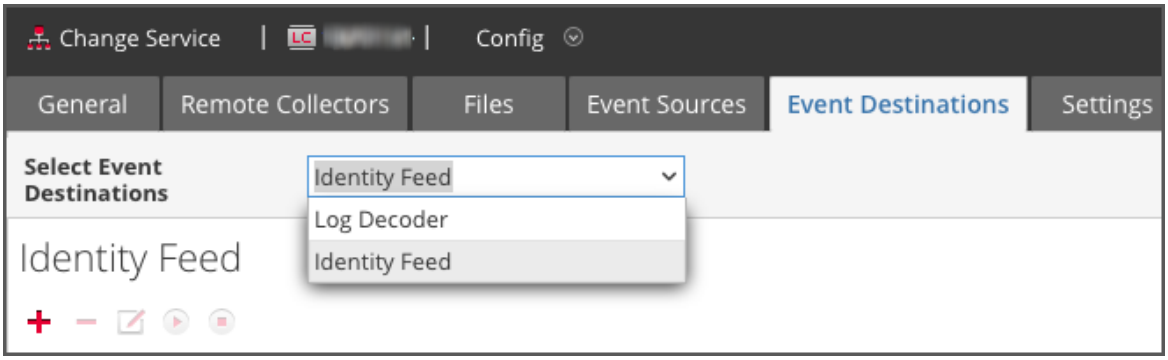
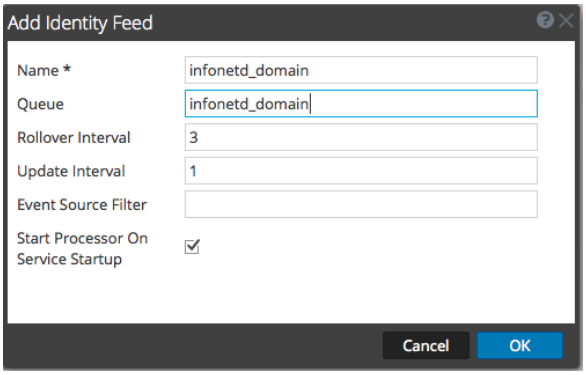
<Field index="2" type="value" key="alert" />
</Fields>
</FlatFileFeed>
</FDF>
```



Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with range="cidr". Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Creating and Managing an Identity Feed

You can easily create an Identity feed and populate it to selected Decoders and Log Decoders. After completing this procedure, you will have created an Identity feed.



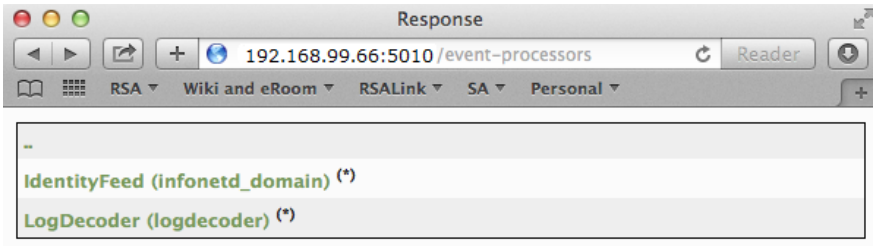
To create an identity feed:

1. Add a destination for the feed.
   a. Go to **(Admin) > Services** and in the **Services**.
   b. In the list of services, select a **Log Collector** service, and select **View > Config**.
   c. Select the **Event Destinations** tab.
   d. In the Select **Event Destinations** field, select **Identity Feed**.

   e. Click and enter a unique name for the feed.

      The Queue name identifies the feed within the Log Collector. Use the name of the feed for the Queue.

   f. Click **OK**.
2. Test generation of messages.
   a. Have users log into Windows boxes on the domain to generate the appropriate log messages on the domain controllers for testing.

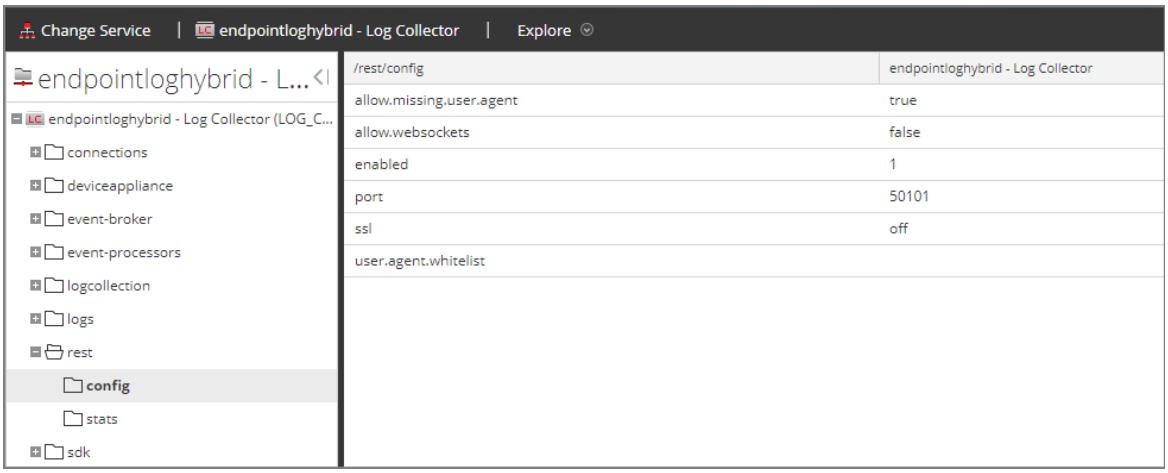


b. Verify that data is written to the feed files. SSH to the Log Decoder/Collector or Virtual Log Collector being configured. Navigate to `/var/netwitness/logcollector/runtime/identity-feed` and verify that the `Identity_deploy` files are getting populated with data.

c. Open up a web browser (Non-Internet Explorer browsers preferred) and log in to the REST interface of the Log Collector. Use administrative credentials when logging in. For example, if the IP address of your Log Collector is 192.168.99.66, the URL would be:

- SSL not enabled: **http://192.168.99.66:50101/event-processors**
- SSL enabled: **https://192.168.99.66:50101/event-processors**

The browser screen should look like this:

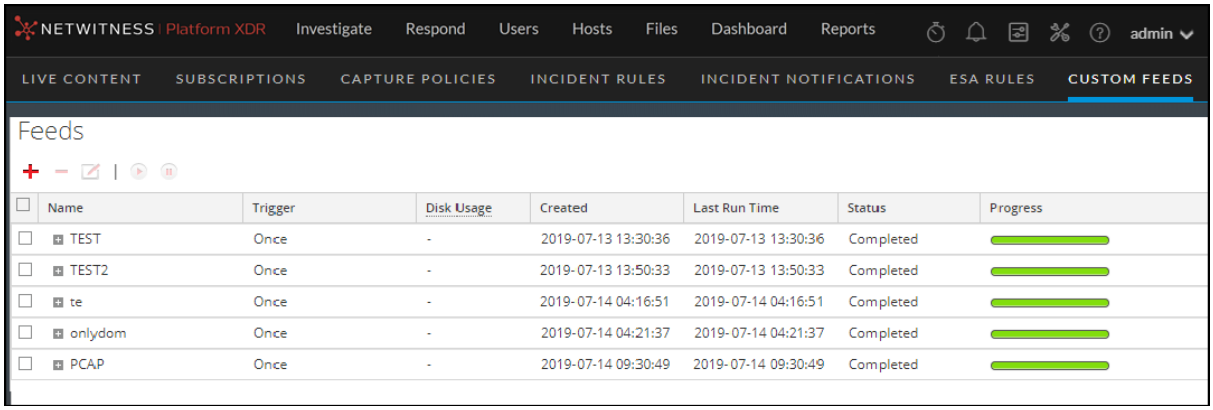


The screen contains the name of the identity feed you created earlier (`infonetd_domain`, in this example).

For the identity feed to function correctly, port 50101 must be active on the Log Collector, and you must determine whether SSL encryption is active.

d. Go to  **(Admin) > Services > <*Log Collector being setup*>**  **> View > Explore**.

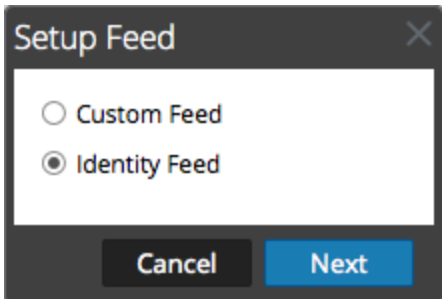
e. In the left pane, expand **rest > config**.



For REST to be active, **enabled** must be set to **1**.

f. Note the value for **ssl**. If SSL should be enabled for your environment, this must be set to **on**.

> **Note:** If you changed the setting for either the **enabled** or **ssl** option you must restart the Log Collector service before moving forward.

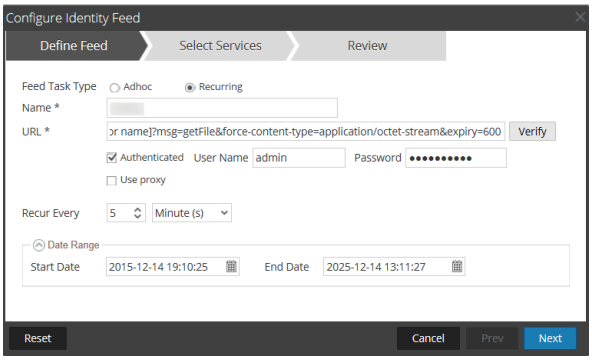


3. Go to **(Configure) > Custom Feeds**.

The Feeds dialog is displayed.

4. In the toolbar, click .

The Setup Feed dialog is displayed.



5. Make sure **Identity Feed** is selected and click **Next**.

The Configure Identity Feed panel opens with the **Define Feed** tab displayed.

6. (Conditional) You can create an on-demand or recurring feed.

   - To define an on-demand Identity feed task that executes once, select **Adhoc** in the **Feed Task Type** field, type the feed **Name**, and browse for and open the feed.
   - To define a recurring Identity Feed task that executes on a recurring basis, select **Recurring** in the **Feed Task Type** field.

     The **Define Feed** dialog includes the fields for a recurring feed.

Note: NetWitness verifies the location where the file is stored, so that NetWitness can check for the latest file automatically before each recurrence.

7. Enter a value and verify the URL field.

   a. In the **URL** field, enter the URL where the feed data file is located. This is the REST API interface that was setup earlier. Make sure you have the following information to construct the URL:

      - The IP address of the Log Collector being used to construct the Identity Feed file.
      - The identity queue name, as set in step 2c.
      - Whether or not SSL is enabled on the Log Collector REST port, as set in step 2f.

      You can construct this value as follows:

      - SSL enabled: `https://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`
      - SSL not enabled: `http://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`

      So, using the example from earlier, the complete value that you would enter into this field is as follows:

      ```
      http://192.168.99.66:50101/event-processors/infonetd_
      domain?msg=getFile&force-content-type=application/octet-
      stream&expiry=600?msg=getFile&force-content-type=application/octet-
      stream&expiry=600
      ```

b. For the URL verification to work correctly, it is important that the NetWitness UI server can access the Log Collector's REST API port (50101). This can be tested by going to the NetWitness UI server via SSH. Once there, run the following command:

- SSL enabled: `curl -vk https://<ip of log collector>:50101`
- SSL not enabled: `curl -v http://<ip of log collector>:50101`

If the `curl` command does not connect then there may be a network firewall or routing issue between the NetWitness UI server and the Log Collector.

Example of a bad connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... No route to host
* couldn't connect to host
* Closing connection #0
curl: (7) couldn't connect to host
```

Example of a good connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... connected
* Connected to 192.168.99.66 (192.168.99.66) port 50105 (#0)
> GET / HTTP/1.1
> User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu) libcurl/7.19.7
NSS/3.19.1 Basic ECC zlib/1.2.3 libidn/1.18 libssh2/1.4.2
> Host: 192.168.99.66:50105
> Accept: */*
>
< HTTP/1.1 401 Unauthorized
< Content-Length: 71
< Connection: Keep-Alive
< Pragma: no-cache
< Expires: -1
< Cache-Control: no-cache, no-store, must-revalidate
< WWW-Authenticate: Basic realm="NetWitness"
< Content-Type: text/xml; charset=utf-8
<

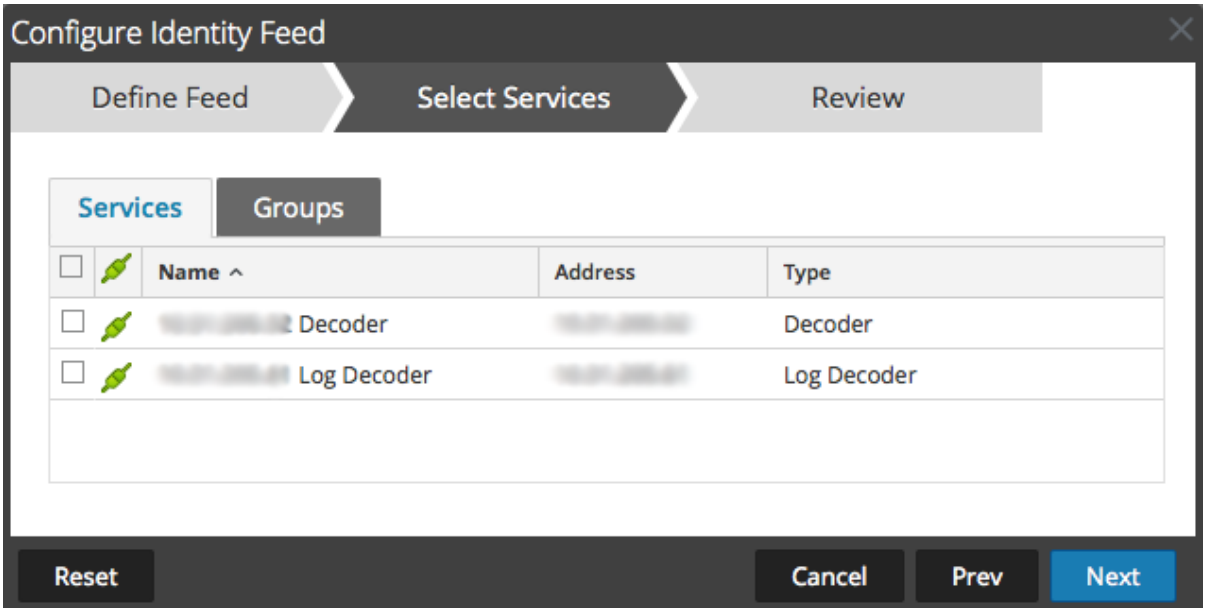
<?xml version="1.0" encoding="utf-8"?>
<error>401 Unauthorized</error>
* Connection #0 to host 192.168.99.66 left intact
* Closing connection #0
```

8. The REST API requires a username and password when attempting to pull the `identity_deploy.csv` file from the Log Collector. This can be any username and password that is available on the service itself. For more information, see the "Services Security View" topic in the *Hosts and Services Guide*.

   To see which accounts are available, go to  **(Admin) > Services > <log collector being setup> > Actions > View > Security**.

   Under the Users table, you see all the users that can be used in this step. It is suggested that a separate user account is created specifically for this setup, and is used nowhere else in the environment, for added security. For details, see "Add a User and Assign a Role" in the *System Security and User Management Guide*. (Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.)

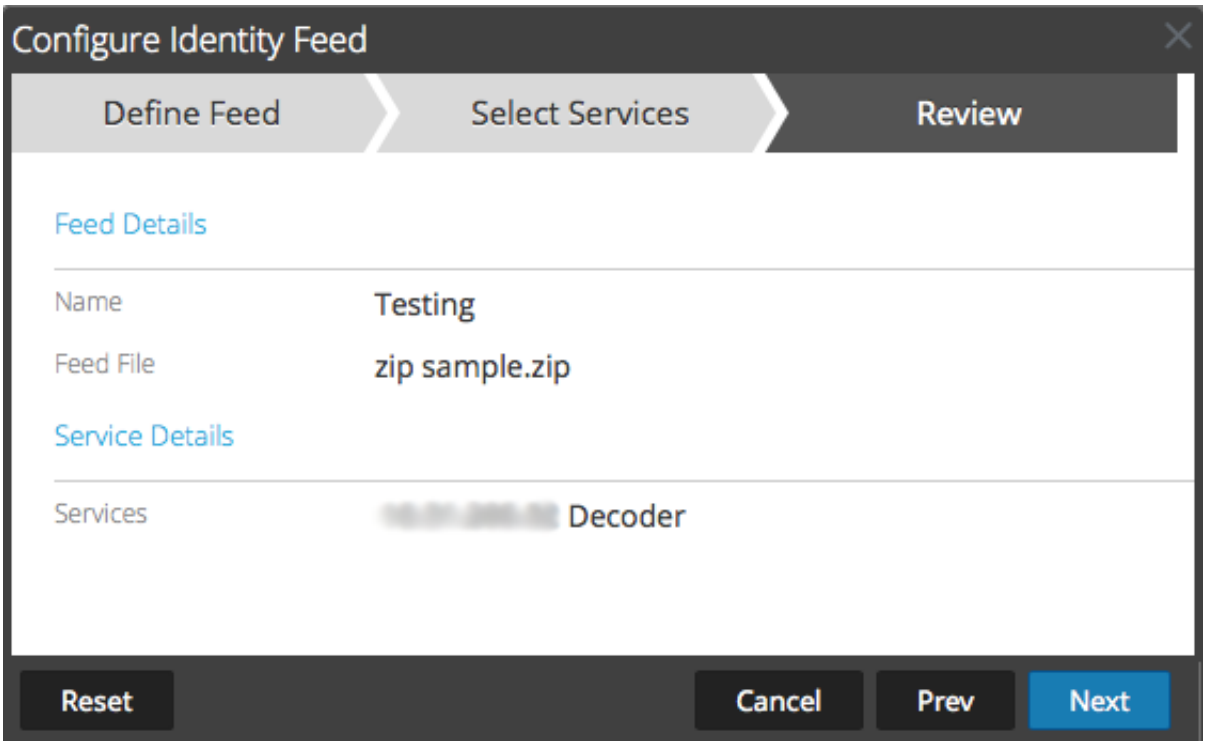
9. To define the recurrence interval, do one of the following:



- Specify the number of minutes, hours, or days between recurrences of the feed.
- Enter the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

10. If using SSL encryption, you need to install the REST API SSL certificate for the Log Collector into the NetWitness UI server. For more information, see Import the SSL Certificate.

    If, after importing the SSL certificate, the verification of the URL still fails, see Cannot Verify Identity Feed URL.



11. Click **Verify** to verify your identity feed configuration before you proceed to the Select Services dialog.
12. Click **Next**.

    The Select Services dialog is displayed.

13. To identify services on which to deploy the feed, select one or more Decoders and Log Decoders and click **Next**.
14. Click the **Groups** tab, select a group, and click **Next**.

    The Review dialog is displayed.

Note: If a group of devices with Decoders and Log Decoders is used to create recurring or custom feeds and this group is deleted, you can edit the feed and add a new group to the feed.

15. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
16. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Import the SSL Certificate

If SSL is configured on the Identity feed's Log Collector, follow these steps to import the Log Collector's SSL certificate into the NetWitness UI server key store. If this certificate is not imported, the NetWitness UI server will be unable to pull the Identify feed file from the Log Collector.

1. To pull the SSL certificate off the Log Collector, SSH into the NetWitness UI server and run the following command:

   ```
   echo -n | openssl s_client -connect <HOST>:<PORT> | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/<SERVERNAME>.cert
   ```

   This command saves the SSL certificate to `/tmp/<SERVERNAME>.cert`. For example:

   ```
   echo -n | openssl s_client -connect 192.168.99.66:50101 | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/logcollector.cert
   ```

2. To import the SSL certificate into the NetWitness UI server, SSH into the UI server and run the following command:

   ```
   keytool -importcert -alias <name an alias for the cert> -file <the cert file pathname> -keystore /etc/pki/java/cacerts
   ```

   For example:

   ```
   keytool -importcert -alias logcollector01 -file /tmp/logcollector.cert -keystore /etc/pki/java/cacerts
   ```

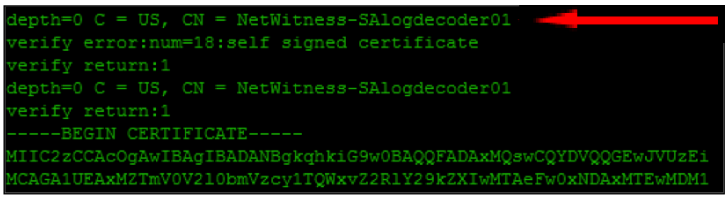
3. The system requests a password. Enter the password for the keystore on the NetWitness UI server, not for the jetty keystore. The default password is **changeit**.

4. Restart **jettysrv** to allow jetty to read the new certificate in the store.

Cannot Verify Identity Feed URL

If the Identity feed URL cannot be verified, and you are using SSL, make sure you followed the steps in Import the SSL Certificate.

If there are issues, it is possible that the internal name of the certificate does not match the hostname of the Log Collector. The following procedure checks this.



1. SSH to the NetWitness UI server.
2. Run the following command to output the CN name of the SSL cert:

   ```
   echo -n | openssl s_client -connect <log decoder>:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

   For example:

   ```
   echo -n | openssl s_client -connect salogdecoder01:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

3. Retrieve the CN name of the SSL certificate.

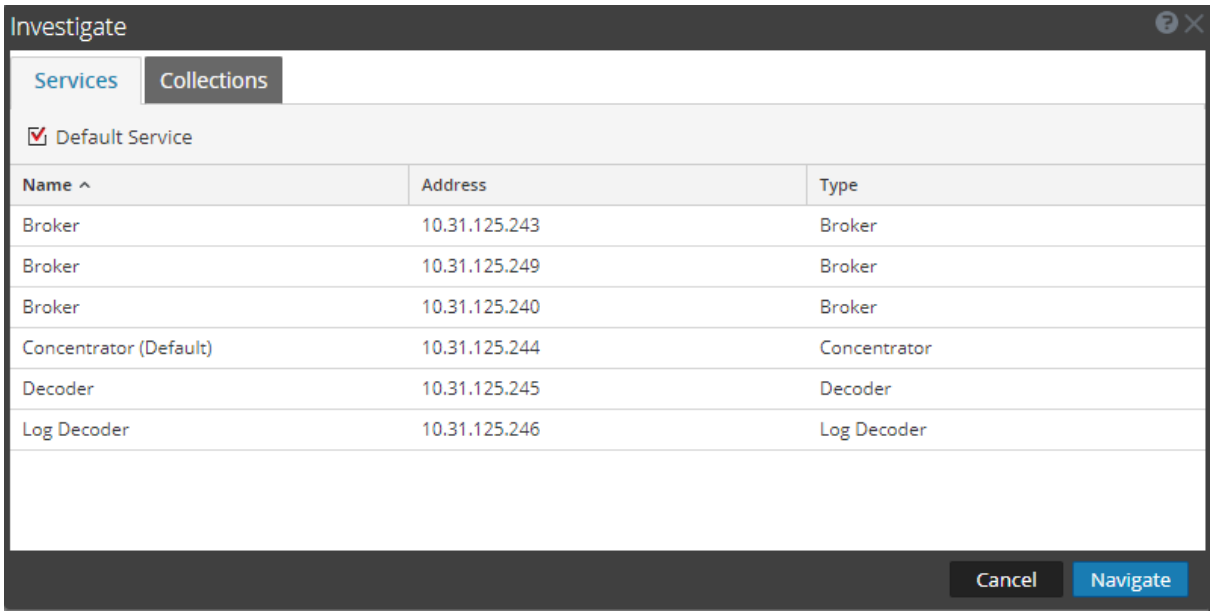
4. Edit the `/etc/hosts` file and add the IP address and CN name to the file.

5. Restart the network service on the appliance.
6. Confirm that the name placed in the **/etc/hosts** file is used instead of the FQDN or IP address in the Identity feed URL.
7. Re-verify the Identity feed URL.

Investigating an Identity Feed

An identity feed tracks interactive log on events from the Windows operating system. Identity feeds do not track interactive log off events.

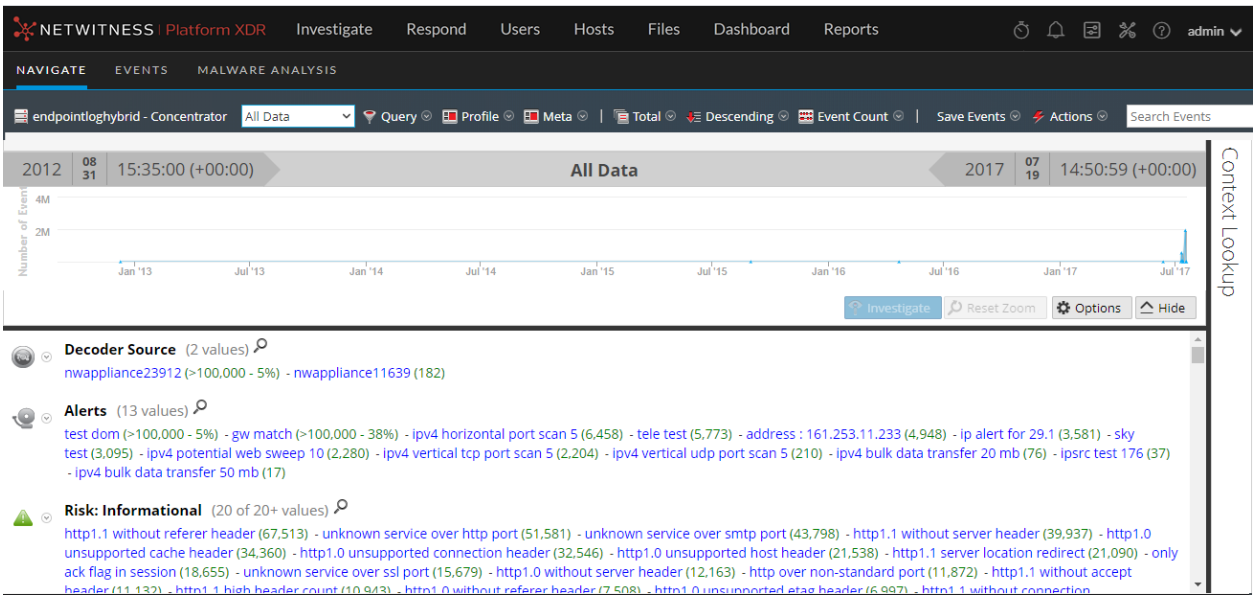
In order for an identity feed to process events and tag them, the events need to be collected using a Windows Log Collection module where an Active Domain Controller or non-Domain Controller is configured. Note that identity feeds can only be processed via an Identity Feed Event Processor.



Note: An identity feed only tracks one log in at a time. If two users log in to a system at the same time, the second user will overwrite the first user's data in the identity feed.

Once you have created an identity feed, you can view the results by investigating the feed.

To investigate a configured identity feed:



1. Go to **INVESTIGATE > Navigate**.

   If no default service is selected, the Investigate dialog is displayed.

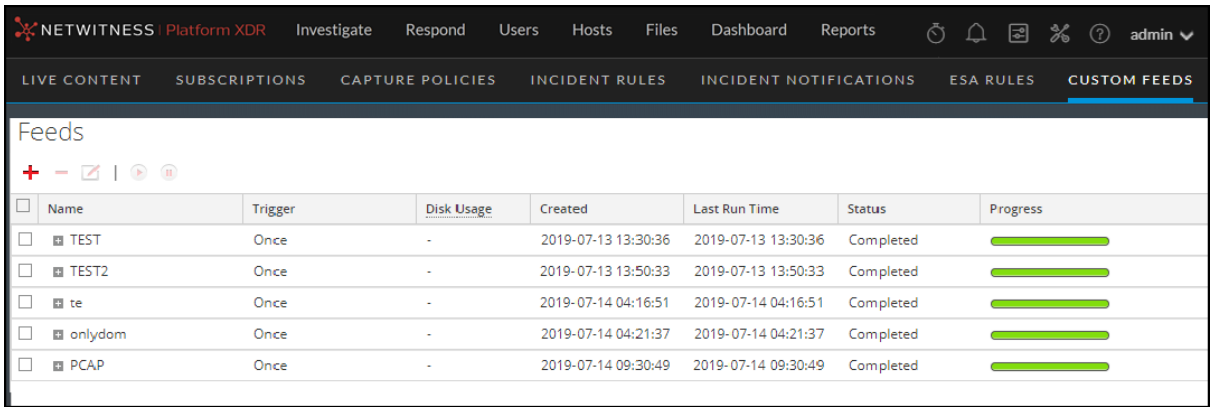
2. Select a service, usually a Concentrator, and click **Navigate**.
3. Select **Load Values** to retrieve meta data.

In the Values panel, scroll down to find the Meta Keys:

The identity feed provides information to selected Decoders and Log Decoders. It associates the Host IP data from the Windows operating system to the user logging into that Host in order to tag all logs associated with that IP and investigate.

Editing a Feed

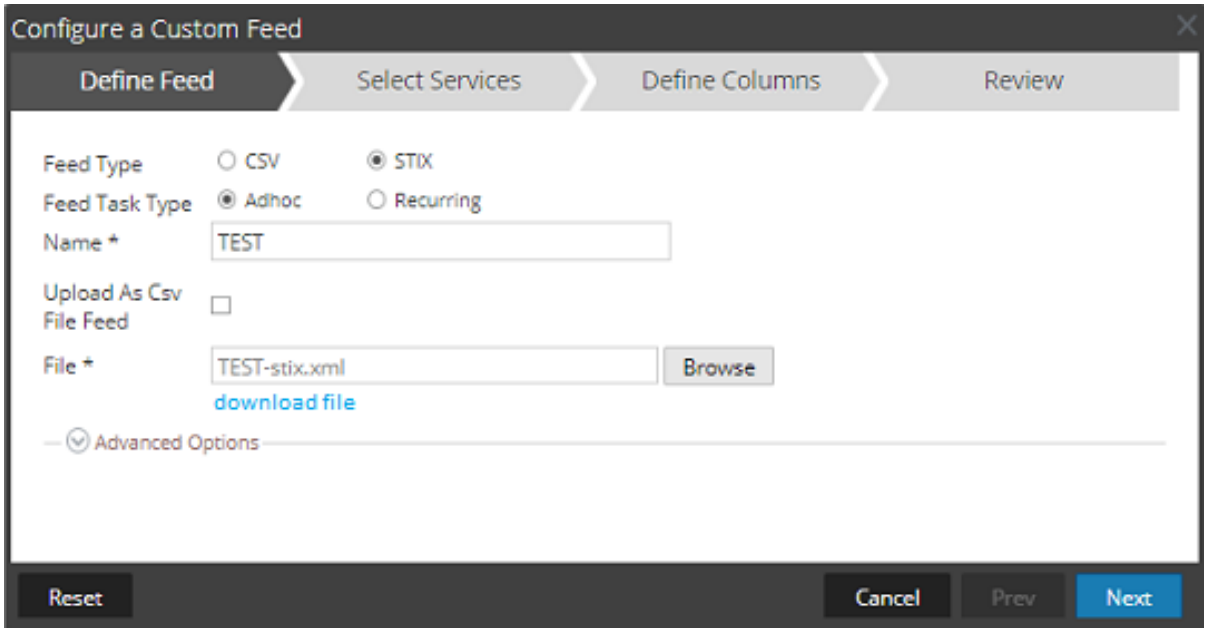
This topic provides instructions for editing a custom feed using the Custom Feed Wizard.



After you edit a feed:

- The feed (**.zip** format) or the file used to create the feed (**.csv** or **.xml**) has been downloaded and edited.
- The feed has been recreated with the updated file and new feed specifications.

To edit an existing feed:



1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds dialog is displayed.

2. In the toolbar, select a feed and click .

   The Configure Custom Feed or Configure Identity Feed panel opens in the Custom Feed wizard.

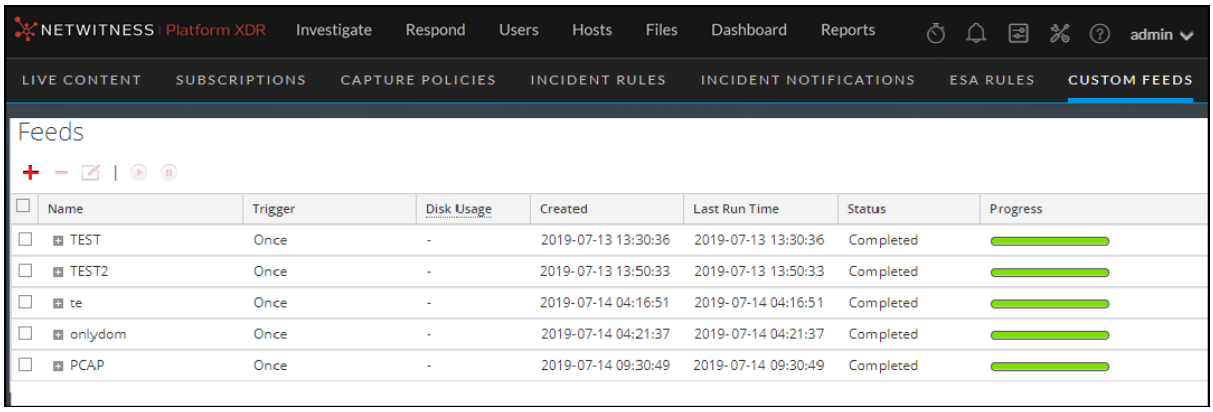
3. If you want to edit the feed file:
   a. Click **download file**.

      For an Identity feed, the .zip file is downloaded. For a custom feed, the .csv or .xml file is downloaded to your local file system.

   b. Edit and save the file.

   c. In the **Define Feed** tab, browse for and open the edited file.
4. Edit any other parameters in the **Define Feed** tab, **Select Services** tab, and **Define Columns** tab that apply to the type of feed.
5. Anytime before you click **Finish**, you can:
   - Click **Cancel** to close the wizard without saving your changes.
   - Click **Reset** to clear the data in the wizard.
   - Click **Next** to display the next form (if not viewing the last form).
   - Click **Prev** to display the previous dialog (if not viewing the first form).
6. In the **Review** tab, review the feed information, and if correct, click **Finish**.

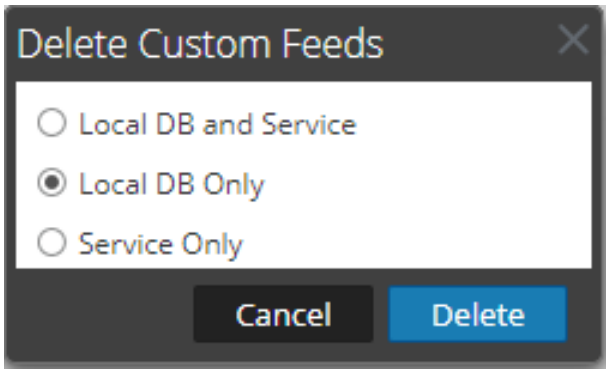
The feed is added to the feeds list and progress bar tracks completion. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file is listed in the Feeds list. You can expand or collapse the entry to see how many services are included, and which services are successful.



Removing a Feed

This topic provides instructions for removing a feed. You might want to remove a feed when some or all of the information in the feed is no longer useful for your organization.

To remove a feed:



1. Go to **(Configure) > CUSTOM FEEDS**.

   The Custom Feeds dialog is displayed.

2. In the toolbar, select a feed and click .

   The Delete Custom Feeds dialog is displayed.

   You can select one of the following options to delete the feed:

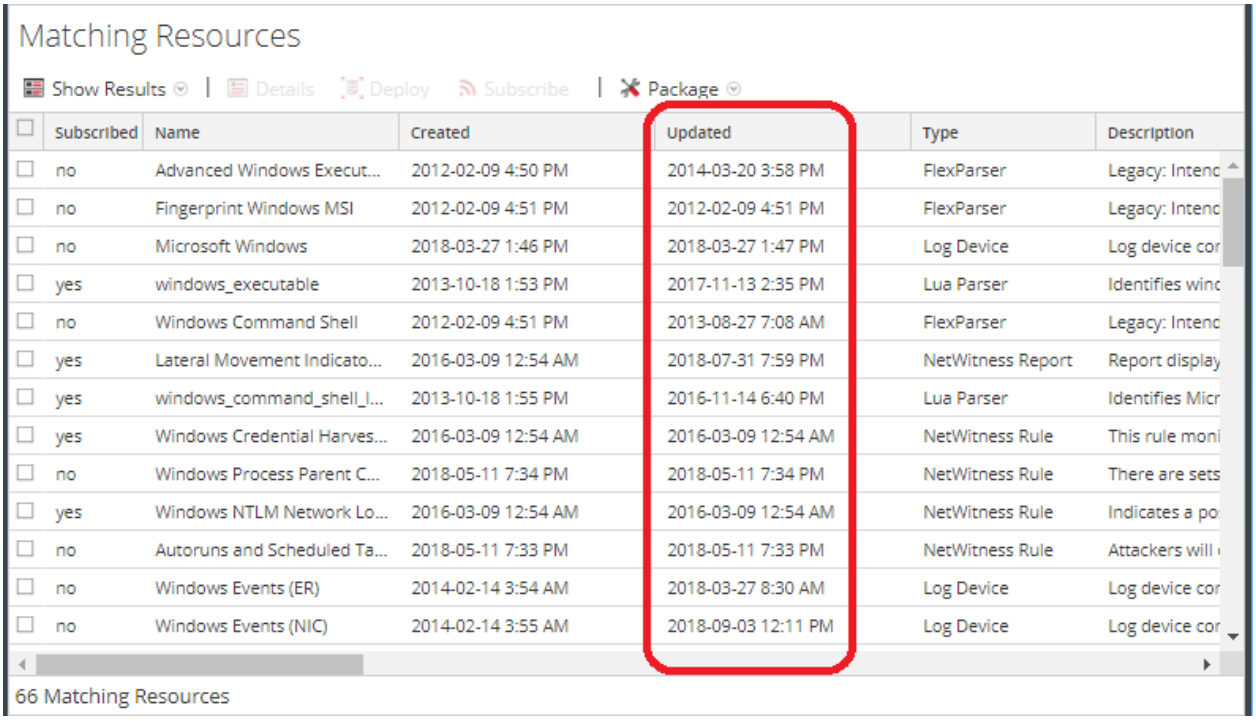
   - If you choose to delete the feed from **Local DB and Service**, the feed is deleted from both the service and the local NetWitness box. The deleted feed will no longer seen on the NetWitness user interface.
   - If you choose to delete the feed from **Local DB Only**, the feed is deleted from the local NetWitness box. The deleted feed will not be seen on the NetWitness user interface; however, the last deployed version of the feeds will be present on the service. The undeployed feeds will be deleted forever.
   - If you choose to delete the feed from **Service Only**, the feed is deleted from the service. The deleted feed will appear on the NetWitness user interface and can be deployed again

3. Select which feed you want to delete and click **Delete**.

   A warning dialog is displayed.

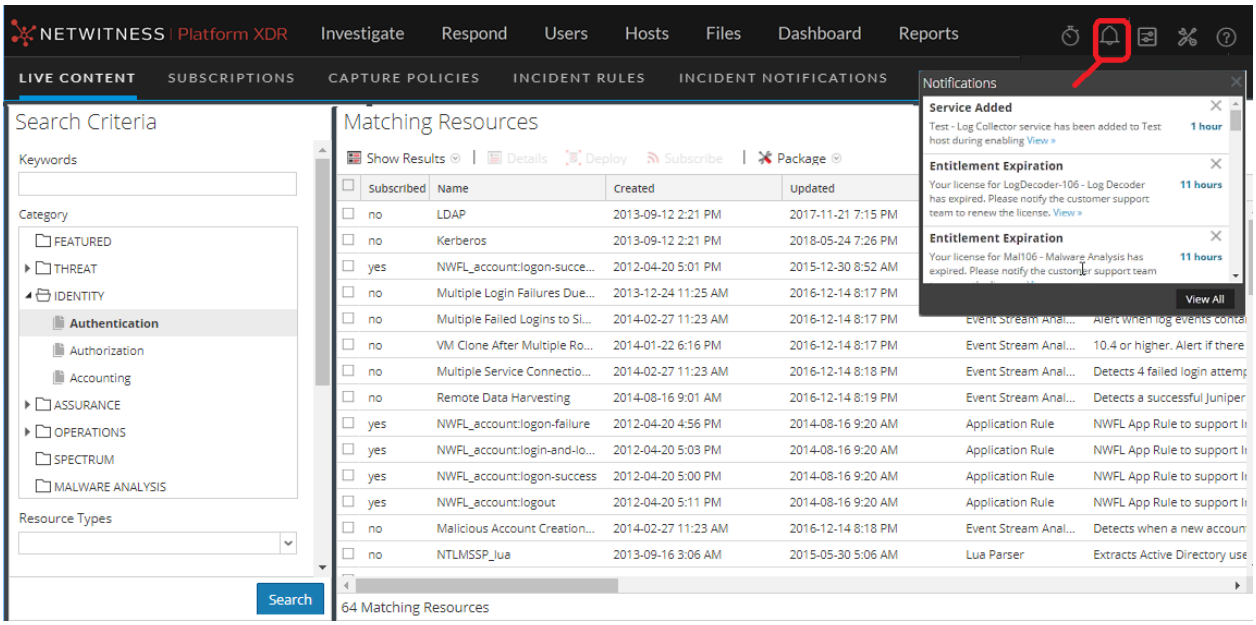
4. Click **yes** to confirm that you want to delete the feed from the selected areas.

Subscribing to Live Resources



This section describes subscriptions in Live.

Threats and the corporate landscape change over time. NetWitness periodically reviews existing content to determine whether it needs to be updated based upon current campaigns, or has become irrelevant due to changes in technology or attack techniques and tools.



You can discover new content by using the What's New dashlet within the Default Dashboard, or by searching through NetWitness Live by data range since last deployed. Be sure to subscribe to any content for which you want to receive update notifications.

Subscription Updates

When you view resources in the Matching Resources panel of the Live Content view, there is a column named **Updated**:

This value is also displayed when you select the detailed view for a resource. Every time a resource changes, its **Updated** value changes to match the specific update. If you are subscribed to a resource, and it gets updated, your system is automatically updated with the latest version, and you receive a notification. You can view your notifications by clicking the Notification icon, , from anywhere in the NetWitness UI.

You can also get email notifications when subscribed resources are updated. System Administrators can add email addresses in the **(Admin) > SYSTEM > Live Services** view. For more information, see the "Live Services Configuration Panel" topic in the *System Configuration Guide*.

Adding Subscribed Resources for Deployment to Services

1. Go to **(Configure) > Subscriptions > Deployments**.
2. In the **Groups** panel, select a group.
   Subscribed resources, if any, are listed in the Deployments tab Subscriptions panel.
3. In the **Subscriptions** panel, click .
   The Add Subscription dialog, which lists subscriptions available for deployment, is displayed.
4. Select the subscribed resources that you want to deploy to the services group.
5. Click **Save**.
   The dialog closes and the subscriptions are added to the listing in the Deployments tab, Subscriptions panel. This stages the resources for deployment at the next synchronization.
6. You can click the Synchronize icon, , to immediately synchronize your changes.

Deleting a Subscription

When you delete a subscription to a resource, deployed instances of the resource are not deleted. The deployed resource remains on services until explicitly removed, but the resource is no longer synchronized with the resource in NetWitness Live.

To delete a subscription:

1. Go to **(Configure) > Subscriptions**.
2. In the **Subscriptions** tab, select the subscriptions you want to delete.
3. Click , then choose **Delete** to delete your selected resources or **Delete All** delete all subscriptions.

   A dialog asks for confirmation that you want to delete the subscription.
4. To confirm removal, click **Yes**.

   Your selected subscriptions are deleted from the subscriptions list, but any deployed instances of the subscribed resource remain on the services.

Removing Subscribed Resources from the Deployments Subscriptions Grid

Subscriptions that are selected for deployment to a service group are deployed during synchronization.

You can remove subscriptions from the Live (Configure) > Subscriptions > Deployments panel, but any that have actually been deployed to services remain deployed until someone removes them.

To remove resources from the Deployments tab Subscriptions panel:

1. Go to **(Configure) > Subscriptions > Deployments**
2. In the **Groups** panel, select a group.

   Subscribed resources, if any, are listed in the Subscriptions panel.
3. In the Subscriptions panel, click .

   A dialog requests confirmation that you want to delete the resource from the service group. The resource is removed from the Deployments tab Subscriptions panel, but is not removed from services on which it is deployed.

Subscribe and Unsubscribe to a Resource

When you subscribe to resources, you will receive notification when new versions of the resources are available.

To subscribe to a resource:

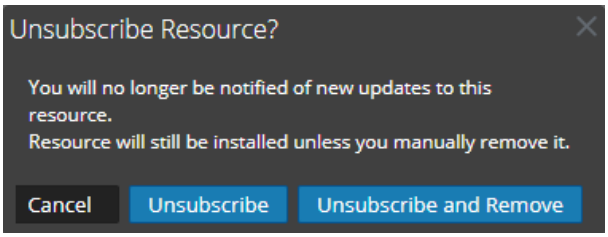
1. Go to **(Configure) > Live Content**.
2. In the **Search Criteria** panel, specify search criteria and click **Search**.
3. Select one or more resources and click Subscribe.

   A confirmation dialog is displayed: **By subscribing to these resources, you are indicating that you wish to receive notification when new versions are available.**
4. To confirm that you want to subscribe to the resource, click **OK**.

   The resource is added to the subscriptions managed in the Subscriptions tab and is available for deployment in the Deployments tab.

When unsubscribing from a resource, you have the option to leave the resource on services on which it is deployed or to remove it from services.

To unsubscribe from a resource:



1. Open a detailed view of a resource in one of the following ways:

   - Perform a search, **(Configure) > Live Content** > enter search criteria, then select the resource in the Matching Resources panel, then click Details.
   - View subscriptions, **(Configure) > Subscriptions**, select the resource from the Subscriptions list, then click Details.

2. With the detailed view of a resource displayed. click Unsubscribe.

   A confirmation dialog is displayed.

3. Do one of the following:

   - To confirm that you want to unsubscribe from the resource and leave it on the services where it is deployed, click **Unsubscribe**.
   - To confirm that you want to unsubscribe from the resource and remove it from the services where it is deployed, click **Unsubscribe and Remove from Services**.
   - To close the dialog without unsubscribing, click **Cancel**.

   The selected action is applied.

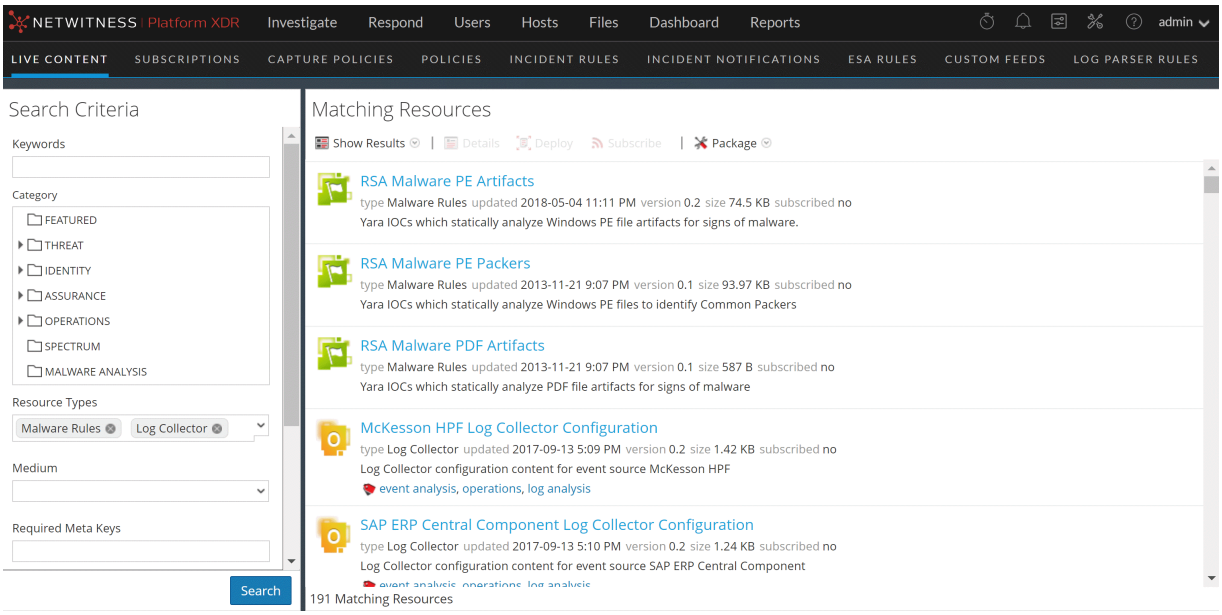
Viewing Subscribed Resources Selected to Deploy on Services

In the  **(Configure) > Subscriptions > Deployments** tab you can view subscribed resources that have been selected for deployment on services.

To view subscribed resources that have been selected for deployment on services:

In the **Groups** panel, select a group, and expand it to view services in the group. The resource subscriptions selected for deployment are listed in the Deployments tab Subscriptions panel.

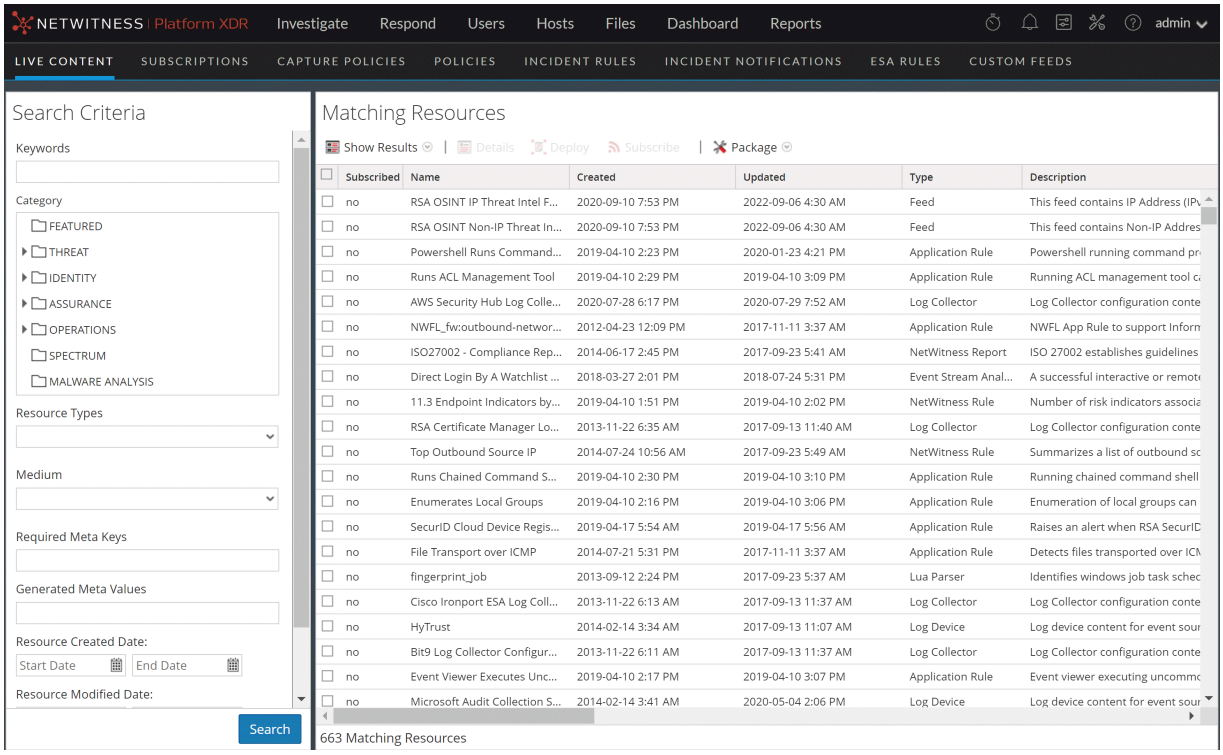
Miscellaneous Live Services Procedures



This section describes several other procedures.

Displaying Resource Details in Live Resource View

After you select a resource (in the Live Resource View), you can view its detailed information.



To open a separate tab in the Live Resource view with details of a selected resource, do one of the following:

- If you are viewing the results in **Show Results** > **Detailed view**, click the resource type icon or the resource name.

- If you are viewing the results in **Show Results** > **Grid view**, double-click a resource or select a

resource and click **Details**.

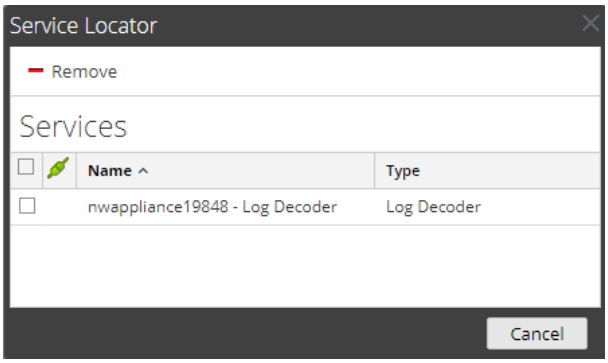
Downloading a Resource

You can download a single resource from the Live Resource View.

To download a resource:

1. Go to **(Configure) > Live Content**.
2. In the **Search Criteria** panel, enter the criteria needed to return the resource you want to download.
3. Select a single resource, then click Details.
4. Click Download.

The resource is saved as a ZIP archive to your local Downloads folder.



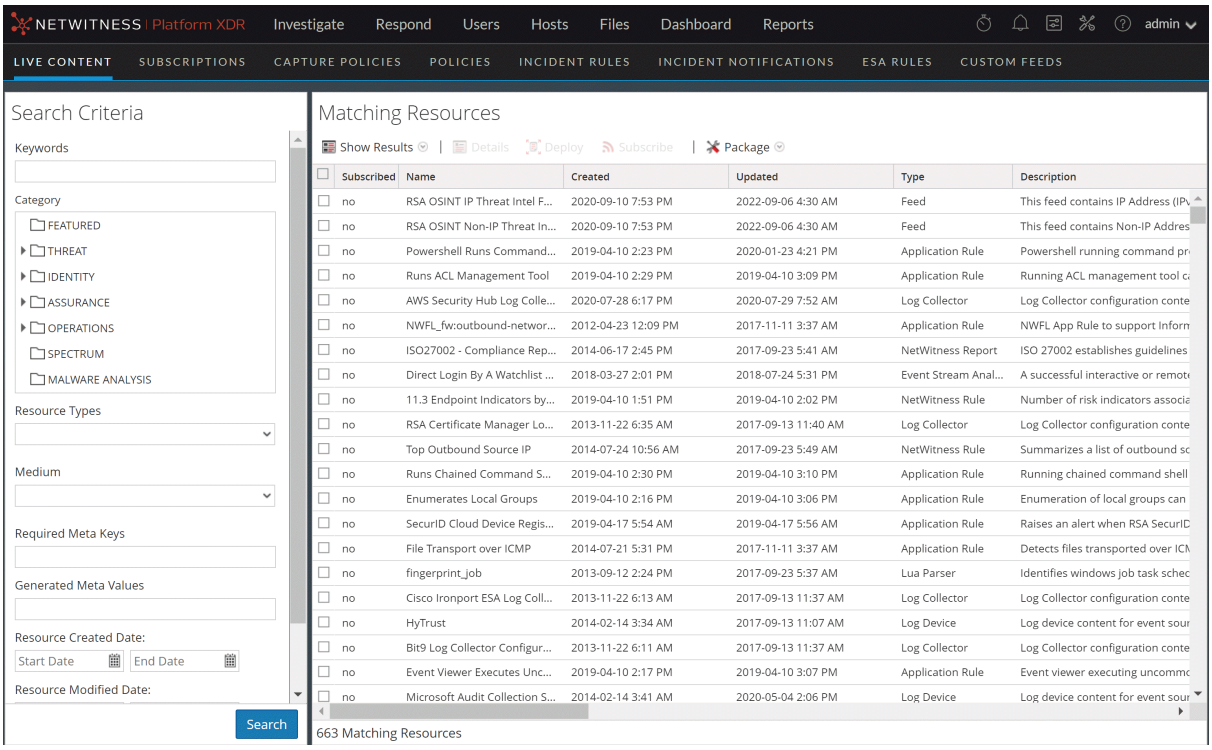
Locating and Removing a Deployed Resource from Services

You can locate and remove a deployed resource from services from the Live Resource View.

To view a list of services on which a resource is deployed:

1. With a resource displayed in the **Resource View**, click Service Locator.

   The Service Locator dialog is displayed.



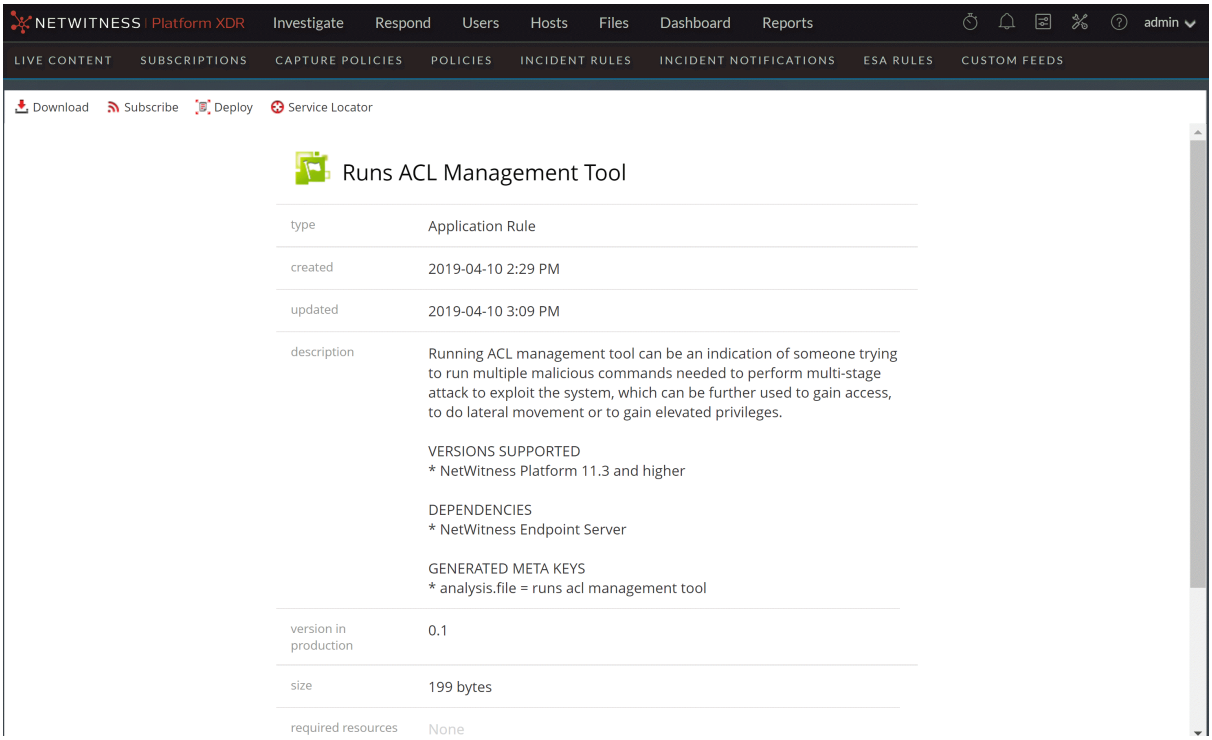
2. Select one or more services in the **Services** list.
3. Click −.

   The resource is removed from the selected services.

Showing Results as a List or in Detail

1. Select **Show Results > Grid** to change to grid results when viewing detailed results.

2. Select **Show Results > Detailed** to change to detailed results when viewing grid results.



Viewing Resource Details

You can display detailed information about a subscribed resource in the Resource View.

To view details:

1. In the **Subscriptions** tab, select a single subscription.
2. Click Details .

The details of the resource are displayed in the Resource View.

References

This topic is a collection of references, which describe the user interface and more detailed information about how Live works in NetWitness. These topics are presented in alphabetical order.

Live Configure View

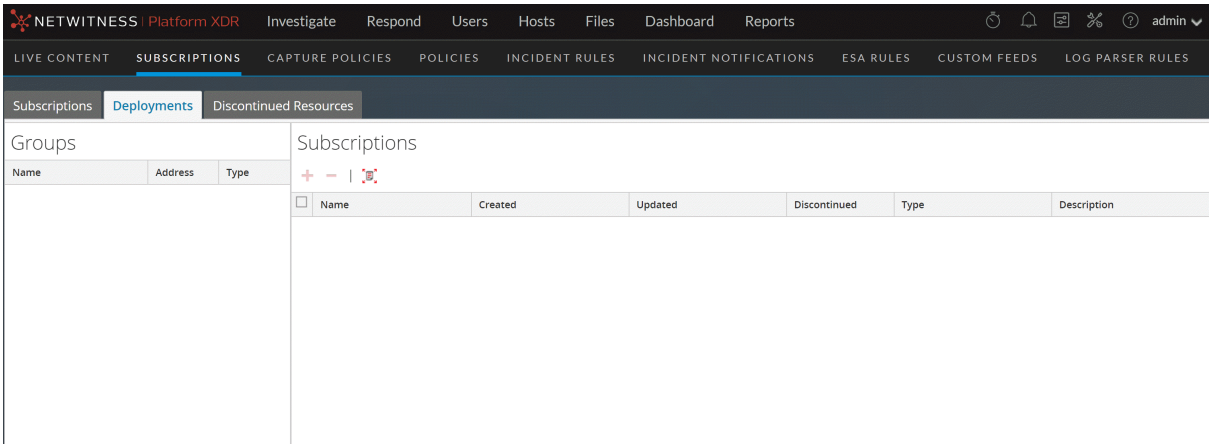
In the Live Configure view, NetWitness provides integrated tools for managing Live resources. You can manage resource subscriptions, deployments to services and discontinued resources. The required role to access this view is **Configure Live Resources**. For a high-level description of how to use the different views in NetWitness Live, please read Live Services Management.

To access this view, navigate to  **(Configure) > Subscriptions**. The view has three tabs: Deployments Tab, Subscriptions Tab, and Discontinued Resources Tab.

Deployments Tab

The Deployments tab provides a user interface in the Live Configure view for:

- Viewing subscribed resources that are selected for deployment on services in a service group.
- Selecting subscribed resources to deploy to services in a service group.
- Removing resources that are selected for deployment on services in a service group.



The resources listed here are not deployed immediately after adding to a service group. Instead the subscribed resources are pushed to the services when NetWitness synchronizes with NetWitness Live. The synchronization schedule is configured in the Live Configuration panel. Additionally, you can synchronize immediately in the **(Configure) > Subscriptions > Deployments** tab.

Likewise, resources deleted from the Deployments panel are not deleted from service where they have been deployed. To delete resources from services, delete them in the Live Resource View.

The required permission to access this view is **Manage Live Resources**.

To access this view:

1. Go to **(Configure) > Subscriptions**.
   The **Subscriptions** tab is displayed.
2. Click the **Deployments** tab.

The Deployments tab has two panels: **Groups** and **Subscriptions**.

Groups Panel

The Groups panel is a static display of configured service groups that were created in the Administration Services view. Selecting a group in the Groups panel populates the Subscriptions panel with a list of subscriptions that are selected for deployment on the services in the service group.

Feature	Description
Name	Displays the service group name. Clicking the plus sign displays a nested list of services in the group.
Address	Displays the IP address of each service in the group.

Feature	Description
Type	Displays the type of service.

Subscriptions Panel

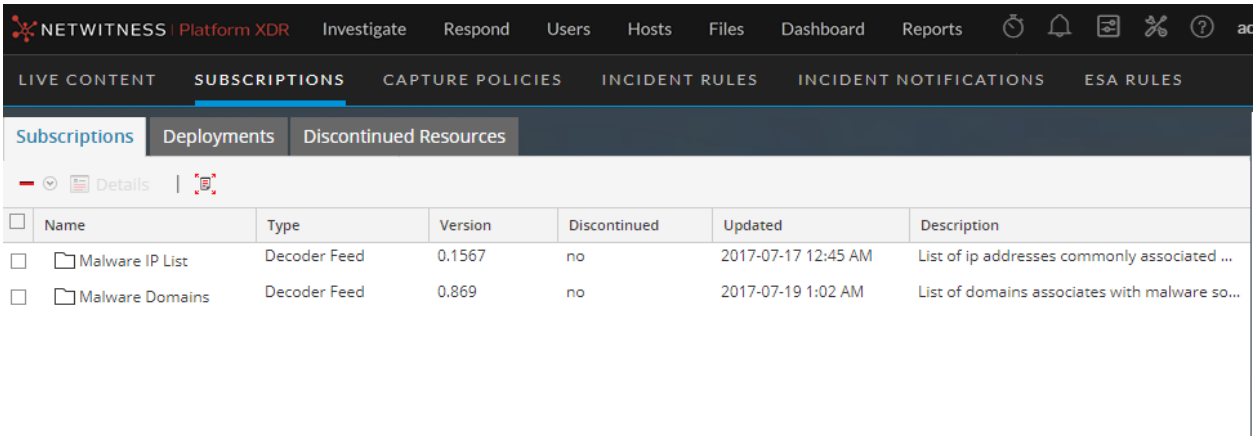
The following table describes the features in the Subscriptions panel.

Feature	Description
	Click  to open a dialog that lists subscriptions that were added in the Live Search view or in the Live Resource view and are available for deployment.
	Click to delete the selected subscriptions from the deployment list for service group.
	Click  to synchronize your resources to the latest versions available on Live.
Name	Displays name of the resource.
Created	Displays date and time that the resource was created.
Updated	Displays date and time that the resource was last updated.
Type	Displays type of resource.
Description	Displays description of the resource.

Subscriptions Tab

Subscriptions are NetWitness Live resources to which you subscribed in the Live Search view or Live Resource view. When you subscribe to a resource, you agree to receive updates on a regular basis from NetWitness Live. The choices made in the Live Configuration panel determine the synchronization frequency and also whether you receive update notifications through email. In addition, if you don't want to wait for the next update, you can force an immediate synchronization.

The Subscriptions tab provides a way to manage subscriptions. Each resource to which NetWitness is subscribed is listed in this tab.



In the Subscriptions tab, you can:

- View all resources to which this NetWitness instance is subscribed.
- Open a detailed view of a subscription in the Live Resource View.
- Delete a subscription.

Note: Subscribing to a resource does not deploy the resource to any services. To deploy one or more subscribed resources, go to the Deployments tab. To deploy a single resource manually, use the Deploy option in the Resource View.

The required permission to access this view is **Manage Live Resources**.

To access this view, in the main menu, select **(Configure) > Subscriptions**. The Subscriptions tab is displayed.

The **Subscriptions** tab has a toolbar and a grid.

Toolbar

This table describes the options available in the toolbar.

Feature	Description
	Deletes the selected subscriptions.
Details	Displays the details of a single subscribed resource in the Resource View.

Feature	Description
	Check the Live Server for the latest discontinued resources.

Grid

Column	Description
	Selects subscribed resources to view in detail or delete. You can view details for a single resource. You can delete one or more resources from the subscribed resources, in effect unsubscribing.
Name	Displays name of the subscribed resource.
Type	Displays type of subscribed resource.
Version	Displays version of the subscribed resource.
Discontinued	Indicates the status of the discontinued resources for the subscribed resource. **Yes** - Resource is discontinued. **No** - Resource is not discontinued. **--** - The Live Server is not checked for the discontinued resources.
Updated	Displays date and time when the subscribed resource was last updated.
Description	Displays description of the subscribed resource.

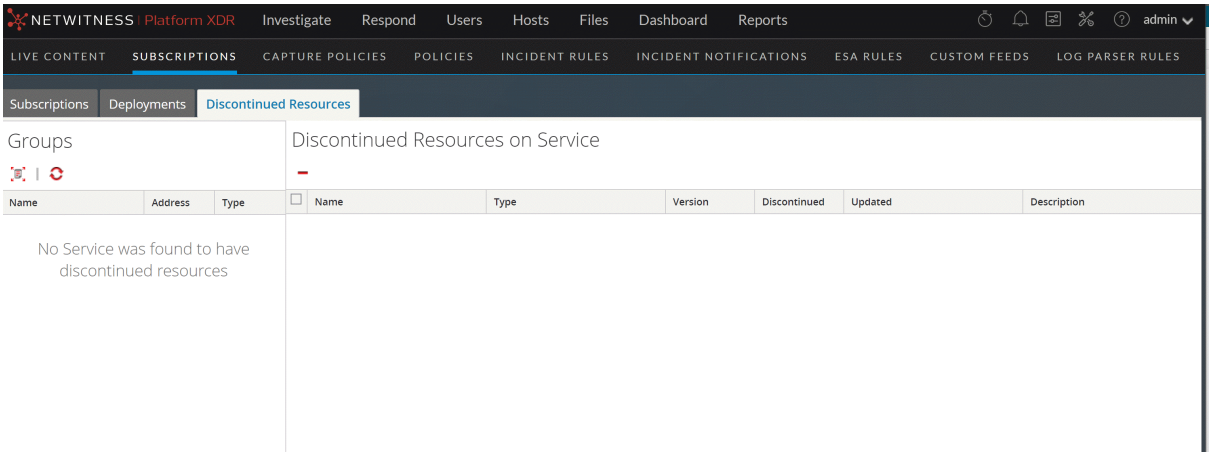
Discontinued Resources Tab

The Discontinued Resources tab provides a user interface in the Live Configure view:

- Scan the services for the discontinued resources.
- Remove the discontinued resources from any service or service group.

Note: Discontinued content still appears. With discontinued content there just won't be any updates, and users won't see these items when they search in Live, unless they check the **Include Discontinued Resources** box while searching.

In the RSA Content space on NetWitness Community, you can view the complete, up-to-date list of discontinued resources (Discontinued Content). For each resource, there is a description of why it was discontinued. Use these details to determine whether or not to remove a discontinued resource from your installation. .



The required permission to access this view is **Manage Live Resources**.

To access this view:

1. Go to  **(Configure) > Subscriptions**.

   The **Subscriptions** tab is displayed.
2. Click the **Discontinued Resources** tab.

   The Discontinued Resources tab is displayed.

The Discontinued tab has two panels: Groups and Discontinued Resources on Service.

Groups Panel

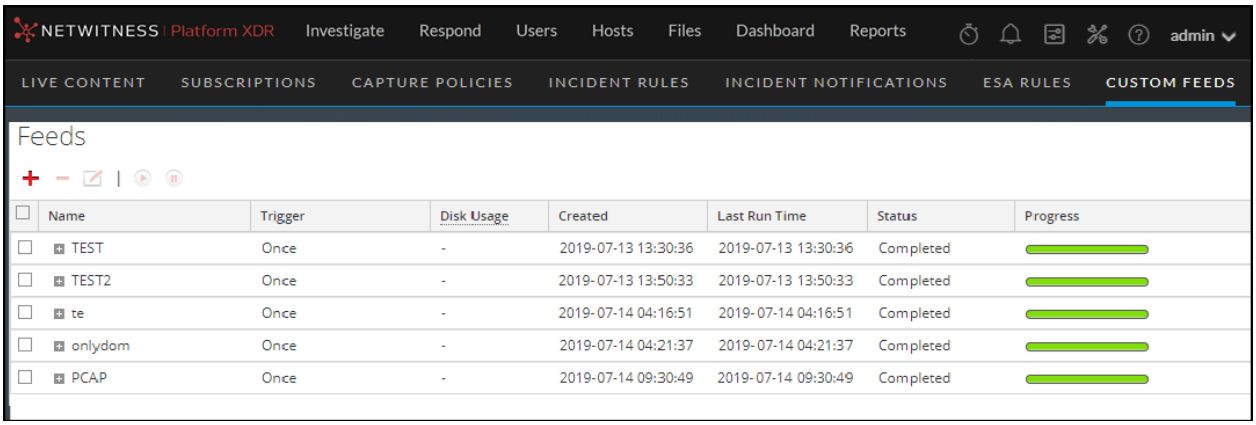
The Groups panel is a static display of configured service groups that were created in the Admin Services view. Selecting a group in the Groups panel populates the Discontinued Resources panel with a list of discontinued resources which are deployed on the selected service or service group.

Feature	Description
	Click the button to scan the services for a discontinued resource.
	Displays the current status of the discontinued resources on a service. **Note:** The status of a service may change while the services are being scanned.
Name	Displays service group name. Clicking the plus sign displays a nested list of services in the group.
Address	Displays IP address of each service in the group.
Type	Displays type of service.

Discontinued Resources on Service Panel

The following table describes the features in the Discontinued Resources on Service panel.

Feature	Description
	Click the button to delete the selected resources from the service or service group.
Name	This is the name of the resource.
Type	This is the type of resource.
Version	Version of the discontinued resource.
Discontinued	Indicates the status of the discontinued resources for the subscribed resource. **Yes** - The resource is discontinued. **No** - The resource is not discontinued. **--** - The Live Server is not checked for the discontinued resources.
Updated	Displays date and time that the resource was last updated.
Description	Displays description of the resource.

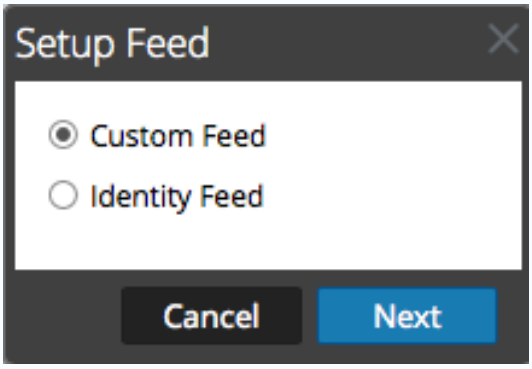


Live Feeds View

Use the Live Feeds View to:

- Create custom feeds.
- Create identity feeds.
- Edit feeds.

The required role to access this view is **Manage Devices**.



To access this view, navigate to **(Configure) > Custom Feeds**.
This is an example of the Feeds view.

The **Feeds** tab has a toolbar and a grid.

Toolbar

This table describes the options in the toolbar.

Feature	Description
	Initiates the creation of a custom or identify feed by displaying the **Setup Feed** dialog is displayed.  • Custom Feed opens the **Configure a Custom Feed** wizard. • Identity Feed opens the **Configure Identity Feeds** wizard.
	Deletes the feed that you selected.
	Opens the Configure Custom Feed or Configure Identity Feed wizard for the feed that you selected (see Editing a Feed.
	Start or resume data feed.
	Stop or pause data feed.

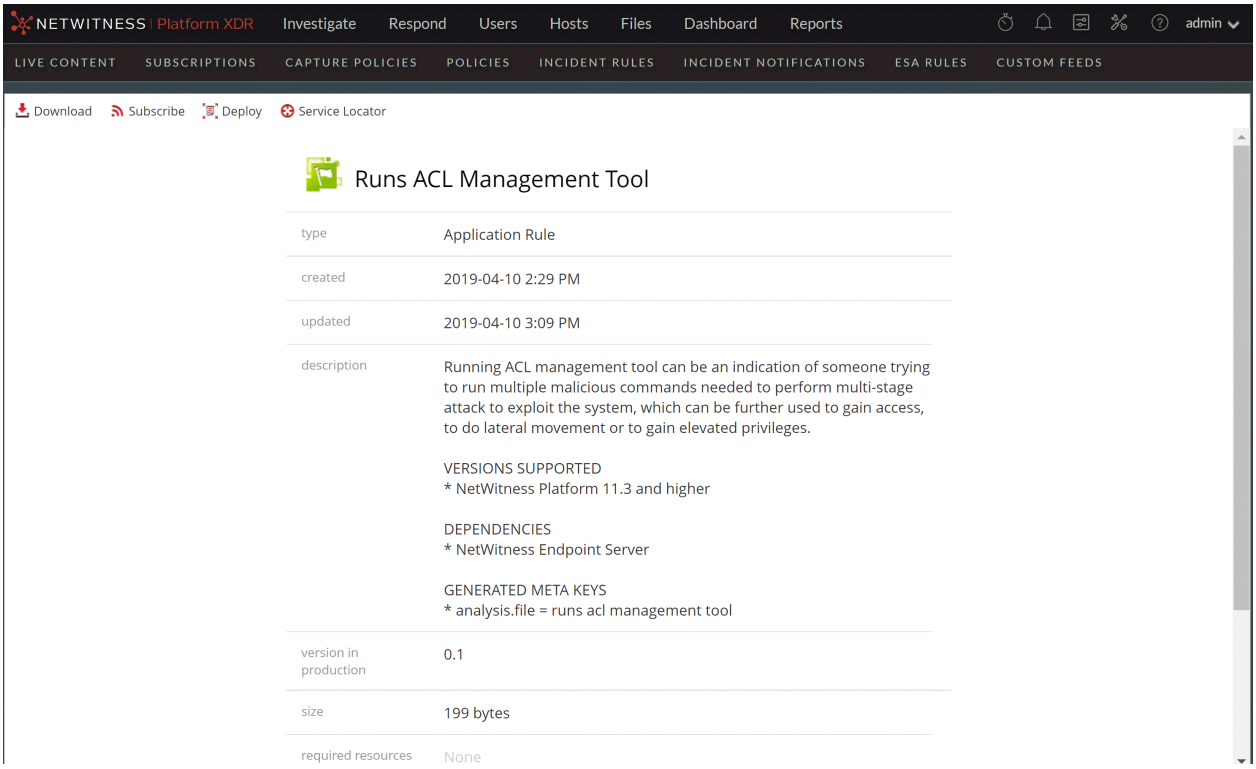
Feeds Grid

This table describes the columns in the grid.

Column	Description
	Selects a feed.
Name	Name of the feed. **Note:** You can now use special characters to define the name of the custom feed.
Trigger	Displays how often the feed runs which is determined by what you defined in **Feed Task Type** when the feed was created.
Created	Displays date and time when the feed was created.
Disk Usage	Displays the MongoDB storage size used by the TAXII feed.
Last Run Time	Displays date and time when the feed was last run.
Status	The status of the feed.
Progress	Progress bar.

Live Resource View

The Live Resource View shows a detailed view of a selected resource, and has the following options:



- Download the resource.
- Subscribe or unsubscribe the resource.
- Deploy the resource to services.
- Locate services on which the resource is deployed and remove the resource from services.

The required permission to access this view is View Live Resource Details.

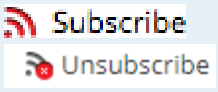
To access this view, do one of the following:

1. Go to **(Configure) > LIVE CONTENT > Search Criteria**.
2. In the Live Search view, **Detailed Results**, click the resource type icon or the resource name.
3. In the Live Search view, **Grid Results**, double-click a resource or select a resource and click **Details**.

This is an example of the Resource view.

The Live Resource View has a detailed view of a single resource and a toolbar.

Resource Details

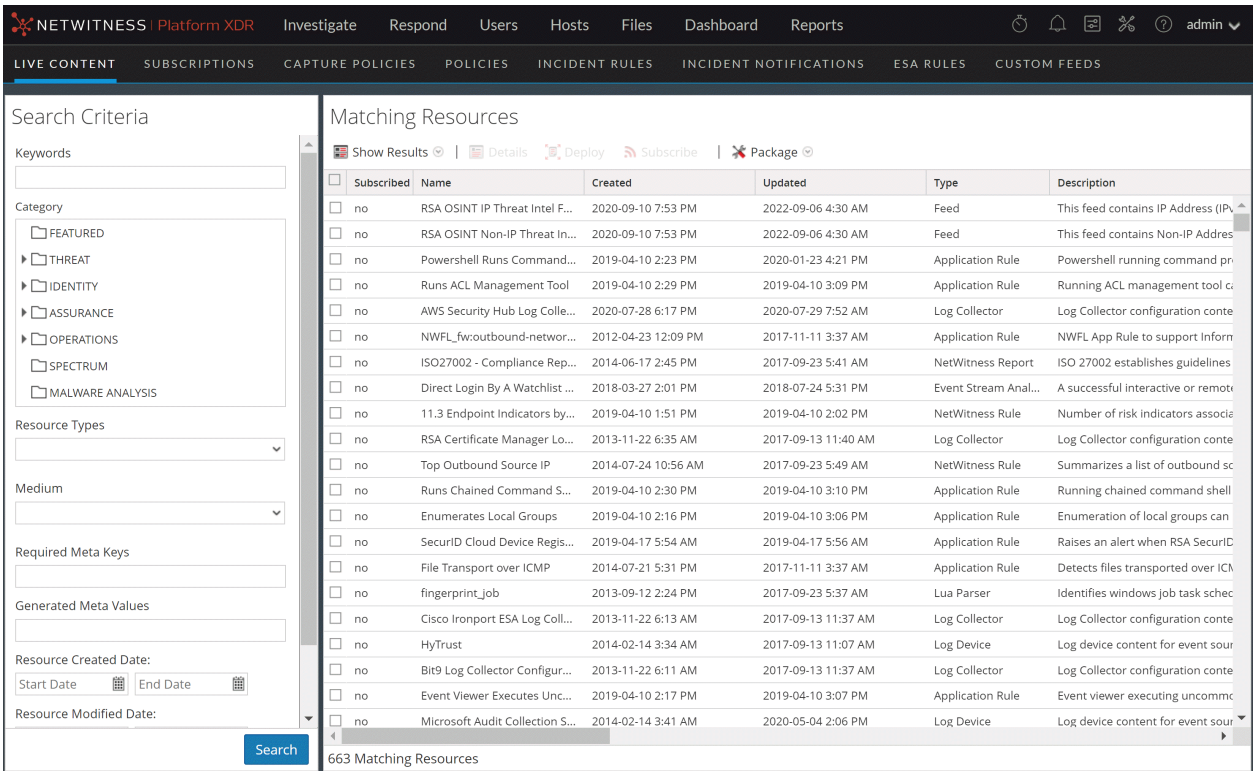


The following table describes the elements in the Resource Details section.

Feature	Description
Resource Type Icon	A graphic representation of the resource type, for example  .
Name	The name of the resource, for example, **fingerprint_office_lua**.
Type	The type of resource, for example, **RSA Lua Parser**.
Created	The date the resource was created, for example, **2013-09-15 02:16 PM**.
Updated	The date the resource was last updated, for example, **2013-09-15 02:16 PM**
Description	The description of the resource, for example, **Identifies Microsoft Office 95, 2007 Word, Excel, and PowerPoint documents**.
Version in production	The version of the resource, for example, **0.1**.
Size	The size of the resource, for example, **9.079 KB**.
Required Resources	A list of resources on which this resource depends, for example, **NetWitness Lua Library**. Clicking a resource replaces the currently displayed details with the details of the one you clicked.
Tagged as 	The tags that apply to the resource. In the example, the tags are **featured, informational**. Clicking a tag opens the Live Search View with the search narrowed to match resources with that tag.
Required Meta Keys	The meta keys  that apply to the resource. In the example, there are no meta keys required. Clicking a meta key opens the Live Search View with the search narrowed to match resources with that meta key.
Generates Meta Values	The meta values  that the resource generates. In the example, there are no meta values generated. Clicking a meta value opens the Live Search View with the search narrowed to match resources with that meta value.
Permissions	The permissions required for the resource.

Resource View Toolbar

This table describes the Live Resource view toolbar options.

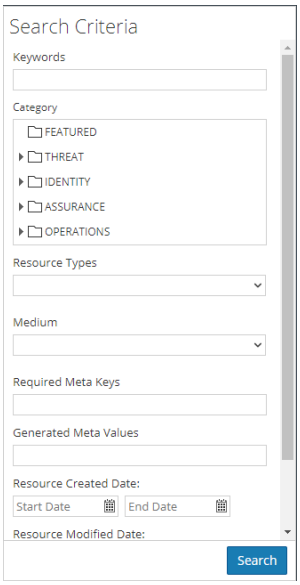


Feature	Icon	Description
Download		This option downloads the resource currently displayed in the Resource View.

Feature	Icon	Description
Subscribe or Unsubscribe		This option subscribes to or unsubscribes from the resource currently displayed in the Resource View. • Clicking **Subscribe** opens a dialog notifying that you are agreeing to receive notification when the selected resources are updated. You can cancel or click **OK**. • Clicking **Unsubscribe** asks for confirmation that you want to stop receiving notification when the selected resources are updated. You can then choose to cancel or you can click **Unsubscribe** or **Unsubscribe and Remove**, which also removes the resource from services on which it is deployed.
Deploy		This option provides a way to deploy the resource currently displayed in the Resource View. Clicking **Deploy** opens the Manual Resource Deployment dialog.
Service Locator		This option displays a list of services on which the currently displayed resource is deployed. You can remove the resource from all services or selected services.

Live Search View

The Live Search view provides the ability to browse the configured Live CMS for resources. Once matching resources are found, you can view details, subscribe to resources, and deploy resources to services and service groups.



This is an example of the Search view.

The Live Search view has a panel for specifying search criteria and a panel that displays matching resources. The Search Criteria panel is collapsible to provide more width for viewing the Matching Resources panel.

Search Criteria Panel

This is an example of the Search Criteria panel.

The following table provides descriptions of the Search Criteria panel features.

Feature	Description
Keyword(s)	Enter a keyword or keywords to browse for resources that have the keyword in the resource name or the resource description. You can use wildcards when you enter a keyword.
Category	The categories mirror the hierarchical Investigation Model that NetWitness uses to organize resources. The purpose of the Investigation model is to deliver an accurate path to information security incident response. For more information, see the Investigation Model topic in the NetWitness Content space on NetWitness Community.

Feature	Description
Resource Types	Select resources types from the drop-down list to filter resources by type of resource. Possible values are: • Advanced Analytics (Warehouse) • Application Rule • Bundle • Correlation Rule • Event Stream Analysis Rule • Feed • FlexParser • Investigation Column Group • Investigation Meta Group • Investigation Profile • Log Collector • Log Device • Lua Parser • Malware Rules • NetWitness List • NetWitness Report • NetWitness Rule • (Version 11.5 and later) Health and Wellness Dashboards • (Version 11.5 and later) Health and Wellness Monitors **Note:** Some rules that have been deployed to an earlier version of NetWitness may not deploy or execute on NetWitness 11.x. For more information, see the Troubleshooting Live Services.
Medium	Select one or more mediums from the drop-down list to search for content based on the meta data source. Available values for medium are as follows: • **endpoint**: for NetWitness 11.3 and later): applied to content that uses meta derived from endpoint agent and endpoint server data • **log**: applied to content that uses meta derived from log data • **packet**: applied to content that uses meta derived from network packets • **log and packet**: applied to content that correlates meta derived across log and packet data

Feature	Description
Tags	Select meta tags from the drop-down list to browse based on how the meta is tagged. For example, to browse resources for a Log Decoder, select the **netwitness for logs** tag. Alternatively, you can click a tag in the Matching Resources panel to insert that tag in this field.
Required Meta Key(s)	Enter a specific meta key; for example, **threat.source**. Alternatively, you can click a meta key in the Matching Resources panel to insert that tag in this field.
Generated Meta Value(s)	Enter a generated meta value; for example, **netwitness**. Alternatively, you can click a generated meta key in the Matching Resources panel to insert that tag in this field.
Research Created Date	Specify a date range during which resources were created. For example, to browse resources that were created between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in mm/dd/yyyy format or you click and pick dates from a calendar.
Research Modified Date	Specify a date range during which resources were modified. For example, to browse resources that were modified between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in mm/dd/yyyy format or you click and pick dates from a calendar.
Search	Click **Search** to send the search request to the Live server. More specific search criteria return matching resources more quickly.
Cancel	Click **Cancel** to cancel the search in progress.
Include Discontinued Resources	Check **Include Discontinued Resources** to include the discontinued resources in the search result. For an up-to-date list of resources that have been discontinued, see the Discontinued Content topic.

Matching Resources Panel

The Matching Resources panel displays search results based on the selections made in the Search Criteria panel. Results are initially displayed in a grid, but you can switch between two Show Results options: Detailed or Grid.

Detailed Results

In the detailed results, you can click a tag, meta key, or resource meta value to auto fill the Search Criteria panel and pivot the search results.

The following table describes the elements in the detailed results.

Feature	Description
Resource Type Icon	A graphic representation of the resource type. For example .
Name	The name of the resource, for example, **Group Management**. **Note:** (Discontinued) is displayed next to the resource name if a resource is discontinued.
Type	The type of the resource, for example, **Rule**.
Updated	The date when the resource was last updated, for example, **2015-09-15 4:27 PM**.
Version	The version of the resource, for example, **0.1**.

Feature	Description
Size	The size of the resource, for example, **153 B**.
Subscribed	Subscription status: • **yes**: This NetWitness instance is subscribed to this content resource. • **no**: This NetWitness instance has not subscribed to this content resource.
Description	The description of the resource, for example, **Compliance Rule-Group Management**.
Tags	The tags that apply to the resource. Clicking a tag narrows the search to resources with that tag. For example,  .
Meta Keys	The meta keys that apply to the resource. Clicking a meta key narrows the search to resources with that meta key. For example,  .
Resource Meta Values	The meta values generated by the resource. Clicking a meta value narrows the search to resources that generated the meta value. For example,  .

Grid Results

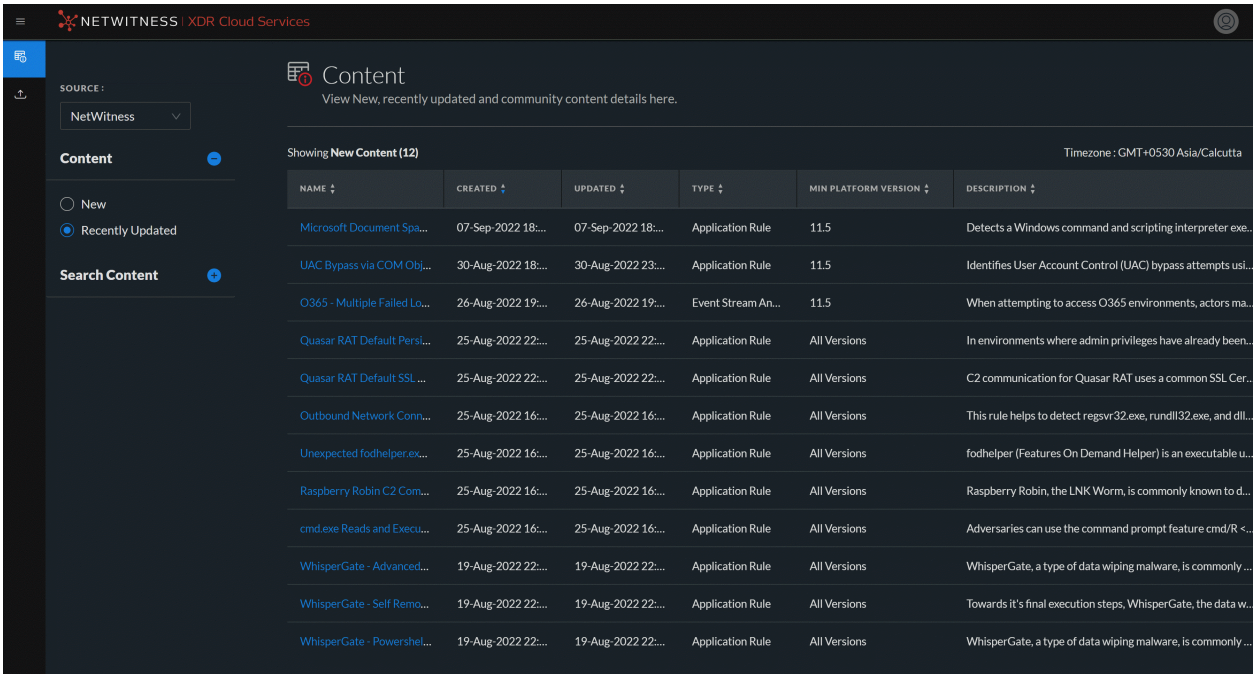
In the grid view, you can select one or more resources and use additional options in the toolbar to view the details of a single resource, subscribe to resources, and deploy resources.

The following table describes the elements in the grid results.

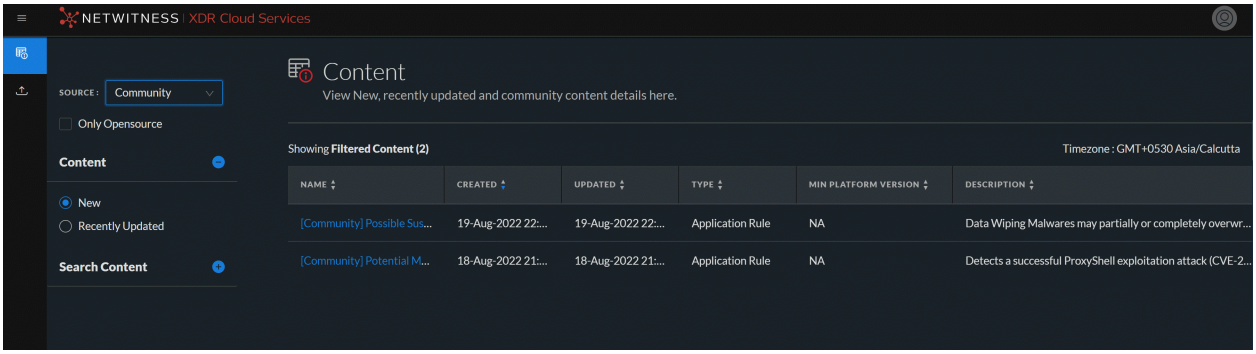
Feature	Description
Subscribed	Subscription status: • **yes**: This NetWitness instance is subscribed to this content resource. • **no**: This NetWitness instance has not subscribed to this content resource.
Name	The name of the resource, for example, **Group Management**. **Note:** The resource name is displayed in red color if it is discontinued.
Created	The date when the resource was created, for example, **2015-08-12 3:11 PM**.
Updated	The date when the resource was last updated, for example, **2015-09-15 4:27 PM**.
Type	The type of the resource, for example, **Rule**.
Discontinued	The status of the discontinued resources: • **yes**: The resource that matches the search criteria is discontinued • **no**: The resource is not discontinued • **--**: The Live Server is not checked for the discontinued resources
Description	The description of the resource, for example, **Compliance Rule-Group Management**.
Toolbar	

Feature	Description
	This menu offers two ways to view search results: **Detailed** and **Grid**.
	This option applies to a single selected resource. Clicking **Details** opens the selected resource in the Live Resource view.
	This option applies to one or more selected resources.
	This option applies to one or more selected resources. Clicking **Subscribe** opens a dialog that asks for confirmation that you want to receive notification when the selected resources are updated.

	This menu offers two packaging functions for the selected resources:
	• **Create**: creates a **resourceBundle.zip** file that contains the selected resources and opens a dialog in which you can either:
	  • open the file, or
	  • save the file for subsequent deployment.
	• **Deploy**: opens the Deployment Wizard, in which you can choose a **resourceBundle.zip** file and deploy it.



See Also



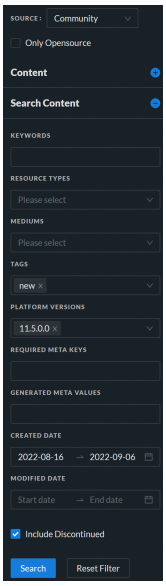
- For more information on Deployment (), see Find and Deploy Live Resources.
- For more information on Deploying a Package (), see the Resource Package Deployment Wizard,.

Live Search Content View

The Live Search Content view provides the ability to search the configured Live CMS for content. Once matching content are found, you can view the details, and download the content.

This is an example of the Search Content view.

The Live Search Content view has a panel for selecting the source and specifying search content. The matching content are displayed on the right panel.



The following table provides descriptions of the Live Search Content panel features.

Feature	Description
NetWitness	Select NetWitness from the Source drop-down menu to search for the content that is provided by NetWitness Platform XDR Live.
Community	Select Community from the Source drop-down menu to search for the content collected and retrieved from third party and open source communities.

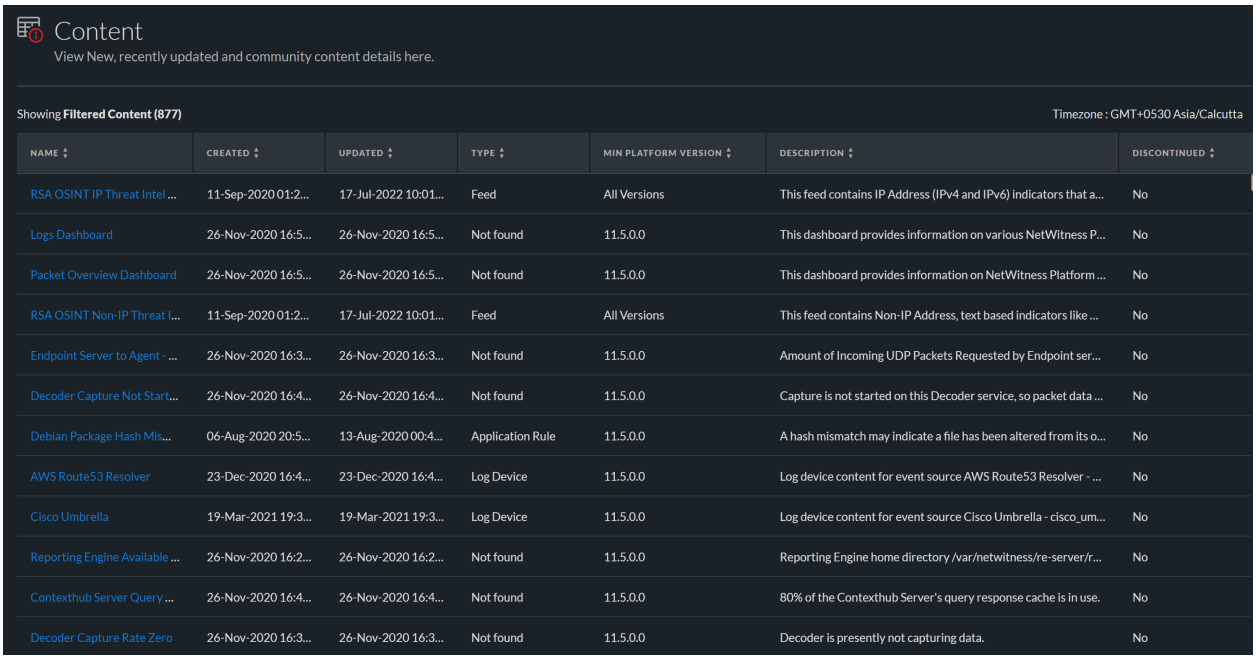
Feature	Description
Only Opensource	Select the Only Opensource checkbox to retrieve the content from the open-source communities. **Note:** When the community is selected as the source, the Only Opensource option will be displayed under the Search Content Panel to select and search for open source-related content.
New	Select New to retrieve the content which is created in the last 21 days.
Recently Updated	Select Recently Updated to retrieve the content which is updated in the last 21 days.

Search Content Panel

This is an example of the Search Content panel.

The following table provides descriptions of the Search Content panel features.

Feature	Description
Keywords	Enter a keyword or keywords to browse for content that have the keyword in the resource name or the resource description. You can use wildcards when you enter a keyword.



Feature	Description
Resource Types	Select resources types from the drop-down list to filter resources by type of resource. Possible values are: • Application Rule • Feed • Log Device • Correlation Rule • NetWitness Rule • NetWitness Report • Lua Parser • Log Collector • NetWitness List • Malware Rules • Event Stream Analysis Rule • Advanced Analytics (Warehouse) • Bundle • Health and Wellness Dashboards • Health and Wellness Monitors • Investigate Profile • Investigate Column Group • Investigate Meta Group
Mediums	Select one or more mediums from the drop-down list to search for content based on the meta data source. Available values for medium are as follows: • endpoint: for 11.3 and higher): applied to content that uses meta derived from endpoint agent and endpoint server data • log: applied to content that uses meta derived from log data • packet: applied to content that uses meta derived from network packets • log and packet: applied to content that correlates meta derived across log and packet data.
Tags	Select meta tags from the drop-down list to browse based on how the meta is tagged. For example, to browse content for a Log Decoder, select the **netwitness for logs** tag.

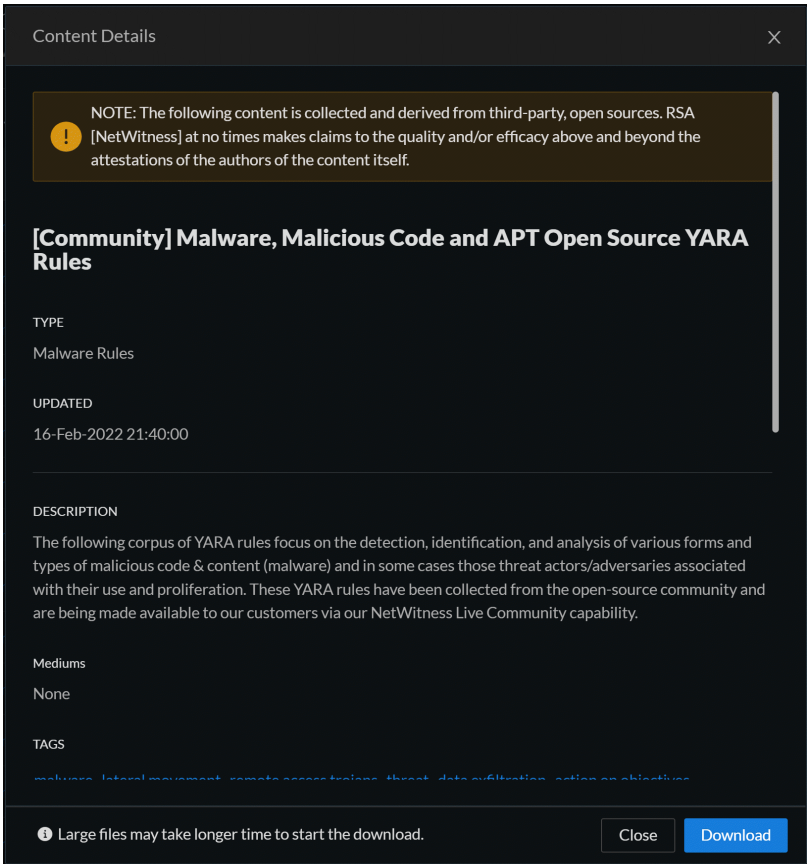
Feature	Description
Platform Versions	Select one or more platform versions from the drop-down list to search for content based on the versions. For example, **11.5**.
Required Meta Keys	Enter a specific meta key. For example, **threat.source**.
Generated Meta Values	Enter a generated meta value. For example, **rsa-firstwatch**.
Created Date	Specify a date range during which content were created. For example, to browse content that were created between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in yyyy/mm/dd format or you click and pick dates from a calendar.
Modified Date	Specify a date range during which content were modified. For example, to browse content that were modified between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in yyyy/mm/dd format or you click and pick dates from a calendar.
Search	Click **Search** to send the search request to the Live server. More specific search criteria return matching content more quickly.
Reset Filter	Click **Reset Filter** to reset the existing search results and displays all the content on the right panel.
Include Discontinued	Check **Include Discontinued** to include the discontinued content in the search result. For an up-to-date list of content that have been discontinued, see the Discontinued Content topic.

Search Results Panel

The Search Results panel displays search results based on the selections made in the Search Content panel.

This is an example of the Search Results panel.

The following table describes the elements in the search results panel.



Feature	Description
Name	The name of the content. For example, **Log Parser Pack**.
Created	The date when the content was created. For example, **04-Aug-2017 15:19:06**.
Updated	The date when the content was last updated. For example, **29-Sep-2020 20:27:14**.
Type	The type of the content. For example, **Bundle**.
Min Platform Version	Platform version that the content supports. For example, 11.5 and higher. **Note:** Min Platform Version is not applicable for Community content.
Description	The description of the content. For example, **Contains all parser files and log collection files**.
Discontinued	The status of the discontinued content: • **Yes**: The content that matches the search criteria is discontinued • **No**: The content is not discontinued

Content Details Panel

In the Search Results panel, you can select any content titles to view the details in the pop-up window and download the content.

Note: NetWitness provides no assurance related to the quality and accuracy of the content provided by the third parties and open source communities.

This is an example of the Content Details panel.

The following table describes the elements in the Content Details section.

Feature	Description
Name	The name of the content. For example, **Log Parser Pack**.
Type	The type of the content. For example, **Bundle**.
Created	The date when the content was created. For example, **04-Aug-2017 15:19:06**.
Updated	The date when the content was last updated. For example, **29-Sep-2020 20:27:14**.
Description	The description of the content. For example, **Contains all parser files and log collection files**.
Version on Production	The version of the content. For example, **0.5**.
Size	The size of the content. For example, **14.96 KB**.
Required Resources	A list of resources on which this resource depends. For example, **NetWitness Lua Library**. Clicking a resource replaces the currently displayed details with the details of the one you clicked in the pop-up window.

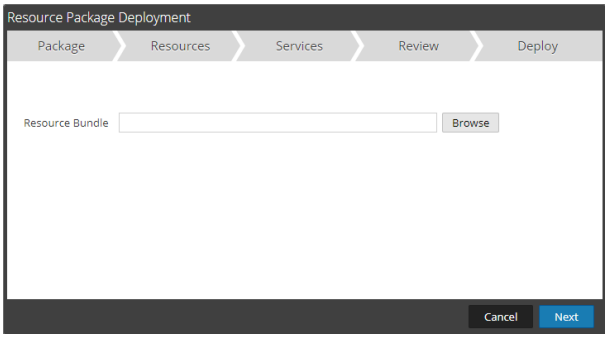
Feature	Description
Tags	The tags that apply to the content. For example, **threat**. Clicking a tag opens the Live Search Content view with the search narrowed to match content with that tag.
Required Meta Keys	The meta keys that apply to the content. For example, **Threat Category**. Clicking a meta key opens the Live Search Content view with the search narrowed to match content with that meta key.
Generated Meta Values	The meta values that the content generates. For example, **rsa-firstwatch**. Clicking a meta value opens the Live Search Content view with the search narrowed to match content with that meta value.
Discontinued	The status of the discontinued content: • **Yes**: The content that matches the search criteria is discontinued • **No**: The content is not discontinued

Resource Package Deployment Wizard

If you have created a package of resources and saved it on a network drive, you can use the Resource Package Deployment Wizard to deploy the resources manually to a service or a service group without subscribing to the resources. NetWitness accepts packages in **.nwp** files or **.zip** files.

Deploying resources manually deploys them directly to the services without taking advantage of the powerful resource management capabilities of NetWitness.

If you want to receive notification and updates for updated resources and be able to easily remove resources from a service, you must subscribe to resources in the Live Search view and deploy the resources in the **Live Configure** view.



Note: Use NetWitness Live to create resource bundles; this is a different application that is not part of NetWitness. Selecting **Package** > **Create** in the **Live Search - Matching Resources** toolbar displays the Content Package Tool window. You can choose resources to include in a package and save the package as a NetWitness Package File.

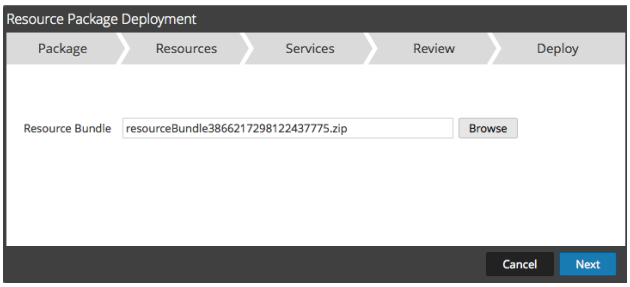
The required permission to access this view is **Deploy Live Resources**.

To access this view:

1. Go to **(Configure) > Live Content**.
2. In the **Live Search - Matching Resources** toolbar, select Package > **Deploy**.

   The Resource Package Deployment wizard is displayed.

Features



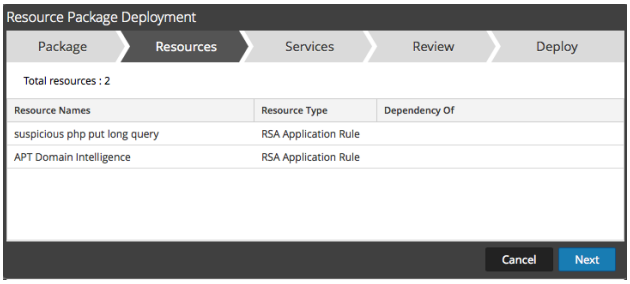
The Deployment Wizard has five tabs: **Package, Resources**, **Services**, **Review** and **Deploy**.
Use **Close** to exit before you complete the wizard.

When you complete the wizard, NetWitness returns to the Live Resources View.

Package Tab

You use this tab to select a resource bundle from your network in this page.

This is an example of the Package tab, with a resource bundle already selected.



The following table describes the elements in the Package tab.

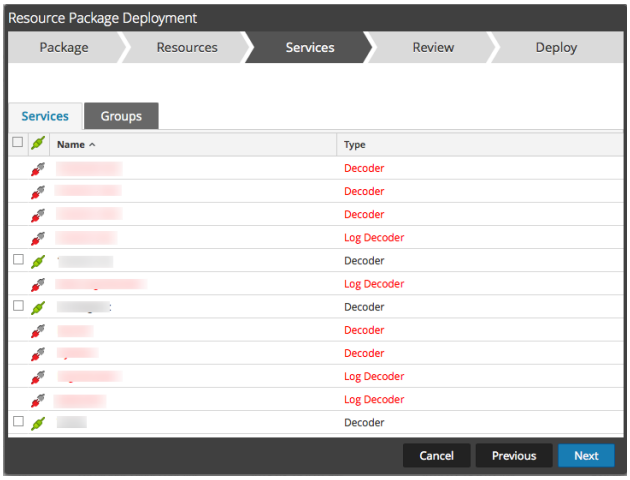
Column	Description
Resource Bundle	The input field to specify a resource bundle. You can type a path in this field or search using the Browse button.
	Command Buttons
Browse	This button opens a File Upload dialog in which you can browse the local file system and select a bundle.
Cancel	Cancels the deployment and closes the wizard.
Next	Displays the next tab of the wizard.

Resources Tab

This tab displays the resources contained in the bundle.

The following figure shows an example of the Resources tab.

The following table describes elements in the Resources tab.



Column	Description
Resource Name	Displays the name of the resources in the bundle (for example, **NetWitness Lua Library**).
Resource Type	Displays the resource types for the resources in the bundle (for example, **RSA Lua Parser**)
Dependency Of	Displays Resources on which the selected resource depends (for example, **AIM lua**).

Services Tab

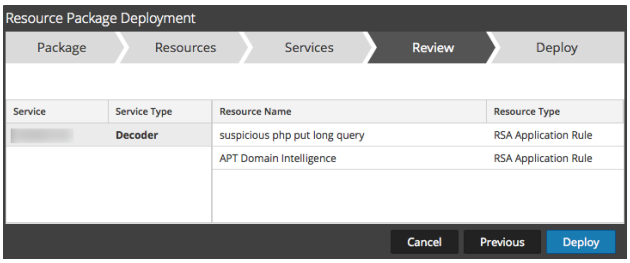
You select the services on which you want to deploy the resources in the bundle.

The Services tab has two tabs, **Services** and **Groups**. These provide a list of services and service groups that are configured in the **(Admin)** > **Services** view. The columns are a subset of the columns available in the Services view. You can select the services or the service groups on which you want to deploy the resources in the bundle.

This is an example of the Services tab.

The following table describes the elements in the Services tab.

Column	Description
	Services
	Selects services on which you want to deploy the content. You can select any combination of services and service groups.
Name	Displays the services in your environment on which you can deploy the content.
Host	Displays the name of the resource host.
Type	Displays the type of NetWitness service.
	Groups
	Selects service groups (if you have service groups defined in your environment).
Name	Displays the names of the service groups.



Review Tab

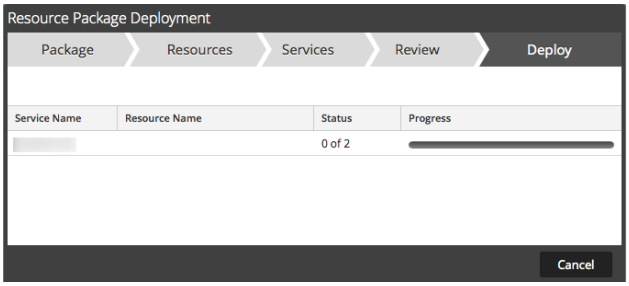
Displays the resources and services on which the resources will be deployed.

In this tab, you can do the following:

- Review the content and services before you deploy.
- Initiate the deployment of the resources.

The following figure shows an example of the Review tab.

The following table describes the elements in the Review tab.



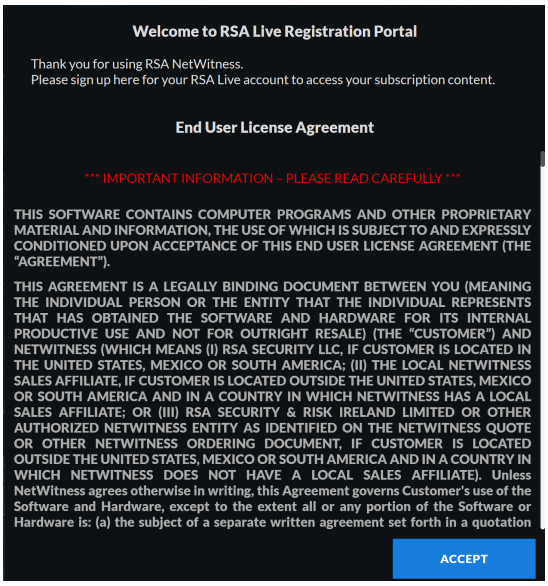
Column	Description
	Service Information
Service	Displays the services in your environment on which you can deploy the content.
Service Type	Displays the type of each NetWitness service (type of host or service).
	Resource Information
Resource Name	Displays the name of the resources you have selected (for example, **NetWitness Lua Library**).
Resource Type	Displays the resource types for the resources you have selected (for example, **RSA Lua Parser**).
Deploy	Initiates the deployment of the resources and displays the **Deploy** page (final page of the wizard).

Deploy Tab

This tab allows you to do the following:

- View the progress of the job
- Cancel the job

This is an example of the Deploy tab.



The following table describes the elements in the Deploy tab.

Feature	Description
Service Name	Name of the services to which resources are deployed.
Resource Name	Name of the resources.

Feature	Description
Status	Status of the manual deployment.
Progress	Progress of the manual deployment in a progress bar. When complete, the bar turns solid green.
	Command Buttons
Close	Closes the wizard.
Errors	Only displays if NetWitness encountered any errors. Click to display the errors.
Retry	Only displays if NetWitness encountered any errors. Click this button to try to deploy the resources again using the wizard.

NetWitness Live Registration Portal

The NetWitness Live Registration Portal is a self-service wizard in which customers can set up a Live account and change or reset the password. A Live account is required to get access to the feeds, parsers, rules, and other content in NetWitness Live library. To access the portal, go to the following URL: https://live.netwitness.com/registration/.

Click **Sign Up For Live**. The License Agreement page is displayed, once you agree to the Terms and Conditions, click **Accept**: the fields for setting up an account are displayed. These include Contact Information, and License ID.

The following table lists the contact information section fields and its descriptions:

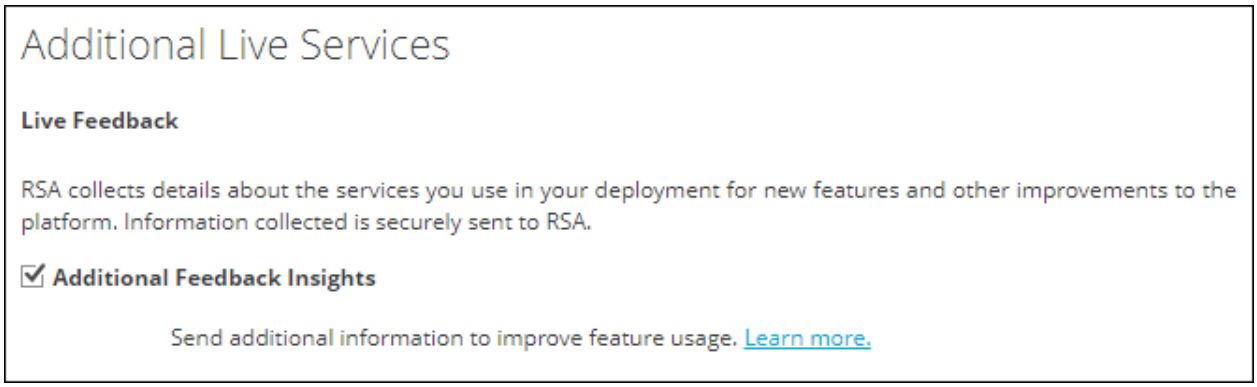
Parameter	Description
First Name	Your first name.
Last Name	Your last name.
Company	The name of your company.
Email	The email address where you want to receive notifications related to the Live account.

Parameter	Description
License ID	This is the License ID on the  (Admin) **> System > Info** page. **Caution:** The license ID on the NetWitness must be valid and must be registered on the Flexera Server. If not, contact NetWitness Customer Support.
Username	The username used to sign in to Cloud Services Live account. The username must contain a minimum of four characters and a maximum of 16 characters.
Password	The password for the Cloud Services Live account. The password must contain minimum of eight characters and the maximum length is 24, with at least one uppercase, one lowercase, one number, and one special character.

NetWitness Feedback and Data Sharing

The Live Feedback Activity Log enables you to download the usage data required for Live Feedback. After you download the Live Feedback data, you can then upload it to share with NetWitness.

The settings for these features are available in **(Admin) > System > Live Services** view, in the Additional Live Services section.



Additional Live Services

Participation in the Additional Live Services is configured in the **(Admin) > System > Live Services** view.

Live Feedback

Note: For NetWitness 11.4.1 and later, this section in the UI has been removed. As of 11.4.1, NetWitness has created the Customer Experience Improvement Program. For details, see "Configure the Customer Experience Improvement Program" in the *NetWitness System Configuration Guide*.

Live Feedback is intended to help improve NetWitness.

Once you set up and configure a Live account, usage data is automatically shared with NetWitness and is protected in accordance with the applicable license agreement. All such data shall be anonymized and shall not have any Personally Identifiable Information.

Before data is sent to NetWitness, all Personally Identifiable Information is removed. Thus, only anonymous usage data gets transferred to NetWitness.

For more information, see the "Live Feedback Overview" topic in the *System Configuration Guide*.

File Reputation

File Reputation service provides instant access to the latest signatures using the RSA Live feed so data is more relevant, with fewer false positives. With this service, users always have reliable data about the reputation of files in their NetWitness Endpoint system. In addition to the whitelisting service, it provides blacklisting information as well.

File Reputation

This option is used to view reputation status of files. The File Hash information from NetWitness Platform is sent to RSA Live to get the reputation status. Reputation status is leveraged by analysts during investigation of files.Learn more.

Troubleshooting Live Services

This section provides troubleshooting instructions for issues faced when using the Live Services module in NetWitness.

Some Rules Are Invalid for Version 11.x

The rules "NetWitness Incident Management - Alert Details" and "NetWitness Incident Management - Incident Summary" are not valid for NetWitness version 11.x. Do not deploy these rules to an 11.x system.

Note: Rules are updated frequently, and the documentation for them is available in the Content space on NetWitness Community. For the latest information on Rules, see RSA NetWitness Rules.

OutOfMemoryError on Context Hub Server

You may encounter an OutOfMemoryError on Context Hub server, and the service becomes unresponsive.

If there are any TAXII feeds configured, Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy because of low memory, perform the following steps:

1. Make sure that the feeds **Start Date** is within 180 days.
2. Check if any TAXII feed is consuming too much disk space. A TAXII feed can consume maximum of 300 MB. If it consumes more disk space, you must reduce the value in the **Remove STIX data older than** field under **Advanced Options** in the **Custom Feed Creation Wizard** when you edit a TAXII feeds.

   Note: If the issue still persists, you must execute step 3.

3. To decrease the number of parallel threads available for processing STIX:

   a. Go to  **(Admin) > Services > Context Hub service > View > Explore**.

   b. In the tree panel, navigate to **enrichment/stix/ config**.

   c. In the right panel, set the **stix-query-scheduler-pool-size** field value to 2. By default the value is 5. This setting controls how many number of threads are allowed to process queries for STIX data at the same time.

   d. Set the **taxii-poll-scheduler-pool-size** field value to 2. By default the value is 5. This setting controls how many number of threads are allowed to poll TAXII servers at the same time.

   e. Restart the Context Hub server.

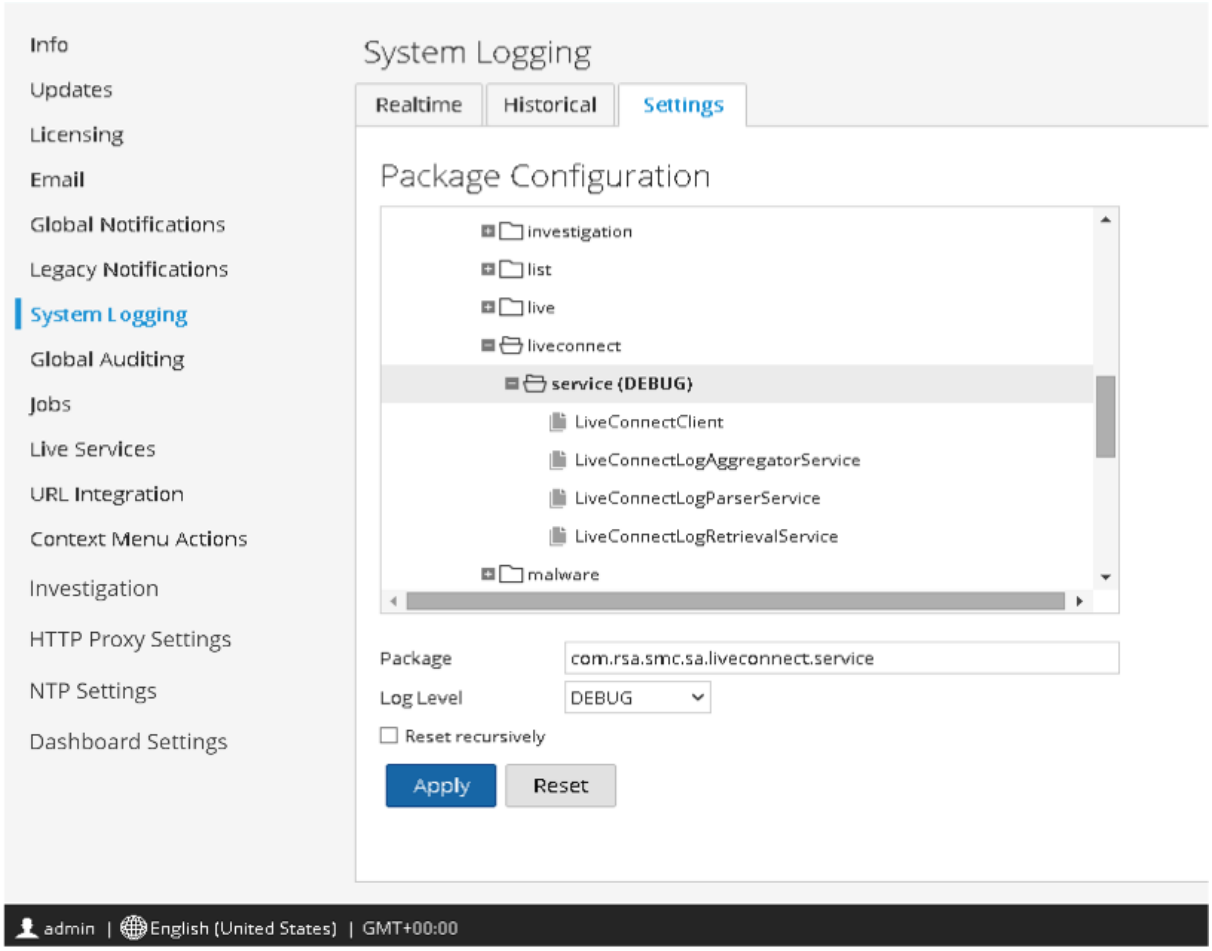
Troubleshooting Live Connect Threat Data Sharing

This section discusses troubleshooting Live Connect Threat Data Sharing.

Query Log Retrieval Sample

To retrieve a sample of threat intelligence data sent to Live Connect, you must construct a URL by setting the following parameters:

- **sendReport**: value is **true** or **false**: true to send this report to the Live Connect server. False to just create the report for viewing. The value defaults to false.
- **hashValues**: value is **true** or **false**: true to hash the values as md5/sha256. False to show values in clear text – should use only for manual viewing. Defaults to false.
- **startDate / endDate**: Dates for time boundaries for log entries. Format: YYYY-MM-DD HH:mm:ss



The following is an example of the URL used to retrieve query logs:

```
https://<server>/admin/liveconnect/force_aggregation?startDate=2016-01-18%2000:00:00&endDate=2016-01-19%2010:10:00&sendReport=false&hashValues=true
```

System Logging: Debug

To access debug information:

1. Go to  **(Admin) > System > System Logging**.
2. Select the **Settings** tab.
3. In the Package Configuration section, select **com > netwitness > platform > server > liveconnect > service (DEBUG)**.

About Log Collection

This guide describes the high-level steps and subtasks for setting up and configuring log collection for event sources that include:

- What Log Collection does, how it works from a high level, and provides high-level deployment diagrams.
- How to start collecting events.
- Where to find instructions to set up more complex deployments.
- How to start any collection protocol.
- Which tools to use to troubleshoot Log Collection issues and lists global troubleshooting instructions.
- How to fine tune and customize Log Collection in your environment.
- How to configure individual collection protocols. Instructions are in the individual Log Collection sections.

Workflow

This workflow depicts the basic tasks needed to start collecting events through Log Collectors.

High-Level Procedures

At a high level, these are the procedures you must follow for log collection:

I. Add local and remote collectors to NetWitness.

   Set up a Log Collector locally on a Log Decoder (that is a Local Collector). You can also set up Log Collectors in as many remote locations (that is Remote Collectors) as you need for your enterprise. For details, see Basic Implementation.

II. Download the latest content from NetWitness Live. You must perform this task periodically, as the content provided on NetWitness Live is updated regularly.

   Log Collection content is marked as one of the following resource types:

   - **NetWitness Log Collector** - content enabling the collection of event source types.
   - **NetWitness Log Device** - the latest supported event source parsers.

   You can also subscribe to content on Live. For details, see the *Live Services Management Guide*.

III. Configure Settings: set up the lockbox and Certificates.

   For details, see Set Up a Lockbox and Configure Certificates.

IV. Configure Event Sources.

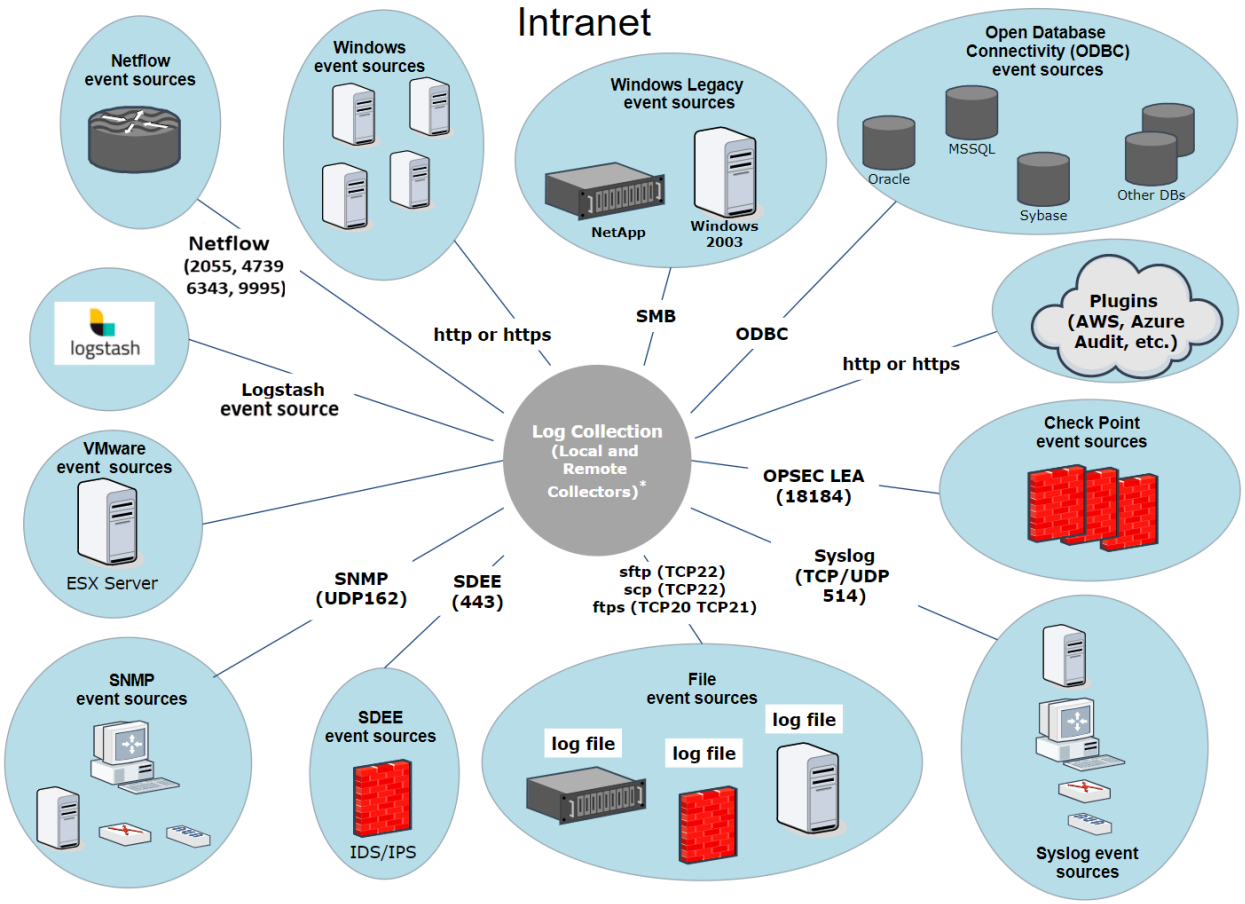
   You configure all the event sources on your network to send their log information to NetWitness. Whenever you add new event sources, you need to perform this procedure as well. All event source configuration guides are found in the NetWitness Supported Event Sources space in NetWitness Link.

V. Start and stop services for configured protocols. Occasionally, you may be required to stop and restart services, based on new event sources that you add to NetWitness.

VI. Verify that Log Collection is working.

   Whenever you set up a new event source or add a new collection protocol, you should verify that the correct logs are being sent to NetWitness.

Log Collection Architecture



This topic describes how NetWitness performs log collection.

How to Deploy Log Collection

You can deploy Log Collection according to needs and preferences of your enterprise. This includes deploying Log Collection across multiple locations and collecting data from varying sets of event sources. You do this by setting up a Local Collector with one or many Remote Collectors.

Components of Log Collection

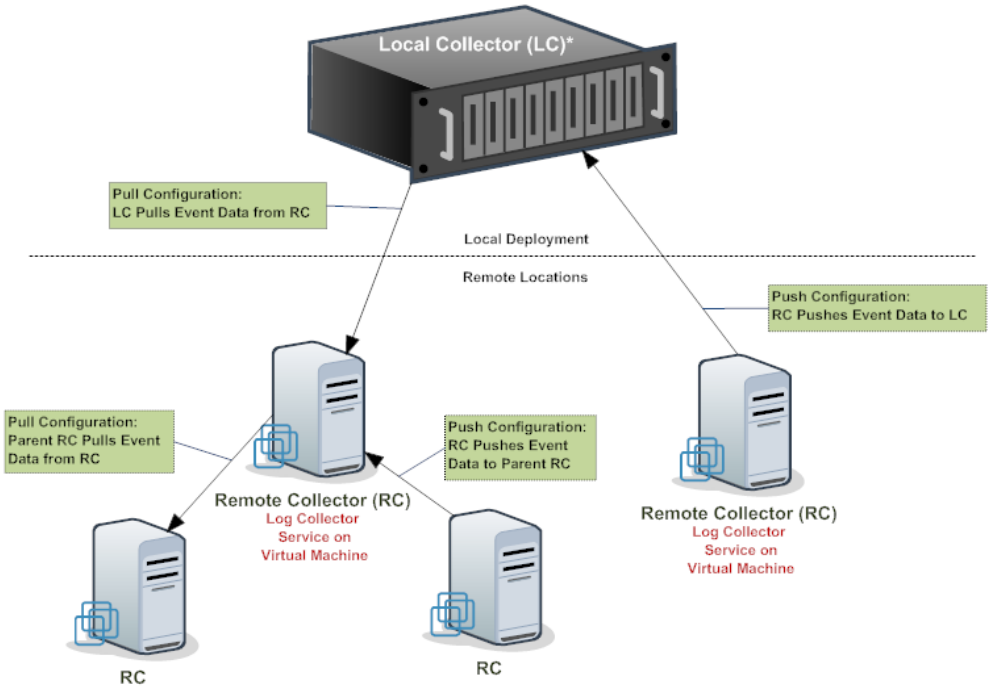
The following figure shows all the components involved in event collection through the NetWitness Log Collector.

*In Log Collection, Remote Collectors send events to the Local Collector and the Local Collector sends events to the Log Decoder.

Local and Remote Collectors

In this scenario, log collection from various protocols like Windows, ODBC, and so on, is performed through both the Remote Collector and Log Collector service. If the log collection is done by the Local Collector, it is forwarded to the Log Decoder service, just like the local deployment scenario. If the log collection is done by a Remote Collector, there are two methods in which these are transferred to the Local Collector:

- **Pull Configuration** - From a Local Collector, you select the Remote Collectors from which you want to pull events.
- **Push Configuration** - From a Remote Collector, you select the Local Collector to which you want to push events.



Note: Typically, the Push configuration is used. Pull is available if you have a DMZ in your environment. Less secure network segments are not allowed to make connections to more secure network segments. With Pull, the Log Collector (or Virtual Log Collector) in the secure network initiates the connection to the VLC in the less secure network, and the logs are then transferred without breaking the connection rules.

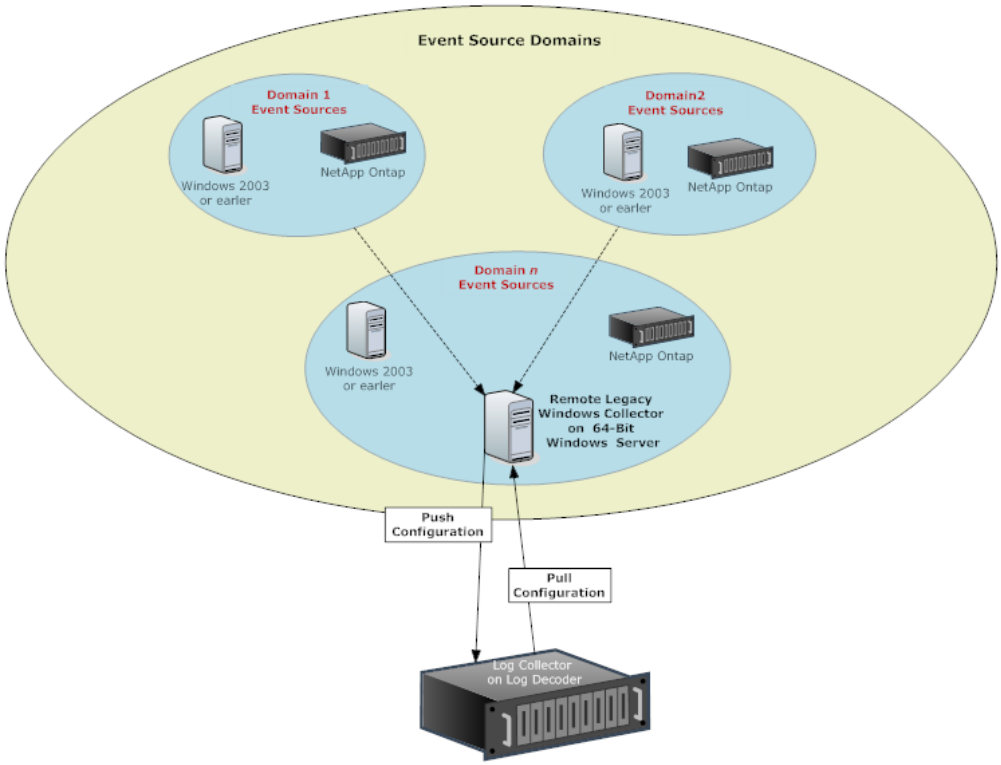
You can configure one or more Remote Collectors to push event data to a Local Collector, or you can configure a Local Collector to pull event data from one or more Remote Collectors.

Additionally, you can set up a chain of Remote Collectors for which you can configure:

- One or more Remote Collectors to push event data to a Remote Collector.
- A Remote Collector to pull event data from one or more Remote Collectors.

The following figure illustrates how the Local and Remote Collectors interact to collect events from all of your locations.

* The Local Collector (LC) is the Log Collector service on the Log Decoder appliance.



Windows Legacy Remote Collector

The NetWitness Windows Legacy Collector is a Microsoft Windows based remote log collector (RC) which can be installed on a Windows domain.

It supports collection from:

- Windows 2003 and earlier event sources
- NetApp ONTAP host evt files

The following figure illustrates the deployment required to collect events from Windows Legacy event sources.

Basic Implementation

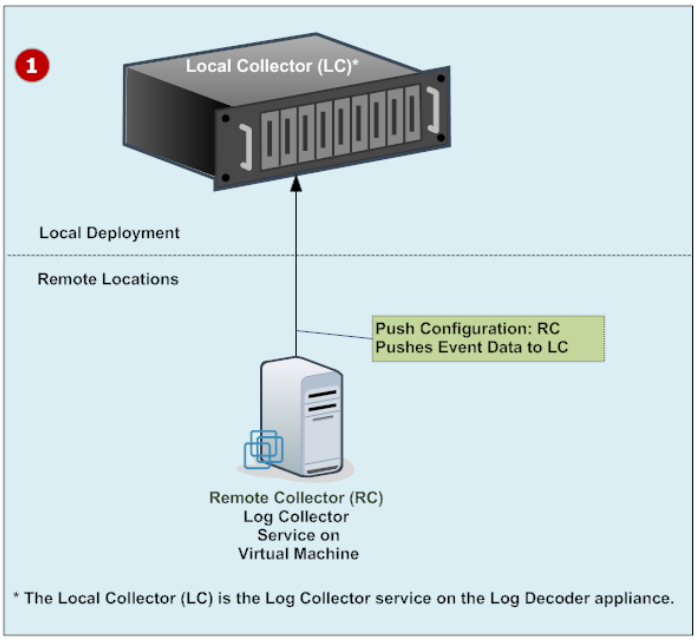
This topic tells how to perform the initial setup of Local Collectors and Remote Collectors.

Prerequisites

Verify that the Log Decoder is set up and:

- is capturing data.
- has the current content loaded.
- is properly licensed.

Roles of Local and Remote Collectors

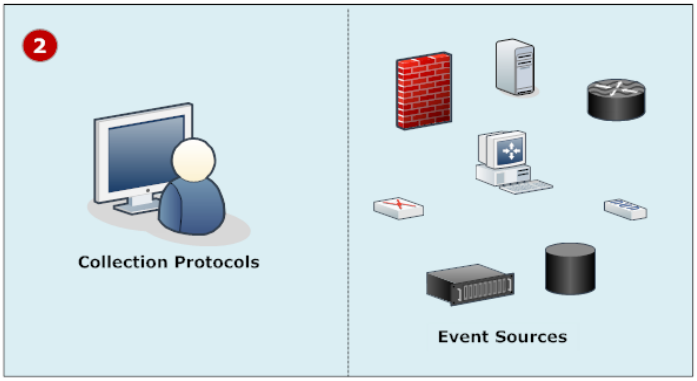


A Local Collector (LC) is a Log Collector service running on a Log Decoder host. In a local deployment scenario, the Log Collector service is deployed on a Log Decoder host, with the Log Decoder service. Log collection from various protocols like Windows, ODBC, and so on, is performed through the Log Collector service, and events are forwarded to the Log Decoder service. The Local Collector sends all collected event data to the Log Decoder service.

You must have at least one Local Collector to collect non-Syslog events.

A Remote Collector (RC), also referred to as a Virtual Log Collector (VLC), is a Log Collector service running on a stand-alone Virtual Machine. Remote Collectors are optional and they must send the events they collect to a Local Collector. Remote Collector deployment is ideal when you have to collect logs from remote locations. Remote Collectors compress and encrypt the logs before sending them to a Local Collector.

Deploying and Configuring Log Collection



The following diagram illustrates the basic tasks you must complete to deploy and configure Log Collection. To deploy Log Collection, you need to set up a Local Collector. You can also deploy one or more Remote Collectors. After you deploy Log Collection, you need to configure the events sources in NetWitness and on the events sources themselves. The following diagram shows the Local Collector with one Remote Collector that pushes events to the Local Collector.

1 Set up Local and Remote Collectors.

The Local Collector is the Log Collector service running on the Log Decoder host.

A Remote Collector is the Log Collector service running on a virtual machine or Windows server in a remote location.

2 Configure event sources:

- Configure collection protocols
- Configure each event source to communicate with the NetWitness Log Collector.

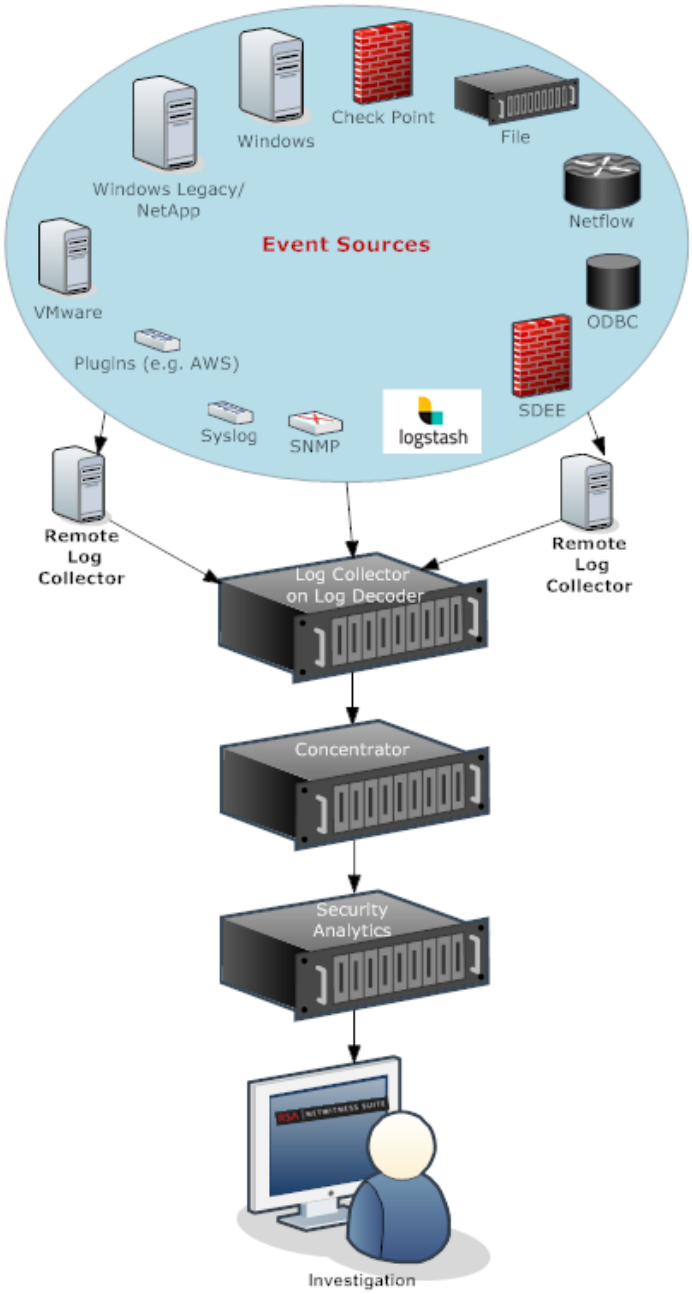
For details on these procedures, see Configure Collection Protocols and Event Sources.

Adding Local Collector and Remote Collector to NetWitness

To add a Local Collector and Remote Collector to NetWitness:

1. Go to **(Admin) > Services**.
2. Click and select **Log Collector** from the menu.
   The **Add Service** dialog box is displayed.
3. Define the details of the **Log Collection** service.
4. Select **Test Connection** to ensure that your Local or Remote Collector is added.

Configuring Log Collection



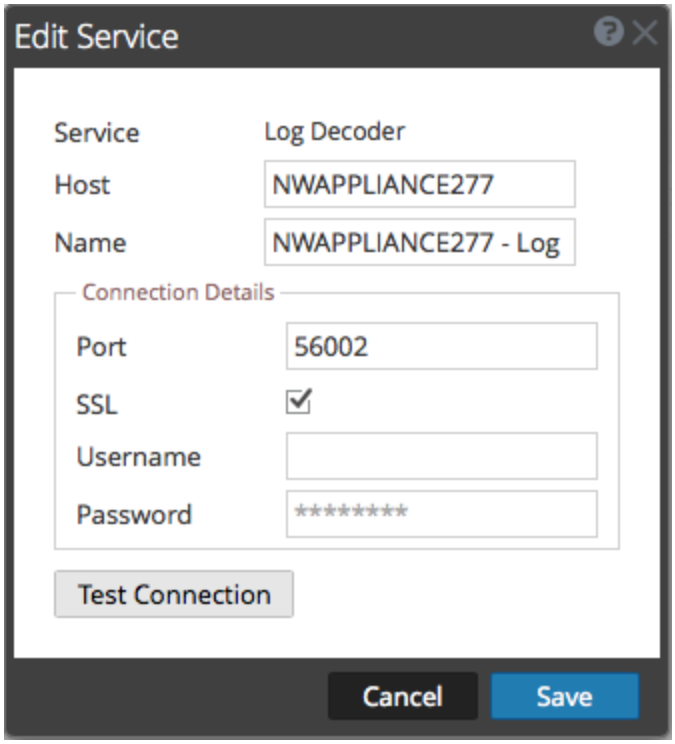
You choose the Log Collector—that is a Local Collector (LC) or Remote Collector (RC)—for which you want to define parameters in the Services view. The following figure shows how to navigate to the Services view, select a Log Collector service, and display the configuration parameter interface for that service.

To configure log collection:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Click **View > Config** to display the Log Collection configuration parameter tabs.
4. Define global Log Collection parameters in the **General** tab.
5. The UI presents tabs, depending on whether the current service is Local or Remote.
   - For a Local Collector, NetWitness displays the **Remote Collectors** tab. Select the Remote Collectors from which the Local Collector pulls events in this tab.
   - For a Remote Collector, NetWitness displays the **Local Collectors**. Select the Local Collectors to which the Remote Collector pushes events in this tab.
6. Edit configuration files as text files in the **Files** tab.
7. Define collection protocol parameters in the **Event Sources** tab.
8. Define the lockbox, encryption keys, and certificates in the **Settings** tab.
9. Define Appliance Service parameters in the **Appliance Service Configuration** tab.

Data Flow Diagram

You use the log data collected by the Log Collector service to monitor the health of your enterprise and to conduct investigations. The following figure shows you how data flows through NetWitness Log Collection to Investigation.



Provision Local Collectors and Remote Collectors

The NetWitness server verifies if an appliance has a Log Decoder service. If there is a Log Decoder service, it becomes a Local Collector. If a Log Decoder service is missing, it becomes a Remote Collector. A local Log Collector has an Event Destination and by default goes to the Local Log Decoder service. A Remote Collector does not have an Event Destination. The NetWitness Server identifies a Legacy Windows Collector as a Remote Collector.

To edit a Local Collector or Remote Collector:

1. Go to **(Admin) > Services**.
2. Select a Log Collector service.
3. In the **Services** view, select in the toolbar.

   The **Edit Service** dialog is displayed.

4. In the **Edit Service** dialog, provide the following information.

Field	Description
Service	Select Log Collector as the service type.
Host	Select a Log Decoder host.
Name	Type name you want to assign to the service.

Field	Description
Port	Default port is 50001 for clear text and 56001 for SSL encrypted.
SSL	Select **SSL** if you want NetWitness to communicate with the host using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates.
(Optional) Username	Type the username of the Local Collector.
(Optional) Password	Type the password of the Local Collector.

5. Click **Test Connection** to determine if NetWitness connects to the service.
6. When the result is successful, click **Save**.

   If the test is unsuccessful, edit the service information and retry.

Configure Local and Remote Collectors

This topic describes how to configure Local and Remote Collectors.

When you deploy Log Collection, you must configure the Log Collectors to collect the log events from various event sources, and to deliver these events reliably and securely to the Log Decoder service, where the events are parsed and stored for subsequent analysis.

You can configure one or more Remote Collectors to push event data to a Local Collector, or you can configure a Local Collector to pull event data from one or more Remote Collectors.

This topic describes how to:

- **Configure Local Collector to Pull Events from Remote Collector**

  If you want a Local Collector to pull events from Remote Collector, you set this up in the Remote Collectors tab of the Local Collector's Configuration view.

- **Configure Remote Collector to Push Events to Local Collectors**

  If you want a Remote Collector to push events to a Local Collector, you set this up in the Local Collector tab of the Remote Collector's Configuration view. In the Push configuration, you can also:

  - **Configure Failover Local Collector for Remote Collector**

    You set up a destination made up of local collectors. When the primary Local Collector is unreachable, the Remote Collector attempts to connect to each Local Collector in this destination until it makes a successful connection.

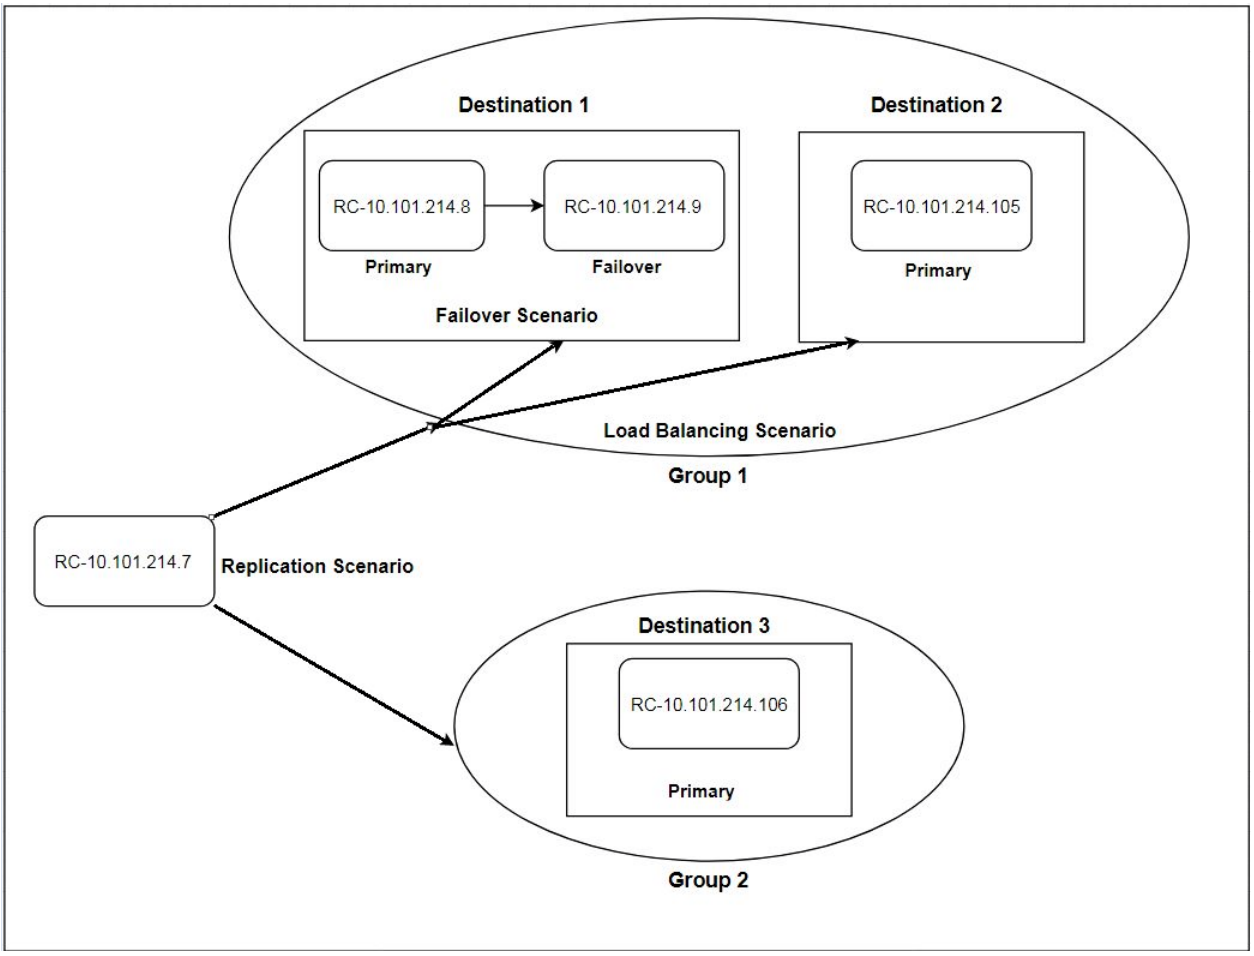
  - **Configure Replication**

    You set up multiple destination groups so that NetWitness replicates the event data in each group. If the connection to one of the destination groups fails, you can recover the required data because it is replicated in the other destination group.

  - **Configure Log Routing for Specific Protocols**

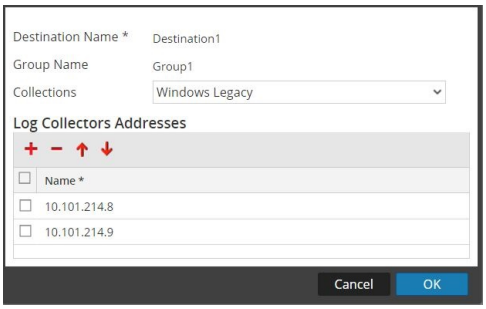
    You set up multiple destinations in a destination group to direct event data to specific locations according to protocol type.

- **Configure Chain of Remote Collectors**



You can set up a chain of Remote Collectors to push event data to a Local Collector, or you can configure a Local Collector to pull event data from a chain of Remote Collectors.

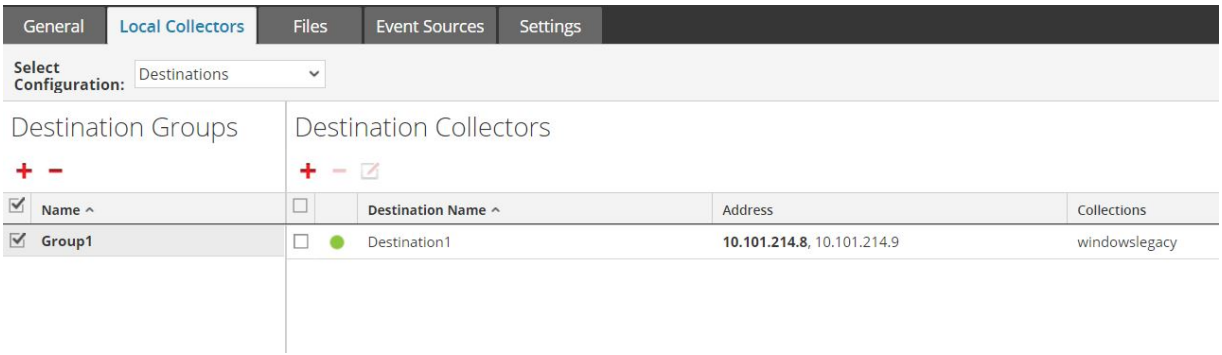
- You can configure one or more Remote Collectors to push event data to a Remote Collector.
- You can configure a Remote Collector to pull event data from one or more Remote Collectors.



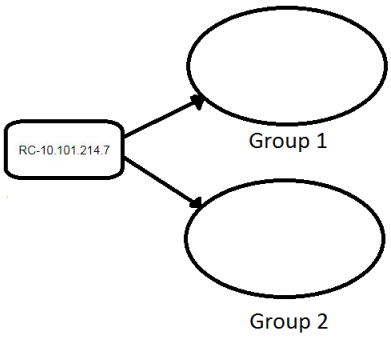
Failover, Replication and Load Balancing

This section describes failover, replication, and load balancing work in how NetWitness.

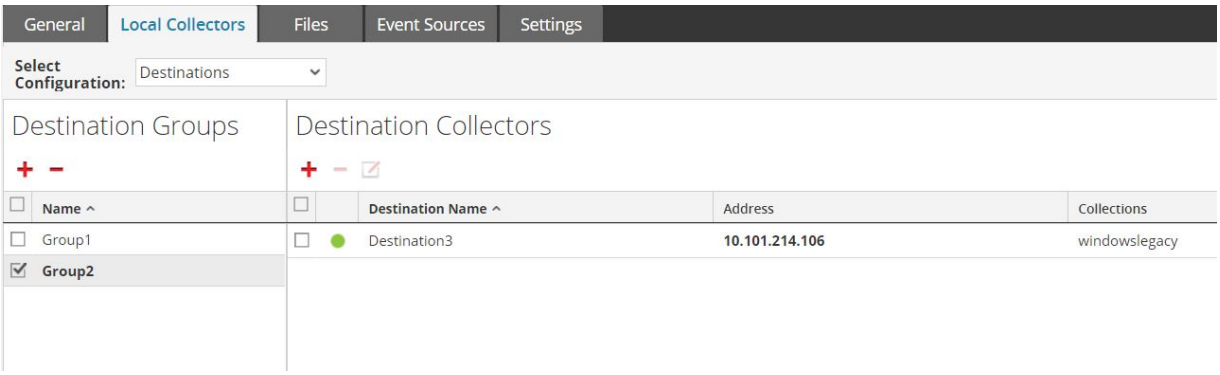
The following figure illustrates a Remote Collector configured for load balancing, failover and replication.



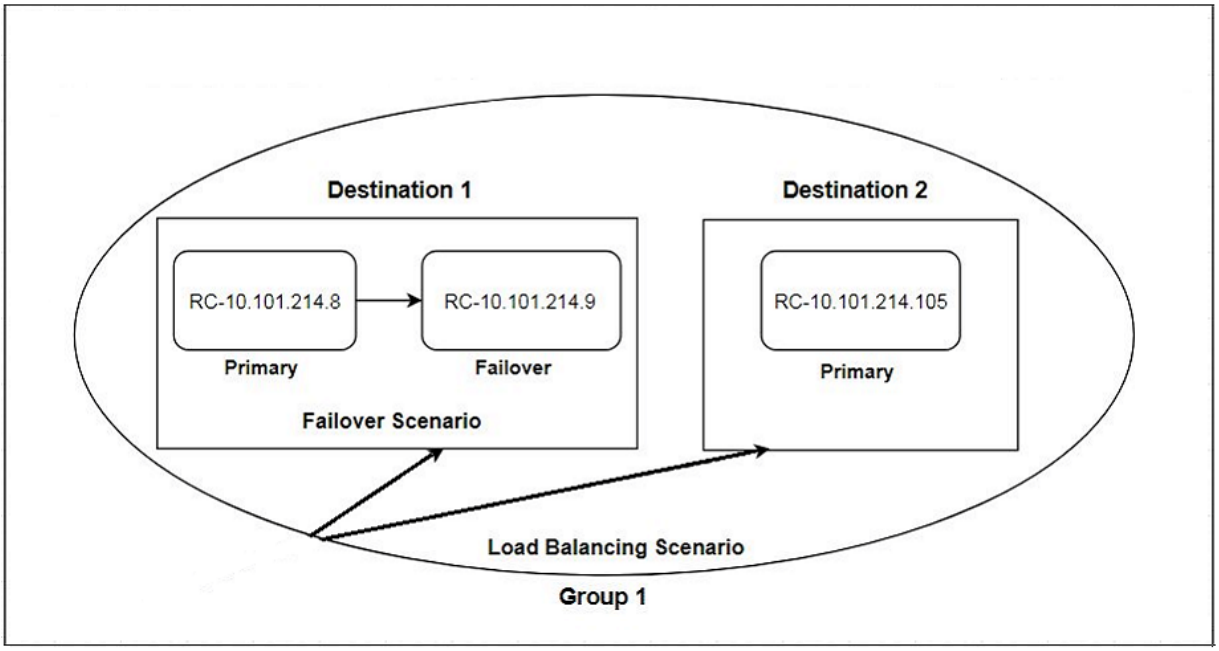
- **Failover** is achieved by setting up multiple collectors in the same Destination. Destination 1 has a primary Collector, and second, failover Collector. This is done in NetWitness by adding multiple Log Collectors to the same Destination.



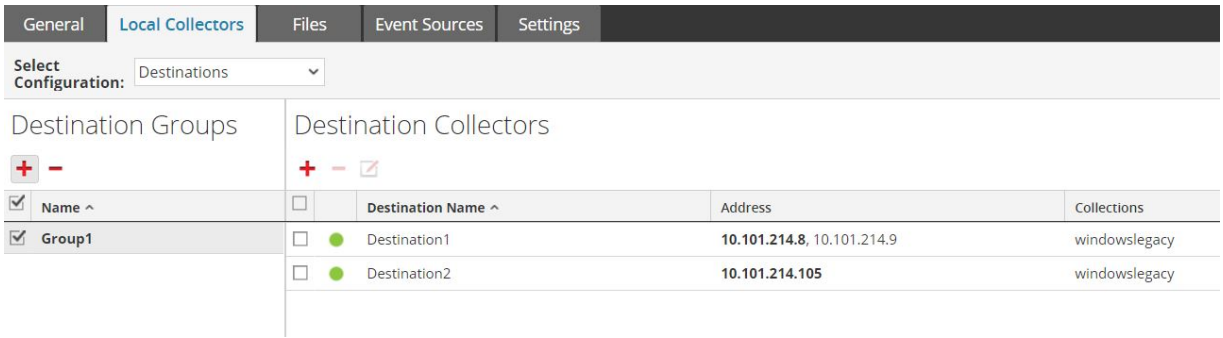
Since 10.101.214.8 is listed first, that becomes the primary collector, and 10.101.214.9 becomes the failover. To make 10.101.214.9 the primary, use the up arrow to change the order.



Below, you can see the two collectors both listed for Destination 1. The primary (10.101.214.8) is in bold.



- **Replication** is accomplished by having multiple Destination Groups: each group receive the entire set of message data.



In the following screen, you can see that message data is sent to the collectors in Group 1 *and* Group 2.

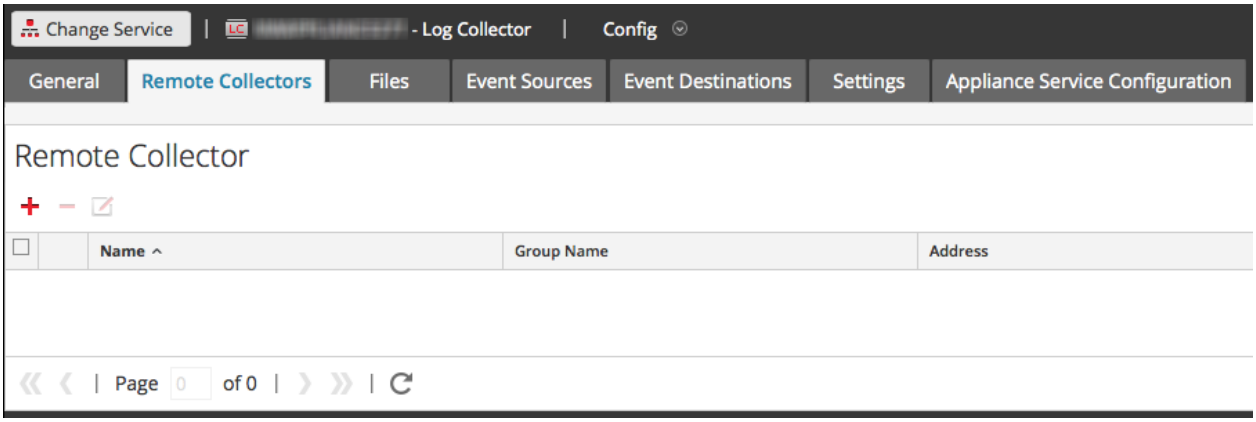
- **Load balancing** is achieved by setting up multiple Destinations within a Group.

In the following screen, you can see that Group 1 has two destinations, Destination 1 and Destination 2. The message data is divided up equally among the Destinations in the group.

With two Destinations, each destination receives half the message data. With three Destinations, each would receive 1/3 of the total message data. Keep adding Destinations to further reduce the load on the collectors in each destination.

Note: You can also set up log routing so that event data for specific protocols is sent to specific destinations.

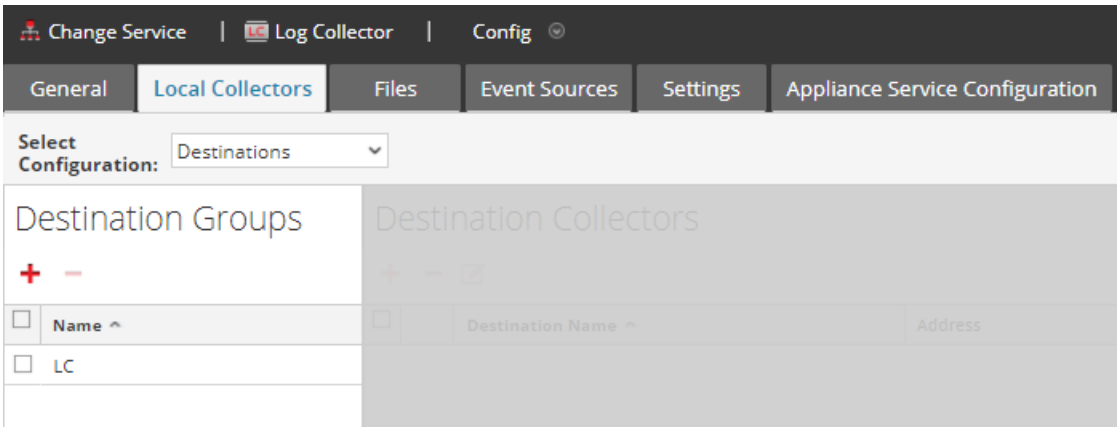
Configure a Local Collector or Remote Collector



You choose the Log Collector, that is a Local Collector (LC) or Remote Collector (RC), for which you want to define deployment parameters in the Services view. The following procedure shows you how to navigate to the Services view, select a Local or Remote Collector, and display the deployment parameter interface for that service.

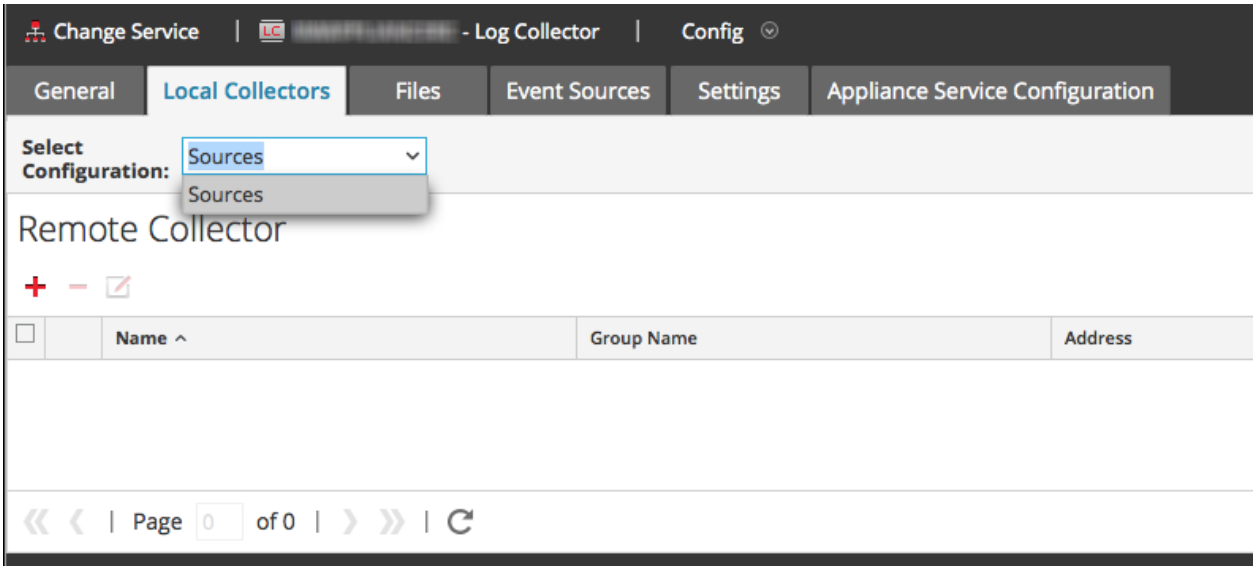
To configure a Local Collector or Remote Collector:

1. Go to **(Admin) > Services**.
2. Select a Local or Remote Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Depending on your selection in step 2:
   - If you selected a Local Collector, the **Remote Collectors** tab is displayed. Select the Remote Collectors from which the Local Collector pulls events in this tab.
   - If you selected a Remote Collector, the **Local Collectors** are displayed. Select the Local Collectors to which the Remote Collector pushes events in this tab.



Remote Collectors Tab

The following figure depicts the **Remote Collectors** tab for a Local Collector that is configured to pull events from a Remote Collector. NetWitness displays this tab when you have selected a Local Collector in (Admin) > Services.



Local Collectors Tab for a Remote Collector

The following figure depicts a **Local Collectors** tab for a Remote Collector that is configured to push events to a Local Collector or another Remote Collector.

The following figure depicts the Local Collectors tab for a Remote Collector that is configured to pull events from a Remote Collector. NetWitness displays this tab when you have selected a Remote Collector in (Admin) > Services.

Parameters

Remote/Local Collectors Configuration Parameters

Configure Failover Local Collector

This topic tells you how to set up a Failover Local or Remote Collector.

Set up a Failover Local Collector

You can set up a Failover Local Collector that NetWitness will fail over to if your primary Local Collector stops operating for any reason.

1. Go to  **(Admin) > Services**.
2. In **Services**, select a Remote Collector service.
3. Click  **View > Config**.

   The Service Config view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. In the **Destination Groups** panel section, select .

   The Add Remote Destination dialog displays.
6. Set up a Destination Group and select a primary Local Collector (for example, **LC-PRIMARY**).
7. Select the Group (for example, **Primary_Standby_LCs**) in the Destination Groups panel and click .

   The Group you selected is displayed in the Local Collectors panel.
8. Add the Failover Local Collector (for example, **LC-STANDBY**).

   The following examples show the newly added primary and failover Local Collectors showing the primary Local Collector as **Active** and the Failover Local Collector as **Standby**. The active Local Collector is highlighted (for example, **LC-PRIMARY**).
9. (Optional) Add, delete, and change the order of Local Collectors to each Remote Destination.

   a. Click  to add a Log Collector as a failover Remote Destination.

   b. When connecting to a Remote Destination, the Remote Collector will attempt to connect to each Local Collector in this list in order, until it makes a successful connection.

   c. Select a Local Collector and use the up () and down () arrow buttons to change the order of connection.

   d. Select one or more Local Collectors and click to remove them from the list.

   The selected Local Collectors are added to the Log Collector section. When the Remote Collector starts collecting data, it pushes data to these Log Collectors.

Set up a Failover Remote Collector

You can set up a Failover Remote Collector that NetWitness will fail over to if your primary Remote Collector stops operating for any reason.

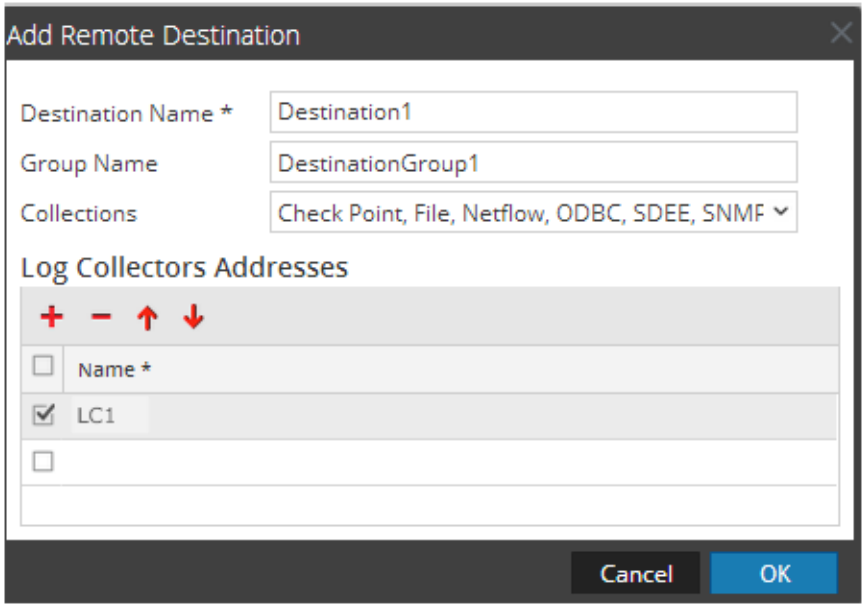
To set up a failover remote collector:

1. Go to  **(Admin) > Services**.
2. In **Services**, select a Remote Collector service.
3. Click  **View > Config**.

   The Service Config view is displayed with the **Log Collector General** tab open.

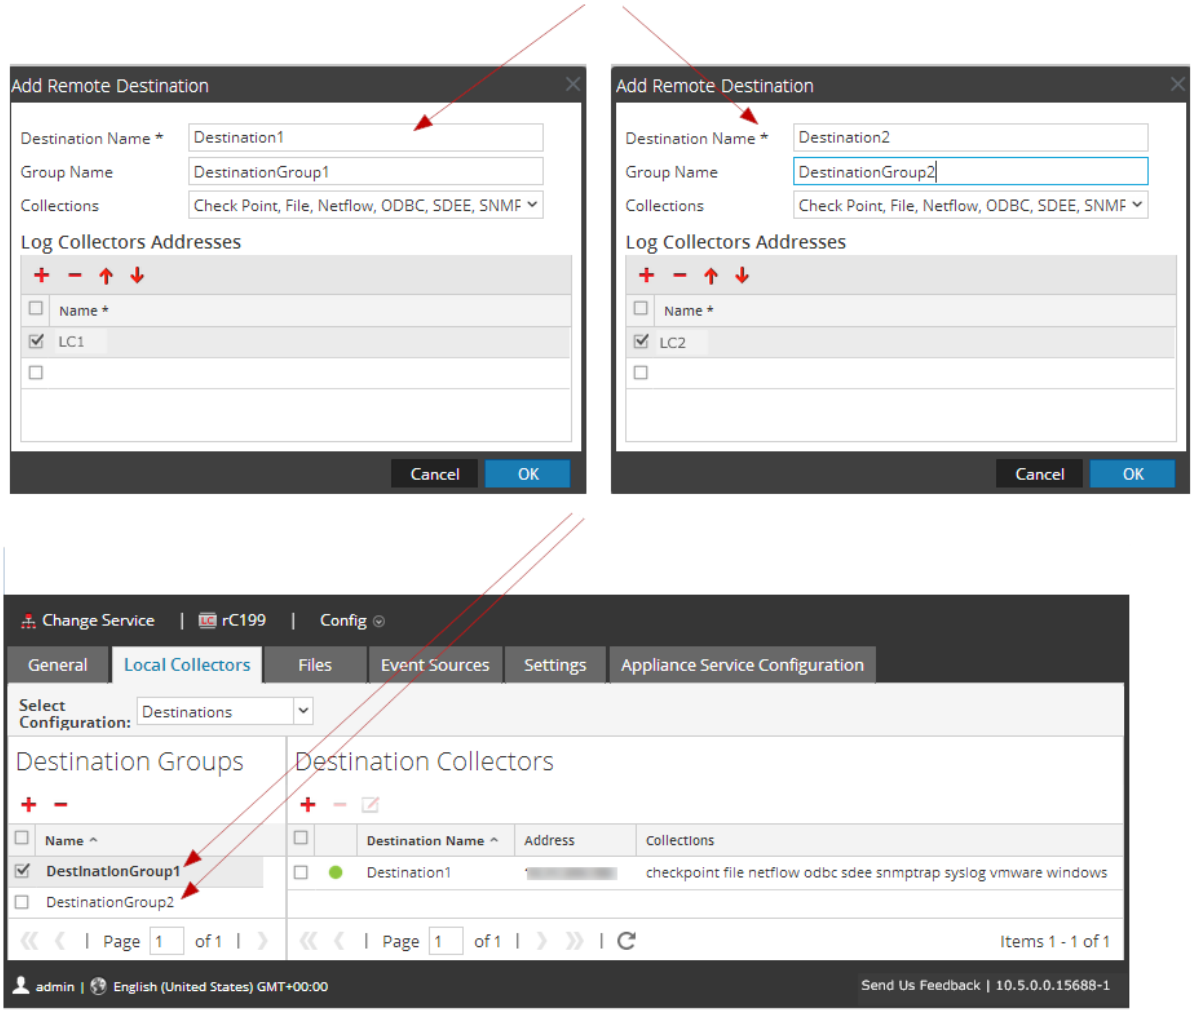
4. Select the **Local Collectors** tab.
5. Select **Sources** in **Select Configuration** drop-down menu.
6. Click + to display in **Add Source** dialog.
7. Define the failover Remote Collector and click **OK**.

Parameters



Remote/Local Collectors Configuration Parameters

Configure Replication



This topic tells you how to replicate event data sent by a Remote Collector.
You can specify multiple Destination Groups so that the event data is replicated to each group.

To replicate event data to multiple Local Collectors:

1. Go to **(Admin) > Services.**
2. Select a Remote Log Collection service.
3. Under Actions, select **> View > Config**.
   The Service Config view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. In the **Destination Groups** panel section, click +.
   The **Add Remote Destination** dialog is displayed.

6. Set up a separate Destination for each Local Collector and designate the protocols for which you want to push event messages to that Local Collector. The following examples shows the addition of two Destination Local Collectors (**Destination1** and **Destination2**) for the **Check Point**, **File**, **Netflow**, **ODBC**, **SDEE**, **SNMP**, **Syslog**, and **Windows** collection protocols:

   a. Type the **Destination Name**.

   b. Type the **Group Name**. If you do not type a Group Name, the Destination Name is taken as the Group Name.

   c. Select the collection protocols in the drop-down list.

   d. Select a Local Collector (for example, **LC1**).

   e. Click **OK**.

   f. Select the new group (for example, **DestinationGroup2**) group in the **Destination Groups** panel and click + in the **Local Collector** panel.

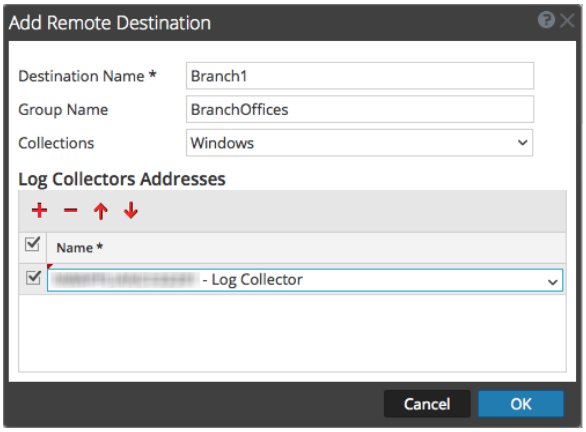
g. In the **Local Collector** panel, click + and complete the **Add Remote Destination** dialog as illustrated in the following figure.

The **Check Point**, **File**, **Netflow**, **ODBC**, **SDEE**, **SNMP**, **Syslog**, and **Windows** collection protocols are sent to two Local Collectors (**LC1** and **LC2**). Both Local Collectors are active and collecting event data.

Configure Chain of Remote Collectors

This topic describes how to chain Remote Collectors (also referred to as VLCs).

You can set up a chain of Remote Collectors to push event data to a Remote Collector, or you can configure a Remote Collector to pull event data from a chain of Remote Collectors.



- **Remote Collectors to push data.** Push data from a Remote Collector to other Remote Collectors or Local Collectors.
- **Remote Collector to pull data.** Use a Remote Collector to pull data from one or more Remote Collectors.

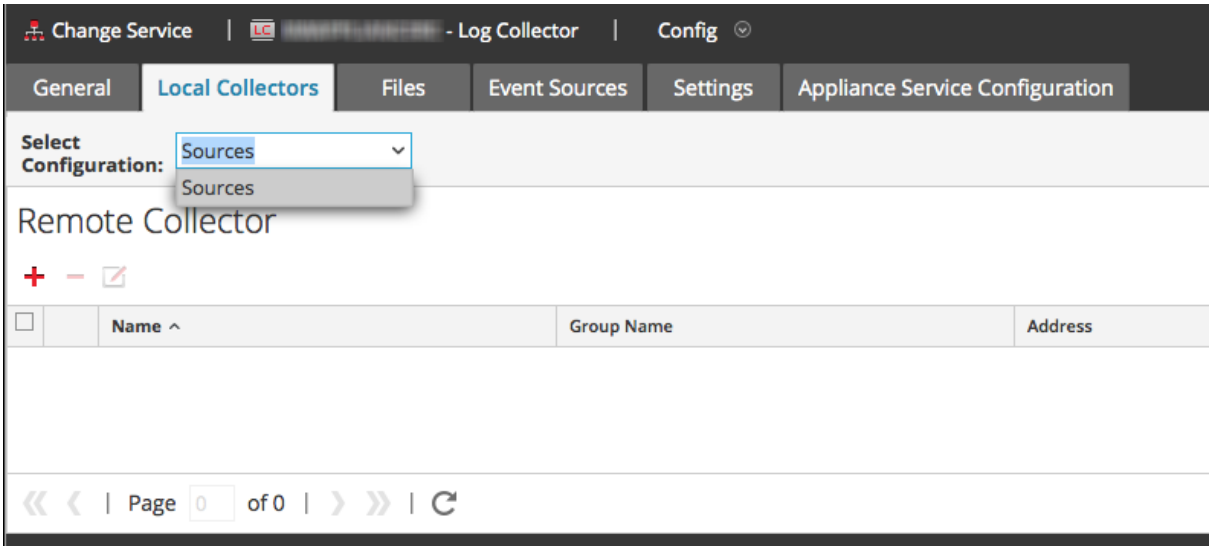
Configure Remote Collector to Push Event Data to Remote Collector

1. Go to **(Admin) > Services.**
2. In **Services**, select a **Remote Collector**.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.

   The **Log Collector Service Config** view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. Select **Destinations** in the **Select Configurations** drop-down menu.
6. In the **Destination Groups** panel section, select .

   The **Add Remote Destination** dialog is displayed.
7. Set up a **Destination Group**:
   a. Enter a **Destination Name**.
   b. (Optional) **Enter a Group Name**. If you leave Group Name blank, NetWitness sets it to the value that you specified in Destination Name.
   c. Select one or more collection protocols in the **Collections** drop-down list.
   d. Under **Log Collectors Addresses**, click to select a Remote Collector.

Note: If you do not select a collection protocol, the Remote Collector pushes all collection protocols to the Remote Collectors.



Configure Remote Collector to Pull Event Data from a Remote Collector

1. Go to **(Admin) > Services.**
2. In **Services**, select a **Remote Collector**.

3. Under Actions, select  > **View** > **Config** to display the Log Collection configuration parameter tabs.

   The **Service Config** view is displayed with the **Log Collector General** tab open.

4. Select the **Local Collectors** tab.
5. Select **Sources** in the **Select Configurations** drop-down menu.

6. In the **Remote Collectors** panel, select +.

   The **Add Source** dialog is displayed.

7. In the **Add Source** dialog:

   a. Select one or more collection protocols.

      If you do not select a collection protocol, the Remote Collector pulls all collection protocols from the Remote Collector.

   b. Click **OK**.

   The Remote Collector is added to the Remote Collector section. When the Log Collector starts collecting data, it pulls event data from this Remote Collector.

Throttle Remote Collector to Local Collector Bandwidth

To improve performance, you can throttle the bandwidth to control the rate that the Remote Collector sends event data to Local Collector or between Message Brokers. To do this, you configure the Linux kernel's filtering and IPTable functionality.

This works for both push and pull Remote Collector configurations. The **set-shovel-transfer-limit.sh** shell script located on the **/opt/netwitness/bin** automates the configuration of the kernel filter and iptables related to this port.

This topic describes how to throttle Remote Collector to Local Collector bandwidth using the **set-shovel-transfer-limit.sh** shell script. It contains the following sections:

- The **set-shovel-transfer-limit.sh** shell script command line help.

  Note: The filter value that you need to set depends on the rate at which remote log collector is sending events to the Local Collector.

- An example that sets the Filter to 4096 kilobits per second.

Command Line Help for Set Shovel Transfer Limit Script

Issue the `-h` command to display help for `set-shovel-transfer-limit.sh` shell script.

```
cd /opt/netwitness/bin
./set-shovel-transfer-limit.sh
```

Usage:

```
set-shovel-transfer-limit.sh -s|-c|-d|[-i interface] [-r rate]
```

where:

- -c = clear existing
- -d = display filter
- -s = set new values
- -i = interface is the name of the network interface. Default value is **eth0**
- -r = rate is the bandwidth rate. Default value is **256kbps**

Bandwidths and rates can be specified in:

- **nolimit**: disables throttling
- **kbit**: Kilobits per second
- **mbit**: Megabits per second
- **kbps**: Kilobytes per second
- **mbps**: Megabytes per second
- **bps**: Bytes per second

Set the Filter to 4096 Kilobits per Second

This example sets the Filter to 4096 kilobits per second.

```
[root@<hostname> bin]#./set-shovel-transfer-limit.sh -s -r 4096kbit

RATE=4096kbit
 PORTNUMBER=5671
 DEVICE_INTERACE=eth0

Set Up a Lockbox

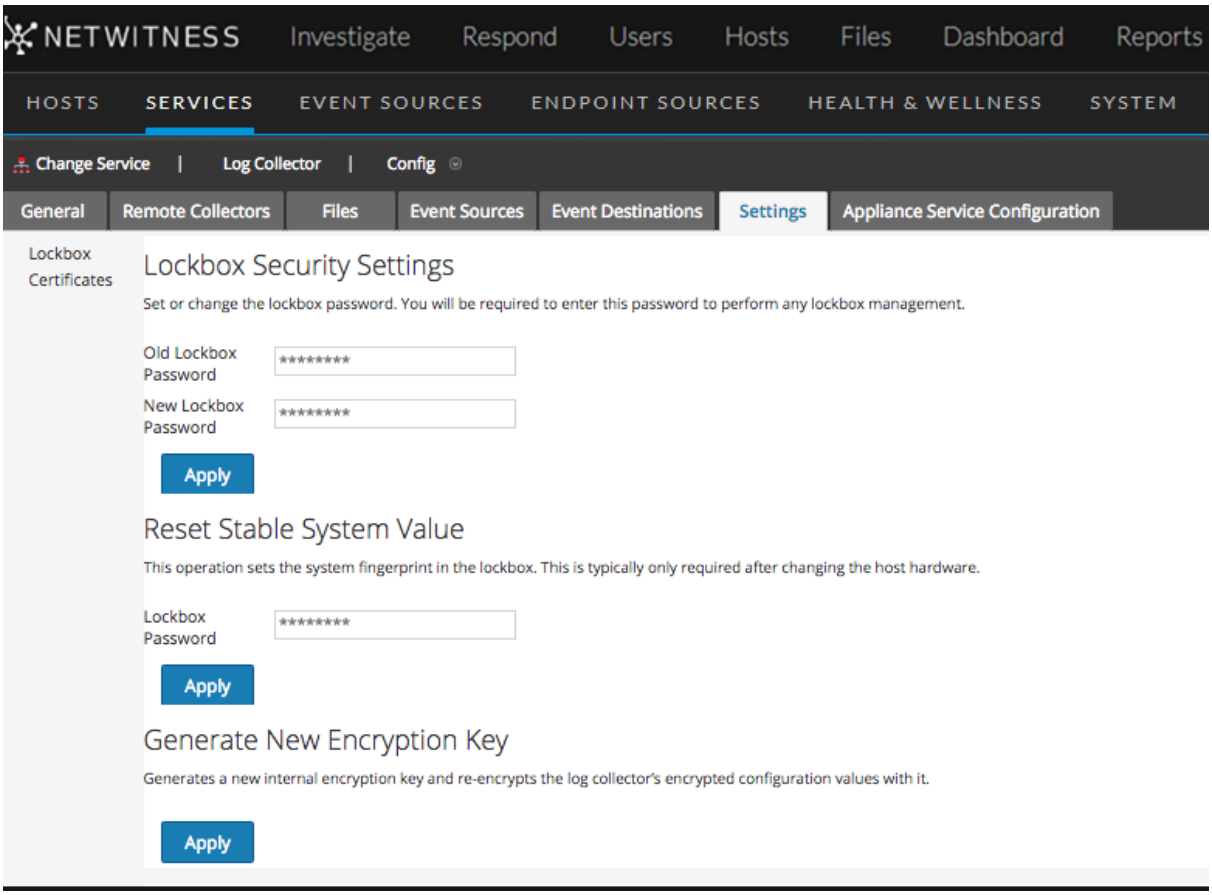
What Is a Lockbox

A lockbox is an encrypted file that you use to store confidential information about an application. The NetWitness Lockbox stores an encryption key for the Log Collector.

The encryption key is used to encrypt all event source passwords and the event broker password.

When you create the Lockbox, you need to define a password for the Lockbox.

The Log Collector operates the Lockbox in a mode during data collection that does not require you to specify the password (the Log Collector uses the host system fingerprint instead).



These are the lockbox security settings.

Feature	Description
Old Lockbox Password	When you set up a Lockbox for the first time, this field is blank. NetWitness populates this field after you enter a New Lockbox Password and click Apply.
New Lockbox Password	Initial or new lockbox password. To maximize lockbox security, specify a password that is eight or more characters in length with at least one numeric character, uppercase character, and non-alphanumeric character such as # or !
Apply	Click **Apply** to save the changes to the lockbox password.

Set Up a Lockbox

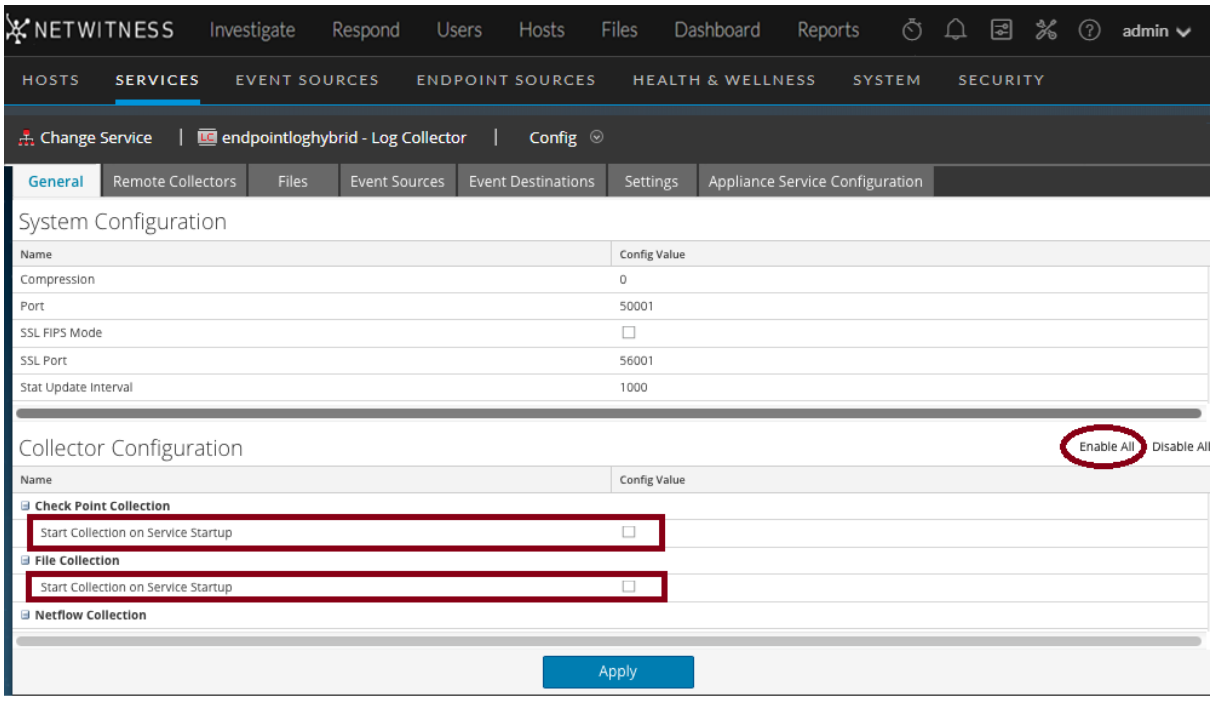
To set up a lockbox you need to set a password, as follows:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Settings** tab.

5. In the options panel, select **Lockbox** to configure Lockbox settings.
6. Under **Lockbox Security Settings**, enter a password in the **New Lockbox Password** field and click **Apply**.

Start Collection Services

If a collection service stops, you may need to start it again. You can also enable the automatic start of collection services.



Start a Collection Service

1. Go to (Admin) > Services.
2. Select a Log Collector service and click under **Actions**.
3. Click **View** > **System**.
4. Click **Collection** > ***service*** (for example **File**) and click **Start**.

Enable Automatic Start of Collection Services

1. Go to (Admin) > Services.
2. Select a Log Collector service and click under **Actions**.
3. Click **View** > **Config**.

   The General tab is displayed.
4. In the Collector Configuration panel, select **Start Collection on Service Startup** for the individual collection services that you want to start automatically. Alternatively, select **Enable All** to automatically start all collection services.

5. Click **Apply** for your changes to take effect.

Verify That Log Collection Is Working

This topic tells you how to verify that you have set up Log Collection correctly.

The following methods verify that Log Collection is working.

- Verify that there is event activity the Event Source Monitoring tab of the **Administration > Health & Wellness** view.
- Verify that there are parsers in the **device.type** field in the **Details** column in the **Investigation > Events** view for the collection protocol you configured.

Please refer to the topics for each Collection Protocol for steps on how to verify that the protocol is set up correctly.

Configure Certificates

You manage certificates by creating trust stores on the Log Collector. The Log Collector refers to these trust stores to determine whether or not the event sources are trusted.

Note: You can configure custom certificates for one or more event sources: for details, see (Optional) Configure Custom Certificates on Log Collectors.

Add a Certificate

To add a certificate:

1. Go to  **(Admin) > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click  under **Actions** and select **View > Config**.
4. Click the **Settings** tab.
5. In the options panel, select **Certificates**.
6. Click  in the **Certificates** tool bar.
   The **Add Cert** dialog is displayed.
7. Click **Browse** and select a certificate (***.PEM**) from your network.
8. Specify a password (if required).
9. Click **Save**.

Certificates Panel

The following table describe the buttons and columns available in the Certificates panel.

Field	Description
	Opens the Add Cert dialog in which you can add a certificate and password.

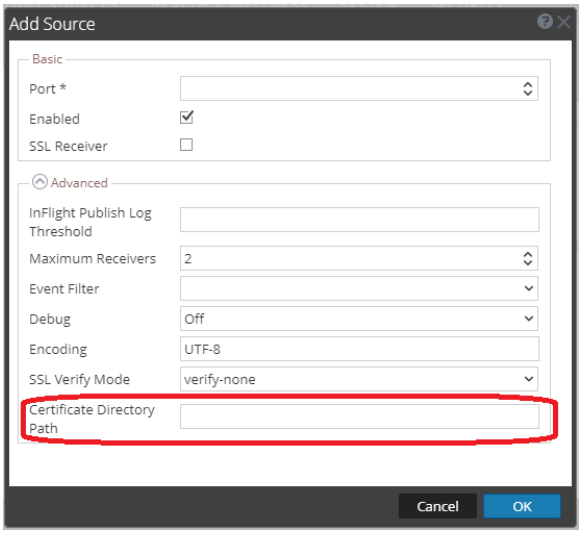
Field	Description
	Deletes the selected certificates.
	Selects certificates.
Trust Store Name	Displays the name of the trust store.
Certificate Distinguished Name	For Check Point event source only, displays the distinguished name for the certificate.
Certificate Password Name	For Check Point event source only, displays the password name for the certificate.

Add Cert Dialog

The following table describes the parameters available in the **Add Cert** dialog.

Field	Description
Trust Store Name	Enter a trust store name.
File	Click Browse to select a certificate (*.PEM file) file from your network
Password	Specify the password for this certificate.
Close	Closes the dialog without adding a certificate.
Save	Adds the certificate.

(Optional) Configure Custom Certificates on Log Collectors



You can configure custom certificates for the syslog listener on Log Collectors. This enables you to put your own trusted certificate in place on the syslog listener for specific event sources, while all other functionality uses the pre-installed certificates.

To configure custom certificates for an event source:

1. Upload the custom certificate and key files onto the Log Collector or Virtual Log Collector, and save them into a folder. You need to add this path information in step 4 below.
2. Go to **(Admin) > Services**, select a Log Collector service and **> View > Config**.
3. Select the **Event Sources** tab, then choose **Syslog** from the drop-down menu.
4. Add (or select) a **syslog-tcp** event source type.
5. In the **Sources** pane, add (or edit) a source.

   The Add Source dialog box is displayed.
6. In the Add Source dialog box, click the Advanced section toggle.

   The Advanced parameters are displayed.
7. For the **Certificate Directory Path**, enter the pathname for the folder that contains the certificate files.

   The Log Collector SSL syslog connections will use the `logcollector_cert.pem` and `logcollector_key.pem` files in the folder specified.
8. Press **OK** to save all parameters that you added or changed.
9. Restart syslog collection for the changes to take effect.

Note: More than one event source can use the same certificates: for each event source that shares the certificate, specify the same **Certificate Directory Path**. However, the specified path cannot contain more than one certificate (that is, one cert and one key file). To use a different custom certificate, you must specify a different **Certificate Directory Path**.

Log Collection Basics

How Log Collection Works

The Log Collector service collects logs from event sources throughout the IT environment in an organization and forwards the logs to other NetWitness components. The logs and the descriptive content are stored as meta data for use in investigations and reports.

Event sources are the assets on the network, such as servers, switches, routers, storage arrays, operating systems, and firewalls. In most cases, your Information Technology (IT) team configures event sources to send their logs to the Log Collector service and the NetWitness administrator configures the Log Collector service to poll event sources and retrieve their logs. As a result, the Log Collector receives all logs in their original form.

Collection Protocols

NetWitness can collect logs from a wide variety of event sources. When you are configuring log collection for a specific event source, you need to know, first and foremost, the protocol that is used to collect the logs.

Collection Protocol	Description
Check Point	Collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs. For details, see Configure Check Point Event Sources in NetWitness.
File	Collects events from log files. Event sources generate log files that are transferred using a secure file transfer method to the Log Collector service. For details, see Configure File Event Sources in NetWitness. **Note:** In NetWitness 11.4 and later, you can perform File Log collection for many event sources using Endpoint Agents, thus simplifying the collection process. For details, see the *NetWitness Endpoint Configuration Guide*. For a list of which event sources are supported, see the section "Currently Supported File Log Event Source Types."
Netflow	Accepts events from Netflow v5 and Netflow v9. For details, see Configure Netflow Event Sources in NetWitness.
ODBC	Collects events from event sources that store audit data in a database using the Open Database Connectivity (ODBC) software interface. For details, see Configure ODBC Event Sources in NetWitness.

Collection Protocol	Description
Plugins	The Plugins collection is a generic collection framework for collecting events using external scripts written in other languages. NetWitness currently provides collection for Amazon Web Services (AWS) CloudTrail and Microsoft Azure. • **AWS**: Collects events from Amazon Web Services (AWS) CloudTrail. Specifically CloudTrail records AWS API calls for an account. For details, see Configure AWS (CloudTrail) Event Sources in NetWitness • **Azure**: Collects events from Microsoft Azure. For details, see Configure Azure Event Sources in NetWitness. Customers can use this framework to develop their own collection protocols.
SDEE	Collects Intrusion Detection System (IDS) and Intrusion Prevention Service (IPS) messages. For details, see Configure SDEE Event Sources in NetWitness.
SNMP Trap	Accepts SNMP traps. For details, see Configure SNMP Event Sources in NetWitness.
Syslog	Accepts messages from event sources that issue syslog messages. For details, see Configure Syslog Event Sources. **Note:** You do not configure Syslog Collection for Local Log Collectors. You only need to configure Syslog Collection for Remote Collectors.
VMware	Collects events from a VMware virtual infrastructure. For details, see Configure VMware Event Sources in NetWitness.
Windows	Collects events from Windows machines that support the Microsoft Windows model. Windows 6.0 is an event logging and tracing framework included in the operating system beginning with Microsoft Windows Vista and Windows Server 2008. For details, see Configure Windows Event Sources in NetWitness.
Logstash	Utilize Logstash as a collection method, leveraging the various number of plugins supported by Logstash, such as: • Custom - This send the events from Logstash to NetWitness Platform. • Filebeat- This collects events from file. • Auditbeat - This collects audit events from an operating system (for example CentOS). • Export connector - This exports events from Decoder or Log Decoder to third party system. By default, Logstash version 7.10.0 is installed with all standard Logstash plugins (Beats, Export connector and so on) when Log collector is installed. For more information see, Configure Logstash Event Sources in NetWitness.

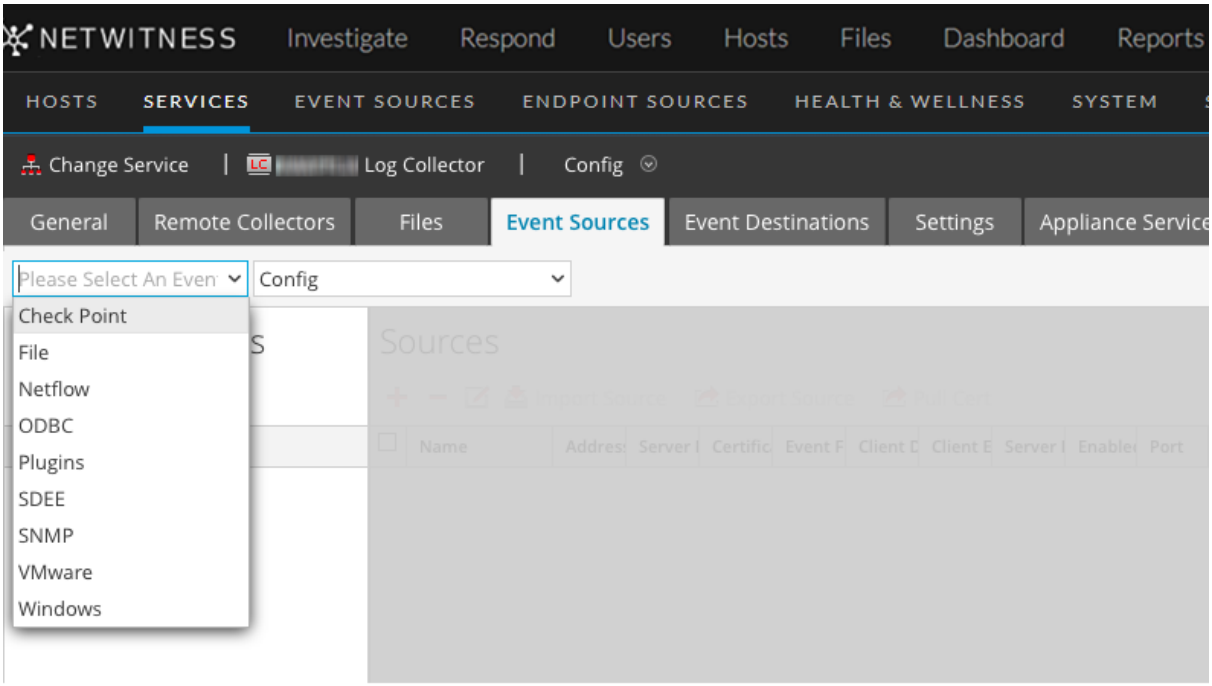
Collection Protocol	Description
Windows Legacy	Collects events from: • Older Windows versions such as Windows 2000 and Window 2003 and collects from Windows event sources that are already configured for enVision collection without having to reconfigure them. • NetApp ONTAP appliance event source so that you can now collect and parse NetApp evt files. • For more information, see.Windows Legacy and NetApp Collection Configuration. **Note:** You install the NetWitness Windows Legacy Collector on a physical or virtual Windows 2008 R2 SP1 64-Bit server using the **SALegacyWindowsCollector-*version-number.exe***.

Log Collection Basic Procedure for all Protocols

The basic procedure is the same for all of the supported Collection Protocols.

To configure collection for an event source:

1. **Set up your Event Source for collection.** Each supported event source has a configuration document available in the NetWitness Supported Event Sources space on NetWitness Link
   a. Navigate to the NetWitness Supported Event Sources space on NetWitness Link.
   b. Find the Instructions for your Event Source.
      The Overview page lists all of the currently supported Event Sources, as well as information about the collection method, device class, and supported versions.
   c. Download the configuration instructions for your event source, and follow them.
2. **Configure collection onNetWitness.** The event source configuration guide contains these instructions. However, this guide also provides these instructions, based on the collection method used by your event source. See Collection Protocols for details.
3. **Start the Service for your Collection Method.** Normally, you only need to do this for the first event source that uses this collection method. For example, the first time you configure an event source that uses File Collection, you may need to start the File Service in NetWitness.
4. **Verify that Collection is working for your Event Source.**



The remainder of this topic discusses steps 2, 3, and 4 in more detail.

Configure Collection in NetWitness

The process to configure event sources is dependent upon the collection method they use. Note, however, that they are very similar. The following procedure is generic: more details for individual collection methods are available in topics that cover the details for each specific collection method.

Basic procedure to configure an event source in NetWitness:

1. Go to **(Admin)** > **Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.

5. In the **Log Collector Event Sources** tab, select your collection method from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .
   The Available Event Source Types dialog box is displayed.
7. Select an event source type and click **OK**.
   The newly added event source type is displayed in the Event Categories panel.
8. Select the new type in the **Event Categories** panel and click in the Sources toolbar.
   The **Add Source** dialog is displayed.
9. Enter values for the available parameters.

Refer to the Parameters section of the specific collection method that you are configuring.

10. Click **OK**.

Start the Service for your Collection Method

To start the service for your collection method:

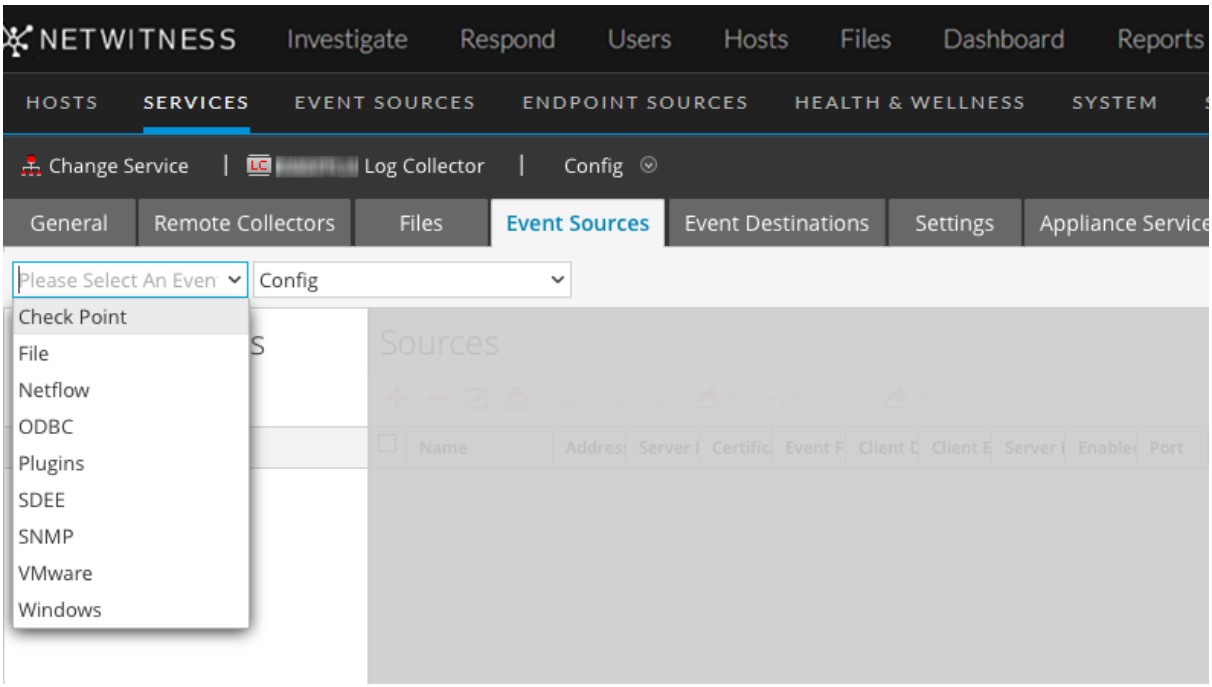
1. Go to **(Admin) > Services**.
2. Select a **Log Collector** and select **> View > System**.
3. Click **Collection > *protocol* > Start**

   where ***protocol*** is the protocol that you wish to start, for example **Netflow**.

Verify that Collection is working for your Event Source

You can verify that a collection method is working from the **(Admin) > Health & Wellness > Event Source Monitoring** tab.

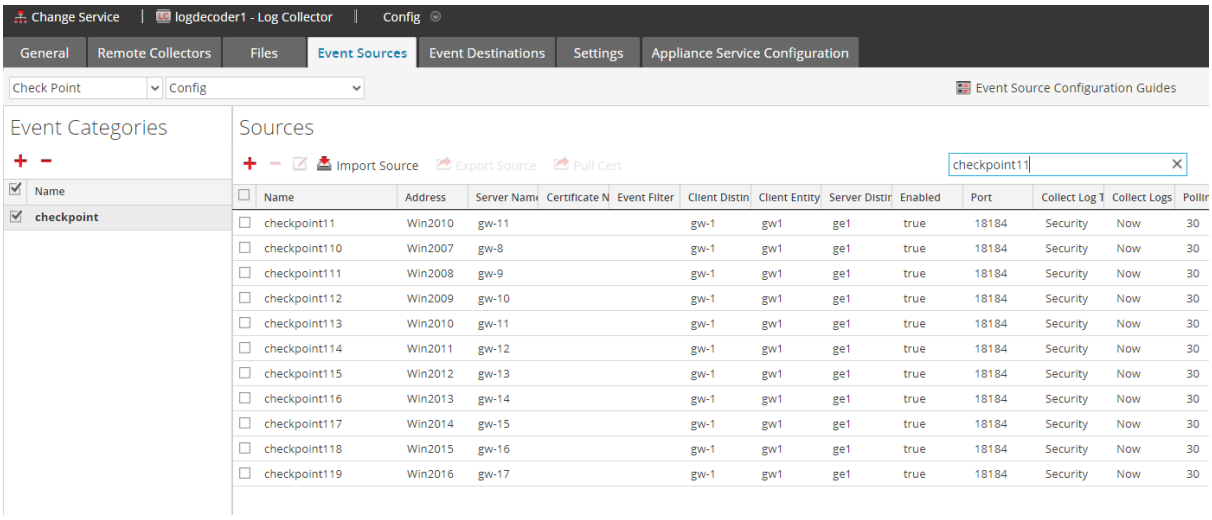
To verify that collection is working for an event source:



1. Go to **(Admin) > Health & Wellness**
2. Click the **Event Source Monitoring** tab.
3. In the grid, find the **Log Decoder**, **Event Source**, and **Event Source Type**.
4. Look for activity in the **Count** column for an event source to verify that collection is accepting events.

Search for Specific Event Sources

In some cases, your Log Collector may contain a lot of pre-configured event sources for a specific collection protocol (for example File). If so, you can quickly search for one or more event sources based on address (IP/hostname) or name.



To search for one or more specific event sources:

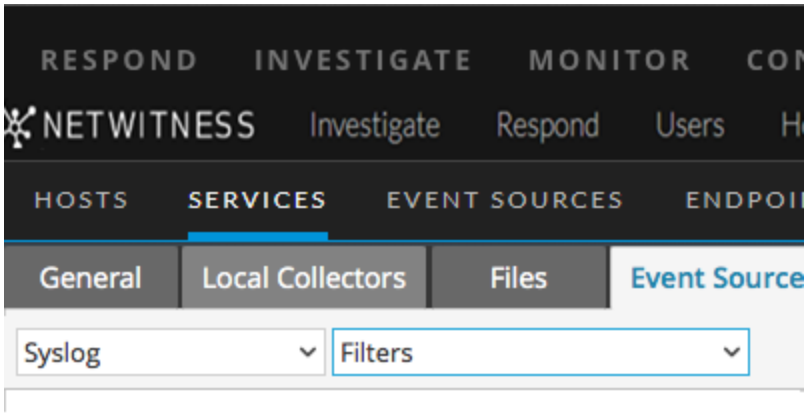
1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select any collection protocol/**Config** from the drop-down menu.

6. From the **Filter by Name / Address** text field, enter an IP address or hostname and click **Enter**.

   Event sources that match the information entered into the search box are returned. For example, the image below shows a list of Check Point event sources whose names match the string **checkpoint11**.

Configure Event Filters for a Collector

This topics tells you how to create and maintain Event filters across all collection protocols.



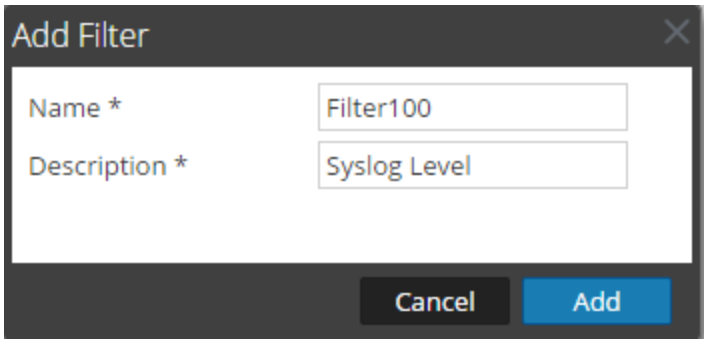
Note: Prior to 11.3, you could not configure Syslog Collection for Local Log Collectors. You ***can*** configure Syslog for local Log Collectors that are on version 11.3 or later.

Configure an Event Filter

To configure an event filter for an event source:

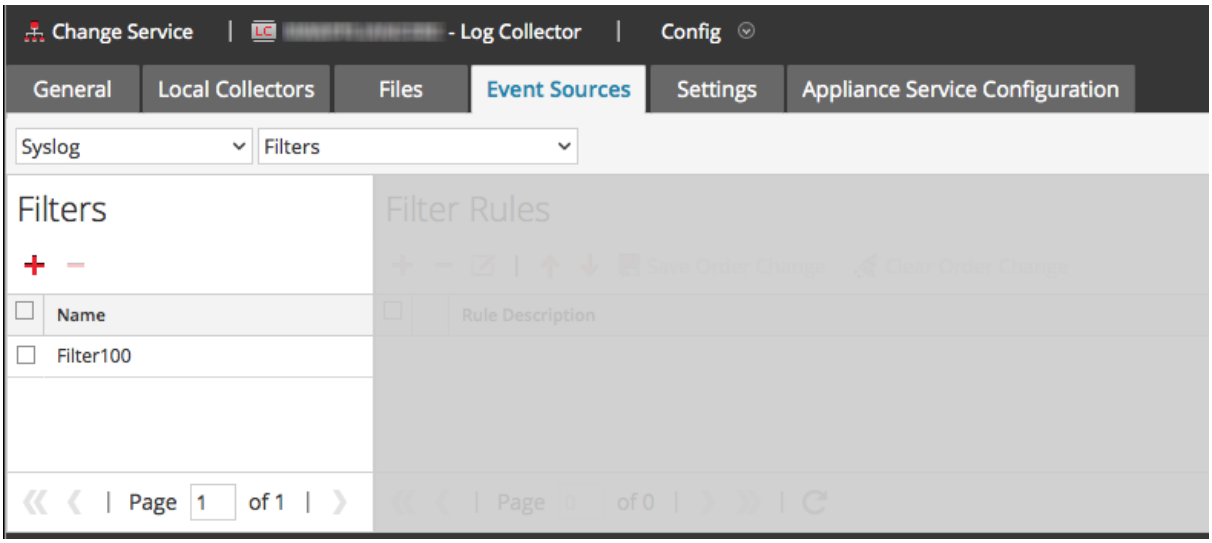
1. Go to  **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select  **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select any collection method / **Filter** from the drop-down menus.

   The following screen shows **Syslog** selected.



> **Note:** Syslog configuration is only available on Remote Collectors prior to 11.3: if you are working with a Local Collector service, **Syslog** is not available from the drop-down menu for Log Collectors on version 11.0, 11.1, or 11.2.

   The **Filters** view displays the filters that are configured for the selected collection method, if any.



6. In the **Filters** panel toolbar, click .

   The **Add Filter** dialog displays.

7. Enter a name and description for the new filter and click **Add**.

   The new filter displays in the **Filter** panel.

8. Select the new filter in the **Filters** panel and click + in the **Filter Rules** panel toolbar.

   The **Add Filter Rule** dialog is displayed.

9. Click + under **Rule Conditions**.
10. Add the parameters for this rule and click **Update > OK**.

NetWitness updates the filter with the rule that you defined.

Note: Rules are processed in order from top down until an Action type aborts the processing, or the final rule is checked. Default behavior is to accept the rule if no matches are found.

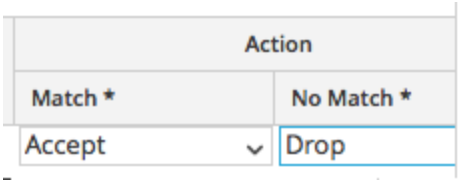
The following tables describe the parameters for adding a filter rule.

Event Filter Rule "Key" Parameter

The values for the Key field depend on the Collection method to which the filter applies.

Collection Method	Values for the *Key* Field
Checkpoint, File, Netflow, Plugin, SDEE SNMP and VMware	• All Data Fields • Event Source Type • Event Source Name • Source IP • Raw Event
ODBC	• All Data Fields • Event Source Type • Event Source Name • Source IP • Message ID • Message Level
Syslog	• All Data Fields • Event Source Type • Event Source Name • Source IP • Syslog level • Raw Event
Windows	• All Data Fields • Event Source Type • Event Source Name • Source IP • Event ID • Provider • Channel • Computer • UserName • DomainName

Collection Method	Values for the *Key* Field
Windows Legacy	• All Data Fields • Event Source Type • Event Source Name • Source IP • Event ID



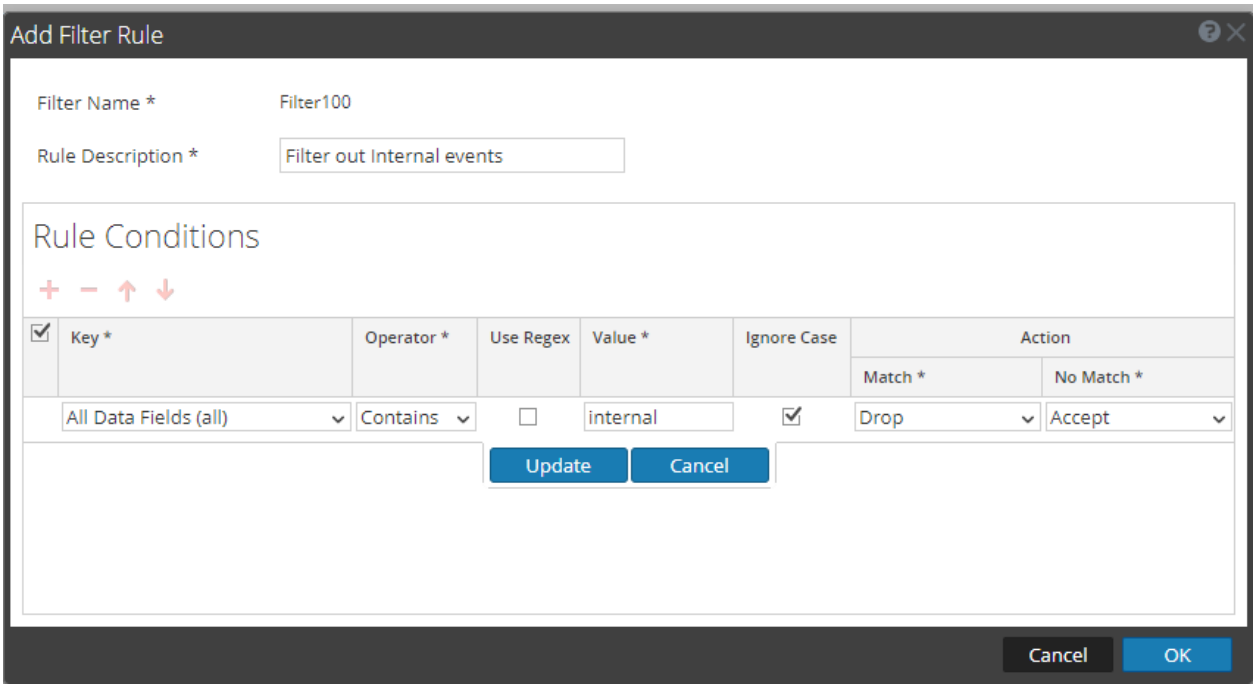
Other Event Filter Rule Parameters

The following table describes all the other available fields for creating an event filter rule.

Field	Description
Operator	Valid values are: • Contains • Equal
Use Regex	Optional. You can select this if you want to use Regex.
Value	Value depends on the key value you selected. For example if you choose **Syslog level** for Key, the value will be a number that denotes the syslog level.
Ignore case	Optional. Select this to ignore the case sensitivity.
Action	Choose actions for message data that matches a condition, or that does not match a condition. See below for more details.

Actions

You can choose a 'match' and 'no-match' action for each rule condition. This screenshot shows a condition that uses the **Accept** action on matches, and **Drop** action on events that do not match the condition.



The available actions are as follows:

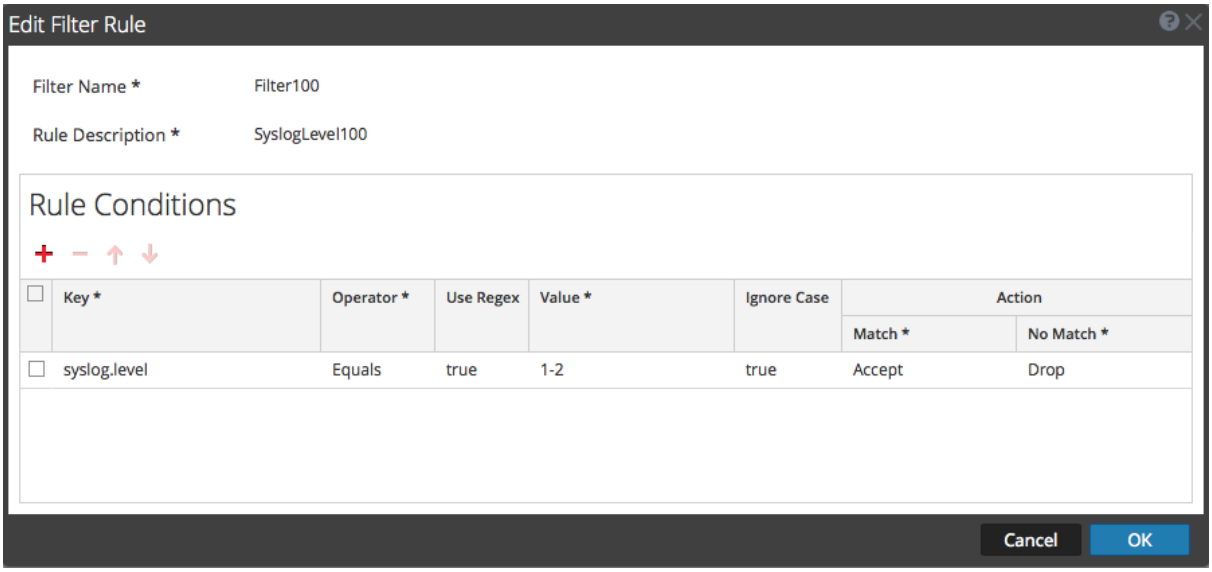
- **Accept**: the filtered event is included in event logs, and no further rule processing is done for the event: the event will display in the NetWitness user interface during Investigation.

- **Drop**: the filtered event will not be included in event logs, and no further rule processing is done for the event: the event will not display during Investigation.
- **Next condition**: the filtered event moves on to the next rule condition in the rule. If there are no more rule conditions in the current rule, it moves on to the next rule.
- **Next rule**: the filtered event moves on to the next rule. If there are no more rules in the filter, the filter event is included in event logs, and no further rule processing is done for the event (same as **Accept**).

For example, consider the following condition:

In this condition, if the event log contains the string "internal," the event is not included in the event meta, nor is it displayed during Investigation. If the string is not found, the event is included and is displayed during Investigation.

Modify Filter Rules



To modify existing filter rules:

1. Go to  **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select any collection method / **Filter** from the drop-down menus.

   The following screen shows **Check Point** selected.

   The **Filters** view displays the filters that are configured for the selected collection method, if any.

6. In the **Filter Rules** list, select a rule and click .
   The **Edit Filter Rule** dialog is displayed.

7. Select the rule condition that you want to modify.

8. Modify the condition parameters that require changes and click **Update** > **OK**.

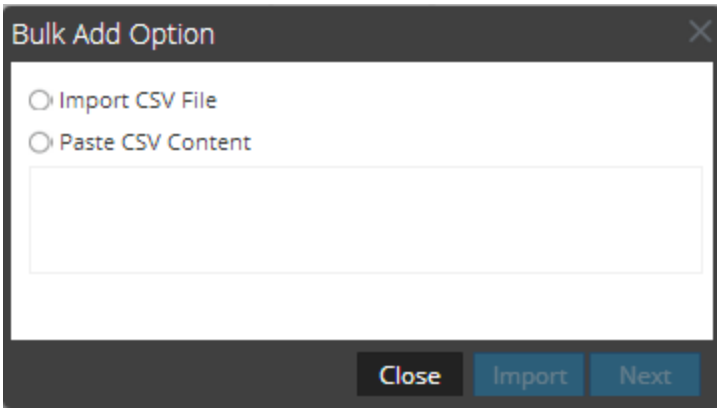
NetWitness applies the condition parameter changes to the selected filter rule.

Import, Export, Edit, and Test Event Sources in Bulk

This topic describes how to import, export, edit, and test event sources in bulk.

You can use the bulk export option to export the event source details of your current set up and store it. This data can be imported in bulk when you face a problem with your current set up and require the event source data you had.

You can use the bulk edit feature when you have multiple event sources that need a specific modification. You can select all the sources and apply the edit option across them at a time and avoid applying the change one by one.



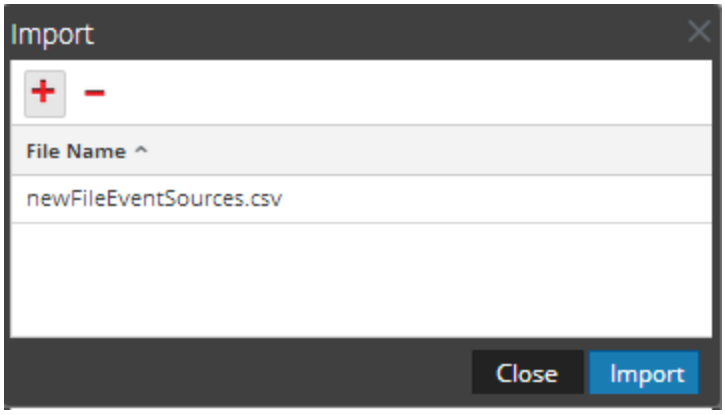
Import Event Sources in Bulk

Warning: When using a spreadsheet program to edit an exported event source CSV file, some data fields like numbers and dates can be re-formatted into the spreadsheet program's native field types. This can cause issues when re-importing this information, as some data fields may be garbled or formatted incorrectly. This can be avoided by importing the CSV file into the spreadsheet program, and specifying all data fields as text values.

To import multiple event sources at once:

1. Go to  **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. Select **Check Point**, **File**, **Netflow**, **Logstash**, **ODBC**, **Plugins**, **SDEE**, **(Syslog for Remote Collectors) only**, **VMware**, **Windows**, or **Windows Legacy** (SNMP does not have an Import function.).
6. In the **Sources** panel toolbar, click **Import Source**.

   The **Bulk Add Option** dialog is displayed.



7. Select either **Import CSV File** or **Paste CSV Content**. If you select:

- Import CSV File:
  a. Click **Next**.

     The **Import dialog** is displayed.

  b. Click **Add** and select a **.csv** file from your network.

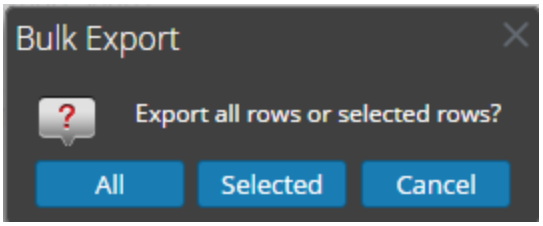
  c. Click **Import**.

     The event sources are added to the **Event Source** list.

- Paste CSV Content
  a. Copy the contents of the **.csv** file and paste them into the dialog.

  b. Click **Import**.

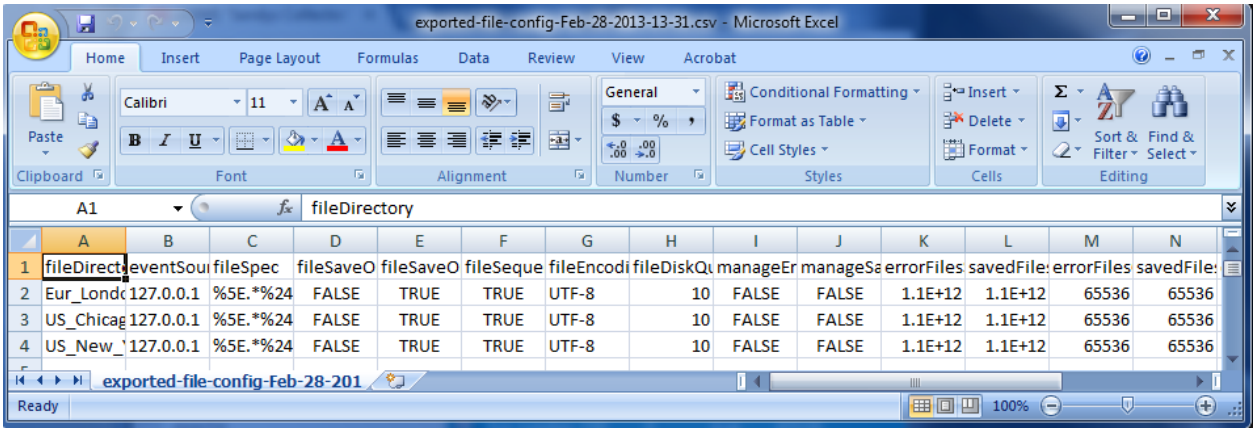
     The event sources are added to **Event Source List**.



Export Event Sources in Bulk

Warning: When using a spreadsheet program to edit an exported event source CSV file, some data fields like numbers and dates can be re-formatted into the spreadsheet program's native field types. This can cause issues when re-importing this information, as some data fields may be garbled or formatted incorrectly. This can be avoided by importing the CSV file into the spreadsheet program, and specifying all data fields as text values.

To export event source information:



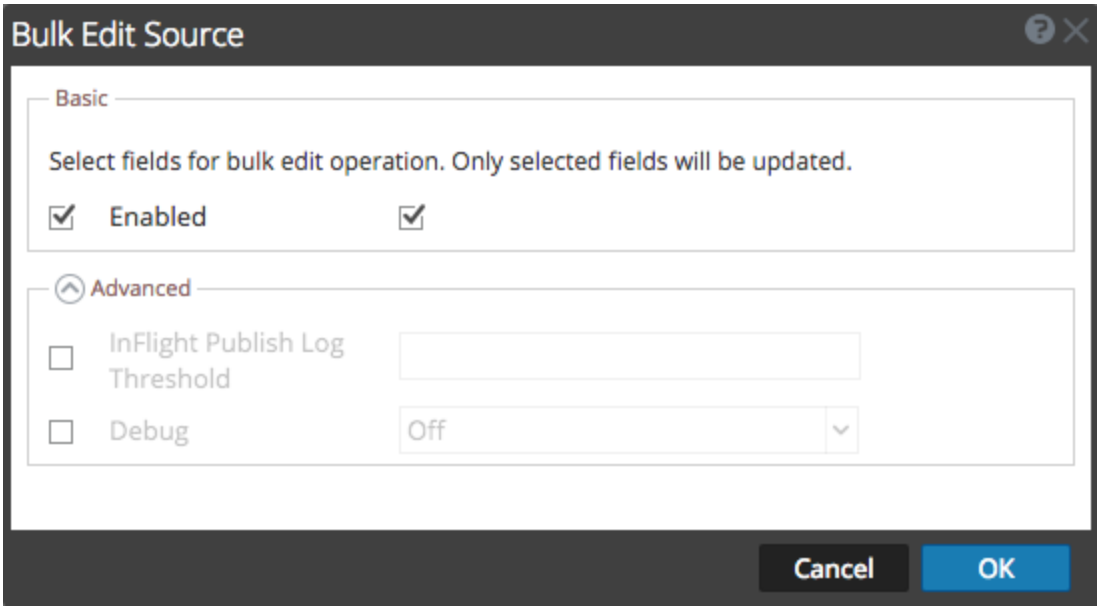
1. Go to  **(Admin) > Services**.
2. Select a Log Collection service.
3. Select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. Select **Check Point**, **File**, **Netflow**, **Logstash**, **ODBC**, **Plugins**, **SDEE**, **(Syslog for Remote Collectors) only**, **VMware**, **Windows**, or **Windows Legacy** (SNMP does not have an Export function.).
6. In the **Sources** panel, select one or multiple event sources and click **Export Source**.

   The **Bulk Export** dialog is displayed.

7. Based on your selection:
   - **All**: NetWitness exports all event sources to a time-stamped CSV file.
   - **Selected**: NetWitness exports the event source or sources you selected to a time-stamped CSV file.
   - **Cancel**: NetWitness cancels the export.

   The following is an example of a time-stamped CSV file that gets created with the event sources that you selected from the list.

Edit Event Sources in Bulk



To edit multiple event sources at once:

1. On the **Log Collector Event Sources** tab, select **Check Point**, **File**, **Netflow**, **Logstash**, **ODBC**, **Plugins**, **SDEE**, **Syslog**, **VMware**, **Windows**, or **Windows Legacy** (SNMP does not have

an Edit function.).

2. In the **Sources** panel, select multiple event sources and click .

   The appropriate **Bulk Edit** dialog for the selected event source is displayed. The following figure is an example of **Bulk Edit Source** dialog for File event source parameters.

3. Select the checkbox to the left of the fields that you want to modify (for example, **Debug**).
4. Modify the selected parameters (for example, change Debug from **Off** to **On**).
5. Click **OK**.

   NetWitness applies the same parameter value change to all of the selected event sources

Test Event Source Connections in Bulk

To test multiple event source connections at once:

1. Go to **(Admin) > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Select the **Event Sources** tab, select **Plugins**, **ODBC**, **Logstash** or **Windows** (the other protocols do not have a bulk test connection function).
5. Select one or more:
   - sources from the **Sources** panel for **Plugins** or **ODBC**
   - hosts from **Hosts** panel for **Windows**

   The **Test Connection** button is enabled.

6. Click Test Connection .

   The **Bulk Test Connections** dialog is displayed showing the current status of the test for each source. The status can be waiting, testing, passed or failed.

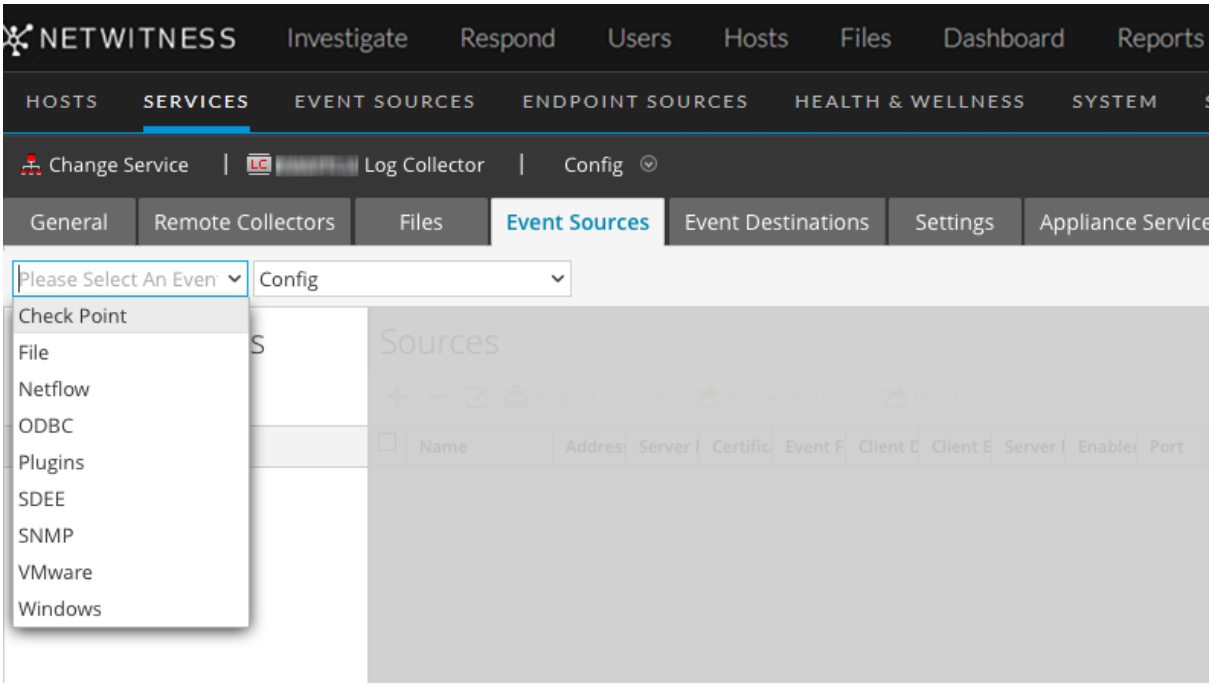
   If you choose to close the testing before it is completed, the testing stops and the **Bulk Test Connections** dialog closes.

After the testing is complete, the results are displayed in the **Bulk Test Connections** dialog.

See Also

You can use the **Event Sources** module ((Admin) > **Event Sources**) to create groups of event sources, typically imported from a CMDB, and to monitor event sources based on those groups. For details, see the following topics in the *Event Source Management Guide*:

- Import Event Sources
- Export Event Sources
- Bulk Edit Event Source Attributes



Configure Collection Protocols and Event Sources

This topic tells you how to configure collection protocols and the event sources using those protocols.

You configure the Log Collector to collect event data from your event sources in the Event Sources tab of the Log Collection parameter view.

To configure a collection protocol:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.

5. Select a collection protocol (for example, **File**) and select **Config**.
6. Click + and select an event source.
7. Select the newly added category and click +.
8. Specify the parameters for the event source. For details, see the individual collection protocol topics.

The following guides provide detailed instructions on how to configure the collection protocols and their associated event sources in NetWitness. Each guide includes an index to configuration instructions for the event sources supported for that collection protocol.

To configure individual collection protocols, see the following topics:

- Configure AWS (CloudTrail) Event Sources in NetWitness
- Configure Azure Event Sources in NetWitness
- Configure Check Point Event Sources in NetWitness
- Configure File Event Sources in NetWitness
- Configure Netflow Event Sources in NetWitness
- Configure ODBC Event Sources in NetWitness
  - Configure Data Source Names (DSNs)
  - Create Custom Typespec for ODBC Collection
  - ODBC Event Source Configuration Parameters
  - ODBC DSNs Event Source Configuration Parameters
- Configure SDEE Event Sources in NetWitness
- Configure SNMP Event Sources in NetWitness
- Configure Syslog Event Sources
- Configure VMware Event Sources in NetWitness
- Configure Windows Event Sources in NetWitness
- Windows Legacy and NetApp Collection Configuration
  - Set Up the Windows Legacy Collector
  - Configure Windows Legacy and NetApp Event Sources
  - Troubleshoot Windows Legacy and NetApp Collection
- Configure Logstash Event Sources in NetWitness

Configure AWS (CloudTrail) Event Sources in NetWitness

This topic tells you how to configure the AWS collection protocol, which collects events from Amazon Web Services (AWS) CloudTrail.

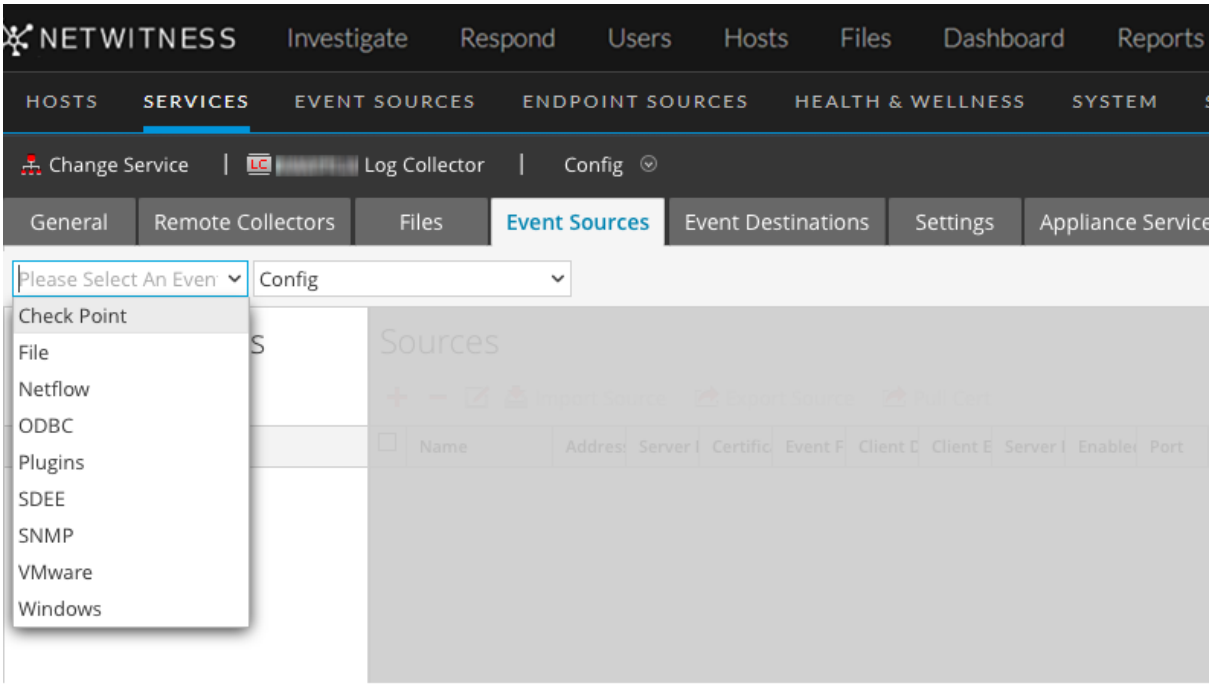
Note: The AWS plugin is meant only for collecting from AWS CloudTrail logs, and not for collecting from arbitrary logs in S3 buckets (under arbitrary directories). The AWS CloudTrail logs are sent in JSON format, as detailed in the AWS documentation here: http://docs.aws.amazon.com/awscloudtrail/latest/userguide/cloudtrail-event-reference.html.

How AWS Collection Works

The Log Collector service collects events from Amazon Web Services (AWS) CloudTrail. CloudTrail records AWS API calls for an account. The events contain the identity of the API caller, the time of the API call, the source IP address of the API caller, the request parameters, and the response elements returned by the AWS service. The AWS API call history provided by CloudTrail events enables security analysis, resource change tracking, and compliance auditing. CloudTrail uses Amazon S3 for log file storage and delivery. NetWitness copies the log files from the cloud (S3 bucket), and sends the events contained in the files to the Log Collector.

Deployment Scenario

The following figure illustrates how you deploy the AWS Collection Protocol in NetWitness.



Configuration

To configure an AWS (CloudTrail) Event Source:

1. Go to  **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Select  **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.

5. In the **Event Sources** tab, select **Plugins/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click + .

   The **Available Event Source Types** dialog is displayed.
7. Select **cloudtrail**) and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click + in the **Sources** toolbar.

   The **Add Source** dialog is displayed.
9. Define parameter values. For details, see AWS Parameters below.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the device or service information and retry.

    Log Collector takes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness displays an error message.
11. If the test is successful, click **OK**.

    The new event source is displayed in the **Sources** panel.

AWS Parameters

The following table describes the **Basic** configuration parameter for AWS collection.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

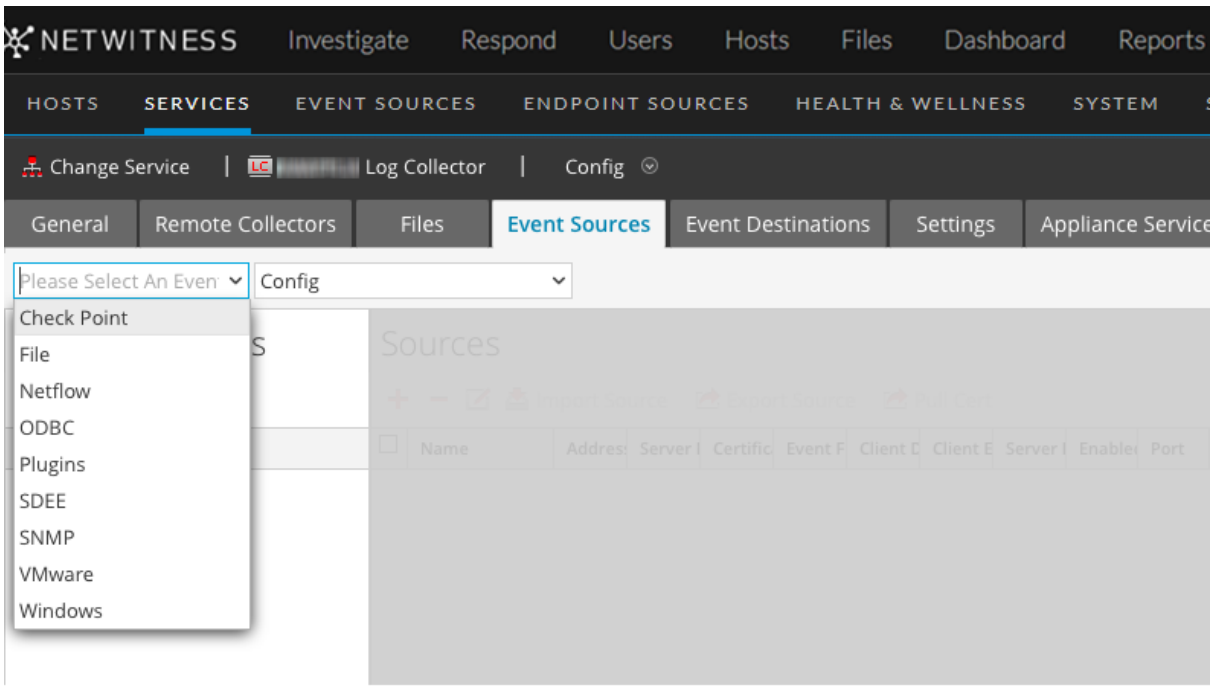
Parameter	Description
Name *	Name of the event source.
Enabled 	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Account Id *	Account Identification code of the S3 Bucket
S3 Bucket Name *	Name of the AWS (CloudTrail) S3 bucket. Amazon S3 bucket names are globally unique, regardless of the AWS (CloudTrail) region in which you create the bucket. You specify the name at the time you create the bucket. Bucket names should comply with DNS naming conventions. The rules for DNS-compliant bucket names are: • Bucket names must be at least three and no more than 63 characters long. • Bucket names must be a series of one or more labels. Adjacent labels are separated by a single period ".". Bucket names can contain lowercase letters, numbers, and hyphens. Each label must start and end with a lowercase letter or a number. • Bucket names must not be formatted as an IP address (for example, 192.168.5.4). The following examples are **valid** bucket names: • `myawsbucket` • `my.aws.bucket` • `myawsbucket.1` The following examples are **invalid** bucket names: • `.myawsbucket` - Do not start a Bucket Name with a period • `myawsbucket.` - Do not end a Bucket Name with a period • `my..examplebucket` - Only use one period between labels.
Access Key *	Key used to access the S3 bucket. Access Keys are used to make secure REST or Query protocol requests to any AWS service API. Please refer to Manage User Credentials on the Amazon Web Services support site for more information on Access Keys.
Secret Key *	Secret key used to access the S3 bucket.
Region *	Region of the S3 bucket. `us-east-1` is the default value.
Region Endpoint	Specifies the AWS CloudTrail hostname. For example, for an AWS public cloud for us-east region, the Region Endpoint would be s3.amazonaws.com. More information can be found at http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region. This parameter is necessary to collect CloudTrail logs from AWS Government or Private clouds.
Use Proxy	Enable **Use Proxy** to set proxy for AWS server. By default, it is disabled.
Proxy Server	Enter the proxy name you want to connect to access the AWS server.
Proxy Port	Enter the port number that connects to the proxy server to access the AWS server.
Proxy User	Enter the user name to authenticate with the proxy server.

Parameter	Description
Proxy Password	Enter the password to authenticate with proxy port.
Start Date *	Starts AWS (CloudTrail) collection from the specified number of days in the past, measured from the current timestamp. The default value is 0, which starts from today. The range is 0–89 days.
Log File Prefix	Prefix of the files to be processed. **Note:** If you set a prefix when you set up your CloudTrail service, make sure to enter the same prefix in this parameter.
Cancel	Closes the dialog without adding the AWS (CloudTrail).
OK	Adds the current parameter values as a new AWS (CloudTrail).

The following table describes the **Advanced** configuration parameter for AWS collection.

Parameter	Description
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).
Command Args	Arguments added to the script.
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is 60. For example, if you specify 60, the collector schedules a polling of the event source every 60 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 60 seconds for the polling to start because the threads are busy.
SSL Enabled 	Select the check box to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The check box is selected by default.
Test Connection	Validates the configuration parameters specified in this dialog are correct. For example, this test validates that: • NetWitness can connect with the S3 Bucket in AWS using the credentials specified in this dialog. • NetWitness can download a log file from the bucket (test connection would fail if there were no log files for the entire bucket, but this would be extremely unlikely).

Configure Azure Event Sources in NetWitness



This topic tells you how to configure the Azure collection protocol. Microsoft Azure is a cloud computing platform and infrastructure for building, deploying, and managing applications and services through a global network of Microsoft-managed data centers.

Configuration in NetWitness

For complete details about configuring Azure as an event source, see the Azure Event Source Configuration Guide, available on NetWitness Link.

To configure an Azure Event Source:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.

5. In the **Event Sources** tab, select **Plugins/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .
   The **Available Event Source Types** dialog is displayed.
7. Select **azureaudit**) and click **OK**.
   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the **Event Categories** panel and click  in the **Sources** toolbar.

   The **Add Source** dialog is displayed.

9. Define parameter values. For details, see Azure Parameters below.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the device or service information and retry.

    Log Collector takes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness displays an error message.

11. If the test is successful, click **OK**.

    The new event source is displayed in the **Sources** panel.

Azure Parameters

This section describes the Azure event source configuration parameters.

Basic Parameters

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Client ID *	The Client ID is found the Azure Application Configure tab. Scroll down until you see it.
Client Secret *	When you are configuring the event source, the client secret is displayed when you are creating a key, and you select a duration of validation. Make sure to save this, because you will only be able to see it once, and it cannot be retrieved later.
API Resource Base URL *	Enter `https://management.azure.com/`. Be sure to include the trailing slash (/).
Federation Metadata Endpoint *	In your Azure application, click the **View Endpoints** button (near the bottom of the pane). There are a lot of links that all begin with the same string. Compare the URLs and find the common string that begins most of them. This common string is the endpoint that you need to enter here.
Subscription ID *	You can find this in the Microsoft Azure dashboard: click on Subscriptions at the bottom of the list on the left.

Name	Description
Tenant Domain *	Go to the active directory and click on the directory. In the URL, the tenant domain is the string directly following **manage.windowsazure.com/**. The tenant domain is the string up to and including the **.com**.
Resource Group Names *	In Azure, select Resource groups from the left navigation pane, then select your group.
Start Date *	Choose the date from which to start collecting. Default's to the current date.
Test Connection	Checks the configuration parameters specified in this dialog to make sure they are correct.

Advanced Parameters

Click  next to **Advanced** to view and edit the advanced parameters, if necessary.

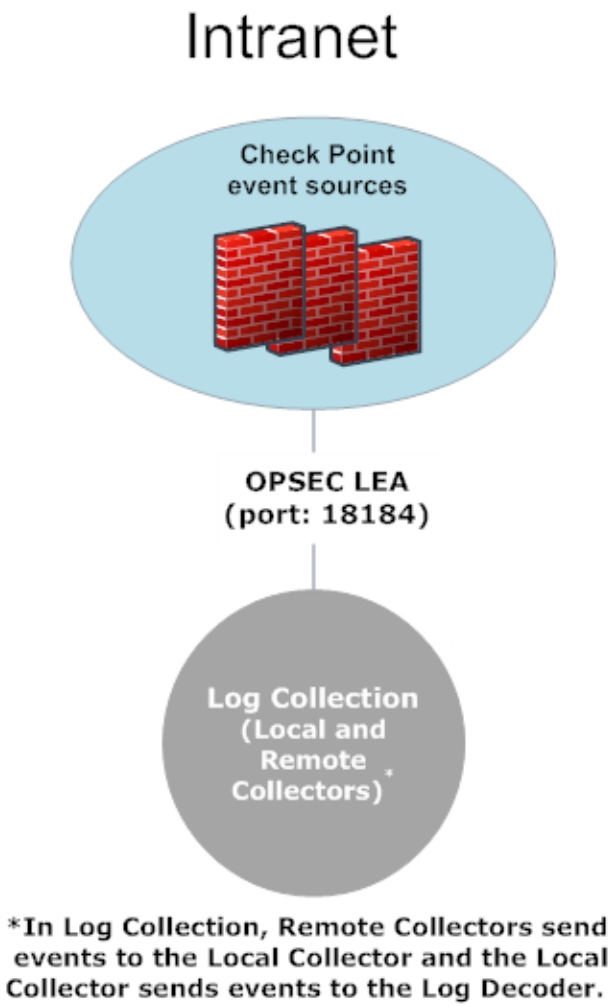
Name	Description
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, the collector waits for that cycle to finish. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Duration Poll	Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit.
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Max Idle Time Poll	Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit.
Command Args	Optional arguments to be added to the script invocation.

Name	Description
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact.

Configure Check Point Event Sources in NetWitness

This topic tells you how to configure the Check Point collection protocol, which collects events from Check Point event sources.

This protocol collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs.



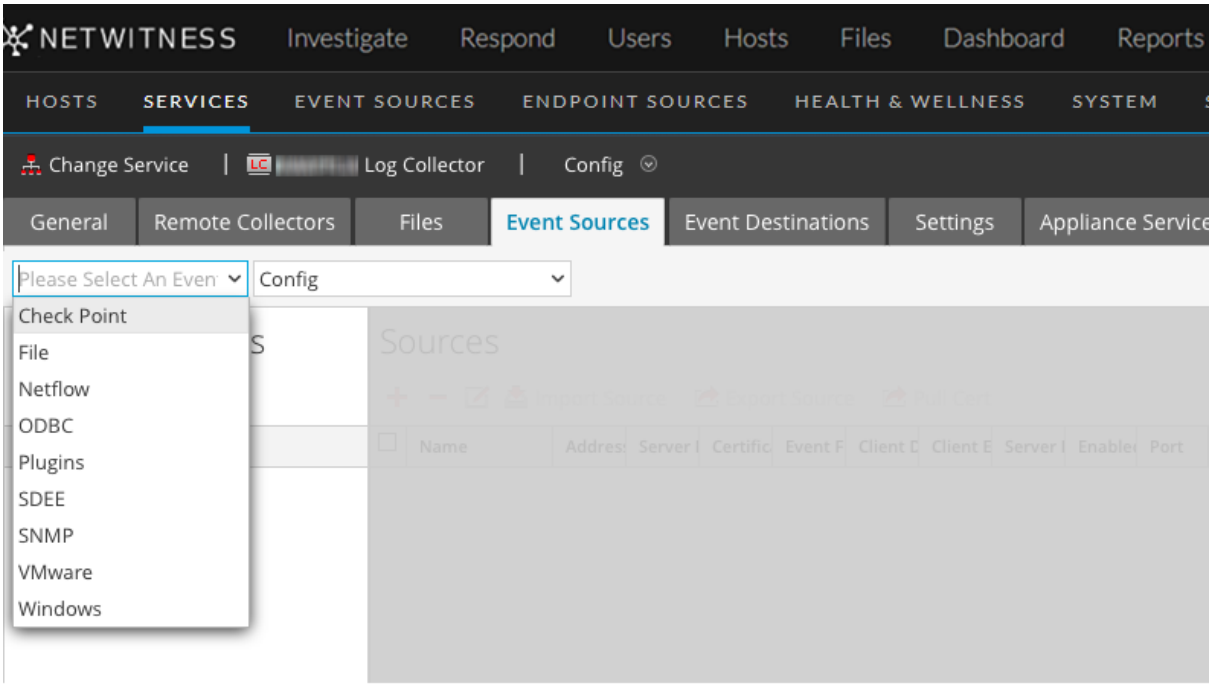
How Check Point Collection Works

The Log Collector service collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs.

Note: OPSEC LEA (Log Export API) supports extraction of logs from Check Point event sources configured with a SHA-256 or SHA-1 certificate.

Deployment Scenario

The following figure illustrates how you deploy the Check Point Collection Protocol in NetWitness.



Configuration in NetWitness

To configure a Check Point Event Source:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.

5. In the **Event Sources** tab, select **Check Point/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click + .

   The **Available Event Source Types** dialog is displayed.
7. Select a check point event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click + in the **Sources** toolbar.

   The **Add Source** dialog is displayed.
9. Define parameter values. For details, see Check Point Parameters below.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the device or service information and retry.

    Log Collector takes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness displays an error message.
11. If the test is successful, click **OK**.

    The new event source is displayed in the **Sources** panel.

Check Point Parameters

This section describes the Check Point event source configuration parameters.

Basic Parameters

Parameter	Description
Name*	Name of the event source.
Address*	IP Address of the Check Point server.
Server Name*	Name of the Check Point server.
Certificate Name	Certificate name for secure connections to use when the transport mode is https. If set, the certificate must exist in the certificate trust store that you created using the Settings tab. Select a certificate from the drop-down list. The file naming convention for Check Point event source certificates is **checkpoint_*name-of-event-source***.
Client Distinguished	Enter the Client Distinguished Name from the Check Point server.
Client Entity Name	Enter the Client Entity Name from the Check Point server.
Server Distinguished	Enter the Server Distinguished Name from the Check Point server.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Pull Certificate	Select the checkbox to pull a certificate for first time. Pulling a certificate makes it available from the trust store.
Certificate Server Address	IP Address of the server on which the certificate resides. Defaults to the event source address.
Password	Only active when you select the Pull Certificate checkbox for first time. Password required to pull the certificate. The password is the activation key created when adding an OPSEC application to Check Point on the Check Point server.

Determine Advanced Parameter Values for Check Point Collection

You use less system resources when you configure a Check Point event source connection to stay open for a specific time and specific event volume (transient connection). NetWitness defaults to the following connection parameters that establish a transient connection:

- Polling Interval = **180** (3 minutes)
- Max Duration Poll = **120** (2 minutes)
- Max Events Poll = **5000** (5000 events per polling interval)
- Max Idle Time Poll = **0**

For very active Check Point event sources, it is a good practice to set up a connection that stays open until you stop collection (persistent connection). This ensures that Check Point collection maintains the pace of the events generated by these active event sources. The persistent connection avoids restart and connection delays and prevents Check Point collection from lagging behind event generation.

To establish a persistent connection for a Check Point event source, set the following parameters to the following values:

- Polling Interval = **-1**
- Max Duration Poll = **0**
- Max Events Poll = **0**
- Max Idle Time Poll = **0**

Parameter	Description
Port	Port on the Check Point server that Log Collector connects to. Default value is 18184.
Collect Log Type	Type of logs that you want to collect: Valid values are: • **Audit** - collects audit events. • **Security** - collects security events. If you want to collect both audit and security events, you must create a duplicate event source. For example, first you would create an event source with Audit selected pulling a certificate into the trust store for this event source. Next you would create another event source with the same values except that you would select Security for the Collect Log Type and you would select the same certificate in Certificate Name that you pulled when you set up the first set of parameters for this event source and you would make sure that Pull Certificate was not selected.
Collect Logs From	When you set up a Check Point event source, NetWitness collects events from the current log file. Valid values are: • **Now** - Start collecting logs now (at this point in time in the current log file). • **Start of Log** - Collect logs from the beginning of the current log file. If you choose "Start of Log" for this parameter value, you may collect a very large amount of data depending on how long the current log file has been collecting events. Note that this option is effective only for the first collection session.
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Duration Poll	The maximum duration of polling cycle (how long the cycle lasts) in seconds.

Parameter	Description
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Max Idle Time Poll	Maximum idle time, in seconds, of a polling cycle. 0 indicates no limit.**> 300** is the default value.
Forwarder	Enables or disables the Check Point server as a forwarder. By default it is disabled.
Log Type (Name Value Pair)	Logs from the event source in Name Value format. By default it is disabled.
Debug	**Caution:** Only enable debugging (set this parameter to "On" or "Verbose") if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables and disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).

Verify Check Point Collection is Working

The following procedure illustrates how you can verify that Check Point collection is working from the **Administration > Health & Wellness > Event Source Monitoring** tab.

To verify Check Point collection from the Event Source Monitoring tab:

1. Access the **Manage** tab from the  **(Admin) > Event Sources** view.
2. Find a checkpoint event source in the **Event Sources** column.
3. Look for activity in the **Total Count** column to verify that Check Point collection is accepting events.

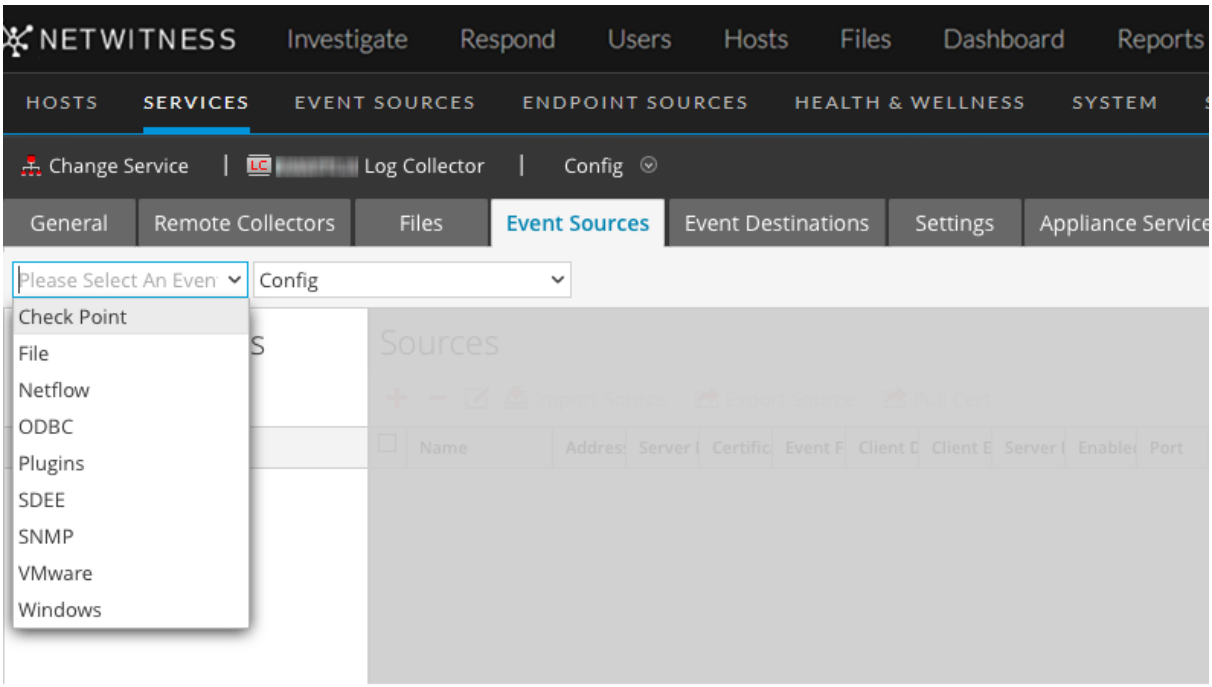
To verify Check Point collection from the Investigation > Events view:

The following procedure illustrates how you can verify that Check Point collection is working from the **Investigation > Events** view.

1. Access the **Investigation > Events** view.
2. Select the Log Decoder (for example, **LD1**) collecting Check Point events in the **Investigate a Device** dialog.
3. Look for a Check Point event source parser (for example, **checkpointfw1**) in the **device.type** field in the **Details** column to verify that Check Point collection is accepting events.

Note: If the logs from the VSX Checkpoint firewall server are collected by the Log Collector checkpoint service, to translate the VSX IP in the logs to **ip.orig** meta, you must add the VSX hostname and the VSX IP address to the `/etc/hosts` file in the Log Collector.

Configure File Event Sources in NetWitness



This topic tells you how to configure the File collection protocol:

Note: In NetWitness 11.4 and later, you can perform File Log collection for many event sources using Endpoint Agents, thus simplifying the collection process. For details, see the *NetWitness Endpoint Configuration Guide*. For a list of which event sources are supported, see the section "Currently Supported File Log Event Source Types."

Configure a File Event Source

To configure a File Event Source:

1. Go to  **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.

5. In the **Event Sources** tab, select **File/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .
   The **Available Event Source Types** dialog is displayed.
7. Select a file event source type and click **OK**.
   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click  in the **Sources** toolbar.
   The **Add Source** dialog is displayed.
9. Add a **File Directory** name and modify any other parameters that require changes. For details, see File Collection Parameters below.
10. To get the public key and enter it into the dialog box, do the following:
    a. Select and copy the public key from the Event Source by running: `cat ~/.ssh/id_rsa.pub`
    b. Paste the public key in the **Eventsource SSH Key** field.
11. Click **OK**.

You need to restart file collection for your changes to take effect.

Stop and Restart File Collection

After you add a new event source that uses file collection, you must stop and restart the NetWitness File Collection service. This is necessary to add the key to the new event source.

File Collection Parameters

The following table provides descriptions of the File Collection source parameters.

The following table describes the **Basic** configuration parameter for File collection.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Name	Description
File Directory*	Collection directory (for example, **Eur_London100**) into which the File event source places its files. Valid value is a character string that is conforms to the following regular expression: **[_a-zA-Z][_a-zA-Z0-9]*** This means that the file directory must start with a letter followed by numbers, letters, and underscores. Do not modify this parameter after you start collecting event data. After you create the collection, the Log Collector creates the work, save, and error sub-directories under the collection directory.
Address*	IP address of the event source. Valid value is an **IPv4 address**, **IPv6 address**, or a **hostname** including a fully-qualified domain name.
File Spec	Regular expression. For example, **^.*$** = process everything.
File Encoding	Character encoding used by the syslog senders to this port. Defaults to UTF-8. **Note:** It is safe to leave this as UTF-8, since UTF-8 handles ASCII characters as well, and most senders have their encoding set to UTF-8. NetWitness has tested the following values: • EUC-KR • SJIS • GB3212/GBK • ISO_8859-1 (German) • ISO_8859-7 (Greek)
Cancel	Closes the dialog without making adding an event source type.
OK	Adds the parameters for the event source.

The following table describes the **Advanced** configuration parameter for File collection.

Name	Description
Ignore Encoding Conversion Errors	Select the check box to ignore encoding conversion errors and ignore invalid data. The check box is selected by default. **Caution:** This may cause parsing and transformation errors.

Name	Description
File Disk Quota	Determines when to stop saving files regardless of the **Save On Error** and **Save On Success** parameter settings. For example, a value of 10 indicates that when there is less than 10% available disk left, the Log Collector stops saving files to reserve enough space for your estimated normal collection processing. **Caution:** Available disk refers to a partition where the base collection directory is mounted. If the Log Decoder server has a 10TB disk size and 2TB is allocated to base collection directory, then setting this value to 10 causes log collection to stop when less than 0.2TB (10% of 2TB) of space is left. It does not mean 10% of 10TB. Valid value is a number in the **0** to **100** range. **10** is the default.
Sequential Processing	Sequential processing flag: • Select the check box (default) to process event source files in collection order. • Do not select the checkbox to process event source files in parallel.
Save On Error	Save on error flag. Check the checkbox to retain the **eventsource collection** file when the Log Collector it encounters an error. The check box is selected by default.
Save On Success	Save **eventsource collection** file after processing flag. Check the checkbox to save the eventsource collection file after processing it. The check box is not selected by default.
Eventsource SSH Key	SSH public key used to upload files for this event source. Please refer to the *Generate Key Pair on Event Source and Import Public Key to Log Collector* section in the Install and Update the SFTP Agent Guide for instructions on generating keys. **Note:** If File collection is stopped, NetWitness does not update the authorized_keys file with the SSH public key that you add or modify in this parameter. You must restart File collection to update the public key. You can add or modify the value of the public key in this parameter in multiple File event sources without File collection running, but NetWitness will not update the **authorized_keys** file until File collection is restarted.
Manage Error Files	By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with error files. If you set this parameter to **true**, you can specify one of these: • Maximum space allotted to error files in the **Error Files Size** parameter. • Maximum number of error files allowed in **Error Files Count** parameter. A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached. Select the check box to manage error files. The check box is not selected by default.

Name	Description
Error Files Size	Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Specifies to what extent NetWitness saves error files. The value that you specify is the maximum total size of all the files in the error directory. Valid value is a number in **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Error Files Count	Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Maximum number of error files allowed in the error directory. Valid value is a number in **0** to **65536** range. **65536** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Error Files Reduction %	Percent amount by size or count of the error files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first. Valid value is a number in the **0** to **100** range. **10** is the default.
Manage Saved Files	Select the check box to manage saved files. The check box is not selected by default. By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with saved files. If check this check box, you can specify one of these: • Maximum space allotted to saved files in the **Saved Files Size** parameter. • Maximum number of saved files allowed in **Saved Files Count** parameter. A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached.
Saved Files Size	Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum total size of all the files in the save directory. Valid value is a number in the **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Saved Files Count	Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum number of saved files in the save directory. Valid value is a number in **0** to **65536** range. **65536** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Saved File Reduction %	Percent amount by size or count of the saved files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first. Valid value is a number in the **0** to **100** range. **10** is the default.

Name	Description
Debug	**Caution:** Only enable debugging (set this parameter to **On** or **Verbose**) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).

Configure Logstash Event Sources in NetWitness

You can configure the Logstash collection protocol.

IMPORTANT:
- Do not change logstash.yml file as it breaks the functionality.
- Do not change sincedb_path input configuration. If you change the sincedb_path, the back up and restore functionality breaks.
- Do not modify any pipeline configuration yml files.

To configure a Logstash Event Source:

1. Go to  **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select **Logstash/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .
   The **Available Event Source Types** dialog is displayed.
7. Select the event source type and click **OK**.
   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the **Event Categories** panel and click  in the **Sources** toolbar.

   The **Add Source** dialog is displayed.

9. Fill in the fields, based on the Logstash event source you are adding. General details about the available parameters are described below in Logstash Collection Parameters.

10. Click **OK**.

Logstash Collection Parameters

The following tables provides descriptions of the Logstash Collection source parameters.

Note: Items that are followed by an asterisk (*) are required.

Basic Parameters

Custom Event Source Parameters

The following table lists the custom event source parameters.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Description	Enter a text description for the event source.
Input Configuration *	An input plugin enables a specific source of events to be read by Logstash.
Filter Configuration *	A filter plugin performs intermediary processing on an event. Paste in any filter details for your Logstash event source.
Device Type *	Enter the device parser type used to parse the data. **Note:** - While saving an existing instance with no specified device type, enter the device type to enable **Ok**. Else, click **Cancel**. - The device type can have 3 to 30 characters of a-z, 1-9, or underscore and must start with a-z.
Source Address	Enter the IP address, host name or other identifier of the event source.
Message ID	Enter the message group ID used to bypass header parsing.
Message Prefix	Enter the prefix added to each message to assist parsing.

Name	Description
Event Destination *	Select the NetWitness Log Collector or Log Decoder to which event needs to be send from the drop-down list.
Test Configuration	Checks the configuration parameters specified in this dialog to make sure they are correct.

Beats Event Source Parameters

The following table lists the beats event source parameters.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Description	Enter a text description for the event source.
Port Number*	Enter the port number (for example, 5044) that you configured for your event sources.
Linux-Audit	Select the checkbox to enable processing for Linux audit.
Linux-System	Select the checkbox to enable processing for Linux system.
Ngnix	Select the checkbox to enable processing for Nginx.
Event Destination*	Select the NetWitness Log Collector or Log Decoder to which event needs to be send from the drop-down list.
Test Configuration	Checks the configuration parameters specified in this dialog to make sure they are correct.

Export Connector Event Source Parameters

The following table lists the custom export connector event source parameters.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Description	Enter a text description for the event source.

Name	Description
Host*	Select the hostname of the Decoder or Log Decoder for data aggregation from the drop-down list.
Username*	Username used to access the Decoder or Log Decoder for data aggregation.
Authentication	**Note:** If you upgrade from NetWitness Platform 11.6.0.0 to 11.6.1.0, automatic key is generated and stored in the key store management for the password set in Logstash pipeline configuration. You can view the key instead of password in the **Authentication** field. Select the authentication type used for data aggregation. By default, **SSL** field is enabled, if you select **trusted authentication**. **Note:** For trusted authentication, make sure you add the PEM file at `/etc/pki/nw/node/node-cert.pem` to the source Decoders REST APIs (`/sys/trustpeer` and `/sys/caupload`).
SSL	Select the check box to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. By default, SSL option is enabled, if you select **trusted authentication** type in the **Authentication** field.
Decoder Type*	Decoder Type is a read only field and it is auto populated when you select the Host.
Output Configuration*	Logstash pipeline output configuration that send the input events.
Test Configuration	Checks the configuration parameters specified in this dialog to make sure they are correct.

HTTP Receiver Event Source Parameters

The following table lists the HTTP receiver event source parameters.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Description	Enter a text description for the event source.
Port Number*	Enter the port number that you configured for your event sources. The default value of port number is 8080.
Device Type*	Enter the device parser type used to parse the data.
Message ID	Enter the message group ID used to bypass header parsing.

Name	Description
Message Prefix	Enter the prefix added to each message to assist parsing.
Event Destination*	Select the NetWitness Log Collector or Log Decoder to which event needs to be sent from the drop-down list.
HTTP Receiver SSL	Select the checkbox to communicate using HTTP receiver SSL. The security of data transmission is managed by encrypting information and providing authentication with HTTP receiver SSL certificates. This checkbox is not selected by default. **Note:** If you select the checkbox, the event source accepts SSL connections only. Also, if you change this setting, you must stop and restart Syslog collection for the change to become effective.
Certificate	Select the name of the HTTP receiver server's SSL certificate.
Key	Select the name of the HTTP receiver server's SSL key.

IPFIX Event Source Parameters

The following table lists the IPFIX event source parameters.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Description	Enter a text description for the event source.
Port Number	Enter the port number that you configured for your event source. The default value of port number is 4739.
Event Destination *	Select the NetWitness Log Collector or Log Decoder to which event needs to be sent from the drop-down list.
Test Configuration	Checks the configuration parameters specified in this dialog to ensure they are correct.

Kubernetes Event Source Parameters

The following table lists the Kubernetes receiver event source parameters.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.

Name	Description
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Description	Enter a text description for the event source.
Port Number*	Enter the port number that you configured for your event sources. The default value of port number is 5044.
Event Destination*	Select the NetWitness Log Collector or Log Decoder to which event needs to be sent from the drop-down list.
Test Configuration	Checks the configuration parameters specified in this dialog to ensure they are correct.

JDBC Oracle 11g Auditing Event Source Parameters

The following table lists the JDBC Oracle 11g auditing event source parameters.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Description	Enter a text description for the event source.
Host ID*	Enter the IP address of the machine where the oracle 11g database server is installed.
Port Number*	Enter the port number that you configured for your event sources. The default value of port number is 1521.
Database Name*	Enter the name of the database where the audit tables exists.
User ID*	Enter the username of oracle 11g database.
Password*	Enter the password to log into the oracle 11g database.
Polling Interval*	Polling interval takes the input in minutes. Based on the minutes entered, the pipeline will pull the data from the database. For example, If the polling interval is 1, then the pipeline will pull the data from the database for every 1 minute. If the polling interval is 2, then the pipeline will pull the data from the database for every 2 minute. This filed takes the values between 1 to 60.
Event Destination*	Select the NetWitness Log Collector or Log Decoder to which event needs to be sent from the drop-down list.
Test Configuration	Checks the configuration parameters specified in this dialog to ensure they are correct.

JDBC Oracle 12c Auditing Event Source Parameters

The following table lists the JDBC Oracle 12c auditing event source parameters.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Description	Enter a text description for the event source.
Host ID*	Enter the IP address of the machine where the oracle 12c database server is installed.
Port Number*	Enter the port number that you configured for your event sources. The default value of port number is 1521.
Database Name*	Enter the name of the database where the audit tables exists.
User ID*	Enter the username of oracle 12c database.
Password*	Enter the password to log into the oracle 12c database.
Polling Interval*	Polling interval takes the input in minutes. Based on the minutes entered, the pipeline will pull the data from the database. For example, If the polling interval is 1, then the pipeline will pull the data from the database for every 1 minute. If the polling interval is 2, then the pipeline will pull the data from the database for every 2 minute. This filed takes the values between 1 to 60.
Event Destination*	Select the NetWitness Log Collector or Log Decoder to which event needs to be sent from the drop-down list.
Test Configuration	Checks the configuration parameters specified in this dialog to ensure they are correct.

JDBC Oracle 18c Auditing Event Source Parameters

The following table lists the JDBC Oracle 18c auditing event source parameters.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Description	Enter a text description for the event source.

Name	Description
Host ID*	Enter the IP address of the machine where the oracle 18c database server is installed.
Port Number*	Enter the port number that you configured for your event sources. The default value of port number is 1521.
Database Name*	Enter the name of the database where the audit tables exists.
User ID*	Enter the username of oracle 18c database.
Password*	Enter the password to log into the oracle 18c database.
Polling Interval*	Polling interval takes the input in minutes. Based on the minutes entered, the pipeline will pull the data from the database. For example, If the polling interval is 1, then the pipeline will pull the data from the database for every 1 minute. If the polling interval is 2, then the pipeline will pull the data from the database for every 2 minute. This filed takes the values between 1 to 60.
Event Destination*	Select the NetWitness Log Collector or Log Decoder to which event needs to be sent from the drop-down list.
Test Configuration	Checks the configuration parameters specified in this dialog to ensure they are correct.

JDBC Oracle 19c Auditing Event Source Parameters

The following table lists the JDBC Oracle 19c auditing event source parameters.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Description	Enter a text description for the event source.
Host ID*	Enter the IP address of the machine where the oracle 19c database server is installed.
Port Number*	Enter the port number that you configured for your event sources. The default value of port number is 1521.
Database Name*	Enter the name of the database where the audit tables exists.
User ID*	Enter the username of oracle 19c database.
Password*	Enter the password to log into the oracle 19c database.

Name	Description
Polling Interval*	Polling interval takes the input in minutes. Based on the minutes entered, the pipeline will pull the data from the database. For example, If the polling interval is 1, then the pipeline will pull the data from the database for every 1 minute. If the polling interval is 2, then the pipeline will pull the data from the database for every 2 minute. This filed takes the values between 1 to 60.
Event Destination*	Select the NetWitness Log Collector or Log Decoder to which event needs to be sent from the drop-down list.
Test Configuration	Checks the configuration parameters specified in this dialog to ensure they are correct.

JDBC IBMDB2 Event Source Parameters

The following table lists the JDBC IBMDB2 event source parameters.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the check-box to enable the event source configuration to start collection. The check-box is selected by default.
Description	Enter a text description for the event source.
Host ID*	Enter the IP address of the machine where the jdbc_ibmdb2 server is installed.
Port Number*	Enter the port number that you configured for your event source. The default value of port number is 50000.
Database Name*	Enter the name of the database where the audit table exists.
User ID*	Enter the username of jdbc_ibmdb2 database.
Password*	Enter the password to log into the jdbc_ibmdb2 database.
Polling Interval*	Polling interval takes the input in minutes. Based on the minutes entered, the pipeline will pull the data from the database. For example, If the polling interval is 1, then the pipeline will pull the data from the database for every 1 minute. If the polling interval is 2, then the pipeline will pull the data from the database for every 2 minute. This filed takes the values between 1 to 60.
Event Destination*	Select the NetWitness Log Collector or Log Decoder to which event needs to be sent from the drop-down list.
Test Configuration	Checks the configuration parameters specified in this dialog to ensure they are correct.

JDBC Custom Event Source Parameters

The following table lists the JDBC Custom event source parameters.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the check-box to enable the event source configuration to start collection. The check-box is selected by default.
Description	Enter a text description for the event source.
JDBC Driver Library*	Enter the JDBC driver library path to interact with a database.
JDBC Driver Class*	Enter the JDBC Driver class to interact with a database.
Host ID*	Enter the IP address of the machine where the Oracle server is installed.
Port Number*	Enter the port number that you configured for your event source. The default value of port number is 1521.
Database Name*	Enter the name of the database where the audit table exists.
User ID*	Enter the username of Oracle database.
Password*	Enter the password to log into the Oracle database.
Polling Interval*	Polling interval takes the input in minutes. Based on the minutes entered, the pipeline will pull the data from the database. For example, If the polling interval is 1, then the pipeline will pull the data from the database for every 1 minute. If the polling interval is 2, then the pipeline will pull the data from the database for every 2 minute. This filed takes the values between 1 to 60.
SQL Statement*	Enter the SQL statements based on the requirement. Here, the text area field will also supports the new custom query.
Device Type*	Enter the device type of the event source used for parsing.
Message ID	Enter the message group ID to bypass header parsing.
Message Prefix	Enter the prefix added to each message to assist parsing.
Event Destination*	Select the NetWitness Log Collector or Log Decoder to which event needs to be sent from the drop-down list.
Test Configuration	Checks the configuration parameters specified in this dialog to ensure they are correct.

Advanced Parameters

Click next to **Advanced** to view and edit the advanced parameters, if necessary.

Name	Description
Debug	**Caution:** Only enable debugging (set this parameter to **On** or **Verbose**) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. **Caution:** Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact.
Beats SSL (This option is applicable only for beats typespec)	Select this checkbox to communicate using beats SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. This checkbox is not selected by default. **Note:** Ensure that you copy the server SSL certificate and the key (generated in your system) to `/etc/logstash/pki` on Log Collector, which is used during SSL connection. `/etc/logstash/pki` is a path in the Log Collector node.

Name	Description
Kubernetes SSL (This option is applicable only for Kubernetes typespec)	Select this checkbox to communicate using Kubernetes SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. This checkbox is not selected by default. **Note:** Ensure that you copy the server SSL certificate and the key (generated in your system) to `/etc/logstash/pki` on Log Collector, which is used during SSL connection. `/etc/logstash/pki` is a path in the Log Collector node.
Certificate (This option is applicable only for beats and Kubernetes typespec)	Select the name of a server SSL certificate located at `/etc/logstash/pki`.
Key (This option is applicable only for beats and Kubernetes typespec)	Select the name of a server SSL key located at `/etc/logstash/pki`.
SSL Enabled	• For custom typespec - Select the checkbox to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. This checkbox is selected by default. • For beats typespec - Select the checkbox to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. This checkbox is selected by default. • For export connector typespec - Select the checkbox for Logstash to communicate with Packet Decoder and Log Decoder in SSL and Non-SSL mode. This checkbox is not selected by default.
Export Logs (This option is applicable only for export_ connector typespec)	Select the checkbox to export logs from Log Decoders.
Starting Session (This option is not applicable for export_connector typespec)	Specify the session ID from which you want to start the aggregation from instead of the default.

Name	Description
Include Metas (This option is not applicable for export_connector typespec)	Specify the list of metas separated by comma that you want to aggregate. The default metas such as time, did and sessionid are collected in addition to the metas you added for aggregation.
Exclude Metas (This option is not applicable for export_connector typespec)	Specify the list of metas separated by comma that you want to exclude from aggregration.
Query (This option is not applicable for export_connector typespec)	Specify the query so the data matching the query is only aggregated. For example, select `* where user.dst = 'john'`.
Enable Metrics Collection (This option is applicable only for export_ connector typespec)	Enables metrics collection in Elastic. **IMPORTANT:** If you enable the metrics collection, you must provide the Elastic host, username, and password.
Elastic Host (This option is applicable only for export_connector typespec)	Specify the Elastic host to forward metrics.
Elastic Port (This option is applicable only for export_ connector typespec)	Port number through which metrics are forwarded.
Elastic Username (This option is applicable only for export_ connector typespec)	Specify the name of the Elastic search.
Elastic Password (This option is applicable only for export_ connector typespec)	**Note:** If you upgrade from NetWitness XDR 11.6.0.0 to 11.6.1.0, automatic key is generated and stored in the key store management for the password set in Logstash pipeline configuration. You can view the key instead of password in the **Elastic Password** field. Specify the Elastic search password.
Minutes Back (This option is applicable only for export_ connector typespec)	Starts collecting data from last xx minutes. For example, if the value is set to 30 minutes, Log Collector starts collecting the logs and metas starting from last 30 minutes.
Persistent Queue (This option is applicable only for export_ connector typespec	Persistent queue stores the message queue on disk to avoid data loss. By default, this option is not enabled.

Name	Description
Additional Custom Configuration	Use this text box for any additional configuration, in case you have multiple inputs or another set of outputs to send somewhere in addition to a NetWitness Log Collector or Log Decoder. For example, you can configure the data to be sent to Elasticsearch. In this case each event that is sent to Netwitness Platform will also be send to Elasticsearch.
Required Plugins	Specify the required plugins in a comma separated list. **Note:** - Backup and restore is not supported for custom plugins. - If the test connection failed due to required plugin is not installed, you must install the required plugin, for more information, see Install or Manage Logstash Plugin.
Pipeline Workers	Number of pipeline worker threads allocated for logstash pipeline.
Ports (This option is only applicable for custom typespec and beats typespec)	Enter a port number (for example, 5000 or UDP:5000, TCP:5000), and ensure the checkbox is checked. This allows the plugins to collect logs over the network (For example, UDP, TCP). **IMPORTANT:** If you are configuring beats event source, ensure you provide beats event source port (For example, 5044) in the advance configuration even if you have updated the port in the basic parameters.
Required Ports (This option is not applicable for custom typespec and beats typespec)	Enter the list of ports required for external access.
Exclude Metas (This option is not applicable for export_connector typespec)	Specify the list of metas separated by comma that you want to exclude from aggregration.
Query (This option is not applicable for export_connector typespec)	Specify the query so the data matching the query is only aggregated. For example, select `* where user.dst = 'john'`.

Name	Description
Destination SSL (This option is only applicable for cutom typespec, http_receiver typespec, ipfix typespec, kubernetes typespec, jdbc_oracle_11g_auditing_typespec, jdbc_oracle_18c_auditing, jdbc_oracle_19c_auditing typespec, ibmdb2 typespec and jdbc_custom typespec)	Select the checkbox to communicate using destination SSL.
Custom SQL Statement (This field is applicable only for jdbc_oracle_18c_auditing typespec, jdbc_oracle_19c_auditing typespec, jdbc_oracle_11g_auditing_typespec and jdbc_oracle_12c_auditing_typespec)	By default, this is an empty text area field. This field also supports the new custom query.
Legacy Codec (This option is only applicable for custom typespec and beats typespec)	Select the check box to send events to Log Decoder using legacy format. When selected, Log Collector will send events to Log Decoder embedded in JSON encoded Logstash events. When not selected, Log Collector will send events in the collected format.

Note: You can monitor the health and throughput for Logstash pipeline using Logstash Input Plugin Overview dashboard. For more information, see "New Health and Wellness Dashboards" topic in the *System Maintenance Guide*.

Note: The JDBC pipelines are supported only from 12.3 version onwards.

View logstash collection in the Investigation > Events view

To view logstash collection in the Events view

1. Go to the **Investigation** > **Events view**.
2. Select a Log Decoder service (for example, LD1) which collects logstash events, from the drop-down list.
3. Select the time range.
4. Click .
5. Look for events with a device.type value that matches the one defined in the Logstash pipeline.

   Note: Though some meta are parsed by default, a custom parser or Log Parser Rules are required for full parsing.

Install or Manage Logstash Plugin

By default, Logstash related plugins are installed when Logstash is installed. In addition, you can add or customize the plugins based on your requirement.

List All Lostash Plugins

You can list all the Logstash plugins available on your environment using the following command:
`/usr/share/logstash/bin/logstash-plugin list --verbose`

Install New Logstash Plugin

You can install new plugin using the following command:

`/usr/share/logstash/bin/logstash-plugin install <plugin-name>`

For example, see the following command:

`/usr/share/logstash/bin/logstash-plugin install logstash-input-github`

Manage Logstash Plugin

You can manage the existing plugins using the following commands:

- To update all Logstash plugins:

  `/usr/share/logstash/bin/logstash-plugin update`

- To update specific Logstash plugin:

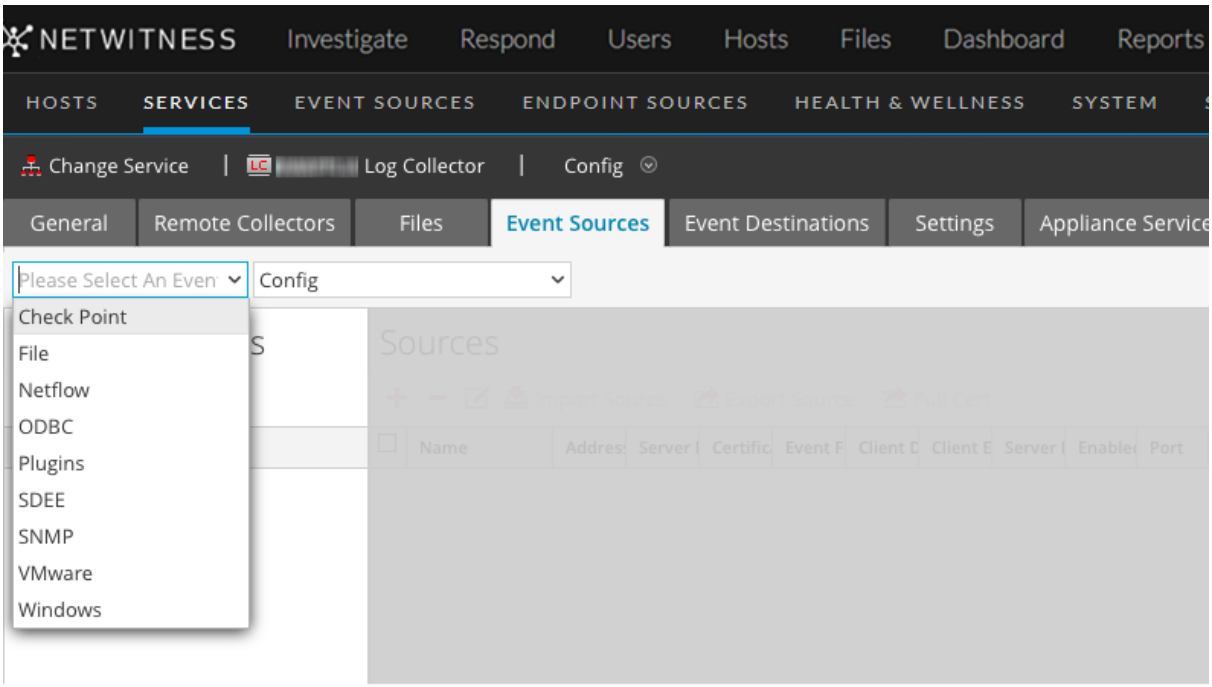
  `/usr/share/logstash/bin/logstash-plugin update <plugin-name>`

Configure Keystore Management

Keystore management allows you to securely store secret values (key and password). These keys are used as a placeholder for authentication credentials within a Logstash pipeline configuration.

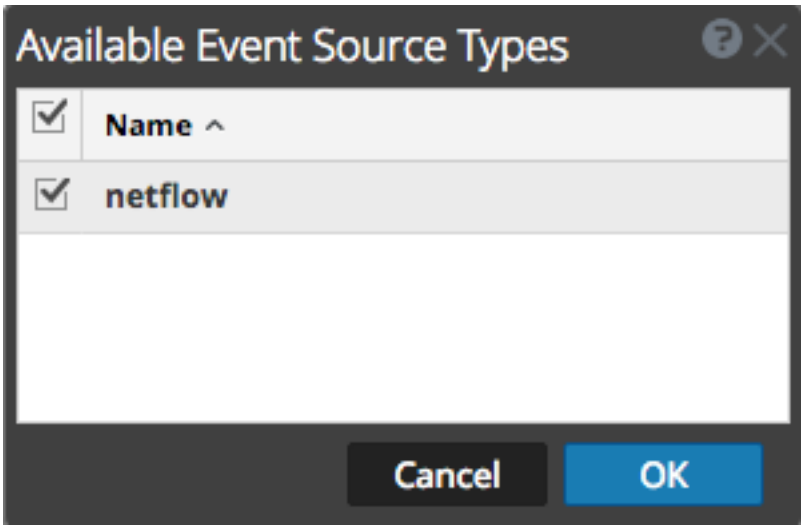
To configure keystore management:

1. Go to  (**ADMIN**) > **Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Under Actions, select  > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select **Logstash > Keystore management** from the drop-down menu.
6. Click .
7. In the **key** field, enter the name of the key.
8. In the **password** field, enter the password.
9. Click **Save**.



Configure Netflow Event Sources in NetWitness

This topic tells you how to configure the Netflow collection protocol.



Configure a Netflow Event Source

To configure a Netflow Event Source:

1. Go to  **(Admin)** > **Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Select  > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.

5. In the **Event Sources** tab, select **Netflow/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .
   The **Available Event Source Types** dialog is displayed.
7. Select the **netflow** event source type and click **OK**.

The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the **Event Categories** panel and click + in the **Sources** toolbar.
   The **Add Source** dialog is displayed.
9. Enter a port number in the **Port** field, and ensure the Enabled box is checked.

   Note: NetWitness opens the 2055, 4739, 6343, and 9995 ports on the firewall by default. You can open other ports for Netflow if required.

   For details of other parameters, see Netflow Collection Parameters below.
10. Click **OK**.

The new event source is displayed in the list.

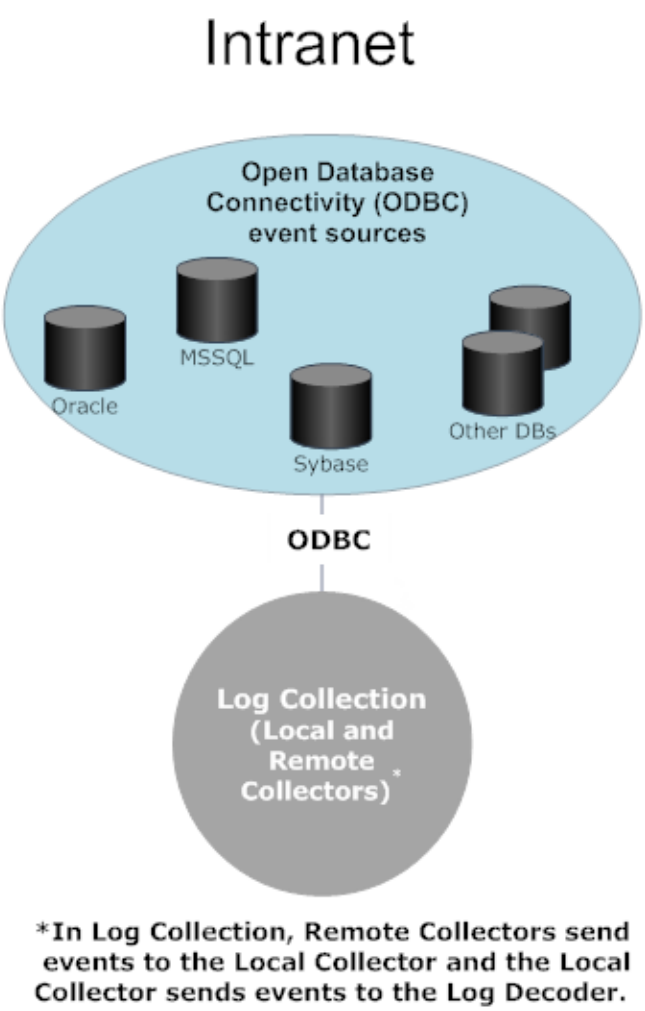
Netflow Collection Parameters

The following table provide descriptions of the basic Netflow Collection parameters.

Name	Description
Port	Specify the port number configured for the Netflow event source. NetWitness opens the 2055, 4739, 6343, and 9995 ports for Netflow by default. You can open other ports for Netflow if required.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Cancel	Closes the dialog without making adding an event source type.
OK	Adds the parameters for the event source.

The following table provide descriptions of the advanced Netflow Collection parameters.

Name	Description
InFlight Publish Log Threshold	Establishes a threshold that, when reached, NetWitness generates a log message to help you resolve event flow issues. The Threshold is the size of the netflow event messages currently flowing from the event source to NetWitness . Valid values are: • **0 (default)** - disables the log message. • **100-100000000** - generates a log message when this Log Collector has processed the specified number of netflow events. For example, if you set this value to 100, NetWitness generates a log message when 100 netflow events of the specific netflow version (v5 or v9) have been processed.
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector . Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).



ODBC

Configure ODBC Event Sources in NetWitness

This topic tells you how to configure ODBC collection protocol which collects events from event sources that store audit data in a database using the Open Database Connectivity (ODBC) software interface.

Deployment Scenario

The following figure illustrates how you deploy the ODBC Collection Protocol in NetWitness.

Configure an ODBC Event Source

To configure an ODBC event source, you need to configure an event source type, and also choose a DSN template.

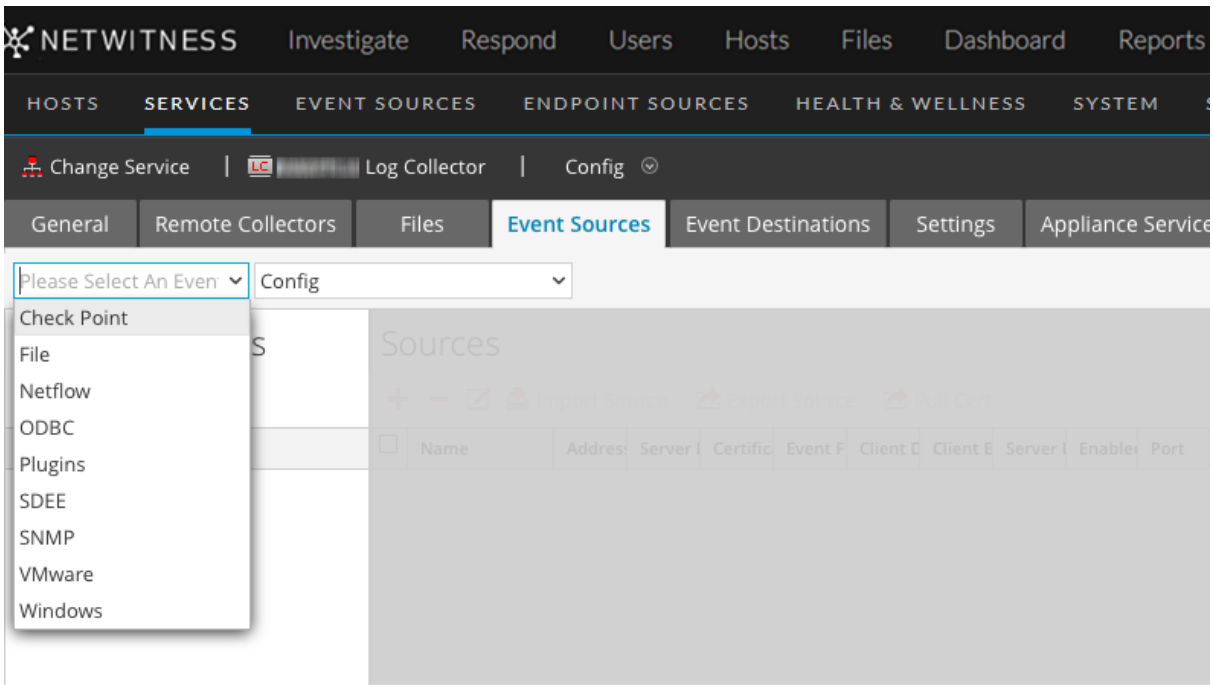
Configure a DSN

The following procedure describes how to add a DSN from an existing DSN template. For other procedures related to DSNs, see Configure Data Source Names (DSNs).

Configure a DSN (Data Source Name):

1. Go to **(Admin) > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click under **Actions** and select **View** > **Config**.
4. In the Log Collector **Event Sources** tab, select **ODBC/DSNs** from the drop-down menu.

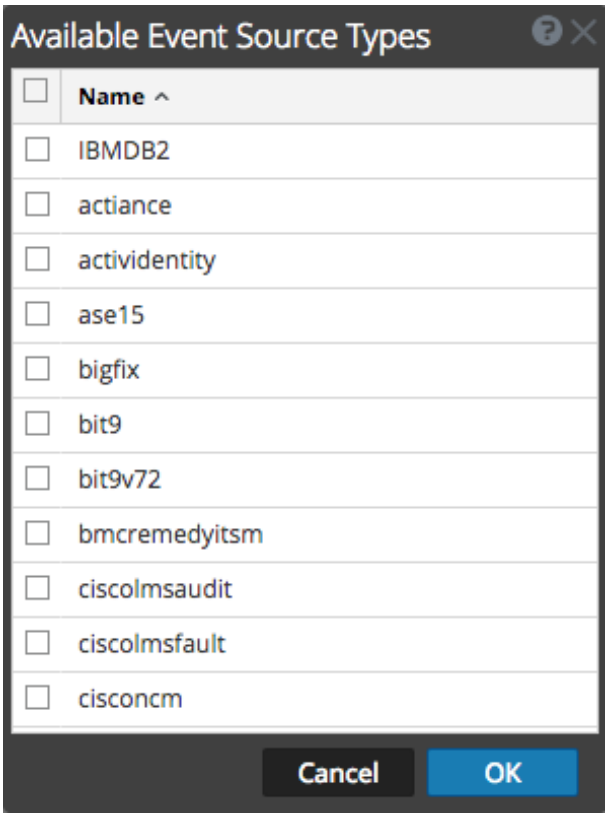
5. The DSNs panel is displayed with the existing DSNs, if any.
6. Click  to open the **Add DSN** dialog.
7. Choose a DSN Template from the drop down menu and enter a name for the DSN. (You use the name when you set up the ODBC event source type.) If required, click 



to add or delete DSN templates.
8. Fill in the parameters and click **Save**.

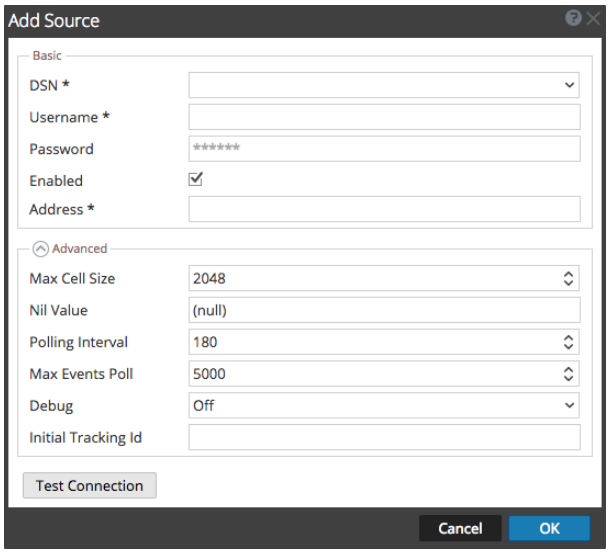
Add an Event Source Type

For details on parameters used in the following procedure, see ODBC Event Source Configuration Parameters.



To configure an ODBC Event Source Type:

1. Go to  **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **ODBC/Config** from the drop-down menu.

6. In the **Event Categories** panel toolbar, click .
   The **Available Event Source Types** dialog is displayed.

7. Select an event source category (for example **mssql** and click **OK**.
   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the **Event Categories** panel and click  in the **Sources** toolbar.
   The **Add Source** dialog is displayed.

9. Select a DSN from the drop down list, specify or modify the other parameters as required, and click **OK**.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the DSN information and retry.

    Note: Log Collector takes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness server displays an error message.
11. If the test is successful, click **OK**.

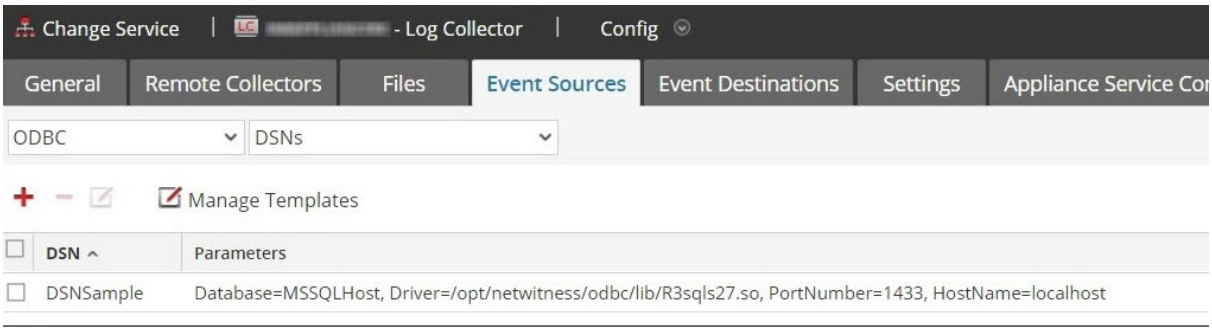
The newly defined DSN is displayed in the **Sources** panel.

Configure Data Source Names (DSNs)

This topic tells you how to create and maintain DSNs for ODBC Collection.

Context

Open Database Connectivity (ODBC) event sources require Data Source Names (DSNs) so you need to define DSNs with their associate value pairs for ODBC event source configuration.



Navigate to the DSN Panel

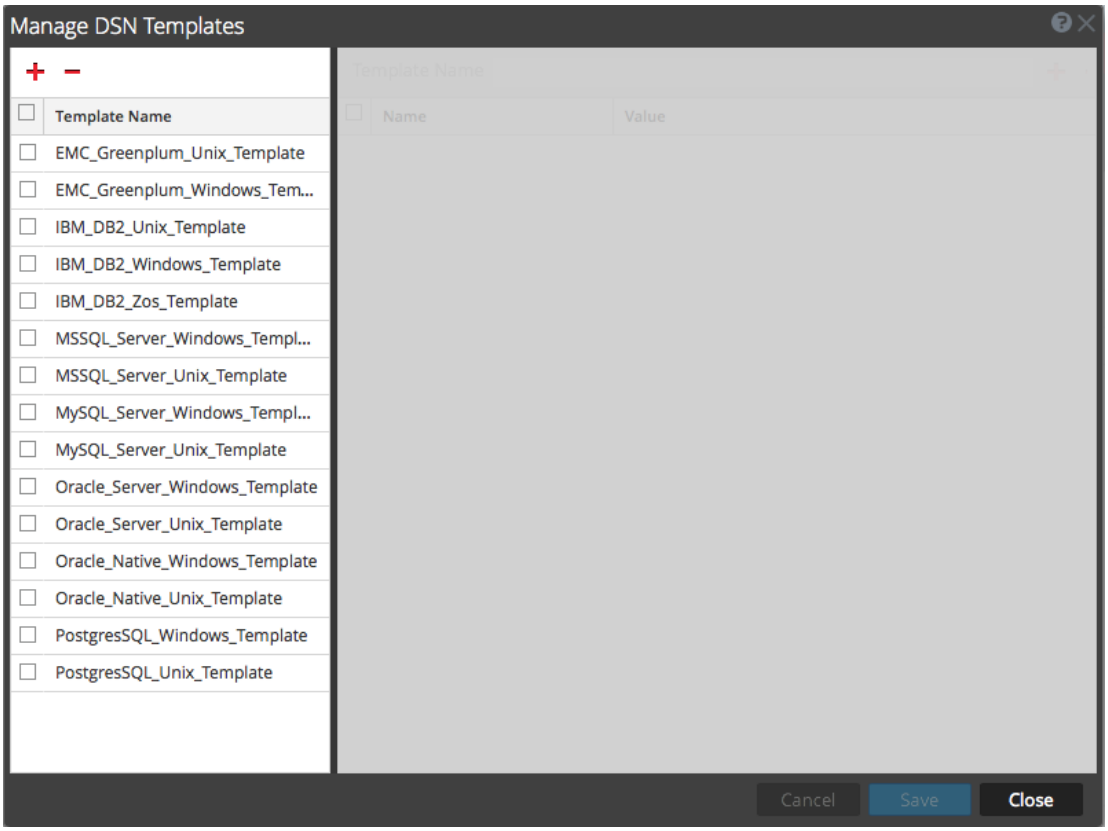
To add or edit DSNs or DSN templates, first navigate to the appropriate screen.

To navigate to the DSN templates panel:

1. Go to  **(Admin) > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click  under **Actions** and select **View > Config**.

4. In the **Log Collector Event Sources** tab, select **ODBC/DSNs** from the drop-down menu.
   The **DSNs** panel is displayed with the DSNs that are added, if any.

From this screen, you can perform the following actions:



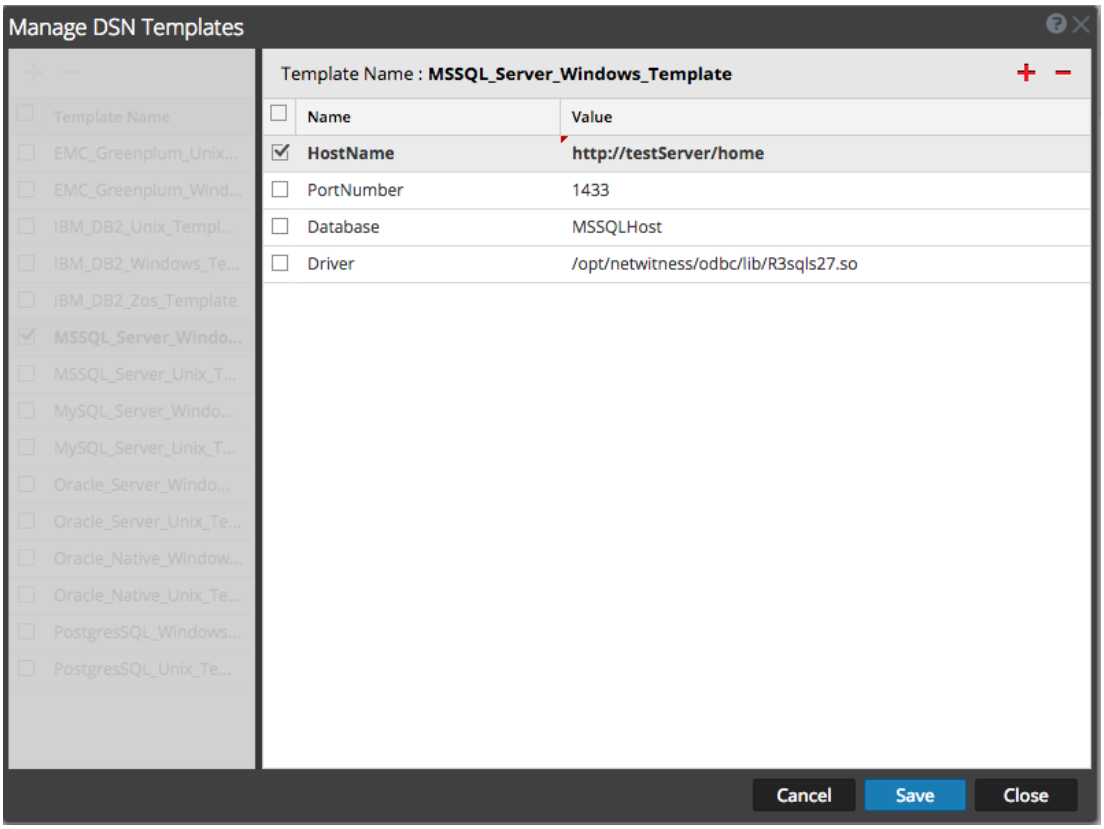
- Add a new DSN template
- Add a DSN from an existing template
- Add a DSN by editing an existing DSN template
- Remove a DSN or DSN template

Add a New DSN Template

If none of the predefined DSN templates fit your needs, use this procedure to add a DSN template.

1. From the DSNs panel, click 

   .
   The **Manage DSN Templates** dialog is displayed.



Note: NetWitness provides default templates on the left side panel that you can use while adding a new DSN.

2. Click  .

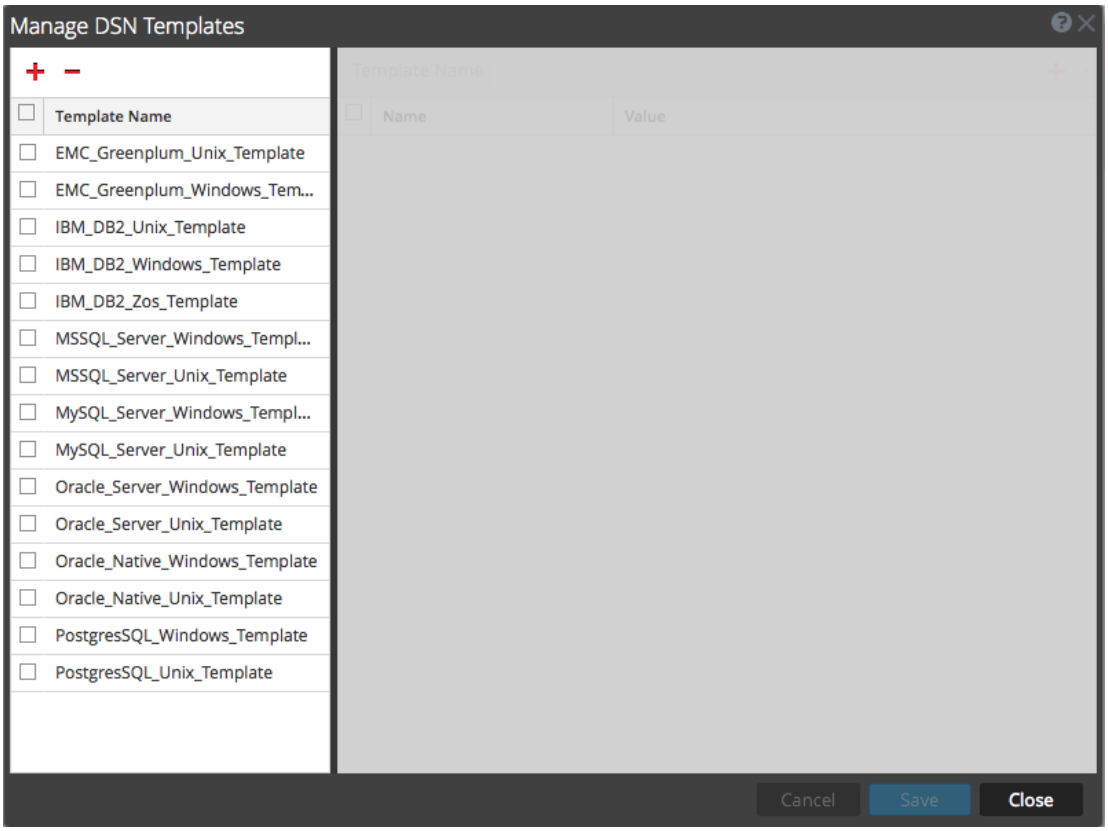
   The right panel is activated.

3. Specify a template name and click  on the right panel to add parameters.
4. Specify the parameters. Click **Save**.

The new DSN template is added in the **Manage DSN Templates** list.

Add a DSN from an existing template

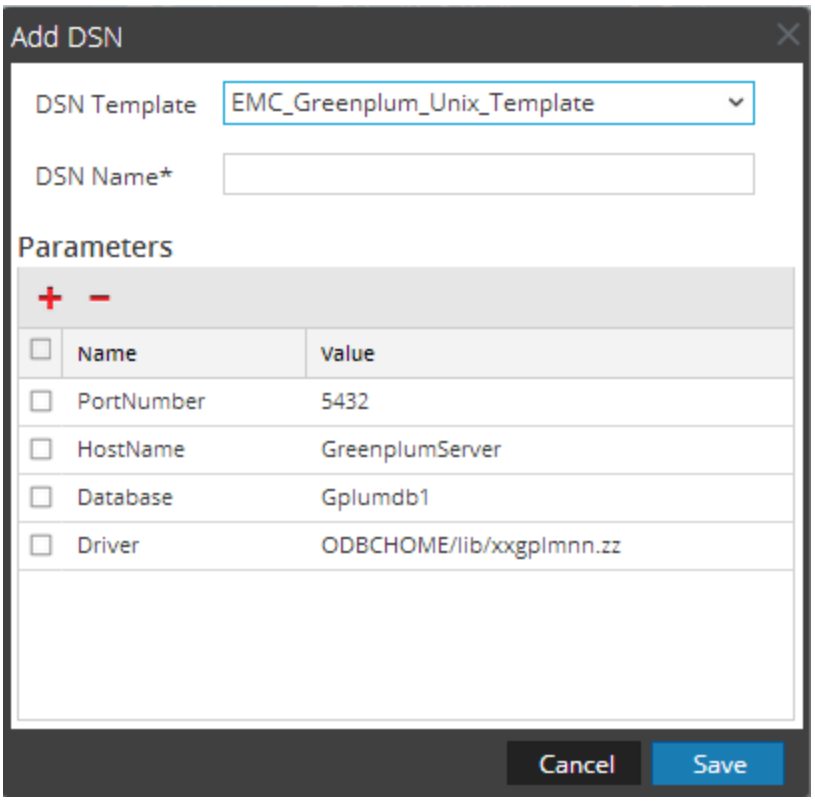
You can select an existing template, and fill in the parameters for your needs.



1. From the DSNs panel, click  to open the Add DSN dialog box.
   The **Add DSN** dialog is displayed with existing DSNs, if any
2. Choose a DSN Template from the drop down menu and enter a name for the DSN. (You use the name when you set up the ODBC event source type.)
3. Fill in the parameters and click **Save**.

Your DSN is added to the list of DSNs.

Add a New DSN by editing an existing DSN template



You can add a DSN by updating an existing DSN template to fit your needs.

1. From the DSNs panel, click .
   The **Manage DSN Templates** dialog is displayed.

2. Select the existing template that you want to modify.

   The right panel is activated, and the default parameters for the selected template are displayed.

3. Specify a name in the **DSN Name** field.
4. Add, delete or edit the default parameters.
5. Once you have the set of required parameters, click **Save**, then **Close**.
6. Choose the DSN Template that you updated from the drop down menu and enter a name for the DSN. (You use the name when you set up the ODBC event source type.)
7. Fill in the parameters and click **Save**.

Your DSN is added to the list of DSNs.

Remove a DSN or DSN template

If you no longer use a DSN or a DSN template, you can remove it from the system.

To remove an existing DSN:

1. From the DSNs panel, select an existing DSN.
2. Click —.

   A Warning message appears, asking whether you are sure you want to delete the DSN.
3. To delete the DSN, click **Yes**. Alternatively, to cancel the deletion, click **No**.

If you confirmed the deletion, the selected DSN is removed from the system.

To remove an existing DSN Template:

1. From the DSNs panel, click Manage Templates.

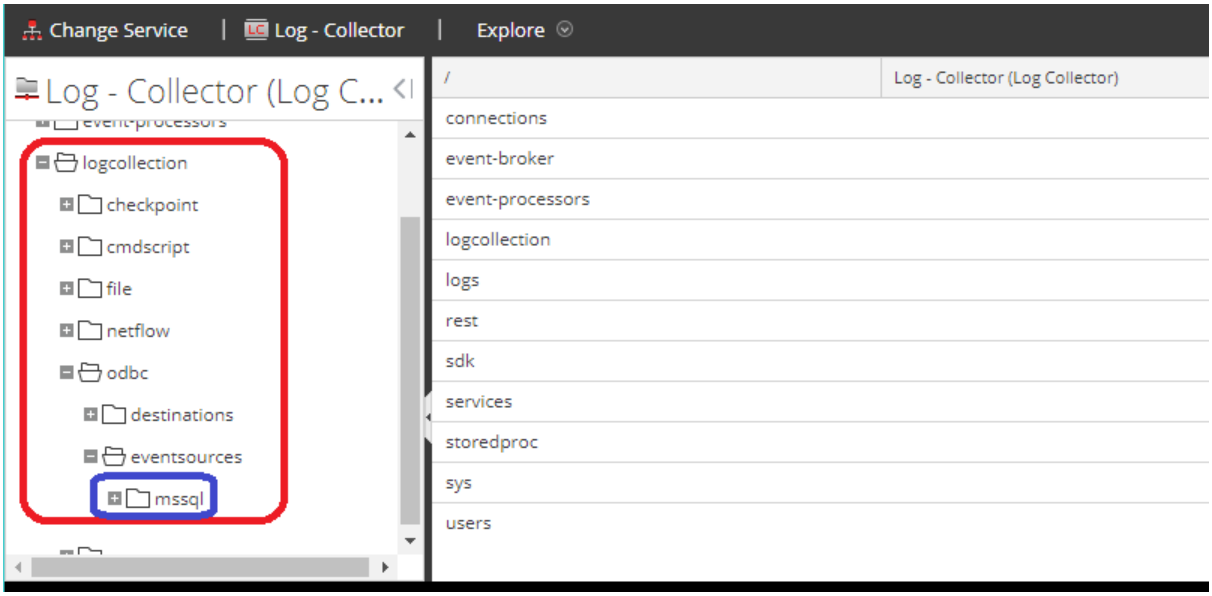
   The **Manage DSN Templates** dialog is displayed.

2. From the DSNs panel, select an existing DSN Template.
3. Click —.

   A Confirmation message appears, asking whether you are sure you want to delete the DSN Template.

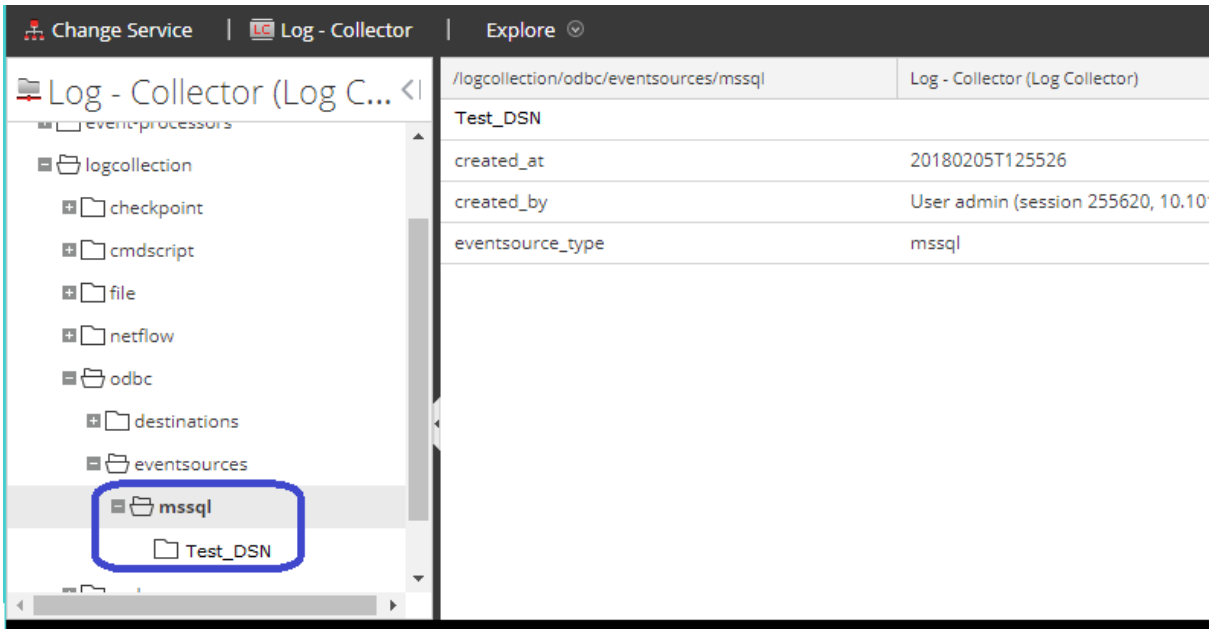
4. To delete the DSN Template, click **Yes**. Alternatively, to cancel the deletion, click **No**.

If you confirmed the deletion, the selected DSN Template is removed from the system.



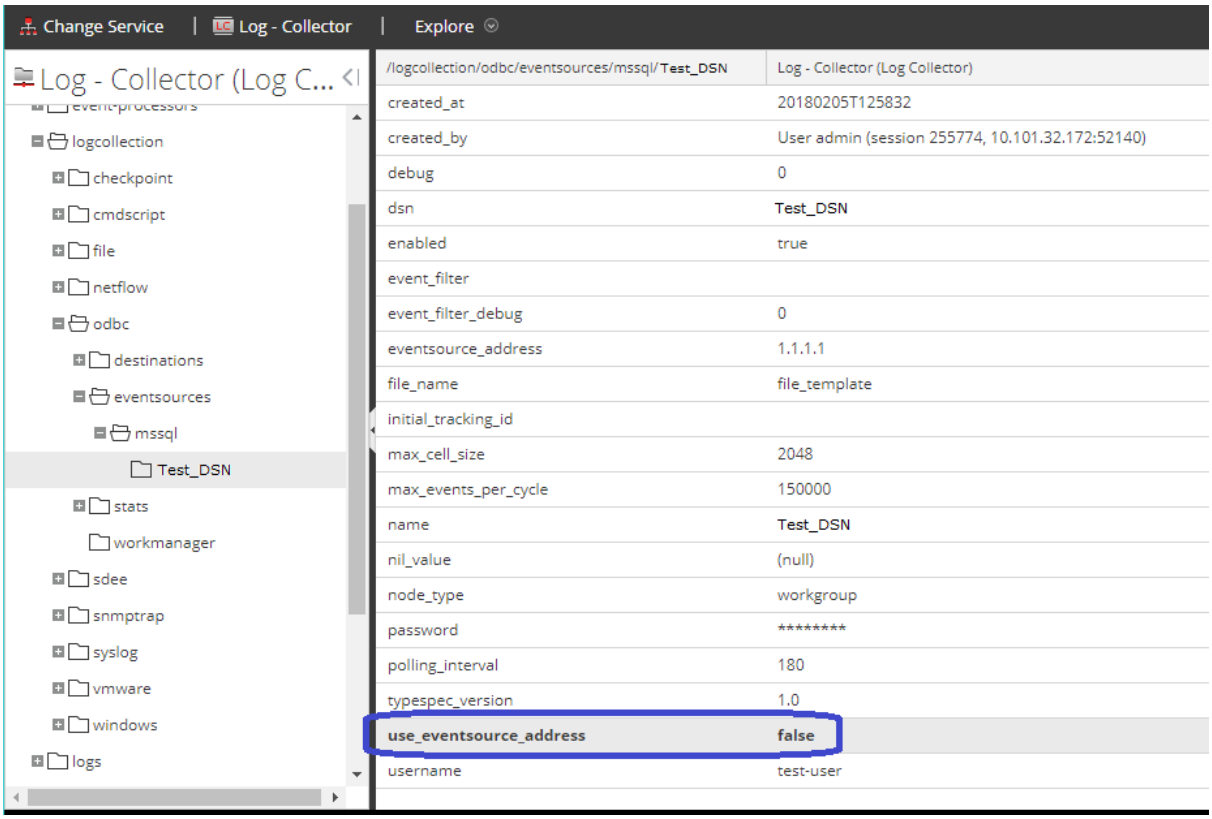
Configure device.ip meta for ODBC Data Source

For any ODBC event source, you can choose to have the ODBC collector populate the **device.ip** meta value with either the event source IP address or the actual source IP on which logs are being collected.



To view or set this parameter:

1. Go to **ADMIN > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click  under **Actions** and select **View > Explore**.
4. Navigate to **logcollection > odbc > eventsources**.



There are entries for each ODBC event source that you have configured in NetWitness. For example, for this installation, the only ODBC event source currently configured is MS SQL:

5. Click + next to an event source to expand it and see its DSN entry.

6. Click the DSN entry (in this example **Test_DSN**) to show the parameters.
7. The **use_eventsource_address** parameter is listed.

- **False**: actual source IP address is used. This is the default value.
- **True**: event source IP address is used.

8. Click on the value (in this case **False**), and type in the new value.

> **Note:** If you type anything other than **true** or **false** (case does not matter), you receive an error saying that the value you entered cannot be set.

Any changes you make take effect immediately.

Create Custom Typespec for ODBC Collection

NetWitness uses type specification (typespec) files for ODBC and file collection. These files act on raw log files, and are used for two main purposes:

- Define where in the log file data resides. For instance, some log files contain header information that is not considered data to be parsed.
- Replace certain types of characters that the log parser cannot parse correctly. For instance, the tab character can sometimes cause problems.

This topic tells you how to create a custom typespec for the Log Collector. The topic includes:

- Create Custom typespec procedure
- ODBC Collection typespec syntax

- Sample ODBC Collection typespec files

Create Custom Typespec

To create a custom typespec file:

1. Open an SFTP client (for example, WinSCP) and connect to a Log Collector or remote Log Collector.
2. Navigate to `/etc/netwitness/ng/logcollection/content/collection/odbc`, and copy an existing file, for example **bit9.xml**.
3. Modify the file according to your requirements. See ODBC Collection Typespec Syntax for details.
4. Rename and save the file to the same directory.
5. Restart the Log Collector.

Note: You will not be able to see new Event Source type in NetWitness until you restart the Log Collector.

ODBC Collection Typespec Syntax

The following table describes the typespec parameters.

Parameter	Description
name	The display name of your ODBC event source (for example, **activeidentity**). NetWitness displays this name in the **Sources** panel of the **View > Config > Events Sources** tab. Valid value is an alphanumeric string. You cannot use - (dashes), _(underscores), or spaces. The name must be unique across all typespec files in the folder.
type	Event source type: **odbc**. Do not modify this line.
prettyName	User-defined name for the event source. You can use the same value as name (for example, apache) or use a more descriptive name.
version	Version of this typespec file. Default value is 1.0.
author	Person who created the typespec file. Replace author-name with your name.
description	Formal description of the event source. Replace formal-description with your description of the event source.
<device> Section	
parser	This optional parameter contains the name of the log parser. This value forces the Log Decoder to use the specified log parser when parsing logs from this event source. **Note:** Please leave the field blank when unsure of the log parser to be used.
name	Name your ODBC event source (for example, **ActivIdentity ActivCard AAA Server**).
maxVersion	The version number of the event source (for example, **6.4.1**).
description	Description of the event source.
<collection> Section	

Parameter	Description
odbc	The syntax under <odbc> is used for event collection and processing. You can provide multiple queries for the same event source type by adding <query> tags.
query	This section contains the details of the query used to collect information from the event source.
tag	The prefix tag you want to add to events during transformation (for example **ActivIdentity**).
outputDelimiter	Specify the delimiter to use to separate fields. Specify any of the following values: • || (piping) • ^ (caret) • , (comma) • : (colon) • **0x20** (to represent a space)
interval	Specify the number of seconds between events. Default value is **60**.
dataQuery	Specify the query to fetch data from the ODBC eventsource database for SQL-syntax. For example: `SELECT acceptedrejected, servername, serveripa, sdate, millisecond, suid, groupname, ipa, reason, info1, info2, threadid FROM A_AHLOG WHERE sdate > '%TRACKING%' ORDER BY sdate`
maxTrackingQuery	The query used on the initial pull of events to identify the starting point within the data set to begin pulling logs from. After the initial pull, this query is no longer used, unless the **maxTracking** value has been reset or altered. For example: `SELECT MAX(Event_Id) from ExEvents`
trackingColumn	The tracking column value used when the ODBC collector pulls a new set of events.

Sample ODBC Collection Typespec Files

The following sample is the typespec file for the IBM ISS SiteProtector event source.

```
<?xml version="1.0" encoding="UTF-8"?>
<typespec>

   <name>siteprotector4_x</name>
   <type>odbc</type>
   <prettyName>SITEPROTECTOR4_X</prettyName>
   <version>1.0</version>
   <author>Administrator</author>
   <description>Collects events from SiteProtector</description>

   <device>
      <name>Internet Security Systems, Inc. RealSecure SiteProtector v 2.0</name>
      <maxVersion>2.0</maxVersion>
```

```
      <description></description>
      <parser>iss</parser>
   </device>

   <configuration>
   </configuration>

   <collection>
      <odbc>
         <query>
            <tag></tag>
            <outputDelimiter></outputDelimiter>
            <interval></interval>
            <dataQuery></dataQuery>
            <maxTrackingQuery></maxTrackingQuery>
            <trackingColumn></trackingColumn>
            <levelColumn></levelColumn>
            <eventIdColumn></eventIdColumn>
            <addressColumn></addressColumn>
         </query>
      </odbc>
   </collection>
</typespec>
```

The following sample is the typespec file for the Bit9 Security Platform event source.

```
<?xml version="1.0" encoding="UTF-8"?>
<typespec>

   <name>bit9</name>
   <type>odbc</type>
   <prettyName>BIT9</prettyName>
   <version>1.0</version>
   <author>Administrator</author>
   <description>Bit9 Events</description>

   <device>
      <name>Bit9</name>
      <parser>bit9</parser>
   </device>

   <configuration>
   </configuration>
```

```
   <collection>
      <odbc>
         <query>
            <tag>BIT9</tag>
            <outputDelimiter>||</outputDelimiter>
            <interval>10</interval>
            <dataQuery>
            SELECT
            Timestamp,
            Event_Id,
            Computer_Id,
            File_Catalog_Id,
            Root_File_Catalog_Id,
            Priority,
            Type,
            Subtype,
            IP_Address,
            User_Name,
            Process,
            Description
            FROM
            ExEvents
            WHERE
            Event_Id > '%TRACKING%'
            </dataQuery>
            <trackingColumn>Event_Id</trackingColumn>
            <maxTrackingQuery>SELECT MAX(Event_Id) from ExEvents</maxTrackingQuery>
            <eventIdColumn></eventIdColumn>
         </query>
      </odbc>
   </collection>
</typespec>
```

Troubleshoot ODBC Collection

You can troubleshoot problems and monitor ODBC collection by reviewing the ODBC collector log informational, warning, and error messages to during execution of collection.

Each ODBC log messages includes the:

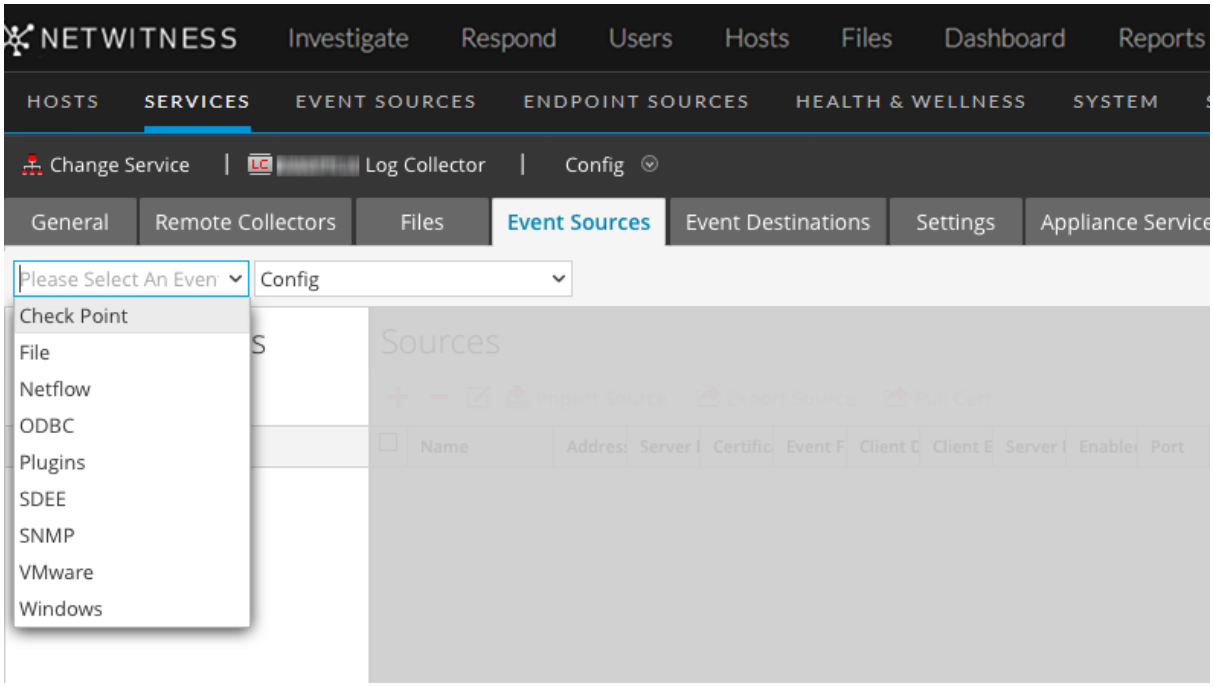
- Timestamp
- Category: `debug`, `info`, `warning`, or `failure`
- collection method = `OdbcCollection`
- ODBC event source type (GOTS-name) = Generic ODBC Type Specification name that you configured for the event source.
- collection function completed or attempted (for example, `[processing]`)
- ODBC event source name (DSN-name) = Data Source Name that you configured for the event source.
- description (for example, how many events the Log Collector collected)
- tracking ID = the Log Collector position in the target database table.

The following example illustrates the message you would receive upon successful collection of an ODBC event:

```
2014-July-25 17:21:25 info (OdbcCollection) : [event-source] [processing]
[event-source] Published 100 ODBC events: last tracking id: 2014-July-25
13:22:00.280
```

The following example illustrates a message you may receive upon unsuccessful collection of an ODBC event:

Log Message	`timestamp failure (OdbcCollection: [event-source] [processing] [event-source-type] Failed during doWork: Unable to prepare statement: state: S0002; error-code:208; description: [RSA] [ODBC-driver][event-source-type]Invalid object name 'object-name'.`
Possible Cause	ODBC collection failed while accessing the ODBC Driver or the target database.
Solutions	Validate the DSN value pairs for the events source.



Configure SDEE Event Sources in NetWitness

This topic tells you how to configure the SDEE collection protocol.

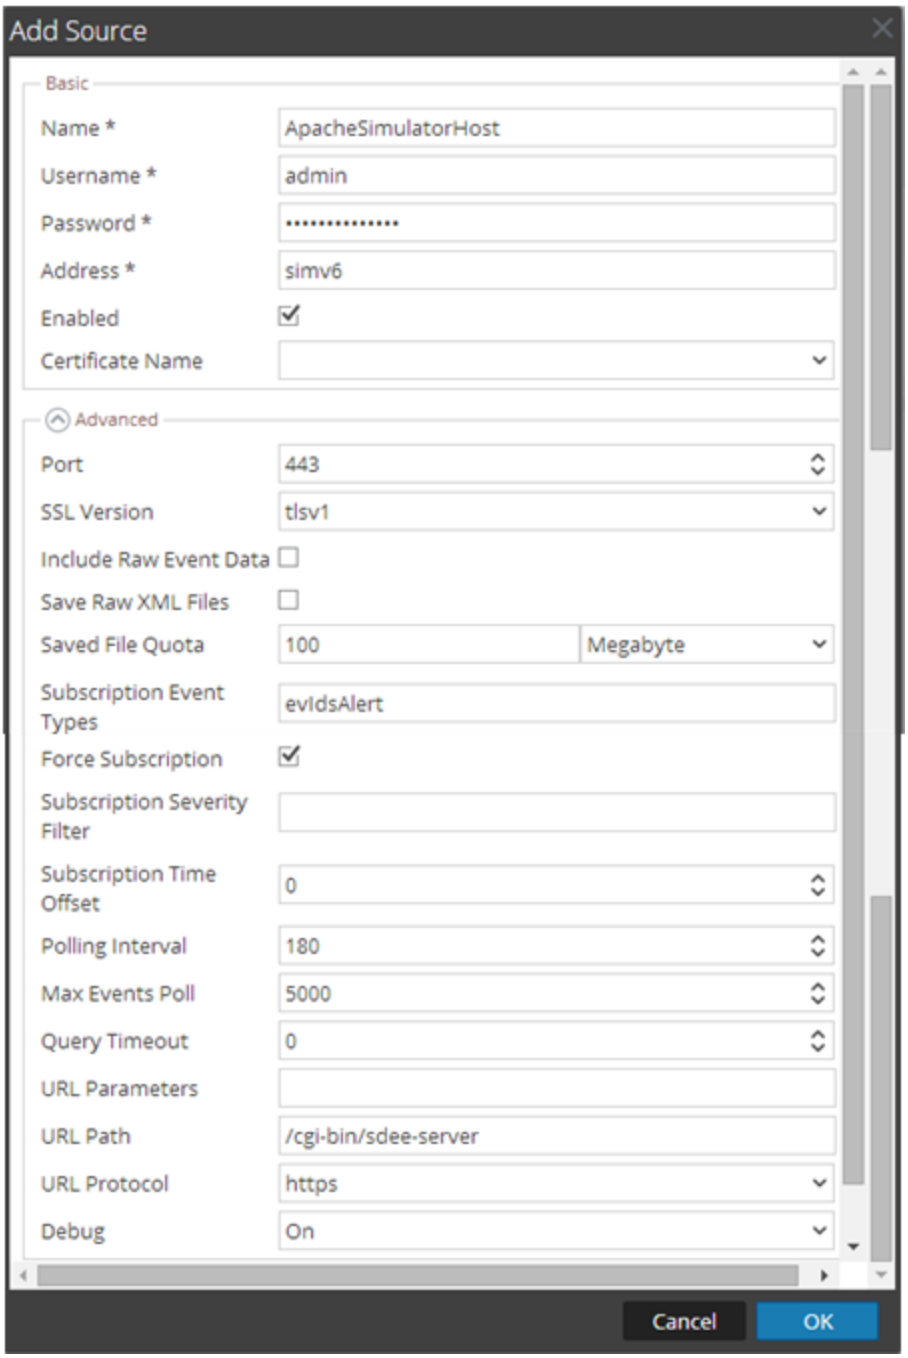
To add an SDEE Event Source:

1. Go to  **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.

5. In the **Event Sources** tab, select **SDEE/Config** from the drop-down menu.

   The Event Categories panel displays the SDEE event sources that are configured, if any.



6. In the **Event Categories** panel toolbar, click .

   The **Available Event Source Types** dialog is displayed.

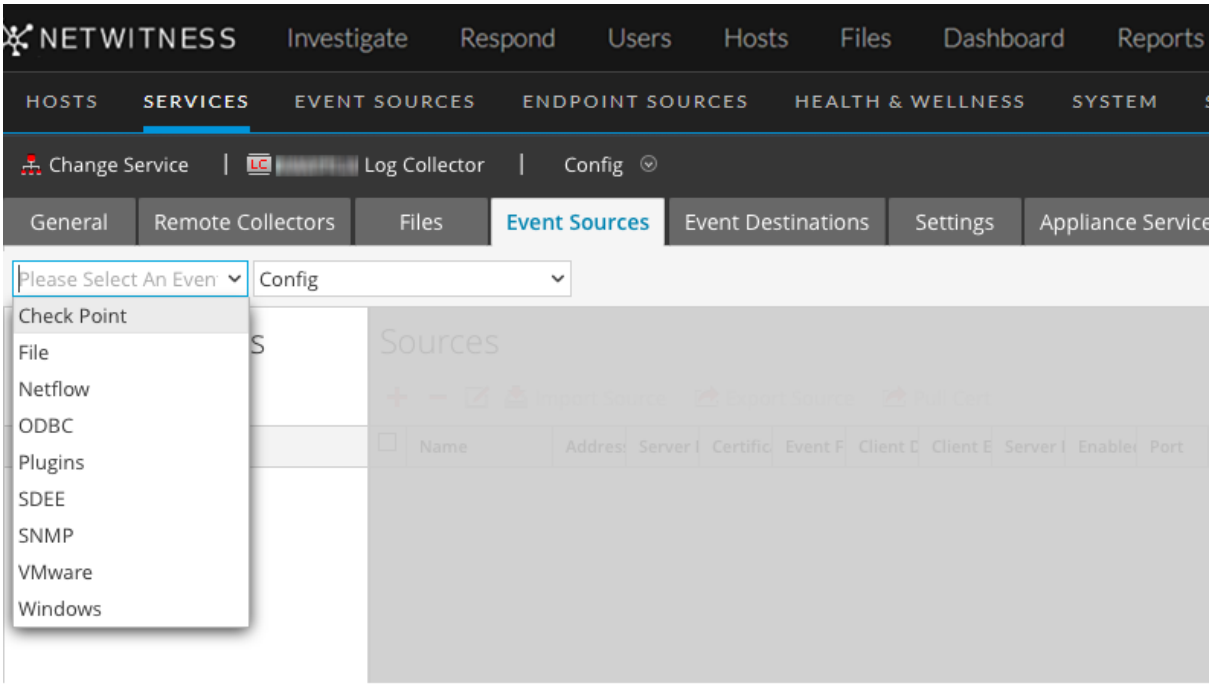
7. Select an event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the Event Categories panel and click  in the Sources panel toolbar. The Add Source dialog is displayed.

9. Add a Name, Username, Address, and Password, and modify any other parameters that require changes, and click **OK**.

Configure SNMP Event Sources in NetWitness



This topic tells you how to configure the SNMP collection protocol.

Configure the SNMP Trap Event Source

To add the SNMP Event Source:

Note: If you have previously added the **snmptrap** type, you cannot add it again. You can edit it, or manage users.

1. Go to **(Admin)** > **Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.

5. In the **Event Sources** tab, select **SNMP/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .
   The **Available Event Source Types** dialog is displayed.
7. Select the **snmptrap** event source type and click **OK**.
   The newly added event source type is displayed in the **Event Categories** panel.

8. Select **snmptrap** in the Event Categories panel.
9. Select **snmptrap** in the Sources panel and then click the Edit icon, , to edit the parameters.
10. Update any of the parameters that you need to change and click **OK**.

(Optional) Configure SNMP Users

If you are using SNMPv3, follow this procedure to update and maintain the SNMP v3 users.

To configure SNMPv3 Users:

1. Go to **(Admin) > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click under **Actions** and select **View** > **Config**.
4. In the Log Collector **Event Sources** tab, select **SNMP/SNMP v3 User Manager** from the drop-down menu.

   The SNMPv3 User panel is displayed with the existing users, if any.

5. Click to open the **Add SNMP User** dialog.
6. Fill in the dialog with the necessary parameters. The available parameters are described below.

SNMP User Parameters

The following table describes the parameters that you need to enter when you create an SNMPv3 user.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Parameter	Description
Username *	User name (or more accurately in SNMP terminology, security name). NetWitness uses this parameter and the **Engine ID** parameter to create a user entry in the SNMP engine of the collection service. The **Username** and **Engine ID** combination must be unique (for example, **logcollector**).
Engine ID	(Optional) Engine ID of the event source. For all event sources sending SNMP v3 traps to this collection service, you must add the username and engine id of the sending event source. For all event sources sending SNMPv3 informs, you must add just the username with a blank engine id.

Parameter	Description
Authentication Type	(Optional) Authentication protocol. Valid values are as follows: • **None** (default) - only security level of **noAuthNoPriv** can be used for traps sent to this service • **SHA** - Secure Hash Algorithm • **MD5 - Message Digest Algorithm** **IMPORTANT:** DO NOT USE: do not select MD5, as it conflicts with the Log Collector running in FIPS mode.
Authentication Passphrase	Optional if you do not have the **Authentication Type** set. Authentication passphrase.
Privacy Type	(Optional) Privacy protocol. You can only set this parameter if Authentication Type parameter is set. Valid values are as follows: • **None** (default) • **AES** - Advanced Encryption Standard • **DES - Data Encryption Standard** **IMPORTANT:** DO NOT USE: do not select DES, as it conflicts with the Log Collector running in FIPS mode.
Privacy Passphrase	Optional if you do not have the **Privacy Type** set. Privacy passphrase.
Close	Closes the dialog without adding the SNMPv3 user or saving modifications to the parameters.
Save	Adds the SNMPv3 user parameters or saves modifications to the parameters.

Configure Syslog Event Sources

This topic tells you how to configure Syslog event sources for the Log Collector.

Note: Prior to NetWitness 11.3, you did not configure Syslog Collection for Local Log Collectors: syslog collection was only configurable for Remote Collectors. You ***can*** configure Syslog for local Log Collectors that are on version 11.3 or later.

Configure a Syslog Event Source

For Remote or Virtual Log Collectors, syslog listeners for UDP on port 514, TCP on port 514 and SSL on port 6514 are created by default. You should not change the SSL settings on the TCP and SSL listeners. If you need SSL certificate verification, create a new event source type to listen on a different port.

Note: For local Log Collectors, you cannot create syslog listeners on ports 514 and 6514: these ports are used by the Log Decoder service.

To configure the Log Collector for Syslog collection:

1. Go to  **(Admin) > Services**.
2. In the Services grid, select a Log Collector, and from the Actions menu, choose  **> View > Config**.
3. Select the **Event Sources** tab.
4. Select **Syslog/Config** from the drop-down menu.

   The Event Categories panel displays the Syslog event sources that are configured, if any.

   Note: For NetWitness, some Syslog event sources are available by default. In this case, you can proceed to step 6.

5. In the Event Categories panel toolbar, click .

   The Available Event Source Types dialog is displayed.
6. Select either **syslog-tcp** or **syslog-udp**. You can set up either or both, depending on the needs of your organization.
7. Select the new type in the Event Categories panel and click  in the Sources panel toolbar.

   The Add Source dialog is displayed.
8. Enter the port number, and select **Enabled**. Optionally, configure any of the Advanced parameters as necessary.

   Click **OK** to accept your changes and close the dialog box.

Once you configure one or both syslog types, the Log Decoder or Log Collector collects those types of messages from all available event sources. So, you can continue to add Syslog event sources to your system without needing to do any further configuration in NetWitness.

Character Encodings

For each protocol (TCP, UDP), you need to instantiate a separate syslog listener for each character encoding.

For example, assume that you have legacy event sources sending syslog in UDP and TCP with EUC-KR and EUC-JP encodings. You would need to configure four listeners for the Log Collector, and configure the syslog event sources to send to separate ports as follows:

- UDP ***<port1>*** for EUC-KR
- UDP ***<port2>*** for EUC-JP
- TCP ***<port3>*** for EUC-KR
- TCP ***<port4>*** for EUC-JP

Alternatively, you could use separate Remote/Virtual Log Collectors, each using the default port 514.

Syslog Parameters

The following tables describe the available basic and advanced parameters for Syslog configuration.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

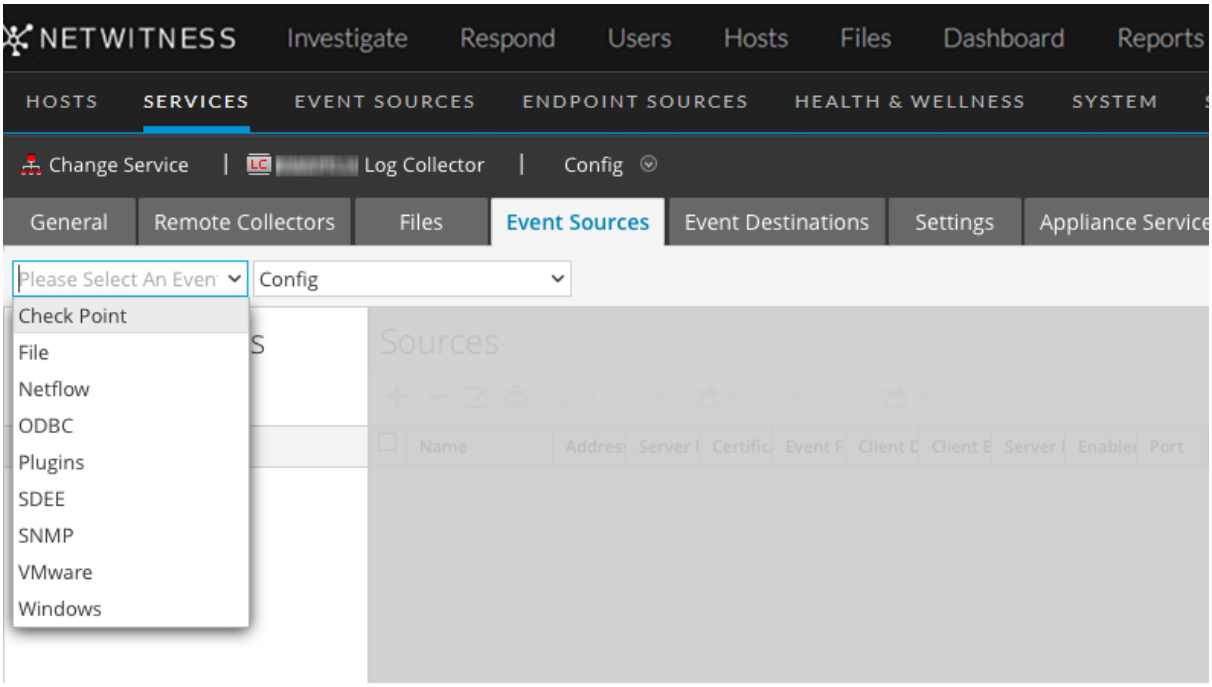
Basic Parameters

Name	Description
Port*	Enter the port number that you configured for your event sources.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
SSL Receiver	**Note:** This parameter applies to NetWitness version 11.1 and newer. It is available only for the **syslog-tcp** Event Category. If you select the check box, the event source accepts SSL/TLS connections only. Also, if you change this setting, you must stop and restart Syslog collection for the change to become effective.
Encoding	Character encoding used by the syslog senders to this port. Defaults to UTF-8. **Note:** It is safe to leave this as UTF-8, since UTF-8 handles ASCII characters as well, and most senders have their encoding set to UTF-8. NetWitness has tested the following values: • EUC-KR • SJIS • GB3212/GBK • ISO_8859-1 (German) • ISO_8859-7 (Greek)

Advanced Parameters

Name	Description
Inflight Publish Log Threshold	Establishes a threshold that, when reached, NetWitness generates a log message to help you resolve event flow issues. The Threshold is the size of the syslog event messages currently flowing from the event source to NetWitness. Valid values are: • **0** (default) - disables the log message • **100-100000000** - generates log message when the syslog event messages currently flowing from the event source to NetWitness are within the 100 to 100000000 byte range.
Maximum Receivers	Maximum number of receiver resources used to process collected syslog events. The default value is **2**.
Event Filter	Select a filter. Refer to Configure Event Filters for a Collector for instructions on how to define filters.
Debug	**Caution:** Only enable debugging (set this parameter to "On" or "Verbose") if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).

