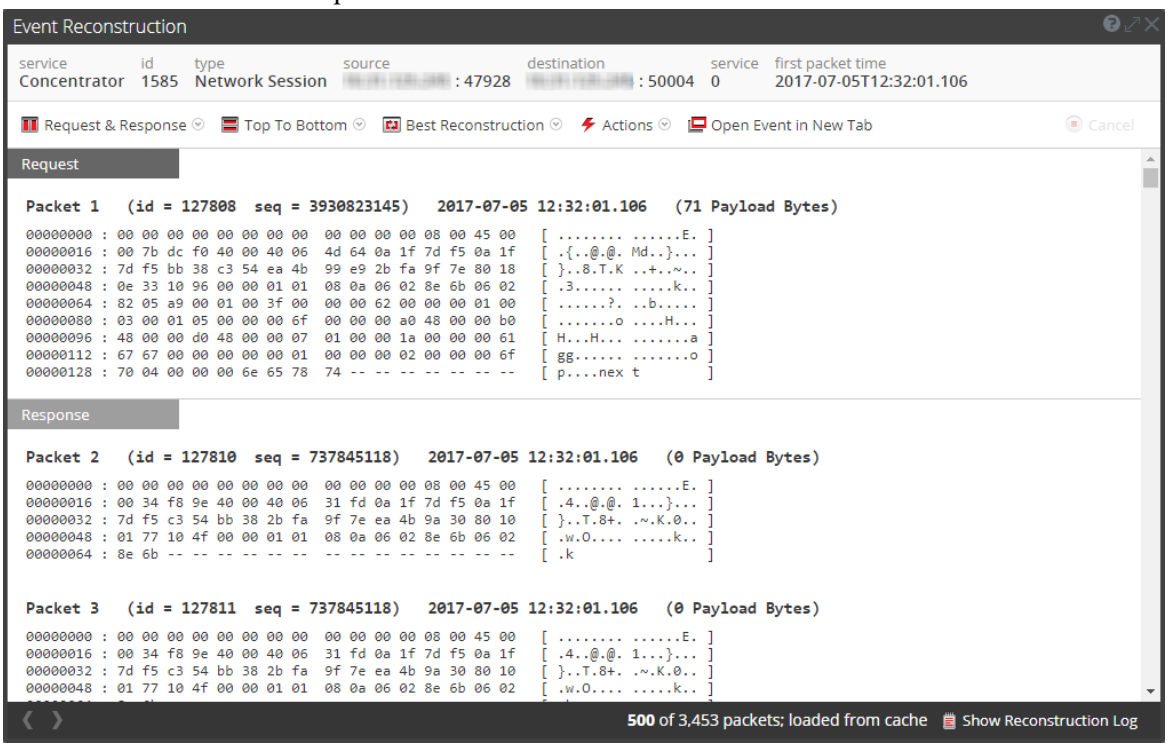
To view a reconstruction or event analysis directly from the Navigate view:

1. Go to **Investigate > Navigate** and select **Actions > Go to event in Events** or **Go to event in Event Reconstruction**.



The Go to event dialog is displayed. There are two dialogs, one for Events and one for Legacy Event reconstruction. Both ask for the Event ID.

2. In the **Event ID** field, type the ID and click **Go**.
   The specified event is reconstructed in the legacy Event Reconstruction view or the Events view.



Reconstruct an Event from a Drill Point in the Navigate View

1. Click the count (the green number following a value) for a value in the Navigate view to open a drill point in the **Events** view.
2. To show all meta data, click + Show Additional Meta .
3. To open an event reconstruction in the Legacy Events view, select an event to reconstruct and select **Actions > View Event > Preview Inline**.
   The Event Reconstruction opens in a popup window in the same view. By default, NetWitness displays the best reconstruction for the event determined by the event content or the reconstruction that you have selected in the Default Session View setting for Investigation. You can use the options in the Event Reconstruction toolbar to change the reconstruction method, view side-by-side results, export an event, open an email attachment, extract files, and open the event in a new tab. The toolbar options vary depending on the type of event being reconstructed (network event, log event, or endpoint event). This is an example of the reconstruction for a network event.

4. To preview a reconstruction of the next event, click  in the lower left corner of the reconstruction or to preview a reconstruction of the previous event, click .
5. To open an event reconstruction in a new tab, do one of the following:
   a. In the **Legacy Events** view, select an event to reconstruct and select **Actions > View Event > Open in New Tab**.
   b. In the **Event Reconstruction** toolbar of previewed reconstruction, click **Open Event in New Tab** in the toolbar.

The Event Reconstruction opens in a new tab.

View Side by Side or Top to Bottom

To select the way requests and responses for an event are displayed:

1. In the **Event Reconstruction** toolbar, click **Top to Bottom** or **Side by Side**.
2. In the drop-down menu, select the information you want to see in the event: **Side by Side** or **Top to Bottom.**
   The reconstruction is refreshed with the selected information.

Select Event Information to View

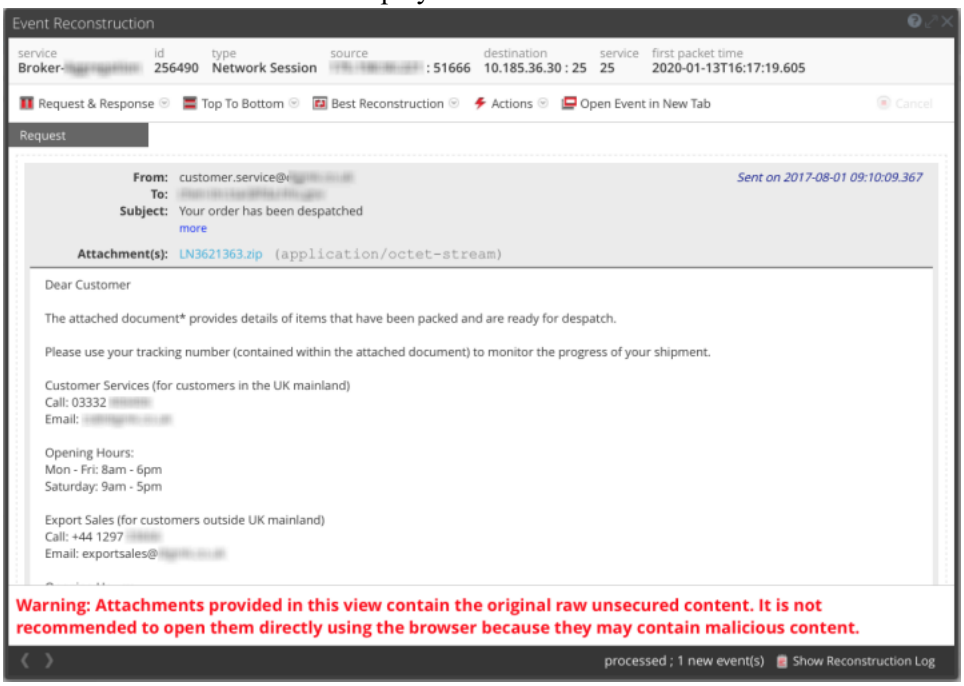
To select what event information to view:

1. In the **Event Reconstruction** toolbar, click **Request & Response**.
2. In the drop-down menu, select the information you want to see in the event: **Request & Response**, **Request**, or **Response**.
   The reconstruction is refreshed with the selected information.

Select Event Reconstruction Type

To select the reconstruction type for an event:

1. In the **Event Reconstruction** toolbar, click **Best Reconstruction**.
2. In the drop-down menu, select the reconstruction type to view: **meta**, **text**, **hex**, **packets**, **web**, **mail**, or **files**.
   The reconstruction is refreshed with the selected reconstruction type.



Open or Download an Email Attachment

When viewing a reconstruction of an email that has attachments, you can open supported file types or download the files to the local system.

Caution: Be careful when selecting file attachments. If your system has an application associated with the file attachments, or the browser is capable of opening them, and the attachments are malicious, they can negatively affect your system.

To open or download email attachments:

1. In the **Event Reconstruction** toolbar, select the **View** drop-down and select **View Mail**.
   The Event Reconstruction is displayed.

2. In the **Event Reconstruction** section of the email, click the Attachment.
   If the file type is supported by the browser, the attachment will open in a new tab.
   If the file type is not supported, the Download dialog is displayed so that you can download the attachment.

Export an Event as a PCAP File

The PCAP export option downloads the sessions for the current time range and drill point to a PCAP file. To export an event as a pcap file:

1. In the **Event Reconstruction** toolbar, click **Actions**.
2. Click **Export PCAP**.
3. A confirmation dialog is displayed.
4. Click **OK**.
   The job is scheduled and when complete the PCAP is downloaded to the local file system. In the Profile > Jobs tab, you can download the PCAP.

Extract Files from a Reconstructed Event

The Extract Files option extracts and downloads the files associated with the event. To extract files:

1. In the **Event Reconstruction** toolbar, click **Actions**.
2. Click **Extract Files**.
   The File Extraction dialog is displayed.
3. Select the types of files to extract, and click **OK**.
4. The job is scheduled and when complete the selected file types are downloaded to the local file system. In the Profile > Jobs tab, you can download the files.

Look Up Additional Context for Results

The Context Hub is a centralized service that aggregates data about entities from multiple configurable data sources. This data can extend your investigation with additional context beyond the immediate results of a specific query. For example, the Context Hub can tell you if a given entity has been mentioned in any incidents, alerts, feeds, or community intelligence publications.

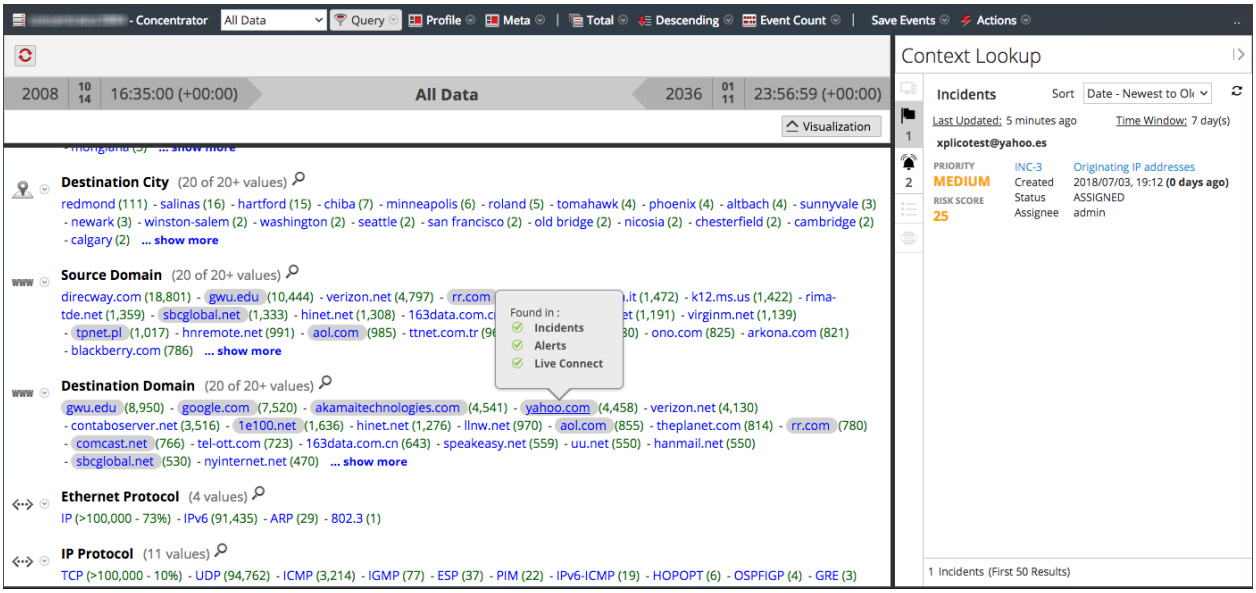
To enable viewing of contextual information, your administrator must add the Context Hub service in NetWitness Platform XDR and configure data sources for the Context Hub service as described in the *Context Hub Configuration Guide*. Analysts also need a role with the permission `Context Lookup` as described in **Role Permissions** and **Manage Users with Roles and Permissions** in the *System Security and User Management Guide*.

When the Context Hub service is enabled and configured, NetWitness provides enrichment data from NetWitness Respond, custom lists, and NetWitness Endpoint directly in the Navigate view, Events view, and Legacy Events view. A visual cue highlights meta values for which enrichment data is available in the Investigate views, and you can click on the highlighted value to look up the contextual information and intelligence. You can look up details and intelligence about elements associated with an event in the Context Hub. These elements, or entities, are identifiers, such as an IP address, a user name, a host name, a domain name, a file name, or a file hash. The data from configured sources, such as NetWitness Endpoint, can help you understand what is happening. In Version 11.5 and later, you can add STIX data sources and view related data using context lookup; associated elements are IP address, file name, file hash, domain name, and URL.

In addition, you can add lists and list values for Context Hub enrichment; you can view lists, edit meta values in an existing list, or create a new list. When you add meta values to a list, you can investigate the meta values using the context lookup option.

For an analyst to manage lists in Investigate, the administrator must:

- Enable the Context Hub service.
- Assign an analyst role with permission `Manage List from Investigation` to the user who will perform Context Lookup from Investigation views.
- Configure appropriate roles and permissions as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.



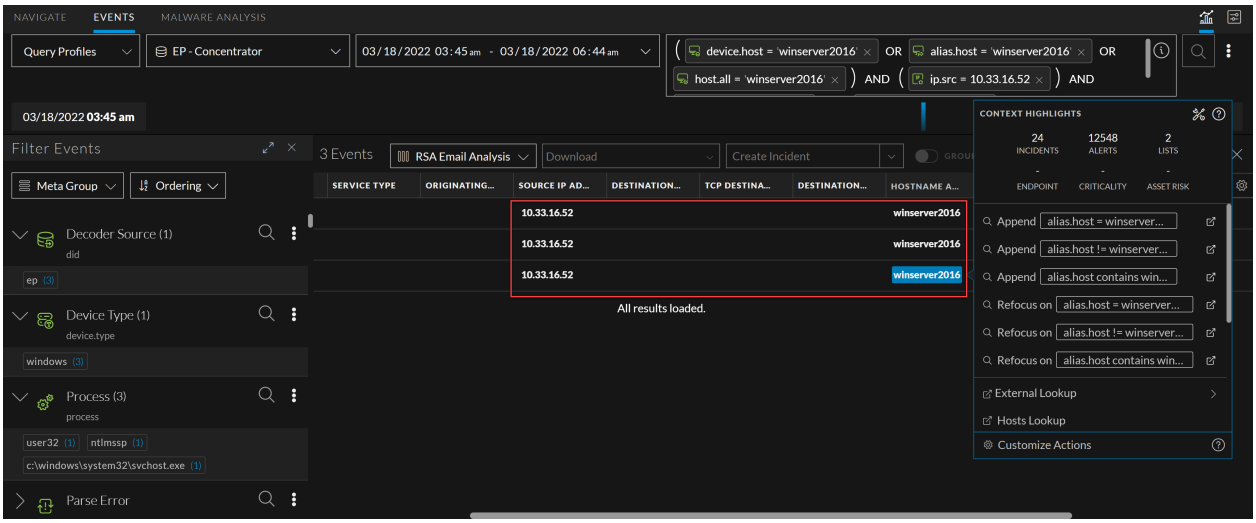
In Version 11.6 and later, you can add REST API data sources and view related data using context lookup. Also, Administrators can now configure specific Context Hub sources (For example, specific lists, Respond, Endpoint, and so on) for context highlighting during investigation. If context highlighting is disabled for a Context Hub source, analysts will see results from all the data sources when opening the Context Panel for a meta value, but the values are not highlighted in the Investigation views. In the View Context:

- No data is shown if the meta values is not highlighted.
- If there are entities common across different data sources, the meta values for those entities are underlined for all the data sources, but the data is shown only for the data source on which context highlighting is enabled.

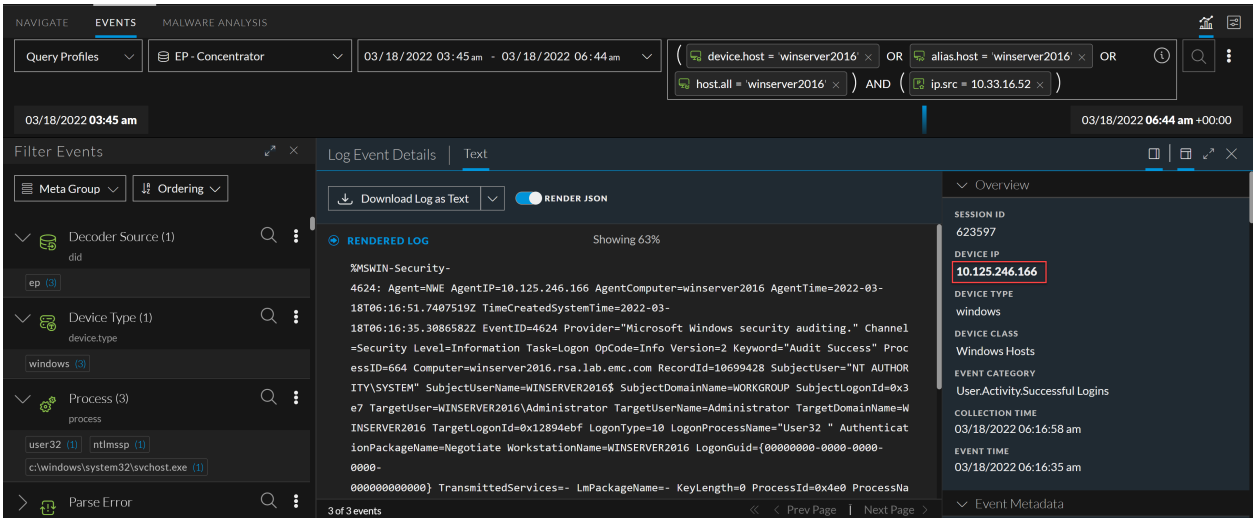
Open the Context Lookup Panel

In the Context Lookup panel, you can view and explore individual data sources for further investigation. For a detailed description of the information displayed for each data source, see Context Lookup Panel.

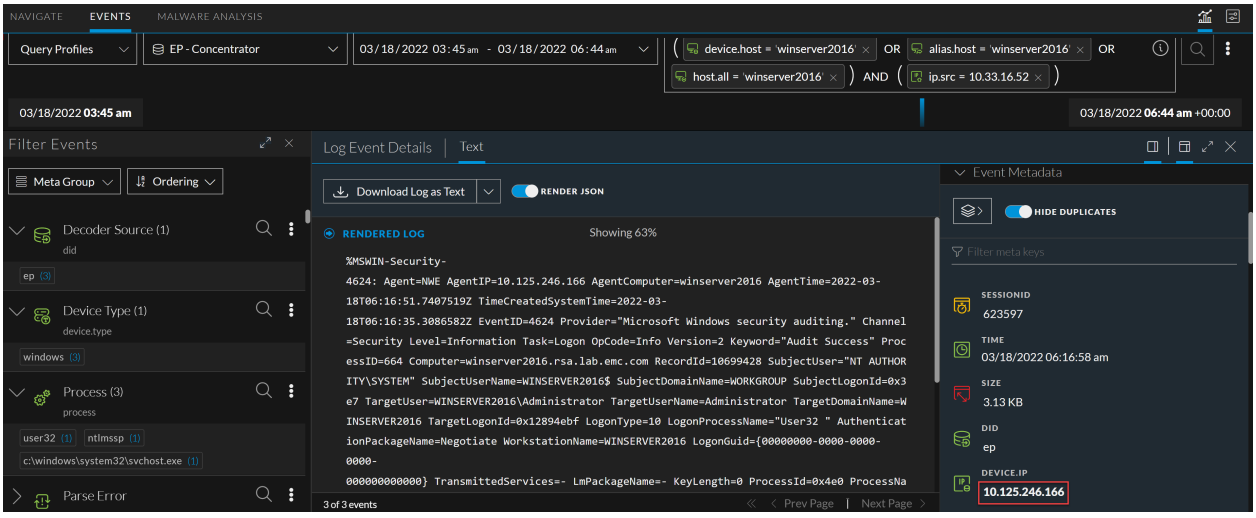
In the Navigate view and Legacy Events view, entities that have associated context data available are highlighted with a gray background; hovering over an entity displays a hover box giving a summary of the available data. When you right-click the entity, the Context Hub queries the configured data sources for relevant information, and the Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available. You can perform another lookup by right-clicking on another entity, and the Context Lookup panel is updated with that entity's information.



Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Users** view to view context lookup for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.



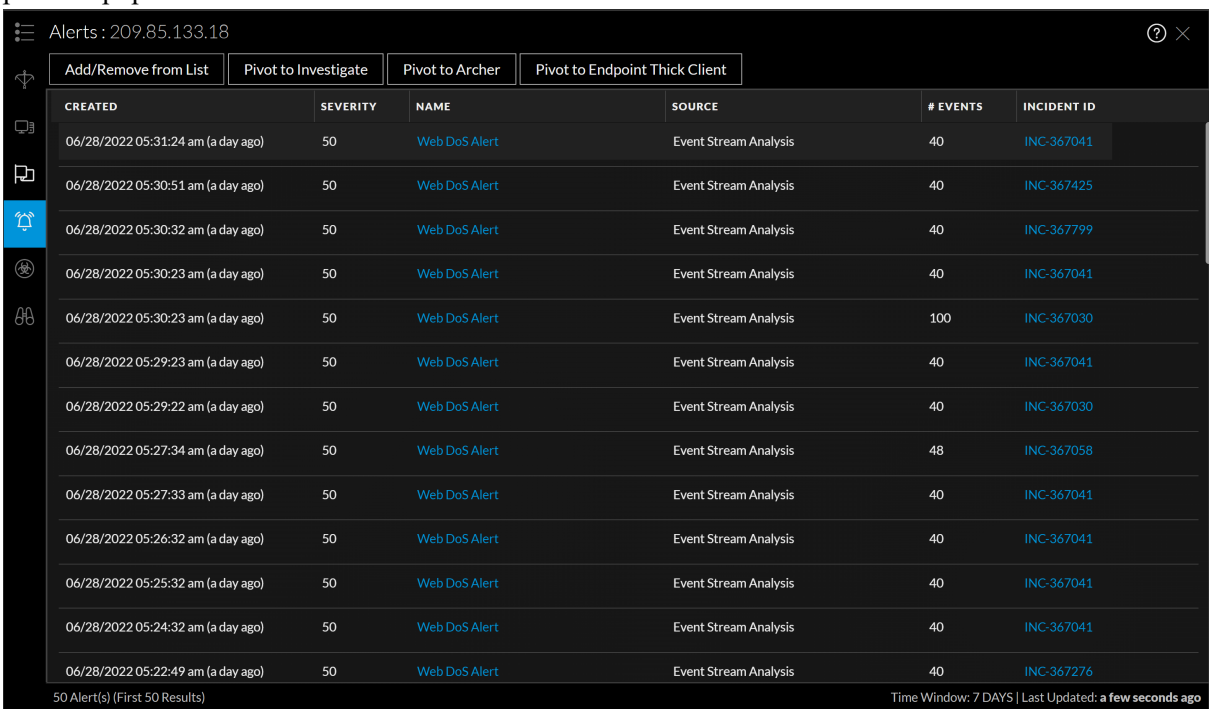
In the Events view, you can see underlined entities in the Events panel, the Event Header, or the Event Meta panel. If an entity is underlined, NetWitness is populating information about that entity type in the Context Hub. There may be additional information available about that entity in the Context Hub.



The following figure shows underlined entities in the Events panel with the context tooltip open. The context tooltip has two sections: Context Highlights and Actions.

- The information in the Context Highlights section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, Endpoint, Criticality, Asset Risk, and STIX. Depending on your data, you may be able to click these items for more information.
- The **Actions** section lists the available actions. In the example, the Add/Remove from List, Pivot to Investigate, Pivot to Archer, and Pivot to Endpoint Thick Client options are available.

The following figures shows bolded entities in the Overview and the Event Meta panel.

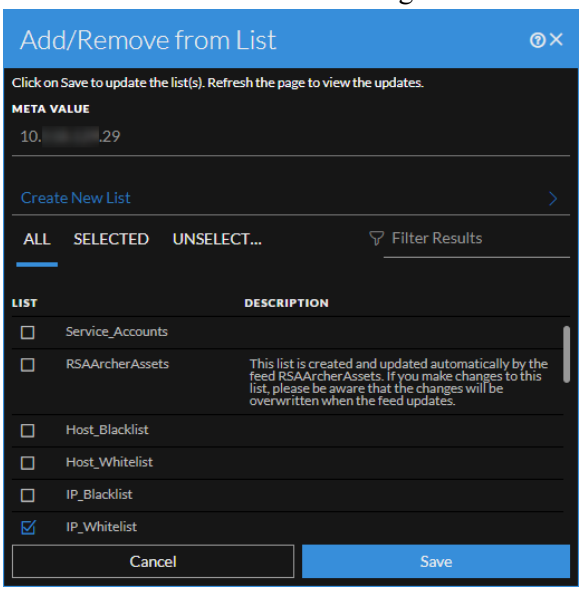


When you click **Context Lookup** in the context tooltip, the Context Hub queries the configured data sources for relevant information, and the Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available. You can perform another lookup by using the View Context option on another entity, and the Context Lookup panel is updated with that entity's information.

You can also take any available action in the Actions section.

To view information in the Context Lookup panel in the Events view

1. In the Events view, left or right-click an underlined entity.
   A context tooltip displays a list of the context data available for the selected meta value.
2. Click **Context Lookup** in the context tooltip to open the Context Lookup panel.
   The Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available.



3. To perform actions on an entity, select one of the available actions in the context tooltip: Add /Remove from List, Pivot to Investigate, Pivot to Archer, Pivot to Endpoint Thick Client. For more information, see Pivot to Investigate, Pivot to Archer (Events View), Pivot to NetWitness Endpoint Thick Client (Events View), and Add an Entity to a Whitelist.

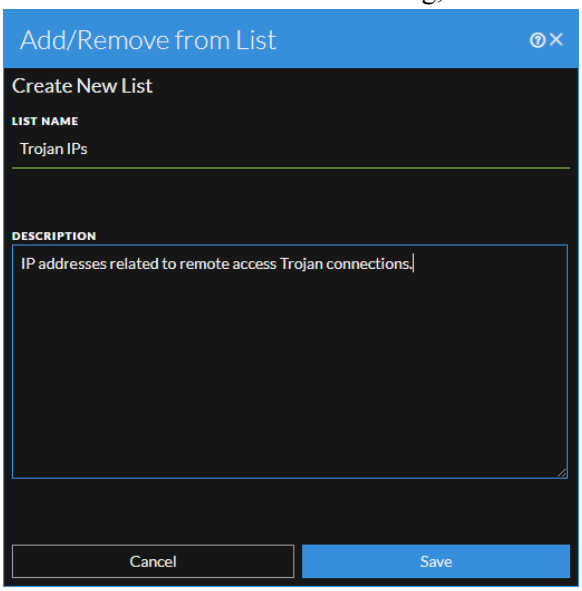
Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer data source is not responding. Check that the Archer configuration is enabled and configured properly.

Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip showing the available actions is displayed.
2. In the **Actions** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove from List dialog shows the available lists.

3. Select one or more lists and click **Save**.
   The entity is added to the selected lists.



Create a List (Events View)

You can create lists in Context Hub from the Events view. In addition to using lists to whitelist and blacklist entities, you can use lists to monitor entities for abnormal behavior. For example, to improve the visibility of a suspicious IP address and Domain under investigation, you may want to include them in two separate lists. One list could be for domains suspected of being related to command and control connections, and another list could be for IP addresses related to remote access Trojan connections. You can then identify indicators of compromise using these lists.

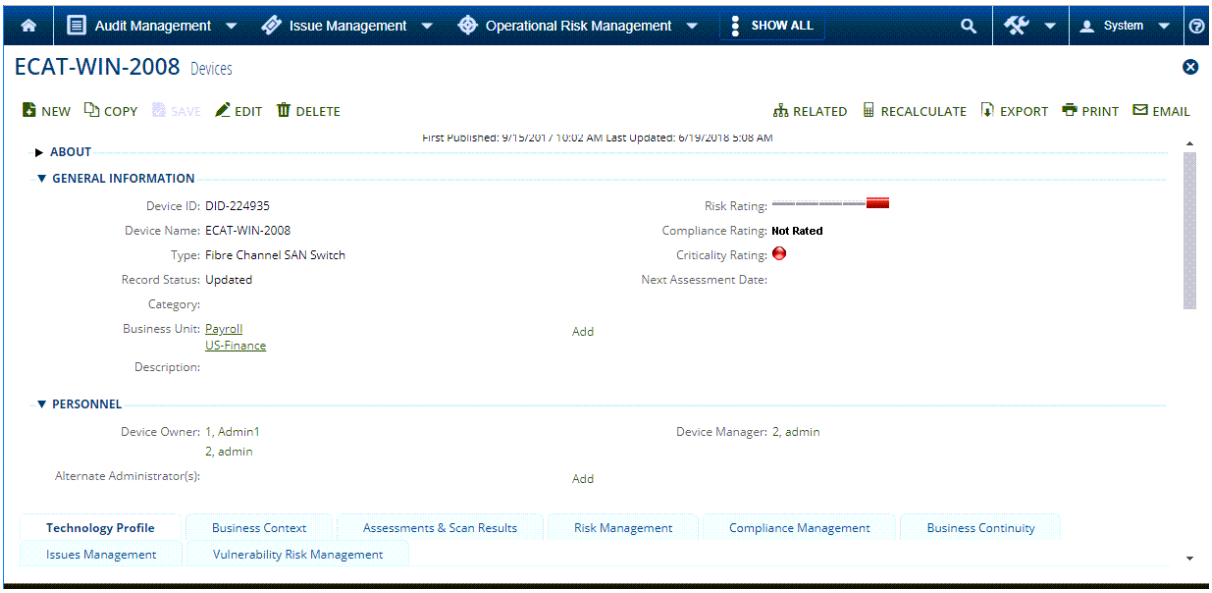
To create a list in the Context Hub

1. In the Events panel, the Event Header, or the Event Meta panel, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip showing the available actions is displayed.
2. In the **Actions** section of the tooltip, click **Add/Remove from List**.

3. In the Add/Remove from List dialog, click **Create New List**.

4. Type a unique **List NAME** for the list. The list name is not case sensitive.
5. (Optional) Type a **DESCRIPTION** for the list.
   Analysts with the appropriate permissions can also export lists in CSV format to send to other analysts for further tracking and analysis. The *Context Hub Configuration Guide* provides additional information.

Pivot to Investigate



For a more thorough investigation of an entity, you can open the Events view.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over any underlined entity.
2. In the **Actions** section of the tooltip, select **Pivot to Investigate**.
   The Navigate view opens, enabling you to perform a deeper dive investigation. For more information, see Begin an Investigation in the Navigate or Legacy Events View.

Pivot to Archer (Events View)

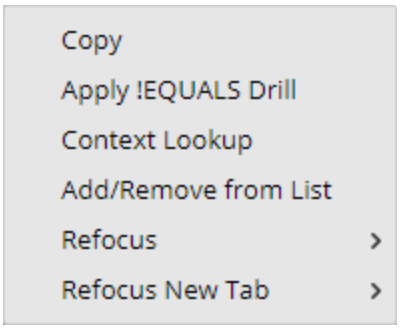
For viewing more details about the device in Archer Cyber Incident & Breach Response, you can pivot to the device details page. This information is displayed only for IP address, host, and Mac address.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over any underlined entity (IP address, host, and Mac address).
2. In the **Actions** section of the context tooltip, select **Pivot to Archer**.
3. The device details page in **Archer Cyber Incident & Breach Response** opens if you are logged in to the application, otherwise the login screen is displayed.

Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the Archer configuration is enabled and configured properly.

For more information, see the *Archer Integration Guide*.

Pivot to NetWitness Endpoint Thick Client (Events View)



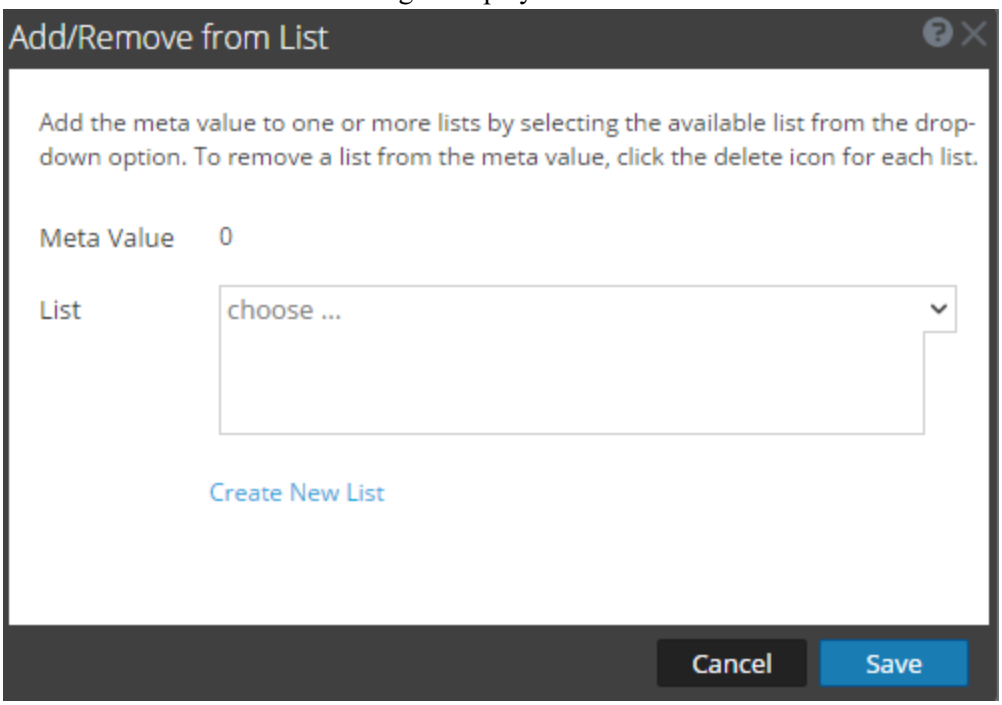
If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over any underlined entity.
2. In the **Actions** section of the tooltip, select **Pivot to Endpoint Thick Client**.
   The NetWitness Endpoint thick client application opens outside of your web browser.

For more information on the thick client, see the *NetWitness Endpoint User Guide*.

View the Context Lookup Panel in the Navigate View or Legacy Events View

1. Hover over different meta values to see the data sources for which data is available.
   A hover box displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, Feeds, and Live Connect.
2. Right-click a meta value, and click **Context Lookup** in the drop-down menu to open the Context Lookup panel.



The Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available.

3. To perform actions from the Context Lookup panel, right-click an entity such as IP address.
   The following options are available: Open Link in New Tab, Query in Investigate, Copy Link, Paste, Google Lookup, Virus Total Lookup, and Query in Endpoint.
4. To close the Context Lookup panel, click ✕ in the panel.

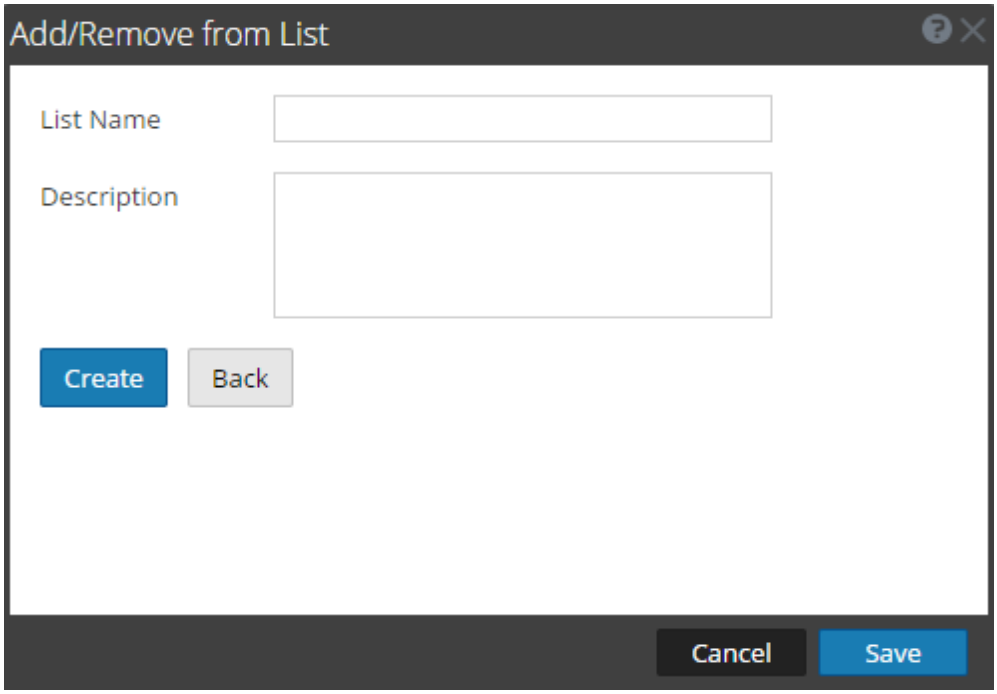
Add Meta Values to an Existing List (Navigate and Legacy Events Views)

To add a meta value to an existing list in Context Hub

1. While investigating a service in the **Navigate** view or the **Legacy Events** view, right-click a meta value (for example, values under Source IP, Destination IP, or Username) and select **Add/Remove from List** in the context menu.
   The Add/Remove from List dialog is displayed.

2. In the **List** field, select one or more lists from the drop-down option to which the meta value must be added.
3. Click **Save**.
   The meta value is added to the selected lists.

Remove a Meta Value from a Context Hub List (Navigate and Legacy Events Views)



To remove a meta value from list

1. In the **Add/Remove from List** dialog, in the **List** field, view the lists which include the meta value.
2. Click the delete icon (x) for each list that should not include the meta value.
3. Click **Save**.
   The meta value is removed from the deleted list.

Create a New List (Navigate and Legacy Events Views)

To create a Context Hub list in Investigate

1. In the **Add/Remove from List** dialog, click **Create New List**.

2. In the **List Name** field, enter an unique name for the list.
3. In the **Description** field, enter the description of the list.
4. Click **Create** to create the list.

5. Click **Save** to add the meta value to the created list.
   These lists are considered as data sources for retrieving context information.

Launch a Lookup of a Meta Key

When you have found data of interest in the Navigate view, the Events view, or the Legacy Events view, you can do internal lookups to NetWitness Endpoint and RSA Live, as well as external lookups of meta values in community resources such as SANS IP History and ThreatExpert Search.

Analysts can use the external lookups to save time during investigations. The external lookups are available by right-clicking one of the these meta keys: IP address (`ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip`), `host (alias-host, domain.dst)`, `client`, and `file-hash`.

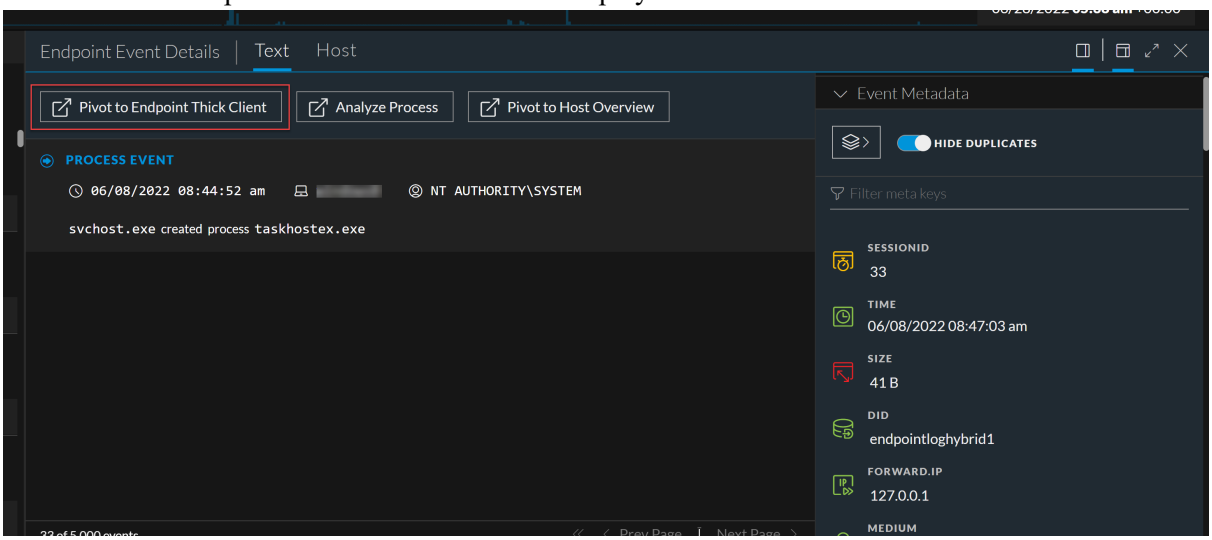
For all `ip` and `host` meta keys, the following lookups are built in to NetWitness:

- Google Malware: Opens a Google Malware search in a new tab.
- SANS IP History: Opens a SANS IP History search in a new tab.
- McAfee SiteAdvisor: Opens a McAfee SiteAdvisor search in a new tab.
- Endpoint Thick Client Lookup: Opens a search in the NetWitness Endpoint Thick Client in a new tab.
- BFK Passive DNS Collection: Opens a BFK Passive DNS collection search in a new tab.
- CentralOps Whois for IPs and Hostnames: Opens a CentralOps Whois search for IPs and hostnames in a new tab.
- Malwaredomainlist.com Search: Opens a Malwaredomainlist.com search in a new tab
- Robtex IP Search: Opens a RobtexIP search in a new tab.
- ThreatExpert Search: Opens a ThreatExpert search in a new tab
- IPVoidSearch: Opens a UrlVoid Search in a new tab n a new tab

For the `file-hash` and `alias-host` meta keys, the Google lookup opens a Google search in a new tab.

For the `client` meta key, the NetWitness Endpoint Lookup option opens an Endpoint Thick Client in a new tab if the client is installed on the same system on which the browser is being used.

Administrators can add additional external lookups and other custom actions as described in "Add Custom Context Menu Actions" in the *System Configuration Guide*.



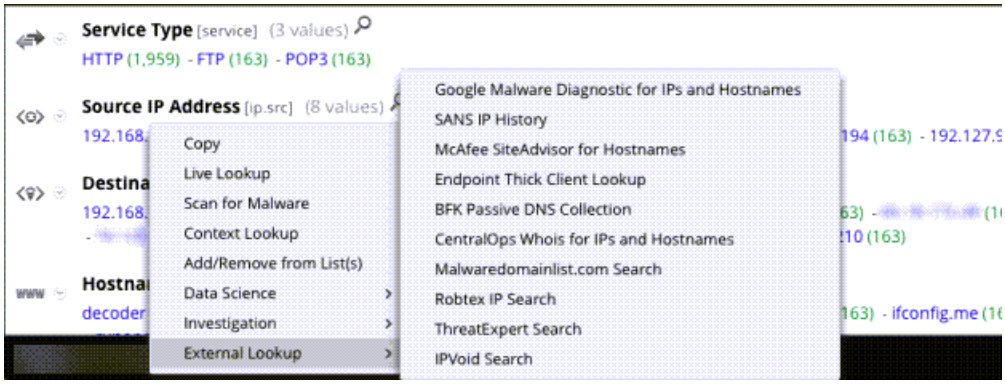
Launch an Endpoint Thick Client Lookup in the Events View

When viewing an endpoint event in the Text panel, you can pivot to analyze the same event in NetWitness Endpoint.

Note: Version 4.4.0.x of the NetWitness Endpoint (NWE) thick client must be installed on the same server, the NWE meta keys must exist in the `table-map.xml` file on the Log Decoder, and the NWE meta keys must exist in the `index-concentrator-custom.xml` file. The NWE thick client is a Windows only application. Complete setup instructions are provided in the *NetWitness Endpoint User Guide* for Version 4.4.

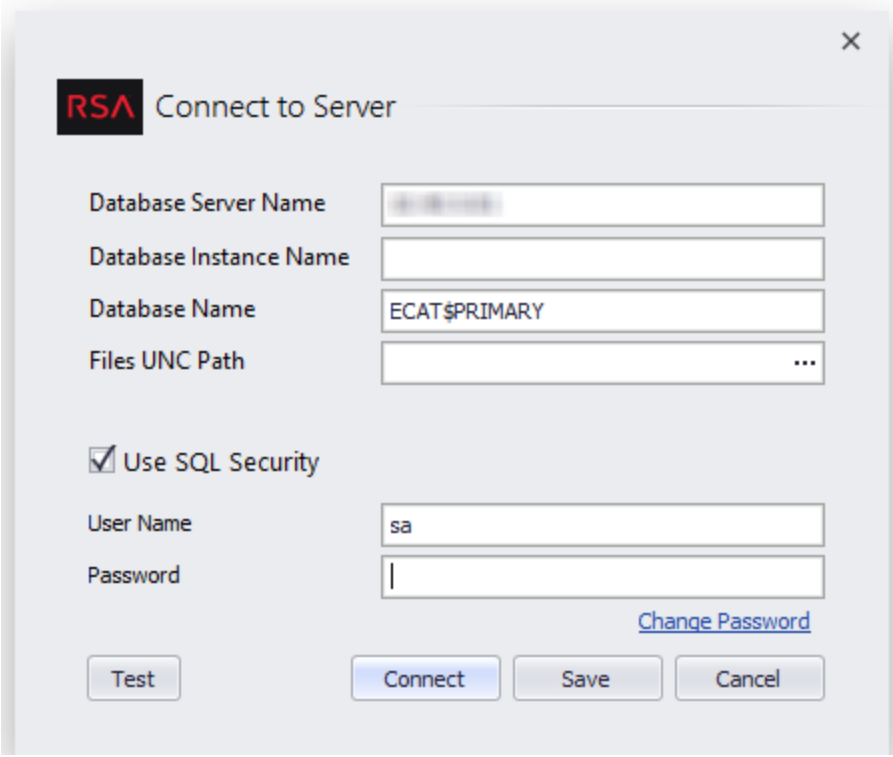
To open an event in NetWitness Endpoint:

1. Starting from the Navigate view:
   a. In the **Query** drop-down, select **Advanced**, and enter one of the following queries:
   `nwe.callback_id exists` or `device.type='nwendpoint'`
   Endpoint data is displayed in the Values panel.
   b. Right-click an event, and select **Events** in the menu.
2. (Version 11.1 and later) Go to **Investigate > Events**. In the **Query** drop-down, select **Advanced**, and enter one of the following queries: `nwe.callback_id exists` or `device.type='nwendpoint'`
   Endpoint data is displayed in the Events panel.
3. Select an event.
   The Events view opens with the selected event displayed in the Text view.



4. In the Event Header click **Pivot to Endpoint.**
   A new browser tab with the url `ecatui://<id>` opens and the NWE Thick Client is launched. If the NetWitness Endpoint Thick Client is not installed, no data is displayed and the following message is displayed: `Applicable for hosts with 4.x Endpoint agents installed, please install the NetWitness Endpoint Thick Client.`

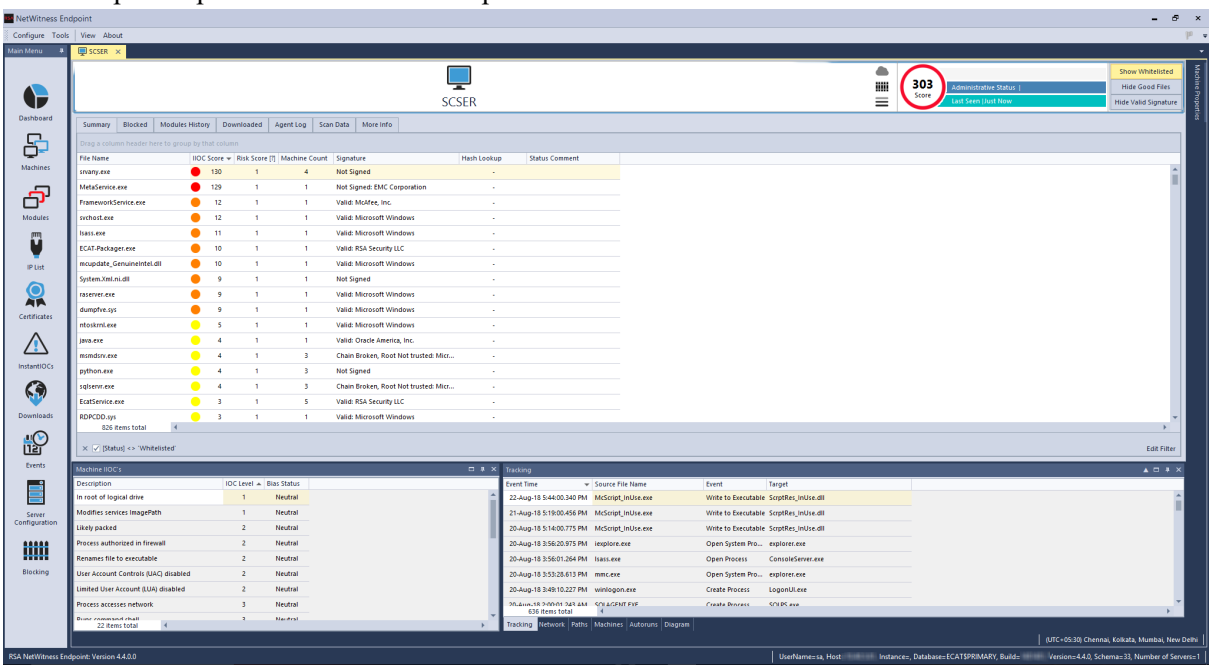
Launch an Endpoint Thick Client Lookup in the Navigate View



To launch an Endpoint Thick Client lookup of data from the Navigate view:

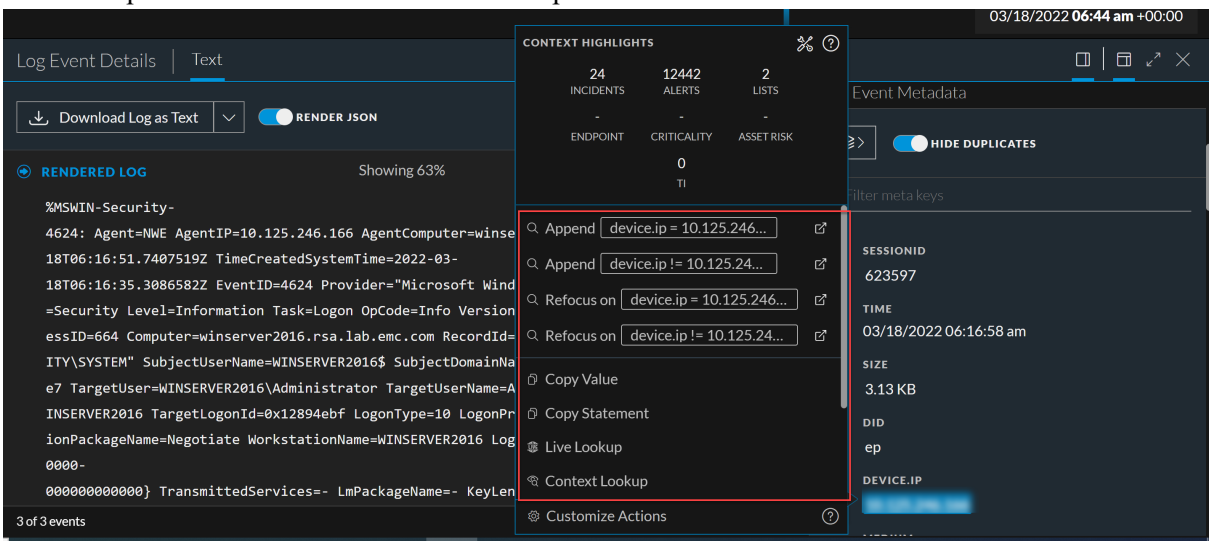
1. Right-click a meta value for one of the following meta keys: `ip-src`, `ip-dst`, `ipv6-src`, `ipv6-dst`, `orig_ip`, `alias-host`, `domain.dst`, or `client`.

2. Select **External Lookup** in the context menu.
   A submenu of external lookup options is displayed.



3. Select **Endpoint Thick Client Lookup**.
   The Connect to Server dialog is displayed.

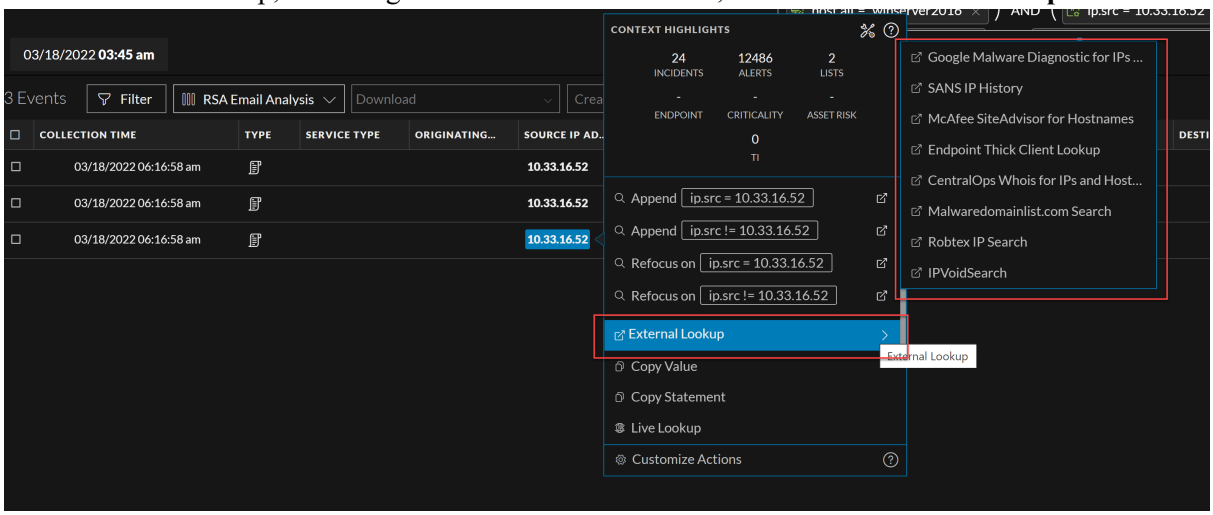
4. Enter the user name and password required to log in to the Endpoint Thick Client, and click **Connect.**



The drill point opens in NetWitness Endpoint.

Perform Lookups of Meta Values in Events

In the Events view, you can further investigate meta values in an event by left or right-clicking certain meta values and using the options in a drop-down menu. To perform internal, external and VirusTotal lookups:

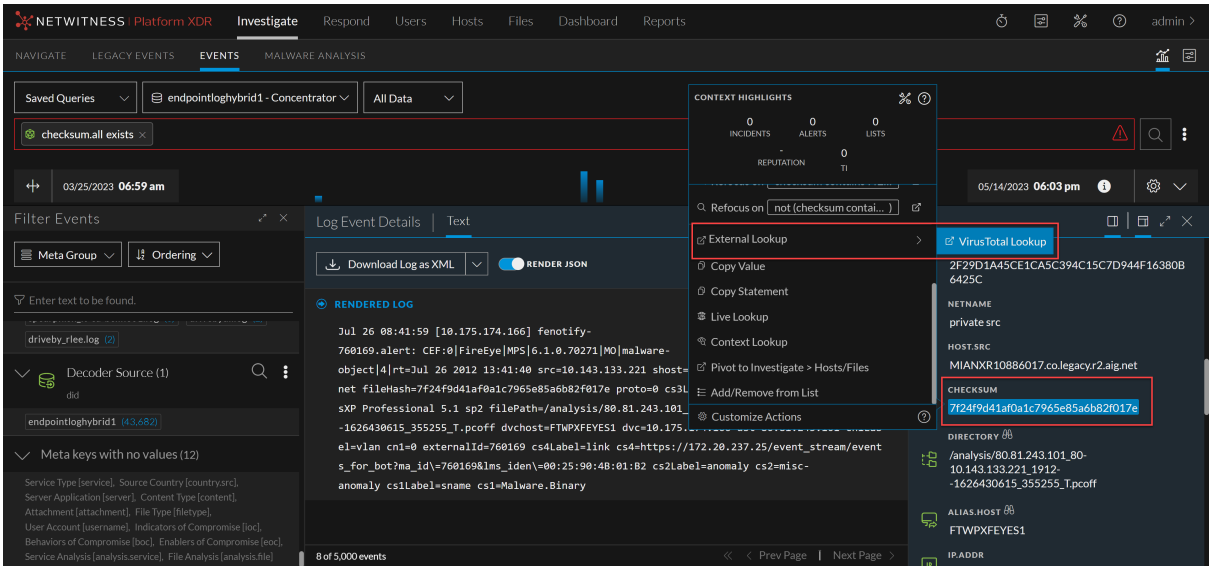


1. In the Events view, left or right-click a meta value in the Events List, the Event Meta panel, or the Overview panel. Some meta values have a drop-down menu.

2. Select one of the following internal lookups:

- **Copy Value**: Copies the meta value to the clipboard.
- **Refocus Investigation in New tab**: Launches the another investigation in a new tab with the focus on the selected meta value.
- **Apply Drill in New Tab**: Applies the drill and launches it in a new tab to drill the data in Navigate view.
- **Apply !EQUALS Drill in New Tab**: Applies (!EQUALS) to the meta and launches a new tab, effectively excluding the meta value from the results.
- **Hosts Lookup**: Looks up the value in the Investigate > Hosts view.
- **Endpoint Thick Client Lookup**: Analyzes the meta value in the Endpoint Thick Client (for clients which have Endpoint Agent).
- **Live Lookup**: Looks up a meta value on Live for further analysis.

3. For an external lookup, left or right-click on a selected meta, and click **External Lookup**.

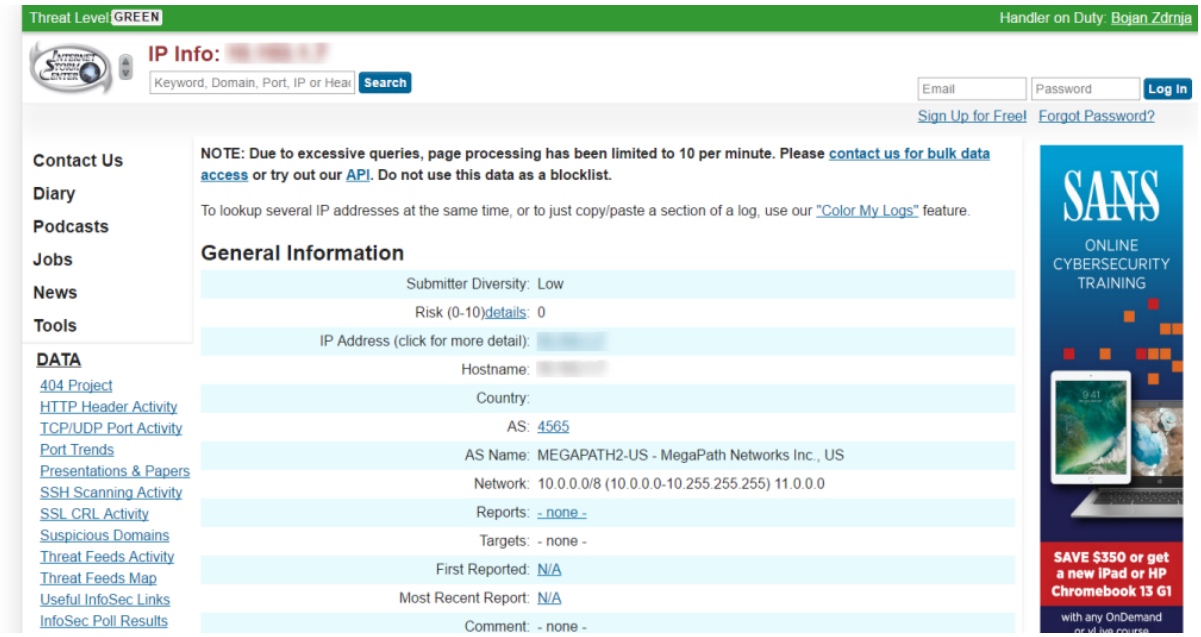


4. In the submenu select one of the available external lookups:
   - **Google**: Looks up a meta value on Google.com
   - **SANS IP History**: Looks up a meta value on SANS IP History, domain = http://isc.sans.org/ipinfo.html?ip=ipaddress
   - **CentralOps Whois for IPs and Hostnames**: Looks up a meta value on CentralOps Whois for IPs and Hostnames, domain = http://centralops.net/co/DomainDossier.aspx?addr=domain&dom_whois=true&dom_dns=true&net_whois=true
   - **Robtex IP Search**: Looks up a meta value on Robtext IP Search, domain = https://www.robtex.com/cidr/domain.ipaddress
   - **IPVoid**: Looks up a meta value on IPVoid, domain = http://www.ipvoid.com/scan/domain/
   - **URLVoid**: Looks up a meta value on URLVoid, domain = http://www.urlvoid.com/scan/ipaddress/
   - **ThreatExpert Search**: Looks up an IP meta value on ThreatExpert Search, domain = http://www.threatexpert.com/reports.aspx?find=IP address

5. For a VirusTotal Lookup:
   - In the Events view, left or right-click a meta value having checksum in the Events List, Filter Events Panel or the Event Meta panel.

     The Context Highlights dialog is displayed.
   - Click **External Lookup** > **VirusTotal Lookup**.

     This looks up the hash value on the VirusTotal for rapid lookup and analysis.



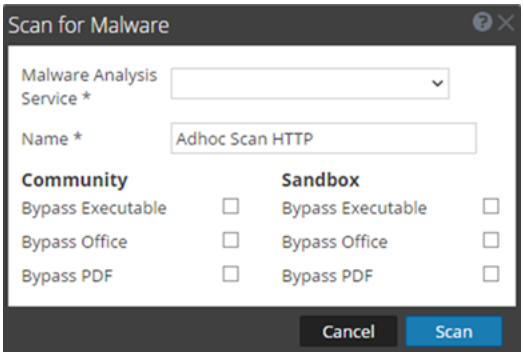
Launch Other External Lookups from the Navigate View

To launch an external lookup of data from the Navigate view (other than NetWitness Endpoint Thick Client Lookup):

1. Right-click a meta value for one of the following meta keys: `ip-src`, `ip-dst`, `ipv6-src`, `ipv6-dst`, `orig_ip`, `alias-host`, `domain.dst`, or `client`.
2. Select **External Lookup** in the context menu.
   A submenu of external lookup options is displayed.

3. Select one of the lookup options.
   The selected meta value opens in the selected lookup, for example, if you selected SANS IP History, the drill point information is displayed in SANS Internet Storm Center.

Launch a Malware Analysis Scan from the Navigate View



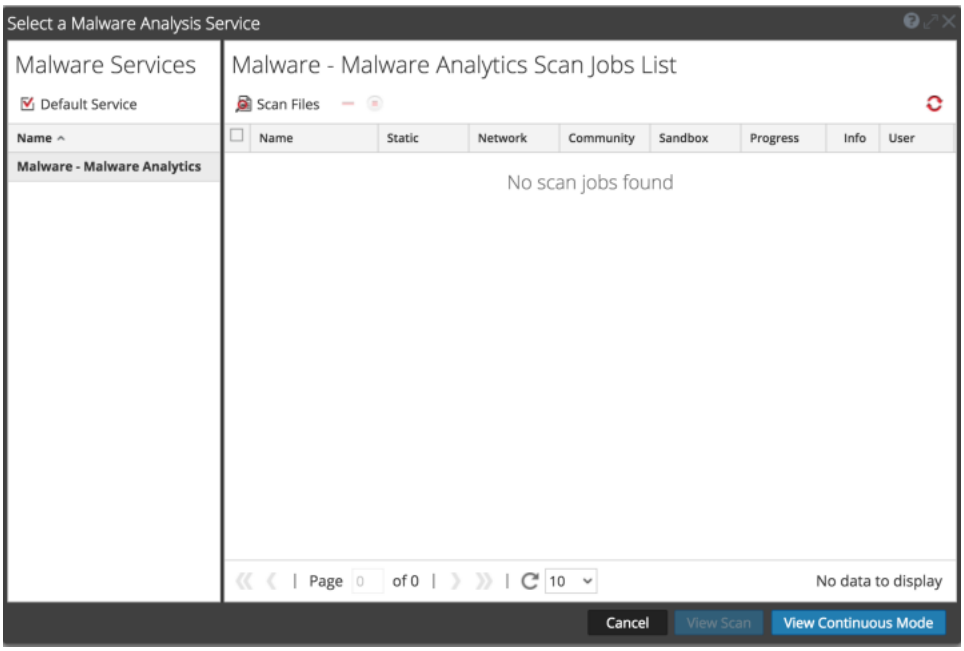
From within Investigate, analysts can launch an on-demand Malware Analysis scan by selecting a service and meta value, and choosing an option from the context menu. When polling is complete, the scanned data is available for malware analysis.

To launch a Malware Analysis scan of data from the **Investigate** > **Navigate** view:

1. Right-click a meta value (for example, OTHER, DNS, or FTP) and select **Scan for Malware** in the context menu.

   The Scan for Malware dialog is displayed with a suggested name for the on-demand scan and no service selected.

2. In the Scan for Malware dialog, select a service to perform the scan, edit the name, and select the types of files to bypass under community and sandbox.



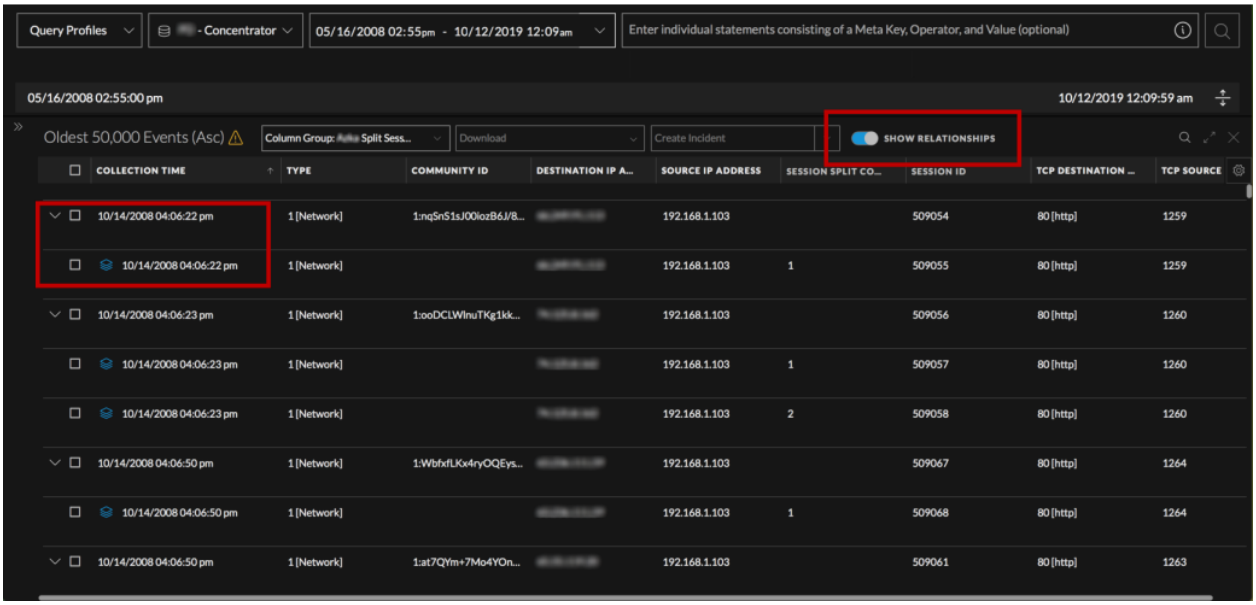
3. Click **Scan**.

   The scan request is added to the Scan Jobs List dashlet and the Jobs Tray. The bypass settings in this dialog override the default settings in the basic Malware Analysis configuration settings.

4. To view the jobs, do one of the following:

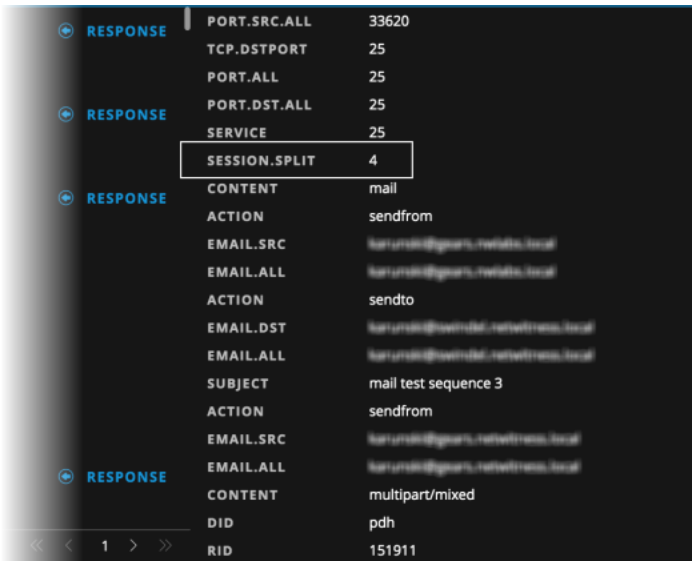
   a. Go to the Scan Jobs List in the Malware Analysis view or in the Unified dashboard. Double-click a scan to view the scan.

b. To view the job in the Jobs tray, click  in the NetWitness toolbar. When the job is complete, scroll to the left and click **View**.



The Malware Summary of Events for the selected scan is displayed. The scan is also added to the list of available scans in the dialog for selecting scans in the Investigation > Malware tab.

Group Events from Split and Related Sessions in the Events and Legacy Events Views



In the Events view listing of events, events from split and related sessions are listed in the order they were parsed; for this reason, they are not always listed together in the Events list. In Version 11.4.1 and later, the Group Events option allows you to change the order in which the events are listed so that you can more easily detect relationships in the captured data. When events are grouped, we refer to the first event as the leading event.

The user interface is designed to help you identify grouped events. Solid row lines delineate different groups of related events while dotted lines depict the events that are part of the same related group. In a group of events, the leading event is first and subsequent events are nested under the leading event with indentation and relationship icons for subsequent events. The numbers next to the relationship icon distinguish the session split count.

If the leading event is not included in the current data set, the subsequent events are still grouped together under the first subsequent event. Only the leading event or the first subsequent event, in the case of no leading event, is sorted; indented events are not sorted. Hovering over the subsequent event marker () displays a tool tip explaining the relationship. The following figure is an example of related events as they are displayed in the Events list.

If events are related based on session fragments, when you select a subsequent event and open the reconstruction, you can see the `session.split` meta key in the Event Meta panel.

Split Network Session

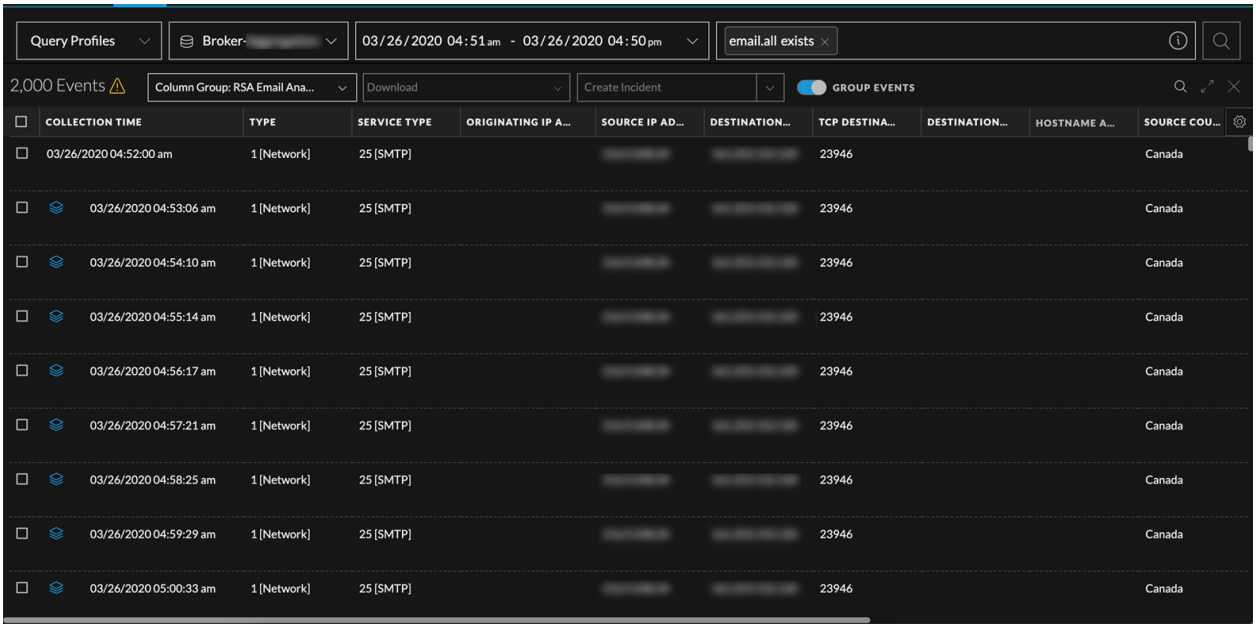
If you see a tool tip like this, the listed events are part of a split network session:
`The event is part of a split session (session.split: #) matching these parameters: ip.src=127.0.0.1 AND ip.dst=127.0.0.1 AND tcp.srcport=25 AND tcp.dstport=1234.`

The reason for the split is one of the following:

- The original event was split into sub-parts by creating additional events for each transaction inside the original event.
- The original session was split as it was ingested into the Network Decoder because the size was larger than the Assembler Maximum Size (default=32 MB).
- The original session was split as it was ingested into the Network Decoder because the time was longer than the Assembler Timeout Session (default=60 sec).

Session Size and Time Split

Network Decoders are configured with a default session size (`assembler.size.max`) and a session timeout (`assembler.timeout.session`). The configuration is described in "Configure Session Split Timeouts" in the *Decoder Configuration Guide*. When a session exceeds either limit, the Network Decoder splits the session, and all subsequent packets become part of a new session, fragmenting the actual network session across multiple Network Decoder sessions. To process session fragments with the context that they are fragments of the larger network session and to improve association of source and destination addresses, ports, and application protocols, Network Decoders parse contextual fragments and highlight session fragments.



Note: In the Legacy Events view, you can find session fragments and export all packets viewed in the Events list to a single PCAP as described in Find and Combine Fragments in the Legacy Events View.

The Network Decoder completes session parsing before splitting the session based on the configured maximum session size (default = 32 MB) or the configured timeout (default = 60 seconds). When parsing is complete, the parsed results include the proper address directionality and application protocol, which are propagated to each subsequent session fragment to ensure consistency with the logical network session they represent.

Transaction Handling Split

Administrators can configure a Network Decoder to subdivide incoming sessions into smaller transaction sessions when using Lua parsers that are designed to create transactions. The configuration is described in "Configure Transaction Handling on a Decoder" in the *Decoder Configuration Guide*. The Decoder service configuration node has a parameter that controls the behavior of the Network Decoder when a parser defines a transaction within a network session: `/decoder/parsers/config/parser.transaction.mode`. If the mode is set to `split`, a large session with multiple application-level transactions is split when a parser generates an application-level transaction such as an email. An example of this is a large session containing multiple emails. For each email (transaction), a new session item (split session) is created, network meta items are copied into the new session, and meta items marked in the transaction are copied from the original session to the new session.

Transactions require a parser update to function, and initially they only support SMTP and HTTP pipelining use cases. This is an example of the reconstruction of an email that is separated based on the individual emails inside the original event. Each transaction highlights a single email and the metadata associated with the transaction is only related to that email. To provide this functionality, the original packets are stored on the Network Decoder as usual for a network event, but the new related transaction events are created on the Concentrator. As a result, analysts see visual queues in the user interface, and they also have the ability to query to find only specific emails or attributes of emails that were previously all bundled together. To eliminate the original event from the query results, the `session.split` meta key has been indexed. When there are transaction splits, the original event does not have that meta key associated with it while all the related transactional events do.

Session Fragments Highlighting

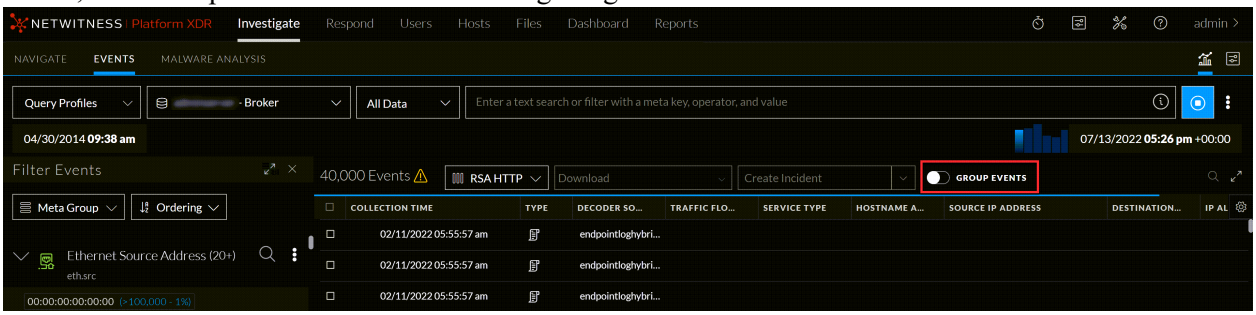
Both types of session fragments have an additional meta key: `session.split`. The earliest fragment is session 0 and sessions with a later time stamp are incrementally numbered 1, 2, 3, and so on. The `session.split` meta key indicates the number of preceding sessions fragments; however, it does not always indicate that there are subsequent session fragments, even with a value of 0. It is also possible for the first fragment of the session to not have `session.split` metadata if the session is parsed before exceeding the maximum session size.

Transaction splits start with a `session.split` value of 1. When viewing sessions, the `session.split` meta key clearly identifies sessions that are fragments in the Events view and the Legacy Events view (Events List view and the Events Detail view).

If this was a session size and timeout split, you can view the session fragments and determine the maximum session size or session timeout necessary for parsing to combine the split sessions into one again. For example, if you have four fragments at 32 MB, you need to configure your test Decoder (usually a virtual machine set up separately from the production service) with a maximum session size greater than 128 MB. The steps are the same to find all fragments based on a session timeout.

Related Network Session

If you see a tool tip like this, separate events processed by the Network Decoder share a set of four values that identify the IP source, IP destination, source port, and destination port:



```
The event is related to a previous session matching these parameters:
ip.src=127.0.0.1 AND ip.dst=127.0.0.1 AND tcp.srcport=25 AND
tcp.dstport=1234"Second category: Related Network Session
```

In this case, the Network Decoder has not inserted a split, and there is no `session.split` metadata associated to any of the events. The reason these events grouped together is to highlight the events that are worthy of scrutiny based on a pattern. Each event has the same source IP address, the same destination IP address, the same source port, and the same destination port. The grouping of related events does not occur if any of the four meta keys is obfuscated for data privacy reasons.

These are the combinations of meta keys that must match to categorize an event as a Related Network Session:

- `ip.dst`, `ip.src`, `tcp.dstport`, `tcp.srcport`
- `ip.dst`, `ip.src`, `upd.dstport`, `udp.srcport`
- `ipv6.dst`, `ipv6.src`, `tcp.dstport`, `tcp.srcport`
- `ipv6.dst`, `ipv6.src`, `upd.dstport`, `udp.srcport`

In Version 11.6, the group events option that retrieves events from logs, network and endpoints is disabled when data privacy is enabled. For example, if the `'ip.src'` is blacklisted or restricted by the admin, then the option shown in the following image is disabled.