Name	Description
SSL Verify Mode	**Note:** This parameter applies to NetWitness version 11.1 and newer. It is available only for the **syslog-tcp** Event Category. This setting is relevant only if the **SSL Receiver** setting is selected. If you change the SSL Verify Mode, you must stop and restart Syslog collection for the change to become effective. Available options: • **verify-none**: (default) The server does not verify the client's certificate, if any. A client can connect without presenting a certificate. • **verify-peer**: The server verifies the client's certificate, if any. A client can connect without presenting a certificate. **Note:** If verification fails, a warning is logged but the messages will still be accepted. • **verify-peer-fail-if-no-cert**: The client must present a certificate and the server will verify it. **Note:** If you use this mode, the client's CA certificate ***must*** be uploaded to the Log Collector's truststore using the REST API at `http://LC-ip-address:50101/sys/caupload`
Certificate Directory Path	You can configure custom certificates for the syslog listener on Log Collectors. For details, see (Optional) Configure Custom Certificates on Log Collectors.

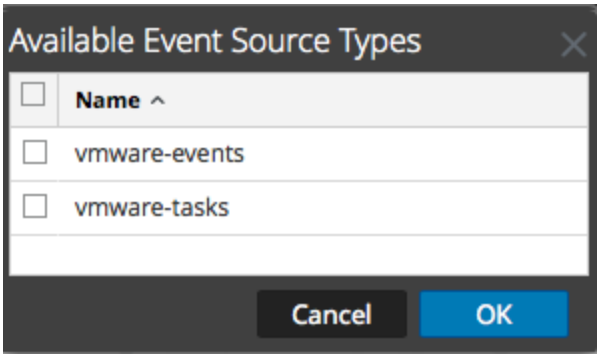


Configure VMware Event Sources in NetWitness

This topic tells you how to configure the VMware collection protocol.

To add a VMware Event Source:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.



4. Click the **Event Sources** tab.

5. In the Log Collector **Event Sources** tab, select **VMware/Config** from the drop-down menu.

   The Event Categories panel displays the VMware event sources that are configured, if any.

6. Click + to open the **Available Event Source Types** dialog.

7. Select **vmware-events** or **vmware-tasks** from the Available Event Source Types dialog and click **OK**.

   The VMware available event source types are as follows:

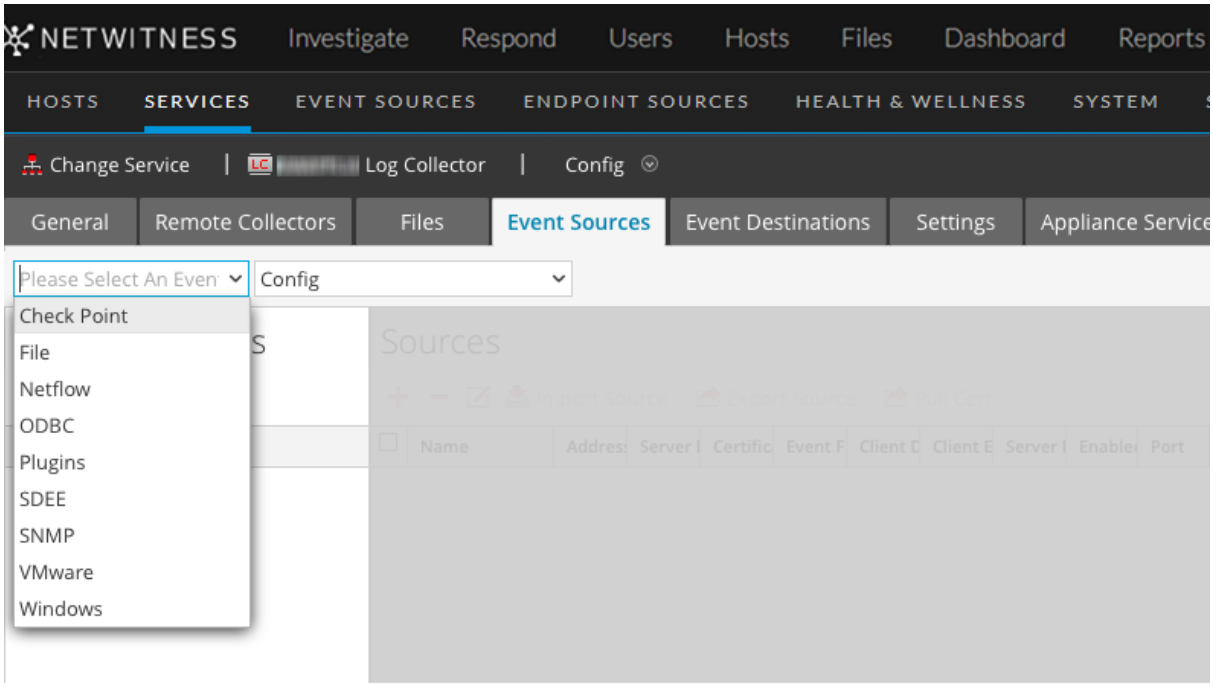
   - **vmware-events:** Setup vmware-events to collect events from vCenter Servers and ESX/ESXi servers.
   - **vmware-tasks:** (Optional) Setup vmware-tasks to collect tasks from vCenter Servers.

8. Select the new type in the Event Categories panel, and click + in the Sources toolbar.

9. Add a Name, Username and Password, and modify any other parameters that require changes.

   Caution: If you need to enter the domain name as part of the Username, you must use a double-backslash as a separator. For example, if the domain|username is corp\smithj, you must specify **corp\\smithj**.

10. Click **OK** to save your changes.



Configure Windows Event Sources in NetWitness

This topic tells you how to configure the Windows collection protocol.

In NetWitness, you need to configure the Kerberos Realm, and then add the Windows Event Source type.

To configure the Kerberos Realm for Windows collection:

1. Go to **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.

5. Select **Windows/Kerberos Realm** from the drop-down menu.
6. In the Kerberos Realm Configuration panel toolbar, click + to add a new realm.

The Add Kerberos Domain dialog is displayed.

7. Fill in the parameters, using the guidelines below.

Parameter	Details
Kerberos Realm Name	Enter the realm name, in all caps. For example, DSNETWORKING.COM. Note that the Mappings parameter is automatically filled with variations on the realm name.
KDC Host Name	Enter the name of the Domain Controller. ***Do not*** use a fully qualified name here: just the host name for the DC. **Note:** Make sure that the log collector is configured as a DNS client for the corporate DNS server. Otherwise, the Log Collector will not know how to find the Kerberos Realm.
Admin Server	(Optional) The name of the Kerberos Administration Server in FQDN format.
Mappings	This parameter is automatically filled after you enter the realm name.

8. Click **Save** to add the Kerberos domain.

To add a Windows Event Source:

1. Go to  **(Admin) > Services**.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the Log Collector **Event Sources** tab, select **Windows/Config** from the drop-down menu.

   The Event Categories panel displays the VMware event sources that are configured, if any.

Next, continue from the current screen to add a Windows Event Category and type.

To configure the Windows Event Type:

1. Select **Windows/Config** from the drop-down menu.
2. In the Event Categories panel toolbar, click  to add a source.

   The Add Source dialog is displayed.
3. Fill in the parameters, using the guidelines below.

Parameter	Details
Alias	The windows domain, referred to as Alias, is the configuration parameter that the Log Collector uses to group event sources. These event source type groups (for example, **domain2**, **domain3**, and **domain4**) categorize the event sources you have configured.

Parameter	Details
Authorization Method	The authentication method. Valid values are: • **Basic** (default) • **Negotiate** - Negotiates authentication between Kerberos and NTLM (Microsoft Windows NT LAN Manager). For security reasons, NetWitness supports Kerberos exclusively. Select this method.
Channel	For most event sources that use Windows collection, you want to collect from the **Security**, **System**, and **Application** channels. This is a comma-separated list of channels from which NetWitness collects events. The default value for this parameter is: `System, Application, Security` You can use parentheses to include and exclude event IDs. The exclude filter must have a ^ between the channel name and the event ID. You must separate event IDs with a |. For example, **Application^(211|300), System(1010|1012)** excludes the 211 and 300 Application events and includes the 1010 and 1012 System events. A channel is a named stream of events that transports them from an event publisher to an event log file. There are many predefined Windows channels. The following are examples of some of these channels: • **System** - applications that run under system service accounts (installed system services), drivers, or a component or application that has events that relate to the health of the system. • **Application** - all user-level applications. This channel is unsecured and it is open to any application. If an application has extensive information, you should define an application-specific channel for it. • **Security** - the Windows Audit Log (event log) used exclusively for the Windows Local Security Authority.
User Name	Enter the account name for the Windows user account that you set up earlier for communicating with NetWitness. Note that you need to enter the full account name, which includes the domain. For example, `rsalog@DSNETWORKING.COM`. **Note:** For negotiate authentication, this must be the Kerberos principal name in the name@kerberos_domain format. For example, **logcollector@LAB30.LOCAL**.
Password	Enter the correct password for the user account for the event source. The password is encrypted internally and is displayed in its encrypted form.
Read All Events	Select this box to read all historical event data from a channel. • **Unchecked** (default) - Log Collector does not collect from all historical event data for a specified channel. • **Checked** - Log Collector collects from all historical event data from a specified channel.
Max Events Per Cycle	(Optional). NetWitness recommends that you set this value to 0, which collects everything.
Polling Interval	(Optional). For most users, a value of **60** should work well.
Render Events	Select this box to request rendered events from the event source. • **Checked** (default) - Log Collector requests rendered events from the event source. • **Unchecked** - Log Collector does not request rendered events from the event source.

4. Click **OK** to add the source.

   The newly added Windows event source is displayed in the Event Categories panel.

5. Select the new event source in the Event Categories panel.

   The **Hosts** panel is activated.

6. Click  in the Hosts panel toolbar.

7. Fill in the parameters, using the guidelines below.

Parameter	Details
Event Source Address	Enter the IP address or host name for the Windows host.
Port	Accept the default value, **5985**.
Transport Mode	Enter **http**.
Enabled	Ensure the box is checked.

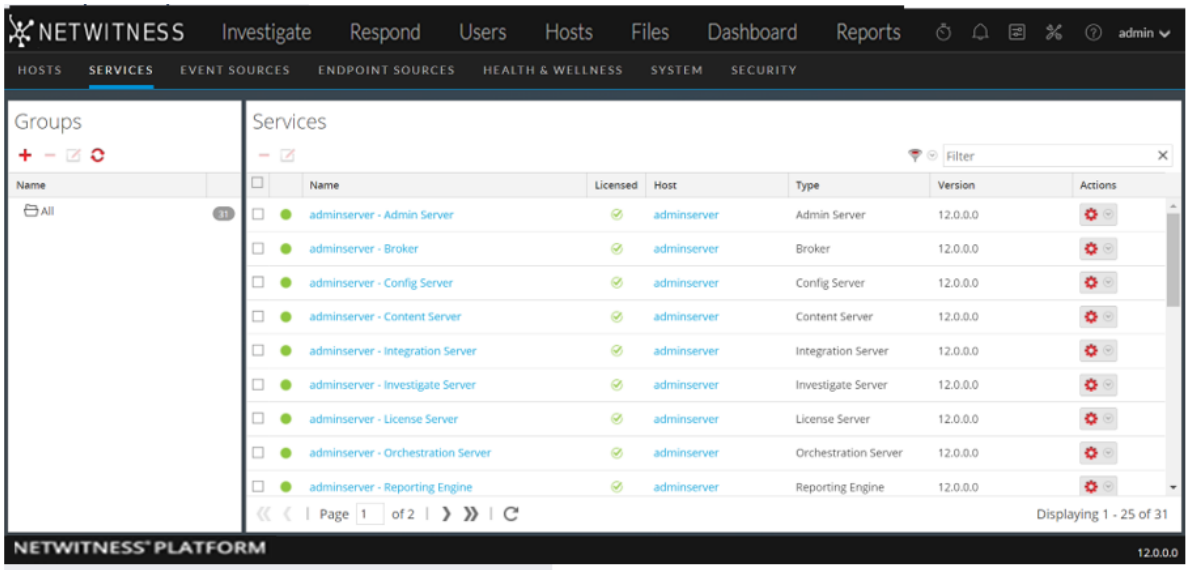
8. Click **Test Connection**.

   Note: You should be able to successfully test the connection, even if the Windows service is not running.

For more information on any of the previous steps, see the following Help topics in the NetWitness User Guide:

- Configure Windows Collection
- Microsoft WinRM Configuration Guide
- Test and Troubleshoot Microsoft WinRM Guide

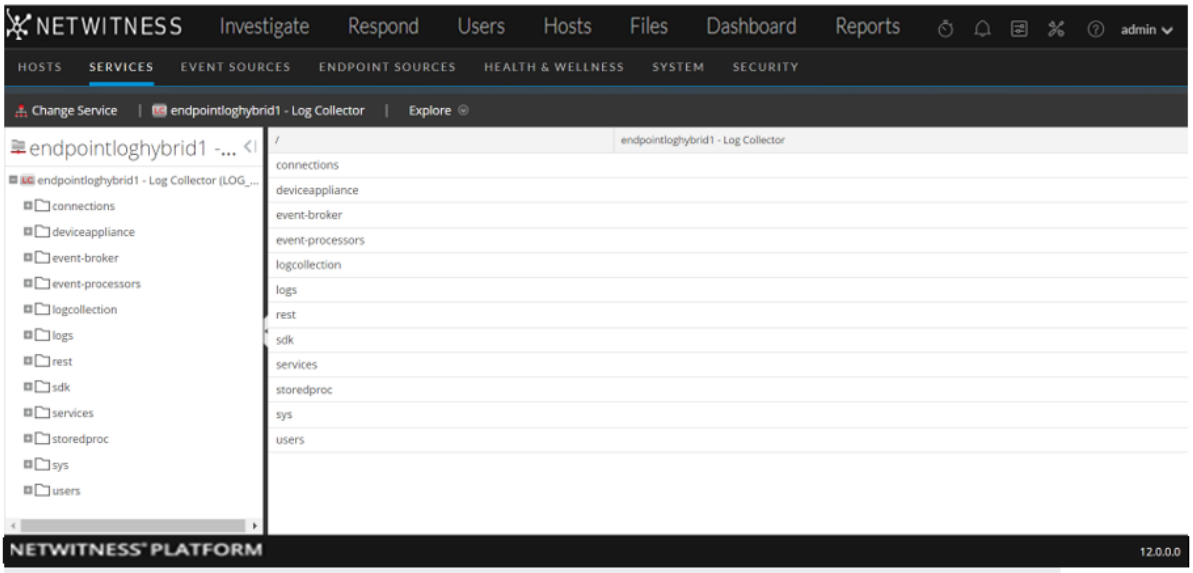
Configure RFC5424 Format



The RFC5424 format is supported for all event types. This format is enabled through the 'Enable RFC5424' flag. The default value of this flag is 'False'. It can be set to either 'True' or 'False' to enable or disable RFC5424 respectively.

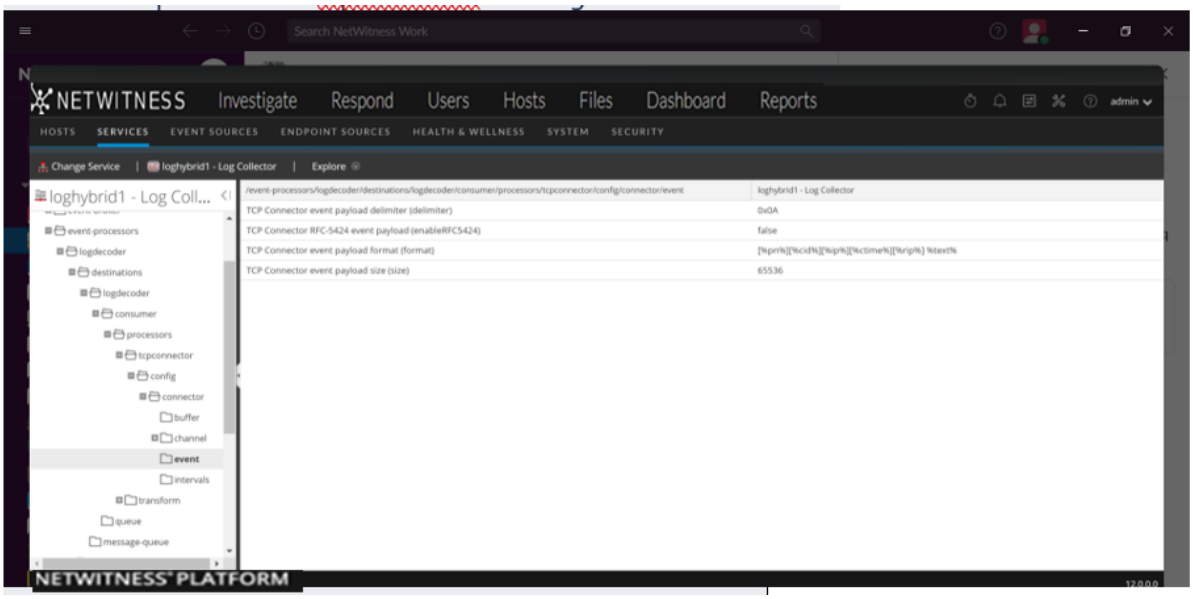
Flag Value	Description
True	Log is sent to Log Decoder in RFC5424 format
False	Log is sent to Log Decoder in Z Connector format

Note: When the log is sent to Log Decoder in RFC 5424 format, the disk utilization for Netwitness database is slightly higher and this may impact the data retention



To enable RFC5424 flag:

1. Go to **(Admin) > Services** from the NetWitness menu.
   The Services panel displays the list of services.



2. Select a Log Collection service.

3. Click > **View** > **Explore**.

4. On the left panel, go to **(event-processors)** > **logdecoder** > **destinations** > **logdecoder** > > > processors > **tcpconnector** > **config** > **connector** > **event**

5. Click **TCP connector RFC-5424 event payload (enable RFC2454)**.
6. Change the value to true to enable the flag.
7. Restart the **Log Collector** service.

Windows Legacy and NetApp Collection Configuration

This **Windows Legacy** protocol collects events from Windows Legacy (Windows 2003 or earlier event sources) and CIFS Auditing events from NetApp ONTAP event sources.

You must deploy Log Collection, that is set up a Local Collector and Windows Legacy Remote Collector, before you can configure the Windows Legacy collection protocol.

How Legacy Windows and NetApp Collection Works

You use the Windows Legacy collection protocol to configure NetWitnessto collection events from:

- Legacy Microsoft Windows event sources (Window 2003 and earlier event sources)
- NetApp event sources

Window 2003 and Earlier Event Sources

Legacy Windows event sources are older Windows versions (such as Windows 2000 and Window 2003). The Windows Legacy collection protocol collects from Windows event sources that are already configured for enVision collection without having to reconfigure them. You set up these event sources under the windows event source type.

NetApp Event Sources

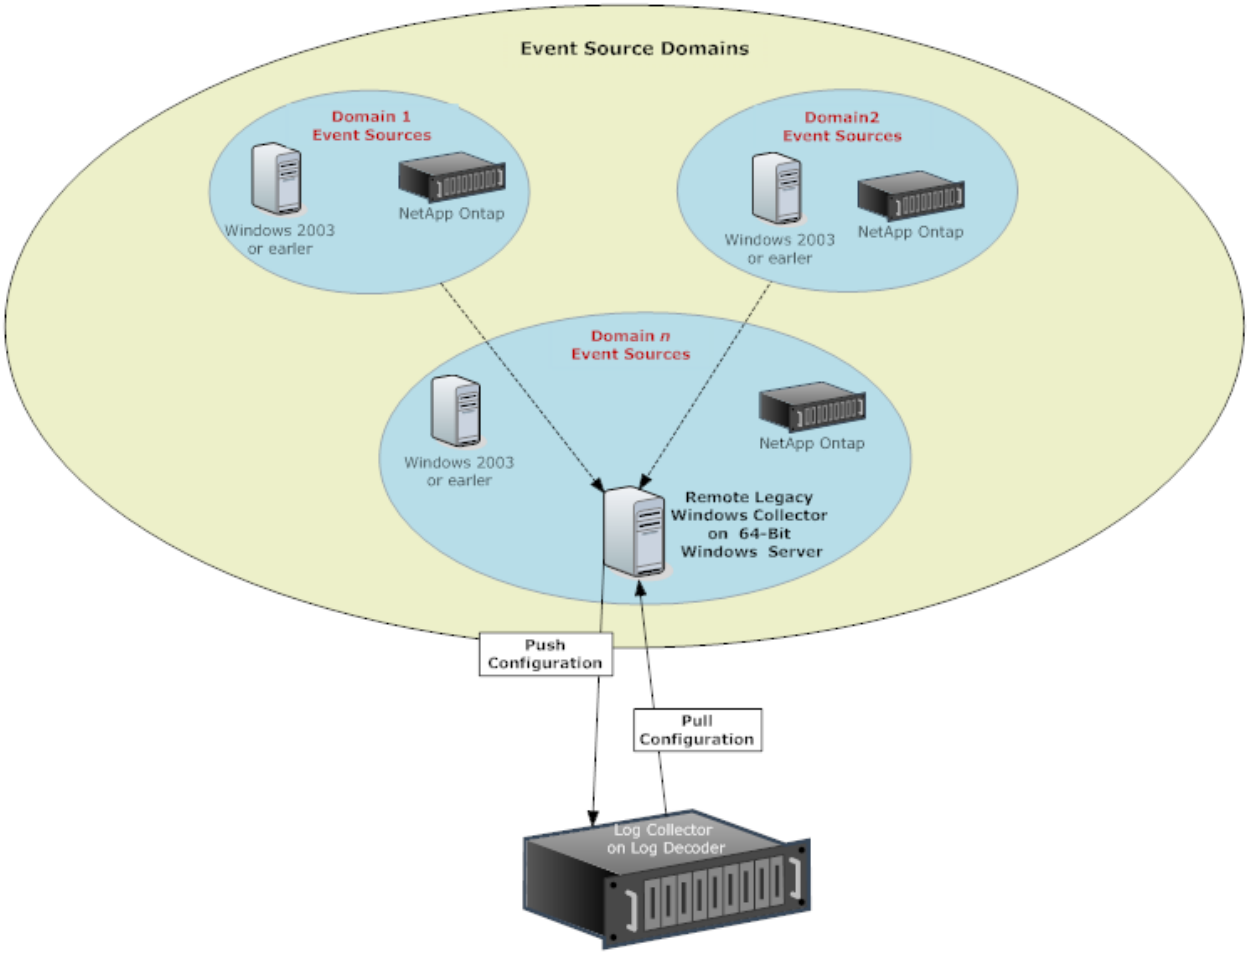
NetApp appliances running Data ONTAP support a native auditing framework that is similar to Windows Servers. When configured, this auditing framework generates and saves audit events in Windows.evt file format. The Windows Legacy collection protocol supports collection of events from such NetApp.evt files. You set up these event sources under the netapp_evt event source type.

The NetApp Data ONTAP appliance is configured to generate CIFS Auditing events and save them periodically as.evt files in a format that includes the timestamp in the filename. Refer to the Network Appliance Data ONTAP Event Source Configuration Guide on NetWitness Link for details. The collection protocol saves the timestamp of the last processed.evt filename to keep track of collection status.

Net App Specific Parameters

Most of the parameters that you maintain in Add/Edit Source dialog apply to both Windows Legacy and Net App events sources.

The following two parameters are unique to NetApp event sources.



- **Event Directory Path** - The NetApp appliance generates event data and saves it in.evt files in a shareable directory on the NetApp appliance. NetWitness requires you to specify this directory path in the Event Directory Path parameter
- **Event File Prefix** - Similar to the Event Directory Path, NetWitness requires you to specify the prefix (for example, adtlog.) of the event data.evt files so that NetWitness can process this data.

In each polling cycle, NetWitness browses the configured NetApp shared path for the **.evt** files that you identified with the Event Directory Path and Event File Prefix parameters. NetWitness:

- Sorts Files matching the event-file-prefix.YYMMDDhhmmss.evt format in ascending order.
- Uses the timestamp of the last file processed to determine the files that still need processing. If NetWitness finds a partially processed file, it skips the events already processed.

Deployment Scenario

The Windows Legacy collection protocol collects event data from Windows 2003 or earlier, and NetApp ONTAP appliance, event sources. The Windows Legacy Remote Collector is the SA Legacy Windows Collector installed on physical or virtual Windows 2008 64-bit server in your event source domain.

Set Up the Windows Legacy Collector

This topic tells you where to find the executable and instructions required to install or upgrade the Windows Legacy collector in your Windows Legacy domain or domains.

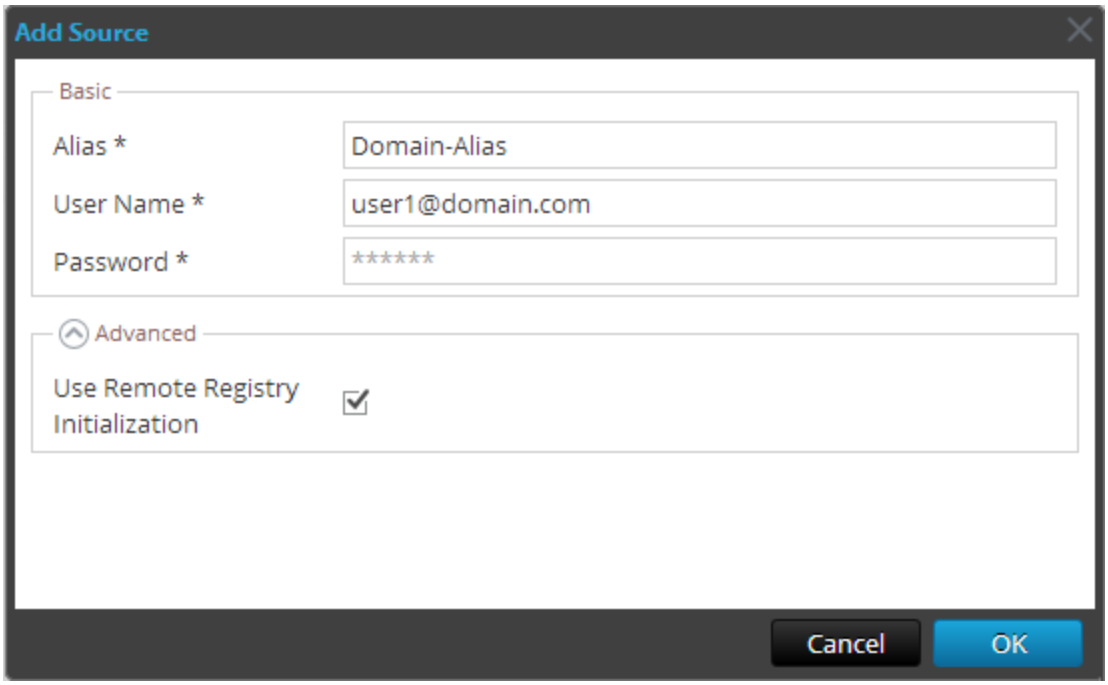
You install the NetWitness Windows Legacy collector on a physical or virtual Windows 2008 R2 SP1 64-Bit server using the **NWLegacyWindowsCollector-11.*version-number.exe***. You download the **NWLegacyWindowsCollector-11.*version-number.exe*** from NetWitness Link. Please refer to the *NetWitness 11.x Windows Legacy Collection Upgrade & Installation Instructions* for the details on how to install or upgrade Windows Legacy collection.

Note: The Microsoft Management Console (MMC) should be closed during the installation process.

Configure Windows Legacy and NetApp Event Sources

This topic tells you how to configure Windows Legacy event sources in NetWitness.

The Windows Legacy collection protocol collects event data from Windows 2003 or earlier event sources, and from NetApp event sources.



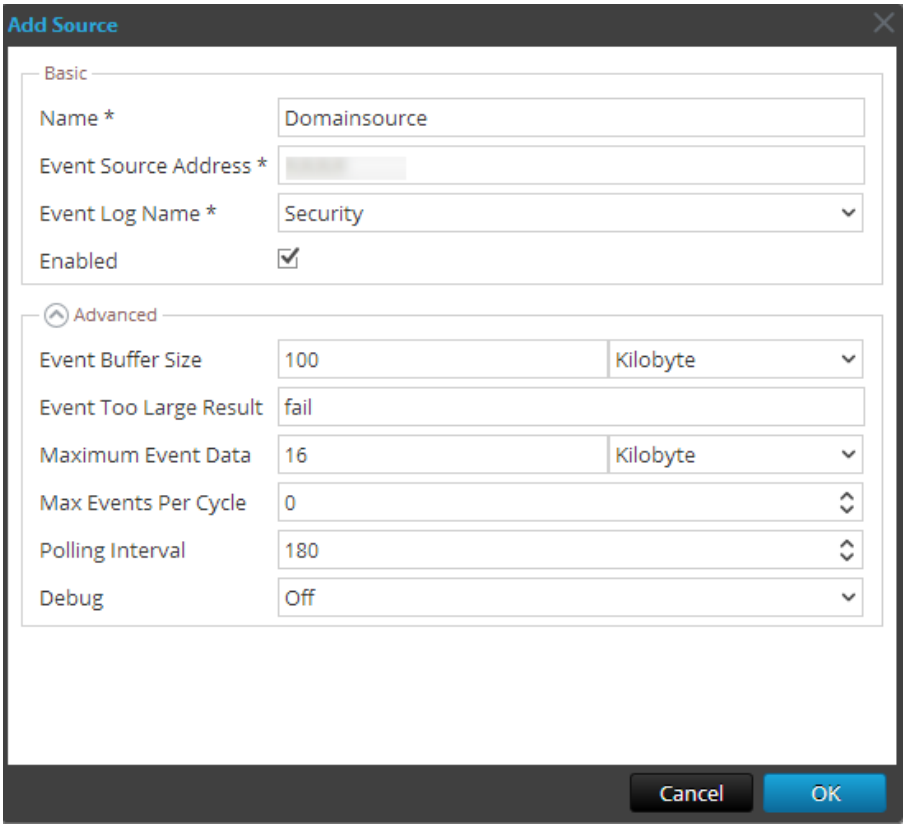
Prerequisites

Before you configure a Windows Legacy event source, make sure that you have:

1. Installed the NetWitness Windows Legacy Remote Collector on a physical or virtual Windows 2008 64-bit server.
2. Added this Windows Legacy Remote Collector to NetWitness.

Add a Windows Legacy Event Source

1. Access the Services view by selecting **(Admin) > Services** from the NetWitness menu.
2. In the **Services** grid, select a **Windows Legacy Log Decoder** service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select one of the following options from the drop-down menu.
   - Windows Legacy/Windows.
   - Windows Legacy/NetApp.
6. Configure the alias:
   a. Click in the **Event Categories** panel toolbar.
   The **Add Source** dialog is displayed.
   b. Specify values for the parameters and click **OK**.



Note: By default, **Remote Registry Initialization** is selected. For details, see Remote Registry Access below.

The newly added windows event source type is displayed in the **Event Categories** panel.

7. Add the event source:

   a. Select the new alias in the **Event Categories** panel and click + in the **Source** panel toolbar.
   The **Add Source** dialog is displayed.

   b. Specify values for the event source parameters and click **OK**.

For details, see Windows Legacy Configuration Parameters below.

The newly added Windows event source is displayed in the **Event Categories** panel.

Remote Registry Access

Windows Legacy Collector performs an initial verification of the event source before collecting data. By default, Windows Legacy Collector uses Windows Management Instrumentation (WMI) method to perform this initial verification. If you enable Remote registry access method, Windows Legacy Collector performs a remote registry query to verify the event source.

Configure Push or Pull between Log Collector and Windows Legacy Collector

You can configure the Windows Legacy Collector to push event data to a Local Collector, or you can configure a Local Collector to pull event data from the Windows Legacy Collector.

To configure a Local Collector or the Windows Legacy Collector:

1. Go to  **(Admin) > Services**.
2. Select a Local Collector or the Windows Legacy Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Depending on your selection in step 2:
   - If you selected a Local Collector, the **Remote Collectors** tab is displayed. Select the Windows Legacy Collector from which the Local Collector pulls events in this tab.
   - If you selected a Windows Legacy Collector, the **Local Collectors** are displayed. Select the Local Collectors to which the Windows Legacy Collector pushes events in this tab.

Windows Legacy Configuration Parameters

The following table describes the basic parameters for a Windows Legacy event source.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Feature	Description
Name*	The name of the event source. Valid value is a name in the **[_a-zA-Z] [_a-zA-Z0-9]*** range. You can use a dash "-" as part of the name.
Event Source Address*	IP address of the event source. Valid value is an IPv4 address, IPv6 address, or a hostname including a fully qualified domain name. NetWitness defaults to **127.0.0.1**. Log Collector converts the hostname to lower-case letters to prevent duplicate entries.
Event Log Name	The name of the event log from which to collect event data (for example, **System**, **Application**, or **Security**). The following are examples of some of these channels: • **System** - applications that run under system service accounts (installed system services), drivers, or a component or application that has events that relate to the health of the system. • **Application** - all user-level applications. This channel is unsecured and it is open to any application. If an application has extensive information, you should define an application-specific channel for it. • **Security** - the Windows Audit Log (event log) used exclusively for the Windows Local Security Authority.

Feature	Description
Enabled	Select this checkbox to collect from this event source. If you do not check this checkbox, the Log Collector does not collect events from this event source.
Event Directory Path	NetApp **.evt or.evtx** files directory path. This must be the UNC path. The NetApp generates event data and saves it in.evt or.evtx files in a shareable directory on the NetApp appliance. • In each polling cycle, Log Collector browses the configured NetApp shared path for the.evt files that you identified with the **Event Directory Path** and **Event File Prefix parameters**. Log Collector : ◦ sorts files that match the **event-file-prefix.YYMMDDhhmmss.evt** format in ascending order. ◦ uses the timestamp of the last file processed to determine the files that still need processing. If Log Collector finds a partially processed file, it skips the events already processed. • In each polling cycle, Log Collector browses the configured NetApp shared path for the **.evtx** files that you identified with the **Event Directory Path** and **Event File Prefix parameters**. Log Collector : ◦ sorts files that match the **event-file-prefix.YYMMDDhhmmssms.evtx** format in ascending order. ◦ uses the timestamp of the last file processed to determine the files that still need processing. If Log Collector finds a partially processed file, it skips the events already processed.
Event File Prefix	Prefix of the **.evt** files (for example, **adtlog**.) saved in the **Event Directory Path**.
Cancel	Closes the dialog without adding the Windows Legacy event source.
OK	Adds the current parameter values as a new event source

The following table describes the advanced parameters for a Windows Legacy event source.

Feature	Description
Event Buffer Size	Maximum size of the data the Log Collector pulls from the event source for each request. Valid value is a number in **0** to **511** Kilobytes range. You specify this value in **Kilobytes**.
Event Too Large Result	Tells Log Collector what to do if an event is too large for the event buffer.
Maximum Event Data	Maximum size of event data to include in the output. Valid value is a number in **0** to **511Kilobytes** range. You specify this value in **Kilobytes** or **Megabytes**. • 1 Kilobyte - 100 Megabytes • 0 = do not include event data in the output.
Max Events Per Cycle	The maximum number of events per polling cycle (how many events collected per polling cycle).
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.

Feature	Description
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). Limit the number of event sources for which you use Verbose debugging to minimize performance impact.

Troubleshoot Windows Legacy and NetApp Collection

This topic highlights possible problems that you may encounter with Windows Legacy Collection (LWC) and suggested solutions to these problems.

Note: In general, you receive more robust log messages by disabling SSL.

Protocol Restart Problems

Problem	Possible Causes	Solutions
You restart the Legacy Windows collection protocol, but NetWitness is not receiving events.	The logcollector service is stopped.	Restart the **logcollector** service. 1. Log on to the **Windows Legacy Remote Collector**. 2. Go to **Start > Administrative Tools > Task Scheduler** and click on **Task Scheduler Library**. 3. In the right panel, look for the **restartnwlogcollector** task and make sure that it is running. 4. If this is not the case, right-click **restartnwlogcollector** and select **Run**.

Installation Problems

If you see any of the following messages in the **MessageBroker.log**, you may have issues.

Log Messages	Any message that contains "rabbitmq"
Possible Cause	RabbitMQ service may not be running. Port **5671** may not be opened.
Solutions	Make sure that the RabbitMQ service is running. Make sure that port **5671** is open.
Log Messages	Error: Adding logcollector user account. Error: Adding administrator tag to logcollector account. Error: Adding logcollection vhost. Error: Setting permissions to logcollector account in all vhosts.
Possible Cause	**rabbitmq-server** was not running when installer tried to create users and vhosts.

Solutions	Make sure that the **RabbitMQ** service is running and run below commands manually.
	`rabbitmqctl -q add_user logcollector netwitness`
	`rabbitmqctl -q set_user_tags logcollector administrator`
	`rabbitmqctl -q add_vhost logcollection`
	`rabbitmqctl -q set_permissions -p / logcollector ".*" ".*" ".*"`
	`rabbitmqctl -q set_permissions -p logcollection logcollector ".*" ".*" ".*"`

Windows Legacy Federation Script Issues

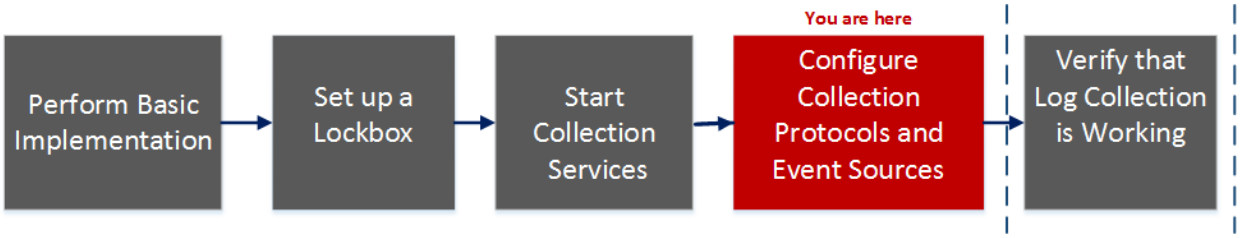
If you see any of the following messages in the federation script log, you may have issues.

Problem	Possible Symptoms	Solutions
Federation script started, but the LWC service went down.	NetWitness log shows connection failure exceptions with Windows Legacy Collector.	This issue is fixed automatically after restarting the Windows Legacy service.

Problem	Possible Symptoms	Solutions

LWC is running, but RabbitMQ service is down or restarting.	Federation log file at Windows Legacy side displays an error message about RabbitMQ service being down.
	The log file to look at is: **C:\NetWitness\ng\logcollector**
	The following error message is logged in case RabbitMQ is not running:
	`"Unable to connect to node logcollector@localhost: nodedown"`
	The following diagnostics messages are displayed:
	`attempted to contact: [logcollector@localhost]`
	`logcollector@localhost: * connected to epmd (port 4369) on localhost * epmd reports: node 'logcollector' not running at all other nodes on localhost: ['rabbitmqctl-4084'] * suggestion: start the node`
		Run the **federation.bat** script manually at LWC. To run the **federate.bat** script manually, perform the following steps:
		1. Go to folder C**:\Program Files\NwLogCollector** where the Windows Legacy instance is installed.
		2. Locate the file **federate.bat i**n this folder. Select the file and right click.
		3. Select **Run as Administrator**.
		4. To monitor the log file, navigate to **C:\NetWitness\ng\logcollector\federate.log** while the **federate.bat** script is being executed.
		Note: Make sure the log file does not show any errors while the script is being executed.

RabbitMQ service is down on the NetWitness side.	NetWitness User Interface pages do not work.	Restart RabbitMQ service.
Customer receives a Health and Wellness notification, or the following Health and Wellness Alarm is displayed: "Communication failure between Master NetWitness Host and a Remote Host" with LWC Host as the Remote IP.	**Federate.bat** script failed to run successfully.	If the **Federate.bat** script did not run correctly, run it manually as described previously.



Reference

AWS Parameters

This topic provides an overview of the AWS collection configuration parameters for deploying a remote log collection service (VLC) in an Amazon Web Services (AWS) environment.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

Related Topics

- Configure AWS (CloudTrail) Event Sources in NetWitness

The following table describes the **Basic** configuration parameter for AWS collection.

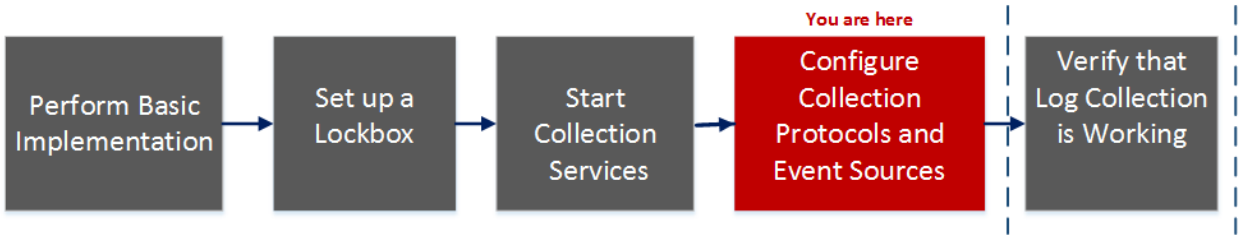
Note: Required parameters are marked with an asterisk. All other parameters are optional.

Parameter	Description
Name *	Name of the event source.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Account Id *	Account Identification code of the S3 Bucket

Parameter	Description
S3 Bucket Name *	Name of the AWS (CloudTrail) S3 bucket. Amazon S3 bucket names are globally unique, regardless of the AWS (CloudTrail) region in which you create the bucket. You specify the name at the time you create the bucket. Bucket names should comply with DNS naming conventions. The rules for DNS-compliant bucket names are: • Bucket names must be at least three and no more than 63 characters long. • Bucket names must be a series of one or more labels. Adjacent labels are separated by a single period ".". Bucket names can contain lowercase letters, numbers, and hyphens. Each label must start and end with a lowercase letter or a number. • Bucket names must not be formatted as an IP address (for example, 192.168.5.4). The following examples are **valid** bucket names: • `myawsbucket` • `my.aws.bucket` • `myawsbucket.1` The following examples are **invalid** bucket names: • `.myawsbucket` - Do not start a Bucket Name with a period • `myawsbucket.` - Do not end a Bucket Name with a period • `my..examplebucket` - Only use one period between labels.
Access Key *	Key used to access the S3 bucket. Access Keys are used to make secure REST or Query protocol requests to any AWS service API. Please refer to Manage User Credentials on the Amazon Web Services support site for more information on Access Keys.
Secret Key *	Secret key used to access the S3 bucket.
Region *	Region of the S3 bucket. `us-east-1` is the default value.
Region Endpoint	Specifies the AWS CloudTrail hostname. For example, for an AWS public cloud for us-east region, the Region Endpoint would be s3.amazonaws.com. More information can be found at http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region. This parameter is necessary to collect CloudTrail logs from AWS Government or Private clouds.
Use Proxy	Enable **Use Proxy** to set proxy for AWS server. By default, it is disabled.
Proxy Server	Enter the proxy name you want to connect to access the AWS server.
Proxy Port	Enter the port number that connects to the proxy server to access the AWS server.
Proxy User	Enter the user name to authenticate with the proxy server.
Proxy Password	Enter the password to authenticate with proxy port.
Start Date *	Starts AWS (CloudTrail) collection from the specified number of days in the past, measured from the current timestamp. The default value is 0, which starts from today. The range is 0–89 days.
Log File Prefix	Prefix of the files to be processed. **Note:** If you set a prefix when you set up your CloudTrail service, make sure to enter the same prefix in this parameter.

Parameter	Description
Cancel	Closes the dialog without adding the AWS (CloudTrail).
OK	Adds the current parameter values as a new AWS (CloudTrail).

The following table describes the **Advanced** configuration parameter for AWS collection.



Parameter	Description
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).
Command Args	Arguments added to the script.
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is 60. For example, if you specify 60, the collector schedules a polling of the event source every 60 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 60 seconds for the polling to start because the threads are busy.
SSL Enabled 	Select the check box to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The check box is selected by default.
Test Connection	Validates the configuration parameters specified in this dialog are correct. For example, this test validates that: • NetWitness can connect with the S3 Bucket in AWS using the credentials specified in this dialog. • NetWitness can download a log file from the bucket (test connection would fail if there were no log files for the entire bucket, but this would be extremely unlikely).

Azure Parameters

Microsoft Azure is a cloud computing platform and infrastructure for building, deploying, and managing applications and services through a global network of Microsoft-managed data centers.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

Related Topics

- Configure Azure Event Sources in NetWitness

Azure Event Source Configuration Parameters

This topic describes the Azure event source configuration parameters.

Basic Parameters

Note: Required parameters are marked with an asterisk. All other parameters are optional.

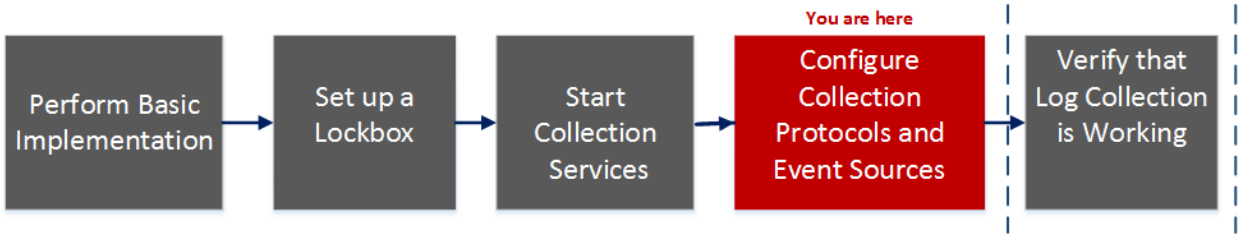
Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.

Name	Description
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Client ID *	The Client ID is found the Azure Application Configure tab. Scroll down until you see it.
Client Secret *	When you are configuring the event source, the client secret is displayed when you are creating a key, and you select a duration of validation. Make sure to save this, because you will only be able to see it once, and it cannot be retrieved later.
API Resource Base URL *	Enter `https://management.azure.com/`. Be sure to include the trailing slash (/).
Federation Metadata Endpoint *	In your Azure application, click the **View Endpoints** button (near the bottom of the pane). There are a lot of links that all begin with the same string. Compare the URLs and find the common string that begins most of them. This common string is the endpoint that you need to enter here.
Subscription ID *	You can find this in the Microsoft Azure dashboard: click on Subscriptions at the bottom of the list on the left.
Tenant Domain *	Go to the active directory and click on the directory. In the URL, the tenant domain is the string directly following **manage.windowsazure.com/**. The tenant domain is the string up to and including the **.com**.
Resource Group Names *	In Azure, select Resource groups from the left navigation pane, then select your group.
Start Date *	Choose the date from which to start collecting. Default's to the current date.
Test Connection	Checks the configuration parameters specified in this dialog to make sure they are correct.

Advanced Parameters

Click next to **Advanced** to view and edit the advanced parameters, if necessary.

Name	Description
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, the collector waits for that cycle to finish. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Duration Poll	Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit.



Name	Description
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Max Idle Time Poll	Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit.
Command Args	Optional arguments to be added to the script invocation.
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact.

Check Point Parameters

The Check Point Collection protocol collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

Related Topics

- Configure Check Point Event Sources in NetWitness

Check Point Collection Configuration Parameters

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Basic Parameters

Parameter	Description
Name*	Name of the event source.
Address*	IP Address of the Check Point server.

Parameter	Description
Server Name*	Name of the Check Point server.
Certificate Name	Certificate name for secure connections to use when the transport mode is https. If set, the certificate must exist in the certificate trust store that you created using the Settings tab. Select a certificate from the drop-down list. The file naming convention for Check Point event source certificates is **checkpoint_*name-of-event-source***.
Client Distinguished	Enter the Client Distinguished Name from the Check Point server.
Client Entity Name	Enter the Client Entity Name from the Check Point server.
Server Distinguished	Enter the Server Distinguished Name from the Check Point server.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Pull Certificate	Select the checkbox to pull a certificate for first time. Pulling a certificate makes it available from the trust store.
Certificate Server Address	IP Address of the server on which the certificate resides. Defaults to the event source address.
Password	Only active when you select the Pull Certificate checkbox for first time. Password required to pull the certificate. The password is the activation key created when adding an OPSEC application to Check Point on the Check Point server.

Determine Advanced Parameter Values for Check Point Collection

You use less system resources when you configure a Check Point event source connection to stay open for a specific time and specific event volume (transient connection). NetWitness defaults to the following connection parameters that establish a transient connection:

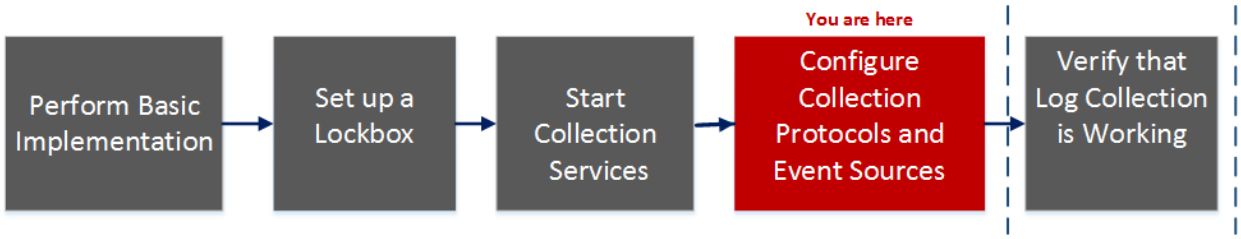
- Polling Interval = **180** (3 minutes)
- Max Duration Poll = **120** (2 minutes)
- Max Events Poll = **5000** (5000 events per polling interval)
- Max Idle Time Poll = **0**

For very active Check Point event sources, it is a good practice to set up a connection that stays open until you stop collection (persistent connection). This ensures that Check Point collection maintains the pace of the events generated by these active event sources. The persistent connection avoids restart and connection delays and prevents Check Point collection from lagging behind event generation.

To establish a persistent connection for a Check Point event source, set the following parameters to the following values:

- Polling Interval = **-1**
- Max Duration Poll = **0**
- Max Events Poll = **0**
- Max Idle Time Poll = **0**

Parameter	Description
Port	Port on the Check Point server that Log Collector connects to. Default value is 18184.
Collect Log Type	Type of logs that you want to collect: Valid values are: • **Audit** - collects audit events. • **Security** - collects security events. If you want to collect both audit and security events, you must create a duplicate event source. For example, first you would create an event source with Audit selected pulling a certificate into the trust store for this event source. Next you would create another event source with the same values except that you would select Security for the Collect Log Type and you would select the same certificate in Certificate Name that you pulled when you set up the first set of parameters for this event source and you would make sure that Pull Certificate was not selected.
Collect Logs From	When you set up a Check Point event source, NetWitness collects events from the current log file. Valid values are: • **Now** - Start collecting logs now (at this point in time in the current log file). • **Start of Log** - Collect logs from the beginning of the current log file. If you choose "Start of Log" for this parameter value, you may collect a very large amount of data depending on how long the current log file has been collecting events. Note that this option is effective only for the first collection session.
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Duration Poll	The maximum duration of polling cycle (how long the cycle lasts) in seconds.
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Max Idle Time Poll	Maximum idle time, in seconds, of a polling cycle. 0 indicates no limit.**> 300** is the default value.
Forwarder	Enables or disables the Check Point server as a forwarder. By default it is disabled.



Parameter	Description
Log Type (Name Value Pair)	Logs from the event source in Name Value format. By default it is disabled.
Debug	**Caution:** Only enable debugging (set this parameter to "On" or "Verbose") if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables and disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).

File Parameters

This topic describes the File Collection configuration parameters.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

File Collection Event Source Parameters

The following table provides descriptions of the File Collection source parameters.

The following table describes the **Basic** configuration parameter for File collection.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Name	Description

Name	Description
File Directory*	Collection directory (for example, **Eur_London100**) into which the File event source places its files. Valid value is a character string that is conforms to the following regular expression: **[_a-zA-Z][_a-zA-Z0-9]*** This means that the file directory must start with a letter followed by numbers, letters, and underscores. Do not modify this parameter after you start collecting event data. After you create the collection, the Log Collector creates the work, save, and error sub-directories under the collection directory.
Address*	IP address of the event source. Valid value is an **IPv4 address**, **IPv6 address**, or a **hostname** including a fully-qualified domain name.
File Spec	Regular expression. For example, **^.*$** = process everything.
File Encoding	Character encoding used by the syslog senders to this port. Defaults to UTF-8. **Note:** It is safe to leave this as UTF-8, since UTF-8 handles ASCII characters as well, and most senders have their encoding set to UTF-8. NetWitness has tested the following values: • EUC-KR • SJIS • GB3212/GBK • ISO_8859-1 (German) • ISO_8859-7 (Greek)
Cancel	Closes the dialog without making adding an event source type.
OK	Adds the parameters for the event source.

The following table describes the **Advanced** configuration parameter for File collection.

Name	Description
Ignore Encoding Conversion Errors	Select the check box to ignore encoding conversion errors and ignore invalid data. The check box is selected by default. **Caution:** This may cause parsing and transformation errors.

Name	Description
File Disk Quota	Determines when to stop saving files regardless of the **Save On Error** and **Save On Success** parameter settings. For example, a value of 10 indicates that when there is less than 10% available disk left, the Log Collector stops saving files to reserve enough space for your estimated normal collection processing. **Caution:** Available disk refers to a partition where the base collection directory is mounted. If the Log Decoder server has a 10TB disk size and 2TB is allocated to base collection directory, then setting this value to 10 causes log collection to stop when less than 0.2TB (10% of 2TB) of space is left. It does not mean 10% of 10TB. Valid value is a number in the **0** to **100** range. **10** is the default.
Sequential Processing	Sequential processing flag: • Select the check box (default) to process event source files in collection order. • Do not select the checkbox to process event source files in parallel.
Save On Error	Save on error flag. Check the checkbox to retain the **eventsource collection** file when the Log Collector it encounters an error. The check box is selected by default.
Save On Success	Save **eventsource collection** file after processing flag. Check the checkbox to save the eventsource collection file after processing it. The check box is not selected by default.
Eventsource SSH Key	SSH public key used to upload files for this event source. Please refer to the *Generate Key Pair on Event Source and Import Public Key to Log Collector* section in the Install and Update the SFTP Agent Guide for instructions on generating keys. **Note:** If File collection is stopped, NetWitness does not update the authorized_keys file with the SSH public key that you add or modify in this parameter. You must restart File collection to update the public key. You can add or modify the value of the public key in this parameter in multiple File event sources without File collection running, but NetWitness will not update the **authorized_keys** file until File collection is restarted.
Manage Error Files	By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with error files. If you set this parameter to **true**, you can specify one of these: • Maximum space allotted to error files in the **Error Files Size** parameter. • Maximum number of error files allowed in **Error Files Count** parameter. A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached. Select the check box to manage error files. The check box is not selected by default.

Name	Description
Error Files Size	Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Specifies to what extent NetWitness saves error files. The value that you specify is the maximum total size of all the files in the error directory. Valid value is a number in **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Error Files Count	Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Maximum number of error files allowed in the error directory. Valid value is a number in **0** to **65536** range. **65536** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Error Files Reduction %	Percent amount by size or count of the error files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first. Valid value is a number in the **0** to **100** range. **10** is the default.
Manage Saved Files	Select the check box to manage saved files. The check box is not selected by default. By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with saved files. If check this check box, you can specify one of these: • Maximum space allotted to saved files in the **Saved Files Size** parameter. • Maximum number of saved files allowed in **Saved Files Count** parameter. A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached.
Saved Files Size	Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum total size of all the files in the save directory. Valid value is a number in the **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Saved Files Count	Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum number of saved files in the save directory. Valid value is a number in **0** to **65536** range. **65536** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Saved File Reduction %	Percent amount by size or count of the saved files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first. Valid value is a number in the **0** to **100** range. **10** is the default.

Name	Description
Debug	**Caution:** Only enable debugging (set this parameter to **On** or **Verbose**) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).

Log Collection Service System View

A Log Collector is a service that runs on a Log Decoder host (referred to as a Local Collector) or sends events from a Remote Collector to a Local Collector, and is configured and managed in a similar way to a Log Decoder.

To access the Log Collection Service System view, go to (Admin) > Services and select a Log Collector service, then select View > System.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

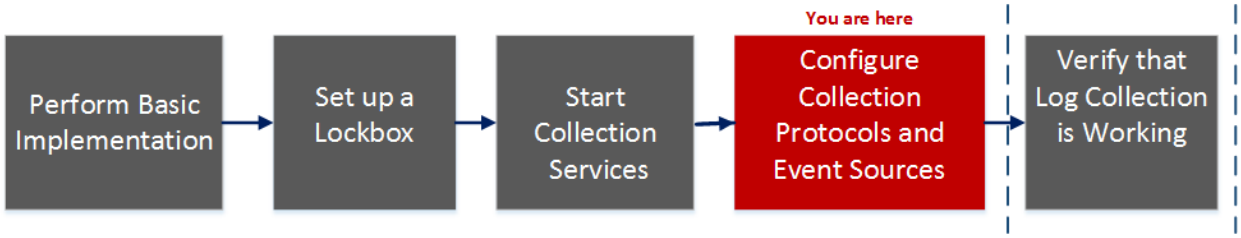
ODBC Event Source Configuration Parameters

This topic tells you how to configure ODBC collection protocol which collects events from event sources that store audit data in a database using the Open Database Connectivity (ODBC) software interface.



Access ODBC Configuration Parameters

To access the ODBC Event Source Configuration Parameters:

1. Go to  **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Select  **> View > Config** to display the Log Collection configuration parameter tabs.
   The **Service Config** view is displayed with the Log Collector **General** tab open.
4. Click the **Event Sources** tab, and select **ODBC/Config** from the drop-down menu.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation.	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

Data Source Name (DSN) Parameters

Use the Sources panel to review, add, modify, and delete Data Source Name (DSN) parameters.

Sources Panel

An ODBC DSN tells the Log Collector how to reach an ODBC endpoint. You refer to an ODBC DSN when you configure a data source name with information such as which ODBC driver to use or the host name and port of the ODBC endpoint.

An ODBC DSN is a sequence of name-value pairs. For information about the valid names for a given ODBC data source type, such as Sybase, Microsoft SQL Server, or Oracle, please download the *DataDirect Connect Series for ODBC User's Guide and DataDirect Connect Series for ODBC User's Guide* in the Progress DataDirect Document Library.

Toolbar

The following table provides descriptions of the toolbar options.

Option	Description
	Opens the Add DSN dialog in which you add an event source for the event source type you selected in the Event Categories panel.
	Deletes the selected event sources.
	Opens the Edit DSN dialog in which you modify the configuration parameters for the selected event source. When you select multiple event sources, this option opens the Bulk Edit Source dialog in which you can edit the parameters values for the selected file directories.
	Opens the Bulk Add Option dialog in which you can import DSN parameters in bulk from a comma-separated values (CSV) file. The Bulk Add Option dialog has the following two options: • Import CSV File • Paste CSV Content
	Creates a **.csv** file that contains the parameters for the selected DSNs.
	Validates the configuration parameters for the selected ODBC database.

Add or Edit DSN Dialog

In this dialog, you add or modify an event source for the selected event source.

Basic Parameters

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Name	Description
DSN*	The data source name (DSN) that defines the database from which to collect events. Select an existing DSN from the drop-down list. For details, see ODBC DSNs Event Source Configuration Parameters.
Username*	User name that the data source name uses to connect to the database. You must specify a user name when you create the event source.
Password	Password that the data source name uses to connect to the database. **Caution:** The password is encrypted internally and is displayed in its encrypted form.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Address*	For ODBC, this field is not used. The Log Collector uses the address in the **ODBC.ini** file.

Advanced Parameters

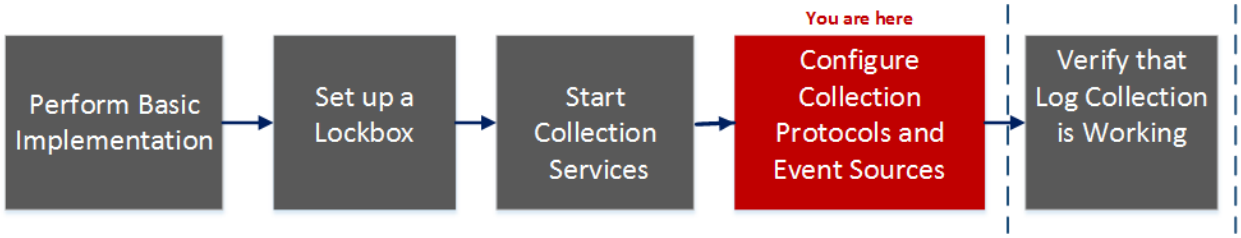
Name	Description
Max Cell Size	Maximum size in bytes of the data that the Log Collector can pull from one cell in the database. The default value is **2048**.
Nil Value	Character string that the Log Collector displays when NIL is returned for a cell in the database. Default value: “” (null).
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, the collector waits for that cycle to finish. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).

Name	Description
Debug	**Caution:** Caution: Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact.
Initial Tracking Id	Initial identification code that the Log Collector assigns to this event source if collection is not started. If there is no value for this parameter, the Log Collector starts at the end of the table and only pulls rows after the end of the table as they are added. The default value is "" (null). For Example: `2020-11-11 05:05:11` **Note:** The Initial Tracking ID format varies based on the format of the tracking column used in the data query in the typespec. For Example: If the tracking column value is in epoch, the Initial Tracking ID must be in the epoch format.
Filename	For Microsoft SQL Server Event Sources only, the location of the trace files directory (for example, **C:\MyTraceFiles**). Refer to the NetWitness Microsoft SQL Server Event Source Configuration Guide, located on NetWitness Link.
Test Connection	Checks the configuration parameters specified in this dialog to make sure they are correct.
Cancel	Closes the dialog without adding or modifying DSN parameters.
OK	Adds or modifies the parameters for the DSN.

ODBC DSNs Event Source Configuration Parameters

Open Database Connectivity (ODBC) event sources require Data Source Names (DSNs) so you need to define DSNs with their associate value pairs for ODBC event source configuration.

Access ODBC Configuration Parameters



To access the ODBC Event Source Configuration Parameters:

1. Access the Services view by selecting  **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Under Actions, select  **View > Config** to display the Log Collection configuration parameter tabs.

   The **Service Config** view is displayed with the Log Collector **General** tab open.
4. Click the **Event Sources** tab, and select **ODBC/DSNs** from the drop-down menu.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services

ODBC DSN Configuration Parameters

This topic describes the Data Source Names DSNs configuration parameters.

DSN Panel

In the DSNs panel, you can add, delete, or edit DSNs and the DSN name-value pairs for ODBC Event sources.

Feature	Description
	Displays the Add DSN dialog in which you define a DSN and its parameters.
	Deletes the selected DSNs.
	Displays the Edit DSN dialog in which you edit the name-value pairs for the selected DSN.
	Displays the Manage DSN Templates dialog in which you can add or delete DSN name-value pair templates.
	Selects DSNs.
DSN	Name of the DSN that you added.
Parameters	**<name-value for="" p="" pairs="" the=""> </name-value>**

Add or Edit DSN Dialog

In this dialog, you add or modify a file directory for the selected event source.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Feature	Description
DSN Template	Select a predefined DSN value name-value pairs template for the DSN.

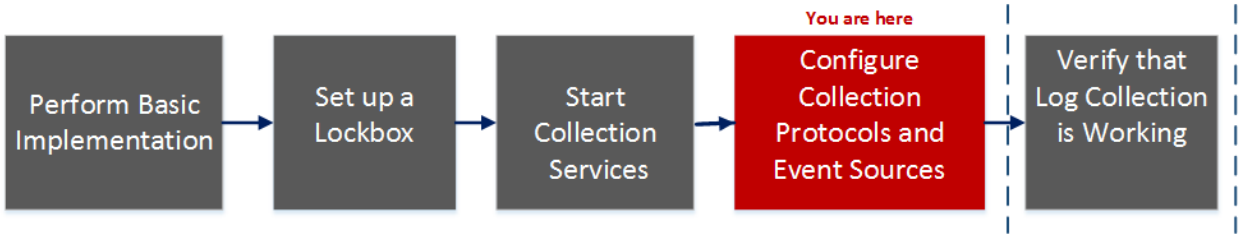
Feature	Description
DSN Name*	Add the name of the DSN. You cannot edit a DSN name after you add it. This value must correspond with a DSN entry in the ODBC.ini file. Valid value is a character string that is restricted to the following characters: `[_a-zA-Z][_a-zA-Z0-9]*` This means that the file directory must start with a letter followed by numbers, letters, and underscores (for example, **oracle_executive_compensation**).
Parameters	 Adds a row in which you can define a parameter name-value pair. Deletes the selected parameter name-value pair.  Selects parameter name-value pairs. Name - Enter or modify the parameter name. Value - Enter or modify the value associated with the parameter name.
Cancel	Closes the dialog without adding the DSN and its name-value pairs or saving modifications to the name-value pairs.
Save	Adds the DSN and its name-value pairs or saves modifications to the name-value pairs.

Manage DSN Templates Dialog

In this dialog, you can add or delete DSN name-value pair templates.

Feature	Description
	Template Selection Panel
	Opens the Add Template panel in which you can add a DSN name-value pair template.
	Deletes the selected template.
	Selects a template for deletion or modification.
	Add Template Panel
	Adds a value pair row.
	Deletes a value pair row.
	Selects a value pair row.

Feature	Description
Name	Enter the parameter name.
Value	Enter the value associated with the parameter name.
Cancel	Cancels any changes you made in the dialog.
Save	Adds the DSN and its name-value pairs or saves modifications to the name-value pairs.
Close	Closes the dialog without adding the DSN and its name-value pairs or saving modifications to the name-value pairs.



Remote/Local Collectors Configuration Parameters

When you deploy Log Collection, you must configure the Log Collectors to collect the log events from various event sources, and to deliver these events reliably and securely to the Log Decoder host, where the events are parsed and stored for subsequent analysis.

This topic introduces features of the Services Config view > Remote Collectors/Local Collectors tab.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

Related Topics

- Provision Local Collectors and Remote Collectors

Services Config View

The Services Config view is the view on which you maintain all the Log Collection parameters. The tab in which you maintain the deployment parameters referred to in this guide is the **Remote/Local** Collectors tab:

- If you are configuring a Local Collector , NetWitness displays the **Remote Collectors** tab so that you can configure the Local Collector to pull events from Remote Collectors.

- If you are configuring a Remote Collector , NetWitness displays the **Local Collectors** tab so that you can configure the Remote Collector to push events to a Local Collector .

Remote Collectors Tab

On a Local Collector, the Remote Collectors panel provides a way to add or delete Remote Collectors from which the Local Collector pulls events.

Column	Description
	Displays the **Add Source** dialog in which you select the Remote Collectors from which you want the Local Collector to pull events.
	Deletes the Remote Collector from the Local Collector Remote Collectors panel.
	Displays the **Edit Source** dialog for the selected Remote Collector .
	Selects Remote Collectors.
Name	Names of the Remote Collectors from which the Local Collector currently pulls events.
Address	IP Addresses of the Remote Collectors from which the Local Collector currently pulls events.
Collections	Choose which collection protocols that the Remote Collector pushes to a Local Collector. You can select any combination of protocols. If you do not select a protocol, NetWitness selects all protocols.

Local Collector Tab

On a Remote Collector , the Local Collector panel provides a way to add or delete the Local Collectors to which you want to the Remote Collector to push events.

Select the **Destination** or **Source** in the **Select Configuration** drop-down menu.

- **Destination** displays the **Add Remote Destination** dialog.
- Source displays the **Add Source** dialog.

The following table describes the Add Source dialog.

Column	Description
	Displays the **Add Source** dialog in which you select the Remote Collectors from which you want the Local Collector to pull events.
	Deletes the Remote Collector from theLocal Collector Remote Collectors panel.

Column	Description
	Displays the **Edit Source** dialog for the selected Remote Collector .
	Selects Remote Collectors.
Name	Names of the Remote Collectors from which the Local Collector currently pulls events.
Address	IP Addresses of the Remote Collectors from which the Local Collector currently pulls events.

The following table describes the Local Collectors Panel.

Column	Description
	Displays the **Add Remote Destination** dialog for the Group that you selected. You add destination Local Collectors for this group to which you want the Remote Collector to push events.
	Deletes the destination Log Collector from the group.
	Displays the **Edit Remote Destination** dialog for the selected destination Local Collector .
	Selects a destination Local Collector .
Destination Name	Displays the name of the destination Local Collector .
Address	Displays the IP address of the destination Local Collector .
Collections	Choose which collection protocols that the Local Collector pulls from a Remote Collector. You can select any combination of protocols. If you do not select a protocol, NetWitness selects all protocols.

Log Collection Tabs

This topic describes the tabs available in the Log Collection view.

Access Log Collection View

To access the log collection view:

1. Go to **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.

3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.

   The **Service Config** view is displayed with the Log Collector **General** tab open.

4. Select any of the available tabs to view or update the corresponding parameters.

Available Tabs

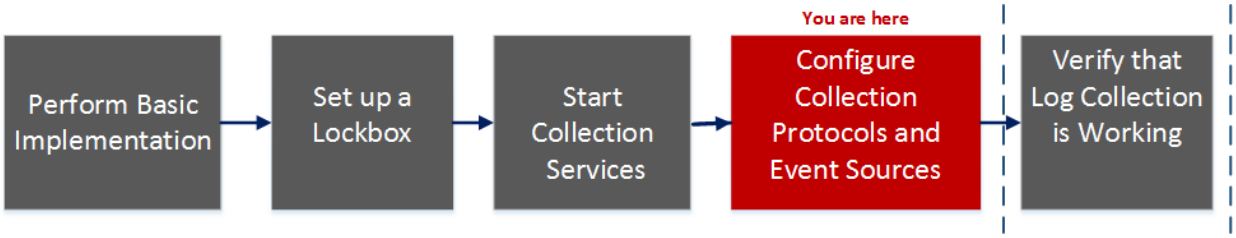
Use the  (Admin) > Services view to maintain Log Collection parameters. It has the following tabs:

- **General**: contains high-level parameters that govern the operation of the Log Collector service and each collection protocol. See Log Collection General Tab for details.
- **Remote Collectors**: use this tab to set up remote collectors. See Configure Local and Remote Collectors for details.
- **Files**: provides an interface for editing Log Collector configuration files.
- **Event Sources**: use this tab to configure collection for your event sources. See Log Collection Event Sources Tab for details.
- **Event Destinations**: Use the Event Destinations tab of the Log Collection service Config view to configure the destination of event data collected by the Log Collector. See Log Collection Event Destinations Tab for details.
- **Settings**: contains parameters for Lockbox security setup, and certificate management.
- **Appliance Service Configuration**: contains configuration parameters for the NetWitness Core Appliance service.

Please refer to the **Files** tab and the **Appliance Service Configuration** tab in the *Host and Services Configuration Guide* for information on the configuration parameters on these tabs.

Log Collection General Tab

This topic introduces features of the service Config view > General tab that relate specifically to Log Collector .



To access the Log Collection General tab:

1. Go to  **(Admin) > Services** from the NetWitness menu.
2. Select a Log Collection service.
3. Click  > **View > Config**.

   The **Service Config** view is displayed with the Log Collector **General** tab open.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	Perform basic Log Collection implementation.	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	*Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

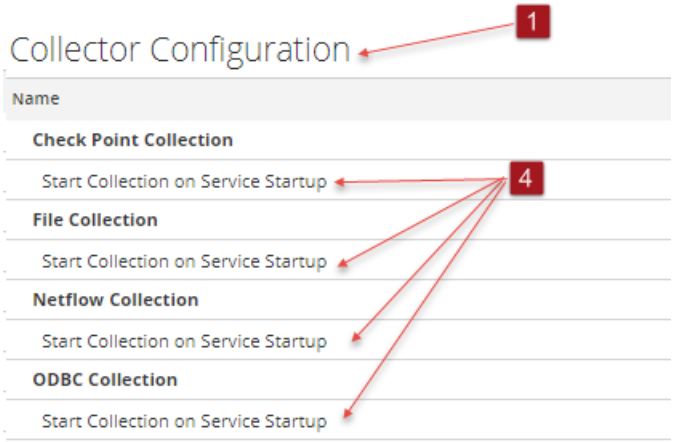
- Windows Legacy and NetApp Collection Configuration

Quick Look

The NetWitness administrator must configure event sources to send logs to the collectors. When event sources are configured they poll event sources, retrieve logs, and send the event data to NetWitness).

System Configuration Panel

The System Configuration panel manages service configuration for a NetWitness service. When a service is first added, default values are in effect. You can edit these values to tune performance. Refer to the **General** tab for a description of these parameters.



1	System Configuration Panel manages service configuration for a NetWitness service.
2	Compression: The minimum number of bytes that must be transmitted per response before compression. A setting of 0 disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
3	Port: The port on which the service listens. The ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators

	• 50007 for other services
4	SSL FIPS Mode: When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
5	SSL Port: The NetWitness Core SSL port on which the service listens. The ports are: • 56001 for Log Collectors • 56002 for Log Decoders • 56003 for Brokers • 56004 for Decoders • 56005 for Concentrators • 56007 for other services
6	Stat Update Interval: The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
7	Threads: The number of threads in the thread pool to handle incoming requests. A setting of 0 lets the system decide. The default value is 15. A change takes effect on service restart.

Collector Configuration Panel

The Collector Configuration panel provides a way to enable automatic start of log collection by event source type.

1	Collector Configuration Panel provides a way to enable automatic start of log collection by event source type.
2	Enable All enables the automatic collection for all event types. **Enable All** = start receiving events and collecting logs for all event types when the Log Collector service starts.
3	Disable all disables the automatic collection for all event types. **Disable All** = (default) do not receive event data for all event types until you explicitly start collection.

4 Start Collection on Service Startup enables automatic start, per event source type, of log collection when the Log Collector service starts. Valid values are:

- Selected = start collecting logs when the Log Collector service starts.
- Not selected = (default) do not collect event data until you explicitly start collection.

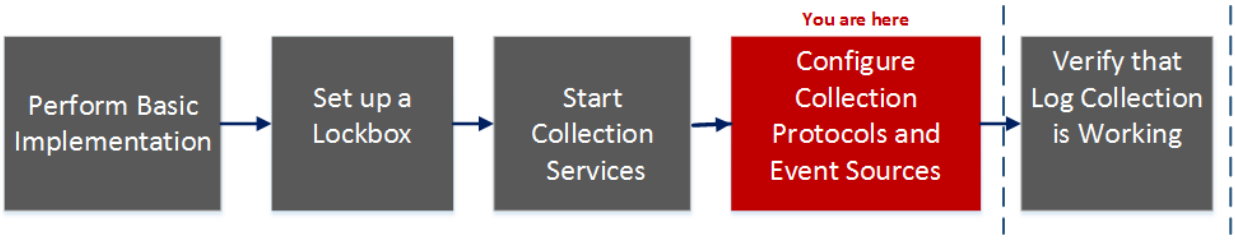
5 **Apply**: Click **Apply** to save the changes to the parameter values.

Log Collection Event Destinations Tab

Use the Event Destinations tab of the Log Collection service Config view to configure the destination of event data collected by the Log Collector :

- Log Decoders
- Identity Feed

Prerequisites



You must implement the following configuration to create an identity feed.

- A Log Collector service with an Identity Feed Event Processor
- A Log Collector service with Windows Collection configured and enabled

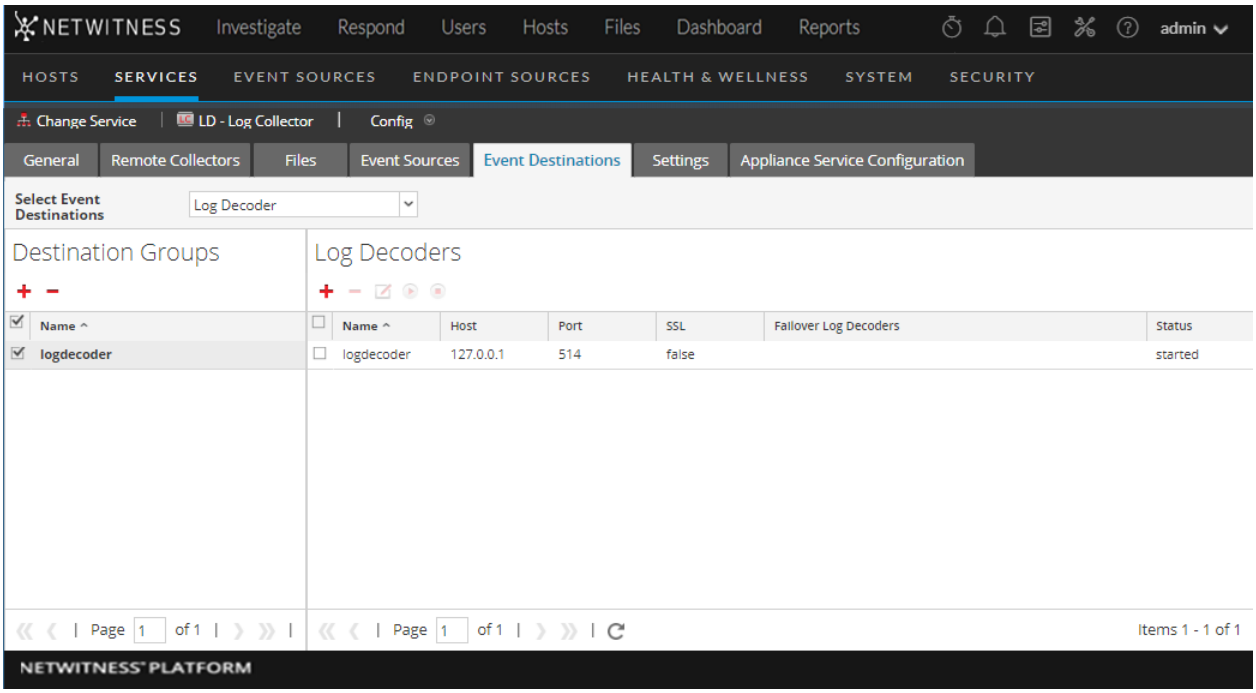
Note: See the "Create an Identity Feed" topic in the *Live Resource Management Guide* for more information on how to create and investigate on an identity feed.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	Perform basic Log Collection implementation.	Basic Implementation
Administrator	Set up a to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working



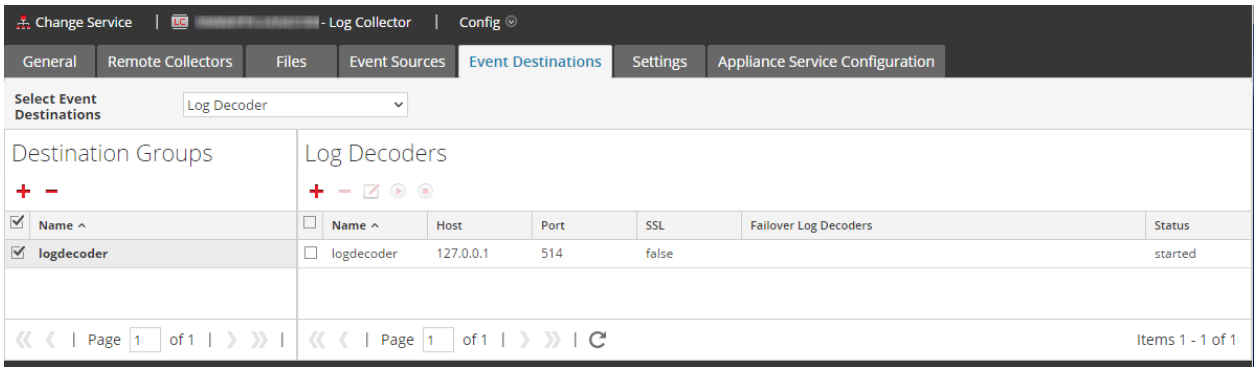
*You can perform this task here.

Related Topics

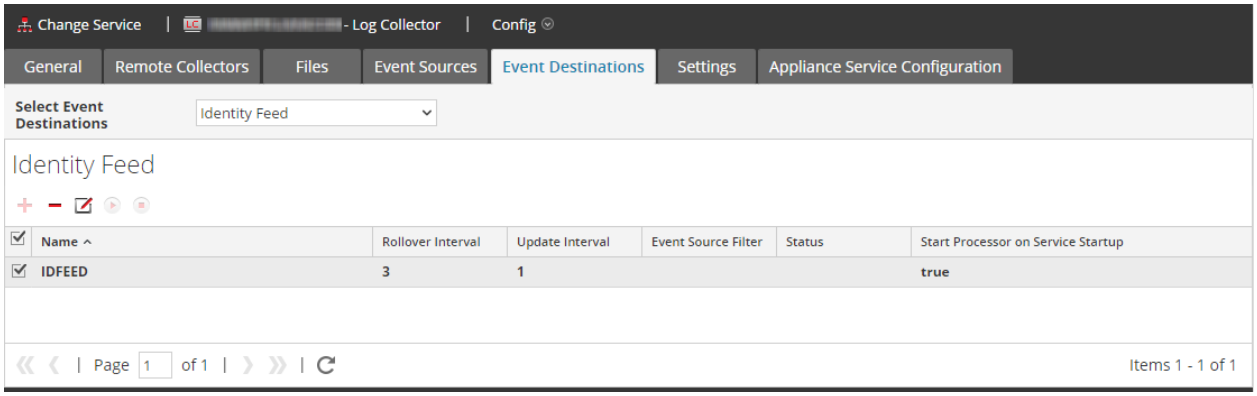
- See the **Create an Identity Feed** topic in the *Live Resource Management Guide.*

Quick Look

The Event Destinations tab of the Log Collection service Config view allows you to configure the destination of event data collected by the Log Collector.



The required permission to access this view is Manage Services.



To access the Event Destinations tab:

1. Go to **(Admin) > Services** .
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Destinations** tab.
5. In the **Select Event Destinations** drop-down menu:
   - Select **Log Decoder** to configure Log Decoder destinations for event data collected by the Log Collector.

     Note: You must select a Log Decoder service from the Add Log Decoder Destination dialog, but the remainder of the configuration is done automatically.

   - Select **Identity Feed** to configure an identity feed destination for event data collected by the Log Collector.

Log Collection Event Sources Tab

Use the Event Sources tab to configure the AWS (CloudTrail), Check Point, File, ODBC, SDEE, Logstash, SNMP, Syslog, SNMP, VMware, Windows, and Windows Legacy event sources.

To access the Event Sources tab, go to (Admin) > **Services** > select **Log Collection service** > **View** > **Config** > **Event Sources**) .

Workflow

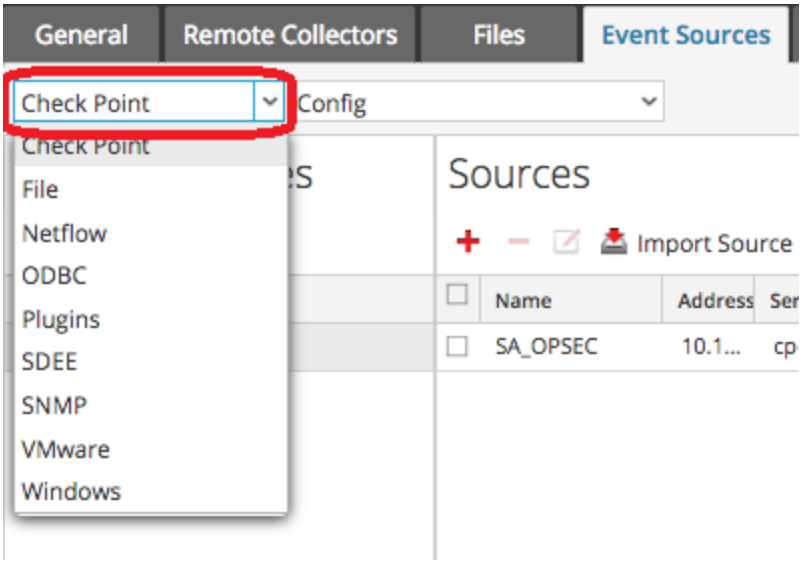
This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	Perform basic Log Collection implementation.	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

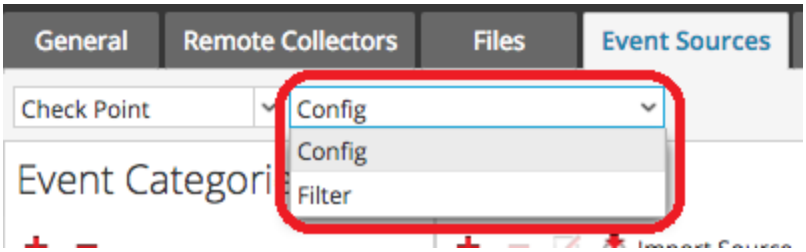
*You can perform this task here.

Related Topics



- Configure AWS (CloudTrail) Event Sources in NetWitness
- Configure Check Point Event Sources in NetWitness
- Configure File Event Sources in NetWitness
- Configure ODBC Event Sources in NetWitness
- Configure SDEE Event Sources in NetWitness
- Configure SNMP Event Sources in NetWitness

- Configure Syslog Event Sources
- Configure VMware Event Sources in NetWitness
- Configure Windows Event Sources in NetWitness
- Configure Logstash Event Sources in NetWitness
- Windows Legacy and NetApp Collection Configuration



Quick Look

The Config view has two drop-down menus:

- The left-most menu lists all of the available collection protocols.

- The right-most menu has two choices: **Config** and **Filter**.

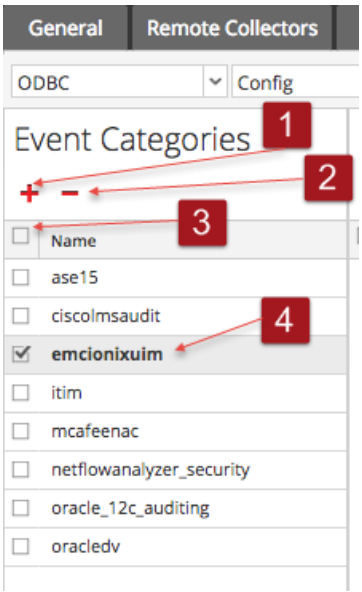
The Config view in the Event sources tab has two panels: Event Categories and Sources.

Note: For details on the Filter menu item, see Configure Event Filters for a Collector.

Event Source Types Menu

The Log Collector Event Sources tab has a two-box, drop-down menu in which you select the collection protocol and any supporting parameters for that protocol.

In the left box, you select one of the following protocols: Check Point, File, ODBC, Plugins, SDEE, SNMP, SNMP, VMware, Windows, and Windows Legacy.



In the right box, you select:

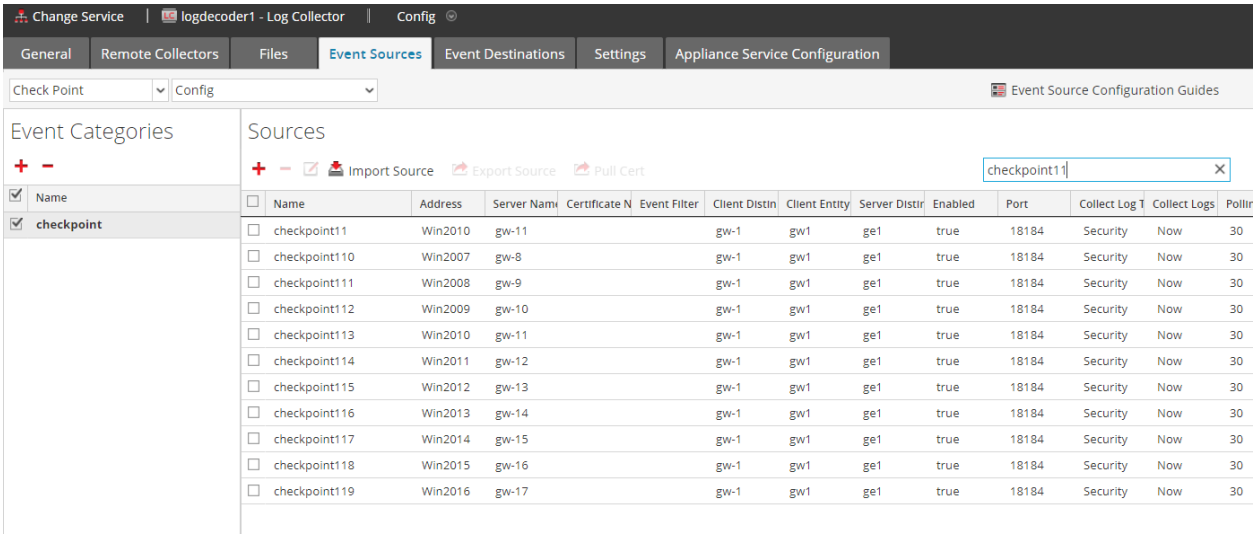
- Config to configure the generic event source parameters for the type you selected in the left drop-down. All generic Config panels have a toolbar with these options:
  - Add, Edit, and Delete
  - Import (also Import Source, Import DSN)
  - Export (also Export Source, Export DSN)
- For ODBC, SNMP, and Windows only:
  - For ODBC, DSNs to configure
  - For SNMP, SNMP v3 User Manager
  - For Windows, Kerberos Realm Configuration

Selecting an option displays a configuration panel where you configure the collection parameters for the event source. The configuration panels are slightly different for different event sources and are described separately.

Event Categories Panel

Once you select a collection protocol, the Event Categories panel is populated with all of the event sources that you have configured for that collection protocol. For example, the following image shows ODBC event sources that have been configured:

The Event Categories panel provides a way to add or delete event source types.



1	Displays the Available Event Source Types dialog from which you select the event source type for which you want to define parameters.
2	Deletes the selected event source types from the Event Categories panel.

3 Selects event source types.
4 Displays the name of the event source types that you have added.

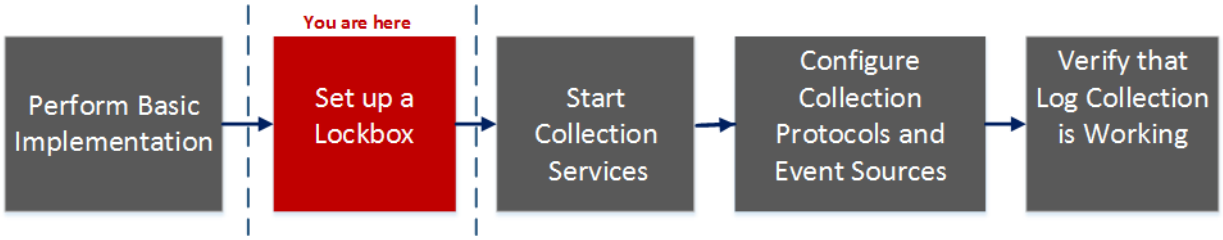
Sources Panel

The Sources panel lists the values of the parameters for the selected event source type. For details, see the individual collection protocol topics.

Below is an example of a list of Check Point event sources. Note that the result set has been limited to sources whose names contain the string **checkpoint11**.

Log Collection Settings Tab

Use the Settings tab to:



- Set up a lockbox
- Reset Stable System value
- Manage certificates

Caution: If the host name on which the Log Collector is installed is changed after installation, the Log Collector will fail to collect events from event sources. You must reset stable system values if the hostname changes.

To access the Log Collection Settings Tab, go to (Admin) > Services. In the Services grid, select a Log Collector Service. Click Actions menu cropped under Actions and select View > Config.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	Perform basic Log Collection implementation.	Basic Implementation
Administrator	*Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services

This is an example of the Settings tab.

Troubleshoot Log Collection

This topic describes the format and content of Log Collection Troubleshooting. NetWitness informs you of Log Collector problems or potential problems in the following two ways.

- Log files.
- Health and Wellness Monitoring views.

Junk Syslog Messages

The remote log collector has been made looser in regards to how it handles syslog messages. This was done to reduce the number of dropped messages due to missing parts of the header, or for other minor formatting errors. However, this might also allow syslog event messages that contain junk to get through the parser. If you see such messages in the system, you can add a syslog collection filter to remove events that are sending these messages.

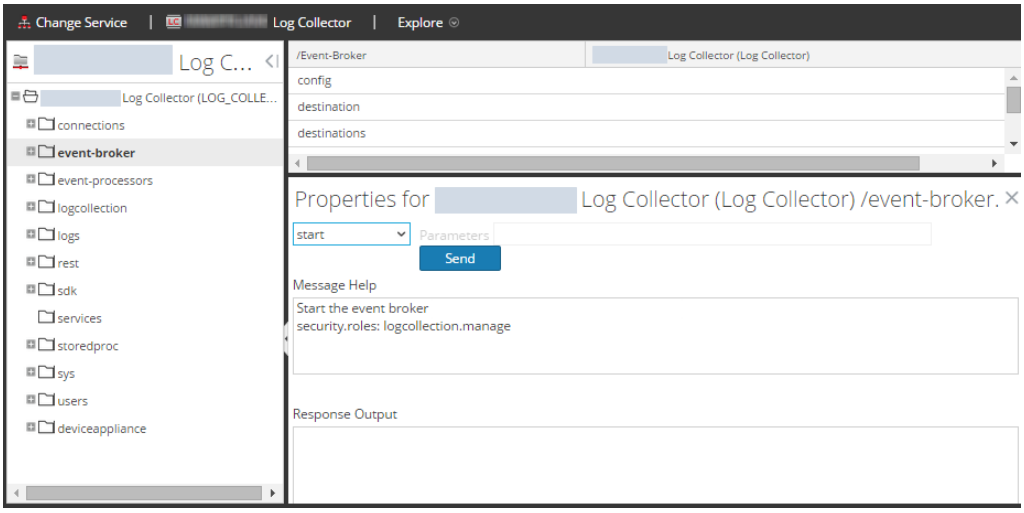
Log Files

If you have an issue with a particular event source collection protocol, you can review debug logs to investigate this issue. Each event source has a Debug parameter that you can enable (set parameter to On or Verbose) to capture these logs.

Caution: Only enable debugging if you have a problem with this event source and you need to investigate this problem. If you have Debug enabled all the time it will adversely affect the performance of the Log Collector.

Health and Wellness Monitoring

Health and Wellness monitoring makes you aware of potential hardware and software problems in a timely manner so that you can avoid to outages. NetWitness recommends that you monitor the Log Collector statistical fields to make sure that the service is operating efficiently and is not at or near the maximum values you have configured. You can monitor the following statistics (Stats) described in the  (Admin) > Health & Wellness view.



Sample Troubleshooting Format

NetWitness returns the following types of error messages in the log files for.

Log Messages	`timestamp failure (LogCollection) Message-Broker Statistics:...`
	`timestamp failure (AMQPClientBaseLogCollection):...`
	`timestamp failure (MessageBrokerLogReceiver):...`

Possible	The Log Collector cannot reach the Message Broker because the Message Broker:

Cause	• has stopped running • has erroneous connection settings

Solutions	1. `<use the="the" systemctl="systemctl" command="command" on="on" console="console" to="to" check="check" status="status" of="of" message="message" broker="broker" shell="shell" console.="console.">returns the following if the message broker is not running:</use>`
	`prompt$ systemctl status rabbitmq-server`
	`rabbitmq start/running, process 10916`
	2. Start the RabbitMQ Message Broker on event-broker node in the Explore view:
	

Troubleshooting Logstash

Issue	Unable to re-configure or edit the custom configuration in Logstash.
Possible Cause	While re-configuring the events source configuration, if you update the Event source host's IP and save it, Logstash still connects to the old IP. For example, suppose the Elasticsearch IP is not reachable due to some reason, and you updated the correct IP, but Logstash connects to the old IP (which is not reachable).
Solution	You must restart the Logstash service: `systemctl restart logstash`

Issue	NetWitness Export connector UI does not validate user aggregation permissions.
Possible Cause	Users without aggregation permission are also allowed to configure NetWitness Export Connector in the UI.
Solution	Make sure you configure the NetWitness Export Connector Event source with the right

	aggregation permissions.

Issue	NetWitness Export Connector UI does not validate user credentials.
Possible Cause	NetWitness Export Connector UI displays test configuration successful even if you have configured Export Connector without appropriate aggregation permissions.
Solution	Make sure you configure the NetWitness Export Connector Event source using the correct credentials.

Issue	Logstash event source test configuration fails with memory allocation an error "There is insufficient memory for JVM".
Possible Cause	Sometimes test configuration fails due to insufficient memory available for JVM.
Solution	You must change the JVM -xms to a lower value at `/etc/logstash/jvm.options`. Perform the following: 1. Go to `/etc/logstash/jvm.options` and change `-Xms8g` to a lower value as per the memory configuration of the appliance. 2. Restart the Logstash service using the following command: `service logstash restart`

Issue	Issue with Logstash Performance.
Possible Cause	If EPS is more than 25K, you must increase JVM to get better performance.
Solution	You must change the JVM -xmx to a higher value at `/etc/logstash/jvm.options`. Perform the following: 1. Go to `/etc/logstash/jvm.options` and update JVM to `-Xmx32g`. 2. Restart the Logstash service using the following command: `service logstash restart`

Log Parser Customization

Note: The JSON Mapping information in this guide applies to NetWitness Version 11.5 and later.

You use the Log Parser Rules view (available from the (Configure) view) to customize rules and to map meta for your log parsers.

The *default log parser* parses logs that do not match any installed log parsers. The information contained in such a log is processed against the default log parser's rules, and metadata is then extracted by those rules and is available for Enrichment, Investigation, Reporting, and Alerting. This provides immediate visibility into logs from custom or unsupported sources.

You can also add or extend a log parser. For example, you may need to parse certain fields differently than in the manner provided by the log parser for a particular event source. You can add rules that change the way meta information is extracted from the logs for the event source. And you can then map the extracted information to NetWitness meta keys.

Finally, you can view and test sample log messages and rules for your log parsers, including the default log parser.

To access this tab, go to **(Configure) > Log Parser Rules**. For more details, see Parser Rules Tab.

Dynamic Rules

The **Dynamic Rules** entry for a log parser displays the following information:

- The default log parser that parses logs that are not associated with a particular log parser
- Native XML-defined device parsers that have been extended with dynamic log parser rules, and
- User-created custom device parsers used to parse unsupported custom event sources

The dynamic parse rules are used to parse arbitrary values triggered by a literal token on the left hand side of the value in unstructured logs. Currently, this is used to parse name-value pairs.

Following are some examples (the token is in bold red):

```
src: 1.2.3.4
src = 1.2.3.4
src=1.2.3.4
Source address is 1.2.3.4
```

JSON Mapping

This allows you to parse JSON nodes from Logstash as well as Log Collection Plugins by mapping JSON nodes to an appropriate meta on which the value should be saved.

The **JSON Mappings** for a log parser displays the following information:

- Sample JSON Message - This allows you paste the log messages.
- The list of JSON Mappings: these are the names that represent the meta information.
- Details of each mapping: for each mapping, the display name, path, NetWitness meta key, and a text description.

The JSON mapping functionality is for strictly paring structured JSON logs, and mapping values from the log to meta or fine parsing. The parsing is not applied to arbitrary logs; only logs where we know the exact structure of the data.

For example:

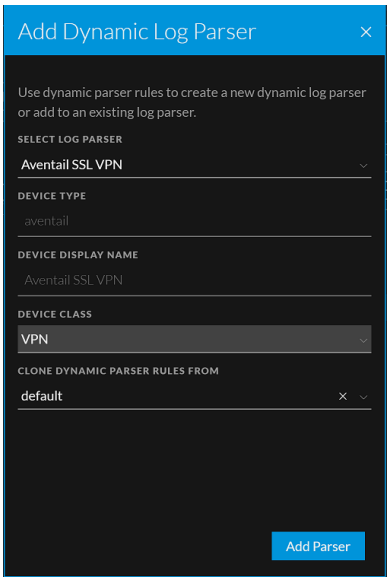
```
{ "event": { "source": { "address": "1.2.3.4", "port":8080 } } }
```

NetWitness knows the structure of logs when it knows the event source type, or when you add specific JSON mappings.

Add or Delete a Log Parser

Note: The information in this topic applies to NetWitness Version 11.2 and later.

For version 11.2, NetWitness has added the ability to add log parsers through the UI. You can also delete log parsers, as long as they have never been deployed to a Decoder. You can create a new log parser definition from scratch, or extend an existing one.



You can add a log parser to extend the functionality for an existing parser. For example, if you have some unknown messages for the Cisco Pix parser, you could add rules to match your unknowns.

IMPORTANT: If you are adding a new log parser, for example when onboarding an event source, you must map the event source IP to the new log parser in order for messages to be parsed. For details, see "Acknowledging and Mapping Event Sources" in the *Event Source Management User Guide*.

Add a Log Parser

1. In the NetWitness UI, navigate to **(Configure) > Log Parser Rules**.
2. From the **Log Parsers** pane, click **Add Parser**.

   The Add Dynamic Log Parser dialog box is displayed.

3. Fill in details for this dialog box. For details, see Add Dynamic Log Parser Parameters below.
4. Click **Save** to save the new log parser.

   This updates the definition file in the file system. It *does not* deploy the changes.
5. To deploy your changes to all of your Decoders, click **Deploy**.

Delete a Log Parser

You can use the UI to delete a log parser.

To delete a log parser:

1. In the NetWitness UI, navigate to **(Configure) > Log Parser Rules**.
2. From the **Log Parsers** pane, select a log parser, then click **Delete**.

   Delete Parser dialog box is displayed.
3. Click **Delete Parser** to remove the log parser from the system.

Note: If you have encounter any issues when you attempt to delete a parser, see the Troubleshooting section, Delete a Log Parser Manually.

Add Dynamic Log Parser Parameters

When you are adding a log parser, the following parameters are available.

Field	Details
SELECT LOG PARSER	Select NEW, or choose an existing log parser. By choosing an existing log parser, you can add rules to that parser, essentially extending its parsing capabilities. **Note:** If you select an existing log parser, the remaining fields are auto-filled based on the values for selected log parser.
DEVICE TYPE	Enter a string to define the device type. The name must be between 3 and 30 alphanumeric characters (including underscores), and must not match the name of any existing log parsers.
DEVICE DISPLAY NAME	Enter the display name for the log parser. **Note:** The display name must be 64 characters or fewer, and must not match the name of any other device display name.
DEVICE CLASS	Select a device class.
CLONE DYNAMIC PARSER RULES FROM	Leave blank to start with no rules, or select one of the existing log parsers to clone its rules.

Import or Export a Log Parser

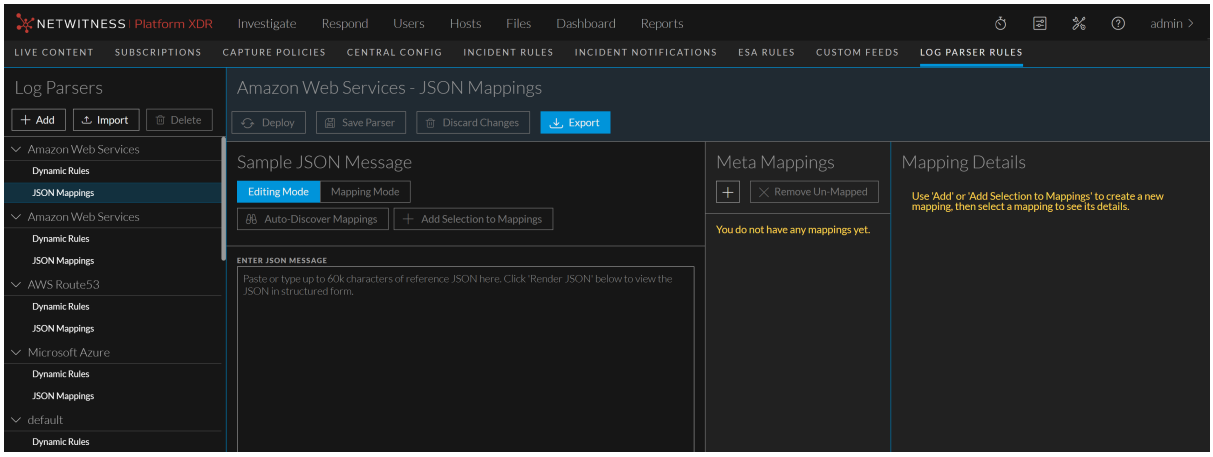
To import the log parser:

1. In the NetWitness UI, navigate to **(Configure) > Log Parser Rules**.
2. From the **Log Parsers** panel, click **Import**.

3. Select a log parser to import.
   The log parser is imported successfully. This will import the selected log parser rules along with the JSON mapping (if any).

To export the log parser:

1. In the NetWitness UI, navigate to  **(Configure) > Log Parser Rules**.
2. Select the log parser to export.
3. In the **Log Parsers** panel, click **Export**.
   The selected parser is exported successfully in a .json format. This will export the selected log parser rules along with the JSON mapping (if any).



JSON Mappings

JSON mappings is applicable from version NetWitness Platform 11.5 and Later.

View JSON Mappings

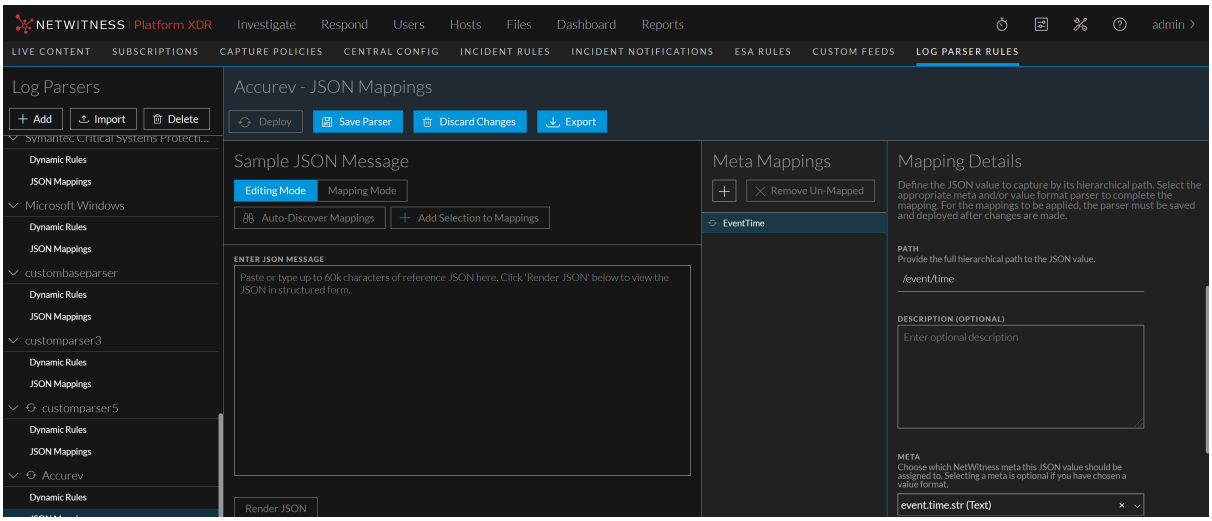
1. In the NetWitness UI, go to **(Configure) > Log Parser Rules**.
2. From the Log Parsers pane, select a parser, then click JSON Mappings.

   The JSON Mappings and Mapping Details are shown for the parser you selected.

The Mapping Details pane displays the following information.

Field	Details
DISPLAY NAME	This name corresponds to the name displayed in the JSON Mappings panel.
PATH	The path to where the values for this portion of the log are stored.
DESCRIPTION	Optionally, you can enter a text description for this mapping.
META	Select a meta key to which this value from the log is mapped. Select a value from the drop-down menu. Optional if you choose a Value Format.

Field	Details
VALUE FORMAT	Choose a value format parser onto which to pass this JSON value. You can either select an existing meta or **Custom Regex Type**. If you select custom regex type, you must define the regex and capture to *fine* parse the value in the meta. Optional if you choose a Meta.
CUSTOM REGEX TYPE	Select Custom Regex Type from the Value Format drop-down, which allows you to add new custom regex type.
REGEX PATTERN	Specify a regex to identify different pieces of data contained within a JSON node value.
FIRST CAPTURE	Select a meta key that should be captured first based on the value defined in the Regex pattern.
ADD A CAPTURE	New capture field is added. By default, it is loaded with meta keys in the drop-down. You can add maximum of 20 captures and this option will be disabled once it reaches maximum.



Note: You need to select a meta or enter a Value Format, but you do not need to fill in values for both settings.

Add a JSON Mapping

After you add a parser, as described in Add a Log Parser, you can then add JSON mappings.

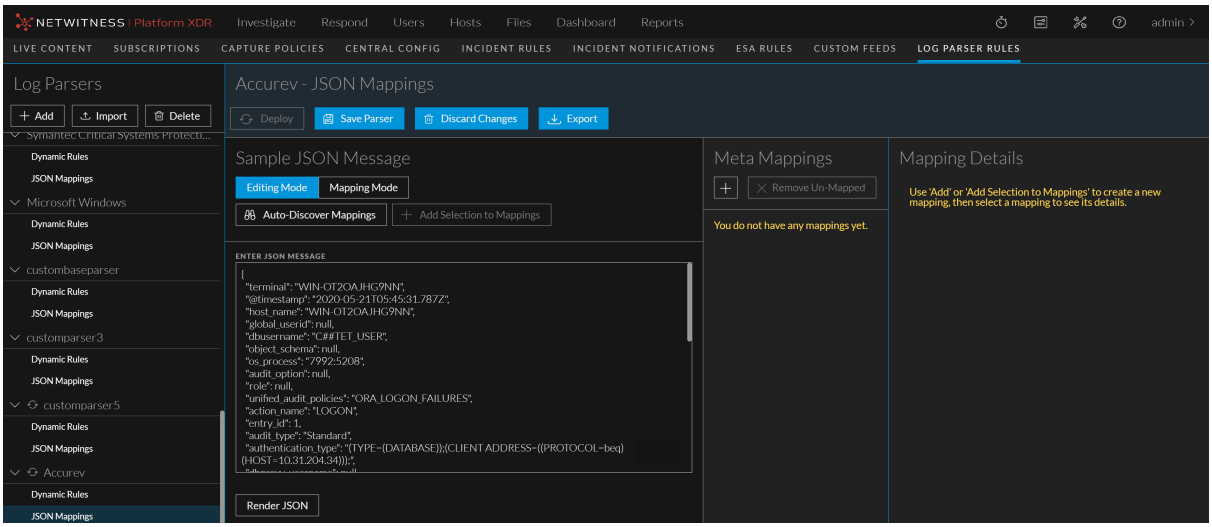
1. Follow the procedure to add a parser.
2. Select the **JSON Mappings** entry for the newly-added parser.

   The following screen shows an example where an Accurev is added:

3. Click **Add New** to begin adding a mapping.
4. Enter values for display name, path, meta or value format (or both), and (optionally) a description.
5. Click **Save Parser** to save your new mapping.

Auto Discover JSON Mappings

Beginning with NetWitness version 11.5.1, you can automatically create the mappings without the need to manually enter the name and path of the mapping.



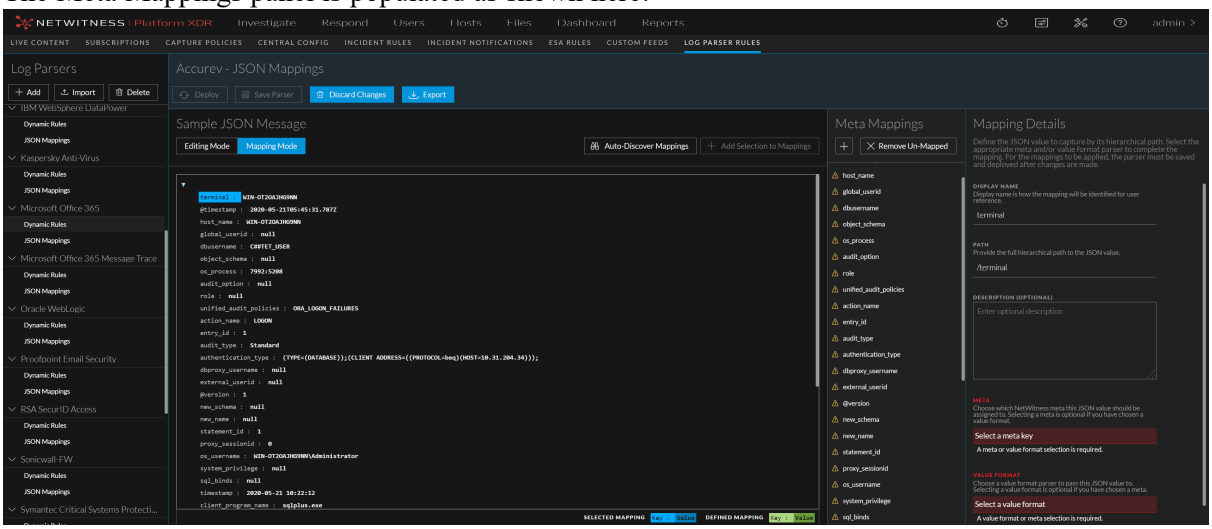
As an example, we are using the following JSON log:

```
{"terminal":"WIN-OT2OAJHG9NN","@timestamp":"2020-05-21T05:45:31.787Z","host_
name":"WIN-OT2OAJHG9NN","global_userid":null,"dbusername":"C##TET_
USER","object_schema":null,"os_process":"7992:5208","audit_
option":null,"role":null,"unified_audit_policies":"ORA_LOGON_
FAILURES","action_name":"LOGON","entry_id":1,"audit_
type":"Standard","authentication_type":"(TYPE=(DATABASE));(CLIENT ADDRESS=
((PROTOCOL=beq)(HOST=10.31.204.34)));","dbproxy_username":null,"external_
userid":null,"@version":"1","new_schema":null,"new_name":null,"statement_
id":1,"proxy_sessionid":0,"os_username":"WIN-
OT2OAJHG9NN\\Administrator","system_privilege":null,"sql_
binds":null,"timestamp":"2020-05-21 10:22:12","client_program_
name":"sqlplus.exe","sessionid":4125005309,"userhost":"WORKGROUP\\WIN-
OT2OAJHG9NN","rman_device_type":null,"object_name":null,"event_timestamp_
utc":"2020-05-20T23:22:12.452Z","system_privilege_used":null,"return_
code":1017,"version":"19.0.0.0.0","instance_name":"orcl","sql_
text":null,"target_user":null,"fga_policy_name":null,"rman_object_
type":null,"dbid":1566661212,"rman_operation":null}
```

To auto-discover JSON mappings:

1. Select the **JSON Mappings** entry for the appropriate parser.
2. Paste JSON formatted log message in to the **Sample JSON message** text box, and click **Render JSON**.

The screen looks like this:



Rendering JSON in Editing Mode allows you to view and edit (if needed) the logs in a pretty format. Additionally, if your text is not valid JSON, the text field is displayed in red.

3. Click **Mapping Mode**, to view the JSON in a collapsable tree format which also highlights the mapping.

Note: In **Mapping mode**, you cannot edit the sample Log.

4. Click **Auto-Discover Mappings** to discover the JSON nodes and create mappings.

The Meta Mappings panel is populated as shown here:

5. After you auto-discover, note that all the mappings are invalid (preceded by this icon: ⚠). You cannot save your changes until all the mappings are valid (mapping is preceded by this icon: 🔄) or removed.

Note:
The meta value is highlighted in blue if it matches the selected mapping including the regex (if used).
The meta value is highlighted in green if it matches any other mappings that are not selected.

6. To make a mapping valid, you need to select a **Meta Key** or **Value Format** for all the mappings that you want to parse and save.

Note: In the **Value Format** you can either select an existing meta or **Custom Regex Type**.

7. If you want to *fine* parse the value in the meta in the **Value Format** drop-down, select **Custom Regex Type** and enter the regex in the **Regex Pattern** field. For example,`\s*(\b(?:[0-9]{1,3}\.){3}[0-9]{1,3}\b):?(\d*).`

Note: The custom regex will be added to the database, when you **Save Parser**.

8. For a value in the Regex, you can select a meta key and store the capture as below:
   - **First capture**: The first portion of the string, up to the period character is stored to the meta key. For example, `ip.src`
   - To add more capture, click **Add Capture** and select the meta key.
     For more information on Regex, see Regex Values.
9. If there are mappings that you do not want to save, you can select the mapping and click **Delete**. Alternatively, after you complete all of the mappings that you want to keep, you can click **Remove Unmapped** to remove all mappings that you have not yet validated.
10. After you have either completed or removed all of your mappings, click **Save Parser** to save your new mappings. Note that the icon preceding each mapping is removed.

Deploy JSON Parser

You need to deploy a JSON parser so that logs coming in to any decoder are parsed appropriately and meta is generated and stored correctly.

To deploy a parser, select it from the list and click **Deploy**. The parser, its dynamic rules, and its mappings are sent to all Log Decoders.

Note: A JSON parser must have at least one rule or mapping to enable deployment.

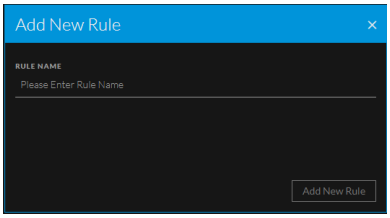
Add or Delete a Log Parser Rule

Note: The information in this topic applies to NetWitness Version 11.2 and later.

For version 11.2, NetWitness has added the ability to create custom rules for log parsers. You can create rules to change how meta values are parsed for a particular log parser. Prior to version 11.2, you could only view the out-of-the-box log parser rules.

About Log Parser Rules

Parsers are described within their XML files. Each log parser has an XML file that contains rules on how to parse messages for that parser. The out-of-the-box rules are contained within these XML files. For details, see the Log Parser Customization topic in the Link space for NetWitness Content.



Custom Log Parser Rules

When you create a new log parser rule, it is saved to another XML definition file for the parser. These files are known as token files. This is important, since the out-of-the-box rules are overwritten if you update the parser through Live, but any custom log parser rules are not overwritten, since Live does not update the token files for log parsers.

To create a custom log parser rule:

1. In the NetWitness UI, navigate to (Configure) > **Log Parser Rules**.
2. From the **Log Parsers** pane, select a log parser, then **Dynamic Rules**.
3. From the **Rules** pane, click **Add Rule**.

   The Add Rules dialog box is displayed.

IMPORTANT: If you click outside of the Add Rule dialog box before you save your rule, your changes will be lost.

4. Enter a name for the new rule, and click **Add New Rule**.
5. Add at least one meta key and a value to match, in order to create a valid rule.
6. Click **Save** to save your new rule.

   This updates the definition file in the file system. It *does not* deploy the changes.
7. To deploy your changes to all of your Decoders, click **Deploy**.

Guidelines for Custom Rules

When you are creating a custom rule, keep in mind the following:

- For the list of tokens that match strings from the log file, very short tokens are not useful. For example, a one- or two-character string can match more items than desired.
- Remember to add the delimiter (especially if it is a space) as part of the token. For example "domain=" or "email ".
- When constructing regular expressions, the more complexity you add, the more performance overhead added to the system to compare against the rule.
- To see examples of good tokens and regular expressions, examine the rules that are provided for the default log parser.

Default Log Parser and Log Parser Rules

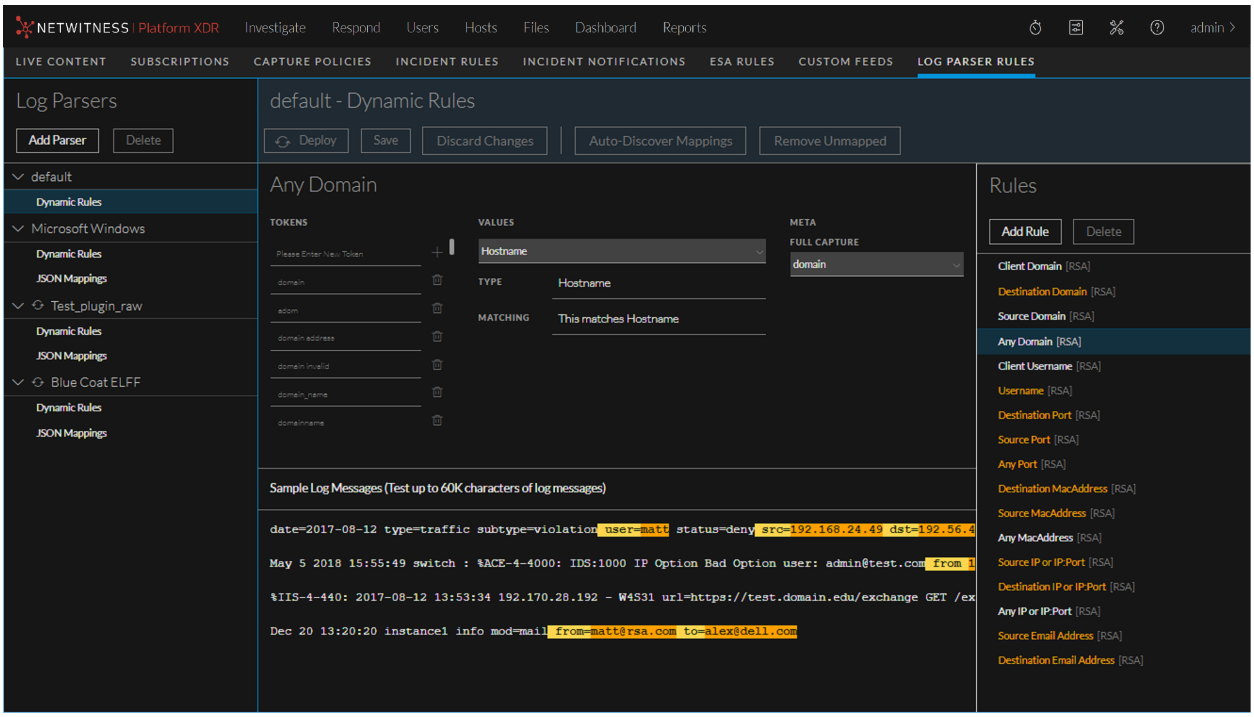
Note: The information in this topic applies to NetWitness Version 11.1 and later.

This tab displays information about pattern matching and rules for the parsers in your system. The features on this tab apply to all log parsers, including the Default Log Parser.

Default Log Parser

The NetWitness default log parser is used to parse logs coming from the Log Decoder that do not match any of the configured log parsers. This default parser parses these logs by using a default set of rules and tokens.

You can view the default log parser and its details by going to **Admin > Event Sources > Log Parser Rules** and selecting **default** from the Log Parsers panel.



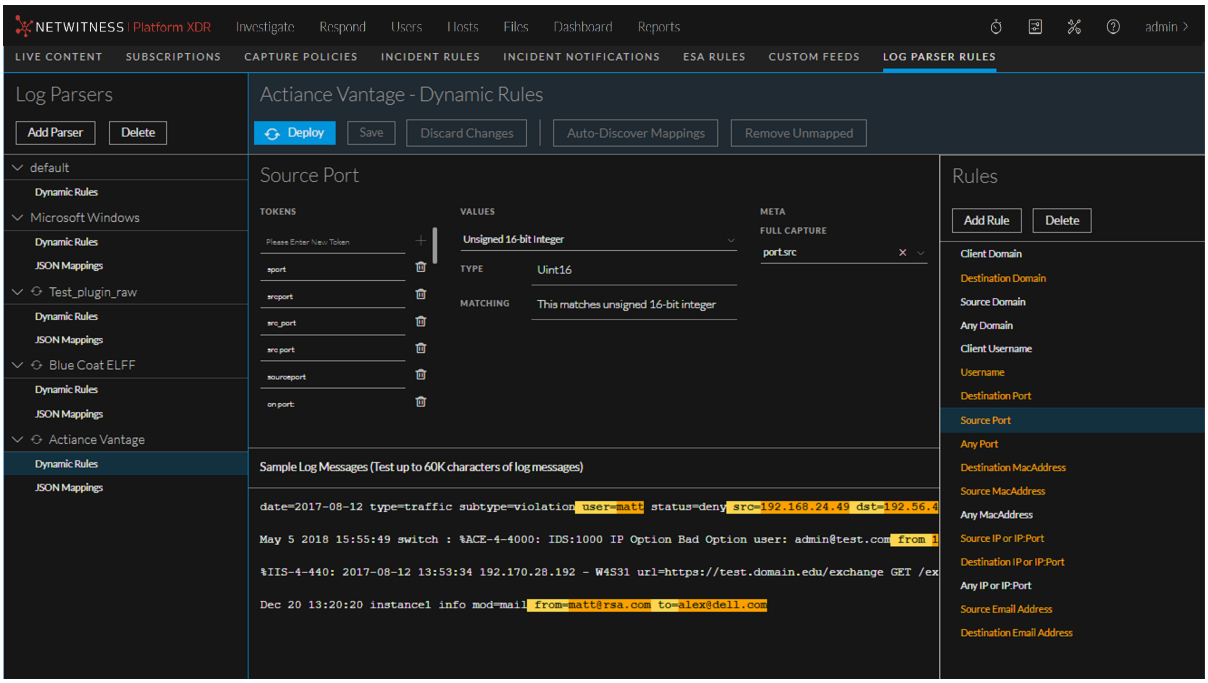
Note: If you do not see the default log parser and its rules, you might need to go to Live and deploy the Content to your log decoders. Additionally, you must have at least one Log Decoder at version 11.2 to view the default log parser.

You can view the default log parser and its details, depending on your version:

- For NetWitness version 11.1, go to **Admin > Event Sources > Log Parser Rules**, then select **default** from the Log Parsers panel.
- For NetWitness version 11.2 and later, go to **Configure > Log Parser Rules**, then select **default** from the Log Parsers panel.

Note: The list of log parsers is based on the first Log Decoder that is installed or registered by the Orchestration Server. If you have more than one Log Decoder, this tab only lists log parsers that have been configured on the first one.

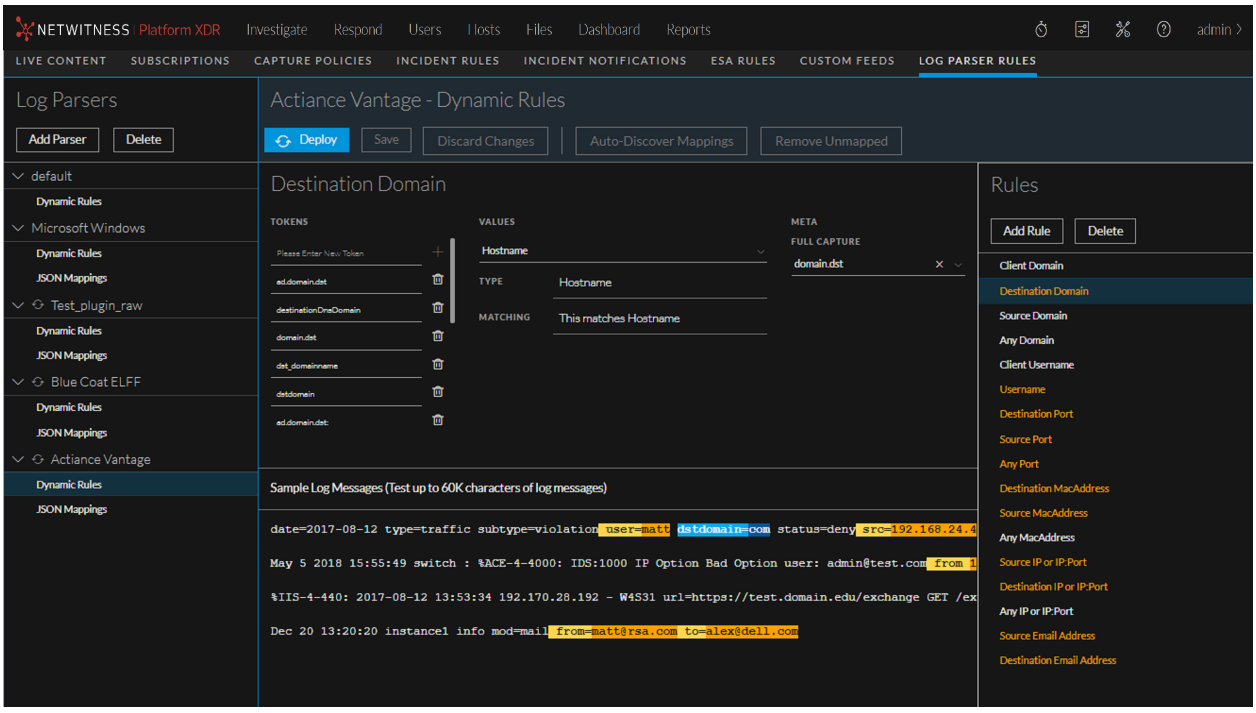
This is a view of the Log Parser Rules tab, showing the **Default Log Parser** and **Any Domain** rule selected:



The Parser Rules Tab topic describes the items available for the Log Parsers tab.

Highlight Matching Patterns

You can paste logs into the Log Messages text box, and the system highlights the matching literals and patterns for the rules for the selected event source type. Use this feature to confirm that the parser is behaving as expected.



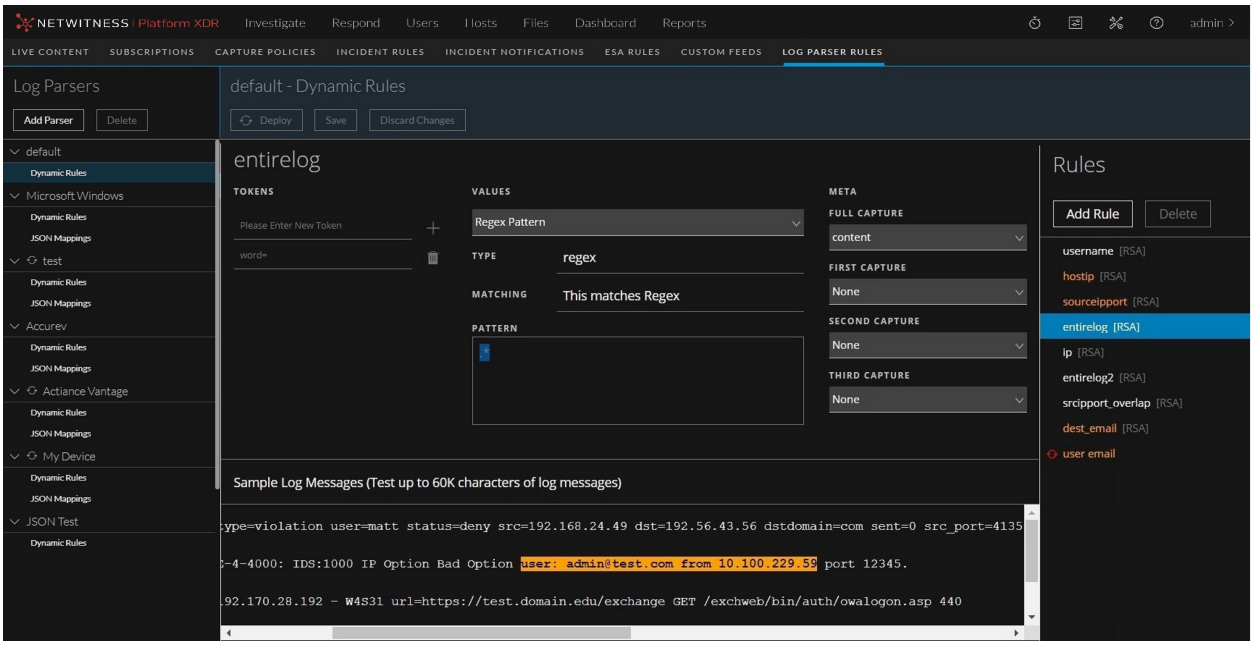
1. In the NetWitness UI, navigate as follows, depending on your version:
   - For NetWitness version 11.1, go to **Admin > Event Sources > Log Parser Rules**.
   - For NetWitness version 11.2 and later, go to  **(Configure) > Log Parser Rules**.
2. From the **Log Parsers** pane, select the **Dynamic Rules** entry for a log parser.
3. From the **Rules** pane, select a rule.

   For example, this screen shows the **Source Port** rule for the **Actiance Vantage** log parser:

4. Add text or paste in a sample log message.

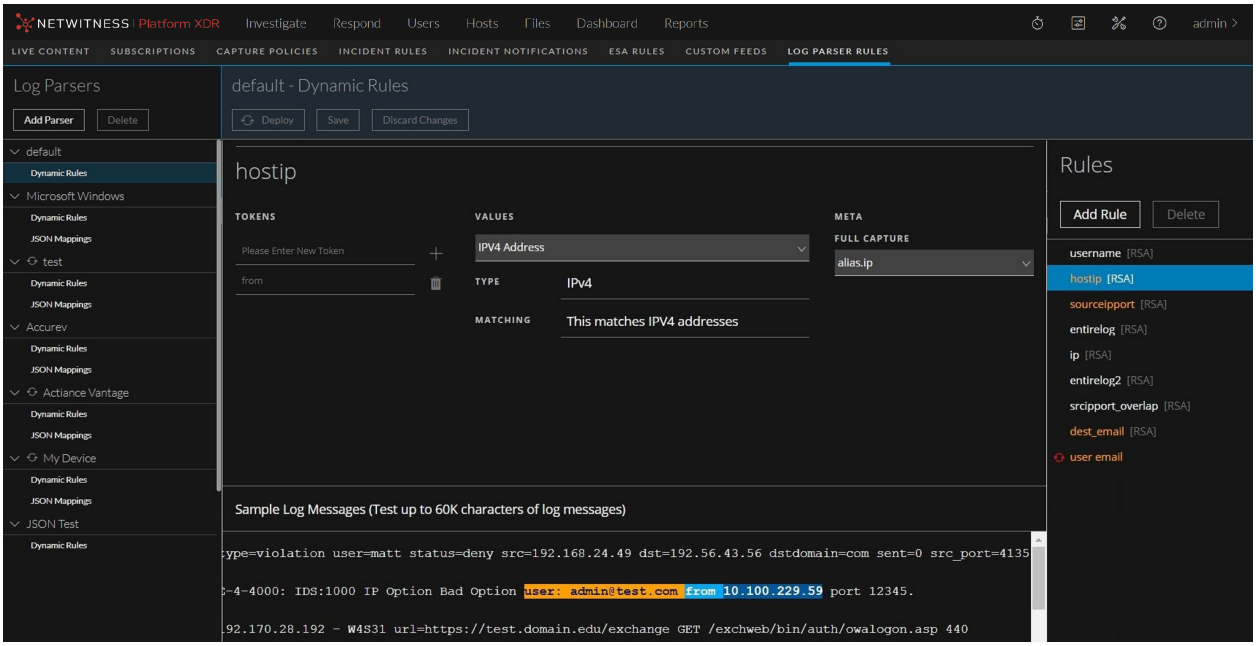
Strings that match tokens for the selected rule are highlighted in blue. Strings that match other rules for the parser (and the rules themselves) are highlighted in orange.

For example, in the previous screen, note:



- The destination domain address, matching the **dstdomain** token, is highlighted in blue. The token is in dark blue, and the matching string is highlighted in light blue. This is because the **Destination Domain** is the currently selected Rule.
- The strings highlighted in orange match tokens for rules for **Username**, **Source IP or IP:Port**, **Destination IP or IP:Port**, **Source Port**, **Source Email Address**, and **Destination Email Address**. This is because they are in rules for the default parser that are not currently selected.

Highlight Overlapping Patterns



When you have patterns that overlap rules (that is, one pattern matches more than one rule), the behavior is as follows:

- The pattern is displayed in a single color (yellow)
- When you select one of the matching rules, the exactly-matched pattern is displayed in light and dark blue

For example, the pattern `user: admin@test.com from 10.100.229.59` matches several rules.

When you select the **hostip** rule, the highlighting that matches only this rule is shown in dark and light blue.

Use Cases

This topic describes the procedures you use to either on board a new event source, or to extend the parsing capabilities for an existing log parser.

Use Case 1: On Board a New Event Source

In this case, a customer has an event source and wants to add it into the NetWitness. Perform the following tasks:

I. For your event source, get examples of the logs.

II. In the **CONFIGURE > Log Parser Rules** view, add the Log Parser.

III. From your sample logs, paste applicable sections into the Sample Log Messages section of the **Log Parser Rules** screen.

IV. Use the sample area to understand which items are being parsed by the current parser, and note the items that are not being parsed.

V. For anything that is not currently being parsed, add rules.

- If the new rules apply to all parsers, you can add them to the Default parser.
- If not, add them only to the new log parser you are creating.

VI. Save the new rules, and deploy them to all Log Decoders.

VII. Map the IP address for the newly added event source to the newly-created log parser. For details, see "Acknowledging and Mapping Event Sources" in the *Event Source Management User Guide*.

Use Case 2: Modify an Existing Parser

In this case, a customer wants to parse some items from the logs that are not currently being parsed by the existing log parser. Perform the following tasks:

I. For your event source, get examples of the logs.

II. In the **CONFIGURE > Log Parser Rules** view, add the Log Parser.

III. From your sample logs, paste applicable sections into the Sample Log Messages section of the **Log Parser Rules** screen.

IV. Use the sample area to understand which items are being parsed by the current parser, and note the items that are not being parsed.

V. For anything that is not currently being parsed, add rules.

VI. Save the new rules, and deploy them to all Log Decoders.

For a detailed walk through of some of the steps in these use cases, see Extend an Existing Log Parser Example.

Extend an Existing Log Parser Example

Note: The information in this topic applies to NetWitness Version 11.2 and later.

Parse Rules can be used to parse unknown logs from existing devices. If a log is identified as a particular type (**device.type** is populated), and is not already being parsed (**msg.id** is not populated), then Parse Rules can be added to pull out relevant data from these logs.

If the neither **device.type** nor **msg.id** are populated for the logs from an existing device, then you need to map the device before Parse Rules can be processed against these logs.

Note: If a log message is already being parsed (**msg.id** is populated) then Parse Rules will not be processed against that log.

Task Overview

In this example, a customer wants to parse some items from the logs that are not currently being parsed by the existing log parser. Perform the following tasks:

I. For your event source, get examples of the logs.

II. In the CONFIGURE > Log Parser Rules view, Add the Log Parser

III. From your sample logs, paste applicable sections into the Sample Log Messages section of the **Log Parser Rules** screen.

IV. Use the sample area to understand which items are being parsed by the current parser, and note the items that are not being parsed.

V. For anything that is not currently being parsed, add rules as described in Add Rules and Deploy.

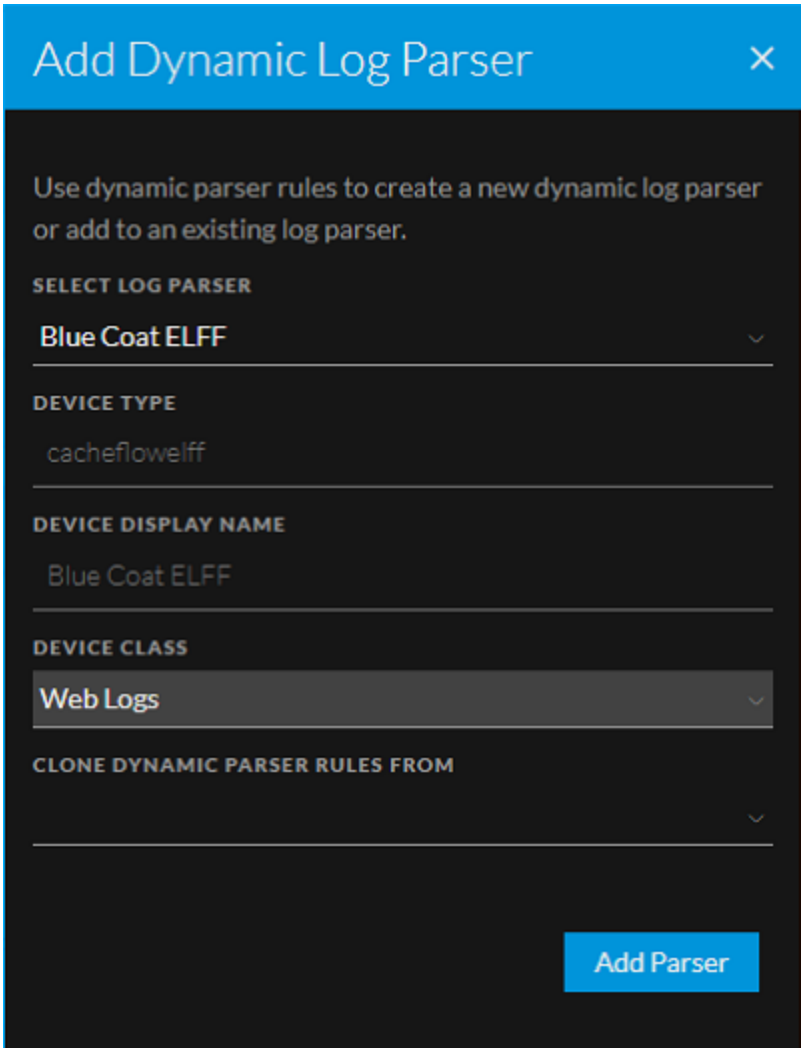
VI. Save the new rules, and deploy them to all Log Decoders.

Notes

Note: All the procedures in the topic use the CONFIGURE > Log Parser Rules view.

In the Log Parser Rules tab, you may see the Refresh icon () next to an item. This indicates that the item has undeployed changes.

Add the Log Parser



The first step in the process is to add a log parser, based on an existing log parser that you want to customize.

To add a log parser

1. In the NetWitness menu, navigate to **(Configure) > Log Parser Rules**.
2. In the Log Parsers panel, click **Add Parser**.

   The Add Dynamic Log Parser dialog box is displayed.
3. In the **SELECT LOG PARSER** field, select the existing parser to extend. In this example, we use Blue coat ELFF.

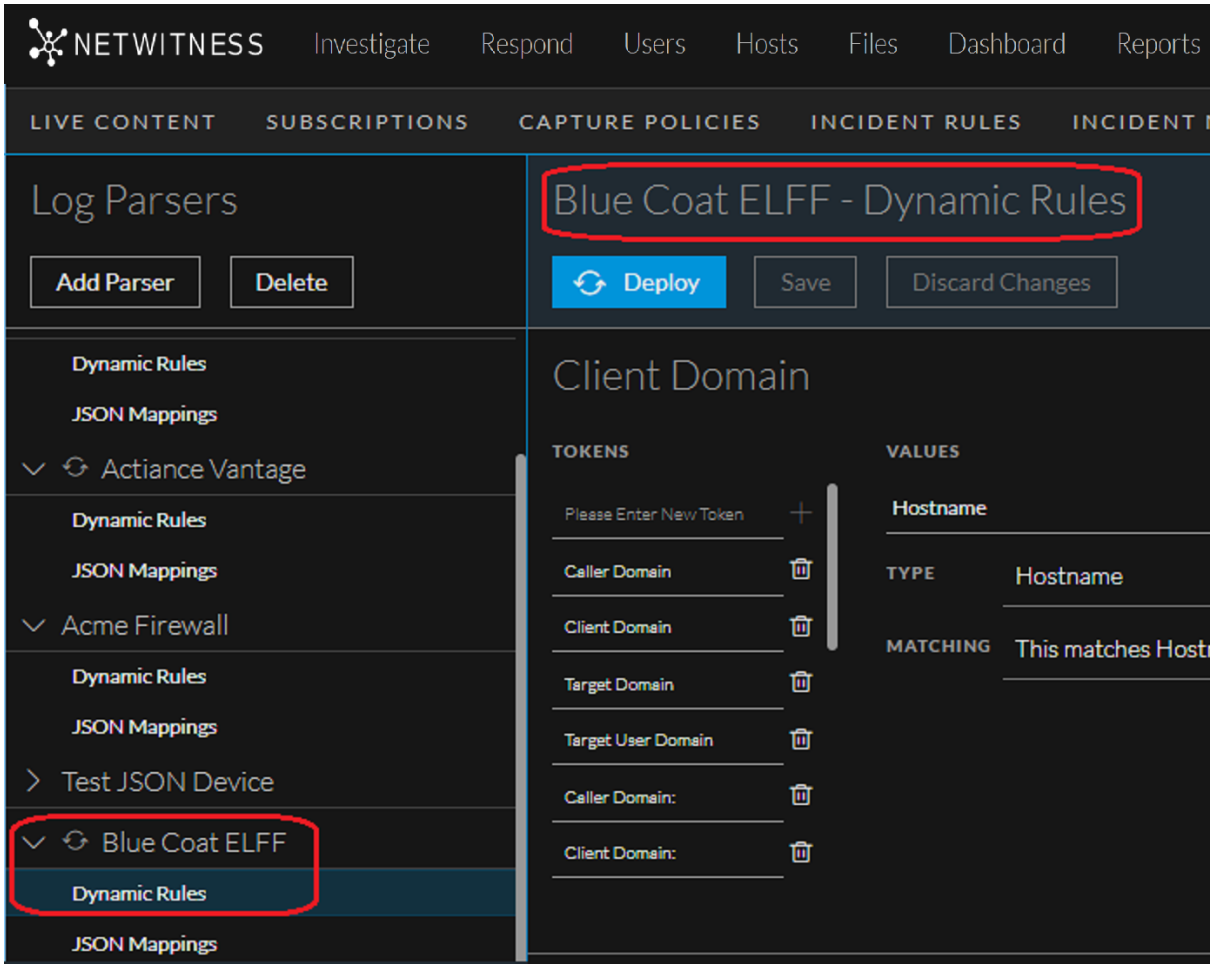
   Note: Values for Device Type, Device Display Name, and Device Class are filled in automatically, based on the log parser you selected.

   You can clone the rules from any of your existing parsers, including the **default** parser. For simplicity, in this example we leave this field blank: thus, only the rules we create are added to the new parser.
4. Click **Add Parser** to create the new parser.

The new parser is listed in the Log Parsers panel. Note the symbol next to the new parser—this indicates that your changes have not yet been saved.

About Custom Rules

When you create a new log parser rule, it is saved to an XML definition file for the parser. These files are known as token files. This is important, because the built-in rules are overwritten if you update the parser through Live, but any custom log parser rules are not overwritten, since Live does not update the token files for log parsers.



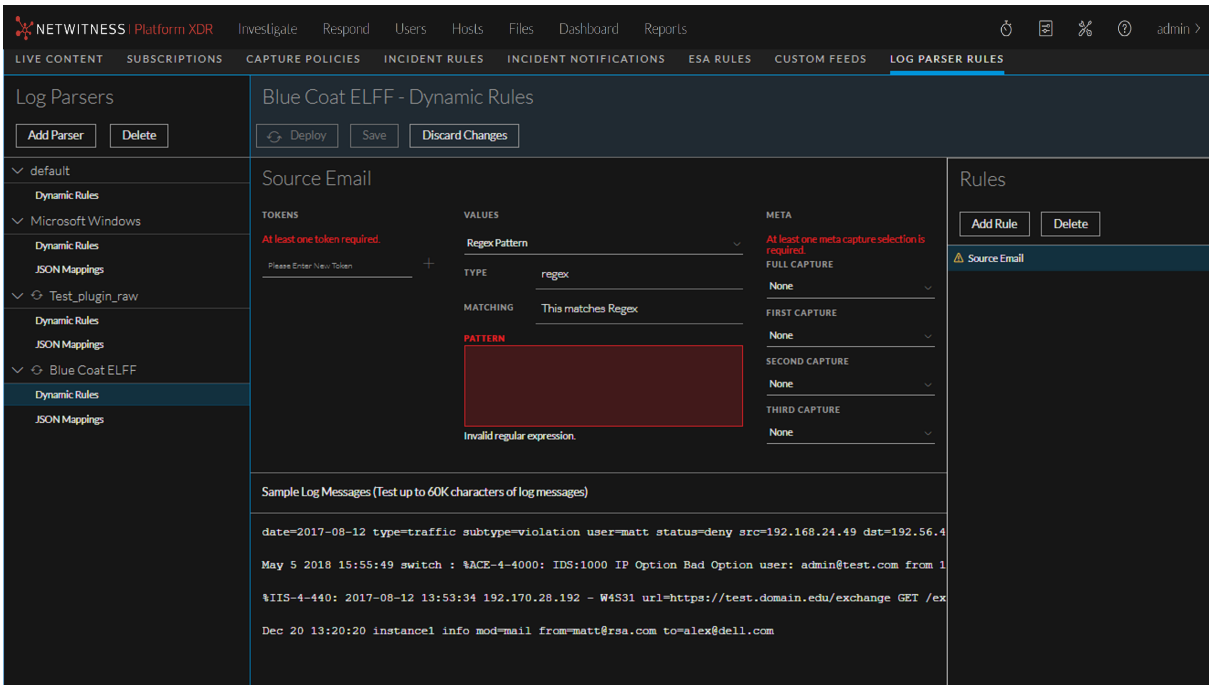
Add Rules and Deploy

After you have added the parser, the next step is to add one or more rules.

For example, you know that your log messages have some email addresses that follow a "source_mail" string. You could add the following rule to parse these strings:

IMPORTANT: If you click on another parser in the **Log Parsers** panel, before you save your rule, your changes are lost.

1. Make sure the Dynamic Rules entry for the Blue Coat ELFF parser is selected.



2. In the Rules panel, click **Add Rule**.

   The Add New Rule dialog box is displayed.

3. Enter a name for the rule, and click **Add New Rule**.

   The center panel is updated to reflect that you are working on a new rule.

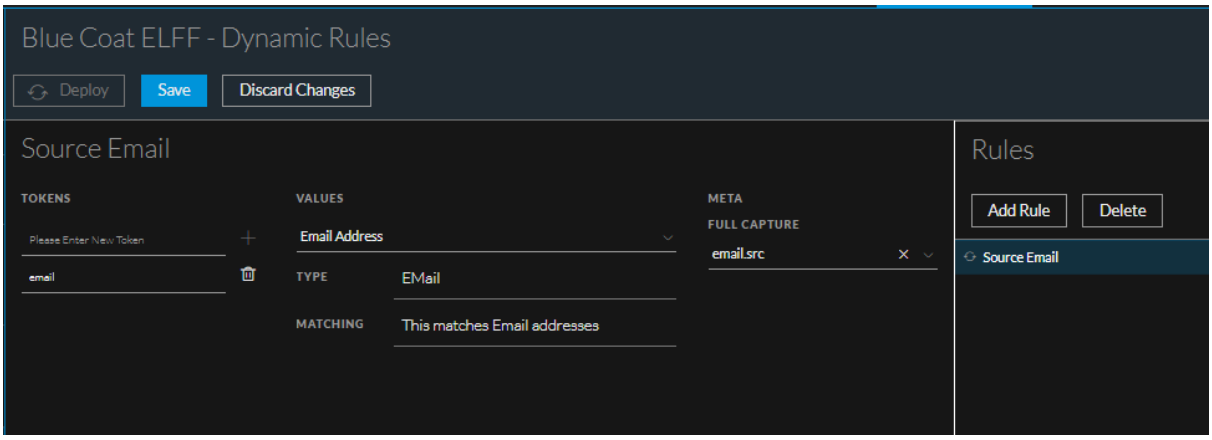
In the TOKENS section, enter a string for the token that you want to match, then click +.

In this example, we entered **email** .

Note: Make sure to include a delimiter for your token. For example, in this case, the token consists of 6 characters: the string "email," and then a space. Some tokens might use a colon, semicolon, or some other character as the delimiter, but it can be easy to forget to add the space character when that is the delimiter.

4. You can enter more tokens, or continue to add values.
5. In the VALUES section, choose the value for the rule. If you choose to match a Regex Pattern, you need to enter the pattern in the PATTERN field. Other values do not require any options.

   In this example, we selected **Email Address**.



6. In the META section, click  to select a meta key to which the rule stores its information. Some notes:

   - Enter characters to filter the list of available meta keys.
   - For Regex values, you can select "pieces" of the value, and store each piece to its own meta key.

Note: If any new meta keys are added to the Log Decoder, they do not appear in the list of Meta immediately. They appear automatically after 24 hours, or you can restart the **content server** service to view them.

In this example, we selected the **email.src** meta key.

The following image shows an example rule:

7. Click **Save** to save the rule. Repeat this procedure to continue adding rules.
8. After you have added all of your rules, click **Deploy** to deploy the new parser to your Log Decoders. Some notes about deploying rules:
   - You deploy an entire set of rules for a parser. That is, you can continue adding rules for a specific parser until you have all of your rules, and then you can deploy them all at once.
   - After you deploy a custom parser, you can no longer delete it. You can only delete parsers that you have not yet deployed.

Note: In this example, we extended an existing log parser. However, if you are creating a new log parser for a new event source, make sure to map the new log parser to the IP address of the event source, as described in "Acknowledging and Mapping Event Sources" in the *Event Source Management User Guide*.

Regex Values

Custom Log Parser Rules can match regular expression patterns. If you select a Regex pattern for your Value, you can capture the entire matched token, or sections of it:

- Full capture: the entire matched string is stored to your selected meta key.
- First capture: the first portion of the string, up to the period character, is stored to the meta key.
- Second capture: the second portion of the string, starting after the first period character, is stored to the meta key.
- Third capture: the third portion of the string, starting after the second period character, is stored to the meta key.

You can choose any or all four of these captures, depending on the token you are matching.

For example, we examine the **Source IP or IP:Port** rule:

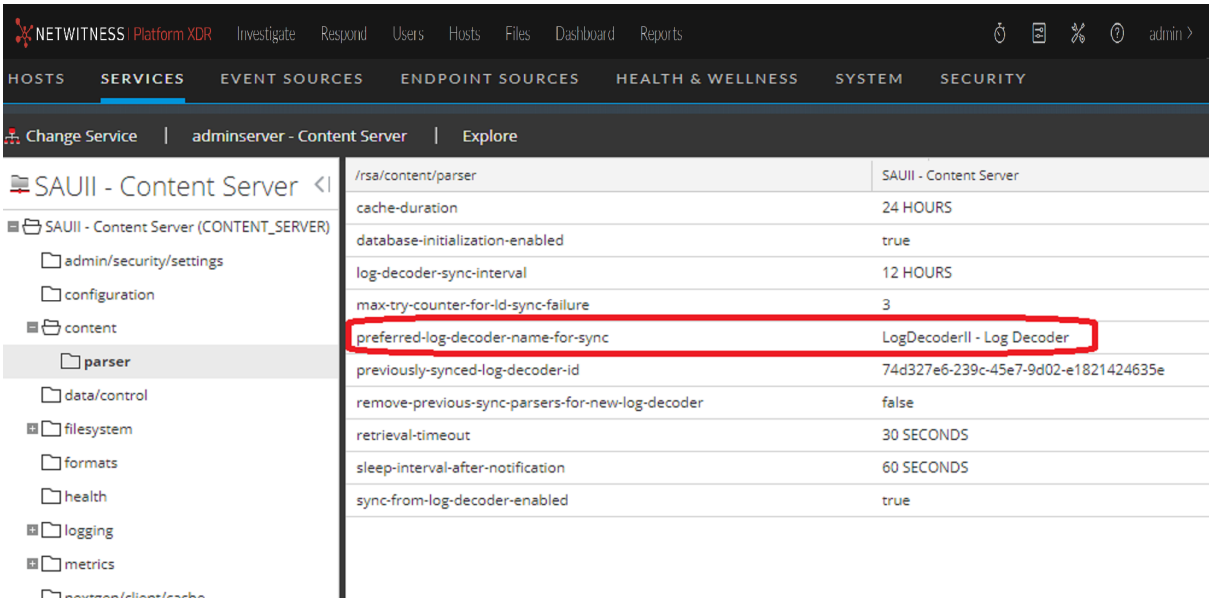
- Regex Pattern: \s*(\b(?:[0-9]{1,3}\.){3}[0-9]{1,3}\b):?(\d*)
- Full capture: none

- First capture: **ip.src**
- Second capture: **port.src**
- Third capture: none
- Assume example string of "src=192.168.24.4:8080", where **src** is one of the tokens defined for this rule:
  - **192.168.24.4** is saved to the **ip.src** meta key.
  - **8080** is saved to the **port.src** meta key.

For more details, see any online reference that describes PERL regular expressions. There are many tutorials available online.

IMPORTANT: Be careful when constructing regular expressions in your custom rules. Badly constructed regular expressions could impact your performance.

Appendix A: Select the Reference Log Decoder



For version 11.2, NetWitness has added the ability to add log parsers and log parsing rules through the UI, using the Log Parsers view. The Log Parsers tab is populated based on your reference Log Decoder. If you have more than one Log Decoder, you can select which acts as the reference one for populating the tab in the UI. This topic describes the procedure to do so.

Note: If you have previously set a reference log decoder, make sure that it is at NetWitness version 11.5 or later to get full functionality.

To change the reference log decoder:

1. In the NetWitness UI, navigate to **(Admin) > Services**.
2. For the **Content Server**, select **View > Explore**.
3. From the left navigation panel, expand **content > parser**.
4. To set the reference log decoder, enter a value for `preferred-log-decoder-name-for-sync`.

   Enter the name listed in the **Name** column on the **ADMIN > Services** screen for your preferred log decoder.

5. The change takes effect during the next system sync, based on the `log-decoder-sync-interval`. To sync sooner, you can do either of the following:

   - To sync immediately, restart the Content Sever: in the **(Admin) > Services** view, from the **Actions** menu for the Content Server, select **> Restart**.
   - Change the `log-decoder-sync-interval` parameter from its default of 12 hours to your preferred interval. Note that the minimum value for this parameter is **1 HOUR**.

Appendix B: Move Log Parsers to Production

You may have a development or test environment where you work on new and updated log parsers and log parser rules. In this case, at some point you need to move your new and updated log parsers into your production environment. This topic describes how to do this.

To move custom log parsers and log parser rules from development to production environment:

1. On the development system, do the following:
   a. SSH to the NetWitness Server
   b. Export the log parser information by running the following command:

      ```
      mongodump --host localhost --port 27017 --db "content-server" --username
      "deploy_admin" --password "netwitness" --authenticationDatabase admin
      ```

   c. Copy the "dump" folder to your production NetWitness Server.
2. On the production system, do the following:
   a. SSH to the NetWitness Server
   b. Drop the content-server table from Mongo by running below commands in the order listed:

      ```
      mongo --username deploy_admin --password netwitness --
      authenticationDatabase admin
      use content-server
      db.logDeviceParser.drop()
      db.patternFormatType.drop()
      exit
      ```

   c. Run the following restore command:

      ```
      mongorestore --host localhost --port 27017 --db "content-server" --
      username "deploy_admin" --password "netwitness" --authenticationDatabase
      admin PATH_TO_DUMP_FOLDER
      ```

      Make sure to replace *PATH_TO_DUMP_FOLDER* with the actual path to the "dump" folder.
   d. Restart the content-server by running the following command:

      ```
      systemctl restart rsa-nw-content-server
      ```

Appendix C: Troubleshooting and Limitations

This section describes some common issues that can occur when you customize log parsers and log parser rules.

Troubleshooting

You do not see any log parsing against a newly created parser.	You may have forgotten to map the new parser. To map a parser, go to **(Admin) > Event Sources > Discovery** tab. See the "Discovery Tab" topic in the *Event Source Management Guide* for details.
Deployment fails	If you click Deploy to deploy a new or updated log parser, and it fails, you should check the log for your reference log decoder. You access this log in the following location on the NetWitness Server: `/var/log/netwitness/content-server/content-server.log`

Delete a Log Parser Manually

If you have any issues when you attempt to remove a Log Parser through the UI, you can manually delete a log parser by using **NwConsole**.

To delete a log parser that has been deployed:

1. Access the NetWitness Console, using the **NwConsole** command. For details, see "Access NwConsole and Help" in the *NwConsole User Guide*.
2. Run the following command:

   ```
   [localhost:50002] /decoder/parsers> send . delete file=filename.xml
   type=device
   ```

   where ***filename*** is the name of the XML file for the log parser. For example, to delete the log parser for Oracle Access Manager, run the following command:

   ```
   [localhost:50002] /decoder/parsers> send . delete file=oracleam.xml
   type=device
   ```

Notes about the log parser filename:

- Log parser files are located on the Log Decoder in the following path:

  `/etc/netwitness/ng/envision/etc/devices`

- Each log parser has its own sub-folder. For example, the Cisco ASA parser files are in the following folder:

  `/etc/netwitness/ng/envision/etc/devices/ciscoasa`

- Some log parser file names begin with **v20_**, while others do not—the only way to tell is by examining the `devices` folders. For Cisco ASA, the log parser file name is **v20_ ciscoasamsg.xml**. However, in the previous command, when you specify the filename, do ***not*** use the **v20_** prefix.

NwLogPlayer

NwLogPlayer is a troubleshooting tool that simulates syslog traffic. `NwLogPlayer.exe` is a command line utility located on the Log Decoder host in `/usr/bin`.

At the command line, type `nwlogplayer.exe -h` to list the available options, as reproduced here:

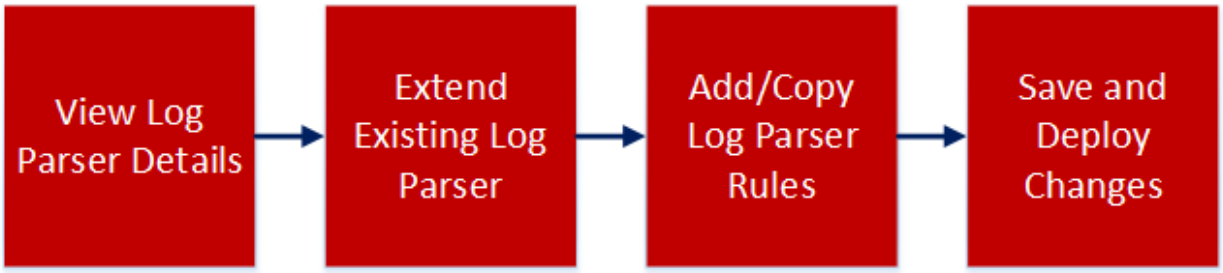
Option	Description
`--priority arg`	set log priority level
`-h [ --help ]`	show this message
`-f [ --file ] arg (=stdin)`	input message; defaults to **stdin**
`-d [dir ] arg`	input directory
`-s [ --server ] arg (=localhost)`	remote server; defaults to **localhost**
`-p [ --port ] arg (=514)`	remote port; defaults to **514**
`-r [ --raw ] arg (=0)`	Determines raw mode. • 0 = add priority mark (default) • 1= File contents will be copied line by line to the server. • 3 = auto detect • 4 = enVision stream • 5 = binary object
`-m [ --memory ] arg`	Speed test mode. Read up to 1 Megabyte of messages from the file content and replays.
`--rate arg`	Number of events per second. This argument has no effect if **rate** > eps that the program can achieve in continuous mode.
`--maxcnt arg`	maximum number of messages to be sent
`-c [ --multiconn ]`	multiple connection
`-t [ --time ] arg`	simulate time stamp time; format is `yyyy-m-d-hh:mm:ss`
`-v [ --verbose ]`	If **true**, output is verbose
`--ip arg`	simulate an IP tag
`--ssl`	use SSL to connect
`--certdir arg`	OpenSSL certificate authority directory
`--clientcert arg`	use this PEM-encoded SSL client certificate
`--udp`	send in UDP

Limitations

Please note the following limitations when using the Log Parser Rules tab:

- **Log Decoder must be at version 11.2:** For the functionality in the Log Parser Rules tab to work, your installation must have at least one Log Decoder running NetWitness version 11.2 or later.
- **JSON Mapping: Log Decoder must be at version 11.5:** For the JSON Mapping Beta functionality to work, your installation must have at least one Log Decoder running NetWitness version 11.5 or later.
- **Mixed Mode:** If any Log Decoders are at version 11.2 or later, and the NetWitness Server is at version 11.2 or later, the Log Decoders will have parseall rules enabled by default, and thus will begin to parse logs accordingly. However, the 11.2 NetWitness Server does not support Log Decoders with versions less than 11.2, so the Log Parser Rules tab in the UI stays blank.
- **Meta key fields list refresh:** If any new meta keys are added to the Log Decoder, they do not appear in the list of Meta in the Log Parser Rules tab immediately. They appear automatically after 24 hours, or you can restart the **content server** service to view them.
- **Field Restrictions:** Note the following field restrictions:
  - **Rule name** must be 64 characters or fewer.
  - **Parser Name** must be between 3 and 30 alphanumeric characters (including underscores), and must not match the name of any existing log parsers.
  - **Parser Display Name** must be 64 characters or fewer, and cannot match any other parser display name.
  - **Regex Expression** must be 1-255 characters, and a valid regex (closed capture list allowed).
  - **Tags** cannot be duplicates.
- **Deploy only to 11.2 Log Decoders:** The Deploy operation only deploys log parsers to version 11.2 or later Log Decoders.
- **Cannot Remove Deployed Parsers:** Once deployed, you cannot delete a log parser using the UI.
- **See log for errors:** Refer to content-server logs for more details on deploy failure details and log decoder names.

Parser Rules Tab



Note: The information in this topic applies to NetWitness Version 11.1 and later.

This tab contains details about the rules for the default log parser, as well as any other custom rules and log parsers that have been defined.

To access this tab, go to  **(Configure) > Log Parser Rules**.

Workflow

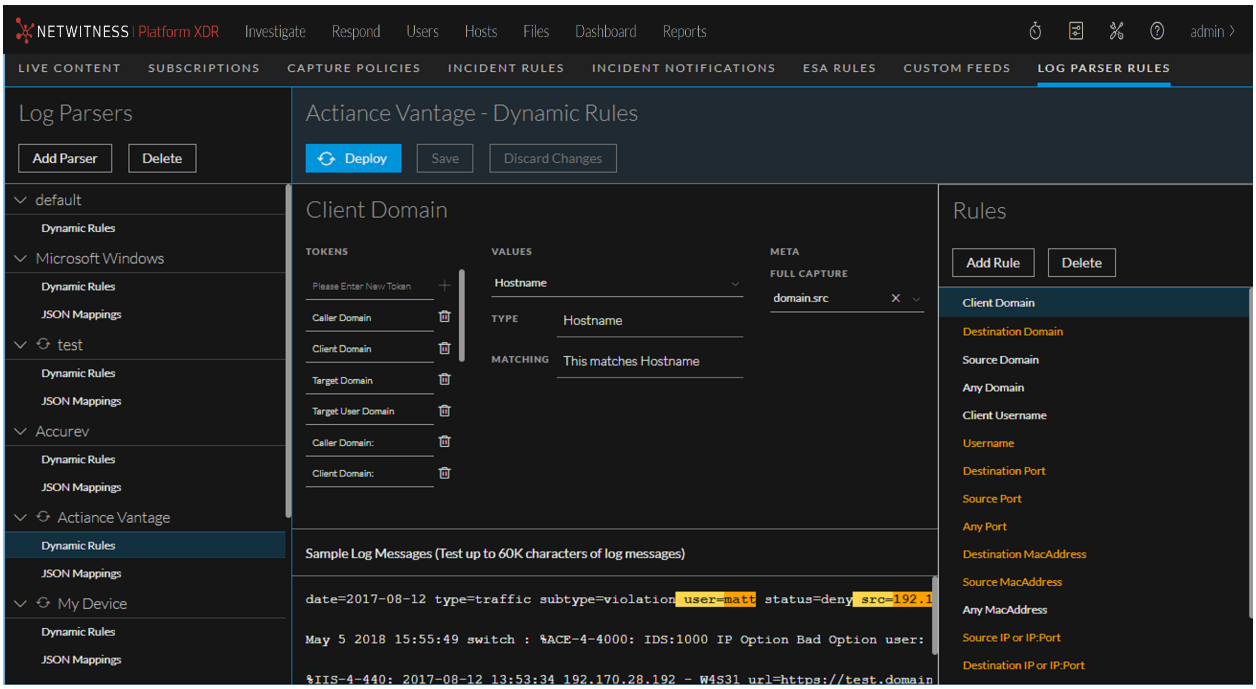
This workflow shows processes available from the Log Parser Rules view.

What do you want to do?

Role	I want to...	Documentation
Administrator	*View log parser rules.	Default Log Parser and Log Parser Rules
Administrator	*Add, edit or delete a log parser rule (version 11.2 and later)	Add or Delete a Log Parser Rule
Administrator	*Add or remove a log parser (version 11.2 and later)	Add or Delete a Log Parser

*You can perform this task here.

Related Topics

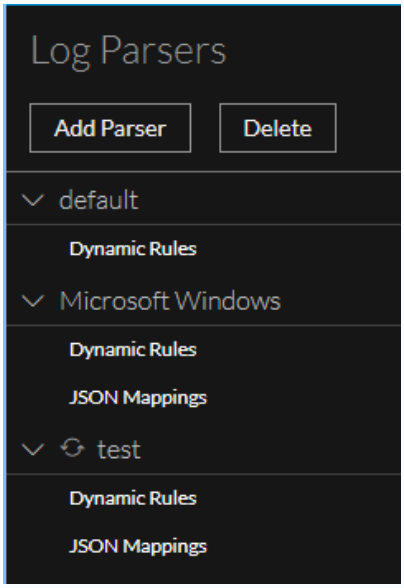


Default Log Parser and Log Parser Rules

Quick Look

Note: The list of log parsers is based on the first Log Decoder that is installed or registered by the Orchestration Server. If you have more than one Log Decoder, this tab only lists log parsers that have been configured on the first one.

The Log Parser Rules tab organizes and displays information about the configured log parsers in your system.

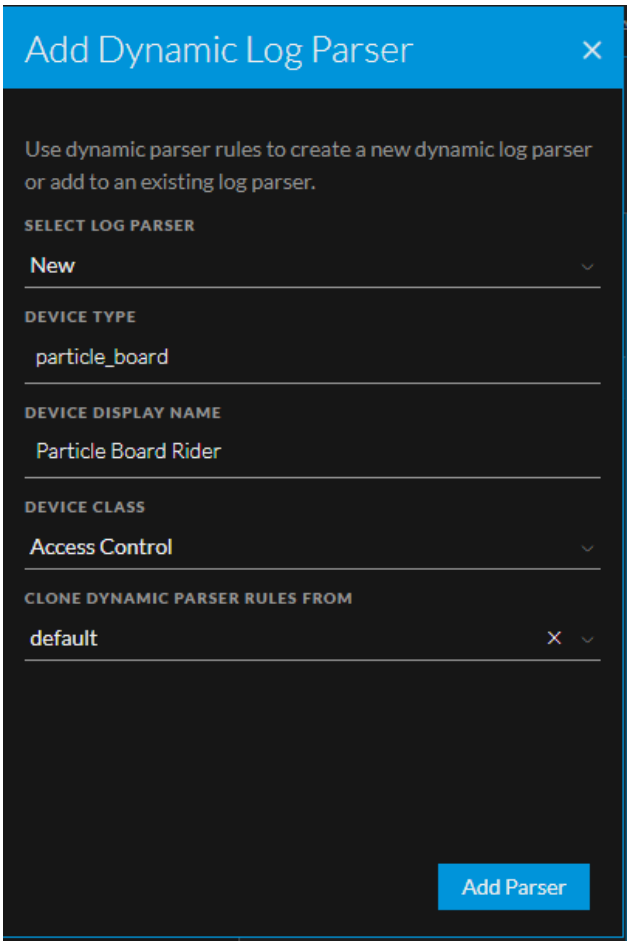


If you select the Dynamic Rules entry for a parser, the screen displays the dynamic rules:

Note: The icon indicates that there is some uncompleted or unsaved work. For example, next to a parser name, it means that the parser has not yet been deployed.

If you select JSON Mappings, the screen displays JSON mappings for the parser.

Log Parsers Panel



The Log Parsers Panel lists the configured log parsers.

- Until you add rules to existing XML parsers on your reference Log Decoder, (or add a new, custom log parser) only the **default** parser is listed here.
- Select a specific log parser to view its details in the Details and Rules panels.
- Click **Add Parser** to open the Add Dynamic Log Parser dialog box.
- Click **Delete** to delete a log parser.

IMPORTANT: Once you deploy a log parser, you can no longer delete it through this interface. The **Delete** button is not available for deployed parsers. To manually delete a log parser, see Add or Delete a Log Parser.

The Add Dynamic Log Parser dialog box allows you to add a custom log parser.

When you are adding a log parser, the following parameters are available.

Field	Details
SELECT LOG PARSER	Select NEW, or choose an existing log parser. By choosing an existing log parser, you can add rules to that parser, essentially extending its parsing capabilities. **Note:** If you select an existing log parser, the remaining fields are auto-filled based on the values for selected log parser.
DEVICE TYPE	Enter a string to define the device type. The name must be between 3 and 30 alphanumeric characters (including underscores), and must not match the name of any existing log parsers.
DEVICE DISPLAY NAME	Enter the display name for the log parser. **Note:** The display name must be 64 characters or fewer, and must not match the name of any other device display name.
DEVICE CLASS	Select a device class.
CLONE DYNAMIC PARSER RULES FROM	Leave blank to start with no rules, or select one of the existing log parsers to clone its rules.

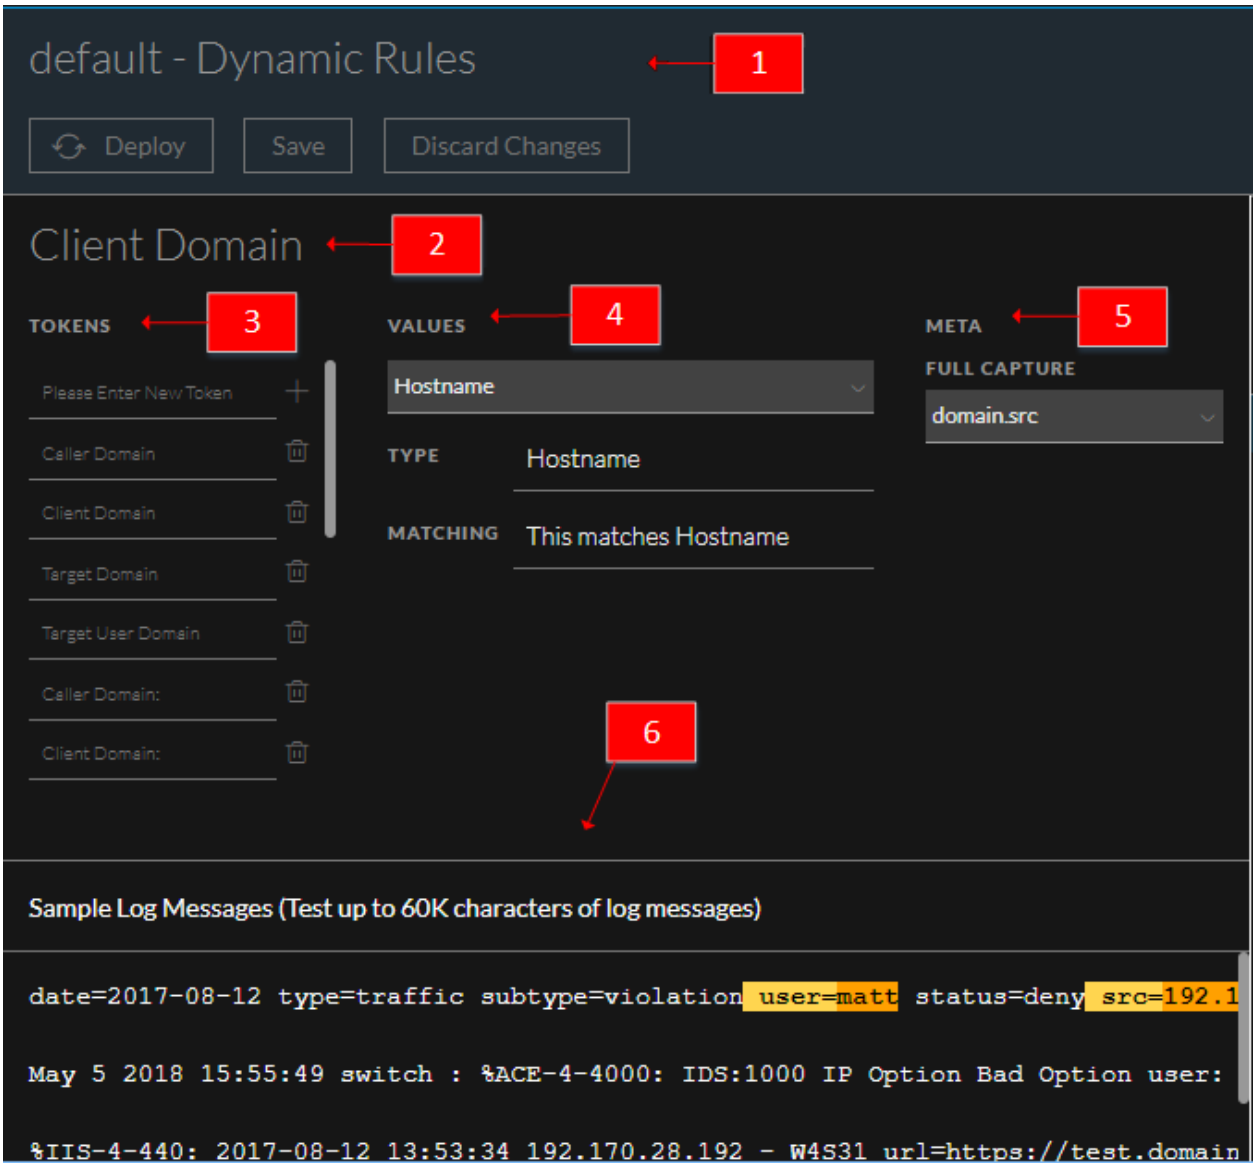
Dynamic Rules

If you select the Dynamic Rules entry for a parser, you see the following panes:

- Details
- Rules

Details Pane

The details pane shows the three pieces for the selected rule:



- **Tokens:** one or more tokens to match in the message. For example, the Any Port rule looks for the following strings to match against: **port** , **port:**, **port=**, and others.
- **Values:** the value that follows the token. This is a string that is captured as meta. For example, assume a log contains the following string:

  ```
  port 12345
  ```

  The Any Port rule has a token that matches "port ". When it encounters that string, it assigns the token value, "12345" to a meta key.
- **Meta:** the meta keys to which the value is mapped. For example, the Any Port rule maps the port value to the **port** meta key.

Essentially, a rule says, "when you are parsing a message, if you match one of my tokens, assign the value that follows the token to the meta key that I want it stored as."

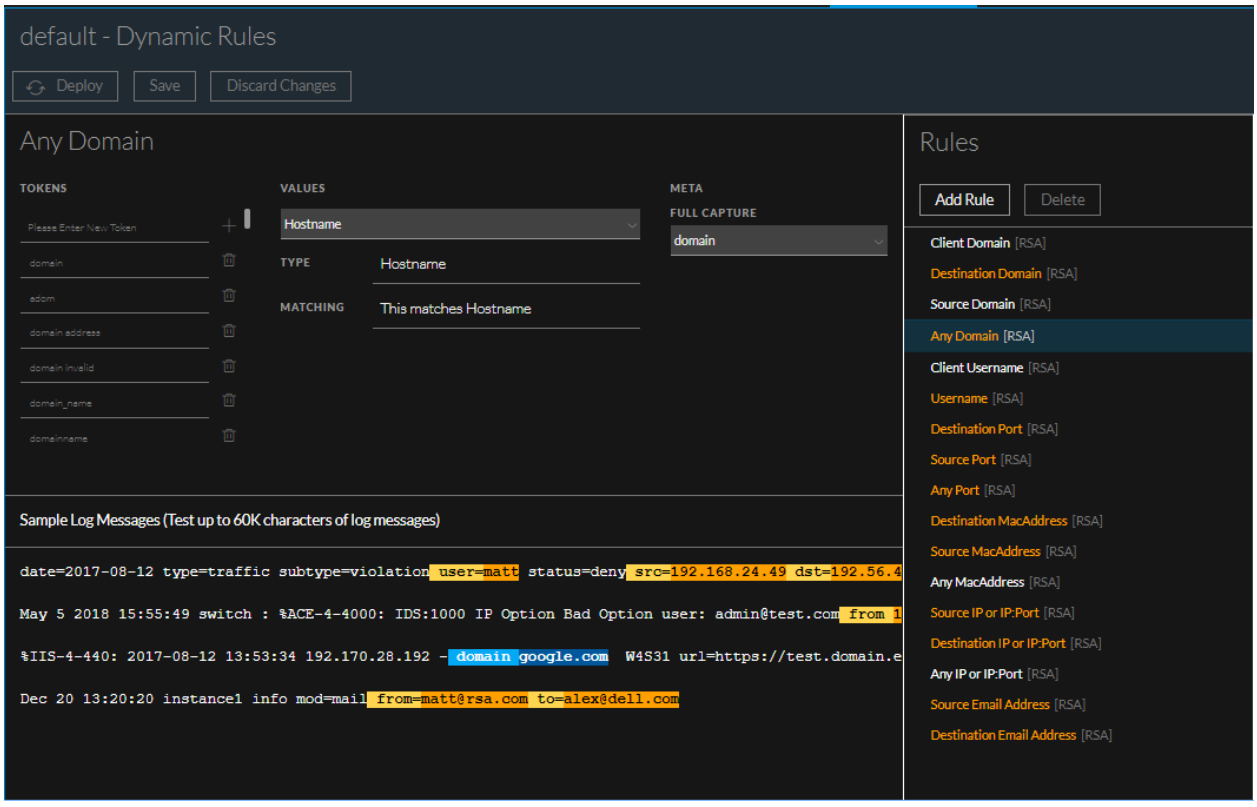
The bottom section of the Details panel contains sample log messages, and how they would be parsed for the selected log parser.

1	Displays the name of the selected log parser, and the buttons for deploying, saving, and discarding changes. This value changes when you select a different parser.
2	Displays the name of the selected rule. This value changes when you select a different rule for this parser.
3	Displays the list of tokens defined for the selected rule.
4	Displays the type and pattern of the value matching for the selected parser. The values here are determined by the type of the selected value. You can also use the Regex option to define a custom regular expression.
5	Displays the NetWitness meta to which the selected rule maps any matched tokens. The values here are determined by the selected Rule.
6	Displays a sample log message, and highlights strings that match tokens in the selected log parser. You can edit this field, and add in your own logs to preview how the selected parser will parse your logs. **Note:** The sample section refreshes whenever a rule is changed or updated, as well as when you

paste in samples from your logs.

For example, consider the following scenario:

- The **default** parser is selected.
- The **Any Domain** rule is selected.
- The Tokens matching list displays all of the tokens that are matched when found in a log message: **Domain**, **Domain Name**, **domain**, **ADMIN_DOMAIN**, and so on.
- The Meta list displays the NetWitness meta to which the value for the token is mapped: **domain**.



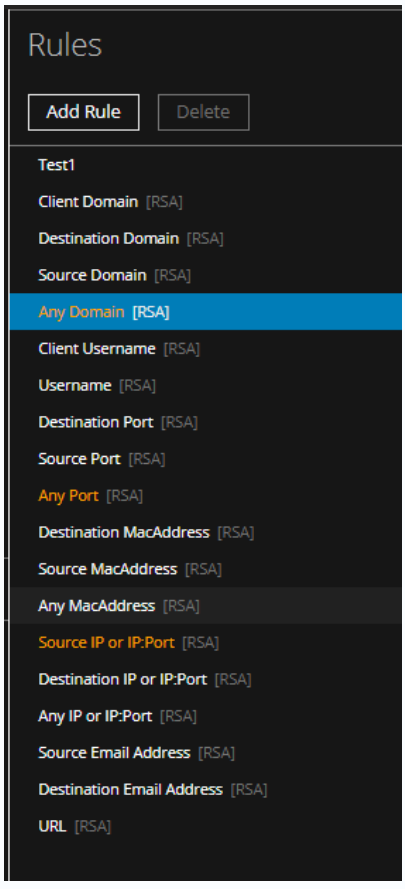
So, let's say the sample log message area has the following text:

```
Below are sample log messages:

May 5 2010 15:55:49 switch : %ACE-4-400000: IDS:1000 IP Option Bad Option
List by user admin@test.com from 10.100.229.59 to 224.0.0.22 on port 12345.

Apr 29 2010 03:15:34 pvg1-ace02: %ACE-3-251008: Health probe failed for
server 218.83.175.75:81, connectivity error: server open timeout (no SYN ACK)
domain google.com with mac 06-00-00-00-00-00.
```

In this case, the Sample Log Message area looks like this:



Note that some strings are highlighted, and that there are two "pairs" of highlight colors:

- Dark blue and light blue highlighting is applied to the strings that match the currently selected rule.
  - Dark Blue highlighted strings match a token in the selected rule. In this case, **domain** is the token that is matched for the **Any Domain** rule.
  - Light Blue highlighted strings are the values that correspond to the tokens in dark blue. For example, **google.com** is highlighted in light blue, because it corresponds to the **domain** token.
- Orange and yellow highlighting is applied to the strings that match rules for the current parser that are *not* currently selected.
  - Orange highlighted strings match a token in a rule that is not currently selected.
  - Yellow highlighted strings are the values that correspond to the tokens in orange. For example, the **user** token matches the **Username** rule (which is not currently selected).

In this example, the **domain** meta would be assigned a value of **google.com** for this log message, if it was parsed using the default log parser.

Rules Pane

The Rules pane displays the list of rules used by the selected log parser. When you select a rule, you change the values that are displayed in both the **Tokens** and **Values** areas of the panel.

Note the highlighted rules:

- The currently selected rule is highlighted in blue.
- Other rules that match tokens in the sample log message area are highlighted in orange.

Other notes for the Rules panel:

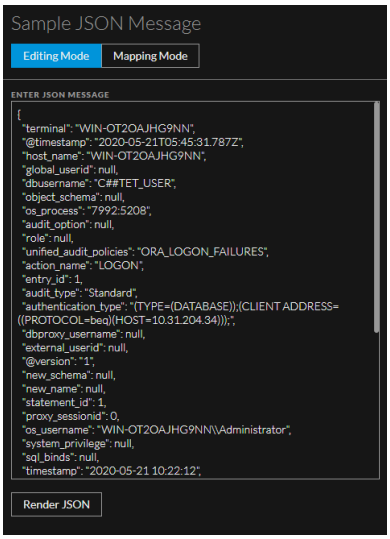
- RSA rules (the rules provided out-of-the-box for each log parser) are identified by **[RSA]** following the rule name.

  You can copy these rules when adding a new log parser, and then change them as needed.
- The **Delete** button is only available for custom rules; for RSA rules, it is greyed out.
- Use the **Add Rule** button to add a custom rule.

JSON Mappings

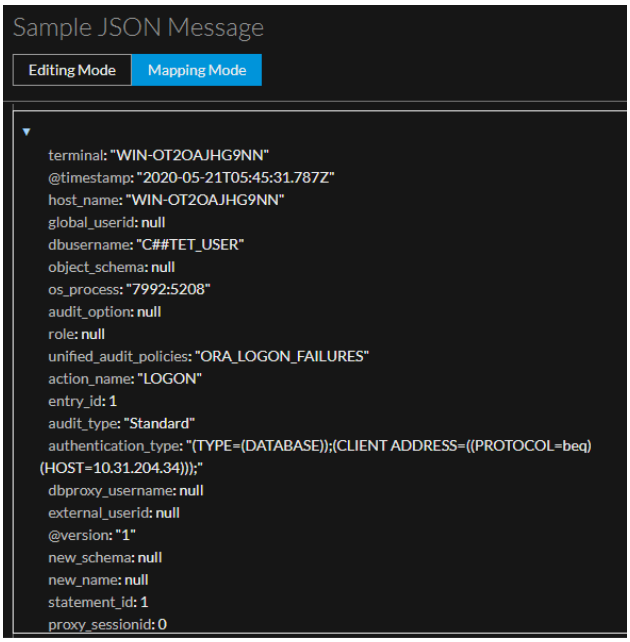
If you select the JSON Mappings entry for a parser, you see the following panes:

- Sample JSON Message
- Meta Mappings
- Mapping Details



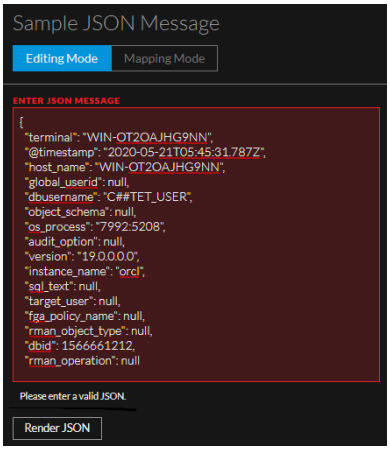
Sample JSON Message

You can enter or paste sample JSON text. Click the **Render JSON** button to automatically format the text into JSON code. If the text is not valid JSON, you receive a message and the text is not formatted.



The following screen shows the Sample JSON Message area with some JSON that has been pasted in:

Since this is valid JSON, clicking **Render JSON** produces the following:



Note that you can see the tree mode of the sample JSON if you click **Mapping Mode**:

Note: You can edit the sample JSON in Editing mode, but not in Mapping mode. Mapping mode is read only.

On the other hand, if you enter text that is not valid JSON, the screen looks as follows:

Auto Discover JSON Mappings

Beginning with NetWitness version 11.5.1, you can automatically create the mappings without the need to manually enter the name and path of the mapping. For details, see .Auto Discover JSON Mappings.

When the system auto discovers mappings, the path is filled in automatically, based on the structure of the mappings. For simple name-value pairs, this is straightforward. For example, for this pair, **"host_ name": "WIN-OT2OAJHG9NN"** , the path is set to `/host_name`.

However, the rules for nested mappings and arrays are as follows:

- For a nested structure, names are separated with a forward slash (/).

```
{
  "parent": {
    "child": "value"
  }
}
```

The path is set to `/parent/child`.

- Arrays are accessed by omitting the index.

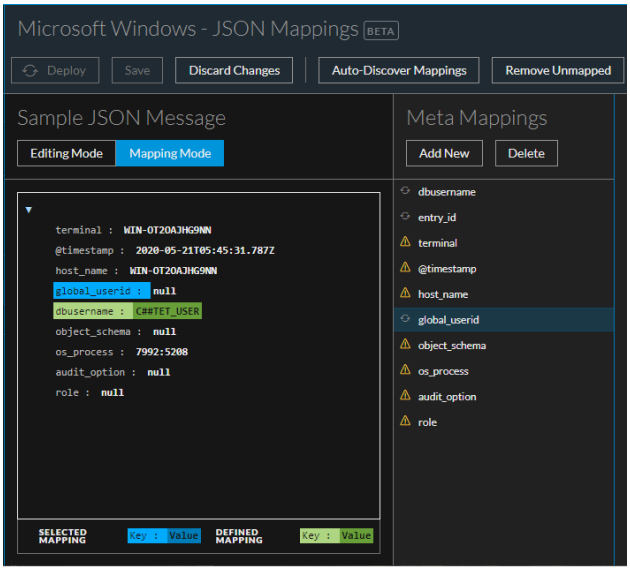
```
{
  "array": [
    "x",
    "y",
    "z"
  ]
}
```

The path is set to `/array/`.

```
{
  "array": [
    {
      "name": "value"
    }
  ]
}
```

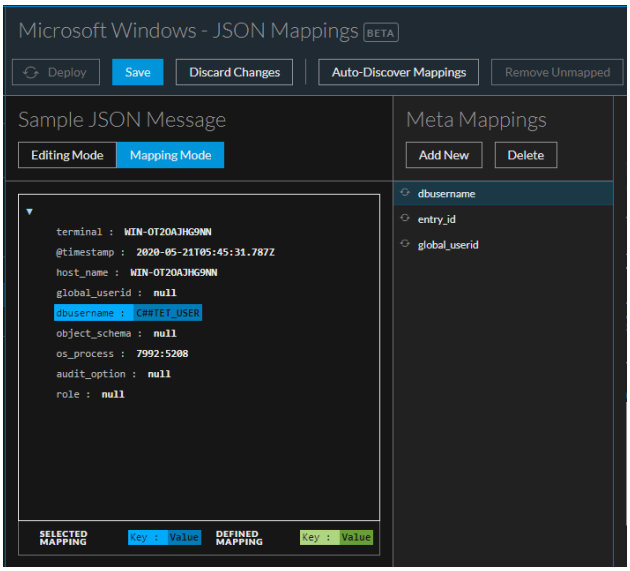
The path is set to `/array//name`.

- Variable names are accessed by omitting them from the path.



```
{
  "root": {
    "x": {
      "name": "value"
    },
    "y": {
      "name": "value"
    }
  }
}
```

The paths are set to `/root/x/name` and `/root/y/name`.



Remove Unmapped Entries

If there are mappings that you do not want to save, you can remove them. After you validate all of the mappings that you want to keep, you can click **Remove Unmapped** to remove all mappings that you have not yet validated.

For example, assume you have auto-discovered some mappings as shown here:

After you click **Remove Unmapped**, you can see that only mapped entries remain:

Note: You cannot save your work until all of the entries have either been mapped or removed from the list.

Meta Mappings

This panel lists the mappings that exist for this parser. You can add a mapping by using the **Add New** button, or delete an existing mapping by selecting it and clicking **Delete**.

Mapping Details

The Mapping Details pane displays the following information.

Field	Details
DISPLAY NAME	This name corresponds to the name displayed in the JSON Mappings panel.
PATH	The path to where the values for this portion of the log are stored.
DESCRIPTION	Optionally, you can enter a text description for this mapping.
META	Select a meta key to which this value from the log is mapped. Select a value from the drop-down menu. Optional if you choose a Value Format.
VALUE FORMAT	Choose a value format parser onto which to pass this JSON value. You can either select an existing meta or **Custom Regex Type**. If you select custom regex type, you must define the regex and capture to *fine* parse the value in the meta. Optional if you choose a Meta.
CUSTOM REGEX TYPE	Select Custom Regex Type from the Value Format drop-down, which allows you to add new custom regex type.
REGEX PATTERN	Specify a regex to identify different pieces of data contained within a JSON node value.
FIRST CAPTURE	Select a meta key that should be captured first based on the value defined in the Regex pattern.

Field	Details
ADD A CAPTURE	New capture field is added. By default, it is loaded with meta keys in the drop-down. You can add maximum of 20 captures and this option will be disabled once it reaches maximum.

Note: You need to select a meta or enter a Value Format, but you do not need to fill in values for both settings.

Disable log Parser Rules

You can disable log parser rules, so that none of them are processed by the Log Decoder. You might have your log parsers working as you like, and do not want any extra processing that you do not need.

You disable them from the reference Log Decoder.

1. Go to  **(Admin) > Services**.
2. In the **Administration Services view**, select the Decoder and  **> View > Config.**

   The Services Config view is displayed with the General tab open.
3. Under **Parsers Configuration**, look at the Config Value for **PARSERULESCAN**.

   If it is **Enabled**, log parser rules are processed. If it is **Disabled**, they are not processed.
4. If the rules are Enabled, click Enabled and select Disabled to disable the log parser rules.

   To save the changes, click **Apply**.

Add VARTYPE Support to CEF Parser

VARTYPE added in 11.0 and later versions provide type and pattern validation for variables. While the variables are parsed, NetWitness has added the ability to condition them to match a certain format.

CEF Parser format logs with **CEF:0** and will use CEF parsers without any further identification. Some CEF sources have structured data embedded in variables. This data requires further processing. To direct parse rules scanning of the data, support for scanned variables is required for the CEF parser. Scanned variables are supported during the VARTYPE implementation.

To add VARTYPE support to CEF parser:

1. Load VARTYPE from CEF parser (cef.xml and cef-custom.xml) successfully.
2. Load all existing CEF parsers and parse the data successfully.
3. Enable VARTYPE to validate the header information.
4. Enable VARTYPE to fine parse CEF variable (MetaName).
5. Ensure that VARTYPE is working fine with custom CEF parser.

Defining Log Decoder Parse Rules

A single rule is defined by the following XML elements:

- **RULE** (element, required) - Each rule is enclosed in a RULE element.
  - **id** (attribute, required) - A name associated with the rule.
  - **stop** (attribute, optional) - An attribute to stop the rule.
  - **order** (attribute, optional) - An attribute to order the rule.
- **LITERAL** (child of RULE, requires one or more) - The literal defines the string inside each log message for which Log Decoder will search. Multiple literals can be defined.
  - **value** (attribute, required) = The string value for which to search.
- **PATTERN** (child of RULE, requires exactly one) - A pattern is defined as either a **regex** or a **format**.
  - **regex** (attribute, optional) - A regular expression that can be used to extract one or more values from the matched string.
  - **format** (attribute, optional) - A built-in format type for which to scan and extract values (see **Built-In Format** below).
  - **range** (attribute, optional) - Determines the range to be searched for the pattern before and after the found LITERAL token. It supports the following values:

Value	Description
after	Applies regex after the anchor till the end of the log. This is the default value.
before	Applies regex from the beginning of the log till the starting position of the anchor.
all	Applies regex to entire log.
before, after	Applies regex to entire log.
Negative Integer (-X)	Applies regex to X or available characters before the found LITERAL token.
Positive Integer (+X)	Applies regex to X or available characters after the found LITERAL token.
-X, +Y (Combination of Positive and Negative Integers)	Applies regex to X or available characters before the found LITERAL token to Y or available characters after the found LITERAL token. - range=”-15,+12”
-X, after (Combination of Negative Character, and After)	Applies regex to X or available characters before the found LITERAL token to the end of the log. - range=”-15,after”

- **CAPTURE** (child of PATTERN, optional) - A capture is used when extracting data from the log that was captured by the regular expression defined in PATTERN.
  - **index** (attribute, required) - The index of the regex match to capture.
  - **key** (attribute, required) - The meta key into which to assign the captured value.
  - **format** (attribute, optional) - The NwType of the key to be created (For example, Text, IPv4, UInt32 and so on). Default is Text.
- **META** (child of RULE, optional) - A meta element defines meta values that get created when there is a match for the pattern.
  - **key** (attribute, required) - The meta key into which to store the value.
  - **value** (attribute, required) - The value to store.
  - **format** (attribute, optional) - The NwType of the key to be created (For example, Text, IPv4, UInt32 and so on). Default is Text.

Note: The **format** defined in the **CAPTURE** and **META** elements determines the meta type of the corresponding key. If this meta key is defined elsewhere in Log Decoder (in another parser, a language file and so on) and the types do not match, then an error will be generated and parse rule could potentially be disabled.

Built-In Formats

Log Decoder Parse Rules also offer several built-in formats for the more commonly used types. These formats are:

Format	Description	Example
IPv4	ipv4	192.168.1.1
IPv6	ipv6	2607:f0d0:1002:51::4
MAC	physical Mac address	01:23:45:67:89:ab
UInt8	unsigned 8-bit integer	0 to 255
UInt16	unsigned 16-bit integer	0 to 65535
UInt32	unsigned 32-bit integer	0 to 4294967295
UInt64	unsigned 64-bit integer	0 to 18446744073709551615
Int8	signed 8-bit integer	-128 to 127
Int16	signed 16-bit integer	-32768 to 32767
Int32	signed 32-bit integer	-2147483648 to 2147483647
Int64	signed 64-bit integer	-9223372036854775808 to 9223372036854775807
Float32	decimal numbers	2.71818
Float64	decimal numbers	2.71818

Format	Description	Example
Email	valid email address	bob@company.com
URI	universal resource identifier	http://www.google.com/path/script?query=param
Hostname	RFC-1123 compliant hostname	abc.xzy.com

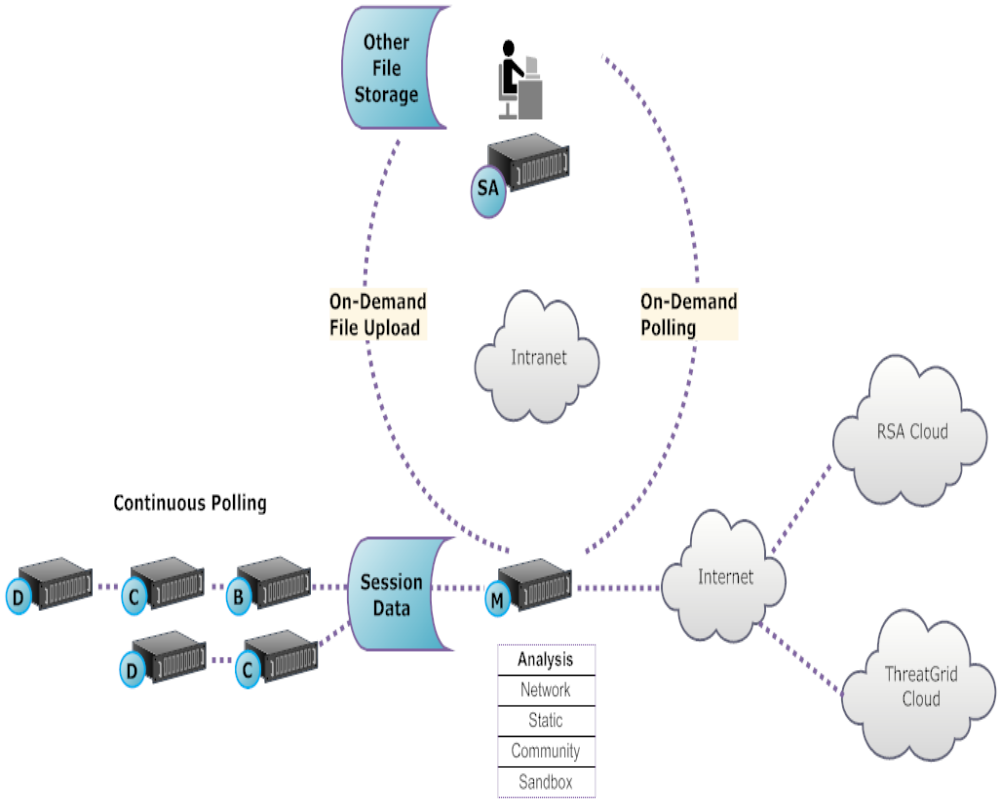
How Malware Analysis Works

NetWitness Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows portable executable (PE), PDF, and MS Office) to assess the likelihood that a file is malicious.

Malware Analysis detects indicators of compromise using four distinct analysis methodologies:

- Network Session Analysis (network)
- Static File Analysis (static)
- Dynamic File Analysis (sandbox)
- Security Community Analysis (community)

Each of the four distinct analysis methodologies is designed to compensate for inherent weaknesses in the others. For example, Dynamic File Analysis can compensate for Zero-Day attacks that are not detected during the Security Community Analysis phase. By avoiding malware analysis that strictly focuses on one methodology, the analyst is more likely to be shielded from false negative results.



In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language, which allows malware researchers to identify and classify malware samples. This allows Indicators of Compromise (IOC) authors to add detection capabilities to Netwitness Malware Analysis by authoring YARA rules and publishing them in Netwitness Live. These YARA-based IOCs in Netwitness Live will automatically be downloaded and activated on the subscribed host, to supplement the existing analysis that is performed in each analyzed file.

Malware Analysis also has features that support alerts for NetWitness Respond.

Functional Description

This figure depicts the functional relationship between the Core services (the Decoder, Concentrator, and Broker), the Malware Analysis service, and the NetWitness Server.

Daily Quota (Number of Files)	Free	Standard	Enterprise
Malware Analysis	100	unlimited	unlimited
ThreatGrid Analysis	5	1000	5000

The Malware Analysis service analyzes file objects using any combination of the following methods:

- **Continuous automatic polling of a Concentrator or Broker** to extract sessions identified by a parser as potentially carrying malware content.
- **On-demand polling of a Concentrator or Broker** to extract sessions identified by a malware analyst as potentially carrying malware content.
- **On-demand upload of files** from a user-specified folder.

When automatic polling of a Concentrator or Broker is enabled, the Malware Analysis service continuously extracts and prioritizes executable content, PDF documents, and Microsoft Office documents on your network, directly from data captured and analyzed by your Core service. Because the Malware Analysis service connects to a Concentrator or Broker to extract only those executable files that are flagged as possible malware, the process is both rapid and efficient. This process is continuous and does not require monitoring.

When on-demand polling of a Concentrator or Broker is chosen, the malware analyst uses Investigation to drill into captured data and choose sessions to be analyzed. The Malware Analysis service uses this information to automatically poll the Concentrator or Broker and to download the specified sessions for analysis.

On-demand upload of files provides a method for the analyst to review files captured external to the Core infrastructure. The malware chooses a folder location and identify one or more files to be uploaded and analyzed by Malware Analysis. These files are analyzed using the same methodology as files automatically extracted from network sessions.

Analysis Method

For the Network analysis, the Malware Analysis service looks for characteristics that seem to deviate from the norm, much as an analyst does. By looking at hundreds to thousands of characteristics and combining the results into a weighted scoring system, legitimate sessions that coincidentally have a few abnormal traits are dismissed, while the actual bad ones are highlighted. A user can learn patterns that indicate anomalous activity in the sessions as indicators that warrant further investigation, Indicators of Compromise.

The Malware Analysis service can perform Static analysis against suspicious objects it finds on the network and determine whether those objects contain malicious code. For Community analysis, new malware detected on the network is pushed to the Netwitness Cloud for checking against Netwitness's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. For Sandbox analysis, the services can also push data into major security, information and event management (SIEM) hosts (the ThreatGRID Cloud).

Malware Analysis has a unique method for analysis that is partnered with industry leaders and experts, so their technologies can enrich the Malware Analysis scoring system.

NetWitness Server Access to the Malware Analysis Service

The NetWitness Server is configured to connect to the Malware Analysis service and import tagged data for deeper analysis in Investigation. Access is based on three subscription levels.

- Free subscription: All NetWitness customers have a free subscription, with a free trial key for ThreatGRID analysis. The Malware Analysis service is rate-limited to 100 file samples per day. The number of samples (within the set of files from above) submitted to the ThreatGRID Cloud for sandbox analysis is limited to 5 per day. If one network session had 100 files in it, customers would hit the rate limit after processing the one network session. If 100 files were manually uploaded, that would cause the rate limit to be reached.
- Standard subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGRID Cloud for sandbox analysis is 1000 per day.
- Enterprise subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGRID Cloud for sandbox analysis is 5000 per day.

Scoring Method

By default, the Indicators of Compromise (IOC) are tuned to reflect industry best practices. During analysis, the IOCs that trigger cause the score to move upward or downward to indicate the likelihood that the sample is malicious. The tuning of IOCs is exposed in NetWitness so that the malware analyst can choose to override the assigned score or to disable an IOC from being evaluated. The analyst has the flexibility to either use the default tuning, or to completely customize the tuning to specific needs.

YARA-based IOCs are interleaved with the built-in IOCs within each built-in category and are not distinguished from native IOCs. When viewing IOCs in the Service Configuration view, administrators can select YARA from the Module selection list to see a list of YARA rules.

After a session is imported into NetWitness, all of the viewing and analysis capabilities in Investigation are available to further analyze Indicators of Compromise. When viewed in Investigation, YARA IOCs are distinguished from the built-in native IOCs by the tag `Yara rule`.

Deployment

The Malware Analysis service is deployed as a separate Netwitness Malware Analysis host. The dedicated Malware Analysis host has an onboard Broker which connects to the Core infrastructure (either another Broker or a Concentrator). Prior to this connection, a collection of parsers and feeds must be added to the Decoders that are connected to the Concentrators and Brokers from which the Malware Analysis service pulls data. This allows suspicious data files to be marked for extraction. These files are `malware analysis` tagged content available through the Netwitness Live content management system.

Scoring Modules

Netwitness NetWitness Malware Analysis analyzes and scores sessions and the embedded files within these sessions by scoring four categories: Network, Static Analysis, Community, and Sandbox. Each category comprises many individual rules and checks that are used to calculate a score between -100 and 100. The higher the score, the more likely the session is to be malicious and worthy of more in-depth follow-on investigation.

Malware Analysis can facilitate a historical investigation into events leading up to a network alarm or incident. If you know that a certain type of activity is taking place on your network, you can select only the reports of interest to examine the content of data collections. You can also modify behavior for each scoring category based on the scoring category or the file type (Windows PE, PDF, and Microsoft Office).

Once you become familiar with data navigation methods, you can explore the data more completely through:

- Searching for specific types of information
- Reviewing specific content in detail.

Category scores for Network, Static Analysis, Community, and Sandbox are maintained and reported independently. When events are viewed based on the independent scores, as long as one category detects malware, it is evident in the Analysis section.

Network

The first category examines each core network session to determine if the delivery of the malware candidates was suspicious. For example, benign software being downloaded from a well-known safe site, using proper ports and protocols, is considered less suspicious than downloading software known to be malicious from a known dubious download site. Sample factors used in the scoring of this criteria set may include sessions that:

- Contain threat feed information
- Connect to well-known bad sites
- Connect to high-risk domains/countries (for example, .cc domain)
- Use well-known protocols on non-standard ports
- Contain obfuscated JavaScript

Static Analysis

The second category analyzes each file in the session for signs of obfuscation in order to predict the likelihood of the file behaving maliciously if allowed to run. For example, software that links to networking libraries is more likely to perform suspicious network activity. Sample factors used in the scoring of this criteria set may include:

- Files found to be XOR encoded
- Files found embedded within non-EXE formats (for example, PE file found embedded in a GIF format)
- Files linking to higher risk import libraries
- Files highly deviating from the PE Format

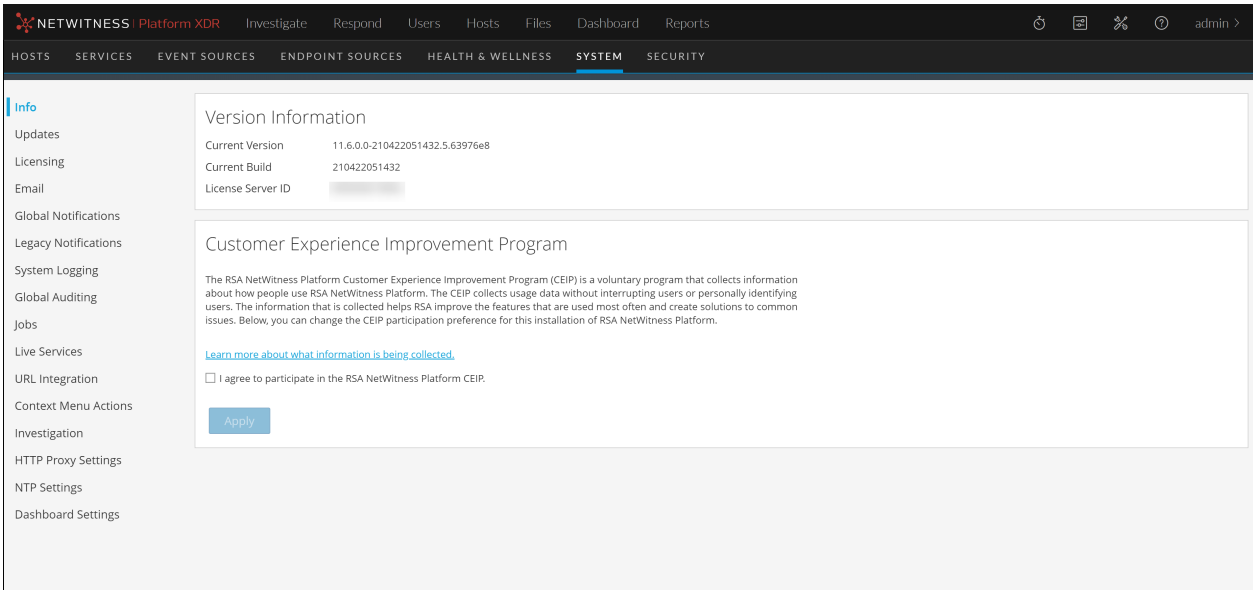
Community

The third category scores the session and files based on the collective knowledge of the security community. For example, files whose fingerprint/hash is already known to be good or bad by respected anti-virus (AV) vendors is scored accordingly. Files are also scored based on knowledge that a file was delivered from a site known to be good or bad by the security community.

Community scoring also indicates whether the AV on your network flagged the files as malicious. It does not indicate that the resident AV product acted to protect your system.

Sandbox

The fourth category examines the behavior of the software by actually running it in a sandbox environment. By running the software to watch its behavior, a score can be calculated by identifying well-known malicious activity. For example, software that configures itself to autostart on each reboot and make IRC connections would score higher than a file with no known bad behavior.



Roles and Permissions for Analysts

This topic identifies the user roles and permissions required for a user to conduct malware analysis in NetWitness. If you cannot perform an analysis task or see a view, the administrator may need to adjust the roles and permissions configured for you.

Required Roles and Permissions

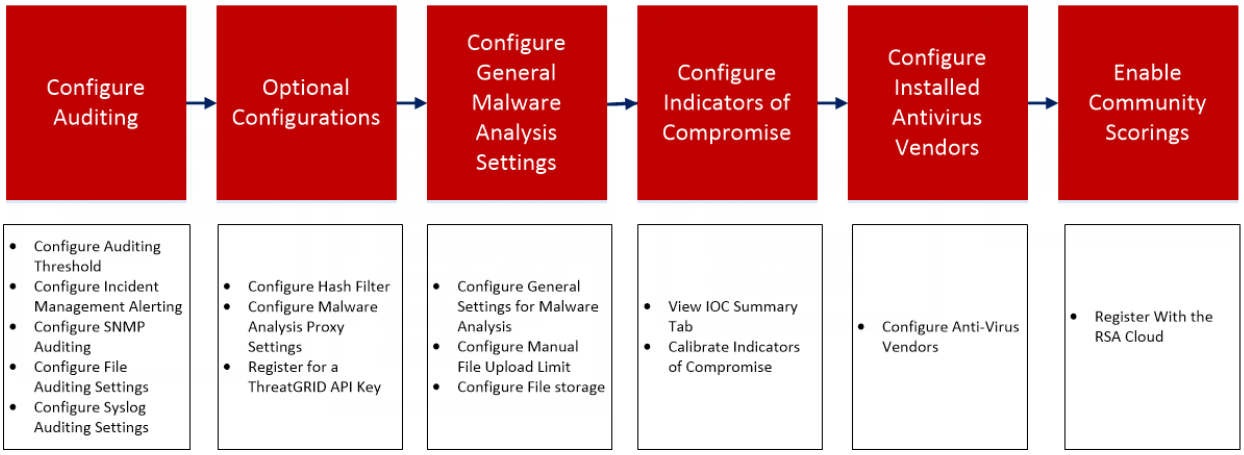
NetWitness manages security by providing access to views and functions using both system permissions and permissions on individual services.

On the system level, the user needs to be assigned a system role, in the (Admin) > System view, that provides access to specific views and functions.

The default `Malware_Analysts` role in NetWitness12.3.0.0 is assigned all of the permissions listed below. If necessary, an Administrator can create a custom role with some combination of the following permissions:

- Access Investigation Module (required)
- Investigation - Navigate Events
- Investigation - Navigate Values
- Access Incident Module
- View and Manage Incidents
- View Malware Events (to view events)
- File Download (to download files from the Malware Analysis service)
- Initiate Malware Scan (to initiate a one-time service scan or one-time file upload)

- Dashlet permissions for convenience: Dashlet - Investigate Top Values Dashlet, Dashlet - Investigate Service List Dashlet, Dashlet - Investigate Jobs Dashlet, Dashlet - Investage Shortcuts Dashlet.



A use case for creating a custom role would be a Junior Malware Analyst role, with limited permissions that do not include the File Download permission.

On specific services, a malware analyst needs to be a member of the **Analysts** group, or to a group that has the two default permissions assigned to the Analyst group: **sdk.meta** and **sdk.content**. Users who have these permissions can use specific applications, run queries, and view content for purpose of analysis on the service.

Basic Setup

Malware Analysis can operate as a service on a Decoder or as a service on a dedicated appliance. This guide includes instructions for setting up the operating environment and then configuring the Malware Analysis service. After this configuration is complete, analysts can conduct malware analysis.

These are the configuration steps for Malware Analysis, and also for editing the configuration. Perform the steps in the section in the sequence they are given.

Basic Configuration Checklist

The following checklist provides the sequence for tasks that are required to configure Malware Analysis that has been added to NetWitness in accordance with the *Hosts and Services Guide*.

Step	High-Level Task
Step 1 - (Optional) Configure Dedicated Appliance	(Optional) Configure Dedicated Appliance This topic describes the procedures for configuring the environment to connect to the Malware Analysis service.
Step 2 - Configure General Malware Analysis Settings	Configure General Malware Analysis Settings • Enable continuous polling. • Configure manual file upload limit. • Configure the file storage repository and database. • Calibrate the Static, Network, Community, and Sandbox scoring modules.

Step	High-Level Task
Step 3 - Configure Indicators of Compromise	Configure Indicators of Compromise Calibrate Indicators of Compromise that are applied for each scoring module (Static, Network, Community, Sandbox) and for YARA-based IOCs.
Step 4 - Configure Installed Antivirus Vendors	Configure Installed Antivirus Vendors
Step 5 - Enable Community Scoring	Enable Community Analysis Register with the Netwitness cloud and test connections to enable Community scoring.
Step 6 - Configure Auditing on Malware Analysis Host	(Optional) Configure Auditing on Malware Analysis Host Configure auditing thresholds and enable Syslog, SNMP, and file auditing.
Step 7 - Configure Hash Filter	(Optional) Configure Hash Filter Configure hash filtering to fine tune Malware Analysis event analysis based on known good or bad file hashes.
Step 8 - Configure Malware Analysis Proxy Settings	(Optional) Configure Malware Analysis Proxy Settings (Optional) Configure Malware Analysis to communicate with the Netwitness Cloud through a web proxy instead of directly.
Step 9 - Register for a ThreatGRID API key	(Optional) Register for a ThreatGRID API Key

(Optional) Configure Dedicated Appliance

You can configure the NetWitness operating environment to connect to a NetWitness Malware Analysis service.

Malware Analysis operates as a service on a dedicated Malware Analysis appliance. If your site is using a dedicated appliance, do one of the following:

- If your site is adding a new dedicated NetWitness Malware Analysis appliance, install the physical appliance in your network and configure the operating environment.
- If your site is upgrading a dedicated Spectrum appliance to a dedicated NetWitness Malware Analysis appliance, re-image the Spectrum appliance as a Malware Analysis appliance.

Malware Analysis is dependent on the Core infrastructure to operate. The following steps are necessary before Malware Analysis can successfully analyze data.

1. Configure the onboard Broker on the Malware Analysis appliance to connect another Broker or Concentrator in the existing Core infrastructure.

   Note: If no Core infrastructure exists, only manually uploaded files can be analyzed.

2. Use NetWitness Live to find all Live resources with the `malware analysis` tag and deploy these resources to each Decoder service that will be capturing traffic for Malware Analysis to analyze. NetWitness uses this proprietary set of parsers and feeds to find events that are likely to be malware.
3. Configure communications ports. Malware Analysis requires a number of different communications ports to be open, including TCP/443 for HTTPS. These are described below in Network Connections.
4. Configure the NextGen source to which Malware Analysis will connect. This is the Broker or the Concentrator.
   Malware Analysis is now ready to begin analyzing network traffic.

Network Connections

The inbound and outbound network connections must be configured for the Malware Analysis appliance to properly communicate with services, Netwitness sources for software updates, and other critical information.

Your network firewall must be configured to allow the Malware Analysis access to the internet. Proxy servers may be used to facilitate these connections, if necessary.

Inbound Connections

TCP/22 - Secure Shell access to the Malware Analysis server to review log files and troubleshoot. Access can be limited to IP addresses that will be managing Malware Analysis.

- TCP/443 - HTTPS web-based connection to access the Malware Analysis user interface.
- TCP/50008 - JMX port for performance troubleshooting, using an application such as JVisualVM. This is optional and access can be limited to IP addresses that will be managing Malware Analysis.

Outbound Connections

- TCP/443 - HTTPS connections to SSL-based web servers. Some features include Malware Analysis sending files or documents to servers for analysis, which require a secure connection. Use of a web proxy server is supported.
- (TCP/443 - SSL connection from Malware Analysis to the Netwitness Cloud. Use of a SOCKS proxy server is supported. Customer infrastructure changes may be required to ensure that 443 is open to cloud.netwitness.com.)
- TCP/50103 - REST API port used to communicate with a Broker. (NetWitness 10.3.x and earlier)
- TCP/50105 - REST API port used to communicate with a Concentrator. (NetWitness 10.3.x and earlier)
- TCP/50003 TCP/56003 - Ports used to communicate with a Broker. (NetWitness 10.4 and later)
- TCP/50005 TCP/56005 - Ports used to communicate with a Concentrator. (NetWitness 10.4 and later)

- ICMP - JMS connection from NetWitness to the Malware Analysis service to verify if the hostname and ip address entered is valid for a successful test connection.

Configure General Malware Analysis Settings

You can configure several basic settings required to enable and calibrate the consumption of sessions, manual file upload, and the different scoring modules that Malware Analysis uses to analyze data.

You can also set up file sharing with the data repository. Malware Analysis has three modes of consuming sessions and files. Any combination of the three choices may be used to initiate analysis in Malware Analysis. The choices are:

- **Continuous Polling of the Core service:** You can enable and configure continuous polling of the Core service. When enabled and configured, Malware Analysis continuously polls the Core service for sessions tagged for analysis. By default, continuous polling is disabled. You can enable Denial of Service (DOS) attack prevention for use during continuous polling. You can test the connection to the Malware Analysis service that is being continuously polled using an option in the Integration tab.

  Note: When adding a Core service as a service for continuous polling on 10.3.5 and earlier Malware Analysis, use the REST port; for example, add a Concentrator to 10.3.5 Malware Analysis with REST port (50105) instead of the native NexGen port (50005).

- **On-Demand Analysis of the Core service:** You can analyze sessions based on Investigations initiated directly in NetWitness. This method allows manually controlled consumption of Core sessions and allows tighter control over how files in those sessions are processed (for example, send to sandbox for processing). Document types can bypass the default restrictions and be sent to community or sandbox processing regardless of the configured setting.
- **Manual File Upload:** You can manually upload one or more files for analysis by navigating to a visible folder on your computer and selecting files to be uploaded. The maximum size for the uploaded files is configurable.

View the Basic Settings

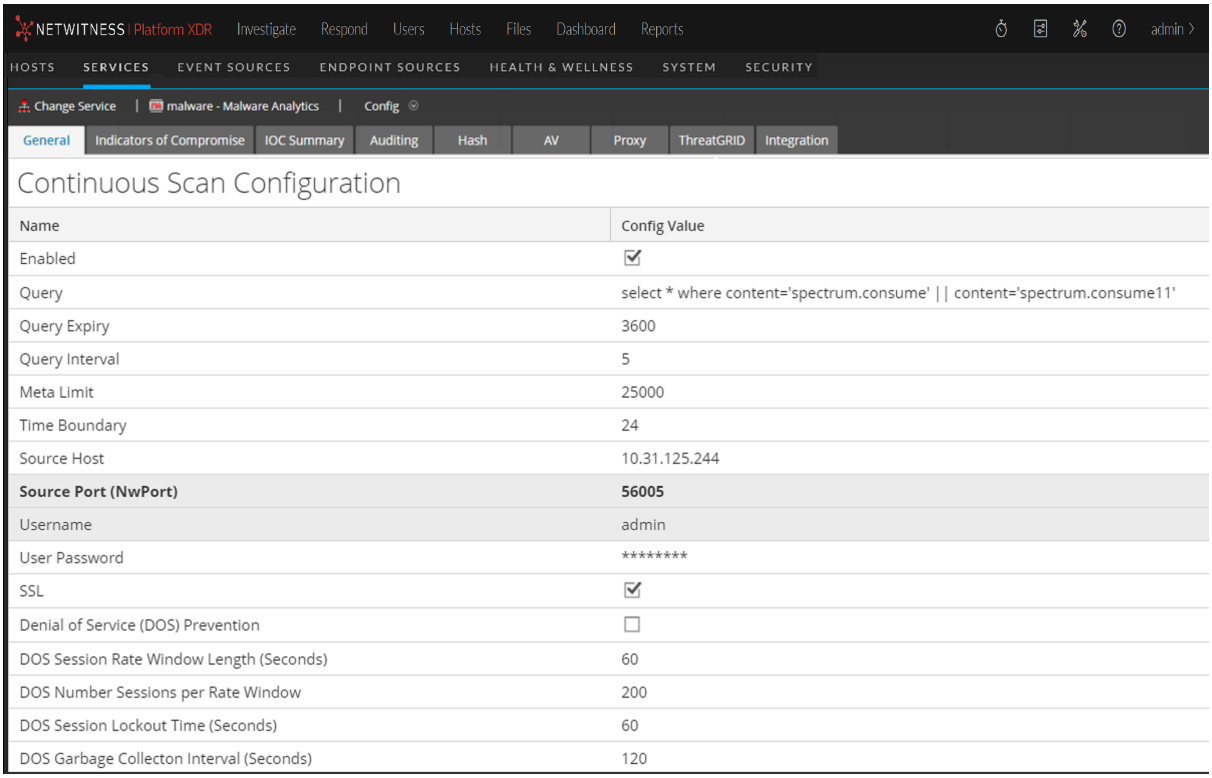
To view the basic settings:

1. Go to  **(Admin) > Services**.
2. In the **Services** grid, select a Malware Analysis service and click  **> View > Config**.
   The Service Config for the service is displayed with the **General** tab open.

Configure Continuous Polling

Malware Analysis is rate limited so that 1,000 files per day may be submitted to ThreatGRID's Cloud for sandbox processing. To optimize your use of the sandbox, Malware Analysis configuration allows you to choose which of several methods of consumption Malware Analysis uses; you can enable or disable continuous polling.

An important consideration when configuring continuous polling is the Denial of Service (DOS) Prevention parameters. By default this feature is disabled because you need to carefully consider the settings for your environment before enabling the feature.



When DOS Prevention is disabled, Malware Analysis analyzes the queued sessions in first-in first-out order. A DOS attack may rapidly fill the queue so that Malware Analysis is busy handling those sessions, while a malware attack is occurring in a later session. The later session with the actual attack may not reach the beginning of the queue and undergo analysis until after the attack has begun.

When DOS Prevention is enabled, Malware Analysis treats too many sessions from a single IP address as a DOS attack. If an IP address exceeds the Number of Sessions per Rate Window, Malware Analysis begins to disregard sessions from that address until the Session Lockout time is reached. Then Malware Analysis resumes analysis of the sessions from that IP address. The disregarded sessions from the IP address are not analyzed at all, so a malware attack may slip through during the Session Lockout period.

Using the DOS Garbage Collection Interval setting, Malware Analysis clears in-memory storage of an IP source after a specified number of seconds. IP addresses with little activity during this interval are cleared from memory. If an IP address is active at intervals that exceed the DOS Garbage Collection Interval, Malware Analysis may not identify it as a DOS attack.

To configure Malware Analysis for continuous polling, in the Continuous Scan Configuration section:

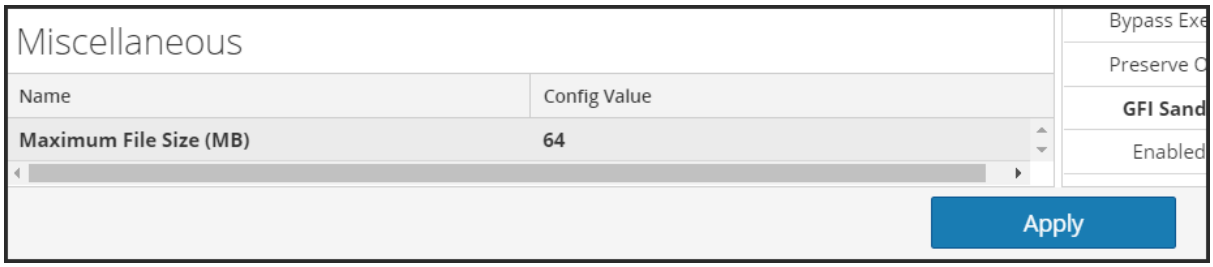
1. In the **General** tab, under **Continuous Scan Configuration** you can configure continuous polling.

Continuous Scan Configuration

Name	Config Value
Enabled	☑
Query	select * where content='spectrum.consume' || content='spectrum.consume11'
Query Expiry	3600
Query Interval	5
Meta Limit	25000
Time Boundary	24
Source Host	10.31.125.244
Source Port (NwPort)	**56005**
Username	admin
User Password	********
SSL	☑
Denial of Service (DOS) Prevention	☐
DOS Session Rate Window Length (Seconds)	60
DOS Number Sessions per Rate Window	200
DOS Session Lockout Time (Seconds)	60
DOS Garbage Collecton Interval (Seconds)	120

2. To enable continuous polling, click **Enabled**.
3. (Optional) If you want to change the default values for querying, enter new values for the **Query Expiry**, **Query Interval**, **Meta Limit**, and **Time Boundary**.
4. To configure the Malware Analysis appliance that Malware Analysis queries to retrieve data for analysis, specify the **Source Host** and **Source Port (NwPort)**.
5. (Optional) If you want to change the default logon credentials for the Malware Analysis appliance, specify the **Username** and **User Password**.
6. If you want to use SSL for communication between the Malware Analysis appliance and the Core service, enable **SSL**.
7. (Optional) If you want to configure Denial of Service (DOS) prevention:
   a. Enable the **Denial of Service (DOS) Prevention** parameter.
   b. Set up the DOS prevention session limitations:
      - Specify the number of seconds of the time window during which Malware Analysis counts sessions for a single IP address (**DOS Session Rate Window Length**). The window is called a Rate Window and a counter is set when the first session is received from that IP source. The default value is 60 seconds.
      - Specify the number of sessions allowed per Rate Window in the **DOS Number Session per Rate Window**. The default value is 200 sessions. When the number of sessions is reached within the Rate Window; Malware Analysis begins disregarding sessions from the IP address

and the disregarded sessions from that IP are not analyzed at all. Malware Analysis continues to disregard sessions until the lockout time is reached.



- Specify the length of lockout time (during which sessions from the IP address are disregarded and not analyzed) in the **DOS Session Lockout Time (Seconds)**. The default value is 60 seconds. When the lockout duration has elapsed, Malware Analysis resumes analysis of sessions from that IP address.
- Specify the interval of inactivity for an IP address before NetWitness removes the in-memory object for the IP source in **DOS Garbage Collection Interval (Seconds)**. The default value is 120 seconds.

8. Click **Apply** to apply the changes.
   The applied changes become immediately effective as Malware Analysis receives new packets.
9. Test the connection of the Malware Analysis service to the Core service selected in the **Integration** tab by clicking the **Test Connection** button in the **Continuous Scan Connection Test** section.

Configure Manual File Upload Settings

To configure the maximum file size for manual file upload:

1. In the Miscellaneous section, type the maximum file size in Megabytes allowed for files uploaded manually for Malware Analysis scanning.

2. Click **Apply**.
   The changes become immediately effective.

Configure the Data Repository

Malware Analysis can store a finite number of files on the appliance. The data repository configuration has a file system retention period of 60 days. This setting determines how long files are retained in the Malware Analysis appliance. When old files are deleted, they cannot be recovered. Every day, Malware Analysis deletes files that exceed the file system retention period to ensure that there is no wasted disk space.

The File System Retention Period is the only setting that governs when files are deleted. Files are not deleted based on the amount of disk space being used. If the setting needs to be changed, the administrator must configure the retention period based on the anticipated space usage during the number of retention days specified.

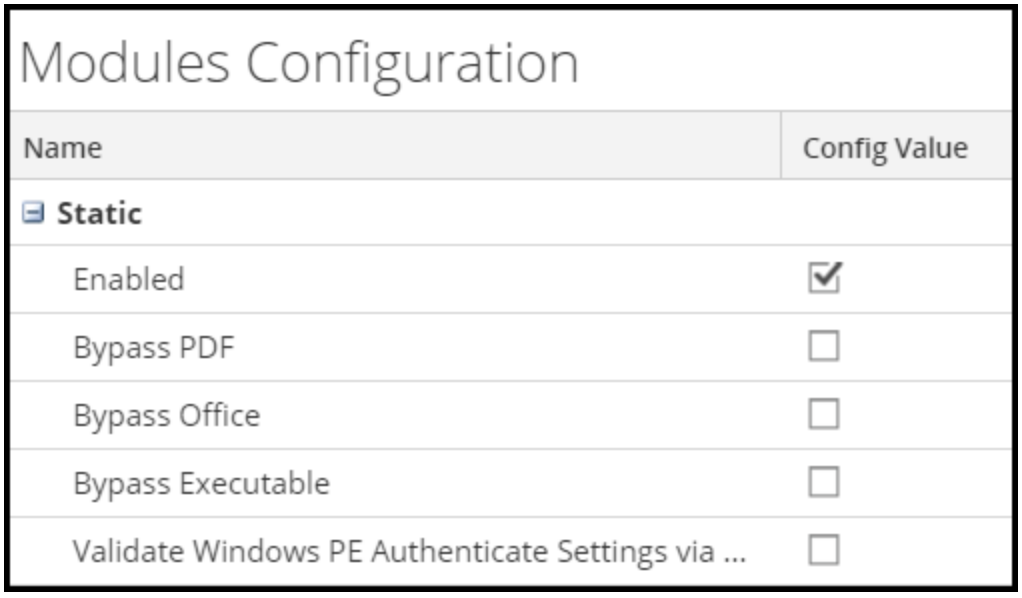
The visible data repository parameters in the NetWitness user interface are:

- The location of the repository is **/var/lib/netwitness/malware-analytics-server/spectrum**. Do not edit this value.
- The file sharing protocol, which allows access through one of the File Sharing Protocols to copy files from the Malware Analysis service.
- The file retention period in number of days.

To configure file sharing, in the Repository Configuration section:

1. Click on the File Sharing Protocol and select **FTP** or **SAMBA** or **None**.
2. Select the number of days that files are maintained in the repository before deletion.
3. Click **Apply.**

The changes become immediately effective.



Calibrate Scoring Modules

The Modules Configuration section helps configure the following components of Malware Analysis to:

- Completely disable any or all of three scoring modules (Static, Community, and Sandbox). Before disabling or enabling any scoring module, ensure that you understand what each scoring module detects.
- Malware Analysis tags sessions containing Microsoft Office, Windows PE, and PDF files for consumption by the Malware Analysis service. You can configure Malware Analysis to ignore Windows PE, Microsoft Office, and PDF documents entirely. If this is the case, a better option is to adjust your Core settings to ignore these files so they are not tagged for Malware Analysis consumption.

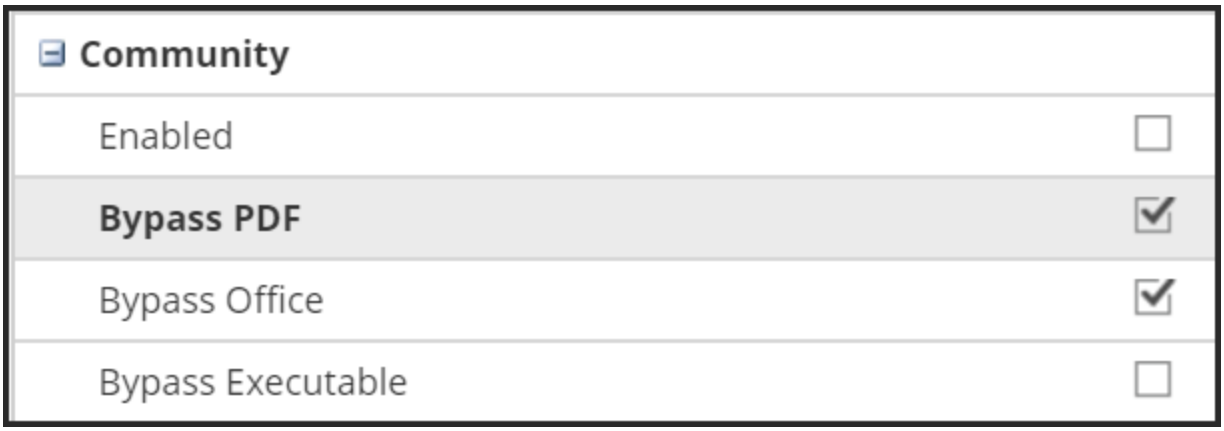
A sample application for using scoring module calibration is this: when setting up rule groups or analyzing system performance, you can test various scenarios in which PDF documents are not analyzed, but Microsoft Office and Windows PE documents are. You can test the scenario in each of the three scoring modules. If you see a measurable improvement in system performance, you can apply this knowledge on a broader scale.

Configure Static Analysis Scoring

To configure Static analysis scoring, in the **Modules Configuration** section:

1. By default the Static module is enabled. To enable or disable Static analysis entirely, click the **Enabled** checkbox.
2. To configure handling of PDF, Microsoft Office, and Windows PE files in a session, select any of the checkboxes **Bypass PDF**, **Bypass Office**, and **Bypass Executable**.
3. To configure your preference for Authenticode validation of digitally signed Windows PE files, click the **Validate Windows PE Authenticate Settings via Cloud** checkbox. If you want to prevent Windows PE files that are digitally signed from being transmitted to the Netwitness Cloud for validation, remove the check.
   When disabled, ALL static analysis is performed locally (skipping Authenticode validation). Regardless of this setting, PDF and MS Office documents are not subject to Authenticode validation and are not transmitted over the network during static analysis.
4. Click **Apply.**The changes become immediately effective as Malware Analysis receives new packets.

Configure Community Analysis Scoring



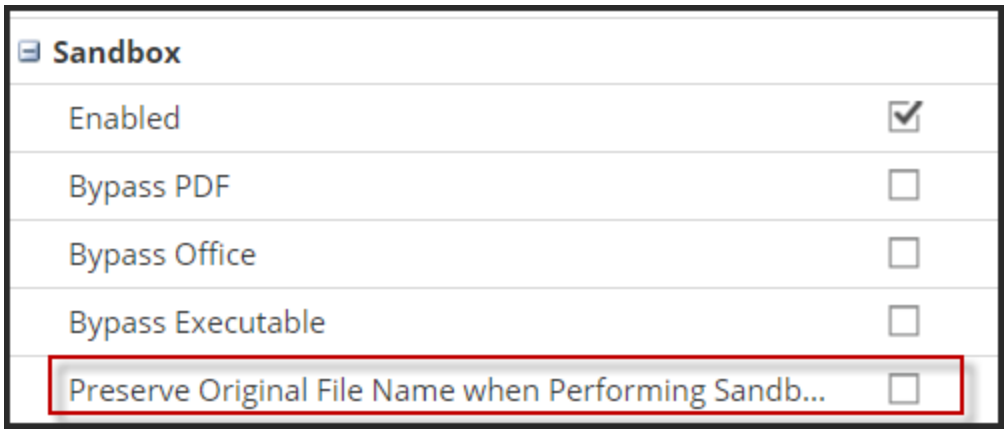
Once the Community module is enabled, the security community analyzes all documents not prevented from processing. This is achieved by sending network session and file attributes to the Netwitness Cloud for processing. The Netwitness Cloud then may make external connection to security community partners as needed to process the information.

The file content is never sent to the community for analysis. Instead, the MD5/SHA-1 hash of the file is sent for Anti-Virus detection and Blacklisting. Similarly, session Meta is harvested and analyzed as part of this process. Meta elements such as URL and Domain Name are examined and transmitted to the Netwitness Cloud to identify known bad URLs/Domains.

You can enable Community analysis and limit which document types are processed. There is no risk for the file content (except for a hash) being sent outside of your network.

Note: To gain access to the Netwitness Cloud where processing occurs, you must register your Malware Analysis service with Netwitness customer service. There are two methods: register the service using the options in the Integration tab or contact Netwitness Customer Care.

To configure Community analysis scoring, in the Modules Configuration section:

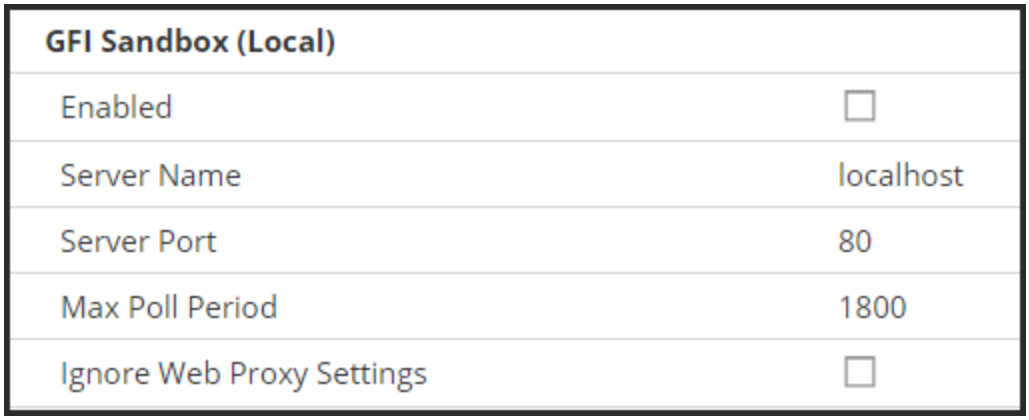


1. To enable or disable Community analysis entirely, click the **Enabled** checkbox. The default value is **Disabled**.
2. To configure handling of PDF, Microsoft Office, and Windows PE files in a session, select the specific checkboxes - **bypasspdf**, **bypass office, bypass executable.**
3. Click **Apply** to save the changes and put them into effect immediately as Malware Analysis receives new packets.

Configure Sandbox Analysis Scoring

By default, the sandbox module is disabled and MS Office and PDF files are prevented from being processed. The intent is to set to the most restrictive settings to force the user to specify whether or not potentially sensitive information is sent outside of the network for processing. If a document type is not prevented from being processed, the entire file (not just the hash) is sent to the destination sandbox server.

In addition, you can choose to preserve the original file name when performing sandbox analysis.



Note: If you do not specify the **Preserve Original File Name when Performing sandbox Analysis** parameter, NetWitness hashes the files.

When you enable the sandbox module, you must specify whether or not the sandbox processing is performed using a local GFI sandbox, a local ThreatGRID sandbox, or a cloud version of the ThreatGRID sandbox. The cloud version of the ThreatGRID sandbox is provided directly by ThreatGRID and requires an activation key to be obtained from ThreatGRID and configured in the ThreatGRID tab.

GFI Sandbox Settings

To use a locally installed GFI sandbox, you must enable GFI and supply the Server Name and Server Port of the GFI sandbox Server. The Max Poll Period and Polling Interval determine how long to wait for a submitted sample to finish processing and how often to check the status (in seconds). The Ignore Web Proxy Settings option allows you to indicate that you want Malware Analysis to bypass a web proxy when making this connection. If no Web Proxy has been configured in Malware Analysis, the setting is ignored.

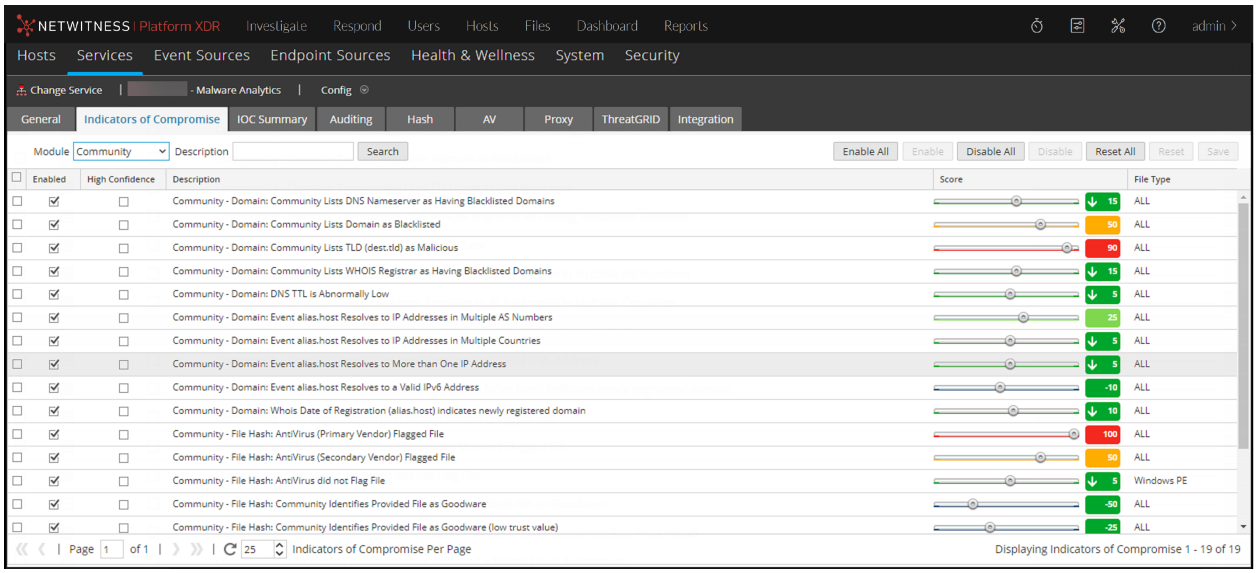
ThreatGRID Sandbox Settings

Note: Before enabling ThreatGRID scoring, a ThreatGRID-supplied Service Key must be configured so that ThreatGRID can recognize that samples submitted from this site are legitimate. Use NetWitness to register for a ThreatGRID API key, then you can enable and configure a locally installed ThreatGRID sandbox or the ThreatGRID Cloud sandbox. Refer to the following detailed task: Register for a ThreatGRID API Key.

The Ignore Web Proxy Settings allows you to indicate that you want Malware Analysis to bypass a web proxy when making this connection. If no Web Proxy has been configured in Malware Analysis, the setting is ignored.

To configure sandbox scoring, in the Modules Configuration section:

1. To enable or disable sandbox analysis entirely, click the **Enabled** checkbox. The default value is **Disabled**.
2. To configure handling of PDF, Microsoft Office, and Windows PE files in a session, select any of the three checkboxes **Bypass PDF**, **Bypass Office, Bypass Executable.**
3. Configure the active sandbox vendor. You have three options:
   a. To use a locally installed instance of the GFI sandbox, provide the Server Name and Server Port of the GFI sandbox Server, the Max Poll Period and Polling Interval, and optionally, select the **Ignore Web Proxy** checkbox.
   b. To use a locally installed instance of ThreatGRID, enable ThreatGRID scoring, provide the ThreatGRID Service Key and optionally, select the **Ignore Web Proxy** checkbox.
   c. To use the ThreatGRID Cloud, you must first register for a ThreatGRID API key. Then enable ThreatGRID scoring, provide the ThreatGRID Service Key, enter the URL for the ThreatGRID server (https://panacea.threatgrid.com), and optionally, select the **Ignore Web Proxy** checkbox.
4. Click **Apply**.
   The changes become immediately effective.



Configure Indicators of Compromise

The Indicators of Compromise (IOC) for the Malware Analysis scoring modules are configured since, each Malware Analysis scoring module -- Network, Static, Community, Sandbox, and YARA -- has a default set of Indicators of Compromise (IOCs) that it uses to evaluate the file and session data in order to assess the likelihood of malware being present.

Each IOC is assigned a numeric score weighting between -100 (good) and 100 (bad). When an IOC triggers, the numeric score weighting is factored into the total score for the session or file being analyzed. The individual score weightings for all matched IOCs are aggregated to produce the resulting score for each session or file. The aggregated score is adjusted to ensure that it does not exceed the valid score range (-100 through 100).

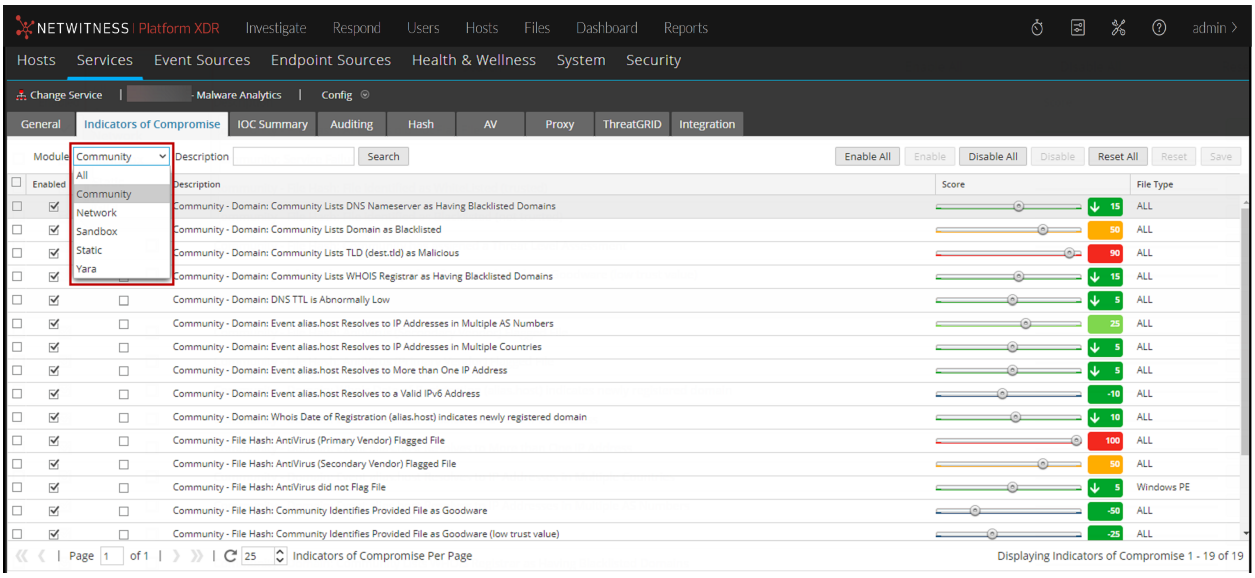
Note: The score weighting assigned to an IOC is not always the explicit score value that is aggregated (it is not a simple addition of score weights for each IOC that triggers). Instead, the IOC's score is a weighting or indicator of importance that is factored into calculating an overall score.

The Indicators of Compromise (IOC) configuration settings for Malware Analysis are in the Service Config view > Indicators of Compromise tab. Below is an example of the tab.

Using the **Community - File Hash: AntiVirus (Primary Vendor) Flagged File** IOC as an example, the IOC's score weighting could be set to 100. However, Malware Analysis dilutes this value based on the percentage of primary AV vendors that agree if the sample is malicious. The closer to 100% of the vendors who agree that the sample is malicious, the closer to the full 100 points are used in aggregating a score. As the percentage drops closer to 0%, the proportion of the full 100 points used in the aggregated score drops.

IOCs use logic implemented natively in Malware Analysis. You cannot adjust the logic. Instead, you can only adjust the IOC to increase or decrease its impact on scoring, to indicate a confidence setting, or to turn the IOC on or off. The typical scenario is to adjust a limited set of IOC score weighting values downward for IOCs that are inflating the final score and causing false positive analysis results. An extreme version of tuning would be to disable the IOCs entirely if they consistently contribute to false positive results. Additionally, the flexibility exists to allow you to disable all IOCs and to choose a select few to leave enabled. For example, all IOCs can be disabled with the exception of a select few IOCs that detect AntiVirus matches. Using Malware Analysis in this extremely limited configuration, you can reduce results in Malware Analysis such that only known A/V matches generate results.

You can configure this functionality in several ways:



- Disable IOCs so that they are not evaluated as part of the scoring module to which they are assigned.
- Adjust the score weight for an IOC such that its impact on the aggregated score is increased or decreased.
- Mark IOCs that you expect to be strong indicators of malware and display a high-confidence (HC) flag on sessions that triggered these IOCs in the Malware Analysis results.
- Customize score and confidence settings uniquely to the file type being analyzed. Each IOC is pre-assigned a file type to which it is applied. Possible values are **ALL**, **PDF**, **MS Office**, and **Windows PE**. The IOC with the most applicable file type is used during file-based analysis. For example, if a PDF is analyzed, an IOC with a file type set to **PDF** will be chosen rather than the same IOC with a file type set to **ALL.** If no file-type specific match is found, the IOC with a file type set to **ALL** is selected.
- Search for rules to display in the grid based on a match to the rule description.

Filter Displayed IOCs by Module

You can filter the displayed IOCs by scoring module: one of the four built-in modules or YARA. YARA-based IOCs are interleaved with the native IOCs with each category. Although the YARA IOCs are not identified as such in the other views, you can select YARA from the Module selection list to see a list of YARA rules.

To view the IOCs for one or the four scoring modules or for YARA:

1. Go to  **(Admin) > Services**.
2. Select a Malware Analysis service.
3. In the row, select  **> View > Config**.
4. Click the **Indicators of Compromise** tab.
5. In the **Module** selection list, select **All**, **NextGen**, **Static**, **Community**, **Sandbox**, or **YARA**.
   The configured rules and settings for the module are displayed.

Filter Displayed Modules to Show Only Modified Modules

The **Indicators of Compromise** tab visually identifies IOCs that are locally modified. When an IOC has been modified, for example, the score weight has been changed, and the name is displayed in red and includes a modification indicator appended to the IOC name. The modification indicator is ++ and can be used as a filtering mechanism when searching for IOCs.
To limit the display to locally modified IOCs:

1. In the **Description** field, enter ++.
2. Click **Search**.
   The view is filtered to show only modified IOCs.

Enable and Disable IOCs for a Scoring Module

When an IOC is disabled, it no longer impacts the aggregate score for the scoring module to which it belongs. If the IOC has multiple instances (differentiated only by file type), disabling a more file-type specific IOC results in use of the more file-type agnostic version of the IOC in scoring.
For example, if the same IOC exists as file type **ALL** and file type **Windows PE**, disabling the **Windows PE** instance of the IOC causes the **ALL** version to be used in scoring. In order to disable the IOC entirely for **Windows PE**, while leaving the IOC enabled for other file types, set the score weighting of the **Windows PE** instance of the IOC to a value of zero as described below. This leaves the IOC enabled for Windows PE files (although it has a zero weighting and is suppressed from being displayed in analysis results), while not affecting the other file types. The remaining file types will continue to use the **ALL** instance of the IOC.

To enable or disable an IOC so that it no longer factors into a scoring module:

1. Go to  **(Admin) > Services**.
2. Select a Malware Analysis service, and in the row select  > **View > Config**.
3. Click the **Indicators of Compromise** tab.
4. In the **Module** selection list, select a scoring module: **All**, **Community**, **Network**, **Sandbox**, **Static**, or **YARA**.
   The configured rules and settings for the module are displayed.
5. Do one of the following:
   a. Click the **Enabled** checkbox in the column next to a rule that you want to enable.
   b. Select one or more rules, and click **Enable** or **Disable** in the toolbar.
   c. To toggle between Enabled and Disabled for all rules displayed on the page, click the **Enabled** checkbox in the column title.
   d. To enable or disable all rules for the scoring module, click **Enable All** or **Disable All** in the toolbar.
6. To save the changes to the page, click **Save** in the toolbar.

> **Note:** Rules that have changed settings are displayed with a red corner. If you navigate to another page of rules before saving, all changes to this page are lost.

Adjust the Score Weight for an IOC

Adjusting the score weight for an IOC increases or decreases the IOC's overall impact on the aggregate score for the module in which it is configured. To raise or lower the overall impact of the IOC, reduce the current value to a new setting.

- Values ranging from -100 to -1 indicate that the session or file being analyzed is not likely to be malware (-100 being the least likelihood).
- Values ranging from 1 to 100 indicate a likelihood that the file or session being analyzed is malware (100 being the highest likelihood).
- Setting the value to zero leaves the IOC enabled, but causes the IOC to no longer impact the aggregate score and suppresses the IOC from being displayed in analysis results. Setting the value to zero is a method of disabling a file-type specific instance of an IOC while leaving the original file-type agnostic instance of the rule intact for scoring of the remaining file types.

To adjust the score weight:

1. Go to  **(Admin) > Services**.
2. Select a Malware Analysis service.
3. In the row, select  **> View > Config**.
4. Click the **Indicators of Compromise** tab.
5. In the **Module** selection list, select a scoring module: **All**, **Network**, **Static**, **Community**, **Sandbox** or **YARA**.
   The configured rules and settings for the module are displayed.
6. Do one of the following:
   a. Drag the score slider left or right to decrease or increase the score weight.
   b. Click directly on the displayed score weight and enter a new score weight.
7. To save the changes to the page, click **Save** in the toolbar.

Note: Rules that have changed settings are displayed with a red corner. If you navigate to another page of rules before saving, all changes to this page are lost.

Set the High Confidence Flag for an IOC

The High Confidence setting is used as a method of flagging specific IOCs as high confidence indicators that malware is present. As an example, the **Community - File Hash: AntiVirus (Primary Vendor) Flagged File** IOC has a low probability of being a false positive, combined with a high probability of being an accurate measurement of malware being present. By flagging this IOC (and others) as High Confidence, you can use a filter in the Malware Analysis results to limit display to only those sessions that include one or more high confidence rules. By doing so, the display is limited to a smaller subset of results whose accuracy is accorded a higher degree of confidence. Displaying results not limited to high confidence IOCs still allows you to review results that are more grey in nature. This provides for results that are less prone to false negative results. Choosing to filter or to not filter results based on confidence level has a valid use case in the NetWitness workflow.
To set the High Confidence flag:

1. In the **Indicators of Compromise** tab, select a scoring module from the **Module** selection list: **All**, **Network**, **Static**, **Community**, **Sandbox**, or **YARA**.
   The configured rules and settings for the module are displayed.
2. Click the **High Confidence** checkbox in the column next to a rule that you want to flag or unflag as highly likely to indicate the presence of malware in a session when matched.
3. To save the changes to the page, click **Save** in the toolbar.

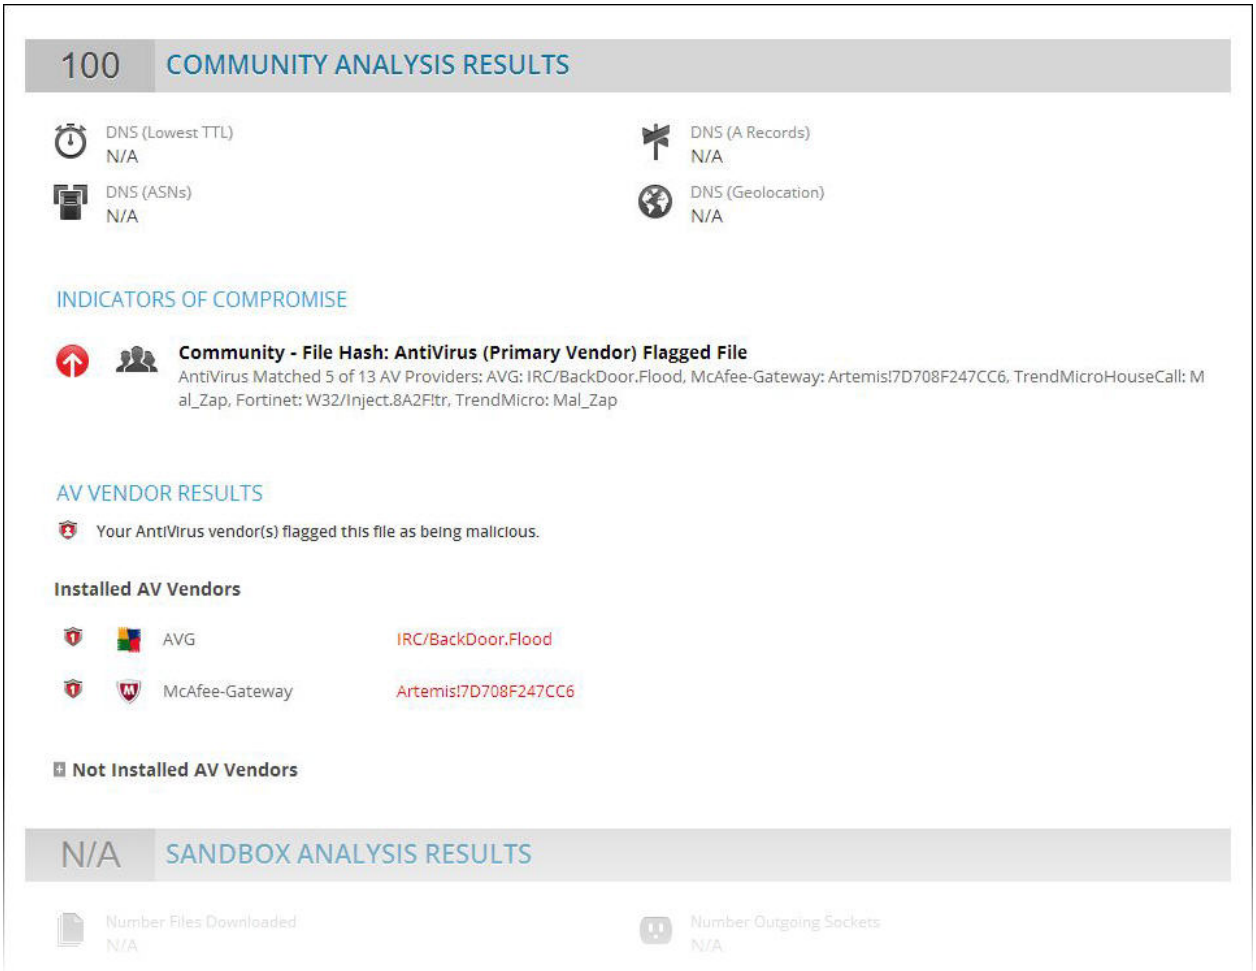
Note: Rules that have changed settings are displayed with a red corner. If you navigate to another page of rules before saving, all changes to this page are lost.

Reset IOCs to Default Settings

1. In the **Indicators of Compromise** tab, select a scoring module from the Module selection list: **All**, **Network**, **Static**, **Community**, **Sandbox**, or **YARA**.
   The configured rules and settings for the module are displayed.
2. If you want to reset all rules on the current page to their default settings, click **Reset** in the toolbar.
3. If you want to reset all rules for the selected scoring module to default settings, click **Reset All** in the

toolbar.

4. To save changes to the page, click **Save** in the toolbar.



Configure Installed Antivirus Vendors

You can compare file analysis results from your installed antivirus (AV) vendors versus community results from the Malware Analysis knowledge base. While a file is being analyzed by community analysis, Malware Analysis checks an antivirus knowledge base to determine if the sample is already known to be malicious. If the file is known to be malicious, NetWitness flags the file to indicate whether a primary antivirus vendor or a secondary antivirus vendor identified the sample. NetWitness classifies vendors as primary and secondary to indicate the level of reputation the vendors have in the industry, and Indicators of Compromise factor the reputation into scoring. For example, detection made solely by secondary antivirus vendors may score less than detection by primary vendors.

Note: When choosing AV vendor software to install on your network, it is highly recommended that you include at least one from NetWitness Primary Vendors list. For more information, please see the Supported Antivirus Vendors.

You can identify the antivirus vendors installed on your network to NetWitness. NetWitness compares the antivirus results during community analysis against the results from the installed vendors selected in the AV tab. If a match is detected, the file being analyzed is flagged to indicate that your locally installed primary or secondary antivirus software detected the sample.

The example below shows the community analysis results for a file that had a score of 100. Under **Indicators of Compromise**, you can see that the file was flagged by the listed AV vendors in the Community. Under **AV Vendor Results**, NetWitness indicates whether the AV vendors installed in your environment flagged the file as malicious. If your installed AV vendors detected the virus, the name of the malware is displayed. If your installed AV vendors did not detected the virus, **--Not detected--** is displayed next the AV vendor name. Under **Not Installed Vendors**, you can click + to expand the section and see if other vendors not installed on your system detected the virus.

Identify Installed AV Software

To identify Antivirus software installed on your network:

1. Go to **(Admin) > Services.**
2. Select a Malware Analysis service, and in the row select **> View > Config**.
3. In the **Service Config View**, select the **AV** tab.
4. Select the checkbox next to each antivirus vendor (primary and other) whose software is installed on your network.
5. To save the changes, click **Apply**.
   The Community Analysis results will indicate whether your software flagged an event.
6. (Optional) If you want to reset the list of installed AV software to the default value (none), click **Reset**.
   All selections are removed.
7. To save changes, click **Apply**.

Enable Community Analysis

An Administrator can enable community analysis. For Community analysis, new malware detected on the network is pushed to the Netwitness Cloud for checking against Netwitness's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. To enable Community analysis, you must register with the Netwitness cloud and test connection to the cloud, then to test the connection between the Netwitness cloud and the service you have configured for continuous scanning.

A complete description of analysis methods is provided in How Malware Analysis Works.

1. Go to  **(Admin) > Services.**
2. Select a Malware Analysis service, and in the row select  **> View > Config**.
3. In the **Service Config View**, select the **Integration** tab.
4. Scroll down to **Netwitness Cloud Connection Test and Registration**.

   NetWitness tests communications with the site at `https://cloud.netwitness.com`. If your company uses a proxy for outbound traffic, please check your Proxy settings. A valid connection is required in order to register with the Netwitness Community Service.
5. Enter your company name and contact email. Click **Register**.

   If all required fields are complete, your registration is completed. The label on the button used to register changes to Update.
6. To verify that the Malware Analysis Service can connect to the Core service selected for continuous scanning, click **Test Connection**.

   NetWitness initiates a check based on the Source Host, Source Port, Username, and User Password specified in the General tab. When the test executes successfully, analysts are able to see Community Scoring in Malware Analysis.

(Optional) Configure Auditing on Malware Analysis Host

This topic introduces the configurable features of the Malware Analysis auditing log and the procedures for configuring the features. Malware Analysis is capable of generating auditing alerts based on configured score module thresholds. Once the analysis score for a file in an analysis session meets or exceeds the configured threshold(s), an auditing alert is generated. Thresholding allows sessions and files that score high enough to be likely malware candidates to automatically generate an alert.

Alerts can be configured to be formatted as SNMP, Syslog or File entries. Supporting various audit formats provides a method for external systems to ingest auditing events based on their capability of parsing the supported formats.

In addition to auditing analysis sessions, the following events will trigger an audit alert:

- User login successes and failures
- Changes to system configuration settings

- Server restart
- Server version upgrade and install

The Auditing configuration settings for Malware Analysis are in the Service Config view > Auditing tab.

Configure the Auditing Threshold

The sole purpose of the thresholds is to specify the criteria that must be reached prior to an alert being generated for an analyzed session/file. If auditing is enabled, each scored file/session is examined to determine if the score in each score module meets or exceeds the configured auditing threshold. If so, an alert is generated using the configured audit alert format (e.g., SNMP, Syslog or File). For example, by configuring SNMP and setting the Community Threshold to 90, all sessions/files that score 90 or higher in the Community Score module generate an SNMP trap. If all of the thresholds are set to 90, then an alert is not generated unless a session or file scores 90 or higher in the Network, Static, Community and sandbox score modules.

To configure the auditing threshold:

1. Go to  **(Admin) > Services**.
2. Select a Malware Analysis service, and select  **> View > Config**.
3. In the **Services Config** view, click the **Auditing** tab.
4. In the **Auditing Thresholds** section:
   a. Set the threshold for the **Community**, **Static**, **Network**, and **Sandbox** by doing one of the following for each scoring module:
      - In the slider, click and drag the handle in either direction.
      - In the value field, type a number between 0 and 100, inclusive.
   b. (Optional for 10.3 SP2) Select one or more triggers to record a message and deliver it through all enabled auditing methods.
   c. Click **Apply**.
      - The threshold setting becomes effective immediately for all enabled auditing methods: SNMP, File, and Syslog.
      - The recorded messages are sent through all enabled auditing methods: SNMP, File, and Syslog.

Configure Incident Management Alerting

When enabled, Malware Analysis alerts feed into the NetWitness Respond workflow.

1. Go to  **(Admin) > Services**.
2. Select a Malware Analysis service, and select select  **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.

4. In the **Respond Alerting** section, select the **Enabled** checkbox and click **Apply**.
   Alerting becomes effective immediately.

Configure SNMP Auditing

The Simple Network Management Protocol (SNMP) is an Internet-standard protocol for managing services on IP networks. When SNMP auditing is enabled, Malware Analysis can send an audit event as an SNMP trap to a configured SNMP trap host. In addition to the score and event ID, the alert includes all session meta as well as generated meta data. This is useful for users who want to feed event data to third-party systems.

To configure SNMP auditing:

1. Go to  **(Admin) > Services**.
2. Select a Malware Analysis service, and select  **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **SNMP Auditing** section, click the checkbox to enable SNMP auditing.
5. Configure the SNMP server name and port.
6. Configure the SNMP version and trap OID for sending traps.
7. Configure the Malware Analysis community, and retry and timeout parameters when sending traps.
8. Click **Apply**.
   The SNMP auditing settings become effective immediately.

Configure File Auditing Settings

When file auditing is enabled, the audit log file is kept in the Malware Analysis Home Directory. The default location for this log file is:

`/var/lib/netwitness/malware-analytics-server/spectrum/logs/audit/audit.log`.

As each log reaches the maximum file size, it is archived and a new log is created. The size of these audit logs and their number are both configurable.

Caution: Avoid setting the max file size and archive file count too high, because it may have an adverse effect on the available disk space on the Malware Analysis appliance.

To configure the file auditing settings:

1. Go to  **(Admin) > Services**.
2. Select a Malware Analysis service, and select  **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **File Auditing** section, click the checkbox to enable file auditing.
5. (Optional) Set the Archive File Count and Max File Size.
6. Click **Apply**.
   The file auditing settings become effective immediately.

Configure Syslog Auditing Settings

When enabled, Syslog provides auditing through the use of the RFC 5424 syslog protocol. Regulations, such as SOX, PCI DSS, HIPAA, and many others are requiring organizations to implement comprehensive security measures, which often include collecting and analyzing logs from many different sources. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

In addition to the score and event ID, the syslog includes all session meta as well as generated meta data. This is useful for users who want to feed event data to third-party systems.

To configure the syslog auditing settings:

1. Go to  **(Admin) > Services**.
2. Select a Malware Analysis service, and select  **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **Syslog Auditing** section, click the checkbox to enable syslog auditing.
5. Configure the host where the target syslog process is running and the port on the host where the syslog process is listening.
6. Configure the facility, encoding, format, max length, and timestamp for outgoing syslog messages.

   Note: (Optional) Configure Identity String to prepend to syslog alerts.
   For CEF format, please refer to Create Custom Alert in CEF Format for additional considerations.

7. Click **Apply**.

   The syslog auditing settings become effective immediately.

(Optional) Configure Hash Filter

This topic introduces hash filters as a method of marking files in Malware Analysis that are known to be good or known to be bad. Hash filtering allows you to maintain a list of known good or known bad file hashes. In the Hash tab, you can fine tune Malware Analysis event analysis based on file hashes. When a file hash is marked as Good, Malware Analysis does not analyze the file the next time it is seen. When a file hash is marked as Bad, Malware Analysis automatically raises the file's community score by a large number of points. Malware Analysis still analyzes the file, just in case new information becomes available.

Note: If an event contains a single file and that file's hash is marked as Good, Malware Analysis filters the entire event and you do not see it in Malware Analysis results.

To add hash filters to the hash list, you can use either of these manual methods:

1. Context menu add in the Event Detail view: Right-click on a file, and a context menu allows marking of the hash for the selected file as Good (Normal) or Bad (Malicious).
2. Hash tab toolbar: Click **Add** in the Hash tab to add a file hash, file size, and optionally, mark the hash as trusted.

There is also an automated method to add hash filters to Malware Analysis by importing a hash list in bulk from the watched folder. Hashes imported through the watched folder do not appear in the hash list. With bulk importing and the watched directory (/var/netwitness/malware-analytics-server/spectrum/hashWatch) on the Malware Analysis server set up, copy a hash list into the watched folder to be automatically imported into the system. Hashes imported using the bulk import method overwrite hashes that were previously imported through the watched folder.

View the Hash List

To view the Hash List:

1. Go to  **(Admin) > Services**.
2. In the Services view, select a Malware Analysis service, and select  **> View > Config**.
3. Select the **Hash** tab.

   The hash list is displayed in the Hash tab. Only file hashes that have been added using one of the methods are displayed.

Add a File Hash to the Hash Filter

To add a file hash to the hash filter:

1. In the **Hash** tab, in the toolbar, click **Add**.

   The Add Hash dialog is displayed.
2. If the hash is trusted, select **Trusted**.
3. Enter the MD5 hash and the file size in bytes.
4. Click **Save**.

   The file hash is added to the hashes and used to perform hash filtering in Malware Analysis.

Mark a Hash as Trusted or Untrusted

To mark a file hash as trusted or untrusted:

1. In the **Hash** tab, to toggle between trusted and untrusted, click in the **Trusted** column for the hash.
2. In the toolbar, click **Save Edit**.

Delete a Hash from the Hash Filter

To delete a hash from the hash filter:

1. In the **Hash** tab, select one or more hashes that you want to remove from the hash filter.
2. In the toolbar, click **Delete**.

   A dialog requests confirmation and offers an opportunity to cancel.
3. To confirm the deletion, click **Yes**.

The file hash is deleted from the grid and no longer used to perform hash filtering in Malware Analysis.

Search for a File Hash

In the Hash tab, you can search for a file hash that is displayed in the grid. In the MD5 field, type the file hash for which you are searching, and click **Search**. The list of files that contain the hash is displayed in the grid.

Import a Hash List Using the Watched Folder

To import a hash list from the watched directory, the hash list must be in the specified format and must be sorted on md5. You can drop a file formatted as described below into a folder (/var/netwitness/malware-analytics-server/spectrum/hashWatch) on the Malware Analysis appliance, and it is automatically imported into the local hash database. This is the only way to import file hashes into. An additional use case is to allow a system administrator to expose the watched directory to some process that would push a file to this directory. This is a bulk import method designed to handle a high volume of hash imports.

This is a csv-formatted file with no spaces between the data in each row. The assumption with the data in the hash list is that there are no duplicates. Duplicates are ignored during processing. If duplicate hashes are encountered, the log file will display the following message to indicate the number of duplicate hashes contained in the file:

2013-08-09 09:46:00,674 [jobExecutor-2(HashFileWatch)] INFO com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Processing - /var/lib/rsa>malware/hashWatch/test.csv
2013-08-09 09:47:56,619 [jobExecutor-2(HashFileWatch)] INFO com.netwitness.malware.core.services.file.hash.HashServiceImpl - Skipped 21 Duplicate Hashes Already on File
2013-08-09 09:48:06,638 [jobExecutor-2(HashFileWatch)] INFO com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Processed - /var/lib/rsa>malware/hashWatch/test.csv

Below is an example of a hash list in the default file format.

```
[BeginFileExample]
392126E756571EBF112CB1C1cdEDF926,98865,True
0E53C14A3E48D94FF596A2824307B492,2226,True
176308F27DD52890F013A3FD80F92E51,42748,False
9B3702B0E788C6D62996392FE3C9786A,32768,False
937ADE76A75712B7FF339403B4FCB5A6,4821,False

E6CAF205E602CFA9A65663DB1A087874,704,False
680CA0BCE1FC7BC4136ADF4E210869C5,2075,False
[EndFileExample]
```

A NetWitness configuration file (**/var/netwitness/malware-analytics-server/spectrum/conf/hashFileWatchConfig.xml**) specifies the format and options in the hash list import process. Below is a listing of the configuration file.

```
<config>
 <enabled>true</enabled>
 <distributedCacheEnabled>true</distributedCacheEnabled>
 <watchDirectory>//var/lib/rsamalware/hashWatch</watchDirectory>

<processedDirectory>/
var/lib/rsamalware/hashWatch/processed</processedDirectory>

<erroredDirectory>/
var/lib/rsamalware/hashWatch/error</erroredDirectory>
 <md5Col>0</md5Col>
 <fileSizeCol>-1</fileSizeCol>
 <isTrustedCol>1</isTrustedCol>
 <isTrust>false</isTrust>
 <ignoreFirstLine>false</ignoreFirstLine>
 <frequencyInMinutes>1</frequencyInMinutes>
 <isGzipCompressed>false</isGzipCompressed>
 </config>
```

Line	Description
<md5Col>0</md5Col>	The location of the md5 hash in each entry. The default value is position **0**, or the first position.
<fileSizeCol>1</fileSizeCol>	The location of the hash size in each entry. The default value is position **1**, or the second position. If the hash size is not included in the csv file, the value must be **-1**.
<isTrustedCol>2</isTrustedCol>	The location of the Trusted Column in each entry. The default value is position **2**. If the Trusted parameter is not included in the csv file, the value must be **-1**.
<isTrust>false</isTrust>	The default assumption for **Trusted** in each entry is **false**.
<ignoreFirstLine>false</ignoreFirstLine>	The presence or absence of a header in the hash. The default value is **false**. If the hash has a header, the value must be set to **true**.
<frequencyInMinutes>1</frequencyInMinutes>	The interval between checks by NetWitness in the watched directory. The default value is **1** minute.
<isGzipCompressed>false</isGzipCompressed>	The hash is compressed using Gzip. The default value is **false**. If the hash is Gzip compressed, the value must be set to **true** here.

When the hash list has been imported, the system log has entries similar to this:

```
2013-04-11 03:22:00,597 [jobExecutor-9(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch -
Processing - /var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
 2013-04-11 03:22:00,600 [jobExecutor-9(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Processed
- /var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
```

If there is a problem loading the file, the system log has entries similar to this:

```
2013-04-11 03:17:00,597 [jobExecutor-4(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch -
Processing - /var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
 ... Verbose log
 2013-04-11 03:17:00,632 [jobExecutor-4(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Error
Processing - /var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
```

To import a hash list using the watched folder method:

1. Copy the hash lists that you want to import into the **/var/netwitness/malware-analytics-sever/spectrum/hashWatch** directory.
   Malware Analysis automatically watches this folder and processes files placed there.
   Malware Analysis adds every hash found in the hash lists to the hash filter.
   If there are processing errors, they are logged in **/var/netwitness/malware-analytics-sever/spectrum/hashWatch/error**
   Processed files are cataloged in **/var/netwitness/malware-analytics-sever/spectrum/hashWatch/processed**
   Processed files are not removed from the hashWatch directory.
2. After importing hashes in bulk, the System Administrator can use a cronjob to clean up old processed files.

(Optional) Configure Malware Analysis Proxy Settings

This topic describes the configuration of a web proxy for communicating with the Netwitness Cloud service and local ThreatGRID or GFI service. The settings in the Service Configuration view > Proxy tab set up communication by web proxy, which Malware Analysis can use to communicate with Netwitness Cloud for community analysis and sandbox analysis. Once the proxy is configured:

- Malware Analysis communicates via web proxy with the Netwitness Cloud for community analysis.
- Malware Analysis communicates via web proxy with the configured ThreatGRID or GFI sandbox service. Using a web proxy may negatively affect performance. ThreatGRID and GFI configuration sections in the General tab have an option to ignore the web proxy and communicate directly with the sandbox to improve performance.

Configure the Web Proxy

To configure the web proxy for Malware Analysis:

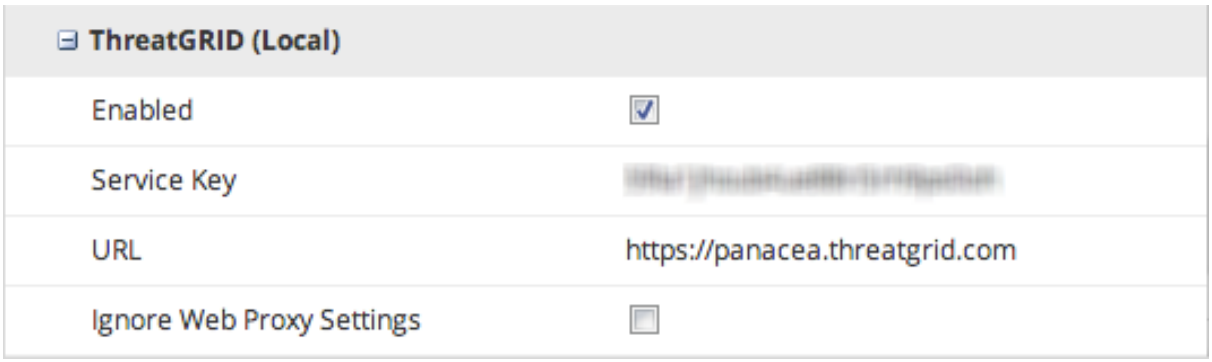
1. Go to  **(Admin) > Services** view.
2. Select a Malware Analysis service, and select  **> View > Config**.
3. In the **Services Config** view, select the **Proxy** tab.
4. To enable the proxy, select the **Enabled** checkbox.
5. (Optional) To automatically detect proxy settings for the NetWitness Server, select the checkbox.
   The proxy host and proxy port fields are autofilled.

6. If you want to use a different proxy, enter the **Proxy Host** and **Proxy Port**.
7. Enter the username and password used to log on to the proxy host.
8. (Optional) Select **SSL**, if the proxy host communicates over SSL.
9. Click **Apply**.
10. Restart the Malware service.

Note: Malware Analysis does not support NTML web proxy authentication.

(Optional) Register for a ThreatGRID API Key

This topic provides the procedure for obtaining a trial ThreatGRID API key for use in the ThreatGRID Cloud sandbox. Before enabling ThreatGRID as the sandbox service in the sandbox module, a ThreatGRID-supplied Service Key must be configured so that ThreatGRID can recognize that samples submitted from this site are legitimate.



If you do not have a ThreatGRID-supplied Service Key, you can obtain a key using this tab. The key is provided on a trial basis.

When you fill in your user information and click **Register**, a key is displayed in this tab, and automatically added to the ThreatGRID configuration in the **General** tab. In a few minutes, you will receive an email from ThreatGRID containing a link to their page where you can log on. After you agree to the license terms on the ThreatGRID page, you can submit files for analysis, and ThreatGRID will recognize files that Malware Analysis submits for sandbox analysis.

To obtain a Trial ThreatGRID API key:

1. Go to  **(Admin) > Services**.
2. Select a Malware Analysis service, and select  **> View > Config**.
3. In the **Services Config** view, select the **ThreatGRID** tab.
4. Enter your full name, job title, organization name, and email address.
5. In the User Id and Password field, create a user ID and password for logging on to ThreatGRID.
6. Click **Register**.

   Your registration is sent to ThreatGRID and an API key is displayed below the Register button. The key is automatically filled in the **General** tab.
7. Select the **General** tab to confirm that the ThreatGRID configuration now includes the API key.

8. When you receive an email from ThreatGRID with a link where you can log on, log on and accept the terms of the agreement.

   Your trial of ThreatGRID begins and Malware Analysis can send five files per day to the ThreatGRID Cloud for sandbox analysis.

Additional Procedures for Configuring Malware Analysis

This topic provides procedures that an Administrator may perform to accomplish an objective that is not part of basic Malware Analysis setup. After Malware Analysis is configured, administrators may want to fine-tune the service and implement advanced customization; an example of this is implementing custom YARA content.

- Create Custom Alert in CEF Format
- Enable Custom YARA Content

Create Custom Alert in CEF Format

This topic provides instructions for creating custom alerts in Common Event Format (CEF) to send to a service that ingests events as CEF. This is an advanced configuration task, which requires sufficient knowledge to manually edit the configuration file: `/var/netwitness/malware-analytics-server/spectrum/conf/malwareCEFDictionaryConfiguration.xml`. Before editing the file, you must stop the Malware Analysis service in the operating system. The CEF Alert becomes active when you restart the Malware Analysis service.

The CEF Template

To send events to a service ingesting events as CEF, NetWitness runs them through a configuration file that serves as a CEF template before feeding the events to a correlation technology. You can tune the configuration file, which specifies the sequence and mapping of syslog fields in each alert.

The following example syslog message shows the CEF fields in the extensions section of the alert (following the last '|' in the alert). Each field can be configured to indicate the sequence (described in the Example section below). Fields can be excluded entirely from the alert via a configuration setting.

```
CEF:0|NetWitness|Spectrum|10.3.0.7995.1.0|Suspicious Event|Detected
suspicious network event ID 4 session ID n/a|2|static=100.0 nextgen=25.0
community=100.0 sandbox=25.0 file.name=myFile.exe file.size=1234556
file.md5.hash=DEADBEEFBABECAFEDEADBEEFBABECAFE
event.source=spectrum://admin@0:0:0:0:0:0:0:1:64563 event.type=MANUAL_
UPLOAD event.id=0 country.dst.code=-- country.dst=Unavailable
ip.src=0:0:0:0:0:0:0:1 ip.dst=0:0:0:0:0:0:0:1 event.uuid=f7a6155a-31de-
4fa6-ba16-41fb9a8e5f26 ...
```

Understand a Syslog Auditing File Entry

The description of the file structure is based on the following sample.

```
Feb 6 10:02:28 10.10.10.125 SpectrumServer125

CEF: 0|NetWitness|Spectrum|1.2.1.130|Suspicious Event|Detected suspicious
 network event ID 857 session ID 73|2|

static=100.0 network=29.0 community=8.0 sandbox=N/R

file.name=-CVE-00_DOC_2010-05-13_attachment.doc file.size=0
file.md5.hash=20a29259c0e5958afb2f50c4177bb307
```

```

First Line

```
Feb 6 10:02:28 10.10.10.125 SpectrumServer125
```

Log Information	Description
Feb 6 10:02:28	The timestamp for the entry.
10.10.10.125	The source IP address for the event.
SpectrumServer125	The source hostname for the event.

Audit Common Event Format (CEF) Header

```
0|NetWitness|Spectrum|1.2.1.130|Suspicious Event|Detected suspicious network
event ID 857 session ID 73|2|
```

The audit CEF header is a pipe-separated listing of the following fields:

Log Information	Description
0	The ArcSight Common Event Format (CEF) version used for the audit syslog.
NetWitness	The service that created the syslog message.
Spectrum	Malware Analysis is the logger for the event.
1.2.1.130	Malware Analysis version.
event ID 857	Unique network event id for this event.
session ID 73	Core unique session id for the session that included this event.

Log Information	Description
2	Severity, an integer between 1 and 6 indicates the level of severity for the message. • 1 = INFORMATION_LEVEL • 2 = WARNING_LEVEL • 3 = ERROR_LEVEL • 4 = SUCCESS_LEVEL • 5 = FAILURE_LEVEL • 6 = AUDIT_FAILURE_LEVEL

Audit CEF Extension

Analysis Scores

The first entry in the audit CEF extension provides the four Malware Analysis scores for the event: Static, Network, Community, and Sandbox.

Log Information	Sample Value
static	100.0
network	29.0
community	8.0 A score of 0.0 can be a community score for the event or can indicate that no community services were enabled.

Log Information	Sample Value
sandbox	N/R N/R means not run. This indicates that the GFI sandbox was not enabled.

File Information

The next three entries provide file information: file name, size, and hash.

Log Information	Sample Value
file.name	-CVE-00_DOC_2010-05-13_attachment.doc
file.size	0
file.md5.hash	20a29259c0e5958afb2f50c4177bb307

Event Meta Data Retrieved by NextGen

The record continues with the Core meta data for the event. The meta data in the message depends on the event. The amount of data in the message is truncated to the maximum length in bytes configured in the Syslog Settings. The default value is 1024.

Log Information	Sample Value
com.netwitness.event.internal.id	73
com.netwitness.event.internal.uuid	37d2bad7-06bc-4b34-88e1-df43d9710204

Edit the Configuration File

1. Stop the Malware Analysis service.
2. Edit the configuration file as described in the Example.

3. Start the Malware Analysis service.

   The Malware Analysis service begins processing alerts through the configuration file and sending CEF alerts to designated services.

Example

The configuration file can be used to dictate which fields appear in the resulting alert as well as the label associated with each field and the order in which the data fields appear. The configuration file is composed of one or more XML `MalwareCefExtension` blocks as shown in the example below. The ordering of these blocks in the configuration file implies the order of the data fields in the CEF alert.

In the example below, the CEF alert would include two data fields, `ip.src` followed by `ip.dst`. The `customKey` is used to indicate the labeling of the data field in the alert. This allows the user to choose a custom label in order to force the alerting format to better match the expectations of the alert consumer. In other words, the format can be tuned to prevent unwanted changes to an existing alert parser. Lastly, the `isDisplay` setting determines if the field is included in the alert output. This allows the user to turn off data fields without having to physically delete the `MalwareCefExtension` block from the configuration.

```
 <config>
 <malwareExtensionList>
<com.netwitness.malware.core.cef.MalwareCefExtension>
   <customKey>ip.src</customKey>
   <malwareKey>ip.src</malwareKey>
   <isDisplay>true</isDisplay>
</com.netwitness.malware.core.cef.MalwareCefExtension>
<com.netwitness.malware.core.cef.MalwareCefExtension>
   <customKey>ip.dst</customKey>
   <malwareKey>ip.dst</malwareKey>
   <isDisplay>true</isDisplay>
</com.netwitness.malware.core.cef.MalwareCefExtension>
 </malwareExtensionList>
</config>
```

At the end of the configuration file are three additional settings that can be used to further tune the alert format. They are as follows:

Setting	Description
includesUnknownMeta	This true or false setting indicates if unknown data elements are included in the resulting alert. Any NextGen session meta can be considered for inclusion into a CEF alert. Because additional session meta can be introduced via authoring new NextGen parsers, meta that is not contained in the default configuration may be encountered. You can set includesUnknownMeta to true to include the unknown meta in the alert and label it using the NextGen meta key name. To force a custom key for the unknown meta, you must edit this file and add a new MalwareCefExtension to the dictionary. To omit unknown meta from the alert, set includesUnknownMeta to false.
displayNulls	This true or false setting indicates if values that are set to null are included in the alert. If displayNulls is set to false, the null value fields are omitted even if their MalwareCefExtension isDisplay property is turned on. This allows dynamic formatting of alerts to exclude null fields.
valueIfNull	This true or false setting allows you to specify a string placeholder (n/a by default) to be used as the value for any null valued fields. If displayNulls is set to true, then null valued fields are included in the alerts. Their value is set to the value specified in valueIfNull.

The following represents the default CEF configuration file. The default configuration file includes all default NextGen session meta.

```
<config>
  <malwareExtensionList>
   <com.netwitness.malware.core.cef.MalwareCefExtension>
   <customKey>static</customKey>
   <malwareKey>static</malwareKey>
   <isDisplay>true</isDisplay>
   </com.netwitness.malware.core.cef.MalwareCefExtension>
   <com.netwitness.malware.core.cef.MalwareCefExtension>
   <customKey>nextgen</customKey>
   <malwareKey>nextgen</malwareKey>
   <isDisplay>true</isDisplay>
   </com.netwitness.malware.core.cef.MalwareCefExtension>
   <com.netwitness.malware.core.cef.MalwareCefExtension>
   <customKey>community</customKey>
   <malwareKey>community</malwareKey>
   <isDisplay>true</isDisplay>
   </com.netwitness.malware.core.cef.MalwareCefExtension>
   <com.netwitness.malware.core.cef.MalwareCefExtension>
   <customKey>sandbox</customKey>
```

```
<malwareKey>sandbox</malwareKey>
<isDisplay>true</isDisplay>
</com.netwitness.malware.core.cef.MalwareCefExtension>
<com.netwitness.malware.core.cef.MalwareCefExtension>
<customKey>file.name</customKey>
<malwareKey>file.name</malwareKey>
<isDisplay>true</isDisplay>
</com.netwitness.malware.core.cef.MalwareCefExtension>
<com.netwitness.malware.core.cef.MalwareCefExtension>
<customKey>file.size</customKey>
<malwareKey>file.size</malwareKey>

Enable Custom YARA Content

This topic provides instructions for enabling custom YARA content on the NetWitness host on which the Malware Analysis service is installed. In addition to the built-in Indicators of Compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language that allows malware researchers to identify and classify malware samples. Netwitness makes built-in YARA-based Indicators of Compromise (IOCs) available in Netwitness Live; these are automatically downloaded and activated on subscribed appliances.

Customers with advanced skills and knowledge can add detection capabilities to Netwitness Malware Analysis by authoring YARA rules and publishing them in Live or placing YARA rules in a watched folder for the appliance to consume. This section provides instructions for the Administrator who configures appliances to enable the creation of custom YARA content.

Prerequisites

This is an advanced configuration task, which requires sufficient privilege and knowledge to set up a GNU Compiler Collection (GCC) and C++ Python development library to build YARA. In addition, you must be thoroughly familiar with the standard YARA documentation. The following components are required:

- The Perl-Compatible Regular Expression (PCRE) library: pcre-8.33.tar.bz2
- The yara 1.7 (rev:167) stand-alone YARA command line: yara-1.7.tar
- The YARA extension for Python: yara-python-1.7.tar.gz
- YARA rules documentation: YARA User's Manual 1.6.pdf

The components are available for download here: https://code.google.com/p/yara-project/downloads/list

Note: As of writing, YARA 2.0 is available but not supported for Malware Analysis 10.5.

Install Libraries and Applications Required to Build YARA on a CentOs-Based Appliance

As a prerequisite to building YARA on a host that is running CentOS, you must install `make`, the GNU Compiler Collection, and C++ Python Development Library on the appliance. To install the applications and libraries required to build YARA:

1. To ensure the standard YUM repo and no other repo files are in the /etc/yum.repos.d folder, enter the following command:
   `ls -al /etc/yum.repos.d`
   The results should be similar to the following:
   ```
   -rw-r-r-. 1 root root 1926 Jun 26  2012 CentOS-Base.repo
   -rw-r-r-. 1 root root  637 Jun 26  2012 CentOS-Debuginfo.repo
   -rw-r-r-. 1 root root  626 Jun 26  2012 CentOS-Media.repo
   -rw-r-r-. 1 root root 2593 Jun 26  2012 CentOS-Vault.repo
   ```
2. To install `make` on the appliance, enter the following commands:
   a. **`yum search make`**
      The following message is returned: `make.x86_64 : A GNU tool which simplifies the build process for user`
   b. **`yum install make.x86_64`**
3. To install and test GCC on the host, enter the following commands:
   a. **`yum search gcc`**
      The following messages are displayed:
      ```
      gcc-c+.x86_64 : C+ support for GCC
       gcc.x86_64 : Various compilers (C, C++, Objective-C, Java, ...)
      ```
   b. Enter the following commands:
      `yum install gcc.x86_64`
      `yum install gcc-c++.x86_64`

c. To test the gcc commands, enter the following commands:

```
gcc -v
cc -v
```

4. To install the C++ Python development library on the appliance, enter the following commands:

a. **yum search python dev**
The following message is returned:
`python-devel.x86_64 : The libraries and header files needed for Python development`

b. **yum install python-devel.x86_64**

Set Up YARA

To create a GCC and C++ Python development library in which you can build YARA on the NetWitness host that is running Malware Analysis:

1. Do one of the following:

a. If the host on which you are installing is running Mac OS, install xCode for Mac OS.

b. If the host on which you are installing is running CentOS, install make, GCC and C++ Python development library using the YUM command line.

2. To Install the PCRE library on the host, open a terminal window and enter the following commands:

```
tar -xvf pcre-8.33.tar.bz2
cd pcre-8.33
./configure
make
sudo make install
```

3. To install the stand-alone YARA command line, enter the following commands:

```
tar -xvf yara-1.7.tar
cd yara-1.7
./configure
make
sudo make install
```

4. To test the stand-alone YARA command line:

a. Enter the following command:

```
yara
```

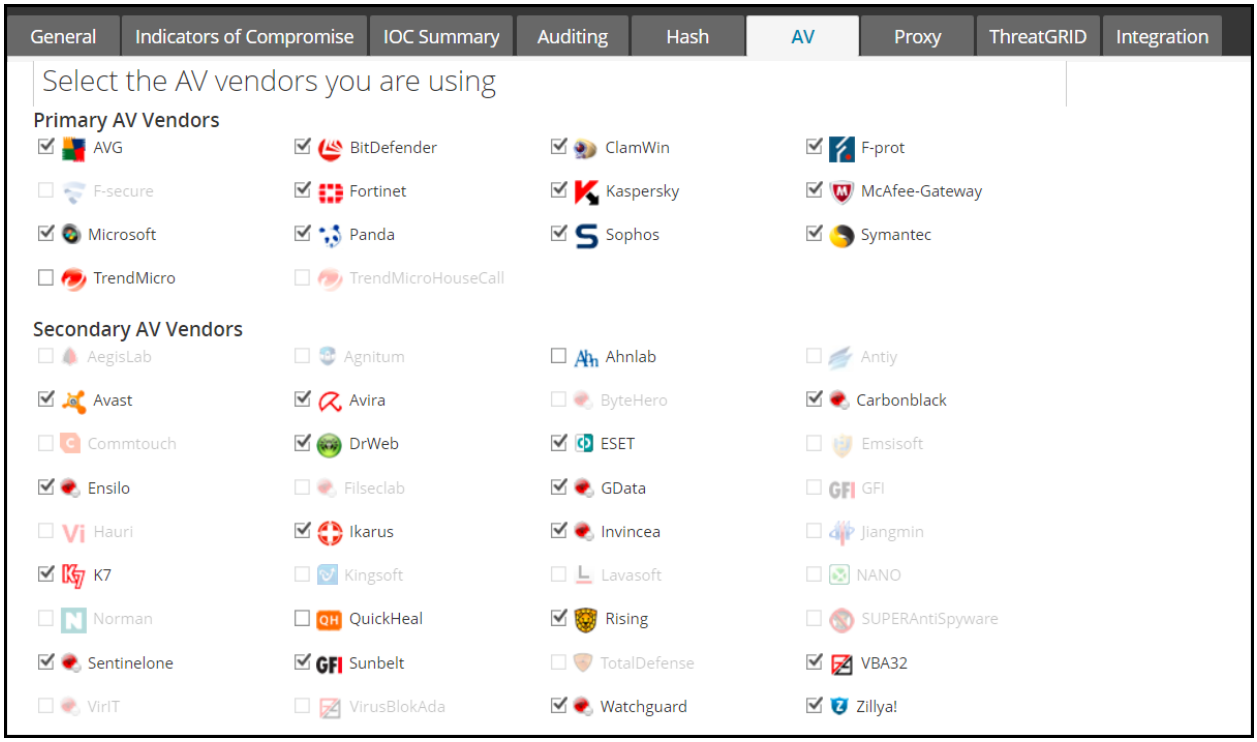
b. If the command succeeds, continue with Step 7. If the command fails and returns the `yara: error while loading shared libraries: libpcre.so.1: cannot open shared object file: No such file or directory` error, enter the following command to check the `/etc/ld.so.conf` file or `LD_LIBRARY_PATH` environment variable.

```
ldconfig -v
```

5. To install the YARA extension for Python, enter the following commands:

```
tar -xvf yara-python-1.7.tar.gz
cd yara-python-1.7
```

```
python setup.py build
sudo python setup.py install
```



6. To test the YARA extension:
   a. Enter the following command: **python**
   b. At the Python prompt (>>>), enter the following commands:

```
import yara
exit()
```

When this configuration is complete, analysts can create custom YARA IOCs for consumption on a Malware Analysis host as described in "Implement Custom YARA Content" in the *Malware Analysis User Guide*

Supported Antivirus Vendors

This section provides detailed information about the NetWitness supported antivirus (AV) vendors.

The following are the new AV vendors supported in NetWitness version 11.4.0.1 or later.

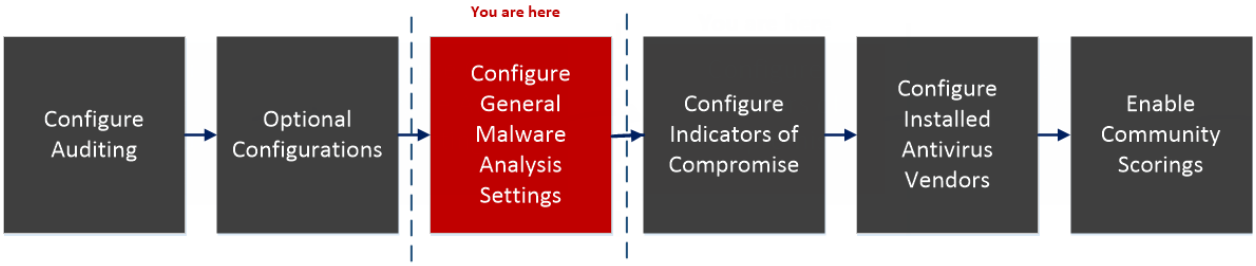
- Panda
- Gdata
- Avast
- Carbonblack
- Dr.Web
- enSilo
- Invincea
- Rising
- SentinelOne
- Sunbelt
- VBA32
- Watchguard

The following AV vendors are not supported in NetWitness version 11.4.0.1 or later.

Note: AV vendors that are not supported by NetWitness Platform are disabled in the user interface.

- F-secure
- TrendMicroHouseCall
- AegisLab
- Agnitum
- Antiy
- ByteHero
- Commtouch
- Emsisoft
- Filseclab
- GFI
- Hauri
- Jiangmin
- Kingsoft
- Lavasoft
- NANO
- Norman
- nProtect
- SUPERAntiSpyware
- TotalDefense
- VirIT
- VirusBlokAda
- Zillya
- Zoner

Malware Analysis References



- Services Config View - General Tab
- Services Config View - Indicators of Compromise Tab
- Services Config View - IOC Summary Tab
- Services Config View - Auditing Tab
- Services Config View - Hash Tab

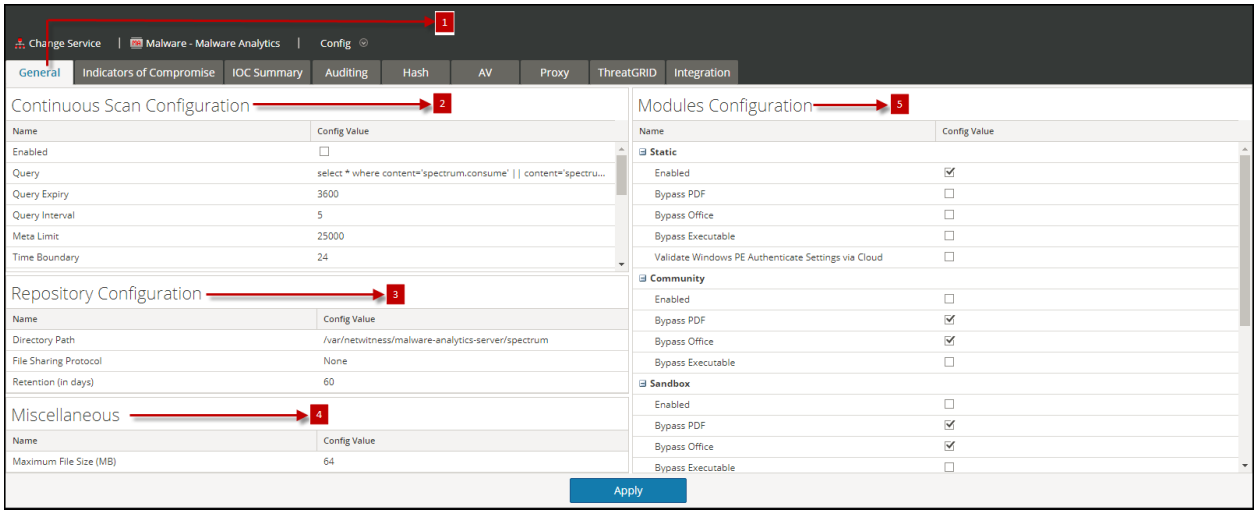
- Service Config View - Proxy Tab
- Services Config View - ThreatGRID Tab
- Services Config View - Integration Tab

Services Config View - General Tab

This topic introduces the configuration settings in the Service Config view > General tab for Malware Analysis, which has parameters specific to the Malware Analysis service. In this tab, you can configure:

- The processing parameters for Core services that are capturing data.
- The repository for captured data.
- The static, community, and sandbox scoring categories used to analyze the data.

Workflow



What do you want to do?

Role	I Want to...	Show me how
Administrator	Configure General Malware Analysis Settings*	Configure General Malware Analysis Settings
Administrator	Configure Indicators of Compromise	Configure Indicators of Compromise
Administrator	Configure Auditing on Malware Analysis Host	(Optional) Configure Auditing on Malware Analysis Host
Administrator	Configure Hash Filter	(Optional) Configure Hash Filter
Administrator	Configure Installed Anti virus Vendor	Configure Installed Antivirus Vendors

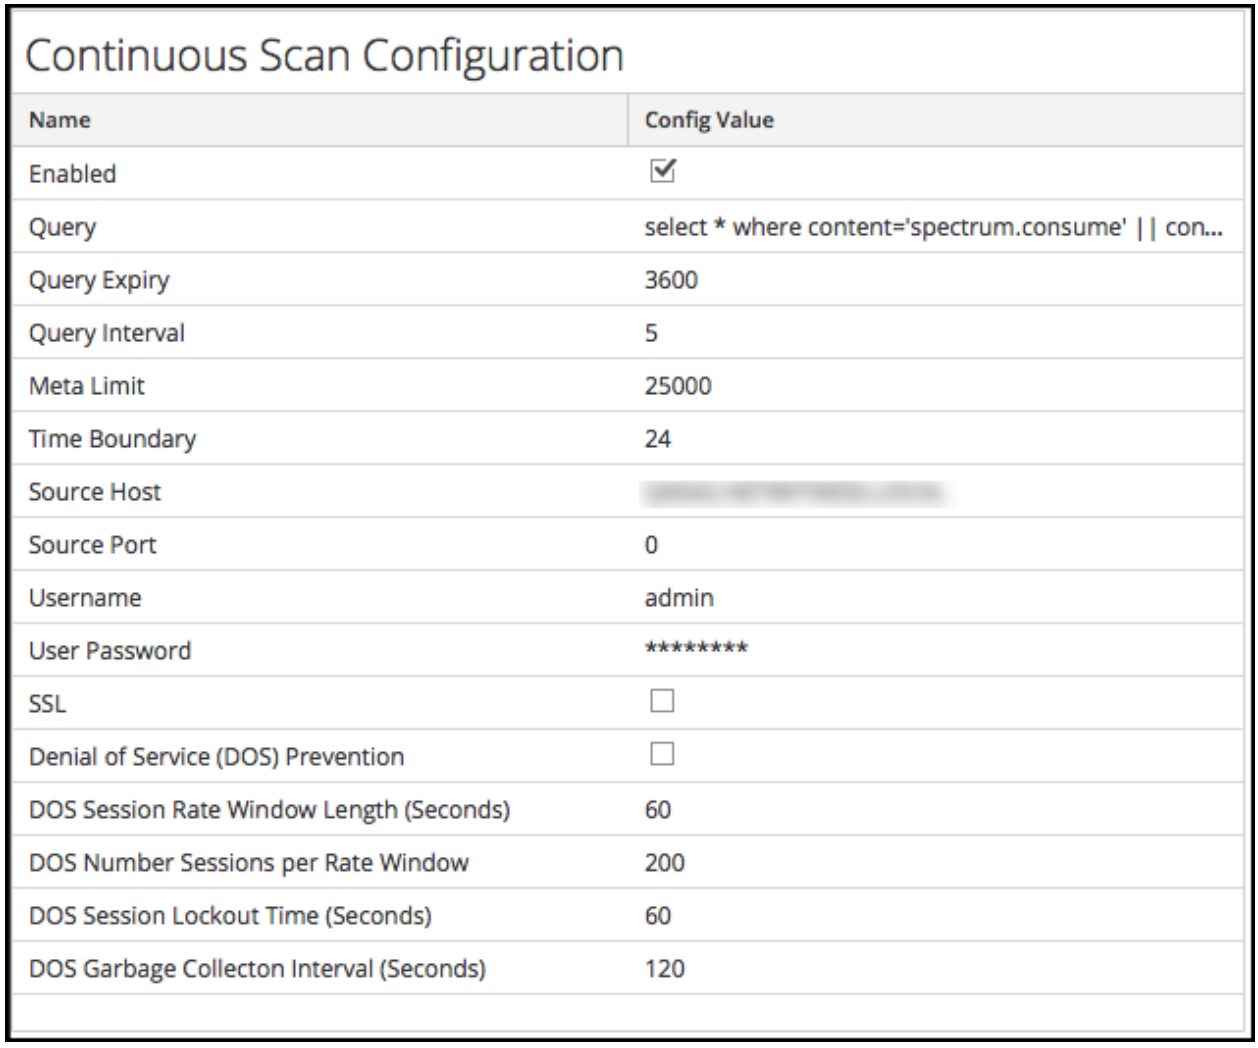
*You can perform this task in the current view

Quick Look



This is an example of the General tab.

1 Displays the General Tab.
2 Allows you to Configure Continuous Scan.
3 Allows you to Configure Repository.
4 Displays Miscellaneous Settings.
5 Allows you to Configure Modules.

This tab has four sections: Continuous Scan Configuration, Repository Configuration, Miscellaneous, and Modules Configuration.

Continuous Scan Configuration Section

Continuous Scan Configuration

Name	Config Value
Enabled	☑
Query	select * where content='spectrum.consume' || con...
Query Expiry	3600
Query Interval	5
Meta Limit	25000
Time Boundary	24
Source Host	[redacted]
Source Port	0
Username	admin
User Password	********
SSL	☐
Denial of Service (DOS) Prevention	☐
DOS Session Rate Window Length (Seconds)	60
DOS Number Sessions per Rate Window	200
DOS Session Lockout Time (Seconds)	60
DOS Garbage Collecton Interval (Seconds)	120

This table describes the features of the Continuous Scan Configuration section.

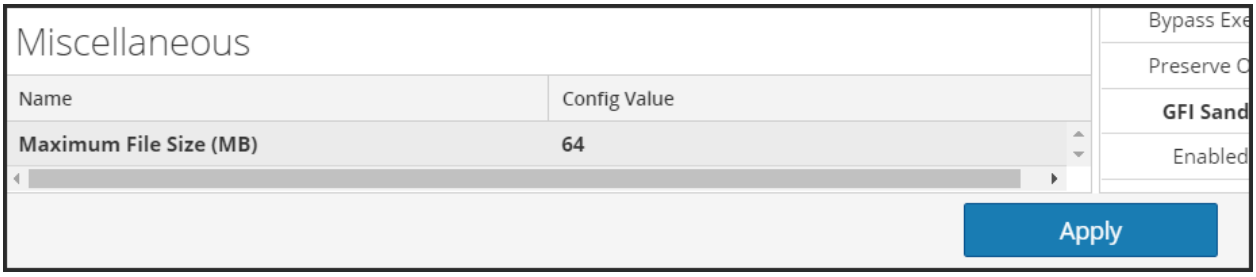
Parameter	Description
Enabled	Completely disable or enable continuous polling of the Core service. By default this is not selected (**disabled**).
Query	While the Decoder is analyzing network traffic, it creates a meta field called content with a value of **spectrum.consume** in sessions that are likely to contain malware. By default, Malware Analysis only performs analysis on events that have this particular meta value. By changing this query, Malware Analysis can be configured to analyze different types of events. Making this query too broad may force Malware Analysis to analyze too many events, causing it to fall behind or perform poorly. The default query is **select * where content='spectrum.consume'**

Parameter	Description
Query Expiry	When Malware Analysis queries the Core service for meta, it gets a result back within a few seconds. If there is a problem, such as a network connectivity issue, Malware Analysis abandons the query after this configured amount of time. The default value is **3600 seconds**.
Query Interval	How often, in minutes, to query for new session meta and files.
Meta Limit	Each time Malware Analysis queries the Core service, it pulls an amount of meta, up to this meta limit. Using this setting, in conjunction with the query interval, you can tune the performance of Malware Analysis in the Core infrastructure. The default value is **25000**.
Time Boundary	Malware Analysis analyzes sessions that occurred after the Time Boundary. This setting is most important when installing a new Malware Analysis appliance, because it determines how far back in time to begin analysis. Setting the boundary too many hours in the past may cause Malware Analysis to analyze too many past events, causing a large delay before you see any traffic happening in real time. The default value is **24 hours**.
Source Host	Hostname of the Malware Analysis appliance. This is the IP address, or the hostname, of the service that Malware Analysis queries to retrieve its data for analysis. Do not use localhost as the source host. Depending on the model of the appliance and the configuration of the NetWitness infrastructure, this source host can vary. **Note:** When you change the host name or the host IP address, ensure that you re add the Source Host in the Malware Service config page, and restart the service to take the source host field changes into effect.
Source Port	Malware Analysis communicates with the NetWitness infrastructure using the REST service listening on this port. This port number is specific to the type of the Core service that is being used as the Source host. This corresponds to the outbound connections for your Core service.
Username	Username. The default value is **admin**. Malware Analysis must authenticate to the Source host each time it queries for data. In most cases, the account used by Malware Analysis is the same account used to access the Core service through NetWitness. However, it is recommended to create a new account on the Core service dedicated to Malware Analysis.
User Password	User password. The default value is **netwitness**.
SSL	Use SSL when communicating with Core. If Malware Analysis is using an SSL connection to communicate with a Core service, check this option. The default value is unchecked.

Parameter	Description
Denial of Service (DOS) Prevention	The Denial of Service Prevention feature provides safeguards against malware that intentionally generates high volumes of network connections between two endpoints containing Windows PE content. Generating a high volume of connections artificially inflates the amount of traffic that security services monitoring the network must consume and analyze resulting in a denial of service. This feature helps identify these sessions so that you can have the analysis processing disregard them. The default value is unchecked.
DOS Session Rate Window Length (Seconds)	Malware Analysis uses this parameter with the **DOS Number Sessions per Rate Window** and **DOS Session Lockout Time (Seconds)** parameters to identify a Denial of Service Attack and determine how long to disregard sessions from a single IP address. To identify a Denial of Service Attack, Malware Analysis monitors the number of sessions established by a single IP address during a specific time frame. The **DOS Session Rate Window Length (Seconds)** defines this time frame. If the number of sessions exceeds the **DOS Number Sessions per Rate Window** setting within the number of seconds defined in **DOS Session Rate Window Length**, Malware Analysis identifies the activity as a Denial of Service attempt. In this case, traffic from the IP address is disregarded for the length of time specified in **DOS Session Lockout Time (Seconds)**. The default value is: **60** seconds.
DOS Number Sessions per Rate Window	Malware Analysis uses this parameter with the **DOS Session Rate Window Length (Seconds)** and **DOS Session Lockout Time (Seconds)** parameters to identify a Denial of Service Attack and determine how long to disregard sessions from the IP address. To identify a Denial of Service Attack, Malware Analysis monitors the number of sessions established by a single IP source during a specific time frame. The **DOS Session Rate Window Length (Seconds)** defines this time frame. If the number of sessions exceeds the **DOS Number Sessions per Rate Window** setting within the number of seconds defined in **DOS Session Rate Window Length**, Malware Analysis identifies the activity as a Denial of Service attempt. In this case, traffic is disregarded for the length of time specified in **DOS Session Lockout Time (Seconds)**. The default value is: **200** sessions
DOS Session Lockout Time (Seconds)	Malware Analysis uses this parameter with the **DOS Session Rate Window Length (Seconds)** and **DOS Number Sessions per Rate Window** parameters to identify a Denial of Service Attack and determine how long to disregard such an attack. To identify a Denial of Service Attack, Malware Analysis monitors the number of sessions established by a single IP address during a specific time frame. The **DOS Session Rate Window Length (Seconds)** defines this time frame. If the number of sessions exceeds the **DOS Number Sessions per Rate Window** setting within the number of seconds defined in **DOS Session Rate Window Length**, Malware Analysis identifies the activity as a Denial of Service attempt. In this case, traffic is disregarded for the length of time specified in **DOS Session Lockout Time (Seconds)**. The default value is: **60** seconds

Parameter	Description
DOS Garbage Collection Interval (Seconds)	Performs garbage collection on the internal memory structure used to track Denial of Service attempts. If memory usage is abnormally high, you can decrease this setting to free unused memory more often. If CPU usage is abnormally high, you can increase this setting to eliminate processing overhead (at the expense of memory usage). The default value is: **120** seconds

Repository Configuration Section

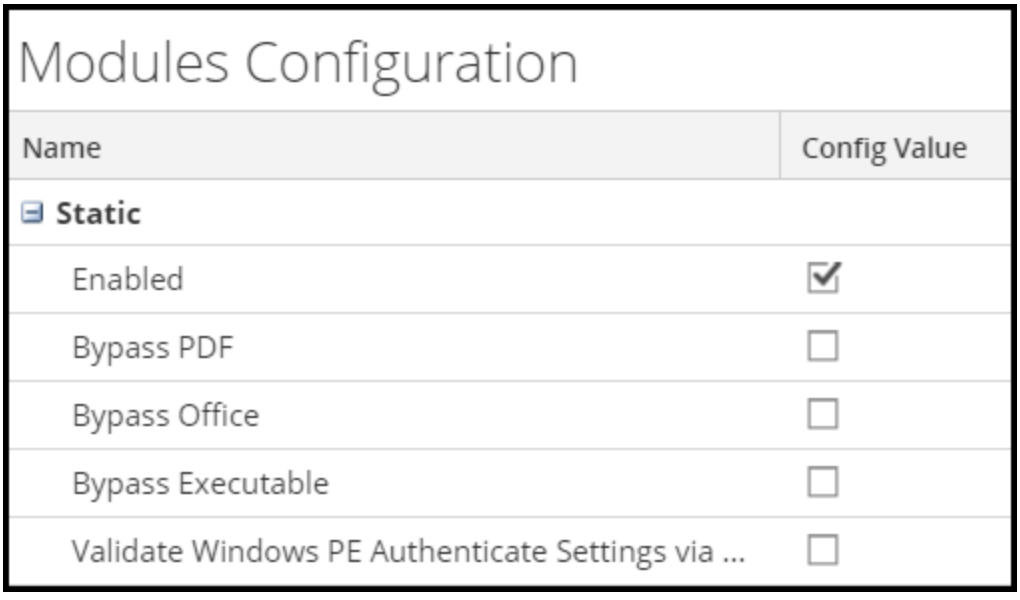


Malware Analysis stores all of the files that are analyzed for future use. These files can be downloaded through the user interface or accessed via one of the file sharing protocols.

This table describes the features of the Repository Configuration section.

Parameter	Description
Directory Path	All files are stored in the following directory on the Malware Analysis appliance: **/var/lib/netwitness/spectrum**
File Sharing Protocol	Possible values for the file sharing protocol are FTP, SAMBA, and None. You can enable FTP access and SAMBA file sharing to allow a user access to the stored files on the Malware Analysis from a remote location. No credentials are required to access these files. The port required for FTP access is TCP/21. The default file sharing protocol is **None**.
Retention (in days)	Malware Analysis maintains files stored in the repository for a specified number of days. You can set the number of days that files are retained before being deleted. The default value is **60** days.

Miscellaneous Configuration Section (10.3 SP2 and Later)

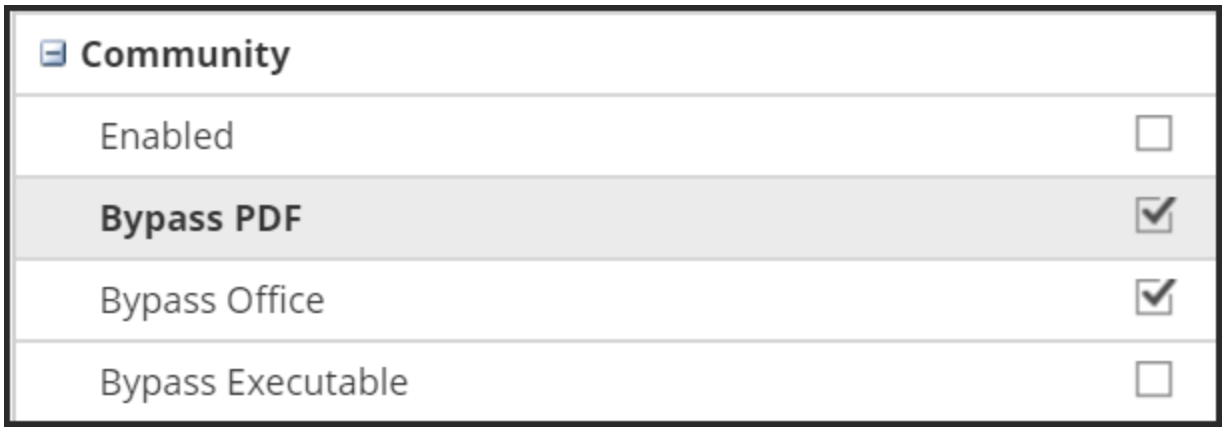


This table describes the features of the Miscellaneous Configuration section.

Parameter	Description
Maximum File Size	Limits the size of each file that you can scan for manually. This parameter applies to the feature described in "Upload Files for Malware Scanning" in the Investigation and Malware Analysis Configuration Guide. The default value is **64 MB**. If the file size limit is exceeded, prevents you from scanning the file.

Modules Configuration Section

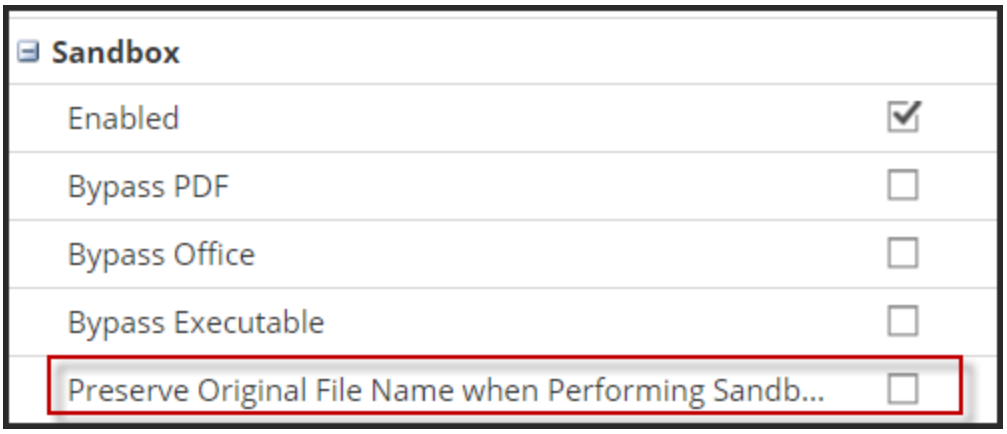
The Modules Configuration section allows configuration of the static, community, and sandbox scoring categories.



Static Analysis Configuration

The static module is the only scoring category that is enabled by default. This table describes the parameters for configuring static analysis.

Feature	Description
Enabled	Completely disable or enable static analysis. By default this is selected (**enabled**).
Bypass PDF	Disable analysis of PDF documents. By default this is not selected; all PDF files undergo static analysis.
Bypass Office	Disable analysis of Office documents. By default this is not selected; all MS Office files undergo static analysis.
Bypass Executable	Disable analysis of Windows PE documents. By default this is not selected; all Windows PE files undergo static analysis.
Validate Windows PE Authenticate Settings via Cloud	Specify whether or not Windows PE files are sent to the Netwitness Cloud for Authenticode validation. The default value is selected. • When selected, any Windows PE file that is digitally signed is transmitted over the network (in its entirety) to the Netwitness Cloud for validation. If the intent is to prevent Windows PE files from leaving the customer network, you should disable this option. • When not selected, ALL static analysis is performed locally (skipping Authenticode validation). Regardless of this setting, PDF and M/S Office documents are not subject to Authenticode validation and are not transmitted over the network during static analysis.

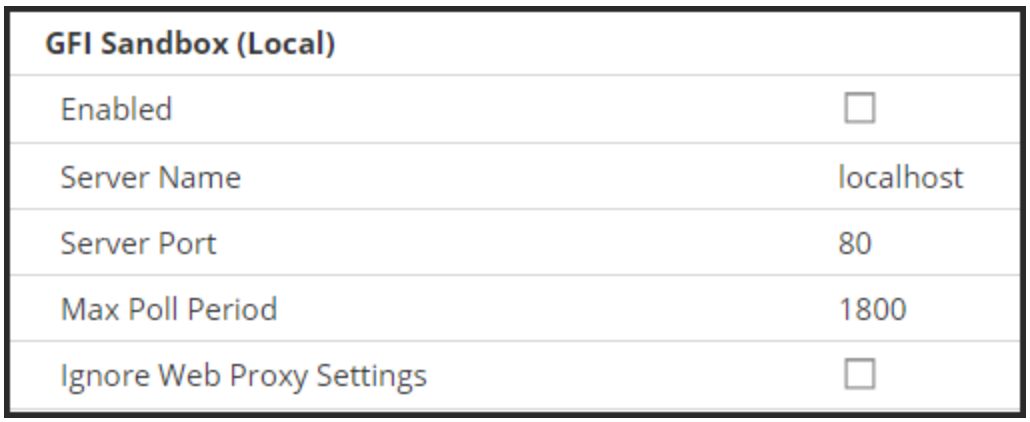


Community Analysis Configuration

By default, the community module is disabled and the options are selected to prevent PDFs and MS Office documents from being processed. The intent is to default the settings to the most restrictive choices so that no sensitive documents leave the network unless the user chooses. This table describes the parameters for configuring Community analysis.

Feature	Description
Enabled	Completely disable or enable community analysis. By default this is not selected (**disabled**). **Note:** Before you enable community, you must log in to live account. For more information about live account, see Live Services Management Guide.
Bypass PDF	Disable analysis of PDF documents. By default this is selected; PDF files are not processed.
Bypass Office	Disable analysis of Office documents. By default this is selected; Microsoft Office documents are not processed.
Bypass Executable	Disable analysis of Windows PE documents. By default this is selected; Windows PE documents are not processed

Sandbox Analysis Configuration

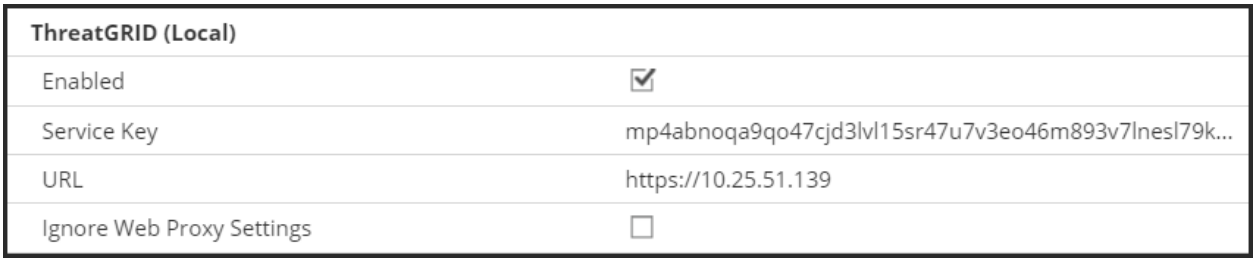


By default, the sandbox module is disabled and MS Office and PDF files are prevented from being processed. The intent is to set the most restrictive settings to force the user to specifically choose whether or not potentially sensitive information is sent outside of the network for processing. If the document type is not prevented from being processed, the file is sent to the destination sandbox server in its entirety (not limited to a hash of the file contents).

This table describes the parameters for configuring Sandbox analysis.

Feature	Description
Enabled	Completely disable or enable sandbox analysis. By default this is not selected **(disabled)**.
Bypass PDF	Disable analysis of PDF documents. By default this is selected; PDF files are not processed. When not selected, all PDF files are submitted in their entirety to the Sandbox for analysis.

Feature	Description
Bypass Office	Disable analysis of Office documents. By default this is selected; Microsoft Office documents are not processed. When not selected, all MS Office files are submitted in their entirety to the Sandbox for analysis.
Bypass Executable	Disable analysis of Windows PE documents. By default this is selected; Windows PE documents are not processed. When not selected, all Windows PE documents are submitted in their entirety to the Sandbox for analysis.
Preserve Original File Name when Performing Sandbox Analysis	In 10.3 SP2 and later, enable the ability to hash for filenames when they are sent to a local sandbox. By default this is not selected. **Note:** If you do not select this parameter, NetWitness hashes the files.



GFI Sandbox Settings

In the GFI Sandbox section, you can enable sandbox processing by GFI and configure the locally installed GFI sandbox. The table describes the parameters for configuring the GFI sandbox.

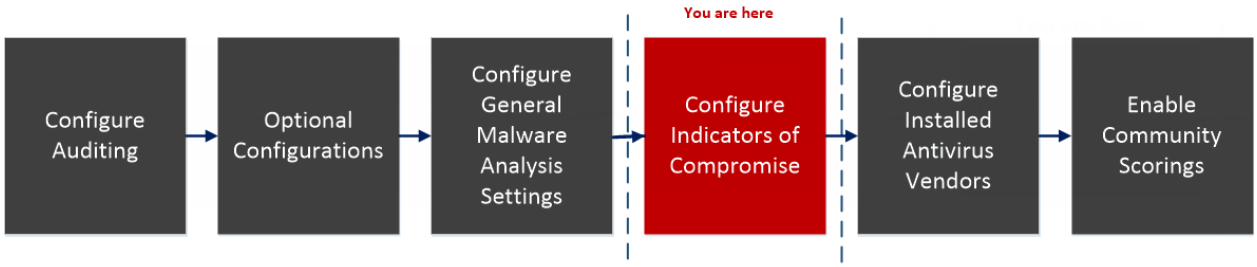
Feature	Description
Enabled	When enabled, sandbox processing is performed by a local copy of GFI. The default value is **disabled**. If you enable GFI, you need to configure the remaining parameters.
Server Name	The GFI Sandbox server name. No default value.
Server Port	The GFI Sandbox server port. Default value is **80**.
Max Poll Period	Determines how long to wait for a submitted sample to finish processing. Default value is **600 seconds**.
Ignore Web Proxy Settings	Tells Malware Analysis to bypass the web proxy, if a web proxy is configured, when making this connection. If no web proxy has been configured in Malware Analysis, the setting is ignored.

ThreatGRID Sandbox Settings

In the ThreatGRID Sandbox section, you can enable sandbox processing by ThreatGRID and choose whether to use the locally installed ThreatGRID or the ThreatGRID Cloud for sandbox analysis.

- If you have a local copy of ThreatGRID, configure sandbox processing to use the local copy.
- If no local instance of ThreatGRID has been purchased and installed, configure the ThreatGRID Cloud.

The table describes the parameters for configuring the ThreatGRID sandbox.



Note: Before enabling this service, you must configure a ThreatGRID-supplied Service Key. The service key allows ThreatGRID to recognize that samples submitted from this site are legitimate.

Feature	Description
Enabled	When enabled, sandbox processing is performed by ThreatGRID, either a local copy or the ThreatGRID Cloud. The default value is **disabled**.
Service Key	Before enabling the sandbox module, a ThreatGRID-supplied Service Key must be configured. The service key allows ThreatGRID to recognize that samples submitted from this site are legitimate.
URL	The URL for the ThreatGRID server to be used (if you are not using a locally installed ThreatGRID). The ThreatGRID Cloud is reachable via https://panacea.threatgrid.com
Ignore Web Proxy Settings	Tells Malware Analysis to bypass the web proxy, if a web proxy is configured, when making this connection. If no Web Proxy has been configured in Malware Analysis, the setting is ignored.

Services Config View - Indicators of Compromise Tab

This topic introduces the features and functions available in the Service Config view > Indicators of Compromise tab, which applies to the Malware Analysis service. This tab provides a way to configure the way each of the four scoring modules uses the available rules to score data.

Workflow

What do you want to do?

Role	I Want to...	Show me how
Administrator	Configure General Malware Analysis Settings	Configure General Malware Analysis Settings

Basic Setup

Quick Look

This is an example of the Indicators of Compromise tab.

1 Displays the Indicators of Compromise Tab.

Features

The Indicators of Compromise tab consists of a toolbar and page-able grid.

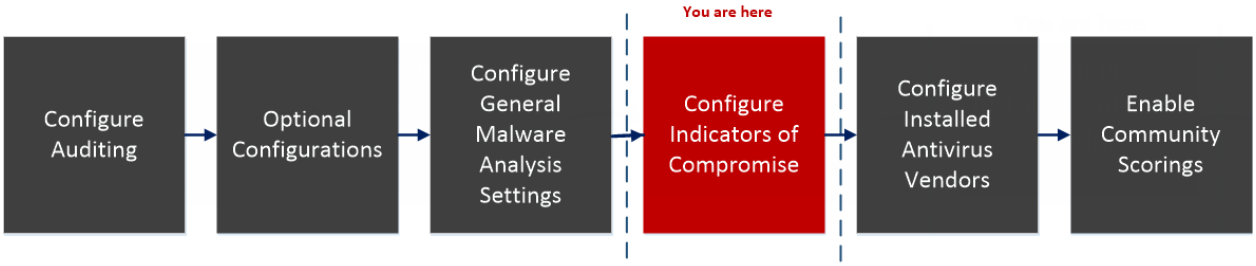
This table describes the features of the grid.

Feature	Description
Module selection list	Selects the scoring module for which you want to view the Indicators of Compromise: All, Network, Static, Community, Sandbox, or Yara.
Search field	Type text for which you are searching in the Description field.
Search option	Filters the grid to display only Descriptions that match the Description search term.
Enable All option	Click to enable all rules for the scoring module, as opposed to enabling all rules on the page using the checkbox.
Enable option	Click to enable selected rules.
Disable All option	Click to disable all rules for the scoring module, as opposed to disabling all rules on the page using the checkbox.
Disable option	Click to disable selected rules.

Feature	Description
Reset All option	Click to reset all rows on the page to their default values.
Reset option	Click to reset selected rows to their default values.
Save option	Click to save changes you made on this page. If you leave the page without saving, the changes are lost. The description of each row with unsaved changes has a red corner.

This table describes the features of the toolbar.

Column	Description
Selection checkbox	Checkboxes for selecting individual rows or all rows on the page.
Enabled checkbox	If the indicator of compromise is enabled, Malware Analysis uses the rule for scoring session data.
High Confidence checkbox	If checked, Malware Analysis treats the rule as one very likely to indicate the presence of malware, and an event that triggers that rule is marked in the results grid.
Description	Describes the Indicator of Compromise.
Score	Specifies the score that you want to factor in to the total score for any event that triggers the rule. The default score is displayed and you can raise or lower the score by dragging the slider or typing a number in the score box.
File Type	Displays the file types to which the rule applies. Possible values are **ALL**, **PDF**, **MS Office**, and **Windows PE**.



Services Config View - IOC Summary Tab

This topic introduces the features and functions available in the Service Config view > IOC Summary tab. This tab provides a way to view summary information for any IOC. A grid for each scoring module lists the configured IOCs along with statistics associated with that IOC of a specific range of time. The statistics include:

- The number of events for a network session or the number of files for a static, community, or sandbox event that were flagged with the IOC.
- The current score configured for the IOC in the Indicators of Compromise tab.
- The scores returned by each of the scoring modules.

When you select an event, you can show the Malware Events view or Malware Files view for the IOC. You can also open the selected IOC in the Indicators of Compromise tab to edit the Current Score.

Workflow

Basic Setup

Quick Look

This is an example of the IOC Summary tab for the Network scoring module.

1. Displays the IOC Summary Tab.
2. Displays the Network View.
3. Displays the Static View.
4. Displays the Community View.
5. Displays the Sandbox View.

Features

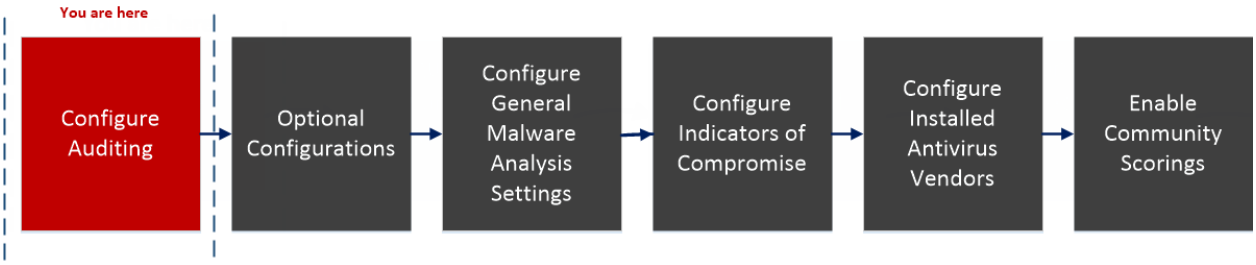
The IOC Summary consists of four tabs, one for each scoring module: Network, Static, Community, and Sandbox. Each tab has the same form and same information with a toolbar and page-able grid.

This table describes the features of each tab.

Feature	Description
Time Range	Selects the time range for the IOC Summary. Possible values are: Last 5 Minutes, Last 15 Minutes, Last 30 Minutes, Last Hour, Last 3 Hours, Last 6 Hours, Last 12 Hours, Last 24 Hours, Last 2 Days, Last 5 Days, Early Morning, Morning, Afternoon, Evening, All Day, Yesterday, This Week, Last Week, or Custom.
Description column	Lists the descriptions for the IOCs.
Count column	Lists the number of occurrences of the IOCs. In the Network tab, the count is the number of events in which the IOC was found. In the other tabs, the count is the number of files in which the IOC was found.
Current Score column	Lists the current score for the IOCs as configured in the Indicators of Compromise tab.
Static, Network, Community, and Sandbox columns	List the scores that each of the scoring modules gave the IOCs.
Actions drop-down	The Actions drop-down menu has two options: • Show Events/Files: opens the IOC in the Investigation Events view or Files view. This view can also be opened by double-clicking on the IOC. • Edit: opens the IOC in the Indicators of Compromise tab to edit the Current Score.

Services Config View - Auditing Tab

This topic introduces the features and functions of the Auditing tab in the Services Config view for Malware Analysis. The Auditing tab in the Services Config view for Malware Analysis provides a way to configure the auditing feature. Malware Analysis has an automated auditing system capable of sending alerts (syslog, snmp, audit log file entries) as Malware Analysis exceeds configured score value thresholds for each scoring module (Network, Static, Community, Sandbox). Malware Analysis can automatically feed any external system capable of ingesting the supported audit formats. One alert is generated for each file in an analyzed session that meets or exceeds the configure threshold.



The audit log is a log file maintained on the Malware Analysis appliance for every significant event or action. Audit logs are rolled out and archived over time as they become large so an audit history is maintained. The size of these audit logs and their number are both configurable.

Some examples of events that are logged are:

- User login successes and failures
- Changes to system configuration settings
- Server restart
- Server version upgrade and install
- Suspicious events that exceed the Audit Thresholds

Malware Analysis can send audit events as an SNMP trap to a configured SNMP trap host, and consolidate logs in syslog format. Refer to the following task topic for detailed procedures: (Optional) Configure Auditing on Malware Analysis Host.

Workflow

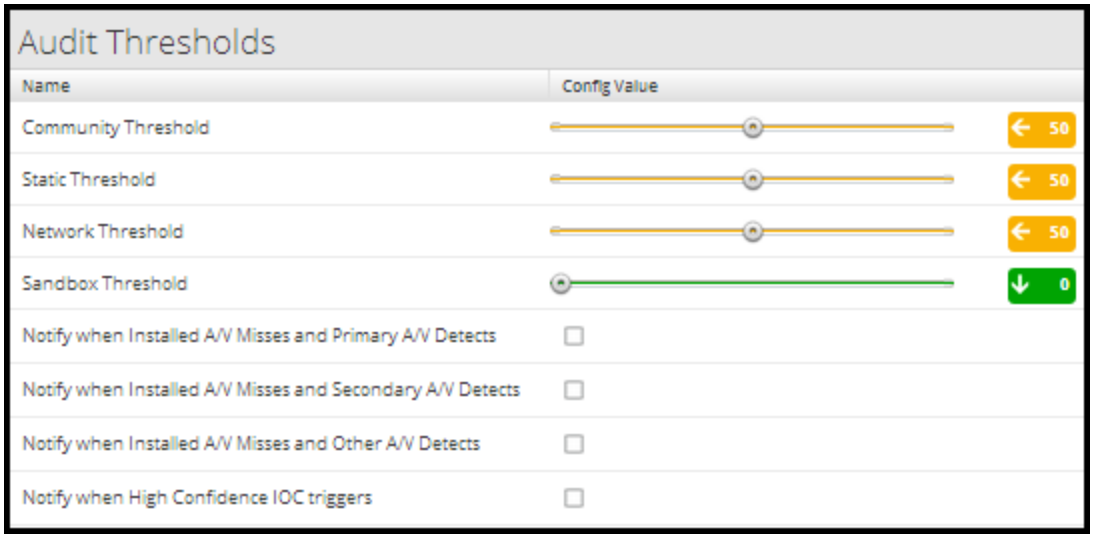
Related Topics

Basic Setup

Quick Look

This is an example of the Auditing tab.

1 Displays the Auditing Tab.
2 Displays the Audit Thresholds section.
3 Displays the SNMP Auditing section.



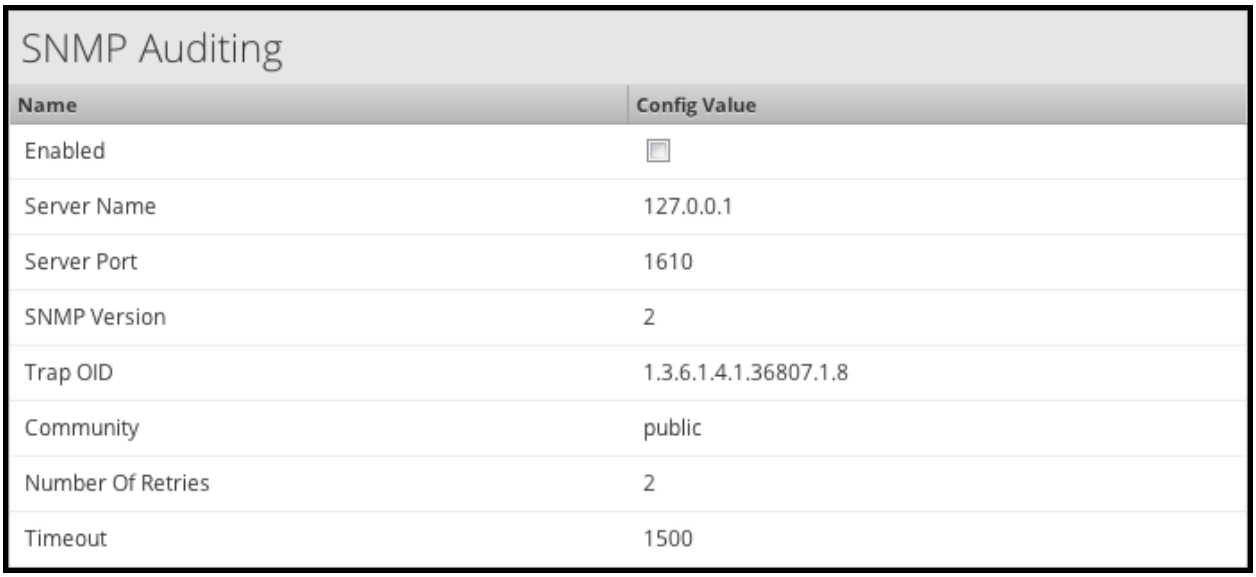
4 Displays the Respond Alerting section.
5 Displays the File Auditing section.
6 Displays the Syslog Auditing section.

Features

The Auditing tab includes five sections and an Apply button used to save changes made in this tab and put them into effect.

- Auditing Thresholds
- SNMP Auditing
- Respond Alerting
- File Auditing
- Syslog Auditing

Audit Thresholds



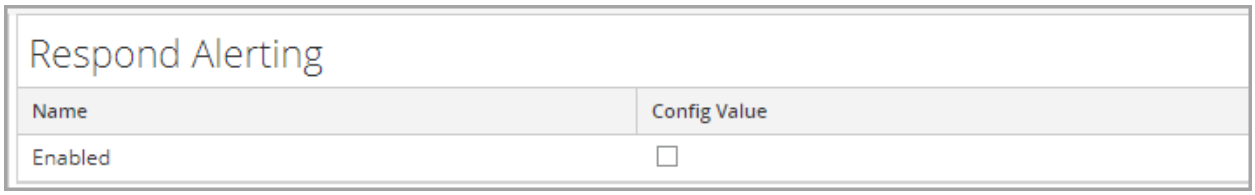
This table describes the features in the Audit Thresholds section.

Name	Config Value
Community, **Static**, **Network**, and **Sandbox Thresholds**	Malware Analysis scoring module thresholds for recording event information in a log file. Malware Analysis records the event information in a log file if the event scored high enough to satisfy all of the auditing thresholds. Each scoring category that completed analysis (for example, not all sessions invoke sandbox analysis) is compared against the configured audit threshold for that category. Any one of the category must exceed the threshold in order for an audit event to be triggered. An integer between 0 and 100 is a valid value. Setting these thresholds too low may cause a very large volume of audit events and notifications.

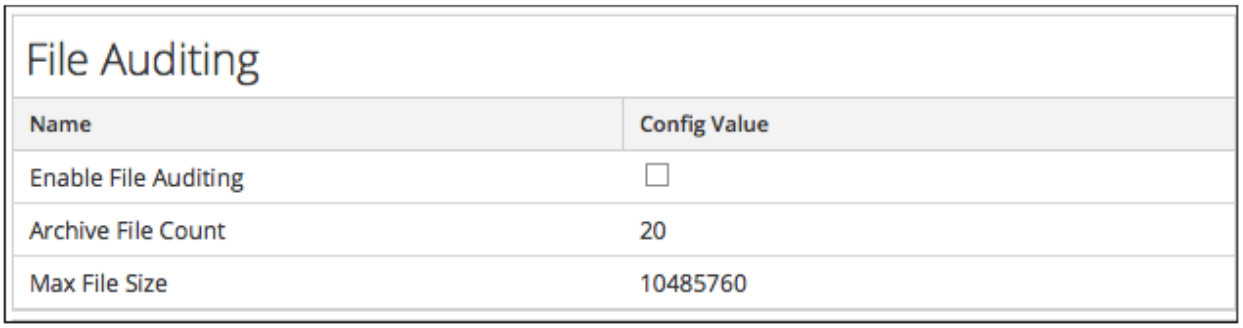
Name	Config Value
Notify when Installed A/V Misses and Primary A/V Detects	Records a message in a log file when installed antivirus software misses a virus and the primary antivirus software detects that virus. The recorded message is sent through all enabled auditing methods: SNMP, File, and Syslog. The default value is unchecked.
Notify when Installed A/V Misses and Secondary A/V Detects	Records a message in a log file when installed antivirus software misses a virus and the secondary antivirus software detects that virus. The recorded message is sent through all enabled auditing methods: SNMP, File, and Syslog. The default value is unchecked.
Notify when Installed A/V Misses and Other A/V Detects	Records a message in a log file when installed antivirus software misses a virus and the other antivirus software detects that virus. The recorded message is sent through all enabled auditing methods: SNMP, File, and Syslog. The default value is unchecked.
Notify when High Confidence IOC triggers	Records a message in a log file when a high confidence IOC (Indicators of Compromise) triggers. The recorded message is sent through all enabled auditing methods: SNMP, File, and Syslog. The default value is unchecked.

SNMP Auditing

The Simple Network Management Protocol (SNMP) is an Internet-standard protocol for managing services on IP networks. When SNMP auditing is enabled, Malware Analysis can send an audit event as an SNMP trap to a configured SNMP trap host.



This table describes the features in the SNMP Auditing section.

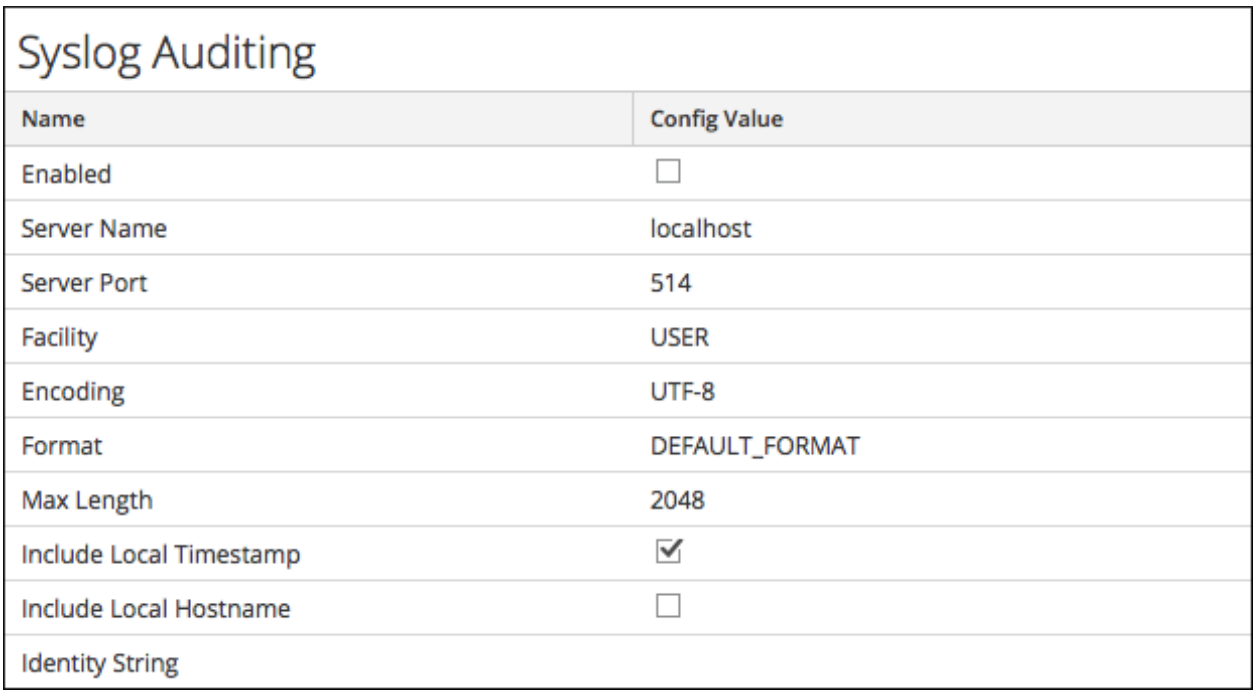


Name	Config Value
Enabled	Click to enable or disable SNMP auditing.
Server Name	The host where the target SNMP server is running.
Server Port	The port used where the SNMP trap receiver is listening.
SNMP Version	The version of the SNMP protocol to use when sending traps.
Trap OID	The object ID to use to identify the type of trap to send.
Community	The SNMP group to which Malware Analysis belongs.
Number Of Retries	The number of retries for sending a trap.
Timeout	The timeout period to wait for acknowledgment.

Respond Alerting

The Respond Alerting section enables NetWitness Respond to receive alerts from Malware Analysis. Select Enabled to forward alerts to the Respond view.

File Auditing



This table describes the features in the File Auditing section. Avoid setting the max file size and archive file count too high because it may have an adverse effect on the available disk space on the Malware Analysis appliance.

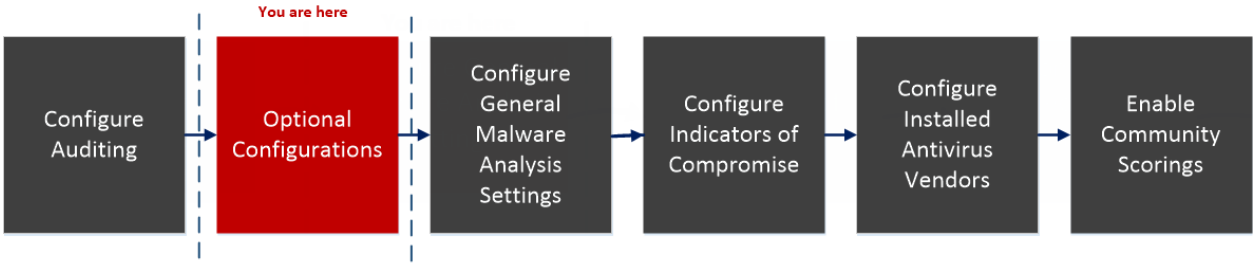
Name	Config Value
Enable File Auditing	Click to enable or disable file auditing.

Name	Config Value
Archive File Count	Malware Analysis keeps only as many log files as defined by this setting. When the maximum number is reached, the oldest log files are deleted and cannot be recovered. The default value is 20. Valid value: Integer between 1 and 50, inclusive.
Max File Size	The maximum file size for a single auditing log before it is archived. The default value is 10485760 bytes.

Syslog Auditing

This table describes the features in the Audit Thresholds section.

Feature	Description
Enabled	Click to enable or disable syslog auditing.
Server Name	This is the host where the target syslog process is running.
Server Port	This is the port where the target syslog process is listening.
Facility	This is the designated syslog facility to use for all outgoing messages. Possible values are KERN, USER, MAIL, DAEMON, AUTH, SYSLOG, LPR, NEWS, UUCP, CRON, AUTHPRIV, and LOCAL1 through LOCAL7.
Encoding	This is the encoding to use for text in syslog messages; for example, UTF-8.
Format	This is the desired message format. Possible values are: Default, PCI DSS, or SEC.



Feature	Description
Max Length	This is the maximum length in bytes that any syslog message can be. Default is 1024. Messages that exceed the maximum length are truncated.
Include Local Timestamp	Check this box to include the local timestamp in messages.
Include Local Hostname	Check this box to include the local hostname.
Identity String	This is an identity string to be prepended to each syslog alert. If the string is blank, no identity string is prepended to the outgoing syslog alerts. You can use this to identify the source of the alert. Users conventionally set it to the name of the program that will submit the messages to a syslog auditing.

Services Config View - Hash Tab

This topic introduces the features and functions available in the Service Config view > Hash tab for Malware Analysis.

In this tab, you can manage hash filtering in Malware Analysis. The hash grid is initially empty; the grid lists filters that have been added to Malware Analysis. In this view, you can add a hash filter, delete a hash filter, mark a hash filter as trusted or untrusted, and save changes.

Workflow

What do you want to do?

Quick Look

This is an example of the Hash tab.

1 Displays the Hash Tab.

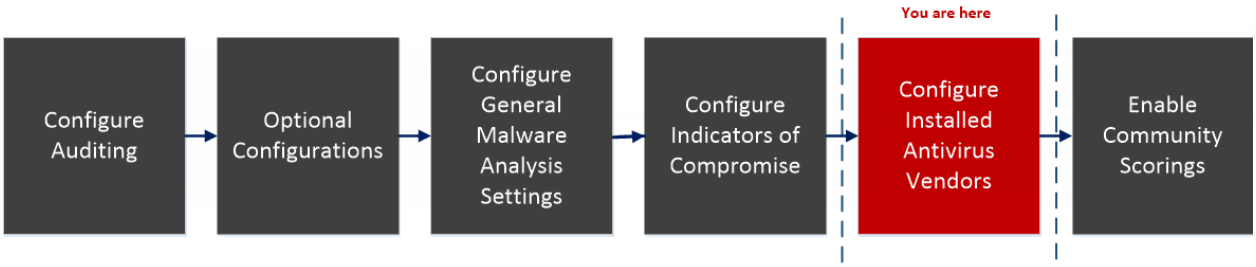
This is an example of the Add Hash dialog.

Features

The **Hash** tab consists of a toolbar and a pageable hash grid.

This table describes the Hash tab toolbar.

Feature	Description
MD5 Search	Enter an MD5 hash for which you want to search the results in the grid. The search function is case-insensitive.
Add	Displays the Add Hash dialog in which you can add a new hash to the hash grid, specify whether the hash is trusted or not, and provide the hash file size.
Save Edit	Saves any additions or edits to hashes in the grid.
Delete	Deletes selected hashes from the grid.



This table describes the Hash grid columns.

Feature	Description
Select Checkbox	Click to select a row. Click in the column header to select a header.
Trusted	Marks a hash as trusted or untrusted.
MD5	Identifies the MD5 hash.
File Size	Identifies the hash file size in kilobytes.

Services Config View - AV Tab

This topic introduces the features and functions of the AV tab in the Service Config view for a Malware Analysis service. The AV tab provides a way to identify the anti-virus software vendors whose software is in use on your network. NetWitness can include the results from these vendors in the detailed results view of an event that has been analyzed using Malware Analysis.

Workflow

What do you want to do?

Configure Installed Antivirus Vendors

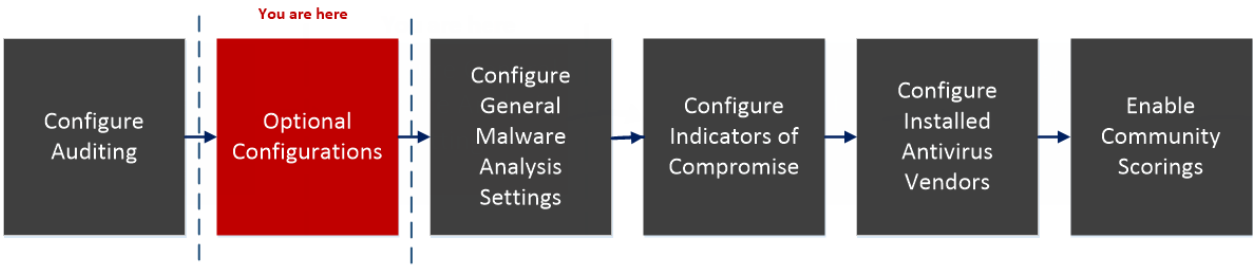
Quick Look

This is an example of the AV tab.

1 Displays the Av Tab.
2 Allows you to select the AV vendor that you are using.
3 Displays the Secondary AV vendors.

Features

The AV tab lists anti-virus vendors whose software may be installed in your network. There are two categories for vendors: Primary, which are the most trusted, and Secondary, which are less known. Each vendor name has a checkbox and an icon. Checking a vendor name indicates that you have installed the selected AV software from that vendor in your environment.



This table describes the options in the AV tab.

Feature	Description
Vendor Checkbox	Choose one or more Anti Virus vendors from the supplied list to indicate which products have been installed in the local organization.
Apply	Saves changes made in the AV tab.
Reset	Resets the AV list to the default state, which has no vendors selected.

Service Config View - Proxy Tab

This topic introduces the parameters configured in the Proxy tab in the Service Config view for a Malware Analysis service. This tab configures Malware Analysis communication via web proxy with the NetWitness Cloud for community analysis and with the sandbox service for sandbox analysis to preserve anonymity. If you are using a local sandbox service, communications via web proxy are unnecessary and may slow performance. When configuring the sandbox module in the **General** tab, you can choose to bypass the configured web proxy.

Workflow

Basic Setup

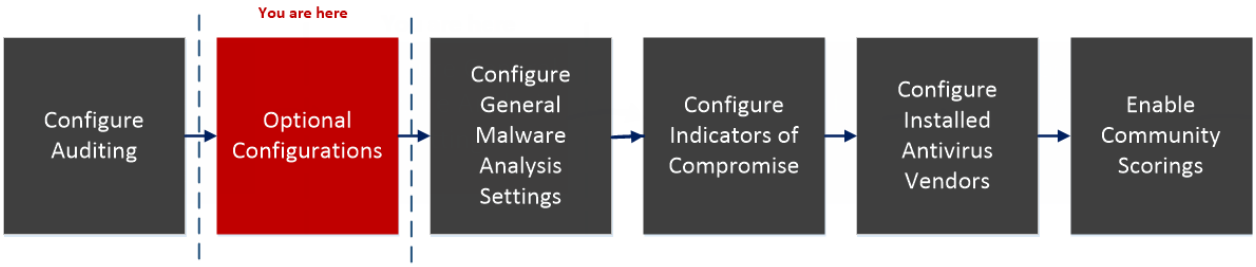
Quick Look

This is an example of the Proxy tab.

1 Displays the Proxy Tab.

Features

This table describes the features in the Proxy tab.



Feature	Description
Enabled	Select the checkbox to enable communication via web proxy with the NetWitness Cloud for community analysis and with the sandbox service for sandbox analysis to preserve anonymity.
Automatically detect web proxy settings	Select the checkbox to use settings configured in the System settings.
Proxy host	Enter the hostname for the proxy host.
Proxy port	Enter the port used for communication on the proxy host
Users	Enter the username used to log on to the proxy host.
User Password	Enter the user password used to log on to the proxy host.
SSL	(Optional) Select the checkbox to enable communication using SSL.
Apply button	Click the **Apply** button to submit chosen settings.

Services Config View - ThreatGRID Tab

This topic introduces the parameters required to obtain a trial ThreatGRID API key in the Malware Analysis **ThreatGRID** tab, which provides a method of obtaining a trial ThreatGRID API key for use in the ThreatGRID Cloud sandbox. Before enabling ThreatGRID as the sandbox service in the Sandbox module, a ThreatGRID-supplied Service Key must be configured so that ThreatGRID can recognize that samples submitted from this site are legitimate.

If you do not have a ThreatGRID-supplied Service Key, you can obtain a key using this tab. The key is provided on a trial basis.

Services Config View - Integration Tab

This topic introduces the features and functions of the Integration tab in the Administration Services Config view for Malware analysis. This tab provides a way to test connections and enable Community scoring by registering the Malware Analysis service. An administrator can test the connection to `cloud.netwitness.com` and to a core service that was configured for continuous scan.

Basic Setup

Quick Look

The following figure is an example of the Integration tab.

1 Displays the Integration Tab.

Features

This tab has two sections: NetWitness Cloud Connection Test and Registration and Continuous Scan Connection Test. The following table describes the features.

Feature	Description
NetWitness Cloud Connection Test and Registration button	Clicking this button tests for an active connection to cloud.netwitness.com. NetWitness tests communications with the site and checks Proxy settings. A valid connection is required in order to register with the Community Service.
Company Name	This is the name of your company. This is a required field.
Contact Email	This is the contact email. This is a required field.
Internal EMC Use Only Check box	This is an optional field. EMC customers, salespersons, or demo users should check this option to ensure that their requests do not use bandwidth on the production server. When the box is checked the following warning is displayed: `Checking this box may cause a less robust performance because the production server isn't being used.`
Register button	Clicking the Register button completes registration if all required fields are filled in. The Register button becomes the Update button after registration is complete.
Update button	The Update button is displayed after registration is complete.

Feature	Description
Continuous Scan Connection Test button	Clicking this button initiates a check to verify that the Malware Analysis service can connect to the Core service selected for continuous scanning (the Source Host, Source Port, Username, and User Password as specified in the General tab).

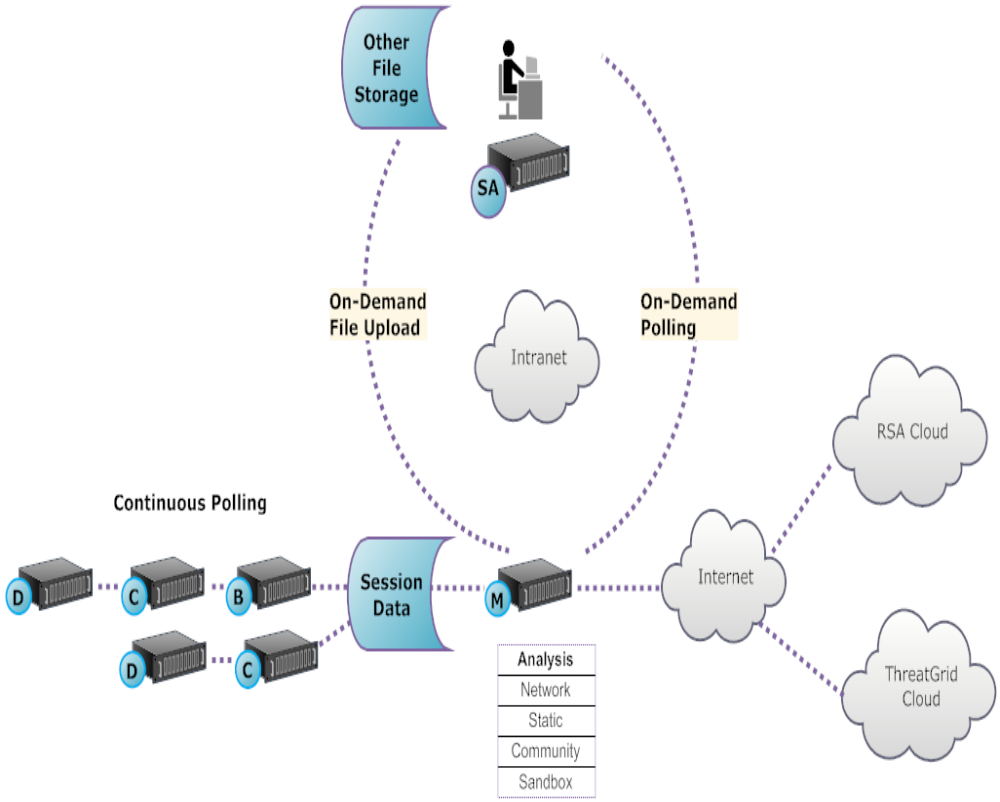
Malware Analysis Functions

NetWitness Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows portable executable (PE), PDF, and MS Office) to assess the likelihood that a file is malicious.

Malware Analysis detects indicators of compromise using four distinct analysis methodologies:

- Network Session Analysis (network)
- Static File Analysis (static)
- Dynamic File Analysis (sandbox)
- Security Community Analysis (community)

Each of the four distinct analysis methodologies is designed to compensate for inherent weaknesses in the others. For example, Dynamic File Analysis can compensate for Zero-Day attacks that are not detected during the Security Community Analysis phase. By avoiding malware analysis that strictly focuses on one methodology, the analyst is more likely to be shielded from false negative results.



In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language, which allows malware researchers to identify and classify malware samples. This allows IOC authors to add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live. These YARA-based IOCs in RSA Live will automatically be downloaded and activated on the subscribed host, to supplement the existing analysis that is performed in each analyzed file.

Malware Analysis also has features that support alerts for Incident Management.

Functional Description

This figure depicts the functional relationship between the Core services (the Decoder, Concentrator, and Broker), the Malware Analysis service, and the NetWitness Server.

Daily Quota (Number of Files)	Free	Standard	Enterprise
Malware Analysis	100	unlimited	unlimited
ThreatGrid Analysis	5	1000	5000

The Malware Analysis service analyzes file objects using any combination of the following methods:

- **Continuous automatic polling of a Concentrator or Broker** to extract sessions identified by a parser as potentially carrying malware content.
- **On-demand polling of a Concentrator or Broker** to extract sessions identified by a malware analyst as potentially carrying malware content.
- **On-demand upload of files** from a user-specified folder.

When automatic polling of a Concentrator or Broker is enabled, the Malware Analysis service continuously extracts and prioritizes executable content, PDF documents, and Microsoft Office documents on your network, directly from data captured and analyzed by your Core service. Because the Malware Analysis service connects to a Concentrator or Broker to extract only those executable files that are flagged as possible malware, the process is both rapid and efficient. This process is continuous and does not require monitoring.

When on-demand polling of a Concentrator or Broker is chosen, the malware analyst uses Investigation to drill into captured data and choose sessions to be analyzed. The Malware Analysis service uses this information to automatically poll the Concentrator or Broker and to download the specified sessions for analysis.

On-demand upload of files provides a method for the analyst to review files captured external to the Core infrastructure. The malware chooses a folder location and identify one or more files to be uploaded and analyzed by Malware Analysis. These files are analyzed using the same methodology as files automatically extracted from network sessions.

Analysis Method

For the Network analysis, the Malware Analysis service looks for characteristics that seem to deviate from the norm, much as an analyst does. By looking at hundreds to thousands of characteristics and combining the results into a weighted scoring system, legitimate sessions that coincidentally have a few abnormal traits are dismissed, while the actual bad ones are highlighted. A user can learn patterns that indicate anomalous activity in the sessions as indicators that warrant further investigation, Indicators of Compromise.

The Malware Analysis service can perform Static analysis against suspicious objects it finds on the network and determine whether those objects contain malicious code. For Community analysis, new malware detected on the network is pushed to the RSA Cloud for checking against RSA's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. For Sandbox analysis, the services can also push data into major security, information and event management (SIEM) hosts (the ThreatGrid Cloud).

Malware Analysis has a unique method for analysis that is partnered with industry leaders and experts, so their technologies can enrich the Malware Analysis scoring system.

NetWitness Server Access to the Malware Analysis Service

The NetWitness Server is configured to connect to the Malware Analysis service and import tagged data for deeper analysis in Investigation. Access is based on three subscription levels.

- Free subscription: All NetWitness customers have a free subscription, with a free key for ThreatGrid analysis. The Malware Analysis service is rate-limited to 100 file samples per day. The number of samples (within the set of files from above) submitted to the ThreatGrid Cloud for sandbox analysis is limited to 5 per day. If one network session had 100 files in it, customers would hit the rate limit after processing the one network session. If 100 files were manually uploaded, that would cause the rate limit to be reached.
- Standard subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGrid Cloud for sandbox analysis is 1000 per day.
- Enterprise subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGrid Cloud for sandbox analysis is 5000 per day.

Scoring Method

By default, the Indicators of Compromise (IOC) are tuned to reflect industry best practices. During analysis, the IOCs that trigger cause the score to move upward or downward to indicate the likelihood that the sample is malicious. The tuning of IOCs is exposed in NetWitness so that the malware analyst can choose to override the assigned score or to disable an IOC from being evaluated. The analyst has the flexibility to either use the default tuning, or to completely customize the tuning to specific needs.

YARA-based IOCs are interleaved with the built-in IOCs within each built-in category and are not distinguished from native IOCs. When viewing IOCs in the Service Configuration view, administrators can select YARA from the Module selection list to see a list of YARA rules.

After a session is imported into NetWitness, all of the viewing and analysis capabilities in Investigation are available to further analyze Indicators of Compromise. When viewed in Investigation, YARA IOCs are distinguished from the built-in native IOCs by the tag `Yara rule`.

Deployment

The Malware Analysis service is deployed as a separate RSA Malware Analysis host. The dedicated Malware Analysis host has an on-board Broker which connects to the Core infrastructure (either another Broker or a Concentrator). Prior to this connection, a collection of parsers and feeds must be added to the Decoders that are connected to the Concentrators and Brokers from which the Malware Analysis service pulls data. This allows suspicious data files to be marked for extraction. These files are `malware analysis` tagged content available through the RSA Live content management system.

Malware Scoring Modules

NetWitness Malware Analysis analyzes and scores sessions and the embedded files within these sessions by scoring four categories: Network, Static Analysis, Community, and Sandbox. Each category comprises many individual rules and checks that are used to calculate a score between 1-100. The higher the score, the more likely the session is to be malicious and worthy of more in-depth follow-on investigation.

Malware Analysis can facilitate a historical investigation into events leading up to a network alarm or incident. If you know that a certain type of activity is taking place on your network, you can select only the reports of interest to examine the content of data collections. You can also modify behavior for each scoring category based on the scoring category or the file type (Windows PE, PDF, and Microsoft Office).

Once you become familiar with data navigation methods, you can explore the data more completely through:

- Searching for specific types of information
- Reviewing specific content in detail.

Category scores for Network, Static Analysis, Community, and Sandbox are maintained and reported independently. When events are viewed based on the independent scores, as long as one category detects malware, it is evident in the Analysis section.

Network

The first category examines each core network session to determine if the delivery of the malware candidates was suspicious. For example, benign software being downloaded from a well-known safe site, using proper ports and protocols, is considered less suspicious than downloading software known to be malicious from a known dubious download site. Sample factors used in the scoring of this criteria set may include sessions that:

- Contain threat feed information
- Connect to well-known bad sites
- Connect to high-risk domains/countries (for example, .cc domain)
- Use well-known protocols on non-standard ports
- Contain obfuscated JavaScript

Static Analysis

The second category analyzes each file in the session for signs of obfuscation in order to predict the likelihood of the file behaving maliciously if allowed to run. For example, software that links to networking libraries is more likely to perform suspicious network activity. Sample factors used in the scoring of this criteria set may include:

- Files found to be XOR encoded
- Files found embedded within non-EXE formats (for example, PE file found embedded in a GIF format)
- Files linking to higher risk import libraries
- Files highly deviating from the PE Format

Community

The third category scores the session and files based on the collective knowledge of the security community. For example, files whose fingerprint/hash is already known to be good or bad by respected anti-virus (AV) vendors is scored accordingly. Files are also scored based on knowledge that a file was delivered from a site known to be good or bad by the security community.

Community scoring also indicates whether the AV on your network flagged the files as malicious. It does not indicate that the resident AV product acted to protect your system.

Sandbox

The fourth category examines the behavior of the software by actually running it in a sandbox environment. By running the software to watch its behavior, a score can be calculated by identifying well-known malicious activity. For example, software that configures itself to autostart on each reboot and make IRC connections would score higher than a file with no known bad behavior.

Conducting Malware Analysis

Analysts can use theNetWitness Malware Analysis service to detect malware in selected data and files.

Analysts who conduct analysis using NetWitness Malware Analysis need to have the appropriate system roles and permissions set up for their user accounts.

The following procedures provide instructions for using Malware Analysis:

- Begin a Malware Analysis Investigation
- Upload Files for Malware Analysis Scanning
- Implement Custom YARA Content
- Configure the Malware Analysis Summary of Events View
- Filter Dashlet Data in the Summary of Events View
- Examine Scan Files and Events in List Form
- View Detailed Malware Analysis of an Event

Begin a Malware Analysis Investigation

You can investigate data that has been scanned, flagged, and rated by Malware Analysis as containing Indicators of Compromise. This includes all types of Malware Analysis scans: continuous mode polling, on-demand polling, and on-demand uploaded files. Continuous mode polling must be enabled when the administrator configures basic settings for the Malware Analysis service.

NetWitness provides several methods of launching a Malware Analysis investigation.

Fastest: Instant Launch from Malware Analysis Dashlets

The fastest way to begin a Malware Analysis investigation is an Instant launch from the NetWitness Dashboard using one of the Malware Analysis dashlets that lists events or files that are likely to contain malware. The dashlets are described as part of the NetWitness Content in Dashlets. From one of these dashlets, you can go directly to the Analysis Results for a specific event that has been listed as worthy of investigation:

- Top Listing of Highly Suspicious Malware
- Top Listing of Possible Zero Day Malware
- Malware with High Confidence IOCs and High Scores Dashlet

On-Demand Polling from a Meta Value in the Navigate View

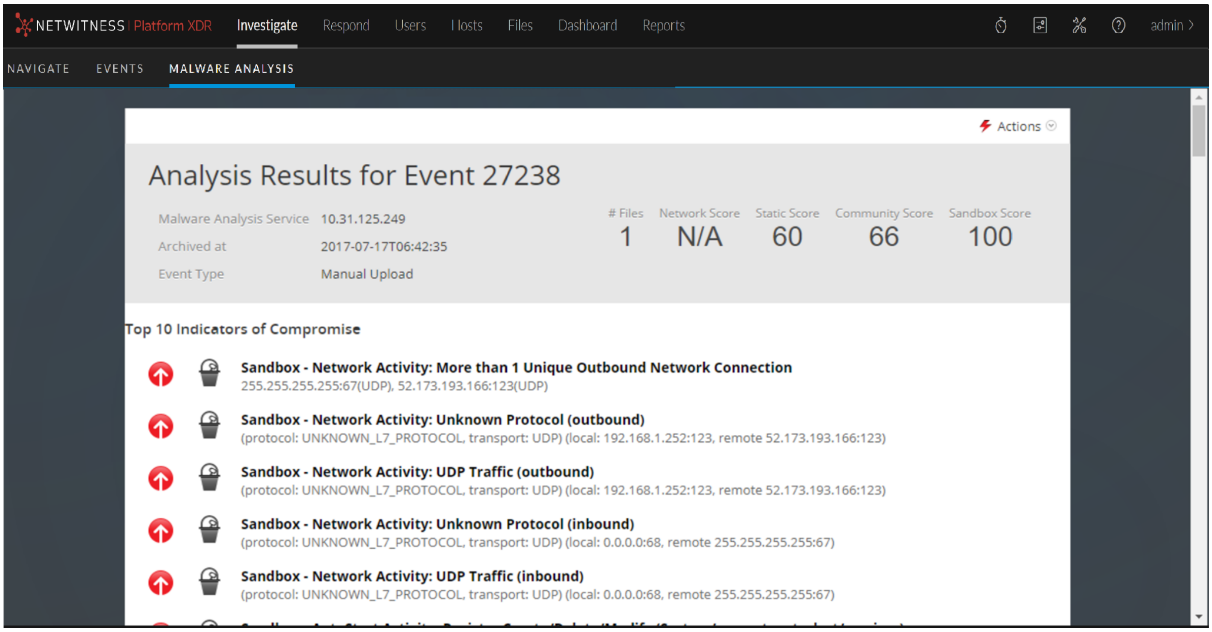
You can initiate on-demand polling from within an investigation by right-clicking a meta value in the Navigate view, and choosing an option from the context menu. When polling is complete, the scanned data is available for malware analysis (see "Launch a Malware Analysis Scan from the Navigate View" in the *NetWitness Investigate User Guide*).

Investigate a Specific Service

You can also begin a Malware Analysis investigation of a service in the Investigate > Malware Analysis view. For Malware Analysis investigation on a service basis, a service must be specified in the Investigate > Malware Analysis view.

1. Investigate opens the Malware Analysis view with the user-specified default service selected.
2. If no default service is currently specified, a dialog allows you to select the Malware Analysis service to investigate.
3. When a service has been selected in the Malware Analysis view, the Summary of Events for the selected service and continuous scan data for the service is displayed.

This topic provides instructions for all methods of launching a Malware Analysis investigation.



Launch a Malware Investigation from a Malware Analysis Dashlet

A prerequisite for this procedure is that one of the following dashlets must be visible in the NetWitness dashboard or in the Malware Analysis view, and must be populated with listed events or files. If you do not see the dashlets, add them and configure the dashlets.

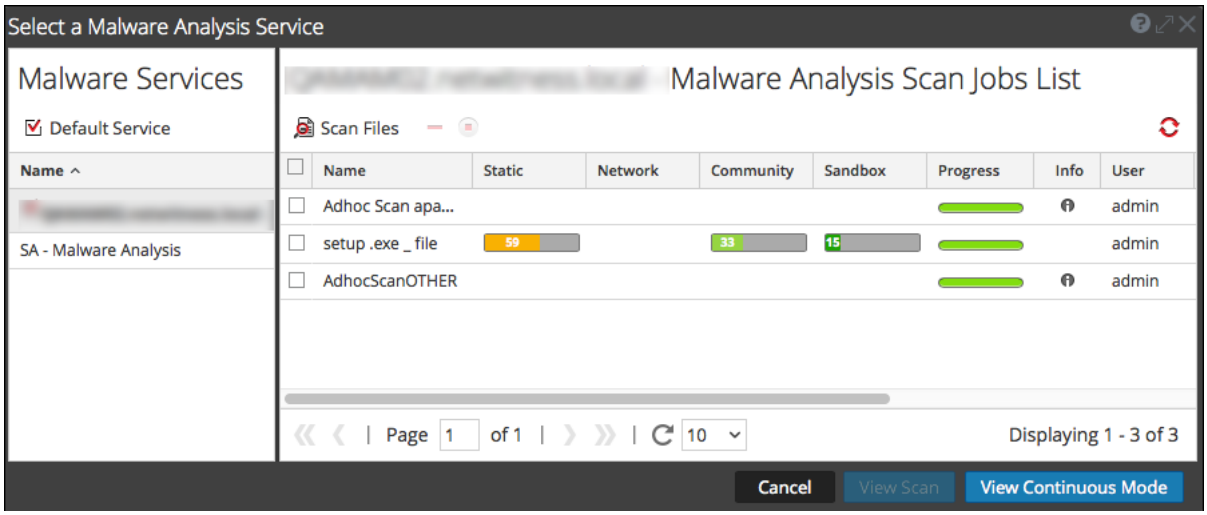
- Top Listing of Highly Suspicious Malware
- Top Listing of Possible Zero Day Malware
- Malware with High Confidence IOCs and High Scores Dashlet

To launch a Malware Analysis investigation from a dashlet:

1. Log in to NetWitness and look for one of the above dashlets in the Monitor view or in the Malware Analysis view
2. In the dashlet, double-click an event or file for deeper analysis. A detailed analysis of the event in the Events List or the event with which the file in the File List is associated is displayed in the Malware Analysis view.

To learn more about configuring the Malware Analysis dashlets in the Monitor dashboard, see "Dashlets" in the *NetWitness Platform Getting Started Guide*.

To learn about the ways you can configure and filter information in dashlets in the Malware Analysis view, refer to Filter Dashlet Data in the Summary of Events View.



To learn about the actions you can perform in the Analysis Results, refer to View Detailed Malware Analysis of an Event.

Begin a Malware Analysis Investigation (No Default Service)

To begin an investigation with no default service specified:

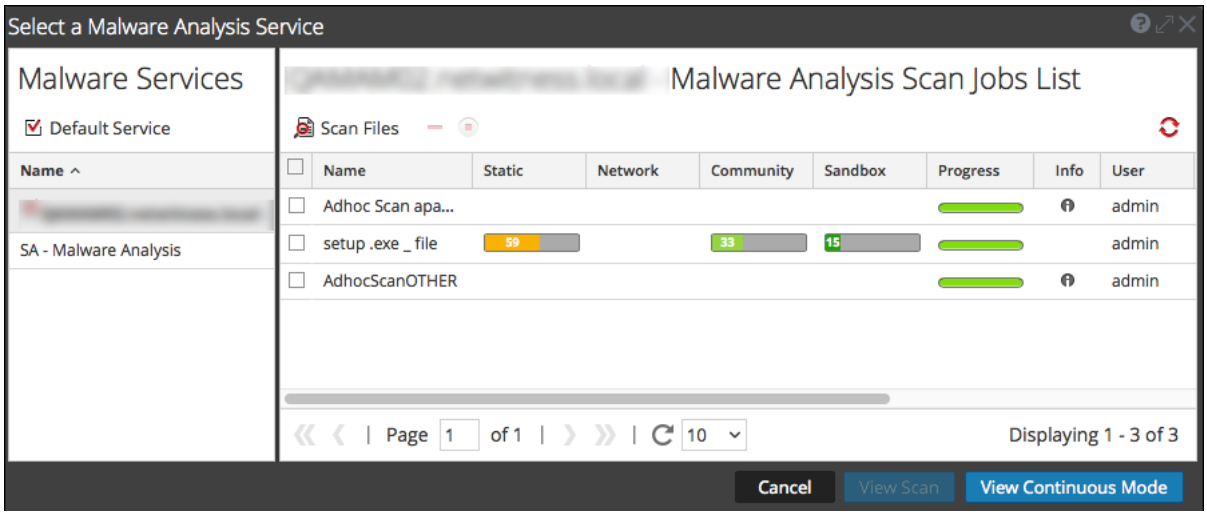
1. Select **Investigate > Malware Analysis**.

   The Select a Malware Analysis Service dialog is displayed, with available Malware Analysis hosts and services for the current user in the left panel and available scan jobs in the right panel. This scan jobs panel contains the same columns as the Malware Scan Jobs dashlet in the Unified dashboard. In addition, it has a toolbar and View options, which are described in Select a Malware Analysis Service Dialog.

2. In the list of Malware Analysis hosts, select a host and a list of scan jobs is displayed in the right panel. These jobs are created when you scan an event or a file (see Upload Files for Malware Analysis Scanning and "Launch a Malware Analysis Scan from the Navigate View" in the *NetWitness Investigate User Guide*.
3. To begin analyzing a scan, do one of the following:
   a. Select a scan and click **View Scan**.
   b. Click **View Continuous Mode**.

      The Summary of Events for the selected scan is displayed with the default dashlets open. Each user can add, modify, and delete default dashlets, which persist through different scan investigations. Users can also restore default dashlets as described in Filter Dashlet Data in the

Summary of Events View.



Set or Clear the Default Service

You can set the default service and clear the default service in the Select a Malware Analysis Service dialog.

To set a default service:

1. Click the service name in the Summary of Events toolbar.

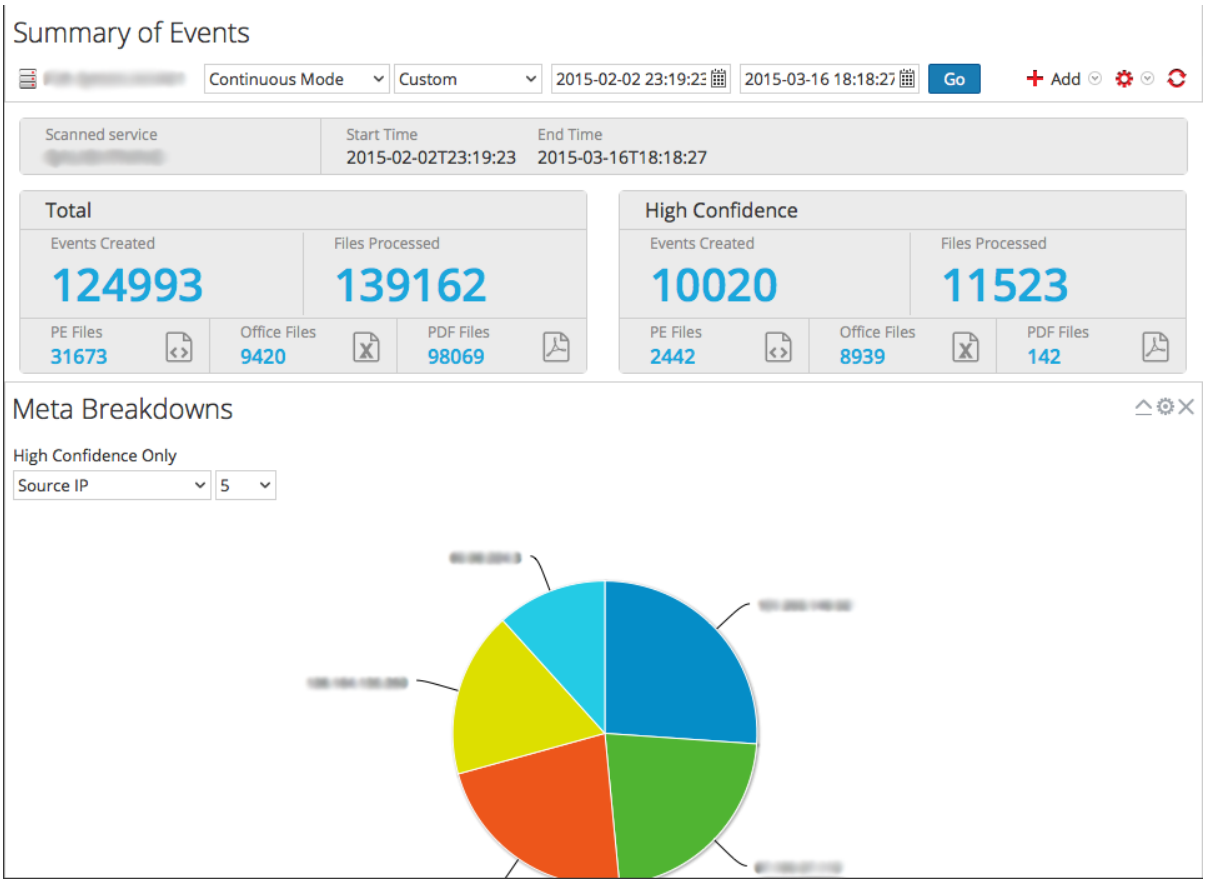
   The Select a Malware Analysis Service dialog is displayed.

2. Select a service on the list of available Malware services, and click Default Service.

   The service becomes the default, (indicated by ☑ in front of the host name).

3. To clear the default service, select the default service in the grid, and click Default Service.

   No default service is set.



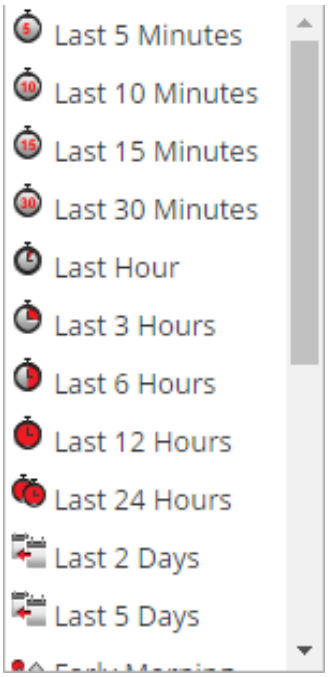
Upload and Scan Files

A Malware Analyst with permission to `Initiate Malware Analysis Scan` can upload files to scan using the Scan Files option in the Select a Malware Analysis Service dialog (see Upload Files for Malware Analysis Scanning. An administrator can upload packet capture files to a Decoder for Malware Analysis in the Services System view as described in "Upload Packet Capture File" in the *Decoder and Log Decoder Configuration Guide*.

Begin an Investigation (Default Service Specified)

To begin an investigation with a default service specified, select **Investigate > Malware Analysis**.

The Summary of Events for a continuous scan of the selected service is displayed with the default dashlets open. Each user can add, modify, and delete default dashlets, which persist through different scan investigations. Users can also restore default dashlets as described in Filter Dashlet Data in the Summary of Events View.



Apply Time Parameters Filter for Results

You can apply a Threshold filter to refresh the results of the chosen dashlets.

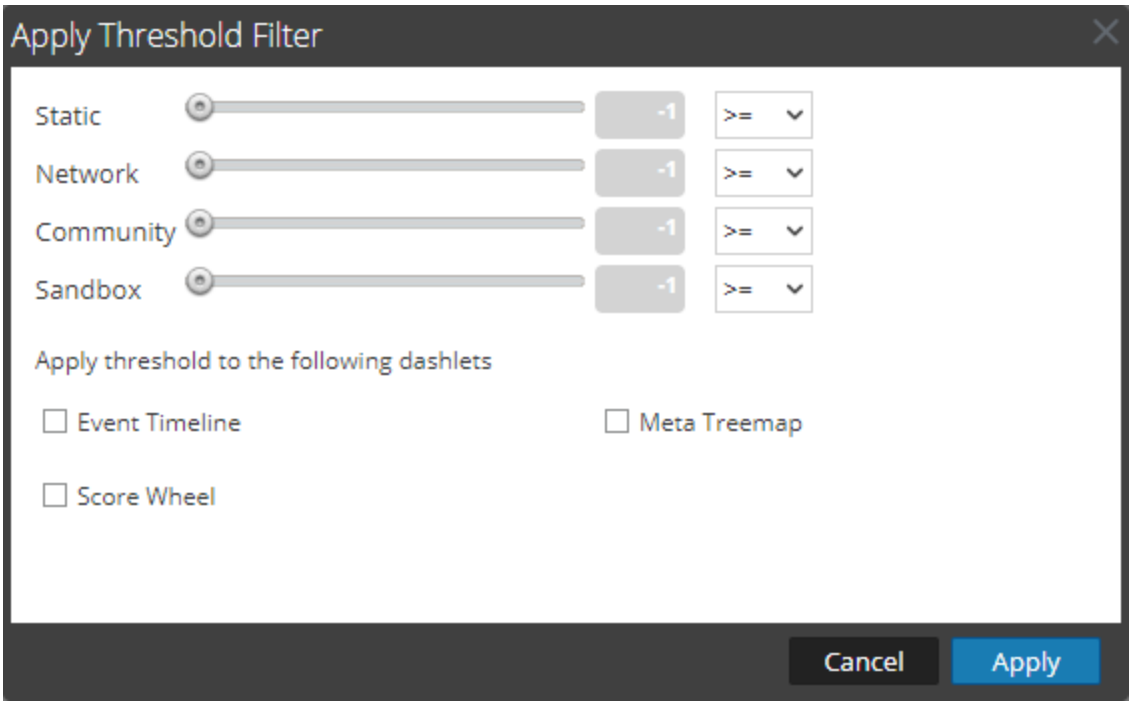
1. To select a different time range, select either **Continuous Mode** or a different scan from the toolbar.

   The Malware Summary of Events for the selected scan is displayed.

2. To select a new time range for the scan, click in the range selection list in the toolbar. Ranges available are: Last 5 minutes, Last 10 minutes, Last 15 minutes, Last 30 minutes, Last Hour, Last 3 Hours, Last 6 Hours, Last 12 Hours, Last 24 Hours, Last 2 Days, Last 5 Days, Early Morning, Morning, Afternoon, Evening, All Day, Yesterday, This Week, Last Week, or Custom.

The results are updated immediately.

3. To refresh a continuous mode scan with new data, click .



Apply a Threshold Filter to Continuous Mode Results

You can apply a new threshold filter to an instance of the Malware with High Confidence IOCs and High Scores dashlet, the Meta Treemap dashlet, the Score Wheel dashlet, and the Event Timeline dashlet.

To customize the scoring applied to the scan, in the toolbar, do the following:

1. Select > **Apply Threshold Filter**.

   The Apply Threshold Filter dialog is displayed.

2. If you want to limit the number of events displayed to events that were given a score above a certain number, do the following:
   a. Drag the slider in the Static, Network, Community, and Sandbox slider bars.
   b. To select the dashlets in which the thresholds apply, select the appropriate checkboxes.
   c. Click **Apply**.

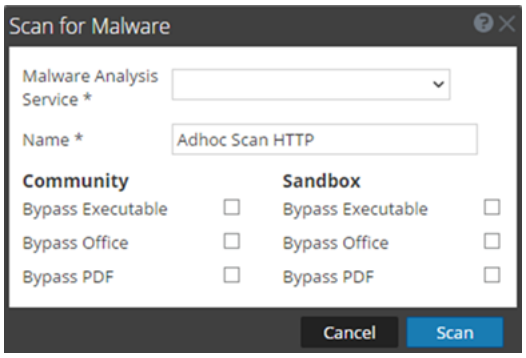
Delete or Resubmit an On-Demand Scan with New Bypass Settings

You can delete an on-demand scan or resubmit an on-demand scan with different bypass settings than those specified in the Service Configuration view for a Malware Analysis service.

To delete a scan while viewing an on-demand scan, do the following:

1. Select **Actions > Delete Scan**.

   A dialog asks for confirmation that you want to delete the scan.



2. Click **Yes**.

   The selected scan is deleted.

To apply different bypass settings to the current scan:

1. Select **Actions > Resubmit Scan**.

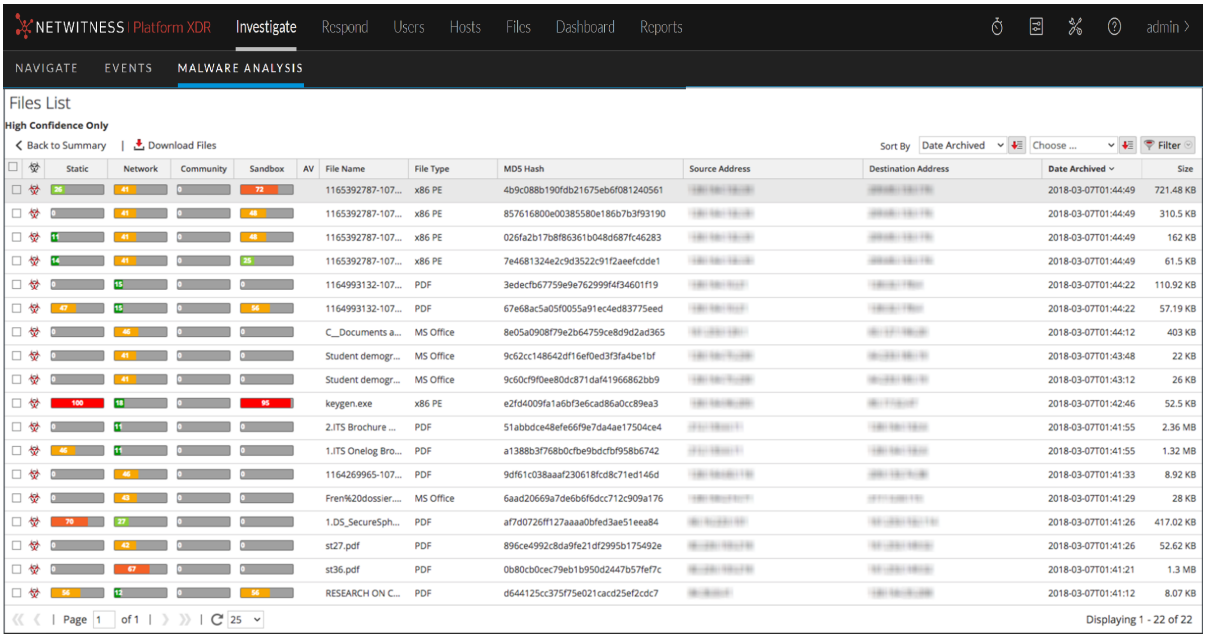
   The Scan for Malware dialog is displayed.

2. Select the bypass settings that you want to use on the new scan, and click **Scan**.

   Malware Analysis resets cache and resubmits the file for a new scan, and the scan jobs are added to the jobs queue.

3. When the job is complete, scroll to the left and select **View**.

   The Malware Summary of Events for the selected scan is displayed.



View the Files List

You can view a list of files for an event from the Malware Analysis Summary of Events and from each of the Visualization charts: Event Timeline, Meta Breakdowns, Meta Treemap, and Score Wheel.

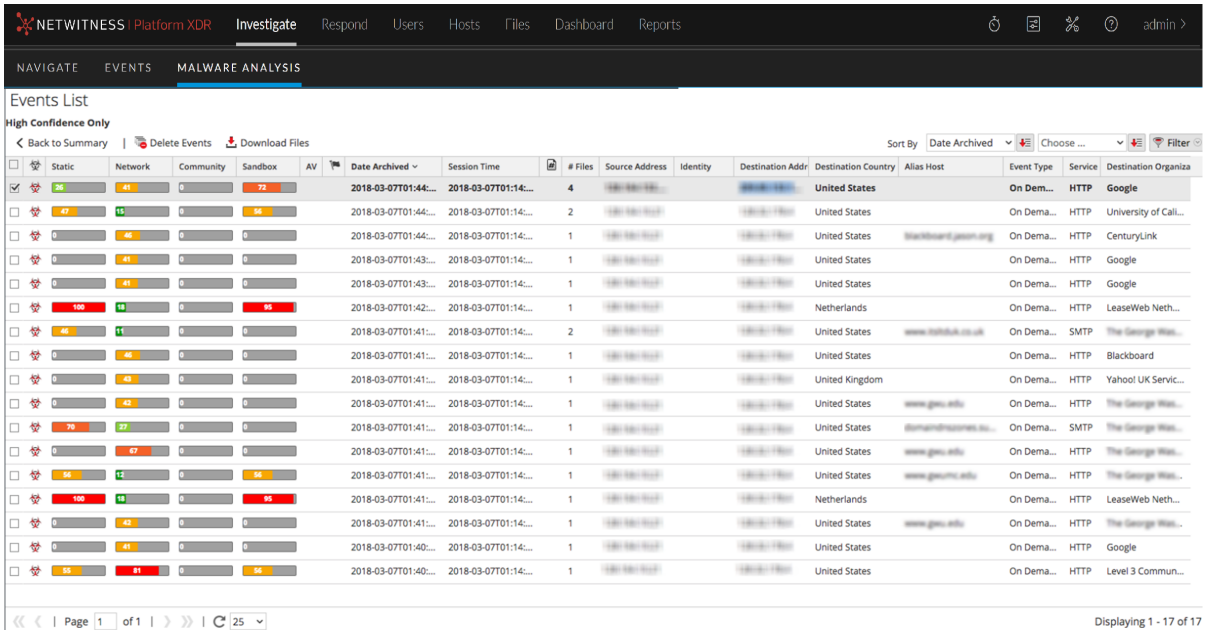
To view the Files List, do one of the following:

- In the Summary of Events, click on the number of files in the **Total** row or the **High Confidence** row under **Files Processed**, **PE Files**, **Office Files**, or **PDF Files**. The Files List is displayed.
- In any visualization dashlet, click the number next to the **Files** field in the top right corner of the dashlet.

The Files List for the selected drill point is displayed.

From the Files List, you can search for a file by filename or MD5 file hash, sort the list using two criteria and ascending or descending order, and download files as described in Examine Scan Files and Events in List Form.

To return to the Summary of Events, click **Back to Summary**.



View the Events List

From the Malware Analysis Summary of Events and from each of the visualization charts (Event Timeline, Meta Breakdowns, Meta Treemap, and Score Wheel), you can select events to view in the Events grid.

To view the Events List, do one of the following:

- In the Summary of Events, click the number of Events Created in the **Total** row or the **High Confidence** row. The Events List is displayed.
- In any visualization dashlet, click the number next to the Events field in the top right corner of the dashlet.

The Events List for the selected time is displayed.

Implement Custom YARA Content

In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language that allows malware researchers to identify and classify malware samples. It makes built-in YARA-based Indicators of Compromise (IOCs) available in Live; these are automatically downloaded and activated on subscribed hosts.

Customers with advanced skills and knowledge can add detection capabilities to Malware Analysis by authoring YARA rules and publishing them in Live or placing YARA rules in a watched folder for the host to consume.

As malware and the threat landscape evolve, it is important to review and examine existing custom rules. Updates are often necessary to incorporate new detection methods. It also updates YARA rules in Live from time to time. To receive updates, you can subscribe to the Blog and Live at http://blogs.rsa.com/feed.

This document provides information to help customers implement custom YARA rules in Malware Analysis.

Prerequisites

The host on which you are adding custom rules must be configured to support authoring of YARA rules as described in "Enable Custom YARA Content" in the *Malware Analysis Configuration Guide*.

YARA Version and Resources

Malware Analysis is packaged with YARA version 1.7 (rev:167). To find out the exact version, you can run `yara -v` on the Malware Analysis host as shown in this example:

```
[root@TESTHOST yara] # yara -v
 yara 1.7 (rev:167)
```

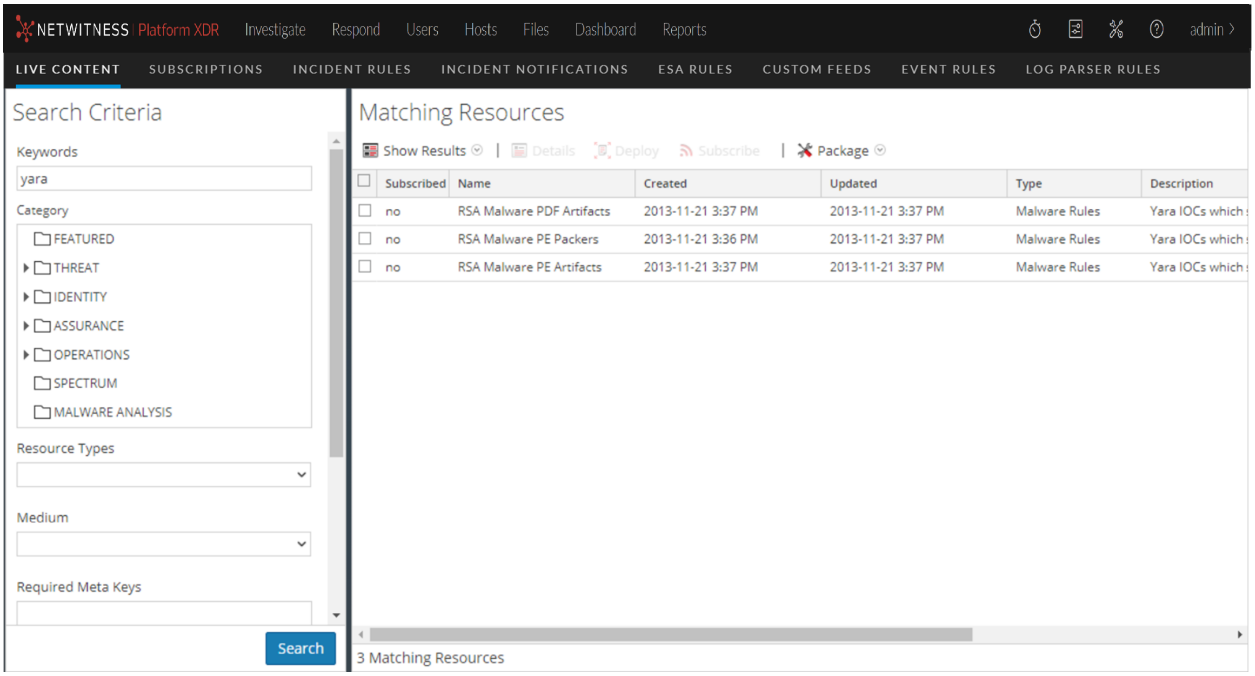
Meta Keys in YARA Rules

Malware Analysis is compliant with other sources of YARA rules, and it also consumes additional meta keys that are specific to Malware Analysis. Each YARA rule is equivalent to an Indicator of Compromise (IOC) within Malware Analysis. The example below illustrates the meta definitions in a rule:

```
meta:
 iocName = "FW.ecodedGenericCLSID"
        fileType = "WINDOWS_PE"
        score = 25
        ceiling = 100
        highConfidence = false
```

Meta Key	Description
iocName	(Required) This is the name that MA uses as the rule name. It is specific to Malware Analysis and is required to add the rule to the IOC list.

Meta Key	Description
fileType	Specifies the files type. Possible values are: WINDOWS_PE, MS_OFFICE, and PDF. If not specified, the default value is WINDOWS_PE.
score	This value that is added to the static score if the YARA rule is triggered. If not specified, the default value is 10.
ceiling	This is the maximum amount that is added to the static scores when a rule is triggered multiple times in one session. For example, if each time a rule is triggered, 20 points are added to the static, and you do not want more that 40 points added when the rule is triggered more than two times, you can specify a ceiling of 40. If not specified, the default value is 100.
highConfidence	This sets the High Confidence flag, which is set on IOCs when there are high confidence indicators that malware is present. If not specified, the default file value is false.

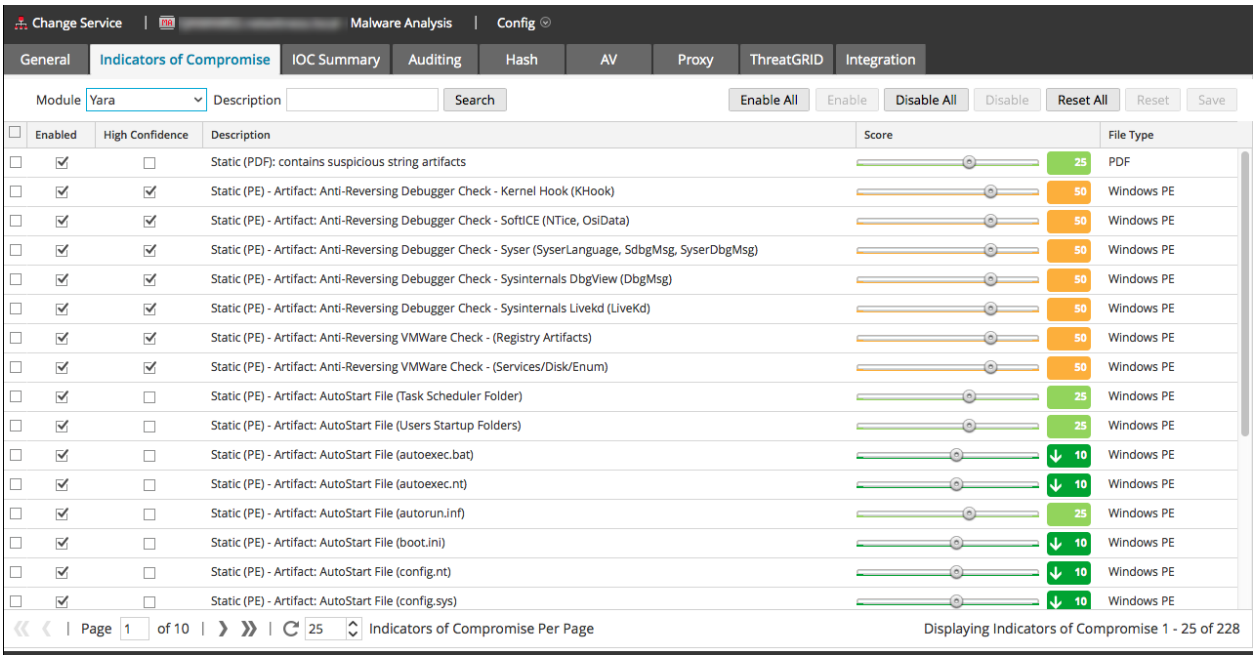


Note: Refer to the following URL for YARA resources: https://code.google.com/p/yara-project/downloads/list. NetWitness uses YARA 1.7, not YARA 2.0.

YARA Content

Live contains 3 sets of Yara rules:

- PE Packers
- PDF Artifacts
- PE Artifacts



The following figure illustrates YARA content available as YARA rules in NetWitness Live.

On the Malware Analysis host, the YARA rules reside in `/var/lib/netwitness/malware-analytics-server/spectrum/yara`, as shown in the example below.

```
[root@TESTHOST yara]# pwd
 /var/lib/netwitness/malware-analytics-server/spectrum/yara
 [root@TESTHOST yara]# ls *.yara
 rsa_mw_pdf_artifacts.yara rsa_mw_pe_artifacts.yara rsa_mw_pe_packers.yara
```

The individual rules are listed as IOCs in the Malware Analysis Service Config view > Indicators of Compromise tab. To view them, use the Yara module as the filter. You can adjust the configuration of an individual in the same way that you configure other IOCs.

Add Custom YARA Rules

To introduce custom YARA rules from other sources:

1. To ensure that the YARA rules follows the correct format and syntax, use the YARA command to compile the YARA rule as shown in the following example. If the rule compiles with no errors, this indicates that the YARA rule has the correct syntax.

   ```
   [root@TESTHOST yara]# yara rsa_mw_pe_packers.yara dummy.txt
    [root@TESTHOST yara]#
   ```

2. Ensure that custom rules do not duplicate existing YARA rules from other sources. All YARA rules are in `/var/lib/netwitness/malware-analytics-server/spectrum/yara`

3. Ensure that the meta keys supports are included to organize the YARA rules as part of the configurable IOCs, and name the file with the yara extension (<filename>.yara). For better organization, make sure that the `iocName` meta is included in the meta section as shown in the following example.

   Example:

   ```
   rule HEX_EXAMPLE
   ```

```
{
    meta:
        author = "RSA"
        info = "HEX Detection"
       iocName = "Hex Example"
     strings:
        $hex1 = { E2 34 A1 C8 23 FB }
        $wide_string = "Ausov" wide ascii
     condition:
        $hex1 or $wide_string
}
```

4. When ready, place the custom YARA file in the folder that the Malware Analysis service watches:
   `/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch`
   The file is consumed within one minute.
   Once consumed, NetWitness moves the file to the `processed` folder, and the new rule is added to the Malware Analysis Services Config view > Indicators of Compromise tab.

Note: If you fail in adding the custom YARA rule, after step 4, do the following:
1. Check the custom YARA file is in `/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch/error`.
2. Check the logs `/var/lib/netwitness/malware-analytics-server/spectrum/logs/spectrum.log`.

Examine Scan Files and Events in List Form

When viewing the Summary of Events in a Malware Analysis scan, you can click a file count or an event count to view the Files List or the Events List for the scan (see Begin a Malware Analysis Investigation). In the Files List and Events List, you can search for a file by filename or MD5 file hash, sort the list using two criteria and ascending or descending order, and download files. When you find an event or file of interest in the Events List or Files List, you can view many details about the event in the Event Details view.

For each event in the Events List, NetWitness provides the following information:

- Flagged as a High Confidence event, which is considered likely to contain Indicators of Compromise.
- The numeric score for each scoring module: Static, Network, Community, and Sandbox.
- Antivirus vendor scores.
- The Influenced by customized rule flag.
- The date the event was archived.
- The session time.
- The MD5 hash filter.
- The number of files in the event.
- The source IP address of the event.
- The Identity.
- The destination IP address.
- The destination country.
- The name of the alias host.
- The event type, for example, Network.
- The service used by the event.
- The destination organization

For each file in the Files List, NetWitness provides the following information:

- Flagged as a High Confidence event, which is considered likely to contain Indicators of Compromise.
- The numeric score for each scoring module: Static, Network, Community, and Sandbox.
- Antivirus vendor scores.
- The filename.
- The file type.
- The MD5 hash filter.
- The source IP address of the event that contained the file.

- The destination IP address.
- The date the event that contained the file was archived.
- The file size.

Sort the Files List or Events List

You can sort the Files List and Events List by column name in ascending and descending order. You can choose one or two columns.

To sort the list:

1. In the first **Sort By** drop-down list, choose a column name and sort direction:  for descending order or  for ascending order.
2. (Optional) In the second **Sort By** drop-down list, choose a column name, and sort direction,  for descending order or  for ascending order.
   The column titles reflect the selected sort order.

Filter the List by Filename or MD5 File Hash

You can filter the Files List and Events List by filename or file hash. With this feature, you can specify a limited subset of the original data based on the search criteria.

Note: When you perform a search, you search the scan that you are currently displaying, not all scans.

1. Click 

   .
   The Filter dialog is displayed.
2. Enter a value in **File Name** or **MD5 Hash** and click **Filter**. The File Name and Hash field are not case sensitive. Wild card or regular expressions are not supported. The filter is based on exact matches. You can drag across a filename or hash to select from the Files list or Events list, then copy and paste it in the dialog.
3. Click **Filter**.
   Malware Analysis filters the list to display only files or events with the selected hash
4. To revert to the unfiltered list, click 

   . When the Filter dialog is displayed, click **Reset**.

Download Files from the Files List

NetWitness lets you select and download files from the Files List or the Events List.

Caution: Use caution when downloading files from Malware Analysis; some files may contain harmful code. File Download is a specific permission that can be configured, refer to "Define Roles and Permissions for Malware Analysts" in the *Malware Analysis Configuration Guide* for more details.

To download files from the Files List or Events List:

1. In the **Files List** or **Events List**, select the checkbox next to one or more rows.
2. In the toolbar, select 

.
   The Malware File Download dialog is displayed.
3. Do one of the following:
   a. If you decide not to download the file, click **Cancel**.
   b. If you want to download the file, select click the **Download** button.
      The file or files selected are downloaded in a zip archive with the name `Malware_Files.zip`.

Delete Events from the Scan

In the Events List, you select one or more events and delete them from the scan. This is useful for removing events that are not of interest.

To remove an event from the scan being viewed:

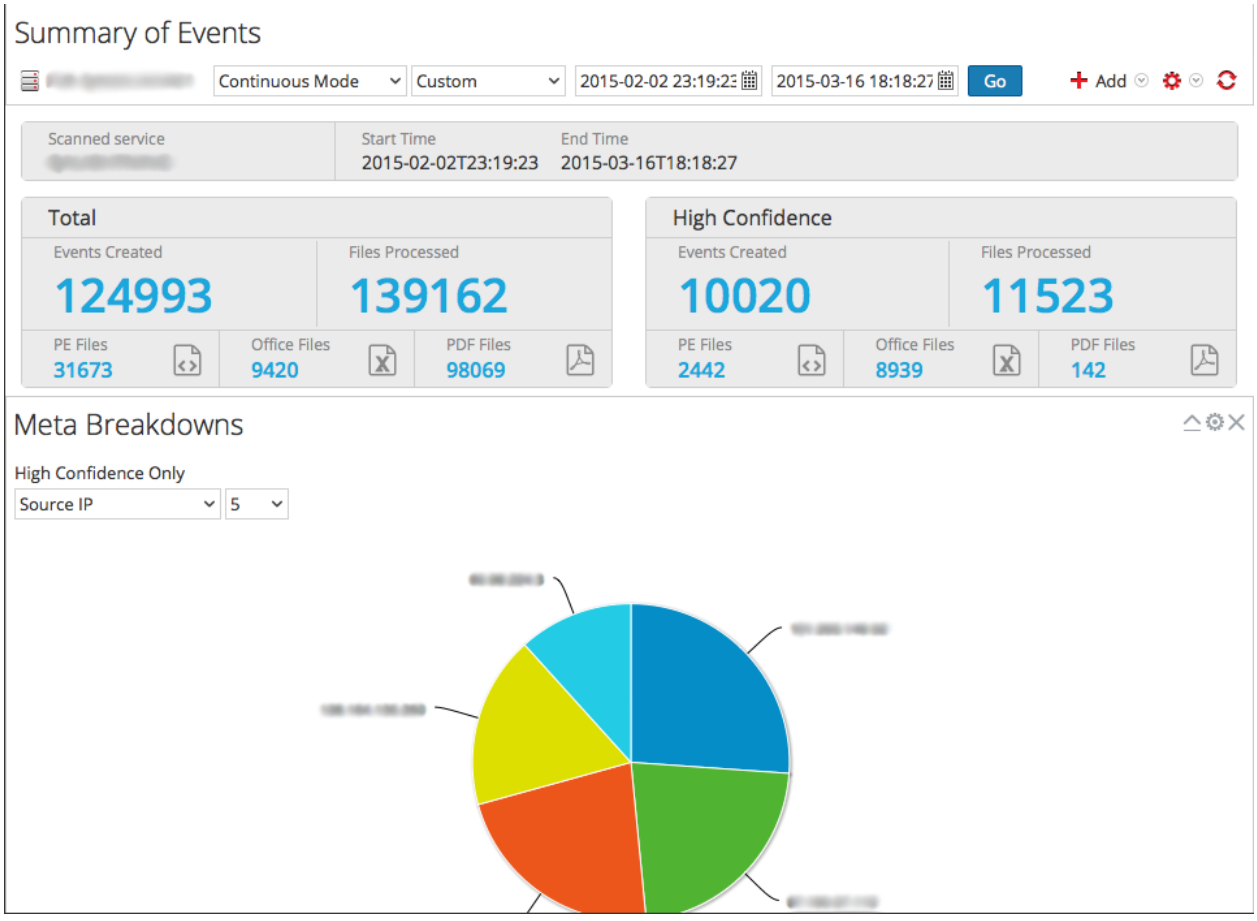
1. In the **Events List**, select one or more events.
2. In the toolbar, click 

.
   NetWitness asks for confirmation that you want to delete the events.
3. In the confirmation dialog, click **Yes**.
   The selected events are deleted.

Return to the Summary of Events

To leave the Files List or Events List and return to the Summary of Events, click **Back to Summary**.

Open the Detailed Analysis for an Event



While you examine events or files in the Files List or Events List, you can double-click any event or file to open a detailed analysis of the event in the Events List or the event with which the file in the Files List is associated (see View Detailed Malware Analysis of an Event).

Configure the Malware Analysis Summary of Events View

The Summary of Events provides a summary of the scan being investigated, and below the summary are configurable dashlets such as visualization charts and listings. By default, the Summary of Events for a scan opens with the default dashlets displayed. You can customize the view by adding, modifying, and deleting default dashlets. The configured customization of dashlets persists through different scan investigations, and you can restore default dashlets at any time. The default dashlets are:

- Summary of Events (Fixed)
- Event Timeline
- Top Listing of Highly Suspicious Malware
- Meta Treemap
- Score Wheel
- Meta Breakdowns

The following figure is an example of the default Summary of Events.

The rest of this topic provides instructions for managing and configuring dashlets.

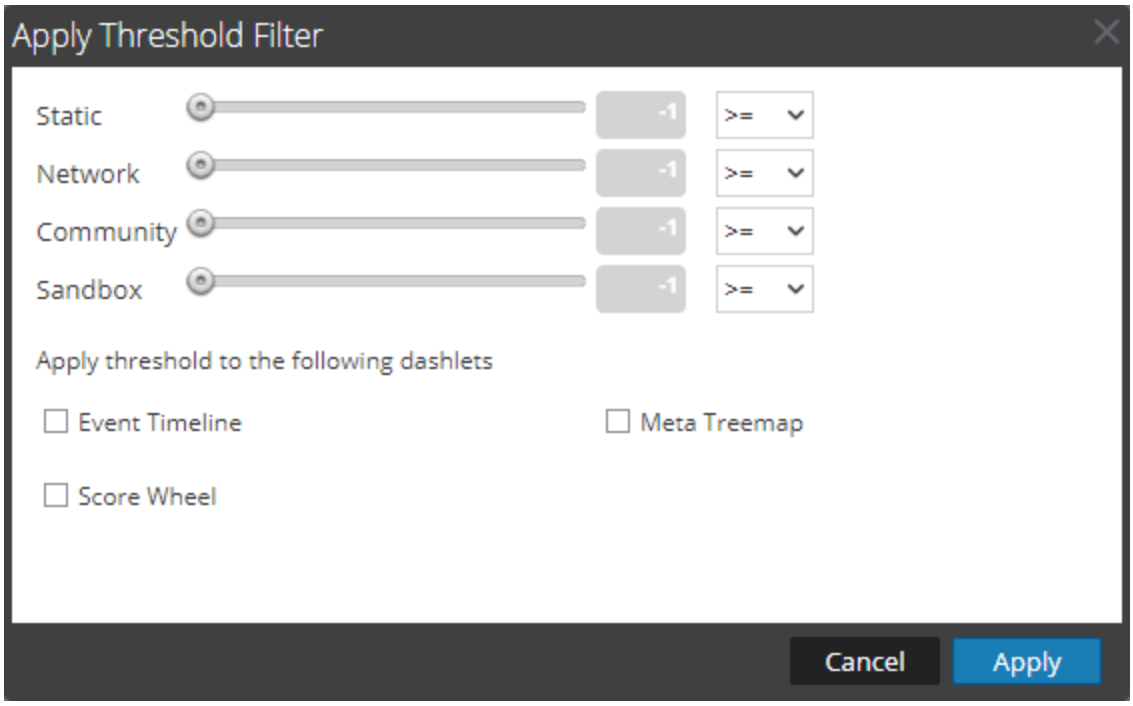
Add a Dashlet

You can add multiple copies of dashlets in the Malware Analysis Summary of Events. To add a dashlet:

1. In the toolbar, select **Add**.
   The drop-down list of dashlets is displayed. There are four visualization options: Score Wheel, Meta Treemap, Meta Breakdowns, and Event Timeline. The other three dashlets are the same dashlets available in the NetWitness dashboard: Malware with high Confidence IOCs and High Scores, Top Listing of Highly Suspicious Malware, Top Listing of Possible Zero Day Malware. Details for these common dashlets are provided in "Dashlets" in NetWitness Content.
2. Select a dashlet.
   The new dashlet is added as the last dashlet below the existing dashlets.
3. If the dashlet is a duplicate of an existing dashlet, change the name of the new dashlet so that it is unique.

Modify or Delete a Dashlet Using Toolbar Options

Each dashlet has a toolbar that offers options for modifying the dashlet. The visualization charts have the same configuration settings, while some of the other dashlets have different additional settings.

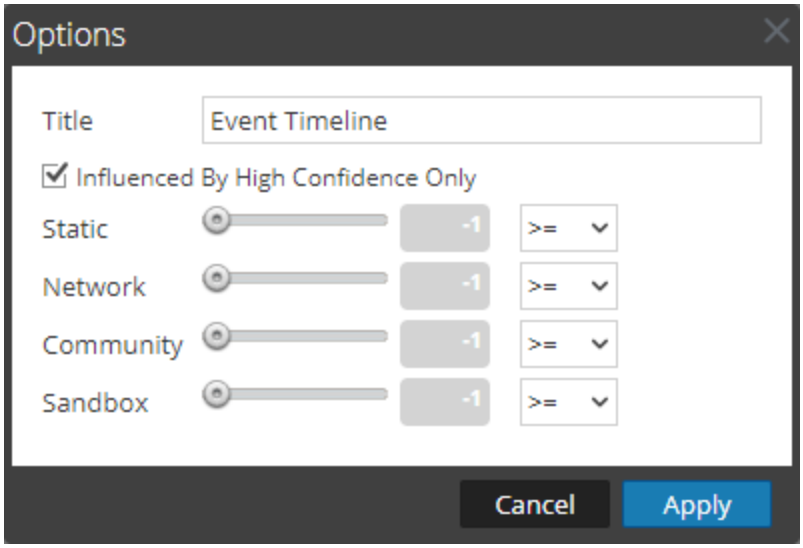


To use the toolbar options:

- To close a dashlet so that only the title bar is displayed, click .
- To open a dashlet that is closed, click .
- To display the configurable settings for a dashlet, click .
  The settings dialog for the dashlet is displayed.
- To delete a dashlet, click .

Apply Threshold Filter to Multiple Dashlets

Within dashlets, you can set a threshold to show only events equal to, above, or below a certain score in the four categories (Static, Network, Community, and Sandbox). This procedure sets the thresholds by dashlet type for these dashlets: Event Timeline, Score Wheel, and Meta Treemap. You can also set the threshold for individual dashlets.

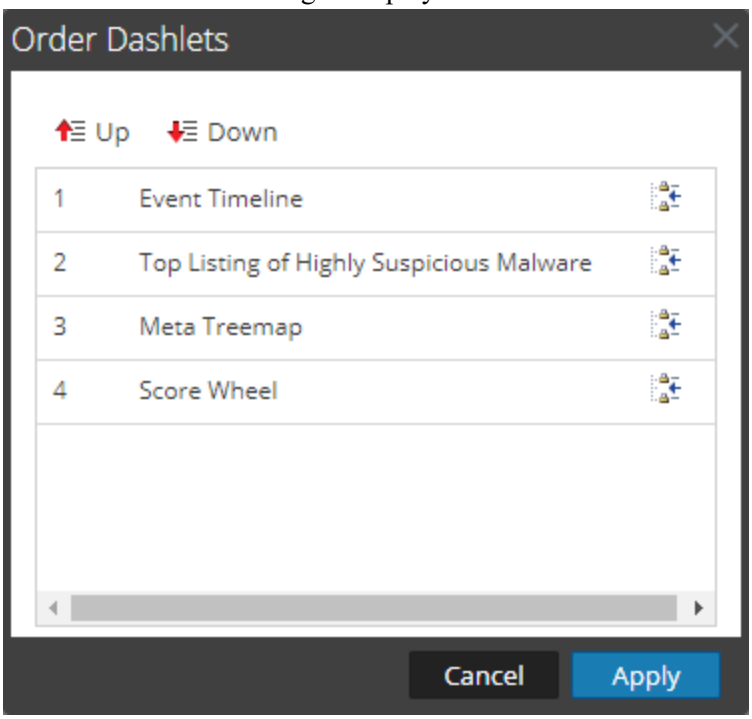


1. In the toolbar, select > **Apply Threshold Filter**.
   The Apply Threshold Filter dialog is displayed.

2. Select one or more dashlet types: Event Timeline, Score Wheel, and Meta Treemap.
3. Drag the corresponding slider or enter a numeric value, then select an operator in the drop-down list: =, >=, or <=.
4. Click **Apply**.
   The threshold filters are applied to the selected dashlet types in the Summary of Events.

Set Title and Category Options for a Dashlet

1. To display the configurable settings for a dashlet, click ⚙.
   The Options dialog for the dashlet is displayed.



2. Type a new title for the dashlet in the **Title** field.
3. If you want to see only events that are influenced by a High Confidence tag, which means there is high confidence that the event contains harmful code, check the **Influenced By High Confidence Only** option.
4. If you want to see only events that were given a score above a certain score in the four categories (Static, Network, Community, and Sandbox), drag the corresponding slider or enter a numeric value, then select an operator in the drop-down list: =, >=, or <=.
5. Click **Apply**.
   The title and filters are applied to the dashlet.

Order Dashlets

To change the order of dashlets as they appear beneath the Summary of Events:

1. In the toolbar, select > **Order Dashlets**.
   The Order Dashlets dialog is displayed.

2. Select a dashlet that you want to move up or down, and click Up or Down.
3. When you are satisfied with the order, click **Apply**.
   The dialog closes and the order of dashlets below the Summary of Events is changed to match your choices.

Restore Default Dashlets

After you have added, modified, and arranged dashlets, you can revert to the default settings for dashlet display. To restore the default dashlets:

1. In the toolbar, select  > **Restore Default Configuration**.
   A dialog requests confirmation that you want to restore the configuration.
2. Do one of the following:
   a. If you decide to keep the dashlet arrangement you have configured, click **No**.
   b. If you are sure that you want to restore the defaults, click **Yes**,
      The dashlet display reverts to the default display.

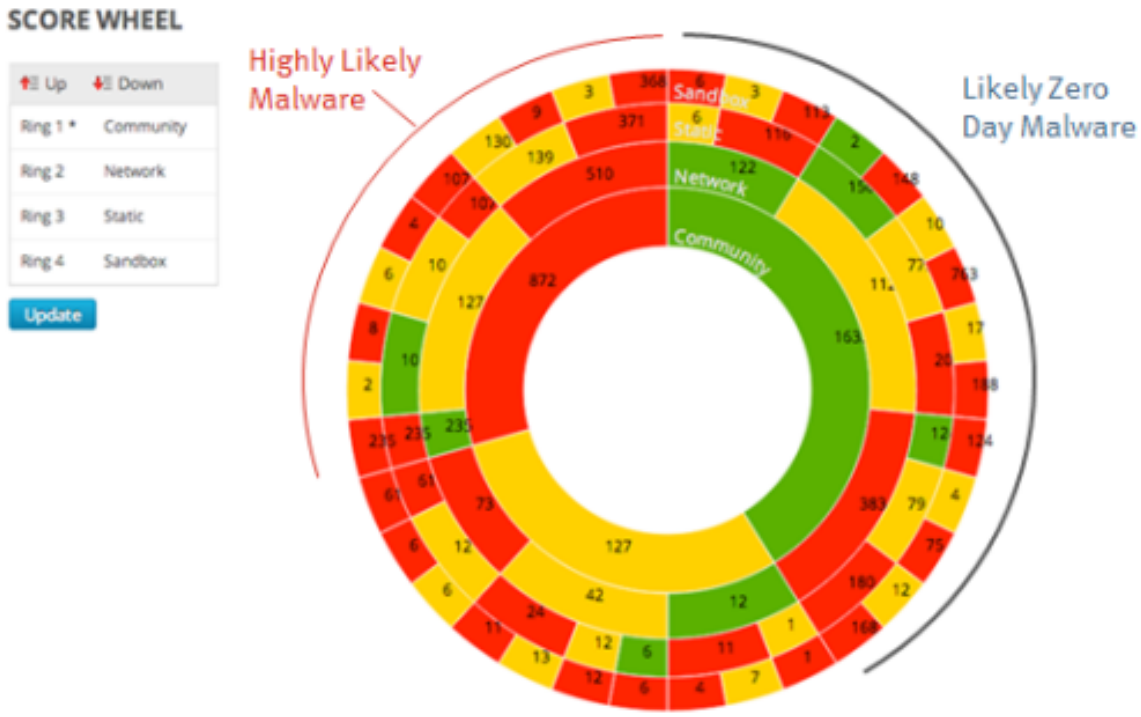
Filter Dashlet Data in the Summary of Events View

The Summary of Events provides a summary of the scan being investigated with selectable dashlets. The Summary of Events is fixed, but Analysts can configure each dashlet to filter out information and drill into the data.

The rest of this topic provides instructions for managing and configuring dashlets.

Configure the Score Wheel Dashlet

The Score Wheel is a high-level visualization of analyzed sessions that scored high, medium, or low in each of the scoring categories: Static, Network, Community, and Sandbox. The Score Wheel is a quick way to drill into sessions to review them. Each ring represents a different scoring category so that you can visually compare results by category.



You can change the order of the rings to highlight indicators of compromise that were flagged in one category but not in another category. Comparing the same results in a different sequence of the rings provides visibility into additional vulnerabilities in a session, and you can drill into sessions of interest. The following examples show two possible use cases.

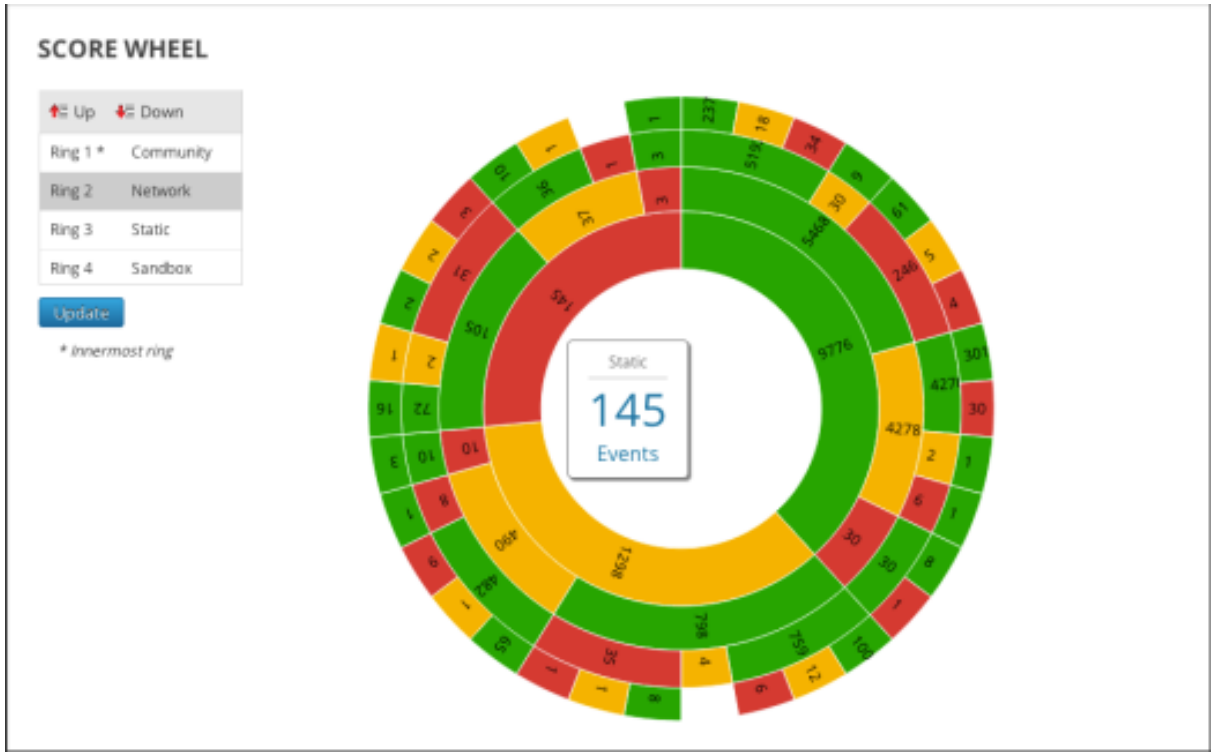
Zero-Day Candidates Example

This example shows how to drill into sessions that the Community did not flag as malicious, but all other scoring categories did. The resulting list of sessions highlights zero-day candidates.

1. Configure the Score Wheel rings in the following sequence:
   Community (innermost) > **Static** > **Network** > **Sandbox** (outermost)
2. Click the red slice in the outermost (Sandbox) ring that aligns with a green slice on the innermost ring (Community): green (innermost) -> **Static**: red -> **Network**: red -> **Sandbox**: red (outermost).

Malicious Sessions Example

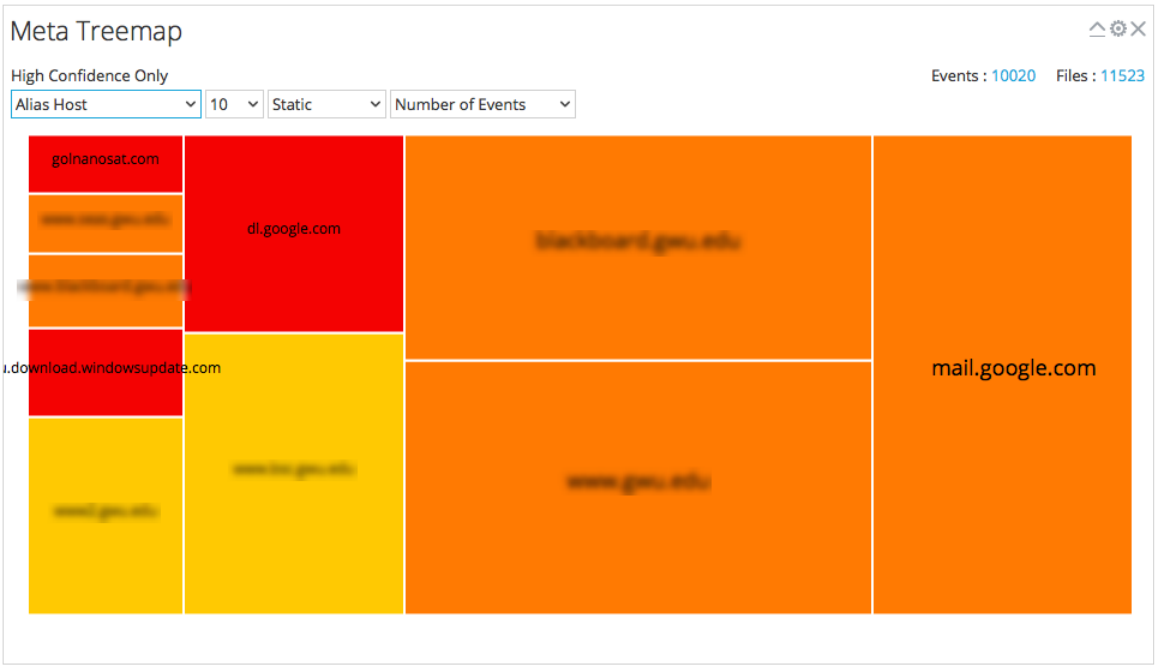
This example shows how to drill into sessions in which all scoring categories identify the resulting list of sessions as malicious, indicating Malware Analysis has the most confidence that they are malware.



1. Configure the Score Wheel rings in the following sequence:
   Community (innermost) > **Static** > **Network** > **Sandbox** (outermost)
2. Click the red slice of the outermost (Sandbox) ring that aligns within a red slice on the innermost ring (Community): red (innermost) -> Static: red -> Network: red -> Sandbox: red (outermost).

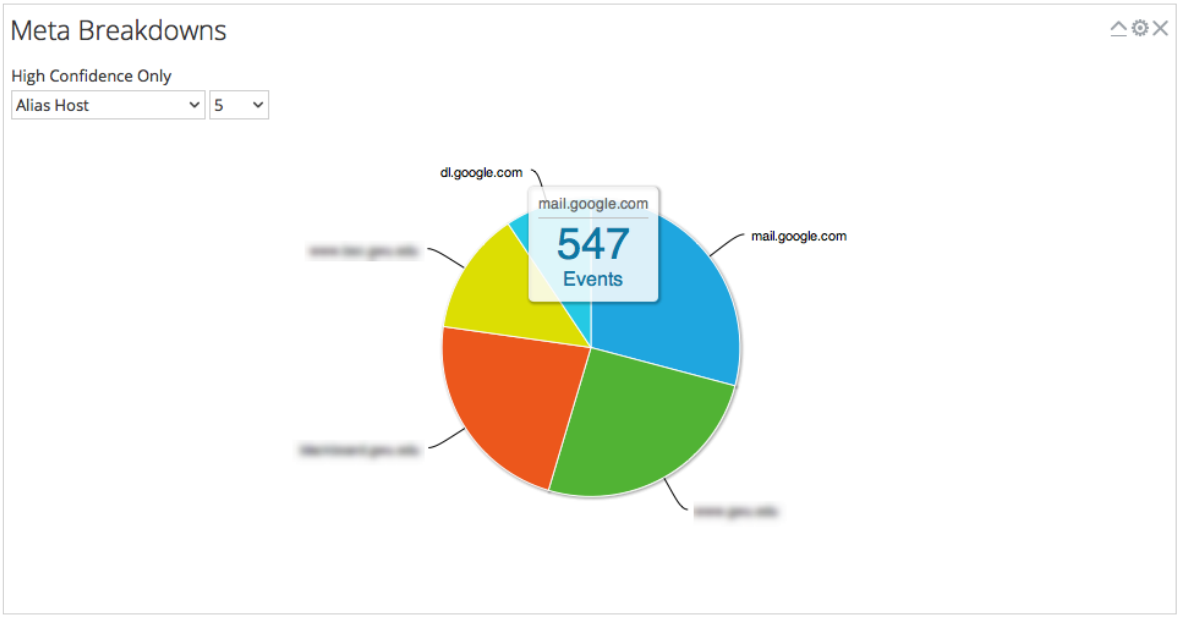
Arrange the Ring Sequence by Scoring Module

In the Score Wheel, you can arrange the sequence of the rings by scoring module. Initially, the sequence of rings from inside to outside is Static, Network, Community, and Sandbox.



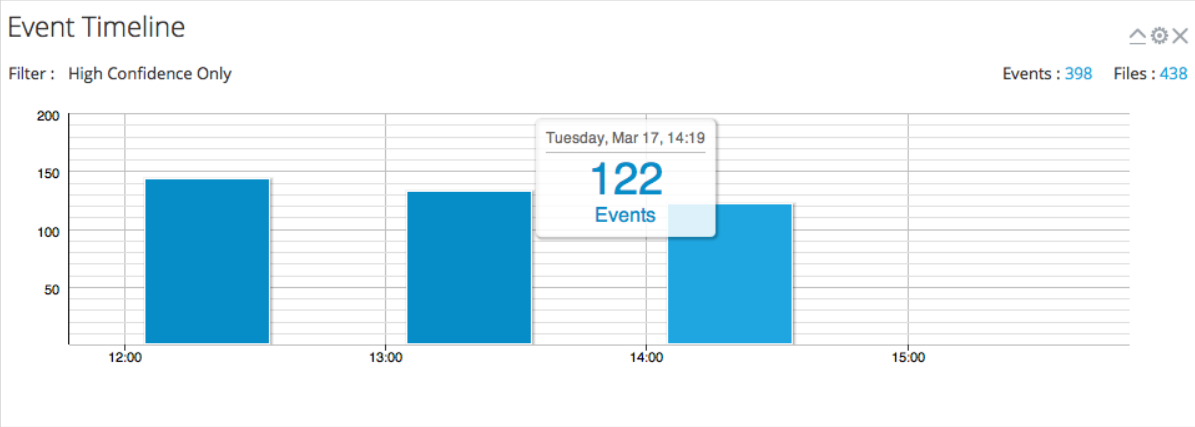
To change the ring sequence:

1. Do one of the following:
   a. Click and drag each scoring module up or down.
   b. Select each scoring module and use the Up and Down buttons to move it.
2. When the ring sequence is the way you want it, click the **Update** button.
   The Score Wheel is refreshed with the new sequence.



Configure the Meta Treemap Dashlet

In the Meta Treemap chart, you can visualize and filter meta breakdowns by meta type, count, and analysis type. Use the three selection lists to set the filter, and the Meta Treemap chart is refreshed immediately.

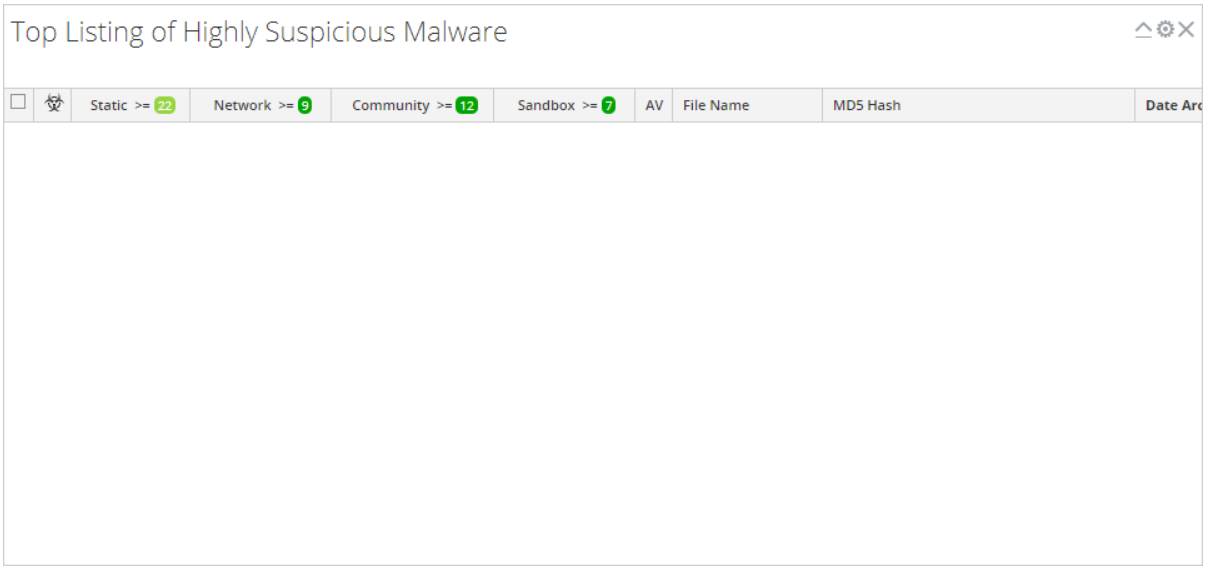


Configure the Meta Breakdowns Dashlet

The Meta Breakdowns dashlet is a visualization of values for a specific meta key in a pie chart. In the Meta Breakdowns chart, you can filter meta breakdowns by meta type and count. Use the two selection lists to set the filter, and the Meta Breakdowns chart is refreshed immediately.

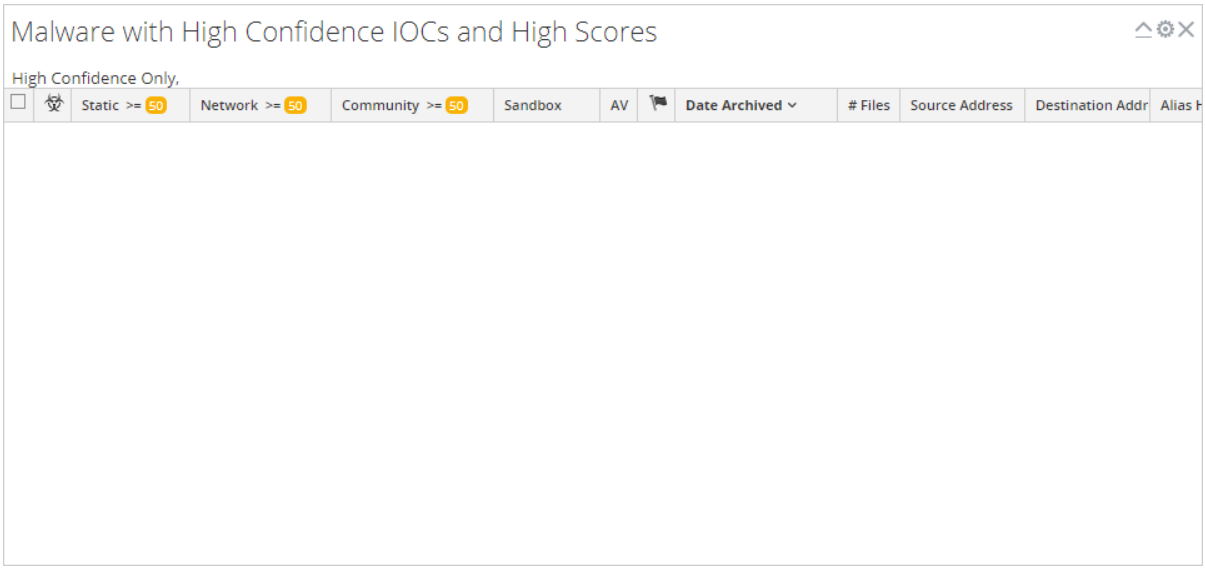
Configure the Events Timeline Dashlet

The Events Timeline dashlet is a visualization of the events along a timeline. No additional filters are available for the Event Timeline.



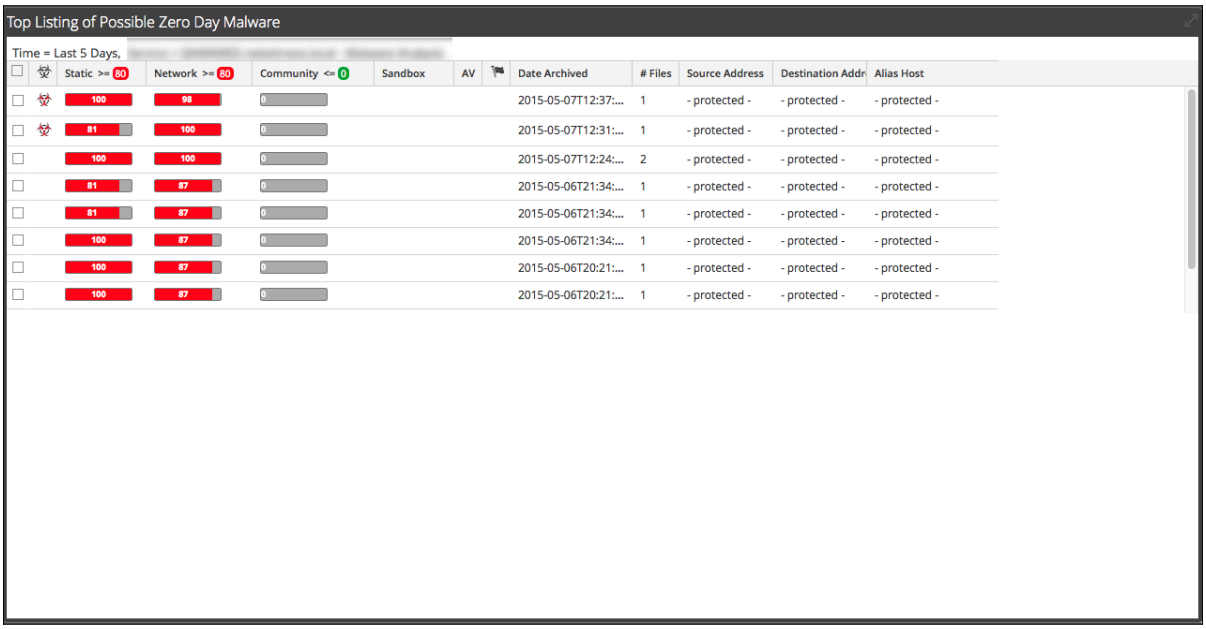
Open All Events in the Events List

From within the Event Timeline, you can open the entire list of events in the Events List. To do so, click View Events. This option is not the same as clicking the count next to Events, which is the same for all visualization charts and opens the current drill point in the Events List.



Configure the Top Listing of Highly Suspicious Malware Dashlet

The Top Listing of Highly Suspicious Malware Dashlet presents the Top 10 most suspicious events in the Events List or the Files List. This dashlet is also available in the Monitor dashboard, and the configuration options are described as part of the NetWitness Content in Dashlets.



Configure the Malware with High Confidence IOCs and High Scores Dashlet

The Malware with High Confidence IOCs and High Scores dashlet presents Indicators of Compromise that have both high scores and high confidence that the events are likely to contain malware. The dashlet is also available in the Unified dashboard, and the configuration options are described as part of the NetWitness Content in Dashlets.

Configure the Top Listing of Possible Zero Day Malware Dashlet

The Top Listing of Possible Zero Day Malware dashlet presents potential zero day events in the Events List or the Files List. The dashlet is also available in the Unified dashboard, and the configuration options are described as part of the NetWitness Content in Dashlets.

Top Listing of Possible Zero Day Malware
Time = Last 5 Days,
Static >= 80
Network >= 80
Community <= 0
Sandbox
AV
Date Archived
Files
Source Address
Destination Addr
Alias Host
100 98 0 2015-05-07T12:37:... 1 - protected - - protected - - protected -

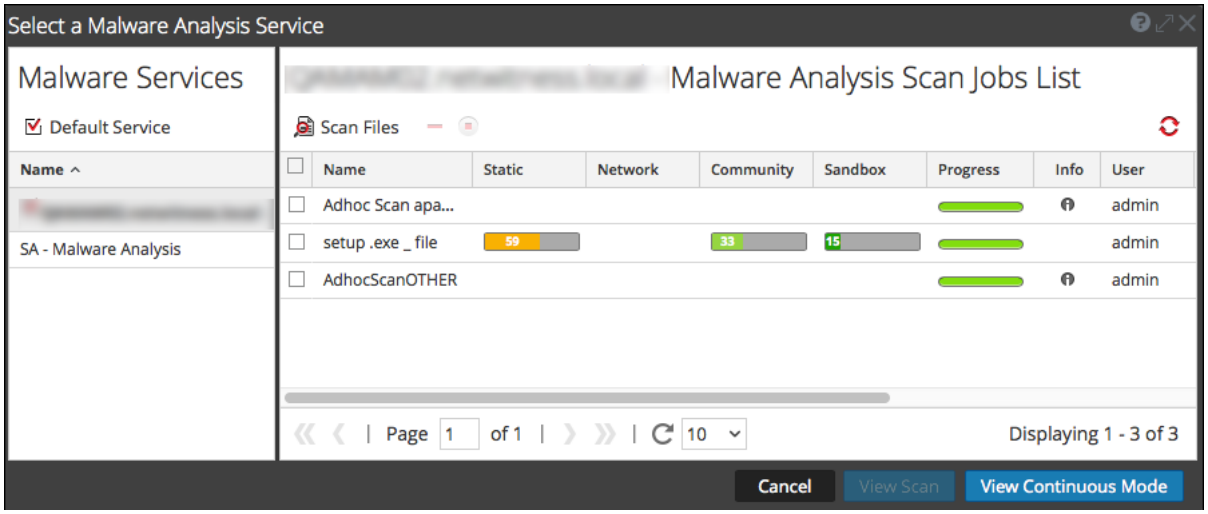
Upload Files for Malware Analysis Scanning

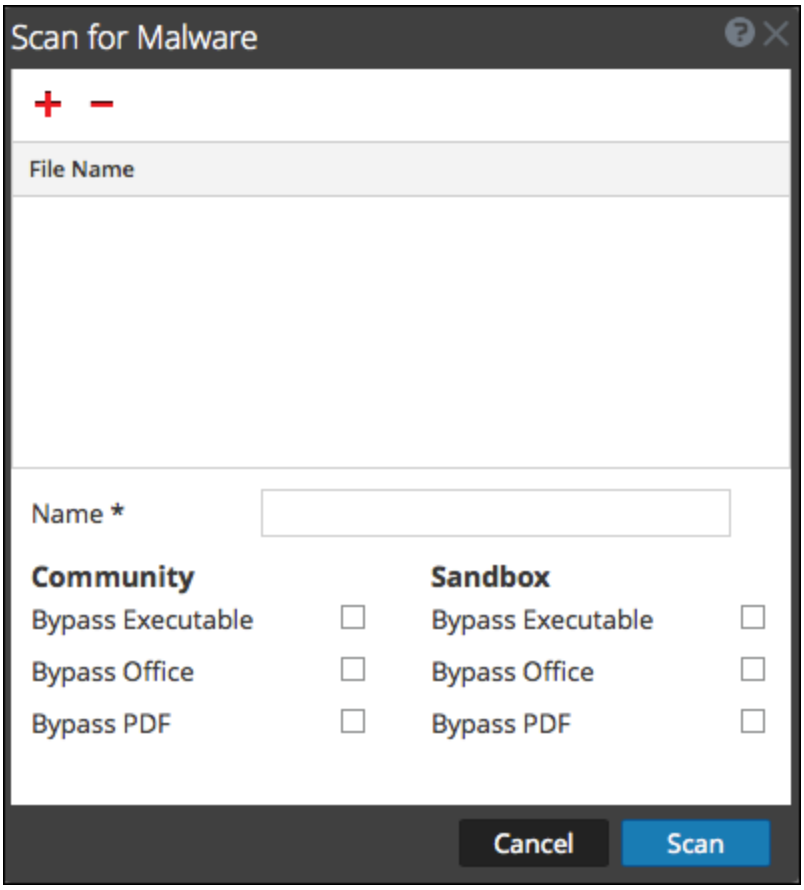
There are two methods for analysts to upload files for Malware Analysis scanning.

A Malware Analyst with permission to Initiate Malware Analysis Scan can upload files to scan using the Scan Files option in the Select a Malware Analysis Service dialog.



It is also possible to upload a file for scanning using a watched file share.

Upload Files Manually



This topic provides instructions for initiating on-demand scanning of an uploaded file. When you upload a file for scanning, NetWitness starts the upload job and adds it to the jobs queue. When the job is complete, you can view the scan in Malware Analysis.

To upload a file to scan:

1. Go to **Investigate > Malware Analysis**.
   The Select a Malware Analysis Service dialog is displayed, with available Malware Analysis hosts and services for the current user in the left panel.

2. Click **View Scan**.
   The Scan for Malware dialog is displayed.

3. Click +
   A view of the files system is displayed so that you can choose files to upload.
4. Select one or more files from the list and click **Open**.
   The file names are added. Malware Analysis escapes the filename characters before processing a file. The maximum number of filename characters after escaping is 200. If the filename is greater than 200 characters, Malware Analysis truncates the filename characters and displays the truncated filename in the NetWitness user interface.
5. Continue adding and deleting files until you have a list of the files that you want to upload.
6. Name the scan and select the types of files to bypass. This is useful for a zip archive that contains different types of files, and overrides the default bypass settings.
7. Click **Scan**.
   The scan job is submitted and NetWitness displays a confirmation message for successful submission. The scan request is added to the Scan Jobs List dashlet. The bypass settings in this dialog override the default settings in the basic Malware Analysis configuration settings.
8. The job is added to the Scan Jobs List in the Select a Malware Analysis Service dialog and in the Unified dashboard Scan Jobs List dashlet.
9. To view the scan when complete, double-click the scan.
   The Malware Summary of Events for the selected scan is displayed.

Upload Files from a Watched Folder

To upload files from a watched folder, you can drop files into a watched file share for Malware Analysis. Analysts can share YARA rules, hash files, and infected zip archives with Malware Analysis.

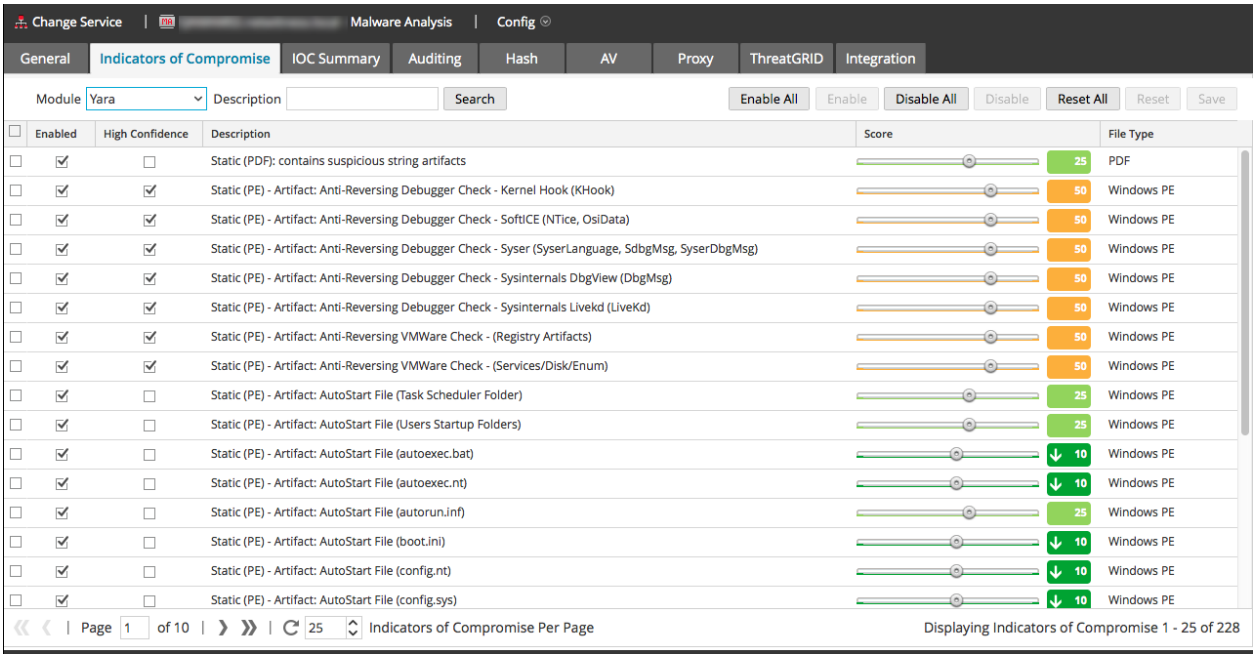
Malware Analysis watches a file share and automatically consumes files placed in specific folders in the file share. This feature is useful for:

- Bulk import of hash files from `/var/lib/rsamalware/spectrum/hashWatch`.
- Addition of custom-YARA rules to the Indicators of Compromise (IOC) list on the host from `/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch`.
- Creation of on-demand scan jobs from a zip archive of infected zip files from `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`.

Analysts need to prepare the files for consumption in accordance with requirements, the file extension must be correct, and the file must be copied to the correct watched folder in the file share.

Import a Hash List

To import a hash list from the watched directory, the hash list must be in the specified format and must be sorted on md5. You can drop a file formatted into a folder (`/var/lib/rsamalware/spectrum/hashWatch`) on the Malware Analysis host, and it is automatically imported into the local hash database. This is described in "Configure Hash Filter" in the *Malware Analysis Configuration Guide.*



To import a hash list using the watched folder method:

1. Copy the hash lists that you want to import into the **`/var/lib/rsamalware/spectrum/hashWatch`** directory.
   NetWitness Malware Analysis automatically watches this folder and processes files placed there.
   a. Malware Analysis adds every hash found in the hash lists to the hash filter.
   b. If there are processing errors, they are logged in: `/var/lib/rsamalware/spectrum/hashWatch/error`
   c. Processed files are cataloged here: `/var/lib/rsamalware/spectrum/hashWatch/processed`
   d. Processed files are not removed from the hashWatch directory.
2. After importing hashes in bulk, the System Administrator can use a cronjob to clean up old processed files.

Import YARA rules to the IOC List

Customers with advanced skills and knowledge can add detection capabilities to Malware Analysis by authoring YARA rules and publishing them in Live or placing YARA rules in a watched folder for the host to consume. Implement Custom YARA Content provides complete information on the prerequisites for using custom YARA content and authoring rules.

When the rules are ready, place the custom YARA files in the folder that the Malware Analysis service watches:
`/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch`
The file is consumed within one minute.
Once consumed, NetWitness moves the file to the `processed` folder, and the new rule is added to the Malware Analysis Service Config view > Indicators of Compromise tab.

Import Files into the Scan Jobs List

When you obtain samples from perimeter security solutions and would like to perform further analysis on the files, you can zip the files and password protect the archive with `infected`, then add to the watched folder for consumption by Malware Analysis. This zipped archive is ready to be placed in the watched folder: `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`.

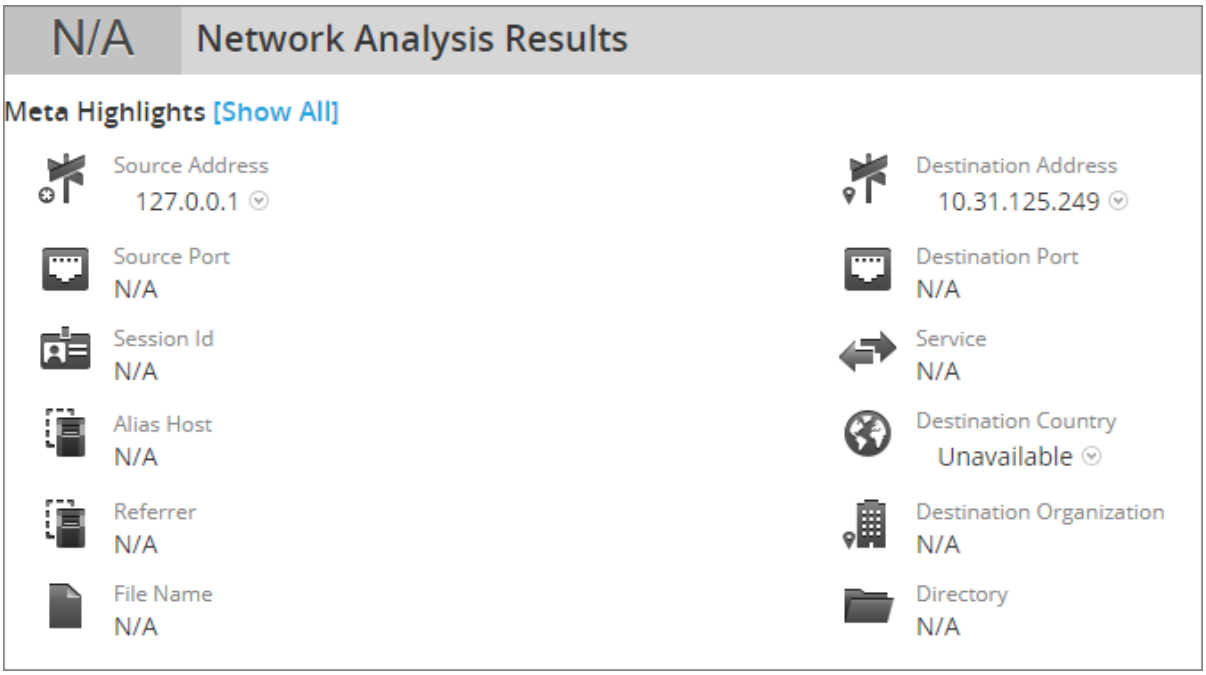
Note: The maximum size of the archive is 100 MB.

To analyze infected, password-protected zip files, Malware Analysis consumes archives place in a watched folder and creates an on-demand job that is added to the Scan Jobs List.

1. While logged on as administrator, place the files to be processed in a zip file with password `infected` at `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`
   In a minute or two Malware Analysis consumes the archive and creates an on-demand job in the Scan Jobs List. The scan job name is the name of the file, the user is **file share**, and the Event Type is 1. The archive is moved to `/var/lib/rsamalware/spectrum/infectedZipWatch/processed`
2. After the job is added to the Scan Job List, run a script or cronjob to clean up the zip file in `/var/lib/rsamalware/spectrum/infectedZipWatch/processed`.

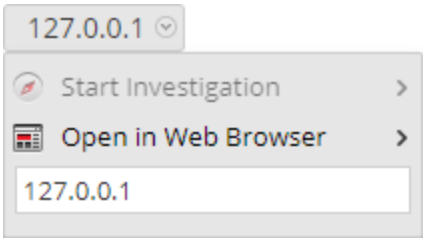
View Detailed Malware Analysis of an Event

When viewing the list of individual events in a Malware Analysis scan in the Malware Analysis Events grid, you can double-click an event to view the detailed analysis results for the event.



View Malware Analysis Details for an Event

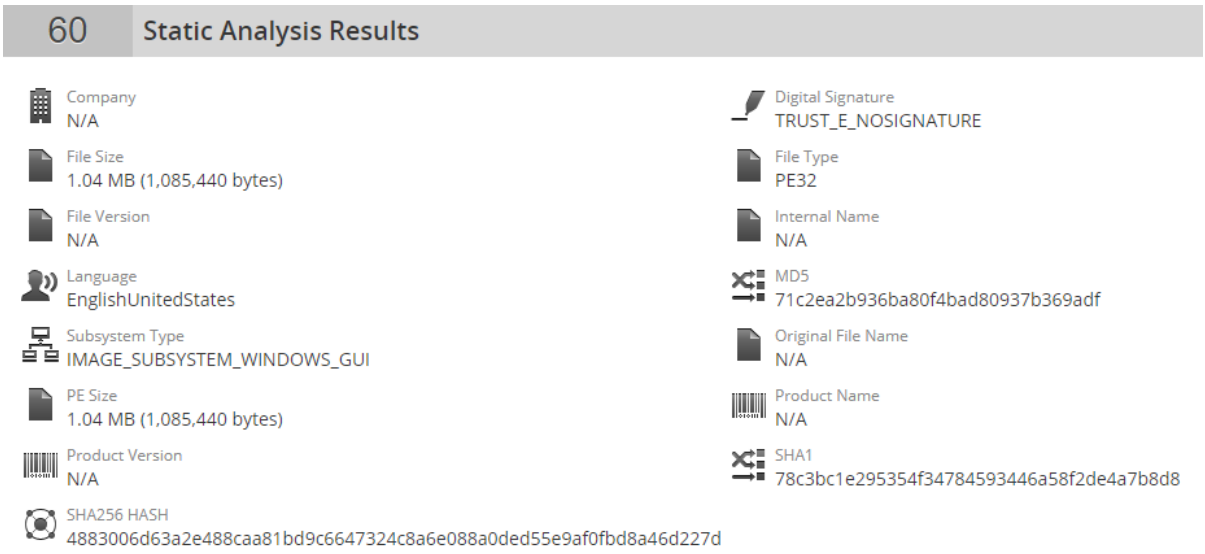
1. Start an investigation in the **Malware Analysis** view.
   The Malware Summary of Events is displayed, and includes four charts, including the Event Timeline.
2. Do one of the following:
   a. To view all events in the Event Timeline, click the **View Events** button.
   b. Double-click data in the **Meta Breakdown**, **Meta Treemap Chart**, or **Score Wheel**.
      The Events List is displayed.
3. Double-click an event.
   The Analysis Results for the event are displayed.
4. (Optional) If you want to delete an event, select **Actions > Delete Event**.
5. If you want to view a reconstruction of the network session, select **Actions > View Network Session**.
   The session opens in the Navigate view > Event Reconstruction.



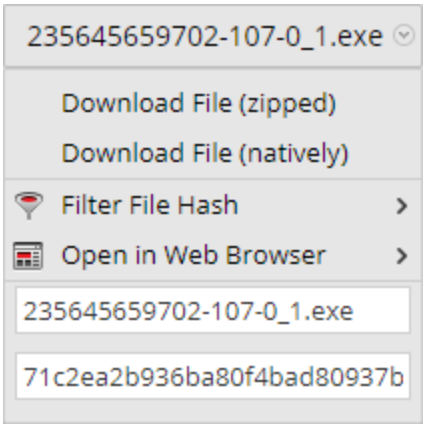
Pivot Network Analysis Results

You can pivot the Network Analysis Results in several ways:

1. Scroll down to the Network Analysis Results.



2. Hover over a meta value and left-click.
   The context menu is displayed.



3. To view the selected meta value in the **Navigate** view, select **Start Investigation** and a time option.
4. To view the selected meta value in a browser, select **Open in Web Browser > Open in Google**.

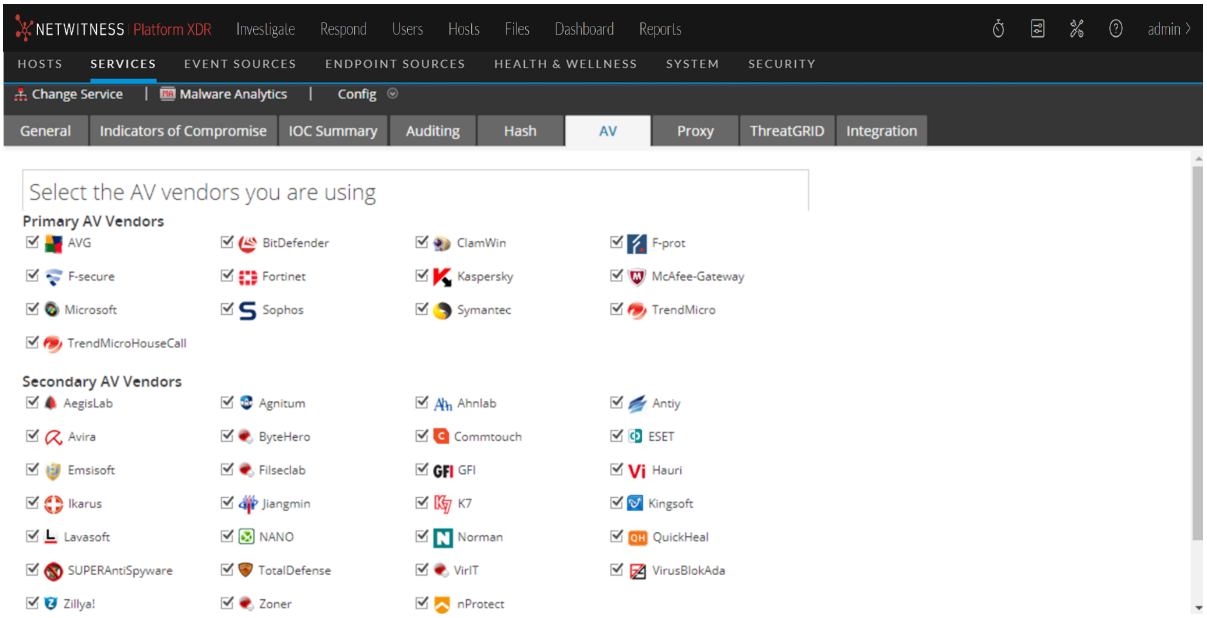
Use File Actions in the Static Analysis Results

1. Scroll down to the Static Analysis Results.

2. If you want to download a file, select the file name and either **Download File (zipped)** or **Download File (natively)** in the drop-down menu. It is safer to download a file in zipped format.

3. If you want to mark the file as safe or unsafe in the hash list, select **Filter File Hash** and **Mark hash as good** or **Mark hash as bad**.

View Community Analysis Results Details

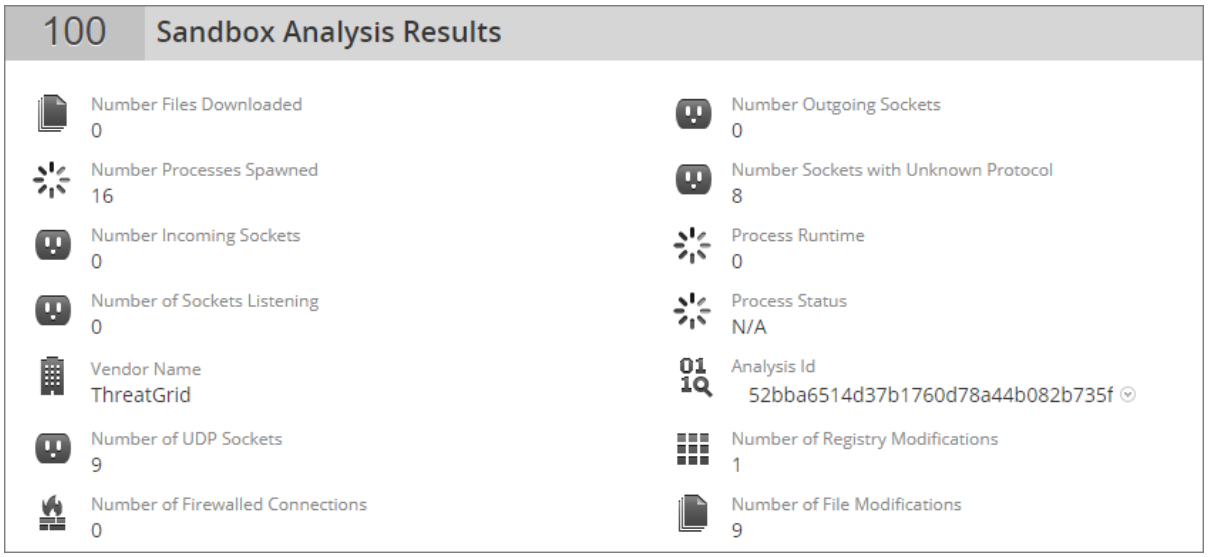


The Community Analysis Results summarizes results from the community, identifying Indicators of Compromise that were flagged as a risk or identified as good.

In addition, this view lists the results from Installed AV Vendors and Not Installed AV Vendors. You can compare results of the installed AV vendors that were configured for the current Malware Analysis service versus Community results. You can also see results from a list of AV vendors that are not configured as installed for the current Malware Analysis service.

Each row of AV vendor results includes the shield icon to show whether the IOC was discovered by a Primary ( ) or Secondary AV ( ) vendor in the community, the name of the Installed or Not Installed vendor, and the name of malware or risk detected by the community and AV vendor. If the AV vendor did not detect a risk, **-- Not detected --** is displayed instead of the name of the risk.

The Not Installed AV Vendors section is expandable to view all entries, but is collapsed by default to minimize the need to scroll. Clicking the + expands the list.



If no installed AV vendors have been configured for the current Malware Analysis service, the following message is displayed: No AV vendors were marked as installed. Please go to the Malware Analysis Service configuration page to identify installed AV vendors.

View Sandbox Analysis Results in the ThreatGRID User Interface

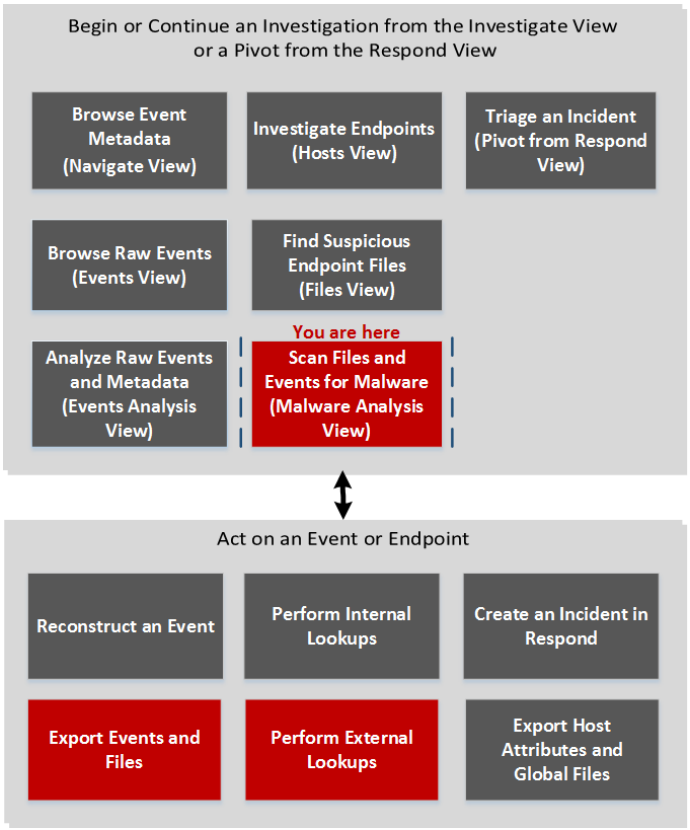
If you have registered with ThreatGRID, you can view the Sandbox results directly in ThreatGRID.

1. Scroll down to the Sandbox Analysis Results.

2. Click the **Analysis ID** and select **Open In ThreatGRID**.
   The analysis report in ThreatGRID is displayed.

Malware Analysis Reference Materials

This section provides is intended to help you understand the purpose and application of Malware Analysis views in NetWitness Investigate. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.



- Malware Analysis View
- Malware Analysis Events List and Files List
- Scan For Malware Dialog
- Select a Malware Analysis Service Dialog

Malware Analysis View

In NetWitness Investigate, the Malware Analysis view provides the user interface for conducting a malware analysis. The Malware Analysis view is in the form of a customizable dashboard, in which default dashlets in the initial view are based on the user role (Administration or Analyst) and user customizations. Initially, the Summary of Events dashlet is displayed in the Malware Analysis view. Additional dashlets present different visualizations of the events being viewed, and each representation is configurable to further refine your view as you search for Indicators of Compromise. The Malware Analysis dashlets available in the Dashboard are also available in the Malware view.

To access this view, select **Investigate > Malware Analysis**. If a default service has not been selected, the Select a Malware Analysis Service dialog is displayed. Select a service, then click **View Continuous Mode**.

Quick Look

Below is an example of the Malware Analysis view.

The Malware Analysis view consists of the Summary of Events panel and four dashlets unique to this view. Each of the unique dashlets have identical Options dialogs. The Malware Analysis dashlets in the MONITOR view are also available, and are described in the Dashlets topic in the NetWitness Content space.

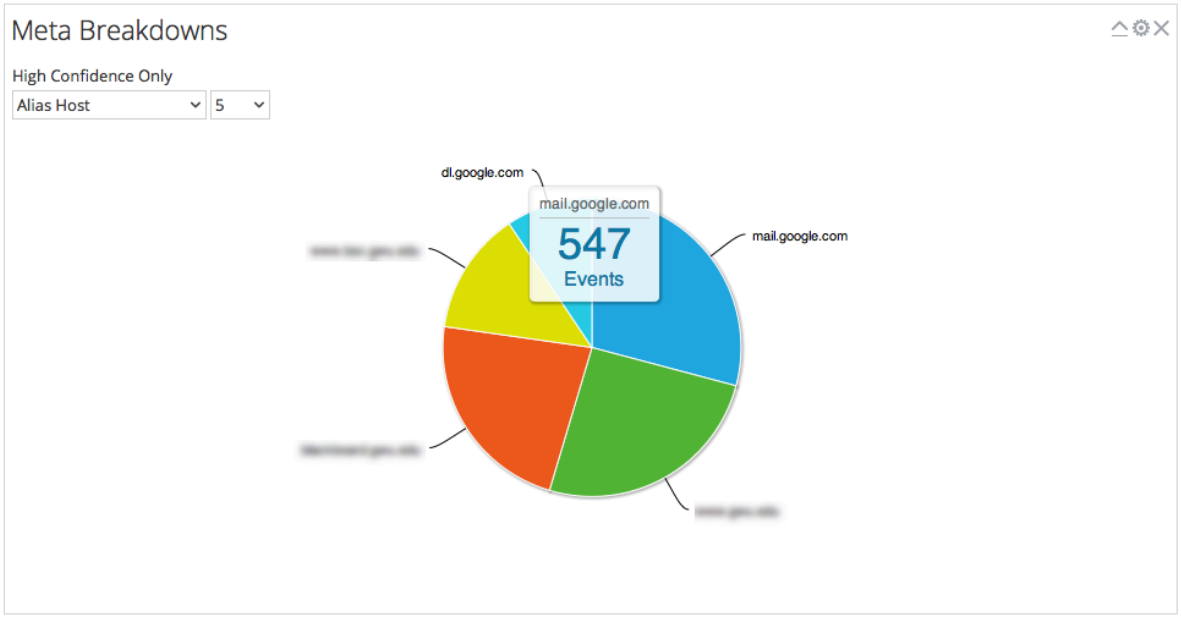
Summary of Events Panel

In the Summary of Events panel, you can select the service, the scan mode, and the time range. In addition, you can select a data point and view the events associated with the event.

The following table describes all features in the Summary of Events panel.

Feature	Description
	Selects a service to display.
Scan Mode	Displays a drop-down list of available scan modes.
Time Range	Displays a drop-down list of time ranges to view events.
Start Date	When Time Range is set to custom, offers a calendar from which to choose the start date of the time range.

Feature	Description
End Date	When Time Range is set to custom, offers a calendar from which to choose the end date of the time range.
	Displays a drop-down list of dashlets you can add to the view.
	Displays a drop-down list of actions you can perform in this view: • Restore Default Configuration • Order Dashlets • Apply Threshold Filter
	Refreshes the Malware Analysis view.



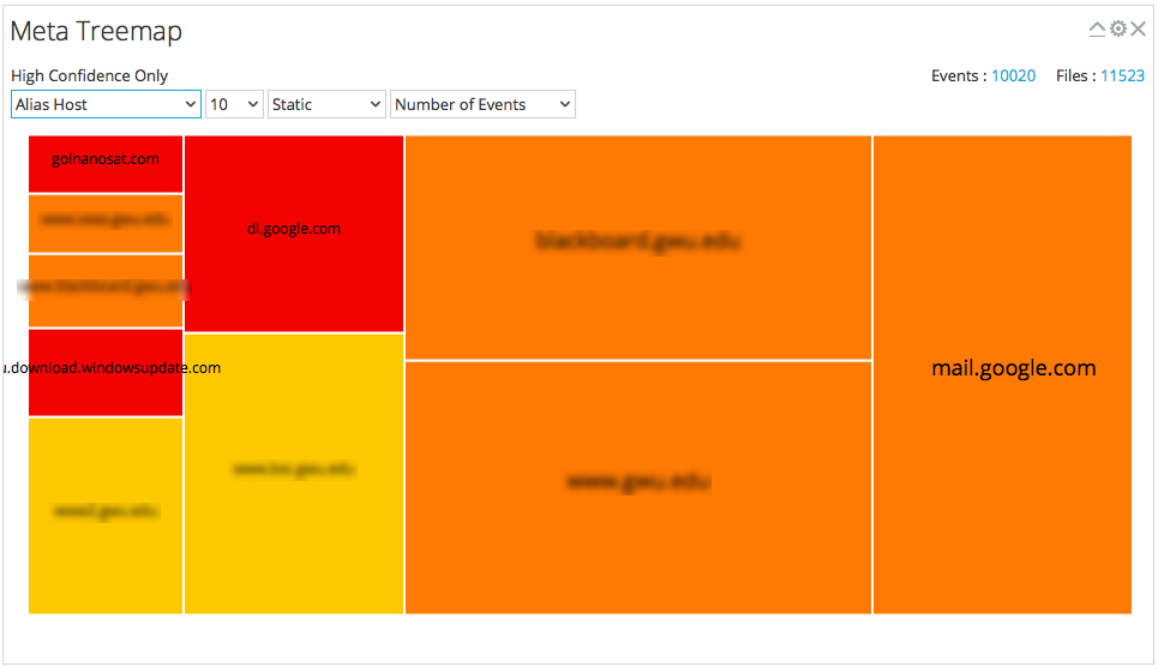
Options Dialog

In the Options dialog, you can customize the results displayed in the dashlet. This dialog can be accessed by clicking the  icon in the top right corner of each dashlet. The following table describes the features of the Options dialog.

Feature	Description
Title	Indicates whether the data shown is restricted to events flagged as high confidence or not. If the data is not restricted, this line will not be displayed.
Influenced By High Confidence Only	Indicates whether the data shown is restricted to events flagged as high confidence.
Static, Network, Community, Sandbox	Allows you to filter results based on the scores in the scoring modules.
Cancel	Closes the dialog without saving any changes.
Apply	Applies changes to the dashlet immediately and closes the dialog.

Meta Breakdowns

Meta Breakdowns presents events in the form of a pie chart, with each slice representing a meta value for the specified meta key. You can select the meta key and the count of meta values for that key to render in the chart, starting with the meta value having the most events. Hovering over an event displays the count.



The following table describes the options in the Meta Breakdowns dashlet.

Feature	Description
High Confidence Only	Indicates whether the data shown is restricted to events flagged as high confidence or not. If the data is not restricted, this line will not be displayed.
Meta Key	Drop-down list of available meta keys.
Count	Drop-down list specifying how many of the top results are displayed.

Meta Treemap

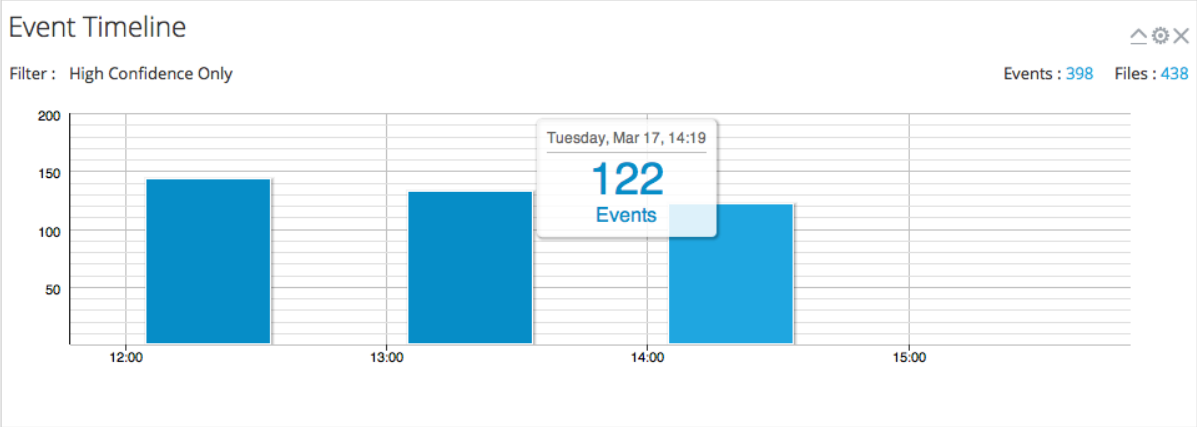
Meta Treemap presents events in the form of a heat map. You can select the meta key and the count of meta values for that key to render in the chart, starting with the meta values having the most events. In addition, you can select the module that detected the meta value in the events: static, network community, or sandbox.

The following table describes the options in the Meta Treemap dashlet.

Feature	Description
High Confidence Only	Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed.
Meta Key	Drop-down list of available meta keys to select as a filter.
Count	Drop-down list specifying how many of the top results are displayed.
Module	Drop-down list specifying which module results will be pulled from.
Value	Drop-down list specifying what information will be displayed when the mouse is hovering over a result (for example, Average Score).

Score Wheel

The Score Wheel offers a view of events as concentric rings with colors representing scores for events based on Indicators of Compromise and the scoring module. You can arrange the position of the rings using the Up and Down arrows to obtain a view that highlights events that were detected by one scoring module (red) and not detected by other scoring modules.



The following table describes the features of the Score Wheel dashlet.

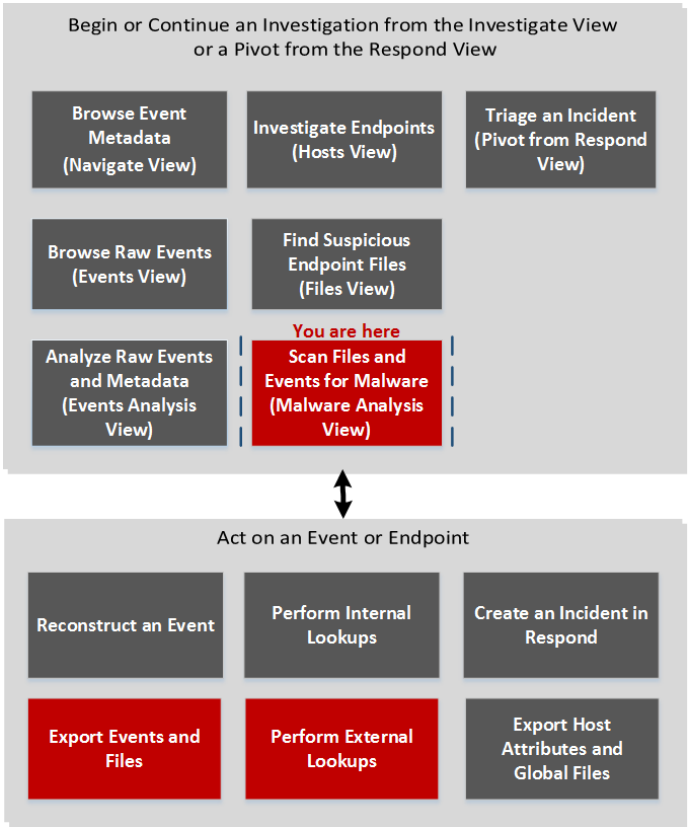
Feature	Description
High Confidence Only	Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed.
Module Order grid	Displays the order of the rings in Score Wheel, Ring 1 being the innermost ring and Ring 4 being the outermost ring. You can click the **Up** and **Down** buttons to reorder the modules, then click **Update** to apply the changes.

Event Timeline

The Event Timeline offers a view of events organized by the time of occurrence in a bar graph. Clicking and dragging to select a time range within the chart zooms in on the selected time.

The following table describes the features of the Event Timeline dashlet.

Feature	Description
High Confidence Only	Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed.
View Events	Displays the Investigate > Events view.



Malware Analysis Events List and Files List

The Malware Analysis Events List and Files List provide a detailed view of events or files. You can double-click on an event or file in either of the lists to display the Analysis Results view in a new browser tab.

To access this view, go to **Investigate > Malware Analysis** > **Select a Malware Analysis Service** dialog. Select a service from the left panel, then select a job from the right panel, and click **View Scan**. In the Summary of Events view do one of the following:

- In either the **Total** panel or the **High Confidence** panel, click the number in the **Events Created** section.
- If you want to view the Files List, click the number in the **Files Processed** section.

Quick Look

This is an example of the Events List view.

This is an example of the Files List view.

These are the features in the Events List toolbar, and the Files List toolbar is the same, except it has no option to delete events.

Feature	Description
Back to Summary	Returns to the Summary of Events view.
Delete Events	Removes the selected events from the current events list.
Download Files	Displays the Malware File Download dialog, which allows you to download available files.

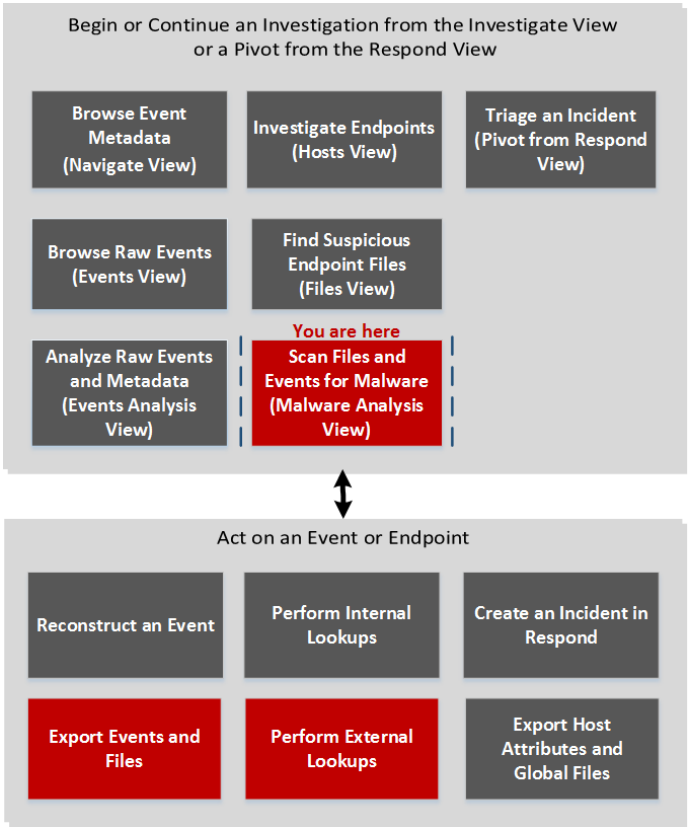
Feature	Description
Choose ...	Displays a drop-down menu from which you can decide how to sort the list. These are the options for sorting: • High Confidence • Static • Network • Community • Sandbox • AV • File Name • File Type • Hash • Date Archived • Size The button directly to the right of this drop-down indicates whether the list will be sorted by ascending or descending values.
Choose ...	Displays a drop-down menu from which you can select a secondary sorting order. This menu includes an option forNetWitness**None**, so selecting a secondary sorting order is not necessary.
Filter	Displays a drop-down window in which you can filter the list by filename or MD5 Hash.

These are the features in the Events List.

Feature	Description
	Indicates whether the event is influenced by the high confidence flag.
Static, Network, Community, Sandbox	Displays the scores for each scoring module.
AV	Indicates whether the AV flagged this event as suspicious.
	Indicates whether the event is influenced by a customized rule.
Date Archived	Displays the date and time the event was archived.
Session Time	Displays the time of the event's session.
	Indicates whether the hash value is marked as trusted.
# Files	Displays the number of files included in the event.

Feature	Description
Source Address	Displays the address of the event source.
Identity	Displays the identity of the event source.
Destination Address	Displays the address of the event destination.
Destination Country	Displays the country of the event destination.
Alias Host	Displays the hostname of the alias.
Event Type	Displays the type of event. For example, Manual Upload.
Service	Displays the service on which the event occurred.
Destination Organization	Displays the organization of the destination.

These are the features in the Files List grid.



Feature	Description
	Indicates whether the event is influenced by high confidence flag.
Static, Network, Community, Sandbox	Displays the scores for each scoring module.
AV	Indicates whether the AV flagged this event as suspicious.
File Name	Displays the name of the file.
File Type	Displays the type of the file (for example, PDF or x86 PE)
MD5 Hash	Displays the MD5 hash.
Source Address	Displays the address of the file source.
Destination Address	Displays the address of the file destination.
Date Archived	Displays the date and time the file was archived.
Size	Indicates the size of the file.

Scan For Malware Dialog

In the Scan for Malware dialog, Malware Analysis analysts can upload files to investigate in Malware Analysis.

To access this dialog go to the **Malware Analysis** view. In the **Select a Malware Analysis Service** dialog, select a service in the left panel, then click Scan Files in the right panel.

Workflow

What do you want to do?

User Role	I want to ...	Show me how

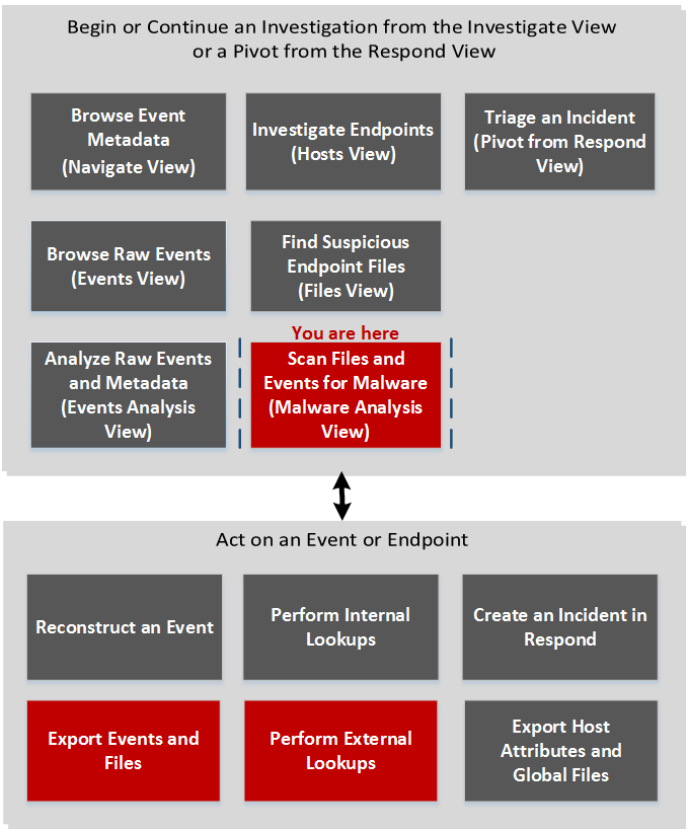
Quick Look

The figure below illustrates the Scan for Malware dialog, and The following table describes the features available in the dialog.



Feature	Description
+	Uploads a file from your computer.
−	Deletes a file from the list.
File Name	Displays the names of the files added to the list.
Name	Allows you to name the scan job.

Feature	Description
Community	Displays options for Community to bypass or ignore certain types of files: • Bypass Executable • Bypass Office • Bypass PDF
Sandbox	Displays options for Sandbox to bypass or ignore certain types of files: • Bypass Executable • Bypass Office • Bypass PDF
Cancel	Closes the dialog without performing any actions.
Scan	Scans the uploaded files.

Select a Malware Analysis Service Dialog

The Select a Malware Analysis Service dialog is accessible in the Malware Analysis view. In this dialog, Malware Analysis analysts can select a service to investigate, choose a scan on that service to investigate, upload a file to scan, and begin a continuous scan of the service.

Workflow

Quick Look

The Select a Malware Analysis Service dialog has a Malware Services panel on the left and a Scan Jobs List on the right. The Scan Jobs List panel has a toolbar, list, and buttons to view scans.

The Malware Services panel is a list of services available for malware analysis. In this panel, you can select the service to investigate and you set a default service using the Default Service icon. When you select a service, the available scan jobs for that service are listed in the Scan Jobs list.

These are the features in the Scan Jobs List toolbar.

Feature	Description
Scan Files	Displays the Scan for Malware dialog, in which you can upload a file to the service for scanning.

Feature	Description
Delete scan job ( )	Deletes one or more selected scan jobs, NetWitness displays a confirmation dialog before deleting scan jobs.
Cancel scan job ( )	Pauses or continues one or more scan jobs.
Refresh ( )	Refreshes the list of scan jobs.

These are the columns in the Scan Jobs list. This list is also available in the Malware Scan Jobs dashlet.

Feature	Description
Name	Displays the name of the job.
Static, Network, Community, Sandbox	Filters the results based on the scores for each scoring module.
Progress	Displays the current progress made on the job. • Green: The job is finished. • Black: The job is in progress. • Red: An error occurred.
Info	Provides additional information. Displays the query for the job. If the job is not complete, it also displays more detailed description of the status.
User	Displays the name of the user who created the job.
Events	Counts the number of events for the job.
Dropped	Counts the number of files or events in the job that were dropped because the scores are below their configured threshold.
Event Type	Displays the type of job: Manual Upload, On Demand, or Resubmit.
Scheduled	Displays the date and time when the job was executed.

These are the available actions in the dialog.

Feature	Description
Cancel button	Cancels the selected scan job.
View Scan button	Displays the Summary of Events for the selected scan with the default dashlets displayed.
View Continuous Mode button	Displays the Summary of Events for the selected scan with the default dashlets displayed.

Access NwConsole and Help

NetWitness Console, also known as NwConsole, is a multi-platform terminal application that provides powerful tools and command line access to Core services, such as Decoder, Log Decoder, Concentrator, Broker, and Archiver. While most users complete their tasks and investigations through the NetWitness user interface, some advanced users, such as administrators and developers, require direct access to the services without going through the user interface. NwConsole enables you to enter commands from the command line or run multiple commands from a file.

This topic describes how to access NwConsole and view the internal help within NwConsole.

Extensive help information is available within the NetWitness console, also known as NwConsole. You can access this help from the NetWitness command line.

Prerequisites

All NetWitness appliances have the NwConsole application installed. You can also install it on Windows, Mac, and CentOS to connect and interact with a Core service.

NwConsole is available from the command line on a NetWitness appliance. If you are accessing a Core appliance remotely, you need to have the NetWitness Console application installed on a Windows, Mac, or CentOS machine. To obtain the NetWitness Console application installer, contact NetWitness Customer Care.

Access NwConsole

To run NwConsole from the command line on a NetWitness appliance or on a terminal emulator, at the <$> prompt, type `NwConsole` (Linux) or `nwconsole` (Windows). The actual command is `NwConsole`, but Windows is not case sensitive. NetWitness Console is displayed as shown in the following example.

```
Last login: Thu Sep 24 14:00:42 on console
usxx<username>m1:~ <username>$ NwConsole
RSA NetWitness Platform Console 11.2.0.0.6105
Copyright 2001-2020, RSA Security Inc. All Rights Reserved.

Type "help" for a list of commands or "man" for a list of manual
pages.
>
```

View Help

NwConsole provides help on individual commands as well as help on specific topics.

Caution: To get the latest information, view the command and help topics within NwConsole.

View a List of Commands

To view a list of available commands and their descriptions, at the (>) prompt, type `help`. The following example shows a list of available commands.

```
> help
Local commands:
    avro2nwd      - Convert AVRO files to NWD files
    avrodump      - Display schema and contents of AVRO file (for debugging)
    blockspeed    - Tests various write block sizes to determine best setting
    compileflex   - Compile all flex parsers in a directory
    createflex    - Create a flex parser that matches tokens read from a file
    dbcheck       - Perform a database integrity check over one or more
                    session, meta, packet, log or stat db files
    diskspeed     - Measures the speed of the disk(s) mounted at a specified
                    directory
    echo          - Echos the passed in text to the terminal
    encryptparser - Encrypt all parsers in a directory
    feed          - Create and work with feed files
    fmanip        - Manipulate a file with XOR and check for embedded PEs
    hash          - Creates or verifies hashes of database files
    help          - Provides help information for recognized console commands
    history       - Displays, erases or executes a command in the command
                    history
    httpAggStats  - Tests HTTP aggregation and reports statistics as it
                    continues
    log           - Perform operations on a log database
    logParse      - Parse line delimited logs on stdin and post results to
                    stdout
    logfake       - Create a fake log pcap file
    lua           - Execute a lua script
    makec3        - Generate C3 Test Data
    makepcap      - Convert packet database files to pcap or log files
    man           - Displays a list of topics or opens a specific manual page
                    on a topic
    metaspeed     - Tests read performance over an existing meta db
    netbytes      - Display statistics on network interface utilization
    nwdstrip      - Convert full NWD file into just session and meta file
    pause         - Wait for user input when running a script file
    reindex       - reindex a collection
```

```
    sdk             - Execute SDK commands based on the C SDK library, type "sdk
                      help" for more information
    sleep           - Sleeps for the specified milliseconds
    timeout         - Globally change the timeout for waiting for a response from
                      a service
    tlogin          - Open a trusted SSL connection to an existing service
    topQuery        - Returns the top N longest running queries from the audit
                      log (either a file or from the log API)
    vslice          - Validate index slices

Remote commands (executed on the connected service, see "login"):
    login           - Connect to a remote service.  Once connected, type help to
                      see commands available for remote execution.

For detailed help, type "help <command>"
>
```

View Detailed Help on a Command

To view detailed information about a command, type `help <command>`. The following example shows help for the `logParse` command after typing `help logParse`.

```
For detailed help, type "help <command>"
> help logParse
Usage: logParse {in=<pathname>} {indir=<pathname>} [out=<pathname>]
                [content=<c2|c3>] [device=<device,[device...]>]
                [path=<log-parsers-config-path>] [metaonly] [srcaddr=<src
                address>] [srcaddrfile=<filename,IP Address>]
Parse line delimited logs on stdin and post results to stdout

    in          - The input source file. "in=stdin" means interactive typing of
                  log.
    indir       - The input source files parent directory
    out         - The output file or output file parent directory if input is
                  set by indir. If not specified, use stdout as output.
    content     - Content version, either c2 or c3. Default is c2.
    device      - Comma delimited device list specifying devices that is
                  enabled. Default enable all devices.
    path        - The logparsers configuration path. Default will find
                  configuration file like logdecoder.
    metaonly    - The output will only contains parsed meta, otherwise will
```

```
                print log message after metas.
    srcaddr     - The source address of the all the logs
    srcaddrfile - The source address for logs in one input file, in the format
                filename,ipaddress
>
```

View a List of Help Topics

To view a list of help topics, type `man`. The following example shows a list of help topics.

```
> man
List of topics:

    Introduction
    Connecting to a Service
    Monitoring Stats
    Feeds
    Converting Packet DB Files to PCAP
    Packets
    Verifying Database Hashes
    SDK Content
    SDK Content Examples
    Troubleshooting

Type "man <topic>" for help on a specific topic, partial matches are acceptable
>
```

View a Specific Help Topic

To view help about a specific topic, type `man <topic>`. The following example shows the Packets help topic after typing `man Packets`.

```
Type "man <topic>" for help on a specific topic, partial matches are acceptable
> man Packets
                                    Packets
                                    =======

The *packets* command can be used to generate a pcap or log file based on a
list of Session IDs, a time period or a where clause.  The command is quite
flexible and can be used on any running service that has access to the raw
data from a downstream component.  Before running the command, you must first
```

```
*login* to a service and then change directory to the appropriate sdk node,
(e.g., "cd /sdk").  Unlike the *makepcap* command, which only works on the
local file system, this command is meant to be used on a remote service.

    login ...
    cd /sdk
    packets where="service=80 && time='2018-03-01 15:00:00'-'2018-03-01
    15:10:00'" pathname="/tmp/march-1.pcap"
Write 10 minutes of HTTP only packets from March 1st, to the file
/tmp/march-1.pcap.  All times are in UTC.

    packets time1="2018-04-01 12:30:00" time2="2018-04-01 12:35:00"
    pathname=/media/sdd1/packets.pcap.gz
Write all packets between the two times to a gzip compressed file at
/media/sdd1/packets.pcap.gz

    packets time1="2018-04-01 12:30:00" time2="2018-04-01 12:35:00"
    pathname=/media/sdd1/mylogs.log
Write all logs between the two times to a plaintext file at
/media/sdd1/mylogs.log.  Any pathname ending with .log indicates that the
format of the output file should be plaintext line-delimited logs.
>
```

Caution: To get the latest information, view the command and help topics within NwConsole.

Quit NwConsole

To exit the NwConsole application, type `quit` at the command line.

Basic Command Line Parameters and Editing

NwConsole is like a Swiss army knife; it contains many tools buried underneath its command line interface. NwConsole is multi-platform. Executables are available for CentOS (which ships on appliances), Windows, and Mac. NwConsole is included on all hosts.

Basic Command Line Parameters

Here are some basic command line parameters:

- `-f` To run a set of commands from a file, use the `-f` attribute as shown here:
  `NwConsole -f /tmp/<somefile.script>`
- `-e` You can use the `-e` attribute (which is similar to the -f attribute) to run a set of commands from a file and allow environment variable substitution within the file using `$ENV_VAR` syntax, as shown here:
  `NwConsole -e /tmp/<somefile.script>`
  Use `\$` to escape a dollar sign and `\\` to escape a backslash.
- `-c` To pass in a list of commands from the command line, use the `-c` attribute as shown here:

  `NwConsole -c <command1> -c <command2> -c <command3>`

  This is not recommended except for very simple scripts. The Bash interpreter can jumble quoted strings if you do not escape properly. If you have non-obvious errors passing through the command line, switch to reading from a file to see if that fixes the issues.
- `-i` Normally, the NwConsole exits after running commands passed by a file or command line. If you want to keep the interactive prompt open after the commands are executed, include `-i` in the command line.
- `-q` To suppress command information messages and only see command output, use `-q` for Quiet mode. This makes it easy to pipe command output (`stdout`) to other commands.

  You can also run NwConsole and type the commands in the console window.

When you use the `-c` option, you can use additional quotes and escape quotes to include embedded spaces for the `where` clause. For example:

```
where="\"tcp.dstport=443 && time='2020-09-07 17:25:00'-'2020-09-08
05:24:59'\""
```

The following example shows how to use the `-c` option for pcap extraction.

```
[root@nwadmin1 ~]# NwConsole -c login 127.0.0.1:56003:ssl <user> <passowrd> -
c cd sdk -c packets
where="\"tcp.dstport=443 && time='2020-09-07 17:25:00'-'2020-09-08
05:24:59'\""
pathname="/var/netwitness/ny_sdwan_tcp_443_20200930.pcap"
RSA NetWitness NextGen Console 11.3.1.0
```

```
Copyright 2001-2020, RSA Security Inc. All Rights Reserved.

>login ...
Successfully logged in to 127.0.0.1:56003 as session 168886
>cd sdk
[127.0.0.1:56003] /sdk
>packets where="tcp.dstport=443 && time='2020-09-07 17:25:00'-'2020-09-08
05:24:59'"
pathname=/var/netwitness/ny_sdwan_tcp_443_20200930.pcap
Writing packets to /var/netwitness/ny_sdwan_tcp_443_20200930.pcap (100%)
```

Line Editing

You can use the keys in the following table when editing a command.

Key	Descripton
Ctrl-U	Clears the current line
Ctrl-W	Deletes the word that the cursor is on
Ctrl-A	Moves the cursor to the beginning of the line
Ctrl-E	Moves the cursor to the end of the line
Ctrl-F	Moves the cursor forward to the next word
Ctrl-B	Moves the cursor backwards to the previous word
Up arrow	Displays the previously executed command
Down arrow	Displays the command executed after the current command (only valid if the up arrow has been pressed)
Left arrow	Moves the cursor to the previous character
Right arrow	Moves the cursor to the next character
Tab	Provides context sensitive completion of most commands and their parameters. The Tab key is very helpful for editing. For example, to view the *Connecting to a Service* help topic, at the command line, you can type `man con` and then press the `Tab` key. NwConsole completes the command for you: `man Connecting to a Service` Press **Enter** to run the command and view the topic.
`history`	Displays a numbered list of previous commands
`history execute=#`	Executes a previous command, which is also equivalent to typing `!#` For example, `!1` executes the previous command.
`history clear`	Clears all command history
`history erase=#`	Erases a specific command from the history buffer. History is automatically stored from one session to the next.

Connecting to a Service

To connect and interact with a NetWitness Core service (Decoder, Concentrator, Broker, Archiver, and so on), you must first issue the `login` command. You must have an account on that service. You can type `help login` at any time for more information. Here is the syntax of the `login` command:

`login <hostname>:<port>[:ssl] <username> [password]`

For example: `login 10.10.1.15:56005:ssl someuser`

If you do not include the password, the NwConsole prompts you.

If you have set up proper trust between NwConsole and the endpoint, you can use the `tlogin` command and avoid having to enter a password. Setting up trust is beyond the scope of this documentation, but it involves adding NwConsole's SSL cert to the endpoint with the `send /sys peerCert op=add --file-data=<pathname of cert>` command. You must first use a normal login with the proper permissions before you can add a peer cert for subsequent trusted logins.

Once connected, you can interact with the endpoint service through a virtual file system. Instead of files, what you are looking at are the nodes of that service. Some nodes are folders and have child nodes, forming a hierarchical structure. Each node serves a purpose and all of them support a subset of commands like `info` and `help`. The `help` message returns information about the commands that each node supports. When you first log on, you are on the root node, which is the path `/`, just like a Linux or Mac system. To see a list of nodes under `/`, type the `ls` command.

All services have nodes like `sys` and `logs`. To interact with the **/logs** API, you can first send the `help` command to the **/logs** node. To do this, you must use the `send` message, which has this syntax:

```
Usage: send {node pathname} {message name} [name=value [name=value]]
            [--file-data=<pathname>] [--string-data=<text>] [--binary-data=<text>]
            [--file-format={binary,params,params-list,string,params-binary}]
            [--output-pathname=<pathname>] [--output-append-pathname=<pathname>]
            [--output-format={text,json,xml,html}]
Sends a command to a remote pathname.  For remote help, use "send <pathname>help" for
details.
    pathname                - The node pathname to retrieve information on
    message                 - The command (message) to send
    parameters              - Zero or more name=value parameters for the command
    --file-data             - Loads data from a file and send as either a BINARY
                              message or as a PARAMS_BINARY message if other
                              parameters exist. Providing the --file-format parameter
will
                              override automatic detection.
   --file format            - Treat file input as the provided format
  --string-data            - Sends text as a STRING message type
   --binary-data            - Send text as either a BINARY message type or as a
                              PARAMS_BINARY message type if other parameters
                              exist
    --output-pathname       - Writes the response output to the given pathname,
```

```
                              overwriting any existing file
  --output-append-pathname - Writes the response output to the given pathname,
                              will append output to an existing file
  --output-format          - Writes the response in one of the given formats,
                              the default is text
```

Parameters are formatted in `<name>=<value>` pairs, with whitespace between each pair. If a `<value>` has whitespace, you should place each value in double quotes. If the value itself should have double quotes, you can escape them by preceding with a backslash. For example: `send /sdk query query="select * where time=\"12-31-2019 14:30:00\"-u" size=100`

You must also escape backslashes; a double backslash is treated as a single backslash. It is also possible to pass special characters by giving their hex value using `\x##`. For example, `\x0a` would pass a line feed in the parameter value.

To send a `help` message, you would send this:

```
send /logs help
```

And your response would look something like this:

```
description: A container node for other node types
  security.roles: everyone,logs.manage
  message.list: The list of supported messages for this node
  ls:  [depth:<uint32>] [options:<string>] [exclude:<string>]
  mon:  [depth:<uint32>] [options:<uint32>]
  pull:  [id1:<uint64>] [id2:<uint64>] [count:<uint32>] [timeFormat:<string>]
  info:
  help:  [msg:<string>] [op:<string>] [format:<string>]
  count:
  stopMon:
  download:  [id1:<uint64>] [id2:<uint64>] [time1:<date-time>] [time2:<date-time>]
    op:<string> [logTypes:<string>] [match:<string>] [regex:<string>]
    [timeFormat:<string>] [batchSize:<uint32>]
  timeRoll:  [timeCalc:<string>] [minutes:<uint32>] [hours:<uint32>] [days:<uint32>]
    [date:<string>]
```

To get more information about a specific message or command, you can specify the `msg=<message name>` on the help command as a parameter. For example, look at the `pull` message help:

```
send /logs help msg=pull
```

```
 pull: Downloads N log entries
  security.roles: logs.manage
  parameters:
  id1 - <uint64, optional> The first log id number to retrieve, this is
     mutually exclusive with id2
  id2 - <uint64, optional> The last log id number that will be sent, defaults to
```

```
       most recent log message when id1 or id2 is not sent
    count - <uint32, optional, {range:1 to 10000}> The number of logs to pull
    timeFormat - <string, optional, {enum-one:posix|simple}> The time format used in
each
       log message, default is posix time (seconds since 1970)
```

The built-in message help says that this command grabs the last N log entries if you omit ID1 and ID2. To look at the last 10 log entries:

```
send /logs pull count=10 timeFormat=simple
```

Almost all of the commands on the service follow this simple format. The only commands that do not are the ones that require more complicated handshaking, like importing a PCAP to a Decoder. To import a PCAP, use the NwConsole `import` command, which takes care of the complicated communication channel handshaking.

Some parameters are specific to NwConsole's `send` command and are not actually sent to the service. You can use these parameters to change the output format of the response, write the response to a file, or read a file from the local machine and send it to the service. The local parameters to NwConsole's `send` command all start with two dashes --.

- `--output-format` — This parameter changes the normal output of the command from plain text to one of these types: JSON, XML, or HTML. The format `values` is a text output that only writes values (query output, stat/config values, and so on) without any other decorations.
- `--output-pathname` — Instead of writing the output to the terminal, the output is written to the specified pathname (truncates any existing file).
- `--output-append-pathname` — This is the same as `--output-pathname` except that it appends the output to an existing file (or creates the file if it does not exist).
- `--file-data` — Reads in a file and uses it as the command payload. This is useful for commands like `/sys fileEdit`. The following example shows how you can send an updated **index-concentrator-custom.xml** file using NwConsole:

  ```
  send /sys fileEdit op=put filename=index-concentrator-
  custom.xml --file-data="/Users/user/Documents/index-
  concentrator-custom.xml"
  ```

- `--file-format` — When reading an input file with `--file-data`, this parameter forces NwConsole to interpret the file as a specific type of input. The allowed enumerations are: `binary`, `params`, `params-list`, `string` and `params-binary`. As an example, to send a file of application rules (`*.nwr`) to a Decoder, you can use this command:

  ```
  send /decoder/config/rules/application replace --file-
  data=/path/rules.nwr --file-format=params-list
  ```

- `--string-data` — Sends the command payload as a string instead of a list of parameters.
- `--binary-data` — Sends the command payload as binary instead of a list of parameters.

Example Streaming Query to JSON file (could be a large result set):

```
send /sdk query size=0 query="select * where service=80 && time='2018-
03-05 13:00:00'-'2018-03-05 13:59:59'" --output-format=json --output-
pathname=/tmp/query.json
```

One thing to note about the `send` command is the fact that, by default, there is a timeout of 30 seconds waiting for a response. Some commands (like the query above) may take longer to receive results. To avoid a premature client-side timeout, you can use the `timeout [secs]` command to increase the wait. For instance, `timeout 600` would wait 10 minutes for a response before timing out. Once enacted, it takes effect for all subsequent commands.

To navigate around the virtual node hierarchy of the service, you can use the `cd` command like you would on any command shell. This covers the basics of connecting and interacting with a service. Once you are connected, the `help` command lists all the commands that you can use to interact with the endpoint. These commands do not display when you are not connected to an endpoint.

Monitoring Stats

You can use NwConsole to watch statistics (stats) change on a service in real time. However, be warned that this can result in a LOT of output. If you are not careful and monitor too many nodes, the screen scrolls by too quickly to be useful.

As a simple example, if you log on to a Decoder, you can monitor the capture rate in real time. To do this, issue these commands after connecting to a Decoder:

```
cd /decoder/stats
```

```
mon capture.rate
```

That is all you need to do! Now, any time the capture rate changes, it outputs into the console window.

You can add another monitor:

```
mon capture.avg.size
```

Now it watches those two stats and outputs those values when they change. You may have noticed that as you tried to type the second command, the output from the original monitor was messing up your display. This is the problem with monitoring stats. It is not really meant for doing more than just watching the stats after the first command is entered.

However, you can stop the monitoring by typing `delmons` and pressing **Enter**. Just ignore the output while you type and it returns you to a proper command prompt. If you want to monitor many stats at once, you can give the path of the parent stat folder and it monitors all of the stats underneath it. For example, typing `mon /decoder/stats` or `mon .` (they are equivalent) monitors everything. Be prepared for a lot of output! Remember to enter `delmons` if it is scrolling too fast.

Useful Commands

The following NwConsole commands are useful when interacting with NetWitness Core services:

- **feed**: Enables you to create and work with feed files.
- **makepcap**: Converts Packet database (DB) files to PCAP.
- **packets**: Retrieves packets or logs from the logged in service.
- **hash**: Creates or verifies hashes of database files.

The following sections as well as the NwConsole help and topic information (man) pages, provide additional information.

Feeds

The `feed` command provides several utilities for creating and examining feed files. A feed file contains the definition and data of a single feed in a format that has been precompiled for efficient loading by a Decoder or Log Decoder. For a complete reference on feed definitions, see the "Feed Definitions File" topic in the *Decoder Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

create

```
feed create <definitionfile> [-x <password>]
```

The `feed create` command generates feed files for each feed defined in a feed definition file. A definition file is an XML document that contains one or more definitions. Each feed definition specifies a data file and the structure of that data file. The resulting feed files will be created in the same directory as the definition file with the same name as the data file, but with the extension changed to **.feed** (for example, **datafile.csv** results in **datafile.feed**). Any existing files with the target name will be overwritten without a prompt.

```
$ ls
 example-definition.xml    example-data.csv
 $ NwConsole
 RSA NetWitness Console 11.3.0.0.0
 Copyright 2001-2020, RSA Security Inc.  All Rights Reserved.

 Type "help" for a list of commands or "man" for a list of manual pages.
 > feed create example-definition.xml
 Creating feed Example Feed...
 done.  2 entries, 0 invalid records
 All feeds complete.
 > quit
 $ ls
 example-definition.xml    example-data.feed    example-data.csv
 $
```

Optionally, feed files can be obfuscated using the option `-x` followed by a password of at least 16 characters (no spaces). This will be applied to all feeds defined in the definition file. In addition to the feed file, a token file will be generated for each feed file. The token file must be deployed with the corresponding feed file.

```
feed create example-definition.xml -x 0123456789abcdef
```

stats

```
feed stats <feedfile>
```

The `feed stats` command provides summary information for an existing, un-obfuscated feed file. Specifying an obfuscated feed file will result in an error.

```
> feed stats example.feed
 Example Feed stats:
 version  : 0
 keys count  : 1
 values count: 2
 record count: 2
 meta key  : ip.src/ip.dst
 language keys:
    alert    Text
```

dump

```
feed dump <feedfile> <outfile>
```

The `feed dump` command generates a normalized, key-value pair listing of an un-obfuscated feed file. You can use the resulting file to validate a feed file or assist in determining which records were considered invalid when the feed was created. Specifying an obfuscated feed file will result in an error. If `outfile` exists, the command will abort without overwriting the existing file.

```
feed dump example.feed example-dump.txt
```

Converting Packet DB Files to PCAP

You can use the `makepcap` command to quickly convert any Packet DB file to a generic PCAP file, preserving the capture time order. This command offers many options (see `help makepcap`), but is easy to use. All it really needs is the Packet DB directory (with the `source=<pathname>` parameter) to get started.

Note: You must stop the Decoder or Archiver service before running this command. If you want to generate a PCAP while the service is running, see the `packets` command.

- `makepcap source=/var/lib/netwitness/decoder/packetdb`
  This command converts every Packet DB file into a corresponding PCAP file in the same directory. If the disk is almost full, see the next command.

- `makepcap source=/var/lib/netwitness/decoder/packetdb dest=/media/usb/sde1`
  This command writes all of the output PCAPs to the directory at **/media/usb/sde1**.

- `makepcap source=/var/lib/netwitness/decoder/packetdb dest=/media/usb/sde1 filenum=4-6`
  This command only converts the files numbered 4 through 6 and skips all other files. In other words, it converts the Packet DB files: **packet-000000004.nwpdb**, **packet-000000005.nwpdb**, and **packet-000000006.nwpdb**.

- `makepcap source=/var/lib/netwitness/decoder/packetdb time1="2020-03-01 14:00:00" time2="2020-03-02 07:30:00" fileType=pcapng`
  This command only extracts packets with a timestamp between March 1st, 2020 at 2 PM and March 2nd, 2020 before or on 7:30 AM. It writes the file as `pcapng` in the same directory as the source. All timestamps are UTC.

Packets

You can use the `packets` command to generate a PCAP or log file based on a list of Session IDs, a time period, or a `where` clause. This command is very flexible, and you can use it on any running service that has access to the raw data from a downstream component. Before running the command, you must first `login` to a service and then change directory to the appropriate SDK node (for example, `cd /sdk`). Unlike the `makepcap` command, which only works on the local file system, you use this command for a remote service.

```
login ...
cd /sdk
packets where="service=80 && time='2020-03-01 15:00:00'-'2020-03-01 15:10:00'"
pathname="/tmp/march-1.pcap"
```

This command writes 10 minutes of HTTP-only packets from March 1st to the file **/tmp/march-1.pcap**. All times are in UTC.

- `packets time1="2020-04-01 12:30:00" time2="2020-04-01 12:35:00" pathname=/media/sdd1/packets.pcap.gz`
  This command writes all packets between the two times to a GZIP compressed file at **/media/sdd1/packets.pcap.gz**.

- `packets time1="2020-04-01 12:30:00" time2="2020-04-01 12:35:00" pathname=/media/sdd1/mylogs.log`
  This command writes all logs between the two times to a plaintext file at **/media/sdd1/mylogs.log**. Any pathname ending with **.log** indicates that the format of the output file should be plaintext line-delimited logs.

Verifying Database Hashes

By default, Archiver writes an XML file for every DB file that is written. This XML file ends with the extension **.hash** and contains a hash of the file along with other pertinent information. You can use the `hash` command to verify that the DB file has not been tampered with by reading the hash stored in the XML file and then rehashing the DB file to verify that the hash is valid. The command does accept wildcards, so something like `/var/netwitness/archiver/database0/default/packetdb/*.hash` will verify all hashes in that directory. You can also use the `--output-pathname` and `--output-format` parameters to write out the verification in json, xml or text formats for scripting purposes. If the DB files are not found in the location that the XML file says it should be in, then the command will attempt to find the DB files in the current directory or the directory where the hash file is found.

```
hash op=verify
hashfile=/var/lib/netwitness/archiver/database0/alldata/packetdb/packe
t-000004880.nwpdb.hash
```

This command verifies that the Packet DB file **packet-000004880.nwpdb** still matches the hash in the XML file **packet-000004880.nwpdb.hash**. For proper security, the hash file should be stored somewhere else to prevent the XML file from being tampered with (such as write-once only media), but the hash command itself is not affected by where it is stored.

SDK Content Command

One of the powerful commands in NwConsole is `sdk content`. It contains numerous options to do just about anything, at least as far as extracting content from the NetWitness Core stack. You can use it to create PCAP files, log files, or extract files out of network sessions (for example, to grab all of the pictures from email sessions). It can append files, have a maximum size assigned before creating a new file, and automatically clean up files when the directory grows too large. It can run queries in the background to find new sessions. It breaks queries into manageable groups and performs those operations automatically. When the group is exhausted, it does a requery to get a new set of data for further operations. The list of options for the SDK content command is very extensive.

Because the command has so many options, this document provides examples of commands for different use cases.

Before you can run `sdk content`, there are a few commands (like logging into a service) that you need to run first. Here are some examples:

- First connect to a service:
  `sdk open nw://admin:netwitness@10.10.25.50:50005`
- If you need to connect over SSL, use the nws protocol:
  `sdk open nws://admin:netwitness@10.10.25.50:56005`
- Keep in mind that you are passing a URL and must URL encode it properly. If the password is `p@ssword`, the URL looks like this:
  `sdk open nw://admin:p%40ssword@10.10.25.50:50005`
  This also applies to username.
- Once you log in, you can set an output directory for the commands: `sdk output <some pathname>`
- For command line help, type: `sdk content`

Before you try the example commands, it is important to understand the `sessions` parameter. This parameter is very important and controls how much or how little data you want to grab (the `where` clause is also important). The sessions parameter is either a single session ID or a range of session IDs. All NetWitness Core services work with session IDs, which start at 1 and increase by 1 for every new session added to the service (network or log session). Session IDs are 64-bit integers, so they can get quite large.

For example, to keep it simple, assume we have a Log Decoder that has ingested and parsed 1000 logs. On the service, you now have 1000 sessions with session IDs from 1 to 1000 (session ID 0 is never valid). If you want to operate over all 1000 sessions, you pass `sessions=1-1000`. If you only want to operate over the last 100 sessions, you pass `sessions=901-1000`. Once the command finishes processing session 1000, it exits back to the console prompt.

Many times, however, we do not care about specific session ranges. We just want to run a query over all of them and process the sessions that match a query. Here are some shortcuts that simplify this:

- The letter `l` (lowercase L) means lower bound or the lowest session ID.
- The letter `u` means the highest session ID. In fact, it actually means the highest session ID for future sessions as well. In other words, if you pass `sessions=l-u`, this special range means operate over all the current sessions in the system, but also do not quit processing, and as new sessions enter the system, process those, too. The command pauses and waits for new sessions once it reaches the last session on the service. To summarize, the command never exits and goes into continuous processing mode. It runs for days, months, or years, unless it is killed.
- If you do not want the command to run forever, you can pass `now` for the upper limit. This determines the last session ID on the service at the time the command starts and processes all sessions until it reaches that session ID. Once it reaches that session ID, the command exits, regardless of how many sessions may have been added to the service since the command started. So, for the example Log Decoder, `sessions=200-now` starts processing at session 200 and goes all the way to session 1000 and quits. Even if another 1000 logs were added to the Log Decoder after the command started, it still exits after processing session 1000.
- The parameter `sessions=now-u` means start at the very last session and continue processing all new sessions that come in. It does not process any existing sessions (except the last one), only new sessions.
- If you want to run this continually and have it remember the last session it processed between invocations, use the `sessionPersist={pathname}` parameter. The pathname should be a valid filename where the command will write the last successful session id. Upon restart, it will read the last session id and pick up where it left off.

For example commands and what they do, type `man sdk content examples` or see SDK Content Command Examples.

SDK Content Command Examples

The first NwConsole SDK content command example below is simple and shows all of the commands that you need to enter. After that, the examples show only the `sdk content` commands. The first example creates a log file and grabs the first 1000 logs out of a Concentrator aggregating from a Log Decoder:

- ```
  sdk open nw://admin:netwitness@myconcentrator.local:50005
  sdk output /tmp
  sdk content sessions=1-1000 render=logs append=mylogs.log
  fileExt=.log
  ```
  This script outputs 1000 logs (assuming sessions 1 through 1000 exist on the service) to the file **/tmp/mylogs.log**. The logs are in a plain text format. The parameter `fileExt=.log` is necessary to indicate to the command that we want to output a log file.

- ```
  sdk content sessions=1-1000 render=logs append=mylogs.log
  fileExt=.log includeHeaders=true separator=","
  ```
  This command grabs the same 1000 logs as above, but it parses the log header and extracts the log timestamp, forwarder, and other information, and puts them in a CSV formatted file.
  Example CSV: `1422401778,10.250.142.64,10.25.50.66,hop04b-LC1,%MSISA-4:81.136.243.248...`
  The timestamp is in Epoch time. The `includeHeaders` and `separator` parameters can only be used on NetWitness installs 10.4.0.2 and later.

- ```
  sdk content sessions=1-now render=logs append=mylogs.log
  fileExt=.log includeHeaders=true separator=","
  where="risk.info='nw35120'"
  ```
  This command writes a log file across the current session range, but only logs that match `risk.info='nw35120'`. Keep in mind that when you add a `where` clause, it performs a query in the background to gather the session IDs for export. The query should be run on a service with the proper fields indexed (which is typically a Broker or Concentrator). In this case, since you are querying the field `risk.info`, double-check the service where you run the command to make sure it is indexed at the value level (`IndexValues`, see **index-concentrator.xml** for examples). By default, most Decoders only have time indexed. If you use any field but time in the `where` clause, you need to move the query from the Decoder to a Concentrator, Broker, or Archiver with the proper index levels for the query. You can find more information on indexing and writing queries in the *NetWitness Core Database Tuning Guide*.

- ```
  sdk content sessions=1-now render=logs append=mylogs.log
  fileExt=.log includeHeaders=true separator=","
  where="threat.category exists && time='2020-01-05 15:00:00'-'2020-01-05 16:00:00'"
  ```
  This command is the same as above, but it only searches for matching logs between 3 PM and 4 PM (UTC) on Jan 5, 2020 that have a meta key `threat.category`. Again, because this query has a field other than time in the `where` clause (`threat.category`), it should be run on a service with

`threat.category` indexed at least at the `IndexKeys` level (the operators `exists` and `!exists` only require an index at the key level, although values work fine, too).

- `sdk content sessions=1-now render=logs append=mylogs fileExt=.log where="event.source begins 'microsoft'" maxFileSize=1gb`
  This command creates multiple log files, each one no larger than 1 GB in size. It prepends the filenames with **mylogs** and appends them with the date-time of the first packet/log timestamp in the file. Some example filenames: **mylogs-1-2020-Jan-28T11_08_14.log**, **mylogs-2-2020-Jan-28T11_40_08.log** and **mylogs-3-2020-Jan-28T12_05_47.log**. On versions older than 10.5, the T separator between date and time is a space.

- `sdk content sessions=1-now render=pcap append=mypackets where="service=80,21 && time='2020-01-28 10:00:00'-'2020-01-28 15:00:00'" splitMinutes=5 fileExt=.pcap`
  This command grabs all the packets between the five-hour time period for service types 80 and 21 and writes a PCAP file. Every five minutes, it starts a new PCAP file.

- `sdk content time1="2020-01-28 14:00:00" time2="2020-01-28 14:15:00" render=pcap append=mydecoder fileExt=.pcap maxFileSize=512mb sessions=1-now`
  Pay attention to this command. Why? It works for both packets and logs and is *extremely fast*. The downside is that you get everything between the two time ranges and you cannot use a `where` clause. Again, it starts streaming everything back almost immediately and does not require a query to run first on the backend. Because everything is read using sequential I/O, it can completely saturate the network link between the server and client. It starts creating files prepended with **mydecoder** and splits to a new file once it reaches 512 MBs in size.

- `sdk tailLogs`
  or (the equivalent command):
  `sdk content render=pcap console=true sessions=now-u`
  This is a fun little command. It actually uses `sdk content` behind the scenes. The purpose of this command is to view all incoming logs on a Log Decoder. As logs come into the Log Decoder (you can also run it on a Broker or Concentrator), they are output on the console screen. It is a great way to see if the Log Decoder is capturing and what exactly is coming into the Log Decoder. This command runs in continuous mode. Do not use it if the Log Decoder is capturing at a high ingest rate (this command cannot keep up with it). However, it is helpful for verification or troubleshooting purposes.

- `sdk tailLogs where="device.id='ciscoasa'" pathname=/mydir/anotherdir/mylogs`
  This command is the same as above, except it only outputs logs that match the `where` clause and instead of outputting to the console, it writes them to a set of log files under `/mydir/anotherdir` that do not grow larger than 1 GB. Obviously, you can accomplish this with the `sdk content` command as well, but this command requires a little less typing if you like the default behavior.

- `sdk content sessions=now-u render=pcap where="service=80" append=web-traffic fileExt=.pcap maxFileSize=2gb maxDirSize=100gb`
  This command starts writing PCAPs of all web traffic from the most recent session and all new incoming sessions that match `service=80`. It writes out PCAPs no larger than 2 GBs and if all the PCAPs in the directory grow larger than 100 GBs, it deletes the oldest PCAPs until the directory is 10% smaller than the maximum size. Keep in mind that the directory size checking is not exact and it only checks every 15 minutes by default. You can adjust the number of minutes between checks by passing `cacheMinutes` as a parameter, but this only works with versions 10.5 and later.

- `sdk content sessions=79000-79999 render=nwd append=content-%1%.nwd metaFormatFilename=did`
  This is a basic backup command. It grabs 1000 sessions and outputs the full content (sessions, meta, packets, or logs) to the NWD (NetWitness Data Format) format. NWD is a special format that can be re-imported to a Packet or Log Decoder without reparsing. So essentially, the original parsed session imports without changes. The timestamp does not change as well, so if it was originally parsed six months ago, the timestamp upon import will be retained as six months ago.

  Note: Do not expect great performance with this command, especially with packets. Gathering the packets for a session involves a lot of random I/O and can drastically slow down the export. Logs do not suffer as much from this problem (only one log per session), but behind the scenes, this command uses the /sdk content API, which is not a performance-minded streaming API like /sdk packets.

  The `metaFormatFilename` parameter is very helpful in this command. If this command is run on a Concentrator with more than one service, the NWD filenames will be created with the `did` meta for each session (the `%1%` in the append parameter is substituted with the value of `did`). Each filename will indicate exactly which Decoder the data came from.

- `sdk content session=1-u where="service=80,139,25,110" render=files cacheMinutes=10 dir=/tmp/content-files maxDirSize=200mb`
  This is another fun little command. It works very similar to our old Visualize product if you pair the output directory with something like Windows Explorer in Icon mode. It extracts files from all web, email, and SMB traffic. This includes all kinds of files, such as images, zip files, videos, PDFs, office documents, text files, executables, and audio files. If it extracts malware, your virus scanner will flag it. Nothing will be executed by the command, so it does not infect the machine (unless you try to execute it yourself). However, it can be useful because if you do find malware, the filename indicates the session ID where it was extracted. You can then query that session ID and see which host the malware possibly infected and take action. You can filter what gets extracted with the parameters `includeFileTypes` or `excludeFileTypes` (see the command help). For example, adding `excludeFileTypes=".exe;.dmg;.msi"` prevents executables and installers from being extracted. This command just runs nonstop extracting files from all existing and any new sessions. After the directory gets littered with more than 200 MBs of files, it automatically starts cleaning up the files every 10 minutes.

  Note: This command only makes sense for packet sessions, not logs.

- `sdk content session=1-now render=files where="time='2015-01-27 12:00:00'-'2015-01-27 13:00:00' && (service=25,110,80)" subdirFileTypes="audio=.wav;.mp3;.aac; video=.wmv;.flv;.mp4;.mpg;.swf; documents=.doc;.xls;.pdf;.txt;.htm;.html images=.png;.gif;.jpg;.jpeg;.bmp;.tif;.tiff archive=.zip;.rar; other=*" renameFileTypes=".download|.octet-stream|.program|.exe;.jpeg|.jpg" maxDirSize=500mb`
  This command extracts files from HTTP and email sessions from a one-hour period and then groups the extracted files into directories specified by the `subdirFileTypes` parameter. For example, any extracted audio file with the extension `.wav`, `.mp3`, or `.aac` will be placed into the subdirectory `audio`, which will be created under the specified output directory. The same goes for all the other groups specified in that parameter. Some files will also be automatically renamed based on their file extension, which is handled by `renameFileTypes`. Any file with an extension `.download`, `.octet-stream` or `.program` will be renamed to `.exe`. Files with the extension `.jpeg` will be renamed `.jpg`. Once the top-level directory exceeds 500 MBs, the oldest files are cleaned. This command stops at the last session at the time the command started.

- `sdk content session=1-u render=111 where="filename exists" maxDirSize=20mb fileHash=md5,sha1,sha256 linkMeta=sessionid,time,did,service_uuid deviceType=filehash logDecoder="<hostname>:<port>[:ssl]" sessionPersist=/tmp/last-session.txt`
  If you want to extract file hashes from network protocols like HTTP, SMB, POP3 and SMTP, this is the command you want to use. Not only will it give you the file hash, but it will send an event to a Log Decoder with this information, which will be processed into a session for querying. For example, use `sdk open` to talk to a Broker or Concentrator that is aggregating from one or more Network Decoders. Set the `where` clause to find sessions of interest that have embedded files in the protocols we support for file extraction (use Live to install Malware Analysis content for example). Next, set up a Log Decoder to receive the file hash information. This information will go into the meta keys `checksum`, `checksum.algo`, `filename`, `filename.size` and `link`. The meta key link is used to indicate the session (with the file that has been hashed) on the device used by `sdk open`. When hashes of interest are discovered on the Log Decoder, the link meta can be used to find the original packet session that contains the file. The parameters `fileHash`, `linkMeta` and `deviceType` can be used to customize how the log is generated that is sent to the Log Decoder. The ports for sending Syslog to a Log Decoder are usually 514 or 6514 (for SSL). You may need to add a `table-map-custom.xml` file on the Log Decoder to properly save the meta keys sent in the file hash log. For the `linkMeta` parameter, `service_uuid` is a special meta key that inserts the UUID of the service the session ID belongs to. This can be used to link back to the original session from the Log Decoder. `sessionPersist` is used to write out our session IDs to pick up where we left off from the last run.

- `sdk search session=1-now where="service=80,25,110" search="keyword='party' sp ci"`
  This command searches all packets and logs (the `sp` parameter) for the keyword `party`. If party is

found anywhere in the packets or logs, it outputs the session ID along with the text it found and the surrounding text for context. The `where` clause indicates that it only searches web and email traffic. The `ci` parameter means that it is a case-insensitive search. You can substitute `regex` for `keyword` and it performs a regex search.

- `sdk search session=1-now search="keyword='checkpoint' sp ci" render=log append=checkpoint-logs.log fileExt=.log`
  This is an interesting command example. It searches all logs (or it could be packets) for the keyword `checkpoint` and if that keyword is seen, it extracts the log to a file **checkpoint-logs.log**. There are all kinds of possibilities with this command. Essentially, when a hit is detected, it hands off the session to the content call. So any parameters you pass to `sdk search` that it does not recognize are just passed along to the content call. This allows the full capabilities of the `sdk content` call, but they only work on those sessions with content search hits.

Commands Used for Troubleshooting

NwConsole provides the following commands that are helpful when troubleshooting NetWitness:

- **whatIsWrong**: Provides a snapshot of a service's configuration, stats, and failure and warning logs for a specified period of time in the past.
- **dbcheck**: Performs consistency checking of database files.
- **topQuery**: Helps pinpoint queries that are taking an excessively long time to run.
- **netbytes**: Troubleshoots the network connections on the current host.
- **netspeed**: Troubleshoots the connection between the host computer running NwConsole and the remote computer connected to it using the `login` command.

The following sections, as well as the NwConsole help and topic information (man) pages, provide additional information.

whatIsWrong

When a service is not working correctly, the reason is usually somewhere in the logs that the service has written. You can use the `whatIsWrong` console command to obtain a snapshot of a service's configuration, stats, and failure and warning logs (with surrounding context logs) for a specified past period of time, which defaults to the previous seven days. You can save the results of running `whatIsWrong` into a specified plain-text file. The output of this command can be a useful starting point to help determine what is currently wrong with a service.

To use the `whatIsWrong` console command, log on to the service to troubleshoot using the `login` command, and run the `whatIsWrong` command.

Note: Use `help whatIsWrong` to see all of the available parameters, including the number of days or hours to look back for events, the pathname to store results, whether or not to append or overwrite the results file, and the delimiter to use for log fields. You can also limit the number of most recent logs used to find context, and you can specify how many context logs per warning or failure log to retrieve.

Whenever you receive a request for logs for a Core service, you should run the `whatIsWrong` command first and use the results collected as a starting point.

dbcheck

The `dbcheck` command is used to perform consistency checking of database files (session, meta, packets, logs, stats, and so on). This might be necessary when a service cannot start because of errors in the consistency of the database files. Normally a service would automatically recover and correct any consistency issues on startup, but there are times when this does not occur. When a service starts (like Decoder), it typically does not read or open most database files in order to start quickly. It assumes most files are in a consistent state and only does a cursory check of the most recently written files. If there are problems, `dbcheck` can perform those consistency checks, but ONLY if the service is not running.

Caution: Do not attempt to run this command while a service is running.

For example, you can check a single file:

```
dbcheck /var/lib/netwitness/decoder/packetdb/packet-000000001.nwpdb
```

You can also use wildcards to check multiple files:

```
dbcheck /var/lib/netwitness/decoder/metadb/meta-00000002*.nwmdb
```

topQuery

The `topQuery` command can help pinpoint queries that are taking an excessively long time to run. This command parses the audit logs of a service and returns the top N longest running queries for the specified time period.

The easiest way to run it is to log on to the service (usually a Broker or Concentrator) and type `topQuery`. The default behavior is to return the top 100 longest running queries for the last seven days.

Type `help topQuery` for the list of parameters. Here are some additional examples with explanations:

- `topQuery hours=12 top=10`
  This command returns the top 10 queries for the last 12 hours.

- `topQuery time1="2020-03-01 00:00:00" time2="2020-03-14 00:00:00"`
  This command returns the top 100 queries between March 1, 2020 and March 14, 2020. Times are in UTC, not local.

- `topQuery input=/var/log/messages output=/tmp/top20.txt top=20 user=sauser1`
  Instead of connecting to a service, it parses the Syslog audit messages for the top 20 queries in the last seven days, but only for queries executed by user sauser1. It writes the top 20 queries to **/tmp/top20.txt** instead of the console screen. The parameter user is a regex, so you can specify multiple usernames by writing something like `user="(sauser1|sauser2)"`.

netbytes

The `netbytes` command is very useful for troubleshooting the network connections on the current host. It displays continuous send and receive statistics for all network interfaces. Once executed, you must press **Ctrl-C** to exit this command, which also exits NwConsole.

netspeed

The `netspeed` command is used to troubleshoot the connection between the host computer running NwConsole and the remote computer connected to it through the `login` command. You must supply the amount of bytes to transfer and it will time the speed of the connection. The netspeed command is very useful for troubleshooting aggregation performance issues that might be network related.

```
login somedecoder:50004 admin ...
netspeed transfer=4g
```

To troubleshoot the connection between a Concentrator and a Decoder, SSH into the Concentrator, run NwConsole, and then log on to the Decoder and run `netspeed`. The output from the command gives you an indication of the maximum network throughput. If it is much less than the standard 1 Gbps interface, it could indicate a network issue.

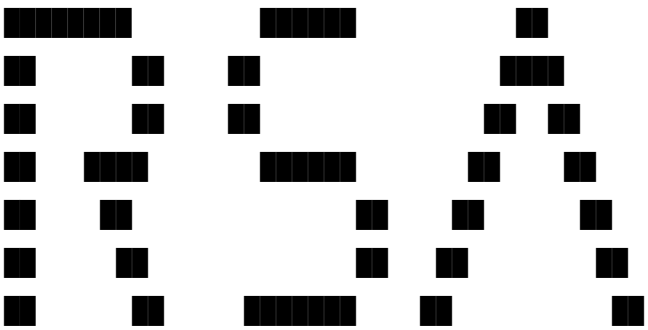
Shell

This guide describes the shell utility `nw-shell` that can be used to troubleshoot the operations of NetWitness management services like `security-server`, `investigate-server`, and `correlation-server`. It is the equivalent of the `NwConsole` utility used to interact with NetWitness capture services like Decoders and Concentrators. The shell utility is independent of the business logic of the service, and works the same with most NetWitness services.

Features



The `nw-shell` utility implements the following features:

- Supports secure connections to the local NetWitness service instances.
- Supports navigation of the service `tree` to explore its operational state (for more information, see Tree View).
- Provides an intuitive display of configuration, metrics, and health-check information to help with troubleshooting.
- Supports scripting to automate simple administration tasks in field deployments.
- Supports Linux, OSX and Windows terminals.

Installation

The `nw-shell` utility can be installed with the `rsa-nw-shell` RPM as shown here:

```
$ sudo yum install rsa-nw-shell
$ /usr/local/bin/nw-shell
```

```
RSA NetWitness Shell. Version: 4.0.0
See  "help" to list available commands, "help connect" to get started.
offline »
```

Usage

The primary goal of `nw-shell` is to help a human operator explore the runtime state of a NetWitness service. It is, essentially, an interactive program that invokes APIs on running NetWitness services. Each NetWitness service includes a system API that exposes its runtime state as a *logical* tree. The shell leverages the Tree API structure to present a hierarchical view of a service that is similar to a file system view. Users can navigate the tree by using the `cd` command to access directories, and can view or modify the corresponding configuration at the location, or invoke API methods and view the current state of components in the node.

The set of commands available to users at a given time depend on the current shell *context*, for example, their placement inside the *logical* tree. Certain commands, however, are always available, and we begin with a description of those commands.

System Commands

Shell *system* commands operate on the shell itself, instead of the nodes of a connected service. These commands are always available.

Command	Function	Example
`help [<command>]`	Provides help on available commands or a particular command.	`help` or `help connect`
`clear`	Clears the screen (shortcut `Ctrl-l`).	`clear`
`exit` or `quit`	Exits the shell.	`quit`
`history`	Displays the history of previously-run commands.	`history`

- Use the `help <command>` to explore the available commands. It is always available.
- `nw-shell` supports tab completion of a command, and the applicable parameter names wherever possible. For example, pressing the **Tab** key after typing **`e`** completes the command to `exit`.
- `nw-shell` also supports a non-interactive mode where it executes scripts from a provided file, used by specifying the absolute filepath prefixed by the `@` argument. See Shell for details.

Available Commands

```
Built-In Commands
        clear: Clear the shell screen.
        exit, quit: Exit the shell.
        help: Display help about available commands.
        history: Display or save the history of previously run commands
```

```
        script: Read and execute commands from a file.
        stacktrace: Display the full stacktrace of the last error.

Context Commands
      * cd: Change the current node. Usage: cd <path>
        connect: Connect to a service. One of --service or --port must be
specified.Usage: connect [--service <service>[.<id>]] [--broker
amqp://localhost/rsa/system] [--host localhost] [--port] [--insecure false]
      * where: Which service shell is connected to?

Token Commands
        login: Authenticate to a service. Usage: login [connect-parameters]
        login-insecure: Authenticate to a service providing user and password
on the command prompt. The password is recorded in the shell history so this
command must be used with care.Usage: login-insecure --user <user> --password
<password> [connect-parameters]
      * logout: Clear the authentication context: logout
      * whoami: Who am I?

Tree Node Commands
      * json: Print the current node as a JSON string
      * show: Pretty print the current node

Tree Node List Commands
      * config: Summarize configuration of the current subtree
      * health: Summarize health of the current subtree
      * ls: List the children of the current node. Usage: ls [<filter>] [--
values] [--types]
      * lsv: Shorthand for ls --values. Usage: lsv [<filter>] [--types]
      * method: Summarize methods of the current subtree
      * metrics: Summarize metrics of the current subtree
      * snapshot: Snapshot the current subtree

Tree Node Method Commands
      * invoke: Invokes the method that exists on the current method type
```

```
node. Usage: invoke [argument] [--file jsonfile]

Tree Node Value Commands
      * get: Get the value of the current node
      * set: Set the value of the current node. Usage: set <new-value>

Commands marked with (*) are currently unavailable.
Type `help <command>` to learn more.
```

Help, History Command Usage

```
offline » help connect
    connect - Connect to a service. One of --service or --port must be
specified. Usage: connect [--service <service>[.<id>]] [--broker
amqp://localhost/rsa/system] [--host localhost] [--port] [--insecure false]
    ...
    ...
offline » history
help
help connect
history
offline »
```

You can navigate previously-typed commands in `nw-shell` by using the Up and Down arrow keys, which can help minimize typing by recalling previously-executed commands.

Authentication Commands

As an administration and monitoring tool, it is important that `nw-shell` authenticates users before handing them control over a running service. The following commands manage the shell authentication context:

Command	Function
`login`	Authenticates and retains tokens for future interactions.
`logout`	Clears the security context and token.
`whoami`	Prints a summary of the current identity.

The `login` command can be used to authenticate the user and establish an identity. Service operators can log in once (against the NetWitness Security Server) and then use the token to connect to multiple services and perform administration based on the roles assigned. This single-sign-on workflow is simplified by separating the `login` and `connect` commands to allow the operator to authenticate once (using `login`) and then switch services seamlessly using `connect`.

In general, the `login` command takes the same parameters as `connect` (described below) to specify the service that performs the credential validation. For example:

```
offline » login
user: admin
password: ********
admin@offline » connect --service respond-server
INFO: Connected to respond-server (23e1dab7-0658-41a5-bb1e-d716a37d5ea5)
admin@respond-server:Folder:/rsa »
admin@respond-server:Folder:/rsa » connect --service investigate-server
INFO: Connected to investigate-server 2f21db20-4b50-48cf-8f7f-c0be0d1d1d12)
admin@investigate-server:Folder:/rsa »
```

The current logged-in identity can be confirmed at any point using the `whoami` command. For example:

```
admin@offline » whoami
```

Subject	admin
Issued By	security-server-ebeb90da-761b-4f14-b9ec-30410499d2b8
Issued At	2018-10-04T17:22:52.041Z
Expires After	2018-10-05T05:22:52.041Z
Roles	[ebeb90da-761b-4f14-b9ec-30410499d2b8]

The shell security context can be cleared by using the `logout` command.

```
security-server:Folder:/rsa » logout
security-server:Folder:/rsa » whoami
You are not logged in.
```

Some operations, such as setting certain configuration properties or invoking a method, require a certain RBAC. To perform such privileged operations, you need to authenticate with an identity that has the necessary permissions. For example:

```
security-server:Configuration » /rsa/logging/operations/max-file-count » get
10
security-server:Configuration:/rsa/logging/operations/max-file-count » set 15
ERROR: Failed to set the node value: Access is denied
security-server:Configuration:/rsa/logging/operations/max-file-count » login
user: admin
```

```
password: **********
admin@security-server:Configuration:/rsa/logging/operations/max-file-count »
set 15
security-server:Configuration:/rsa/logging/operations/max-file-count » get
15
```

Context-Changing Commands

The following commands change the current shell context.

Command	Function	Options	Examples
`connect`	Connect to a service	`servicehost`, `port`, `http`, `broker`	`connect --service security-server.d6a55b48...`
`cd`	Change context to a node		`cd /rsa/security`, `cd ../sys`, `cd ..`, `cd`

Connecting to a Service

The shell can connect to services over AMQP or HTTP(S), however, AMQP is the preferred and default option.

To connect to a specific instance of a service, `name` and `serviceId` needs to be supplied in the format:
`connect --service {service-name}.{serivceId}`
For example, `foo-server.d6a55b48-6103-46bd-9ead-3b4d589b302b`.

If the service identifier is skipped, it is assumed to be `any`, for example, `connect --service foo-server` will connect with any service named `foo-server` that is connected to the AMQP broker.

Change Node

The `cd` command can be used to change the current node. Just like `cd` on a file system shell, it takes relative or absolute paths as input and changes the current context to the node at that path.

```
offline » cd
Command 'cd' was found but is not currently available because you are not
connected to any service.

offline » connect
```

```
security-server:Folder:/rsa » cd log
security-server:Folder:/rsa/logging » cd ../security
security-server:Component:/rsa/security » cd /rsa/security/fips-mode
security-server:Configuration:/rsa/security/fips-mode » cd
security-server:Folder:/rsa »
```

The shell prompt summarizes and presents the user's current context. It starts off with `offline`, and once the shell is connected to a service, it displays the service name it is connected to, and the type and the path of the current node. Once the user is authenticated, the userId is included in the prompt.

Invoking `cd` before connecting to a service reminds the user that some commands work only in certain contexts.

Note: Some commands are available only in certain contexts. For example, `cd` works only when the shell is *online*. The Help command lists all the commands, but commands marked with (*) are unavailable in the given context.

Certain node-specific commands are enabled only when the current node is of a certain type. For example, method nodes support a command `invoke`, which is not enabled for any other node type.

Node Display Commands

The following commands are available with all node types. They do not take any arguments, and display the node details for the user to review.

Command	Function
`show`	Pretty-print the current node.
`json`	Print the current node as a JSON string.

For example:

```
security-server:Configuration:/rsa/security/authentication/token-
lifetime » show
```

Configuration	/rsa/security/authentication/token-lifetime
value	10 hours
valueType	com.rsa.asoc.launch.api.helpers.Seconds
defaultValue	10
description	The time-to-live on a token.

```
security-server:Configuration » /rsa/security/authentication/token-lifetime »
json
{
  "path"  :  "/rsa/security/authentication/token-lifetime",
  "type"  :  "Configuration",
```

```
  "value"  :  "10 HOURS",
  "parent"  : {
    "path"  :  "/rsa/security/authentication",
    "type"  :  "Component"
  },
  "attributes"  : {
    "defaultValue"  : 10,
    "valueType"  :  "com.rsa.asoc.launch.api.helpers.Seconds",
    "description"  :  "The time-to-live on a token."
  }
}
```

The output of `json` dumps the API payload and may contain more details than those shown by `show`.

Node Value Commands

`Configuration`, `Metric` and `Health` nodes have values. Their current values can be obtained using the `get` command.

Command	Function	Examples
`get`	Get the current value of the node.	
`set`	Update the value of the node.	`set false`, `set '{"enabled": false}'`

For example:

```
security-server:Gauge:/rsa/process/hostname » get
"hostxyz.corp.emc.com"
security-server:Gauge:/rsa/process/hostname » cd /rsa/transport/http/secure
security-server:Configuration:/rsa/transport/http/secure » get
true
```

The value of a `Configuration` node can be changed by invoking the `set` command. For example:

```
admin@security-server:Configuration:/rsa/security/pki/tls-protocols »
show
```

Configuration	/rsa/security/pki/tls-protocols
value	[TLSv1.2]
valueType	java.lang.String[]
description	This property controls the TLS protocol versions supported by the applications.

```
admin@security-server:Configuration:/rsa/security/pki/tls-protocols » set '
["SSLv3"]'
admin@security-server:Configuration:/rsa/security/pki/tls-protocols » value
[
  "SSLv3"
]
```

Node List Commands

`Folder`, `Component` and `Method` nodes can contain other nodes as their children. You can use the `ls` command to list the children nodes, their types, and where available, their current values.

Command	Function	Options	Examples
`ls <filter>`	List the child nodes of the current node.	`types`, `values`	`ls`, `ls cfg`, `ls --values`
`lsv <filter>`	Shorthand for `ls <filter> --values`	`types`	`lsv metrics ls name:fips`

For example:

```
security-server:Component:/rsa/process » ls
jvm                       Component
modules                   Component
current-time-utc          Gauge
current-time-utc-pretty   Gauge
fips140-mode              Gauge
hostname                  Gauge
mode                      Gauge
service-id                Gauge
service-name              Gauge
status                    Gauge
uptime                    Gauge
uptime-pretty             Gauge
version                   Gauge
version-full              Gauge
version-raw               Gauge
```

```
ready                    Method
shutdown                 Method

security-server:Component:/rsa/process » ls comp
jvm      Component
modules  Component

security-server:Component:/rsa/process » ls name:uptime
uptime         Gauge
uptime-pretty  Gauge

security-server:Component:/rsa/process » ls name:uptime --values
uptime         Gauge  3713854
uptime-pretty  Gauge  1 hour 1 minute 53 seconds

security-server:Component:/rsa/process » lsv
jvm
modules
current-time-utc         1483978142782
current-time-utc-pretty  2017-01-09T16:09:02.782Z
fips140-mode             true
hostname                 hostxyz.corp.emc.com
mode                     Normal
service-id               1fb7572a-4d87-497e-a4da-802819c10a72
service-name             no-op-server
status                   Running
uptime                   512064
uptime-pretty            8 minutes 32 seconds
version                  0.0
version-full             0.0.0.0
version-raw              0.0.0.0
ready
shutdown
```

Listing commands are not available on nodes that do not have children (for example, configuration or metric nodes):

```
security-server:Component:/rsa/process » cd hostname
security-server:Gauge:/rsa/process/hostname » ls
Command 'ls' exists but is not currently available because you are not logged
in.
```

Note: Values displayed in `ls` and `lsv` may be truncated for presentation purposes. Use `get` on the value node to get the complete (unaltered) value of a node.

Method Node Commands

The `method` command shows all the available methods and all the sub-folders under the current node.

```
security-server:Component:/rsa/process » method
/rsa/process/ready
/rsa/process/shutdown
```

On a node that is of `Method` type , the `invoke` command will invoke the method. For example:

```
security-server:Method:/rsa/process/ready » invoke
{
  "ready" : true,
  "serviceId" : "84f36740-5ae7-409f-b14f-b17e98703983",
  "marketingVersion" : "0.0"
}
```

If the `method` signature takes `input`, then `invoke <input>` will invoke the `method` with given parameters.

```
security-server:Method:/rsa/health/get » show
```

Method	/rsa/health/get
output	java.util.List<com.rsa.asoc.launch.api.health.api.HealthStatus>
input	java.lang.String
description	Get the details of a single composite health check @param id The health check id @return The composite health check

Metric	Value
failed	0
invoked	0
timer	0.0

```
Method:/rsa/health/get » invoke 'rsa.health.checks.security-pki'
[
  {
    "name" : "rsa.security.pki.pki-health",
    "status" : "Unhealthy",
    "details" : {
      "Reason" : "Using a self-signed certificate"    }
  }
]
```

For inline `method` execution with input payload, in cases where the input contains any special characters such as `\, \n, \r, \t , ",` the input needs to be properly escaped with a backslash (`\`).

In cases where `method` takes a complex payload, payload can be supplied with a file reference. In this case, payload does not need any special escaping.

```
Method:/rsa/configuration/collections/register » invoke --file
/tmp/jsonfile.txt
```

Run State of a Service

Once `nw-shell` is connected to a service, commands like `health`, `metrics`, `config` or `snapshot` can be used to retrieve the current state of the service at the current node, and all the sub-folders under the current node.

Health

The `health` command lists the health of the components, and the all the sub-folders, under the current node.

```
admin@security-server:Component:/rsa/process » health
/rsa/process/jvm/memory-health      Healthy
/rsa/process/modules/module-health  Healthy
```

Respond Server APIs

You can use `nw-shell` to retrieve and modify the incident details. In order for this to work, make sure that the relevant APIs are exposed. You can perform following actions using these APIs.

Retrieve Incidents

Retrieve Incident Details

Retrieve Incidents

Add Alerts to an Incident
Delete Alerts from an Incident

Retrieve Incidents

You can retrieve incidents using a single criteria. The criteria can include name, priority, risk score, status, alert count, etc. The `invoke` command returns all the incidents with the matching criteria.

Note: You must export the output to a file to avoid rollover in the shell output. You can query using single meta filters only, for example, filter by name or priority. Depending on the load, a large number of results might cause the request time-out.

Sample Query

```
admin@respond-server:Folder:/rsa » cd respond/incident
admin@respond-server:Component:/rsa/respond/incident » cd find-incident-by-criteria
admin@respond-server:Method:/rsa/respond/incident/find-incident-by-criteria »
invoke '["<meta name>", "<meta value>", "<number of records>"]'
```

Examples

The following example command reads the query from an input file and exports the results to an output file.

```
invoke --file /root/incident_req.txt outputFile /root/output_incidents.json
```

In the above example, the `incident_req.txt` file contains the following information.

```
[root@SA ~]# cat incident_req.txt
["status", "ASSIGNED", "500"]
```

The output is exported to the `output_incidents.json` file that contains 500 incidents with ASSIGNED status.

The following are some more examples:

- Retrieve incidents with `testinc for rule` as name and a maximum of 10 incidents.
  `["name", "testinc for rule", "10"]`
- Retrieve incidents with HIGH priority and a maximum of 50 incidents.
  `["priority", "HIGH", "50"]"]`
- Retrieve incidents with ASSIGNED status and a maximum of 500 incidents.
  `["status", "ASSIGNED", "500"]`

Retrieve Incident Details

The `invoke` command is used to list the details of specific incidents.

Sample Query

```
admin@respond-server:Folder:/rsa » cd respond/incident
admin@respond-server:Component:/rsa/respond/incident » cd find-by-ids
```

```
admin@respond-server:Method:/rsa/respond/incident/find-by-ids » invoke '["INC-1", "INC-2"]'
```

The output is incident details in JSON format displayed in `nw-shell`.

Examples

You can use an input file containing the request to list the incident details.

```
admin@respond-server:Method:/rsa/respond/incident/find-by-ids » invoke --file /tmp/findIncidents.txt
```

The output is incident details in JSON format displayed in `nw-shell`.

In the above example, the file `/tmp/findIncidents.txt` file contains the following information.

```
[root@NWAPPLIANCE27144 ~]# cat /tmp/findIncidents.txt

["INC-10", "INC-12"]
```

You can store the incident details to an output file.

```
admin@respond-server:Folder:/rsa » cd respond/incident
admin@respond-server:Component:/rsa/respond/incident » cd /rsa/respond/alert/add-alerts-to-incident
admin@respond-server:Method:/rsa/respond/incident/find-by-ids » invoke '["INC-1", "INC-2"]' outputFile /root/result_output.json
```

The output is incident details in JSON format stored in the `result_output.json` file.

Retrieve Alerts

You can retrieve alerts using a single criteria. The criteria can include any field that is part of the alert record (alert name, alert type, alert source, etc). The `invoke` command returns the alert with the matching criteria.

Note: You must export the output to a file to avoid rollover in the shell output. You can query using single meta filters only, for example, filter by name or type. Depending on the load, a large number of results might cause the request time-out.

Sample Query

```
admin@respond-server:Folder:/rsa » cd respond/alert
admin@respond-server:Component:/rsa/respond/alert » cd find-alerts-by-criteria
admin@respond-server:Method:/rsa/respond/alert/find-alerts-by-criteria »
invoke '["<meta name>", "<meta value>", "<number of alerts to retrieve>", "<list of alert fields (include fields)>"]'
```

Note: If you provide `<null>` as the `<list of alert fields>` value, the output returns all the alert fields.

Examples

The following example command reads the query from an input file and exports the results to an output file.

```
invoke --file /root/alerts_req.txt outputFile /root/output_alerts.json
```

In the above example, the `alerts_req.txt` file contains the following information.

```
[root@SA ~]# cat alerts_req.txt
["alert.source","Event Stream Analysis", "20", "alert.severity"]
```

The output is exported to the `output_alerts.json` file that contains 20 alerts from Event Stream Analysis and the alert severity field included.

The following are some more examples:

- Retrieve 20 alerts from Event Stream Analysis with the alert severity field included.
  `["alert.source","Event Stream Analysis", "20", "alert.severity"]`
- Retrieve 20 alerts from Event Stream Analysis with all the alert fields included.
  `["alert.source","Event Stream Analysis", "20", "null"]`

Add Alerts to an Incident

The `invoke` command is used to add alerts to an existing incident. You will require alert IDs and Incident ID.

Sample Query:

```
admin@respond-server:Folder:/rsa » cd respond/alert

admin@respond-server:Component:/rsa/respond/incident » cd
/rsa/respond/alert/add-alerts-to-incident
admin@respond-server:Method:/rsa/respond/alert/add-alerts-to-incident » invoke
'["INC-1","603dcc5091e818391ee57e1d","603dcc5091e818391ee57e1c",
"603dcc5091e818391ee57e1e"]'
```

Alternatively, you can specify the add alert query in an input file.

```
invoke --file /tmp/add_alerts.txt
```

In the above example, the `/tmp/add_alerts.txt` file contains the following information.

```
[root@NWAPPLIANCE27144 ~]# cat /tmp/add_alerts.txt

["INC-1","603dcc5091e818391ee57e1d","603dcc5091e818391ee57e1c",
"603dcc5091e818391ee57e1e"]
```

The first parameter is the incident ID (INC-1). The rest of the parameters are alert IDs (for example, 603dcc5091e818391ee57e1e) to be added to the incident mentioned in the first parameter.

The output is a list of alert IDs added to the incident.

Delete Alerts from an Incident

The `invoke` command is used to remove alerts from an existing incident. You will require alert IDs and Incident ID.

Sample Query:

```
admin@respond-server:Folder:/rsa » cd respond/alert

admin@respond-server:Component:/rsa/respond/incident » cd
/rsa/respond/alert/delete-alerts-by-alert-ids
admin@respond-server:Method:/rsa/respond/alert/delete-alerts-by-alert-ids »
invoke '["INC-1","603dcc5091e818391ee57e1d","603dcc5091e818391ee57e1c",
"603dcc5091e818391ee57e1e"]'
```

Alternatively, you can specify the delete alert query in an input file.

```
invoke --file /tmp/delete_alerts.txt
```

In the above example, the file `/tmp/delete_alerts.txt` file contains the following information.

```
[root@NWAPPLIANCE27144 ~]# cat /tmp/delete_alerts.txt

["INC-1","603dcc5091e818391ee57e1d","603dcc5091e818391ee57e1c",
"603dcc5091e818391ee57e1e"]
```

The first parameter is the incident ID (INC-1). The rest of the parameters are alerts IDs (for example, 603dcc5091e818391ee57e1e) to be removed from the incident mentioned in the first parameter.

The output is a list of alert IDs removed from the incident.

Metrics

The `metrics` command lists all of the available metrics, and all the sub-folders, under the current node.

```
admin@respond-server:Component:/rsa/tree/node » metrics
/rsa/tree/node/get/invoked   14
/rsa/tree/node/get/timer     5666541.077918259
/rsa/tree/node/list/invoked  12
/rsa/tree/node/list/timer    6652400.379371729
```

In the above example, `/rsa/tree/node/get/invoked 14` shows that the method `get` is invoked `14` times, and `timer` shows that it took on average `5666541.077918259` nano seconds to process the `get` request.

Using `cd` into the `timer` node shows more details, such as rate of requests, for the current node for per-minute and five minutes. For example:

```
admin@respond-server:Timer:/rsa/tree/node/get/timer » show
```

Timer	/rsa/tree/node/get/timer
value	3267513.7521543643
valueType	java.lang.Double
stdDeviation	4381863.808014679
fiveMinuteRate	0.018725581010540414
max	181326026
count	27
sampleSize	27
oneMinuteRate	0.038516144812437314
min	810240
fifteenMinuteRate	0.009425563630894371
median	2146170.0
meanRate	5.189274295248098E-4
mean	3267513.7521543643

Config

The `config` command shows all the configuration properties in the current node and all the sub-folders under the current node.

```
admin@respond-server:Component:/rsa/logging » config
/rsa/logging/audit/max-file-count       10
/rsa/logging/audit/max-file-size        10 MB
/rsa/logging/forward/categories         [Audit]
/rsa/logging/forward/destination        SYSLOG_UDP
/rsa/logging/forward/enabled            true
/rsa/logging/forward/host               localhost
/rsa/logging/forward/port               50514
/rsa/logging/forward/secure             false
/rsa/logging/levels
/rsa/logging/operations/max-file-count  10
/rsa/logging/operations/max-file-size   10 MB
```

Snapshot

The `snapshot` command combines `metrics`, `configuration`, and `health` of the current state of the service node and all the sub-folders under the current node. This command is very useful for troubleshooting purposes. When opening a support case, take a `snapshot` dump at the root node `\rsa` of a service that might be having issues, and attach it to the case.

```
admin@security-server:Component:/rsa/security » snapshot
/rsa/security/account/external/get-all/invoked      16
/rsa/security/account/external/get-all/timer        NaN
/rsa/security/account/external/get/failed           6
/rsa/security/account/external/get/invoked          6
/rsa/security/account/external/get/timer            NaN
/rsa/security/account/force-password-change/invoke  1
/rsa/security/account/force-password-change/timer   NaN
/rsa/security/account/get/invoked                   123
/rsa/security/account/get/timer                     902163.0
/rsa/security/account/password-policy/cannot-inclu  false
/rsa/security/account/password-policy/min-chars     8
/rsa/security/account/password-policy/min-lower-ch  0
/rsa/security/account/password-policy/min-non-lati  0
/rsa/security/account/password-policy/min-numeric-  0
/rsa/security/account/password-policy/min-special-  0

----
```

Scripting

`nw-shell` supports non-interactive executions that can take commands from files. For example:

```
> cat /tmp/foo.script
connect --service security-server
cd /rsa/security/pki/ciphers
get
> time nw-shell @/tmp/foo.script
INFO: Connected to security-server (52c7b92c-23d5-4b3e-9973-31d8b1b27ec4)
[
```

```
  "TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256",
  "TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA",
  "TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256",
  "TLS_DHE_RSA_WITH_AES_128_CBC_SHA"
]
nw-shell    5.89s user 0.33s system 305% cpu 2.032 total
```

`nw-shell` also has a built-in `script` which can be used to execute scripts in the shell once the shell is launched.

```
offline » script --file /tmp/foo.script
INFO: Connected to security-server (52c7b92c-23d5-4b3e-9973-31d8b1b27ec4)
[
  "TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256",
  "TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256",
  "TLS_DHE_RSA_WITH_AES_128_GCM_SHA256",
  "TLS_RSA_WITH_AES_128_CBC_SHA256"
]
```

Note: `nw-shell` is primarily meant to help a human to explore the runtime state of a NetWitness Platform service. For most other purposes, it is usually best to use the service published APIs.

Troubleshooting Commands

The `nw-shell` utility provides troubleshooting commands to help recover from misconfigurations that may cause the service to work improperly.

fix-keystore

When a service's keystore is corrupt or its SSL trust is broken with the rest of NetWitness, you can use the `fix-keystore` command to fix this issue. This command reads the keystore file of the services running on the host and attempts to reestablish trust with the NetWitness Platform CA. For example, the following is the command to repair the respond-server 's keystore:

```
>> fix-keystore --service respond-server
```

This command repairs the keystore `keystore.p12` that is located at `/etc/netwitness/respond-server`. It does not modify the service's original keystore. The repaired keystore can be found with the suffix

`.good`, for example, `keystore.p12.good`. If no fixes can be made to the keystore, this command does not write the new `keystore.p12.good` file.

Once the keystore repair is successful, the system admin can restore the service's communication by renaming `keystore.p12.good` to `keystore.p12` and restart the service.

print-keystore

The `print-keystore` command prints the requested NetWitness Platform Service's keystore certificates to the given output file in JSON format. Unless verbose is enabled, only a few key attributes of the certificates are printed to the file. For example, the following command prints the respond-server's keystore certificates.

```
>> print-keystore respond-server outputFile /tmp/crts
```

With verbose enabled:

```
>> print-keystore respond-server outputFile /tmp/crts verbose
```

reconstruct-keystore

The `reconstruct-keystore` command can be used when a service's keystore needs to be restored to its original clean state.

The following command reconstructs the respond-server's keystore to the new file `/etc/netwitness/respond- server/keystore.p12.new` (it does not modify the original keystore).

```
>> reconstruct-keystore --service respond-server
```

To restore the service back to its healthy state, restore `keystore.p12.new` to `keystore.p12`, and restart the service.

Advanced Customization

The following JVM system properties can be used to customize certain aspects of the `nw-shell` presentation:

System Property	Controls	Default Value
`console.width`	The width of text.	100
`console.colors`	The use of colors.	true
`console.prompt`	The prompt.	`%s%s%s »`
`timeout`	The API timeout.	30s

These can be specified using the `JAVA_OPTS` environment variable. For example:

```
> export JAVA_OPTS="-Dtimeout=100s -Dconsole.width=40 -
Dconsole.prompt=%s%s%s>"
> export JAVA_OPTS="-Dconsole.colors=false"
> nw-shell
```

The API timeout is a time unit which can use typical time unit values such as 30 MINUTES, 30 mins, 30 m, 5 seconds, 5 sec, 5s, 5, 8000 milliseconds, or 8000 ms (ms = milliseconds).

The value of `console.prompt` must contain placeholders (for example, `%s`) for three strings which are replaced, in order, by:

1. The node type
2. A separator (`:`)
3. The node path

Setting `console.colors` to `false` will not turn off *all* use of colors, it only disables colors used by `nw-shell` in its output. The underlying libraries that the program uses may still output some text in color.

Tree View

A NetWitness service, such as `security-server` or `investigate-server`, is a collection of components working together to implement the goals of the service. This topic describes the support for exposing these components and their associated elements (for example, configuration parameters, metrics, API methods, health checks, and so on) in a `tree-view`. The `tree-view` is a hierarchically-nested arrangement of `tree-node`s, each of which corresponds to a distinct functional area of the service. The arrangement enables the end-user to navigate the nodes at run-time and to explore the current state of the service. See Shell for an interactive tool that uses the tree-view.

Features

The `tree-view` implements the following features:

- Supports encapsulation of functionally related elements under the same `tree-node`.
- Supports hierarchical linkage of `tree-node` s to enable navigation from one node to another.

Implementation

The current implementation of the `tree-view` is described in the following sections.

Node Types

The `tree-view` is comprised of `tree-node` instances taken from the following types.

Type	Represents
`Component`	A service component with associated configurations, metrics, health, APIs, etc.
`Configuration`	A configuration parameter that controls some aspect of the service behavior (for example, `rsa.filesystem.prefix`).
`Metric`	A *quantitative* measure of some aspect of the component operations (for example, Requests Processed).
`Health`	A *qualitative* assessment of some aspect of the component (for example, "Using too much memory").
`Method`	An API that can be invoked remotely to interact with the component (for example, `/rsa/security/pki/setCertificate`)
`Parameter`	A payload parameter that is an input or an output from an API.
`Folder`	A logical grouping of nodes that are related to one another but are not a component (for example, the root `/rsa`).

Node Structure

All `tree-nodes` have the same structure. In particular, they include the following elements:

Item	Information
`path`	The node path is a backslash (/) separated path, for example, `/rsa/security/pki/api-secure`.
`type`	The type of the node, taken from the previous table.
`attributes`	A map of string keys to attribute values. The available keys depend on the type of the node.
`value`	The value of this node. This can be null if the node has no associated value (or if it has a null value).
`children`	A list of child nodes, if the node has any.
`parent`	The parent node. This is only null for the root node.

Introduction

The instructions in this guide apply to physical hosts exclusively. See the *Virtual Host Installation Guide for NetWitness Platform 12.1* for instructions on how to set up virtual hosts in 12.1.

Note: Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Supported Hardware

Series 5, and Series 6.

Refer to the *NetWitness* Hardware Setup Guides for detailed information on each series type (https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation).

Endpoint Log Hybrid Host Hardware Specifications

Series 5 (Dell R730) hardware or Series 6 (Dell R740 hardware. See "(Optional) Task 2 - Install Endpoint Log Hybrid" in Post Installation Tasks for instructions on how to install the Endpoint Log Hybrid.

Note: If you have RSA NetWitness Endpoint 4.x hardware, you can re-purpose it for NetWitness Endpoint Log Hybrid 12.0.

NetWitness UEBA Host Hardware Specifications

S5 (Dell R630 appliance) or S6 (Dell R640) hardware. See "(Optional) Task 3 - Install NetWitness UEBA" in Post Installation Tasks for instructions on how to install NetWitness UEBA.

SERIES 5 (DELL R630) SPECIFICATIONS

Specification	Capacity
Model	Dell PowerEdge R630xl
Processor Type	Intel Xeon E5 -2680v3
Processor Speed	2.5 GHz
Cache	30MB
Number of Cores	12
Number of Processors	2
Number of Threads	24
Total Memory	256GB
Internal Disk Controller	Dell PERC H730
External Disk Controller	Dell PERC H830

Specification	Capacity
SAN Connectivity (HBA) - Optional	N/A
Remote Management Card	iDRAC8 Enterprise
Drives	Total - 6 Drives 2 x 1TB, 2.5" HDD 4 x 2TB, 2.5" HDD
Chassis	1U
Weight	18.4 kg (40.5 lbs)
NIC Card*	On Board 2 x 10 Gb Copper 2 x 10 Gb & 2 x 1Gb Copper (Other options are available)
Dimensions	H: 4.28 cm (1.68 in.) x W: 48.23 cm (18.98 in.) x D: 75.51 cm (29.72 in.)
Power	1100W Redundant
BTU/hr	4100 BTU/hr (max)
Amps (Spec)	1100W / 220VAC = 5A
Actual Amp Draw (Post Startup)	2.1 Amps
Events Per Second (EPS)	100K EPS
Throughput	N/A

Note: Network Interface Controller (NIC) card options are available for swap with on-board daughter cards or add ons.

External Attached Storage

If you have external storage devices (for example, DACs or PowerVaults) attached to physical hosts, refer to the Hardware Setup Guides on NetWitness Community (https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation) for information on how to configure this storage.

Physical Host Installation Workflow

The following diagram illustrates the NetWitness 12.1 Physical Host Installation workflow.

Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Ask it** fields in NetWitness Community to find specific information here: https://community.netwitness.com/
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the Guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Contact NetWitness Support

If you contact NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

NetWitness Community	https://community.netwitness.com/ In the main menu, click **Support** > **Case Portal** > **View My Cases**.
International Contacts (How to Contact NetWitness Support)	https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897
Community	https://community.netwitness.com/t5/support/ct-p/support

Installation Tasks

This topic contains the tasks you must complete to install NetWitness 12.1 on physical hosts.

Checklist

Complete the installation tasks in the following order.

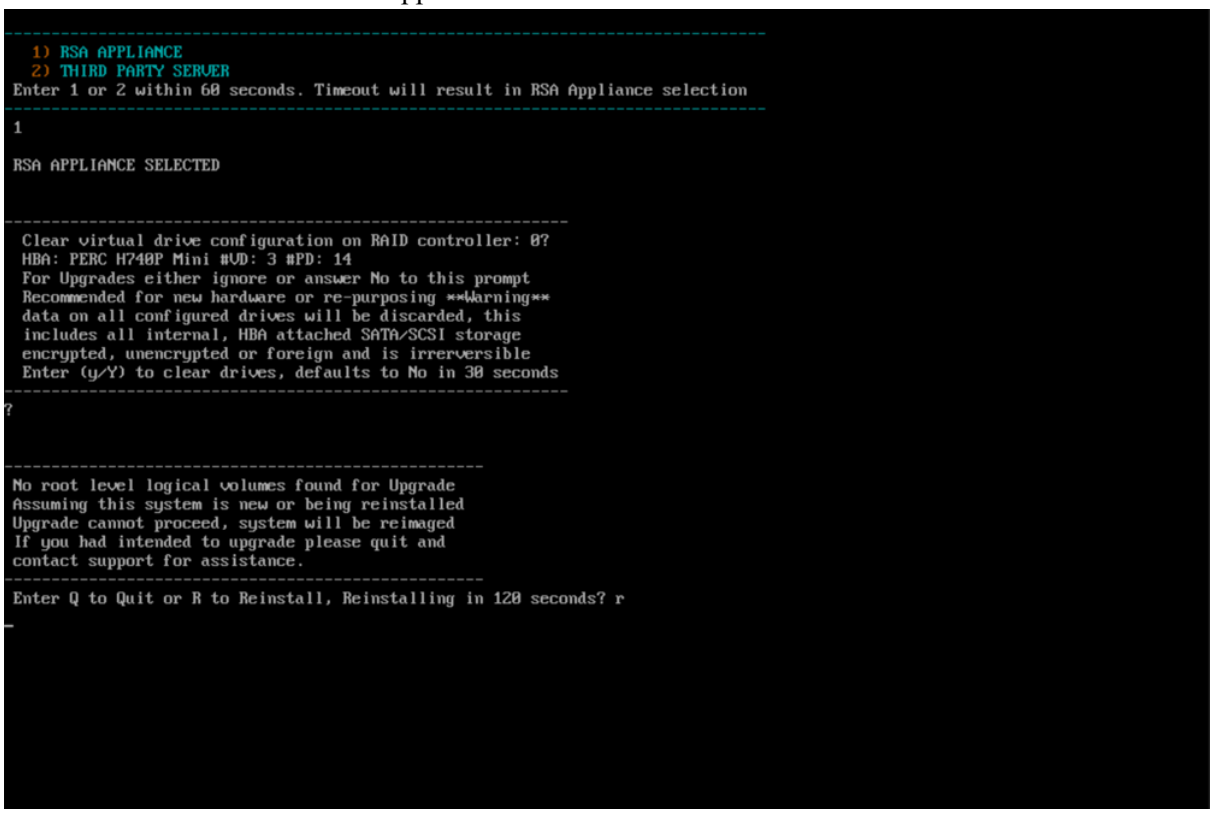
Step	Description	Instructions
1	Install 12.1 on NetWitness hosts.	Install 12.1 on the NetWitness Server (NW Server) Host and Other Component Host
2	Set up ESA hosts.	Set Up ESA Hosts
3	Install component services on your hosts.	Install Component Services on Hosts
4	Complete licensing requirements for services.	Complete Licensing Requirements
5	(Optional) Install warm standby NW Server host.	(Optional) Install Warm Standby NW Server

Caution: Before you begin the installation process, open all your firewall ports. The"Network Architecture and Ports" topic in the *Deployment Guide for NetWitness Platform 12.1* lists all the ports in a deployment. Do not proceed with the installation until the ports on your firewall are configured.

Install 12.1 on the NetWitness Server (NW Server) Host and Other Component Host

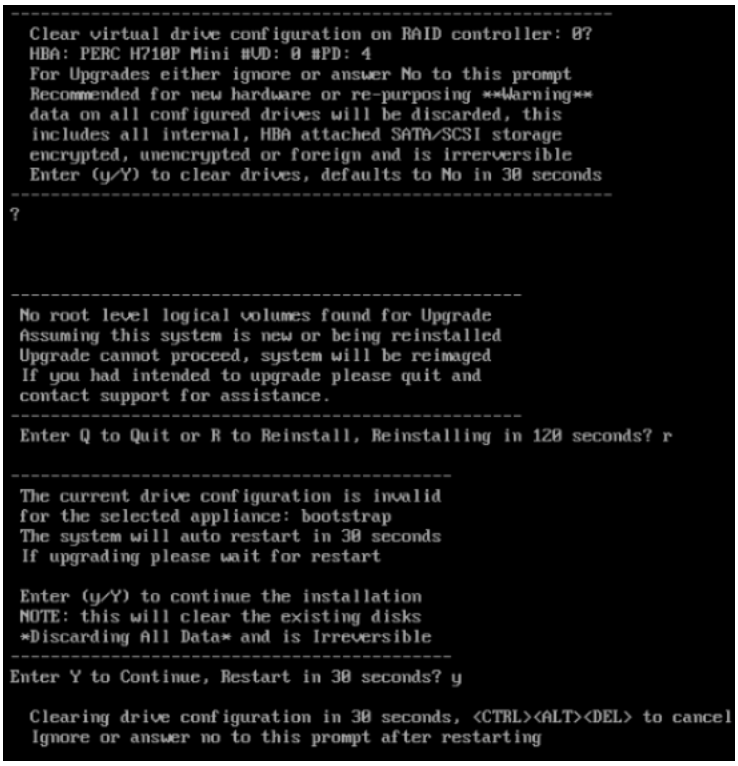
Complete the following steps to install 12.1 on NW Server host and other component hosts. Steps that are specific to the NW Server host or to component hosts are noted.

Create a Base Image on the RSA Appliance



1. Attach media (ISO) to the host.
   See the *USB Build Stick Instructions for NetWitness* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
   - Hypervisor installations - see the *Virtual Host Installation Guide for NetWitness Platform 12.1*
   - Physical media - use the ISO image to create bootable flash drive media. You can use Rufus or another suitable imaging tool to create a Linux file system on the USB drive. Rufus is available at https://rufus.ie

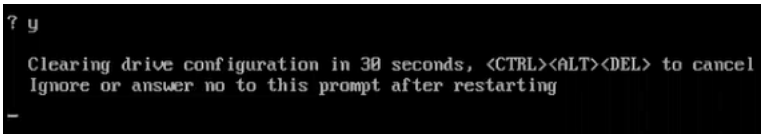
- iDRAC installations - the virtual media type is:
  - **Virtual Floppy** for mapped flash drives
  - **Virtual CD** for mapped optical media devices or ISO file.



2. Log in to the host and reboot it.

```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```

3. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After system checks, the **Welcome to NetWitness Platform 12.1** installation menu is displayed.
4. Select **Install NetWitness Platform 12.1** (default selection) and press **Enter**. The Appliance Type selection menu is displayed.
5. You must enter **1** to select RSA appliance.



6. The Installation program runs and stops at the Enter (**y**/**Y**) to clear drives prompt that asks you to format the drives.

Caution: You must respond **y** or **Y** to this prompt even if the host does not have an internal RAID configuration or the installation will fail.

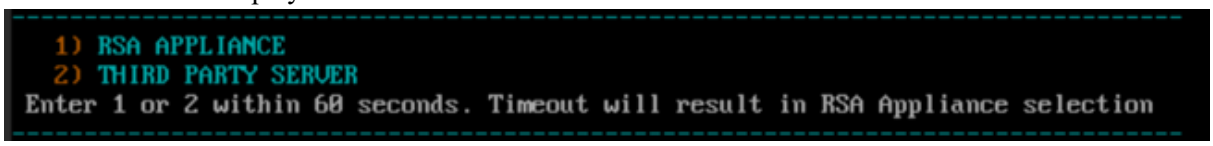
7. Type **y** to continue. The default action is No, so if you ignore the prompt, it will select No in 30 seconds, and will not clear the drives.

The system displays all the installation tasks it is performing. This can take a minute or so. After it completes the tasks, the installation program reboots the host.

Caution: Do not reboot with the attached media attached (media that contains the ISO file, for example a build stick).

Create a Base Image on the Third Party Server Hardware

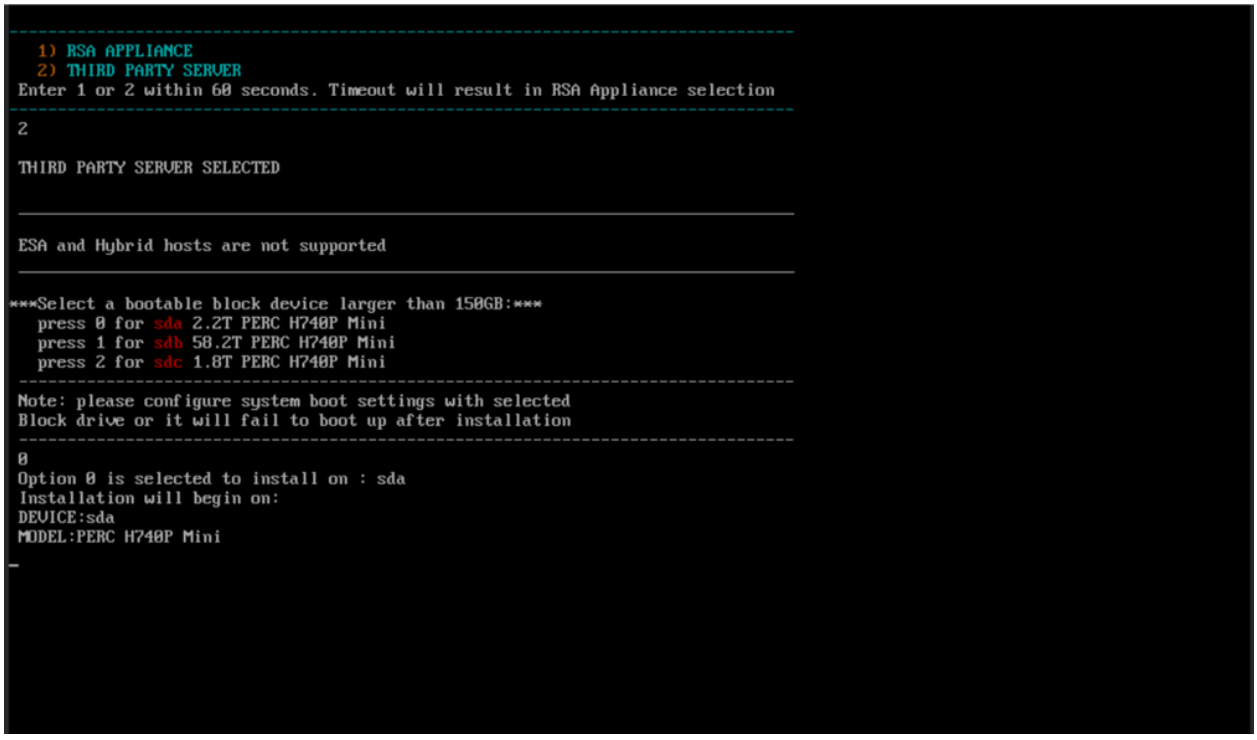
Prerequisites



NetWitness recommends that the Third party Server Hardware meets the criteria defined in Appendix D. Third Party Server System Requirement.

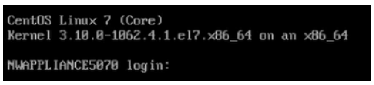
1. Attach media (ISO) to the host.
   See the *USB Build Stick Instructions for NetWitness* for more information. Go to the NetWitness All

Versions Documents page and find NetWitness Platform guides to troubleshoot issues.



- Physical media - use the ISO image to create bootable flash drive media. You can use Rufus or another suitable imaging tool to create a Linux file system on the USB drive. Rufus is available at https://rufus.ie.

2. Log in to the host and reboot it.
3. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After system checks, the **Welcome to NetWitness Platform 12.1** installation menu is displayed.
4. Select **Install Netwitness Platform 12.1** (default selection) and press **Enter**. The Appliance Type selection menu is displayed.



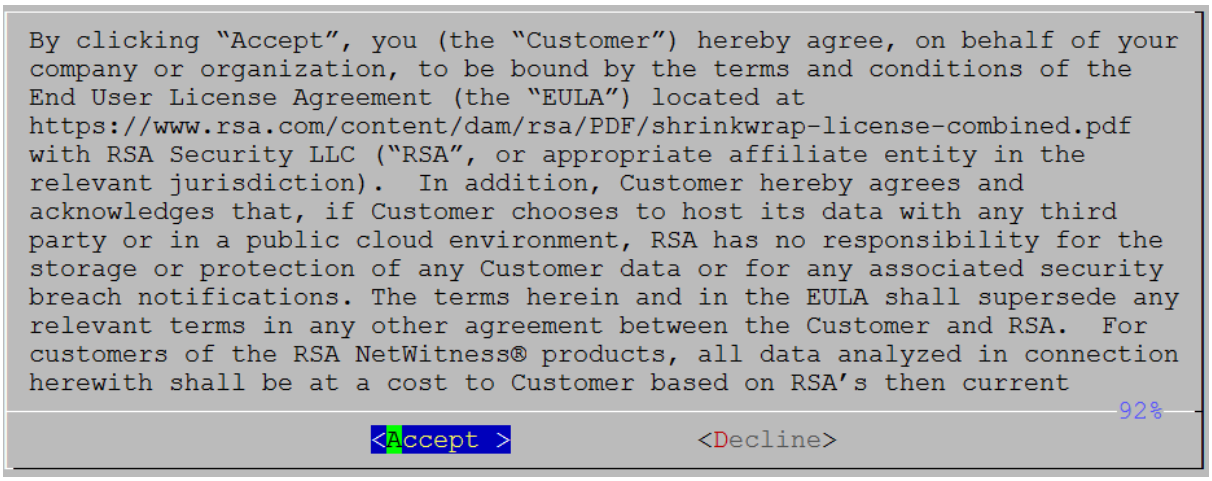
5. Enter **2** to select the Third Party Server.
6. All the available block devices are displayed. Select a block device larger than 150 GB to install the Netwitness Platform.

Note: You must configure the system boot settings with selected block device else the system will not boot after imaging.

7. The system displays all the installation tasks running, and it may take few minutes to complete the installation. Once the installation is complete, the installation program reboots the host.

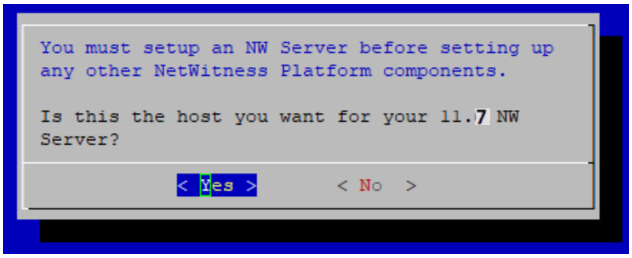
Caution: Do not reboot with the attached media that contains the ISO file, for example, build stick.

Install NetWitness Platform



Caution: If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

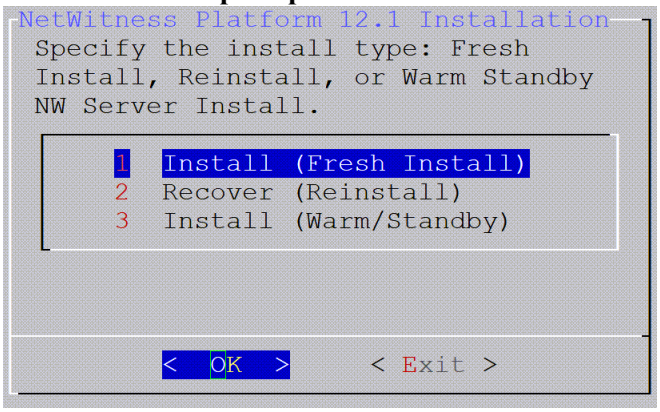
IMPORTANT: In NetWitness Platform version 11.6 or Later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.



1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

   Note: Use the following options to navigate the Setup prompts.
   1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
   3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
   If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 12.1 NW Server** prompt is displayed.

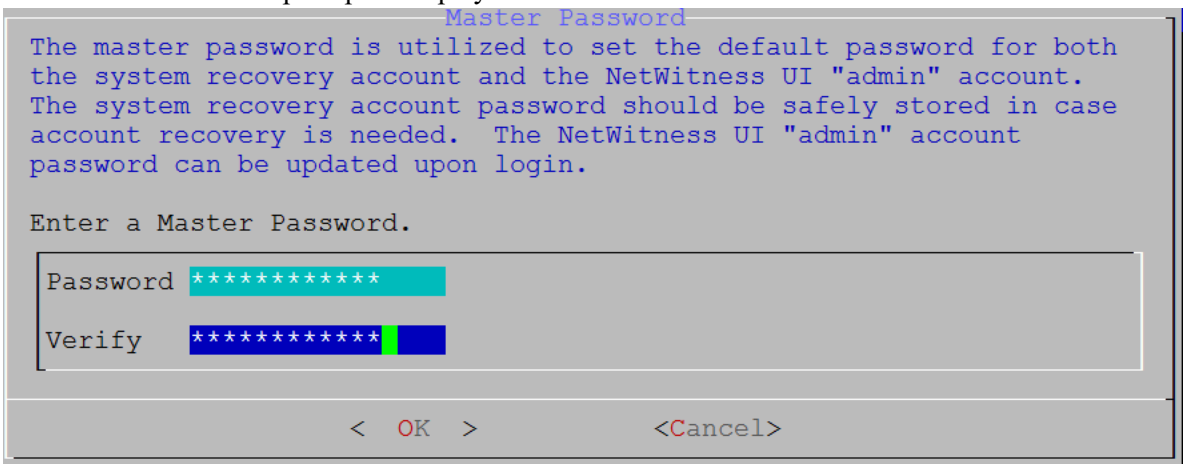
3. Tab to **Yes** and press **Enter** to install 12.1 on the NW Server.
   Tab to **No** and press **Enter** to install 12.1 on other component hosts.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

4. The **Install** prompt is displayed (**Recover** does not apply to the installation.).
   NW Server Host prompt:

   Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)

5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   NW Server prompt:



Other Component Hosts prompt says <non-nwserver-host-name>

Caution: If you include "." in a host name, the host name must also include a valid domain name.

Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

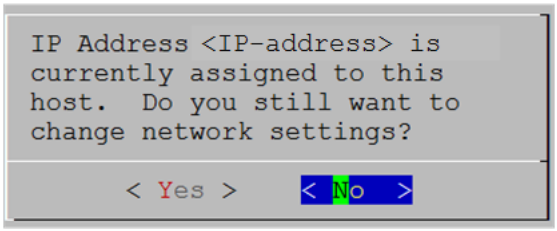
6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.

   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols: **! @ # % ^ +**
   - Numbers: **0-9**
   - Lowercase Characters: **a-z**
   - Uppercase Characters: **A-Z**

   No ambiguous characters are supported for Master Password and Deployment Password. For example:
   space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

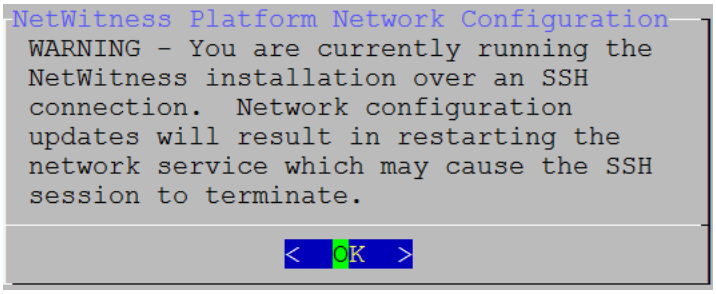
   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.

Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

8. One of the following conditional prompts is displayed.



- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

  Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration on the host.

- If you are using an SSH connection, the following warning is displayed.

  Note: If you connect directly from the host console, the following warning is not displayed.

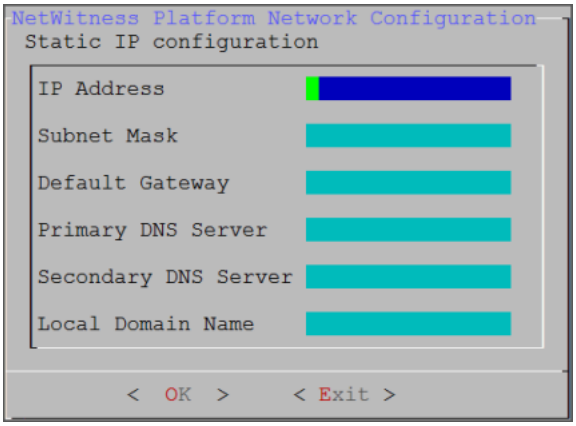
  Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.

- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

  Caution: Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.

Tab to **OK** and press **Enter** to use **Static IP**.



If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.

The **Network Configuration** prompt is displayed.

9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**

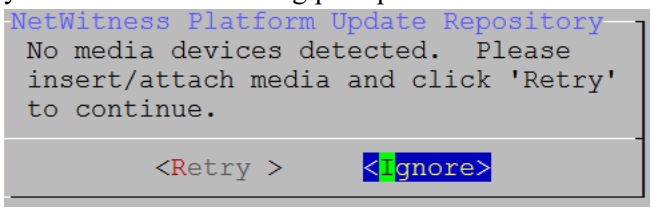
   The following **Static IP Configuration** prompt is displayed.

10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

11. The Use Network Address Translation (NAT) prompt is displayed.

    For the NW Server, tab to **No** and press **Enter**.
    For component hosts, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

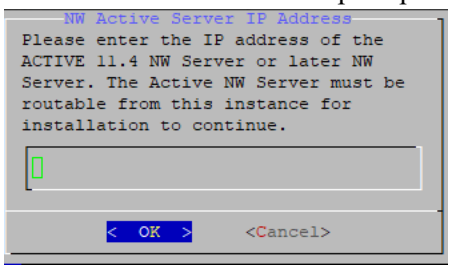


12. The **Update Repository** prompt is displayed.

    For the NW Server:

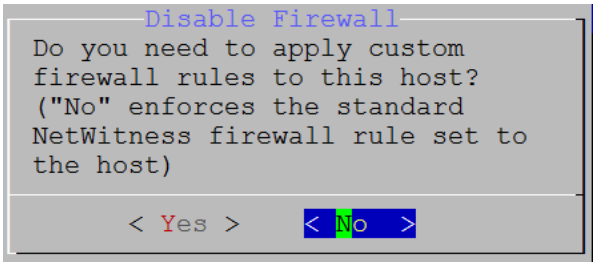
    - Press **Enter** to choose the **Local Repo**.
    - If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 12.1. If the program cannot find the attached media,

you receive the following prompt.



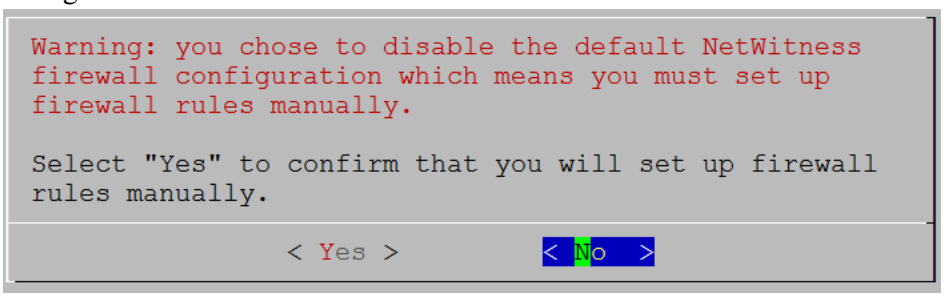
- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to NetWitness updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.



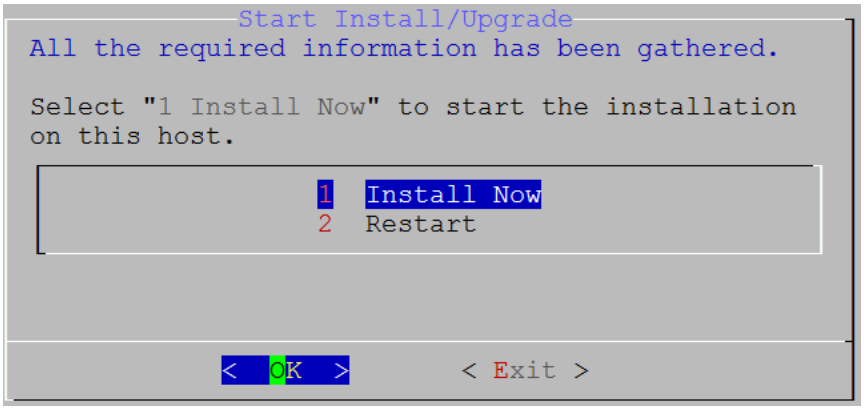
For component hosts:

- Select the same repo that you selected when you installed the NW Server host and follow the steps above.
- The NW Server IP Address prompt is displayed.



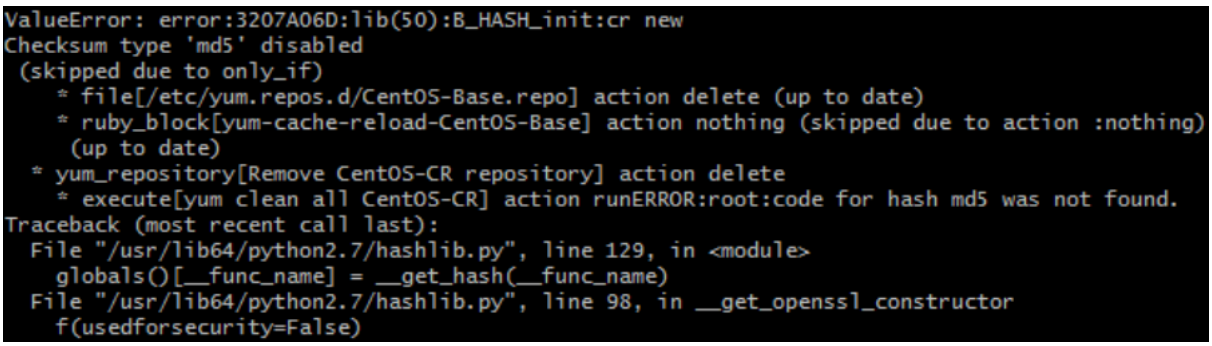
Type the NW Server IP address. Tab to **OK** and press **Enter**.

13. The Disable firewall prompt is displayed.



Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall

configuration.



14. The **Start Install** prompt is displayed.

15. Press **Enter** to install 12.1.
When **Installation complete** is displayed, you have installed 12.1 on this host.

Note: Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
`nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`

Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 12.1 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in  (Admin) > **Hosts** > :
- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in  (Admin) > **Hosts** > :

Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host.
   a. Log into NetWitness and go to (missing or bad snippet)> **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view and click .
   The **Install Services** dialog is displayed.

   d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.

Complete Licensing Requirements

Complete licensing requirements for installed services. See the *NetWitness Platform 12.1 Licensing Management Guide* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

(Optional) Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for NetWitness Platform 12.1* for instructions on how to set up a Warm Standby NW Server.

Update or Install Windows Legacy Collection

Refer to Windows Legacy Collection Guide for NetWitness for NetWitness Legacy Windows Collection Update & Installation Instructions.

Note: After you update or install Windows Legacy Collection, reboot the system to ensure that Log Collection functions correctly.

Post Installation Tasks

This topic contains the tasks you complete after you install 12.1.

- Event Stream Analysis (ESA)
- NetWitness Endpoint
- NetWitness UEBA

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Event Stream Analysis (ESA)

Configure Meta Keys on New ESA Hosts to Match Upgraded ESA Hosts in the Same NetWitness Platform Network

If you have one or more ESA hosts in a NetWitness Platform network, which were upgraded from a version before 11.3.0.2 to 11.7, and you add a new ESA host, you must configure the meta keys on the new ESA host to match the other ESA hosts. All ESA Correlation services on the same NetWitness Platform network must have the same Meta Key configurations.

1. For each ESA Correlation service on an upgraded ESA host and for the ESA Correlation service on the newly installed ESA host:
   a. Open a new tab, go to  (Admin) > **Services**, and in the Services view, select the ESA Correlation service and then select  > **View** > **Explore**.
   b. In the Explore view node list for the ESA Correlation service, select **correlation** > **stream**.
2. Ensure that the **`multi-valued`** and **`single-valued`** meta key values are the same on each of the upgraded ESA Correlation services.
3. Ensure that the **`multi-valued`** and **`single-valued`** meta key values on the newly installed ESA host are the same as those on the upgraded services.
4. To apply any changes on the ESA Correlation services, go to  **(Configure)** > **ESA Rules** and click the **Settings** tab. In the Meta Key References, click the **Meta Re-Sync (Refresh)** icon ().
5. If you updated the ESA Correlation services, redeploy the ESA rule deployments.

For more information, see "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*.

NetWitness Endpoint

The tasks in this section only apply to customers that use the NetWitness Endpoint component of NetWitness Platform.

Install Endpoint Log Hybrid

Depending on the number of agents and the location of the agents, you can choose to deploy a single Endpoint Log Hybrid host or multiple Endpoint Log Hybrid hosts. To deploy a host, you provision it and install a category on it.

- **Single Endpoint Log Hybrid host** - Deploy NetWitness Server host, Endpoint Log Hybrid host, and ESA host or hosts.
- **Multiple Endpoint Log Hybrid hosts** - Deploy NetWitness Server host, ESA host or hosts, Endpoint Log Hybrid hosts. You can deploy up to 6 Endpoint Log Hybrid hosts. For a consolidated view of all endpoint data from multiple Endpoint Log Hybrid hosts, install the Endpoint Broker. You can add only one broker in a NetWitness platform deployment which serves upto 6 Endpoint Log Hybrid hosts.

  Note: NetWitness recommends that you co-locate the Endpoint Broker on the NetWitness Broker host. However, you can deploy the Endpoint Broker on a separate host or co-locate it on the Endpoint Log Hybrid.

  Note: You must plan to scale your ESA deployment to support multiple Endpoint Log Hybrid hosts.

Follow these steps to deploy an Endpoint Log Hybrid host.

Complete the following steps first:

- For a physical host, complete steps 1 - 16 in "Install NetWitness Platform" under Installation Tasks in the *Physical Host Installation Guide for NetWitness Platform*
- For a virtual host, complete steps 1 - 16 in "Step 4. Install NetWitness Platform" under Install NetWitness Platform Virtual Host in Virtual Environment in the *Virtual Host Installation Guide for NetWitness Platform 12.1*

Configuring Multiple Endpoint Log Hybrids

Follow these steps to install another Endpoint Log Hybrid.

Step 1: Install additional Endpoint Log Hybrid

- To install a physical host, complete steps 1 - 16 in "Install NetWitness Platform" under Installation Tasks in the *Physical Host Installation Guide for NetWitness Platform 12.1*

- To install a virtual host, complete steps 1 - 16 in "Step 4. Install NetWitness Platform" under Install NetWitness Platform Virtual Host in Virtual Environment in the *Virtual Host Installation Guide for NetWitness Platform 12.1*

Step 2: Setup the Endpoint Log Hybrid

1. Create a directory `mkdir -p /etc/pki/nw/nwe-ca`.
2. Copy the following certificates from the first Endpoint Log Hybrid to the secondary Endpoint Log Hybrid:

   `/etc/pki/nw/nwe-ca/nwerootca-cert.pem`

   `/etc/pki/nw/nwe-ca/nwerootca-key.pem`

   Note: NetWitness recommends that you copy certificates from Endpoint Log Hybrid to secondary Endpoint Log Hybrid CentOS to Windows using the `SCP` command to avoid any corruption caused by Antivirus or third-party tools.

Step 3: Switch to the NetWitness UI and add Hosts

- See Add Hosts to the Endpoint Log Hybrid: for more information.

Add Hosts to the Endpoint Log Hybrid:

1. Log into NetWitness Platform and click  **(Admin) > Hosts**.

   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.

2. Select the host in the **New Hosts** dialog and click **Enable**.

   The New Hosts dialog closes and the host is displayed in the Hosts view.

3. Select that host in the **Hosts** view (for example, **Endpoint**) and click 

.

   The Install Services dialog is displayed.

4. Select the **Endpoint Log Hybrid** category and click **Install**.
5. Make sure that the Endpoint Log Hybrid service is running.
6. Configure Endpoint Meta forwarding.

   See the *Endpoint Configuration Guide* for instructions on how to configure Endpoint Meta forwarding.

7. Deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the ESA Configuration Guide.

   Note: The Endpoint IIOCs are available as OOTB Endpoint Application rules.

8. Review the default policies and create groups to manage your agents. See *Endpoint Configuration Guide*.

   Note: In 11.3 or later, agents can operate in Insights or Advanced mode depending on the policy configuration. The default policy enables the agent in an advanced mode. If you want to continue to use the Insights agent, before updating, review the policy, and make sure that the Agent mode is set to Insights.

9. Install the Endpoint Agent. You can install an Insights (free version) or an Advanced agent (licensed). See *Endpoint Agent Installation Guide* for detailed instructions on how to install the agent.

   Note: You can migrate the Endpoint Agent from 4.4.0.x to 11.7. For more information, see the *NetWitness Endpoint 4.4.0.x to NetWitness Platform 12.1 Migration Guide*.

(Optional) Configure an Endpoint Service on an Existing Log Decoder Host

You can install an Endpoint service category on an existing Log Decoder host. For an overview of installing service categories on hosts, see "Hosts and Services Set Up Procedures" in the *Host and Services Getting Started Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

- If you have an existing Endpoint Log Hybrid, you must copy certificates from that Endpoint Hybrid host to the Log Decoder before you install the Endpoint service category on the Log Decoder.
- If you do not have an Endpoint Log Hybrid host, you do not need to copy over the certificates before you install the Endpoint service category on the Log Decoder.

Do You Need to Install an Endpoint Service onto Separate Hardware

If you are only using NW Platform for collecting and analyzing logs, you can co-locate your Endpoint Server on the same physical hardware as your Log Decoder. For more information, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness Platform*.

If you exceed these guidelines, the amount of disk space usage and CPU might become so high as to create alarms for your Endpoint Server in Health and Wellness. If you notice this, and are running both log collection and EDR scans, you can use Throttling to control the amount of data coming into the Log Decoder.

If that doesn't help, NetWitness recommends that you move your Endpoint Server onto separate hardware from that used by your Log Decoder.

Install an Endpoint Service Category on an Existing Log Decoder

To install an Endpoint service category on an existing Log Decoder if you have an existing Endpoint Log Hybrid:

1. Create a directory `mkdir -p /etc/pki/nw/nwe-ca`.
2. Copy the following certificates from the first Endpoint Log Hybrid to the Log Decoder on which you are going to install the additional **Endpoint** service category.

   Note: NetWitness recommends that you copy certificates from Endpoint Log Hybrid to secondary Endpoint Log Hybrid using the `SCP` command to avoid any corruption caused by Antivirus or third-party tools.

   `/etc/pki/nw/nwe-ca/nwerootca-cert.pem`

   `/etc/pki/nw/nwe-ca/nwerootca-key.pem`
3. Log into NetWitness Platform and click  **(Admin) > Hosts**.
4. Select the Log Decoder host in the **Hosts** view and click .

   The Install Services dialog is displayed.
5. Select the **Endpoint** category and click **Install**.

To install an Endpoint service category on an existing Log Decoder if you do not have an existing Endpoint Log Hybrid:

1. Log into NetWitness Platform and click  **(Admin) > Hosts**.
2. Select the Log Decoder host in the **Hosts** view and click .

   The Install Services dialog is displayed.
3. Select the **Endpoint** category and click **Install**.

NetWitness UEBA

The tasks in this section only apply to customers that use the UEBA component of NetWitness Platform.

Install UEBA

To set up NetWitness UEBA in NetWitness Platform 11.7, you must install and configure the NetWitness UEBA service.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. For:
   - A physical host, complete steps 1 - 16 in "Install NetWitness Platform" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.7*.
   - A virtual host, complete steps 1 - 16 in "Step 4. Install NetWitness Platform" in the *Virtual Host Installation Guide for NetWitness Platform 11.7*.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy admin password. Make sure that you record this password and store it in a safe location.

2. Log into NetWitness Platform and go to  **(Admin) > Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.

3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.

4. Select that host in the **Hosts** view (for example, **UEBA**) and click .
   The Install Services dialog is displayed.

5. Select the **UEBA** Host Type and click **Install**.

6. Make sure that the UEBA service is running.

7. Complete licensing requirements for NetWitness UEBA.
   See the *Licensing Management Guide* for more information.

   Note: NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is used based on the number of users. The Out-of-the-Box Trial License is a 90-day trial license. In case of UEBA licenses, the 90-day trial period begins from the time the UEBA service deployed on the NetWitness Platform product.

Configure NetWitness UEBA

To start running UEBA:

1. Define the following parameters: data schemas, data source (NetWitness Broker or Concentrator) and start date.

   a. Define UEBA schemas:
      Choose schemas from the following list:

      AUTHENTICATION, FILE, ACTIVE_DIRECTORY, PROCESS, REGISTRY and TLS.

      Note: The TLS packet requires adding the hunting package and enabling the JA3 feature. For more information regarding events that each schema contains, see the *NetWitness UEBA Configuration Guide*.

   b. Define the data source:
      If your deployment has multiple Concentrators, we recommend that you assign a Broker at the top of your deployment hierarchy for the NetWitness UEBA data source.

   c. Define the UEBA start-date:

      Note: The selected start date must contain events from all configured schemas.

      NetWitness recommends that the UEBA start date is set to 28 days earlier than the current date. For UEBA systems that intend to process TLS data, you must make sure that the start date is set to no later than 14 days earlier than the current date.

2. . Create a user account for the data source (Broker or Concentrator) to authenticate to the data.
   a. Log into NetWitness Platform.
   b. Go to (Admin) **> Services**.
   c. Locate the data source service (Broker or Concentrator).
      Select that service, and select (Actions) > **View** > **Security**.
   d. Create a new user and assign the "Analysts" role to that user.
      The following example shows a user account created for a Broker.

3. SSH to the NetWitness UEBA server host.
4. Submit the following commands with the above parameters that you already defined.
   `/opt/rsa/saTools/bin/ueba-server-config -u <user> -p <password> -h <host> -o <type> -t <startTime> -s <schemas> -v -e <argument>`
   Where:

Argument	Variable	Description
-u	<user>	User name of the credentials for the Broker or Concentrator instance that you are using as a data source.
-p	<password>	Password of the credentials for the Broker or Concentrator instance that you are using as a data source. The following special characters are supported in a password. !"#$%&()*+,-:;<=>?@[\]^_`\{\|} If you want to include a special character or special characters, you must delimit the password with an apostrophe sign, for example: sh /opt/rsa/saTools/bin/ueba-server-config -u brokeruser -p **'!"UHfz?@ExMn#$'** -h 10.64.153.104 -t 2018-08-01T00:00:00Z -s 'AUTHENTICATION FILE ACTIVE_DIRECTORY TLS PROCESS REGISTRY' -o broker -v
-h	<host>	IP address of the Broker or Concentrator used as the data source. Currently, only one data source is supported.
-o	<type>	Data source host type (broker or concentrator).
-t	<startTime>	Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, 2018-08-15T00:00:00Z). **Note:** The script interprets the time you enter as UTC (Coordinated Universal Time) and it does not adjust the time to your local time zone.
-s	<schemas>	Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, AUTHENTICATION FILE ACTIVE_ DIRECTORY PROCESS REGISTRY TLS).
-v		**verbose mode**.
-e	<argument>	Boolean Argument. This enables the UEBA indicator forwarder to Respond. **Note:** If your NetWitness deployment includes an active Respond server, you can transfer NetWitness UEBA indicators to the Respond server and create incidents by enabling the indicator forwarder, from this data. For more information on how to enable the NetWitness UEBA incidents aggregation, see Enable User Entity Behavior Analytics Incident Rule.

5. If you are deploying a hot fix on 11.x.x.x version, you must do the following:
   a. Run the presidio-upgrade DAG.
   b. Press the play sign next to the DAG and then click the trigger button.

Enable Access Permission for the NetWitness UEBA User Interface

After you install NetWitness UEBA 11.7, you need to assign the UEBA_Analysts and Analysts roles to the UEBA users. For more information, see 'Assign User Access to UEBA' topic in the *NetWitness UEBA Configuration Guide*. After this configuration, UEBA users can access the **Investigate** > **Users** view.

Note: To complete NetWitness UEBA configuration according to the needs of your organization, See the *NetWitness UEBA Configuration Guide*.

Deployment Options

NetWitness Platform has the following deployment options. See the *NetWitness Deployment Guide* for detailed instructions on how to deploy these options.

- **Analyst User Interface** - gives you access to a subset of features in the NetWitness Platform UI that you can set up in individual locations when you deploy NetWitness Platform in multiple locations. It is designed to reduce latency and improve the performance that can occur when accessing all functionality from the Primary User Interface on the NW Server Host (Primary UI).
- **Group Aggregation** - configures multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.
- **New Health and Wellness Search** - New Health and Wellness is an advanced monitoring and alerting system that provides insights on the operational state of the host and services in your deployment, and helps identify potential issues.
- **Hybrid Categories on Series 6 (R640) Hardware** - installs Hybrid Categories such as Log Hybrid and Network (Packet) Hybrid service categories on a Series 6 (R640) Physical host. This gives you the ability to attach multiple PowerVault external storage devices to the Series 6 (R640) Physical host.
- **NW Server Deployment on ESA Hardware** - installs the NW Server host on NetWitness Series 5 and Series 6 Analytics hardware. The Series 6 Analytics Hardware has more memory and storage capacity than the standard Core appliance on which NW Server has typically been deployed. This results in better overall responsiveness and larger retention capacity for Report Engine.
- **Second Endpoint Server** - deploys a second Endpoint Server.
- **Warm Standby NW Server** - duplicates the critical components and configurations of your active NW Server Host to increase reliability.

Appendix A. Troubleshooting

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness creates log messages when it encounters these problems.

Note: If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Event Stream Analysis

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Command Line Interface (CLI)

Error Message	Command Line Interface (CLI) displays: "Orchestration failed." `Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log`
Cause	Entered the wrong `deploy_admin` password in `nwsetup-tui`.
Solution	Retrieve your `deploy_admin` password. 1. SSH to the NW Server host. `security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password` SSH to the host that failed. 2. Run the `nwsetup-tui` again using correct `deploy_admin` password.

Error Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health. AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service. `systemctl restart rsa-sms`

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Event Stream Analysis

For ESA Correlation troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.

Appendix B. Create an External Repository

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. (Conditional) Complete this step if you have an external repo and you want to override it.
   - Case 1: You bootstrapped the host from an external repo and you want to upgrade using a local repo on the Admin Server.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.
        `https://nw-node-zero/nwrpmrepo`
     c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool.
   - Case 2: You bootstrapped the host from local repo on the Admin server (NW Server host) and you want to use an external repo for the upgrade.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.
        `https://<webserver-ip>/<alias-for-repo>`
     c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool. The instructions are in "Appendix A. Offline Method (No Connectivity to Live Services) - Command Line Interface" in the *Upgrade Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. Set up the external repo.
   a. Log in to the web server host.
   b. Create directory to host the NW repository (`netwitness-11.7.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, /var/netwitness is the web-root, run the following command string.
      `mkdir -p /var/netwitness/<your-zip-file-repo>`
   c. Create the 11.7.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.7.0.0`
   d. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.7.0.0`.
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS`
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.7.0.0/RSA`

e. Unzip the `netwitness-11.7.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.7.0.0` directory.
`unzip netwitness-11.7.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.7.0.0`
Unzipping `netwitness-11.7.0.0.zip` results in two zip files (`OS-11.7.0.0.zip` and `RSA-11.7.0.0.zip`) and some other files.

f. Unzip the:
`OS-11.7.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.7.0.0/OS` directory.
`unzip /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS-11.7.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS`

The external url for the repo is `http://<web server IP address>/<your-zip-file-repo>`.

g. Unzip the:
`RSA-11.7.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.7.0.0/RSA` directory.
`unzip /var/netwitness/<your-zip-file-repo>/11.7.0.0/RSA-11.7.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.7.0.0/RSA`

h. (Conditional - For Azure) Follow these steps for Azure update.

   i. `mkdir -p /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS/other`

   ii. `unzip nw-azure-11.3-extras.zip -d /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS/other`

   iii. `cd /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS`

   iv. `createrepo`

i. Use the `http://<web server IP address>/<your-zip-file-repo>` in response to **Enter the base URL of the external update repositories** prompt from NW 11.7.0.0 Setup program (`nwsetup-tui`) prompt.

Appendix C. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-
   pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-
   firewall=false --ip-override=false --eula=true
   ```

Note: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to  **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click 

.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

Arguments

Argument	Description
`--help-install-opts`	Display all the arguments in this table.

Argument	Description
`--eula`	Accept or decline the End User License Agreement (EULA). Specify: • `true` (default) to accept the agreement • `false` to decline it and cancel the installation. For example: `--eula=true`
`--is-head`	Designate the host as the NW Server host or a component host. Specify: • `true` for NW Server host. • `false` for Component host. For example: `--is-head=true`
`--host-name`	Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname. For example: `--host-name=<hostname>`
`--master-pass`	Enter master password. For example: `--master-pass=<password>`
`--deploy-pass`	Enter deployment password. For example: `--deploy-pass=<password>`
`--iface-name`	Specify network interface. For example: `--iface-name=eth0`
`--ip-override`	Accept or override IP address found for this host or change the IP configuration found on the host. Specify: • `true` provide IP address. • `false` use IP address found on the host. For example: `--ip-override=false`
`--ip-type`	Select ip address configuration type. Specify: • `1` Static IP Configuration) • `2` DCHP For example: `--ip-type=1`
`--ip-addr`	For Static IP configuration, enter IP Address for static address. For example: `--ip-addr=<ip-address>`
`--ip-netmask`	For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>`

Argument	Description
`--ip-gateway`	For Static IP configuration, enter default gateway for static address. For example: `--ip-gateway=<default-gateway>`
`--ip-nameserver`	IP address assigned to DNS server. `--ip-nameserver=<ip-address>`
`--ip-nameserver-secondary`	Optional - IP address assigned to a secondary DNS server. For example: `--ip-nameserver-secondary=<ip-address>`
`--ip-domain`	For Static IP configuration, enter Local Domain Name for static address. For example: `--ip-domain=<default-gateway>`
`--repo-type`	Select type of update repository. Specify: • `1` Local repository • `2` External repository For example: `--repo-type=1`
`--repo-url`	For an external update repository, specify the url of the repository. For example: `--repo-url=<url>`
`--head-ip`	For a component host, specify IP Address of the NW Server. For example: `--head-ip=<ip-address>`
`--custom-firewall`	Disable default firewall configuration and use your custom configuration. Specify: • `true` use custom firewall configuration. • `false` use default firewall configuration. For example: `--custom-firewall=true`
`--use-nat`	Configure the host to use Network Address Translation (NAT) based IP addresses: • `true` use NAT IPs to connect to other hosts • `false` do not use NAT IPs to connect to other hosts (default) For example: `--use-nat=false`

Appendix D. Third Party Server System Requirement

This section contains all the hardware requirements and configuration needed to successfully deploy NetWitness Platform on Third Party Server Hardware. It contains the required compute, memory, drive types and recommendations.

Third Party Server Deployments only support the following NetWitness Platform components:

- Core Services (Broker , Decoder, Log Decoder, Archiver , Concentrator)
- Analyst UI
- New Health & Wellness
- Log Collector
- Malware Analysis
- Warehouse connector

Hardware Requirements

Administrators must configure single bootable block device (RAID volume/group) and ensure it is bootable. After installation is complete, See core service storage configuration the NetWitness Storage Guide.

Item	Core
Host Type	• NW Server • Warm standby • Analyst UI • Health & Wellness • Core Services • Log Collector • Malware Analytics • Warehouse Connector
Memory	128 GB
Processor	
Processor Speed	3.2 Ghz
# of Processors	2
# of Cores	8 Cores Per Processor
# of Threads	16 Threads Per Processor
Storage Configuration	

Item	Core
Volume	Single block device. 150 GB or greater.
Drive Types	10K SAS or SSD
RAID Configuration	1, 5 or 6
Network	
NIC	Supported by Centos 7.9 (1G, 10G or 40G)
Capture Speed	3G

NetWitness® Platform XDR

Getting Started with NetWitness Platform XDR

Overview

NetWitness is a powerful threat detection suite that enables Security Operation Centers (SOCs) to quickly locate, prioritize, and triage threats. NetWitness helps you to isolate and remediate known threats as well as those that were previously unknown. It provides deep insight into packets, logs, and endpoints that provide you with an unparalleled view into your enterprise or business.

NetWitness is powerful, but it is easier for Tier 1 Analysts to use because it automates the process of identifying and prioritizing suspicious threats. Tier 2 and Tier 3 Analysts can hunt for and locate threats by searching and filtering events and then examining events using reconstruction and analysis tools.

Architecture

NetWitness is a distributed and modular system that enables highly flexible deployment architectures that scale with the needs of the organization. NetWitness allows administrators to collect three types of data from the network infrastructure: packet data, log data, and endpoint data. The key aspects of the architecture are:

- **Distributed Data Collection**: The **Decoder** ingests packet data while the **Log Decoder** ingests log data. Decoders parse and reconstruct all collected network traffic from Layers 2 - 7, or log and event data from hundreds of devices and event sources, including NetWitness Endpoint data (if installed and configured). The **Concentrator** indexes metadata extracted from network or log data and makes it available for enterprise-wide querying and real-time analytics while also facilitating reporting and alerting. The **Broker** aggregates data captured by other devices and event sources. Brokers aggregate data from configured Concentrators; Concentrators aggregate data from Decoders. Therefore, a Broker bridges the multiple real-time data stores held in the various Decoder or Concentrator pairs throughout the infrastructure.
- **Real-time Alerting**: The NetWitness **Event Stream Analysis (ESA)** service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It can process large volumes of disparate event data from Concentrators. ESA uses an advanced Event Processing Language (EPL) that allows analysts to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams. Event Stream Analysis helps to perform powerful incident detection and alerting.
- **Real-time Analytics** (automatic analysis of events): The Automated Threat Detection functionality includes preconfigured ESA analytics module for detecting Command and Control traffic.
- **NetWitness Server**: The NetWitness Server provides reporting, investigation, administration, and other aspects of the user interface.
- **Capacity**: NetWitness has a modular-capacity architecture enabled with direct-attached capacity (DACs) or storage area networks (SANs), that adapts to the organization's short-term investigation and long-term analytic and data-retention needs.

NetWitness provides large deployment flexibility. You can design its architecture using as many as multiple dozens of physical hosts or a single physical host, based on the particulars of the customer's performance and security-related requirements. In addition, the entire NetWitness system has been optimized to run on virtualized infrastructure.

The System Architecture comprises of these major components- Decoders, Brokers, Concentrators, Archivers, ESA, and Warehouse Connectors. NetWitness components can be used together as a system or can be used individually.

- In a security information and event management (SIEM) implementation, the base configuration requires these components- Log Decoder, Concentrator, Broker, Event Stream Analysis (ESA), and the NetWitness Server.
- In a forensics implementation, the base configuration requires these components- Decoder, Concentrator, Broker, ESA, Malware Analysis, and Endpoint Log Hybrid. The Respond Server service is also required and is used to prioritize alerts.

The table provides a synopsis of each major component:

System Component	Description
Decoder / Log Decoder	• NetWitness collects packet, log, and endpoint data. • Packet data, that is, network packets, are collected using the Decoder through the network tap or span port, which is typically determined to be an egress point on an organization's network. • A Log Decoder can collect four different log types - Syslog, ODBC, Windows eventing, and flat files. • Windows eventing refers to the Windows 2008 collection methodology and flat files can be obtained via SFTP. • Both types of Decoders ingest raw transactional data that is enriched, closed out, and aggregated to other NetWitness components. • The process for ingesting and parsing transactional data is a dynamic and open framework.
Endpoint Log Hybrid	• Collects and manages endpoint (host) data from Windows, Mac, or Linux hosts. • Records data about every critical action, such as process, file, registry modification, network connections, and user console interactions. • Collects Windows logs and file logs from Windows host, if configured. • Generates metadata to correlate endpoint data with sessions from other events sources, such as logs and network. • Performs on-demand memory analysis and suspicious user behavior detection.

System Component	Description
Concentrator	• Provides index and query capability to NetWitness Collections. • Can optionally forward data to ESA.
Broker	• Distributes NetWitness Collection access across many Concentrators or Archivers, making the entire NetWitness enterprise appear as a single collection.
Archiver	• The Archiver service enables long-term log archiving by indexing and compressing log data and sending it to archiving storage. • The archiving storage is optimized for long-term data retention, and compliance reporting. • Archiver stores raw logs and log metadata from Log Decoders for long-term retention, and it uses Direct-Attached Capacity (DAC) for storage. **Note:** Raw packets and packet metadata are not stored in the Archiver.
Event Stream Analysis (ESA)	• ESA provides event stream analytics such as correlation and complex event processing at high throughputs and low latency. It can process large volumes of disparate event data from Concentrators. • ESA uses advanced Event Processing Language that allows users to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams. • ESA helps to perform powerful incident detection and alerting.

Core Versus Downstream Components

In NetWitness, the Core services ingest and parse data, generate metadata, and aggregate generated metadata with the raw data. The Core services are Decoder, Log Decoder, Concentrator, and Broker. Downstream systems use data stored on Core services for analytics; therefore, the operations of downstream services are dependent on Core services. The downstream systems are Archiver, ESA, Malware Analysis, Investigate, and Reporting.

Although the Core services can operate and provide a good analytics solution without the downstream systems, the downstream components provide additional analytics. ESA provides real-time correlation across sessions and events as well as between different types of events, such as log, packet, and endpoint data. Investigate provides the ability to drill into data, examine events and files, and reconstruct events in a safe environment. The Malware Analysis service provides real-time, automated inspection for malicious activity in network sessions and associated files.

Logging in to NetWitness Platform XDR

Note: NetWitness supports modern (or current) versions of Google Chrome, Mozilla Firefox, Microsoft Edge, and Apple Safari. It is possible to use a different browser, but some features may not function as expected. Internet Explorer is no longer supported.

Logging in to NetWitness can vary based on your environment. You may have an internal user account or an external user account. Internal user accounts are local to the NetWitness and internal users can log in to NetWitness and receive role-based permissions. External user accounts authenticate outside of the NetWitness and are mapped to NetWitness roles. If you are an external user and you cannot access NetWitness or view the information that you need, contact your System Administrator. Your Administrator can assign the appropriate roles to your account.

NetWitness Platform XDR 11.4 or later also supports Single Sign-On authentication (SSO) using Security Assertion Markup Language 2.0 (SAML 2.0) protocol with Active Directory Federation Services (ADFS) as the Identity Provider.

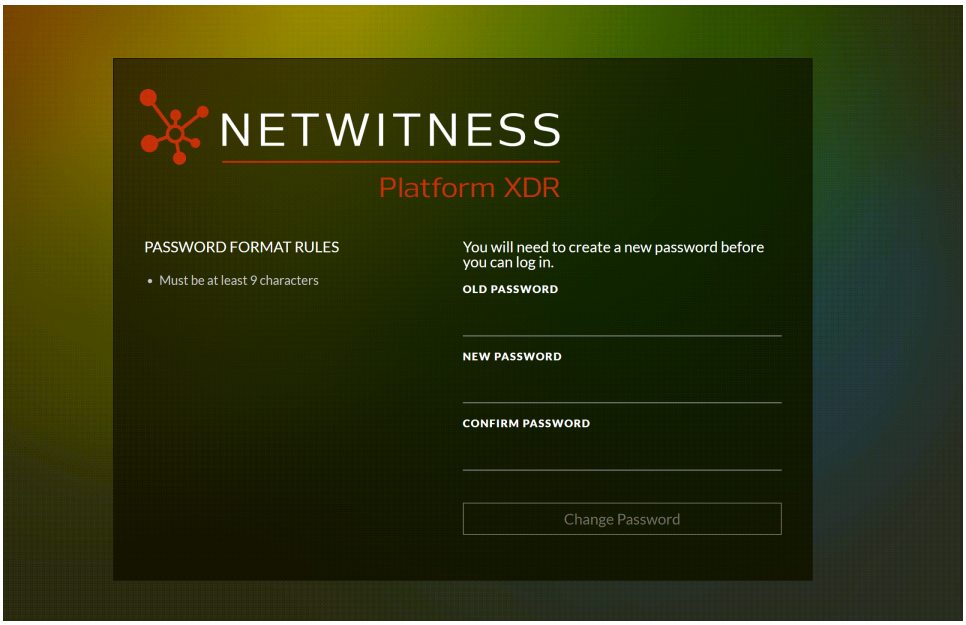
If SSO authentication is enabled by your administrator, you will be redirected to the Identity Provider User Interface instead of the default NetWitness login page. After you enter the username and password you will be securely logged into NetWitness Platform XDR.

Note: In 11.4 or later, Single Sign-On (SSO) authentication can be used to access the NetWitness Platform XDR UI, and Analyst UI Deployment.

1. Use the icon provided by your Administrator, or type the following in your web browser:
   `https://<hostname or IP address>/login`
   Where `<hostname or IP address>` is the hostname or the IP address of your NetWitness server.
   If Single Sign-On authentication is enabled, this redirects you to the ADFS login screen.
2. Enter the username and password, and then click **Sign in**.
   If the login is successful, you will be logged into the landing page specified in the user preferences.

Note: If you had previously authenticated to any other application configured to the same IDP, then you may be redirected to the requested NetWitness Platform XDR UI without being prompted for the credentials.

If you are locked out



Note: This information applies to internal accounts only. It does not apply to Active Directory or PAM accounts.

If you try too many times to log in with an incorrect username or password, your account will be locked. Contact your Administrator to unlock your account.

If you have a new account or your account is expired

Note: This procedure applies to internal accounts only. It does not apply to Active Directory or PAM accounts.

1. In the dialog to create a new password, enter your old password, type a new password, and confirm it. Password format rules (as defined by your system administrator) are provided on the left and your new password must conform to the indicated format rules.

2. Click **Change Password**.

If you do not have the appropriate access to NetWitness

If you are able to log in successfully, but you are not able to view the information that you need, it is possible that you need a user role assigned to your user account. Contact your NetWitness Administrator for assistance.

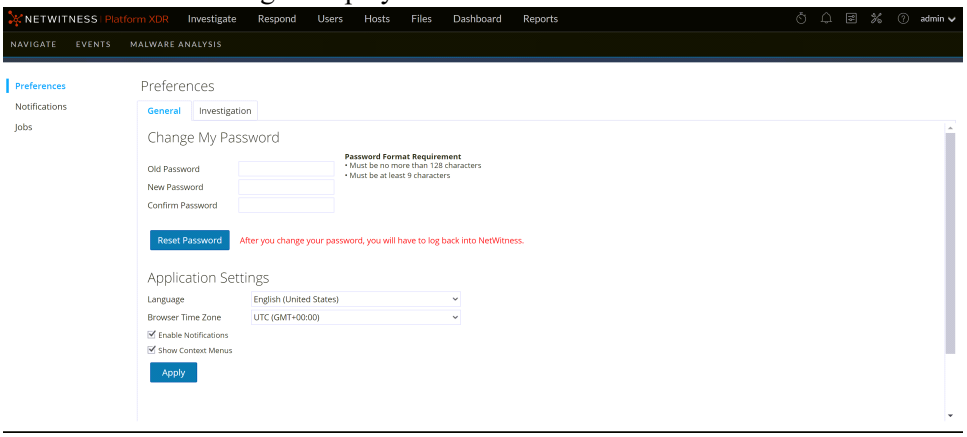
Log Off NetWitness Platform XDR

To log off from the Respond and some Investigate views

1. In the main menu bar, select your username, for example, admin.
2. In the User Preferences, click **Sign Out**.

To log off from the other views

In the main menu bar, select your username and then select **Sign Out**.



Changing Your Password

You can change the password that you use for NetWitness authentication at any time in your user preferences. Your administrator defines the appropriate password strength requirements for your NetWitness password, such as minimum password length and minimum number of uppercase, lowercase, decimal, non-Latin alphabetic, and special characters. These requirements are then displayed when changing your password.

To change your password:

1. Do one of the following:
   - For most views, such as Investigate, Dashboard, Reports,  (Configure) or  (Admin) , select your username, for example , and then select **Profile**.
   - In the Springboard, Investigate view (Events), Respond, Users, Hosts, and Files, select your username, for example , and in the User Preferences dialog click **Change my password**.

   The Preferences dialog is displayed.

2. In the **Change My Password** section, enter the password that you used to authenticate to NetWitness in the **Old Password** field.
3. In the **New Password** field, enter the password that you want to use for the next login.
4. In the **Confirm Password** field, retype the new password.
5. Click **Reset Password**.
   You will be logged out of NetWitness for the changes to take effect. The new password becomes effective the next time you log in to NetWitness.

For more information on user preferences, see Setting User Preferences.

Identifying Your Role

The roles listed here are the typical roles or functions of a Security Operations Center (SOC). Determine the role or roles that you perform in the SOC. You can use these functions as a guide to decide how to set up and navigate NetWitness so that you can efficiently perform your job tasks.

SOC Team

SOC Manager
(SOC Management and Reporting)

- Manage SOC readiness
- Respond to incidents
- Respond to data breaches

Data Privacy Officer

- Monitor and protect privacy and sensitive information

Incident Responder
(T1 Analyst)

- Respond to incidents
- Remediate incidents

Threat Hunter
(T2/T3 Analyst)

- Hunt for threats
- Conduct forensic analysis
- Recommend issues for remediation
- Remediate issues

Content Expert
(Threat Intelligence)

- Investigate new threat intelligence
- Evaluate and create new feeds
- Create correlation rules to flag indicators of compromise

System Administrator

- Install and configure equipment and software
- Manage user access
- Monitor and fine tune performance
- Backup and restore data
- Manage storage and archives
- Update software
- Create reports for regulatory compliance

NetWitness Platform XDR Basic Navigation

The NetWitness application is divided into ten main functional areas, known as views, that are based on typical Security Operation Center (SOC) roles.

Note: On upgrade to version 11.5 or later, by default the Springboard is displayed if you have not configured the default landing page in previous versions.

- **Springboard**: Springboard presents Analysts with the platform-wide detections and signals in a single view to hunt and investigate faster than ever before. System Administrators set up and maintain the Springboard. You can view the Springboard at any time by clicking NetWitness in the main menu. For more information, see Managing the Springboard.
- **Investigate**: This view is primarily for Threat Hunters, who prefer to manually hunt for threats using NetWitness metadata, raw event data, and event reconstruction and analysis. Incident Responders also use this view to get details about events associated with an incident being investigated. Both Threat Hunters and Incident Responders can use the forensic event reconstruction and event analysis features in this view.
- **Respond**: This view is for Incident Responders, who can view a list of prioritized incidents to triage. These incidents come from sources such as ESA rules, NetWitness Endpoint, or ESA Analytics modules for Automated Threat Detection. You can also view all of the alerts received by NetWitness here.
- **Users**: This view is for SOC Managers and Analysts to discover, investigate, and monitor risky behaviors across entities namely Users and Network in your environment.
- **Hosts**: This view is for Analysts, who can investigate or perform analysis on hosts using attributes such as IP address, host name, Mac address, risk score, and so on.
- **Files**: This view is for Analysts, who can investigate or perform analysis on files using attributes such as IP address, host name, Mac address, risk score, and so on
- **Dashboard**: This view is for all users. You can view dashboards on different areas of interest depending on your user permissions.
- **Reports**: This view is for all users. You can view reports on different areas of interest depending on your user permissions.
- **Configure**: This view is for Threat Intel personnel (Content Experts), who configure data sources and inputs to NetWitness. Content Experts use this area to download and manage Live content. They can also create and manage incident and ESA rules.
- **Admin**: This view is for System Administrators, who set up and maintain the overall application.

Menu changes

The following table illustrates the top-level menu changes in the 11.5 version.

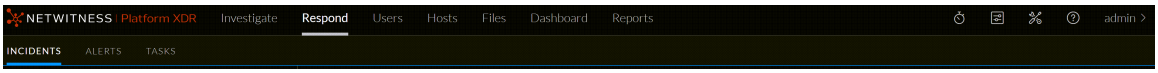
Previous Version - 11.4 and earlier	11.5 Version
N/A	RSA Click the RSA logo at the top left corner to view the Springboard.
Monitor > Dashboard Monitor > Reports	Dashboard Reports
Investigate > Hosts Investigate > Files Investigate > Entities	Hosts Files Users
Configure	
Admin	

The following table illustrates the menu changes in the 12.0 version.

Previous Version - 11.5 to 11.7.x.x	12.0 Version
RSA logo	NETWITNESS Click the NetWitness logo at the top left corner to view the Springboard.

The following table illustrates the menu changes in the 12.1 version.

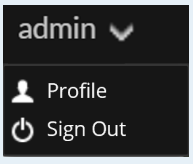
12.0 Version	12.1 Version
NETWITNESS logo	NETWITNESS Platform XDR Click the NetWitness Platform XDR logo at the top left corner to view the Springboard.



Accessing Main Views

The options that open each of the main views are listed at the top of the browser window. With the appropriate permissions, you can access any of these views at the top of every UI at any time.

Secondary Menus



The main views have secondary menus with additional views that you can select, which vary according to the tasks that you can complete. The following example shows the Respond menu.

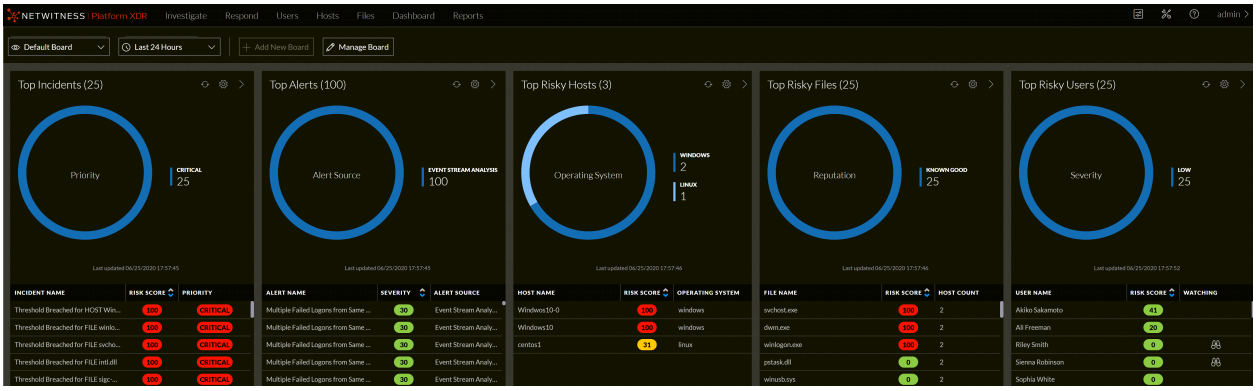
Additional Options

In addition to the main views, there are additional options at the top of the UI that are common to the application.

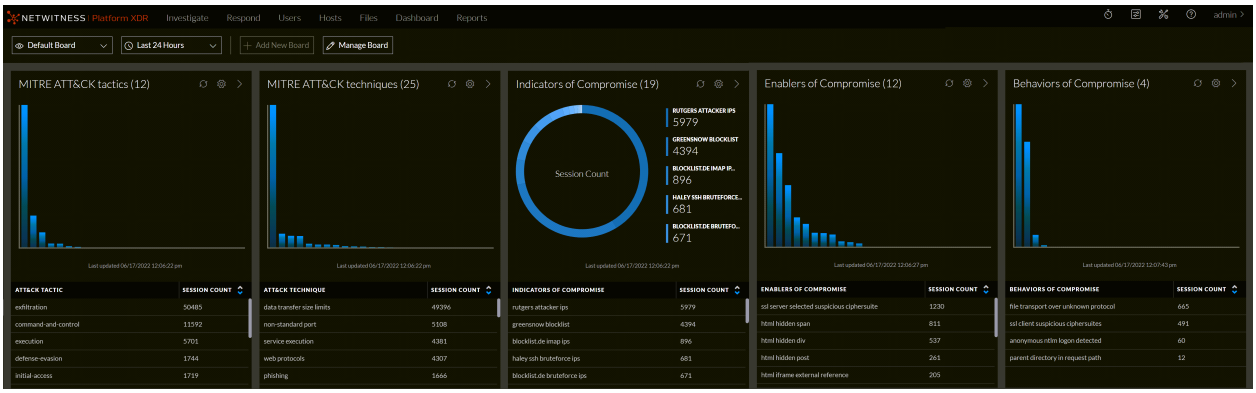
The following table describes the common options.

Common Option	Name	Description
	Jobs	In the Investigate, Dashboard, Reports,  (Configure) , and  (Admin) views, click this icon to view and manage your jobs in the Jobs tray. Jobs are on-demand or scheduled tasks that take some time to complete in the NetWitness application.
	Notifications	Click this icon to view notifications from the application.
	User Preferences	Click this icon to view your available user preference options. You can manage your user preferences and log out of NetWitness.
	User Profile	Click your user profile to view the available options. You can manage your user preferences, change your password, and log out of NetWitness UI.
	Help	Click this icon to view NetWitness help topics.

Main Views



The following sections explain the main views:

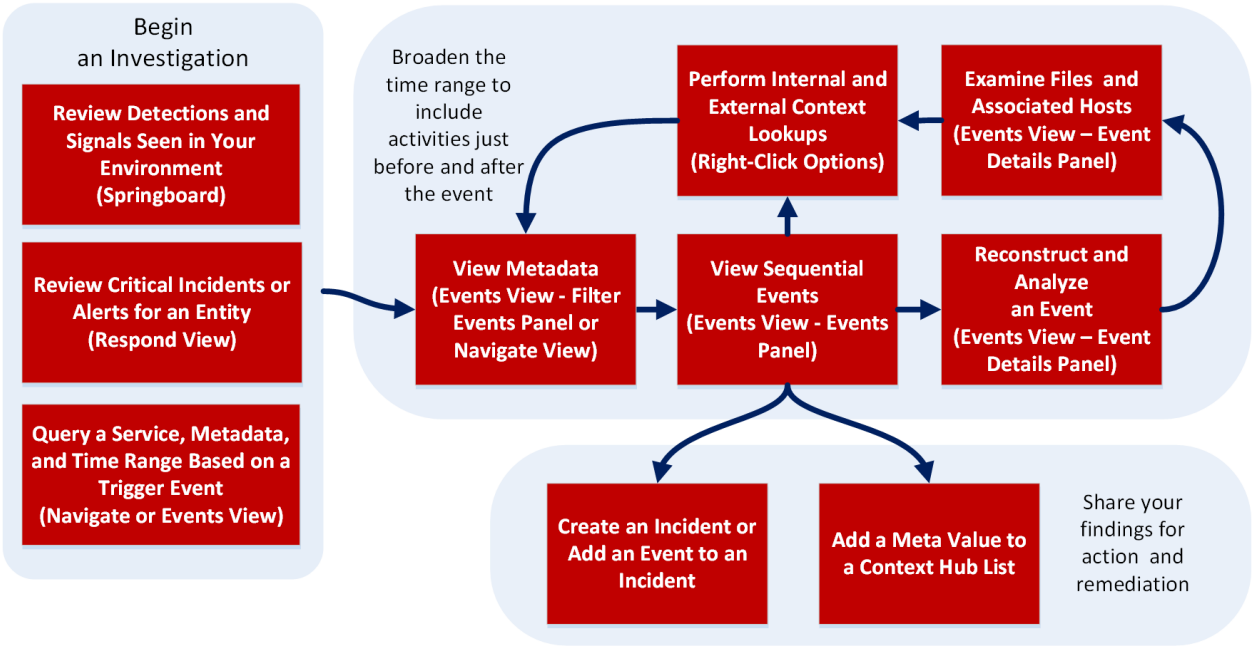


- Springboard
- Investigate
- Respond
- Users
- Hosts
- Files
- Dashboard
- Reports
-  Configure
-  Admin

Springboard

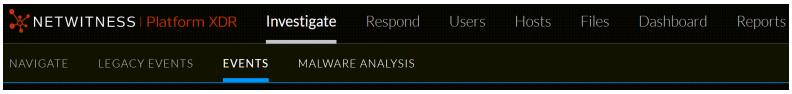
(From 11.5 and later) NetWitness Platform XDR Springboard is an easy-to-use landing page that presents platform-wide detections and signals in a single view to help analysts hunt and investigate faster than ever before.

Click the NetWitness logo at the top left corner to view the Springboard.



What can I do here?	Path	Show me how
View out-of-the-box panels Edit a panel Refresh a panel Select time range View all incidents, alerts, users, files, and hosts View details of selected incident, alert, user, file, and host Manage Board (add, rearrange, and delete panels) Add a new custom private board	Springboard view	See Managing the Springboard.

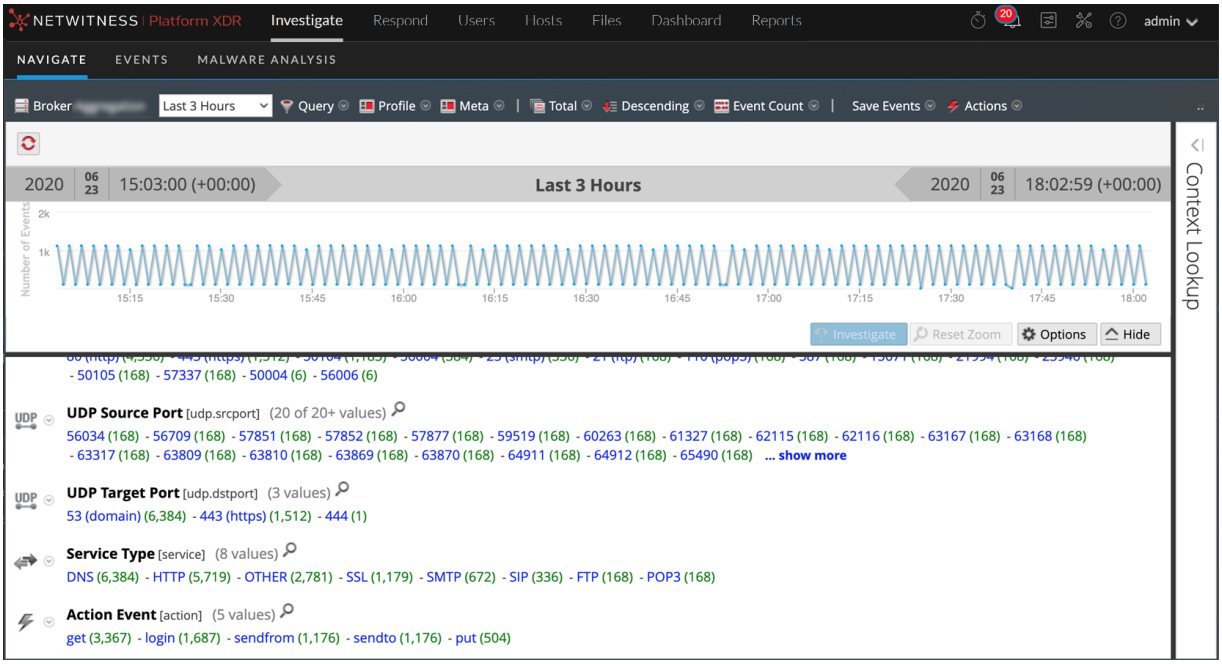
Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.



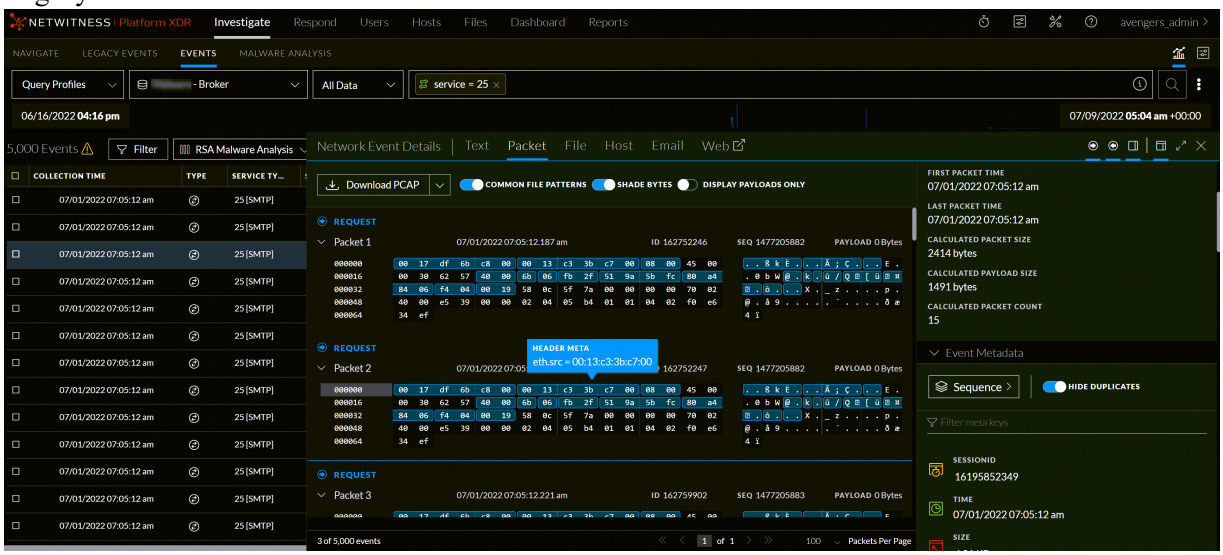
Investigate

The Investigate view is the tool for SIEM, network, and endpoint data investigation, presenting different views into a set of data. Analysts can see metadata and raw data for endpoints, logs, and events, as well as potential indicators of compromise. In addition to investigating data on a specific service, you can pivot into Investigate from Respond, the Dashboard view, an entry in a report generated by the Reporting Engine, or a properly configured third-party application.

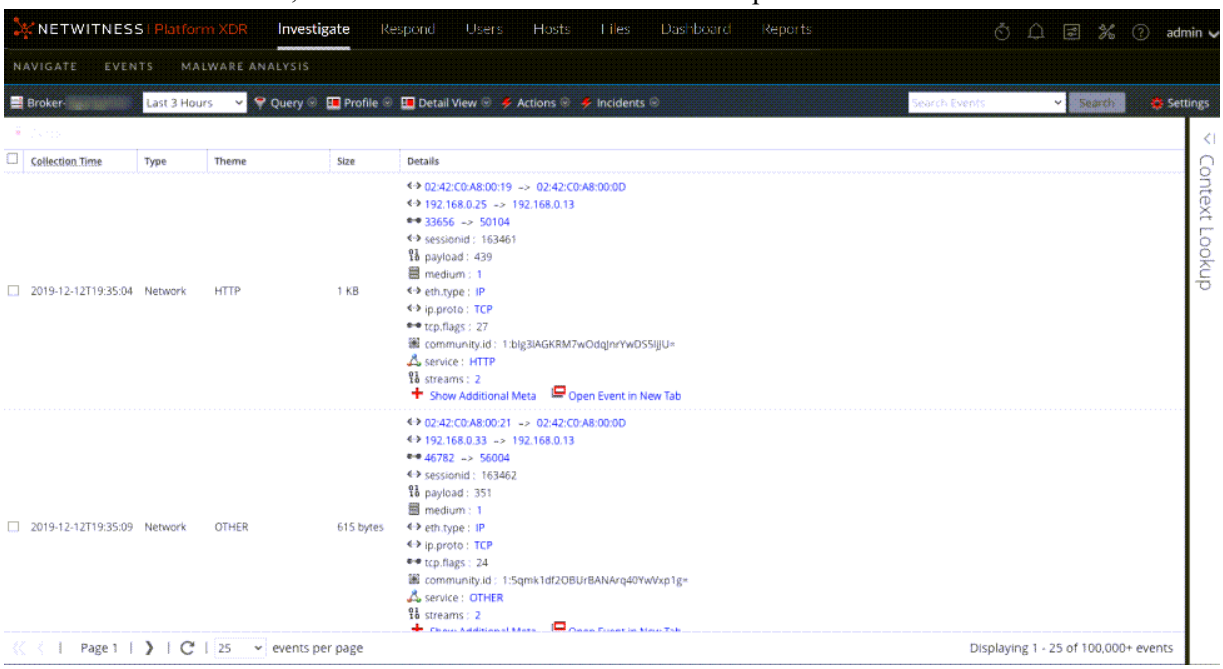
You can begin your investigation in any Investigate view, then continue the investigation seamlessly in another Investigate view. The manner in which you proceed is determined by the question that needs to be answered. If you find an event that needs a response, you can create an incident in Respond where an incident responder will take further action. The following figure depicts the high-level flow of an investigation. The *NetWitness Investigate User Guide* provides detailed information.



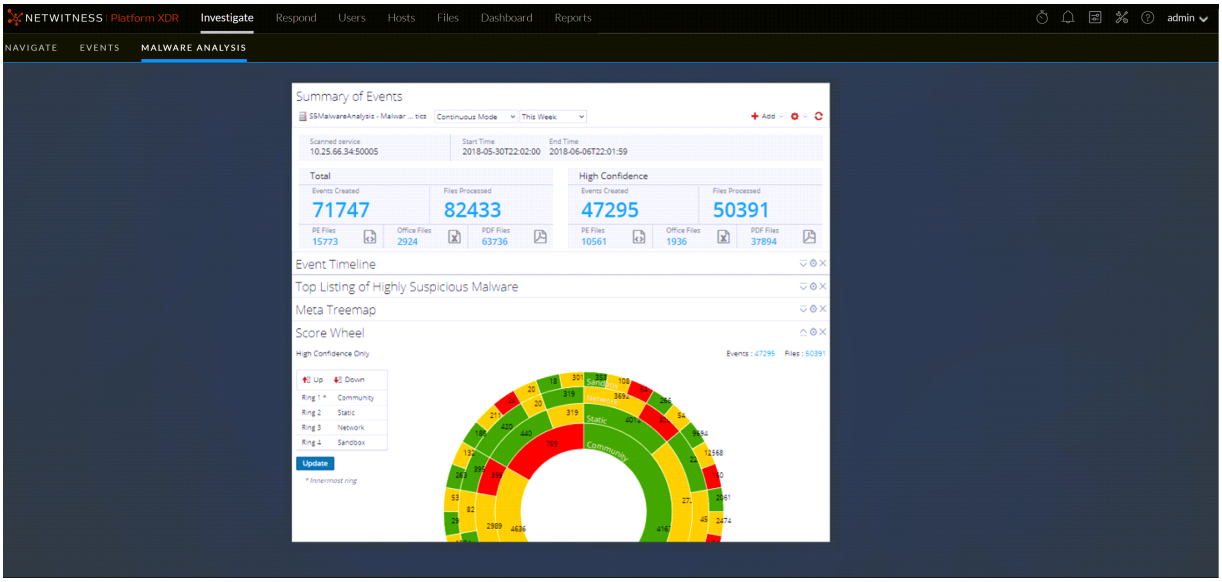
Investigate Menu



The Investigate menu has the following options:



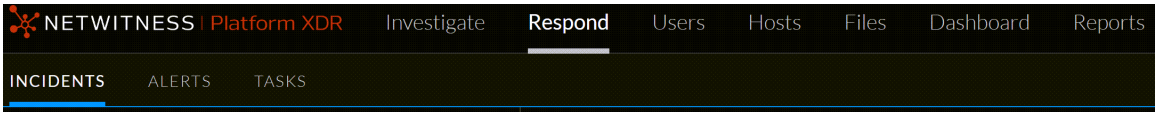
- **Navigate**: The Navigate view provides a list of meta keys and meta values with a focus on metadata. You can drill into the data, search for events, open a selected event in the Events view, and look up additional context from the Context Hub service.



- **Events**: The Events view (formerly Event Analysis view) is the default user interface for interacting with events. It provides a sortable list of events with focus on metadata and raw data. You can search for events, view a reconstruction that offers helpful cues to identify points of interest, pivot to standalone Endpoint, look up additional context from the Context Hub service, look up data in Live, do external lookups, and create an incident for incident responders. By default only the Events view appears in the menu, but when the Legacy Events view is enabled, both the Events view and the Legacy Events view are visible in the menu bar.

- **Legacy Events**: With major functionality added to the 11.3 Events view, the Legacy Events is no longer needed and it is hidden unless the administrator enables it. The Legacy Events view provides a list of events with a focus on raw data. You can browse a simple list of events, a detailed list, and a log list. You can search for events, view a reconstruction of an event, look up additional context from the Context Hub service, and create an incident for incident responders.

- **Malware Analysis**: Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows PE, PDF, and MS Office) to assess the likelihood that a file is malicious. Using Malware Analysis, you can prioritize the massive number of files captured in order to focus analysis efforts on the files that are most likely to be malicious.

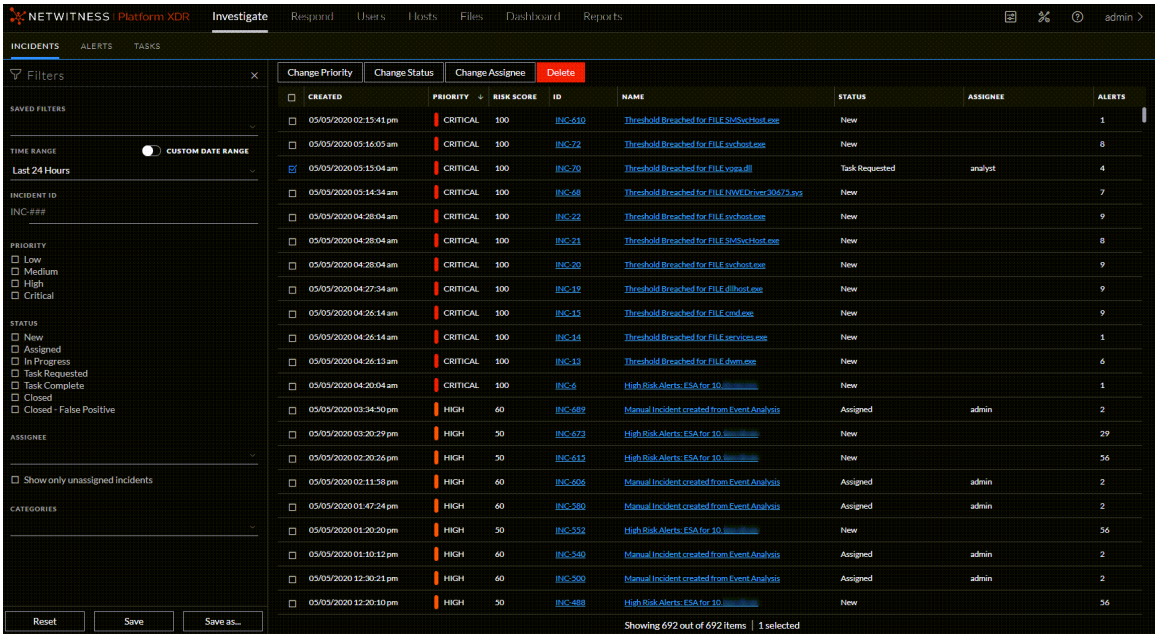


What can I do here?	Path	Show me how
Configure Investigate Views and Preferences	Investigate view	See "Configuring Investigate Views and Preferences" in the *NetWitness Investigate User Guide*.
Browse Event Metadata	Navigate view	See "Refining the Results Set" in the *NetWitness Investigate User Guide*.
Browse Raw Events	Events view	See "Refining the Results Set" in the *NetWitness Investigate User Guide*.
Analyze Raw Events and Metadata	Events view	See "Reconstructing and Analyzing Events" in the *NetWitness Investigate User Guide*.
Scan Files and Events for Malware	Malware Analysis view	See the *Malware Analysis User Guide*.
Triage an Incident	Pivot from the Respond view	See the *NetWitness Respond User Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

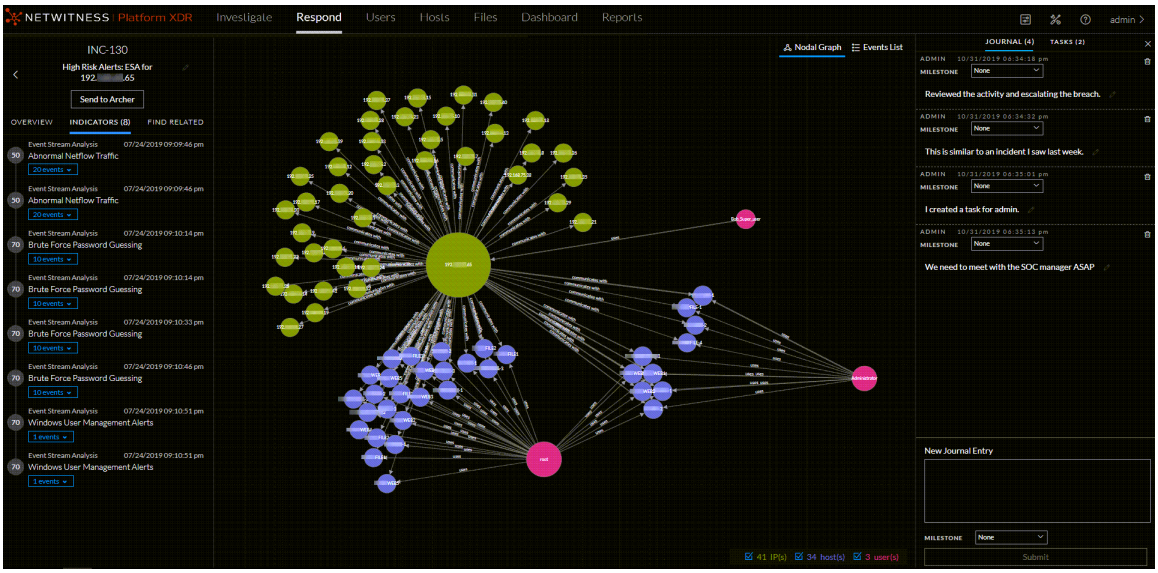
Respond

The Respond view presents analysts with a queue of incidents in severity order. When you take an incident from the queue, you receive relevant supporting data to help you investigate the incident. From there, you can determine the incident scope and escalate or remediate it as appropriate.



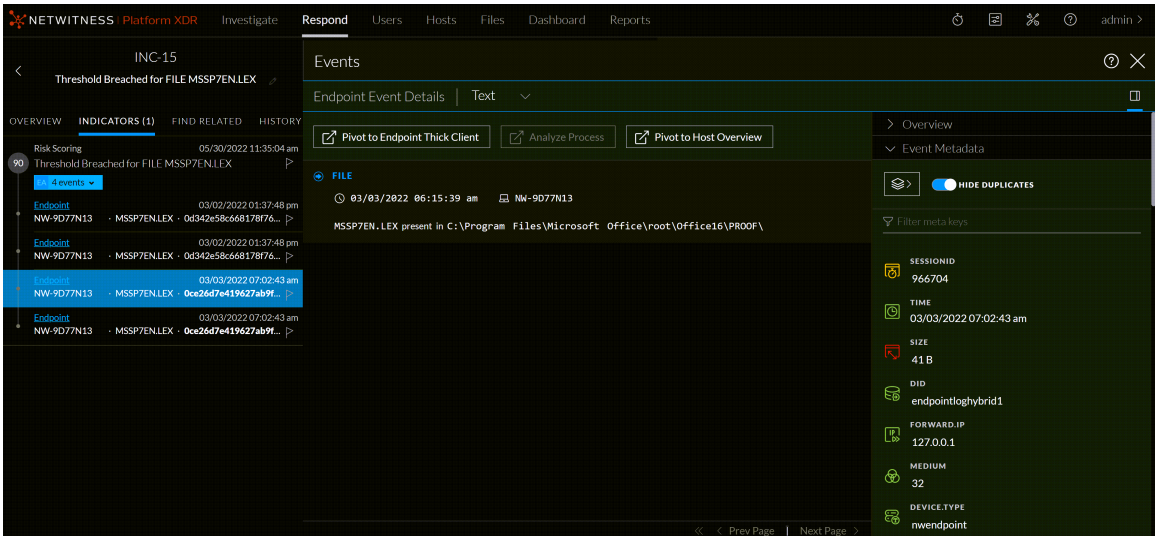
Respond Menu

The Respond menu has the following options:

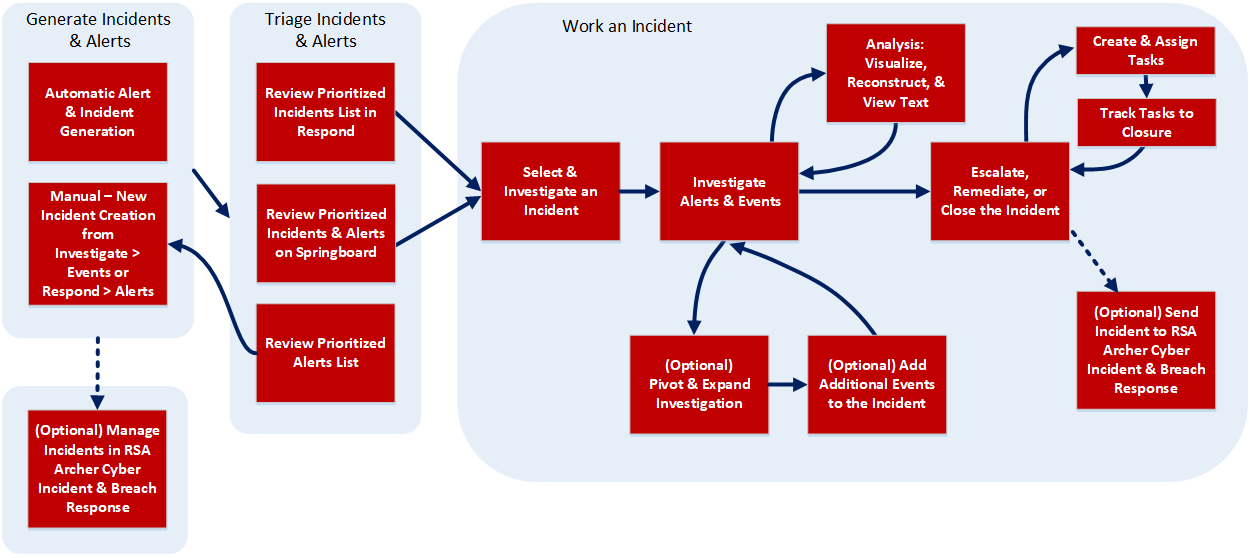


- **Incidents**: The Incidents List view contains a list of all incidents with basic information. The Incident Details view provides extensive details about the incident.
- **Alerts**: The Alerts List and Alert Details views provide information about all of the threat alerts and indicators received by NetWitness in one location.
- **Tasks**: The Tasks List view enables you to create tasks and track them to completion.

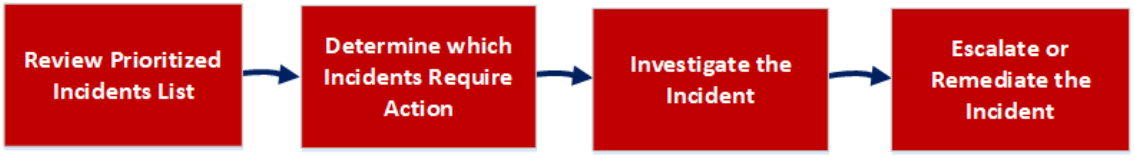
The following figure shows the Respond view - Incidents List view, which shows a list of prioritized incidents.



When using NetWitness as your case management tool, you can also manage incidents from this view. New incidents appear at the top of the incident queue.



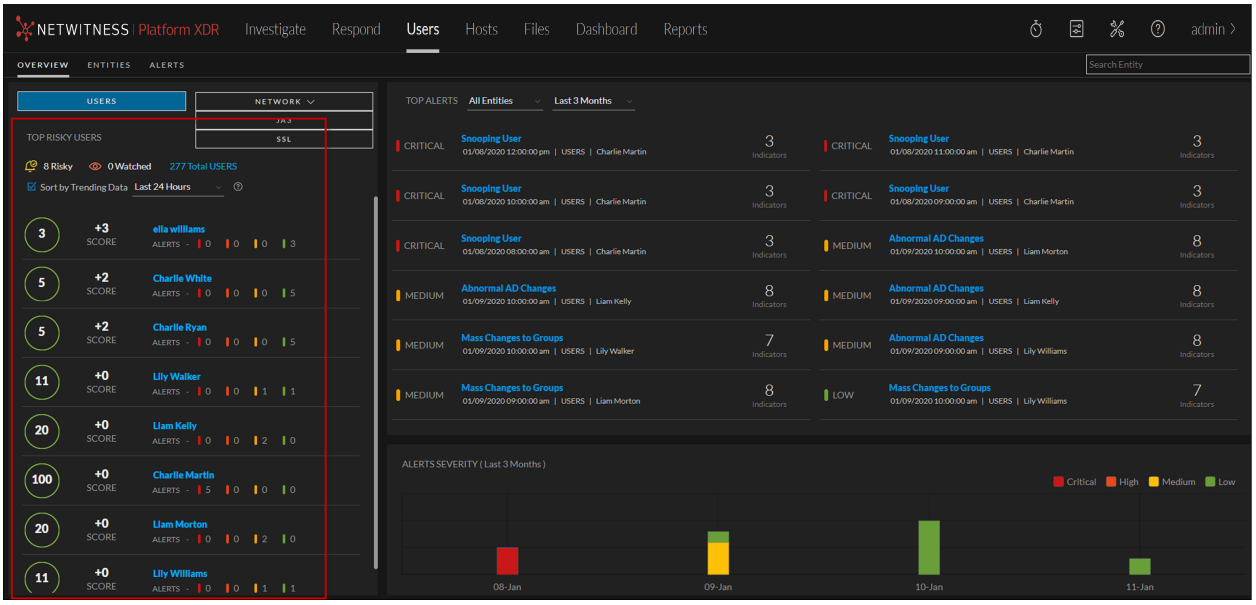
The following figure shows an example of the Respond view - Incident Details view, which shows details for a selected incident.



The Respond view is designed to make it easy to evaluate incidents, contextualize that data, collaborate with other analysts, and pivot to a deep-dive investigation as needed. The following figure shows an example of an event analysis in the Incident Details view.

The following figure shows the high-level Respond workflow process.

The following figure shows the high-level process that Incident Responders use to respond to incidents in the Respond view.



In the Respond view, analysts look at the prioritized list of incidents and determine which incidents require action. They click an incident for a clear picture of the incident with supporting details and they can investigate the incident further. Analysts can then determine how to respond to the threat, by escalating or remediating it.

What can I do here?	Path	Show me how
View prioritized incident lists	Respond > Incidents (Incidents List view)	See the *NetWitness Respond User Guide*.
Determine which incidents require action (Triage an incident)	Respond > Incidents (Incident Details view)	See the *NetWitness Respond User Guide*.
Investigate the incident	Respond > Incidents (Incident Details view)	See the *NetWitness Respond User Guide*. (You can also pivot to the Investigate view.)
Escalate or Remediate the Incident	Respond > Incidents (Incident Details view) and Respond > Tasks (Tasks List view)	See the *NetWitness Respond User Guide*.
Review Alerts	Respond > Alerts (Alerts List and Alert Details views)	See the *NetWitness Respond User Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

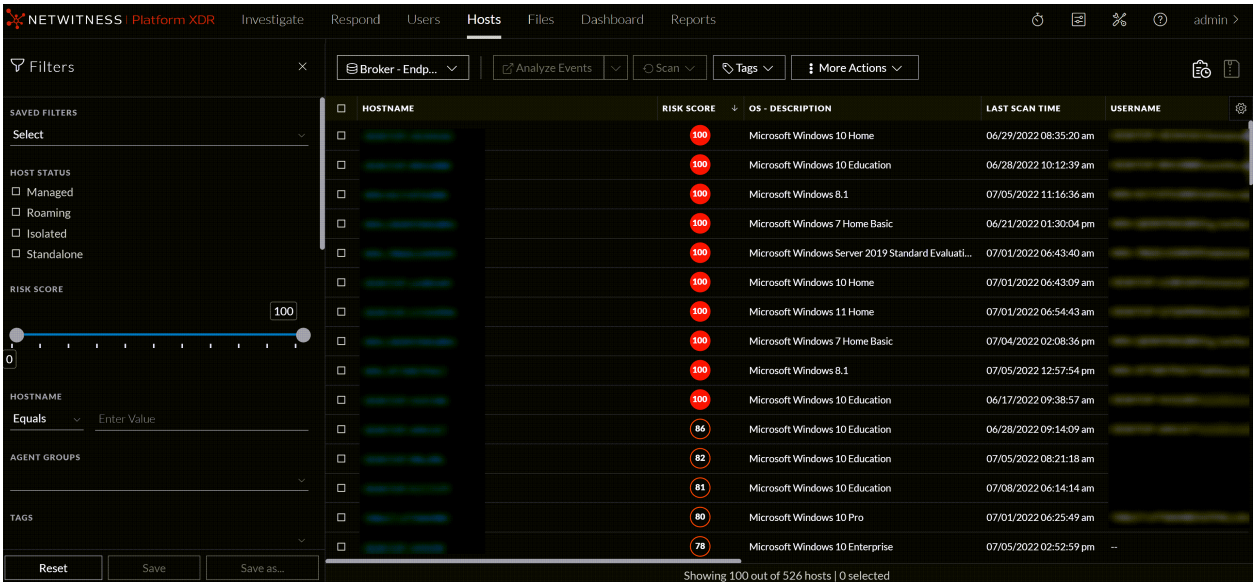
Users

The Users view provides visibility into risky user behaviors across your enterprise with NetWitness UEBA. You can view a list of high-risk users and a summary of the top alerts for risky behavior for your environment. Then you can select a user or an alert and view details about the risky behavior and a timeline during which the behaviors occurred.

The Users menu has the following options:

- **Overview**: It provides an initial view into the recent and most important user or network entity activities in the environment. Each panel shows either prioritized incidents for investigation or consolidated metrics reflecting potential risks to the enterprise.
- **Entities**: It is a proactive threat hunting console. You can use behavioral filters to build use case driven target lists, and to continuously monitor the environment for specific risky behavior patterns.

Note: The Entities view is only available if you are assigned the role of Administrator or UEBA Analyst.



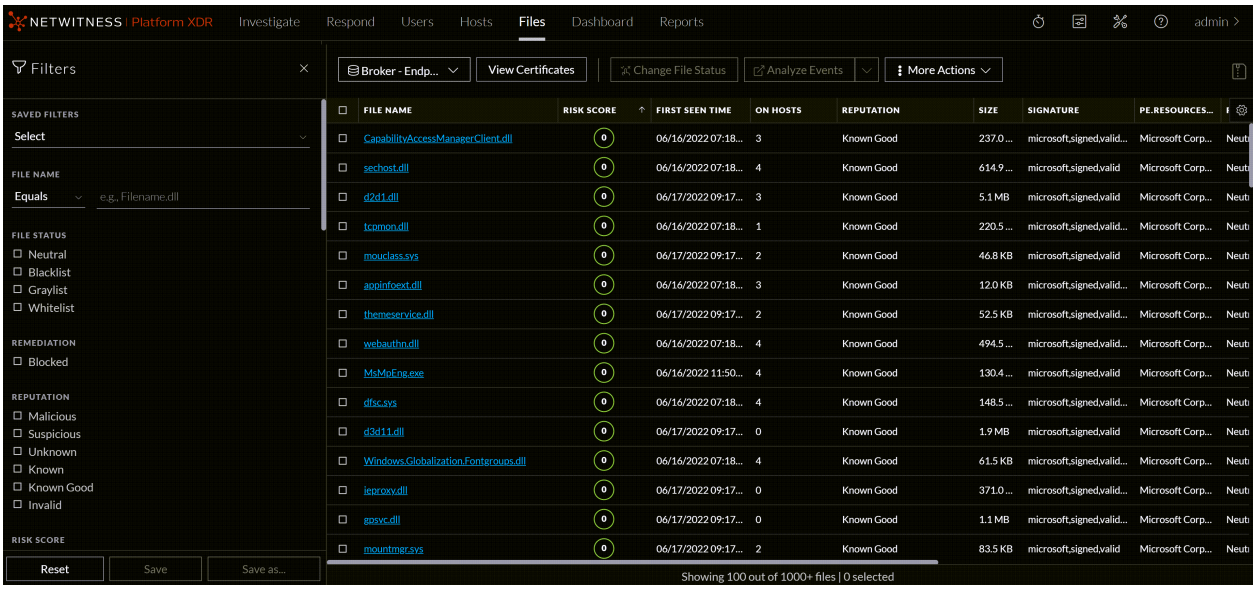
- **Alerts**: It displays details about all the alerts in your environment. You can view forensic information about suspicious activity in your environment that is based on a specific timeframe.

What can I do here?	Path	Show me how
Find Risky User Behavior	Users view	See the *NetWitness UEBA User Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Hosts

The Hosts view lists all hosts that have a NetWitness Endpoint agent running. You can filter hosts based on operating system, agent last seen, last scan time, risk score, and other factors. You can open a specific host to view events related to alerts, anomalies, process details, and information related to logged-in users.

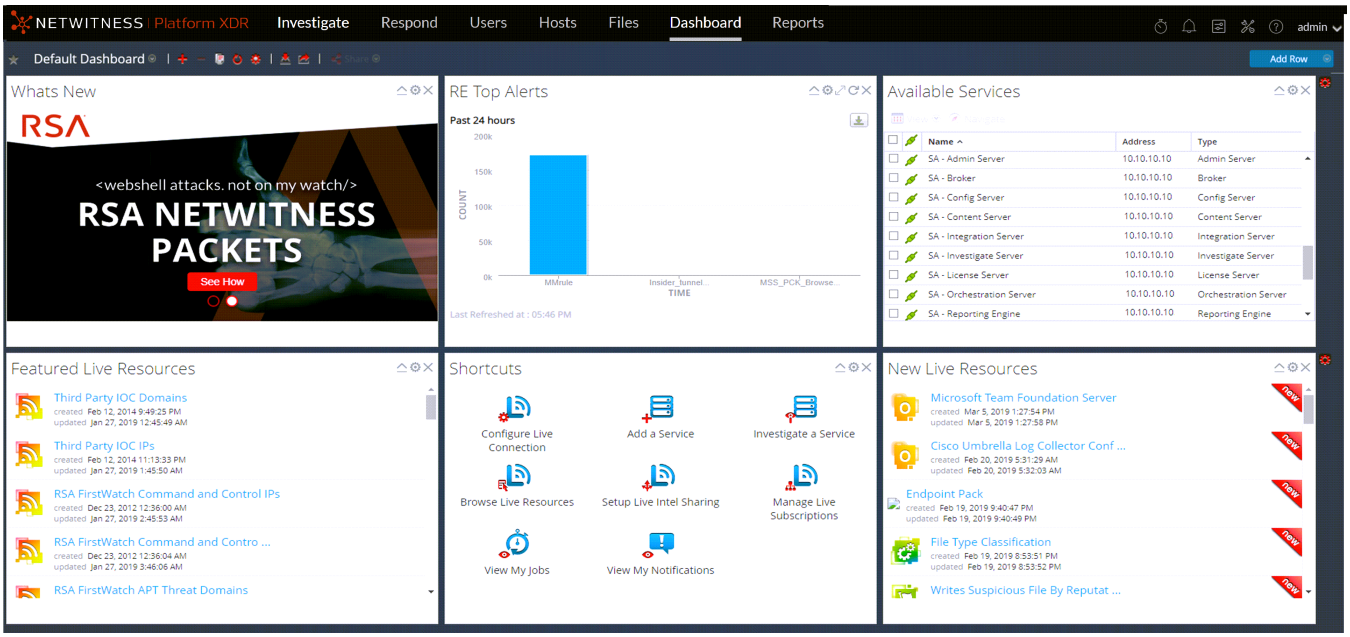


What can I do here?	Path	Show me how
Investigate Endpoints	Hosts view	See the *NetWitness Endpoint User Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Files

The Files view provides a holistic view of all files in your deployment. You can apply filters, sort, and categorize files by status to reduce the number of files for analysis, and identify suspicious or malicious files.



What can I do here?	Path	Show me how
Find Suspicious Endpoint Files	Files view	See the *NetWitness Endpoint User Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

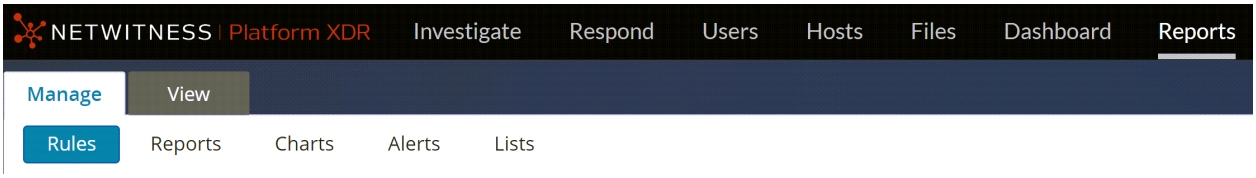
Dashboard

A dashboard is a group of dashlets that give you the ability to view data in one space, the key snapshots of the various components that you consider important. In NetWitness® Platform XDR, you can compose dashboards to obtain high-level information and metrics that portray the overall picture of a NetWitness Platform XDR deployment, displaying only the information that is most relevant to the day-to-day operations.

NetWitness Platform XDR has predefined dashboards that you can select in the Dashboard view depending on the tasks you perform:

You can select the following preconfigured dashboards:

- Default
- Identity
- Investigation
- Operations - File Analysis
- Operations - Logs
- Operations - Network
- Operations - Protocol Analysis
- Overview
- RSA SecurID
- Threat - Hunting
- Threat - Intrusion
- Threat - Malware Indicators



What can I do here?	Path	Show me how
Select a Dashboard	Dashboard view	See Managing Dashboards.
Create a Dashboard	Dashboard view	See Managing Dashboards.
Manage Dashboards	Dashboard view	See Managing Dashboards.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

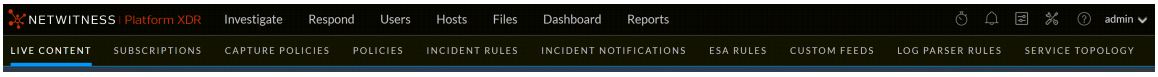
Reports

The Reports view enables you to view and manage reports relevant to your SOC role according to your assigned permissions.

Reports Menu

The Reports menu has the following options:

- **Manage**: This panel allows you to create or modify an rules, reports, charts, alerts, and lists as per the requirement.
- **View**: You can view a report or list of all reports. You can also view the scheduled reports to know the state of the scheduled report. If the scheduled report is in a stop or disable state, you can start or enable the scheduled report.



What can I do here?	Path	Show me how
View a Report	Reports > View	See the *Reporting User Guide*.
Manage Reports	Reports > Manage	See the *Reporting User Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Configure

The Configure view enables Threat Intel personnel (Content Experts) to configure data sources and inputs to NetWitness in one convenient location.

Configure Menu

The Configure menu has the following options:

- **Live Content** (Live Services): The Live Content view enables you to search for and subscribe to Live Services resources. Live Services is the component of the NetWitness that manages communication and synchronization between NetWitness services and a library of Live content available to

NetWitness customers. You can view, search, deploy, and subscribe to content from the RSA Live Content Management System (CMS) to NetWitness services and software. When you subscribe to a resource, you agree to receive updates on a regular basis from RSA Live Services.

- **Subscriptions** (Live Services): The Subscriptions view enables you manage the Live content that you subscribed to, in the Live Content view. To set up Live Services on NetWitness, you configure the connection and synchronize between the CMS server and NetWitness.
- **Capture Policies**: The Capture Policies view enables you to set up selective network data collection, which gives you the ability to apply centrally managed capture policies across your Network Decoders. This results in better use of service resources, including hard drive space, which leads to more predictable costs and lessens the burden of managing multiple services. You can determine which traffic is stored and how it is stored by using policies. Each policy contains a list of supported base protocols and definitions for handling any other protocols that are detected.
- **Policies**: The Policies view contains two sub-tabs, namely **Configuration** and **Content**.
  - **Configuration**: Centralized Service Configuration via policy allows you to manage the configuration of services in your environment efficiently. The Decoder, Concentrator, and Log Decoder deployed in your environment may be large in number and geographically distributed.
  - **Content**: Policy-based Centralized Content Management enables you to find, deploy, and manage content through the entire life cycle based on policies that can be assigned to groups of devices. It is a single location to view, modify and manage the content deployed across all services in the environment.
- **Incident Rules**: The Incident Rules view enables you to create incident rules with various criteria to automatically create incidents. You can view prioritized incidents in the Respond view.
- **Incident Notifications**: The Incident Notifications view enables you to automatically send email notifications to SOC Managers and the Analysts assigned to the incidents when incidents are created or updated.
- **ESA Rules**: The ESA Rules view enables you to manage the Event Stream Analysis (ESA) rules that specify criteria for problematic behavior or threatening events in your network. When ESA detects a threat that matches the rule criteria, it generates an alert.
  You can create ESA rules yourself or download them from Live Services. The Rule Library shows all ESA rules created or downloaded. To activate rules, you have to add them to a deployment. Deployments map rules from your rule library to the appropriate ESA services.
- **Custom Feeds** (Live Services): The Custom Feeds view streamlines the task of creating and managing custom feeds, as well as populating the feeds to selected Decoders and Log Decoders. You can set up and maintain custom and identity feeds.
  NetWitness uses feeds to create metadata based on externally defined metadata values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created.
  You can create custom feeds to provide extra metadata extraction, for example, to accommodate custom network applications.

- **Log Parser Rules**: The Log Parser Rules tab displays information about individual log parsers, as well as the default, "parse all" parser that can parse logs that are not associated with a particular log parser. This tab contains the following information:
  - You can view the rules for a particular event source type, including the default parser.
  - You can view the names, literals, patterns, and metadata for each configured log parser.
  - You can add log parsers.
  - You can add, edit, and delete custom rules for log parsers.
- **Service Topology**: The Service Topology tab enables administrators and analysts to view all the NetWitness core services in a hierarchical layout depicting the collection and aggregation of the services in your deployment. This visualization displays the topology for Broker, Concentrator, Log Decoder, Packet Decoder, Hybrids, ESA and Log Collector.

Admin

In the Admin view, administrators can manage network hosts and services; monitor the health and wellness of NetWitness; and manage system-level security. They can also configure global system resources and manage event sources.

Admin Menu

The (Admin) menu has the following options:

- **Hosts**: The Hosts view is where you set up and maintain hosts. A host is the machine on which services run and a host can be a physical or virtual machine.
- **Services**: The Services view enables you to manage services, manage service users and roles, maintain service configuration files, and explore and edit service properties. A service performs a unique function, such as a Decoder service, which captures network data in packet form.
- **Event Sources**: The Event Sources view enables you to manage event sources and configure alerting policies for them. Organizations typically monitor event sources in groups based on the criticality of the event sources. You can create monitoring policies for each event source group and order them based on priority.
- **Endpoint Sources**: The Endpoint Sources view enables you to manage and update endpoint agent configurations through groups and manage the agents behavior using policies. You can either use the default policies or customize these policies.
- **Health & Wellness**: The Health & Wellness view enables you to monitor the health of the NetWitness hosts and services in your network environment.
- **System**: The System view enables you to set global NetWitness configurations. You can configure global audit logging, email, system logging, jobs, RSA Live Services, URL integration, Investigation, Event Stream Analysis (ESA), ESA Analytics, and advanced performance settings. In addition, you can manage NetWitness versions and configure the local licensing server.
- **Security**: The Admin Security view provides the capability to manage user accounts, manage user roles, map external groups to NetWitness roles, and modify other security-related system parameters. These apply to the NetWitness system and are used in conjunction with the security settings for individual services.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Setting Up Your Default View by SOC Role

After logging in to NetWitness, you can navigate into the application easier by setting up your default view based on your Security Operations (SOC) role. You can set your default view, also known as a landing page, in your user preferences.

On upgrade to version 11.5 or later, by default the Springboard is displayed if you have not configured the default landing page in previous versions.

In version 11.4 and prior versions, if you configured the default landing page as Respond or Investigate in the User Preferences, then on upgrade to version 11.5, the default landing page will be Respond or Investigate view.

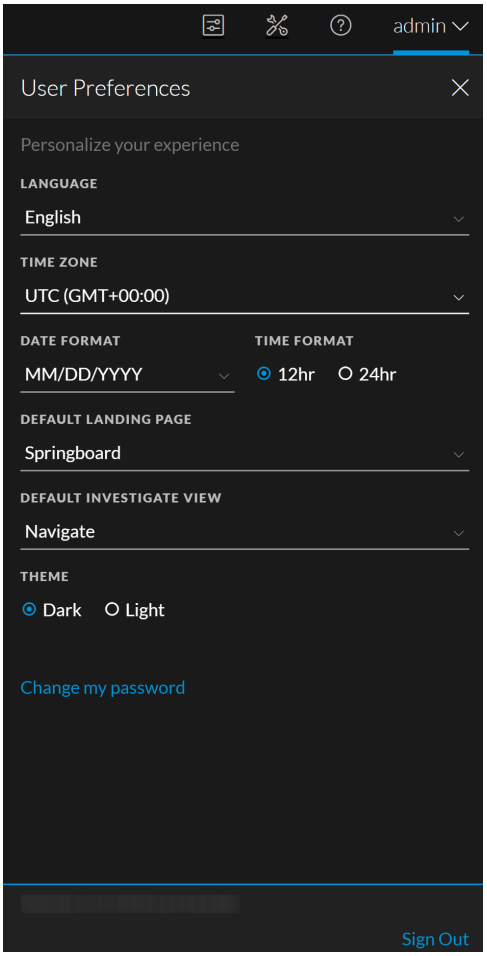
On fresh install of NetWitness 11.5 version, when you log in, by default Springboard is the landing page.

The following figure shows the main NetWitness views.

- **Springboard**: This view is for Analysts, who can see panels for prioritized alerts, incidents, risky hosts, risky users, risky files, and focused event data to help hunt and investigate faster than ever before.
- **Investigate**: This view is for Threat Hunters, who investigate and hunt for advanced threats. Other analysts such as Incident Responders may pivot into this view for deeper analysis of an incident.
- **Respond**: This view is for Incident Responders, who can view a list of incidents to triage and alerts.
- **Users**: This view is for SOC Managers and Analysts to discover, investigate, and monitor risky behaviors across entities namely Users and Network in your environment.
- **Hosts**: This view is for Analysts, who can investigate or perform analysis on hosts using attributes such as IP address, host name, Mac address, risk score, and so on.
- **Files**: This view is for Analysts, who can investigate or perform analysis on files using attributes such as IP address, host name, Mac address, risk score, and so on.
- **Dashboard**: This view is for all users. You can view dashboards on different areas of interest depending on your user permissions. You have the option to select a preconfigured dashboard, import a dashboard, or create your own custom dashboard.
- **Reports**: This view is for all users. You can view reports on different areas of interest depending on your user permissions.
-  **Configure**: This view is for Threat Intel personnel (Content Experts), who configure data sources and inputs to NetWitness. Content Experts use this area to download and manage Live content. They can also create and manage incident and ESA rules.
-  **Admin**: This view is for System Administrators, who set up and maintain the overall application.

You can select any of the main NetWitness views as your default view. In addition to the main views, NetWitness has predefined dashboards that you can select in the Dashboards view depending on the tasks you perform:

- Default Dashboard
- Identity Dashboard
- Operations - Logs Dashboard
- Operations - Network Dashboard
- Overview Dashboard
- Threat - Indicators Dashboard
- Threat - Intrusion Dashboard



The following table shows typical SOC roles and the available views you can select as your landing page in your user preferences based on your SOC role. If you have more than one role, select the view that is most appropriate for you to start with when you log in to NetWitness.

SOC Roles	Role Description	Consider this Default Landing Page
Incident Responder (Tier 1 Analyst)	Addresses incidents and alerts queued for them to review and mitigate.	**Springboard** or **Respond**
Threat Hunter (Tier 2/Tier 3 Analyst)	Investigates and hunts for advanced threats.	**Springboard**, **Investigate**, **Users**, **Hosts**, or **Files** For information on selecting the default Investigate view, see the *NetWitness Investigate User Guide*.
SOC Manager (SOC Management and Reporting)	Manages SOC readiness and responds to incidents and data breaches.	**Springboard** or **Dashboard** When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard.
Content Expert (Threat Intelligence)	Configures data sources and inputs to NetWitness.	**Dashboard** or  (Configure) When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard. If you choose Dashboard as your default view, you can navigate to the  (Configure) view from the main menu.
Data Privacy Officer (DPO)	Similar to an Administrator, but a DPO monitors and protects privacy-sensitive information.	**Dashboard** When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard.

SOC Roles	Role Description	Consider this Default Landing Page
System Administrator	Focuses on the configuration and stability of the overall application. Manages user access.	**Springboard**

Set Your Default View

1. On the main menu bar, select your username, for example, admin.
   The User Preferences dialog shows your current preferences.

2. In the **Default Landing Page** field, select the default view that you would like to see when you log in to NetWitness. Use the above table to make your selection based on your SOC role. For example, if you are an Analyst, you can select **Springboard**; if you are an Incident Responder you can select **Respond**; and if you are a Threat Hunter, you can select **Investigate**.

   Your preferences become effective immediately. You can change your default landing page at any time. For information on other preferences, see Setting User Preferences.

3. To verify that you can see the correct default view, click **Sign Out** to log out and then log back in to NetWitness.

Managing the Springboard

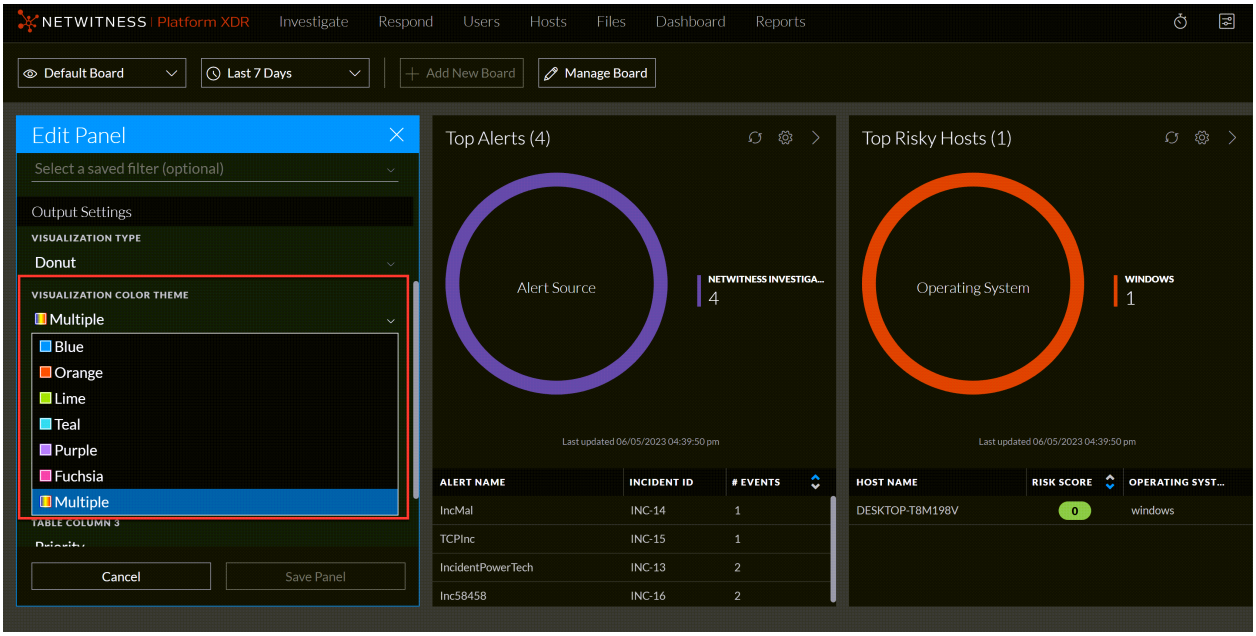
(From 11.5 and later) NetWitness Platform XDR Springboard presents platform-wide detections and signals in this view so analysts hunt and investigate faster than ever before.

From 12.0 and later, NetWitness Platform XDR Springboard introduces five more out-of-the-box panels based on the events processed with a specific query and presented on Springboard view. This helps analysts with further investigation.

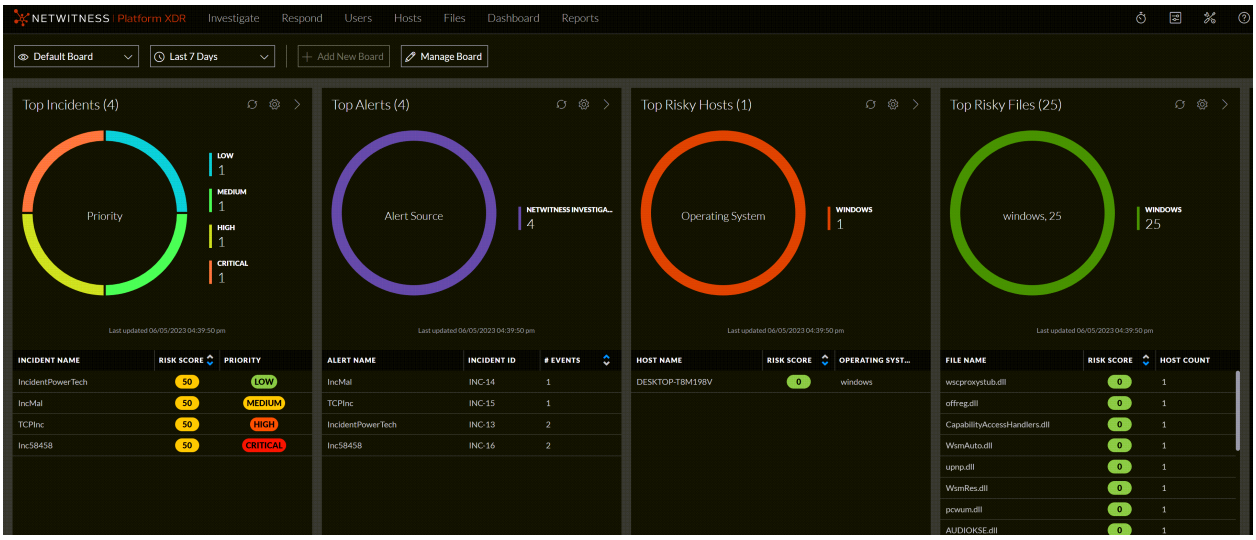
The Springboard congregates the following information for analysts to view:

- Critical incidents and high severity alerts that require attention.
- Hosts and files with high risk scores that may be potential threats.
- Risky users that are potential leads for investigation.
- Events with specific query and high severity that require immediate attention.