This option is disabled if one or more of the following 12 metas are restricted:

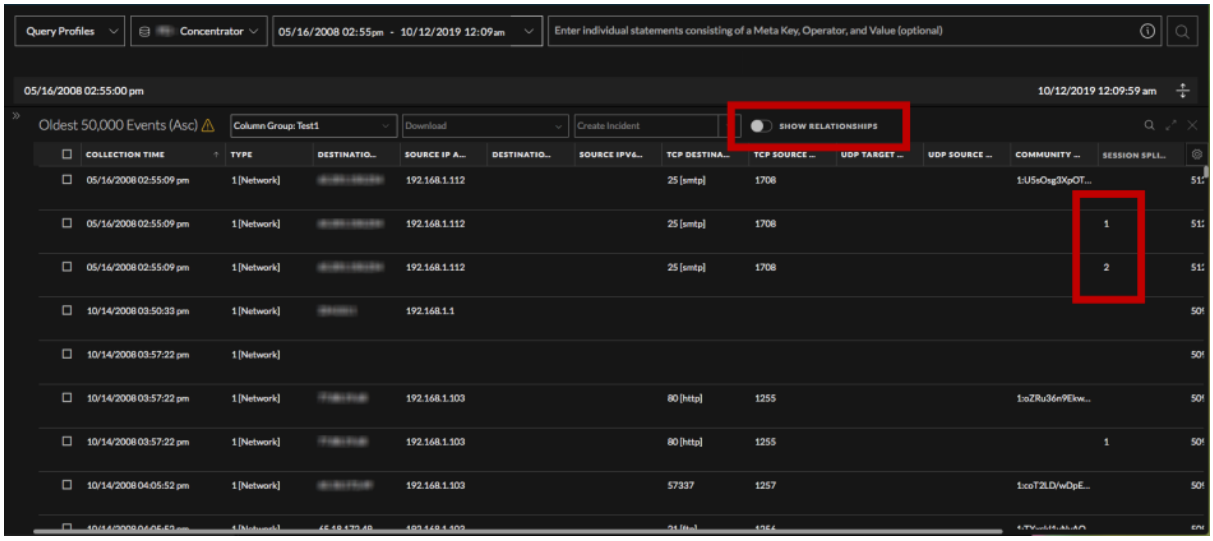
```
'sessionid'
'nwe.callback_id'
'medium'
'session.split'
'ip.dst'
'ip.src'
'ipv6.src'
'ipv6.dst'
'tcp.dstport'
'tcp.srcport'
'udp.dstport',
'udp.srcport'
```

Use Cases for Viewing Events from Split and Related Network Sessions

These are examples of practical use cases for viewing events from split sessions:

- A Network Decoder that is inline with a proxy server receives a lot of email connections that get bundled into a single session based on event time as NetWitness sees them. The single session has multiple meta values for `subject`, `email.src`, `email.dst`, and other meta keys relevant to email, which are difficult to map together correctly. Seeing the session organized as leading and subsequent events, gives the analyst a clear idea of the details of each email.
- An analyst is attempting to understand what IP address out of all the metadata associated with a session resulted in the generated metadata or an alert, but the IP address is not in the output. For example, a feed that is parsing for an indicator of compromise may have many triggers in a session that has many IP addresses. By viewing the complete event organized as leading and subsequent events, the analyst can understand which IP triggered the alert.
- An analyst wants to know which file was deleted from which directory versus which file was read out in which directory, but the session encompasses multiple files and directories. For example, an HTTP

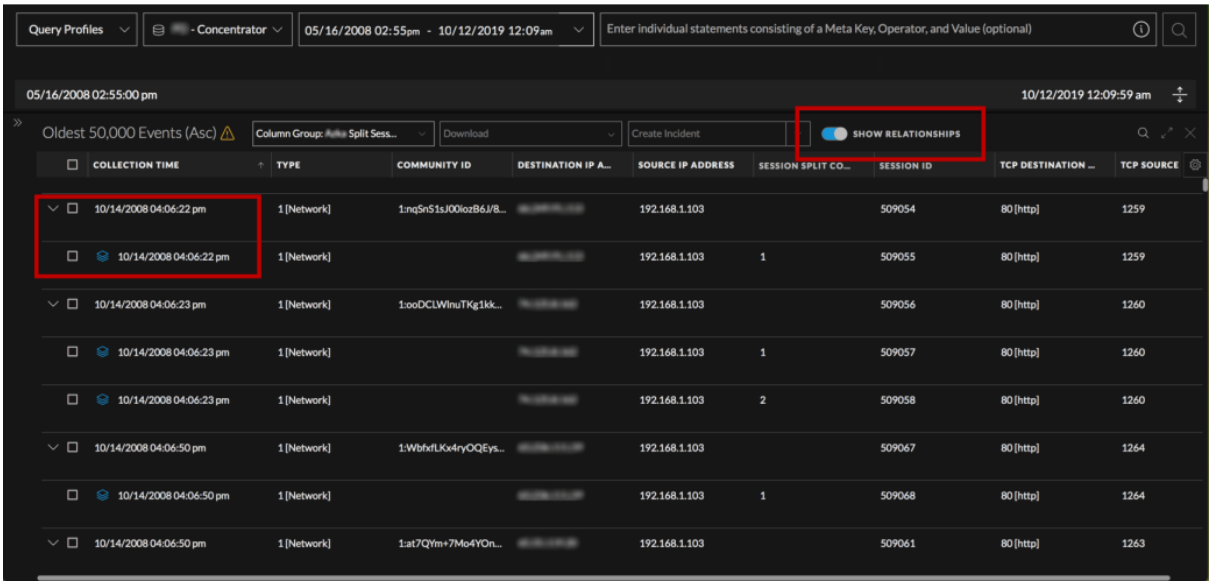
connection with commands: `directory /keep/`, `directory /temp/`, `filename foo.txt`, `filename me.doc`, `action delete`, and `action read`. Viewing the leading and subsequent events tells the analyst that `/temp/me.doc` was deleted and `/keep/foo.txt` was read. Now the analyst or analytics can form an opinion about how bad these actions really were.



- An analyst is attempting to retrieve a large file related to an event that triggered a suspicous alert. However, the file that was transferred was so large that the network decoder split it into 100 separate sessions. When viewing this group related split sessions, the analyst can download a PCAP of the sessions, then extract the original file by either running it through a Decoder with larger assembler settings or a third-party tool.

Show and Hide Relationships in the Events List

For both types of related events, you can see the relationship of events in the Events view Events list. When the Events list is first displayed, you can tell if set of results includes related events by looking at the Group Events switch at the top of the Events list. If the results do not include related events, the switch is dimmed as shown in the following figure.

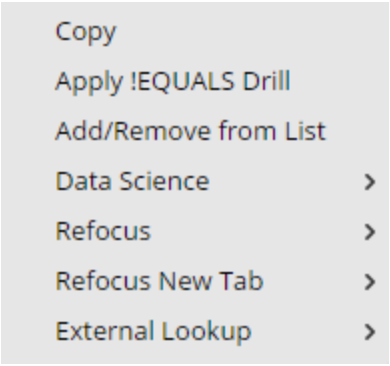


To look for related events in the Events list

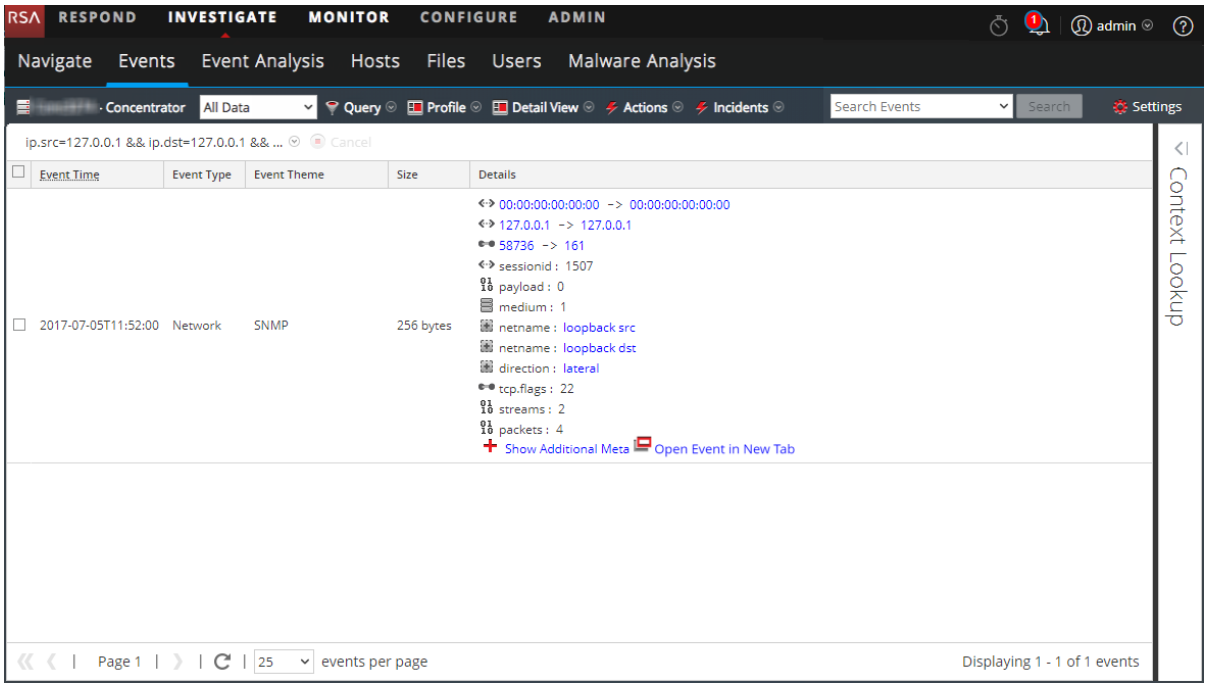
1. Go to **Investigate > Events** and submit a query.
   If the results include related events, the Group Events switch is active, but not enabled. The figure below illustrates a set of results that include split sessions, and the Group Events switch is disabled. The related events are not nested.

2. Click the **Group Events** switch.
   Related subsequent events are nested below the leading event. The subsequent events are indented

and marked by an icon. Clicking on the icon explains why the event is grouped.



Find and Combine Fragments in the Legacy Events View



From within the Legacy Events view, you can find fragments of a session using the Refocus > Find Session Fragments context menu option. NetWitness composes a query using the source and destination addresses and ports of the selected session and displays all sessions that match that query within the current time window.

To find session fragments

1. In the **Legacy Events** view, right-click any of the source and destination address and port values: `ip.src`, `ip.dst`, `ipv6.src`, `ipv6.dst`, `tcp.srcport`, `tcp.dstport`, `udp.srcport`, and `udp.dstport`) as well as `session.split` values.
   The context menu is displayed.

2. Select **Refocus > Find Session Fragments** or **Refocus New Tab > Find Session Fragments**.
   NetWitness repopulates the Events list with session fragments for a single session within the current time range. Depending on the option you selected, the refocus replaces the current view or opens in a new tab. (All data is used in these examples but is not recommended on production systems).

3. If necessary, adjust the time range to include any session fragments that may precede or follow the current time window. You can tell that the time range needs to be expanded if the fragments occur near the time boundary, especially if the first visible fragment does not have a split value of 0 (or none). Alternately, inspecting the packets of the last visible session may lead you to believe that the session continues. Here is an example:

   a. If you are looking at fragments that are obviously not the first fragment, for example, 1, 2, 3, and 4 in time range 10:30 to 10:35, there should be a fragment 0. You can increase the time range to start earlier (for this example, 10:25) to find the additional fragment.

   b. If the session size of last fragment is close to maximum session size (12 MB in this example), look for additional fragments by increasing the time window to include a later time (for this example, 10:40).
   When all of the session fragments of a network session are included within a single Events list, the list can span multiple pages.

4. (Optional) To export the packets for every session fragment to a single PCAP file, select **Actions > Export All PCAP**.
   A message informs you that the PCAP is being downloaded. When download is complete, PCAP file includes the entire network session that was fragmented.

Visualize Metadata as Parallel Coordinates

Analysts can use the parallel coordinates visualization in the Navigate view to focus the investigation on combinations of meta keys and meta entities, and values that may indicate events are abnormal and worth investigation. The parallel coordinates chart is a way of visualizing the current drill point in Investigate to examine more than two meta keys simultaneously. Visualizing multiple meta keys simultaneously can help in identifying security issues associated with multivariate patterns and comparisons, such as when individual meta keys and values may not be of concern, but combining them together may bring an abnormal pattern or relationship to light. Meta groups (see Use Meta Groups to Focus on Relevant Meta Keys) can be used effectively to define a collection of meta keys that you want to visualize as parallel coordinates.

Best Practices for Effective Parallel Coordinates Charts

To create effective parallel coordinates charts, follow these recommendations:

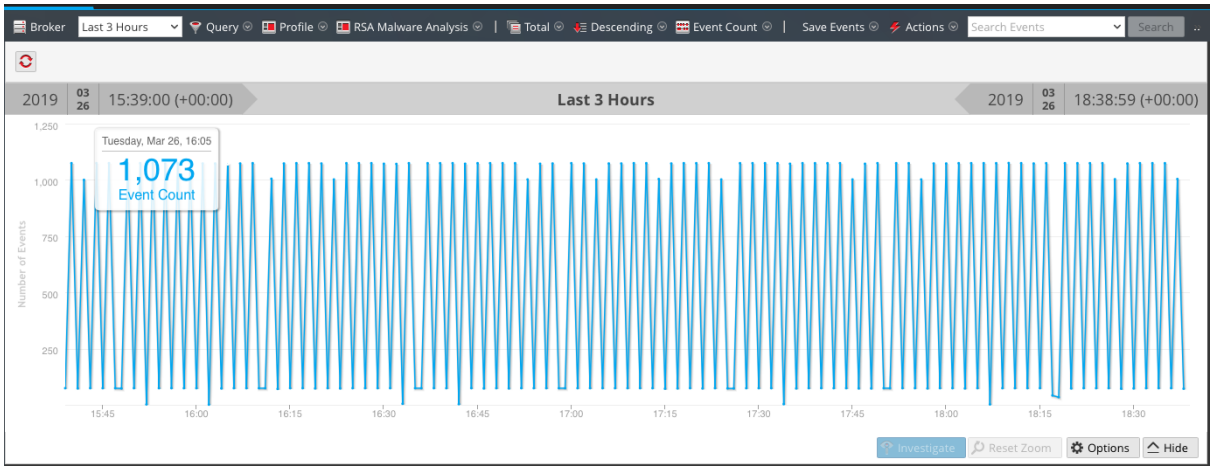
- Use the RSA built-in meta groups that are included in a new installation.
- Start from a drill point rather than attempting to visualize all data.
- Limit the time range if necessary.
- Choose the smallest useful set of meta keys to display as axes.
- Specify the sequence of axes to highlight anomalies between the meta values as you follow a line across the chart.
- When you can identify a useful set of meta keys and sequence, create a custom meta group to use for future investigations. For example, you can create a custom meta group for Windows executable file types.
- Reuse and share custom meta groups by importing and exporting groups as `.jsn` files.
- It may be useful to create two versions of each custom meta group. One for analysis of meta values and one for creating a parallel coordinates chart focusing on a smaller subset of the same use case.

Note: When you import meta groups, an error message is displayed if any group is already present. To import a group that is a duplicate, you must first delete the existing group. If you want to delete a meta group, it cannot be in use by a profile.

To help build better parallel coordinates charts, several optimizations are included in NetWitness.

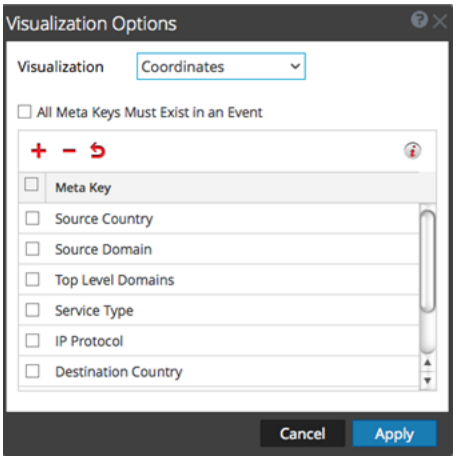
- Analysts can specify that only sessions in which all meta keys exist are rendered in the chart.
- The administrator can increase the number of meta values rendered in the Parallel Coordinates Settings in the ADMIN > System > Investigation panel > Navigate tab.

RSA Meta Groups for Parallel Coordinates Use Cases



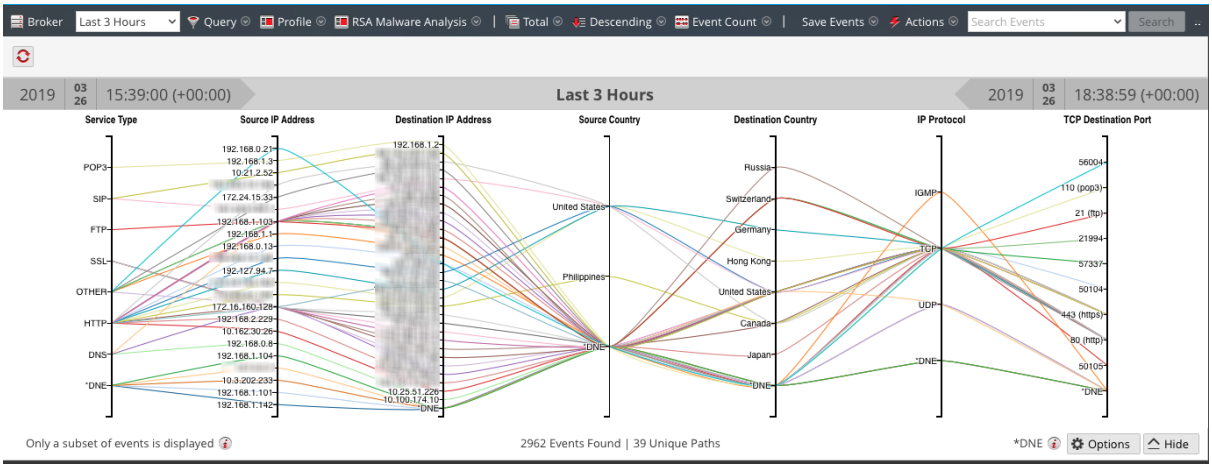
A set of predefined meta groups is included with NetWitness. If you want to get the latest version, you can import the meta groups file, `MetaGroups_ootb_w_query.jsn`, in the Manage Meta Groups dialog. Some of the targeted activities that lend themselves well to Parallel Coordinates visualizations are:

- Botnet Beaconing
- Covert Channels
- Email Analysis
- Encrypted Sessions
- Endpoint Analysis
- File Analysis
- Malware Analysis
- HTTP
- SSL/TLS
- SQL Injection Attacks
- Threat Analysis
- Web Analysis



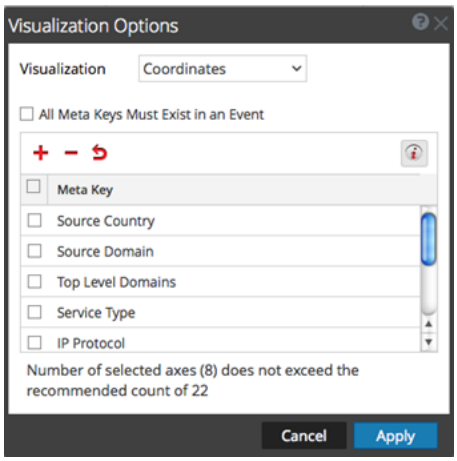
View a Parallel Coordinates Visualization

From an investigation in the Investigate > Navigate view:

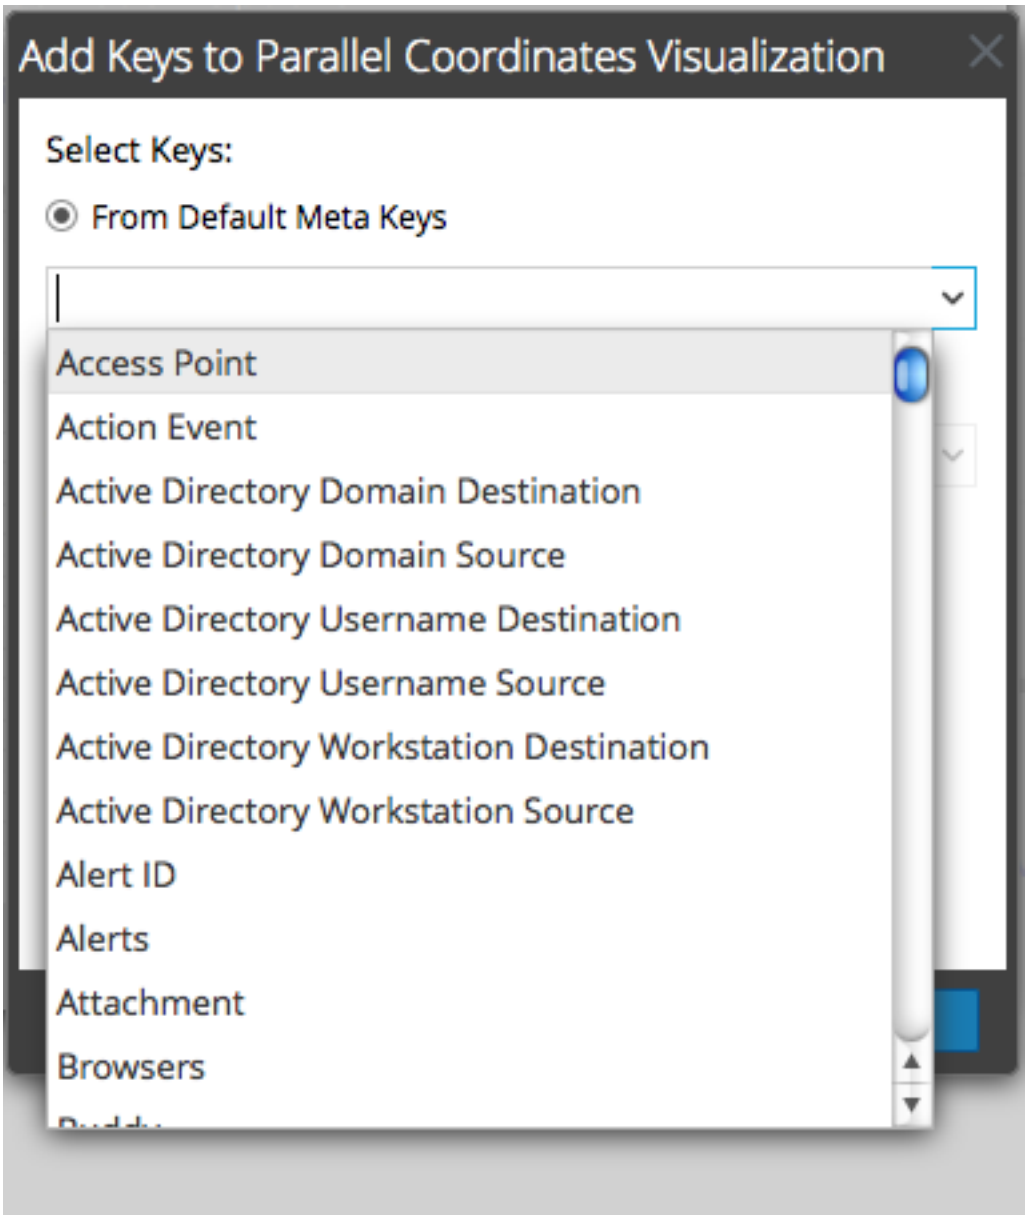


1. If the Visualization panel above the Values panel is closed, select **Visualization**.
2. In the toolbar, select **Meta** > **Use Meta Group > RSA Malware Analysis**.
3. A default visualization for the current drill point is displayed as a timeline.

4. In the **Visualization** panel, select **Options**.
   The Visualization Options dialog is displayed.
5. In the **Visualization** drop-down list, select **Coordinates** and click **Apply**.

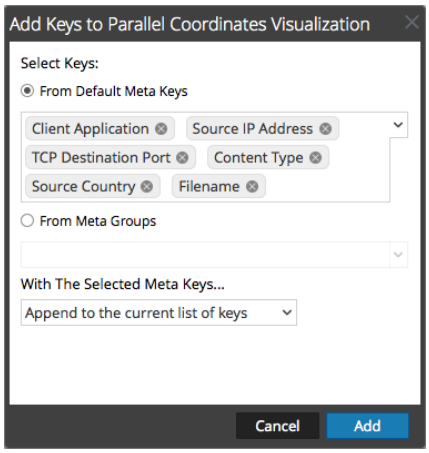


The visualization is loaded. In this example, 2962 events are found and 39 unique paths are visualized.

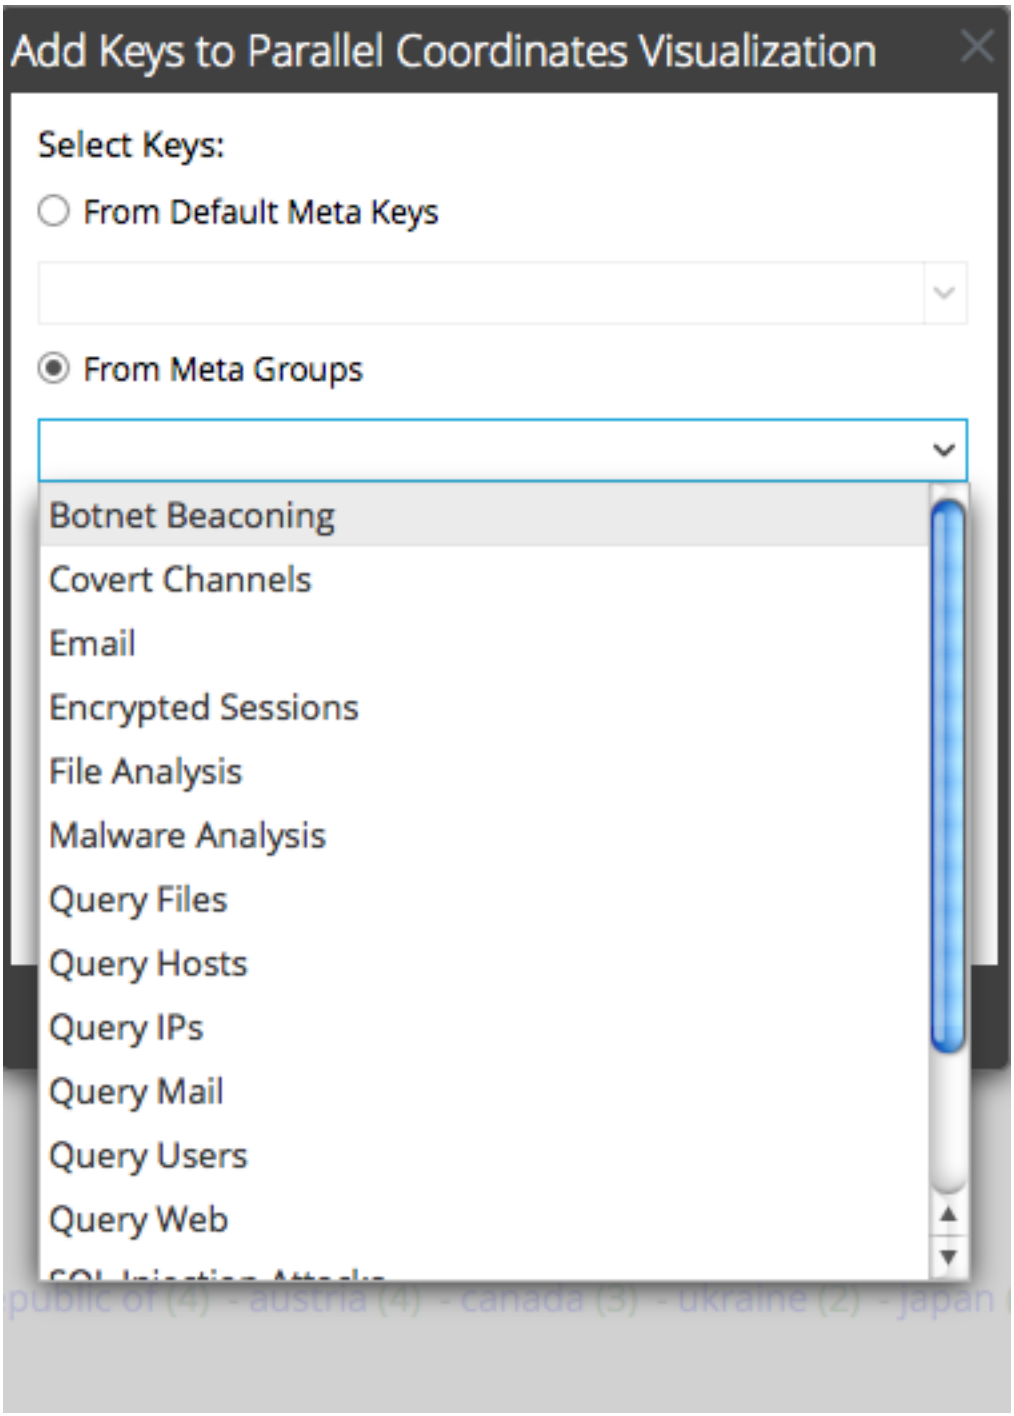


Select Meta Keys for a Parallel Coordinates Visualization

With a Parallel Coordinates visualization open, do the following:

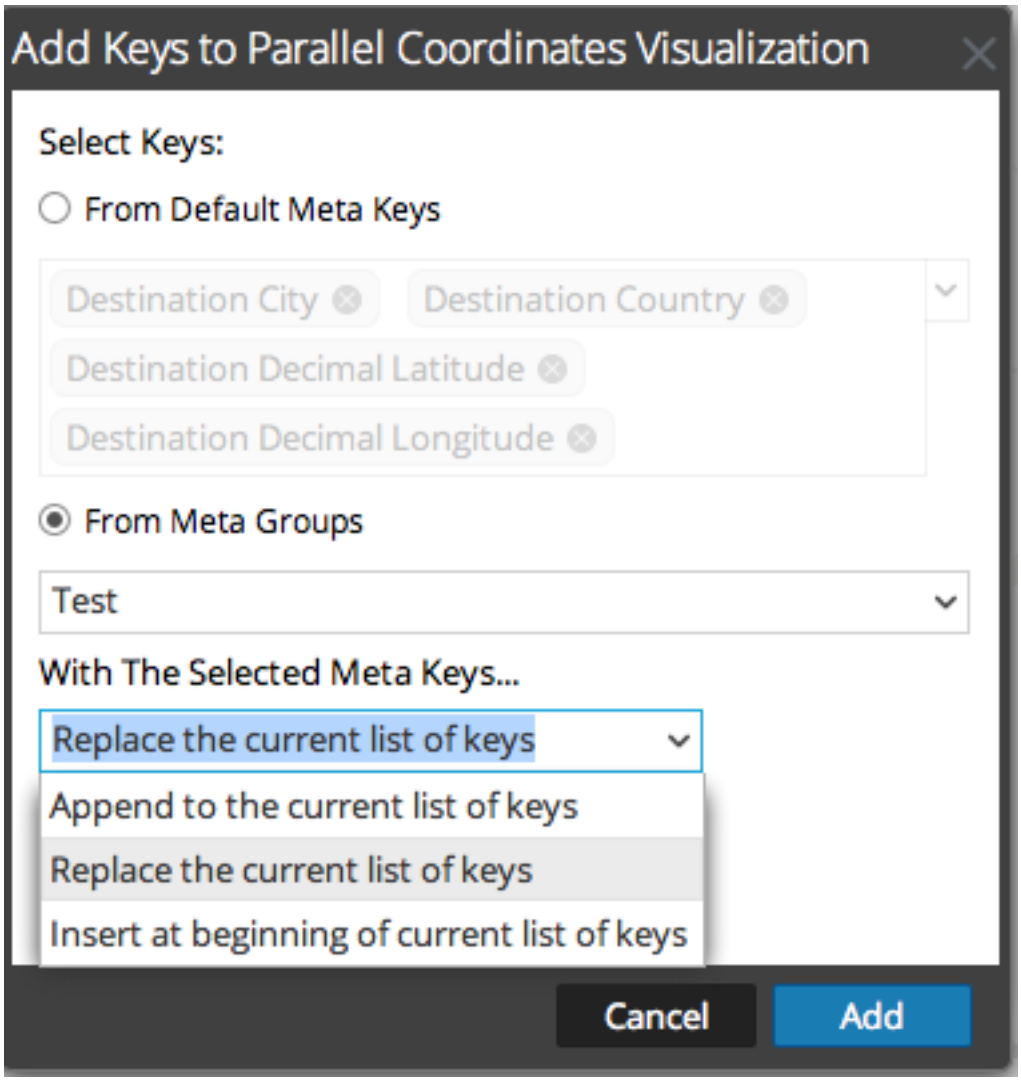


1. In the Visualization panel, select **Options**.
   The Visualization Options dialog is displayed. In the toolbar, click  to display the recommended number of axes for a readable visualization. When a recommended count of keys is displayed, the count changes based on the browser size. If you make the browser window larger, the recommended count is increased.



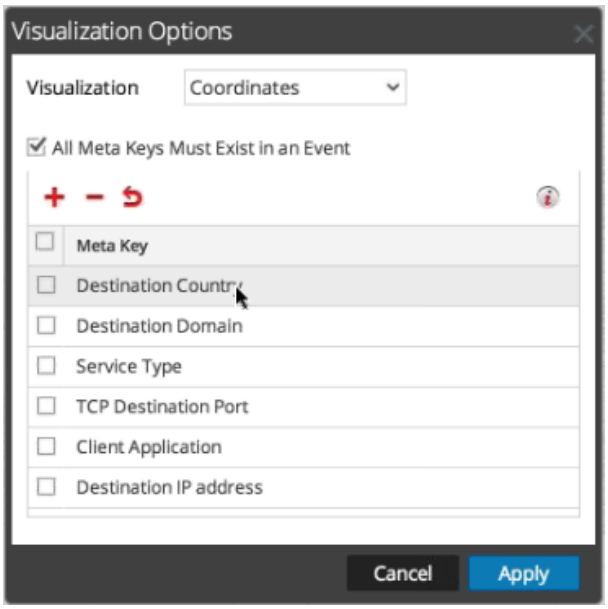
2. If you want to change the sequence of the meta keys, drag meta keys up or down to the desired sequence.
3. If you want to delete any meta keys, click in the selection box, and click .
   The meta keys are removed, but the change has not been applied.
4. If you want to revert to the previous state, click .
   Any meta keys you have deleted are restored and any changes that you made are removed.
5. If you want to select individual meta keys, click , select **From Default keys**, and in the drop-down list, select the meta keys.

The selected keys are listed.

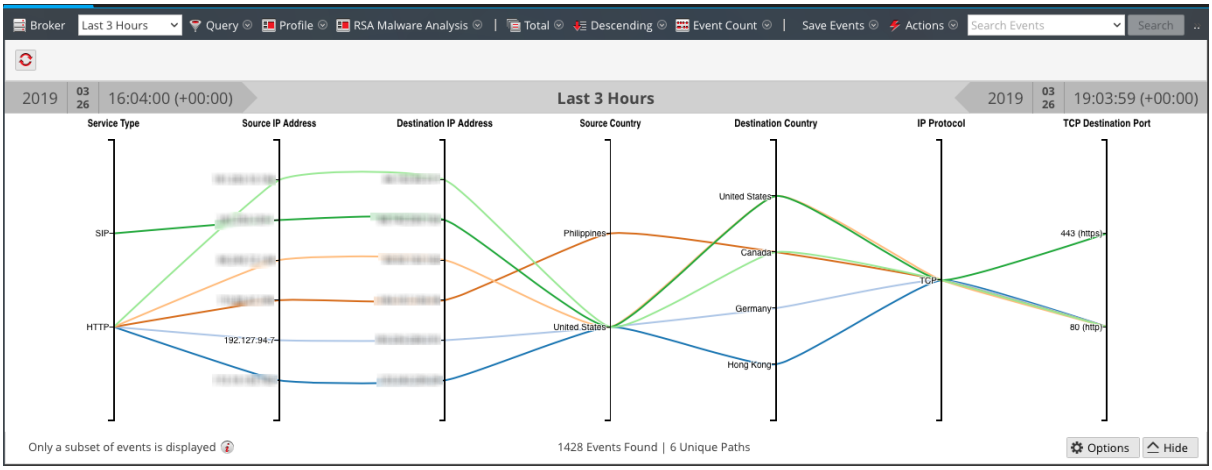


6. If you want to add all the keys in a meta group, you cannot add individual meta keys. Select **From Meta Groups**, and select a group from the drop-down list.

The selected meta groups are listed in the field.



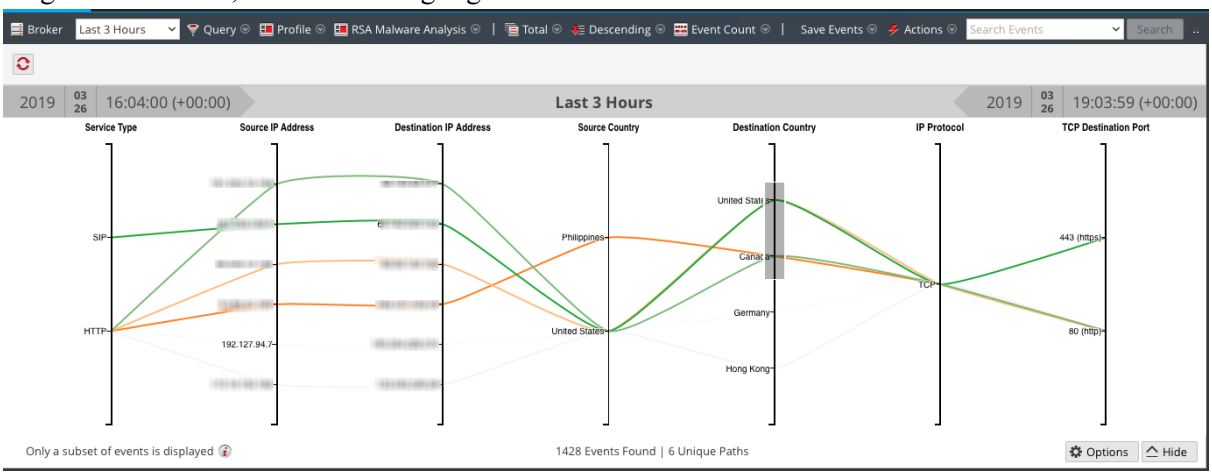
7. Select the method of adding the keys or groups: **Replace the current list of keys**, **Append to the current list of keys** (at the end), or **Insert at the beginning of current list of keys.**



8. To complete the procedure, click **Add**.
   The Visualization Options dialog is displayed with the meta keys or groups you selected.
9. To display the new visualization chart, click **Apply**

Optimize a Parallel Coordinates Visualization

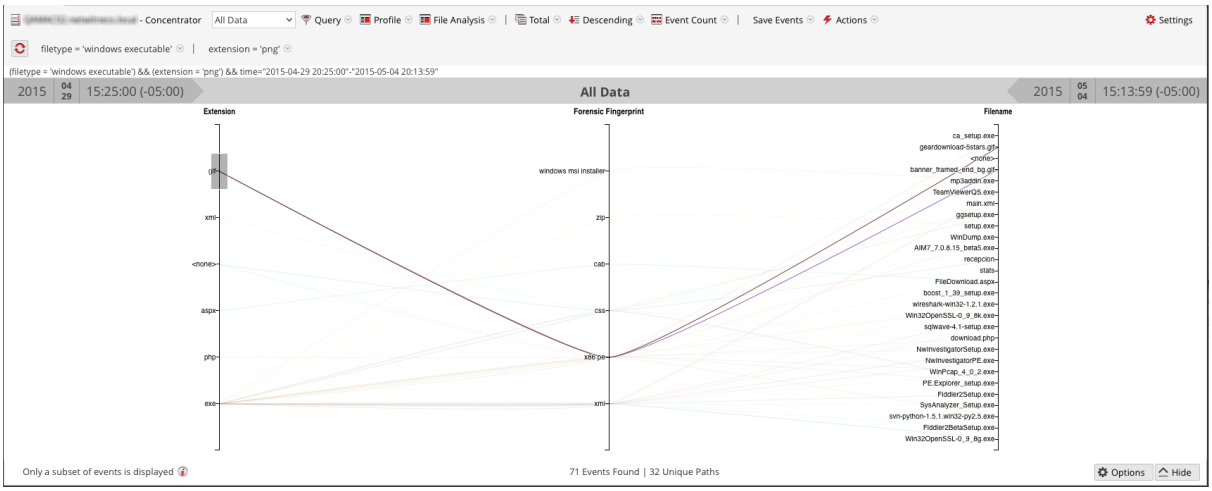
1. To optimize the visualization by removing events in which not all meta keys exist, select **Options.**



2. In the Visualization Options dialog, select **All Meta Keys Must Exist in an Event**. Click **Apply**. The resulting graph is more readable and useful and has fewer unique paths.

3. If you want to highlight a small set of points to see the path of the line from right to left, click on an axis. The cursor changes to cross hairs, which you can drag to select one or more values. When you

let go of the mouse, the lines are highlighted.



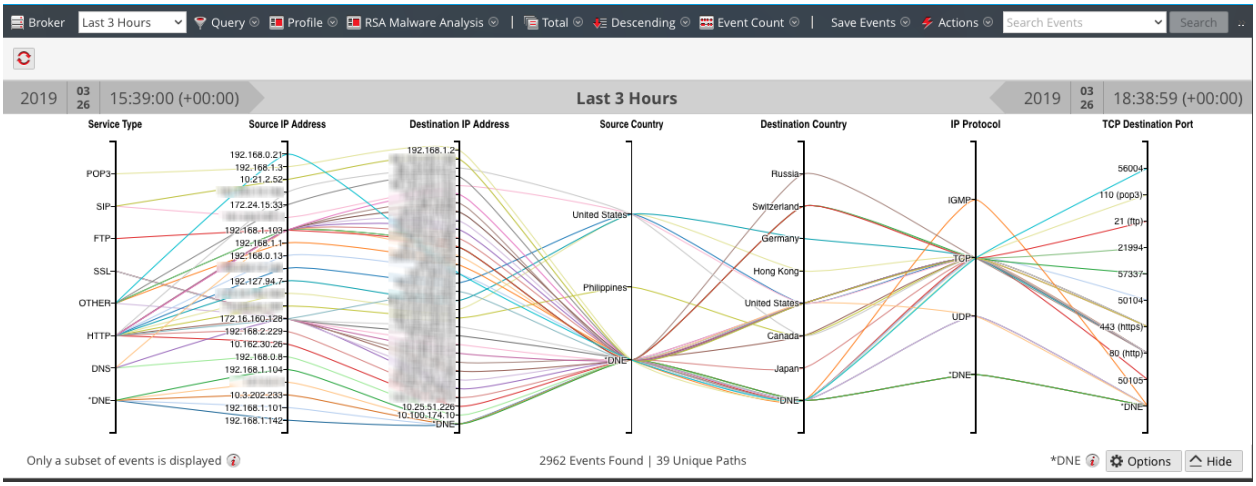
4. If you want to enlarge the visualization, drag the bottom edge of the panel down and drag the right edge of the browser window wider.

Sample Use Case

Below is an example of a parallel coordinates visualization of meta keys representing file metadata in a session. There are three meta keys or axes from left to right: Extensions, Forensic Fingerprint, and Filename with values listed along each axis. Values on the Extension axis show the file extension, and values on the Forensic fingerprint axis are windows executables. Normally the file type matches the expected forensics fingerprint; however, it is abnormal for a `gif` file type to be combined with the Windows executable fingerprint. The `gif` file type is selected to highlight the correlations of that file type, `x86pe` , and two filenames in the third axis so that an analyst can quickly identify the files that merit investigation.

To reach this view:

1. Order by Value and Sort in Ascending order.
2. Apply two filters (file type = 'windows executable' and extension = 'gif') in the Navigate view to limit the amount of data.
3. Configure a parallel coordinates chart by choosing three axes: `file extension`, `forensic fingerprint`, and `filename`.



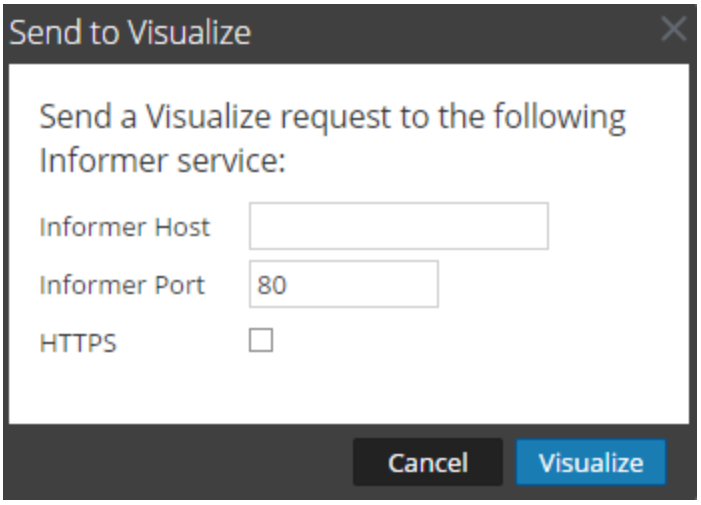
Sample Visualization of a Large Data Set

This example of a parallel coordinates visualization applied to a larger set of data illustrates several messages that help analysts to understand what has been charted.

- To create a chart, NetWitness begins scanning meta values and returning results. A typical time range could have up to 10,000,000 meta values. When the number of meta values returned reaches the Meta Values Result Limit, the chart is rendered even if NetWitness has not scanned a number of meta values equal to the Meta Values Scan Limit.
- There is a fixed limit on the amount of data that can be rendered as a parallel coordinates chart.The administrator configures parallel coordinates limits as part of the Investigation settings In the ADMIN > System view.

With a larger set of data, the parallel coordinates chart takes longer to process than the smaller set of data and meta keys. To preserve performance, NetWitness renders the meta values from the Values panel below until the limits set by the Administrator are reached. An informational message tells you: **Only a subset of events is displayed.**

Of all the data visualized for 2962 events, there were only 39 unique parallel coordinates paths. Some events are included though they do not include some of the meta keys; these are labeled **DNE** because the metadata does not exist in the event.



Visualize the Current Drill Point in Informer

This topic provides instructions for sending a drill point in the Navigate view to an Informer visualization.

Informer must be installed in your network and accessible by the service being investigated. You need to supply the host name and the port used on the Informer host to communicate with NetWitness.

To display a visualization in Informer of the current drill point:

1. With a drill point open in the Navigate view, click **Actions > Visualize**.
   The Send to Visualize dialog is displayed.

2. Type the Informer hostname or IP address, and verify the NetWitness server port used to communicate with the Informer host.
3. (Optional) Select the HTTPS option if the Informer host uses secured communications.
4. Click **Visualize**.
   The visualization is displayed in a new tab.

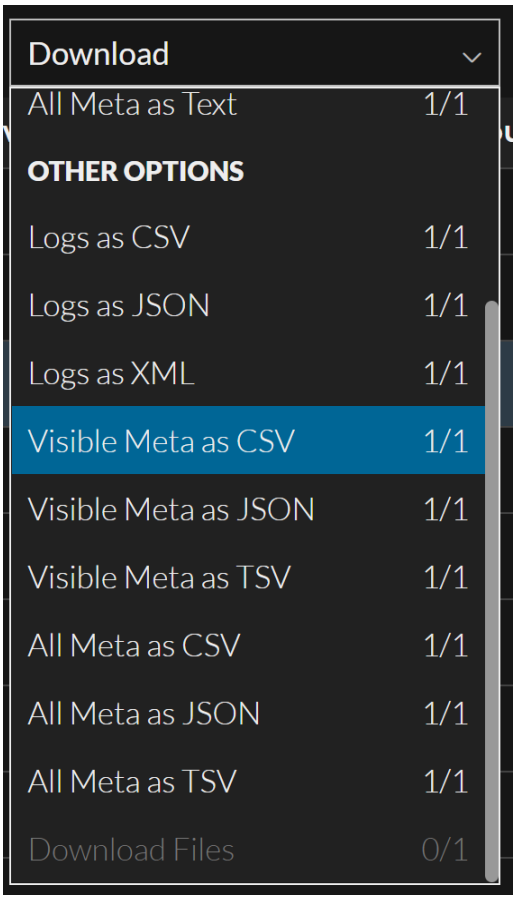
Downloading and Acting Upon Results

When working in Investigate, you may want to extract and shared data with other analysts, incident responders, SOC managers, and others. The topics in this section provide instructions for downloading results and creating incidents that appear in the Respond view:

- Download Data in the Events View
- Export or Print a Drill Point in the Navigate View
- Export Events in the Legacy Events View
- Add Events to an Incident in the Events View
- Add Events to an Incident in the Legacy Events View

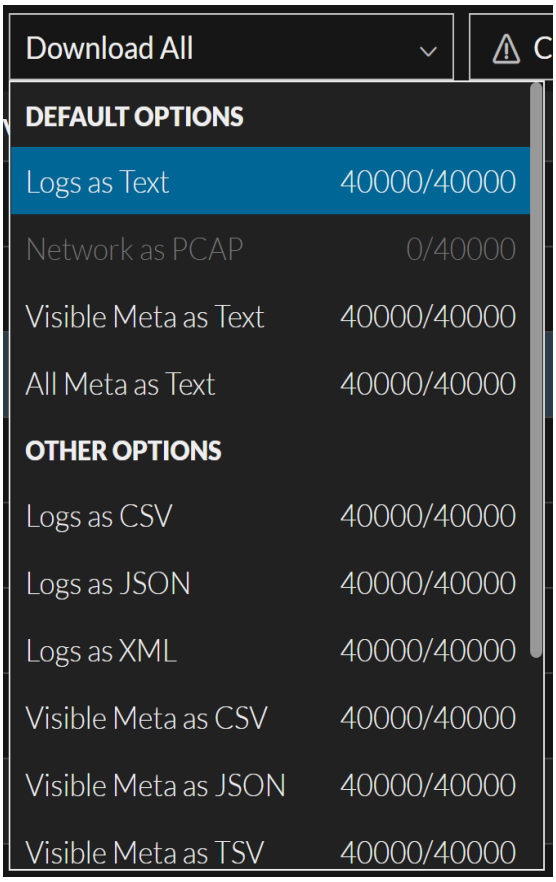
Download Data in the Events View

In the Events view, you can download data from the Events panel and from a reconstruction. The Events panel download available in Version 11.4 and later is a bulk download of log and network events for all event types.



- Version 11.4.1 has the added capability to download visible metadata for all event types. From within a reconstruction, you can download events, logs, and files.
- Version 11.5 has the added capability to download metadata for all event types in the Events panel and in the event reconstructions.

Note: The information that you can view and download is managed by Role-Based Access Controls (RBAC) that your administrator has implemented. When RBAC is configured to prevent downloads of certain data, events for which you do not have download permission may appear to download successfully, but they are 0 byte in size. When RBAC is configured to prevent reconstruction of certain events, the reconstruction is disabled from the Events panel, but the bulk download button is still enabled.



Download Events or Metadata in the Events Panel

After submitting a query, you can download logs, network events, visible metadata (Version 11.4.1), or all metadata (Version 11.5) for events in your preferred format, directly from the Events panel. The preferences are set in the Event Preferences dialog and any changes made there are reflected inside the **Download** menu. See Configure the Events View for more information about preferences.

In the Events panel, you can select events individually or select all events returned by your search. The selection checkboxes appear only if you have permission to download the events. All checkboxes are deselected when a new query is submitted. When you select events and click Download, the Download menu is displayed. The number of events selected for each event type is displayed next to each option in the format `Events of this type selected/ Total number of events selected`. If an event type has no events selected, the corresponding download option is disabled and the number of events selected is displayed as `0 / Total number of events selected` as shown in the following figure.

If the Select All checkbox is selected in the Events list, the Download All options are available. In addition to the options that download all logs or network events.

The difference between the All Meta options and the Visible Meta options are as follows:

- In Version 11.4.1 and later, visible metadata for the selected events is downloaded in the format that you selected in the Events Preference menu (**Visible Meta as Text**, **Visible Meta as CSV**, **Visible Meta as JSON**, or **Visible Meta as TSV**) or the format that you select under **Other Options** in the **Download** menu at the time of download. The downloaded metadata for each event corresponds to the columns visible when the metadata is downloaded. The visible columns are determined by the selected column group and the Column Selector. For additional information about selecting columns, see Use Columns and Column Groups in the Events List. If the Summary column group is selected in the Events panel, all metadata for the events is downloaded. When you use one of the Download Visible Meta options; the downloaded metadata is sorted in order of collection time rather than the current sort order in the Events panel.
- In Version 11.5, all metadata for the selected events is downloaded in the default format that you selected in the Events Preference menu (**All Meta as Text**, **All Meta as CSV**, **All Meta as JSON**, or **All Meta as TSV**) or the format that you select under **Other Options** in the **Download All** menu at the time of download. The resulting download includes all metadata for the events selected, regardless of what columns are visible in the Events list. For example, if an event has 40 meta keys in the meta database, even if the column group in the Events list has 20 columns with 10 columns visible, all 40 meta keys for that event are included in the downloaded file.

- In Version 11.5.1, all metadata for the selected events is downloaded in the default format that you selected in the Events Preference menu (**All Meta as Text**, **All Meta as CSV**, **All Meta as JSON**, **All Meta as TSV**, or **Download Files**) or the format that you select under **Other Options** in the **Download All** menu at the time of download. The resulting download includes all metadata for the events selected, regardless of what columns are visible in the Events list. For example, if an event has 40 meta keys in the meta database, even if the column group in the Events list has 20 columns with 10 columns visible, all 40 meta keys for that event are included in the downloaded file.

Note: When you select all events for download, only the events in the current result set are downloaded. If you canceled the query before all results were returned, only the events that were loaded are downloaded.

To download event data for one event, multiple events, or all events in the Events panel

1. Do one of the following:

   a. To select events individually, select the checkbox next to each event you want to download, and click the downward arrow on the **Download** menu button to see the options.

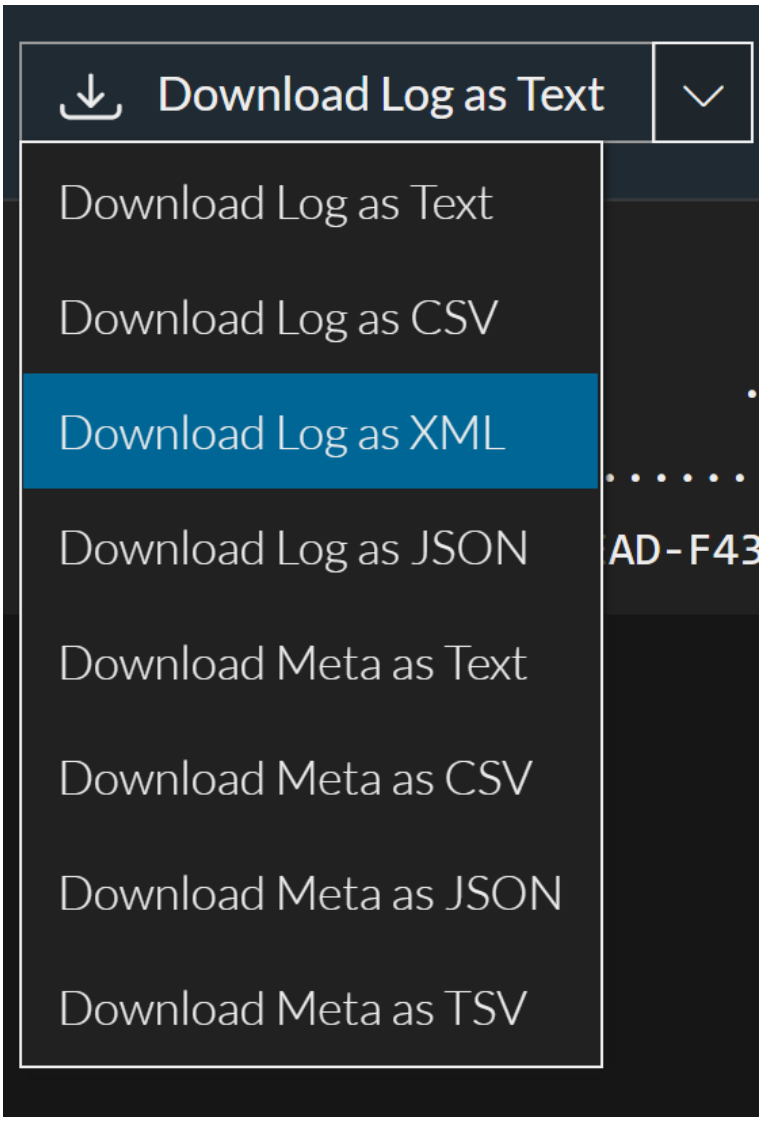
   b. To select all events displayed in the Events panel, select the checkbox at the top of the Events panel and click the **Download All** menu button.

2. Review the **Default Options** in effect in the top section of the menu. If you do not want to use the default format, you can choose a different format from the **Other Options** section of the menu.
   - Logs are downloaded in the preferred format that you selected in the Events Preference menu (**Logs asText**, **Logs as CSV**, **Logs as JSON**, or **Logs as XML**). If you want to choose a different format for this download, select one of the formats from **Other Options**.
   - Network events are downloaded as a PCAP. When downloading multiple network events in the Events panel, the format is always PCAP. The preferred format that you specified in the Events Preference menu (**Network as PCAP**, **Network as Payloads**, **Network as Request Payload**, or **Network as Response Payload**) is ignored in this menu. Your preferred format applies only to downloading a single network event in the network reconstruction panel.
   - Visible metadata is downloaded in the format that you selected in the Events Preference menu (**Visible Meta as Text**, **Visible Meta as CSV**, **Visible Meta as JSON**, or **Visible Meta as TSV**). If you want to choose a different format for this download, select one of the formats from **Other Options**. The downloaded metadata for each event corresponds to the columns visible when the metadata is downloaded. If the Summary column group is selected in the Events panel, all metadata for the events is downloaded.
   - All metadata is downloaded in the format that you selected in the Events Preference menu (**All Meta as Text**, **All Meta as CSV**, **All Meta as JSON**, **All Meta as TSV**, or **Download Files**). If you want to choose a different format for this download, select one of the formats from **Other Options**. The downloaded metadata for each event includes all metadata, not just the visible columns.

3. Click the menu label: **Download** or **Download All**.
   The download begins immediately within the browser window if the **Download extracted files automatically** preference is set (**Events** view >). If the preference is not set, the download job for the selected events is added to the Jobs tray, where you can download the events.
   If the download fails, a message provides feedback regarding why the download failed. The download button is re-enabled and any selected events remain selected. These are examples of reasons for a failed download: timeout after X minutes, connection failed, event limit reached, and permission denied.

4. To display the Jobs tray, go to **Investigate > Navigate** or **Investigate > Legacy Events**, and click the  Jobs icon, which looks like a stop watch.

The jobs are displayed in the Jobs tray.



Download a Log in the Text Reconstruction

When viewing a text reconstruction of a log event, you can download a log file in the following formats using options in the Download Log menu:

- Raw log (log) using the **Download Log** (11.3) or **Download Text** (11.4 and later) or **Download Log as Text** (11.5 and later) option.
- Comma-separated values (CSV) using the **Download CSV** or **Download Log as CSV** (11.5 and later) option.
- Extensible Markup Language (XML) using the **Download XML** or **Download Log as XML** (11.5 and later) option.
- JavaScript Object Notation (JSON) using the **Download JSON** of **Download Log as JSON** (11.5 and later) option.

In Version 11.5 and later, you can also download the metadata for the log using one of these options:

Download Meta as Text, **Download Meta as CSV**, **Download Meta as JSON**, or **Download Meta as TSV**.

Note: For endpoint events, the **Download Log**, **Download Text**, or **Download Log as Text** option applies only to events that have at least one meta value exceeding 256 characters. For an endpoint event, the raw log is populated only when the meta value exceeds 256 characters. Long-running or historically downloaded files are not downloadable. For example, meta values like launch arguments can exceed 256 characters. In this case, 256 characters are available as a meta value while the full value is available in the raw log to view.

The downloaded log file contains the log and is named to help identify the service on which the log was collected, the session ID, and the file type. This is an example of the filename for a raw log: **Concentrator_SID2.log**. The exported log file is named using the following convention:

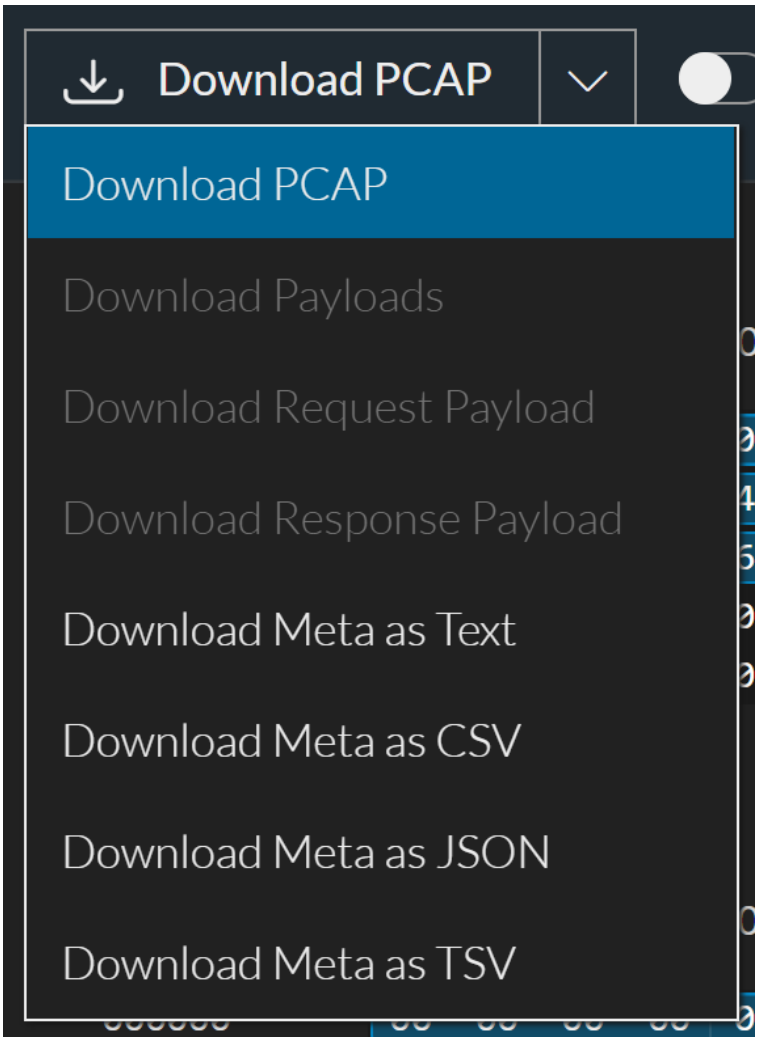
```
<service-ID or host name>_SID<n>.<filetype>
```

where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.
- `<filetype>` identifies the format of the downloaded log. These are the possible log types: raw log, CSV, XML, and JSON. By default, the format is a raw log.

Note: Some formats do not have time stamps or the device IP where the event was generated, so a log downloaded in CSV, XML, or JSON format has an extra value called `timestamp` along with the raw log content. The additional information inside the log is in this form: `Log timestamp="1490824512" source="10.12.35.65"`.

To download the log or the metadata for a log



In the text reconstruction of a log event, do one of the following:

1. To download the log as a raw log (the default format), click **Download Log**, **(Download Text)** or **(Download Log as Text)**.
2. To download the log in one of the other formats, click the downward arrow on the **Download Log**, **Download Text**, or **Download Log as Text** button, then select one of the file formats for the downloaded log.
3. To download the metadata for the log, click the downward arrow on the **Download Log**, **Download Text**, or **Download Log as Text** label, then select **Download Meta as Text**, **Download Meta as CSV**, **Download Meta as JSON**, or **Download Meta as TSV**).

The log file or the metadata for the log is downloaded to your local file system in the format specified. If you initiate a download and move away from the view while the log is being extracted and before the log starts to download, the log is not downloaded in your browser. A message notifies you that you can find the downloaded log in the job queue.

Download Network Event Data in the Text or Packet Reconstruction

When viewing a packet reconstruction or a text reconstruction of a network event, you can export network data files for further analysis. In Version 11.5 and later, you can also download metadata for the reconstructed event.

The download includes events for the current time range and drill point. You can download the data in these formats:

- The entire event as a packet capture (`*.pcap`) file using the **Download PCAP** option.
- The payload as a `*.payload` file using the **Download All Payloads** (11.3) or **Download Payloads** (11.4) option.
- The request payload as a `*.payload1` file using the **Download Request Payload** option.
- The response payload as a `*.payload2` file using the **Download Response Payload** option.
- (Version 11.5) The metadata for the event using one of these options: **Download Meta as Text**, **Download Meta as CSV**, **Download Meta as JSON**, or **Download Meta as TSV**.

The label on the download menu button is one of these formats, based on the setting selected in the Event Preferences dialog. If the event does not have that type of data, the menu button is dimmed. You can click the downward arrow on the menu button to see which options are available. For example, if an event has a request payload, but no response payload, the Download Response Payload label is dimmed. You can click the downward arrow on the button and select **Download Request Payload** for this download. After selecting a valid format, clicking the button executes the download.

This is an example of the filename for a PCAP file: `C01 - Concentrator_SID1697309.pcap`. The exported network data file is named using the following convention:

`<service-ID or host name>_SID<n>.<filetype>`

where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.
- `<filetype>` is pcap, payload, payload1, or payload2.

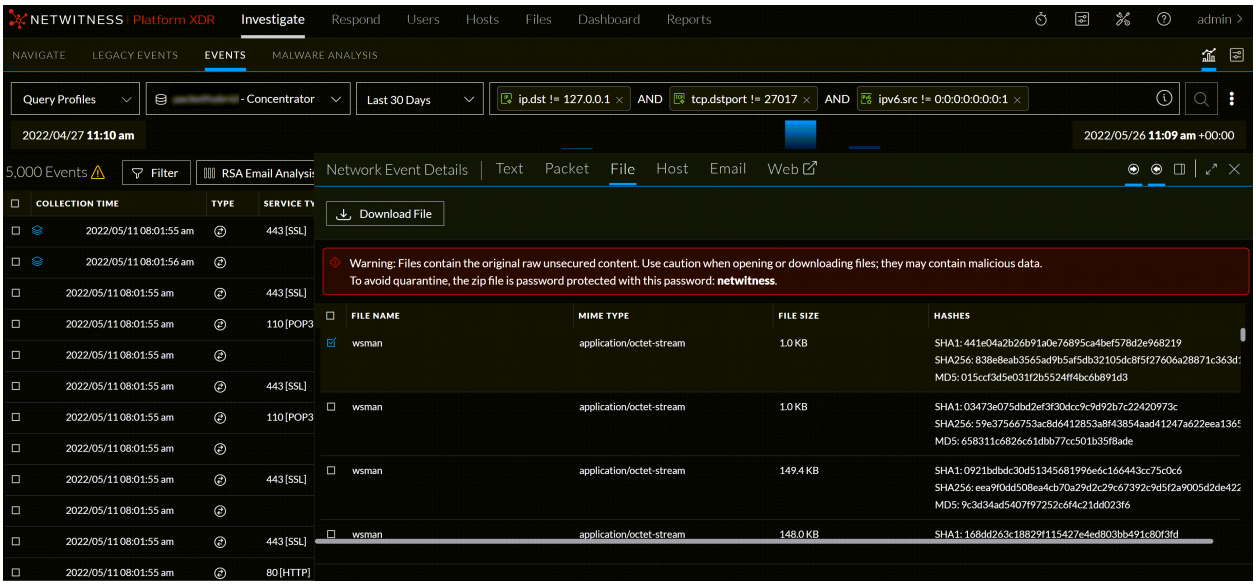
The network data is downloaded directly into your browser if the download is quick. If the download takes longer due to network factors or file size, the file is downloaded in the background and the task is tracked in the Jobs queue. In this case, you can check your jobs in the queue and get the file when the download is complete.

Note: If you initiate a download and move away from the view while the file is being extracted and before the file starts to download, the file is not downloaded in your browser. A message notifies you that you can find the downloaded document in the job queue.

To export an event as a network data file or to download the metadata for the event

Go to the packet reconstruction of a network event and do one of the following:

1. To download the event as a PCAP file (the system-defined default format) or in the user-defined default format, click the **Download <format>** button. The label is the same as the download option set in the Events Preferences dialog.
2. To download the event in one of the other formats, click the downward arrow on the button, and select one of the file formats for the downloaded event data.
3. To download the metadata for the event, click the downward arrow on the button, and select one of the file formats for the downloaded metadata.



The network data file is downloaded to your local file system in the format specified or the metadata for the event is downloaded in the format specified.

Download Files from a Network Event in the File Reconstruction

When viewing reconstructed network events that contain files in the file reconstruction, you can select one or more files, or all files, to download to your local file system.

Note: If you initiate a download and move away from the view while the file is being extracted and before the file starts to download, the file is not downloaded in your browser. A message notifies you that you can find the downloaded file in the job queue.

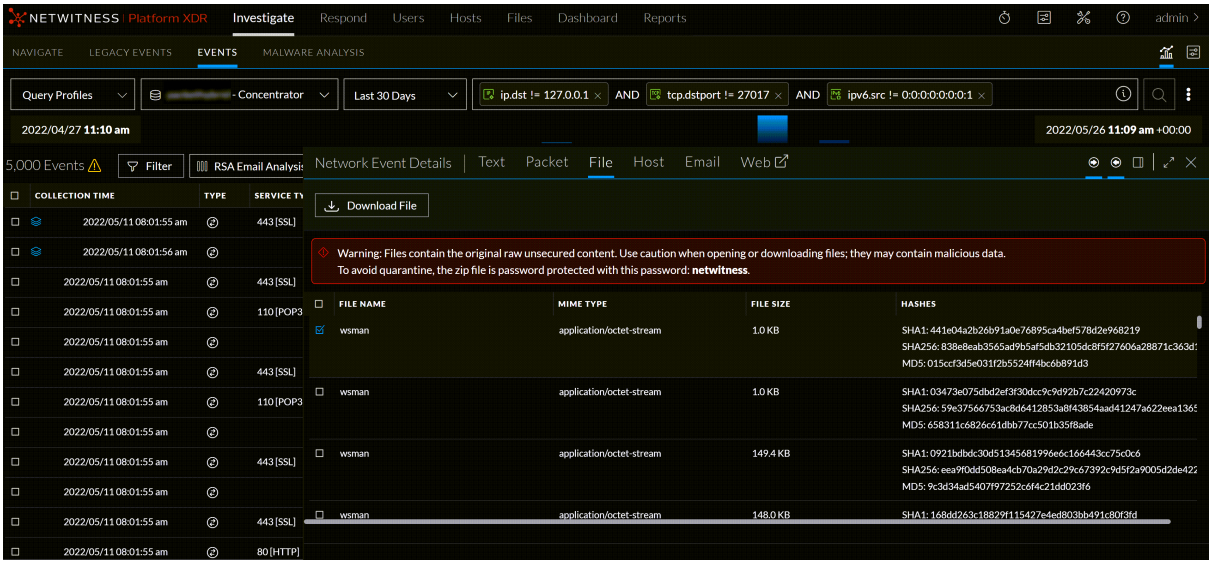
When files are selected, the Download Files button becomes active and reflects the number of files selected.

Clicking Download Files exports the selected files as a password-protected zip archive. The password to open the exported archive is `netwitness`. Exporting the files in this form ensures that:

- The archive is not quarantined by antivirus software.
- Potentially malicious files are not automatically opened by the default application and executed.

When downloading files form the file reconstruction, the exported archive is of the form `<service-name>SID<service ID><file-count>_FILES_FILES`, for example, `Broker_SID8_1_FILES_FILES.zip`. This is the password to open the zip archive: netwitness.

`<service-ID or host name>_SID<n>_<file-count>FILES_FILES.zip`



where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.
- `<file-count> FILES` is the number of files in the archive.
- `FILES` identifies the reconstruction type from which the files were downloaded.

Caution: Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

To export files in a reconstructed event

1. In the **Events** view, go to the file reconsruction of an event that contains files.

2. Click one or more files that you want to extract, and click **Download File** or **Download Files**. The job is scheduled and when complete the selected file are downloaded, in the form of a password-protected zip archive, to the local file system.
3. To open the archive on your local file system, enter the following password when prompted: `netwitness`.

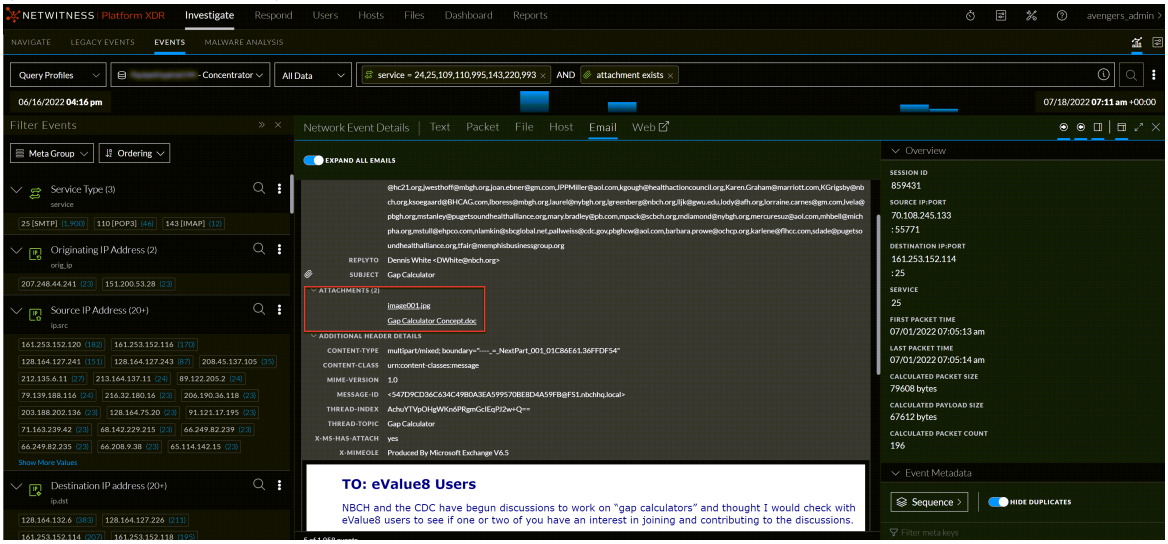
Download Attachments from an Email Reconstruction

When viewing an email reconstruction that contains attachments, you can select one or more attachments, or all attachments (Version 11.4.1.x), to download to your local file system. This feature exports the selected files as a password-protected zip archive. The password to open the exported archive is `netwitness`. Exporting the files in this form ensures that:

- The archive is not quarantined by antivirus software.
- Potentially malicious files are not automatically opened by the default application and executed.

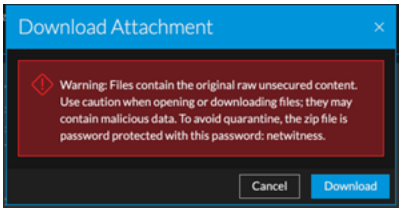
When downloading files from an email reconstruction, the filename is of the form `<service-name>_SID<n>_EMAIL`, for example, `Broker-_SID34_EMAIL.zip`. This is the password to open the zip archive: netwitness. The exported archive is named using the following convention:

`<service-ID or host name>_SID<n>_EMAIL.zip`



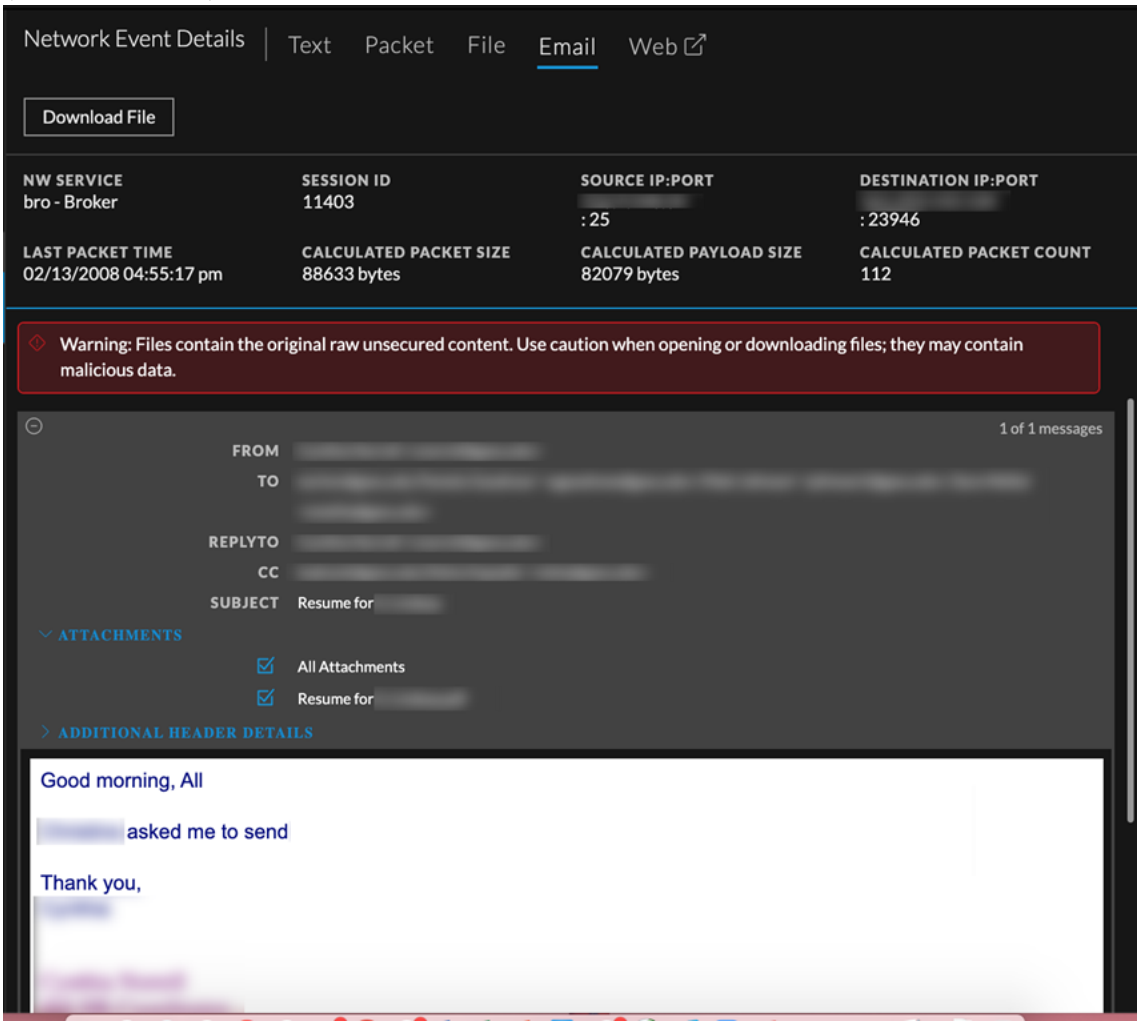
where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.
- `EMAIL` is the type of reconstruction from which the files were downloaded.