The Springboard displays important information for the last 24 hours in the following out-of-the-box panels:



- **Top Incidents**
- **Top Alerts**
- **Top Risky Hosts**
- **Top Risky Files**



- **Top Risky Users**
- **MITRE ATT&CK tactics**
- **MITRE ATT&CK techniques**
- **Indicators of Compromise**
- **Enablers of Compromise**
- **Behaviors of Compromise**

For example, the Top Risky Hosts displays the top 25 risky hosts based on the highest risk score and Operating system (Windows, Linux, and Mac). The result displays hosts of all Endpoint Servers if the Endpoint Broker is available. Otherwise, it displays the result of the first Endpoint Server.

From 12.3 version and later, NetWitness Springboard provides the ability for analysts to choose from a variety of color palettes when creating or editing panels using the **Visualization Color Theme** option. This option gives analysts more control over the appearance of their panels, making them more visually appealing and easier to understand. As a result, analysts can visualize the data better and perform analysis and investigations more efficiently.

Note: The **Multiple** color option is available only for the Donut chart.

You can perform the following actions on the Springboard:

- Change the time range for some panels namely Incidents and Alerts panels. To change the time range, select the time range selection box from the drop-down menu in the top left corner of the Springboard view.

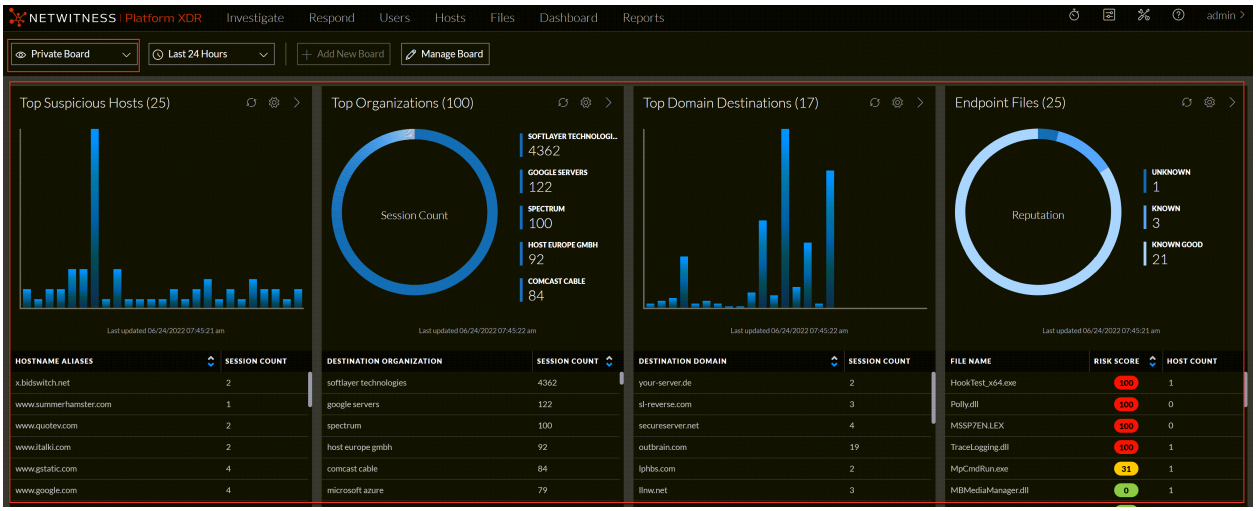
  IMPORTANT: If the selected filter has a time range selected, it is given priority, otherwise the Springboard time range for the specified panel is considered.

- Increase the display of the results in the table to view more than 25 results. Click on the panel, the Edit Panel dialog is displayed. Edit the number of results field and click **Save Panel**.
- Click a row in the table to view details or to investigate.
- Click at the top of the panel to view all the results. For example, in the Top Incidents panel, click to view all incidents in the **Incidents** list view.
- Click a row name in the events panel to view or investigate the event details with relevant filters applied in the **Events** view.
- Scroll to view the different panels using the scroll bar available below the panels.

Administrators can customize the Springboard by performing the following:

- Create own custom private board and add panels on the board. For more information, see Add a Custom Private Board.
- Edit the out-of-the-box panels. For more information, see Edit a Panel.
- Refresh the out-of-the-box panels. For more information, see Refresh a Panel.
- Create new panels with important system indicators. For example, a new panel showing focused event metadata based on pre-defined query conditions can be created. For more information, see Add a Panel.

Working with the Springboard



Note: An administrator must provide the appropriate permissions to allow users to edit the springboard panels. For more information see the the Springboard section in the "Role Permissions" topic in the *System Security and User Management Guide*.

You can customize the information on the out-of-the-box Springboard by adding, editing, copying, moving, and deleting panels.

From 12.0 and later, the data sources and query filters are automatically added for the new out-of-the-box panels.

Add a Custom Private Board

(From 12.0 and later), Administrators and Analysts can create their own custom private board in the springboard and add panels with important system indicators, which helps in threat hunting and investigation. The users can also add, edit, rearrange, and delete panels in the custom private board view. The board allows users to organize and manage information in an easy manner.

IMPORTANT:
- The board will be saved as a custom private board, and other users will not be able to view the board.
- Only one custom private board can be created.

Note: The maximum number of panels on the custom private board must not exceed 20 panels.

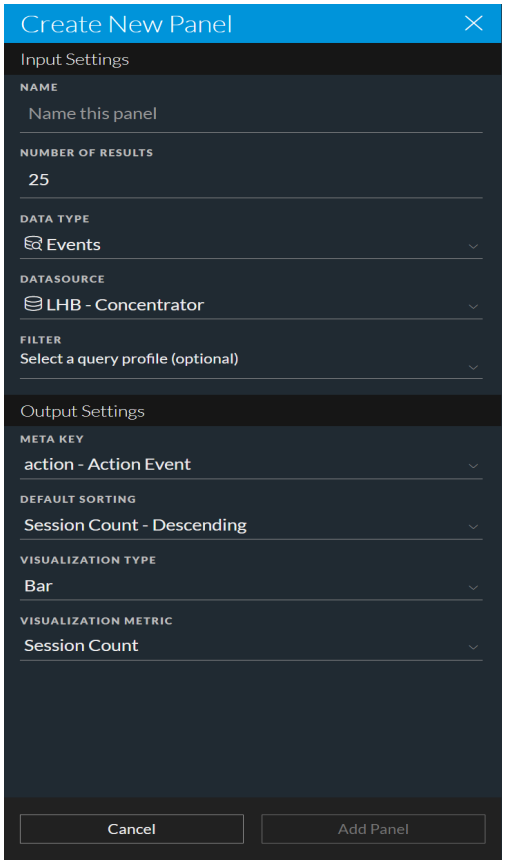
To add a custom Board:

1. Click + **Add New Board**.

   It navigates to a custom private board view to add panels.

2. Add the panels. For more information, see Add a Panel.
3. To edit the custom board's name, click at the top left corner and enter a unique name.
4. Click **Save Board**.

Add a Panel



You can add a panel to the Springboard according to the analyst preferences. For example, an analyst can watch top risky users or top risky hosts for a particular region in a panel.

Note: The maximum number of panels on the Springboard should not exceed 20 panels.

To add a panel:

1. Click **Manage Board**.
2. Click + New Panel either on the top or on the right side of the view or click ⊞ at the bottom of the view to add a panel.

The Create New Panel dialog is displayed. The following figure is an example of the events panel configuration.

3. In the Input Settings section:
   - **Name**: Enter a unique name for the panel. The name can include letters, numbers, spaces, and special characters, such as `_ - ( ) [ ]`.
   - **Number of Results**: By default, the number of results is 25. Specify the number of results that range from 25 to 100.
   - **Data Type**: Select the type of data to use for the panel:
     - Alerts
     - Incidents
     - Events
     - Files
     - Hosts
     - Users
   - **Data Source**: Select the source of the data to use for the panel. This field is enabled when the data type is Events, Files, Hosts and Users.

- Events: Select either Broker or Concentrator.
- Files: Select either Endpoint Broker Server or Endpoint Server.
- Hosts: Select either Endpoint Broker Server or Endpoint Server.
- Users: Select either UEBA Server 1 or UEBA Server 2.

Note: You can only select different data sources for **Users** if you have configured multiple UEBA servers in your environment. For more information, see "Configure Multiple UEBA Servers" in *NetWitness UEBA Configuration Guide*.

- (Optional) **Filter**: Filter the data as required from the drop-down for each data type from the saved filters list.

4. In the Output Settings section, select the appropriate settings based on the data type.
5. Click **Add Panel**.
6. Click **Save Board** once you have added all the panels.

Edit a Panel

You can edit the out-of-the-box or newly added panels on the Springboard.

To edit a panel:

1. Click  on the panel that you want to edit.
   The Edit Panel dialog is displayed.
2. Edit and click **Save Panel**.

Rearrange Panels

You can arrange the panels by dragging and dropping them into a different order on the Springboard.

To rearrange panels:

1. Click **Manage Board**.
2. To move a panel, click anywhere on the panel, drag and drop the panel to the desired location.
3. Click **Save Board**.

Delete Panels

You can delete panels permanently in the following situations:

- Services are not installed. For example, if you do not have Endpoint Log Hybrid installed, then you can delete the panels for Top Risky Hosts and Files.
- The maximum number of panels have exceeded the limit, that is 20, and you want to add a new panel.

To delete existing panels:

1. Click **Manage Board**.
2. Select the panels that you want to delete.
3. Click **Remove Panel**.
4. Click **Save Board**.

Restore System Default Settings

Note: This is enabled only if any changes are made to the out-of-the-box Springboard panels.

To restore the out-of-the-box panels:

1. Click **Manage Board**.
2. Click **Restore System Default**.

   A confirmation pop-up is displayed to confirm if you want to restore the out-of-the-box panels or not.
3. Click **Restore System Default**.

Refresh a Panel

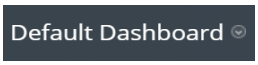
To refresh a panel:

Click  on the panel that you want to refresh, it loads the latest data in the panel.

Managing Dashboards

A dashboard is a group of dashlets that give you the ability to view data in one space, the key snapshots of the various components that you consider important. In NetWitness, you can compose dashboards to obtain high-level information and metrics that portray the overall picture of a NetWitness deployment, displaying only the information that is most relevant to the day-to-day operations.

The dashboards for all NetWitness components are available to add to the default NetWitness dashboard or a custom NetWitness dashboard.



You can view dashboards on different areas of interest depending on your user permissions. You have the option to select a preconfigured dashboard, import a dashboard, or create your own custom dashboard. The dashboards help you to quickly and easily view reports. You can configure your dashboards to display the information that supports your workflow. This topic explains the high-level tasks that can be done when you are setting up a dashboard.

Dashboard Basics

If the Dashboard view is your default landing page following logging in to NetWitness, you always see either the default dashboard or the currently configured dashboard immediately after completing the login process. To return to the dashboard from another NetWitness component, click **Dashboard**.

Dashboard Title

The dashboard title reflects the currently active dashboard; for example, Default Dashboard.

Dashboard Selection List

You can access preconfigured and custom dashboards on the dashboard selection list. When you select a dashboard, its title is displayed below the NetWitness toolbar.

A dashboard has:

- The dashboard toolbar
- The dashboard title and the dashboard selection list.

Dashboard Toolbar

The dashboard toolbar is available next to the title of the selected dashboard. The dashboard toolbar allows various operations on dashboards and dashlets.

Note: The Copy, Delete, Import, Export, Share, and Add Row options are disabled for preconfigured dashboards.

Option	Description
★	Sets the selected dashboard as the Favorite.
Default Dashboard	Displays the list of available dashboards from which you can make a selection.
+	Displays the Create a Dashboard dialog, where you define or add a custom dashboard.
−	Deletes a custom dashboard. The default dashboard cannot be deleted.

Option	Description
	Allows you to copy a dashboard.
	Displays the Manage Dashlet dialog.
	Exports a dashboard as a .zip file.
	Imports a dashboard as .zip or.cfg file.
	Allows you to share a dashboard with another user.
	Enables user to add rows and columns to the dashboard based on the requirement. Click the  icon in a row to add a dashlet.

The Default Dashboard

The default dashboard is configured to display specific dashlets in specific positions. The default dashboard serves as an example of dashboard composition and a starting point for customization.

- You can customize the information on the default dashboard by editing, adding, moving, maximizing, and deleting dashlets.
- After modifying the default dashboard, you can restore the default dashboard () to its original layout.
- The default dashboard cannot be deleted or shared.

Selecting a Preconfigured Dashboard

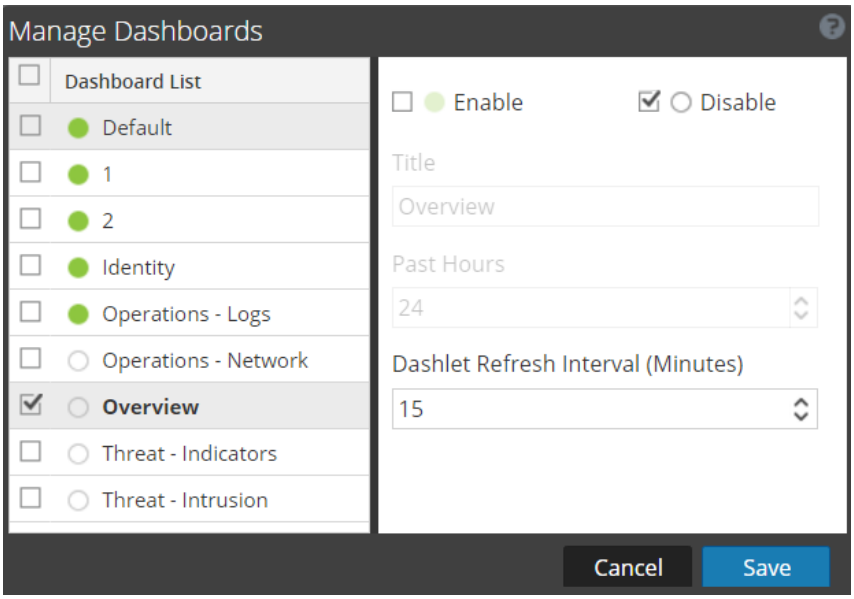
On installation of NetWitness, the following preconfigured dashboards are automatically activated and are available to you:

- Default
- Identity
- Investigation
- Operations - File
- Operations - Logs
- Operations - Network
- Operations - Protocol Analysis
- Overview

- RSA SecurID
- Threat - Hunting
- Threat - Intrusion
- Threat - Malware Indicators

You cannot perform the following actions on a preconfigured dashboard:

- Edit a dashboard
- Export a dashboard
- Share a dashboard
- Delete a dashboard

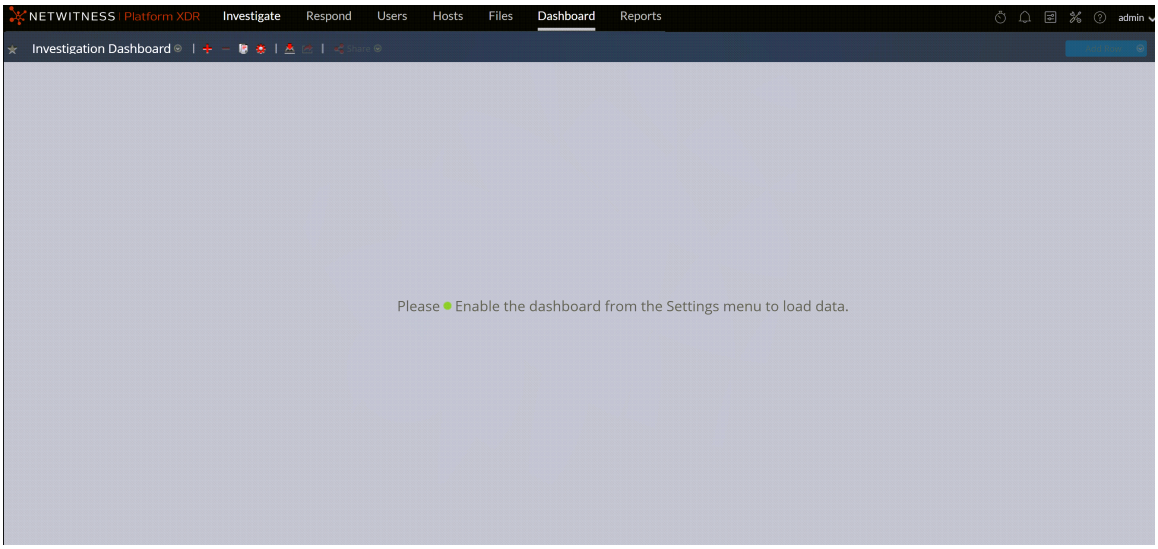


For more information on each preconfigured dashboard, see the Dashboards Catalog in the NetWitness Content space on NetWitness Community.

Note: If you are logged into an Analyst UI, you can view but cannot enable, disable, or edit preconfigured Dashboards.

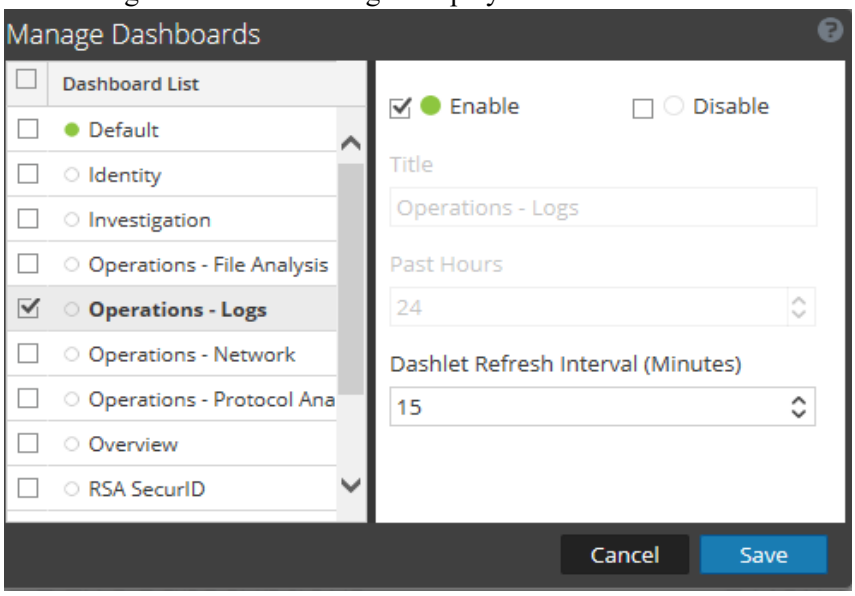
Enabling or Disabling Dashboards

When you enable or disable a dashboard, all the dashlets within the dashboard are enabled or disabled along with the associated charts, unless they are used in any other dashboard.



NetWitness modules can display only those dashlets presented in the Manage Dashboard dialog. The main dashboard offers all NetWitness dashlets. This is an example of currently available dashlets.

Name	Description
Dashboard List	Displays a list of the default, preconfigured, and custom dashboards.
Enable	Indicates if the selected dashlet is enabled.
Disable	Indicates if the selected dashlet is disabled.
Title	Displays the title of the selected dashlet and you can also rename the dashboard.
Past Hours	Displays the time for which the data is collected.
Dashlet Refresh Intervals (Minutes)	Displays the refresh interval time of a dashlet.

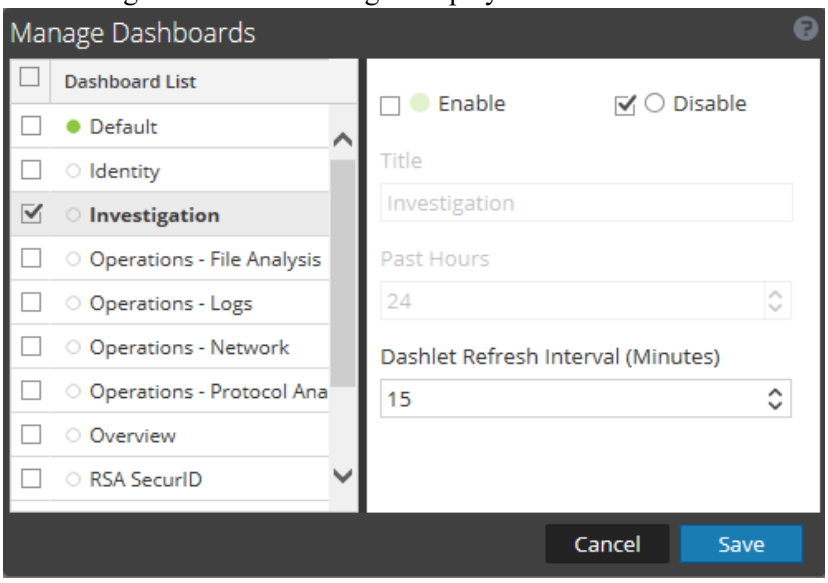


Enable a Dashboard

If you select a dashboard that is not enabled, a masked screen is displayed.

To enable one or more dashboards:

1. Navigate to the dashboard to be enabled.
2. In the dashboard toolbar, click  (Manage Dashboards).
   The Manage Dashboards dialog is displayed.



3. From the dashboard list, select the dashboards to be enabled.
4. Select the **Enable** checkbox.
5. Click **Save**.

Disable a Dashboard

To disable one or more dashboards:

1. Navigate to the dashboard to be disabled.
2. In the dashboard toolbar, click  (Manage Dashboards).
   The Manage Dashboards dialog is displayed.

3. From the dashboard list, select the dashboards to be disabled.
4. Select the **Disable** checkbox.
5. Click **Save**.

Setting a Dashboard as a Favorite

To customize the views in NetWitness, you can set a preconfigured or custom dashboard as a Favorite. The NetWitness dashboard offers all NetWitness dashlets. The Favorite dialog sets a specific dashboard as your favorite dashboard and is listed as favorite every time you log in to NetWitness.

1. Navigate to any dashboard.
2. In the dashboard toolbar, click 

   If the favorite icon is red in color, it indicates that selected dashboard is set as a Favorite and is listed on top above the line.

Creating Custom Dashboards

You can create custom dashboards to serve a particular purpose; for example, to represent a specific geographical or functional area of the network. Each custom dashboard is appended to the dashboard selection list.

To create a custom dashboard:

1. In the dashboard toolbar, click .
   The Create a Dashboard dialog is displayed.

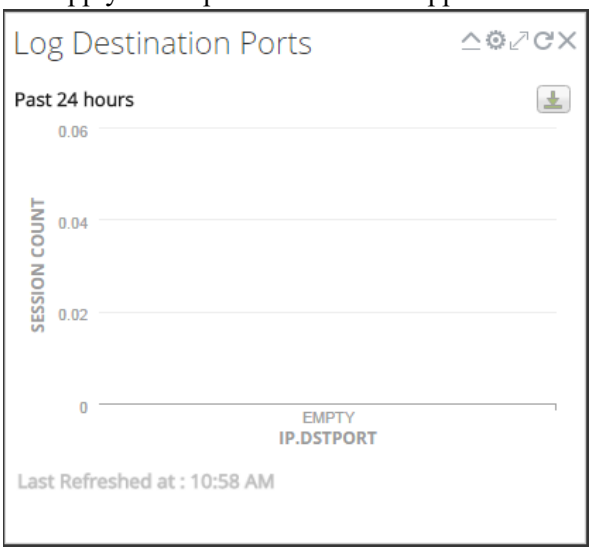
2. Enter a title for the new dashboard and click **Create**.
   The new dashboard is displayed as a blank screen.

3. Add rows to the dashboard, which can contain one or more columns, using the **Add Row** option on the right side of the screen (). Click the desired column configuration in the drop-down list to add one row to the dashboard with the selected number of columns. Repeat the process to add more rows.

4. You can add any desired dashlets to the dashboard by clicking  in an empty placeholder in a row.
   For complete details on adding and managing dashlets, see Working with Dashlets.

After custom dashboards are created, you can:

- Switch between dashboards by selecting an option from the dashboard selection list.
- Delete any custom dashboard.
- Import or export a dashboard.



Each dashboard has:

- The dashboard toolbar.
- The dashboard title and the dashboard selection list.
- Zero or more dashlets.

Working with Dashlets

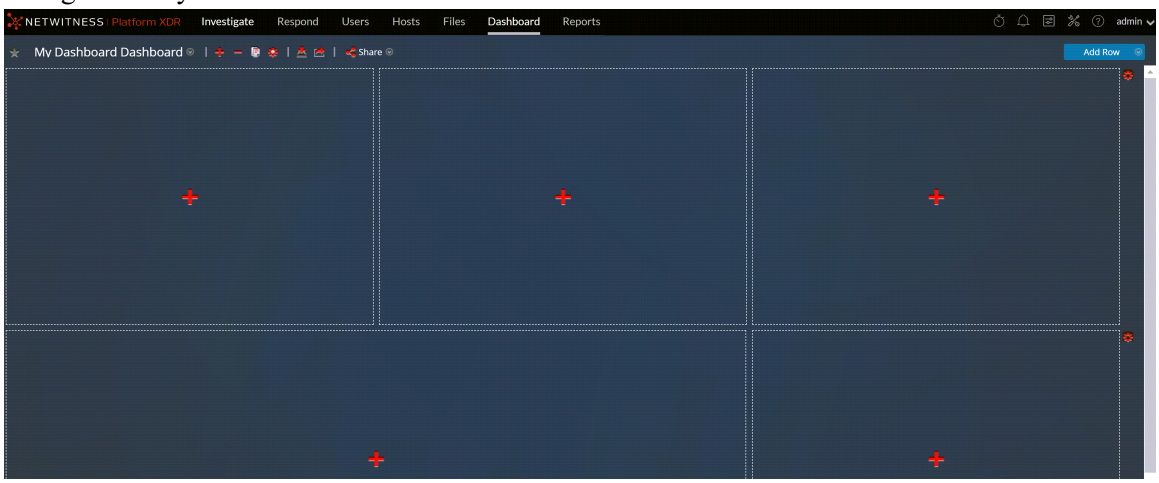
Dashlets are the parts that make up a dashboard. NetWitness uses dashlets to display focused subsets of system information, services, jobs, resources, subscriptions, rules, and other information.

The controls for a dashlet are in the title bar. All dashlets use a common set of controls, and only those that apply to the particular dashlet appear in the title bar of the dashlet.

The following table displays the description of each icon on the dashlet.

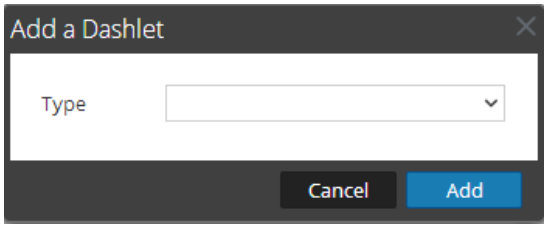
Icon	Name	Description
	Collapse vertically	Collapses the dashlet vertically so that only the title is visible.
	Expand vertically	Expands the dashlet to its original size.
	Reload	Reloads the dashlet.
	Settings	Displays configurable settings for the dashlet.
	Maximize	In some dashlets with content that does not fit horizontally within the width of the dashlet, maximizes a chart or a dashlet to full screen.
	Delete	Deletes the dashlet from the dashboard.

Icon	Name	Description
Last Refreshed at		Displays the time at which the data is polled from the related chart.
View More		When clicked, navigates to the corresponding dashboard which is linked to the main dashlet and displays more details. If you have not linked the dashboard to an existing dashlet, this link with not be available on the dashlet. To configure this option, click , and in the Dashboard Link field select a related dashboard view more details of the specific dashlet.



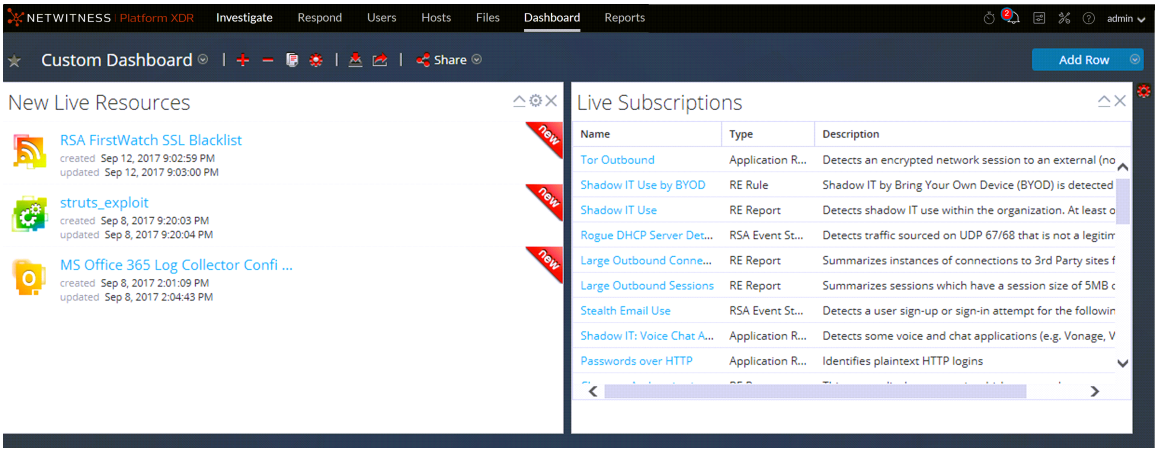
You can add dashlets to the default dashboard or construct a custom dashboard with your own useful set of dashlets to make your workflow more efficient.

Add a Dashlet



To customize the views in NetWitness, you can add dashlets to a default dashboard or create custom dashboards. However, you cannot add dashlets to preconfigured dashboards.

To add a dashlet:



1. Navigate to any dashboard or create a new dashboard.

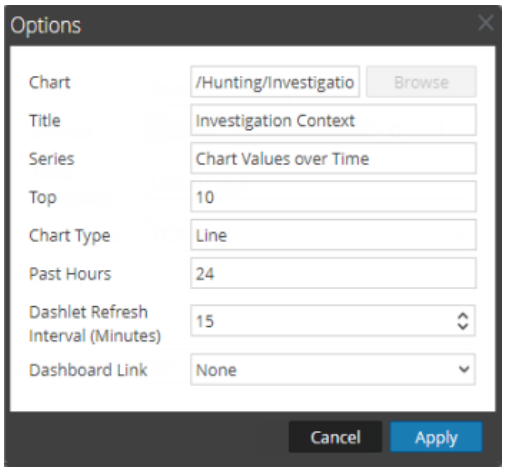
2. Click on the placeholder where you want to add the dashlet.
   The Add a Dashlet dialog is displayed.

3. Click the **Type** selection list to view the available dashlets, and select the type of dashlet you want to add. Depending on the type of dashlet you are adding, some configurable fields appear in the **Add a Dashlet** dialog.
4. Type a title for the dashlet. The title can include letters, numbers, special characters, and spaces.
5. If there are additional configurable fields for the dashlet, set appropriate values.
6. When all required fields have been configured, click **Add**.
   The dashlet is added to the dashboard in the selected placeholder and is automatically saved.

Edit Dashlet Properties

All preconfigured dashlets are read-only and their properties cannot be edited. Other dashlets are editable and allow users to customize some aspect of the data displayed in the dashlet. A dashlet with editable properties has a settings ( ) option that displays all the editing options.

After the dashlets are added, you can drag and drop them and they can be swapped.



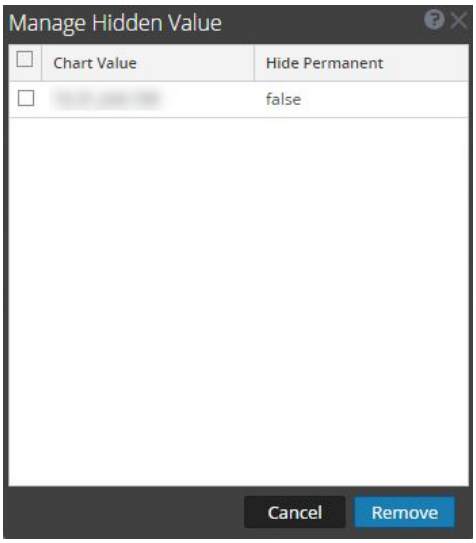
A dashlet without editable properties, such as the Live Subscriptions dashlet, does not display the settings option in the title bar. Many dashlets have an editable title where you can edit the following properties:

- Dashlet display title.
- Type of services to monitor; for example, you can monitor only Decoders, or you can monitor Decoders and Concentrators.

Other dashlets have parameters that you define to specify the kind and amount of information you want to see in the dashlet. For example, a Realtime Chart Dashlet has the settings option.

1. To display and modify the options for a dashlet, click settings ( ) in the dashlet title bar.

   The Options dialog is displayed.



2. Edit any of the displayed properties. For example, in an in Operations - File Analysis Dashboard, edit Dashlet Refresh Interval from 15 to 20.
3. Click **Apply**.

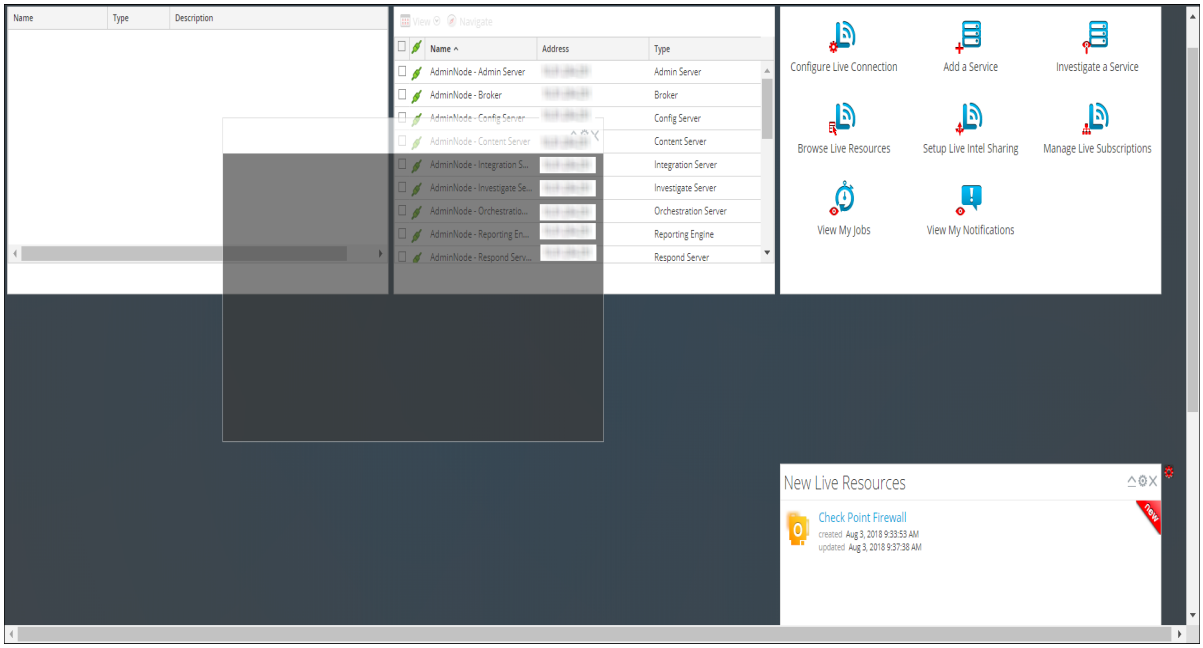
Some dashlets have configuration options to tailor the appearance or the contents of the dashlet. The following options are available for RE Top Alerts, RE Alert Variance, and RE Realtime Charts dashlets on left-click:

- **Hide For 24 Hours**: This option allows you to hide the selected value for the next 24 hours. After 24 hours, the data is automatically displayed on the dashlet, if the value is configured and listed on top.
- **Hide Permanently**: This option allows you to hide the selected value permanently until you add it back using the Manage Hidden Values option.

- **Manage Hidden Values**: This option displays a list of all the hidden values. You can select the checkbox for a value and click **Remove** to view the data back on the chart.

The options to Hide for 24 Hours, Hide Permanently, and Manage Hidden Values are not available for Geomap charts.

Note: When you edit a value in a preconfigured dashboard, it is a user-specific change. The changes made to a preconfigured dashboard are applicable only to your dashboard and cannot be viewed by other users who use the same preconfigured dashboard. For example, if you hide a value in an overview dashboard, the change is applicable only to your dashboard. If another user views the same overview dashboard, the value is still displayed. The same applies to a custom dashboard. When you hide a value in the custom dashboard and share the same dashboard with another user, the values are still displayed even though the dashboard is shared.



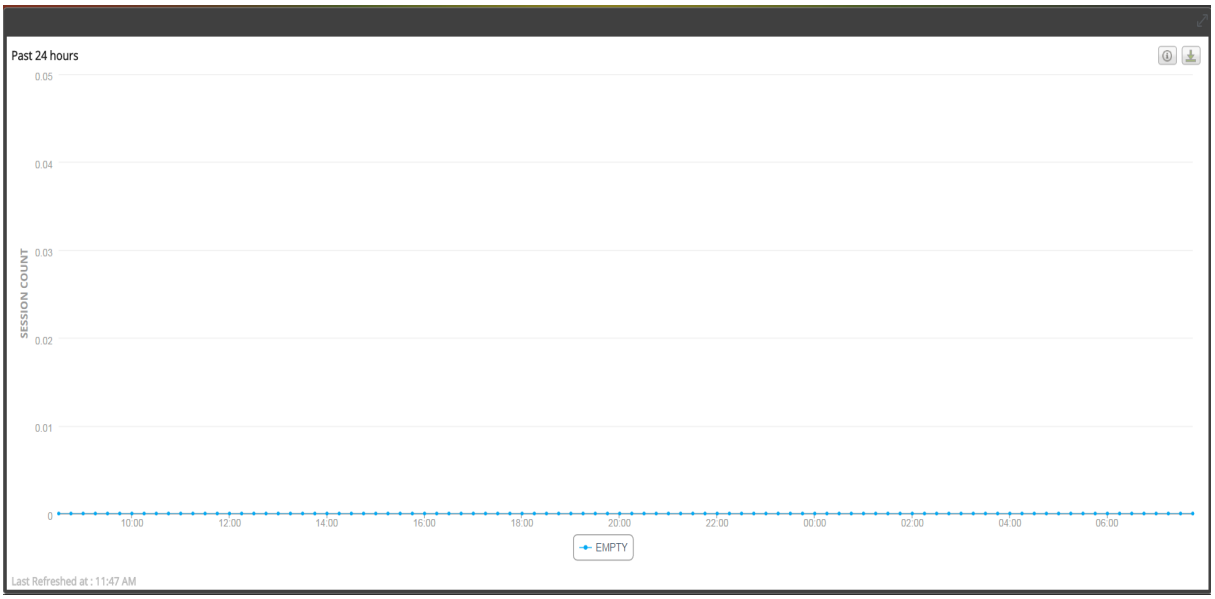
For more information on available dashlets, see the Dashboards Catalog in the NetWitness Content space on NetWitness Community.

Rearrange a Dashlet

You can arrange dashlets according to your preference by dragging and dropping them into a different order on the dashboard.

1. To move a dashlet, hover in the header of the dashlet that you want to move.
   The directional cursor appears over the dashlet. Click and hold in the header of the dashlet that you want to move.

2. Continue to hold the left mouse button and drag the window toward the new location.
   The figure below shows a dashlet as it is being re-arranged.



3. Release the mouse button when the dashlet is in the desired location.
   The dashlet that currently occupies that position moves down.

Maximize a Single Dashlet

This section explains how to open a dashlet on the entire area of the main NetWitness dashboard with the same dashlet title. Dashlets that have a lot of columns or charts, for example some Reporting dashlets, are easier to view when maximized so that the entire contents is visible without scrolling.

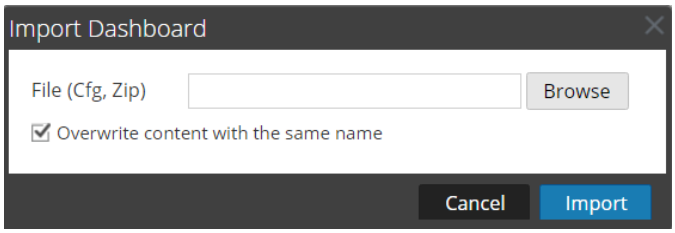
To maximize a dashlet, click the maximize control icon in the dashlet title bar: ⤢. The dashlet is displayed on full screen.

To minimize a dashlet, click the same control icon in the dashlet title bar: ⤢. The dashlet is restored to previous size.

Delete a Dashlet

1. Click ✕ in the dashlet title bar:
   A confirmation pop-up is displayed to confirm if you want to delete the dashlet.
2. Click **Yes**, if you want to delete. The dashlet is removed from the dashboard.
   Click **No**, if you do not want to delete.

Note: After you remove the dashlet, the empty space is replaced by a placeholder where you can add another dashlet using the above Add a Dashlet procedure.



Importing and Exporting Dashboards

The ability to customize dashboards to changing circumstances and conditions could result in a large number of dashboards that are not needed on a daily basis. Rather than reinvent the wheel each time you want to recreate a particular custom dashboard, you can export your dashboards that are not currently in use. When you are ready to use a previously exported dashboard, import the dashboard into NetWitness.

Import a Dashboard

Note: You can import the Reporter Realtime Charts dashboard and its related charts in different instances of the NetWitness server and Reporting Engine from which it was exported.

1. In the dashboard toolbar, click (Import Dashboard).
   The Import Dashboard dialog is displayed.

2. Browse to the dashboard file in the **Import Dashboard** dialog. You can import .cfg and .zip files.
3. Click **Import**.
   The dashboard is displayed in NetWitness

Note: If you import a dashboard from Security Analytics 10.6. x into NetWitness11.x, the dashboard and the associated rules and charts must be imported separately. But when you import a dashboard from NetWitness11.x into NetWitness, the dashboard and all the rules and charts associated with it are imported in .zip format.

Export a Dashboard

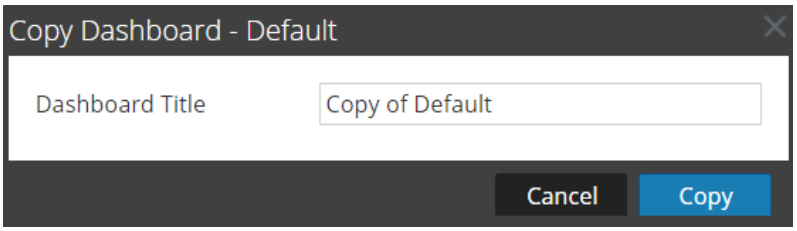
Note: When you export a Reporter Realtime dashboard, the corresponding Reporting Engine contents is also exported.

Exported dashboards are designed to work within the same NetWitness instance. It is also possible to share your custom dashboards with other users in your organization, provided they have equivalent permissions.

To export a dashboard, you must have the dashboard open to access the Export Dashboard option under the Edit drop-down menu in the dashboard toolbar.

1. Navigate to the dashboard that you want to export. All existing dashboards appear in the drop-down **Dashboard Selection List** in the currently displayed dashboard.
2. In the dashboard toolbar, click  (Export Dashboard).
   The exported file is saved in .zip format.

Note: The Export feature is not applicable for preconfigured dashboards.



Copying a Dashboard

To customize the views in NetWitness, you can copy dashboards to the NetWitness dashboard or a custom dashboard. The NetWitness dashboard, as the name suggests, offers all NetWitness dashlets. The Copy Dashboard dialog creates a duplicate dashboard, which can be customized. When you copy a dashboard, the default name is prefixed with `Copy of`. For example, if the name of the original dashboard is `XYZ`, the default title of the copied dashboard will be `Copy of XYZ`.

To copy a dashboard:

1. Navigate to any dashboard.
2. In the dashboard toolbar, click .
   The Copy Dashboard dialog is displayed. The following screenshot is an example of copying a

dashboard.

3. Enter the Dashboard Title.
4. Click **Copy**.

Sharing a Dashboard

In NetWitness, as an administrator you can share dashboards for viewing purposes with other roles such as Administrators, Analysts, Operators and so on. When you share a dashlet, the users can only view the dashboard, make dashboard as favorite, copy the dashboard, and export the dashboard. In case of other roles such as Analysts, Operators, and so on, you can share the dashboard only with similar roles. For example, an analyst can share a dashboard with other analysts only.

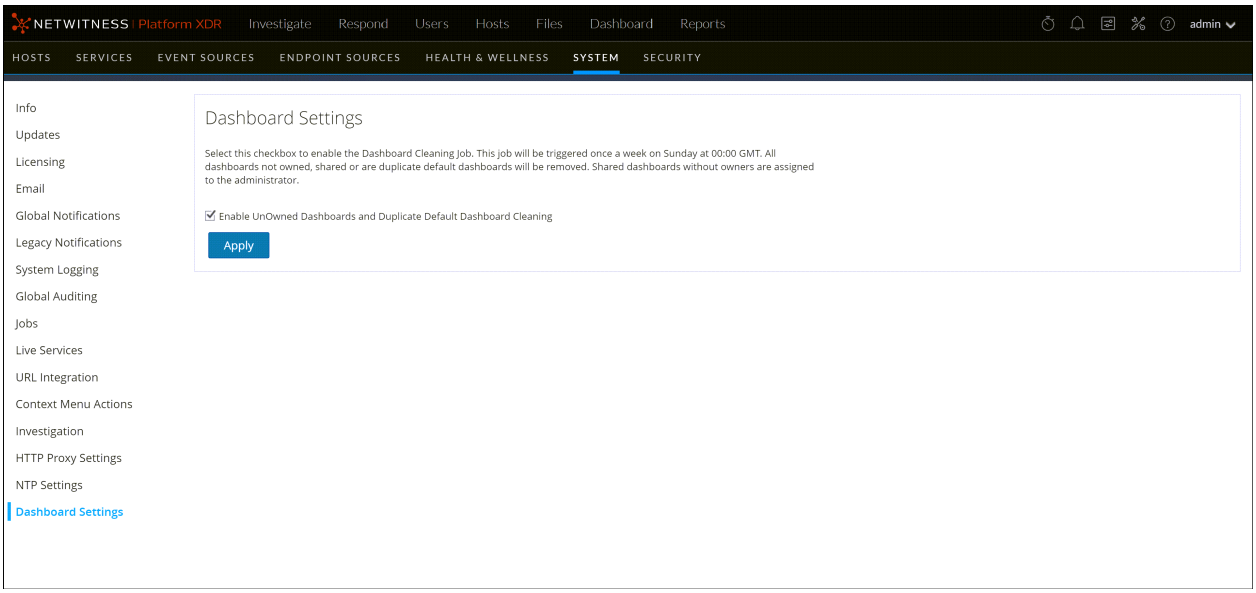
1. Navigate to any dashboard.
2. In the dashboard toolbar, click 

and select the checkbox of the role with whom you want to share the dashboard.

Note: If you do not want to share the dashboard, clear the checkbox of the role. If a dashboard is shared, the dashboard name will be displayed with the share icon .

Removing Unwanted Dashboards

You can remove the following dashboards by enabling the dashboard cleaning job.



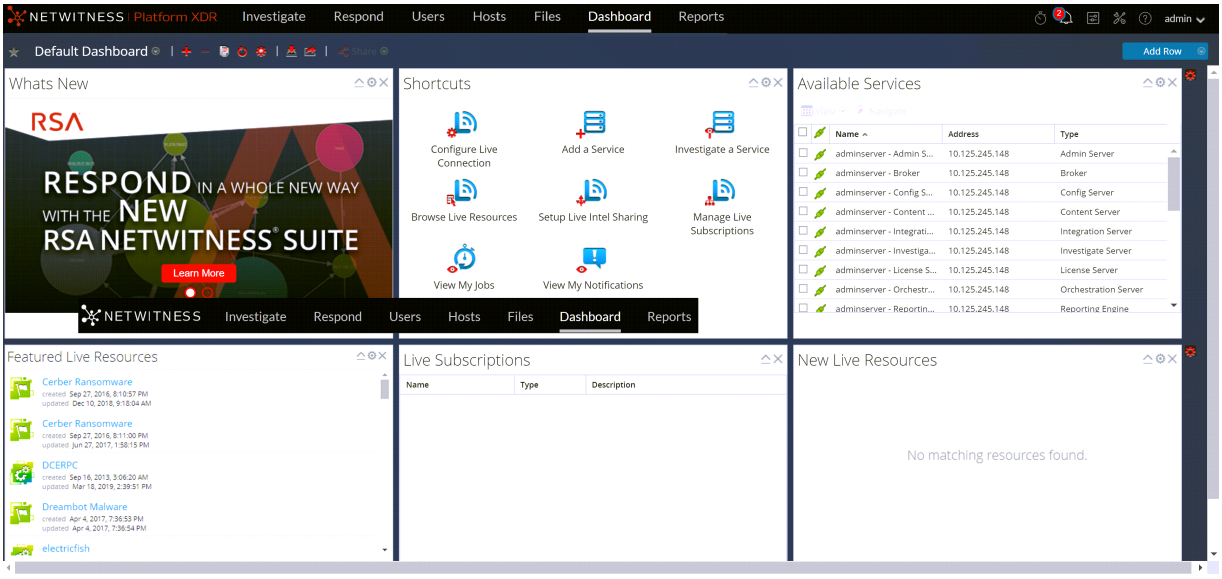
- Dashboards not owned by anyone
- Dashboards not shared
- Duplicates default dashboards

When the dashboard cleaning job is enabled, a scheduled job is triggered once a week on Sunday at 00:00.

Shared dashboards without owners are assigned to the administrator.

To enable Dashboard Cleaning Job:

1. Go to **(Admin) > System > Dashboard Settings**.
2. Select the **Enable UnOwned Dashboards and Duplicate Default Dashboard Cleaning** checkbox.
3. Click **Apply**.



Using Dashboards in the Analyst User Interface

Large environments that include geographical distribution with a single data center and multiple NetWitness Servers require Analyst UI instances in all their NetWitness locations or managed entities. For example, if an Analyst UI is deployed for the EMEA SOC team, analysts can query their EMEA NetWitness Platform XDR hosts directly. If the EMEA team has Broker hosts and Concentrator hosts within the region, the Analyst UI can connect and query them instead of connecting back to Primary User Interface (Primary UI).

When using the dashboards in the Analyst UI, these features apply and affect the dashboards available to analysts:

- Each Analyst UI instance is connected to its local Reporting Engine service. Every Reporting Engine has its own copy of the built-in content such as rules and charts and the local Reporting Engine runs them on the default data source (if configured in Reporting Engine) when the dashboard is enabled.
- The built-in Reporting Engine content that is modified on local Analyst UI is available only to that specific Analyst UI. This behavior is same for an Admin UI as well.
- Dashboards that are shared across different Analyst deployments display the Reporting Engine chart data from the shared instance. To edit the shared dashboard, the analyst must create a copy or contact the Admin to customize it.
- When built-in preconfigured dashboards are enabled from an Admin UI, the dashboard is enabled for all the roles and for all the Analyst UIs. However, the data displayed in every Analyst UI is specific to the associated Reporting Engine.
- By default, all the built-in preconfigured dashlets are disabled and can be enabled only from an Admin UI. Before you enable a preconfigured dashlet, you must set up the Live Services Account, see

the *Set Up Live Services* topic in the Live Services Management Guide.

Note: The Analyst UI functions are similar to the Admin UI functions, except all configurations must be performed from the Admin UI.

Setting User Preferences

You can view and manage your NetWitness global application preferences from your user profile. There are two global user preference dialogs that have different options. The user Preferences dialog is accessible from the Springboard, Investigate (Events), Respond, Users, Hosts, Files and Configure views.

The Preferences dialog is accessible from the Investigate, Dashboard, Reports,  (Configure) , and  (Admin) views. The dialog that you see depends on where you access the user preferences.

You can:

- Change the application language
- Set the application time zone
- Set the application date and time format*
- Select your default NetWitness starting location*
- Select your default Investigate view*
- Choose a dark or light theme for the application*
- Change your password (See Changing Your Password for more information.)
- Enable or disable notifications**
- Enable or disable context menus**

* You can make this change from the **User Preferences** dialog accessible from these views: Springboard, Investigate > Events (formerly Event Analysis), Respond, Users, Hosts, Files, and  (Configure) > (Capture Policies, Incident Rules, Incident Notifications, and Log Parser Rules). See User Preferences.

** You can make this change from the **Preferences** dialog accessible from these views: Investigate, Dashboard, Reports,  (Configure) > (Live Content, Subscriptions, ESA Rules, and Custom Feeds), and  (Admin) . See Preferences.

Preferences

This section gives instructions for various tasks that can be performed in the Preferences dialog that is accessible in Investigate, Dashboard, Reports,  (Configure) , and  (Admin) .

View your Preferences

In the upper right corner of the NetWitness browser window, select your username, for example , and then select **Profile**.
The Preferences dialog shows your current preferences.

Set the Language and Time Zone

Note: The Language preference option applies to NetWitness 11.2 and later.

You can change your preferred language for the entire NetWitness Platform XDR. The default language is English (United States).

1. In the Preferences dialog, select your localization preferences:
   a. **Language**: Select your preferred language for NetWitness.
   b. **Browser Time Zone**: Set the time zone to use in the NetWitness.
2. Click **Apply**.
   Your preferences become effective immediately.

Note: When Daylight Saving Time (DST) starts or ends, if the selected time zone for the currently logged in user observes DST, the user interface automatically updates to reflect the correct time.

Enable or Disable System Notifications for Your User Account

By default, NetWitness system notifications are enabled when a new user account is created. You can disable and enable these notifications at any time.

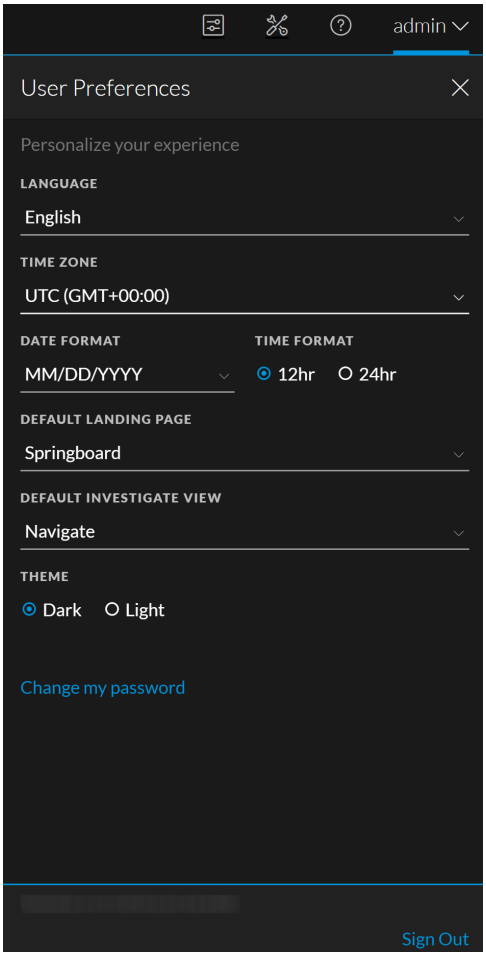
1. In the Preferences dialog Application Settings section:
   - To enable notifications for your user account, select the **Enable Notifications** checkbox.
   - To disable notifications, clear the **Enable Notifications** checkbox.
2. Click **Apply**.
   Your preference becomes effective immediately.

Enable or Disable Context Menus for Your User Account

By default, context menus are enabled when a new user account is created. Context menus provide additional functions for specific views when you right-click a view.

1. In the Preferences dialog Application Settings section:
   - To enable context menus for your user account, select the **Show Context Menus** checkbox.
   - To disable context menus, clear the **Show Context Menus** checkbox.
2. Click **Apply**.
   Your preference becomes effective immediately.

Note: Settings available on the Investigate tab in the Preferences dialog are documented in the *NetWitness Investigate User Guide*.



User Preferences

This section gives instructions for various tasks that can be performed in the User Preferences dialog that is accessible in the Springboard, Events, Respond, Users, Hosts, Files and (Configure) views.

View Your User Preferences

In the upper right corner of the NetWitness browser window, select your username, for example, admin.

The User Preferences dialog shows your current preferences when accessed through the Springboard, Events, Respond, Users, Hosts, Files and (Configure) views.

Any selections that you make become effective immediately.

Set the Language, Time Zone, and Date and Time Format

Note: The Language preference option applies to NetWitness 11.2 and later.

You can change your preferred language for the entire NetWitness Platform XDR UI. The default language is English (United States). You can also change the time zone and the format of the date and time for your location.

1. Open the User Preferences dialog.
2. In the User Preferences dialog, select your localization preferences:
   a. **Language**: Select your preferred language for NetWitness.
   b. **Time Zone**: Set the time zone to use in the NetWitness.
   c. **Date Format**: Set the format for the order of the display of the month (MM), day (DD), and year (YYYY). For example, the MM/DD/YYYY format shows the date as 05/11/2019.
   d. **Time Format**: Set the time as 12-hour or 24-hour time. For example, 2:00 PM in 12-hour time is 14:00 in 24-hour time.

   Changes in the Investigate and Respond views become effective immediately.

Note: When Daylight Saving Time (DST) starts or ends, if the selected time zone for the currently logged in user observes DST, the user interface automatically updates to reflect the correct time.

Select the Default NetWitness Platform XDR Starting Location

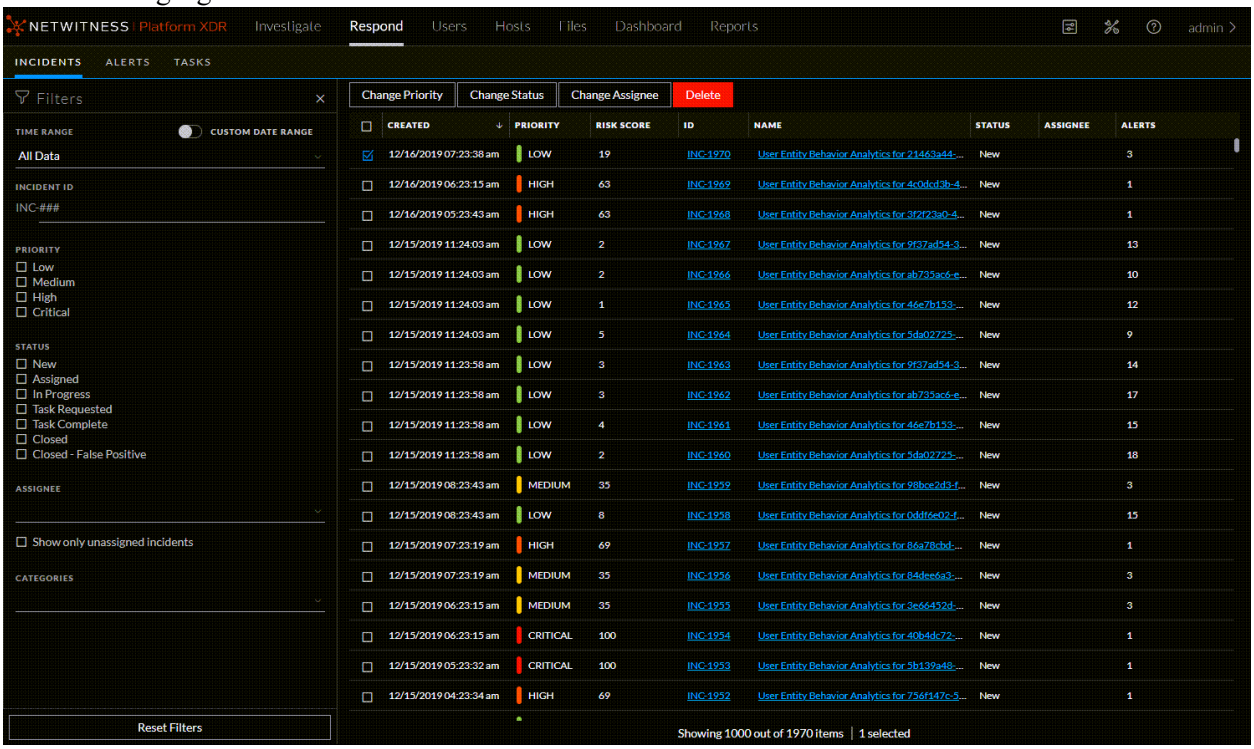
1. Open the User Preferences dialog.
2. In the **Default Landing Page** field, select the opening view that you would like to see when you log in to NetWitness. You can choose Springboard, Investigate, Respond, Users, Hosts, Files, Dashboard, Reports, Configure, and Admin, and according to your user role. For example, you can choose Respond to go directly to the relevant section of the application for Incident Responders. For more information, see Setting Up Your Default View by SOC Role to help you select the appropriate default view.
   This selection sets the default view for the entire application. The changes take effect immediately.

Select the Default Investigate View

1. Open the User Preferences dialog.
2. In the **Default Investigate View** field, select the default landing page when you log in to NetWitness and navigate to Investigate. You can choose Navigate, Legacy Events (if enabled), Events (formerly Event Analysis), or Malware Analysis as the default Investigate view. For example, you can choose Events for the default Investigate view to go directly to the Events view to see the events generated for a service. See Setting Up Your Default View by SOC Role to help you select the appropriate default view. For more information, see the *NetWitness Investigate User Guide*.

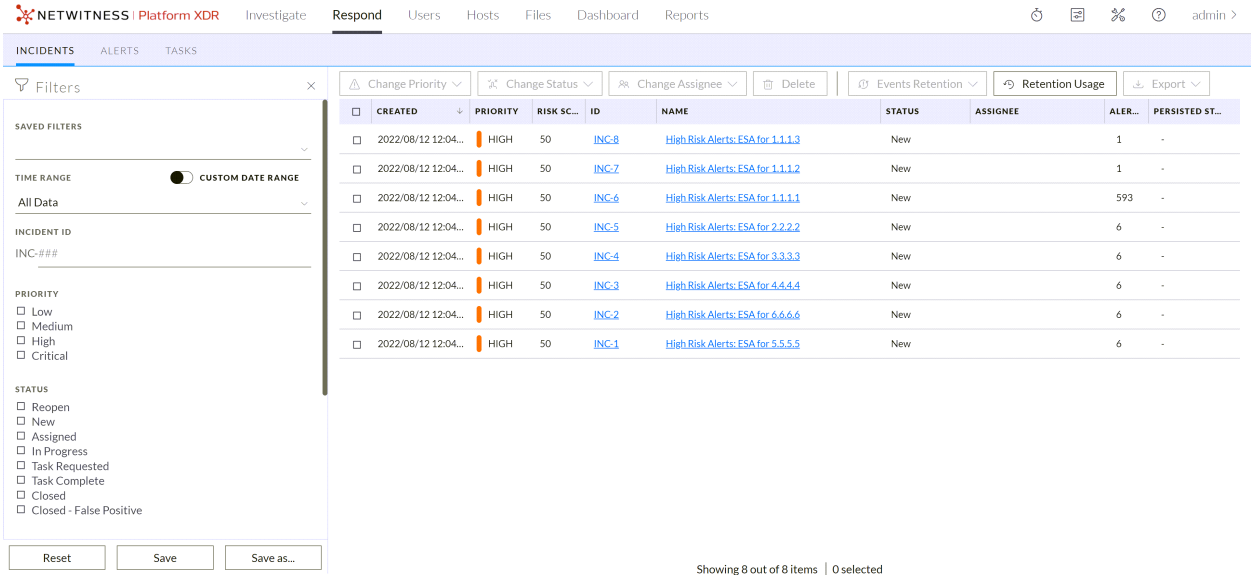
Note: After you have applied the change in the drop-down, sometimes it takes few seconds for the changes to take effect.

Choose the Appearance of NetWitness Platform XDR



Note: This option is only available for NetWitness versions 11.1 and later.

You can choose a dark theme or a light theme for your application, depending on your personal preference. When you change the theme, the Respond view and some Investigate views change to the light or dark theme. Your selection only changes how NetWitness appears to you, not other users.



1. Open the User Preferences dialog.
2. Under **Theme**, select one of the following options:
   - **Dark**: The dark theme is best for darker environments or when you do not need as much contrast.
   - **Light**: The light theme is best for lighter environments, when you need more contrast, or when you are projecting the application for others to view. Since some views are not affected by the theme changes, you may want to choose the light theme for a more cohesive viewing experience.

Changes become effective immediately.

The following figure shows the dark theme.

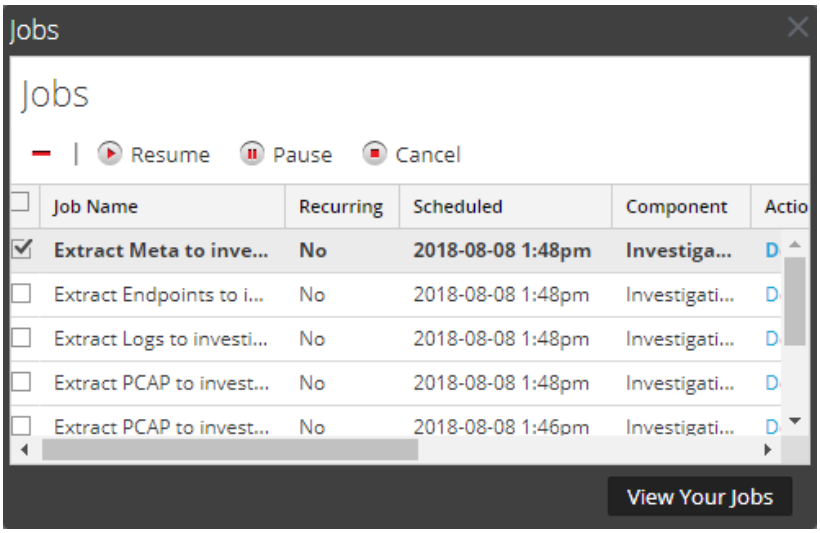
The following figure shows the light theme.

Managing Jobs

Inevitably, there are on-demand or scheduled tasks in NetWitness that take a few minutes to be completed. The NetWitness jobs system lets you begin a long-running task and continue using other parts of NetWitness while the job is running. Not only can you monitor the progress of the task, but you can also receive notifications when the task has completed and whether the result was a success or failure.

While you are working in NetWitness, you can open a quick view of your jobs from the toolbar. You can look anytime, but when a job status has changed, the Jobs icon ( ) is flagged with the number of running jobs. Once all jobs are completed, that number disappears.

You can also see the jobs in these two views:

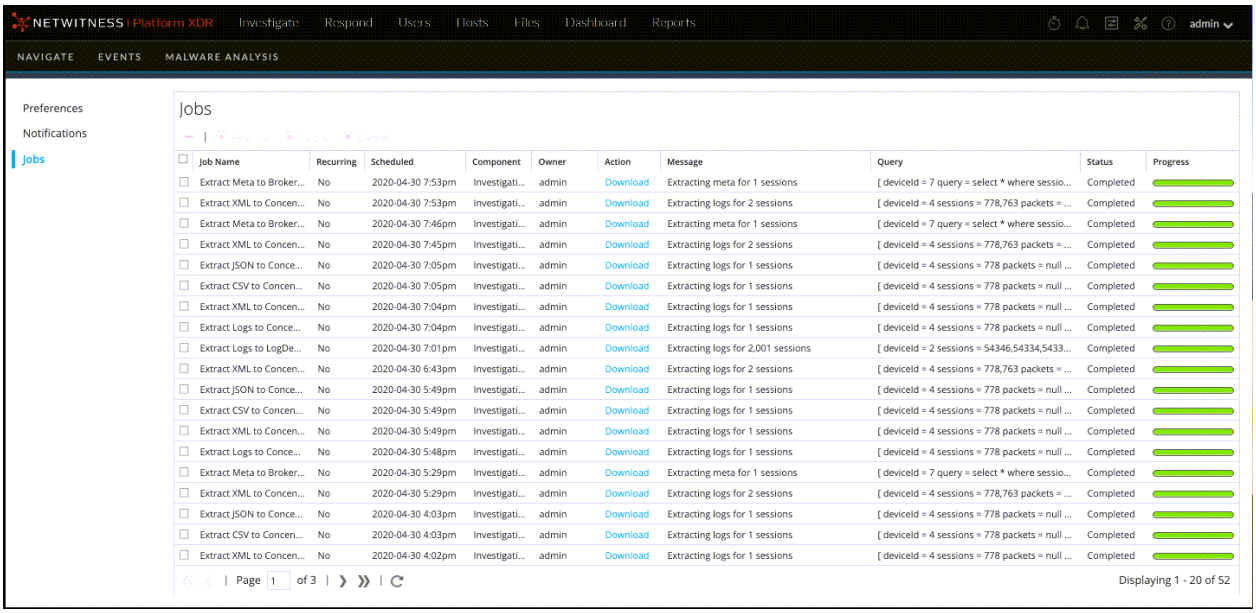


- In the user Profile Jobs panel, you see the same jobs in a full panel. These are only your jobs.
- In the System view, users with administrative privileges can view and manage all jobs for all users in a single jobs panel.

The structure of the jobs panel is the same in all views.

Display the Jobs Tray

In the NetWitness toolbar, click the Jobs icon ( ).



The Jobs Tray is displayed.

The Jobs Tray lists all recurring and non-recurring jobs that you own, using a subset of the columns available in the Jobs panel. Otherwise the Jobs Tray and the user Profile view Jobs panel are the same. In the Admin System view, the Jobs panel lists information about all NetWitness jobs for all users.

View All of Your Jobs

To see a complete view of your jobs, in the Jobs Tray, click **View Your Jobs**.
The Jobs panel is displayed. The Query column is available in Version 11.5 and later.

Pause and Resume Scheduled Execution of a Recurring Job

The Pause and Resume options apply only to recurring jobs. You can pause a recurring job that is running; however, it has no effect on that execution. The next execution (assuming the job is still paused) is skipped.

1. To stop the next execution of a recurring job, in any **Jobs panel**, select the job, and click **Pause**.
   The next execution of the job is skipped, and the schedule is paused until you click Resume.
2. To restart execution of paused recurring jobs, select the job and click **Resume**.
   The next execution of the job occurs as scheduled, and the schedule for the job resumes.

Cancel a Job

To cancel jobs that are executing or in the queue to execute:

1. In the **Jobs Tray** or either **Jobs** panel, select one or more jobs.
2. Click **Cancel**.
   A confirmation dialog is displayed.
3. Click **Yes**.
   The jobs are canceled, and the entries remain in the list with a status of **canceled**.

   If you cancel a recurring job, it cancels that execution of the job. The next time the job is scheduled to run, it executes normally.

Delete a Job

Caution: When you delete a job, the job is instantly deleted from the list. No confirmation dialog is offered. If you delete a recurring job, all future executions are removed as well.

Users can delete their own jobs before, during, or after execution. Administrators can delete any job. To delete jobs:

1. Select one or more jobs.
2. Click −.
   The jobs are deleted from the list.

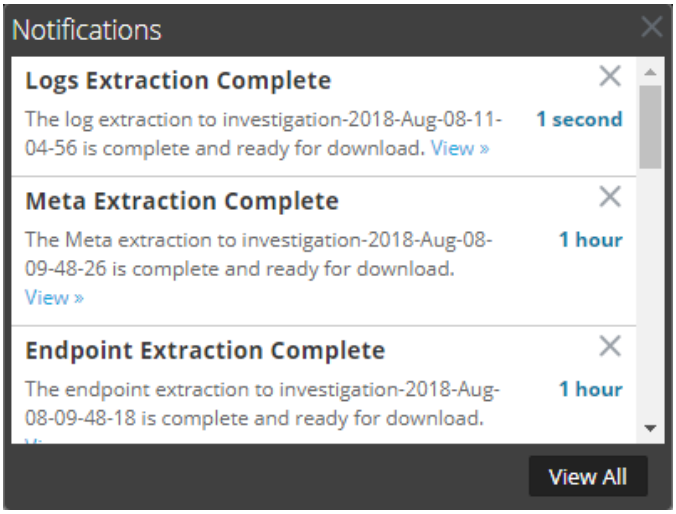
Download a Job

When a job has the Download status in the Action column, you can download the result of the job. If you are working in the Investigate view and extract the packet data for a session as a PCAP file or extract the payload files (for example, Word documents and images) from a session, a file is created. To download the file to your local system, click **Download**.

Viewing and Deleting Notifications

While you are working in NetWitness, you can view recent system notifications without leaving the area where you are working. You can open a quick view of notifications from the NetWitness toolbar. You can look anytime, but when a new notification is received, the Notifications icon is flagged ( ).

Examples of notifications include:



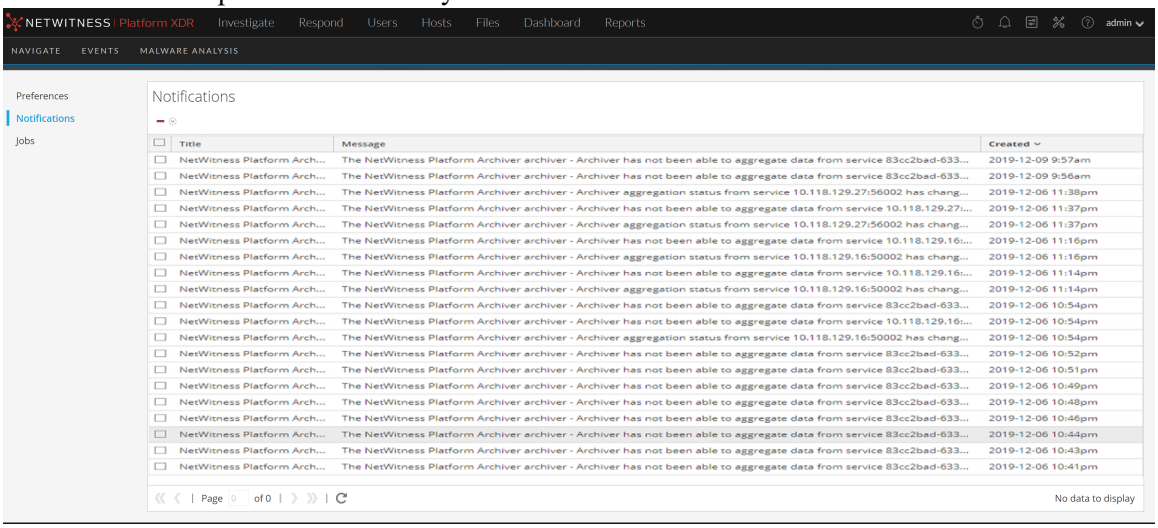
- A host upgrade completed.
- A parser push to decoders completed.
- A newer software version is available.

You can see notifications in these two views:

- In the Notifications tray, you can see your recent notifications.
- In the user Profile Notifications panel, you can view all of your notifications.

View Recent Notifications

To display recent notifications, click the Notifications icon ( ).
The Notifications tray is displayed.



View All Your Notifications

To view all of your notifications, do one of the following:

- Click  to open the Notifications tray and then click **View All** in the Notifications tray.
- In the upper right corner of the NetWitness browser window, select your username and then select **Profile**. In the options panel of the Preferences dialog, select **Notifications**.

The Notifications panel shows all of your notifications.

Delete Notification Records

To delete notification records:

1. In the **Profile Notifications** list, select the notifications that you want to delete.
2. Click −.

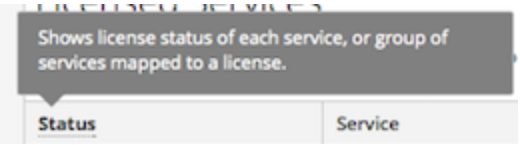
   The selected notifications are deleted from this list and from the Notifications tray.

Viewing Help in the Application

There are different ways available to get help while using NetWitness. You can use inline help, tooltips, and online help links.

View Inline Help

Inline help provides additional information about what to do in sections or fields that you are currently viewing in the NetWitness user interface. To display inline help, hover over . The inline help shows a brief description of the element.

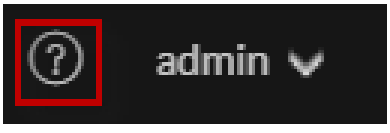


Inline help example:

View Tooltips

Tooltips are a quick way for you to see a description of the text or additional information about an action, field, or parameter. Tooltips appear as underlined text. To display the tooltip and see a brief description of the term, hover over the underlined text.

Tooltip example:



View Online Help

Online help links take you outside of NetWitness to the NetWitness Community online documentation. This site has a complete documentation set for NetWitness, and the links take you directly to the topic that describes the part of the user interface currently in view.

To view the online help topic for the current location, click in the NetWitness toobar or in a dialog. The relevant help topic is displayed in a separate browser window. The topic describes the features and functions of the current view or dialog. From that topic, you can quickly navigate to the related procedures.

The following figure is an example of the online help icon in the NetWitness toobar.

Finding Documents on NetWitness Community

The NetWitness documentation is located on NetWitness Community. NetWitness Community brings all of your NetWitness resources together in one place. It includes advisories, product documentation, knowledge base articles, downloads, and training. To view a *Guided Tour of NetWitness Community*, see https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness.

Locate NetWitness Documentation

NetWitness Logs, Networks, Endpoints, and UEBA documentation is at the following link: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation

To navigate to NetWitness Logs, Networks, Endpoints, and UEBA documentation:

1. On the NetWitness Community homepage (https://community.netwitness.com), under **Products**, click **NetWitness Platform**.
2. On the NetWitness Platform page, click **Documentation**.

Locate NetWitness Content

NetWitness Content contains feeds, parsers, reports, and rules. It is located at the following link: https://community.netwitness.com/t5/threat-intelligence/ct-p/threat-intelligence.

To navigate to NetWitness Content:

1. On the NetWitness Community homepage (https://community.netwitness.com), under **Products**, click **NetWitness Platform**.
2. On the NetWitness Platform page, click **Documentation** > **Threat Intelligence**.

Locate NetWitness Supported Event Sources

The NetWitness Integrations Catalog is located at the following link: https://community.netwitness.com/t5/netwitness-platform-integrations/tkb-p/netwitness-integrations.

To navigate to the NetWitness Integrations Catalog:

1. On the NetWitness Community homepage (https://community.netwitness.com), under **Products**, click **NetWitness Platform**.
2. On the NetWitness Platform page, click **Integrations**

Locate Hardware Setup Guides

The Hardware Setup Guides are at the following link: https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation.

1. On the NetWitness Community homepage (https://community.netwitness.com), under **Products**, click **NetWitness Platform**.
2. On the NetWitness Platform page, click **Documentation** > **Hardware Setup Guides**.

Follow Content for Updates

You can follow pages or documents to be notified of changes.

1. Log in to NetWitness Community.
2. Navigate to a page or a document and next to the Search bar, click ⋮ > **Subscribe**.

Troubleshooting the User Interface

This section describes common issues that users may face during setup and provides basic troubleshooting information.

Basic Troubleshooting Tips for User Setup

The following table provides basic troubleshooting tips that may be helpful for user setup in NetWitness.

Problem	Troubleshooting Tip
When I log in to NetWitness, I see the wrong default view.	Verify that the correct default view is set in the Default Landing Page field in your user preferences. If you select the Dashboard view, you can select the predefined dashboard that is most appropriate for your SOC role. You can also import or create your own dashboard.
I see the correct view, but the metadata does not load.	Make sure that you are using the latest version of the browser. If that does not work, try using another browser. For example, if you are using Safari, try using Firefox or Chrome.
I am using Internet Explorer 10 and I get the following error: `The page can't be displayed.`	NetWitness supports current versions of Firefox, Chrome, and Safari. Internet Explorer is no longer supported.
When I log in, I cannot see anything.	See your administrator, you may need a user role assigned to your account or additional troubleshooting.
I can't see where to change my default landing page.	Go to the User Preferences in the Respond view or Events view (formerly Event Analysis view) or see your administrator.

Analyst User Interface Dashlet Issue

Problem	Cause	Solution
I see the following error message on my dashboard: `The underlying chart for this dashlet is unavailable.`	This scenario occurs on an Analyst UI deployment when an Analyst creates a dashboard on one NetWitness Server, logs in to another NetWitness Server, and tries to view a dashboard that the Analyst did not share.	Share the dashboard to view the data. For more information, see Sharing a Dashboard.

Springboard Issue

Problem	Cause	Solution
I see the following error message on a Springboard panel: `Filter definition is missing! Edit the panel to remove the filter or update with a new filter.`	A query profile that is used to filter events in the panel may have been deleted in the Investigate view. Springboard panels that use a deleted query profile as a filter do not work.	Edit the Springboard panel to remove the filter or use a different filter. For more information, see Managing the Springboard.

Springboard Fails to Load the Panel Issue

Problem	Cause	Solution
I see the following error messages on a Springboard panel: `Request timed out! Contact your administrator or refer to the Getting Started Guide on NetWitness Community for details.` `Failed to fetch the results. Refresh the panel. If the issue persists, contact your administrator or refer to the Getting Started Guide on NetWitness Community for details.`	• The Springboard panels request time out in 60 seconds. • The associated data sources are offline or not reachable. • Allocated memory is insufficient to execute the query.	• Limit the results by narrowing the time range for the Springboard using the time range field above the panels. • Go to the Investigate > Events view and refine the Query Profile used in the panel as described in "Use Query Profile to Encapsulate Common Areas of Investigation" in the *Investigate User Guide*. • Make sure that the associated data sources are online. • Increase the memory by modifying the `max.query.memory` parameter setting. • If the above solution does not work and if the issue still persists, check the service logs in the given order: ▪ Admin server ▪ Investigate server ▪ Respective core services For more information, see “Display System and Service Logs” section in the *System Maintenance Guide*.

Inconsistent Event Panel Count Issue

Problem	Cause	Solution
Event count on the panel is inconsistent.	The underlying data sources are offline or not reachable.	Make sure that all underlying data sources are online and refresh the panel. For more information, see Managing the Springboard.

NetWitness Platform XDR Getting Started References

The following section contains user interface reference information related to getting started with the NetWitness application.

- User Preferences
- Notifications Panel and Notifications Tray
- Jobs Panel and Jobs Tray

User Preferences

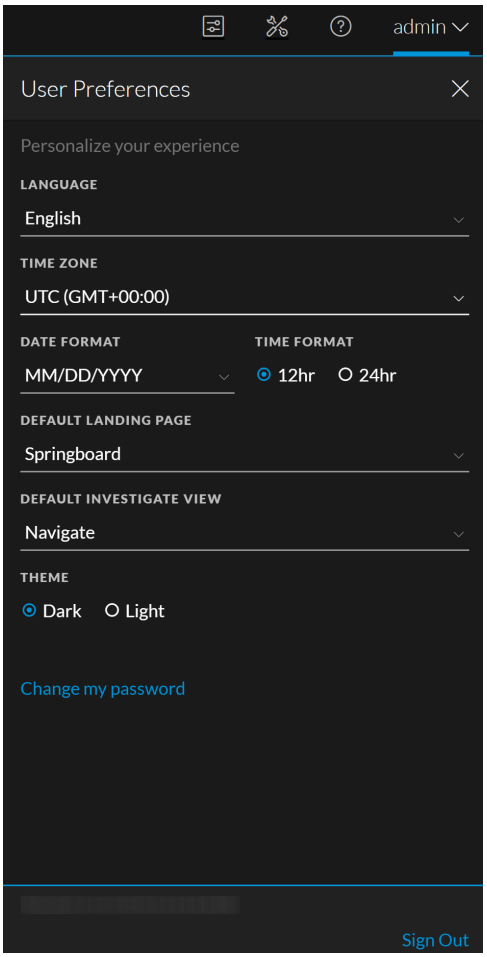
To adjust NetWitness to best fit your environment and work practices, you can set your own global application preferences. You can:

- Change the application language
- Set the application time zone
- Set the date and time formats
- Select your default NetWitness starting location
- Select your default Investigate view
- Choose a dark or light theme for the application
- Change your password
- Enable notifications
- Enable context menus
- Change Investigate preferences - Described in the *NetWitness Investigate User Guide*.

Your global preference options vary depending on whether you access them, such as Springboard, Investigate, Respond, Users, Hosts, Files, Dashboard, Reports, Configure, and Admin. There are two global user preferences dialogs accessible from the main menu bar:

- **User Preferences** dialog - Accessible from these views: Springboard, Investigate > Events (formerly Event Analysis), Respond, Users, Hosts, Files, and  (Configure) > (Capture Policies, Incident Rules, Incident Notifications, and Log Parser Rules).
- **Preferences** dialog - Accessible from these views: Investigate, Dashboard, Reports,  (Configure) > (Live Content, Subscriptions, ESA Rules, and Custom Feeds), and  (Admin) .

What do you want to do?



Role	I want to ...	Show me how
All	Change my Password	Change My Password Section
All	Choose my Default Landing Page	Setting Up Your Default View by SOC Role
All	Set my User Preferences	Setting User Preferences

Related Topics

- NetWitness Platform XDR Basic Navigation

User Preferences

To access your user preferences, click your username, for example, admin.
The User Preferences dialog shows your current preferences and the NetWitness version.

The following table describes the global application preference options that you can access from the User Preferences dialog.

Option	Description
Language	(This option applies to NetWitness 11.2 and later.) Sets the preferred language for the entire NetWitness Platform. The default language is English (United States).
Time Zone	Sets the time zone to use in NetWitness.
Date Format	Sets the format for the order of the display of the month (MM), day (DD), and year (YYYY). For example, the MM/DD/YYYY format shows the date as 05/11/2017.
Time Format	Sets the time as 12-hour or 24-hour time. For example, 2:00 PM in 12-hour time is 14:00 in 24-hour time.

Option	Description
Default Landing Page	Enables you to select the default view when you log in to NetWitness. You can choose Springboard, Investigate, Respond, Users, Hosts, Files, Dashboard, Reports, (Configure) , and (Admin) , according to your user role. For example, you can choose Respond to go directly to the relevant section of the application for Incident Responders. This selection sets the default view for the entire application.
Default Investigate View	(This option applies to NetWitness 11.1 and later.) Select the default landing page for the Investigate view. You can choose Navigate, Legacy Events (if enabled), Events (formerly Event Analysis), or Malware Analysis as the default Investigate view. For example, you can choose Events for the default Investigate view to go directly to the Events page to view the events generated for a service.
Theme	(This option applies to NetWitness 11.1 and later.) Changes the appearance of the Respond view and some Investigate views that you see in the application. You can choose between light and dark themes: • **Dark**: The dark theme is best for darker environments or when you do not need as much contrast. • **Light**: The light theme is best for lighter environments, when you need more contrast, or when you are projecting the application for others to view. Since some views are not affected by the theme changes, you may want to choose the light theme for a more cohesive viewing experience. Your selection only changes how NetWitness appears to you, not other users.
Change my password	Opens the Preferences dialog where you can change your password.
Version	Shows the NetWitness version.
Sign Out	Enables you to log out of NetWitness.

Any selections that you make become effective immediately.

Preferences

To access additional global user preferences, do one of the following:

- For most views, such as Investigate, Dashboard, Reports, (Configure) , or (Admin) , select your username and then select **Profile**.
- In the Springboard, Investigate view [Events (formerly Event Analysis)], Respond, Users, Hosts, Files, and some (Configure) views, select your username, for example admin, and in the User Preferences dialog click **Change my password**.

The Preferences dialog shows your current preferences.

The following tables describe the global application preference options that you can access from the Preferences dialog.

Change My Password Section

This section enables you to change your password. Your administrator defines the appropriate password strength requirements for your NetWitness password, such as minimum password length and minimum number of uppercase, lowercase, decimal, non-Latin alphabetic, and special characters. These requirements are then displayed when changing your password.

The following tables describes the options in the Change My Password section.

Option	Description
Old Password	Enter the password that you used to log in to NetWitness.
New Password	Enter the password that you want to use for the next login.
Confirm Password	Retype the new password.
Reset Password	Updates your user profile with the new password. You will be logged out of NetWitness for the changes to take effect. The new password becomes effective the next time you log in to NetWitness. The password change is applied to your system login and to all NetWitness services on which your account has been added.

If you changed your password, you will be logged out of NetWitness for the changes to take effect. The new password becomes effective the next time you log in to NetWitness.

Application Settings Section

The following tables describes the options in the Application Settings section.

Option	Description
Language	(This option applies to NetWitness 11.2 and later.) Sets the preferred language for the entire NetWitness Platform. The default language is English (United States).
Browser Time Zone	Sets the time zone to use in NetWitness. Your time zone preference is displayed on the toolbar.
Enable Notifications	This checkbox enables and disables notifications for your user account. By default, NetWitness system notifications are enabled when a new user account is created.
Enable Context Menus	This checkbox enables and disables context menus for your user account. By default, context menus are enabled when a new user account is created. Context menus provide additional functions for specific views when you right-click in a view.
Apply	Updates your preferences and applies the changes immediately.

Notifications Panel and Notifications Tray

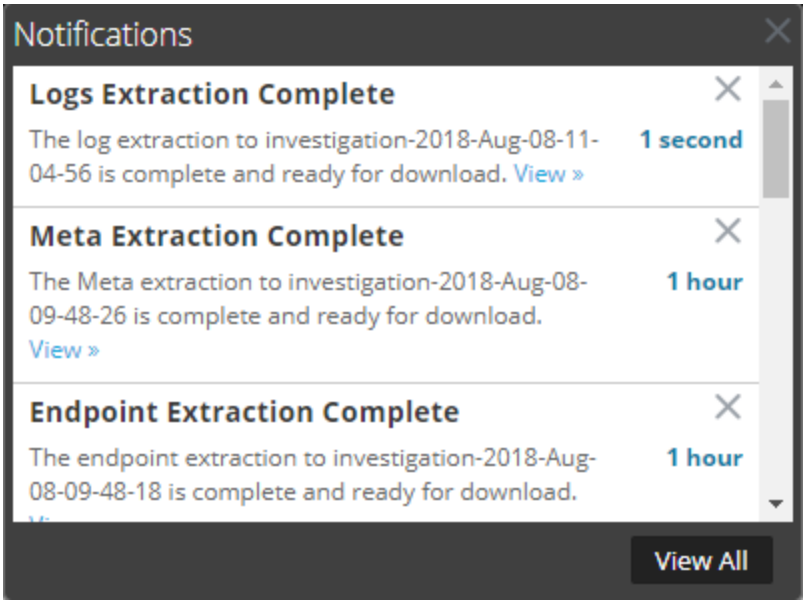
NetWitness provides system notifications to advise users about certain actions or conditions:

- A host upgrade completed.
- A parser push to decoders completed.
- A service went down (critical log of a certain type).
- A visualization completed.
- A report completed.
- A newer software version is available.

While you are working in NetWitness, you can view recent system notifications without leaving the area where you are working. You can open a quick view of notifications from the NetWitness toolbar. You can look anytime, but when a new notification is received, the Notifications icon is flagged ().

When you are viewing notifications in the Notifications tray, only recent notifications are displayed. You can access all of your notifications from your user Profile and from the Notifications tray by selecting the View All option. Procedures for viewing notifications are provided in Viewing and Deleting Notifications.

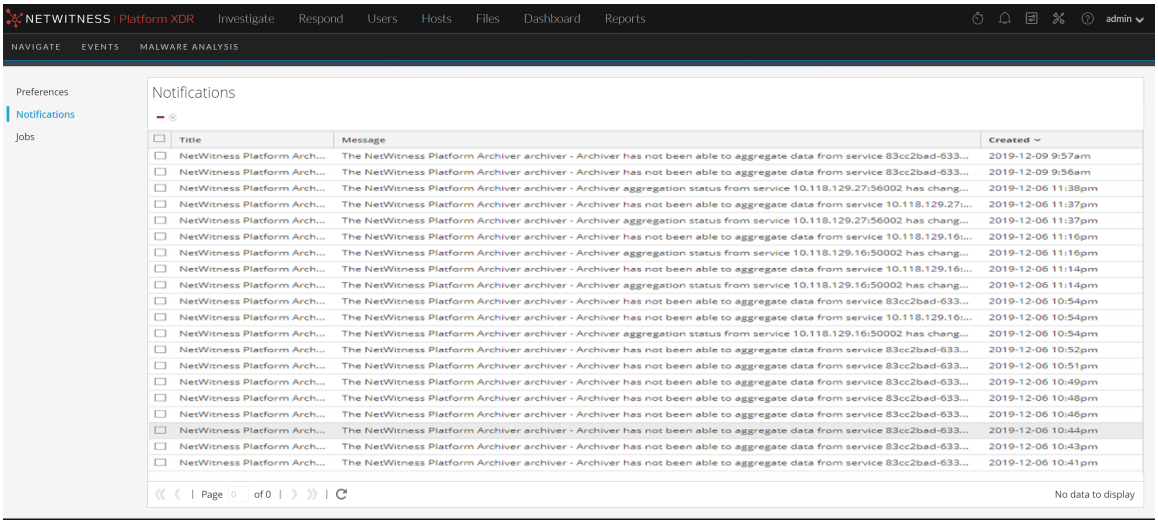
Note: In the Analyst UI, the license notifications are not displayed in the notification tray or login window when the license goes out of compliance or when the license expires. This is displayed only on the Admin UI.



What do you want to do?

Role	I want to ...	Show me how
All	View all notifications	Viewing and Deleting Notifications
All	Delete notifications	Viewing and Deleting Notifications

Quick Look



To access the Notifications panel, do one of the following:

- Click  to open the Notifications tray and then click **View All** in the Notifications tray.

- In the upper right corner of the NetWitness browser window, select your username and then select > **Profile**. In the options panel of the Preferences dialog, select **Notifications**.

  The Notifications panel is displayed.

The Notifications tray shows your recent notifications. It contains a subset of the information in the Notifications panel. The Notifications panel shows all of your notifications. The following table describes the Notifications panel and Notifications tray features.

Feature	Description
	(Notifications panel only) Displays a drop-down menu where you can delete the selected notification or all of your notifications in the Notifications panel and in the Notifications tray.
Title	The title of the notification, for example, **Logs Extraction Complete**.
Message	The entire message, for example, **The log extraction to Investigation is complete and ready for download.**
View	Some messages include a **View** link that displays a view where you can take action. For example, if there is a file to download, clicking this link opens the Jobs panel, the view where you can download the file.
Created	The date and time the notification was created. In the Notifications tray, it shows the number of hours or days since the notification was created.
View All	(Notification tray only) Opens the Notifications panel, which lists all of your notifications.

Jobs Panel and Jobs Tray

Jobs are started by various NetWitness components; for example, downloading Content Management System (CMS) resources from Live Services and extracting logs, meta, and PCAP files from NetWitness Investigate.

In the  (Admin) > System view, Administrators can manage all NetWitness jobs in the Jobs panel. Other non-administrative users can view their own jobs in the user Profile Jobs panel.

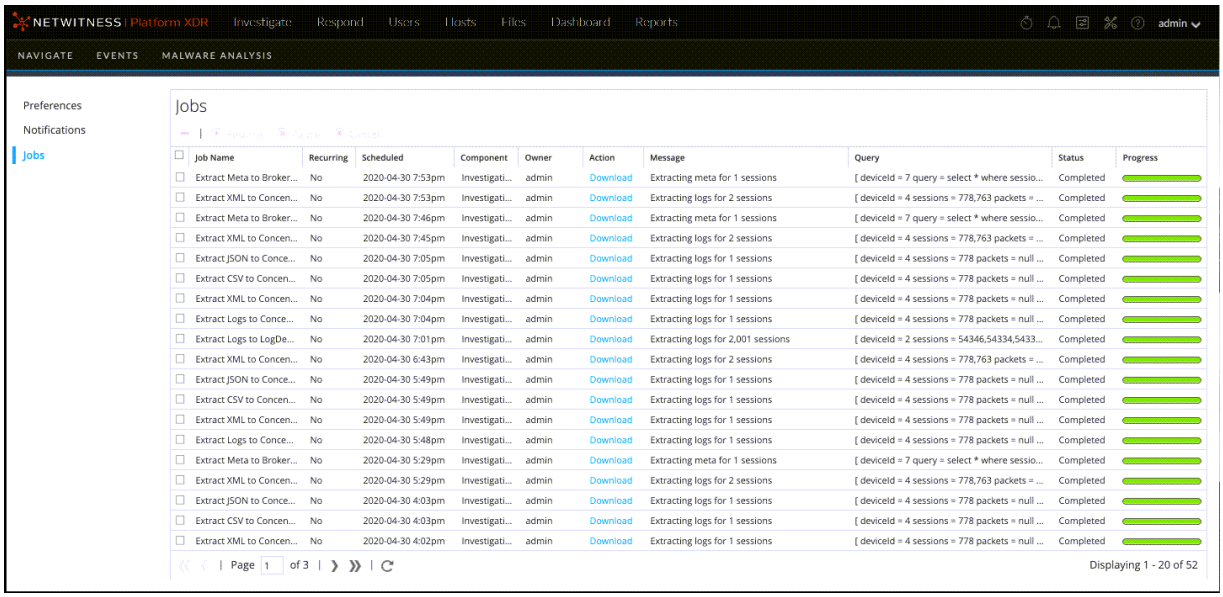
In addition, while working in NetWitness, you can open a quick view of your jobs from the NetWitness toolbar. When a job status has changed, the Jobs icon () is flagged with the number of running jobs. Once all jobs are completed, that number disappears.

In the Jobs panel, you can:

- View and sort the jobs
- Pause or resume a job
- Cancel a job
- Delete a job
- Download a job

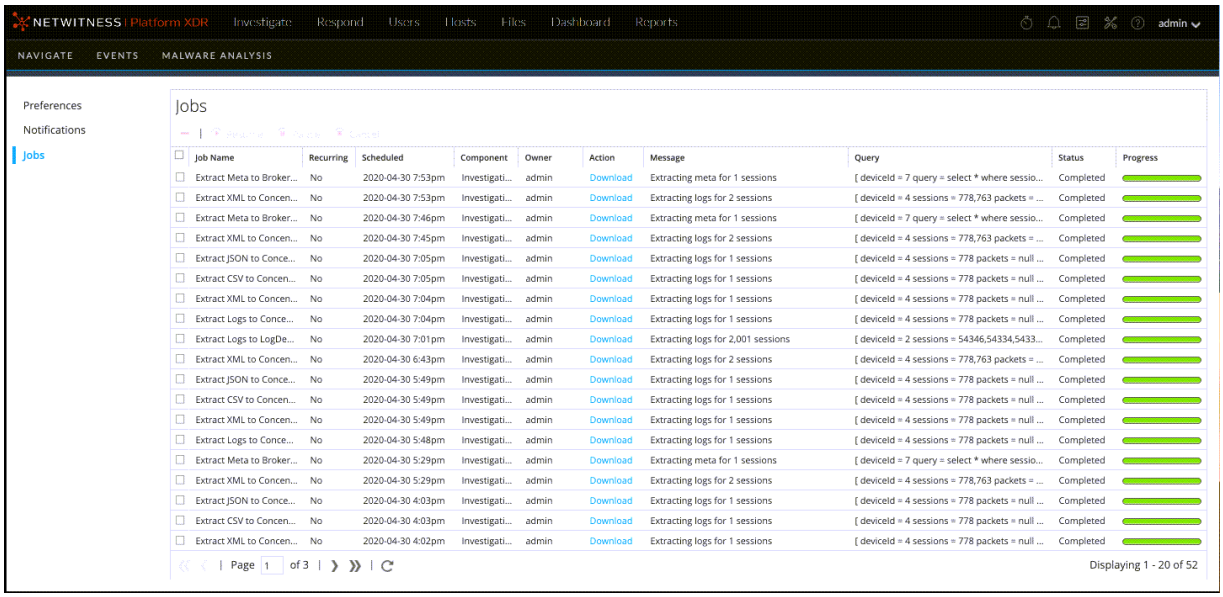
The structure of the jobs panel is the same in all views.

What do you want to do?



Role	I want to ...	Show me how
All	Pause and Resume a Scheduled Job	Managing Jobs
All	Cancel or Delete a Job	Managing Jobs
All	Download a Job	Managing Jobs

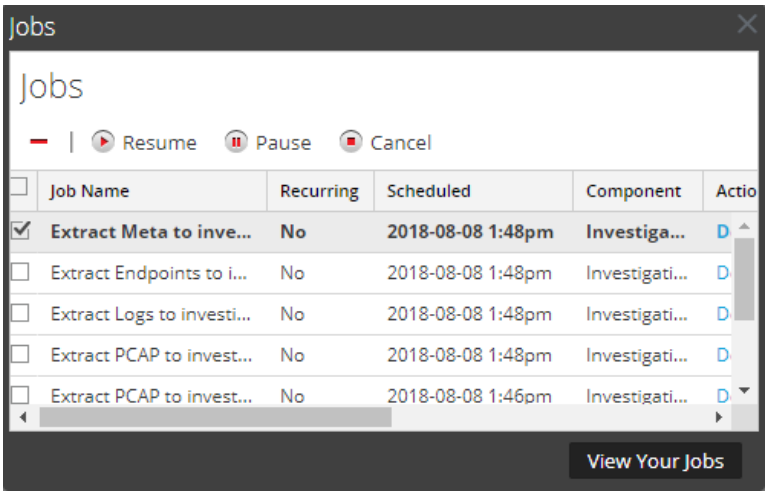
Your actions may be limited to your own jobs depending on your permissions.



Quick Look

To access the Jobs panel, do one of the following:

- In the upper right corner of the NetWitness browser window, select your username and then select **Profile**. In the options panel of the Preferences dialog, select **Jobs**.
  The Jobs panel is displayed. It shows the jobs of a particular user.



- Go to **(Admin) > System**, and in the options panel, select **Jobs**.
  The Jobs panel in the Admin System view is displayed. It shows the jobs for all users.

The Jobs panel organizes information about jobs into a list. The columns present a job progress bar, the job name, an indication that the job is recurring or not recurring, the NetWitness component that is controlling the job, the owner of the job, the status, any associated message, and a download button to allow downloading of a job's packet capture files or payload files.

To display the Jobs tray, click the **Jobs** icon .

The Jobs tray lists all jobs that you own, recurring and non-recurring, using a subset of the columns available in the **Jobs** panel. Otherwise the Jobs tray and the user Profile Jobs panel are the same. In the Admin System view, the Jobs panel lists information about all NetWitness jobs for all users.

The following table describes the available options in the Jobs panel.

Option	Description
Resume	The Resume option applies only to recurring jobs that have been paused. When you resume a paused job, the next execution of the job executes as scheduled.
Pause	The Pause option applies only to recurring jobs. When you pause a recurring job that is running, it has no effect on that execution. The next execution (assuming the job is still paused) is skipped.
Cancel	Cancels a recurring or non-recurring job. You can cancel a job while it is running. If you cancel a recurring job, it cancels that execution of the job. The next time the job is scheduled to run, it executes normally.
–	Deletes a recurring or non-recurring job from the Jobs panel. When you delete a job, the job is instantly deleted from the Jobs panel. No confirmation dialog is offered. If you delete a recurring job, all future executions are removed as well.

The following table describes the Jobs tray and Jobs panel columns.

Column	Description
Selection box	Enables you to select one or more jobs.
Job Name	Displays the name of the job; for example, **Extract Files** or **Upgrade Service**.
Recurring	Indicates whether the job is recurring or non-recurring. **Yes** = recurring, **No** = non-recurring.
Scheduled	Indicates the date and time at which the job was scheduled to begin.
Component	Indicates the component in which the job originated; for example, **Investigation** or **Administration**.
Owner	Indicates the owner of the job. The owner of the job is not included in the default **Jobs Tray**, because only the current user's jobs are displayed here. The column is available to add.
Action	Views the job in another view or downloads job files for the job to the default **Downloads** directory on the local system. Only successfully completed jobs have the **View** link in the **Action** column. Only jobs that create a file have the **Download** link in the **Action** column.
Message	Displays additional information about the job; for example, **Extracting files** or **No sessions found.**
Query	Displays the query associated with the job to help you understand any issues with the result. This example provides the deviceid and the query that was submitted: `[Deviceid = 7 query = select * where sessionid=35667 size = 0 flags = 0]`
Status	Indicates the status of the job. Common values for status are **Paused**, **Running**, **Canceled**, **Failed**, **Completed**, and other status values are possible.
Progress	Shows the percentage complete for a job.
View Your Jobs	(Jobs tray only) Displays your jobs in the **Jobs panel**.

Disaster Recovery (Backup and Restore Instructions)

You can take a backup and restore of NetWitness Hosts using any of the following:

- (Recommended) NetWitness Recovery Wrapper Tool
- NetWitness Recovery Tool (NRT)

(Recommended) NetWitness Recovery Wrapper Tool

Note: NetWitness Recovery Wrapper tool is supported from NetWitness 11.6.1.4 and later. In case of host with large volume of data (>500GB), NetWitness recommends to use NetWitness Recovery Tool (`nw-recovery-tool`) for backup.

NetWitness Recovery Wrapper Tool (NRWT) provides centralized backup and restore that makes it easy for you to take a backup of all the supported installation options (Physical Host, Virtual Host, AWS, and Azure).

With NRWT you can:

- Backup (export) an individual, a specific, or all hosts at a time.
- Restore (import) an individual host at a time.
- Customize files or folders during backup and restore.
- Copy back up data to/from remote host location from/to Netwitness hosts provided:
  - Remote host is reachable via SSH from each NetWitness hosts.
  - The credentials are correct.
  - The location specified has sufficient space to take a backup in case of export.
  - The location specified should contain valid backup data in case of import.
- (For version 11.7.1 and later) Back up Mongo databases for Endpoint and ESA instances.
- (For version 11.7.1 and later) Include Broker index for NetWitness node in which Broker service is running.
- (For version 11.7.1 and later) Back up custom files and folders provided by user.

- (For version 12.3 and later) Avoid entering the password in the Command Line Interface (CLI) while exporting and importing the data.
- (Optional) (For version 12.3 and later) Log in to the NetWitness Server or any other component host systems as a non-root user and perform backup and recovery of data. You must use the following login credentials to log in to the NetWitness Server or any other component host systems.
  - Username: **nwnrt**
  - Password: **netwitness**

  Note: To log in as a non-root user to the NetWitness Server or any other component host systems, root users must use the username **su nwnrt**.
- (For version 12.3 and later) Back up Group Hosts and Category Hosts.

For details on previous run, check NRWT logs at `/var/log/netwitness/recovery-tool/nw-recovery-wrapper.log` on the Admin Server.

Basic Usage of the NetWitness Recovery Wrapper Tool

You can use the NRWT to back up data by using the `export` option. To restore data, use the `import` option. The basic usage of the tool is to run the following command from the root directory level:

```
nw-recovery-wrapper [command] [option]
```

The commands and options that you can use with this tool are described in the following tables.

Commands and Options	Description
`-h --help`	Display help on commands and option. For example, specify: `nw-recovery-wrapper --help` to get a list of supported operations and arguments.
`-e, --export`	Export data or configuration.
`-i, --import`	Import data or configuration.
`-d, --dump-dir <path>`	Path for the where data will be exported or imported from (for example, `/var/netwitness/backup`).
`--host-key HOST_KEY [HOST_KEY ...]`	Host IP, ID or display name.
`--host-all`	Specify for all hosts - supported only for export.
`--category-group CATEGORY_GROUP [CATEGORY_GROUP ...]`	Specify for host and service groups - supported only for export.
`--host-group HOST_GROUP [HOST_GROUP ...]`	Specify host group created on the UI hosts page - supported only for export.
`--include CUSTOM_PATH [CUSTOM_PATH ...]`	Custom path or file.
`--remote-location REMOTE_LOCATION`	Remote host path for remote host configuration.
`--remote-ip REMOTE_IP`	Remote host IP for remote host configuration.
`--remote-password REMOTE_PASSWORD`	Remote host password for remote host configuration.
`--remote-user REMOTE_USER`	User for remote host configuration. (Optional) user for remote host configuration. If not specified, defaults to root user.

Required Conditions

- Make sure that there is adequate disk space on dump directory to take the backup on each NetWitness Hosts.
- Valid Host key is entered. Host key can be Host ID, IP address or display name.

Back Up using NRT wrapper:

1. Backup NetWitness Hosts and store on local dump directory of each hosts:

```
nw-recovery-wrapper export --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
<Host 2 IP/ID/Name>......<Host N IP/ID/Name>

nw-recovery-wrapper export --dump-dir <dir> --host-all
```

> **Note:** If you have logged in with the username **nwnrt** or **su nwnrt**, you must enter **sudo** before the commands you run while performing the backup and recovery actions on the NetWitness Server Host or any other Component Hosts using the NetWitness Recovery Wrapper Tool.
> For Example: To backup NetWitness hosts using the NetWitness Recovery Wrapper Tool, the first step is to run the following command after logging in.
> `sudo nw-recovery-wrapper export --dump-dir <dir> --host-key <Host 1 IP/ID/Name> <Host 2 IP/ID/Name>......<Host N IP/ID/Name>`

2. (Optional) Add custom files or folders during backup and restore other than what is predefined in recovery tool:

> **Note:** Make sure the custom files or directories are available on NetWitness Hosts, if not, the files or directories will be ignored.

```
nw-recovery-wrapper export --dump-dir <dir> --include-file <custom files>/-
-include-dir --host-key <Host 1 IP/ID/Name> <Host 2 IP/ID/Name>......<Host
N IP/ID/Name>
nw-recovery-wrapper export --dump-dir <dir> --include-file <custom files>/-
-include-dir --host-all
```

3. (Optional) Copy backup data to remote Location:

> **Note:** Make sure that:
> - You specify valid values for `--remote-ip`, `--remote-location` arguments for remote copy operation.
> - Remote Host IP is valid and reachable via SSH from all NetWitness Hosts.
> - Remote Host location (`--remote-location`) has adequate space to take backup.

```
nw-recovery-wrapper export --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
<Host 2 IP/ID/Name>......<Host N IP/ID/Name> --remote-ip <IP ADDRESS of
remote host> --remote-location <remote-location-where-backups-should-be-
copied-to>
nw-recovery-wrapper export --dump-dir <dir> --host-all --remote-ip <IP
ADDRESS of remote host> --remote-location <remote-location-where-backups-
should-be-copied-to>
```

Note:
- Optional argument `--remote-user` defaults to root if you do not specify any value.
- Optional argument `--remote-password <remote-password>` uses ssh keys if argument is not specified.

Note: To perform password-less export, follow these steps on all the NetWitness nodes:
1. ssh-keygen (Without passphrase)
2. ssh-copy-id <remote - username>@<remote - ip>
Confirm the ssh connection by performing step 3 and exit from the remote machine.
3. ssh <remote - username>@<remote - ip>

Example:

For adminserver, the backup folder name will be adminserver-backup-2021-09-08-12:48:13

4. Backup (export) including custom files or folders and copy to remote location:

Note: Make sure that:
- the custom files or directories are available on NetWitness Hosts, if not, the files or directories will be ignored.
- You specify valid values for `--remote-ip`, `--remote-location` arguments for remote copy operation.
- Remote Host IP is valid and reachable via SSH from all NetWitness Hosts.
- Remote Host location (`--remote-location`) has adequate space to take backup.

```
nw-recovery-wrapper export --dump-dir <dir> --include <custom files/folder>
--host-key <Host 1 IP/ID/Name> <Host 2 IP/ID/Name>......<Host N IP/ID/Name>
--remote-ip <IP ADDRESS of remote host> --remote-location <remote-location-
where-backups-should-be-copied-to>
```

```
nw-recovery-wrapper export --dump-dir <dir> --include <custom files/folder>
--host-all --remote-ip <IP ADDRESS of remote host> --remote-location
<remote-location-where-backups-should-be-copied-to>
```

Note:
- Optional argument: `--remote-user` defaults to root if argument is not specified.
- Optional argument `--remote-password <remote-password>` uses ssh keys if argument is not specified.

Note: To perform password-less export, follow these steps on all the NetWitness nodes:
1. ssh-keygen (Without passphrase)
2. ssh-copy-id <remote - username>@<remote - ip>
Confirm the ssh connection by performing step 3 and exit from the remote machine.
3. ssh <remote - username>@<remote - ip>

Example:

For Admin server, the backup folder name will be adminserver-backup-2021-09-08-12:48:13

5. (For version 11.7.1 and later) (Optional) Include Mongo service.

   Note: Make sure that:
   - Mongo service is running on the NetWitness host.
   - `--host-all and --host-key` with multiple values are not supported for include Mongo operation.

   ```
   nw-recovery-wrapper export --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
   --include-mongo
   ```

6. (For version 11.7.1 and later) (Optional) Include Broker index.

   Note: Make sure that:
   - Broker service is running on the NetWitness host.

   ```
   nw-recovery-wrapper export --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
   <Host 2 IP/ID/Name>......<Host N IP/ID/Name> --include-broker-index
   ```

   ```
   nw-recovery-wrapper export --dump-dir <dir> --host-all --include-broker-
   index
   ```

7. (For version 11.7.1 and Later) (Optional) Backup (export) including Mongo and Broker index.

   Note: Make sure that:
   - Mongo service is running on the NetWitness host.
   - Broker service is running on the NetWitness host.
   - `--host-all and --host-key` with multiple values are not supported for include Mongo operation.

   ```
   nw-recovery-wrapper export --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
   --include-mongo --include-broker-index
   ```

8. (For version 11.7.1 and later) (Optional) Backup (export) including custom files or folders, copying to remote location, Broker index and Mongo.

   ```
   nw-recovery-wrapper export --dump-dir <dir> --include-broker-index --
   include-mongo ---include-file <custom files>/--include-dir <custom folders>
   --host-key <Host 1 IP/ID/Name> --remote-ip <IP ADDRESS of remote host> --
   remote-location <remote-location-where-backups-should-be-copied-to>
   ```

   Note: To perform password-less export, follow these steps on all the NetWitness nodes:
   1. ssh-keygen (Without passphrase)
   2. ssh-copy-id <remote - username>@<remote - ip>
   Confirm the ssh connection by performing step 3 and exit from the remote machine.
   3. ssh <remote - username>@<remote - ip>

9. (For version 12.3 and later) Back up all the hosts specific to a given group created on the `/admin/appliances` page.

   ```
   nw-recovery-wrapper export --dump-dir <dump location> --host-group <UI host
   group>
   ```

   Example:

   ```
   nw-recovery-wrapper export --dump-dir /var/netwitness/Test-backup --host-
   group TestGroup
   ```

10. (For version 12.3 and later) Back up all the hosts specific to a given category such as Log Hybrid, Log Collector, and Standalone Broker in the environment.

    ```
    nw-recovery-wrapper export --dump-dir <dump location> --category-group
    <category name>
    ```

    Example:

    ```
    nw-recovery-wrapper export --dump-dir /var/netwitness/Test-backup --
    category-group LogDecoder
    ```

    Note: Make sure that:
    - Custom files or directories are present on NetWitness hosts to be backedup, if it is not present it skips the files or directory.
    - Fields such as `--remote-ip`, `--remote-location` are mandatory for remote copy operation.
    - Remote host IP credentials should be valid and reachable via SSH from all NetWitness hosts.
    - Remote host location (`--remote-location`) should have sufficient space to contain backups.
    - Mongo service is running on the NetWitness host.
    - Broker service is running on the NetWitness host.
    - `--host-all`,`--host-key`, `--category-group`, and `--host-group` with multiple values are not supported for include Mongo operation.
    - Optional argument `--remote-password <remote-password>` uses ssh keys if argument is not specified.

Restore (import) options supported in NRT Wrapper

Caution: Use import commands carefully as it performs system level changes.

1. Restore (import) single host at a time (using IP address, Host name, or Host ID).
   ```
   nw-recovery-wrapper import --dump-dir <dir> --host-key <Host IP/ID/Name>
   ```
2. Restore custom files or folders (if any).

   Note: Make sure the custom files or directories are available on NetWitness Hosts, if not, the files or directories will be ignored.

   ```
   nw-recovery-wrapper import --dump-dir <dir> --include-file <custom files>/-
   -include-dir --host-key <Host IP/ID/Name>
   ```
3. Restore from a remote location.

   Note: Make sure that:
   - `--remote-location` contains remote host location in which data is backedup.
   - Remote Host IP is valid and reachable via SSH from all NetWitness Hosts.
   - Remote Host location (`--remote-location`) has adequate space to take backup.

   ```
   nw-recovery-wrapper import --remote-ip <IP address of remote host> --
   remote-location <location-of-backup-on-remote-host> --dump-dir <dir> --
   host-key <Host IP/ID/Name>
   ```

Note:
- Optional argument: `--remote-user` defaults to root if argument is not specified.
- Optional argument `--remote-password <remote-password>` uses ssh keys if argument is not specified.

Note: To perform password-less import, follow these steps on all the NetWitness nodes:
1. ssh-keygen (Without passphrase)
2. ssh-copy-id <remote - username>@<remote - ip>
Confirm the ssh connection by performing step 3 and exit from the remote machine.
3. ssh <remote - username>@<remote - ip>

Example, for adminserver, the backup folder name should be adminserver-backup-2021-09-08-12:48:13

```
nw-recovery-wrapper import --dump-directory <dir> --host-key <host-1> --
remote-ip <remote-ip> --remote-location /home/adminserver-backup-2021-09-
08-12:48:13
```

Note:
- Optional argument: `--remote-user` defaults to root if argument is not specified.
- Optional argument `--remote-password <remote-password>` uses ssh keys if argument is not specified.

4. **Note:** To perform password-less import, follow these steps on all the NetWitness nodes:
1. ssh-keygen (Without passphrase)
2. ssh-copy-id <remote - username>@<remote - ip>
Confirm the ssh connection by performing step 3 and exit from the remote machine.
3. ssh <remote - username>@<remote - ip>

5. Restore data from remote location including custom files or folders.

Note: Make sure that:
- The custom files or directories are available on NetWitness Hosts, if not, the files or directories will be ignored.
- `--remote-location` contains remote host location in which data is backedup.
- Remote Host IP is valid and reachable via SSH from all NetWitness Hosts.
- Remote Host location (`--remote-location`) has adequate space to take backup.

```
nw-recovery-wrapper import --dump-dir <dir> --include <custom files/folder>
--host-key <host1> --remote-ip <IP ADDRESS of remote host> --remote-
location <remote-location-where-backups-should-be-copied-to>
```

Example, for Admin Server, the backup folder name will be adminserver-backup-2021-09-08-12:48:13

Note:
- Optional argument: `--remote-user` defaults to root if argument is not specified.
- Optional argument `--remote-password <remote-password>` uses ssh keys if argument is not specified.

6. **Note:** To perform password-less import, follow these steps on all the NetWitness nodes:
1. ssh-keygen (Without passphrase)
2. ssh-copy-id <remote - username>@<remote - ip>
Confirm the ssh connection by performing step 3 and exit from the remote machine.
3. ssh <remote - username>@<remote - ip>

7. (For version 11.7.1 and later) (Optional) Restore Mongo service.

   Note: Make sure that:
   - Mongo service is running on the NetWitness host.
   - `--host-all and --host-key` with multiple values are not supported for include Mongo operation.

   ```
   nw-recovery-wrapper import --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
   --include-mongo
   ```

8. (For version 11.7.1 and later) (Optional) Restore Broker index.

   Note: Make sure that:
   - Broker service is running on the NetWitness host.
   - `--host-all option is not support for include broker index operation.`

   ```
   nw-recovery-wrapper import --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
   --include-broker-index
   ```

9. (For version 11.7.1 and later) (Optional) Restore Mongo and Broker index.

   Note: Make sure that:
   - Mongo service is running on the NetWitness host.
   - Broker service is running on the NetWitness host.
   - `--host-all and --host-key` with multiple values are not supported for include Mongo operation.

   ```
   nw-recovery-wrapper import --dump-dir <dir> --host-key <Host 1 IP/ID/Name>
   --include-mongo --include-broker-index
   ```

10. (For version 11.7.1 and later) (Optional) Restore custom files or folders, copying to remote location, Broker index, and Mongo.

    Note: Make sure that:
    - Custom files or directories are present on NetWitness hosts to be backedup, if it is not present the files or directory is skipped for backup.
    - Fields such as `--remote-ip`, `--remote-location` are mandatory for remote copy operation.
    - Remote host IP credentials should be valid and reachable via SSH from all NetWitness hosts.
    - Remote host location (`--remote-location`) should have sufficient space to contain backups.
    - Mongo service is running on the NetWitness host.
    - Broker service is running on the NetWitness host.
    - `--host-all and --host-key` with multiple values are not supported for include Mongo operation.

    ```
    nw-recovery-wrapper import --dump-dir <dir> --include-file <custom files>/-
    -include-dir <custom folders> --include-mongo --include-broker-index --
    host-key <host1> --remote-ip <IP ADDRESS of remote host> --remote-location
    <remote-location-where-backups-should-be-copied-to>
    ```

Note:
- Optional argument: `--remote-user` defaults to root if argument is not specified.
- Optional argument `--remote-password <remote-password>` uses ssh keys if argument is not specified.

Note: To perform password-less import, follow these steps on all the NetWitness nodes:
1. ssh-keygen (Without passphrase)
2. ssh-copy-id <remote - username>@<remote - ip>
Confirm the ssh connection by performing step 3 and exit from the remote machine.
3. ssh <remote - username>@<remote - ip>

Status Check

You can check the Backup or Restore status using the below command.

`/var/log/netwitness/recovery-tool/recovery.log`

Troubleshooting

Error Message	NRT Wrapper fails during backup or restore.
Solution	Do any one of the following: • Log in to host where backup is failing and check `/var/log/netwitness/recovery-tool/recovery.log`. • Run in debug mode (`nw-recovery-wrapper -l debug`) on Node 0 to get recovery logs of each host.

Error Message	NRT Wrapper fails due to incorrect password for remote copy operation (`--remote-password`).
Cause	NRWT fails if you enter wrong password multiple times during remote copy. Since SFTP uses

	SSH, it locks the system SSH for a while.
Solution	You must retry after sometime.

Error Message	NRT Wrapper fails after running for long hours for a particular host but the backup is still in progress. For example, Endpoint or ESA node.
Cause	NRT architecture is designed to take a backup of configuration and not user data. It uses salt to communicate between admin server(SA) and nodex. Due to large volume of data in the particular host, this issue is caused when salt communication times out.
Solution	SSH to the particular host and check the backup status at `/var/log/netwitness/recovery-tool/recovery.log`. If the data to be backed up is huge, recommend using "nw-recovery-tool" by logging into particular host.

NetWitness Recovery Tool (NRT)

You can use the NetWitness Recovery Tool (NRT) to back up and restore data from the NetWitness Server and component host systems. The NRT is a script that you run from the command line to back up and restore data on hosts for RMAs, hardware refreshes, and general backup and restore requirements. Refer to Disaster Recovery in Azure Deployment for specific steps on how to perform disaster recovery for hosts deployed in Azure VMs.

Note: You must run the NRT on each host system locally. You cannot run it from remote hosts or an external host.

The following types of hosts can be backed up and restored.

Note: In the NRT script, the following terms in bold are referred to as categories.

- **NetWitness Admin Server** (may include Broker, Investigate, Respond, Health and Wellness, and Reporting Engine)
- **AnalystUI** (may include Broker, Investigate, Respond, Reporting Engine)

- **Archiver** Log Archiver (Workbench and Archiver)
- **Broker** Stand-alone Broker
- **Concentrator** Network or Log Concentrator
- **Decoder** Network Decoder (Packets)
- **Endpoint** Endpoint Agents
- **Endpoint Broker** Endpoint Broker
- **Endpoint Log Hybrid** Log Collector, Log Decoder, Endpoint Server, and Concentrator
- **Event Stream Analysis (ESA) Primary** Contexthub, ESA Correlation, and Incident Management database
- **ESA Secondary** ESA Correlation
- **Gateway** Cloud Gateway
- **Log Hybrid Retention** Log Hybrid-Retention Optimized (for RSA Series 6 Hybrid hardware with Log Hybrid-Retention Optimization)
- **Log Collector** Log Collector including Virtual Log Collector if installed
- **Log Decoder** Log Decoder including Local Log Collector and Warehouse Connector, if installed
- **Log Hybrid** Log Collector, Log Decoder, and Concentrator
- **Malware** Malware Analysis and Broker
- **Network Hybrid** Concentrator and Decoder
- **Search** (for Health & Wellness Beta Host)
- **UEBA** User Entity and Behavior Analytics
- **Warehouse** Warehouse Connector

Basic Usage of the NetWitness Recovery Tool

You can use the NRT to back up data by using the `export` option. To restore data, use the `import` option. The basic usage of the tool is to run the following command from the root directory level:

```
nw-recovery-tool [command] [option]
```

The commands and options that you can use with this tool are described in the following tables.

Commands and Options	Description
`-h, --help`	Display help on commands and option. For example, specify: `nw-recovery-tool --help-categories` to get a list of all the valid category names.
`-e, --export`	Export data or configuration.
`-i, --import`	Import data or configuration.
`-d, --dump-dir <path>`	Path for the where data will be exported or imported from (for example, `/var/netwitness/backup`).
`-C, --category <name>`	Select components by category. Valid category names are `AdminServer`, `AnalystUI`, `Archiver`, `Broker`, `Concentrator`, `Decoder`, `Endpoint`, `EndPointBroker`, `EndpointLogHybrid`, `ESAPrimary`, `ESASecondary`, `Gateway`, `LogHybridRetention`, `LogCollector`, `LogDecoder`, `LogHybrid`, `Malware`, `NetworkHybrid`, `Search`, `UEBA`, and `Warehouse`. You can specify a single category or multiple categories if multiple categories are co-located on the same host. For example: • `--category AdminServer` for the Admin Server exclusively. `--category AdminServer --category Gateway` for the Admin Server and the Cloud Gateway. • `--category ESAPrimary` for the ESA Primary exclusively. • `--category Broker` for the Broker exclusively. `--category Broker --category EndpointBroker` for the Broker and the Endpoint Broker.
`--remote-location <path>`	Remote backupfile path.
`--remote-ip <IP>`	Remote machine IP.
`--remote-user <name>`	Remote machine Username, (optional) user for remote host configuration. If not specified, defaults to root user.

Commands and Options	Description
`--remote-password <pass>`	Remote machine password.

Required Conditions

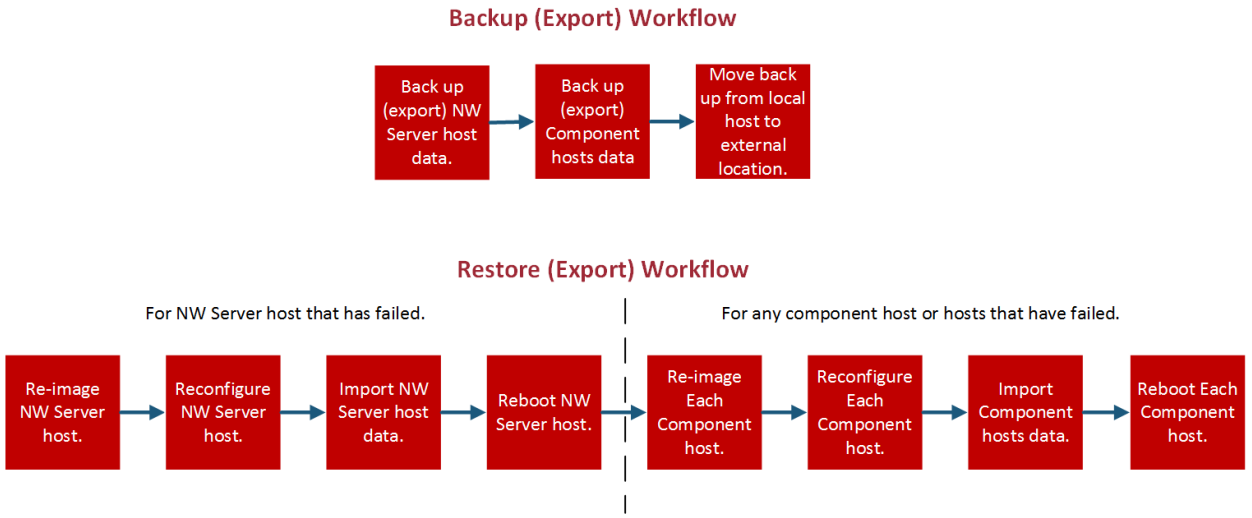
Make sure that the following conditions are met:

- Read the entire document before backing up any data. The document covers all deployment scenarios, so you want to make sure you have all the information required to back up and restore your implementation of NetWitness Platform before going through this process.
- Run the NRT for both backup and recovery locally, on each system being backed up or restored. You cannot run the NRT on an external host, or back up or restore several hosts simultaneously. However, you can back up several components on the same host system simultaneously.
- Export and import data on the same host. If a host fails and you need to build a new system, the new system must have the same identity parameters (i.e., the same IP address), and must be on the same version of NetWitness Suite.
- Make sure that there is adequate disk space in the backup location (`/var/netwitness/backup` is the recommended directory) before the export command in the nw-recovery tool is executed. Do not use a `tmp` directory because it fills up quickly and may cause the system to crash.
- Check the sizing of the Malware disks and adjust them before you back them up. The following table shows you the maximum size of Malware databases that you can back up by hardware type with the actions you can take to reduce them to the maximum size.

Host	Source Hardware	Target Hardware	Database	Maximum Size for Backup	Actions to Reduce Size to Backup Maximum
Malware	Series 4S Hybrid	Series 6 Core	`/var/netwitness`	2.5TB	Configure a rollover. Purge data that you do not need from the database.

- Restore to the exact ISO Image that each host had at the time of backup.
- If you have multiple services co-located on a single host, include all the services in a single command string for the `import` and `export` commands in the nw-recovery tool.

Note: When you run the NRT, the Malware , Reporting Engine, and Postgresql services are stopped and restarted during both the backup (export) and restore (import) processes



Disaster Recovery Workflow

The following diagram shows the high-level Disaster Recovery tasks.

Note: You only need to recover a host if it failed. This means that you can recover a single host, or any combination of hosts depending on which host or hosts failed.

The following diagram shows the tasks for:

- Backup (perform as soon as possible and as frequently as possible).
- Restore (only required if you need to restore your data).

Back Up and Restore Data for Hosts

The procedures for backing up and restoring data are different for NetWitness Server host systems and for component systems.

Caution: 1.) Do not remove component hosts (that is any host other than the NW Server host) from the Hosts View ((Admin) > **Hosts**) from the user interface when you are performing the following disaster recovery procedure. 2.) You must retain (restore) the 'Host name' that existed prior to performing the disaster recovery procedure.

Back Up and Restore Data on the NetWitness Server

Note: If you are using shared storage to export data from multiple hosts (for example, a shared mount or drive), use host-specific subfolders for the path to the location of the exported files for each host, to avoid overwriting one host's exported data with another. For example, you could use a path similar to `--dump-dir /mnt/storage/<host-specific-name>` for the path to the location of the exported files.

Back Up Data on a NetWitness Server Host

Perform this procedure on an existing, functional NetWitness Server host system.

1. At the root level, type the following command:

   ```
   nw-recovery-tool --export --dump-dir /var/netwitness/backup --category
   AdminServer
   ```

   Note: If you have logged in with the username **nwnrt** or **su nwnrt**, you must enter **sudo** before the commands you run while performing the backup and recovery actions on the NetWitness Server Host or any other Component Hosts using NetWitness Recovery Tool.
   For Example: To backup the data on a NetWitness Server host using the NetWitness Recovery Tool, the first step is to run the following command after logging in.
   `sudo nw-recovery-tool --export --dump-dir /var/netwitness/backup --category AdminServer`

   Note: If a service is co-located with another category on the same host rather than on its own, dedicated host, you must include it in the command string. The `Gateway` and `EndpointBroker` can be co-located as show in the following examples:
   `nw-recovery-tool--export --dump-dir /var/netwitness/backup --category AdminServer --category Gateway`
   `nw-recovery-tool--export --dump-dir /var/netwitness/backup --category Broker --category EndpointBroker`

2. Replace `/var/netwitness/backup` with the path to the location to which the data should be exported.

   a. Ensure that this location has sufficient space to store the backup data.

   b. The backup directory path should be located on the local host. However, the backup files could be located on a network mount or an external device.

The data is backed up on the NetWitness Server host in the location you set up in step 2.

3. Move the backed up data from the local host to an external server or a USB stick.
4. (Optional) Copy backup data to remote Location:

   Note: Make sure that:
   - You specify valid values for `--remote-ip`, `--remote-location` a rguments for remote copy operation.
   - Remote Host IP is valid and reachable via SSH from all NetWitness Hosts.
   - Remote Host location (`--remote-location`) has adequate space to take backup.

```
nw-recovery-tool --export --dump-dir /var/netwitness/backup --category
AdminServer --remote-ip <IP ADDRESS of remote host> --remote-location
<remote-location-where-backupsshould-be-copied-to>
```

Note:
- Optional argument `--remote-user` defaults to root if you do not specify any value.
- Optional argument `--remote-password <remote-password>` uses ssh keys if argument is not specified.

Note: To perform password-less export, follow these steps on all the NetWitness nodes:
1. ssh-keygen (Without passphrase)
2. ssh-copy-id <remote - username>@<remote - ip>
Confirm the ssh connection by performing step 3 and exit from the remote machine.
3. ssh <remote - username>@<remote - ip>

Restore Data on a NetWitness Server Host

1. Re-image the NetWitness Server host using the same network configuration settings of the original host. For information about re-imaging the NetWitness Server host, see "Task 1 - Install 12.3 on the NetWitness Server Host" in the *Physical Host Installation Guide for Version 12.3 Guide*

   a. **Optional** If you need to establish network connectivity before you can fetch backup data, for example, if it is on a remote host, run the following script using the same IP address, subnet, gateway, DNS and domain information as the original host:

   ```
   netconfig --static --interface <name> --ip <address> --netmask <netmask>
   --gateway <gateway>
   ```

   For example:

   ```
   netconfig --static --interface eth0 --ip 192.168.1.100 --netmask
   255.255.255.0 --gateway 192.168.1.1
   ```

   Optional: To specify DNS server(s), include the following additional parameter:

   ```
   --dns <address>
   ```

   Optional: To set the local domain name, include the following additional parameter:

   ```
   --domain <name>
   ```

   b. (**Optional**) If you are using DHCP, run the following script:

   ```
   netconfig --dhcp --interface <name>
   ```

   For example:

   ```
   netconfig --dhcp --interface eth0
   ```

   c. Add the backup data to the backup directory path on the local host, for example:

   ```
   /var/netwitness/backup
   ```

2. Run the `nwsetup-tui` command. This initiates the Setup program.

   Note: During the Setup program, when you are prompted for the network configuration of the host, be sure to specify the same identical network configuration that was used for the original installation of the host.

3. When you are prompted, select install type option **2: Recover (Reinstall)**, click **OK**, and then enter the path to the backup directory containing the backup data.
4. After the installation completes successfully, ensure that the host is running the exact same release and patch version of the data that was backed up:

   - If the data was on an system that was updated to a later patch release, update the host by following the instructions for updating systems offline in the update guide for the same patch version as what was previously running on the host (the exact release or patch version for which data was backed up).
   - If the data was on a major release version (for example, 12.3) that had not been updated to a later patch version, you do not need to update the host system.

5. When the host is running at the correct version, run the following command on the NetWitness Server to restore data:

```
nw-recovery-tool --import --dump-dir /var/netwitness/backup --category
AdminServer
```

Note: If a service is co-located with another category on the same host rather than on its own, dedicated host, you must include it in the command string. The `Gateway` and `EndpointBroker` can be co-located as show in the following examples:

```
nw-recovery-tool--import --dump-dir /var/netwitness/backup --category
AdminServer --category Gateway
nw-recovery-tool--import --dump-dir /var/netwitness/backup --category
Broker --category EndpointBroker
```

6. (Optional) Restore backup from a remote location:

Note: Make sure that:
- You specify valid values for `--remote-ip`, `--remote-location` arguments for remote copy operation.
- Remote Host IP is valid and reachable via SSH from all NetWitness Hosts.
- Remote Host location (`--remote-location`) has adequate space to take backup.

```
nw-recovery-tool --import --dump-dir /var/netwitness/backup --category
AdminServer --remote-ip <IP ADDRESS of remote host> --remote-location
<location-of-backup-on-remote-host>
```

Note:
- Optional argument `--remote-user` defaults to root if you do not specify any value.
- Optional argument `--remote-password <remote-password>` uses ssh keys if argument is not specified.

Note: To perform password-less export, follow these steps on all the NetWitness nodes:
1. ssh-keygen (Without passphrase)
2. ssh-copy-id <remote - username>@<remote - ip>
Confirm the ssh connection by performing step 3 and exit from the remote machine.
3. ssh <remote - username>@<remote - ip>

7. (Conditional) If you use custom firewall rules or custom entries in `/etc/hosts`:
   a. (Conditional) If you use custom firewall rules (that is, replied "Yes" to the "Disable Firewall" nwsetup-tui prompt during installation), restore the `/etc/sysconfig/iptables` file from the backup copy located in the `<dump-dir>/unmanaged/etc/sysconfig/iptables` file.
   b. (Conditional) If you use custom entries in `/etc/hosts`, restore the `/etc/hosts.users` file from the backup copy located at `<dump-dir>/unmanaged/etc/hosts.user` to `/etc` on the host.
   c. If you performed step 6a or 6b, refresh the host by running the following command:
   `nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>`
8. Reboot the NetWitness Server host.

Note: If you want to add any more custom entries to `/etc/host`, you must add them to the `/etc/hosts.users` file and then refresh the host as described in step 6c.

Back Up and Restore Data on Other Component Hosts

Perform these procedures on each existing, functional component host system.

Back Up Data on a Component Host

1. At the root level, type the following command:
   `nw-recovery-tool --export --dump-dir /var/netwitness/backup --category <category name>`
   where the category name is one of the following:
   `AdminServer`, `AnalystUI`, `Archiver`, `Broker`, `Concentrator`, `Decoder`, `Endpoint`, `EndPointBroker`, `EndpointLogHybrid`, `ESAPrimary`, `ESASecondary`, `Gateway`, `LogHybridRetention`, `LogCollector`, `LogDecoder`, `LogHybrid`, `Malware`, `NetworkHybrid`, `Search`, `UEBA`,or `Warehouse`

   Note: If you have logged in with the username **nwnrt** or **su nwnrt**, you must enter **sudo** before the commands you run while performing the backup and recovery actions on the NetWitness Server Host or any other Component Hosts using NetWitness Recovery Tool.
   For Example: To backup the data on a component host using the NetWitness Recovery Tool, the first step is to run the following command after logging in.
   `sudo nw-recovery-tool --export --dump-dir /var/netwitness/backup --category <category name>`

   Note: 1.) Use the category that matches the host type. 2.) If services are co-located on a Component Host rather than on its own dedicated host, you must include it in the command string. For example, a Warehouse Connector resides on a Log Decoder host. The following is an example of this command string.
   `nw-recovery-tool--export --dump-dir /var/netwitness/backup --category LogDecoder --category Warehouse`

2. (Optional) Copy backup data to remote Location:

   Note: Make sure that:
   - You specify valid values for `--remote-ip`, `--remote-location` arguments for remote copy operation.
   - Remote Host IP is valid and reachable via SSH from all NetWitness Hosts.
   - Remote Host location (`--remote-location`) has adequate space to take backup.

   ```
   nw-recovery-tool --export --dump-dir /var/netwitness/backup --category
   <category name> --remote-ip <IP ADDRESS of remote host> --remote-location
   <remote-location-where-backupsshould-be-copied-to>
   ```

   Note:
   - Optional argument `--remote-user` defaults to root if you do not specify any value.
   - Optional argument `--remote-password <remote-password>` uses ssh keys if argument is not specified.

Note: To perform password-less export, follow these steps on all the NetWitness nodes:
1. ssh-keygen (Without passphrase)
2. ssh-copy-id <remote - username>@<remote - ip>
Confirm the ssh connection by performing step 3 and exit from the remote machine.
3. ssh <remote - username>@<remote - ip>

3. **(Optional)** Replace `/var/netwitness/backup` with the path to the location to which the data should be exported:
   a. Ensure that this location has sufficient space to store the backup data.
   b. The backup directory path should be located on the local host. However, the backup files could be located on a network mount or an external device.
4. For **Endpoint Log Hybrid** and **ESA Primary** hosts, you can export application data that is stored in the database by running the following command:
   `nw-recovery-tool --export --dump-dir /var/netwitness/backup --component mongo`
   You can replace `/var/netwitness/backup` with the path to the location to which the data should be exported.

   Note: 1.) Make sure that there is enough space in the export location for the files from the Mongo database. 2.) You can back up the **Endpoint Log Hybrid** or **ESA Primary** host data and Mongo database in a single command string. For example, `nw-recovery-tool --export --dump-dir /var/netwitness/backup --category EndpointLogHybrid --component mongo`
5. For **Malware**, you can export application data from the Malware application database by running the following command:
   `nw-recovery-tool --export --dump-dir /var/netwitness/backup --component postgresql`
   You can replace `/var/netwitness/backup` with the path to the location to which the data should be exported.

   Note: Ensure that there is enough space in the export location for the files from the Malware database.
6. Move the backed up data from the local host to an external server or a USB stick.

Restore Data on a Component Host

1. Re-image the component host using the same network configuration settings of the original host. For information about re-imaging a component host, see "Task 2 - Install 12.3 on Other Component Hosts" in the *Physical Host Installation Guide for Version 12.3 Guide*

2. **Optional** If you need to establish network connectivity before you can fetch backup data, for example, if it is on a remote host, run the following script using the same IP address, subnet, gateway, DNS and domain information as the original host:
   `netconfig --static --interface <name> --ip <address> --netmask <netmask> --gateway <gateway>`
   For example:
   `netconfig --static --interface eth0 --ip 192.168.1.100 --netmask 255.255.255.0 --gateway 192.168.1.1`
   Optional: To specify DNS server(s), include the following additional parameter:
   `--dns <address>`
   Optional: To set the local domain name, include the following additional parameter:
   `--domain <name>`

   a. (**Optional**) If you are using DHCP, run the following script:
      `netconfig --dhcp --interface <name>`
      For example:
      `netconfig --dhcp --interface eth0`

   b. Add the backup data to the backup directory path on the local host, for example, `/var/netwitness/backup`.

3. Run the `nwsetup-tui` command. This initiates the Setup program.

   Note: During the Setup program, when you are prompted for the network configuration of the host, be sure to specify the same identical network configuration that was used for the original installation of the host.

4. When you are prompted, select install type option **2: Recover (Reinstall)**, click **OK**, and then enter the path to the directory containing the backup data.

5. After you complete the `nwsetup-tui` command setup, you must re-install the appropriate services on the host using the **Install** command from the Hosts View in the NetWitness Platform User Interface.
6. After the service installation completes, ensure that the host is running the exact same release and patch version of the data that was backed up:
   - If the data was on system that was updated to a later patch release, update the host by following the instructions for updating systems offline for the same patch version as what was previously running on the host (the exact release or patch version for which data was backed up).
   - If the data was on a major release version (for example, 12.3) that had not been updated to a later patch version, you do not need to update the host system.
7. When the host is running at the correct version, return to the root level of the component host and run the following command to restore data:
   ```
   nw-recovery-tool --import --dump-dir /var/netwitness/backup --category
   <category name>
   ```

   Note: If services are co-located on a Component Host rather than on its own dedicated host, you must include it in the command string. For example, a Warehouse Connector resides on a Log Decoder host. The following is an example of this command string.
   ```
   nw-recovery-tool--import --dump-dir /var/netwitness/backup --category
   LogDecoder --category Warehouse
   ```
8. (Optional) Restore backup data from remote Location:

   Note: Make sure that:
   - You specify valid values for `--remote-ip`, `--remote-location` a rguments for remote copy operation.
   - Remote Host IP is valid and reachable via SSH from all NetWitness Hosts.
   - Remote Host location (`--remote-location`) has adequate space to take backup.

   ```
   nw-recovery-tool --import --dump-dir /var/netwitness/backup --category
   <category name> --remote-ip <IP ADDRESS of remote host> --remote-location
   <location-of-backup-on-remote-host>
   ```

   Note:
   - Optional argument `--remote-user` defaults to root if you do not specify any value.
   - Optional argument `--remote-password <remote-password>` uses ssh keys if argument is not specified.

   Note: To perform password-less export, follow these steps on all the NetWitness nodes:
   1. ssh-keygen (Without passphrase)
   2. ssh-copy-id <remote - username>@<remote - ip>

   Confirm the ssh connection by performing step 3 and exit from the remote machine.
   3. ssh <remote - username>@<remote - ip>
9. For **EnpointLogHybrid** and **ESAPrimary** systems, you can import application data to be restored by running the following command:
   ```
   nw-recovery-tool --import --dump-dir /var/netwitness/backup --component
   mongo
   ```

10. For **Malware**, you can import application data from the Malware application database to be restored by running the following command:
    ```
    nw-recovery-tool --import --dump-dir /var/netwitness/backup --component
    postgresql
    ```

11. For a Decoder, Log Decoder , Concentrator, Archiver, Network Hybrid, or Log Hybrid configured with external storage (that is, DAC, SAN, Unity or Powervault):

    a. Scan the `<dump-dir>/unmanaged/etc/fstab` file for devices with mount points that do not exist in the system `/etc/fstab` file.

    IMPORTANT: If you are migrating to new host hardware (that is a new Decoder, Log Decoder, Concentrator, Archiver, Network Hybrid, or Log Hybrid host), before you proceed to the next step you must:
    1. Power off the old hardware host and the external storage device attached to it.
    2. Attach the external storage device to the new host hardware.
    3. Power on both the new host hardware and the external storage device attached to it.

    a. Complete the following steps for each device in the backup copy of `<dump-dir>/unmanaged/etc/fstab`.

        i. Verify that the corresponding device is present and attached. If it not attached, attach it. If the device is no longer applicable, skip it and go to the next device.

        ii. Verify that the mount point directory exists on the file system. If it does not exist, create the directory with the `mkdir <path>` command.

        iii. Add the `fstab` entry from the backup copy to the system `/etc/fstab` file.

        Caution: For a Series 5 or 6 Hybrid, you must restore backed up data to the `/etc/fstab` directory according to the instructions in Appendix A. Modify fstab for Series 5 and 6 Hybrid Storage After Recovery.

    b. Run the following command on each host.
    ```
    mount -a
    ```

12. (Conditional) If you use custom firewall rules or custom entries in `/etc/hosts`:

    a. (Conditional) If you use custom firewall rules (that is, replied "Yes" to the "Disable Firewall" nwsetup-tui prompt during installation), restore the `/etc/sysconfig/iptables` file from the backup copy located in the `<dump-dir>/unmanaged/etc/sysconfig/iptables` file.

    b. (Conditional) If you use custom entries in `/etc/hosts`, restore the `/etc/hosts.users` file from the backup copy located at `<dump-dir>/unmanaged/etc/hosts.user` to `/etc` on the host.

    c. If you performed step 11a or 11b, refresh the host by running the following command:
    ```
    nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>
    ```

13. Reboot the component host.

Hardware Refresh Only - Use Additional Space in New Hardware Hosts

Refer to the *Core Database Tuning Guide for NetWitness Platform* for instructions on how to use all the space you have available on your new hardware. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Disaster Recovery in Azure Deployment

This section tells you how to back up and restore NetWitness Platform deployed on Azure virtual hosts (also referred to as VMs in this section). The two major tasks to back up and restore data in an Azure deployment are:

- Task 1 - Backup and Export Data
- Task 2 - Restore and Import Data

Task 1 - Backup and Export Data

1. Export the data by running the `nw-recovery-tool --export` commands as described in the Disaster Recovery (Backup and Restore Instructions) section of this document.

Task 2 - Restore and Import Data

You need to refer to the *10.6.6.x to 11.3 Azure Upgrade Guide* to complete this task. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

1. Delete the VM.

   Caution: Do not delete the resources (for example, do not delete Disks, Network Interface, and so on).

2. Complete the following steps for the NW Server host, Broker host, ESA host, Endpoint Log Hybrid host, and Log Collector host (where host = `--category`).

   a. Delete all the resources except the network interface card of the older 12.3 VM.

   b. Deploy the fresh 12.3 VM with the same disk and resources and power it off.
   For detailed instructions on how to deploy a virtual host in Azure, see the *Azure Installation Guide*.

   c. Run the `azure-mac-retention.ps1` from the local machine.
   See the *10.6.6 to 11.3 Azure Upgrade Guide* for instructions on how to run this script.

   d. Follow the procedure for the NRT restoration for the respective host as described in Disaster Recovery (Backup and Restore Instructions).

   e. After you restore NRT the component host, restore the following files.

   - `/etc/fstab`
   - `/etc/hosts` (if hostname is not changed)
   - `/etc/waagent.conf`
   - `/etc/logrotate.d/waagent.logrotate`
   - `/etc/krb5.conf` from the `<dump-dir>/unmanaged` folder

3. Complete the following steps for the Log Decoder host, Concentrator host, and Archiver host (where host = `--category`.

   a. Delete all the resources except the disks that are named **external** and the network interface card of the older 12.3 VM.

   b. Deploy the fresh 12.3 VM with the same disk and resources listed in the *Azure Installation Guide* and power it off.

   > **Note:** Do not create the **external** disk. Only create the **nwhome** disks.

   c. Run the `azure-mac-retention.ps1` from the local machine.
   See the *10.6.6 to 11.3 Azure Upgrade Guide* for instructions on how to run this script.

   d. Follow the procedure for the NRT restoration for the respective hosts as described in Restore Data on a Component Host.

   e. After you restore NRT the component host, restore the following files.

   - `etc/fstab`
   - `/etc/hosts` (if hostname is not changed)
   - `/etc/waagent.conf`
   - `etc/logrotate.d/waagent.logrotate`
   - `/etc/krb5.conf`

Disaster Recovery in AWS Deployment

This section tells you how to back up and restore NetWitness Platform deployed on AWS virtual hosts (also referred to as VMs in this section). The two major tasks to back up and restore data in an AWS deployment are:

- Task 1 - Backup and Export Data
- Task 2 - Restore and Import Data

Task 1 - Backup and Export Data

1. Export the data by running the `nw-recovery-tool --export` commands as described in the Disaster Recovery (Backup and Restore Instructions) section of this document.
2. Record the IP addresses. You need to refer to them later in the Disaster Recovery process. Refer to the *10.6.6 to 11.3 AWS Upgrade Guide* for instructions on how retain the IP addresses. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Task 2 - Restore and Import Data

You need to refer to the *10.6.6 to 11.3 AWS Upgrade Guide* to complete this task.

1. Delete the VM.

   Caution: Do not delete the resources (for example, do not delete Disks).

2. Complete the following steps for the NW Server host, Broker host, ESA (Primary/Seconday) host, Endpoint Log Hybrid host, and Log Collector host (where host = `--category`).
   a. Delete all the resources of the older 12.3 VM.
   b. Deploy the fresh 12.3 VM with the same IP address, disk and resources and power it off. For detailed instructions on how to deploy a virtual host in AWS, see the *AWS Installation Guide*.
   c. Follow the procedure for the NRT restoration for the respective host as described in Restore Data on a Component Host.
   d. After you restore NRT the component host, restore the following files.
      - `/etc/fstab`
      - `/etc/hosts` (if hostname is not changed)
3. Complete the following steps for the Log Decoder host, Decoder (Network Decoder) host, Concentrator host, and Archiver host (where host = `--category`.
   a. Delete all the resources except the **external disks** of the older 12.3 VM.
   b. Deploy the fresh 12.3 VM with the same IP address, disk, and resources listed in the *AWS Installation Guide* and power it off.

Note: Do not create the **external** disk. Only create the **nwhome** disks.

c. Follow the procedure for the NRT restoration for the respective hosts as described in Restore Data on a Component Host.

d. After you restore NRT the component host, restore the following files.

- `etc/fstab`
- `/etc/hosts` (if hostname is not changed)
- `/etc/krb5.conf`

Appendix A. Modify fstab for Series 5 and 6 Hybrid Storage After Recovery

Note: The procedures in this Appendix do not apply if the hybrid was an 11.4 fresh installation and you had a disaster.

You must modify the `/etc/fstab` file for a Series5 or Series 6 Hybrid if a Series 5 or Series 6 Network Hybrid was upgraded from 11.2.x.x or 11.3.x.x to 11.4 and a disaster occurred.

These are the tasks to recovery from this disaster scenario.

1. Image a new Series 5 or Series 6 Hybrid as Network Hybrid using an 11.4 ISO.
2. Import the backed up data or configuration (`nw-recovery-tool --import`).
3. Modify the recovered `/etc/fstab` file.

Sample etc/fstab File Before Disaster

The following data is an example of the external storage configuration backup for a Series 5 or 6 Hybrid that was upgraded to 11.4.

The data highlighted in yellow corresponds to internal storage on an upgraded system. This configuration is carried over from prior releases during upgrade process. This lay out changed in 11.4 (Fresh Install). You must only copy the entries corresponding to external storage (highlighted in green) to the new `etc/fstab` file as part of a disaster recovery.

When you export data or configuration using the `nw-recovery-tool --export` command, the storage configuration details are saved to `<back-location>/unmanaged/etc/fstab`. The `fstab` file contains both internal storage (highlighted in yellow) and external storage configuration (highlighted in green). The contents on a upgraded (10.6 or 11.x -> 11.4) Series 5 or Series 6 Network Hybrid look similar to the following storage configuration.

```
/dev/mapper/netwitness_vg00-root / xfs defaults 0 0 UUID=906e2a3d-3b59-46d1-
975d-fa2b8467d009
/boot xfs defaults 0 0 /dev/mapper/netwitness_vg00-usrhome
/home xfs nosuid 0 0
/dev/mapper/netwitness_vg00-varlog /var/log xfs defaults 0 0
/dev/mapper/netwitness_vg00-nwhome /var/netwitness xfs nosuid,noatime 0 0
/dev/mapper/concentrator-vlnwc /var/netwitness/concentrator xfs noatime,nosuid
0 0
/dev/mapper/index-vlnwci /var/netwitness/concentrator/index xfs noatime,nosuid
0 0
/dev/mapper/concentrator-vlnwcm /var/netwitness/concentrator/metadb xfs
noatime,nosuid 0 0
/dev/mapper/concentrator-vlnwcs /var/netwitness/concentrator/sessiondb xfs
noatime,nosuid 0 0
/dev/mapper/decoderpacket-vlnwd /var/netwitness/decoder xfs noatime,nosuid 0 0
```

```
/dev/mapper/decoderpacket-vlnwdi /var/netwitness/decoder/index xfs
noatime,nosuid 0 0
/dev/mapper/decodermeta-vlnwdm /var/netwitness/decoder/metadb xfs
noatime,nosuid 0 0
/dev/mapper/decoderpacket-vlnwdp /var/netwitness/decoder/packetdb xfs
noatime,nosuid 0 0
/dev/mapper/decoderpacket-vlnwds /var/netwitness/decoder/sessiondb xfs
noatime,nosuid 0 0
/dev/mapper/netwitness_vg00-swap swap swap defaults 0 0
/var/netwitness/decoder /var/netwitness/logdecoder none defaults,rbind 0 0
/dev/concentrator0/sessiondb /var/netwitness/concentrator/sessiondb0 xfs
noatime,nosuid 1 2
/dev/concentrator0/metadb /var/netwitness/concentrator/metadb0 xfs
noatime,nosuid 1 2
/dev/decoder0/packetdb /var/netwitness/decoder/packetdb0 xfs noatime,nosuid 1
```

Sample etc/fstab File After Recovery - Before Modification

After you install 11.4 with the 11.4 ISO and execute the recovery tool execution to restore all previous configurations, the `/etc/fstab` file appears looks like the following example.

```
#
# /etc/fstab
# Created by anaconda on Thu Dec 5 17:31:26 2019
#
# Accessible filesystems, by reference, are maintained under '/dev/disk'
# See man pages fstab(5), findfs(8), mount(8) and/or blkid(8) for more info
#
/dev/mapper/netwitness_vg00-root / xfs defaults 0 0
UUID=d84db66c-fce6-4fec-9f84-b3449861f664 /boot xfs defaults 0 0

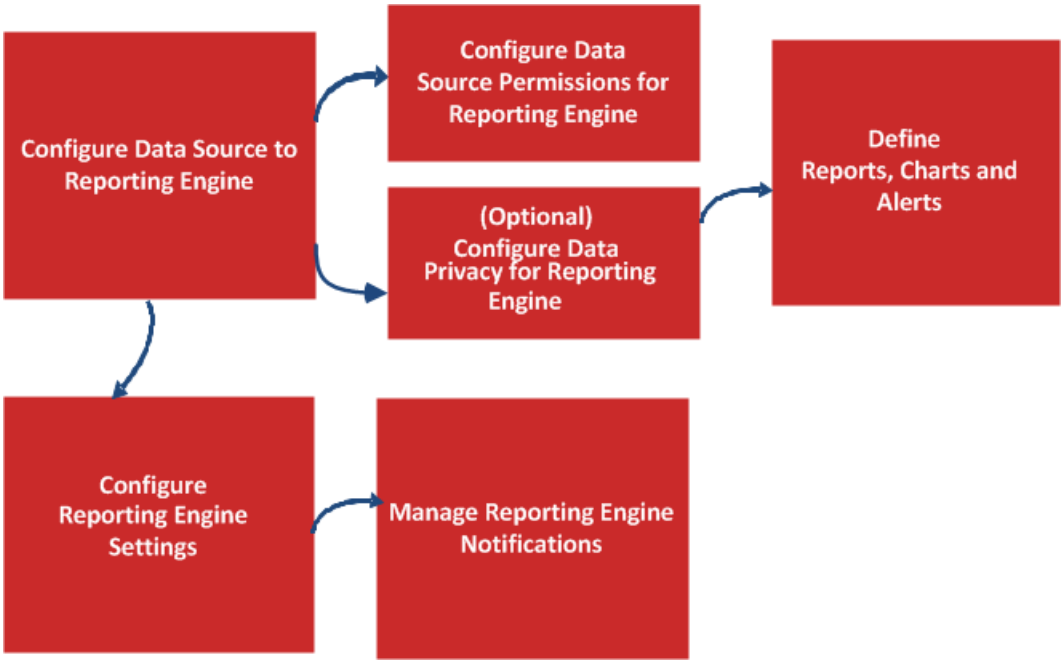
How Reporting Engine Works

NetWitness Reporting Engine is a service on the NetWitness Admin Server. It facilitates the data extraction from different data sources to generate reports for compliance and analysis. Reporting Engine stores the definitions of the charts, rules, reports and alerts that are used to generate reports, charts and alerts.

Reporting Engine configuration includes configuring the data sources, definitions of outputs or notifications and parameters to improve the performance of data extraction and report, chart, and alert generation.



When you install the NetWitness, Reporting Engine is automatically installed as a service. This enables the Reports, Charts, and Alerts to be maintained in the NetWitness and be available to view, download reports as PDF or CSV format, download charts as PDF and be added as dashlets.

For the Reporting Engine to run reports and alerts based on the data drawn from a data source, you must associate a data source, or multiple data sources to a Reporting Engine. There are three types of data sources:

- NWDB - The NetWitness Database (NWDB) data sources are Decoders, Log Decoders, Brokers, Concentrators, Archiver, and Collection. Reporting Engine supports the generation of reports, alerts, and charts.
- Warehouse - The Warehouse data sources are Horton Works and MapR which collects information from the Warehouse Connector and generates reports and alerts. This data source generates Reports only.
- Respond - Respond is used to generate reports on alerts and incidents. This data source generates Reports only.

Workflow

The following workflow shows an overview of the Reporting Engine configuration which enables the user to generate Reports, Charts, and Alerts.

Configure the Reporting Engine

On installation of the NetWitness Server, the Reporting Engine service is automatically available and some parameters are pre-populated with default values to achieve optimal results.

Make sure that the data sources are deployed and configured in the NetWitness. For more information, see "Add Service or Edit Service Dialog" topic in the *Host and Service Configuration Guide*.

You can perform the following tasks:

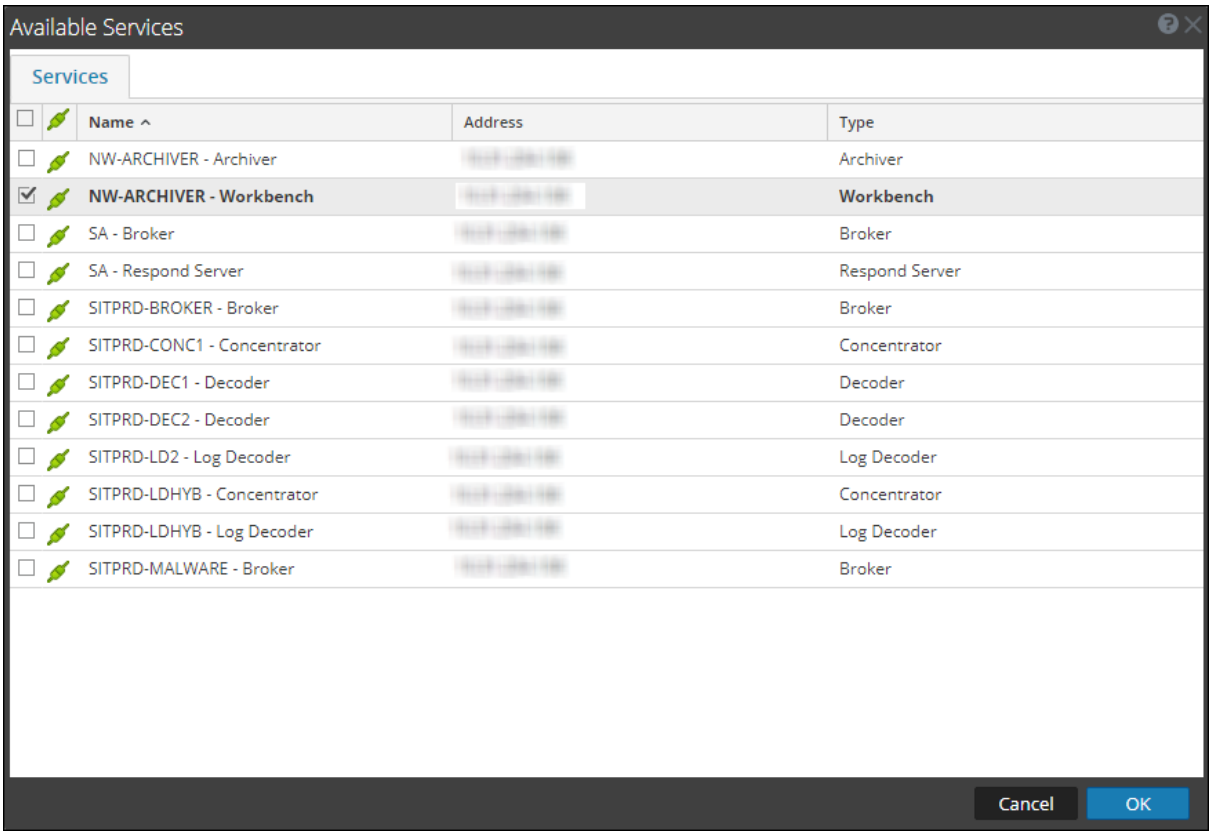
- Check Live for the latest data source content and deploy it on a regular basis. (For more information, see "Manage Live Resources" topic in the in *Live Services Guide*).
- (Optional) Add Additional Space for Large Reports.

Configure the Data Sources

You must configure NWDB, Warehouse, and Respond to generate Reports, Charts, and Alerts. Optionally, you can also configure Archiver, Collection, and Workbench data sources.

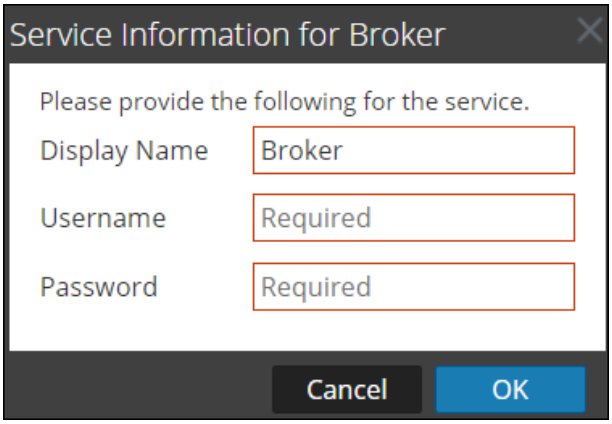
IMPORTANT: If you change the admin password on a NetWitness service that is used as a Reporting Engine data source, you must remove and then re-add the service as a data source.

Note: To execute Reports and Charts on an Analyst UI, make sure the admin adds the data sources to each Reporting Engine instance from the admin node using the relevant procedure described in this topic.



Configure a NWDB Data Source

To add a NWDB data source:



1. Go to  **(Admin) > Services**.
2. In the **Services**, select **Reporting Engine** service.
3. Click  > **View** > **Config**

   The Services Config View of Reporting Engine is displayed.
4. On the **Sources** tab, click  > **Available Services**.

   The **Available Services** dialog is displayed.

5. Select a NWDB service you want to add and click **OK**.
6. In the Service Information for Broker dialog, enter the service information for the service and click **OK**. In this example, we are adding a Broker service.

7. The service is displayed in the Sources tab when it is successfully added.

Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

Configure a Warehouse Data Source

You can add the warehouse data source to Reporting Engine, so that you can extract the data from the required services, store them in MapR or Horton works and generate Reports and Alerts. The procedure to configure Warehouse as a data source differs. To extract data from a Warehouse data source, you must configure it using the following procedure.

Note: Warehouse Connector is still supported, as it is reporting against a warehouse in NetWitness 11.x.

Prerequisite

Make sure you:

- Add a Warehouse Data Source to Reporting Engine.
- Set Warehouse Data Source as the Default Source.
- HIVE server is in running state on all the Warehouse nodes. Use the following command to check the status of the HIVE server:

  ```
  status hive2 (MapR deployments)
  service hive-server2 status (Horton Works deployments)
  ```

- Warehouse Connector is configured to write data to the warehouse deployments.
- If Kerberos authentication is enabled for HiveServer2, make sure that the keytab file is copied to the `/var/netwitness/re-server/rsa/soc/reporting-engine/conf/` directory in the Reporting Engine Host.

  Note: The `rsasoc` user should have read permissions for the keytab file. For more information, see Configure Data Source Permissions.

  Also, make sure that you update the keytab file location in the **Kerberos Keytab File** parameter in the Reporting Engine Service Config View. For more information, see Reporting Engine General Tab.

To add Warehouse data source for MapR:

1. Go to  **(Admin) > Services**.
2. In the **Services** list, select the **Reporting Engine** service.
3. Click  > **View** > **Config**.

   The **Service Config** view is displayed with the **General** tab open.
4. Click the **Sources** tab.
5. In the **Sources** tab, click  and select **New Service**.

   The New Service dialog is displayed.

6. In the **Source Type** drop-down menu, select **WAREHOUSE**.
7. In the **Warehouse Source** drop-down menu, select the warehouse data source.
8. In the **Name** field, enter the host name of the Warehouse data source.
9. In the **HDFS Path** field, enter the HDFS root path to which the Warehouse Connector writes the data.

   For example:

   If `/saw` is the local mount point for HDFS that you have configured while mounting NFS on the device. And if you have installed the Warehouse Connector service to write to SAW. For more information, see "Mount the Warehouse on the Warehouse Connector" topic in the *Warehouse (MapR) Configuration Guide*.

   If you have created a directory named `Ionsaw01` under `/saw` and provided the corresponding Local Mount Path as `/saw/Ionsaw01`, then the corresponding HDFS root path would be `/Ionsaw01`.

   The `/saw` mount point implies to `/`as the root path for HDFS. The Warehouse Connector writes the data `/Ionsaw01` in HDFS. If there is no data available in this path, the following error is displayed:

   `"No data available. Check HDFS path"`

   Make sure that `/lonsaw01/rsasoc/v1/sessions/meta` contains avro files of the meta data before performing test connection.
10. Select the **Advanced** checkbox to use the advanced settings, and fill in the **Database URL** with the complete JDBC URL to connect to the HiveServer2.

    For example:

If kerberos is enabled in HIVE then the JDBC url will be:

```
jdbc:hive2://<host>:<port>/<db>;principal=<Kerberos serverprincipal>
```

If SSL is enabled in HIVE then the JDBC url will be:

```
jdbc:hive2://<host>:<port>/<db>;ssl=true;sslTrustStore=<trust_store_
path>;trustStorePassword=<trust_store_password>
```

For more information on HIVE server clients, see https://cwiki.apache.org/confluence/display/Hive/HiveServer2+Clients.

11. If not using the advanced settings, enter the values for the **Host** and **Port**.
    - In the **Host** field, enter the IP address of the host on which HiveServer2 is hosted.

      Note: You can use the virtual IP address of MapR only if HiveServer2 is running on all the nodes in the cluster.

    - In the **Port** field, enter the HiveServer2 port of the Warehouse data source. By default, the port number is **10000**.
12. In the **Username** and **Password** field, enter the JDBC credentials used to access HiveServer2.

    Note: You can also use LDAP mode of authentication using Active Directory. For instructions to enable LDAP authentication mode, see Enable LDAP Authentication.
13. Enable Kerberos authentication: see Enable Kerberos Authentication.
14. If you want set the added Warehouse data source as default source for the Reporting Engine, select the added Warehouse data source and click Set default.

To add Warehouse data source for Horton Works (HDP):

Note: Make sure you download the `hive-jdbc-1.2.1-with-full-dependencies.jar`. This jar contains the driver file of HIVE 1.2.1 which connects to Reporting Engine for Hive 1.2.1 Hiveserver2.

1. SSH to the NetWitness server.
2. In the `/opt/rsa/soc/reporting-engine/plugins/` folder, take a backup of the following jar:

   `hive-jdbc-0.12.0-with-full-dependencies.jar` or `hive-jdbc-1.0.0-mapr-1508-standalone.jar`
3. Remove the following jar:

   `hive-jdbc-0.12.0-with-full-dependencies.jar` or `hive-jdbc-1.0.0-mapr-1508-standalone.jar`
4. In the /opt/rsa/soc/reporting-engine/plugins folder, copy the following jar using WinSCP:

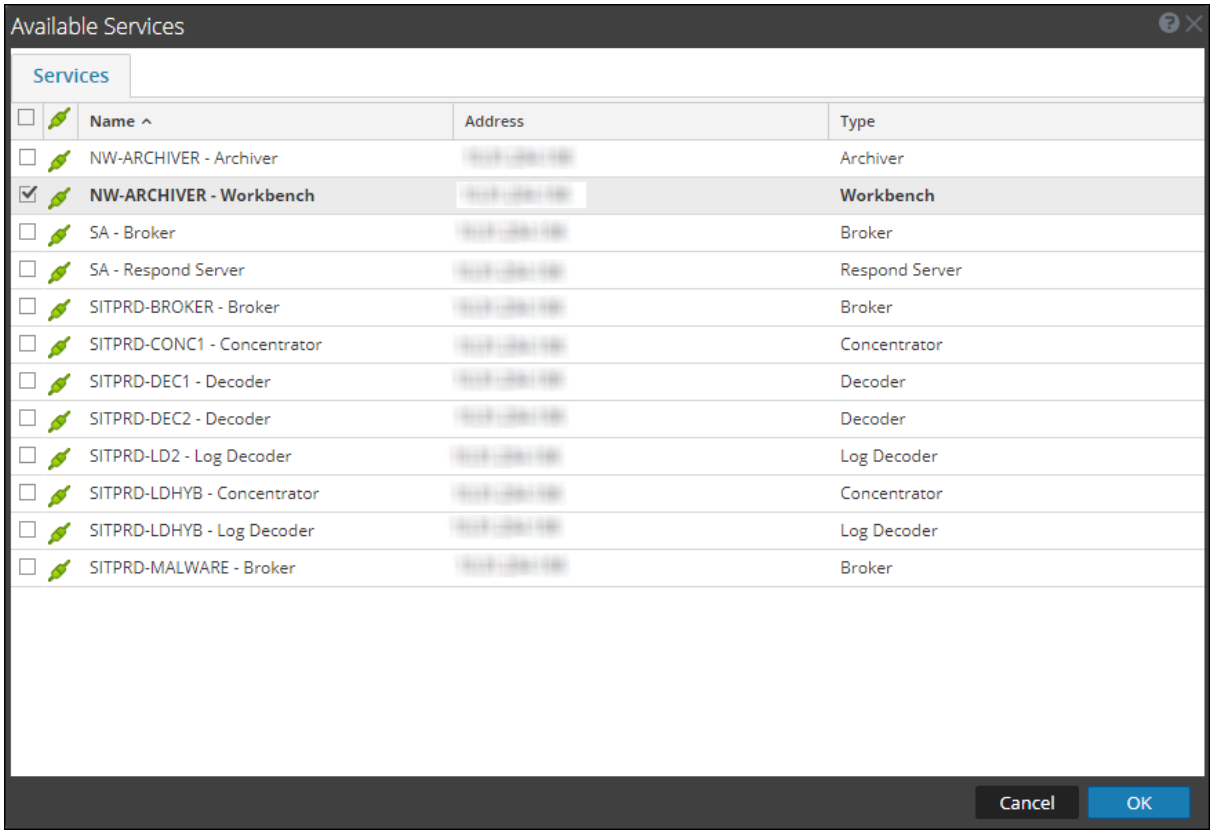
   `hive-jdbc-1.2.1-with-full-dependencies.jar`
5. Restart the Reporting Engine service.
6. Log in to NetWitness UI.
7. Select the **Reporting Engine** service and select > **View** > **Explore**.
8. In the **hiveConfig**, set **EnableSmallSplitBasedSchemaLiteralCreation** parameter to **true**.

Enable Kerberos Authentication

1. Select **Kerberos Authentication** checkbox, if the Warehouse is Kerberos enabled HIVE server.

2. Fill in the fields as follows:

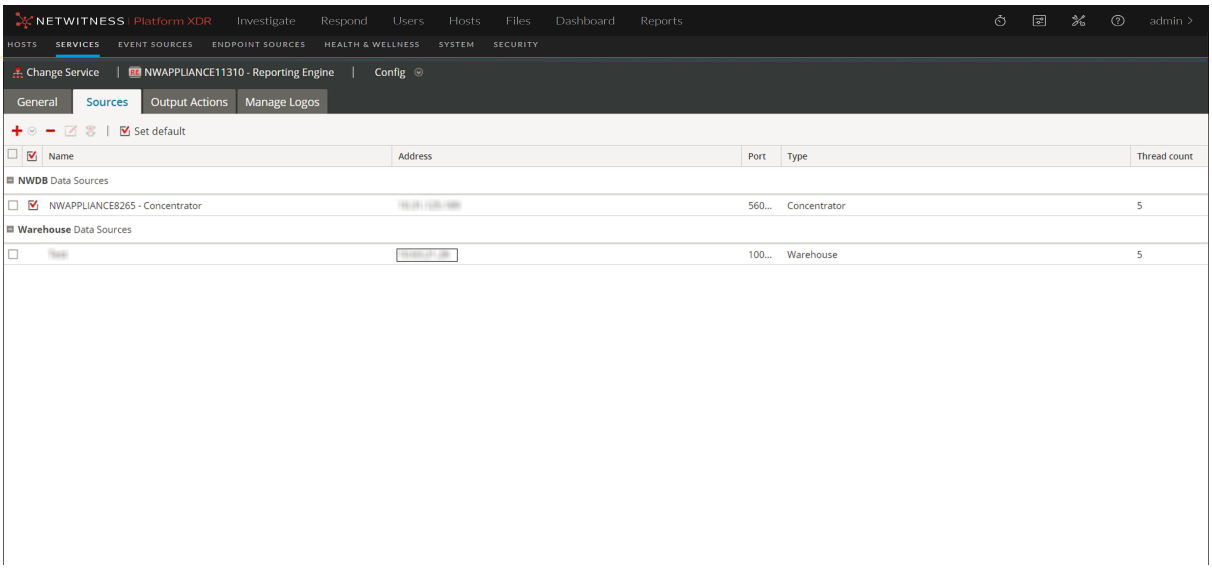
Field	Description
Server Principal	Enter the Principal used by the HIVE server to authenticate with the Kerberos Key Distribution Center (KDC) Server.
User Principal	Enter the Principal that HIVE JDBC client uses to authenticate with the KDC server for connecting the HIVE server. For example, gpadmin@EXAMPLE.COM.



Field	Description
Kerberos Keytab File	View the Kerberos keytab file location configured in the HIVE Configuration panel on the Reporting Engine General Tab. **Note:** Reporting Engine supports only the data sources configured with the same Kerberos credentials, like, User Principal and key tab file.

3. Click **Test Connection** to test the connection with the values entered.
4. Click **Save**.

   The added Warehouse data source is displayed in the Reporting Engine Sources tab.



5. Click  > **Available Services**.

   The Available Services dialog box is displayed.

6. In the Available Services dialog box, select the service that you want to add as data source to the Reporting Engine and click **OK**.

   NetWitness adds this as a data source available to reports and alerts against this Reporting Engine.

Note: This step is relevant only for an Untrusted model.

Set a Data Source as the Default Source

To set a data source to be the default source when you create reports and alerts:

1. Go to **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Select > **View**> **Config**.

   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The **Services Config View** is displayed with the Reporting Engine Sources tab open.
5. Select the source that you want to be the default source (for example, Broker).
6. Click the Set default checkbox.

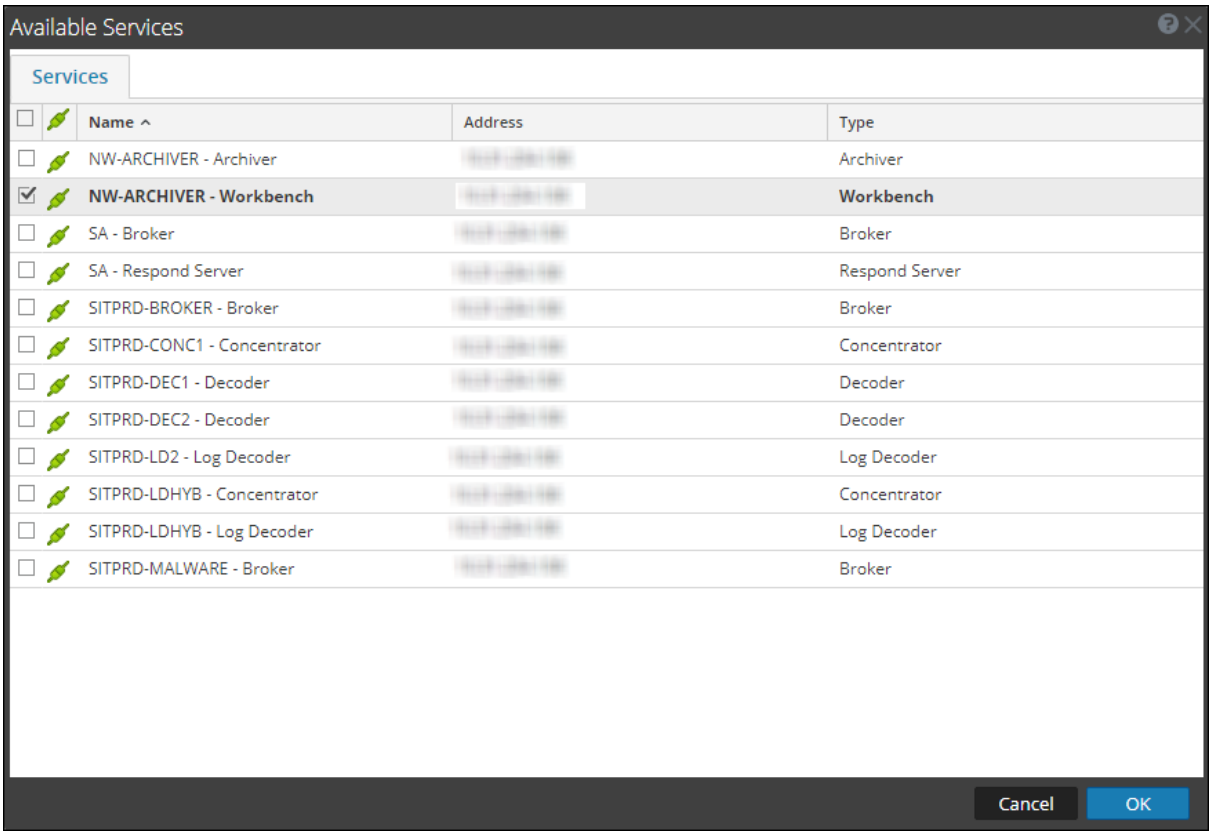
   NetWitness defaults to this data source when you create reports and alerts against this Reporting Engine.

(Optional) Add Workbench as Data Source

You must configure Workbench,to be able to use data from Workbench data source to generate Reports and Alerts. The following instructions describe how to add Workbench service as a data source to Reporting Engine to generate report for the data collected by Workbench.

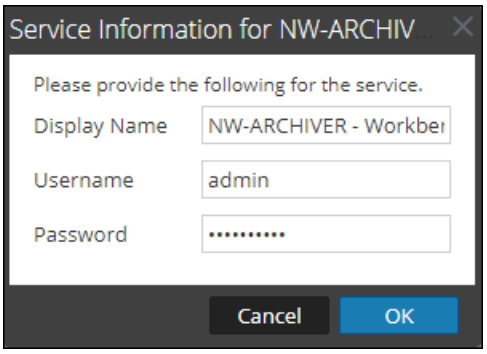
Prerequisites

Make sure you have:



1. Added Workbench as a service to your NetWitness deployment. For more information, see the *Archiver Configuration Guide*.
2. Added a Collection on the Workbench service.

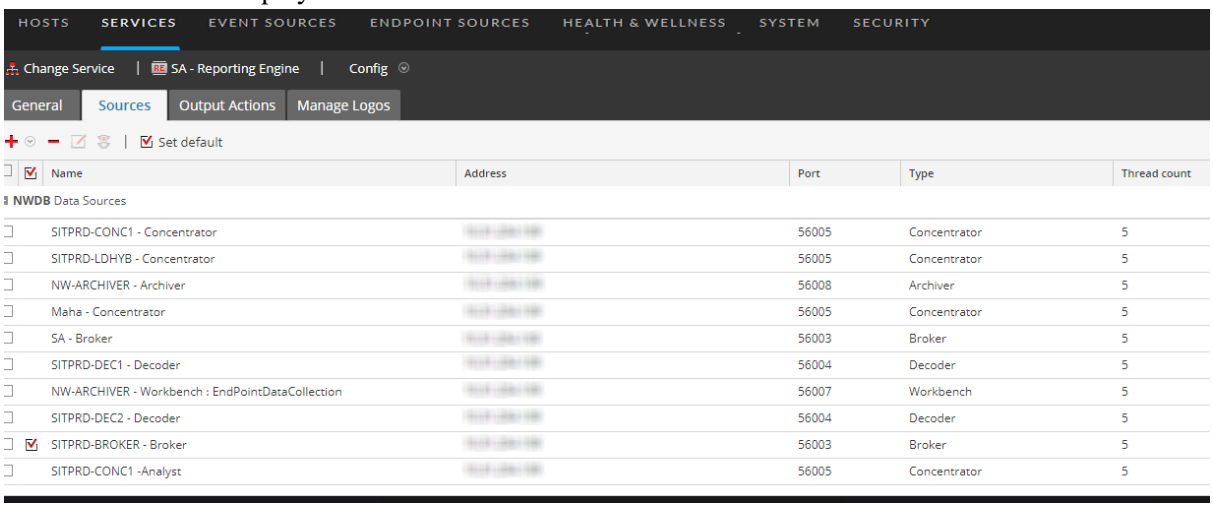
To add Workbench as a data source to Reporting Engine:



1. Go to  **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Select  > **View** > **Config**.

   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click  and select **Available Services**.

   The Available Services dialog is displayed:



6. Select the Workbench service and click **OK**.
   A list of collections are displayed.
7. Enter the service information, and click **OK**

8. Select a collection from the dropdown.

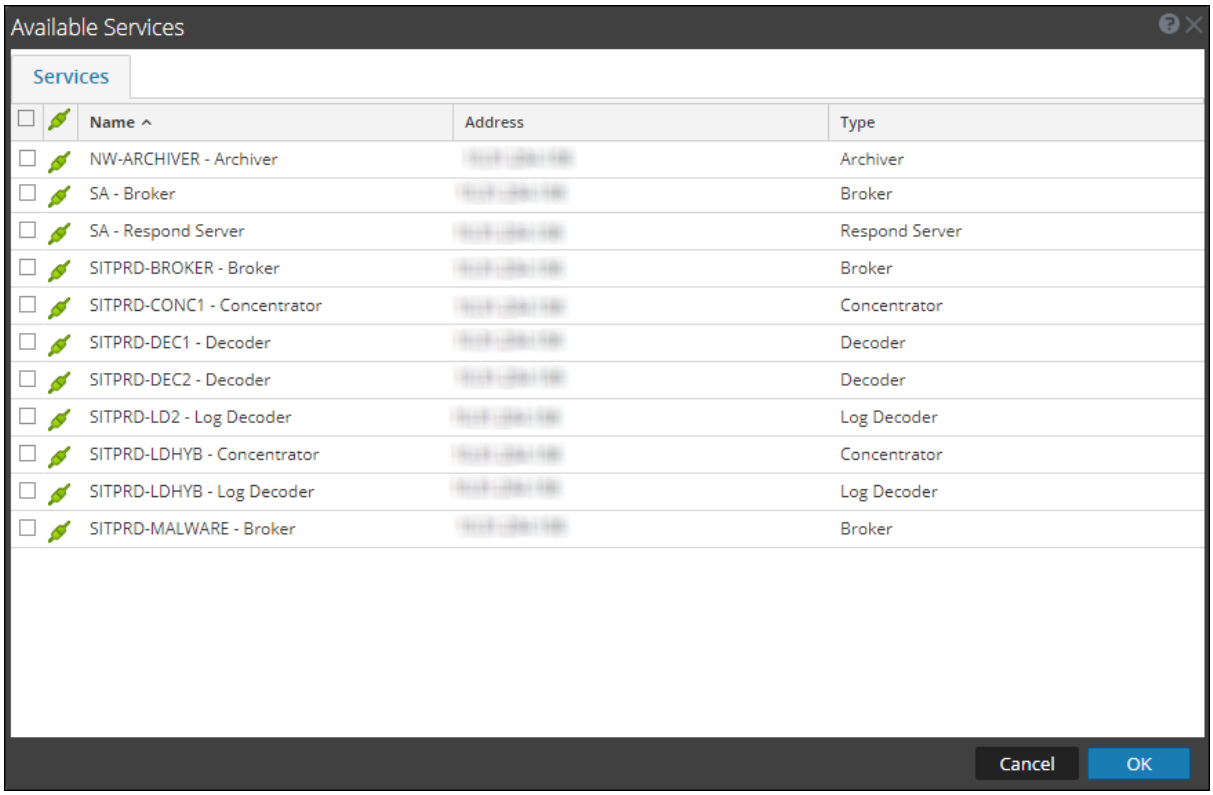
9. The data source is displayed in the Sources tab.

The workbench service is now added as a data source to the Reporting Engine.

Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

(Optional) Add Archiver as Data Source

You must configure Archiver, to be able to use data from Archiver data source to generate Reports and Alerts:



Prerequisites

Make sure that you have:

1. Installed the NetWitness Archiver host in your network environment. For more information, see the *Hosts and Services Getting Started Guide*.
2. Installed and configured Log Decoder in your network environment. For more information, see "Add Log Decoder as a Data Source to Archiver" in the *Archiver Configuration Guide*.
3. Reporting Engine service is available in your NetWitness deployment.
4. Added Archiver service to your NetWitness deployment. For more information, see "Add the Archiver Service" in the *Archiver Configuration Guide*.
5. Applied license to the Archiver service.

To add Archiver Data Source to Reporting Engine:

1. Go to  **(Admin) > Services**.
2. In the **Services** list, select the **Reporting Engine** service.
3. Click  > **View** > **Config**.
   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click  and select **Available Services**.
   The Available Services dialog is displayed.

6. Select the Archiver service and click **OK**.

   The service authentication dialog box is displayed.

   Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

7. Enter the Username and Password for the Archiver.
8. Click **OK**.

   The selected Archiver is listed in the Aggregate Services pane.

(Optional) Integrate Endpoint Information Into Reports

You can use the Endpoint data by using the following instructions to add the Endpoint information into Reports. The *Endpoint Integration Guide* provides an overview of Endpoint integration into NetWitness.

Prerequisites

Make sure that:

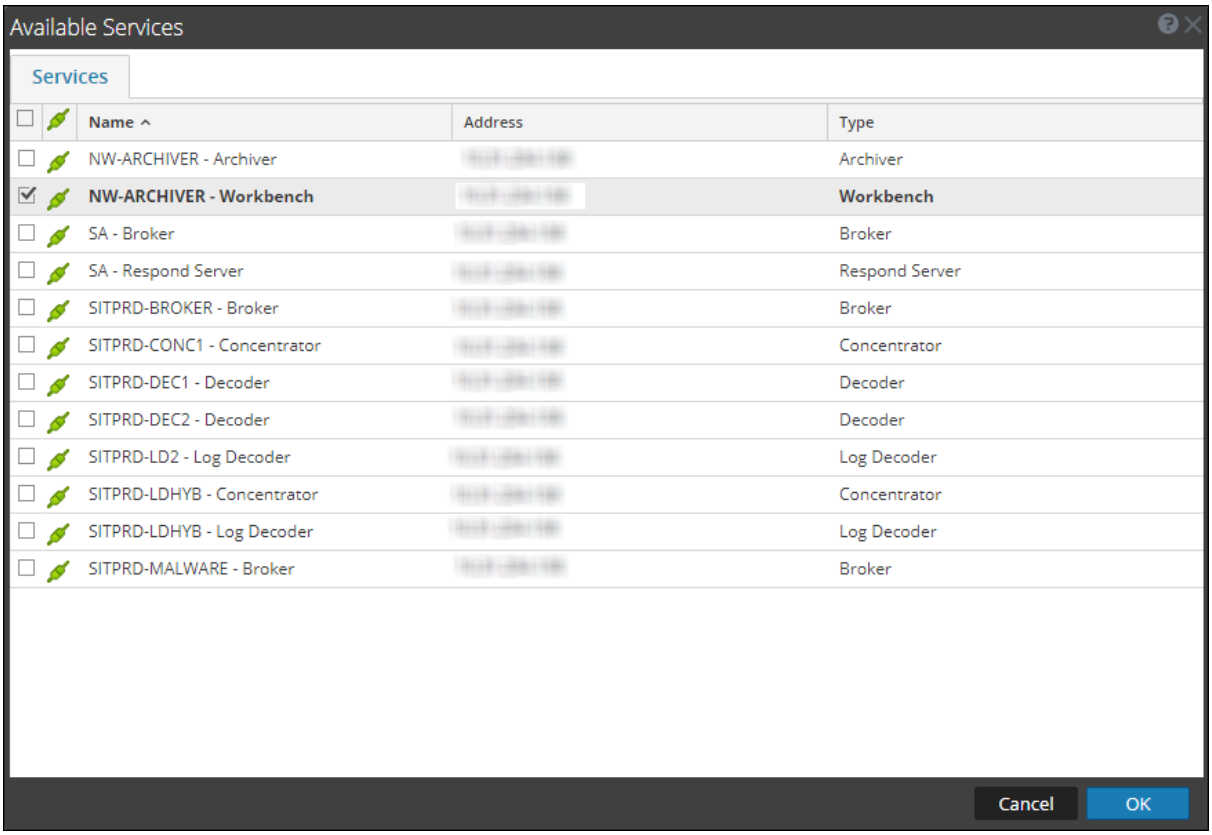
- You have configured the Endpoint alerts via syslog into a Log Decoder. For more information see, "Configure Endpoint Alerts Via Syslog into a Log Decoder" topic in *Endpoint Integration Guide*).

To integrate Endpoint information into Reports:

1. In **Reporting Engine**> **View**> **Config**> **Sources**.
2. Add the Concentrator that is consuming data from the Log Decoder as a data source.
   Endpoint meta is populated in Reporting Engine.
3. Run reports by selecting the appropriate meta.

(Optional) Add Collection as Data Source to Reporting Engine

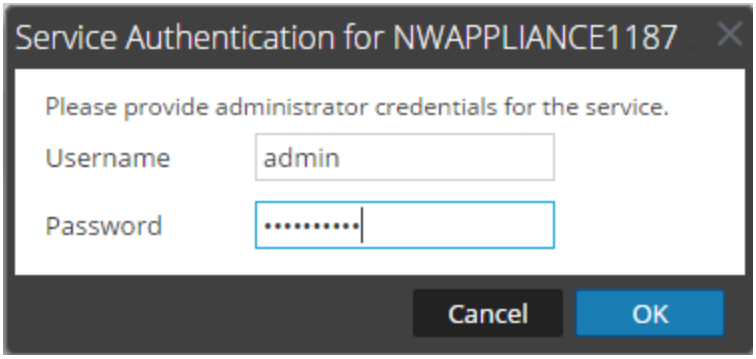
You must configure Collection, to be able to use data from Collection data source to generate Reports, Charts, and Alerts:



Prerequisites

Make sure that you have:

- Installed a Workbench service on a Reporting Engine host.
- Backed up data in a known location on your local host, if you are adding a collection using the data restored from the backed up data.



To associate a Collection as a data source with Reporting Engine:

1. Go to  **(Admin) > Services**.
2. In the **Services** list , select a **Reporting Engine** service.
3. Click  > **View** > **Config**.
   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click  and select **Available Services**.
   The Available Services dialog is displayed.

6. Select the Workbench service and click **OK**.

   The Service Authentication dialog for the selected service is displayed.

Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

7. Enter the username and password for admin credentials for the service.
8. Click **OK**.

   The add collection dialog is displayed.

9. Select a collection from the drop-down list and click **OK**.

   The workbench service is now added as a data source to the Reporting Engine.

Configure Data Privacy for the Reporting Engine

You can configure the data privacy for all data sources of Reporting Engine using the Sources tab of the **Services** > **View** > **Config** view.

With the addition of the Data Privacy feature to NetWitness 11.0 and above, access to sensitive meta in NetWitness Core services can be restricted by configuring separate data sources for Data Privacy Officer (DPO) users and non-DPO users, and limiting access to those data sources by assigning appropriate permissions.

In the **Services** > **Config** view, you can add each Core service as two separate data sources: one with a service account having privileges equivalent to a DPO and the other with a service account having privileges equivalent to any other user. Then, to limit access to those data sources based on roles, you can assign read access or no access to those data sources for individual roles. To limit access to Warehouse data sources, you can do the same.or more information, see Configure Data Source Permissions.

Note: A user assigned to the `Data_Privacy_Officers` role (or an equivalent custom role), can create a report, chart and alert. Also, configure a report or alert output actions in the Reporting module. In an environment where data privacy features of NetWitness are enabled and one or more meta keys are configured as protected, these actions can result in the following:
- When an alert is created by a DPO user, any protected or sensitive meta involved in the alert is automatically available in Respond. This may inadvertently provide all the users of Respond module access to the sensitive meta values, regardless of their roles. One option to prevent this is to disable publishing into Respond from Reporting.
- When an Output Action is configured by a DPO user, either sensitive meta values, reports with sensitive meta values or both, may become available to target users or destinations of that Output Action, regardless of the role assigned to the target user.

It is strongly recommended that DPO users completely avoid creating alerts or configuring output actions for a report or alert in the Reporting module. If they do such configuration, the above implications must be carefully considered.

NetWitness Core services (for example, Concentrator, Broker, or Archiver) support the ability to restrict meta data based on the configured user role. To make use of the data privacy feature for Reporting Engine, you can configure two separate service accounts against Core services. One service account for general purpose reporting that does not include any sensitive data and the other account for privileged users with access to all data including sensitive data. The access to restricted meta data for the two service accounts is configured as part of the data privacy plan on each Core service.

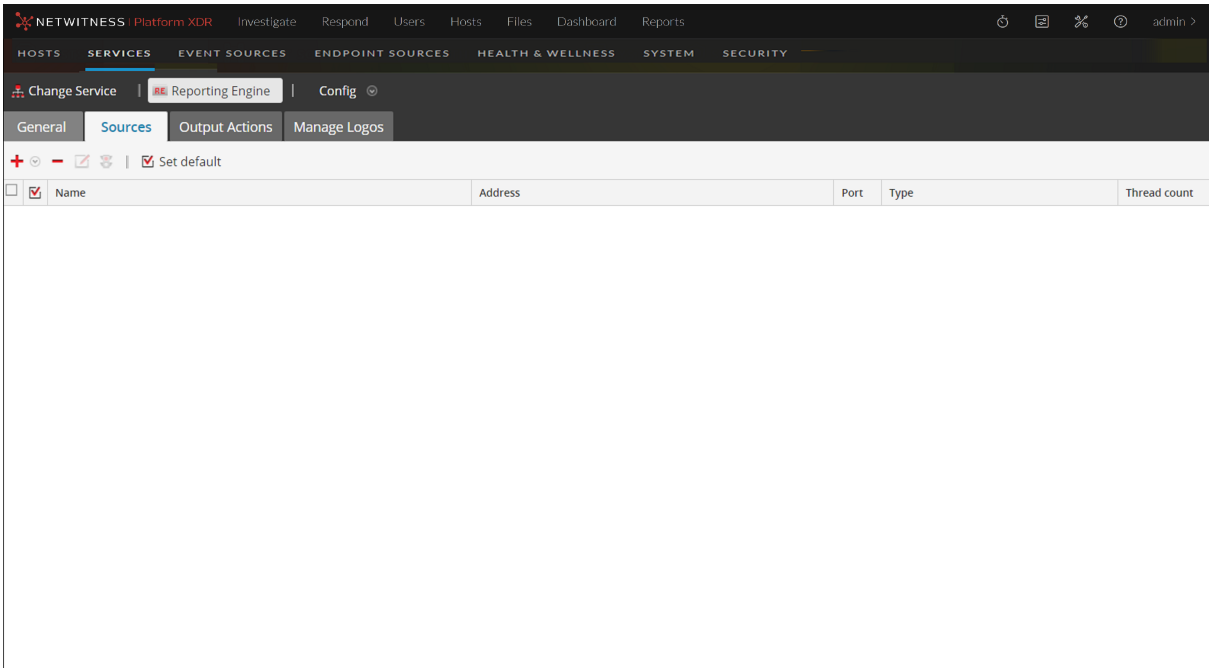
In Reporting Engine, you can add each Core service as two separate data sources (one being the regular data source and the other a privileged data source) using the two separate service accounts. You can configure Reporting Engine to allow only users with privileged roles to access the sensitive data source. Hence, Reporting Engine can connect to a NWDB Data source in two ways:

- Using a service account with DPO role.
- Using a service account without a DPO role.

Note: You can also add two or multiple data sources for the same Core service.

After adding two data sources with different service accounts for the same Core service, you can configure data source permissions to manage access to these data sources. For more information, see Configure Data Source Permissions.

Note: If the content is changed to utilize the transformed meta key, the hash value of the original meta is displayed in its place when viewing reports, charts and alerts.



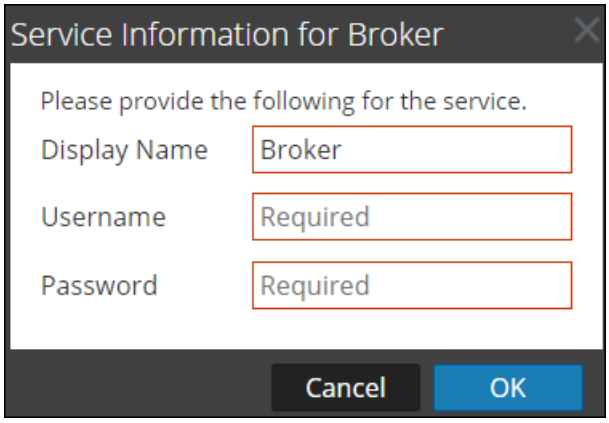
Add a NWDB Data Source with Different Service Accounts

To add a NWDB data source:

1. Go to **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click **View** > **Config**.

   The Services Config view of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The Services Config View is displayed.

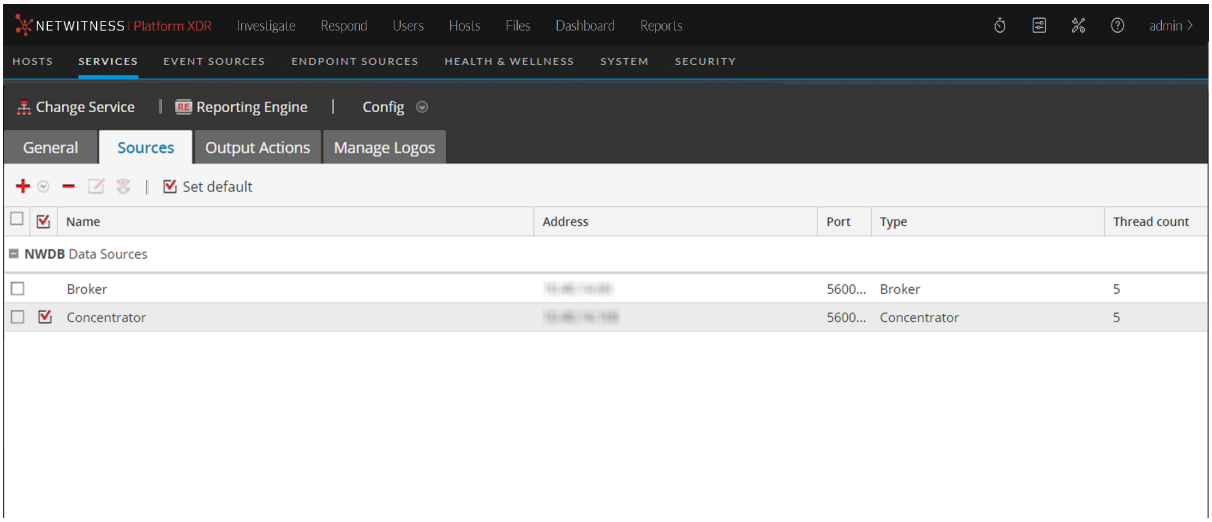


5. Click and select Available Services.

   The Available Services dialog is displayed. All services are listed, including those that have already been added to the Reporting Engine.

6. Select the checkbox next to the service and click **OK**.

   The Service Information dialog for the selected service is displayed.



Note: NetWitness prompts you to provide a username and password for the selected service. To limit access to sensitive data, DPO users must use their credentials while adding the source instead of using the admin credentials. These credentials need to be applied to the host even if using trusted connections between the NetWitness server and NetWitness Core hosts.

   Repeat the step for Non-DPO data source.

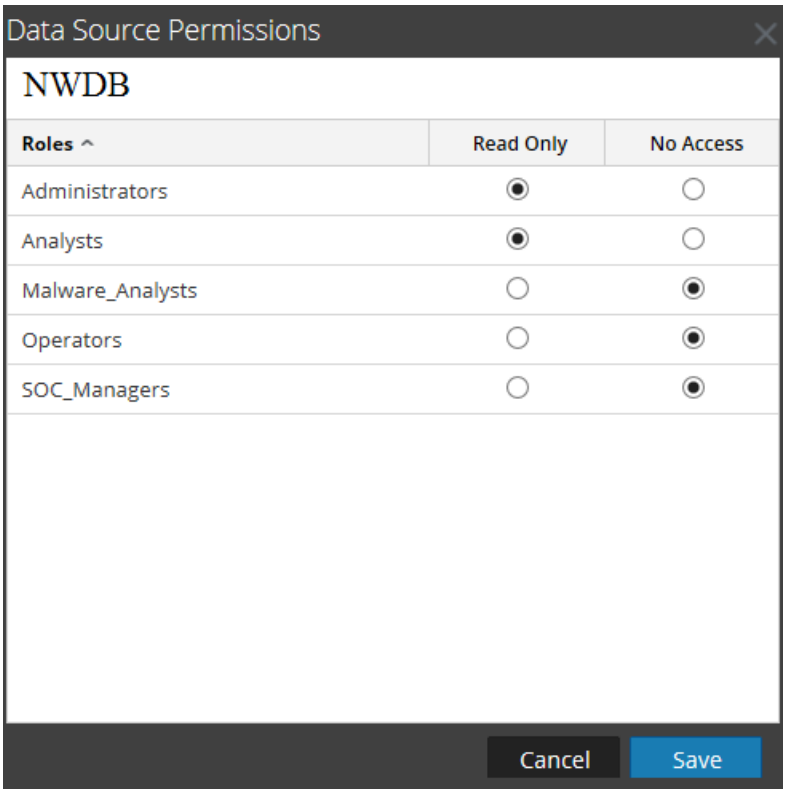
7. Enter the username and password for the required service account.
8. Click **OK**.

The required service is added as a data source to the Reporting Engine. Two data sources are added to Reporting Engine for the same Core device.

Configure Data Source Permissions

You can configure data source permissions for Reporting Engine using the **Sources** tab of the **Services** > **Config** view. This helps manage access control to the data sources by setting the data source permissions. Now, with the ability to add more than one data source for the same Core service, you can configure different permissions for each data source of the same Core service. For example, data privacy officers (DPO) can create a Warehouse source using their credentials, and that allows them to execute reports against the Warehouse while restricting everyone else from being able to use that source.

Note: In 11.x, the permissions for NWDB and Warehouse data sources are automatically set based on the permissions of the reporting objects. For example, if the role had the permissions set as **Read Only**/**Read & Write** for any reporting object in 10.5, then that role is automatically assigned read only permission for all the data sources that existed in 10.5. If no permission is set for the role, then the data source permission is automatically set to No Access.



To configure permissions to data sources:

1. Go to  **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click  > **View** > **Config**.

   The Services Config view of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The Service Config View displays the Sources tab.
5. Select the data source for which you want to configure permissions by selecting the checkbox.
6. Click .

   The Data Source Permissions dialog is displayed.

7. Modify the access permission for different users based on the type of service account of the data source. The permission can be either **Read Only** or **No Access**.
8. Click **Save**.

   The required permissions are configured for the data source. For more information, see the *Reporting Guide*.

Configure Reporting Engine Settings

After you configure the Reporting Engine and required data sources based on your requirements, you can modify some of the configurations to customize your Reports, Charts, and Alerts.

To configure the settings:

1. Go to  **(Admin) > Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click  > **View** > **Config**.

   The Services Config View of Reporting Engine is displayed with the General tab highlighted. For more information on Reporting Engine General tab, see Reporting Engine General Tab.
4. Edit the Reporting Engine service settings and click **Apply**.

   The service settings are configured on Reporting Engine.

Enable LDAP Authentication

To enable LDAP mode of authentication using Active Directory for HiveServer2 for Warehouse data source, follow these steps.

1. Log on to the Analytics Warehouse appliance as root user.
2. Navigate to `/opt/mapr/hive/hive-0.11/conf.new/` directory. Type the following command and press ENTER:

   ```
   cd /opt/mapr/hive/hive-0.11/conf.new/
   ```
3. Edit the file `hive-site.xml`. Type the following command and press ENTER:

   ```
   vi hive-site.xml
   ```
4. Add the following properties under `<Configuration>` tag:

   ```
   <property> <name>hive.server2.authentication</name> <value>LDAP</value>
   </property> <property> <name>hive.server2.authentication.ldap.url</name>
   <value>LDAP_URL</value> </property>
   ```

   Where `LDAP_URL` is the URL of the LDAP Server.
5. Restart HiveServer2.

Add Additional Space for Large Reports

To add additional disk space to the Reporting Engine for large reports, follow the below steps. If large compliance reports have to be generated for Warehouse, the Reporting Engine disk space might get consumed quicker than expected. In such cases, you can mount any external storage such as SAN or NAS for storing reports.

The directories that tend to fill up disk space are `resultstore` and `formattedReports` under the Reporting Engine home directory. It is recommended to move only these two directories to SAN or NAS and replace the original locations with soft links pointing to the new locations. It is also recommended to leave the remaining directories in the local disk itself for reliable and high I/O performance.

Note: The following steps assume that the Reporting Engine home directory is located at `/var/netwitness/re-server/rsa/soc/reporting-engine/` and the external storage is mounted under `/externalStorage/`. Also, the 'rsasoc' user must have read-write access to the specified external storage path.

To move disk space for the Reporting Engine to external storage:

1. Stop Reporting Engine service as a root user.

   ```
   service rsasoc_re stop
   ```

2. Switch to `rsasoc` user.

   ```
   su rsasoc
   ```

3. Change to RE home directory.

   ```
   cd /var/netwitness/re-server/rsa/soc/reporting-engine/
   ```

4. Move the resultstore directory to a mounted external storage. Type the following command and press ENTER:

   ```
   mv resultstore /externalStorage
   ```

5. Move the formatted Reports directory to a mounted external storage. Type the following command and press ENTER:

   ```
   mv formattedReports /externalStorage
   ```

6. Create a soft link for resultstore. Type the following command and press ENTER:

   ```
   ln -s /externalStorage/resultstore /var/netwitness/re-
   server/rsa/soc/reporting-engine/resultstore
   ```

7. Create a softlink for formattedReports. Type the following command and press ENTER:

   ```
   ln -s /externalStorage/formattedReports /var/netwitness/re-
   server/rsa/soc/reporting-engine/formattedReports
   ```

8. Exit the `rsasoc` user.

   ```
   exit
   ```

9. Start Reporting Engine service as a root user.

   ```
   service rsasoc_re start
   ```

   Note: If the external storage is offline, you cannot perform the following tasks:
   1) Execute Reports or Reporting Alerts
   2) View existing Reports or Reporting Alerts
   However, you can create new Reporting objects such as Reports and Charts, and access Charts and Live Dashboard created for charts. Therefore, you must ensure that the external storage is reliable and has the required space.

   Additionally, if you want to store reports beyond 100 days, change the retention configuration appropriately for the service that you are using as a data source.

Accessing Reporting Engine Log Files

You can access the Reporting Engine log files which are stored in the following logs directory `/var/netwitness/re-server/rsa/soc/reporting-engine/logs/`

- Current logs in the `reporting-engine.log` file.
- Backup copies of previous logs in the `reporting-engine.log.*` file.
- All UNIX script logs in the files that have the following syntax: `reporting-engine.sh_timestamp.log` (for example, `reporting-engine.sh_20120921.log`)

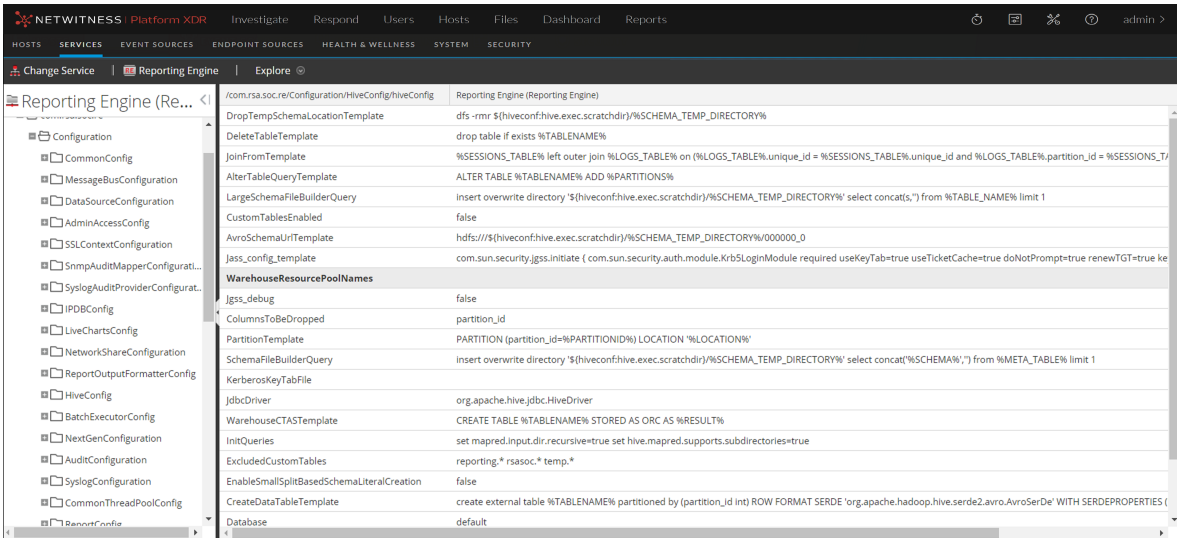
The Reporting Engine rarely writes command line error messages to the `rsasoc/nohup.out` file.

The Reporting Engine appends the log messages and output written by systemd system and the commands used to start the reporting-engine to the directory `/var/log/messages`.
A `/var/log/messages` log file is a system log file so only the root user can read it.

Configure Task Scheduler for a Reporting Engine

You can configure queues and pools in the Reporting Engine to schedule NWDB or Warehouse reports. For more information on Task Schedulers, see "Task Scheduler for Warehouse Reporting" in the *Reporting Guide*

Prerequisites



Make sure that you have identified the following:

- Scheduler type and pools or queues you want to use. You can configure only one scheduler for the Reporting Engine. By default the Fair Scheduler is configured.
- Names of the queues or pools, and the resources given to each queue and pool.
- NetWitness does not support multiple queues or pools per cluster. Netwitness recommends that you either provide unique names to queues or pools in all the clusters or use the same queue or pool names in both the clusters. If cluster size is large, there may be more than 3 pools or queues.
- If you are using an unsupported scheduler, the Reporting Engine does not set any property for the jobs that it launches.
- If the name of the pool or queue does not exist in the cluster, then Capacity Scheduler uses the default queue for the report. The Fair Scheduler may not execute the rule or creates a new pool with the lowest share. This is based on the value specified for the Fair Scheduler property `mapred.fairscheduler.allow.undeclared.pools`.
- If you do not specify a pool or queue, the job launched by the test rule is in the `mapr` pool or the default queue. It recommends that you configure a pool mapr with low (around 1/10 of total capacity) share with `maxRunningJobs = 2` so that these rules do not disrupt running reports. Make sure that you do not specify this pool name for any reports.

Specify the Pools and Queues

To specify the pools and queues:

1. Go to  **(Admin) > Services**.
2. Select **Reporting Engine** and click  > **View** > **Explore**.
3. Select **com.rsa.soc.re** > **Configuration** > **HiveConfig** > **hiveconfig** > **WarehouseResourcePoolNames**.
4. In the **WarehouseResourcePoolNames** field, enter the pool or queue names separated by spaces. For example, to configure four pools or queues with the names pool1, pool2, wrong and default, enter the names separated by a space.

Define Reports, Charts and Alerts

After you configure the Reporting Engine and the required data source based on your requirement, you can generate your Reports, Charts, and Alerts.

Define Reports

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Reporting module:

- Define a Rule
- Test a Rule
- Schedule Reports
- Add an Alert
- Add a Chart
- Test a Chart

For more information, see the above topics in the *NetWitness Reporting Guide*.

Define Charts

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Reporting module:

- Define a chart and Chart Groups
- Test a Chart
- Investigate Charts
- Manage Charts

For more information, see the above topics in the *NetWitness Reporting Guide*.

Define Alerts

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Alerting module:

- Configure Alerts
- Generate Alerts
- Add an Alert
- View an Alert

- View and Alert
- View Alerts Schedule
- Investigate an Alert

For more information, see the above topics in the *NetWitness Reporting Guide*.

Configure Reporting Engine General Settings

After you add and configure the Reporting Engine service, the system settings are defined with default values to achieve optimal results. However, you can modify and customize the Reporting Engine notifications based on your requirement by navigating to the **General** tab in the **Services** > **Config** view for a Reporting Engine.

Access the General Tab

You need to open the General tab to configure the general parameters for Reporting Engine.

To access this view:

1. Go to  **(Admin) > Services**.
2. In the Services list, select a **Reporting Engine** service.
3. Click **View** > **Config**.
4. Select the **General** tab.
5. Click **Apply** after you edit the parameters.

After you navigate to the General tab, you can modify the following parameters.

- System Configuration
- Logging Configuration
- Warehouse Kerberos Configuration

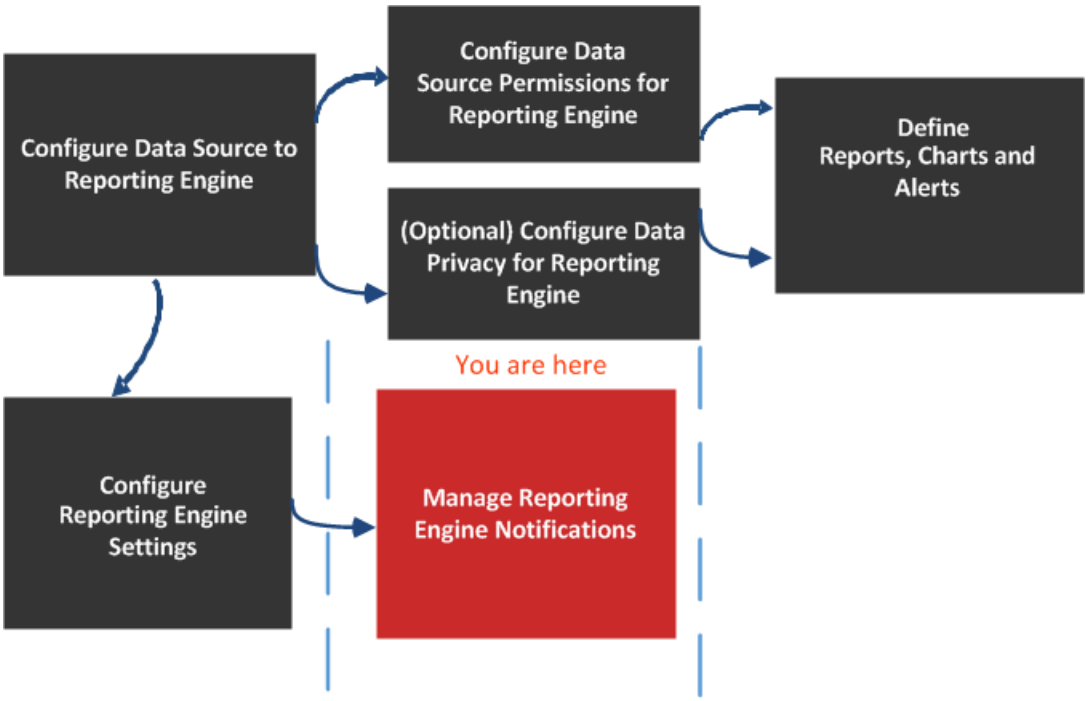
For more information see, General tab for details on the configuration parameters.

Troubleshooting Reporting Engine Configuration

Problem	Solution
When the NetWitness Server IP address is changes, the Reporting Engine datasource configuration does not get updated with the new IP	You must manually configure the new IP. Perform the following manual steps to configure the new IP address: 1. Login in NetWitness Platform. 2. Go to  **(Admin) > Services** > **Reporting Engine** > **View** > **Config**. 3. Click the **Output Actions** tab. 4. Add the new IP address in the **Hostname** field. 5. Click **Apply**. 6. Click the **Sources** tab and add the data sources again.

References

You can customize and make optimum use of the service by modifying the Reporting Engine settings in the **Services** > **Config** view, which has parameters that specifically pertain to the Reporting Engine.



See the following sections for details:

- Reporting Engine General Tab
- Reporting Engine Sources Tab
- Reporting Engine Output Actions Tab
- Reporting Engine Manage Logos Tab

Reporting Engine General Tab

The General tab for the Reporting Engine service controls several settings that can tune the performance of a service and specify the user credentials for the service. Navigate to Services > View > Config > Reporting Engine > General. These settings are used for the Reporting Engine service exclusively.

The required permission to access this view is Manage Services.

What do you want to do?

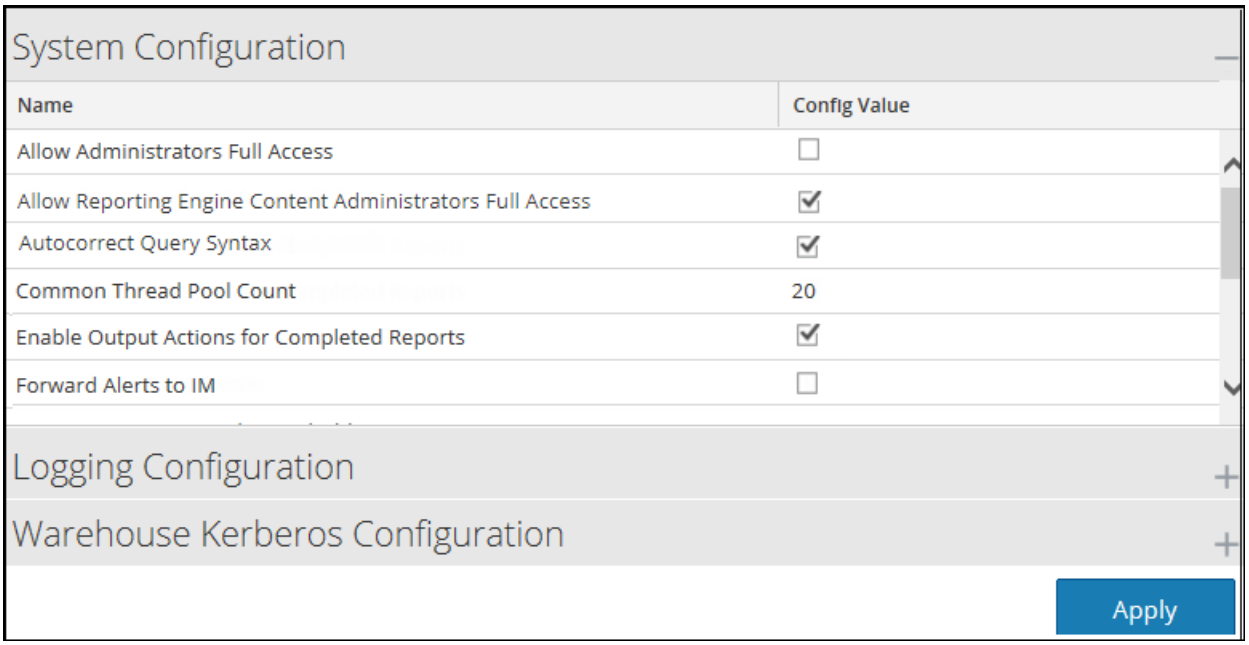
- How Reporting Engine Works

Quick Look

Here is example of the General tab where service configurations are displayed.



1. Displays all the available configurable tabs.
2. Displays the available configuration parameters for the system.
3. Displays the name of the parameter.
4. Displays the set values for each parameter.
5. Applies the changes.

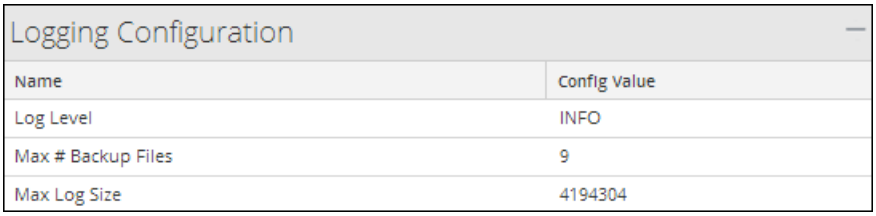
System Configuration

The System Configuration panel parameters for the Reporting Engine manage service configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. The default values are designed to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance.

The following figure displays the fields that can be configured in the System Configuration panel:

The following table describes the System Configuration panel features.

Name	Config Value
Allow Administrators Full Access	Select the checkbox if you want to access all the Reporting Engine objects (Reports, Rule, Charts, Schedule, and List) created by other users (non-admin). By default, this is not enabled. **Note:** If you enable the checkbox and then disable it, the access on all Reporting Engine objects that were enabled by selecting the checkbox will not be accessible. But, if you have defined the access on specific objects via Permissions window (**Reports > Manage > RE Object >**  **> Permissions**), enabling/disabling this checkbox will not have impact on these objects.
Allow Reporting Engine Content Administrators Full Access	Select the checkbox if you want to access all the Reporting Engine objects (Reports, Rule, Charts, Schedule, and List) created by other users. By default, this is enabled. If disabled, you cannot access the Reporting Engine objects (Reports, Rule, Charts, Schedule, and List) created by other users.
Common thread pool count	The number of thread pools assigned for executing common tasks on the Reporting Engine. A valid value is an integer (**20** default).
Enable Output Actions for Completed Reports	Select the checkbox to process the output actions only for reports with all rule executions successful. By default, this is enabled. If disabled, the output actions are processed for all scenarios (completed, partial, failure).
Forward Alerts to Respond	Select the checkbox to forward all the alerts to Respond. By default, this is not enabled.



Name	Config Value
Max# of Concurrent Alerts	The maximum number of alerts that can be run simultaneously. This has a direct impact on the NetWitness service against which the alerts are run, as each alert consumes a query thread on the NetWitness service. A valid value is an integer (**10** default).
Max # of Concurrent Charts	The maximum number of charts that can be run simultaneously. A valid value is an integer (**10** default).
Max # of Concurrent LookupAndAdd Queries	The maximum number of parallel LookupAndAdd Queries that can be run per NWDB rule. A valid value is an integer (**2** default). When you increase this value, for better performance, you must ensure the NWDB data source is configured to handle the parallel queries.
Max # Concurrent List Value Reports	The maximum number of list value reports per schedule that can be generated in parallel. A valid value is an integer (**1** default).
Max # List Value Reports	The maximum number of list value reports generated, irrespective of the number of values in the list. A valid value is an integer (**10000** default).
Max rows stored per Rule (Billions)	The maximum number of rows that a rule can fetch when queried. A valid value is an integer (**100** default).
Maximum disk space threshold	The maximum disk space threshold allotted (in GB) to execute reports, alerts and charts. The initial value is configured based on the available system space.
Minimum disk space threshold	The minimum disk space threshold allotted (in percentage) required to execute reports, charts, and alerts. By default, this is value is set to 5. **Note:** If the minimum threshold is reached, then the execution of reports, charts and alerts will stop even if the service is running.
NWDB Info Queries Time Out	The info queries time out in seconds for NWDB server. A valid value is an integer (**1800** default).
NWDB Maximum aggregate Rows	The maximum number of rows that is returned when an aggregation is used in the NWDB rule. A valid value is an integer (**1000** default).
NWDB Query Time out	The time out in seconds for NWDB server to time out the rule execution, if it cannot process the result in configured time. A valid value is an integer (**259200000** default).
Process output actions for successful reports only	Select this checkbox to process output actions only for reports whose all rule executions are successful. When you de-select this checkbox, output action will be triggered for partial, completed, and failed reports. **Note:** This is applicable for all output actions except for dynamic list output actions.

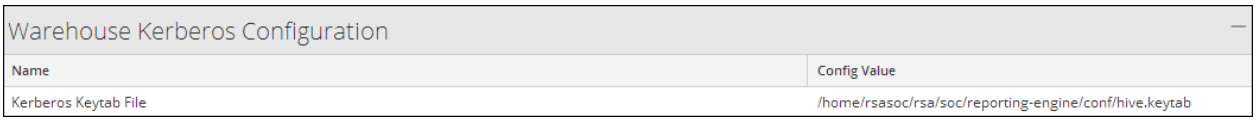
Name	Config Value
Retain Alert history for # days	The maximum number of days to retain the alert history and alert status. A valid value is an integer (**100** default).
Retain Chart history for # days	The maximum number of days to retain the chart history and chart status. A valid value is an integer (**30** default).
Retain Report history for # days	The maximum number of days the system retains report history and report status. A valid value is an integer (**100** default).
Schedule Thread pool count	The number of thread pools assigned for scheduled tasks (for example, clearing history) on the Reporting Engine. A valid value is an integer (**5** default).

Logging Configuration

The Logging Configuration panel parameters of the Reporting Engine manages the logging configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. NetWitness designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance of the Reporting Engine.

The following figure displays the fields that can be configured in the Logging Configuration panel.

The following table describes the Logging Configuration panel features.



Name	Config Value
Log Level	The logging level that determines the scope of information included in log files. Possible values are: • `ERROR` • `WARN` • `INFO (default)` • `DEBUG` • `ALL`
Maximum # Backup Files	The maximum number of backup log files the system retains. A valid value is an integer (**9** default).
Max Log Size	The maximum size (in bytes) of the primary log file. A valid value is an integer (**4194304** default).

For more information on Reporting Engine logging, see Accessing Reporting Engine Log Files.

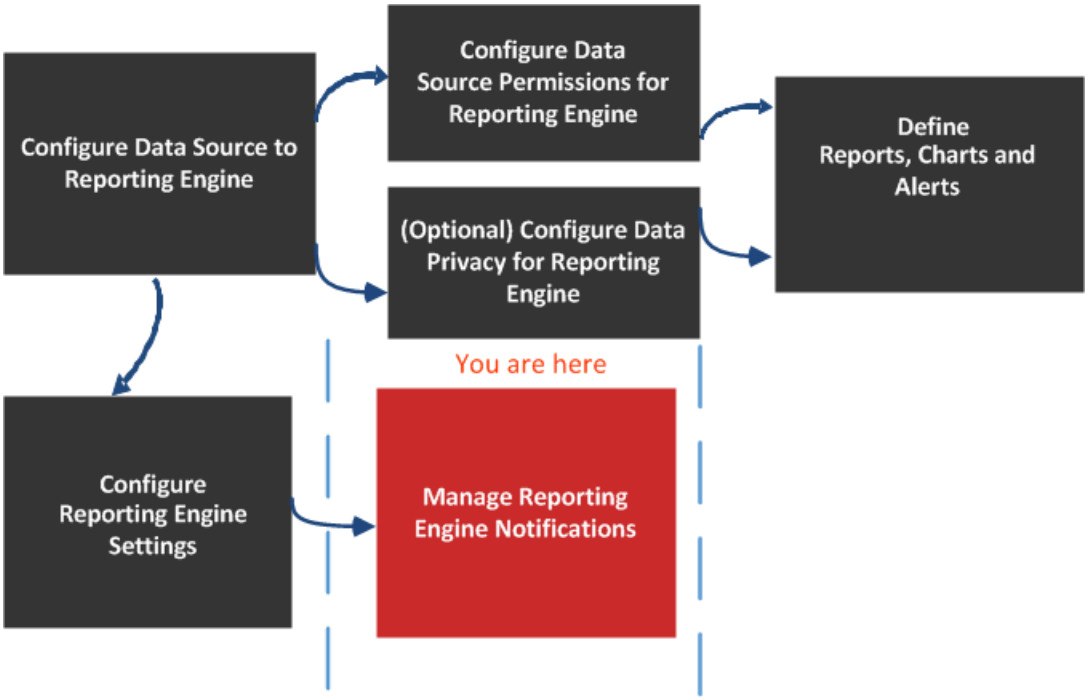
Warehouse Kerberos Configuration

The Warehouse Kerberos Configuration panel provides a way to specify the Kerberos Keytab file on this Reporting Engine.

The following figure displays the field that can be configured in the Warehouse Kerberos Configuration panel:

The following table describes the Kerberos Configuration panel features:

Name	Config Value
Kerberos Keytab File	The Kerberos keytab file location. For example: `/var/netwitness/re-server/rsa/soc/reporting-engine/conf/hive.keytab`



The default Kerberos configuration file is located at, `/etc/kbr5.conf` in the Reporting Engine. You can modify the configuration file to provide details for Kerberos realms and other parameters related to Kerberos.

Added the host name (or FQDN) and IP address of the Horton Works nodes and Warehouse Connector to the DNS server. If the DNS server is not configured, add the host name (or FQDN) and IP address of the Horton Works nodes and Warehouse Connector to the `/etc/hosts` file in the host on which the Warehouse Connector service is installed.

Reporting Engine Sources Tab

The services configuration parameters are available in the Sources tab of the Services Config view for the Reporting Engine. The Sources tab for the Reporting Engine service in the Services Config view controls that data sources associated with a Reporting Engine. The Source tab consists of a single panel with a toolbar and a grid that lists the data sources associated with the Reporting Engine.

Workflow

Related Topics

- How Reporting Engine Works

Quick Look

Here is example of the Sources tab where the available services are displayed.

1 Displays all the available configurable tabs.
2 Displays the available configuration parameters for the selected service .
3 Displays the field parameters for the selected service.

The data sources available to the Reporting Engine for which you are defining reports, charts and defining alerts are:

- **NWDB Data Sources** - The NetWitness Database (NWDB) data sources are Decoders, Log Decoders, Brokers, Concentrators, Archiver, and Collection.

  Note: When a data privacy plan has been implemented to limit access to sensitive data on a data source, you must configure different service accounts in Reporting Engine for privileged and non-privileged users. To configure different service accounts for data privacy, you can add more than one NWDB data source. This procedure is available under Configure Reporting Engine Settings.

  IMPORTANT: If you change the admin password on a NetWitness service that is used as a Reporting Engine data source, you must remove and then re-add the service as a data source.

- **Warehouse Data Sources** - The Warehouse data sources are Horton Works and MapR.

- **Respond Data Sources** - Respond is used to generate reports on alerts and incidents. The Respond data sources are Reporting Engine, ESA, Malware, EndPoint, and Web Threat Detection. Respond is used to store the alerts and incidents reports.

If you set a source as the default data source, NetWitness uses that source when you create reports and alerts unless you choose to override it with one of the other sources listed in this tab.

Note: You can manage access control to NWDB and Warehouse Data Sources. For more information, see Configure Reporting Engine Settings.

Features

You can perform the following actions on the Sources tab:

Icon	Actions
	This option adds new services as data sources for Reporting Engine. Add existing services (Archiver, Workbench, and Collection) as data sources for Reporting Engine. For details, see the corresponding topic: • (Optional) Add Archiver as Data Source • (Optional) Add Collection as Data Source to Reporting Engine • (Optional) Add Workbench as Data Source
	This option removes data sources from a Reporting Engine.
	This option configures the Data Source Permissions. This is enabled only for NWDB and Warehouse Data Sources. For more information, see Configure Data Source Permissions.
	This option sets the default data sources for a Reporting Engine. This is the source to which NetWitness defaults in the **Data source** field of the following views: • Rule Definition view. • Create or Modify Alert view.

The NetWitness data sources are listed under the different categories as follows:

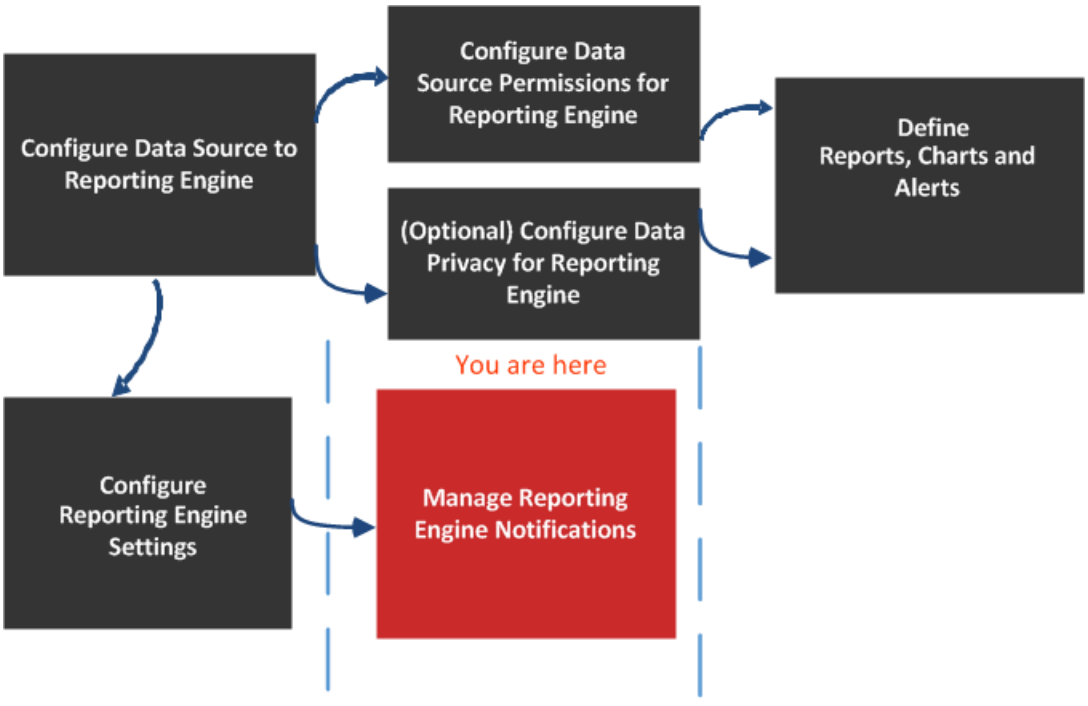
- NWDB Data Sources category displays the NetWitness data sources.
- Warehouse Data Sources category displays the Warehouse data sources.

Column	Description
	Clicking the check box selects the data source. After you select it, you can use toolbar to remove the source or set the source as the default.
Name	Displays the name of the data source.
Address	Displays the IP Address of the data source.
Port	Displays the port of the data source.

Column	Description
Type	Displays the service type of the data source.
Thread Count	Displays the thread pool size used for executing rules on the data source.

Reporting Engine Output Actions Tab

You can configure output actions for a Reporting Engine to determine the format you want the data to be presented to you based on your requirements. The service configuration parameters are available in the Output Actions tab of the Services Config view configured for a report or an alert execution. This tab consists of the following panels:



- NetWitness Configuration
- Simple Mail Transfer Protocol (SMTP)
- Simple Network Management Protocol (SNMP)
- Syslog
- Simple File Transfer Protocol (SFTP)
- Uniform Resource Locator (URL)
- Network Share

For instance, Syslog output action is used specifically for Reporting Engine Alerts, whereas, SFTP, URL, and Network Share output action is used specifically for Reporting Engine Reports.

You can configure the required permission to access this view in Manage Services.

You must ensure that the Reporting Engine is up and running and the data source from which you want to generate a report is configured in the NetWitness.

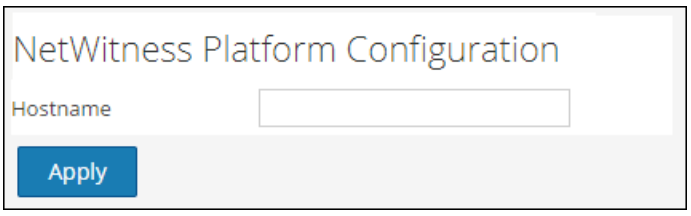
Related Topics

- How Reporting Engine Works

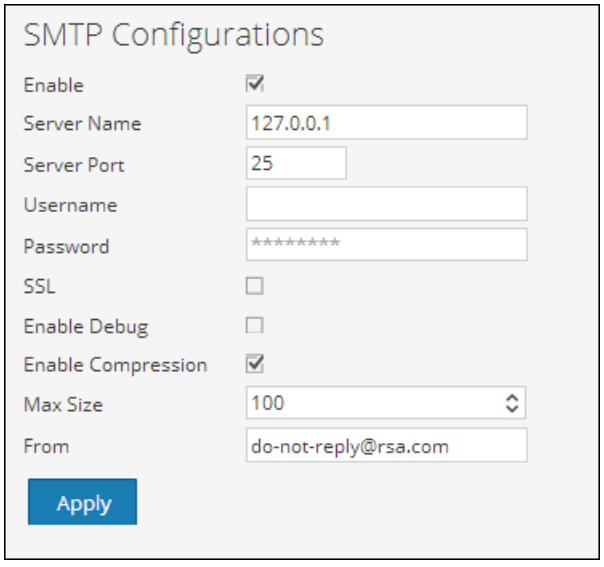


Quick Look

1	Displays all the available configurable tabs.
2	Displays the NetWitness configuration host.
3	Displays all the types of output action that can be configured.

NetWitness Configuration

The following figure shows the NetWitness Configuration on the Output Actions Tab.



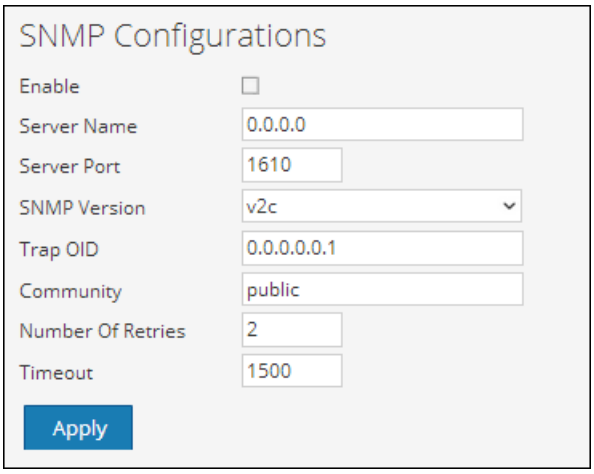
The following parameters identify the NetWitness host that is associated with the Reporting Engine.

Name	Config Value
Host Name	IP Address or Hostname of the NetWitness server. You must specify this parameter for all kind of deployments so that you can refer to this address to create investigation links to NetWitness from Reports, Alerts, and so on. The NetWitness uses this parameter to correctly generate: • SMTP Output Action • SNMP Output Action • Syslog Output Action • SFTP Output Action • URL Output Action • Network Share Output Action • Hyperlinks for meta values in Report PDFs
Apply	Update the configuration.

SMTP

After an execution is completed, an email notification is sent to the user based on the SMTP configuration.

The following figure shows the SMTP Configuration on the Output Actions Tab.



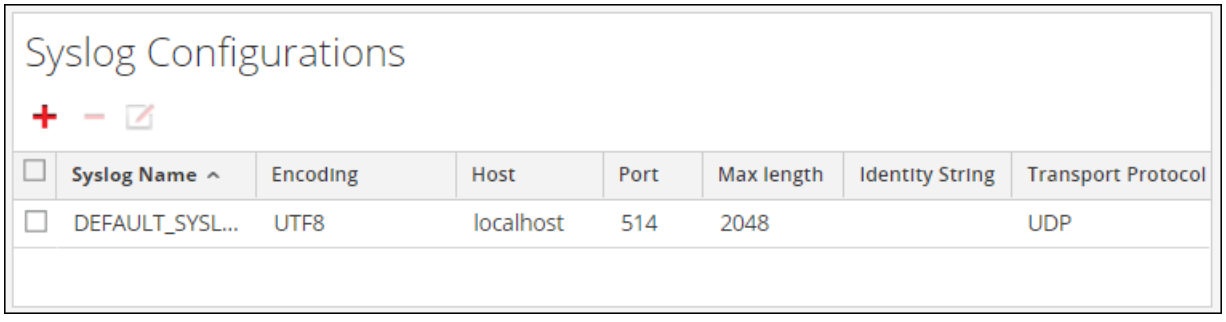
The following parameters manage SMTP (email) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
Enable	Check this box to enable SMTP as an output action for both alert and report from this Reporting Engine. By default, this value is enabled.
Server Name	Specify the hostname or IP Address of the server on which the target SMTP server runs. Default value is 0.0.0.0.
Server Port	Specify the SMTP server port number. Default value is 25.
Username	Specify the username of your SMTP account. Default value is blank. Password Specify
Password	Specify the password of your SMTP account.
SSL	Check this box to use Secure Socket Layer (SSL) to communicate with the SMTP server. Default value is do not use SSL.
Enable Debug	Check this box to enable debugging. Default value is do not enable debug.
Enable Compression	Check this box to enable compression. Default value is enable compression. If this value is enabled, the output files will have `.zip` extension.
Max Size	Specify the maximum size of attachments that can be sent. Default value is 100.
From	Specify the email address from which Security Analytics sends all messages. Default value is `do-not-reply@rsa.com`.
Apply	Update the configuration.

SNMP

After an execution is completed, a trap notification is sent to the user based on the SNMP configuration.

The following figure shows the SNMP Configuration on the Output Actions Tab.



The following parameters manage SNMP (messages to network-attached services) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
Enable	Check this box to enable SNMP output action as an output for alert messages from this Reporting Engine. Default value is Disable.
Server Name	Specify the hostname or IP Address of the server on which the target SNMP server runs. Default value is **0.0.0.0**.
Server Port	Specify the port number of the server on which the target SNMP server listens for faults and exceptions. Default value is **1610**.
SNMP Version	Specify the version number of the SNMP protocol NetWitness uses to send SNMP traps.
Trap OID	Specify the object identification number that identifies the type of trap to send. Default value is **0.0.0.0.0.1**.
Community	Specify the SNMP group to which NetWitness belongs. The default value is **public**.
Number Of Retries	Specify the maximum number of times NetWitness tries to resend the alert message through SNMP. Default value is **2**.
Timeout	Specify the number of seconds after which NetWitness times out (stops trying to send SNMP alerts). Default value is **1500**.
Apply	Update the configuration.

Syslog

After an execution is completed, all notifications are sent via Syslog messages to a particular host based on the Syslog configuration. Multiple Syslog servers can be configured on the Syslog Configuration panel.

The following figure displays the Syslog Configuration on the Output Actions Tab.

The following parameters manage syslog output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

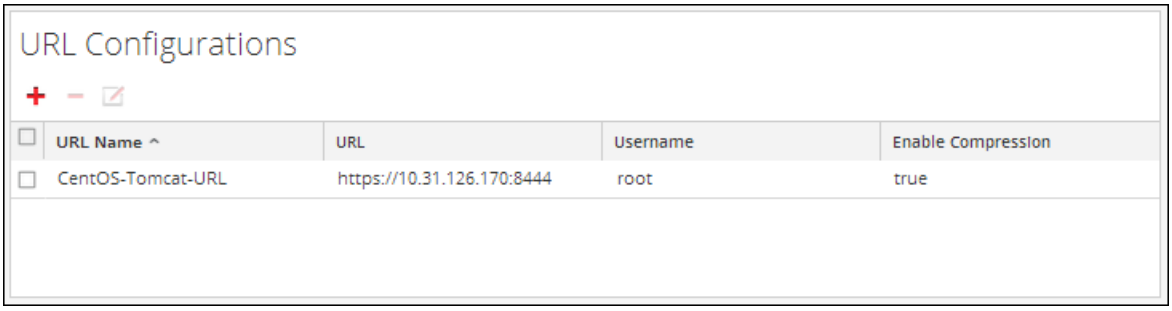
Name	Config Value
Syslog Name	The name of the Syslog configuration. **Note:** You cannot create a Syslog configuration with a name that already exists in the Reporting Engine Syslog configuration list.
Encoding	Specify the internationalization encoding for Syslog messages. Default value is **UTF8**.
Server Name	Specify the hostname or IP Address of the server on which the target Syslog process runs. Default value is blank.
Server Port	Specify the port number of the server on which the target Syslog server listens for faults and exceptions. Default value is **514**.
Max Length	Specify the maximum size (in bytes) of each Syslog alert message. Default value is **2048**. If **UDP** is the transport type and the Syslog message size is greater than 1024 bytes, you must configure a Syslog server that supports message sizes greater than 1024 bytes.
Identity String	Specify the string NetWitness inserts as a prefix in all Syslog alert messages. Default value is blank.
Include Local Hostname	Check this box to include the local hostname in all Syslog alert messages. Default value is do not include local hostname.
Truncate Message	Check this box to truncate all Syslog alert messages. Default value is do not truncate Syslog messages.
Use Identity	Check this box to use the IDENT protocol. Default value is does not use this protocol.
Include Local Timestamp	Check this box to include the local timestamp in all Syslog alert messages. Default value is do not include local timestamp.
Transport Protocol	Specify the transport type for Syslog message delivery. There are three parts to the Syslog transport type: UDP, TCP, and SECURE_TCP. Default value is **UDP**.
Syslog Message Delimiter	Specify the delimiter for the Syslog message. There are three delimiters: CR, LF, and CRLF. By default the value is **CR**. **Note:** This field populates when you select TCP or SECURE_TCP as the transport protocol.
Trust Store Password	Specify the password for the Trust store. **Note:** This field populates when you select SECURE_TCP as the transport protocol.
Key Store Password	Specify the password for the Key store. **Note:** This field populates when you select SECURE_TCP as the transport protocol.

Name	Config Value
Apply	Save the configuration.

SFTP

After an execution is completed, you can send or transfer files to a remote location based on the SFTP configuration.

The following figure displays the SFTP Configuration on the Output Actions Tab.



The following parameters manage SFTP (file transfer to a local drive) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
SFTP Name	The name of the SFTP configuration. **Note:** You cannot create an SFTP configuration with a name that already exists in the Reporting Engine SFTP configuration list.
Host	The IP Address or Hostname of the Reporting Engine server associated with the file transfer.
Port	If you want to use a different port than the default port, enter a port number. Default value is **22**.
Username	Specify the username for the SFTP configuration.
Password	Specify the password for the SFTP configuration.
Custom Folder	Select an SFTP location where you want to transfer the file to. You can use the pre-defined Windows or Linux directory structure in the custom folder path. For example, **/root/Downloaded_Files**. **Note:** If the directory does not exist, RE will create the directory in the custom folder path and copy files to this directory.
Enable Compression	Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension.

URL

After an execution is completed, the output files are published to a URL based on the URL configuration.

The following figure shows the URL Configuration on the Output Actions Tab.

The following parameters manage URL (file transfer to a URL) output action configuration for a Reporting Engine service. When you add an Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the Config Values of these parameters according to the requirements of your enterprise.

Name	Config Value
URL Name	The name of the URL configuration. **Note:** You cannot create a URL configuration with a name that already exists in the Reporting Engine URL configuration list.
URL	The URL address associated with the file transfer.
Username	Specify the username for the URL configuration.
Password	Specify the password for the URL configuration.
Enable Compression	Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension.

After the URL is configured, the files will be copied under the "URL_OUTPUT_ACTION" directory and the following parameters are sent to the server along with the compressed file.

Name	Config Value
filename	The name of the file.
filesize	The file size in bytes.
filetype	The file type associated with the file.
filechecksum	The number computed from a file that can be used to confirm that this is the one you expect and has been downloaded and stored properly.
hashingalgorithm	The hashing algorithm used to calculate the file checksum.

Name	Config Value
reportname	The name of the downloaded report.
executionid	The execution id associated with the report execution.
reportexecutionstarttime	The start time the report was executed.
status	The report creation status.
status description	The status description.

Network Share

After an execution is completed, you can transfer the output files to a mounted path or shared location based on the Network Share configuration.

The following figure shows the Network Share Configuration on the Output Actions Tab.

The following parameters manage Network Share (file transfer to a shared location on the network) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

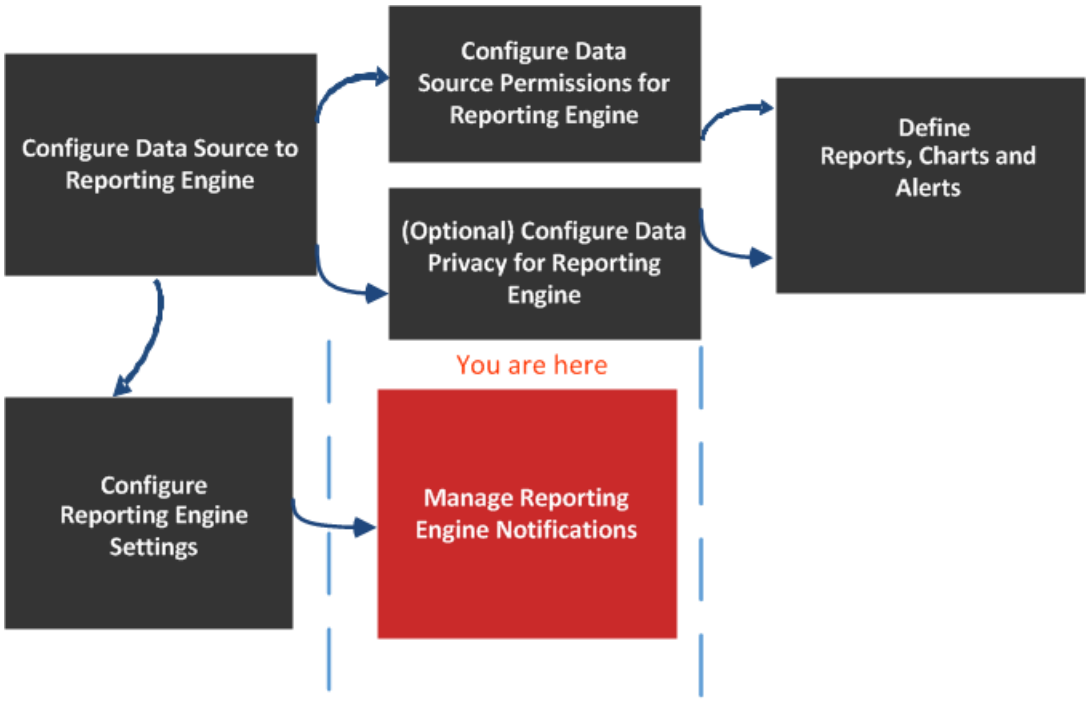
Name	Config Value
Network Share Name	The name of the Network Share. **Note:** You cannot create a Network Share configuration with a name that already exists in the Reporting Engine Network Share configuration list.
Mounted Path	The path (location) associated with the file transfer. You can use the pre-defined Linux directory structure in the mounted path. For example, **/mnt/win**. **Note:** The 'rsasoc' user must have read-write access to the specified Network Share mounted path.
	Click to view how the mounted path is created. This pop-up notifies that you must manually create the mounted path.

Name	Config Value
Destination Directory	Name of the directory where the transferred file is stored in the shared location.
Enable Compression	Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension.

The following table lists the common operations you can perform in the Syslog, SFTP, URL and Network Share sections.

Operation	Description
	Create a Syslog, SFTP, URL and Network Share configuration.
	Delete a Syslog, SFTP, URL and Network Share configuration.
	Edit a Syslog, SFTP, URL and Network Share configuration.

Reporting Engine Manage Logos Tab



The Manage Logos option available in the **Services Config View** > **Manage Logos** tab, helps you to manage the logos associated with the Reporting Engine. The Manage Logos tab consists of a single panel with a toolbar and a grid that lists the logos.

You can upload the logos that you want to use in your report. After you upload the logo, you can set any logo as a default logo which will be automatically used in all the scheduled reports. You can choose to override the default logo with any other logo listed in this tab when you schedule a report. For more information, see "Select a Logo Dialog" topic in the *Reporting Guide*.

The supported image formats are:

- .jpg
- .png
- .gif

Reporting Overview

Reporting is a collection of data as a result of monitoring the network traffic, which can be used for further analysis. In NetWitness you can run a report against NetWitness Database core services to identify the network activities. For example, if you want to identify the Top Source Countries and Destination Countries, or top Threat and Risk trends that help monitor any changes to the normal categories or monitor the users and services that may potentially have malicious activities etc.

The reporting typically consist of: Reports and Charts. You can report on the log, packet and endpoint data collected, and customize the reports and charts to enhance the visual appearance. You can create real-time reports for historical data. You can create charts and dashlets, that can be added in the real-time chart dashlets as well.

Reporting Engine

Reporting relies on the Reporting Engine to provide data for the reports, alerts and charts. Hence, you must configure the Reporting Engine as a service to NetWitness before you can generate the reports. You must also specify the data source in the Reporting Engine from which the data is extracted.

The data that you can report or alert depends on the configuration of Reporting Engine and the data sources that you specify as part of the rule definition.

Note: Make sure you have access to the components in the Reporting.

Note: Reporting is accessible based on the role based access, defined for the user.

Report

A report is a combination of rules and other formatting objects such as headers and HTML-formatted notes that describe and identify data pertaining to a particular area of interest. Reports are defined and managed in the Build Report page and can be scheduled to run on an adhoc or timely basis. Once a report is run, results are stored centrally and can be automatically sent over email, SFTP, URL, and NFS to users, viewed via the NetWitness web interface, downloaded as PDF and CSV files.

A report consists of the following:

Property	Description	Example
Report Name **Note:** For **Name** field, the icon to extend the column size is not displayed at the end of the column field. You have to hover the mouse a little to the left side to see the icon for extending the column.	Used to identify the report to schedule them at a later time.	Report1
Text	Pre-defined text fields used within a report to make the report more meaningful to the user.	Header1, Comment
Rules	The rules (queries) used to create a report.	select user.dst where ip.src = 10.10.10.1

Note: In the Reporting user interface, the displayed date or time is always according to the user-selected time zone profile.

Rule

A rule is the basic and essential building block in the Reporting. You must create a rule which can be used in a Report, Chart or Alert.

A rule represents a unique query that detects and summarizes the requested information within a collection of network data.

The rule syntax is very similar to that of Standard Query Language (SQL) where you can use the select clause, where clause, sort and group options and limits for the result set. A rule consists of the following:

Property	Description	Example
Name	The name of the rule.	Windows System Account Activity
Select	List of meta types that are returned in the result set. The list of meta types is provided in the Meta Library. Meta Library in the Rule Builder is continually synchronized with the index configuration of the NetWitness host to which NetWitness is connected. The number of meta types that this property can represent depends on how the rule is to be sorted. If the Sort by property is 'None' or Custom, a rule can have more than one select field, for example, for each match, include the ip.src, ip.dst, size, time in the rule result. If a rule is set to be sorted, either by session count, session size, or packet size, then there can only be one field on which to select.	
Where	A clause that is the base query for the rule.	alert='cleartext_ftp_password'
Then (Rule Actions)	A series of functions that manipulate the original result set of a rule in order to make the output in a report more meaningful or add additional functionality other than querying and displaying data.	lookup_and_add ('username','ip.src',10);
Sort By	Determines how the data in the result set is sorted. The various possibilities are: • Total • Value • Column Name	Total
Limit	Designates how large a result set can be for the given rule. Users must note that if a result set is sorted by count or size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.	20

Note: In the User Interface (UI), the date or time displayed depends on the time zone selected by the user.

Rule Types

There are different rule types in the Reporting. Rule types designate the source of data for the report rule. Following are the rule types:

Rule Type	Description
NetWitness Database (**NetWitness DB**)	The NetWitness database extracts the meta from a Reporting Engine configured to use a Concentrator, Broker and Archiver as the data sources and provides the meta for rules.
Warehouse Database (**Warehouse DB**)	The Warehouse database, also referred to as the NetWitness Warehouse, warehouses large volumes of data. The Warehouse is designed so that you can retrieve large volumes of data easily and efficiently. The Warehouse also extracts the meta from the Reporting Engine.
Respond Database (**Respond DB**)	The Respond database contain alerts and incidents generated from different services and you can create a report on those alerts and incidents.
Unused Rules	The Unused Rules is an option that helps in listing out the rules that are not used by any chart, alert and, report. For more information, see Filter Unused Rules.

Note: In the User Interface (UI), the date or time displayed depends on the time zone selected by the user.

List

A list is a variable that refers to a series of comma-separated values (CSV). You can insert a list into a rule or use it as an argument to a rule action. Lists can act as placeholders for other values, which you can populate and update as needed.

You can create, manage and view lists that can be used to define rules for Reporting and Alerting. You can also filter and delete the unused lists.

Lists cannot be empty or have duplicate or blank values.

Note: If you are defining a report with a rule which has lookup_and_add in the **Then** clause and direct the report output to a list, the list is not populated with the result.
For example, if you create a rule with ip.src in the **Select** clause and lookup_and_add ('ip.dst','ip.src', 10) in the **Then** clause, the report displays the result, but if you have redirected the output to a list, the list will be empty

Chart

Chart is a tabular or grid representation of data. It consists of the following:

Property	Description	Example
Chart Name	Identifies the chart.	Chart1
Rule Basis	Identifies the rule path chosen from the folder hierarchy.	

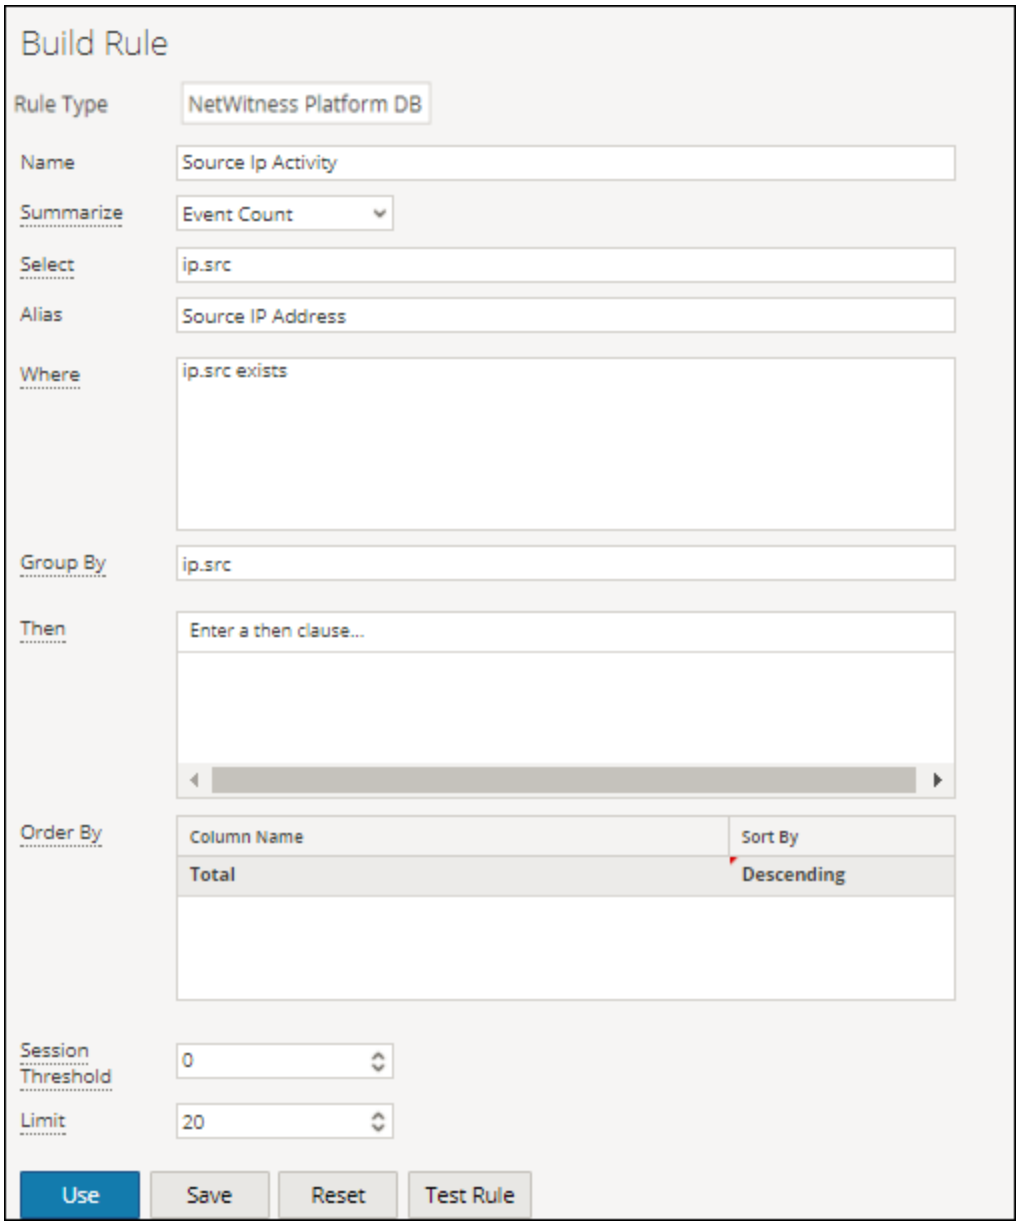
Any NetWitness DB rule in the Reporting Engine system which is not sorted by none can be used to instantly create a chart. In NetWitness, the chart interval can be adjusted from the chart definition panel itself. Each time a chart runs, it stores its result data locally in the Reporting Engine, so that it can be reviewed in either the Dashboard View or Chart View without any performance considerations. You can also filter the unused charts from Chart View.

Note: In the Reporting user interface, the output for the field where Date and Time are displayed is always according to the user-selected time zone profile.

Note: The Reporting Engine (RE) will automatically check for the available disk space before you execute a Test Rule, Report, Chart and Alert. If the RE disk space (in percentage) is less than the minimum disk space threshold (default value is 5), the RE will stop the current execution and an error message 'Available disk space of Reporting engine home is <5%, please clean up the space to proceed further' is displayed. Additionally, you may also configure the minimum disk space threshold by using the following path: **RE>Config>General>System Configuration>Mini disk space threshold in %.**

Reporting Guidelines

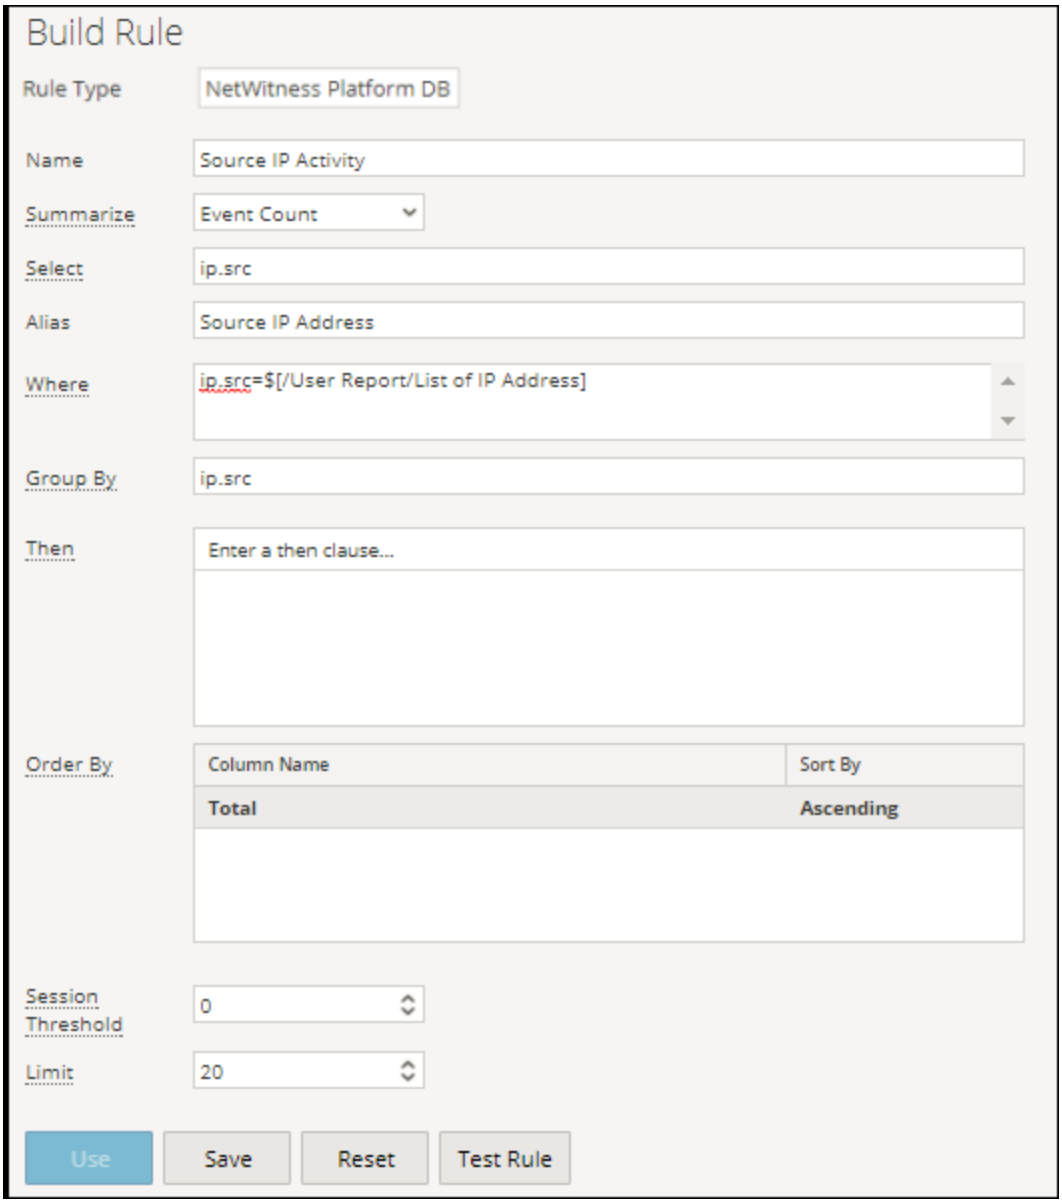
This section lists recommended guidelines to enhance the execution time of your reporting entities such as rules, reports, alerts, charts, and lists. The guidelines are provided for the following:



- NWDB Rules
- Timeout Configuration for NWDB Rules
- Lookup and Add rule action
- List value Reports

NWDB Rules

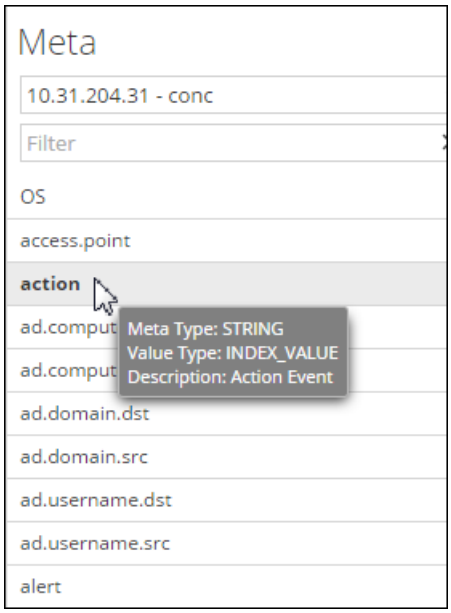
If the reporting entities such as report, alert, or chart contain NWDB rules (in most cases where the query contains Group By) takes a long time to execute, you may do the following:



1. Refine the Where clause:

   You may limit the number of sessions scanned by using or refining the Where clause (especially when you use the Group By option). For example, consider the following rule.

If you use a Where clause as mentioned above, the number of sessions aggregated is huge. To avoid this, you can filter only required sessions by specifying the list of IP addresses or creating a List (list of IP Address) that contains relevant IP addresses.



Note: The NWDB rule where clause is appropriately quoted if the syntax has an invalid quote. For example, in case of an invalid meta, or missing separator, the status and the error message is updated appropriately.

2. Using indexed Meta keys in the Where clause:

   To understand if the Meta is indexed or not, mouse hover the Meta List present on the right panel. If the Value Type is INDEX_VALUE, then the Meta is indexed. The Value Type is INDEX_KEY or INDEX_NONE if the Meta is not indexed.

   Below is a snapshot of a Meta key that is indexed.

3. Configure the Timeout option:

   If the query is taking a long time and fails due to timeout issues, you can configure the timeout for the NWDB rule executions. For more information, see below section "Timeout Configuration for NWDB Rules".

4. Schedule the queries to run at different times:

   If multiple query aggregates are concurrently executed and timeout occurs, you may schedule the queries to run at different times without much overlap.

Timeout Configuration for NWDB Rules

Note: It is a good practice to check the statistics of the Reporting Engine and the NWDB data sources before you make any changes to the configuration. For more information, see the "Monitor Service Details" topic for Reporting Engine and "Monitor System Statistics" topic in the *System Maintenance Guide*.

If NWDB rule execution fails due to timeout, you may get the following errors on the View a Report panel:

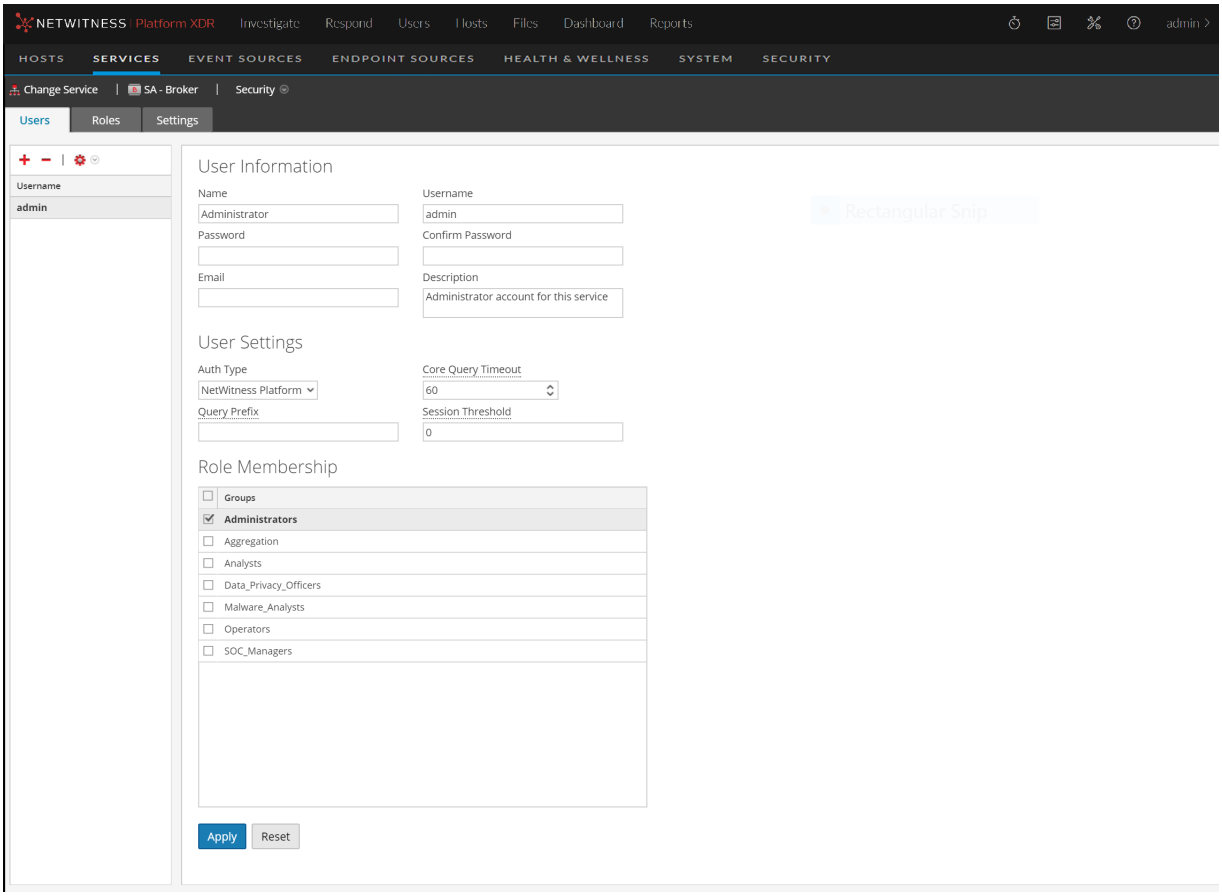
- Reporting Engine timeout error

  “Data source ‘`10.31.x.x Concentrator`' did not respond within the configured time `30` minutes for the ‘`/sdk/values`' request.”

- NWDB timeout error

  "Error occurred while fetching data from source '`10.31.x.x Concentrator`'. `{Timeout message from NWDB}`”

In such cases, you need do the following:



- Reporting Engine timeout

  In case of Reporting Engine timeout, you may set the timeout to a longer duration so the long running queries can be executed. For more information on setting the `NWDB Queries Time Out` and `NWDB Info Queries Time Out` option for the Reporting Engine, see "Step 2. Configure Reporting Engine Settings" topic in the *Reporting Engine Configuration Guide*. NetWitness recommends you set the `NWDB Query Time Out` to zero minutes (implies no timeout) and `NWDB Info Queries Time Out` to 60 minutes.

- NWDB timeout

  In case of NWDB timeout, you may need to configure the `query.level.timeout` and `max.concurrent.queries` parameters for the NWDB data source based on the recommendations in the *Core Database Tuning Guide* to fine tune the queries.

  The following figure is an example of Explorer view where you can set the parameters for NWDB data source.

- Schedule Reports at different times

  If the NWDB core devices are heavily utilized, you may schedule the reports to run at different times without overlap.

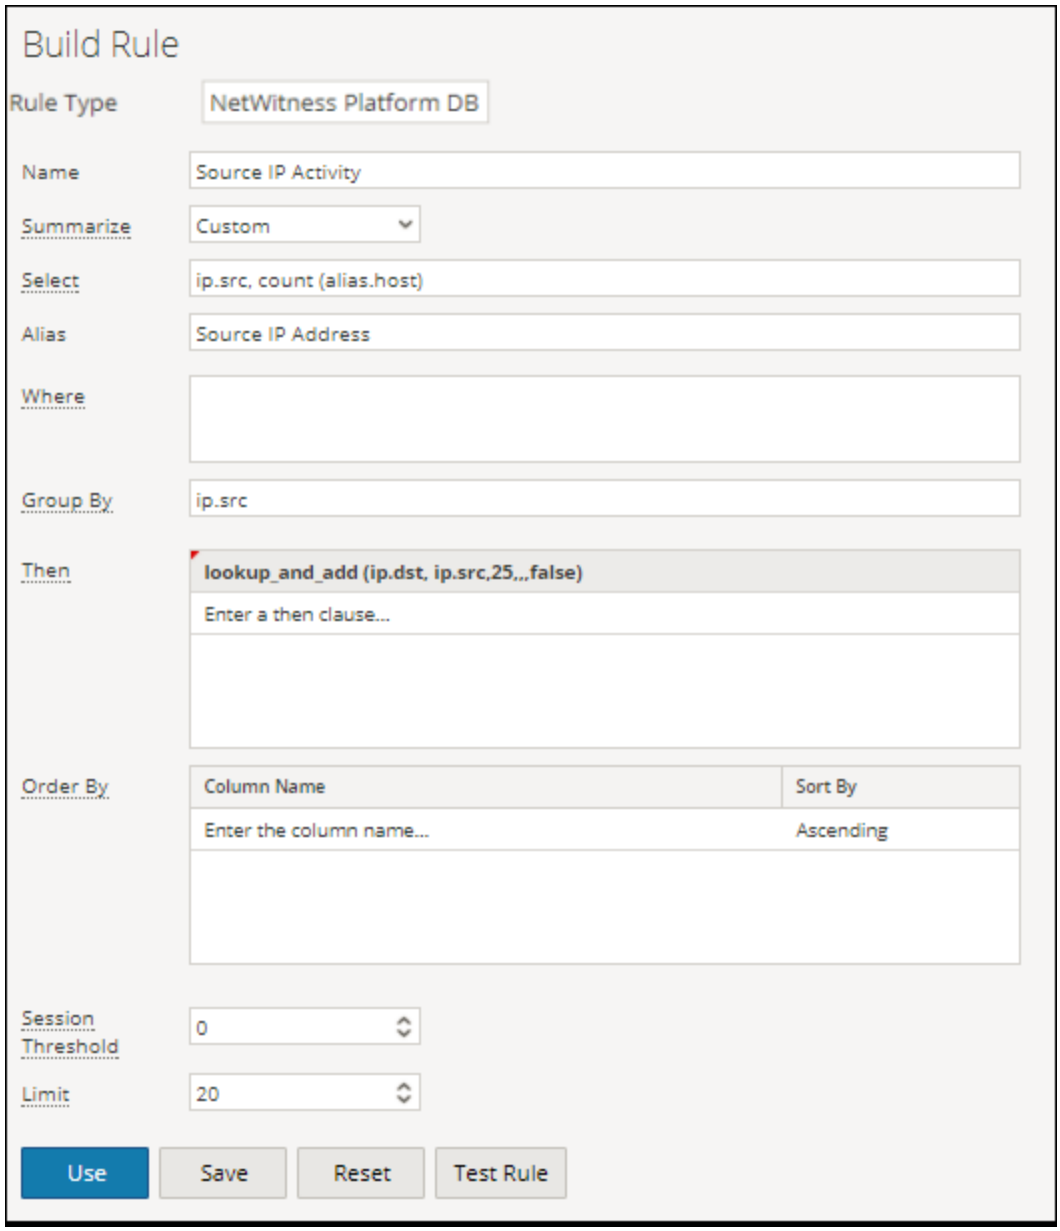
- Split the Report

If you have many rules in a Report, split the report into multiple reports with each report containing logical set of rules. If you have multiple rules, all rules will begin to execute at the same time based on available threads, therefore you may group the rules logically into separate reports.

Lookup_and_Add Rule Action

If a rule that consists of single or multiple `lookup_and_add` rule actions, takes a long time to execute the report, it is because each of the rule action triggers multiple lookup queries on the NWDB data source resulting in longer execution time.

To improve the report execution time, you may do the following:



- Refine the Where clause in the following:
  - Rule that contains the `lookup_and_add` rule action
  - `lookup_and_add` rule action
- Set Limits

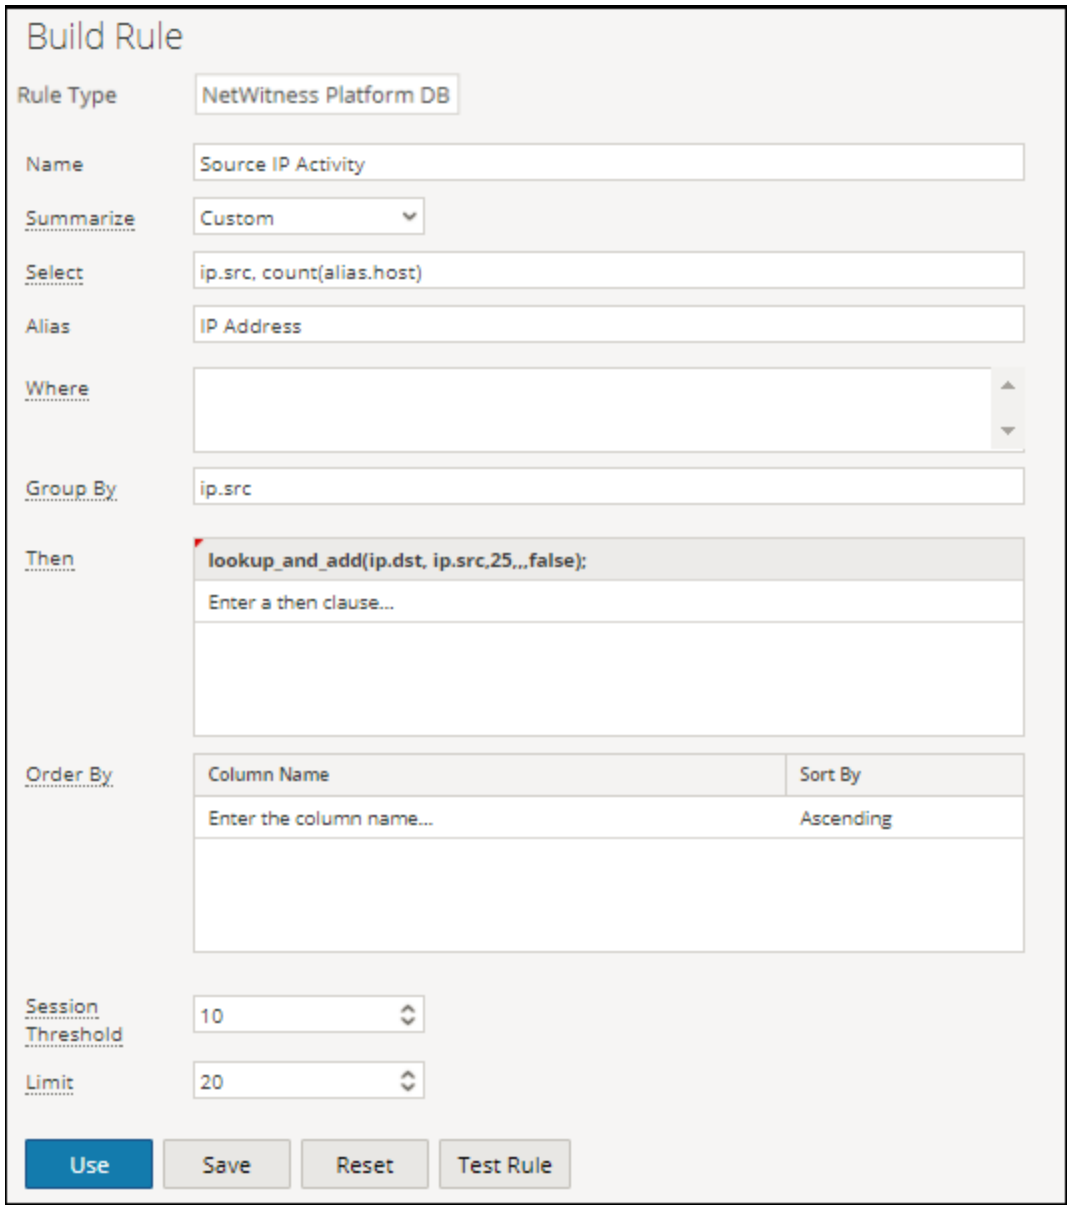
  You must set appropriate limits for the rule and rule actions. If the limit is high it will result in many queries being triggered and hence the report will take a long time to execute.
- Set the boolean aggregate parameter

  If you do not want the aggregate value such as `sum(meta), count(meta)` etc. for the lookup values, set the boolean aggregate parameter to false in the `lookup_and_add` rule action. For more information, see the "NWDB Rule Syntax" section in Rule Syntax.

  ```
  lookup_and_add(string select, string field, int limit, boolean inherit,
  string extraWhere, boolean aggregate)
  ```

  Consider the rule with lookup_and_add rule action:

The output is displayed:



- Each `lookup_and_add` rule action triggers by default two concurrent lookup queries on the data source. NetWitness recommends that you retain the default setting, however if you want to increase the value you may want to ensure the value of `Max # of Concurrent LookupAndAdd Queries` parameter in Reporting Engine is less than the `Max Concurrent Queries` value in the NWDB data source configuration.

  If the NWDB data source is shared across other services, then you may retain a low value for the `Max # of Concurrent LookupAndAdd Queries` parameter in Reporting Engine as increasing it will impact the queries from other services. For more information, see "Reporting Engine General Tab" topic in *Reporting Engine Configuration Guide*.

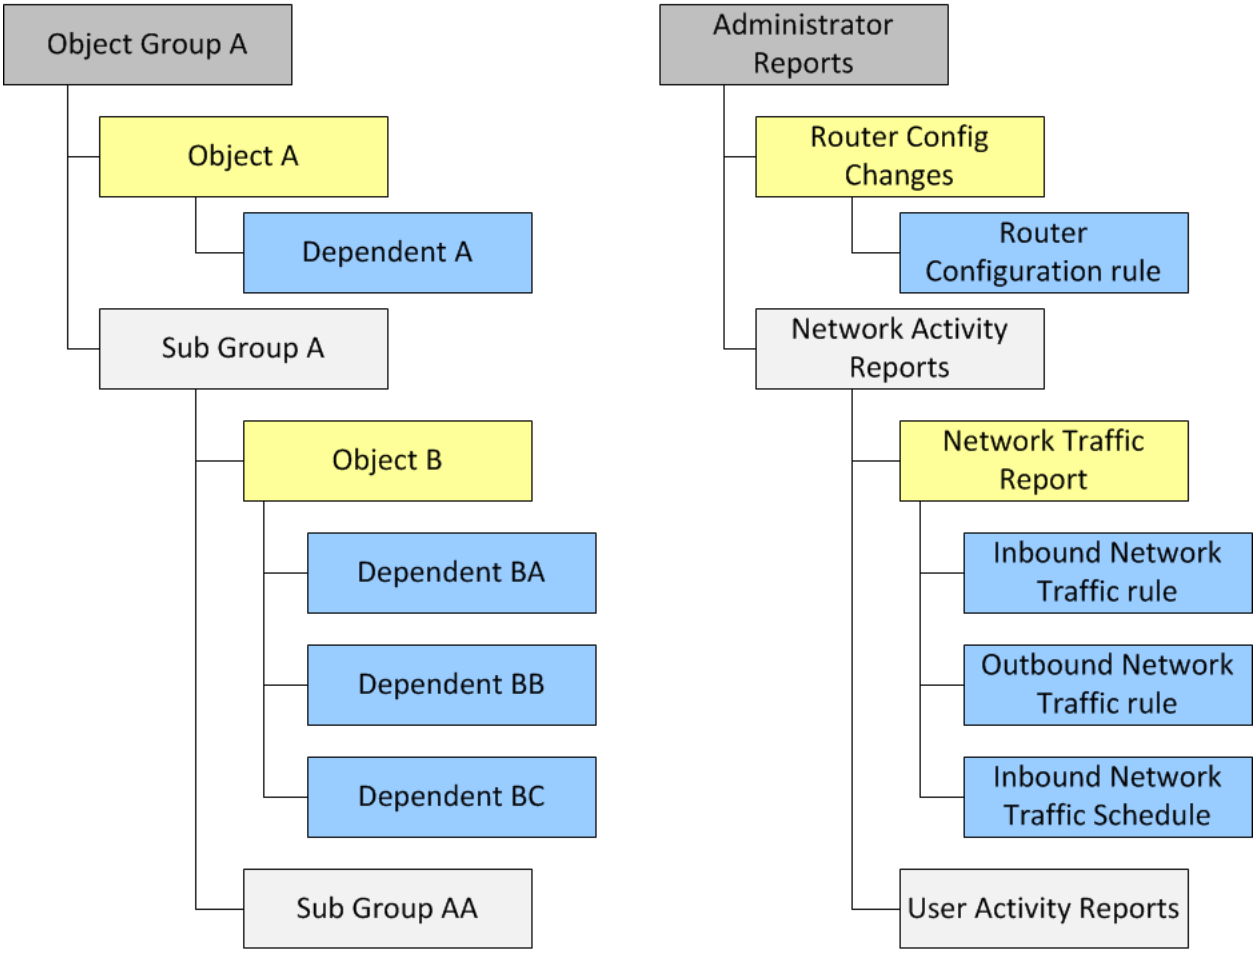
- If you are interested only in unique values and not accurate aggregates, then set the `Session Threshold` to a non-zero value for the NWDB rule. For more information, see "Create a Rule Using NetWitness Data Source" section in Configure a Rule. The higher the value, the longer is the rule execution. If the value is set to zero it will take a longer time but will provide accurate aggregates.

  Consider a rule with lookup_and_add rule action and Session Threshold set to 10.

The output is displayed:

List Value Reports

Use a Refined List:



In case of List value reports (for any data source type), individual reports will be generated for each value in the list. Therefore, more the number of values in the list the longer the reports will take to execute. Hence, you must use a refined list to generate such reports.

Access Control for Reporting

Reporting Module provides you the option to set up access control for all the components in the module. In NetWitness, you can define different roles and specify the access control for each of the role from the System Security module. You can define the access control to be provided for the Reporting module for each role. For more information, see "Step 1: Review the Pre-Configured NetWitness Platform Roles" and "Step 2: (Optional) Add a Role and Assign Permission" topics in the *System Security and User Management Guide*.

In the Reports module, you can modify the role permissions or access to the following Reporting objects:

The Following is an example of the hierarchy of the object groups, objects and dependents. This is an illustration of the Report Groups and Reports hierarchy.

Report Groups and Reports Hierarchy

Permission for Object Groups

- You must have the Read & Write permission to set the permissions for the Object Group, Objects, or Dependents. The dependents with “No Access” permission are grayed out and dependents with “Read-Only” permission are indicated with an icon.
- When you set the permission for the Object Group, the Objects and Dependents in the Object Group do not inherit the permission automatically. You must select the "Apply these permissions to sub-groups and <Objects> in this group" option to achieve this. For example, if you do not want Operators roles to access reports in Report Group A, then you must set the permission on Group A to No access for the Operator role and select the "Apply these permissions to sub-groups and Reports in this group" option.
- When you set the permissions for the Object Group and select the "Apply these permissions to sub-groups and <Objects> in this group" option, the dependents such as rules or schedules in the objects do not inherit the permissions automatically. You must use the "Apply Read-only permission to Rules in the <Object>" option to apply the permission to the rules.

- When you set the permissions for the Objects, you must ensure that the Objects in hierarchy should always have a permission that is less than or equal to the one above in the hierarchy for the permission to be applied. For example, if the reports in a Report Group have Read & Write permission and you apply a Read-Only or No Access permission at the Report Group level and select the "Apply these permissions to sub-groups and Reports in this group" option, then the permission on the rules will remain unchanged.
- The permissions are cascaded from top to down in the hierarchy and not vice-versa. For example, if you apply a permission to a rule, it does not change the permission of the Report that contains the rule.

Permission for Objects or Dependents

- You must have the Read & Write permission to set the permissions for the Objects or Dependents.
- You can specify the permission for multiple objects at once instead of setting the permission for each object.
- When you set the permission for the Object, the dependents in the Object do not inherit the permission automatically. You must select the "Apply Read-only permission to Rules in the <Object>" option to achieve this.

When you apply the permission to dependents the permission is applied based on the existing permission for the role. For example, consider an Analyst and a Operator with the following permissions for the different dependents (Report A object has Rule AA, Rule AB, and Rule AC as dependents).

Object or Dependent	Analyst	Operator
Report A	Read & Write	No Access
Rule AA	Read & Write	No Access
Rule AB	Read and Write	Read and Write
Rule AC	Read-only	No Access

When the Analyst applies a Read & Write permission for the Operator role and selects the option "Apply Read-only permission to Rules in the <Object>", the permissions is set for the different dependents as follows:

Modify the Permissions

- **Group Level:** Set the permissions at the Object Group level and for all the object and entities in the Group. For example, if you have 80 reports in the Administrators Reports group and you do not want anyone except the Administrator to add or modify these reports, you can set the permission for all the other roles at the group level to Read-Only and select the option to apply it to all the reports and sub-groups in the report group.
- **Multiple Objects:**Select multiple objects and specify the access for all the selected objects. For example, if you have 10 reports in the Network Traffic sub group with sensitive information that you

do not want anyone to access, select the 10 reports and then set the permission for all the roles as "No Access".

- **Single Object:** Select only the object and specify the permission. For example, select the Network Traffic Report and specify the Read-Write permission for the Security Analyst role or select the Login Failure Alert and specify the Read-Write permission for a Security Analyst role.

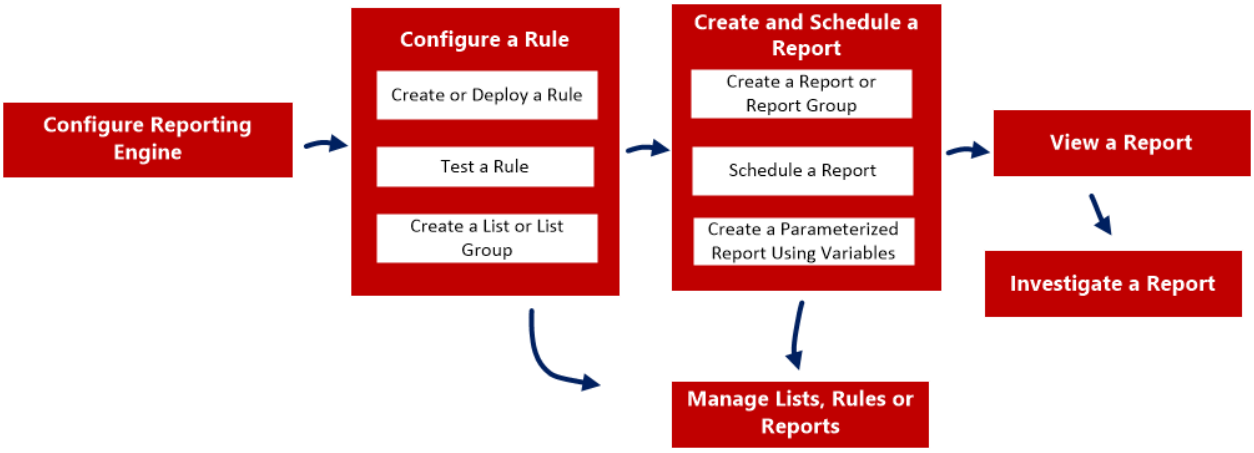
Object or Dependent	Operator (Before Permission is applied)	Operator (After Permission is applied)
Report A	No Access	Read & Write
Rule AA	No Access	Read-only
Rule AB	Read and Write	Read & Write
Rule AC	No Access	Read-only

Roles and Permissions for Reporting Module

Although NetWitness has five pre-configured roles, you can add custom roles. For example, in addition to the pre-configured Analysts role, you can add custom roles for AnalystsEurope and AnalystsAsia.

Role	Permission
Administrators	Full system access
Operators	Access to configurations but not to data
Analysts	Access to data but not to configurations
SOC_Managers	Same access as Analysts and an additional permission to handle incidents
Malware_Analysts	Access to malware events only

Depending on the user role, you can set the following access permissions to access the Reporting module components (Rules, Reports, Charts, Alerts, Lists):



- Create
- Delete
- Export
- Manage
- View

Note: You must enable all these permissions for a user role to be able to define, delete, manage and view each of the Reporting modules. You must also have appropriate permissions for the data source to be listed, while defining the reports, charts, or alerts. For more information, see "Configure Data sources Permissions" topic in the *Reporting Engine Configuration Guide*.

For a detailed list of permissions and how to add a role and assign permissions, see "Role Permissions" and "Step 2. (Optional) Add a Role and Assign Permissions" topics in the *System Security and User Management Guide*.

Configure and Generate a Report

This figure is an overview of the entire process of configuring and generating a report.

To configure and generate a report, perform the following tasks:

1. Configure Reporting Engine - You must configure the Reporting Engine before you can configure and generate a report. You must also specify the data source in the Reporting Engine from which the data is extracted. For more information on how to configure Reporting Engine, see "Configure Reporting Engine" topic in the *Reporting Configuration Guide*.
2. Configure a Rule
3. Create and Schedule a Report
4. View a Report
5. Investigate a Report
6. Manage Lists, Rules or Reports

Configure a Rule

You can create a new rule or deploy an existing rule from the Live Services which can be used in a report. You can use different conditions to refine the data or information in the data sources such as:

- Select clause
- Where clause
- Group By
- Order By and so on

For example, you can write a rule to view the top 20 web addresses that the users visit daily.

You can create different type of rules using different data sources. Based on your requirements you can select any of the following options to create a rule:

- Create a Rule Using NetWitness Data Source
- Create a Rule Using Warehouse Data Source
- Create a Rule Using Respond Data Source

You can also use a list in a rule to refine a search result from the data source. Once a rule is created you can test a rule to see the results returned by the rule.

Create a Rule Group

To create a rule group or rule sub-group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Do one of the following.
   - To define a rule group:
     a. In the **Rules Groups** Panel, click  .
     The new rule group is added to the Rule Groups panel.
     b. Enter the name for the rule group and press ENTER.
   - To add a rule sub-group:
     a. In the **Rules Groups** panel, select the rule group to which you want to add a sub-group.
     b. Click  .
     The new rule sub-group is added to the rule group.
     c. Enter the name for the rule sub-group and press **ENTER**.

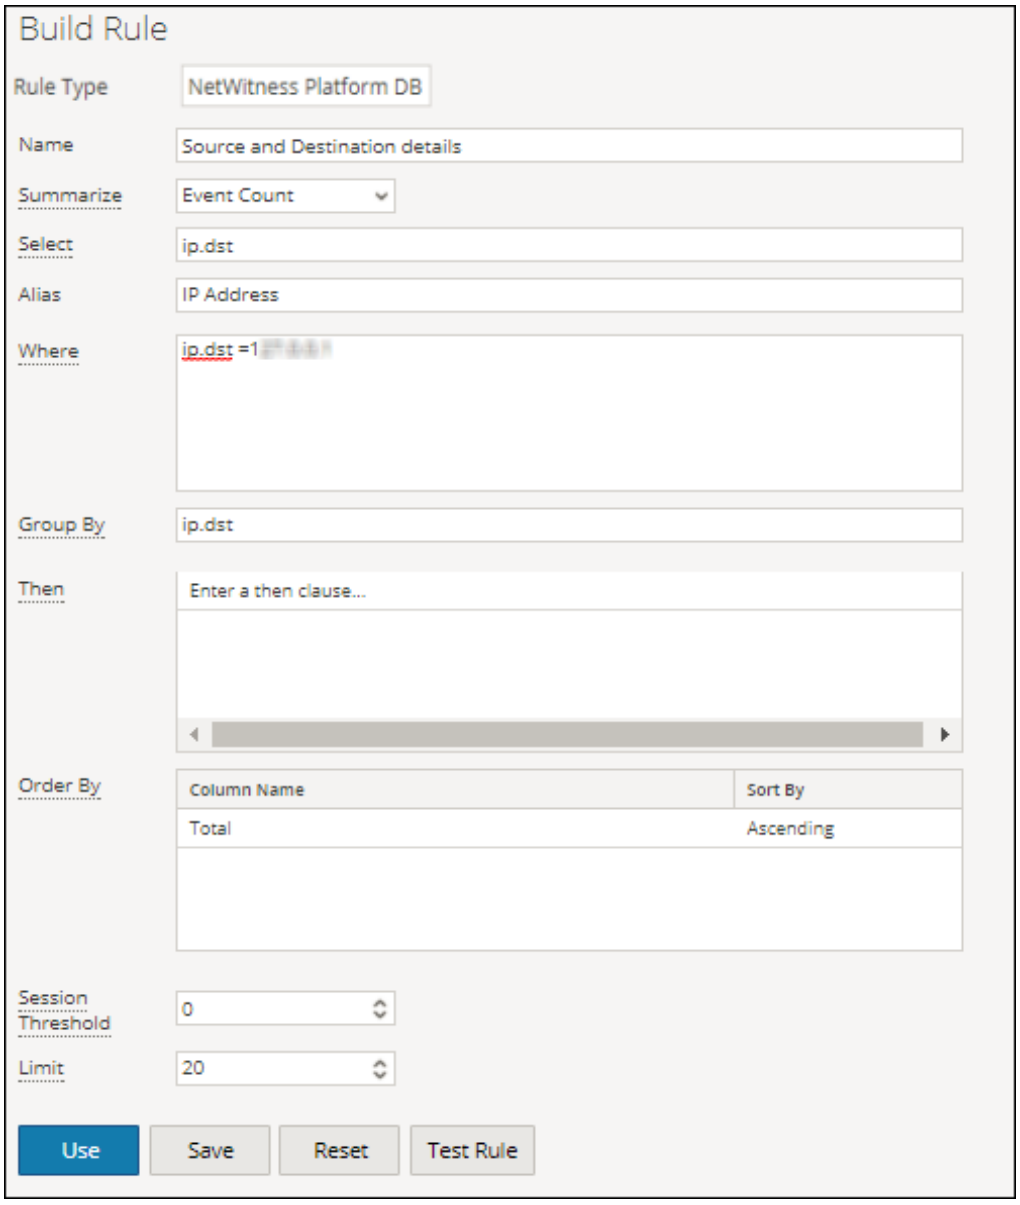
Create a Rule Using NetWitness Data Source

You can create a rule to fetch data or events from a NetWitness data source. The same procedure is used to define a rule to fetch data or events from an Archiver data source.

The Archiver data source can be added in the Services Config View of the Reporting Engine. For more information, see "(Optional) Add Archiver as a Data Source to Reporting Engine" topic in the *Archiver Configuration Guide*.

Prerequisites

Make sure that you understand how custom meta keys are created using custom feeds. For more information, see "Create Custom Meta Keys using Custom Feed" topic in the *Decoder and Log Decoder Configuration Guide*.



To create a rule to fetch data or events from a NetWitness Data Source, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** toolbar, click + > **NetWitness Platform DB**.

   The Build Rule view tab is displayed.

3. In the **Rule Type** field, **NetWitness Platform DB** is selected by default.
4. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and reports.
5. The **Summarize** field determines the type of summarization or aggregation for the rule. Based on the type of rule to be defined, you must select one of the following:
   - To define a **Non-Aggregate** rule without any grouping, select: **None**
   - To define an **Aggregate** rule with special aggregation like the collection (sessions/events/packets) related aggregates, select one of the following:
     - Event Count
     - Packet Count
     - Session Size

- To define an **Aggregate** rule with meta values and custom aggregates like sum(), count(), and so on, select: **Custom**

  Choosing 'Custom' in the **Summarize** field enables you to define aggregate function of your choice in the *Select* clause. For example, select ip.src, countdistinct(ip.dst), distinct(ip.dst). The supported aggregate functions are:

  - sum (<meta>)
  - count(<meta>)
  - countdistinct(<meta>)
  - min(<meta>)
  - max(<meta>)
  - avg(<meta>)
  - first(<meta>)
  - last(<meta>)
  - len(<meta>)
  - distinct(<meta>)

  For more detailed information about Aggregate and Non-aggregate rule, see "NWDB Rule Syntax section" in Rule Syntax.

6. In the **Select** field, enter a meta or select a meta from the list of available meta types provided in the Meta Library. For more information, see "Meta Panel" in Build Rule View. The meta name to fetch raw log is raw. raw can only be used in the **Select** field. It cannot be used in the **Where** and **Then** fields. Multiple aggregate functions are supported for Custom aggregate rule in the **Select** field. For example, Select: *ip.src, username, service, distinct(country.src), sum(payload).*
7. In the **Alias** field, enter the alias name for columns used in the Select clause.
8. In the **Where** field, enter a meta or select a meta from the list of available meta types and use the operators to construct the Where clause for the base query criteria.
9. The **Group By** field is a read-only field which gets populated with meta that are defined in the Select clause. For a Non-Aggregate function, this field is not visible. A maximum of six meta are supported in the **Group By** field.

   Note: In earlier versions of NetWitness, only one meta was supported for Custom aggregate rule in the **Group By** clause. From now, a maximum of six meta are supported in the **Group By** clause.

10. In the **Then** field, enter the rule actions that manipulate the original result set of a rule in order to make the output in a report more concrete or add additional functionality other than querying data and displaying it, for example, creating a feed from the results. For a complete list of available rule actions, see "NWDB Rule Syntax" in Rule Syntax.

    Note: When a rule is executed for an Archiver data source, it is recommended not to use query intensive rule actions such as lookup_and_add() and show_whats_new().

11. In the **Order By** field, perform the following:

a. In the **Column Name** column, enter the name of the columns by which you want to sort the results. By default, the value is empty. The value gets populated based on the value selected in the **Summarize** field.

- For Summarize 'None', if no **Order By** is selected, then by default it is ordered by session or collection time.
- For other Summarize values, the default sorting is based on the first 'group by' meta selected when no 'order by' is defined. For Event Count, Packet Count, and Session size, the accepted values are Total and Value.

b. In the **Sort by** column, select one of the following ways to sort the results:

- Ascending Order
- Descending Order

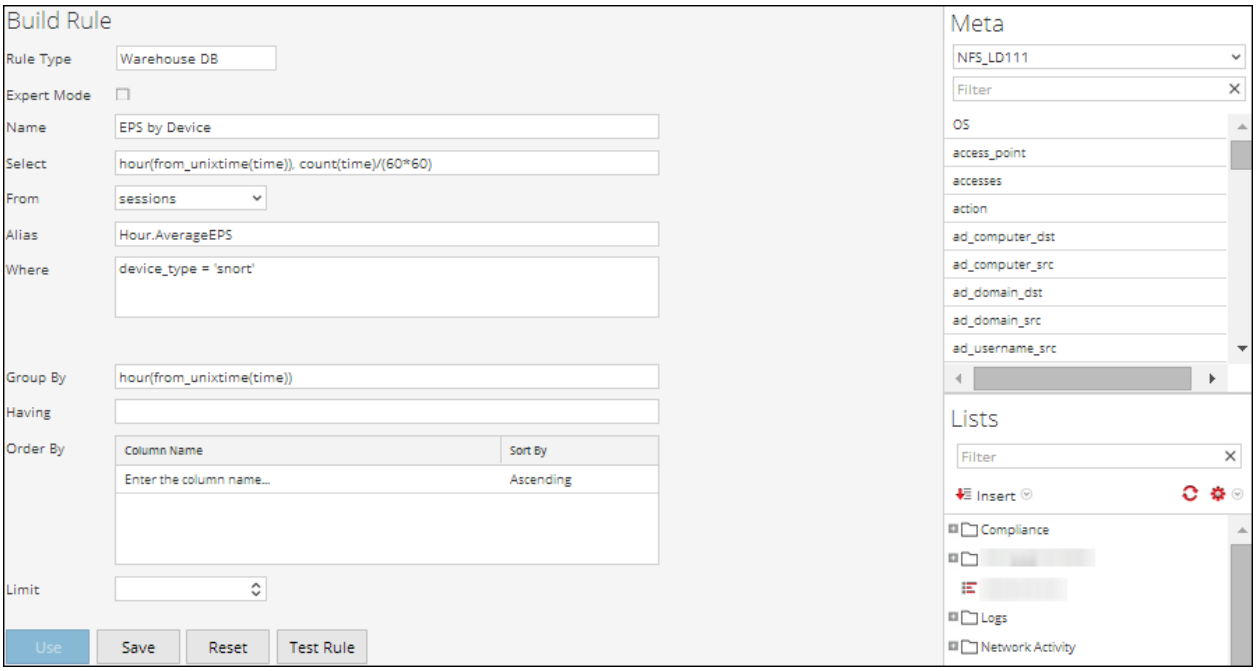
12. In the **Session Threshold** field, enter the optimization setting to stop scanning the matching sessions for each possible unique value for the selected meta. The threshold is an integer between 0 (default) and 2147483647.

Note: This is applicable to only NWDB Aggregate rules. If the default value is specified, all the matching sessions will be scanned and the accurate value will be returned. A higher session threshold allows accurate counts for a value. However, this causes longer rule execution time. For example, consider you set the Session Threshold as 1000 for ip.src. If there are 5000 matching sessions then for a particular ip.src value which is present in more than 1000 sessions, NWDB stops the scan after 1000 sessions and returns the extrapolated aggregate value. This optimizes the query execution time. If the value is present in less than 1000 sessions, then the actual value is returned.

13. In the **Limit** field, enter the limit to be put on the query while fetching data from the database. If a result set is sorted by event count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.
14. Click **Save**.

Note: Unlike parsed meta, raw logs are fetched from decoders. When both raw log and parsed meta are queried in a single rule, due to different retention periods, parsed meta might be available and raw logs missing in the same session. So the result will have parsed meta values and empty raw value for those sessions. For example, for the rule Select **ip.src**, **ip.dst**, **service**, **username**, **raw**, the parsed meta might be populated and the **raw** meta remains empty for a few sessions.

Create a Rule Using Warehouse Data Source



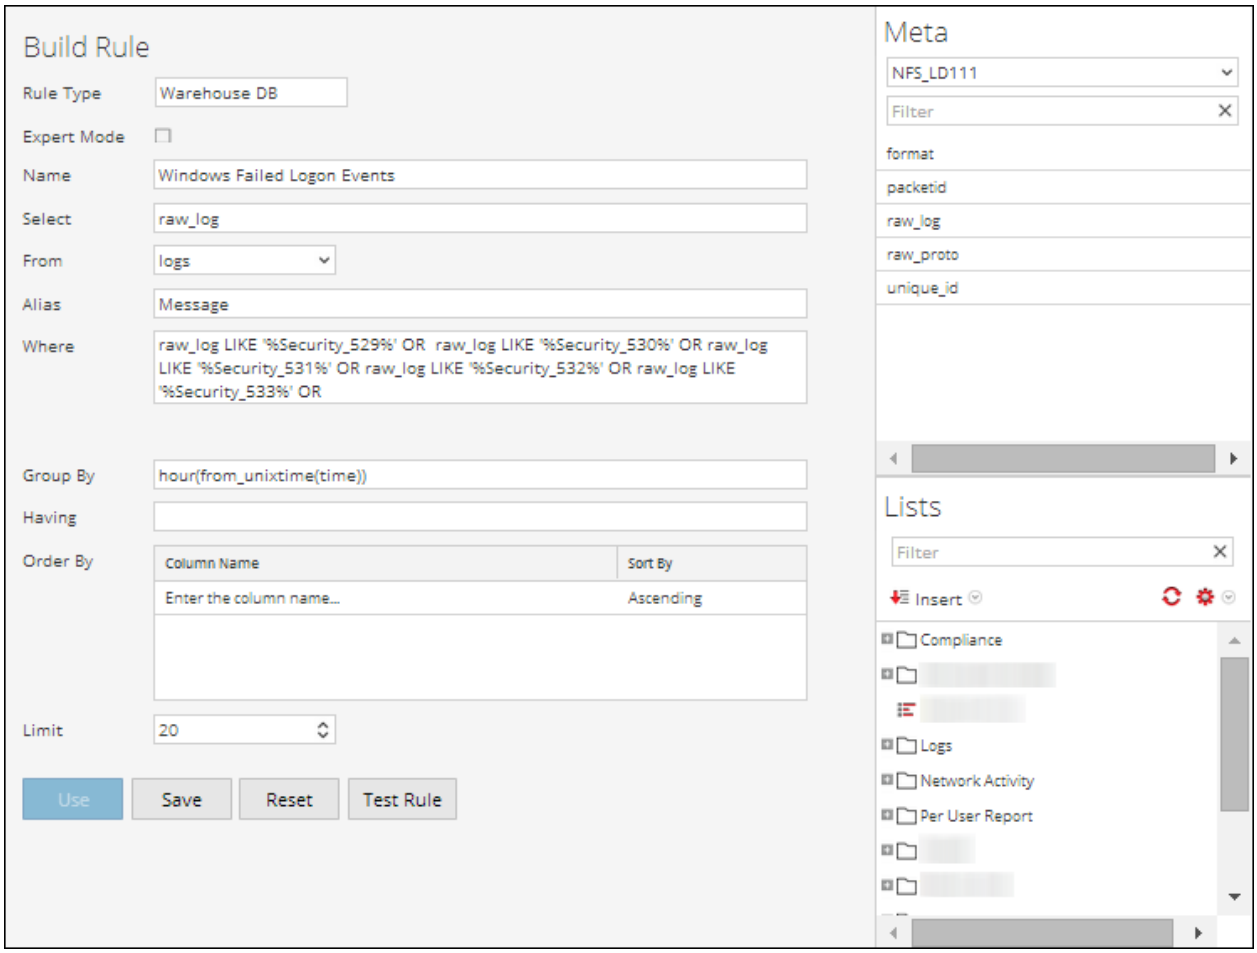
You can create a rule to fetch data or events from a Warehouse event source. You can define the rules in two modes:

- Default Mode
- Expert Mode

Default Mode

In Default Mode, you can create rules containing simple SQL like HIVE queries that contain clauses like Select, Where, Group By, and Having. By default, you can create rules to query sessions or raw logs. For more information on "Simple query syntax and examples", see Warehouse DB Simple Rules Syntax.

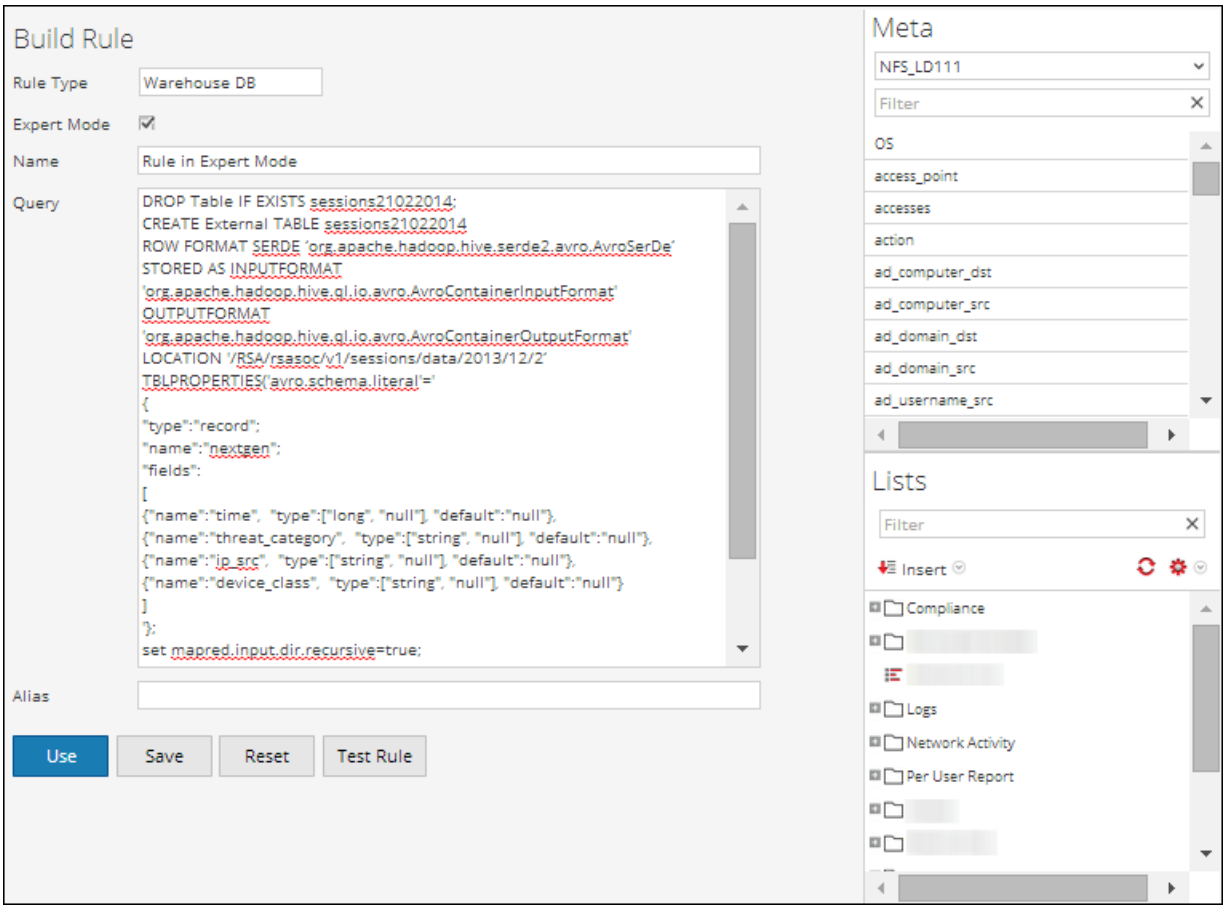
The following figure is an example of the **Build Rule view** that displays when you select **Warehouse DB** for **Rule Type** without the Expert Mode selected.



Querying Raw Logs

The raw log format is used in the select or where clause to query for raw logs.

Note: The time range that you can specify in your query is a day (24 hours). If you have specified a time range less than a day in your query, the result set contains data of at least a day (24 hours).



The following figure is an example of the **Build Rule view** that displays when you select **Warehouse DB** for **Rule Type** and create a rule for querying raw logs.

Expert Mode

Advanced rules are defined using complex HIVE queries created using the clauses DROP, CREATE, and so on. Unlike simple rules, we always insert the results into a table. For more information on "Advanced HIVE query language", see *HIVE language manual*.

The following figure is an example of the Build Rule view that is displayed when you select **Warehouse DB** for **Rule Type** with Expert Mode selected.

If you want to generate a report for a specific time range, you need to manually define the time range in the query using the following two variables:

- ${report_starttime} - The starting time of the range in seconds.
- ${report_endtime} - The ending time of the range in seconds.

For example, **`SELECT col1, col2 FROM custom_table WHERE timecol >= ${report_starttime} AND timecol <= ${report_endtime};`**

Note: By default, Reporting Engine treats `${keyword}` as a variable. If you want to specify HIVE variables, you must mention the complete syntax of a variable. For example, `${hiveconf:hive.exec.scratchdir}`.

Prerequisites

Make sure that you understand how custom meta keys are created using custom feeds. For more information, see "Create Custom Meta Keys using Custom Feed" topic in the *Host and Services Configuration Guide*.

To create a rule to fetch data or events from a Warehouse data source, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** toolbar, click  > **Warehouse DB**.

   The Build Rule view is displayed.

3. In the **Rule Type** field, **Warehouse DB** is selected by default.

   If you are defining the rule in Default mode, perform the following:

   a. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and reports.

   b. In the **Select** field, enter a meta or select the meta from the drop-down or select a meta from the list of available meta types provided in the Meta Panel. For more information, see " Meta Panel" in Build Rule View.

   c. In the **From** drop-down menu, select one of the following:

      - Session
      - Logs

   d. In the **Alias** field, enter the alias name for columns used in the Select clause.

   e. In the **Where** field, enter a meta or select a meta from the list of available meta types provided in the Meta Panel. The Where clause provides the base query criteria for the rule.

   f. In the **Group By** field, enter the meta selected in the Select clause, so that the result set is grouped based on the meta.

   g. In the **Having** field, enter the criteria to filter the result set for aggregated queries.

   h. In the **Order By** field, perform the following:

      1. In the **Column Name** column, enter the name of the columns by which you want to group the results.
      2. In the **Sort by** column, select one of the following ways to sort the results:

         - Ascending Order
         - Descending Order

   i. In the **Limit** field, enter the limit to be put on the query while fetching data from the database. If a result set is sorted by session count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.

   j. Click **Save**.

4. If you are defining the rule in Expert mode, select the **Expert Mode** checkbox and perform the following:

   a. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and reports.

   b. In the **Query** field, enter the Hive query statement to query the data source.

   c. In the **Alias** field, enter the alias name for columns used in the Select clause.

   d. Click **Save**.

Create a Rule Using Respond Data Source

You can create a rule to fetch incidents or alerts from a Respond data source.

Prerequisites

Make sure that you:

- Ensure Reporting Engine service is up and running.
- Ensure the Incident Management service is up and running. For more information, see "Configure a Database for the Respond Server Service" topic in the *NetWitness Respond Configuration Guide*.
- (Optional) Ensure the Event Stream Analysis service is up and running. For more information, see "Step 2. Configure Advanced Settings for an ESA Service" topic in the *ESA Configuration Guide*.
- (Optional) Ensure the Malware Analysis service is up and running. For more information, see " (Optional) Configure Auditing on Malware Analysis Host" topic in the *Malware Configuration Guide*.

Note: You need to configure any one of the services (Event Stream Analysis, Reporting Engine, Malware Analysis, or Endpoint) based on your requirement and the type of alerts or incidents you want to generate.

To create a rule to fetch data or events from a Respond Data Source, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** toolbar, click  > **Respond DB**.

   The Build Rule view tab is displayed.

3. In the **Rule Type** field, Respond is selected by default.
4. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and incident reports.
5. The **Summarize** field determines the type of summarization or aggregation for the rule. Based on the type of rule to be defined, you must select one of the following:
   - To define a **Non-Aggregate** rule without any grouping, select **None**
   - To define an **Aggregate** rule with meta values and custom aggregates select **Custom**

     Choosing 'Custom' in the **Summarize** field enables you to define aggregate function of your choice in the *Select* clause based on the report type you have selected.

     For more detailed information about Aggregate and Non-aggregate rule, see Rule Syntax.
6. In the **From** field, based on the type of report output to be displayed, you must select one of the following:
   - Alert
   - Incident

- incidentStats
- incidentUserStats

7. In the **Select**field, enter a meta or select a meta from the list of available meta types provided in the Meta Library. For more information, see "Meta Panel" in Build Rule View. It cannot be used in the **Where** field. Only one aggregate function is supported at a time in a query.

   For example, the supported metas for alert are:

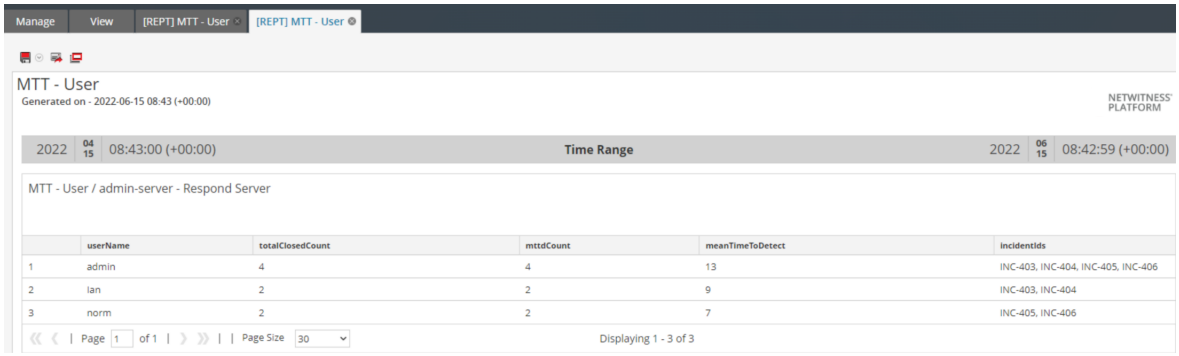
   - alert_host_summary
   - alert.name
   - alert.numEvents
   - alert.severity
   - alert.source
   - alert.timestamp
   - incidentCreated
   - incidentId
   - receivedTime

   For example, the supported metas for incident are:

   - categories
   - created
   - priority
   - riskScore
   - sealed
   - status
   - assignee.id
   - tta (for more information on this meta, see **View Basic Summary Information about the Incident** topic in the *Respond User Guide.*)
   - ttd (for more information on this meta, see **View Basic Summary Information about the Incident** topic in the *Respond User Guide.*)
   - ttr (for more information on this meta, see **View Basic Summary Information about the Incident** topic in the *Respond User Guide.*)

   Note: When an incident is assigned, tta and assignee.id metas are populated. Similarly, when the task assigned is completed and the incident is closed, ttd and ttr metas are populated. Refer to

the following figure.



For example, the supported metas for incidentStats are:

- created
- mtta.time - This meta displays the average time taken to acknowledge the incidents in a single day.
- mtta.count - This meta displays the number of incidents acknowledged in a single day.
- mttd.time - This meta displays the average time taken to detect the incidents in a single day.
- mttd.count - This meta displays the number of incidents detected in a single day.
- mttr.time - This meta displays the average time taken to resolve the incidents in a single day.
- mttr.count - This meta displays the number of incidents resolved in a single day.

For example, the supported metas for incidentUserStats are:

- userName - This meta displays the assignee's or the user's ID for the associated user stats.
- totalClosedCount - This meta displays the total number of Incidents closed by the assignee till date.
- meanTimeToDetect - This meta displays the average time taken by the user to detect the incidents in the time range selected.
- mttdCount - This meta displays the count of incidents contributing to the MTTD value computed.
- incidentIds - This meta displays the list of incident IDs closed by the user during the time range selected.

For more detailed information, see "Aggregate and Non-aggregate rule" topic in the Rule Syntax.

8. In the **Alias** field, enter the alias name for columns used in the Select clause.
9. In the **Where** field, enter a meta or select a meta from the list of available meta types and use the operators to construct the Where clause for the base query criteria.
10. The **Group By** field is a read-only field which gets populated with meta that are defined in the Select clause. For a Non-Aggregate function, this field is not visible. A maximum of six meta are supported in the **Group By** field.
11. In the **Order By** field, perform the following:
    a. In the **Column Name** column, enter the name of the columns by which you want to sort the results.

    Note: by default the first meta in the select clause will be dispalyed.

    b. In the **Sort by** column, select one of the following ways to sort the results:
    - Ascending Order
    - Descending Order
12. In the **Limit** field, enter the limit to be put on the query while fetching data from the database. If a result set is sorted by the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.
13. Click **Save**.

Deploy a Rule

In NetWitness you can deploy the selected rules on the service (for example, Reporting Engine), using the Deployment Wizard.

Prerequisites

Make sure that:

- The services on which you deploy a rule is up and running.
- The Live Services is configured.

To deploy a rule, perform the following:

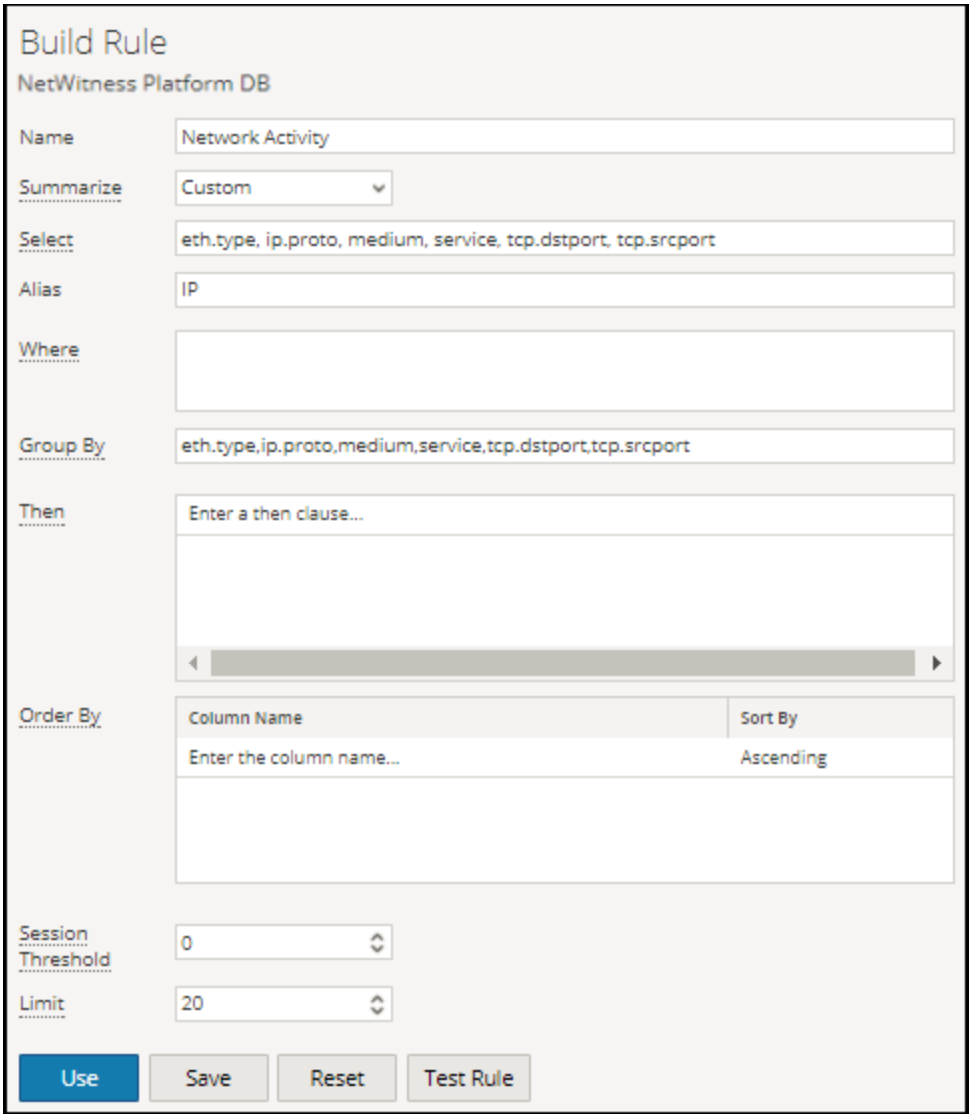
1. Go to  **(Configure) > LIVE CONTENT**.
2. In the **Search Criteria** panel, search Live resources (for example, search for the **Application Rule** resource Type).
3. In the **Matching Resources** panel, select **Show Results > Grid**.
4. Select the checkbox to the left or the rules that you want to deploy.
5. In the **Matching Resources** toolbar, click .
6. Click **Next**.
7. Select the service on which you to deploy a rule (For example, Reporting Engine) and click **Next**.
8. Click **Deploy**.
   The rule is deployed successfully.

Use Meta Aliases for Reporting

When you refer to meta data in Reports and Charts, you can only view aliases for the meta names. These aliases makes them more understandable to a broader audience.

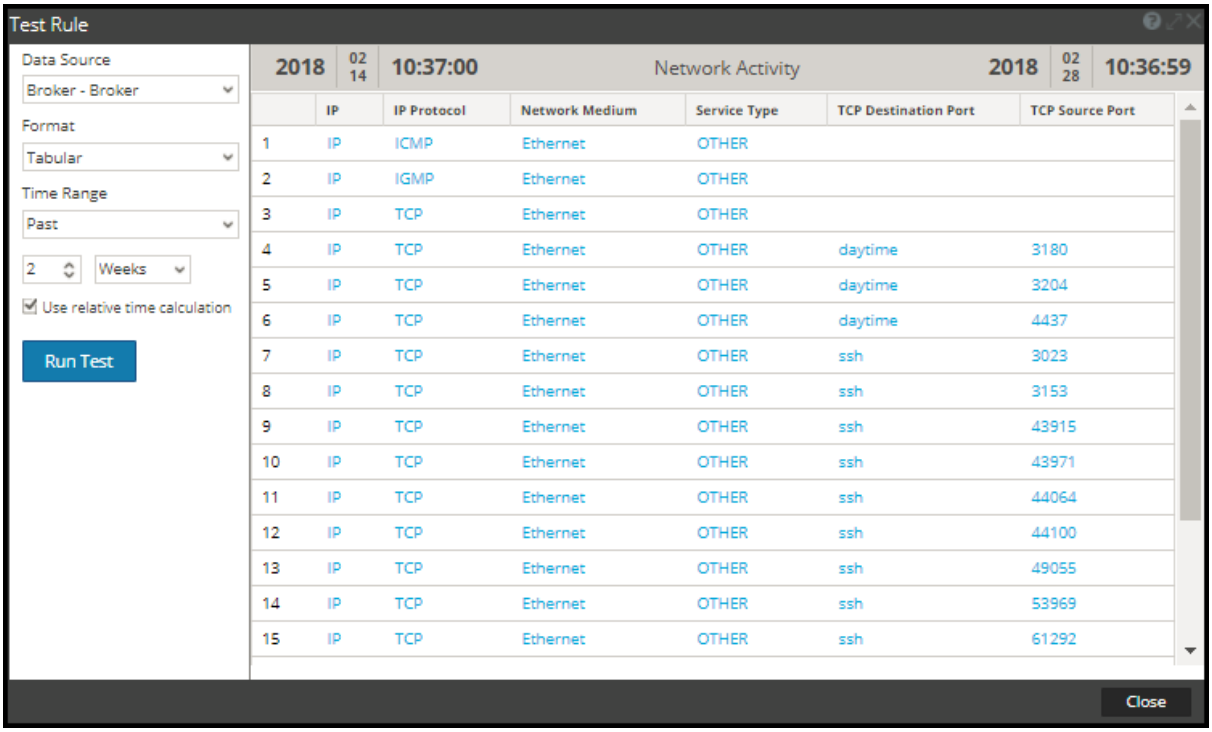
You cannot provide alias values for any meta in the WHERE clause because NetWitness uses the WHERE clause to fetch data from the data source (for example, in the Concentrator) and data sources do not support aliases. In other words, you cannot provide the alias value **HTTP** for the HTTP port # 80.

Note: * You cannot create aliases for meta other than the ones that have existing aliases by Reporting Engine. Also, the format of the aliases cannot be changed.
* Aliases are not supported for Alerts and CSV reports.



To use alias in a rule, perform the following:

1. Go to **Reports**.
   The Manage tab is displayed.
2. In the **Rules** panel, do one of the following:



- Select a rule and click in the Rules toolbar.
- Click > **Edit**.

3. Specify the meta key with aliases in the **Select** field.

The following example specifies the **eth.type**, **ip.proto**, **medium**, **service**, **tcp.dstport**, and **tcp.srcport** meta in the Select field.

4. Click **Test Rule**.
   The following example displays the results under the **eth.type**, **ip.proto**, **medium**, **service**, **tcp.dstport**, and **tcp.srcport** alias columns that were specified in the **Select** field of the rule.

	IP	IP Protocol	Network Medium	Service Type	TCP Destination Port	TCP Source Port
1	IP	ICMP	Ethernet	OTHER		
2	IP	IGMP	Ethernet	OTHER		
3	IP	TCP	Ethernet	OTHER		
4	IP	TCP	Ethernet	OTHER	daytime	3180
5	IP	TCP	Ethernet	OTHER	daytime	3204
6	IP	TCP	Ethernet	OTHER	daytime	4437
7	IP	TCP	Ethernet	OTHER	ssh	3023
8	IP	TCP	Ethernet	OTHER	ssh	3153
9	IP	TCP	Ethernet	OTHER	ssh	43915
10	IP	TCP	Ethernet	OTHER	ssh	43971
11	IP	TCP	Ethernet	OTHER	ssh	44064
12	IP	TCP	Ethernet	OTHER	ssh	44100
13	IP	TCP	Ethernet	OTHER	ssh	49055
14	IP	TCP	Ethernet	OTHER	ssh	53969
15	IP	TCP	Ethernet	OTHER	ssh	61292

Alias Definitions

The alias files in this section are examples only and are based on current alias definitions in the Reporting Engine. NetWitness cannot modify these definitions in the Reporting Engine depending on the changes in the concentrator xml file. Since any changes in the Concentrator xml file are not reflected in the Reporting Engine.

The details of different meta are explained in each of the **meta.aliases**.

Test a Rule

You can test a rule based on the time range and the data source selected.

To test a rule, perform the following:

1. Go to **Reports**.
   The Manage tab is displayed.
2. In the **Rules** panel, do one of the following:
   - Select a rule and click  in the Rules toolbar.
   - Click  > **Edit**.
     The Build Rule view tab is displayed.

3. Click **Test Rule**.
   The Test Rule view is displayed.

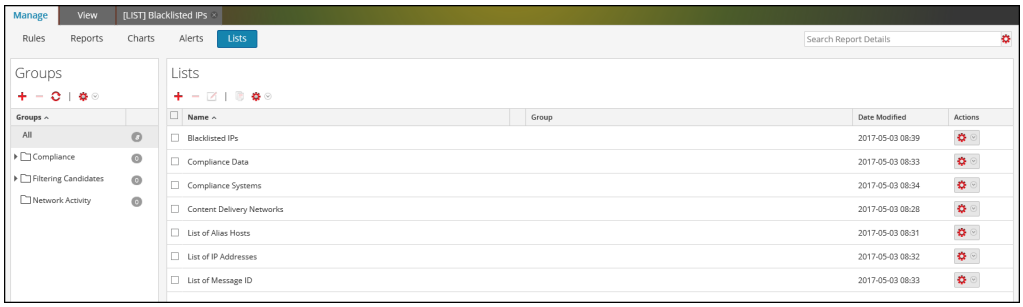
> **Note:** When you click **Test Rule**, the rule is not saved. You have to click **Save**in the Build Rule view to save the rule.

4. From the **Data Source** drop-down list, select a data source.
   You must select the appropriate data source for the rule defined.
5. From the **Format** drop-down list, select the format in which you want the result displayed.
6. From the **Time Range** drop-down list, select one of the following.
   - **Past** -To specify number of years, days, weeks, months, days or hours.
   - **Range** - To specify a date range and time period.

   > **Note:** In the User Interface (UI), the date or time displayed depends on the time zone profile selected by the user.

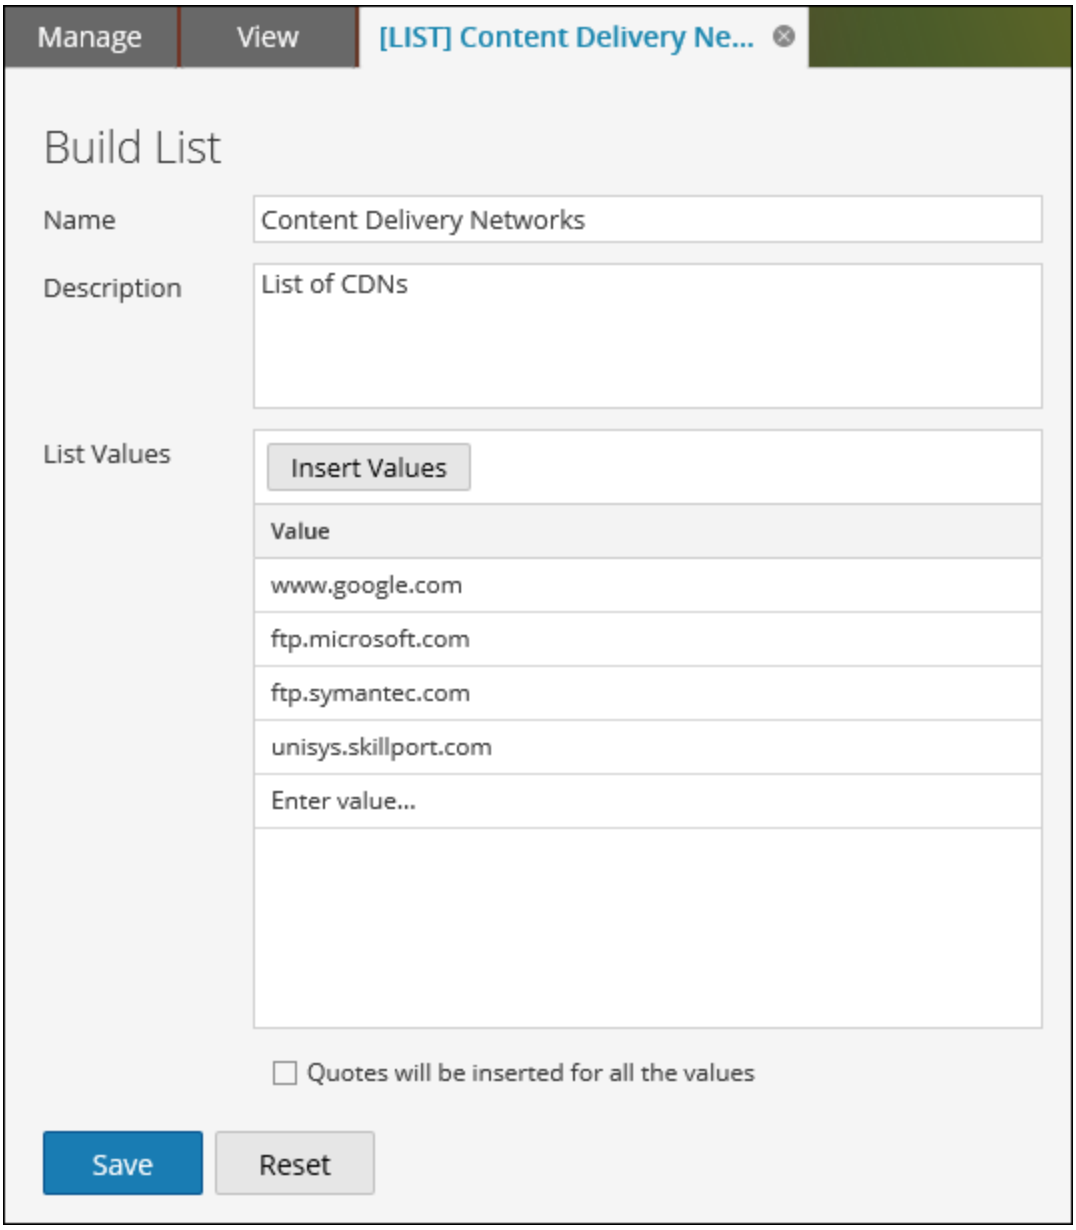
7. **X-Axis** and **Y-Axis** are used to specify the meta to be plotted in charts.
   In **X-Axis**, the Meta for the 'Group by' rule is displayed. In **Y-Axis**, the aggregate functions used in the rule are displayed.

> **Note:** Sum, Count, Countdistinct and Average are the supported aggregate functions for rule. By default, for Custom Rules with multiple 'Group by', you can select only the first meta in **X-Axis**.



8. Click **Run Test** to execute the rule.
   The rule data (if any) for the selected time range is displayed.

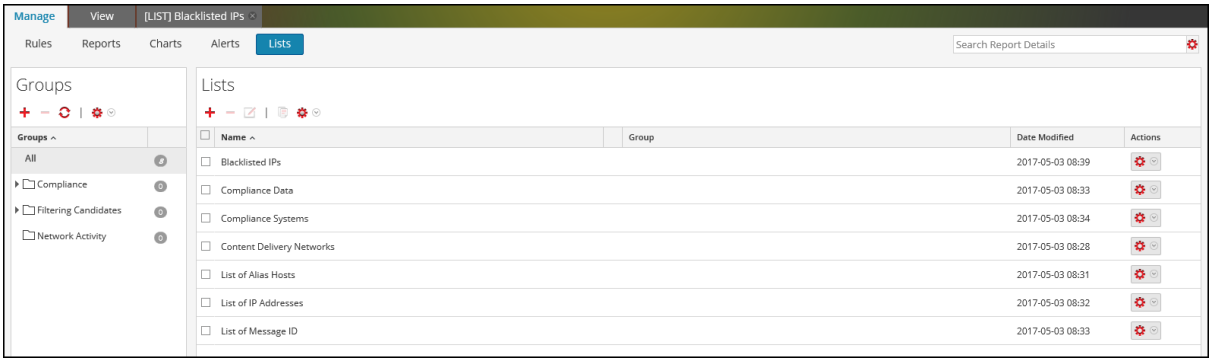
Create a Lists or List Group



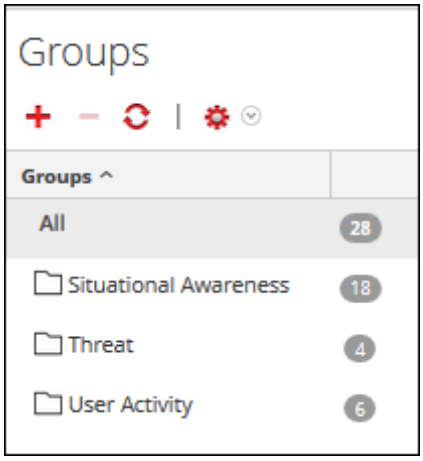
To create a list, perform the following:

Lists can be added within a group or in the root folder.

1. Go to **Reports**, and click **Lists**.
   The List view is displayed.



2. In the **Lists** toolbar, click .
   The Build List view tab is displayed.



3. In the **Name** field, enter a unique name for the list.
4. In the **Description** field, enter a description for the list.
5. In the **List Values** field, do one of the following:
   - Click **Insert Values** and enter the values separated by commas. You can paste a list of values from a file or other lists.
   - In the **Value** column, enter the values.
6. If you want quotes to be inserted directly for the values at runtime, select **Quotes will be inserted for all the values**.
7. Click **Save**.

To create a list group, perform the following:

1. Go to **Reports**, and click **Lists**.
   The List view is displayed.

2. Do the following:
   - To create a list group:
     a. In the **Lists Groups** panel, click  .
        A new list group is added to the List Groups panel.

     b. Enter the name for the list group and press **ENTER**.
   - To create a list subgroup:
     1. In the **Lists** Groups panel, select the list group to which you want to add a subgroup.
     2. Click  .
        A new list subgroup is added to the list group.
     3. Enter the name for the list subgroup and press **ENTER**.

Create and Schedule a Report

You can create a simple or complex report and configure its execution properties by scheduling a report. A report can include multiple rules and you can schedule different time range to execute the same report. For example, depending on your requirement, you can schedule a report to run daily, weekly or monthly.

When you run a report, the results are stored in Reporting Engine.

After you generate a report, you can perform the following:

- Send the reports by email to other users by configuring the output actions. You can also configure the output actions before generating a report.
- Download the reports as PDF or Comma-Separated Values (CSV) format files.

Note: The cancel operation is not supported for Respond Reports.

Create a Report or Report Group

To create a report to a group or sub-group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** toolbar, click + .

   The Build Report tab is displayed.

4. Enter the name of the report.

5. Drag and drop the text and rules to the report.

   Note: The text entered is optional and you may need this option only when you want to display user-defined headers or content.

6. Click **Save**.

   A confirmation message that the report is saved successfully is displayed.

To create a group to the default folder or add sub-groups under a report group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

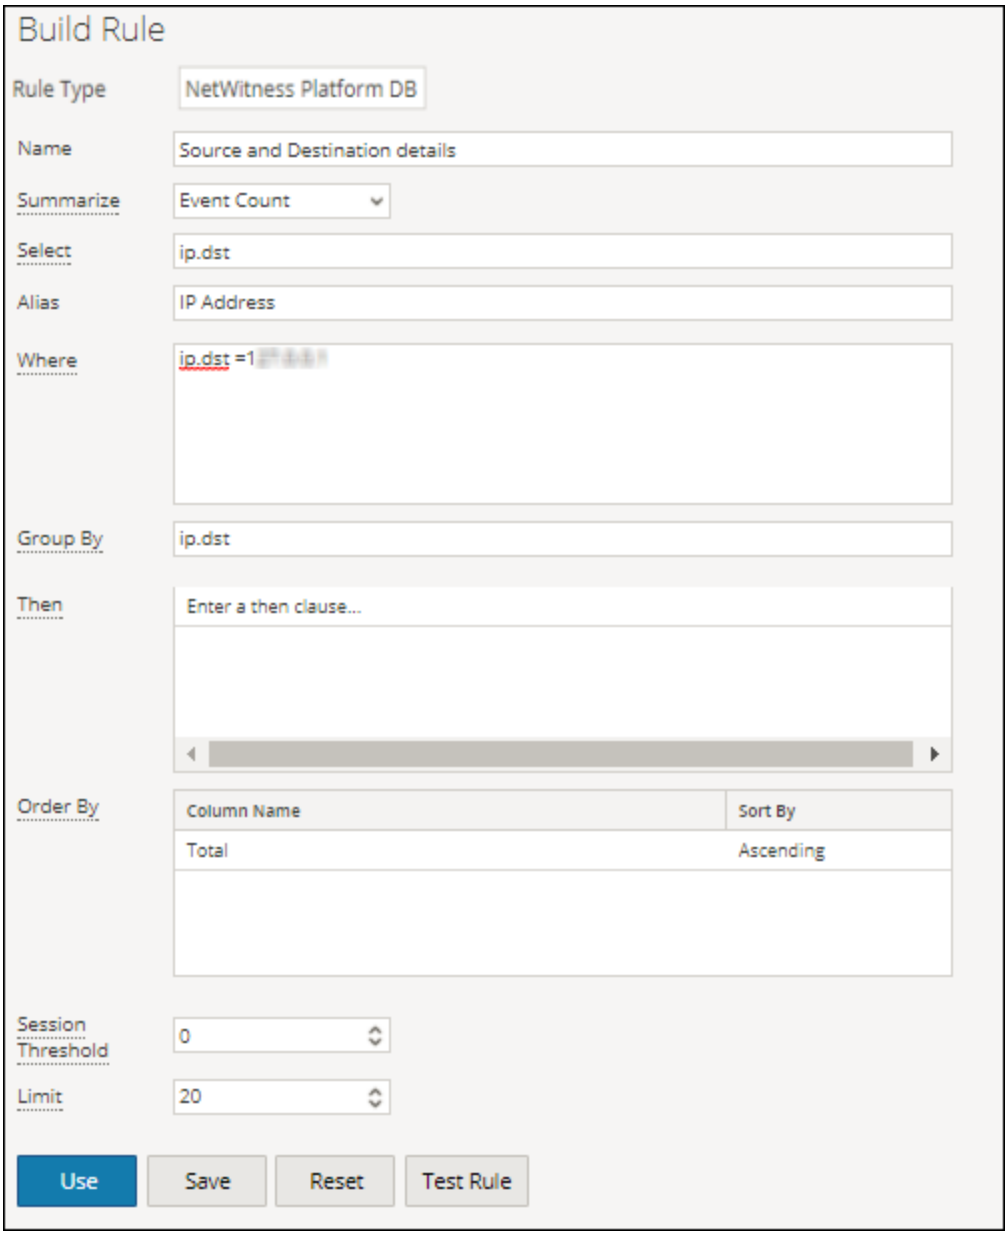
3. In the **Reports Groups** panel, click  .

   A default group is added in the Report Groups panel.

4. Enter the name of the new group.
5. Press **Enter**.

   The group is added to the Report Groups panel.

Schedule a Report



Note: When you schedule a Warehouse report, you can use a supported task scheduler to allocate specific resources in a cluster for the scheduled job. For more information on "supported task schedulers", see Task Scheduler for Warehouse Reporting.

To schedule a report, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** panel, click  to create a rule.
3. Click **Save**.
4. Click **Use**.

5. Go to **Reports**.

   The Manage tab is displayed.

6. Click **Reports**.

   The Report view is displayed.

7. On the **Reports** panel, click + to create a report.
8. Enter the Report Name in the field.
9. Add the rule by drag and drop which has the user defined variable from the Rules tab.
10. Click **Schedule**.

The Schedule Report view is displayed.

If you provide another user with access permissions to a report, you must also provide permissions for the report group, the rules used in the report, and the rule groups otherwise an error message is displayed.

11. To execute the reports as per the schedule, select the **Enable** checkbox.
12. In the **Schedule Name** field, enter a name for the schedule report configuration.
13. From the Data Source field, select the data source.

    Note: If the data source is not listed, then ensure you have **Read**permissions set for the data source. This is applicable for NWDB, Respond and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in *Reporting Engine Configuration Guide*.

14. (Optional) From the **Warehouse Resource Pool** drop-down, select the pools or queues available in the cluster to schedule the report to run on either the pool or queue. This drop-down list is available only if you select a Warehouse DB report.

    Note: All the queues or pools you specified in the Explore page for the Reporting Engine are listed. If no pools or queues are configured in the Explorer page, this drop-down is disabled and the jobs are submitted to the clusters without any a queue or pool name.

    Note: If the pool or queue configured in the report schedule is removed from the Cluster, then in the Capacity Scheduler, the queue name remains undefined. However, in the Fair Scheduler, the specified pool name will be created using the property mapred.fairscheduler.allow.undeclared.pool.

15. From the Time Zone drop-down, select a time zone to display all the time-related data in a report output in the specified format. This setting is configurable from the Reporting Engine Explore view (/com.rsa.soc.re/configuration/reportoutputformatterconfig/reportoutputformatterconfig).
16. From the **Run** field, select the type of run schedule. (For example, Now or Hourly).

    Depending on the type of run schedule, choose one of the following:

    - If you select a **Later** or **Monthly** run schedule, you must provide a value for the day and time in the respective field provided.
    - If you select an **Hourly** run schedule, you must specify the minutes in the **At Minute** field.
    - If you select a **Daily** run schedule, you must enter a value in the **At** field.
    - If you select a **Weekly** run schedule, you must enter a value in the **At** field and also select the week days.

    Note: While scheduling a report, if you select **Past** option or **Range (specific/generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.

    For information on how to generate a report with variables, see Create a Parameterized Report Using Variable.

17. (Optional) In the **Output Actions** panel, do the following:

a. Enter the email address and subject.

b. Edit the body of the message for the report.

c. Select the format of the attachment.

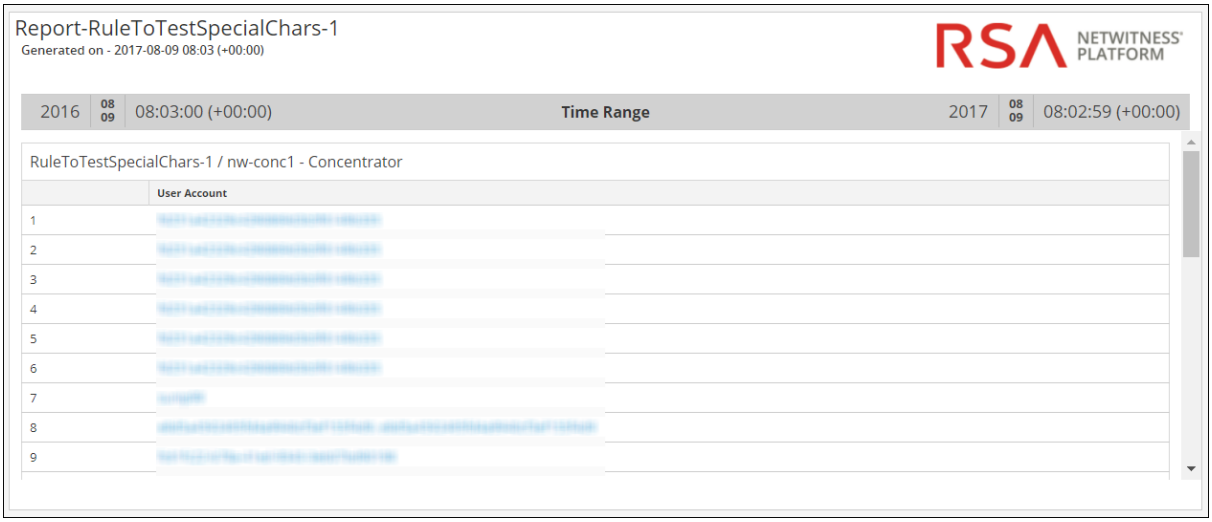
d. Enter a value for the CSV and Multi-value delimiters.

e. (Optional) In the Other Options field, do the following:

i. Click + and select SFTP, URL, or Network Share output action.

A row gets added with the selected output action.

ii. Select the appropriate options to send the report in PDF or CSV format, or both to the RE configured SFTP, or URL, or Network Share output action.



18. (Optional) To add a list in the Dynamic List panel, see Generate a List from the Scheduled Report.

19. (Optional) To choose a logo in the Logo panel, see "Manage and Select a Report Logo" section in Manage Lists, Rules or Reports.

Note: If you do not specify a logo, the default logo will be used.

20. Click **Schedule**.

The scheduled report executes as scheduled and provides the configured outputs.

After you create and Schedule a report, you can perform any of the following tasks:

- You can notify the email recipient when the report execution completes and send reports in PDF and CSV formats as attachments in the email.
- You can generate a list based on the scheduled report and view them in the **Lists** module.
- You can send a scheduled report in PDF or CSV format, or both to the RE configured SFTP location, or URL, or Network Share.
- You can change the default logo and view them in the scheduled report.

- You can modify the NetWitness Reporting Engine config details, by navigating to the Reporting Engine General Tab. See the "Reporting Engine General Tab" topic in the *Reporting Engine Guide*.

Examples

When you schedule reports in the Schedule Report view, by default, the results for the **Past** option are presented based on the user specified time zone. The following examples provide a clear picture on what results to expect when you select **Hours**, **Days**, **Weeks**, **Months**, or **Years** for the **Past** option based on the absolute or relative duration.

Note: By default, the relative duration checkbox is de-selected. This implies that the results for the **Past** option are presented based on the absolute duration.

- **Based on Absolute duration** - Absolute Duration allows a report to be scheduled at an absolute time with respect to the current time, excluding the seconds and considering the time interval as a whole. For example, 12.00pm is the absolute time with respect to the current time (12.45 pm).
  - Hours - Suppose that you select Hours and specify one hour. If the current user specified time is 4.20PM, the report is generated for the time range, 3.00PM to 4.00PM.
  - Days - Suppose that you select Days and specify one day. If the current date is August 27, 2014 and the current user specified time is 10.15AM, the report is generated for the range: August 26, 2014, 12.00AM to August 27, 2014, 12.00AM.
  - Weeks - Suppose that you select Weeks and specify one week. If the current date is August 27, 2014 2.30PM and the day is Wednesday, the report is generated for the range: Saturday, August 16, 2014, 12.00AM to Saturday, August 23, 2014, 12.00AM.
  - Months - Suppose that you select Months and specify one month. If the current date is August 27, 2014 2.30PM, the report is generated for the range:
    July 01, 2014, 12.00AM to July 31, 2014, 12.00AM.
  - Years - Suppose that you select Years and specify one year.If the current date is August 27, 2014 2.30PM, the report is generated for the range:
    January 01, 2013, 12.00AM to December 31, 2013, 12.00AM.
- **Based on Relative duration** - Relative Duration allows a report to be scheduled at a time relative to the current time which might vary based on the current time. For example, 12.45 pm is the relative time with respect to the current time (12.45 pm).
  - Hours - Suppose that you select Hours and specify one hour. If the current user specified time is 4.20PM, the report is generated for the time range, 3.20PM to 4.20PM.
  - Days - Suppose that you select Days and specify one day. If the current date is August 27, 2014 and the current user specified time is 10.15AM, the report is generated for the range: August 26, 2014, 10.15AM to August 27, 2014, 10.15AM.
  - Weeks - Suppose that you select Weeks and specify one week. If the current date is August 27, 2014 12.30PM and the day is Wednesday, the report is generated for the range: Thursday, August 21, 2014 12.30PM to Wednesday, August 27, 2014 12.30PM.
  - Months - Suppose that you select Months and specify one month. If the current date is August 27, 2014, 2.30PM the report is generated for the range:
    July 27, 2014 2.30PM to August 27, 2014 2.30PM.

- Years - Suppose that you select Years and specify one year.If the current date is August 27, 2014 2.30PM, the report is generated for the range: August 27, 2013 2.30PM to August 27, 2014 2.30PM.

Generate a List from the Scheduled Report

You can generate a list from the output of the scheduled report. Make sure that your lists are created in NetWitness prior to generating a list to schedule a report.

To generate a list from the Build Report view, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Reports**.

   The Report view is displayed.
3. In the **Reports** panel, select a report and in Actions column, click  > **Schedule Report**.

   The Schedule Report view tab is displayed.
4. In the Output Actions section, in **Dynamic List** panel, click .

   The Generate List dialog box opens.
5. Click **Browse**.

   The List Selection panel is displayed.
6. Choose a list item and click **Select**.

   The list name gets populated in the List Name field.
7. Select a valid rule to filter the report results further based on the rule definition.
8. Select a value for the **Column** field.

   The column forms the values for the list that gets created.
9. If you want to overwrite the existing list, select the **Overwrite Existing List?** checkbox.
10. Click **Save**.

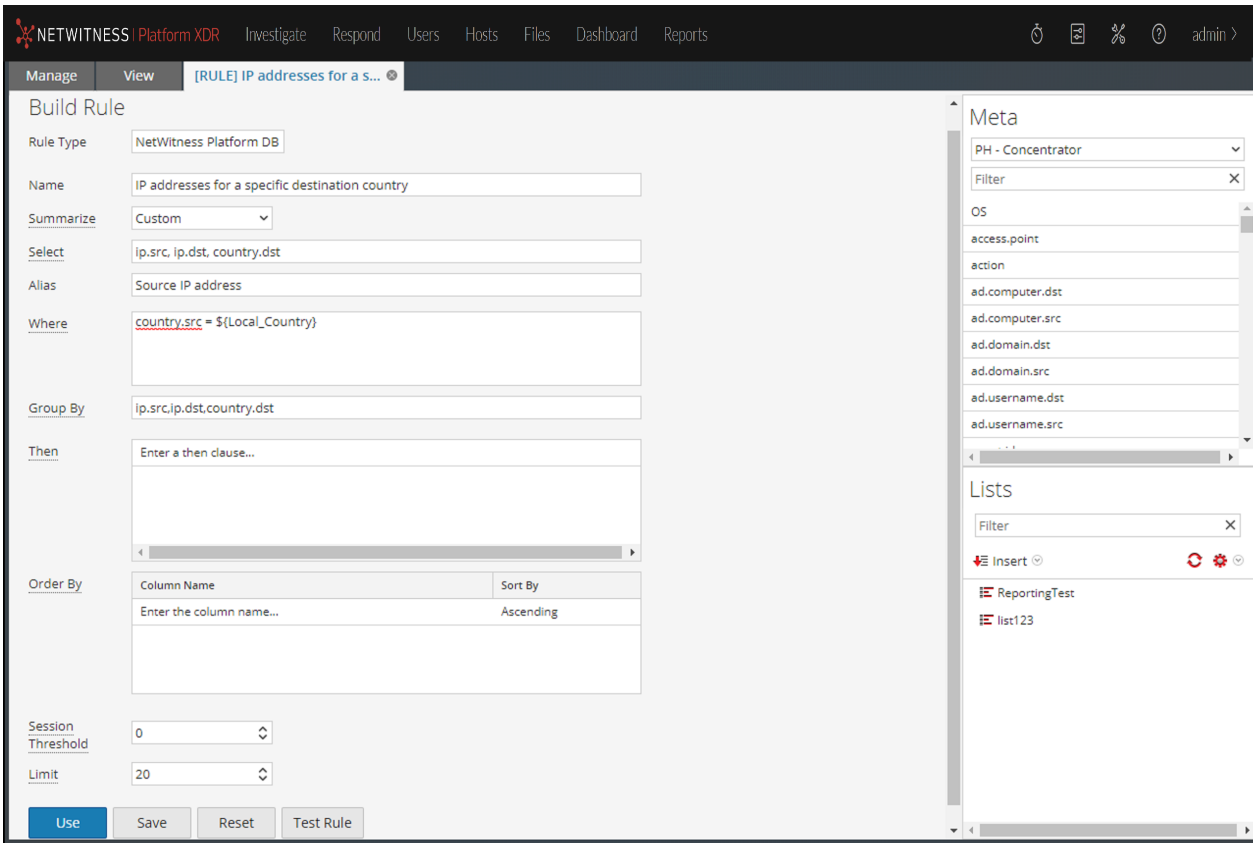
    The list name gets populated in the Generate List panel.

11. (Optional) Select a list from the Generate List panel and click to delete the selected list.
12. (Optional) Select a list from the Generate List panel and click to edit the list details.

Create a Parameterized Report Using Variable

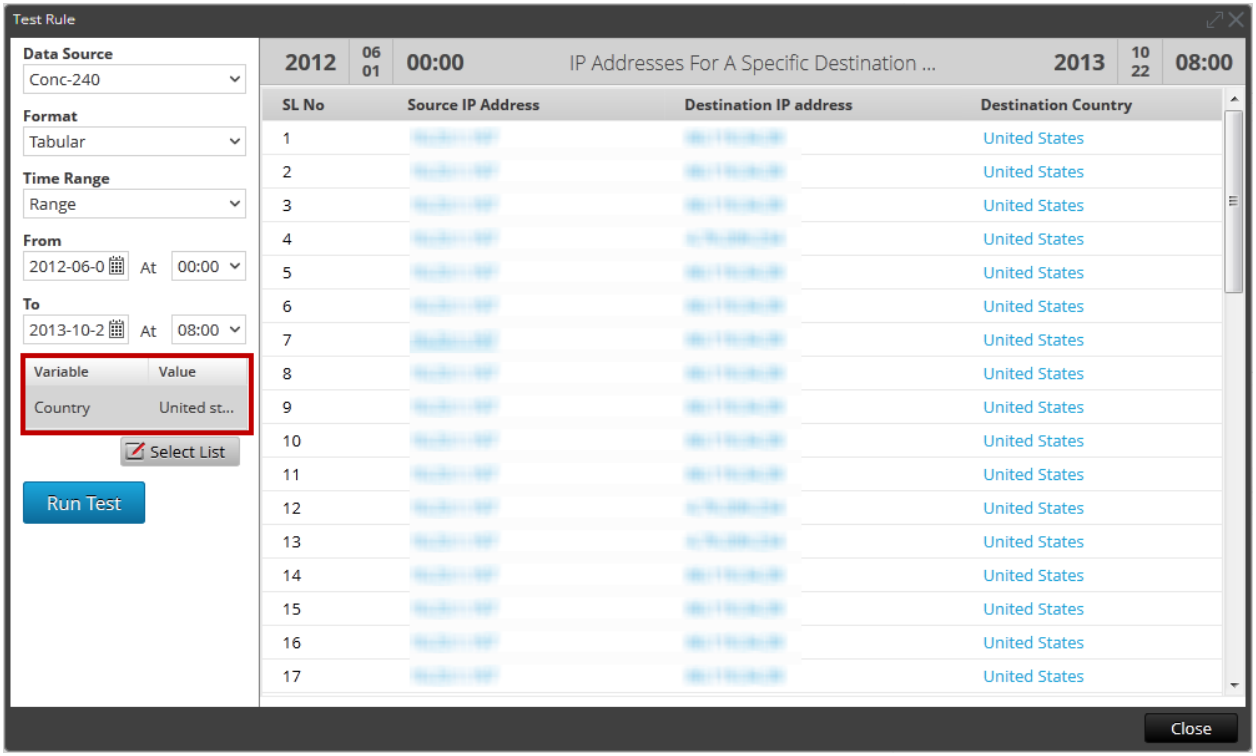
You use variables for reporting in the NetWitness Reporting module. Parameterized reporting allows you to specify values dynamically at runtime without changing the rule definition so you can view the results based on a particular value. You can achieve parameterize reporting by using variables in the query or rule. For information on adding a rule, see Configure a Rule. At runtime, you can enter the value for the variable or select the value from the list based on which the result set is displayed.

The syntax to specify the variable is as follows:



Description	Examples of Supported Syntax
Insert `$` before a variable. Enclose a variable within braces.	`columnname=${<variable>}`

The syntax to define the variable is the same for NetWitness DB and Warehouse DB data sources. When you assign the value of the variable in a Run Configuration, you must enclose the value within single quotes: `'<value>'`.



Some examples where a variable can be used are provided in this section.

View Source IP Addresses for a Specific Destination Country

The following is an example of a NetWitness DB rule to view the source and destination ip addresses for a specific destination country. Here the value for source country is defined as a variable `${local_country}`.

At runtime, you are prompted to enter the value for the variable. The figure below shows the `local_Country` variable where you can enter the value. If you enter the value as **United states**, all the source and destination ip addresses with destination country as United states are listed.

You can use the above rule to schedule a report. You can schedule two types of reports:

- Report with Dynamic Variables
- Iterative Report

Report with Dynamic Variables

Dynamic variables allows the user to specify the values for a variable defined in a rule while scheduling a report.

To schedule a report with Dynamic Variable, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

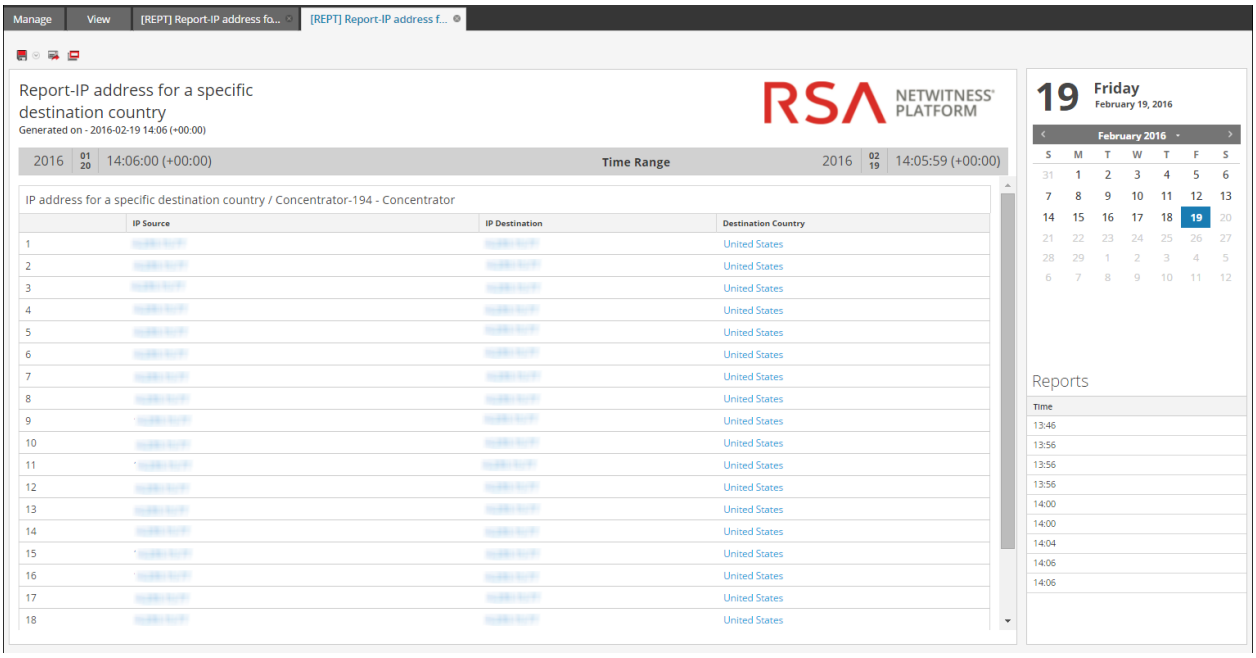
2. Click **Reports**.

   The Report view is displayed.

3. On the **Reports** panel, click + to create a report.
4. Enter the Report Name in the field.
5. Add the rule by drag and drop which has the user defined variable from the Rules tab.
6. Click **Schedule**.

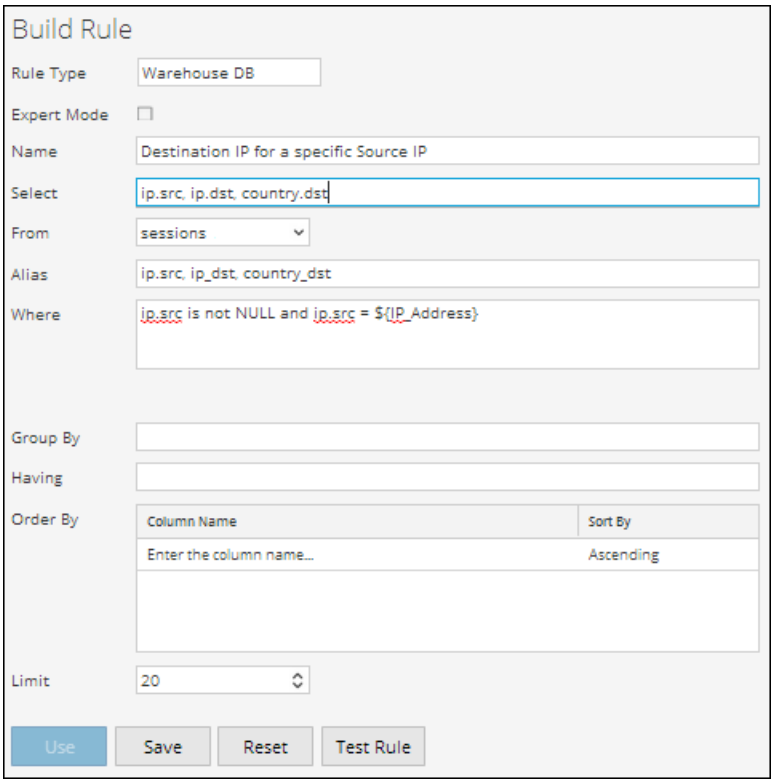
   The Schedule Report view tab is displayed.

7. To execute the reports as per the schedule, select the **Enable** checkbox.
8. In the **Schedule Name** field, enter a name for the schedule report configuration.
9. In the **NetWitness DB** drop-down, select the database.
10. From the Time Zone drop-down, select a time zone to display all the time-related data in a report output in the specified format.This setting is configurable from the Reporting Engine Explore view (/com.rsa.soc.re/configuration/reportoutputformatterconfig/reportoutputformatterconfig).
11. From the **Run** field, select the type of run schedule. (For example, Now or Hourly). Depending on the type of run schedule, do either of the following:
    - If you select a **Later** or **Monthly** run schedule, you must provide a value for the day and time in the respective field provided.
    - If you select an **Hourly** run schedule, you must specify the minutes in the **At Minute** field.
    - If you select a **Daily** run schedule, you must enter a time value in the **At** field.
    - If you select a **Weekly** run schedule, you must enter a value in the **At** field and also select the week days.



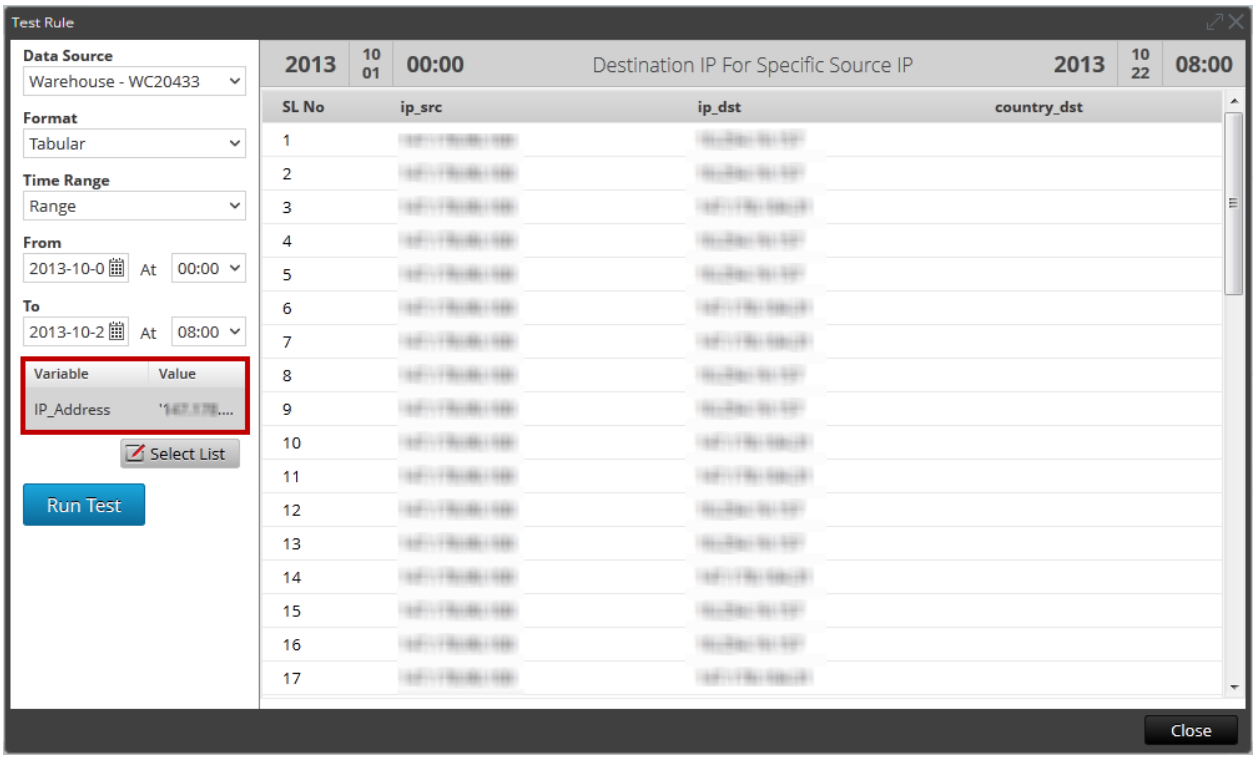
Note: While scheduling a report, if you select **Paste** option or **Range (specific/generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.

12. In the variables field, click .
13. Do one of the following:
    - Enter the value for the variable, or
    - Choose the list value for the variable.



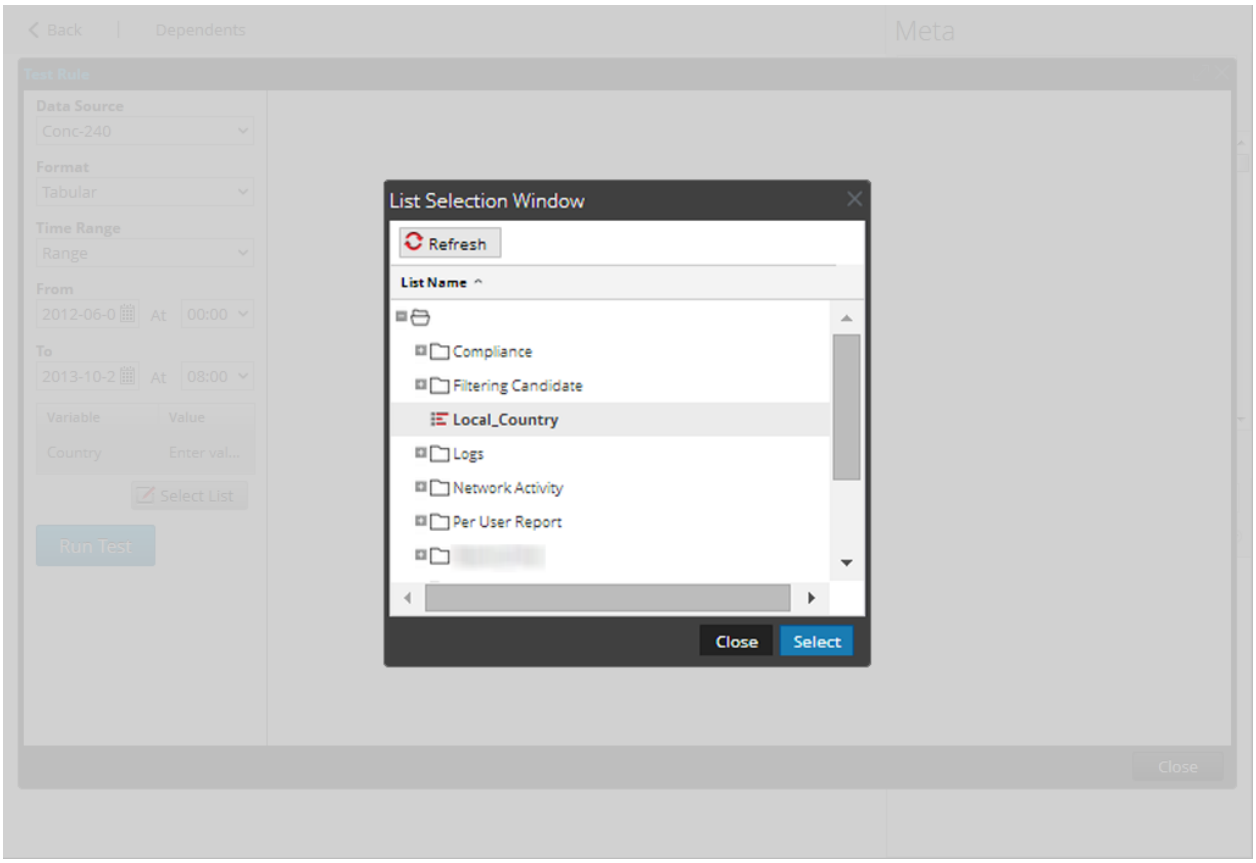
14. Click **Select**.
15. Click **Schedule**.

    The scheduled report executes as scheduled and provides the configured outputs.



View All Destination IP Addresses for a Source IP Address

The following is an example of a Warehouse rule to view all the destination IP addresses for a specific source IP. The source IP address `ip_src` is defined as a variable `${IP_Address}`.



At runtime, you are prompted to enter the source IP address. The figure below shows the `IP_Address` variable, and you can enter a valid source IP address. All the destination IP addresses with the specified source IP are listed.

Associate a Variable to a List of Values

You can associate the variable to a list. For example, you can create a list called `Local_Country` and enter all the country names as values. You can select the list `Local_Country` as the value for the variable `Local_Country`. At Run Configuration, the `Local_Country` list is populated and you can select the country based on which results are displayed.

Iterative Report

An iterative report generates a report for every value in the list.

To schedule an iterative report, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. On the **Reports** panel, click + to create a report.

4. Enter a Report name in the field.

5. Add the rule which has the user defined variable from the Rules tab.

6. Click **Schedule**.
   The Schedule Report view tab is displayed.

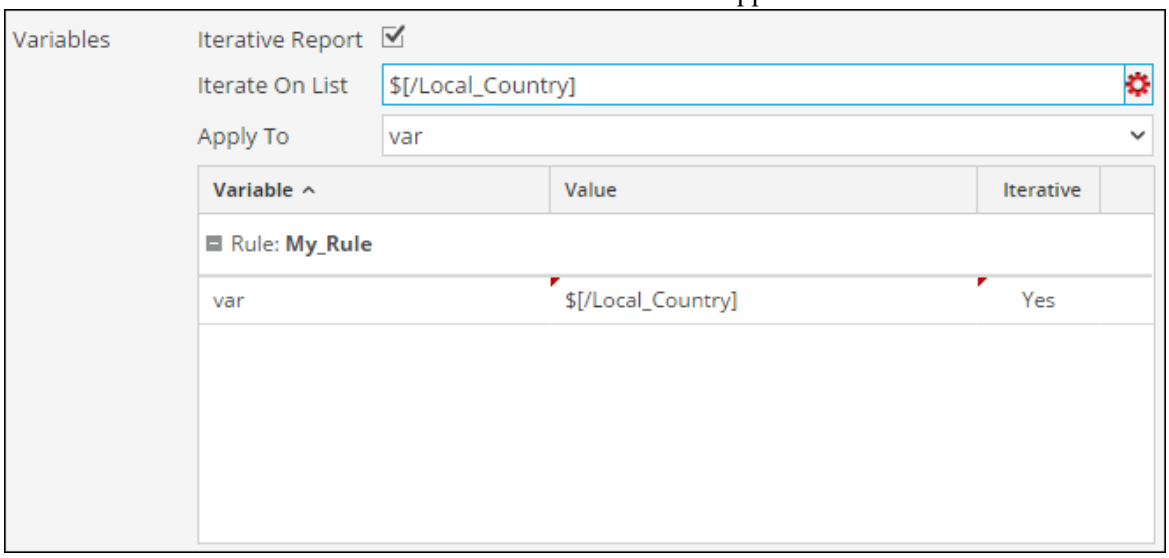
7. To execute the reports as per the schedule, select the **Enable** checkbox.
8. In the **Schedule Name** field, enter a name for the schedule report configuration.
9. From the **Data Source** field, select the data source.

> **Note:** If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in the *Reporting Engine Configuration Guide*.

10. (Optional) From the **Warehouse Resource Pool** drop-down, select the pools or queues available in the cluster to schedule the report to run on either the pool or queue. This drop-down list is available only if you select a Warehouse DB report.

> **Note:** All the queues or pools you specified in the Explore page for the Reporting Engine are listed. If no pools or queues are configured in the Explorer page, this drop-down is disabled and the jobs are submitted to the clusters without any a queue or pool name.

Note: If the pool or queue configured in the report schedule is removed from the Cluster, then in the Capacity Scheduler, the queue name remains undefined. However, in the Fair Scheduler, the specified pool name will be created using the property `mapred.fairscheduler.allow.undeclared.pool`.

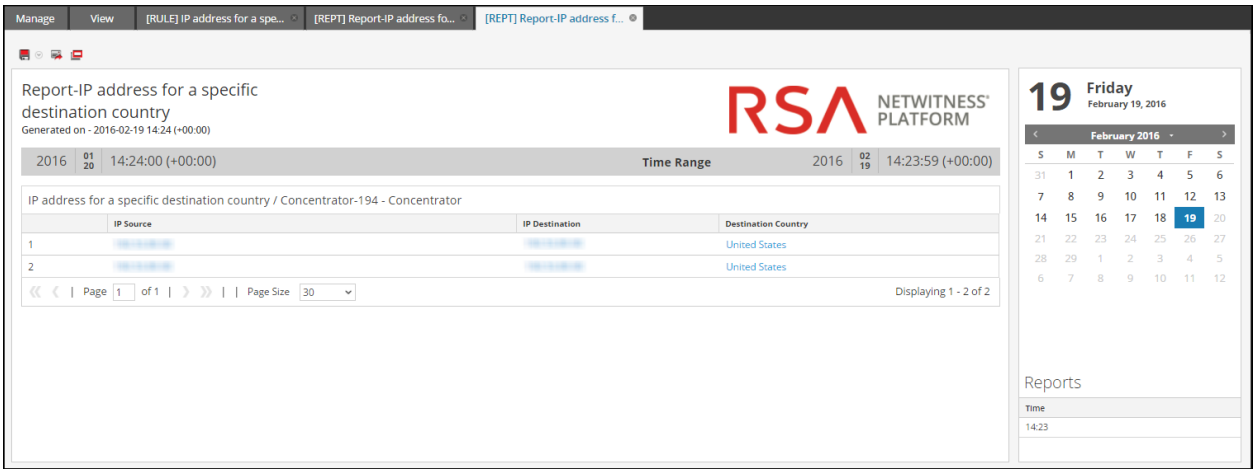


11. From the Time Zone drop-down, select a time zone to display all the time-related data in a report output in the specified format. This setting is configurable from the Reporting Engine Explore view (/com.rsa.soc.re/configuration/reportoutputformatterconfig/reportoutputformatterconfig).
12. From the **Run** field, select the type of run schedule. (For example, Now or Hourly). Depending on the type of run schedule, do either of the following:
    - If you select a **Later** or **Monthly** run schedule, you must provide a value for the day and time in the respective field provided.
    - If you select an **Hourly** run schedule, you must specify the minutes in the **At Minute** field.
    - If you select a **Daily** run schedule, you must enter a time value in the **At** field.
    - If you select a **Weekly** run schedule, you must enter a value in the **At** field and also select the week days.

    Note: While scheduling a report, if you select **Paste** option or **Range (specific/generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.
13. In the variables field, do the following:
    a. To run iterative reports, select the **Iterative Report** checkbox.
    b. To Iterate on List value, click .

       The List Selection Window opens.
    c. Choose a list and click **Select**.

       The list item selected gets added to the **Iterate on List** field.



d. Select the variable on which the selected list value has to be applied.

14. Click **Schedule**.
    The scheduled report executes as scheduled and provides the configured outputs.

The following figure shows the Iterative Report view.

Create a Report Using a Rule

You can create a report using a rule. When you create a report using a rule, a default report is created with this single rule. You can further edit the report to add more rules.

To create a report using a rule, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Choose any of the following:

   - Create a report using a rule when you create or edit the rule:

     a. In the **Rules** view, select a rule and click  > **Use**> **Report**.

     The Use Rule dialog is displayed.

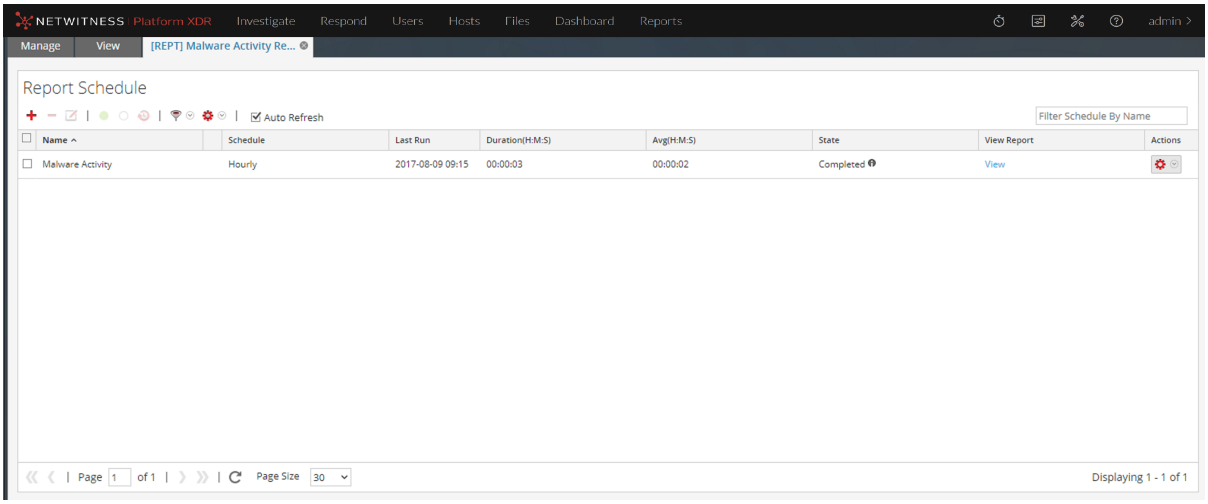
   - Select a rule in the Rules panel and click  in the Rule toolbar. From the drop-down menu, select **Use** > **Report**.

   - In the Rules panel click  > **Create Report**.

Note: Custom rules can be used to create a Report and If you select the view for the rule as "Area" or "Pie", a window pops up for **X-Axis** and **Y-Axis** inputs. By default, you can select only the first meta in **X-Axis**.

3. Select **New Report** or **Existing Report** based on your requirement.
4. Click **Select**.

View a Report



You can view a report or list of all reports. You can also view the scheduled reports to know the state of the scheduled report. If the scheduled report is in a stop or disable state, you can start or enable the scheduled report.

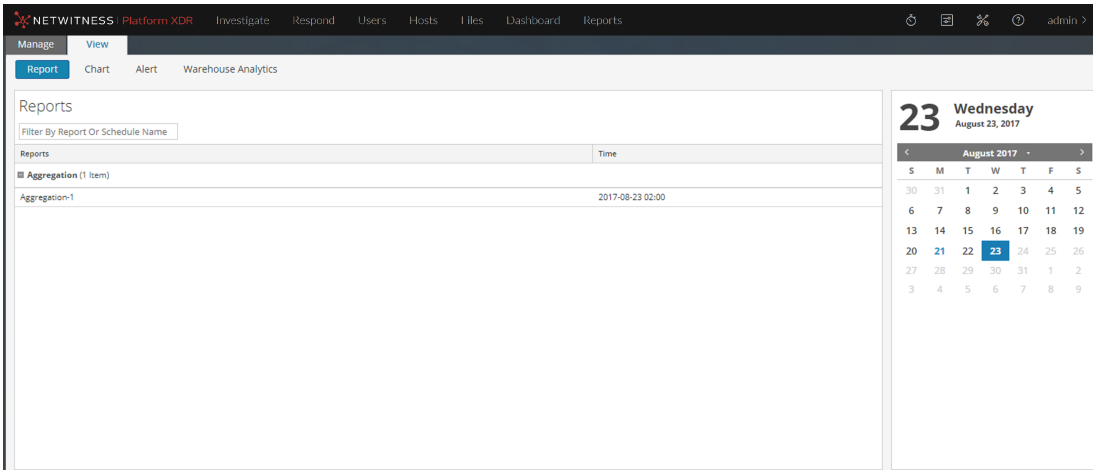
After you view a report, you can perform any of the following tasks:

1. You can print, save, email and view reports on full screen.
2. You can also select a date from the calendar to view a list of successfully run reports for the chosen date.

To view a report, perform the following:

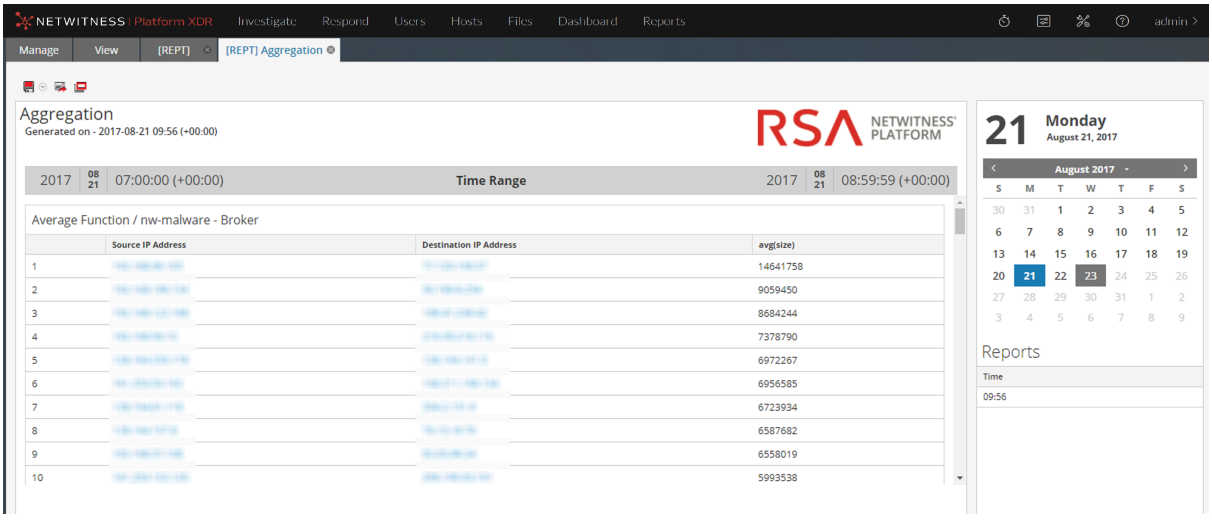
1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, select a report and in Actions column, click  > **View Scheduled Reports**.
4. Click the **#Schedules** column.
   The Schedule Reports view tab is displayed with the status of each of the scheduled report.

5. Select a scheduled report and click **View**.
   One of the following is displayed:
   - The selected report.
   - The Sub reports panel for a scheduled report having 'Iterative' selected.



For each value in the configured list a report is displayed.

> **Note:** If the report status is partial or complete, the "last run timestamp" and the "last run (seconds)" are updated. However, the average time taken to run the report is updated only when the report status is complete and not when it is partial.



To view a list of all reports, perform the following:

1. Go to **Reports**.
   The **Manage** tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, click **View All Reports**.
   A list of reports along with their schedule name and time are displayed on the View tab.

> **Note:** If no list is displayed, select a date from the calendar to view a list of reports for that date.

4. Double-click on a report to view the details of the report.
5. You can select a scheduled report and print, save as PDF/CSV, send email notifications, or view it on full screen.

Investigate a Report

You can investigate a report by directly navigating to the Investigation View from the report. With the Investigate a report option, you can investigate each event mentioned in the report.

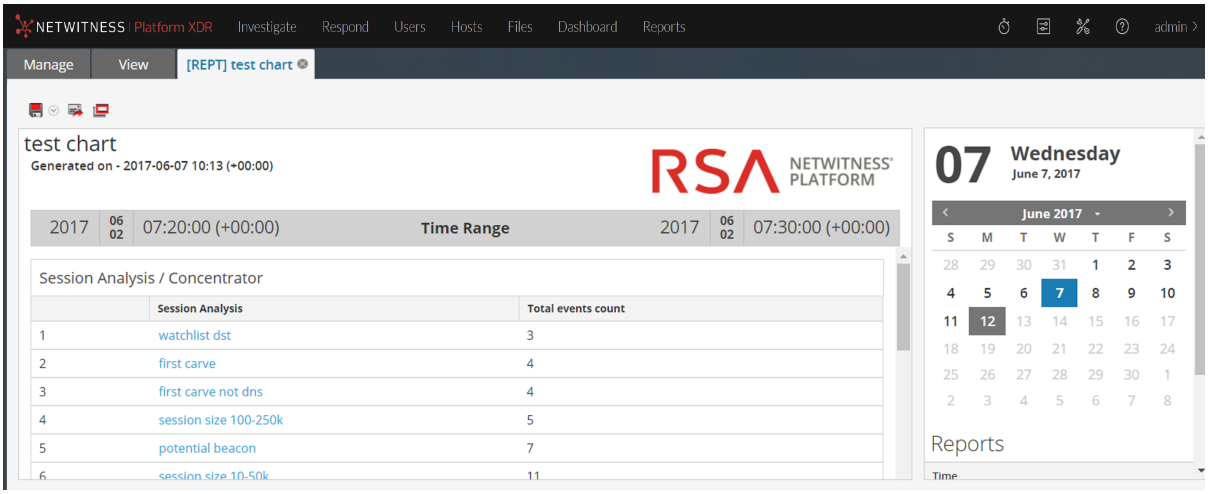
To investigate a report, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.



3. In the **Reports** toolbar, click **View All Reports**.

   The View All Reports tab is displayed.

   Note: If no reports are displayed in the View All Reports, select a date for which you want to display the reports.

4. Double-click the report name to view the report details.

   The Report details screen is displayed.

   You can click on the session analysis to investigate on the report.

Note: If you want to manually copy the result data and use it for investigation, make sure that the binary values are prefixed with 'hex:'.

Manage Lists, Rules or Reports

You can set access control, delete, edit, import, or export a list, rule or report.

Manage a List

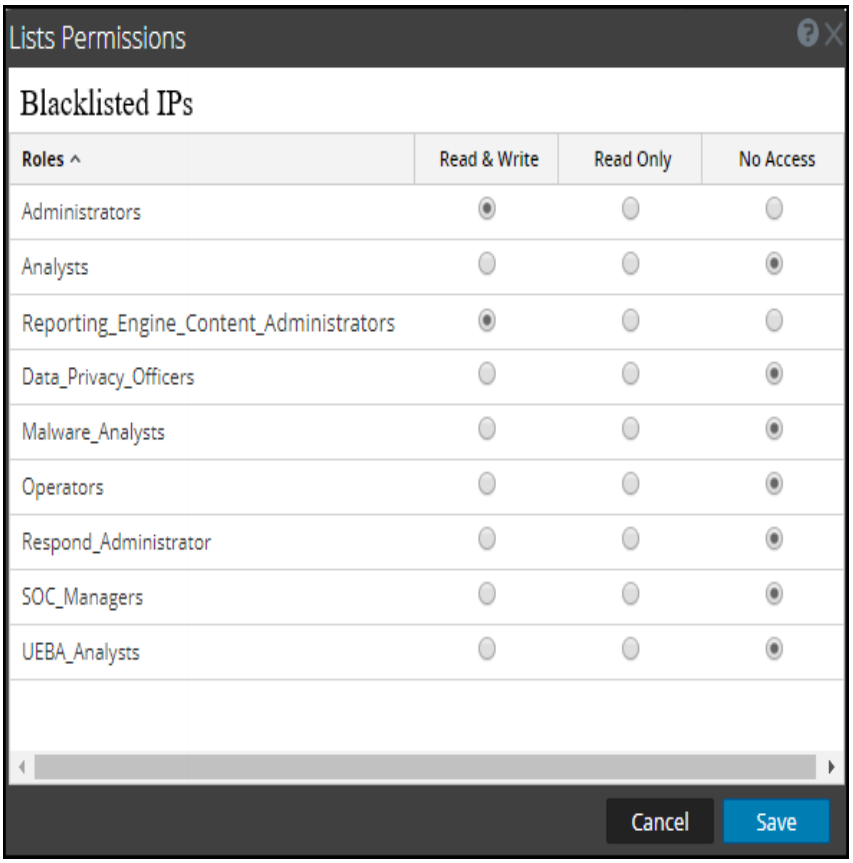
You can perform the following procedures to manage a list.

- Access Control for a List and List Group
- Edit a List
- Delete a List or List Group
- Duplicate a List
- Export a List or List Group
- Import a List or List Group
- Filter Unused Lists

Access Control for a List and List Group

You can set up the access permissions for the user roles to manage lists or list groups. The Reporting provides access control at the list and list group level. Only a user who has the right set of permissions can perform the tasks in the Reporting. The access control is managed by the administrator from the  (Admin) > Security > Roles tab.

As an administrator, you must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.



Lists or list groups can be assigned to a specific set of user roles. When users log into NetWitness, they can access only those lists to which they belong. Users who belong to a user role with the **Read & Write** access permission have full access rights on the lists. Further, the access can be strengthened so that lists are accessed only by those who have the **Read Only** access.

Note: You must have **Read Only** permission for a list group to view the lists within that group.

For example, if you want **Security Analysts** to have access to all the lists in a list group, you can set the permission **Read & Write** at the list group level. And, if you do not want the **Operator** role to have access to a specific set of lists in a list group, you can set the permission **No Access** at the list group level.

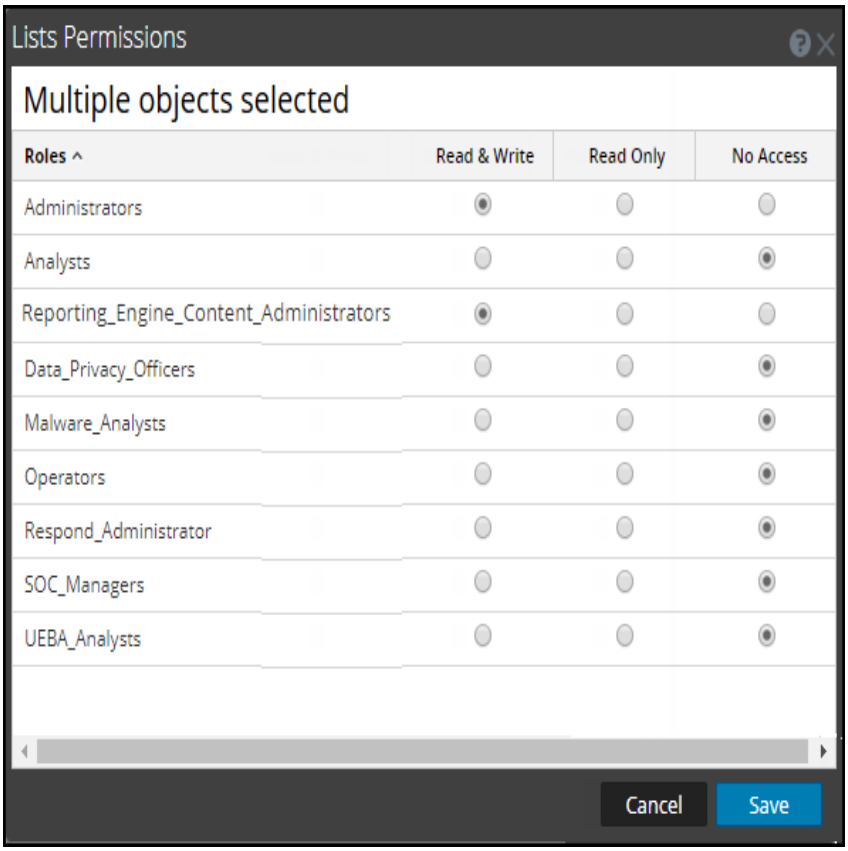
At the list or list group level, you can set the following access permissions for the user roles in NetWitness. For more information, see List View:

- Read & Write
- Read Only
- No Access

The following table lists the columns in the Lists Permissions panel:

Column	Description
Roles	Describes roles of the users logged into the NetWitness user interface.
Read & Write	Allows users to access, view, edit, delete, import, and export lists on the Lists view. Users can also change the permission on the rule.
Read Only	Allows users to only access and view the list on the lists view.
No Access	Doesn't allow users to access or view the lists.

Access Control for a List



To change the list permissions, you must select a list and set access permissions using the List Permissions panel.

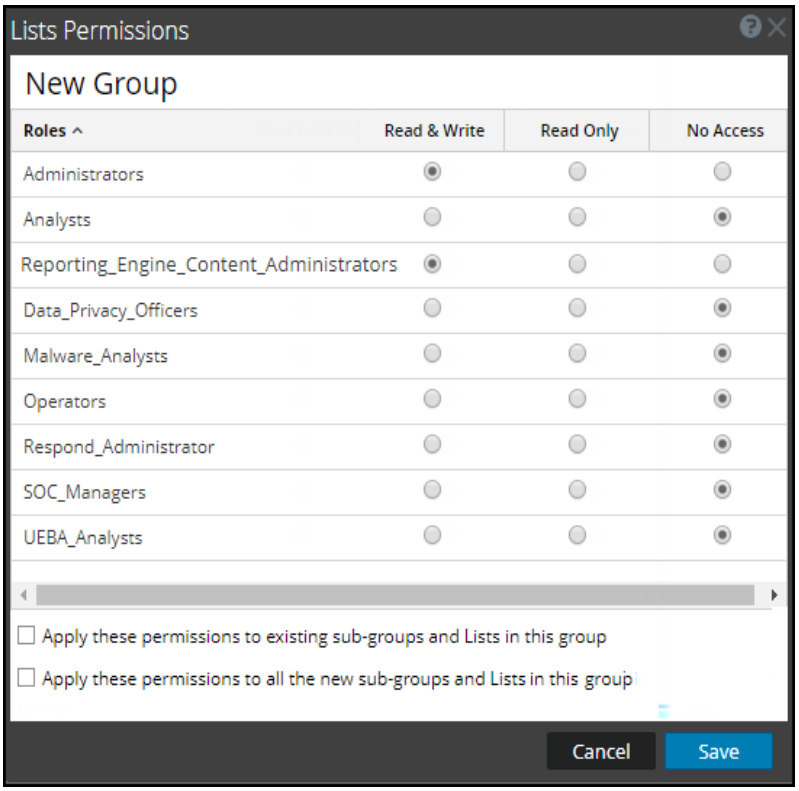
If you want to change the access permission for a specific user role, you must set it at the list level. Except for administrators (with full access in Reporting Engine service Config page) and reporting engine content administrators, the default permission set for all the user roles is **No Access** before applying job permissions.

Access Control Multiple Lists

You can select multiple lists at once and set access permissions using the Lists Permissions Panel. The access permission that you choose is applied to all the selected lists.

Note: The **"*"** beside the role name indicates that other permissions are available for the user role. If you want to change the access permission for the required user role, select the user role and change the access permission.

Note: If a user (other than ADMIN) creates a list, ADMIN cannot access that list.



Access Control for a List Group

To change the list group permissions, you must select a list group and set access permissions using the Lists Permissions panel.

If you want to change the access permission for a specific user role, you must set it at the list group level. The default permission set for all the other user roles is **No Access** before applying job permissions.

You can also apply permissions to existing subgroups and lists in the group by selecting the appropriate checkbox.

You can also apply permissions to all the new subgroups and lists in the group by selecting the appropriate checkbox.

The following scenarios describe defining permissions for list groups or subgroups and lists in the groups:

- Scenario 1: Permissions applied to list group or subgroup based on the user role.

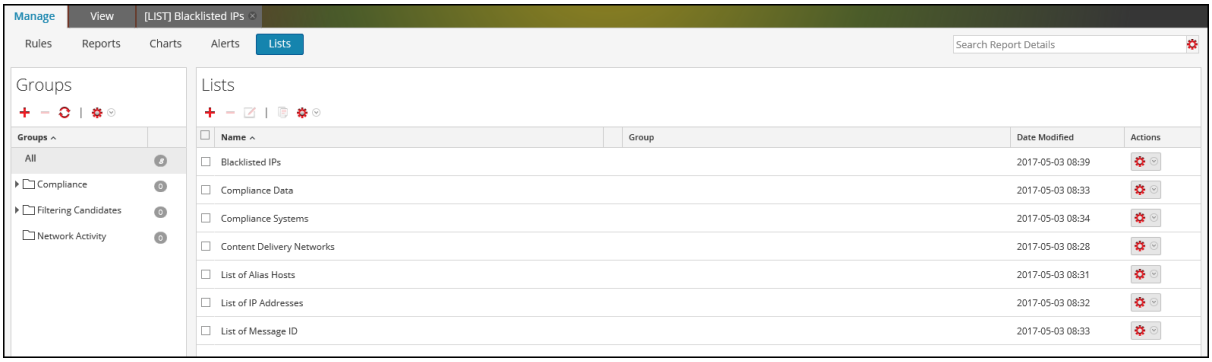
  Each of the levels will have a permission set depending on the user role. For example, if a list group is assigned the role of Security Analyst, permissions are set to Read & Write for the list group.

- Scenario 2: Permissions applied to subgroups and lists in the group.

  The access permissions that you set can be applied to subgroups and child objects of this group. Permission at the list group level will be inherited by the subgroups and lists in the group.

Role (Analysts)	Permissions applied to list group or subgroup based on the user role	Permissions applied to subgroup and lists in the group
Group	Read & Write	Read & Write
Subgroup	Read	Read & Write - Inherited
Lists	Read	Read & Write - Inherited

Access permission for a list or list group



Ensure that you have at least **Read & Write** access permission so that you can set access permissions for lists or list groups.

To set access permission for a list, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

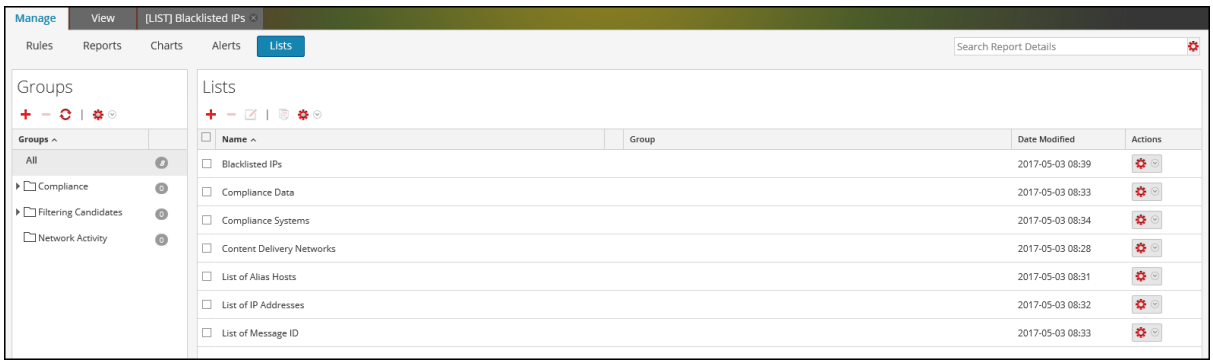
2. Click **Lists**.
   The List view is displayed.

3. In the **Lists** panel, select a list.

4. Click  > **Permissions** in the List toolbar.
   The List Permissions dialog is displayed.

5. Select the appropriate access permission for each of the user roles and click **Save**.

   A confirmation message that the permission is successfully set for the selected list is displayed.



To set access control for a list group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.

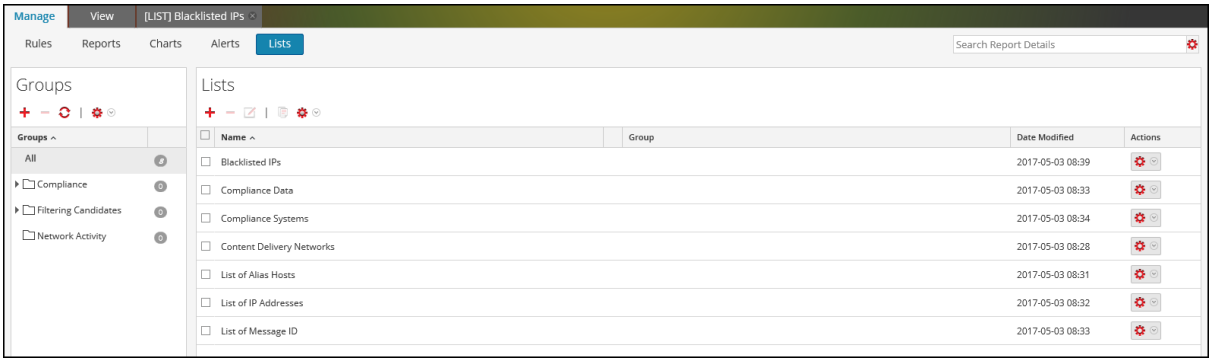
3. In the **Lists Groups** panel, select a list group.

4. Click  > **Permissions**.

   The List Permissions dialog is displayed.

5. (Optional) Select the appropriate checkbox to apply these permissions to existing subgroups and lists in this group.
6. (Optional) select the appropriate checkbox to apply these permissions to all the new subgroups and lists in this group.
7. Click **Save**.

   A confirmation message that the permission is successfully set for the selected list group is displayed.



Edit a List

To edit a list, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Lists**.

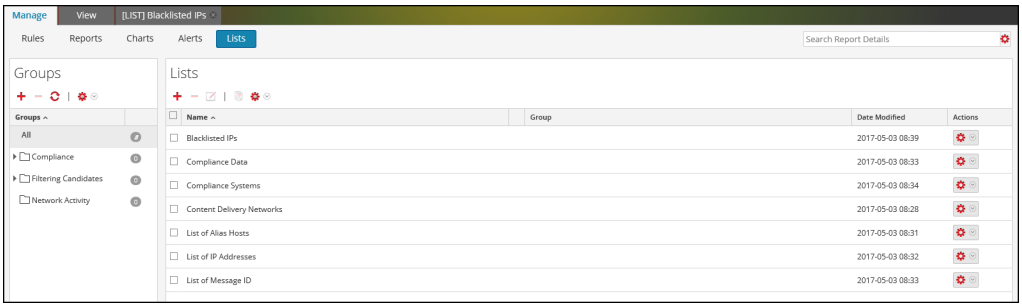
   The List view is displayed.

3. In the **Lists** panel, select a list that you want to edit and do one of the following.
   - Click  in the **Lists** toolbar.
   - In the **Lists** panel, click  > **Edit**.

     Note: You can only edit one list at a time.
4. Modify the required fields and add new values to the list.
5. Click **Save**.

   A confirmation message that the list is saved successfully is displayed.

Delete a List or List Group



To delete a list, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.

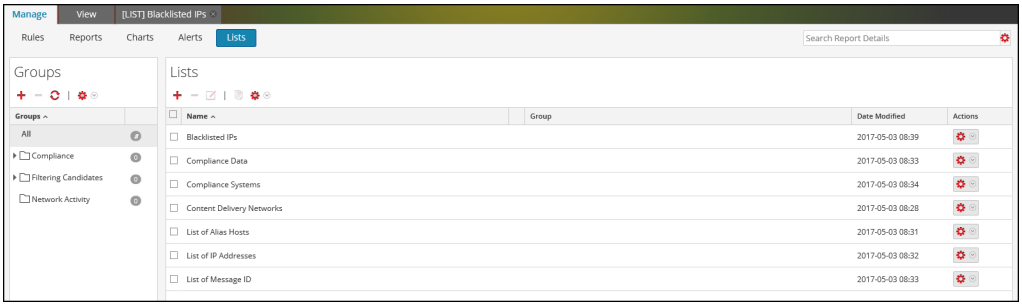
3. In the **Lists** panel, do one of the following:

   - Select a list or multiple lists that you want to delete and click in the **Lists** toolbar.
   - In the **Actions** column, click > **Delete**.

     Note: Before you delete a list, make sure that the list is not associated with any rule.

4. Click **Yes** to delete the list.

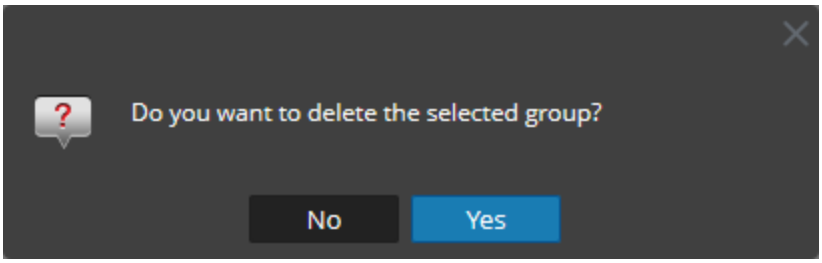
   A confirmation message that the list is deleted is displayed and the selected list is deleted from the List View panel.



To delete a list group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.



2. Click **Lists**.

   The List view is displayed.

3. In the **Lists Groups** panel, select the group and click .

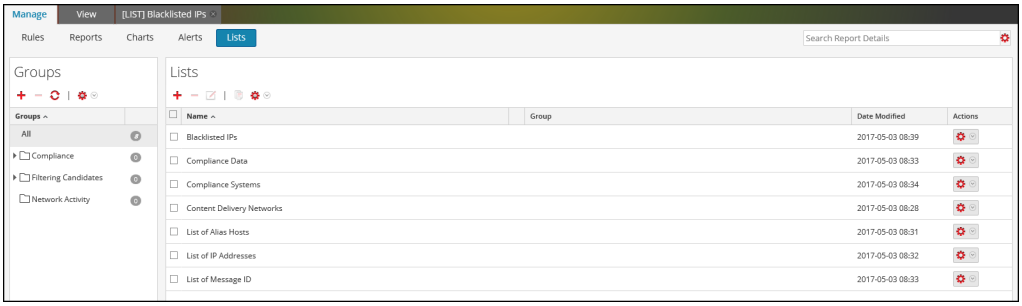
   A confirmation dialog is displayed.

Caution: If you delete a group, all subgroups and lists in that group are deleted.

4. Click **Yes** to delete the selected group.

Note: If you try to delete a list group that has lists referenced in a rule or an alert, a warning message that **Lists are referenced in a rule** is displayed.

Duplicate a List



To duplicate a list, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

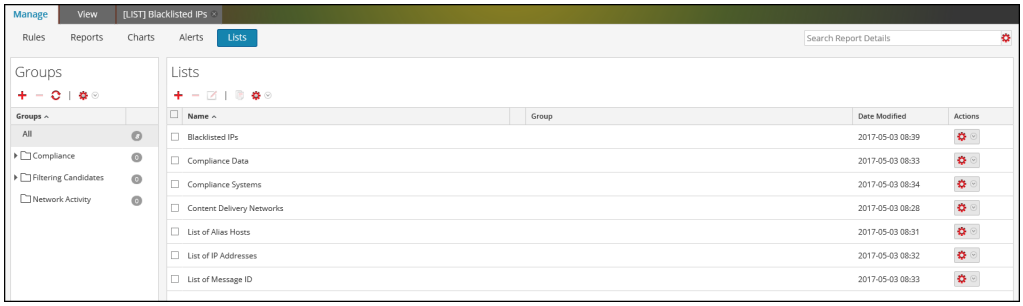
   The List view is displayed.

3. In the **Lists** panel, select a list that you want to duplicate.

   Note: You can only duplicate one list at a time.

4. In the **Lists** toolbar, click .

Export a List or List Group



To export a list, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

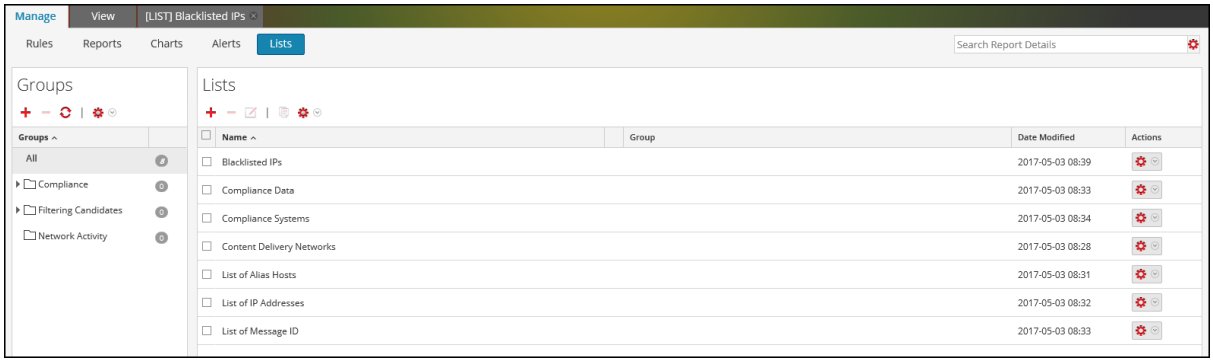
The List view is displayed.

3. In the **Lists** panel, do one of the following:

   - Select a list and click  **> Export** in the List toolbar.
   - In **Actions** column, click  > **Export**

   You can export multiple lists at a time. To select multiple lists, select the checkbox of the lists to be exported. A browser-specific export dialog may be displayed allowing you to open or save the file.

To export a list group, perform the following:



You can export selected list groups to an external file that can be later imported to NetWitness. If nothing is selected in the List Library panel, the entire list tree is exported. When you export, the result is a single export file in binary format.

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.

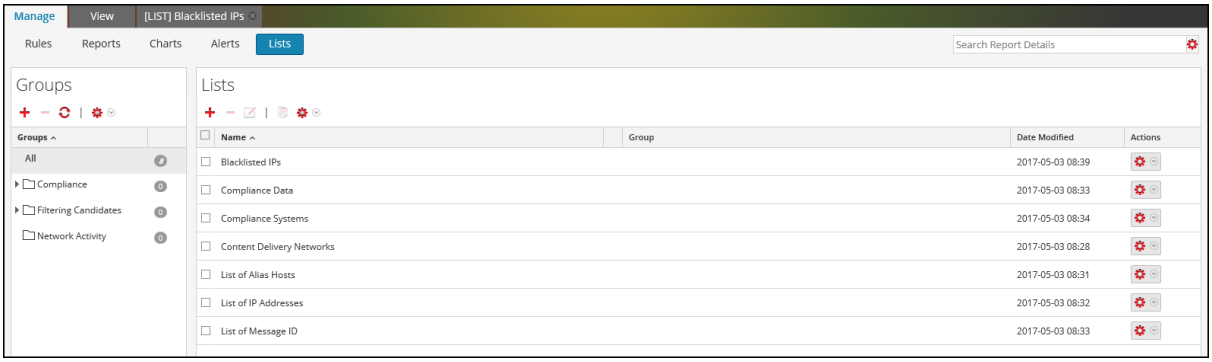
3. In the **Lists Groups** panel, select the list group containing the lists which you want to export.

4. Click  > **Export**.

   You can export multiple list groups at a time. To select multiple list groups, press and hold the CTRL button and select the list groups to be exported. The exported file is saved to the local drive.

Import a List or List Group

To import a list, perform the following:



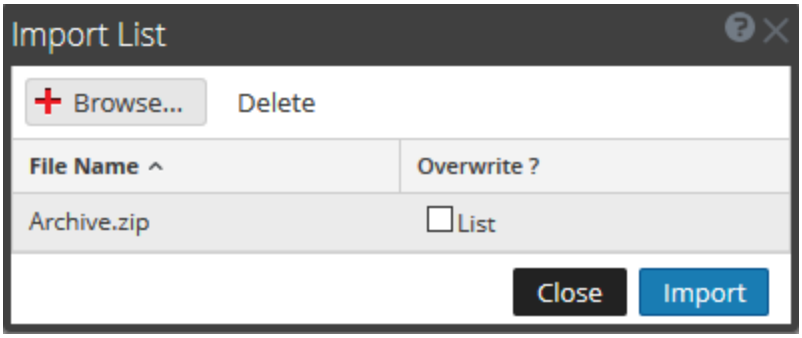
You can import lists from instances of NetWitness into the list tree in the List View panel. Lists must be in a valid binary file exported from a NetWitness instance.

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.



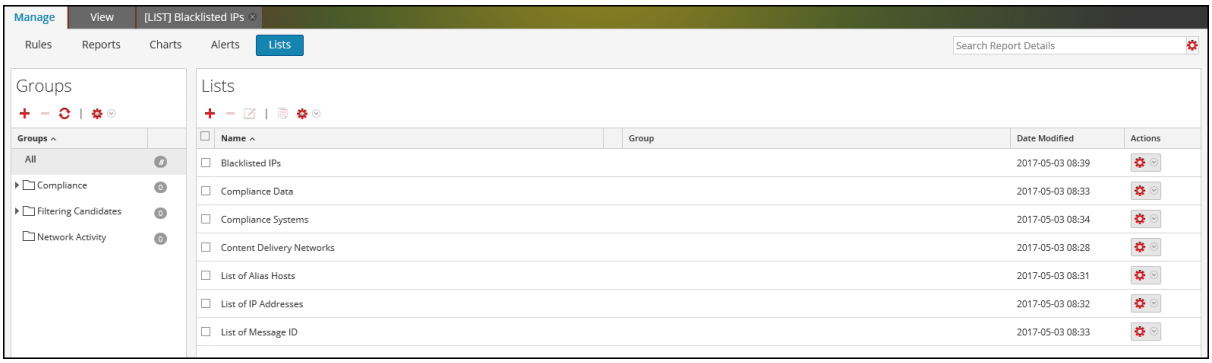
3. In the **Lists** toolbar, click  > **Import**.

   The Import List dialog is displayed.

   Note: You can import multiple lists at a time. To select multiple lists, press and hold the CTRL button and select the lists to be imported.

4. Click **Browse** and select archived file containing the lists.

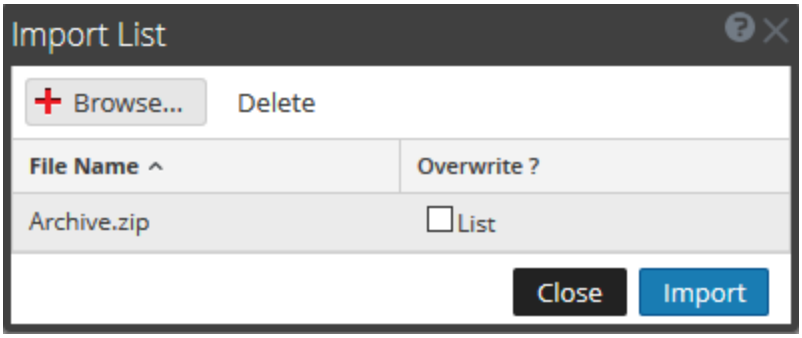
5. Click **Import**.



Note: During the import process, if a duplicate list exists and you do not select the overwrite option, the list is imported and no message about duplicate lists is displayed.

To import a list group, perform the following:

You can import list groups from instances of NetWitness into the list tree in the List Groups panel. Lists must be in a valid binary file exported from a NetWitness instance.



1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Lists**.

   The List view is displayed.

3. In the **Lists Groups** panel, click  > **Import**.

   The Import List dialog box is displayed.
4. Click **Browse** and select archived file containing the list groups.

   You can import multiple list groups at a time. To select multiple list groups, press and hold the CTRL button and select the list groups to be imported.
5. Click **Import**.

Note: During the import process, if a duplicate list group exists and you do not select the overwrite option, the list group is imported and no message about duplicate list group is displayed.

Filter Unused Lists

You can filter and delete the lists that are not used by any rule. To filter unused lists:

1. Go to **Reports**.
   The **Manage** tab is displayed.
2. In the **Lists** panel, click  and select **Unused Lists**.
   List of unused lists will get displayed.

3. [Optional] Delete the unused lists.
   For more information, see Delete a List or List Group.

Manage a Rule

You can perform the following procedures to manage a rule.

- Access Control for a Rule and Rule Group
- Delete a Rule or Rule Group
- Duplicate a Rule
- Edit a Rule
- View Dependents of a Rule
- Export a Rule or Rule Group
- Filter Unused Rules

Access Control for a Rule and Rule Group

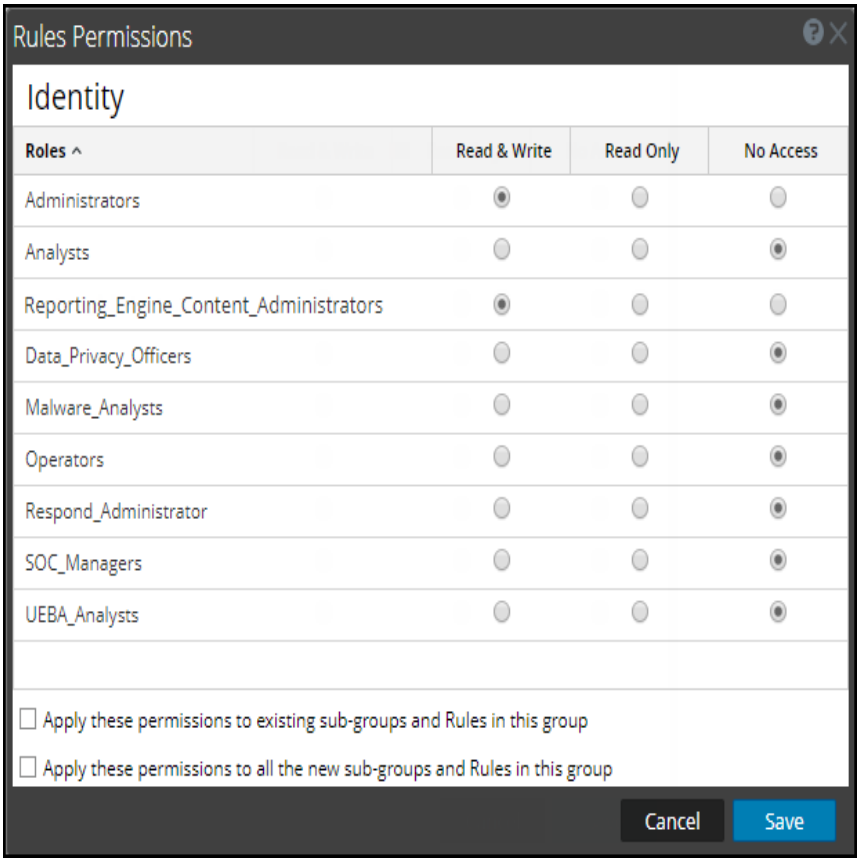
To set access permissions the user will have depending on the user role to manage a rule or rule group. The Reporting provides access control at the rule and rule group level. Only a user who has the right set of permissions can perform the tasks in the Reporting. The access control is managed by the administrator from the  **(Admin) > Security > Roles** tab.

When creating users and user roles, the administrator must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

Rules or Rule Groups can be tied to a specific set of user roles so that when a user logs into NetWitness, the only rules they can access are rules accessible to the group to which the user belongs. Users that belong to a user role with the ‘Read & Write’ access permission have full access rights on the rule. Further, the access can be tightened so that rules are accessed only by those who have the ‘Read Only’ access.

Note: You must at least have ‘Read Only’ permission on a group to view the rules within that group.

At the rule level, you can set the following access permissions for the user roles:

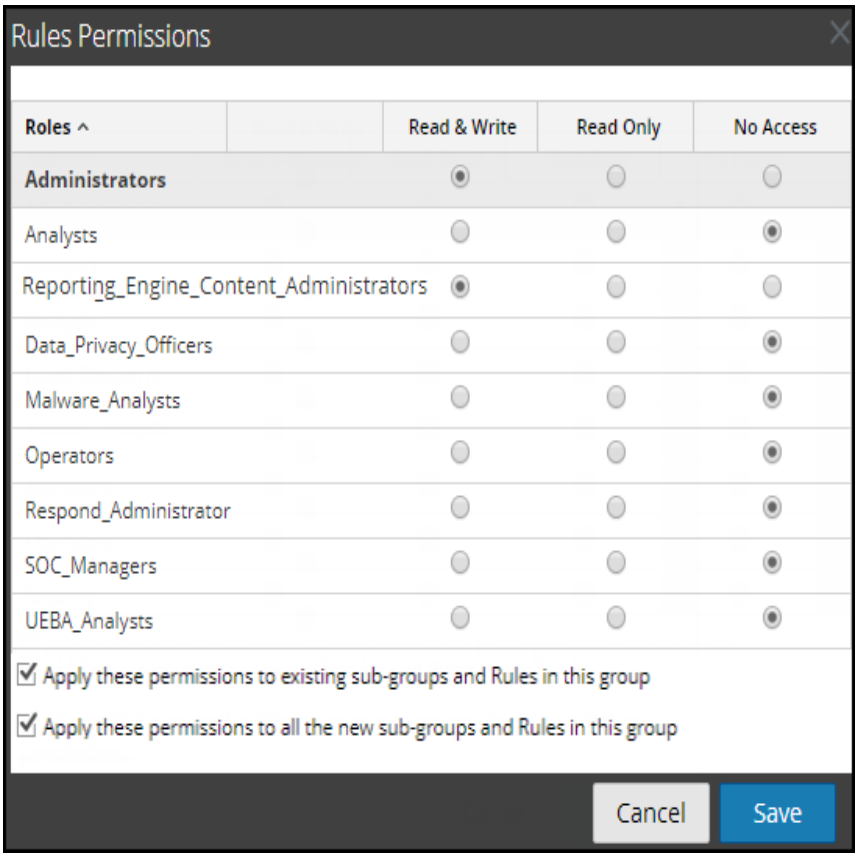


- Read & Write
- Read Only
- No Access

Suppose, you want the **Security Analysts** to have access to all the rules in a Rule Group, you can set the permission '**Read & Write**' at the Rule Group level. And, if you do not want the **Operator** role to have access to a specific set of rules in a rule group, you can set the permission '**No Access**' at the Rule Group level. The permission is set only for the rule group but not the rules or subgroups in the Rule Group.

Access Control for a Rule Group

When you want to change the rule group permissions, you must select a rule group and set access permissions using the Rule Permissions panel.



Before applying rule group permissions, the default permission set for all the user roles is 'No Access' permission, and the checkboxes are deselected.

If you want to change the access permission for a specific user role, you must set these at the rule group level, as shown in the figure. Suppose, you want the **Administrators** to have access to all the rules in a Rule Group, you can set the permission '**Read & Write**' in the Rule Group Permissions panel.

You can also apply permissions to existing subgroups and Rules in the group by selecting the appropriate checkbox.

You can also apply permissions to all the new subgroups and Rules in the group by selecting the appropriate checkbox.

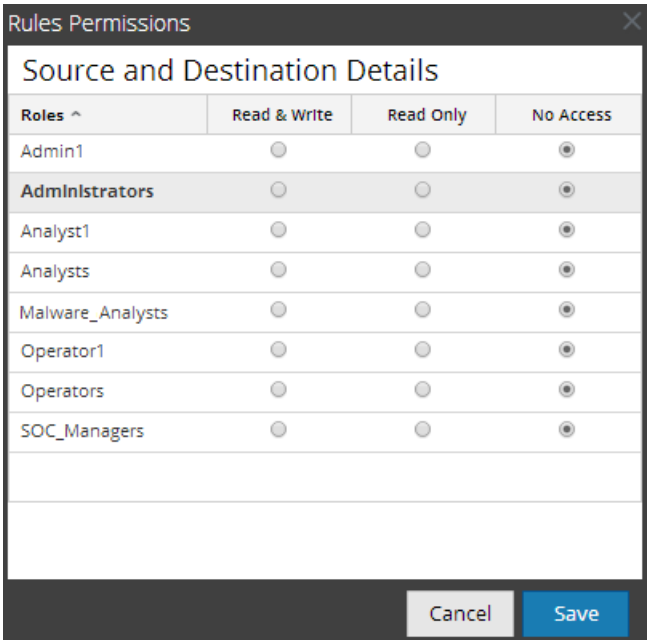
You can also apply permissions to subgroups and rules in the group by selecting the checkbox.

The two scenarios are explained in brief:

- Scenario 1: Permissions applied to Rule Group/ Sub Group/ Rules based on the user role.
- Scenario 2: Permissions applied to Sub Group and Rules in the Group.

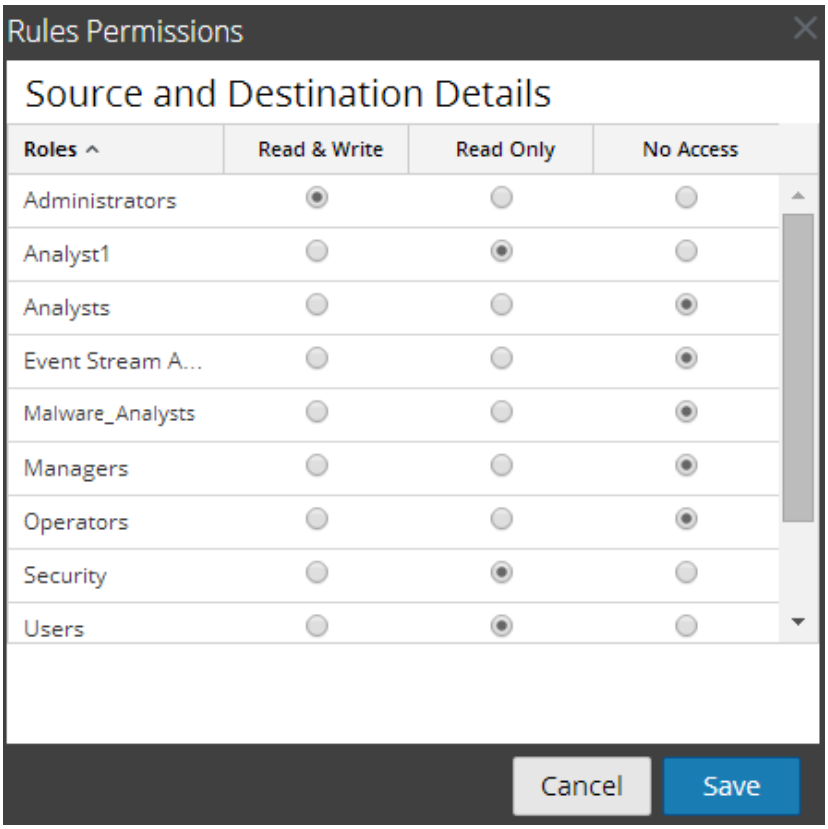
Role (Analysts)	Permissions applied to Rule Group/ Sub Group/ Rules based on the user role	Permissions applied to Sub group and Rules in the Group
Group	Read & Write	Read & Write
Sub Group	Read	Read & Write - Inherited
Rules	Read	Read & Write - Inherited

The access permissions that you set can be applied to subgroups and child objects of this group.



The Rule Group will be assigned the role of a **Security Analyst** and permissions are set to **Read & Write** rule group.

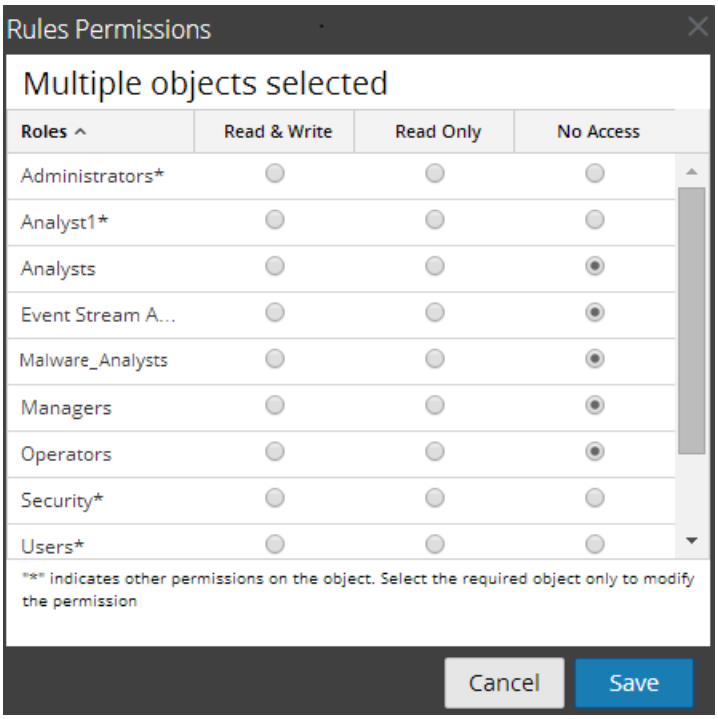
For scenario 1, each of the levels will have a permission set depending on the user role. For scenario 2, the permission at the Rule Group level will be inherited by the Sub Group and Rules in the Group.



Access Control for a Rule

When you want to change the rule permissions, you must select a rule and set their access permissions using the Rule Permissions panel.

Before applying the Rule permissions, the default permission set for all the user roles is 'No Access' permission and the checkbox is deselected.



If you want to change the access permission for a specific user role, you must set these at the rule level, as shown in the figure. Suppose, you want the **Administrators** to have access to a specific rule, you can set the permission '**Read & Write**' in the Rule Permissions panel.

Access Control for a Rule When Multiple Rules are Selected

When you want to change permissions of multiple rules, you can select multiple rules at a time and set their access permissions using the Rules Permissions Panel. The access permission that you choose will be applied to all the selected rules.

Note: The '*' besides the role name indicates the other permissions available on the user role. If you want to change the access permission for the required user role, select the user role and change the access permission.

Log in as a specific user and view the access details

When you log in to the NetWitness UI as a user having 'Read access' permission, all the rules will be denoted with the symbol (📖) and when you click on the symbol the 'Read Only' callout is displayed on the Rules panel.

When you log in to the NetWitness

UI as a user not having 'Read & Write' access permission on a Rule, all the rules will be denoted with the symbol ( ) and the rules appear grayed out on the Rules List panel.

The following figure shows the Rules panel when logged in with minimal 'Read & Write' access permission.

Name	Type	Group	Date Modified	Actions
*(raw_log)-RULE	Warehouse	Aggregate Function	2014-07-13 09:46	
[redacted]	Warehouse	Regular	2014-07-16 07:34	
Accounts Created	NetWitness DB	Identity Management	2014-07-14 10:56	
Accounts Created SAW	Warehouse	Compliance_old	2014-07-14 09:40	
Accounts Created SAW	Warehouse	Warehouse	2014-07-25 09:48	
Accounts Created SAW(1)	Warehouse	Warehouse	2014-07-25 09:54	
Accounts Deleted	NetWitness DB	Identity Management	2014-06-26 08:35	

Note: If a user (other than administrator) creates a rule, ADMIN cannot access that rule.

Tabular Listing

The following table lists the columns in the Rules Permissions panel:

Column	Description
Roles	The role of the user logged into the NetWitness user interface.
Read & Write	The user can access, view, edit, delete, import, and export rules on the Rules view. The user can also change the permission on the rule.
Read Only	The user can only access and view the rule on the Rules view
No Access	The user cannot access or view the rule for which this permission is set.

Set Access Control for a Rule

You can set access control for a rule. The Reporting Engine provides access control at the rule level. Only a user who has the right set of permissions can perform tasks on the rule. The administrator when creating users and roles must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

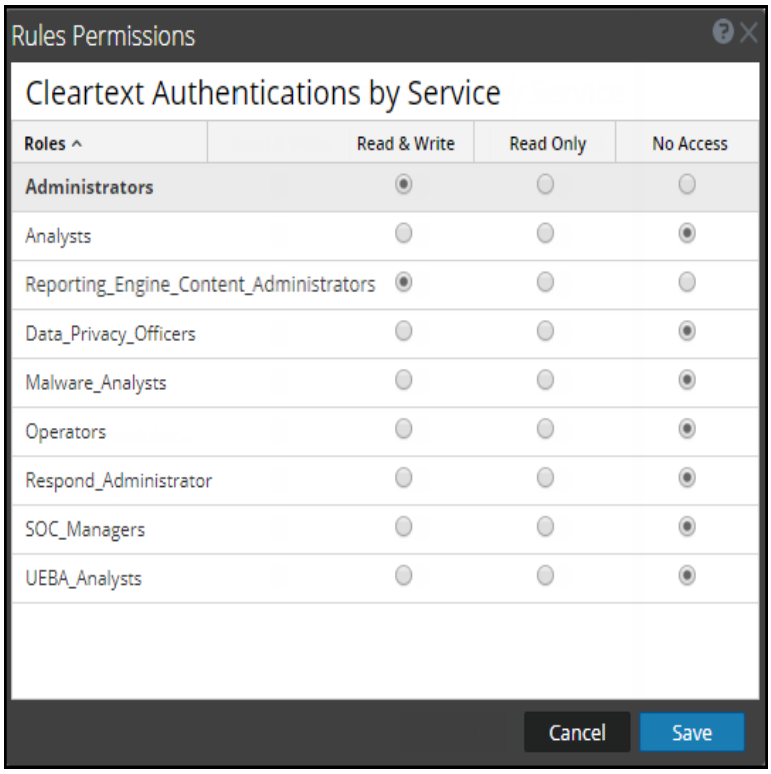
At the rule level, you can set the following access permissions for the user roles in NetWitness:

- Read & Write – View or edit the rules in the rule group.
- Read Only – View the rules in the rule group.
- No Access – Cannot view or edit the rules in the rule group.

Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a rule.

To set access control for a rule, perform the following:



1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** panel, select the rule.

3. Click  > **Permissions** in the Rule toolbar.

   The **Rules Permissions** dialog is displayed.

4. Select the following appropriate access permission for the user role and click **Save**.
   - Read & Write
   - Read Only
   - No Access

Set Access Control for a Rule Group

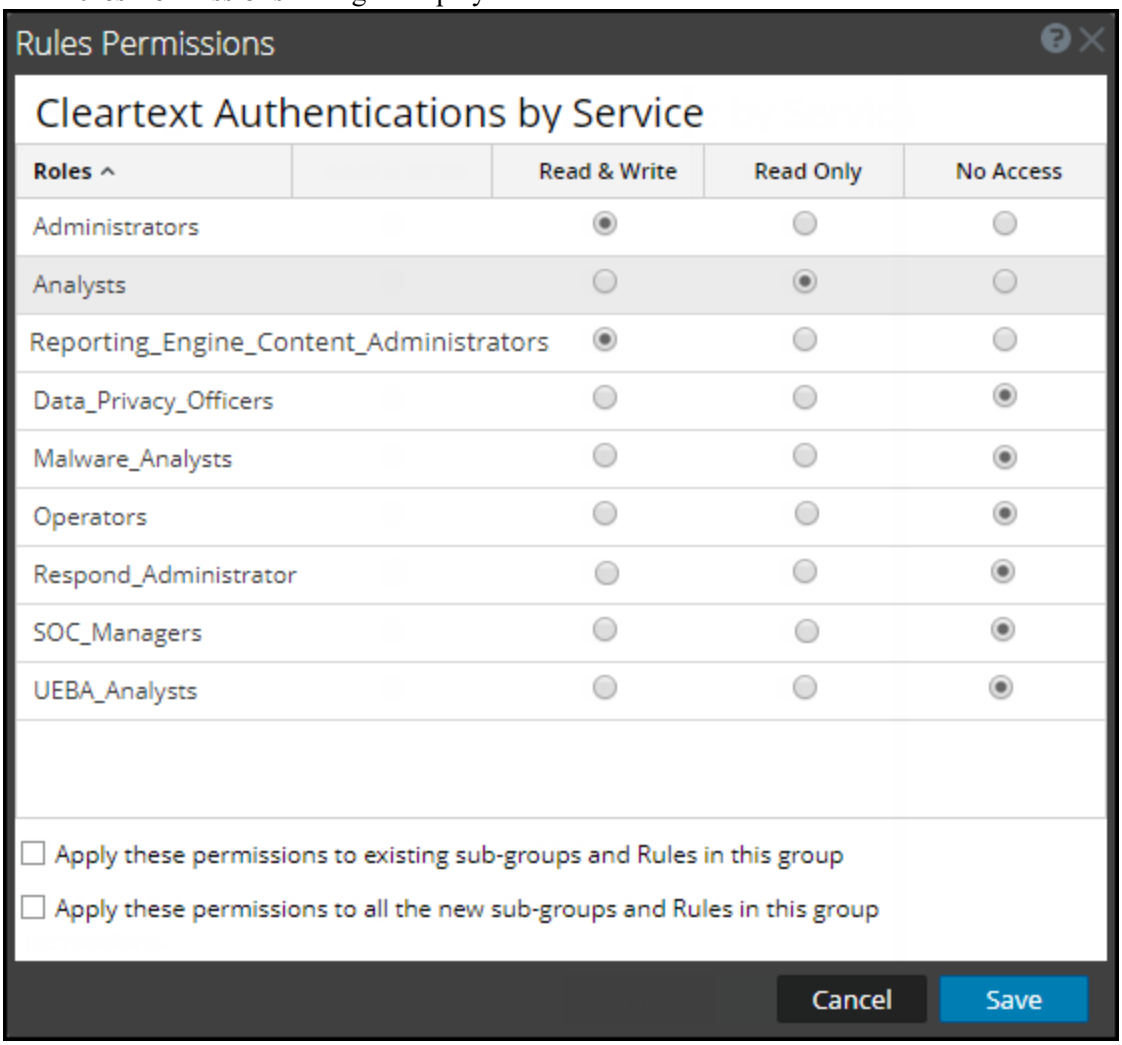
You can set access control at the rule group level. Only a user who has the right set of permissions can perform the tasks on the rule. The administrator when creating users and roles must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

At the rule group level, you can set the following access permissions for the user roles in NetWitness:

- Read & Write – View or edit the rules in the rule group.
- Read Only – View the rules in the rule group.
- No Access – Cannot view or edit the rule in the rule groups.

Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a rule group.



To set access control for a rule group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

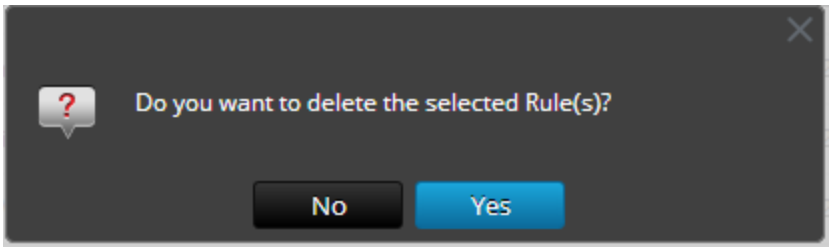
2. In the **Rules Groups** panel, select the rule group and Click and select **Permissions**.

   The **Rules Permissions** dialog is displayed.

3. (Optional) Select the appropriate checkbox to apply these permissions to existing subgroups and Rules in this group.
4. (Optional) Select the appropriate checkbox to apply these permissions to all the new subgroups and Rules created in this group.
5. Click **Save**.

   A confirmation message that permission is successfully set for the selected rule group is displayed.

Delete a Rule or Rule Group



To delete a rule, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

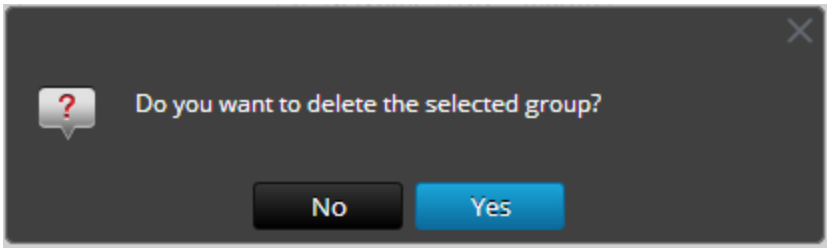
2. In the **Rules** panel, do one of the following.
   - Select a rule and click − in the Rule toolbar.
   - Click ⚙ > **Delete**.

     A confirmation dialog is displayed.

   Note: If a rule is being used in a report, a warning that the rule is in use and cannot be deleted is displayed.

3. Click **Yes** to delete the rule.

   A confirmation message that the rule is deleted successfully is displayed and the selected rule is deleted from the Rules panel.



To delete a rule group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules Groups** panel, select the rule group that you want to delete.
3. Click −.

   A confirmation dialog is displayed.

   Note: If any one of the rules in the group is being used in reports, a warning that the rule is in use and cannot be deleted is displayed.

4. Click **Yes** to delete the group.

   A confirmation message that the group is deleted successfully is displayed and the selected group is deleted from the Rule Groups panel.

Duplicate a Rule

To duplicate a rule, perform the following:

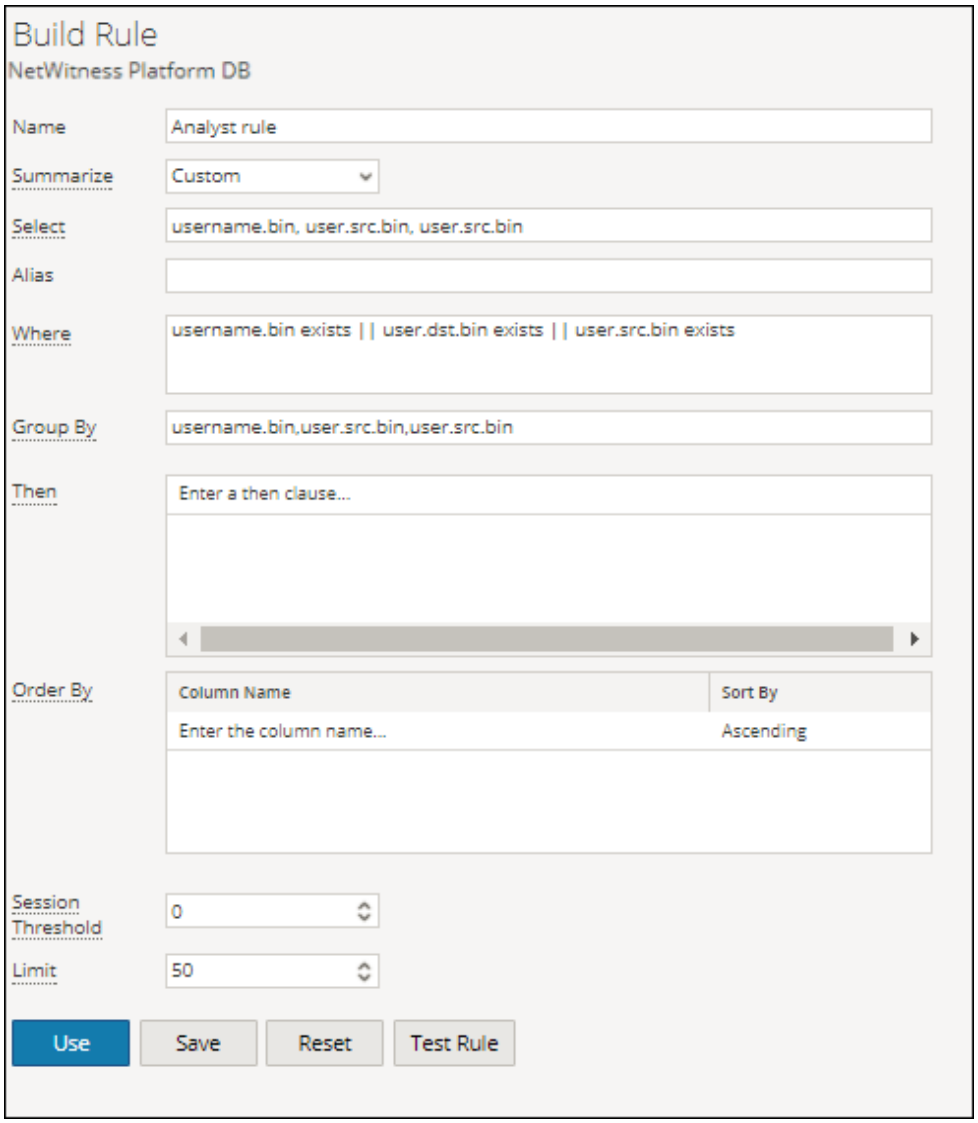
1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** panel, select a rule that you want to duplicate.
3. In the Rule toolbar, click .

Edit a Rule

To edit a rule, perform the following:



1. Go to **Reports**.

   The Manage tab is displayed.

2. In the **Rules** panel, do one of the following:

   - Select a rule and click  in the Rule toolbar.
   - Click  > **Edit**.

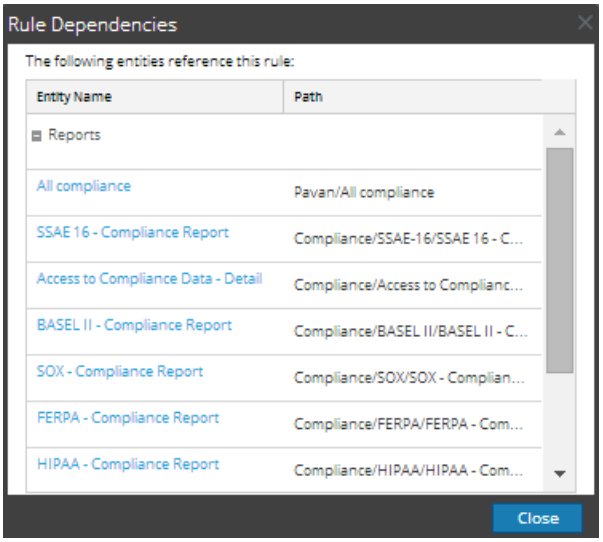
     The Build Rule view tab is displayed.

Note: If a rule is edited, the updated rule definition is applied to the Reports, Charts, and Alerts where the rule is included.

3. Modify the required fields.
4. Click **Save**.

   A confirmation message that the rule is saved successfully is displayed.

When you edit a rule, ensure to re-select the Rule for which you want the Chart to be generated, so that the edited rule is applied. If you do not re-select the Rule and attempt to save or test the rule, the rule is saved and a warning message is displayed.



View Dependents of a Rule

You can view dependents of a rule. You must traverse a rule list, select a rule for which you want to identify the dependency over a report, chart, or alert.

The following figure shows the Rule View where you select the rule 'Access to Compliance Data Details'.

The following figure shows the dependency of the rule over alerts and reports.

The following table lists the various columns in the Rule Dependencies dialog and their description.

Column	Description
Entity Name	The name of the entity referencing the rule.
Path	The path where the entity is located in the user interface.

To view dependents of a rule, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Rules**.

   The Rule view is displayed.

3. In the **Rules** panel, select a rule and in Actions column, click > **Dependents**.

   The Rule Dependencies dialog is displayed.

Export a Rule or Rule Group

Note: Make sure that you have rules in the rule group.

To export a rule, perform the following:

1. Go to **Reports**.

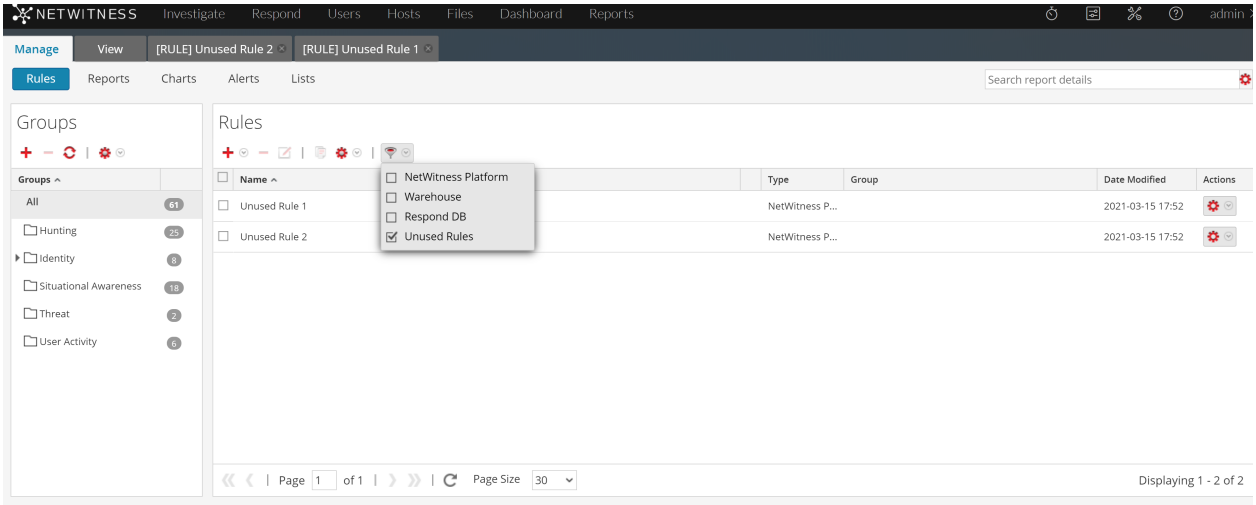
   The Manage tab is displayed.

   In the **Rules** panel, do one of the following:

   - Select a rule and click > **Export** in the Rule toolbar.
   - Click > **Export**.

2. A browser-specific export dialog may be displayed, allowing you to open or save the file. You can export multiple rules at a time. To select multiple rule, press and hold the CTRL button and select the rules to be exported.

To export a rule group, perform the following :



1. Go to **Reports**.
   The Manage tab is displayed.
2. In the **Rules Groups** panel, select the rule group containing the rules which you want to export. You can export multiple rules groups at a time. To select multiple rule groups, press and hold the CTRL button and select the rules groups to be exported.

3. Click  > **Export**.
   A browser-specific export dialog may be displayed allowing you to open or save the file.

Filter Unused Rules

You can filter and delete the rules that are not used by any group in charts, alerts, and reports. To filter unused rules:

1. Go to **Reports**.
   The **Manage** tab is displayed.
2. In the **Rules** panel, click  and select **Unused Rules**.
   List of unused rules is displayed.
3. [Optional] Delete the unused rules.
   For more information, see Delete a Rule or Rule Group.

Manage a Report

You can perform the following procedures to manage a report.

- Access Control for a Report or Report Group
- Delete a Report or Report Group
- Duplicate a Report
- Edit a Report
- Refresh a Report Group or Report List
- Edit a Scheduled Report
- Delete a Scheduled Report
- Export a Report

- Export a Report Group
- Import a Report or Report Group
- Enable or Disable a Scheduled Report
- Start or Stop a Scheduled Report
- View an Execution History of a Scheduled Report
- Manage and Select a Report Logo
- Search Reporting Details

Access Control for a Report or Report Group

This section covers the access permissions the user has depending on the user role to manage a report and report group. The Reporting provides access control at the report and report group level. The user who has the right set of permissions can only perform the tasks in reporting module. The access control is managed by the administrator from the **(Admin) > Security > Roles** tab.

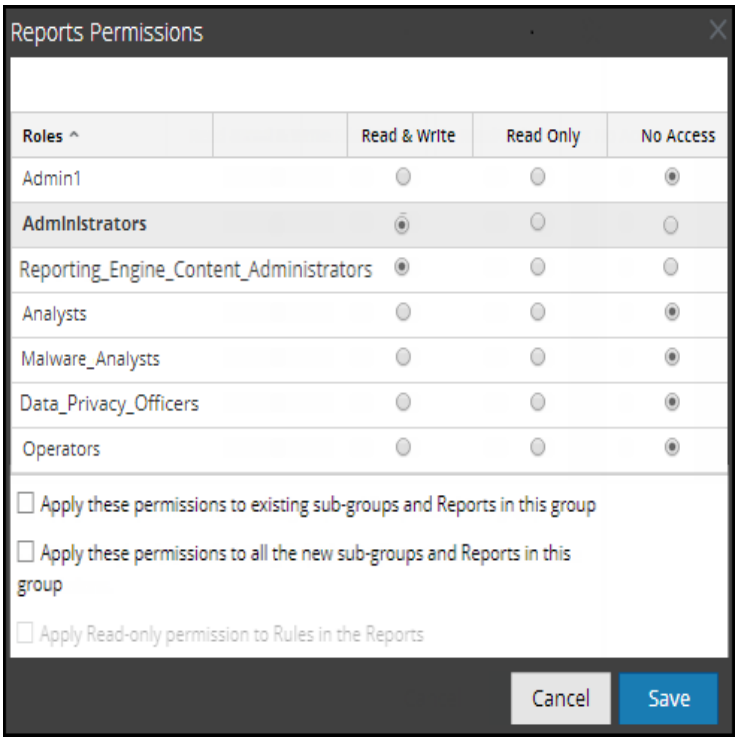
When creating users and user roles, the administrator must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

Reports and Report Groups can be tied to a specific set of user roles so that when a user logs into NetWitness, the reports with the access rights for the specific user role can be viewed. Users that belong to a user role with the 'Read & Write' access permission can define reports. Further, the access can be tightened so that reports are accessed only by those who have the 'Read Only' access.

Note: You must have 'Read Only' permission for a group to view the reports within that group.

At the report level, you can set the following access permissions for the user roles in NetWitness:

- Read & Write
- Read Only
- No Access

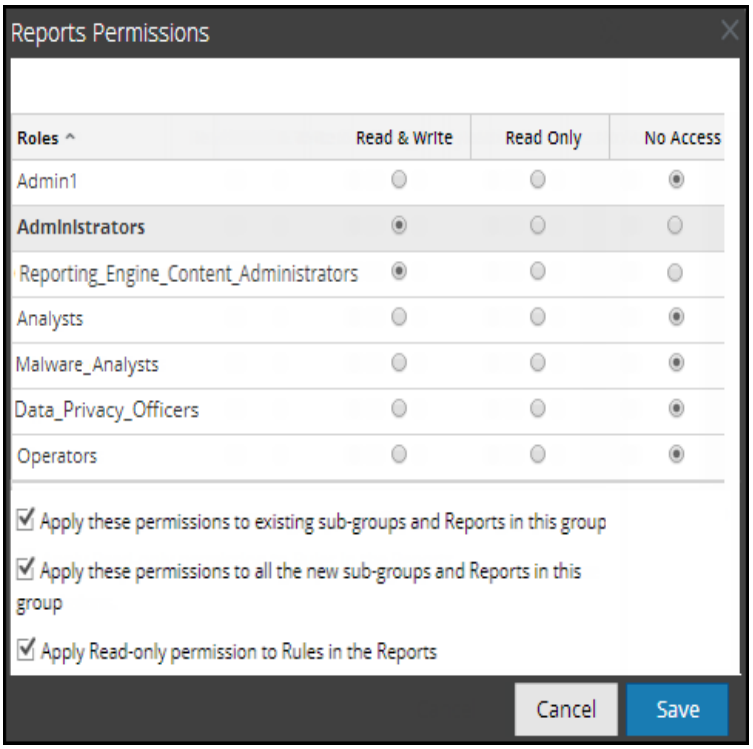


Suppose, you want the NetWitness to have access to all the reports in a Report Group, you can set the permission '**Read & Write**' at the Report Group level. And, if you do not want the **Operator** role to have access to a specific set of reports in a report group, you can set the permission '**No Access**' at the Report Group level.

The permission is set only for the report group but not the reports, rules, or subgroups in the Report Group.

Access Control for a Report Group

When you want to change the report group permissions, you must select a report group and set access permissions using the Reports Permissions panel.



Before applying report group permissions, the default permission set for all the user roles is 'No Access' except for administrators (with full access in Reporting Engine service Config page) and reporting engine content administrators, as shown in the figure.

If you want to change the access permission for a specific user role, you must set these at the report group level, as shown in the figure. <suppose,>Administrators to have access to all the reports in a Report Group, you can set the permission '**Read & Write**' in the Report Group Permissions panel.

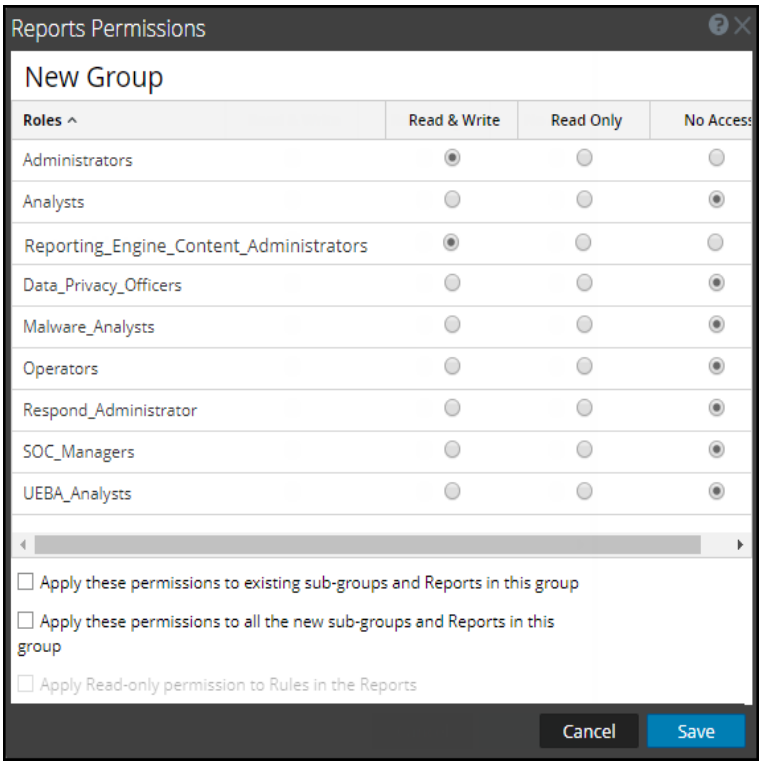
You can also apply permissions to existing subgroups and reports in the group, as well as apply read-only permission to rules in the reports by selecting the appropriate checkboxes, as shown in the figure.

You can also apply permissions to all the new subgroups and reports by selecting the appropriate checkbox.

The three scenarios are explained in brief:

- Scenario 1: Permissions applied to Report Group/ Sub Group/ Report based on the user role.
- Scenario 2: Permissions applied to Sub Group and Report in the Group.
- Scenario 3: Read-only permission applied to Rules in the Report.

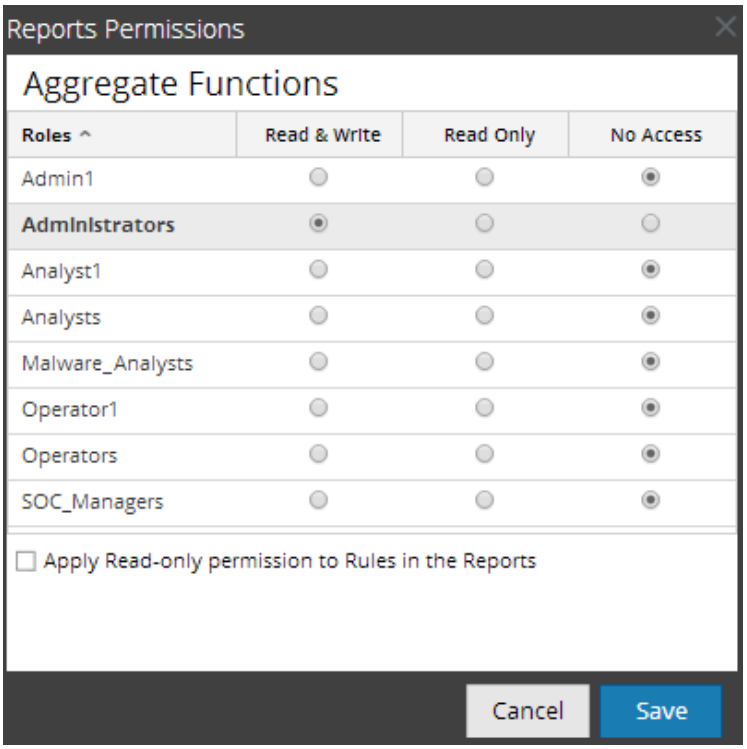
	Role (Analyst)	Permissions applied to Report Group/ Sub Group/ Report based on the user role	Permissions applied to Sub group and Report in the Group	Permission (Read-only) applied to Rules in the Report
Group	Read & Write	Read & Write	Read & Write	Read & Write
Sub Group	Read	Read	Read & Write - Inherited	Read & Write
Report	Read	Read	Read & Write - Inherited	Read & Write
Rules	Read	Read	Read	Read



The Report Group will be assigned the role of a **Security Analyst** and permissions are set to **Read & Write** report group.

For scenario 1, each of the levels has a permission set depending on the user role. For scenario 2, the permission at the Report Group level (Read & Write) is inherited by the Sub Group and Reports in the Group. For scenario 3, the Read permission is set for the Rules except that the permission set for the rules cannot be higher than the permissions set for the Report Group.

Access Control for a Report



When you want to change the report permissions, you must select a report and set their access permissions using the Report Permissions panel.

Before applying the Report permissions, the default permission set for all the user roles is 'No Access' permission and the checkbox is unchecked, as shown in the figure.

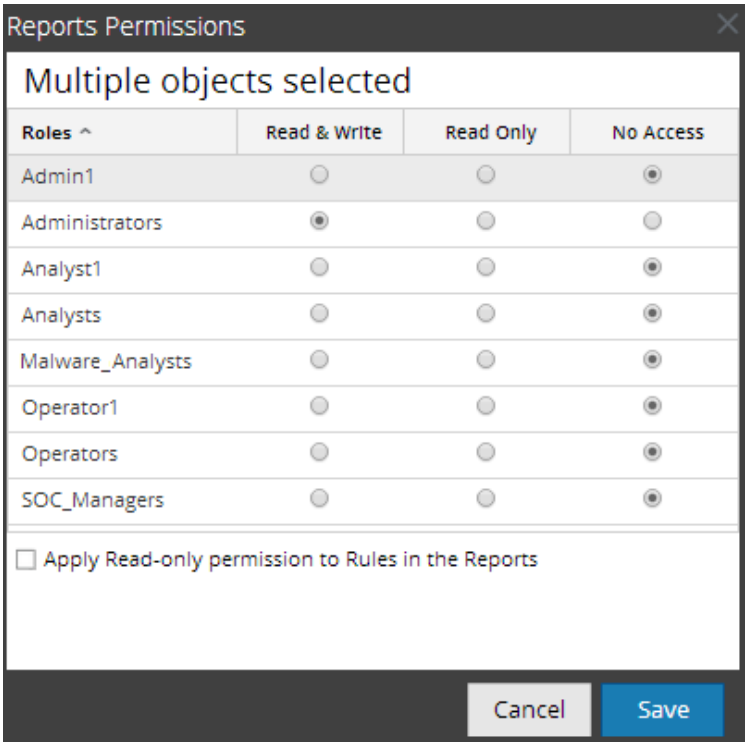
If you want to change the access permission for a specific user role, you must set these at the report level, as shown in the figure. Suppose, you want the **Administrators** to have access to a specific report, you can set the permission '**Read & Write**' in the Report Permissions panel.

You can apply read-only permission to rules in the reports by selecting the checkbox, as shown in the figure.

The two scenarios are explained in brief:

- Scenario 1: Permissions applied to Report Group/ Sub Group/ Report/ Rules.
- Scenario 2: Read-only permission applied to Rules in the Report.

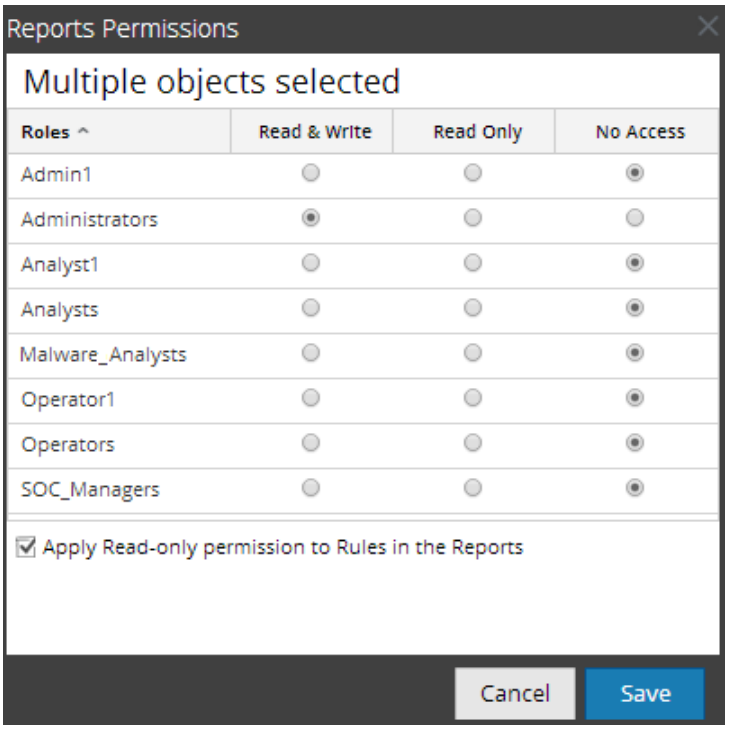
	Role (Analysts)	Permissions applied to Report Group/ Sub Group/ Report/ Rules based on the user role	Permission (Read-only) applied to Rules in the Report
Group	Read & Write	Read & Write	Read & Write
Sub Group	Read	Read	Read & Write
Report	Read	Read	Read & Write
Rules	Read	Read	Read



The Report will be assigned the role of a **Security Analyst** and permissions are set to **Read & Write** reports.

For scenario 1, each of the levels has a permission set based on the user role. For scenario 2, the Read permission is set for the Rules except that the permission for the rules cannot be higher than the permission for the Reports.

Note: If the permission for the rules is higher than the permission for the Reports then the permission is be applied only to the reports. For example, if you set the permissions for the Report Group as **No Access** and then specify the option *Apply Read-only permission to Rules in the Reports*, then the read-only permission is not set for the rules.

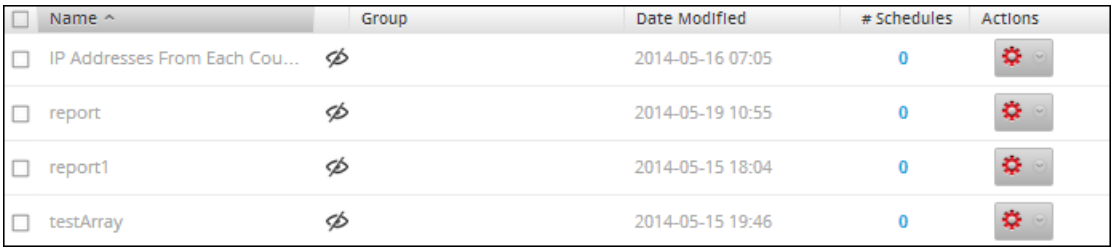


Access Control for a Report When Multiple Reports are Selected

When you want to change permissions of multiple reports, you must select several reports and set their access permissions using the Report Permissions panel. The access permission that you choose is applied to all the selected reports.

Access Control for a Report When Multiple Reports with several rules are Selected

When you want to change permissions when multiple reports with several rules are selected, you must select the checkbox in the Report Permissions panel, as shown in the figure. The read-only access permission is applied to all the rules of the selected reports, provided that the permission of the rules are lower than the permission of the reports.



Log in as a Specific User and View the Access Details

When you log in to the NetWitness UI as a user having 'Read access' permission, all the reports is denoted with the symbol (📖) and when you click on the symbol the 'Read Only' callout is displayed on the Reports panel.

When you log in to the NetWitness UI as a user not having 'Read & Write' access permission on a Report, all the reports are denoted with the symbol (⊘) and the reports appear grayed out on the Reports panel.

The following figure shows the Reports panel when logged in with minimal 'Read & Write' access permission.

Note: If a User (other than the super user) creates a report there will be no access to that report for the super user.

Tabular Listing

The following table lists the various columns in the Reports Permissions Panel:

Column	Description
Roles	The role of the user logged into the NetWitness UI.
Read & Write	The user can access, view, edit, import, export, and delete the report on the Reports view. The user can also change the permission on the report.
Read Only	The user can only access and view the report on the Reports view.
No Access	The user cannot access or view the report for which this permission is set.
Apply these permissions to existing subgroups and Reports in this group	Select the checkbox to apply the selected permissions to the existing subgroups in the group and reports in the group. **Note:** This checkbox is populated only when you set access permissions for a Report Group.
Apply these permissions to all new subgroups and Reports in this group	Select the checkbox to apply the selected permissions to the all new subgroups in the group and reports in the group. **Note:** This checkbox is populated only when you set access permissions for a Report Group.
Apply Read-only permission to Rules in the Reports	Select the checkbox to automatically apply permissions to the rules in the reports.

Set Access Control for a Report

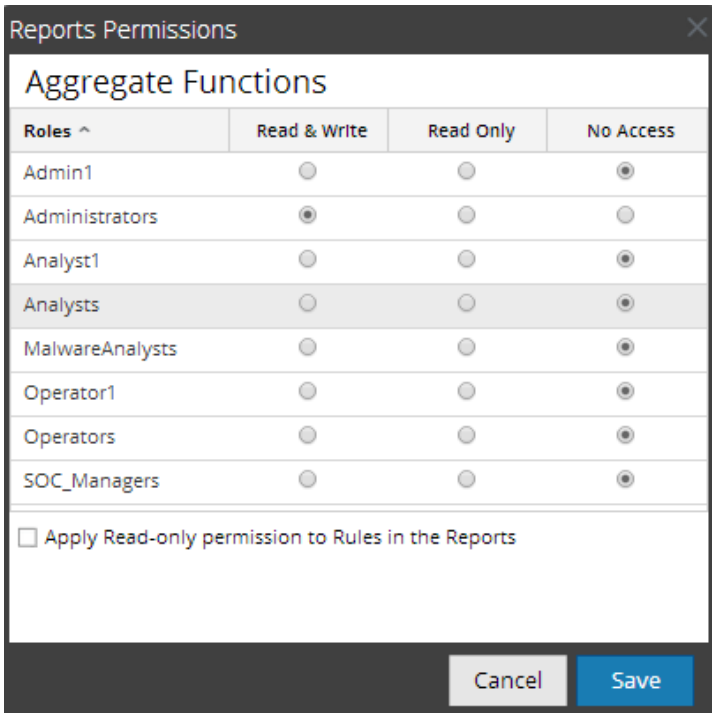
Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a report.

To set access permissions for a report, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.



2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, select a report.

4. Click > **Permissions**.

   The Reports Permissions dialog is displayed.

5. Based on the user role, select the appropriate buttons.
6. (Optional) Select the checkbox, if you want to provide read access permission to rules in the reports.

   Note: On selecting the check box, all dependent rules are given READ access permission, provided the permissions for the report is higher compared to the permissions of the rules.

7. Click **Save**.

   A confirmation message that the permission is set for the selected report is displayed.

Set Access Control for a Report Group

Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a report group.

To set access permissions for a Report Group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports Groups** panel, select or right-click on a report group.
4. Click > **Permissions**.

The Reports Permissions dialog box is displayed.

4. Based on the user role, select the appropriate buttons.
5. (Optional) Select the appropriate checkbox to apply the selected permissions to subgroups and reports in the group.
6. (Optional) Select the appropriate checkbox to apply the selected permissions to all the new subgroups and reports in this group.
7. (Optional) Select the appropriate checkbox to provide read access permission to rules in the reports.

   Note: On selecting the check box, all dependent rules is given READ access permission, provided the permissions for the report is higher compared to the permissions of the rules.

8. Click **Save**.

   A confirmation message that the permission is successfully set for the selected report group is displayed.

Delete a Report or Report Group

To delete reports in a group or subgroup from the Reports panel:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, do one of the following:
   - Select the reports and click −.
   - Click ⚙ > **Delete**.

     A confirmation dialog is displayed.

4. Click **Yes** to delete the report.

   A confirmation message that the report is deleted successfully is displayed and the selected report is deleted from the Reports panel.

Delete a Report Group

Prerequisites

Make sure that you have no reports associated with the report group.

To delete report groups in the default folder or subgroups under a report group, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports Groups** panel, select the report group and click −.

   A confirmation dialog is displayed.

4. Click **Yes** to delete the group.

   A confirmation message that the group is deleted successfully is displayed and the selected group is deleted from the Report Groups panel.

Duplicate a Report

You can duplicate a report to schedule multiple report for the same report. The duplicated report is displayed in the Reports panel with suffixes. For example, Report (1).

Generally, the duplicate option is used in two scenarios:

- You want to make a copy of the report, to move the same report to another group.
- You want to retain most of the configuration settings for an object but modify few of these settings. For example, when you have a complex query in a rule or several rules in a report, it is very much appropriate to use the duplicate option.

To duplicate an existing report, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, select a report that you want to duplicate and click .

   The report is saved successfully and added to the Report list.

You can move the duplicated report to another group.

Edit a Report

To edit reports in a group or subgroup from the Reports panel, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. Select a report and in Actions column, click  > **Edit**.
   The Build Report view tab is displayed.

4. Modify the text and add more rules to the report (if required).
5. Click **Save**.

   A confirmation message that the report is saved successfully is displayed.

Refresh a Report Group or Report List

You can refresh a report group or reports to view the re-arrangement of groups or reports.

To refresh a report group or reports, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. Do the following to move the group or reports to a new location:

   - In the **Reports Groups** panel, drag and drop the group.
   - In the **Reports** panel, drag and drop the reports to the desired group in the Report Groups panel.
     The report group or reports are moved to the new location.

4. Do the following to refresh a group or report list:

   - In the **Reports Groups** panel, click .

     The report group gets refreshed.

   - In the **Reports** panel, click  .

     The Report list gets refreshed.

Edit a Scheduled Report

To edit a scheduled report from the Scheduled Reports List panel, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, select a report and in Actions column, click  > **View Scheduled Reports**.

   The Report Schedule tab is displayed.

4. In the **Report Schedule** panel, do one of the following:

   - Select a report and click .
   - Select a report and click  > **Edit Schedule**.
     The Schedule Report tab is displayed.

5. In the Schedule Report tab, do the following:

   a. In the **Schedule Name** field, modify the name for the schedule report configuration.

   b. To execute the reports as per the schedule, select the **Enable** checkbox.

   c. From the **Data Source** field, select the datasource.

   > **Note:** If the data source is not listed, ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in the *Reporting Engine Configuration Guide*.

6. (Optional) From the **Warehouse Resource Pool** drop-down, select the pool or queue for the report.

   Note: The **Warehouse Resource Pool** drop- down is displayed only if the Warehouse Rule is selected. If no pools or queues are entered for the Reporting Engine, this field is disabled.

7. From the **Run** field, select the type of run schedule. (For example, Now or Hourly).
8. Select the date range to run the query based on absolute duration or select the **Use relative time duration** checkbox to run the query based on relative duration.
9. (Optional) In the Output Actions panel, do the following:
   a. Type the email address and subject.
   b. Edit the body of the message for the report.
   c. Select the format of the attachment.
   d. Type a value for the CSV and Multivalue delimiters.
10. (Optional) In the Other Options field, do the following:
    a. Click > **SFTP** or **URL** or **Network Share**. Based on the selected option, a row gets added in the Other options field.
    b. Select the appropriate options to send the report in PDF or CSV format to the configured SFTP, URL or Network Share.
11. (Optional) To add a list in the Dynamic List panel, see Generate a List from the Scheduled Report section in Create and Schedule a Report.
12. (Optional) To choose another logo in the Logo panel, see Manage and Select a Report Logo section.

    Note: If you do not specify a logo, the default logo is used.

13. Click **Schedule**.

    The scheduled report executes as scheduled and provides the configured outputs.

Delete a Scheduled Report

To delete a scheduled report from the Scheduled Reports List panel, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** toolbar, click **View All Schedules**.

   View Report Schedule is displayed.

4. In the **Report Schedule** panel, select the report.
5. Click >**Delete Schedule**.

   A confirmation dialog is displayed.

6. Click **Yes** to delete the scheduled report.

   A confirmation message that the scheduled report is deleted successfully is displayed and the selected schedule is deleted from the Scheduled Reports List panel.

Export a Report

You can export the selected reports to an external file that can be later imported to another NetWitness environment.

Prerequisites

Make sure that you have reports in the report group.

To export selected reports in the Report Groups panel to an external file, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

   In the **Reports** panel, do one of the following:

   - Select a report and click  > **Export**.
   - Click  > **Export**.

3. You can export multiple reports at a time. To select multiple reports, check the checkbox of the report to be exported. The exported file is saved to the local drive in an archived format.

Open CSV files with Unicode characters in MS Excel

To open downloaded CSV files containing Unicode characters in MS Excel, follow these steps:

1. Download and save the CSV file.
2. Open Microsoft Excel and navigate to the **Data** tab.
3. Click on **From Text** menu item; find the CSV file that you downloaded and click **Import**.
   The Text Import Wizard is displayed.
4. Select **Delimited** or **Fixed Width** data type from the **Original data type** radio button.
5. Click **File origin** drop down list and select **65001: Unicode (UTF-8)** and click **Next**.
6. Select the delimiter that was used in the file that you imported and click **Next**.
7. Select the data format for each column of data that you want to import and click **Finish**.
   The correct output is displayed in an MS Excel sheet.

Export a Report Group

You can export a selected report groups to an external file that can be later imported to another NetWitness environment.

Prerequisites

Make sure that you have reports in the Report Group.

To export selected report groups in the Report Groups panel to an external file, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports Groups** panel, select a report group and click  and select one of the following:

   - **Export** - This selection exports a report in a .zip file.
   - **Export as Text** - This selection exports all the content from the Reporting Engine in a .zip file which contains the data in text format.

   You can export multiple report groups at a time. To select multiple report groups, press and hold the CTRL button and select the report groups to be exported. The exported file is saved to the local drive.

Import a Report or Report Group

You can import a group containing subgroups and reports from other instances of NetWitness into Report Groups panel. Reports must be in a valid binary file that was exported from another NetWitness instance.
During the import process, you select the binary file and specify whether existing reports with the same name must be overwritten or not by the reports contained in the binary import file.

- If you choose to overwrite, all duplicate rules, lists and reports are overwritten by the contents of the binary import file.
- If you choose not to overwrite, and a duplicate rule, list or report exists in the target folder, the import fails and display a message about duplicate reports.

You cannot import reports to a specific report group. The imported files are stored in the **All**root folder.

Prerequisites

Make sure that you have the reports or report groups exported from other instances of NetWitness.

To import groups containing subgroups and reports from other instances of NetWitness into Report Groups panel, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

The Report view is displayed.

3. In the **Reports Groups** panel, select a folder to import the file.
4. Do one of the following:
   - In the **Reports Groups** toolbar, click > **Import** to import a group.
   - In the **Reports** toolbar, click > **Import** to import a report.
     The Import Report dialog is displayed. You can import multiple reports and report groups at a time. To select multiple reports or report groups, press and hold the CTRL button and select the reports or report groups to be imported.
5. Click **Browse** to select the binary file.

   NetWitnessprovides a file system view of the files.
6. Locate the binary file and click **Open**.

   The file gets added to the Import Report list.
7. (Optional) To overwrite any existing rule in the library with an identically named rule in the binary file when importing, check the **Rule** checkbox. If you do not select the Overwrite option, and an identical rule is encountered in the binary file, the binary file is imported and no error message is displayed.
8. (Optional) To overwrite any existing list in the library with an identically named list in the binary file, check the **List** checkbox. If you do not select the Overwrite option, and an identical list is encountered in the binary file, the binary file is imported and no error message is displayed.
9. (Optional) To overwrite any existing report in the library with an identically named report in the binary file when importing, check the **Report** checkbox. If you do not select the Overwrite option, and an identical report is encountered in the binary file, the binary file is imported and no error message is displayed.
10. Click **Import** to import the binary file.

Enable or Disable a Scheduled Report

To enable or disable a scheduled report from the Scheduled Reports List panel, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, select a report and click > **View Scheduled Reports**.
   View Report Schedule is displayed.
4. Select a report from the Report Schedule panel.
5. In the Actions column, click > **Enable**.
   The state of the report is changed to ‘Running’, if the report is scheduled to run immediately.

6. In the Actions column, click  > **Disable**.
   The state of the report is changed to 'Inactive'.

Start or Stop a Scheduled Report

To start or stop a scheduled report, perform the following:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, select a report and click  > **View Scheduled Reports**.
   The Report Schedule view is displayed.
4. Select a report from the Scheduled Reports List panel.
5. In the Actions column, click  > **Start**.
   The state of the report is changed to 'Running', if the report is scheduled to run immediately.
6. In the Actions column, click  > **Stop**.
   The state of the report is changed to 'Completed'.

Note: If you have multiple executions running for a scheduled report and the state of the report is in Queued state, the STOP option is disabled till all the previous executions are completed and last execution is in running state. To stop the individual execution of a particular schedule, refer to Stop an Individual Execution of a Scheduled Report.

View an Execution History of a Scheduled Report

You can view the execution history of a scheduled report. You can view the history of a scheduled report that is run. You can view the history based on the following criteria:

- Number of past schedules executed
- Start date and end date for the date range

You can view the details such as how many times the scheduled report was executed, the time of execution (seconds), execution state. You can also view the report generated on a full screen.

To view the execution history of a scheduled report, perform the following:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.

3. In the **Reports** panel, do one of the following:
   - Click  > **View Scheduled Reports**.
   - Click the **#Schedules** column.
     The Schedule Reports view tab is displayed with the status of each of the scheduled report.
4. Do one of the following:
   - Select a scheduled report and click  > **Execution History**.
   - Select a scheduled report and click  .
     The Execution History view is displayed.

   Note: By default, you can view 10 number of execution history of a scheduled report. The execution history shown depends on the Retain Report History Configuration set on the **General**tab of the  **(Admin) > Services > Reporting Engine Config** view.
   For example, if you set the Retain Report History Configuration to 100 days, the data displayed on the Execution History view. is the past 100 days execution history details considering the current date information.
5. From the **Get history by:** field, select the type of history to be fetched. (For example, Past or Range (Specific))
6. In the **Count** field, enter the number of executions to be displayed.
7. Click **Show History**.
   The execution history of the scheduled report is displayed.

Stop an Individual Execution of a Scheduled Report

If you have multiple executions running for a scheduled report, you can stop the individual execution of the scheduled report in **Execution History** panel.

To stop the individual execution of a scheduled report, perform the following:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, do one of the following:
   - Click  > **View Scheduled Reports**.
   - Click the **#Schedules** column.
     The Schedule Reports view tab is displayed with the status of each of the scheduled report.
4. Do one of the following:
   - Select a scheduled report and click  > **Execution History**.
   - Select a scheduled report and click  .
     The Execution History panel is displayed.

5. Select a schedule, in the **Actions** column, click .
   The state of the execution schedule is changed to 'Cancelled'.

Manage and Select a Report Logo

Prerequisites

Make sure that you have the Reporting Engine service defined prior to managing a logo.

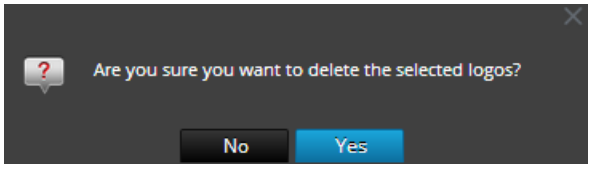
Manage Report Logos

To manage logos, perform the following:

1. Go to **(Admin) > Services**.
   The Services view is displayed.
2. In the **Services** panel, select an Reporting Engine service and click **View** > **Config**.
   The services config view is displayed.
3. Select the **Manage Logos** tab.
   All the available logos are displayed.

Add a Logo

To add a logo, perform the following:



1. In the **Manage Logos** tab, click .
   A file browser opens where you can choose the file from the local drive.
2. Select the logo and click **Open**.
   The selected logo gets added to the Manage Logos section.

Delete a Logo

To delete a logo, perform the following:

1. In the **Manage Logos** tab, do one of the following:
   - Select the logo and click .
   - Perform (Ctrl+click) to select multiple logos and click .

   A confirmation dialog is displayed.

2. If you want to delete the logo, click **Yes**.
   The selected logo is deleted from the Manage Logos section.

Set Default Logo

To set a default logo, perform the following:

In the **Manage Logos** tab, select a logo and click Set default.
The chosen logo is set as the default logo for the RE service.

Select a Logo

To select a logo, perform the following:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, select a report.

4. Click > **View Scheduled Reports**.
   The View scheduled reports view tab is displayed.

5. Select a scheduled report and in Actions column, click > **Edit Schedule**.

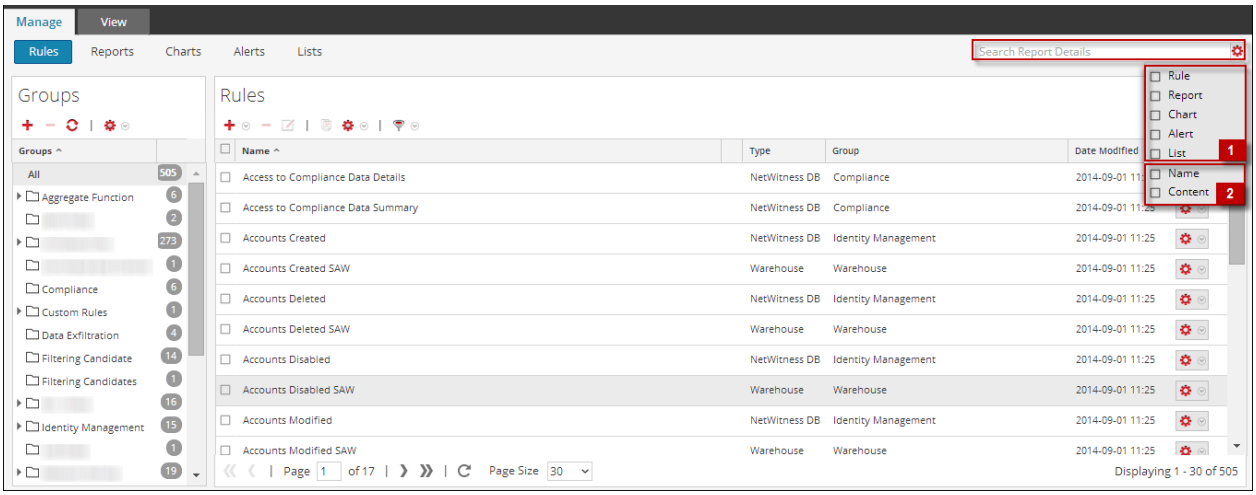
   The Schedule Report view tab is displayed.

6. In the Logo panel, click **Change Logo**.

   The Change a Logo dialog box is displayed.

7. Do one of the following:

   - Click **Upload new logo** to upload another logo.
   - Select a logo from the list.



8. Click **Select**.
   The selected logo is available on the Logo panel.

Search Reporting Details

This section provides instructions on how to perform a keyword search on name and content for each of the Reporting components. You can perform a keyword search on name and content for each of the Reporting components (Rule/Report/Chart/Alert/List) on the Reporting UI.

Note: You cannot search based on date and numeric values.

The following figure shows the search parameters available in the Reporting Module:

The following are the search parameters available on the Reporting UI:

1. Search for entities (rule, report, chart, alert, list).
2. Search for the entities based on either the name or content.

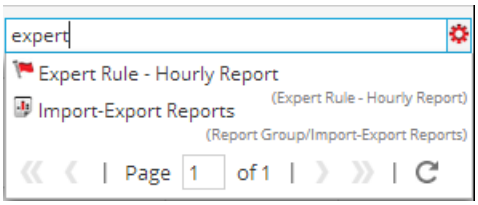
Note: Searches are case insensitive. For example, Completed is equivalent to completed.

Prerequisites

In the Reporting Module, you can perform a keyword search based on the name and content (definition). In this context, content implies definition of each of the reporting components. For instance, the value defined in the rule, report, report schedule, chart, and alert panel. You can also prioritize your search by selecting either or all of the components: Rule, Report, Chart, Alert, or List.

Note: You cannot search based on the List values and list path stored in schedule definition panel.

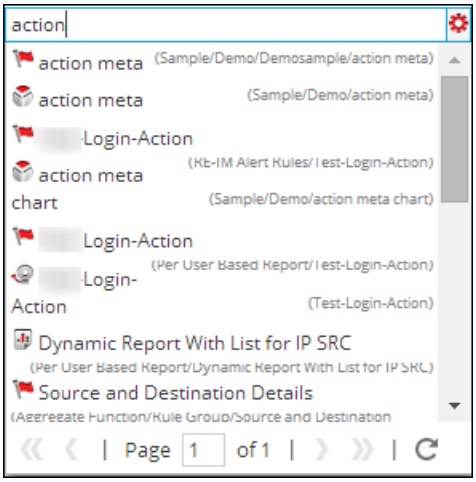
For example, to search for the rule name (ExpertRule), you must select **Rule, Name, and Content** in the **filtering options** drop-down to view all the rule names that matched the search. You can similarly search for a report, chart, alert, or list definition.

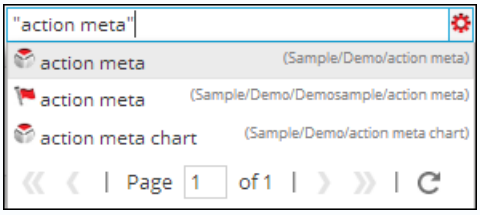


To search for reporting details from the Manage tab, perform the following:

1. Go to **Reports**.

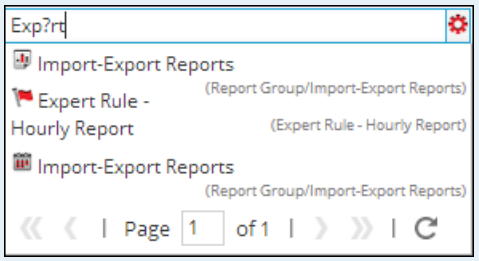
   The **Manage** tab is displayed.

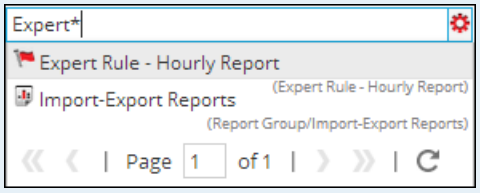


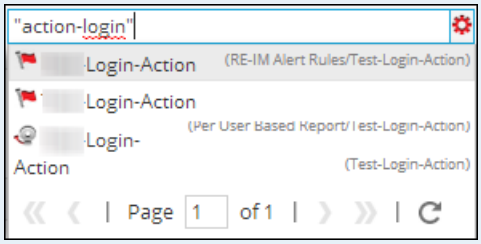


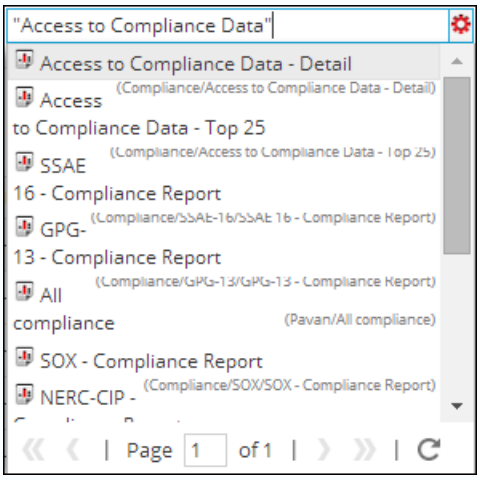
2. Click  and select the appropriate criteria to search.
3. In the **Search** field, enter the text to be searched.

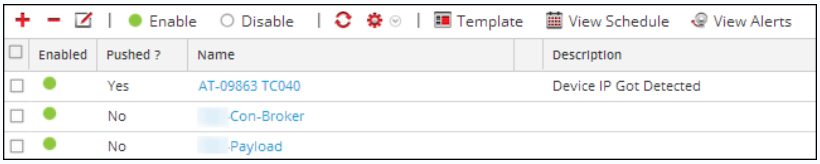
   The search drop-down list is displayed:

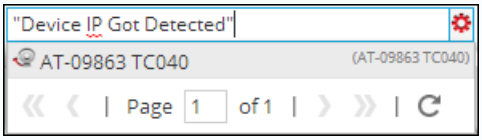












Search Syntax and Different Types of Search

The following table explains the search syntax and the possible searches that can be performed on the Reporting user interface.

Search Types	Description
Word or phrase based search	**Word Based Search:** To search for a word such as "action" or "meta", you must enter the word in the search box. The following figure shows the search results for the text **action**.  **Phrase based search:** A Phrase is a group of words surrounded by double quotes such as "action meta". To search for a phrase, you must enclose phrases in double-quotes in the search box. The following figure shows the search results for the phrase "action meta". 

Search Types	Description

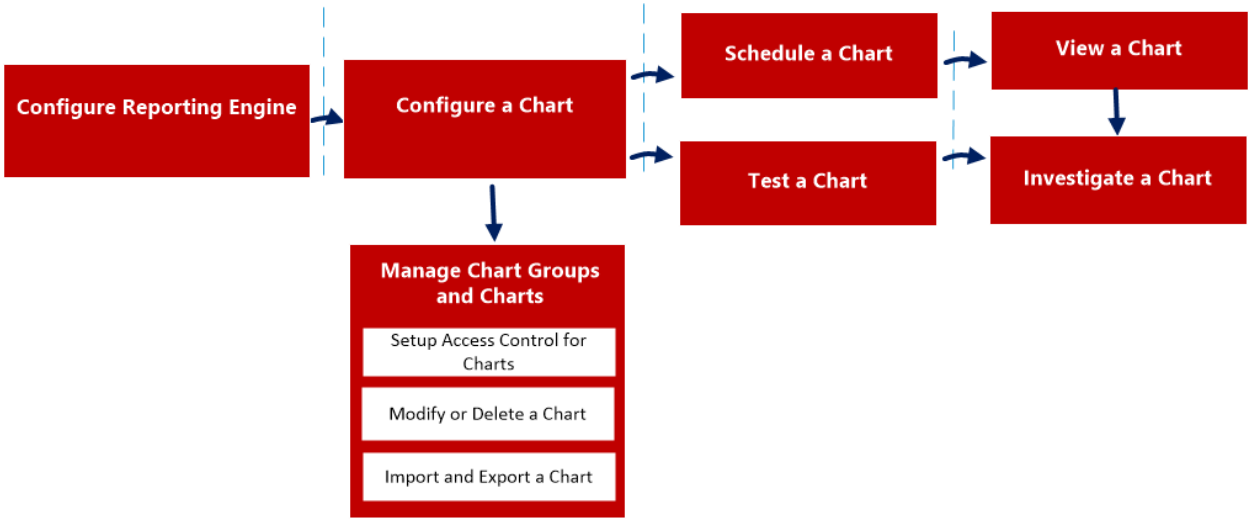
Wildcard Search (Single/ Multiple/ Special Character Search)
 	
The question mark "**?**" symbol is used to perform a single character wild card search and asterisk "*" symbol is used to perform multiple character wildcard search.
	Single character search:
	The single character wildcard search looks for terms that match with the single character replaced. For example, to search for "Expert" or "Export" you can use the search syntax:
	`Exp?rt`
	The following figure shows the search results for the wildcard character **Exp?rt**.
	
	Multiple character search:
	Multiple character wildcard search looks for 0 or more characters. For example, to search for Expert, or Experts, you can use the search syntax:
	`Expert*`
	The following figure shows the search results for the wildcard multiple character **Expert***.
	
	Special character search:
	Certain punctuation and special characters are ignored during search (@#$%^&*(){}"~=+-[]\?|!:,.). For example, a search for action-login will be interpreted during search as "action" "login", that is, if rules exist with name "action-login" and "action@login" and search string is "action-login", the search result will return both the rules.
	

Search Types	Description
Search based on name or content	**Search based on name:** When you want to search based on the name of a report, select **Report**and **Name**box from the filtering options drop-down. For example, to search for the report name "Report With Multiple Rules", you can use the search syntax: "Access to Compliance Data" **Note:** When you search for a report, it implies you can search for the report schedules as well. The search result will return the report containing the specific name.  **Search based on content:** When you want to search for the content within an alert, say alert description, select **Alert** and **Content** box from the filtering options drop-down. For example, to search for the alert description "Device IP Got Detected", you can use the search syntax: "Device IP Got Detected"  The search will return the result having the specific content. 

Working with Charts

The Reporting module user interface provides access to NetWitness charts. The following topics discuss charts:

- Configure and Generate a Chart
- Configure a Chart
- Schedule a Chart
- View a Chart
- Test a Chart
- Investigate a Chart
- Manage a Chart Group and Chart



Configure and Generate a Chart

Chart is a graphical visualization of data. You can view different kinds of charts, including multiple types of plot, line, bar, and area charts.

Any NWDB rule in the Reporting Engine system which is not sorted by none can be used to instantly create a chart. For more information on "How to create an NWDB rule", see Configure a Rule.

The chart interval can be adjusted from the chart definition panel itself. Every time a chart is executed, it stores its result data locally in the Reporting Engine, so that it can be reviewed in either the Dashboard View or Chart View without any performance considerations.

The following is an overview of the entire process of configuring and generating a chart.

To configure and generate a chart, perform the following:

1. Configure Reporting Engine
2. Configure an NWDB rule
3. Configure a Chart

4. Schedule a Chart
5. View a Chart
6. Test a Chart
7. Investigate a Chart
8. Manage a Chart Group and Chart

Configure Reporting Engine

You must configure the Reporting Engine before you can configure and generate a chart. You must also specify the data source in the Reporting Engine from which the data is extracted. For more information on how to configure a Reporting Engine, see "Configure Reporting Engine" topic in *Reporting Engine Configuration Guide*.

Configure an NWDB Rule

The NetWitness rule which is not sorted by none is used to create a chart. The NetWitness database extracts the meta from the Reporting Engine and provides the meta for rules. These rules are an essential building block in managing a chart.

Note: If the rule contains the lookup_and_add, sum_count, or sum_values rule actions, the associated chart will not contain data. Do not use lookup_and_add function in a rule to create a chart or a report in a chart format as the output of the lookup_and_add function in a rule will not be displayed on the chart and may result in graphical representation of incorrect information. Also, the PDF for that chart created may show an empty chart or incorrect representation of data.

Configure a Chart

You can configure a chart using the NWDB rules.

Schedule a Chart

After a chart is defined with the required components, you can configure its execution properties by scheduling a chart. Here, you can quickly view, add, and edit the schedule details for a chart.

View a Chart

You can view the scheduled charts in the Chart View.

Test a Chart

You can run the test on a chart and view all the chart details based on the selected time range.

Access Control for a Chart

The Reporting Module provides access control at the chart level. Only a user who has the right set of permissions can perform the tasks in Reporting module. The access control is managed by the administrator from the  **(Admin) > Security > Roles** tab.

When you create users and user roles, ensure that the roles that you create for specific tasks have access to all the necessary permissions. This could require permissions at several levels of the role hierarchy.

Charts can be tied to a specific set of user roles so that when a user logs in NetWitness, the charts with the access rights for the specific user role can be viewed. Users that belong to a user role with the 'Read & Write' access permission can define charts. Further, the access can be tightened so that charts are accessed only by those who have the 'Read Only' access.

At the chart level, you can set the following access permissions for the user roles in NetWitness:

- Read & Write
- Read Only
- No Access

To change the access permission for a specific user role, you must set the permission at the chart level. For example, for **Administrators** to have access to a specific chart, you could set the permission 'Read & Write' in the Charts Permissions dialog.

You can apply read-only permission to rules in the charts by selecting the checkbox.

Two scenarios that describe how to set access control are explained here:

- Scenario 1: Permissions applied to Chart Group/ Subgroup/ Chart/ Rules based on the user role.
- Scenario 2: Read-only permission applied to Rules in the Chart.

	Role (Analyst)	Permissions applied to chart group, subgroup, chart or rules based on the user role	Permissions (Read-only) applied to rules in the chart
Group	Read & Write	Read & Write	Read & Write
Subgroup	Read	Read	Read & Write
Chart	Read	Read	Read & Write
Rules	Read	Read	Read

The chart is assigned the role of a **Security Analyst** and permissions are set to 'Read & Write' charts.

For scenario 1, each of the levels has a permission set based on the user role. For scenario 2, the Read permission is set for the rules except that the permission for the rules cannot be higher than the permission for the charts.

Note: If the permission for the rules is higher than the permission for the chart, the permission is not applied. For example, if you set the permissions for the Report Group as **No Access** and specify the option *Apply Read-only permission to Rules in the Reports*, the read-only permission is not set for the rules.

Access Control for a Chart When Multiple Charts are Selected

To change permissions for multiple charts, you must select several charts and set their access permissions using the Charts Permissions panel. The access permission that you choose is applied to all the selected charts.

Access Control for a Chart When Multiple Charts with Several Rules are Selected

To change access permissions for a specific user role when multiple charts with several rules are selected, select the checkbox in the Charts Permissions panel.

The read-only access permission is applied to all the rules of the selected charts, provided that the permission of the rules are lower than the permission of the charts.

Note: If a user (other than the super user) creates a chart, the super user cannot access that chart.

Access Control for a Chart Group

To change chart group permissions, select a chart group and set the access permissions using the Charts Permissions panel. Before chart group permissions are applied, the default permission set for all the user roles is 'No Access'.

To change the access permission for a specific user role, set the permission at the chart group level. For example, for administrators to have access to all the charts in a Chart Group, set the permission 'Read & Write' in the Charts Group Permissions panel.

You can also apply permissions to subgroups and charts in the group, and apply read-only permission to rules in the charts by selecting the appropriate checkboxes.

Three scenarios that describe how to set access control are explained here:

- Scenario 1: Permissions applied to chart groups, subgroups, or charts based on user roles.
- Scenario 2: Permissions applied to subgroups and charts in the group.
- Scenario 3: Read-only permission applied to rules in the chart.

	Role (Analyst)	Permissions applied to chart groups, subgroups, or charts based on user roles	Permissions applied to subgroups and charts in the group	Permissions (Read-only) applied to rules in the chart
Group	Read & Write	Read & Write	Read & Write	Read & Write
Subgroup	Read	Read	Read & Write - Inherited	Read & Write
Chart	Read	Read	Read & Write - Inherited	Read & Write
Rules	Read	Read	Read	Read

The chart group is assigned the role of a **Security Analyst** and permissions are set to 'Read & Write'.

For scenario 1, each of the levels will have a permission set depending on the user role.

For scenario 2, the permission at the chart group level will be inherited by the subgroup and by charts in the group.

For scenario 3, the Read permission is set for the rules. However, the permission set for the rules cannot be higher than the permissions set for the chart group.

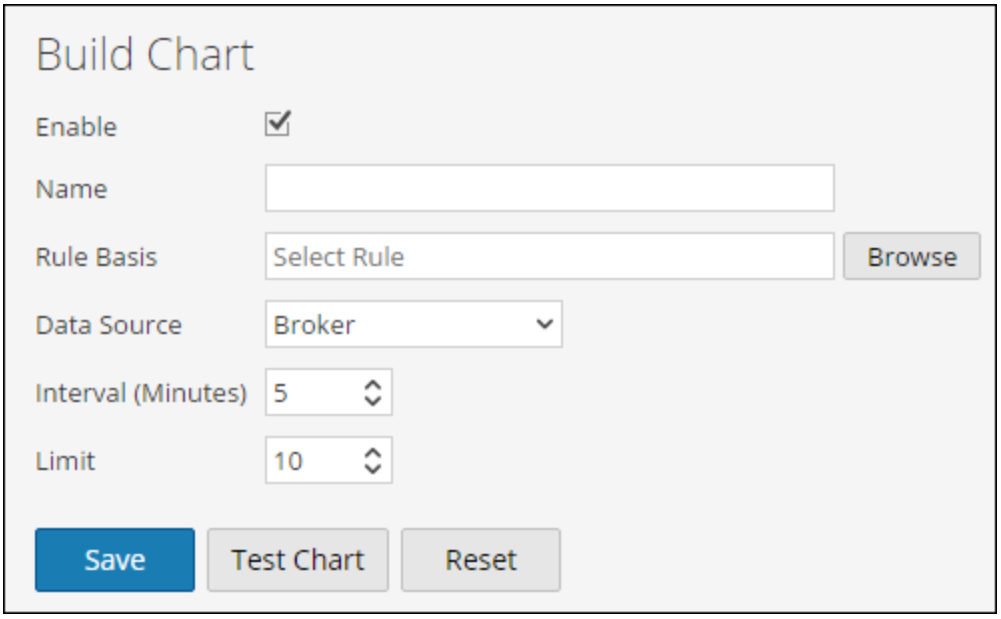
The following table lists the columns in the Charts Permissions panel:

Column	Description
Roles	The role of the user logged into the NetWitness UI.
Read & Write	The user can access, view, edit, import, export, and delete the chart in the Charts view. The user can also change the permission for the chart.
Read Only	The user can only access and view charts on the Charts view.
No Access	The user cannot access or view charts for which this permission is set.
☐ Apply these permissions to existing sub-groups and Charts in this group	Select the checkbox to apply the selected permissions to the existing subgroups in the group and charts in the group. **Note:** This checkbox is populated only when you set access permissions for a Chart Group.
☐ Apply these permissions to all new sub-groups and Charts in this group	Select the checkbox to apply the selected permissions to the new subgroups in the group and charts in the group. **Note:** This checkbox is populated only when you set access permissions for a Chart Group.
☐ Apply Read-only permission to Rules in the Charts	Select the checkbox to automatically apply permissions to the rules in the charts.

Configure a Chart

After a chart is defined with the NetWitness rules with NWDB as the data source, you can configure its execution properties.

Create a Chart Group



To add groups to the default folder or to add subgroups under a chart group:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Charts Groups** panel, click .
   A default group is added in the Chart Groups panel.
4. Enter the name of the new group.
5. Press **Enter**.
   The group is added to the Chart Groups panel.

Create a Chart

To add charts to a group or subgroup:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Charts** to display the Chart view.
3. In the **Charts** toolbar, click .
   The Build Chart tab is displayed.

4. Enter the name of the chart.
5. For the Reporting Engine to collect the data and generate chart results, select the **Enable** checkbox.
6. In the Rule Basis field, do the following:
   a. Click **Browse**. The Add Rule dialog box is displayed.
   b. Navigate the Rule tree and select a rule.
   c. Click **Select**.
7. The Rule appears in the **Rule Basis** field.
8. Select the data source from the **Data Source** drop-down list.

   Note: If the default data source is configured in the Reporting Engine, then the data source is displayed by default on the Build Chart page. If the data source is not displayed, ensure you have Read permissions set for the data source. This is applicable for NWDB and Warehouse data sources. For more information, see the "Configure Data Source Permissions" topic in the *Host and Services Configuration Guide*.

9. (Optional) To modify the Interval value, click the up or down arrow.
   The Interval value is the interval in minutes at which the rule which forms the basis of the chart is

run to collect data.

10. Select the **Limit** value to limit the number of records to be displayed.
11. **X-Axis** and **Y-Axis** are used to specify the meta to be plotted in charts.
    In the **X-Axis**, the meta for the 'Group by' rule is displayed. In the **Y-Axis**, the aggregate functions used in the rule are displayed.

    Note: Sum, Count, Countdistinct and Average are the supported aggregate functions for chart. By default, for Custom Rules with multiple 'Group by', you can select only the first meta in **X-Axis**.
12. Click **Save**.
    A confirmation message that the chart is saved successfully is displayed.

Schedule a Chart

You must schedule a chart to further investigate on the chart details.

By enabling a chart, the chart executes as scheduled and provides the configured output with the state of the chart changed to ‘Scheduled’.

To schedule a chart:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Charts** panel, select a chart or several charts that display ○ in the **Enabled** column.
4. Click .
   A confirmation message indicates that the chart(s) state is changed successfully.

View a Chart

After you view a chart, you can perform the tasks:

- You can print, save, email and view charts on full screen.
- You can also select a date from the calendar to view a list of successfully run charts for the chosen date.

To view a chart:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, Select a chart and click  > **View**.

   The View Chart view tab is displayed.

4. In **Chart Options**, do the following:

   a. Select the **Time Range**.

   > **Note:** When you select the Time Range option, you can select a pre-set time range such as last hour, last 3 hours and the Last N Days...or you can customize the selection by choosing Last N Days or Custom. If you select Last N Days option, you can view the historical data for a maximum of 15 days. If you select the Custom option, you can select a start date and end date to view the data for the selected date range.

   b. Select the **Series**, either **Chart Values over Time** or **Chart with Totals**.
   When you select **Chart Values over Time**, the chart displays the change in values for the selected time. When you select **Chart with Totals**, the chart displays a total for each aggregate value for the selected time.

   c. Select **Items To Plot** to define the number of events to view on the chart.

   d. From the **Chart Type** drop-down list, select the chart type.

   e. Click **Reload** to reload the selected chart.
   If there is a delay in retrieving the historical data for the selected time range, a message is displayed.

After the chart is generated, a notification is displayed in the notification tray available in the NetWitness toolbar. For more information on the NetWitness toolbar, see the "Browser Window" topic in the *NetWitness Getting Started Guide*.

View all Charts List

To view a list of all the charts:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** toolbar, click **View All Charts**.

   All the executed charts for the selected date are displayed in a new tab.

   > **Note:**
   > * If no list is displayed, you can select a date from the calendar to view a list of charts.
   > * If you want to view a specific chart, enter the chart name in the search criteria.

4. Click the chart name to view the chart details for that date.

Test a Chart

You can test a chart in the **Test a Chart** view.

To test a chart:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. Do one of the following:

   - In the **Charts** toolbar, click .
   - In the **Charts** panel, double-click a chart or select a chart and click .
   - In the **Charts** panel, select a chart and in Actions column, click  > **Edit**.

   The Build Chart view tab is displayed.

4. Click **Test Chart** to view the chart.

   The View Chart view tab is displayed.

5. In the **Time Range** drop-down, select the hours range.
6. Select the **Series**, either **Chart Values over Time** or **Chart with Totals**.
7. In the **Items To Plot** field, select the number of items to plot.
8. From the **Chart Type** drop-down list, select the chart type.
9. Click **Run Test** to run the test.

The chart data (if any) for the selected time range is displayed.

Investigate a Chart

You can investigate the chart by navigating directly to the Investigation module from the chart.

To investigate a chart:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** toolbar, click **View All Charts**.

   All the executed charts for the selected date from the **Chart Options** panel are displayed on a new tab.

4. Double-click the chart name to view the chart details such as the time at which the chart is executed and the default data source used for the chart execution.
5. Do one of the following:

- Click a data point on the chart to investigate.
- In the toolbar, click **Investigate** to investigate for the entire time range.

Manage a Chart Group and Chart

You can manage chart groups and charts using the following procedures.

Manage a Chart Group

Depending on the access permissions set for the user role, you can modify or delete, import or export, drag and drop a chart, or refresh a chart group.

Modify a Chart Group

To modify a chart group in the default folder or subgroups under a chart group:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts Groups** panel, select the chart group to modify.

The selected chart group is modified and can be viewed on the **Charts Groups** panel.

Delete a Chart Group

To delete a chart group in the default folder or subgroups under a chart group:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts Groups** panel, select the group and click −.

   A confirmation dialog asks for confirmation that you want to delete the selected group.

4. Click **Yes** to delete the group.

The selected group is deleted from the Chart Groups panel.

Import a Chart Group

To import chart groups from other instances of NetWitness:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. From the **Charts Groups** panel, select a folder to import the file.
4. Do one of the following:

   - In the Chart Groups panel, click  > **Import**.

     The **Import Chart** dialog box is displayed.

   - You can import multiple chart groups at the same time. To select multiple chart groups, press and hold the CTRL button and select the chart groups to be imported.

5. Click **Browse** to select the binary file.

   NetWitness provides a file system view of the files.

6. Locate the binary file and click **Open**.

   The file is added to the Import Chart list.

7. (Optional) To overwrite any existing rule in the library with an identically named rule in the binary file when importing, select the **Rule** checkbox. If you do not select the Overwrite option, and an identical rule is encountered in the binary file, the binary file is imported and no error message is displayed.
8. (Optional) To overwrite any existing list in the library with an identically named list in the binary file, select the **List** checkbox. If you do not select the Overwrite option, and an identical list is encountered in the binary file, the binary file is imported and no error message is displayed.
9. (Optional) To overwrite any existing chart in the library with an identically named chart in the binary file when importing, select the **Chart** checkbox. If you do not select the Overwrite option and an identical chart is encountered in the binary file, the binary file is imported and no error message is displayed.
10. Click **Import** to import the binary file.

Export a Chart Group

To export selected chart groups:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts Groups** panel, select a chart group and click  and do one of the following:

   - **Export** - This selection exports a chart in a .zip file.
   - **Export as Text** - This selection exports all the content from the Reporting Engine in a .zip file which contains the data in text format.

   You can export multiple chart groups at the same time. To select multiple chart groups, press and hold the CTRL button and select the chart groups to be exported. The exported file is saved to the local drive.

Drag and Drop Chart to a Group

To drag and drop a chart from the Charts panel to a group in the Charts Groups panel:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. Select a chart from the **Chart** panel and drag and drop the chart to a group in the **Chart Groups** panel.

The chart is copied to the group in the Chart Groups panel.

Refresh a Chart Group

To refresh chart groups:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts Groups** panel, drag and drop the group.

   The chart group is moved to the new location.

4. In the **Charts Groups** panel, Click .

The chart group is refreshed.

Manage a Chart

Depending on the access permissions set for the user role, you can modify or delete, duplicate, import and export, enable or disable charts, search for existing charts, and refresh a chart list.

Access Control for a Chart

To set access permissions for a chart:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, select a chart.

4. Click  > **Permissions**.

   The Charts Permissions dialog box is displayed.

5. Based on the user role, select the appropriate buttons.

6. (Optional) Select the checkbox if you want to provide read access permission to dependent rules.

   Note: On selecting the check box, all dependent rules with No access permission are granted a READ access permission.

7. Click **Save**.

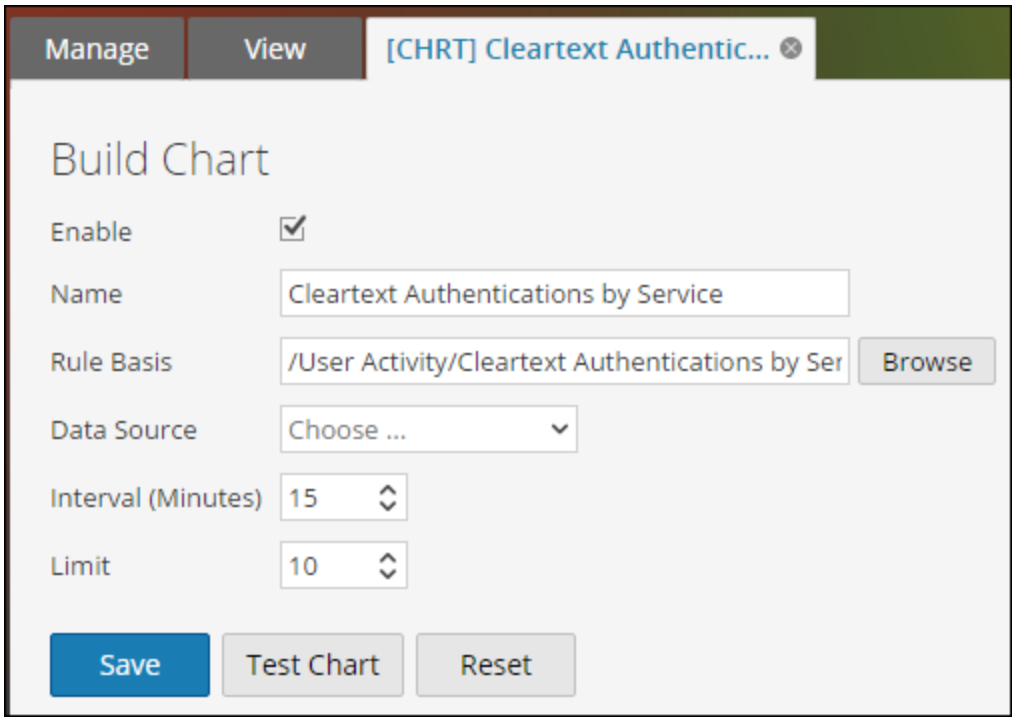
A confirmation message that the permission is successfully set for the selected chart is displayed.

Modify a Chart

To modify a chart in a group or subgroup:

1. Go to **Reports**.

   The Manage tab is displayed.



2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, do one of the following:

   - Double-click a chart or select a chart and click .
   - Select a chart and click  > **Edit**.

     The Build Chart view tab is displayed.

4. Modify the name of the chart.
5. For the Reporting Engine to collect the data and generate chart results, select the **Enable** checkbox.
6. (Optional) In the **Rule Basis** field, do the following:

a. Click **Browse**.

The Add Rule dialog is displayed.

b. Navigate the Rule tree and select a rule.

c. Click **Select**.

The Rule appears in the Rule Basis field.

7. Select the data source from the **Data Source** drop-down list.

> **Note:** If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data sources. For more information, see the "Configure Data Source Permissions" topic in the *Host and Services Configuration Guide*.

8. (Optional) To modify the Interval value, click the up or down arrows.
9. Select the limit value to limit the number of records to be displayed.
10. Click **Save**.

A confirmation message that the chart is modified successfully is displayed.

Delete a Chart

To delete a chart in a group or subgroup:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Charts** panel, do one of the following:
   - Select the charts and click .
   - Click  > **Delete**.
     A confirmation message asks if you want to delete the selected chart.
4. Click **Yes** to delete the chart.

A confirmation message that the chart is deleted successfully is displayed and the selected chart is deleted from the Charts panel.

Duplicate a Chart

To duplicate an existing chart:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Charts**.

   The Chart view is displayed.

3. From the **Charts** panel, select a chart to be duplicated.
4. In the **Charts** toolbar, click .

The chart is duplicated and gets added to the Charts panel.

Import a Chart

To import charts from other instances of NetWitness:

1. Go to **Reports**.

   The Manage tab is displayed.
2. Click **Charts**.

   The Chart view is displayed.
3. From the **Charts Groups** panel, select a folder from which to import the file.
4. Do one of the following:

   - In the **Chart** toolbar, click  > **Import**.

     The **Import Chart** dialog box is displayed.
   - You can import multiple charts at the same time. To select multiple charts, press and hold the CTRL button and select the charts to be imported.
5. Click **Browse** to select the binary file.

   NetWitness provides a file system view of the files.
6. Locate the binary file and click **Open**.

   The file is added to the Import Chart list.
7. (Optional) To overwrite any existing rule in the library with an identically named rule in the binary file when importing, select the **Rule** checkbox. If you do not select the Overwrite option, and an identical rule is encountered in the binary file, the binary file is imported and no error message is displayed.
8. (Optional) To overwrite any existing list in the library with an identically named list in the binary file, select the **List** checkbox. If you do not select the Overwrite option, and an identical list is encountered in the binary file, the binary file is imported and no error message is displayed.
9. (Optional) To overwrite any existing chart in the library with an identically named chart in the binary file when importing, select the **Chart** checkbox. If you do not select the Overwrite option and an identical chart is encountered in the binary file, the binary file is imported and no error message is displayed.
10. Click **Import** to import the binary file.

Export a Chart

To export selected charts to an external file:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, select a chart and click  and do one of the following:

   - **Export** - This selection exports a chart in a .zip file.
   - **Export as Text** - This selection exports a chart from the Reporting Engine in a .zip file which contains the data in text format.

   You can export multiple charts at the same time. To select multiple charts, select the checkboxes of the charts to be exported. The exported file is saved to the local drive.

Enable a Chart

To enable a chart:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, select a chart or several charts that display ○ in the **Enabled** column.

4. Click ●.

A confirmation message indicates that the chart(s) state is changed successfully.

Disable a Chart

To disable a chart:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, select a chart or several charts that display ● in the **Enabled** column.

4. Click ○.

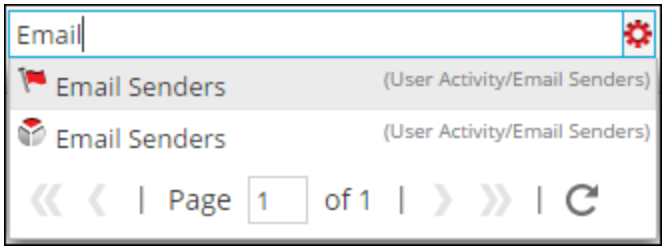
A confirmation message indicates that the chart(s) status is changed successfully.

Search an Existing Chart

To search for an existing chart:

1. Go to **Reports**.

   The Manage tab is displayed.



2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** toolbar, enter text in the Search text box.

4. Click > **Chart**.

All charts that match the search string are displayed in the search drop-down list.

Refresh a Chart

To refresh charts:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Charts**.

   The Chart view is displayed.

3. In the **Charts** panel, drag and drop the charts to the desired group in the **Charts Groups** panel.

   The charts are moved to the new location.

4. Do either of the following:

   - In the **Charts** panel, click .
   - In the **Charts** toolbar panel, select **Auto Refresh**.

   The Chart list is refreshed.

Filter Unused Charts

You can filter and delete the charts that are not used in any dashlet.

To filter unused charts:

1. Go to **Reports**.
   The **Manage** tab is displayed.

2. In the **Charts** panel, click  and select **Unused Charts**.
   List of unused charts will get displayed.
3. Delete the unused charts.
   For more information, see Delete a Chart.

Working with Alerts

The Alerting module user interface provides access to NetWitness alerts. The following topics discuss alerts:

- Alerting Overview
- Configure Reporting Engine
- Configure an Alert
- Schedule an Alert
- View an Alert
- Investigate an Alert
- Manage an Alert and Alert Template

Alerting Overview

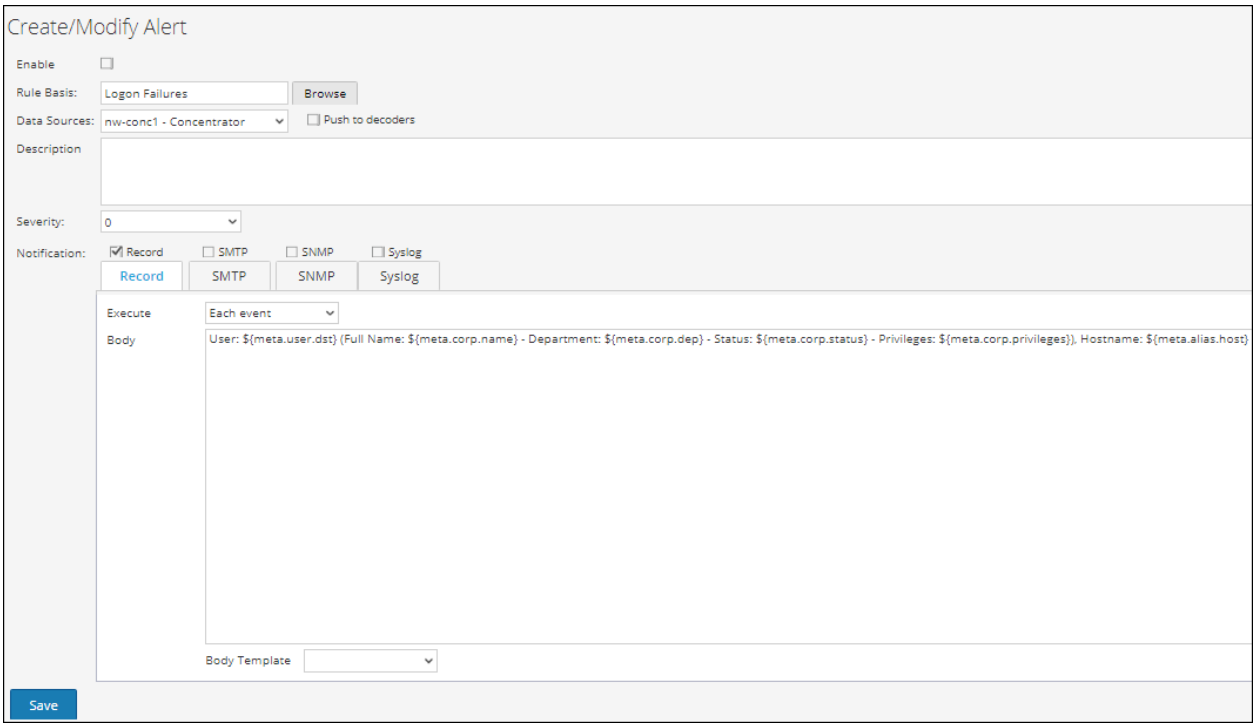
Alerts can be used to generate timely insights about current security issues, vulnerabilities, and exploits. For example, when a malicious email is sent from a compromised account, you would need an alert that automatically notifies you when such an event occurs.

The following concepts of alerting will help you understand more about alert rules, conditions, notifications, and templates.

Alert Rules

Alert rules specify the logic for alert generation. Alert rules allow you to set up threshold limits and define how to be notified if these limits are exceeded. For example, you may set up a rule to be alerted if the CPU usage remains abnormally high for 5 minutes or more.

Alert Definitions



The alert definition is similar to defining rules for reports. These rules must be defined based on your use case. Alert definitions are made by selecting the alert rules you define in the Build Rule view. You select this rule while defining an alert.

Note: You can only alert using rules defined for NetWitness data source.

Once an alert is created, this data is collected from the Reporting Engine and displayed on the user interface.

Once an alert is defined, you can schedule the alert to run every minute (by default), or run at the present time, or run at the near future.

Note: In the NetWitness user interface, wherever Date and Time is displayed, it is always according to the user selected time zone profile.

Alert Notifications

The following are the components required to configure alert notifications:

- Notification server – Notification Server is used to send alert notifications. For example, SMTP mail server. Once you configure a notification server, you can add it to a rule. When the rule triggers an alert, the rule will use that server to send alert notifications.
- Notifications – Alert outputs, which can be email, SMTP, SNMP, and Syslog.
- Templates – The pre-defined format of an alert message.

When ever the rule condition is encountered, alerts get generated based on the severity level and notifies the user depending on the notification method set for that specific alert. The following are the various notification methods:

- Email/ SMTP: Simple Mail Transfer Protocol (SMTP) sends alert emails for system activity. Email alerts can be sent to their intended recipients by selecting SMTP as notification type.
- SNMP: Simple Network Management Protocol (SNMP) sends alerts to multiple computers for SNMP traps. SNMP alerts can be sent to other computers by selecting SNMP as notification type.
- Syslog: Syslog alerts generate notifications from Syslog messages. Syslog alerts can be sent by selecting Syslog as notification type.

Alerts can be configured to notify events that require attention, or as mechanisms to take automated actions based on conditions configured in an alert. An alert is sent when conditions within the entity have met the criteria selected for the alert. The notification criteria determines when and at what frequency the alert is generated.

Alert Templates

Alert templates are pre-defined format for an alert message. You can use these templates to create alerts.

Access Control for Alerting

Depending on the user role, the user is provided with specific set of access permissions in order to manage an alert. The Administrator manages the access rights provided to each user role from the **(Admin) > Security > Roles** tab. You can set access permissions for the user roles to manage an alert. The Reporting module provides access control at the alert level.

Note: Reporting Engine Alert permissions are prefixed with 'RE' to distinguish them from Event Streaming Analysis (ESA).

When you create users and user roles, ensure that the roles that you create for specific tasks have access to all the necessary permissions. This could require permissions at several levels of the role hierarchy.

Alerts can be combined with a specific set of user roles so that when a user logs into NetWitness, the only alerts they can access are alerts accessible by the role to which the user belongs. Users that belong to a user role with the '**Read & Write**' access permission can define alerts. The access can further be tightened so that the alerts are accessed only by those who have the '**Read Only**' access.

At the alert level, you can set the following access permissions for the user roles in NetWitness:

- Read & Write
- Read Only
- No Access

Note: Before applying the Alert permissions, the default permission set for all the user roles is '**No Access**' permission and the checkbox is unchecked.

If you want to change the access permission for a specific user role, you must set it at the alert level. Except for administrators, the default permission set for all the other user roles is '**No Access**' permission.

The two scenarios are explained in brief:

- Scenario 1: Permissions applied to alert/ rules based on the user role.
- Scenario 2: Read-only permission applied to rules in the Alert.

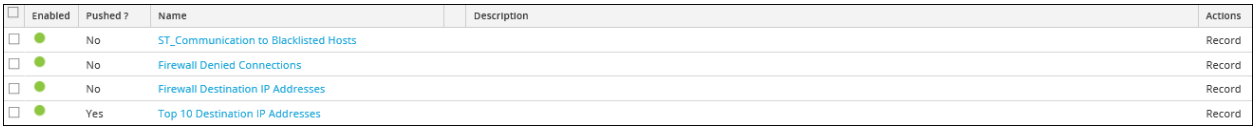
	Role (Analysts)	Permissions applied to Alert/ Rules based on the user role	Permission (Read-only) applied to Rules in the Alert
Alert	**Read & Write**	**Read & Write**	**Read & Write**
Rules	**Read**	**Read**	**Read**

The Alert is assigned the role of a Security Analyst and permissions are set to **Read & Write** alerts.

For scenario 1, each of the levels has a permission set based on the user role. For scenario 2, the **Read** permission is set for the Rules except that the permission for the rules must not be higher than the permission for the Alerts.

If the permission for the rules is higher than the permission for the Alerts, the permission is not applied. For example, if you set the permissions for the Alert as **No Access** and then specify the option *Apply Read-only permission to Rules in the Alerts*, the read-only permission is not set for the rules.

Access Control for an Alert When Multiple Alerts are Selected



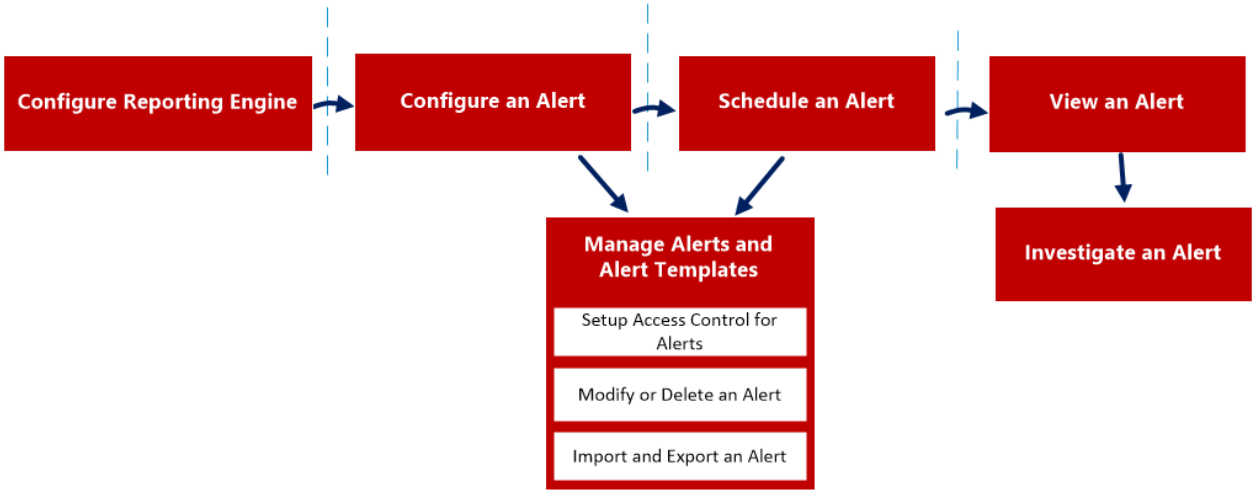
When you want to change permissions of multiple alerts, you must select several alerts and set their access permissions using the Alert Permissions panel. The access permission that you choose is applied to all the selected alerts.

Log in as a specific user and view the access details

When you log in to the NetWitness UI as a user having **Read** access permission, all the alerts will be denoted with the symbol (📖) and when you click on the symbol the 'Read Only' callout is displayed on the Alert panel.

When you log in to the NetWitness UI as a user not having **Read & Write** access permission on an Alert, all the alerts will be denoted with the symbol ( ) and the alerts appear grayed out on the Alert panel.

The following figure shows the Alert panel when logged in with minimal **Read & Write** access permission.



Note: If a user (other than ADMIN) creates an alert, ADMIN cannot access that alert.

The following table lists the various columns in the Alert Permissions panel:

Column	Description
Roles	The role of the user logged into the NetWitness user interface.
Read & Write	The user can access, view, edit, import, export, and delete the alert on the Alerts page. The user can also change the permission on the alert.
Read Only	The user can only access and view the alert on the Alerts page.
No Access	The user cannot access or view the alert for which this permission is set.
Apply Read-only permission to Rules in the Alerts	The user can automatically apply permissions to the rules in the alerts.

The following is an overview of the entire process of alerting:

To configure and generate an alert on Reporting Engine, perform the following:

1. Configure Reporting Engine
2. Configure an Alert
3. Schedule an Alert
4. View an Alert
5. Investigate an Alert
6. Manage an Alert and Alert Template

Configure Reporting Engine

Ensure that:

- You have Decoders that are connected to the Concentrator added to the Reporting Engine for the selected data source, before creating an alert rule.
- You have installed and configured a Syslog server that supports TCP/TLS in your environment. For example, WinSyslog. You can configure the Reporting Engine to send Syslog messages over TCP with Transport Layer Security (TLS) when an alert is triggered.

To configure the Reporting Engine to send Syslog alerts over TCP with Transport Layer Security (TLS):

1. Obtain the required certificates.
2. Append the CA certificate to the ca.pem file on the NetWitness server.
3. Configure the Syslog server to accept messages from client machines.
4. Configure the delivery of alert messages in the NetWitness UI.

Task 1: Obtain the required certificates

To generate certificates for configuring Reporting Engine to send Syslog messages over TCP with TLS:

1. Generate a Certifying Authority (CA) certificate. For more information, see http://www.rsyslog.com/doc/tls_cert_ca.html.

Note: You can ignore this step if you already have a CA running in your environment.

2. Generate a key pair for the Syslog server. For more information, see http://www.rsyslog.com/doc/tls_cert_machine.html.

Note: You can ignore this step if you have already configured security for the Syslog server using the key and certificates generated by the same CA.

Task 2: Append the CA certificate to the ca.pem file on the NetWitness Server

To append an existing CA certificate to the ca.pem file:

1. Manually append the contents of the CA certificate that you generated to the **/etc/pki/CA/certs/ca.pem** file.
2. Run the following command on the NetWitness server to have the certificate populate to the Truststore:
   ```
   keytool -import -file /etc/pki/CA/certs/ca.pem -keystore cacerts
   ```

Task 3: Configure the Syslog Server to accept messages from client machines

To configure the Syslog server to accept messages from client machines that have the same CA certificates:

1. Copy the following files to your secure TCP server target location:
   - ca_cert.pem
   - server_cert.pem
   - server_key.pem

   Where:

   ca_cert.pem - is the CA certificate

   server_cert.pem - is the server certificate

   server_key.pem - is the server key

   For more information, see the documentation specific to your Syslog server. If you are using rsyslog, refer to http://www.rsyslog.com/doc/tls_cert_server.html.

Task 4: Configure the delivery of alert messages in NetWitness

Configure Reporting Engine to send Syslog messages over TCP with Transport Layer Security (TLS) when an alert is triggered by enabling **SECURE_TCP** in the **Output Actions** tab for the Reporting Engine service in the Reporting Engine Services Config View. For more information, see the **"Reporting Engine Output Actions"** topic in the *Host and Services Configuration Guide*.

Configure an Alert

You can configure an alert by setting up alert notifications and adding a notification method to a rule.

Note: Only Administrators can set up these notifications.

To configure an alert:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Alerts**.

   The Alert view is displayed.

3. In the **Alert** toolbar, click .

   The Create/Modify Alert panel is displayed.

4. Click **Enable** to enable the alert.
5. In the **Rule Basis** field:
   a. Click **Browse**.

      The Lookup Rule Basis dialog box is displayed.

   b. Navigate the Rule tree and select a rule.
   c. Click **OK**.

      The Rule name is displayed in the Rule Basis field.

6. From the **Data Sources** drop-down list, select a data source.

   Note: If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse Connector data sources. For more information, see **"Configure Data Source Permissions"** topic in the *Host and Services Configuration Guide*.

7. Select the **Push to decoders** checkbox for the Reporting Engine to send the rule to the Decoder.
8. (Optional) Enter an alert description in the **Description** field.
9. From the **Severity** drop-down list, select the severity level.
10. In the **Notification** field:
    a. Select the appropriate notification.
       The selected notification tab is displayed in the Create/Modify Alert dialog box.
    b. (Optional) Deselect the notification to disable the notification tab.
    c. Define an action in one of the **Notification** tabs:

i. In the **Record** tab field:

   a. From the **Execute** drop-down list, select the frequency for recording an alert.

   b. Enter the RECORD message. You can create a new message or select a template in the **Body Template** field and modify the template here.

   c. (Optional) If templates have been defined, select a template for the RECORD message that you can use as is or modify.

ii. In the **SMTP** tab field:

   a. From the **Execute** drop-down list, select a value to identify the number of times to send an email message for the alert.

   b. Enter an email address or comma-separated list of email addresses to send this alert.

   c. Enter the subject of the email message.

   d. Enter the body of the message. You can create a new message or select a template in the **Body Template** field and modify the template here.

iii. In the **SNMP** tab field:

   a. From the **Execute** drop-down list, select a value to identify the number of times that you want to send an SNMP message for the alert.

   b. Enter the SNMP message. You can create a new message or select a template in the **Body Template** field and modify the template here.

iv. In the **Syslog** tab field:

> **Note:** You can configure Multiple Syslog servers on the Syslog Configuration panel. For more information, see **"Reporting Engine Output Actions"** topic in the *Host and Services Configuration Guide*.

   a. Click .

   The New Syslog Configuration dialog box is displayed.

b. From the **Syslog Configs** drop-down list, select a value for the syslog configuration.

c. From the **Execute** drop-down list, select a value to identify the number of times to send a Syslog message for the alert.

d. From the **Facility** drop-down list, select the facility.

e. From the **Severity** drop-down list, select the severity level.

f. Enter the Syslog message. You can create a new message or select a template in the **Body Template** field and modify the template here.

> **Note:** If you want to add a metakey, specify the same in the format: ${meta.metakey}. For example, ${meta.ip.dst}.

g. Click **Save**.
The Syslog configuration gets added to the alert.

11. Click **Create**.

NetWitness creates an alert with a confirmation message that the alert is saved successfully. NetWitness generates the alert and executes the output actions every minute.

Schedule an Alert

You must schedule an alert to search for events on a regular schedule.

To schedule an alert:

1. Go to **Reports** to view the Manage tab.
2. Click **Alerts** to open the Alert view.
3. Select an alert to schedule.
4. On the **Alert** toolbar, click **Enable**.
The selected alert is scheduled.

View an Alert

You can view an alert or a list of all alerts.

You can view the alerts triggered and investigate any alert in the Investigation module and customize these views to show alerts for a specific period of time, and set the maximum number of alerts displayed in a single page.

To view an alert:

1. Go to **Reports** to view the Manage tab.
2. Click **Alerts** to open the Alert view.
3. On the **Alert** toolbar, click **View Alerts**.
   The View Alerts view is displayed.

Investigate an Alert

You can investigate every alert that is triggered on the Alert View. For more detailed investigation on a particular alert, you can view the alert on the Investigation module.

To investigate an alert:

1. In the **Alert** section toolbar, click **View Alerts** to navigate to the View Alerts view.
2. Do one of the following:
   - Click the  button against the alert you want to investigate.
     The Investigation module displays the details of the first session that registered the match for the given alert for immediate analysis.
   - Click on the alert name of the alert you want to investigate.
     The Investigation module displays all matches for that particular alert for the hour surrounding the registered alert.

Manage an Alert and Alert Template

You can manage alerts, scheduled alerts, and alert templates using the following procedures.

Manage an Alert

Depending on the access permissions set for the user role, you can modify or delete, import and export, enable or disable alerts, view or refresh an alert list.

Access Control for an Alert When a Single Alert is Selected

To set access permissions for an alert:

1. Go to **Reports**.
   The Manage tab is displayed.

2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** panel, select an alert.
4. Click > **Permissions**.
   The Alert Permissions dialog box is displayed.
5. Based on the user role, select the appropriate options.
6. (Optional) Select the checkbox if you want to automatically provide read access permission to dependent rules.

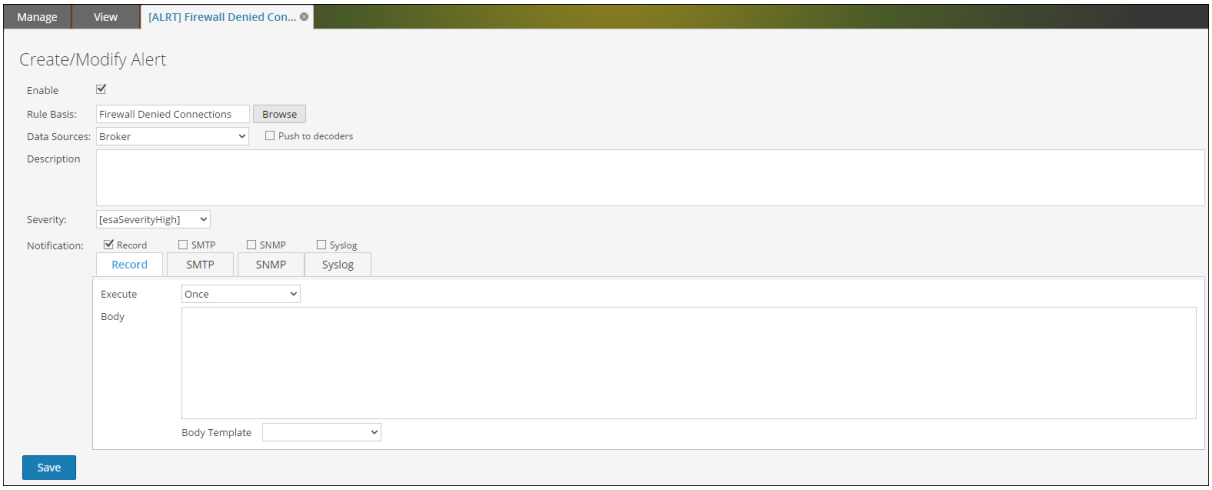
Note: When the check box is selected, all dependent rules with the No access permission will be given the READ access permission.

7. Click **Save**.
   A confirmation message that the permission is successfully set for the selected alert is displayed.

Access Control for an Alert When Multiple Alerts are Selected

To change permissions of multiple alerts:

1. In the **Alerts** panel, select all the alerts whose permissions must be set.
2. Click > **Permissions**.
   The Alert Permissions dialog box is displayed.
3. Select the permission to set for the respective user role.
4. Click **Save**.
   A confirmation message that the permission is successfully set for all the selected alerts is displayed.



Edit an Alert

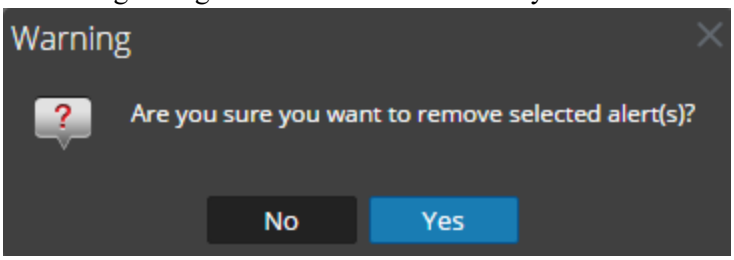
For example, if you want to be notified about the alert over an email on a different Email ID, you will have to modify the alert notification section with the new Email ID details to be reverted over an email when an alert is generated. Additionally, you can also modify the alert description and alert notification in the Create or Modify Alert panel.

To edit an alert:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.

3. In the **Alert** panel, select an alert and click .
   The Create or Modify Alert tab is displayed.

4. In the **Rule Basis** field, navigate the rule tree and select another rule.
   The Rule name is displayed in the Rule Basis field.
5. (Optional) Select a data source from the **Data Sources** drop-down list.



> **Note:** If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see **"Configure Data Source Permissions"** topic in the *Host and Services Configuration Guide*.

6. (Optional) Modify the alert description in the **Description** field.
7. Modify the appropriate **Notification** tabs – **RECORD**, **SMTP**, **SNMP**, and **Syslog**.
8. Click **Save**.
   A confirmation message that the alert is modified successfully is displayed.

Delete an Alert

To delete an alert:

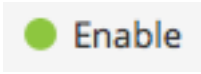
1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** panel, select the alert and click .
   A warning dialog asks for confirmation that you want to remove the selected alerts.

4. Click **Yes** to delete the alert.
   A confirmation message that the alert is deleted successfully is displayed and the selected alert is deleted from the Alert panel.

Import an Alert

To import an alert from other instances of NetWitness in the Alerts panel:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** toolbar, click > **Import**.
   The Import Alert dialog box is displayed.
4. Click **Browse** to select the binary file.
   NetWitness provides a file system view of the files. You can import multiple alerts at a time. To select multiple alerts, select the checkbox of the alert to be imported.
5. Locate the binary file, and click **Open**.
   The file is added to the Import Alert list.
6. (Optional) To overwrite any existing alert in the library with an identically named alert in the binary file when importing, select the Alert checkbox. If you do not select the Overwrite option, and an identical alert is encountered in the binary file, the binary file is imported and no error message is displayed.
7. Click **Import** to import the binary file.



Export an Alert

To export an alert to an external file that can be later imported to NetWitness:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** panel, select an alert and click and do one of the following:
   - **Export** - This selection exports an alert in a .zip file.
   - **Export as Text** - This selection exports all the content from the Reporting Engine in a .zip file which contains the data in text format.
     You can export multiple alerts at a time. To select multiple alerts, check the checkbox of the alert to be exported.
4. Click > **Export**.
   The exported binary file is saved to the local drive.

Enable an Alert

To enable an alert:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** panel, select the alert that displays ○ in the **Enabled** column.
4. Click 

.
   A confirmation message shows that the change to the alert(s) state was successful.

Disable an Alert

To disable an alert:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** panel, select the alert that displays ● in the **Enabled** column.
4. Click 

.
   A confirmation message shows that the alert(s) status is changed successfully.

View an Alert List

To view an alert list:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** toolbar, click **View Alerts**.
   The View Alerts view tab is displayed.
4. Select the last number of days from the drop-down list.
5. Enter a value for the **Max no of alerts**.
   The alerts list is displayed based on the chosen filter value.

Refresh an Alert List

To refresh the list of alerts:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. From the **Alert** toolbar, click  to refresh the alerts list.
   The Alert panel is refreshed.

Manage a Scheduled Alert

You can enable or disable a scheduled alert, and view all scheduled alerts.

Enable a Scheduled Alert

To enable a scheduled alert:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. Click View Schedule.
   The View Alerts Schedule view tab is displayed.
4. In the **Alerts Schedule List** panel, select the scheduled alert (s) to be enabled.
5. Click .
   A confirmation message indicates that the alert(s) status is changed successfully and the alert is now available in the Alert panel.

Disable a Scheduled Alert

To disable a scheduled alert:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. Click View Schedule.
   The View Alerts Schedule view tab is displayed.
4. In the **Alerts Schedule List** panel, select the scheduled alert (s) to be disabled.
5. Click .
   A confirmation message indicates that the alert(s) status is changed successfully and the alert is now available in the Alert panel.

View all Alerts Scheduled

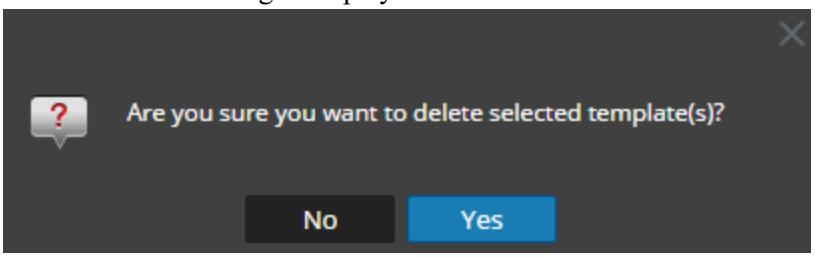
To view all the alerts scheduled:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** toolbar, click **View Schedule**.
   The View Alerts Schedule view is displayed with a list of all the scheduled alerts.

Manage an Alert Template

You can modify or delete an alert template, and view all alert templates.

Edit an Alert Template



To edit an alert template:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. Click Template.
   The Alert Template view is displayed.
4. In the **Alert Template** panel, select a template and click .
   The Create/Modify Template dialog box is displayed.
5. Click **Save**.
   A confirmation message that the template is modified successfully is displayed.

Delete an Alert Template

To delete an alert template:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. Click Template.
   The Template view tab is displayed.
4. In the **Alert Template** panel, select a template and click .
   A confirmation dialog is displayed.

5. Click **Yes** to delete the template.
   A confirmation message that the template is deleted successfully is displayed.

View all Alert Templates

To view all alert template messages:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.

3. In the **Alert** toolbar, click **Template**.
   The Template view tab is displayed with a list of templates.

List of Available Variables

Below are the list of variables available on the Reporting Engine notification for Reporting Engine alerts.

```
Name: ${name}
Severity: ${severity}
alert count: ${count}
Start_session_id = ${sid1}
end_session_id = ${sid2}
data source id = ${device.id}
netwitness host = ${nw.host}
```

See below example for how to use metadata information on the notification template.

To use ip.src and ip.dst meta, use the format `${meta.<meta-name>}`.

```
ip.src meta = ${meta.ip.src}
ip.dst meta = ${meta.ip.dst}
```

Appendix

This section provides detailed information about the supported aggregate functions, rule syntax, advanced rules query syntax in Reporting and task scheduler for Warehouse Reporting.

Rule Syntax

This section describes the different rule syntax supported in the Reporting Engine.

NWDB Rule Syntax

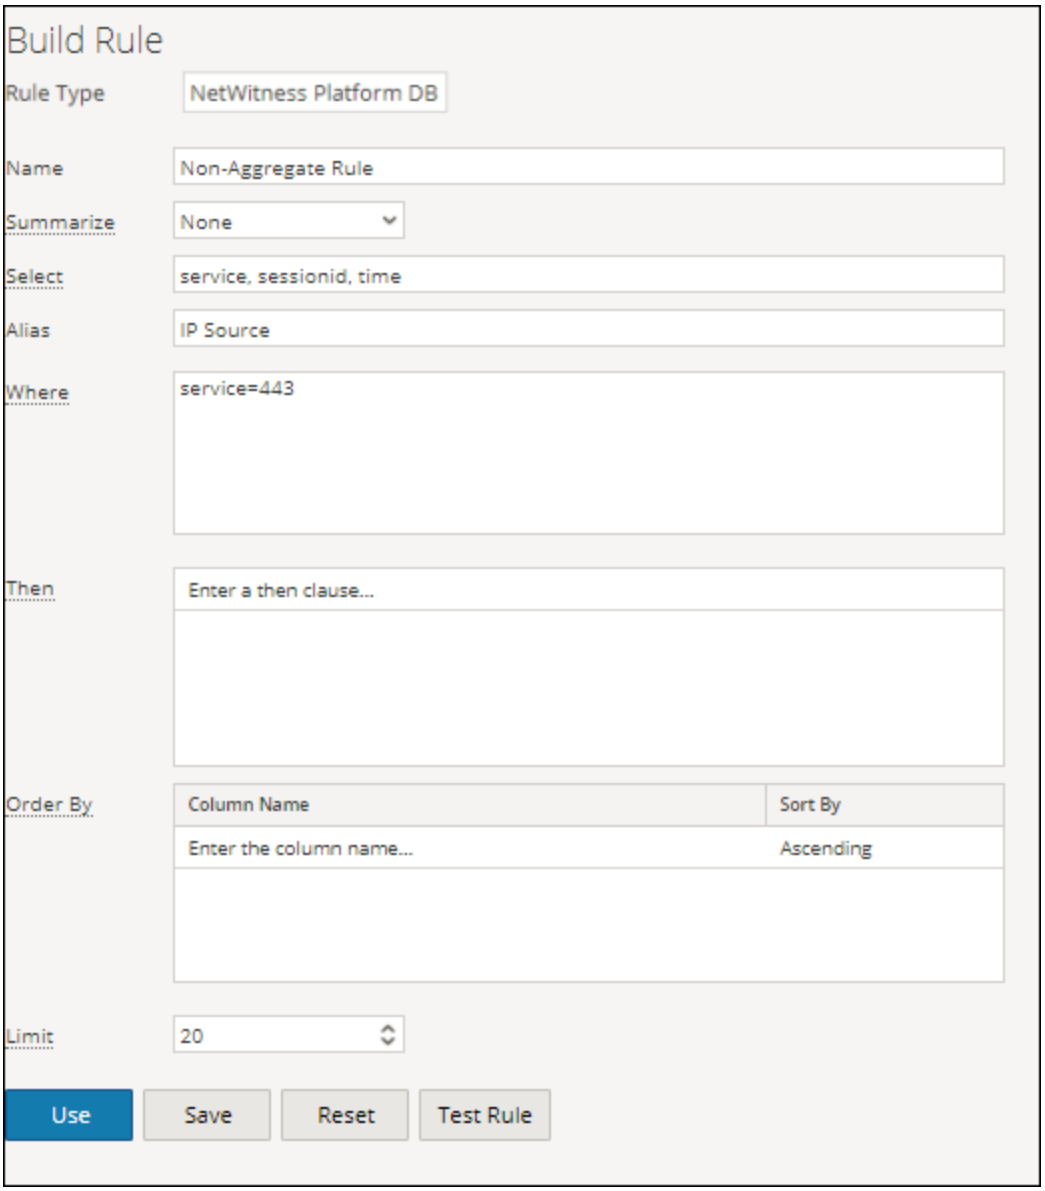
The NWDB rule is one of the rule syntax supported in the Reporting Engine. To enhance the execution time of your reporting entities, see "Reporting Guidelines" section in Reporting Overview.

A Rule is a function that manipulates the result set of a rule in order to make the output in a report more meaningful or add additional functionality to a rule other than querying data and displaying it. Any combination of these rule actions can be used to create unique and interesting representations of the information collected by NetWitness.

The Reporting Engine supports the following categories of NWDB data source rule syntax:

- **select** clause
  - Non-Aggregate Rule
  - Aggregate Rule
- **alias**
- **where** clause
- **where** clause Operators
- **then** clause
- **Limit** field
- Rule Actions
- Rule Operators

Select Clause



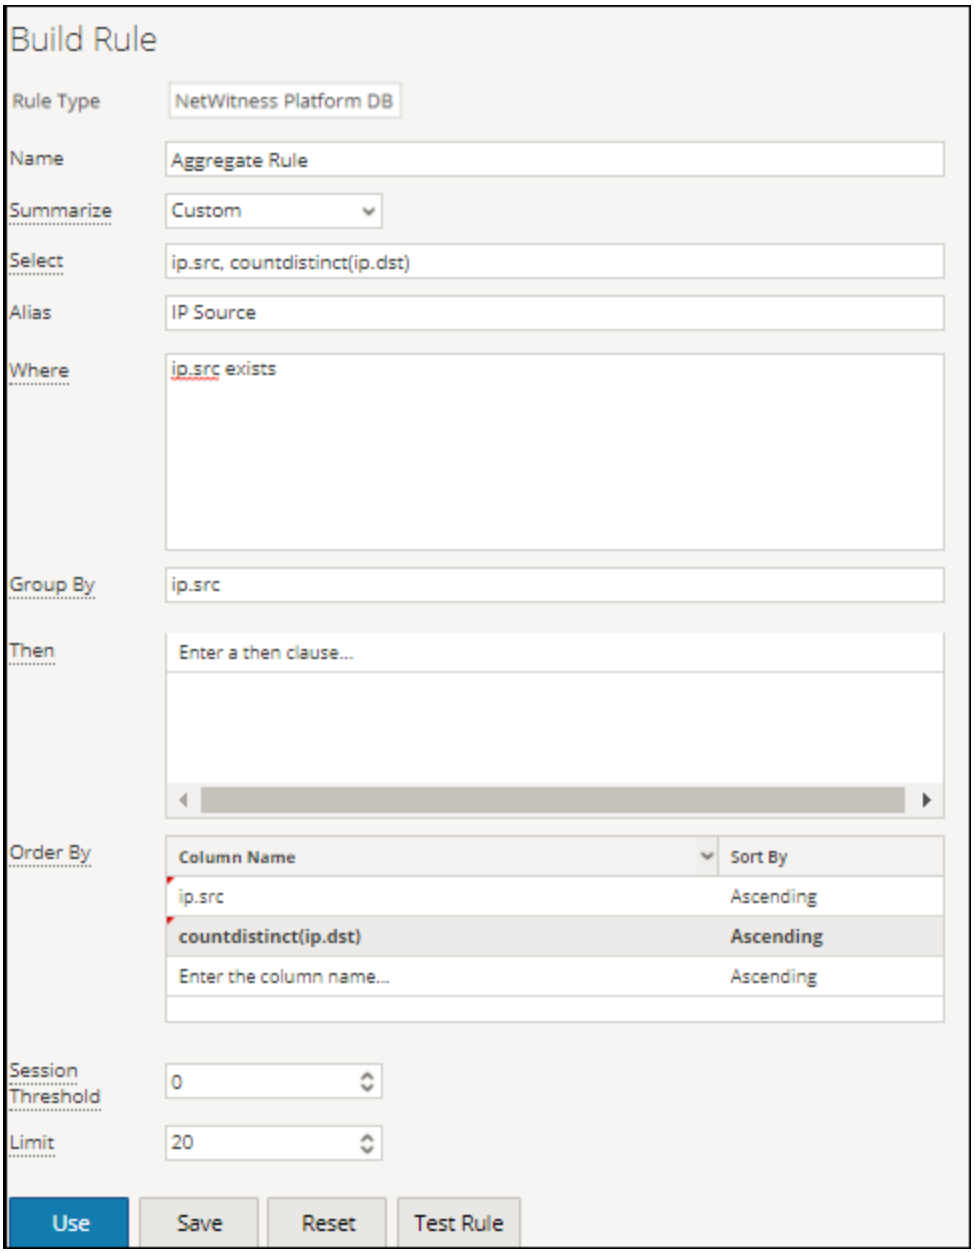
The select clause is a comma separated list of values. For example: select sessionid,time,service.

There are two types of select clause for NWDB Rule:

- Non-aggregate rule
- Aggregate rule

Non-Aggregate Rule

When you want to define a rule without any grouping, choose 'None' in the Summarize field. In a non-aggregate rule, you can select any number of metas in the *Select* clause. For example, select service, sessionid, time.



Aggregate Rule

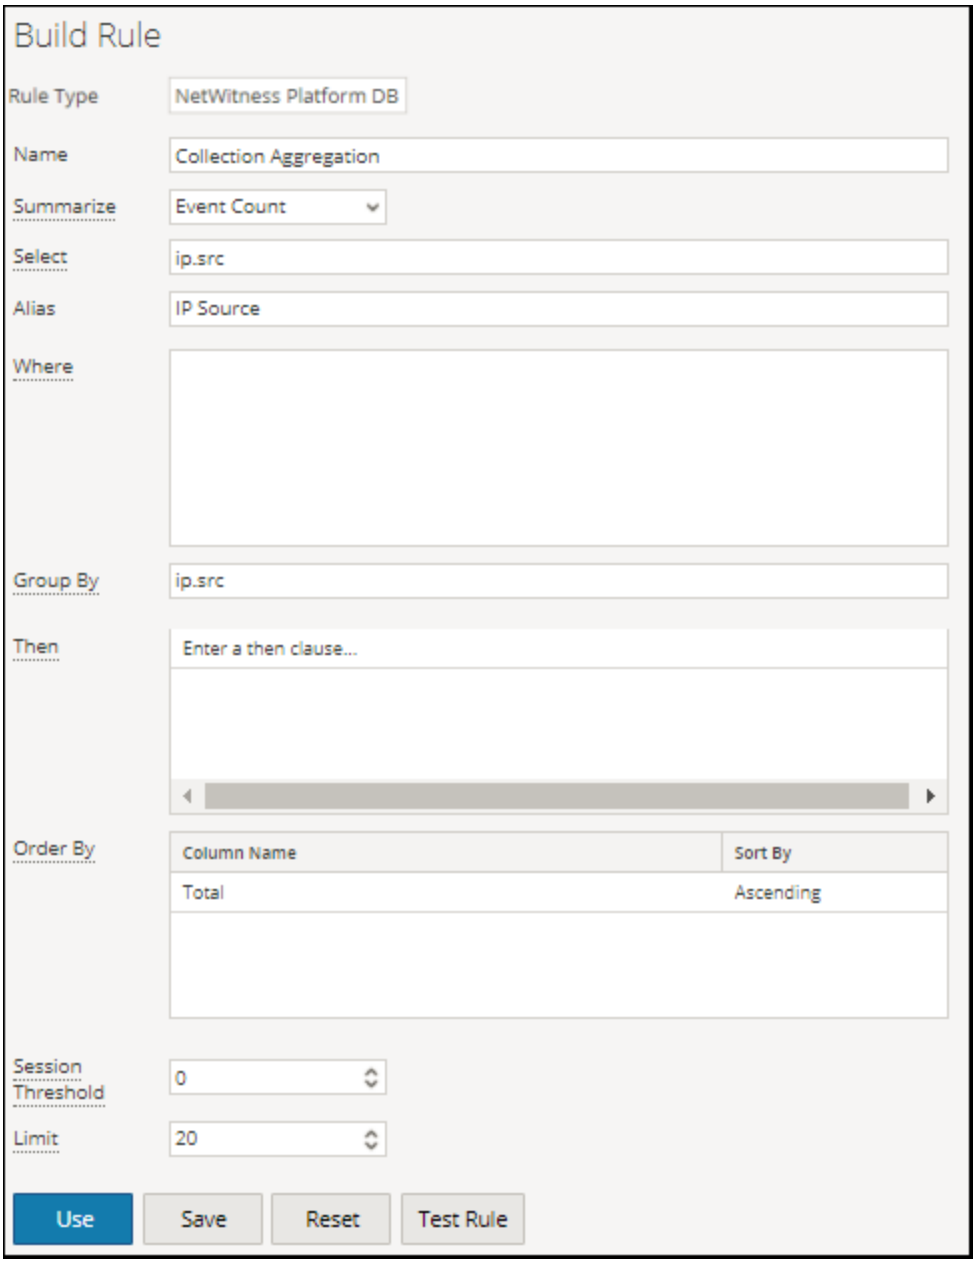
When you want to query for a specific meta and its associated aggregate value then you must use the Aggregate rule. To get an aggregate, you must choose either of the three metas (Event Count, Packet Count, Session Size) or choose 'Custom' in the **Summarize** field to include an aggregate function in the *Select* clause. For example, select ip.src, sum (ip.dst). When Custom aggregate rule is enabled, the following fields are populated in the user interface:

- Group By
- Order By
- Session Threshold

The following figure shows the Build Rule view for Aggregate Rule.

There are two types of aggregate values that can be queried:

- Collection aggregation
- Meta aggregation



Collection Aggregation

With collection aggregation, you can get aggregates related to Event, Session or Packets. The following values can be queried in a collection aggregation:

- **Event Count**: The total count of events.
- **Packet Count**: The total count of packets.

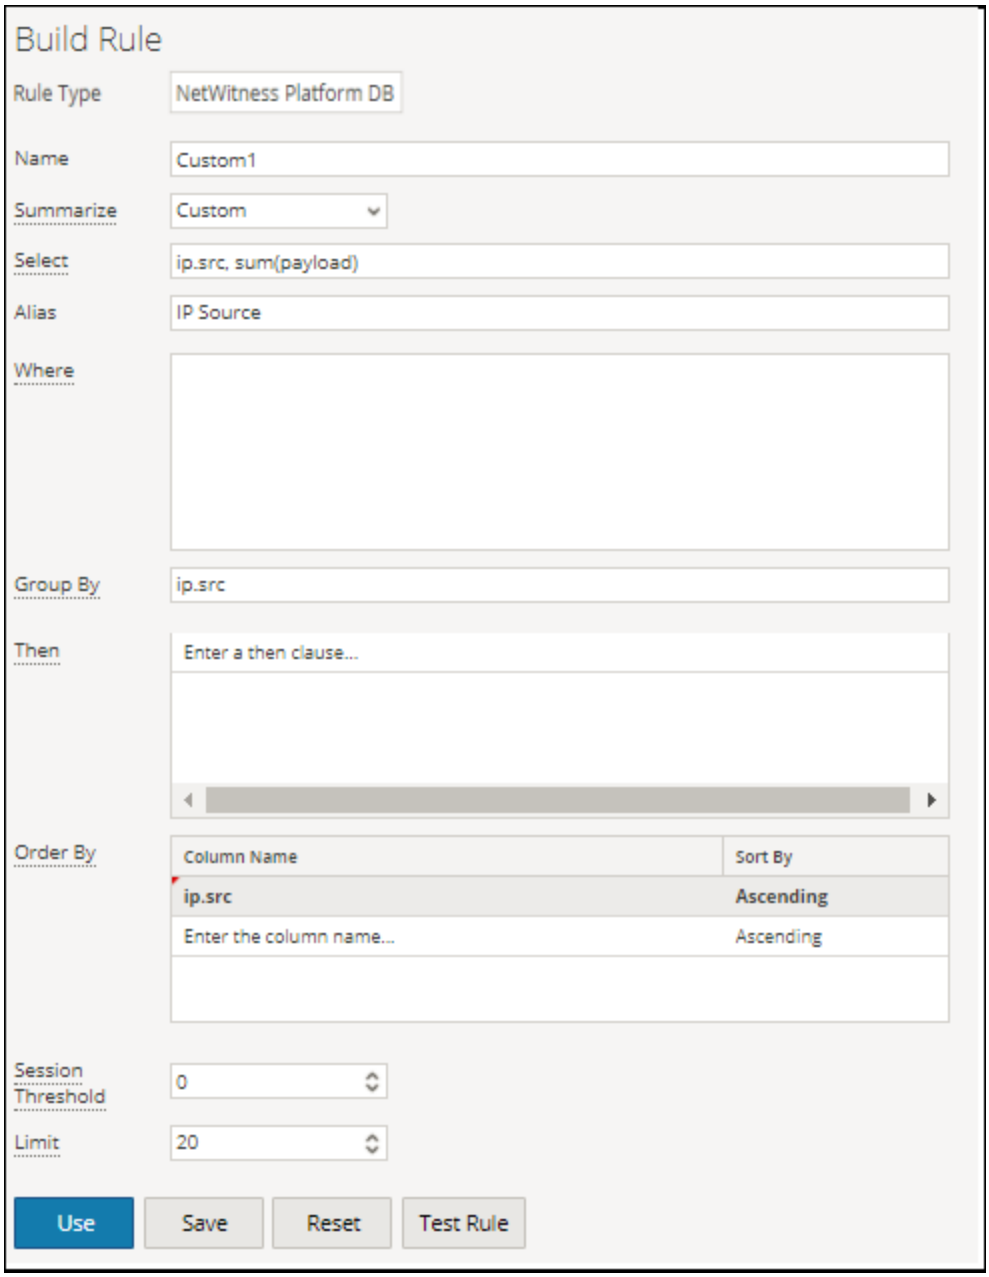
- **Session Size**: The total session size.

These options are listed in 'Summarize' field and any one of them can be selected in a rule.
For example, choose any of the Collection aggregates (Event Count or Packet Count or Session Size) in the 'Summarize' field and select ip.src.

Meta aggregation

With meta aggregation, you can get aggregates of meta values. The following are the supported meta aggregate functions:

- sum(meta)
- count(meta)
- countdistinct(meta)
- min(meta)
- max(meta)
- avg(meta)
- first(meta)
- last(meta)
- len(meta)
- distinct(meta)



Supported Meta Aggregate Functions

The NWDB service supports the following meta aggregate functions and syntax in this release.

Syntax	Function
sum(<meta>)	The sum of all meta values. For example, if you provide the field sum(payload) in the select clause, the resultset is the sum of payload size. **Note:** The meta field chosen for the sum aggregate function must be of numeric data type.
count(<meta>)	The total number of meta fields that would be returned. For example, if you provide the field count(ip.dst) in the select clause, the resultset is the number of times an ip.dst value is returned.
countdistinct (<meta>)	The total number of distinct meta fields that would be returned. For example, if you provide the field countdistinct(ip.dst) in the select clause, the resultset is the number of times a distinct ip.dst value is returned.
min(<meta>)	The minimum of all meta values. For example, if you provide the field min(payload) in the select clause, the resultset is the min of payload size.
max(<meta>)	The maximum of all meta values. For example, if you provide the field max(payload) in the select clause, the resultset is the max of payload size.
avg(<meta>)	The average of all meta values. For example, if you provide the field avg(payload) in the select clause, the resultset is the avg of payload size. **Note:** The meta field chosen for the avg aggregate function must be of numeric data type.

Syntax	Function
first(<meta>)	The first occurrence of the meta value. For example, if you provide the field first(ip.src) in the select clause, the resultset is the first occurrence of ip.src for that group.
last(<meta>)	The last occurrence of the meta value. For example, if you provide the field last(ip.src) in the select clause, the resultset is the last occurrence of ip.src for that group.
len(<meta>)	Converts all field values to a UInt32 length instead of returning the actual value. This length is the number of bytes to store the actual value, not the length of the structure stored in the meta database. For instance, the meta value "NetWitness" returns a length of 10. All IPv4 fields, like ip.src, returns 4 bytes.
distinct (<meta>)	The distinct values of the meta. For example, if you provide the field distinct(ip.src) in the select clause, the resultset is all the distinct ip.src for that group.

You must select 'Custom' in 'Summarize' field and provide the meta and the meta aggregate functions in the select clause.

Note: Meta aggregate functions cannot be used in a WHERE clause and the rule actions like min_threshold/max_threshold can be used to filter aggregate functions. It is advised to use a more refined WHERE clause to get a better rule performance while using 'group by'.

Aggregate Query for Multiple Meta

To execute aggregate query for multiple Meta, follow these steps:

1. Go to **Reports**.

   The Manage tab is highlighted and the **Rules** view is displayed.

2. In the **Rules** toolbar, click + > **NetWitness Platform DB**.

   For example, enter the following meta in the fields highlighted below:

   SELECT: ip.src, service, count(alias.host)
   ALIAS: Source IP Address, Service Type, count(alias.host)
   WHERE: ip.src = 59.96.136.142

   Note: In the alias field you can enter a name for columns used in the select clause. If you do not specify the alias for one of the field in the select clause, then the default description will be used. For example, if the select clause has Field1, Field2, Field3, Field4, and alias has only Field1, Field3, Field4, then for Field2 a default description is used.

3. Click the **Test Rule** button at the bottom of the screen.

   The Test Rule page is displayed.

Summarize

Summarize determines the type of summarization or aggregation for the rule.

Name	Config Value
Summarize	To query metas without any custom grouping, select: • **None**: The data is grouped by session in this case. To get collection (sessions/events/packets) related aggregates, select either of the following: • **EventCount**: The total count of events. • **Packet Count**: The total count of packets. • **Session size**: The total session size. To get meta based aggregates, select: • **Custom**: This indicates that expected meta aggregate function is defined in rule select clause.

Order By

Order By determines how to sort the result set.

Name	Configuration Value
Column Name	The **Column Name** is the name of the columns by which you want to sort the results. By default, the value is empty. When you click on a column, the value gets populated based on the Summarize field. • For 'None' and 'Custom', the value gets populated based on the entries made in the Select field. You can select from this list or add custom name. • For Event Count, Packet Count and Session size, accepted values are Total and Value. • Total - sort by aggregate value • Value - sort by group by meta
Sort By	**Sort By** determines the order in which you want to sort the results. The following are the values: • Ascending Order • Descending Order

Session Threshold

The session threshold is the optimization setting to stop scanning the matching sessions for each possible unique value for the selected meta. The threshold is an integer between 0 (default) and 2147483647. The threshold 0 scans for all matching sessions.

Note: If you provide a non-zero value (a value higher than zero), the aggregate results are inaccurate. This can be used only when you are interested in unique values and not aggregate values.

Supported where Clause

Syntax	Description
where <field1> [<field-operator>] < value1>,<value2>,<value3-value4> <logic-operator> <field2>,and so on	The where clause is a comma separated list of language field values and ranges that is used by NwValues function. In the where clause, string values have to be enclosed within single quotes. For example, where username = 'admin' && service = 22.
where <field1> [<field-operator>] <List1>	You can use a list in the where clause if you have multiple values to report on. For example, where ip.src exists && alias.host exists && alias.host contains $[User Reports/List of Alias Host]. When you use the list you must specify in the format $[<path>/<List name>].

In the where clause, make sure the syntax is correct based on the meta type.
For example,
For all text meta type use quotes for example, username = ‘user1’.
For all IP Addresses, Ethernet Addresses, and Numeric meta types do not use quotes for example, service = 80 && ip.src = 192.168.1.1.
For date and time meta types, if the date and time format is 'YYYY-MM-DD HH:MM:SS‘, use quotes.
If the date and time format is 1448034064 (number of seconds since EPOCH (Jan 1, 1970)), do no use quotes.

Note: If list is used in the rule, make sure that the list values are quoted or unquoted based on the type of the meta used. Checking the **Quotes will be inserted for all the values** checkbox in list definition page (for more information see, "Create Lists or List Groups" section in Configure a Rule) would quote all the list values.

Supported where Clause Operators

Syntax	Description
=	Returns results where the field is equal to any provided value. For example, tcp.dstport = 21-25,110 returns session with TCP destination ports of 21, 22, 23, 24, 25, or 110.
!=	Returns results for fields that do not match the values specified. For example, eth.type !=0x0800 returns sessions outside of hex value (decimal value of 2048) that is all non-IP based protocols.
begins	Checks for a value at the beginning of a text or binary field.
contains	Searches a text or binary value for a partial match.
ends	Checks for a value at the end of a text or binary field.
exists	If the field value exists, regardless of value, the operation evaluates to true.
!exists	If the field value does not exist, the operation evaluates to true.
length	Evaluates the length of the field. For example, username length 20-u returns any username that is 20 or more characters long.

Syntax	Description
regex	Performs a regular expression search against text or binary values.
not	Not operator is used to negate a clause or condition. For example, (not(user.dst ends "$")) will not display values for user destination.

Supported then Clause

Syntax	Description
then <rule action>	The then clause contains a rule action that manipulates the original result set of a rule in order to make the output in a report more concrete or add additional functionality other than querying data and displaying it. For example, dedup (filename).

Limit field

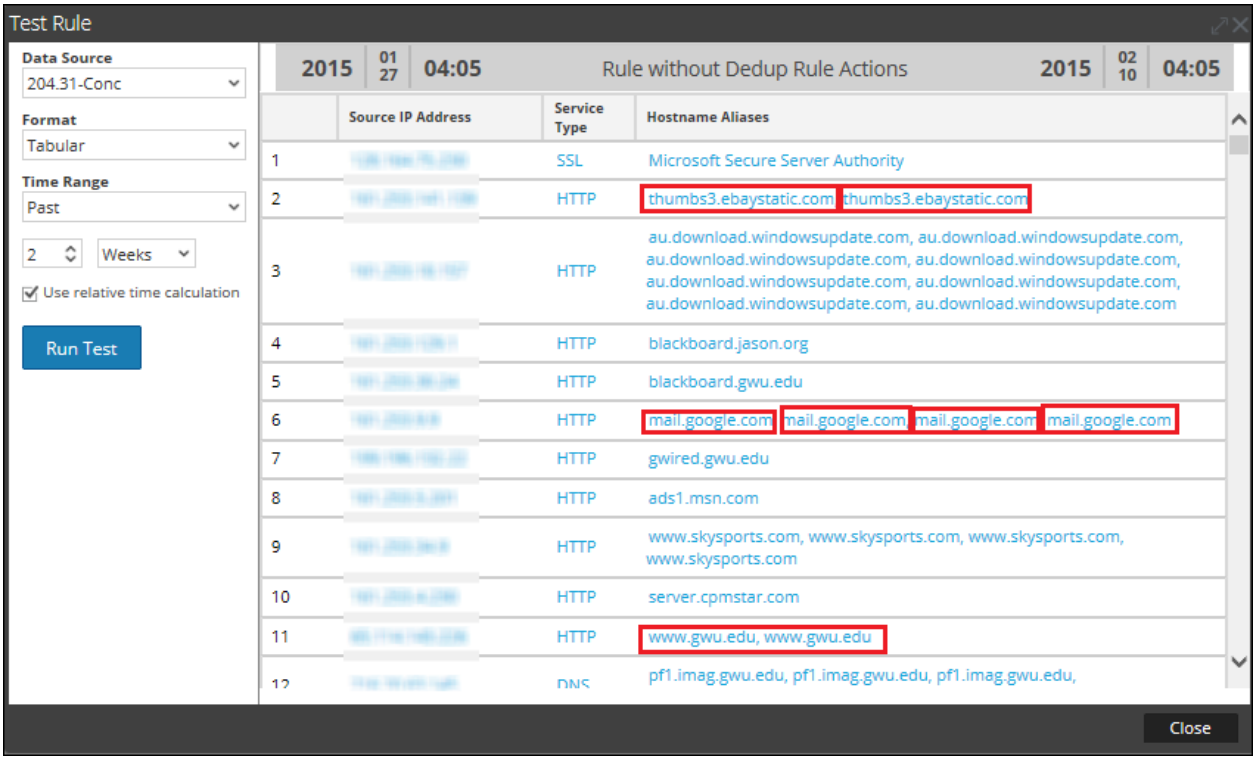
This indicates the limit to be put on the query while fetching data from the database. If a result set is sorted by event
count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not
sorted, the first N values are returned.

Rule Actions

The NWDB data source rule syntax supports the following rule actions:

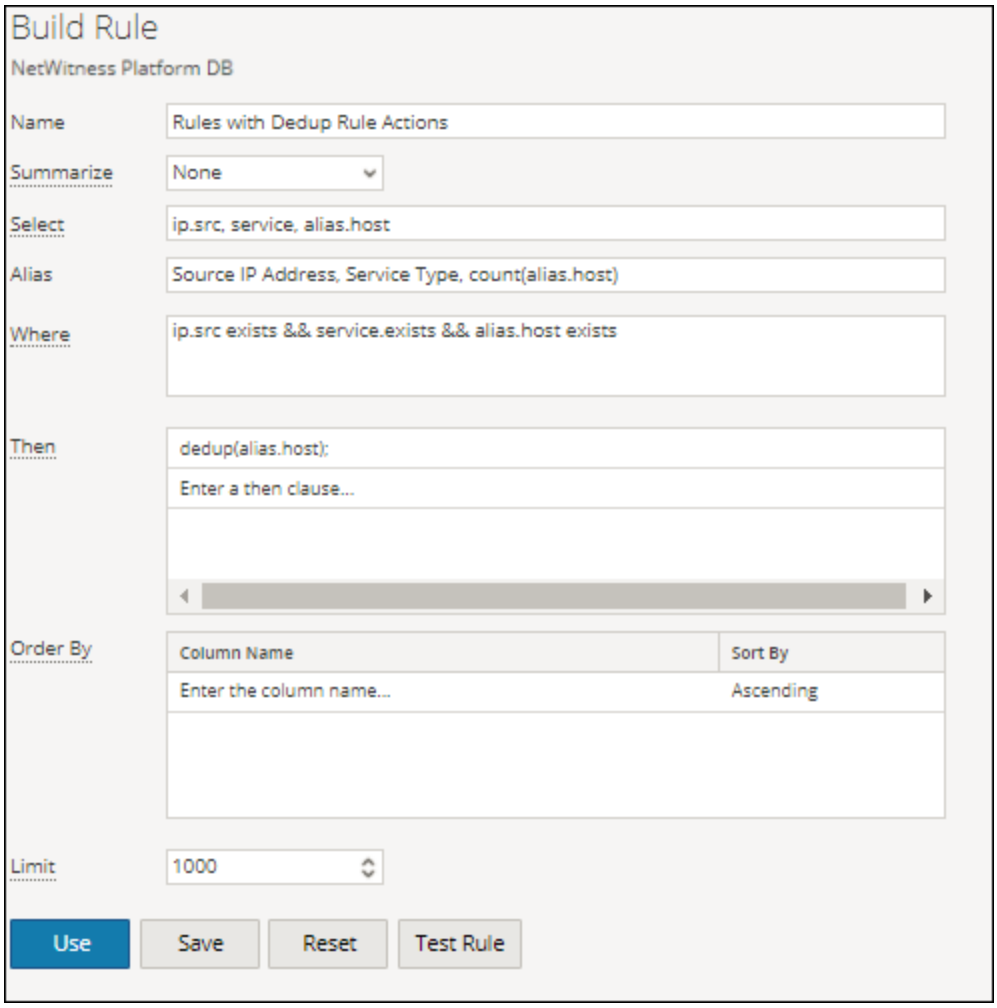
- dedup
- filter_on
- filter_out
- lookup_and_add
- max_threshold
- min_threshold
- regex
- sum_count
- sum_values
- show_whats_new

dedup (string field)



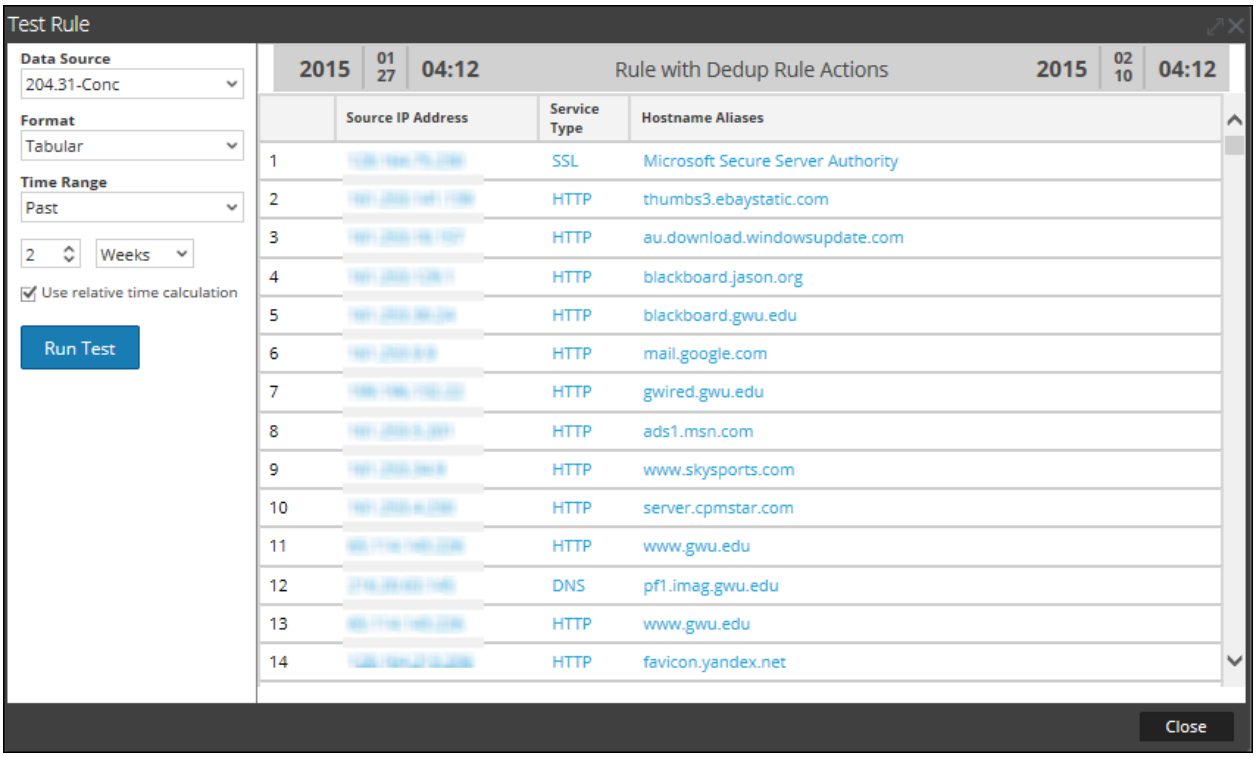
dedup removes the duplicate entries in an unsorted result set and displays only pertinent data.
The dedup rule action removes duplicate entries of a specific field in the report, so that only the first occurrence of that value is listed in the report.

Note: The dedup rule action cannot be used with an aggregate rule.



For example, the meta data generated by an individual session is often repetitive, especially when you have sessions with a lot of DNS lookups or web sessions that access the same host multiple times for various resources (such as, javascript, css). To remove the duplicate entries of the host, you can use the dedup rule action.

Example:



The following example is a lengthy result set that can be trimmed by removing the duplicate values in the same session.

The following figure shows the use of dedup rule action to remove the duplicate entries from the result set.

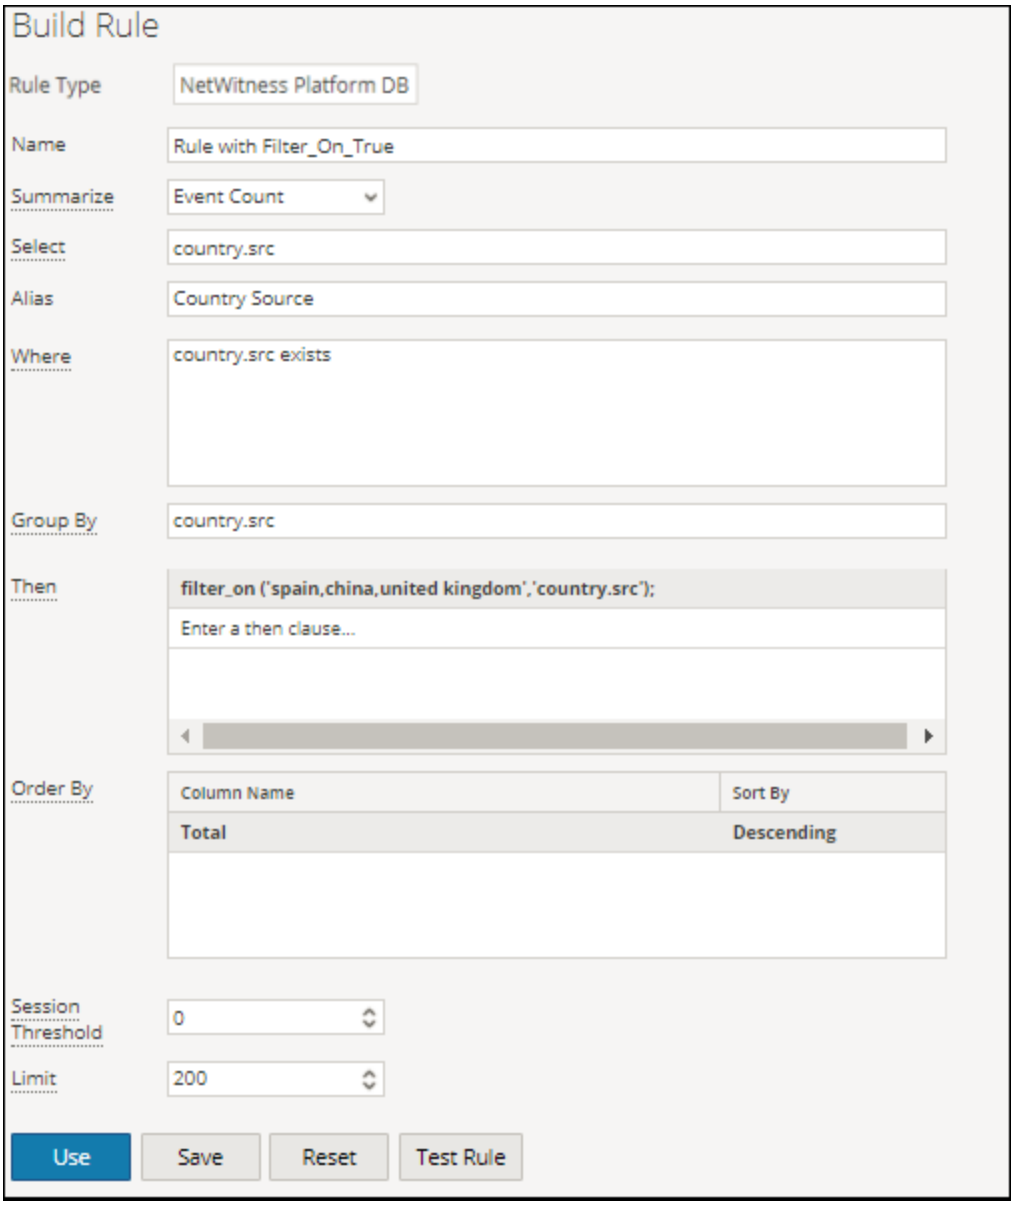
The duplicate value for each entry in the rule result set is reduced to one value.

filter_on (string filter, string field, bool matchExact)

`filter_on` removes values that do not contain the `filter` criteria from the result set. If the result set contains multiple fields, you must select a specific field to which the filter is applied. To add additional results to a single result set, include function such as lookup_and_add.

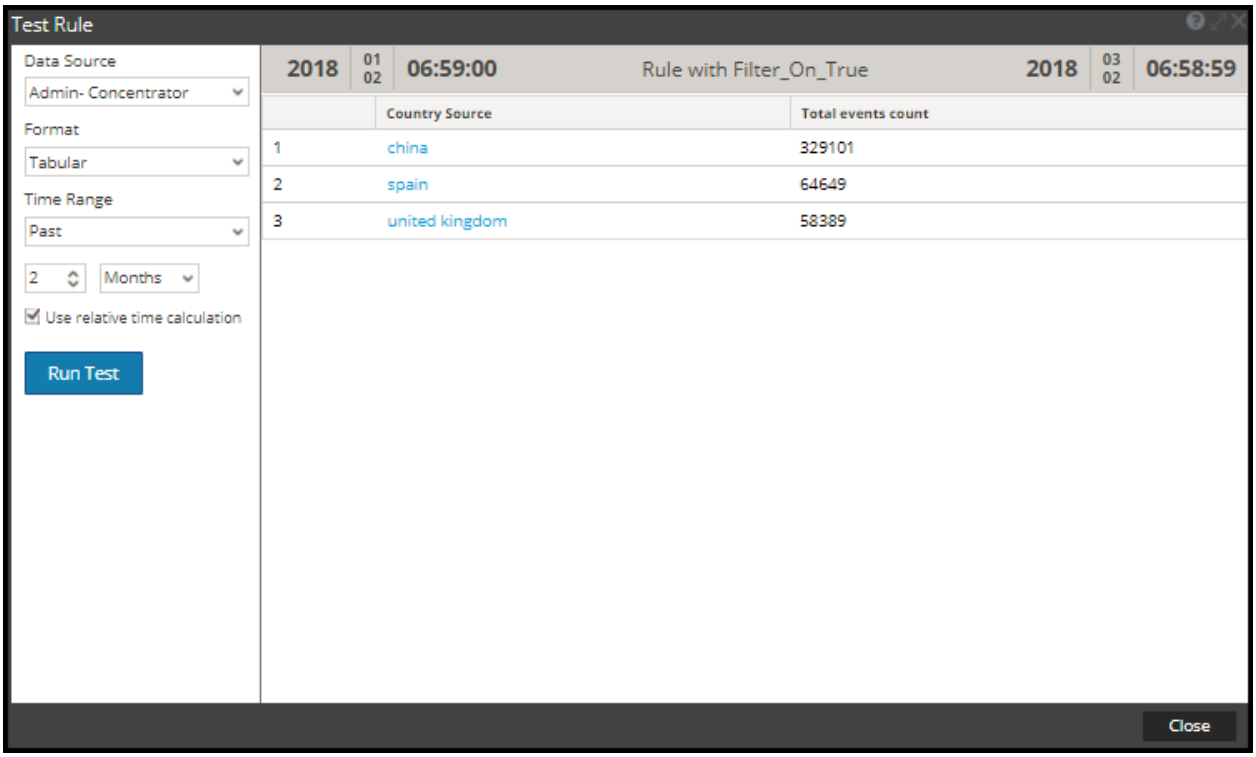
The matchExact parameter determines if the match is an exact match or contains a match.

- If matchExact is set to `false`, any value that contains the filter text is considered a match.
- If matchExact is set to `true`, only values that match the provided filter text is included in the result set.



Note: Unless the matchExact parameter is specified, the default behavior of the rule action is to match exactly the text specified in the filter parameter. To specify that results containing the filter text must be kept in the result set, users must set the matchExact parameter to false.

Example:



The following figure displays the list of countries and their event count.

The following figure shows a filter_on rule action to filter out countries except Spain, China, United States and United Kingdom from the result set.

The following figure shows the output with the filter_on rule action.

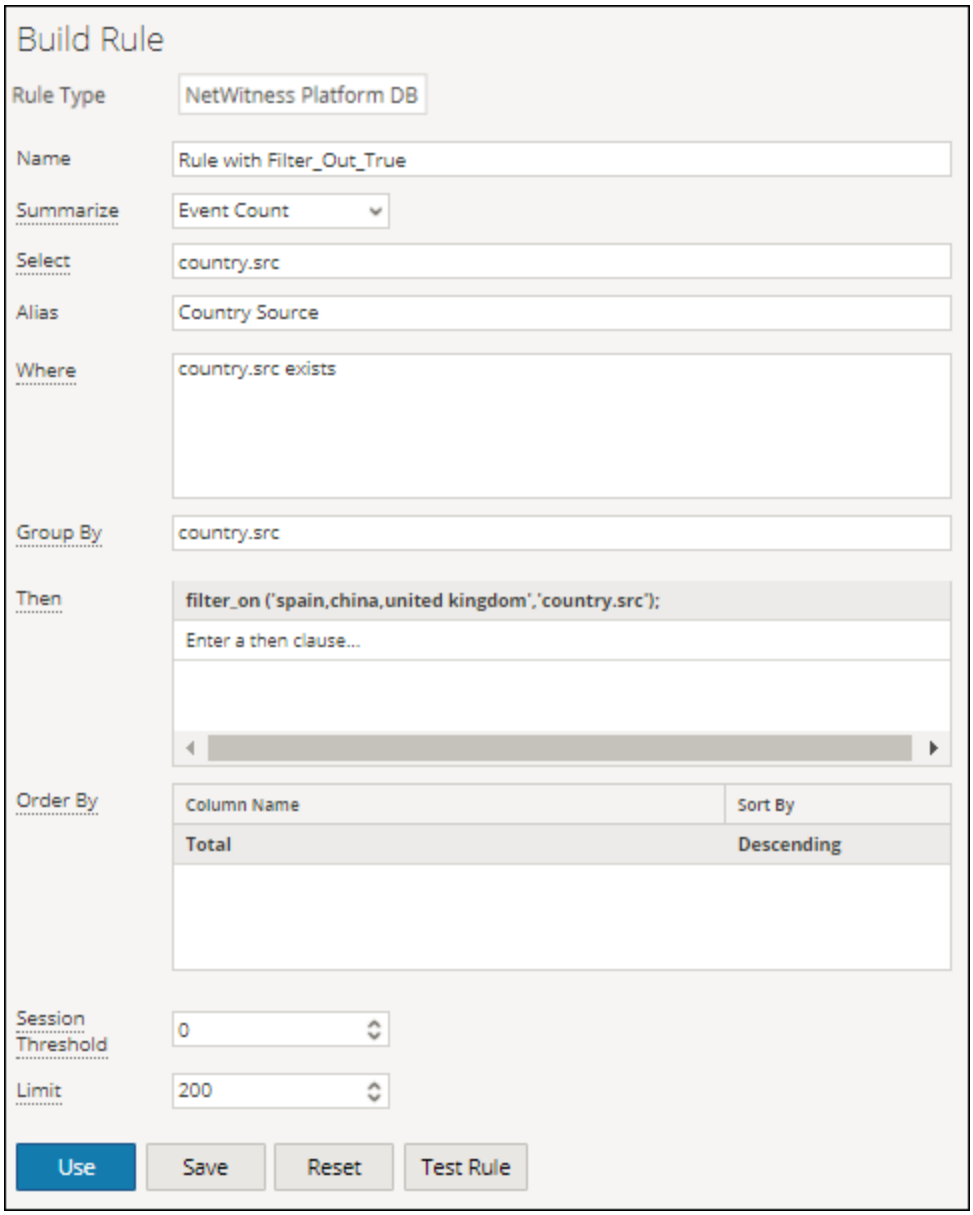
Another way of filtering out the entries from the result set is to create a list of variables which you want to filter out. For example, you can create a list with United Kingdom, France and Germany as values in the list. You can use this list in the rule action to get the same result set. For example, if you create a list called COUNTRY_LIST, you can use the list as follows:

```
filter_on ('$COUNTRY_LIST', 'country.src', 'false');
filter_out (string filter, string field)
filter_out (string filter, string field, bool matchExact)
```

filter_out removes the values that contain the *filter* criteria from the result set. If the result set contains multiple fields, you must select a specific field to which the filter is applied (for example, you can use a lookup_and_add to add results to a single result set).

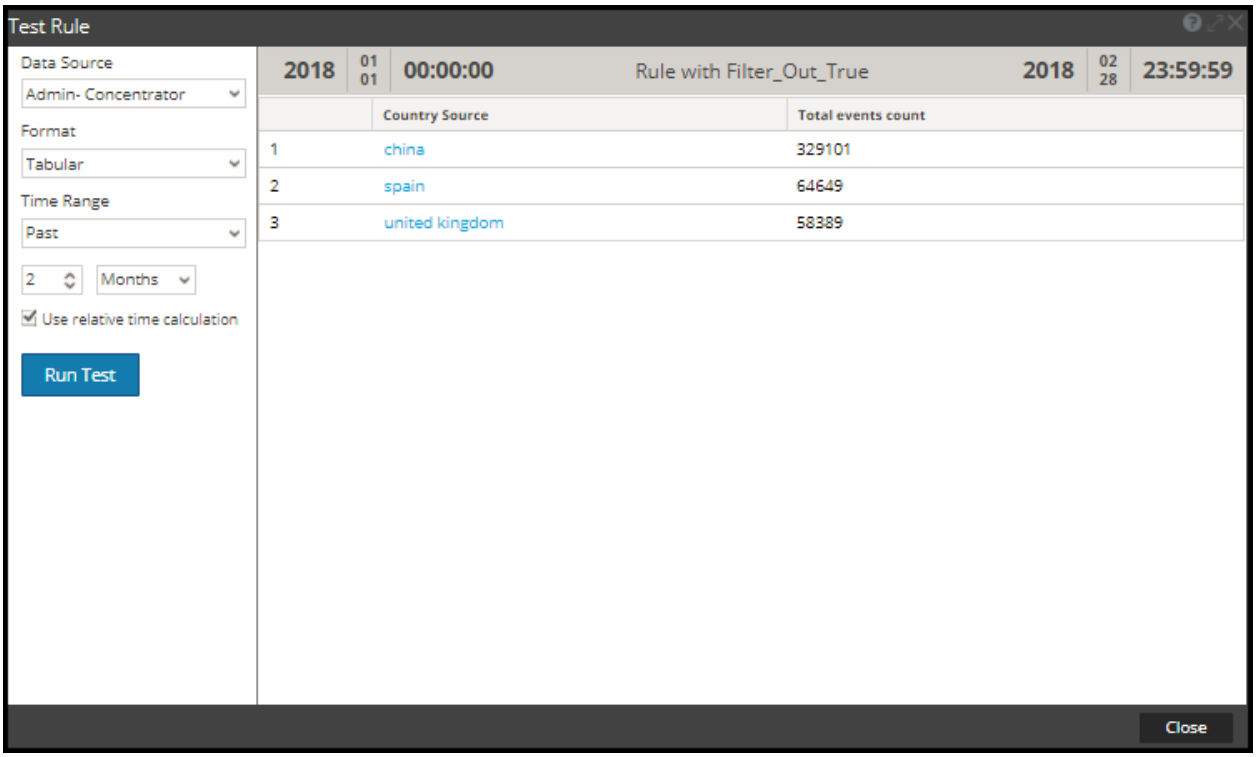
The matchExact parameter determines if the match is an exact match or contains a match.

- If matchExact is set to false, any value that contains the filter text is considered a match.
- If matchExact is set to true, only values that match the provided filter text is excluded from the result set.



Note: Unless the `matchExact` parameter is specified, the default behavior of the rule action is to match exactly the text specified in the filter parameter. To specify that results containing the filter text must be removed from the result set, users must set the `matchExact` parameter to false.

Example:



The following figure displays the list of countries and their event count.

The following figure shows the filter_out rule action to remove the event count for Spain, China, United States and United Kingdom from the result set.

The following figure shows the output with the filter_out rule action.

```
lookup_and_add (string select, string field)
lookup_and_add (string select, string field, int limit)
lookup_and_add (string select, string field, int limit, boolean inherit)
lookup_and_add (string select, string field, int limit, boolean inherit, string extraWhere)
lookup_and_add(string select, string field, int limit, boolean inherit, string extraWhere, boolean aggregate)
```

This rule action iterates through a list of values in a result set and lookup additional meta data to further describe the relationships between various elements in a result set.

Note: The lookup_and_add rule action can be used only with an aggregate rule.

The first parameter, select, designates the type of meta data that must be added to elements of the result set. The second parameter, field, specifies where in the result set the append must apply to. Also, a limit can be applied to avoid crowding the result set with a large result set.

By default, subsequent queries to the SDK will inherit the where clause of the parent rule. To use a unique where clause, you can specify a boolean value in the fourth parameter as false and in the fifth parameter you can specify a different where clause.

Note: If you are using a unique where clause in your query, make sure that you use a single quote (') for enclosing arguments and double quotes (") for string values.

Now, with the addition of **Custom** summarization and **Group By** feature, the result can be achieved even without having lookup_and_add rule action. The new rule syntax with groupby displays the result in a flat structure which is better than the earlier rule syntax without groupby Hence it is recommended to manually edit/update rules with lookup_and_add rule action and use groupby clause wherever it is applicable.

Note: Lookup_And_Add rule action is supported only if the SELECT clause has one meta and aggregate function.

For example, see below scenarios: In Example **2a**, lookup_and_add rule action is used. Instead of using lookup_and_add rule action, the same result can be achieved by using **Custom** summarization and **Group By** feature. See Example **2b** below.

But, lookup_and_add rule action is still supported for NWDB rules on the following conditions:

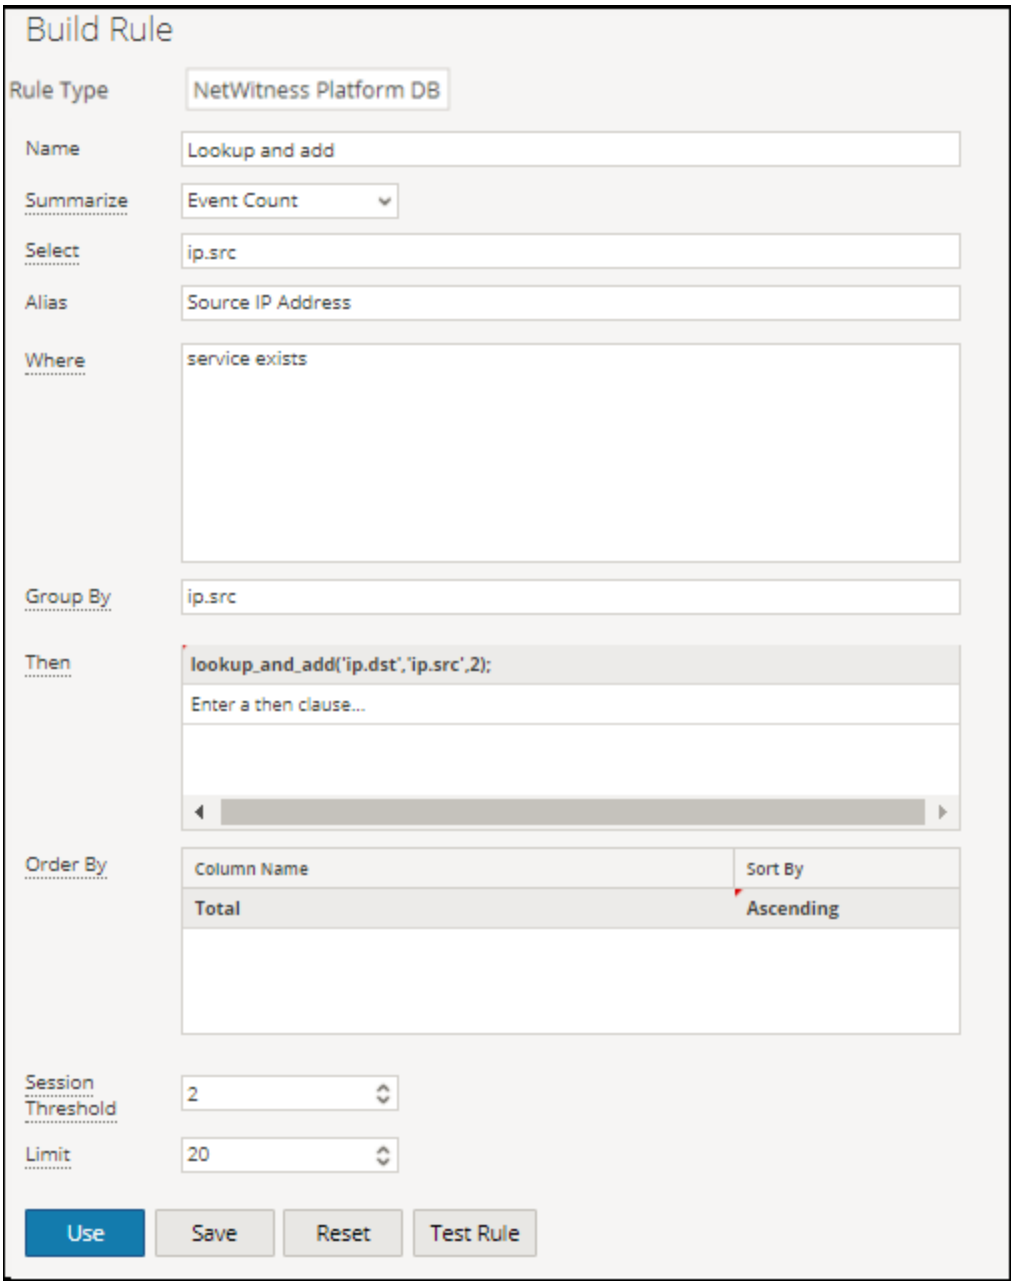
- All versions of NWDB rules with Summarization as Event Count, Packet Count, or Session Size.
- For Custom summarization, the lookup_and_add rule must have only one group by meta with only one aggregate function where the aggregate function must be either sum() or count().

Note: It is not supported for “Summarize-None”.

For example, lookup_and_add rule action can be used for the following rules:

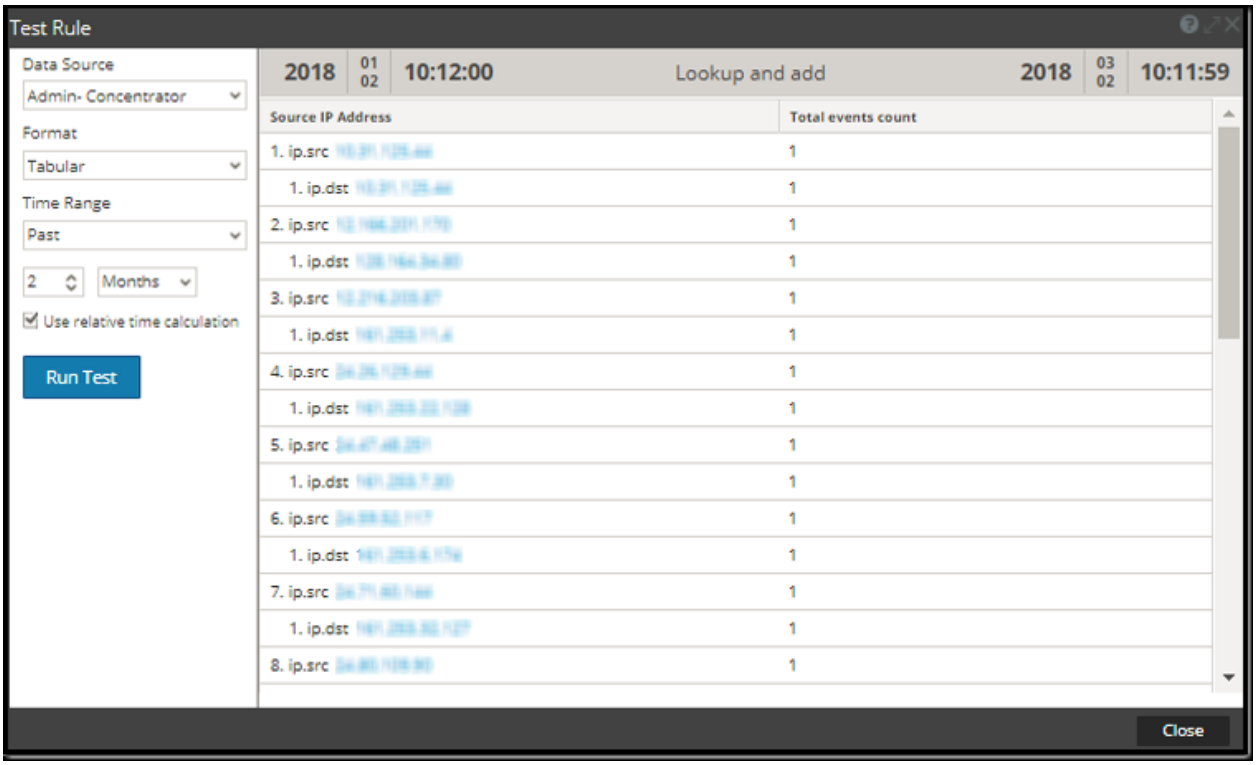
- select ip.src, sum(size) group by ip.src
- select ip.src, count(filename) group by ip.src

It cannot be used for the following rules:



- select ip.src, sum(size),count(filename) group by ip.src
- select ip.src, sum(size),avg(size) group by ip.src
- select ip.src,ip.dst count(filename) group by ip.src,ip.dst

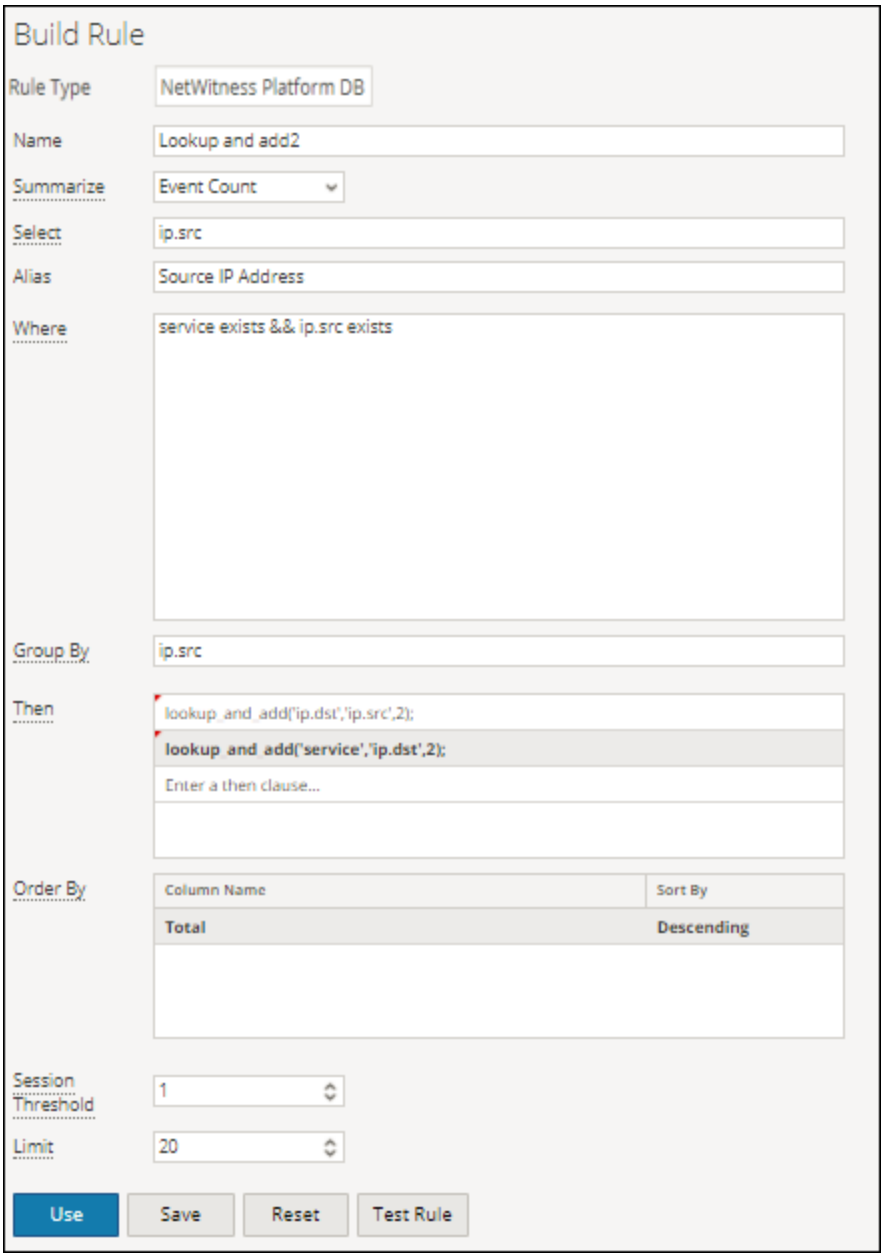
Examples:



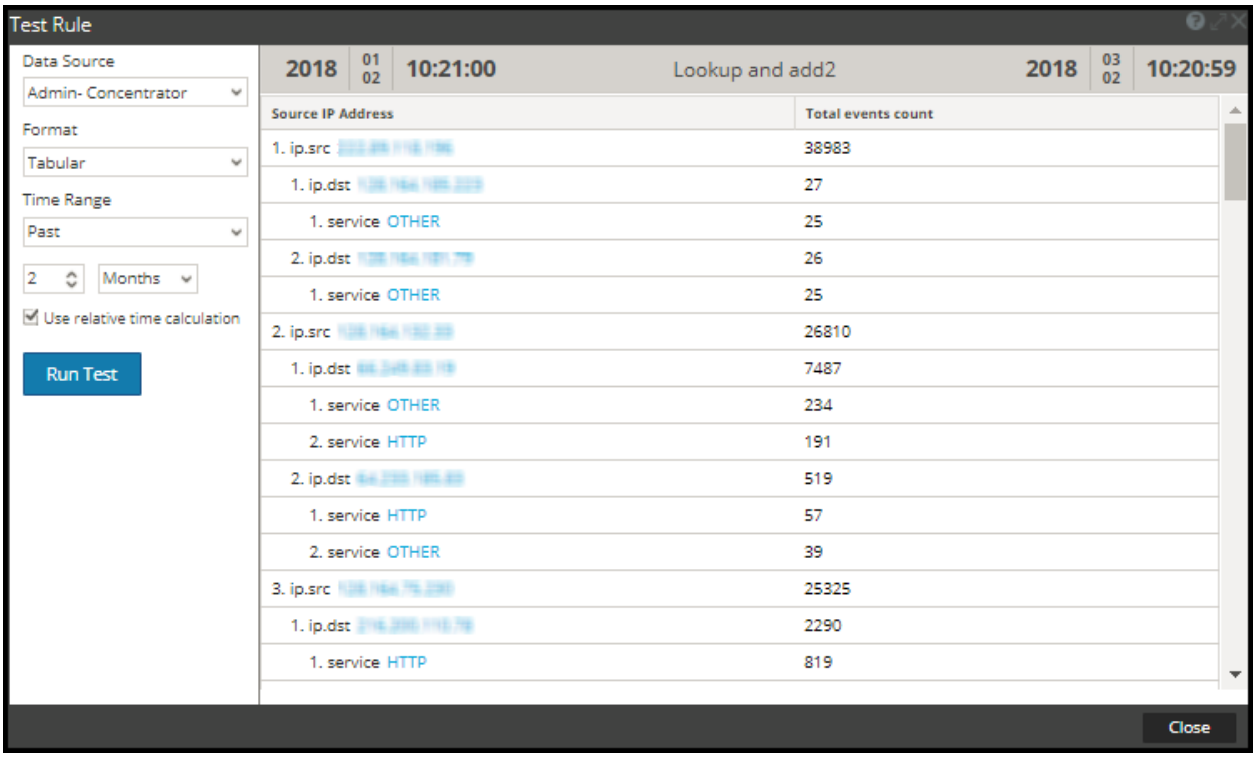
1. lookup_and_add('ip.dst','ip.src', 2);

This rule action would iterate through each ip.src in the initial result set and lookup the top two destination IP addresses with each ip.src.

The following figure shows the rule definition.



The following figure shows the result set containing the source IP addresses and the top two destination IP addresses with each ip.src.

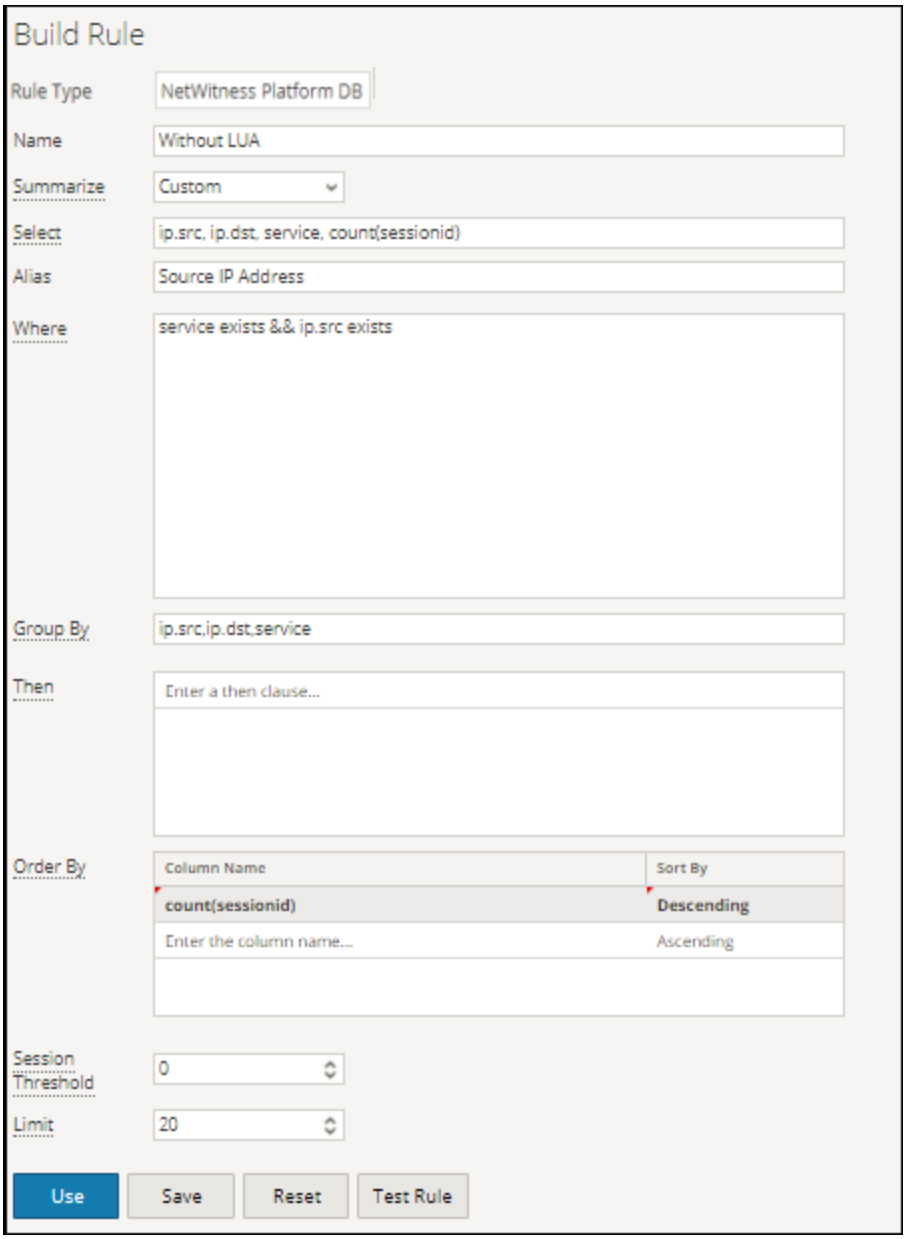


2a. lookup_and_add('ip.dst','ip.src', 2); lookup_and_add('service','ip.src', 3);

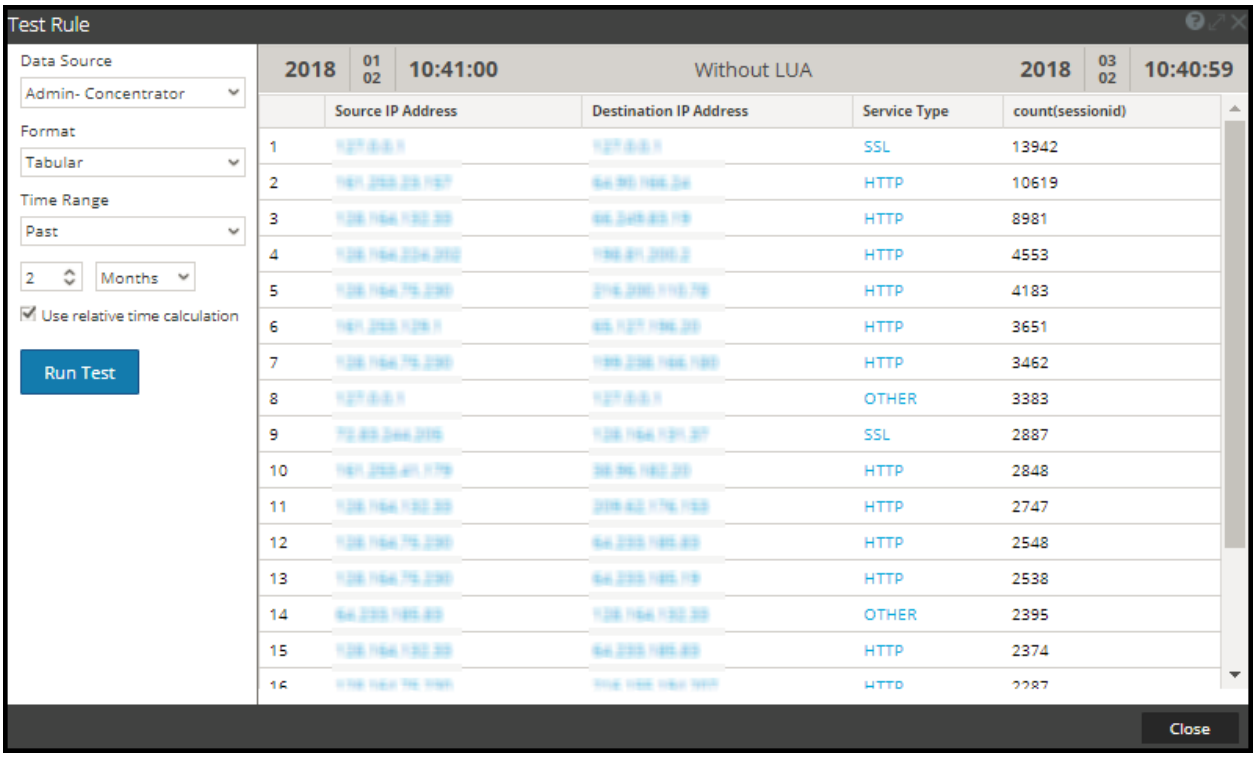
This rule action would iterate through each ip.src in the initial result set and lookup the top two destination IP addresses with each ip.src and the top three ports used by each ip.src.

The following figure shows the rule definition.

The following figure shows the result set containing the source IP addresses and the top two destination IP addresses with each ip.src and the top three ports used by each ip.src.



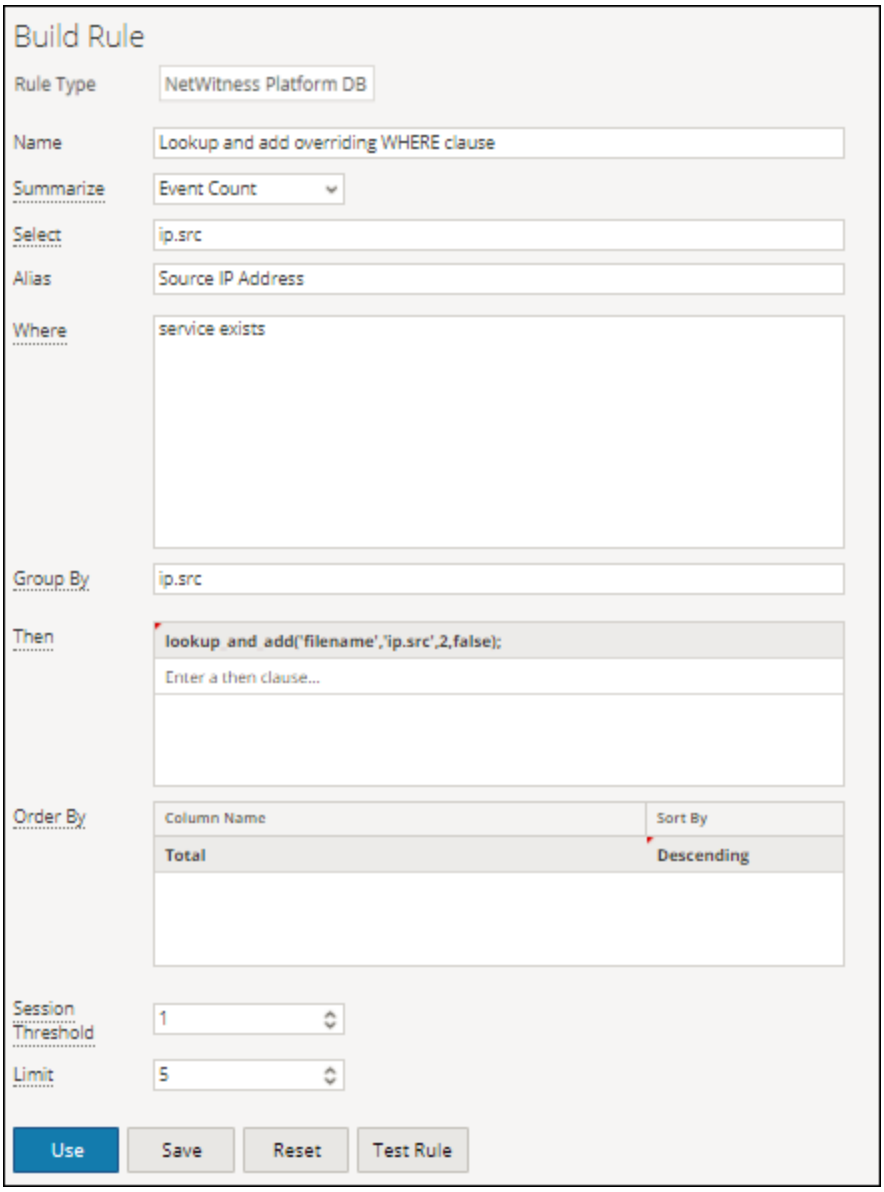
You can make the query as complex as you want by selecting different fields in the result set and by appending to different parts. For example, you may want to know what files each source IP had touched. However, because the parent rule has a WHERE clause of service = 6667 and the default behavior of this rule action is to append to the original WHERE clause, it becomes necessary to override the parent WHERE clause. The easiest way to understand this concept is to look at the previous lookup_ and_add call lookup_and_add('ip.dst','ip.src',2). The actual query that is sent to the server is SELECT ip.dst WHERE service = 6667 &&ip.src = 206.42.199.194. In order to force the WHERE clause to override the service = 6667 portion of the WHERE clause (inherited from the parent rule), the user can specify a 4th parameter of false as shown in example 3.



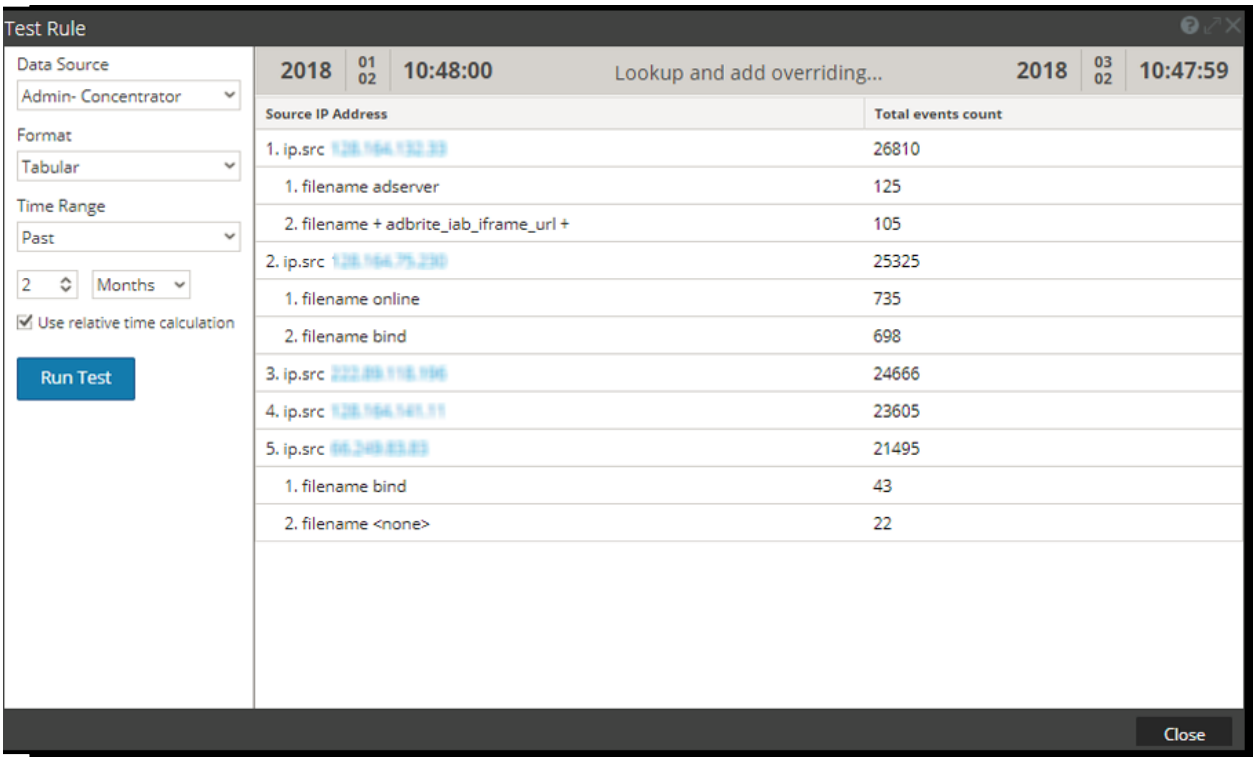
2b. Without Lookup_and_add Rule

This rule uses the Custom summarization and Group By feature to sort the results.

The following figure shows the rule definition.



The following figure shows the result set containing the source IP addresses and the top two destination IP addresses with each ip.src and the top three ports used by each ip.src.

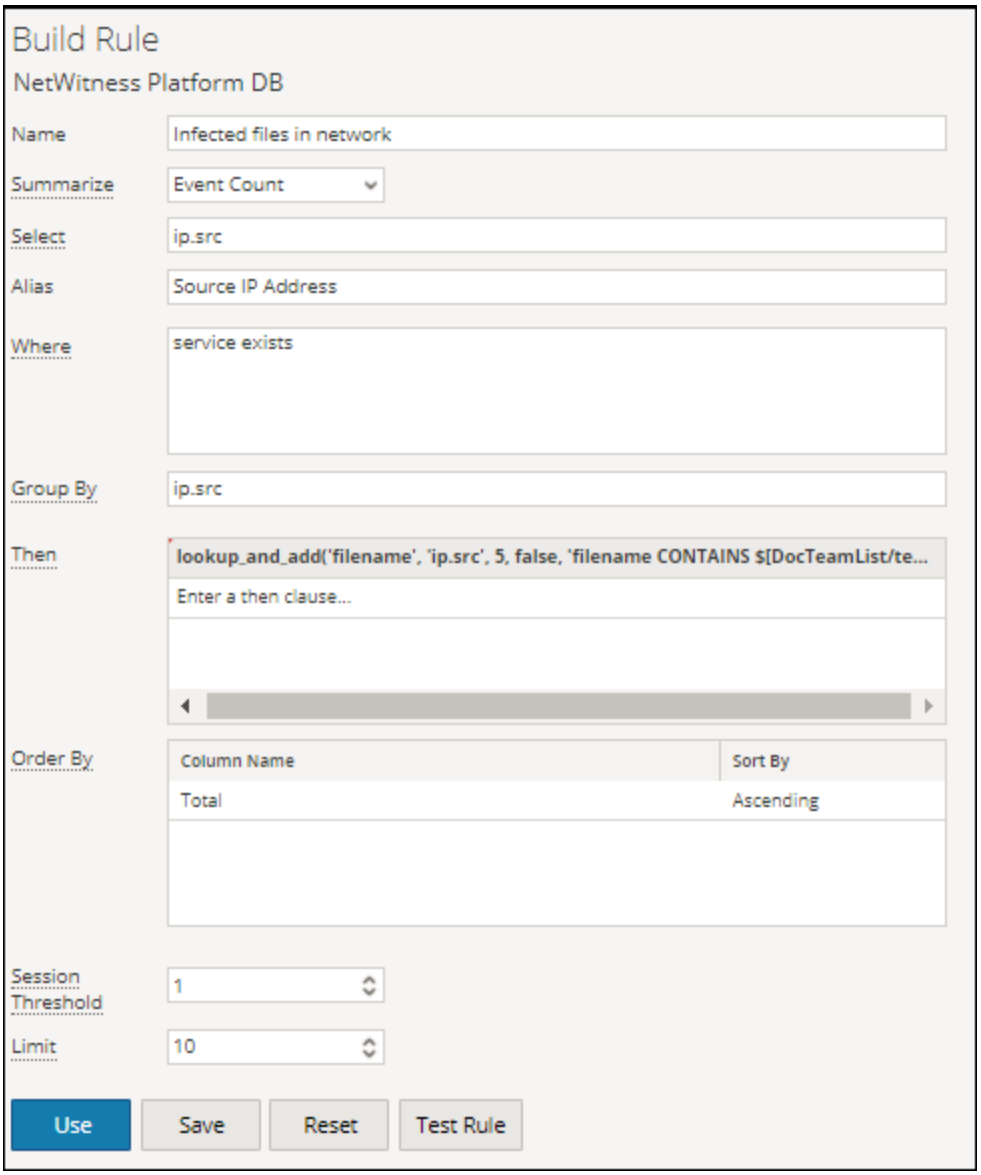


3. lookup_and_add('filename', 'ip.src', 2, false);

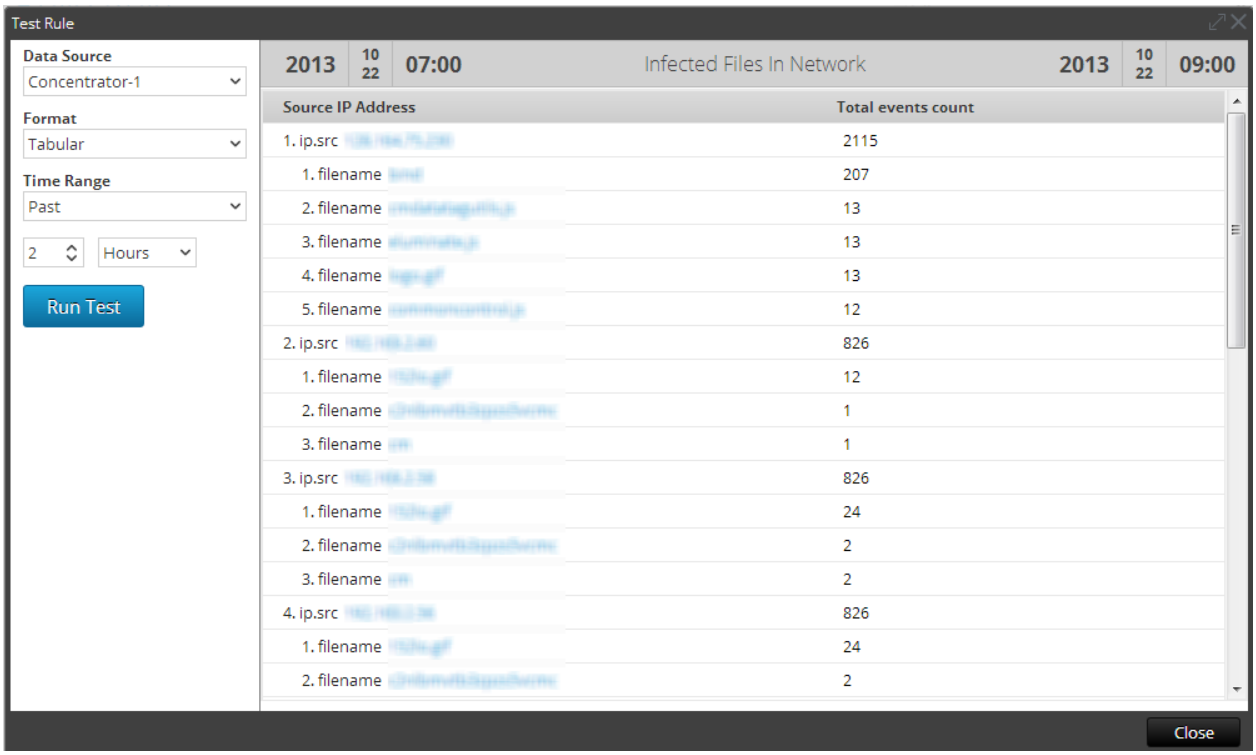
This call would issue a query to the server, like `SELECT filename WHERE ip.src = 90.0.0.142` rather than `SELECT filename WHERE service = 6667' && ip.src = 90.0.0.142` because you have specified the rule action to ignore the initial `WHERE` clause of the parent rule.

The following figure shows the rule definition.

The following figure shows the result set.



The test list is in a group name netwitness, you can access that list with the following syntax.

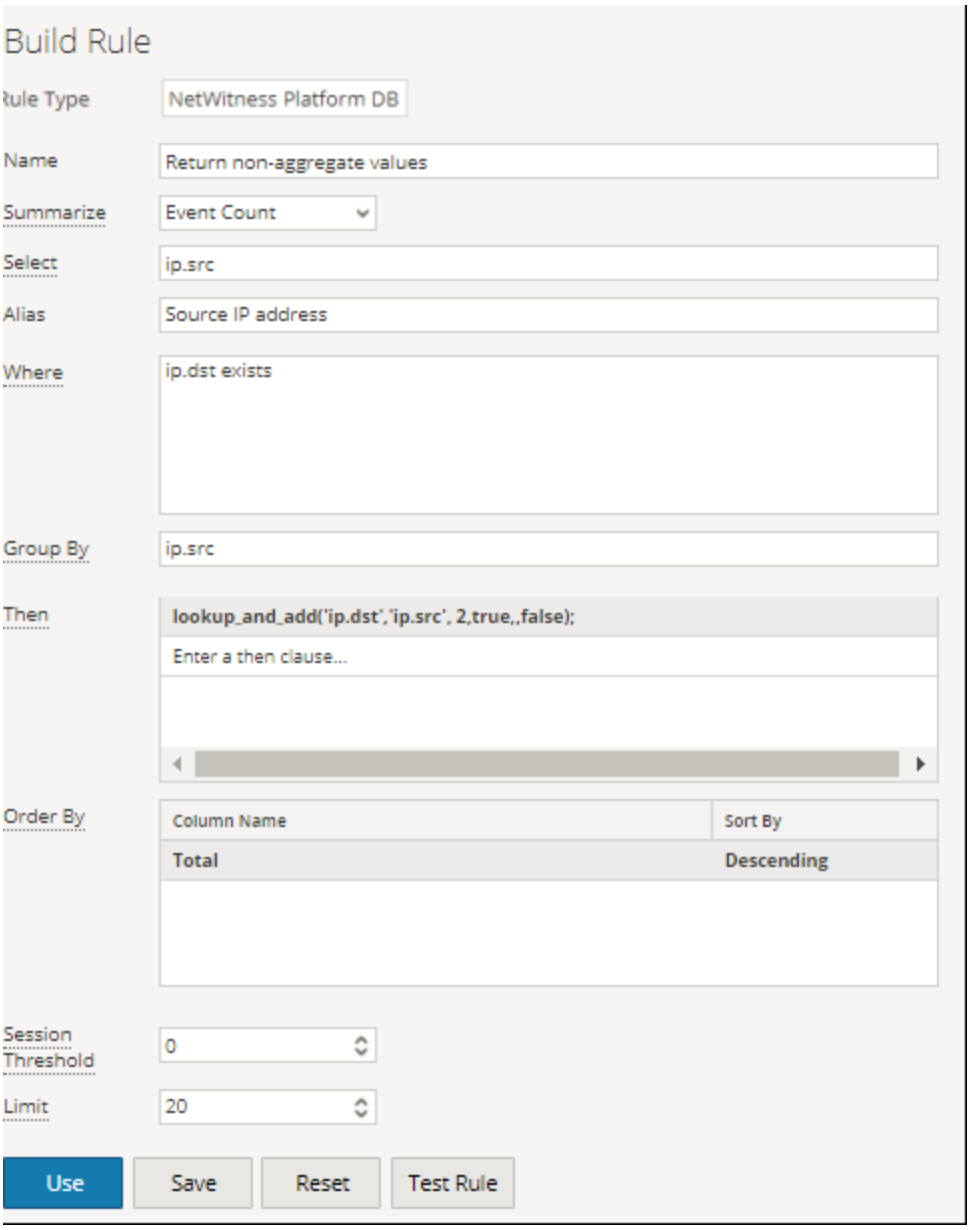


You can even narrow down these appended results even further to only include filenames that have .gif as filename extension by using the fifth parameter in the rule action. The fifth parameter allows you to specify additional WHERE clause criteria. The files with .gif filename extension would be stored in the **test** list within a group named **DocTeamList**. You can access this list with the following syntax: threat.source = $[DocTeamList/test]
This can be referenced in the extra where clause parameter in the following manner:

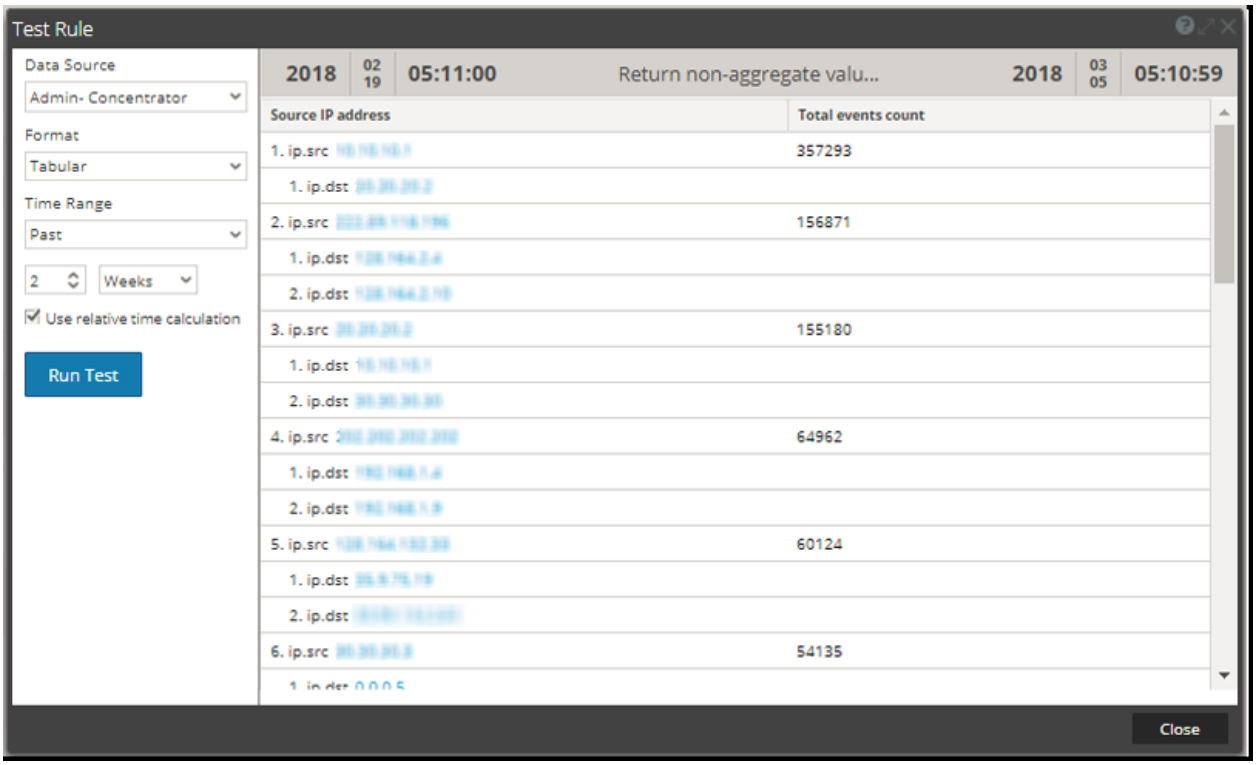
4. lookup_and_add('filename', 'ip.src', 5, false, 'filename CONTAINS $[DocTeamList/test]');

The following figure shows the rule definition.

The following figure shows the result set.



5. lookup_and_add('ip.dst','ip.src', 2,true,,false);



This rule action would iterate through each ip.src in the initial result set and lookup the top two destination IP addresses with each ip.src. The 'aggregate' parameter is set to 'false', this implies that aggregates would be skipped for lookup values and hence the lookup query executions will complete faster.

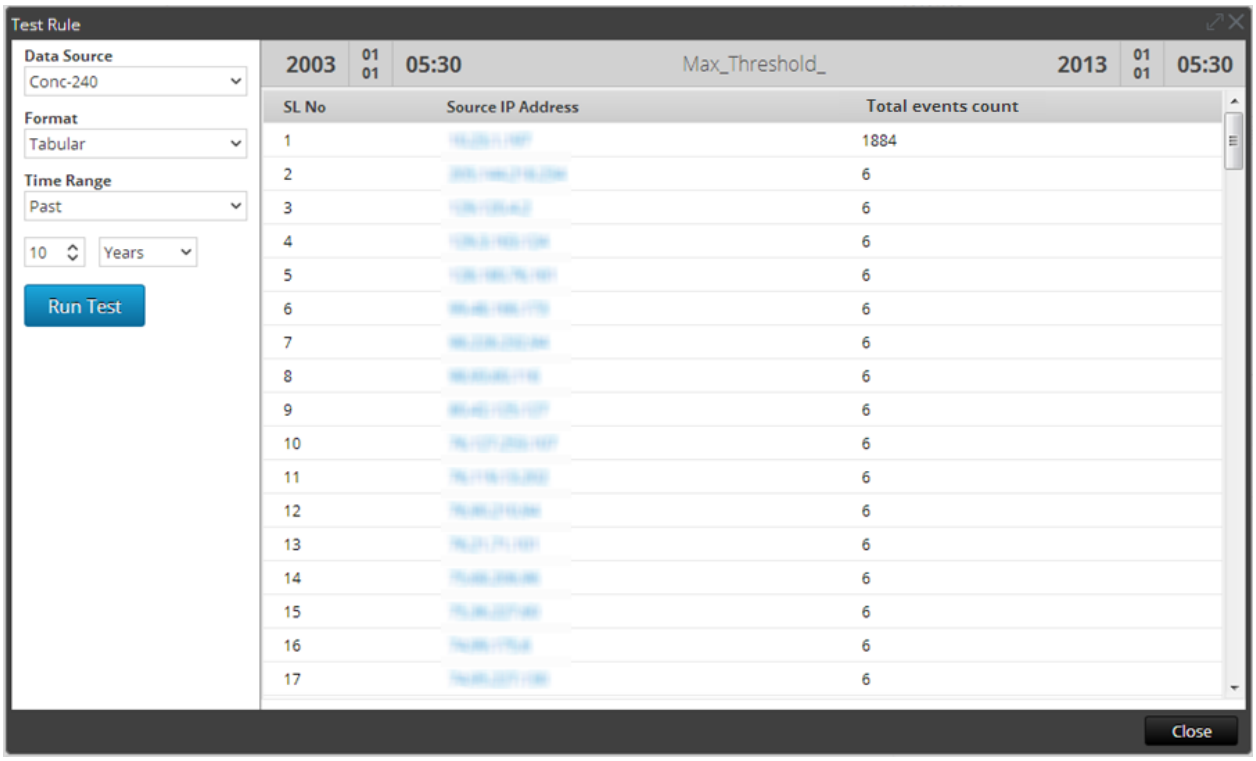
Note:
The default value for 'aggregate' is 'true'. When 'aggregate' is set to 'false', Reporting Engine passes threshold=1, Sort by='value' and Order=Ascending to NWDB to make lookup queries run faster.
. You must set the 'aggregate' to false, when rule contains aggregate functions or when the rule is run against a wide time range. This helps the rule to complete the execution faster.

The following figure shows the rule definition.

The following figure shows the result set.

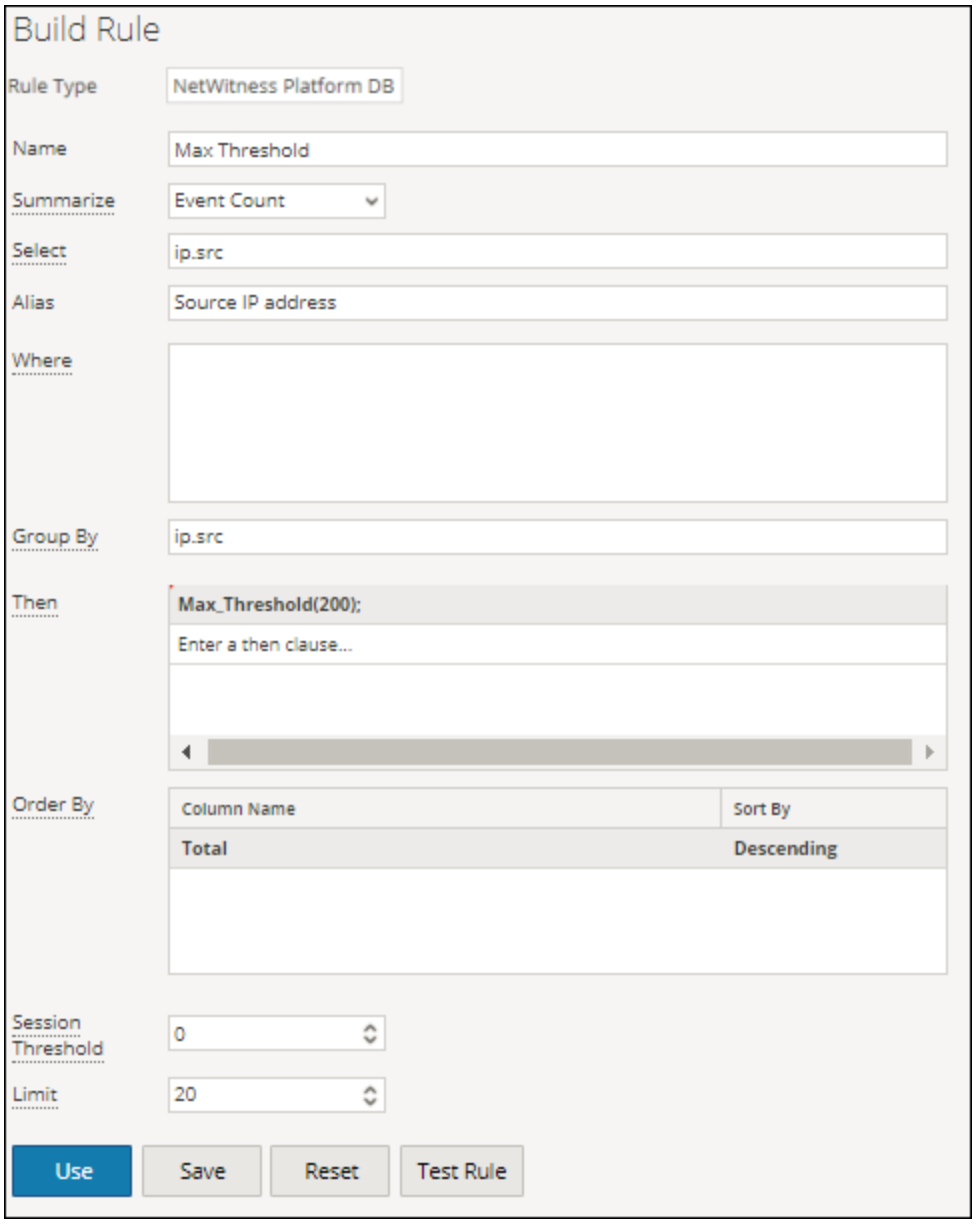
```
max_threshold (string quantity)
max_threshold (string quantity, string field)
```

max_threshold removes any results with a quantity that is larger than the maximum threshold quantity from a result set. The quantity can either be in terms of count or size and it is relative to the sorting options of the parent rule. This means that if you sort a rule by size, the rule action expects you to specify the parameter in bytes (you can append KB, MB, GB, TB to the parameter to make size conversion easier).



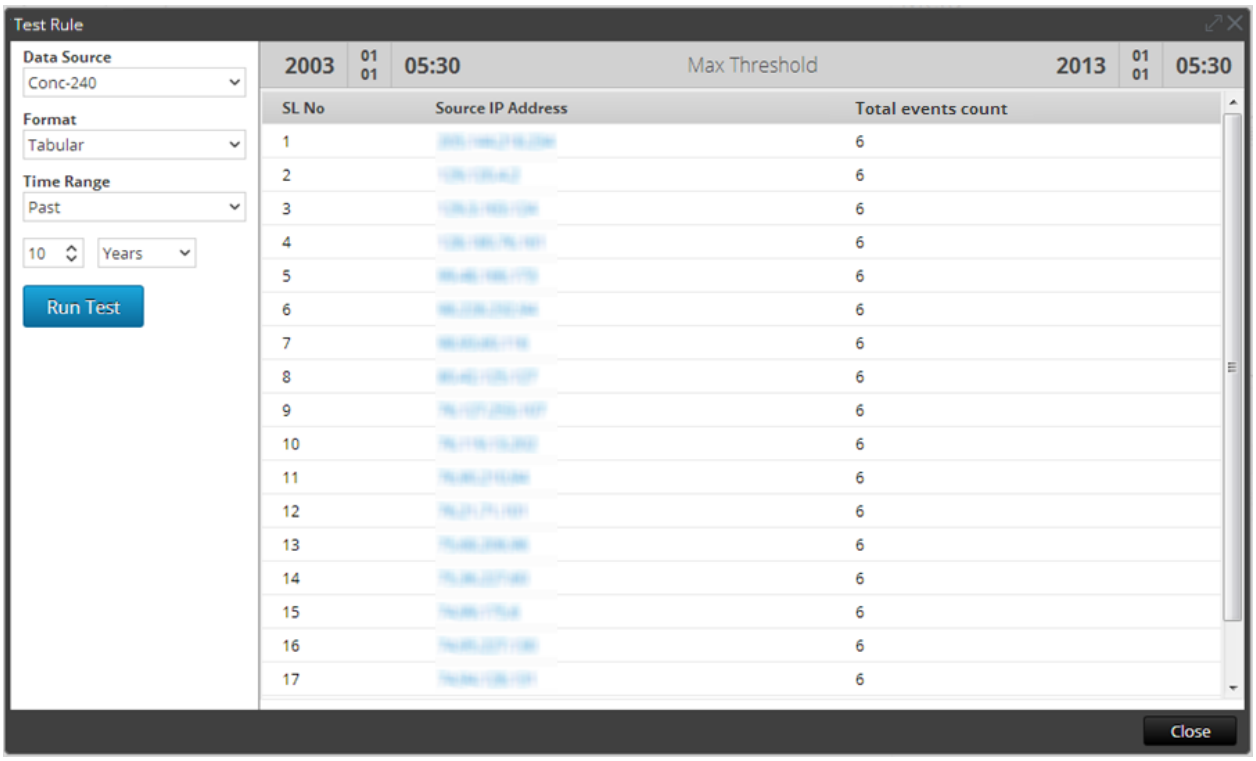
max_threshold rule can also be used to filter values based on the aggregate function values. Use the syntax based on the type of summarization used in the rule as below:

- max_threshold(String quantity): Can be used to filter Event Count, Packet Count, and Session Size.
- max_threshold(String quantity, String field): Can be used to filter values of Custom aggregates or any metas.



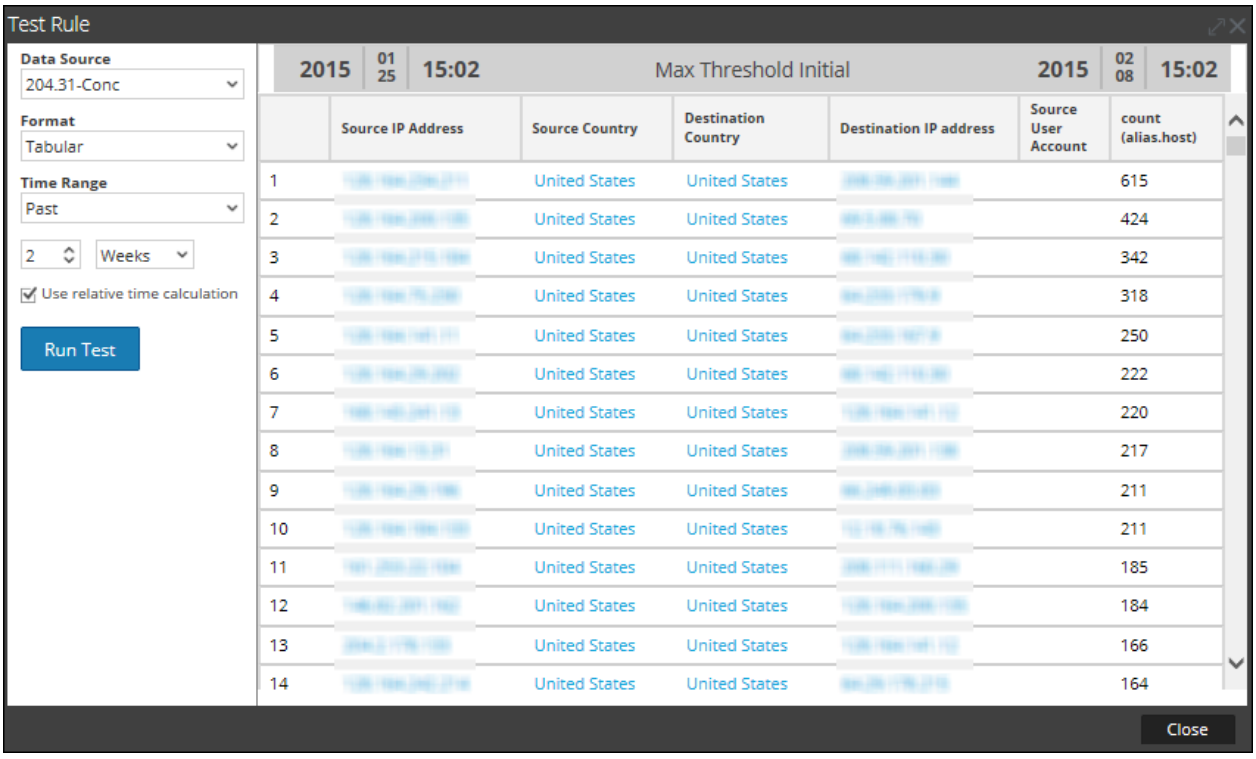
Examples:

1. max_threshold(200);

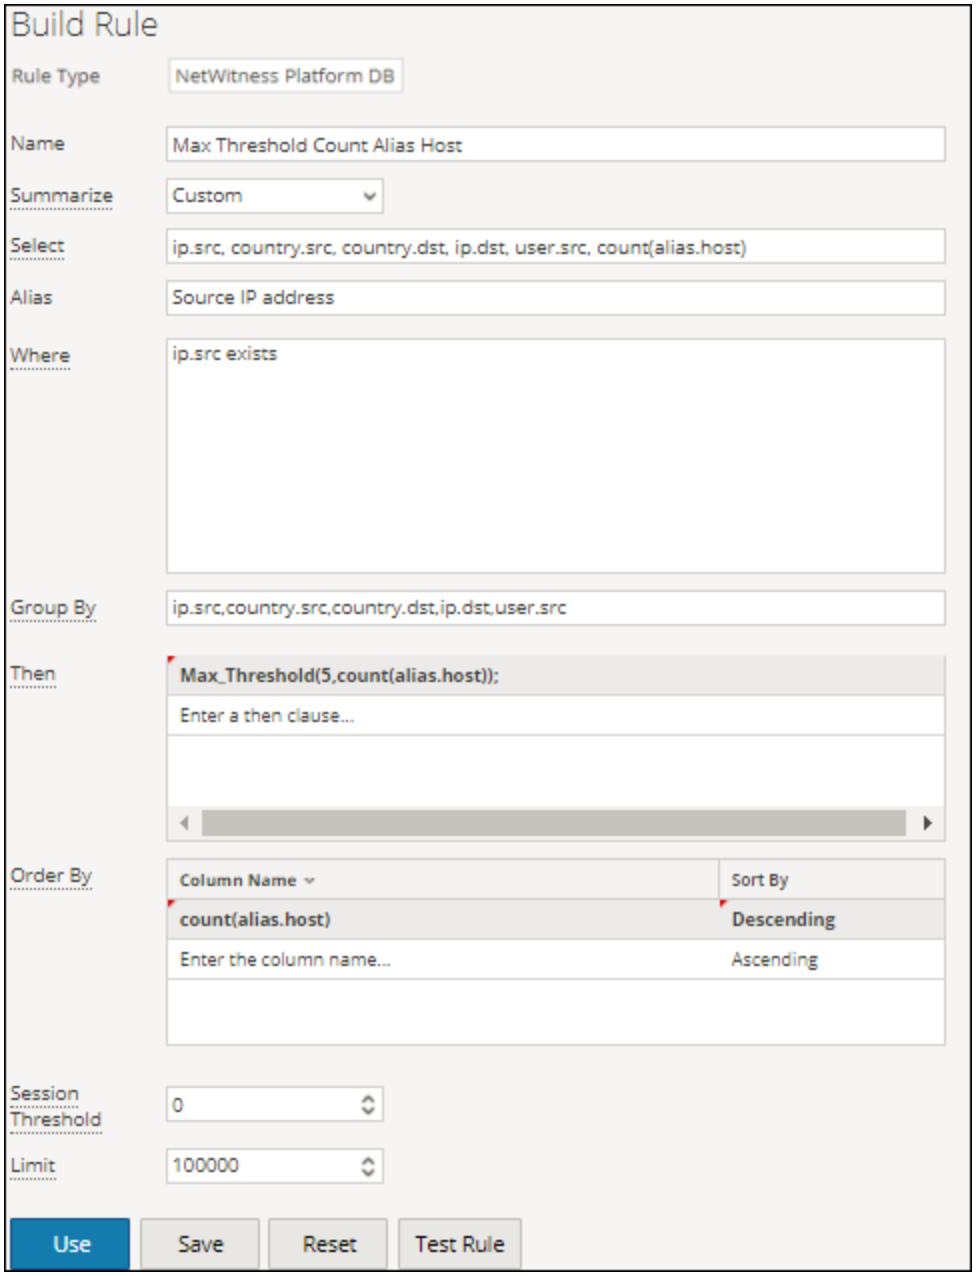


The following figure shows the result without the max_threshold argument. The output results have event counts exceeding 200.

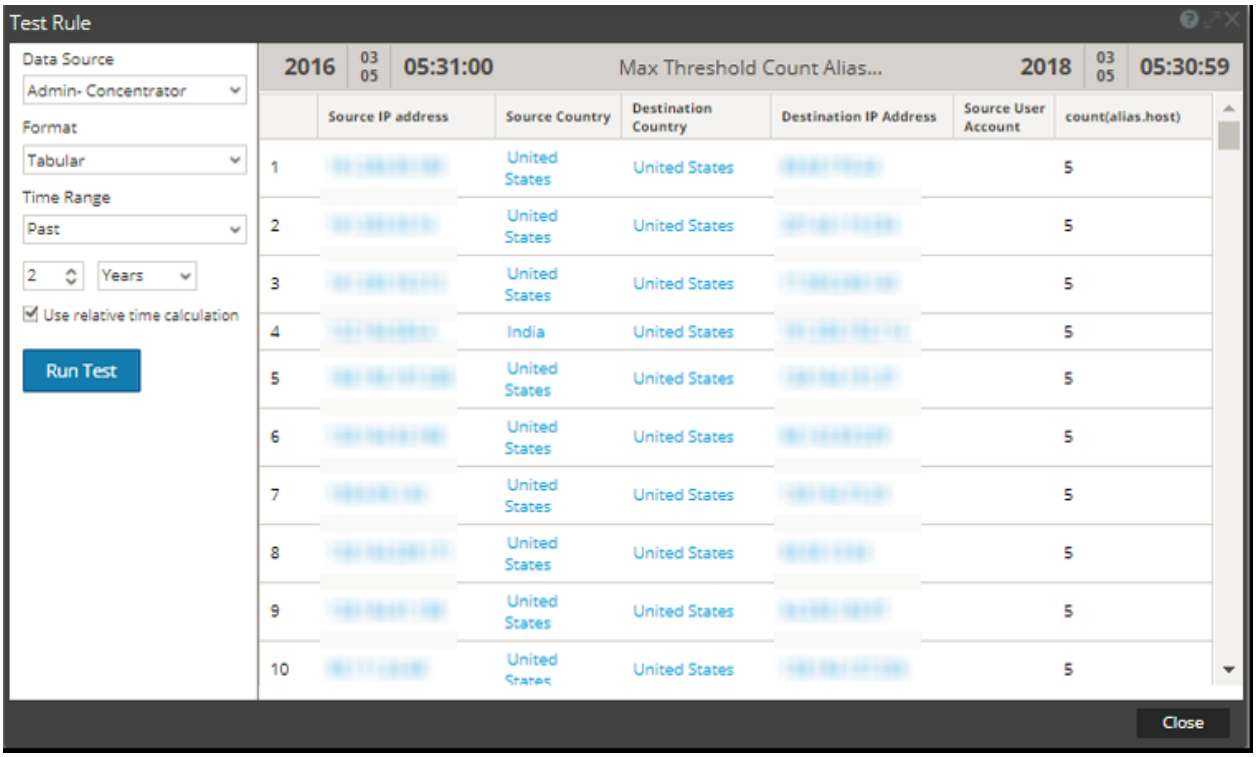
The following figure shows a the max_threshold rule action that puts a limit of 200 bytes on the output. Any output having more than 200 bytes of data are not listed.



The following figure shows the result when the max_threshold rule action is applied. The result numbered 1 in the above screen capture is removed from the result.



2. max_threshold(5,count(alias.host));



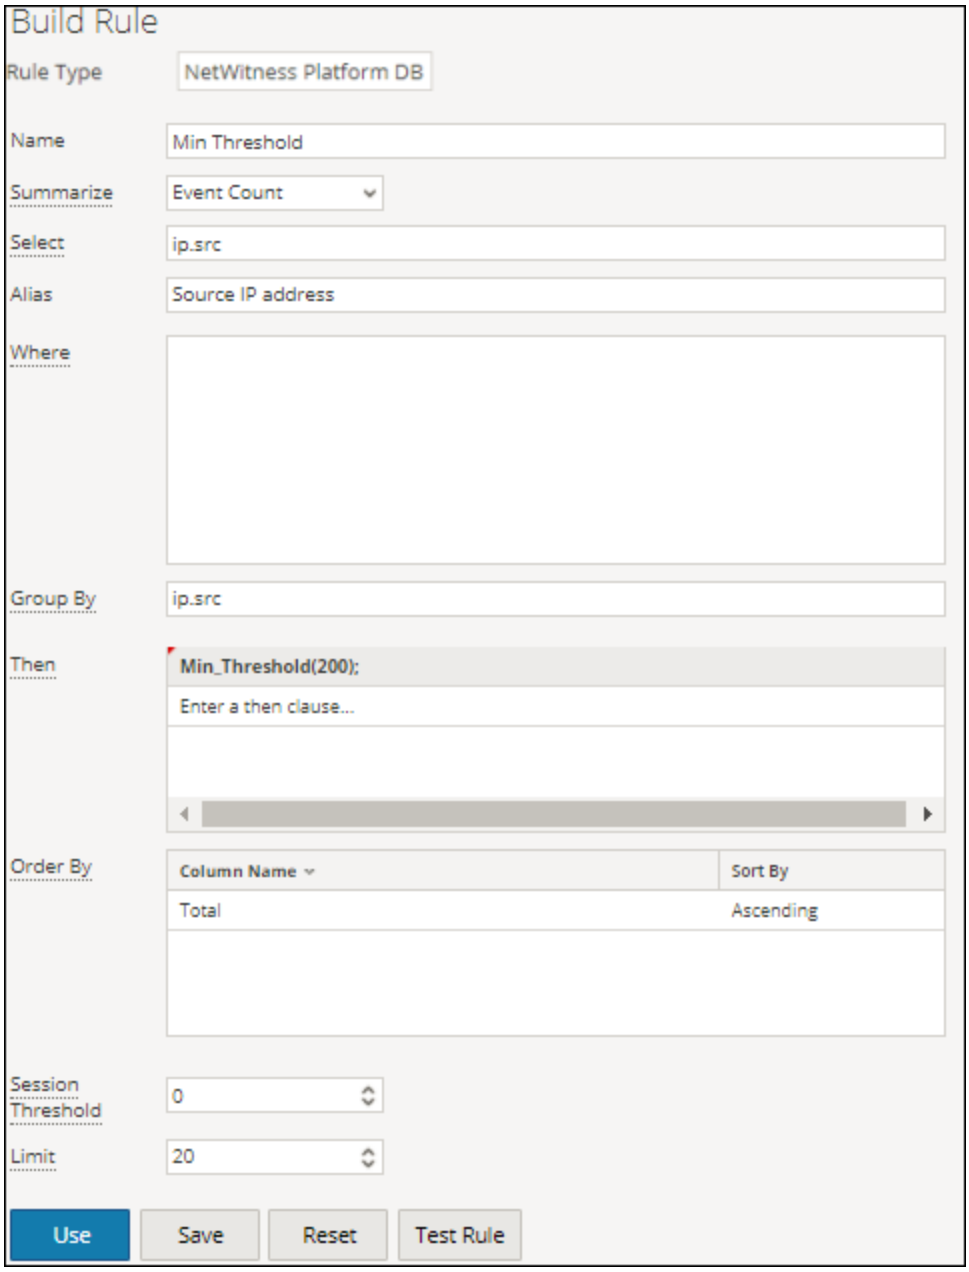
The following figure shows the result without the max_threshold argument. The output results have count of alias.host exceeding 5.

The following figure shows a the max_threshold rule action that puts a limit of 5 on the output. Any output having value more than 5 is not listed.

The following figure shows the result when the max_threshold rule action is applied. Any output having value more than 5 is removed from the result.

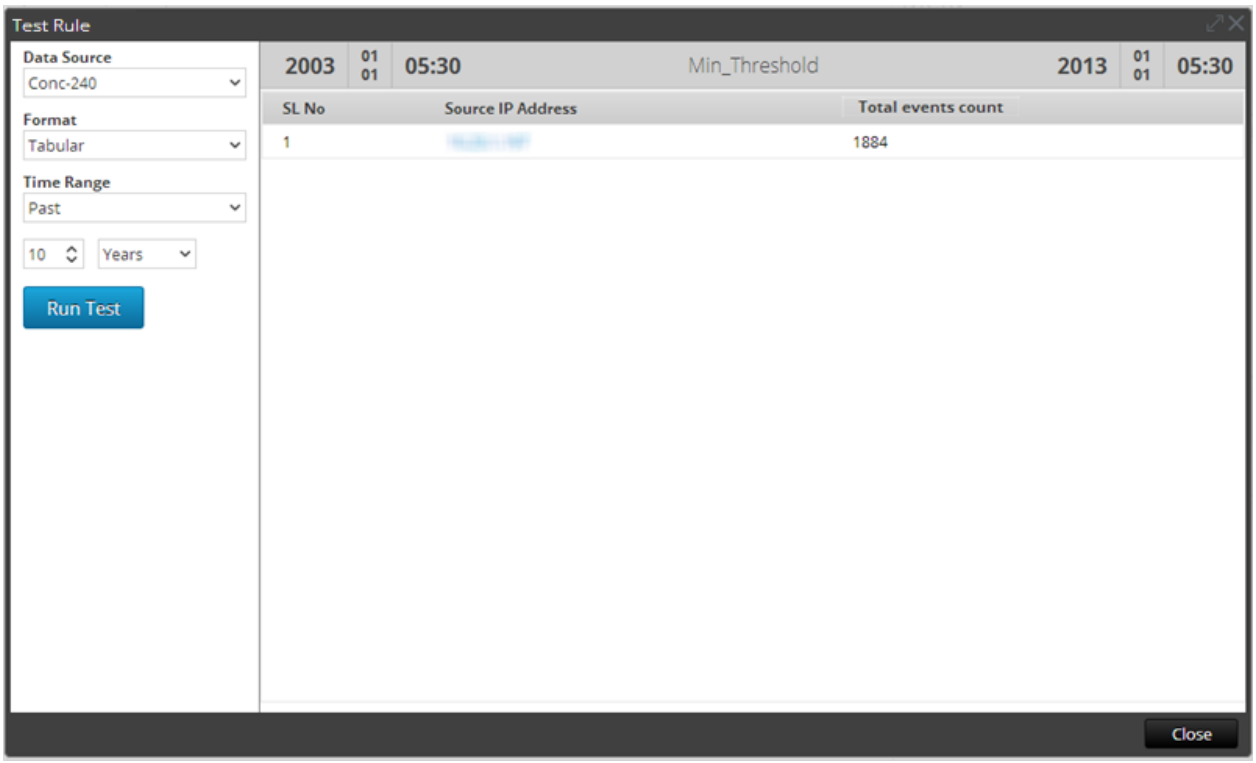
min_threshold (string quantity)

min_threshold removes results with a quantity that is smaller than the minimum threshold quantity from a result set. The quantity can either be in terms of count or size and it is relative to the sorting options of the parent rule. This means that if you sort a rule by size, the rule action expects you to specify the parameter in bytes (you can append KB, MB, GB, TB to the parameter to make size conversion easier).



min_threshold rule can also be used to filter values based on the aggregate function values. Use the syntax based on the type of summarization used in the rule as below:

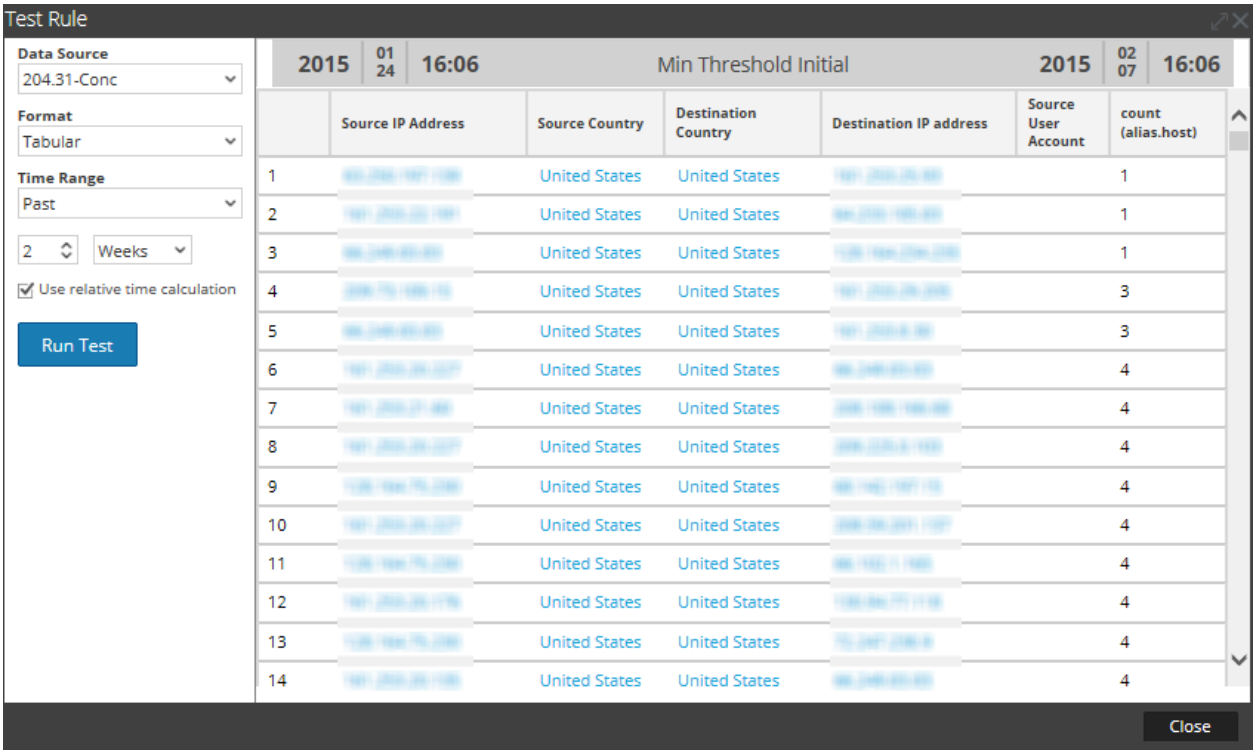
- min_threshold(String quantity): Can be used to filter Event Count, Packet Count, and Session Size.
- min_threshold(String quantity, String field): Can be used to filter values of Custom aggregates or any metas.



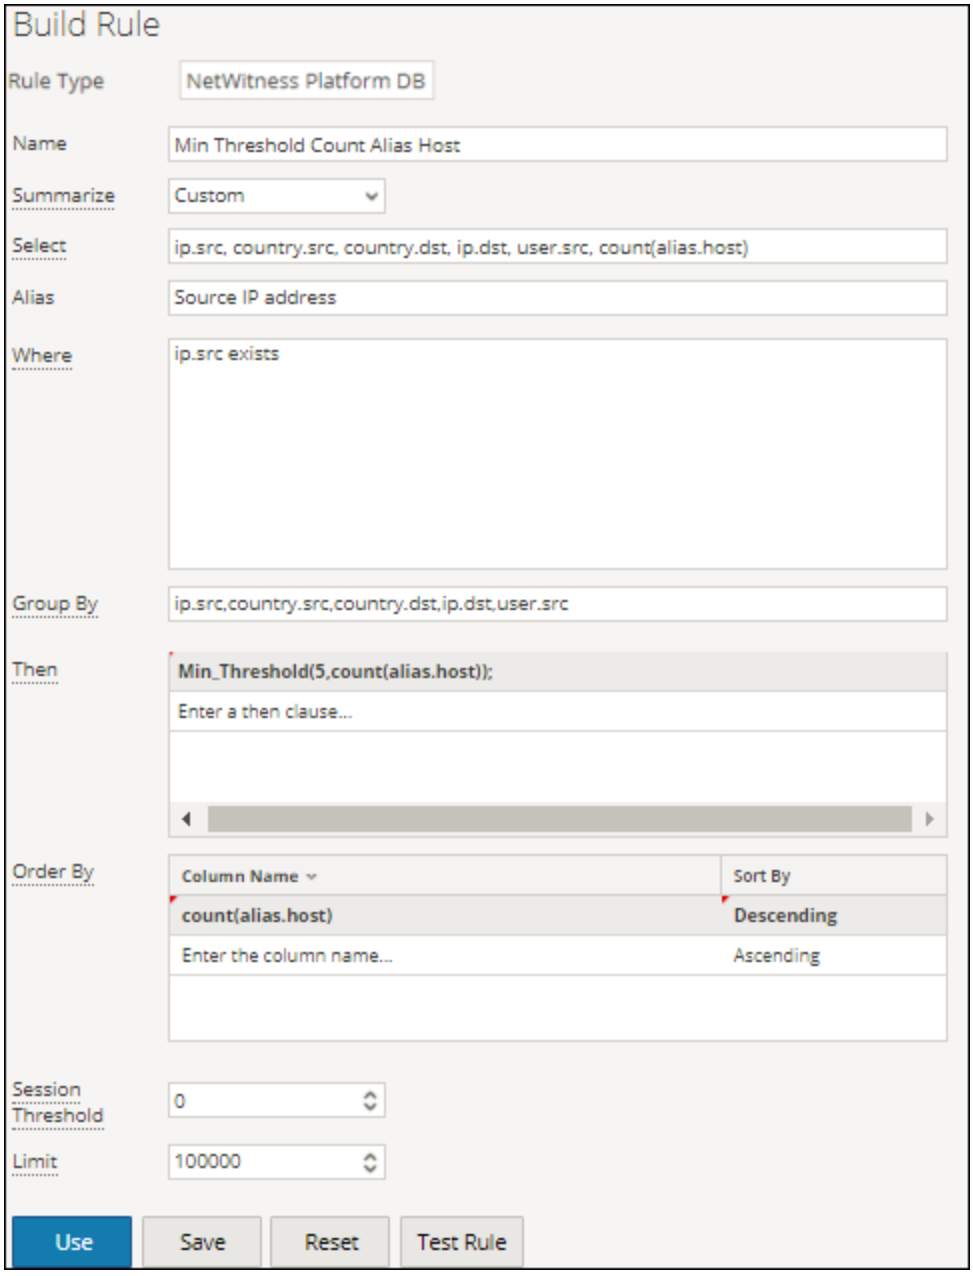
Examples:

1. min_threshold(200);

The following figure shows a sample of the min_threshold query.

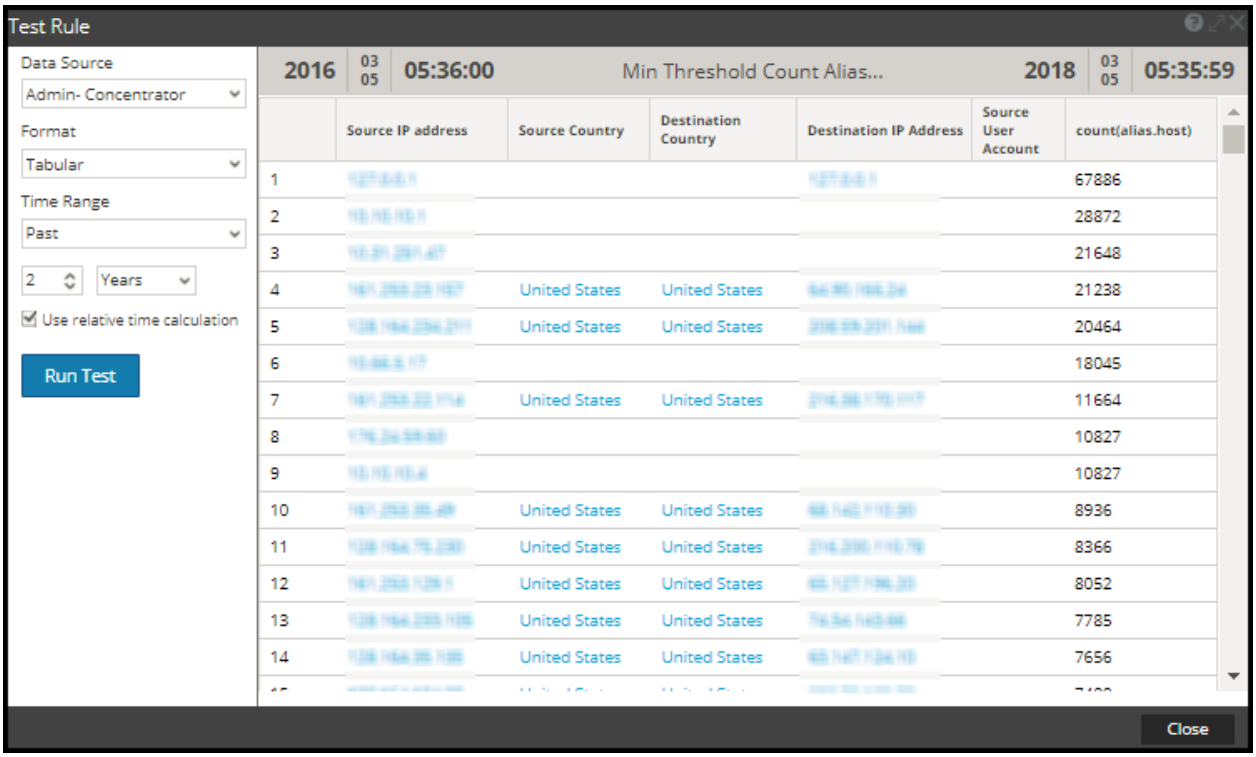


The above figure puts a limit of 200 bytes on the output. Any output having less than 200 bytes of data is not listed. The output with the min_threshold rule action is applied.



As shown, all the values are greater than 200 bytes.

2. min_threshold(100,count(alias.host));



The following figure shows the result without the min_threshold argument. The output results have count of alias.host below 100.

The following figure shows a the min_threshold rule action that sets the minimum limit of 100 on the output. Any output having data less than 100 is not listed.

The following figure shows the result when the min_threshold rule action is applied. Any output having data less than 100 is removed from the result.

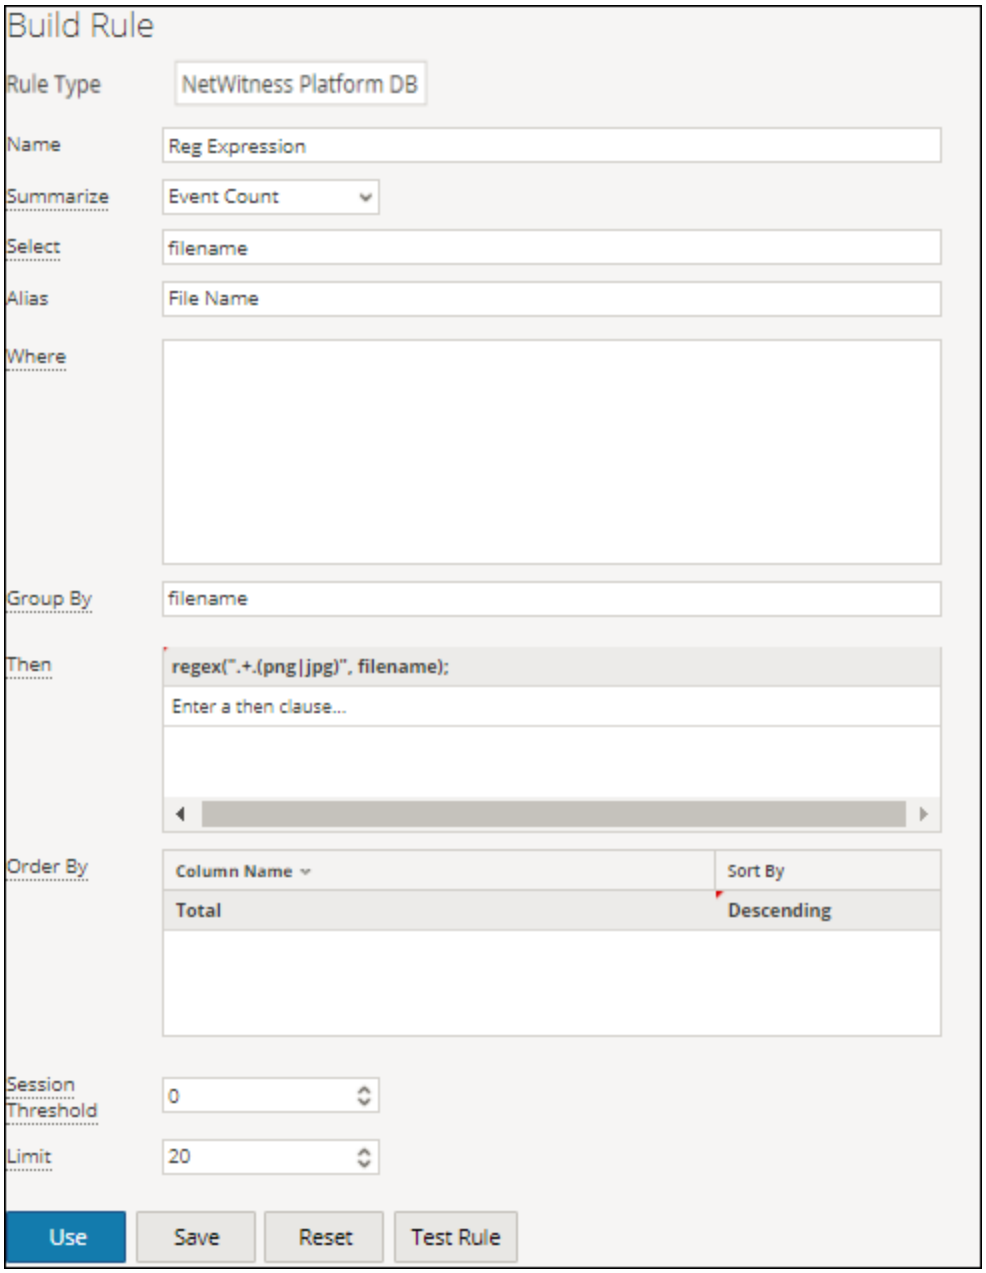
regex (string regex, string field)

The regex rule action applies regular expression to the result set. The following is the format of the regex rule action:

regex(regular_expression, meta_name)

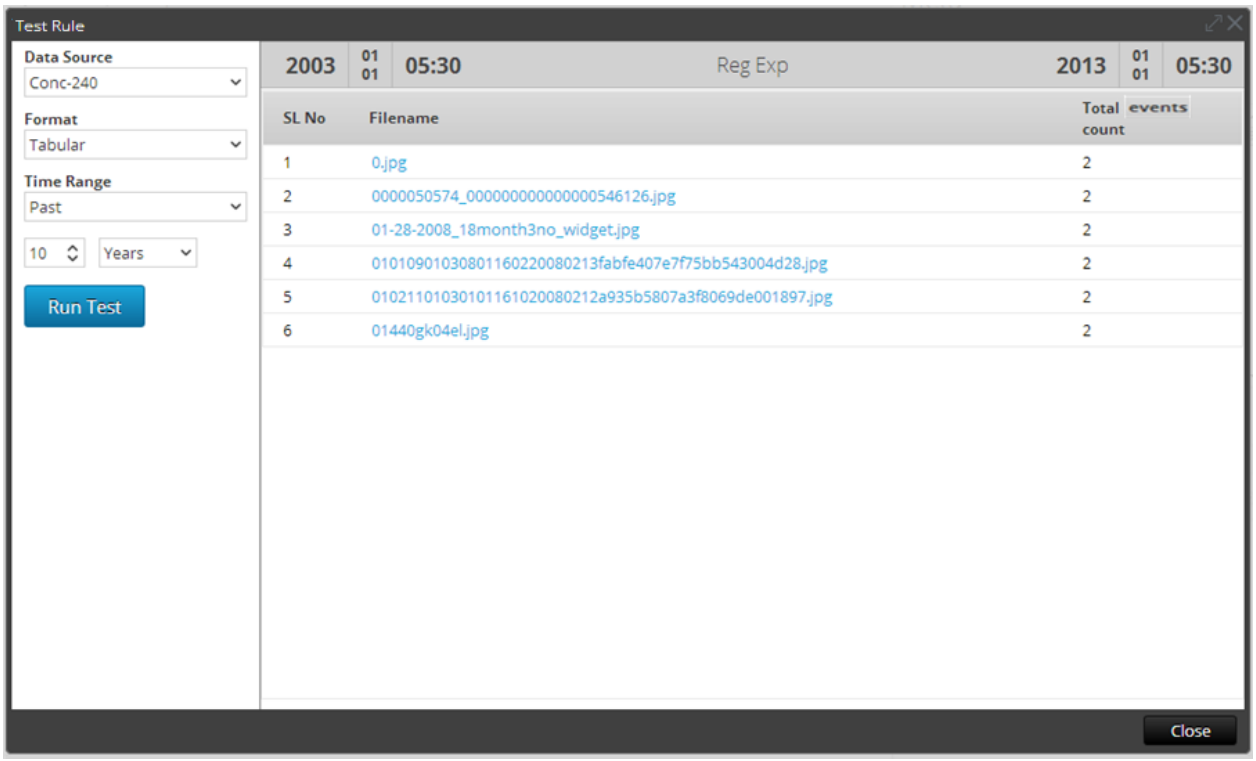
Where:

- regular_expression - Regular expression to match the value of the meta.
- meta_name - Meta or field name on which the regex has to be applied.



For a comprehensive list of supported regex patterns, refer to http://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html.

Sample regex rule action:

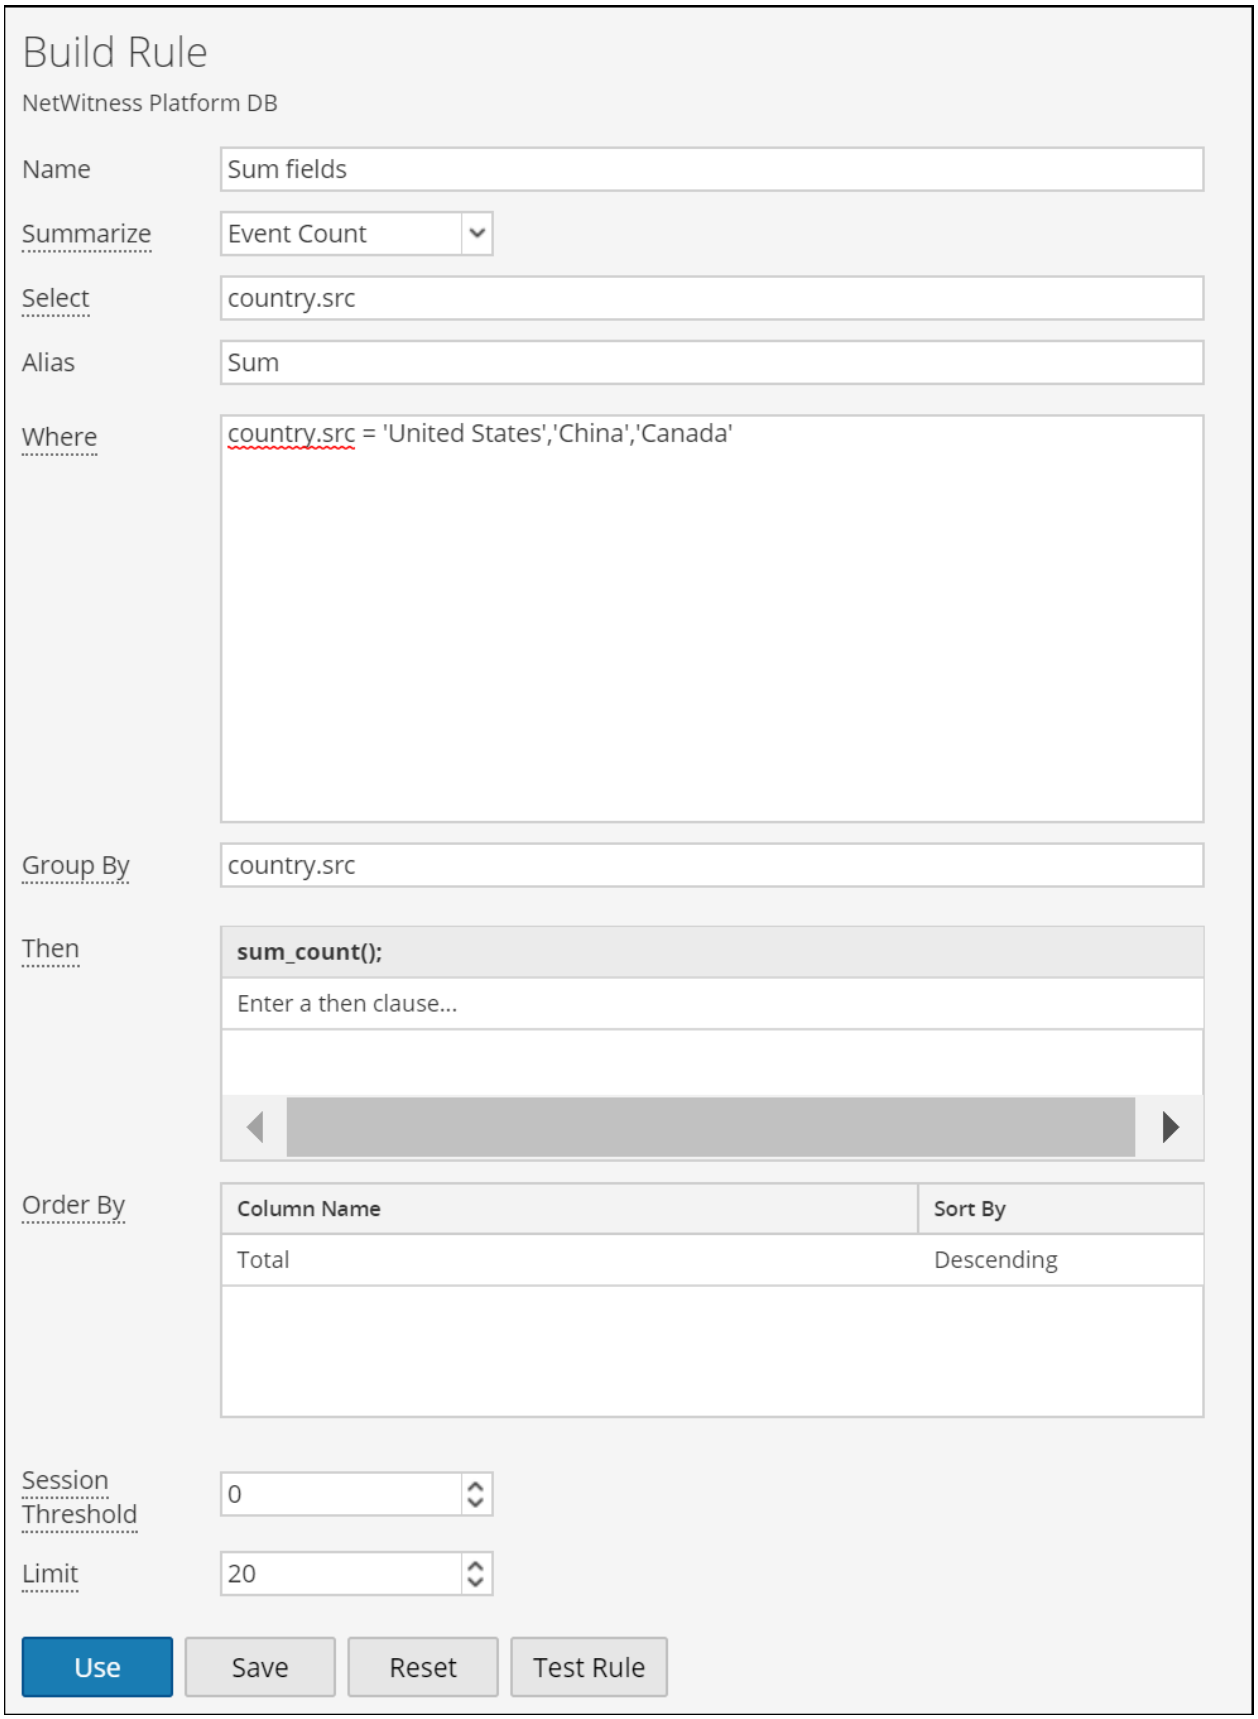


If you want to list filenames of all the PNG and JPEG format files from various sessions, you can write a rule with the following regex rule action:

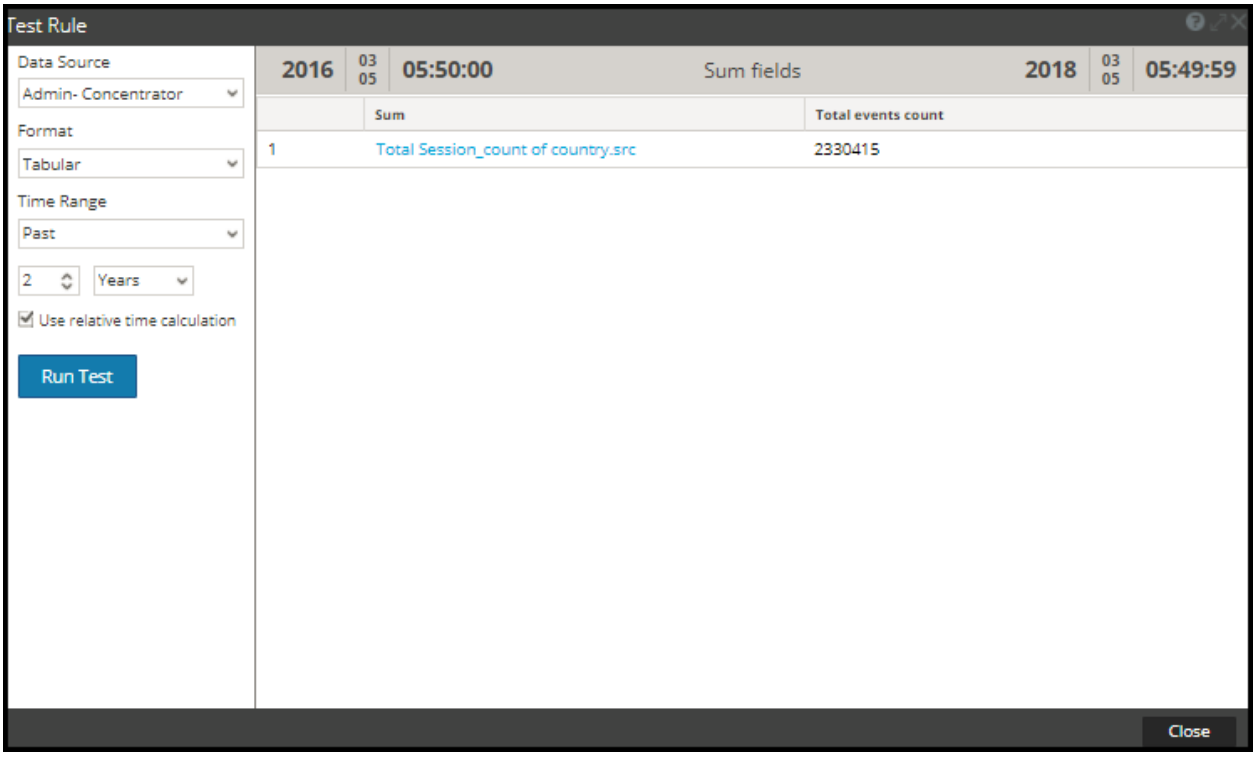
regex(".+.(png|jpg)", filename);

The following figure shows the rule.

The output with the regex rule action applied is shown in the following figure.



`sum_count()`



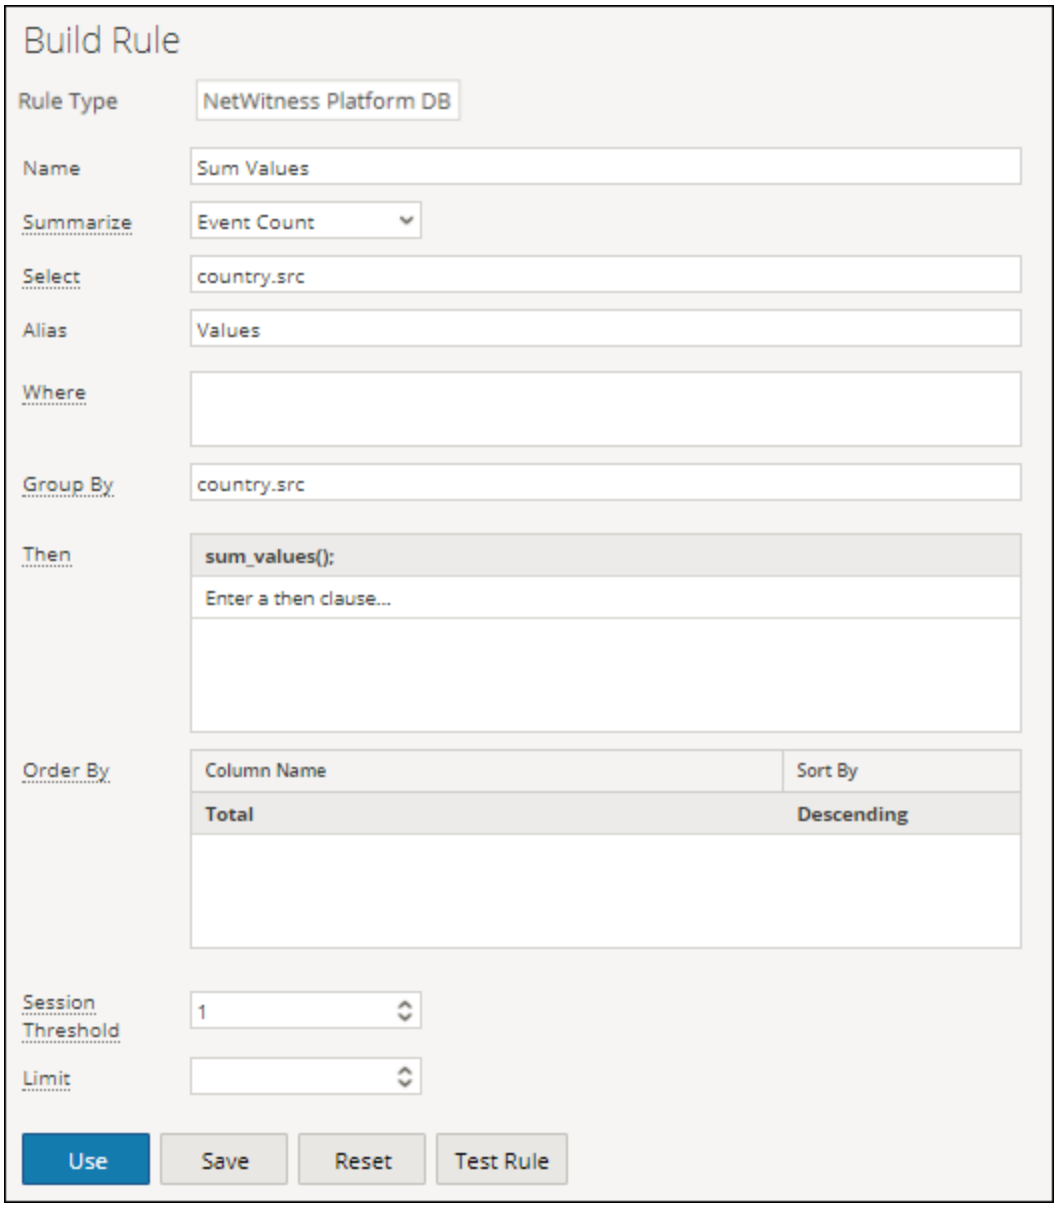
Totals the quantifiers for a given result set. For example, calling a sum_count() for a rule that is sorted by event count totals the size of all values in the result set and displays the total in place of the result set.

Example:

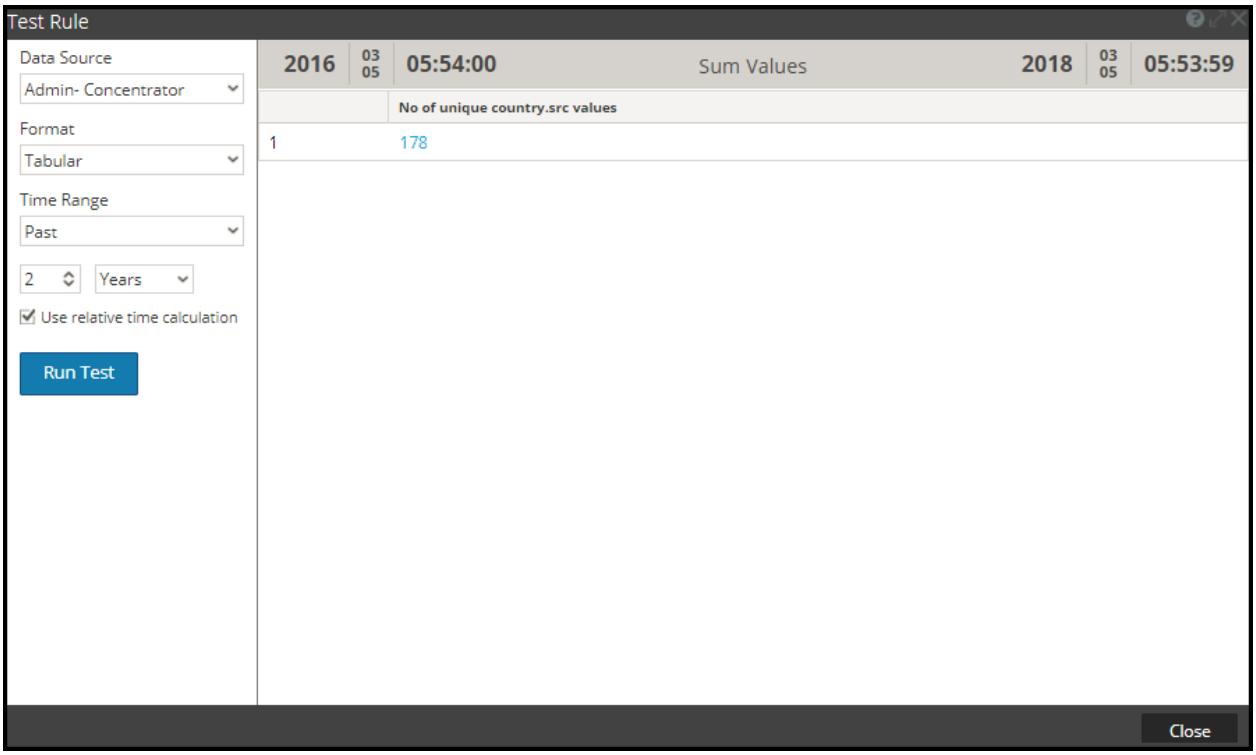
The following figure shows the sum_count() rule action.

Build Rule
NetWitness Platform DB
Name
Sum fields
Summarize
Event Count
Select
country.src
Alias
Sum
Where
country.src = 'United States','China','Canada'
Group By
country.src
Then
sum_count();
Enter a then clause...
Order By
Column Name
Sort By
Total
Descending
Session Threshold
0
Limit
20
Use
Save
Reset
Test Rule

With sum_count() rule action, the output shows the total size of all the event counts.



`sum_values()`



Totals the number of values for a given result set. Use this action to display how many matches exists for a given rule.

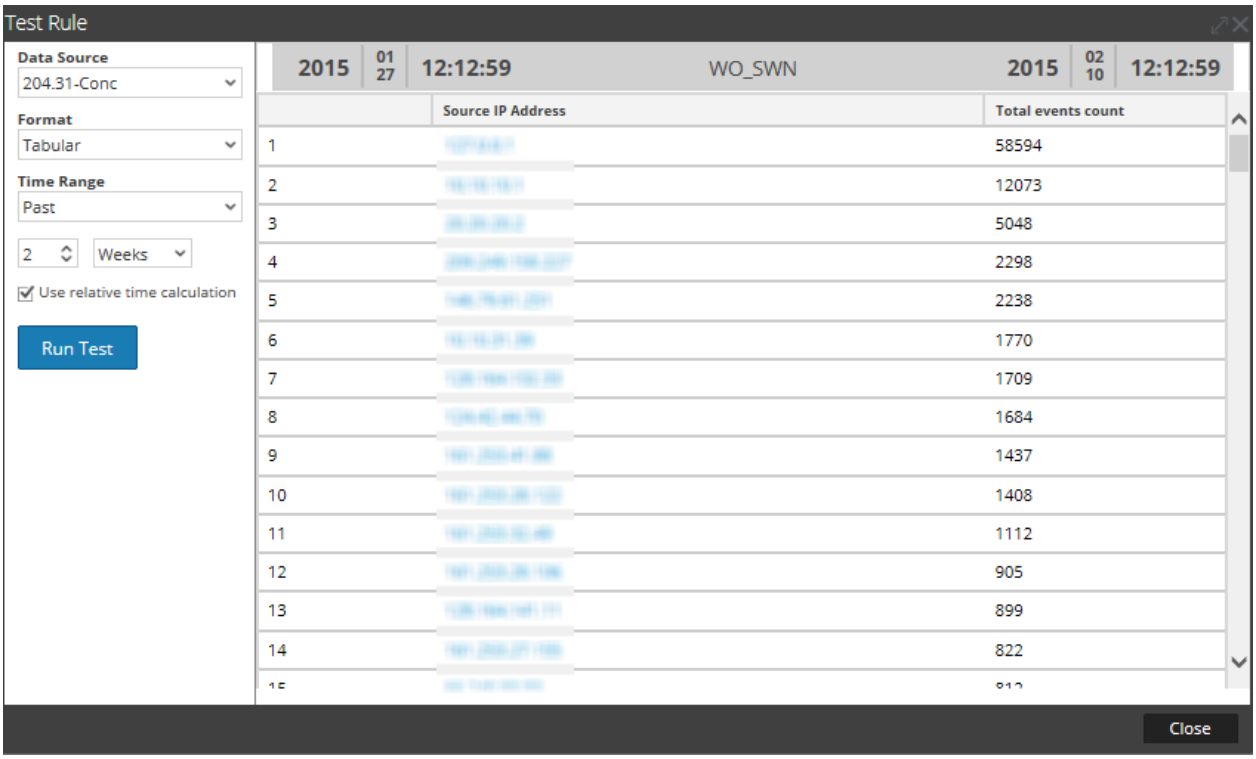
Example:

The following figure shows the sum_values() rule action.

The following figure shows the result with sum_values rule action.

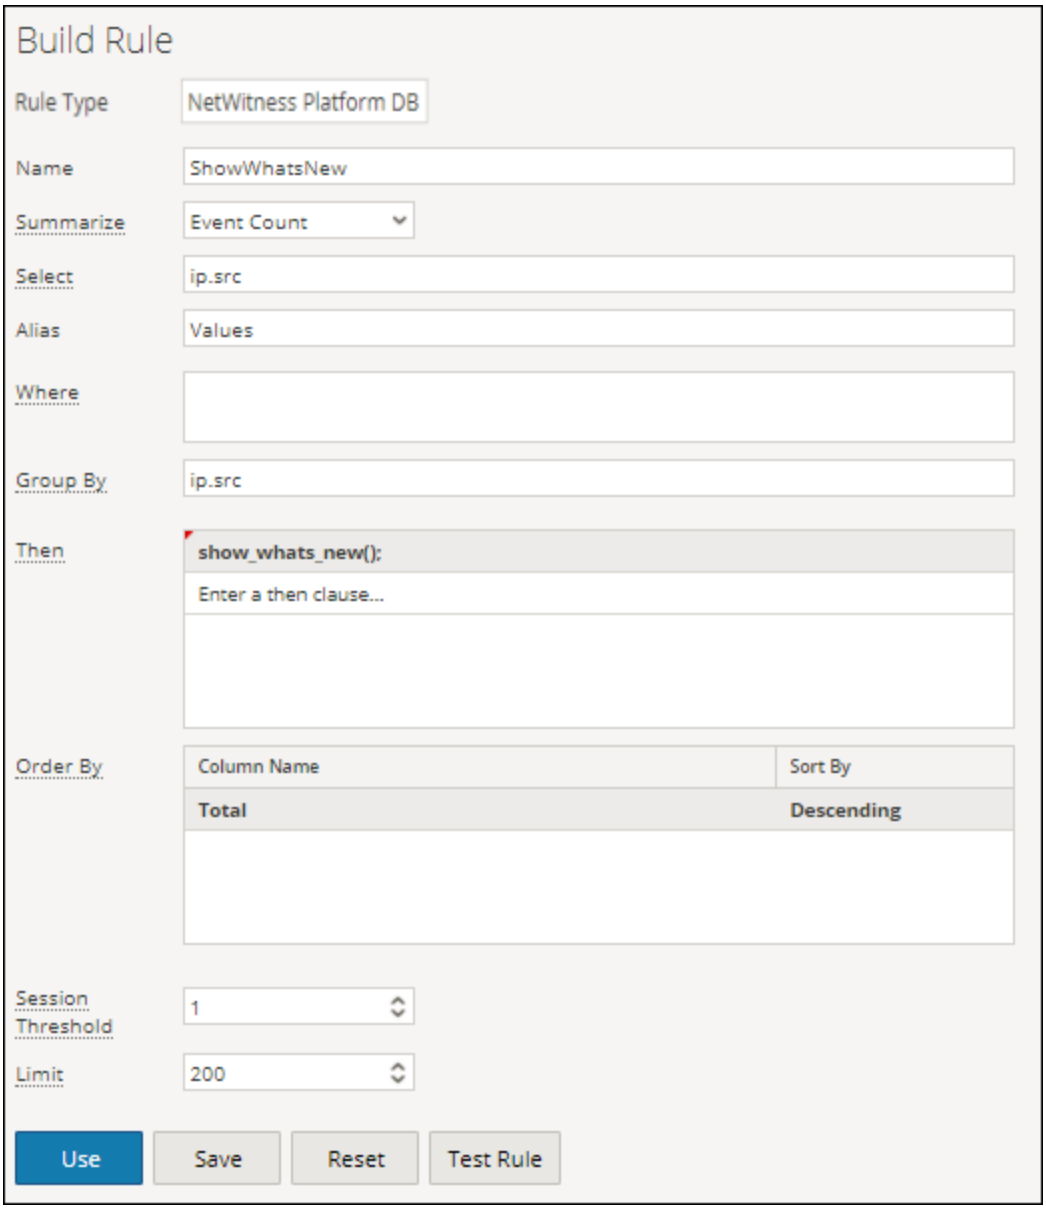
show_whats_new()

The show_whats_new() rule action takes any result in a result set and filters out any value that is available in the NetWitness meta database prior to the time frame of the currently running report. When a report runs, NetWitness determines the ID of the first session in the time range of the report. If a value in a result set has a first session id that is greater than the first session id of the report time frame, it did not exist in the NetWitness meta database prior to the report being run and so is new to the NetWitness system relative to the time frame of the report.



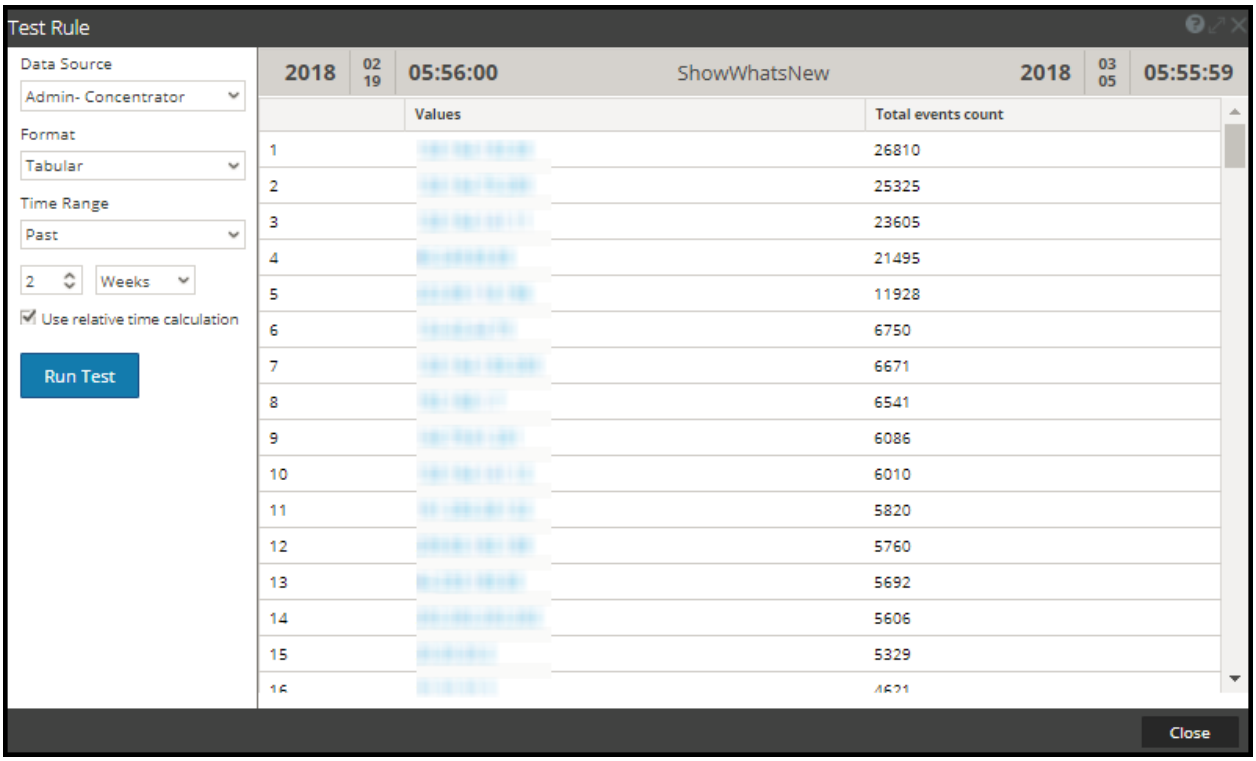
The show_whats_new() rule action is also supported for Custom Aggregate Rule. When multiple meta's are selected in the Custom rule, the first meta is considered for filtering out the old values. See "Example 2" below to understand how this rule action is used for Custom Aggregate Rule.

Note: The show_whats_new() rule action can be used only with an aggregate rule.



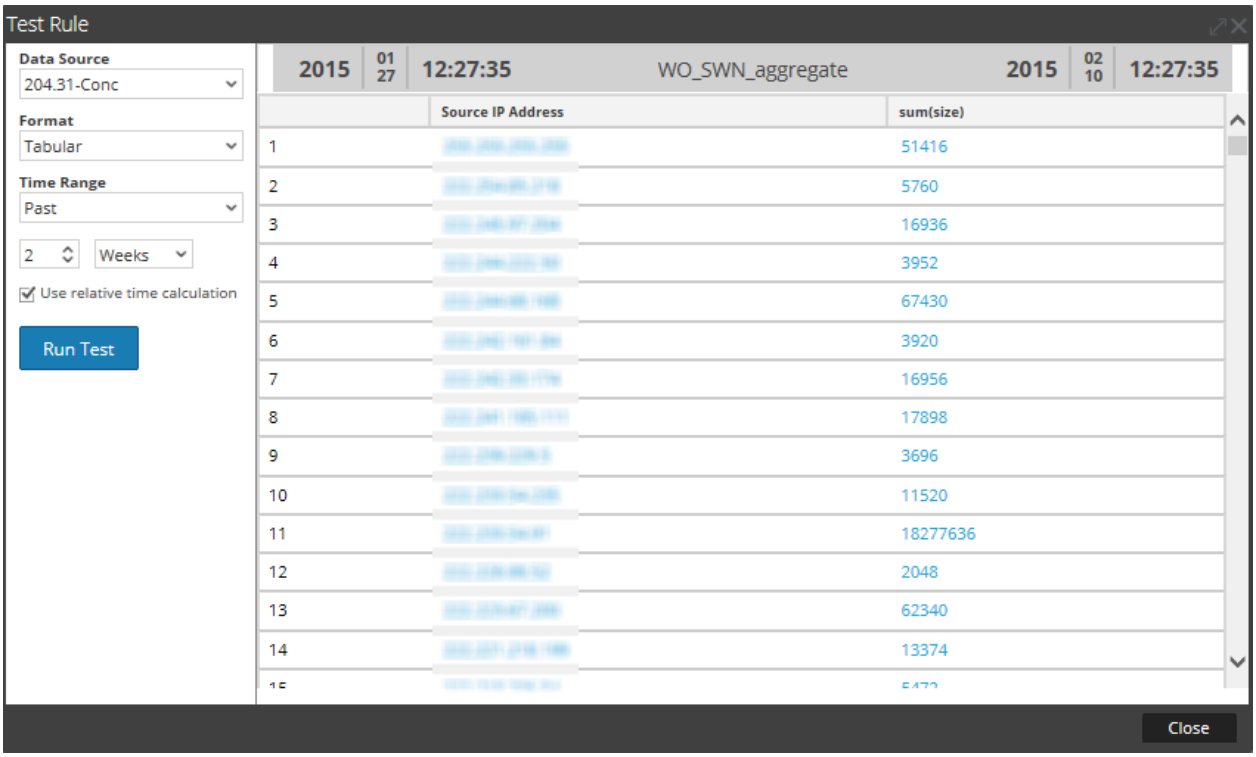
Examples:

1. show_whats_new() for aggregate rule with Event Count

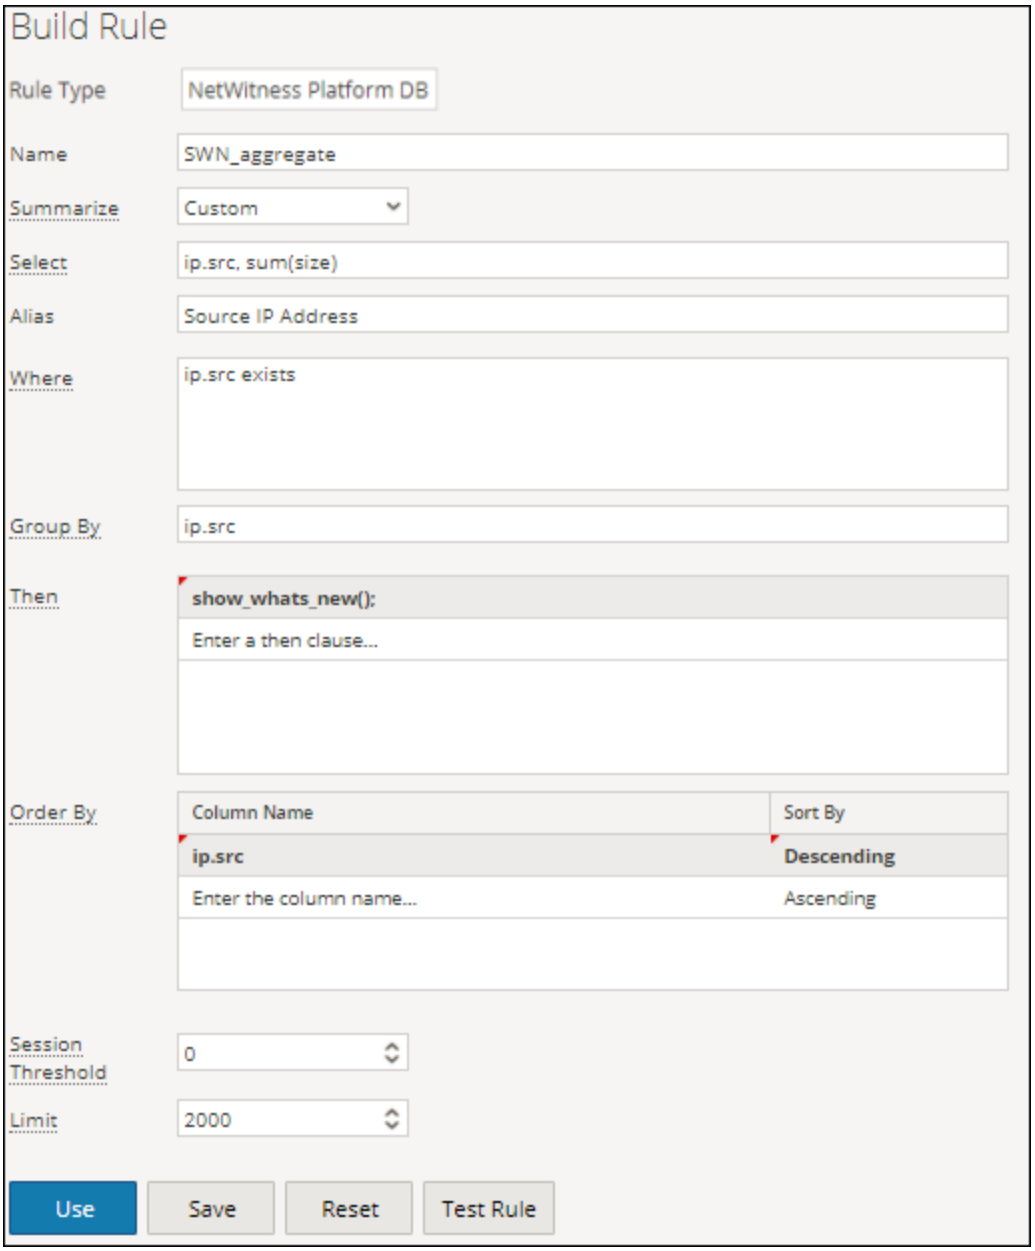


In the following example, all the Source IP Addresses available for the past two weeks are listed.

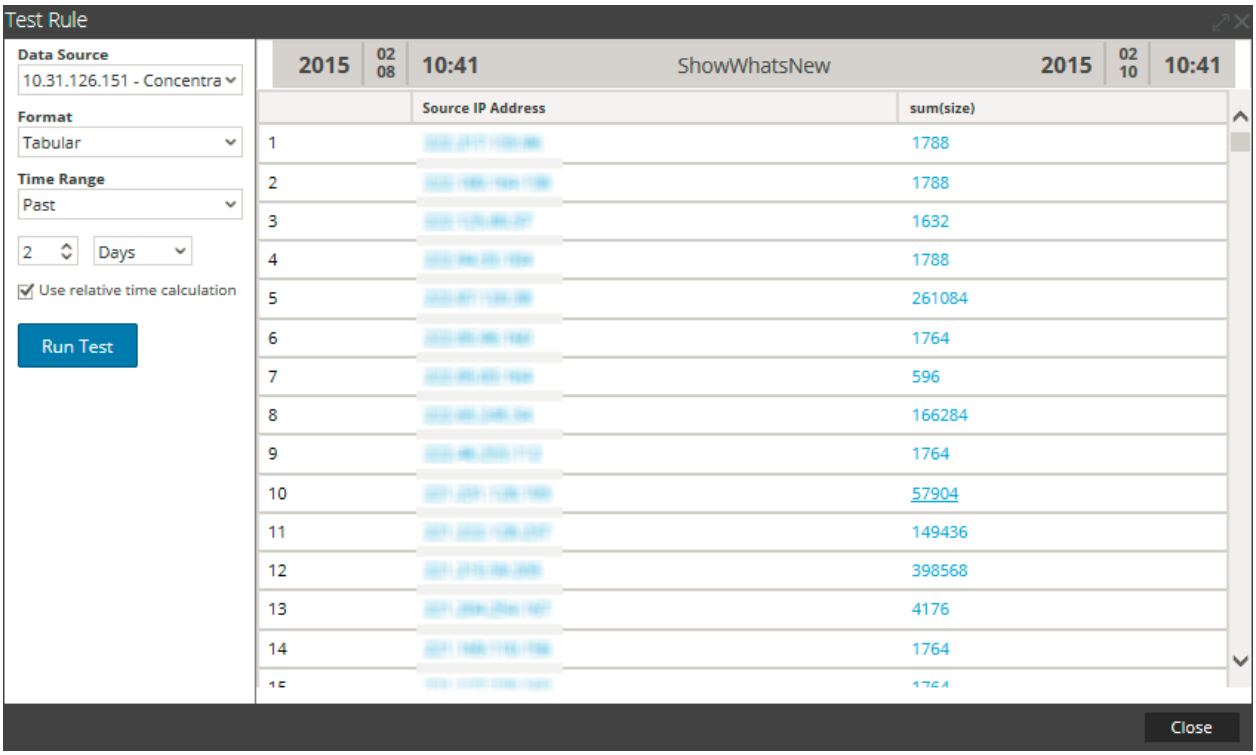
The following figure shows the use of the show_whats_new rule action to list only the new entries for the past two weeks.



The following figure lists the new entries for the past two weeks.



2. show_whats_new() for Custom aggregate rule



In the following example, all the Source IP Addresses available for the past two weeks are listed.

The following figure shows the use of the show_whats_new rule action to list only the new entries for the past two weeks.

The following figure lists the new entries of Source IP Addresses for the past two weeks.

The power of this feature is that it doesn't matter when the report is run in identifying values that are new to NetWitness. The caveat with this feature is that if a data reset occurs, you will lose your data. However, it is easy to baseline a system and identify changes and new items without a tremendous amount of strain on the system (depending on the size of your result set).

Supported Rule Operators

The NWDB Reporting Engine data source rule syntax supports a subset of rule operators that are supported by NetWitness.

Syntax	Description
*	Use an asterisk (*) as the sole operator in a rule to select all traffic.
=	Equals operator
!=	Does not equal operator
&&	Logical AND operator
||	Logical OR operator
-u	Upper boundary. For example, **tcp.port = 40000-u** selects all TCP ports above 40000.
l-	Lower boundary. For example, **tcp.port = l-40000** selects all TCP ports below 40000.
-	The dash (-) operator only applies to numeric values. Separate the lower and upper boundaries of the range with a dash (-). For example, **tcp.port = 25-443** selects all TCP ports between 25 and 443.

Sample Supported Queries

Respond Rule Syntax

The supported rule syntax for the Respond service through descriptions and examples of supported and unsupported syntax. There is a finite set of syntax that you can use to construct rules for reports using the Respond service in this release.

The Reporting Engine supports the following categories of Respond data source rule syntax:

- **select** clause
  - Non-Aggregate Rule
  - Aggregate Rule
- **alias**
- **where** clause
- **where** clause Operators
- Group By
- Order By
- **Limit** field

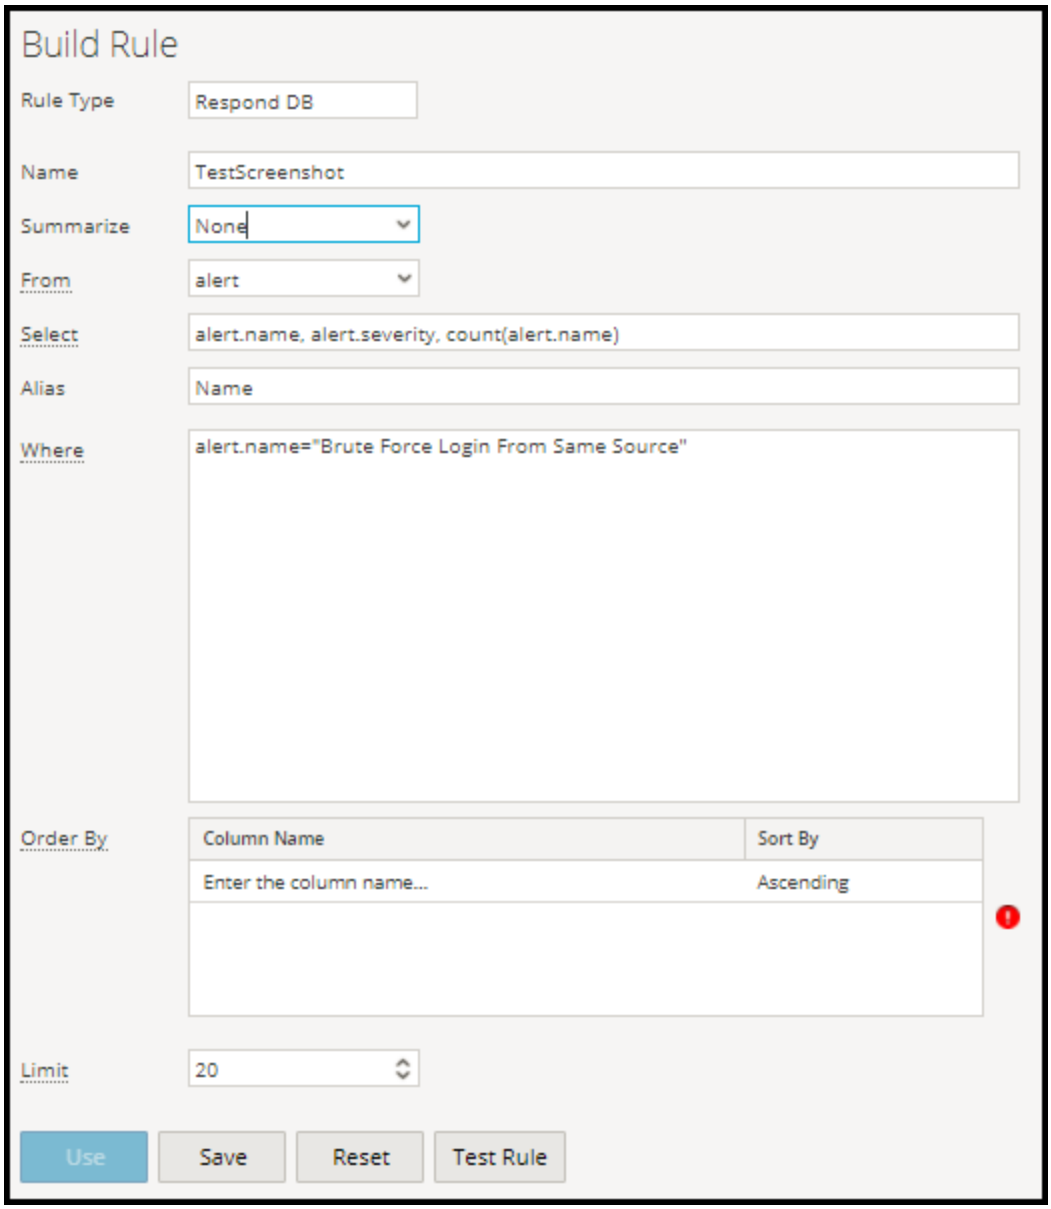
Note: List is not supported in Respond Data source rules.

Select Clause

The select clause is a comma separated list of values. For example: select alert.severity, alert.name, count (*).

There are two types of select clause for Respond Rule:

- Non-aggregate rule
- Aggregate rule



Non-Aggregate Rule

When you want to define a rule without any grouping, choose 'None' in the Summarize field. In a non-aggregate rule, you can select any number of metas in the *Select* clause. For example, select alert.severity, alert.name.

Aggregate Rule

When you want to query for a specific meta and its associated aggregate value then you must use the Aggregate rule. To get an aggregate, you must choose 'Custom' in the **Summarize** field to include an aggregate function in the *Select* clause. For example, select alert.severity, alert.name, count(*).

The following figure shows the Build Rule view for Aggregate Rule.

Supported Aggregate Functions

The rules on Respond service supports the following aggregate functions and syntax.

- count
- max
- min
- sum
- avg

Note: The aggregate functions must be added in the end of a select clause for aggregate query. For example, alert.name, alert.severity, sum(alert.numEvents). By default, a maximum of 10,000 rows results are fetched and this can be configured using the **rsa.response.query.QueryProperties**.

Examples of select Clause Syntax

The following table provides examples of the select Clause Syntax.

Examples	Descriptions
select *column1* ,*column2*,*column3*,...,*columnN*	Select specific metas from an Respond Data Source (You must separate each column with a comma.).

Examples of Supported Select Queries

select alert.name, alert.numEvents, count(alert.numEvents)

select alert.severity, avg(alert.severity)

select alert.timestamp, incidentCreated where alert.timestamp >= 1475658011

Summarize

Summarize determines the type of summarization or aggregation for the rule.

Name	Config Value
Summarize	To query metas without any custom grouping, select: • **None**: To get meta based aggregates, select: • **Custom**: This indicates that expected meta aggregate function is defined in rule select clause.

Alias

Some meta names may not be descriptive, in this case description can be added in the the alias field to make column names more readable. For example, **SELECT**: alert.severity, alert.name, count(*)
ALIAS: Alert Severity, Alert Name

In the alias field you can enter a name for columns used in the select clause. If you do not specify the alias for one of the field in the select clause, then the default description will be used. For example, if the select clause has Field1,Field2,Field3,Field4, and alias has only Field1, ,Field3,Field4, then for Field2 a default description is used.

Where Clause

The where clause is a language field values and ranges that is used by Respond function. In the where clause, string values have to be enclosed within single quotes.

Examples	Descriptions
alert.host summary =' (Primary) Link status "Down" on interface INTNAME.'	For TEXT or string type data, enclose the string or text in single or double quote. If there is any special character such as an apostrophe within the data then you need to add an additional single or double quotes. For example, alert.name = 'top alerts from Cote d"Ivoire'.
alert.timestamp >= 1475658011	For Date and Time (date/timestamp data type columns), use the EPOCH syntax.

Supported Where Clause Operators

Operator	Syntax
= (equals)	*column1* = '*value*'
!= (does not equal)	*column1* != '*value*'
>	*column1* > '*value*'
>=	*column1* >= '*value*'
<	*column1* < '*value*'
<=	*column1* <= '*value*'

Group By

Syntax	Function
group by : alert.severity, alert.timestamp, incidentCreated **Note:** Group by field is enabled for Aggregate queries and are not editable.	Respond picks the metas for Group By field from the selected Select clause automatically.

Order By

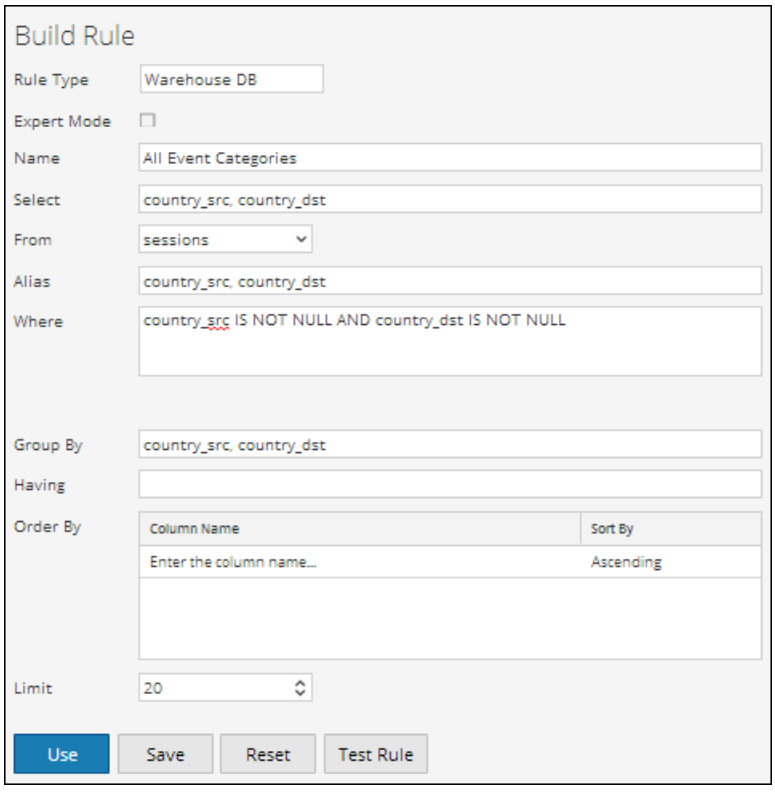
Order By determines how to sort the result set and is not case sensitive.

Name	Configuration Value
Column Name	The Column Name is the name of the columns by which you want to sort the results. By default, the value is empty. When you click on a column, the value gets populated based on the Summarize field. • order by alert.name asc • order by incidentCreated desc • order by count(numEvents) • order by status
Sort By	Sort By determines the order in which you want to sort the results such as ascending or descending. **Note:** For all queries, it is mandatory for you to select the order by field.

Limit field

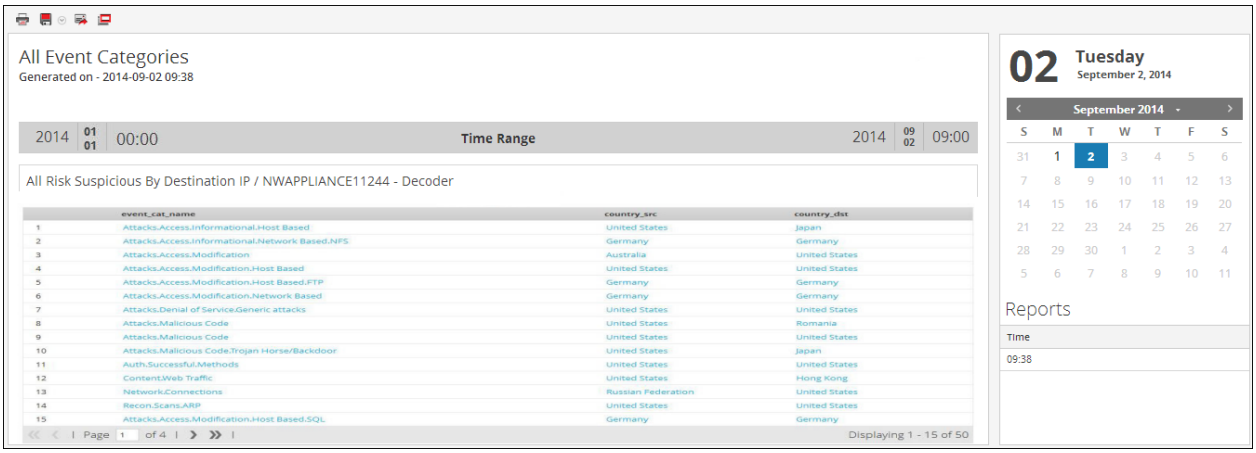
This indicates the limit to be put on the query while fetching data from the database. If a result set is sorted by event count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.

Warehouse DB Simple Rules Syntax



The section explains the simple rules query syntax and examples.

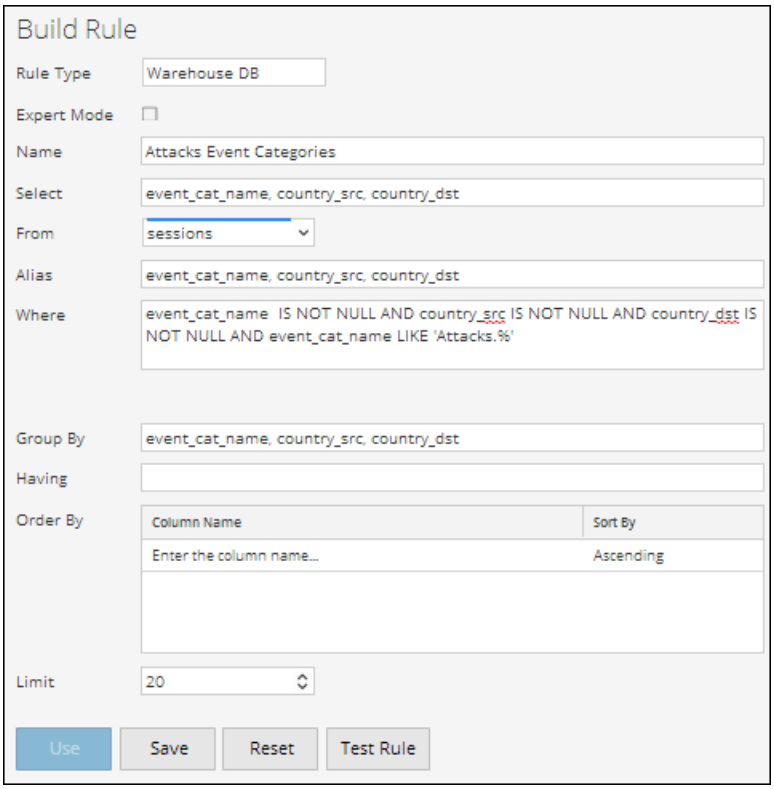
The following examples illustrate simple rules in the default mode:



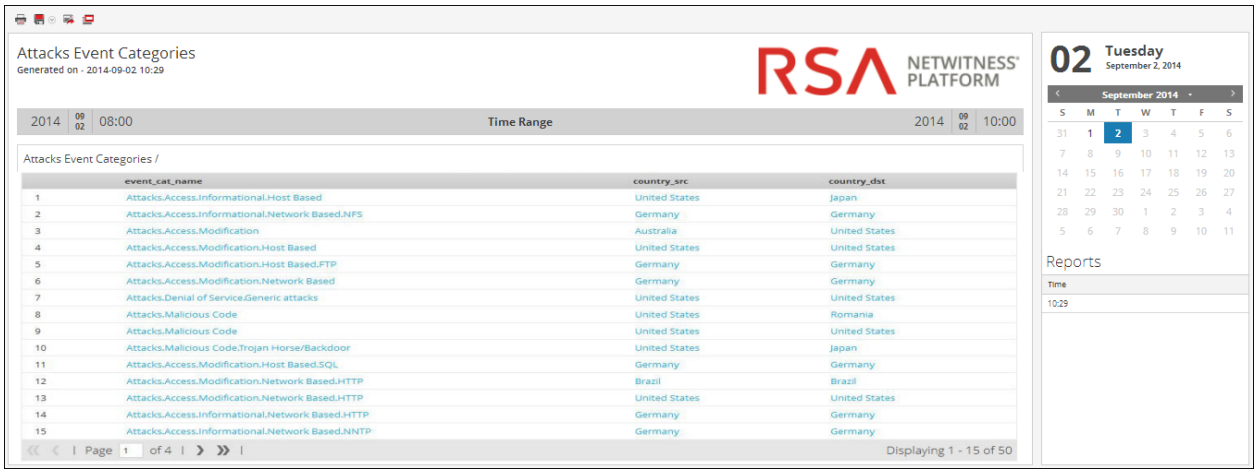
- All Event Categories Report
- Attacks Event Categories Report
- Source: China Event Categories Report
- IP Source and Destination Event Categories Report
- Time Threat Categories Report
- Array Query Report
- Raw Log Query Report

All Event Categories Report

This rule fetches all event categories, source country, and destination country from the **sessions** table by defining alias names (temporary column names) for each of the fields to be fetched from the table, that is, **country_src** for the source country, and **country_dst** for the destination country.

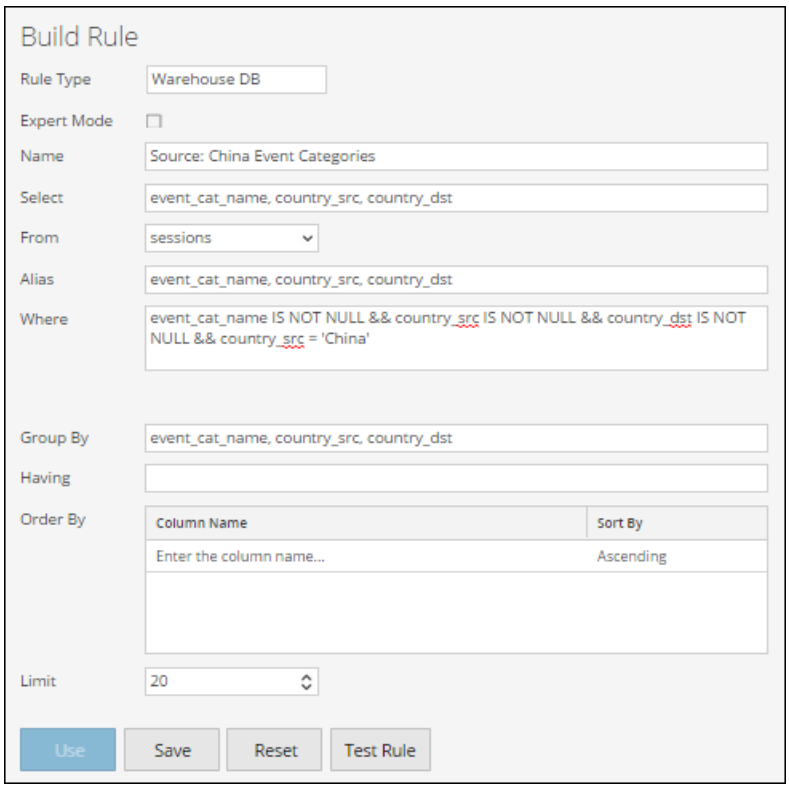


The following figure shows the result set of the All Event Categories rule.

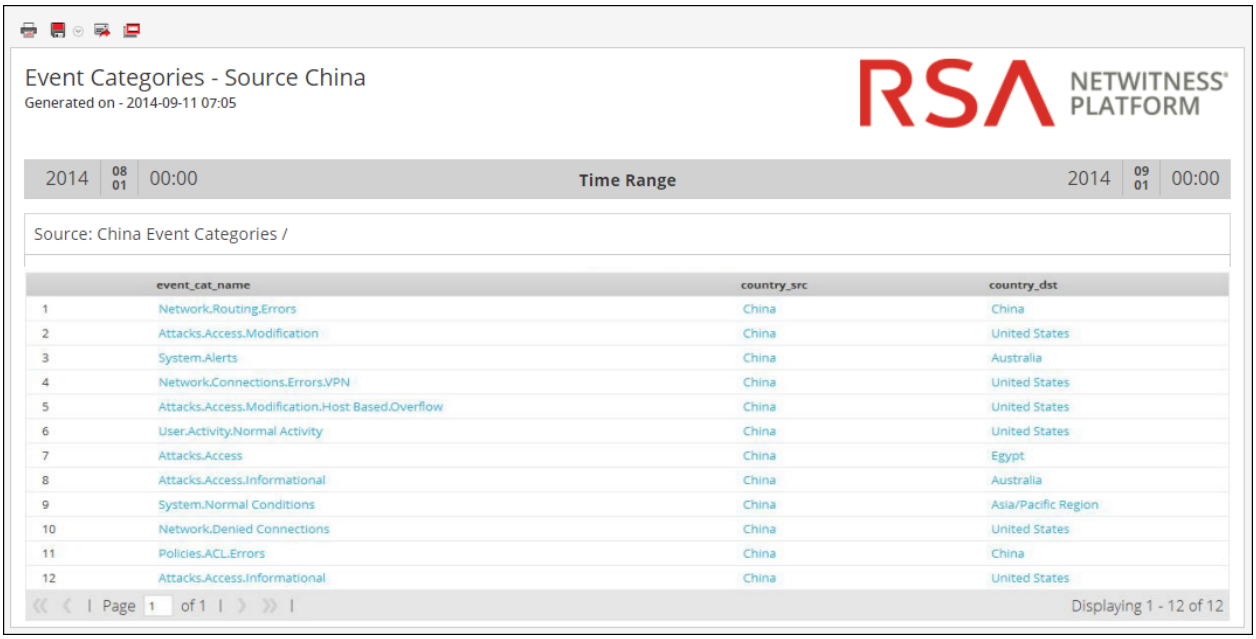


Attacks Event Categories Report

This rule fetches the event categories, source country, and destination country from the **sessions** table by defining alias names (temporary column names) for each of the fields to be fetched from the table and selecting only those columns whose event category name like 'Attacks.%'.



The following figure shows the result set of the Attacks Event Categories rule.



Source: China Event Categories Report

This rule fetches the event categories, source country, and destination country from the **sessions** table by defining alias names (temporary column names) for each of the fields to be fetched from the table and selecting only those columns whose source country is 'China'.

The following figure shows the result set of the Source: China Event Categories rule.

Event Categories - Source China

IP Source and Destination Event Categories Report

This rule fetches the IP address of source and destination country from the **sessions** table by defining alias names (temporary column names) for each of the fields to be fetched from the table and selecting only those columns whose destination country is NOT NULL.

Build Rule

Rule Type: Warehouse DB

Expert Mode: ☐

Name: Destination Country By IP Source

Select: ip_src, country_dst

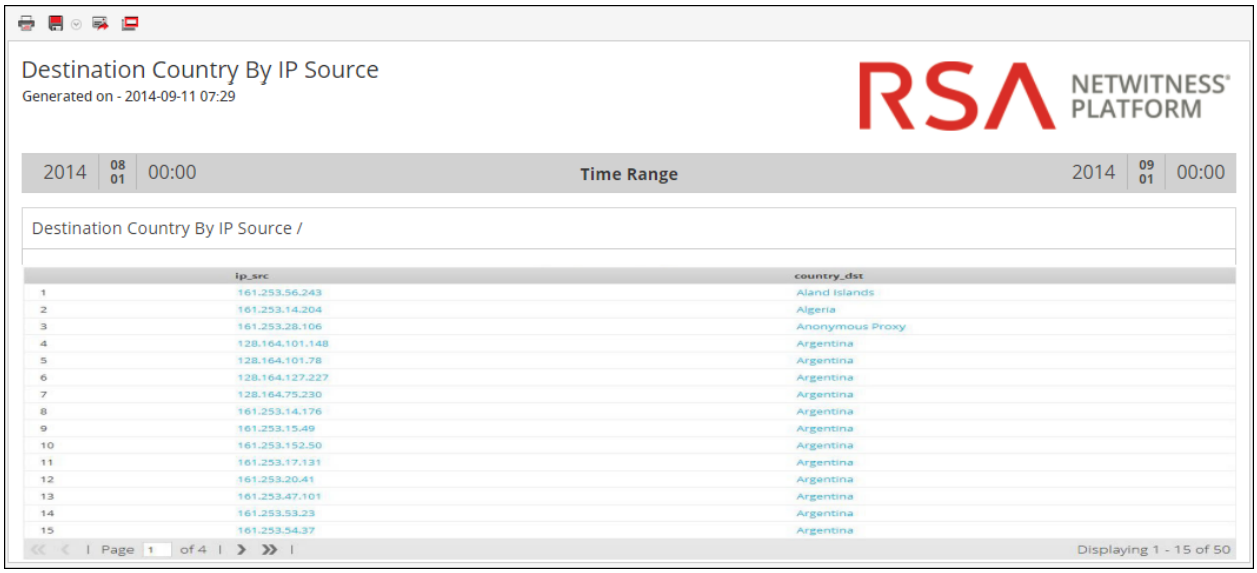
From: sessions

Alias: ip_src, country_dst

Where: device_class IS NULL && country_dst IS NOT NULL

Group By: country_dst, ip_src

Having:



Order By:

Column Name	Sort By
Enter the column name...	Ascending

Limit: 50

Use | Save | Reset | Test Rule

The following figure shows the result set of the IP Source and Destination Event Categories rule.

Destination Country By IP Source

Time Threat Categories Report

This rule fetches the threat category events, the time the log or event was ingested into Log Decoder/Decoder, and the source IP addresses from the **sessions**table by defining alias names (temporary column names) for each of these fields to be fetched from the table.

Build Rule

Rule Type: Warehouse DB

Expert Mode: ☐

Name: by Time Threat Categories

Select: time, threat_category, ip_src

From: sessions

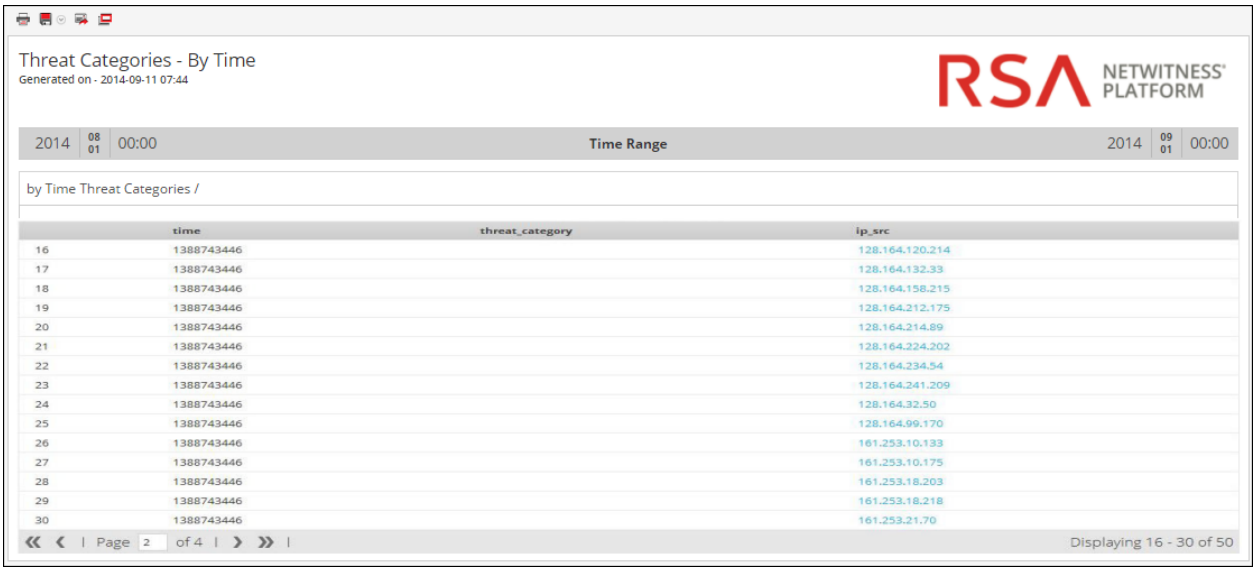
Alias: time, threat_category, ip_src

Where: device_class IS NULL

Group By: time, threat_category, ip_src

Having:

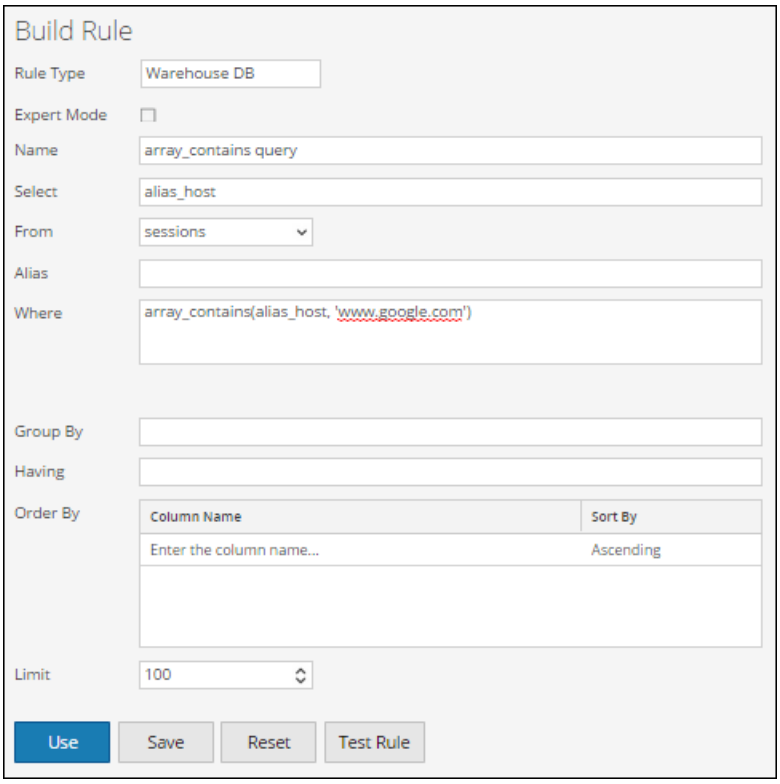
Order By:



Column Name	Sort By
Enter the column name...	Ascending

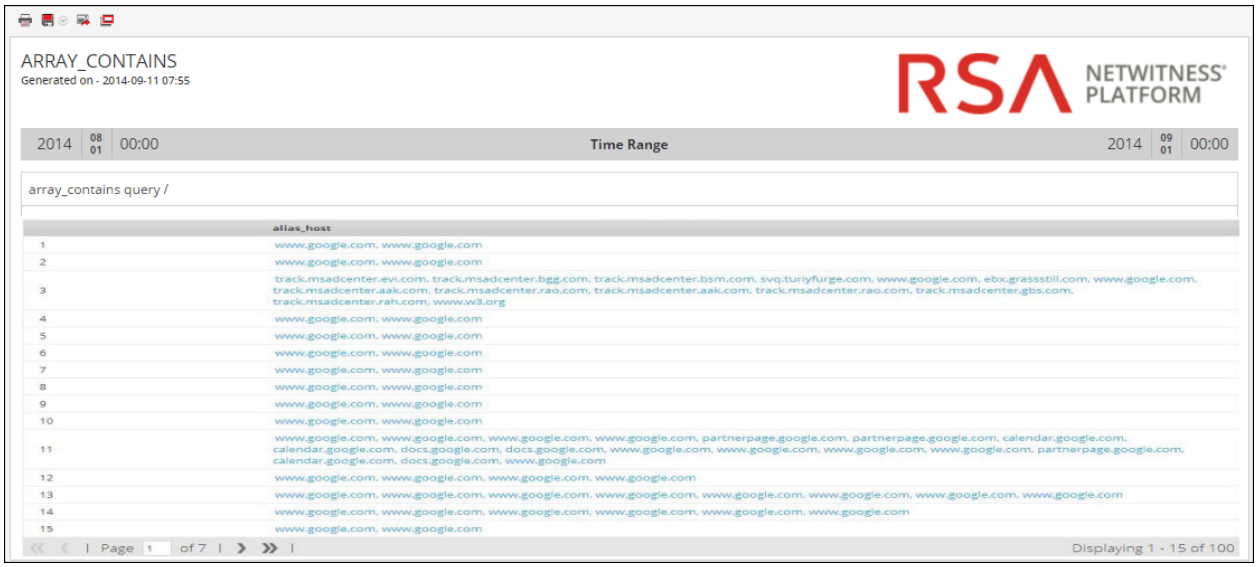
Limit: 20

Use | Save | Reset | Test Rule



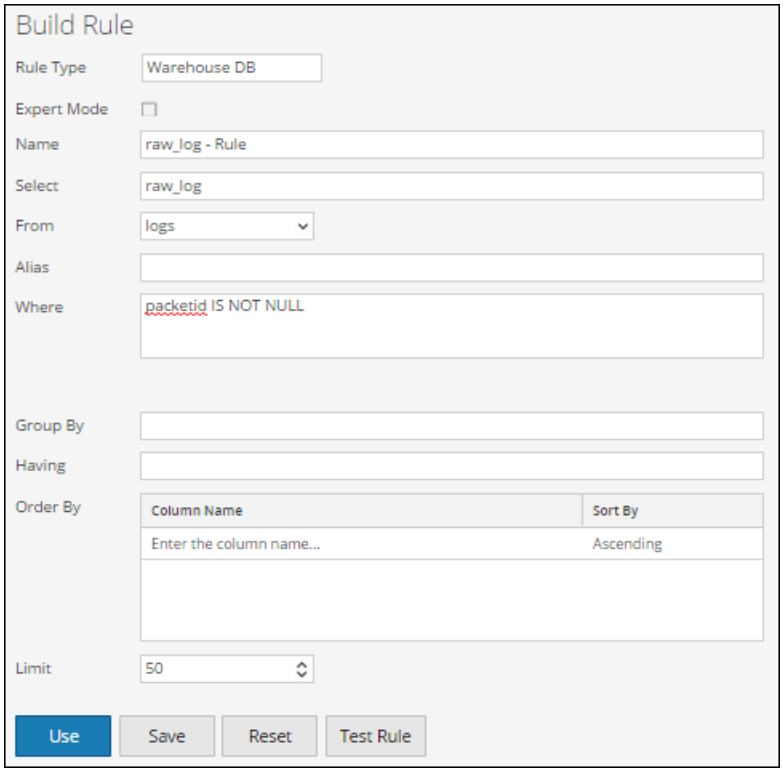
The following figure shows the result set of the by Time Threat Categories rule. The time displayed in the time field is the UNIX time (For example, 1388743446).

Note: In the “Select” clause the syntax would be “UNIX time” to convert to UTC time in report. For example, you can use the Epoch time converter tool to convert UNIX time (1388743446) to UTC (Coordinated Universal Time) (1/3/2014 3:34:06 PM).

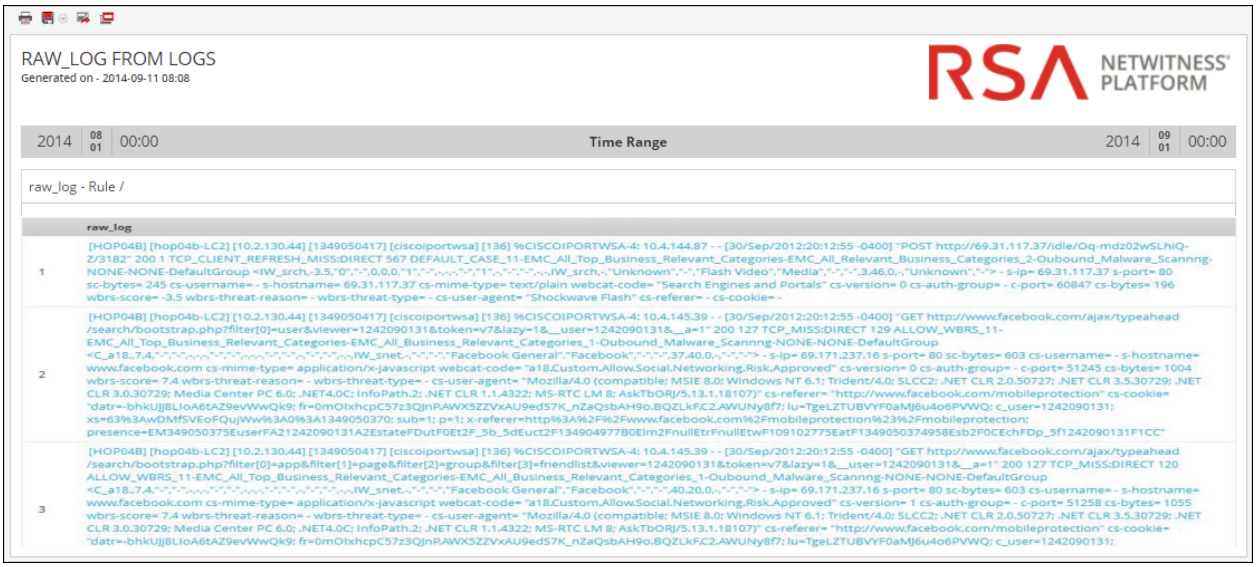


Array Query Report

This rule fetches an array of alias host names from the **sessions** table which contains the value 'www.google.com'.



The following figure shows the result set for querying an array from sessions.



Raw Log Query Report

Raw logs can be queried either from the logs or sessions table.

This rule uses **raw_log** as a meta for querying raw log from logs whose packet ID is NOT NULL.

The following figure shows the result set for querying raw logs from logs.

Warehouse DB Advanced Rules Syntax

The section explains the advanced rules query syntax and examples.

General Syntax of an Advanced Rule

The following figure shows how to define an advanced query.

The following syntax is an example of an advanced query:

```
DROP Table IF EXISTS sessions21022014;
CREATE External TABLE sessions21022014
ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.AvroSerDe'
STORED AS INPUTFORMAT
'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
 OUTPUTFORMAT 'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat'
LOCATION '/RSA/rsasoc/v1/sessions/data/2013/12/2'
TBLPROPERTIES('avro.schema.literal'='
 {
"type":"record";
"name":"nextgen";
"fields":
 [
 {"name":"time",  "type":["long", "null"], "default":"null"},
{"name":"threat_category",  "type":["string", "null"], "default":"null"},
```

```
{"name":"ip_src",  "type":["string", "null"], "default":"null"},
{"name":"device_class",  "type":["string", "null"], "default":"null"}
 ]
 '};
set mapred.input.dir.recursive=true;
set hive.mapred.supports.subdirectories=true;
```

select `from_unixtime(time), threat_category, ip.src` from `time_variable` where `threat_category` is not `NULL` and `time >= ${report_starttime}` and `time <= ${report_endtime};`

Note: Reporting Engine treats a line beginning with <hyphen> <hyphen> as a comment in Expert Warehouse Rule.
For example,

```
set mapred.input.dir.recursive=true;
-- This is an Expert comment
 set hive.mapred.supports.subdirectories=true;
```

The general syntax of an advanced query is as explained below:

1. Drop and create an external table, and then format the row:
   Firstly, we drop the table, if the table already exists and create an external table **sessions21022014**

   ```
   DROP TABLE IF EXISTS sessions21022014
    CREATE EXTERNAL TABLE sessions21022014
   ```

   Note: You must create an external table only if you are using an other table. For example, if you are using an other table apart from **sessions21022014** then you must drop the table and create an external table.

   Then, specify the row format as Avro.SerDe interface to instruct HIVE as to how a record is to be processed. Avro.SerDe allows you to read or write Avro data as HIVE tables and store them as input format and output format.

   ```
   ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.Avro.SerDe'
    STORED AS INPUTFORMAT
   'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
    OUTPUTFORMAT 'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat'
   ```

2. Specify the HDFS location:
   Secondly, you must specify the HDFS location '/RSA/rsasoc/v1/sessions/data/2013/12/2' from where the data is queried before executing the HIVE statements.The location parameter specifies the data to be fetched depending on the date input provided. This is a variable parameter hence you can fetch values depending on the date entered.

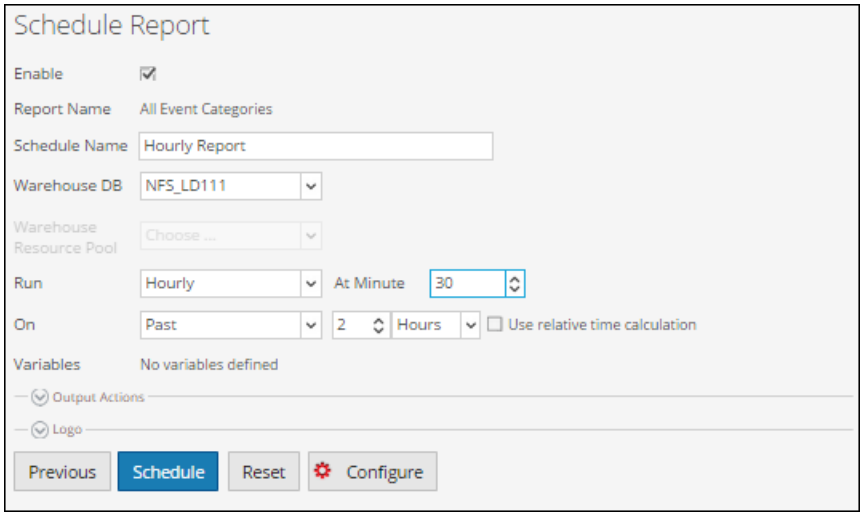
3. Define the table schema:
   Thirdly, you define the table schema by defining columns with a specific data type and default value as 'null'.

   ```
   TBLPROPERTIES('avro.schema.literal'='
    {"type":"record";
    "name":"nextgen";
    "fields":
    [
    {"name":"ip_src",  "type":["string", "null"], "default":"null"}
    ]
    '};
   ```

4. Import data from directory which contains sub directories:
   Then, you must enable HIVE to recursively scan all sub-directories and fetch all the data from all sub-directories.
   ```
   set mapred.input.dir.recursive=true;
   set hive.mapred.supports.subdirectories=true;
   ```
5. Fetch data from the HIVE table:
   Once you execute all the above statements, you can query the database with the HIVE query **select** clause to fetch the data from the HIVE table.

The following examples illustrate advanced rules in the expert mode:

- Hourly, daily, weekly, and monthly report
- Table partition based on location report
- Join logs and sessions based on unique_id report
- List report
- Parameterized report
- Partition based table with multiple locations
- Automated partition using custom function (10.5.1 onwards)



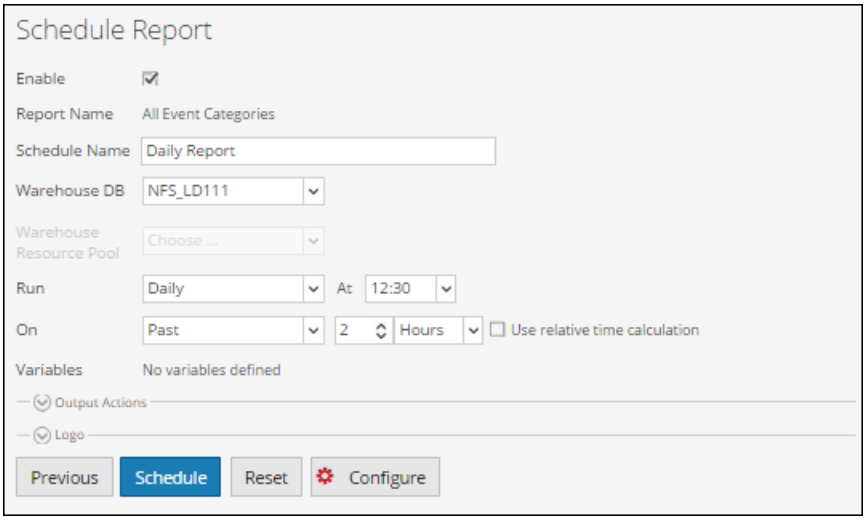
Hourly, Daily, Weekly, and Monthly Report

In these example rules, you can create various reports for December 02, 2013 (as in the below figure). The date variable in the LOCATION statement can be altered, depending on which you can create an hourly, daily, weekly, and monthly report.

Hourly Report

In this example rule, you can create an houly report for December 02, 2013. The LOCATION statement can be altered to generate an hourly report.

LOCATION '/RSA/rsasoc/v1/sessions/data/2013/12/2' - the date input (2013/12/2) indicates year/month/day. The entire data for 02 December, 2013 is retrieved using this location statement.

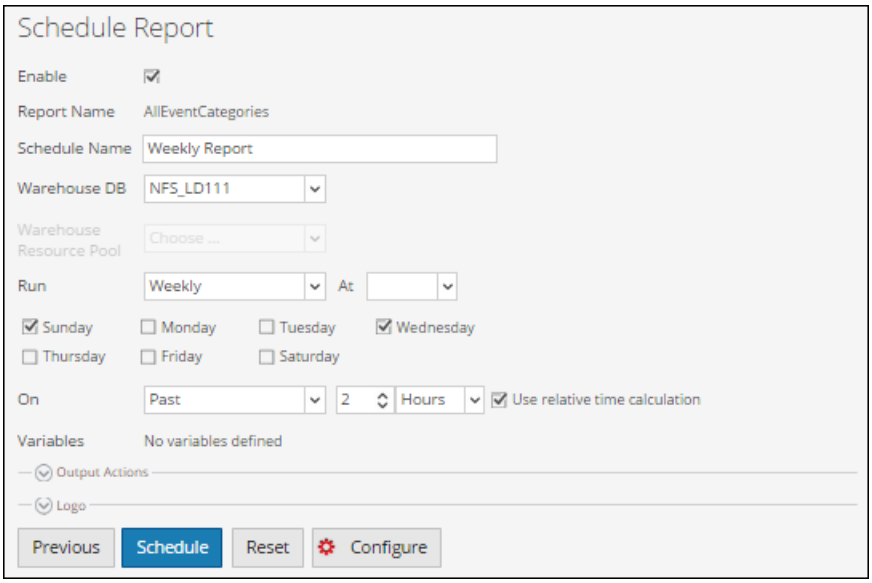


The result set of this query would be an hourly report.

Daily Report

In this example rule, you can create a daily report for December 2013. The LOCATION statement can be altered to generate a daily report.

LOCATION '/RSA/rsasoc/v1/sessions/data/2013/12' - the date input (2013/12) indicates year/month. The entire data for December, 2013 is retrieved using this location statement.

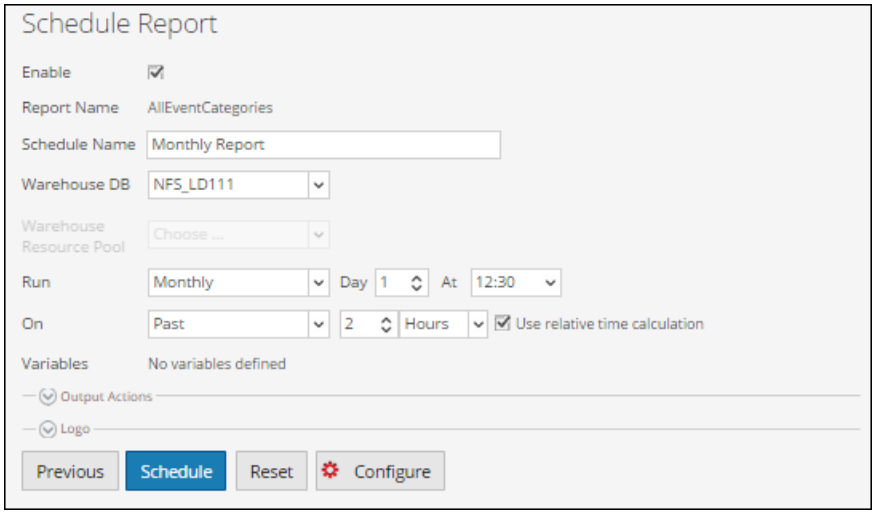


The resultset of this query would be a daily report.

Weekly Report

In this example rule, you can create a weekly report for December 2013. The LOCATION statement can be altered to generate a weekly report.

LOCATION '/RSA/rsasoc/v1/sessions/data/2013/12' - the date input (2013/12) indicates year/month. The entire data for December, 2013 is retrieved using this location statement.

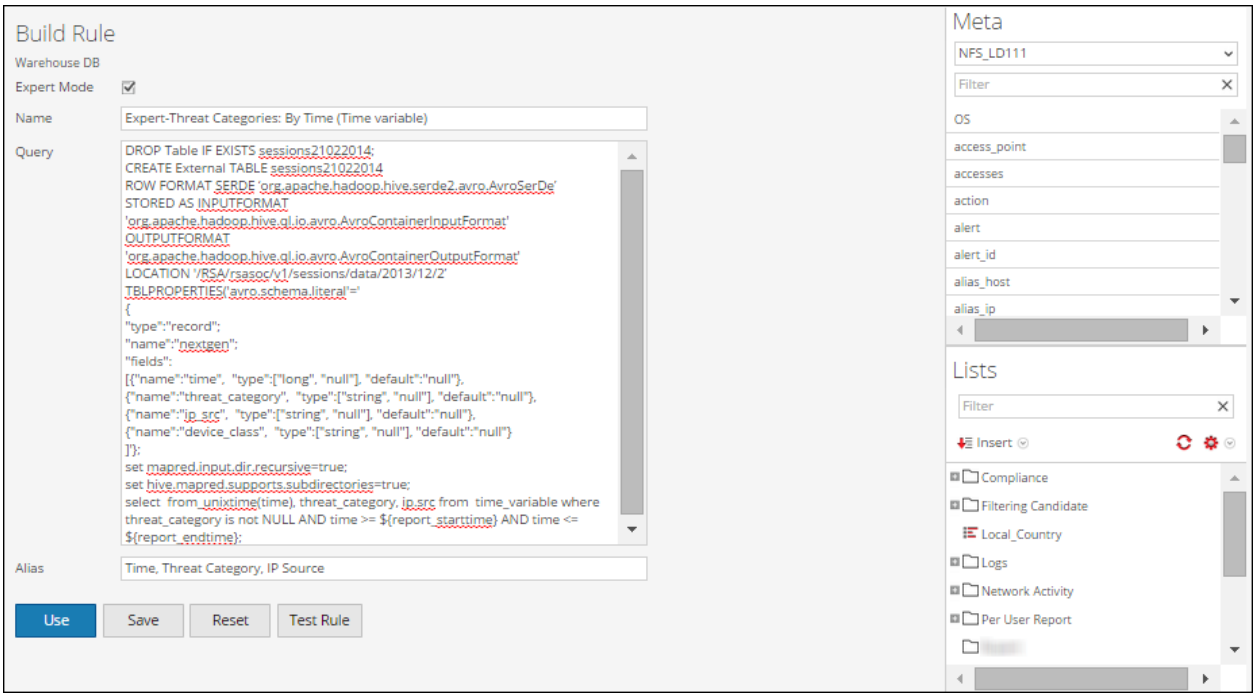


The result set of this query would be a weekly report.

Monthly Report

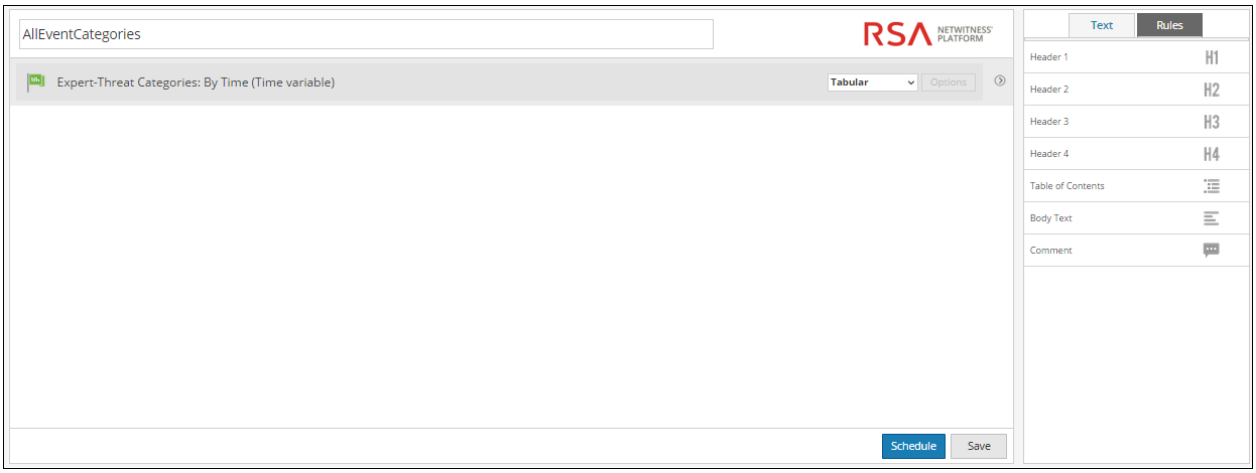
In this example rule, you can create a monthly report for the year 2013. The LOCATION statement can be altered to generate a monthly report.

LOCATION '/RSA/rsasoc/v1/sessions/data/2013' - the date input (2013) indicates year. The entire data for the year 2013 is retrieved using this location statement.



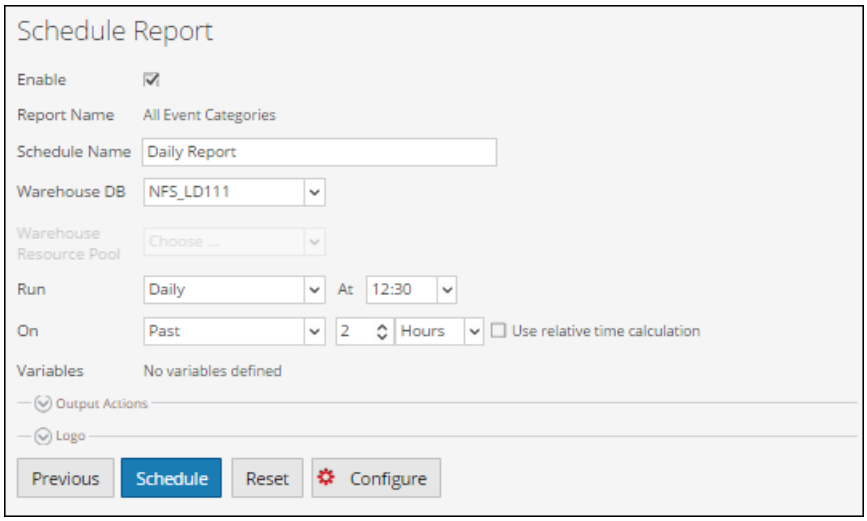
The result set of this query would be a monthly report.

For more information on LOCATION definition, see **Specify the HDFS location** in the **"General Syntax of an Advanced Rule"** section.



You must perform the following steps in sequence to view the resultset of an advanced rule:

1. Define an Advanced Rule
2. Add an advanced rule to a Report
3. Schedule a Report
4. View a scheduled Report



The following figure shows how to define an advanced rule.

The following figure shows how to add an advanced rule to a report (For example, **AllEventCategories**).

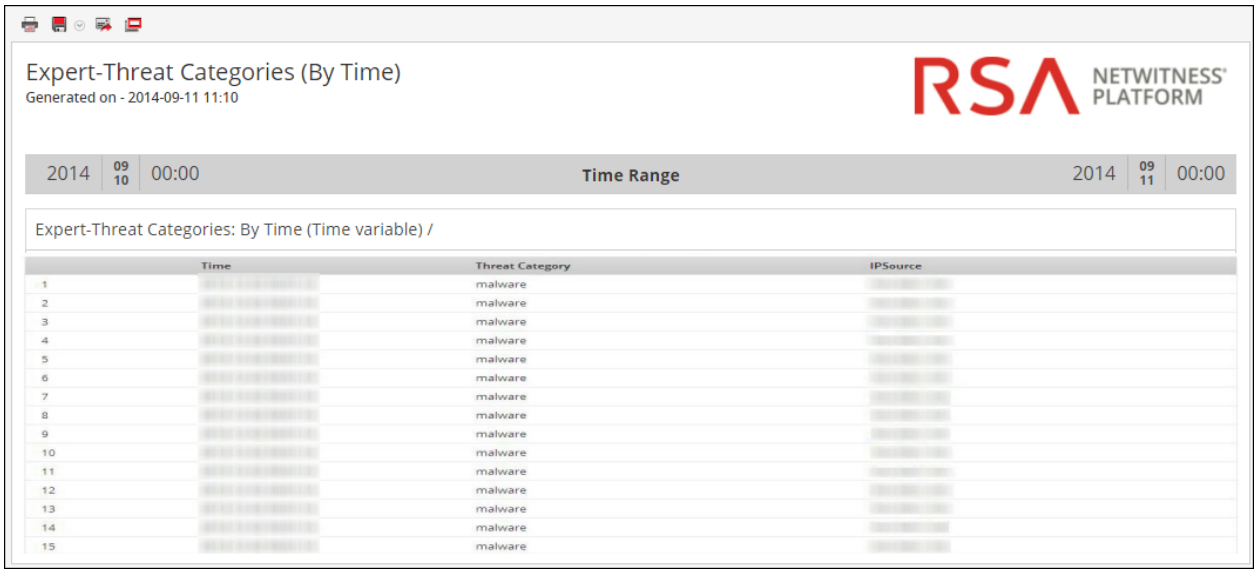
The following figure shows how to schedule a daily report.

If you want to generate a report for a specific time range, you need to manually define the time range in the query using the following two variables:

`${report_starttime} - The starting time of the range in seconds.`
`${report_endtime} - The ending time of the range in seconds.`

For example, `SELECT from_unixtime(time), threat_category, ip.src FROM time_variable WHERE threat_category is not NULL AND time >= ${report_starttime} AND time <= ${report_endtime};`

The following figure shows the result set of scheduling a daily report.



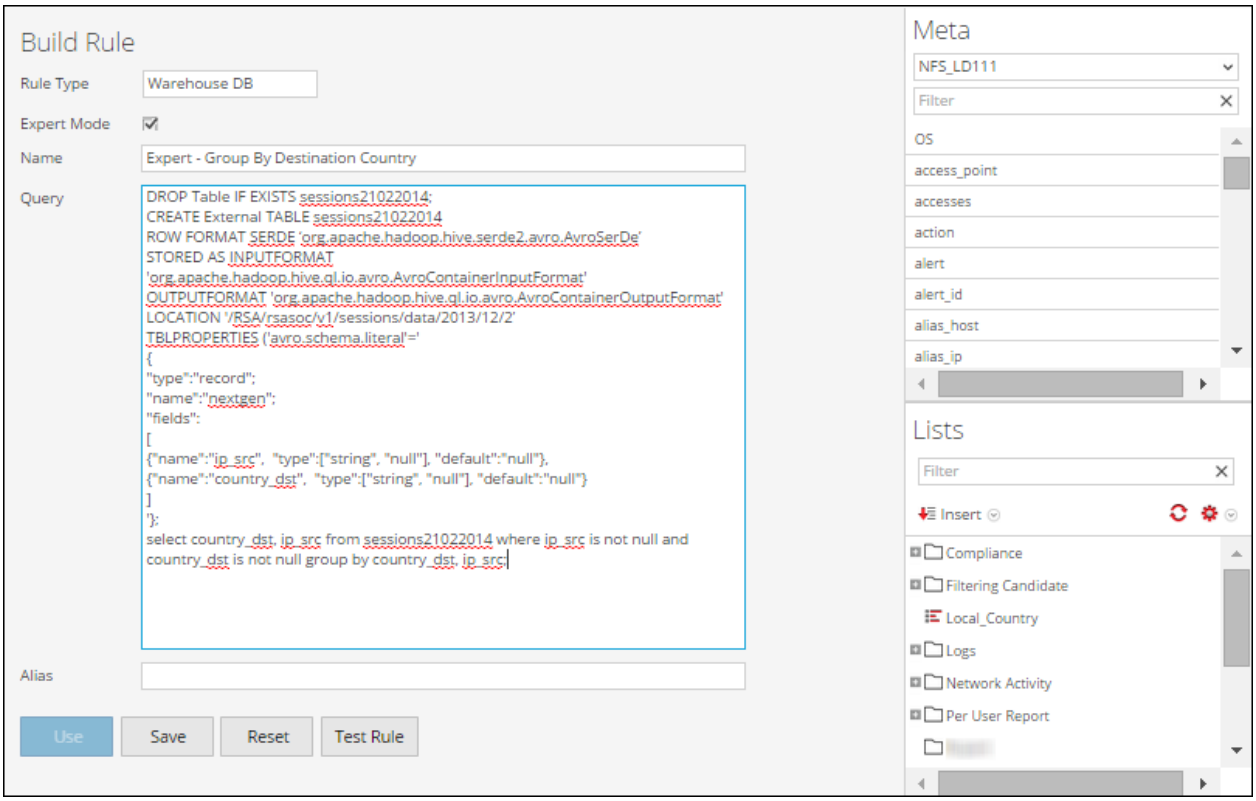


Table Partition Based on Location Report

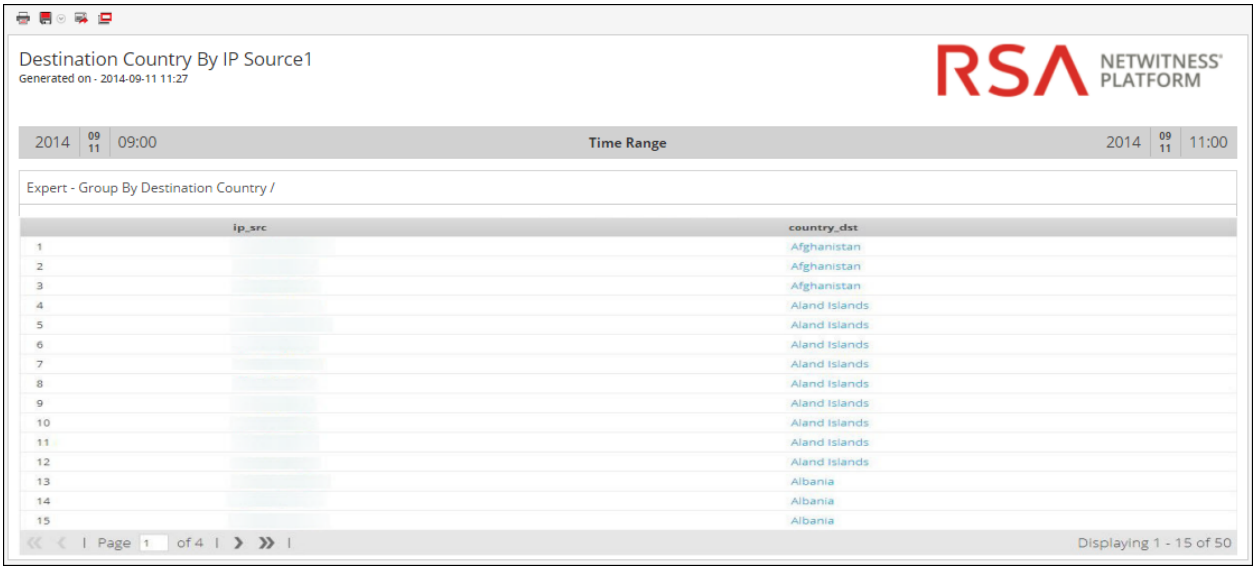
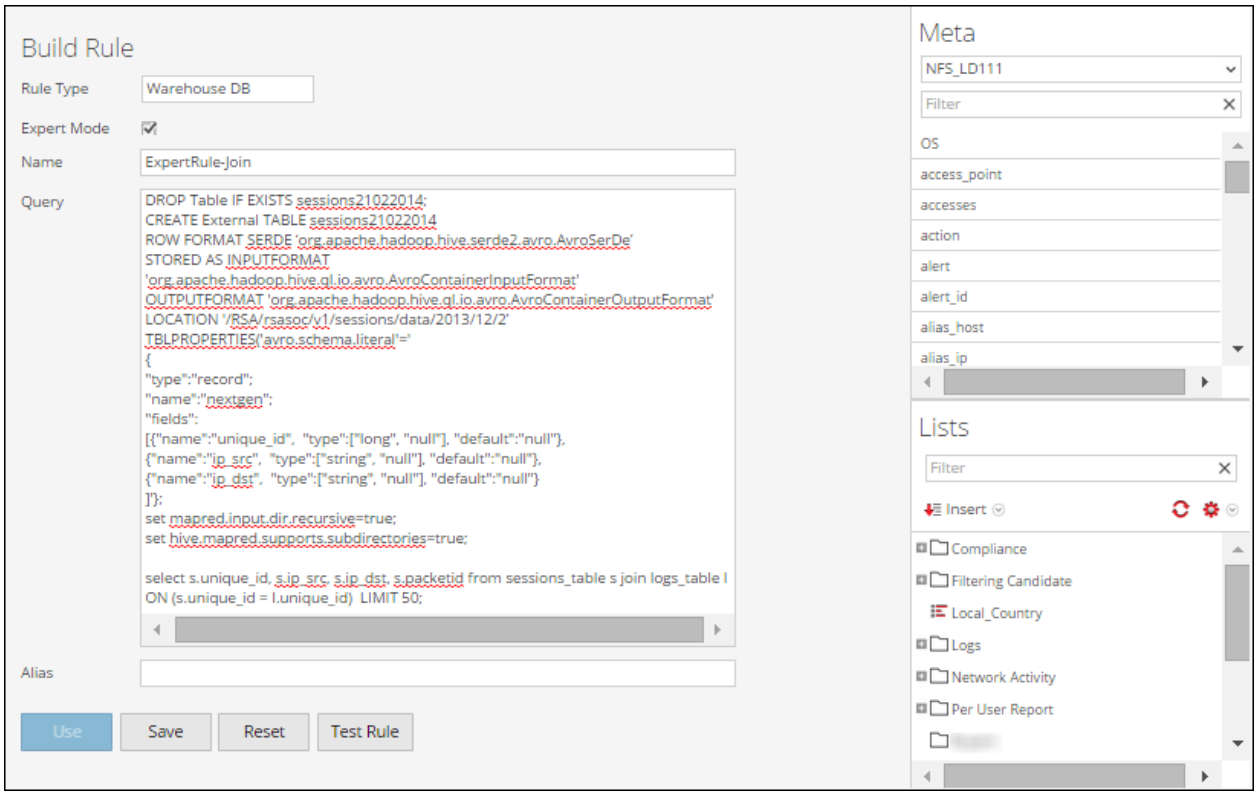


In this example rule, you can create a table partition based on location. Each table can have one or more partition keys which determines how the data is stored. For example, a country_dst of type STRING and an ip_src of type STRING. Each unique value of the partition keys defines a partition of the table.

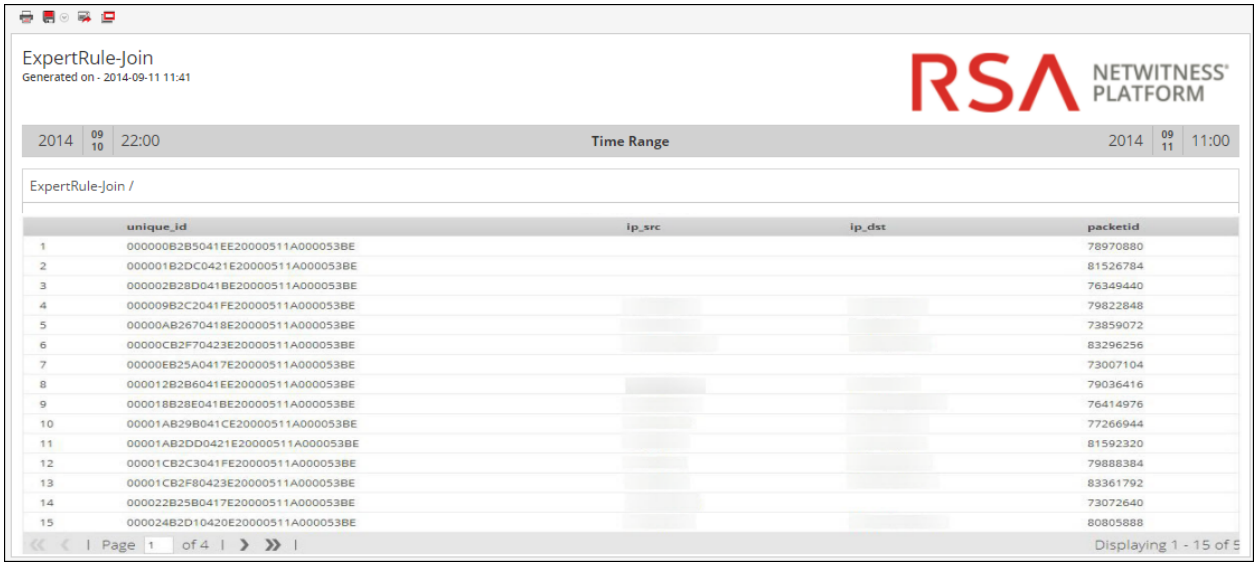
In the example provided, we execute a HIVE query to fetch destination country and IP address of source from the sessions05032014 table and group the result set by these fields.

This rule provides information about the table created, row formatted, location (directory path) for avro data files in Warehouse, and returns a result set as per the HIVE query to indicate that the query returned a result set. For more information on these statements, see "General Syntax of an Advanced Rule" section.

The following figure shows the result set of creating a table partition based on location report.



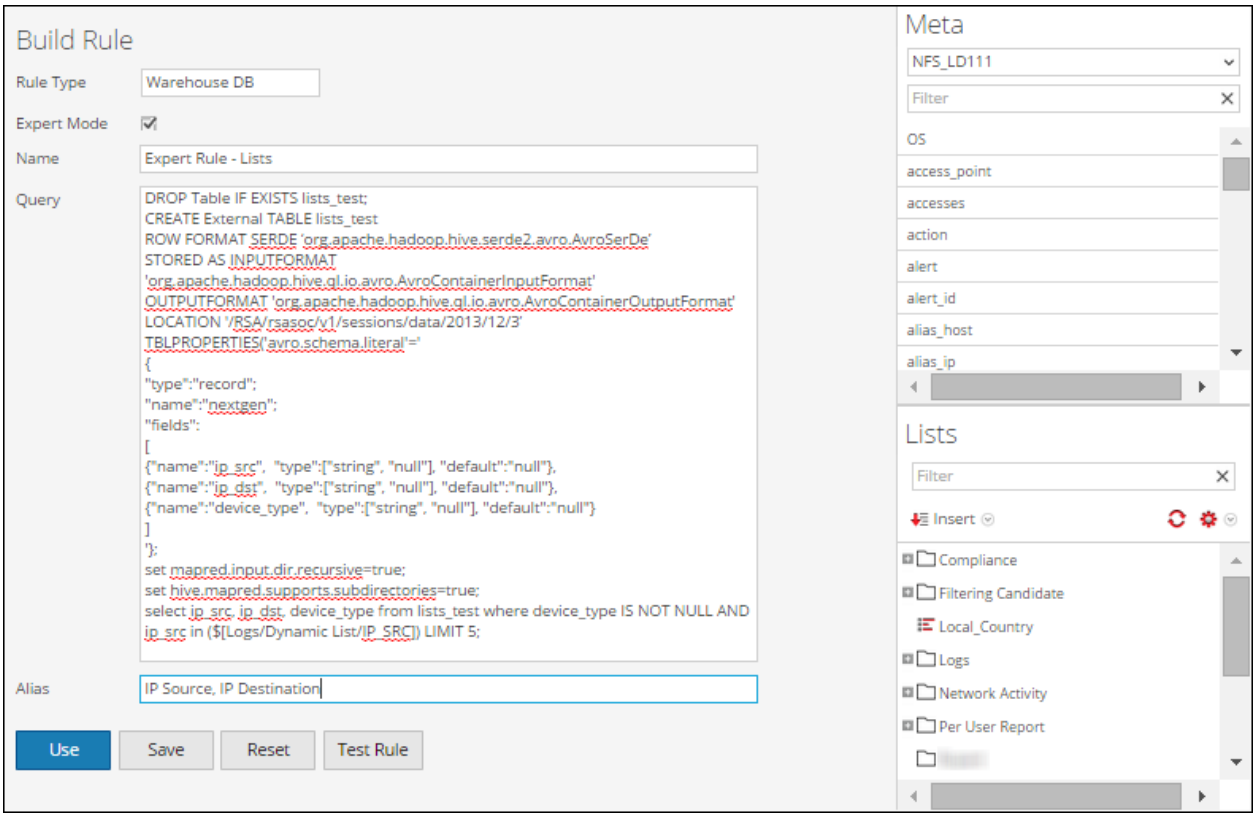
Join Logs and Sessions Based on unique_id Report



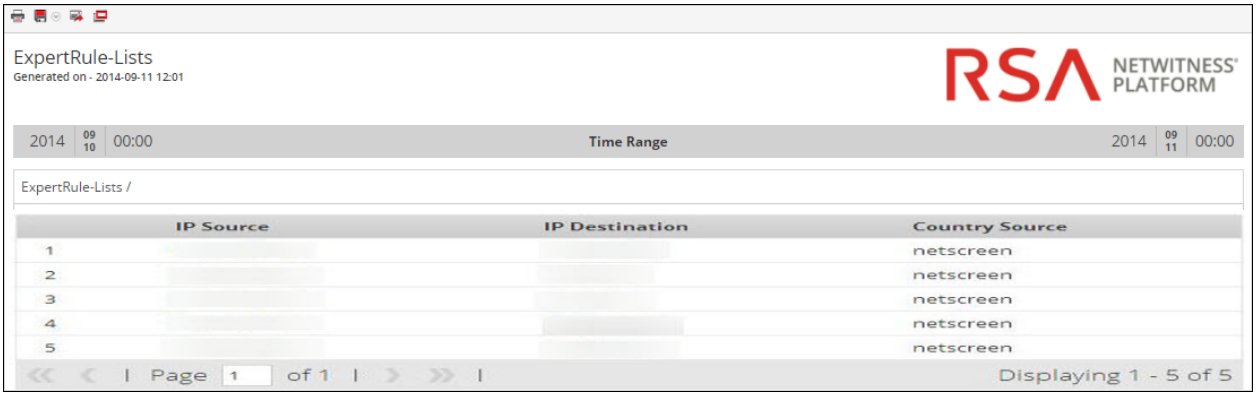
In this example rule, you can create a rule to join logs and sessions table to fetch unique_id, IP address of source and destination, and packet ID based on unique_id.

In the example provided, we execute a HIVE query to fetch certain fields from both the sessions_table and logs_table by performing a join based on the 'unique_id' field.

This rule provides information about the table created, row formatted, location (directory path) for avro data files in Warehouse, and returns a result set as per the HIVE query to indicate that the query returned a result set. For more information on these statements, see the **"General Syntax of an Advanced Rule"** section.



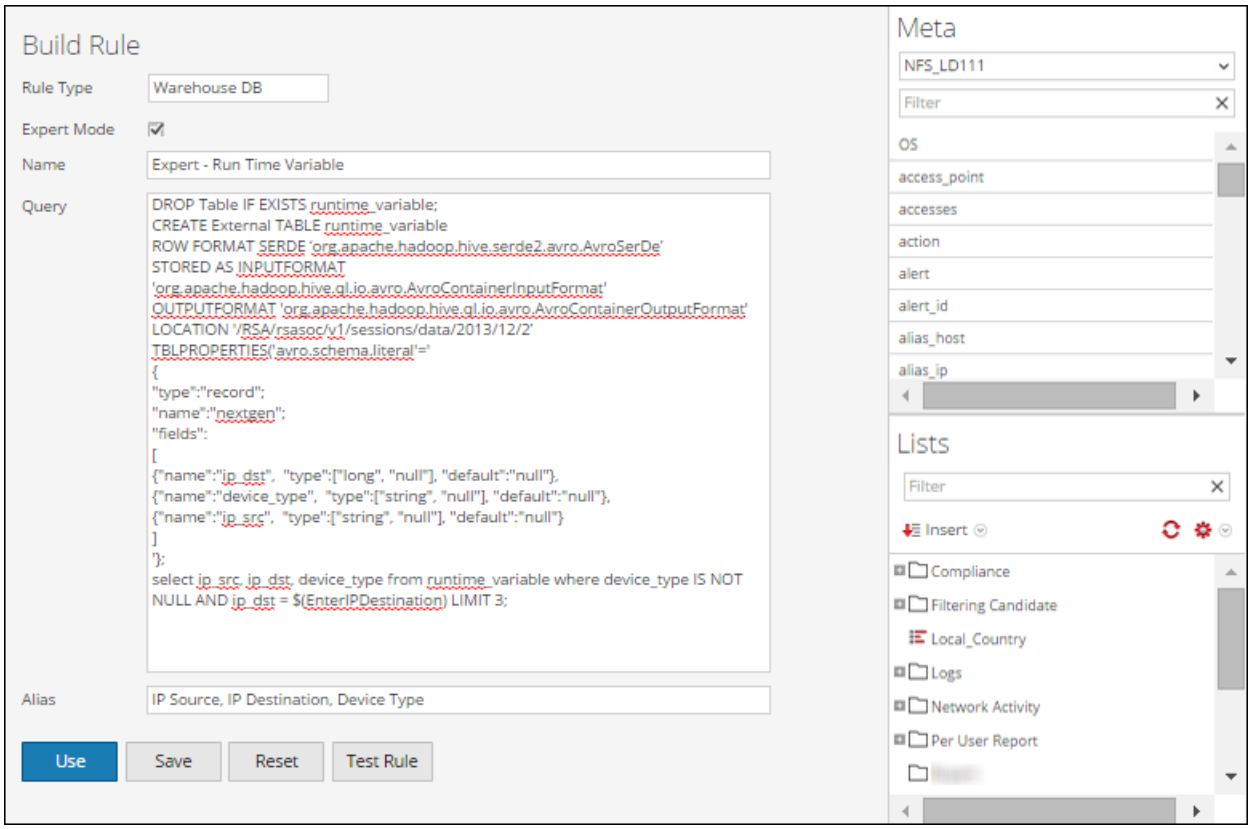
The following figure shows the result set of joining logs and sessions table based on unique_id.



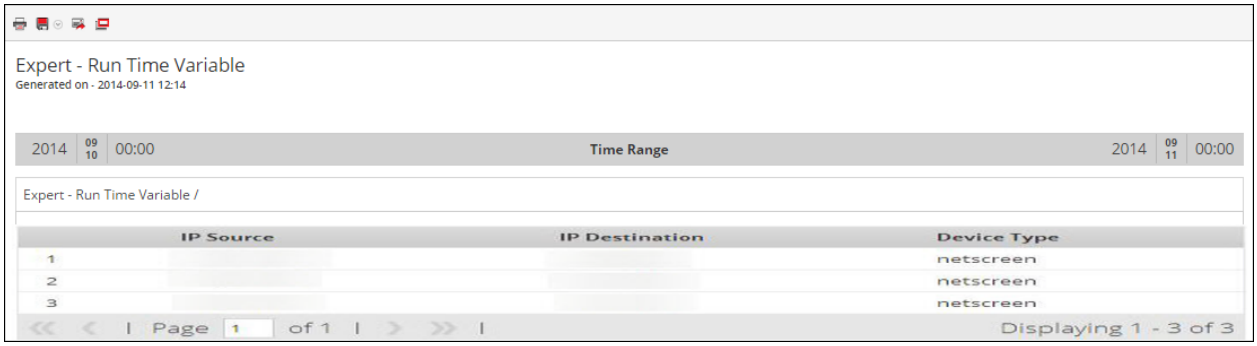
List Report

In this example rule, you can create a List report to fetch IP address of source and destination, and device type from the **lists_test** table where device type is not null and IP address of source is fetched from the appropriate event list.

This rule provides information about the table created, row formatted, location (directory path) for avro data files in Warehouse, and returns a result set as per the HIVE query to indicate that the query returned a result set. For more information on these statements, see the "General Syntax of an Advanced Rule" section.



The following figure shows the result set of executing a list report.



Parameterized Report

In this example rule, you can create a rule to fetch IP addresses of source and destination, and device type from the **runtime_variable** table based on the specified run time variable `${EnterIPDestination}`. At run time, you are prompted to enter a value for the IP address of destination ip_dst. Based on the value entered, the result set is displayed.

This rule provides information about the table created, row formatted, location (directory path) for avro data files in Warehouse, and returns a result set as per the HIVE query to indicate that the query returned a result set. For more information on these statements, see the "General Syntax of an Advanced Rule" section.

The following figure shows the result set of executing a parameterized report.

Partition Based Table with Multiple Locations

The following is an example of partition based table with multiple locations:

```
set mapred.input.dir.recursive=true;
 set hive.mapred.supports.subdirectories=true;
 DROP TABLE IF EXISTS AVRO_COUNT;
 CREATE EXTERNAL TABLE AVRO_COUNT
 PARTITIONED BY (partition_id int)
 ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.AvroSerDe'
 WITH SERDEPROPERTIES (
 'avro.schema.literal'='{
 "name": "my_record", "type": "record",
 "fields": [
 {"name":"sessionid", "type":["null", "long"], "default" : null},
 {"name":"time", "type":["null", "long"], "default" : null}
 ]}'
 )
 STORED AS
 INPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
 OUTPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=0) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/8';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=1) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/9';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=2) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/10/';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=3) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/11/';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=4) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/12/';
 SELECT COUNT(*) as TOTAL FROM AVRO_COUNT WHERE time >= ${report_
starttime} AND time
 <= ${report_endtime};
```

The partition based table with multiple location is as explained below:

1. Enable HIVE to recursively scan all sub-directories and read all the data from the sub-directories.
   ```
   set mapred.input.dir.recursive=true;
    set hive.mapred.supports.subdirectories=true;
   ```
2. Drop and create an external table, and then format the rows:
   ```
    DROP TABLE IF EXISTS AVRO_COUNT;
    CREATE EXTERNAL TABLE AVRO_COUNT
    PARTITIONED BY (partition_id int)
    ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.AvroSerDe'
    WITH SERDEPROPERTIES (
    'avro.schema.literal'='{
    "name": "my_record", "type": "record",
    "fields": [
    {"name":"sessionid", "type":["null", "long"], "default" : null},
    {"name":"time", "type":["null", "long"], "default" : null}
    ]}'
    )
   ```

```
STORED AS
INPUTFORMAT
'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
OUTPUTFORMAT
'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat';
```

Note: You must create an external table only if you are using any other table. For example, if you are using any other table apart from **AVRO_COUNT** then you must drop the table and create an external table.

Note: Points to remember when you create a table:
- Dropping a 'non-external' table deletes the data.
- The table is partitioned on a single column called partition_id and this is the standard column for Reporting Engine.
- The default value of any column is null as the AVRO file may not contain the specified column.
- The column names should be in the lowercase as HIVE is case insensitive but AVRO is case sensitive.
- You must specify **avro.schema.literal** in the *SERDEPROPERTIES* .

For more information on the "rule syntax", refer to *Apache HIVE*.

3. Add partitions:
   Once you define a table, you must specify the HDFS locations from where the data needs to be queried before you execute the HIVE statements.The location parameter specifies the data to be fetched depending on the specified date. The data is spread across multiple locations or directories in HDFS. For each location you need to add a partition with unique values assigned to the partition column. The locations can be any directory in the HDFS

```
ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=0) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/8';
ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=1) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/9';
ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=2) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/10/';
ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=3) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/11/';
ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=4) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/12/';
```

   Note: HIVE reads each file in these locations as AVRO. Incase if there is a non-AVRO file available in one of these locations then the query may fail.

4. Run the query

```
SELECT COUNT(*) as TOTAL FROM AVRO_COUNT WHERE time >= ${report_
starttime} AND time
<= ${report_endtime};
```

   When a table is created, you can execute specific queries to filter the data. For example, after you create the table you can filter the data as shown in the below examples:
   Sessions with a specific Source IP Address:

```
SELECT * FROM AVRO_COUNT WHERE time >= ${report_starttime} AND time
<= ${report_endtime}  AND ip_src = '127.0.0.1';
```

Group by based on user destination:

```
SELECT * FROM AVRO_COUNT WHERE time >= ${report_starttime} AND time
<= ${report_endtime}  GROUP BY usr_dst;
```

Automated Partition using Custom function

In 10.5.1, you can use the custom function to automate the addition of partitions to a user defined table in the expert mode.

General syntax

```
RE WH CUSTOM ADDPARTITIONS(table, namespace, rollup, [starttime,
endtime])
```

The following table describes the custom function syntax:

S.No	Name	Description
1	table	The table name for which the partition has to be added.
2	namespace	The namespace can be sessions or logs.
3	rollup	This value determines the level of directory path to be included in partitions. The value can be HOUR, DAY, or MINUTE. If Warehouse Connector is configured for Day rollup, setting this value as HOUR produces ZERO results. The number and location of each partition is based on time range used to run the rule and the rollup value.
4	(Optional) starttime, endtime	To generate partitions for a specific time range other than the time range mentioned in the rule, you must specify the starttime and endtime in **Epoch Seconds**. **Note:** Expressions are not supported for the starttime and endtime.

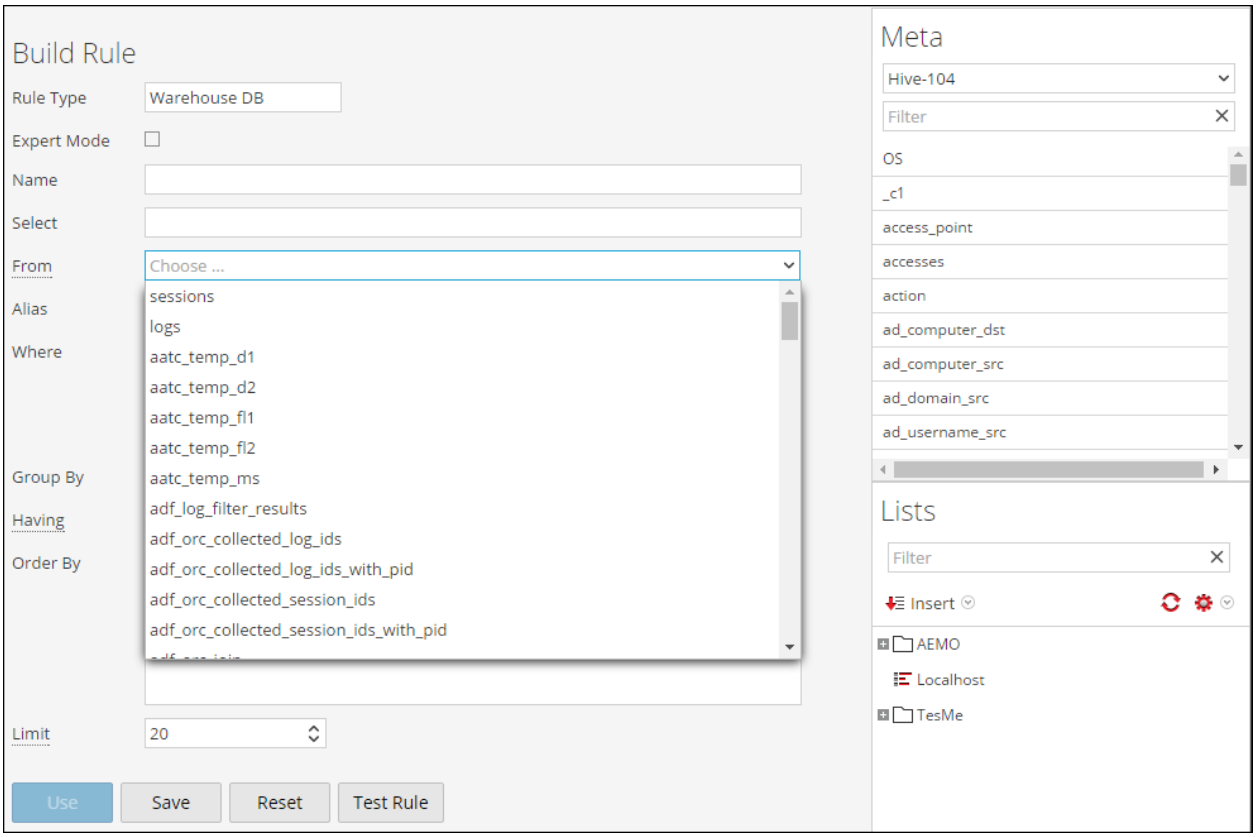
The custom function is invoked when Reporting Engine executes the rule either during test rule or scheduled report. While running a expert rule, whenever Reporting Engine identifies the function declaration, it extracts the required arguments and insert *n* number of ADD PARTITION HiveQL statements and executes them on the Hive Server.

The location and directory structure is determined by the argument passed in the rule and the Hive data source configuration in Reporting Engine. The number of partitions depends on the rollup specified and the time range used while executing the rule. For example, with the rollup as HOUR and the time range as PAST 2 Days results in 48 partitions for 48 Hours while with the rollup as DAY, Reporting Engine creates 2 partitions, one for each day.

The partition query is generated by the Syntax Template as set in Reporting Engine's Hive Configuration attribute AlterTableTemplate.

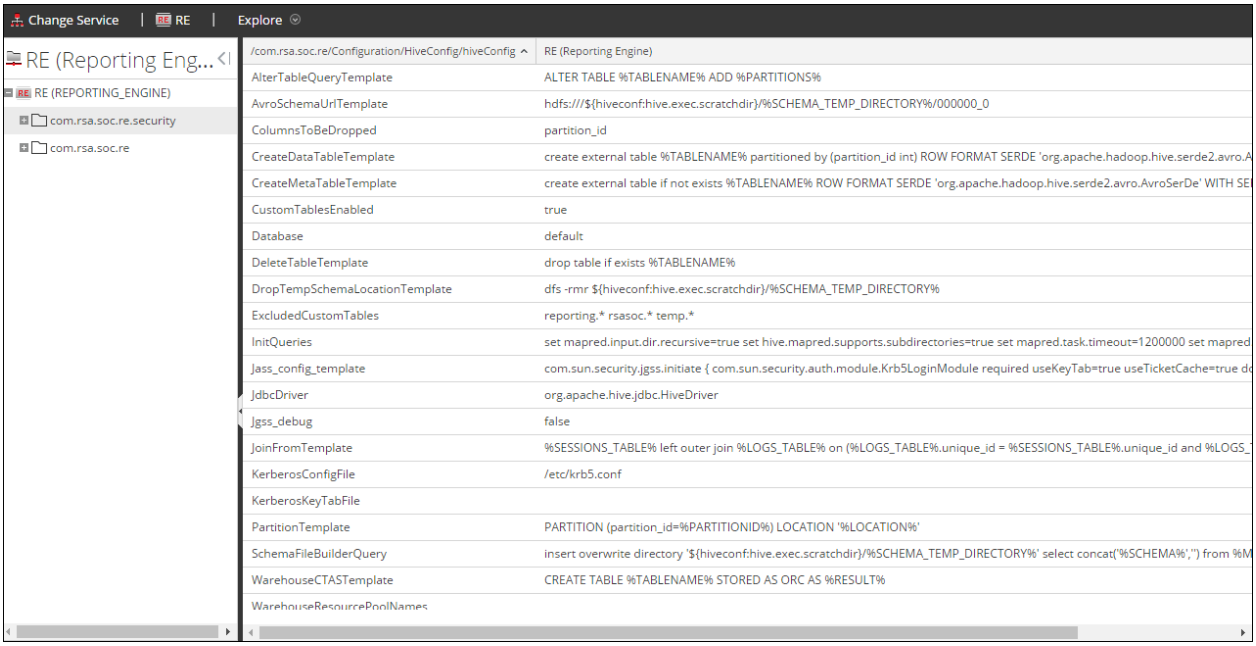
Note: By default, this function starts adding partitions to a table with partition id from 0 to N-1. Hence this requires that the table must be partitioned by single integer column named partition id.

The following is an example of automated partition using custom function:



```
set mapred.input.dir.recursive=true;
 set hive.mapred.supports.subdirectories=true;
 DROP TABLE IF EXISTS AVRO_COUNT;

CREATE EXTERNAL TABLE AVRO_COUNT
 PARTITIONED BY (partition_id int)
 ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.AvroSerDe'
 WITH SERDEPROPERTIES (
 'avro.schema.literal'='{
  "name": "my_record", "type": "record",
  "fields": [
  {"name":"sessionid", "type":["null", "long"], "default" : null}
  ,{"name":"time", "type":[ "null" , "long"], "default" : null}
  ,{"name":"unique_id", "type":["null", "string"], "default" : null}
  ]}'
 )
 STORED AS
 INPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
 OUTPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat';

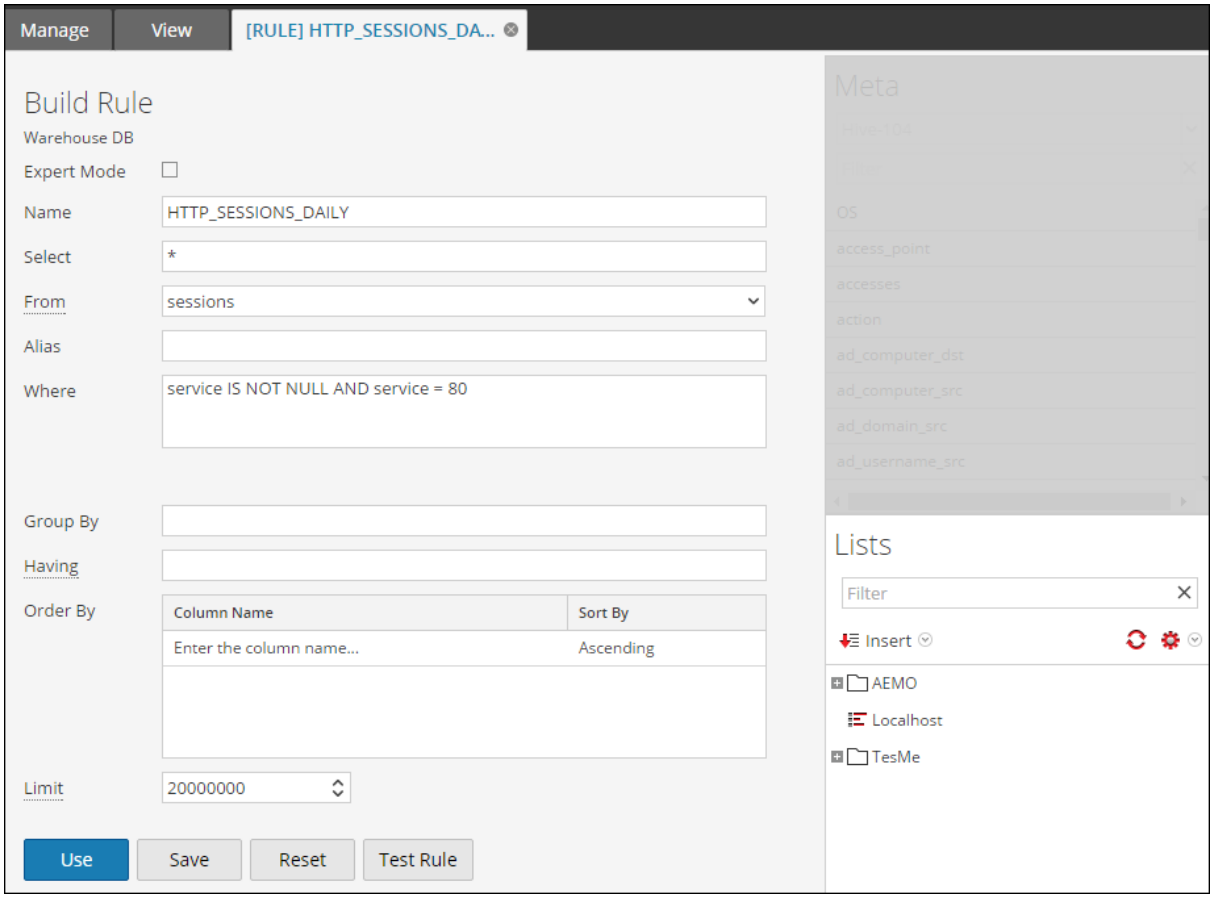


RE_WH_CUSTOM_ADDPARTITIONS(AVRO_COUNT, 'sessions', 'DAY');
 SELECT COUNT(*) as TotalSessions FROM AVRO_COUNT
 WHERE time >= ${report_starttime} AND time <= ${report_endtime};
```

Creating Custom Tables Report

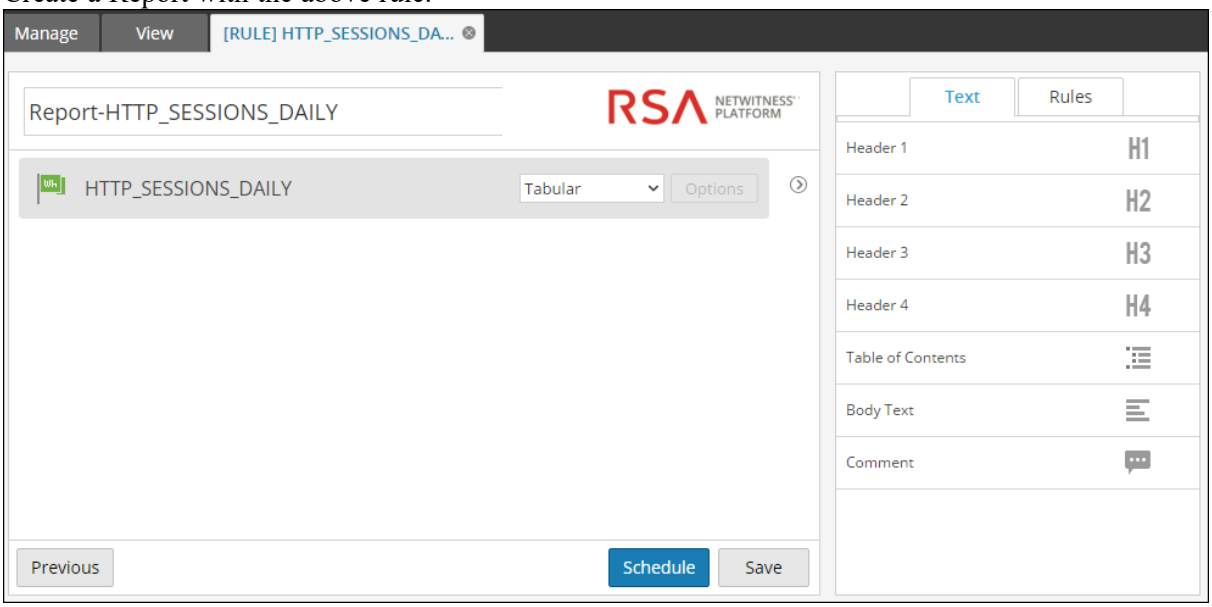
In 10.6.1, you can use and create Custom Tables on the Hive Server. Reporting Engine supports running queries on user defined tables and the ability to create a new table from a Single Rule output. When this feature is enabled in the Warehouse Rule Builder UI, user can see a list of custom tables available in Hive Server.

To enable this feature set **customTablesEnabled** to **TRUE** by navigating to **Reporting Engine** -> **Explore** ->**Hive Config**.



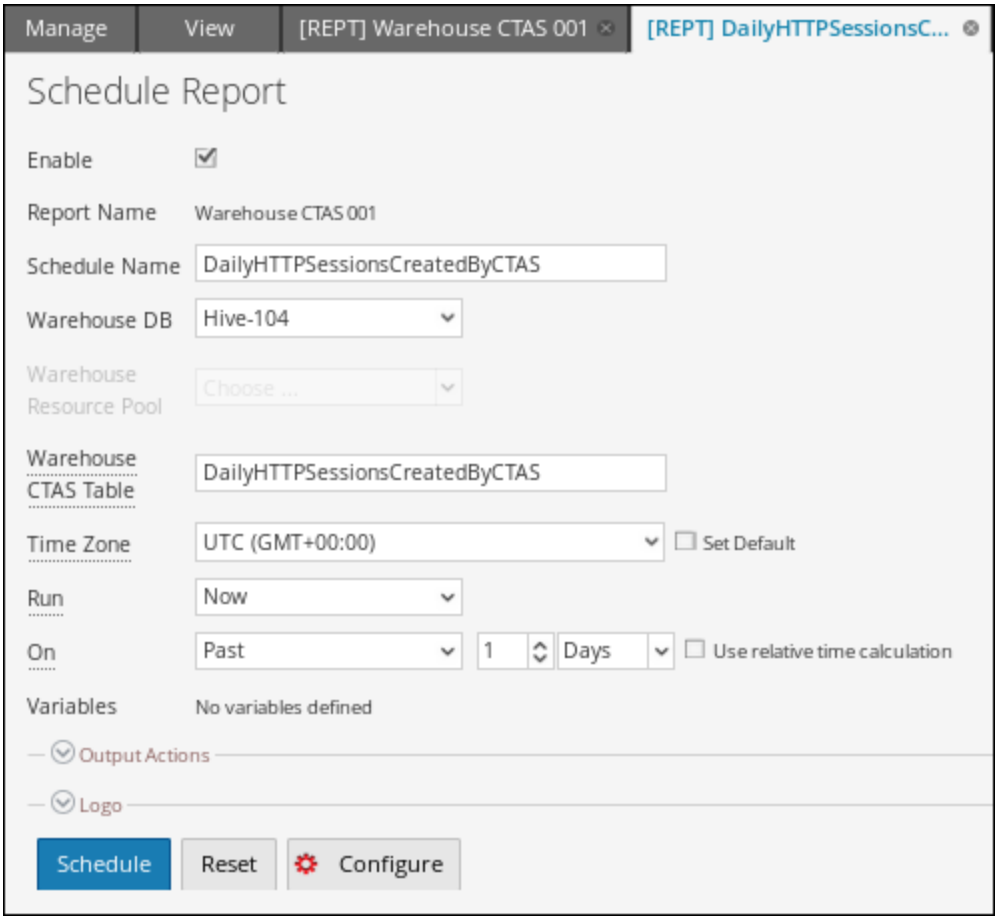
Creating Custom Table from Regular Rules

To schedule a report which contains a single SAW rule, a new text input with a **Warehouse CTAS Name** is added. The user can now specify a Custom Table name that will be created out of the output of the rule in Report.

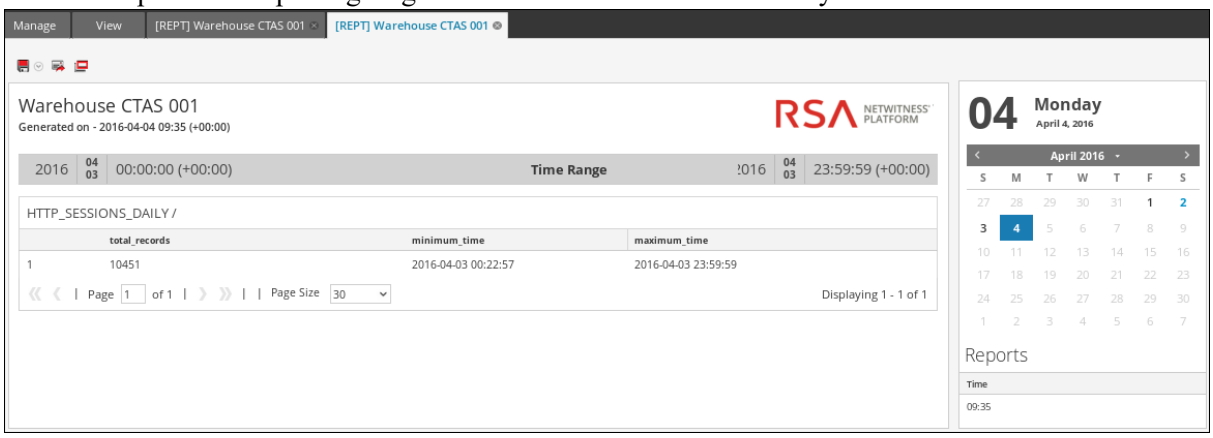


Note: This feature is available only if the Report contains a single SAW rule on the Schedule page. Otherwise, this option is hidden.

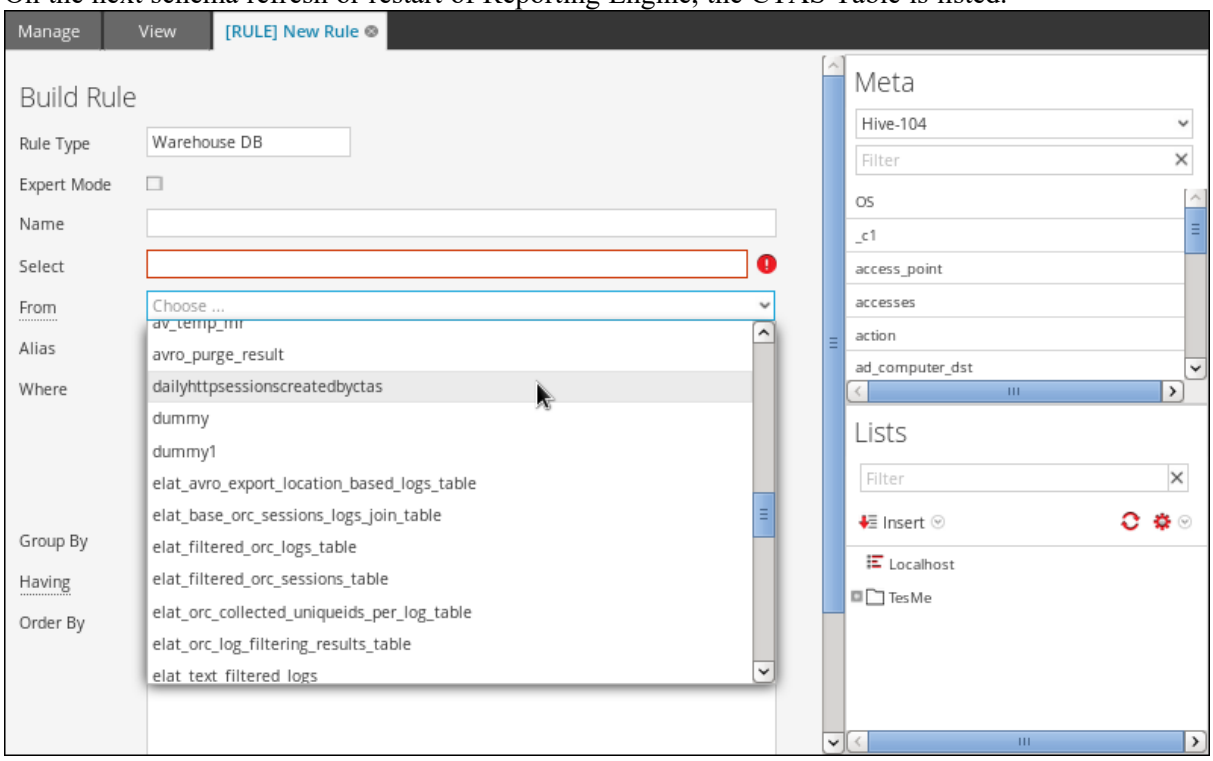
The process to use the feature is explained below:



1. Create a rule to filter with data in SAW.



2. Create a Report with the above rule.



3. Create a Schedule and enter the CTAS Table Name.

4. Run the Report and Reporting Engine will create the Result Summary as below for the Schedule.

5. On the next schema refresh or restart of Reporting Engine, the CTAS Table is listed.

Task Scheduler for Warehouse Reporting

A task scheduler in a Hadoop cluster schedules the jobs consisting of tasks, and allocates specific resources to each job running in a cluster. By default, the task scheduler allocates equal number of resources to all the jobs. For example, if 10 jobs are running they will share resources of the cluster equally. However, you can configure the task scheduler to control the execution of the jobs such that one job runs faster than others by allocating more resources (pools or queues) to the job. This helps you prioritize to run a few reports over others.

Features

NetWitness supports two task schedulers:

- Fair Scheduler (`org.apache.hadoop.mapred.FairScheduler`)
- Capacity Scheduler (`org.apache.hadoop.mapred.CapacityTaskScheduler`)

Fair Scheduler

This scheduler divides the total capacity of the cluster into logical pools. You can submit a job to any one of these pools. All the jobs submitted to a pool share the resources allocated to the pool only. Once a pool has free resources, the freed resources are given to other pools with jobs running. For example, a fair scheduler has 100% resources with two pools namely Pool A and Pool B which share the total resources at 40% and 60% respectively. If Pool A has four jobs running, it allocates 10% resources to each job. When the four jobs are completed, the freed resources are allocated to Pool B.

Note: You can configure a pool to run more than one job in parallel.

Capacity Scheduler

This scheduler divides the total capacity of the cluster into queues. Each queue is allocated a pre-configured share of the total capacity. A job may be submitted to any of these queues. If more than one job is submitted to the same queue, the jobs will be executed sequentially. For example, if a capacity scheduler has 100% resources with three queues namely the Default, Low and High and they share the total resources at 20%, 30% and 50% respectively. If Default has two jobs D1 and D2, Low has three jobs L1, L2 and L3, and High has four jobs H1, H2, H3 and H4, these jobs are executed in their respective queues sequentially. If the jobs in a queue are completed, the freed resources will not be distributed to other queues.

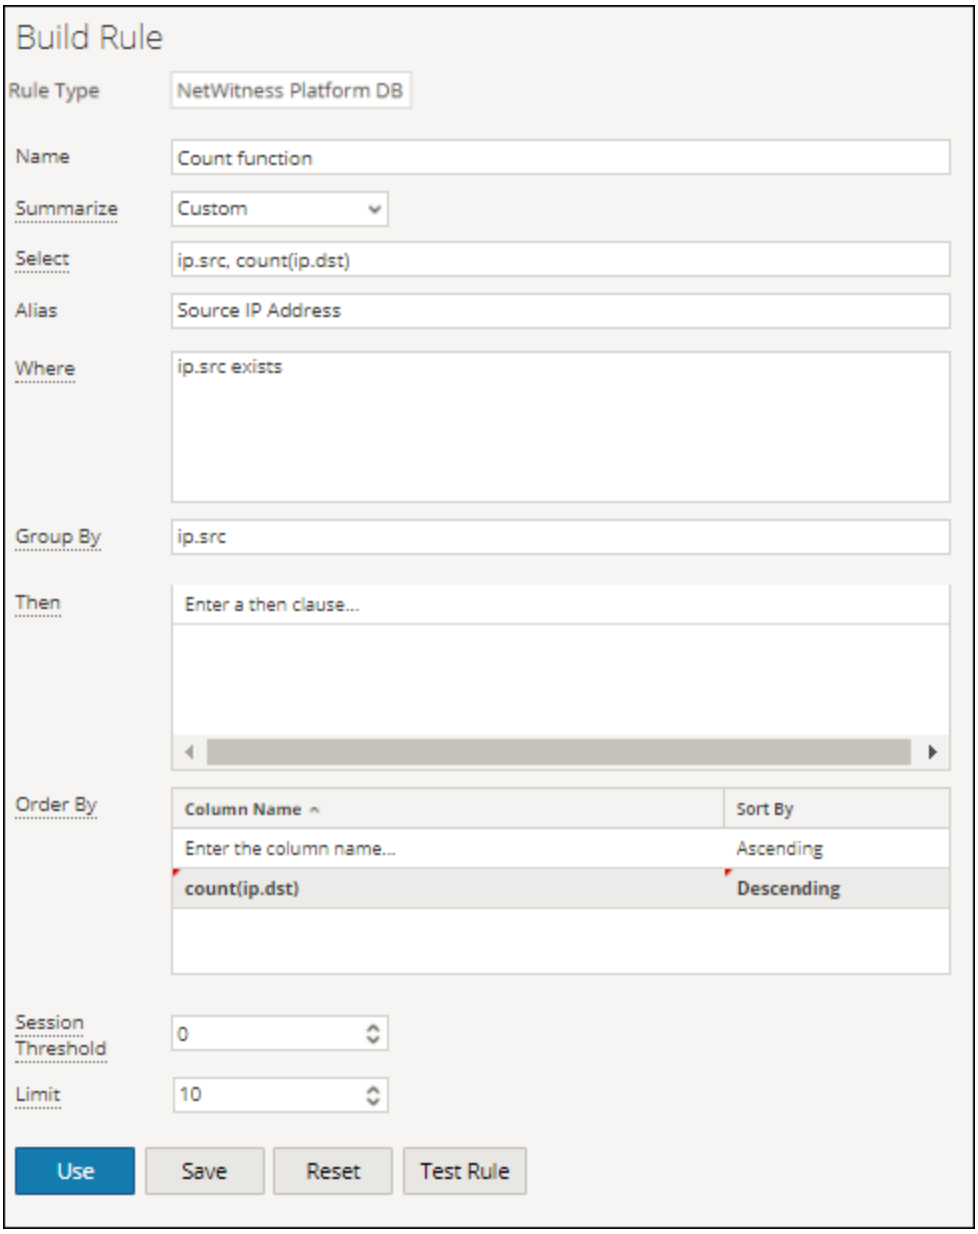
Query Aggregates

This section explains the supported aggregate functions.

Supported Aggregate Functions

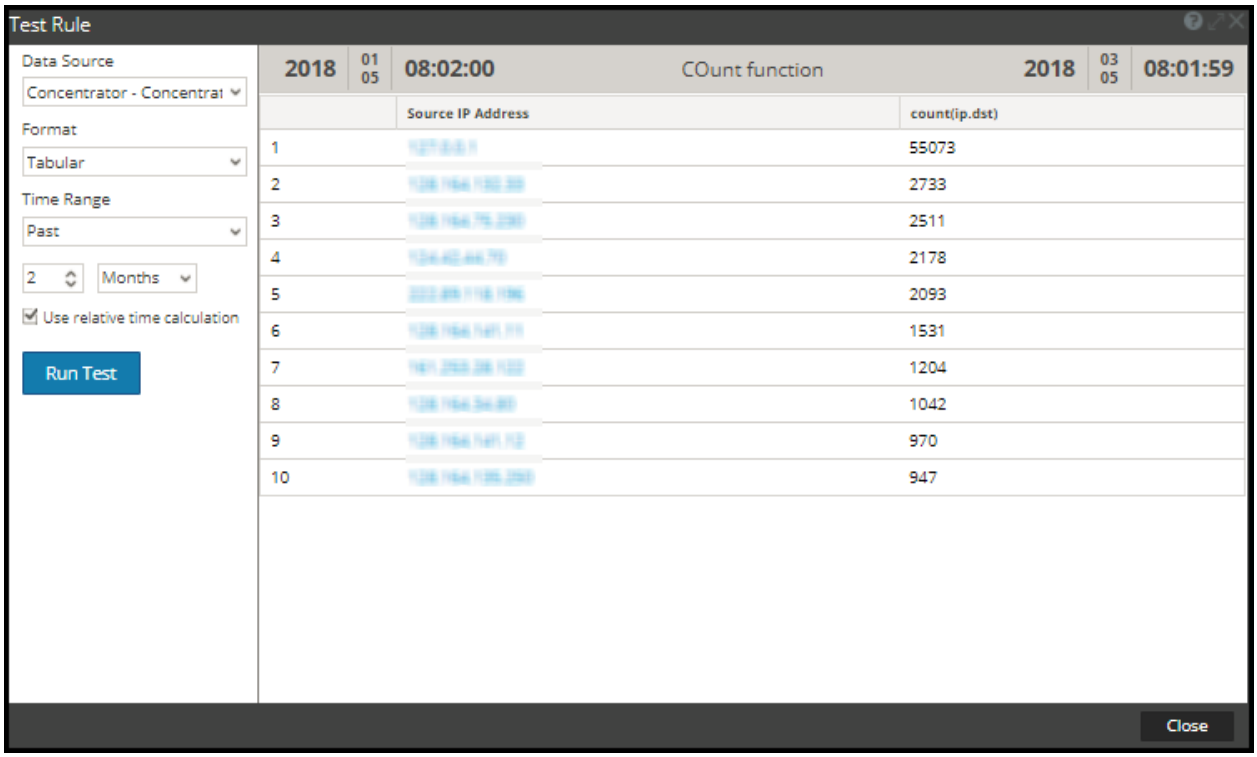
The following table lists the supported Aggregate Functions.

Aggregate Function	Description	Input data types	Output data types
count	Returns the count of meta values, which includes duplicate values as well.	Numeric	Numeric
countdistinct	Returns the total number of distinct or unique values.	Numeric	Numeric
distinct	Returns all the unique values.	Any	Any
first	Returns the first occurrence of the meta value.	Any	Same as input
last	Returns the last occurrence of the meta value.	Any	Same as input
sum	Returns a sum of all non-NULL values of metaKey in a group.	Numeric	Numeric
avg (Average)	Returns the average value of all non-NULL values of the metaKey within a group.	Numeric	Numeric
min (Minimum)	Returns the minimum for all values of metaKey in each group. This value is based on order by field.	Any	Any
max (Maximum)	Returns the maximum for all values of metaKey in each group. The maximum value is the value that is returned by order by field.	Any	Any
length	Returns the length of the values of metakey. This is called a "scalar function" in SQL.	Any	Numeric



Examples of Queries and Results per Function

Count



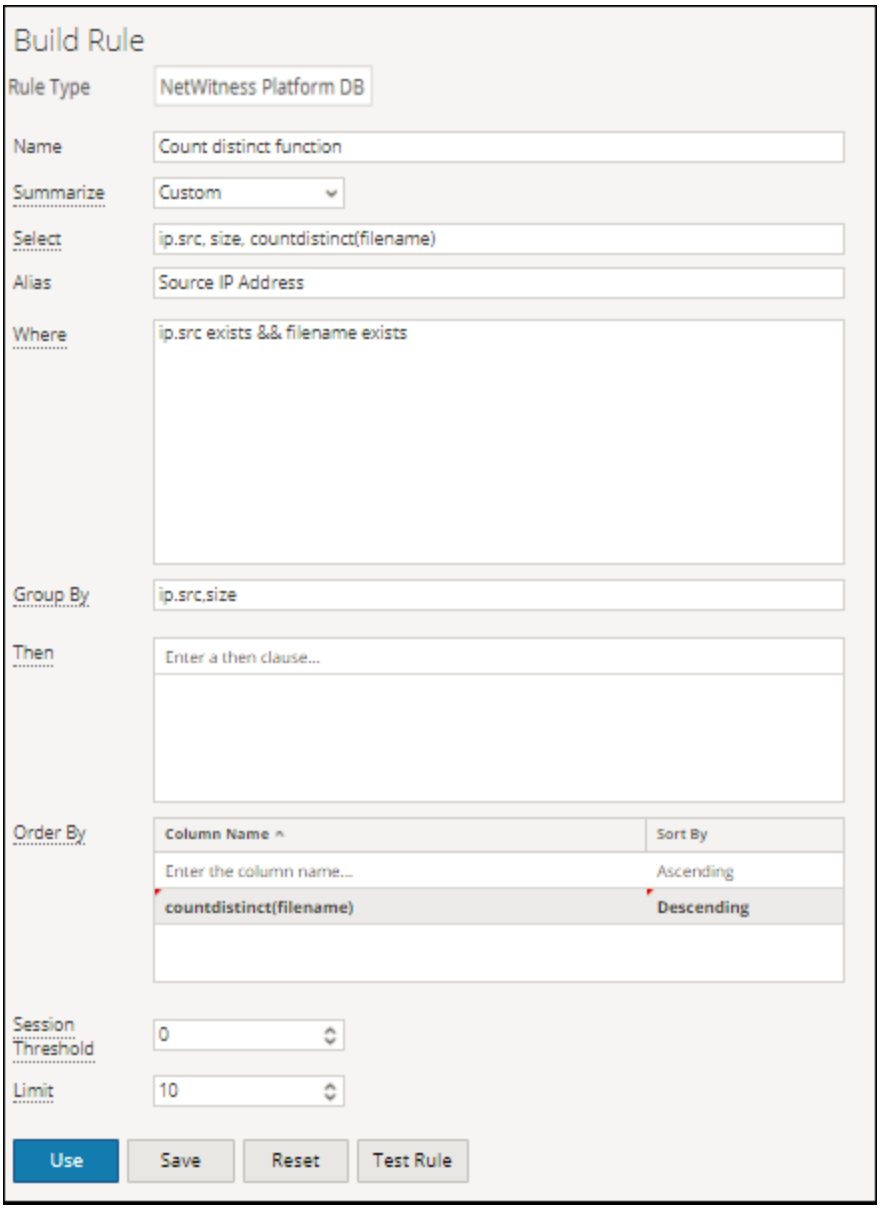
This function returns the number of values for a specified meta key, that exclude null values but include duplicate ones. .

Example

The following figure shows a sample query for count function used for the destination IP and the respective source IP.

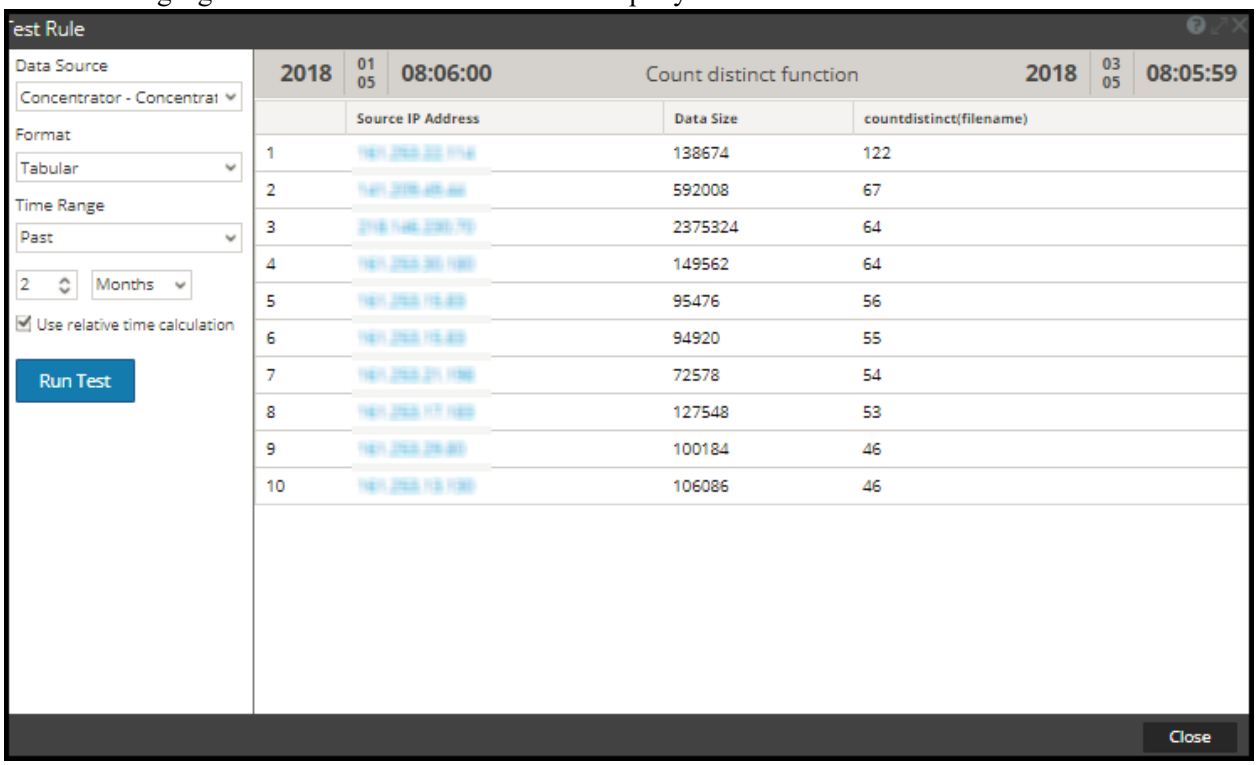
The following figure shows the result for the above query.

Here, for each unique ip.src (source IP), the page returns the total number or count of ip.dst (destination IP) values, which include the duplicate values as well.



Note: If your NetWitness is currently on 10.5 or newer version and any of the NetWitness Core devices are on 10.3 or 10.4 versions, then some of the aggregate functions may display unexpected errors. However, aggregate functions such as sum() and count() are supported in 10.4 version.

Countdistinct



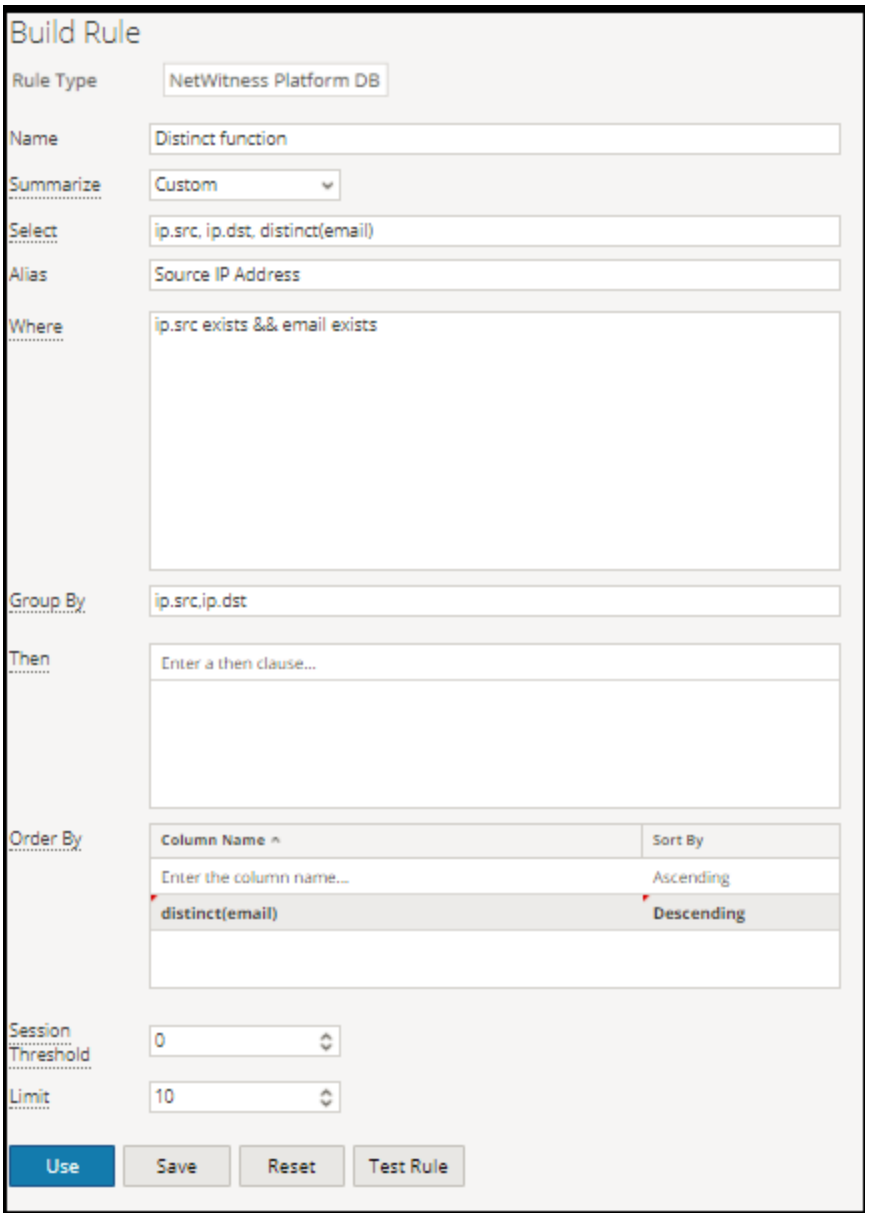
The countdistinct function returns the count of unique or distinct values for the metakey. In other words, countdistinct function can be used to retrieve a number of distinct values for the specified metakey.

The following figure shows a sample query where the countdistinct function is used along with IP source (ip.src) and data size(size).

Example

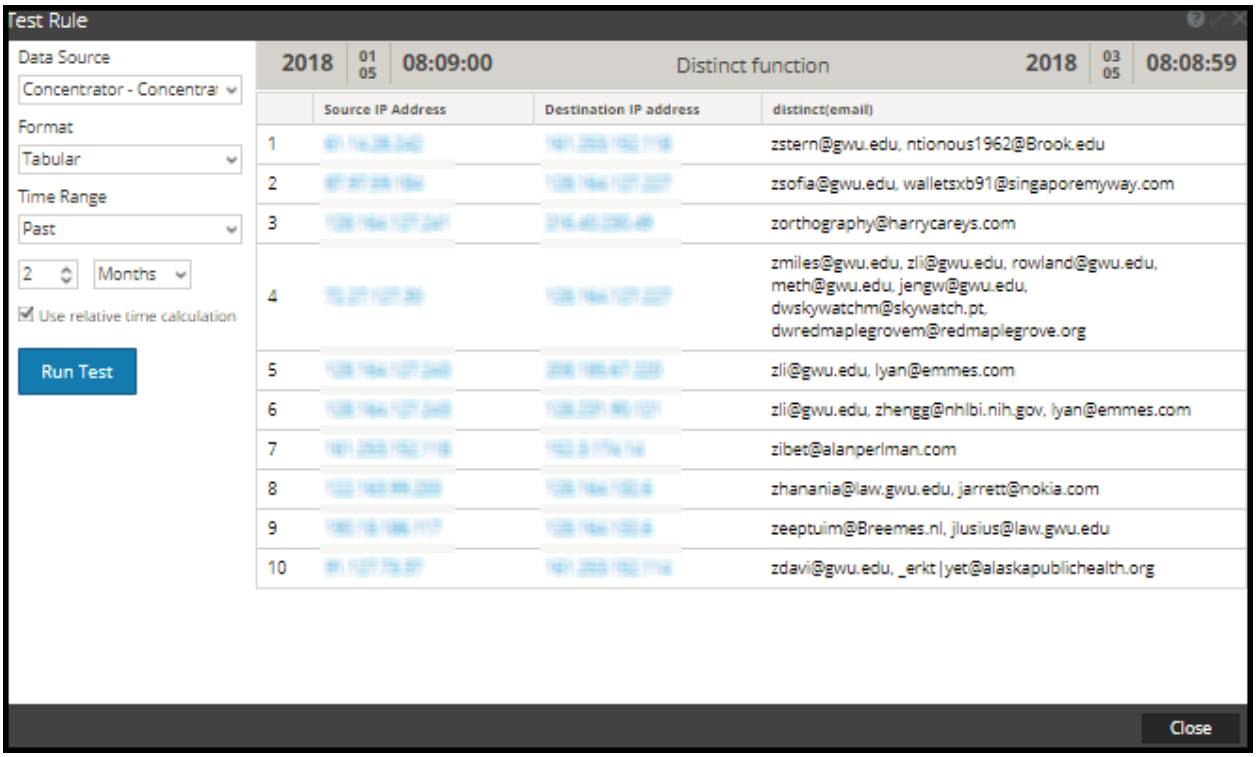
Build Rule
Rule Type
NetWitness Platform DB
Name
Count distinct function
Summarize
Custom
Select
ip.src, size, countdistinct(filename)
Alias
Source IP Address
Where
ip.src exists && filename exists
Group By
ip.src,size
Then
Enter a then clause...
Order By
Column Name
Sort By
Enter the column name...
Ascending
countdistinct(filename)
Descending
Session Threshold
0
Limit
10
Use
Save
Reset
Test Rule

The following figure shows the result for the above query.



Here, the page displays the data size along with the total number or count of distinct filenames from the respective IP source. Unlike the count function, the countdistinct excludes the duplicate values from the result.

Distinct

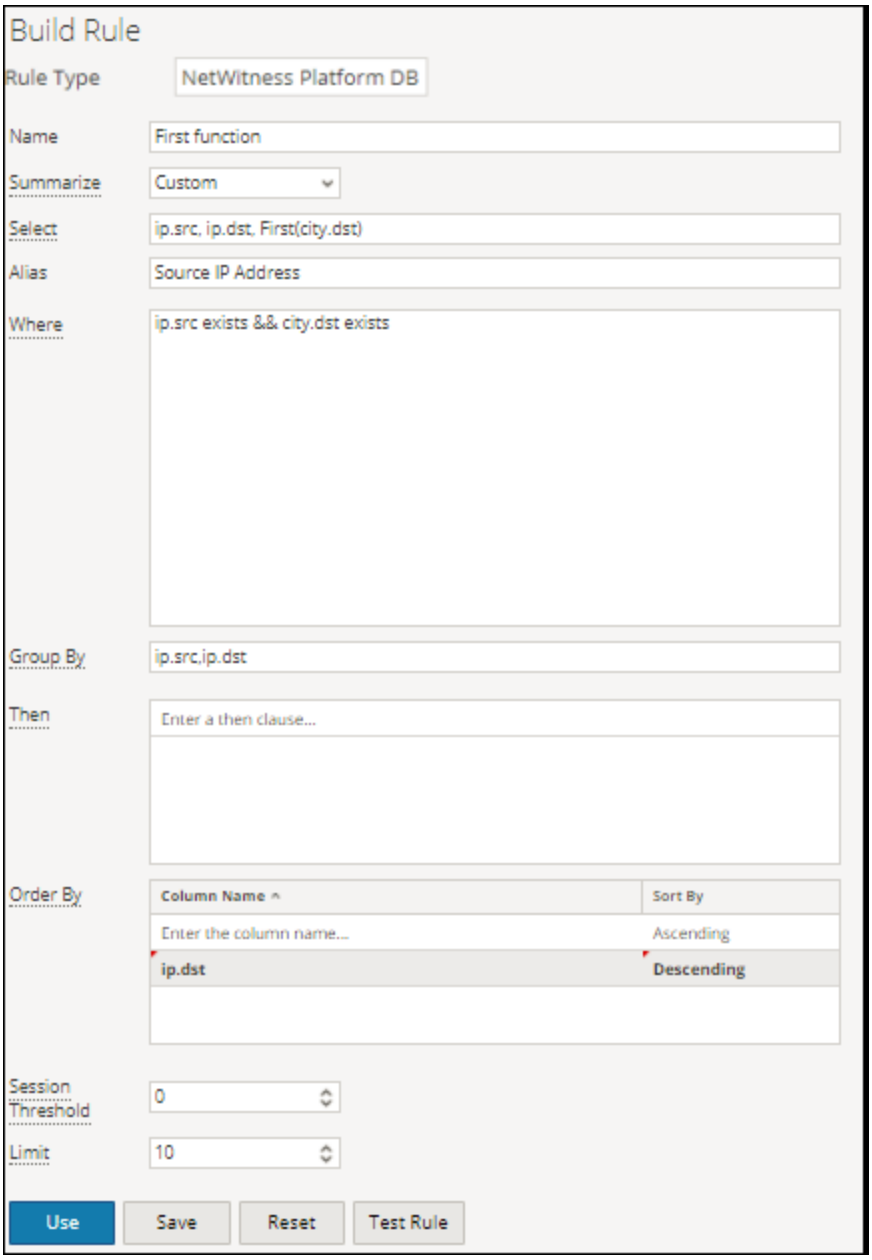


This function returns all the unique or distinct values of the metakey.

Example

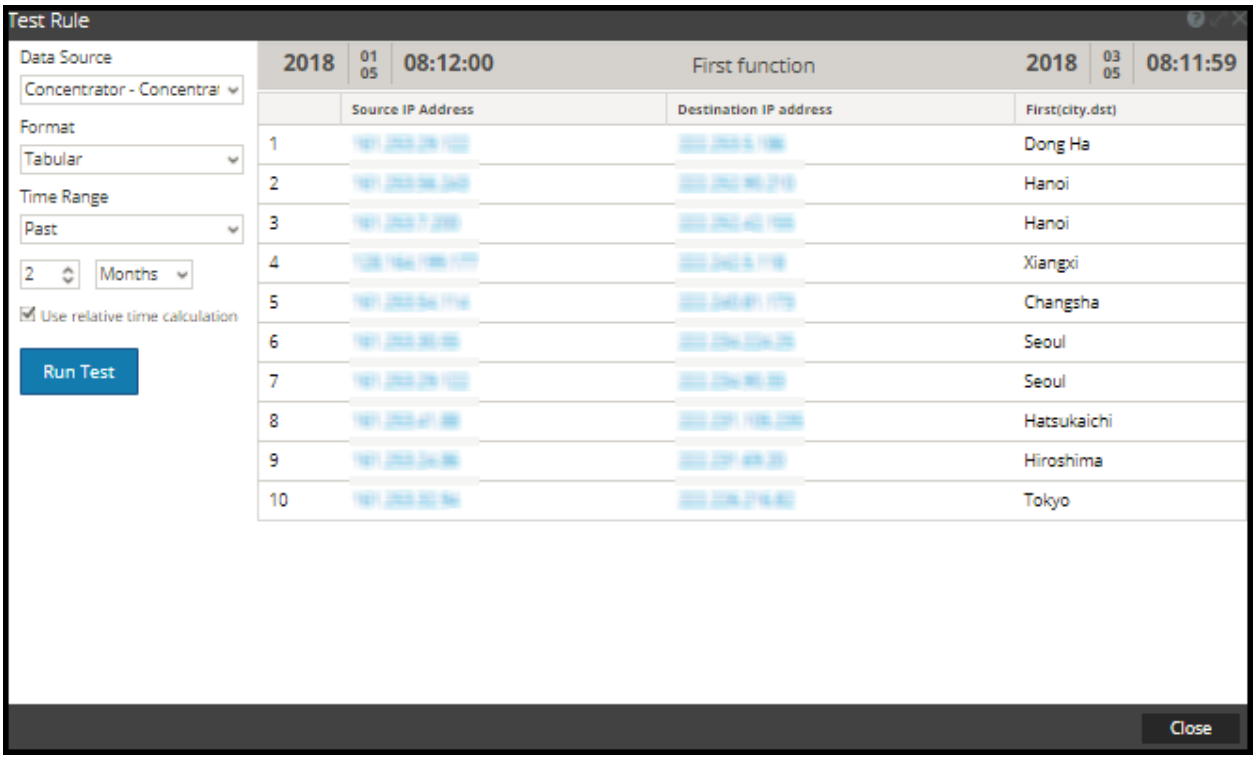
The following figure shows a sample query for distinct function used to retrieve e-mails, between various source and destination IP (ip.dst).

The following figure shows the result for the above query.



Here, the page displays the list of unique e-mails that were exchanged between the respective IP source and destination.

First

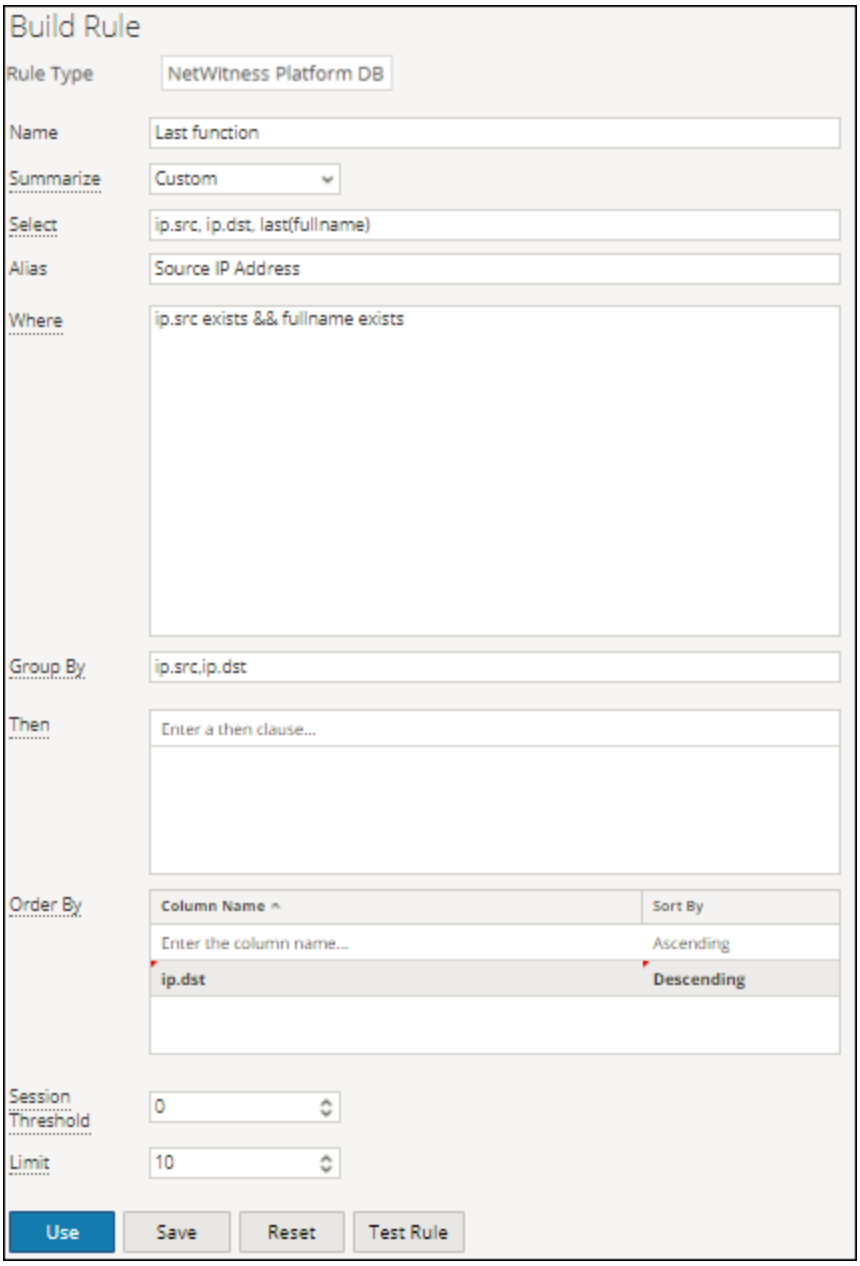


This function is used to retrieve the first value from an ordered sequence of values for a specified metakey.

Example

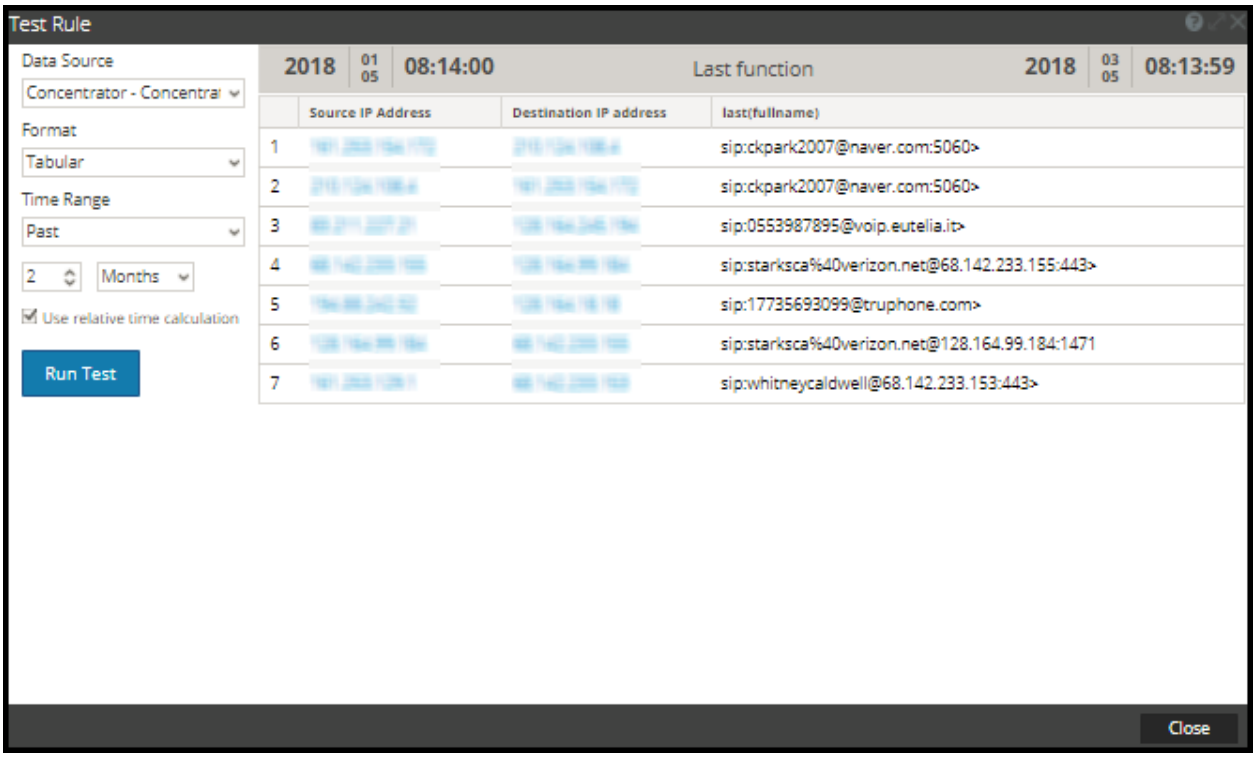
The following figure shows a sample query for first function used to retrieve the first destination city name.

The following figure shows the result for the above query.



Here, the page displays the the first destination city for the corresponding source and destination IP. You can use the first function to isolate a particular value from a search result.

Last

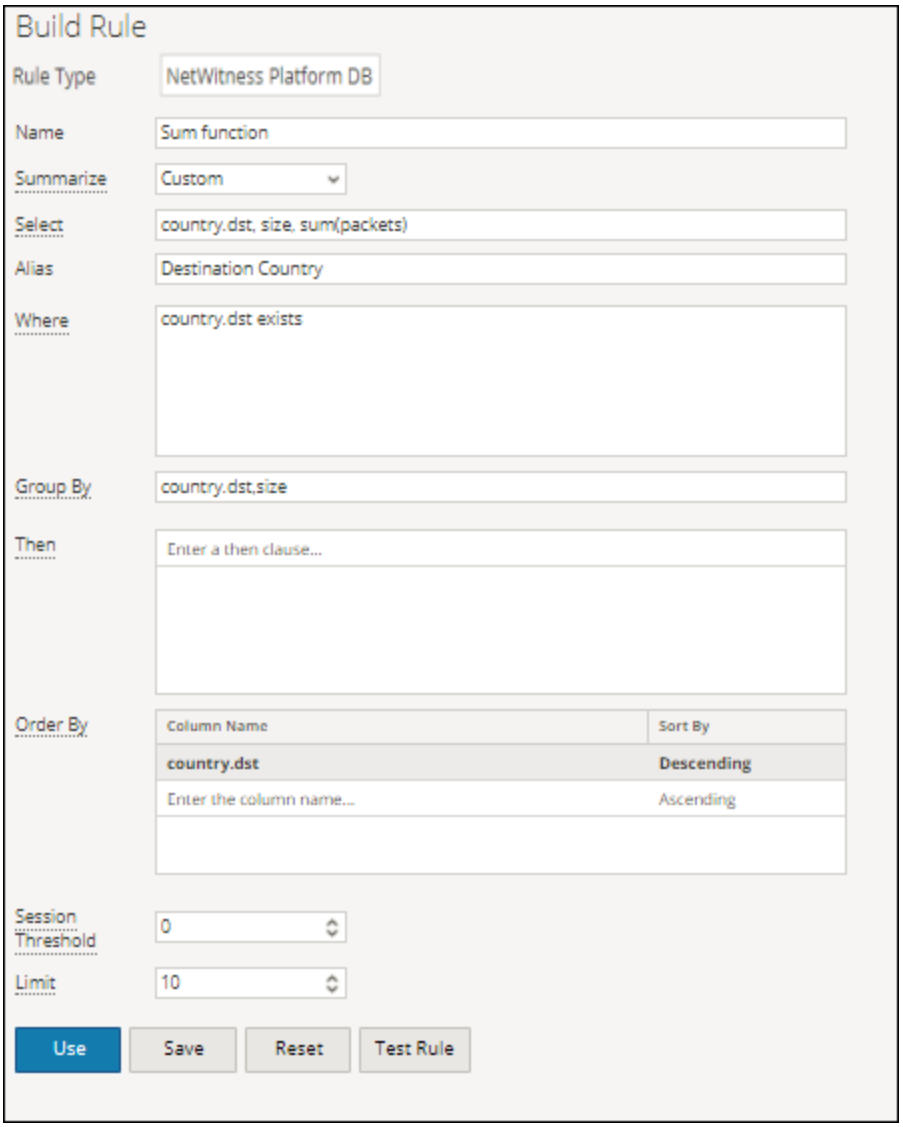


This function is used to retrieve the last value from an ordered sequence of values for a specified metakey.

Example

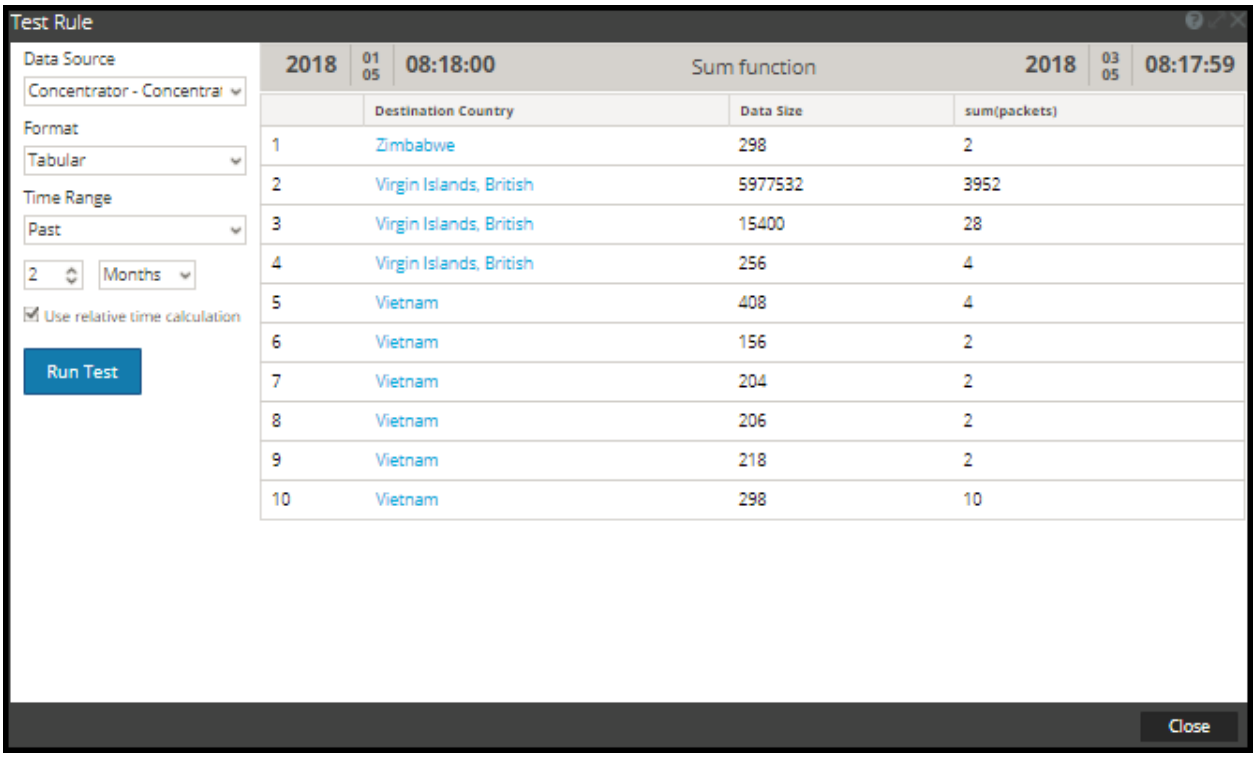
The following figure shows a sample query for last function used to retrieve the most recent user name.

The following figure shows the result for the above query.



Here, the page displays the list of most recent or last usernames in full, that were exchanged between the source and destination IP.

Sum

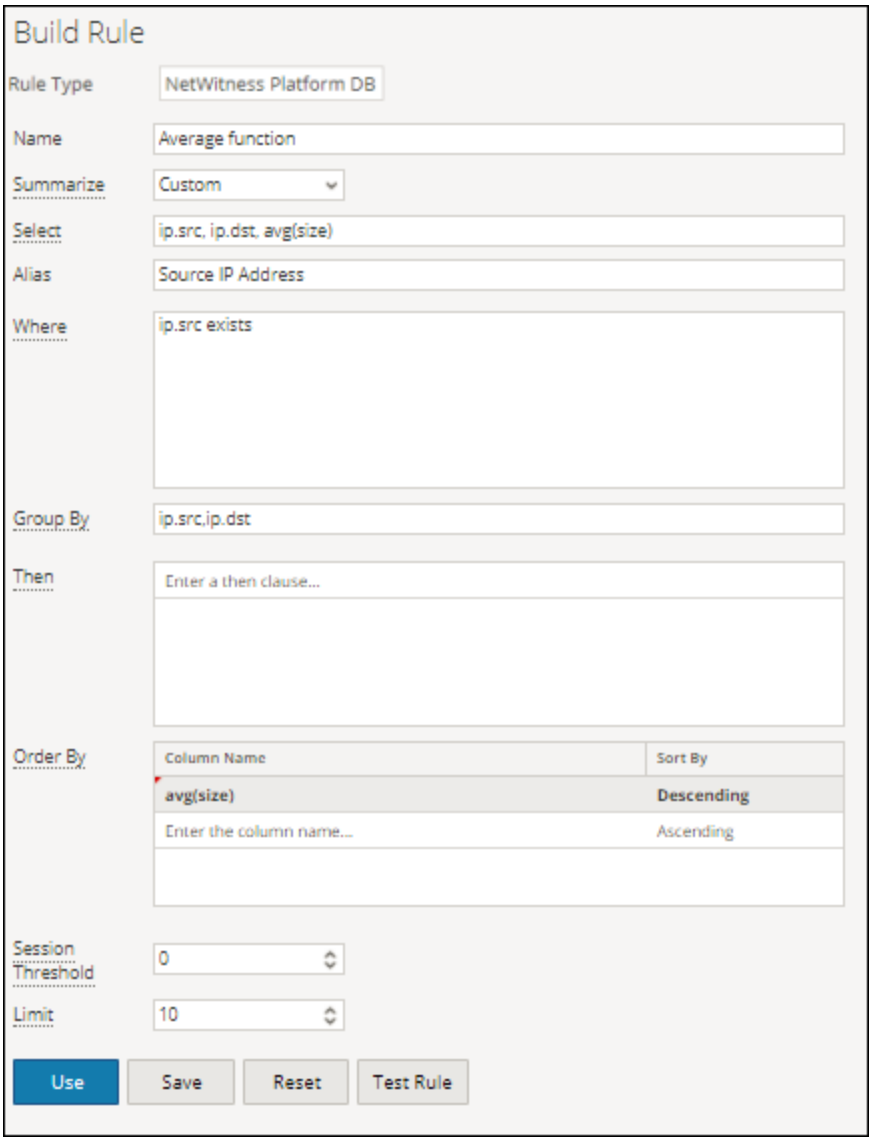


This function returns the total of the non-NULL values of the metaKey within a group.

Example

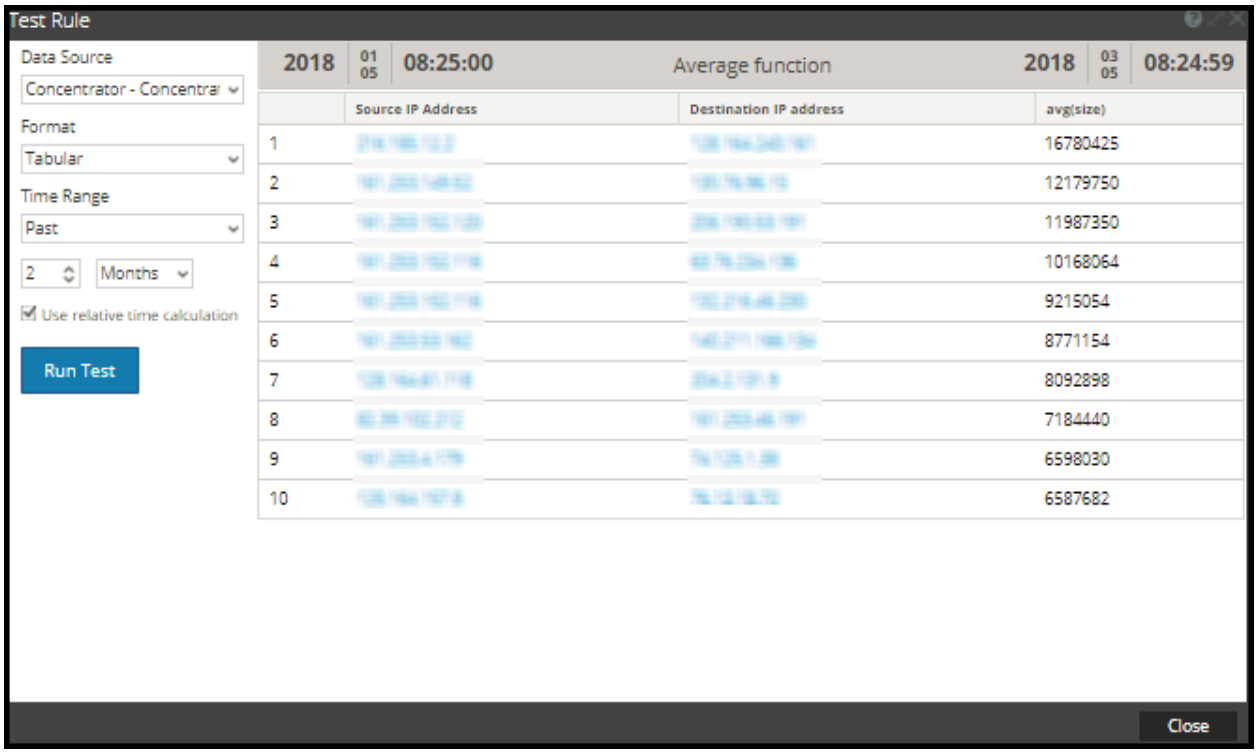
The following figure shows the query for the Sum function used for packets.

The following figure shows the result of the above query.



Here the page displays the total or sum of the packets along with the size of the data for the respective destination country.

Avg

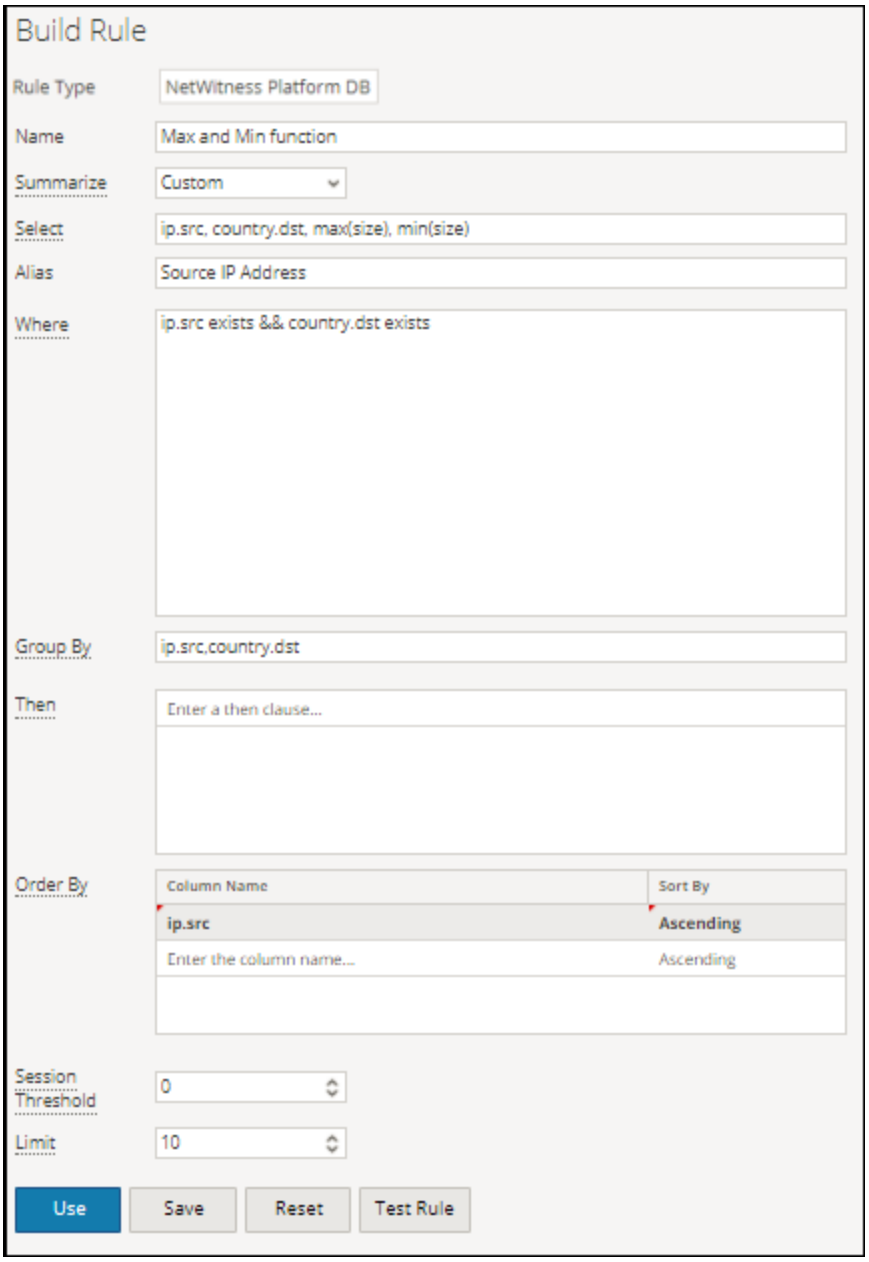


The average function returns the average of non-NULL values of the meta within a group.

Example

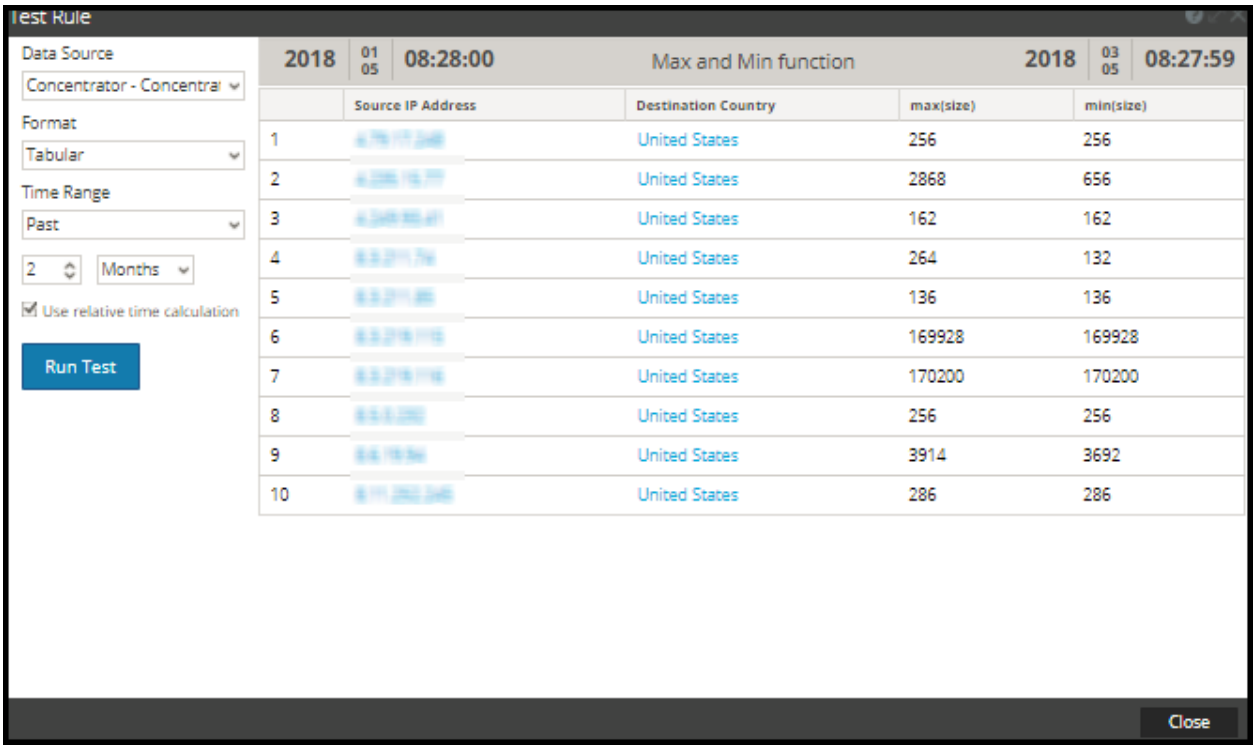
The following figure shows a sample query for average data size transmitted between a source and destination IP.

The following figure shows the result for the above query.



Here, the page displays the average size of data exchanged between source and destination IP:

Max and Min



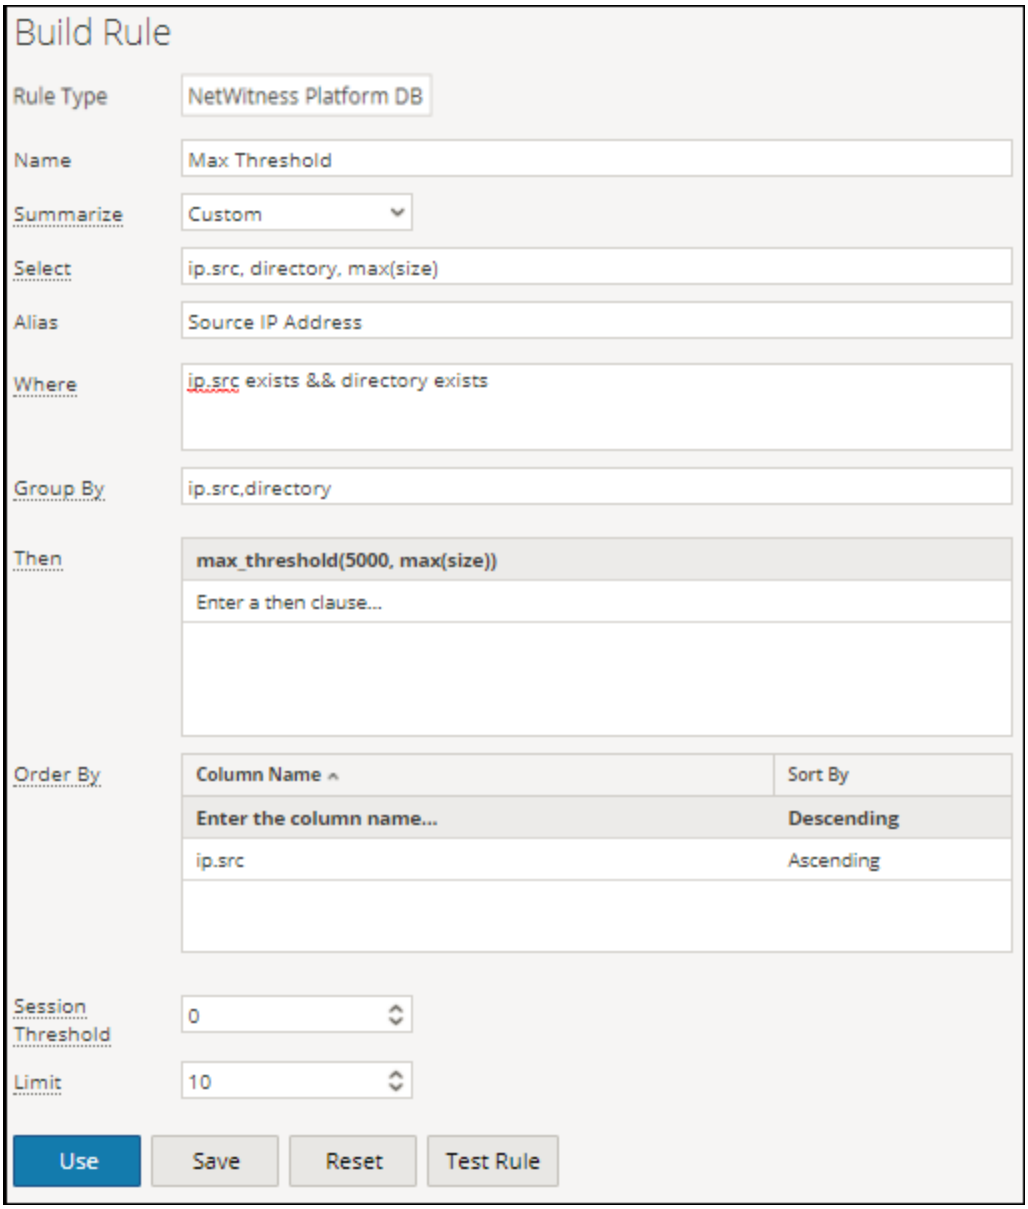
Max and Min functions provide the maximum and minimum for given values of a meta respectively.

The following figure shows a sample query for max and min functions for various data sizes, for source IP and destination country.

Example

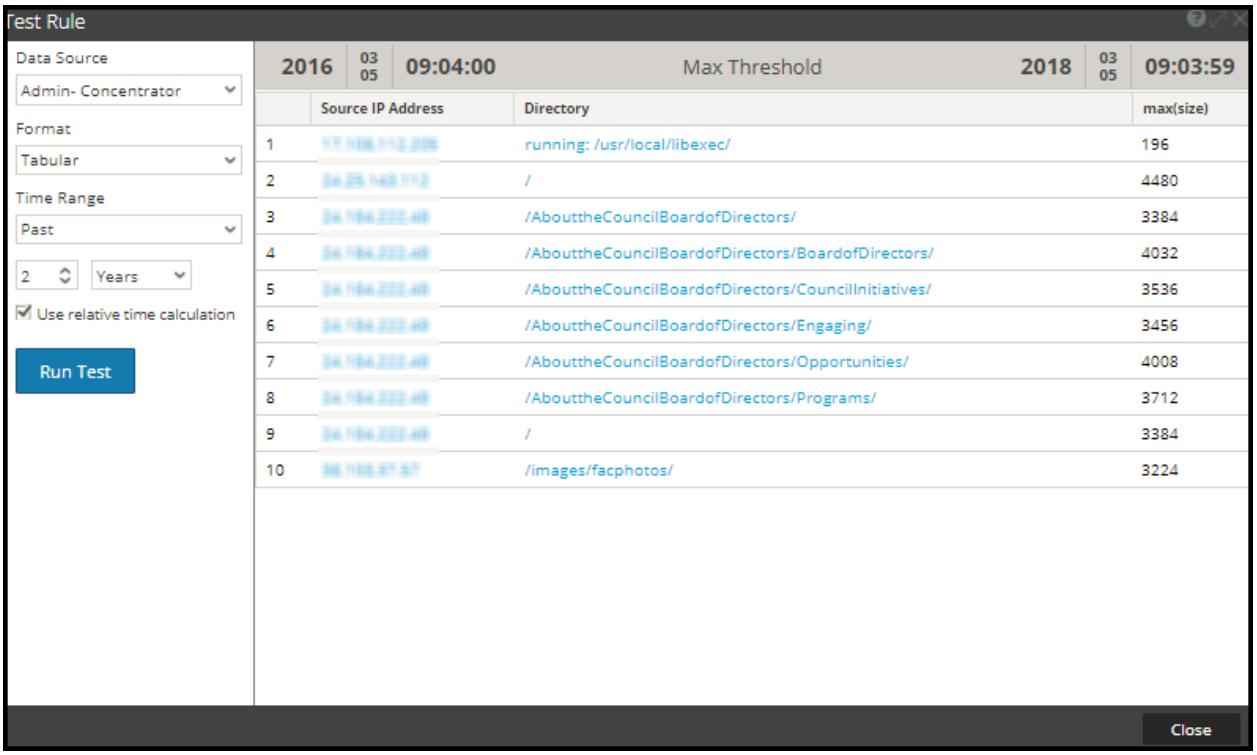
The following figure shows the result for the above query.

Here, the page displays the max(size) and min(size) columns, along with the list of source IP and destination country. The max(size) column lists the maximum data sizes exchanged while the min(size) column lists the minimum data sizes that were exchanged.



Filter aggregate meta results with Max_threshold

You can further filter the results of any function by using the threshold rule action.



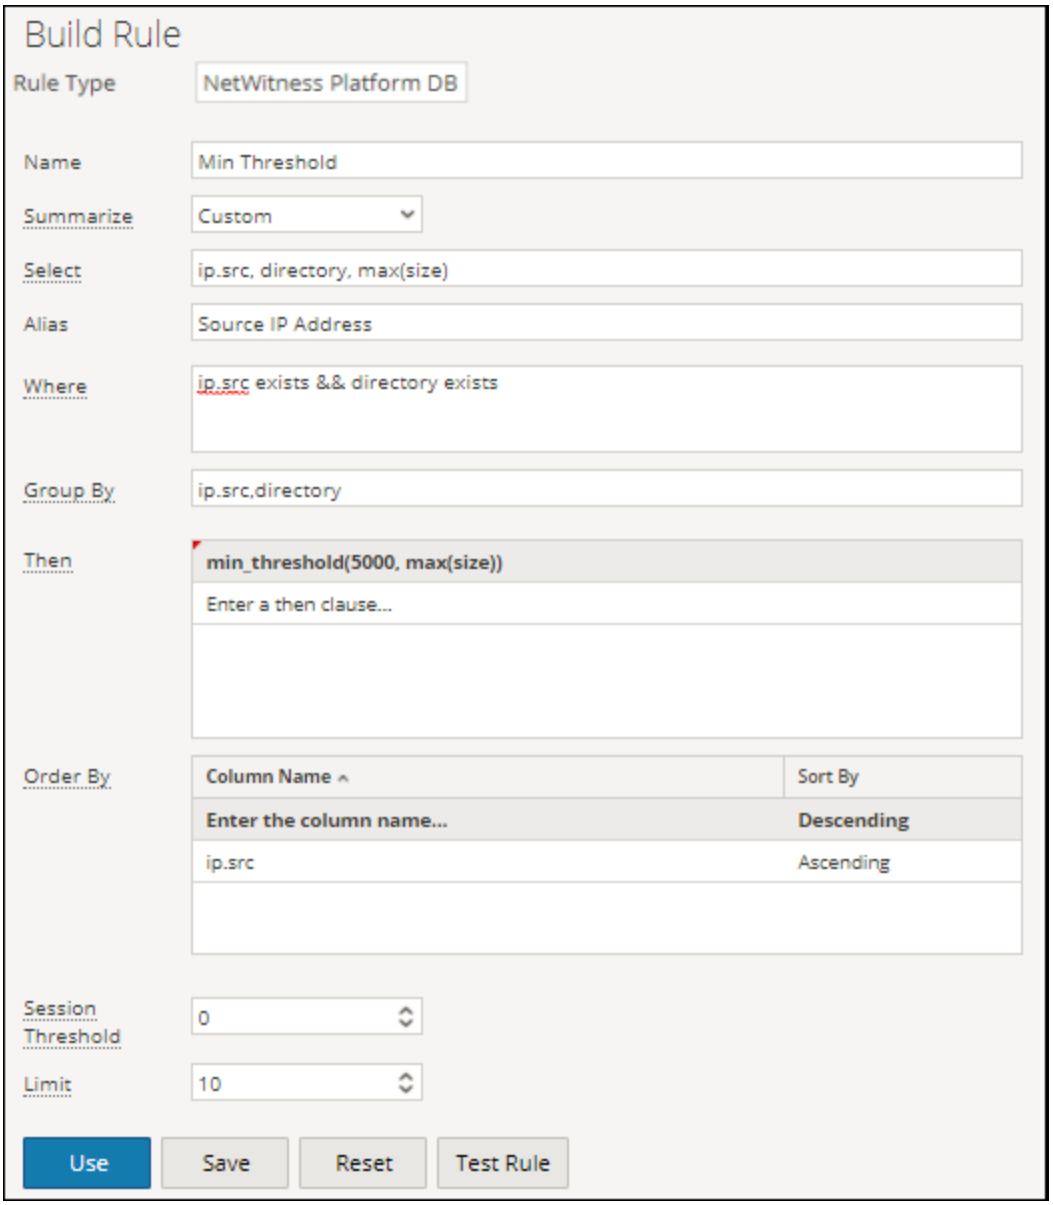
Example

Following is a sample query for max_threshold used along with the Max function in the **Then** field is:
max_threshold(5000,max(size))

The following figure shows the Build Rule screen for the above query.

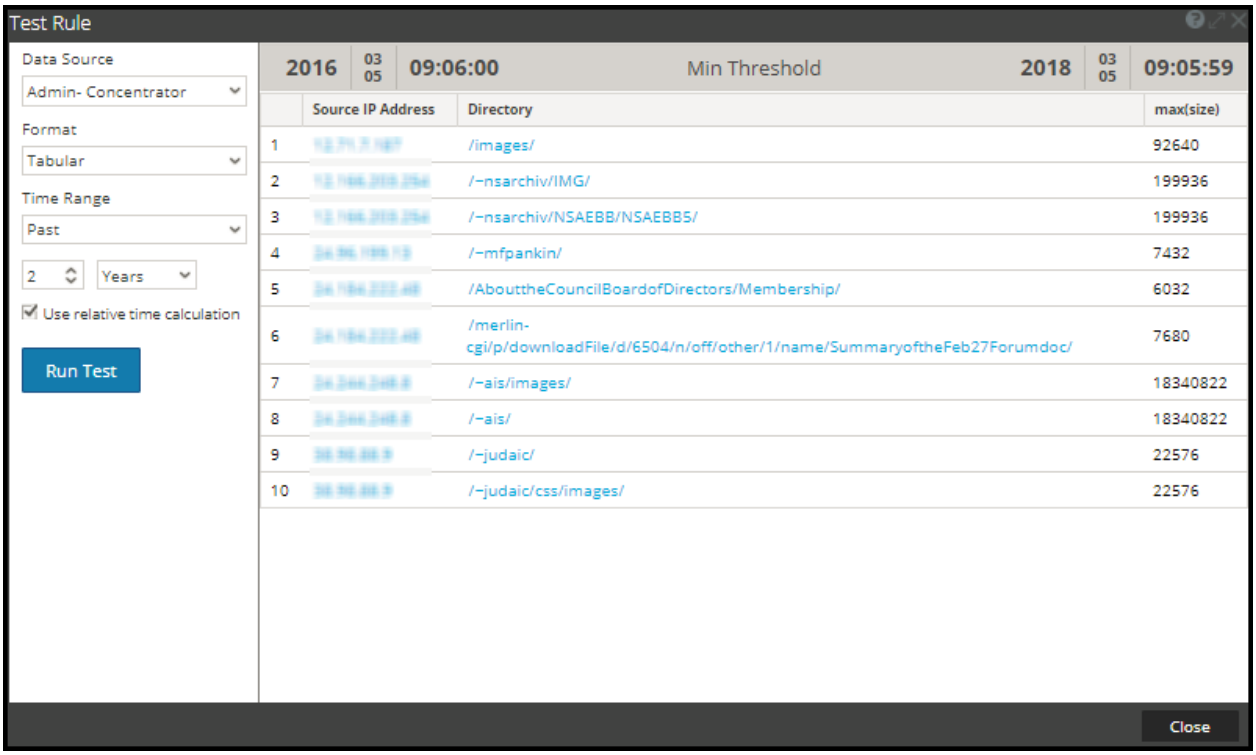
Here the max_threshold is applied for data size with an upper limit of 5000. The following figure shows the result.

Here, the result page displays the max(size) column, that lists the data sizes lesser than 5000 as this is the maximum threshold in the query, along with the corresponding IP source and the respective directory.



Filter aggregate meta results withMin_threshold

Similarly, min_threshold is used to filter the results for any function. A similar scenario as max_ threshold is considered to explain this.



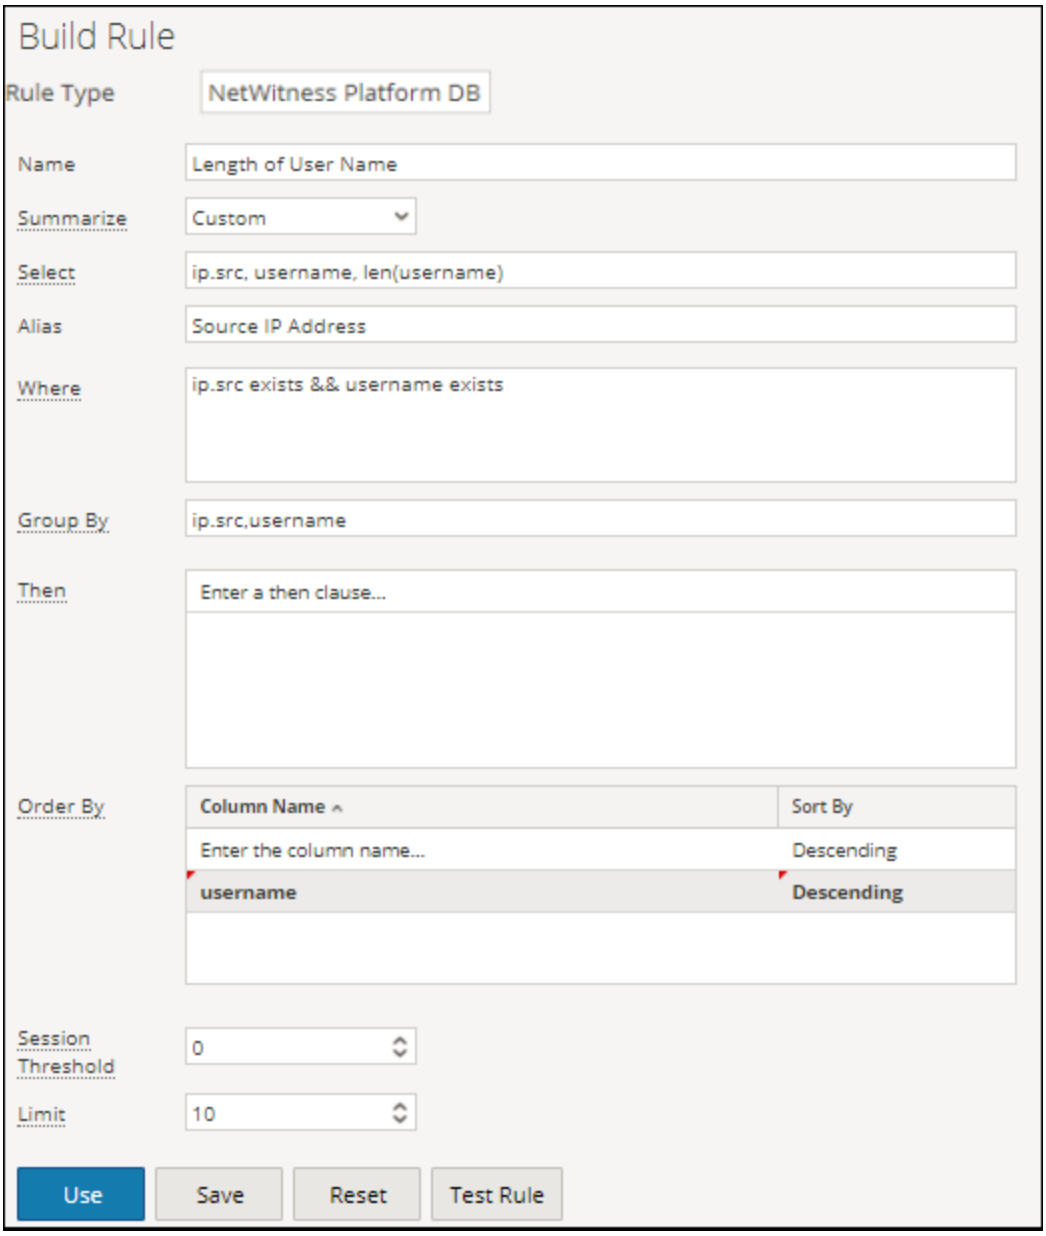
Example

Query for min_threshold used along with the Max function in the **Then** field is:
min_threshold(5000,max(size))

The following figure shows the Build Rule screen for the above query.

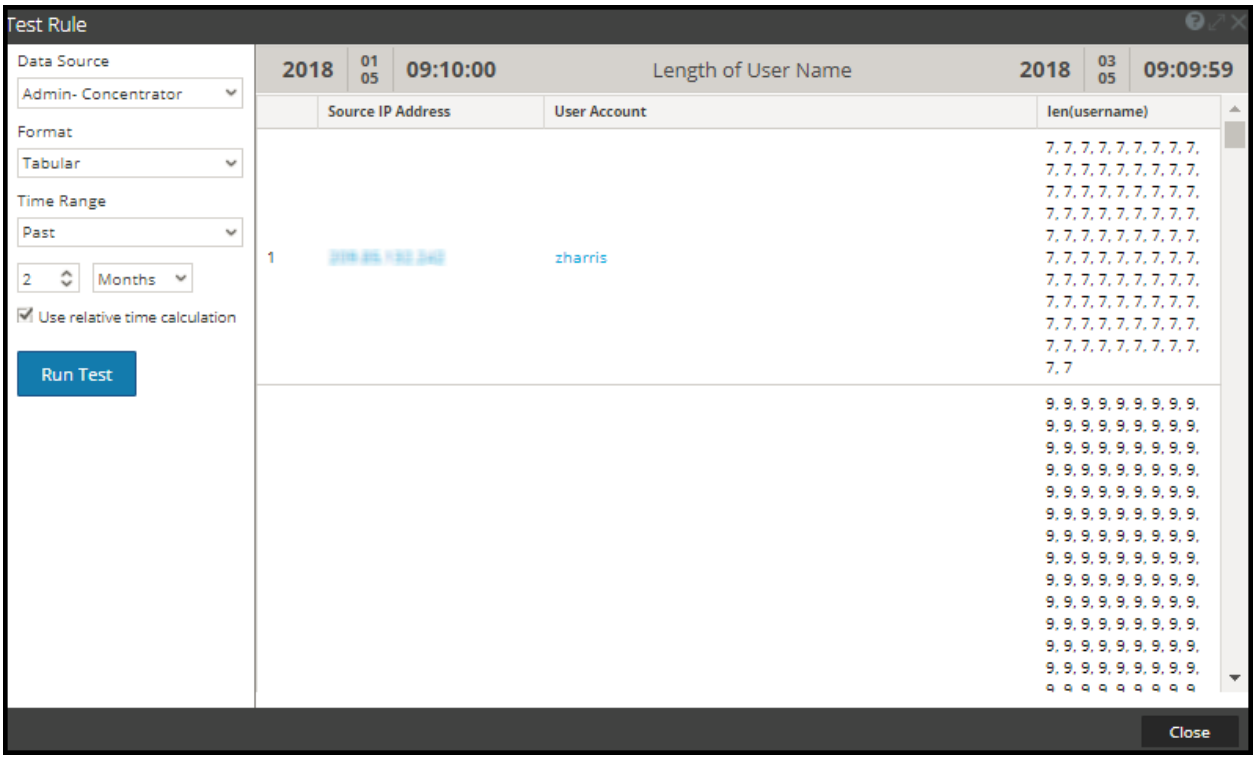
Here the min_threshold is applied for data size with a lower limit of 5000. The following figure shows the result.

Here, the result page displays the max(size) column, that lists the data sizes greater than 5000 as this is the minimum threshold in the query, along with the corresponding IP source and the respective directory.



Note: Max_threshold and Min_threshold rule actions are common across all the functions, and can be used along with the other queries in the **Then** field to retrieve the respective output.

Length



This function returns the length of a meta value. In other words, Length function returns the number of bytes used to store the actual value.
For instance, for the value "Analytics" it returns the length as 9. Similarly, for an IPv4 ip.src, it returns 4 (representing 4 bytes).

Example

The following figure shows a sample query for the length function used for usernames.

The following figure shows the result for the above query.

Here, the page displays the length of the usernames associated with the user account and their respective source IP.

Additional Information

When you query for aggregates (E.g. sum(size)) with **Group By** on a meta which has multiple values in a session, then the session with multiple values is accounted for aggregate calculation for each value of that meta.

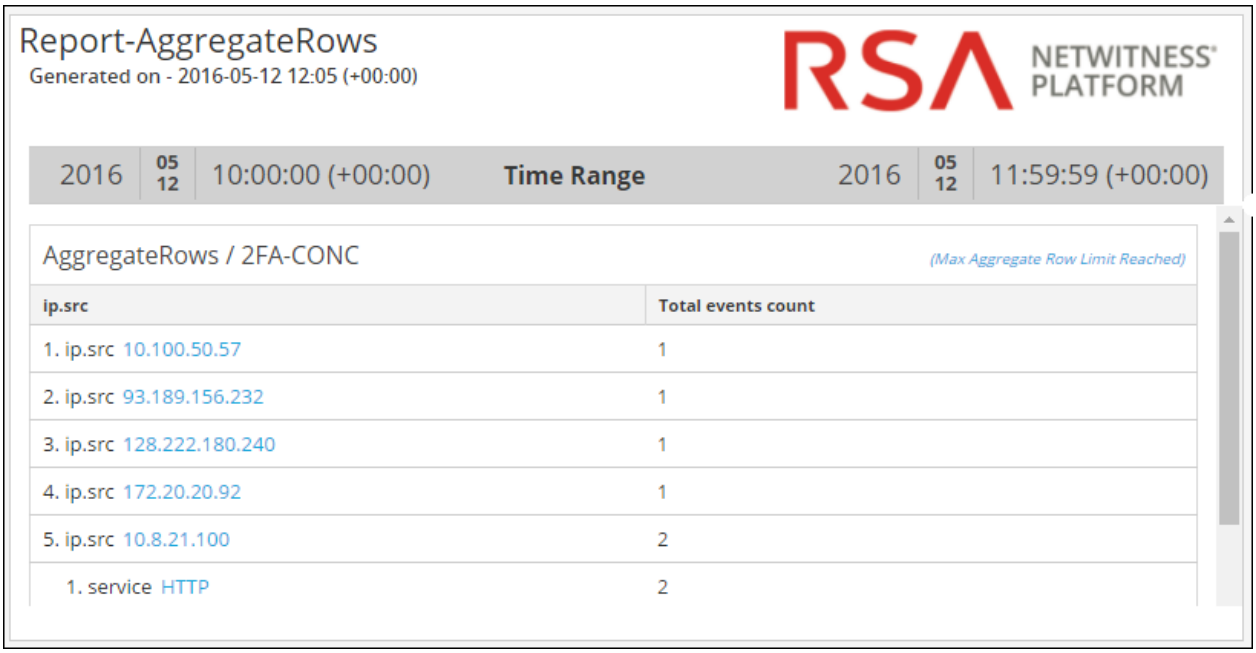
Example

When you query for the Count aggregate function with Group By on Alias.host and if the column has multiple values in a session, then the session is counted for each occurrence, including the duplicate values.

Consider the following table.

SessionID	Alias.host	Ip.src	Size
1	host-a, host-b, host-a	a	10
2	host-b, host-c, host-a, host-c	c	20
3	host-b, host-c, host-d	b	30
4	host-c, host-a	a	40

In the above table, alias.host for **host-a** and **host-c** has duplicate values listed for a single session. Let us consider the following query:



Select : alias.host, count(ip.src), sum(size)
Group By : alias.host

Here, **host-a** and **host-c** are present in 3 sessions and they are duplicated for two different sessions. However, the output is as shown below.

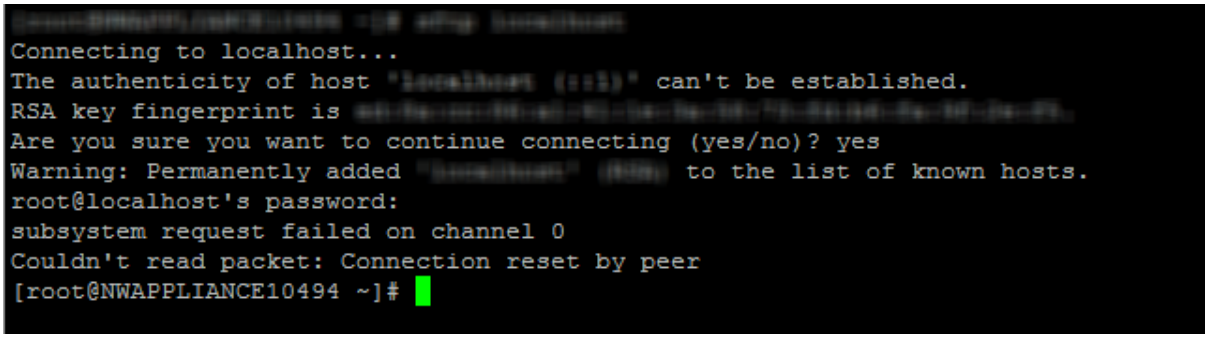
Alias.host	count(lp.src)	Sum (size)
host-a	4	80
host-b	3	60
host-c	4	110
host-d	1	30

Output table shows that the count for **host-a** and **host-c** is 4. This is because for each alias.host value, the entire session is considered. Similarly to calculate sum (size), the same sessions are considered for each alias.host value.

In the report output if the number of rows has reached **NWDB maximum aggregate rows** defined in RE configuration, then a message **Max Aggregate Row Limit Reached** is displayed to indicate that there is more information to be displayed. The default limit is 1000, and you can change this value as per your requirement, in the Reporting Engine Configuration page .

Troubleshoot Reporting

This section provides troubleshooting instructions for issues faced when using the Reporting module in NetWitness.



Configuring SFTP Server Issue

Procedure

Try the following steps if you face any issues while configuring the Linux SFTP server:

1. If the Report Output Action for the configured SFTP fails, you must SSH to the SFTP server and try to connect locally to check if SFTP is working fine.

   Connect to SFTP server:

2. If the Local connection fails, open the file **sshd_config> vi /etc/ssh/sshd_config.**
3. Check for the entry in the file:

   ```
   # override default of no subsystems
   Subsystem sftp /usr/libexec/openssh/sftp-server
   ```

4. If this entry does not exist, add the two lines mentioned in Step 3 at the bottom of the file and **Save** it.
5. Restart service from **SSH > service sshd restart**.
6. Retry the SFTP connection now.
7. Make sure SFTP port is not blocked by SA server appliance firewall. Update iptables rules to allow sftp port.

Meta Values in Investigation Link Issue

Issue	When the device information on the datasource is changed, the Investigation link for the meta values of the executed reports is not displayed on the NWDB results page.
Resolution	Remove and re-add the datasource to Reporting Engine. *Note: This workaround is not applicable for reports that are already generated.*

Internet Explorer 10 Browser Issue

Issue	When you click the Test Rule multiple times in quick succession, results with large input data may not displayed in Internet Explorer 10.
Resolution	If this issue occurs, try one of the following steps: • Close the Test Rule window on Internet Explorer 10 and run the test again. • Use other browsers like Chrome or Mozilla Firefox to test the rule execution.

Dynamic List Editing Issue

Issue	A dynamic list cannot be added from the Edit option on the 'View All Schedules' page to an existing schedule.
Resolution	1. Reports > Select the report > 2. Click the #Schedules for the specific report 3. Select the schedule to be modified from the Report Schedule page 4. Edit the schedule

Deployment Failure Issue

Issue	Deployment of reports fail, if the dependencies of certain compliance reports in Live are not deployed prior to the reports.
Resolution	Retry the deployment. If the problem persists, try to deploy the rule or list dependencies first and then deploy the reports.

Respond Server Issue

Issue	When the Forward Alerts to Respond option is enabled and RabbitMQ connections to the Respond Server are blocked, some of the Reporting Engine threads may be blocked.
Resolution	Disable the Forward Alerts to Respond option until the RabbitMQ broker in the NetWitness server at the Respond has begun and accepts the connections.

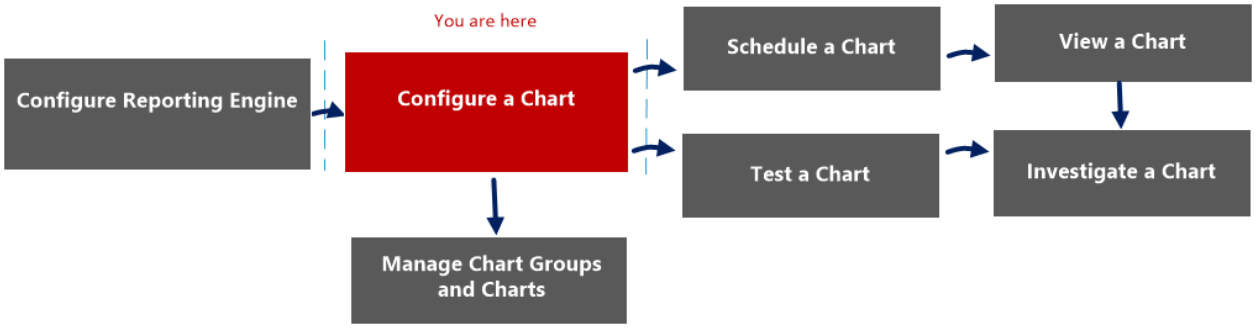
Post-Upgrade Issue

Issue	Post-upgrade from 10.6.x to 11.2, Categories meta for incident collection is not supported.
Resolution	When using the Categories meta for incident collection, the results rendered are in an incorrect format. Hence this meta is not supported and you cannot use the categories meta in either select clause or where clause. Also, it is not available in the list of metas for selection in the Rule Builder page.

Report Query Timeout Issue

Issue	When scheduling the report, if you choose a high time range, the query may timeout with the error message **`Query on channel 12345 was canceled by the system for exceeding time usage limits. Check timeout values.`**
Resolution	Set the **Summarize** option to **None** in the **Build Rule** view to exclude the **Group-By** clause (that is performance intensive) and then re-schedule the report. If the query still times out after 60 minutes, increase the timeout value from 60 minutes to 90 minutes on all the core services. To increase the timeout value: 1. Go to **Admin** > **Services** > **Security** > **Users** and set the **Core Query Timeout** to 90 minutes. 2. Enter the Service Admin Password and click **Save**. 3. Re-schedule the report.

Reporting References



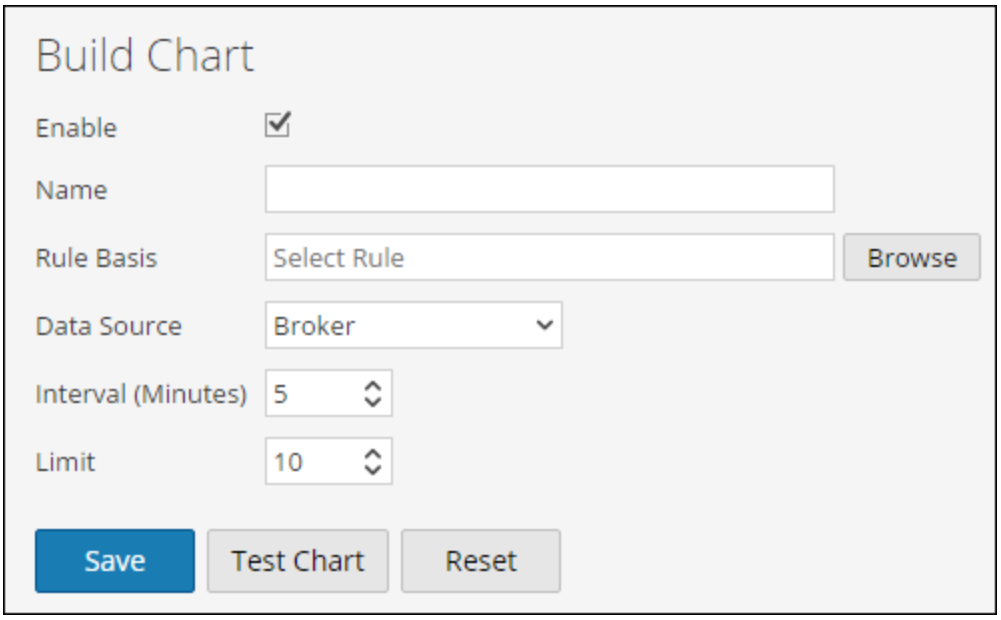
This section provides information about the Reporting user interface. You can look at your place in the workflow for creating and generating a report with theNetWitness, get a quick look at the important features, and follow links to the detailed concepts and procedures.

Build Chart View

In the Build Chart view, you can define and test a chart. You build a chart by assigning a name and then selecting a rule to include.

Note: Only the NetWitness DB rules can be used in charts.

Workflow



What do you want to do?

Role	I want to ...	Documentation
Administrator/ Analyst	Configure Reporting Engine	For more information, see "Configure Reporting Engine" in the *Reporting Engine Configuration Guide*.
Administrator/ Analyst	Configure a chart*	Configure a Chart
Administrator/ Analyst	Schedule a chart	Schedule a Chart
Administrator/ Analyst	View a chart	View a Chart
Administrator/ Analyst	Test a chart	Test a Chart
Administrator/ Analyst	Investigate a chart	Investigate a Chart
Administrator/ Analyst	Manage a chart group and chart	Manage a Chart Group and Chart

*You can complete these tasks here.

Quick View

The following figure is an example of the Build Chart view.

The following table describes the features in the Build Chart view.

Field	Description
Enable	Specifies if the Reporting Engine must collect the data and generate chart results. If the **Enable** checkbox is not selected, the results are not rendered.
Chart Name	Identifies the name of the chart.
Rule Basis	Displays the Add Rules dialog box from which you select a rule that is the basis of a chart. The rule that you select must be a rule which is not sorted by none.
Data Source	If the default data source is configured in the Reporting Engine, the data source is displayed on the Build Chart page. If a chart is configured to run on any other data source, that data source is displayed on the Build Chart page instead of the default data source. The Reporting module works with the following data sources: • Broker • Concentrator • Decoder • Log Decoder • Log Collector
Interval (Minutes)	The chart data refresh interval in minutes.
Limit	The number of records for which a chart is generated.
Save	Saves a chart to the database.
Test Chart	Plots a test chart based on the chart definition.

Field	Description
Reset	Resets the chart details.

Build List View

In the Build List view, you can enter or import values to create a list and save or reset the values. You can use lists when you are writing reporting rules to simplify the process of specifying values in the rule.

Workflow

This workflow shows the procedure to define lists or list groups. You can set access control at the list or list group level so that only users with specific roles can access the lists.

You must ensure that Reporting Engine is configured on the NetWitness.

What do you want to do?

Role	I want to ...	Show me how
Administrator / Analyst	Configure Reporting Engine	For more information, see "Step 3: Configure Reporting Engine Data Sources" topic in the *Reporting Engine Configuration Guide*

Quick View

The following figure shows the Build List View.

To access this view

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The Lists view is displayed.

3. In the **Lists** toolbar, click .

   The Build List tab is displayed.

The following table describes the features in the Build List view.

Feature	Description
Name	Identifies and labels the list.
Description	Provides a short description for the list.
List Values	Provides the grid of values associated with selected list from the List Library panel. You can import these values from a file or list. You can also enter values manually.
Quotes will be inserted for all the values	Automatically includes quotes for the values at runtime if checkbox is selected. If the checkbox is not selected and if a value in the list contains a comma, then that value has to be enclosed within single quotes. This syntax does not apply to list values for an NWDB rule.
Save	Saves the rule which can be used to create a report, a chart or an alert.
Reset	Deletes all the information from the fields.

Build Report View

In the Build Report view, you can create a report, add text and rules, and schedule a report.

Workflow

This workflow shows the procedure to create and schedule a report.

What do you want to do?

Role	I want to ...	Show me how

Quick View

The following figure shows the Build Report View.

To access this view

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Reports view is displayed.

3. In the **Reports** toolbar, click + .

   The Build Report tab is displayed.

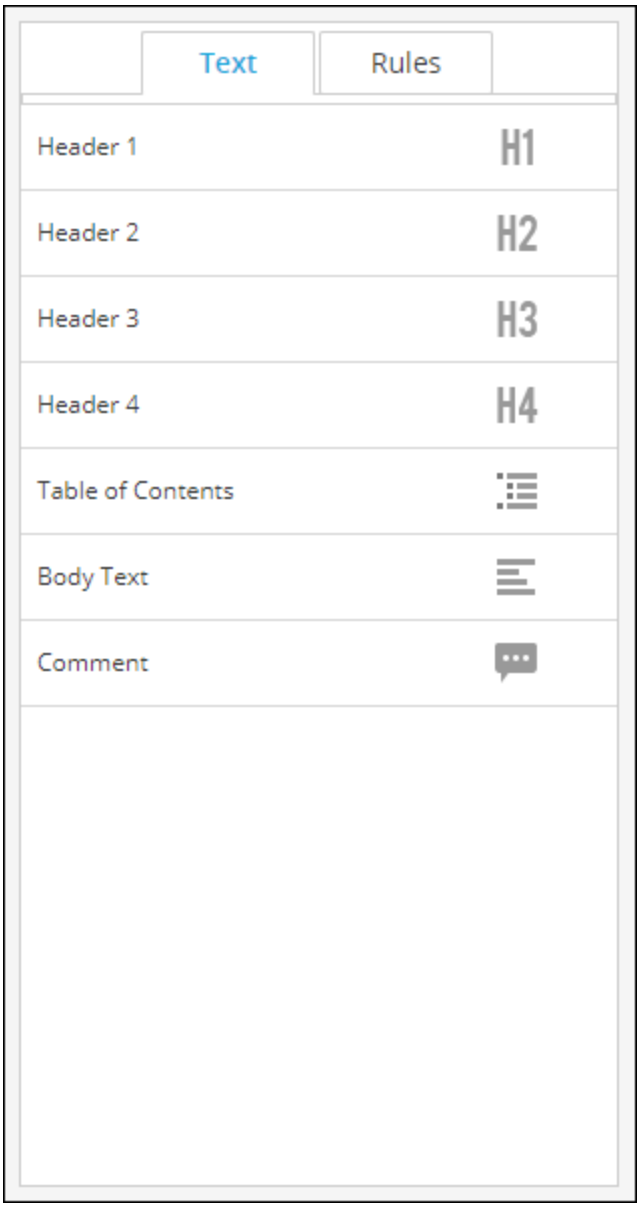
The Build Report view consists of the following panels:

1	Report Panel
2	Text Panel
3	Rules Panel

Report Panel

The Report panel allows you to create a report by assigning a name to the report. The content in a report depends on the items selected from the Text and Rules panels.

When you add rules to a report, you can change the output format of these rules either to tabular, area, line or pie by clicking the ⌄ button.



The following table lists the features of the Report Panel and the description.

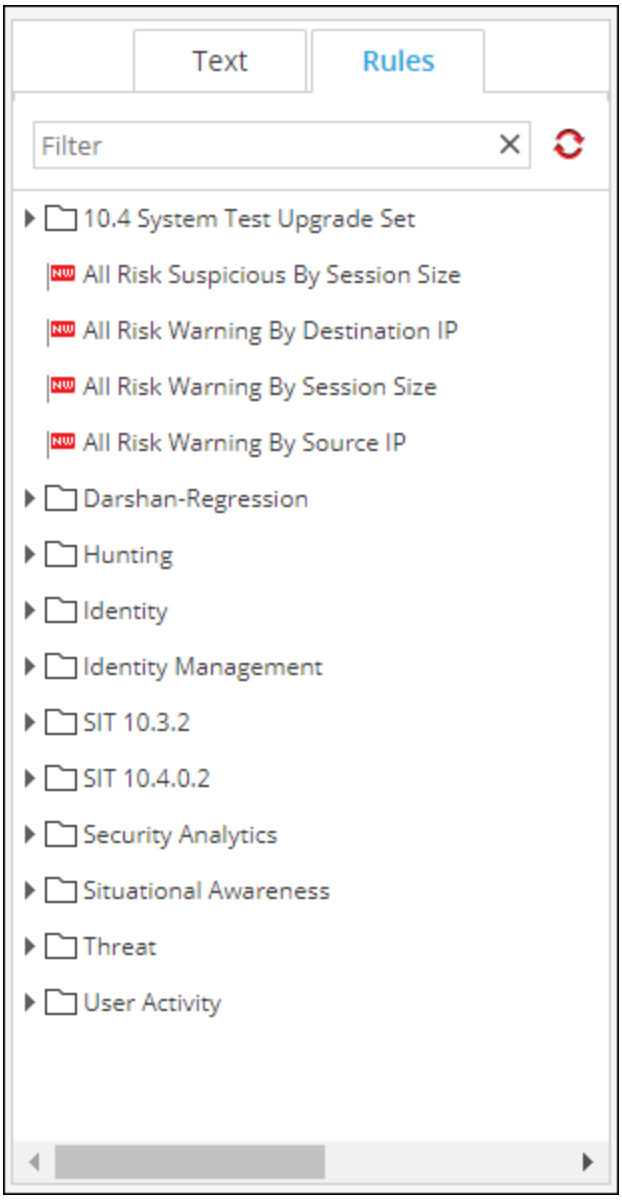
Feature	Description
Name	This field allows you enter the name of the report.
Options	This field allows you to select the output format of the report such as Tabular, Area, Bar, Bubble, Column, Line, Pie, Step Line, Step Area, Spline Area and Spline.
Schedule	Clicking this option generates the report.
Save	Clicking this option saves the report.

Text Panel

The Text panel consists of a list of text elements that add to the look and feel of the report. You can use these text elements to format the report.

- To add more structure to reports, you can use these headers defined in the Text panel to indent up to four levels. This allows you to identify specific sections in a report that can be included in the Table of Contents for easy navigation in the report result.
- To add headers to the Report panel, drag and drop H1, H2, H3, or H4 onto the Report pane based on the desired level of indentation.

The following table lists the text elements used to format a report:



Text Elements	Description
Header 1 H1	The Header 1 element adds a first-level heading to the report definition.
Header 2 H2	The Header 2 element adds a second-level heading to the report definition.
Header 3 H3	The Header 3 element adds a third-level heading to the report definition.

Text Elements	Description
Header 4 	The Header 4 element adds a fourth-level heading to the report definition.
Table of Contents 	The Table of Contents adds table of contents to the report definition.
Body Text 	The Body Text element adds body text to the report definition.
Comment 	The Comment element adds comments to the report definition. **Note:** The Comment element is not displayed when you view all the reports.

Rules Panel

The Rules panel consists of a list of rules that are defined in the Rules. From the rules list, you can drag and drop rules onto the Report panel to associate those rules with the report.

You can search for a specific rule using search text box provided in the Rules panel.

Text
Rules
Filter

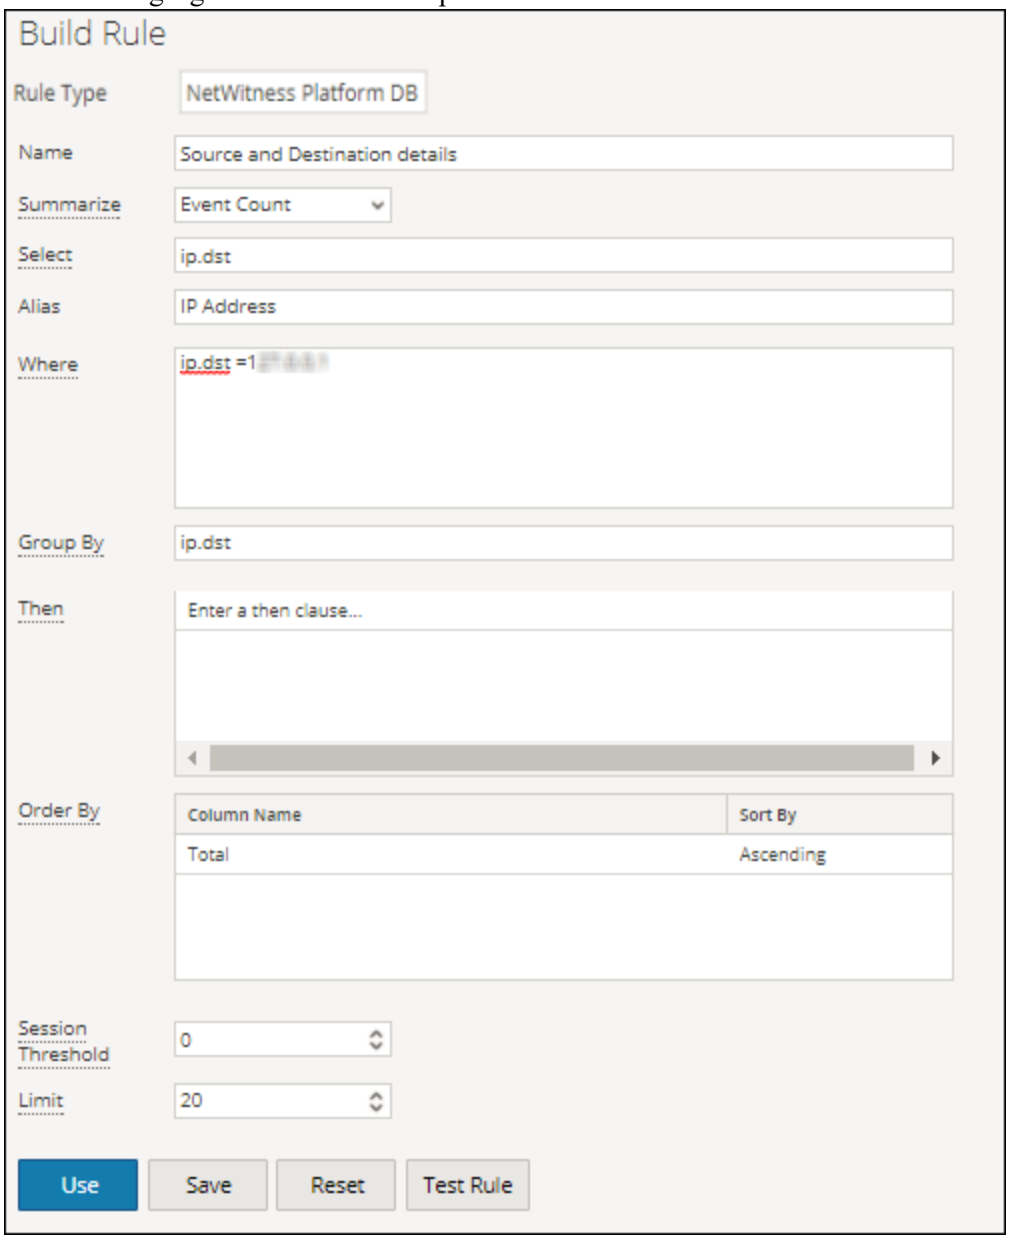
Quick View

To access the Build Rule view:

1. Go to **Reports**.
   The Manage tab is displayed.

2. In the **Rules** toolbar, click + > **NetWitness Platform DB**.
   The Build Rule view tab is displayed

Features



The Build Rule view includes the following panels.

1	Rule panel
2	Meta panel
3	Lists panel

Rule Panel

The Rule panel allows you to create a rule for the selected database type.

The following figure shows the Rule panel.

The following table describes the features in the Rule panel.

Feature	Description
Rule Type	A drop-down list of supported database types for which you can create rules. The options are: NetWitness DB and Warehouse DB.
Name	The name of the rule that you are creating or editing.
Summarize	A drop-down list of summarize options. The options are: None, Event Count, Packet Count, Session Count and Custom.
Select	The meta key for which you need the aggregate values; for example, ip.dest.

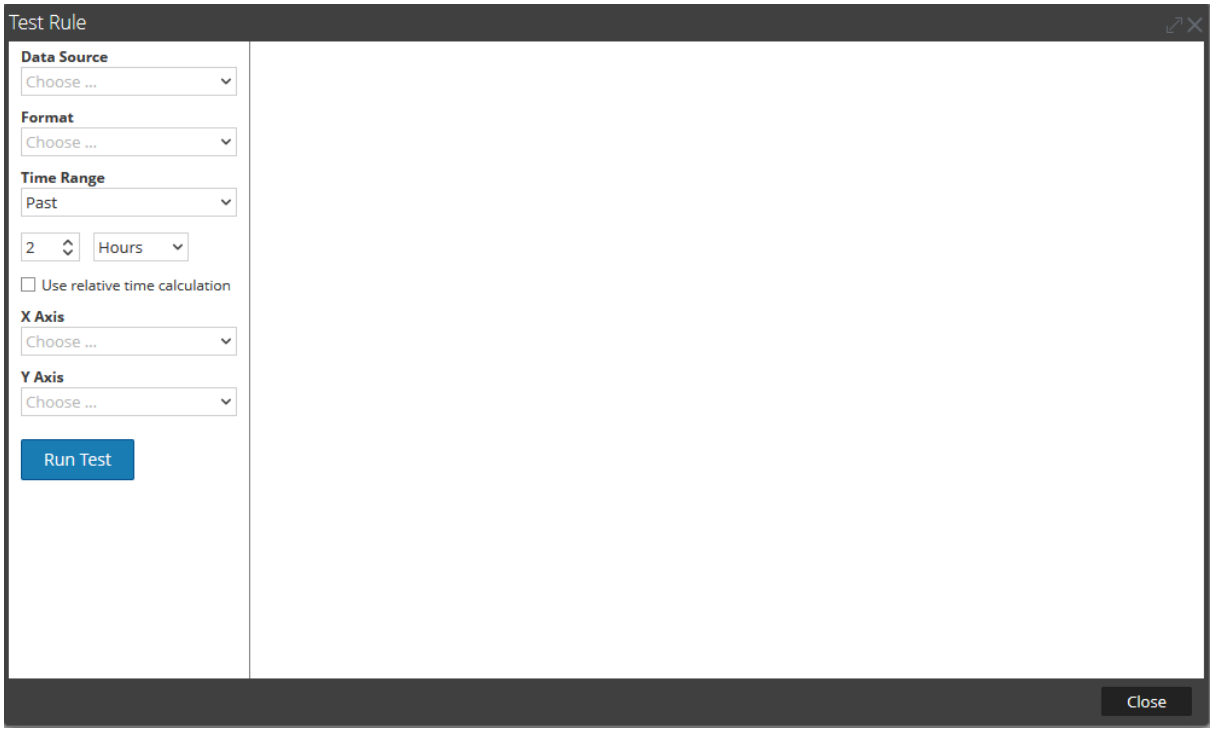
Feature	Description
Where	A Where clause that defines the conditions that trigger the rule execution; for example, ip.dest = 127.0.0.1.
Group By	The grouping method for the results. For example, specifying ip.dest produces a report in which like ip.dest values are grouped.
Then	A Then clause that defines the rule actions for additional processing on the output.
Order By	The sequencing method used to show results. For example, specifying Order By the value in the Total column, Ascending, produces a report in which the results are sorted in ascending order based on the value in the Total column.
Session Threshold	A selection list for the session threshold, which specifies maximum number of sessions that should be processed for aggregate functions.
Limit	A selection list for the maximum number of result rows to be fetched.
Use	Clicking Use enables you to use the Rule to generate a Report, Alert of Chart.
Save	Clicking Save saves the rule that you are editing and the Build Rule panel remains open. Before testing a rule, you must save it if you want to keep your changes.
Reset	Clicking Reset clears all the field information .
Test Rule	Clicking test rule opens the Test Rule dialog.

Test Rule Dialog

To access the Test Rule view:

1. Go to **Reports**.

   The Manage tab is displayed.



2. In the **Rules** panel, do one of the following:

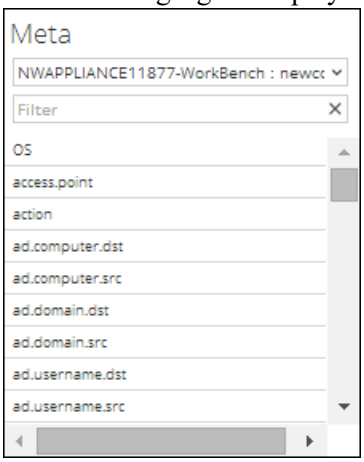
   - Select a rule and click  in the Rules toolbar.
   - Click  > **Edit**.

     The Build Rule view tab is displayed.

3. Click **Test Rule**.

The Test Rule view is displayed.

The following table describes the features in the Test Rule Dialog.



Feature	Description
Data Source	A drop-down list of data sources for the type of rule you are testing. Possible data sources are: Concentrator, Broker, Decoder or Log Decoder.
Format	A drop-down list of the formats for displaying results for the rule. Possible formats are: Tabular, Area, Bar, Bubble, Column, Line, Pie, Step Line, Step Area, Spline Area, and Spline.
Time Range	A drop-down list of time range specification methods. • Selecting Past allows you to specify a number of years, months, days, weeks, or hours. For example, Hours, Days, Weeks, Months, or Years. • Selecting Range allows you to specify a date range and time period. For example, start date to end date. In the user interface, the date or time displayed depends on the time zone profile selected by the user.
Use relative time calculation	Selecting this option calculates the time range relative to the current time.

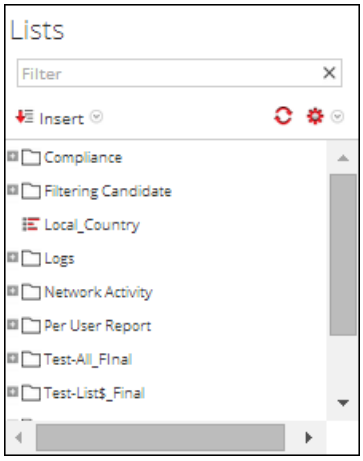
Feature	Description
X Axis	X-Axis and Y-Axis specify the metadata to be plotted in charts. In the X-Axis drop-down list, the meta types for the `Group by` setting in the rule are listed. You can select multiple meta types when the rule has a single `Group by` setting. For Custom Rules with multiple `Group by` values, you can select only the first meta type for the X-Axis.
Y Axis	In the Y-Axis drop-down list, the aggregate functions used in the rule are listed. Sum, Count, Countdistinct and Average are the supported aggregate functions for rules. You can select one or more aggregate functions.
Run Test	Clicking Run Test executes a test of the rule last saved in the Rule Builder dialog. When the test is complete, the rule data (if any) for the selected time range is displayed.

Meta Panel

The Meta panel provides a list of available meta types that you can use to build the rule. You can use the meta types in the Select, Where, and Then clauses. The Reporting Engine maintains an active list of the available meta names by continuously synchronizing with the data source to which it is connected.

The following figure displays the Meta panel.

The following table describes the features in the Meta panel.



Operation	Description
Choose	Based on the rule type that you have selected, the available data sources are displayed in the drop-down list of the Meta panel. Select the required data source. The available meta types for the data source are displayed. Select a meta.
Filter	Filter the meta for a specific meta value.

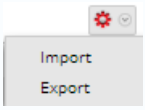
Lists Panel

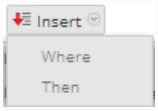
A List is a placeholder for a set of values that you can use in a meta or a variable. For example, you can define a list with all the whitelisted event source IP addresses. Once the List is defined then you can use the List name in the rule. This provides the flexibility of adding, modifying, and deleting the list values.

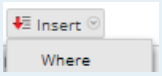
The Lists panel is a collection of Lists. The Reporting Engine maintains an active list of the available list names by continuously synchronizing with the collection to which it is connected.

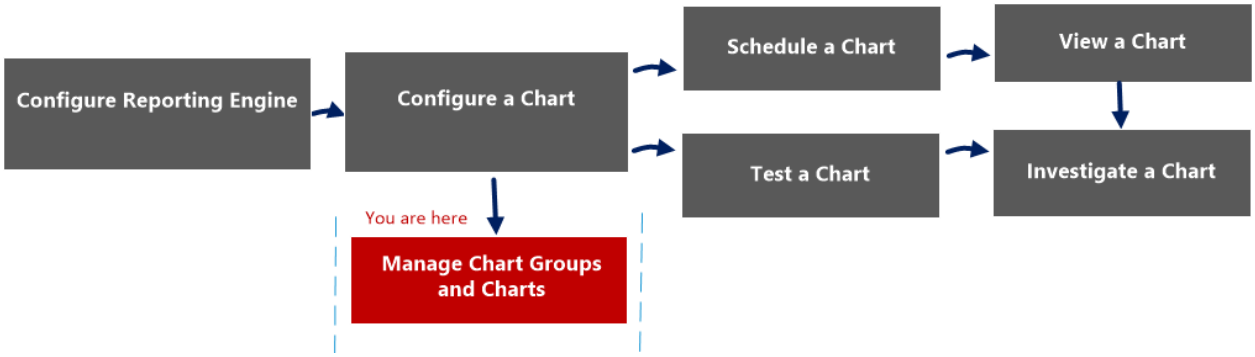
The following figure displays the Lists panel.

The following table describes the features in the Lists panel.









Operation	Description
	Import or Export a list.
	Refresh the Lists.
	If you select the **NetWitness DB** rule type, the options Where and Then are displayed. Insert the list in the Where or Then clause in the rule.
	If you select the **Warehouse DB** rule type, the option Where is displayed. Insert the list in the Where clause in the rule.

Chart Permissions Dialog

In the Chart Permissions dialog, you can manage access permissions for user roles at the chart and chart group level. Only a user with the 'Read & Write' permission can configure the chart in the Reporting module.

Workflow

What do you want to do?

Role	I want to ...	Documentation
Administrator/ Analyst	Configure Reporting Engine	For more information, see "Configure Reporting Engine" in the *Reporting Engine Configuration Guide*.
Administrator/ Analyst	Configure a chart	Configure a Chart
Administrator/ Analyst	Schedule a chart	Schedule a Chart
Administrator/ Analyst	View a chart	View a Chart
Administrator/ Analyst	Test a chart	Test a Chart
Administrator/ Analyst	Investigate a chart	Investigate a Chart
Administrator/ Analyst	Manage a chart group and chart*	Manage a Chart Group and Chart

*You can complete these tasks here.

- Configure and Generate a Chart

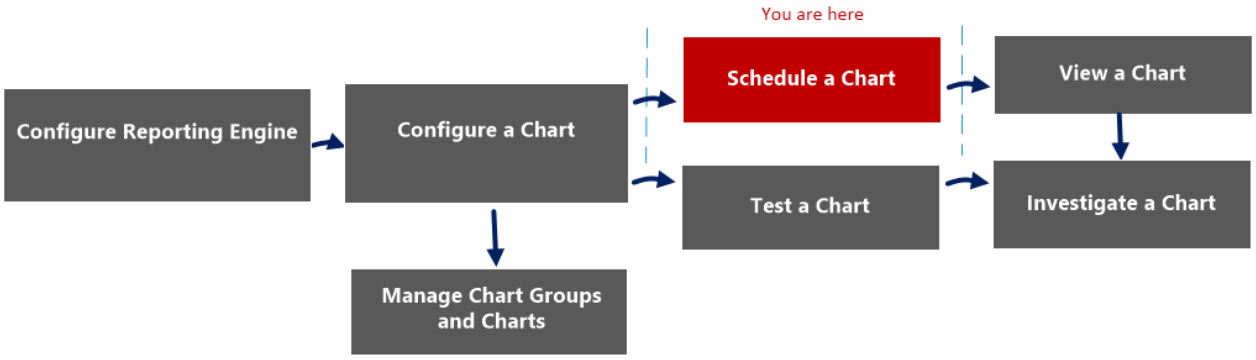
Quick View

The Chart permissions dialog allows you to set chart permissions depending on the user role.

The following figure is an example with the important features labeled.

1. Click **Reports** to view the Manage tab.
2. Click **Charts** to open the Chart view.
3. In the **Charts** panel, select a report and click > **Permissions**. The Chart Permissions dialog box is displayed.
4. Based on the user role, select the appropriate options.
5. (Optional) Select the checkbox if you want to automatically provide read access permission to dependent rules.
6. Click **Save**.

The following table lists the columns in the Charts Permission dialog.



Column	Description
Roles	Displays all the user roles in the NetWitness user interface.
Read & Write	Allows you to apply 'Read&Write' access to the chart.
Read Only	Allows you to apply only 'Read' access to the chart.

Column	Description
No Access	By selecting this permission, you cannot access or view the chart.
☐ Apply these permissions to sub-groups and Charts in this group	Allows you to apply permissions to the chart group, subgroups in the group and charts in the group. **Note:** This checkbox is populated only when you set access permissions for a Chart Group.
☐ Apply Read-only permission to Rules in the Charts	Allows you to automatically apply permissions to the rules in the charts.
Cancel	Cancels all the changes made to the permissions.
Save	Saves the selection and provides access to the role based on the selection.

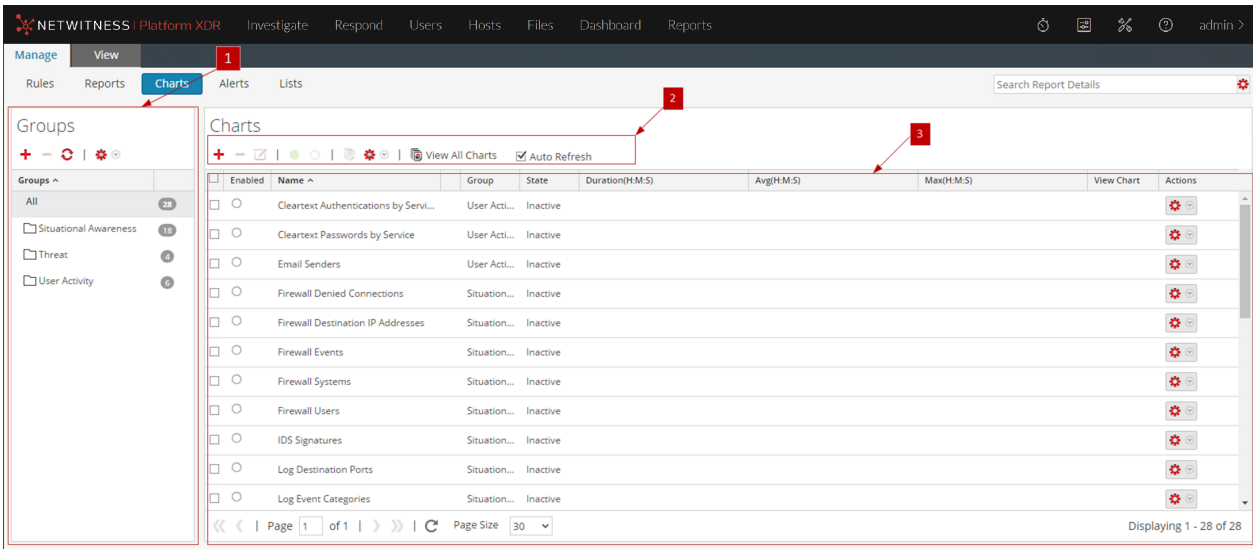
Chart View

In the Chart View, you can see the available charts and groups in a grid format and also schedule them by enabling the charts.

Workflow

What do you want to do?

Role	I want to ...	Documentation
Administrator/ Analyst	Configure Reporting Engine	For more information, see "Configure Reporting Engine" in the *Reporting Engine Configuration Guide*.
Administrator/ Analyst	Configure a chart	Configure a Chart
Administrator/ Analyst	Schedule a chart*	Schedule a Chart
Administrator/ Analyst	View a chart	View a Chart
Administrator/ Analyst	Test a chart	Test a Chart
Administrator/ Analyst	Investigate a chart	Investigate a Chart
Administrator/ Analyst	Manage a chart group and chart	Manage a Chart Group and Chart



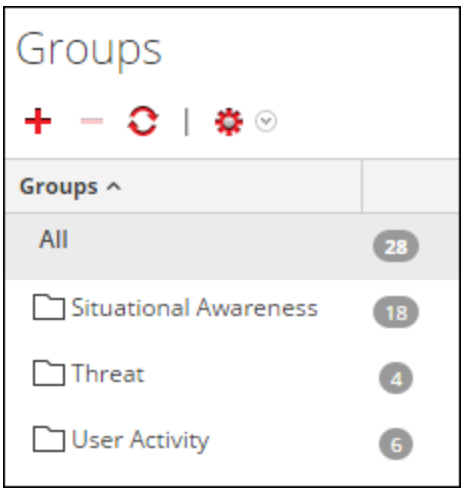
*You can complete these tasks here.

Related Topics

- Configure and Generate a Chart

Quick View

The following figure is an example with the important features labeled.



The Chart view includes the following panels:

1 Charts Groups panel
2 Charts toolbar
3 Charts panel

Charts Groups Panel

The Charts Groups panel allows you to organize charts in a group. You can create a group, add charts to the group and move charts among groups. The following figure shows the Charts Groups panel.

The Charts Groups Panel includes the following options:

Feature	Description
+	Adds a new chart to the Reporting module.

Feature	Description
	Deletes one or more selected charts.
	Edits a chart.
	Refreshes the view.
	Provides the following options: Import, Export and Permissions.

Charts Toolbar

The Charts toolbar allows you to add, modify, delete, duplicate, activate, deactivate, import and export a chart. You can also set access permissions for charts in a group.

The Chart toolbar includes the following options:

Feature	Description
	Adds a new chart to the Reporting module.
	Deletes one or more selected charts.
	Edit charts.
	Enables the selected charts.
	Disables the selected charts.
	Creates a duplicate copy of the selected chart.
	Provides the following options: Import, Export, Export as Text and Permissions.
View All Charts	Displays all the executed charts.
Auto Refresh	Automatically refreshes the charts list.
	Allows users to filter unused charts.

Charts Panel

The Charts Panel presents all the charts in a tabular or grid format.

The following table lists the columns in the Chart panel and their description.

Feature	Description
Enabled	● - The chart is enabled. ○ - The chart is disabled.
Name	The name of the chart.
Group	The Chart Group to which the chart belongs.
State	The state of the chart: • Queued • Completed • Failed
Duration (H:M:S)	The time taken to execute the latest chart.
Avg(H:M:S)	The average time taken to run the chart.
Max(H:M:S)	The maximum time taken to run the chart.
View Chart	A hyperlink that redirects to the View a Chart panel.
	The actions menu has the following options: Enable, Disable, View, Delete, Edit, and Export.

Execution History Panel

The Execution History panel allows you to fetch and display history details.

Workflow

This workflow shows the procedure to view report or report groups.

What do you want to do?

Role	I want to ...	Show me how

- Generate List Panel

- Scheduled Reports View

Quick View

The following figure is an example of the Execution History view.

Features

The View Execution History has the following panels:

1 Execution History Options panel
2 Execution History Output panel

To access this view:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, do one of the following:

   - Hover the mouse over a report and click > **View Scheduled Reports**.
   - Click **#Schedules** column.
     The Schedule Reports view is displayed with the status of each of the scheduled report.
4. Select a scheduled report and do one of the following:

- Click  > **Execution History**.
- Click  from the **Scheduled Reports** Toolbar Panel.

Execution History Options Panel

The Execution History Options panel allows you to fetch the history details based on either past n number of scheduled reports or a specific date range.

The following table lists the operations in the Execution History Options panel:

Operation	Description
Get history by:	This is the criteria to view the execution history: • **Past # Executions**: The past n number of scheduled reports. By default this option is displayed. • **Range (specific)**: The start date and end date for the date range. **Note:** The **From** and **To** field is populated in the NetWitness UI only when you select 'Range (Specific)' from the **Get history by** list.
From	The start date for the date range.
To	The end date for the date range.
Count	The number of execution history of the scheduled report to be displayed.
Show History	Shows the history details based on the selected criteria.

Execution History Output Panel

The Execution History Output panel displays the history details with the execution date, execution duration (seconds), state of the scheduled report, and a link to view the report.

The following table lists the various columns in the Execution History Output panel:

Column	Description
Execution Date	The date on which the scheduled report was executed. By default, the execution date is in descending order.
Execution Duration (Sec)	The time duration taken to execute the scheduled report.

Column	Description
State	The state of the scheduled report: • Scheduled: If a report is scheduled to run on an hourly, daily, weekly, monthly, or later time, the state of the report is displayed as scheduled, for the first run. • Queued: If a report is still waiting to get executed, the state of the report is displayed as queued. • Running: If the report schedule is in progress, the state of the report is displayed as running. • Partial: If in a report with several rules, a single rule execution failed or an output action failed or creation of PDF/CSV failed, the state of the report is displayed as partial. For example, consider a report with five rules and four rules are executed successfully and one fails, then the state is displayed as Partial. • Failed: If in a report with several rules, all the rule schedule executions failed, the state of the report is displayed as failed. • Completed: If a report schedule is successfully executed, the state of the report is displayed as completed. • Canceled: When cancel request is completed, the state of the report is displayed as canceled. • Inactive: If a report schedule is disabled, the state of the report is displayed as Inactive. • Not available: If the report schedule executed information is not available, the state of the report is displayed as not available.
View Report	The hyperlink to View a Report on full screen.
Action	Displays the icon to stop the execution schedule.
Close	Closes the execution history view.

Generate List Panel

The Generate List dialog allows you to generate and customize a list.

Workflow

This workflow shows the procedure to create and schedule a report.

What do you want to do?

Role	I want to ...	Show me how
Administrator / Analyst	Configure Reporting Engine	For more information, see "Step 3: Configure Reporting Engine Data Sources" topic in the *Reporting Engine Configuration Guide*

- Configure and Generate a Chart

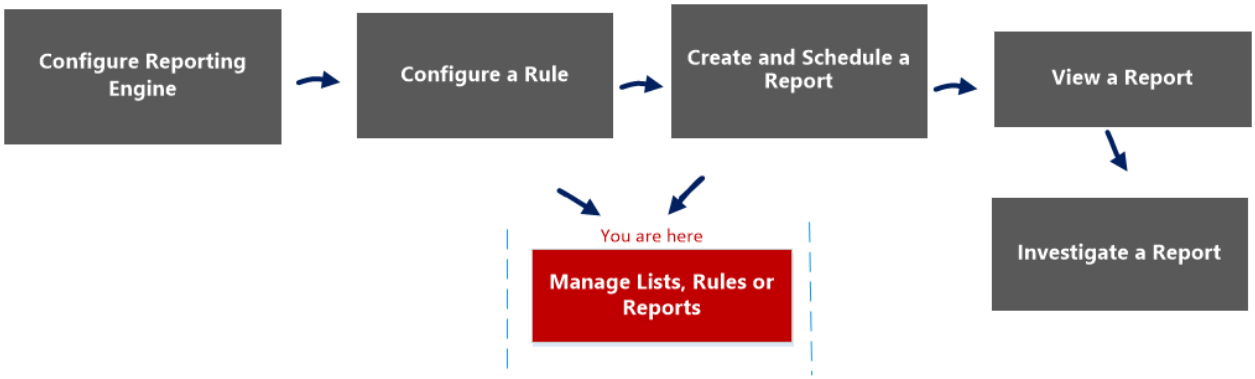
Quick View

This dialog displays differently when you use it to import groups containing subgroups and charts from other instances of NetWitness into the Chart Groups panel.

The following figure is an example of the Import Chart dialog.

1. Click **Reports** to view the Manage tab.
2. Click **Charts** to open the Chart view.
3. In the **Charts Groups** panel, select a folder to import the file.
4. In the **Charts Groups** panel or **Charts** toolbar, click > **Import** to import the file.

The following table describes the features in the Import Chart dialog.



Feature	Description
Browse	Displays a view of the local file system so that you can select the chart to be imported.
Delete	Deletes an imported report from the list of imported charts.
File Name	Displays a list of chart files that will be imported to your Charts module when you click Import.
Overwrite?	Allows you to select the option to overwrite an existing version of the chart you are importing. If you do not select the Overwrite option, a duplicate file is imported and no error message is displayed.
Close	Closes the dialog. If you have charts to select for import, but have not clicked Import. The charts are not imported, and are not saved in this dialog.
Import	Imports the selected charts to your Charts module.

Import Report Dialog

In Import Report dialog, you can import groups containing subgroups and reports from other instances of NetWitness into Report Groups panel. Reports must be in a valid binary file that was exported from another NetWitness instance.

Workflow

This workflow shows the procedure to manage reports or report groups.

Quick View

To access the Import Report dialog:

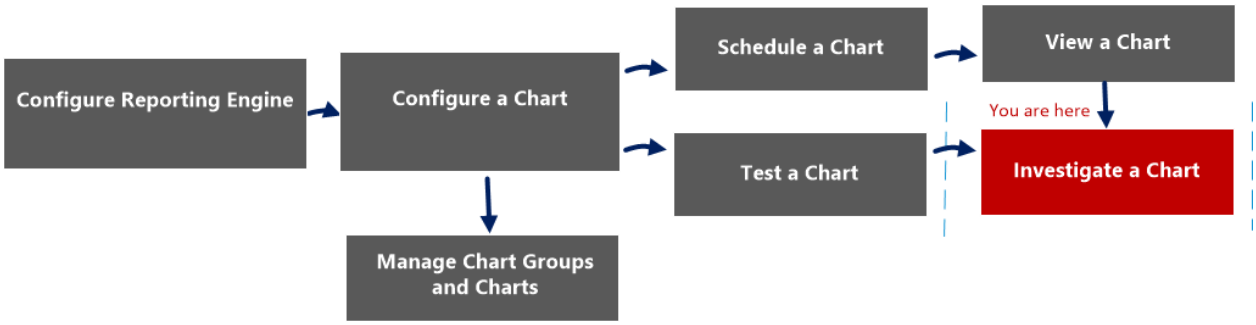
1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports Groups** panel, select a folder to import the file.
4. Do one of the following:
   - In the **Reports Groups** panel, click > **Import** to import a group.
   - In the **Reports** toolbar, click > **Import** to import a report.



The following table lists the features of the Import Report dialog.

Feature	Description
Browse	This option displays a view of the local file system so that you can select the report to be imported.
Delete	This option deletes an imported report from the list of imported reports.
File Name	Displays a list of report files that will be imported to your Reports module when you click Import.
Overwrite?	Allows you to select the option to overwrite an existing version of the report you are importing. If you do not select the Overwrite option, a duplicate file is imported and no error message is displayed.
Close	This option closes the dialog. If you select a report and not clicked Import. The reports are not imported, and are not saved in this dialog.
Import	This option imports the selected reports to your Reports module.

Investigate a Chart View

In the Investigate a Chart view, you can view and investigate chart details. There are options for filtering and sorting the information in the chart, as well as options for the type of chart, the number of items to chart, and charting values or totals. When viewing a chart, you can open the charted sessions in the Investigation module and save the chart as a PDF.

Quick View

The following figure shows the List view.

To access this view

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The Lists view is displayed.

The List view includes the following panels:

1 Lists Groups panel
2 Lists toolbar
3 Lists panel

Lists Groups Panel

The Lists Groups panel provides a list of groups used to organize lists and has a toolbar that allows you to create and manage the groups.

Feature	Description
	Allows users to add a new group to the Reporting module.
	Allows users to delete groups.
	Refreshes the view.

Feature	Description
	Allows users to access following options: Import, Export and Permissions.
	Allows users to filter unused lists.

You can perform the following actions using the Lists Groups panel.

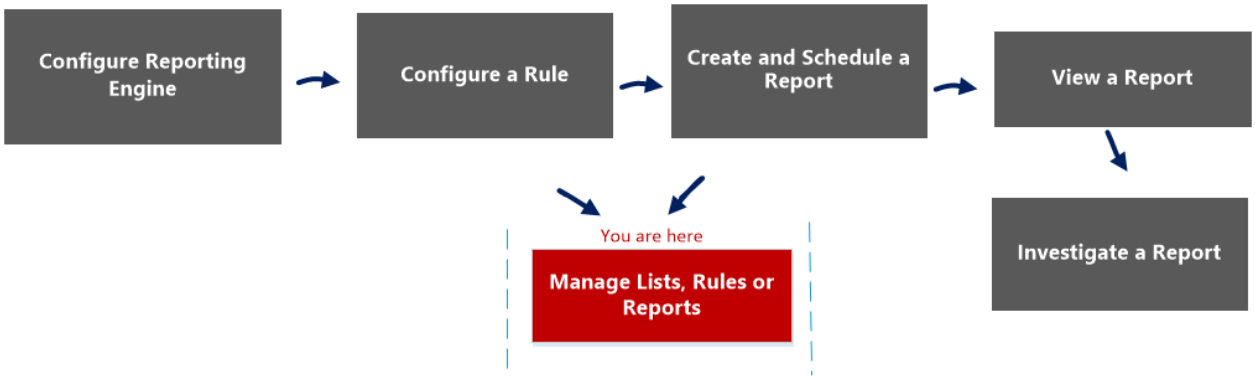
- Refresh lists in a group.
- Move lists between different groups. You can move a list from one group to another by dragging and dropping the list in the required group.
- Create list groups.
- Delete list groups.
- Import list groups.
- Export list groups.
- Set access control for list groups.

Lists Toolbar

Feature	Description
	Allows user to add a new list to the Reporting module.
	Allows user to delete one or more selected lists.
	Allows user to edit lists.
	Creates a duplicate copy of the selected list.
	Allows user to access the following options: Import, Export and Permissions.

Lists Panel

The Lists panel displays all the lists defined in a tabular format.



Column	Description
Name	Displays the name of the list. **Note:** For **Name** field, the icon to extend the column size is not displayed at the end of the column field. You have to hover the mouse a little to the left side to see the icon for extending the column.
Group	Displays the list group to which the list belongs.
Date Modified	Displays the date and time when the list was modified.

Reports Permissions Dialog

In the Reports Permissions dialog, the users with 'Read & Write' access permission can configure permissions.

Workflow

This workflow shows the procedure to manage reports or report groups.

   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** panel, select a report.
4. Click > **Permissions**.
   The Reports Permissions dialog is displayed.

Note: When you select the check box, all dependent rules are given READ access permission, provided the permissions for the report is higher compared to the permissions of the rules.

The following table describes the features in the Reports Permissions dialog.

Feature	Description
Roles	Displays all the roles who can get access to the permissions.

Feature	Description
Read&Write	Allows you to get Read&Write access to the Rules in the Reports.
Read Only	Allows you to get Read Only permissions to the Rules in the Reports.
No Access	If you select this option, you will not get permission to the Rules in the Reports.
Apply Read-only permissions to Rules in the Reports	Allows to set Read Only permissions to the Rules in the Reports for all the roles .
Cancel	This option cancels all the changes made to the permissions.
Save	This option saves the selections and provides access to the roles based on the selections.

Report View

In the Report view, you can create and manage the report or report groups.

Workflow

This workflow shows the procedure to create and schedule a report.

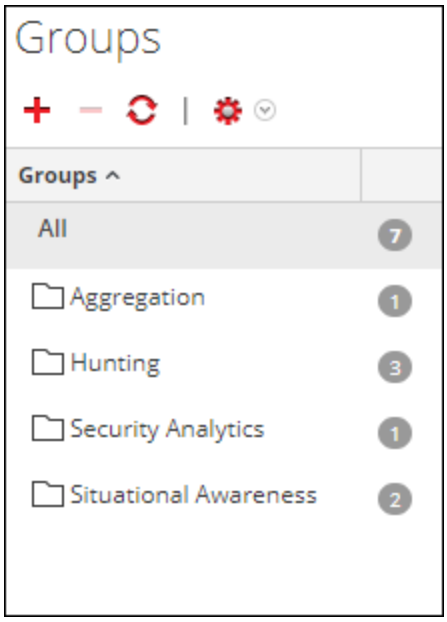
Quick View

To access this view:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Reports view is displayed.



Features

The Report view includes the following sections:

1	Reports Groups panel
2	Reports toolbar
3	Reports panel

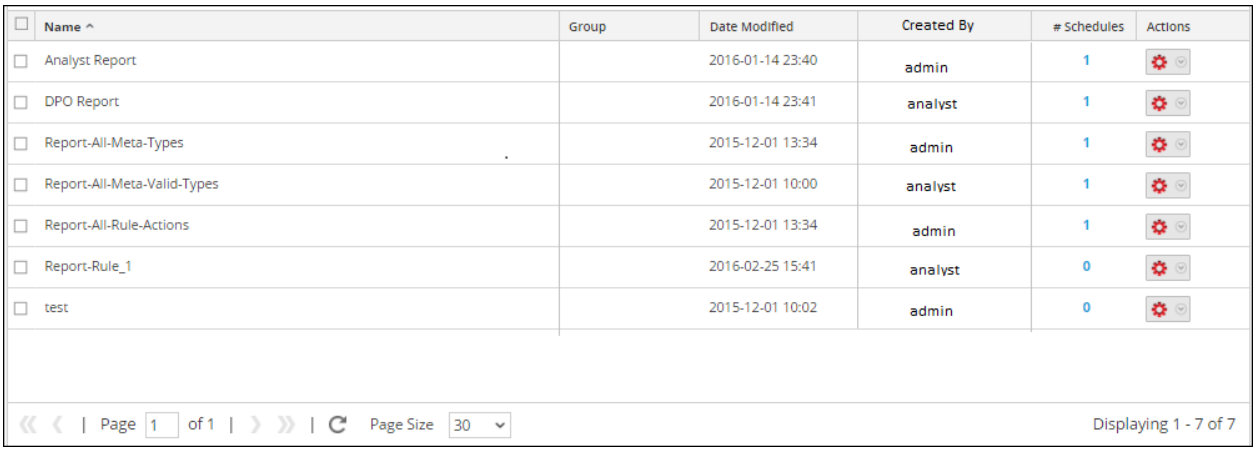
Report Groups Panel

The Report Groups panel allows you to organize reports in a group. You can create a report group, add reports to the group, and move reports among groups. You can view all reports by selecting All option under the Groups column.

Feature	Description
+	This option allows you to add a new report to the Reporting module.
−	This option allows you to delete one or more selected report.
↻	This option refreshes the view.
⚙	The actions menu has the following options: Import, Export and Permissions.

Reports Toolbar

The Reports toolbar allows you to add, modify, delete, duplicate, import and export reports. You can also set access permissions for a report in a group.



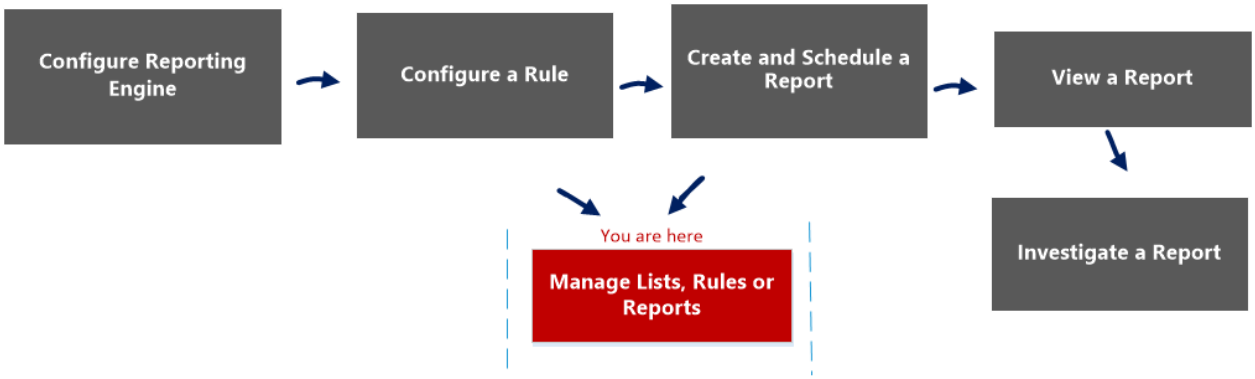
Feature	Description
+	This option allows you to add a new report to the Reporting module.
−	This option allows you to delete one or more selected reports.
✎	This option allows you to edit a chart.
⧉	This option creates a duplicate copy of the selected report.
⚙	The actions menu has the following options: Import, Export , Export as Text and Permissions.

Feature	Description
View All Reports	This option allows you to view a list of reports along with their schedule name and time.
View All	This option allows you to view all the scheduled reports.

Report List Panel

The Report List panel lists all the reports in a tabular format.

The following table describes the columns in the Report List panel.



Column	Description
Name	The name of the report.
Group	The Report Group to which the report belongs.
Date Modified	The date and time when the report was modified.
Created By	The creator of the report.
#Schedules	The count indicates the number of schedules created for a report.
Actions	The actions menu has the following options: Schedule Report, View Scheduled Reports, Delete, Edit, and Export.

Rule Permissions Dialog

The Reporting module provides access control at the rule level. Only a user who has the right set of permissions can perform tasks on the rule. When creating user roles, the administrator must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

Workflow

This workflow shows the procedure to manage rule or rule groups.

What do you want to do?

Role	I want to ...	Show me how

- Rule View

Quick View

This figure shows the Rules Permissions dialog for a single rule.

This figure shows the Rules Permissions dialog when multiple rules are selected.

The dialog has a different appearance for rule groups versus rules. To access the dialog:

1. Go to **Reports**.
   The Manage tab is displayed.
2. In the **Rules** panel, select one or more rules or a rule group.

3. Click  > **Permissions** in the toolbar.

   The Rules Permissions dialog is displayed.

Feature	Description
Roles column	Lists the NetWitness user roles, both built-in and custom roles. Each user who is logged in to NetWitness has user roles assigned. When multiple rules are selected, the asterisk beside the role name, for example, `Security*`, indicates there are other permissions available on that user role. To change the other permissions, you must select the user role and change the access permission.
Read & Write column	When the checkbox in this column is selected, the corresponding user role has permission to view, edit, delete, import, and export rules in the Rules view. The user can also change the permission on the rule.
Read Only column	When the checkbox in this column is selected, the corresponding user role has permission to view the rules in the rule group.
No Access column	When the checkbox in this column is selected, the corresponding user role cannot view or edit the rules in the rule group. Before applying rule permissions, this is the default permission set for all the user roles though the checkbox is unchecked.
Apply these permissions to sub-groups and Rules in this group checkbox	When checked, NetWitness applies permissions to sub-groups and rules in the group.
Cancel option	Clicking Cancel closes the dialog without saving any changes made.
Save option	Clicking Save closes the dialog and updates the rule group permissions for user roles. If specified, the access permissions are applied to subgroups and child objects of this group. When multiple rules are selected, the access permission is applied to all the selected rules.

Rule View

The Rule view is the user interface for managing rules.

Workflow

This workflow shows the procedure to define rule or rule groups.

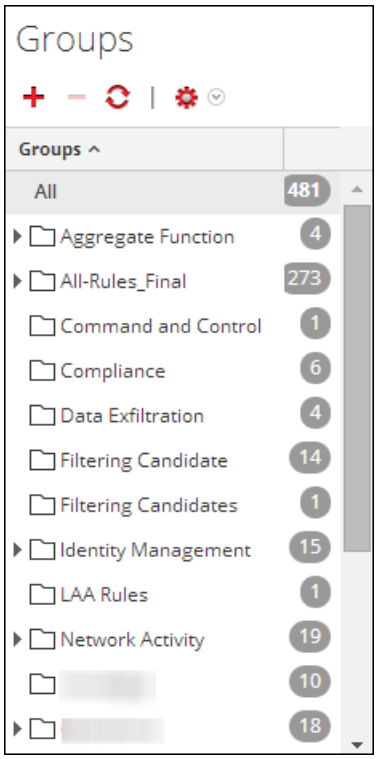
Quick View

To access the Rules view:

1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Rules**.

   The Rules view is displayed.



The Rule view includes the following panels.

1	Rules Groups
2	Rules panel
3	Rules Toolbar

Rule Groups Panel

The Rule Groups panel allows you to organize rules into groups using the options in the toolbar. You can create groups and sub-groups and add rules to them. You can also group and move rules between different groups.

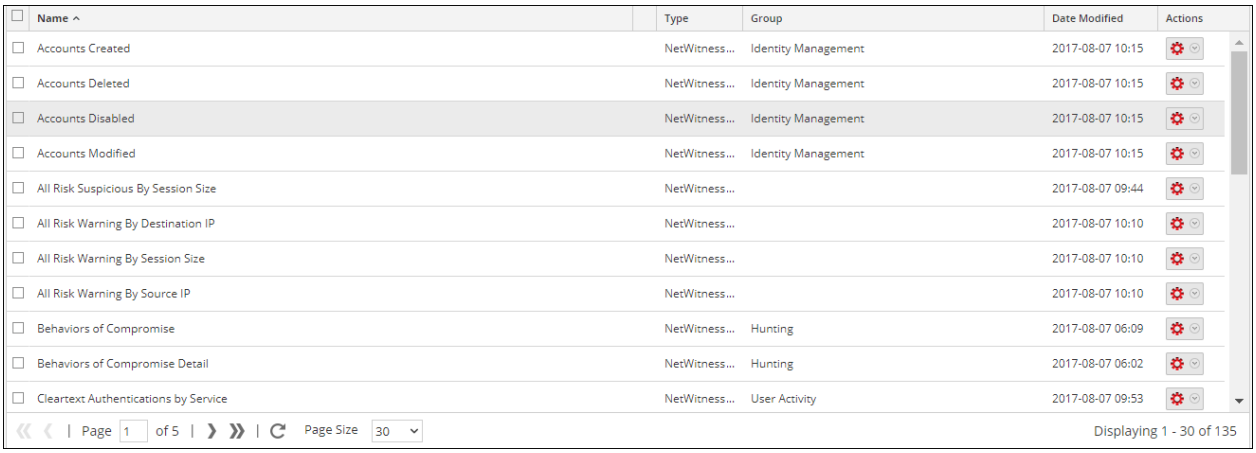
The following figure shows the groups in the Rule Groups panel:

The following table describes the features in the Rule Groups Panel.

Feature	Description
+	This option allows you to add a new rule group to the Reporting module.
−	This option allows you to delete one or more rule groups.
↻	This option refreshes the rule group list.
⚙	The actions menu has the following options: Import, Export and Permissions.
All	Displays a list of all the rule groups.

Rule Toolbar

The Rule toolbar allows you to add, delete, edit, and duplicate a rule. The following figure shows the toolbar.



The following table describes the features in the Rule Toolbar

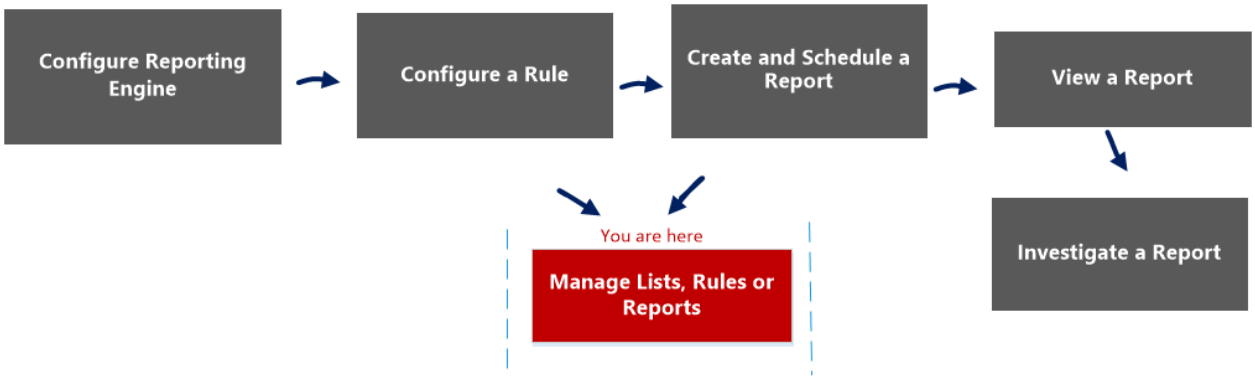
Feature	Description
+	This option allows you to add a new rule to the Reporting module.

Feature	Description
	This option allows you to delete one or more selected rules.
	This option allows you to edit a rule.
	This option allows you to duplicate a rule.
	The actions menu has the following options: Use, Import, Export and Permissions.
	This option allows you to filter the rule type.

Rule List Panel

The following figure shows the list of rules in the Rule List panel.

The following table describes the features in the Rule List Panel.



Feature	Description
Name	Displays the name of the rule that you are created or edited. **Note:** For the **Name** field, the icon to extend the column size is not displayed at the end of the column field. You have to hover the mouse a little to the left side to see the icon for extending the column.
Type	Displays the supported database type for the rule you created.
Group	Displays the values which are grouped.
Date Modified	Displays the date when the rule was last modified.
Actions	Displays the actions menu has the following options: Create Alert, Create Chart, Create Report, Delete, Edit, Export, and Dependents.

Select a Logo Dialog

In the Select a Logo dialog, you can upload a new logo that is not available in Reporting Engine Services Config view or choose an existing logo from the Reporting Engine Services Config view.

Workflow

This workflow shows the procedure to manage reports or report groups.

Related Topics

- Configure and Generate a Chart

Quick View

The following figure shows the Schedule a Chart view.

The Schedule a Chart view includes the following panels:

1. Charts Groups panel
2. Charts toolbar
3. Charts panel

Charts Toolbar

The Charts toolbar allows you to add, modify, delete, duplicate, enable, disable, import and export a chart. You can also set access permissions for charts in a group.

The Charts toolbar includes the following options:

Feature	Description
	Adds a new chart to the Reporting module.
	Deletes one or more selected charts.
	Edit charts.
	Enables the selected charts.
	Disables the selected charts.
	Creates a duplicate copy of the selected chart.
	Provides the following options: Import, Export, Export as Text and Permissions.
View All Charts	Displays all the executed charts.
Auto Refresh	Automatically refreshes the charts list.

Charts Panel

The Charts Panel presents all the charts in a tabular or grid format.

The following table lists the columns in the Charts panel and their description.

Feature	Description
Enabled	- The chart is enabled. - The chart is disabled.
Name	The name of the chart.
Group	The Chart Group to which the chart belongs.
State	The state of the chart: • Queued • Completed • Failed
Duration (H:M:S)	The time taken to execute the latest chart.
Avg(H:M:S)	The average time taken to run the chart.
Max(H:M:S)	The maximum time taken to run the chart.
View Chart	A hyperlink that redirects to the View a Chart panel.
	The actions menu has the following options: Enable, Disable, View, Delete, Edit, and Export.

Schedule Report Panel

The Schedule Report panel allows you to schedule a customized report. Prior to scheduling a report, you can create a dynamic list (with the overwrite option selected) with services added. For more information, see "Generate a List from the Scheduled Report" section in Create and Schedule a Report. Then use the list to generate a report with details in the report like services and host names.

Workflow

This workflow shows the procedure to create and schedule a report.

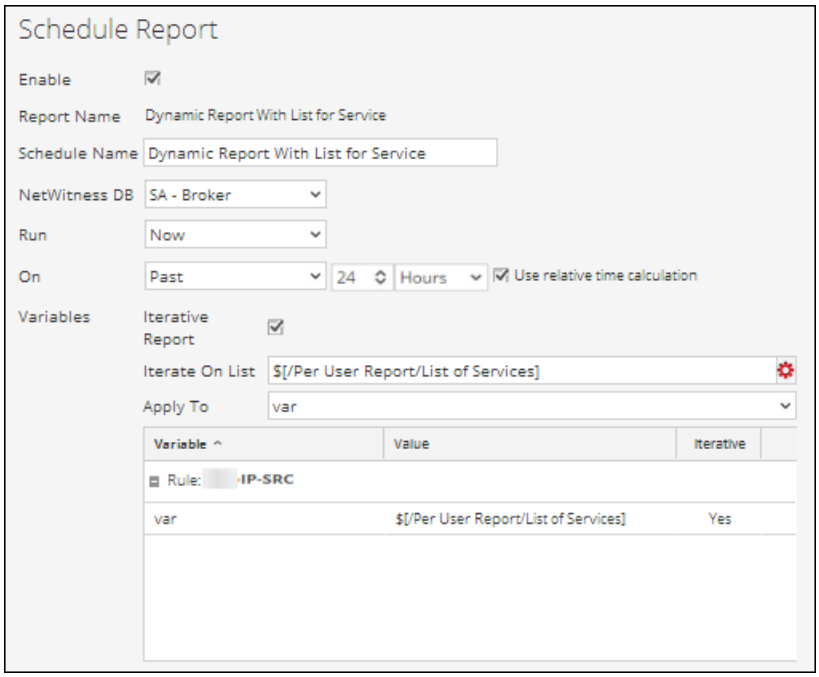
Quick View

To access this view:

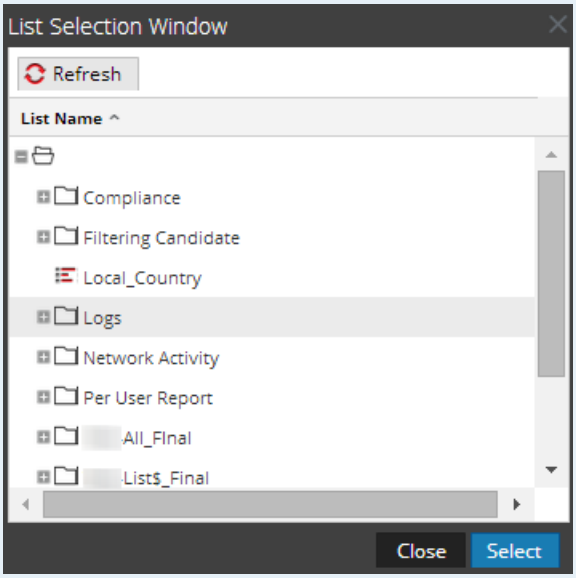
1. Go to **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Reports view is displayed.
3. In the **Reports** panel, click  > **Schedule Report**.



Features

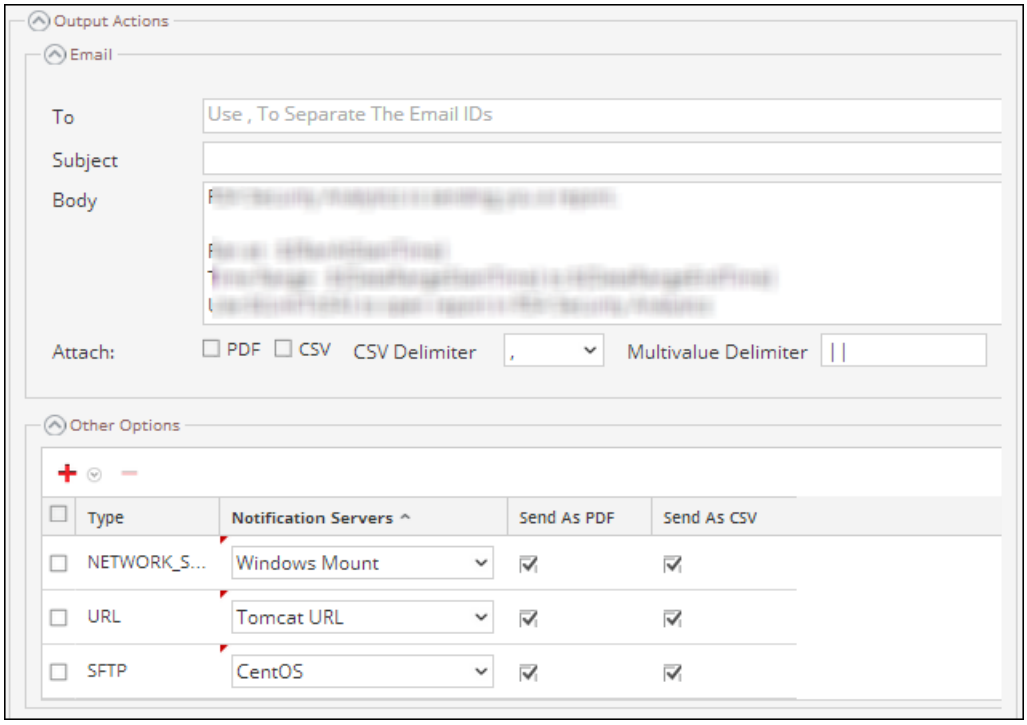
The Schedule Report view consists of the following panels:

1	Schedule Report View
2	Output Actions Panel
3	Dynamic List Panel
4	Logo Panel



Schedule Report View

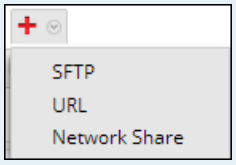
The Schedule Report view allows you to schedule reports.



The following table lists the fields in the Schedule Report panel.

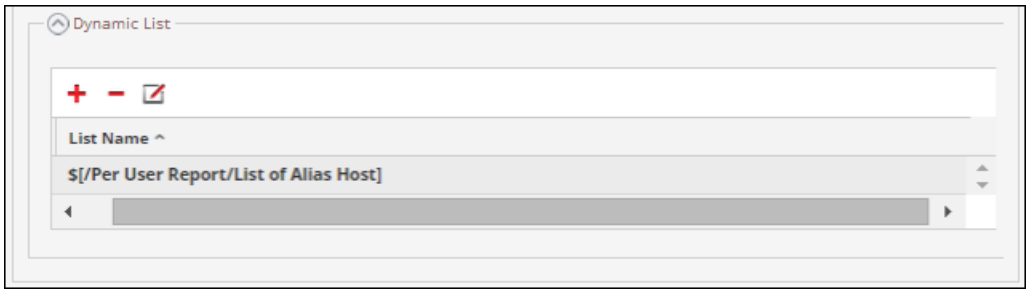
Field	Description
Enable	Enables the report schedules and runs the report.
Report Name	The name of the report.
Schedule Name	The name of the scheduled report configuration.
NetWitness DB	The database can be NWDB and Warehouse DB depending on the type of database that you selected in the rule definition. If the report has rules of NWDB and Warehouse DB types, all the database types or rule types are displayed.
Warehouse Resource Pool	If the report has rules of Warehouse DB, the Warehouse Resource Pool drop-down is displayed to select the pools or queues available in the cluster. If no pools or queues are entered for the Reporting engine, this field is disabled. For more information, see "Step 5: Configure Task Scheduler for a Reporting Engine" topic in the *Host and Services Configuration Guide*.
Run	Provides the type of schedule for the run configuration: • Ad-hoc execution • Hourly execution • Daily execution • Weekly execution • Monthly execution
On	The data range on which the query is run.

Field	Description
Use relative time calculation	Uses the relative time duration to schedule a report.
Iterative Report	Select the checkbox to schedule a report for the selected list value.
Iterate on List	Click this button to navigate to the List Selection panel and select a list. The following figure displays this panel:  The List Selection panel is a collection of Lists. The Reporting Engine maintains an active list of the available list names by continuously synchronizing with the collection to which it is connected.
Apply To	Apply list values on the selected variable.
Variables	Displays the rule variables along with their associated values and the iterative properties included in the report. **Note:** Depending on the rule chosen while creating a report, you can view dynamic variables defined for the rule in the **Variables** field of the Schedule Report panel. For example, Test-Country is the rule having the dynamic variable var.
Schedule	Schedules the report.
Reset	Resets the scheduled report.
Configure	Allows you to alter the Reporting Engine configuration details on the "Reporting Engine General Tab" topic in the *Host and Services Configuration Guide*. **Note:** This button is visible on the Schedule Report panel only when you have the 'Manage Device' access permissions on the Reporting module.



Output Actions Panel

The Output Actions panel specifies output actions to notify the email recipient when the report execution completes and also sends reports in PDF and CSV formats as attachments in the email, based on your selection.



The following table lists the fields in the Output Actions panel.

Field	Description
To	A comma-separated list of email addresses to receive the output.
Subject	The subject entered in the mail.
Body	The body of the email. By default, the body field is populated with pre-defined text that has certain variables that will add meta appropriate to the generated report. In the Reporting Engine, these variables are replaced with actual values. • `${RanAtStartTime}` : The Start time of the report. • `${DataRangeStartTime}` : The Start time of the data time range. • `${DataRangeEndTime}` : The End time of the data time range. • `${LinkToSA}` : The link to the NetWitnessHost from the email which in turn opens the report in NetWitness interface. • `${ReportName}` : The name of the report. • `${DataSource}` : The name of the data source.

Field	Description
Attach:	The output format in which the report is attached to the email, such as PDF or CSV as configured in the Schedule Report dialog.
CSV Delimiter	The default CSV delimiter is comma (,). If the CSV content contains a comma, you must identify a unique separator so the content is stored in its original form. For example, if msg is a column in the report to be saved as CSV and the msg content is as follows: `ASA-SSM-CSC-20 Module in slot 1," application reloading ""CSC SSM""," version ""6.2.1599.0"" CSC SSM scan services are reloading because of a pattern file or configuration update` The above content will be included in three columns due to the commas (,). To avoid this, you must specify a different delimiter such as a pipe line character "|". **Note:** To import the CSV file into Microsoft Excel, use the Data > From Text option in the Excel application. When you import the CSV file you must specify the file type of the file being imported as Delimited and use the same delimiter that you specify to generate the CSV file.
Multivalue Delimiter	The data in multivalued fields are separated by the multivalue delimiter. The default Multivalue delimiter is two pipe line characters (||).
Other Options	You can select an SFTP, URL, or Network Share location configured in ((RE}} and then send the report either in PDF or CSV format based on the requirement.
	Select this option to send the report to the SFTP, URL or Network Share location configured in the Reporting Engine Services Config view.
Type	The type of output action chosen. For example, SFTP, URL or Network Share.
Output Actions	Select the SFTP, URL or Network Share name configured in the Reporting Engine Services Config view.
Send as PDF / Send as CSV	Select these options to send the report either in PDF or CSV format, or both to the configured Notification Server (SFTP, URL or Network Share).

Dynamic List Panel

The Dynamic List panel populates the lists created and you can add, edit or delete the list. The list is generated based on the scheduled report which can be viewed in the Lists view.

The following table lists the operations in the Generate List panel.

Operation	Description
	Adds a new list to the report.
	Deletes all the lists added to the report.
	Displays the Generate List dialog.
List Name	The name of the list chosen from the List Selection panel. For more information on the List Selection panel topic, see Generate List Panel.

Logo Panel

The Logo panel populates the default logo from the Select a Logo panel. For more information on choosing a logo from this panel, see "Manage and Select a Report Logo" section in the Manage Lists, Rules or Reports.

You can set the default logo for a Reporting Engine. This is the logo that is used in the generated reports. For more information on choosing a logo, see Select a Logo Dialog.

Note: If you have not selected any logo then the default NetWitness logo is used on the report. The option **Save as PDF** for the previously executed reports does not support a new customer logo. It displays the default NetWitness Logo, if the customer logo must be displayed in the Schedule a Report view.

Scheduled Reports View

The Scheduled Reports view allows you to create, view and manage scheduled reports.

Workflow

This workflow shows the procedure to create and schedule a report.

Related Topics

- Build Report View
- Report View

- Schedule Report Panel
- Reports Permissions Dialog

Quick View

To access this view:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, do one of the following:

   - Click  > **View Scheduled Reports**.
   - Click the **Schedules** column.

Features

The View Scheduled Reports has the following features:

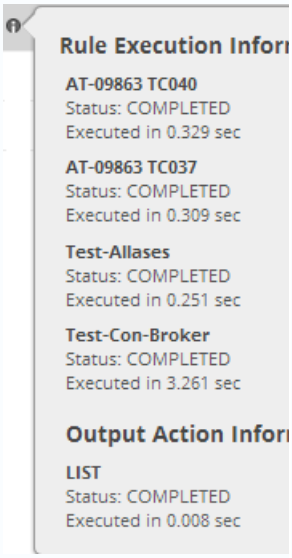
1	Report Schedule Toolbar
2	Report Schedule List panel

Report Schedule Toolbar

The Scheduled Reports has options to add, modify and delete the scheduled report as well as options to enable or disable the selected run configuration.

The following table lists the operations in the Scheduled Reports toolbar.

Operation	Description
	Create a new report schedule.
	Delete the selected report schedule.
	Edit the selected report schedule. **Note:** Double-click on a desired report schedule to edit it.
	Enables the selected report schedule.
	Disables the selected report schedule.
	View the history of the scheduled report.
	Filter schedules based on the type of schedule. (For example, AdHoc)
	Allows you to set permissions for the selected scheduled report.
	Automatically refreshes the scheduled reports list.
	Searches schedules based on the schedule name.

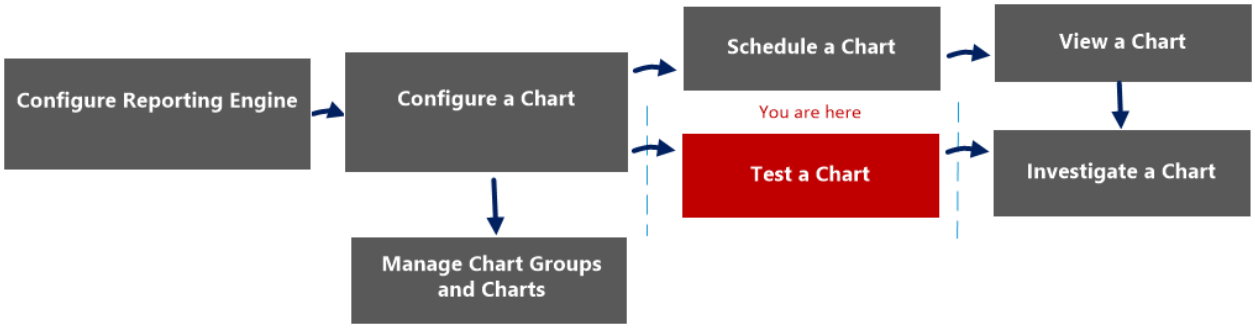


Report Schedule List Panel

The Scheduled Reports List panel lists the scheduled reports in a tabular format.

The following table lists the columns in the Scheduled Reports List panel:

Column	Description
Name	The name of the scheduled report.
Schedule	The type of schedule for the run configuration: • Ad-hoc execution • Hourly execution • Daily execution • Weekly execution • Monthly execution
Last Run	Displays the last time the report was run.
Duration(H:M:S)	Displays the time taken for last execution of the report.



Column	Description
Avg (H:M:S)	Displays the average time taken to run the report.
State	Indicates the state of the scheduled report. • Scheduled: If a report is scheduled to run on an hourly, daily, weekly, monthly, or later time, the state of the report is displayed as scheduled, for the first run. • Queued: If a report is still waiting to get executed, the state of the report is displayed as queued. • Running: If the report schedule is in progress, the state of the report is displayed as running. • Partial: If in a report with several rules, a single rule execution failed or an output action failed or creation of PDF/CSV failed, the state of the report is displayed as partial. For example, consider a report with five rules and four rules are executed successfully and one fails, then the state is displayed as Partial. • Failed: If in a report with several rules, all the rule schedule executions failed, the state of the report is displayed as failed. • Completed: If a report schedule is successfully executed, the state of the report is displayed as completed. • Canceled: When cancel request is completed, the state of the report is displayed as canceled. • Inactive: If a report schedule is disabled, the state of the report is displayed as Inactive. • Not available: If the report schedule executed information is not available, the state of the report is displayed as not available.

Column	Description
	Click to view the rule execution information and output action information. This pop-up notifies the status of multiple rules in a report and the time taken for its execution. **Note:** You can view the rule execution and output action information for a scheduled report having the state **Completed**, **Running**, **Partial** or **Failed**. By default, the Output Actions for Completed Report on Reporting Engine Config page is set to enable, to receive an email when the report status is completed. To receive an email for **Failed** or **Partial** reports, you must disable this option.
View Report	Click to view the rule execution information on the View a Report Panel. You can view the rule execution information for a scheduled report having the state 'running' as well.

Test a Chart View

In the Test a Chart view, you can view and test the charts.

- Configure and Generate a Chart

Quick View

The following figure is an example with the important features labeled.

The Test a Chart view consists of the following panels:

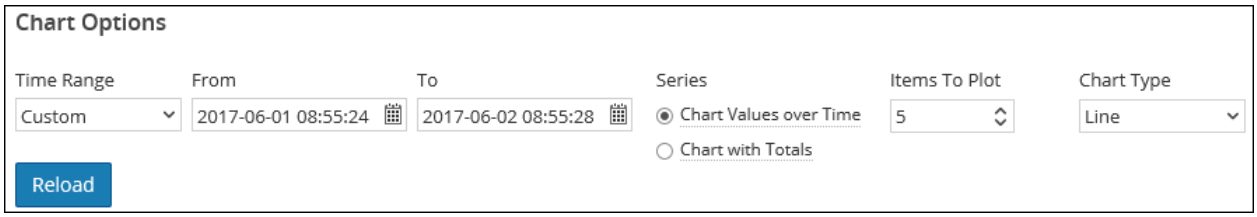
1 Chart toolbar
2 Chart Output panel
3 Chart Options panel

Chart Toolbar

The Charts toolbar allows you to investigate on a particular chart and change the screen to full screen.

Feature	Description
Investigate	Investigates further on the selected chart.
Full Screen	Displays the chart in full screen.

Chart Output Panel



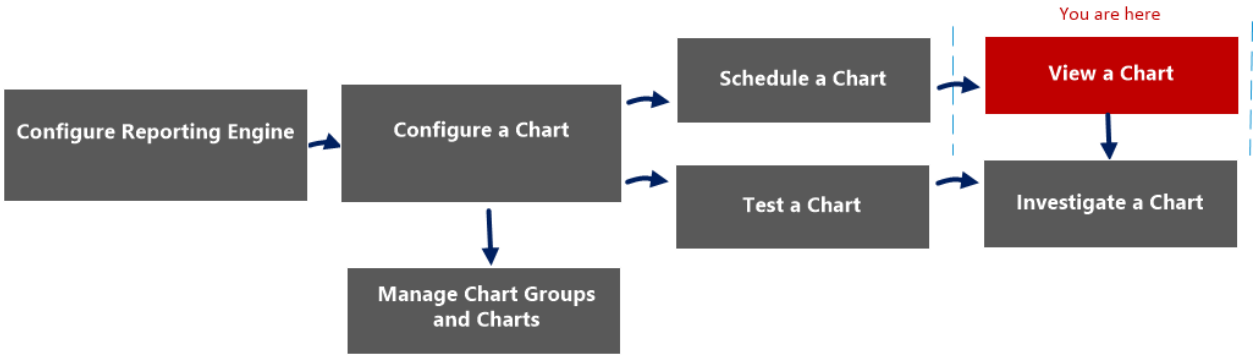
The Chart Output panel displays the information in a chart format for the selected time chart options.

The following table lists the features in the Test a Chart View and their descriptions.

Feature	Description
Display	Allows you select the values that needs to be displayed and have the following options: X Axis, Y Axis and Legends.
X Axis	Displays the session count.
Y Axis	Displays the actual output.
Legends	Displays the list of variables appearing in the chart.

Chart Options Panel

The following figure shows the Chart Options panel, which displays the time range, series, and chart type fields to configure the chart display.



The following table lists the fields in the Charts Options panel and the descriptions.

Feature	Description
Time Range	The default time range is Last 3 Hours. However, you can select a different value from the drop-down list, for example, Last Hour, or Last 6 Hours which are the preset values. Or you can customize by selecting Last N Days or the Custom option.
From	The start date and time. (only for custom options).
To	The end date and time. (only for custom options).
Series	The series field provides you with two options: • Chart Values over Time: Renders the chart for the entire time range selected. • Chart with Totals: Renders the summary of data for the selected date range.
Items to Plot	The maximum number of events the user wants to view on the chart.
Chart Type	The type of chart to be rendered either area, bar, column, line, step line, step area, spline area or spline.

View a Chart Panel

In the View a Chart panel, you can view and manage charts. There are options for filtering and sorting the information in the chart, as well as options for the type of chart, the number of items to chart, and charting values or totals. When viewing a chart, you can open the charted sessions in the Investigation module and save the chart as a PDF.

- Configure and Generate a Chart

Quick View

The following figure is an example with the important features labeled.

The View a Chart panel includes the following panels:

1. Chart toolbar
2. Chart Output panel
3. Chart Calendar panel
4. Chart Options panel
5. Chart Executed list

Chart Toolbar

The Chart toolbar has options that allow you to investigate, and view the chart on another screen.

The following table lists the options in the Chart toolbar.

Operation	Description
Investigate	Investigates the chart details.
Full Screen	Displays the chart on a full screen.

Chart Output Panel

The Chart Output panel displays the chart with sortBy on the Y-axis, time on the X-axis and legends.

Note: You can save the chart as PDF using the icon on the Chart Output panel.

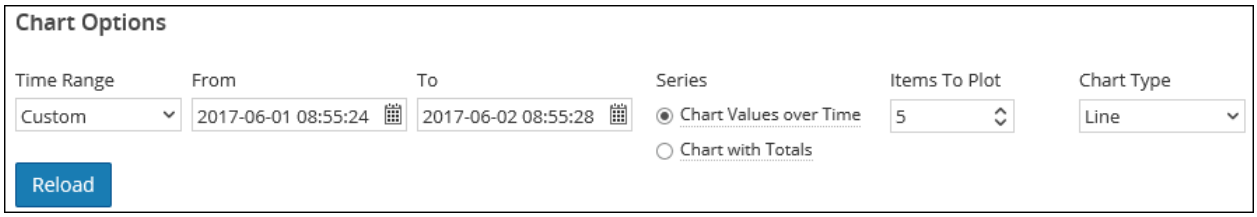

Chart Calendar Panel

The Chart Calendar panel is the default calendar with which you can filter the list of charts depending on the date you select from the Calendar, as shown in the following figure.

Chart Options Panel

The Chart Options panel displays the time range, series, and chart type fields to configure the chart is displayed.

The following table lists the fields in the Chart Options panel.

Field	Description
Time Range	The default time range is Last 3 Hours. However, you can select a different value from the drop-down list, for example, Last Hour, or Last 6 Hours which are the preset values. Or you can customize by selecting Last N Days or the Custom option. **Note:** The time range selected by you for a chart will be saved. When you open the same chart the next time, the time range that is saved will be displayed. This behavior is not applicable for the custom option.
From	The start date and time. (only for custom options)
To	The end date and time. (only for custom options)
Series	The series field provides the user with two options: • Chart Values over Time: Renders the chart for the entire time range selected. • Chart with Totals: Renders the summary of data for the selected date range.

Field	Description
Items to Plot	The maximum number of events the user wants to view on the chart.
Chart Type	The type of chart to be rendered. Either area, bar, column, line, step line, step area, spline area or spline.

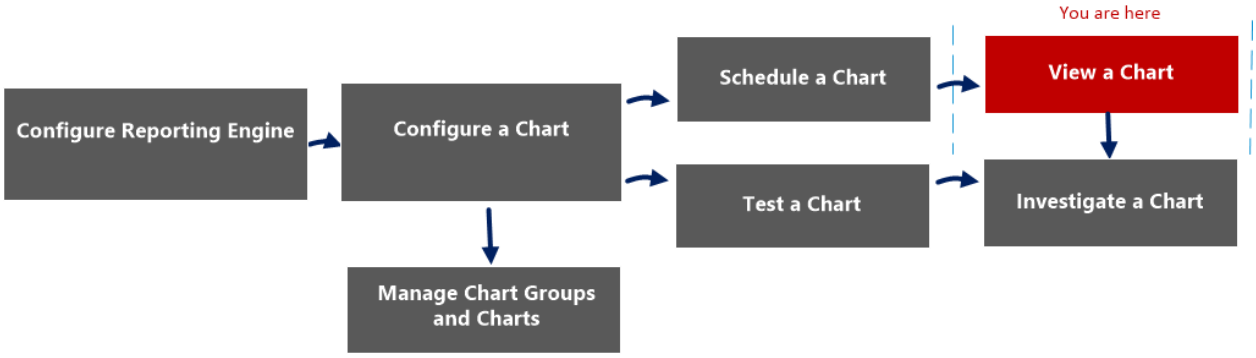

Chart Executed List Panel

The Chart Executed List panel displays all the executions for a particular chart for the selected date. Double-clicking on any chart execution loads the chart on the Chart Output panel. By default, the last executed chart is displayed in the Chart Output panel.

View All Charts View

In the View All Charts view, you can display, print, save and email charts.

- Report View

Quick View

To access this view:

1. Go to **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** panel, do one of the following:

   - Click  >**View Scheduled Reports**.
   - Click the **#Schedules** column.

     The Report Schedule view is displayed.

4. Click **View**.

Features

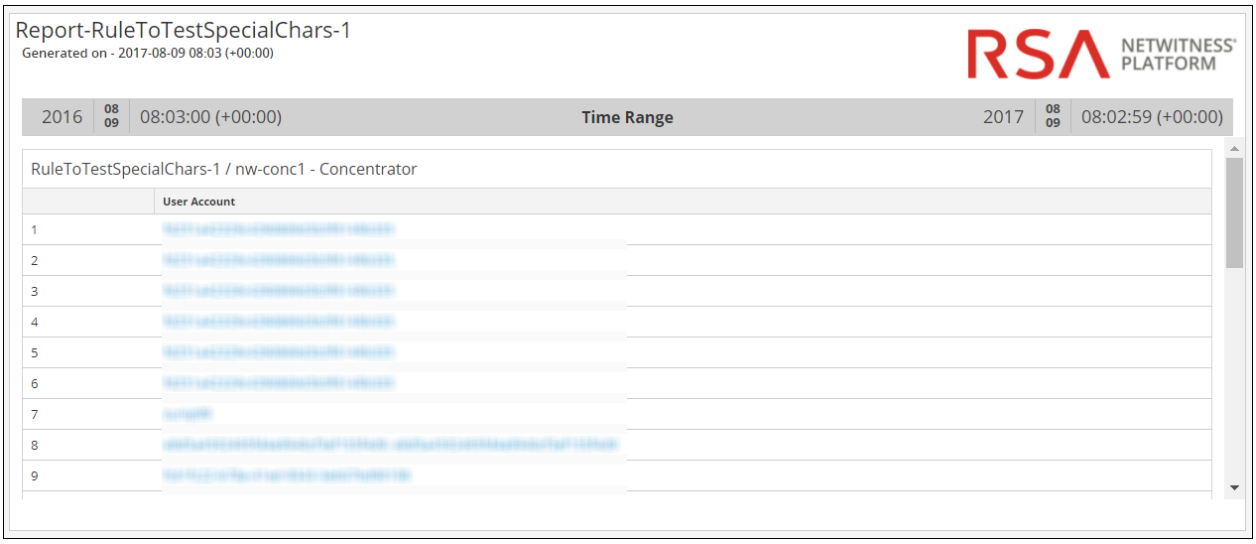
The View a Report panel has the following sections.

1	Reports Toolbar
2	Reports Output panel
3	Reports Calendar panel
4	Reports Time panel

Reports Toolbar

The Reports toolbar allows you to print, save, email, and view reports on full screen.

Note: The Reporting Engine is responsible for generating PDF and CSV output of the reports based on the report definition. The size of the PDF files for a report must not exceed 50,000 cells.



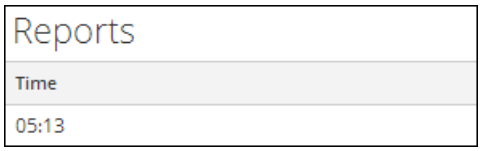
The following table lists the options in the Reports toolbar.

Operation	Description
	Prints the generated report.
	Saves the report as a PDF and a CSV file. **Note:** The **Save As PDF** option is not available for a large report. If you are generating a PDF for a report and it takes a longer time than expected, you get a warning message stating **PDF generation is in progress, please try after some time**. When you click download as a CSV file, the Select Rule to download dialog is displayed. You must select a rule from this dialog to download the rule result in a CSV file. If the file generation takes a while, you can click on the **Notify me** option to be notified once the PDF or CSV is generated. Once the PDF or CSV is generated, you can view the Notifications for the status.
	Emails the report with the PDF or CSV attachment.
	Opens the generated report on a new window.

Reports Output View

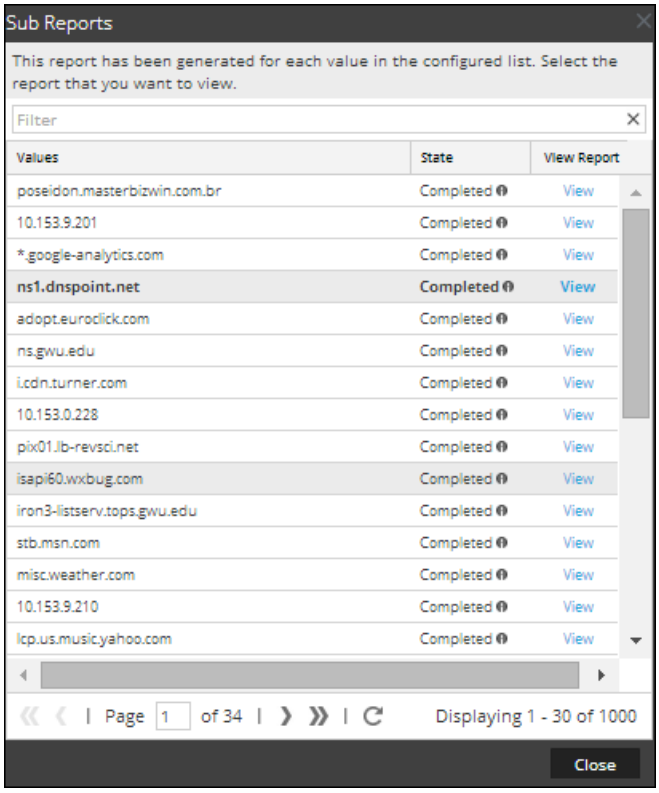
The Reports Output panel view the report with the report schedule name, report generated time and the actual report with the selected rule variables.

Feature	Description
Name	This field displays the name of the scheduled report.
Time	This field displays the time when the report is generated.
Report	This field displays the details report with the selected rule variables.



Reports Calendar View

The Reports Calendar view is used to select a date from the Calendar. Based on the date you select, the list of successfully run reports for the date is displayed.



Reports Time View

The Reports Time view displays the time when the report was actually run.

When you click **View** on the scheduled report having **Iterative** selected, the **Sub Reports** panel is displayed. For each value in the configured list a report is generated.

The following table lists the columns in the Sub Reports panel.

Column	Description
Values	The List values chosen for a dynamic variable from the List Selection panel.
State	Indicates the state of the scheduled report for each of the list values. • Partial: If in a report with several rules, a single rule execution failed or an output action failed or creation of PDF/CSV failed, the state of the report is displayed as partial. For example, consider a report with five rules and four rules are executed successfully and one fails, then the state is displayed as Partial. • Failed: If in a report with several rules, all the rule executions failed, the state of the report is displayed as failed. • Completed: If a report is successfully executed, the state of the report is displayed as completed.

Column	Description
View	Clicking on any of the report schedules or sub reports listed and then **View** displays the desired report. **Note:** You can view the completed rules on the **View a Report** page even when the report is 'running'.

View All Reports View

In the View All Reports view, you can display, print, save and email reports.

Workflow

This workflow shows the procedure view a report or list of all reports.

Alerting Overview

Quick View

The following figure is an example with the important features labeled.

1 Click **Alerts** to open the Alert view.

2 The Alert toolbar allows you to add, modify, delete, enable, disable, refresh, import, and export an alert. Using this toolbar, you can also set access permissions for the selected alert.

3 The Alert panel lists all the alerts in a tabular format.

The Alerts List view has the following panels:

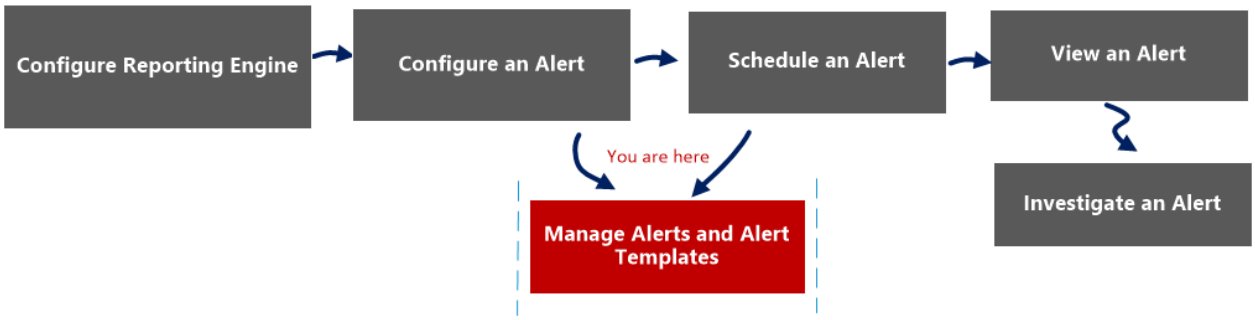
- Alert Toolbar
- Alert

Alert Toolbar

The Alert toolbar panel has the following features:

Feature	Description
+	Adds a new alert to the Reporting module.
−	Deletes one or more selected alerts.
	Edits an alert.
Enable	Enables the selected alerts.
Disable	Disables the selected alerts.
	Refreshes the view.
	Enables the following options: Import, Export and Permissions.

Alert



The Alert panel lists all the alerts in a tabular format. The following table lists the columns in the Alert panel and their descriptions.

Feature	Description
Enabled	Displays the state of the alert: • Enabled - the alert is active and fires based on the rule assigned to it. • Disabled - the alert is not active.
Pushed?	Indicates whether the alert is sent to Decoders or Log Decoders: • Yes - Alert is pushed to Decoders or Log Decoders. • No - Alert is not pushed to Decoders or Log Decoders.
Name	Identifies the name of the alert. Clicking the alert name displays the rule on which this alert is based in the Define Rules panel.
Description	Indicates the alert description.
Actions	Indicates the action the system takes when the alert fires. The different available action types are as follows: • Record • SMTP • SNMP • Syslog

Alert Permissions Dialog

In the Alert Permissions dialog, the users with 'Read & Write' access permission can set access permissions for an alert to configure permissions in the Alert Permissions dialog.

Workflow

Alerting Overview

Quick View

The Alert permissions dialog allows you to set alert permissions depending on the user role.

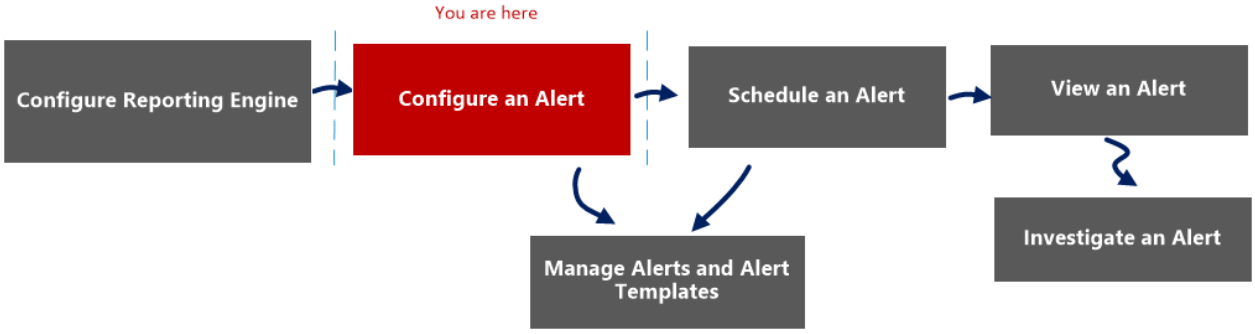
The following figure is an example with the important features labeled.

1. Click **Alerts** to open the Alert view.
2. Click ⚙ > **Permissions**. The Alert Permissions dialog box is displayed.
3. Based on the user role, select the appropriate options.
4. (Optional) Select the checkbox if you want to automatically provide read access permission to dependent rules.
5. Click **Save**.

Note: If a User (other than a super user) creates an alert, super users will not be able to access the alert.

The following table lists the columns in the Alert Permissions dialog.

Column	Description
Roles	Displays all the user roles in the NetWitness user interface.



Read & Write	Allows you to apply 'Read&Write' access to the alert.
Read Only	Allows you to apply only 'Read' access to the alert.
No Access	By selecting this permission, you cannot access or view the alert.
Apply Read-only permission to Rules in the Alerts	Allows you to automatically apply permissions to the rules in the alerts.
Cancel	Cancels all the changes made to the permissions.
Save	Saves the selection and provides access to the role based on the selection.

Alert Schedules View

In the Alert Schedules view, you can view all the alerts scheduled. Alternately, you can also disable the scheduled alerts.

Workflow

The following workflow shows the tasks involved in creating or modifying an alert.

What do you want to do?

Alerting Overview

Quick View

The following example shows you how to access the Alert Schedules view dialog.

1 Click **Alerts** to open the Alert view.
2 Click **View Schedule** to open the View Alerts Schedule view.
3 The Alerts Schedule toolbar allows you to modify the state of the scheduled alert.
4 The Alerts Schedule List panel lists only the Enabled alerts in a tabular format.

Features

The different panels on the Alert Schedules View dialog are:

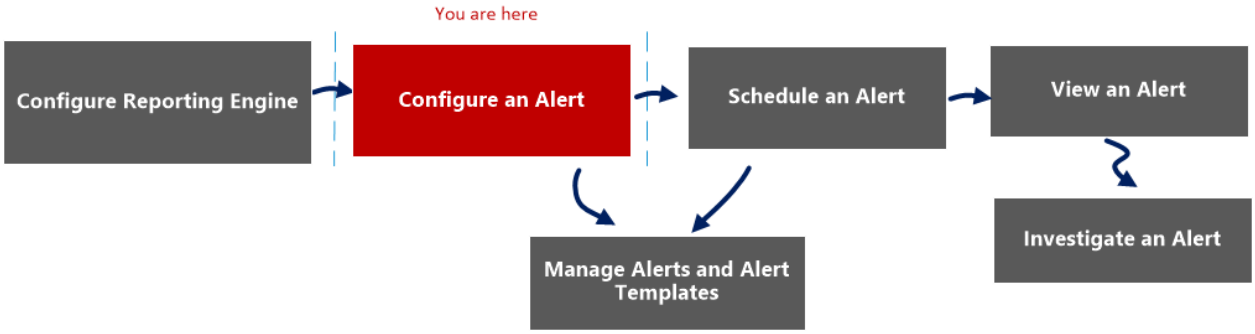
- Alerts schedule toolbar panel
- Alerts schedule list panel

Alerts Schedule Toolbar Panel

In the Alerts Schedule Toolbar panel, the Disable icon disables the selected alert. When schedule alerts are no longer needed or are determined to be ineffective, you can disable them so that they are no longer executed. You can select one of more alerts to disable. When an alert is disabled, it is removed from the scheduled alerts list so that you cannot view it here, and it will not execute again unless you manually execute the alert or set up a new schedule for it.

Alerts Schedule List Panel

The following table lists the columns in the Alerts Schedule List panel and their description.



Column	Description
State	The state of the scheduled alert: • Completed • Failed
Name	The name of the scheduled alert.
Last Run {#time}	The last time the scheduled alert was run.
Last Session Id	The Session Id of the last scheduled alert.
Total Alerts	The total number of event occurrences.
Duration	The time taken to run the scheduled alert.

Column	Description
Avg (s)	The average time taken to run the scheduled alert.
Max (s)	The maximum time taken to run the scheduled alert.

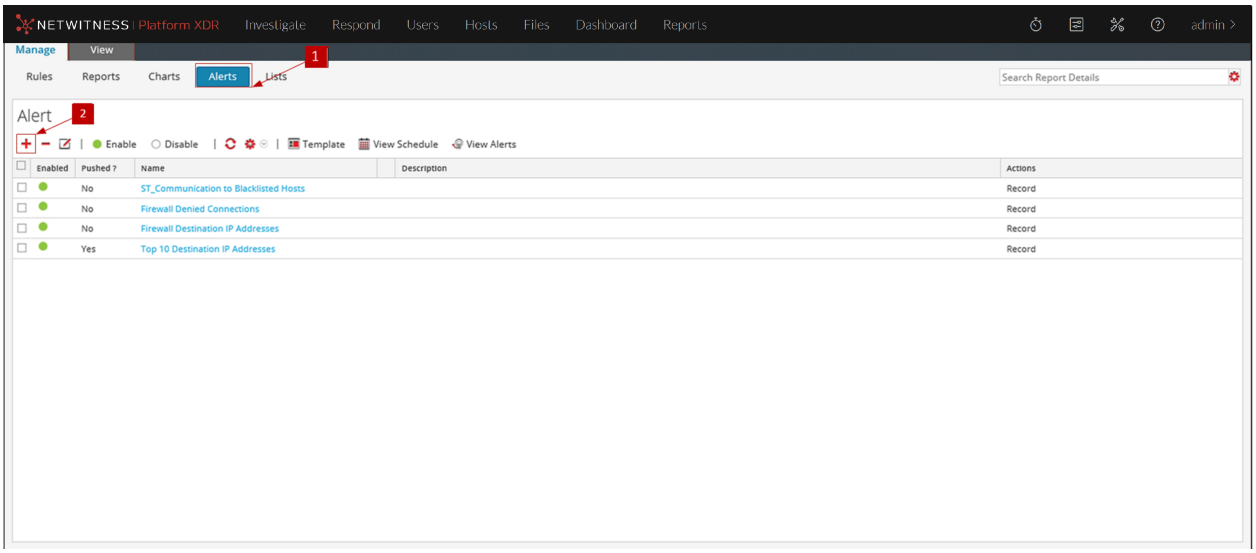
Create or Modify Alert Panel

The Create or Modify alert panel is a panel in the Alert List view. This panel allows you to create or modify an alert as per the requirement.

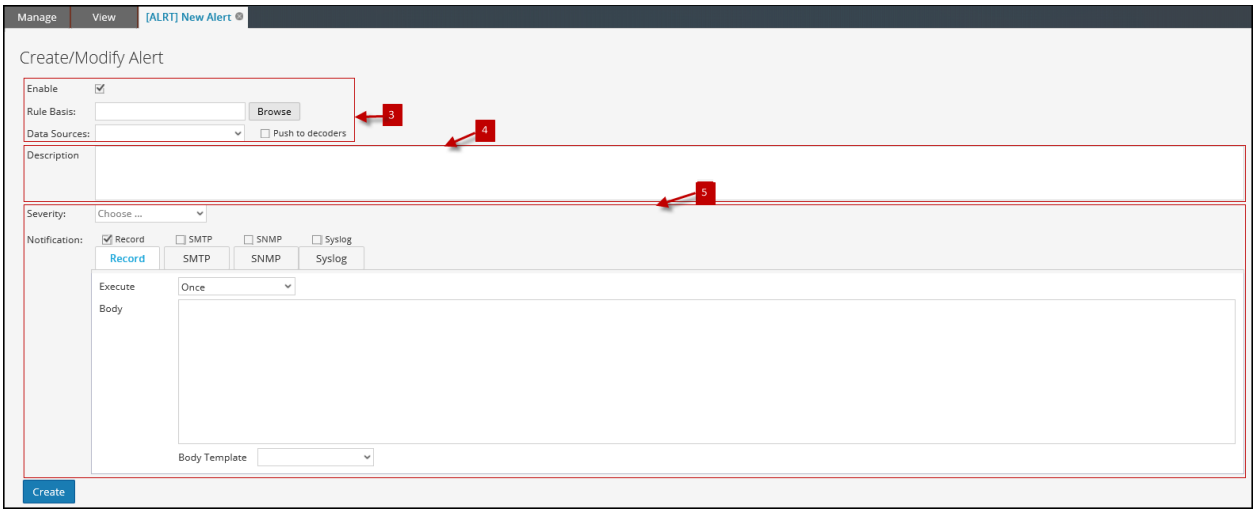
Workflow

What do you want to do?

Role	I want to...	Documentation
Administrator/ Analyst	Configure Reporting Engine	Configure Reporting Engine
Administrator/ Analyst	Configure an alert*	Configure an Alert
Administrator/ Analyst	Schedule an alert	Schedule an Alert
Administrator/ Analyst	View an alert	View an Alert
Administrator/ Analyst	Investigate an alert	Investigate an Alert
Administrator/ Analyst	Manage an alert and alert template	Manage an Alert and Alert Template



*You can complete these tasks here.



Related Topics

Alerting Overview

Quick View

The following figure is an example with the important features labeled.

1. Click **Alerts** to open the Alert view.
2. Click + to navigate to the Create or Modify Alert panel.
3. Enable the alert, navigate the rule, and select a data source to alert.
4. Enter a brief description of an alert.
5. Define the alert notification methods(RECORD, SMTP, SNMP, Syslog) to alert, when an alert condition is matched.

The Create or Modify Alert panel has the following sections:

- Alert Definition
- Alert Description
- Alert Notification

Alert Definition

The following table describes the fields in the Alert Definition:

Field	Description
Enable	• **Enable** activates the alert. The alert executes and sends output actions every minute (by default) when the alert conditions are met. • **Disable** deactivates the alert. The alert does not execute and does not send any output actions.
Rule Basis	Click **Browse** to display the Rules Library panel from which you select the rule that is the basis of this alert. You must select a rule that has a unique 'where' clause for an alert.
Data Sources	Specifies the data source for the alert.
Push to decoders	Pushes the ‘where’ clause of the alert rule to Decoders connected to the selected NWDB data source. This is the recommended option used to create RE alerts, as the alert conditions are checked on the Decoder itself and the alert queries will be comparatively faster in NWDB. If you deselect this option, the alert rule ‘where’ clause will be queried against the selected NWDB data source. Based on the complexity and metas in the ‘where’ clause of the rule, the alert queries might take more time to process in NWDB. **Note:** NetWitness does not send rules to the Decoder automatically.

Alert Description

The following table describes the fields in the Alert Description:

Field	Description
Description	Describes the alert.
Create	Creates the alert. (This option is displayed when you create an alert.)
Save	Saves the changes made to the alert. (This option is displayed when you modify an alert.)

Alert Notification

The Alert Notification allows you to define the notification action NetWitness takes when an alert is generated, for example, recording or sending the alert using one of the defined output actions. The output actions are Simple Mail Transfer Protocol (SMTP), Simple Network Management Protocol (SNMP), or Syslog message.

The Notification contains the default Record tab, which you use to create an alert. The icon beside the Record tab allows you to select the notification type from the drop-down list for the output to specify for the alert: SMTP, SNMP, or Syslog.

Depending on the selected notification type, the Notification section is populated with predefined text that contains variables that add Meta that is appropriate for the alert. In the Reporting Engine, these variables are replaced with actual values. The following table lists the variables and their descriptions.

Variable	Description
`${meta.<metakey>}`	The meta key value. **Note:** If the <metakey> did not fetch any value, an empty string("") is printed. By default, Reporting Engine displays all the repeated values for a meta key. If you do not want the meta values to repeat in the Alert output, enable the "removeRepeatedMetaValue" option by navigating to **Configuration > Alert Configuration** available for the Reporting Engine in the **Services - Configuration > Explore** view. For example, in an HTTP Session the value for the action is displayed as get, get, put, put, post, get. When this option is enabled, the value is displayed as get, put, post.
`${meta.time}` / `${meta.time:<time_format>}`	`${meta.time}` - The session time is printed in "yyyy-MMM-dd HH:mm:ss" format. `${meta.time:<time_format>}` - The session time is printed in the user-defined custom time format. For example, `${meta.time:dd-MM-yyyy HH:mm:ss}`. For more information on the supported time formats, see http://docs.oracle.com/javase/7/docs/api/java/text/SimpleDateFormat.html **Note:** If the time format provided by the user is invalid, the default time format will be used. The default time format is "yyyy-MMM-dd HH:mm:ss".
`${name}`	The alert name defined in Reporting Engine.
`${count}`	The number of times an alert is detected in a given time frame. (By default, it is one minute)
`${nw.host}`	The NetWitness host name as configured in Reporting Engine.
`${device.id}`	The NetWitness device ID of the data source.

The Alert Notification view has four tabs:

- **Record Tab**
- **SMTP Tab**
- **SNMP Tab**
- **Syslog Tab**

Record Tab

Use the Record tab to define the frequency for recording an alert and the message to generate when an alert is generated.

The following table lists the fields in the Record tab and their description.

Field	Description
Execute	The frequency for recording an alert. • **Once** - Record the alert only once based on the alert interval no matter how often the alert is generated. NetWitness records the number of times the alert has actually generated during that interval in the log file so that analysts know how many times the alert registered a match over a given day. • **Each Event** - Record the alert each time as it generates. If an alert generates unlimited number of times during a day, that alert is often treated as noise and can be ignored, except in case of alerts that require continuous monitoring such as network configuration changes and DDOS attacks. **Note:** Select **Each Event** setting from the **Execute** drop-down list for SNMP and Syslog output actions.
Body	The body of the message.
Body Template	(Optional) If templates have been defined, select a template for the alert message.

SMTP Tab

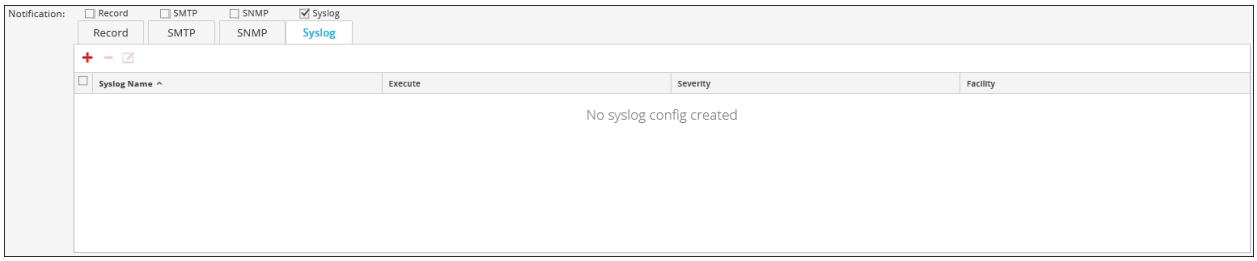
The SMTP tab allows you to define the SMTP (email) output for this alert.

The following table lists the fields in the SMTP tab and their description.

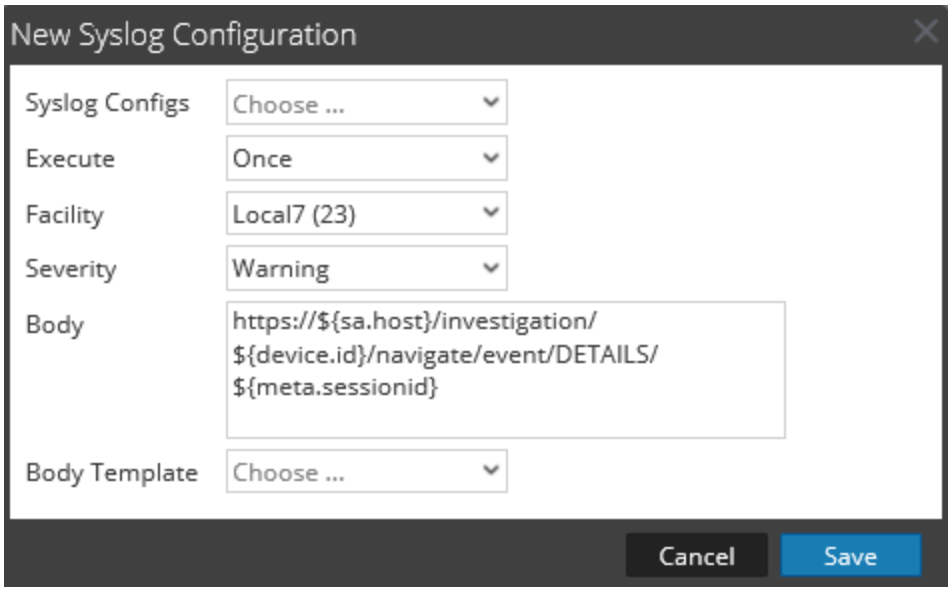
Field	Description
Execute	The frequency to send an email message for the alert. • **Once** - Sends only one email for an interval, if an alert generates in that interval, irrespective of how many alerts generated. • **Each Event** - Send an email with the alert for every event in which the rule criteria are met.
To	The email addresses to which to send this alert.
Subject	The subject of the email message.
Body	The body of the message.
Body Template	(Optional) If templates have been defined, select a template for the SMTP message that you can use as is or modify.

SNMP Tab

The SNMP tab allows you to define the SNMP output for the alert.



The following table lists the various fields in the SNMP tab and their description.



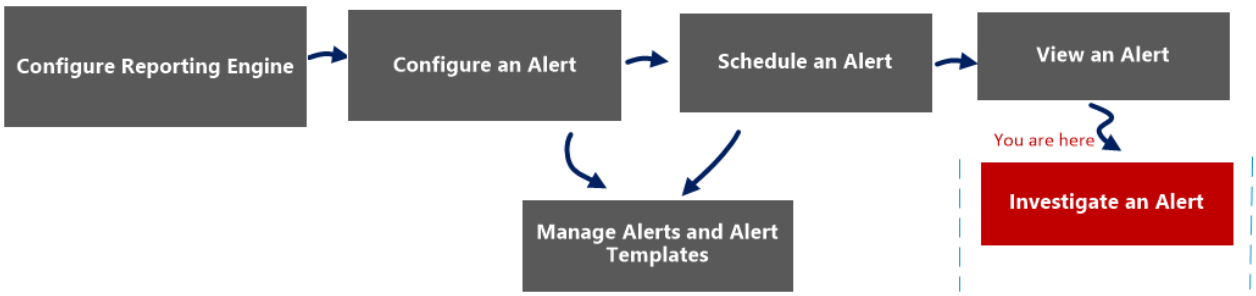
Field	Description
Execute	The frequency to send an SNMP output for an alert. • **Once** - Sends an SNMP message along with an email for an interval, if an alert generates in that interval, irrespective of how many alerts generated. • **Each Event** - Sends an SNMP message with the alert for every event in which the rule criteria are met.
Body	The body of the message.
Body Template	(Optional) If templates have been defined, select a template for the SNMP message to use as is or modify.

Syslog Tab

The Syslog tab allows you to define the Syslog message output for this alert.

Click  to add Syslog configuration to an alert. The New Syslog Configuration dialog box is displayed:

The following table describes the fields in the New Syslog Configuration dialog:



Field	Description
Syslog Configs	The Syslog configuration of the Device Config view located at the Syslog Configuration panel.
Execute	The number of times that you want to send a Syslog output for the alert. • **Once** - Sends a Syslog output along with an email for an interval, an alert generates in that interval, irrespective of how many alerts generated. • **Each Event** - Sends a Syslog output with the alert for every event in which the rule criteria are met.
Facility	The type of program logging the message. Examples for the type of programs are Syslog, Daemon, Mail, and Kernel.

Field	Description
Severity	The severity level of the alert that generated. • Emergency • Alert • Critical • Error • Warning • Notice • Informational • Debug
Body	The body of the message.
Body Template	(Optional) If templates have been defined, select a template for the Syslog message to use as is or modify.

Investigate an Alert View

In the Investigate an Alert view, you can view and investigate alert details. When investigating an alert, you can open the sessions in the Investigation module for further investigation.

Alerting Overview

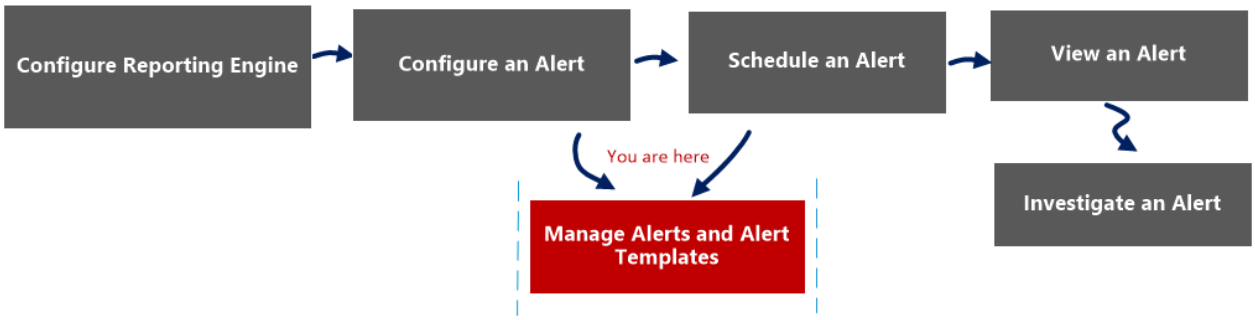
Quick View

The following figure is an example with the important features labeled.

The View an Alert view has the following panels:

- View Alerts Toolbar
- View Alerts List

View Alerts List



The following table lists the columns in the View Alerts List panel.

Column	Description
	The icon that opens the Investigation module, where the details of the first session that registered the match for the given alert is displayed for immediate analysis. **Note:** You are not redirected to the Investigation module when: -You reconfigure a data source for an existing alert and run an alert on the new data source. -You enter a host name instead of an IP address in the data source field.
Name	The name of the alert that registered the match. The hyperlink on the name opens the Investigation module to view all matches for that particular alert for the hour surrounding the registered alert.
Number of hits	The number of times the alert is generated.
Detected	The date and time at which the alert generates.
Message	The alert message.

Import Alert Dialog

The Import Alert dialog allows you to import an alerts archive and specify whether to overwrite existing rules, lists, and alerts.

Alerting Overview

Quick View

The following figure is an example with the important features labeled.

1. Click **Alerts** to open the Alert view.
2. Click **View Schedule**to view all the alerts scheduled.
3. The Alerts schedule toolbar allows you to disable the scheduled alert.
4. The Alerts schedule list allows you to view the scheduled alert details.

The View Alerts Schedule view includes the following panels:

1. Alerts Schedule toolbar
2. Alerts Schedule list

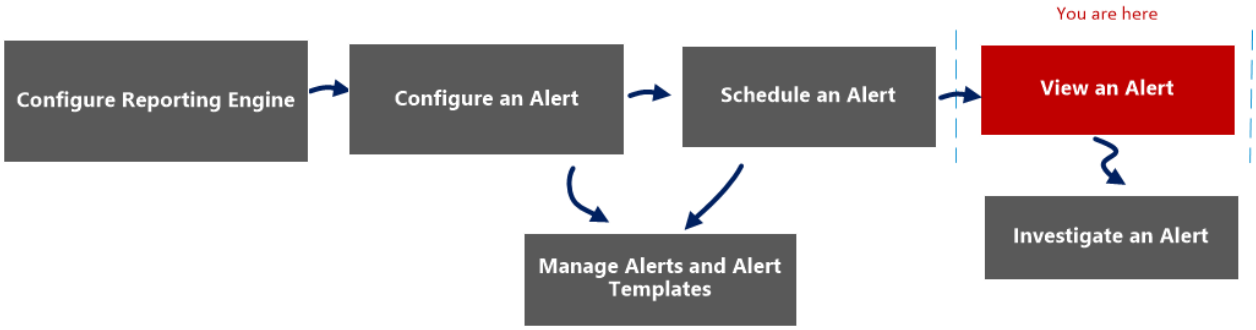
Alert Schedule Toolbar

The Alerts Schedule Toolbar panel allows you to modify the state of the scheduled alert.

Feature	Description
Disable	Clicking **Disable** disables the selected alert. When schedule alerts are no longer needed or are determined to be ineffective, you can disable them so that they are no longer executed. You can select one of more alerts to disable. When an alert is disabled, it is removed from the scheduled alerts list so that you can't view it here, and it will not execute again unless you manually execute the alert or set up a new schedule for it.

Alert Schedule List Panel

The Alerts Schedule List panel lists only the Enabled alerts in a tabular format. The following table lists the columns in the Alerts Schedule List panel and their description.



Feature	Description
State	The state of the scheduled alert: • Completed • Failed

Feature	Description
Name	The name of the scheduled alert.
Last Run {#time}	The last time the scheduled alert was run.
Last Session Id	The Session Id of the last scheduled alert.
Total Alerts	The total number of event occurrences.
Duration	The time taken to run the scheduled alert.
Avg (s)	The average time taken to run the scheduled alert.
Max (s)	The maximum time taken to run the scheduled alert.

View Alerts View

In the View Alerts view, you can view all the alerts. Also, you can also customize the view to show alerts for a specific period of time, and set the maximum number of alerts displayed in a single page.

Alerting Overview

Quick View

The following figure is an example with the important features labeled.

1 Click **Alerts** to open the Alert view.
2 Click **View Alerts** to view the different panels on View Alerts.
3 The View Alerts toolbar allows you to filter alerts based on a count, or the start and end date of the alerts.
4 The View Alerts List lists all the filtered alerts in a tabular format.

The View Alerts view has the following panels:

- View Alerts Toolbar
- View Alerts List

View Alerts Toolbar

The following table lists the operations in View Alerts toolbar panel.

Option	Description
Last Hour(s) data	The data fetched from the previous execution.
Max No Of Alerts	The maximum number of alerts that you want to fetch from the Reporting Engine service for a specific time-range.

View Alerts List

The following table lists the columns in the View Alerts List panel.

Column	Description
	The icon that opens the Investigation module, where the details of the first session that registered the match for the given alert is displayed for immediate analysis. **Note:** You are not redirected to the Investigation module when: -You reconfigure a data source for an existing alert and run an alert on the new data source. -You enter a host name instead of an IP address in the data source field.
Name	The name of the alert that registered the match. The hyperlink on the name opens the Investigation module to view all matches for that particular alert for the hour surrounding the registered alert.
Number of hits	The number of times the alert is generated.
Detected	The date and time at which the alert generates.
Message	The alert message.

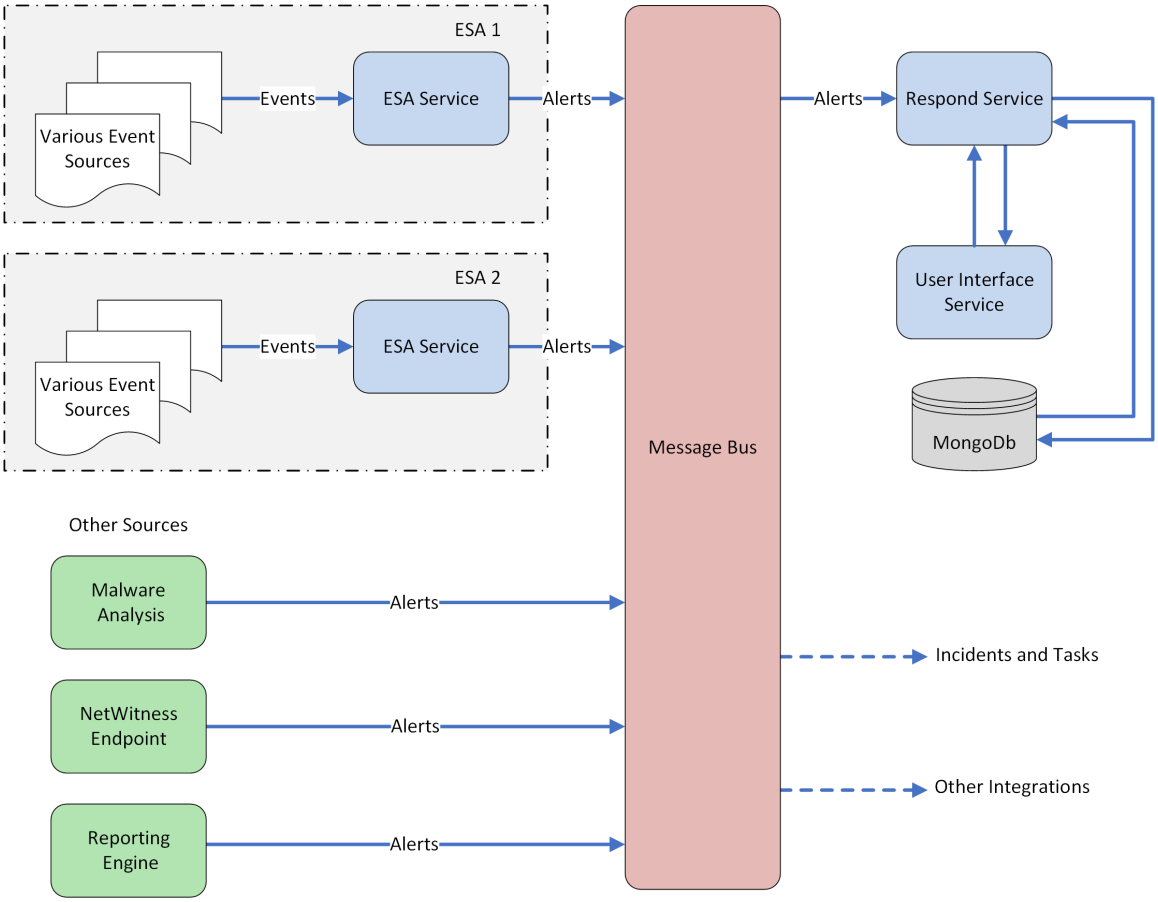
About this Document

The *NetWitness Respond Configuration Guide for NetWitness® Platform* provides an overview of NetWitness, detailed instructions on how to configure NetWitness Respond in your network, additional procedures that are used at other times, and reference materials that describe the user interface for configuring NetWitness Respond in your network.

Topics

- NetWitness Respond Configuration Overview
- Configuring NetWitness Respond
- Additional Procedures for Respond Configuration
- NetWitness Respond Configuration Reference



NetWitness Respond Configuration Overview

NetWitness Respond consumes alert data from various sources via the Message Bus and displays these alerts on the NetWitness user interface. The Respond Server service allows you to group the alerts logically and start a NetWitness Respond workflow to investigate and remediate the security issues raised.

The Respond Server service consumes alerts from the message bus and normalizes the data to a common format (while retaining the original data) to enable simpler rule processing. It periodically runs rules to aggregate multiple alerts into an incident and set some attributes of the Incident (for example, severity, category, and so on). The incidents are persisted into MongoDb by the Respond Server service. Incidents are also posted onto the message bus for consumption by other systems (for example, Archer integration).

Note: NetWitness Respond requires an ESA primary server that contains the MongoDb. Alerts, Incidents, and Task records are persisted into this MongoDb by the Respond Server.

The following diagram illustrates the high-level flow of alerts.

You have to configure various sources from which the alerts are collected and aggregated by the Respond Server service.

Configuring NetWitness Respond

This topic provides the high-level tasks required to configure the Respond Server service. The administrator needs to complete the steps in the sequence provided.

Topics

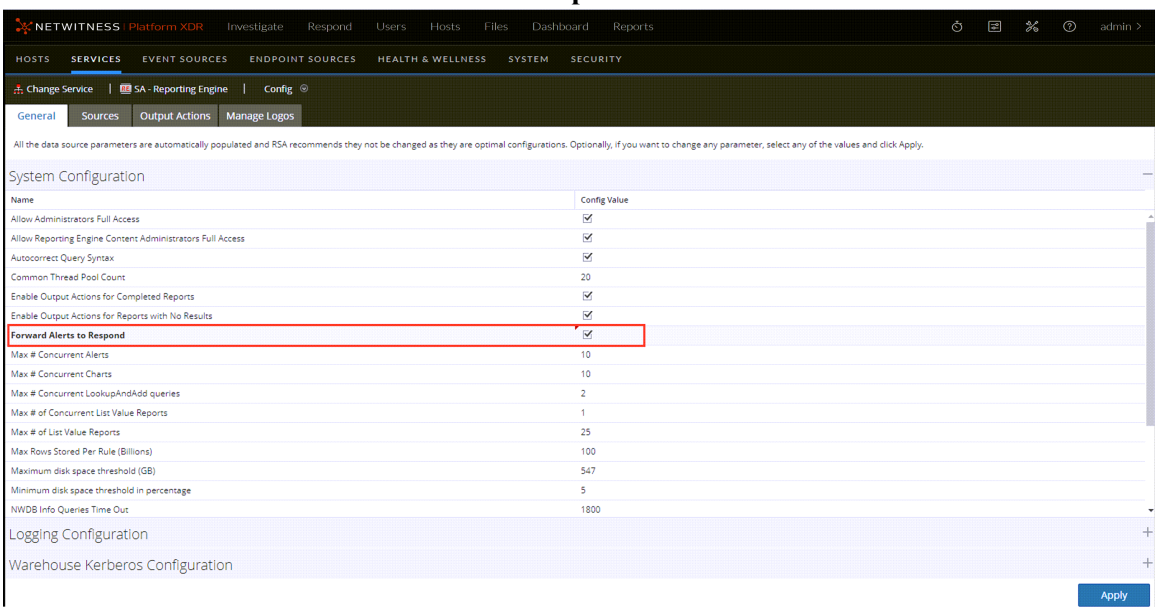
- Step 1. Configure Alert Sources to Display Alerts in the Respond View
- Step 2. Assign Respond View Permissions
- Step 3. Enable and Create Incident Rules for Alerts

Step 1. Configure Alert Sources to Display Alerts in the Respond View

This procedure is required so that alerts from the alert sources are displayed in NetWitness Respond. You have an option to enable or disable the alerts being populated in the Respond view. By default this option is disabled for Detect AI, Reporting Engine, Malware Analysis, and NetWitness Endpoint and enabled only for Event Stream Analysis. So when you install the Respond Server service you need to enable this option in the Reporting Engine, Malware Analysis, and NetWitness Endpoint to populate the corresponding alerts in the Respond view.

Prerequisites

Ensure that:



- The Respond Server service is installed and running on NetWitness.
- NetWitness Endpoint is installed and running. This is necessary only if you want to configure NetWitness Endpoint as an alert source in the Respond view.

Configure Reporting Engine to Display Reporting Engine Alerts in the Respond View

The Reporting Engine alerts are by default disabled from being displayed in Respond view. To display and view the Reporting Engine alerts, you have to enable the NetWitness Respond alerts in the Services Config view > General tab for the Reporting Engine.

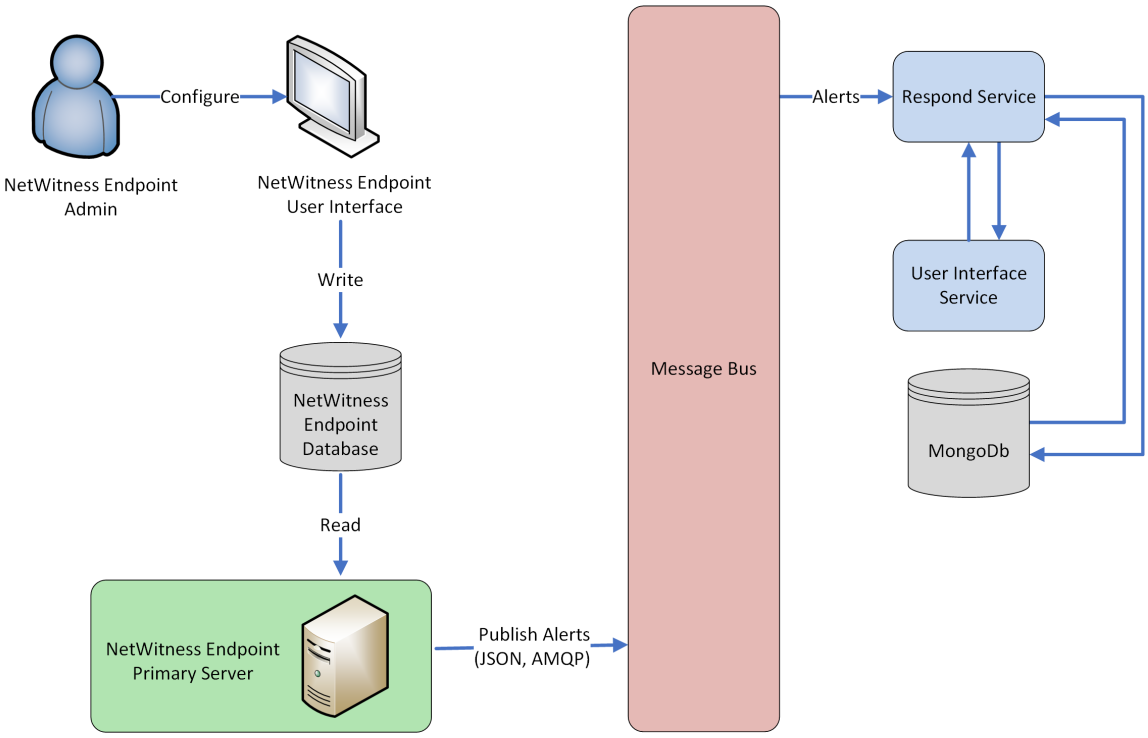
1. Go to  **(Admin) > Services**, select a Reporting Engine service, and then select  **> View > Config**.
   The Services Config view is displayed with the Reporting Engine General tab open.
2. Select **System Configuration**.

3. Select the checkbox for **Forward Alerts to Respond**.

4. Click **Apply**.
   The Reporting Engine now forwards the alerts to NetWitness Respond.

For details on parameters in the General tab, see the "Reporting Engine General Tab" topic in the *Reporting Engine Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Configure Malware Analysis to Display Malware Analysis Alerts in the Respond View

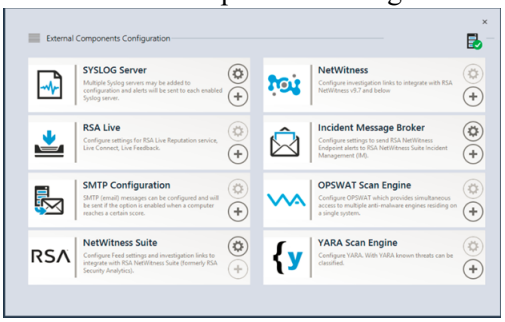


Viewing NetWitness Respond alerts is a function of auditing in Malware Analysis. The procedure for enabling NetWitness Respond alerts is described in the "(Optional) Configure Auditing on Malware Analysis Host" topic in the *Malware Analysis Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Configure NetWitness Endpoint to Display NetWitness Endpoint Alerts in the Respond View

This procedure is required to integrate NetWitness Endpoint with NetWitness so that the NetWitness Endpoint alerts are picked up by the NetWitness Respond component of NetWitness and displayed in the **Respond > Alerts** view.

Note: NetWitness supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later for NetWitness Respond integration. For more detailed information, see "NetWitness Endpoint Integration" in the *NetWitness Endpoint User Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.



The diagram below represents the flow of NetWitness Endpoint alerts to the NetWitness Respond Server service and its display in the **Respond > Alerts** view.

To configure NetWitness Endpoint to display NetWitness Endpoint alerts in the NetWitness user interface:

1. In the NetWitness Endpoint user interface, click **Configure > Monitoring and External Components**.

   The External Components Configuration dialog is displayed.

2. From the components listed, select **Incident Message Broker** and click + to add a new IM Broker.
3. Enter the following fields:
   a. **Instance Name**: Enter a unique name to identify the IM broker.
   b. **Server Hostname/IP address**: Enter the Host DNS or IP address of the IM Broker (NetWitness Server).
   c. **Port number**: The default port is 5671.
4. Click **Save**.
5. Navigate to the **ConsoleServer.exe.Config** file in **C:\Program Files\RSA\ECAT\Server**.

6. Modify the virtual host configurations in the file as follows:
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness 11.0 and later, the virtual host is "/rsa/system". For version 10.6.x and below, the virtual host is "/rsa/sa".

7. Restart the API Server and Console Server.

8. To set up SSL for Respond Alerts, perform the following steps on the NetWitness Endpoint primary console server to set the SSL communications:

   a. Export the NetWitness Endpoint CA certificate to .CER format (Base-64 encoded X.509) from the personal certificate store of the local computer (without selecting the private key).

   b. Generate a client certificate for NetWitness Endpoint using the NetWitness Endpoint CA certificate. (You MUST set the CN name to `ecat`.)

   ```
   makecert -pe -n "CN=ecat" -len 2048 -ss my -sr LocalMachine -a sha1 -sky
   exchange -eku 1.3.6.1.5.5.7.3.2 -in "NWECA" -is MY -ir LocalMachine -sp
   "Microsoft RSA SChannel Cryptographic Provider" -cy end -sy 12
   client.cer
   ```

   Note: In the above code sample, if you upgraded to Endpoint version 4.3 from a previous version and did not generate new certificates, you should substitute `EcatCA` for `NWECA`.

   c. Make a note of the thumbprint of the client certificate generated in step b. Enter the thumbprint value of the client certificate in the IMBrokerClientCertificateThumbprint section of the `ConsoleServer.Exe.Config` file as shown.

   ```
   <add key="IMBrokerClientCertificateThumbprint"
   value="896df0efacf0c976d955d5300ba0073383c83abc"/>
   ```

9. On the NetWitness Server, copy the NetWitness Endpoint CA certificate file in .CER format into the import folder:
   `/etc/pki/nw/trust/import`

10. Issue the following command to initiate the necessary Chef run:
    `orchestration-cli-client --update-admin-node`
    This appends all of those certificates into the truststore.

11. Restart the RabbitMQ server:
    `systemctl restart rabbitmq-server`
    The NetWitness Endpoint account should automatically be available on RabbitMQ.

12. Import the **/etc/pki/nw/ca/nwca-cert.pem** and **/etc/pki/nw/ca/ssca-cert.pem** files from the NetWitness Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Step 2. Assign Respond View Permissions

Add users with the required permissions to investigate incidents and alerts in NetWitness Respond. Users with access to the Respond view need both Incidents and Respond-server permissions. Users with access to configure incident email notification settings need additional Integration-server permissions.

The following pre-configured roles have permissions in the Respond view:

- **Analysts**: The Security Operations Center (SOC) Analysts have access to Alerting, NetWitness Respond, Investigate, and Reporting, but not system configurations.
- **Malware Analysts**: Malware Analysts have access to investigations and malware events.
- **Operators**: Operators have access to configurations, but not Investigate, ESA, Alerting, Reporting and NetWitness Respond.
- **SOC_Managers**: The SOC Managers have the same access as Analysts plus additional permissions to handle incidents and configure NetWitness Respond.
- **Data_Privacy_Officers**: Data Privacy Officers (DPOs) are like Administrators with additional focus on configuration options that manage obfuscation and viewing of sensitive data within the system. See the *Data Privacy Management Guide* for additional information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
- **Respond_Administrator**: The Respond Administrator has full access to NetWitness Respond.
- **Administrators**: The Administrator has full system access to NetWitness and has all permissions by default.

The NetWitness Respond default permissions are shown in the following tables. You need to assign user permissions from both the **Incidents** and **Respond-server** tabs, which are the Permissions tab names in the  (Admin) > Security view Add or Edit Roles dialogs. You may want to add additional user permissions for Alerting, Context Hub, Investigate, Investigate-server, and Reports.

Caution: It is very important that you assign equivalent user permissions from BOTH the Respond-server tab AND the Incidents tab.

Users who configure incident email notification settings also need permissions in the Integration-server tab.

Respond-server

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
respond-server.alert.delete			Yes*	Yes*		
respond-server.alert.manage	Yes	Yes	Yes*	Yes*		Yes
respond-server.alert.read	Yes	Yes	Yes*	Yes*		Yes
respond-server.alertrule.manage		Yes	Yes*	Yes*		
respond-server.alertrule.read		Yes	Yes*	Yes*		
respond-server.configuration.manage			Yes*	Yes*		
respond-server.health.read			Yes*	Yes*		
respond-server.incident.delete			Yes*	Yes*		
respond-server.incident.manage	Yes	Yes	Yes*	Yes*		Yes
respond-server.incident.read	Yes	Yes	Yes*	Yes*		Yes
respond-server.journal.manage	Yes	Yes	Yes*	Yes*		Yes
respond-server.journal.read	Yes	Yes	Yes*	Yes*		Yes
respond-server.logs.manage			Yes*	Yes*		
respond-server.metrics.read			Yes*	Yes*		
respond-server.notification.manage (Available in 11.1 and later)		Yes	Yes*	Yes*		
respond-server.notification.read (Available in 11.1 and later)		Yes	Yes*	Yes*		
respond-server.process.manage			Yes*	Yes*		
respond-server.remediation.manage	Yes	Yes	Yes*	Yes*		Yes
respond-server.remediation.read	Yes	Yes	Yes*	Yes*		Yes

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
respond-server.risk.manage	Yes		Yes*	Yes*		
respond-server.risk.read	Yes		Yes*	Yes*		
respond-server.security.manage			Yes*	Yes*		
respond-server.security.read			Yes*	Yes*		

* Data Privacy Officers and Respond Administrators have the **respond-server.*** permission, which gives them all of the Respond-server permissions.

Incidents

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
Access Incident Module	Yes	Yes	Yes	Yes		Yes
Configure Incident Management Integration		Yes	Yes	Yes		
Delete Alerts and Incidents			Yes	Yes		
Manage Alert Handling Rules		Yes	Yes	Yes		
View and Manage Incidents	Yes	Yes	Yes	Yes		Yes

The Respond Administrator has all of the Respond-server and Incidents permissions.

Integration-server

Note: The Integration-server permissions are available in NetWitness version 11.1 and later.

Users who configure incident email notification settings also need Integration-server permissions. The following table lists the incident notification permissions in the Integration-server tab assigned to each role.

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
integration-server.notification.read		Yes	Yes	Yes		

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
integration-server.notification.manage		Yes	Yes	Yes		

Investigate-server

Users who view Event Analysis in Respond also need Investigate-server permissions. The following table lists the Respond Event Analysis permissions required in the Investigate-server tab and the permissions assigned to each role.

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
investigate-server.event.read	Yes	Yes	Yes	Yes		Yes
investigate-server.content.reconstruct	Yes	Yes	Yes	Yes		Yes
investigate-server.content.export	Yes	Yes	Yes	Yes		Yes

Incident Email Notification Settings Permissions

Note: Incident email notification setting permissions are available in NetWitness version 11.1 and later.
If you are updating from NetWitness version 11.0 to 11.1 or later, you will need to add additional permissions to your existing built-in NetWitness user roles. For all upgrades to 11.1 or later, you will need to add additional permissions to custom roles.

The following permissions are required for Respond Administrators, Data Privacy Officers, and SOC Managers to access incident email notification settings [(Configure) > Incident Notifications].

Incidents tab:

- Configure Incident Management Integration

Respond-server tab:

- respond-server.notification.manage
- respond-server.notification.read

Integration-server tab:

- integration-server.notification.read
- integration-server.notification.manage

Respond Event Analysis Permissions

Note: The Event Analysis panel in the Respond view is available in NetWitness version 11.2 and later.

The Events panel in the Respond view, formerly known as the Event Analysis panel, shows the Events view from Investigate for specific indicator events. The following permissions are required to view the Events panel in the Respond view. These permissions are provided by default for users with the Analysts role.

Investigate-server tab:

- investigate-server.event.read
- investigate-server.content.reconstruct
- investigate-server.content.export

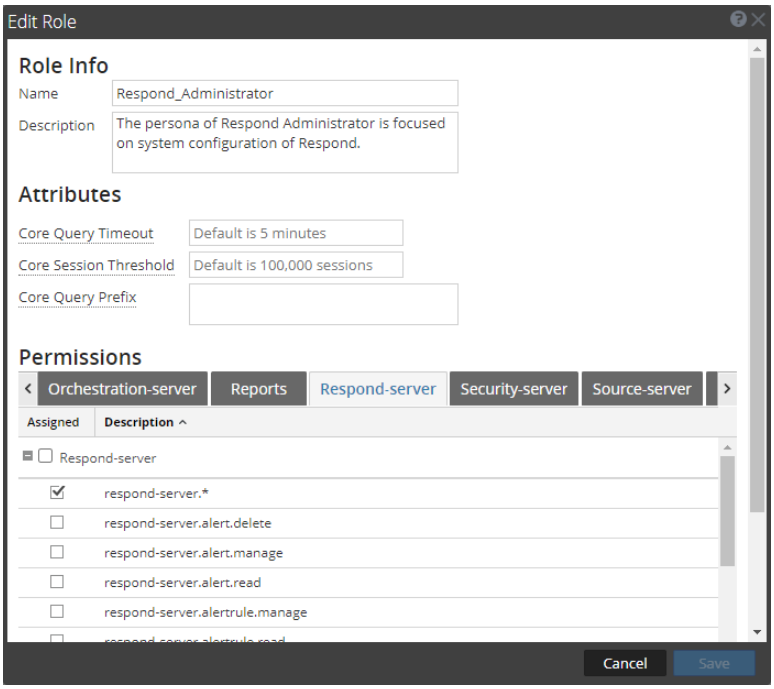
Administration tab:

- Access Administration Module

Note: Migrated incidents from NetWitness versions before 11.2 will not show the Events panel in the Respond Incident Details view Indicators panel. Likewise, if you use alerts that were migrated from versions before 11.2 to create incidents in 11.2, you will also not be able to view the Events panel in the Respond view for those incidents.

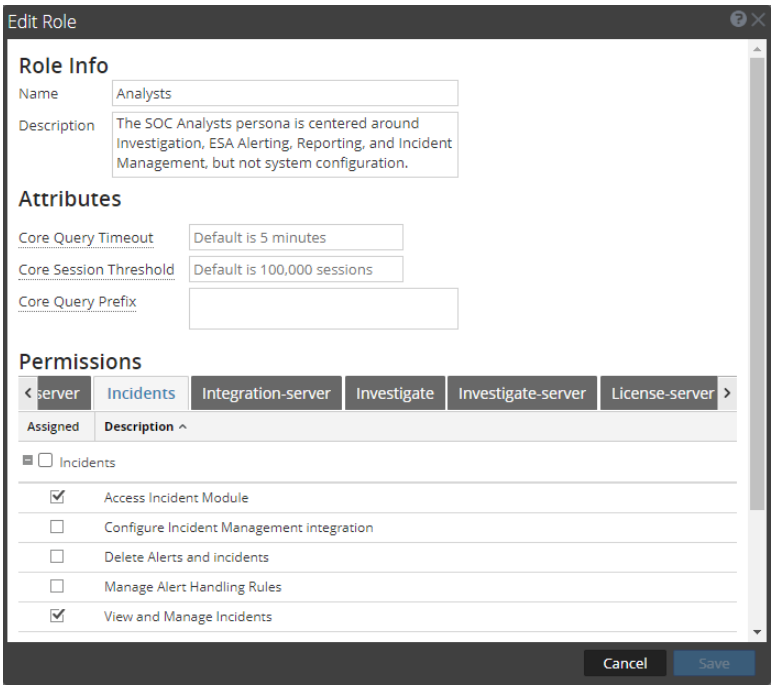
Respond Saved Filter Permissions

Note: Saved filters for the incidents and alerts lists in Respond are available in NetWitness version 11.5 and later.



The following permissions are required for the incidents and alerts filters (Respond > Incidents and Respond > Alerts). The Analysts role has the required Respond filter permissions by default.

Respond-server tab:



- respond-server.incident.manage
- respond-server.incident.read
- respond-server.alert.manage
- respond-server.alert.read

Respond Role Permission Examples

The following figure shows Respond-server permissions for the default Respond Administrator role. The Respond Administrator role contains all of the NetWitness Respond permissions.

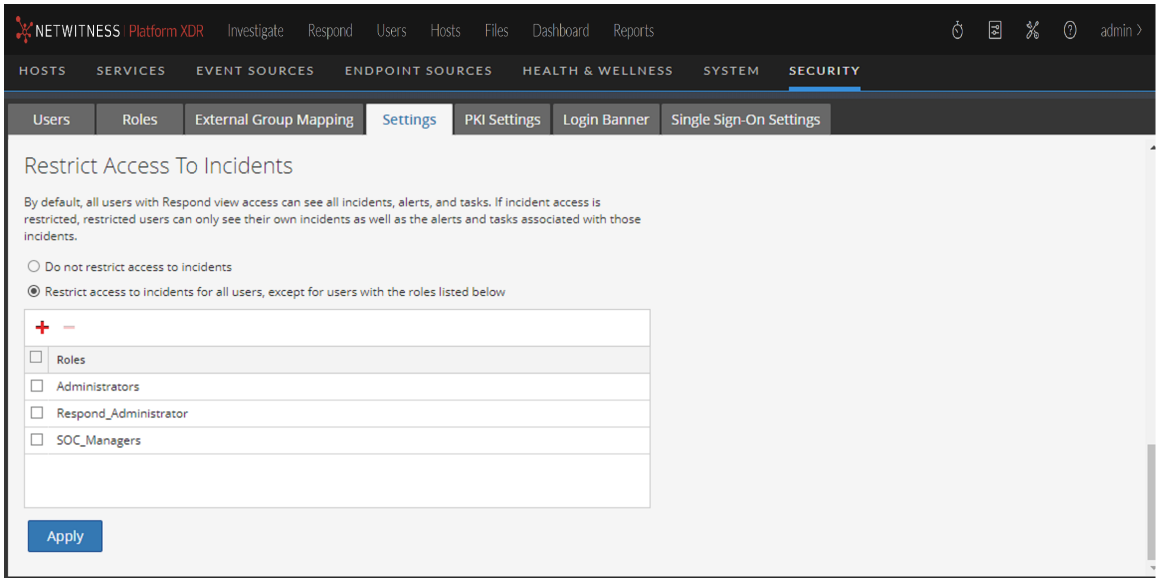
The following figure shows the Incidents permissions for the default Analysts role:

For more information, see "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Restrict Access to Incidents

By default, analysts can view all of the incidents, alerts, and tasks in the Respond view. If you have sensitive or restricted information that should not be shared, you can restrict what analysts and other users can see in the Respond view.

If you restrict access to incidents:



- Analysts can only see incidents assigned to them as well as the alerts and tasks associated with those incidents. Likewise, they can only change the status of and add journal entries (notes) to their own incidents.
- Analysts cannot see the Alerts and Tasks tabs in the Respond view (Respond > Tasks and Respond > Alerts are hidden), so they cannot view all alerts and tasks.
- Analysts cannot see the Assignee button or change the assignee of an incident.
- Analysts cannot see the Related Indicators (alerts) panel (Incident Details view > Find Related tab in the left-side panel).
- When adding events to incidents from the Investigate views, users can only add events to incidents to which they have access. The list of incidents to which users can add events only shows incidents that the user can access.
- When creating incidents from the Investigate views, users must have access to those incidents to view them in the Respond view. For example, when creating incidents from the Investigate view, Analysts must assign the incidents to themselves to view them in the Respond view.

Caution: These restrictions apply to all NetWitness users, except users with the **Administrators**, **Respond_Administrator**, and **SOC_Managers** roles. However, you can adjust the list of user roles whose access to incidents should not be restricted.

To restrict access to incidents:

1. Go to  **(Admin) > Security** and click the **Settings** tab.

2. In the **Restrict Access to Incidents** section, select **Restrict access to incidents for all users, except for users with the roles listed below**.

3. In the list, add the user roles whose access to incidents should not be restricted.
4. Click **Apply**.
   Changes take effect on the next log in to NetWitness.

Step 3. Enable and Create Incident Rules for Alerts

NetWitness Respond incident rules contain criteria to automate the process of creating incidents from alerts. Alerts that meet the rule criteria are grouped together to form an incident. Analysts use these incidents to locate indicators of compromise. Instead of creating an incident for a particular set of alerts and adding the alerts to that incident manually, you can save time by using incident rules to create incidents from alerts for you.

NetWitness provides predefined incident rules that you can use and you can also create your own rules based on your business requirements.

To create incidents automatically, you need to enable at least one incident rule.

When you have two or more incident rules enabled, the order of the rules becomes very important. The highest priority rules are at the top of the Incident Rules list. The highest priority rule has the number 1 in the Order field. The next highest priority rule is number 2 in the Order field, and so on. Alerts can only be part of one incident. If an alert matches more than one rule in the Incident Rule list, it is only evaluated using the highest priority rule that it matches.

In 11.6.1, the Incident rule execution pattern is modified such that the alert aggregation queries refer to the lastRun parameter of the incident rule. So, now multiple incident rules (positioned as per the priority in the order field) in the Incident rules list match the same alert name.

For example,

- INC-rule 1 is at the 4th position in the order field that is associated with the conditions alert.name equal to test and **source** equal to **ESA**.
- INC-rule 2 is at the 24th position in the order field that is associated with the condition **source** equal to **ESA**.

  Before 11.6.1 upgrade, the INC-rule 1 matched the alert name test. On upgrade, the INC-rule 2 at the 24th position in the order field matches the alert name test as the source is ESA.

  To address this scenario, configure each incident rule to have unique conditions. Make sure the conditions in the lower priority incident rules are not duplicate of the conditions in the highest priority rules.

NetWitness has 13 predefined incident rules that you can use. To set up your incident rules, you can do any of the following:

- Enable predefined incident rules
- Add new rules
- Clone rules
- Edit existing rules
- Export and import rules

The Detect AI default incident rule is available in NetWitness 11.6 and later. It captures the network user behavior and uses the deployed RSA Live ESA Rules to create incidents from alerts.

The NetWitness core default incident rule is available from 12.3 and later versions. It helps to create an incident from alerts that are coming from NetWitness core services.

The User Entity Behavior Analytics incident rule is available in 11.3 and later. It captures user entity behavior grouped by Classifier ID to create incidents from alerts. The User Behavior default incident rule is available in NetWitness 11.1 and later. It captures network user behavior and uses deployed RSA Live ESA Rules to create incidents from alerts.

The User Entity Behavior Analytics incident rule is available in 11.3 and later. In NetWitness 11.3 to 11.5.0, it captures user entity behavior grouped by UEBA Classifier Id to create incidents from alerts. In NetWitness 11.5.1 and later, it captures user entity behavior grouped by both UEBA Classifier Id and UEBA Entity Name. The incident name created by the rule uses the UEBA Entity Name. In addition, the User Entity Behavior Analytics incident rule default priority threshold ranges are now consistent with the severity ranges in NetWitness UEBA. To update your rule for 11.5.1 and later, see Update the User Entity Behavior Analytics Incident Rule Priority Thresholds, Grouping Options, and Title .

The User Behavior default incident rule is available in NetWitness 11.1 and later. It captures network user behavior and uses deployed RSA Live ESA Rules to create incidents from alerts.

You can select and deploy the RSA Live ESA Rules that you want to monitor. For more information, see Deploy the RSA Live ESA Rules.

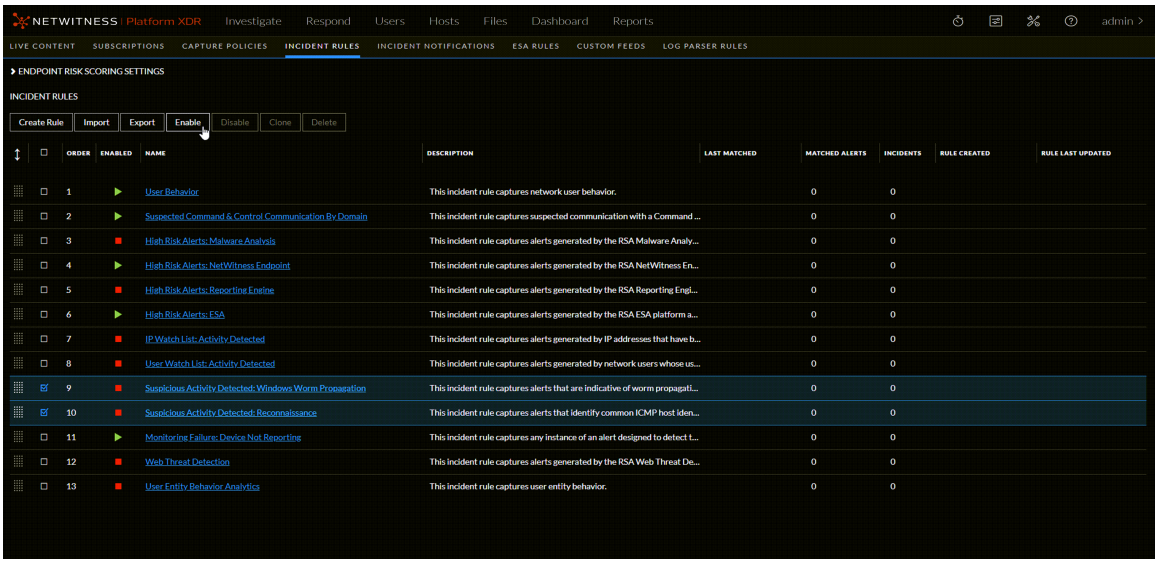
To configure the default incident rules or verify your existing default incident rules with the 11.5 default incident rules, see Set Up and Verify Default Incident Rules.

This topic contains the following procedures:

- Enable Incident Rules
- Create an Incident Rule
- Verify the Order of Your Incident Rules
- Clone an Incident Rule
- Edit an Incident Rule
- Export Incident Rules
- Import Incident Rules

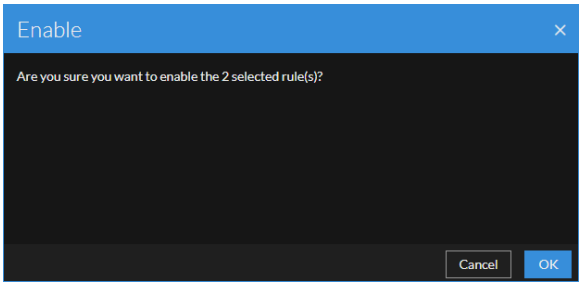
Enable Incident Rules

To create incidents automatically, you need to enable at least one incident rule. Predefined (default) incident rules or rules that you create must be enabled before they start creating incidents.



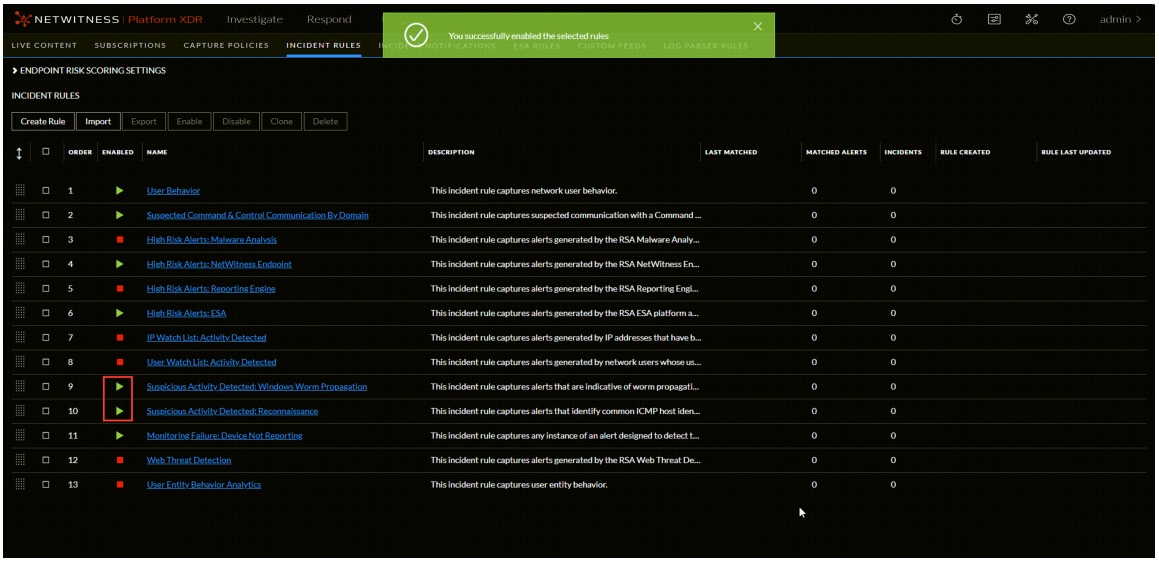
To enable one or more incident rules:

Note: Enabling one or more incident rules from the Incident Rules view is only available in NetWitness version 11.4 and later.



This is the easiest way to enable rules. Use this method after you have made the necessary adjustments to the rules and you just want to quickly enable them.

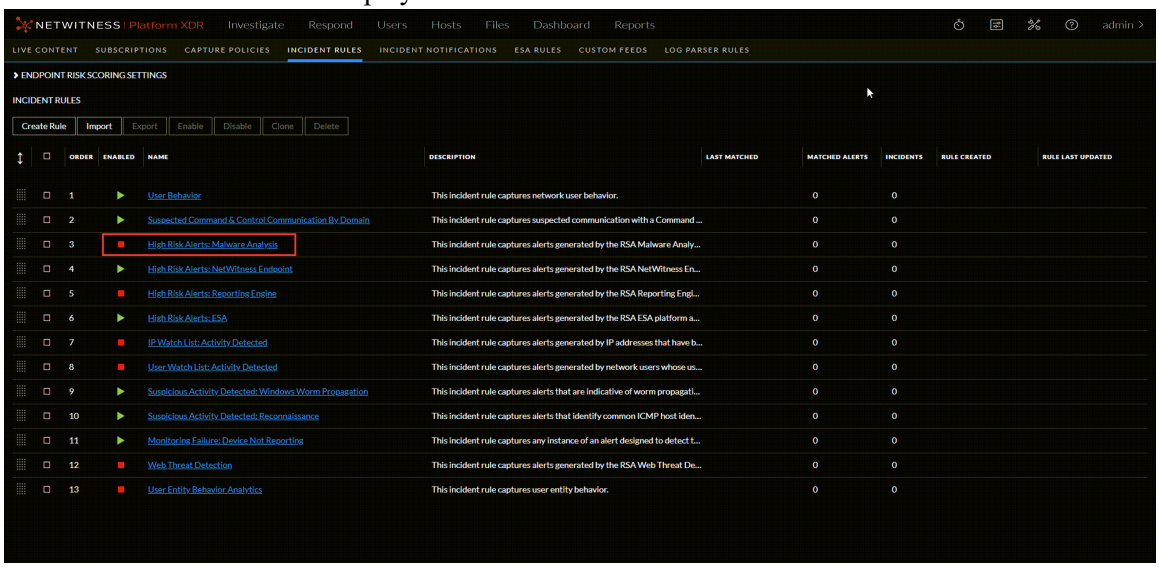
1. Go to  **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.



2. Select one or more incident rules and click **Enable**.

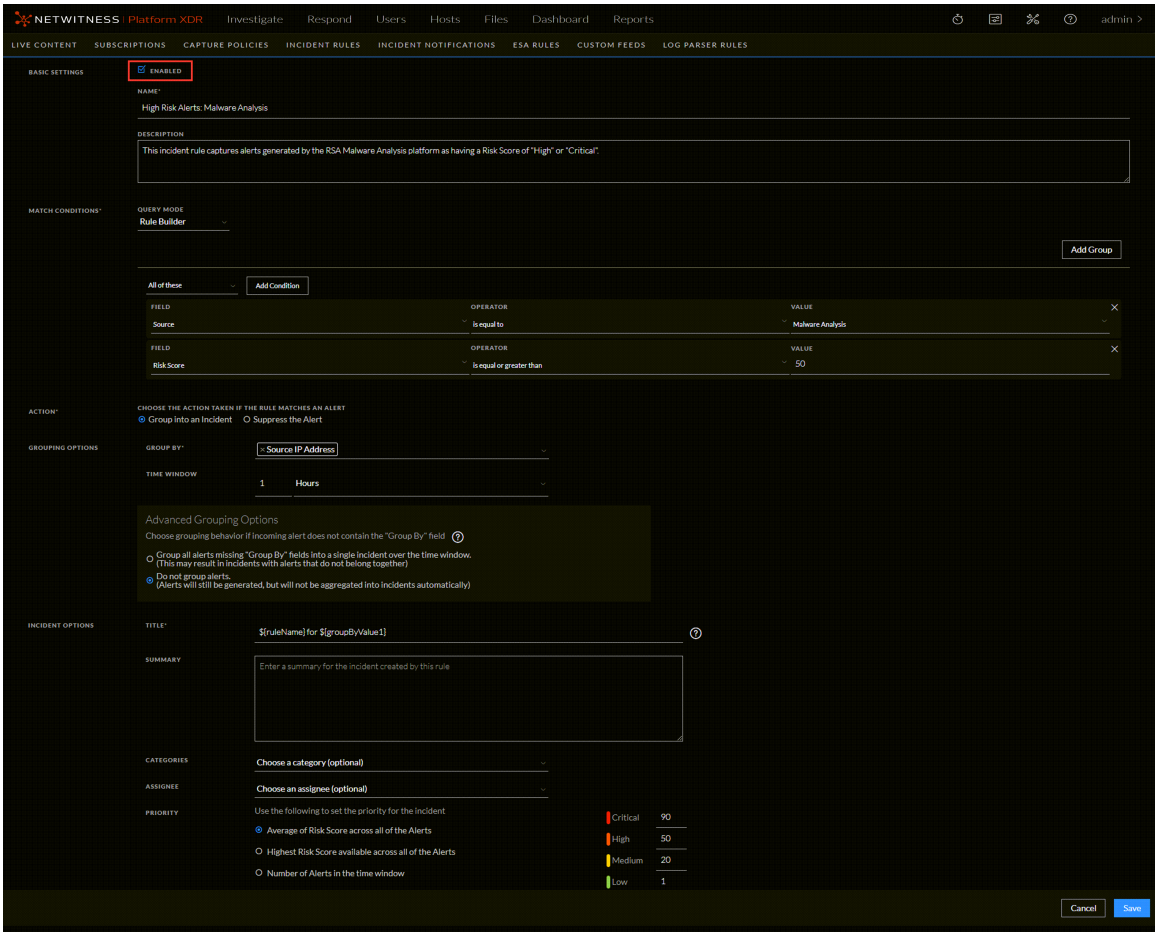
3. Click **OK** to verify that you want to enable the selected rules.

In the Incident Rules view, the Enabled column changes from a red square ■ (Disabled) to a green triangle ▶ (Enabled).



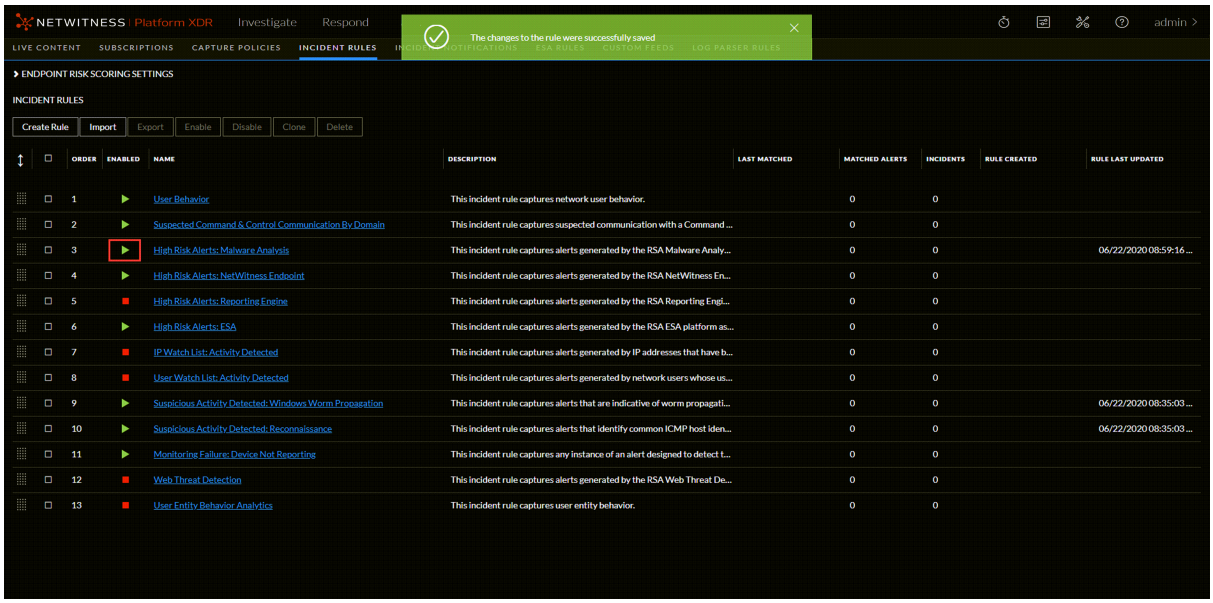
4. Verify the order of your incident rules.

Note: To disable incident rules, follow the above procedure but select the Disable button instead of the Enable button.



To enable an incident rule from within the incident rule details:

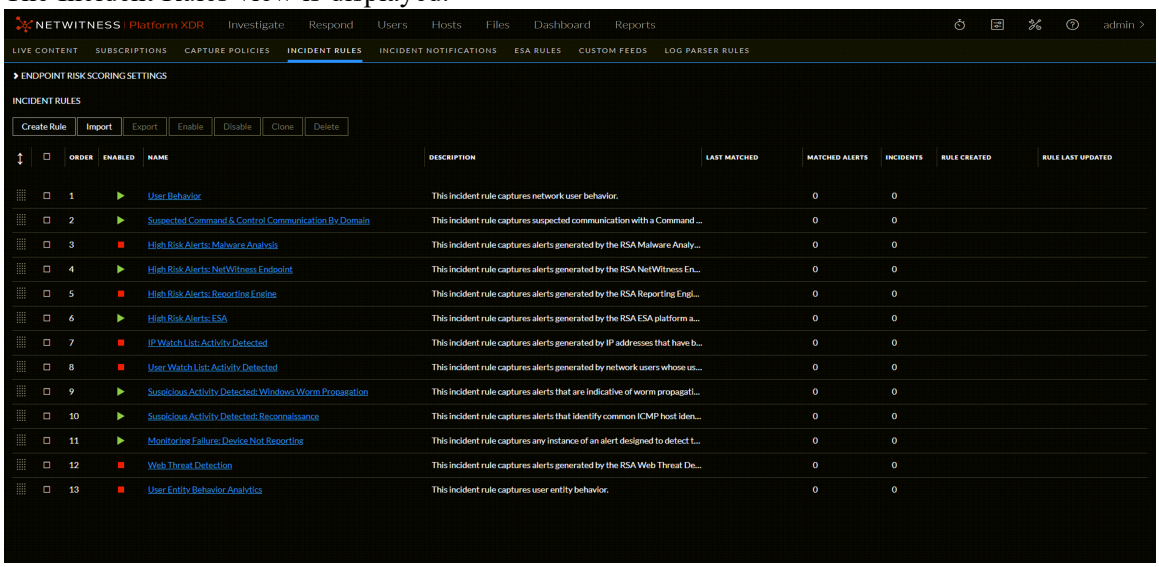
You can enable rules from within the incident rule details when you save your rule adjustments.



1. Go to **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.

2. Click the link in the **Name** column for the rule that you want to enable.
   The Incident Rule Details view is displayed for the selected rule.

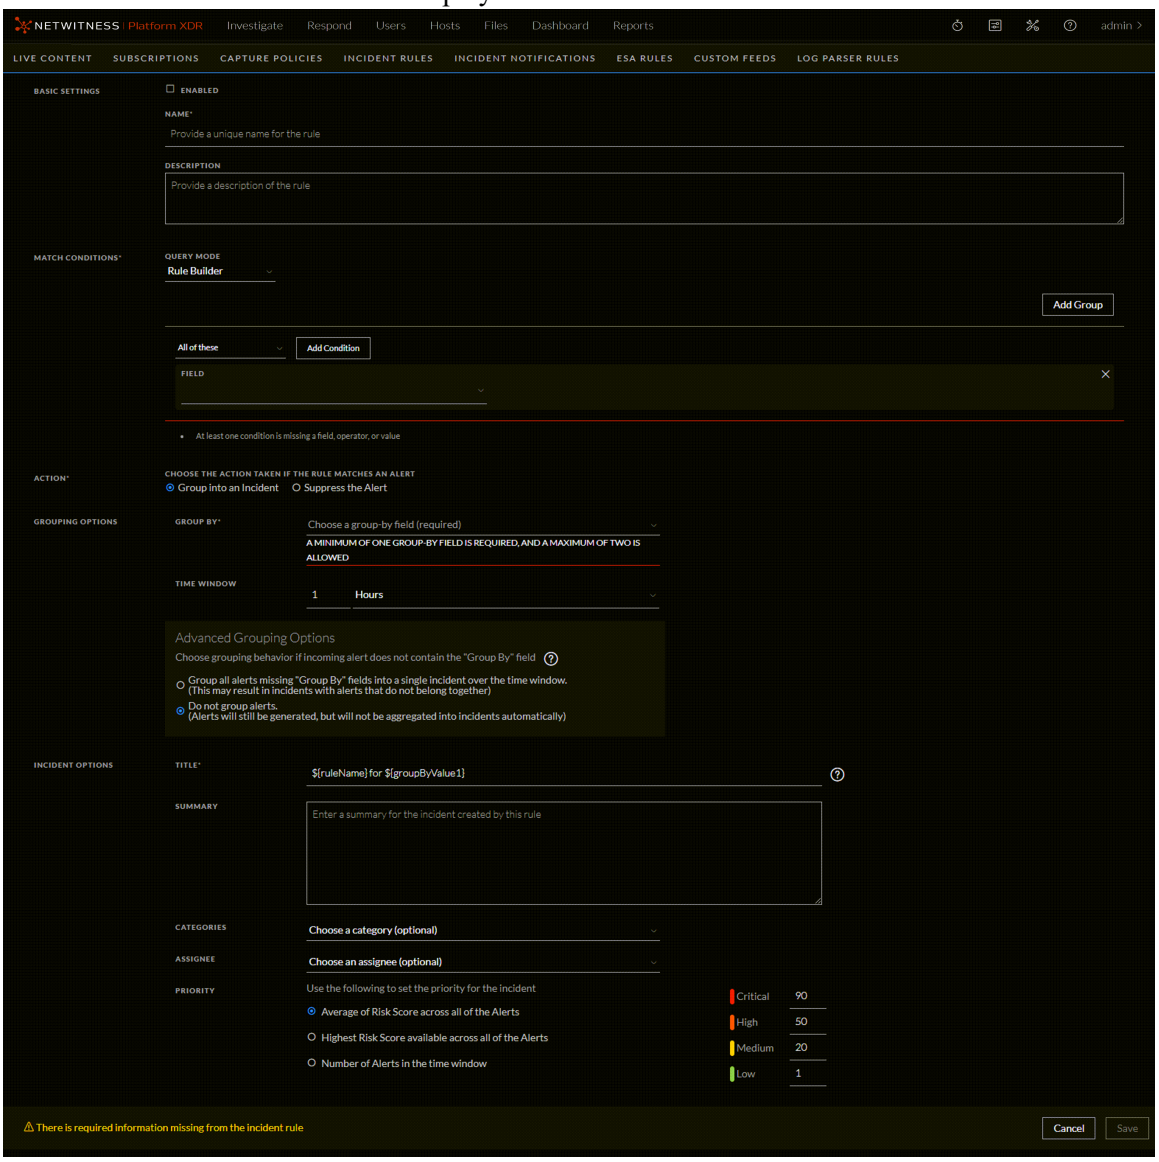
3. Adjust the parameters and conditions of your rule as required. For details about various parameters that can be set as criteria for an incident rule, see Incident Rule Details View. To adjust the default rules, see Set Up and Verify Default Incident Rules.
4. In the Basic Settings section, select the **Enabled** checkbox.
5. Click **Save** to enable the rule.
   Notice that the Enabled column changes from a red square (Disabled) to a green triangle (Enabled).



6. Verify the order of your incident rules.

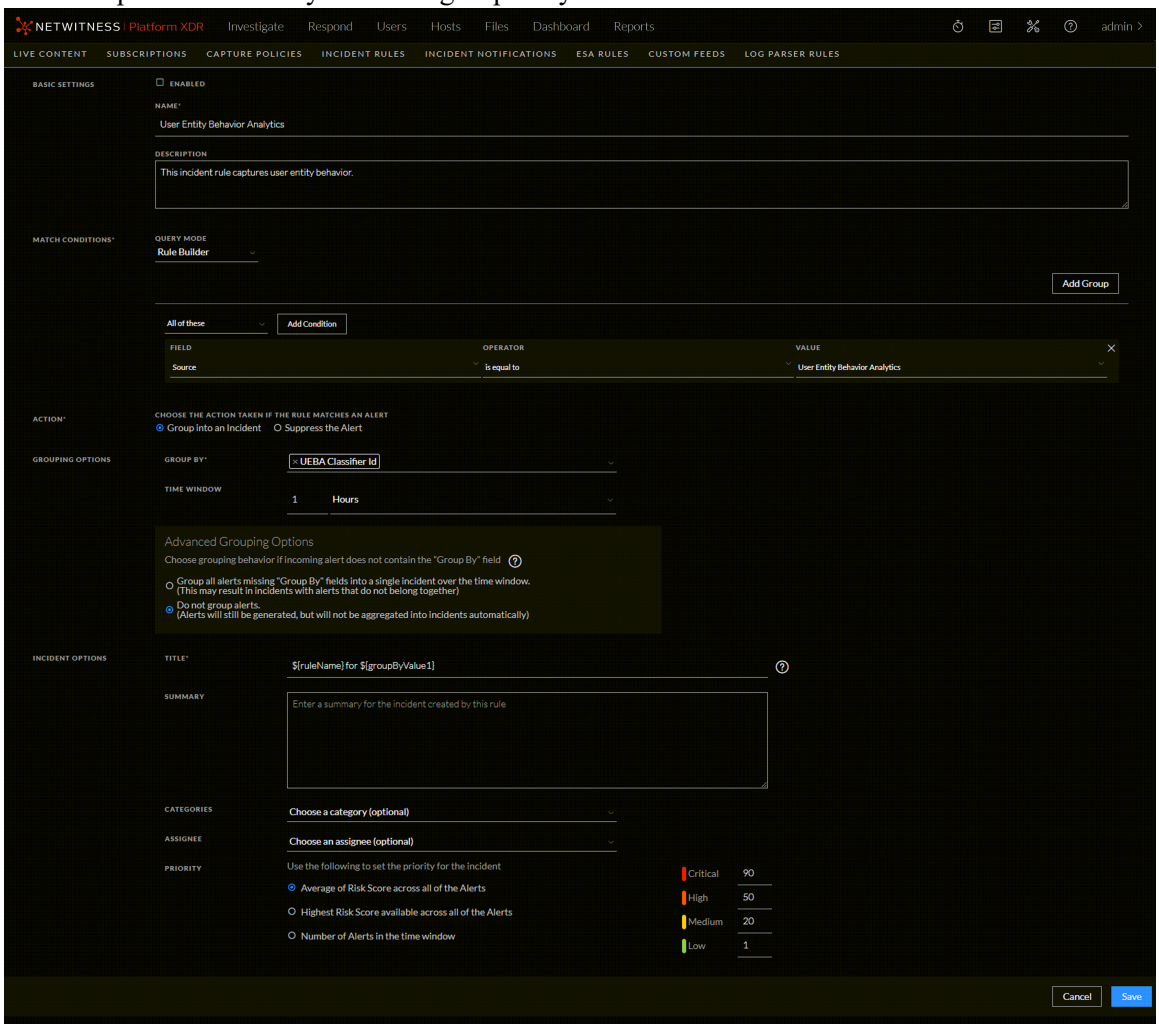
Note: To disable an incident rule in the Incident Rule Details view, follow the above procedure but clear the Enabled checkbox instead of selecting it.

Create an Incident Rule



1. Go to  **(Configure) > Incident Rules**.

   The Incident Rules view is displayed.



2. To add a new rule, click **Create Rule**.

The Incident Rule Details view is displayed.

3. Enter the parameters and conditions of your rule. All rules need to have at least one condition. For details about parameters that can be set as criteria for an incident rule, see Incident Rule Details View.

   The following figure shows a rule example. It is the default User Entity Behavior Analytics incident rule. It captures user entity behavior grouped by Classifier ID to create incidents from alerts.

4. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
5. Click **Save**.

   The rule appears in the Incidents Rules list. If you selected Enabled, the rule is enabled and it starts creating incidents depending on the incoming alerts that match the selected criteria.

6. Verify the order of your incident rules.

Note: Once a new incident rule is created, every past alert may not be considered for the further incident creation process. Instead, the fetching from the past happens based on the time window parameter specified in the rule. If the rule specifies a time window of 1 hour, then for the first run of the incident rule, all those alerts which have arrived one hour before the creation of the incident rule are considered, and from then, the rule works in the real-time grouping of incidents. This is to keep the incident creation in more real-time and to avoid the old alerts getting mapped to new incident rules.

Verify the Order of Your Incident Rules

NetWitness Respond evaluates incoming alerts against the incident rules in the order that you define. If alerts match the first rule listed, then that rule creates an incident. If alerts match the second rule listed and those alerts did not match the first rule, then the second rule creates an incident. If alerts match the third rule listed and those alerts did not match the first or second rule listed, then the third rule creates an incident, and so on.

To change the order of the rules, use the drag pads () in front of the rules to move them up and down in the list.
The rule order determines which rule takes effect if the criteria for multiple rules match the same alert. If multiple rules match an alert, only the rule with the highest priority creates an incident.

Clone an Incident Rule

It is often easier to duplicate an existing rule that is similar to a rule that you want to create and adjust it accordingly.

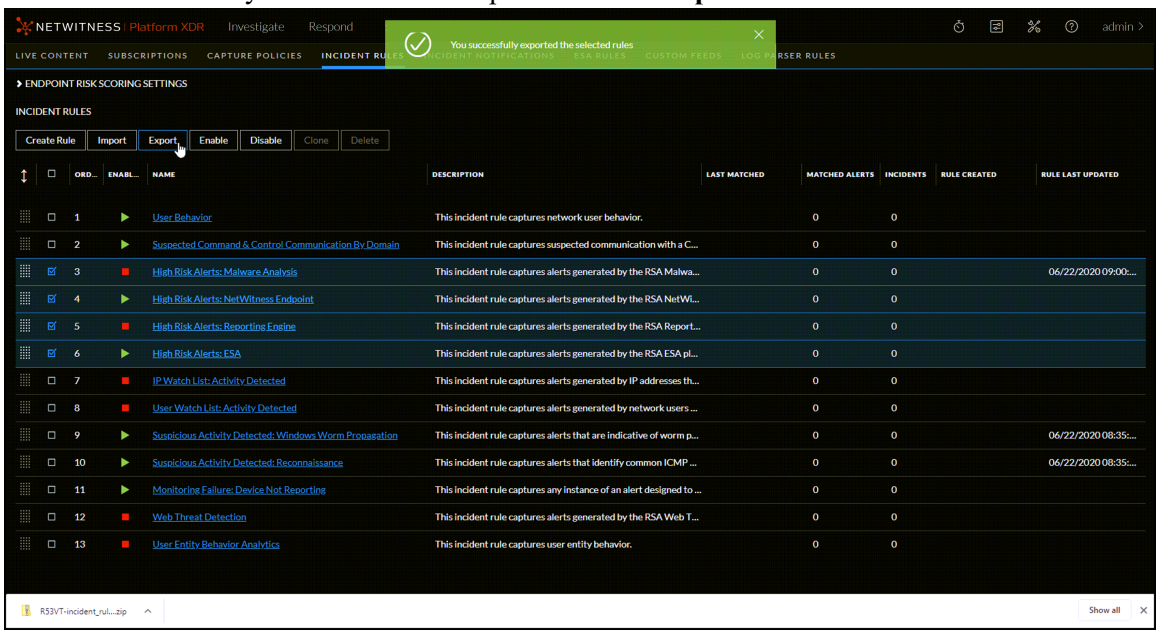
1. Go to  **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.
2. Select the rule that you would like to copy and click **Clone**.
3. Adjust the parameters and conditions of your rule as required. All rules need to have at least one condition.
4. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
5. Click **Save** to create the rule.
6. Verify the order of your incident rules.

Edit an Incident Rule

1. Go to  **(Configure) > Incident Rules** and click the link in the **Name** column for the rule that you want to update.
   The Incident Rule Details view is displayed.
2. Adjust the parameters and conditions of your rule as required. All rules need to have at least one condition.
3. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
4. Click **Save** to update the rule.
5. Verify the order of your incident rules.

See Also:

- For details about parameters that can be set as criteria for an incident rule, see Incident Rule Details View.



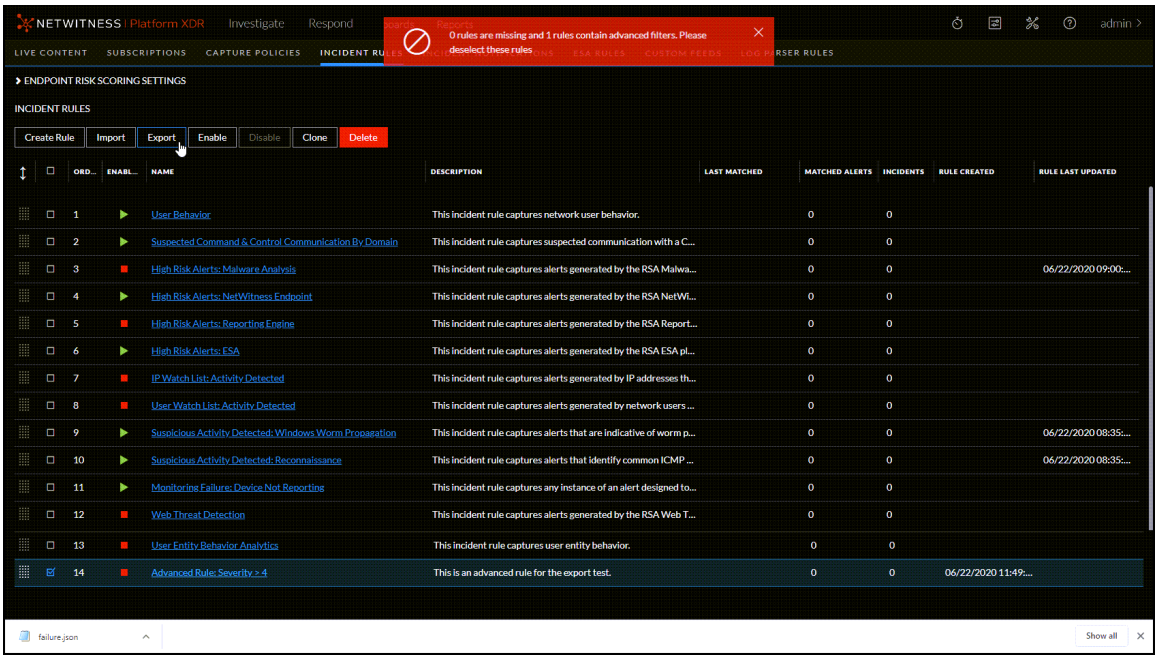
- For details on the parameter and field descriptions in the Incident Rules list, see Incident Rules View.

Export Incident Rules

Note: Exporting and importing incident rules from the Incident Rules view is only available in NetWitness version 11.4 and later.

Exporting incident rules enables you to share incident rules with other NetWitness Servers on the same release version. The exported incident rules file is a ZIP file that contains two JSON files: one file contains the incident rules and the other file contains the incident rule schema. You cannot export Advanced incident rules; the export function only allows incident rules created using Rule Builder.

1. Go to **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.
2. Select the rules that you would like to export and click **Export**.



The exported incident rules file is a ZIP file in the format `<random ID>-incident_rules_export.json.zip`, which contains mandatory JSON files:

- `aggregation_rule_schema.json` contains the default incident rule schema.
- `custom_aggregation_rule_schema.json` contains the custom incident rule schema.
- `<random ID>-incident_rules_export.json` contains the incident rules.

Note: You cannot export Advanced rules.

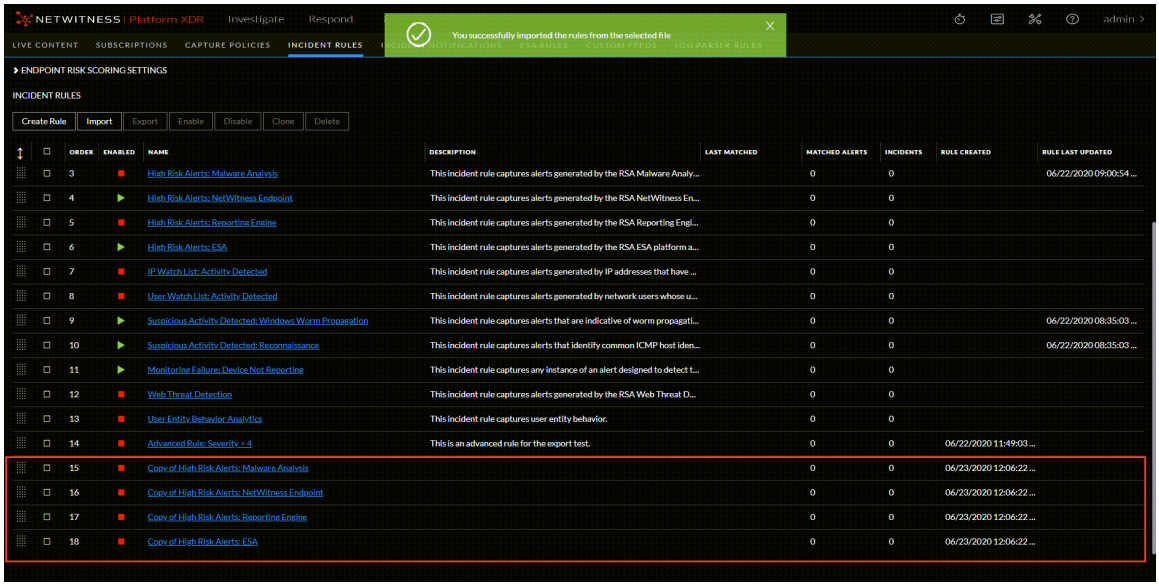
You can import this ZIP file on another NetWitness Server on the same release version.

If for some reason the export is not successful, and you receive only a .JSON file, for example, `failure.json`, refresh your browser and try again. This could happen if someone made an adjustment to the incident rules at the same time. You can also receive an error if you attempt to export an Advanced incident rule, which is not allowed.

Import Incident Rules

Note: Exporting and importing incident rules from the Incident Rules view is only available in NetWitness version 11.4 and later.

You can import an incident rules ZIP file from NetWitness Servers on the same release version. The incident rules ZIP file must be in the original exported format `<random ID>-incident_rules_export.json.zip` and contain mandatory JSON files:



- `aggregation_rule_schema.json` contains the default incident rule schema.
- `custom_aggregation_rule_schema.json` contains the custom incident rule schema.
- `<random ID>-incident_rules_export.json` contains the custom incident rules.

The import fails if the ZIP file contains additional files or folders. To edit the incident rules ZIP file, see Edit the Incident Rules Export ZIP File.

To import incident rules:

1. Go to **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.
2. Click **Import** and select the incident rules ZIP file to import.
   If the import is successful, a successful import notification is displayed, and the imported incident rules are disabled and shown at the bottom of the incident rules list. The **Rule Created** column

shows the date and time of the import.

See Also:

- For details about parameters that can be set as criteria for an incident rule, see Incident Rule Details View.
- For details on the parameter and field descriptions in the Incident Rules list, see Incident Rules View.

Additional Procedures for Respond Configuration

Use this section when you are looking for instructions to perform a specific task after the initial setup of NetWitness Respond.

- Set Up and Verify Default Incident Rules
- Configure Risk Scoring Settings for Automated Incident Creation
- Configure Analyst UI for Respond Server Alert Normalization
- Configure Incident Notification Settings
- Set a Retention Period for Alerts and Incidents
- Obfuscate Private Data
- Manage Incidents in Archer Cyber Incident & Breach Response
- Configure the Option to Send Incidents to Archer
- Configure Threat Aware Authentication
- Set a Counter for Matched Alerts and Incidents
- Configure a Database for the Respond Server Service

Set Up and Verify Default Incident Rules

The User Entity Behavior Analytics default incident rule is available in NetWitness 11.3 and later. It captures user entity behavior grouped by Classifier ID to create incidents from alerts.

The Detect AI default incident rule is available in NetWitness 11.6 and later. It captures the anomalies generated by Detect AI.

The User Entity Behavior Analytics incident rule is available in 11.3 and later. In NetWitness 11.3 to 11.5.0, it captures user entity behavior grouped by UEBA Classifier Id to create incidents from alerts. In NetWitness 11.5.1 and later, it captures user entity behavior grouped by both **UEBA Classifier Id** and **UEBA Entity Name**. The incident name created by the rule uses the UEBA Entity Name. In addition, the User Entity Behavior Analytics incident rule default priority threshold ranges are now consistent with the severity ranges in NetWitness UEBA. To update your rule for 11.5.1 and later, see Update the User Entity Behavior Analytics Incident Rule Priority Thresholds, Grouping Options, and Title .

The User Behavior incident rule, which captures network user behavior, is available in NetWitness 11.1 and later. This rule uses deployed RSA Live ESA Rules to create incidents from alerts. You can select and deploy the RSA Live ESA Rules that you want to monitor.

The following default incident rules changed slightly for 11.1 and later and now have **Source IP Address** as the Group By value:

- High Risk Alerts: Reporting Engine
- High Risk Alerts: Malware Analysis
- High Risk Alerts: ESA

The following default incident rule changed slightly for 11.3 and later and now has the **Host Name** as the Group By value:

- High Risk Alerts: NetWitness Endpoint*

*If you have NetWitness Endpoint, the High Risk Alerts: NetWitness Endpoint default incident rule captures alerts generated by NetWitness Endpoint with a risk score of High or Critical. To aggregate NetWitness Endpoint alerts based on the File Hash instead of Host Name, create another NetWitness Endpoint Rule using the File Hash as the Group By value. See Create a NetWitness Endpoint Incident Rule using File Hash for step-by-step instructions.

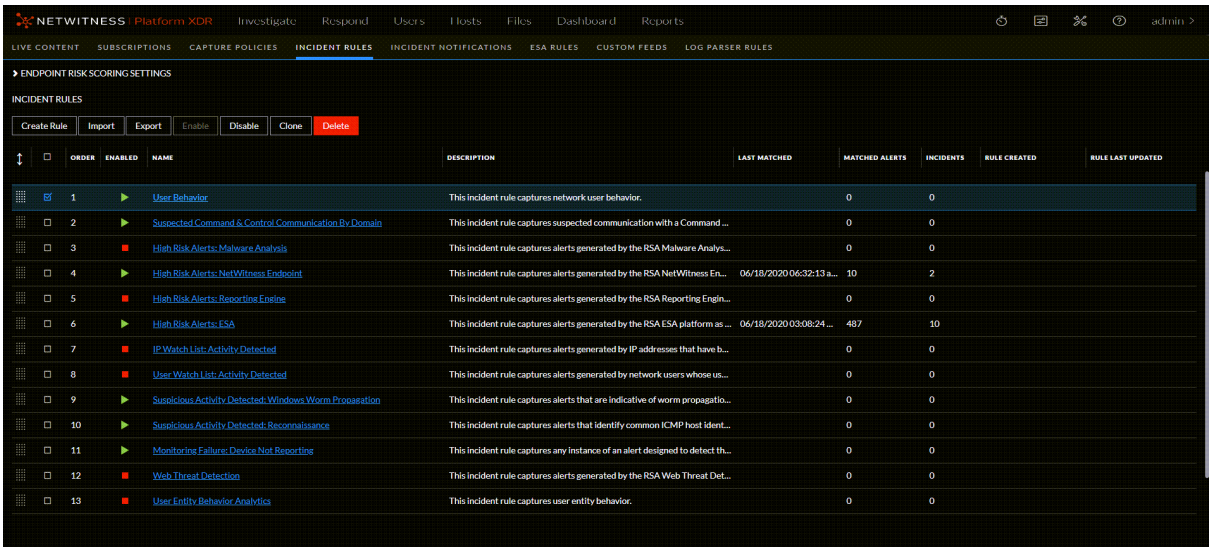
To verify your existing default incident rules with the 11.5 default incident rules, look at the default incident rule tables following these procedures. If you are missing a default incident rule, you can create it manually. Review the default incident rules and adjust them to your environment as required.

Set Up the User Behavior Incident Rule

In order to use the default User Behavior incident rule, you need to deploy the RSA Live ESA Rules that you want to monitor from those listed in the User Behavior incident rule conditions. Complete the following procedures to start aggregating alerts for the User Behavior default incident rule:

- Deploy the RSA Live ESA Rules
- Adjust and enable the User Behavior default rule (or create it if you do not have it)

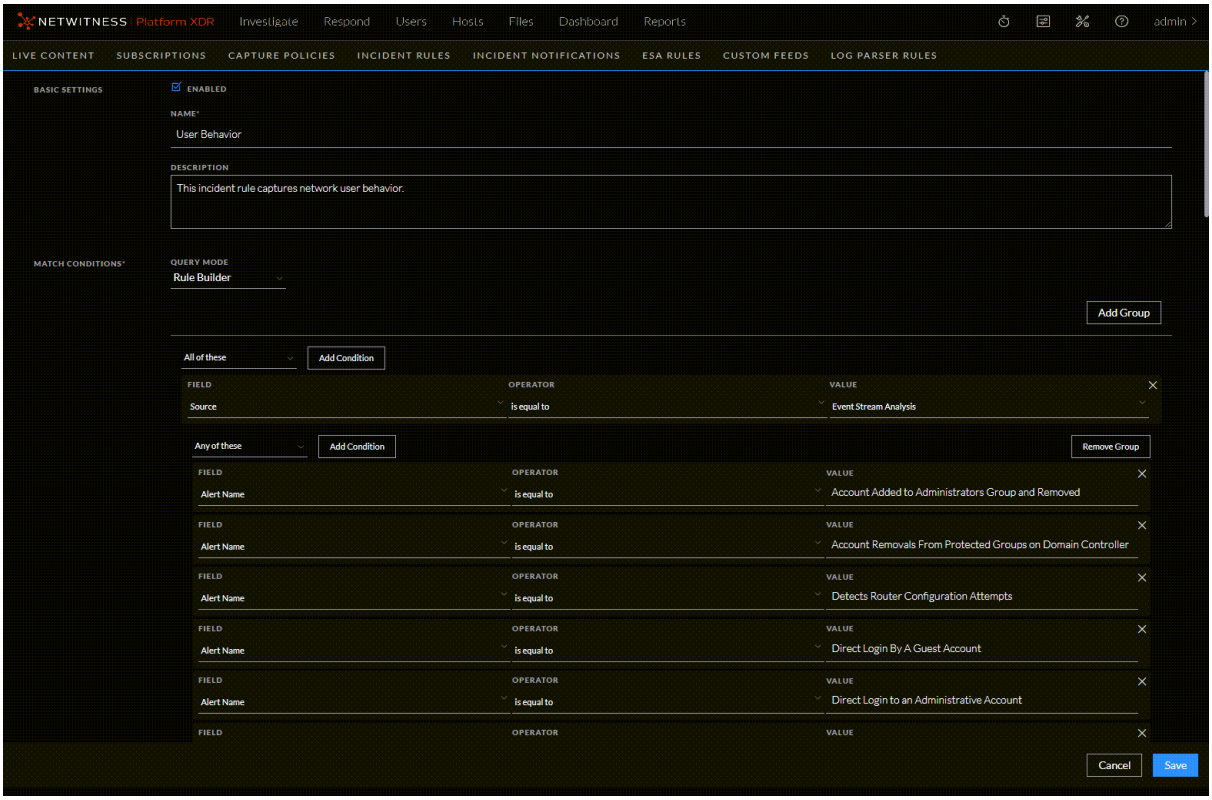
Deploy the RSA Live ESA Rules



1. Go to **(Configure) > Live Content**.
2. In the **Resource Types** field, select **Event Steam Analysis Rule** and click **Search**.
3. In the **Matching Resources** list, select the ESA Rules from the following **User Behavior** table that you are interested in monitoring and deploy them (click **Deploy**).
4. Go to **(Configure) > ESA Rules > Rules** tab, and in the Rule Library **Filter** drop-down list, select **RSA Live ESA Rule**.
5. To add a new ESA rule deployment, in the drop-down list near **Deployments**, click **Add**.
   a. In the ESA Services section, add and then select your ESA service.
   b. In the Data Sources section, click + and add a data source to use for the ESA rule deployment.
   c. In the ESA Rules section, click + and in the Deploy ESA Rules dialog, select the ESA Rules that you selected from the **User Behavior** table, and then click **Save**.
   The selected ESA rules are listed with a status of **Added**.
6. Select the ESA rules that you added from the previous step, and click **Deploy Now**.
   The status of the selected ESA rules changes to **Deployed**.
7. Go to **(Configure) > ESA Rules > Services** tab.
   In the **Deployed Rule Stats** for your ESA service, the rules that you added should have a status of enabled, which is indicated by a green circle in the Enable column.

Adjust and Enable the User Behavior Default Rule (or Create It If You Do Not Have It)

If you have the User Behavior default rule, you can adjust it for your environment and enable it. If you do not have the User Behavior default rule, you can create it manually.



(Optional) To create the User Behavior default rule:

1. Go to **(Configure) > Incident Rules.**
   The Incident Rules view is displayed. (The following figure shows what the User Behavior rule looks like if it was there.)

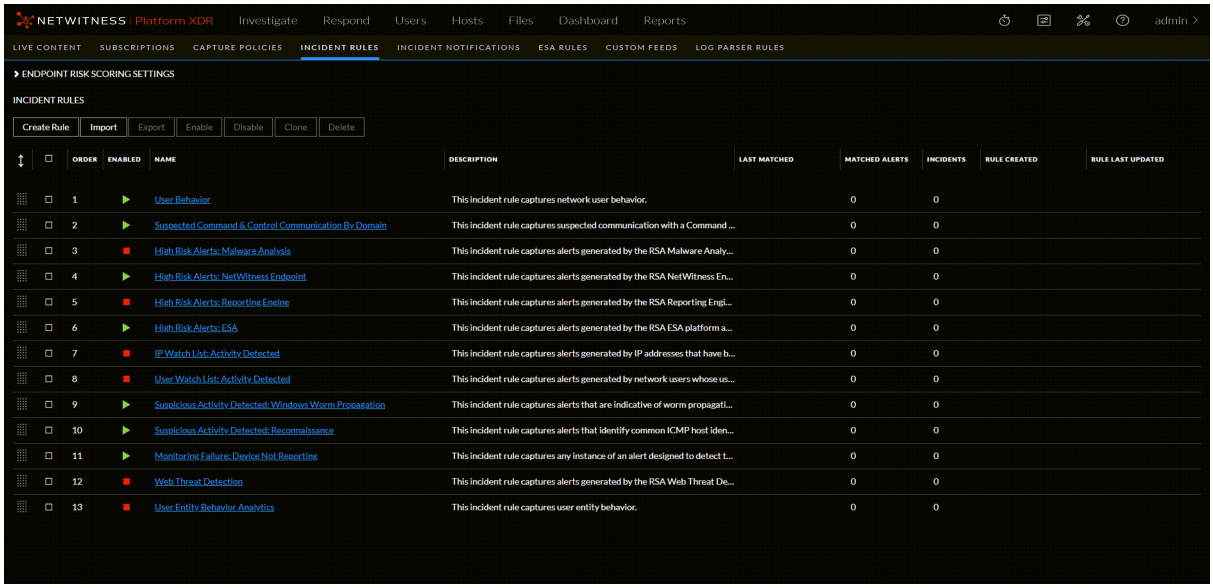
2. Click **Create Rule** and in the Incident Rule Details view, create the User Behavior default incident rule using the values in the User Behavior table following this procedure. The conditions as well as the values not listed in the table should be set for your business requirements. For details about various parameters that can be set as criteria for an incident rule, see Incident Rule Details View.

   The following figure shows a portion of the User Behavior default rule details. Notice that there are two groups in this rule.

3. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.

4. Click **Save**.
   The rule appears in the Incidents Rules list. If you selected Enabled, the rule is enabled and it starts creating incidents depending on the incoming alerts that are matched as per the rule criteria.
5. Verify the order of your incident rules. For more information, see Verify the Order of Your Incident Rules.

User Behavior



The following table shows the values for the User Behavior default incident rule.

Field	Condition Field	Condition Operator	Value
Name			User Behavior
Description			This incident rule captures network user behavior.
Query Mode:			Rule Builder **Note:** For information about advanced query mode, see Incident Rule Details View
1st Group:			All of these
Condition:	Source	is equal to	Event Stream Analysis
2nd Group:			Any of these
Conditions:	Alert Name	is equal to	Account Added to Administrators Group and Removed
	Alert Name	is equal to	Account Removals From Protected Groups on Domain Controller
	Alert Name	is equal to	Detects Router Configuration Attempts
	Alert Name	is equal to	Direct Login By A Guest Account
	Alert Name	is equal to	Direct Login to an Administrative Account
	Alert Name	is equal to	Failed Logins Followed By Successful Login Password Change
	Alert Name	is equal to	Insider Threat Mass Audit Clearing
	Alert Name	is equal to	Internal Data Posting to 3rd Party Sites
	Alert Name	is equal to	kbrtgt Account Modified on Domain controller
	Alert Name	is equal to	Lateral Movement Suspected Windows
	Alert Name	is equal to	Logins across Multiple Servers
	Alert Name	is equal to	Logins by Same User to Multiple Servers

Field	Condition Field	Condition Operator	Value
	Alert Name	is equal to	Malicious Account Creation Followed by Failed Authorization
	Alert Name	is equal to	Multiple Account Lockouts From Same or Different Users
	Alert Name	is equal to	Multiple Failed Logins Followed By a Successful Login
	Alert Name	is equal to	Multiple Failed Logins from Same User Originating from Different Countries
	Alert Name	is equal to	Multiple Failed Privilege Escalations by Same User
	Alert Name	is equal to	Multiple Intrusion Scan Events from Same User to Unique Destinations
	Alert Name	is equal to	Multiple Login Failures by Administrators to Domain Controller
	Alert Name	is equal to	Multiple Login Failures by Guest to Domain Controller
	Alert Name	is equal to	Multiple Failed Logons from Same Source IP with Unique Usernames
	Alert Name	is equal to	Multiple Successful Logins from Multiple Diff Src to Diff Dest
	Alert Name	is equal to	Multiple Successful Logins from Multiple Diff Src to Same Dest
	Alert Name	is equal to	Privilege Escalation Detected
	Alert Name	is equal to	Privilege Escalation Detected in Unix
	Alert Name	is equal to	Privilege User Account Password Change
	Alert Name	is equal to	Failed Logins Outside Business Hours
	Alert Name	is equal to	DNS Tunneling
	Alert Name	is equal to	User Login Baseline
Group By			Destination User Account
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}

Set up or Verify a Default Incident Rule

1. Go to **(Configure) > Incident Rules.**
   The Incident Rules view is displayed.

2. Click the link in the **Name** field of a default incident rule to view the Incident Rule Details view. Set up or verify the default incident rule using the values in the default incident rules tables in this topic. Values not listed in the tables should be set for your business requirements. For details about various parameters that can be set as criteria for an incident rule, see Incident Rule Details View.
3. When you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
4. Click **Save**.
5. Verify the order of your incident rules. For more information, see Verify the Order of Your Incident Rules.

Suspected Command & Control Communication By Domain

The following table shows the values for the Suspected Command & Control Communication By Domain default incident rule.

Field	Condition Field	Condition Operator	Value
Name			Suspected Command & Control Communication By Domain
Description			This incident rule captures suspected communication with a Command & Control server and groups results by domain.
Group:			All of these
Conditions:	Source	is equal to	Event Stream Analysis
	Alert Rule Id	is equal to	Suspected C&C
Group By			Domain for Suspected C& C
Time Window			7 Days
Title			Suspected C&C with ${groupByValue1}
Summary			NetWitness Platform detected communications with ${groupByValue1} that may be command and control malware. 1. Evaluate if the domain is legitimate (online radio, news feed, partner, automated testing, etc.). 2. Review the domain registration for suspect information (Registrant country, registrar, no registration data found, etc). 3. If the domain is suspect, go to the Investigation module to locate other activity to or from it.

High Risk Alerts: Malware Analysis

The following table shows the values for the High Risk Alerts: Malware Analysis default incident rule.

Field	Condition Field	Condition Operator	Value
Name			High Risk Alerts: Malware Analysis
Description			This incident rule captures alerts generated by the NetWitness Malware Analysis platform as having a Risk Score of "High" or "Critical".
Group:			All of these
Conditions:	Source	is equal to	Malware Analysis
	Risk Score	is equal or greater than	50
Group By			Source IP Address
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}

High Risk Alerts: NetWitness Endpoint

The following table shows the values for the High Risk Alerts: NetWitness Endpoint default incident rule.

Field	Condition Field	Condition Operator	Value
Name			High Risk Alerts: NetWitness Endpoint
Description			This incident rule captures alerts generated by the NetWitness Endpoint platform as having a Risk Score of "High" or "Critical".
Group:			All of these
Conditions:	Source	is equal to	NetWitness Endpoint
	Risk Score	is equal or greater than	50
Group By			Host Name*
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}

*To aggregate NetWitness Endpoint alerts based on the File Hash, create another NetWitness Endpoint Rule using the File Hash as the Group By value. See Create a NetWitness Endpoint Incident Rule using File Hash for step-by-step instructions.

High Risk Alerts: Reporting Engine

The following table shows the values for the High Risk Alerts: Reporting Engine default incident rule.

Field	Condition Field	Condition Operator	Value
Name			High Risk Alerts: Reporting Engine
Description			This incident rule captures alerts generated by the NetWitness Reporting Engine as having a Risk Score of "High" or "Critical".
Group:			All of these
Conditions:	Source	is equal to	Reporting Engine
	Risk Score	is equal or greater than	50
Group By			Source IP Address
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}

High Risk Alerts: ESA

The following table shows the values for the High Risk Alerts: ESA default incident rule.

Field	Condition Field	Condition Operator	Value
Name			High Risk Alerts: ESA
Description			This incident rule captures alerts generated by the NetWitness ESA platform as having a Risk Score of "High" or "Critical".
Group:			All of these
Conditions:	Source	is equal to	Event Stream Analysis
	Risk Score	is equal or greater than	50
Group By			Source IP Address

Field	Condition Field	Condition Operator	Value
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}

IP Watch List: Activity Detected

The following table shows the values for the IP Watch List: Activity Detected default incident rule.

Field	Condition Field	Condition Operator	Value
Name			IP Watch List: Activity Detected
Description			This incident rule captures alerts generated by IP addresses that have been added as "Source IP Address" *and* "Destination IP Address" conditions of the rule. To add additional IP addresses to the watch list, simply add a new Source and Destination IP Address conditional pair.
Group:			Any of these
Conditions:	Source IP Address	is equal to	1.1.1.1
	Destination IP Address	is equal to	1.1.1.1
	Source IP Address	is equal to	2.2.2.2
	Destination IP Address	is equal to	2.2.2.2
Group By			Source IP Address
Time Window			4 Hours
Title			${ruleName}

User Watch List: Activity Detected

The following table shows the values for the User Watch List: Activity Detected default incident rule.

Field	Condition Field	Condition Operator	Value
Name			User Watch List: Activity Detected
Description			This incident rule captures alerts generated by network users whose user names have been added as a "Source UserName" condition. To add more than one Username to the watch list, simply add an additional Source Username condition.
Group:			Any of these
Conditions:	Source Username	is equal to	jsmith
	Source Username	is equal to	jdoe
Group By			Source Username
Time Window			4 Hours
Title			${ruleName}

Suspicious Activity Detected: Windows Worm Propagation

The following table shows the values for the Suspicious Activity Detected: Windows Worm Propagation default incident rule.

Field	Condition Field	Condition Operator	Value
Name			Suspicious Activity Detected: Windows Worm Propagation
Description			This incident rule captures alerts that are indicative of worm propagation activity on a Microsoft network
1st Group:			All of these
Condition:	Source	is equal to	Event Stream Analysis
2nd Group:			Any of these
Conditions:	Alert Name	is equal to	Windows Worm Activity Detected Logs

Field	Condition Field	Condition Operator	Value
	Alert Name	is equal to	Windows Worm Activity Detected Packets
Group By			Source IP Address
Time Window			1 Hour
Title			${ruleName}

Suspicious Activity Detected: Reconnaissance

The following table shows the values for the Suspicious Activity Detected: Reconnaissance default incident rule.

Field	Condition Field	Condition Operator	Value
Name			Suspicious Activity Detected: Reconnaissance
Description			This incident rule captures alerts that identify common ICMP host identification techniques (i.e. "ping") accompanied by connection attempts to multiple service ports on a host
1st Group:			All of these
Condition:	Source	is equal to	Event Stream Analysis
2nd Group:			Any of these
Conditions:	Alert Name	is equal to	Port Scan Horizontal Packet
	Alert Name	is equal to	Port Scan Vertical Packet
	Alert Name	is equal to	Port Scan Horizontal Log
	Alert Name	is equal to	Port Scan Vertical Log
Group By			Source IP Address
Time Window			4 Hours
Title			${ruleName}

Monitoring Failure: Device Not Reporting

The following table shows the values for the Monitoring Failure: Device Not Reporting default incident rule.

Field	Condition Field	Condition Operator	Value
Name			Monitoring Failure: Device Not Reporting
Description			This incident rule captures any instance of an alert designed to detect the absence of log traffic from a previously reporting device
Group:			All of these
Conditions:	Source	is equal to	Event Stream Analysis
	Alert Name	is equal to	No logs traffic from device in given time frame
Group By			Source IP Address
Time Window			2 Hours
Title			${ruleName}

Web Threat Detection

The following table shows the values for the Web Threat Detection default incident rule.

Field	Condition Field	Condition Operator	Value
Name			Web Threat Detection
Description			This incident rule captures alerts generated by the NetWitness Web Threat Detection platform.
Group:			All of these
Condition:	Source	is equal to	Web Threat Detection
Group By			Alert Rule Id
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}

User Entity Behavior Analytics

The following table shows the values for the User Entity Behavior Analytics default incident rule.

Field	Condition Field	Condition Operator	Value
Name			User Entity Behavior Analytics
Description			This incident rule captures user entity behavior.
Group:			All of these
Condition:	Source	is equal to	User Entity Behavior Analytics
Group By			UEBA Classifier Id
Group By (11.5.0 and Earlier)			UEBA Classifier Id
Group By (11.5.1 and Later)			UEBA Classifier Id, UEBA Entity Name
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}
Title (11.5.0 and Earlier)			${ruleName} for ${groupByValue1}
Title (11.5.1 and Later)			${ruleName} for ${groupByValue2}
Priority Thresholds (11.5.0 and Earlier)			• Critical: 90 • High: 50 • Medium: 20 • Low: 1
Priority Thresholds (11.5.1 and Later)			• Critical: 98 • High: 93 • Medium: 85 • Low: 1

Detect AI

The following table shows the values for the Detect AI default incident rule.

Field	Condition Field	Condition Operator	Value
Name			DetectAI
Description			This incident rule captures anomalies generated by Detect AI
Group:			All of these
Condition:	Source	is equal to	DetectAI
Group By			UEBA Classifier Id, UEBA Entity Name
Time Window			1 Hour
Title			${ruleName} for ${groupByValue2}
Priority Thresholds (11.5.0 and Earlier)			• Critical: 98 • High: 93 • Medium: 85 • Low: 1

NetWitness Core

The following table shows the values for the NetWitness Core default incident rule.

Field	Condition Field	Condition Operator	Value
Name			NetWitness Core
Description			This incident rule captures anomalies generated by NetWitness Core
Group:			All of these
Condition:	Source	is equal to	NetWitness Core
Group By			Alert Name
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}
Priority Thresholds			• Critical: 90 • High: 50 • Medium: 20 • Low: 1

Update the User Entity Behavior Analytics Incident Rule Priority Thresholds, Grouping Options, and Title

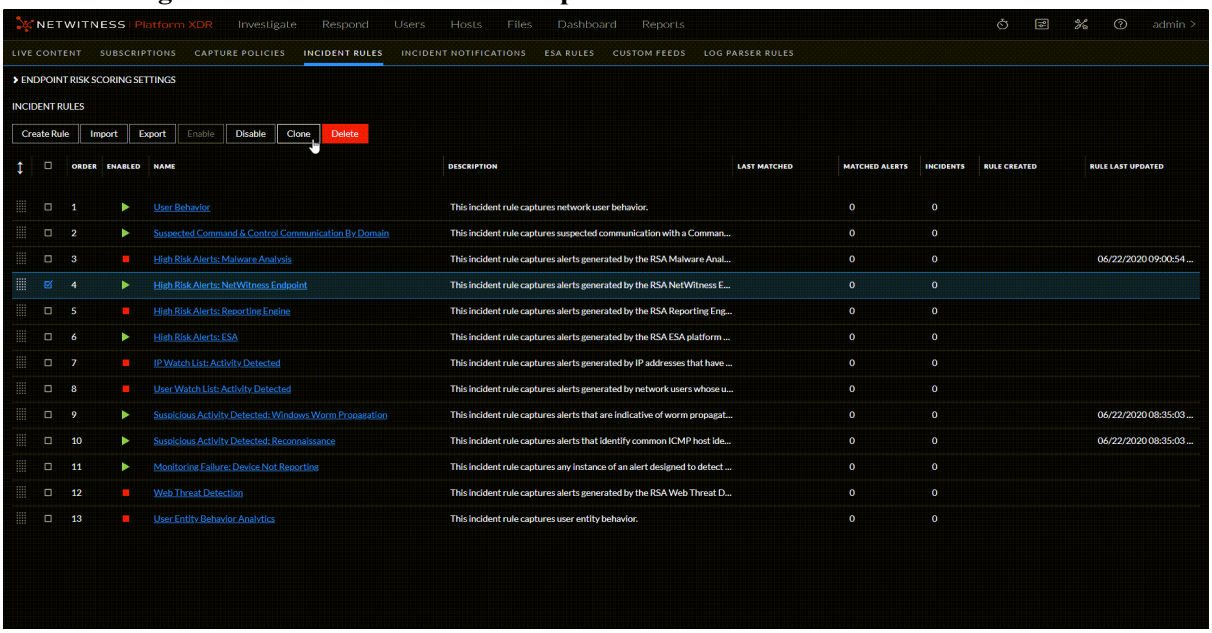
In NetWitness 11.5.1 and later, the User Entity Behavior Analytics incident rule default priority threshold ranges are consistent with the severity ranges in NetWitness UEBA. The rule also captures user entity behavior grouped by both UEBA Classifier Id and UEBA Entity Name. The incident name created by the rule uses the UEBA Entity Name.

It is important to update the User Entity Behavior Analytics incident rule priority thresholds for matched incidents, grouping options, and incident title to the 11.5.1 default values.

1. Go to **(Configure) > Incident Rules** and in the Incident Rules list, double-click the **User Entity Behavior Analytics** incident rule.
2. In the **Grouping Options – Group By** field, add **`UEBA Entity Name`**.
   You should have both UEBA Classifier Id and UEBA Entity Name.
3. In the **Incident Options – Title** field, change `${groupByValue1}` to `${groupByValue2}`: **`${ruleName} for ${groupByValue2}`**
4. In the **Incident Options – Priority** section, update the **Critical**, **High**, **Medium**, and **Low** priority thresholds to the default values.

Priority Threshold	Default Value
Critical	98
High	93
Medium	85
Low	1

   For example, with the Critical priority now set to 98, incidents with a risk score of 98 or higher are assigned a Critical priority for this rule.

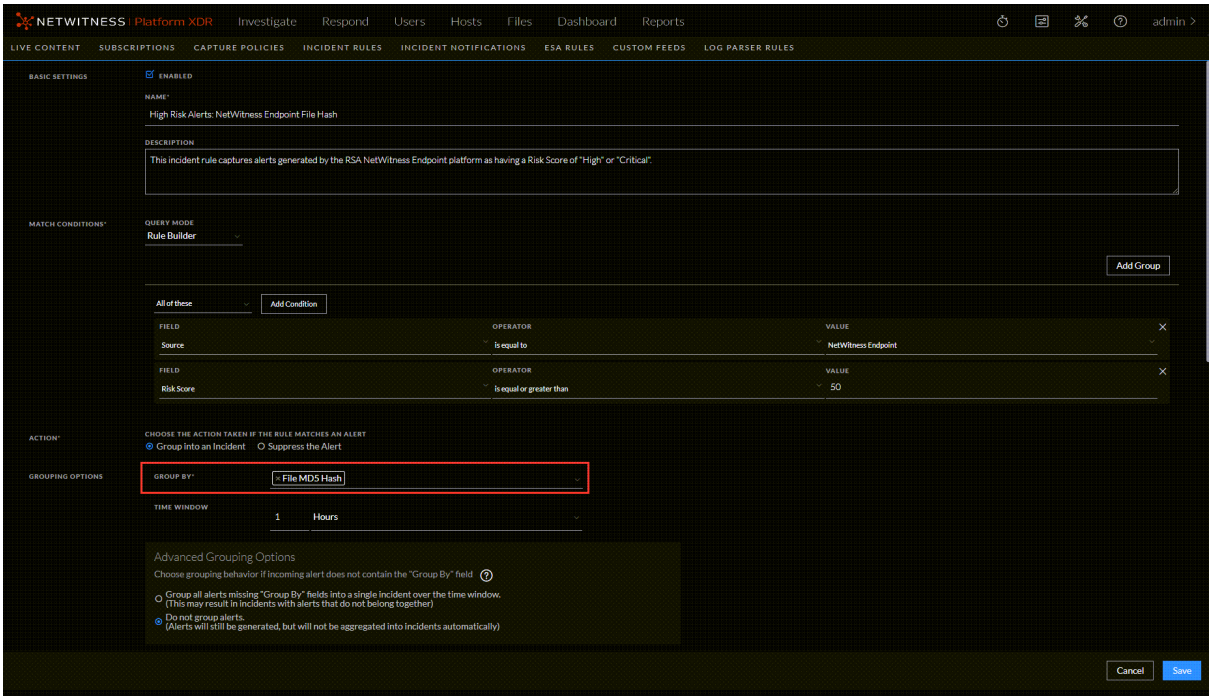


5. Click **Save**.

Create a NetWitness Endpoint Incident Rule using File Hash

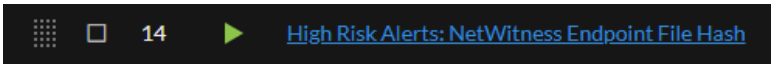
To aggregate NetWitness Endpoint alerts based on the File Hash, create another NetWitness Endpoint Rule using the File Hash as the Group By value. To do this, clone the default NetWitness Endpoint incident rule and change the Group By value.

1. Go to **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.



2. Select the **High Risk Alerts: NetWitness Endpoint** default incident rule and click **Clone**.

You will receive a message that you successfully cloned the selected rule.



3. Change the **Name** of the rule to an appropriate name, such as High Risk Alerts: NetWitness Endpoint File Hash.

4. In the **Group By** field, remove the previous Group By value and add **File MD5 Hash**.
It is important that File MD5 Hash is the only Group By value listed.

5. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.

6. Click **Save** to create the rule.
   The Incident Rules view shows your new rule.

7. Verify the order of your incident rules. For more information, see Verify the Order of Your Incident Rules.

Configure Risk Scoring Settings for Automated Incident Creation

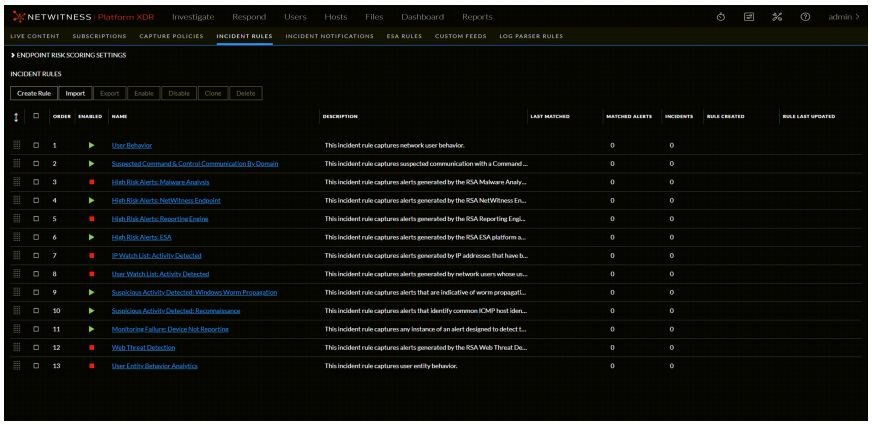
Note: The information in this topic applies to NetWitness Version 11.3 and later.

Endpoint Risk Scoring Settings only apply to NetWitness Endpoint.

In addition to automatically creating incidents with predefined rules and rules that you define, NetWitness Respond automatically creates risk scoring incidents for suspicious files and hosts when defined risk score thresholds are crossed. In the background, it monitors the following types of alerts and calculates risk scores for each file and host:

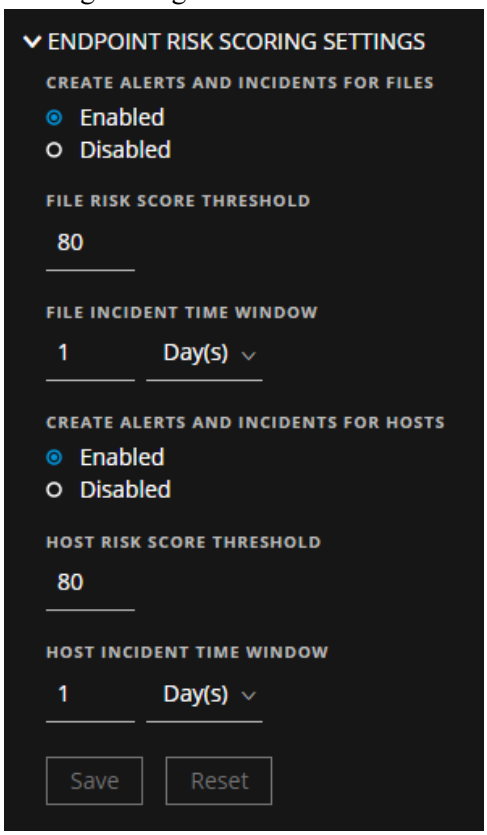
- Critical and High priority alerts from NetWitness Respond
- Medium priority Endpoint alerts from ESA

NetWitness Respond calculates risk score using a combination of the number of distinct alerts and the severity of alerts associated with the file or host. A higher risk score indicates more of these types of alerts. When the calculated risk score exceeds the specified threshold, NetWitness Respond does one of the following during the specified time window, such as 1 day:



- Creates a risk scoring alert and uses it to create a risk scoring incident
- Adds risk scoring alerts along with associated events to the same incident

For more information on configuring NetWitness Endpoint, see the *NetWitnesss Endpoint Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.



To configure the Endpoint Risk Scoring Settings:

You should leave the Endpoint Risk Scoring Settings at the default values. However, if you are getting too many risk scoring alerts and incidents created, increase the risk score threshold to a higher value. Also, if you are getting too many incidents created for the same hosts or files, increase the time window to add more alerts to the same risk scoring incidents. If you are not seeing many risk scoring incidents, you can either decrease the risk scoring thresholds for hosts and files or decrease the incident time windows.

1. Go to  **(Configure) > Incident Rules**.
   The Incident Rules view is displayed.

2. Click the arrow in front of **ENDPOINT RISK SCORING SETTINGS** to expand the Endpoint Risk Scoring Settings section.

3. In the Endpoint Risk Scoring Settings section, adjust the settings as follows:

   a. **Create Alerts and Incidents for Files**:

   - Select **Enabled** to automatically create risk scoring alerts and incidents for suspicious files. When calculated file risk scores go above the file risk score threshold, it triggers the creation of risk scoring alerts and incidents.
   - Select **Disabled** to stop automatically creating risk scoring alerts and incidents. If you disable it, incidents are not created for suspicious files where risk scores are high.

b. **File Risk Score Threshold**: The File Risk Score Threshold is the risk score level used to trigger alert and incident creation. The File Risk Score Threshold range is from 0-100. For example, if the File Risk Score Threshold is 80 and the calculated risk score of a suspicious Openme.rar file is 81, which is over the Risk Score Threshold of 80, NetWitness Respond creates a risk scoring alert and incident or adds a risk scoring alert to an existing incident depending on the file incident time window.

   - If you are seeing too many alerts and incidents, increase the risk score threshold.
   - If you are not seeing many alerts and incidents, decrease the risk score threshold.

c. **File Incident Time Window**: The File Incident Time Window is the period of time to wait before creating another incident. The file incident time window range is from 1-24 (hours or days). For example, the suspicious Openme.rar file has a calculated risk score of 81 and a file time window of 1 day. A risk scoring alert and incident is created for the Openme.rar file. During the time window, any similar risk scoring alerts with the same name created for the Openme.rar file get added to the same incident. At the end of the time window (day 1), if the calculated risk score of the file is still over the file risk score threshold and a change occurs with the risk score, another risk scoring alert and incident gets created and any new risk scoring alerts associated with the file get added to the new incident until the next time window (day 3).

   - If you are seeing too many alerts and incidents, increase the incident time window.
   - If you are not seeing many alerts and incidents, decrease the incident time window.

d. **Create Alerts and Incidents for Hosts**:

   - Select **Enabled** to automatically create risk scoring alerts and incidents for suspicious hosts. When calculated host risk scores go above the host risk score threshold, it triggers the creation of risk scoring alerts and incidents.
   - Select **Disabled** to stop automatically creating risk scoring alerts and incidents when calculated host risk scores go above the host risk score threshold. If you disable it, incidents are not created for suspicious hosts where risk scores are high.

e. **Host Risk Score Threshold**: The Host Risk Score Threshold is the risk score level used to trigger alert and incident creation. The host risk score threshold range is from 0-100. For example, if the Host Risk Score Threshold is 80 and the calculated risk score of a suspicious host IP address is 81, which is over the Risk Score Threshold of 80, NetWitness Respond creates a risk scoring alert and incident or adds a risk scoring alert to an existing incident depending on the file incident time window.

   - If you are seeing too many alerts and incidents, increase the risk score threshold.
   - If you are not seeing many alerts and incidents, decrease the risk score threshold.

f. **Host Incident Time Window**: The Host Incident Time Window is the period of time to wait before creating another incident. The host incident time window range is from 1-24 (hours or days). For example, the suspicious host has a calculated risk score of 81 and a Host Time Window of 1 day. During the time window, any similar risk scoring alerts with the same name created for the suspicious host get added to the same incident. At the end of the time window

(day 1), if the calculated risk score of the host is still over the host risk score threshold and a change occurs with the risk score, another risk scoring alert and incident gets created. Any new risk scoring alerts associated with that suspicious host add to that incident until the next time window.

- If you are seeing too many risk scoring alerts and incidents, increase the incident time window.
- If you are not seeing many risk scoring alerts and incidents, decrease the incident time window.

4. Click **Save**.

Configure Custom Respond Server Alert Normalization

Note: This procedure is optional. Administrators can use it to change Respond Server alert normalization.

Analysts who are content experts can create ESA Correlation rules that generate alerts. When a rule is more complex than what can be specified in the ESA Rule Builder, they can write advanced Event Process Language (EPL) rules. After the ESA rules are deployed and the alert criteria is met, ESA Correlation-server forwards the raw alerts to Respond-server.

The schema, meta key selection, and event pattern of the raw alerts are unknown to the Respond-server since they depend on the way the ESA rules are written. In this case, you can customize the logic to parse the raw alert to an acceptable format. The parsing (normalization) logic is written in JavaScript language and NetWitness users who know how to write JavaScript code can customize the Respond normalization script files.

In NetWitness version 11.4 and later, to prevent overwriting future customizations in the Respond normalization scripts, add any custom logic to the **`custom_normalize_<alert type>.js`** files. The custom normalization script files have a `custom_normalize` prefix and are located in the **`/var/lib/netwitness/respond-server/scripts`** directory:

```
data_privacy_map.js
custom_normalize_alerts.js
custom_normalize_core_alerts.js
custom_normalize_ecat_alerts.js
custom_normalize_ma_alerts.js
custom_normalize_ueba_alerts.js
custom_normalize_detectai_alerts.js
custom_normalize_wtd_alerts.js
utils.js
```

For Example, the `custom_normalize_core_alerts.js` is the normalization script used to add custom logic for ESA alerts. This JavaScript file has a `normalizeAlert` function with the parameters `headers`, `rawAlert`, and `normalizedAlert`. The `normalized` variable is an immutable copy object which has an embedded object with a list of normalized events. So if you have any custom meta keys configured for the events then you have to iterate through the `normalized.events` to populate the appropriate meta keys with values from the `rawAlert.events` object. The following figure shows sample code.

Sample Custom Normalize Core Alerts Code

```
normalizeAlert = function (headers, rawAlert, normalizedAlert) {
    // normalizedAlert is the immutable copy of ootb normalizer alert, make sure
you use
    // normalized object to update/set the values in your scripts
    var normalized = Object.assign(normalizedAlert);
    var custom_events;
    if(normalized.events !== undefined) {
        custom_events = normalized.events;

    } else {
        custom_events = new Array([]);
```

```
    }
    for (var i = 0; i < rawAlert.events.length; i++) {
        custom_events[i].legalentity=Utils.stringValue(rawAlert.events[i].isgs_
legalentity);
        custom_events[i].companycode=Utils.stringValue(rawAlert.events[i].isgs_
companycode);

    }

    if(normalized.events === undefined){
        normalized.events = custom_events;
    }
   return normalized;
};
```

To Configure Custom Respond Server Alert Normalization:

1. Open the `custom_normalize_core_alerts.js` file.

custom_normalize_core_alerts.js

```
exports.normalizeAlert = function (headers, rawAlert, normalizedAlert) {

       // normalizedAlert is the immutable copy of ootb normalizer alert, make
sure you use
       // normalized object to update/set the values in your scripts
       var normalized = Object.assign(normalizedAlert);
       // Add custom logic below
       return normalized;
};
```

The `normalizedAlert` object has been broadcasted, which already comes through the basic parsing logic flow where some of the meta values have been copied to `normalizedAlert` from `headers` and `rawAlert`.

2. Populate The `normalizedAlert` object with the custom meta values that are not covered in the basic parsing logic:
   a. Add your custom logic below the line: `var normalized = Object.assign (normalizedAlert);`

      The `headers` parameter has very few attributes like:

      `headers.severity`

      `headers.deviceProduct`

      The important parameter is `rawAlert`, which has an embedded `events` object, which is an array. It is basically the list of events associated with the alert. The `events` object has all meta keys governed from the Concentrator. Here are some example meta keys:

      `event.user_dst`

      `event.user_src`

```
event.username
event.domain_dst
event.domain_src
event.host_dst
event.host_src
event.analysis_session
event.analysis_service
event.analysis_file
event.agent_id
event.device_type
event.category
event.action
event.user
event.owner
event.port_dst
event.OS
event.process_vid_src
```

To view the look-up table for meta keys, go to  **(Configure) > Esa Rules > Settings > Meta Key References**.

The `normalized` object also has an embedded `events` object, which is an array.

b. Iterate through each item of the `normalized.events` and `rawAlert.events` and then copy the custom meta attributes from the `rawAlert.events` to the `normalized.events`.

The following example shows how to add custom meta keys to the `custom_normalize_core_alerts.js` file.

Example of Custom Alert Normalization

```
exports.normalizeAlert = function (headers, rawAlert, normalizedAlert) {
  // normalizedAlert is the immutable copy of ootb normalizer alert, make sure
you use
  // normalized object to update/set the values in your scripts
  var normalized = Object.assign(normalizedAlert);
  var custom_events;
  if (normalized.events != undefined)
  {
      custom_events = normalized.events;
  }
  else
  {
    custom_events = new Array();
  }

// iterate through each item
 for (var i = 0; i < rawAlert.events.length; i++)
 {
          custom_events[i].metaKey1=Utils.stringValue(rawAlert.events
[i].rawCustomMetaKey1);
          // Utils is a helper module to stringify the object
          custom_events[i].metaKey2=Utils.stringValue(rawAlert.events
[i].rawCustomMetaKey2);
}

If (normalized.events == undefined)
{
    normalized.events = custom_events;
}
    return normalized;
};
```

The `metaKey1` and `metaKey2` meta keys are now assigned meta keys, which you can view in the NetWitness user interface.

When customizing normalization script files, you can also look at the built-in Respond normalization script files for reference, such as `normalize_alerts.js`.

Creating Custom Match Conditions and GroupBy Fields

This topic describes how to create Custom Match Conditions and GroupBy Fields for Respond server in NetWitness Platform 12.3.1. and later. custom_aggregation_rule_schema.json is added to prevent overwriting customization and easier management of custom fields.

In case of upgrade, the custom fields would be migrated to custom_aggregation_rule_schema.json and all the custom entries would be removed from aggregation_rule_schema.json. The custom fields added to custom_aggregation_rule_schema.json will be persisted.

Procedure

In this example, using a custom meta key named "Instance" and alert Source from ESA.

1. Add the new lines highlighted in pink in the screenshot below in custom_aggregation_rule_ schema.json file.

   Note: Attention to the formatting and syntax within this file which is very important.

   ```
   # vi /var/lib/netwitness/respond-server/data/custom_aggregation_rule_
   schema.json (Replace customkey with your real custom key)
   ```

   ```
   },
   {
   "value": "alert.events.<customkey>",
   "name": "<customkey>",
   "type": "textfield",
   "operators": [0, 1, 8, 9, 10, 11, 12, 13],
   "groupBy": true,
   "groupByField": "alert.groupby_<customkey>"
   }
   ```

   Example:

   ```
   {
     "value": "alert.events.operating_system",
     "name": "Operating System",
     "type": "textfield",
     "operators": [0, 1],
     "groupBy": true,
     "groupByField": "alert.groupby_os"
   },
   {
     "value": "alert.events.instance",
     "name": "Instance",
     "type": "textfield",
     "operators": [0, 1, 8, 9, 10, 11, 12, 13],
     "groupBy": true,
     "groupByField": "alert.groupby_instance"
   }

   ]
   ```

   If custom keys were added for user in group clause prior to 12.3.1, the custom fields from the aggregation_rule_schema.json, will be automatically migrated to custom_aggregation_rule.json.

   In any case if this custom fields are missing in custom_aggregation_rule.Schema.json, use the back up file located in /var/lib/netwitness/respond-server/data/aggregation_rule_schema.json.bak<time of the backup> to copy the custom fields to custom_aggregation_rule_schema.json

2. Add new lines that are highlighted in pink in the screenshots below for a custom key to the following files.

   ```
   # vi /var/netwitness/respond-server/scripts/custom_normalize_core_alerts.js
   (Replace <customkey> with your real custom key)
   ```

```
var custom_events;
if (normalized.events != undefined) {
custom_events = normalized.events;
}else {
custom_events = new Array();
}
for (var i = 0; i < rawAlert.events.length; i++) {
custom_events[i].<customkey>=Utils.stringValue(rawAlert.events
[i].<customkey>);
}
if(normalized.events == undefined) {
normalized.events = custom_events;
}
```

Example:

```
var custom_events;
if (normalized.events != undefined) {
custom_events = normalized.events;
}else {
custom_events = new Array();
}
for (var i = 0; i < rawAlert.events.length; i++) {
custom_events[i].file_hash=Utils.stringValue(rawAlert.events
[i].file_hash);
custom_events[i].event_computer=Utils.stringValue(rawAlert.events
[i].event_computer);
custom_events[i].risk_info=Utils.stringValue(rawAlert.events
[i].risk_info);
custom_events[i].alias_host=Utils.stringValue(rawAlert.events
[i].alias_host);
custom_events[i].url=Utils.stringValue(rawAlert.events[i].url);
custom_events[i].sensor=Utils.stringValue(rawAlert.events
[i].sensor);
}
if(normalized.events == undefined) {
normalized.events = custom_events;
}
```

```
# vi /var/netwitness/respond-server/scripts/custom_normalize_alerts.js
(Replace <customkey> with your real custom key).
```

```
normalized.groupby_<customkey> = Utils.generateFlattenedColumnValue
(normalized.events, "<customkey>");
```

Example:

```
    if (!transformer) {
        throw new Error("No matching Alert transformation script found.");
    } else if(transformer.scriptError) {
        throw new Error(transformer.scriptError);
    } else {
        // Normalize
        var normalized = transformer.normalizeAlert(headers, alert, normalizedAlert);
        normalized.groupby_instance = Utils.generateFlattenedColumnValue(normalized.events, "instance");
        return normalized;
    }
}

/**
 * Calls require() on each script and stores the resulting object in a map that can be referenced later.
 *
 * @param scriptList the list of scripts to include
 * @returns an object containing each script keyed by its name, or an object containing the script error if there was a problem
loading the script
 */
```

3. Restart Respond Server service, either from within the NW UI:

   NW UI > Admin > Services > Respond Server > Actions column > Restart

   Or command line from NW Admin Server.

   ```
   # systemctl restart rsa-nw-respond-server
   ```

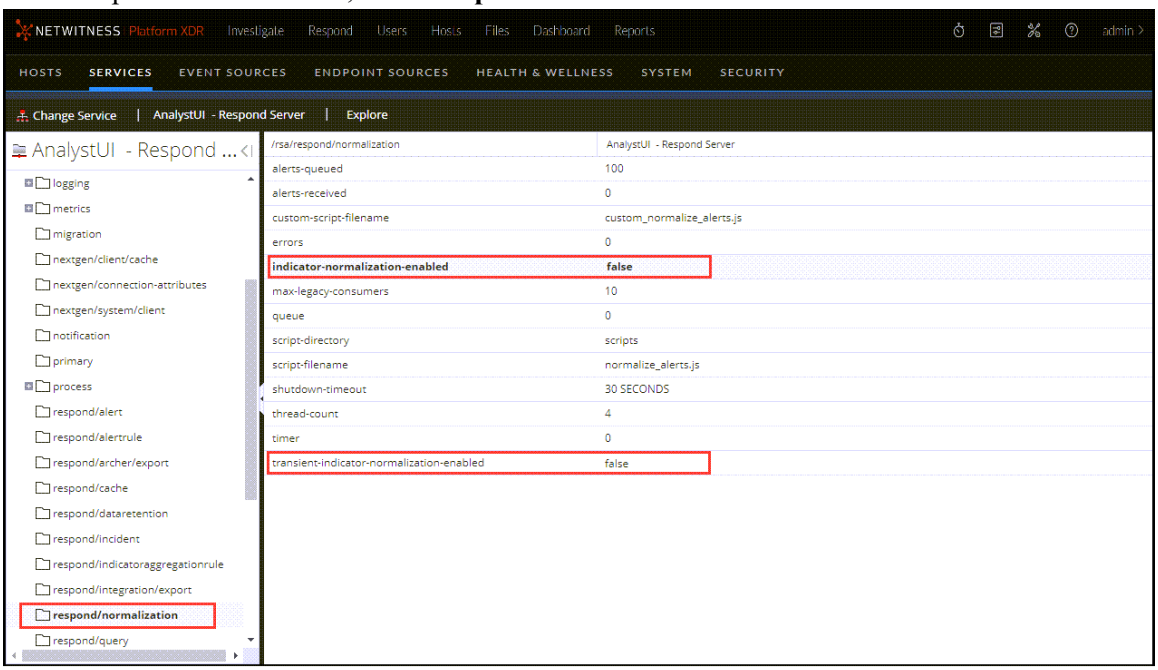
Configure Analyst UI for Respond Server Alert Normalization

This procedure is optional. Administrators can use it to change Respond Server alert normalization on the Analyst UI.

Note: This option is available in NetWitness version 11.4 and later.

The Analyst UI (Analyst User Interface) enhances the performance of investigations for analysts who work in locations geographically separated from the NetWitness Server host. Respond Server alert normalization is disabled by default on the Analyst UI, but with enough bandwidth you can configure the Respond Server on the Analyst UI to normalize alerts for potential performance gains.

Respond Server alert normalization at the Analyst UI should be very carefully considered. If the Analyst UI is deployed in an environment that is geographically separated from the NetWitness Server (NW Server) and ESA services, depending on available bandwidth, normalizing alerts at the Analyst UI can generate large volumes of traffic, potentially impacting other services on the network. Potential gains from normalizing alerts at the Analyst UI can result in a performance decrease on the NW Server and ESA services.



You can configure whether to normalize alerts for any Respond Server (NW Server or Analyst UI) by enabling or disabling alert normalization.

- Normalization is enabled by default for the Respond Server running on the NW Server host.
- Normalization is disabled by default for the Respond Server running on the Analyst UI.

To change the alert normalization settings for the Respond Server running on the Analyst UI:

1. Log in to NetWitness on the NW Server host as administrator.
2. Go to  **(Admin) > Services**, select the Respond Server service running on the Analyst UI, and then select  **> View > Explore**.

3. In the Explore view node list, select **respond/normalization**.

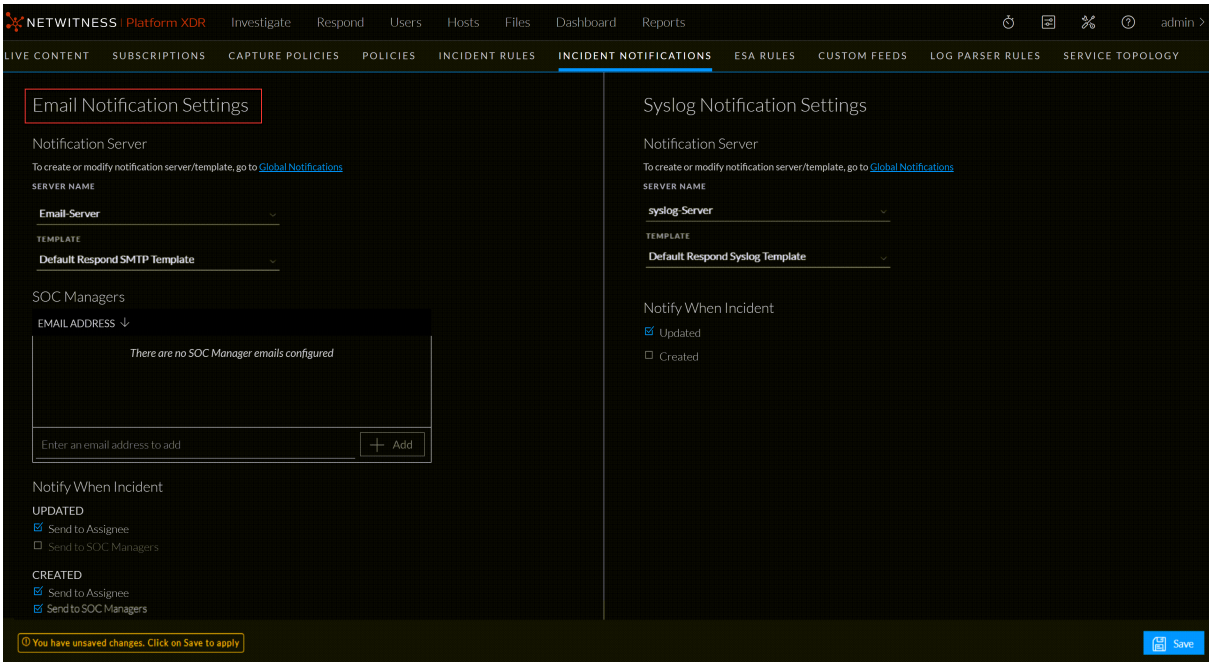
   a. To turn on alert normalization for ESA and other alert generating sources, in the **indicator-normalization-enabled** field, enter **true**. To turn it off, enter **false**.

   b. To turn on alert normalization coming from event correlation for risk scoring alerts, in the **transient-indicator-normalization-enabled** field, enter **true**. To turn it off, enter **false**.

4. Restart the Respond Server service on the Analyst UI for the new settings to take effect. To do this, go to **(Admin) > Services**, select the Respond Server service on the Analyst UI, and then select **> Restart**.

Configure Incident Notification Settings

Incident notification settings enable notifications to be sent to SOC Managers and the Analyst assigned to an incident when an incident is created or updated. You can configure incident notification setting with Email Notification Settings and Syslog Notification Settings.



Email Notification Settings

Administrators can configure email notification settings in the **Configure > INCIDENT NOTIFICATIONS > Email Notification Settings** view to receive email notifications when:

- An incident is updated.
- An incident is created.

To configure email notification settings:

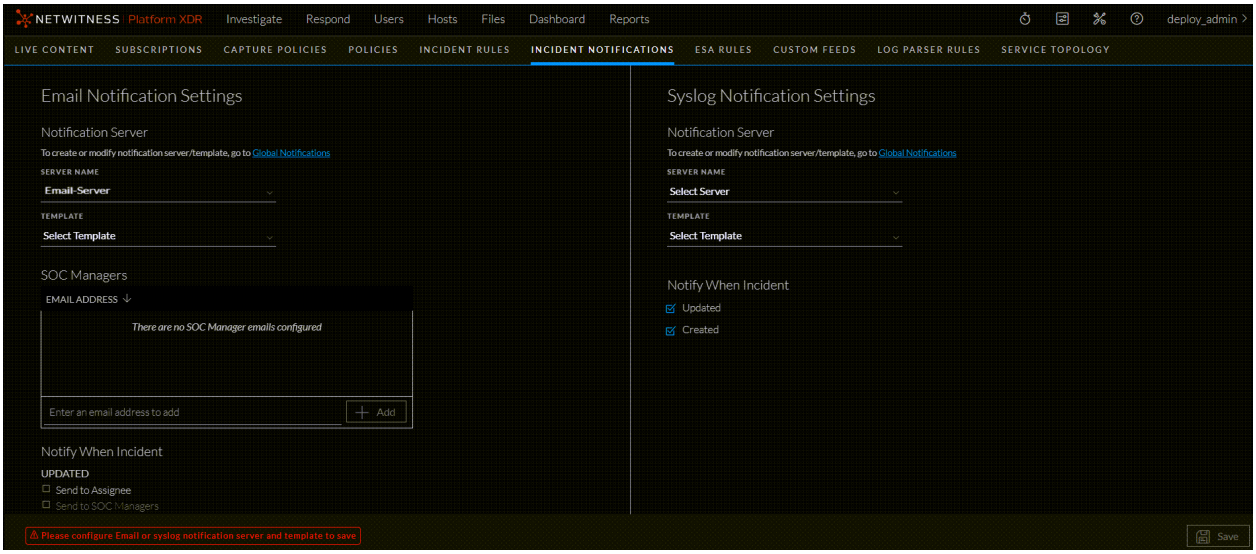
1. Go to  **(Configure) > Incident Notifications**.
   The Email Notification Settings view is displayed.

2. In the **Server Name** section, select the email server from the drop-down list that will send out email notifications when the notification settings are enabled. If there is no email server configured, you do not see an email server listed in the drop-down list. You have to configure an email server before you can continue with this procedure. To configure an email server, click the **Global Notifications** link and go to the **Servers** tab. For more information, see *System Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

3. Select the email template from the **Template** drop-down list.

   Note: NetWitness Platform XDR provides out-of-the-box **Default Respond SMTP Template**.
   - NetWitness Platform XDR provides **Default Respond SMTP Template** out of the box.
   - Click the **Global Notifications** link in the **Email Notification Settings** view (**Configure > Incident Notifications > Email Notification Settings**) to create or modify the email notification template.

4. In the **SOC Manager Email Address** section, add the email addresses of the SOC Managers that you want to receive email notifications. To add an SOC Manager email address to the list, type it in the field that shows **Enter an email address to add** and click **Add**. To remove an SOC Manager email address from the list, click  next to the email address to be removed.



5. Select one of the following options and specify who should receive an email notification when an incident is created and when an incident is updated.

   - **Send to Assignee**: An email is sent to the Analyst assigned to the incident.
   - **Send to SOC Manager**: An email is sent to all of the addresses listed in the **SOC Manager Email Addresses** list.

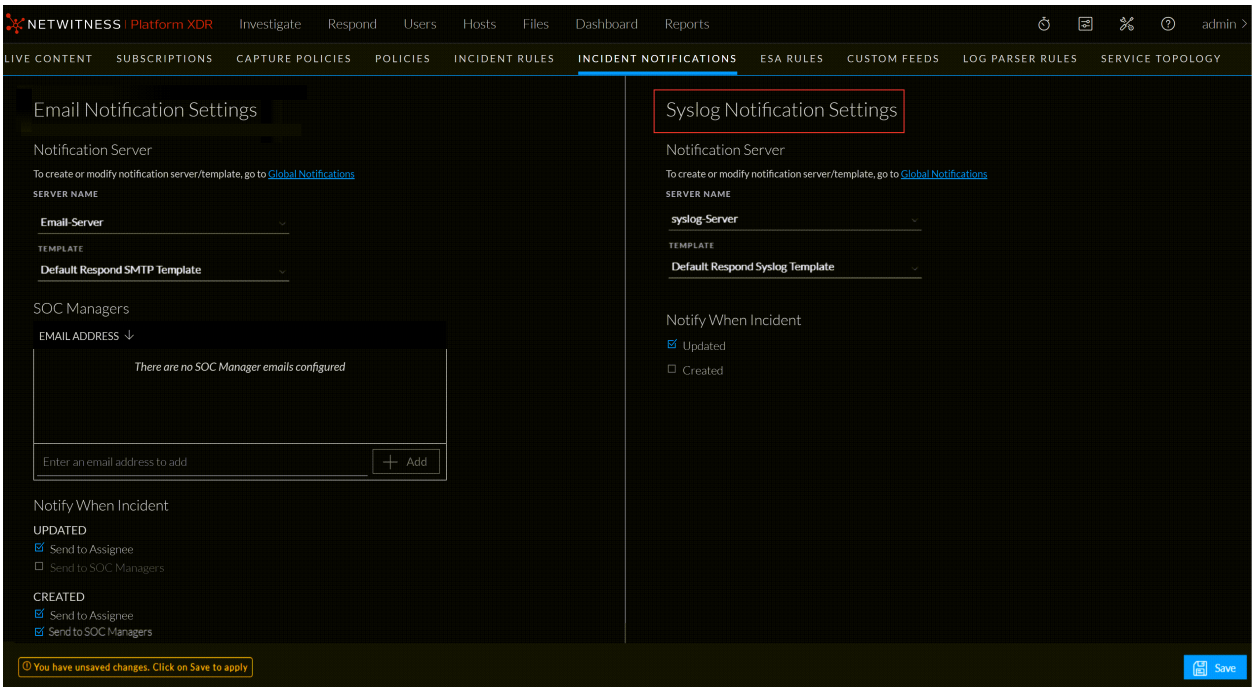
6. Click **Save**. Changes take effect immediately.

Note:
- **Save** button is enabled only when you select both email server and email template. Refer the following figure.

- If user email address information is updated in the  (Admin) > Security > Users tab, it can take up to two minutes for the new email changes to take effect. Any incident creation or incident update email notifications sent during this time go to the old email address.
- If you delete or disable the selected email server or delete the email template, the Email Notification Settings are reset. You must re-configure the email notification server and template.

Upgrade Considerations

In 12.2, the new **Template** field is added in the **Email Notification Settings** view with **Default Respond SMTP Template** as the default template in it. You can select the pre-configured custom email notification template after upgrading to 12.2 from 12.1 or older versions. To modify the email notification template, click the **Global Notifications** link in the **Email Notification Settings** view (**Configure > Incident Notifications > Email Notification Settings**).



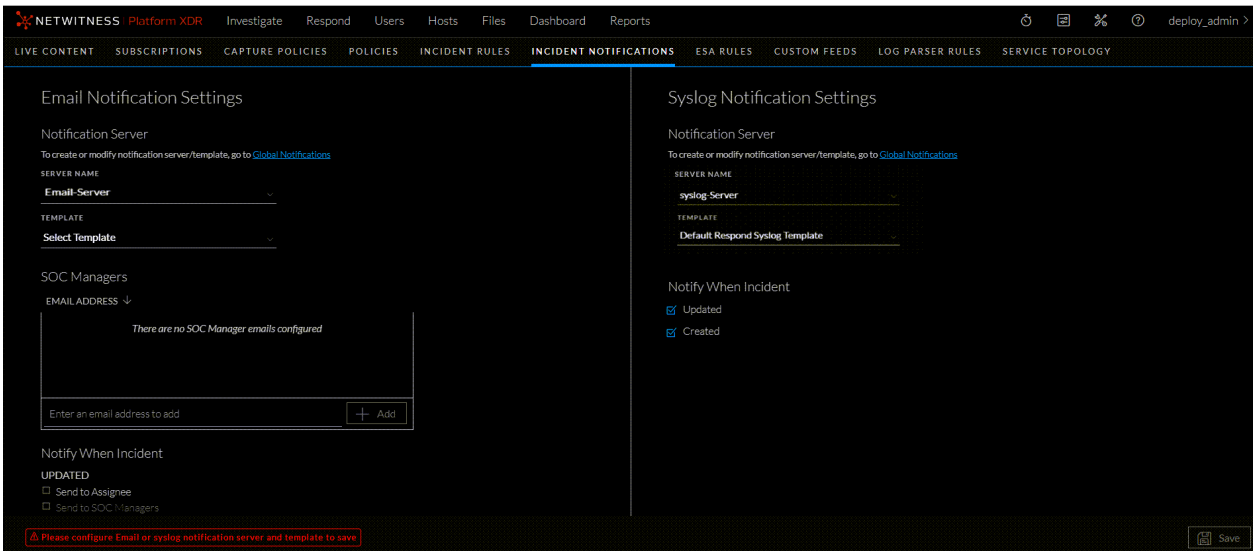
Syslog Notification Settings

Administrators can configure syslog notification settings in the **Configure > INCIDENT NOTIFICATIONS > Syslog Notification Settings** view to receive syslog notifications when:

- An Incident is updated.
- An incident is created.

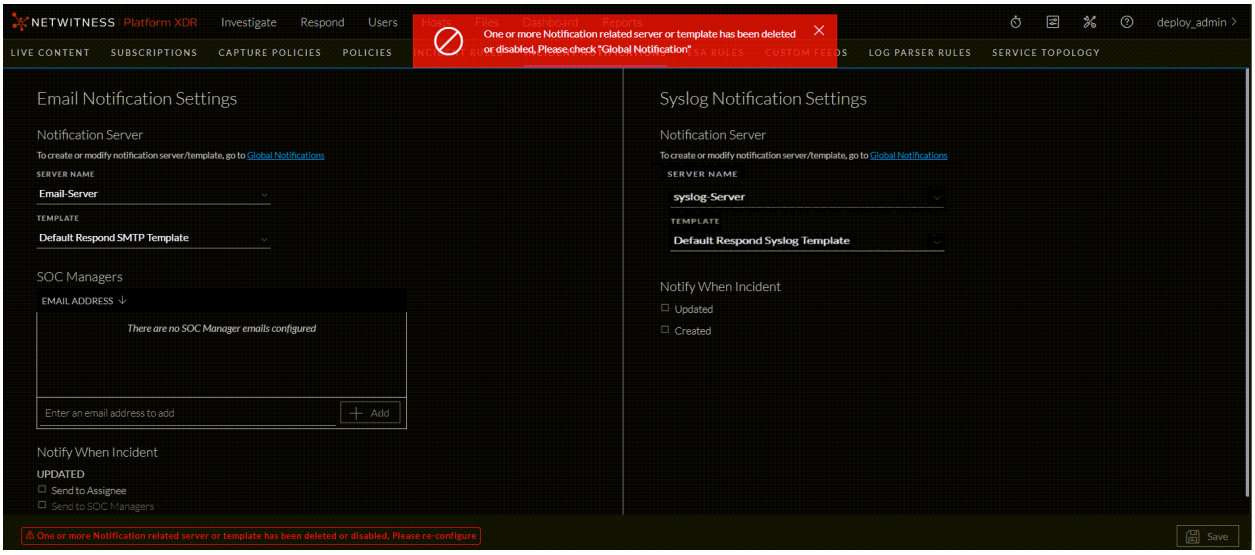
To configure syslog notification settings:

1. Go to **Configure > INCIDENT NOTIFICATIONS > Syslog Notification Settings** view.



2. Select the Syslog Server Name from the **SERVER NAME** drop-down list.
3. Select the Syslog template from the **TEMPLATE** drop-down list.
4. Select one of the following checkboxes:

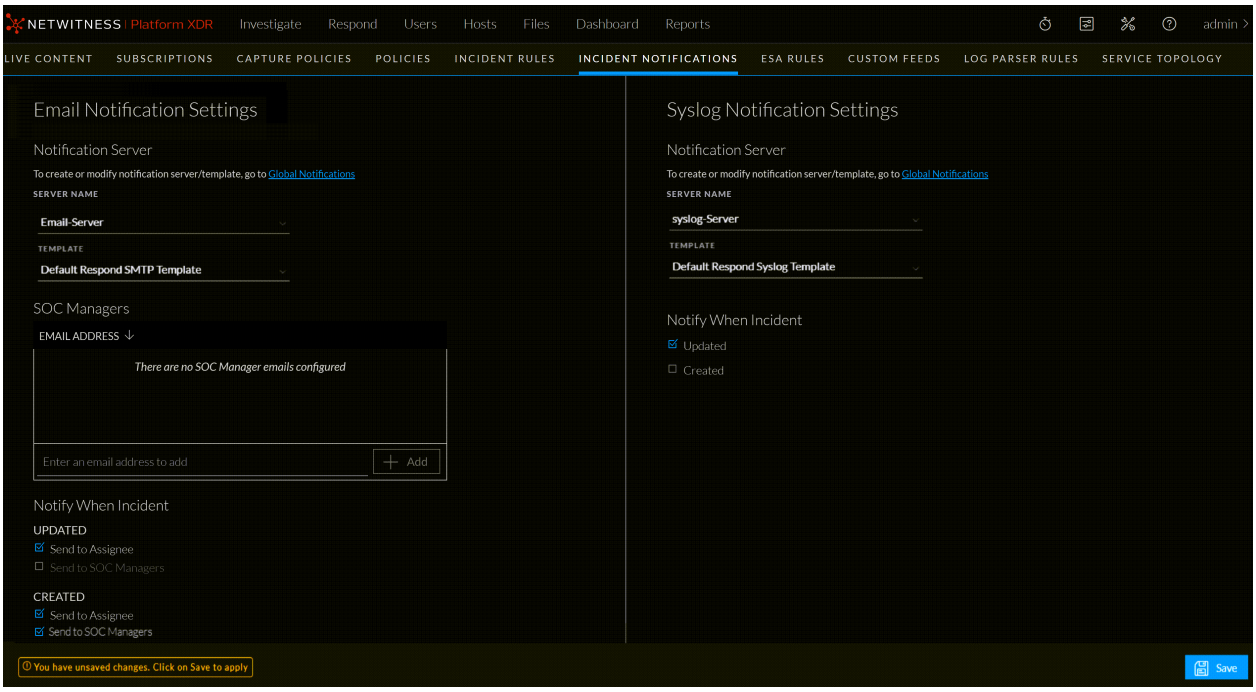
- **Updated:** Select this check box to receive Syslog notifications when an Incident is updated.
- **Created:** Select this check box to receive Syslog notifications when an Incident is created.



You can select both the checkboxes to receive Syslog notifications when an Incident is updated or created.

5. Click **Save**.

Note: Save button is enabled only when you select both Syslog Server and Syslog Template. Refer the following figure.



Note:
- Click the **Global Notifications** link in the **Syslog Notification Settings** view (**Configure > INCIDENT NOTIFICATIONS > Syslog Notification Settings**) to create or modify the Syslog notification server and template.
- For information regarding the Syslog notification server and template configuration in the **Global Notifications** panel, refer **Configure a Syslog Notification Server** and **Configure Templates for Notifications**.
- If you delete or disable the selected Syslog server or delete the Syslog template, the Syslog Notification Settings are reset. You must re-configure the Syslog notification server and template.

Refresh Global Notification Settings

When you click the **Global Notifications** link , the **Refresh** button is displayed in the **Incident Notification Settings** view. Once you click the **Refresh** button, all the incident notification settings are refreshed with the updated information.

Set a Retention Period for Alerts and Incidents

Sometimes data privacy officers want to retain data for a certain period of time and then delete it. A shorter retention period frees up disk space sooner. In some cases, the retention period must be short. For example, laws in Europe state that sensitive data cannot be retained for more than 30 days. After 30 days, the data must be obfuscated or deleted.

Setting a retention period for data is an optional procedure. The time that NetWitness Respond receives alerts and creates an incident determine when retention begins. Retention periods range from 30 to 365 days. If you set a retention period, one day after the period ends data is permanently deleted.

Retention is based on the time that NetWitness Respond receives the alerts and the incident creation time.

Caution: Data deleted after the retention period cannot be recovered.

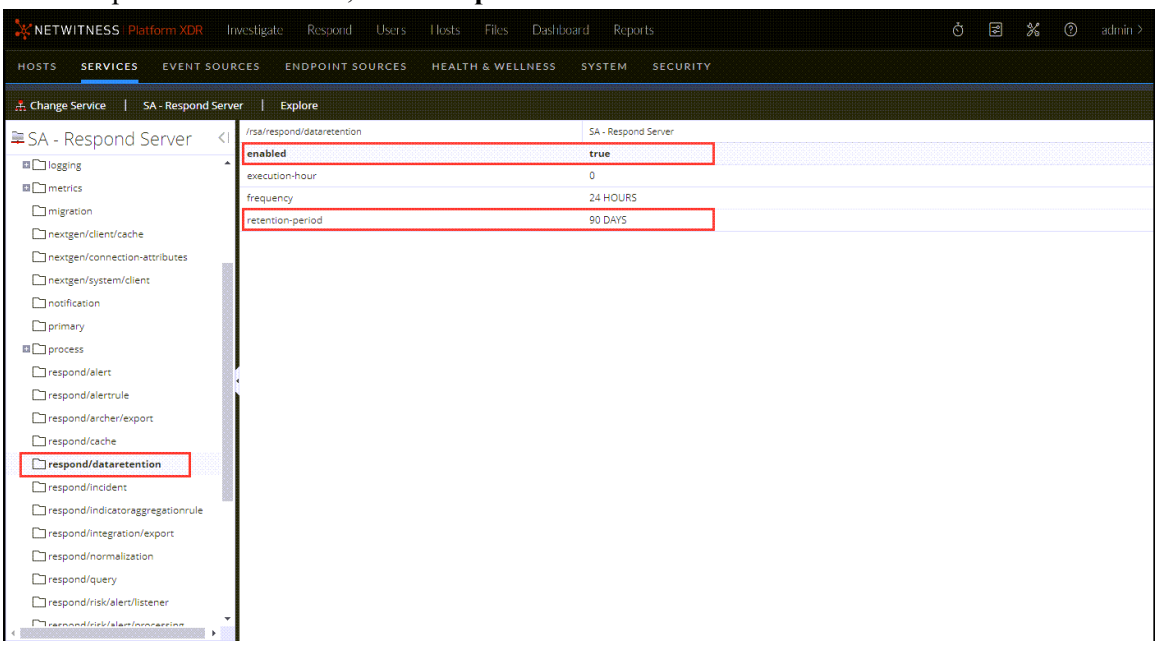
When the retention period expires, the following data is **permanently deleted**:

- Alerts
- Incidents
- Tasks
- Journal entries

Logs track retention and manual deletion so you can see what has been deleted. You can view Respond Server logs in the following locations:

- **Respond Server Service log**: `/var/log/netwitness/respond-server/respond-server.log`
- **Respond Server Audit log**: `/var/log/netwitness/respond-server/respond-server.audit.log`

The data retention period that you set here does not apply to Archer or other third-party SOC tools. Alerts and incidents from other systems must be deleted separately.



Prerequisites

The Administrator role must be assigned to you.

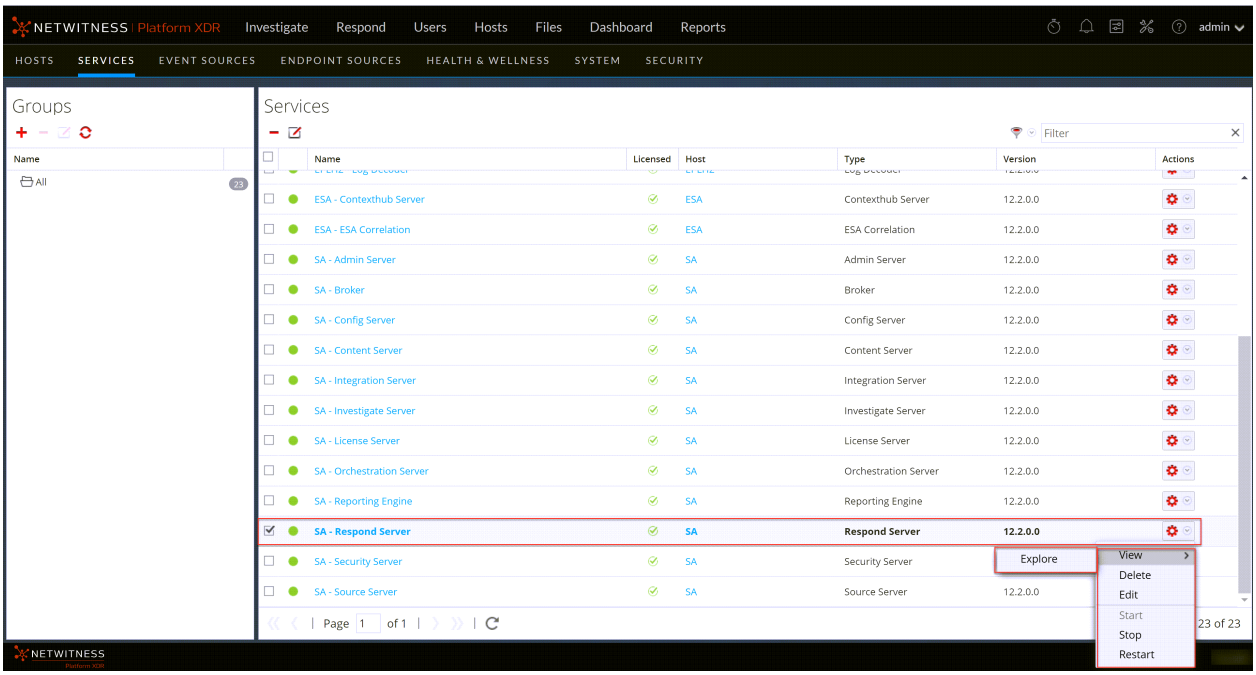
Procedure

1. Go to  **(Admin) > Services**, select the Respond Server service, and then select  **> View > Explore**.

2. In the Explore view node list, select **respond/dataretention**.

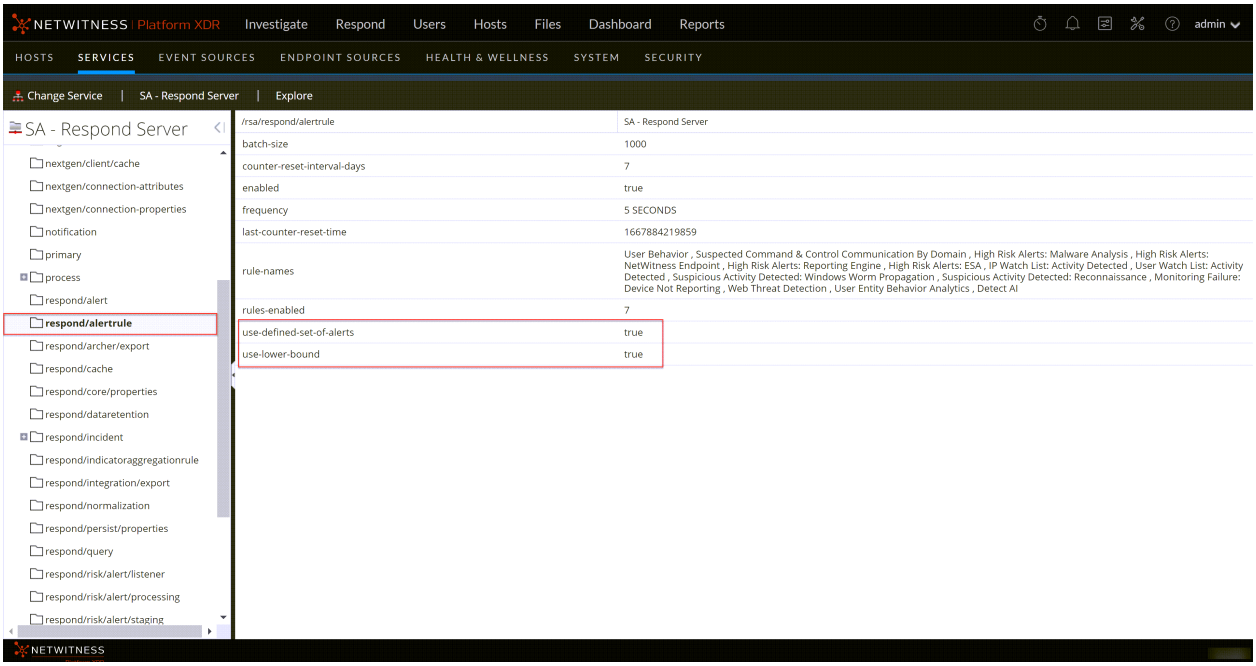
3. In the **enabled** field, select **true** to delete incidents and alerts older than the retention period. The scheduler runs every 24 hours at 23:00.
   You will see a notice that the configuration was successfully updated.
4. In the **retention-period** field, type the number of days to retain incidents and alerts. For example, type 30 DAYS, 60 DAYS, 90 DAYS, 120 DAYS, 365 DAYS, or any number of days.
   A message informs you that the configuration was successfully updated.

Result



Within 24 hours after the retention period ends, the scheduler permanently deletes all alerts and incidents older than the specified period from NetWitness Respond. Journal entries and tasks associated with the deleted incidents are also deleted.

Default Configurations



Respond architecture of incident delay issues changed in 11.7.1 and further versions; this affects the configurations in the UI explore page of the service.

To Configure:

1. Go to  **(Admin) > Services**, select the Respond Server service, and then select  **> View > Explore**.

2. In the Explore view node list, select **respond/alartrule** node.
3. Set **use-define-set-of-alarts** to true.
4. Set **use-lower-bound** to true.

Obfuscate Private Data

The Data Privacy Officer (DPO) role can identify meta keys that contain sensitive data and should display obfuscated data. This topic explains how the administrator maps those meta keys to display a hashed value instead of the actual value.

The following caveats apply to hashed meta values:

- NetWitness supports two storage methods for hashed meta values, HEX (default) and string.
- When a meta key is configured to display a hashed value, all security roles see only the hashed value in the Incidents module.
- You use hashed values the same way you use actual values. For example, when you use a hashed value in rule criteria the results are the same as if you used the actual value.

This topic explains how to obfuscate private data in NetWitness Respond. Refer to the "Data Privacy Management Overview" topic in the *Data Privacy Management Guide* for additional information about data privacy. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

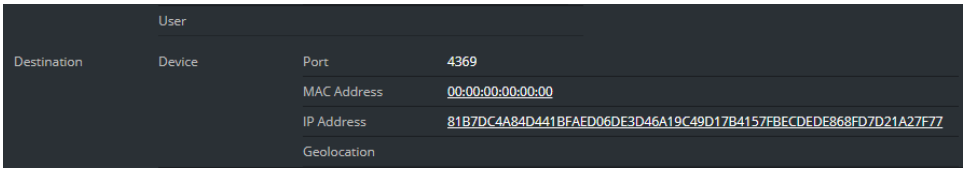
Mapping File to Obfuscate Meta Keys

In NetWitness Respond, the mapping file for data obfuscation is data_privacy_map.js. In it you type an obfuscated meta key name and map it to the actual meta key name.

The following example shows the mappings to obfuscate data for two meta keys, ip.src and user.dst:

```
'ip.src.hash' : 'ip.src',
 'user.dst.hash' : 'user.dst'
```

You determine the naming convention for obfuscated meta key names. For example, ip.src.hash could be ip.src.private or ip.src.bin. You must choose one naming convention and use it consistently on all hosts.



Prerequisites

- DPO role must specify which meta keys require data obfuscation.
- Administrator role must map meta keys for data obfuscation.

Procedure

1. Open the data privacy mapping file:
   /var/lib/netwitness/respond-server/scripts/data_privacy_map.js
2. In the `obfuscated_attribute_map` variable , type the name of a meta key to hold obfuscated data. Then map it to the meta key that does not contain obfuscated data according to this format:
   `'ip.src.hash' : 'ip.src'`
3. Repeat step 2 for every meta key that should display a hashed value.
4. Use the same naming convention as in step 2 and use it consistently on all hosts.

5. Save the file.
   All mapped meta keys will display hashed values instead of actual values.
   In the following figure, a hashed value displays for the destination IP address in the Event Details:

   New alerts will display obfuscated data.

Note: Existing alerts still display sensitive data. This procedure is not retroactive.

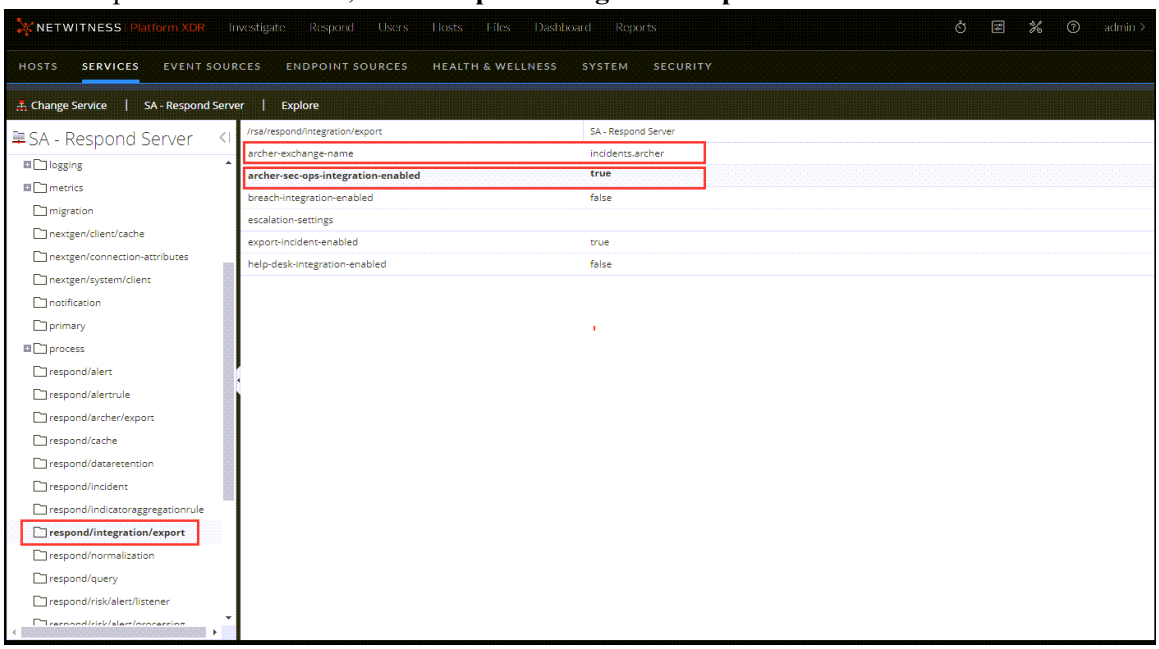
Manage Incidents in Archer Cyber Incident & Breach Response

If you want to manage incidents in Archer Cyber Incident & Breach Response instead of NetWitness Respond, you have to configure system integration settings in the Respond Server service Explore view. After you configure the system integration settings, all incidents are managed in Archer Cyber Incident & Breach Response. Incidents created before the integration will not be managed in Archer Cyber Incident & Breach Response.

Caution: If you are managing incidents in Archer Cyber Incident & Breach Response instead of NetWitness Respond, do not use the following in the Respond view: Incidents List view, Incident Details view, and Tasks List view. Do not create incidents from the Respond Alerts List view or from Investigate. In NetWitness 11.4 and later, you can manually create incidents from Respond and Investigate.

For more detailed integration information, see the *NetWitness Archer Integration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Prerequisites



- Archer Cyber Incident & Breach Response 1.3.1.2 (NetWitness 11.0 works only with Archer Cyber Incident & Breach Response 1.3.1.2.)

Procedure

Follow this procedure to configure Respond Server service settings to manage incidents in Archer Cyber Incident & Breach Response.

1. Go to  **(Admin) > Services**, select the Respond Server service, and then select  **> Config > Explore**.

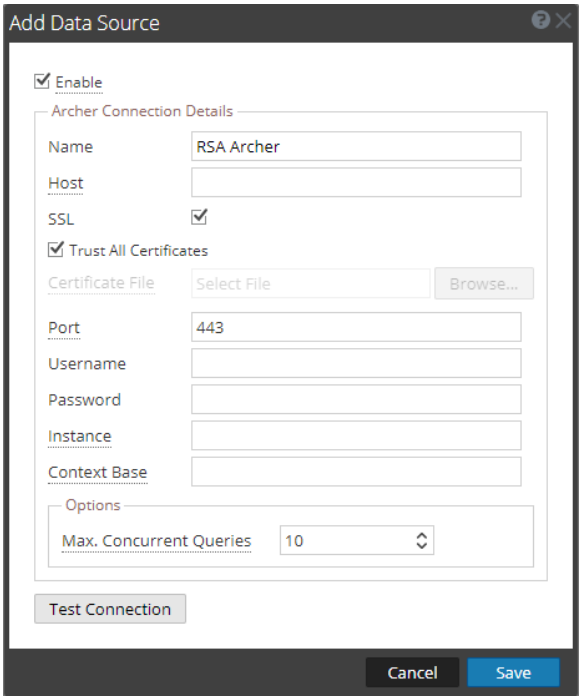
2. In the Explore view node list, select **respond/integration/export**.

3. In the **archer-exchange-name** field, type `incidents.archer`.
   You will see a notice that the configuration was successfully updated.
4. In the **archer-sec-ops-integration-enabled** field, select **true**.
   A message informs you that the configuration was successfully updated.
   Incidents will be managed exclusively in Archer Cyber Incident & Breach Response.

Configure the Option to Send Incidents to Archer

Note: The information in this topic applies to NetWitness Version 11.2 and later.

If you want to manage incidents in NetWitness Respond, you have the option to configure the NetWitness so that you can send incidents to Archer Cyber Incident & Breach Response. If Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and you will be able to see a Send to Archer option and a Sent to Archer status in NetWitness Respond. For information on how to use the Send to Archer option and Sent to Archer status, see the *NetWitness Respond User Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.



Prerequisites

- Archer release 6.6 P4, 6.6 P5, or 6.7 P2 only is required for NetWitness 11.4 and 11.5.
- Archer release 6.4 or later is required for NetWitness 11.2 and 11.3.

Add Archer as a Data Source for Context Hub

To configure sending incidents to Archer Cyber Incident & Breach Response from NetWitness Respond, Archer must be configured as a data source for Context Hub. For more detailed instructions for configuring the Archer data source, see the "Configure Archer as Data Source" topic in the *Context Hub Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

1. Go to  **(Admin) > Services**.
   The Services view is displayed.
2. Select the Context Hub service, and then select  **> View > Config**.
   The Services Config view is displayed.
3. On the **Data Sources** tab, click  **> RSA Archer**.
   The **Add Data Source** dialog is displayed.

4. Provide the following information:

- By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
- Enter the following fields:
  - **Name**: Enter a name for Archer data source.
  - **Host**: Enter the hostname or IP address where Archer server is installed.
  - **SSL**: By default this option is selected and enables SSL communication to Archer .
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid Endpoint server certificate for the connection to be successful.
  - **Port**: The default port is 443.
  - **Username**: Enter the Archer Server username.
  - **Password**: Enter the Archer Server password.
  - **Instance**: Enter the Instance name from which you want to extract data. An Archer instance is a single setup that includes unique content in a database, the connection to the database, the interface, and login. You might have individual instances for each office location or region or for development, test, and production environments. The Instance Database stores the Archer content for a specific instance.
  - **Context Base**: Enter the virtual directory name where the files are stored. For example, rsaarcher located at the Archer web address https://archer.company.com/**rsaarche**r/default.aspx. If the files are stored in the IIS default web address https://archer.company.com/default.aspx, then this field must be empty.
  - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the Archer data source.
6. Click **Save**.
   Archer is added as a data source for Context Hub and is displayed in the **Data Sources** tab. A Send to Archer button and Sent to Archer status is visible in NetWitness Respond.

Configure Threat Aware Authentication

Note: The information in this topic applies to NetWitness Version 11.3 and later.

NetWitness Platform creates a list of suspicious users that have an incident created against them and sends it to RSA SecurID Access. The list contains the email IDs of the corresponding suspicious users associated with the incident. RSA SecurID Access maintains this high-risk users list and reduces the access levels or blocks such users using defined policies. When an incident is closed in NetWitness Platform, the associated email IDs are automatically removed from the RSA SecurID high-risk user list.

By default this configuration is disabled in the NetWitness Server. You can enable this feature by editing the yml file located at `/etc/netwitness/respond-server/respond-server.yml`.

Enable Threat Aware Authentication

To enable this configuration:

1. Create a yml file at `/etc/netwitness/respond-server/respond-server.yml`
2. Edit and enter `rsa.respond.securid-integration.enabled: true`