Caution: Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

To download email attachments:



1. Go to the **Events** view and open an email reconstruction by clicking an event that contains an email with attachments.
2. Expand the **Attachments** drop-down list and do one of the following:
   a. (Version 11.5 and later) Click a link to an attachment.

A dialog warns you that downloaded email attachments may contain malicious data and asks you to cancel or confirm the download. If you want to complete the download, click **Download**. Otherwise, click **Cancel** to cancel the download.

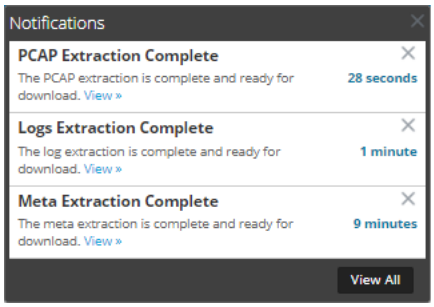
b. (Version 11.4.1.x) Select one or more attachments or **All Attachments**.

A warning message is displayed in the reconstruction. Click the **Download File** or **Download Files** button. The attachments are downloaded with no additional opportunity to cancel.

Export or Print a Drill Point in the Navigate View

In NetWitness Investigate, when the data for a drill point is displayed in the Navigate view, you can:

- Extract files from a session and choose the type of files to extract: archives, audio BitTorrent, documents, executable, images, other, video, and web.
- Export the drill point as a packet capture (PCAP) file, a log file, or a metadata file.
- Print the drill point.



The details being exported are affected by both the time range and drill point at the time of exporting.

Note: When you export the drill point as a log file, only the log sessions are exported. The job queue message refers to the total number of sessions in the drill point rather than the number of logs. For example, if the drill point has 505 sessions and only five log sessions, the job queue message states that NetWitness is extracting logs for 505 sessions.

To export a drill point from the Navigate view

1. Conduct an investigation until you reach the desired drill point.
2. For Version 11.0, In the toolbar, select **Actions > Export** and select one of the export options: **PCAP**, **Logs**, or **Meta**.
   The drill point is extracted, and a message advises that the job is scheduled. You can check the jobs page for the status.
3. For Version 11.1, in the toolbar, select **Save Events** > and select one of the export options: **PCAP**, **Logs**, **Files**, or **Meta**.
   A dialog gives you an opportunity to edit the default filename for the file. The default filename is in the form `investigation-Feb-21-15-44-33`. When you are exporting a PCAP, the file is exported with no choice of formats. If you are using one of the other export options, a dialog is displayed.
4. In the dialog, select:
   - The export log format: **Text**, **XML**, **CSV**, or **JSON**.
   - The file types to export: Archives, Audio, BitTorrent, Documents, Executables, Images, Other, Video, and Web.
   - The Meta format: **Text**, **CSV**, **TSV**, **JSON**.

5. When the scheduled file extraction is complete, it is displayed in the Job Notifications tray.

6. Click the **View** link in the Jobs tray and download the specific extraction file requested.

To print the current drill point

In the Navigate view, you can display the contents of the current drill point in printer friendly format in the browser window.

To display the current drill point in a print view:

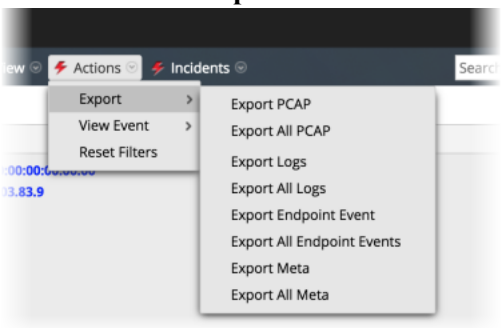
1. With a drill point open in the **Navigate** view, select **Actions** > **Print** in the toolbar.
   A new tab is created with the print view of the current drill point.

2. Use the print option in your browser to send the printable view to the printer.

Export Events in the Legacy Events View

In the Legacy Events view, the Actions menu has an option to export events from the event being viewed to an archive.

Note: You can only export files that you have permission to view or access.



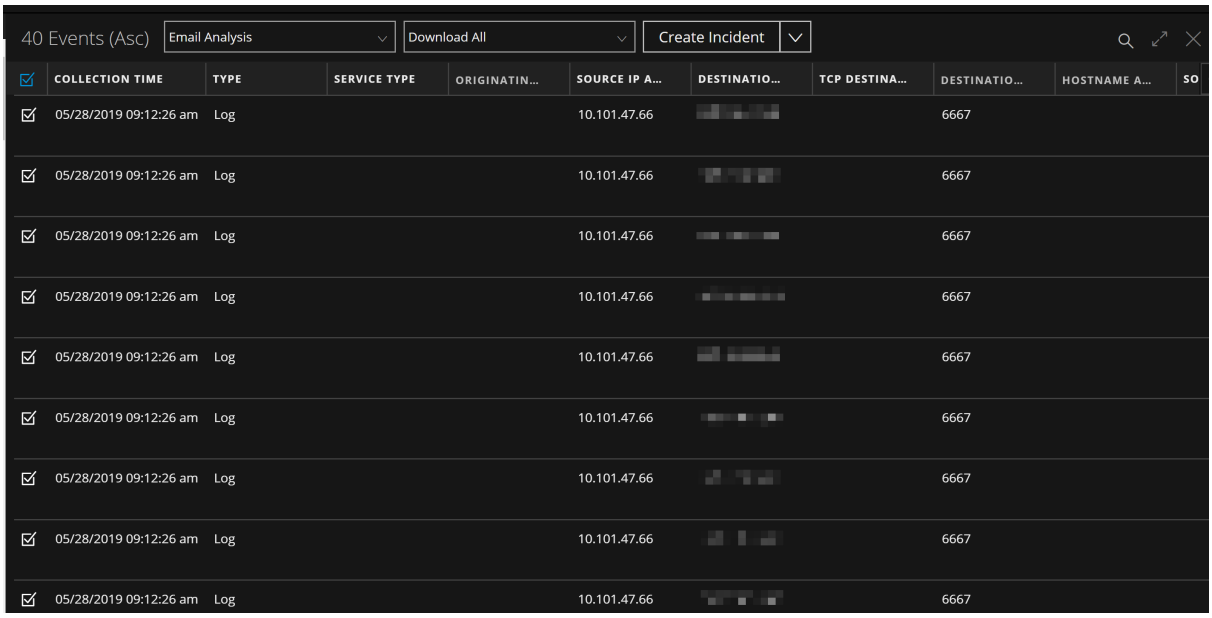
The export function queries the service for all sessions inside the selected time range and drill point to extract the content of each session. The details being exported are affected by both the time range and drill point at the time of exporting. In the File Extraction dialog, you can choose to export:

- PCAPs
- Logs
- NetWitness Endpoint events
- Meta values

The format of the exported archive: ZIP or GZIP file. After you send the request, a job is scheduled and you can track the job in in the Jobs tray. If there is an error retrieving the log or PCAP from the service, an error notification is displayed.

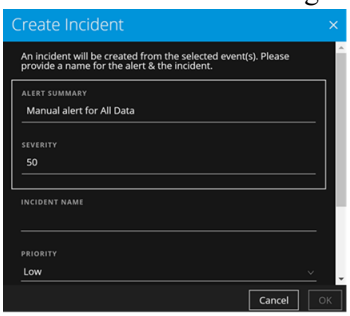
To extract files from an event

1. While in the **Event view**, click an event.
2. Click **Actions** > **Export.**.



3. Select the export option.
   A message informs you that the PCAP is being downloaded.

Add Events to an Incident in the Events View



When conducting an investigation in the Events view, you can select one or more events and create an incident that is available for incident responders in Respond. When you create an incident, if access restrictions are in effect, you can view only incidents to which you have access. For example, when creating incidents from the Investigate view, analysts must assign the incidents to themselves to view them in the Respond view. You can also add events to an existing incident in Respond to which you have access.

Note: An administrator must configure the `respond-server.incident.manage` and `investigate-server.incident.manage` roles and permissions. For more information, see "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

1. Go to **Investigate > Events**.
2. In the Events view, select one or more events.

3. Click **Create Incident.**
   The Create Incident dialog is displayed. Complete the information in the Create Incident dialog.

a. Select the severity. The alert summary field is a pre-defined value which is auto-populated but can be edited if required.

b. Type a name for the incident in the **Incident Name** field.

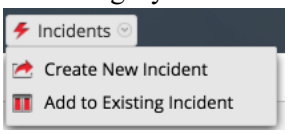
c. From the **Priority** drop-down list, select a priority for the incident. For example, an incident may be critical, high, medium, or low priority.

d. Select an assignee for the incident from the drop-down list. This list includes the built-in users that have access to Investigate as well as any custom users that have been added to your system. For example, this list might include users for admin, analyst, dpo, operator, and users for incident responders.

e. From the Categories drop-down list, select one or more categories of events that apply to this incident.

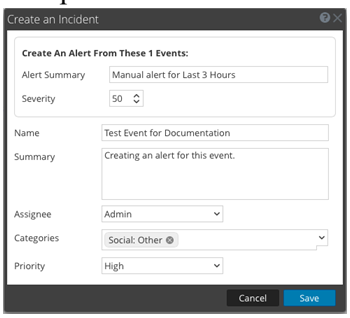
f. Click **OK**.
An incident is created with the selected event in Investigate.

4. To add one or more events to an existing incident, select one or more events, and then click **Add to Incident**.



5. In the Add to Incident dialog, select the alert summary and severity, and select one or more open and existing incidents to which the incidents will be added. You can Search for an existing incident by Incident-ID or Incident Name. When ready, click **OK**. The event is added to the selected incidents and updated in Respond.

Add Events to an Incident in the Legacy Events View



When conducting an investigation in the Legacy Events, you can select one or more events and create an incident that is available for incident responders in Respond. When you create an incident, if access restrictions are in effect, you can view only incidents to which you have access. For example, when creating incidents from the Investigate view, analysts must assign the incidents to themselves to view them in the Respond view. You can also add events to an existing incident in Respond to which you have access.

Note: An administrator must configure the required roles and permissions as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

1. Go to **Investigate > Legacy Events**.
2. In the Legacy Events view, select one or more events, and then **Incidents > Create New Incident**.

3. Complete the information in the Create an Incident dialog.

   a. Select the severity, an integer between 1 and 100, with 100 being the most severe.
   b. Type a name for the incident and describe the incident in the **Summary** field.
   c. Select an assignee for the incident from the drop-down list. This list includes the built-in roles that have access to Respond as well as any custom roles that have been added to your system. For example, this list might include roles for admin, analyst, dpo, operator and roles for incident responsers.
   d. From the **Categories** drop-down list, select one of more categories of alerts that apply to this incident.
   e. From the **Priorities** drop-down list, select a category for the incident. For example, an incident may be critical, high, medium, or low priority.
   f. Click **Save**.
   The new incident is created and is available immediately in the incident queues for the selected role in Respond.

4. To add one or more events to an incident, select one or more events, and then **Incidents > Add to Existing Incident**.
5. In the Add Events to an Incident dialog, select the severity, and select one or more incidents to which the events will be added. You can Search for an existing incident by Incident-ID or Incident Name. When ready, click **Add to Incident**.
   The events are added to the selected incidents and updated in Respond.

Troubleshooting NetWitness Investigate

This section provides information about possible issues when using NetWitness Investigate.

Navigate View and Legacy Events View Issues

Behavior	A meta key that normally returns values in the Navigate view returns values, but has a `Not Indexed` message following the meta key name. For example, the in this figure the Service Type meta key is followed by the message: `Service Type[service] Not Indexed`. 
Issue	When you first set up the environment or very rarely after performing a data reset on the broker due to other issues, you see meta keys as Not Indexed when they are indexed at meta key or meta values level.
Explanation	To fix the issue on a Broker, log out of NetWitness Platform XDR and then log in again. Valid sessions will be displayed.

Message	`Not indexed; will experience longer than usual load times.` in the Manage Meta Groups dialog.
Issue	Meta keys in the Manage Meta Groups dialog are marked by a red exclamation point, and the error message is displayed. This can occur when investigating a Broker or Decoder while adding a meta group with meta keys that are not indexed in the index file or the custom index file for the service. For a Broker, it could mean that the Broker has not begun aggregating data from a Concentrator. In this case the Broker will not have the contents of the custom index file from the aggregate services and the keys will not be indexed. For a Decoder, it means that the meta keys are not indexed in the Decoder index or custom index file.
Explanation	To fix the issue on a Broker, log out, log in, and restart the Broker service so that it can aggregate the meta key information from connected Concentrators. To fix the issue on a Decoder, edit the custom index file to index the meta keys, log out, log in, and restart the Decoder service.

Behavior	When downloaded from the Event Reconstruction view, logs and metadata are always in text format irrespective of the format selected in the Legacy Events view.

Issue	When you download metadata or a log in the Event Reconstruction view, the format that you selected in the Legacy Events view is not used. The exported data is always in text format.
Explanation	Download metadata and logs from the Legacy Events view if you want to use a format other than text format.

Events View Issues

Message	`Applicable for hosts with 4.x Endpoint agents installed, please install the NetWitness Endpoint Thick Client.`
Issue	When you click **Pivot to Endpoint** in the Events view, no data is displayed and the message is displayed.
Explanation	Version 4.4 of the NetWitness Endpoint Thick Client must be installed on the same server, the NWE meta keys must exist in the `table-map.xml` file on the Log Decoder, and the `index-concentrator-custom.xml` file on the Concentrator. The NWE Thick Client is a Windows only application. Complete setup instructions are provided in the *NetWitness Endpoint User Guide* for Version 4.4.

Behavior	Download jobs are in a Waiting state or Failed state in the Jobs tray during and after upgrading the software to Version 11.4.
Issue	If you had download jobs running while your administrator was upgrading the software, you may see a job in a Waiting state while the upgrade is in progress and then in a Failed state after the upgrade is complete. You cannot resume or cancel the failed job.
Explanation	To delete the failed jobs, select the failed jobs in the Jobs tray and click .

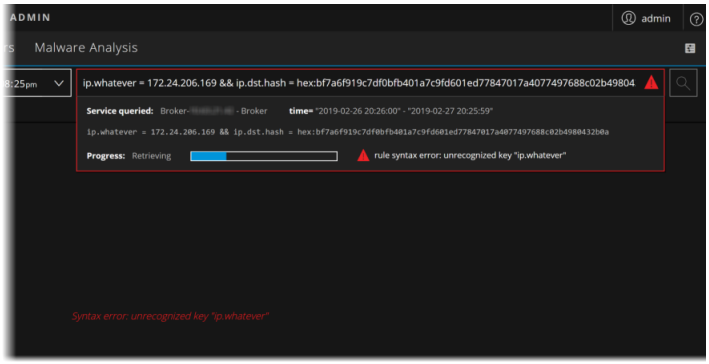
Message	Event counts in the Filter Events panel and the Events panel may sometimes differ when showing results for the same query.
Issue	The Filter Events panel uses only index data to produce counts of events, which is less accurate than the Events panel. The Events panel results are filtered for exact matches on data retrieved from the meta database, which takes longer to process.
Explanation	At worst the difference is in false positives in the Filter Events panel, not false negatives; so you will not miss an event.

Message	`Event Analysis requires all core services to be NetWitness 11.1. Connecting prior versions of services to the 11.1 NetWitness Server results in limited functionality (see "Investigate in Mixed Mode" in the *Physical Host Upgrade Guide*).`
Issue	When attempting to investigate a service that has not been updated to Version 11.1 in the Event Analysis view, the informational message is displayed.
Explanation	When an analyst opens the Event Analysis view in mixed mode (that is, some services are upgraded to 11.1 and later, and some are still on 11.0.0.x or 10.6.x), Role-Based Access (RBAC) is not applied uniformly. This affects viewing and downloading content, and validation of filters in the interactive breadcrumb. You will see this informational message when you open Events. As you select a service, services that are not up to date are displayed in a red box, with the message that the service is not up to date. When your administrator has upgraded all connected services to 11.1 and later, these features work as expected.

Message	`Forbidden. You cannot access the requested page.`
Issue	When attempting to access the Events view, the view opens with the message.
Explanation	Your administrator has prevented access to the Events view using role and permissions.

Behavior	If you can download an event in the Events view, but get a 0-byte file, the administrator may have restricted access to the content.
Issue	Role-Based Access Controls applied by your administrator allowed you to download an event for which you did not have permission; therefore, the file download was empty.
Explanation	If you believe you should have access to the event, contact your administrator.

Message	`Insufficient permissions for the requested data.`
Issue	While attempting to access an event in the Events view, the message is displayed.
Explanation	You have entered an event ID for an event that you do not have permission to view. The administrator may have placed some restrictions to limit access by role and permissions.



Message	`Invalid session ID: <<eventId>>`
Issue	No `sessionId` matches the `sessionId` that you queried.
Explanation	The reason for an invalid session ID can vary. Perhaps you edited the session ID manually, and no such session exists. Another case may be when you query a Broker, and the aggregated data has not been refreshed, you may see this error for a session that no longer exists.

Behavior	Investigation Profiles and built-in column groups are not present in 11.1 Event Analysis.
Issue	Post upgrade to NetWitness v11.1, the default column groups - Endpoint Analysis, Outbound SSL and Outbound HTTP are not added under column groups. Also, a few of the Investigation Profiles are missing post upgrade.
Explanation	It is observed that this issue occurs only when you have created a custom column group with the name which is same as one of the new 11.1 OOTB custom column group name. For example, if you create a custom column group in 11.0 with name **RSA Endpoint Analysis** then after upgrade to 11.1. Due to the same name already existing in 11.1, OOTB column groups and built-in profiles will not be available in the UI. To fix this, change the name of custom column group to something other than one of the OOTB column groups and restart the jetty server by using the following command on the NetWitness server: `systemctl restart jetty`

Message	`Memory limit of <XXXXXX> GB reached, controlled by setting max.query.memory`
Issue	The query that you submitted failed because the result set was too large, and the memory limit set by `max.query.memory` was reached.
Explanation	To avoid this error, try to further limit results by narrowing the time range, adding filters, and decreasing the number of columns in the column group. You can also ask an administrator to limit the number of events returned.

Behavior	No text data was generated during content reconstruction. This could mean that the event data was corrupt or invalid, or that an administrator has disabled the transmission of raw endpoint events in the Endpoint server configuration. Check the other reconstruction views.
Issue	When you reconstruct an event as text in the Events view, no data is displayed and the message is displayed.
Explanation	If you do not see the raw text in other Events views or Legacy Events view reconstructions, and you believe the data is not corrupted or invalid, your administrator has likely disabled transmission of raw endpoint events on the NetWitness Endpoint server. Contact your administrator for additional information.

Message	`Rule Syntax error: Unrecognized key "<meta key or meta entity name>"` `Syntax error: Unrecognized key "<meta key or meta entity name>"`
Issue	While querying a service, the matching events are not listed and the message is displayed in the query console and the Events view.

	
Explanation	The query you entered is querying a meta entity that is not configured properly. All upstream devices connected to the Broker being queries should have the same entity configuration. This error indicates that the Broker is operating with mismatched entity definitions. Ask your administrator to review the configuration described in "Index Customization" in the *Core Database Tuning Guide*.

Message	`Selected Column Group is no longer available. The default summary column group has been selected instead.`
Issue	If you had set a preferred column group before the 11.4 upgrade, on your first visit to the Events view, the flash message is displayed even when the column group is available or is the default group (summary). This issue was resolved in Version 11.4.1.
Explanation	This is a one-time occurrence. If you reload the Events view, the message is not displayed.

Message	`Session is unavailable for viewing.`
Issue	While querying an event ID, the reconstruction is not displayed and the message is displayed.
Explanation	The query you entered is trying to look at restricted data, for example, if you are allowed to see only log data and you are using a link to network data .

Message	`The query on channel <channel-number> was auto-canceled by the system for exceeding time usage limits. Check timeout values. Query running time was 00:05:00 (HH:MM:SS)`
Issue	If you continually get this timeout message, first check the query console to determine if there are issues around time it takes for a service to respond, index error messages, or other warnings that may need to be addressed to increase query response time.
Explanation	If there are no messages indicating any specific warnings, ask your administrator to increase the Core Query Timeout from 5 minutes to 10 minutes as described in the *System Security and User Management Guide*.

Message	`The session id is too large to be handled:<<eventId>`
Issue	The session id that you typed in, or got from the Legacy Events view or Navigate view is too large.
Explanation	If you manually typed the sessionId or edited a sessionId in the Events view, you may have created an integer that is too large for Events to process.

Behavior	When reconstructing network events with a large number of packets (>250) in the Events view > Packets panel, with the option to display only payloads enabled and the packets per page setting higher than the default (100), the current browser tab may become unresponsive for up to 45 seconds as it is working to render the payloads.
Issue	Depending on the amount of resources (memory and CPU) on the client machine and the number of packets in the event there may be a performance lag when displaying only payloads in packet reconstruction.
Explanation	To limit the amount of data processed in a reconstruction of a single event, change the Packets per Page setting in the footer to a lower value. 

Behavior	When working in the Version 11.4 Events view, the Query Profile drop-down menu and Column Group drop-down menu do not function.
Issue	You do not have permission to read columns groups and profiles. The default column group , Summary List, is applied to the Events list, and you cannot change the column group, create a column group, or delete a column group.
Explanation	This occurs only when the administrator has created a custom role for you instead of assigning the default Analyst role. Ask your administrator to enable column group read and profile read permission for your role.

Issue	No matching Endpoint data available on Investigate > Events view > Host tab.
Explanation	The Endpoint data may not be available due to any of the following: • **No Endpoint Deployment** – You must install Endpoint Log Hybrid, see "NetWitness Endpoint" in the *Physical Host Installation Guide*. • **Endpoint data is not captured for the host associated with the selected network event-** Make sure that NetWitness Endpoint Agent is installed, and expanded network visibility is configured to track the network events. To enable expanded network visibility, see "Creating Groups and Policies" in the *NetWitness Endpoint Configuration Guide*. **Note:** For Expanded Network Visibility to work, ensure the service user account

	used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide for NetWitness Platform*. • **Concentrators or Endpoint services are offline or very slow** – You must check the status (online or offline) of the services on Health and Wellness. If the service is online, you must check the Endpoint server logs and (Endpoint) Concentrator logs for details. • **Endpoint data is rolled over for the host associated with the selected network event** - The Endpoint data may be rolled over due to data retention period configured. You must configure the data retention period to retain the endpoint data for a longer period. For more information, see "Configure Data Retention" in the *Data Privacy Management Guide*.

Investigate Events Reporting Issues

Reporting Engine Service Unavailable

Message	I see the following error message while generating a report: `The Reporting Engine service may be offline or inaccessible. Try starting the service.`
Issue	This scenario occurs if the reporting engine service becomes offline or inaccessible due to the following reasons: • The administrator might have turned off the service. • The server on which the service is installed is not accessible. **Note:** The offline service will be shown (circle with red) indicator.
Explanation	To fix the issue, you need to perform the following actions: 1. Go to  (Admin) > **Services**. 2. In the **Services** list, select the Reporting Engine Service. 3. Click  > **Start**.

Insufficient Permissions

Message	I see the following error message while generating a report: `You do not have the required permissions to generate a report. Contact your administrator to request access.`
Issue	This scenario occurs when an analyst tries to create or schedule a report without the required permissions.

Explanation	**Note:** By default, only administrators will have access. To fix the issue, analysts must contact their administrators to request access permissions. Once the permissions are provided, the analysts can try generating the report later. For more information, see Configure Data Source Permissions in the *NetWitness Reporting Configuration Guide*.

Unsupported Custom Columns

Message	I see the following error message while generating a report: `The following custom columns are not supported to generate a report. Remove them and try again.` • `<column name 1>` • `<column name 2>`
Issue	This scenario occurs because the Reporting Engine Service does not support a few custom columns for generating the report on the **Investigate** > **Events** page.
Explanation	Perform the following actions to remove the custom columns from the list. 1. In the **Events** view, click the () **Settings** icon. An available list of custom columns is displayed in a pop-up window. 2. Unselect the unsupported custom columns from the list and try generating a new report.

Datasource is not Configured or Unavailable

Message	I see the following error message while generating a report: `The datasource <service name> is not configured in the Reporting Engine. Add the datasource and try again.`
Issue	This scenario occurs when you select a datasource that is not configured in the Reporting Engine. **Note:** When the name of the datasource on the Investigate page differs from the name on the reporting page, an error message is displayed.
Explanation	To fix the issue, perform the following steps: 1. Go to  (Admin) > **Services**. 2. In the **Services** list, select the Reporting Engine service. 3. Click  > **View** > **Config**.

The Services Config View of Reporting Engine is displayed.

4. Select the **Sources** tab.
5. Click  and select **Available Services**.

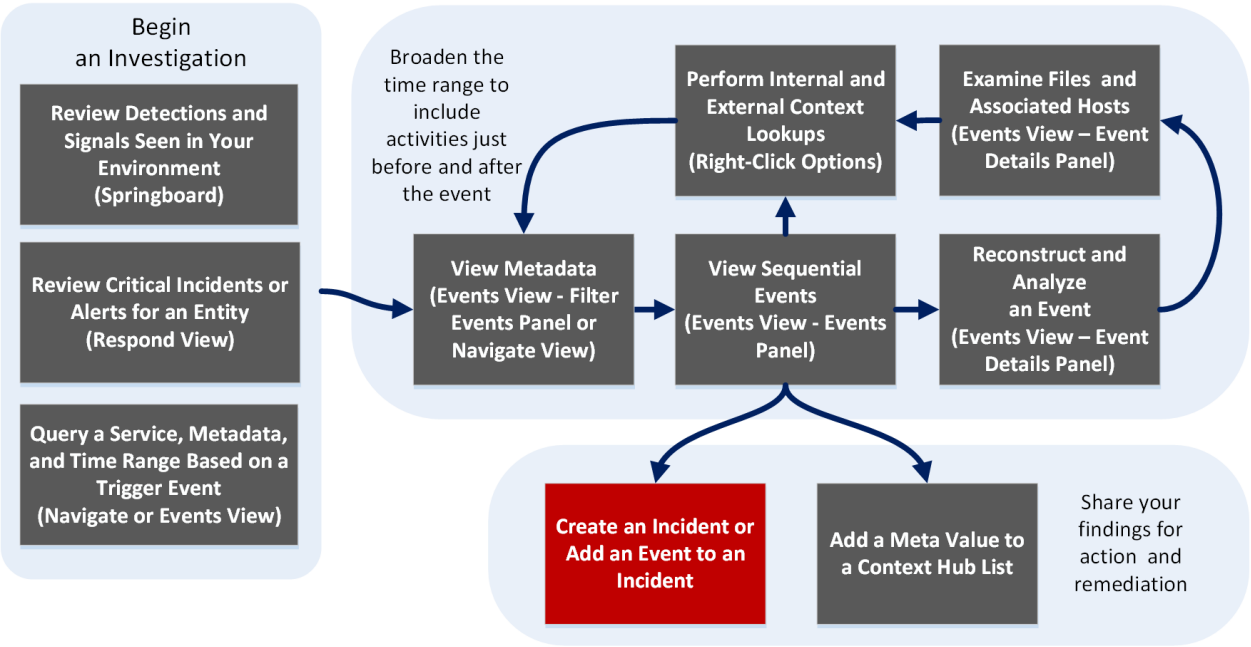
   The Available Services dialog is displayed.
6. Select the required service (for example, Log Decoder) and click **OK**.

   The service authentication dialog box is displayed.

   Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.
7. Enter the Username and Password for the service.
8. Click **OK**.

   The selected service is listed in the Aggregate Services pane.

Investigate Reference Materials



This section provides is intended to help you understand the purpose and application of NetWitness Investigate views. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.

- Investigate View

Add Events to an Incident Dialog

In the Add Events to an Incident dialog, analysts can add alerts to an existing incident so that incident responders look at the associated events as part of an incident response. To access this dialog while investigating a service in the Events view and the Legacy Events view, see Add Events to an Incident in the Events View and Add Events to an Incident in the Legacy Events View.

Workflow

Quick Look

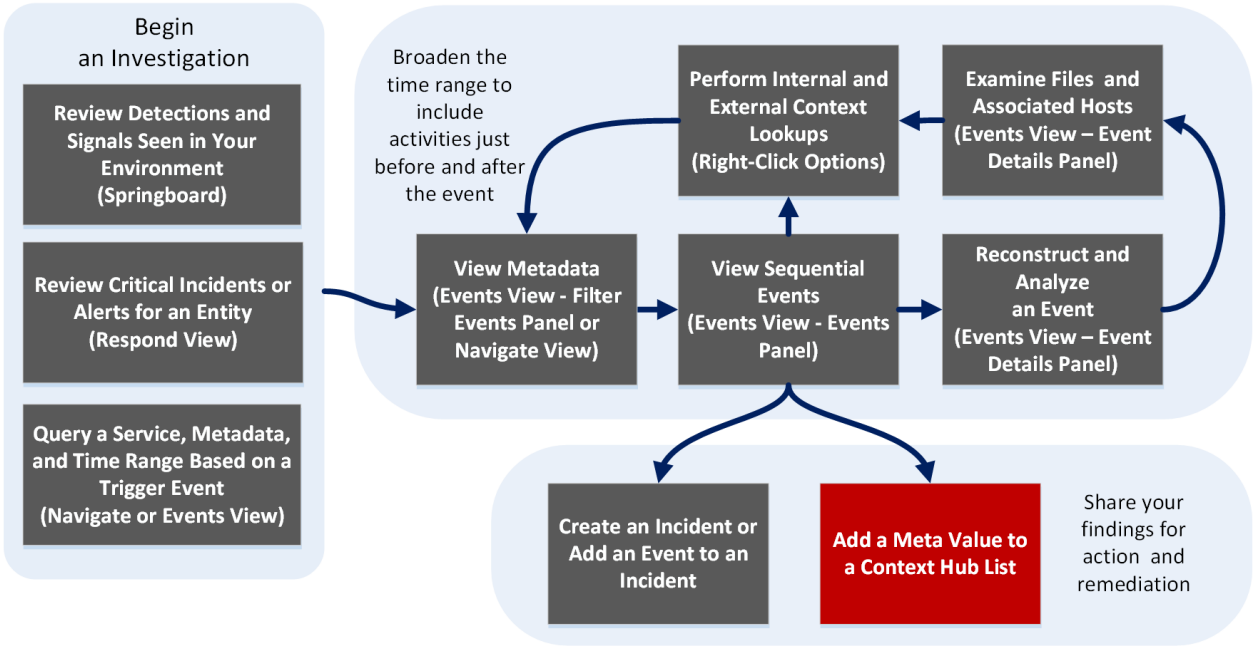
The following figure is an example of the Add Events to an Incident dialog in the Legacy Events. The table describes the information and options in the Add Events to an Incident dialog .

Feature	Description
Alert Summary	The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident. The Severity field reflects the Severity of the selected alert, an integer between 1 and 100.
Search	Allows you to search for an existing event.
ID	The ID of the incident. You can sort IDs in ascending or descending order.
Name	The incident name. You can sort the Name in ascending or descending order.
Date Created	Displays the date and time the incident was created. You can sort the dates in ascending or descending order.
Priority	Displays the priority of the incident: either low or critical.
Cancel	Closes the dialog without saving changes.
Add to Incident	Adds the alerts to the incident. A dialog confirms that alerts are successfully added

The following figure is an example of the Add to Incident dialog in the Events view. The table describes the information and options in the Add to Incident dialog.

Feature	Description
Alert Summary	The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident.
Severity	The Severity field reflects the Severity of the selected alert, an integer between 1 and 100.
Search Open Incidents	Allows you to search for an existing incidents.
ID	The ID of the incident.
Name	The incident name.
Created	Displays the date and time the incident was created.
Assignee	Displays the team member currently assigned to the incident
Cancel	Closes the dialog without saving changes.
OK	Adds the alerts to the incident. A confirmation message is displayed after the incident is successfully added

Add/Remove from List Dialog



The Add/Remove from List dialog allows you to add an entity or meta value to an existing Context Hub list, remove an entity or meta value, or create a new Context Hub list containing the entity or meta value. When you look up an IP address or other entity and you find it suspicious or interesting, you can add it to a list that has been added as a data source. An example of a commonly used list is a white list or black list. This improves the visibility of the suspicious IP addresses and reduces false positives that do not need further investigation.

You can add entities or meta values to more than one list. For example, you can add them to one list for suspected domains related to command and control connections and to another list for Trojan connection IP addresses related to remote access. If a list is not available, you can create a list.

The dialog is available in NetWitness Investigate and in NetWitness Respond. When working in Investigate, in the Navigate view, Legacy Events view, or Events view, you can add meta values for the `Source IP`, `Destination IP`, or `Username` meta keys to an existing context hub list or you can create a new list containing the meta values. When you add meta values to a list, you can look up additional context on those meta values.

- To display the dialog in the Navigate view or the Legacy Events view, right-click a meta value under `Source IP`, `Destination IP`, or `Username`) and select **Add/Remove from List** in the context menu.
- To display the dialog in the Events view, hover over a value and select **Add/Remove from List** in the Actions section of the context tooltip.

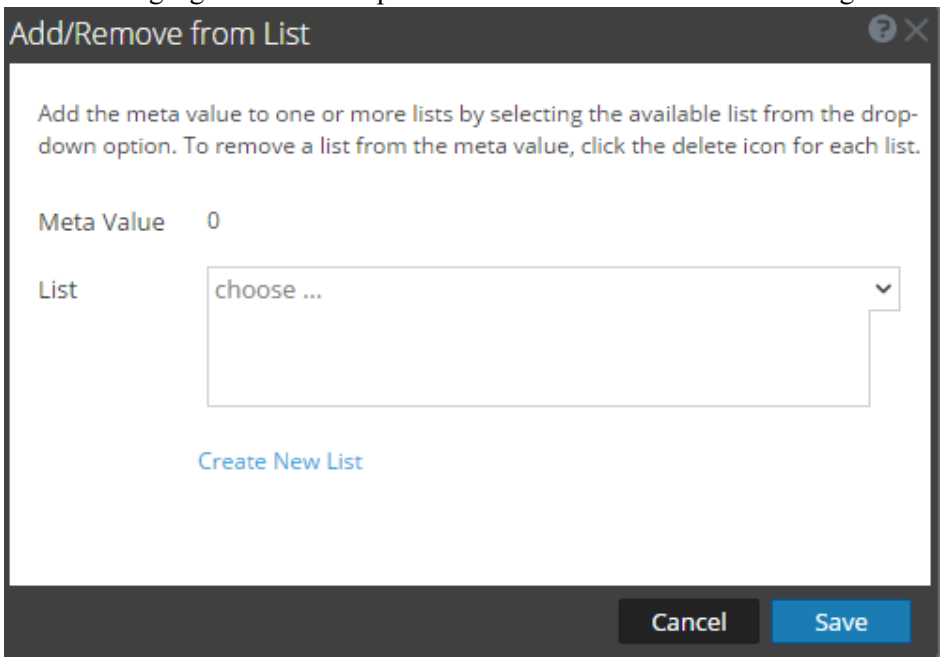
Quick Look in the Events View

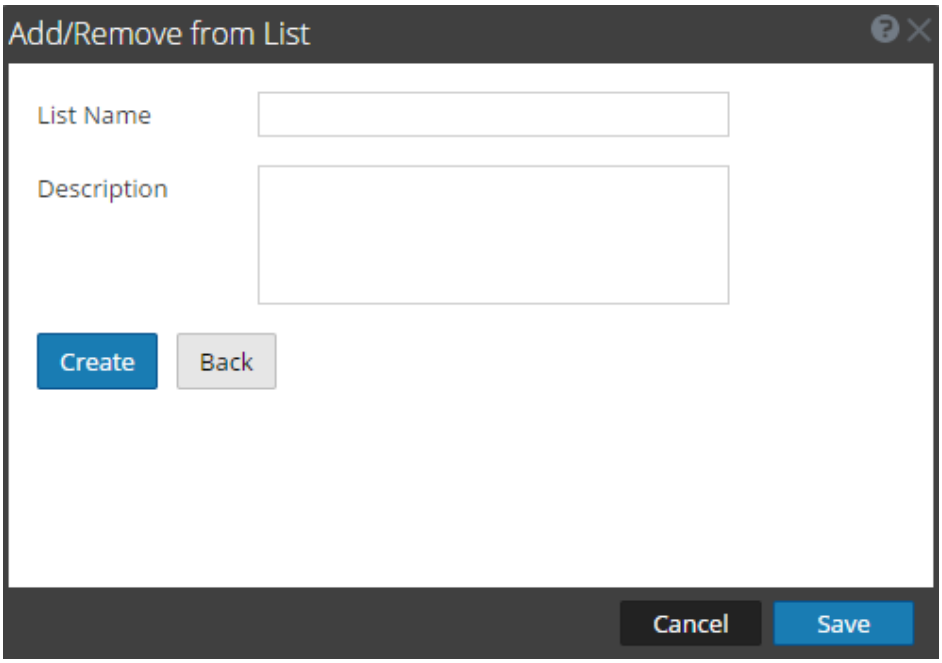
The following is an example of the **Add/Remove from List** dialog in the Events view.

1 Entities or meta values to be added or removed.
2 Create a new list using the selected meta.
3 Select any of the tabs: All, Selected, or Unselected.
4 Search using the list name or description.
5 Cancel the action.
6 Save to update lists or create a new list.



The following table shows the options in the Add/Remove from List dialog.

Option	Description
Meta Value	Displays the selected entity or meta value that needs to be added to or removed from one or more lists. You can also a create a new list using the selected value.



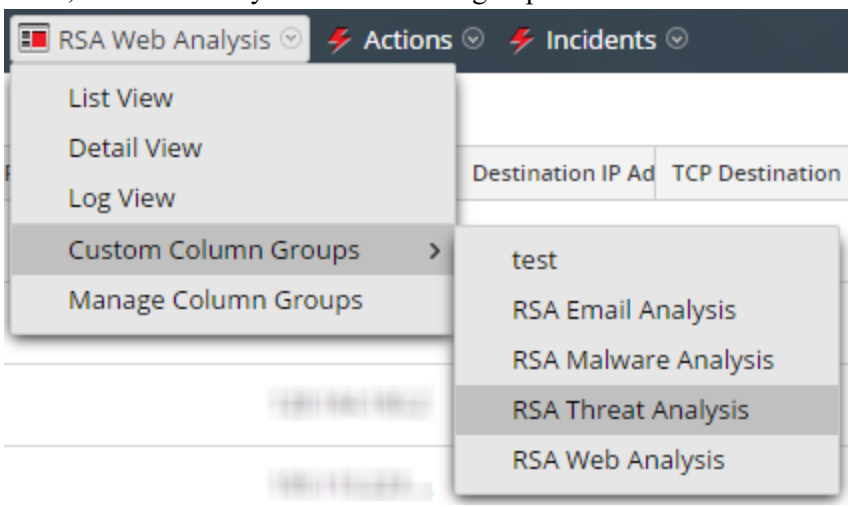
Option	Description
Create New List	Displays a dialog to create a new list using the selected meta value.
All	Shows all of the available Context Hub lists. The lists that contain the selected entity or meta value are selected. Select a checkbox to add an entity or meta value to a list. Clear a checkbox to remove it from the list.
Selected	Shows only the lists that contain the selected entity or meta value. (All lists are selected.)
Unselected	Shows only the lists that do not contain the selected entity or meta value. (All lists are unselected.)
Filter Results	Enter the name or description of a specific list to search from multiple lists.
List	Displays the name of all the lists.
Description	Displays information about the selected list. The description that you provide when creating a list appears in this dialog. For example: This list contains all of the blacklisted IP addresses.
Cancel	Cancels the operation.
Save	Saves the changes.

Quick Look in the Navigate and Legacy Events Views

The following figure is an example of the Add/Remove from List dialog when initially opened.

The following figure shows the dialog when you select Create New List.

The following table describes the features of the Add/Remove from List and Create New List dialogs.



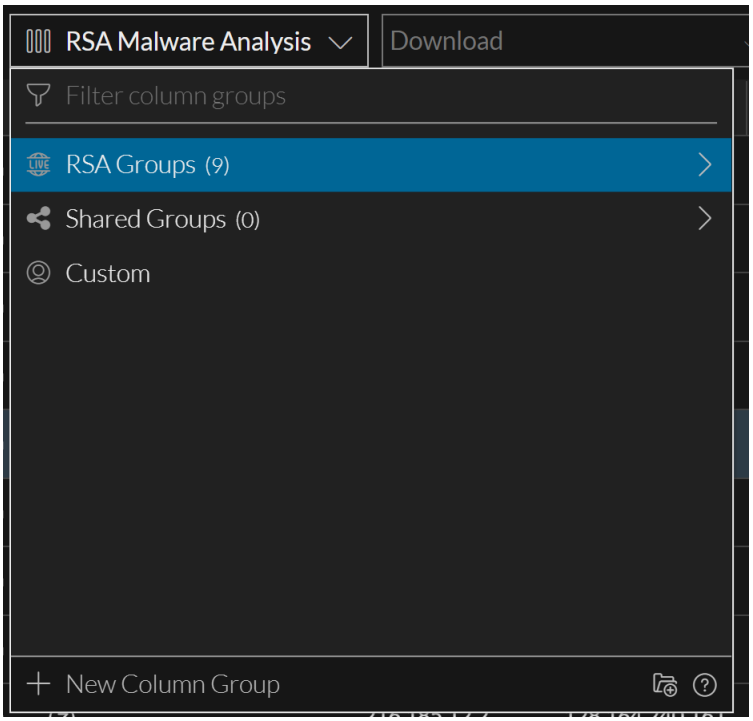
Feature	Description
Meta Value	The selected meta value to be added to the existing or new list.
List	The list to which the selected meta value must be added. A drop-down menu provides a list of available lists to which you can add the meta value.
Create New List	Opens a new dialog in which you can create a new list for the selected meta value.
List Name	The name of the new list.
Description	The description of the new list.
Create	Creates a new list after entering the required fields.
Back	In the new list mode, cancels the new list creation and returns to the original dialog.
Cancel	Cancels the addition of the meta value to a list and closes the dialog.
Save	Saves the changes made to the lists and closes the dialog.

Column Groups Dialogs

Column groups allow you to format the events list to include only the relevant meta keys in the Events view and Legacy Events view (see Use Columns and Column Groups in the Events List). When the events list in Investigate is populated with events, each column lists the values returned for a meta key. Changing the meta keys displayed in the events list is a useful method of narrowing the focus of your investigation. For example, the default column group includes columns for **Collection Time**, **Type**, **Theme**, **Size**, and **Summary**. These are just the basic information, not specialized in any way. The NetWitness Email Analysis list has only that contain information useful when investigating email.

The column group definition includes the meta keys to use as column titles, the position of the column in the list, and the default width of the column. You can add, delete, import, export, and edit column groups. At fresh installation, built-in column groups are available. The built-in column groups are prefixed with NetWitness and can be duplicated but cannot be edited or deleted. You can also create custom column groups.

- The Create Column Group dialog is for the 11.4 and later Events view. To access this dialog, select **Column Group > New Column Group** in the **Events** view toolbar.
- The Column Group Details dialog is for the 11.4 and later Events view. To access this dialog, select **Column Group** in the **Events** view toolbar, then click the edit icon ( ) next to a custom column group name.
- The Manage Column Groups dialog is for the Legacy Events view (Version 11.4) , and the Events view (Version 11.4 and earlier). The Manage Column Groups dialog has these features that are not yet available in the Create Column Group dialog: set column width, import, and export. To access this dialog, go to **Investigate > Legacy Events** and in the **View** drop-down list select **Manage Column Groups**. The **View** option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.



After column groups are defined, you can use them in other Investigate views. In the Navigate view, Query Profiles allow you to select a column group to use when the profile is applied. In the Events view and the Legacy Events view, you can select a column group to apply to the Events panel.

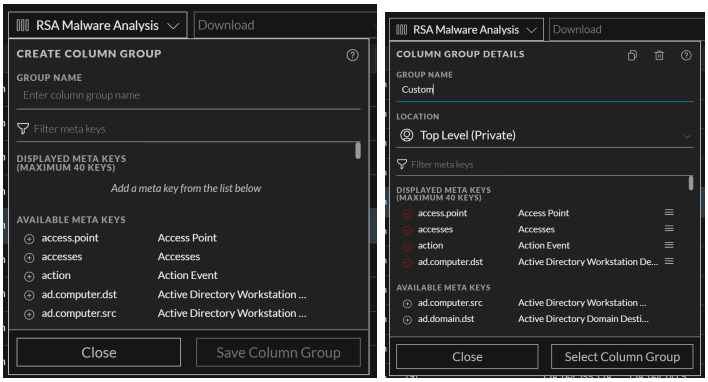
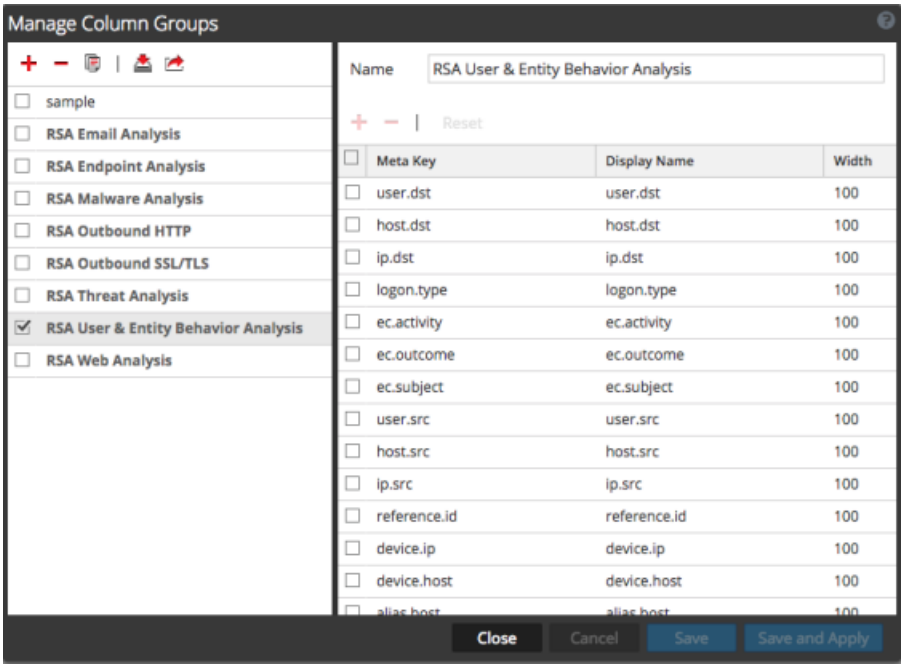
Quick Look - Column Group Menu, Create Column Group Dialog, and Column Group Details Dialog



This section introduces the Column Group Menu, Create Column dialog, and the Column Group Details dialog. The following figure is example of the Column Group menu. The table describes the options.

Feature	Description
Visibility Options	(Version 11.5 and later) Control the types of column groups that are visible in the list, using any combination of the visibility options (blue = selected, black = not selected): **Private** = display private groups that only you can manage **Shared** = display shared groups that anyone in your organization can manage **RSA** = display built-in groups that only RSA can manage The visibility options work together with the Filter Column Groups field. If the visibility option is hiding built-in groups (which include "RSA" in the group name) and you search for a name that contains "RSA," the list is empty.

Feature	Description
Filter Column Groups	Filters the list of column groups as you type text so that only group names that contain that text are displayed.
Column Group List	The list of column groups consists of custom and built-in groups, which are distinguished by the icons that precede the name. In Version 11.5 and later, custom groups can be shared or private. The RSA column groups are built-in column groups. The icons distinguish the private custom groups, shared custom groups, and built-in groups.
New Column Group	Displays the Create Column Group dialog, where you can create a custom column group.



The Create Column Group dialog, shown in the figure on the left, allows you to define a custom column group. The figure on the right illustrates the Column Group Details dialog, in which you can edit a custom column group. The table describes the fields and options in the dialogs.

Feature	Description
	Deletes the custom column group in the Column Group Details dialog. This action is irreversible and applies globally; the column group is no longer available to anyone who is using it on this service.
Group Name	Displays the name of the column group. The name must be unique and contain fewer than 64 characters. You can type in this field to edit the name in a custom column group.
Sharing	In Version 11.5 and later, you can create column groups that are shared or private. This setting is available when you first create the group. After it is created, you cannot change a shared column group to private, or a private column group to shared.
Filter Meta Keys	Filters the Displayed Meta Keys and Available Meta Keys based on the text that you type. Only meta keys that contain the typed text are displayed.
Displayed Meta Keys	Displays a scrollable list of meta keys that are selected for use in the custom column group. You can add meta keys in the Available Meta Keys list to this list, remove meta keys from this list , and drag meta keys up or down to change the order in this list ().

Feature	Description
Available Meta Keys	Displays a scrollable list of meta keys that are available (on the service) for use in the custom column group. You can add them to the Available Meta Keys list. Clicking  next to the meta key name adds it to the Displayed Meta Keys list.
Close button	Closes the dialog.
Save Column Group	For the Create Column Group dialog only, saves the new column group.
Reset	For the Column Group Details dialog only, reverts the edited column group to the last saved state.
Update Column Group	For the Column Group Details dialog only, applies changes to an edited column group.
Select Column Group	Applies the column group.

Quick Look - Manage Column Groups Dialog

The Manage Column Groups dialog has two panels: Groups and Settings. At the bottom of this dialog are four buttons: Close, Cancel, Save, and Save and Apply.

The left panel is the Groups panel. This is where you can add, delete, import, or export column groups. At the top of the panel is a toolbar. Below the toolbar is a list of added column groups, where you can select one or more groups.

The following table lists the actions in the toolbar.

Action	Description
	Adds a column group. Clicking this button highlights the Settings panel on the right, where you can name the column group and add or delete meta keys. At least one meta key is required to add a group.
	Deletes a column group. A confirmation dialog is displayed before the selected group is deleted. OOTB column groups cannot be deleted.
	Creates a copy of the selected column group.
	Displays the Import Column Groups dialog, where you can select a file to upload.
	Exports one or more selected groups to your local file system.

The right panel is the Settings panel. This is where you can create and edit column groups. This panel contains the Name field, a toolbar, and a list. The following table describes the features of the Settings panel.

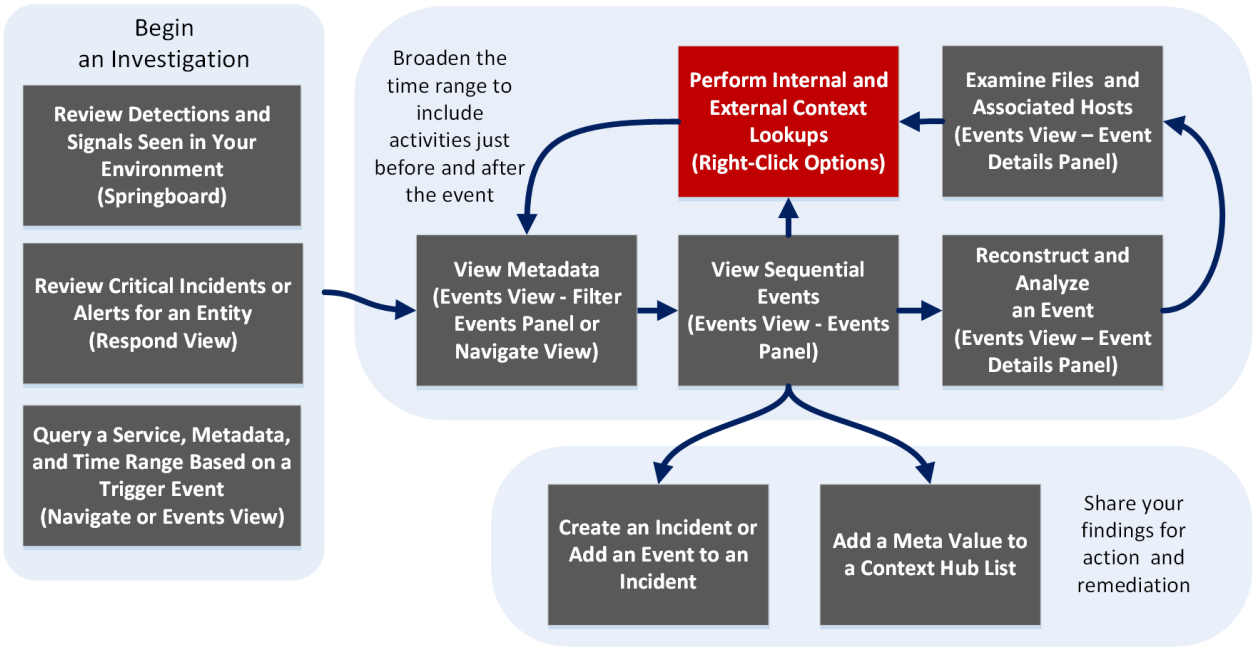
Feature	Description
Name	The name of the selected column group.
	Adds a new row to the list of meta keys, where you can open a drop-down menu to select a new meta key.
	Deletes one or more selected meta keys. Displays a confirmation dialog before deleting.
Reset	Returns the column group to its most recently saved settings.
Meta Key	Lists the meta keys added to the selected column group.
Display Name	Lists the names of the meta keys as they are displayed in the Navigate, Events, and Event Analysis views.
Width	Specifies the width of each meta key's column. The width can be set between **10** and **1000**. The default width is **100**.

The following table provides descriptions of the action buttons.

Feature	Description
Close	Closes the dialog without saving.
Cancel	Cancels all unsaved changes.

Feature	Description
Save	Saves all changes without closing the dialog.
Save and Apply	Saves and applies all changes immediately, closing the dialog.

Context Lookup Panel



After an administrator configures the Context Hub service, you can view the contextual information for the meta values in the Navigate view, Legacy Events view, and Events view (Version 11.2 and later). The Context Hub service is pre-configured with a default meta type and meta key mapping. For information about mapping of the context hub meta value with investigation meta key, see "Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*.

The Context Lookup panel is displayed on the right side of the Navigate view, Legacy Events view, or Events view. Meta values that have been added to a Context Hub list are highlighted in gray in the Navigate view or Legacy Events view results. In the Events view, they are marked by an underscore. When you right-click a highlighted value and select **Context Lookup** in the resulting context menu, the lookup results are displayed in the Context Lookup panel for configured sources for the selected meta value. You can select a source in the Context Lookup panel icon bar to view the contextual information.

There are some differences between the appearance and contents of the Context Lookup panel when open in the Navigate view or Events view and when open in the Events view.

Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Investigate > Events** view to view context lookup for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

Quick Look (in the Navigate and Legacy Events Views)

The following figure is an example of the Context Lookup panel as it appears in the Navigate view. Controls and features are described in the table.

Feature	Description
Source Options Bar	Displays the icons for the available sources: Endpoint, Incidents, Alerts, and Lists.
Source Name	Displays the source name based on the selected icon: • Endpoint • Incidents • Alerts • Lists
Sort	Provides a drop-down of sort options for the listed context information. Possible sort options are Severity - High to Low, Severity Low to High, Date - Oldest to Newest. and Date - Newest to Oldest. The sorting options vary by source type.
	Refreshes the lookup results.

Feature	Description
<n items> (First <n> Results)	The footer provides a count of results currently displayed and the total number of results. For example, 5 Alerts (First 50 Results).

Incidents

Incidents are displayed based on time first (Newest to Oldest) and then priority status. The following information is displayed for incident lookups:

- Incident Name and ID
- Priority status of the incidents
- Risk Score value of the incidents
- Date when the incident was created
- Status of the incident
- Assignee for the incident
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Time window: This is based on the value that is set for the "Query Last (Days)" field in the Configure Respond window. For details, see the "Configure Respond as a Data Source" topic in the *Context Hub Configuration Guide*.
- Sort: This drop-down field provides options to change the sorting of result based on time or priority.

Alerts

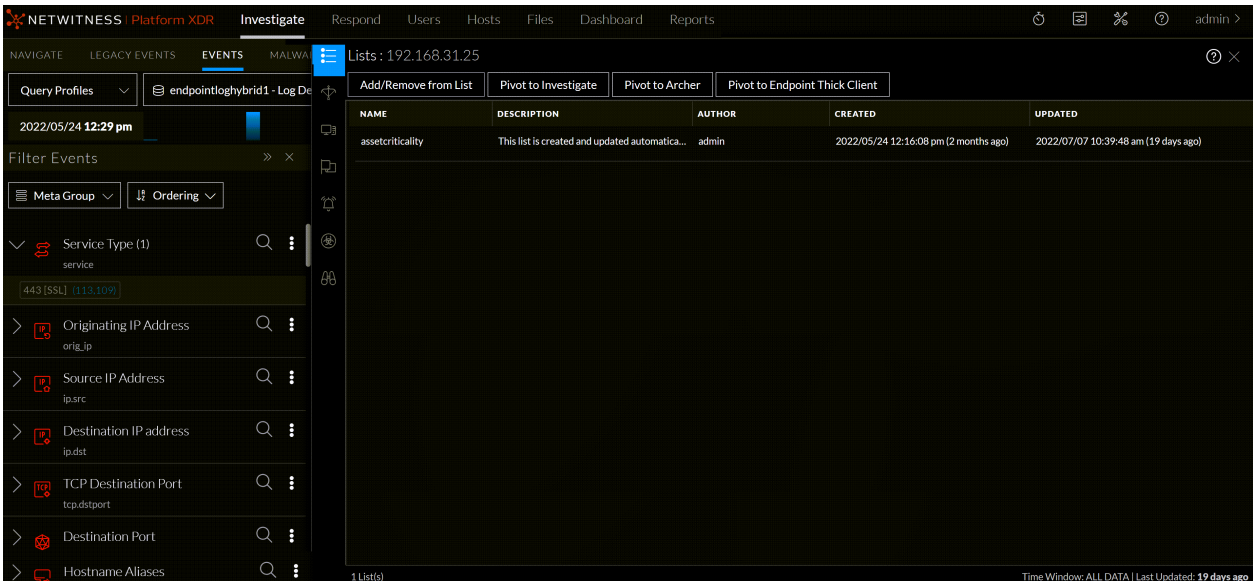
Alerts are displayed based on the Severity. ;The following information is displayed for alert lookups:

- Alert Name
- Severity value of the alerts
- Date when the alert was created
- Incident ID: This is the ID of the incident that the alert is associated with (If any).
- Sources: Event source name
- Number of events associated with the alert.
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Time window: This is based on the value that is set for the "Query Last (Days)" field in the Configure Respond window. For details, see the "Configure Respond as a Data Source" topic in the *Context Hub Configuration Guide*
- Sort: This drop-down field provides option to change the sorting of result based on time or priority.

Lists

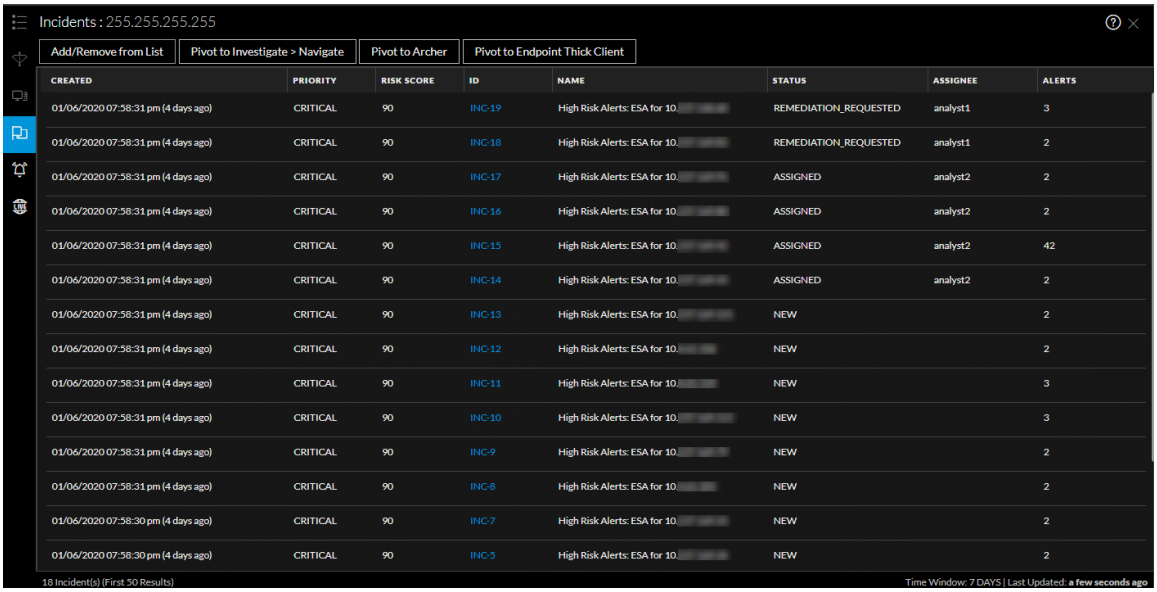
The following information is displayed for list lookups.

- List Name (user defined)
- Description of the list (user defined)
- Header
- Value
- Owner who created the list
- Created Date
- Last Updated Date



Endpoint

The following information is displayed for Endpoint lookups.



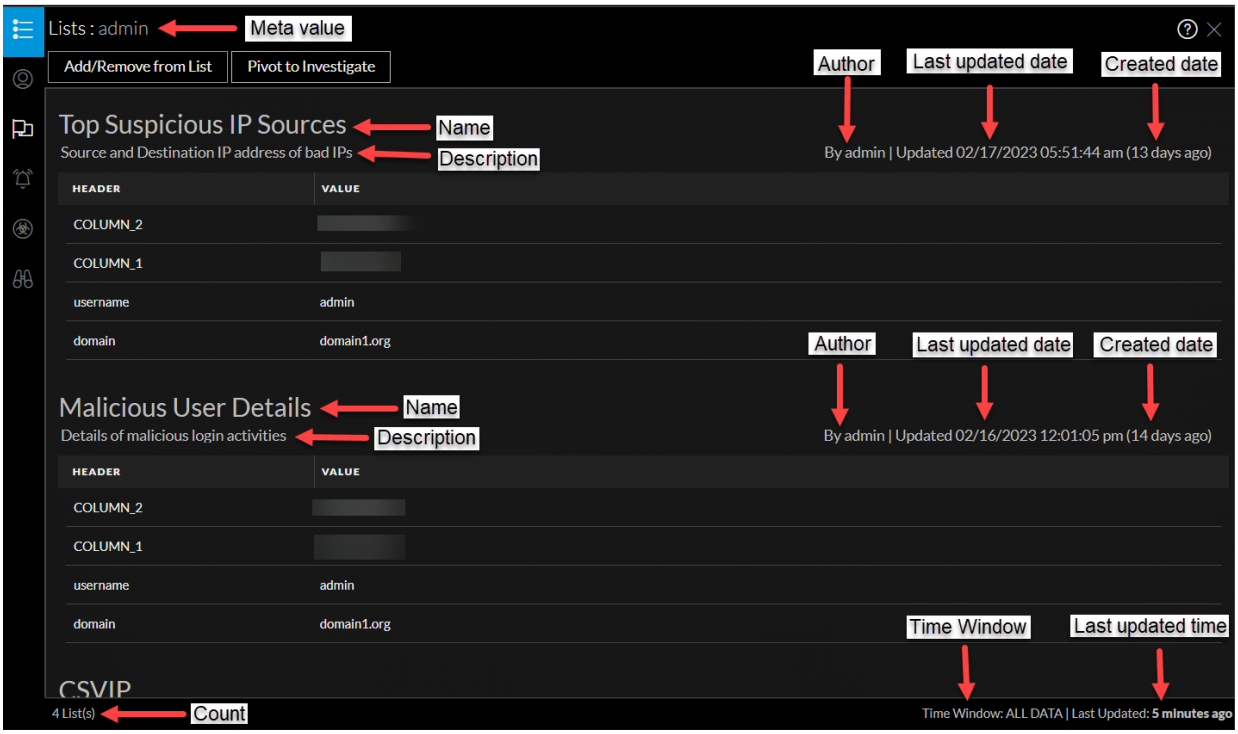
- Machine name and IP address of the machine.
  By clicking on the IP or Endpoint machine name, you will be navigated to Endpoint UI to perform further investigation.
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Machine Score: A machine IIOC score is aggregated based on the module scores.
- Number of modules: Number of active files for the selected machine.
- Last Updated: Indicates when the scan results were last updated in Endpoint database.
- Last Login User
- Machine MAC Address
- Operating System Version
- Admin Notes (if any)
- Admin Status (if any)
- Top Suspicious Modules (Modules that have an IIOC score > 500). This is based on the value set for "Minimum IIOC Score" field in the Configure Endpoint window. The default value for "Minimum IIOC Score" is 500.
- Machine IIOC Levels

Quick Look in the Events View

The following figure is an example of the Context Lookup panel as it appears in the Events view.

The contextual information or query results displayed in the Context Lookup panel depends on the selected entity and the associated data sources. The Context Lookup panel has separate tabs for each of the data sources. The tabs are: List data source, Archer, Active Directory, Endpoint, Incidents, Alerts, and REST API. The following figure shows the Context Lookup panel for a selected entity in the Incident Details view.

The following table describes the data available on each tab and the supported entities.



Tab	Description	Supported Entities
 (Lists)	Displays all of the list data associated with the selected entity or meta value. The result is sorted by the last updated list.	All entities

Tab	Description	Supported Entities
 (Archer)	Displays asset information along with criticality ratings using the Archer data source.	IP, Host, and Mac
 (Active Directory)	Displays all user information for the selected user.	User
 (NetWitness Endpoint)	Displays the NetWitness Endpoint data source information for the selected entity or meta value, which includes the Machines, Modules, and IIOC levels. Modules are by highest IOC score to lowest IIOC score and IIOC levels are sorted by highest IOC levels to lowest IOC levels.	IP, MAC address, and Host
 (Incidents)	Displays the list of incidents associated with the selected entity or meta value. The result is sorted by newest incidents to oldest incidents.	All entities
 (Alerts)	Displays the list of alerts associated with the selected entity or meta value. The result is sorted by newest alerts to oldest alerts.	All entities
 (Live Connect)	Displays information related to Live Connect.	IP, Domain, and Filehash
 (File Reputation)	Displays file reputation status for Filehash entities.	Filehash entities
 TI	Displays information for STIX data sources.	IP address, email address, domain, filename, URL's, and file hash. **Note:** The context lookup for email address and URL will be displayed only if these metas are mapped. Navigate to  (Admin) > System > Investigation > Context Lookup.

Tab	Description	Supported Entities
REST API	Displays the list of REST APIs (enabled in Context Hub) associated with selected the entity.	All entities

Lists Tab

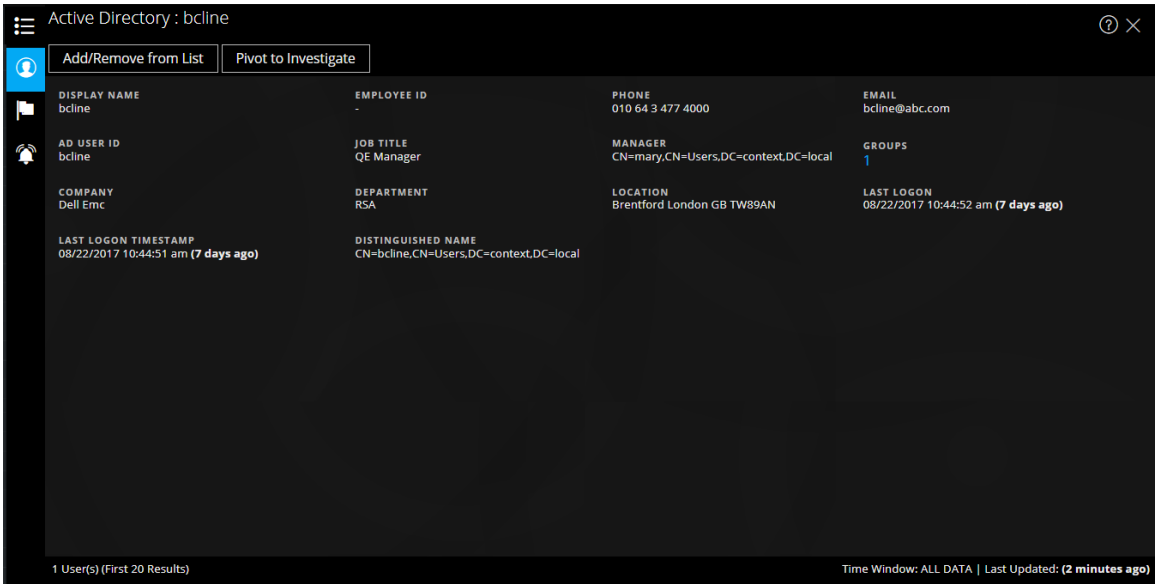
The Context Lookup panel for Lists shows one or more lists associated with the selected entity or meta value. The following figure is an example of the Context Panel for Lists, and the table describes the fields.

Field	Description
Name	The name of the list (defined while creating the list).
Description	The description of the list (defined while creating the list).
Header	Displays the metas available for the list.
Value	Displays the values for each meta in the list.
Author	The owner who created the list.
Created	The date when the list was created.
Updated	The date when the list was last updated or modified.
Count	The number of lists in which the selected entity or meta value is available.

Field	Description
Time Window	The time window based on the value set for the "Query Last" field in the Configure Responses dialog. By default, all Lists data is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Archer Tab

The Context Lookup panel for Archer displays asset information along with criticality ratings using the Archer data source for IP, Host, and Mac entities. The following figure is an example of the Context Lookup panel for Archer, and the table describes each field.



Field	Description
Criticality Rating	The device operational criticality based on the applications it supports. The criticality ratings can be set as Not Rated, Low, Medium-Low, Medium, Medium-High, or High.
Risk Rating	The calculated risk rating for the device based on the most recent assessment and the average risk rating of facilities using the device. The risk rating can be set as Severe, High, Medium, Low, or Minimal.
Device Name	The unique name of the device.
Host Name	The host name of the device.
IP Address	The primary internal IP address of the device.
Device ID	The automatically populated value that uniquely identifies the record across all applications within the system.
Type	The device type, for example, server, laptop, desktop, and others.
Facilities	Links to records in the Facilities application that are related to this device.

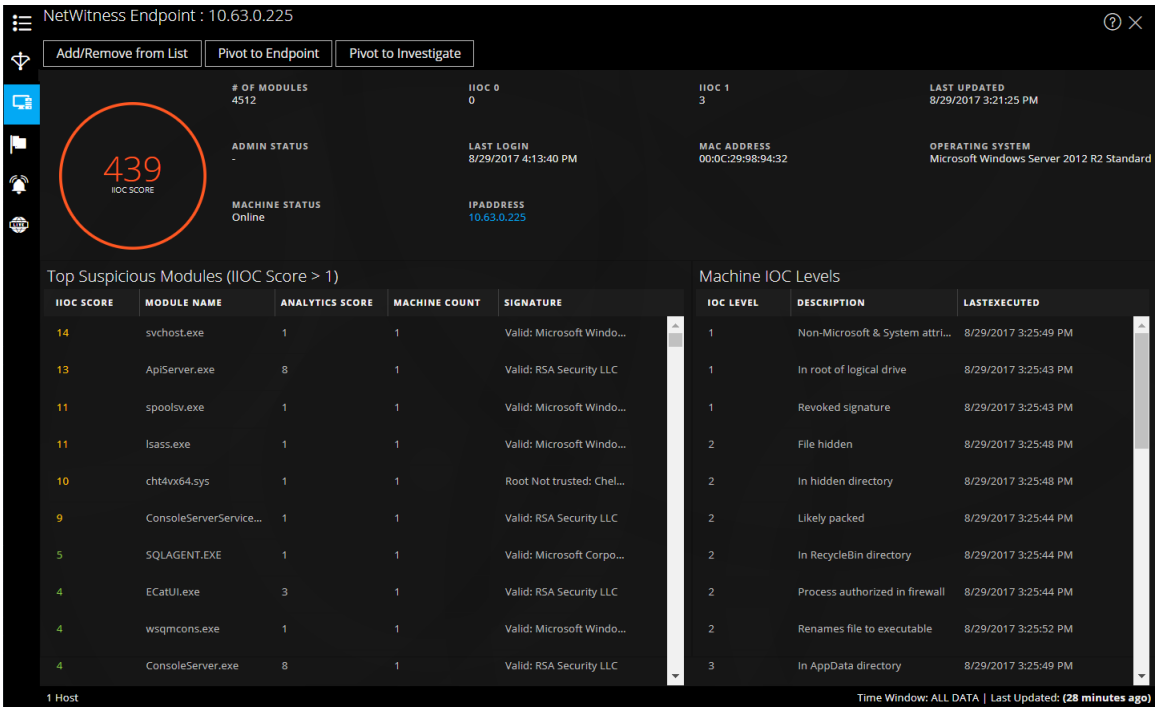
Field	Description
Business Unit	Links to records in the Business Unit application that are related to this device. For more than three business unit values, you can hover over the field to view the values.
Device Owner	The person who is responsible for the device and receives read and update rights of the record.
Count	The number of assets available.
Time Window	The time window based on the value that is set for the "Query Last" field in the Configure Responses dialog. By default, all data for Archer is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Note: In the localized versions, only these twelve fields are displayed: Criticality Rating, Risk Rating, Device Owner, Business Unit, Host Name, MAC Address, Facilities, IP Address, Type, Device ID, Device Name, and Business Processes.

Active Directory Tab

The following figure is an example of a Context Lookup panel for Active Directory.

The Context Lookup panel for Active Directory displays all the related information, incidents, and alerts for a user. You can perform a look up using the following formats:



- userPrincipalName
- Domain\UserName
- sAMAccountName

The following information is displayed for Active Directory.

Field	Description
Display Name	The name of the user.
Employee ID	The employee ID of the user.
Phone	The phone number of the user.
Email	The email ID of the user.
AD User ID	The unique identification of the user within an organization.
Job Title	The designation of the user.
Manager	The name of the user's manager.
Groups	The list of groups of which the user is a member.
Company	The name of the user's company.
Department	The department name to which the user belongs within the organization.
Location	The location of the user.
Last Logon	The time when the user logged into the system, only if the Global Catalogue is defined.
Last Logon TimeStamp	The time when the user logged into the system.
Distinguished Name	The unique name assigned to the user.
Count	The number of users.
Time Window	The time window based on the value that is set for the "Query Last" field in the Configure Data Source Settings dialog. By default, all data for Active Directory is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

NetWitness Endpoint Tab

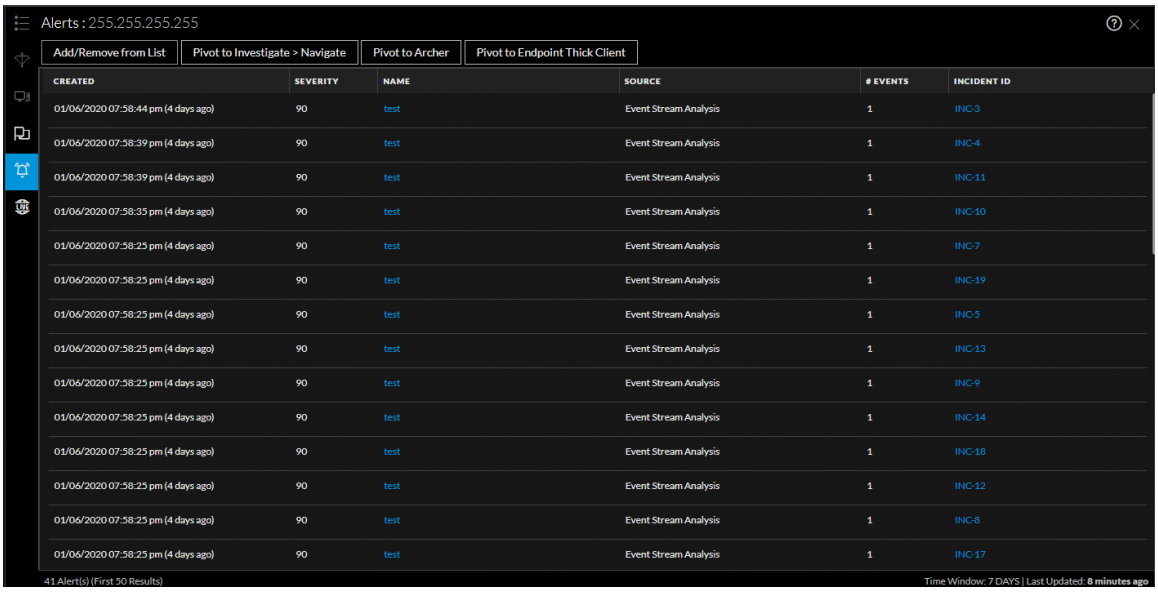
The following figure is an example of the Context Lookup panel for NetWitness Endpoint.

The following information displayed for IIOCs.

Field	Description
# Of Modules	The number modules that are looked up.
Admin Status	The admin status (if any).
Last Updated	The time when the data was last refreshed.
Last Login	The time when the user last logged in.
MAC Address	The Machine MAC Address.
Operating System	The Version of the Operating System used by the NetWitness Endpoint machine.
Machine Status	The state of the module being viewed: Online, Offline, Active, or Inactive.
IP Address	The IP address of the specific module.

The following information is displayed for modules.

Field	Description
IIOC Score	A machine IIOC score is an aggregated score based on the module scores. This is based on the value set for Minimum IIOC Score field in the Context Hub Data Source Settings dialog. The default value for Minimum IIOC Score is 500. See "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.



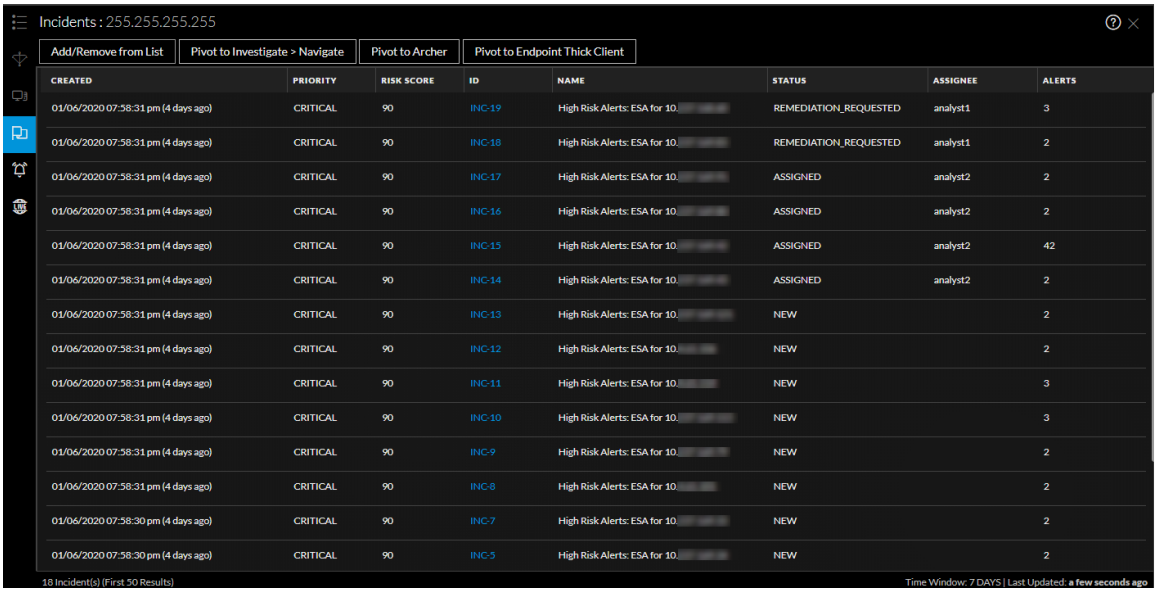
Field	Description
Module Name	The name of the module that is being looked up.
Analytic Score	The number of active files for the selected machine.
Machine Count	The number of machines on which that particular IOC got triggered.
Signature	Indicator of whether the file is signed or unsigned, valid or invalid, and signatory information. For example, Google, Apple, and so on.

The following information is displayed for machines.

Field	Description
IOC Levels	The IOC levels.
Description	The description for he IOC level if available.
Last executed	The time when the action was executed.
Count	The number of hosts that are being looked up.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, all data for NetWitness Endpoint is fetched.
Last Updated	The time when scan results were last updated in NetWitness Endpoint database.

Alerts Tab

The following figure is an example of Context Panel for Alerts that is displayed based on time first (Newest to Oldest) and then severity.

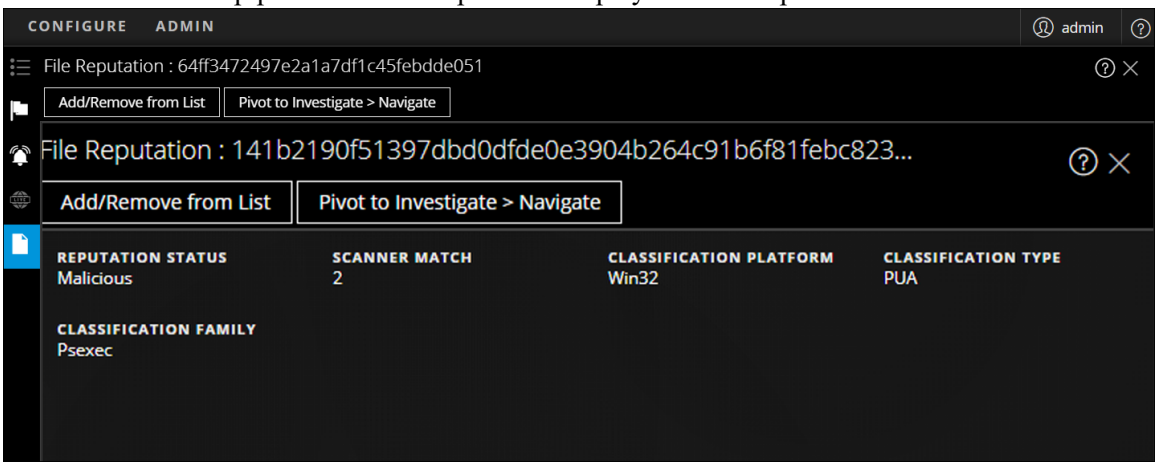


The following information is displayed in the Context Lookup panel for Alerts.

Field	Description
Created	The date and time when the alert was created.
Severity	The severity value of the alerts.
Name	The name of the alert. You can click the name to view the details of a specific alert.
Source	The alert source name from which the alert is triggered.
#Events	The number of events associated with the alert.
Incident ID	The ID of the incident (if any) with which the alert is associated. You can click the ID to view the details of a specific alert.
Count	The number of alerts. By default only the first 100 alerts are displayed. For more information on how to configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	The time when contextual data was last fetched from data source.

Incidents Tab

The following figure is an example of the Context Panel for Incidents, which is based on time first (Newest to Oldest) and then priority status.

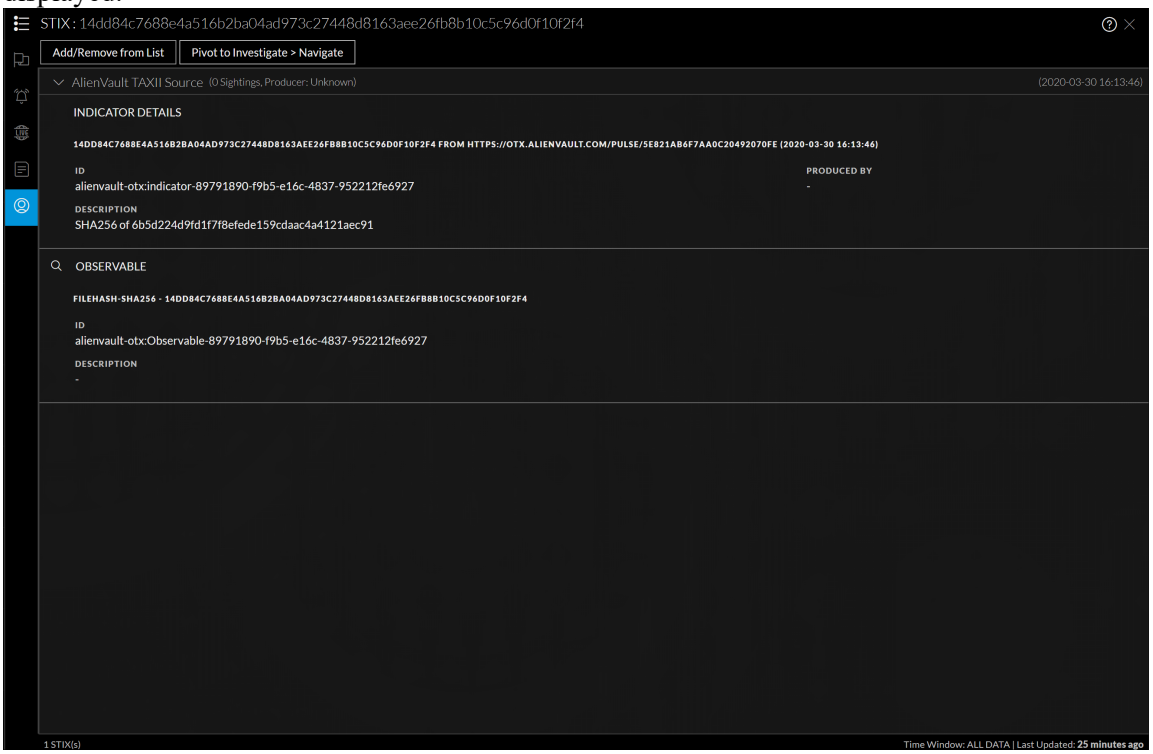


The following information is displayed in the Context Lookup panel for Incidents.

Field	Description
Created	The date when the incident was created.
Priority	The priority status of the incidents.
Risk Score	The risk score of the incidents.
ID	The Incident ID of the incident. You can click on the ID to display further details about the incident.
Name	The incident name.
Status	The status of the incident
Assignee	The current owner of the incident.
Alerts	The number of alerts associated with the incident.
Count	The number of incidents. By default only the first 100 incidents are displayed. For more information on how configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	The time when contextual data was last fetched from data source.

File Reputation Tab

The Context Lookup panel for File Reputation displays the file reputation status of a file.



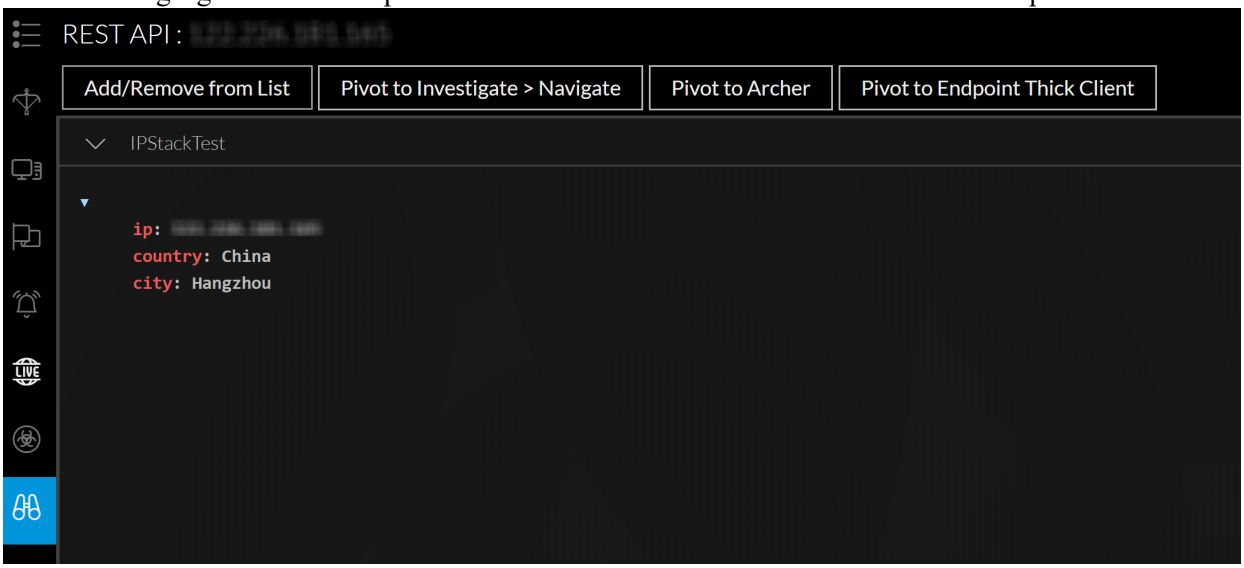
Field	Description
Reputation Status	Reputation Status of filehash. For more information about reputation status, see "View Reputation of files" in the *UEBA User Guide*.

Field	Description
Scanner Match	Number of scanners that detected malware or suspicious activity in the last scan.
Classification Platform	Classification for the queried filehash based on the platform. For example, the platform can be Win 32.
Classification Type	Classification for the queried filehash based on the type.
Classification Family	Classification for the queried filehash based on the malware family name.

TI Tab

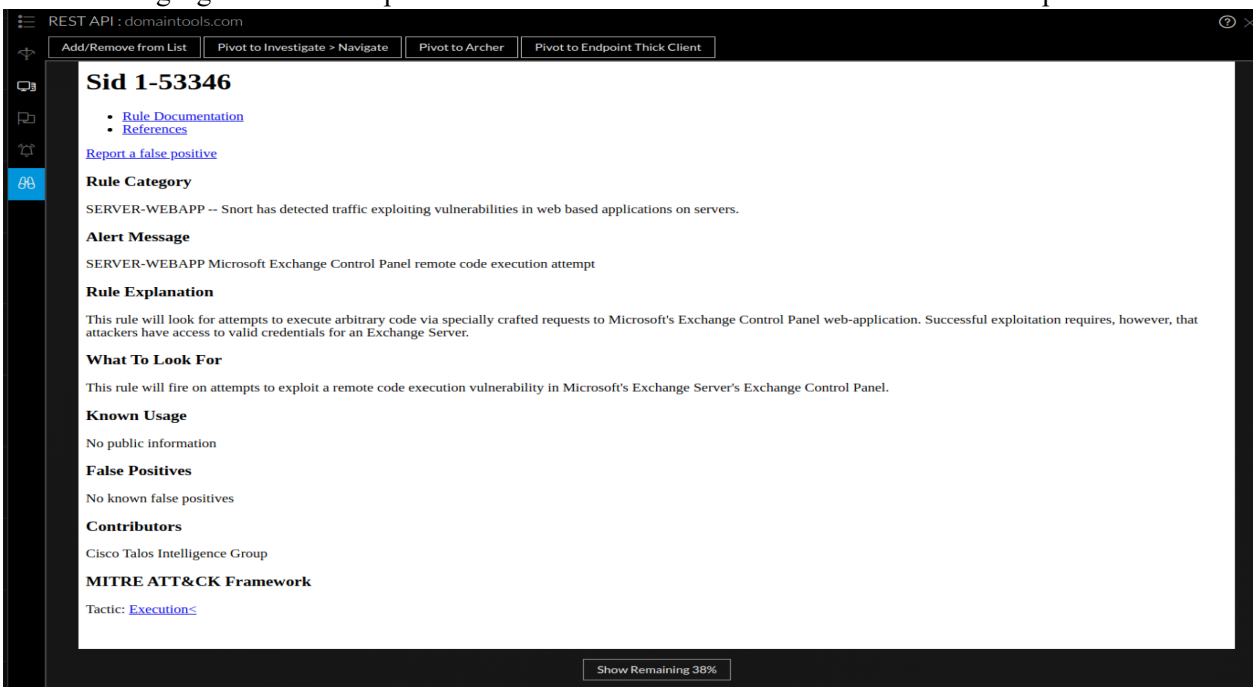
The following figure is an example of a Context Panel for TI, and the table describes the information displayed.

Field	Description
Data Source name	Displays the STIX data source name from where the data is retrieved.
Timestamp	The time when the event was created.



Field	Description
Indicator Details	Indicator Title: Displays the details that contains a pattern that can be used to detect suspicious or malicious cyber activity. ID: Displays the ID of the selected indicator. Produced by: Displays the user role who requested for the STIX data. Description: Displays details about the selected IP address which are being watch listed.
Observable	Observable Title: Displays and conveys information about cyber security related entities such as files, systems, and networks using the STIX Cyber-observable Objects (SCOs). ID: Displays the ID of the selected observable.
(Optional) SightingsREST	Sightings Title: Displays the name of the sighting source. Confidence: Displays the criticality of the sighting. Reference: Displays the reference URL of the sighting source.

REST API Tab

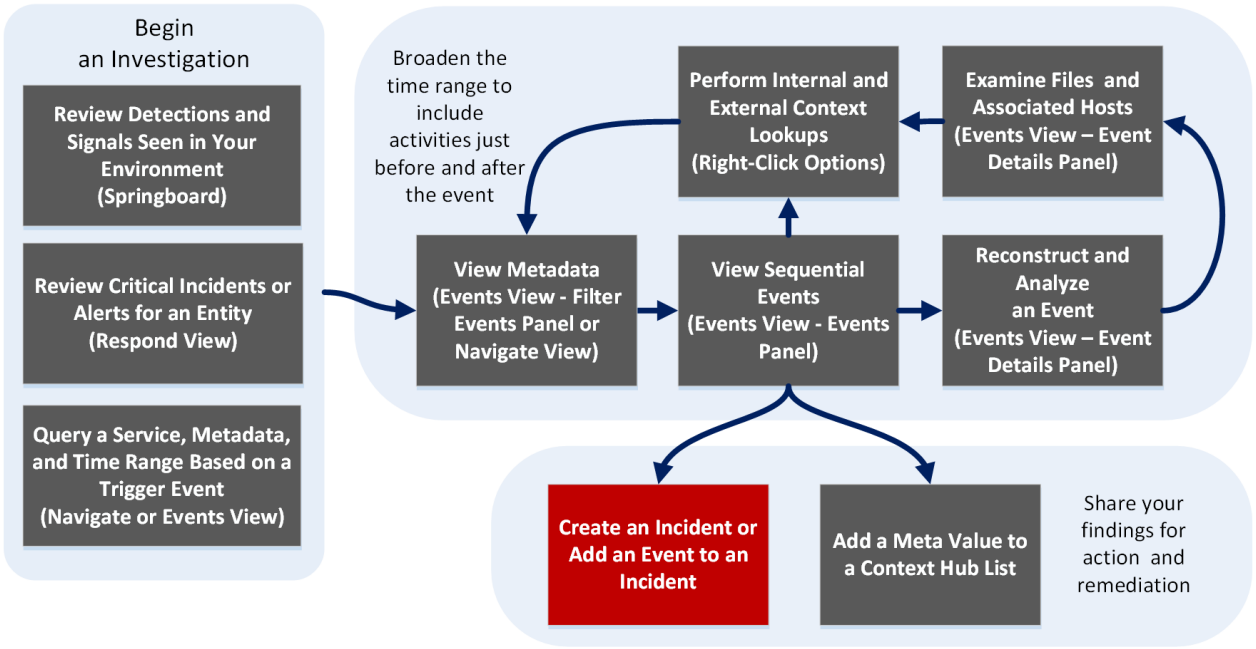


The Context Lookup panel for REST API shows HTML or JSON response (based on the response type configured) associated with the selected entity or meta value.

Note: For JSON response type, the fields that are mapped with friendly names (during REST API configuration) are only displayed for context Lookup. If you have not mapped any fields, all fields are displayed for context lookup.

The following figure is an example of the Context Panel for REST API with JSON response:

The following figure is an example of the Context Panel for REST API with HTML response:



Create an Incident Dialog

In the Create an Incident dialog, analysts can create an incident from selected events in the Events view. The incident is then available to incident responders working in Respond.

To access this dialog, while investigating a service in the **Investigate** > **Events** view, select **Incidents** > **Create New Incident** from the toolbar.

Workflow

What do you want to do?

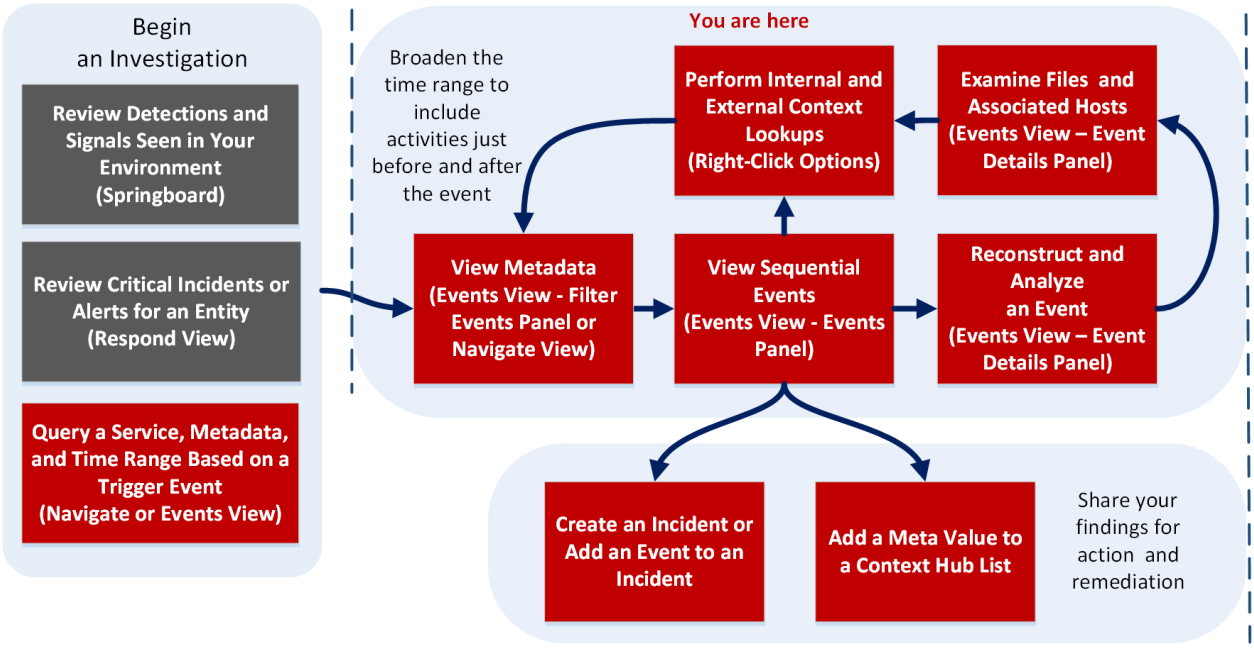
Quick Look

The following figure is an example of the Create an Incident Dialog, and the features are described in the table.



Feature	Description
Create Summary from These Events	The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident. The Severity field reflects the Severity of the selected alert, an integer between 1 and 100.
Name	(Required) Specifies a name to identify the incident. In the example, the name is Sample Incident. You can provide a name that clearly identifies the nature of events that will be added to this incident
Summary	(Optional) Specifies a description for the incident. A good summary clearly identifies the incident for other analysts and responders.
Assignee	(Optional) Assigns the incident to a user in the SOC. Clicking Assignee opens a drop-down list showing the user names of SOC personnel who respond to incidents.
Categories	(Optional) Identifies categories of incidents. Clicking Categories, opens a drop-down list of Incident categories and subcategories. You can select one or more categories to which the incident belongs. Categories fall into these major groups: Environmental, Error, Hacking, Malware, Misuse, and Social.
Priority	Identifies the priority for the incident. Clicking Priority opens a drop-down list of priorities: Critical, High, Medium, or Low displayed in the drop-down list.
Cancel	Closes the dialog without saving changes.
Save	Saves the incident and closes the dialog. A message confirms that the incident was created successfully.

Events View

In the Events view analysts can view a sequential list of network, log and endpoint events, select an event for reconstruction and analysis, and view the raw event and metadata with interactive features that enhance the ability to see meaningful patterns in the data. In Version 11.5 and later, you can drill into metadata for the listed events. The Events view offers packet, file, host, text, log, and email reconstruction. When you open a web reconstruction of an event, the same web reconstruction used in the Legacy Events view is displayed.

Workflow

The following figure is a high-level workflow illustrating the tasks you can do in NetWitness Investigate, with the Events view tasks highlighted in red.

What do you want to do?

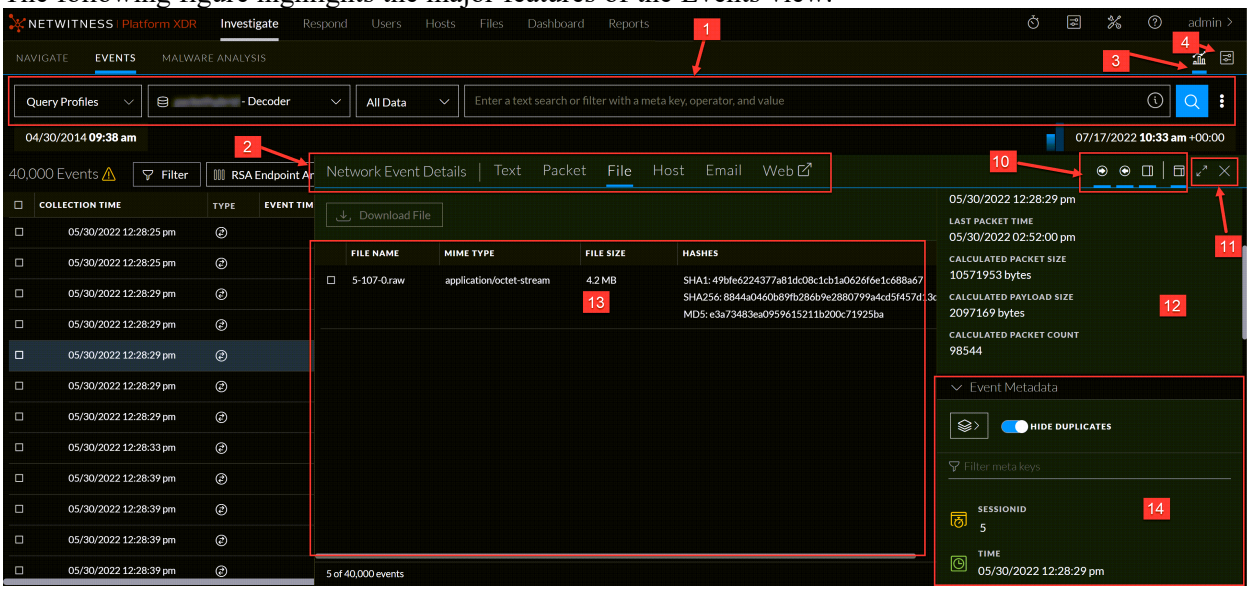
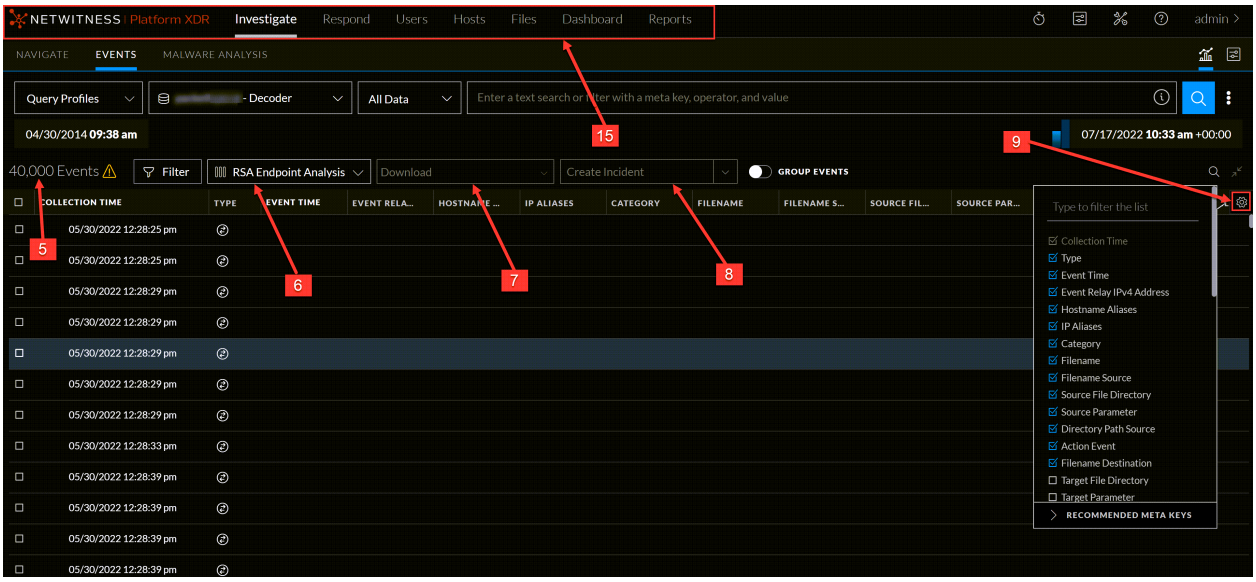
Quick Look



There are multiple access points to this view, which are described in Begin an Investigation in the Events View. If you access the Events view from the Respond view, you can see the analysis for a selected event in an incident. The options are a subset of the options available when you open an event from within the Investigate view. To get complete functionality and examine other events, you can go to the Event view directly (INVESTIGATE > Event).

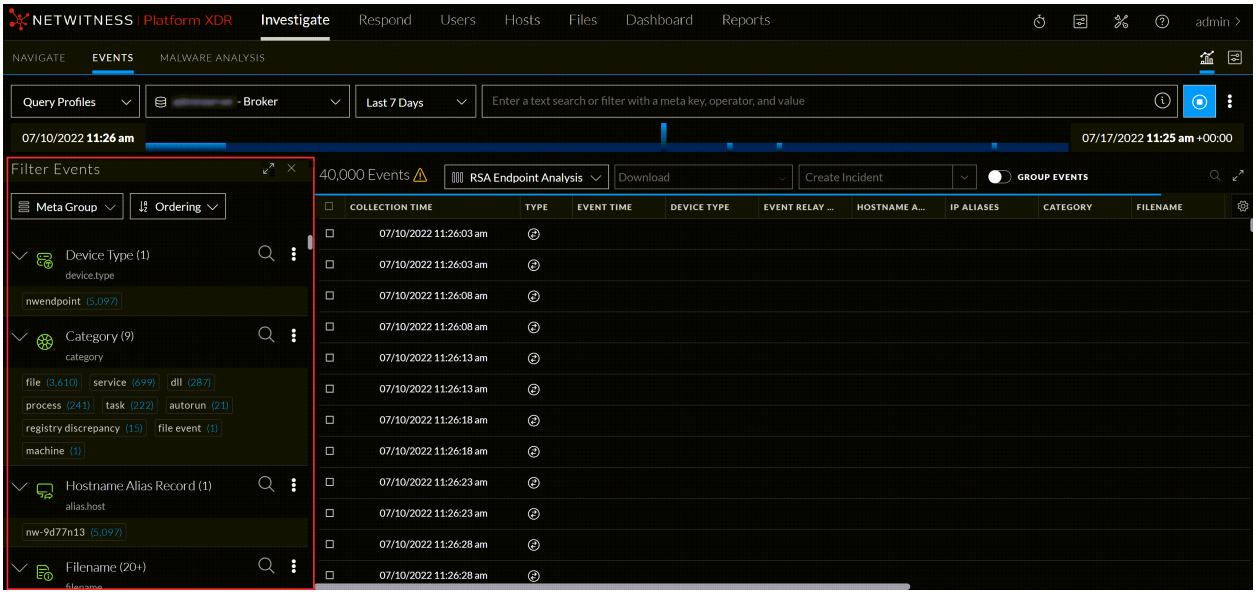


The Events view lists events in ascending order by time in the Events panel. The events displayed can be results for the drill point in the Navigate view or Legacy Events view, or results for a query entered in the Events view query bar.

Input fields for a query are displayed so that you can select a service and time range, and type an optional query. When you submit a query, the service being investigated counts the results up to a limit of 10,000 events, and 10,000 network, log, and endpoint events are loaded in the Events panel. Different columns are displayed, depending on the selected column group. You can rearrange and resize the columns, choose a built-in or custom column group, and choose individual columns that you want to see. When you find an event of interest, clicking the event opens the reconstruction in a new panel (Packet, Text , or File).

Note: For versions earlier than 11.3, the first 100 events are loaded. You can scroll through the list and click **Show Next 100 Events** at the bottom of the list. If the next page contains fewer than 100 events, the button changes to reflect the number of remaining events.

The following figure highlights the major features of the Events view.



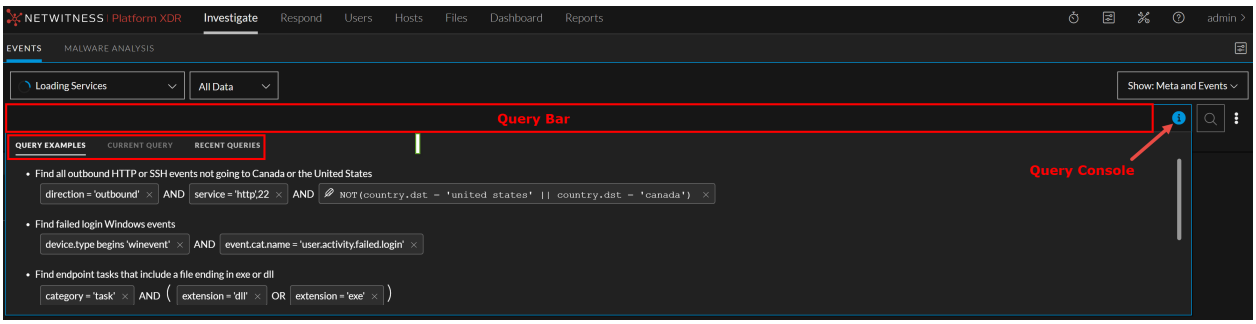
1	**Query Bar**: When a service is selected, displays the service selector, time range selector, and the queries you have entered. You can select a service as described in Begin an Investigation in the Events View and refine the query as described in Filter Results in the Events View. Clicking submits the query and sends a request to the selected service to load the data. In Version 11.3 and later, clicking the ( ) > **Query Console** **Current Query** tab, detailed status of the current query is provided (see Events View below).
2	The type of event being analyzed and the type of reconstruction are reflected in the heading. • These are the event types: **Network Event Details**, **Log Event Details**, or **Endpoint Event Details**. • The types of analysis available for the event type are Text, Packet, File, Host, Email, and Web. Network events can use all types of analysis: text, packet, file, and email (Version 11.4.1 and later). Log and endpoint events use only text analysis. The email (Version 11.4.0.x and earlier) type and web type open the current event as an email or web reconstruction in the Events view. For details, see Examine Event Details in the Events View.
3	Reopens the Events panel if you have closed it. For details, see Analyze Events in the Events View.
4	Sets preferences for the Event view (see Configure the Events View).
5	The Events panel title. • In Version 11.3 and later, the Events panel title is slightly different than the title in prior versions, and a row number indicator has been added. The title lists the number of events and sort order; for example, **40,000 Events (Asc)** means that 40,000 events were found and they are listed in ascending order by time. If more than 10,000 events are found, only the oldest 10,000 events are displayed in ascending order, and an amber triangle highlights the fact that not all events were loaded. This may indicate that you need to refine the query. For more information about refining the events listed here, see Filter Results in the Events View.

	• Versions prior to 11.3 simply list the number of events found, and you can load 100 of them at a time. In Version 11.4 and later, clicking  opens the Find Text in Table dialog.
6	The Column Group drop-down lists built-in and custom column groups that you can apply to the Events panel. Built-in column groups are sometimes updated between one version and the next. Some examples of built-in column groups are Email, Endpoint Analysis, Malware Analysis, Outbound HTTP, Outbound SSL/TLS, and Summary List. Summary List is the default column group. For details, see Use Columns and Column Groups in the Events List.
7	The Download drop-down menu lists the available options for downloading event data. The options are Log, Visible Meta, and Network (see Downloading and Acting Upon Results. You can change the preferred format of the event type data in the Event Preferences dialog (see Configure the Events View).
8	The Create Incident button enables you to create incidents from events. The Add to Incident button enables you to add selected events to an open and existing incident (see Add Events to an Incident in the Events View and Add Events to an Incident in the Legacy Events View).
9	Displays the column selection settings to select the individual columns displayed in the Events panel. For details, see Use Columns and Column Groups in the Events List.
10	Controls to show or hide the Overview panel, show or hide requests and responses, and open the Event Meta panel. For details, see Analyze Events in the Events View.
11	Controls to change the size of the panel and close the panel. For details, see Analyze Events in the Events View.
12	The Overview panel provides summary information about the event you are currently analyzing. The selected event is highlighted in the Events panel with a blue background. The summary information is different for the different event types (packet, log, and endpoint). In Version 11.5, the redundant NW Service is removed.
13	The event data for the event you are currently analyzing.
14	The Event Meta panel is redesigned in Version 11.5, but has the same functions as in Version 11.4. The Event Meta panel lists the meta keys and values found in the data. This data can be sorted in two ways - Alphabets or Sequence. Some metadata are searchable; they have a binoculars icon, which you can click to see the associated data highlighted in the event data (see Analyze Events in the Events View). • For a packet, the data is called a payload and is displayed in the form of a request and response. • For a log event, the data is a line of text from the raw log. • For an endpoint event, the event data is relevant to data from the NetWitness Endpoint agents running on hosts in the network. It may be a single process, driver, DLL, file (executable), service, or autorun, and information related to logged-in users. (See the *NetWitness Endpoint User Guide* for complete information about endpoint event data.)
15	The Version 11.5 main menu for NetWitness Platform has relocated Hosts, Files, and Users (Entities) options for easier access.

Filter Events Panel

The Filter Events panel is a beta feature added from Version 11.5. Clicking the Filter button (Filter) in the Events panel, opens the panel to provide a view of meta keys and meta values found in the data set. (Version 11.6) By default, the Filter Events panel is open in the Events view. The user preference (open, closed, or fully expanded) is saved across sessions and logins. See Drill into Metadata in the Events View for more information about drilling into metadata.

Note: (Version 11.6) By default, the Filter Events panel is open in the Events view. The last used state of the panel (narrow or fully expanded) is saved throughout the session and across logins. Also, the Filter Events panel provides additional contrast between meta keys, meta values, and meta counts to improve readability.



Meta Groups Menu

With the Filter Events panel open, you can select a meta group to define the meta keys displayed in the Filter Events panel.The Default Meta Keys meta group is in effect the first time you log in. If you selected a different meta group the last time you logged in, it remains in effect until browser cache is cleared. See Use Meta Groups to Focus on Relevant Meta Keys for details about meta groups.

Ordering Menu	With the Filter Events panel open, you can look at two parameters for each value: the event count or the event size. Each meta key entry includes either the event count or the event size in parentheses after the value. In both cases, there are four options for ordering: • By default, the meta keys are displayed using the Event Count > Descending by Total Count method. When showing the event count for each value, you can order by Descending by Total Count, Ascending by Total Count, Ascending by Value, and Descending by Value. • When you prefer to see the size of the event that contains the value, you can use one of the four Event Size ordering options: Descending by Total Size, Ascending by Total Size, Ascending by Value, and Descending by Value.
Meta Key options button (⚙)	The Meta Key options button offers actions that you can take on an individual meta key. In Version 11.5, the only action is to copy all of the visible meta values for a meta key.
Meta Key List	An icon before each meta key name identifies the indexing method for the key. The indexing method determines the types of interactions and queries possible using that meta key. • This meta key is indexed by value: Action Event [action] (40+). The green color indicates that the all available interactions and queries are supported. You can see the available interactions in the context menu by right-clicking the meta value. • This meta key is indexed by meta key: Bytes Sent [bytes.src]. The yellow color is a clue that a subset of available interactions is supported, and queries on this meta key may take longer than meta keys that are indexed by value. You can see the available interactions in the context menu by right-clicking the meta value. • This meta key is not indexed: MAC Alias Record [alias.mac]. Values for non-indexed meta keys cannot be used to query. If you want to query a meta key that is not indexed, your administrator needs to edit the index file for the service to index the meta key by value or meta key.

Query Console

Clicking  (the console icon) opens the query console, where Query Examples, Current query, and Recent Query details are provided.

Query Examples

In the **Query Console** > **Query Examples** tab, you can see the example query list to help you understand the query construction.

Current Query

In the **Query Console** > **Current Query** tab, you can see which service, time range, and metadata was queried as well as real-time information about the status of the query and the services being queried. A progress bar indicates the query's completion percentage at the bottom of the console. The statuses let you know details about what is happening; for example, you can tell when the query is executing, queued, reading the index file for the queried service, retrieving events, and complete. All statuses and non-fatal messages are displayed as they come in, and the border color changes if a non-fatal error occurs. View Status of a Query provides additional details on this subject.

Several messages that may be displayed in the query console require additional explanation.

Message: Maximum value limit (`valueMax`) of %1% reached on meta key %2% in index slice %3%

Explanation: The `valueMax` property on the specified meta key has been reached in the index being queried. An administrator configures this inside the index files available in `ADMIN > Services > [Service Name] > Files > index-[service type].xml` or `index-[service type]-custom.xml`. As an example, the statement below from the index file states the meta key called `client` has a limit of 250,000 values by default.

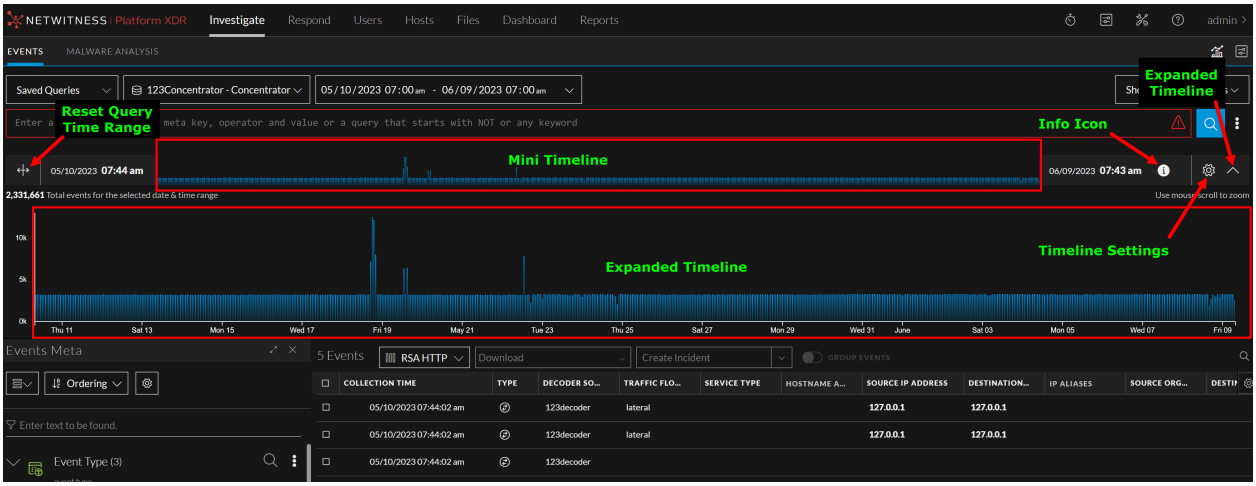
```
<key description="Client Application" level="IndexValues" name="client"
format="Text" valueMax="250000" />
```

Message: The query on channel %2% was auto-canceled by the system for exceeding time usage limits. Check timeout values.

The server has a per-operation limit on execution time, and the requested operation exceeded the limit. To avoid this error, split the operation into smaller pieces, such as smaller time ranges.

Memory limit of %1% reached, controlled by setting max.query.memory

The server has a per-operation limit on memory utilization, and the requested operation exceeded the limit. The limit is related to the amount of memory in the server, which an administrator can adjust in  (Admin) **Admin > Services > [Service Name] > sdk > config**. To avoid this error, split the operation into smaller pieces, such as smaller time ranges.



Recent Queries

In the **Query Console** > **Recent Queries** tab, up to 100 recent queries are displayed. Use the scroll wheel on the mouse to move through the recent query list. You can click on  at the start of the query to select that query and directly insert it into the query bar.

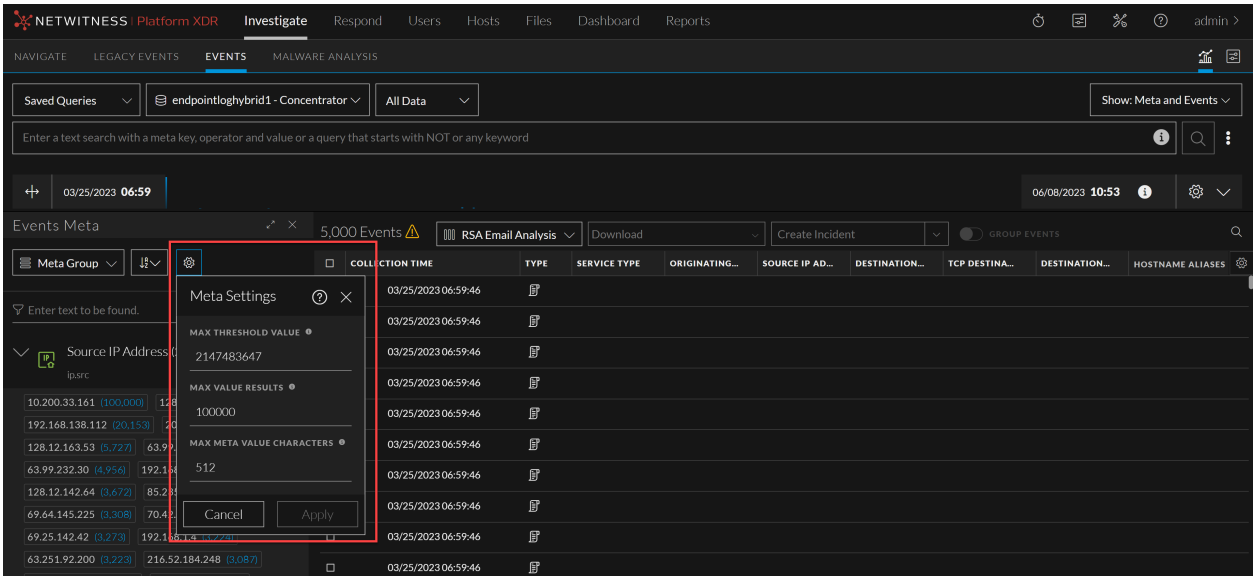
When you select a recent query, the query is displayed as per your preferences set to the query bar (Guided or Advanced Mode). Click  to initiate the selected query.

Timeline

The timeline visualizes the events count that occurs at a specific instance. The timeline provides event counts so that you can see if the number of events increases drastically at a given point in time. The timeline displays activity for the specified service and time range as a bar chart.

The following are some key features of the timeline:

- The start time and end time are displayed on either side of the timeline to depict the matching events over the duration of the query. The timezone is also displayed on the right side of the timeline by showing the offset from UTC.
- The section of the timeline that matches the event data is highlighted. The data is highlighted up to the specified threshold. If the data is not sorted using time, the entire timeline is highlighted. Also, if the data is not sorted in a specific order, it might highlight the individual bars in the timeline as events are not ordered using time.
- The query results that exceed the threshold are displayed in grey color. If events are sorted using time, the threshold highlight shifts from left (ascending) to right (descending) depending on your sort preference.
- Hover over the timeline to display the total number of events that occurred in the queried time duration. You can hover over the individual bars in the timeline to get the total number of events that occurred at a specific time.
- When you sort the events, the timeline does not refresh. You must run the query again to refresh the timeline.
- All capabilities of the timeline work when user is querying using the collection time (`time`) or when the preference is set to use the event time (`event.time`).



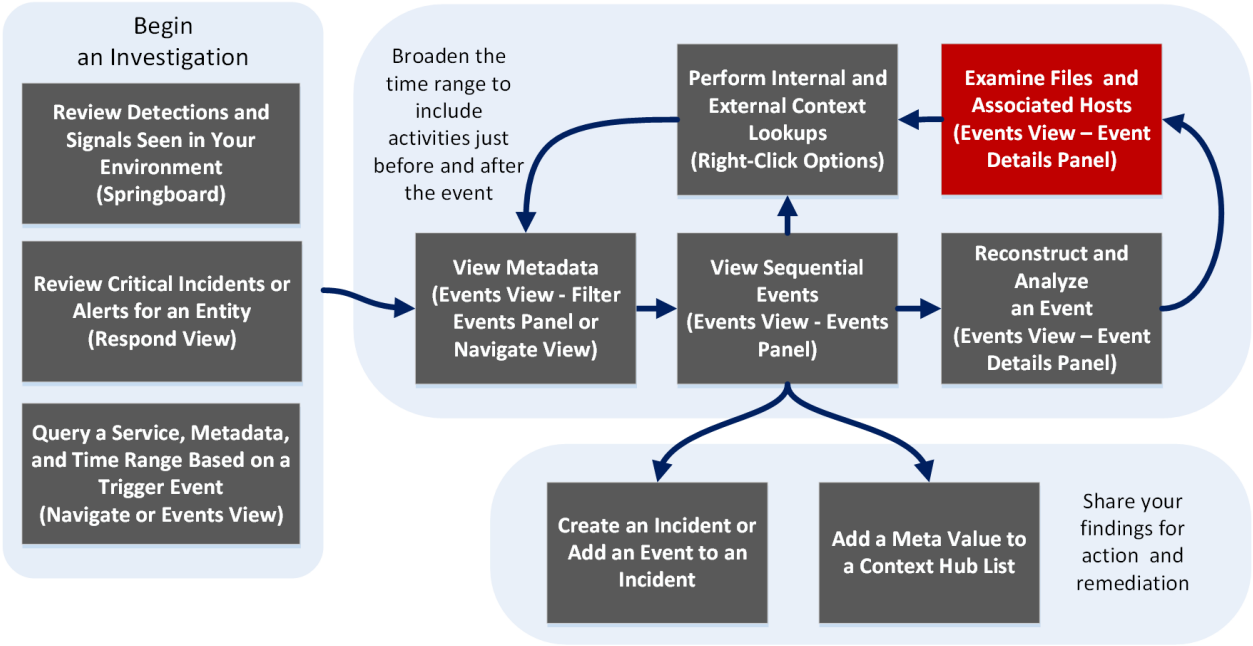
For more information, see *Investigate on Timeline* topic in Begin an Investigation in the Events View.

Meta Settings Panel

From the 12.3 or later version, NetWitness introduces the new **Meta Settings** panel under the **Investigate** > **Events** view. This panel allows analysts to configure the number of sessions required for the specific meta key value within the Events view.

Quick Look - Meta Settings Panel

This is an example of the Timeline Settings dialog.



The following table describes the fields in the Meta Settings Panel .

Feature	Description
Max Threshold Value	Sets the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The Max Threshold Value should be between **1-2147483647**. The default value is **100,000**.
Max Value Results	Sets the maximum number of values to load in the Navigate view when the Max Results option is selected in the Meta Key menu for an open meta key. The Max Value Results should be between **100-100000**. The default value is **1000**.
Max Meta Value Characters	Set the maximum number of characters in a meta value name displayed in the Events Meta panel. The Max Meta Value Characters should be between **60-512**. The default value is **60**
Apply	Applies the settings immediately and they are visible the next time you load values. The same changes are also applied in the Profiles view.
Cancel	Cancels the editing operation and closes the dialog, leaving the settings unchanged.
X	Closes the Meta Settings dialog.

Events View - Email Tab

The Email tab is in the Event Details panel. Here you can view a list of email received and associated attachments for an event.

Workflow

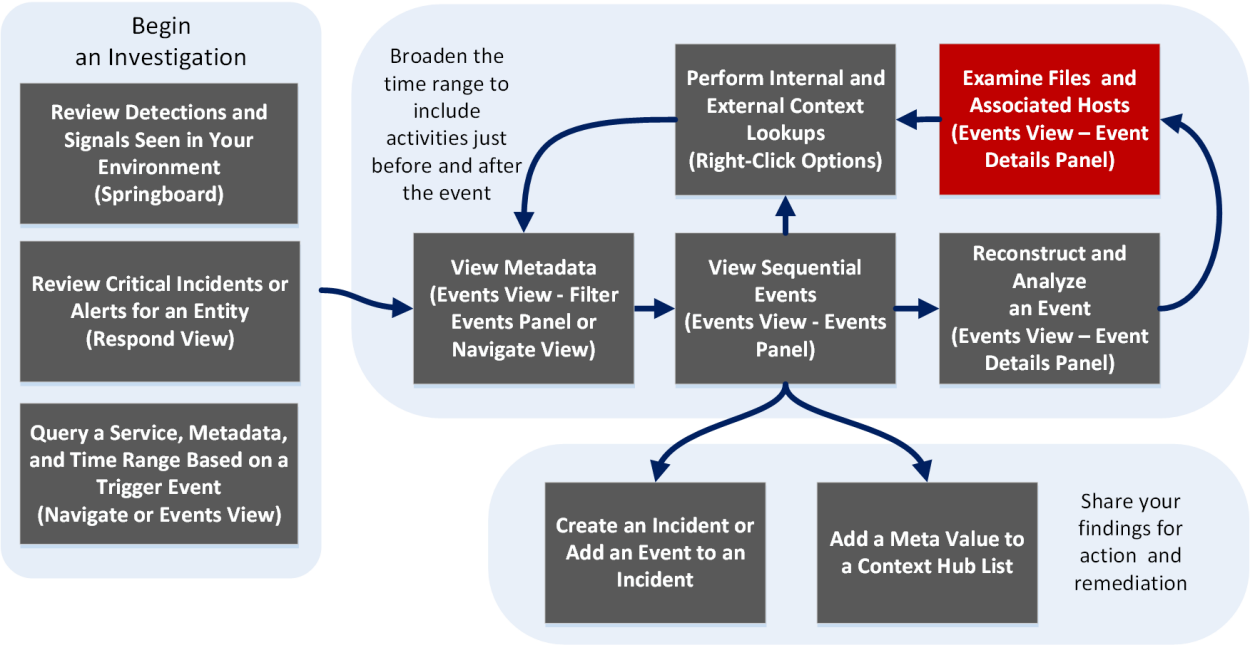
Quick Look

The Email panel displays a list of emails associated with a network event. When an analyst opens the email, the email reconstruction is displayed along with the associated attachments and additional header details, if any.
The following figure is an example of an email reconstruction.



The following table describes all the fields within an email.

Field	Description
From	Displays the email address of the sender of the email.
To	Displays the email addresses of the recipients of the email.
CC (Carbon Copy)	Displays email addresses of additional recipients of the email. The field is displayed only if the sent email has any value and the email addresses are visible to the recipient.
BCC	Displays email addresses of additional recipients privately. This field is displayed only if the sent email has any value and the email addresses are not visible to the recipient.
Reply to	Displays the address designated to receive replies, the sender address.
Subject	Displays the subject of the email.
Attachments	Displays any files shared by the sender that can be downloaded by the recipient. This field is displayed only if email contains attachments. See Download Data in the Events View for details about downloading email attachments.
Additional Header Details	Provides additional details of the email event such as Received, Sender, Message-ID and others.

Events View - File Tab

The File tab is in the Event Details panel. Here you can safely view a list of files and download one or more files in an event.

- Events View - Text Tab
- Events View - File Tab
- Events View - Email Tab
- Events View - Host Tab

Quick Look

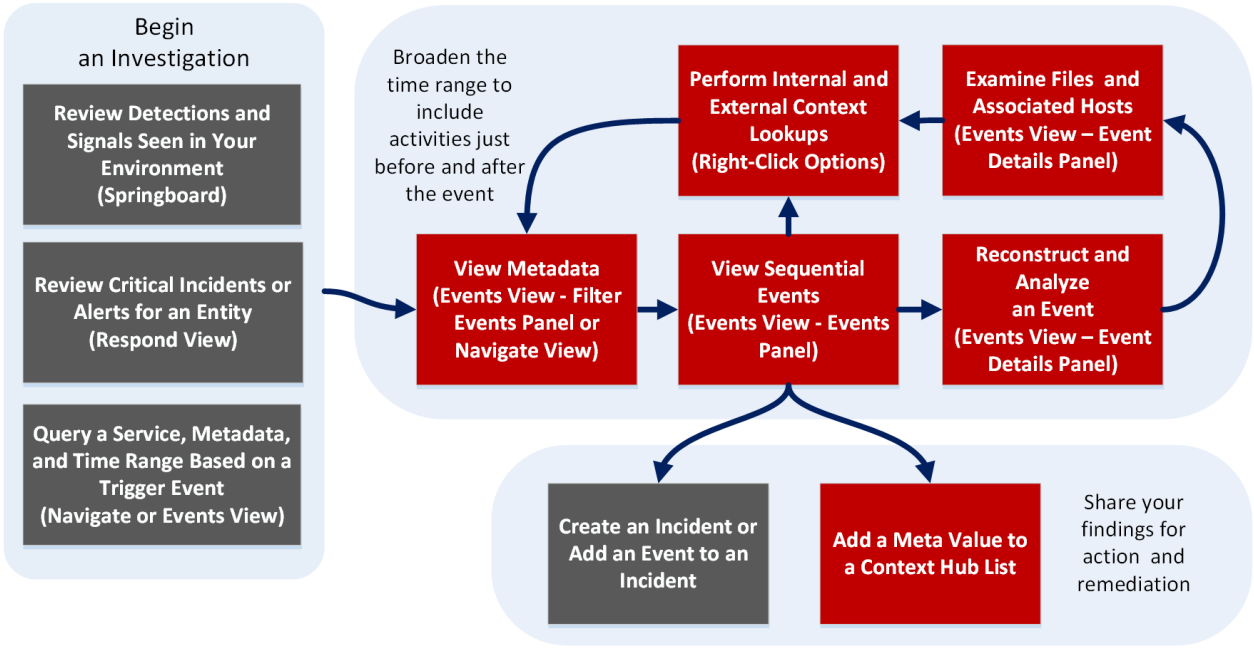
Only network events can be analyzed in the Packet panel. The Packet panel lists each packet in the event. The list of packets is scrollable. When you scroll, the packet or text identification information as well as the Request and Response labels remain visible rather than scrolling out of view.

In Version 11.1 and later, you can use pagination controls to go backward and forward through the pages, go to a specific page, and select the number of packets to display per page (50, 100, 300, or 500).

Each packet is displayed with shading and highlighting to help identify common file patterns: significant header and payload bytes, hexadecimal and ascii bytes, and common file signatures. In addition, you can adjust the request/response display, and display or hide the packet summary.

Below is an example of the Packet panel (formerly known as Packet Analysis) with labels to identify features. For details and examples of each feature, see Analyze Events in the Events View.



1	Options for exporting a network event. You can export a PCAP, all payloads, request payloads, or response payloads for deeper analysis and to share with others.
2	The option to identify common file signatures is activated by default. Common file signatures are highlighted in orange; hovering over the highlight reveals the file type.
3	The Shade Bytes option adds shading to identify the different hexadecimal bytes (00 to FF) using degrees of highlighting.
4	The option to display payloads only hides the packet headers, leaving more space for the payload.
5	The Overview panel information.
6	Significant bytes are highlighted in a blue background; as you move the cursor over the highlighting the meta data is displayed in a hover box.
7	(Version 11.1 and later) Packet pagination controls allow more flexibility in paging through a list of packets. When a control is unavailable, the image is dimmed; for example, when you are viewing page 1, the ⟪ and ⟨ controls are dimmed. ⟪ - Go to the first page ⟨ - Go to the previous page 1 of 206 - Go to a specific page ⟩ - Go to the next page ⟫ - Go to the last page  - Select the number of packets per page. If you are reconstructing large packets, lowering this limit can improve performance.

Events View - Text Tab

The Text tab is in the Event Details panel. Here you can safely view and analyze the raw text payload of an event. The Text reconstruction includes features that can show decompressed or compressed text, expand truncated entries, perform URL and Base64 encoding and decoding, and download network events, logs, and endpoint events. The text reconstruction is available for all types of events: network, log, and endpoint.

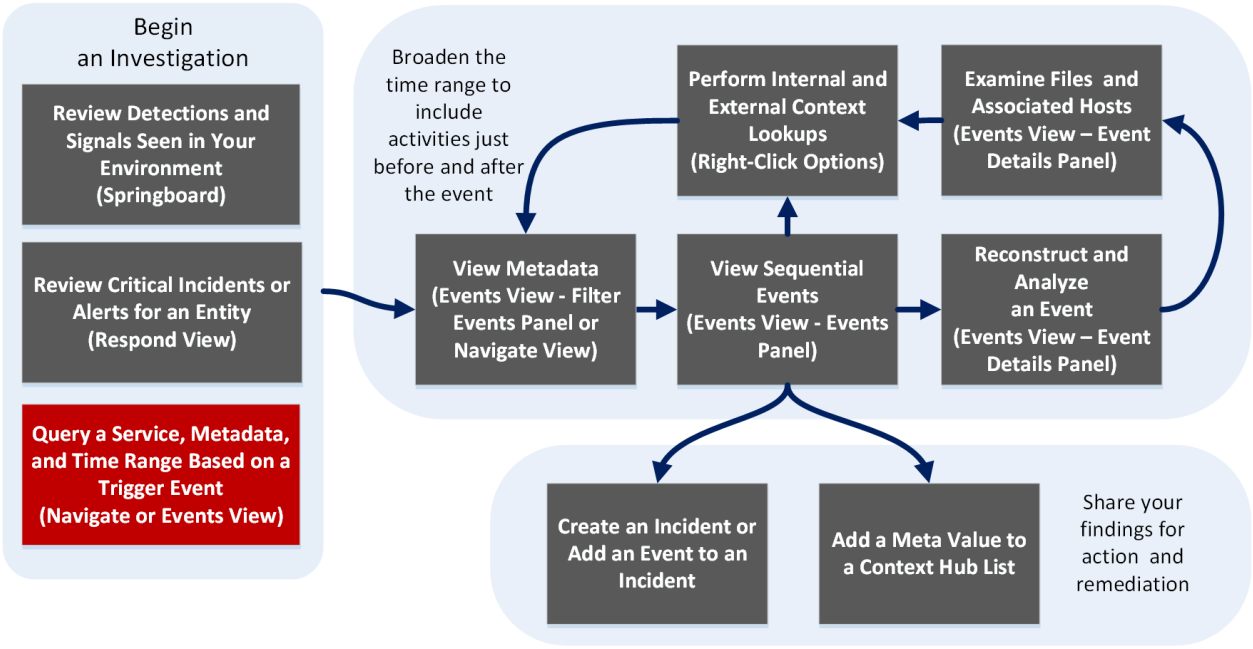
Quick Look

The Events view displays the text of a single event in the Text panel (formerly known as Text Analysis). When you click an event in the Event list panel, the adjacent panel shows the text reconstruction. Only the raw log for log events and endpoint events is shown in the Text panel. For network events, the direction of the packet (Request or Response) and contents of each packet are provided in text format. For more examples of the Text, see Reconstructing and Analyzing Events. For detailed procedures, see Analyze Events in the Events View.



1	Options for exporting a log, a PCAP, or files for deeper analysis and to share with others. This download menu is for network data.
2	The Overview panel information.
3	The payload for a network event includes requests and responses. This is the request side of the packet.
4	This is the response side of the packet.
5	(Version 11.2 and later) Event pagination controls allow more flexibility in paging through a list of events. When a control is unavailable, the image is dimmed; for example, when you are viewing page 1, the ⏮ and ◀ controls are dimmed. ⏮ - Go to the first page ◀ - Go to the previous page ▶ - Go to the next page ⏭ - Go to last page (Only available after last page has already been navigated to)

Investigate Dialog

In the Investigate dialog, analysts can select a service or a collection to investigate. The dialog is automatically displayed when you first go to the Navigate view or Legacy Events view and have not selected a default service to investigate. To access the dialog from a current investigation, select the current service name in the toolbar.

Quick Look

The Investigate dialog has two tabs: Services and Collections.

Note: Collections are also known as workbench collections. You can only view workbench collections that you have created, and only administrators can create a workbench collection.

The Services tab includes a list of services available for investigation, and three buttons. All features are described in the following table.

Feature	Description
Default Service	Clicking this button sets or clears the default service to investigate. When a service has been set as the default service, the word (Default) is appended to the service name.
Name	The name of the service.
Address	The IP address of the service.
Type	The type of service.
Cancel	Closes the dialog.
Navigate	Opens the selected service in the Navigate or Legacy Events view.

The Collections tab has two buttons and two panels: Workbench and Collections.

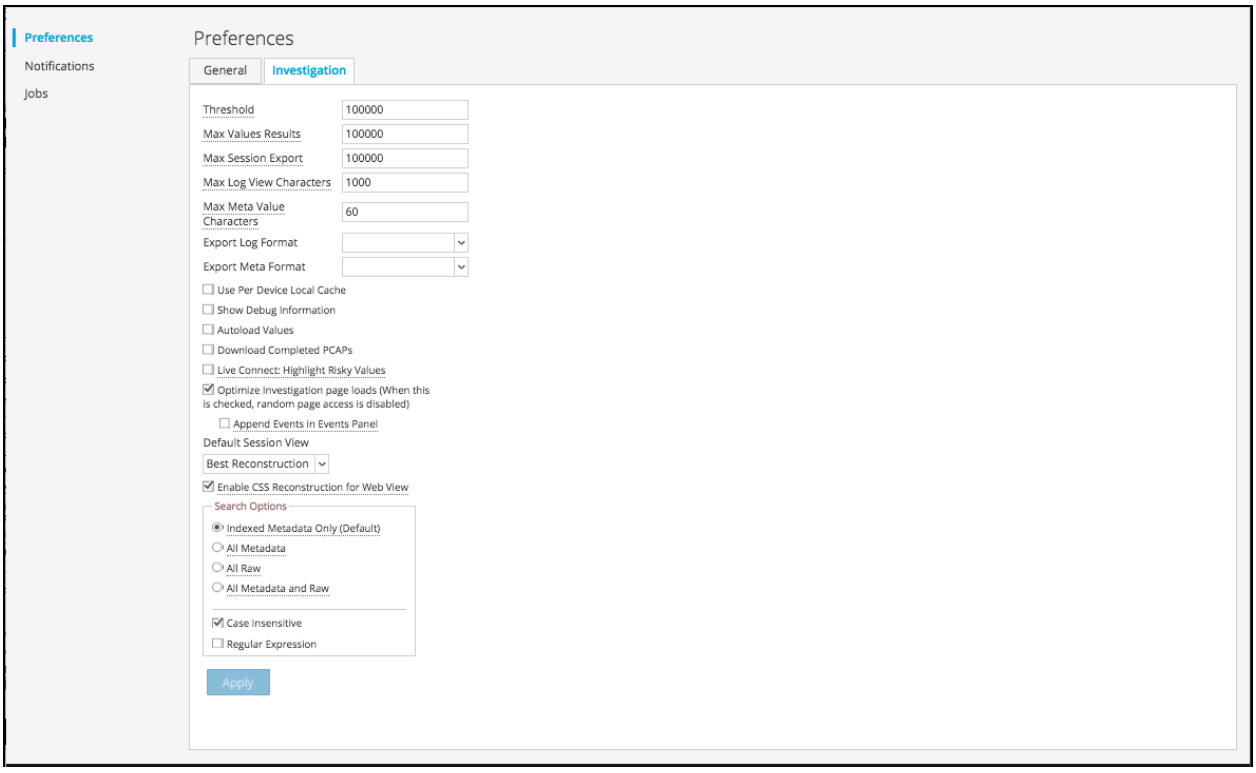
The Workbench panel lists available Workbench services by name. After a Workbench service is selected, you can select a collection from the Collections panel.

The Collections panel lists available collections to investigate. After a collection is selected, you can click Navigate to view the collection.

The following table describes the features of the Collections panel.

Feature	Description
Name	The name of the collection.
Type	The type of collection.
Size	The size of the collection.
Data Type	The type of data within the collection.
Date Created	The date the collection was created.

Investigation Tab - User Preferences Panel



In the Profile view > Preferences panel > Investigation tab, users can set several preferences that affect the performance and behavior of NetWitness when analyzing data, viewing events, and reconstructing events in NetWitness Investigate. To access this tab, select > Profile from the Navigate view or the Legacy Events view. When the Profile view is displayed, select **Preferences > Investigation**. You can change user preferences at any time when you are working in NetWitness.

Quick Look

This figure is an example of the Investigation tab, and the following table describes the preferences that affect Investigate. There are slight differences between the 11.1 search settings and later versions of the search settings and these are explained in Search for Text Patterns in the Navigate and Legacy Events Views.

Feature	Description
Threshold	This setting controls the count shown for a meta key value in the Navigate view during the load. A higher threshold allows more accurate counts for a value. However, a higher threshold causes longer load times. When the threshold is reached, NetWitness displays the count and the percentage of time used to reach the count in comparison to the time necessary to load all sessions with that value. For example, **(>100000 - 18%)** indicates that the threshold was set at 100000 and this load took only 18% of the time it would have taken with no threshold set. The default value is **100000**.
Max Values Results	This setting controls the maximum number of values to load in the Navigate View when the Max Results option is selected in the Meta Key Menu for an open meta key. The default value is **1000**.
Max Session Export	This setting controls the maximum number of sessions that can be exported. The default value is **100000**.
Max Log View Characters	This setting controls the maximum number of characters to be displayed on **Investigate > Legacy Events > Log Text**. The default value is **1000**.
Export Log Format	This setting specifies the default format for exporting logs from Investigate. Available options are **Text**, **XML**, **CSV**, and **JSON**. There is no default value for the log export format. If you do not select a format for logs here, NetWitness displays a selection dialog when you invoke export of logs. When you select one of the options from the Export Log Format drop-down menu and click Apply, the setting goes into effect immediately.
Export Meta Format	This setting specifies the default format for exporting meta values from Investigate. Available options are Text, XML, CSV, and JSON. There is no default value for the meta export format. If you do not select a format for exporting meta values here, NetWitness displays a selection dialog when you invoke export of meta values. When you select one of the options from the Export Meta Format drop-down menu and click Apply, the setting goes into effect immediately. **Note:** If you upgrade to version 11.5.2, the **Export Meta Format** preference is not retained and is reset to blank. You must re-configure this value after you upgrade to version 11.5.2.
Use Per Device Local Cache	Allows you to specify the use of locally cached data from the selected service. By default, this checkbox is cleared (Off), which means that Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If the option is set, Investigate uses the data from local cache.
Show Debug Information	When this option is set, NetWitness displays the `where` clause beneath the breadcrumb in the Navigate view. For each meta value load, the load time is displayed. If the service is a Broker, the elapsed time for each aggregated service is reported. The default value is **Off.**

Feature	Description
Append Events in Events Panel	When this option is set, the events displayed in the **Events Panel** are added incrementally rather than overwriting the currently displayed events. Each time you click the next page icon, the additional events are appended to the previous events; 1 -25, then 1 -50, then 1 -75 and so on. **Note:** This option is available only if the Optimize Investigation Page Loads option is enabled.
Autoload Values	When this option is set, the service values are automatically loaded in the Navigate view. When not set, NetWitness displays a **Load Values** button, allowing the user the opportunity to modify the options. The default value is **Off**.
Download Completed PCAPs	This setting automates the downloading of extracted PCAPs in the Investigate so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP format.
Live Connect: Highlight Risky Values	If you want NetWitness Platform XDR to highlight and display only IP addresses that are considered to be risky by the NetWitness community, set this option. When not enabled, NetWitness Platform displays all IP addresses. By default, this option is cleared (Off).
Optimize Investigation Page Loads	This option is enabled by default (checked) and controls how the Legacy Events view retrieves events. When enabled, results are returned as quickly as possible, but you cannot go to a specific page in the event list. Clearing the checkbox changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). Being able to go to any page in the list costs additional overhead to determine the events in advance.
Default Session View	This setting selects the default reconstruction type for the initial reconstruction view. By default events are reconstructed using the reconstruction type most appropriate to the event.
Enable CSS Reconstruction for Web View	This setting controls how web content reconstruction is performed. If enabled, the web reconstruction includes cascaded style sheet (CSS) styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for stylesheets and images used in the target event. The option is enabled by default. Clear the checkbox if there are problems viewing specific websites. **Note:** The appearance of the reconstructed content may not match the original web page perfectly if related images and stylesheets could not be found or were loaded from the web browser's cache. Also, any layout or styling that is performed dynamically via client side javascript does not render in the reconstruction because all client side javascript is removed for security purposes.

Feature	Description
Search Options	This setting specifies the default search options to apply to a search in the Navigate and Legacy Events views. Search for Text Patterns in the Navigate and Legacy Events Views provides detailed information.
Apply	Saves your preferences and puts them into effect immediately.

Investigate View

The Investigate view is the primary entry point to NetWitness Investigate. In Version 11.5, several of the Investigate submenus are moved to the main menu for easier access. Prior to Version 11.5, the Investigate view had six submenus, which opened different views that allow you to analyze events from different perspectives. The submenus that remain under Investigate are: Navigate, Legacy Events, Events (formerly Event Analysis), and Malware Analysis. The Hosts, Files, and Users views (formerly Entitites) are available from the main menus to improve the workflow for analysts.

Note: In Version 11.4 and later, the Legacy Events is no longer needed and it is hidden unless the administrator enables it. By default only the Events view appears in the menu, but when the Legacy Events view is enabled, both the Events view and the Legacy Events view are visible in the menu bar.

How NetWitness Investigate Works provides an introduction to all of the capabilities available in the Investigate view.

Legacy Event Reconstruction View

The Event Reconstruction view is deprecated in favor of the Events view. The Legacy Events view provides a reconstruction of a selected event from the Legacy Events view. By default, NetWitness displays the best reconstruction for the event determined by the event content, or the default reconstruction that you have selected in the Default Session View setting for Investigate. You can use the options in the Event Reconstruction toolbar to change the reconstruction method, view top-to-bottom or side-by-side results, select request and response views, export an event, export meta values, extract files, open an email attachment, and open the event in a new tab.

To access this view, do one of the following:

- In any Legacy Events view, double-click an event.
- In the Legacy Events view with Detail View selected, right-click **Events** at the end of the event, and select **Event Reconstruction**.
- In the Event Reconstruction toolbar of previewed reconstruction, click **Open Event in New Tab**.
- In the Navigate view, select **Actions > Go to event in Event Reconstruction**, and enter an event ID.

Quick Look

This figure is an example of the Event Reconstruction view. The following table describes the toolbar options.

Feature	Description
Request & Response	Displays a drop-down menu for selecting whether the view displays: • Request & Response • Request • Response
Organization	Displays a drop-down menu for selecting whether the information is displayed top to bottom or side by side.
Reconstruction View	Displays a drop-down menu for selecting what information is displayed. By default, Best Reconstruction is selected. Other options are: • View Meta • View Text • View Hex • View Packets • View Web • View Mail • View Files
Actions	Displays a drop-down menu with the actions available in the Event Reconstruction view (Export PCAP, Extract Files, and Export Meta).

Feature	Description
Open Event in New Tab	Opens the event in a new browser tab.
Event Analysis	Open the event in the Event Analysis view.

Beneath the toolbar is a list of meta keys and values. Some of the keys offer a drop-down menu with available actions.

The bar at the bottom of the view offers several options.

Feature	Description
	Displays the previous event.
	Displays the next event.
Show Reconstruction Log	Displays the reconstruction log at the bottom of the view. Once you click this button, it changes to Hide Reconstruction Log.

Legacy Events View

The Legacy Events view is deprecated in favor of the Events view. In the Legacy Events view a list of events associated with a session is available; this view is optimized for viewing raw events in sequence by time. You can display the events list in several forms, filter events, search for events, and open a reconstruction of an event.

There are two ways to display the Legacy Events view:

- Go to **Investigate > Legacy Events.** NetWitness runs a default query on the last three hours for the default service (if one is set) or displays a dialog in which you can select a service and then runs the default query. The default query selects all events and the Legacy Events view displays events on the selected service, with the oldest events first.
- From within the **Navigate** view, double-click an event. The Legacy Events view displays the events on the selected service based on the drill point in the Navigate view.

Note: The Legacy Events view was the original Events view (11.0 to 11.3.x.x). The Legacy Events is no longer needed and it is hidden unless the administrator enables it. By default only the Events view appears in the menu, but when the Legacy Events view is enabled, both the Events view and the Legacy Events view are visible in the menu bar.

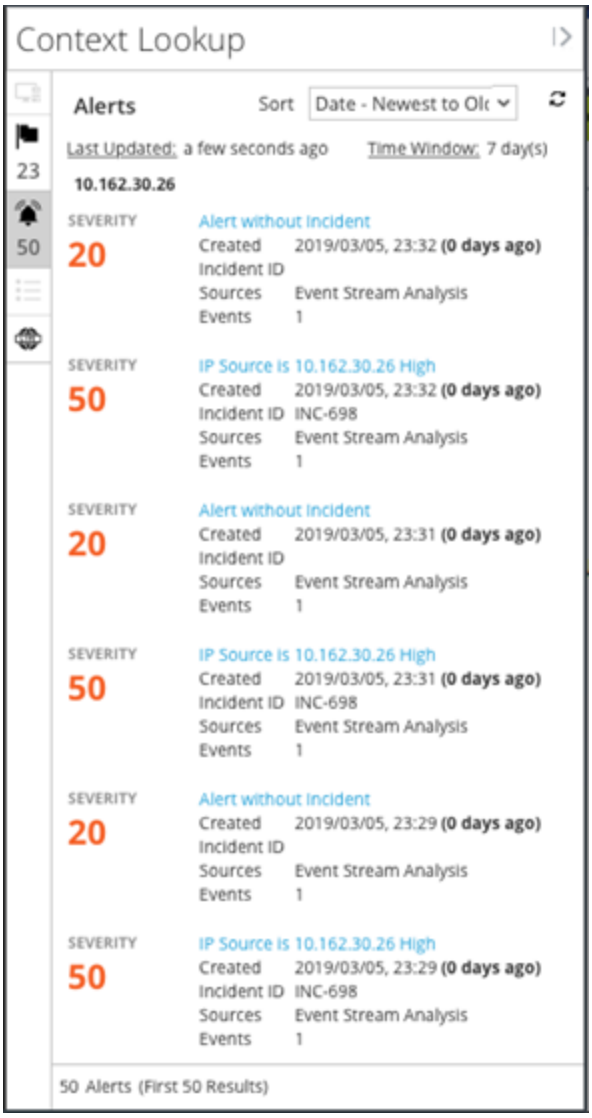
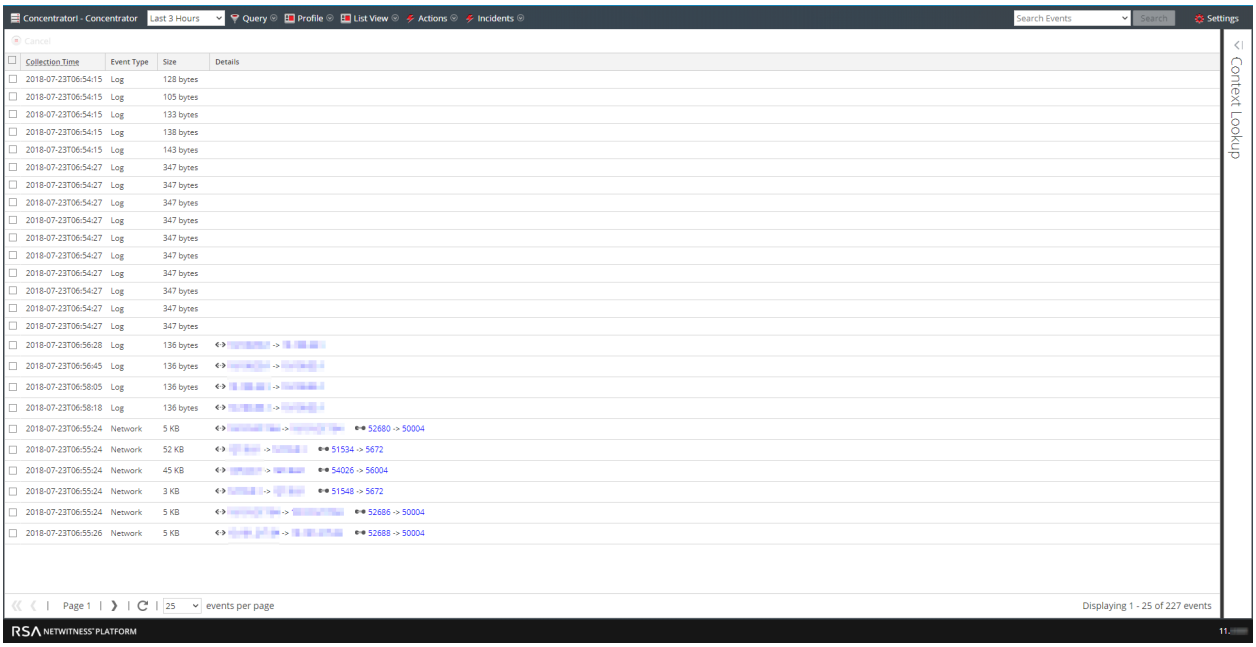
Related Topics

- How NetWitness Investigate Works
- Filter Results in the Legacy Events View
- Downloading and Acting Upon Results



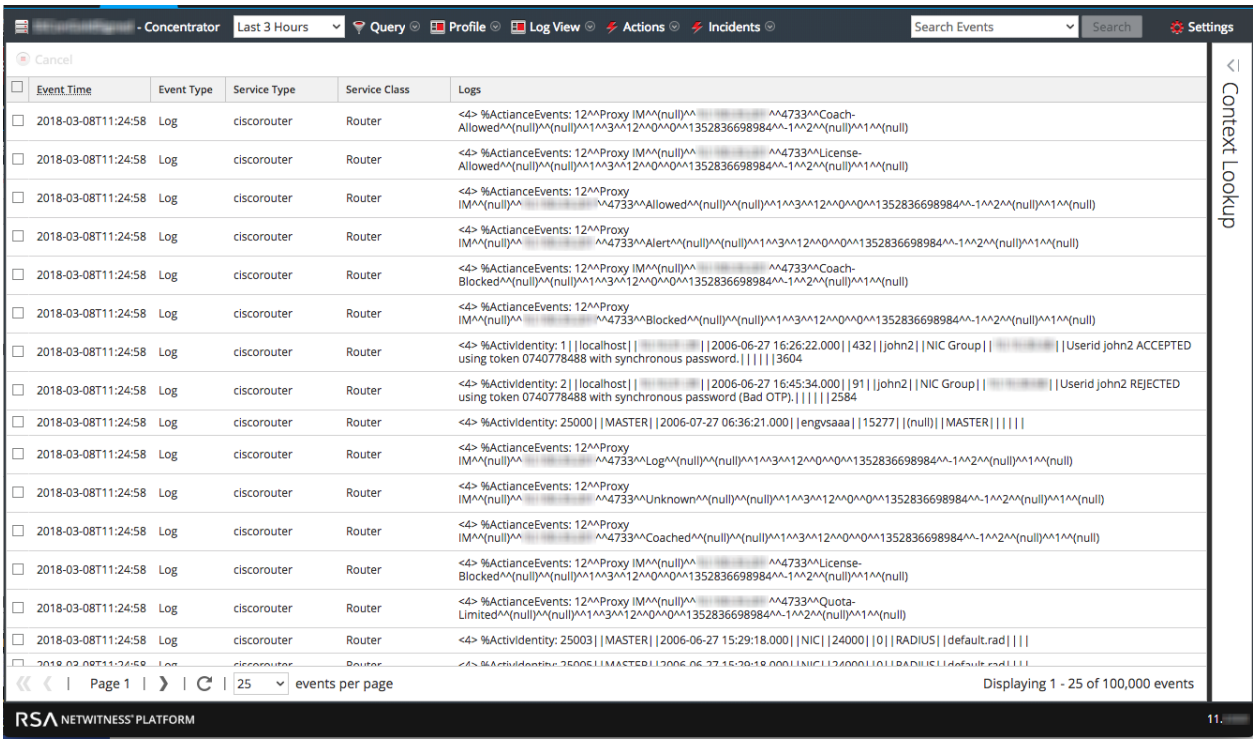
Quick Look

The Legacy Events view provides three built-in presentations of event data: the Detail view, the List view, and the Log view. The List view and Detail view provide more information for each event including the timestamp, event type, event theme, and size.

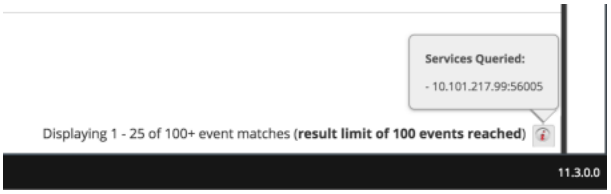


- The List View shows corresponding source and destination address and port information for events in summary form in a grid.
- The Detail View shows all metadata collected for the event in a paged view.
- The Log View is optimized for viewing log and endpoint information, and provides more information for each log including the timestamp, event type, service type, service class, and the logs.

You can use queries, the time range setting, and profiles to filter the events listed in the Legacy Events view. From any view type in Legacy Events view, you can extract files; export network events, endpoint events, logs, and meta values, and open the Event Reconstruction panel. In the Detail View you can also open the event in the Events view.



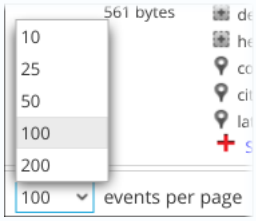
The following figure is an example of events in the Detail View. The Context Lookup panel is visible only if the Context Hub service is configured.



The following figure is an example of events in the List View.

The following figure is an example of the Log View.

The following figure shows the information added to the footer for Version 11.3 and later.



Detailed Description

The Legacy Events view has a toolbar at the top with the following options.

Feature	Description
Select Service	Displays the selected service name next to the icon. Opens the Investigate dialog, in which you can select a service for which the event list is displayed.
Time Range	Displays a drop-down menu for selecting the time range to apply to the event list. You can choose one of the standard options or specify a custom time range.
Query	Displays the Query dialog, in which you can enter a custom query directly instead of drilling down the data (see Create a Query in the Navigate and Legacy Events Views).
Profile	Displays the Profile menu; the currently selected profile is displayed in the toolbar. The menu options include built-in (Default) profiles and custom profiles, as well as an option to manage profiles. Each profile can include a meta group, a column group, and a beginning query that is applied to the Navigate view (meta groups and queries) and the Legacy Events view (column groups and queries) as you investigate events. (see Use Query Profiles to Encapsulate Common Areas for Investigation).
View Type Drop-down	Displays a drop-down menu for selecting the event view type. • Detail View shows events in a paged format with detailed information for each event. • List view shows the events in table form with a summary of each event in a separate row. • Log View shows a log-oriented events grid with a summary of each log in a separate row. • Custom Column Groups displays the event list using a column group selected from a drop-down list of custom column groups. • Manage Column Groups displays the dialog for creating and editing custom column groups.
Actions	Displays a drop-down menu with actions in the Legacy Events view: • Export an events as PCAP files, export logs, export endpoint events, or export meta values. • View an event reconstruction in a popup window or in a new tab. • Reset all filters in the Legacy Events view.
Incidents	Create a new incident in Respond and add the selected events, or add selected events to an existing incident in Respond.

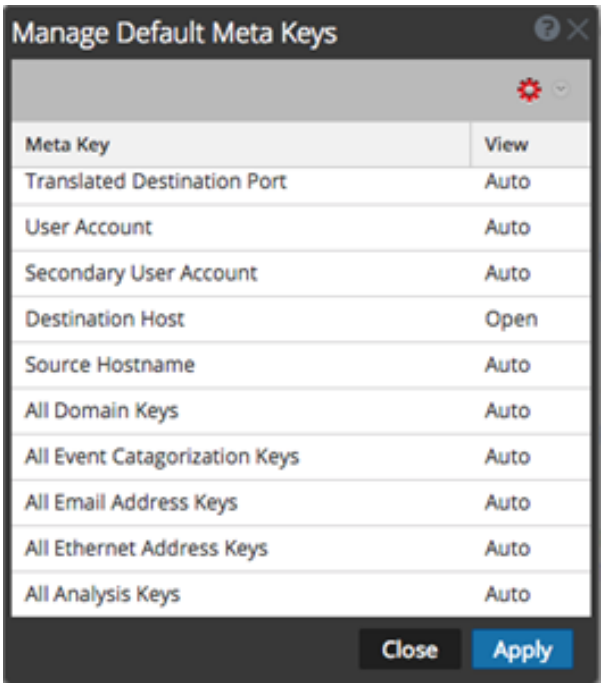
Feature	Description
Search	Displays the Search Events options, which allow you to specify the export log and export meta value format with additional options explained in Search for Text Patterns in the Navigate and Legacy Events Views.
Settings	Displays the Investigation settings for the Legacy Events view (which are also available in the Profile view) so that you can change Investigation settings without navigating away from the Legacy Events view. When you change a setting In the Legacy Events view, the setting is also changed in the Profile view (see Configure the Navigate View and Legacy Events View).

Other features of the Legacy Events view are described in this table.

Feature	Description
+ Show Additional Meta (in the Detail View of an event)	Displays the rest of the metadata for the event.
Event Analysis (in the Detail View of an event)	Opens the selected event in the Events view.
 (in the footer)	Pagination controls allow more flexibility in paging through a list of events. When a control is unavailable, the image is dimmed; for example, when you are viewing page 1, the « and ‹ controls are dimmed. « - Go to the first page ‹ - Go to the previous page 3 Page 3 - Go to a specific page › - Go to the next page » - Go to the last page  - Select the number of packets per page When you select a number of events per page, the setting is saved in browser cache so that you do not have to select your preferred number of events each time you log in. The setting applies to all views: Log View, List View, and Details View.

Feature	Description
Displaying 1-100 of 100,000 events (in the footer) Displaying 1-25 of 100+ event matches (result limit of 100 events reached) (in the footer)	Displays the count of events displayed versus the total number of matching events. In Version 11.3 and later, the footer includes a notification if the results limit configured by the administrator has been reached to let you know that more results are available but not viewable. To view the additional results, you need to refine the filter to get fewer results. Clicking the information icon in the footer displays the IP address and connecting port number for all services queried.

Manage Default Meta Keys Dialog



In the Manage Default Meta Keys dialog, analysts can specify the meta keys to be displayed in the Navigate view > Values panel (see Manage and Apply Default Meta Keys in an Investigation. This can help you find the desired data more quickly and prevents the loading of meta keys that are not of interest. To access this dialog, in the **Navigate View** toolbar, select **Meta > Manage Default Meta Keys**.

Related Topics

- How NetWitness Investigate Works
- Use Meta Groups to Focus on Relevant Meta Keys

Quick Look

The following figure illustrates the Manage Default Meta Keys dialog, which has a list of meta keys, toolbar, Close button, and Apply button. In the list, you can view, sort, and manage default meta keys. If you click and drag meta keys, you can rearrange their order. The following table describes columns in the list.

Column	Description
Meta Key	This column displays the meta keys available for the service. In Version 11.1 and later, default meta entities are also included, for example All Domain Keys and All Email Address Keys.

Column	Description
View	This column displays the type of view assigned to each meta key. By clicking on the view in each row, you can assign the meta key a different default view. There are four views: • Auto: Reverts to the default view for meta keys as specified in the service index file. • Close: The values of this meta key are closed by default, and can be opened manually. • Hidden: These meta keys are hidden by default, and are not shown in Investigation at all. • Open: The values of this meta key are displayed by default. When you modify the default meta keys for a non-indexed meta key, you cannot set the key to **Open**. If you change the default view for a group of meta keys to **Open** and some of the meta keys are non-indexed, the non-indexed meta keys revert to **Auto**. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are **Closed** until opened manually.

The following table describes the toolbar options and buttons.

Feature	Description
	Displays a drop-down menu that allows you change the default view of all the meta keys. There are four views: • Auto: Reverts to the default view for meta keys as specified in the service index file. • Close: The values of this meta key are closed by default. • Hidden: The values of this meta key are hidden by default. • Open: The values of this meta key are displayed by default.
Close	Closes the dialog. Any unsaved changes are lost.
Apply	Applies the changes, and they become effective immediately.

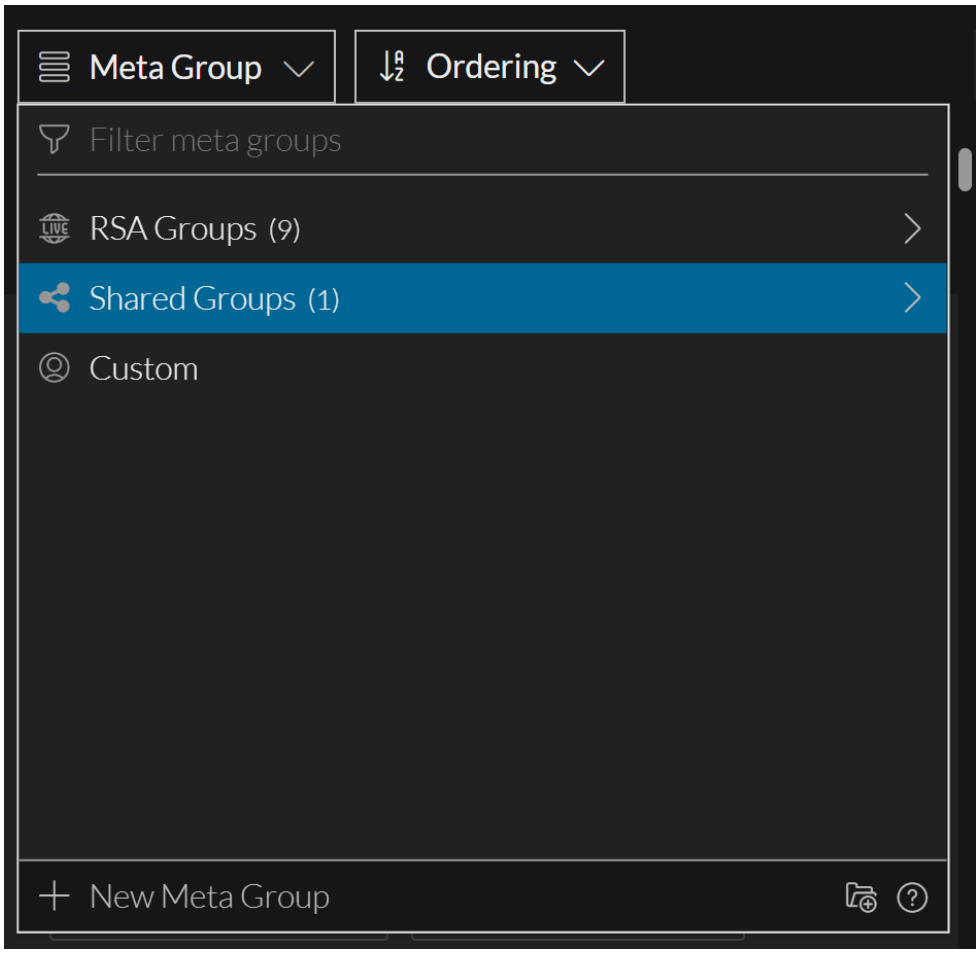
Meta Groups Dialogs

You can use meta groups to filter data displayed in an investigation. A fresh installation of NetWitness includes built-in meta groups to help you find interesting data sets in Investigate. The built-in meta groups are prefixed with RSA for identification and can be duplicated but cannot be edited or deleted. You can create your own groups and you can duplicate and edit a built-in group to create a custom group. With a meta group in effect during an investigation, the information in the Navigate view and Events view includes only the meta keys in the selected group.

While the functionality of meta groups is similar in the Navigate view and the Events view, the user interface and some of the procedures are different.

Using options in the Events view Meta Groups menu (Version 11.5 and later) , you can:

- Select a meta group to apply.
- See the details of a meta group.
- Create, edit, and delete custom meta groups.
- Clone and edit the clone of a built-in or custom meta group.



Using options In the Navigate view Manage Meta Groups dialog, you can do all of the above as well as import and export a meta group. Refer to Use Meta Groups to Focus on Relevant Meta Keys for detailed information.

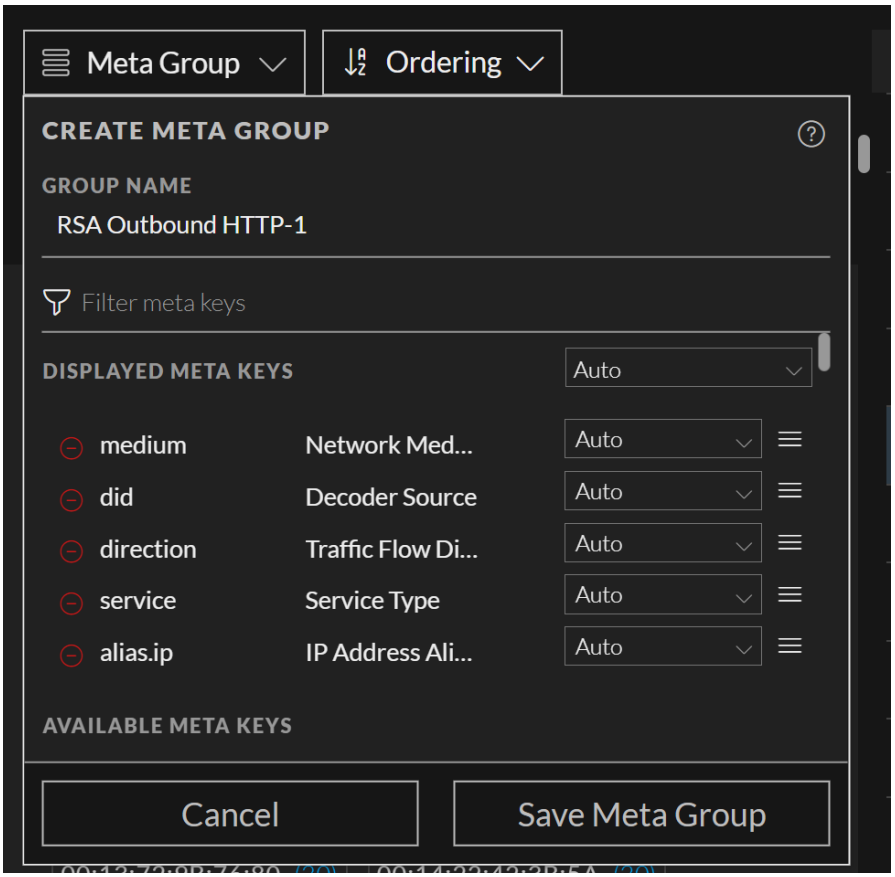
- Filter Results in the Navigate View

Quick Look - Meta Groups Menu, Create Meta Group Dialog, and Meta Group Details Dialog

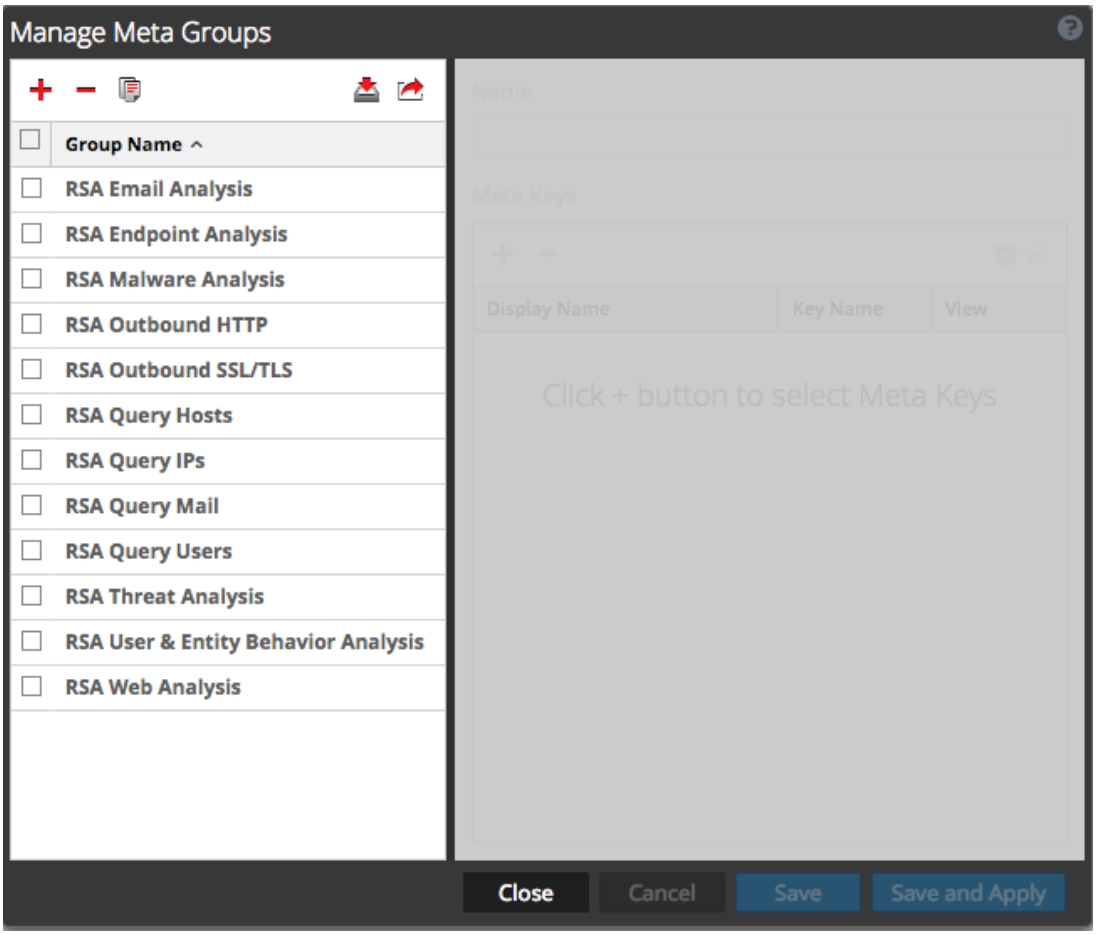


This section introduces the Meta Groups Menu, Create Meta Group dialog, and the Meta Group Details dialog. The following figure is an example of the Meta Group menu. The table describes the options.

Feature	Description
Visibility Options	Control the types of meta groups that are visible in the list. You can use any combination of the visibility options: **Private**, **Shared**, or **RSA** (blue = selected, black = not selected). Initially none of the buttons are selected and all meta group types are visible. This is the same result as if all three buttons are selected. The visibility options work together with text in the Filter Meta Groups field. If the visibility option is hiding built-in groups (which include "RSA" in the group name) and you search for a name that contains "RSA," the list is empty. Private = display private groups that only you can manage Shared = display shared groups that anyone in your organization can manage RSA = display built-in groups that only RSA can manage
Filter Meta Groups	Filters the list of meta groups as you type text so that only group names that contain the typed text are displayed.
Meta Group List	The list of meta groups consists of custom and built-in groups. Custom meta groups can be shared or private. The RSA meta groups are built-in meta groups; you cannot edit or delete these, but you can make a copy and edit the copy. Icons preceding the meta group name distinguish the private groups, shared groups, and built-in groups.

Feature	Description
New Meta Group	Displays the Create Meta Group dialog, where you can create a custom meta group.

The Create Meta Group dialog, shown in the figure on the left, allows you to define a custom meta group. The figure on the right illustrates the Meta Group Details dialog, in which you can edit a custom meta group. The table describes the fields and options in the dialogs.



Feature	Description
	Creates a copy of the meta group so that you can edit a copy. This is useful if you want your own copy of a built-in group, a shared copy of a private group, or a private copy of a shared group.
	Deletes the custom meta group that you are currently editing. This action is irreversible and applies globally. If the meta group is a shared group, it is no longer available to anyone.
Group Name	Displays the name of the meta group. The name must be unique and contain fewer than 64 characters. You can type in this field to edit the name in a custom meta group.
Sharing	Specifies whether the meta group is shared or private. This setting is available when you first create the group. After it is created, you cannot change a shared column group to private, or a private column group to shared.

Feature	Description
Filter Meta Keys	Filters the Displayed Meta Keys and Available Meta Keys based on the text that you type. Only meta keys that contain the typed text are displayed.
Displayed Meta Keys	Displays a scrollable list of meta keys that are selected for use in the custom meta group. You can add meta keys in the Available Meta Keys list to this list, remove meta keys from this list, and drag meta keys up or down to change the order in this list ( ). Drag and Drop is disabled when text is typed in the Filter Meta Keys field. For each displayed meta key you can choose:
Available Meta Keys	Displays a scrollable list of meta keys that are available (on the service) for use in the custom column group. You can add them to the Available Meta Keys list. Clicking next to the meta key name adds it to the Displayed Meta Keys list. You can also set the initial view of each meta key: Open, Closed, Hidden, or Auto (the default setting).
Initial View Option	For each meta key, you can set the initial view option: -When set to Auto, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are Closed until opened manually. If you change the default view for a group of meta keys to Open and some of the meta keys are non-indexed, the non-indexed meta keys revert to Auto. -Open meta keys are listed in the Filter Events panel, and the values are loaded. -Closed meta keys are listed in the Filter Events panel, but the meta values are not loaded until you open the meta key. -Hidden meta keys are not listed in the Filter Events panel at all. This is useful if you are using a single meta group for multiple purposes instead of creating several meta groups; you can turn off certain keys off without removing them from the meta group. You can also use the Hidden view when testing out some new keys or if you want to prepare a meta group with some new meta keys that are not yet available and would error out if in an Auto, Open, or Closed state.
	Allows you to drag and drop meta keys in the Displayed Meta Keys list so that you can see the data in the order you prefer.
Close button	Closes the dialog.
Save Meta Group	For the Create Meta Group dialog only, saves the new meta group.
Reset	For the Meta Group Details dialog only reverts the edited meta group to the last saved state.
Update Meta Group	For the Meta Group Details dialog only, applies changes to an edited meta group.
Select Meta Group	Applies the meta group. The Filter Events panel is refreshed to display only the meta keys in the selected meta group.

Quick Look - Manage Meta Groups Dialog

The following figure is an example of the Manage Meta Groups dialog.

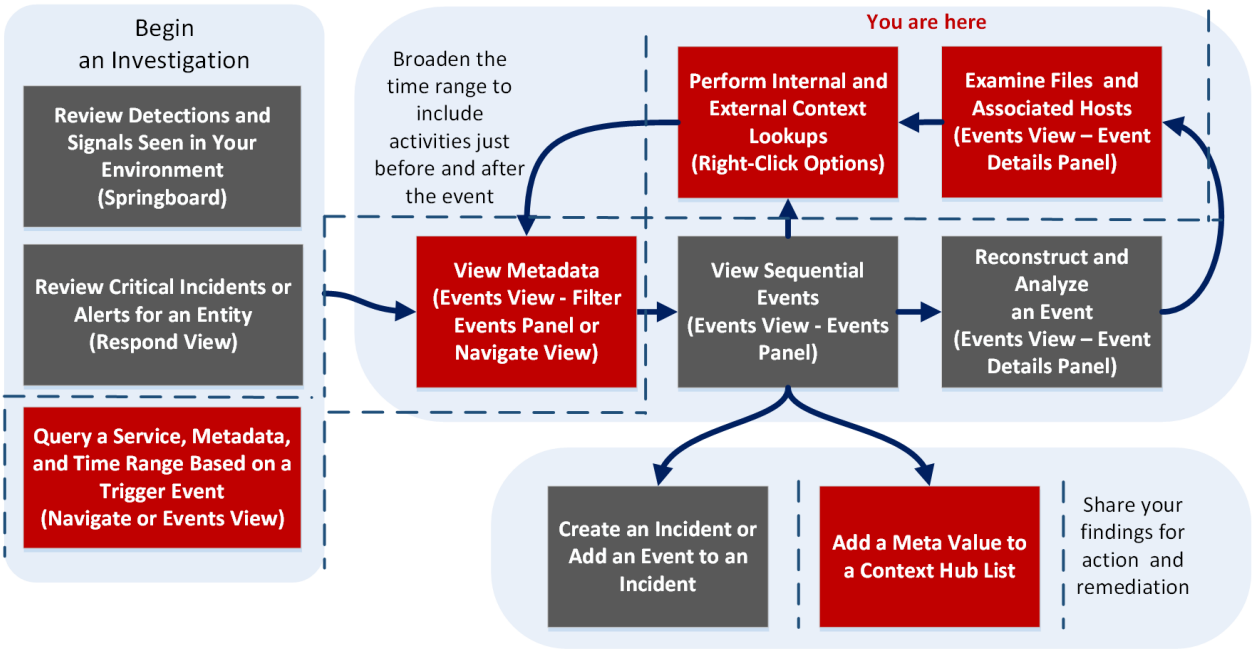
The Meta Groups panel is on the left side of the Manage Meta Groups dialog. This is where you can add, delete, import, and export meta groups. The following table describes the features of the Meta Groups panel.

Feature	Description
	Adds a meta group using the Settings panel on the right side of the Manage Meta Groups dialog.
	Deletes the selected meta group. A confirmation dialog is displayed before the meta group is deleted.
	Creates a copy of the selected meta group.
	Displays the Meta Group Import dialog, where you can upload a file.
	Exports the selected meta group to your computer.
Group Name	Lists all meta group names.

The Settings panel is on the right side of the Manage Meta Groups dialog. This is where you create and edit meta groups. Below the Name field is the Meta Keys list. The following table describes the features of the Settings panel.

Feature	Description
Name	Displays the name of the selected meta group.
	Displays the Available Meta Keys dialog, where you can select meta keys to add to the group.
	Deletes the selected meta keys.
	Displays a drop-down menu, where you can select the view for all meta keys. There are four options based on the possible values for the `defaultAction` property used to define a key in the custom index file for the service: • Hidden: These meta keys are hidden by default, and are not shown in Investigation at all. • Open: The values of this meta key are displayed by default. • Close: The values of this meta key are closed by default, and can be opened manually. • Auto: Reverts to the default view for meta keys as specified in the service index file.
Display Name	Indicates the name that is displayed for the key in Investigate views, and is defined by the `description` property for the key in the custom index file for the service..
Key Name	Indicates the `name` of the meta key as defined in the custom index file for the service.
View	Indicates the view to which the meta key is set. You can change: • Change the view for all meta keys by clicking  in the View column header, then selecting a view from the drop-down menu. • Change the view for a single meta key by clicking a single meta key in the View column, then  and selecting a view from the drop-down menu.

The following table describes the buttons at the bottom of the dialog.



Feature	Description
Close	Closes the dialog.
Cancel	Cancels all changes.
Save	Saves all changes.
Save and Apply	Saves and immediately applies all changes.

Navigate View

The Navigate view (**Investigate** > Navigate) displays event metadata--the meta keys and meta values--that were found in captured data for the selected service. The data is filtered and displayed in accordance with the options you set for profile, time range, meta group, and query. You can also drill into the data by clicking meta keys and meta values.

Note: By default, the Navigate view is disabled in Version 11.6 as the Filter Events Panel in the Events view provides this functionality. To enable the Navigate view, see Configure the Navigate View and Legacy Events View.

Workflow

In the Navigate view, you can:

- View metadata for events in the Values panel.
- Visualize events in a timeline or parallel coordinates chart.
- Save events, go to an event using the event ID, visualize an event, and print an event.
- View additional contextual data for meta keys and values.
- Open a drill point or an event in the Legacy Events or the Events view.

What do you want to do?

User Role	I want to ...	Show me how
Incident Responder or Threat Hunter	review detections and signals seen in my environment	*NetWitness Platform Getting Started Guide*
Incident Responder	review critical incidents or alerts	*NetWitness Respond User Guide*
Threat Hunter	query a service, metadata, and time range*	Begin an Investigation in the Events View Begin an Investigation in the Navigate or Legacy Events View
Threat Hunter	view metadata*	Filter Results in the Navigate View Drill into Metadata in the Events View
Threat Hunter	view sequential events	Filter Results in the Events View Filter Results in the Legacy Events View
Threat Hunter	reconstruct and analyze an event	Examine Event Details in the Events View Reconstruct an Event in the Legacy Events View
Threat Hunter	examine files and associated hosts*	Download Data in the Events View Export or Print a Drill Point in the Navigate View Export Events in the Legacy Events View
Threat Hunter	perform lookups*	Look Up Additional Context for Results Launch a Lookup of a Meta Key
Threat Hunter	create an incident or add to an incident	Add Events to an Incident in the Legacy Events View Add Events to an Incident in the Events View
Threat Hunter	add a meta value to a Context Hub list*	Look Up Additional Context for Results

*You can perform this task in the current view.

- Events View

Quick Look

This figure illustrates the Version 11.5 Navigate view.

The Navigate view consists of these features:

- Toolbar
- Pause/reload button and breadcrumb
- Time banner
- Optional debug information.
- Collapsible Visualization panel
- Values panel
- Context Lookup panel
- Context menus

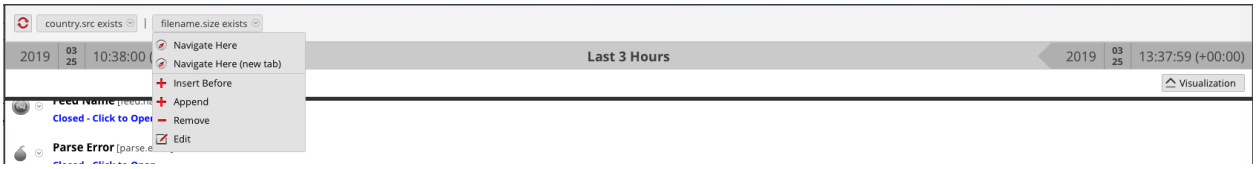
Toolbar

The following figure is an example of the toolbar. The toolbar provides a way to:

- Change the service being investigated.
- Control the range of data displayed: You can select use profiles, set a time range, use meta groups, and create queries to apply to the data.
- Set the quantification method and sorting method for data in the Values panel.
- Perform actions on the results. You can export and print results, open an event for which you have an event ID in the Legacy Events view or Events view, and pass a query to Informer.
- Configure Investigate settings without navigating away from the Investigate views.

Some of the toolbar options are labeled with the default value or the selected value rather than displaying the name of the option. For example, the time range option in the example above is labeled **Last 5 Minutes** to reflect the currently selected value. These are the toolbar options.

Option	Description
	Displays the selected service name next to the icon. Clicking the icon opens the Investigate a Service dialog, in which you can select a service to investigate and set the default service to investigate (see Begin an Investigation in the Navigate or Legacy Events View). Changing the service does not cause a reload of the data.



Option	Description
Time Range	Displays the Time Range options; the currently selected option is displayed in the toolbar (see Filter Results in the Navigate View). Possible choices are: • All Data • Last 5, 10, 15, or 30 Minutes • Last Hour, Last 3, 6, 12, or 24 Hours • Last 2 or 5 Days • Early Morning • Morning • Afternoon • Evening • All Day • Yesterday • This Week • Last Week • Custom **Note:** If you specify custom start or end times in seconds, the value for start time in seconds always defaults to :00, and the value for end time in seconds always defaults to :59. For example, if you are using time to drill down into an issue, the drill time will be interpreted as `HH:MM:00 - HH:MM:59`. Seconds display in this format in Investigate functions.
Query	Displays the Query dialog, in which you can enter a custom query directly instead of drilling down the data. See Query Dialog for a description of the dialog.
Profile	Displays the Profile menu; the currently selected profile is displayed in the toolbar. A profile allows you to manage and use profiles that can include custom meta groups, a default column group, and a beginning query. The Profiles apply to the Navigate view (meta groups and queries), the Legacy Events view, and the Events view (column groups and queries). See Use Query Profiles to Encapsulate Common Areas for Investigation for more information.
Meta	Displays the Meta Group menu. You can use Default Meta Keys or a custom Meta Group. You also have the option to make changes to both group types (see Use Meta Groups to Focus on Relevant Meta Keys).

Option	Description
Sort Field	Displays the Sort Field menu; the currently selected option is displayed in the toolbar. The menu has two options: Order by Total and Order by Value. The Sort Field is a complement to the Sort Order option; the data for each meta key is ordered based on the total (green number) or the meta value (blue text) (see Filter Results in the Navigate View).
Sort Order	Displays the Sort Order menu; the currently selected option is displayed in the toolbar. The menu has two options: Sort in Ascending Order and Sort in Descending. The Sort Order is a complement to the Sort Field option; the selected sort field for each meta key is ordered in ascending or descending order (see Filter Results in the Navigate View).
Quantification Method	Displays the Quantification Method menu; the currently selected option is displayed in the toolbar. The Quantification Method only applies to the meta key results in the Values panel. It does not apply to the timeline. The drop-down menu contains three options for calculating the quantity (green number in parentheses) for a meta value: Quantify by Event Count, Quantify by Event Size, and Quantify by Packet Count (see Filter Results in the Navigate View). These are applied differently depending on the type of data in view. For packet data: • Quantify by Event Count shows the number of sessions. • Quantify by Event Size shows the size in bytes. • Quantify by Packet Count shows the number of packets. For log data: • Quantify by Event Count shows the number of logs. • Quantify by Event Size shows the size in bytes. • Quantify by Packet Count shows the number of logs.
Save Events	Displays the Save Events menu, in which you can use options to: extract files associated with an event, export the current drill point as a PCAP file, and export the current drill point as a log file (see Export a Drill Point).
Actions	The Actions menu includes actions that you can perform in the Navigate view (see Refining the Results Set). In Version 11.1 and later, the options are Visualize, Go to event in Event Reconstruction, Go to event in Events view, and Print).
Search Events	Enables you to search for text patterns within the current set of events. If you click in the Search field, it shows a drop-down menu with search options. If you click Apply, it saves the selected options and also updates the search options in the Legacy Events view and the Investigations profile (see Search for Text Patterns in the Navigate and Legacy Events Views).

Option	Description
Settings	Displays the settings for the Navigate view (which are also editable in the Profile view) so that you can change Investigate settings without navigating away from the Navigate view. When you change a setting In the Navigate view the setting is also changed in the Profile view (see Configure the Navigate View and Legacy Events View).

Pause/Reload Button and Breadcrumb

The breadcrumb tracks each query as you drill down through the metadata for the service. The following figure is an example of the breadcrumb.

Each query is listed with a drop-down menu in a pipe separated string. The last point is the current point, also called the tip. The icon in front of the breadcrumb allows you to pause the loading of meta values and to reload meta values. The breadcrumb does not include the service name and appears only if a query is in effect. If too many drill points exist for display, the overflow is shown as double angle brackets, >>, at the end of the breadcrumb. Each drop-down menu in the breadcrumb is the same, with slight variation based on the position of the crumb.

The following table describes the controls and menu options in the breadcrumb.

Feature	Description
Pause	Pause and Reload button. Controls the loading of data in the view. It has three possible functions: pause loading, continue loading, and reload.
Navigate Here	Opens the selected drill point in the current Values panel.
Navigate Here (new tab)	Opens the selected drill point in a new tab.
Insert Before	Inserts a query before the current drill point. The Create Filter dialog opens and you can define a custom query to insert in the breadcrumb (see Create a Query in the Navigate and Legacy Events Views).
Append	Appends a query after the current drill point. The Create Filter dialog opens and you can define a custom query to append to the end of the breadcrumb (see Create a Query in the Navigate and Legacy Events Views).
Remove	Removes the selected drill point from the breadcrumb.
Edit	Opens the selected drill point in the Create Filter dialog so that you can edit the query.
>>	Clicking the angle brackets displays a drop-down menu of the breadcrumb overflow.

(Optional) Debug Information

If you have activated the Show Debug Information setting and the service you are navigating is a Broker, NetWitness, displays the debug information beneath the breadcrumb.

The debug information is the `where` clause from the current query. The only time there is no `where` clause is when the time range is all data and there are no drill points. If the Broker has at least one aggregate service that is offline, the debug information also lists the offline service.

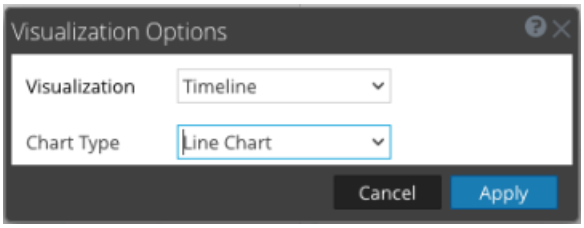
For example:

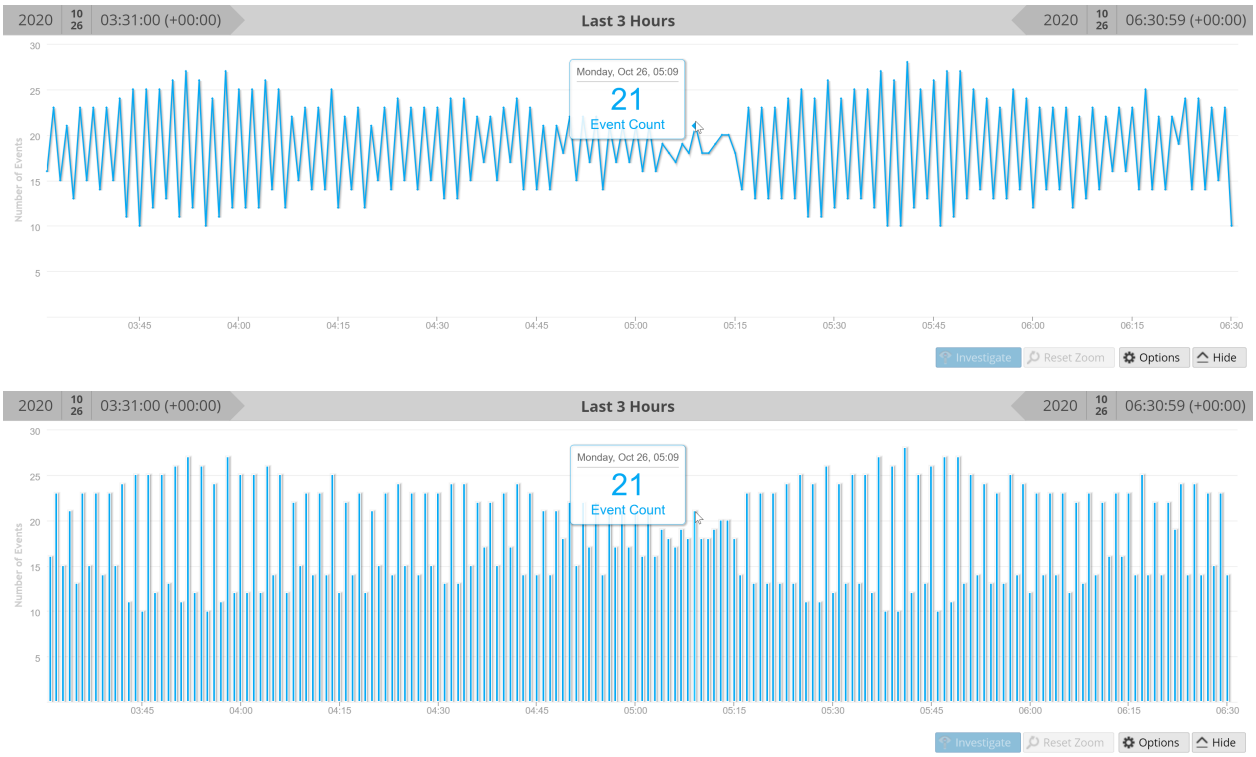
```
(attachment exists)&&(tcp.dstport = '80')&&(risk.info exists)$$time='2014-05-
04 18:50:00"-"2014-05-09 18:59:59(attachment exists) && (tcp.dstport = '80')
&& (risk.info exists) && time="2014-05-04 18:50:00"-"2014-05-09 18:50:59"
```

In addition, the time taken to load is displayed at the end of each meta key in the Values panel.

Time Banner

Just below the breadcrumb and debug information (if present), the time banner shows the time range used to create the chart. The following figure is an example of the time banner.



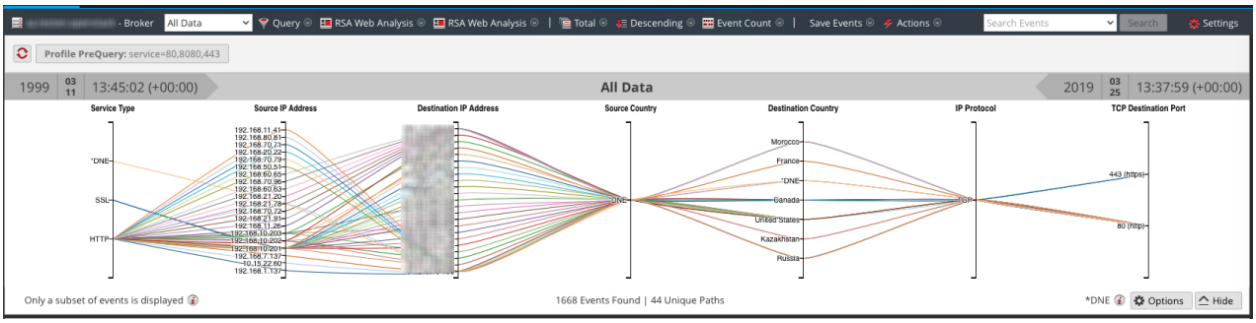


Visualizations

At the top of the Navigate view is a visualization of the current drill point. You can use this to drill into data from the Visualization panel (see Filter Results in the Navigate View). You can show or hide the visualization, and choose one of thevisualization options: Timeline or Coordinates. The Visualization opens initially to the last saved Visualization.

Timeline Chart

The timeline is the count of the number of events that occur at a specific instance. The timeline provides event counts so that you can see if the number of events increases drastically at a given point in time. The timeline displays activity for the specified service and time range as a line chart or a bar chart based on your choice in the Options menu. The second figure illustrates a line chart and third figure illustrates a bar chart.



The timeline displays activity for the specified service and time range, as a line chart or a bar chart based on your choice in the Options menu.

Feature	Description
Number of Events (Timeline)	The Y axis of the chart based on thousands of events.
Time Line (Timeline)	The X axis of the chart based on the time the events occurred.
Event point (Timeline)	If you want to explore a specific section, simply select the range from the chart. The new time range will be reflected in the chart.
Investigate (Timeline)	Displays the meta values for the selected subset.
Reset Zoom (Timeline)	To return to the original time range, click Reset Zoom.
Options	Displays the Visualization Options dialog. Data points can be displayed as a Line chart (default), a Bar chart, or Coordinates chart. When a chart type is select, the relevant options are displayed.
Hide	Collapses the chart.

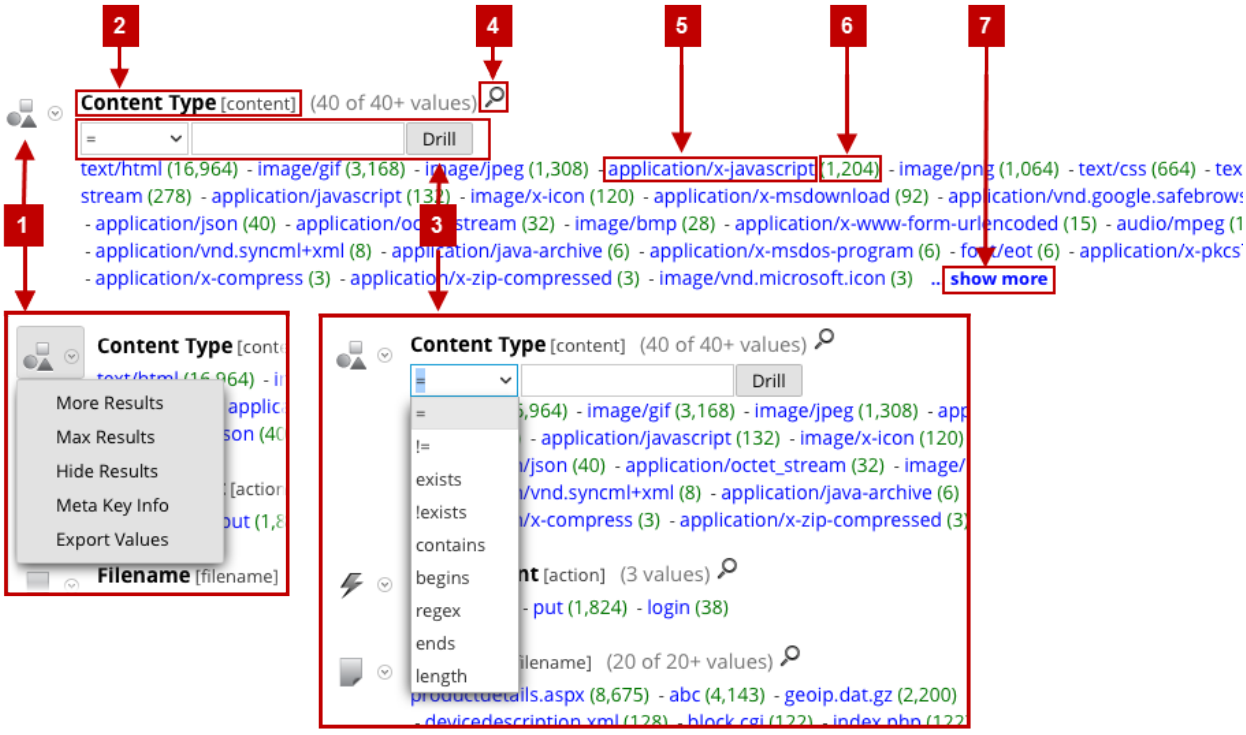
Parallel Coordinates Chart

The Parallel Coordinates chart is one of the choices in the Options menu for visualizing the current drill point. With Coordinates selected in the Visualization Options dialog, you can select the meta data to be displayed (see Visualize Metadata as Parallel Coordinates). An easy way to view a useful Parallel Coordinates chart is to choose a profile group as shown in the following figure.

Feature	Description
Axes	Each axis is a meta key. The number of meta keys affects the load time for the chart. All meta keys are loaded, but it there the number of events per meta key is limited.
Lines	Lines represent events and they connect values on the axes to show the correlation between multiple meta keys.
Options	Displays the Visualization Options dialog. Data points can be displayed as a Line chart (default), a Bar chart, or Coordinates chart. When a chart type is select, the relevant options are displayed.
Only a subset of events is displayed.	This message is a notification that not all events in the values panel are drawn in the chart. Removing axes or filtering the data in the Values panel can help to display all events.
Events Found | Unique Paths	Displays the total number of events charted versus the number of unique paths charted. Setting the All Meta Keys Must Exist in an Event option redraws the chart so that it is more targeted and legible.
DNE	Indicates that there is no values for this meta key in the event.

In the Visualization Options dialog for Coordinates, you can select the meta keys to chart.

Feature	Description
Visualization selection	Displays a drop-down list of visualization types: Timeline and Coordinates
All Meta Keys Must Exist in an Event	Limits the data represented in the visualization to only those events that include all selected meta keys. This can result in a cleaner, more targeted visualization.



Feature	Description
	Displays the Add Keys to Parallel Coordinates Visualization dialog so that you can add axes to the visualization. This is useful if you are looking for relationships between the default meta keys and some additional ones.
	Deletes the selected keys so that they do not appear as axes in the visualization. This can help to make the visualization less cluttered and allow for more data points to be included in the visualization.
	Reverts to the default meta keys for visualization, which consist of all meta keys in the current drill point.
	Controls the display of additional information about the number of selected axes versus the recommended count. This helps to make you aware of possible performance improvements by removing axes.
Axes	Lists the meta keys selected as axes in the visualization.
Cancel	Cancels any changes made to the visualization options.
Apply	Saves the changes made to the visualization options and applies to the current visualization.

In the Add Keys to Parallel Coordinates Visualization dialog, you can select the meta keys or meta groups to use as axes the Parallel Coordinates visualization.

Feature	Description
Visualization selection	Select Keys: Two options for selecting meta keys are: • From Default Meta Keys • From Meta Groups Each option offers a drop-down list from which to select.
With the Selected Meta Keys...	The options for the method of adding meta keys allow you to: • Replace the current list of keys • Append to the current list of keys • Insert at beginning of the current list of keys
Cancel	Closes the dialog and does not add any keys.
Add	Closes the dialog and adds the selected keys as specified.

Values Panel

The major feature of the Navigate view is the Values panel, which presents meta keys and meta values found in the service being investigated. Procedures for analyzing data in the Values panel are provided in Filter Results in the Navigate View.

Note: Title, values, and counts for non-indexed meta keys are not drillable; the Values and counts are shown in black.

1	The meta keys in the Values panel have drop-down menus, which offer actions that can apply to that meta key. You can use these to change the way the results for the meta key are displayed in the current view. Changes made to meta keys are displayed in the current view and persist until you refresh the page or select a new service in the Navigate view toolbar. See Drill into Data in the Values Panel Refresh reverts to the current view of meta keys as defined in the Manage Default Meta Keys dialog (see Manage and Apply Default Meta Keys in an Investigation). If you have never made modifications in the Manage Default Meta Keys dialog, NetWitness, a refresh restores the default meta keys from the core service. • More Results • Max Results • Hide Results • Meta Key Info • Export Value
2	The name of the meta key for which values are listed. In Version 11.3 and later, the user friendly name of the meta key is displayed with the index file name of the meta key following in brackets. For example **Content Type [content]** gives the user friendly name of the `content` meta key with the index file name in parentheses. For meta groups, the name of the group is given in plain English with the meta group name following in

	parentheses. This is an example of a meta group name as it would appear in the Values panel: **All User Keys [users.all]**.
3 and 4	Clicking on an indexed meta key opens the Search dialog in which you can enter a filter for the current meta key. The search function is not available for non-indexed meta keys, and is based on the actual meta value rather than the alias. Drilling in the Search dialog using aliases is not supported. NOTE: Check with your administrator to obtain a list of aliases used for a meta key in Investigation. When an alias is used, this search dialog does not provide results. Instead, you must query the meta key using the Right-click query capability or the Query dialog.
5	The meta value associated with the found meta key. These are listed in order by meta value name or by the count of events in which the meta value was found, according to your preference.
6	The number of events that include the meta value.
7	The number or values rendered is specified by the Render Threads value in the Investigation Preference settings. In the example above, the meta key is **Content Type**, and 40 of 40+ values are currently displayed. You can display additional values by clicking **...show more**. The number of instances found for a particular meta in the session.

Values Panel Loading Behavior

The default view is for the last 3 hours of collection, using the default meta keys and non-indexed meta keys closed. The meta keys within the meta groups are displayed in the order that NetWitness queries the keys. As the data loads into the Values panel, NetWitness is optimized to show partial results, loading progress, and service status as the data loads.

The loading behavior is determined by several configuration settings. The highest level settings are configured by the administrator for each user. These are:

- The maximum amount of time allowed for this user to run a query (Query Timeout).
- The limit at which NetWitness stops counting the number of meta values in a session (Session Threshold). If a threshold is set for a session, the Navigate view shows that the threshold was reached and the percentage of results loaded. Any session that does not show a percentage is accurate and was processed to completion. If there is a percentage, that reflects how much processing was completed. The percentage displayed is estimated by extrapolating from the value at the time processing finished, considering the amount of work remaining. Larger percentages are generally more accurate because they require less extrapolating
- The limit at which NetWitness stops counting the number of meta values in a session (Session Threshold). If a threshold is set for a session, the Navigate view shows that the threshold was reached and the percentage of query time used to reach the threshold.

Note: The values for non-indexed meta keys take longer to load in the Values panel. To optimize loading, NetWitness does not open non-indexed meta keys by default. Refer to Manage and Apply Default Meta Keys in an Investigation for a detailed description of non-indexed meta keys in Investigation.

When you have launched an investigation of a service, NetWitness displays results in the Values panel.

1. NetWitness loads meta keys and meta values in the Values panel. For each meta key load, the stages of load are:

a. **Waiting to Be Loaded** or **Closed**. If Closed, no data for that key is loaded.

b. **Loading**

   i. **Loading progress**: NetWitness is receiving and displaying progress messages.

   ii. **Partial results**: NetWitness is receiving values messages and partial results are displayed in the Values panel.

c. **Load Complete**: All results are finished loading.

2. As each meta key load is completed, and final values are displayed, the next meta key is started. The number or values rendered for each meta key is specified by the Render Threads value in the Investigation Preference settings. Loading continues until all keys to be loaded have finished.
3. If **Show Debug Information** is active and the service you are navigating is a 10.4 or later Broker, NetWitness displays load time information beneath the values for each meta key and displays additional load details for the aggregated services. NetWitness also displays the debug information beneath the breadcrumb.

Iterative results

Iterative results provide feedback on the status of queries within the interfaces to provide additional context for how long the data load will take and if any service data is missing. For example, if you are querying a Broker that is aggregating from two Concentrators, NetWitness starts displaying the results from the first Concentrator as soon as it is available, even if the second Concentrator is still waiting for results.

Iterative results also include a notification that service data is missing because the service is unreachable.

Partial results

When partial values from the Core service are returned but not completed, a message at the end of the meta key listing shows the progress of values loaded. For example, Currently looking at 38 ip.src values 71% indicates that loading of values for the meta key is 71% complete.

Debug Information

If the Show Debug Information setting is in effect, a field at the end of the values displays the status for the different systems against which you are querying within NetWitness. For example, when you are querying against a 10.4 broker pulling from multiple concentrators, NetWitness displays the status of the query on each of the Concentrators, which provides insight into the relative speed of data loading from each of the Concentrators. Each service that participated in the query is listed with the total elapsed time for the query.

Each service that participated in the query is listed with the total elasped time for the query. In the example above, two services returned in 3.207 seconds, localhost:50005 took 2 seconds to return the results. In addition, the where clause of the query is displayed below the breadcrumb. You can copy this syntax directly into an application rule or Reporting where clause of a rule.

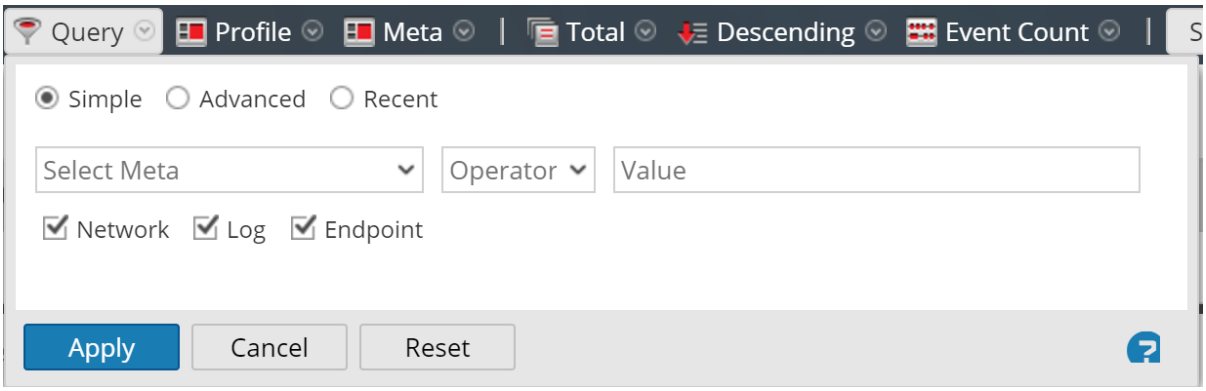
Load Complete

For each meta key, there is a list of values (blue text) and counts (green text) found in the current drill point. When you click a value to drill down into a subset of the currently selected data, the display is updated and the new drill point is recorded in the breadcrumb. You can specify the sorting and quantification methods for the values list using the option in the toolbar.

Query Dialog

In the Navigate view or Legacy Events view, you can create a query rather than clicking through the meta keys and values to drill down into the meta data. The dialogs for creating a query offer syntax help with drop-down lists of applicable meta keys and operators. To access this dialog in the **Navigate** or **Legacy Events** view toolbar, select **Query**.

What do you want to do?



User Role	I want to ...	Show me how
Incident Responder or Threat Hunter	review detections and signals seen in my environment	*NetWitness Platform Getting Started Guide*
Incident Responder	review critical incidents or alerts	*NetWitness Respond User Guide*
Threat Hunter	query a service, metadata, and time range*	Begin an Investigation in the Events View Begin an Investigation in the Navigate or Legacy Events View
Threat Hunter	view metadata	Filter Results in the Navigate View Drill into Metadata in the Events View

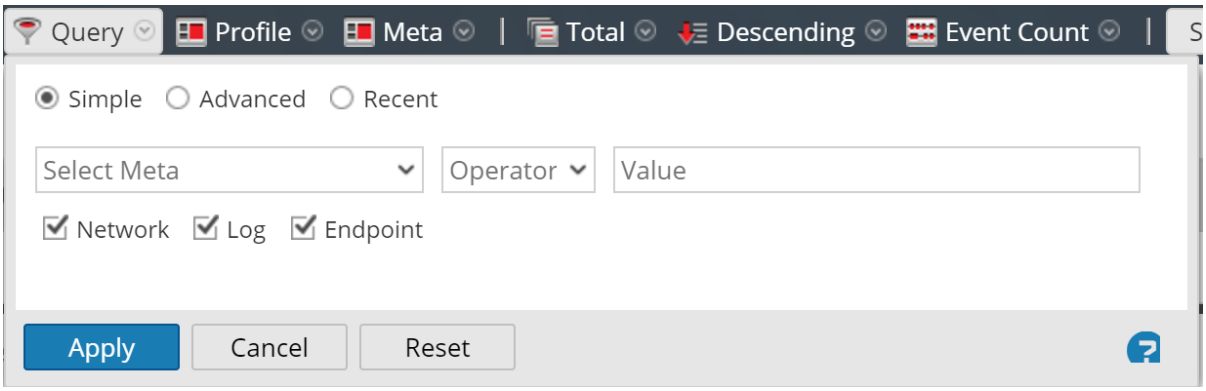
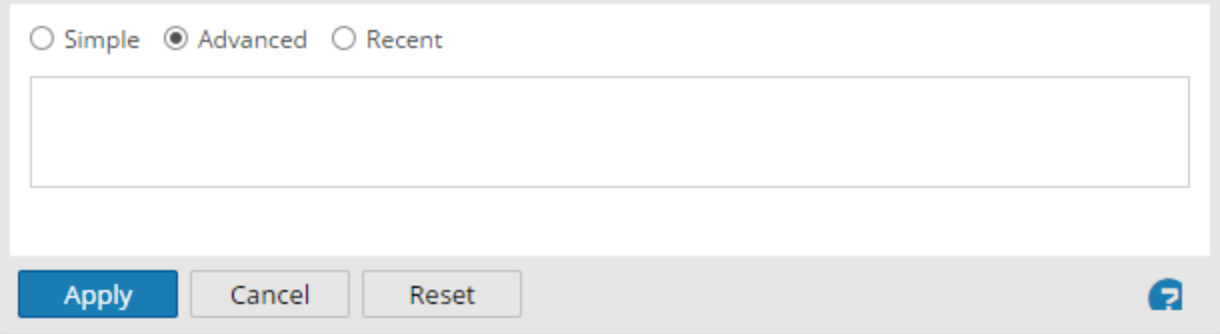
Quick Look

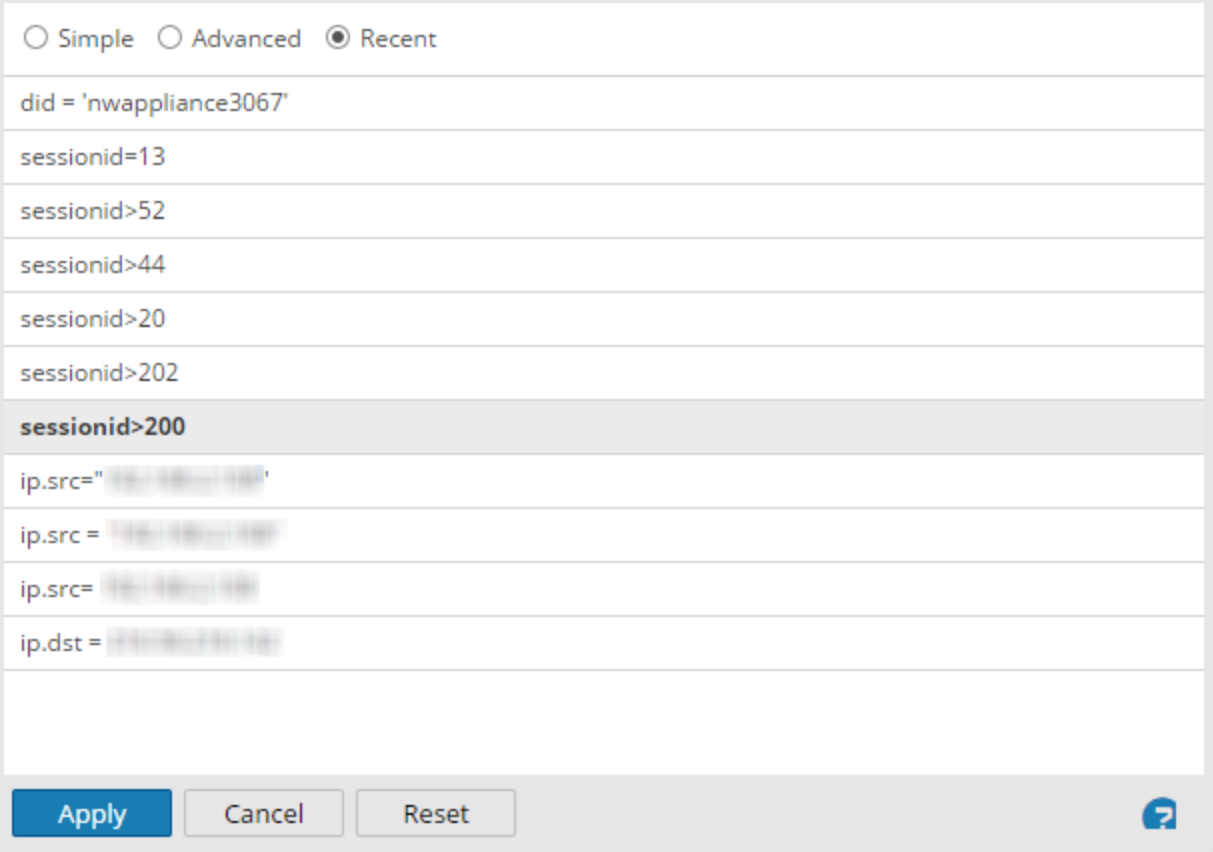


The Query dialog has three views:



- Simple
- Advanced
- Recent

In the Simple view, you can create a query using the options displayed in the dialog. In the Advanced view, you can create a query without guidance. In the Recent view, you can select a query from a drop-down list of recent queries.



Simple View

Advanced View

Recent View

The following table describes features of the Query dialogs.

Feature	Description
Select Meta	Displays a drop-down list of meta groups.
Operator	Displays a drop-down list of operators (=,NetWitness!=,NetWitnessexists,NetWitness!exists)

Feature	Description
Value	Allows you to enter a value to complete the query.
Network	Limits the query to packets if Log is not selected.
Log	Limits the query to logs if Network is not selected.
Query box	Allows you to enter a query in the Advanced view. When you begin typing, a drop-down list of available meta keys for the service is displayed, then a drop-down of operators is displayed as you type. If the expression currently entered in the query box is invalid, a warning appears near the box. When the query is valid, the warning is removed.
Query list	Allows you to select a query from a list of recent queries in the Recent view. Double-clicking a query automatically applies it.
Apply	Applies the new query to the current Investigation view.
Cancel	Closes the dialog without applying changes.
Reset	Resets all fields.

Query Profiles Dialogs

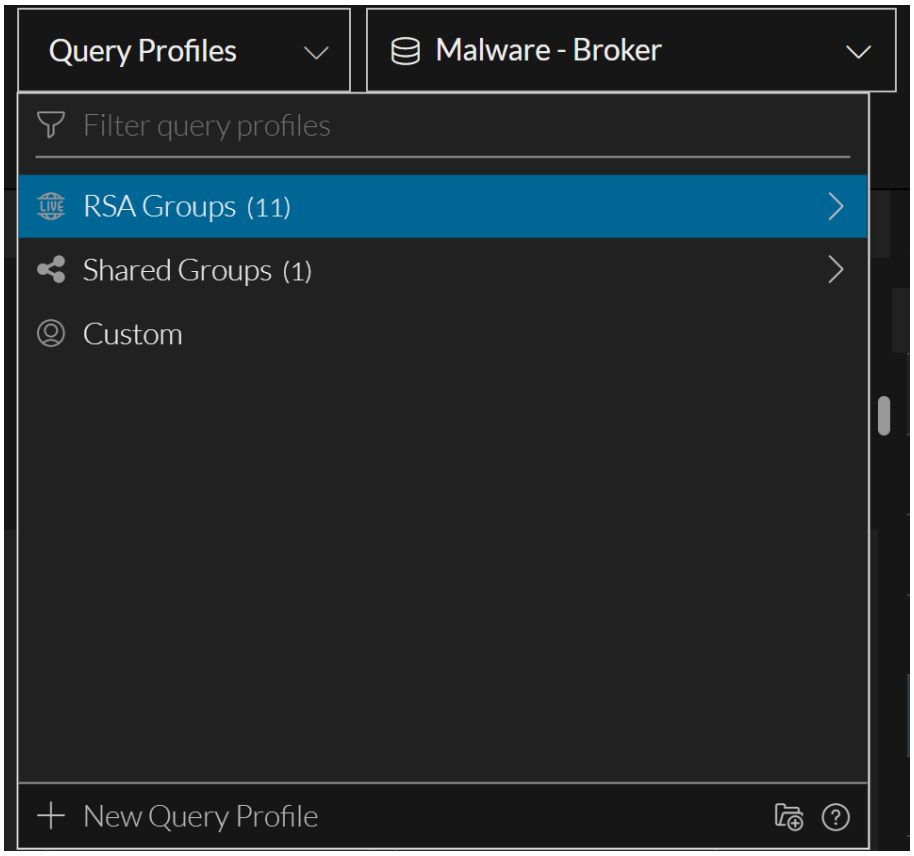
Query profiles offer a quick and easy way to define a meta group, column group, and a limiting filter (pre-query condition) that you can apply in the Navigate view, the Events view, and the Legacy Events view (see Use Query Profiles to Encapsulate Common Areas for Investigation). The same query profiles are shared between all views, and they are available in the Springboard (Version 11.5) for use in panels. Private query profiles created in the Events view are only available in the Events view for the analyst who created them.

Each query profile specifies a meta group, column group, and sometimes includes a pre-query condition appropriate for the type of investigation.

In a query profile:

- The meta group defines the meta keys that are queried (see Use Meta Groups to Focus on Relevant Meta Keys).
- The column group defines which meta keys from the meta group are displayed as columns in the Events list. (see Use Columns and Column Groups in the Events List).
- When the query profile is in effect, the optional pre-query conditions add a limiting filter in the query bar. You can edit or delete the limiting filter and then create additional filters for your query (see Filter Results in the Events View)

You can manage profiles in the Manage Profiles dialog, the Create Query Profile dialog and the Query Profile Details dialog.



- The Manage Profiles dialog is for the Navigate view, the Legacy Events view (Version 11.4 and later) , and the Events view (Version 11.3 and earlier). To access this dialog, select **Profile > Manage Profiles** in the **Navigate** or **Legacy Events** view toolbar.
- The Create Query Profile dialog is for the 11.4 and later Events view. To access this dialog, select **Query Profiles > New Query Profile** in the **Events** view query bar.
- The Query Profile Details dialog is for the 11.4 and later Events view. To access this dialog, select **Query Profiles** in the **Events** view query bar, then click the edit icon () next to a custom profile name.

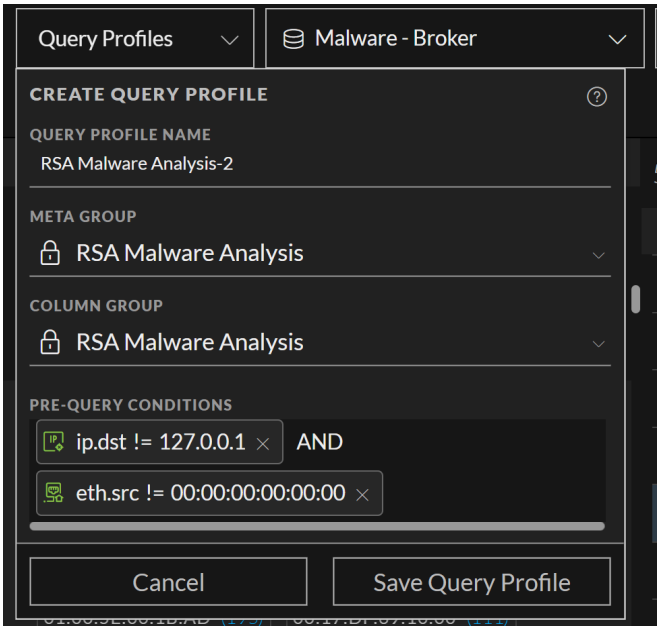
Quick Look - Query Profile Menu, Create Query Profile Dialog, and Query Profile Details Dialog

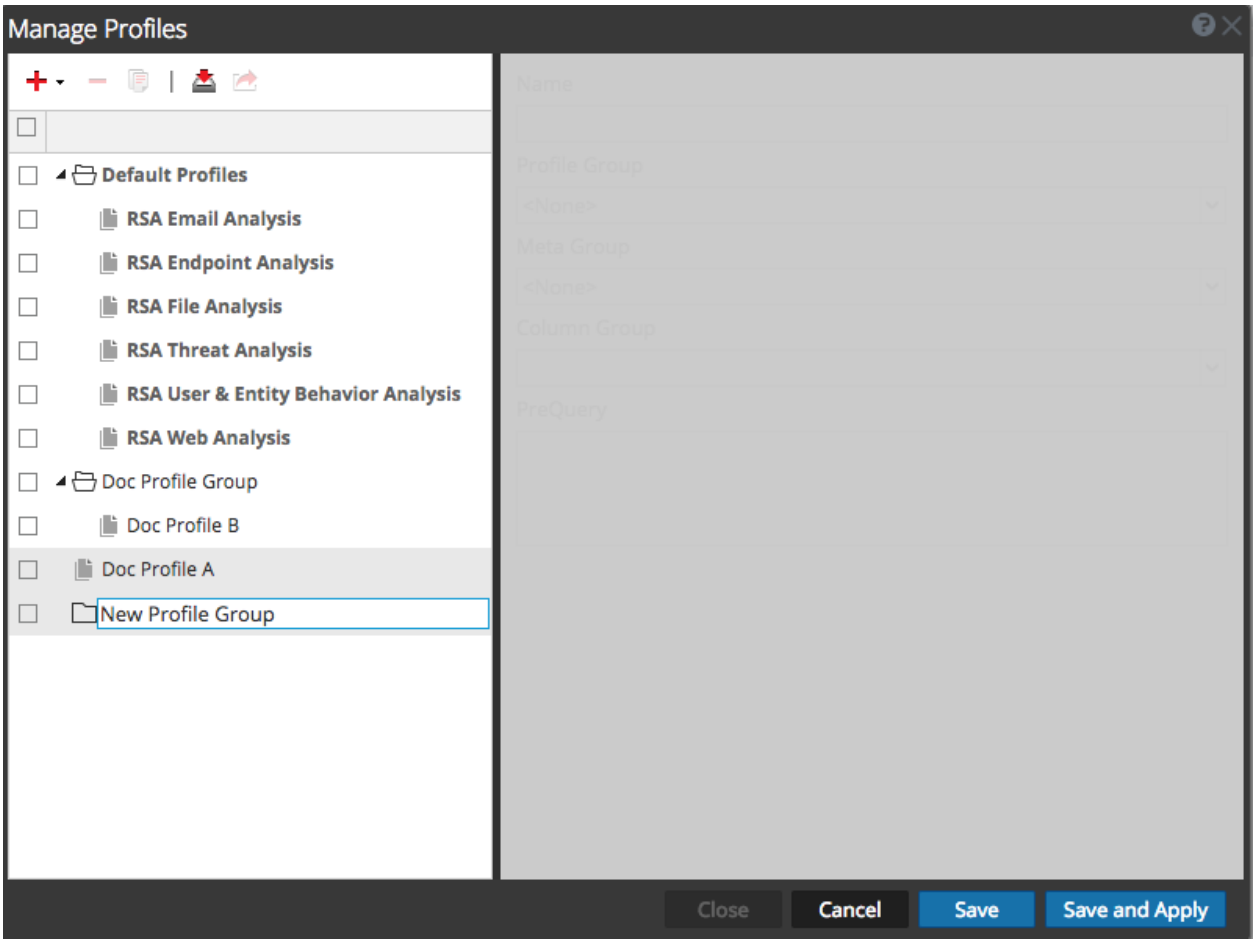


This section introduces the Query Profile menu, Query Profile dialog, and the Query Profile Details dialog. The following figure is an example of the Query Profiles menu and the table describes the options. The example on the left has built-in profile highlighted so that the information icon is visible. The Version 11.4 menu is on the left and the Version 11.5 menu is on the right.

Feature	Description
Visibility Options	Control the types of query profiles that are visible in the list. You can use any combination of the visibility options: **Private**, **Shared**, or **RSA** (blue = selected, black = not selected). Initially none of the buttons are selected and all profile types are visible. This is the same result as if all three buttons are selected. The visibility options work together with text in the Filter Query Profiles field. If the visibility option is hiding built-in profiles (which include "RSA" in the name) and you search for a name that contains "RSA," the list is empty. Private = display private groups that only you can manage Shared = display shared groups that anyone in your organization can manage RSA = display built-in groups that only RSA can manage

Feature	Description
Filter Query Profiles	Filters the list of query profiles as you type text so that only profile names that contain that text are displayed.
Query Profile List	The list of profiles consists of custom and built-in profiles, which are distinguished by the icons that precede the name. In the example, RSA Email Analysis-1 and RSA Email Analysis-2 are custom profiles. The RSA Email Analysis is a built-in profile.
New Query Profile	Displays the Create Query Profile dialog, where you can create a custom profile.

The Create Query Profile dialog, shown in the figure on the left, allows you to define a custom profile. The figure on the right illustrates the Query Profile Details dialog, in which you can edit a custom profile. The table describes the fields and options in the dialogs.



Feature	Description
	Creates a clone of the meta group so that you can edit a copy. This is useful if you want your own copy of a built-in group, a shared copy of a private group, or a private copy of a shared group.

Feature	Description
	Deletes the custom profile in the Query Profile Details dialog. This action is irreversible and applies globally; the profile is no longer available to anyone who is using the profiles on this service.
Query Profile Name	Displays the name of the profile. The name must be unique and contain fewer than 64 characters. You can edit the name in a custom profile.
Column Group	Displays a drop-down menu listing available column groups, with the currently selected column group from the Events list already selected. You can change the column group in a custom profile.
Pre-Query Conditions	Defines a limiting filter for results in the Events view. If you had a query active in the query bar when you began to create the new profile, the active query is added to the pre-Query field. In a custom profile, you can delete the prepopulated pre-query condition and type additional text for a text search or additional filters in the Pre-Query Conditions field. This is an example of a pre-query condition: `'service=80,25,110'`.
Close button	Closes the dialog.
Save Query Profile	For the Create Query Profile dialog only, saves the new profile.
Reset	For the Query Profile Details dialog only, reverts the edited profile to the last saved state.

Feature	Description
Update Query Profile	For the Query Profile Details dialog only, applies changes to an edited profile.
Select Query Profile	Applies the query profile.

Quick Look - Manage Profiles Dialog

This is an example of the Manage Profiles dialog showing several profile groups.

The Profile panel on the left side of the dialog displays available profiles and allows you to add, delete, import, and export profiles. The following table describes the fields in the Profile panel.

Field	Description
+	Adds a new profile using the Settings panel on the right side of the Manage Profiles dialog.

Field	Description
	Deletes the selected profile. A confirmation dialog is displayed before the profile is deleted.
	Creates a copy of the selected profile.
	Displays the Profile Import dialog, where you can upload a file.
	Exports the selected profile to your computer.
Profile Name	Lists all profile names.

The Settings panel on the right side of the dialog offers options to configure profiles. It can only be used when one profile is selected. The following table describes the fields in the Settings panel.

Feature	Description
Name	Displays the name of the profile.
Meta Group	Displays a drop-down menu listing available meta groups.
Column Group	Displays a drop-down menu listing available column groups. The OOTB column groups and these three groups are available by default: • List View • Detail View • Log View
PreQuery	Defines a limiting query for filtering Investigate results. This query is used when the associated profile is activated and the preQuery applies to any queries used in the Navigate and Events views. This is an example of a preQuery: `'service=80,25,110'`.

The following table describes the buttons.

Field	Description
Close	Closes the dialog.
Cancel	Cancels all changes.
Save	Saves all changes.
Save and Apply	Saves and applies all changes immediately.

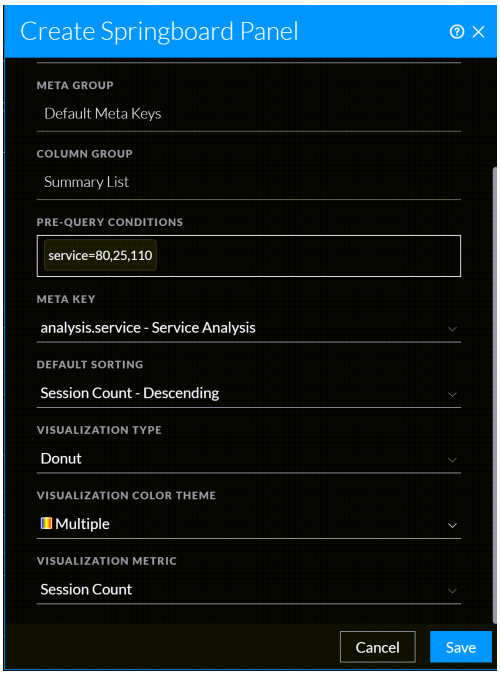
Create Springboard Panel Dialog

In the Create Springboard Panel dialog, you can create a Springboard panel from selected query in the Events view. You can add any number of filters in the query search bar and convert them into Springboard panels. The Springboard panels are then available to analysts for detection and monitor the results.

To access this dialog, while investigating a service in the **Investigate** > **Events** view, add a query on the query search bar >  > **Create Springboard Panel** from the toolbar.

IMPORTANT: Ensure that you first create a custom private board in Springboard.

What do you want to do?



User Role	I want to ...	Show me how
Incident Responder or Threat Hunter	review detections and signals seen in my environment	*NetWitness Platform Getting Started Guide*
Threat Hunter	query a service, metadata, and time range*	Begin an Investigation in the Events View

Related Topics

- Use Query Profiles to Encapsulate Common Areas for Investigation
- Managing the Springboard

Quick Look - Create Springboard Panel Dialog

This is an example of the Create Springboard dialog.

The following table describes the fields in the Create Springboard Dialog view.

Feature	Description
Name	(Required) Specifies a name to identify the panel. In the example, the name is Sample Incident. You can provide a name that clearly identifies the nature of events that will be added to this incident
Meta Group	Displays the currently selected meta group from the filter query already selected.
Column Group	Displays the currently selected column group from the filter query already selected.
Location	Displays the location where the defined query is saved.
Pre-Query Conditions	Defines a limiting filter for results in the Events view. If you had a query active in the query bar when you began to create the new Springboard panel, the active query is added to the pre-Query field. This is an example of a pre-query condition: `'service=80,25,110'`.
Meta Key	Displays a drop-down listing meta keys available for the service.
Default Sorting	Displays a drop-down listing sorting options.
Visualization Type	Displays a drop-down listing Visualization type options: • **Donut** • **Bar**

Feature	Description
Visualization Color Theme	Displays a drop-down listing different color theme options: • **Blue** • **Teal** • **Orange** • **Fuchsia** • **Purple** • **Lime** • **Multiple** **Note:** The **Multiple** color option is available only for the Donut chart.
Visualization Metric	Displays a drop-down listing available Visualization metric options.
Cancel	Closes the dialog without applying changes.
Save	Saves the changes.

Create Future Alert Dialog

In the **Create Future Alert** dialog, Administrators and Analysts can create an application rule from the **Investigate** > **Events** page for any suspicious activity. You can create rules with a flexible query that covers a wide set of events and system information from your network, including suspected breach activities and misconfigured servers. Once the rule is applied to a matched policy with services (Decoders), it generates alerts whenever a match occurs and helps analysts with further investigation.

To access this dialog, while investigating a service in the **Investigate** > **Events** view, add a query on the query search bar >  > **Create Future Alert** from the toolbar.

IMPORTANT: The **Create Alert** option will be enabled for users only if the Decoder services are managed by Policy-based Centralized Content Management and the user has the **investigate-server.alert.manage** permission enabled.

Note: An administrator must enable **investigate-server.alert.manage** permission and **source-server.centralpolicy.manage** permission on the source server and **rules.manage** permission on the core devices to allow analysts to create the application rules.
For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

What do you want to do?

Quick Look - Create Future Alert Dialog

This is an example of the Create Future Alert Dialog.

The following table describes the fields in the Create Future Alert view.

Feature	Description
Alert Name	Specify a descriptive Name to identify the alert or leave the default name automatically populated using **Query Based App Rule** format.
Select Policy	Displays a drop-down list of available policies for selection.

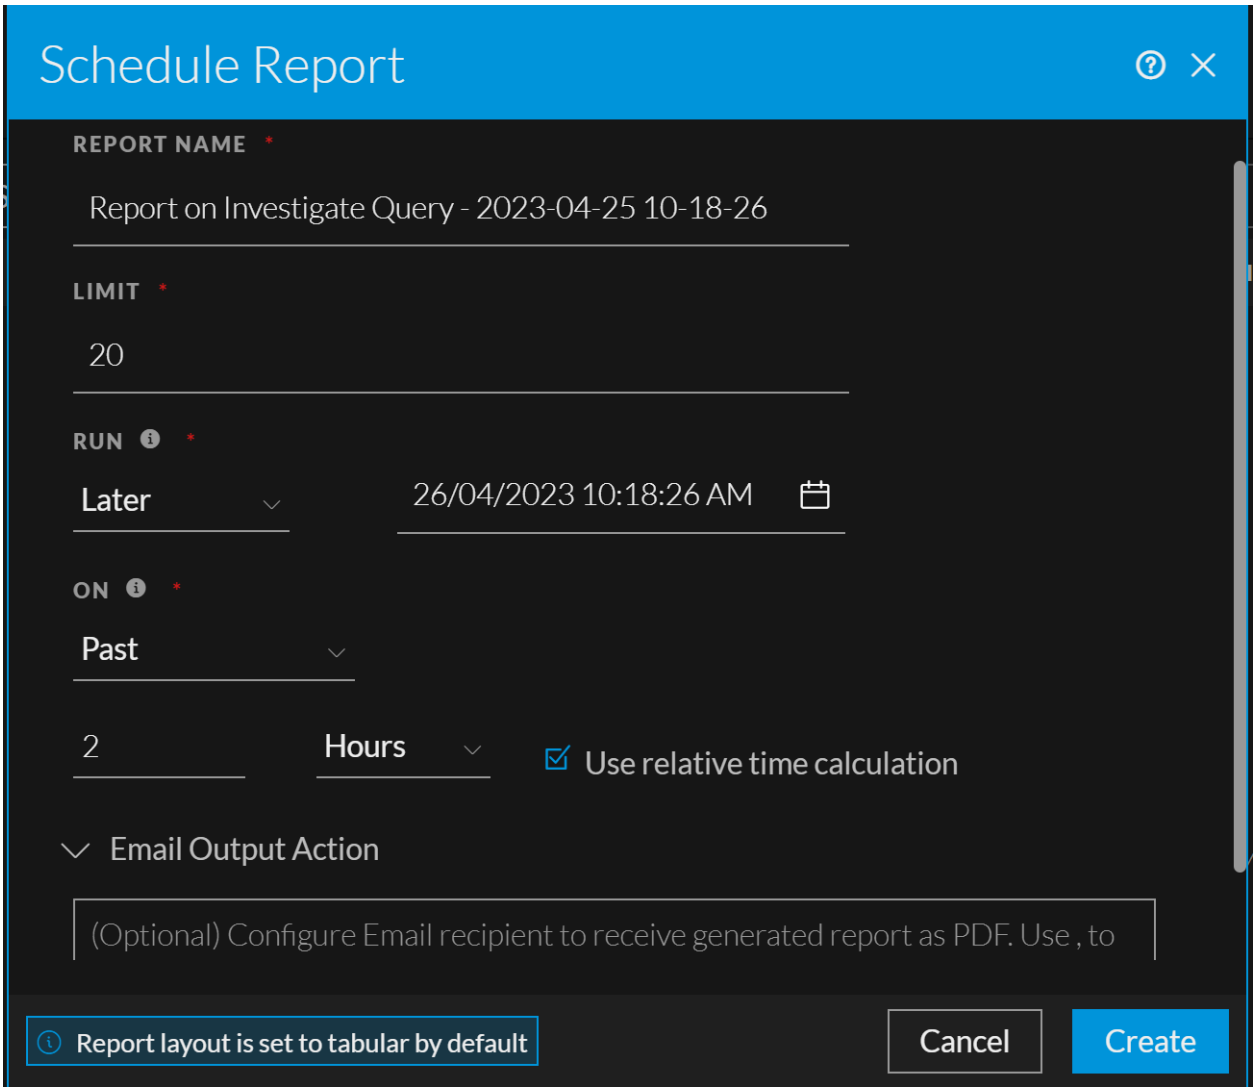
Feature	Description
Select Severity	Displays the level of severity for the alert to be generated. The options are listed below: • Low • Medium • High • Critical **Note:** By default, Low is selected as severity.
Create	Creates the Application rule and closes the dialog. A message confirms that the application rule was created successfully.
Cancel	Closes the dialog without applying changes.

Schedule Report Dialog from Events View

The **Schedule Report** dialog enables you to create a schedule for the report. Reports can be scheduled hourly, daily, weekly, or monthly. In order to schedule a report at a specific time or on a daily, weekly, or monthly basis, you must configure the scheduling options on the Schedule report dialog.

To access this dialog, while investigating a service in the **Investigate** > **Events** view, add a query on the query search bar >  > **Schedule Report** from the toolbar.

What do you want to do?



User Role	I want to ...	Show me how
Administrator / Analysts	Schedule Report	Generate Reports from Events View

Related Topics

- Use Query Profiles to Encapsulate Common Areas for Investigation
- Generate Reports from Events View

Quick Look - Schedule Report Dialog

This is an example of the Schedule Report Dialog.

The following table describes the fields in the **Schedule Report Dialog** view.

Feature	Description
Report Name	Specifies a name to identify the panel. In the example, the name is **Report on Investigate Query - 2023-04-25 10-18-26**. You can provide a name that clearly identifies the nature of events that will be added to this report.
Limit	A selection list for the maximum number of results to be displayed in the generated output. By default, the limit is 20 and you can specify a maximum number of 100 results.

Feature	Description
Run	Time interval to use for running the scheduled job: • **Later**: Runs on specific date and time. • **Hourly**: Runs on a designated repeating interval. For example, if you schedule the report for 50 minutes, for every 50th minute, the report will be prepared. **Note:** A maximum of only 59 minutes can be selected. • **Daily**: Runs daily at a designated time. For example, if you schedule the report at 04:25, the report will be prepared at 04:25 AM every day. • **Monthly**: Runs on a monthly basis at a designated time and day of the month. For example, select 25 for the 25th day of the month. The report will be prepared on the 25th month of every month. **Note:** During the monthly report generation process, a message will appear if the day is greater than 28. This will notify the user that the report will be scheduled for the month containing that day.
ON	Set the frequency, duration, and time for running the report: • **Past**: You can schedule the report based on **Hours**, **Days**, **Weeks**, **Months**, and **Years**. • **Range(specific)**: You can schedule the report for a specific date and time range. **Note:** This field appears only if you select Later in the Run field. • **Range(generic)**: You can schedule the report for a generic date and time. **Note:** This field appears only if you select Later, Daily, Weekly, and Monthly in the Run field.
Use relative time calculation	The Use relative time calculation option is enabled by default, and it uses the relative time duration to schedule a report. For example, if you schedule a report to run over the past 1 hour –1h for the relative time, the time is exactly 1 hour from when the report is run. If the current time is 3 P.M., the events that occurred in the past 60 minutes or between 2 P.M. and 3 P.M. today.
Email Output Action	Specify email addresses to send the report to, separated by commas.
Create	Creates the report and closes the dialog. A message confirms that the report was scheduled successfully.
Cancel	Closes the dialog without applying changes.

Timeline Settings Panel

Analysts can use the **Timeline Settings** option to change the values based on the Spike Y-axis (Count and Size) and view the data presented on the timeline. This allows analysts to detect significant spikes that could indicate anomalies. Using the visual representation, analysts can conduct a more detailed investigation of the events that occurred during that specific period.

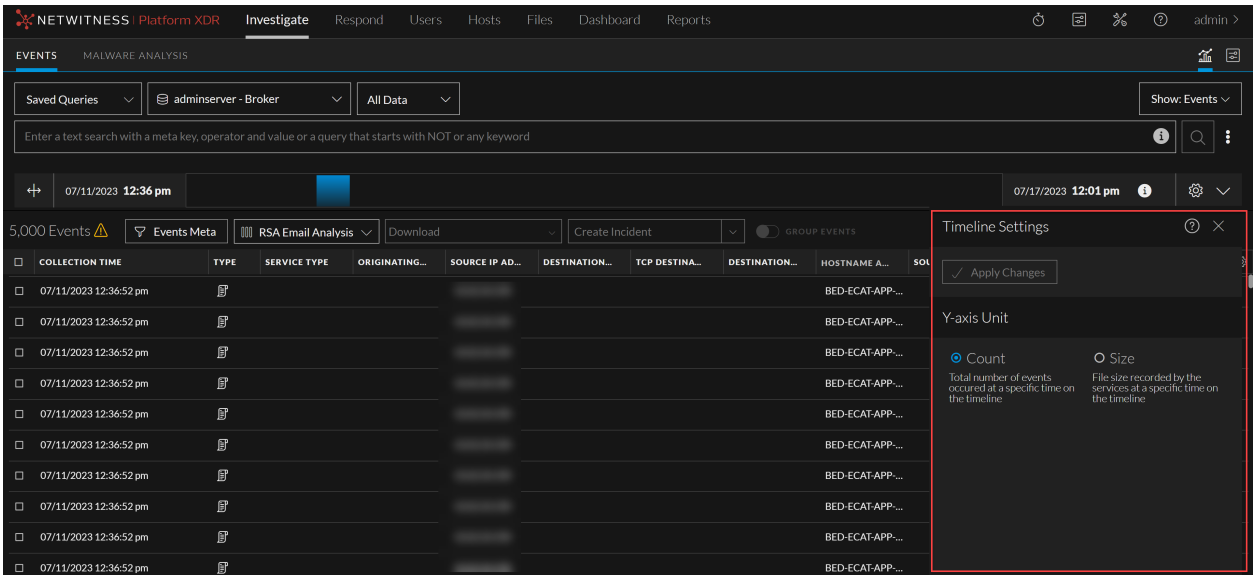
For more information on Timeline, see the section **Investigate on Timeline** in the topic Begin an Investigation in the Events View.

Note: To change the X-axis settings, you must change the Query Time options set within the Events Preferences panel. For more information on Query time, see Configure the Events View.

What do you want to do?

User Role	I want to ...	Show me how
Analysts	Configure Timeline Settings	Begin an Investigation in the Events View

To change the Timeline Settings



1. Log in to the NetWitness Platform XDR.
2. Go to **Investigate** > **Events**.
3. Click () **Timeline Settings**.
4. Select the Spike (Y-axis) based on your preference:
   - **Count**: Displays the total number of events that have occurred at a specific time on the timeline.
   - **Size**: Displays the total size of the events recorded by services at a certain time on the timeline.
5. Click **Apply Changes**. The changes are reflected on the Timeline bar.
6. Click **X** to close the Timeline Settings.

Related Topics

Quick Look - Timeline Settings Panel

This is an example of the Timeline Settings Panel.

The following table describes the fields in the **Timeline Settings** Panel.

Feature	Description
Count	Displays the total number of events that have occurred at a specific time on the timeline.
Size	Displays the total size of the events recorded by services at a certain time on the timeline.
Apply Changes	Applies the changes and the changes are reflected on the timeline bar.
X	Closes the dialog without applying changes

Settings Dialogs for Investigate Views

NetWitnessVersion 11.0 has two settings dialogs, one for the Navigate view and one for the Legacy Events view. With the addition of the settings dialog for the Events view in Version 11.1, Investigate has three settings dialogs.

The settings in these dialogs are a subset of the Investigation settings made in the Profiles > Preferences panel > Investigation. Analysts can save time by editing these settings within the Investigate view. If you change a setting here, the same setting is changed in the Profiles view, and if you change a setting in the Profiles view, the same setting is changed here.

To access this dialog, go to the **Navigate** or **Legacy Events** view, and select the **Settings** option in the toolbar.

The settings in the Events view have no corresponding settings in the Profiles > Preferences panel.

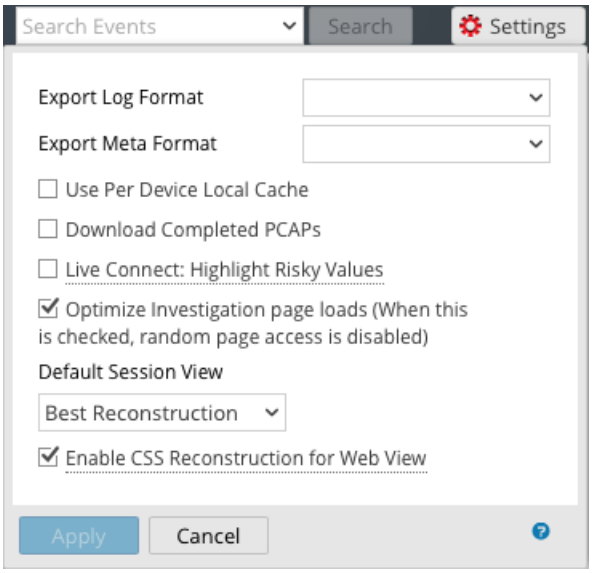
Quick Look

This is a quick look at the settings dialog for the Navigate view, Legacy Events view, and Events view.

Navigate View Settings Dialog

The following figure illustrates the Navigate view Settings dialog. The settings that influence performance when loading values in the Values panel have default values based on common usage, and individual analysts can adjust these settings for their own investigations. The following table describes the features.

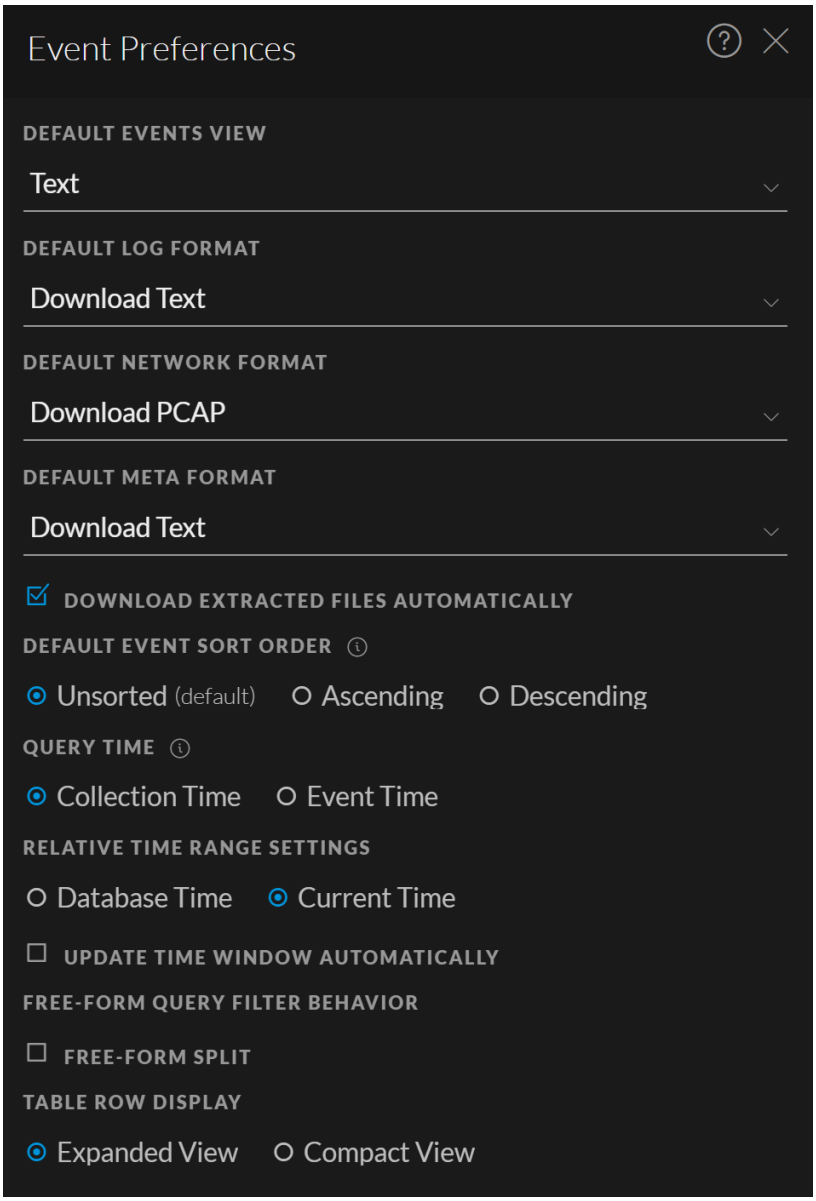


Feature	Description
Threshold	Sets the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The default value is **100000**.
Max Values Results	Sets the maximum number of values to load in the Navigate view when the Max Results option is selected in the Meta Key menu for an open meta key. The default value is **1000**.
Max Session Export	Sets the maximum number of sessions that can be exported. The default value is **100000**.
Export Log Format	Sets the file format of exported logs. There are four formats available: • **Text**: Raw log format. • **SML**: Structured Markup Language format. • **CSV**: Comma-separated values (CSV) format. • **JSON**: The JavaScript Object Notation (JSON) format.

Feature	Description
Export Meta Format	Sets the file format of exported meta values. There are four formats available: • **Text**: Raw log format. • **SML**: Structured Markup Language format. • **CSV**: Comma-separated values (CSV) format. • **JSON**: The JavaScript Object Notation (JSON) format. **Note:** If you upgrade to version 11.5.2, the **Export Meta Format** preference is not retained and is reset to blank. You must re-configure this value after you upgrade to version 11.5.2.
Use Per Device Local Cache	When the checkbox is cleared, Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If the checkbox is selected, Investigate uses the data from local cache.
Show Debug Information	This option controls the display of the `where` clause beneath the breadcrumb in the Navigate view and the elapsed load time for each aggregated service on a Broker. When the checkbox is selected, the debug information is displayed. The default value is **Off** (checkbox cleared).
Autoload Values	This option controls automatic loading of values for the selected service in the Navigate view. When the checkbox is selected, values are automatically loaded when you select a service to investigate. When the checkbox is cleared, Investigate displays a **Load Values** button, allowing the opportunity to modify options. The default value is **Off**.
Download Completed PCAPs	This setting automates the downloading of extracted PCAPs in Investigate so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP form. When the checkbox is selected, the option is enabled. The default setting is disabled (checkbox is cleared).
Live Connect: Highlight Risky IPs	If the checkbox for this option is cleared, all the meta values that have context available in Live Connect are highlighted in the Navigate view Values panel. If the checkbox is selected, among the values that have context in Live Connect, only those values deemed Risky/Suspicious/Unsafe by the community are highlighted. By default this option is disabled (checkbox cleared).
Apply	Applies the settings immediately and they are visible the next time you load values. The same changes are also applied in the Profiles view.
Cancel	Cancels the editing operation and closes the dialog, leaving the settings unchanged.

Legacy Events View Settings Dialog

The following figure is an example of the Settings dialog for the Legacy Events view, and the table describes the features.



Feature	Description
Export Log Format	Sets the file format of exported logs. There are four formats available: • **Text**: Raw log format. • **SML**: Structured Markup Language format. • **CSV**: Comma-separated values (CSV) format. • **JSON**: The JavaScript Object Notation (JSON) format.
Export Meta Format	Sets the file format of exported meta values. There are four formats available: • **Text**: Raw log format. • **SML**: Structured Markup Language format. • **CSV**: Comma-separated values (CSV) format. • **JSON**: The JavaScript Object Notation (JSON) format.
Download Completed PCAPs	This setting automates the downloading of extracted PCAPs in Investigate so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP form.
Live Connect: Highlight Risky IPs	When the checkbox is selected, Investigate uses a filter to fetch only IP addresses that are considered as risky by RSA community. When the checkbox is cleared, NetWitness displays all IP addresses. By default, this option is disabled (checkbox cleared).

Feature	Description
Optimize Investigation page loads	Sets a paging option. When optimized, results are returned as quickly as possible, sacrificing the original ability to go to a specific page in the event list. Clearing this checkbox changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). The default value is enabled (checkbox selected).
Append Events in Event Panel	This option affects paging in the Legacy Events panel and in prior releases was located in the Navigate view settings dialog. When the checkbox is selected, the next group of events is appended to the already displayed events. When cleared, the previous page of events is replaced by the next page. The default value is Off (checkbox cleared).
Default Session View	Selects the default reconstruction type for the initial reconstruction in the Events view. The default value is **Best Reconstruction** in which events are reconstructed using the reconstruction method most appropriate to the event.
Enable CSS Reconstruction for Web View	This setting controls how web content reconstruction is performed. If enabled, the web reconstruction includes cascaded style sheet (CSS) styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for style sheets and images used in the target event. The option is enabled by default. Clear the checkbox to disable this option if there are problems viewing specific websites.
Apply	Applies the settings immediately and they are visible the next time you view events. The same changes are also applied in the Profiles view.
Cancel	Cancels the editing operation and closes the dialog, leaving the settings unchanged.

Events View Preferences Dialog

Beginning with Version 11.1, the Events view has user preferences that you can configure in the Events view > Event Preferences dialog. These settings persist so that they are applied each time you log in and go to the Events view. The following figures are examples of the dialog for Version 11.3 and Version 11.6. The table below describes the options.

Feature	Description
Default Events View	Selects the default event analysis view that is displayed every time you open the Events view. For example, if you select File, the File Analysis panel is highlighted and displayed every time you investigate an event in the Events view. These are following options: • **Text** : View and analyze the raw text payload of an event. • **Packet** : View and interactively analyze the packets and payload of an event. • **File** : View a list of files and download one or more files in an event.

Feature	Description
Default Log Format	Selects the default format for downloading logs: • **Download Log** or **Download Text**: Raw log (log) format. • **Download CSV**: Comma-separated values (CSV) format. • **Download XML**: The Extensible Markup Language (XML) format. • **Download JSON**: The JavaScript Object Notation (JSON) format.
Default Packet Format or Default Network Format	Selects the default format for downloading packets. • **Download PCAP**: To download the entire event as a packet capture (*.pcap) file. • **Download All Payloads** or **Download Payloads**: To download the payload as a *.payload file. • **Download Request Payload**: To download the request payload as a *.payload1 file. • **Download Response Payload**: To download the response payload as a *.payload2 file.
Default Meta Format	Selects the default format for downloading metadata: • **Download CSV**: Comma-separated values (CSV) format. • **Download JSON**: The JavaScript Object Notation (JSON) format. • **Download Text**: Plain text format. • **Download TSV**: Tab-separated values (TSV) format.
Time Format for Query	The Events view can display results based on the database time or the current clock time. **Note:** (Version 11.6) **Current Time** is the default for **Relative Time Range Settings**. In previous versions, **Database Time** was the default value. Make a note that this may cause time range mismatch between **Events View** (using **Current Time** as default) and **Navigate View** (using **Database Time** as default). This change does not affect the existing users and is applicable only to the new users. When **Database Time** is selected, the start and end time for a query is based on the time that the event was captured (collection time). When **Current Time** (labeled **Wall Clock Time** in Version 11.3 and earlier) is selected, the query is executed using the end time based on the current browser time; the start time is calculated based on that end time and the time range.

Feature	Description
Event Sort Order (Version 11.4 and Later)	Sets the sort sequence by collection time for the events listed in the Events panel. If results exceed the events limit, not all events can be loaded. The portion of returned events loaded in the Events panel matches the sort order preference: the oldest portion of events is loaded when Ascending order is selected, and newest portion of events is loaded when Descending order is selected. A change to this setting becomes effective the next time you submit a query. **Unsorted**: Default sorting method for Version 11.4.1. To list events as processed by the Core services. Unsorted is faster because it streams back the events as soon as a match is found versus waiting for all Core services to respond and then displaying them in the chosen order. **Ascending**: Default sorting method for Version 11.4. To put the events with the earliest collection time first in the list. **Descending**: To put the events with the latest collection time first in the list. When investigating logs, you may want to change the sort sequence to latest collection time first.
Download Extracted Files Automatically	Enables the automatic download of files if they are in the selected default format in the **Default Log Format** and **Default Packet format** fields set in the Event Preferences dialog. Select the checkbox to enable downloading the selected format automatically to local file system. Otherwise, the download job goes to the job queue, and you can download it manually.
Update Time Window Automatically	(Version 11.3 and later) Enables automatic update of the time range window in the query bar when the service is polled (at one minute intervals) so that fresh results are sent. The default setting is disabled. When the checkbox is selected, as the time range is updated, the  (Submit Query) button is activated so you can click to get the fresh results. When the checkbox is cleared, the automatic update is disabled keeping the time range window in the breadcrumb synchronized with the current results.

Entitlement Capability Implementation

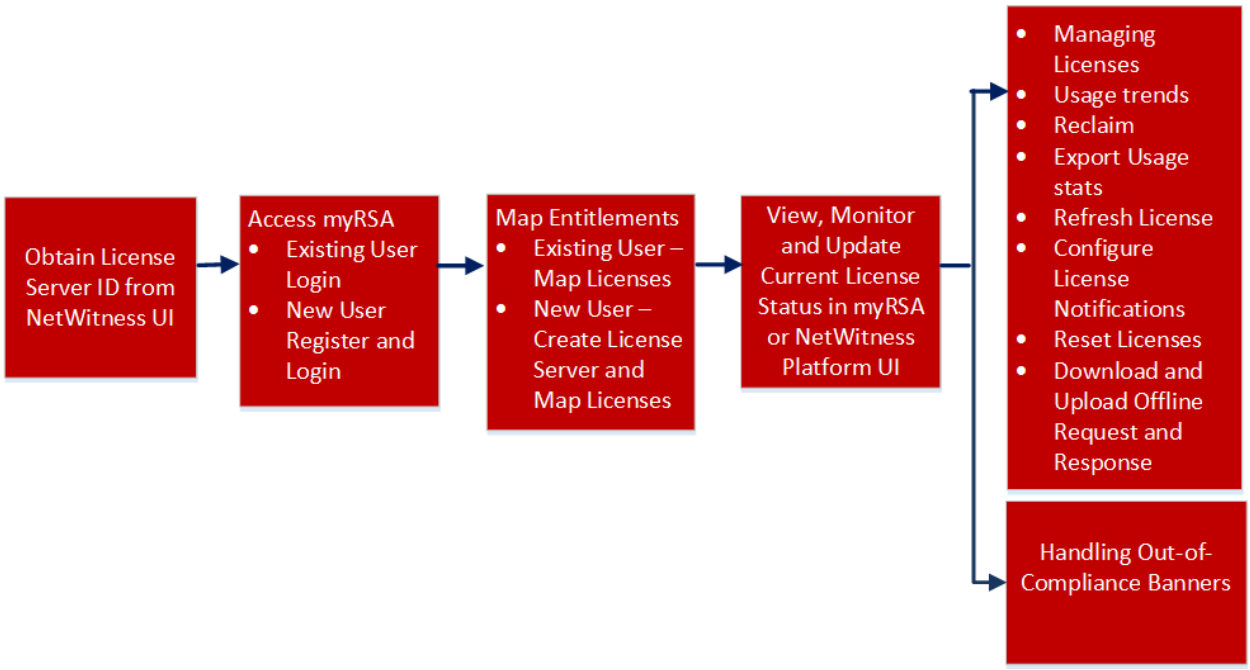
This topic describes how licensing of appliances and services is implemented in NetWitness. The entitlement capability leverages myRSA (https://my.rsa.com/) as the mechanism for entitlement delivery.

Key	Description
1	**Entitlements Created and Available to Customer.** After a customer order is processed, the entitlements (licenses) become available in myRSA. The entitlements are tied to an individual account.
2	**Register NetWitness Server on myRSA and Map Entitlements to the Local License Server (LLS).** • Customers log on to myRSA and view the entitlements to which they have access within their account. • Customers map entitlements to their Local License Server using the License Server ID (displayed in the NetWitness (Admin) **> System > Info** panel). The License Server ID is used only for mapping entitlements to a Local License Server and does not pertain to appliance activation.

Key	Description
3	**Synchronize the Server and Download Mapped Entitlements.** There are two methods for customers to synchronize with FlexNet Operations-On Demand (FNO-OD) and download the mapped entitlements to their LLS. • **Sites with Internet connectivity.** If the LLS has Internet connectivity, the LLS attempts to synchronize with FNO-OD every 24 hours over HTTP (TCP-80). Customers with Internet connectivity can also perform on-demand synchronization, using the **Refresh** option in the  (Admin) **> System > Licensing** panel on the NetWitness Server. For more information, see Register the Server (Online Registration). After the synchronization, endpoint entitlements that were mapped to the Local License Server on the NetWitness Platform appliance are synchronized on hourly basis by port 443. • **Sites in closed environments.** Customers can synchronize the mapped entitlements by downloading a capability request and importing it on the NetWitness Server. For more information, see Register the Server (Offline Capability Request). After the synchronization, entitlements that were mapped to the Local License Server on the NetWitness appliance are synchronized, but the entitlements have not been used in any way. For example, if you have purchased 10 Decoders and 10 Concentrators, 10 of 10 Decoder entitlements and 10 of 10 Concentrator entitlements would be available on the NetWitness Server.

Note: FNO-OD is the license server in the cloud on myRSA. The URL is rsasecurity.subscribenet.com. The customer's firewall must allow communications between this URL on port 80 (whatever it resolves to when using lookup or whois) and the NetWitness IP address.

NetWitness Platform Licensing Overview



After you have purchased the licenses and have received all the relevant email communications, perform the steps required to map entitlements in NetWitness. You must perform each step in the proper sequence.

This document is divided into three parts:

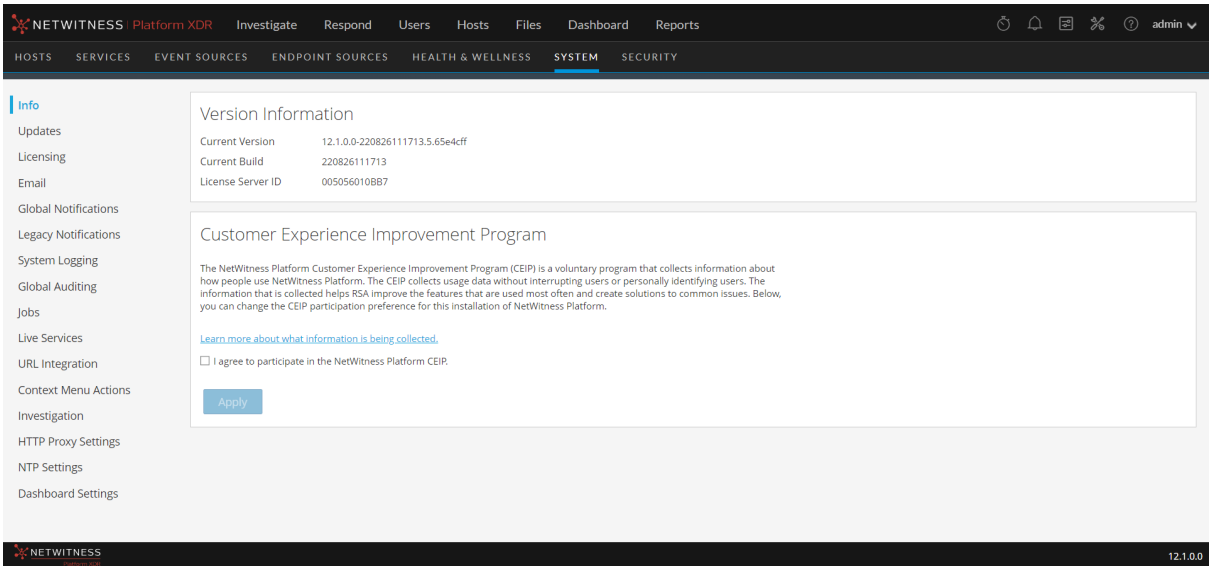
- How to obtain license information from myRSA and view in the NetWitness Platform UI
- Understanding License Types and its functionality
- Troubleshooting or maintenance information

Workflow

The following workflow illustrates the end-to-end licensing process after you have the NetWitness product installed .

Configuration Step	Description
Obtain License Server ID from NetWitness Platform User Interface	Before you begin the licensing process, you must ensure that you obtain the License Server ID displayed on the NetWitness User Interface.
Access myRSA	Your myRSA Welcome e-mail message contains system log in instructions to myRSA. Instructions for downloading your product licenses can be found in this document, as well as the myRSA website.

Configuration Step	Description
Register the Server (Online Registration)	Your NetWitness Server must be registered to myRSA and entitlements must be mapped. There are two methods of synchronizing NetWitness with myRSA: online and offline.



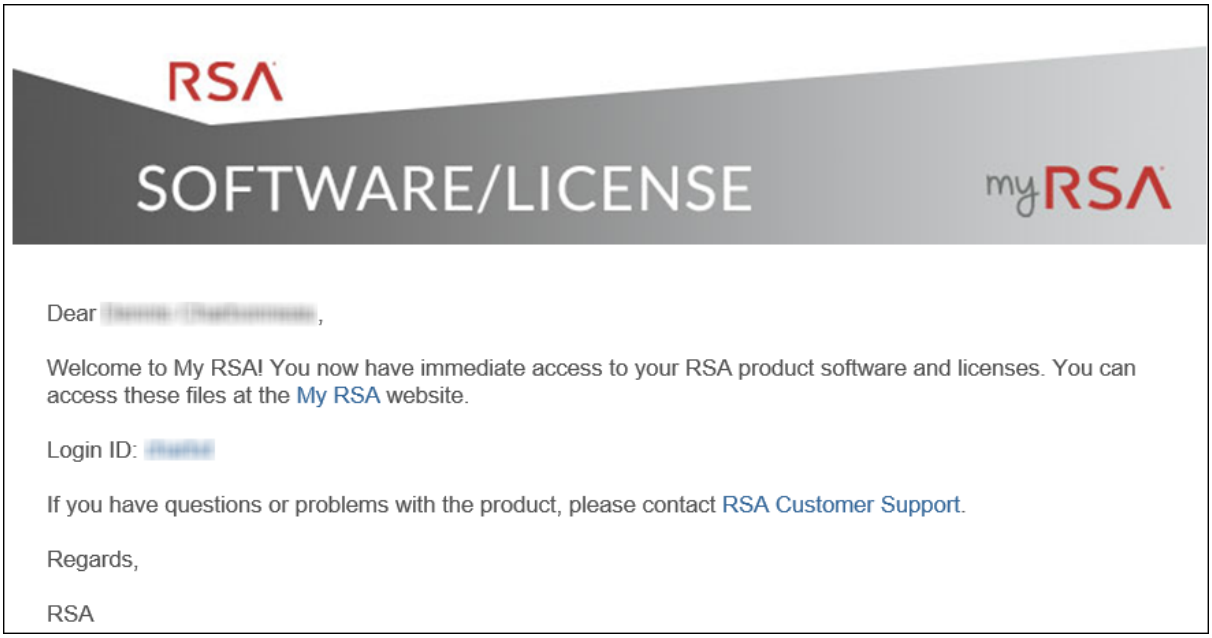
Obtain License Server ID from NetWitness Platform User Interface

Before you begin the licensing process, you must make sure that you obtain the License Server ID displayed in the NetWitness User Interface which is generated on the successful installation of the product.

To obtain the license service ID:

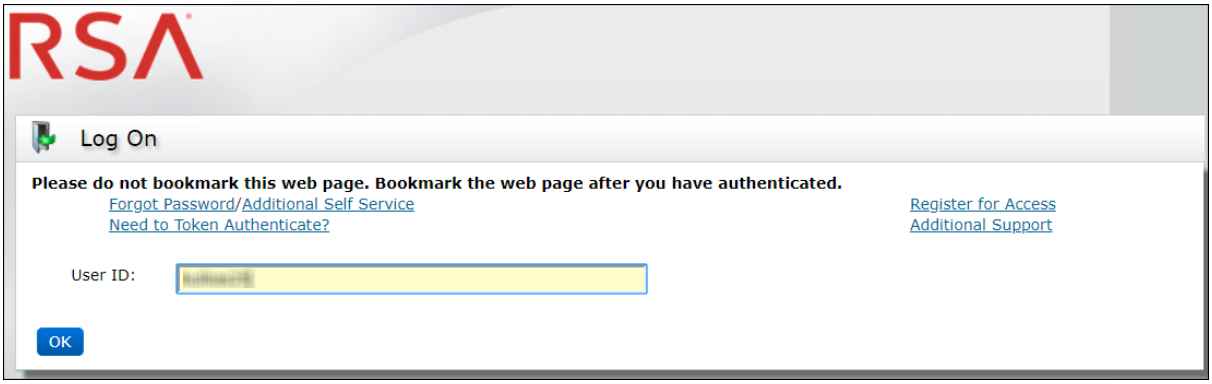
1. Log in to the NetWitness user interface.
2. Go to  **(Admin) > System**.

   The Admin System view opens to display the Version Information in the **Info** panel.



3. Under **Version Information**, locate the **License Server ID** and make a note.
   Log in to **myRSA** and enter the License Server ID to view your entitled license information. For more information, see Access myRSA.

Access myRSA



You will receive an order confirmation e-mail. Refer to your myRSA email for login information. If you are a new myRSA user, you also receive an e-mail containing instructions on how to create a new account. Your myRSA Welcome e-mail message contains system log in instructions to myRSA. This document provide you instructions on how to map your product licenses on the myRSA website.

1. The new users instruction e-mail contains a **Click Here** link. This link opens an Enrollment Portal, where the -Based Authentication (RBA) method must be configured for the account.
2. After the RBA method is enabled, a Confirmation e-mail message containing the User ID (which is your e-mail address), along with a temporary password is sent. After the first login, you are prompted to change the password. Once the password is changed, you are logged into myRSA.

Note: If you have a pre-existing account for the RSA Link or RSA Online websites, you receive only one e-mail on how to use your existing login credentials. You must log into myRSA with your existing User ID, password, and RSA method.

3. When you navigate to https://my.rsa.com/, the **RSA Secure Logon** screen is displayed.

4. Enter your User ID and click **OK**, which displays the **Password** field. When you enter the password, you are logged into myRSA.

   Your contact e-mail address is used to authenticate your User ID. If the Customer Authentication process is successful, the myRSA Software/License page displays a list of all the following products available which are associated to your site location:

   - RSA Products
   - Serial Numbers
   - Purchase Orders
   - Sales Orders

   Note: You may be prompted to verify your identity through your RBA method, if multiple log in failures occur in a row, or if you have not logged into myRSA within the past several months.

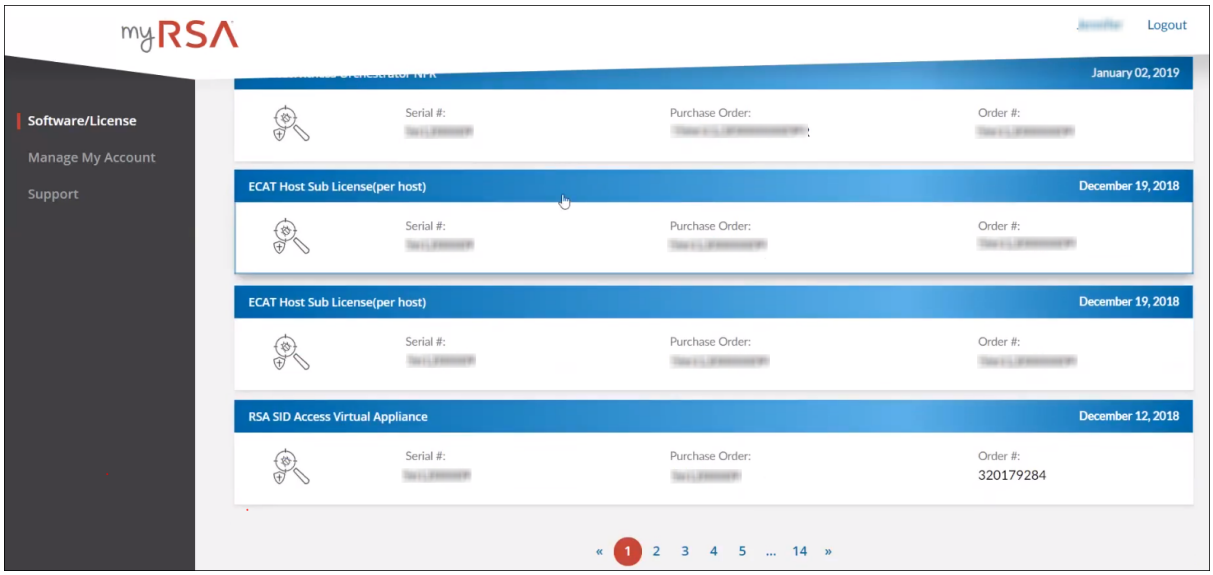
5. In the Sofware/License page, select the Order Location from the drop-down menu. The list of products, sales orders, and purchase orders are filtered and displayed.

   The **Order Detail** screen is displayed.

License for NetWitness Endpoint 4.4.0.x Agents

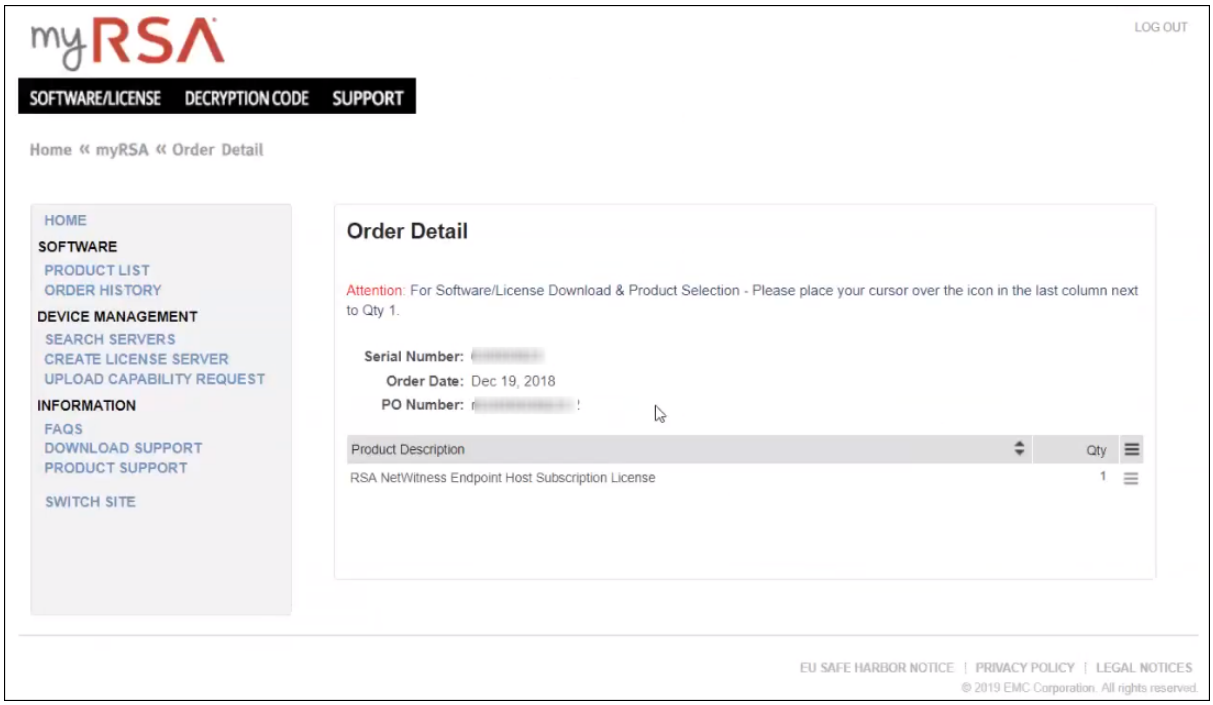
If you are an existing NetWitness Endpoint 4.4.0.x customer, who also has NetWitness Server, Log Hybrid and an ESA box, you receive licenses for NetWitness Endpoint 4.4 and 11.6 agents. You receive the following RSA Order Fulfillment Confirmation email which contains the license details for NetWitness Endpoint 4.4.0.x and NetWitness 11.6.

Note: If you are a new NetWitness 11.6 customer, the RSA Order Fulfillment Confirmation email contains the license details for the current 11.6 version only.



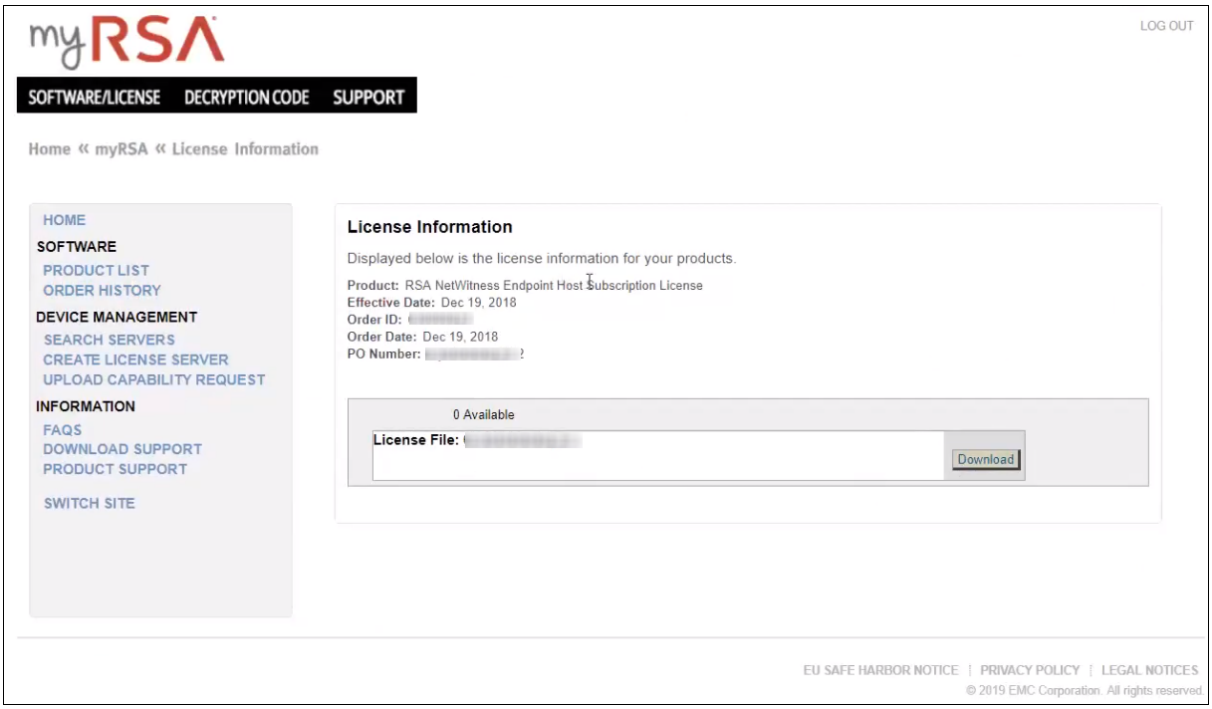
Part Number	Part Description	Quantity	Fulfillment Date
ECAT-SUB-T4	Tier4 RNWE Subsc p/Host 1001-2500 1Mo	1	February 7, 2019
# of License Months - 3 Billing Plan Type - Annual in advance License Duration - Term Sales Type - Upgrade Number of Hosts - 500			
Serial/License Number: [redacted]			
RSA-0015012	ECAT Host Sub License(per host)	1	February 7, 2019
# of License Months - 3 Billing Plan Type - Annual in advance License Duration - Term Sales Type - Upgrade Number of Hosts - 500			
Serial/License Number: [redacted]			

In the above screenshot, the part number with **RSA-0015012** indicates that it is aNetWitness Endpoint 4.4 license and the part number with **ECAT-SUB-T4** indicates that it is a NetWitness 11.6 license. You will get NetWitness 11.6 license and if you have NetWitness Endpoint 4.4 license, myRSA will upgrade the number of host for both licenses.



To download an Endpoint (ECAT) 4.4.x license, perform the following steps:

1. After you log in to myRSA, an ECAT Subscription Licenses option is displayed.



2. Click on ECAT Host Sub License (per host).

   The Order Detail page is displayed.

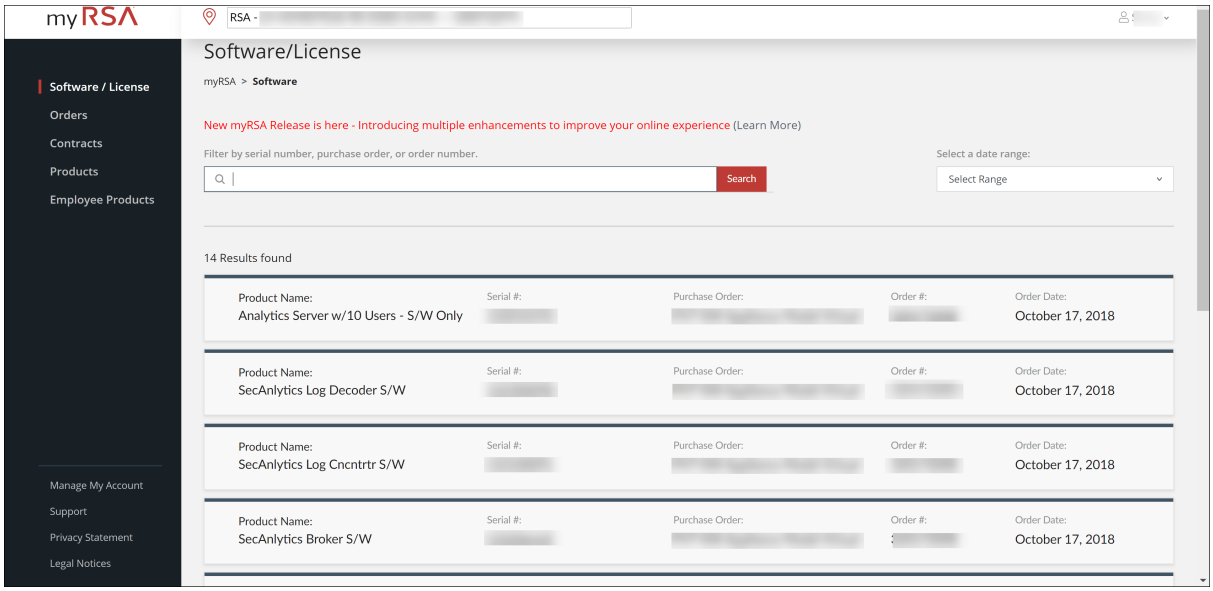
3. Click on **Product Description**.

   The License information page is displayed.

4. Click **Download** to download NetWitness Endpoint 4.4.0.x license.

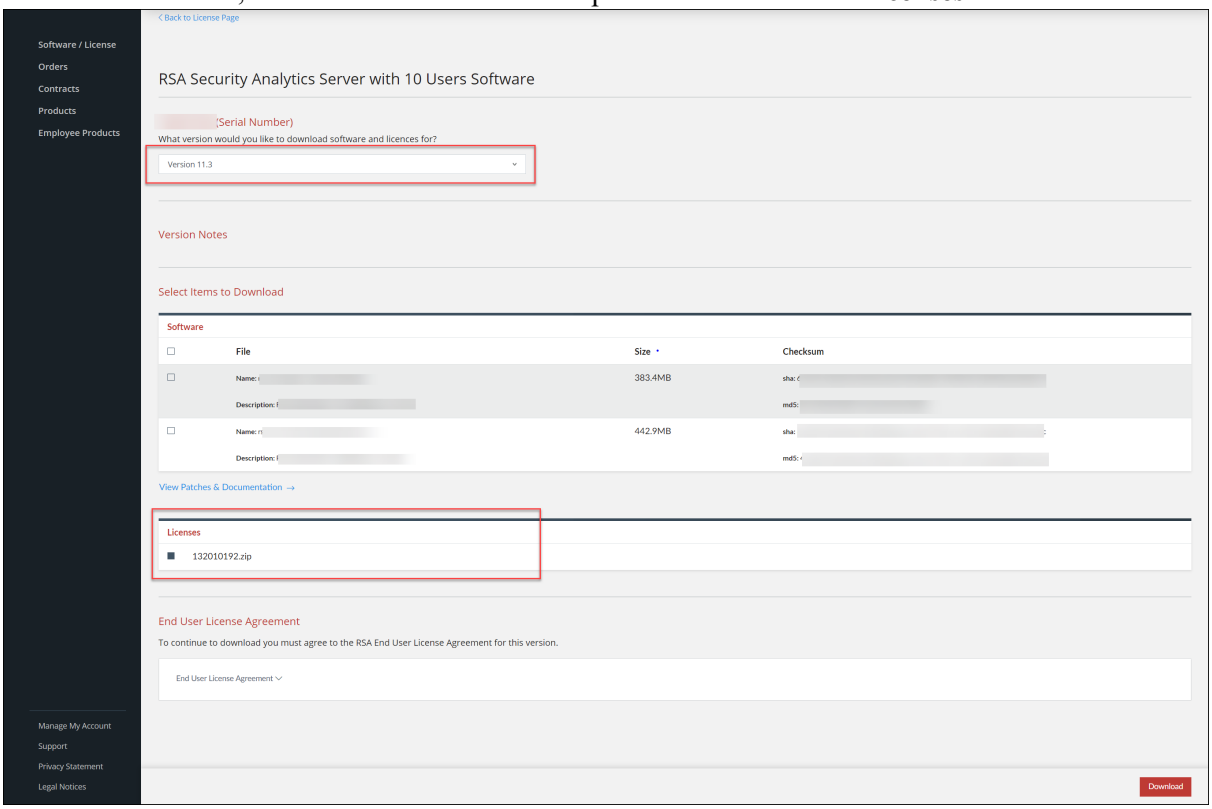
If you have an existing NetWitness Endpoint 4.4.0.x and do not have RSA NetWitness Platform, then you must register to the license server. For more information. see Register the Server (Online Registration).

If you have an existing NetWitness Endpoint 4.4.0.x customer, and also NetWitness, then you can use the same license in NetWitness.



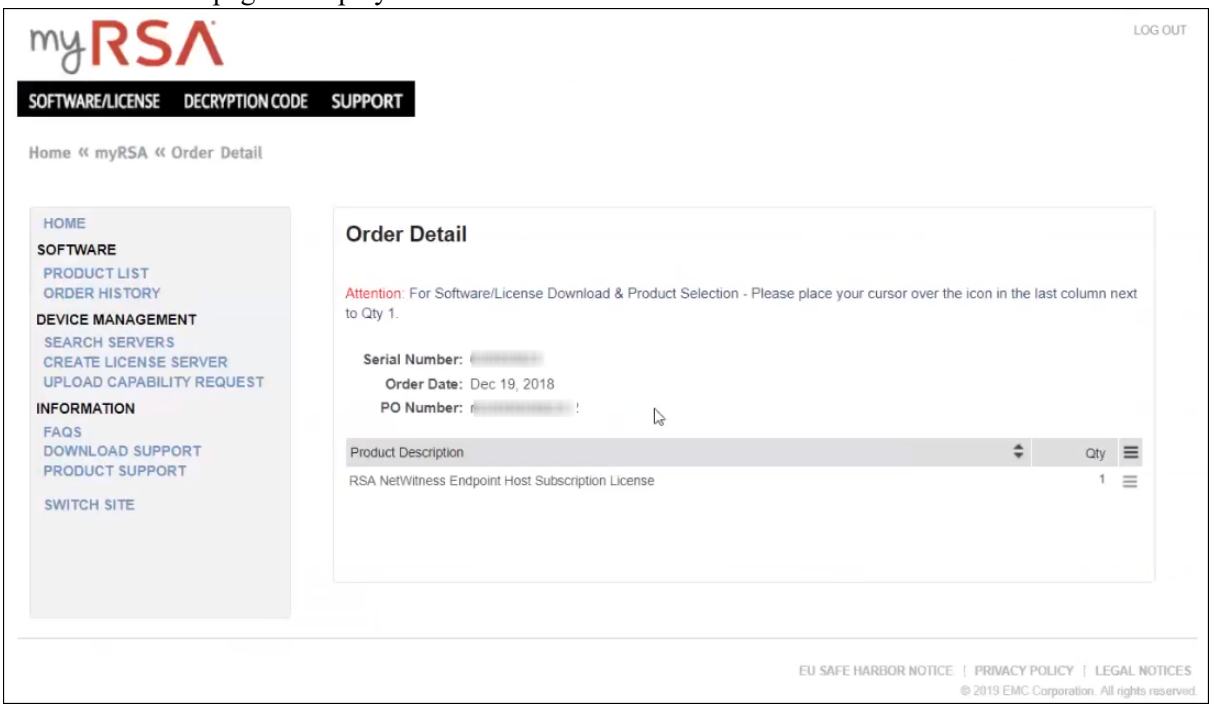
If you are new to NetWitness 11.6 , and have NetWitness Endpoint, then you can view the license only for the current version in NetWitness.

Register the Server (Online Registration)

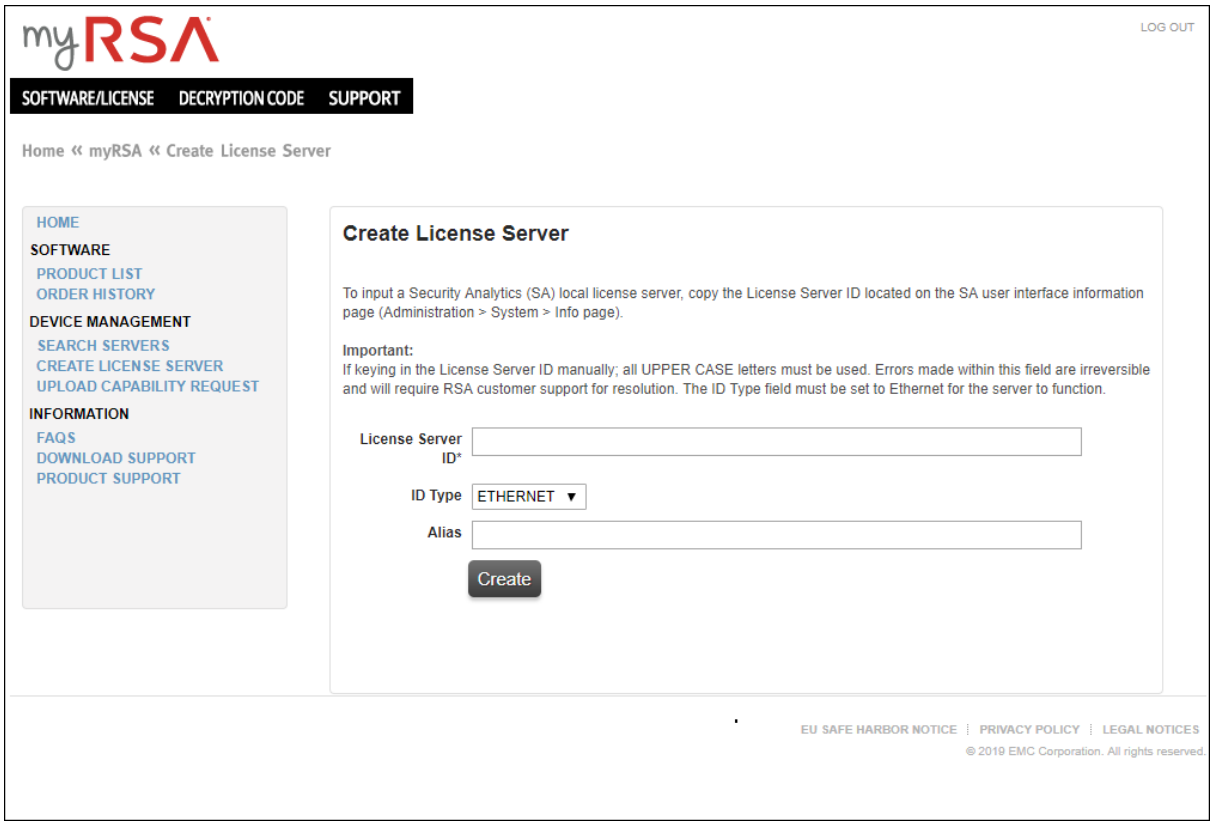


In the NetWitness entitlement process, you need to register the NetWitness Server and map the entitlements to the Local License Server (LLS). There are two methods of synchronizing NetWitness with myRSA: online and offline.

Note: By default NetWitness is configured to synchronize with myRSA at regular intervals hence manual synchronization is not required.

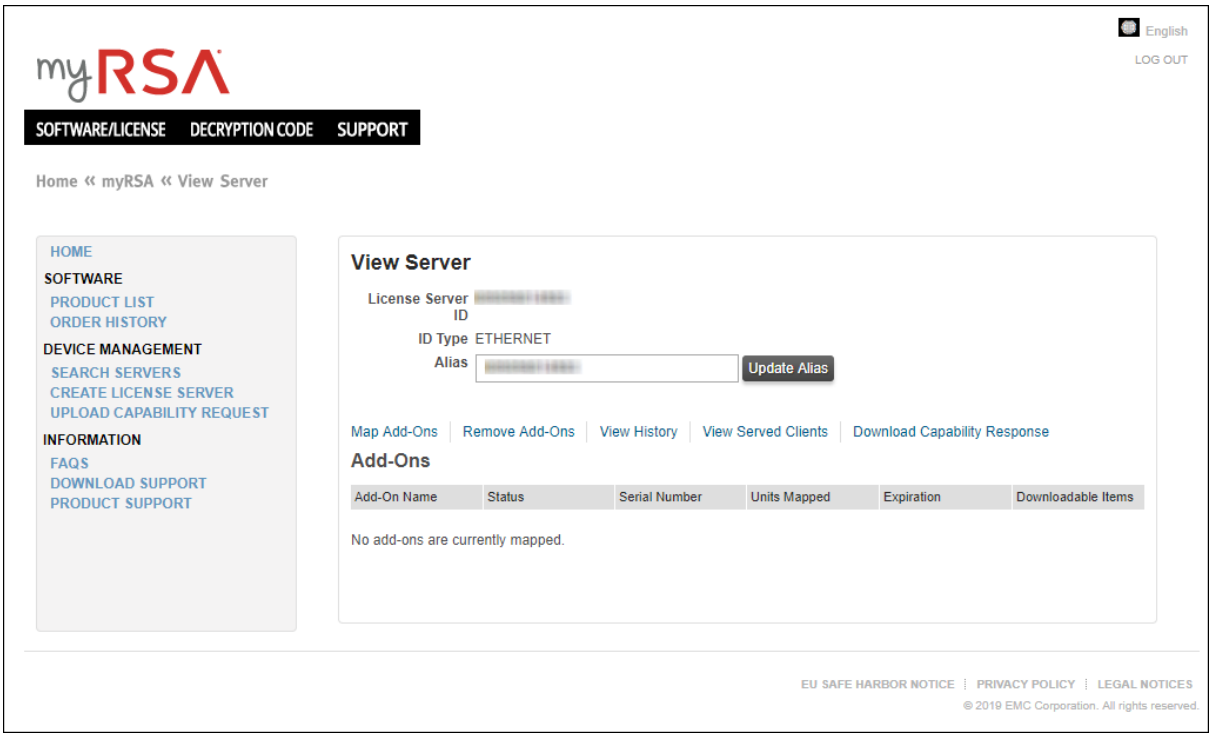


1. On the Sofware/License page, select the Order Location from the drop-down menu. The list of products, sales orders, and purchase orders are filtered and displayed.

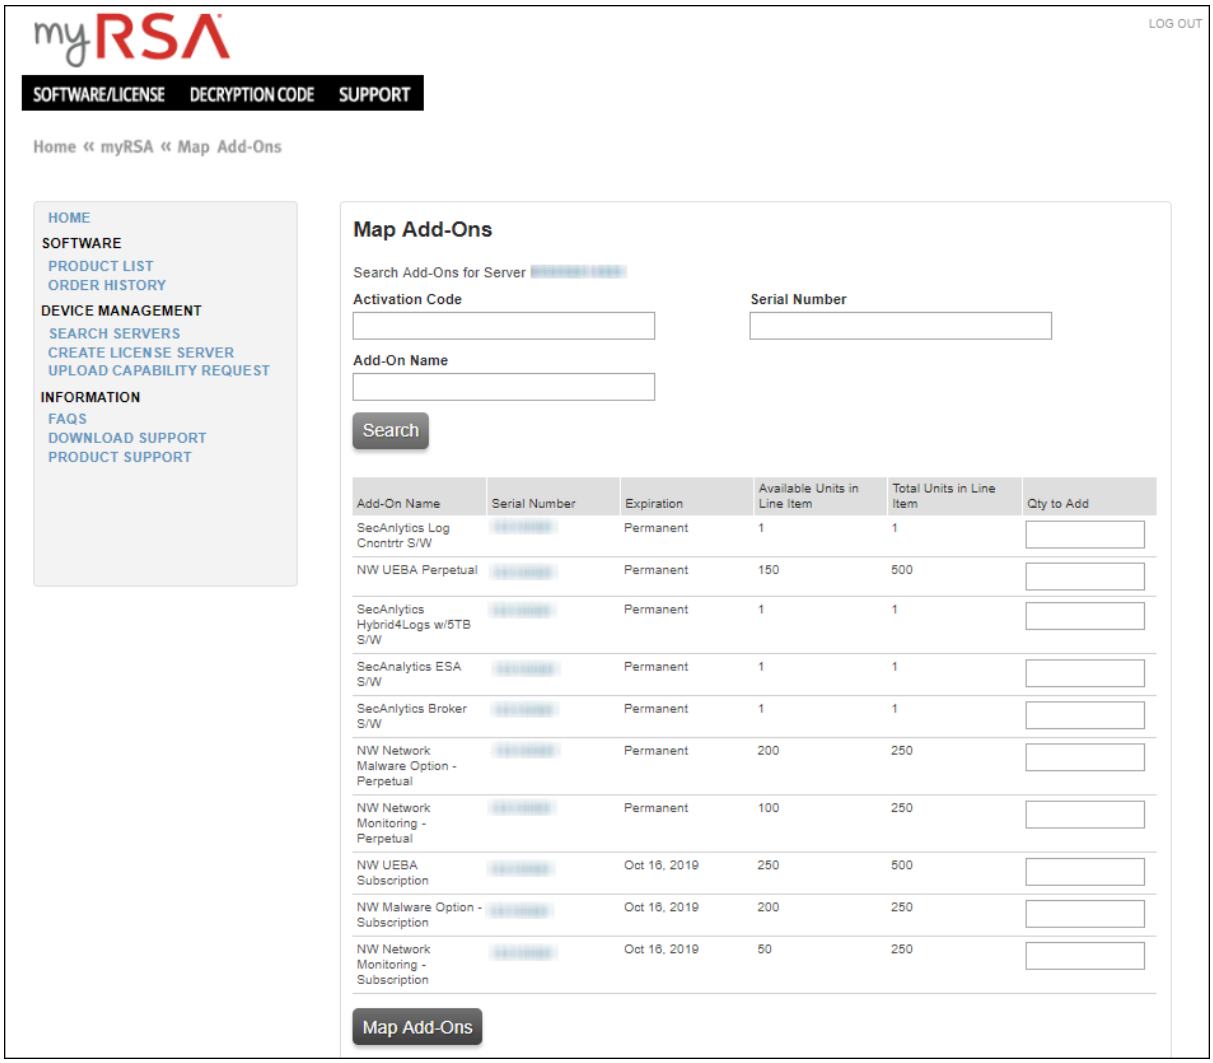


2. Click on a line item, select a version from the drop-down and select the **Licenses** checkbox.

3. Click **Download**.
The Order Detail page is displayed.



4. Click **Create License Server**.



5. Complete the following fields:
   - Copy or enter (in uppercase letters) the License Server ID in the License Server ID field.
   - In the **ID Type** drop-down, select **ETHERNET** (the default value).
   - In the **Type** drop-down, select **Ethernet** (the default value).
   - (Optional) In the **Alias** field, type an alias to your Appliance ID.
6. Click **Create**.

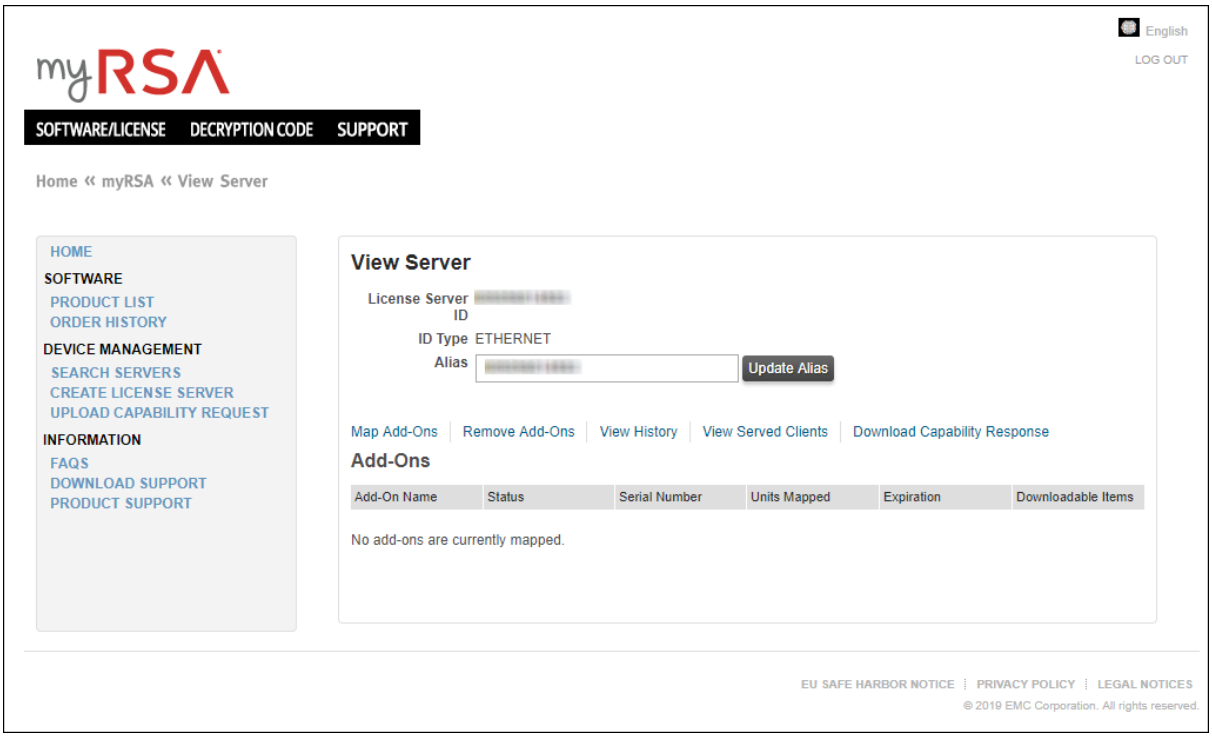
   The View Server page is displayed.

7. Click Map Add-Ons.

   The Map Add-Ons page is displayed.

8. After you have registered the license server and viewed the license details, you must map the entitlements. For more information, see Map Entitlements .

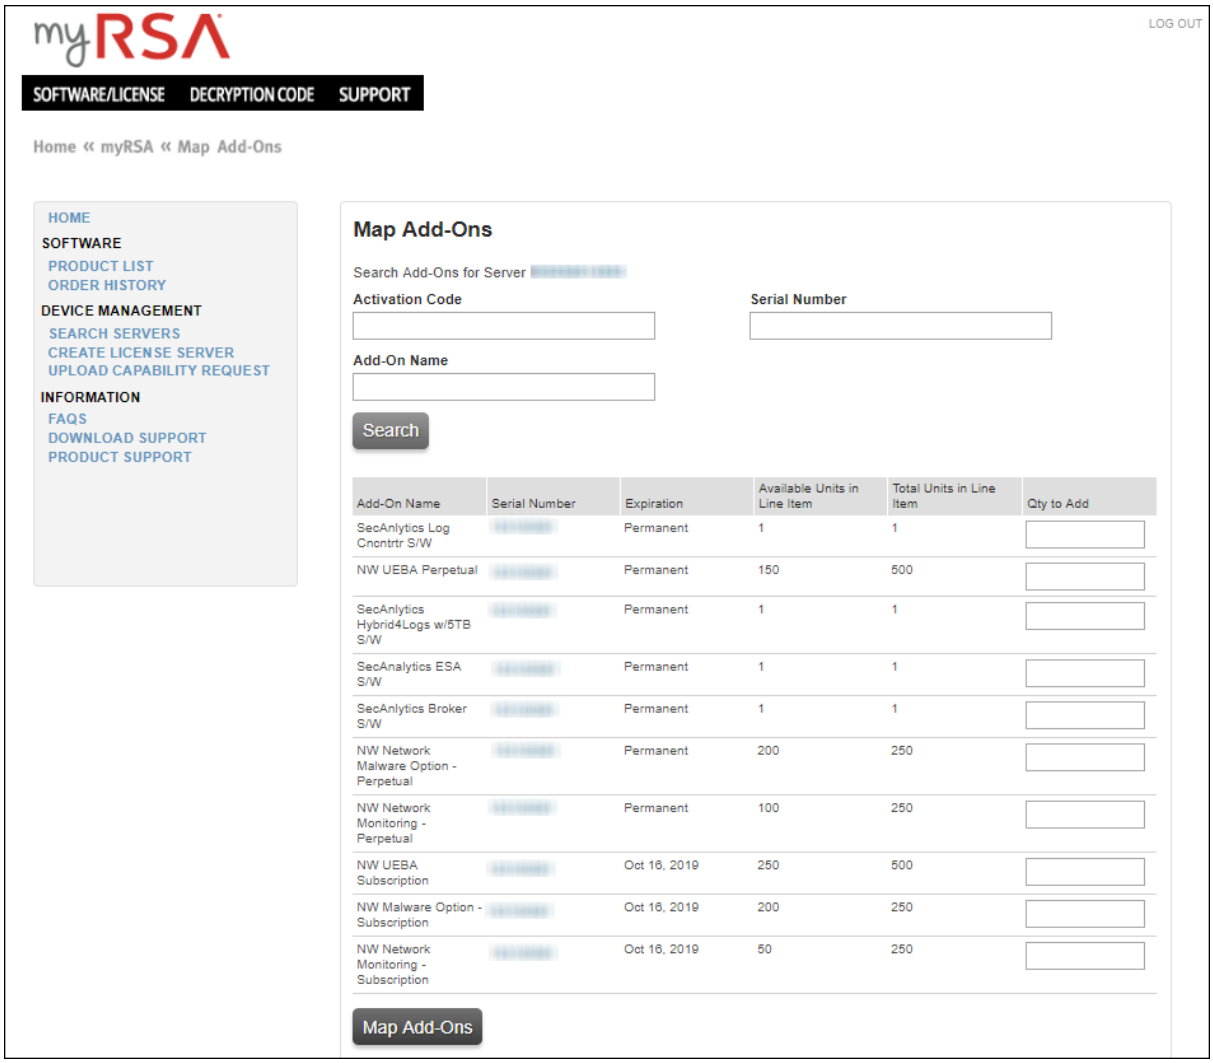
Note: By default NetWitness host is configured to synchronize with myRSA at regular intervals and also a designated nameserver (DNS). No action is required.



Note: In a multiple NetWitness deployment where the services are connected to both primary and secondary NetWitness hosts and the services are licensed only with the primary NetWitness, a license expiry message is shown for the same services on the secondary NetWitness. You can ignore the message and continue using the product.

Map Entitlements

Mapping entitlements involves choosing the quantity of available entitlements to pull to the NetWitness Server during synchronization.



To map appliance entitlements to the server:

1. Log in to myRSA.
2. Click on the **SEARCH SERVERS** and then click on the License Server ID to view the entitled Server Details.

3. Click **Map Add-Ons**s.

   The Map Add-Ons page is displayed.

The Add-On table lists all entitlements that are available for your account. The table has a row for each NetWitness product entitlement, with the following information:

- **Add-On Name**: The name of the entitlement; for example, SMC Concentrator or SMC Decoder.
- **Serial Number**: The serial number associated with a product.
- **Expiration**: For licenses that are not permanent, the expiration information is displayed. The value in this field is a specific date (for example, Oct 6, 2019) or a time range (for example, 90 days). If the value is a time range, the expiration period begins when the add-on is mapped to a server.
- **Available Units in Line Item**: The quantity of entitlements currently available for that license. This quantity is the difference between the Total Units and the entitlements that have been mapped to a NetWitness Server for licensing.
- **Total Units in Line Item**: The total quantity of entitlements tied to a specific license.
- **Quantity to Add**: The number of entitlements for a specific license.

4. To designate the quantity of entitlements to map to the NetWitness Server from a license, type a quantity in the **Units to Configure** column.
5. Click **Map Add-Ons**.

   The View Server page displays a message indicating that the entitlements were successfully mapped to the NetWitness Server.

   Entitlements are now dedicated and set aside from an accounts pool. The message **Waiting to add to appliance** is displayed in the **Status** for each entitlement. The entitlements are not yet synchronized with the server.
6. (Optional) If you want to add more entitlements, use the **Map Add-Ons** option.
7. (Optional) If you want to remove entitlements, use the **Remove Add-Ons** option.

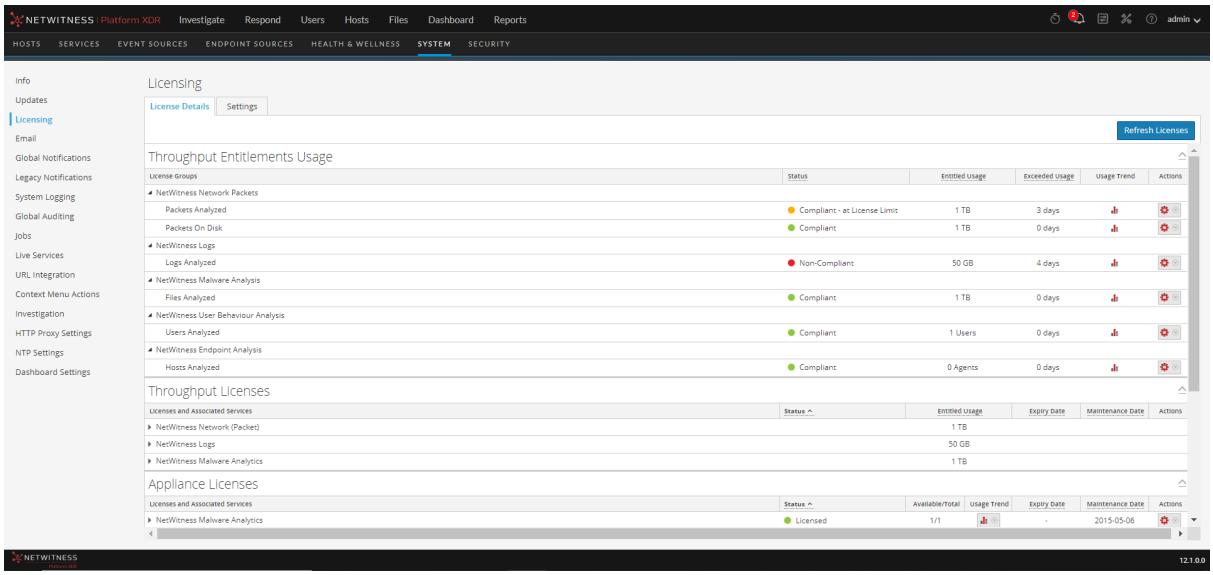
Now you can synchronize and pull down the mapped entitlements to the NetWitness Server

View Current Licenses

After you have completed the license process, you can view the current licensing status in the NetWitness UI.

Each NetWitness Server is a license server providing capabilities to entitle services connected to it. To make entitlements available for licensing services, the entitlements must be mapped to the Local License Server (LLS) on the NetWitness Server.

Note: If licensing a hybrid system, which has a Concentrator and Decoder on the same appliance, each component must be licensed separately.



View and Manage Licenses

In NetWitness, you can view and manage available licenses.

To view the licenses that are available on this instance of NetWitness:

1. Go to  **(Admin) > System.**
2. In the options panel, select **Licensing**.

   The **License Details** tab is displayed.

Each license is listed in the grid by license type. Information includes the status of the license indicated using color-coded circles and the related information.

Register the Server (Offline Capability Request)

NetWitness manages licensing through a Local License Server (LLS). Each client appliance is shipped with an installed LLS. This topic provides instructions for offline synchronization of the Local License Server (LLS) with the online repository. For more information on the functional description of the LLS, see Entitlement Capability Implementation.

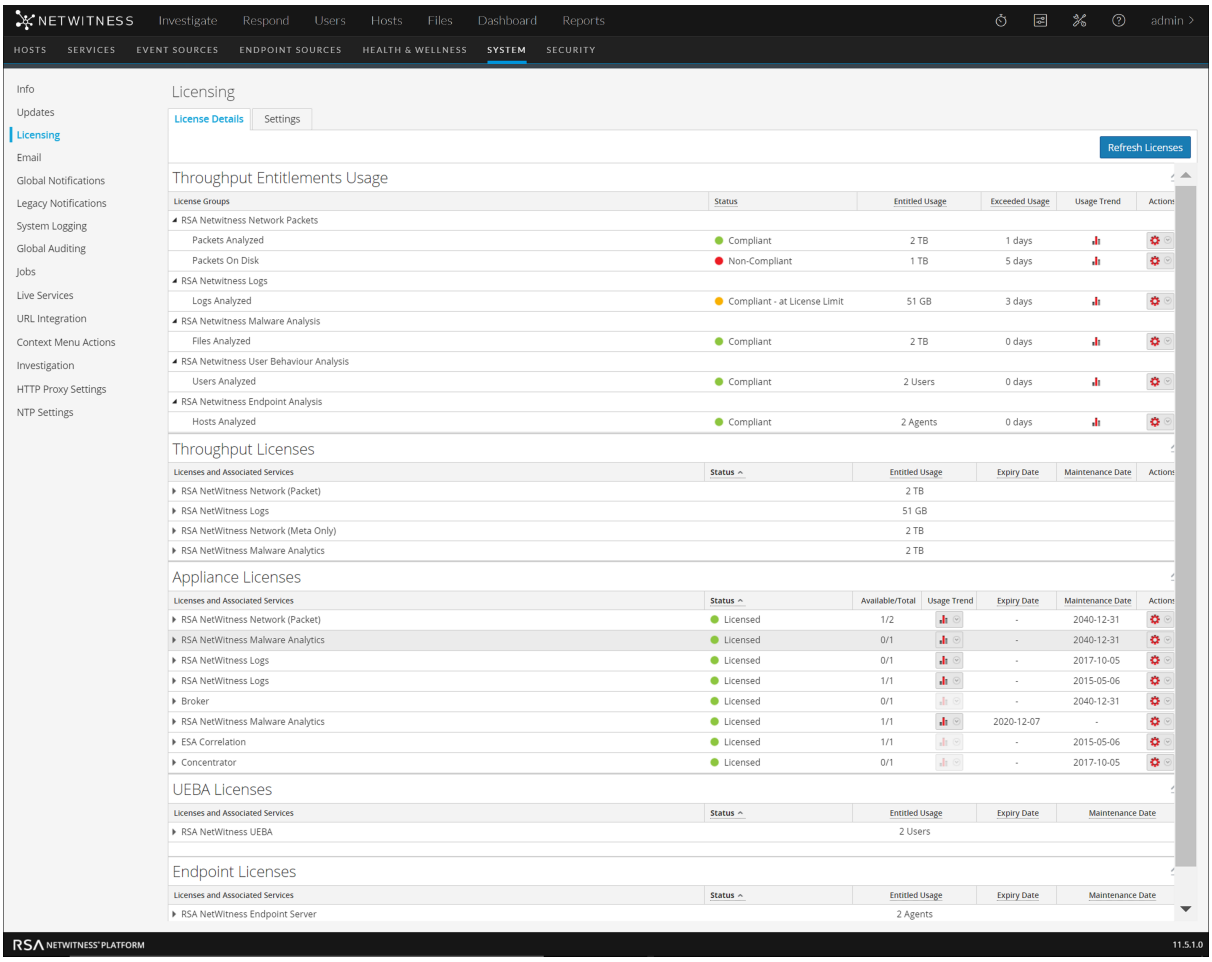
If you are unable to register the NetWitness Server online, you can download an offline capability request in NetWitness and upload that binary request to the myRSA Portal. If the NetWitness Server is not connected to the Internet, you can perform offline synchronization of entitlements through the View Server page in myRSA.

Prerequisites

Before implementing the NetWitness Platform entitlements capability offline, ensure the following

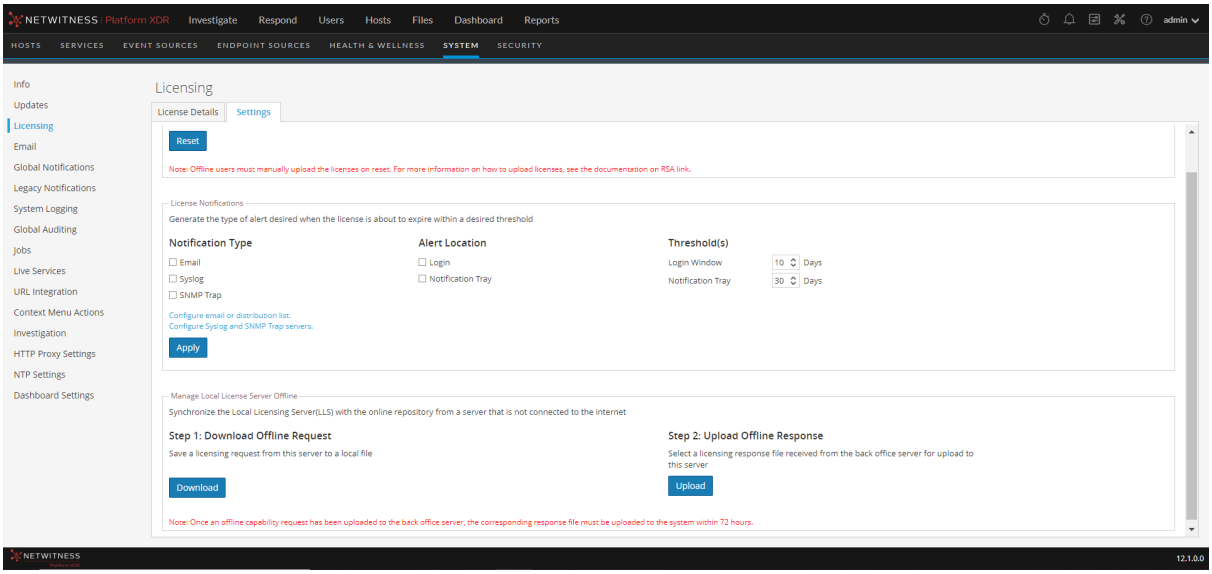
- The NetWitness Server is registered to myRSA (https://my.rsa.com/) and entitlements are mapped. Internet access is not required for offline synchronization.
- An Offline Capability Request has been downloaded from the NetWitness UI to be uploaded to myRSA.
- An Offline Response has been uploaded to NetWitness that was received from myRSA within 24 hours.

Here is a workflow that describes how to use the offline capability to acquire the licenses from myRSA and view them.



Download an Offline Request for Submission to myRSA

To register the server using an offline capability request:



1. Go to  **(Admin) > System**.
2. Click **Licensing**.

   The License Details page is displayed.

3. Select the **Settings** tab.

   The Settings page is displayed.

4. In the **Step 1. Download Offline Request** panel, click **Download**.
   A file called **OfflineCapabilityRequest.bin** is downloaded to the local system.
5. Login to the myRSA Portal at https://my.rsa.com/ with your user credentials.
6. Click on a service which needs to be licensed.

   Under **Device Management**, click **Upload Capability Request**.

   The **Upload Capability Request** dialog is displayed.

7. Click **Choose File** and browse the local file system to find the file downloaded from the NetWitness Server. Select **OfflineCapabilityRequest.bin**.

   The filename is displayed next to the **Choose File** button.
8. Click **Send**.
   The license data in a .bin file format is downloaded. The .bin file contains the data you entered as well as information about any entitlements that have been added to the NetWitness Server. If the server has just been added, there are no entries under **Add-Ons**. The server is registered and you can now map entitlements as described in the following sections.
9. After you download the .bin file from myRSA, login to NetWitness UI to upload the .bin file on the Settings page. For more information, see Upload an Offline Capability Response to NetWitness Platform.

Upload an Offline Capability Response to NetWitness Platform

If the NetWitness Server is not connected to the Internet, you can perform offline synchronization of entitlements through the View Server page in myRSA. To upload an offline capability response (**response.bin**) file saved to the local file system from myRSA:

1. Follow the steps 1 to 3 mentioned in the Download a Capability Request for Submission to myRSA procedure.
2. Login to the NetWitness user interface.
3. Go to **(Admin) > System** > **Licensing** > **Settings** tab.
4. In the **Upload Offline Response** section, click **Upload Response**.

   A dialog to upload the file is displayed.

5. Browse and select the **response.bin** file so that it is displayed in the Upload File (bin) field.
6. Click **Upload**.

   The entitlements are uploaded to NetWitness and the licenses added to the grid in the **Licensing Details** tab. They are available for licensing appliances.

   After you have uploaded the entitlements, you can verify the synchronization by performing any one of the following:

   - To view results in NetWitness, go to **(Admin) > System**>**Licensing** > **Licensing Details** tab. The individual product entitlements that have been pulled down to NetWitness are displayed in the **Available/Total** column.
   - Within the myRSA interface, you can see the status for entitlements changed to **In Sync**.

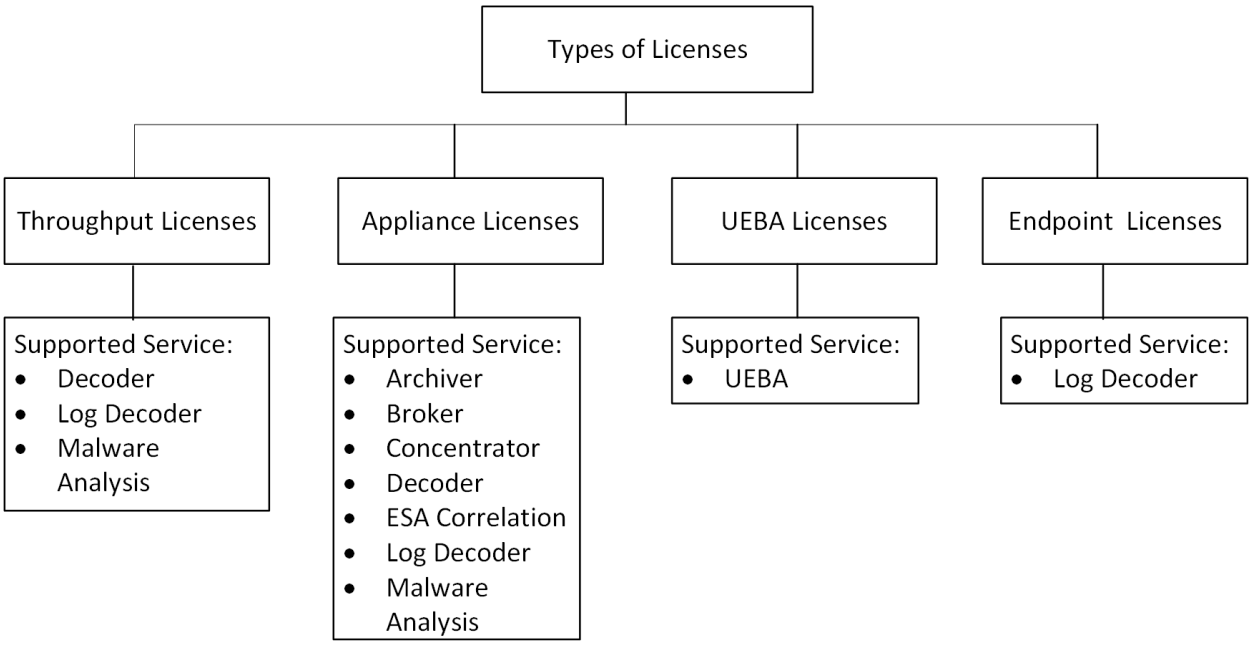
Refresh Licenses

When a new license is added, to map the view with the new license, click **Refresh Licenses.**

Refreshing your licenses performs the following behind-the-scenes tasks:

- Restarts the LLS server to ensure the latest licenses are pulled down from the central Flexera server.
- Associates any unlicensed service with a valid license (if available).
- Replaces expired or Out-of-the-Box license with valid licenses (if available).

License Types



After you have installed the NetWitness software and the required services, you need to acquire the relevant licenses for the each of the services or a group of services based on your requirements. NetWitnessentitlement uses a trust-based licensing model. Appliances continue to function as usual even when the license is out-of-compliance.

Choosing a License Type

The type of license you choose is based on your network requirements. The following types of licenses are available in RSA NetWitness:

- Throughput License
- Appliance License
- UEBA (User and Entity Behavior Analytics)
- Endpoint License

Here is a chart, followed by a description of each license type available for the NetWitness Platform products and services.

Throughput Licenses

Throughput license are based on the amount of data used per day for logs (SIEM), or network (packets) or malware.

The throughput per day is measured in Gigabytes per day for logs, and in Terabytes per day for packets. The total amount of throughput is selected based on the total amount of throughput per day that is being licensed across your entire enterprise deployment of NetWitness Platform. This license is measured as follows:

Service	Unit of Measurement	Increments	License Duration
Network Decoder	Terabytes (TB) per day	1 TB	Subscription or perpetual
Log Decoder	Gigabytes (GB) per day	50 GB	Subscription or perpetual
Malware	Terabytes (TB) per day of Files Analyzed by Malware Analysis	1 TB	Subscription or perpetual

Note: In version 11.5 and later, NetWitness Platform introduced Network Meta-Only license in addition to the Network Full Packet license.

Network Full Packet License captures, analyzes, and stores packet payloads and metadata and allows users to retain the packet payload for analysis or for session reconstruction. Network Full Packet License measures the bytes analyzed and the bytes written to the disk for Network Packets.

Network Meta-Only License captures and analyzes packet payloads and discards the packet payload data after analysis. Using this license, NetWitness Platform can be deployed in an environment where full packet capture is not required. This helps to optimally manage the storage space, and easily detect threats without the need to retain the full payload of the sessions. Network Meta-Only License measures the bytes analyzed for Network Packets and can be used with or without the Network Full Packet License.

When customers have both - Network Meta-Only License and Network Full Packet Licenses, the entitlement is aggregated and measured against the bytes analyzed for Network Packets. However, the entitlement for bytes written to disk for Network Packets will continue to be measured against the Network Full Packet Licenses. The following table is an example of how the license is used and analyzed.

Available Licenses	Network Full Packet License	Network Meta-Only License	Network Packet Bytes Analyzed	Network Packet Bytes Written to Disk
10TB of Network Full Packet	10TB	0TB	10TB	10TB
10TB of Network Meta-Only	0TB	10TB	10TB	0TB
10TB of Network Full Packet 5TB of Network Meta-Only	10TB	5TB	15TB	10TB
5TB of Network Full Packet 10TB of Network Meta-Only	5TB	10TB	15TB	5TB

For more information on the status of your license, usage and out of compliance licenses, see About Out-of-Compliance Banners.

Appliance Licenses

NetWitness Platform supports the Appliance license, which is applicable to all hosts that require a license. Other services do not require a license. Appliance licenses are measured as follows:

- Services are licensed automatically if you have a valid appliance based license for a specific service to be licensed.
- Appliance licenses can be purchased as a perpetual license that does not expire and will have a maintenance contract. If you purchase a subscription license, then it will expire if you do not renew the contract.

User and Entity Behavior Analytics Licenses

NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is based on the number active of users.

NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). UEBA monitors the number of active users from the previous day and sends it to the licensing server. The entitlement is measured for logs and endpoint events for the number of active users and is checked against a user id. If a threshold is identified in a calendar month an appropriate banner is displayed. For more information on banners, see About Out-of-Compliance Banners.

Note: There is no change in the license for multiple UEBA servers, as the license is based on the number of users monitored by UEBA.

Endpoint Licenses

Endpoint license are entitled based on the number of active agents deployed.

There are two types of agents:

- **Advanced Agents**: The license for these agents is based on the number of advanced agents in your deployment. A 90-days trail license period is provided. After the 90-days trial period, a zero MB and zero Agent license is applied to the Log Decoder service and Endpoint service in the NetWitness Endpoint Log Hybrid. Once an Endpoint license is applied any Archivers, Brokers, Concentrators, and ESA are automatically licensed as a result. An usage exceeded banner is displayed when the license goes out-of-compliance in the following scenarios:

  a. If the number of active agents exceeds the number of licensed agents

  b. If the Endpoint Subscription is about to expire in near future or has already expired.

  For example, if you have purchased a license for 50,000 agents and if the number of agents exceeds more than 50,000, the banner is displayed.

  Or, if you have purchased a license for 50k agents but have mapped the entitlements for only 10k agents on myRSA, an out-of-compliance banner is displayed when your usage exceeds these 10k active agents.

- **Insights Agents** - There is no license required for these agents if they are used to collect only endpoint data.
- **Log Collection with Endpoint Agents** - All Endpoint agents (Advanced or Insights) can forward Windows Log data only to a licensed Log Decoder (or Hybrid). Windows Logs sent to a licensed Log Decoder (or Hybrid) will count against either the applied Throughput or Appliance license. Logs may be retained in the NetWitness Endpoint Log Hybrid as long as a Log (SIEM) Throughput license with available capacity is available. In either case, a license for Logs is required, irrespective of the Insights or Advanced agent.

NetWitness Endpoint **4.4.0.x License**

If you have a **NetWitness Endpoint** 4.4.0.x license, you can use the same amount of license on NetWitness 11.6. For example, if you have purchased a 50,000 license for NetWitness Endpoint 4.4.0.x, you will get a 50,000 license on NetWitness Endpoint 4.4.0.x as well as on NetWitness 11.6. For more information on how to get a license for **NetWitness Endpoint 4.4.0.x**, see License for NetWitness Endpoint 4.4.0.x Agents.

Out-of-the-Box Trial License

RSA NetWitness Platform comes with an OOTB 90-days trial license.

For Endpoint metered license, you will be provided with 0MB Log Decoder license. The 0MB license from the Log Decoder will be utilized after the 90-days trial period is complete. If you are still within the 90-days trial period and if you have an Endpoint Metered license, then the Log Decoder uses the remaining trial license. The Log Decoder will apply the 0MB license only after the trial license completed.

Configure License Support For Multiple NetWitness Servers

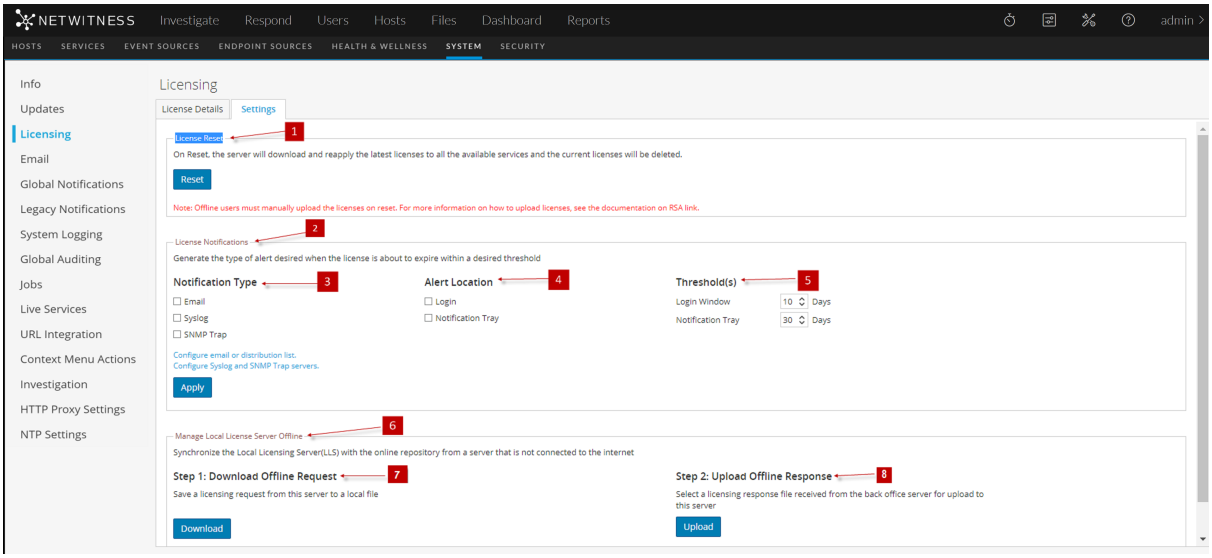
If you have multiple NetWitness servers deployed in your environment, and require license support, you must configure multiple Mac addresses.

To configure online:

1. Log in to the NetWitness Server console.
2. Navigate to /opt/netwitness/flexnetls.
3. Edit the local-configuration.yaml file and add the mac address of the back up or secondary host.
   For example, `backup-hostid: 685B3596A5F3` or `backup-hostid: "685B3596A5F3:785B3596A5F3"`.
4. Restart `systemctl restart flexnetls-RSALM`.
5. Obtain the instance details from `wget http://localhost:3333/api/1.0/instances` and set the `"failOverRole"` to `MAIN` to verify the failover.
   For example, `"failOverRole" : "MAIN"`.

To configure offline:

1. Perform the step 1 to step 6 from the online procedure .
2. Download the capability request from NetWitness UI.
3. Upload the request to FNO (myRSA).
4. Upload the response from FNO (myRSA) to the NetWitness UI.



Configure License Notifications

This topic provides instructions for configuring notification settings for the Local License Server (LLS). If you wish to receive alerts about the approaching license expiration date, you can configure NetWitness to send notifications. You can receive notification by email, syslog and SNMP. You can also view the notification during system log on and in the Notification Tray. You can also specify the number of days before expiration as a threshold for notification.

Note: In the Analyst UI, the license notifications will not be displayed in the notification tray or login window when the license goes out of compliance or when the license expires. This is displayed only on the Admin UI.

To configure the notification:

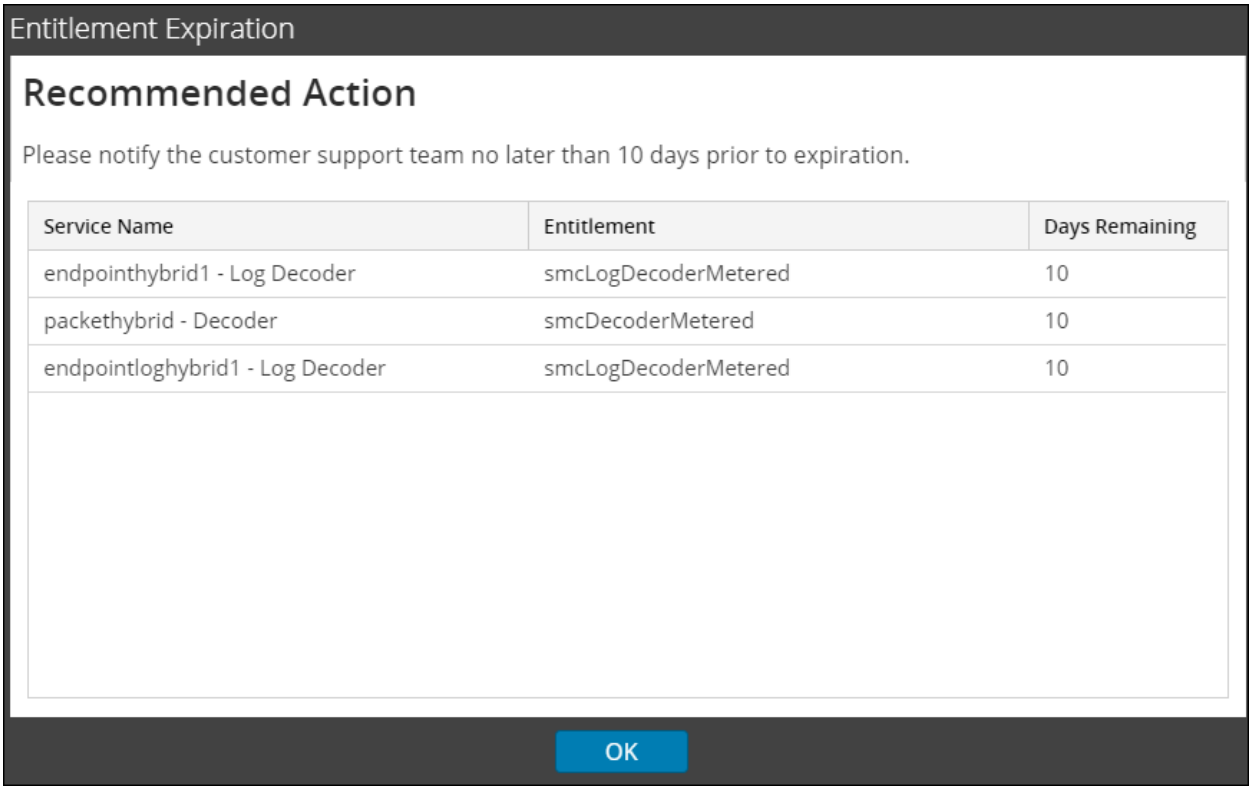
1. Go to **(Admin) > System**.
2. Select **Licensing**.
3. Select the **Settings** tab.

4. Select each of the methods for NetWitness to use when sending a notification about the license status.
   a. To receive a notification at log on, select **Login** and specify the number of days before the license expires that you want to receive notification in the **Login Window Threshold** field.
   b. To receive a notification in the Notifications tray, select **Notification Tray** and specify the number of days before the license expires that you want to receive notification in the **Notification Tray Threshold** field.
   c. To receive an Email notification to a configured distribution list, select **Email** and select **Configure email or distribution list**. The Email panel is displayed in a separate tab, and you can

configure notifications in the Email Server Settings section. Refer to the *System Configuration Guide* for further details.

d. To receive syslog notifications, select **Syslog** and click **Configure Syslog and SNMP Trap servers**. The System Auditing panel opens in another tab and you can configure the system settings.

e. To receive notifications through SNMP Trap, select **SNMP Trap** and select **Configure Syslog and SNMP Trap servers.** The System Auditing panel opens in another tab and you can configure the SNMP auditing settings.



5. Click **Apply Notifications**.
   The settings are saved and go into effect immediately.

About Out-of-Compliance Banners

Banners let you know the status of your license and usage compliance.

Note: To help customers transition seamlessly to Throughput license for their network (packet) usage, NetWitness Platform provides a 45 days grace period. So, on upgrading to 11.6, you will not see the Out-of-Compliance notification or banner for 45 days from the day of upgrade for any network license usage. If you upgrade from 11.5.1 or later to 11.6, the available balance of the unused grace period will be applicable after the upgrade. For example
• If the grace period of 20 of the 45 days is used post upgrade to 11.5.1 or later then customers upgrading to 11.6 will get the remaining 25 days of the grace period.
• If the grace period of 45 days is used post upgrade to 11.5.1 or later the customers upgrading to 11.6 will not have any grace period left.

When a license for a specific service is about to expire, an **Entitlement Expiration** message is displayed with the list of services about to expire.

After you log on, either a red or yellow banner may be displayed, based on the license issue:

- A red banner is displayed if your license has expired, or exceeded the allotted usage, or if the license has internal errors.

Note: A red banner cannot be dismissed and the license issue must be resolved.

- A yellow banner is displayed if the license is approaching expiration or the license is nearing the allotted usage. The banner can be dismissed by clicking the **Reject** button.

Here is an of example of how the license usage is calculated and a way that you can resolve the license issues:

- Contracted daily usage can be exceeded three times in a calendar month. The fourth spike puts the system in an out-of-compliance state. If you are able to keep your usage within compliance for seven consecutive days until the end of calendar month, the Out-of-Compliance Red banner disappears.
- For example, if the fourth spike occurs on November 23, 2019, the Grace Period ends on December 31, 2019 and the Out-of-Compliance Red banner disappears.
- The breach period starts immediately after Grace Period ends. However, if your deployment is in a breach state, you can bring the state back to normal by keeping the usage in a compliant state for seven consecutive days.

Note: Even when the Red banner is displayed, there is no loss of functionality, all NetWitness appliances continue to work with full functionality. All other functionality is included in the license (ESA, storage, and so on).

Troubleshoot Licensing

This topic provides information about possible issues that NetWitness users may encounter when setting up licensing in NetWitness. You can look up explanations of issues and their solutions. NetWitness notifies users of issues using the popup notifications and the system log as described in the "Troubleshoot NetWitness" topic in the *System Maintenance Guide*.

Out-of-Compliance Banners

Problem	Possible Causes	Solutions
Yellow and Red Out-of-Compliance Banners	• A service is not licensed. • A license has expired, or is due to expire within the next two weeks. • Usage exceeds entitled limit. • Usage is approaching entitled limit.	• Contact Customer Support to buy or renew your license. • Reduce usage or • Adjust contracted usage amount

Common Log and Configuration Files

When troubleshooting licensing, the following files contain information that may help to diagnose the problem. Specific conditions for searching the files are described in the troubleshooting tables.

On the NetWitness Server, run `wget` for the following files after you ssh onto the NetWitness Server:

- `http://localhost:3333/api/1.0/features`
- `http://localhost:3333/api/1.0/instances`
- `http://localhost:3333//api/1.0/hostids`
- `http://localhost:3333/api/1.0/capability_request`

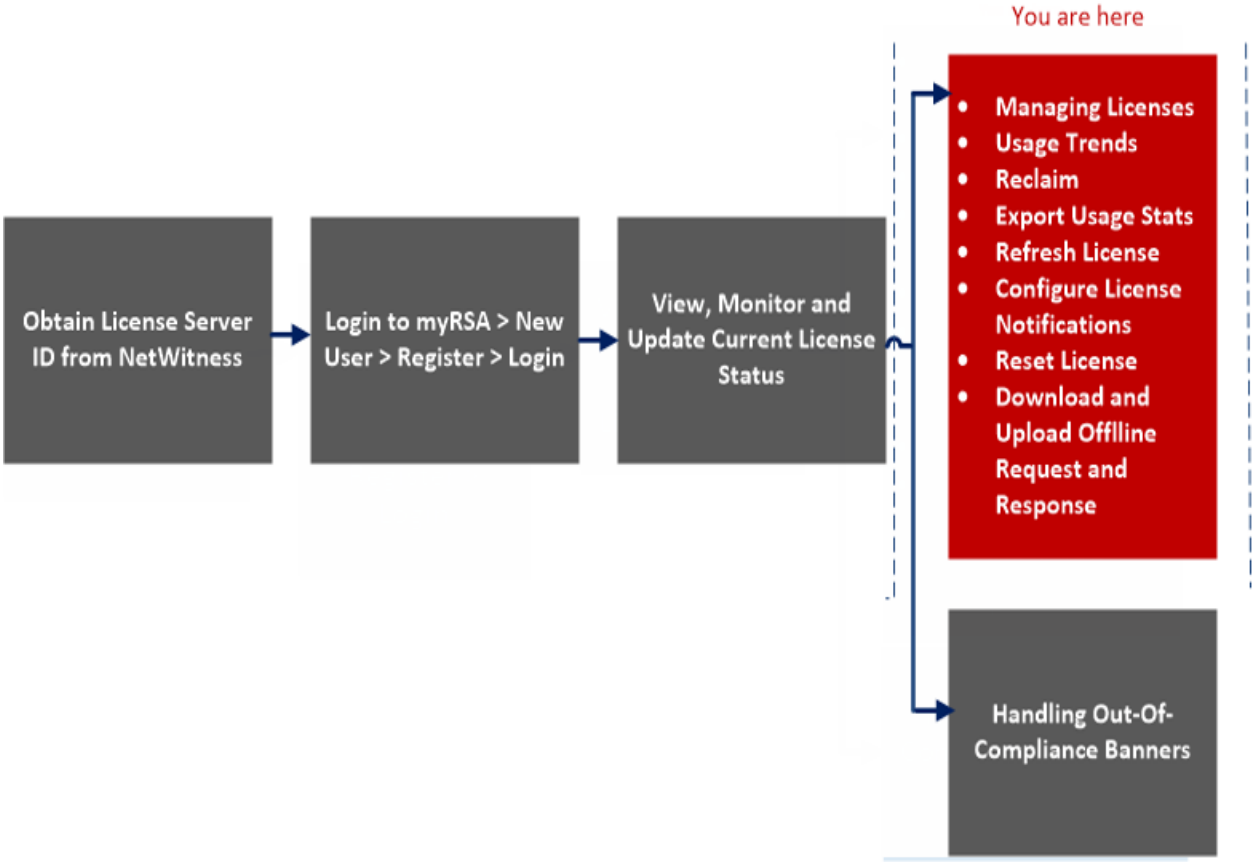
NetWitness Server Problems

This table lists possible problems with the NetWitness Server errors that can affect entitlements.

Problem	Possible Causes	Solutions
Some features have been mapped in the central Flexera server, but the NetWitness Server does not display them.	Ensure that the NetWitness Server is connected to the Internet.	To resolve the error execute a License Refresh as follows: 1. GSo to **(Admin) > Services > Licensing.** 2. In the License Details tab, click **Refresh Licenses**. **Note:** If the NetWitness Server is not connected to the Internet, try to synchronize offline. For more information, see Register the Server (Offline Capability Request)
NetWitness Platform Licensing page not showing any license information although there are services available.	Ensure that you have the required entitlements pulled down from the Central Flexera server.	To resolve the error execute a License Refresh as follows: 1. Go to **(Admin) > Services > Licensing**. 2. In the License Details tab, click **Refresh Licenses**.

Wrong License Mapping Issue

Problem	Possible Causes	Solution
Decoder license not available due to core appliances being removed from the NetWitness Server without releasing the license. Several core appliance licenses were not available for use.	Various possible causes.	Reset the license on NetWitness Server.



Problem	Possible Causes	Solution
Archiver DACs are not mapped to the license server with all other appliances' licenses.	Various possible causes.	1. Enter **1** in Quantity field to add for each license. 2. Select **Map Add-ons** at the bottom of the screen. 3. Click **Download Capability Request** and upload license to the Offline Capability Request in the User Interface under the **License** tab.
Two new appliances were installed: one Log Hybrid and one Log Archiver. Able to license the Log Hybrid, but the following error occurred when attempting to license the Archiver: "There is an issue with registering your product, please contact RSA Customer Support." Also, one of the Concentrators showed as a Trial license, and a separate Log Decoder showed as a Trial license when they should be licensed.	The new entitlements are not mapped to the license server.	Map add-ons to myRSA and upload the `.bin` file into the NetWitness User Interface.

License Details

This topic introduces the features of the System Licensing panel. NetWitness manages licensing through a Local License Server (LLS). Each client appliance is shipped with an installed LLS.

Workflow

Note: On initial start up, the usage shown in the Licensing page displays zero usage for the initial one hour.

Quick Look

The following table describes the features of the License Details tab.

1	**Refresh Licenses**:Refreshes and maps the new licenses.

2	Displays the following details of the Throughput license or licenses.
	• **License and Associated Service** - Displays the license and the services assigned to it.
	• **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit.
	• **Entitled Usage** - Displays the entitled usage for aggregate as well as individual services .
	• **Exceeded Usage** - Displays the number of days the usage exceeded the entitled usage in the last 30 days for each individual service.
	• **Usage Trend** - Displays the trend of how the license usage has been for a period of time for aggregate as well as individual services.
	• **Expiry Date** - Displays the expiry date of the customer subscription contract.
	• **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
	• **Actions** - Displays the Licensing Actions button that offers the following options:
	  • **Export Usage Stats**: Exports license usage statistics for the selected service or license.
	  • **Reassign to Another License**: Reassigns an extensively used Throughput license to another unused Throughput license. This is applicable only for Throughput and Appliance license.

3	Displays the following details of the Appliance license or licenses. • **License and Associated Service** - Displays the license and the services assigned to it. • **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near

Usage Limit, and Within Usage limit.

- **Available/Total** - Displays the number of available license and the total number of licenses.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time for aggregate as well as individual services
- **Expiry Date** - Displays the renewal date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Export Usage Stats**: Exports license usage statistics for the selected service or license.
  - **Reassign to Another License**: Move the license from Appliance to Throughput license.
  - **Reclaim**: This option gets activated when any appliance service is down. When you click **Reclaim** the license becomes available in the pool of the specific license service. This is applicable only for Appliance license.

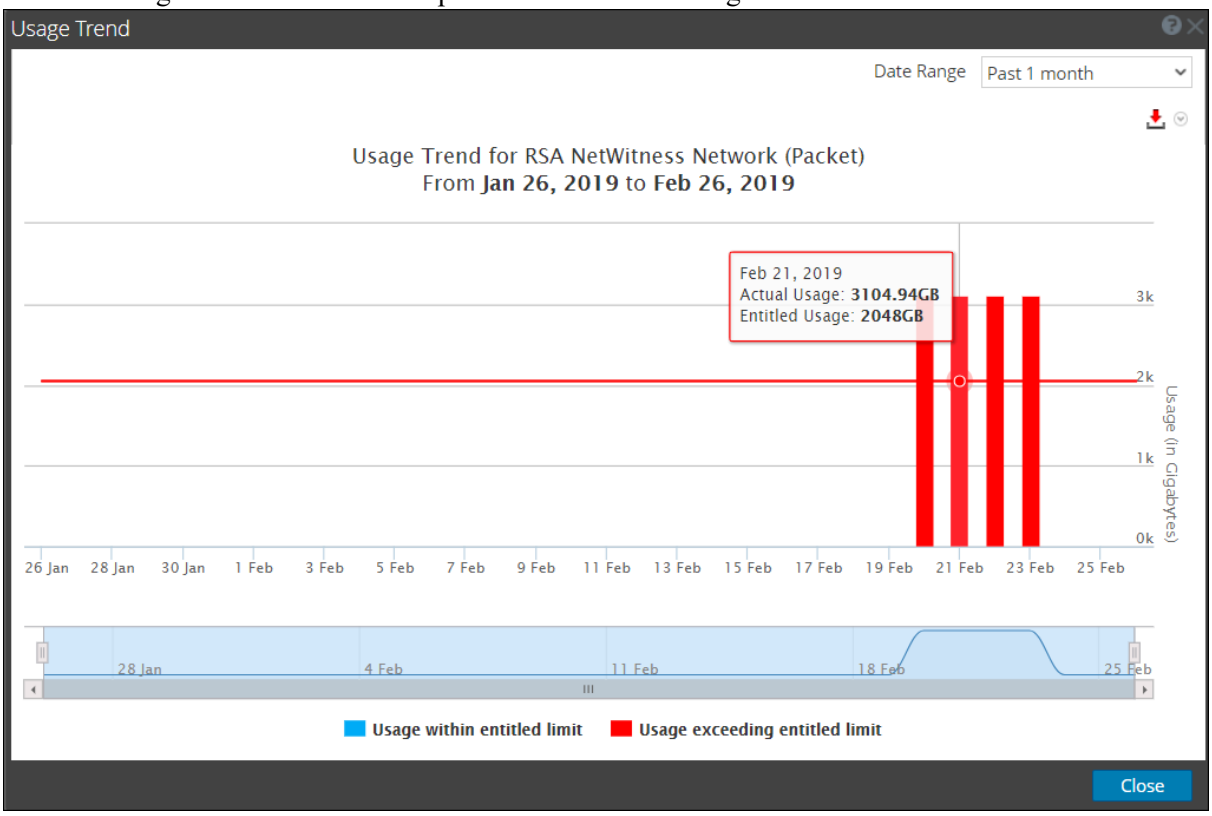
4 Displays the following details of UEBA license or licenses.

- **License and Associated Service** - Displays the license and the services assigned to it.
- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit.
- **Entitled Usage** - Displays the number of entitled users.
- **Actual Usage** - Displays the daily active users.
- **Exceeded Usage** - Displays the number of days the usage exceeded the entitled usage in the last 30 days for each individual service.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time for aggregate as well as individual services
- **Expiry Date** - Displays the renewal date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Sort Ascending**
  - **Sort Descending**

5 Displays the following details of Endpoint license or licenses.

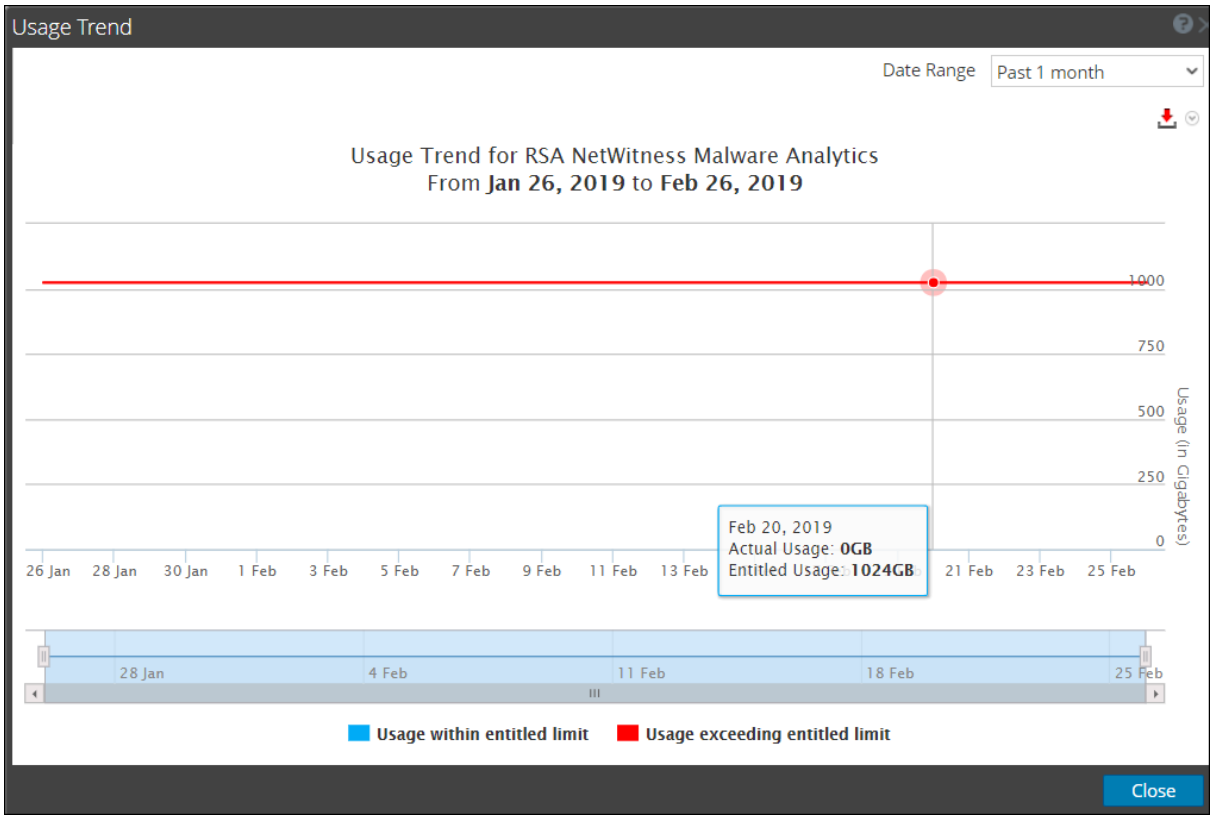
- **License and Associated Service** - Displays the license and the services assigned to it. For example, Endpoint Hybrid or Endpoint Log Hybrid.
- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit.
- **Entitled Usage** - Displays the users of the entitled agents .

- **Actual Usage** - Displays the number of daily active agents .
- **Exceeded Usage** - Displays the number of days on which the actual number of agents exceeded the entitled threshold.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time.
- **Expiry Date** - Displays the renewal date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Sort Ascending**
  - **Sort Descending**



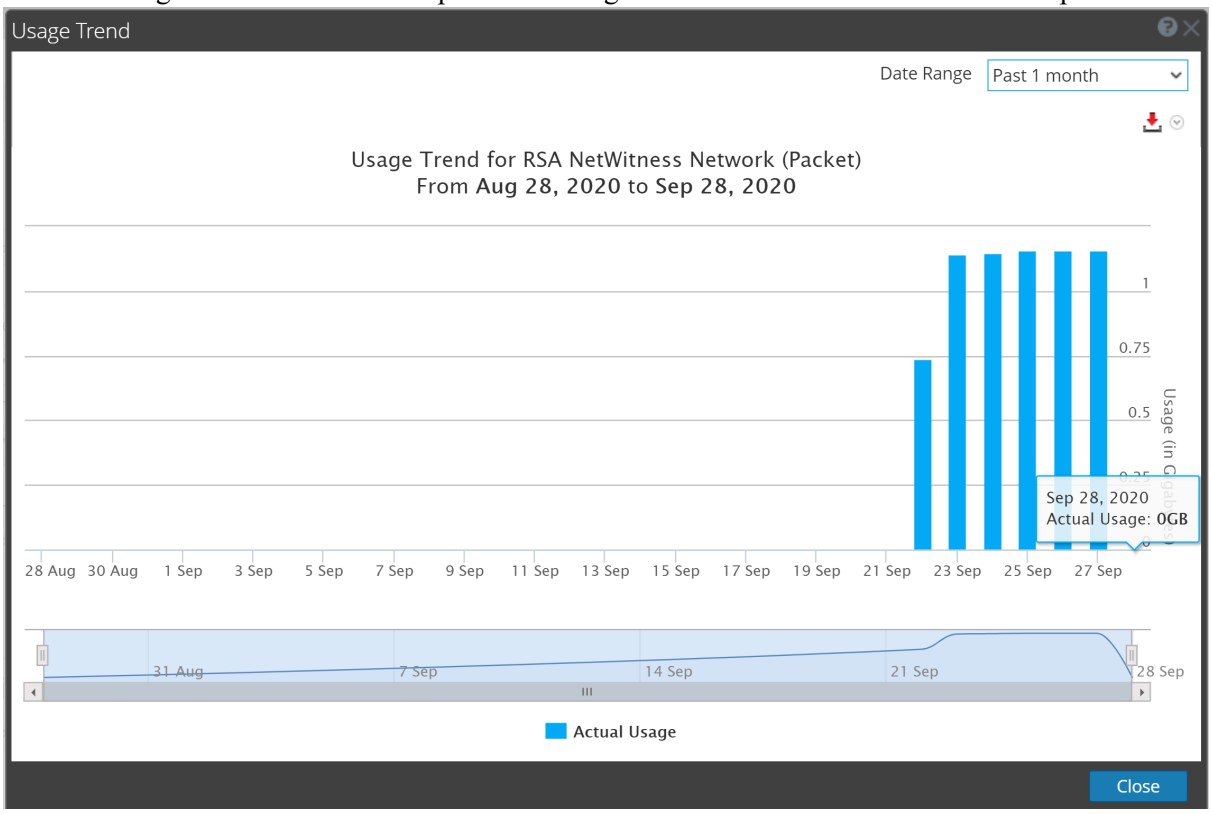
Usage Trends

You can view the usage trend for aggregate licenses as well as individual licenses. The data is displayed for each day. When you click the usage trend icon, it opens a new window and displays the usage data as a chart. The user can use this data to analyze the license usage in the deployment.



To access this view:

1. Go  (Admin) > **System** and select **Licensing**.
   The Licensing page is displayed with the License Details tab opens.
2. Select a service or license and click the  icon under the Usage Trend column.
   The Usage Trend window is displayed.



The following screenshot is an example of the Exceeded Usage Trend.

The following screenshot is an example of Within Limits Exceeded Usage Trend.

Usage within entitled limit
Usage exceeding entitled limit
Close

The following screenshot is an example of the Usage Trend chart for a license with multiple services.

The threshold limit is indicated as a horizontal red-dotted line across the chart. When actual data usage exceeds the entitled daily usage, those days are indicated by red colored bars.
The chart can be generated to collect data for 1 month, 3 months, 6 months, 12 months or custom date range.

These charts can be exported in CSV, and PDF formats by clicking the icon.

Note: The maximum range for which trend can be viewed is 12 months. The pan-zoom bar at the bottom of the chart can be used to narrow the chart to a smaller time range for better visibility in that range.

If the entitled limit exceeds the usage limit then an appropriate out-of-compliance banner is displayed. For more information, see About Out-of-Compliance Banners.

Reassign Service Licenses

You can move service between licenses only if a similar service license is available.

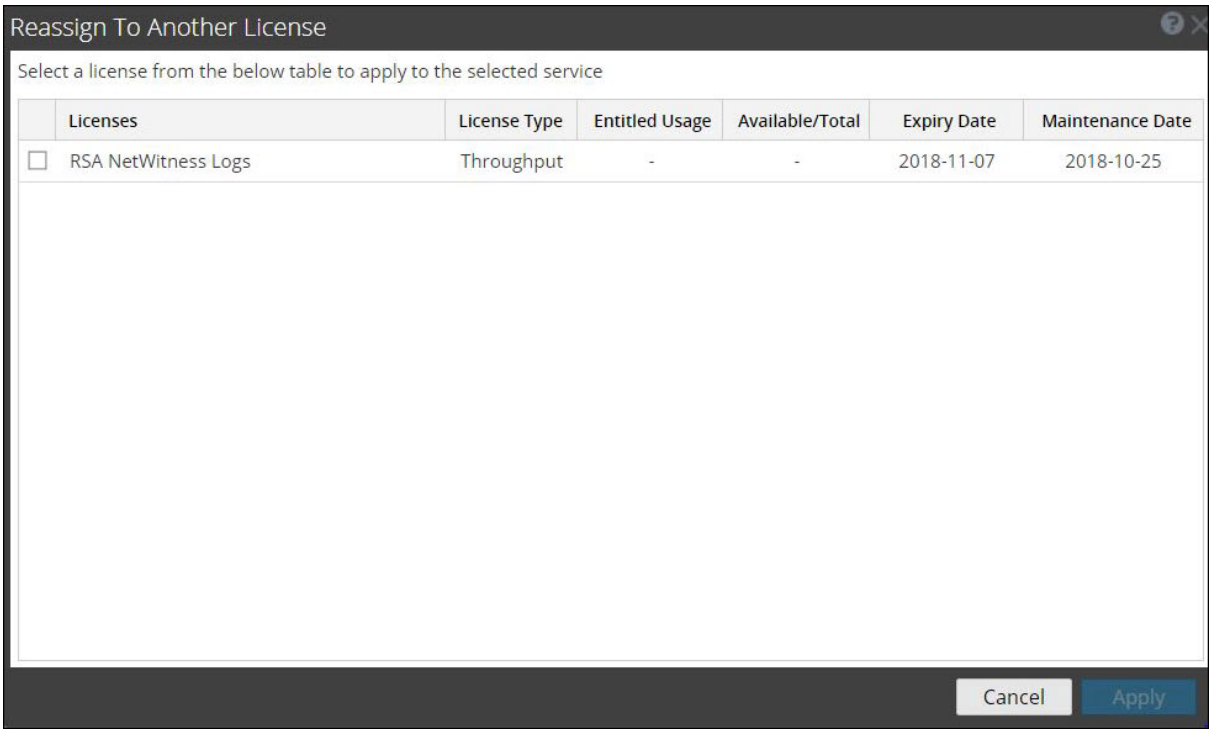
You can move the services between the following licenses.

- Throughput License to Throughput License
- Throughput License to Appliance License
- Appliance License to Throughput License
- Appliance License to Appliance License

Note: If you want to change the licenses by moving between throughput and appliance, you can do this by selecting the license under the actions of each license. Trail licenses cannot be moved.

You can move the licenses for following reasons:

1. If the subscription based license has expired
2. If there are any unused available license for any service
3. If you want to reduce the usage of the service



To access this view:

1. Go  **(Admin) > System** and select **Licensing**.

   The License Details tab is displayed.

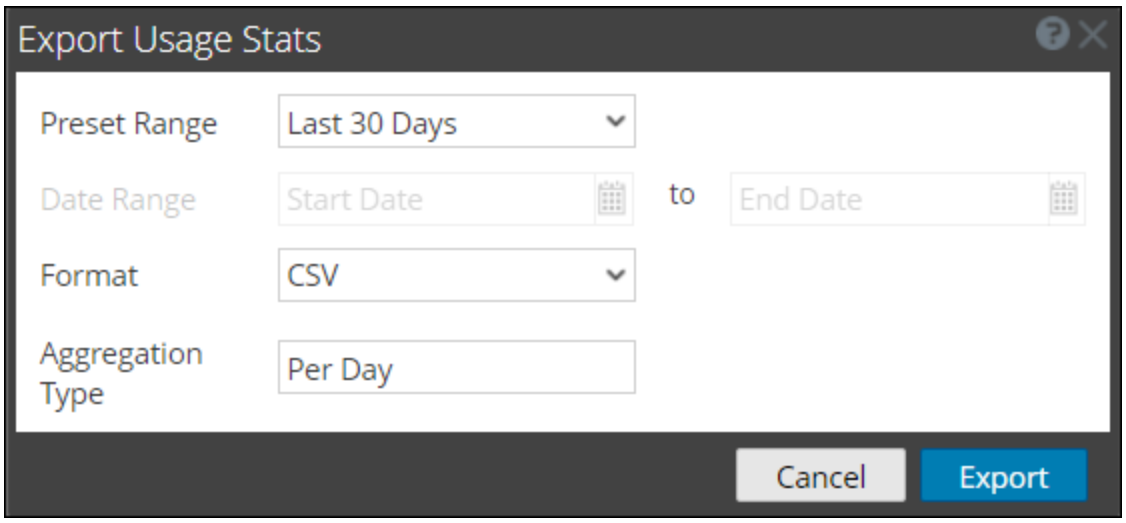
2. Select a service of which you want to move the license.
3. Click  , and select the **Reassign to Another License** option.

   The Reassign To Another License dialog is displayed with a list of the available licenses that can be moved.

4. Select a license to be applied for the selected service.
5. Click **Apply**.

Note: The above procedure can be used to move both Throughput Licenses and Appliance Licenses. However, the UEBA and Endpoint licenses cannot be moved.

View and Export Usage Stats



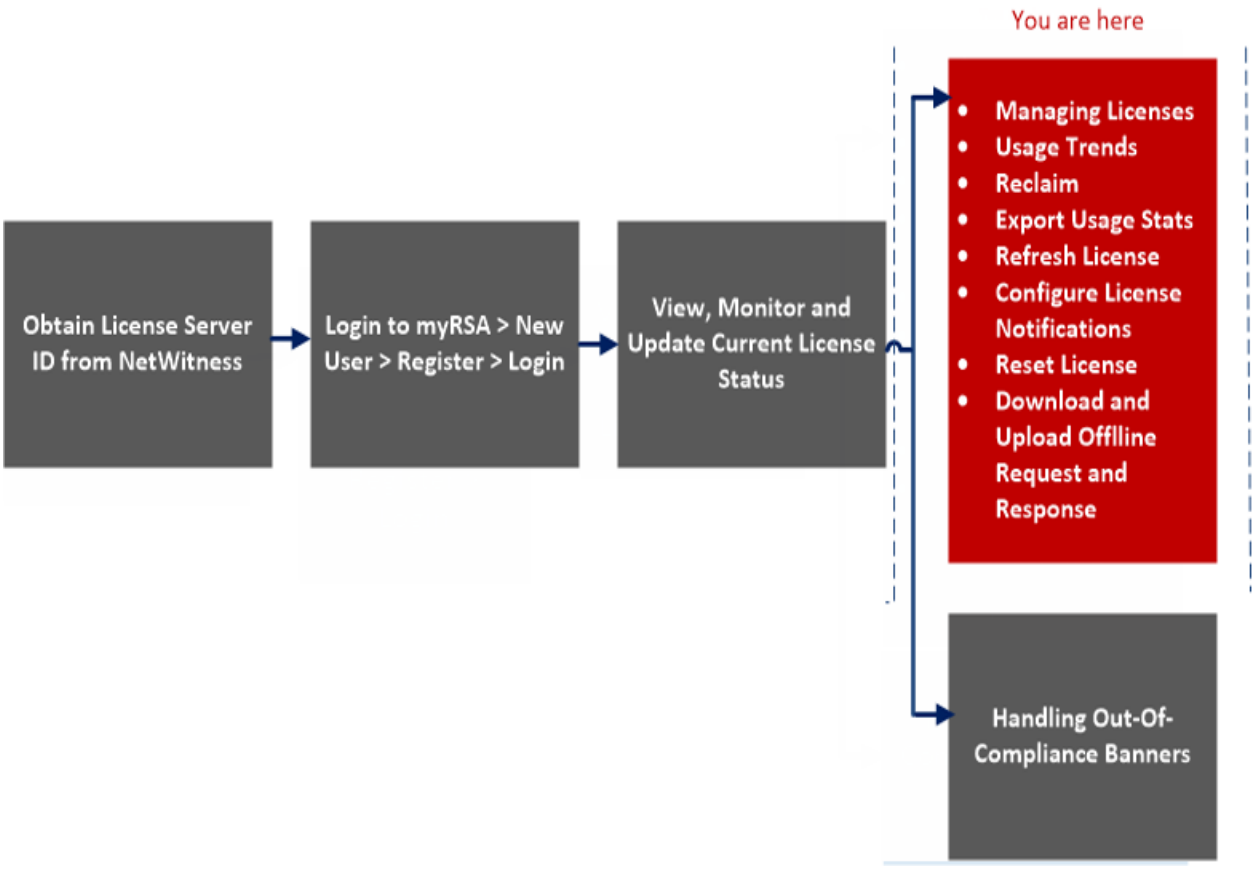
NetWitness provides the ability for Administrators to view usage statistics of device types that are eligible for a Throughput , Appliance Licenses such as Log Decoder, Decoder, Malware, UEBA, and Endpoint Server licenses. An hourly usage statistics is captured for all supported services connected to the NetWitness Server and are made available in CSV, and PDF formats. Metrics can be tracked securely, allowing Administrators to save data locally on their systems to use in reporting usage compliance.

To access Export Usage Stats:

1. Go  **(Admin) > System** and select **Licensing**.
   The License Details tab is displayed.

2. Select a service for which you want to export usage stats.

3. Click  , and select the **Export Usage Stats** option.
   The **Export Usage Stats** dialog is displayed.



4. Select a **Preset Range**, **Date Range** (in case of custom range), **Format** and **Aggregation Type** to generate the report.
5. Click **Export** to export the report or click **Cancel** to return to the **License Details** tab.

Settings

This topic describes the notification settings for the NetWitness in the **Licensing panel** > **Settings** tab.

Workflow

This workflow illustrates the end-to-end licensing process.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Register NetWitness Server	Obtain License Server ID from NetWitness Platform User Interface
Administrator	Synchronize NetWitness Server	Register the Server (Online Registration)
Administrator	Install product licenses from DLC.	Access myRSA
Administrator	Monitor and update current licenses.	View Current Licenses
Administrator	*Configure licensing notifications.	Configure License Notifications

Role	I want to...	Show me how...
Administrator	View Out-of-Compliance banners	About Out-of-Compliance Banners

*You can perform this task here.

Obtain License Server ID from NetWitness Platform User Interface

Configure License Notifications

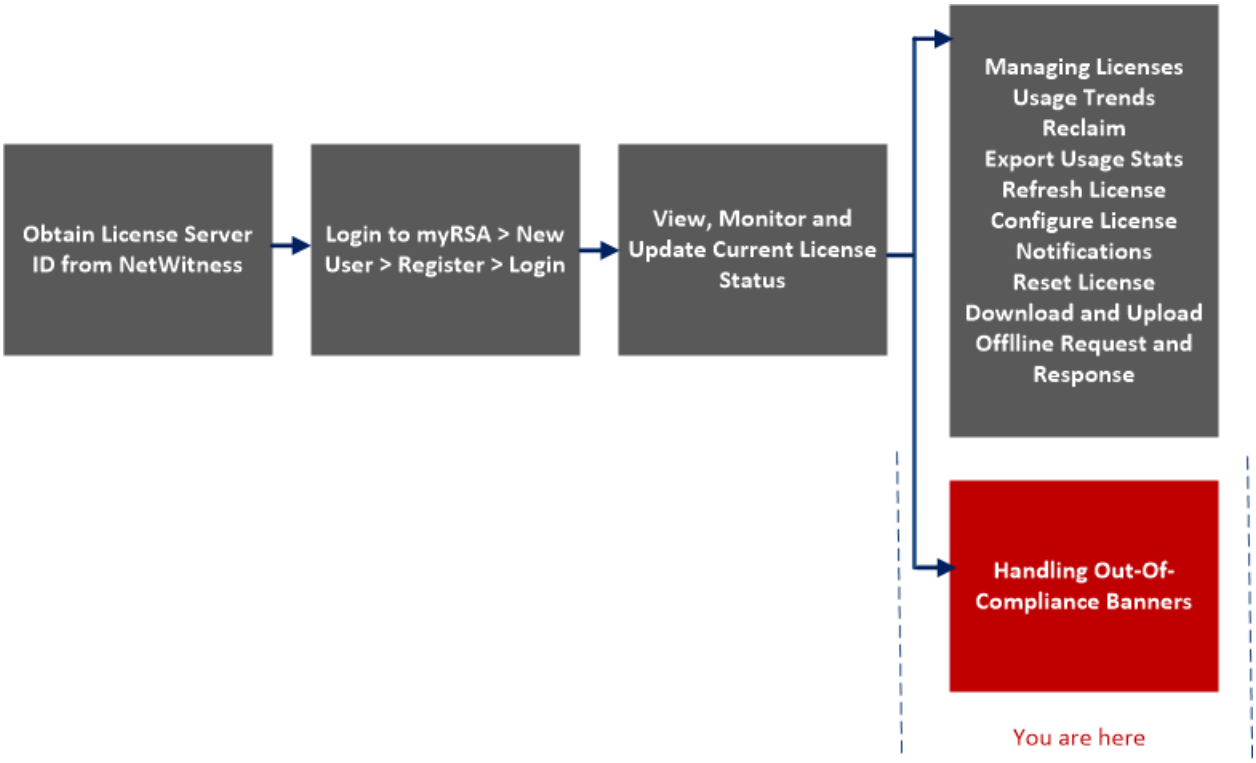
Quick Look

From the **Settings** tab you can:

- Configure licensing notifications.
- Download an Offline Capability Request in NetWitness for submission to DLC.
- Within 72 hours, upload to NetWitness an Offline Response that was received from DLC.

The following table describes the **Settings** tab features.

1	Displays the **License Reset** panel which applies the default license settings.
2	Displays the **Licensing Notifications** panel.
3	Displays the **Notification Type**. There are three types of notifications: • **Email:** Checkbox to receive a notification of approaching license expiration in an email message. The email is sent to the configured email or distribution list. • **Syslog:** Checkbox to receive a notification of approaching license expiration in an syslog message. The syslog is generated in accordance with the settings in the Syslog Auditing Settings. • **SNMP Trap:** Checkbox to receive a notification of approaching license expiration in an SNMP trap. The trap is generated in accordance with the settings in the SNMP Auditing Settings.
4	Displays the type of **Alert Notification**. • **Login:** Select this checkbox to receive a notification of your approaching license expiration when you log on to NetWitness. The **Login Window Threshold** field specifies the number of days before the license expires to display the notification at log on. • **Notification Tray:** Select this checkbox to receive a notification of approaching license expiration in the Notifications tray.
5	Displays the **Threshold** field, which specifies the number of days before the license expires to send a notification to the Notifications tray.
6	Displays the **Manage Local License Server Offline** panel.
7	Displays the **Download Offline Request** button. This button enables you to download a request from the NetWitness Platform LLS into a local file for processing by a back-office server. The downloaded bin file should be uploaded to DLC to generate the offline response.
8	Displays the **Upload Offline Request** button. This button enables you to browse for an offline



response that you received from the back-office server, and uploads the selected response to NetWitness. The file must be uploaded within 72 hours after receiving the file.

Out-of-Compliance Reference

This topic describes the workflow when your license is out of compliance.

Workflow

This workflow illustrates the end-to-end licensing process.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Register NetWitness Server	Obtain License Server ID from NetWitness Platform User Interface
Administrator	Synchronize NetWitness Server	Register the Server (Online Registration)
Administrator	Install product licenses from DLC.	Access myRSA
Administrator	Monitor and update current licenses.	View Current Licenses
Administrator	Configure licensing notifications.	Configure License Notifications
Administrator	*View Out-of-Compliance banners.	About Out-of-Compliance Banners

*You can perform this task here.

Note: When throughput devices are under trial period, warning messages will not be displayed unless usage is observed on the corresponding device.

Out-of-Compliance State

The following sample banner is displayed when a license expires:

If your license has internal errors, the following banner is displayed:

In addition to a red banner being displayed during system log on, an Out of Compliance Acknowledgment dialog is also displayed. Click **Accept** to continue using your NetWitness product.

Licenses may become out-of-compliance due to reasons provided in the following table:

Red Banner Message	Possible Causes	Solutions
One or more services is not licensed.	Trial license period has expired. There are pre-11.0.0.0 services in the deployment that are not licensed.	Contact Sales team to procure a NetWitness license. Upgrade the services to NetWitness version 11.0.0.0 or later.
One or more licenses is expired.	Log ingestion usage has been observed after the date of renewal. The license is not valid anymore for the corresponding usage.	Contact Sales team to renew or resolve the license.
You have exceeded license usage limits.	If the allotted daily usage is exceeded on four or more occasions, the Grace Period begins. The Grace Period begins on the day of the fourth occurrence and ends at the end of the following calendar month. Seven continuous days of standard usage will end the Grace Period. If the daily allotted usage is still being exceeded at the end of the Grace Period, the 30-day Breach Period begins. Seven continuous days of standard usage will end the Breach Period.	Contact Sales to extend or increase your allotted usage by purchasing a NetWitness license.

Red Banner Message	Possible Causes	Solutions
Your Trial license has internal errors.	An internal licensing issue was reported during your Out-of-the-Box Trial period.	Contact Technical Support to resolve this issue.

Note: If a license has not been installed within 90 days, you must contact Sales to purchase a NetWitness license.

License Approaching Out-of-Compliance

When your license is approaching expiration, or it is nearing its allotted usage, a yellow banner with a brief description is displayed. A yellow banner is displayed 14 days before your license is due to expire. You will also see a yellow banner if you are approaching your allotted license usage. You can get rid of the yellow banner by clicking the **Dismiss** button.

The following sample banner is displayed in the NetWitness screen if your license is approaching its allotted usage:

The following table explains the messages that are displayed when you see a yellow banner.

Yellow Banner Message	Possible Causes	Solutions
You are nearing license usage limits.	One or more Throughput licenses has exceeded your allotted usage for three times during the current calendar month. The fourth time that you exceed your allotted usage during the current month will push the deployment into an Out-of-Compliance state.	Contact RSA Sales if your allotted usage spikes four times within a calendar month.
One or more licenses is expiring.	One or more licenses is due to expire within 14 days. Or Log ingestion usage has been observed. The license is not valid anymore for the corresponding usage.	Contact RSA Sales to purchase a new license.

Live Services Management

NetWitness Live is the gateway to a rich environment that offers access to feeds, tools, and other resources.

NetWitness Live

Live is the component of NetWitness that manages communication and synchronization between NetWitness services and a library of Live content available to NetWitness customers. Live provides a simple interface for browsing, selecting, and deploying content from the NetWitness Live Content Management System to NetWitness services and software. In addition to managing feeds from the CMS Library, Live allows users to deploy custom feeds and packages.

Note: Any customer with valid maintenance can access NetWitness Live.

The content management system (CMS) library (known as *Live*) is a valuable source of the latest internet security resources for NetWitness customers. It provides a view into the collective intelligence and analytical skills of the worldwide security community to ensure that users have the most current visibility into attack vectors.

Live gathers the best advanced threat intelligence and content in the global security community - the ideas, research, ongoing tracking, and analysis - and brings it directly into the user's security operations center to definitively classify computers associated with botnets, malware, and other malicious exploits. Live aggregates, consolidates, and illuminates only the most pertinent information relevant to an organization on a real-time basis.

NetWitness Feedback and Data Sharing

Live Feedback is intended to help improve NetWitness. Once you set up and configure a Live account, usage data is shared with RSA.

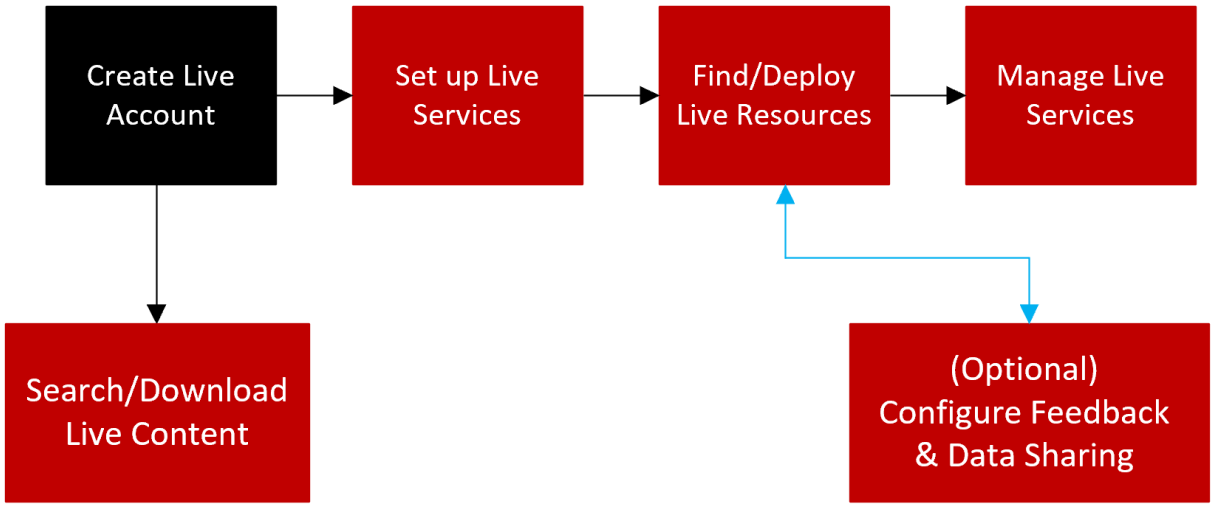
For more details, see NetWitness Feedback and Data Sharing.

For Debian Linux and NetWitness Endpoint Users

If you are upgrading to NetWitness 11.5 or later, and you are using NetWitness Endpoint and also have any Debian Linux endpoint systems, NetWitness recommends that you go to Live and download the following application rules:

- autorun debian package mismatch
- autorun file path not part of debian package
- debian package hash mismatch in important system directory
- debian package hash mismatch
- file path not part of debian package in important system directory
- file path not part of debian package

Deploy Content



This section explains the different ways available to deploy content:

- Deploy Content using Live Content UI
- Centrally Deploy Content using Policy UI

Create Live Account

Note: The NetWitness Live Registration Portal now has a new user interface and supports email verification.

You must create a Live account using the NetWitness Live Registration Portal (https://live.netwitness.com/registration/) on the Live server. Live Account is required to access all Live services including CMS. The CMS Library provides access to all NetWitness content in one place where you can view, search, deploy, and subscribe to NetWitness content.

Make sure the following are available to set up a NetWitness Live account:

- Active internet connection to access the portal.
- A valid and registered NetWitness License Server on the Flexera Server, before you can register for a Live account. You can view the License ID on the **(Admin) > System > Info** panel.

Note: If the License Server is not set up, contact NetWitness Customer Support.

To create a Live Account:

1. Access the NetWitness XDR Cloud Services Live Registration Portal using the URL: https://live.netwitness.com/registration/

   The NetWitness XDR Cloud Services Live sign up page is displayed.

2. Click **Sign Up For Live**.

   The End User License Agreement page is displayed.

   Read the Terms and Conditions carefully and click **Accept**.

3. In the **Sign Up for NetWitness Live Account** page, enter all the fields:
   - The **First Name** and **Last Name** of the user.
   - The **Company** for which the Live Account is being created.
   - The **Email address** you enter will be used to receive the verification code for your new Live account and other notifications related to the Live account.
   - The **License ID** can be viewed on  **(Admin) > System > Info** panel.

- The **Username** and **Password** for the Live Account.

4. Click **Create Account**.
   You will be directed to **Confirm Sign up** page.
5. Enter the **Confirmation Code** sent to your registered email address.
   Click **Confirm**.
   You can see the confirmation message for your NetWitness Live Account registration.

   Note: You cannot create more than one Live account for the same License ID. For additional license, contact NetWitness Customer Support.
6. Once the account is created, enter your credentials and click **Sign In** to access the NetWitness XDR Cloud Services Live.
7. After you sign in, you can perform the following:
   - Search and Download Content from NetWitness XDR Cloud Services Live
   - Share Telemetry Data to NetWitness

Reset the Password for Your Live Account

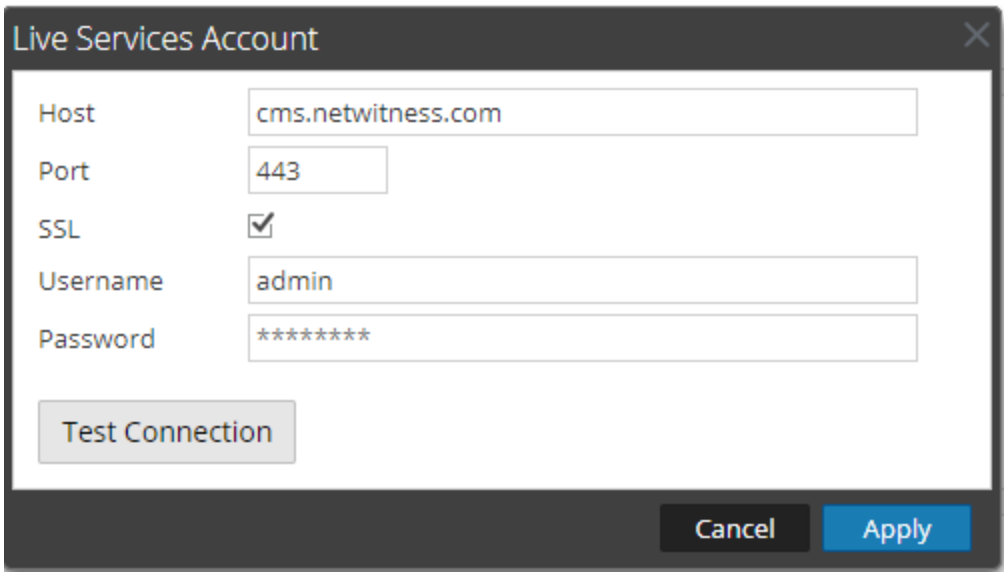
If you want to reset the password for your Live Account, do the following:

1. Access the NetWitness XDR Cloud Services Live Registration Portal using the URL:

   https://live.netwitness.com/registration/

   The NetWitness XDR Cloud Services Live sign up page is displayed.

2. On the Sign Up page, click **Forgot Password?**.
3. Enter your **Username** and click **Send Code**.
   A verification code will be sent to your registered email address.
4. Enter the **Verification Code** and **New Password** on the Reset Password page and click **Submit**.



Set Up Live Services on NetWitness Platform XDR

To set up Live on NetWitness Platform XDR, you configure the connection and synchronization between the CMS server and NetWitness. The user interface for this setup is the **(Admin) > System > Live Services** Configuration panel.

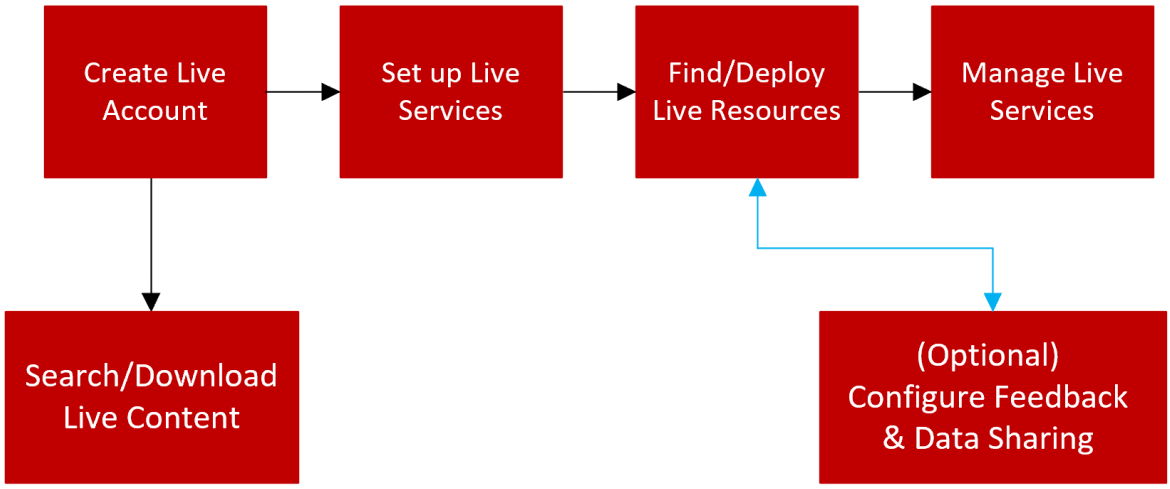
To configure the connection to the CMS Server:

1. Navigate to **(Admin) > System > Live Services**.
2. Click Sign In and enter your credentials in the Live Services Account dialog box.

3. Click Test Connection to make sure your connection is working.

4. If the test is successful, click **Apply**. If not, contact NetWitness Customer Support for help connecting to the Live server.
5. Configure the timing for synchronization of NetWitness Platform XDR with updates from Cloud Services Live.

For more details, see the "Configure Live Services Settings" topic in the *System Configuration Guide*.

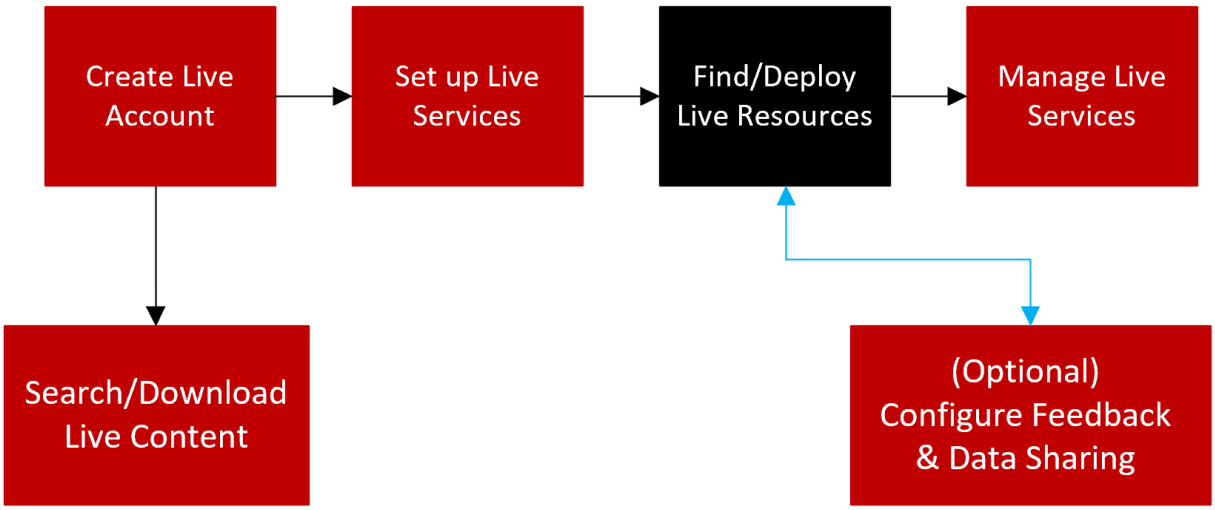


Deploy Content using Live Content UI

This topic explains the process of deploying the content using Live Content UI.

- Live Services Required Procedures
- Additional Procedures
- References
- Troubleshooting Live Services

Live Services Required Procedures

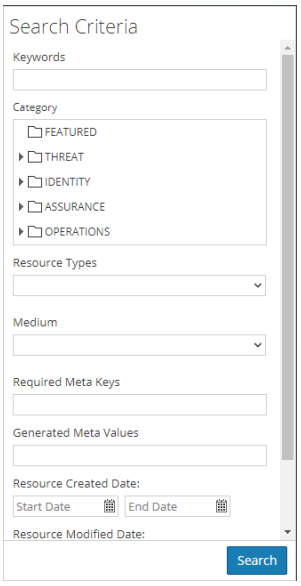


The following workflow describes the basic setup into four steps, which you perform individually.

Configuration Step	Description
Create Live Account	Create a Live Account on the Cloud Services Live Registration portal URL: https://live.netwitness.com/registration/.
Set Up Live Services on NetWitness Platform XDR	Set Up Live Services on NetWitness Platform XDR by configuring a connection with the CMS server.
Find and Deploy Live Resources	Search and browse for resources in the Live Search view, and then, deploy the selected resources.
Manage Live Resources	Procedures for administrators to search for, subscribe to, and deploy resources from Live.
Search and Download Content from NetWitness XDR Cloud Services Live	Search and browse for content in the Cloud Services Live, and then, download the selected content.
NetWitness Feedback and Data Sharing	Describes the feedback and data sharing features provided in NetWitness, from Live Services. Participation is optional, but can help to provide useful threat intelligence for the community.

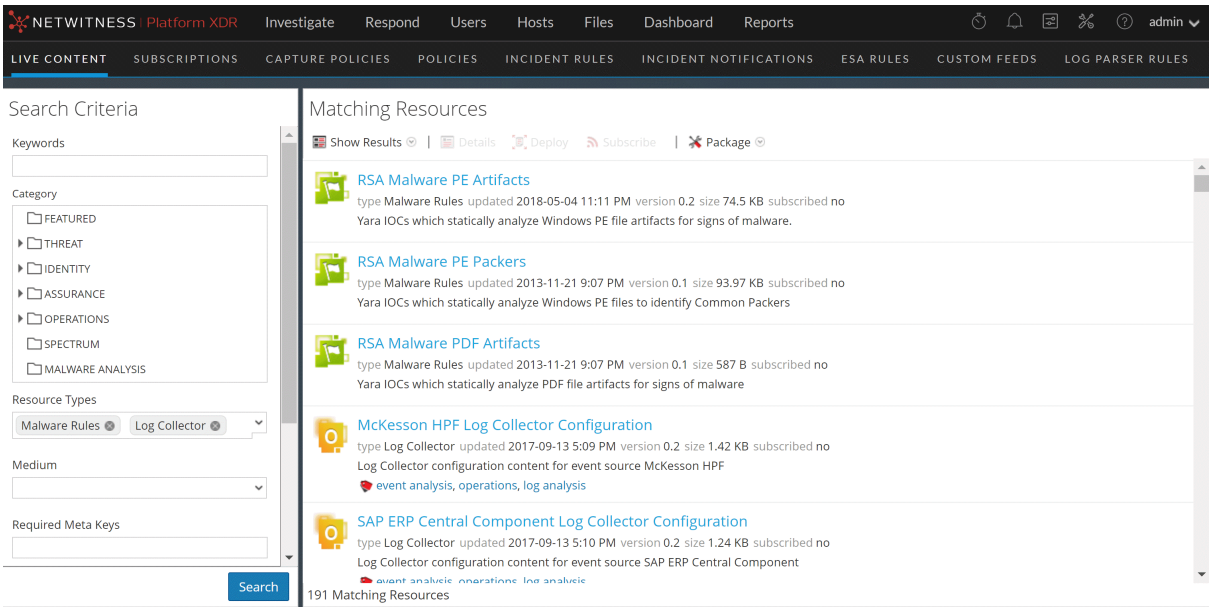
Find and Deploy Live Resources

Administrators can search for resources in the Live Search view, which is also the same as browsing the Live CMS for resources using the Search Criteria panel of the Live Search View.



Find Resources in Live

IMPORTANT: ESA Rules cannot be deployed manually via Live Services. By default, all the ESA rules are available in the ESA Rule library if Live Service is configured.



To find resources:

1. Navigate to **(Configure) > Live Content**.
2. In the **Search Criteria** panel, specify search criteria. Enter any or all of these: keyword, category, type of resource, medium, meta keys, meta values, date resource was created, and date resource was modified.

3. Click **Search**.

   The Matching Resources panel displays detailed results.

4. (Optional) To further narrow the results In the Matching Resources panel, click on a tag, meta key, medium or resource meta value in a result.

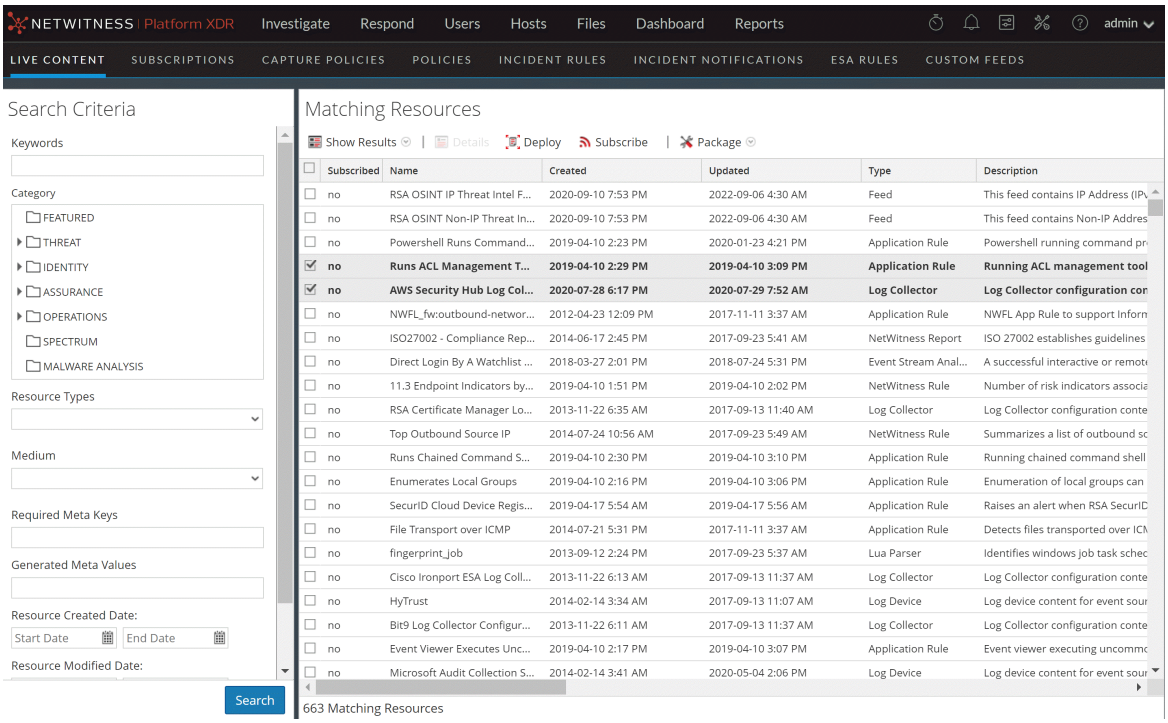
Deploy Resources in Live

In NetWitness, you can deploy selected resources manually, using the Deployment Wizard, or you can subscribe to a group of resources.

- When you have results from browsing resources in NetWitness Live, you can deploy resources manually to a service or a service group without subscribing to the resources. To deploy resources, select one or more from the list.
- Deploying resources manually deploys to services without taking advantage of the powerful resource management capabilities of NetWitness. If you want to receive notification and updates for updated resources and be able to easily remove resources from a service, you must subscribe to resources in the Live Search view and deploy them in the Live Configure View.
- If you have previously created and saved a resource package, you can deploy the package to services. Please refer to Resource Package Deployment Wizard for instructions on how to create a package.

Caution: For NetWitness 11.3, there is a new Content bundle for Endpoint, which contains approximately 400 application rules. Do not deploy this bundle (or the Endpoint application rules) onto any Log Decoder that is running an earlier version of NetWitness. The rules are only useful for 11.3 and newer, and would have major performance implications if deployed on Log Decoders that cannot process them.

To deploy resources manually:



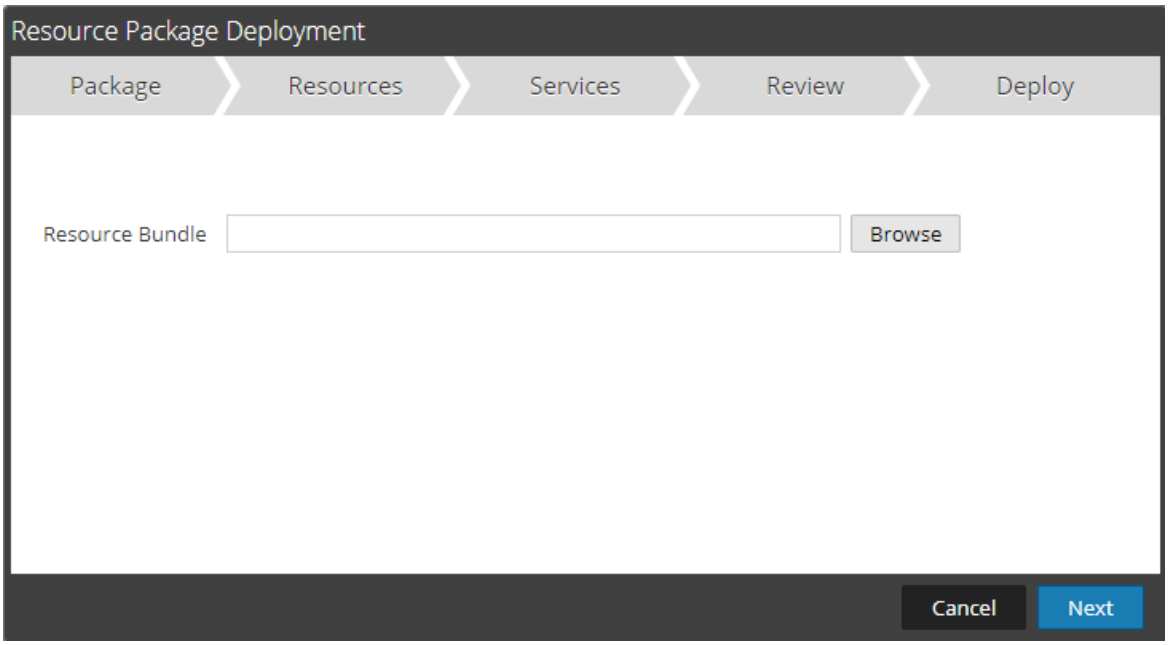
1. Go to  **(Configure) > Live Content**.
2. Select a group of resources, or a previously created resource package.

   To select a resource or group of resources:

   a. In the **Live Search View,** browse Live resources (for example, search for the **Log Collector** resource Type).

   b. In the **Matching Resources** panel, select **Show Results > Grid**.

   c. Select the checkbox to the left of the resources that you want to deploy.



d. In the Matching Resources toolbar, click Deploy.

3. To select a resource package to deploy:

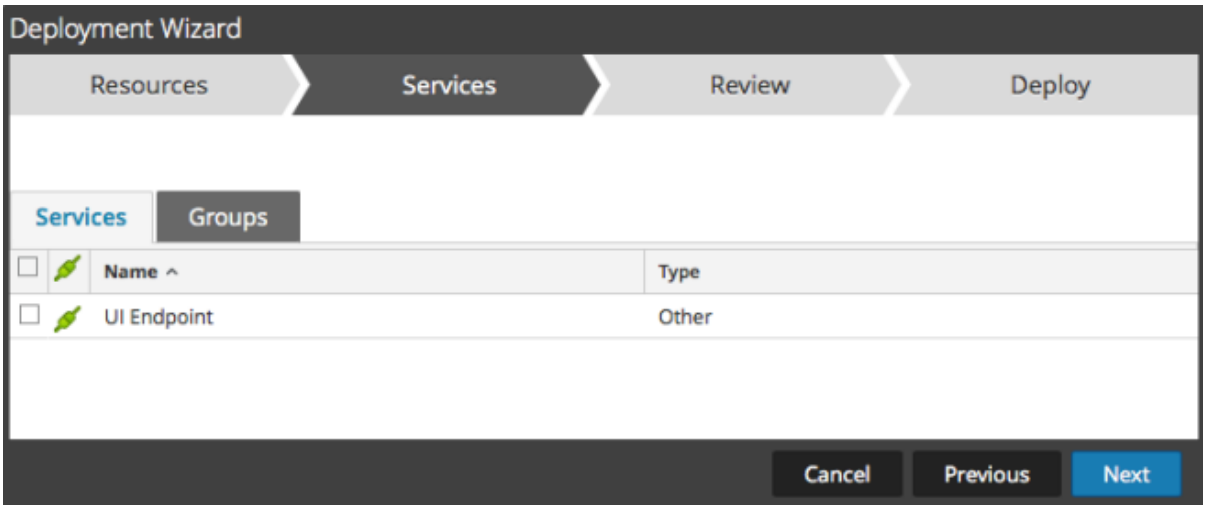
   a. In the **Live Search** view **- Matching Resources** toolbar, select **Package** > **Deploy** .

   The Package page of the Resource Package Deployment wizard is displayed.

b. Click Browse and select a package from your network (for example **resourceBundle-FeedsParsersContent.zip**).

c. Click **Open**.

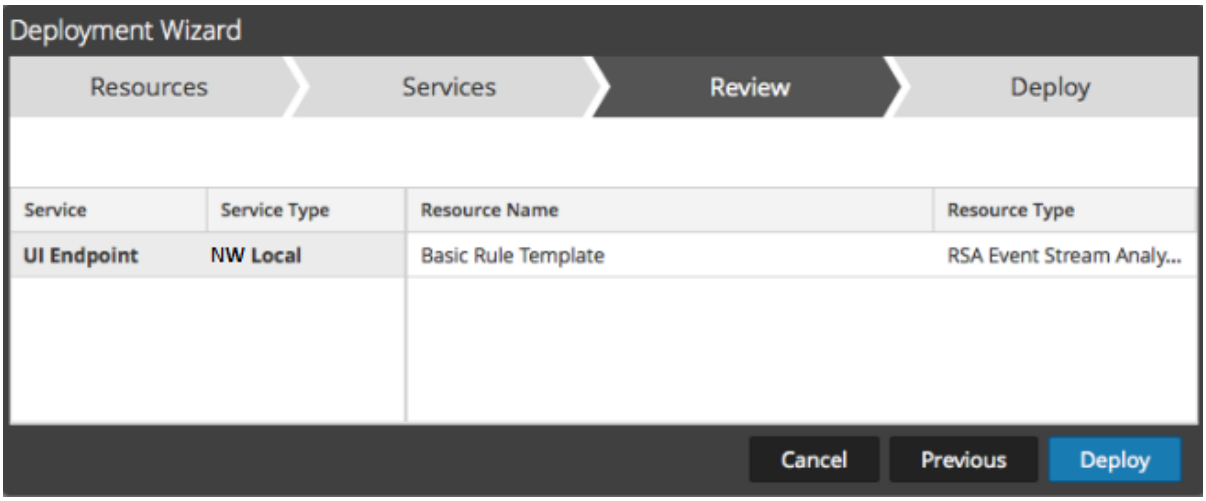
At this point, whether you are deploying a package or a group of resources, the **Deployment Wizard** opens, and the **Resources** page is displayed.



4. Click **Next**.

The **Services** page displayed has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the **(Admin) > Services** view. The columns are a subset of the columns available in the Services view.

Note: The Live server is "smart" about deploying resources to Services. For example, it does not deploy resources that have a Medium of packets to any Log Decoders. This means that only applicable content resources are deployed to each Service.



5. Select the services on which you want to deploy the content. You can select any combination of services and service groups.

- Use the **Services** tab to select individual services, list of services, and service groups that are configured in the **(Admin) > Services** view.
- Use the **Groups** tab to select groups of services.

6. Click **Next**.

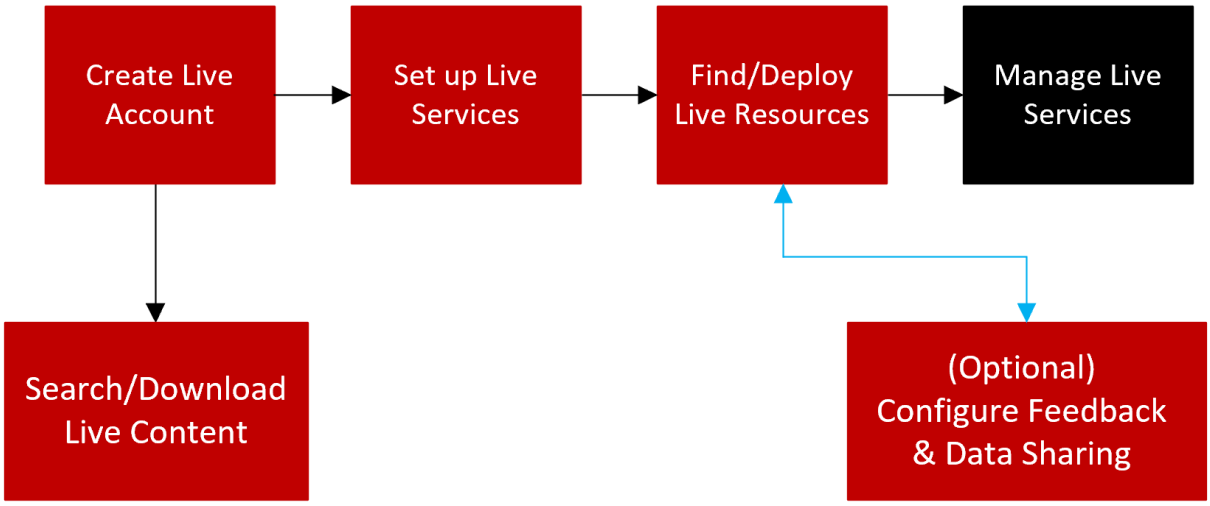
   The **Review** page is displayed.

   Make sure that you have selected correct resources and the services on which you want to deploy them.

7. Click **Deploy**.

   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.

If you try to deploy resources and services that are not compatible, NetWitness displays the Errors and Retry buttons, which you can click to review the errors and re-attempt the deployment.



8. Click **Close**.

Next steps

After deploying parsers to Decoders and Log Decoders, you must enable parsers on the individual services. For more information, see the *Decoder and Log Decoder Configuration Guide*.

Manage Live Resources

With a connection to the CMS server, you can search for, subscribe to, and deploy resources from Live in accordance with your subscription level. Once you have found resources, you deploy them to services and service groups that have been configured in the the **(Admin) > Services** view.

There are several workflows for deploying resources to services and managing those deployments. These include:

- Subscribe and deploy resources
- Deploy a resource bundle
- Remove deployments of resources
- Download resources
- Set up data feeds

Manage Subscription and Deployment

The subscription and deployment workflow takes advantage of the resource management tools available in Live. By subscribing to resources, you agree to receive updated resources in accordance with the synchronization configured in the **(Admin) > System > Live Services panel**.

By adding subscribed resources to the deployments list, you configure NetWitness to automatically push those resources to the selected services at the configured synchronization intervals. This method requires some planning of service groups and services where resources are deployed. In addition:

- You can remove a resource from the deployments list in the Deployments Tab.
- You can unsubscribe from a resource in the Subscriptions Tab and the Live Resource View.

To manage subscriptions and deployment:

1. In the **(Admin) > System > Live Services** panel, specify an interval at which NetWitness checks for updates to subscribed resources in Live and specify the email addresses of people to receive an email listing subscribed resources that have been updated.
2. In the **(Configure) > Live Content** search view, search for and subscribe to Live resources.
3. In the **(Configure) > Subscriptions > Deployments** tab, select subscribed resources and add them to the deployment list for services groups.
4. (Optional) In the **(Configure) > Subscriptions > Deployments** tab, click to deploy the resources listed in the Deployments tab immediately.
5. In the **(Configure) > Subscriptions > Deployments** tab, select deployed resources from a Group, and remove them from services.
6. In the **(Configure) > Subscriptions** tab, unsubscribe from resources.

Remove a Deployed Resource

Once deployed to a service, Live resources remain on the service until removed. It is a good practice to remove unused resources from services on which they are deployed.

To remove deployed resources:

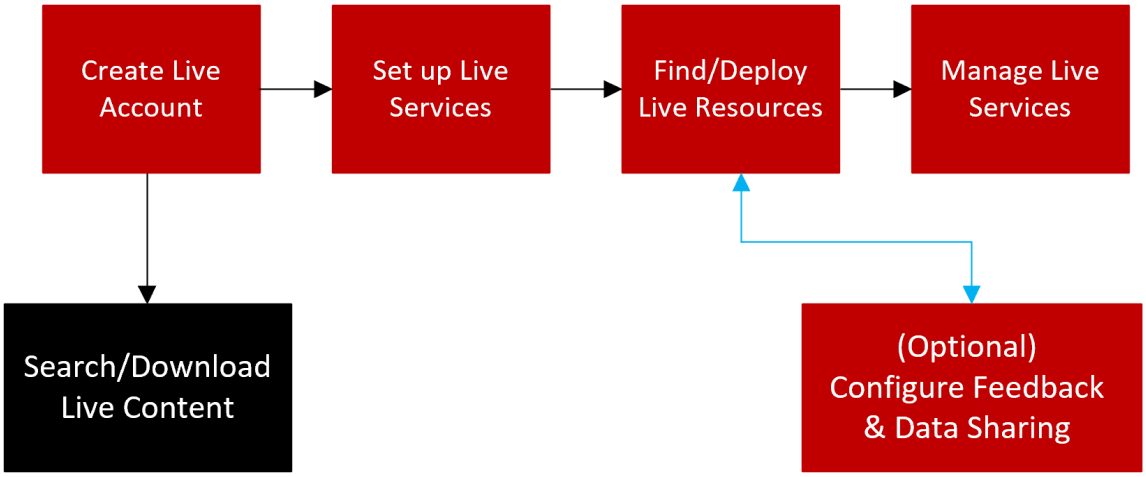
1. Go to the Live Resource View
2. Unsubscribe from a resource, and remove it from deployed services.

Deploy a Resource Bundle

To deploy a content package, use the Resource Package Deployment Wizard. You can deploy a content package created in Live to one or more services. NetWitness accepts packages in **.nwp** files or **.zip** files.

Download Resources

To download resources to your local file system, use the **Download** button in the Live Resource view.



Set Up Data Feeds

In the **Live** > **Feeds** view, you can set up and maintain Custom and Identify feeds.

Search and Download Content from NetWitness XDR Cloud Services Live

Administrators can search for live content using the Search Content panel in the NetWitness XDR Cloud Services Live, which is similar to browsing the live CMS content in the (Configure) > Live Content page on the NetWitness Platform XDR.

Note: If Admin server is not connected to the Live Services, you can use the NetWitness XDR Cloud Services Live to search and download the required content.

Prerequisites

- Ensure that you have created the Live account. For more information, see Create Live Account.

Quick Search for Content

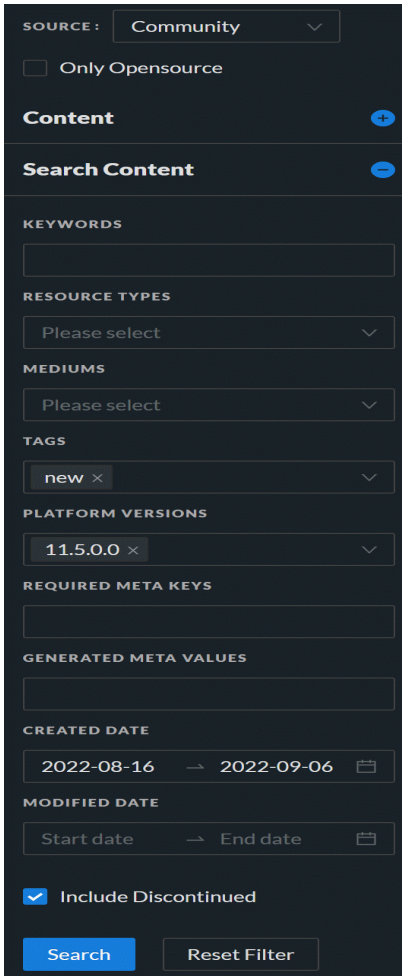
You can now select and view the content based on the Sources available in the Cloud Services Live. You can select either NetWitness or Community from the Source drop-down list.

- **NetWitness**: Displays all the content provided by NetWitness.
- **Community**: Displays the content collected and retrieved from third party and open source communities.

  Note: The **Only Opensource** option will appear under the Search Content panel only when the community is selected as the source. You can use this option to select and search open-source related content.

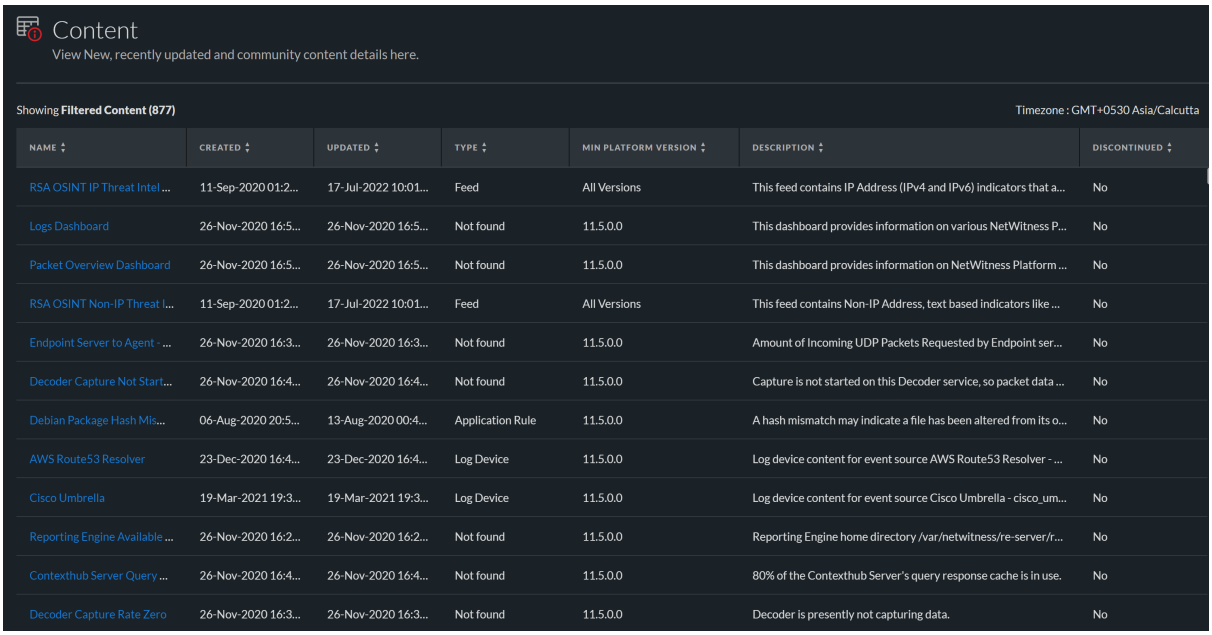
You can also quickly select and view the available content types under Content section.

Clicking expands the **Content** section and displays the following options:



- **New**: Displays the content which is created in the last 21 days.
- **Recently Updated**: Displays the content which is created or updated in the last 21 days.

Advanced Search for Content



You can search for the specific content in the Search Content view. For more information, see Live Search Content View.

To search the content:

1. Click to expand the **Search Content** section.
2. In the **Search Content**, specify the search criteria. Enter any or all of these: keyword, type of resource, medium, tag, platform versions, meta keys, meta values, date when content was created, date when content was modified, and (optional) discontinued content.

3. Click **Search**.
   The matching results are displayed on the right panel.

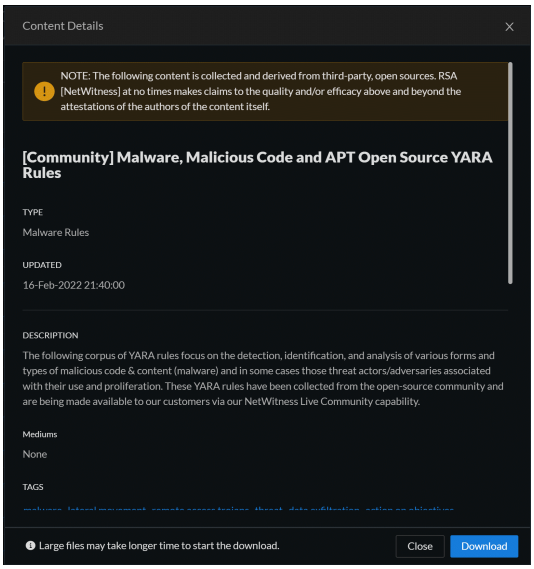
You can sort the content using the name, created, updated, type, or any of the column.

Note: Clicking **Reset Filter** removes the existing filters applied from the **Search Content**, and displays all the available content on the right panel.

Download Content



You can download the content from the results displayed in the right panel by performing the following steps:

Note:
- You cannot download a discontinued content.
- NetWitness provides no assurance related to the quality and accuracy of the content provided by the third parties and open source communities.

To download the content:

1. Click the name of the content that you want to download.

   The **Content Details** dialog is displayed.

2. Click **Download**.

   The content file is downloaded.

Additional Procedures

This topic explains the additional procedures an administrator could choose to follow which are not essential for the configuration or use of Live Services.

- Export Data to RSA
- Packaging Resources
- Manage Custom Feeds
  - Creating a Custom Feed
  - Create a STIX Custom Feed
  - Creating and Managing an Identity Feed
  - Editing a Feed
  - Removing a Feed
- Miscellaneous Live Services Procedures

Export Data to RSA

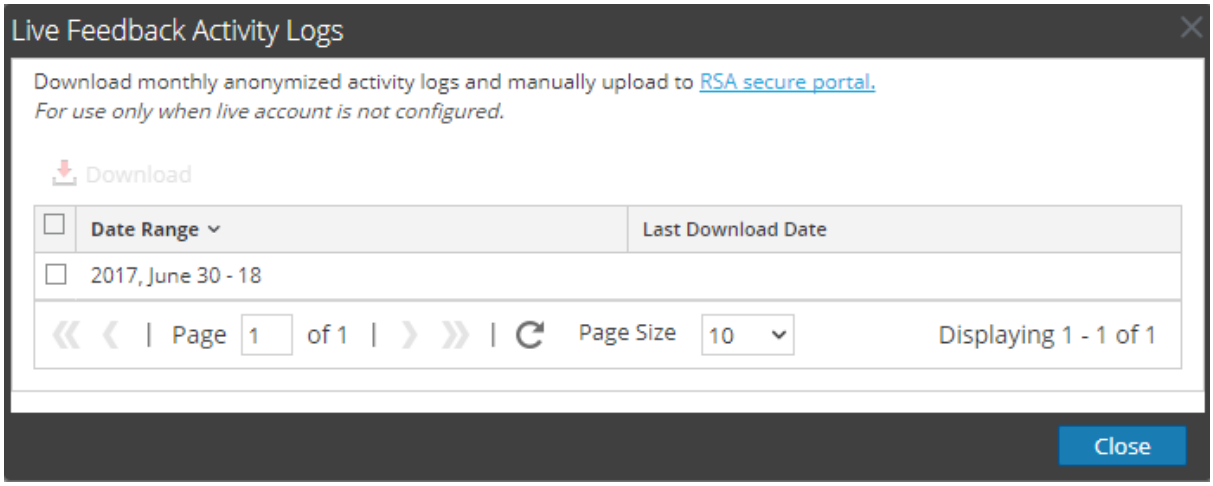
A NetWitness administrator can export the metrics in NetWitness for Live Feedback.

About Live Feedback

In the Live Services Configuration panel, there is a Live Feedback Activity Log which enables you to download the usage data required for Live Feedback. This is active regardless of the Live Account configuration.

If the Live Account is not configured, you can manually upload the usage data to RSA. For more information, see the "Configure Live Services Panel" topic in the *System Configuration Guide*.

You must first download the Live Feedback historical data, and then upload it to share with RSA.



Download Live Feedback Historical Data

To download the Live Feedback historical data:

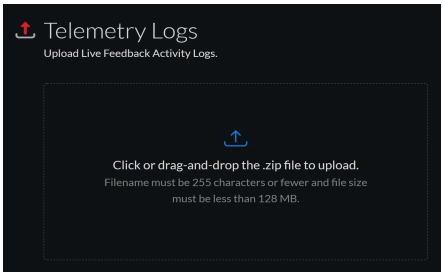
1. Go to **(Admin) > System**.
2. In the options panel, select **Live Services**.

   The **Live Account** screen is displayed which consists of the **RSA Live Status** and Download **Live Feedback Activity Log**.
3. Click **Live Feedback Activity Log**.

   The **Live Feedback Activity Log** window opens which allows you to download the required Live Feedback historical data.

4. Select one or multiple entries by selecting the checkboxes and click **Download**.

   Note: If you select multiple entries in the history table, the Live Feedback data is downloaded into a ZIP archive, consisting of individual JSON files for each month.



Share Telemetry Data to NetWitness

After you download the Live Feedback data, you can then upload it using the following procedure.

Note:
- To download the Live Feedback data, see topic Download Live Feedback Historical Data.
- You can share data through NetWitness XDR Cloud Services Live portal. For more information, Create Live Account.

To share the data to NetWitness

1. Log in to the NetWitness XDR Cloud Services using your Live account credentials.
2. Click  on the left panel.
   The **Telemetry Logs** dialog is displayed.

Note:
- You can upload only .zip files.
- Filename must be 255 characters or less and file size must be less than 128 MB.

3. Click or drag-and-drop a file onto this area to upload.

Packaging Resources

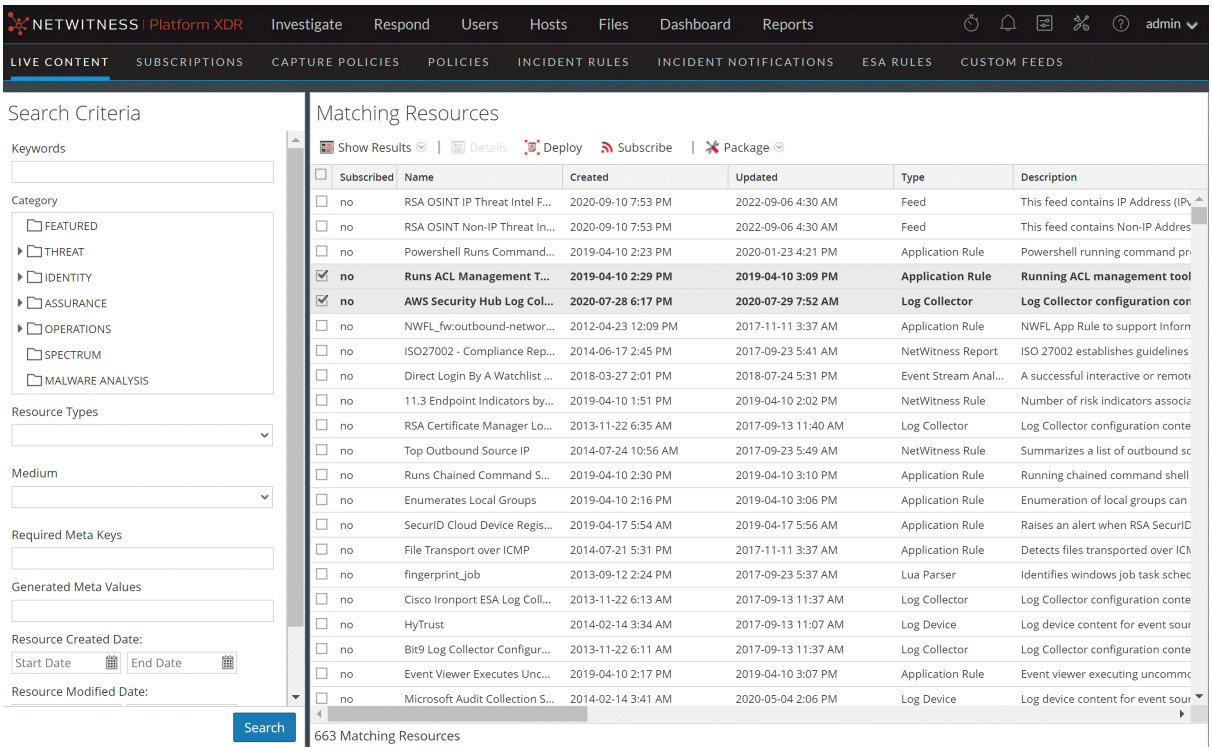
The primary use for creating and subsequently deploying a resource package is for customers using an air gap network environment. In this case, you create a resource package on the network that is connected to the internet, and then deploy the resource package on a more secure network.

Create and Deploy Resource Package Use Case

The basic steps are as follows:

1. Access NetWitness Live Services using an instance that is connected to the internet.
2. Create a Resource package as described below, adding whichever content items you need.
3. Copy the ZIP archive of the packages to your secure NetWitness instance, by using a thumb drive or other manual copying process.
4. On the secure NetWitness instance, deploy the resource package. For more information, see Resource Package Deployment Wizard.

Prerequisites to Create a Resource Package



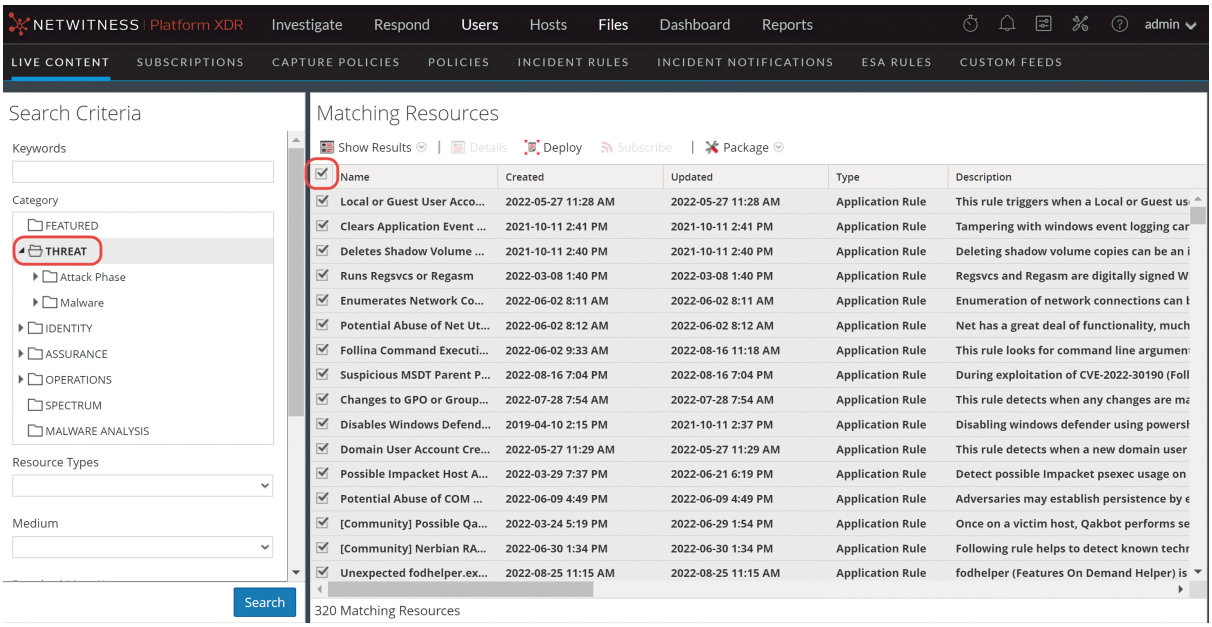
A prerequisite for creating resource packages is configuration of the connection and synchronization between the CMS server and NetWitness and the ability to search for resources in the User Interface.

Creating a Resource Package

The following procedure describes how to create a resource package, as a ZIP archive and save it to your local file system.

To create a resource package:

1. Go to  **(Configure) > Live Content** from the NetWitness UI.
2. Select the resources that you want to package in the Matching Resources grid.



3. Select some or all the resources that are listed in the Matches Resources pane.
4. Select Package > **Create**.

NetWitness creates a **.zip** archive that contains the selected resources and downloads it to your default download folder. NetWitness gives the package a generic name. You should rename it when you save it so that it identifies the resources contained in the package.

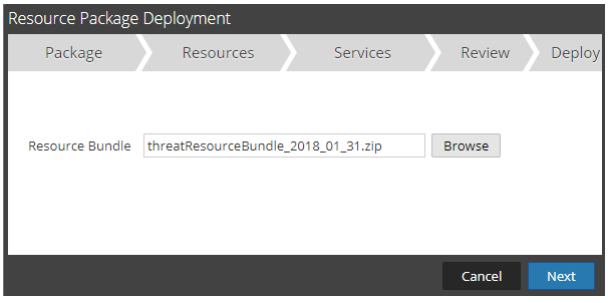
Creating Threat Package

The following procedure describes how to create a resource package that contains all the content that is categorized as **Threat**. Then we rename it, using the type of content and date.

1. Go to **(Configure) > Live Content**.
2. From the **Category** section, select **Threat**.
3. Select all items returned by clicking on the checkbox in the column header row of the **Matching Resources** pane.

4. Select Package > **Create**.

   A ZIP archive is saved to your Downloads folder. For example, **resourceBundle8740753704980701969.zip**.



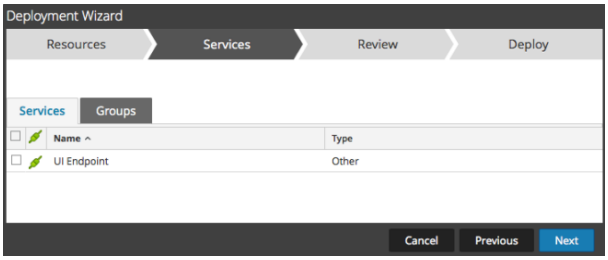
5. Rename the package to something meaningful. For example, in this case, you cold change the package name to **threatResourceBundle_2018_01_31.zip** (assuming today's date is January 31, 2018).

The resource package is now available for later deployment.

Deploying a Threat Package

This procedure assumes that you saved a package named **threatResourceBundle_2018_01_31.zip**, as described in the previous section. It describes how to deploy a saved resource package

1. Go to **(Configure) > Live Content**.
2. In the **Matching Resources** pane, select Package > **Deploy**.
3. Click **Browse** and navigate to the **threatResourceBundle_2018_01_31.zip** file that were created earlier.



4. Click **Next**.

The **Resources** page displays details for the resources in the package.

5. Click **Next**.

   The **Services** page displays two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the **(Admin) > Services** view. The columns are a subset of the columns available in the Services view.

6. Select the services on which you want to deploy the content. You can select any combination of services and service groups.

7. Click **Next**.

   The **Review** page is displayed.

   Note: Make sure that you have selected correct resources and the services to which you want to deploy them.

8. Click **Deploy** to complete the deployment process. Alternatively, you can choose **Cancel** or **Previous** to either cancel the deployment or go back to the previous screen.

Manage Custom Feeds

The custom feed capability is implemented using the Custom Feed Wizard in NetWitness, allowing you to quickly populate Decoders with custom and identity feeds.

Custom Feed Creation

You can use the **Live > Custom Feeds > Setup Feed > Configure a Custom Feed** wizard to create and deploy Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides you through the process to create both on-demand and recurring feeds, you should understand the form and content of a feed file when you create a feed.

Feed file names in NetWitness are in the form `<filename>.feed`. To create a feed, NetWitness requires a feed **data** file in `.csv` or `.xml` (for STIX) format and a feed **definition** file in `.xml` format, which describes the structure of a feed data file. The Configure a Custom Feed wizard can create the feed definition file based on a feed data file, or based on a feed data file and the corresponding feed definition file.

The files that you use to create an on-demand feed must be stored on your local file system. The files used to create a recurring feed must be stored at an accessible URL, whence NetWitness can fetch the most current version of the file for each recurrence. After a NetWitness feed is created, you can download the feed to your local file system, edit the feed files, and edit the NetWitness feed to use the updated feed files.

Sample Feed Definition File

This is an example of a feed definition file named `dynamic_dns.xml`, which NetWitness creates based on your entries in the Feed wizards. It defines the structure of the feed data file named `dynamic_dns.csv`.

Note: The feed file path should be `.csv` regardless of the Feed Type (Default or STIX).

Sample Feed Definition File

```
<?xml version="1.0" encoding="utf-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
    <FlatFileFeed name="Dynamic DNS Domain Feed"
        path="dynamic_dns.csv"
        separator=","
        comment="#"
        version="1">

        <MetaCallback
            name="alias.host"
            valuetype="Text"
            apptype="0"
            truncdomain="true"/>

        <LanguageKeys>
            <LanguageKey name="threat.source" valuetype="Text" />
```

```
            <LanguageKey name="threat.category" valuetype="Text" />
            <LanguageKey name="threat.desc" valuetype="Text" />
        </LanguageKeys>

        <Fields>
            <Field index="1" type="index" key="alias.host" />
            <Field index="4" type="value" key="threat.desc" />
            <Field index="2" type="value" key="threat.source" />
            <Field index="3" type="value" key="threat.category" />
        </Fields>

    </FlatFileFeed>
</FDF>
```

Feed Definition Equivalents for Custom Feed Wizard Parameters

The NetWitness Feeds wizard provide options to define the structure of the data feed file. These correspond directly to attributes in the feed definition (.xml) file.

NetWitness Parameter	Feed Definition File Equivalent
	Define Feed tab
Feed Type	Select: **Default** - to define a feed based on a `.csv` formatted feed data file. **STIX** - to define a feed based on STIX formatted `.xml` file.
Feed Task Type	Select: **Adhoc** - to create an on-demand feed. **Recurring** - to create a feed that recurs automatically.
Name	Enter a custom feed name in the feed data file that corresponds to the `flatfeedfile name` attribute in the feed definition file; for example, `Dynamic DNS Test Feed`.
File/ Browse	Enter a name of the feed data file that corresponds to the `flatfeedfile path` attribute in the feed definition file; for example, `dynamic_dns.csv`.
(STIX, Recurring) **Trust All Certificate**	Select **Trust All Certificate**, if you do not want to validate the REST server certificate. This option is enabled by default (checked).
(STIX, Recurring) **Certificate/Browse**	For client authentication with the REST URL, in the **Certificate** field, click **Browse** and select the self signed certificate. The supported certificate formats are .cer, .crt with Base64 & DER encoded files.
	Define Feed tab - Advanced Options
XML Feed File	Enter a name of the feed definition file, for example, `dynamic_dns.xml`.
Separator	The separator character used to separate attributes in the feed data file. It corresponds to the **`flatfeedfile separator`** in the feed definition file; for example, a comma.

NetWitness Parameter	Feed Definition File Equivalent
Comment	The character used to identify a comment in the feed data file. It corresponds to the **`flatfeedfile comment`** attribute in the feed definition file; for example, #.
Remove STIX data older than	The number of days for which the STIX packages downloaded from TAXII server have to be stored. The STIX packages older than the specified number of days are deleted automatically. The default value is 180 days, which is also the maximum.
Select Services tab	Select the services to which you want to send the data feed.
(Define Columns tab, Define Index) **Type**	The type of lookup value in the index position of the feed data file. **IP** means that each row in the feed data file contains an IP address in the lookup value position. The IP value is in dotted-decimal format (for example, 10.5.187.42). **IP Range** means that each row in the feed data file contains a range of IP addresses in the lookup value position. The IP range is in CIDR format (for example, 192.168.2.0/24). **Non IP** means that the each row in the feed data file contains a metadata value other than IP address in the lookup value position. The Service Type and Truncate Domain, and Callback Keys fields become active for a Non IP index.
(Define Columns tab, Define Index) **CIDR**	Specifies that the IP value in the lookup position is in CIDR format. The **CIDR** attribute sets the IP address format in the field to Classless Inter-Domain Routing (CIDR) notation.
(Define Columns tab, Define Index) **Service Type**	For a Non IP index, the integer service type to filter meta lookups. It corresponds to **MetaCallback apptype** attribute in the feed definition file. A value of **0** indicates no filtering by service type.
(Define Columns tab, Define Index) **Truncate Domain**	For a Non IP index, for meta values that contain domain names (for example, hostnames), the system can strip off the host specific element in the data. Truncate Domain corresponds to the **MetaCallback truncdomain** attribute. If the value is www.example.com, it is truncated to example.com. A value of **False** selects no truncation, and **True** selects truncation.
(Define Columns tab, Define Index) **Ignore Case**	If this option checked, the feed will ignore the case.
(Define Columns tab, Define Index) **Callback Keys**	For a Non IP index, the available meta keys to match on instead of ip.src/ip.dst (the defaults for IP index type) are selectable from the drop-down list. The Callback Key corresponds to the **MetaCallback name** attribute, and the index column of the csv file must contain data that can match the chosen meta key. For example, if the username meta key is chosen, the index column of the csv file needs to be populated with users to be matched.

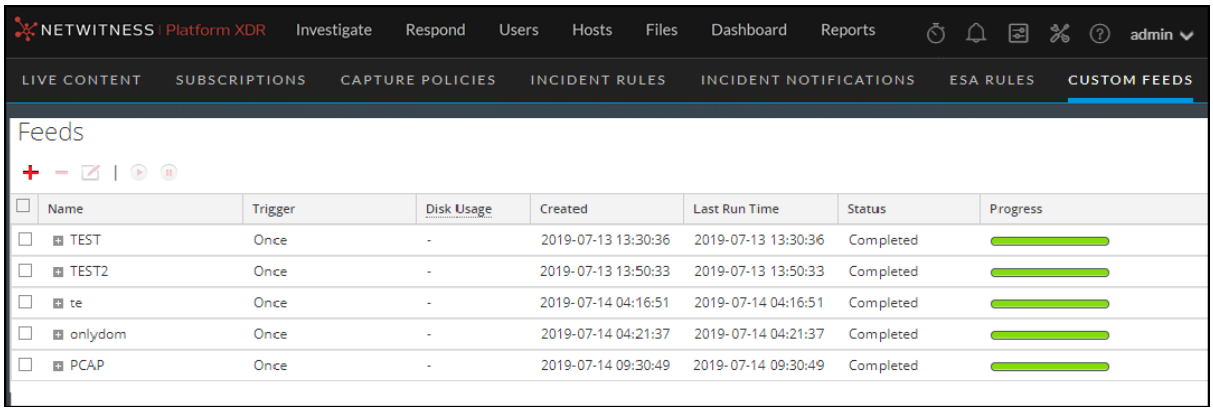
NetWitness Parameter	Feed Definition File Equivalent
(Define Columns tab, Define Index) **Index Column**	Identifies the column in the feed data file that provides the lookup value for the row. Each position in each row of the feed data file is identified by a **Field index** attribute in the feed definition file. A field with an index of **1** is the first entry in a row, the second field has an index of **2**, the third field has an index of **3**, and so on. You can select multiple index columns, if the **Feed Type** is **STIX** and **Index Type** is **Non IP**. When you select multiple index columns the values from all the selected columns are merged in the first index column that you selected.
(DEFINE VALUES) **Key**	The name of the **LanguageKey**, as defined in the feed definition file, for which meta is created from this row of the feed data file. It corresponds to the **Field key** attribute in the feed definition file. A key applies only to a field whose type is set to **value**. In the feed definition file, there is a list of LanguageKeys from **index.xml**, or a summary name if Source Name and Destination Name are used. For example, **reputation** is a summary name for **reputation.src** and **reputation.dst**). This value is referenced by the Field key attribute.

Creating a Custom Feed

This topic provides instructions for creating a custom feed using a .csv or STIX formatted feed data file in NetWitness. For more information about STIX and creating a STIX custom feed, see Create a STIX Custom Feed.

You can easily create a custom feed using the Custom Feed wizard. To complete this procedure, you need a feed data file in `.csv`or `.xml` format. If you also have an associated feed definition file in `.xml` format, which describes the structure of the feed data file, you can use the feed definition file to create a feed. The Custom Feed wizard can create the feed based on a feed data file, or based on a feed data file and corresponding feed definition file.

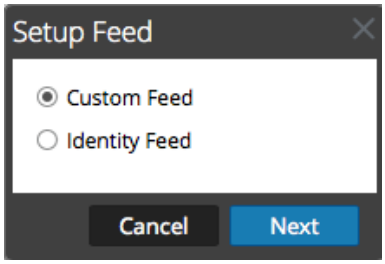
After completing this procedure, you will have created a custom feed.



The feed data file (`.csv` or STIX (`.xml`)) and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

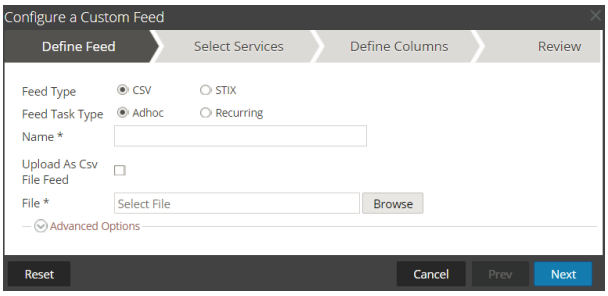
Note: Any feeds that are created in 11.2 release or prior will be automatically pushed to Context Hub as Lists. The lists can be looked up in the context lookup panel of the Respond and Investigate pages. If Context Hub is not configured or the service is down, then the feeds will be pushed to Context Hub the next time the server is available.

To create a custom feed:



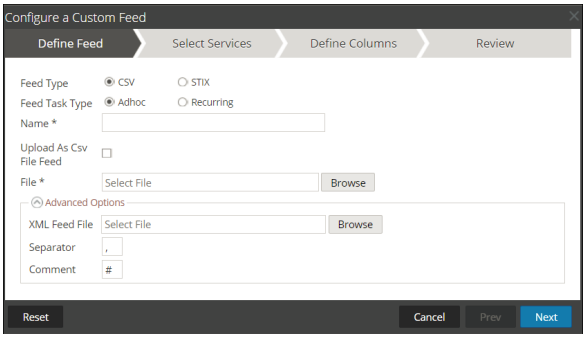
1. Go to  **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



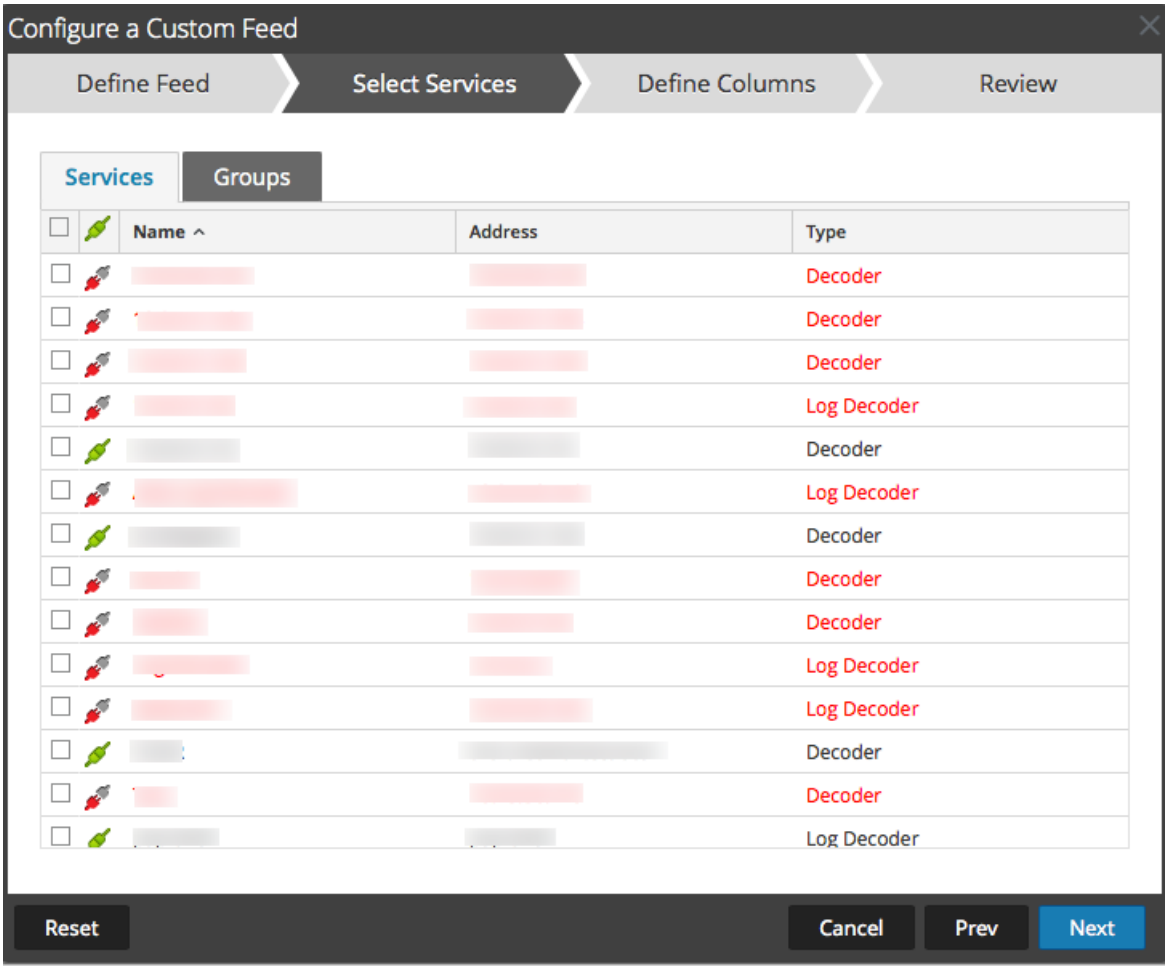
2. In the toolbar, click .

   The Setup Feed dialog is displayed.



3. To select the feed type, click **Custom Feed** and **Next**.

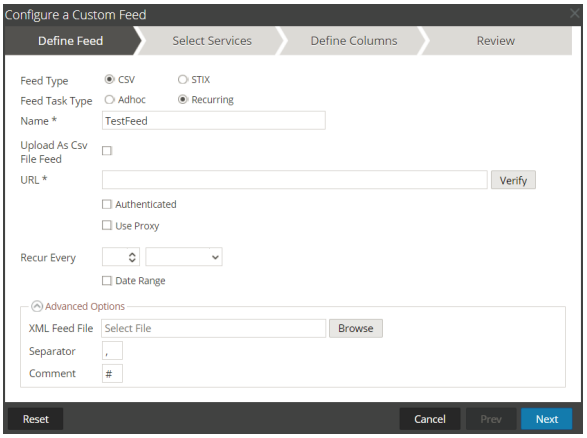
   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.



4. To define a feed based on a `.csv` formatted feed data file, select **CSV** in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on a .csv formatted feed data file, type the feed **Name**.
   b. Select the checkbox **Upload As CSV File Feed**, if required.
   c. Select a .csv content **File** from the local file system, and click **Next**.
   d. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      The Advanced Options are displayed:

   e. Select an XML feed file from the local file system, choose the **Separator** (default is comma), and specify the **Comment** characters used in the feed data file (default is #), and click **Next**.
   f. The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the



Define Columns tab is not needed.

6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range.

   a. Select **Recurring** in the **Feed Task Type** field.

   The Define Feed dialog includes the fields for a recurring feed.

b. In the **URL** field, enter the URL where the feed data file is located, for example, `http://<hostname>/<feeddatafile>.csv`, and click **Verify**.

   NetWitness verifies the location where the file is stored, so that NetWitness can check for the latest file automatically before each recurrence.

c. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.

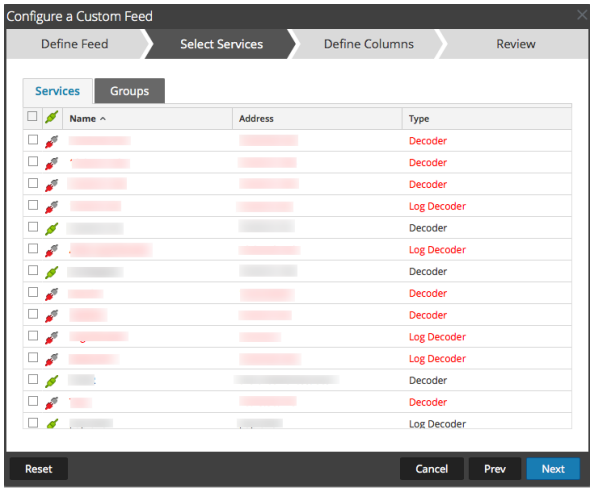
   NetWitness provides your user name and password for authentication to the URL.

d. If you want the NetWitness server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see the **Configure Proxy for NetWitness** topic in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not selected.
   NOTE:
   If you are using an HTTPS based feed server, ensure that you import and install the certificates. For more information, see Import Certificates for HTTPS Service

e. To define the interval for recurrence, do one of the following:

   - Specify the number of minutes, hours, or days between recurrences of the feed.
   - Specify recurrence every week, and select the days of the week.

f. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.



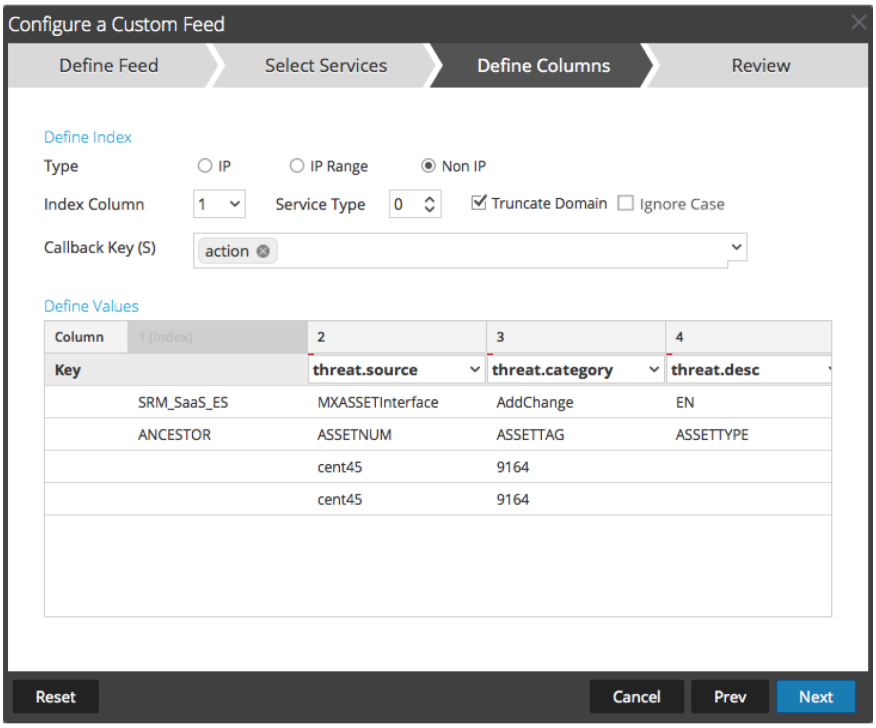
7. (Conditional) If you want to define a feed based on an XML feed file:

   - Type the feed **Name**, select **Advanced Options**.

     The Advanced Options fields are displayed.

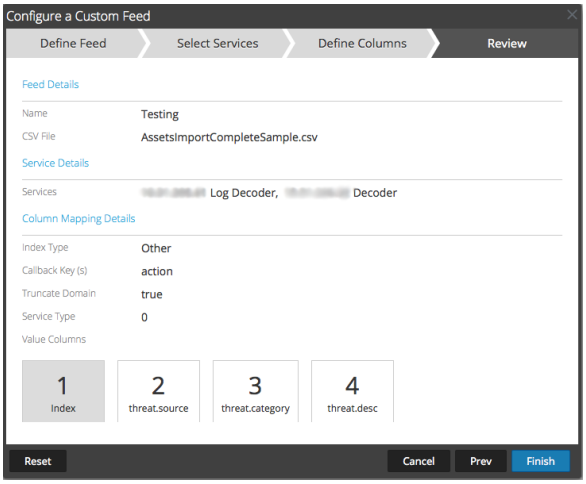
   - Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #) and click **Next**.

The Select Services dialog is displayed.



8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**.
   b. Click the **Groups** tab and select a group. Click **Next**.

      The Define Columns dialog is displayed.
9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR.**
   c. (Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** and **Ignore Case** option.



d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

> **Note:** When a custom feed gets converted into a context hub list, you must map at least one meta key with one or more meta types by mapping a column header with a meta. However, you can add or edit the entity mapping of a list by clicking ⚙ in the Lists tab. For more information, see the *Context Hub Configuration Guide*.

e. Click **Next**.

The Review dialog is displayed.

10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

> **Note:** When you create a feed, and if there is no entity mapping done such as in case of custom meta, then those columns in the List will not have entity mappings in Context Hub. You have to manually map the entities from the List page.

Import Certificates for HTTPS Service

Import certificates to communicate with the HTTPS services:

1. SSH to the NW node and copy the CA certificate located in the following directory:
   /etc/pki/ca-trust/source/
2. Execute the following command to update the certificates:
   `update-ca-trust`

3. Execute the following command to add the certificate to the java keystore:
   ```
   keytool -list -keystore /etc/pki/java/cacerts -storepass changeit |& head
   ```
4. Restart the service on the NW node.

Note: Perform the procedure for all the HTTPS servers.
Example: HTTPS proxy server and HTTPS feed server.

Create a STIX Custom Feed

You can create a custom feed using a .csv or STIX formatted feed data file in NetWitness.

Note: NetWitness supports Structured Threat Information Expression (STIX) 1.0, 1.1 and 1.2 versions only.

Structured Threat Information Expression (STIX™) is a structured language for describing cyber threat information so it can be shared, stored, and analyzed in a consistent manner. For more information about STIX, see https://oasis-open.github.io/cti-documentation/.

Caution: If STIX recurring feed is configured and you update Security Analytics from 10.6.x to NetWitness 11.0, you must re-configure the STIX recurring feed.

In NetWitness Platform XDR, STIX feeds are supported. STIX content (with version 11.x) can be uploaded in an ".xml" format. The constructs such as Indicator Title and Description, Observable Title and Description, and Indicator Sightings information are parsed from STIX and pushed to the decoders or log decoders that are selected during feed configuration. Information such as IP addresses, File hashes, Domain names, URIs, and Email addresses are extracted from the STIX observable to be included in the feed.

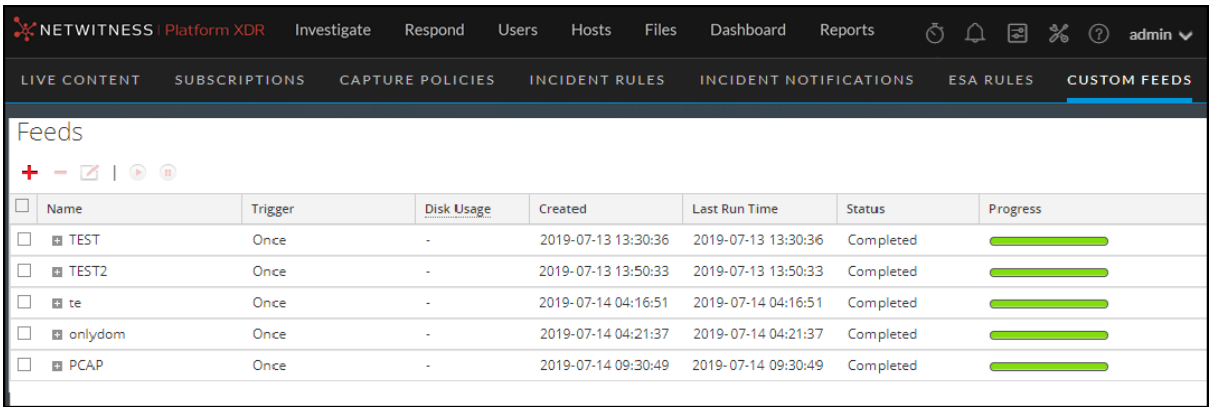
Make sure the following criteria are met before you upload the STIX file:

1. Only STIX Observables with property values in the "Equals" operator
2. The uploaded STIX xml file must have only one STIX_Package

TAXII (Trusted Automated eXchange of Indicator Information) is the main transport mechanism for cyber threat information represented in STIX. Using the TAXII services, organizations can share cyber threat information in a secure and automated manner.

The STIX and TAXII communities work closely together to ensure that they continue to provide a full stack for sharing threat intelligence.

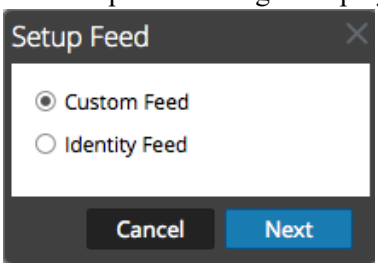
Apart from TAXII server, STIX data can also reside on REST server and you can fetch STIX file from the REST server by providing the URL of the REST server. For example, http://stixrestserver.internal.com.



The feed data file (`.csv` or STIX (`.xml`)) and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness server.

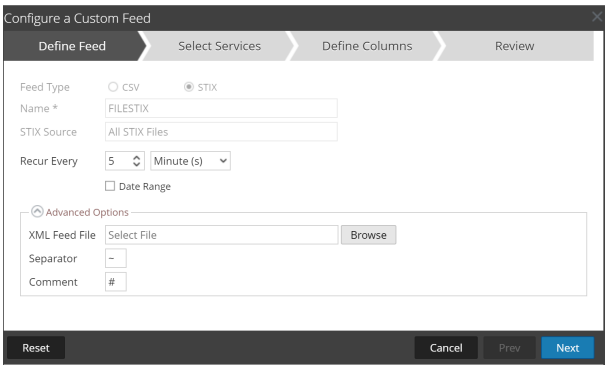
In NetWitness Platform XDR, STIX (.xml) feed of type Indicators or Observable which contains the properties such as the IP addresses, File hashes, Domain names, URIs and Email addresses are supported. The properties values in the Equals operator is only supported. The STIX constructs that are parsed are Indicator Title and Description, Observable Title and description and Indicator Sightings information. The STIX (.xml) with a single STIX_Package is only supported."

To create a STIX custom feed:



1. Go to  **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



2. In the toolbar, click .

   The Setup Feed dialog is displayed.

3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed dialog open.

4. Enter the following details:

   a. **Feed Type**: Select **STIX**, to define a feed based on a STIX formatted `.xml` file.

   b. **Name**: type the feed name, to define a feed based on STIX formatted `.xml` file.

   c. **STIX Source**:Select a STIX data source from the drop-down which is added in Context Hub.

   d. **Recur Every**: Specify a recurring feed task that executes repeatedly at specified intervals.

   Note: NetWitness verifies the connection to the server, so that NetWitness can check for the latest file automatically before each recurrence.

   e. **Date Range**: Select the checkbox and specify the date range for the feed task to recur.

5. (Optional) Select **Advanced Options**,to define a feed based on an XML feed file.
   a. **XML Feed file**: Browse and select an XML feed file from the local file system.
   b. **Separator**: Choose a separator (default is comma).
   c. **Comment**: Specify the comment characters used in the feed data file (default is #).
6. Click **Next**.
7. The Select Services dialog is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.

8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**.
   b. In case of STIX feed, Context Hub will be selected by default and you are not allowed to deselect it. In addition, you can select one or more Decoders and Log Decoders and click **Next** or Click the **Groups** tab and select a group. Click **Next**.

      If the data from the STIX server is large, the following message is displayed:

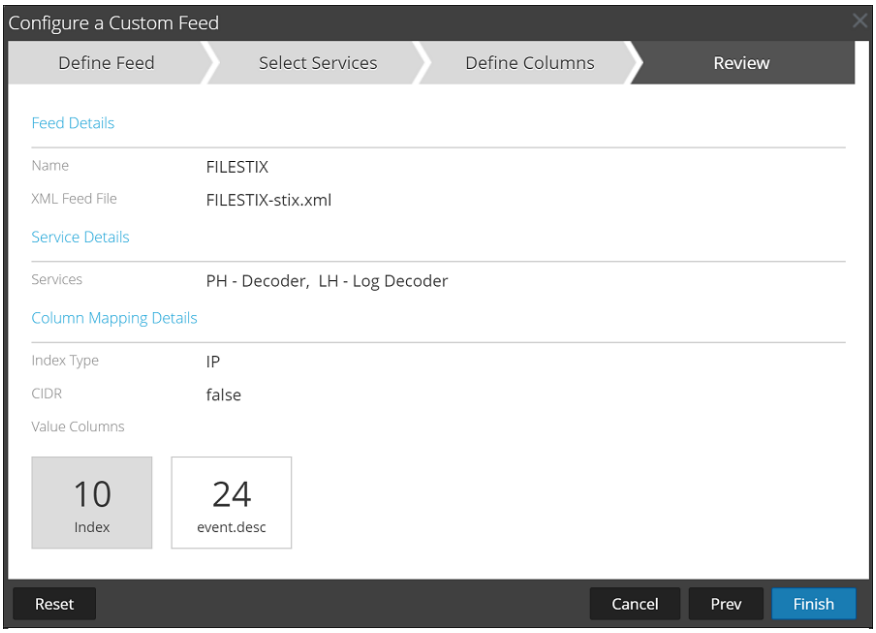
      - If you click **Continue to Wait**, it continues to wait till the sample data is fetched or timeout (10 minutes) whichever is sooner. In case of timeout no sample data is retrieved even after 10 minutes.
      - If you click **Map Without Sample data**, the mapping column is displayed without any sample data.

      The Define Columns dialog is displayed.
9. To map columns in the Define Columns form:

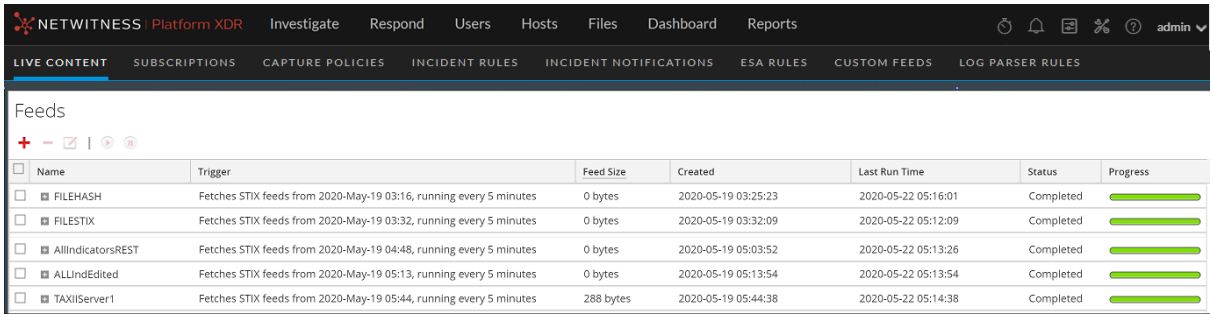
a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.

b. (Optional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.

c. (Optional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.



Note:
- If the **Index Type** is Non IP, you can select multiple index columns in the **Index Column(S)**. The values from all the selected columns are merged in the first index column that you selected and the merged values are pushed to the Log Decoder for parsing. For example, in the **Index Column(S)** if you select 2,4,7 as index columns the values from the 2,4 and 7 columns are merged in the column 2 and the values are pushed to Log Decoder for parsing.
- Indexing cannot be done for the columns such as Indicator Title, Indicator Description, Observable Title, Observable Description, as the look up cannot be performed for those columns.



d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

e. Click **Next**.

The Review dialog is displayed.

10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next dialog (if not viewing the last form).
    - Click **Prev** to display the previous dialog (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Note: Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low and the status displays as unhealthy due to low memory. For more information on how to troubleshoot the `OutOfMemoryError` on the Context Hub Server, see "Troubleshooting" in the *Live Services Management Guide*.

MetaCallback Feeds using CIDR Index Range for IPv4 and IPv6

You can use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using MetaCallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the content of both a .csv file and an .xml file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

CSV File Content

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

XML File Content

```
<?xml version="1.0" encoding="UTF-8"?><FDF
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
<MetaCallback name="DstIP" valuetype="IPv4" apptype="0" truncdomain="false">
<Meta name="ip.dst"/>
</MetaCallback>
<LanguageKeys>
<LanguageKey name="alert" valuetype="Text" />
</LanguageKeys>
<Fields>
<Field index="1" type="index" range="cidr"/>