```
[root@adminserver ~]# vi /etc/netwitness/respond-server/respond-server.yml
[root@adminserver ~]# cat /etc/netwitness/respond-server/respond-server.yml
rsa.respond.securid-integration.enabled: true
rsa.security.pki.use-jvm-trust: true
[root@adminserver ~]# service rsa-nw-respond-server restart
Redirecting to /bin/systemctl restart rsa-nw-respond-server.service
[root@adminserver ~]#
```

3. Enter `rsa.security.pki.use-jvm-trust: true` to enable the configuration.
4. Save the yml file and restart the Respond Server service.

Note: Make sure you perform the above configuration if you have enabled a stand-by NW server. In case the primary NW server fails and goes offline, this configuration will allow the standby NW server to connect to RSA SecurID.

Obtain SecurID API Key

A super administrator must generate and download a SecurID API key, and connect to RSA SecurID Access.

To obtain the API key from RSA SecurID Access:

1. Log in to the **RSA SecurID Access Cloud Administration** Console.
2. Click **Platform** > **API Key Management**.
3. Click **ADD**.
   The new key is displayed.

4. Change the **Administrator** role to **Super Administrator**.
5. Click **Save** and **Download** to download and save the API key file.

For more information about generating the API Keys and other related details, see "Manage the Cloud Administration API Keys" at https://community.securid.com/t5/securid-cloud-authentication/manage-the-cloud-administration-api-keys/ta-p/623066 and "Determining Access Requirements for High-Risk Users in the Cloud Authentication Service" topic at https://community.securid.com/t5/securid-cloud-authentication/determining-access-requirements-for-high-risk-users-in-the-cloud/ta-p/623067.

Configure RSA SecurID Access API Key

To configure RSA SecurID Access API key using NetWitness Shell:

1. SSH to the NetWitness Server.
2. Type the command `nw-shell`.
   A console window is displayed.

3. Type `connect --service respond-server.<service-id>` to connect to the Respond Server.
   For example: `connect --service respond-server.36334277-9f93-4402-9523-ed15ad543bfa`.
   You can obtain the `<service_id>` from `cat /etc/netwitness/respond-server/service-id`.
4. Type `login` and enter admin username and password.
5. To set the API key:
   a. Navigate to set-api-key node: `cd /rsa/respond/securid/set-api-key`
   b. type: `invoke --file <path to api key>`

   Note: The path to the API key is the location on the NetWitness Server.

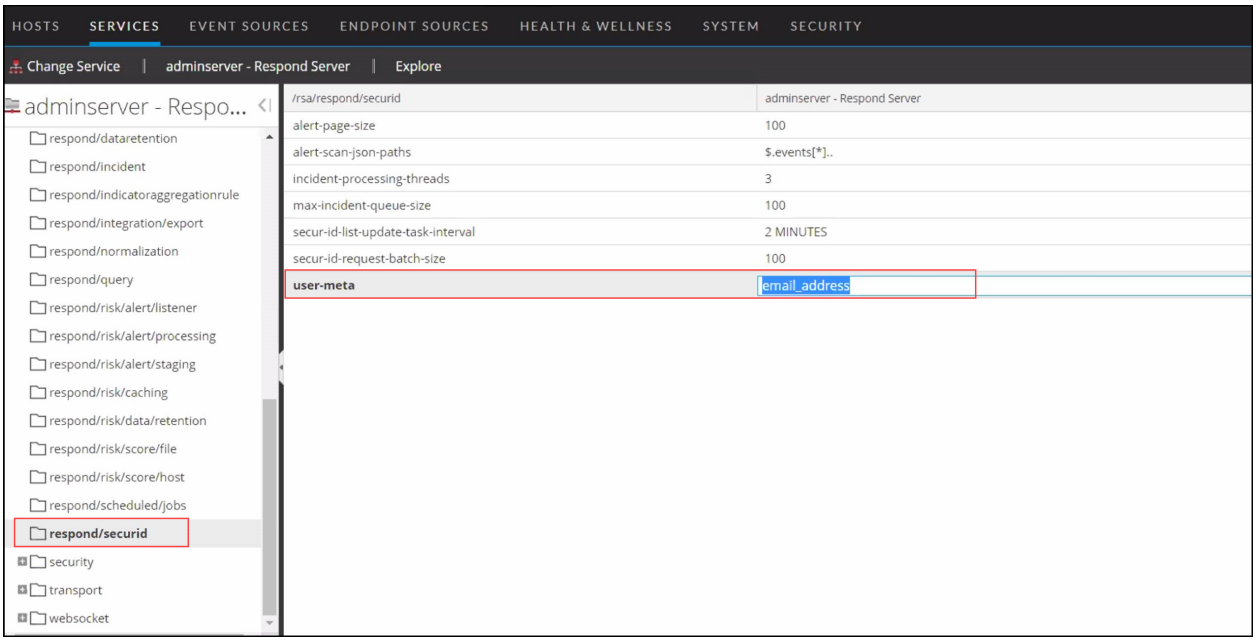
6. Test the connection using the command:
   a. `cd /rsa/respond/securid/test-secur-id-connection`
   b. Type `invoke`.
      A "Connection OK" message is displayed if test connection is successful.
7. To start the process use the command:
   a. `cd /rsa/respond/securid/process-incidents`
   b. `invoke`.

   For more information on how to define policies, see the *RSA SecurID Access Guide* on NetWitness Community.

Configure Sync Frequency

By default, the sync frequency is set to 15 minutes.

To edit the frequency:

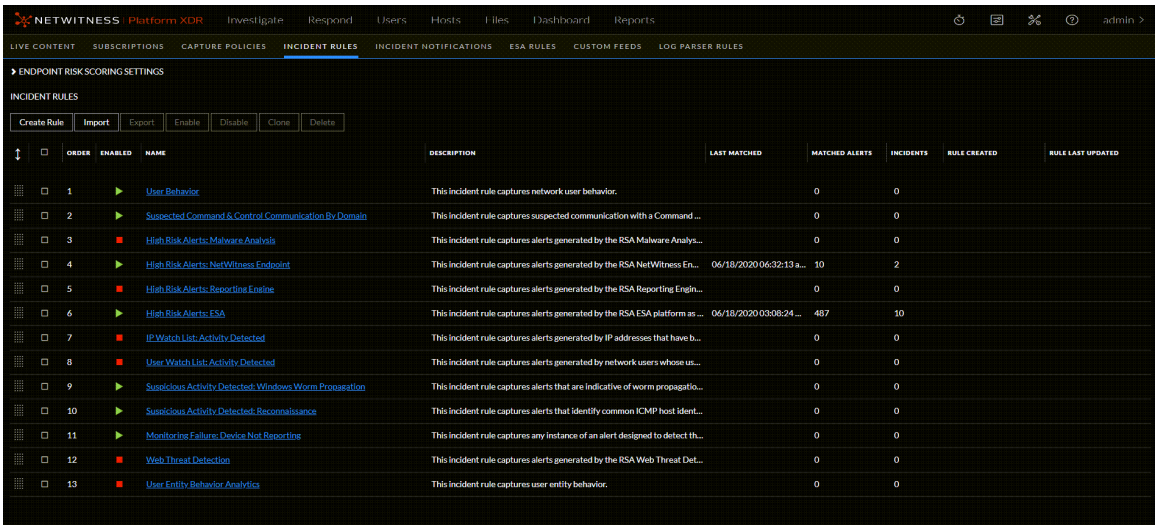


1. Log in to NetWitness.
2. Go to (Admin) **> Services**, select the Respond Server service, and then select > **> View > Explore**.
3. Edit the duration at **rsa/respond/securid**.

Configure Meta

You can configure a respond specific meta in an alert to identify a user to be added to SecurID high-risk user's list. By default, the meta is set to `email_address`. Currently, the Respond Server supports metas such as ad_username, and email_address.

To add a Respond Server supported meta:



1. Log in to NetWitness Platform.
2. Go to **(Admin) > Services**, select the Respond Server service, and then select > **> View > Explore**.
3. In the Explore view node list, select **respond/securid**.
4. Edit and enter a meta in the **user-meta** field.

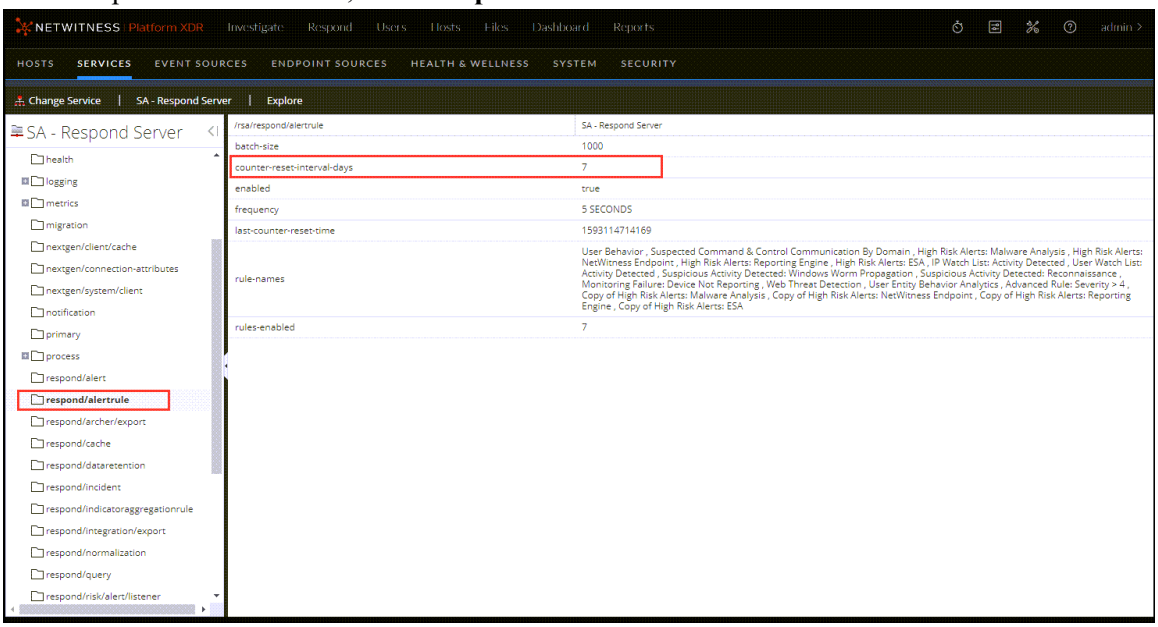
Note: If at any time you change the meta configuration from email address to ad_username, make sure to run Step 7 from Configure RSA SecurID Access API Key to process the older incidents. In case of a multi-analyst deployment, make sure you configure the same meta on all Respond servers. For example, if you update the meta to ad_username, then the same must be updated on all Respond servers.

Set a Counter for Matched Alerts and Incidents

This procedure is optional. Administrators can use it to change when the count for matched alerts is reset to 0. The Incident Rules view displays these counts in columns on the right.

The following columns provide matched alert information for a rule:

- **Last Matched** column shows the time when the rule last matched alerts.
- **Matched Alerts** column displays the number of matched alerts for the rule.
- **Incidents** column displays the number of incidents created by the rule.



By default, these values reset to zero every 7 days. Depending on how long you want the counts to continue, you can change the default number of days.

Note: When the counter resets to zero, only the numbers in the three columns change to zero. No alerts or incidents are deleted.

To set a counter for matched alerts and incidents:

1. Go to  **(Admin) > Services**, select the Respond Server service, and then select  **> View > Explore**.

2. In the Explore view node list, select **respond/alertrule**.

3. In the right panel, type the number of days in the **counter-reset-interval-days** field.

4. Restart the Respond Server service for the new setting to take effect. To do this, go to  **(Admin) > Services**, select the Respond Server service, and then select  **> Restart**.

Edit the Incident Rules Export ZIP File

This procedure is optional and is for advanced users. When exporting incident rules from the Respond Incident Rules view, the exported incident rules file is a ZIP file in the format `<random ID>-incident_rules_export.json.zip`, which contains mandatory JSON files:

- `aggregation_rule_schema.json` contains the default incident rule schema.
- `custom_aggregation_rule_schema.json` contains the custom incident rule schema.
- `<random ID>-incident_rules_export.json` contains the incident rules.

You can import this ZIP file on another NetWitness Server on the same release version.

There may be situations when you need to edit the these files before you import them to another NetWitness Server.

To edit the incident rules export files:

1. Follow the Incident Rule Export Files Editing Guidelines below to edit the export files.
2. Before importing, verify that the ZIP file does not contain additional files or folders. The ZIP file should contain only the mandatory `aggregation_rule_schema.json, custom_aggregation_rule_schema.json` and `<random ID>-incident_rules_export.json` files to go through the import. Any files other than these two cause the import to fail.
   For example, when compressing files on a Mac, it adds a temp folder `__MACOSX` that needs to be excluded while zipping the file.

Note: You cannot export Advanced rules.

Incident Rule Export Files Editing Guidelines

Ensure that the following fields have at least one value. Removing a value or having an empty value for the following fields results in abnormal behavior.

Field	Possible Values
name	`A-Z a-z 0-9 " !"#$%&'()*+,-./:;<=>?@[\]^_`{|}~"`
groupByFields	A Minimum of 1 or a Maximum of 2 group_by keys should be present in `aggregation_rule_schema.json`. **Note:** If there are no custom field, you can remove the `custom_aggregation_rule_schema.json`. If you have custom field, then you can add the custom fields to `custom_aggregation_rule_schema.json`.

Field	Possible Values
timeWindow	A String value in the following accepted formats: Days – Min:`1d` Max: `24d` Hours – Min: `1h` Max: `100h` Minutes – Min: `1m` Max :`100m`

action	Should be one of following values:
	`GROUP_INTO_INCIDENT`
	`SUPPRESS_ALERT`

incidentScoringOptions	Should be one of the following string values: `average`: Average of Risk Score across all of the Alerts `high`: Highest Risk Score available across all of the Alerts `count`: Number of Alerts in the time window
priorityScale	Condition: LOW < MEDIUM < HIGH < CRITICAL

	Sub Fields — **Possible Values**
	`MEDIUM` — `1-100`
	`CRITICAL` — `1-100`
	`HIGH` — `1-100`
	`LOW` — `1-100`

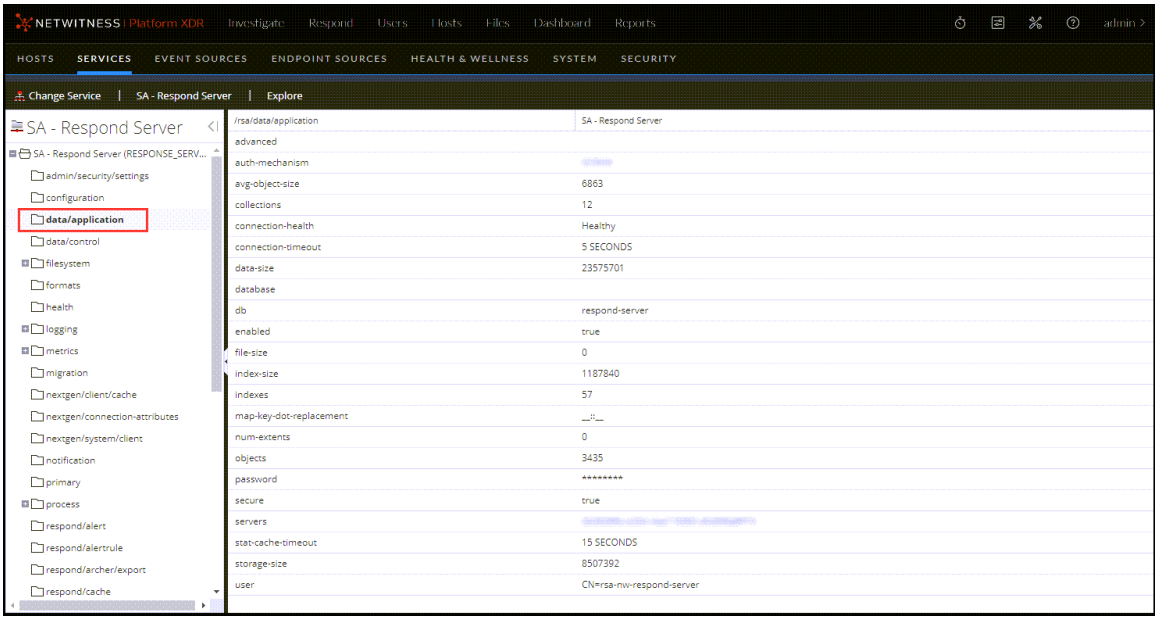
uiFilterConditions	Sample UI Conditions Filter Structure

	Sub Fields — **Possible Values**
	`filterType` — `FILTER`
	`FILTER_GROUP`
	Possible values for `FILTER` are listed below.
	`property` — `value`: fetched from `custom_aggregation_rule_schem.json` and `aggregation_rule_schem.json`
	`operator` — `operators`
	`value` — `type`: dictates the data type.
	Available options:
	`textfield`: String
	`combobox` : from a list of options available in the json
	`datefield`: unix time stamp, for example: 2019-06-12T12:00:00Z
	`numberfield`: Integer

incidentCreationOptions	`ruleSummary`: String `categories`: JSON `array assignee`: JSON

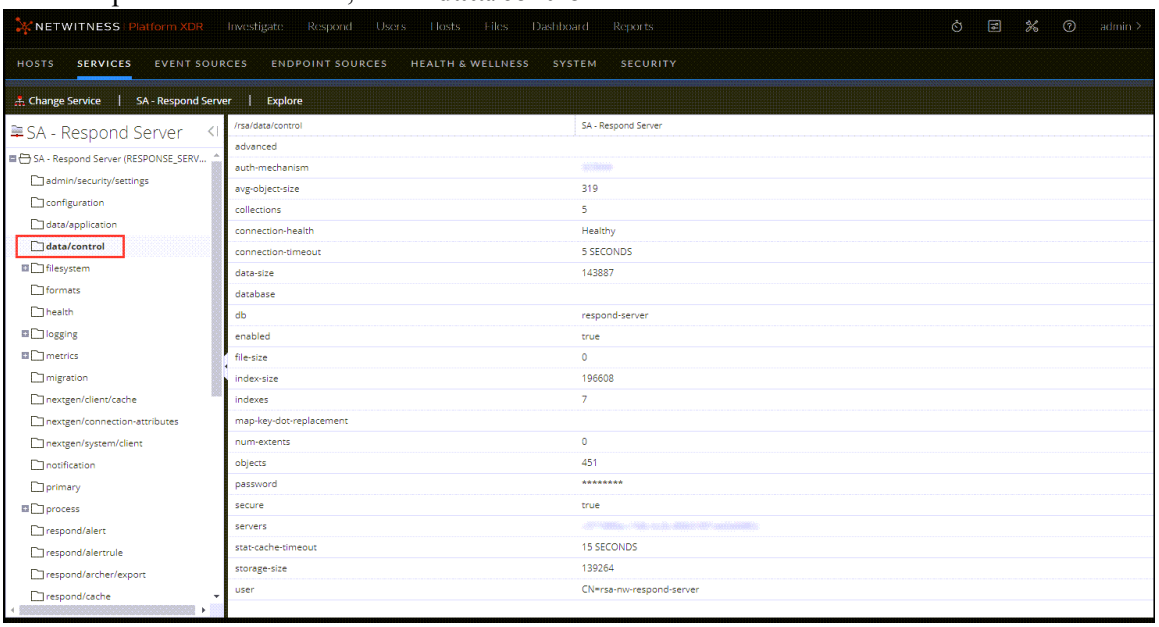
Configure a Database for the Respond Server Service

This procedure is required only if you need to change the database configuration for Respond Server after the deployment of the NetWitness or ESA Primary hosts and their corresponding services. You have to select the ESA Primary server to act as the database host for NetWitness Respond application data, such as alerts, incidents, and tasks. You also have to select the NetWitness Server to act as the database host for NetWitness Respond control data, such as incident rules and categories.



Prerequisites

Ensure that:



- The Respond Server service is installed and running on NetWitness.
- An ESA host is installed and configured.

Procedure

1. Go to  **(Admin) > Services**.
   The Services view is displayed.
2. In the Services panel, select the Respond Server service and then select  **> View > Explore**.
3. In the Explore view node list, select **data/application**.

4. Provide the following information:
   - **db**: The database name. The default value is respond-server.
   - **password**: The password used for the deployment of the ESA primary server (password for deploy_admin user).
   - **servers**: The hostname or IP address of the **ESA primary server** to act as the database host for NetWitness Respond application data, such as alerts, incidents, and tasks.
   - **user**: Enter **deploy_admin**.
5. In the Explore view node list, select **data/control**.

6. Provide the following information:
   - **db**: The database name. The default value is respond-server.
   - **password**: The password used for the deployment of the NetWitness Server (password for deploy_admin user).
   - **servers**: The hostname or IP address of the **NetWitness Server** to act as the database host for NetWitness Respond control data, such as incident rules and categories.
   - **user**: Enter **deploy_admin**.
7. Restart the Respond Server service. To do this, go to **(Admin) > Services**, select the Respond Server service, and then select **> Restart**.

Note: Restarting the Respond Server service is required for the database configuration to be complete.

NetWitness Respond Configuration Reference

This section contains reference information for configuring NetWitness Respond.

Configure View

The Configure view enables you to configure NetWitness Respond functionality.

You can configure incident rules to automate the Respond workflow for automatically creating incidents. You can also configure notification settings to send emails when incidents are created or updated.

Topics

- Incident Rules View
- Incident Rule Details View
- Incident Email Notification Settings View
- Aggregation Rules Tab (11.0 and earlier)
- New Rule Tab (11.0 and earlier)

Incident Rules View

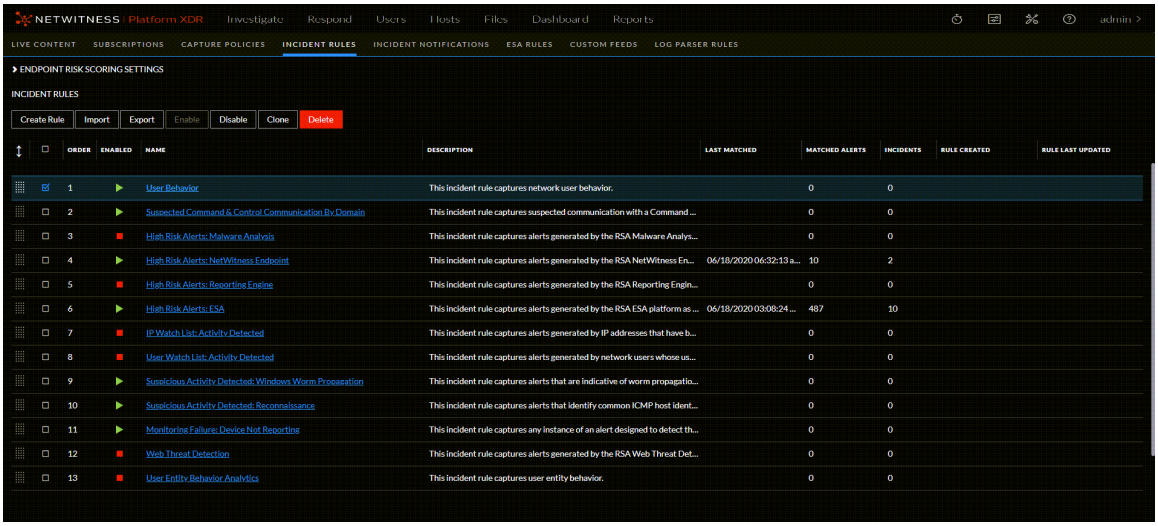
The Incident Rules view enables you to manage the automated incident creation process. NetWitness Respond creates incidents in two ways:

- **Incident Rules**: NetWitness provides preconfigured rules that you can adjust for your environment. You can also create your own rules.
- **Risk Scoring**: (Endpoint Risk Scoring Settings are available in NetWitness version 11.3 and later and only apply to NetWitness Endpoint.) NetWitness Respond uses these settings to automatically create risk scoring incidents for suspicious files and hosts that cross the defined risk score thresholds. If you get too many or too few risk scoring incidents, you can adjust these thresholds.

Note: The information in this topic applies to NetWitness 11.1 and later.

What do you want to do?

Role	I want to ...	Show me how
Analyst, Content Expert, SOC Manager	Create, edit, enable, export, or import an incident rule.	Step 3. Enable and Create Incident Rules for Alerts
Analyst, Content Expert, SOC Manager	Configure the threshold that creates risk scoring alerts and incidents to adjust the amount of alerts and incidents created. Turn off the creation of risk scoring alerts and incidents. Endpoint Risk Scoring Settings only apply to NetWitness Endpoint.	Configure Risk Scoring Settings for Automated Incident Creation
Incident Responders, Analysts, Content Experts, SOC Manager	View the results of my incident rule (View Detected Threats).	See "Responding to Incidents" in the *NetWitness Respond User Guide*.

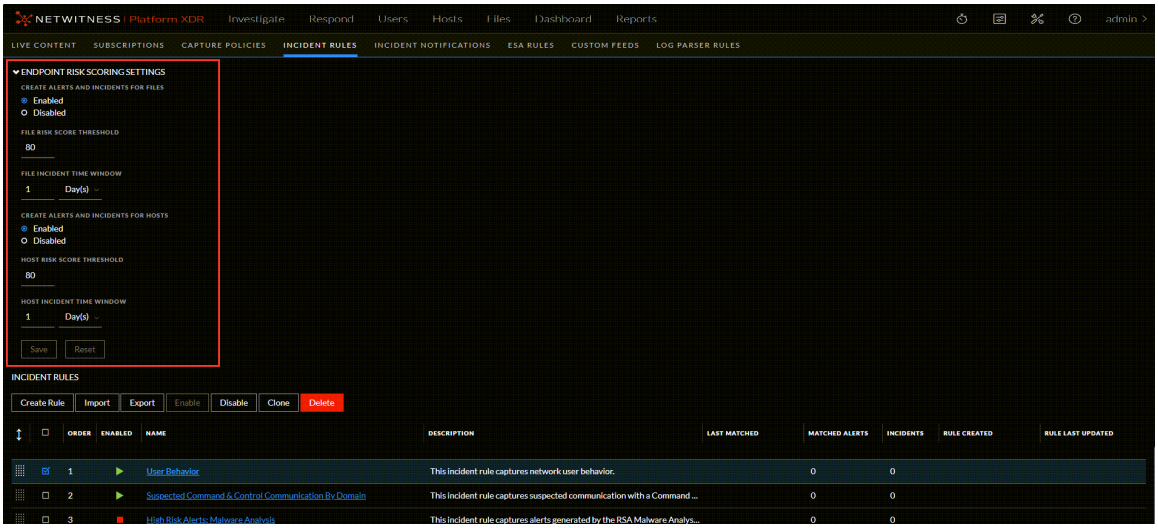


Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Related Topics

- Incident Rule Details View

Quick Look

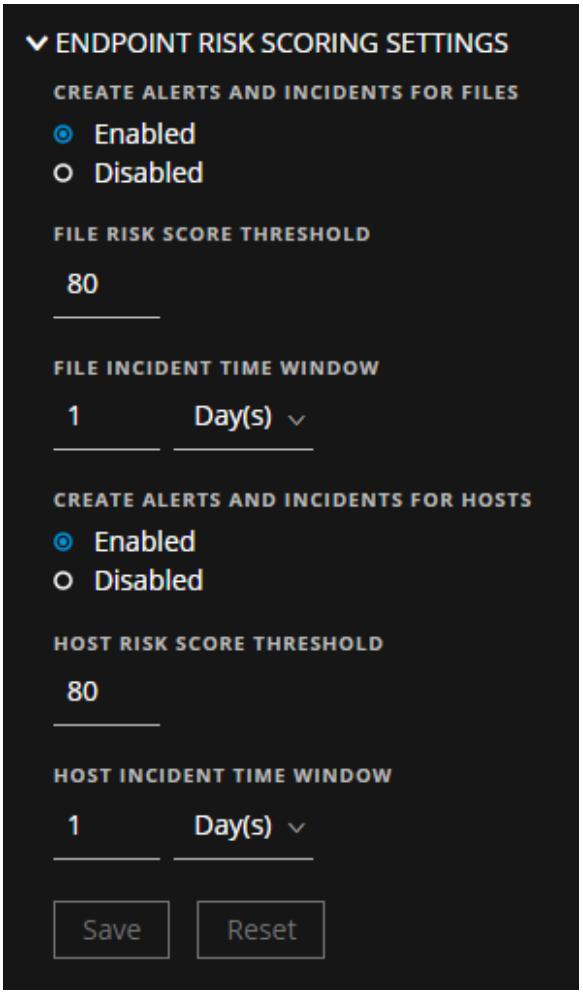


1. To access the Incident Rules view, go to  **(Configure) > Incident Rules**.

The Incident Rules view has two sections, one for each type of automated incident creation:

- Endpoint Risk Scoring Settings
- Incident Rules

2. To view the Endpoint Risk Scoring Settings section, click the arrow in front of **Endpoint Risk Scoring Settings**.



Endpoint Risk Scoring Settings

Note: Endpoint Risk Scoring Settings are available in NetWitness version 11.3 and later and only apply to NetWitness Endpoint. NetWitness Respond uses these settings to automatically create risk scoring incidents for suspicious files and hosts that cross the defined risk score thresholds.

The Endpoint Risk Scoring Settings enable you to configure the thresholds used to automatically create risk scoring alerts and incidents. When calculated risk scores for suspicious files and hosts exceed the specified thresholds, it triggers the creation of risk scoring alerts and incidents. NetWitness recommends that you keep the thresholds at the default values, but you may need to adjust these settings if you get too many or too few alerts and incidents.

For more information on configuring NetWitness Endpoint, see the *NetWitnesss Endpoint Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

The following table describes the fields in the Endpoint Risk Scoring Settings.

Field / Button	Description
Create Alerts and Incidents for Files	Select **Enabled** to automatically create risk scoring alerts and incidents for suspicious files. When calculated file risk scores go above the file risk score threshold, it triggers the creation of risk scoring alerts and incidents. Select **Disabled** to stop automatically creating risk scoring alerts and incidents. This option is enabled by default.

Field / Button	Description
File Risk Score Threshold	The File Risk Score Threshold is the risk score level used to trigger alert and incident creation. The file risk score threshold range is from 0-100. NetWitness Respond calculates risk score using a combination of the number of distinct alerts and the severity of alerts associated with the file or host. A higher risk score indicates more of these types of alerts. For example, if the file risk score threshold is 80, any calculated file risk score over 80 creates a risk scoring alert and incident or adds a risk scoring alert to an existing incident depending on the file incident time window.
File Incident Time Window	The File Incident Time Window is the period of time to wait before creating another incident. The file incident time window range is from 1-24 (hours or days). For example, an openme.rar file containing suspicious code with enough associated endpoint alerts to get a risk score of 81, which is over the file risk score threshold of 80, automatically creates a risk scoring alert and incident or adds a related risk scoring alert to the same incident within a 1 day time window.
Create Alerts and Incidents for Hosts	Select **Enabled** to automatically create risk scoring alerts and incidents for suspicious hosts. When calculated host risk scores go above the host risk score threshold, it triggers the creation of risk scoring alerts and incidents. Select **Disabled** to stop automatically creating risk scoring alerts and incidents. This option is enabled by default.
Host Risk Score Threshold	The Host Risk Score Threshold is the risk score level used to trigger alert and incident creation. The host risk score threshold range is from 0-100. NetWitness Respond calculates risk score using a combination of the number of distinct alerts and the severity of alerts associated with the file or host. A higher risk score indicates more of these types of alerts. For example, if the host risk score threshold is 80, any calculated host risk score over 80 creates a risk scoring alert and incident or adds a risk scoring alert to an existing incident depending on the host incident time window.
Host Incident Time Window	The Host Incident Time Window is the period of time to wait before creating another incident. The host incident time window range is from 1-24 (hours or days). For example, a suspicious host with enough associated endpoint alerts to get a risk score of 81, which is over the host risk score threshold of 80, automatically creates a risk scoring alert and incident or adds a related risk scoring alert to the same incident within a 1 day time window.

Incident Rules

The Incident Rules section enables you to create and manage incident rules for automating the incident creation process. NetWitness provides preconfigured rules. You can add to and adjust these rules for your own environment.

The Incident Rules section consists of a list and series of buttons. The following table describes the columns in the Incident Rules list.

Column	Description
	Enables you to change the priority order of the rules. Use the drag pad () in front of a rule to move it up and down in the list.
 (Select)	Enables you to select one or more rules in order to take an action, such as Enable or Export. You can select all rules by selecting the checkbox in the column header. You can only select one rule for the Clone or Delete actions.
Order	Shows the order in which the rule is placed. The rule order determines which rule takes effect if the criteria for multiple rules match the same alert. If multiple rules match an alert, only the rule with the highest priority creates an incident. NetWitness Respond evaluates incoming alerts against the incident rules in the order that you define. If alerts match the first rule listed, then that rule creates an incident. If alerts match the second rule listed and those alerts did not match the first rule, then the second rule creates an incident. If alerts match the third rule listed and those alerts did not match the first or second rule listed, then the third rule creates an incident, and so on.
Enabled	Shows whether the rule is enabled or not. The ▶ specifies that the rule is enabled. The ■ specifies that the rule is not enabled.
Name	Displays the name of the rule with a hyperlink. If you click the link, it opens the Rule Details view, where you can edit the rule.
Description	Displays the description of the rule.
Last Matched	Displays the time when an alert was successfully matched with the rule. This value is reset once a week.
Matched Alerts	Displays the number of matched alerts. This value is reset once a week. To change the setting, see Set a Counter for Matched Alerts and Incidents.
Incidents	Displays the number of incidents created by the rule. This value is reset once a week. To change the setting, see the Set a Counter for Matched Alerts and Incidents.
Rule Created	Shows the date and time that the incident rule was created or imported.

Column	Description
Rule Last Updated	Shows the date and time that the incident rule was last updated.

Incident Rules Actions

The following table shows the operations that can be performed on the Incident Rules list.

Action	Description
Create Rule button	Allows you to add a new incident rule.
Export button	(This option is available in NetWitness 11.4 and later.) Allows you to export one or more incident rules. This enables you to share incident rules with other NetWitness Servers on the same release version. The exported incident rules file is a ZIP file that contains two JSON files: one file contains the incident rules and the other file contains the incident rule schema. You cannot export Advanced incident rules; the export function only allows incident rules created using Rule Builder.
Import button	(This option is available in NetWitness 11.4 and later.) Allows you to import an incident rules ZIP file. This enables you to share incident rules with other NetWitness Servers on the same release version.
Enable button	(This option is available in NetWitness 11.4 and later.) Allows you to enable one or more rules from the incident rules list. You can also enable a rule in the Incident Rule Details view by selecting the Enabled checkbox in the Basic Settings section and then saving the rule.
Disable button	(This option is available in NetWitness 11.4 and later.) Allows you to disable one or more rules from the incident rules list. You can also disable a rule in the Incident Rule Details view by clearing the Enabled checkbox in the Basic Settings section and then saving the rule.
Clone button	Allows you to duplicate one incident rule at a time.
Delete button	Allows you to delete one incident rule at a time.
Name hyperlink	Allows you to edit an incident rule.

Incident Rule Details View

The Incident Rule Details view enables you to create and edit incident rules for creating incidents from alerts. This topic describes the information required when creating or editing a new rule.

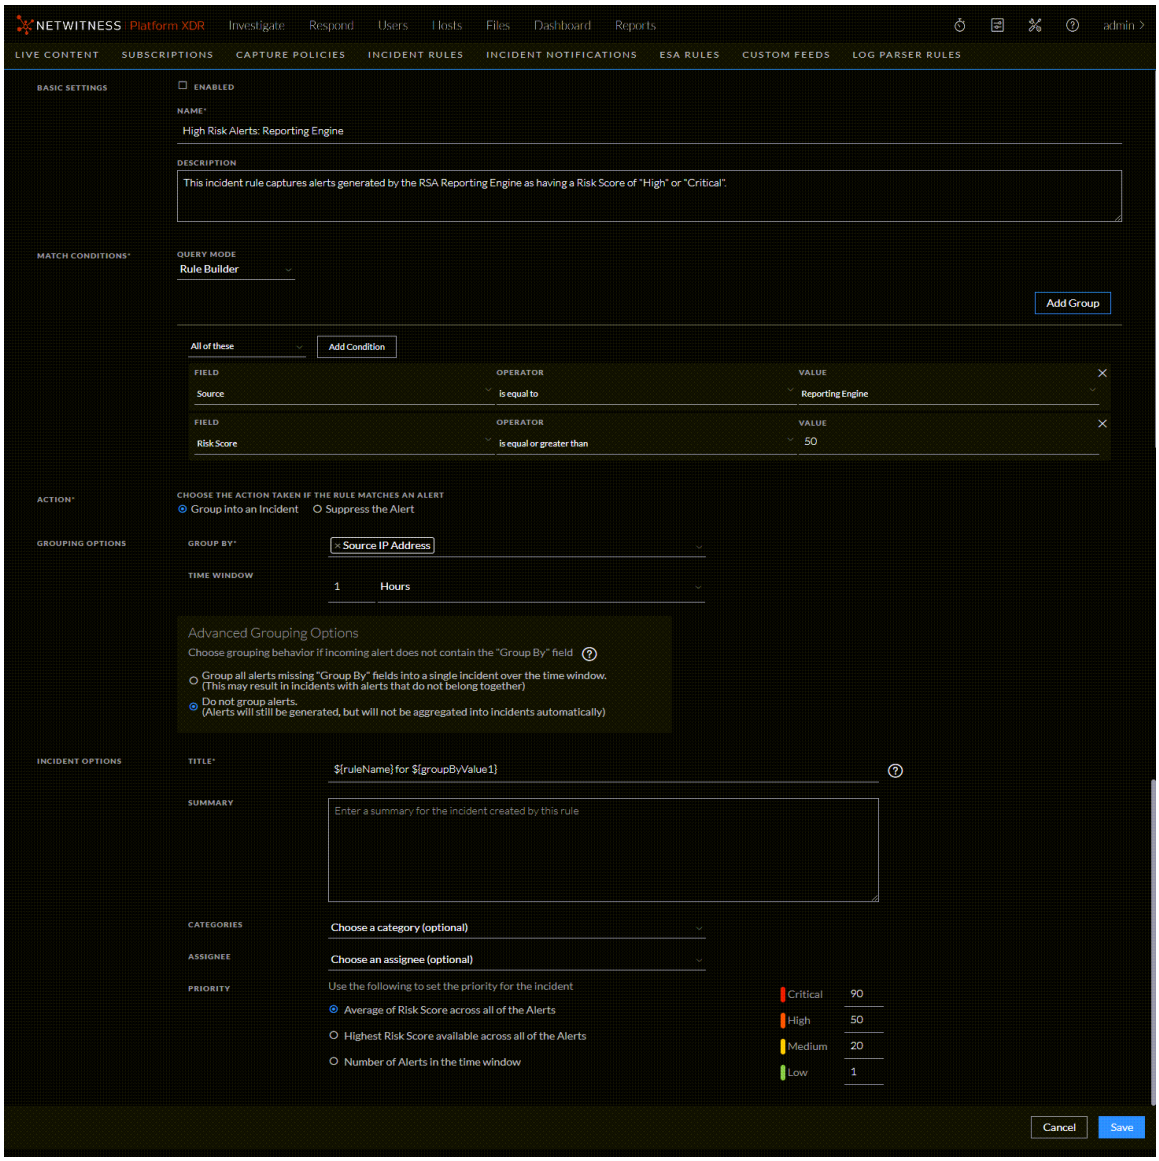
Note: The information in this topic applies to NetWitness Version 11.1 and later.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure alert sources for the Respond view.	Step 1. Configure Alert Sources to Display Alerts in the Respond View
Administrator	Assign Respond view permissions.	Step 2. Assign Respond View Permissions
Analyst, Content Expert, SOC Manager	Enable, create, or edit an incident rule.	Step 3. Enable and Create Incident Rules for Alerts
Analyst, Content Expert, SOC Manager	Set up and use the User Behavior default rule. Set up or verify the preconfigured (default) incident rules.	Set Up and Verify Default Incident Rules
Incident Responders, Analysts, Content Experts, SOC Manager	View the results of my incident rule (View Detected Threats).	See "Responding to Incidents" in the *NetWitness Respond User Guide*.

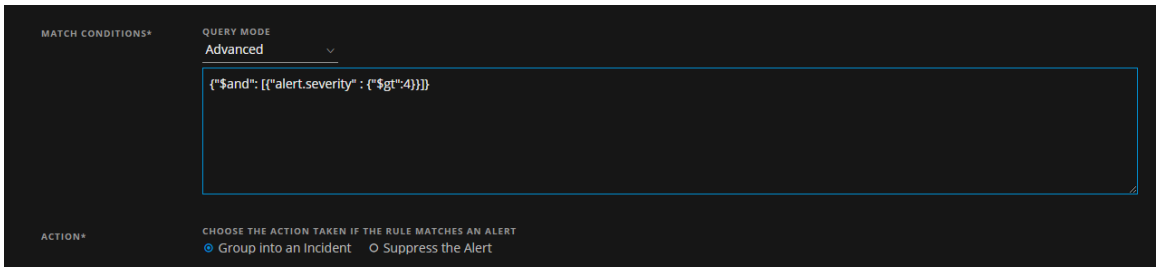
Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Related Topics



- Incident Rules View

Quick Look



To access the Incident Rule Details view, do one of the following:

- To create a rule, go to  **(Configure) > Incident Rules** and click **Create Rule**.
- To edit a rule, go to  **(Configure) > Incident Rules** and click the link in the **Name** column for the rule that you want to update.

  The Incident Rule Details view is displayed. The following figure shows the Incident Rule Details view in Rule Builder query mode.

In the Match Conditions section, if you select Advanced query mode, a field to enter advanced queries is available as shown in the following figure.

The following table describes the options available when creating or editing incident rules.

Section	Field	Description
Basic Settings	Enabled	Select to enable the rule.
	Name*	Name of the rule. *This is a required field.
	Description	A description of the rule to indicate which alerts get aggregated.
Match Conditions*	Query Mode	**Rule Builder**: Select the Rule Builder option if you want to build a query with various conditions that can be grouped. You can also have nested groups of conditions. In the Match Conditions, you can set the value to **All of these**, **Any of these**, or **None of these**. Depending on what you select, the criteria types specified in the Conditions and Group of conditions are matched to group the alerts. For example, if you set the match condition to **All of these**, alerts that match the criteria mentioned in the Conditions and Group Conditions are grouped into one incident. • Add a Condition to be matched by clicking the **Add Condition** button. • Add a Group of Conditions by clicking the **Add Group** button and add conditions by clicking the **Add Condition** button. You can include multiple Conditions and Groups of Conditions that can be matched as per criteria set and group the incoming alerts into incidents. **Advanced**: Select the Advanced query option if you want to use the advanced query builder. You can add a specific condition that needs to be matched as per the matching option selected. For example, you can type the criteria builder format **{"$and": [{"alert.severity" : {"$gt":4}}]}** to group alerts that have severity greater than 4. For advanced syntax, refer to http://docs.mongodb.org/manual/reference/operator/query/ or http://docs.mongodb.org/manual/reference/method/db.collection.find/
Action*	Choose the Action Taken if the Rule Matches the Alert	**Group into an Incident**: If enabled, the alerts that match the criteria set are grouped into an alert. **Suppress the Alert**: If enabled, the alerts that match the criteria are suppressed.

Section	Field	Description
Grouping Options	Group By*	The criteria to group the alerts in accordance with the specified alert fields. You can use a maximum of two fields to group the alerts. You cannot group alerts with fields that do not have values. When alerts are grouped on an alert field, all matching alerts containing the same meta key value for that field are grouped together in the same incident. (See the following **Group By Meta Key Mappings** table.)
	Time Window	The time range for grouping alerts. For example, if the time window is set to 1 hour, all alerts that match the criteria set in the Group By field and that arrive within an hour of each other are grouped into an incident.
	Advanced Grouping Options	Alerts may sometimes come into Respond missing fields that are expected and used for aggregation into incidents (as defined by incident aggregation rules). This can be due to missing parsers, overly generic matching conditions, unexpected data sources, or log sources with unexpected formats. Choose how to handle alerts missing the fields required by the configured incident aggregation rules: • Automatically group them into a single incident over the configured time window. • Do not group them and manually include these orphaned alerts into an incident when required.

Section	Field	Description
Incident Options	Title*	Title of the incident. You can optionally include placeholders in your title. Placeholders enable you to have different titles based on the attributes you grouped. If you do not use placeholders, all incidents created by the rule will have the same title. For example, if you grouped them according to the source, you can name the resulting Incident as Alerts for **${groupByValue1}**, and the incident for all alerts from NetWitness Endpoint would be named **Alerts for NetWitness Endpoint**.
	Summary	(Optional) Summary of the incident created by this rule.
	Categories	(Optional) Category of the incident created. An incident can be classified using more than one category.
	Assignee	(Optional) Name of the user assigned to the incident.
	Priority	**Average of Risk Score across all of the Alerts**: Takes the average of the risk scores across all the alerts to set the priority of the incident created. **Highest Risk Score available across all of the Alerts**: Takes the highest score available across all the alerts to set the priority of the incident created. **Number of Alerts in the time window**: Takes the count of the number of alerts in the time window selected to set the priority of the incident created. **Critical, High, Medium, and Low**: Specify the incident priority threshold of the matched incidents. The defaults are: • Critical: 90 • High: 50 • Medium: 20 • Low: 1 For example, with the Critical priority set to 90, incidents with a risk score of 90 or higher are assigned a Critical priority for this rule.

Group By Meta Key Mappings

When alerts are grouped on an alert field, all matching alerts containing the same meta key value for that field are grouped together in the same incident. For example, if you select the Group By field value **Destination Host**, it uses the mapped meta key `alert.groupby_host_dst`. All alerts with the same meta key value for `alert.groupby_host_dst` are grouped together in the same incident.

The following table shows the mapped meta keys for the Group By field selections.

Group By Field Value	Mapped Meta Key
Alert Name	alert.name
Alert Rule Id	alert.signature_id
Alert Type	alert.groupby_type
Date Created	alert.timestamp
Destination Country	alert.groupby_destination_country
Destination Domain	alert.groupby_domain_dst
Destination Host	alert.groupby_host_dst
Destination IP Address	alert.groupby_destination_ip
Destination Port	alert.groupby_destination_port
Destination User Account	alert.groupby_user_dst
Detector IP Address	alert.groupby_detector_ip
Domain	alert.groupby_domain
Domain for Suspected C&C	alert.groupby_c2domain
File Analysis	alert.groupby_analysis_file
Filename	alert.groupby_filename
File MD5 Hash	alert.groupby_data_hash
Risk Score	alert.risk_score
Service Analysis	alert.groupby_analysis_service
Session Analysis	alert.groupby_analysis_session
Severity	alert.severity
Source	alert.source
Source Country	alert.groupby_source_country
Source Domain	alert.groupby_domain_src
Source Host	alert.groupby_host_src
Source IP Address	alert.groupby_source_ip
Source User Account	alert.groupby_user_src
Source Username	alert.groupby_source_username
User Account	alert.groupby_username

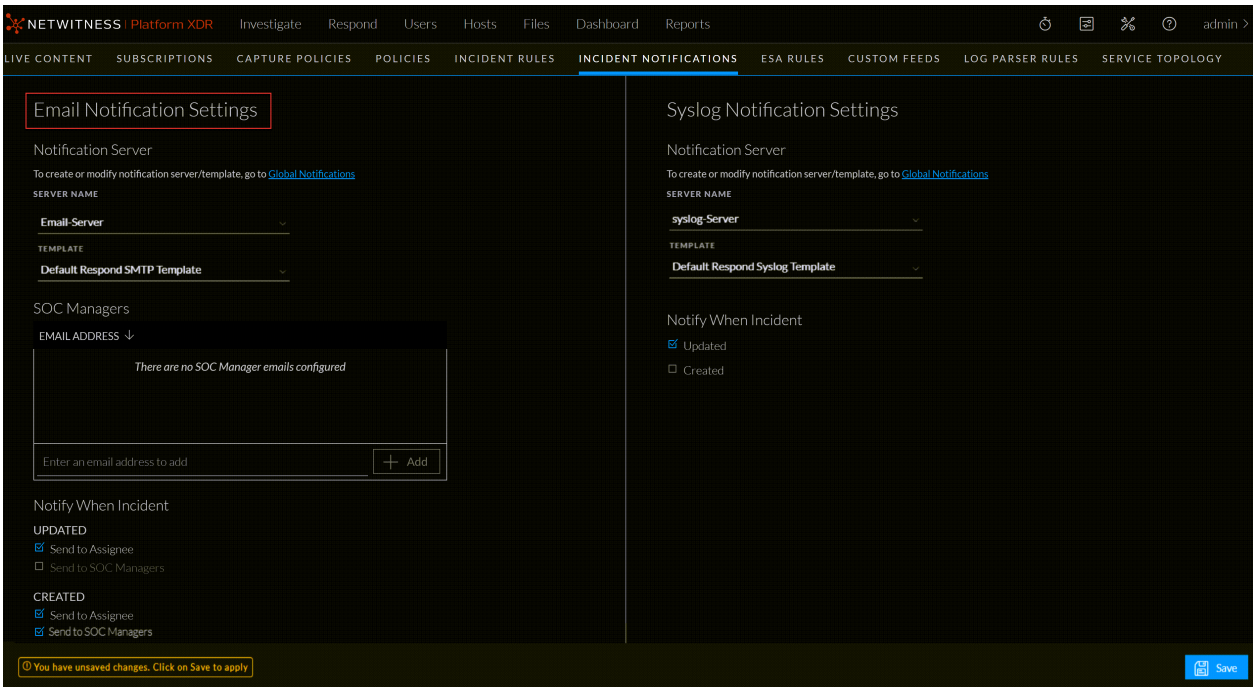
Incident Email Notification Settings View

The Incident Email Notification Settings view enables you to send email notifications when incidents are created or updated to SOC Managers and the Analysts assigned to the incidents.

Note: The information in this topic applies to NetWitness 11.1 and later.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure an email server.	Refer to "Configure the Email Settings as Notification Server" in the *System Configuration Guide*. (To access these settings, click the **Email Server Settings** link and go to the Servers tab or alternatively go to (Admin) > System > Global Notifications > Servers tab.)
Incident Responders, Analysts, Content Experts, SOC Manager	Configure email notifications for when an incident is created or updated.	Configure Incident Notification Settings



Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Related Topics

- Incident Rules View

Quick Look

To access the incident email notification settings, go to **(Configure) > Incident Notifications**. The Incident Email Notification Settings view is displayed.

The following table lists the incident email notification settings.

Setting	Description
Email Server	Specifies the Email server that will send the email notifications.
Email Server Settings	Allows you to configure an Email server if the one you want to use for notifications is not listed. Clicking the **Email Server Settings** link goes to (Admin) > System > Global Notifications. Configure the email server on the Servers tab. For instructions, refer to "Configure the Email Settings as Notification Server" in the *System Configuration Guide*.
SOC Manager Email Addresses	Lists the SOC Manager email addresses that receive email notifications when you select **Send to SOC Manager** in the Notification Types section. You can add and remove email addresses as needed.
Notification Types - Incident Created	Specifies who should receive an email notification when an incident is created. • **Send to Assignee**: When an incident is created, an email is sent to the Analyst assigned to the incident. • **Send to SOC Manager**: When an incident is created, an email is sent to all of the addresses listed in the SOC Manager Email Addresses list.

Setting	Description
Notification Types - Incident Updated	Specifies who should receive an email notification when an incident is created. • **Send to Assignee**: When an incident is updated, an email is sent to the Analyst assigned to the incident. • **Send to SOC Manager**: When an incident is updated, an email is sent to all of the addresses listed in the SOC Manager Email Addresses list.
Apply	Applies changes made to the incident notification settings. Changes to these settings take effect immediately.

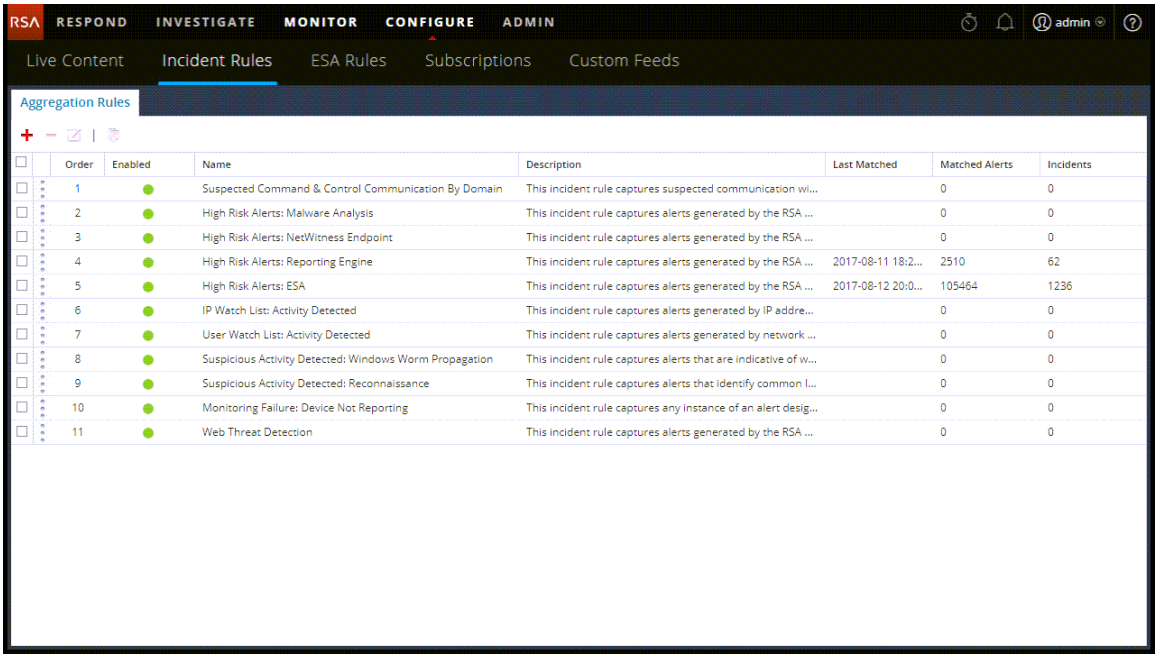
Note: If user email address information is updated in the  (Admin) > Security > Users tab, it can take up to two minutes for the new email changes to take effect. Any incident creation or incident update email notifications sent during this time go to the old email address.

Aggregation Rules Tab (11.0 and earlier)

The Aggregation Rules tab enables you to create and manage aggregation rules for automating the incident creation process. NetWitness provides 11 preconfigured rules. You can add to and adjust these rules for your own environment.

Note: This topic applies to NetWitness version 11.0 and earlier.

What do you want to do?



Role	I want to ...	Show me how
Analyst, Content Expert, SOC Manager	Create an aggregation rule.	Step 3. Enable and Create Incident Rules for Alerts
Incident Responders, Analysts, Content Experts, SOC Manager	View the results of my aggregation rule (View Detected Threats).	See "Responding to Incidents" in the *NetWitness Respond User Guide*.

Related Topics

- New Rule Tab (11.0 and earlier)

Quick Look

To access the Aggregation Rules tab, go to **Configure > Incident Rules > Aggregation Rules** tab.

The Aggregation Rules tab consists of a list and toolbar.

Aggregation Rules List

The following table describes the columns in the Aggregation Rules list.

Column	Description
Select	Enables you to select a rule in order to take an action, such as Clone or Delete.
Order	Shows the order in which the rule is placed. The rule order determines which rule takes effect if the criteria for multiple rules match the same alert. If two rules match an alert, only the rule with the highest priority is evaluated.
Name	Displays the name of the rule.
Enabled	Shows whether the rule is enabled or not. The ● specifies the rule is enabled.
Description	Displays the description of the rule.
Last Matched	Displays the time when an alert was successfully matched with the rule. This value is reset once a week.
Matched Alerts	Displays the number of matched alerts. This value is reset once a week. To change the setting, see Set a Counter for Matched Alerts and Incidents.
Incidents	Displays the number of incidents created by the rule. This value is reset once a week. To change the setting, see the Set a Counter for Matched Alerts and Incidents.

Aggregation Rules Toolbar

The following table shows the operations that can be performed in the Aggregation Rules tab.

Option	Description
+	Allows you to add a new rule.
✎	Allows you to edit a rule.
−	Allows you to delete a rule.
⧉	Allows you to duplicate a rule.

New Rule Tab (11.0 and earlier)

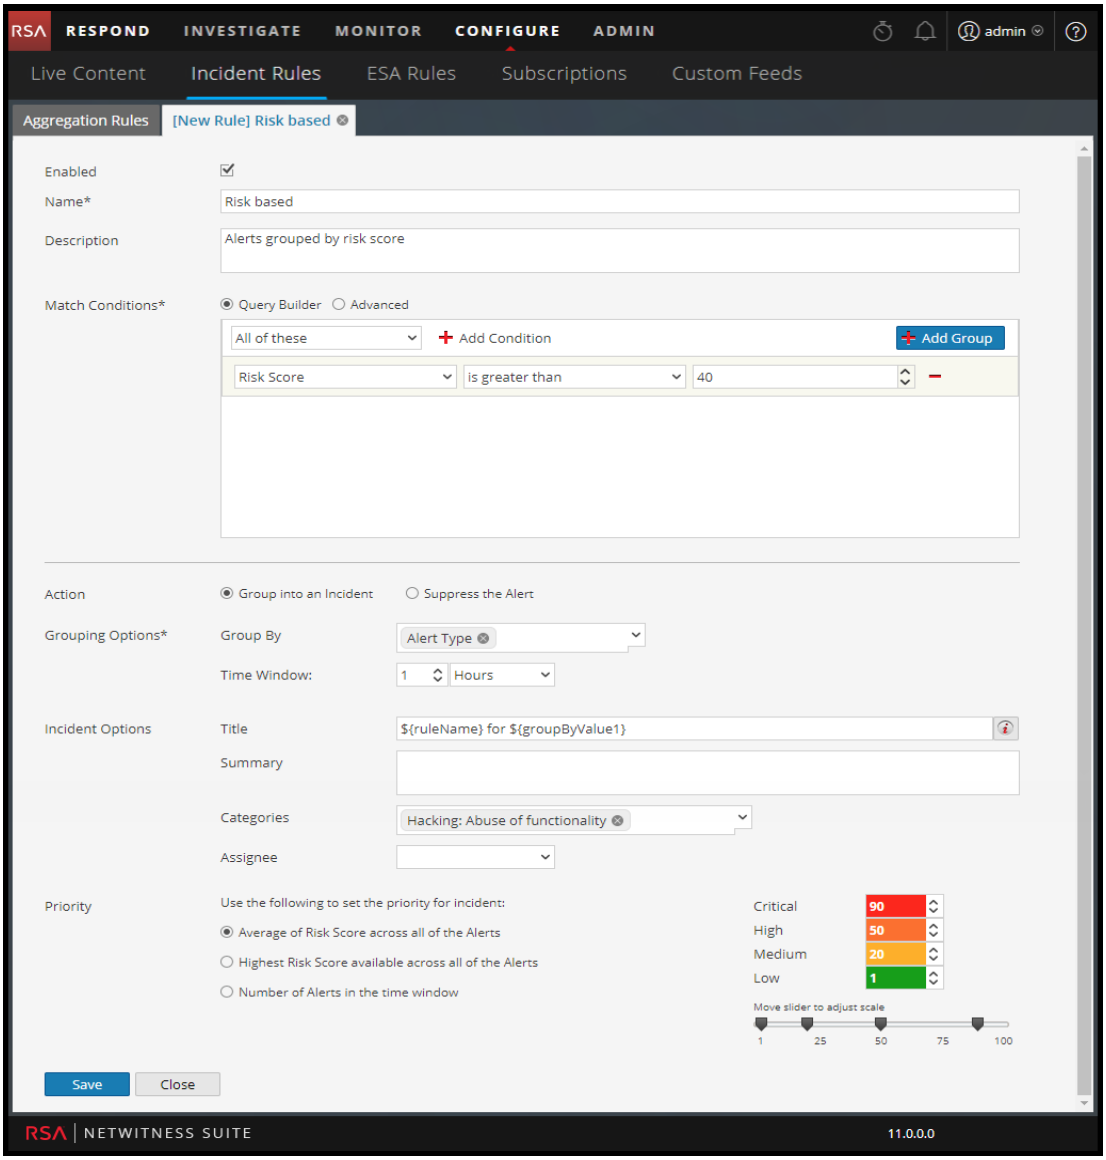
The New Rules tab enables you to create custom aggregation rules for automating the incident creation process. This topic describes the information required when creating a new rule.

Note: This topic applies to NetWitness version 11.0 and earlier.

What do you want to do?

Role	I want to ...	Show me how
Analyst, Content Expert, SOC Manager	Create an aggregation rule.	Step 3. Enable and Create Incident Rules for Alerts
Incident Responders, Analysts, Content Experts, SOC Manager	View the results of my aggregation rule (View Detected Threats).	See "Responding to Incidents" in the *NetWitness Respond User Guide*.

Related Topics



- Aggregation Rules Tab (11.0 and earlier)

Quick Look

To access the New Rule tab view:

1. Go to **Configure > Incident Rules > Aggregation Rules** tab.
2. Click +.

The **New Rule** tab is displayed.

The following table describes the options available when creating customized aggregation rules.

Field	Description
Enabled	Select to enable the rule.
Name*	Name of the rule. *This is a required field.
Description	A description for the rule to give an idea about what alerts get aggregated.

Field	Description
Match Conditions*	**Query Builder** - Select if you want to build a query with various conditions that can be grouped. You can also have nested groups of conditions. Match Conditions - You can set the value to **All of these**, **Any of these**, or **None of these**. Depending on what you select, the criteria types specified in the Conditions and Group of conditions are matched to group the alerts. **For example**, if you set the match condition to **All of these**, alerts that match the criteria mentioned in the Conditions and Group Conditions are grouped into one incident. • Add a Condition to be matched by clicking **Add Condition**. • Add a Group of Conditions by clicking **Add Group** and adding conditions by clicking **Add Condition**. You can include multiple Conditions and Groups of Conditions that can be matched as per criteria set and group the incoming alerts into incidents.
	Advanced - Select if you want to add an advanced query builder. You can add a specific condition that needs to be matched as per the matching option selected. **For example:** you can type the criteria builder format **{"$and": [{"alert.severity" : {"$gt":4}}]}** to group alerts that have severity greater than 4. For advanced syntax, refer to http://docs.mongodb.org/manual/reference/operator/query/ or http://docs.mongodb.org/manual/reference/method/db.collection.find/
Action	**Group into an Incident** - If enabled, the alerts that match the criteria set are grouped into an alert. **Suppress the Alert** - If enabled, the alerts that match the criteria are suppressed.
Grouping Options*	**Group By:** The criteria to group the alerts as per the specified category. You can use a maximum of two attributes to group the alerts. You can group the alerts with one or two attributes. You can no longer group alerts with attributes that do not have values (empty attributes). Grouping on an attribute means that all matching Alerts containing the same value for that attribute are grouped together in the same incident. **Time Window:** The time range specified to group alerts. For example if the time window is set to 1 hour, all alerts that match the criteria set in Group By field and that arrive within an hour of each other are grouped into an incident.

Field	Description
Incident Options	**Title -** (Optional) Title of the incident. You can provide placeholders based on the attributes you grouped. Placeholders are optional. If you do not use placeholders, all Incidents created by the rule will have the same title. For example, if you grouped them according to the source, you can name the resulting Incident as Alerts for **${groupByValue1}**, and the incident for all alerts from NetWitness Endpoint would be named **Alerts for NetWitness Endpoint**.
	Summary - (Optional) Summary of the incident.
	Category - (Optional) Category of the incident created. An incident can be classified using more than one category.
	Assignee - (Optional) Name of the assignee to whom the incident is assigned to.
Priority	**Average of Risk Score across all of the Alerts** - Takes the average of the risk scores across all the alerts to set the priority of the incident created. **Highest Risk Score available across all of the Alerts** - Takes the highest score available across all the alerts to set the priority of the incident created. **Number of Alerts in the time window** - Takes the count of the number of alerts in the time window selected to set the priority of the incident created. **Critical, High, Medium, and Low** - Specify the incident priority threshold of the matched incidents. The defaults are: • Critical: 90 • High: 50 • Medium: 20 • Low: 1 For example, with the Critical priority set to 90, incidents with a risk score of 90 or higher will be assigned a Critical priority for this rule. You can change these defaults by manually changing the priorities or by moving the slider under **Move slider to adjust scale**.

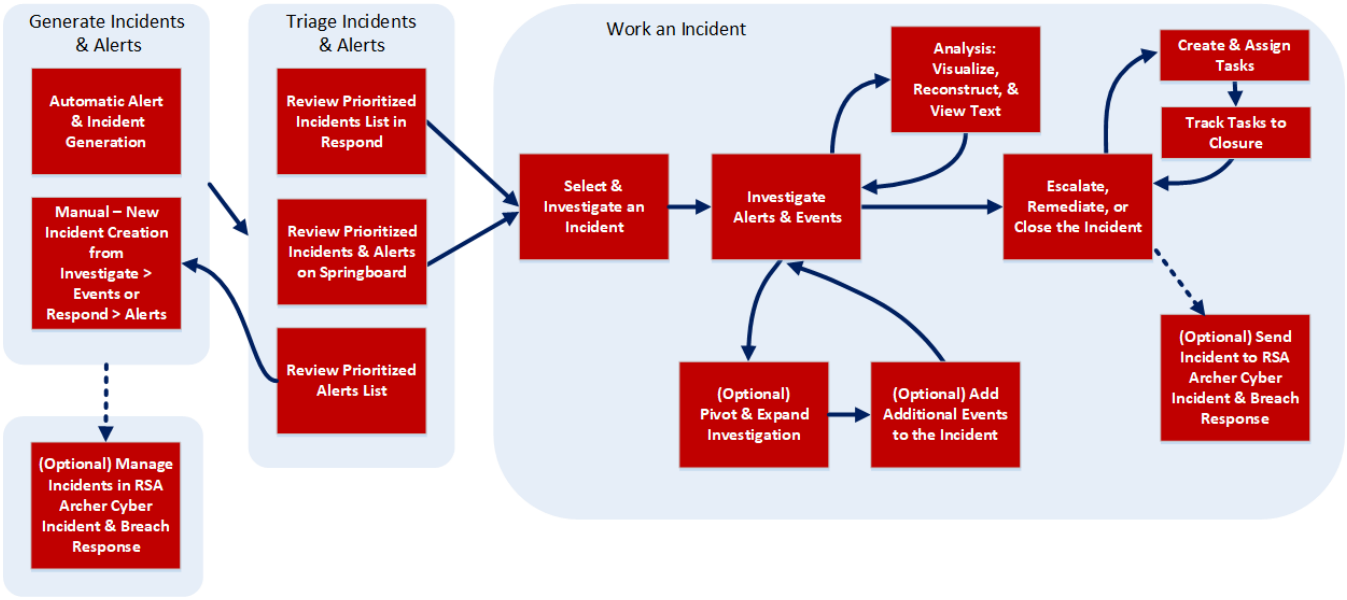
NetWitness Respond Process

NetWitness Respond collects alerts from multiple sources and provides the ability to group them logically and start an Incident Respond workflow to investigate and remediate the security issues raised. NetWitness Respond enables you to configure rules that automatically aggregate alerts into incidents. Alerts are normalized by the system to a common format to provide users with a consistent view for the rule criteria regardless of the data source. You can build query criteria based on the alert data with the ability to query on fields that are common as well as specific to data sources.

The rule engine allows you to group similar alerts together into an incident so that the investigation and remediation workflow can be shared across a set of similar alerts. You can create rules that can group alerts into incidents depending on a common value they share for one or two attributes (for example, source hostname) or if they are reported within a limited time window (for example, alerts that are within four hours of each other).

If an alert matches a rule, an incident is created using the criteria. As new alerts are ingested, if an existing incident was already created that matched those criteria, and that incident is not "in progress" yet, the new alerts continue to be added to the same incident. If there is no existing incident for the grouped value (for example, the specific hostname) or the time window, a new incident is created and the alert is added to it.

You can have multiple incident rules. The rules can either group alerts into incidents or suppress alerts from being matched by any rule. The rules are ranked top-to-bottom and only the first rule to match an incoming alert is used to include that alert in an incident. The incidents provide a context for the alerts, provide tools to record the investigation status, and track the progress of associated tasks.



The stages in the NetWitness Respond process are:

- **Generate Incidents & Alerts**
  - Automatic Alert & Incident Generation
  - Manual - New Incident Creation from Investigate > Events or Respond > Alerts
  - (Optional) Manage Incidents in Archer Cyber Incident and Breach Response (If you manage incidents in Archer instead of in NetWitness Respond, the process ends here.)
- **Triage Incidents & Alerts**
  - Review Prioritized Incident List in Respond
  - Review Prioritized Incidents & Alerts on Springboard
  - Review Prioritized Alerts List
- **Work an Incident**
  - Select & Investigate Incident
  - Investigate Alerts & Events
    - Analysis: Visualize, Reconstruct, and View Text
    - (Optional) Pivot & Expand Investigation
    - (Optional) Add Additional Events to Incident

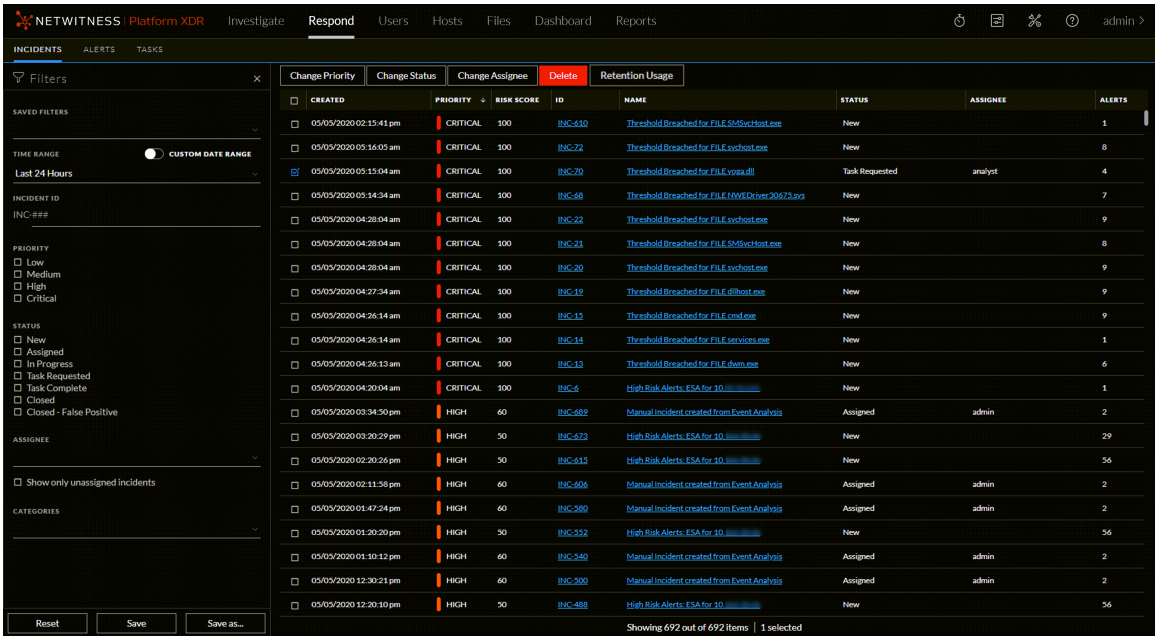
- Escalate, Remediate, or Close the Incident
  - Create & Assign Tasks
  - Track Tasks to Closure
  - (Optional) Send Incidents to Archer Cyber Incident & Breach Response. (In NetWitness version 11.2 and later, if Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response.)

NetWitness Respond Workflow

The following figure shows the high-level NetWitness Respond workflow process.

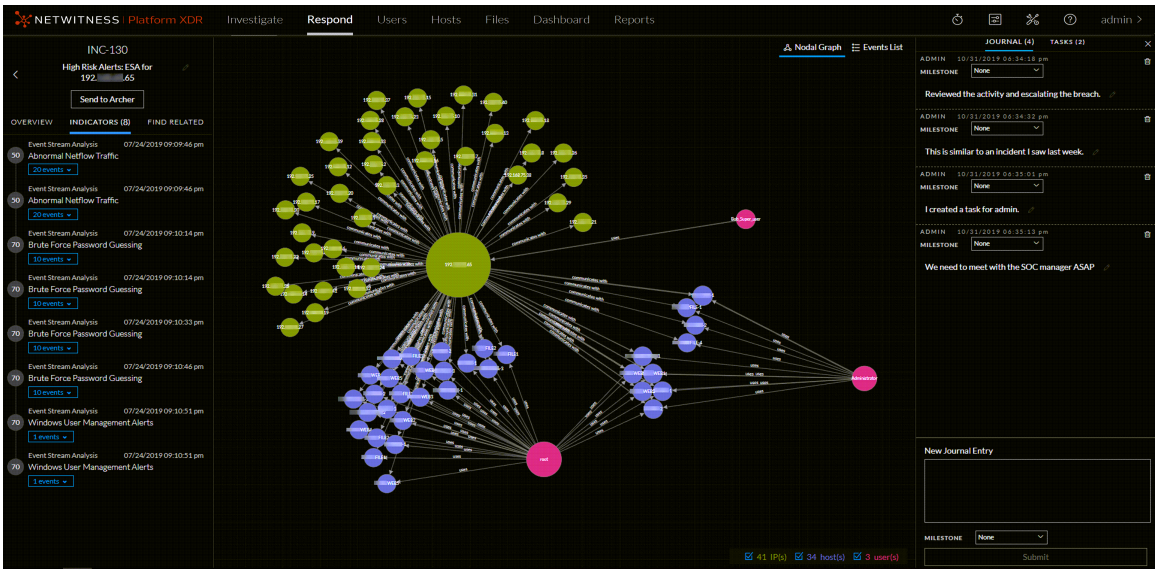
Responding to Incidents

An *Incident* is a logically grouped set of alerts created automatically by the Incident Aggregation Engine and grouped by a specific criteria. An incident, available in the Respond view, allows an Analyst to triage, investigate, and remediate these groups of alerts. Incidents can be moved between users, notated, and explored using a nodal graph. Incidents allow users to ensure that they understand the full scope of an attack or event in their NetWitness system and then take action.



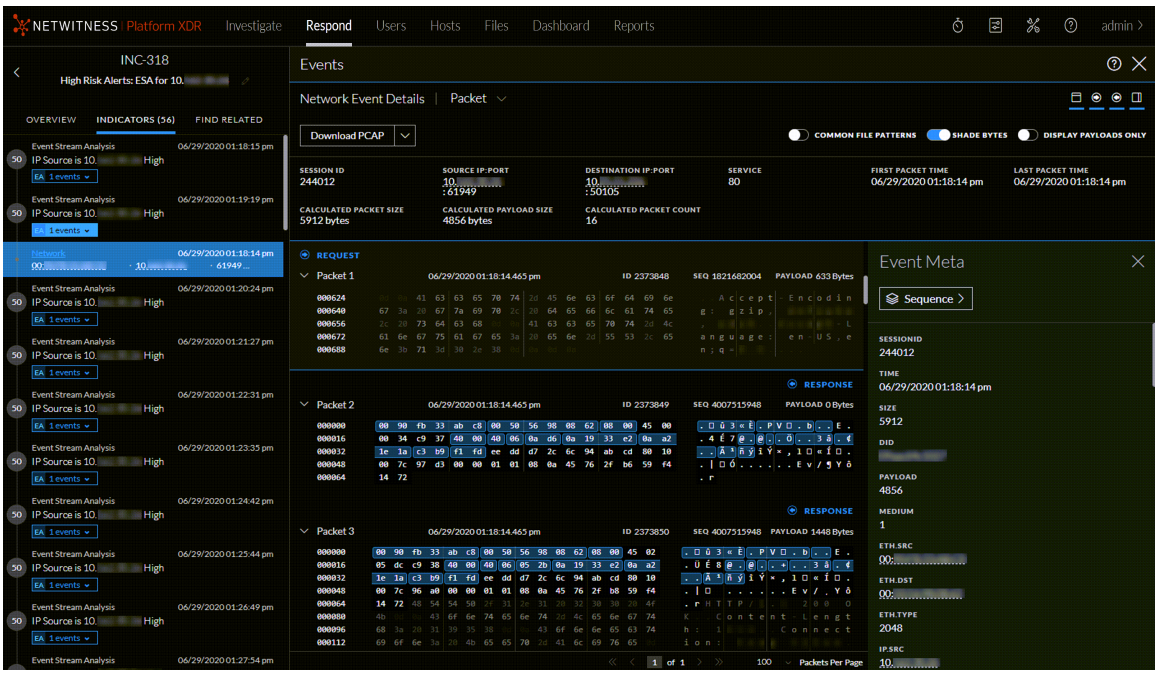
The **Respond** view is designed to help you quickly identify the ongoing issues in your network and work with other Analysts to quickly solve the issues.

The Respond view presents Incident Responders with a queue of incidents in severity order. When you take an incident from the queue, you receive relevant supporting data to help you investigate the incident. This enables you to determine the incident scope so you can escalate or remediate it as appropriate.

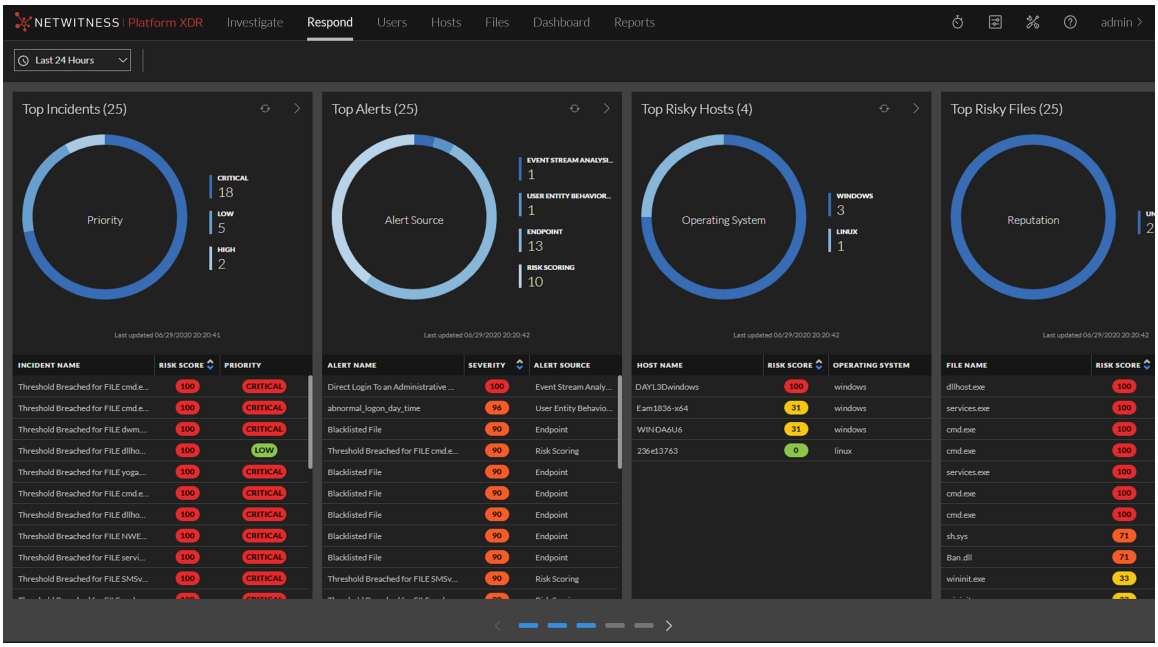


Within the Respond view, you can see Incidents, Alerts, and Tasks:

- **Incidents**: Enables you to respond to and manage incidents from start to finish.
- **Alerts**: Enables you to manage alerts from all sources received by NetWitness and create incidents from selected alerts.
- **Tasks**: Enables you to view and manage the complete list of tasks created for all incidents.



If you navigate to Respond > Incidents, you can see the Incidents List view and from there you can access the Incident Details view for a selected incident. These are the main views that you use to respond to incidents. The following figure shows the list of prioritized incidents in the **Incidents List** view.



The next figure shows an example of details available in the **Incident Details** view.

The Respond view is designed to make it easy to evaluate incidents, contextualize that data, collaborate with other analysts, and pivot to a deep-dive investigation as needed. The following figure shows an example of an event analysis in the Incident Details view.

In NetWitness Version 11.4 and later, alerts and incidents are also displayed in the Springboard by default. Springboard is a landing page for analysts showing them all risks detected by the platform in a single place. For more information on the Springboard, see "Managing the Springboard" in the *NetWitness Platform Getting Started Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Respond Persist Data

The primary objective of this feature is to enable you to investigate events for a longer period of time. When investigating a set of alerts or events, it is important to have the assurance that the underlying data (raw and meta) will be available for both the length of time it takes to run the analysis, and for historical look up. From NetWitness Platform Version 11.6, you can persist events that are associated with particular incidents, thereby enabling you to view the incident in the future, regardless of its age. You can also add a new journal entry in the **JOURNAL** tab for the persisted events for future reference. The event data will always be available for viewing and reconstruction as long as the event is persisted, enabling you to easily refer back to details, even if the original event has rolled over from the NetWitness database.

Once you persist an event, the data is copied from the NetWitness database into a long term storage cache within the data source. You can persist or suspend persist events per incident or per alert within an incident or a specific event in an alert that belongs to an incident. The roll over in the NetWitness database does not impact the events that are already saved in the long term cache.

You can:

- You can persist or suspend persist events per incident or per alert within an incident or a specific event in an alert that belongs to an incident.
- Perform complete event reconstruction for persisted events even after the session is rolled over from the NetWitness database.

- Filter incidents which has persisted events.
- Suspend persist of all events associated with an incident, even if only a few events persisted in it.
- Remove all associated persisted events by deleting an alert or incident.

This topic contains the following basic Respond Persist Data procedures:

- Customizing Respond Persist Data
- Working with Incident Filters
- Persist and Suspend Persist Events
- Change Event Retention

Customizing Respond Persist Data

The persisted events are saved in the directory `/var/netwitness/pin-<servicetype>`, by default. You can manually change the event storage location from the default directory to any other directory, as per the requirement. You can increase the storage space as per your requirement by performing an Network File System (NFS) mount. For more information on how to perform an NFS mount, see Configure the Destination Using NFS.

To customize the persist directory:

1. Go to **Admin** >**Services**.
The **Services** page appears.

2. From the **Filter** pull down menu, select the concentrator and the log decoder services.
The concentrator and log decoder are listed in the **Services** page.

3. Go to **Actions** > **View** > **Explore**.
The **Explore** page appears.

4. Go to **sdk** > **config** .

The **Configuration** page appears.

The following table provides information on the default values for each parameter that are configured in the **Configuration** page.

S.No	Parameter	Default Value
1.	Long Term Cache Behavior (pin.cache.behavior)	fail-on-new
2.	Long Term Cache Directory (pin.cache.dir)	/var/netwitness/pin-<serviceType>***
3.	Long Term Cache Size (pin.cache.size)	10 GB

2. [Optional]*** In the **Long Term Cache Directory (pin.cache.dir)**, enter the path of the custom directory where you want to save the persisted events, if you do not want to use the default location. The default path is `/var/netwitness/pin-S<serviceType>`.

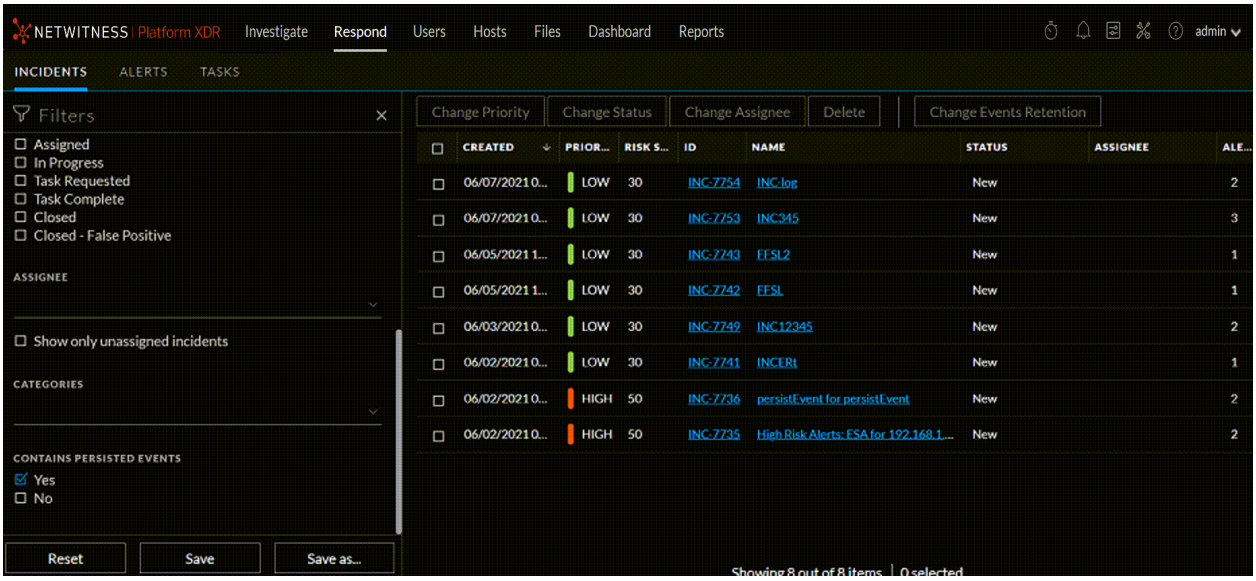
Note: When you install NetWitness Platform for the first time or upgrade to the 11.6 version, the directories are pre-configured with default values.

Working with Incident Filters

You can filter incidents based on the persisted events.

To filter incidents:

1. Go to **Respond** > **INCIDENTS**.



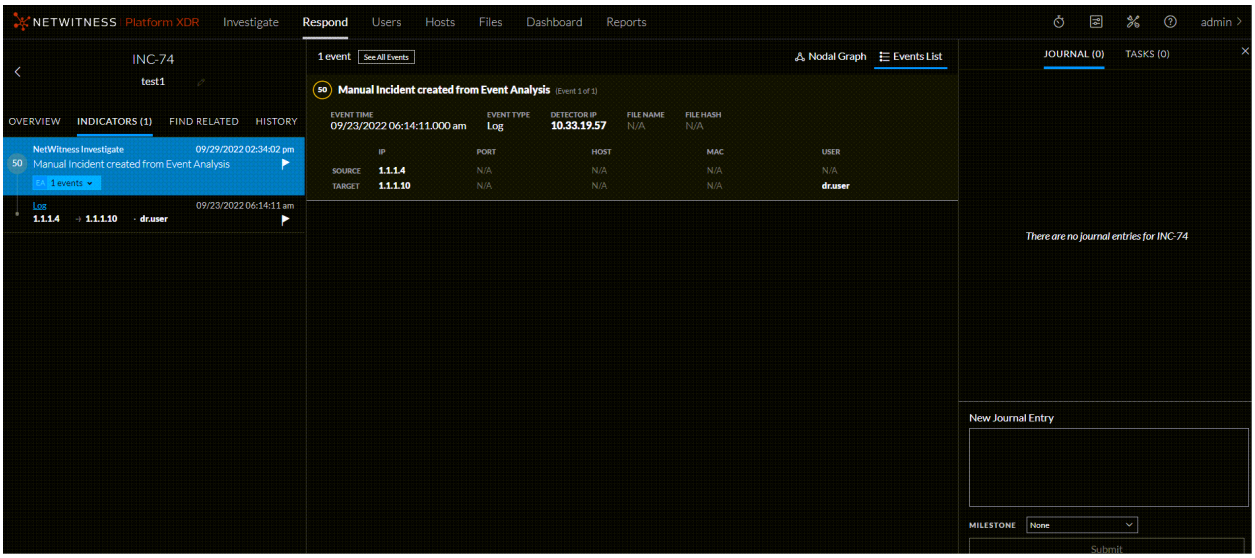
The **INCIDENT** page appears.

2. In the **FILTERS** tab, the **CONTAINS PERSISTED EVENTS** menu provides the filters to view incidents based on the persisted events.

a. Select **Yes** to view the incidents that contain persisted events.

b. Select **No** to view the incidents that do not contain persisted events.

For more information on working with filters, see Filter the Incident List.



Persist and Suspend Persist Events

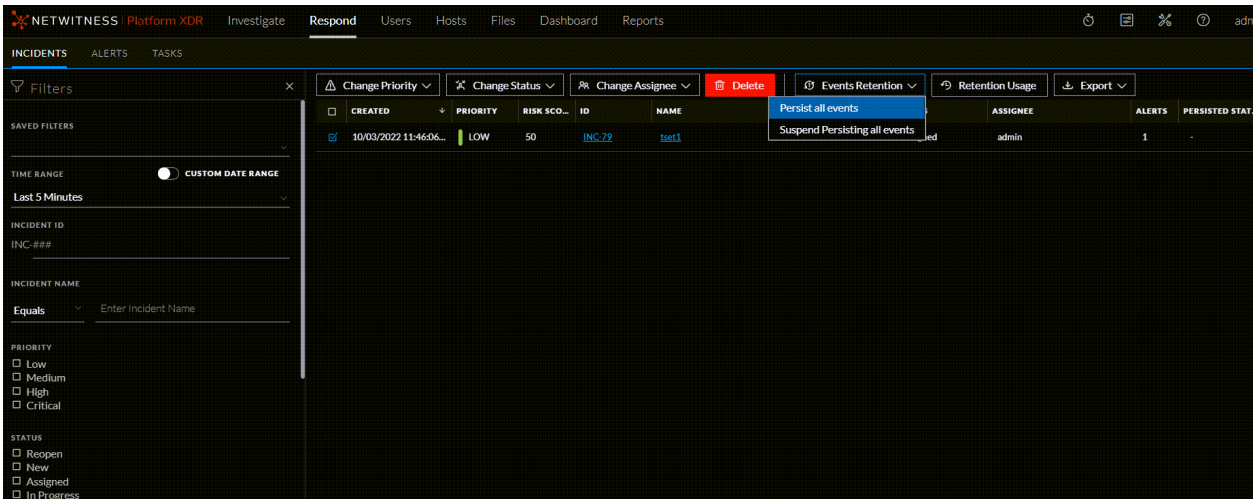
Persist an event to retain the event and thereby, copy the event data from the regular database into a long-term storage cache within the NetWitness source. Suspend persist the event to delete the event in the long-term storage cache.

- To persist an event, click the flag listed under each of the event. The selected flag is highlighted, and the message Event Persisted successfully appears.
- To suspend persist event, click a highlighted flag (persisted event) once again. The selected flag is no longer highlighted, and the message Suspended Event Persist successfully appears.
- To persist all events in an alert, click the flag at the alert level. The selected flag is highlighted along with all the flags associated with events of the alert.

- To suspend persist all events in an alert, click the flag at the alert level. The selected flag is highlighted along with all the flags associated with events of the alert.

Change Event Retention

Incidents can contain multiple persisted events, for which analysis has been completed. They can be suspended from persisting at a time using this feature.



Note: A maximum of 1 incident can be persisted or suspend persisted at a time in the source NetWitness database. If you try to change event retention for more than 1 incidents, an error message will be displayed. This limitation is introduced to optimize and extract the best performance for this feature. This limit cannot be changed.

To change event retention:

1. Go to **Respond** > **INCIDENTS**.
   All the incidents are listed in the **INCIDENTS** page.
2. Click the selection check-box to select the incident.
3. Click **Change Events Retention** > **Persist all events** or **Suspend Persist all events**.
   The **Confirm change in Retention** window appears.
4. Click **OK**.
   The events in the selected incident are either persisted or suspended from persisting.

Note: You cannot change the event retention for incidents that are in **New** or **Closed** state.

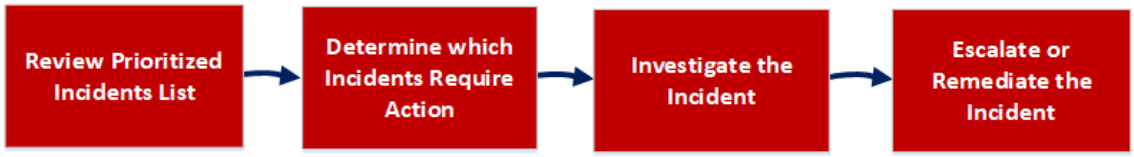
Note: Suspending persist of events in an incident from NetWitness will delete it from the long term cache of the source only. This may not be reversible if the original event data has rolled out in the source database. The events will be deleted permanently.

When you delete incidents or alerts, or suspend persist all the events in an incident, the action will always be successful. However, there are chances for the back-end function to fail due to, but not limited to the following reasons:

- Decoder/Concentrator outage
- Network disruption
- Service Outage

A data retention job is scheduled to run on a daily basis to clean up the events that failed from being deleted. To access the data retention job settings, see To change event retention:

The following table provides information on the parameters that are configured to run the job, which are enabled by default:



Parameter	Default Setting
`failure-count`	5
`persisted-events-retention-job-enabled`	true - default false.
`persisted-alerts-retention-period`	90 Days

Everyday at a preset time, the data retention job is executed. The default `failure-count` is set to 5 days. If the data retention job is unable to suspend persist an event from the back-end after 5 days, it deletes the event from the repository.

Note: The retention period of risk score context is the same as the retention period of alerts. For example, if the retention period for alerts is set to 90 days, then the retention period of risk score context is also set to 90 days automatically.

Responding to Incidents Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in the Respond view.

First, you review the list of prioritized incidents, which shows basic information about each incident, and determine which incidents require action. You can click a link in an incident to get a clearer picture of the incident with supporting details in the Incident Details view. From there, you can further investigate the incident. You can then determine how to respond to the incident, by escalating or remediating it.

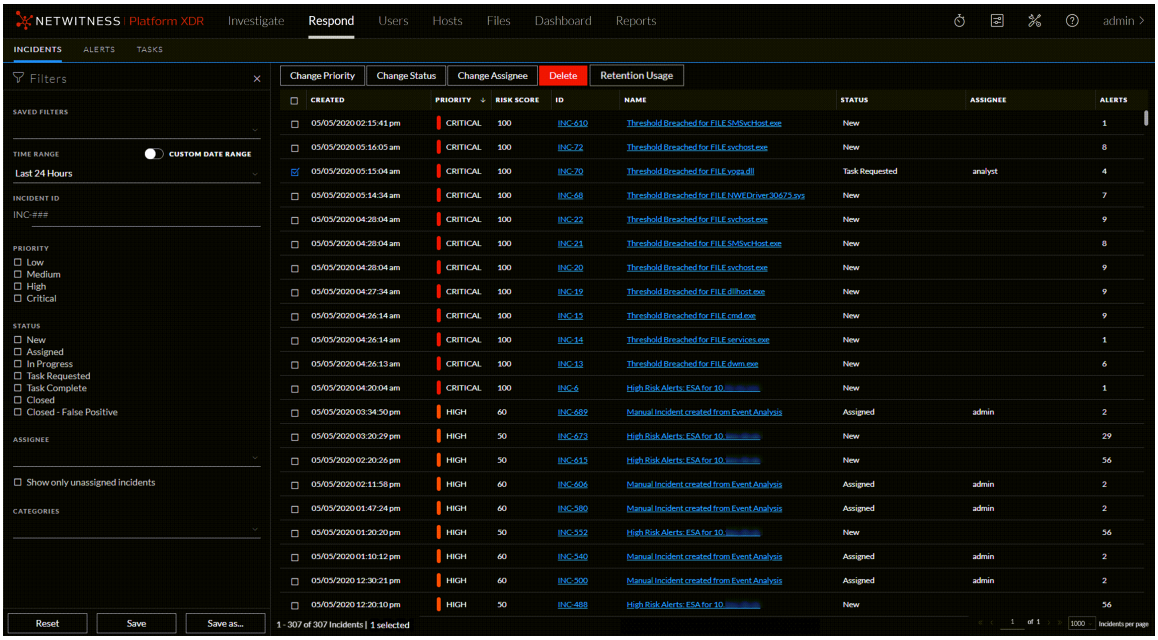
These are the basic steps for responding to an incident:

1. Review Prioritized Incident List
2. Determine which Incidents Require Action
3. Investigate the Incident
4. Escalate or Remediate the Incident

Review Prioritized Incident List

In the Respond view, you can view the list of prioritized incidents. The incident list shows both active and closed incidents.

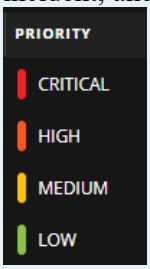
This topic contains the following basic incident list procedures:



- View the Incidents List
- Filter the Incident List
- Remove My Filters from the Incidents List View
- Save the Current Incidents Filter
- Update a Saved Incidents Filter
- Delete a Saved Incidents Filter
- View My Incidents
- Find an Incident
- Sort the Incidents List
- View Unassigned Incidents

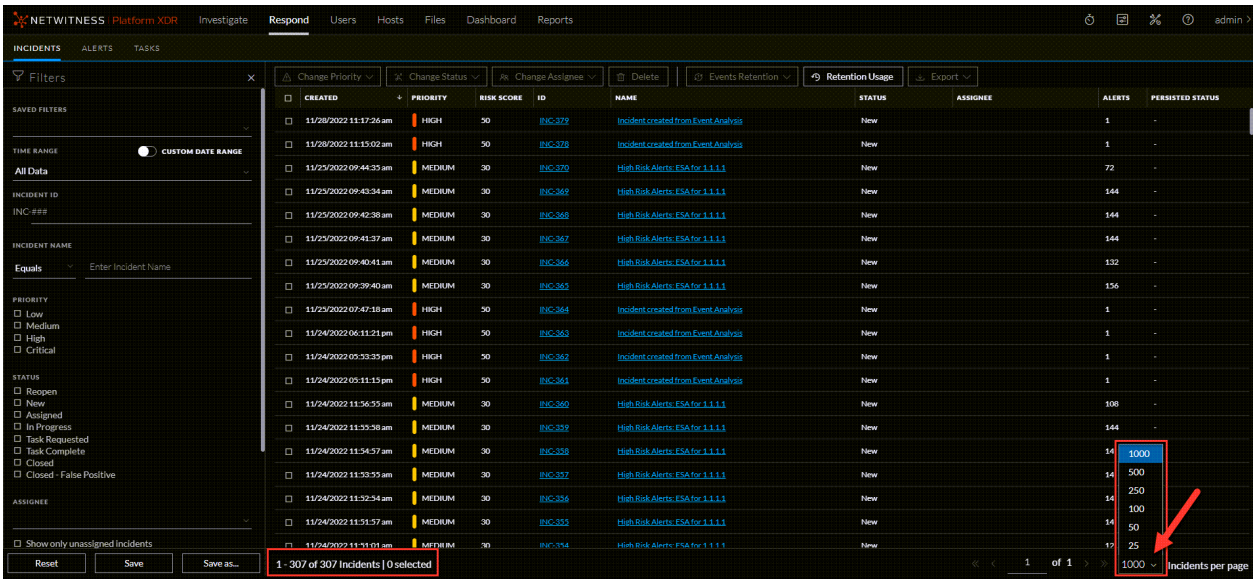
- Assign Incidents to Myself
- Unassign an Incident

View the Incidents List



After logging in to NetWitness, most Incident Responders see the Respond view, which is set as the default view. If you have a different initial view, you can navigate to the Respond view.

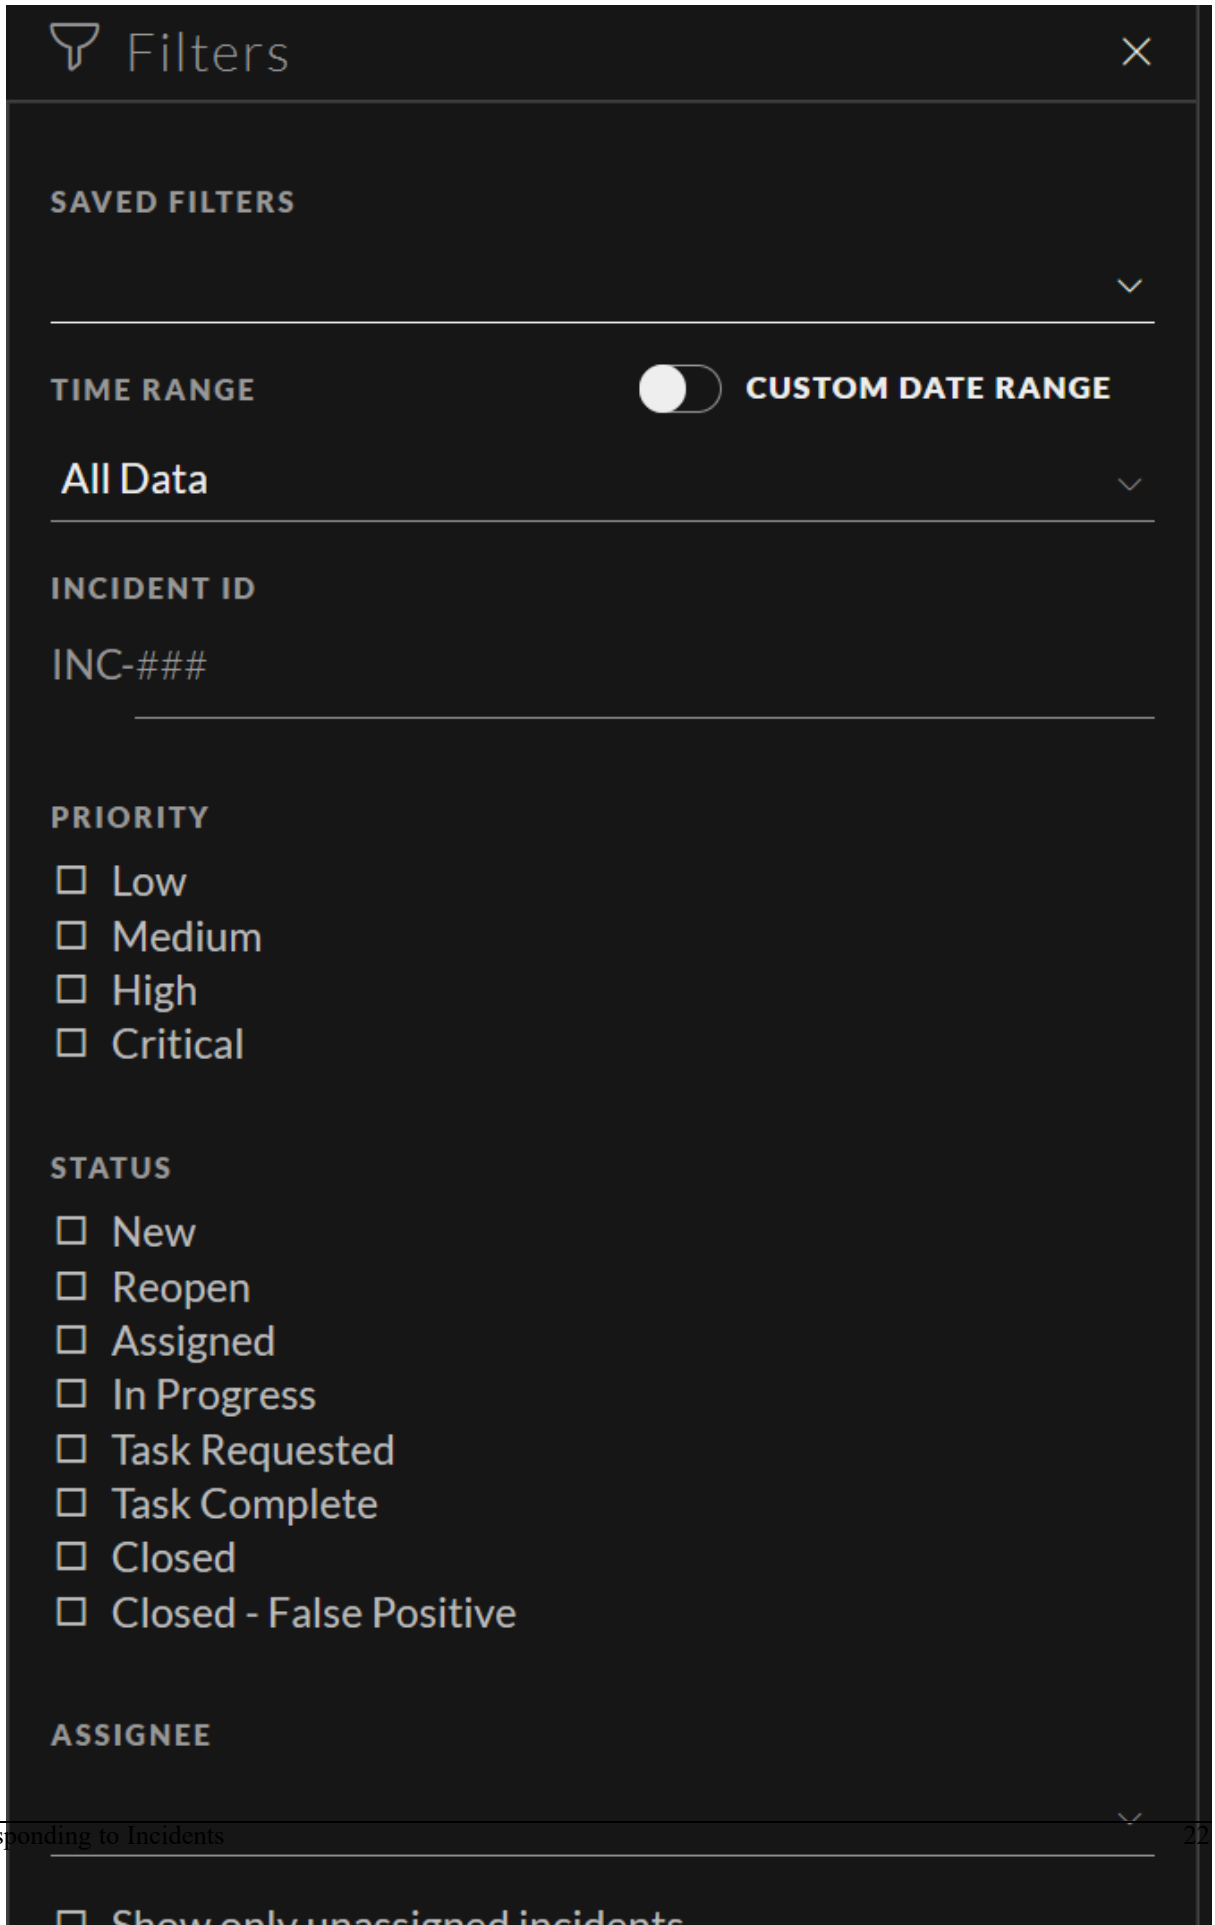
1. Log in to NetWitness.
   The Respond view shows the list of incidents, also referred to as the Incident List view.



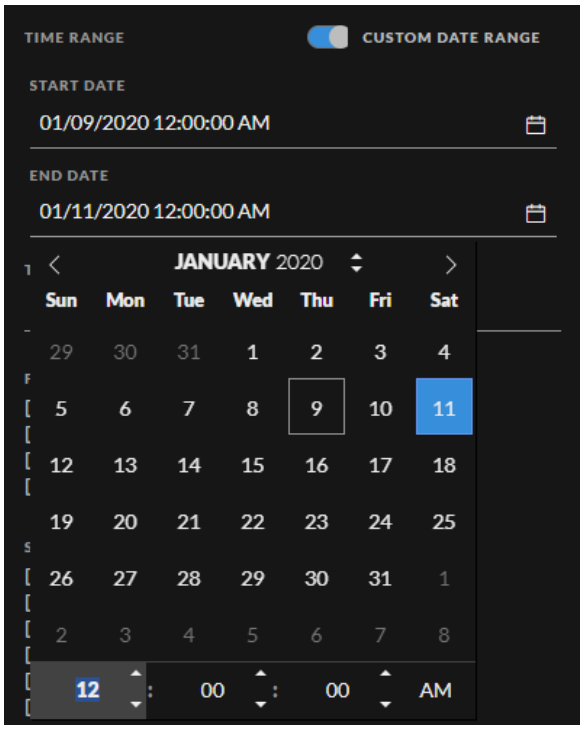
2. If you do not see the incidents list in the Respond view, go to **Respond > Incidents**.
3. Scroll through the incidents list, which shows basic information about each incident as described in the following table.

Column	Description
Created	Shows the creation date of the incident.

Column	Description
Priority	Shows the incident priority. Priority can be Critical, High, Medium, or Low. The Priority is color coded, where red indicates a **Critical** incident, orange represents a **High** risk incident, yellow indicates a **Medium** risk incident, and green represents a **Low** risk incident. For example: 
Risk Score	Shows the incident risk score. The risk score indicates the risk of the incident as calculated using an algorithm and is between 0-100. 100 is the highest risk score.
ID	Shows the automatically created incident number. Each incident is assigned a unique number that you can use to track the incident.
Name	Shows the incident name. The incident name is derived from the rule used to trigger the incident. Click the link to go to the Incident Details view for the selected incident.
Status	Shows the incident status. The status can be: **Reopen**, **New**, **Assigned**, **In Progress**, **Task Requested**, **Task Complete**, **Closed**, and **Closed - False Positive**.
Assignee	Shows the team member currently assigned to the incident.
Alerts	Shows the number of alerts associated with the incident. An incident may include many alerts. A large number of alerts might mean that you are experiencing a large-scale attack.



At the bottom of the list, you can see the number of incidents on the current page, the total number of incidents, and the number selected. For example: **1 - 500 of 2400 Incidents | 0 selected**. The maximum number of incidents that you can view at one time is 1,000. You can also change the maximum number of incidents per page by selecting from the drop-down at the bottom right corner.



Filter the Incident List

The number of incidents in the Incidents List view can be very large, making it difficult to locate particular incidents. The Filter enables you to specify those incidents that you would like to view. You can also choose the timeframe when those incidents occurred. For example, you may want to view all of the new critical incidents created within the last hour.

1. Verify that the Filters panel appears to the left of the incidents list. If you do not see the Filters panel, in the Incident List view toolbar, click , which opens the Filters panel.

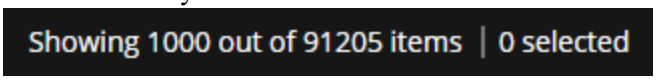
ASSIGNEE



2. In the Filters panel, select one or more options to filter the incidents list:
   - **Time Range**: You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the incidents. For example, if you select Last Hour, you can see incidents that were created within the last 60 minutes.
   - **Custom Date Range**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar.

   - **Incident ID**: Type the number of the incident that you would like to locate. For example, for INC-1050, type only the number "1050" to view the incident.
   - **Priority**: Select the priorities that you would like to view.
   - **Status**: Select one or more incident statuses. For example, select Closed - False Positive to view only false positive incidents, which were initially identified as suspicious, but then they were later found to be safe.
   - **Assignee**: Select the assignee or assignees of the incidents that you would like to view. For example, if you only want to view the incidents assigned to Cale or Stanley, select Cale and Stanley from the Assignee drop-down list. If you want to view incidents regardless of the assignee, do not make a selection under Assignee.
     (Available in version 11.1 and later) To view only unassigned incidents, select **Show only unassigned incidents**.
   - **Categories**: Select one or more categories from the drop-down list. For example, if you only want to view incidents classified with the Backdoor or Privilege abuse categories, select Backdoor and Privilege abuse.

- **Sent to Archer**: (In version 11.2 and later, if Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and this option will be available in NetWitness Respond.) To view incidents that were sent to Archer, select **Yes**. For incidents that were not sent to Archer, select **No**.
- **CONTAINS PERSISTED EVENTS**: Select a filter to view incidents based on the persisted events.

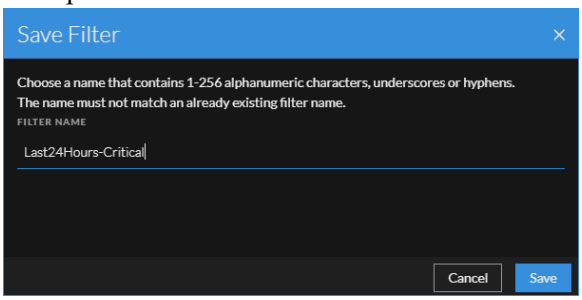
The incidents list shows a list of incidents that meet your selection criteria. You can see the number of incidents in your filtered list at the bottom of the incident list.

3. If you want to close the Filters panel, click . Your filters remain in place until you remove them.

Remove My Filters from the Incidents List View

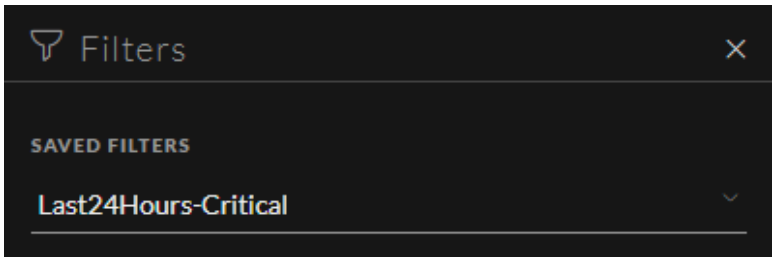
NetWitness remembers your filter selections in the Incidents List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of incidents that you expect to see or you want to view all of the incidents in your incident list, you can reset your filters.

1. In the Incident List view toolbar, click .
   The Filters panel appears to the left of the incidents list.
2. At the bottom of the Filters panel, click **Reset**.



Save the Current Incidents Filter

Note: This option is available in NetWitness Platform Version 11.5 and later.



Saved filters provide a way for analysts to save and quickly apply specific filter conditions to the list of incidents. You can also use these filters to customize the Springboard landing page. For example, you may want to create a filter to show only critical incidents over the last 24 hours.

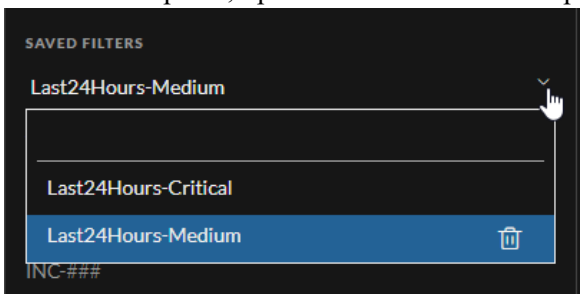
Saved filters are global. You can save a filter for other analysts to use and you can use any saved filter.

1. In the Filters panel, select one or more options to filter the incidents list. For example, in the Time Range field, select Last 24 Hours, and for Priority, select Critical.
2. Click **Save As** and in the **Save Filter** dialog, enter a unique name for the filter and save it, for example Last24Hours-Critical.

The filter is added to the **Saved Filters** list.

Update a Saved Incidents Filter

Note: This option is available in NetWitness Platform Version 11.5 and later.



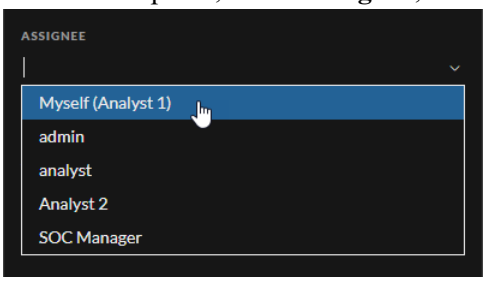
1. In the Filters panel **Saved Filters** drop-down list, select a saved filter.
2. Update your filter selections and click **Save**.

Delete a Saved Incidents Filter

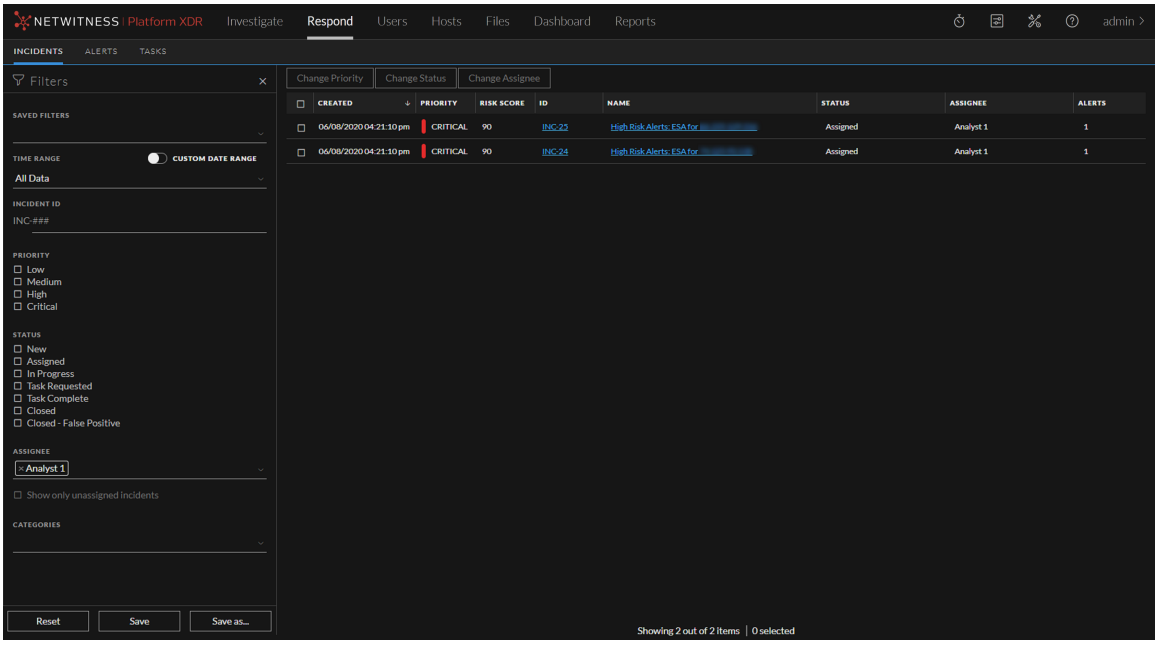
Note: This option is available in NetWitness Platform Version 11.5 and later.

When a saved filter is no longer required, you can remove it from the saved filters list. Filters used in the Springboard cannot be deleted.

1. In the Filters panel, open the **Saved Filters** drop-down list.



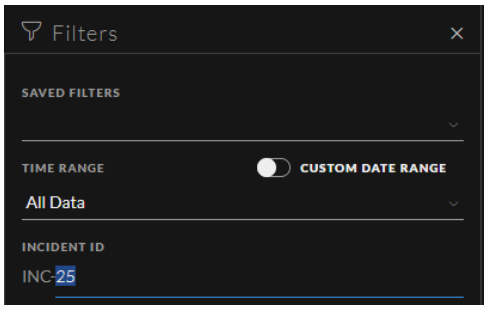
2. Next to the filter name, click  to delete it.



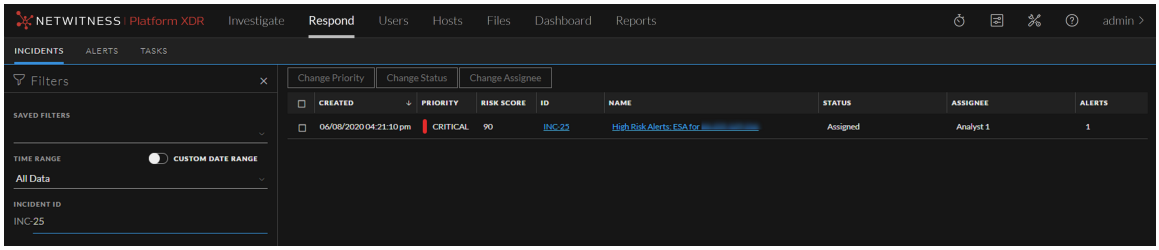
View My Incidents

You can view your incidents by filtering the incidents by your username.

1. If you cannot see the Filter panel, in the Incidents List view toolbar, click .
2. In the Filter panel, under **Assignee**, select **Myself (your full name)** from the drop-down list.



The incidents list shows the incidents that are assigned to you.



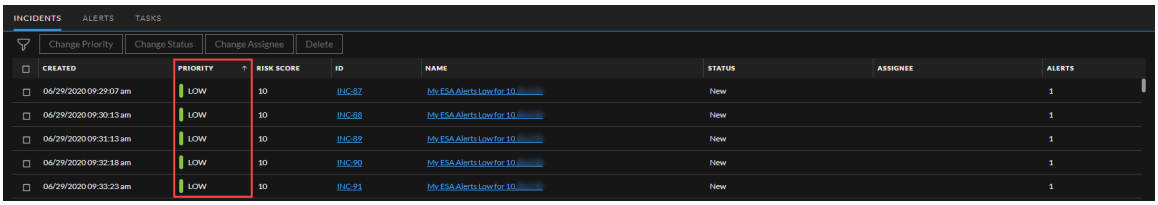
Find an Incident

If you know the Incident ID, you can quickly locate an incident using the Filter. For example, you may want to locate a specific incident out of thousands of incidents.

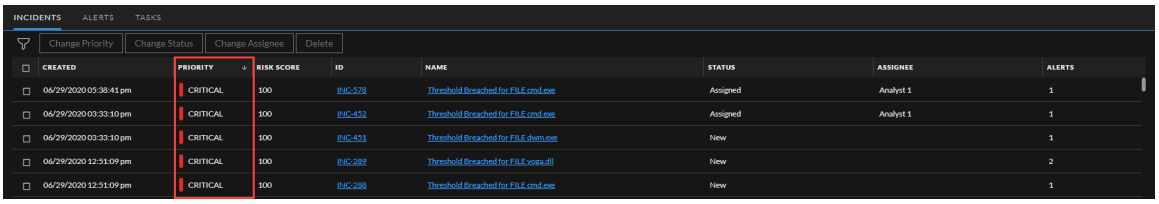
1. Go to **Respond > Incidents**.
   The Filters panel is located to the left of the incidents list. If you do not see the Filters panel, in the Incident Lists view toolbar, click , which opens the Filters panel.

2. In the **INCIDENT ID** field, type the Incident ID for an incident that you would like to locate, for example, type **25** for INC-25.
   The specified incident appears in your incident list. If you do not see any results, try resetting your filters.

Sort the Incidents List



The default sort for the incidents list is by Created date in descending order (newest on the top).

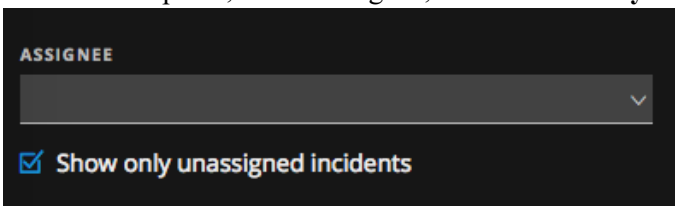


You can change the sort order of the incidents list by clicking a column header in the list.

For example, to prioritize the incidents, you can sort your view by clicking the Priority column header.

The following figure shows the incidents list sorted by Priority in ascending order (lowest priority on top).

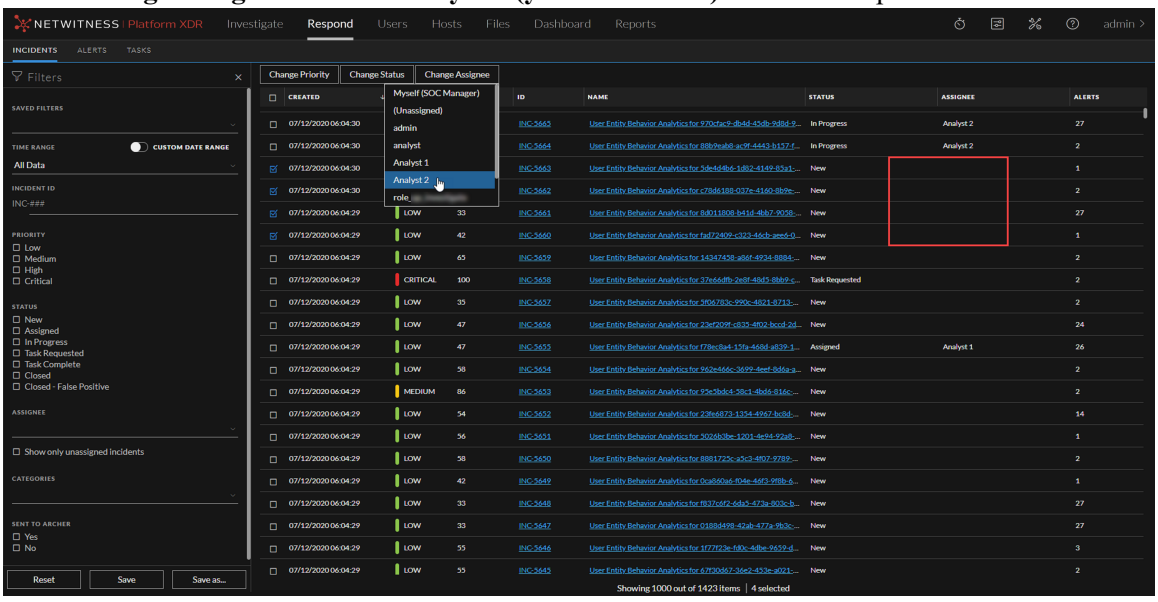
To sort by Priority in descending order (highest priority on top), click the Priority column header again. The highest priority incidents are at the top as shown in the following figure.



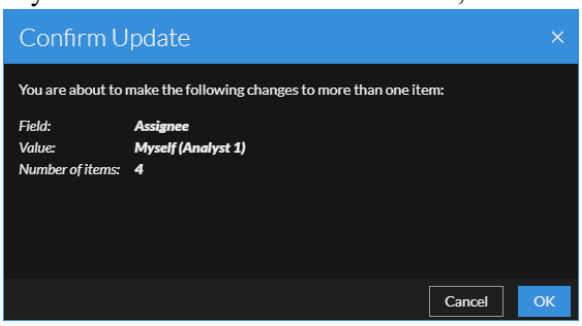
View Unassigned Incidents

Note: This option is available in NetWitness Platform Version 11.1 and later.

You can view unassigned incidents using the Filter.

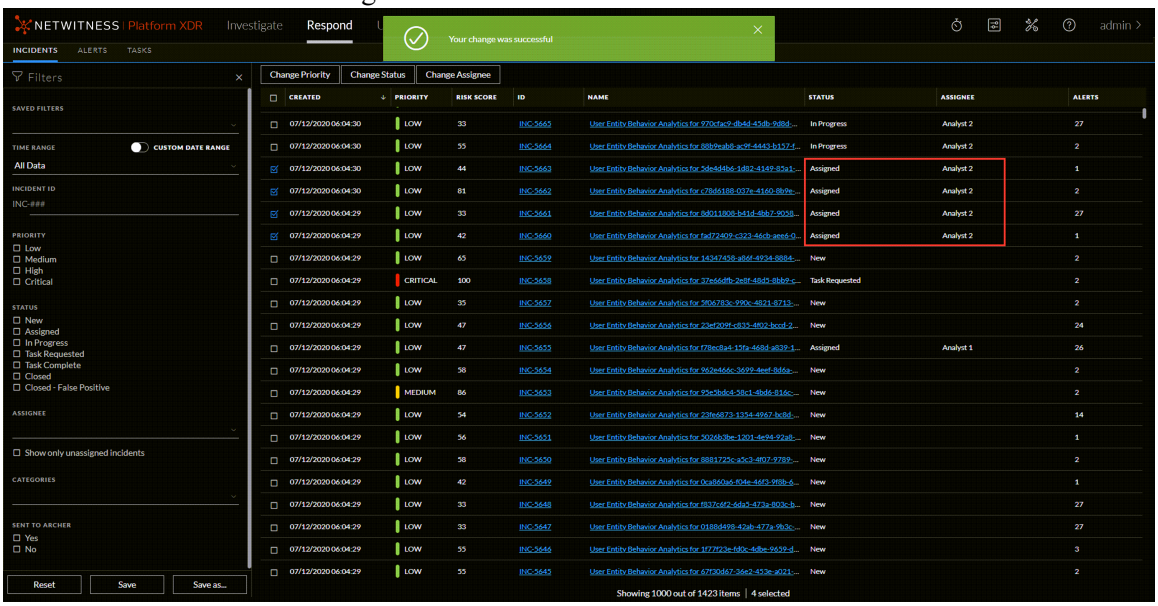


1. If you cannot see the Filter panel, in the Incident List view toolbar, click .
2. In the Filters panel, under Assignee, select **Show only unassigned incidents**.

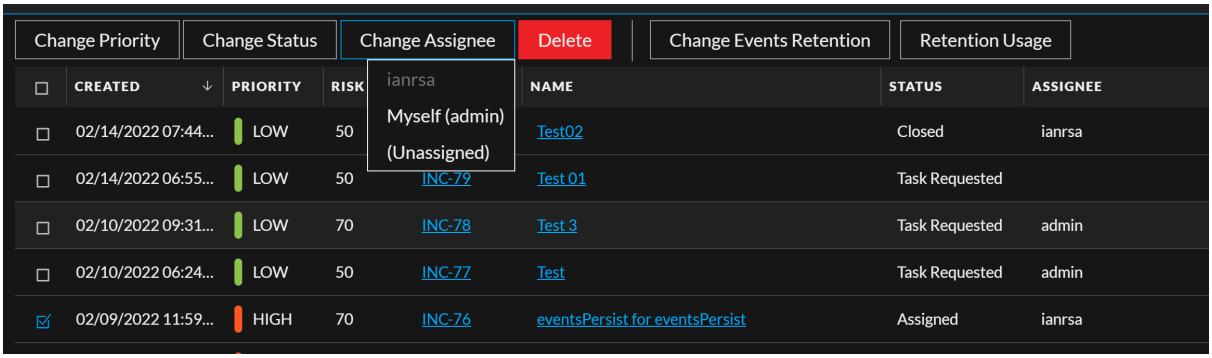


The incidents list is filtered to show unassigned incidents.

Assign Incidents to Myself

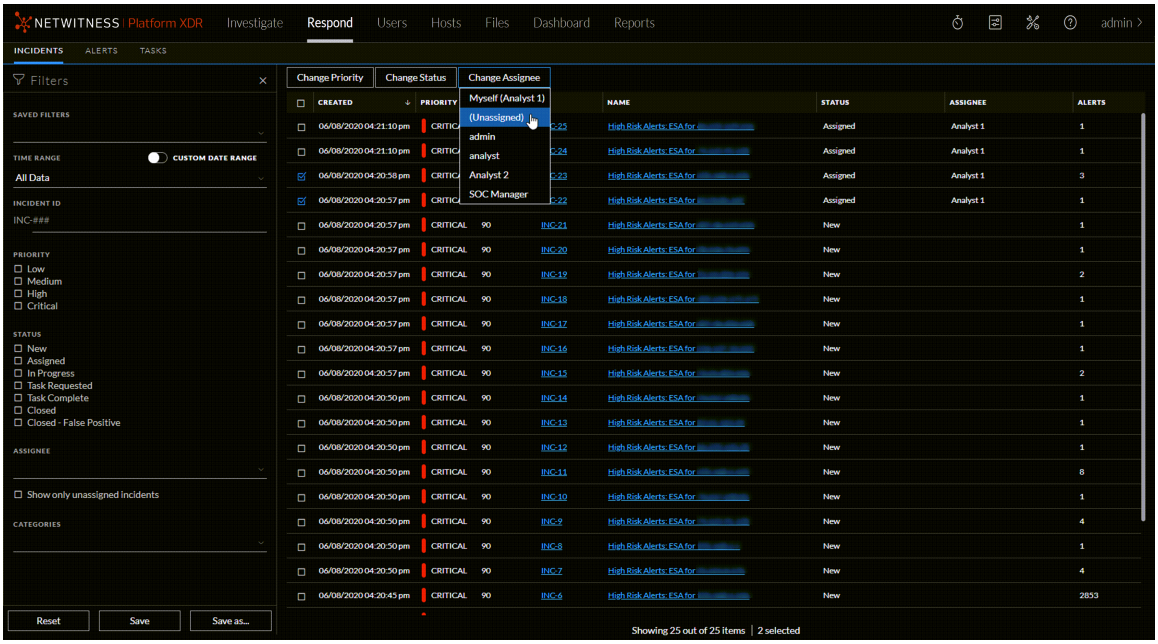


1. In the Incident List view, select one or more incidents that you want to assign to yourself.
2. Click **Change Assignee** and select **Myself (your full name)** from the drop-down list.

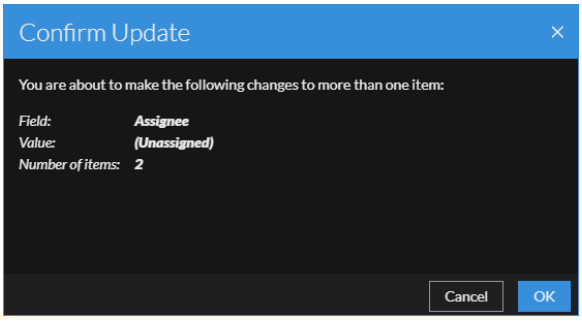


3. If you selected more than one incident, in the Confirm Update dialog, click **OK**.

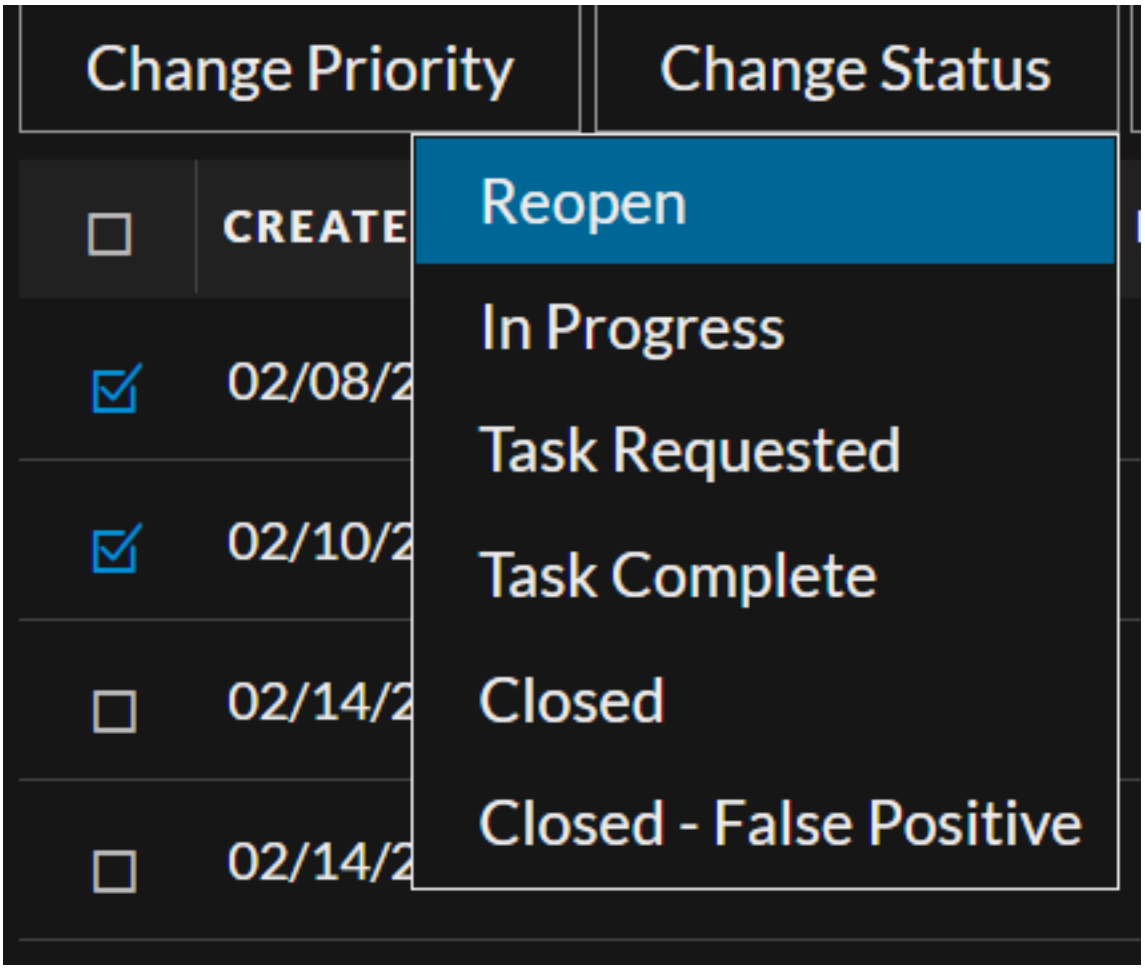
You can see a successful change notification.



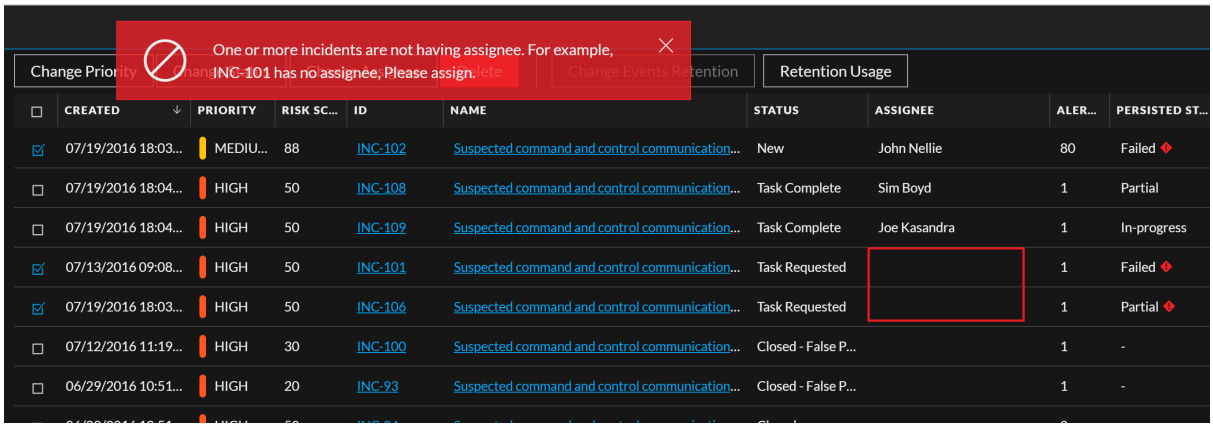
Note: On selecting any particular incident, current assignee name is grayed out under **Change Assignee** drop-down list. This is not applicable in case multiple incidents are selected. Refer the following figure.



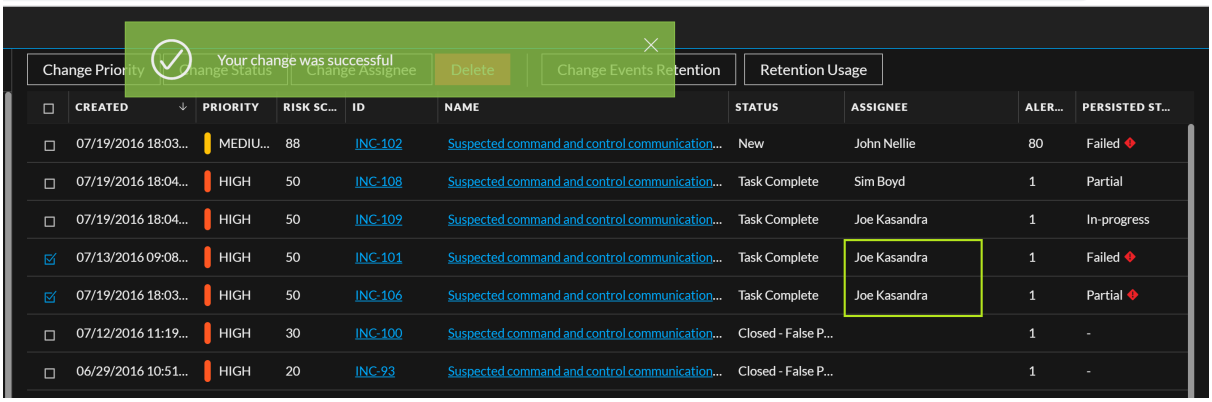
Unassign an Incident



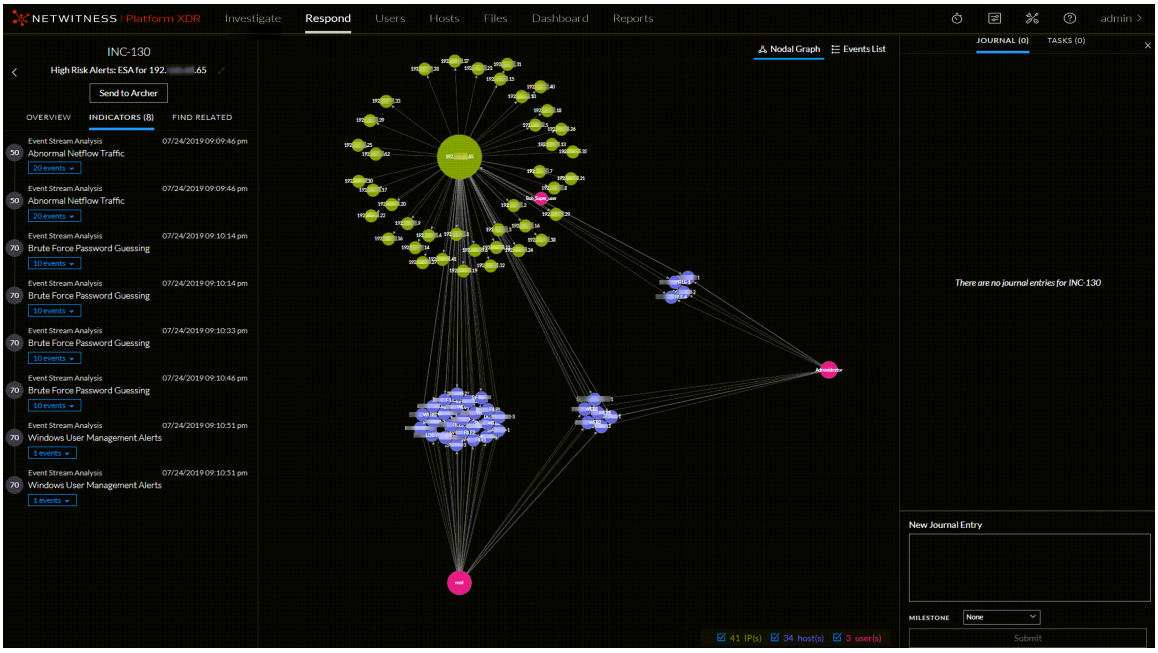
1. In the Incident List view, select one or more incidents that you want to unassign.
2. Click **Change Assignee** and select **(Unassigned)** from the drop-down list.



3. If you selected more than one incident, in the Confirm Update dialog, click **OK**.



4. Verify that the Status is still correct and make changes as required. To change the status, select one or more incidents, click **Change Status**, and select a new status.



Note: You must assign the incidents to change their status. If you try to change the incident status without assigning the incident, the error message **One or more incidents are not having assignee. For example, INC-x has no assignee, Please assign.** is displayed. Refer the following figures.

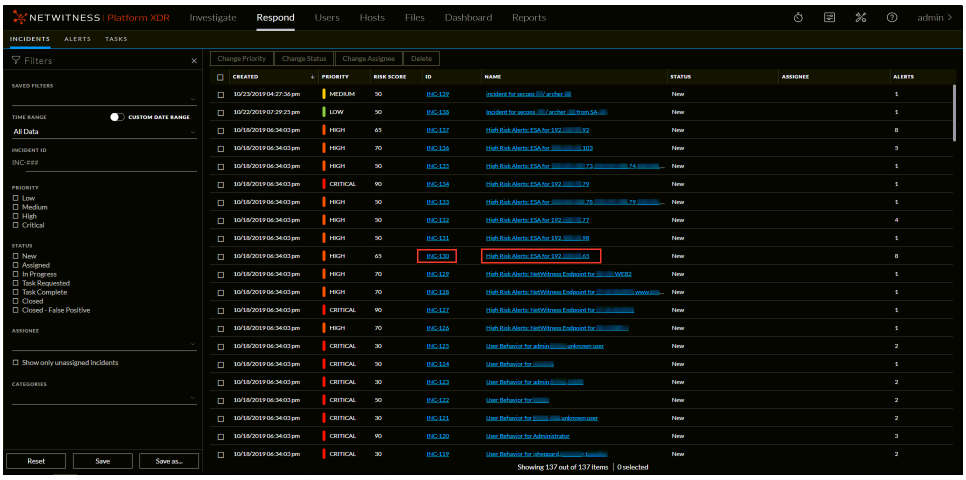
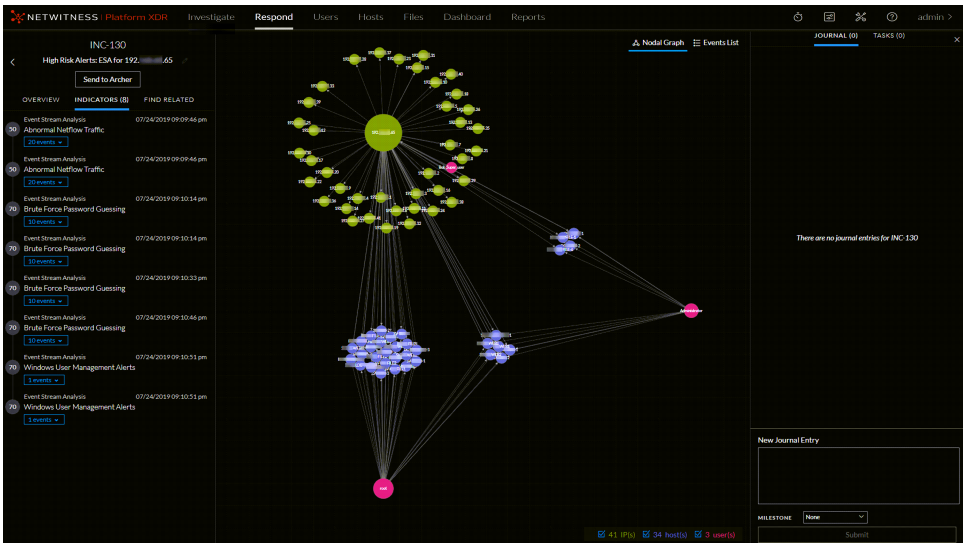
Determine which Incidents Require Action

Once you get the general information about the incident from the Incident List view, you can go to the Incident Details view for more information to determine the action required.



You can perform the following procedures in the Incident Details view to determine the action required on an incident:

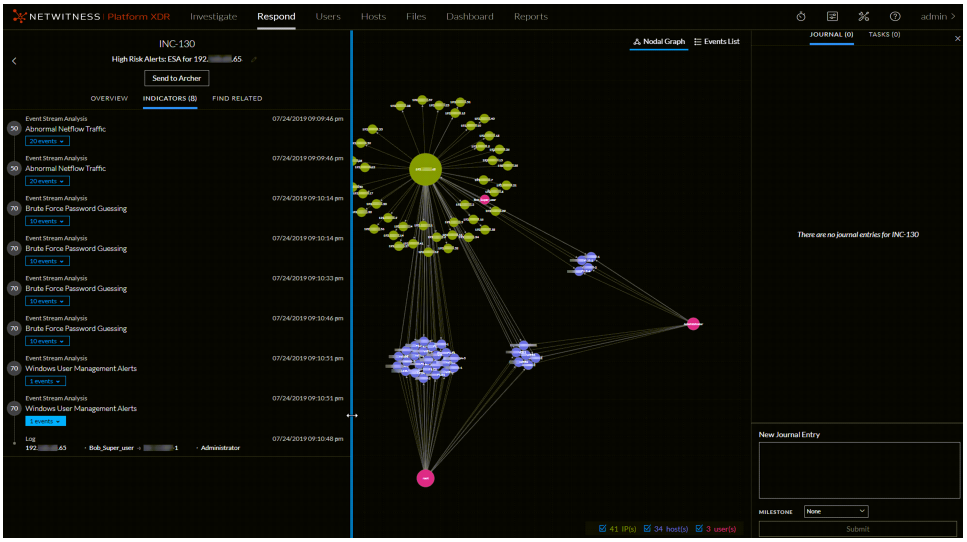


- View Incident Details
- View Basic Summary Information about the Incident
- View the Indicators and Enrichments
- View and Study the Events
- View C2 Enrichment Information for Suspected C&C Incidents
- View and Study the Entities Involved in the Events on the Nodal Graph
- Nodal Graph Behaviors and Characteristics
- Select Node Types to View on the Nodal Graph
- Filter the Data in the Incident Details View
- View the Tasks Associated with an Incident
- View Incident Notes
- Find Related Indicators
- Add Related Indicators to the Incident

View Incident Details

To view details for an incident, in the Incidents List view, choose an incident to view and then click the link in the **ID** or **NAME** column for that incident.

The Incident Details view for the selected incident appears with the Indicators panel, Nodal Graph, and Journal in view.



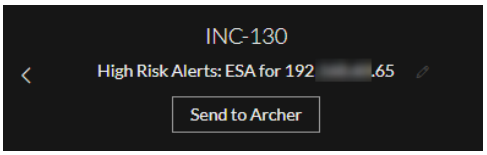
The Incident Details view has the following panels:

- **Overview**: The incident Overview panel contains high-level summary information about the incident, such as the score, priority, alerts, and status. You have the option to send the incident to Archer and change the incident Priority, Status, and Assignee.
- **Indicators**: The Indicators panel contains a chronological listing of indicators. *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert. This listing helps you to connect indicators and

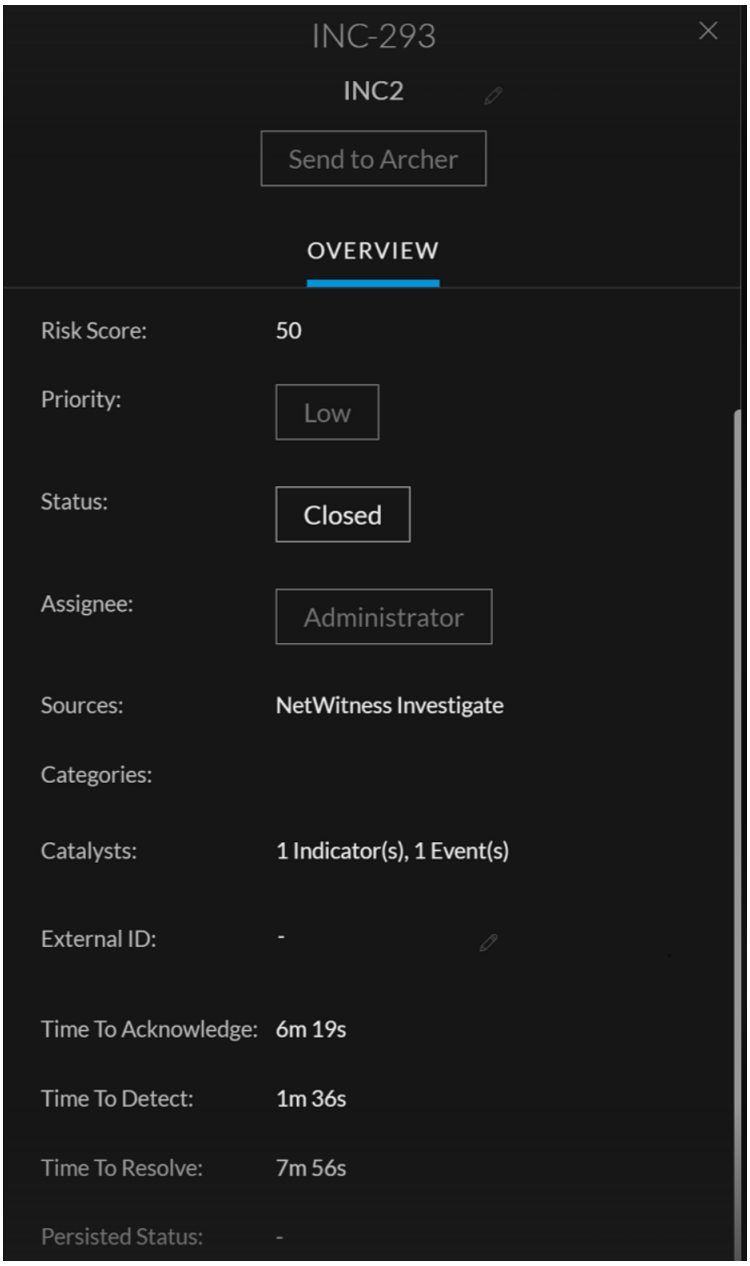
notable data. For example, an IP address connected to a command and communication ESA alert might also have triggered a NetWitness Endpoint alert or other suspicious activities.

- **Related Indicators**: The Related Indicators panel enables you to search the NetWitness alerts database to find alerts that are related to this incident. You can also add related alerts that you find to the incident.
- **History**: The History panel allows you to view the different actions performed by the user on an incident. Events such as Incident Assignee change, Incident Status change, Incident Priority change, and Incident creation are recorded in this panel.
- **Nodal Graph**: The nodal graph is an interactive graph that shows the relationship between the entities involved in the incident. An *Entity* is represented by an IP address, MAC address, user, host, domain, file name, or file hash.
- **Events List**: The Events List, also known as the Events table, lists the events associated with the incident. It also shows event source and destination information along with additional information depending on the event type. You can click the top of an event in the list to view the detailed data for that event.
- **Journal**: The Journal panel enables you to access the Journal for the selected incident, which allows you to communicate and collaborate with other analysts. You can post notes to a journal, add Investigation Milestone tags (Reconnaissance, Delivery, Exploitation, Installation, Command and Control, Action on Objective, Containment, Eradication, and Closure), and view the history of activity on your incident.
- **Tasks**: The Tasks panel shows all of the tasks that have been created for the incident. You can also create additional tasks from here.

To view more information in the left-side panel without scrolling, you can hover over the right edge and drag the line to resize the panel as shown in the following figure:

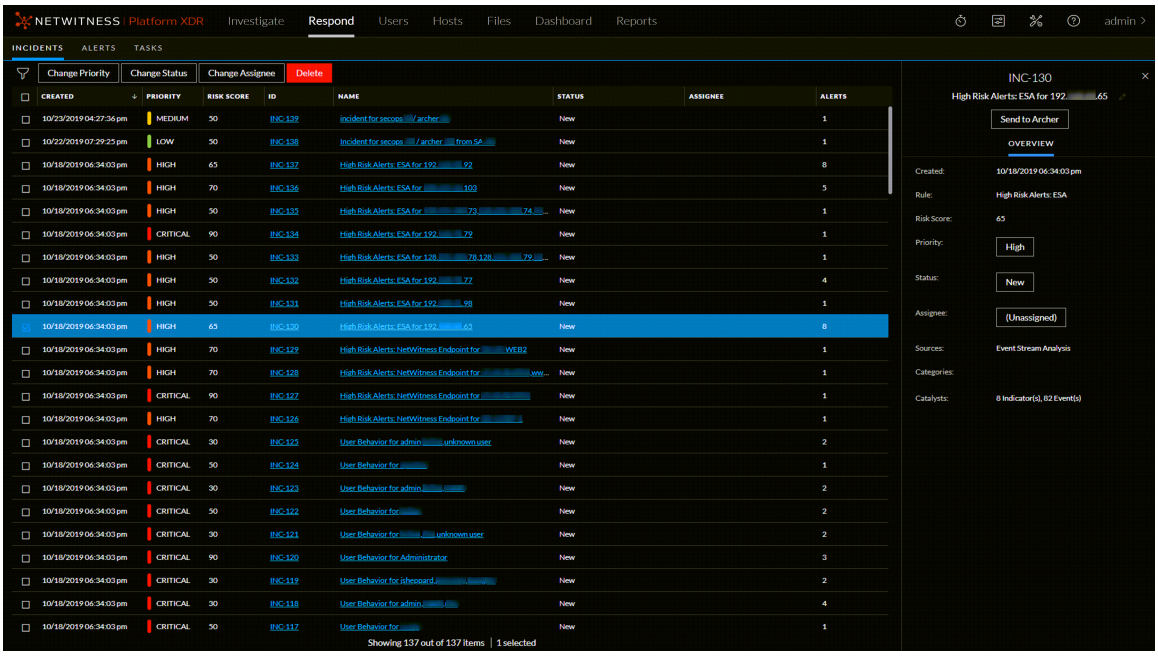


View Basic Summary Information about the Incident



You can view basic summary information about an incident in the Overview panel.

Above the Overview panel, you can see the following information:

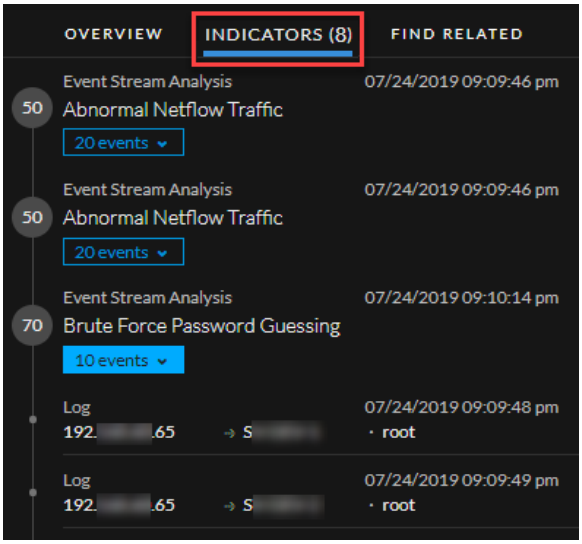


- **Incident ID**: This is an automatically created unique ID assigned to the incident.
- **Name**: The incident name is derived from the rule used to trigger the incident.
- **Send to Archer / Sent to Archer**: (In version 11.2 and later, if Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and this option is available in NetWitness Respond.) This shows whether an incident has been sent to Archer Cyber Incident & Breach Response. An incident sent to Archer shows as Sent to Archer. An incident that has not been sent to Archer shows as Send to Archer. You can click the Send to Archer button to send the incident to Archer Cyber Incident & Breach Response.

To view the Overview panel from the Incident Details view, select **Overview** in the left panel.

To view the Overview panel from the Incidents List view, click a row in the incident list. The Overview panel appears on the right.

The Overview panel contains basic summary information about the selected incident:



- **Created**: Shows the creation date and time of the incident.
- **Rule / By**: Shows the name of the rule that created the incident or the name of the person who created the incident.
- **Risk Score**: Shows a value between 0 and 100 that indicates the risk of the incident as calculated by an algorithm. 100 is the highest risk score.
- **Priority**: Shows the incident priority. Priority can be Critical, High, Medium or Low.
- **Status**: Shows the incident status. The status can be Reopen, New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed - False Positive. After you create a task, the status changes to Task Requested.
- **Assignee**: Shows the team member currently assigned to the incident.
- **Sources**: Indicates the data sources used to locate the suspicious activity.
- **Categories**: Shows the categories of the incident events.
- **Catalysts**: Shows the count of indicators that gave rise to the incident.
- **External ID**: Allows storing the Incident ID referrals from a different platform such as Archer.
- **Time to Acknowledge**: Shows the time taken to assign an Incident after creating it.
- **Time to Detect**: Shows the time taken for completing the task after the Incident is assigned.
- **Time to Resolve**: Shows the time taken for closing the task after the Incident is created.
- **Persisted Status**: Shows the persist status of the Incident. The status can be Complete, Partial, or None (-).

View the Indicators and Enrichments

Note: *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert.

You can find indicators, events, and enrichments on the Indicators panel. The Indicators panel is a chronological listing of indicators that helps you to find enrichments and events related to the triggering indicator. For example, an indicator might be a Command and Control alert, a NetWitness Endpoint alert, a Suspicious Domain (C2) alert, or an alert from an Event Stream Analysis (ESA) rule. The Indicators panel helps you to aggregate and order these indicators (alerts) from different systems so that you can see how they are related and also help you develop a timeline of a given attack.

To view the Indicators panel, in the left panel of the Incident Details view, select **Indicators**.

Indicators are alerts, such as an ESA alert or a NetWitness Endpoint alert. This listing helps you to connect indicators and notable data. For example, indicators can show the data found by your rules. In the Indicators panel, the risk score for an indicator is shown within a solid-colored circle.

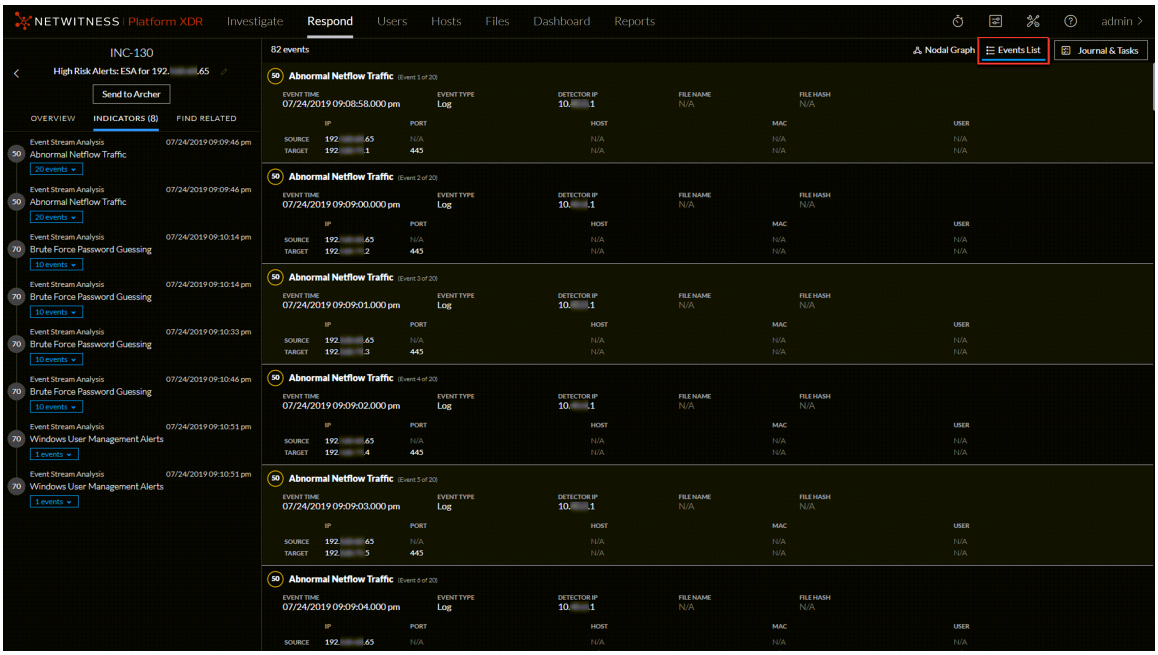
Data source information is shown below the names of the indicators. You can also see the creation date and time of the indicator and the number of events in the indicator. When data is available, you can see the number of enrichments. You can click the event and enrichment buttons to view the details.

Note: The maximum number of indicators (alerts) displayed in the Indicators panel is 1,000.

View and Study the Events

You can view and study the events associated with the incident from the Events List. It shows information about the events, such as event time, source IP, destination IP, detector IP, source user, destination user, and file information about the events. The amount of information listed depends on the event type.

There are two types of events:



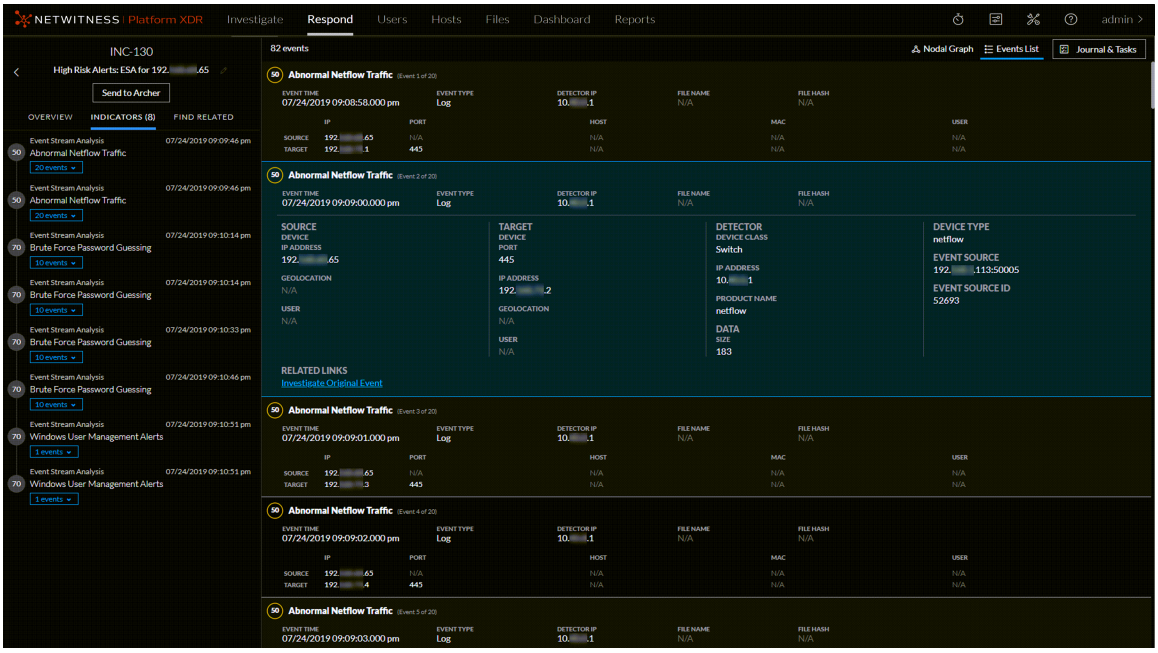
- A transaction between two machines (a Source and a Destination)
- An anomaly detected on a single machine (a Detector)

Some events will only have a Detector. For example, NetWitness Endpoint finds malware on your machine. Other events will have a Source and Destination. For example, packet data shows communication between your machine and a Command and Control (C2) domain.

You can drill further into an event to get detailed data about the event.

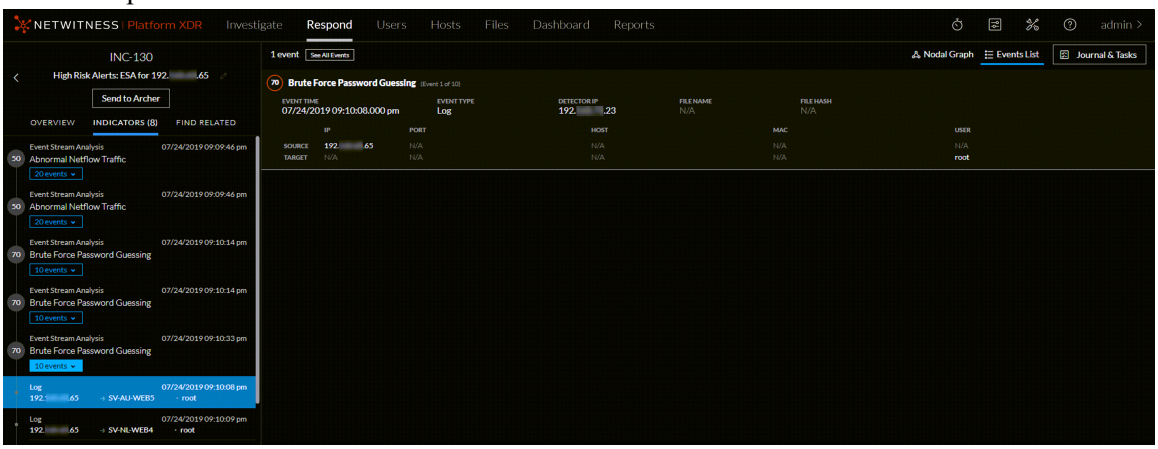
To view and study the events:

1. To view the Events List, in the Incident Details view toolbar, click Events List.



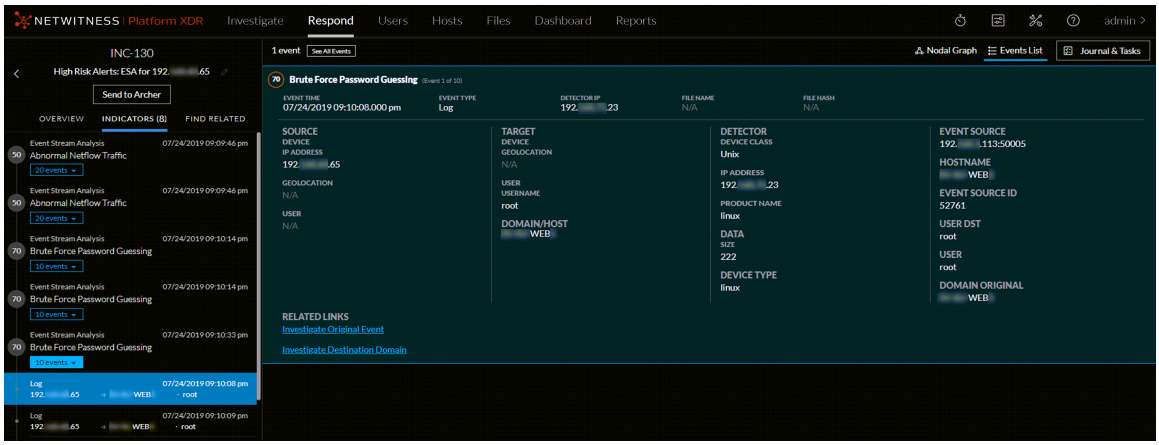
Note: The EVENT TIME displayed on this screen is the same as the COLLECTION TIME from the investigation page.

The Events List shows different information about each event depending on the event type. The maximum number of events displayed in the Events List is 1,000.



The following table lists typical event information. For details specific to endpoint events, see Events List.

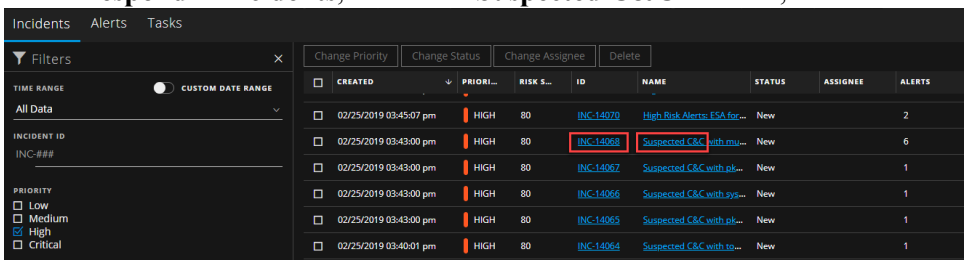
Field	Description
EVENT TIME	Shows the time the event occurred.
EVENT TYPE	Shows the type of alert, such as Log and Network.
DETECTOR IP	Shows the IP address of the machine where an anomaly was detected.
FILE NAME	Shows the file name if a file is involved with the event.
FILE HASH	Shows a hash of the file contents.
SOURCE IP	Shows the source IP address if there was a transaction between two machines.
SOURCE PORT	Shows the source port of the transaction. The source and destination ports can be on the same IP address.
SOURCE HOST	Shows the destination host where the event took place.
SOURCE MAC	Shows the MAC address of the source machine.
SOURCE USER	Shows the user of the source machine.
TARGET IP	Shows the destination IP address if there was a transaction between two machines
TARGET PORT	Shows the destination port of the transaction. The source and destination ports can be on the same IP address.
TARGET HOST	Shows the host name of the destination machine.
TARGET MAC	Shows the MAC address of the destination machine.
TARGET USER	Shows the user of the destination machine.



2. Click the top of an event in the Events List to view the event details.
   This example shows the event details for a selected event in the list.

3. To view the events for a specific indicator (alert), go to the Indicators panel on the left and click the indicator to view the events for that indicator in the Events List on the right.
   This example shows one event for a selected indicator.

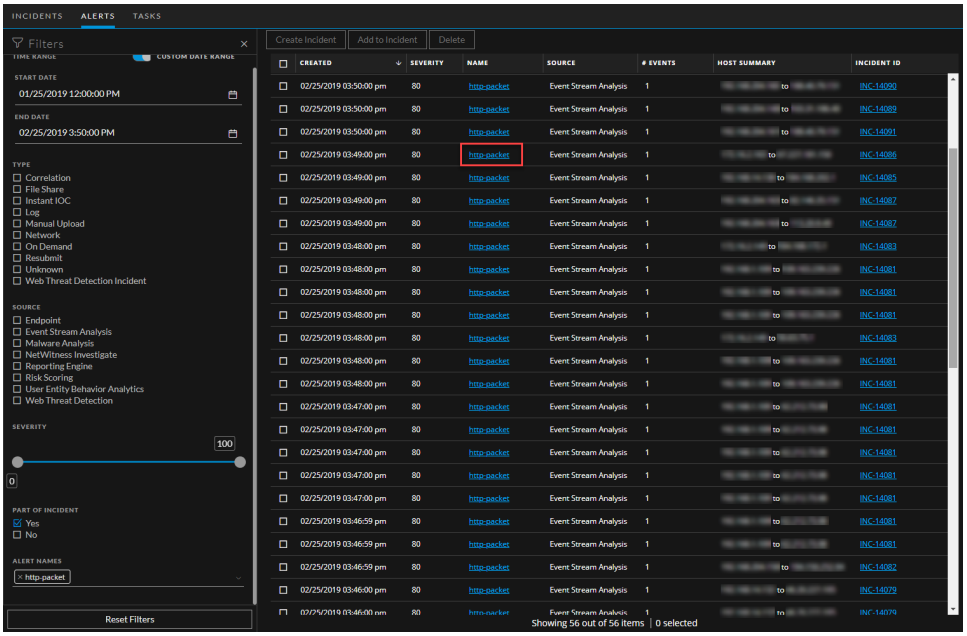
4. To view event details for a specific indicator event, select an event in the Indicators panel. Click the top of the event to view the details.
   The following example shows information for the selected event.



If you have additional Investigate-server permissions, you can also access event analysis details for events. See View Event Analysis Details for Indicators. If you have the UEBA_Analysts role, you can access UEBA details for indicators. See View User Entity Behavior Analytics for Indicators.

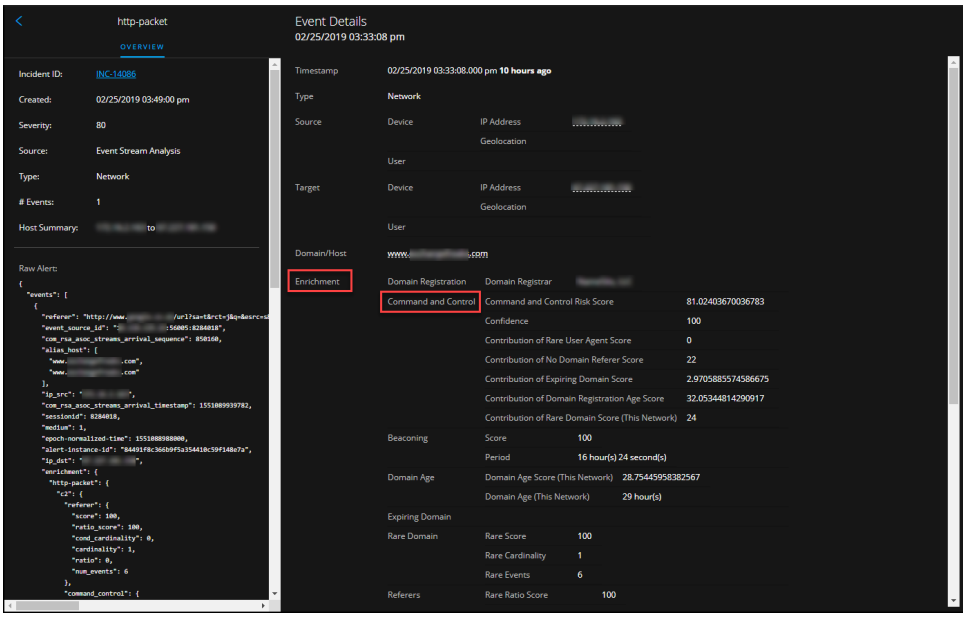
View C2 Enrichment Information for Suspected C&C Incidents

Note: This procedure applies only to incidents from ESA Analytics in NetWitness Version 11.3 and 11.4. The Event Stream Analytics Server (ESA Analytics) service, which is used for Automated Threat Detection, is end of life (EOL) and not supported in NetWitness Platform Version 11.5 and later.



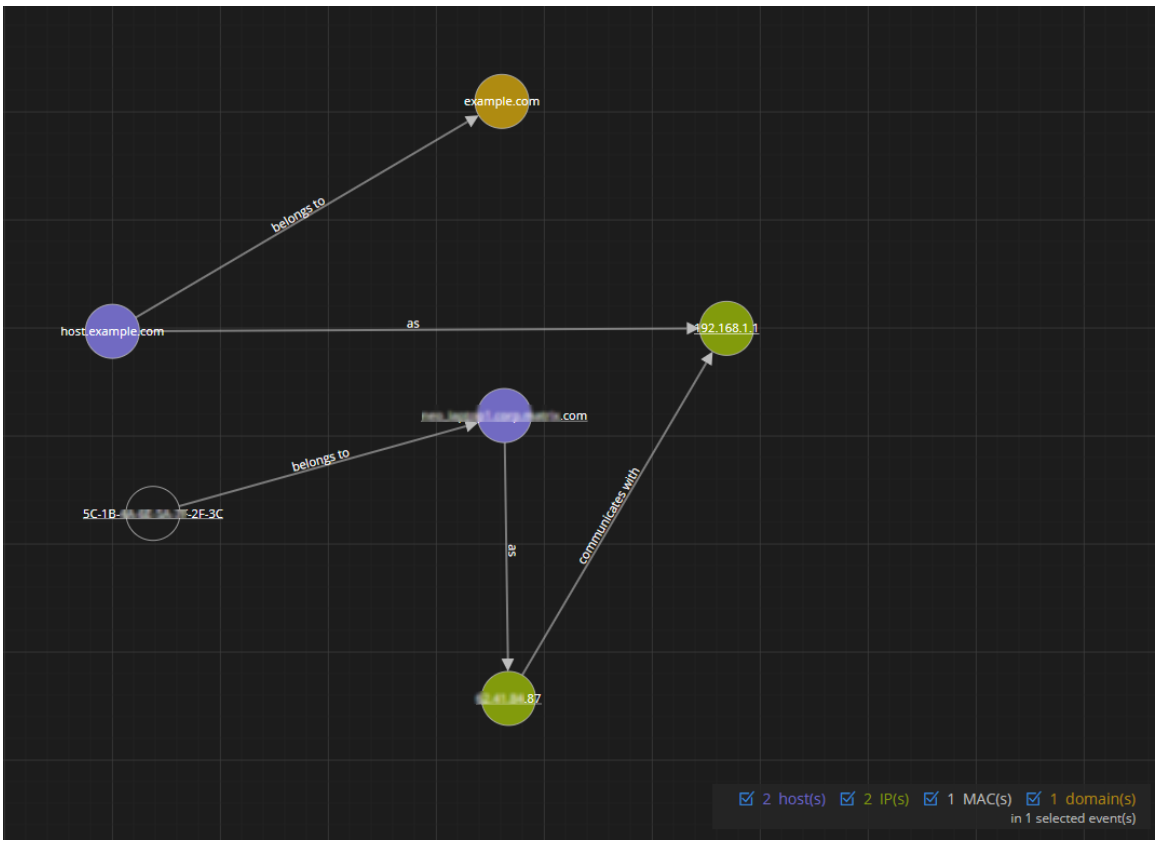
The Events List in version 11.3 and later does not show the Command and Control (C2) enrichment information for HTTP packet alerts in Suspected C&C incidents. However, you can view the C2 enrichment information in the Alert Details view.

1. Go to **Respond > Incidents**, look for a **Suspected C&C** incident, and note the incident ID.



2. Go to **Respond > Alerts** and in the Filters panel, select the following to locate an alert in the Alerts list with the incident ID noted above:
   a. In the **Part of Incident** section, select **Yes**.
   b. In **Alert Names** section, select **http-packet**.

If you are still not able to locate an alert in the Alerts list with the incident ID noted above, try filtering your alerts list more using the time range of the incident.



3. In the Alerts list, click the **http-packet** link in the **NAME** field of the alert associated with the incident ID.
The Event Details view shows the C2 enrichment information.

View and Study the Entities Involved in the Events on the Nodal Graph

An *Entity* is either an IP address, MAC address, user, host, domain, file name, or file hash. The nodal graph is an interactive graph that you can move around to get a better understanding of how the entities involved in the events relate to each other. The nodal graphs look different depending on the type of event, the number of machines involved, whether the machines are associated with users, and if there are files associated with the event.

The following figure shows an example nodal graph with six nodes.

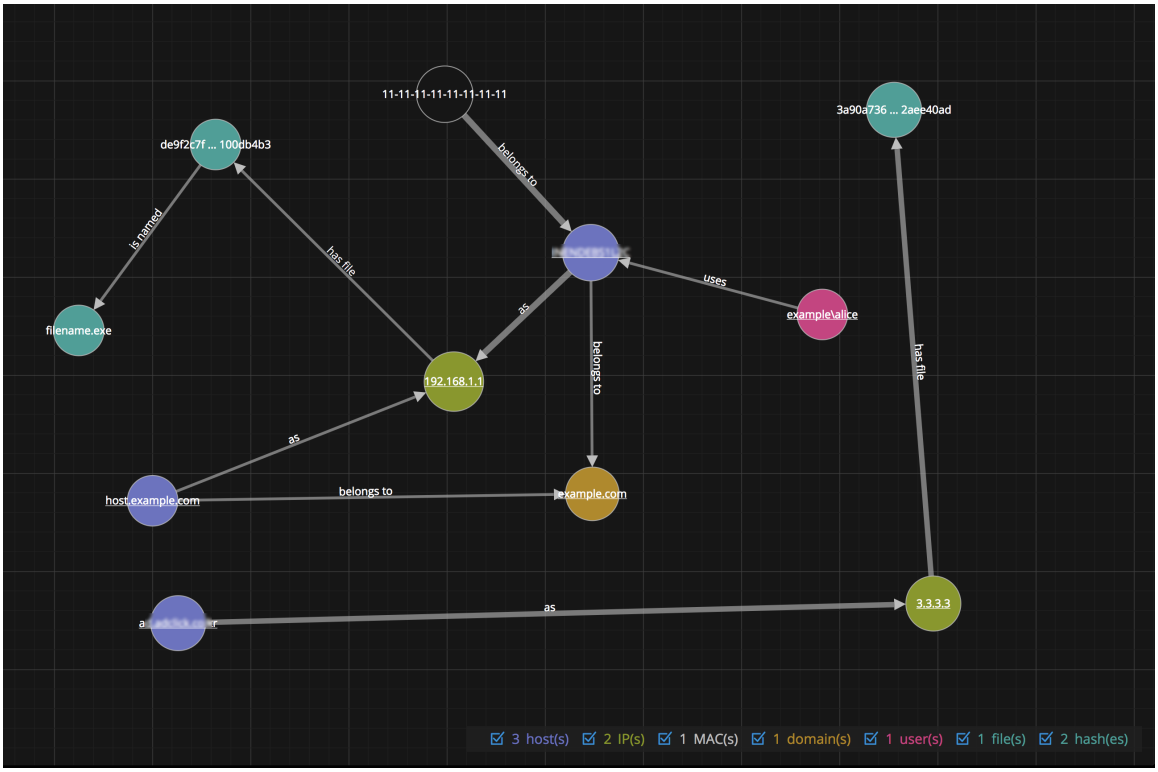
If you look closely at the nodal graph, you can see circles that represent nodes. A nodal graph can contain one or more of the following types of nodes:

- **IP address** (If the event is a detected anomaly, you can see a Detector IP. If the event is a transaction, you can see a Destination IP and a Source IP.)
- **MAC address** (You may see a MAC address for each type of IP address.)
- **User** (If the machine is associated with a user, you can see a user node.)
- **Host**
- **Domain**

- **Filename** (If the event involves files, you can see a filename.)
- **File Hash** (If the event involves files, you may see a file hash.)

In NetWitness 11.3 events, nodes for source filename and file hash are supported, but nodes for target filename and file hash are not supported. In NetWitness 11.4 and later events, nodes for both source and target filenames as well as file hashes are supported.

The legend at the bottom of the nodal graph shows the number of nodes of each type and the color coding of the nodes.

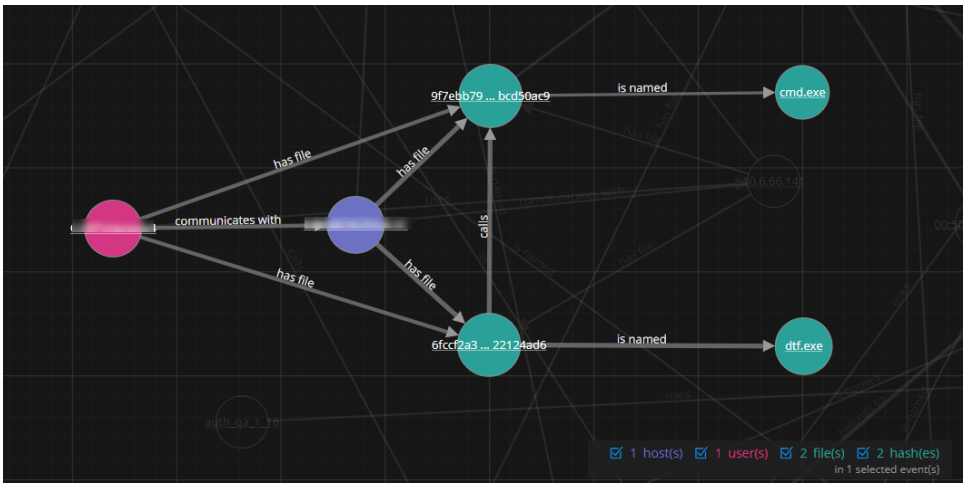


You can click and drag any node to reposition it.

The arrows between the nodes provide additional information about the entity relationships:

- **Communicates with**: An arrow between a Source machine node (IP address or MAC address) and a Destination machine node labeled with "communicates with" shows the direction of the communication.
- **Has file**: An arrow between a machine node (IP address, MAC address, or Host) and a file hash node labeled with "has file" indicates that the IP address has that file.
- **Uses**: An arrow between a User node and a machine node (IP address, MAC address, or Host) labeled with "uses" shows the machine that the user was using during the event.
- **Calls**: (This arrow is available in NetWitness Platform 11.4 and later.) An arrow between two file hash (checksum) nodes labeled with "calls" indicates the direction of the interaction between the associated files. The source file hash "calls" the target (destination) file hash, which indicates that the source file associated with the source file hash is performing an action on the target file associated with the target file hash.
- **As**: (This relationship type represents attributes of the connected node.) An arrow between nodes labeled with "as" provides additional information about the IP address that the arrow points to. In the above example, there is an arrow from the host node circle that points to an IP address node that is labeled with "as". This indicates that the name on the host node circle is the hostname of that IP address and is not a different entity.
- **Is named**: (This relationship type represents attributes of the connected node.) An arrow from a File Hash node to a File Name node labeled with "is named" indicates that the file hash corresponds to a file with that name.
- **Belongs to**: (This relationship type represents attributes of the connected node.) An arrow between two nodes labeled with "belongs to" indicates that they pertain to the same node. For example, an arrow between a MAC address and a Host labeled with "belongs to" indicates that it is the MAC address for the host.

Larger line size arrows indicate more communication between the nodes. Larger nodes (circles) indicate more activity than smaller nodes. The larger nodes are the most common entities mentioned in the events.



The following nodal graph example has 11 nodes.

In this example, notice that there are two IP nodes. They both have hashed files, but they do not communicate with each other. The IP address at the top (192.168.1.1) represents one machine with two hostnames (host.example.com is one of them) in the example.com domain. The MAC address of the machine is 11-11-11-11-11-11-11-11-11-11 and Alice uses it.

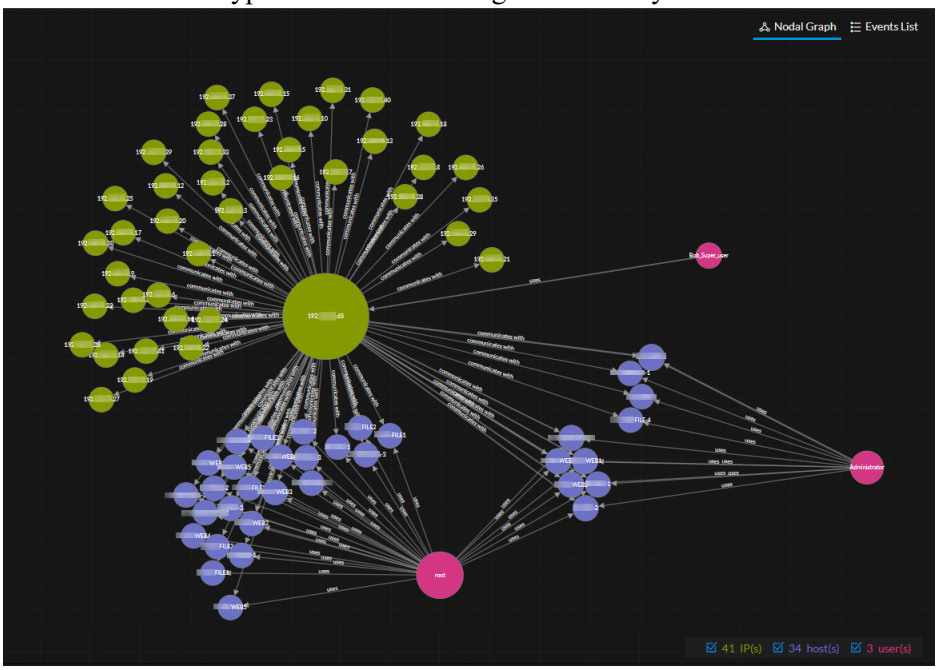
Note: The following example applies to NetWitness Platform 11.4 and later.

In the following nodal graph example, you can see the interaction between source and target (destination) files. There are six nodes in the selected event.

In this example, the user communicates with a host that has `dtf.eve` and `cmd.exe` files. The `dtf.exe` file on the host "calls" (in this case, launches) the `cmd.exe` file, which is suspected to be malicious activity. Notice that the "calls" arrow appears between the source and target file hashes, which are associated with the files.

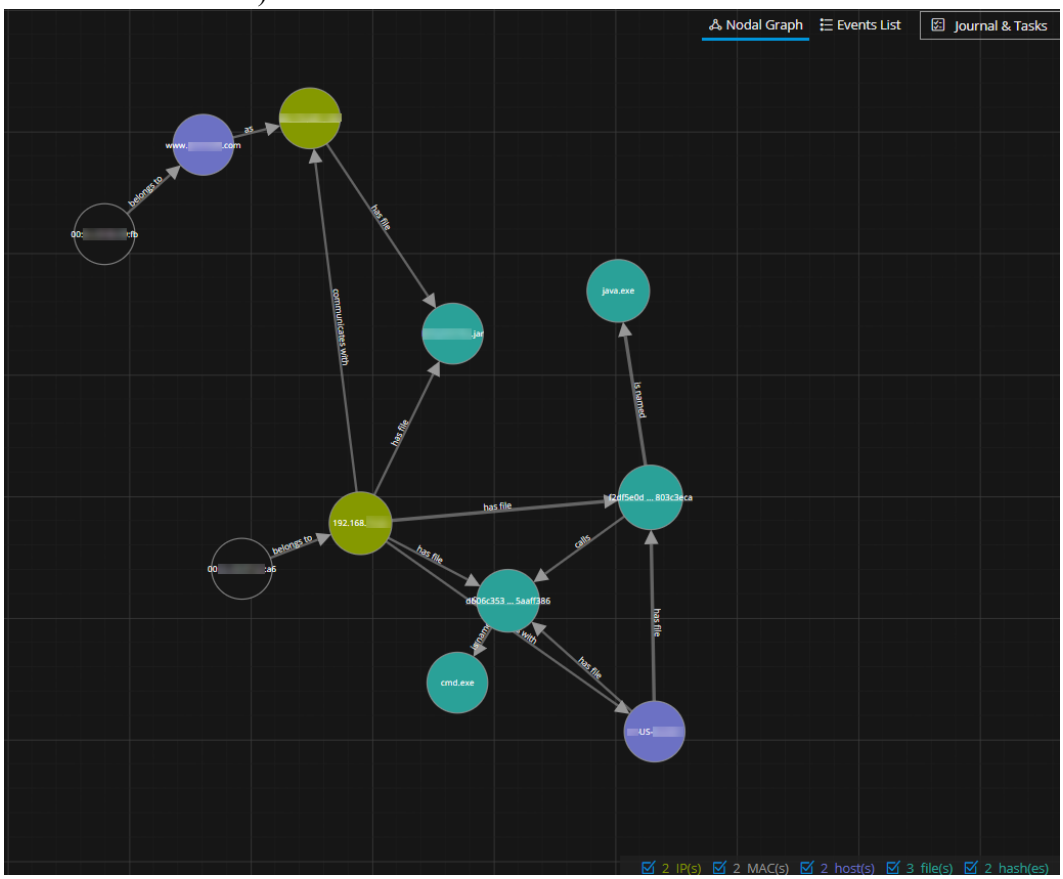
Nodal Graph Behaviors and Characteristics

Note: These nodal graph behaviors and characteristics are available in NetWitness Platform Version 11.4 and later.



The nodal graph makes it easier for an analyst to get an initial understanding of an incident with minimal effort.

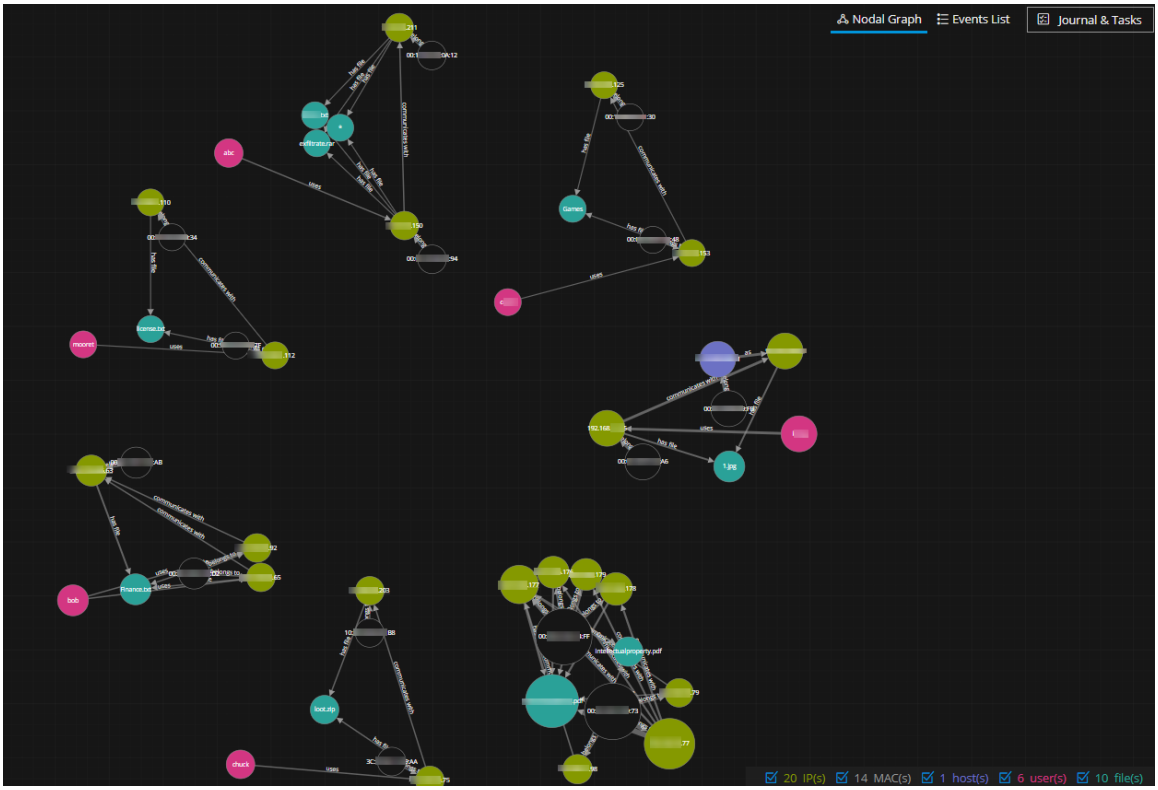
The nodal graph provides the following benefits to an analyst when responding to an incident:



- The nodal graph helps determine scope, commonalities, and outliers in a given dataset, which can be useful context for an analyst.
- In many cases, the initial nodal graph layout presents valuable insight without any interaction from the analyst.
- In cases where the initial layout does not give enough clarity or when an analyst wants to view things differently, a few nodal mouse-drag position adjustments can provide a much faster method of exposing insightful relationships and clusters.

The following behaviors and characteristics are now part of the graph:

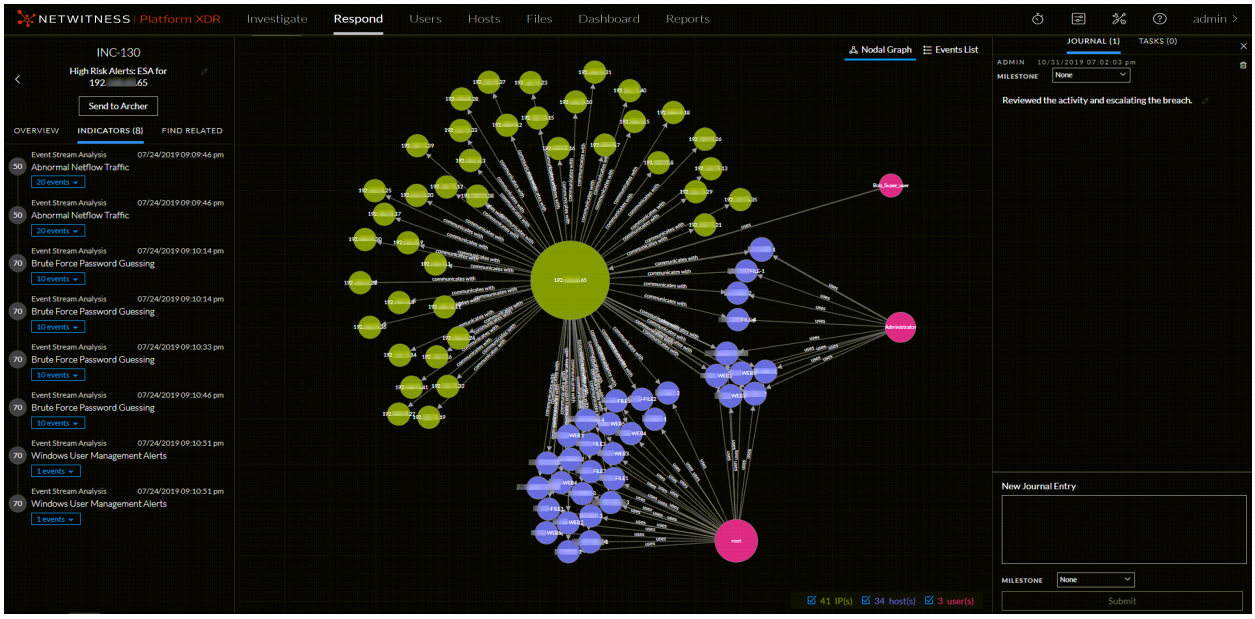
- Entities of similar types tend to cluster together visually.



- Attributes and actions are better differentiated. Arrows that represent attributes ("as", "is named", "belongs to", and "has file") tend to be shorter than those representing actions ("call" and "communicates with").

- Leaf nodes, which are nodes that only have a single relationship to a single entity, tend to stay closer together.

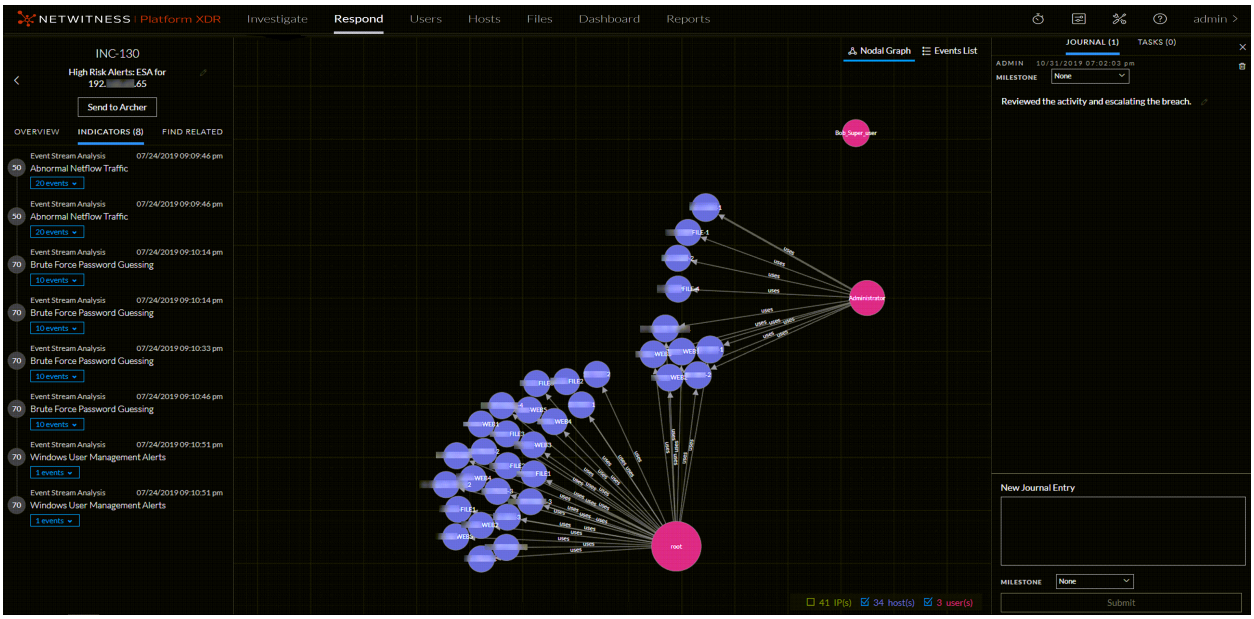
- Disjointed graphs, such as clusters of entities and relationships that do not have connections with one another, are forced apart.



Dragged nodes are pinned in place. Double-click a node to unpin it and allow the forces to apply again to the node.

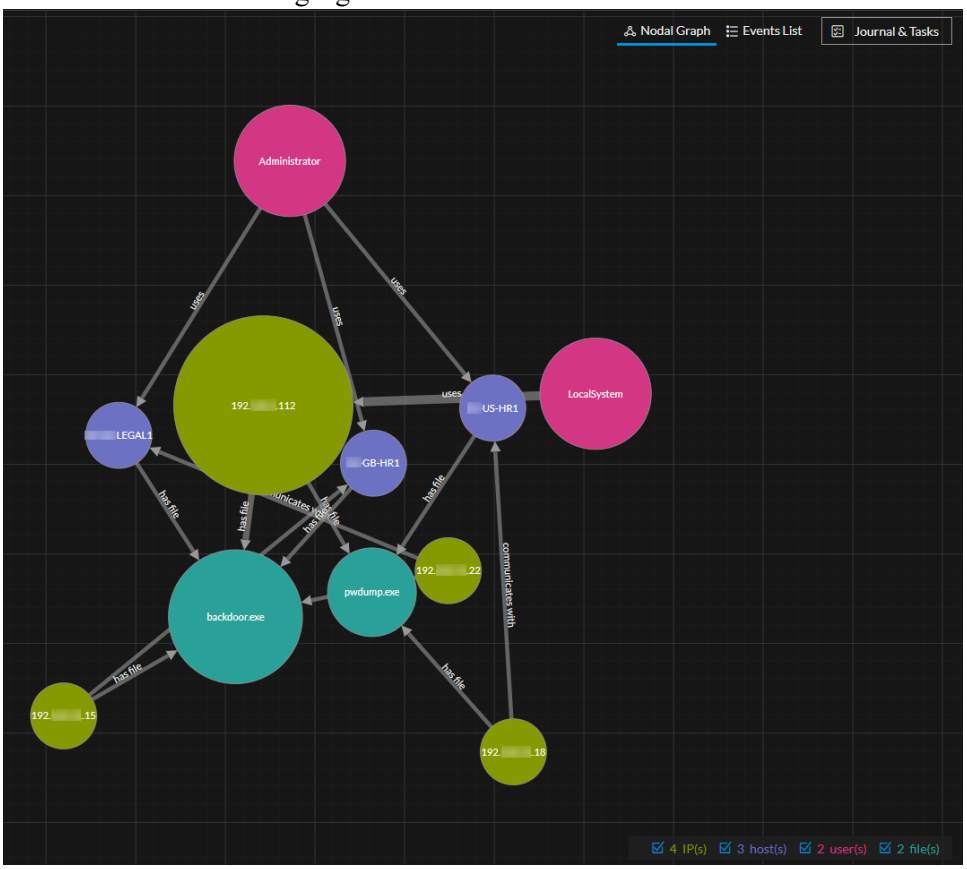
Select Node Types to View on the Nodal Graph

Note: This option is available in NetWitness Platform Version 11.2 and later.



In the Incident Details view nodal graph, you can hide node types to further study the interactions between the entities on the nodal graph.

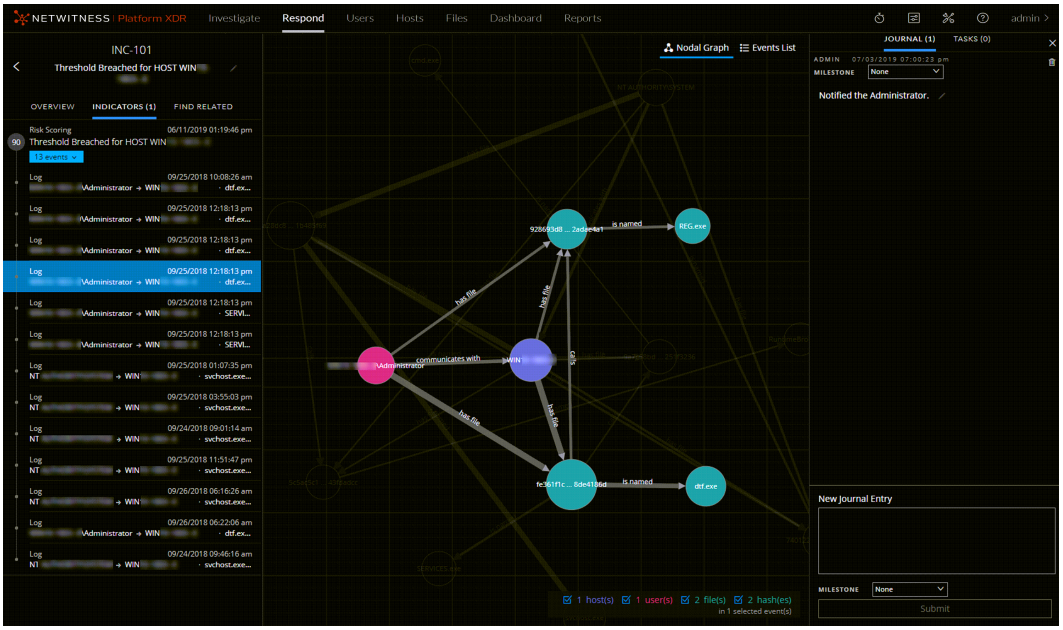
1. Go to **Respond > Incidents**.
2. In the Incidents List view, choose an incident to view and then click the link in the **ID** or **NAME** column for that incident.
   The Incident Details view for the selected incident appears with the Nodal Graph in view. The legend below the nodal graph has all of the entity node types selected by default.
   If you do not see the nodal graph, click Nodal Graph.



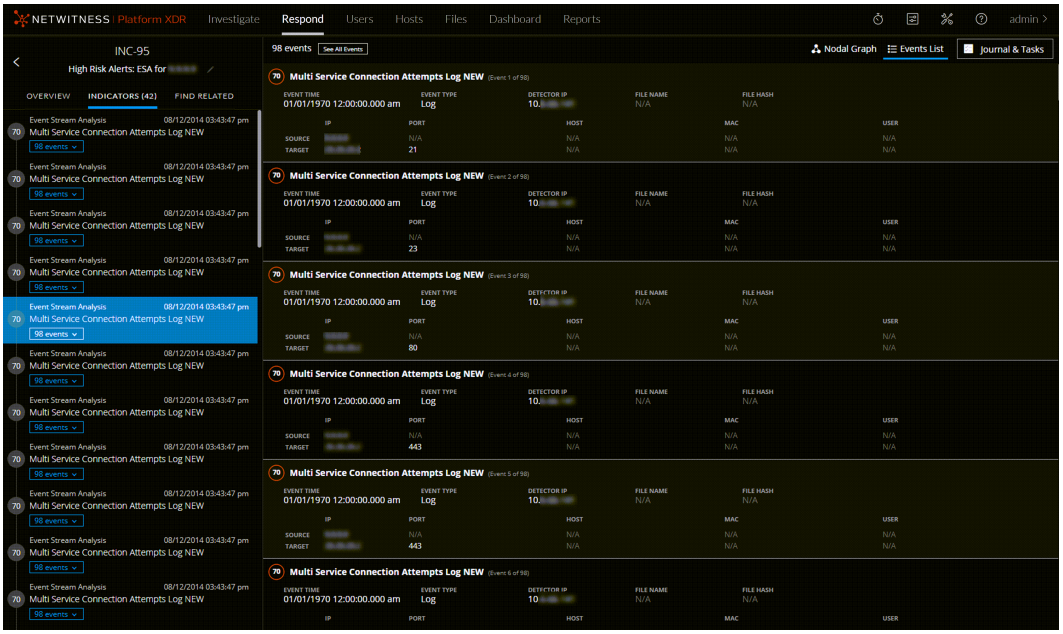
3. To hide node types, in the legend, clear the checkbox for the node types that you would like to hide in the nodal graph.

   The following example shows the IP address node type cleared and the IP address nodes are now hidden.

4. To include (unhide) node types, select the checkbox for the node types that you would like to appear in the nodal graph.
   Hiding node types can be especially helpful if the nodal diagram has overlapping entity relationships as shown in the following figure.



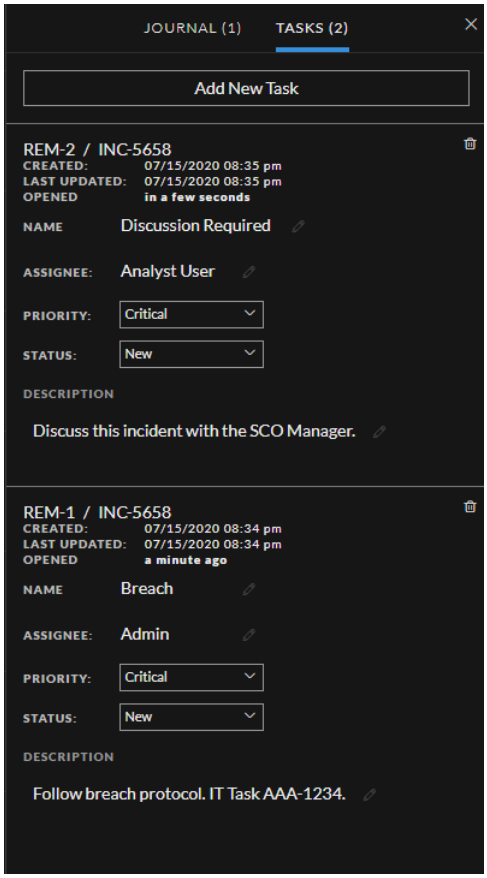
After hiding the IP node types, you can get a better understanding of what is happening with the remaining nodes.



Filter the Data in the Incident Details View

You can click indicators in the Indicators panel to filter what you can see in the Nodal Graph and the Events List.

If you select an indicator to filter the nodal graph, data that is not part of your selection is dimmed, but it is still in view as shown in the following figure.

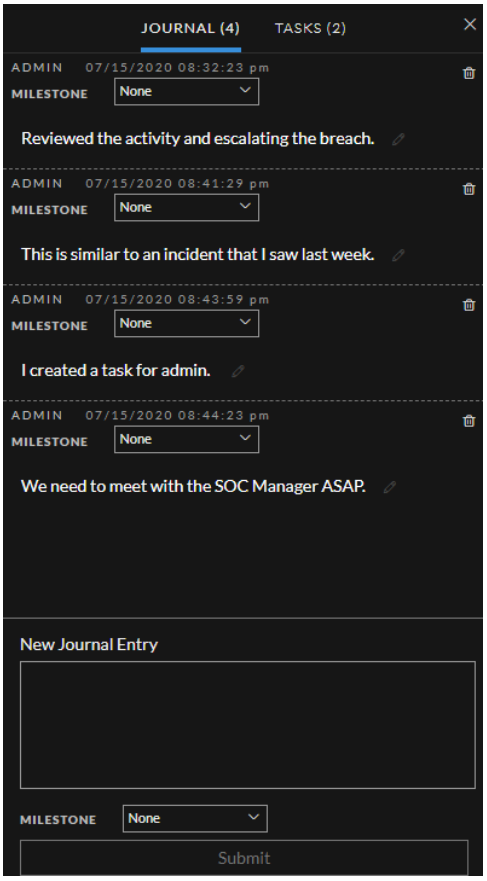


If you select an indicator to filter the Events List, only the events for that indicator are shown in the list. The following figure shows an indicator selected that contains ninety-eight events. The filtered Events List shows those ninety-eight events.

View the Tasks Associated with an Incident

Threat responders and other analysts can create tasks for an incident and track those tasks to completion. This can be very helpful, for example, when you require actions on incidents from teams outside of your security operations. You can view the tasks associated with an incident in the Incident Details view.

1. Go to **Respond > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident.
3. In the Journal on the right side of the Incident Details view, click the **TASKS** tab.
   If you cannot see the Journal, click **Journal & Tasks** and then click the **TASKS** tab.
   The Tasks panel shows all of the tasks for the incident.

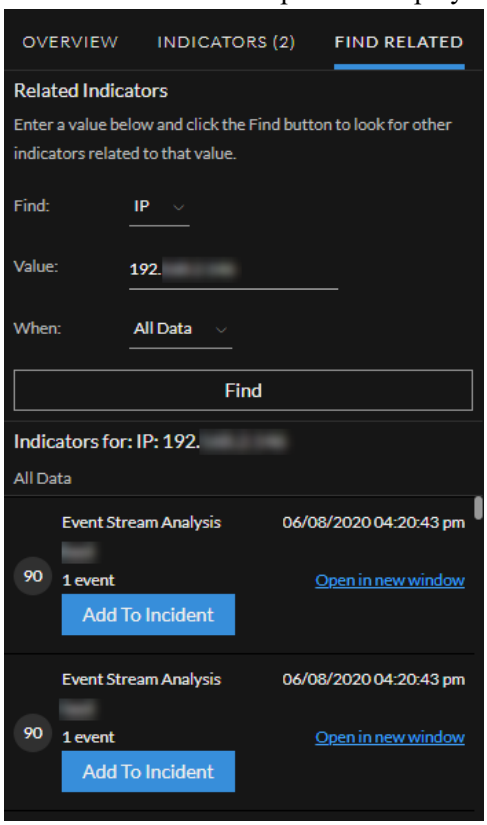


For more information about tasks, see Tasks List View, View All Incident Tasks, and Create a Task.

View Incident Notes

The incident Journal enables you to view the history of activity on your incident. You can view journal entries from other analysts and also communicate and collaborate with them.

1. Go to **Respond > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident.
   The Journal on the right side of the Incident Details view shows all of the journal entries for the incident.
   If you cannot see the Journal, in the toolbar, click **Journal & Tasks**.

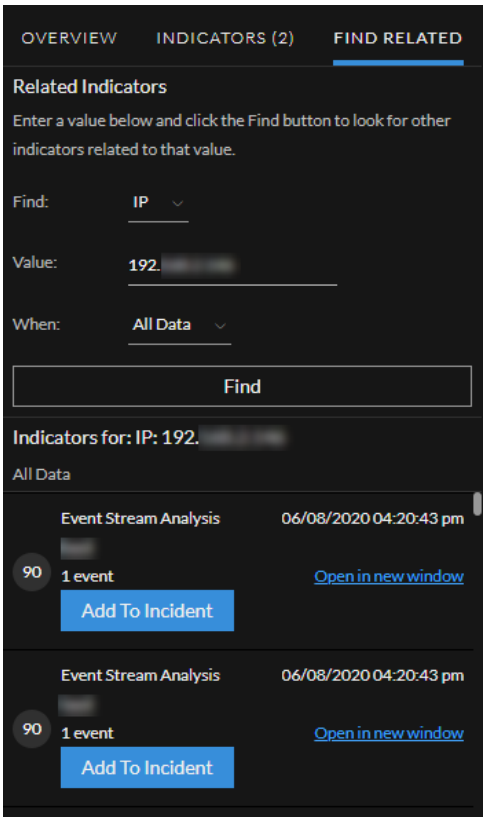


Find Related Indicators

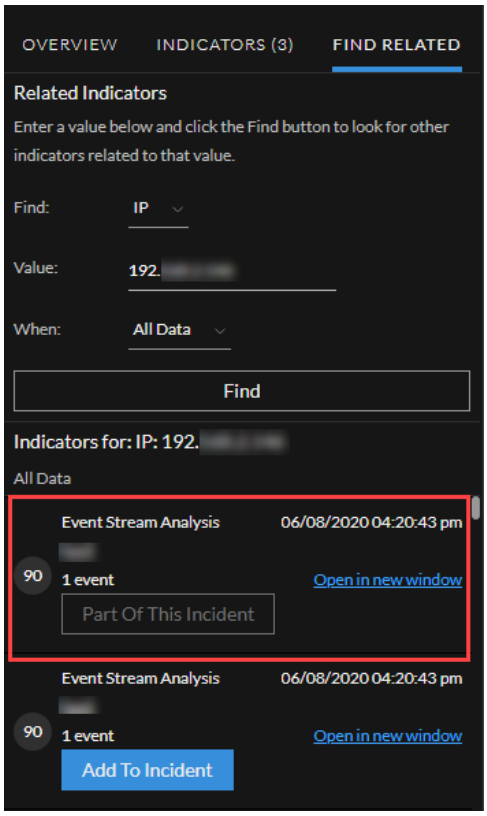
Related Indicators are alerts that were not originally part of the selected incident, but they are related in some way to the incident. The relationship may or may not be obvious. For example, related indicators can involve one or more entities from the incident, but they can also be related due to some intelligence outside of NetWitness.

In the Incident Details view Related Indicators panel, you can search for an entity (such as IP, MAC, Host, Domain, User, Filename, or Hash) in other alerts outside of the current incident.

1. Go to **Respond > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident.
3. In the left panel of the Incident Details view, click the **FIND RELATED** tab.
   The Related Indicators panel is displayed.



4. In the **Find** field, select the entity type to search, such as IP.
5. In the **Value** field, type a value for the entity, such as a specific IP address.
6. In the **When** field, select the time period to search, such as the Last 24 Hours.
7. Click **Find**.
   A list of related indicators (alerts) appear below the **Find** button in the **Indicators for** section. If an alert is not part of another incident, you can click the **Add to Incident** button to add the related indicator (alert) to the current incident. See Add Related Indicators to the Incident below.



Add Related Indicators to the Incident

You can add related indicators (alerts) to the current incident from Related Indicators panel. An indicator that is already part of an incident cannot be part of another incident. In the search results, if an alert is not already part of an incident, it has an **Add to Incident** button.

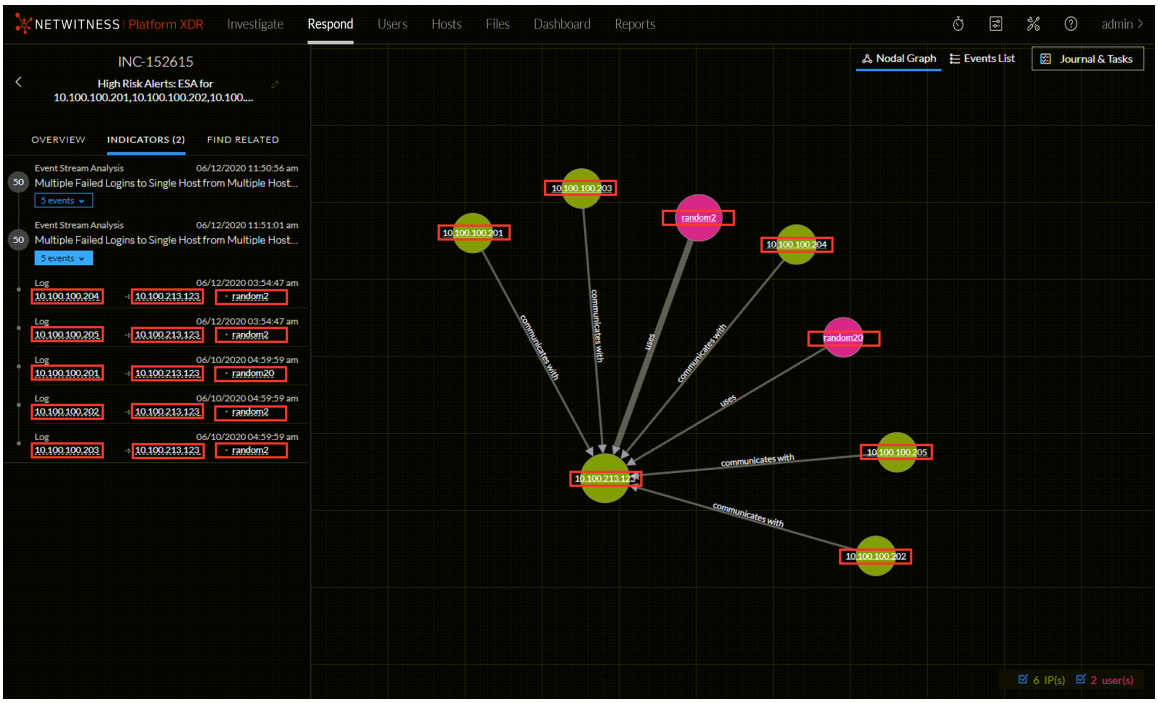
1. In the Related Indicators panel, do a search to find related indicators. See Find Related Indicators above.

2. Review the alerts in the search results. The **Indicators for** section (below the Find button) lists the related indicators (alerts).
3. To inspect the details of an alert before adding it as a related indicator to the incident, you can click the **Open in New Window** link to view the alert details for that indicator.
4. For each alert that you want to add to the current incident as a related indicator, click the **Add to Incident** button.
   The button in the Related Indicators panel now shows **Part of This Incident**.

The selected related indicator adds to the Indicators panel. The Indicators tab now shows the additional indicator.

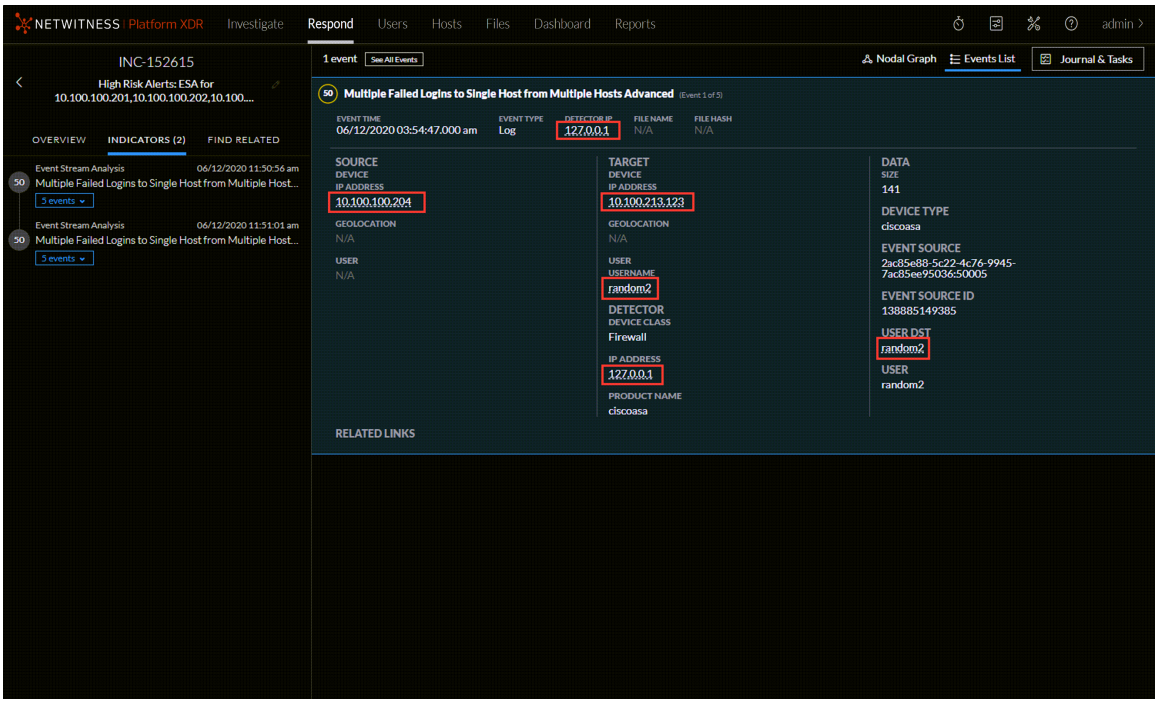
Investigate the Incident

To further investigate an incident within the Incident Details view, you can find links that take you to additional contextual information about the incident when it is available. This additional context can help you understand additional technical context and business context about a specific entity in the incident. It can also provide additional information that you may want to research to ensure that you understand the full scope of the incident.



You can perform the following procedures to further investigate an incident:

- View Contextual Information
- Add an Entity to a Whitelist
- Create a List
- View the Reputation Status of a File Hash
- Pivot to the Investigate > Events View
- Pivot to the Hosts or Files View
- Pivot to NetWitness Endpoint Thick Client
- Pivot to Archer
- View Event Analysis Details for Indicators
- View User Entity Behavior Analytics for Indicators
- Document Steps Taken Outside of NetWitness
  - View the Journal Entries for an Incident
  - Add a Note
  - Delete a Note

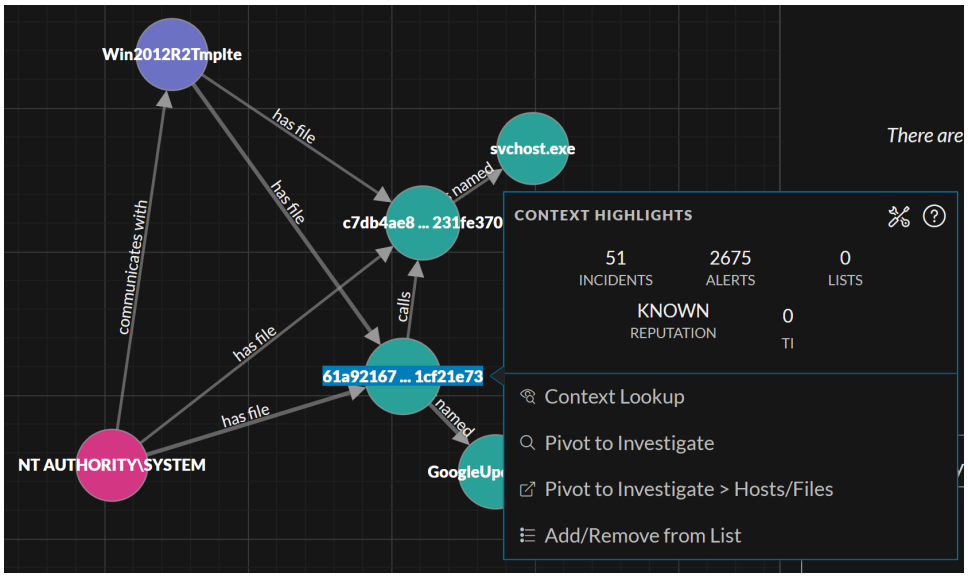


View Contextual Information

In the Indicators panel, Events List, or the Nodal Graph, you can view the underlined entities. If an entity is underlined, NetWitness is populating information about that entity type in the Context Hub. There may be additional information available about that entity in the Context Hub.

The following figure shows underlined entities in the Indicators panel and the Nodal Graph.

The following figure shows underlined entities in the Events list details.



The Context Hub is preconfigured with meta fields mapped to the entities. NetWitness Respond and NetWitness Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Settings for a Data Source" in the *Context Hub Configuration Guide*.

Caution: For the Context Lookup to work correctly in the Respond and Investigate views, NetWitness recommends that when mapping meta keys in the **Admin > System > Investigation > Context Lookup** tab, you add only meta keys to the Meta Key Mappings, not fields in the MongoDB. For example, ip.address is a meta key and ip_address is not a meta key (it is a field in the MongoDB).

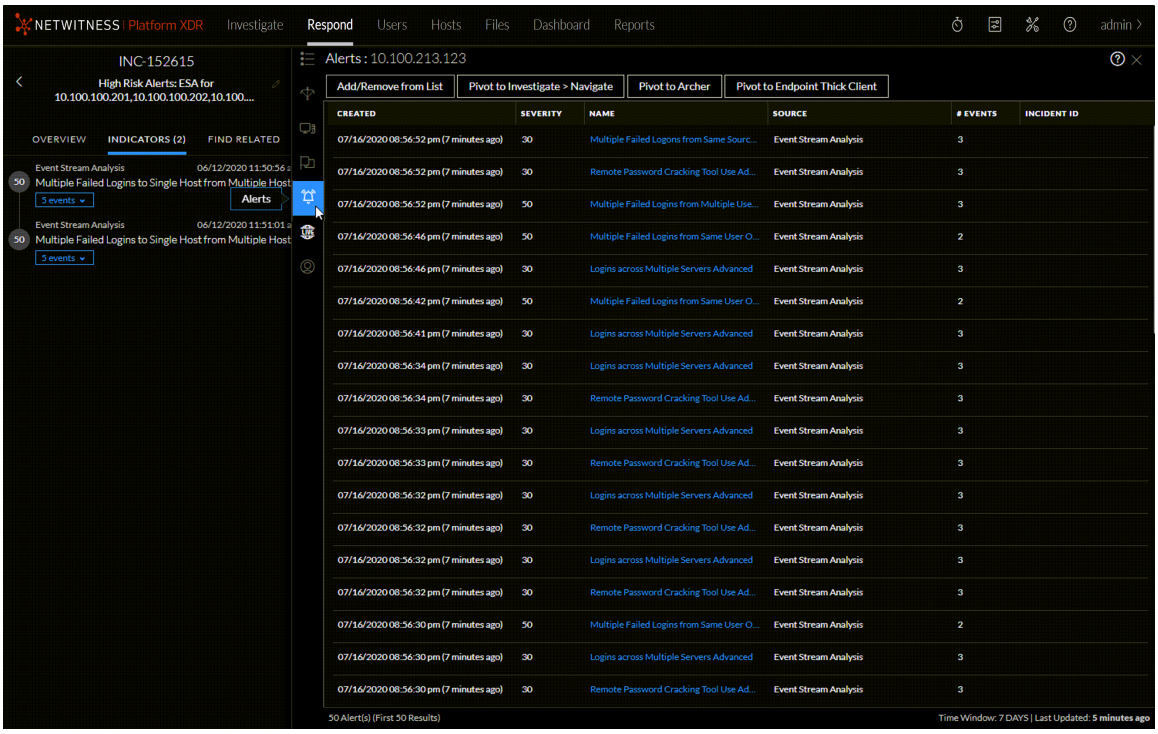
Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Respond** view to view context lookup for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

To view contextual information:

1. In the Indicators panel, Events List, or the Nodal Graph, left or right-click an underlined entity.
   A context tooltip appears with a quick summary of the type of context data that is available for the selected entity.

The information in the **Context Highlights** section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, Endpoint//, Criticality, Asset Risk, Reputation, and Threat Intelligence (TI). Depending on your data, you may be able to click these items for more information.

The above example shows 0 related incidents, 6800 alerts, 0 lists for the selected host, 0 incidents for TI, and no information available for Endpoint, Live Connect, Criticality, and Asset Risk.



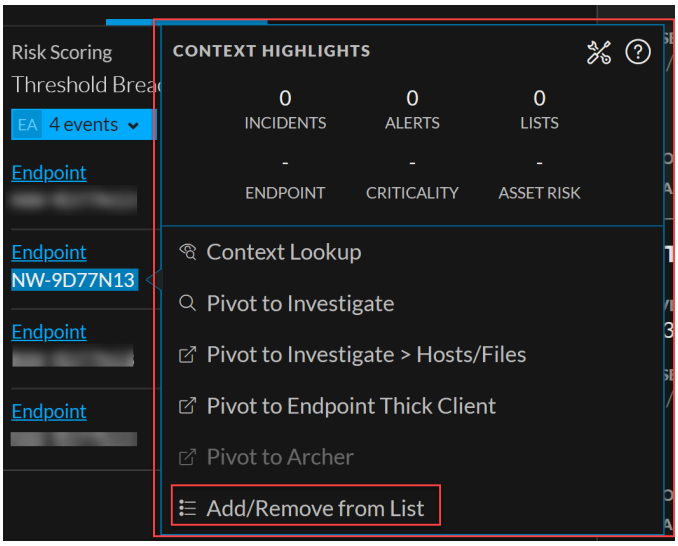
TI information comes from the STIX data source configured in Context Hub. For more information, see the *Context Hub Configuration Guide*.

The **Actions** section lists the available actions. In the above example, the Add/Remove from List, Pivot to Investigate > Navigate, Pivot to Investigate > Hosts/Files and Pivot to Endpoint Thick Client options are available.

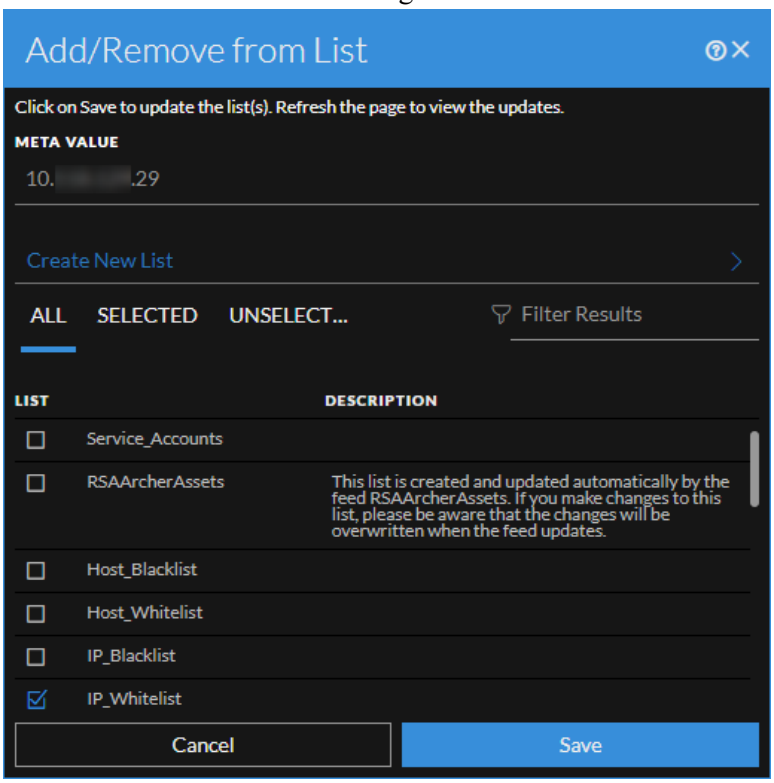
Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer data source is not responding. Check that the Archer configuration is enabled and configured properly.

For more information, see Pivot to the Investigate > Events View, Pivot to Archer, Pivot to NetWitness Endpoint Thick Client, Pivot to the Hosts or Files View, and Add an Entity to a Whitelist.

2. To see more details about the selected entity, click the **View Context** button.
   The Context Lookup panel opens and shows all of the information related to the entity.
   The following example shows contextual information for a selected host. It lists all of the incidents that mention that host.



To understand the different views within the Context Hub Lookup panel, see Context Lookup Panel - Respond View.

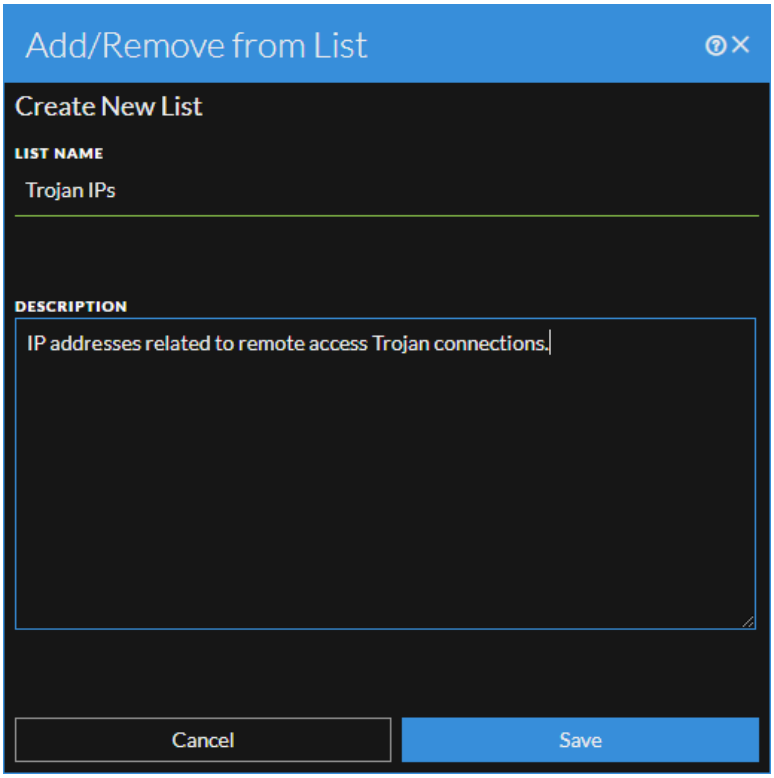


Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Indicators panel, Events List, or the Nodal Graph, left or right-click the underlined entity that you would like to add to a Context Hub list.
   A context tooltip appears showing the available actions.

2. In the **ACTIONS** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove from List dialog shows the available lists.



3. Select one or more lists and click **Save**.
   The entity appears on the selected lists.
   Add/Remove from List Dialog provides additional information.

Create a List

You can create lists in Context Hub from the Respond view. In addition to using lists to whitelist and blacklist entities, you can use lists to monitor entities for abnormal behavior. For example, to improve the visibility of a suspicious IP address and Domain under investigation, you may want to include them in two separate lists. One list could be for domains suspected of being related to command and control connections, and another list could be for IP addresses related to remote access Trojan connections. You can then identify indicators of compromise using these lists.

To create a list in Context Hub:

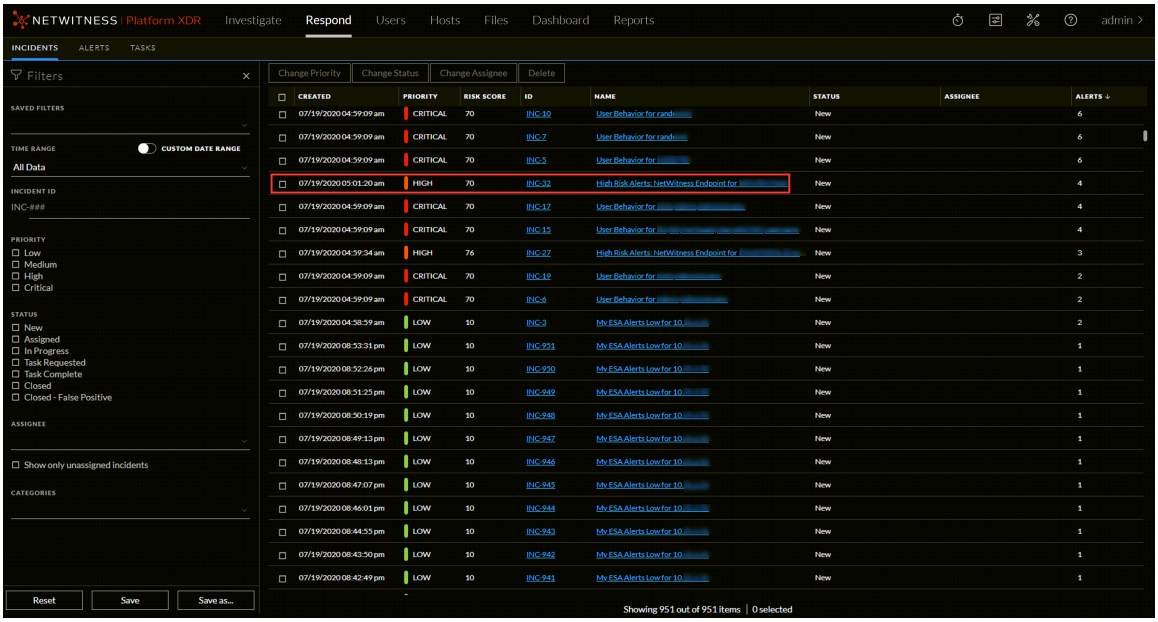
1. In the Indicators panel, Events List, or the Nodal Graph, left or right-click the underlined entity that you would like to add to a Context Hub list.
   A context tooltip opens showing the available actions.
2. In the **Actions** section of the tooltip, click **Add/Remove from List**.
3. In the Add/Remove from List dialog, click **Create New List**.

4. Type a unique **List Name** for the list. The list name is not case sensitive.
5. (Optional) Type a **Description** for the list.
   Analysts with the appropriate permissions can also export lists in CSV format to send to other analysts for further tracking and analysis. The *Context Hub Configuration Guide* provides additional information.

View the Reputation Status of a File Hash

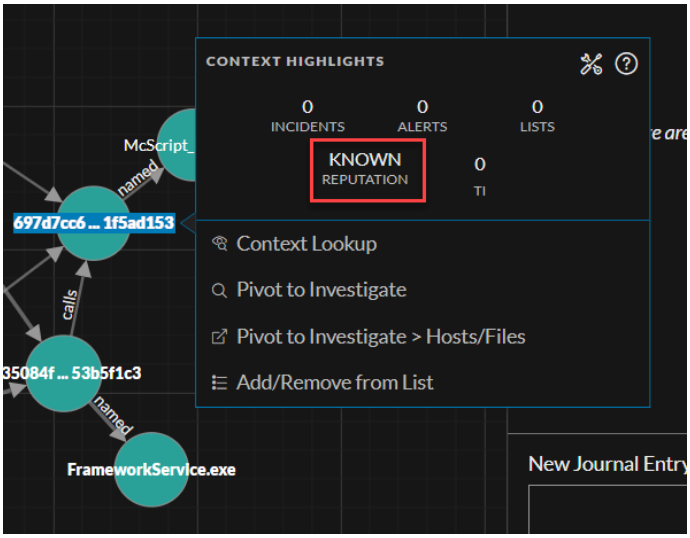
The File Reputation service available on RSA Live checks the reputation of every file hash against an extensive database of known file hashes updated in real-time. The file reputation is displayed in the Investigate and Respond views. In the View Context lookup, if the reputation status changes, Context Hub notifies the change in reputation status to all Endpoint servers. Information about the file hash such as any suspicious or malicious activity on the file is populated from Context Hub. There may be additional information available about that entity in the Context Hub.

The following table describes the file hash reputations.



Reputation	Description
Malicious	File hash is labeled as malicious.
Suspicious	File hash is suspected to be malicious.
Unknown	File hash is not known.
Known	File hash information is known to the file reputation service and does not have any previous bad record.
Known Good	File hash information is known good, such as files signed by Microsoft or NetWitness.
Invalid	File hash format is invalid.

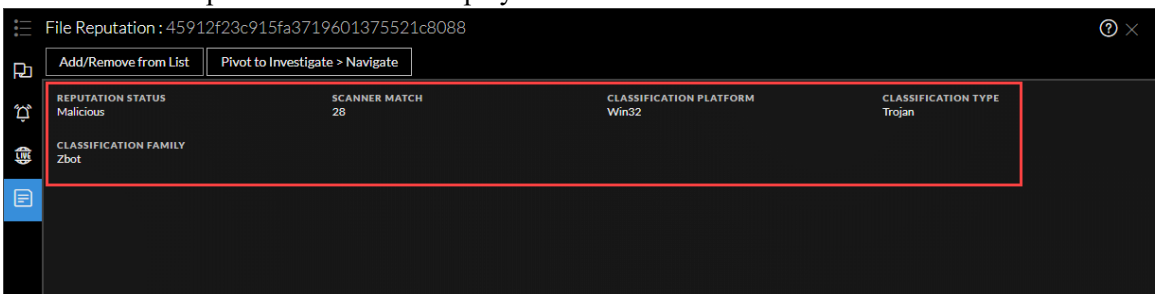
Note: A reputation status is visible for a file hash entity only and File Reputation service supports a maximum of 10 million files for a reputation of file hash.



The suspicious or malicious files are available for further analysis in the **Investigate > Navigate** view and **Investigate > Events** view. For more information on the file reputation service, see the *Live Services Management Guide* and the *NetWitness Endpoint User Guide*.

To view the reputation of a file hash:

1. Go to **Respond > Incidents**.
2. In the Incidents List view, choose an incident to view and then click the link in the **ID** or **Name** column for that incident.



3. In the Incident Details view, left or right click the file hash entity.
   The context tooltip displays the reputation status of the selected file hash entity.

4. Click **Reputation** to view the reputation status information.

5. Click the **File Reputation** icon  to view further details.
   The details for reputation status are displayed.

Pivot to the Investigate > Events View

For a more thorough investigation of the incident, you can access the **Investigate** > **Events**.

1. In the Indicators panel, Events List, or the Nodal Graph, left or right click any underlined entity to access a context tooltip.
2. In the context tooltip panel, select **Pivot to Investigate**.
   The Events view opens, which enables you to perform a deep dive investigation.

For more information, see the *NetWitness Investigate User Guide*. For troubleshooting information with the Investigate > Events link see the *Alerting with ESA Correlation Rules User Guide*.

Pivot to the Hosts or Files View

For a more thorough investigation about specific Hosts and Files, you can access the Hosts and Files views.

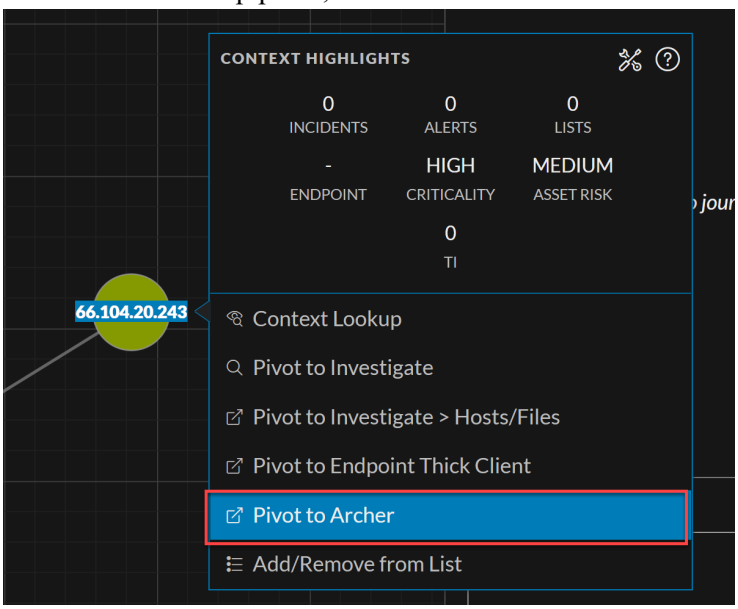
1. In the Indicators panel, Events List, or the Nodal Graph, hover over any entity to access a context tooltip.
2. In the context tooltip panel, select **Pivot to Investigate > Hosts/Files**.
   If you hover over a host or IP or MAC address entity and click **Pivot to Investigate > Hosts/Files**, it displays the Hosts view with a specific host listed.
   If you hover over a filename or file hash entity and click **Pivot to Investigate > Hosts/Files** it displays the Files view with a specific file listed.

Note: By default, the search for entities is on the previously selected Endpoint Server. However, you can select a different Endpoint Server to fetch the information or data.

For more information, see the *NetWitness Investigate User Guide*.

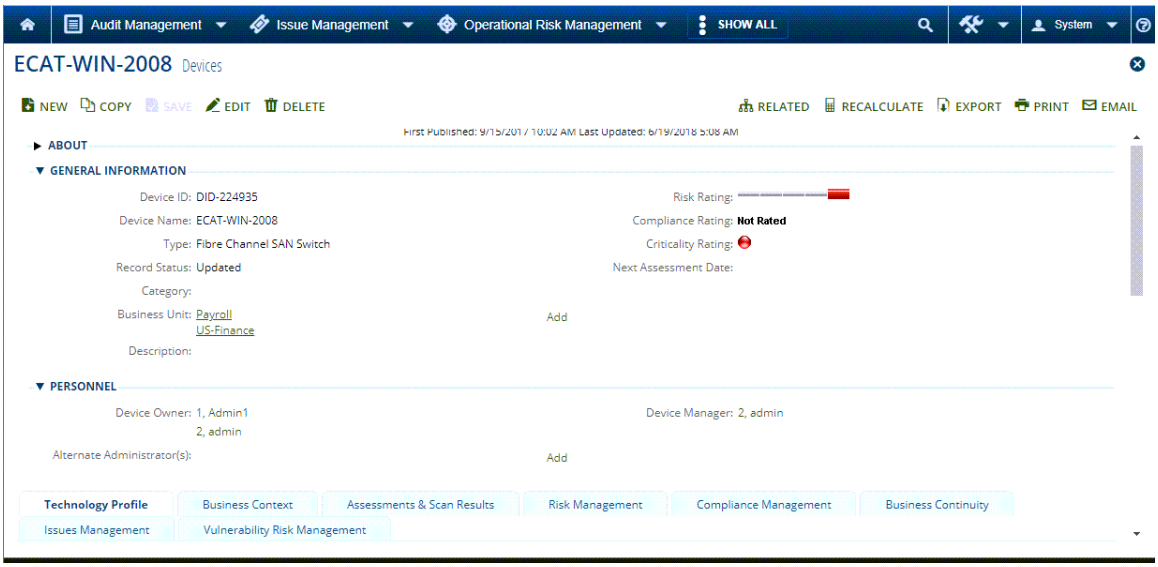
Pivot to NetWitness Endpoint Thick Client

If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.



1. In the Indicators panel, Events List, or the Nodal Graph, hover over any underlined entity to access a context tooltip.
2. In the context tooltip panel, select **Pivot to Endpoint Thick Client**.
   The NetWitness Endpoint thick client application opens outside of your web browser.

For more information on the thick client, see the *NetWitness Endpoint User Guide*.



Pivot to Archer

For viewing more details about the device in Archer Cyber Incident & Breach Response, you can pivot to the device details page. This information is displayed only for IP address, host, and Mac address.

1. In the Indicators panel, Events List, or the Nodal Graph, left or right click any underlined entity (IP address, host, and Mac address) to access a context tooltip.
2. In the context tooltip panel, select **Pivot to Archer**.

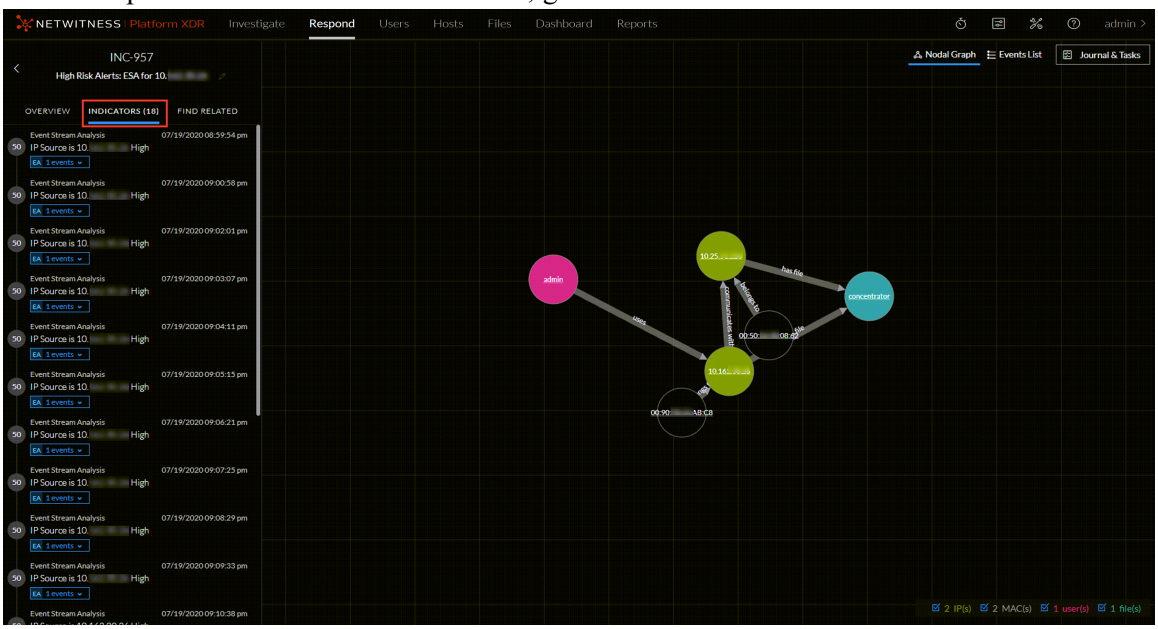
3. The device details page in **Archer Cyber Incident & Breach Response** opens if you are logged in to the application, otherwise the login screen is displayed.

Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the Archer configuration is enabled and configured properly.

For more information, see the *NetWitness Archer Integration Guide*.

View Event Analysis Details for Indicators

In the Incident Details view Indicators panel, you can drill deeper into the events associated with the listed indicators to get a better understanding of the events. In the Events panel, you can view raw events and metadata with interactive features that enhance your ability to find meaningful patterns in the data. You can examine network, log, and endpoint events in the Events panel. The Events panel in the Respond view shows the Events view from Investigate for specific indicator events. For detailed information about the Events view, see the *NetWitness Investigate User Guide*.

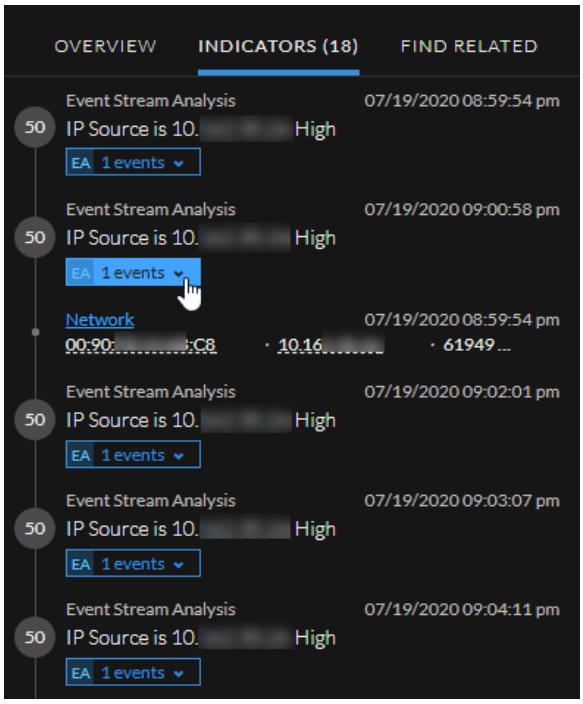


Note: You must have the following Investigate-server permissions to view the Events panel in the Respond view:
`event.read`
`content.reconstruct`
`content.export`
The Events view requires all Core services to be on NetWitness Platform 11.4 or later.

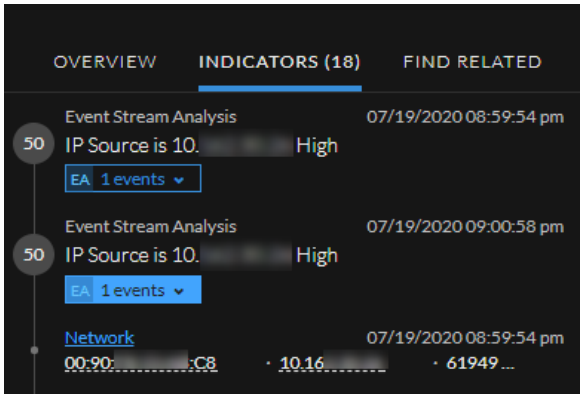
Migration Considerations

Migrated incidents from NetWitness versions before 11.2 will not show the Events panel in the Respond Incident Details view Indicators panel. Likewise, if you use alerts that were migrated from versions before 11.2 to create incidents in 11.5, you will also not be able to view the Events panel in the Respond view for those incidents.

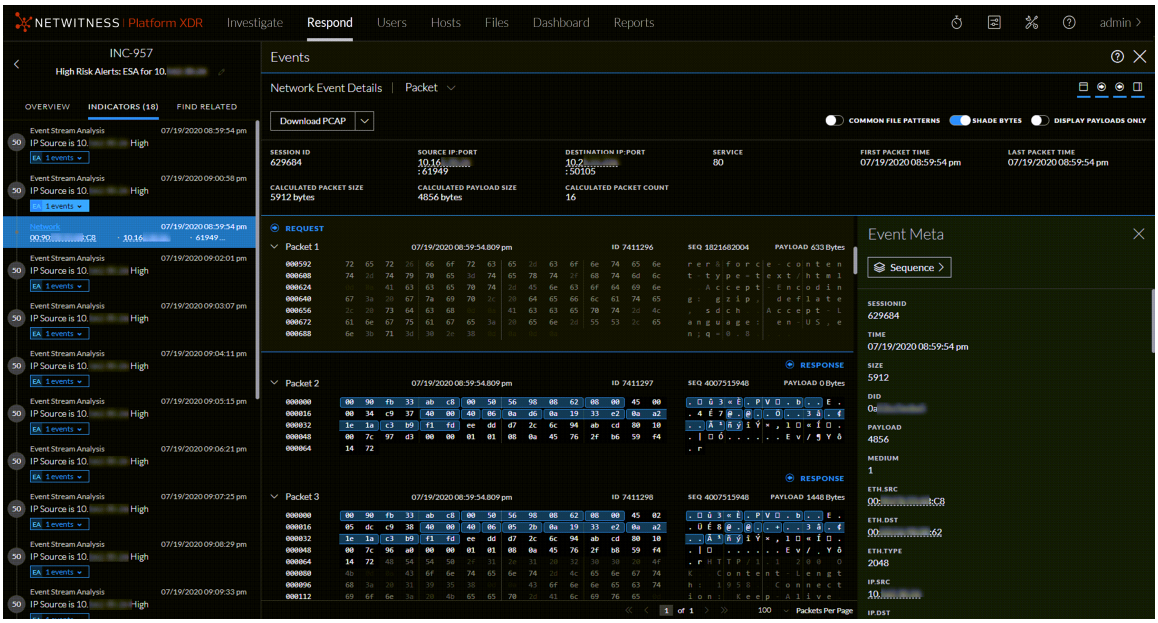
To access event analysis details for an event in the Indicators panel:



1. Go to **Respond > Incidents**.
2. In the Incidents List view, choose an incident to view and then click the link in the **ID** or **NAME** column for that incident.
   The Incident Details view is displayed.
3. In the left panel of the Incident Details view, go to the **Indicators** tab.



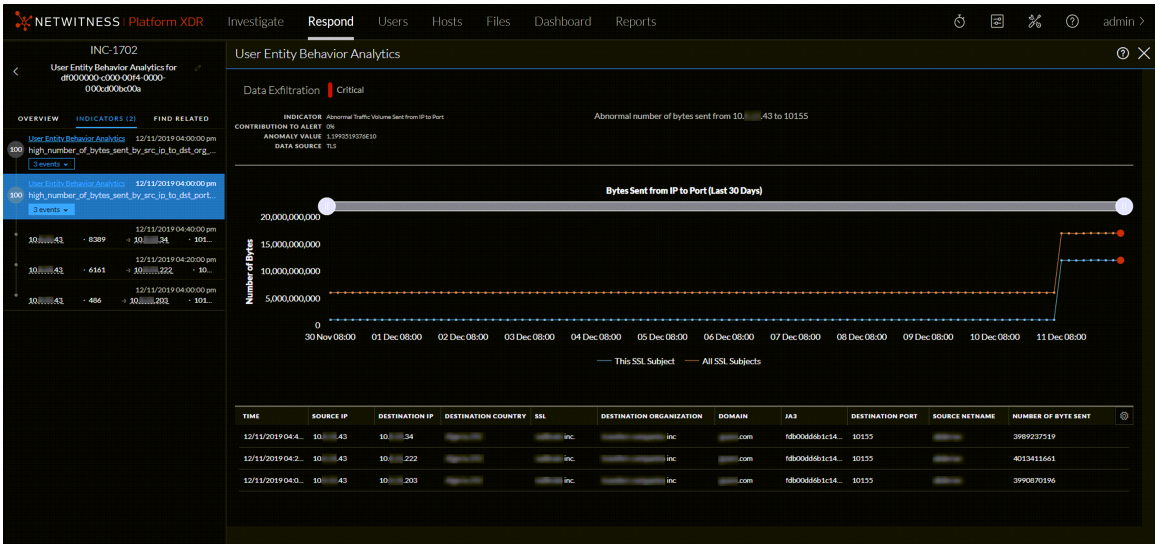
Data source information is shown above the names of the indicators. You can also see the creation date and time as well as the number of events in the indicator. If event analysis (EA) information is available, you can see an **EA** icon in front of the event count as shown in the following figure.



4. Click an event count with an **EA** icon to view additional event information.

5. Click an event type hyperlink within the event to open the Events panel. In the following example, the event type is Network.

The Events panel shows event details for the event, such as packet analysis details. The information available can vary based on the event type.

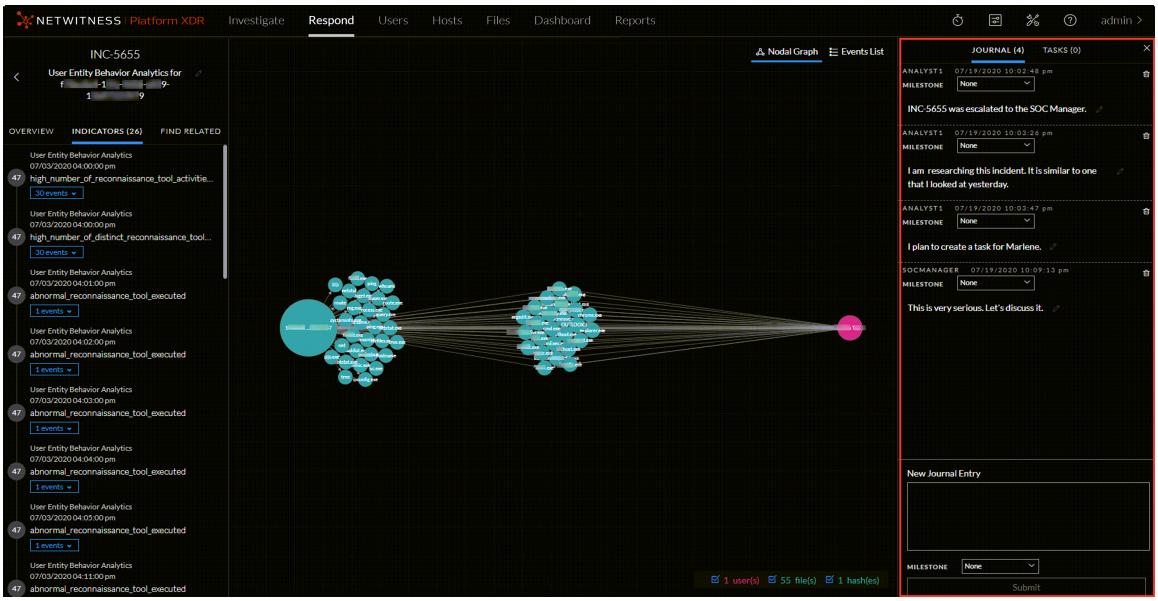


For detailed information about the Events view, see the *NetWitness Investigate User Guide*.

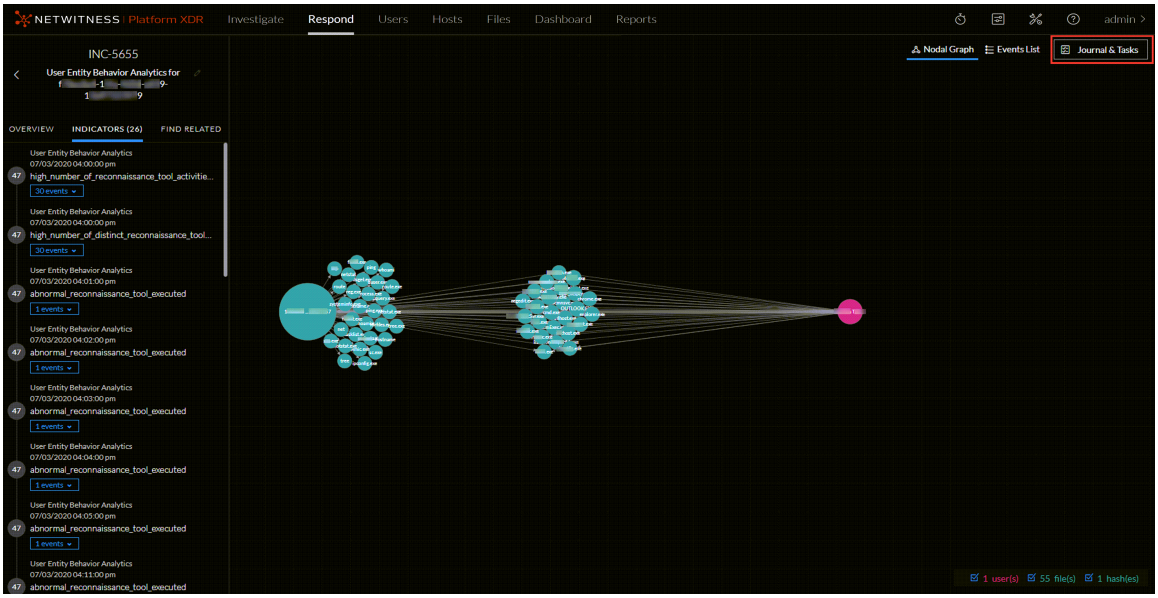
Note: If you want to send the Events URL link to another analyst, you can copy the event type hyperlink, for example Network.

View User Entity Behavior Analytics for Indicators

NetWitness UEBA (User and Entity Behavior Analytics) is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all users and entities in your network environment. You can access UEBA from the Respond Incident Details view Indicators panel. Indicators with a **User Entity Behavior Analytics** hyperlink have additional UEBA information available. For detailed information about UEBA, see the *NetWitness UEBA User Guide*.

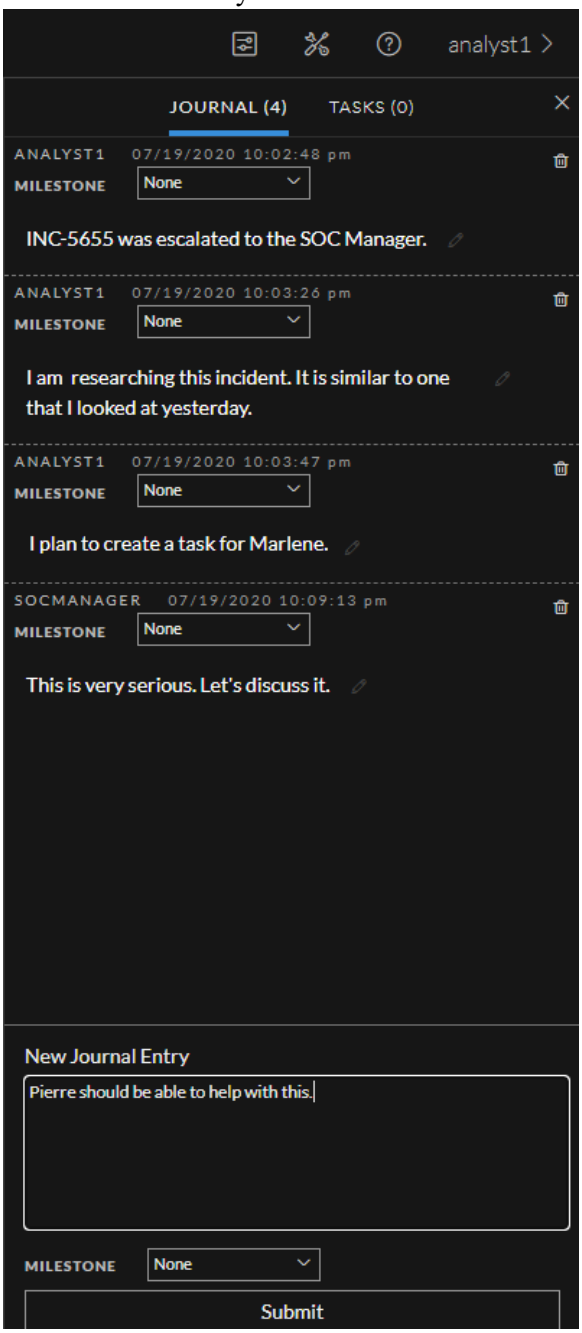


Document Steps Taken Outside of NetWitness



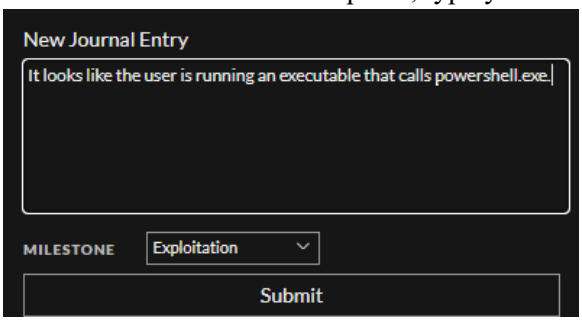
The journal shows notes added by analysts and it enables you to collaborate with your peers. You can post notes to a journal, add Investigation Milestone tags (Reconnaissance, Delivery, Exploitation, Installation, Command and Control, Action on Objective, Containment, Eradication, and Closure), and view the history of activity on your incident.

View the Journal Entries for an Incident



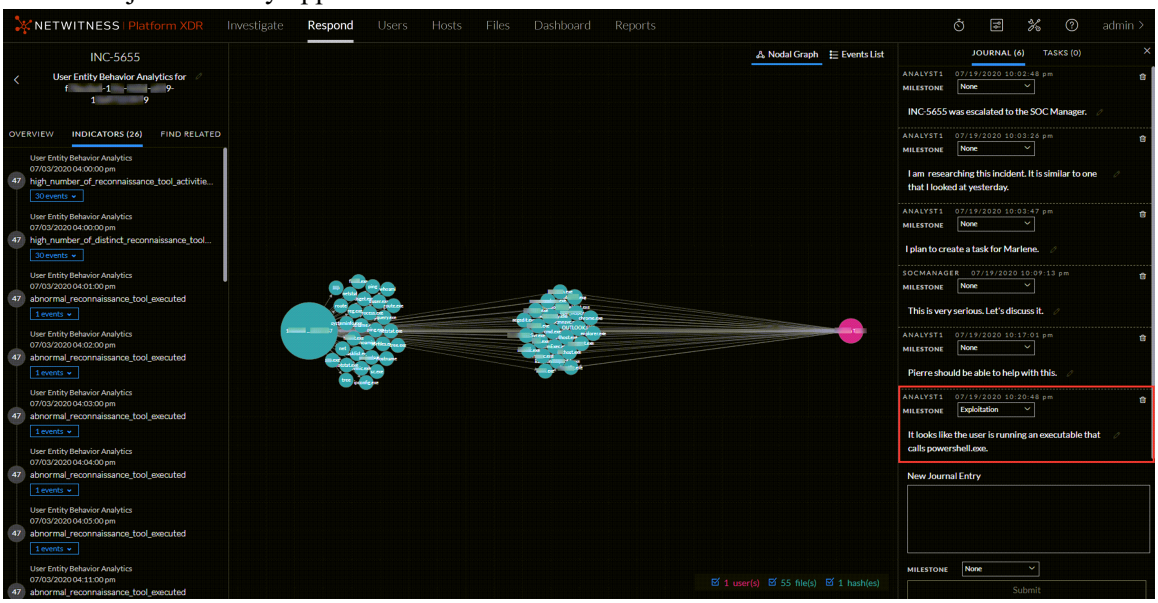
The Journal is on the right side of the Incident Details view.

If you do not see the Journal, in the toolbar, click **Journal & Tasks**.



The Journal shows the history of activity on an incident. For each journal entry, you can see the author and time of the entry.

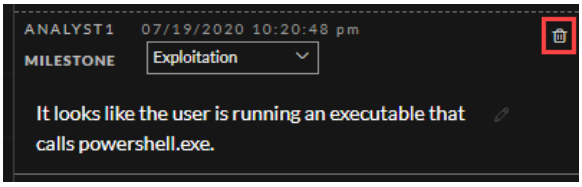
Add a Note



Typically, you will want to add a note to allow another analyst to understand the incident, or add a note for posterity so that your investigative steps are documented.

1. At the bottom of the Journal panel, type your note in the **New Journal Entry** box.

2. (Optional) Select an Investigation Milestone from the drop-down list (Reconnaissance, Delivery, Exploitation, Installation, Command and Control, Action On Objective, Containment, Eradication, and Closure).

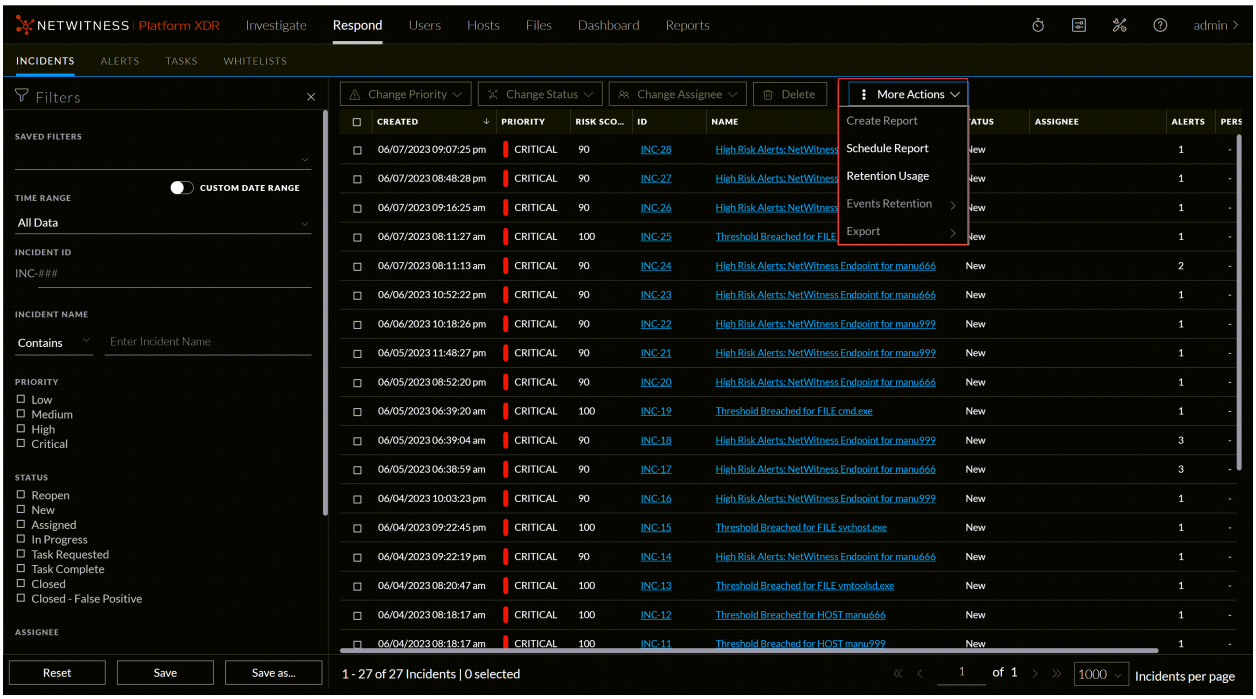


3. After you finish your note, click, **Submit**.
   Your new journal entry appears in the Journal.

Delete a Note

1. In the Journal panel, locate the journal entry that you would like to delete.

2. Click the trash can (delete) icon  next to the journal entry.



3. In the confirmation dialog that appears, click **OK** to confirm that you want to delete the journal entry. This action cannot be reversed.

Generate Reports from Respond View

From NetWitness Platform XDR 12.3 or later, Users can directly create or schedule a report from the Respond view. You can create a simple ad-hoc report or complex report and configure its execution properties by scheduling a report. You can generate a report to capture details related to past, current, or predicted resource needs and schedule different time ranges to execute the same report. For example, depending on your requirement, you can schedule a report to run hourly, daily, weekly, or monthly.

Note:
- If the administrator has not configured the time zone, the reports follow the UTC time zone by default.
- If the administrator configures the time zone under the User Preferences panel, the report follows the administrator's configured time zone. For more information, see Setting User Preferences in the *NetWitness Getting Started Guide*.
- A generated output report can contain up to 100 results in tabular format.

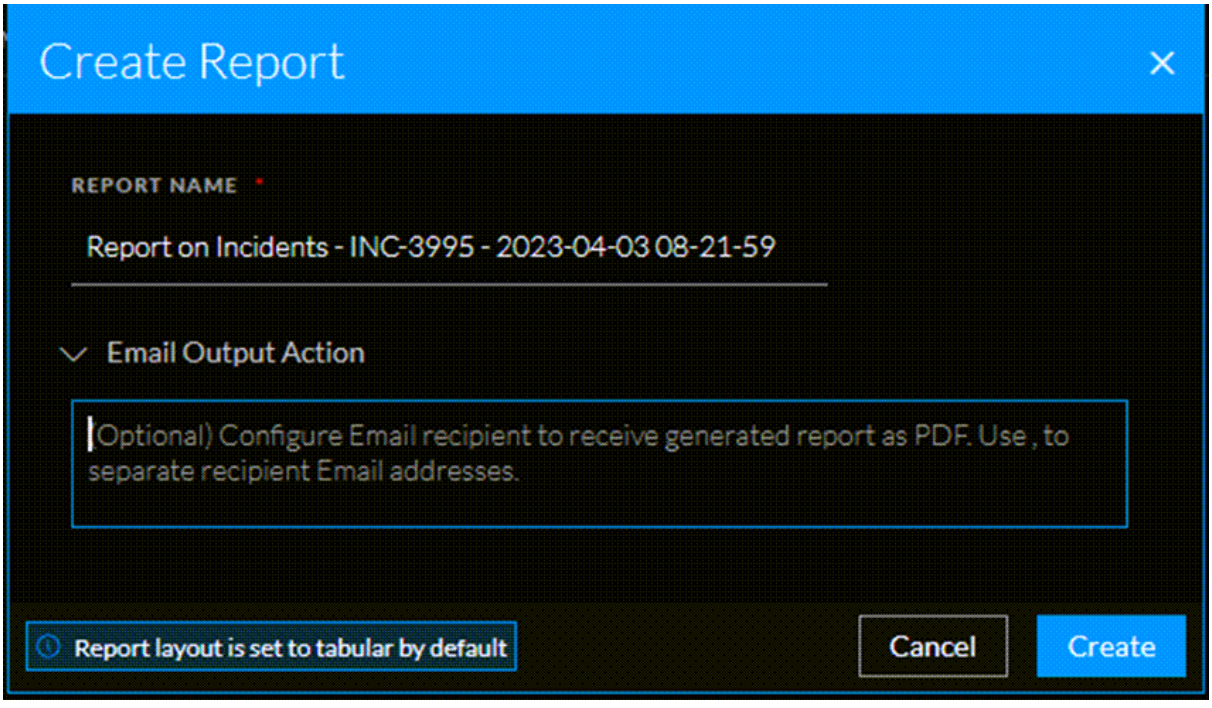
IMPORTANT: The minimum permissions for the users required to create/schedule reports in Respond View:
- Must enable Define rule, Access configure, and Define report in the report permission section.
- Must enable alert.manage, incident.manage, alert.read, incident.read in the respond-server permission section.

- Create a Report.
- Schedule a Report.

Create a Report

The Create Report dialog enables you to create a report instantly. To create a report, you must select the incidents or alerts via their checkboxes.

Note: The report will only include data from the selected records on the screen.



To create a Report

1. Log in to the NetWitness Platform XDR.
2. Go to **Respond** > **Incidents**.

   IMPORTANT: You can create reports from the Incidents and Alerts pages separately as per your requirements. For generating reports from the Alerts page, Go to **Respond** > **Alerts**
3. Apply the required filters on the incident or alert page, select the desired records, and create a report for selected Incidents or Alerts.

   Note:
   - Once - Once the Incident or Alerts are displayed, you can sort them by ascending or descending order, and the report will be generated for the selected records.
   - To generate the reports, users must select one or more incidents or alerts.
4. Click **More Actions** > **Create Report**.

   The **Create Report** dialog is displayed.

5. The default report name with a time stamp will be displayed initially. For example, **Report on Incident - 2023-02-25 10-16-09**.

   Note:
   • You can customize the report name as per the requirement, and the name must be unique to create a report.
   • The report name must not have special characters such as / \ : * ? ” < > |.

IMPORTANT: Ensure that the SMTP mail server is configured in order to send reports to users.

6. (Optional) Click **Email Output Action** and enter the email address to which the generated report needs to be sent.

   You can enter multiple comma-separated valid email IDs. For example, **email1@example.com**,**email2@example.com**,**email3@example.com**.

7. Click **Create**.

   The success message is displayed on the screen.

Note: The time required for reports to be generated may vary based on the amount of data. Please wait for the requested report to be created.

8. To view the report, do one of the following:

   - On the success message banner, click the hyperlink **click here** to directly open the report in the reports tab.
   - Go to **Reports** > **Manage** > **Reports** > **View All Reports**.

Note:
• You can download the report in a PDF or CSV file format for future and offline needs.
• When the report is generated, it is attached as a PDF to the email and sent to all users configured during the report creation process.

Schedule a Report

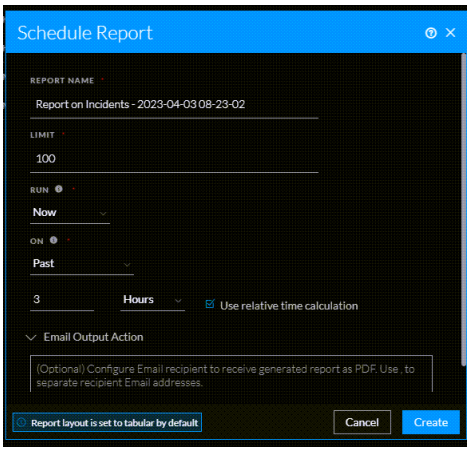
The Schedule Report dialog enables you to create a schedule for the report. Reports can be scheduled later (required time-line), hourly, daily, weekly, or monthly. In order to schedule a report at a specific time or on a daily, weekly, or monthly basis, you must configure the scheduling options on the Schedule tab.

Note: The report will only include data from the selected time interval. You can change the interval starting with the next recurrence.

To create a Schedule Report

1. Log in to the NetWitness Platform XDR.
2. Go to **Respond** > **Incidents**.

   IMPORTANT: You can create reports from the Incidents and Alerts pages separately as per your requirements. For generating reports from the Alerts page, Go to **Respond** > **Alerts**



3. Apply the required filters on the incident or alert page, select the desired records, and create a report for selected Incidents or Alerts.

   All filters applied on the filters panel will be included in the reporting rule to create your report.

   Note: Once the events are displayed, you can sort the events by ascending or descending order, and the report will be generated based on the limit configured.

4. Click **More Actions** > **Schedule Report**.

   The **Schedule Report** dialog is displayed.

5. The default report name with a time stamp will be displayed initially. For example, **Report on Incident - 2023-04-25 10-18-26**.

6. Specify the following parameters to configure the Schedule.

   Depending on the type of run schedule, select one of the following:

Field	Description
Run	Time interval to use for running the scheduled job: • **Now**: If you select a Now. The system will instantly generate reports with the filters applied from the filters panel. • **Later**: If you select a **Later** run schedule, you must provide a value for the day and time in the respective field provided. • **Hourly**: If you select an **Hourly** run schedule, you must specify the minutes in the **At** Minute field. For example, if you schedule the report for 50 minutes, for every 50th minute, the report will be prepared. **Note:** A maximum of only 59 minutes can be selected. • **Daily**: If you select a **Daily** run schedule, you must enter a value in the **At** field. For example, if you schedule the report at 04:25, the report will be prepared at 04:25 AM every day. • **Weekly**: If you select a **Weekly** run schedule, you must enter a value in the **At** field and select the weekdays. **Note:** The report runs on the day of the week that the schedule begins. For example, if you schedule the report to first run on Monday, the report runs on Monday every week. • **Monthly**: If you select a **Monthly** run schedule, you must provide a value for the day and **At** field. For example, select 25 for the 25th day of the month. The report will be prepared on the 25th month of every month. **Note:** During the monthly report generation process, a message will appear if the day is greater than 28. This will notify the user that the report will be scheduled for the month containing that day.

Field	Description

ON	• **Past**: If you select the **Past** option, you can schedule the report based on **Hours**, **Days**, **Weeks**, **Months**, and **Years**. For example, if you want to schedule the report to start three days before the current date, do the following actions:
	  • Select **Past** in the **ON** field.
	  • Enter **3** in the field and select **Days** from the drop-down list.
	  This field appears only if you select **Later** in the **Run** field.
	  Note:
	  • This field appears if you select Later, Hourly, Daily, Weekly, and Monthly in the Run field.
	  • For Hourly, the maximum value allowed is 168 (24 hours x 7 days) which is counted as total hours.
	• **Range(specific)**: If you select Range(specific) option, you must provide the **From** and **To** values.
	  For example, if you want to schedule the report for a specific date and time range from 02/01/2023 12:00:00 AM to 02/15/2023 12:00:00 AM. The report runs for the data on the specified period.
	  Note: This field appears only if you select Later in the Run field.
	• **Range(generic)**: If you select **Range(generic)** option, you must provide the **From** and **To** values.
	  For example, if you want to schedule the report daily for a time range, from 04:00 to 10:00. The report runs for the data on the specified period.
	  Note: This field appears only if you select Later, Daily, Weekly, and Monthly in the Run field.

Field	Description
	Note: While scheduling a report, if you select the **Past** option or **Range(specific)/Range (generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.
Use relative time calculation	• By default, the **Use relative time calculation** option is enabled, and it uses the relative time duration to schedule a report. For example, if you schedule a report to run over the past 3 hours for the relative time, the time is exactly 3 hours from when the report is run. If the current time is 6:30 P.M., the events that occurred in the past 60 minutes or between 3:30 P.M. and 6:30 P.M. today. • You can deselect the option and schedule a report. For example, if you schedule a report to run over the past 3 hours, it will take the past 3 hours, excluding the minutes. If the current time is 6:30 P.M., the events occurred between 3 P.M. and 6 P.M. today.

IMPORTANT: Ensure that the SMTP mail server is configured in order to send reports to users.

7. (Optional) Click **Email Output Action** and enter the email address to which the generated report needs to be sent.

   You can enter multiple comma-separated valid email IDs. For example, **email1@example.com**,**email2@example.com**,**email3@example.com**.

8. Click **Create**.

   The success message is displayed on the screen.

   Note: The time required for reports to be generated may vary based on the amount of data. Please wait for the requested report to be created.

9. To view the report, do one of the following:

- On the success message banner, click the hyperlink **click here** to navigate to the reports tab and open the generated report.
- Go to **Reports** > **Manage** > **Reports** > **View All Reports**.

Note:
• You can download the report in a PDF or CSV file format for future and offline needs.
• When the report is generated, it is attached as a PDF to the email and sent to all users configured during the report creation process.

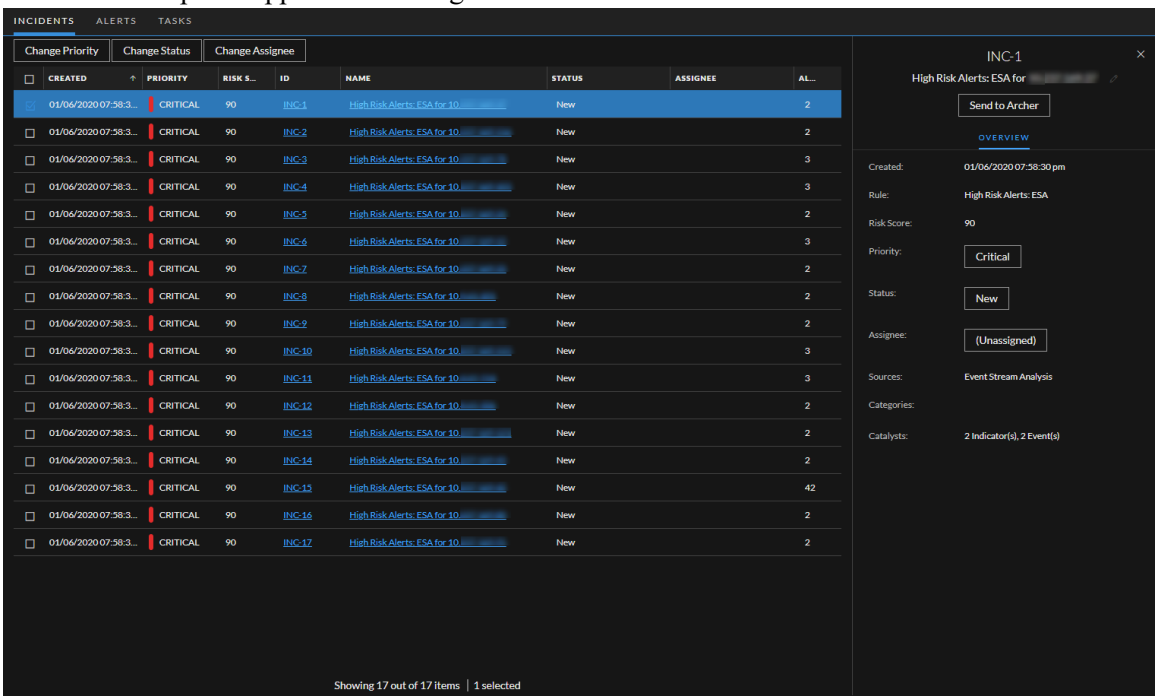
Escalate or Remediate the Incident

You may want to escalate an incident, assign incidents to another Analyst, or change the status and priority of an incident as you gather more information about it. This is useful if, for example, you upgrade the priority of an incident from high to critical after determining that the incident is a major breach. You may also want to send the incident to Archer Cyber Incident & Breach Response for additional analysis and action.

You can perform the following procedures to escalate or remediate an incident:

- Send an Incident to Archer
- View All Incidents Sent to Archer
- Update an Incident
- Change Incident Status
- Change Events Retention
- Obtain Retention Usage Details
- Export Incident Data
- Change Incident Priority
- Assign Incidents to Other Analysts
- Rename an Incident
- View All Incident Tasks
- Filter the Tasks List
- Remove My Filters from the Tasks List
- Create a Task
- Find a Task
- Modify a Task
- Delete a Task
- Close an Incident

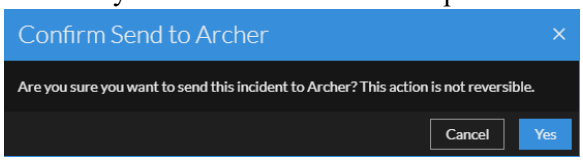
Send an Incident to Archer



Note: This option is available in NetWitness Version 11.2 and later. If Archer is configured as a data source in Context Hub, you can send incidents to Archer and you can see the Send to Archer option and Sent to Archer Status in NetWitness Respond.

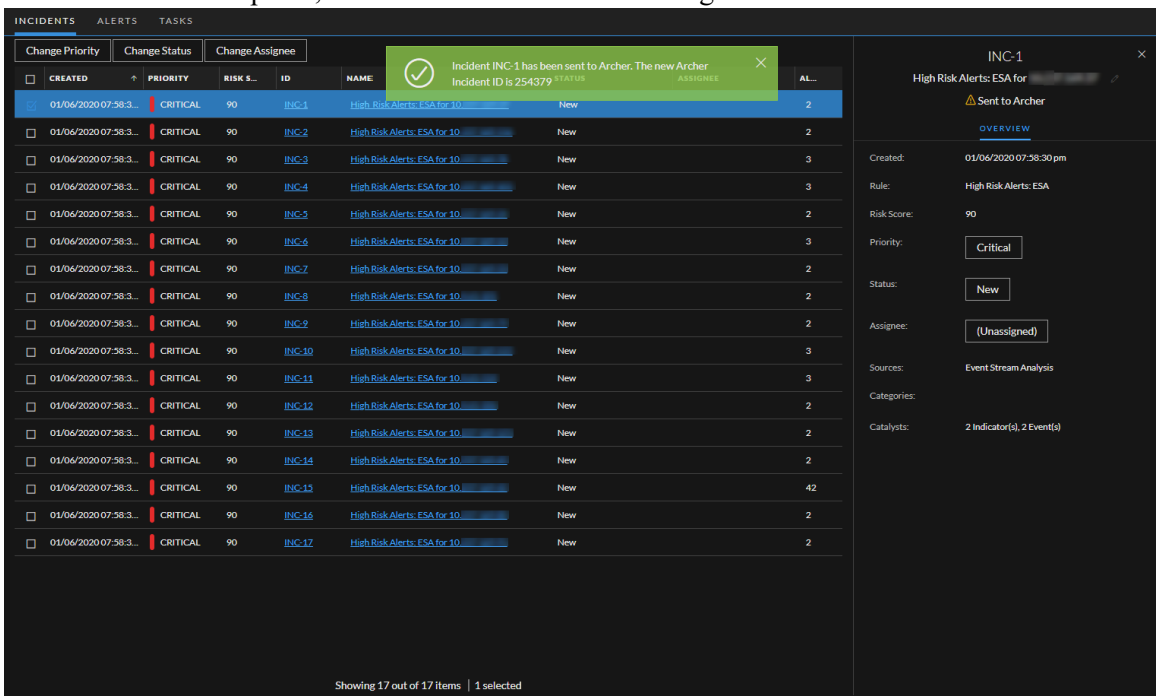
When you send an incident to Archer, a Sent to Archer notification appears within the incident. When configured, the NetWitness Platform can start additional business processes in Archer Cyber Incident & Breach Response. You can view all of the incidents that were sent to Archer Cyber Incident & Breach Response using the filter in the Incident Lists view.

You send an incident to Archer by clicking the Send to Archer button in the Overview panel in the Incident Lists view or the Incident Details view.



Caution: The **Send to Archer** action is not reversible.

1. Go to **Respond > Incidents**.
2. From the Incidents List view, click the incident that you want to send to Archer Cyber Incident & Breach Response.
   The Overview panel appears on the right.

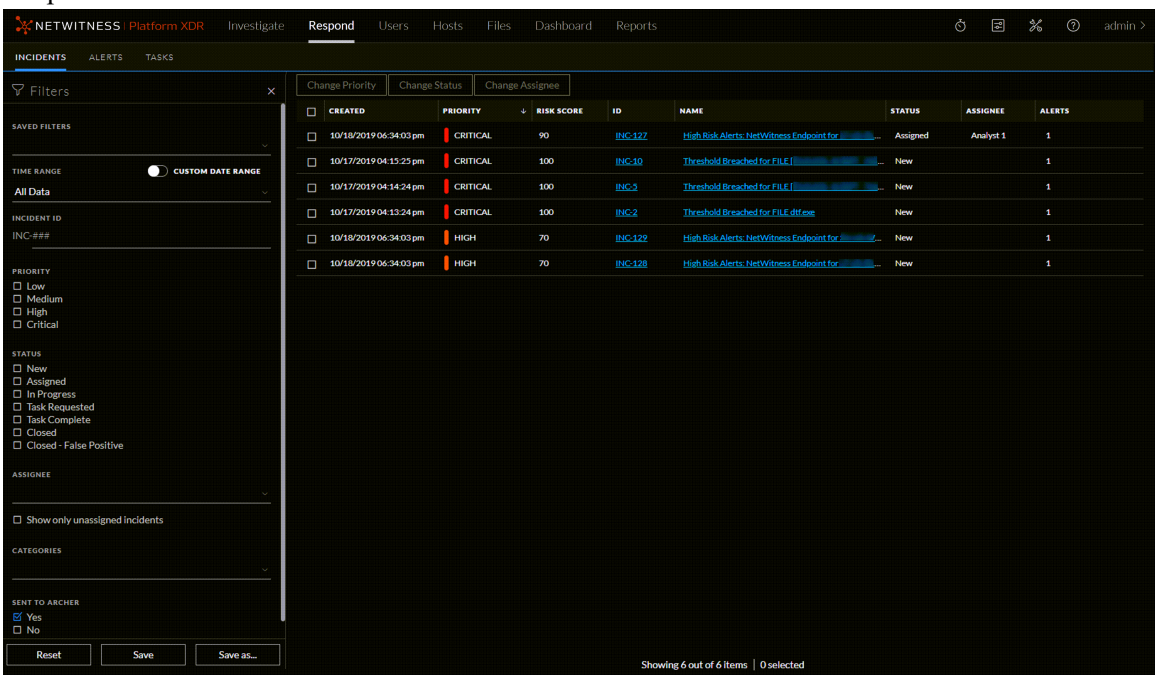


3. In the Overview panel, click **Send to Archer**.

4. Read the **Confirm Send to Archer** dialog and then click **Yes** to confirm sending the incident to Archer Cyber Incident & Breach Response. This action is not reversible.

You will receive a confirmation that the incident was sent to Archer along with an Archer incident ID. In the Overview panel, the Send to Archer button changes to Sent to Archer.

In the Incident Details view (click the link in the ID or NAME field of the incident sent to Archer) you can see the Sent to Archer notification above the Overview and Indicators panels. If you open the Journal, you can see a system journal entry that shows that the incident was sent to Archer and it now has an Archer ID number.



View All Incidents Sent to Archer

Note: This option is available in NetWitness Version 11.2 and later. If Archer is configured as a data source in Context Hub, you can send incidents to Archer and you will be able to see the Sent to Archer option and Sent to Archer Status in NetWitness Respond.

You can view incidents sent to Archer Cyber Incident & Breach Response using the Filter.

1. Go to **Respond > Incidents**. The Incidents List is displayed.
2. If you cannot see the Filters panel, in the Incident List view toolbar, click .
3. In the Filters panel, under **Sent To Archer**, select **Yes**.
   The incidents list will be filtered to show incidents that were sent to Archer Cyber Incident & Breach

Response.

Update an Incident

You can update an incident from several places. You can change the priority, status, or assignee from the Incident List view and the Incident Details view. For example, if you are an Analyst, you may want to assign yourself a case from the Incident List view if you see that it is related to another case you are working on. If you are an SOC Manager or an Administrator, you may want to view unassigned incidents from the Incident List view and assign the incidents as they come in. SOC Managers and Administrators can do bulk updates of the priority, status, or assignee instead of updating them one incident at a time.

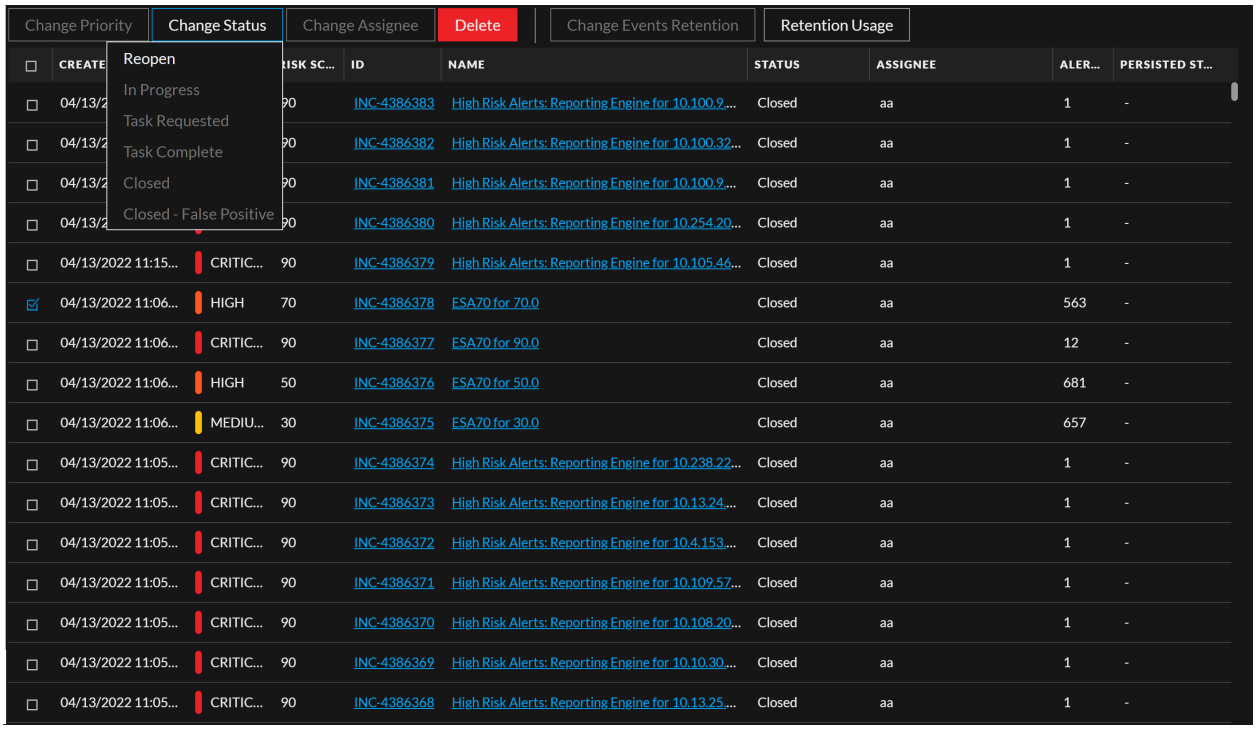
From the Details view, you might want to change the status to In Progress once you begin working on an incident, and then update it to Closed or Closed - False Positive after you resolve the issue. Or you might change the priority of the incident to Medium or High as you determine the details of the case.

Change Incident Status

When an incident first appears in the incident list, it has an initial status of New. You can update the status as you complete your work on the incident. The following statuses are available:

- Reopen
- In Progress
- Task Requested
- Task Complete

- Closed
- Closed - False Positive



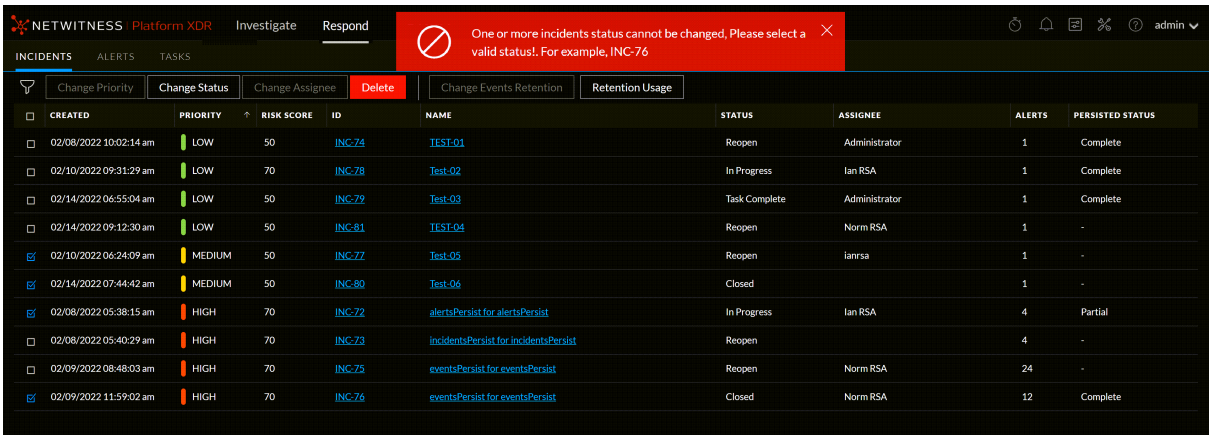
> **Note:** New and Assigned statuses under the Change Status drop-down list are removed in the version 12.0 and later.

Status Change Workflow

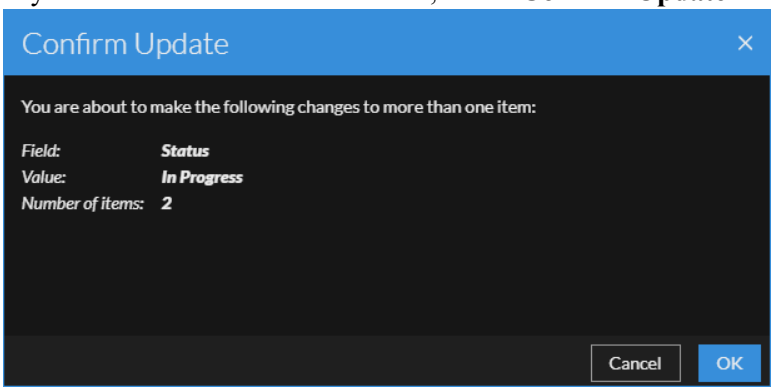
The table below lists all the statuses and provides information about specific Status Change Workflow.

Status	New	Reopen	Assigned	In Progress	Task Requested	Task Complete	Closed / Closed - False Positive
New	No	No	Yes	Yes	No	No	Yes
Reopen	No	No	Yes	Yes	No	No	Yes
Assigned	No	No	No	Yes	No	No	Yes
In Progress	No	No	No	No	Yes	Yes	Yes
Task Requested	No	No	No	Yes	No	Yes	Yes
Task Complete	No	No	No	Yes	Yes	No	Yes
Closed / Closed - False Positive	No	Yes	No	No	No	No	No

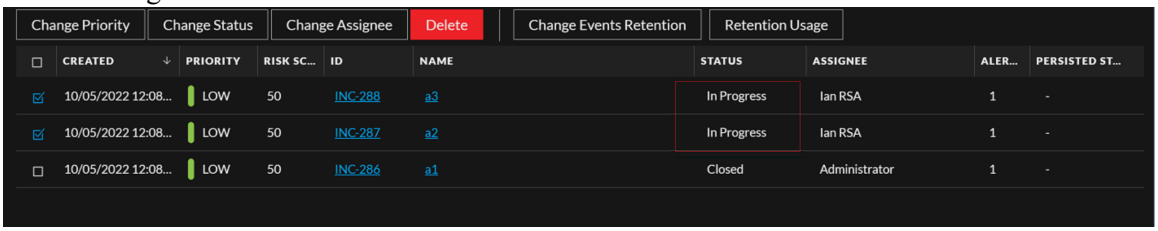
> **Note:** When you select an incident and click Change Status, all the invalid statuses are grayed out under the Change Status drop-down list. This is not applicable for multi-select of incidents. Refer the following figure.



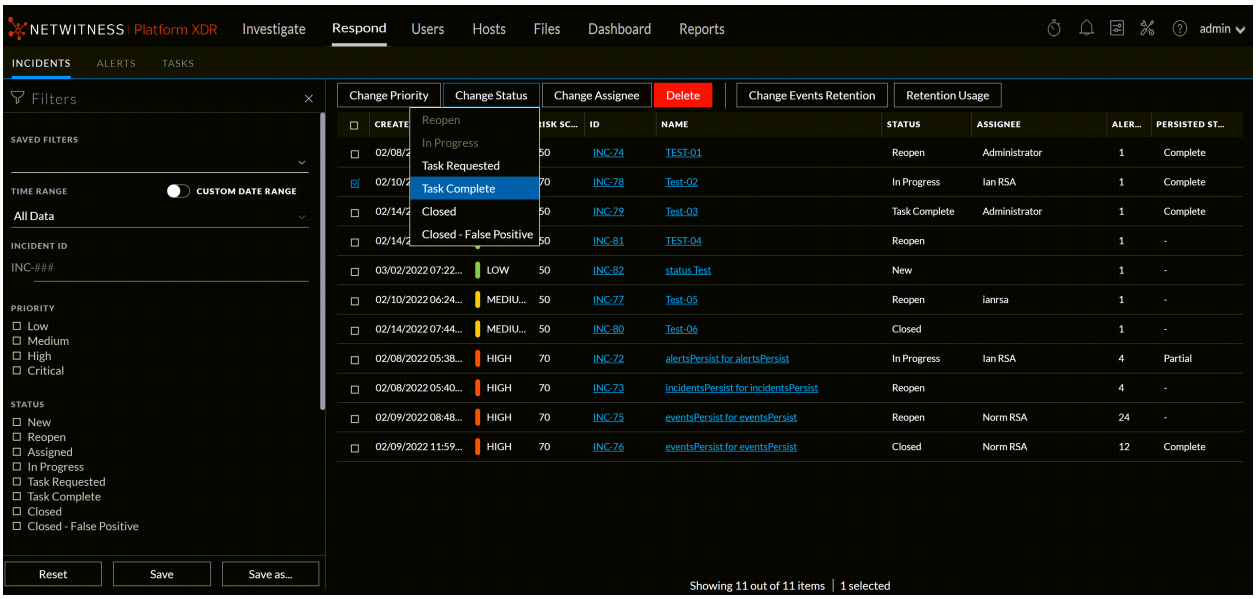
To update the status of multiple incidents:



1. In the Incidents List view, select one or more incidents that you would like to change. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Status** and select a status from the drop-down list. In this example, the current status is Assigned, but the Assignee would like to change it to In Progress for the selected incidents.

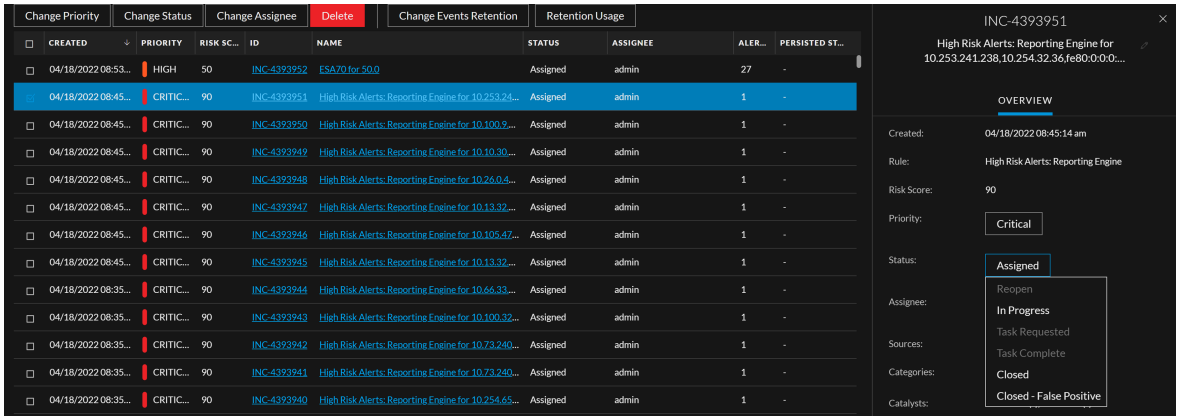


Note: The incident status can be changed to **Reopen** only if the current status of the incident is **Closed** or **Closed - False Positive**. This is also applicable when multiple incidents are selected. Even if one of the multiple incidents selected has the status other than **Closed or Closed - False Positive**, the error message **One or more incidents status cannot be changed, Please select a valid status!. For example, INC-x** is displayed. Refer the following figure.

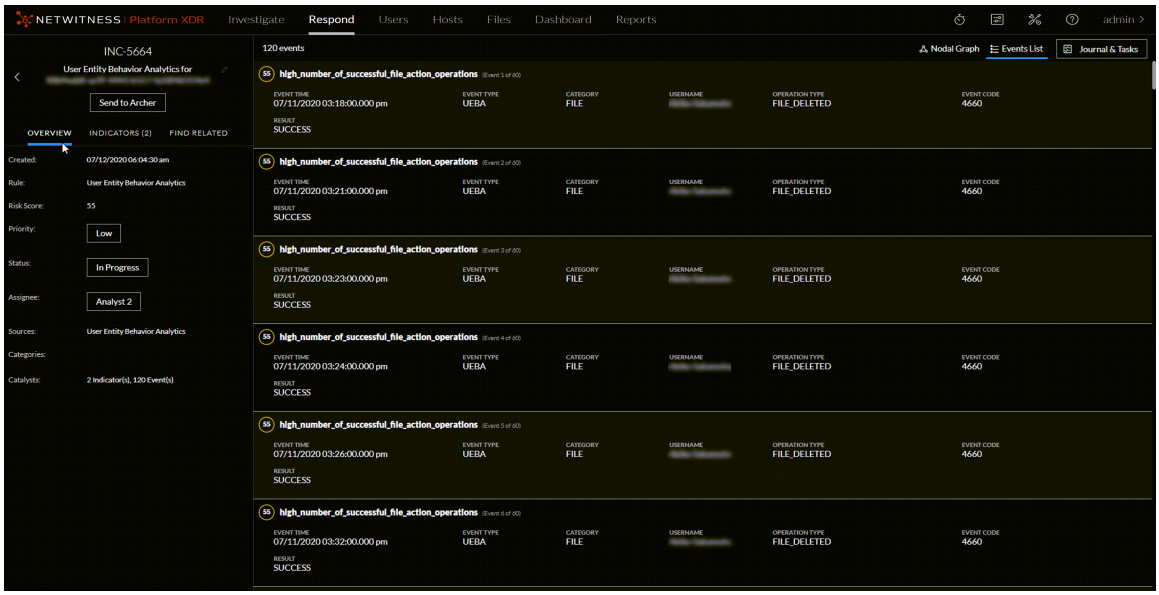


3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.

You can see a successful change notification. In this example, the status of the updated incidents now show In Progress.

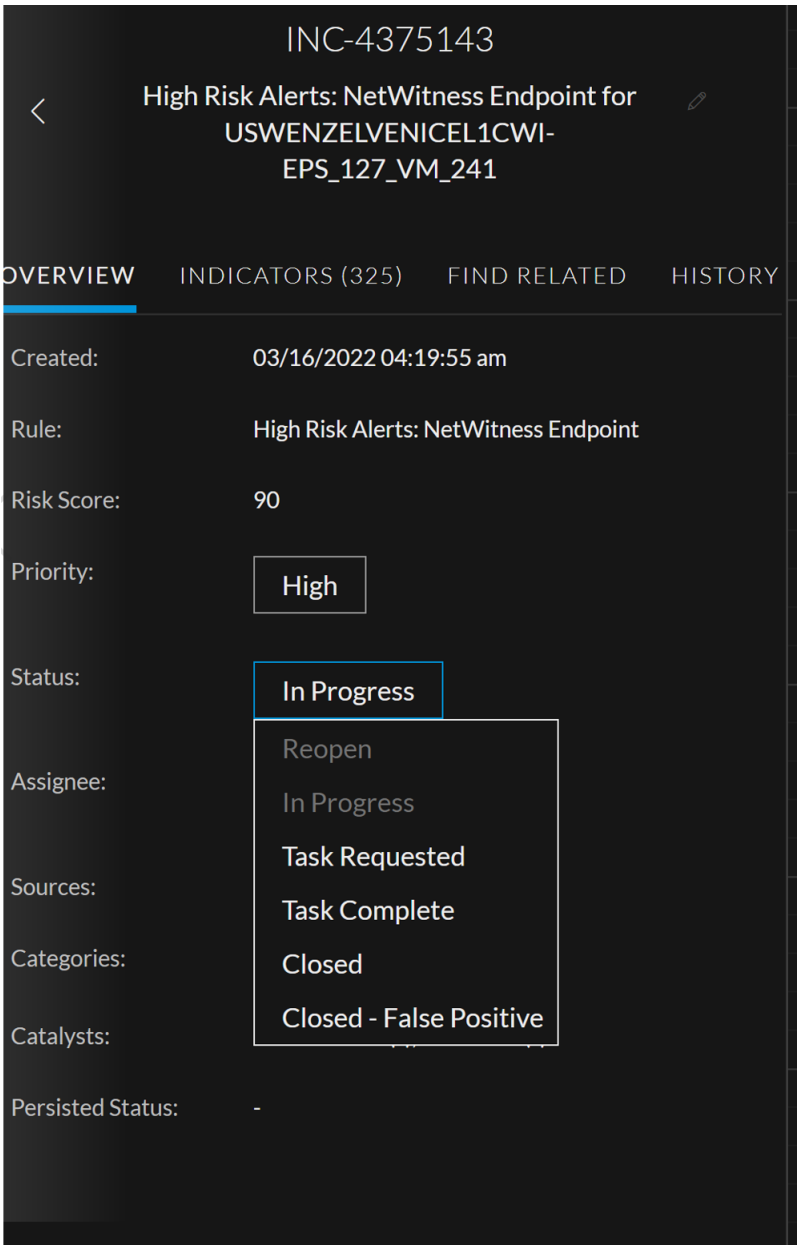


Note: If you select any incident and click **Change Status**, the current status of the incident is grayed out in the drop-down list. This is not applicable if you select multiple incidents. Refer the following figure.

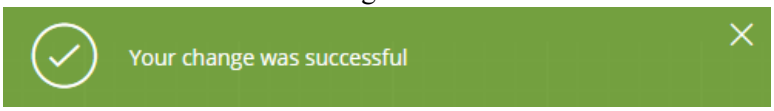


To change the status of a single incident from the Overview panel:

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click the row of an incident that needs a status update.



- From the Incident Details view, click the **OVERVIEW** tab.



In the Overview panel, the Status button shows the current status of the incident.

2. Click the **Status** button and select a status from the drop-down list.

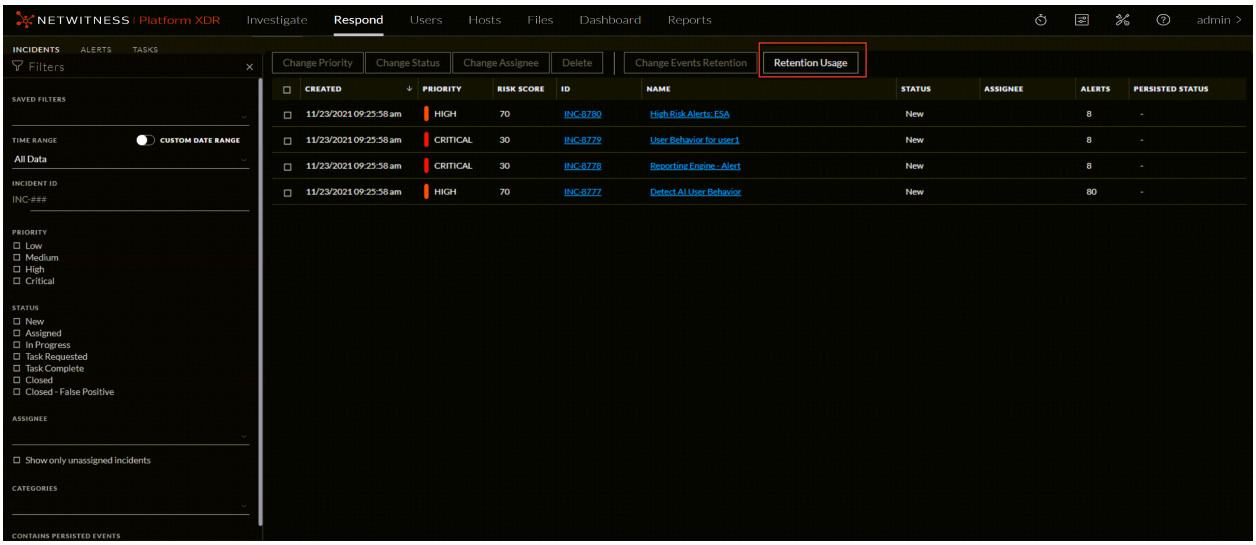
You can see a successful change notification.

Note: The incident status can be changed to **Reopen** only if the current status of the incident is **Closed** or **Closed - False Positive**.

Change Events Retention

Events retention enables you to persist events that are associated with particular incidents, thereby enabling you to view the incident related events in the future, regardless of its age. The event data will always be available for viewing and reconstruction as long as the event is persisted, enabling you to easily refer back to details, even if the original event has rolled over from the NetWitness database. You can perform the following functions:

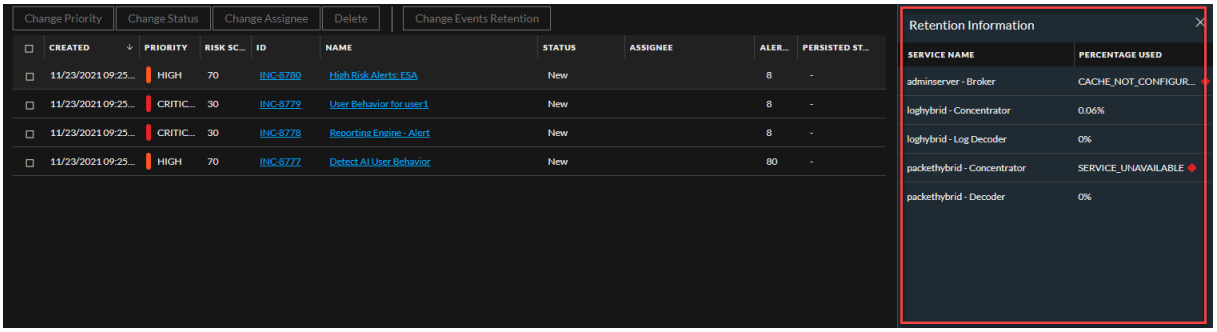
- Persist all events
- Suspend persisting all events



To change event retention:

1. Select the incidents for which you want to change the event retention plan.
2. Select **Persist all events** from the **Change Events Retention** tab to persist all the events that are associated with the selected incidents.
   a. The confirmation message appears. Click **OK** to persist all events.
   Persisting all events in an incident in NetWitness will save the events data in the long term cache of the source.
3. Select **Suspend Persisting all events** from the **Change Events Retention** tab to stop persisting the events that are associated with the selected incidents.
   a. The confirmation message appears. Click OK to suspend persist all events.
   Suspending persist of events in an incident from NetWitness will delete it from the long term cache of the source only. This may not be reversible if the original event data has rolled out in the source database.

Note: You cannot change the event retention for incidents that are in **New** or **Closed** state.



Obtain Retention Usage Details

The Retention Usage tab allows an analyst to fetch all the persisted data disc usage stats of all the configured services and the percentage used by the pinned cache directories. This will enable the analyst to determine if the disk is running out of space and if additional space needs to be added or suspend persist on the existing events in an incident.

After the analyst clicks on the Retention Usage tab, a Retention Information panel is displayed with the following status:

- Percentage of the disk used when data is persisted
- Cache directory is configured or not. In case it is not configured it is explicitly indicated.
- List of all the status of a configured service. In case the service is not available it is explicitly indicated.

Note: In case the disk space exceeds the usage, a warning message displayed. The service threshold can be configured by navigating to **Respond** > **Services** > **respond/core/properties** > **warning-threshold field**.

Export Incident Data

NetWitness Platform XDR enables the analysts to export and store the Incidents with Alerts and Events in JSON format for offline investigation. The **Export** drop-down allows you to export and download the data (such as fields or attributes) associated with Alerts and Events of the selected Incidents. The data can only be downloaded in JSON format.

Schema Files for Incident Export

NetWitness Platform XDR provides Schema files (Default and Custom) located at `/var/netwitness/respond-server/export-schema` to allow you to export only a subset of attributes among the many list of attributes available in Mongo DB for Incidents and Alerts. Default schema files cannot be modified, but the Custom schema files can be modified to add the attributes as required. For more information, see Schema Files for Incidents and Schema Files for Alerts.

Schema Files for Incidents

The Incident Schema files contain various fields or attributes associated with an Incident. Based on the requirement, you can modify these Schema files and download additional fields. The Schema files are categorized into two types:

- **Default Incident Schema File** (**default_incident_export.json**): This file contains a default list of attributes associated with the Incidents (in Mongo DB) that are used to export. This pre-populated out-of-the-box file provided by NetWitness Platform XDR must not be modified.
- **Custom Incident Schema File** (**custom_incident_export.json**): This is an empty file provided by NetWitness Platform XDR to allow users to download the attributes unavailable in the **Default Incident Schema File**, but listed in the **incident** collection in Mongo DB.

  To download the required attributes using Custom Incident Schema File:

  1. Edit the `custom_incident_export.json` file located at `/var/netwitness/respond-server/export-schema` to add the required attributes.
  2. Restart the **Respond** Service.
  3. Export the Incidents data from UI.

  Note: The attributes downloaded using the **Custom Incident Schema File** include the attributes already listed in the **Default Incident Schema File** and the newly added attributes.

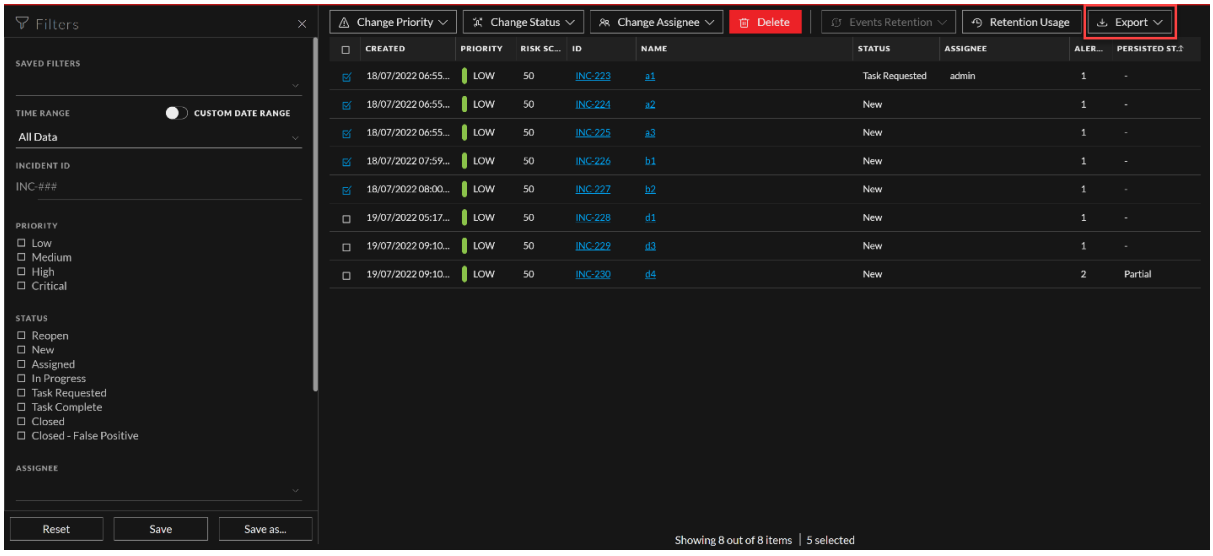
Schema Files for Alerts

NetWitness Platform XDR allows you to download various fields or attributes associated with the Original and Normalized alerts.

Original Alerts

The alerts triggered and received through different sources such as Endpoint, User Entity Behavior Analytics (UEBA), Event Stream Analysis (ESA), Malware Analysis, NetWitness Investigate, Reporting Engine, Risk Scoring, Web Threat Detection, and NetWitness UEBA (Cloud) are Original Alerts.

Normalized Alerts



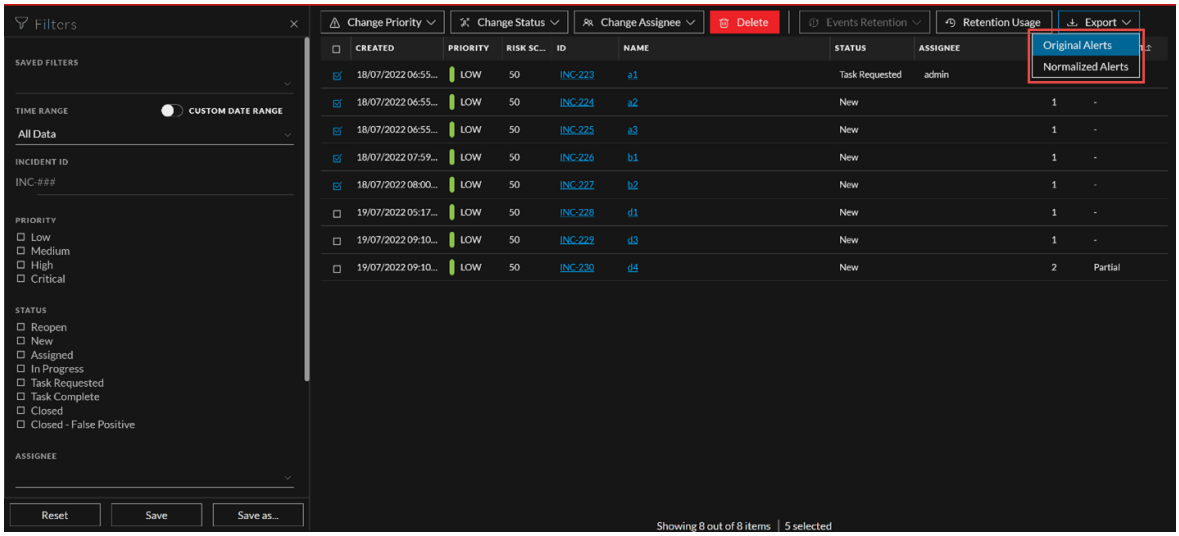
The structure or pattern of the Original Alerts varies based on the source from which the alerts are triggered. These alerts are normalized and standardized in the **Respond** service to unify their structure.

Based on the attributes (associated with the Original and Normalized Alerts) downloaded, the Alerts Schema files are categorized into:

- **Default Original Alerts Schema File** (**default_alert_original_export.json**): This file contains a default list of attributes associated with the Original Alerts (in Mongo DB) that are used to export. This pre-populated out-of-the-box file provided by NetWitness Platform XDR must not be modified.
- **Custom Original Alerts Schema File** (**custom_alert_original_export.json**): This is an empty file provided by NetWitness Platform XDR to allow you to download the attributes unavailable in the **Default Original Alerts Schema File**, but listed in the **originalAlert** (**alert** > **originalAlert**) collection in Mongo DB.
- **Default Normalized Alerts Schema File** (**default_alert_normalized_export.json**): This file contains a default list of attributes associated with the Normalized Alerts (in Mongo DB) that are used to export. This pre-populated out-of-the-box file provided by NetWitness Platform XDR must not be modified.
- **Custom Normalized Alerts Schema File** (**custom_alert_normalized_export.json**): This is an empty file provided by NetWitness Platform XDR to allow you to download the attributes unavailable in the **Default Normalized Alerts Schema File**, but listed in the **alert** (**alert** > **alert**) collection in Mongo DB.

To export the Incident data:

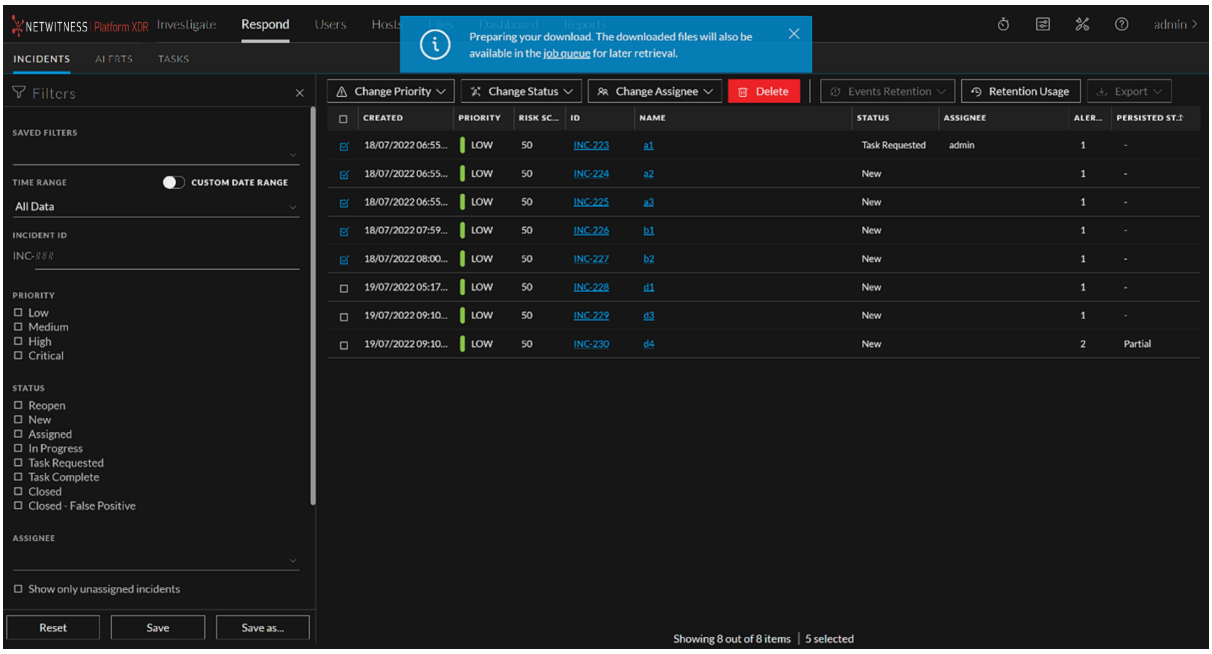
1. Go to **Respond** > **Incidents**.
2. In the Incidents List view, select one or more incident and click the **Export** drop-down.



IMPORTANT: To access the **Export** drop-down, you must have access to escalate or remediate the incident.

Note: The **Export** drop-down is enabled only in the following scenarios:
- When an incident is selected in the Incidents List view.
- When the different set of incidents are selected in the Incidents List view after incident data export.
- When you select the same set of incidents again in the Incidents List view to export the data.

Note:
- You must refresh the page to select the same set of incidents again in the Incidents List view to export the data.
- You can export data of a maximum of ten incidents at a time. Once the data download is in progress, you can select a different set of incidents (ten incidents) and export their data simultaneously. You can repeat this action until the condition **max-user-tasks** (a maximum limit set for exporting the incidents data in the **Respond** service under **rsa.respond.incident.exports**) is met.



3. Select one of the following options in the **Export** drop-down list to download the files.

   - **Original Alerts**: Select this option to download the attributes associated with the Original Alerts. For more information, see Original Alerts.
   - **Normalized Alerts**: Select this option to download the attributes associated with the Normalized Alerts. For more information, see Normalized Alerts.

   Once the file download is initiated, a notification message is displayed.

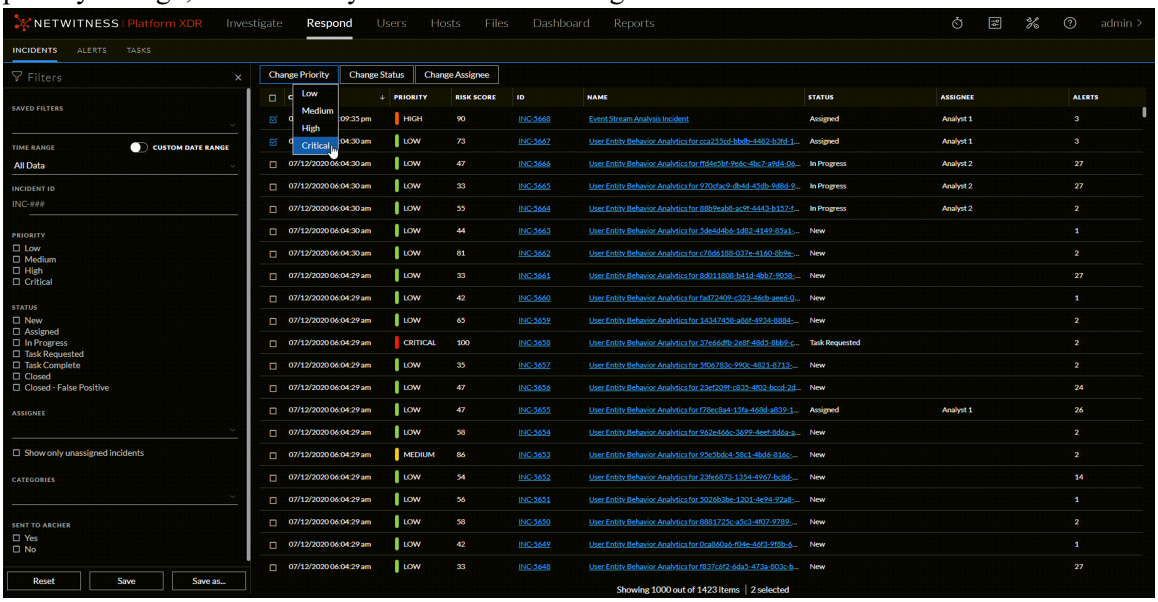
4. Click the **job queue** link.

The **Jobs** page is displayed.

5. Select the file and click **Download** under the **Action** column once the download status is displayed as **Completed** under the **Status** column.

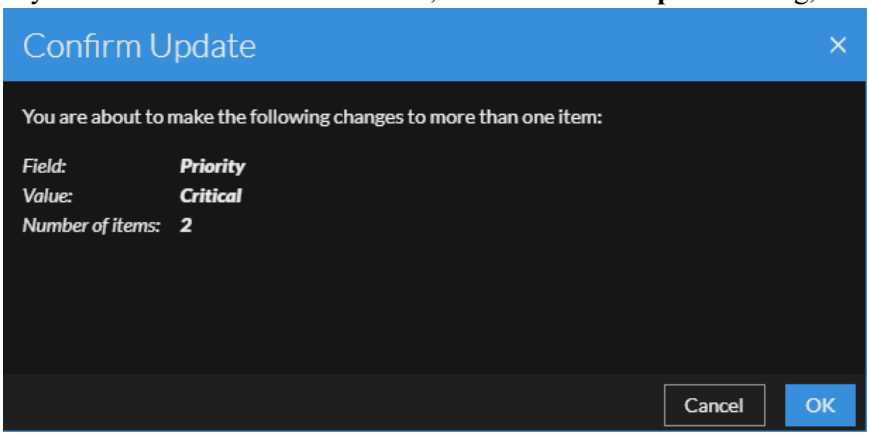
Change Incident Priority

The incident list is sorted by Priority by default. You can update the priority as you study the details of the case. The following priorities are available:



- Critical
- High

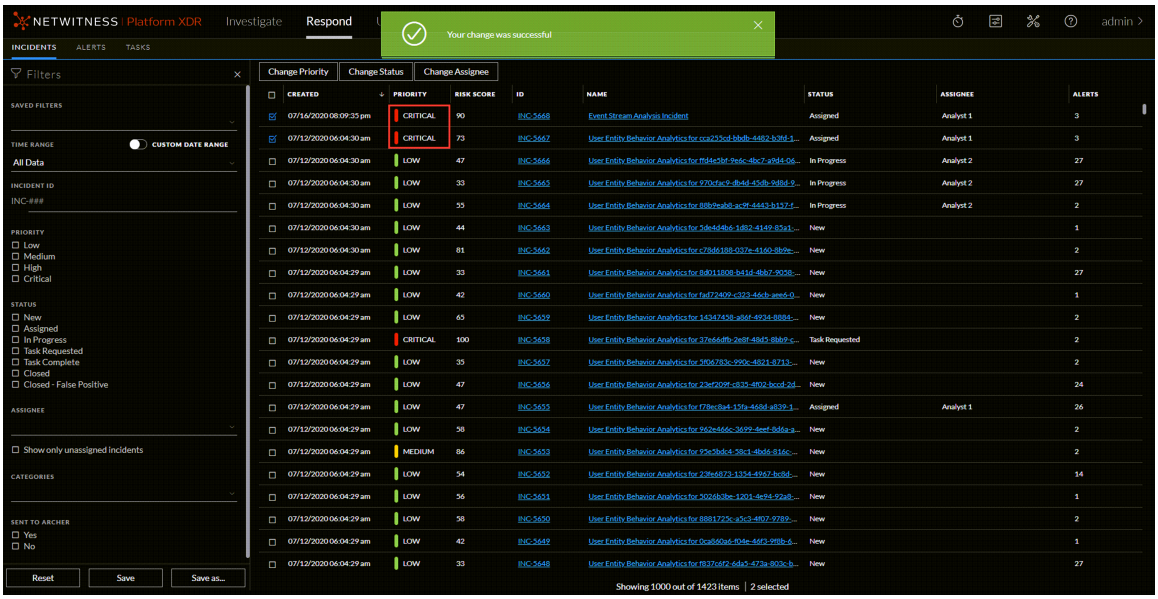
- Medium
- Low



Note: You cannot change the priority of a closed incident.

To update the priority of multiple incidents:

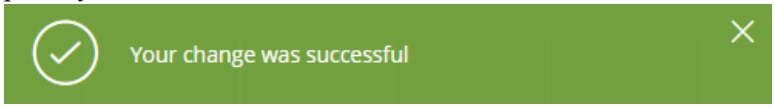
1. In the Incidents List view, select one or more incidents that you would like to change. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Priority** and select a priority from the drop-down list. In this example, the current priority is High, but the Analyst would like to change it to Critical for the selected incidents.



3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.

You can see a successful change notification. In this example, the status of the updated incidents now

show Critical.

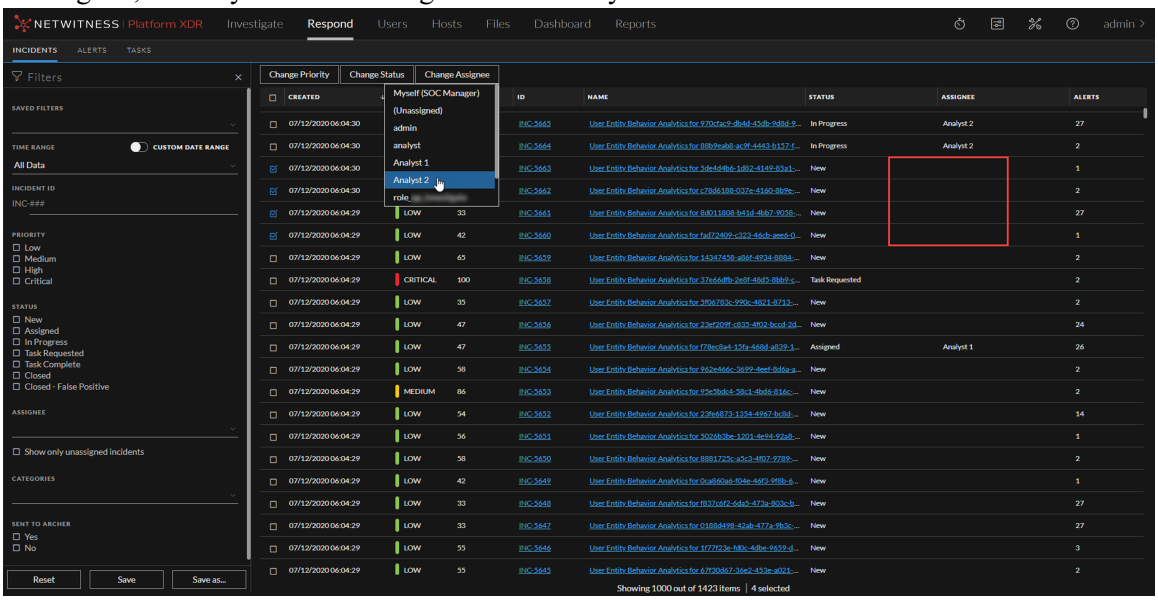


To change the priority of a single incident from the Overview panel

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click the row of an incident that needs a priority update.
   - From the Incident Details view, click the **Overview** tab in the left panel.
     In the Overview panel, the Priority button shows the current priority of the incident.
2. Click the **Priority** button and select a status from the drop-down list.

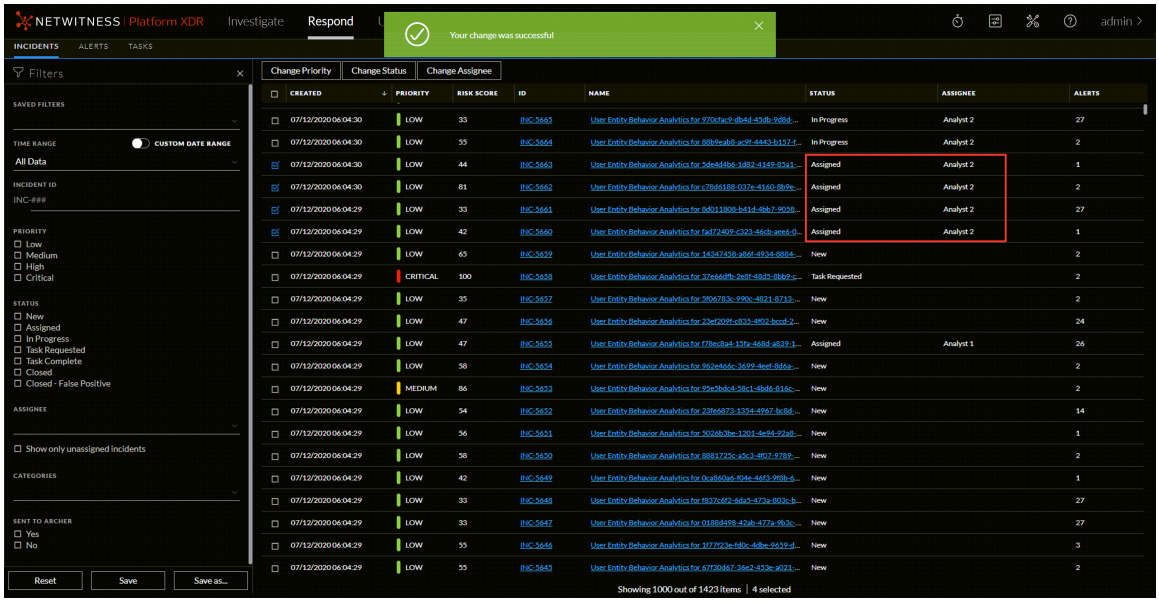
You can see a successful change notification. The Priority button changes to show the new incident priority.

Note: Current priority is grayed out under **Priority** drop-down list. You will not be able to select the grayed out priority.



Assign Incidents to Other Analysts

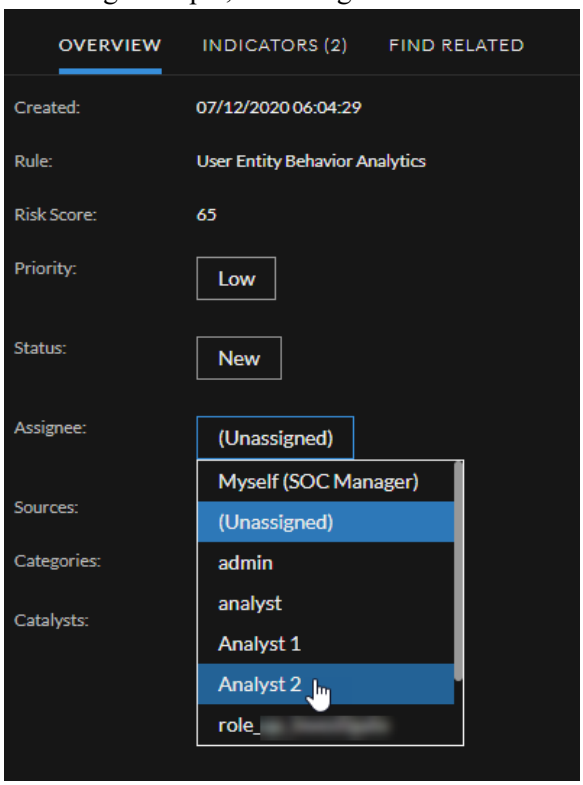
You can assign incidents to other Analysts in the same way as you assign incidents to yourself. SOC Managers and Administrators can assign multiple incidents to a user at the same time.



Note: You cannot change the assignee of a closed incident.

To assign multiple incidents to a user:

1. In the Incidents List view, select the incidents that you would like to assign to a user. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Assignee** and select a user from the drop-down list. In this example, the incidents are unassigned, but they should be assigned to an Analyst.



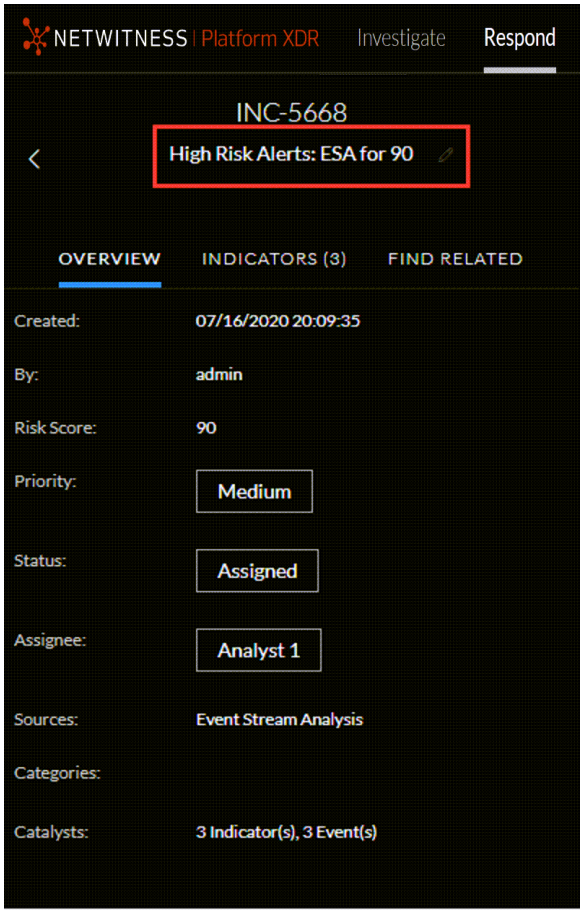
3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.
   You can see a successful change notification. The assignee changes to the selected user.

To assign a user to an incident from the Overview panel:

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click the row of an incident that you would like to assign to a user.
   - From the Incident Details view, click the **Overview** tab in the left panel.
     In the Overview panel, the Assignee button shows the current assignee of the incident. In the

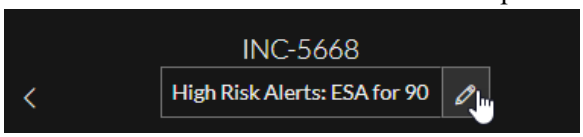
following example, the Assignee button has a current status of Unassigned.

2. Click the **Assignee** button and select a user from the drop-down list.
   You can see a successful change notification. The Assignee button changes to show the assigned user.



Note: Current assignee name is grayed out under **Assignee** drop-down list. You will not be able to select the grayed out user.

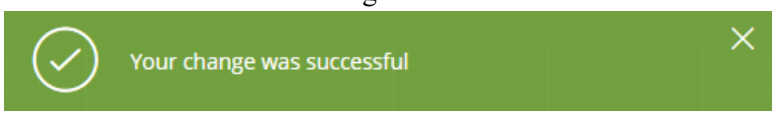
Rename an Incident



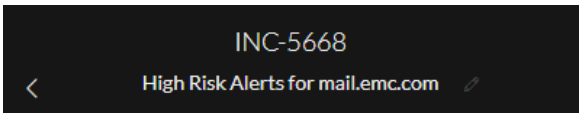
You can rename an incident from the Overview panel in the Incidents List view and the Incident Details view. For example, you may want to rename an incident to provide clarification about the issue, especially if multiple incidents have the same name.

1. Go to **Respond > Incidents**.
2. To open the Overview panel, do one of the following:
   - From the Incidents List view, click the row of an incident that needs a name change.
     The Overview panel opens.

- From the Incident Details view, click the **OVERVIEW** tab in the left panel.
  In the header above the Overview panel, you can see the incident ID and the incident name.

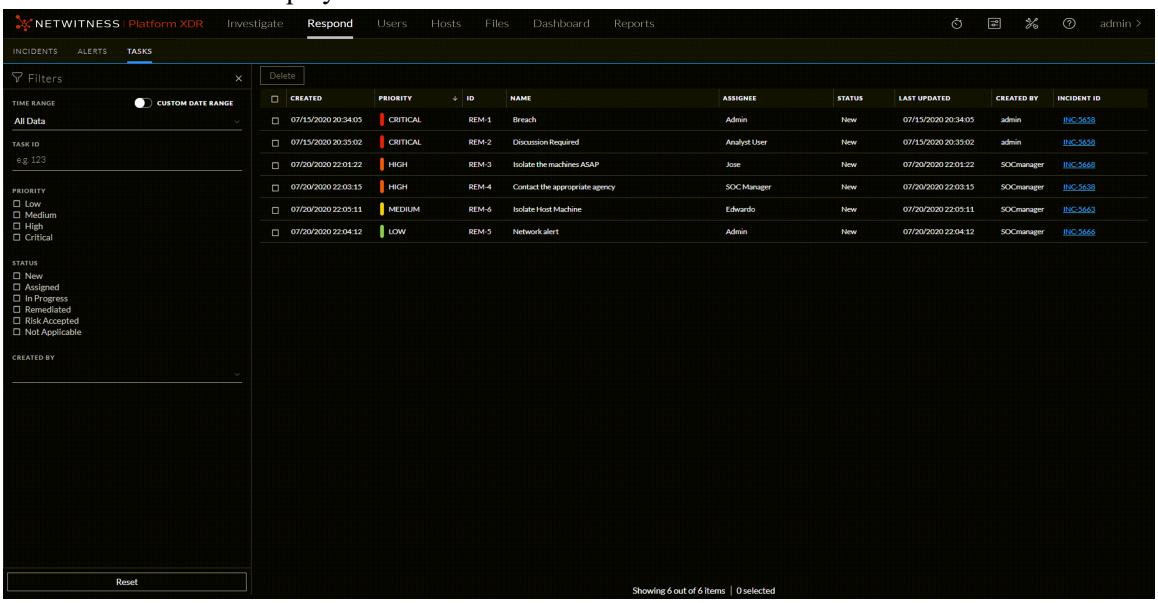


3. Click the incident name in the header to open a text editor.



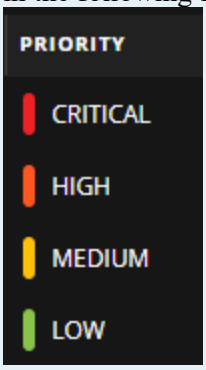
4. Type a new name for the incident in the text editor and click the check mark to confirm the change.

For example, you can change "High Risk Alerts: ESA for 90.0" to "High Risk Alerts for mail.emc.com" for more clarification.
You can see a successful change notification.



The incident name field shows the new name.

View All Incident Tasks

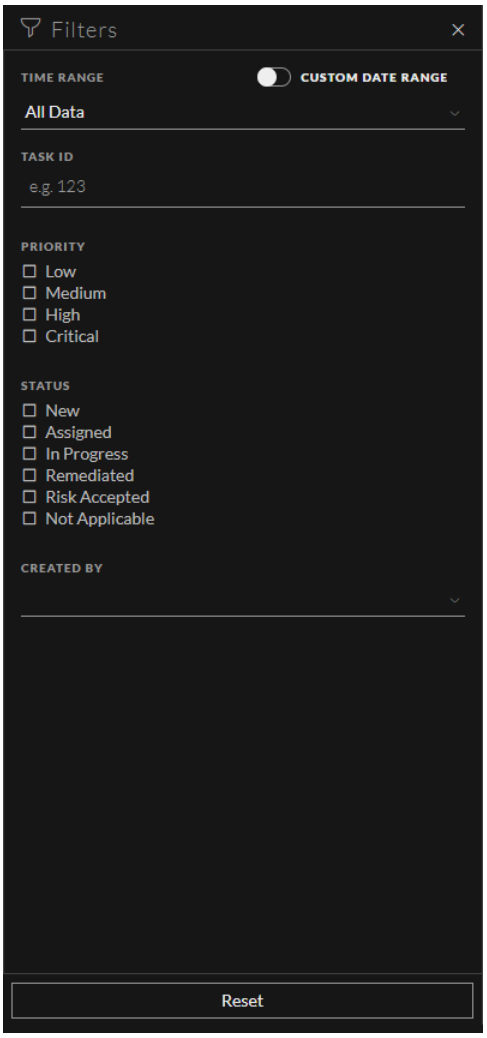


When additional work is required for an incident, you can create tasks for the incident and track the progress on those tasks. This is helpful, for example, when the work being done is outside security operations or you make a request for a computer reimage. In the Tasks List view, you can manage and track the tasks to closure.

1. Go to **Respond > Tasks**.
   The Tasks List view displays a list of all incident tasks.

2. Scroll through the tasks list, which shows basic information about each task as described in the following table.

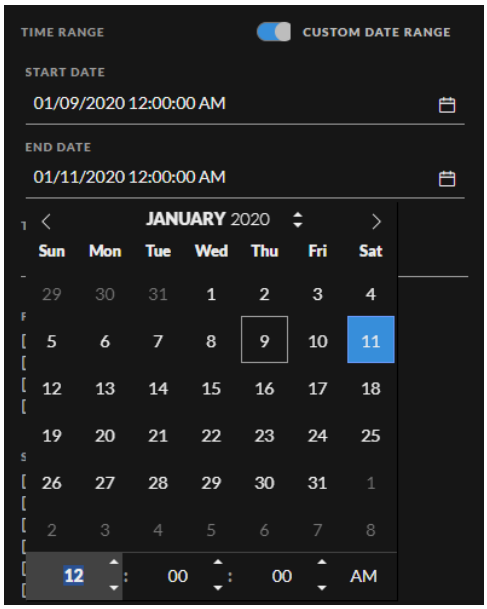
Column	Description
Created	Displays the date when the task was created.



Column	Description
Priority	Displays the priority assigned to the task. The priority can be any of the following: Critical, High, Medium, or Low. The Priority is also color coded, where red indicates **Critical**, orange represents **High** risk, yellow indicates **Medium** risk, and green represents **Low** risk as shown in the following figure: 
ID	Displays the task ID.
Name	Displays the task name.
Assignee	Displays the name of the user assigned to the task.
Status	Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
Last Updated	Displays the date and time when the task was last updated.
Created By	Displays the user who created the task.
Incident ID	Displays the incident ID for which the task was created. Click the ID to display the details of the incident.

At the bottom of the list, you can see the number of tasks on the current page, the total number of tasks, and the number of tasks selected. For example: **Showing 6 out of 6 items | 2 selected**.

Filter the Tasks List



The number of tasks in the Tasks List can be very large, making it difficult to locate particular tasks. The Filter enables you to specify those tasks that you would like to view, such as tasks created within the last 7 days. You can also search for a specific task.

1. Go to **Respond > Tasks**.
   The Filters panel appears to the left of the Tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.

2. In the Filters panel, select one or more options to filter the incidents list:
   - **Time Range**: You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the tasks. For example, if you select Last Hour, you can see tasks that were created within the last 60 minutes.
   - **Custom Date Range**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of CUSTOM DATE RANGE to view the Start

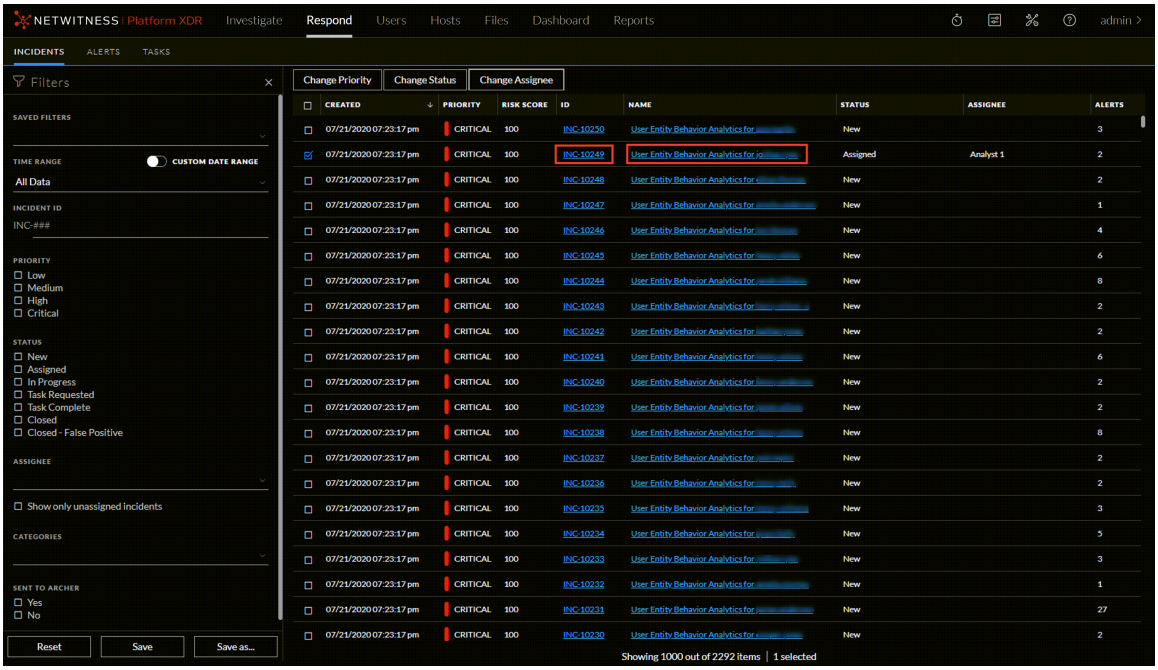
Date and End Date fields. Select the dates and times from the calendar.

- **Task ID**: Type the Task ID for a task that you would like to locate, for example REM-123.
- **Priority**: Select the priorities that you would like to view.
- **Status**: Select one or more incident statuses. For example, select Remediated to view completed remediation tasks.
- **Created By**: Select the user who created the tasks that you would like to view. For example, if you only want to view the tasks created by Edwardo, select Edwardo from the CREATED BY drop-down list. If you want to view tasks regardless of the person who created the task, do not make a selection under CREATED BY.

The Tasks List shows a list of tasks that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the tasks list.
For example: **Showing 6 out of 6 items**

3. If you want to close the Filters panel, click **X**. Your filters remain in place until you remove them.

Remove My Filters from the Tasks List

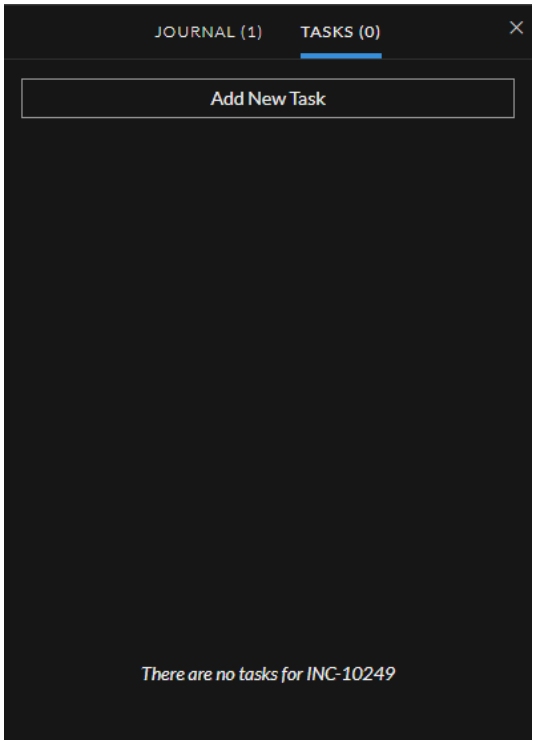


NetWitness remembers your filter selections in the Tasks List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of tasks that you expect to see or you want to view all of the tasks in your tasks list, you can reset your filters.

1. Go to **Respond > Tasks**.
   The Filters panel appears to the left of the tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.
2. At the bottom of the Filters panel, click **Reset Filters**.

Create a Task

After you investigate an incident and know more about it, you can create a task, assign it to a user, and track it to closure. You create tasks from the Incident Details view.

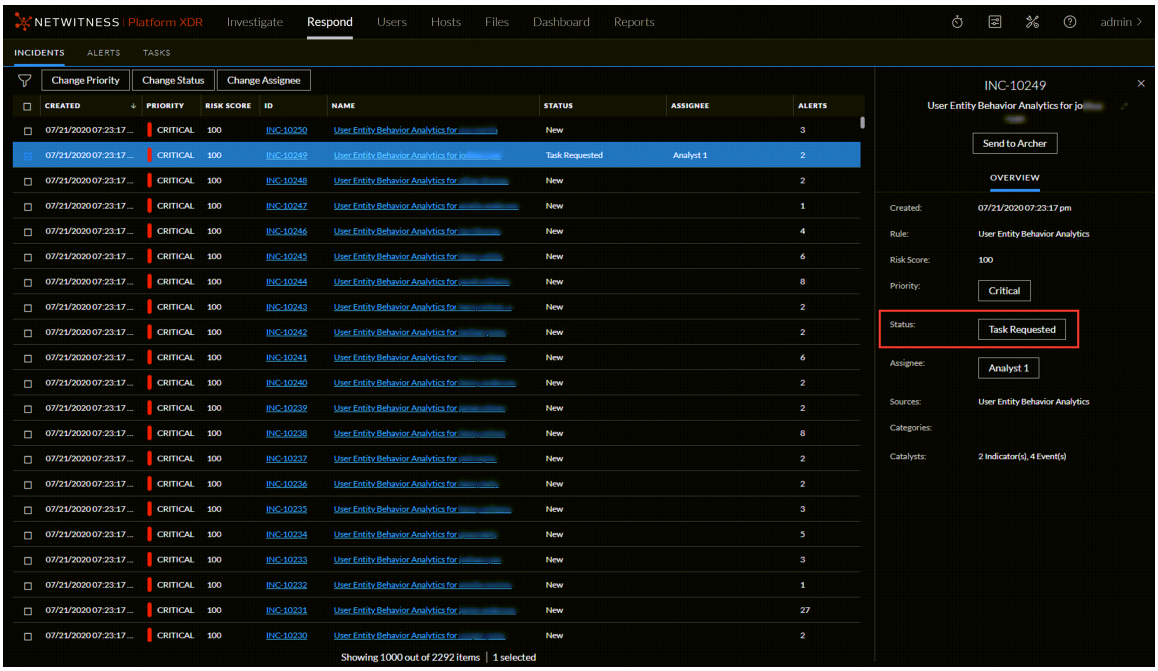


1. Go to **Respond > Incidents**.
   The Incidents List view displays a list of all of the incidents.
2. Locate the incident that needs a task and click the link in the **ID** or **Name** field.

3. In the Journal panel on the right side of the Incident Details view, click the **Tasks** tab.
   If you do not see the Journal panel, click **Journal & Tasks** and then click the **Tasks** tab.

4. In the Tasks panel, click **Add New Task**.

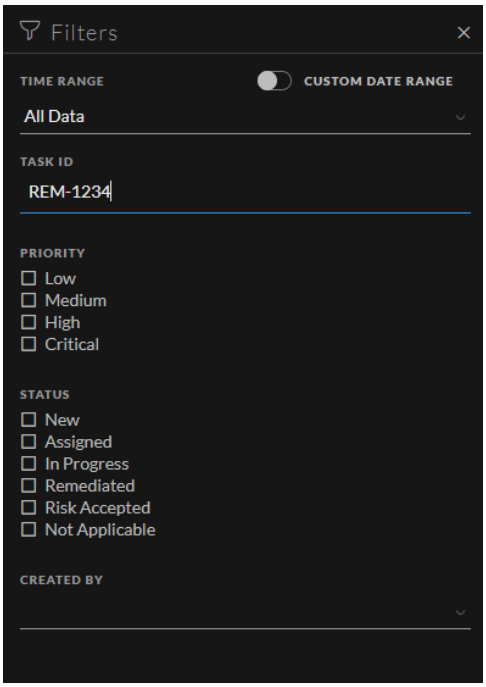
   You can see the new task fields.



If the incident is in a closed state (Closed or Closed - False Positive), the Add New Task button is disabled.

5. Provide the following information:
   - **Name** - Name of the task. For example: Re-image the machine.
   - **Description** - (Optional) Type information that describes the task. You may want to include any applicable reference numbers.
   - **Assignee** - (Optional) Type the username of the user to whom the task is to be assigned.
   - **Priority** - Click the priority button and select a priority for the tasks from the drop-down list: Low, Medium, High, or Critical.
6. Click **Save**.
   You can see a confirmation that your change was successful. The incident status changes to **Task Requested**. (You may need to refresh the Incident Details view to see the changes.) The task appears in the Tasks panel for this incident.

   In the Incidents List view, the incident status also changes to Task Requested.



The task also appears in the Tasks list (Respond > Tasks), which shows a list of all incident tasks.

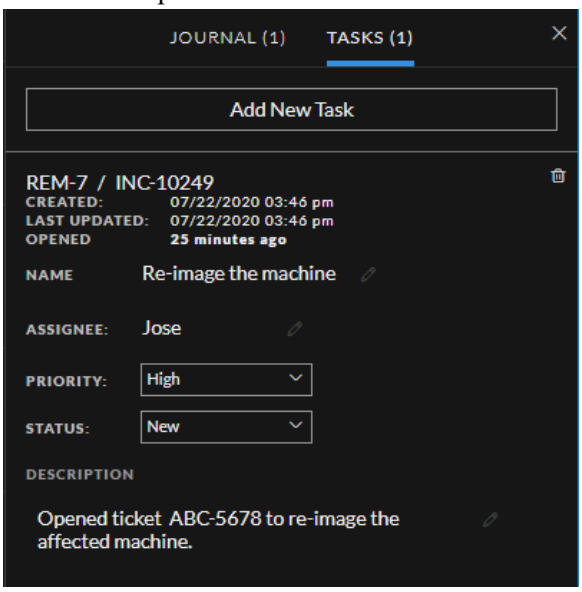
Note: If you do not see the status change, you may need to refresh your internet browser.

Find a Task

If you know the Task ID, you can quickly locate a task using the Filter. For example, you may want to locate a specific task out of thousands of tasks.

1. Go to **Respond > Tasks**.
   The Filters panel appears to the left of the Tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.

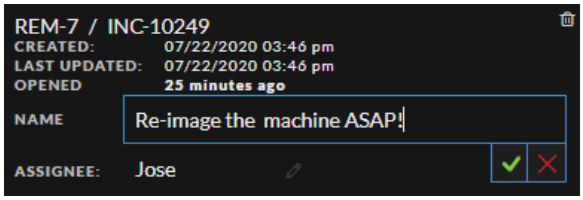
2. In the **Task ID** field, type the Task ID for a task that you would like to locate, for example REM-1234.
   The specified task appears in your task list. If you do not see any results, try resetting your filters.



Modify a Task

You can modify a task from within an incident and from the Tasks list. For example, you may want to show the status of the task as In Progress and add some additional information to the task. If the task is in a closed state (Not Applicable, Risk Accepted, or Remediated), you cannot modify the Priority or Assignee.

To modify a Task from within an incident:



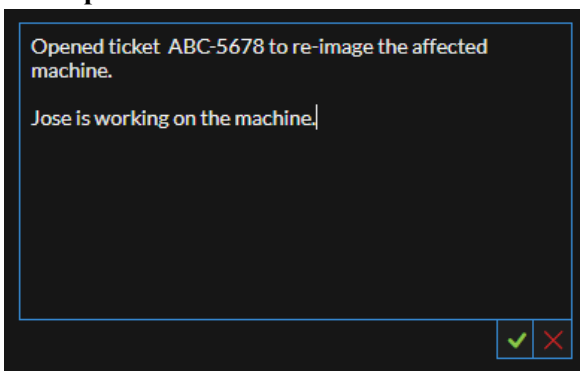
1. Go to **Respond > Incidents**.
   The Incidents List view displays a list of all incidents.
2. Locate the incident that needs a task update and click the link in the **ID** or **Name** field.
3. In the Journal panel on the right side of the Incident Details view, click the **Tasks** tab.
   If you do not see the Journal panel, click **Journal & Tasks** and then click the **Tasks** tab.
   In the Tasks panel, a pencil icon indicates a text field that you can change. A button indicates that

there is a drop-down list to make a selection.

4. You can modify any of the following fields:

- **Name** - Click the current task name to open a text editor.

  Click the check mark to confirm the change. For example, you can change "Re-image the machine" to "Re-image the machine ASAP!"

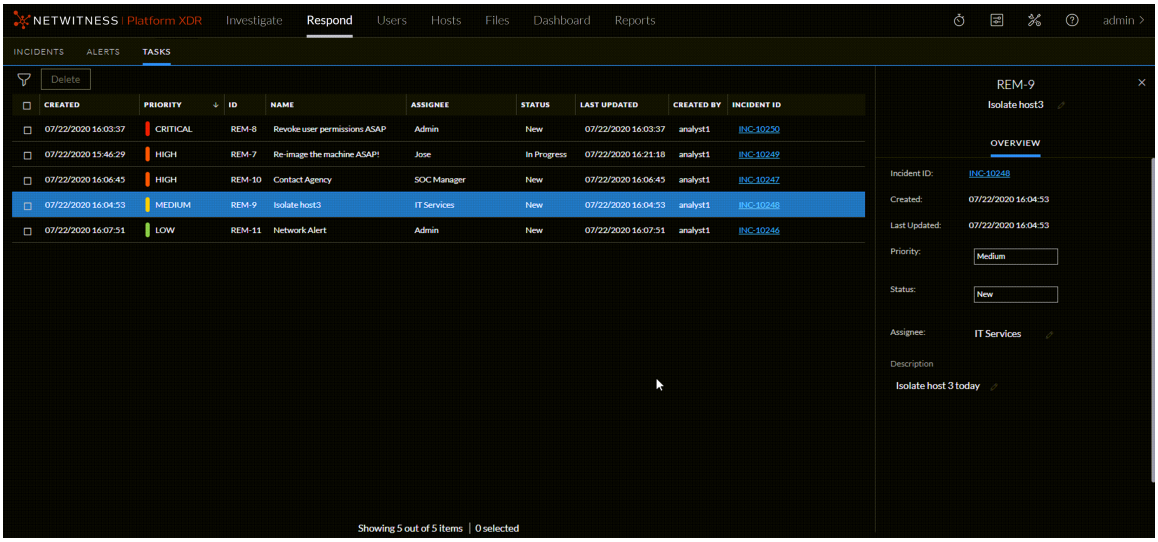


- **Assignee** - Click (Unassigned) or the name of the previous assignee to open a text editor. Type the username of the user to whom the task is to be assigned.
  Click the check mark to confirm the change.

- **Priority** - Click the Priority button and select a priority for the task from the drop-down list: Low, Medium, High, or Critical.

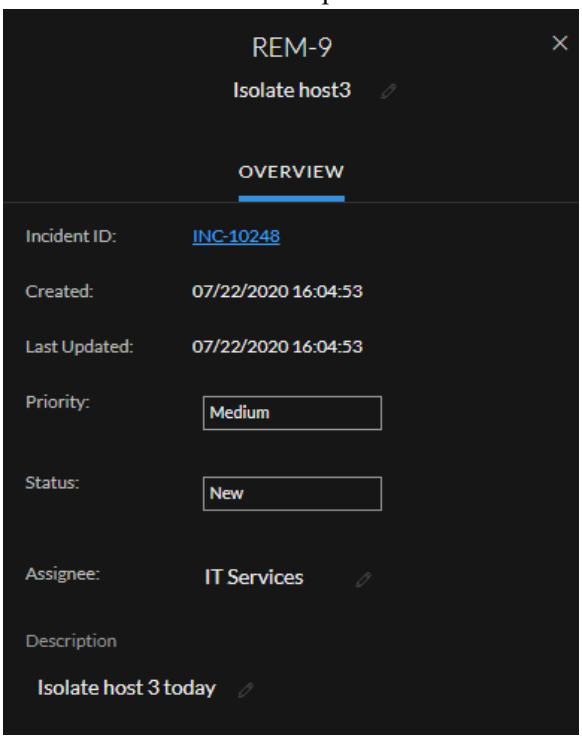
- **Status** - Click the Status button and select a status for the task from the drop-down list: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. For example, you can change the status to In Progress.

- **Description** - Click the text underneath the description to open a text editor.



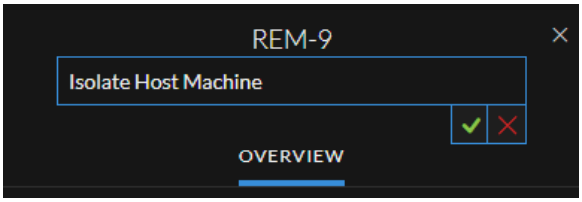
Modify the text and click the check mark to confirm the change.

For each change that you make, you can see a confirmation that your change was successful.



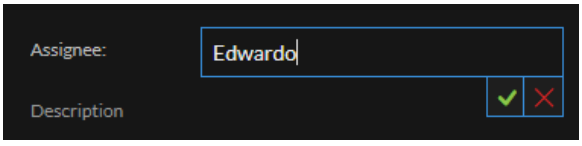
To modify a Task from the Tasks list:

1. Go to **Respond > Tasks**.
   The Tasks List view displays a list of all incident tasks.
2. In the Tasks list, click the task that you want to update.
   The Task Overview panel appears to the right of the tasks list.



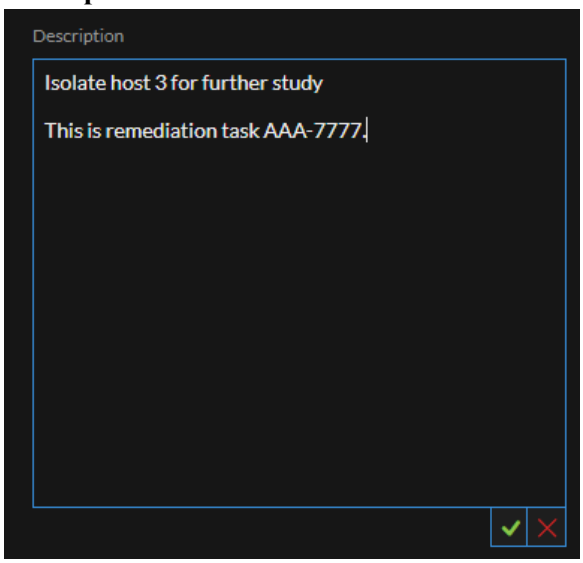
In the Task Overview panel, a pencil icon indicates a text field that you can change. A button

indicates that there is a drop-down list to make a selection.



3. You can modify any of the following fields:

- **<Task Name>** - At the top of the Task Overview panel, below the Task ID, click the current task name to open a text editor.



Click the check mark to confirm the change. For example, you can change Isolate Host to Isolate Host Machine.

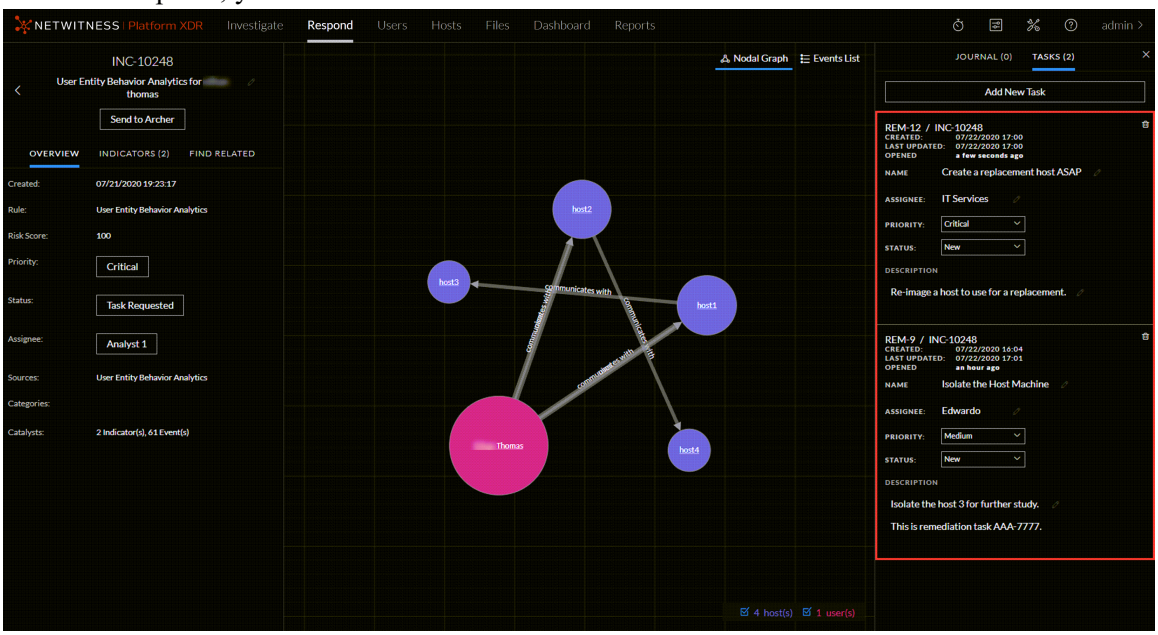
- **Priority** - Click the Priority button and select a priority for the task from the drop-down list: Low, Medium, High, or Critical.
- **Status** - Click the Status button and select a status for the task from the drop-down list: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
- **Assignee** - Click (Unassigned) or the name of the previous assignee to open a text editor. Type the username of the user to whom the task is to be assigned.

Click the check mark to confirm the change.

- **Description** - Click the text underneath the description to open a text editor.

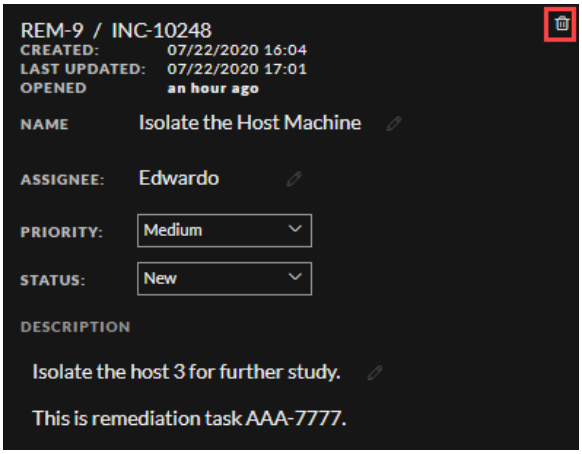
  Modify the text and click the check mark to confirm the change.

For each change that you make, you can see a confirmation that your change was successful.



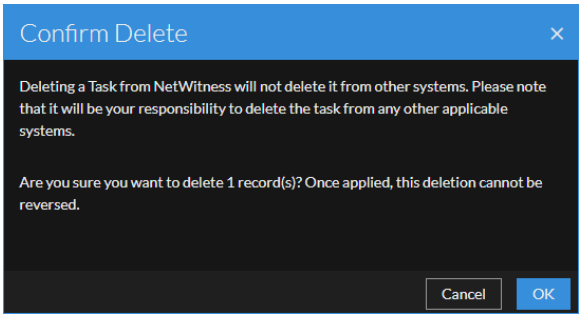
Delete a Task

You can delete a task, if, for example, you created it in error or you find that it is not needed. You can delete a task from within an incident and also from the Tasks List view. In the Tasks List view, you can delete multiple tasks at the same time.



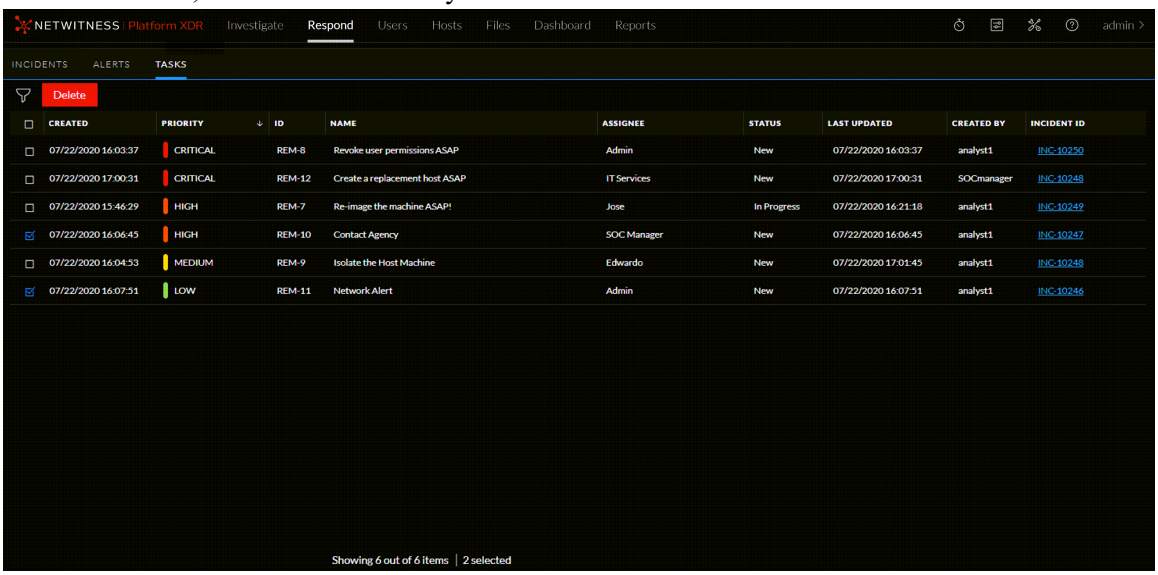
To Delete a Task from within an incident:

1. Go to **Respond > Incidents**.
   The Incidents List view displays a list of all incidents.
2. Locate the incident that needs a task update and click the link in the **ID** or **Name** field.
3. In the Journal panel on the right side of the Incident Details view, click the **Tasks** tab.
   If you do not see the Journal panel, click **Journal & Tasks** and then click the **Tasks** tab.

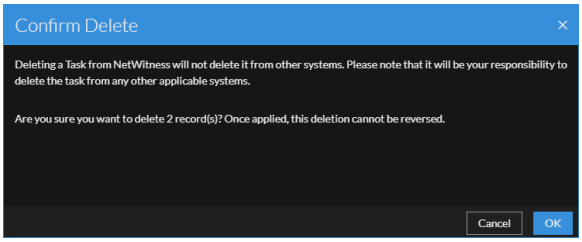


In the Tasks panel, you can see the tasks created for the incident.

4. Click  to the right of the task that you want to delete.



5. Confirm that you want to delete the task and click **OK**.



The task is deleted from NetWitness. Deleting tasks from NetWitness does not delete them from other systems.

To Delete Tasks from the Tasks List:

1. Go to **Respond > Tasks**.
   The Tasks List view displays a list of all incident tasks.
2. In the Tasks list, select the tasks that you want to delete and click **Delete**.

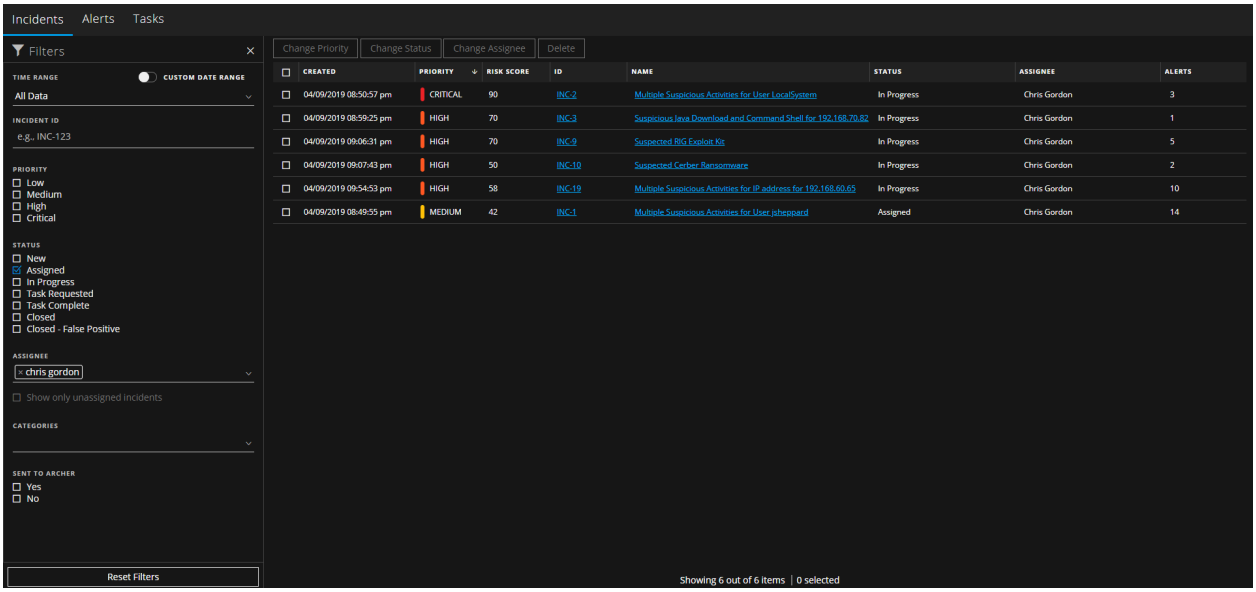
3. Confirm that you want to delete the tasks and click **OK**.

   The tasks are deleted from NetWitness. Deleting tasks from NetWitness does not delete them from other systems.

Close an Incident

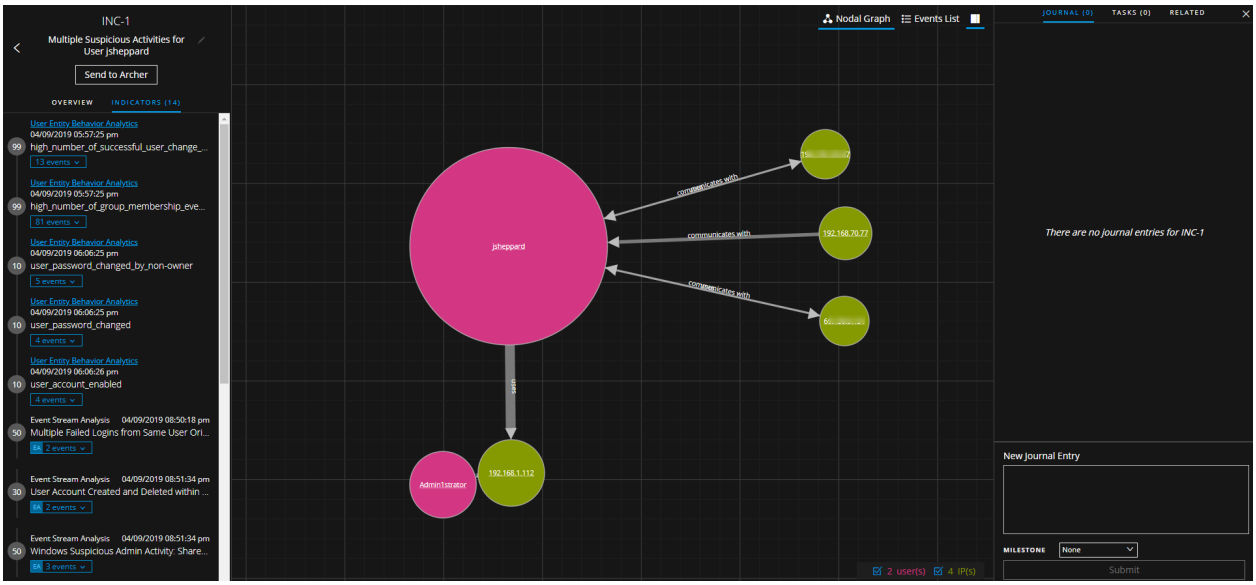
When you have arrived at a solution after investigating an incident and remediating it, you close the incident.

1. Go to **Respond > Incidents**.
2. In the Incident List view, select the incident that you want to close and click **Change Status**.
3. Select **Closed** from the drop-down list.
   You can see a successful change notification. The incident is now closed. You cannot change the priority or assignee of a closed incident.



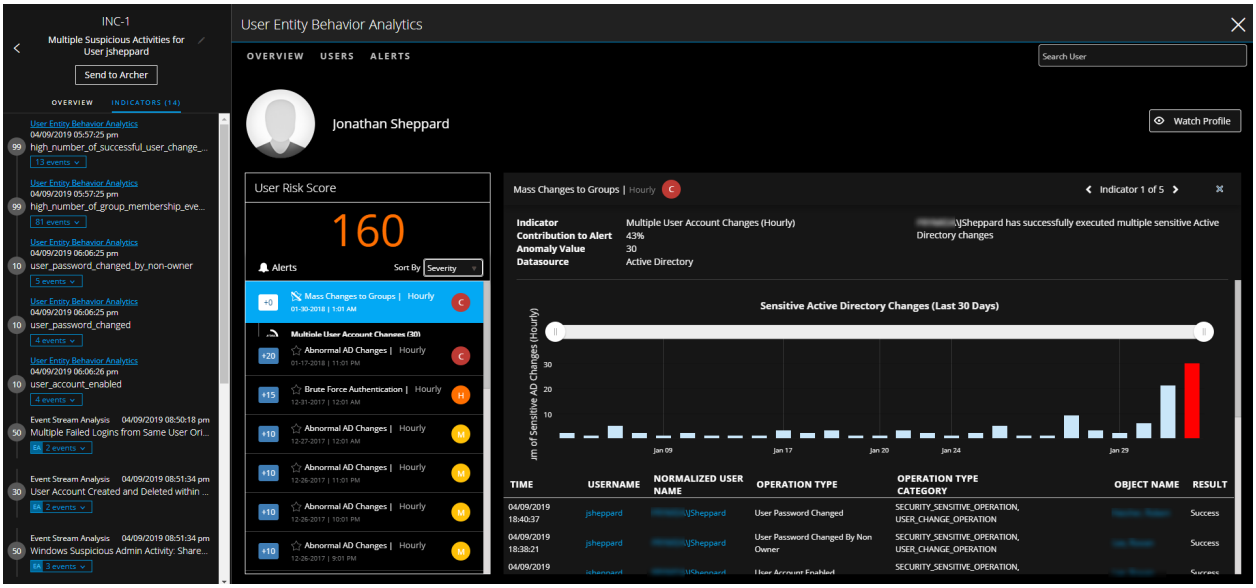
Note: You can also close an incident in the Overview panel. You can close multiple incidents at the same time in the Incident List view. Change Incident Status provides additional details.

Incident Response Use Case Examples

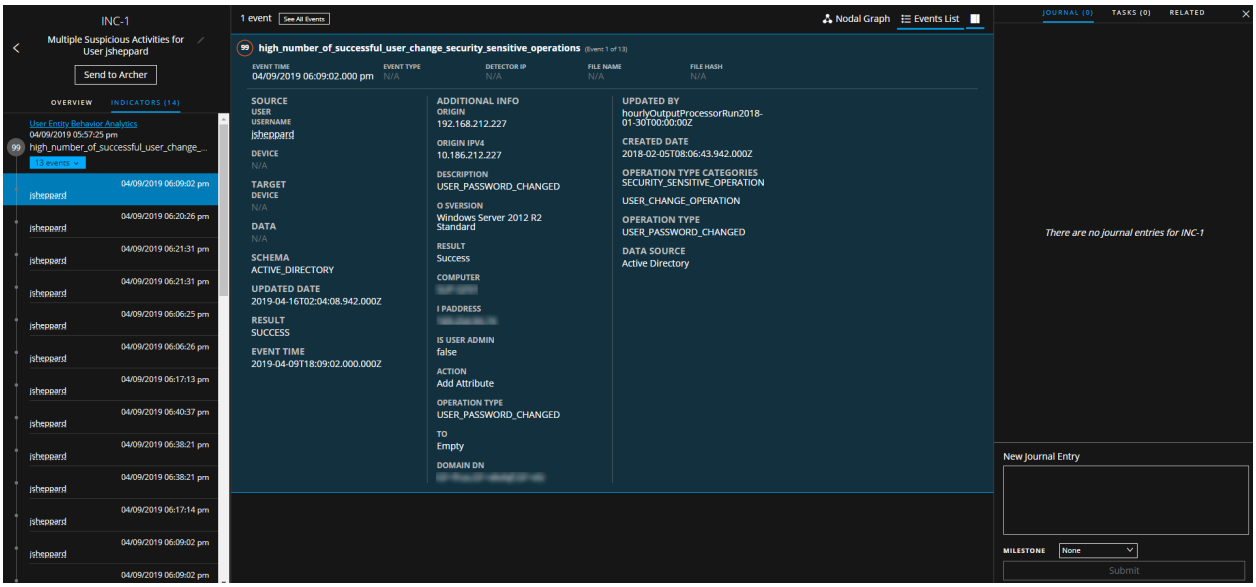


The following use cases provide examples of an analyst using NetWitness to quickly respond to incidents, identify threats, and take action to reduce or eliminate the ability of threat actors to compromise valuable information in the corporate network.

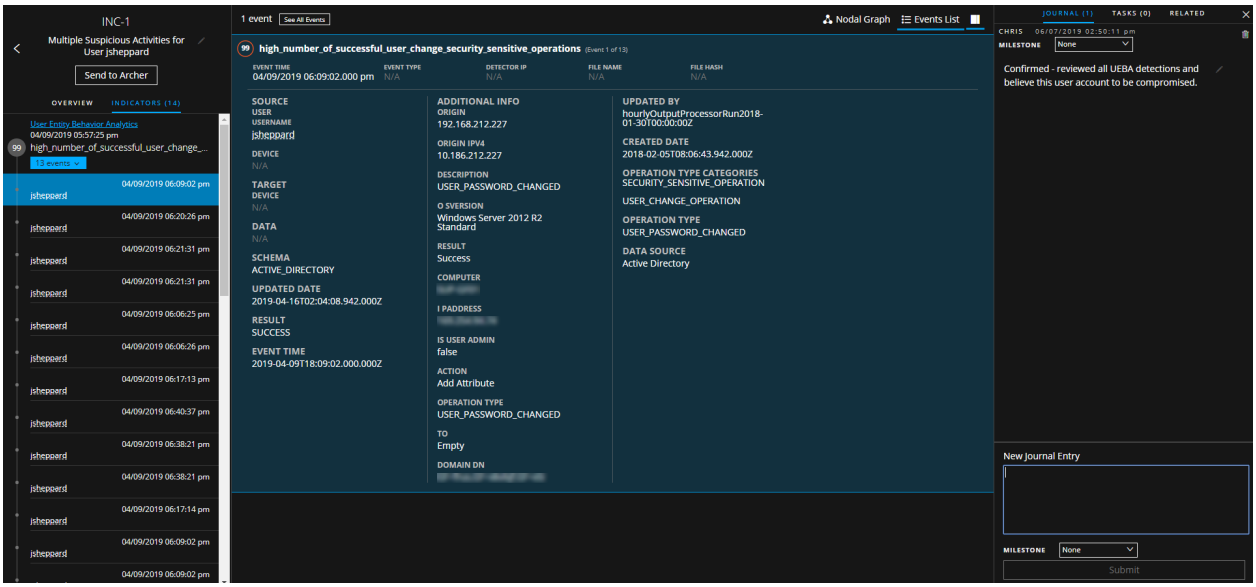
Use Case #1: UEBA Anomalous User Activity



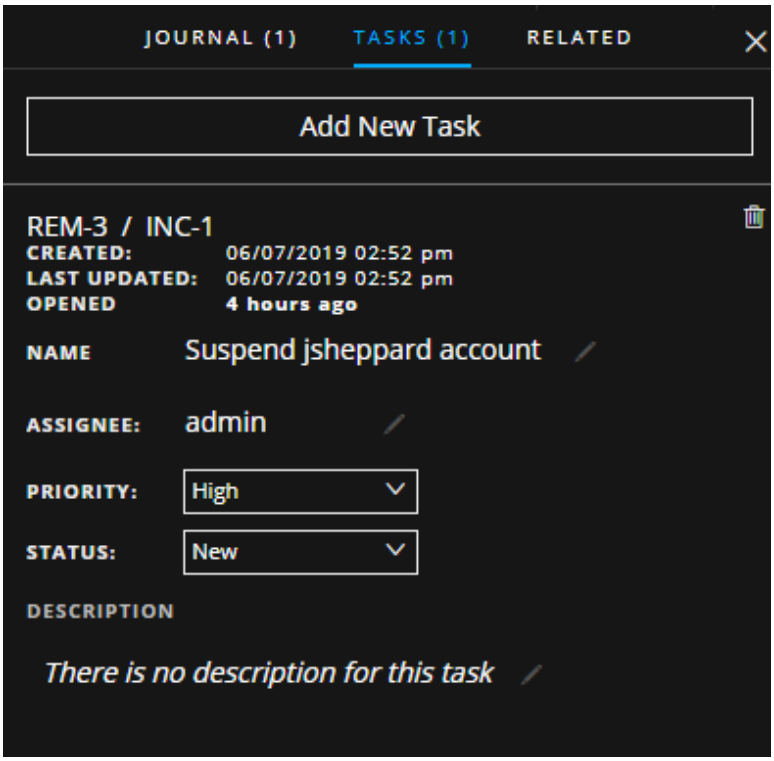
An analyst named Chris logs in, goes to the Incidents List view, and uses the filters on the left-hand side to look at all of the incidents assigned to her. In the list, she notices an incident that she has not yet reviewed (status is Assigned) and opens the incident.



In the Incident Details view, the analyst sees a timeline of contributing events (Indicators panel) on the left, a visualization of the entities involved in the middle, and additional panels on the right where she can keep track of notes and tasks during her review.

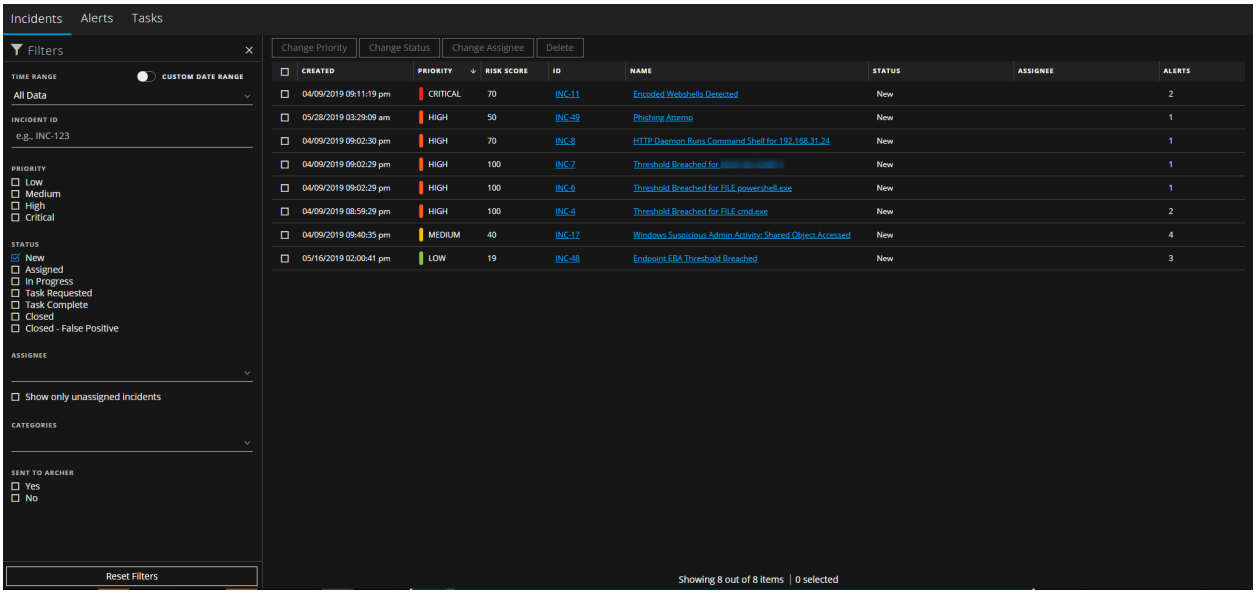


Chris uses the Indicators panel to get finer detail on the events that lead to this incident being created. Clicking the "User Entity Behavior Analytics" link in the Indicators panel exposes the analysis that was done and the anomaly that was detected on the user account "Jonathan Sheppard (jsheppard)." The User Entity Behavior Analytics panel below shows an overall risk score of 160, details the Windows events that contributed to the severity, and shows the actual anomaly in user account changes attributed to this user. She can explore the data in as much depth as required to help validate and understand the alert.

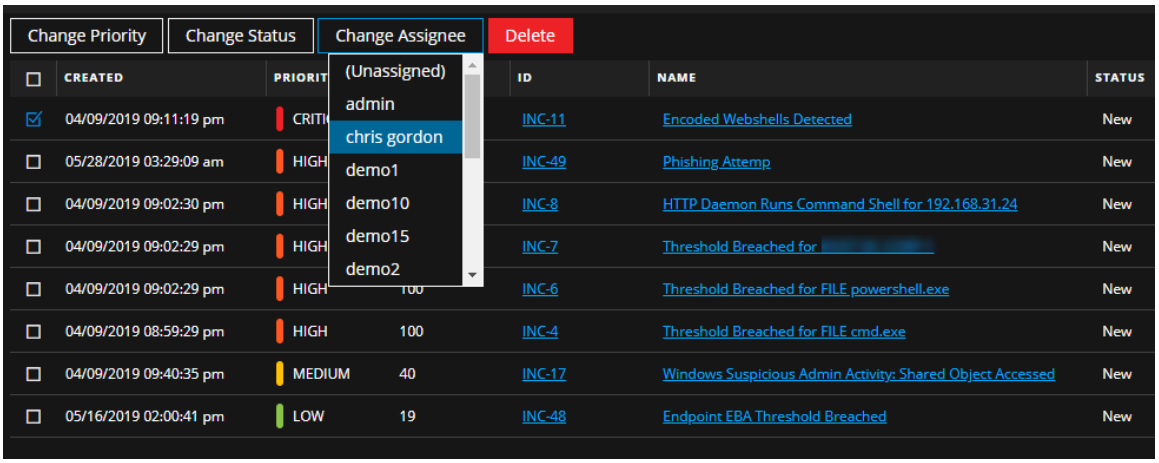


In the Events List, Chris can even inspect the details of the individual log events involved.

During her review and investigation, she can update the incident with her notes, as well as create and assign tasks for herself or other analysts.

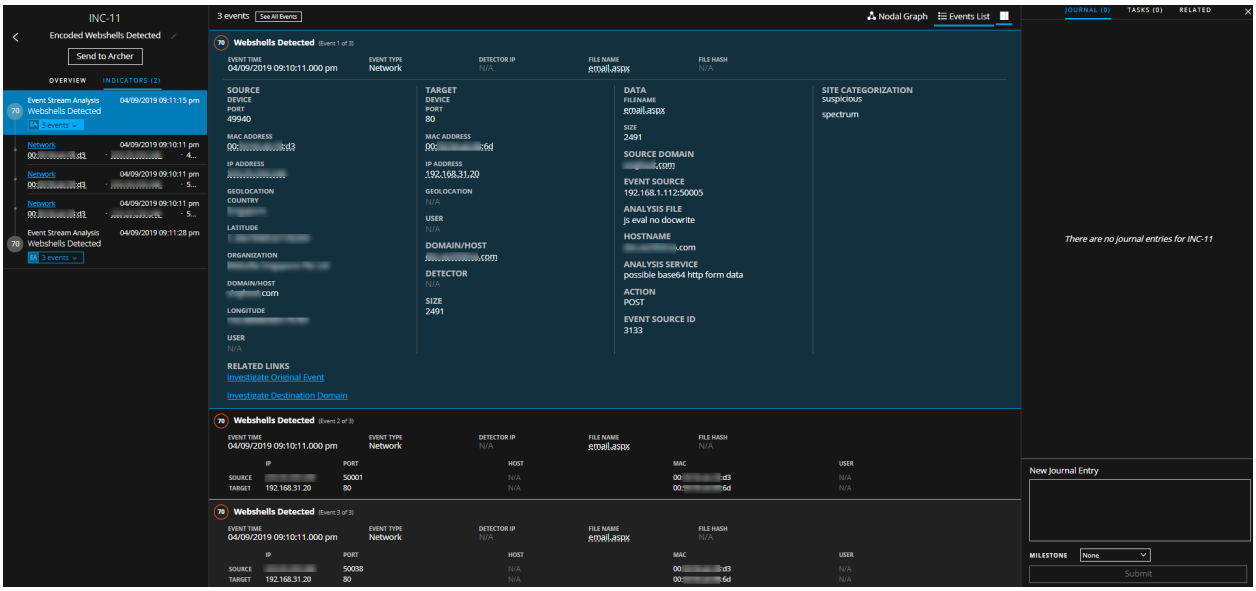


To remediate the incident, Chris opens a task for the administrator (admin) to suspend the jsheppard account.

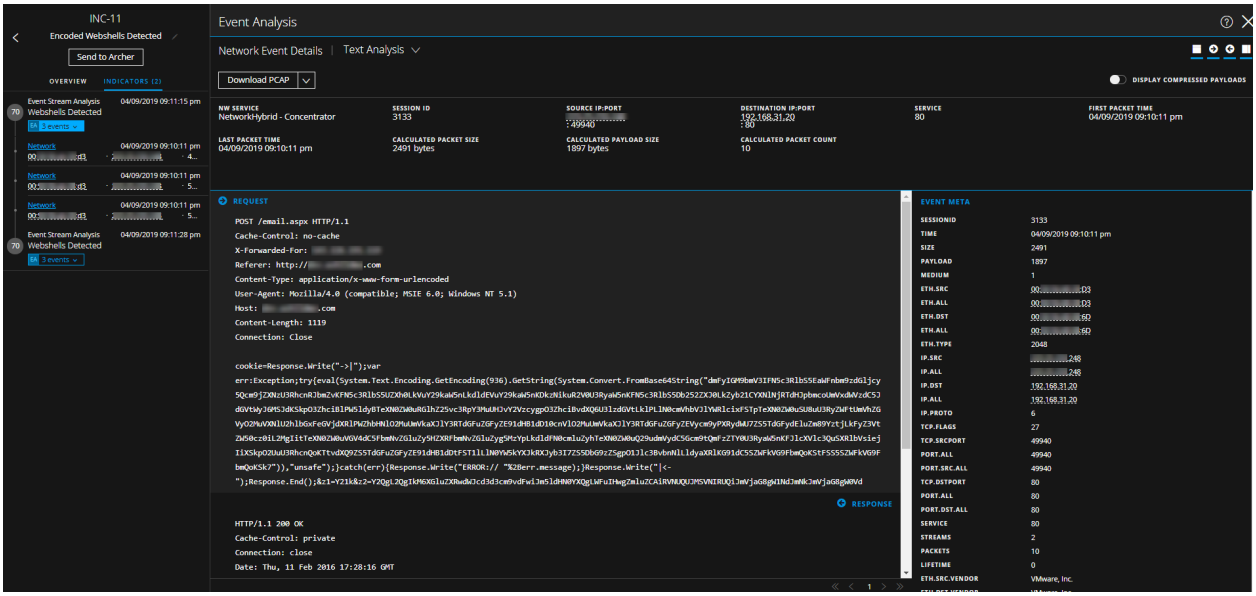


Use Case #2: Encoded Webshells Detected

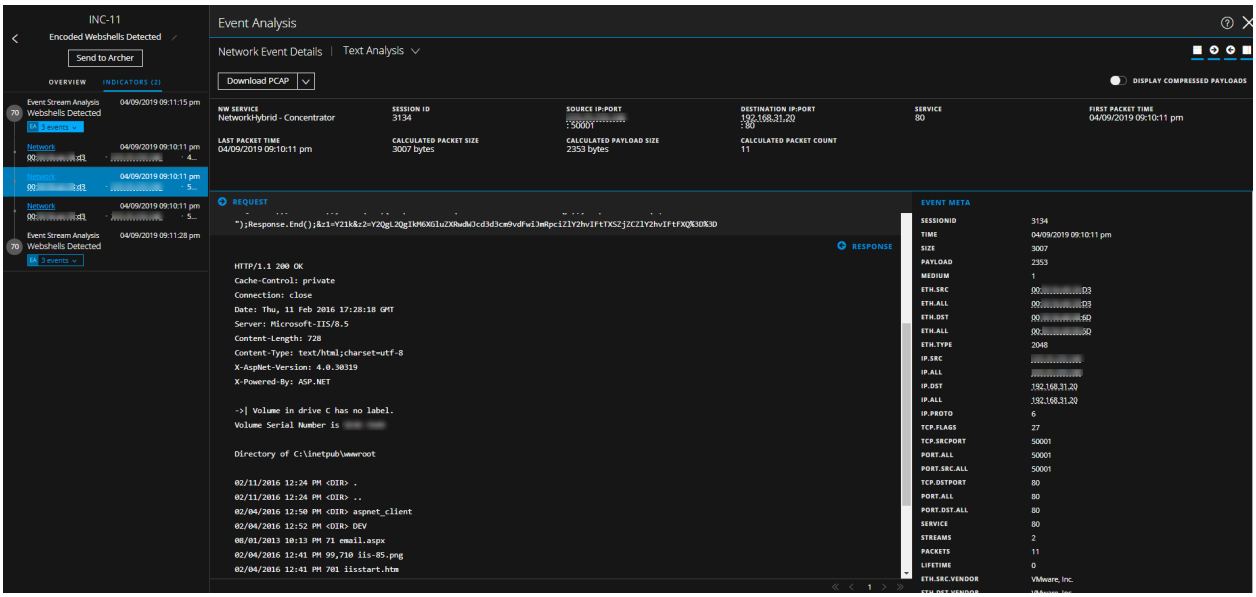
Analyst Chris logs in, looks at all of the new incidents that have not yet been assigned to anyone, and notices a highly critical incident "Encoded Webshells Detected."



Chris decides to assign this incident to herself and investigate it.

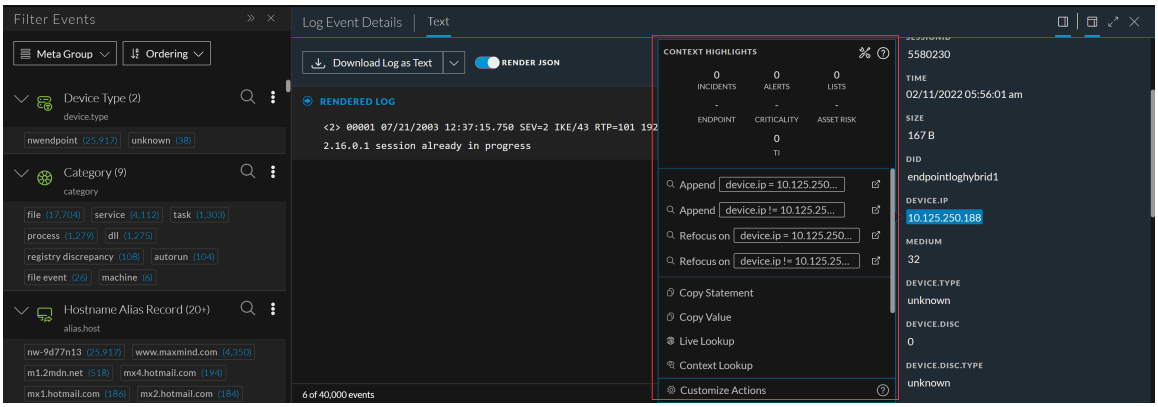


At first glance using the visual summary, Chris can see a couple of specific Event Stream Analysis alerts that kicked off this incident, and the entities associated with the alerts. She sees that a public IP address (xxx.xx.xxx.248) has been detected as interacting with a webshell on the internal web server 192.168.31.20. It looks like the suspicious request was made to the file `email.aspx`. She dives in to investigate.

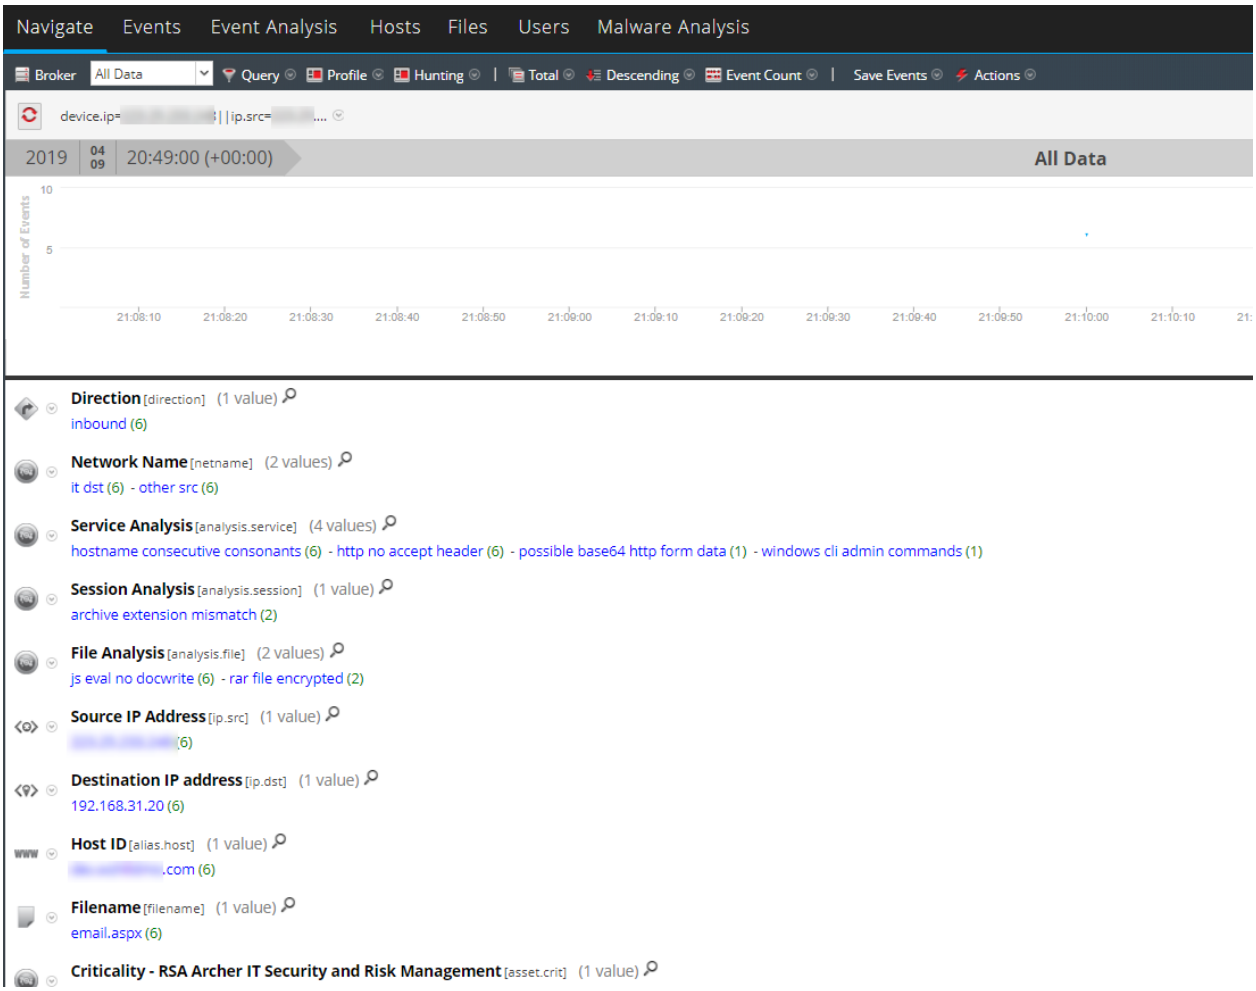


By drilling into the indicator (alert) on the left-hand side, Chris can view the entire list of events associated with the incident and all of the metadata generated by the system, including details about the connections between the external and internal host. She notices that the type of data in this case is "Network," meaning that these events were generated by the full packet capture component of NetWitness.

While the metadata associated with these events does look suspicious to Chris, she wants to investigate even deeper to see what is going on. To do this she can drill into the raw packet reconstruction of the HTTP sessions simply by clicking the "Network" link in the Indicators panel on the left-hand side.



From this deep dive, Chris can examine the raw payload of the suspicious connections and can easily see the strange nature of this request. In the request payload she can see a strange looking request, but most alarmingly, once she scrolls down to the response portion she can see the information that her web server is sending back out to the suspect external IP address.



Chris sees what looks to be a directory listing in the packet data, which is not something she would expect from normal web site communications. With this information, she confirms that this is indeed a malicious webshell that has been installed on the internal web server.

From here, Chris can take a number of actions. She can journal her confirmation, assign a task to another user to handle the incident from there, or she can expand her investigation to look for any other activity that has been associated with the malicious external IP address. Chris does this by left or right click the IP address to open a context tooltip and pivoting into Investigate.

This pivot brings Chris into another part of the NetWitness interface where she can perform free-form search and analysis outside of the incident.

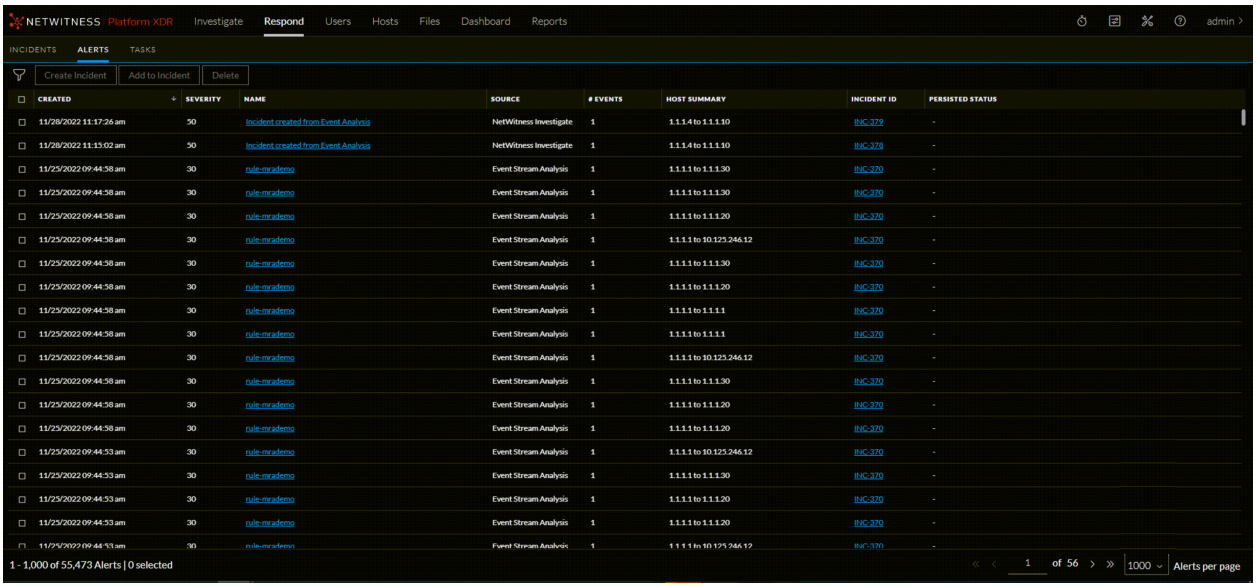
In this case she did not uncover anything other than the same network events that were part of the original incident, which is a good step in validating the isolated scope of the incident. If, however, she were to find other interesting events across any log, network, or endpoint data in the system, she could easily add those events into the incident to keep track.

Reviewing Alerts

NetWitness enables you to view a consolidated list of threat alerts generated from multiple sources in one location. You can find these alerts in the Respond > Alerts view. The source of the alerts can be ESA correlation rules, NetWitness Endpoint, NetWitness UEBA (Cloud), Malware Analysis, Reporting Engine, Risk Scoring, as well as many others. You can see the source of the alerts, the alert severity, and additional alert details.

Note: ESA correlation rule alerts can ONLY be found in the Respond > Alerts view.

To better manage a large number of alerts, you have the ability to filter the alerts list based on criteria that you specify, such as severity, time range, and alert source. For example, you may want to filter the alerts to only show those alerts with a severity between 90 and 100 that are not already part of an incident. You can then select a group of alerts to create an incident or add to an existing incident.



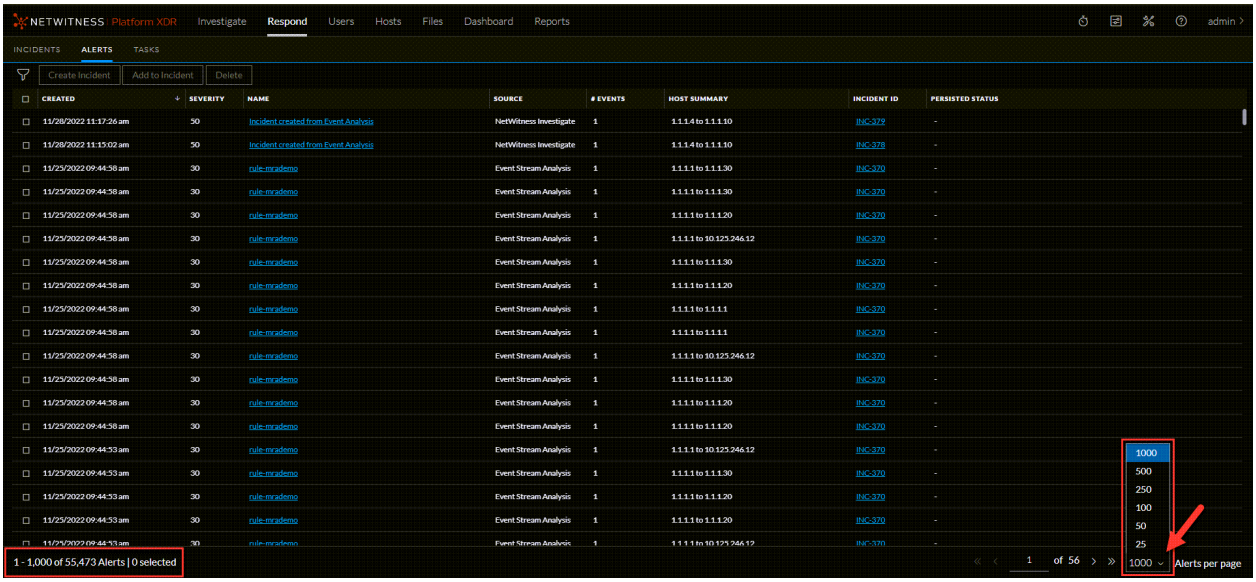
You can perform the following procedures to review and manage alerts:

- View Alerts
- Filter the Alerts List
- Remove My Filters from the Alerts List
- Save the Current Alerts Filter
- Update a Saved Alerts Filter
- Delete a Saved Alerts Filter
- View Alert Summary Information
- View Event Details for an Alert
- Investigate Events
- Create an Incident Manually
- Add Alerts to an Incident
- Delete Alerts

View Alerts

In the Alerts List view, you can browse through various alerts from multiple sources, filter them, and group them to create incidents. This procedure shows you how to access the alerts list.

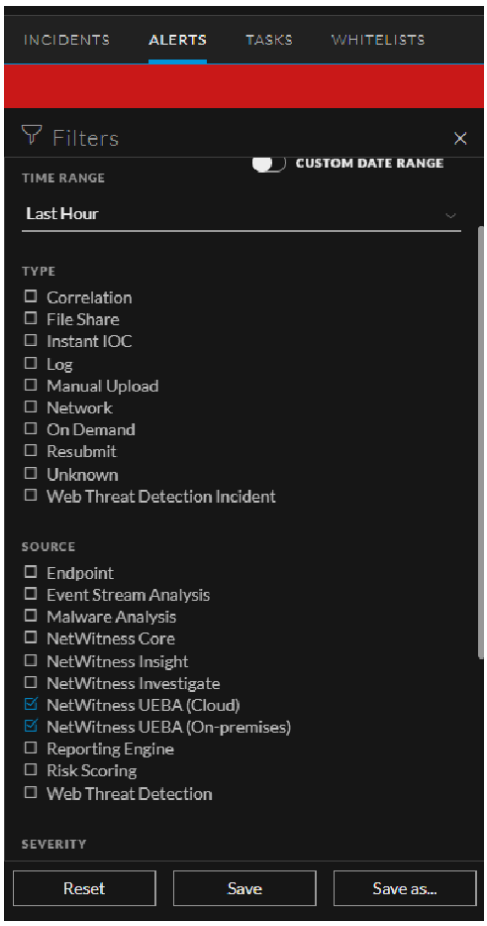
1. Go to **Respond > Alerts**.
   The Alerts List view displays a list of all NetWitness alerts.



2. Scroll through the alerts list, which shows basic information about each alert as described in the following table.

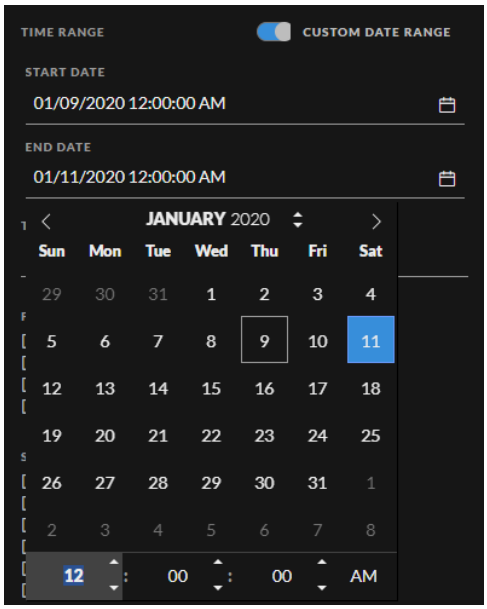
Column	Description
Created	Displays the date and time when the alert was recorded in the source system.
Severity	Displays the level of severity of the alert. The values are from 1 through 100.
Name	Displays a basic description of the alert.
Source	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, NetWitness UEBA (Cloud), Malware Analysis, Event Stream Analysis (ESA Correlation Rules), Reporting Engine, Web Threat Detection, Risk Scoring, and many others. **Note:** In NetWitness Platform 11.3 and later, the **Endpoint** source includes Endpoint alerts from all NetWitness Endpoint versions. If one of the events in an alert has a device_type of `nwendpoint`, the source changes to Endpoint.
# Events	Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky.
Host Summary	Displays details of the host like the host name from where the alert was triggered. The details may include information about the source and destination hosts in an Alert. Some alerts may describe events across more than one host .

Column	Description
Incident ID	Shows the Incident ID of the alert. If there is no incident ID, the alert does not belong to any incident and you can create an incident to include this alert or the alert can be added to an existing incident.



At the bottom of the list, you can see the number of alerts on the current page and the total number of alerts. For example: **1 - 500 of 2400 Alerts | 0 selected**. The maximum number of alerts that you can view at one time is 1,000. You can also change the maximum number of alerts per page by selecting from the drop-down at the bottom right corner.

Filter the Alerts List



The number of alerts in the Alerts List can be very large, making it difficult to locate particular alerts. The Filter enables you to view the alerts you want to see, for example, alerts from a particular source, alerts of a particular severity, alerts that are not part of an incident, and so on.

1. Go to **Respond > Alerts**.
   The Filters panel appears to the left of the Alerts list. If you do not see the Filters panel, in the Alerts List view toolbar, click , which opens the Filters panel.

2. In the Filters panel, select one or more options to filter the alerts list:
   - **Time Range**: You can select a specific time period from the Time Range drop-down list. The time range is based on the date that the alerts were received. For example, if you select Last Hour, you can see alerts that were received within the last 60 minutes.
   - **Custom Date Range**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and

End Date fields. Select the dates and times from the calendar.

- **Type**: Select the type of events in the alert to view, for example, logs, network sessions, and so on. In NetWitness Platform 11.3 and later, if one of the events in an alert has a device_type of `nwendpoint`, Endpoint is included in the Type field.
- **Source**: Select one or more sources to view alerts triggered by the selected sources. For example, to view NetWitness Endpoint alerts only, select Endpoint as the source. Netwitness Core is available from 12.3 and later version. For more information, see the *NetWitness Respond Configuration Guide*.
- **Severity**: Select the the level of severity of the alerts to view. The values are from 1 through 100. For example, to concentrate on the highest severity alerts first, you may want to view only those alerts with a severity from 90 to 100.
- **Part of Incident**: To view only alerts that are not part of an incident, select **No**. To view only alerts that are part of an incident, select **Yes**. For example, when you are ready to create an incident from a group of alerts, you can select No to view only those alerts that are not currently part of an incident.
- **Alert Names**: Select the name of the alert to view. You can use this filter to search for all alerts generated by a specific rule, for example, Direct Login to an Administrative Account.

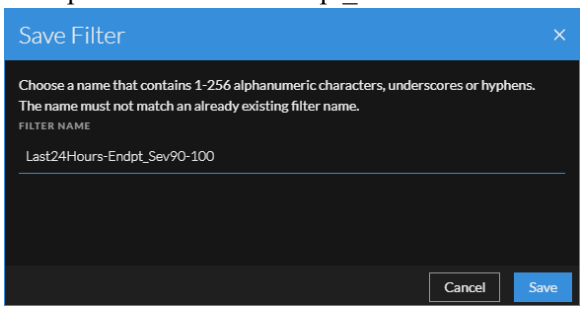
The Alerts List shows a list of alerts that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the alerts list.
For example: **Showing 30 out of 30 items**

3. If you want to close the Filters panel, click **X**. Your filters remain in place until you remove them.

Remove My Filters from the Alerts List

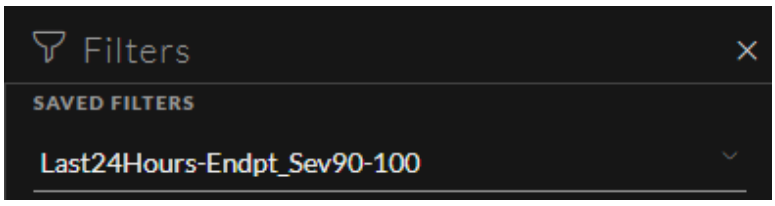
NetWitness remembers your filter selections in the Alerts List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of alerts that you expect to see or you want to view all of the alerts in your alerts list, you can reset your filters.

1. Go to **Respond > Alerts**.
   The Filters panel appears to the left of the alerts list. If you do not see the Filters panel, in the Alerts List view toolbar, click , which opens the Filters panel.
2. At the bottom of the Filters panel, click **Reset Filters**.



Save the Current Alerts Filter

Note: This option is available in NetWitness Platform Version 11.5 and later.



Saved filters provide a way for analysts to save and quickly apply specific filter conditions to the list of alerts. You can also use these filters to customize the Springboard landing page. For example, you may want to create a filter to show only alerts from a specific source and severity level over the last 24 hours. (This option is available in NetWitness Platform 11.5 and later.)

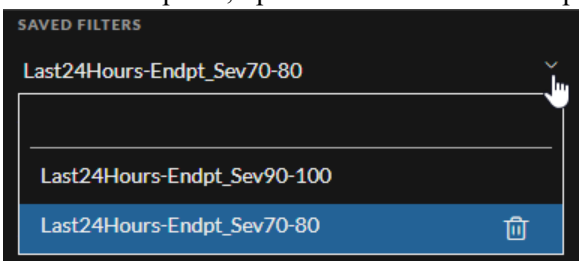
Saved filters are global. You can save a filter for other analysts to use and you can use any saved filter.

1. In the Filters panel, select one or more options to filter the incidents list. For example, in the Time Range field select Last 24 Hours, in the Source field select Endpoint, and for Severity, select the 90 to 100 range.
2. Click **Save As** and in the **Save Filter** dialog, enter a unique name for the filter and save it, for example Last24Hours-Endpt_Sev90-100.

The filter is added to the **Saved Filters** list.

Update a Saved Alerts Filter

Note: This option is available in NetWitness Platform Version 11.5 and later.



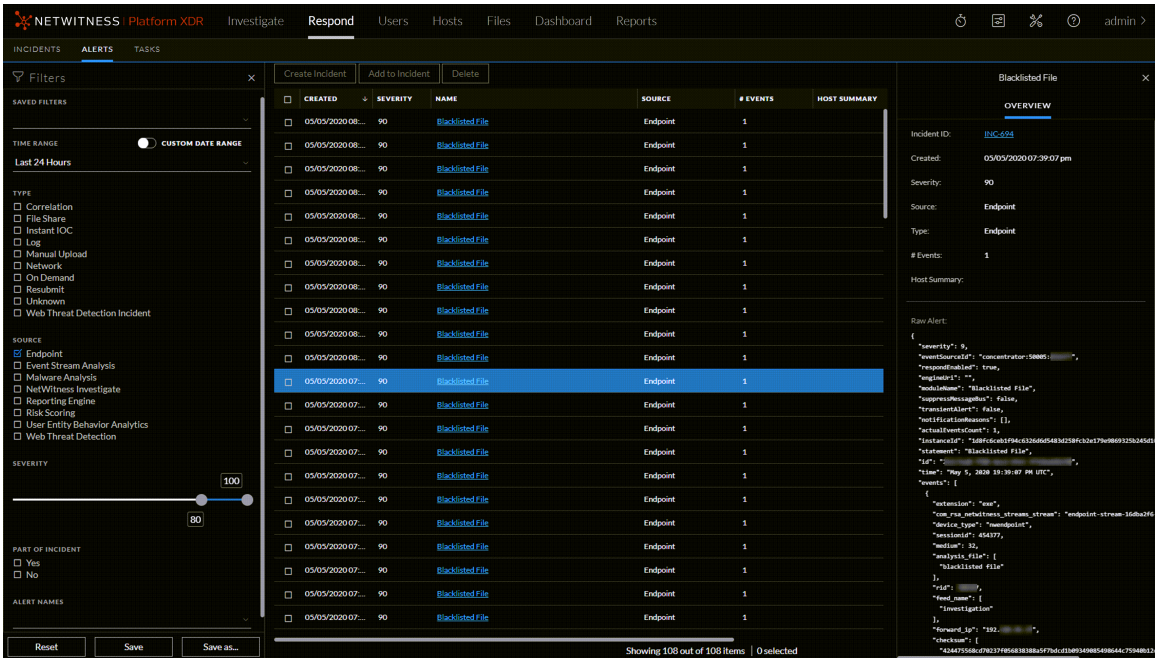
1. In the Filters panel **Saved Filters** drop-down list, select a saved filter.
2. Update your filter selections and click **Save**.

Delete a Saved Alerts Filter

Note: This option is available in NetWitness Platform Version 11.5 and later.

When a saved filter is no longer required, you can remove it from the saved filters list. Filters used in the Springboard cannot be deleted.

1. In the Filters panel, open the **Saved Filters** drop-down list.

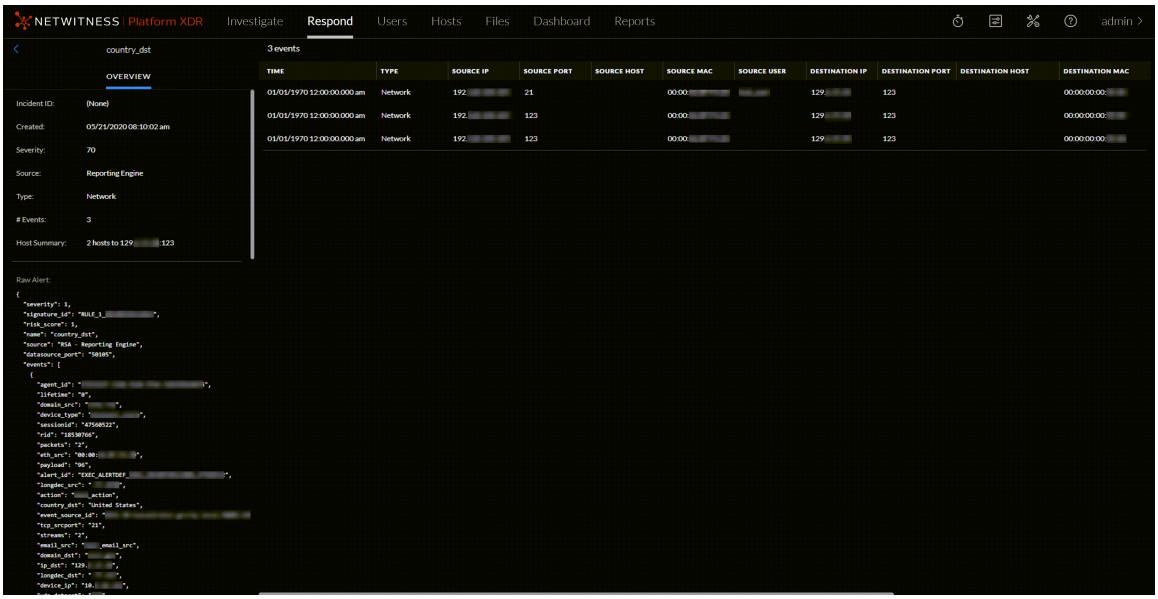


2. Next to the filter name, click  to delete it.

View Alert Summary Information

In addition to viewing basic information about an alert, you can also view raw alert metadata in the Overview panel.

1. In the Alerts list, click the alert that you want to view.
   The Alert Overview panel appears to the right of the Alerts list.



2. In the Overview panel Raw Alert section, you can scroll to view the raw alert metadata.

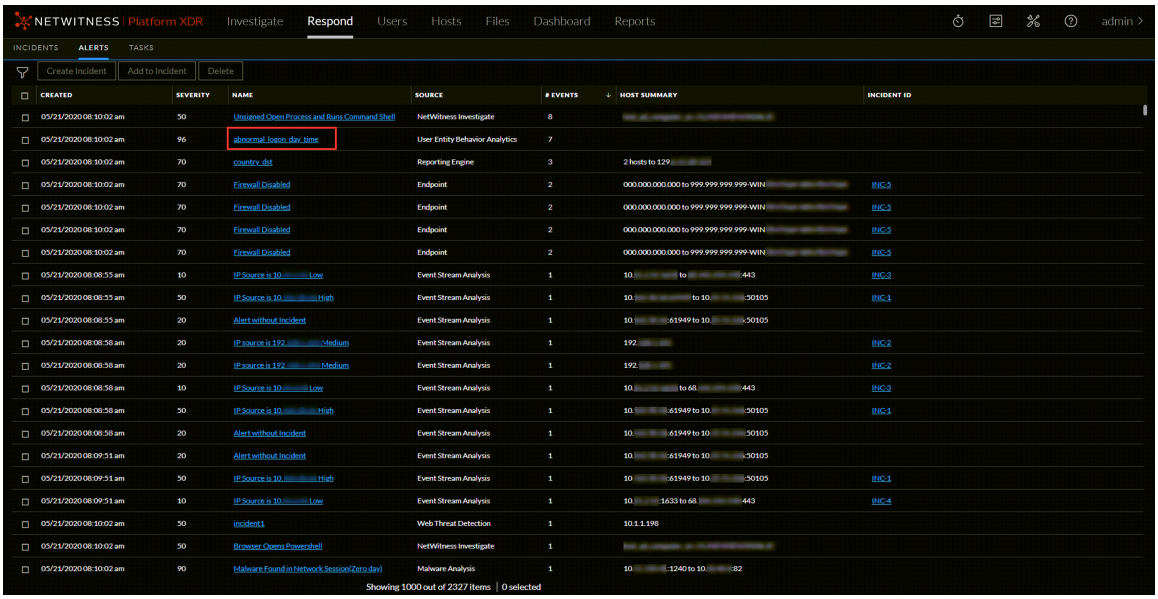
View Event Details for an Alert

After you review the general information about the alert in the Alerts List view, you can go to the Alert Details view for more detailed information to determine the action required. An alert contains one or more events. In the Alert Details view, you can drill down into an alert to get additional event details and further investigate the alert. The following figure shows an example of the Alert Details view.

The Overview panel on the left has the same information for an alert as the Overview panel in the Alerts List view.

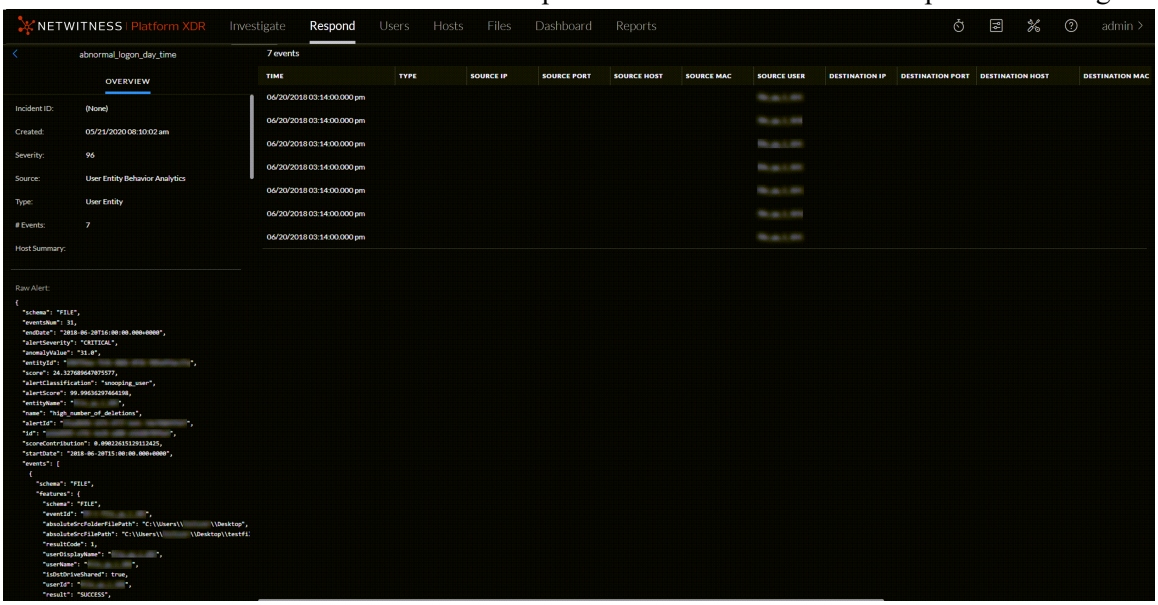
The Events panel on the right shows information about the events in the alert, such as event time, source IP, destination IP, detector IP, source user, destination user, and file information about the events. The amount of information listed depends on the event type.

There are two types of events:



- A transaction between two machines (a Source and a Destination)
- An anomaly detected on a single machine (a Detector)

Some events will only have a Detector. For example, NetWitness Endpoint finds malware on your machine. Other events will have a Source and Destination. For example, packet data shows communication between your machine and a Command and Control (C2) domain.

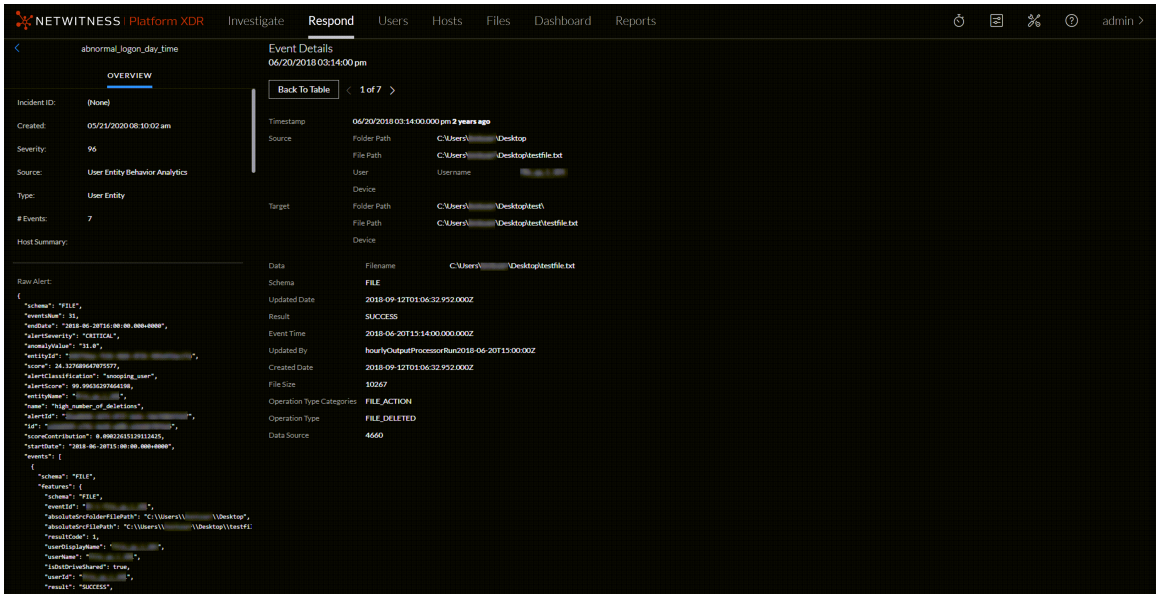


You can drill further into an event to get detailed data about the event.

To View the Event Details for an Alert:

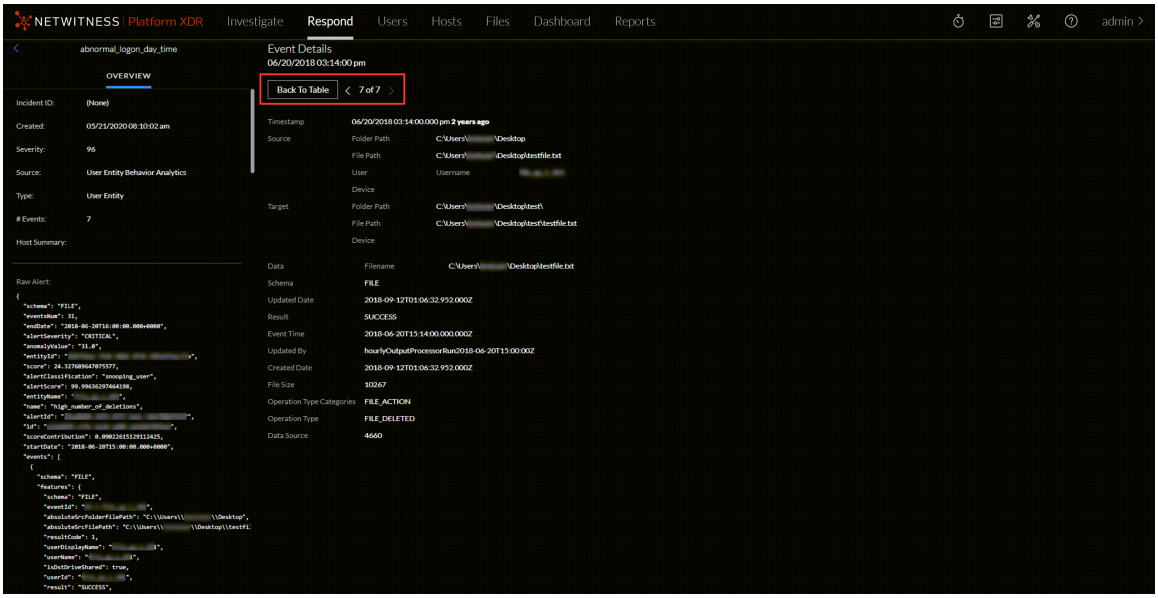
1. To view event details for an alert, in the Alerts List view, choose an alert to view and then click the link in the **Name** column for that alert.

The Alerts Details view shows the Overview panel on the left and the Events panel on the right.



The Events panel shows a list of events with information about each event. The following table shows some of the columns that can appear in the Events List (Events Table).

Column	Description
Time	Shows the time the event occurred.
Type	Shows the type of alert, such as Log and Network.
Source IP	Shows the source IP address if there was a transaction between two machines.
Destination IP	Shows the destination IP address if there was a transaction between two machines

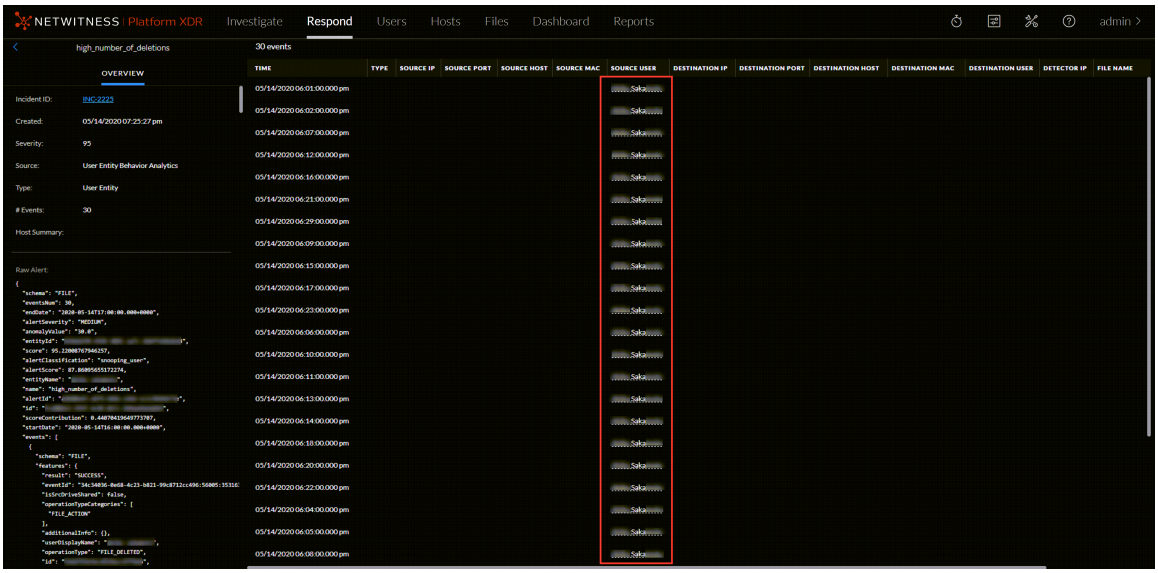


Column	Description
Detector IP	Shows the IP address of the machine where an anomaly was detected.
Source User	Shows the user of the source machine.
Destination User	Shows the user of the destination machine.
File Name	Shows the file name if a file is involved with the event.
File Hash	Shows a hash of the file contents.

If there is only one event in the list, you see only the event details for that event instead of a list.

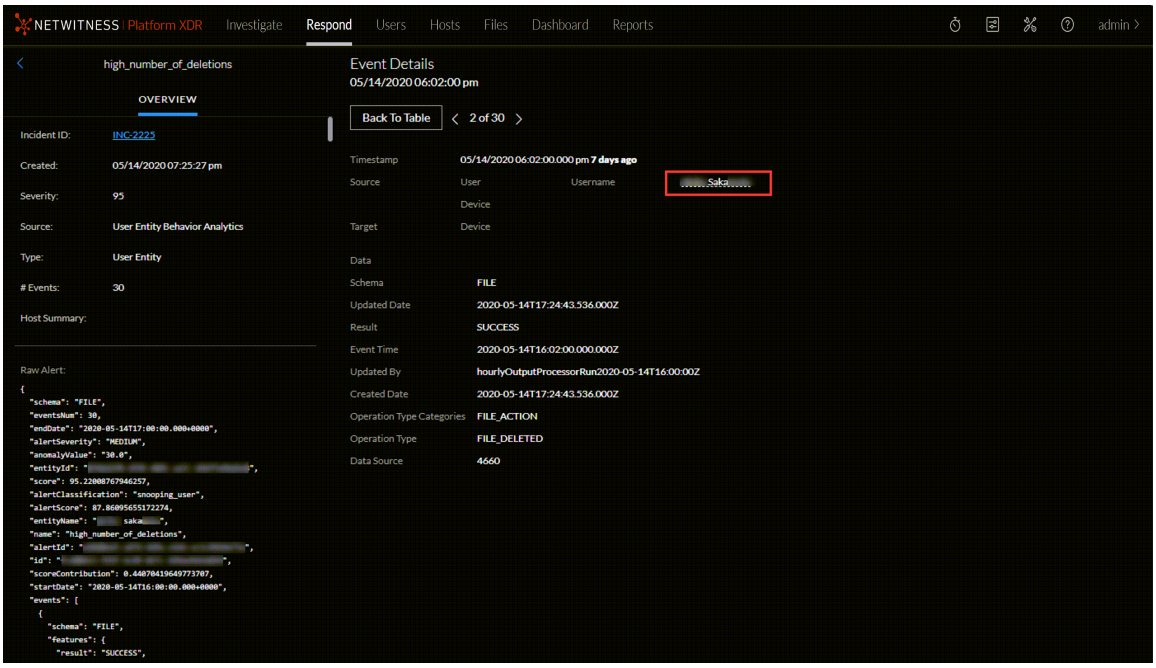
2. Click an event in the Events list to view the Event details.
   This example shows the event details for the first event in the list.

3. Use the page navigation to the right of the Back To Table button to view other events. This example shows the event details for the last event in the list.



See Alert Details Panel for detailed information about the event data listed in the Alert Details panel.

Investigate Events

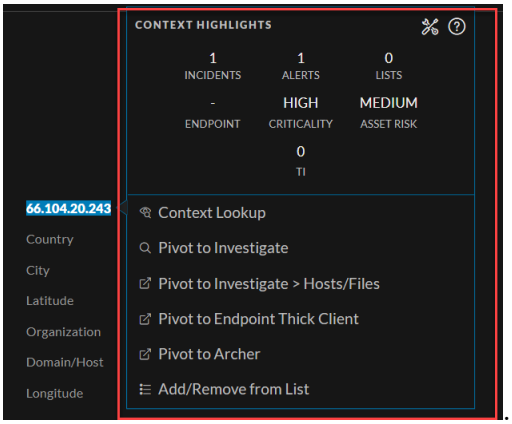


To further investigate the events, you can find links that take you to additional contextual information. From there, you have options available depending on your selection.

View Contextual Information

In the Alert Details view, you can see underlined entities in the Events panel. An underlined entity is considered an entity in the Context Hub and has additional contextual information available. The following figure shows underlined entities in the Events list.

The following figure shows an underlined entity in the Event Details.



The Context Hub is preconfigured with meta fields mapped to the entities. NetWitness Respond and NetWitness Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Settings for a Data Source" in the *Context Hub Configuration Guide*.

Caution: For the Context Lookup to work correctly in the Respond and Investigate views, NetWitness recommends that when mapping meta keys in the **(missing or bad snippet) > System > Investigation > Context Lookup** tab, you add only meta keys to the Meta Key Mappings, not fields in the MongoDB. For example, ip.address is a meta key and ip_address is not a meta key (it is a field in the MongoDB).

To View Contextual Information:

1. In the Alert Details view Events List or Event Details, left or right click an underlined entity.
   A context tooltip appears with a quick summary of the type of context data that is available for the selected entity.

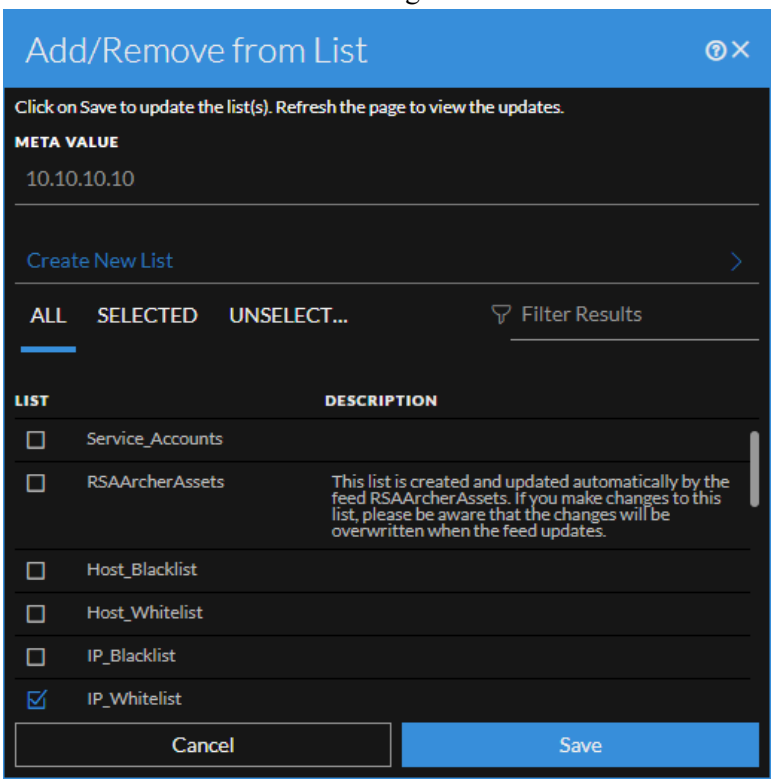
   The information in the **Context Highlights** section helps you to determine the actions that you would like to take. It shows the number of related alerts and incidents. It can show related data for Incidents, Alerts, Lists, Endpoint, Criticality, Asset Risk, Reputation, and Threat Intelligence (TI). Depending on your data, you may be able to click these numbered items for more information. The above example shows 1 related incidents, 1 related alerts, and one list associated with the selected IP address. There is no information for Endpoint, , Criticality, or Asset Risk. TI information comes from the STIX data source configured in Context Hub. For more information, see the *Context Hub Configuration Guide*.

   The other section lists the available actions. In the above example, the Add/Remove From List, Pivot to Investigate, Pivot to Investigate > Hosts/Files, Pivot to Endpoint Thick Client, and and Pivot to Archer options are available.

   Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the Archer configuration is enabled and configured properly.

   For more information, see Pivot to the Investigate > Events View, Pivot to the Hosts or Files View, Pivot to Archer, Pivot to Endpoint Thick Client, and Add an Entity to a Whitelist.

2. To see more details about the selected entity, click the **View Context** button.
   The Context panel opens and shows all of the information related to the entity.
   Context Lookup Panel - Respond View provides additional information.



Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Alert Details view Events List or Event Details, left or right click the underlined entity that you would like to add to a Context Hub list.
   A context tooltip appears showing the available actions.

2. In the **Actions** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove From List dialog shows the available lists.

3. Select one or more lists and click **Save**.
   The entity appears on the selected lists.
   Add/Remove from List Dialog provides additional information.

Create a Whitelist

You can create a whitelist in the Context Hub in the same way as you would create it in the Incident Details view, see Create a List.

Pivot to the Investigate > Events View

For a more thorough investigation of the incident, you can access the Investigate > Navigate view.

1. In the Events List or Event Details in the Alert Details view, hover over any underlined entity to access a context tooltip.
2. In the **Actions** section of the tooltip, select **Pivot to Investigate** > **Events**.
   The Navigate view opens, which enables you to perform a deeper dive investigation.

For more information, see the *NetWitness Investigate User Guide*. For troubleshooting information with the Investigate > Events link see the *Alerting with ESA Correlation Rules User Guide*.

Pivot to the Hosts or Files View

For a more thorough investigation about specific Hosts and Files, you can access the Hosts and Files views.

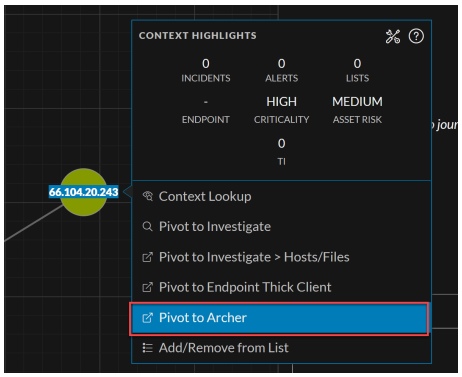
1. In the Events List or Event Details in the Alert Details view, left or right click any entity to access a context tooltip.
2. In the tooltip, select **Pivot to Investigate** > **Hosts/Files**.
   If you left or right click a host or IP or MAC address entity and click **Pivot to Investigate** > **Hosts/Files**, it displays the Hosts view with a specific host listed.
   If you left or right click a filename or file hash entity and click **Pivot to Investigate** > **Hosts/Files** it displays the Files view with a specific file listed.

Note: By default, the search for entities is on the previously selected Endpoint Server. However, you can select a different Endpoint Server to fetch the information or data.

For more information, see the *NetWitness Investigate User Guide*.

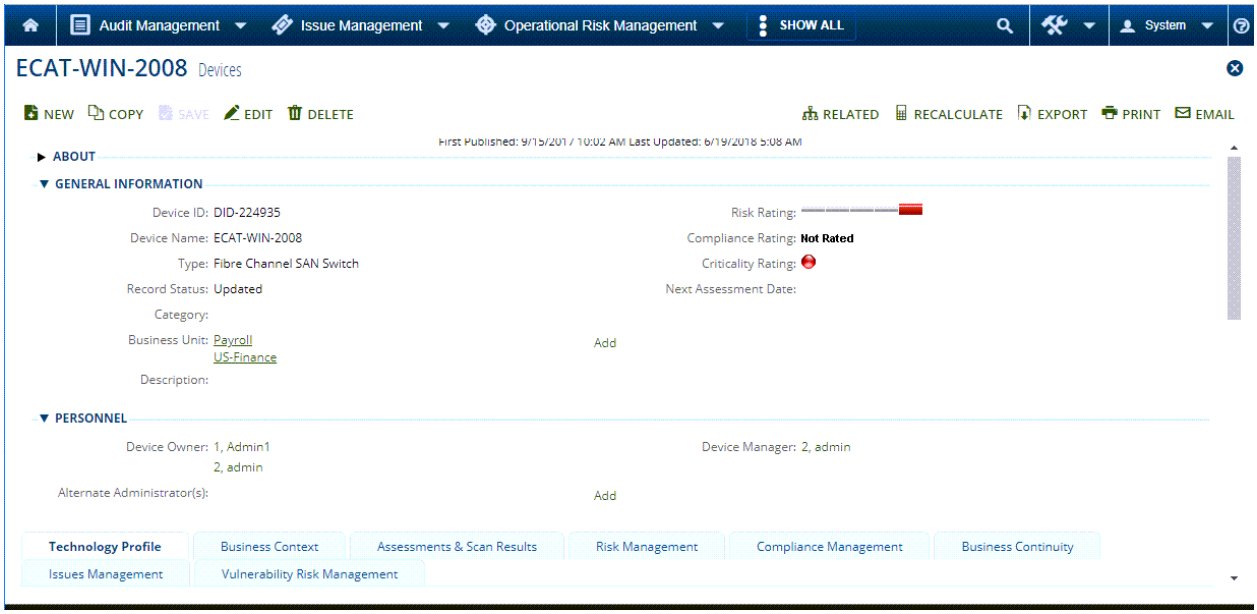
Pivot to Endpoint Thick Client

If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.



1. In the Events List or Event Details in the Alert Details view, hover over any underlined entity to access a context tooltip.
2. In the **Actions** section of the tooltip, select **Pivot to Endpoint Thick Client**.
   The NetWitness Endpoint thick client application opens outside of your web browser.

For more information on the thick client, see the *NetWitness Endpoint User Guide*.



Pivot to Archer

For viewing more details about a device in Archer Cyber Incident & Breach Response, you can pivot to the device details page. This information is displayed only for IP address, host, and Mac address.

1. In the Events List or Event Details in the Alert Details view, left or right click any underlined entity to access a context tooltip.
2. In the **Actions** section, select **Pivot to Archer**.

3. The device details page in **RSA Archer Cyber Incident & Breach Response** opens if you are logged in to the application, otherwise the login screen is displayed.

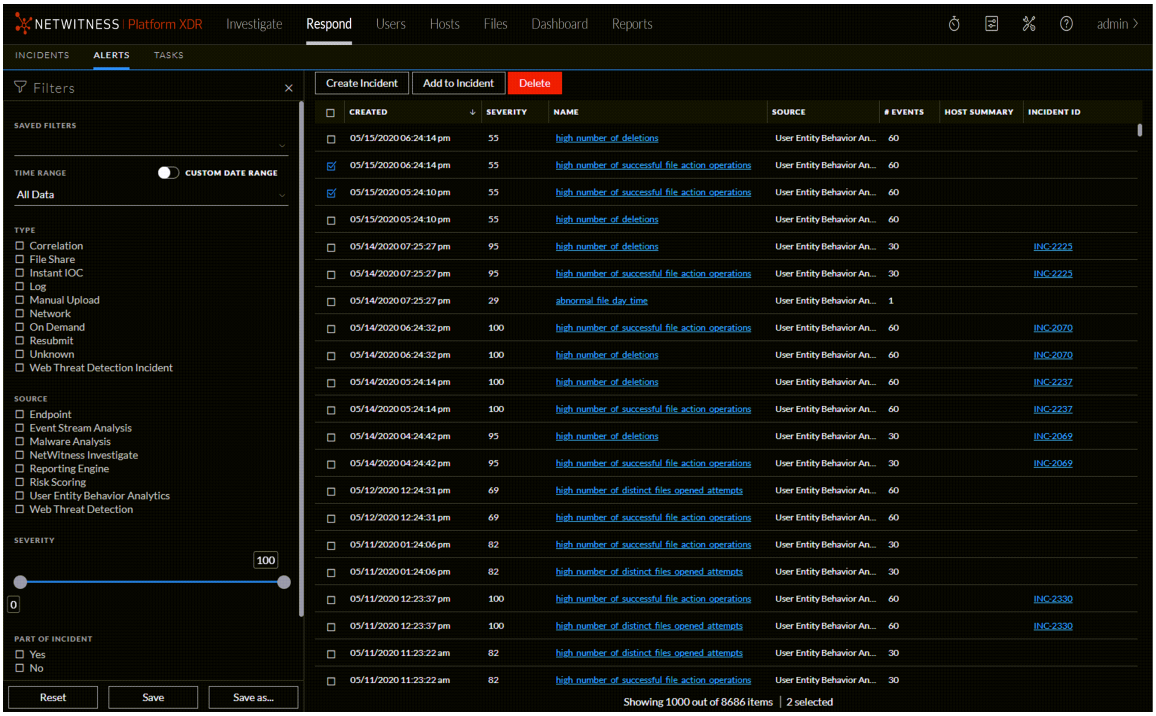
Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the Archer configuration is enabled and configured properly.

For more information, see the *NetWitness Archer Integration Guide*.

Create an Incident Manually

You can create incidents manually from alerts in the Alerts List view. The alerts that you select cannot be part of another incident.

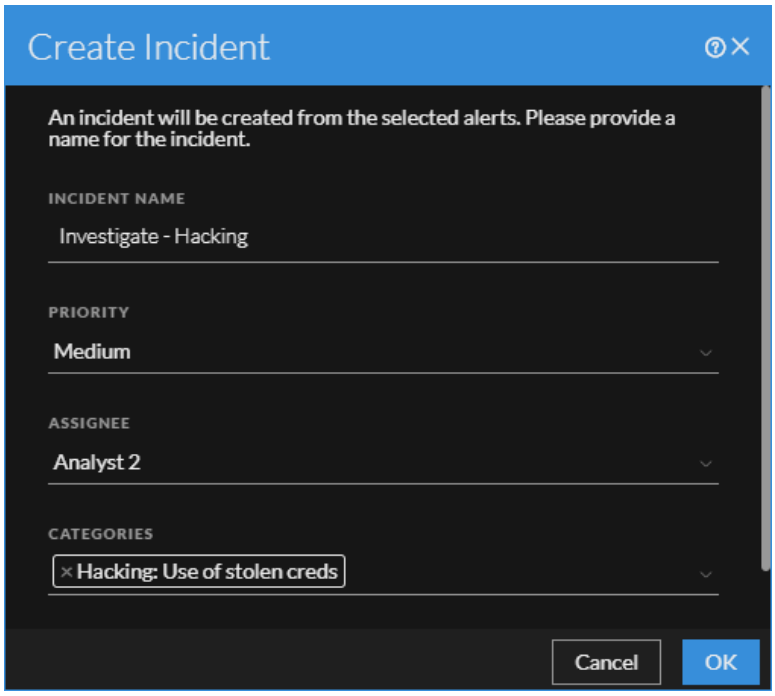
In NetWitness Version 11.2 and later, you can change the assignee, category, and priority when you create an incident manually from alerts.



In NetWitness Version 11.1, incidents created manually from alerts default to Low priority, but you can change the priority after you create it. You cannot add categories to manually created incidents in version 11.1.

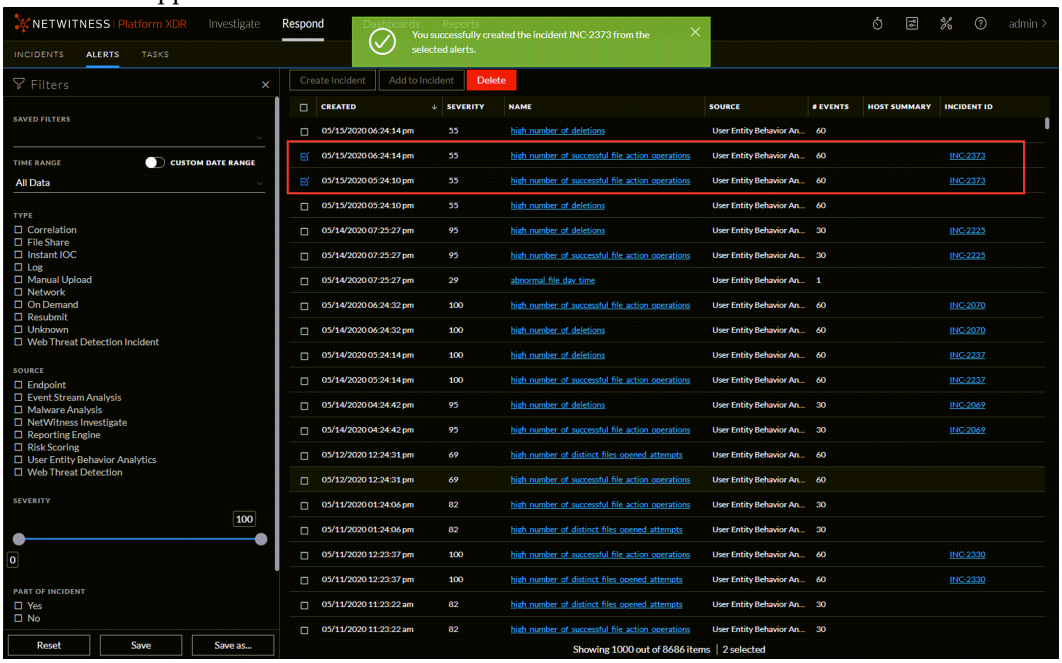
Note: Incidents can be created manually or automatically. An Alert can only be associated with one Incident. You can create incident rules to analyze the alerts collected and group them into incidents depending on which rules they match. For details, see the "Create an Incident Rule for Alerts" topic in the *NetWitness Respond Configuration Guide*.

To Create an Incident Manually:



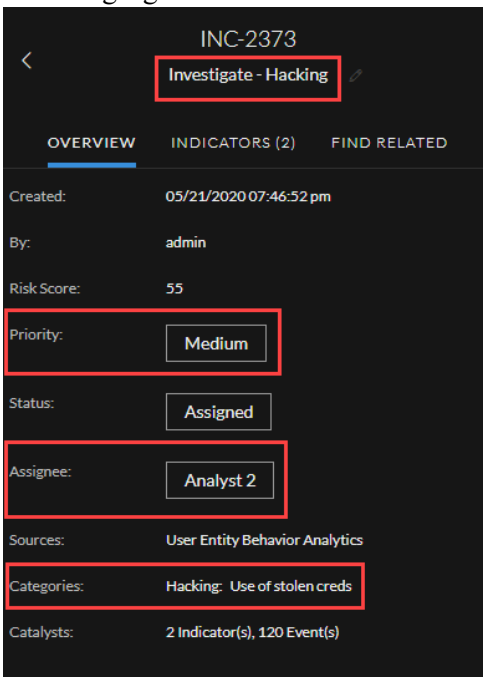
1. Go to **Respond** > **Alerts**.
2. Select one or more alerts in the Alerts List.

   Note: Selecting alerts that do not have incident IDs enable the **Create Incident** button. If the alert is already part of an incident, the button is disabled. You can filter alerts that are not part of an incident by selecting the option **Part of Incidents** as **No** in the Filters panel.



3. Click **Create Incident**.

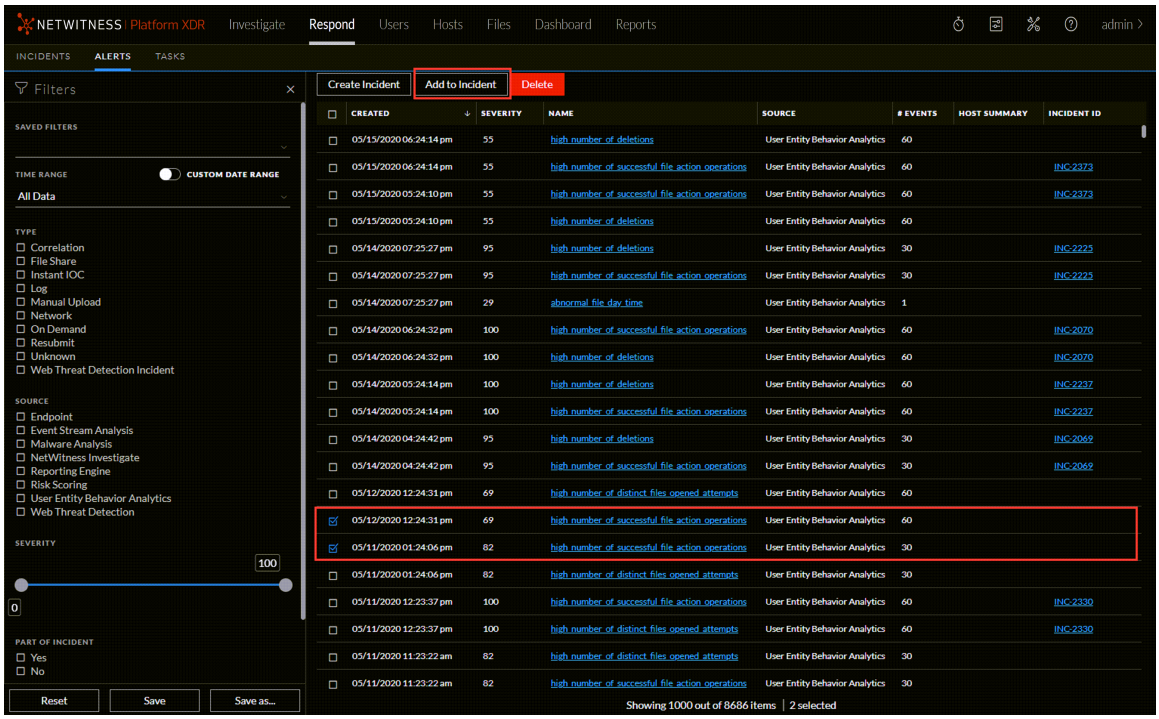
   The **Create Incident** dialog is displayed.



4. In the **Incident Name** field, type a name to identify the incident. For example, Investigate - Hacking.
5. In the **Priority** field, select a priority for the incident. The priority defaults to Low.
6. (Optional) If you are ready to assign the incident, in the **Assignee** field, select a specific user.
7. (Optional) In the **Categories** field, you can select a category to classify the incident, such as Hacking: Use of stolen creds. This is also helpful when trying to locate the incident later using the incidents filter.

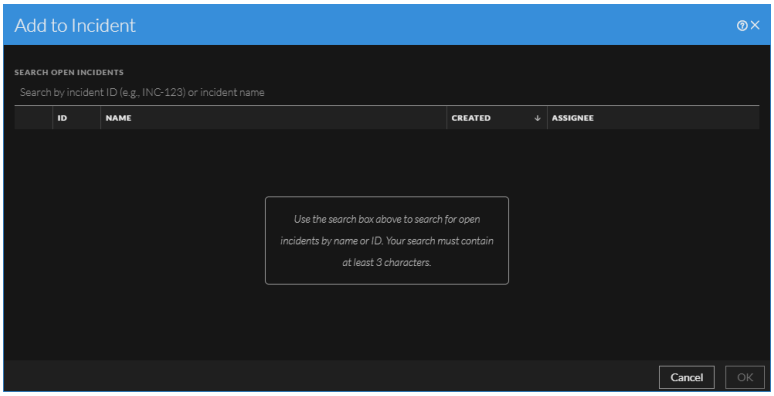
8. Click **OK**.
   You can see a confirmation message that an incident was created from the selected alerts. The new incident ID appears as a link in the INCIDENT ID column of the selected alerts.

If you click the link, it takes you to the Incident Details view for that incident, where you can update information, such as changing Priority to high or assigning the incident to another user. The following figure shows the Incident Details view Overview panel for the new incident.



Add Alerts to an Incident

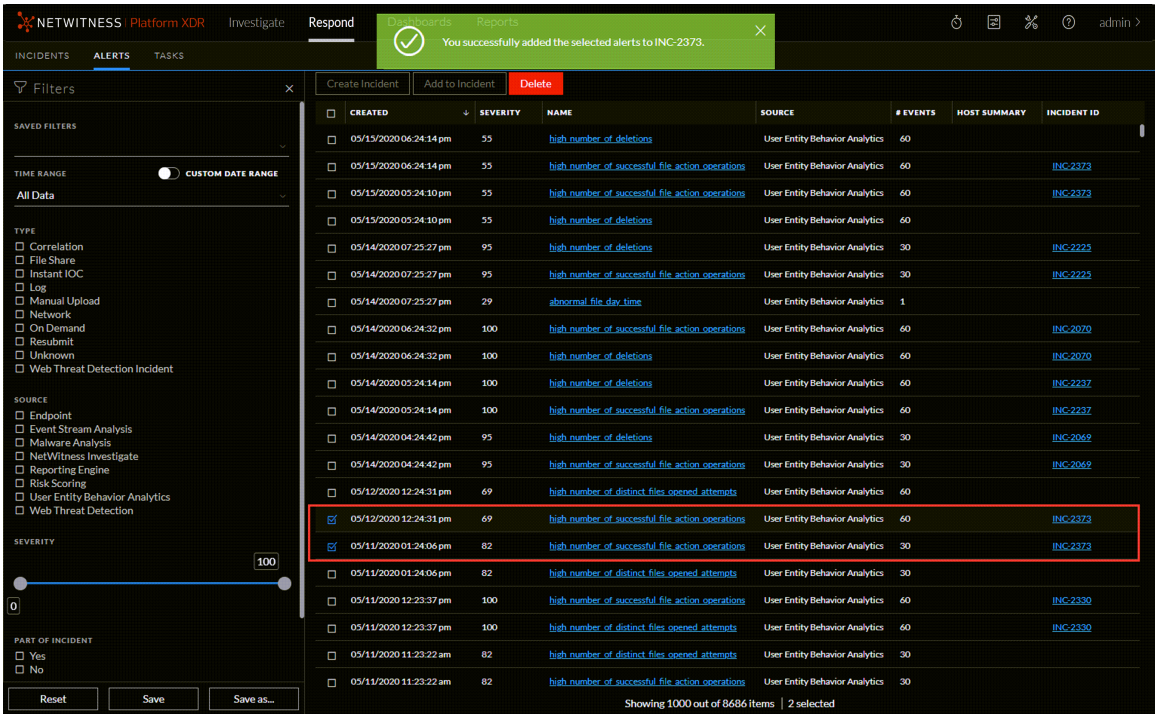
Note: This option is available in NetWitness Version 11.1 and later.



If you have alerts that fit a particular existing incident, you do not have to create a new incident. Instead, you can add alerts to that incident from the Alerts List view. The alerts that you select cannot be part of another incident.

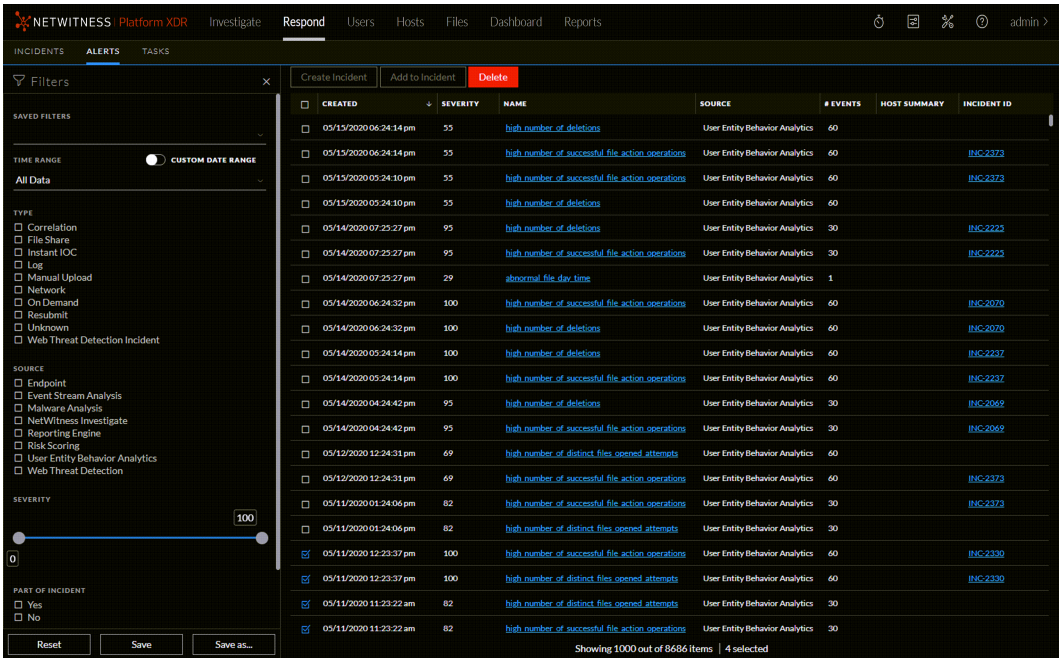
1. Go to **Respond > Alerts**.
2. In the Alerts List, select one or more alerts that you want to add to an incident, and click **Add to Incident**.

   Note: Selecting alerts that do not have incident IDs enables the **Add to Incident** button. If the alert is already part of an incident, the button is disabled. You can filter alerts that are not part of an incident by selecting the option **Part of Incident** as **No** in the Filters panel.

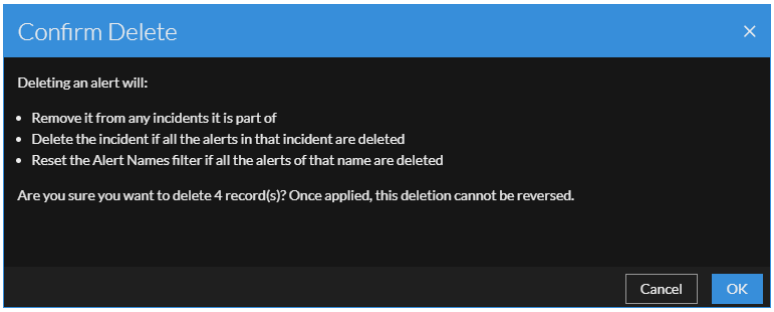


3. In the **Add to Incident** dialog, type at least three characters in the **Search** field to search for the incident by **Name** or **Incident ID**.

4. In the results list, select the incident that will receive the selected alerts and click **OK**.



The selected alert or alerts are now part of the selected incident and will have that incident ID.



Delete Alerts

Users with the appropriate permissions, such as Administrators and Data Privacy Officers, can delete alerts. This procedure is helpful when you want to remove unnecessary or non-relevant alerts. Deleting these alerts frees up disk space.

1. Go to **Respond > Alerts**.
   The Alerts List view displays a list of all NetWitness alerts.
2. In the Alerts list, select the alerts that you want to delete and click **Delete**.

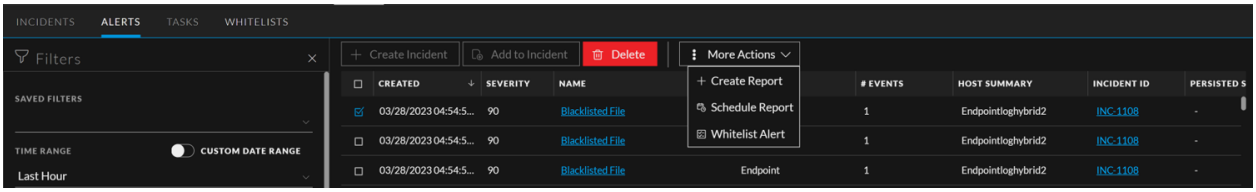
   If you do not have permission to delete alerts, you will not see the Delete button.
3. Confirm that you want to delete the alerts and click **OK**.

   The alerts are deleted from NetWitness. If a deleted alert is the only alert in an incident, the incident is also deleted. If the deleted alert is not the only alert in an incident, the incident is updated to reflect the deletion.

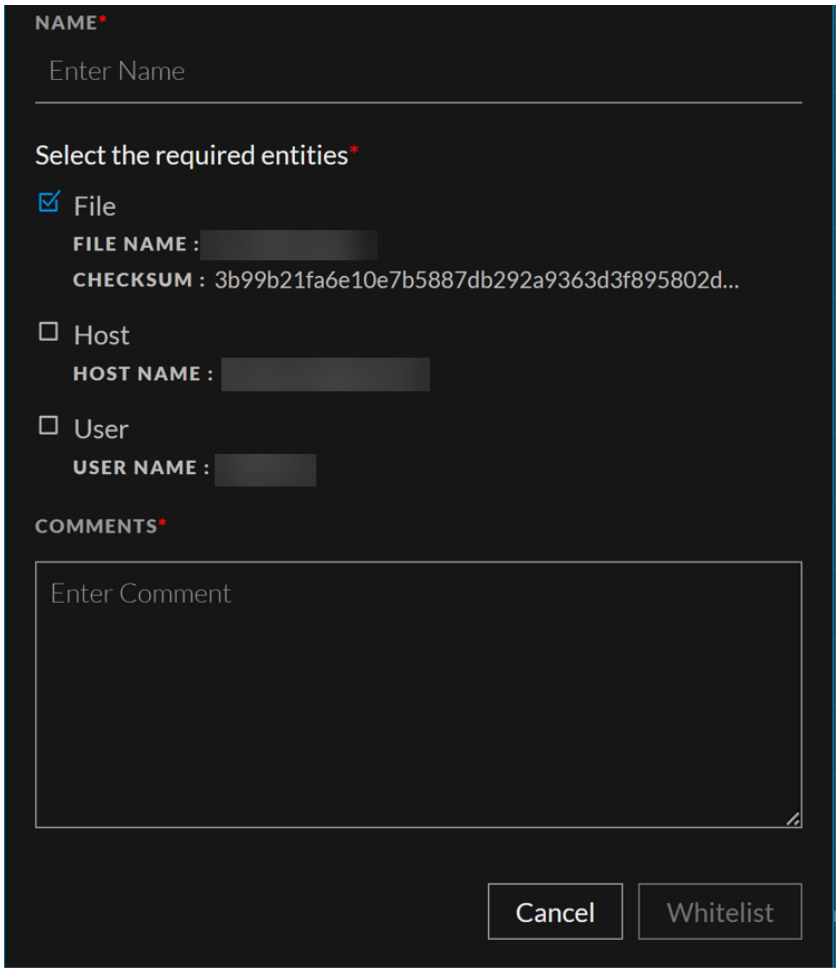
Whitelist Endpoint Alerts

The **Whitelist Alert** feature allows you to whitelist the unwanted and recurring non-suspicious Endpoint alerts triggered in the **Respond** > **Alerts** view. With this feature, you can select entities such as File, User, and Host and define the Whitelist condition to avoid triggering unwanted alerts for the required entities. Administrators can permanently delete the existing alerts matched with the Whitelist condition by enabling the Config in the **Services** > **Respond Server** > **Explore** view.

Note: By default, the Config is disabled in the **Services** > **Respond Server** > **Explore** view (the `alert-cleanup-enabled` parameter is set to **false**). To enable the config, you must set the `alert-cleanup-enabled` parameter to **true** in **Services** > **Respond Server** > **Explore** view. Refer to the following figures.



Note:
- When you enable the config, the existing alerts matched with the Whitelist condition still continue to exist over a period of time before they are permanently deleted. Once deleted, the alerts cannot be reversed to the selected entities.
- You can select only one alert at a time for whitelisting.



To whitelist an Endpoint alert

1. Go to **Respond** > **Alerts**.

   The **Alerts** view is displayed.

2. Select an alert and click **More Actions** > **Whitelist Alert**.
3. Enter the name of the Whitelist and select the required entities.

4. Specify the reason for whitelisting in the **Comments** section.
5. Click **Whitelist**.

   The **Confirm Whitelist** confirmation dialog is displayed.
6. Click **Confirm Whitelist**.

Use Case: Unwanted Endpoint Alerts Triggering in the Respond service

John, an analyst, logs in to the NetWitness Platform XDR and clicks **Respond** > **Alerts**. While investigating the alerts in the Respond **Alerts** view, John notices that a few alerts displayed in the UI are not suspicious. Analyst selects a non-suspicious alert and clicks the **Whitelist Alert** tab under **More Actions** in the toolbar. Once the **Alert Whitelisting** confirmation window is displayed, John performs the following:

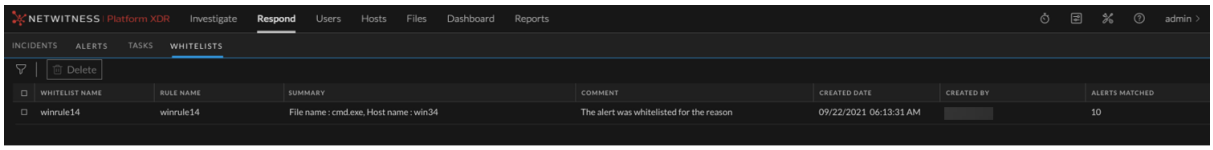
- Enters the name of the Whitelist.

- Selects the entities **File** and **Host** to stop triggering the new matching alerts for the particular file **xxxx.smp** and the host **Windows**.

- Specifies the reason for whitelisting the alert in the **Comments** section and clicks **Whitelist**.
- Once the **Confirm Whitelist** confirmation window is displayed, John clicks **Confirm Whitelist**.

After whitelisting the selected alert, John selects another non-suspicious alert in the Respond Alerts view for whitelisting. This time, John enables the config in the **Services** > **Respond Server** > **Explore** view to permanently delete the existing alerts matched with the Whitelist condition. Later, John selects the entities **User**, **Host**, and **File** in the **Alert Whitelisting** confirmation window to stop triggering the new matching alerts for the selected entities.

Note: Upon enabling the config and then whitelisting the alert for the selected entities **User**, **Host**, and **File**, John finds that the risk score of the entities **File** and **Host** is affected. This is due to the permanent deletion of the existing alerts matched with the Whitelist condition after enabling the config.



Delete the Whitelists

You can delete the Whitelists to start receiving the new matched alerts for the selected entities in the **Respond** > **Alerts** view. Once you delete the selected Whitelist, the new matching alerts are triggered only for the selected entities.

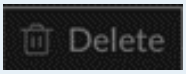
To delete the Whitelists

1. Go to **Respond** > **Whitelists**.

   The **Whitelists** view is displayed.

2. Select the Whitelist and click **Delete**.

   The confirmation window is displayed.



3. Click **Delete Whitelist**.

   The Whitelist is deleted.

Note:
- When you delete the Whitelists, only the new matching alerts are triggered. The whitelisted old alerts cannot be recovered for the selected entities.
- Analysts must have one of the following permissions to view the **Whitelists** tab in the **Respond** view:
  - **respond-server.alert.delete**
  - **respond-server.alert.read**
  - **respond-server.alert.manage**
  - **respond-server.alertrule.manage**
  - **respond-server.alertrule.read**
- Analysts must have the **respond-server.alert.read** permission to view the whitelists in **Respond** > **Whitelists** view and **respond-server.alert.manage** permission to delete the Whitelists.

Toolbar Actions

The table below lists the toolbar actions available in the Whitelists List view.

Option	Description
	Select this option and access the **Filters** panel to filter the required Whitelists.
	Select this option to delete the selected Whitelist.

Whitelists List View

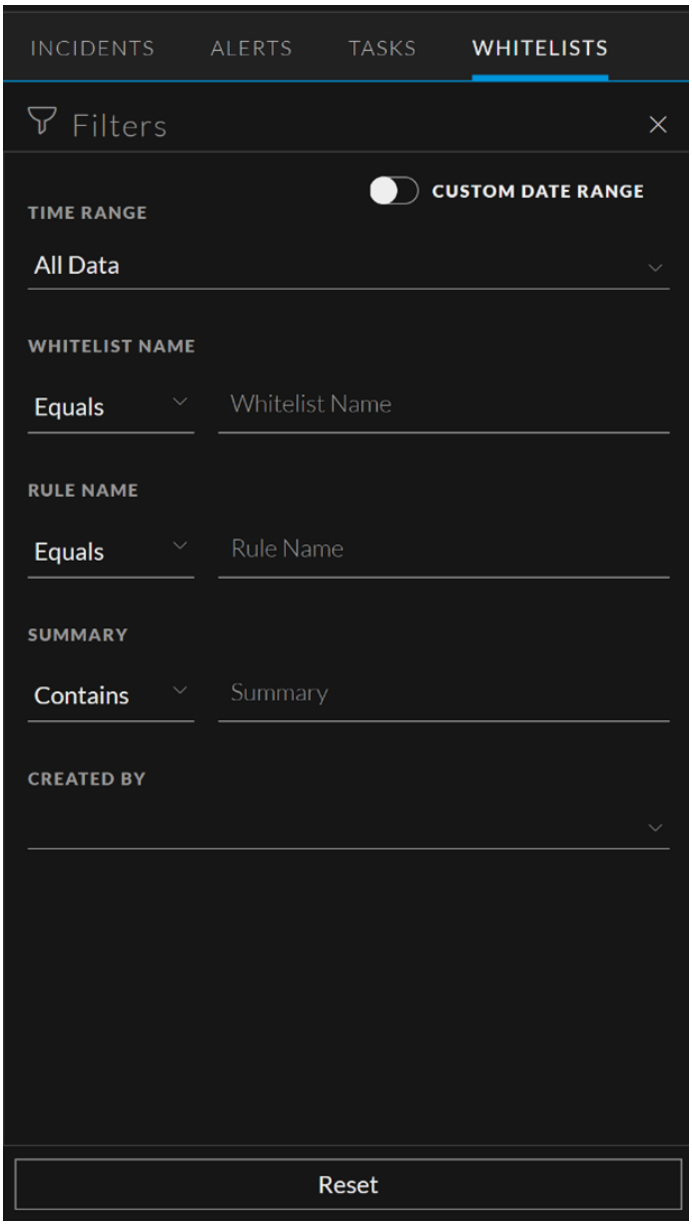
The Whitelists List view displays the list of all the Endpoint Whitelists with the Rule Name, Creation Date, and the Summary associated with the respective Whitelisted Endpoint Alerts. The view consists of a Filters panel and the Whitelists List.

Whitelists List

The Whitelists List displays all the Endpoint Whitelists in the NetWitness Platform XDR. You can filter this list to view only the Whitelists of interest.

The following table describes the columns in the Whitelists List.

Columns	Description
Whitelist Name	Displays the name of the Whitelist you provided during the whitelisting of the selected alert.
Rule Name	Displays the rule name associated with the whitelisted alert.
Summary	Displays the details of the entities selected during the whitelisting of the selected alert. For Example: **File name: cmd.exe, Host name: win34.**
Comment	Displays the comment added during the whitelisting of the selected alert.
Created Date	Displays the Whitelist creation date and time.
Created By	Displays the name of the user who created the Whitelist.
Alerts Matched	Displays the number of new matching alerts that are not triggered for the selected entities in the **Respond** > **Alerts** view after whitelisting the selected alert.



Filters Panel

You can filter the Whitelists based on the following parameters.

- Time Range
- Whitelist Name
- Rule Name
- User who created the Whitelists
- Summary associated with the Whitelists

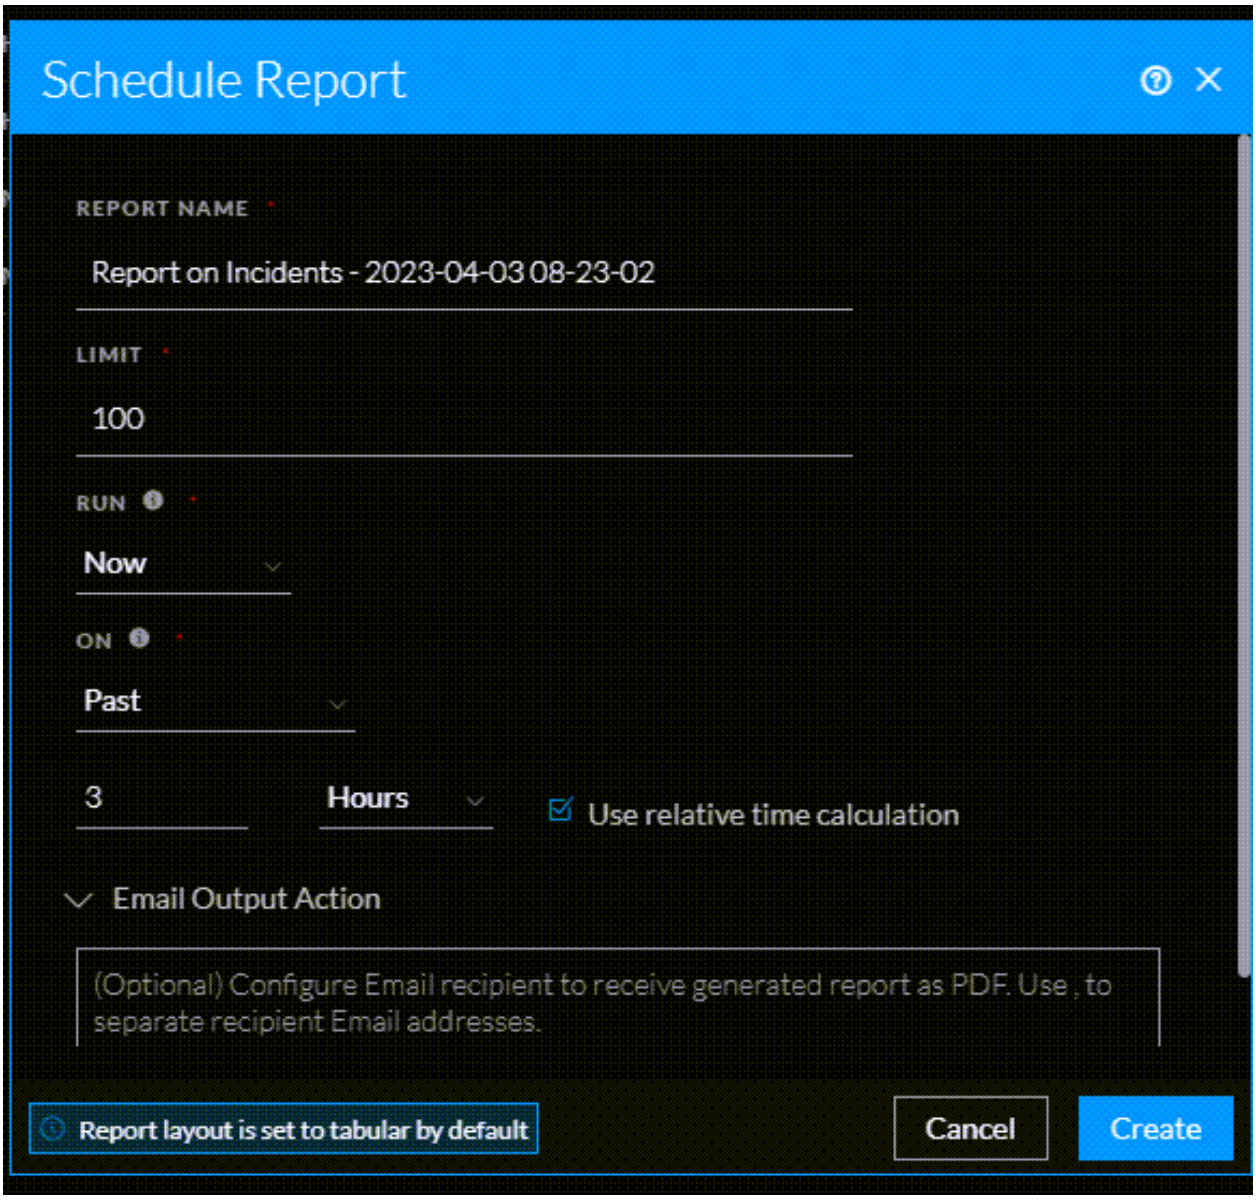
The following table lists all the fields displayed in the Whitelists List view Filters panel.

Fields	Description
Time Range	Allows you to select the required time duration and view the Whitelists created in the time duration selected. **Note:** Turn On the **Custom Date Range** Toggle to select a custom date range of your choice.
Whitelist Name	Allows you to enter the name of required Whitelist.
Rule Name	Allows you to enter the name of the rule associated with the Whitelists created.
Summary	Allows you to enter the complete value or a part of the value of the entities associated with the required Whitelist. For example: **cmd.exe** or **win34** or **analyst1**.
Created By	Allows you to filter the Whitelists on the basis of the user who created them.

Click **Reset** to remove the filters applied.

Schedule Report Dialog from Respond View

The **Schedule Report** dialog enables you to create a schedule for the report. Reports can be scheduled hourly, daily, weekly, or monthly. In order to schedule a report at a specific time or on a daily, weekly, or monthly basis, you must configure the scheduling options on the Schedule report dialog.



To access this dialog, Go to the **Respond** > **Incidents** view, add a query on the query search bar >  > **Schedule Report** from the toolbar.

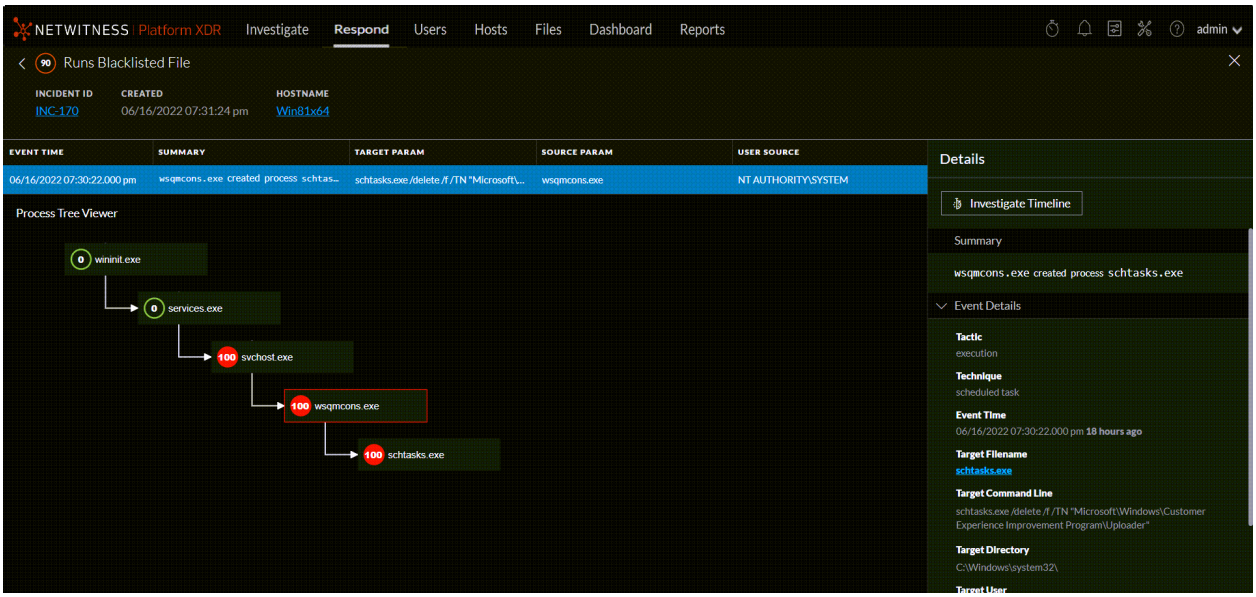
What do you want to do?

User Role	I want to ...	Show me how
Administrator / Analysts	Schedule Report	Generate Reports from Respond View

Quick Look - Schedule Report Dialog

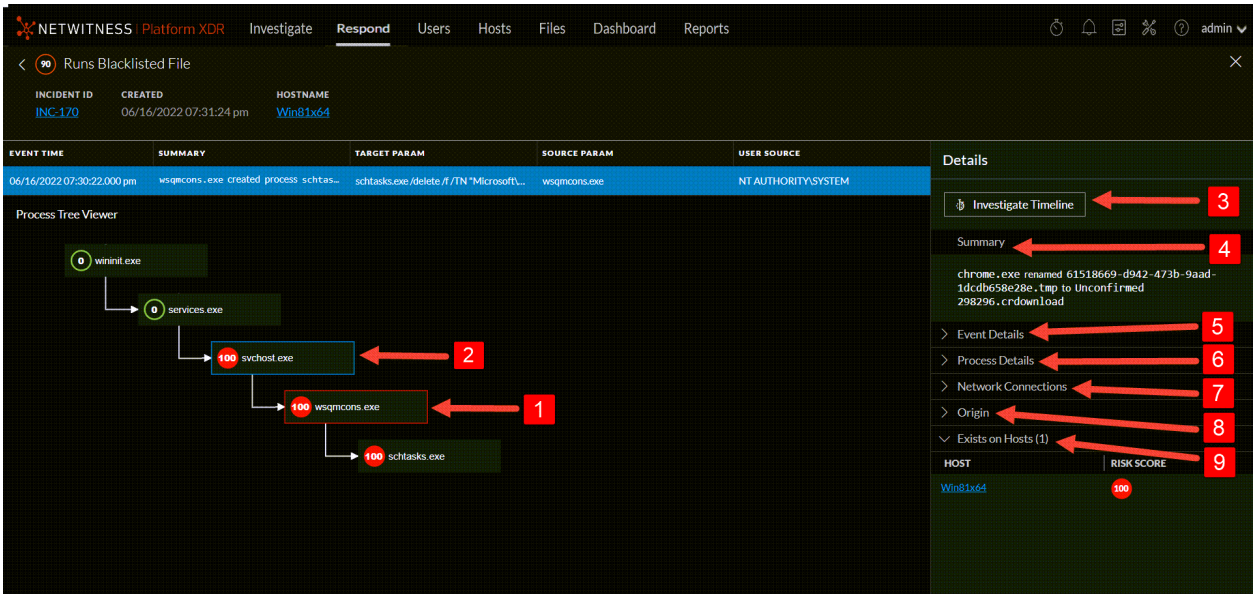
This is an example of the Schedule Report Dialog.

The following table describes the fields in the **Schedule Report Dialog** view.



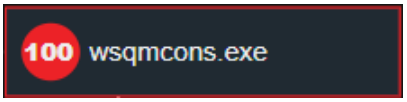
Feature	Description
Report Name	Specifies a name to identify the panel. For example, **Report on Incident - 2023-04-25 10-18-26**. You can provide a name that clearly identifies the nature of events that will be added to this report.

Feature	Description
Run	Time interval to use for running the scheduled job: • **Later**: Runs on specific date and time. • **Hourly**: Runs on a designated repeating interval. For example, if you schedule the report for 50 minutes, for every 50th minute, the report will be prepared. **Note:** A maximum of only 59 minutes can be selected. • **Daily**: Runs daily at a designated time. For example, if you schedule the report at 04:25, the report will be prepared at 04:25 AM every day. • **Monthly**: Runs on a monthly basis at a designated time and day of the month. For example, select 25 for the 25th day of the month. The report will be prepared on the 25th month of every month. **Note:** During the monthly report generation process, a message will appear if the day is greater than 28. This will notify the user that the report will be scheduled for the month containing that day.
ON	Set the frequency, duration, and time for running the report: • **Past**: You can schedule the report based on **Hours**, **Days**, **Weeks**, **Months**, and **Years**. • **Range(specific)**: You can schedule the report for a specific date and time range. **Note:** This field appears only if you select Later in the Run field. • **Range(generic)**: You can schedule the report for a generic date and time. **Note:** This field appears only if you select Later, Daily, Weekly, and Monthly in the Run field.
Use relative time calculation	The Use relative time calculation option is enabled by default, and it uses the relative time duration to schedule a report. For example, if you schedule a report to run over the past 1 hour –1h for the relative time, the time is exactly 1 hour from when the report is run. If the current time is 3 P.M., the events that occurred in the past 60 minutes or between 2 P.M. and 3 P.M. today.
Email Output Action	Specify email addresses to send the report to, separated by commas.
Create	Creates the report and closes the dialog. A message confirms that the report was scheduled successfully.
Cancel	Closes the dialog without applying changes.



Review Endpoint Alerts using Process Tree

From version 12.0.0.0 and higher, the Alert details page for Endpoint alerts will show a process tree along with the details of Summary, Event details, Process details, etc.



After you filter the Endpoint alerts in the Alerts List view, you can go to the Alert Details view for more detailed information on the Endpoint alerts, to determine the action required. An alert contains one or more events. In the Alert Details view for Endpoint alerts, you can view the alert details in the form of a process tree and additional event details, process details and much more on the right panel. The following figure shows an example of the Alert Details view for Endpoint alerts.

The process tree on the Alert Details view provides a complete picture about where the suspicious/malicious file originated including the path in the form of a process tree.

The **Details** panel on the right has more information for an alert than the Overview panel in the Alerts List view.

- The file that caused the alert is outlined in red.

- Selected file is outlined in blue.

1 - The file that caused the alert, and it is outlined in red. If you click on this file, the red outline will become blue to show it is selected.

2 - The file from which the suspicious/malicious file is originated.

3 - **Investigate Timeline** takes to the Investigate view for the selected alert.

4 - **Summary** shows a short description of the event.

5 - **Event Details** section provided a detailed information about the event that includes the Event Time, Target Filename, Tactic, Technique, Target User etc.

6 - **Process Details** section shows the Directory where the file is stored besides User name, Hash value, Risk score, Signature etc.

7 - **Network Connections** shows any network connection the selected file established since ten minutes before and till ten minutes after the alert triggered time. For example, if the alert was triggered at 16:00 hours, the network connections(if any)established by the selected file from 15:50 hours to 16:10 hours will be shown.

8 - **Origin** section shows how the selected file originated in the host.

9 - **Exists on Hosts** shows the list of hosts(with risk score) the selected file exists.

Process Details Section Values

Name	Description	Example
Tactic	Shows the tactic, as per MITRE ATT&CK frame work, this attempt falls under.	*execution*

Name	Description	Example
Technique	Shows the technique, as per MITRE ATT&CK frame work, this attempt falls under.	*masquerading*
Event Time	Shows the event occurred time.	*06/22/2022 10:14:28.000 am 8 hours ago*
Target Filename	Shows the name of file that is targeted. You can also view it in the process tree, next to the file that caused the alert.	*Unconfirmed 298296.crdownload*
Target Command Line	Shows the command line argument of the target file.	N/A
Target Directory	Shows the targeted directory.	*C:\Users\Administrator\Downloads*
Target User	Shows the user name through which the attempt was made.	*WIxxxxxx\Administrator*
Target Hash	Shows the hash value of the selected file.	*f214c48dc1daxxxx41d327c6bed1b52xxxx492573d85a305d8183eaa0222cc96*

Event Details Section Values

Value	Description	Example
File name	Shows the selected file name with extension	*iexplore.exe*
Command Line	Shows the command line name for the selected file	*IEXPLORE.EXE*
Directory	Shows the location of the selected file	*C:\Program Files\Internet Explorer*
User	Shows the user name	*WIxxxxxx\Administrator*

Hash	Shows the hash value of the selected file	*f214c48dc1daxxxx41d327c6bed1b52xxxx492573d85a305d8183eaa0222cc96*
Risk Score	Risk score of the selected file	*100*
Signature	Shows whether the selected file is signed or not	*microsoft,signed,valid*
Reputation Status	Shows the reputation of a file hash	*Suspicious*
File Status	Shows the file status for the selected file	*Blacklist*

Incidents List View

The Incidents List view (Respond > Incidents) shows Incident Responders and other Analysts a prioritized results list of incidents created from various sources. For example, your results list could show incidents created from ESA rules or NetWitness Endpoint. From the Incidents List view, you have easy access to the information that you need to quickly triage and manage incidents through completion.

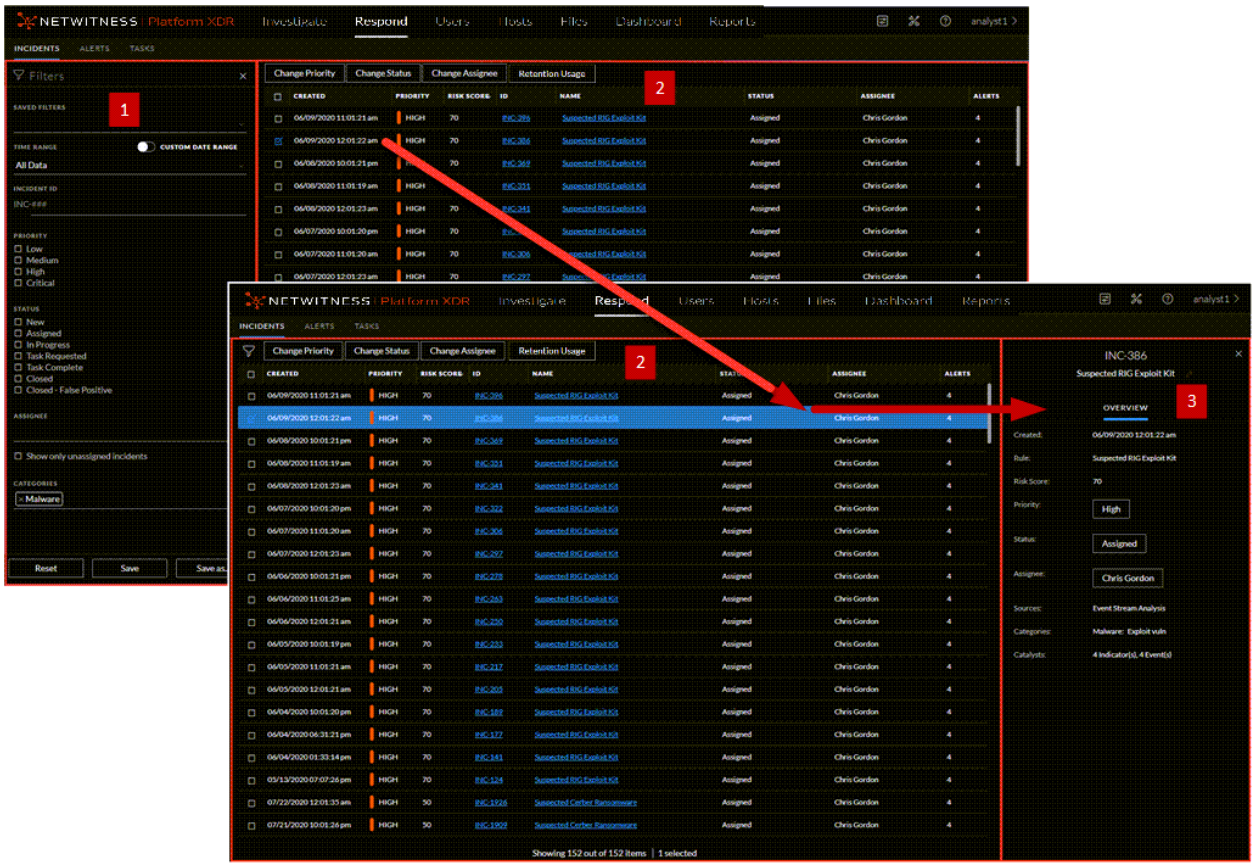
Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in NetWitness.

In the Incidents List view, you can review the list of prioritized incidents, which shows basic information about each incident. You can also change the assignee, priority, and status of the incidents. Because the results can be large in the incidents list, you have the option to filter those incidents by time range, incident ID, custom date range, priority, status, assignee, and categories.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts, and SOC Manager	View prioritized incidents*	Review Prioritized Incident List
Incident Responders, Analysts, and SOC Manager	Filter and sort the incident list*	Filter the Incident List
Incident Responders, Analysts	View my incidents*	View My Incidents
Incident Responders, Analysts	Assign incidents to myself*	Assign Incidents to Myself
Incident Responders, Analysts, and SOC Manager	Find Incidents*	Find an Incident
Incident Responders, Analysts, and SOC Manager	Send an incident to Archer Cyber Incident & Breach Response or update an incident.*	Escalate or Remediate the Incident
Incident Responders, Analysts	View incident details.	Determine which Incidents Require Action
Incident Responders, Analysts	Further Investigate an incident.	Investigate the Incident
Incident Responders, Analysts, and SOC Manager	Create a task.	Escalate or Remediate the Incident



*You can complete these tasks here (that is, in the Incidents List view).

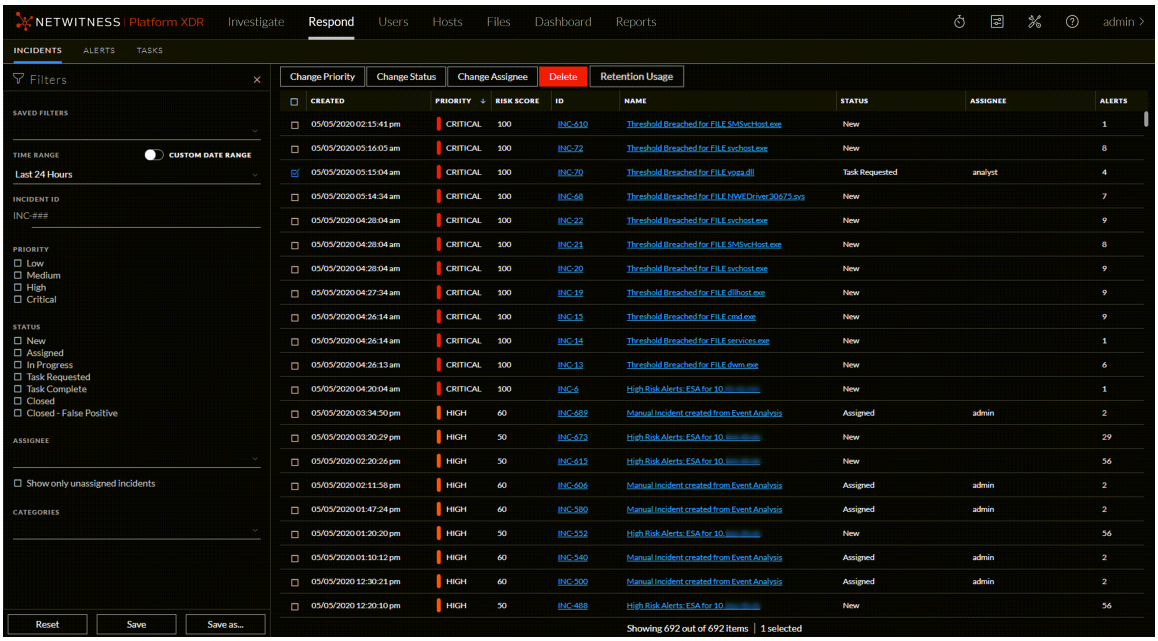
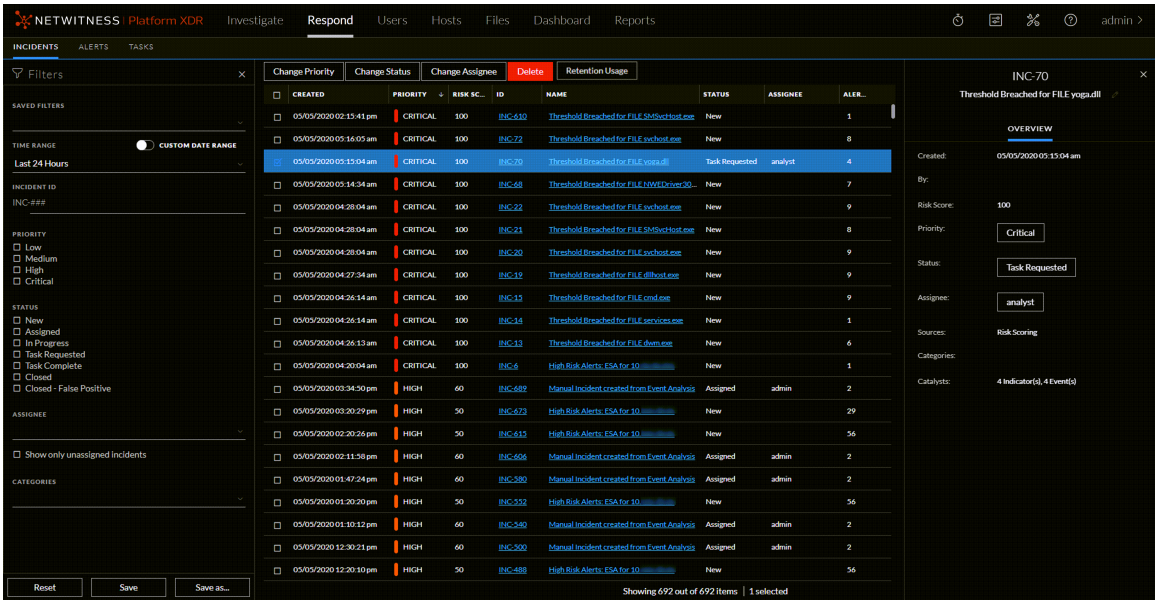
Quick Look

The following example shows the initial Incidents List view with the Filter panel. You can open the Overview panel for an incident by clicking an incident in the Incident List.



1 Filters Panel
2 Incidents List
3 Overview Panel

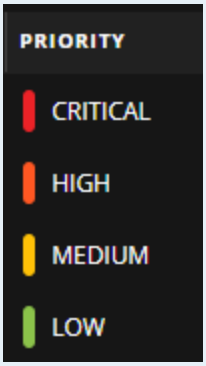
You can go directly to the Incident Details view from the Incidents List by clicking the hyperlinked ID or NAME. The Overview panel is also available in the Incident Details view. For more information about the Incidents Details view, see Incident Details View.



Incidents List View

To access the Incidents List view, go to **Respond > Incidents**. The Incidents List view displays a list of all incidents. The Incidents List view consists of a Filters panel, an Incidents List, and an Incidents Overview panel.

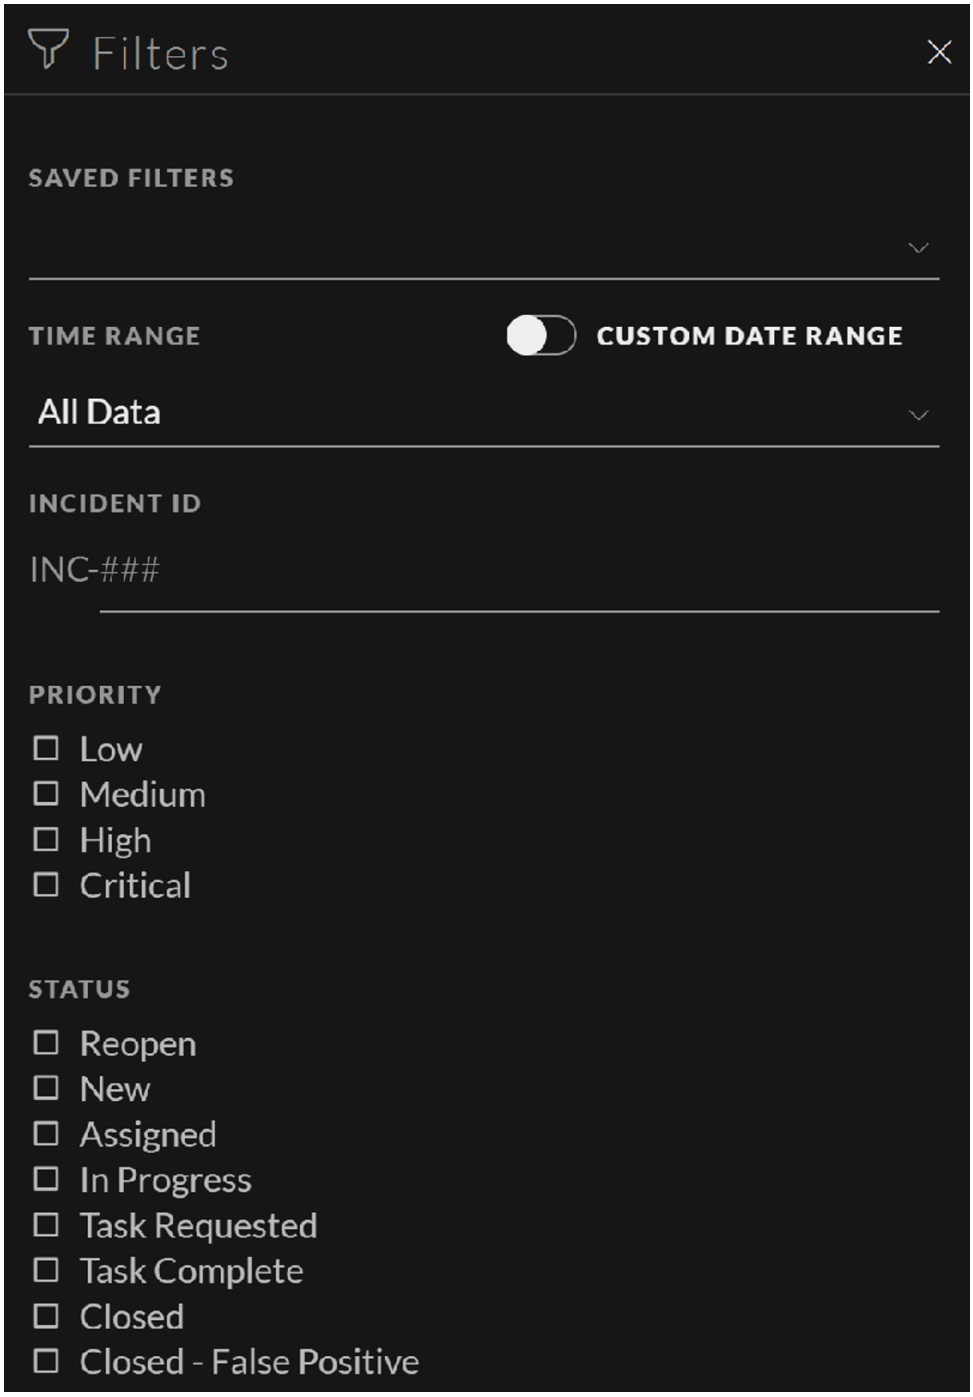
The following figure shows the Filter Panel on the left and the Incidents List on the right.



The following figure shows the incident Overview panel on the right.

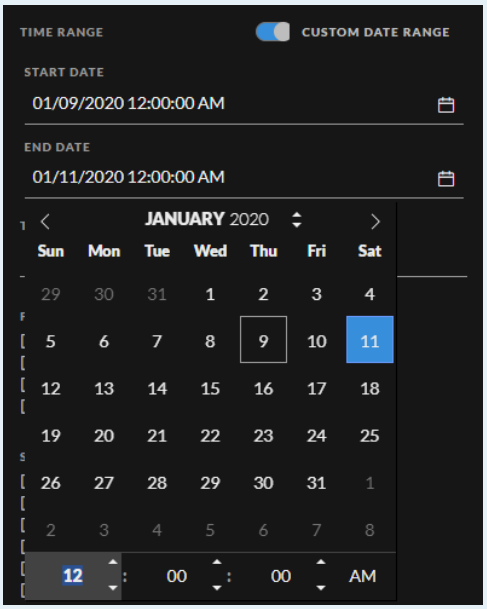
Incidents List

The Incidents List shows a list of all of the prioritized incidents. You can filter this list to show only incidents of interest.



Column	Description
Created	Shows the creation date of the incident.

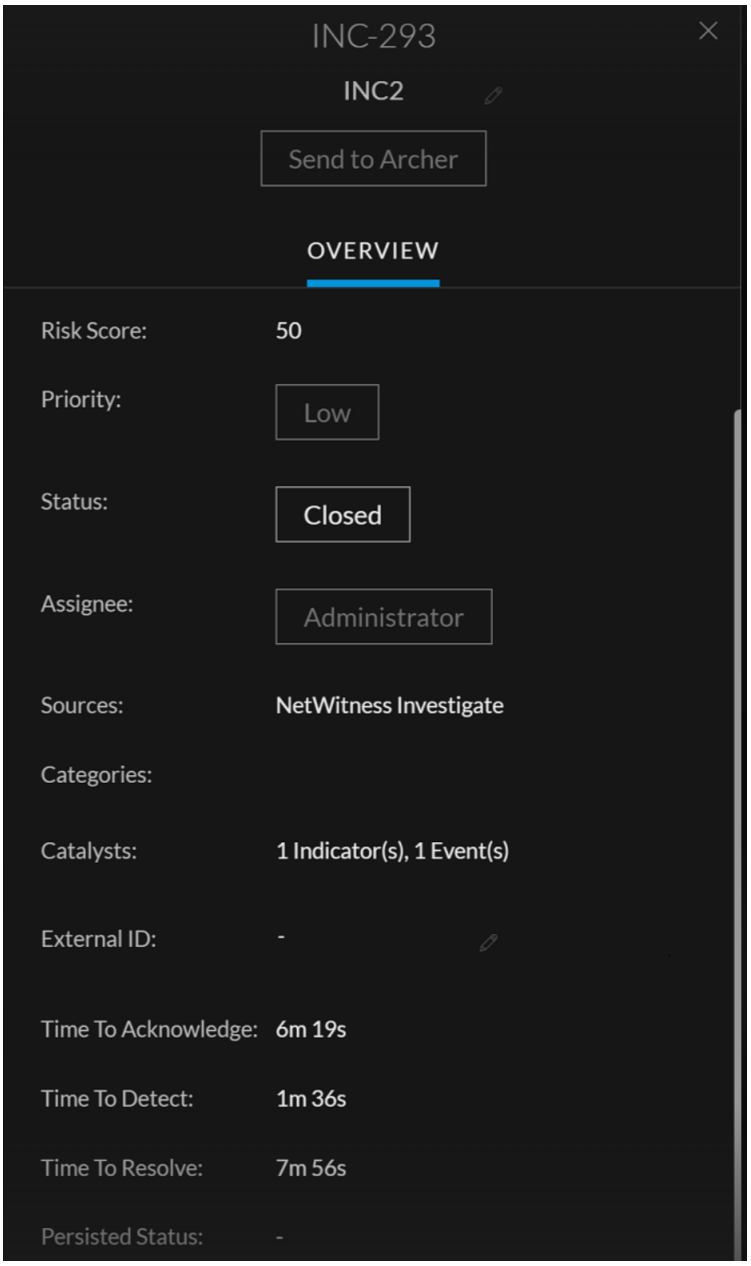
Column	Description
Priority	Shows the incident priority. Priority can be Critical, High, Medium, or Low. The Priority is color coded, where red indicates a **Critical** incident, orange represents a **High** risk incident, yellow indicates a **Medium** risk incident, and green represents a **Low** risk incident. For example: 
Risk Score	Shows the incident risk score. The risk score indicates the risk of the incident as calculated by an algorithm and is between 0-100. 100 is the highest risk score.
ID	Shows the automatically created incident number. Each incident is assigned a unique number that you can use to track the incident.
Name	Shows the incident name. The incident name is derived from the rule used to trigger the incident. Click the link to go to the Incident Details view for the selected incident.
Status	Shows the incident status. The status can be: Reopen, New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed-False Positive.
Assignee	Shows the team member currently assigned to the incident.
Alerts	Shows the number of alerts associated with the incident. An incident may include many alerts. A large number of alerts might mean that you are experiencing a large-scale attack.



At the bottom of the list, you can see the number of incidents on the current page, the total number of incidents, and the number of incidents selected. For example: **Showing 1000 out of 2517 items | 2 selected**. The maximum number of incidents that you can view at one time is 1,000.

Incident Filters Panel

The following figure shows the filters available in the Filters panel.



The Filters panel, on the left of the Incidents List view, has options that you can use to filter the incidents list. When you navigate away from the Filters panel, the Incidents List view retains your filter selections.

Option	Description
Saved Filters	You can select a saved filter to filter the incident list. Saved filters are global. You can save a filter for other analysts to use and you can use any saved filter. Saved filters are also available for use on the Springboard landing page. Filters used in the Springboard cannot be deleted. (This option is available in NetWitness Platform 11.5 and later.)
Time Range	You can select a specific time period from the Time Range drop-down list. The time range is based on the received date of the alerts. For example, if you select Last Hour, you can see alerts that were received within the last 60 minutes.
Custom Date Range	You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar. 
Incident ID	Type the number of the incident that you would like to locate. For example, for INC-1050, type only the number "1050" to view the incident.
Priority	Select the priorities that you would like to view.
Status	Select one or more incident statuses. For example, select Closed - False Positive to view only false positive incidents, which were initially identified as suspicious, but then they were later found to be safe.

Option	Description
Assignee	Select the assignee or assignees of the incidents that you would like to view. For example, if you only want to view the incidents assigned to Cale or Stanley, select Cale and Stanley from the Assignee drop-down list. If you want to view incidents regardless of the assignee, do not make a selection under Assignee. (Available in NetWitness Version 11.1 and later) To view only unassigned incidents, select **Show only unassigned incidents**.
Categories	Select one or more categories from the drop-down list. For example, if you only want to view incidents classified with the Backdoor or Privilege abuse categories, select Backdoor and Privilege abuse.
Sent to Archer	(In NetWitness Version 11.2 and later, if Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and this option will be available in NetWitness Respond.) To view incidents that were sent to Archer, select **Yes**. For incidents that were not sent to Archer, select **No**.
Reset	Removes your filter selections. If you reset filters on a saved filter, it takes you to the default empty filter.
Save	Saves the currently applied incidents filter or updates a saved filter. For a new filter, choose a unique name that contains 1-256 alphanumeric characters, underscores, or hyphens. (This option is available in NetWitness Platform 11.5 and later.)
Save As	Saves the currently applied incidents filter for future use. Choose a unique name that contains 1-256 alphanumeric characters, underscores, or hyphens. (This option is available in NetWitness Platform 11.5 and later.)

Incident Overview Panel

The Overview panel shows basic summary information about a selected incident. From the Incidents List, you can click an incident to access the Overview panel. The Overview panel in the Incident Details view contains the same information.

The following table lists the fields displayed in the Incident Overview panel.

Field	Description
<Incident ID>	Displays the Incident ID.

Field	Description
Send to Archer / Sent to Archer	(In NetWitness Version 11.2 and later, if Archer is configured as a data source in Context Hub, you can escalate incidents to Archer Cyber Incident & Breach Response and this option will be available in NetWitness Respond.) Shows whether the incident was sent to Archer Cyber Incident & Breach Response: • **Send to Archer**: The incident was not sent to Archer. You can click the **Send to Archer** button to send the incident to Archer Cyber Incident & Breach Response for additional processing. This action is not reversible.  • **Sent to Archer**: The incident was sent to Archer Cyber Incident & Breach Response for additional analysis and action. 
<Incident Name>	Displays the name of the incident. You can click the incident name to change it. For example, rules can create many incidents with the same name. You can change the incident names to be more specific.
Created	Shows the creation date and time of the incident.
Rule / By	Shows the name of the rule that created the incident or the name of the person who created the incident.
RiskScore	Shows a value between 0 and 100 that indicates the risk of the incident as calculated by an algorithm. 100 is the highest risk score.
Priority	Shows the incident priority. Priority can be Critical, High, Medium or Low. To change the priority, you can click the Priority button and select a new priority from the drop-down list.
Status	Shows the incident status. The status can be Reopen, New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed - False Positive. To change the status, you can click the Status button and select a new status from the drop-down list.
Assignee	Shows the team member currently assigned to the incident. To change the assignee you can click the Assignee button and select a new assignee from the drop-down list.

Field	Description
Sources	Displays the data sources used to locate the suspicious activity.
Categories	Displays the categories of the incident events.
Catalysts	Displays the count of indicators that gave rise to the incident.
External ID	Allows storing the Incident ID referrals from a different platform. **Note:** Click **Send to Archer** to generate the External ID. The ID generated is automatically stored as External ID.
Time to Acknowledge	Displays the time taken to assign an Incident after creating it.
Time to Detect	Displays the time taken for completing the task after the Incident is assigned.
Time to Resolve	Displays the time taken for closing the task after the Incident is created.
Persisted Status	Displays the persist status of the Incident. The status can be Complete, Partial, or None (-).

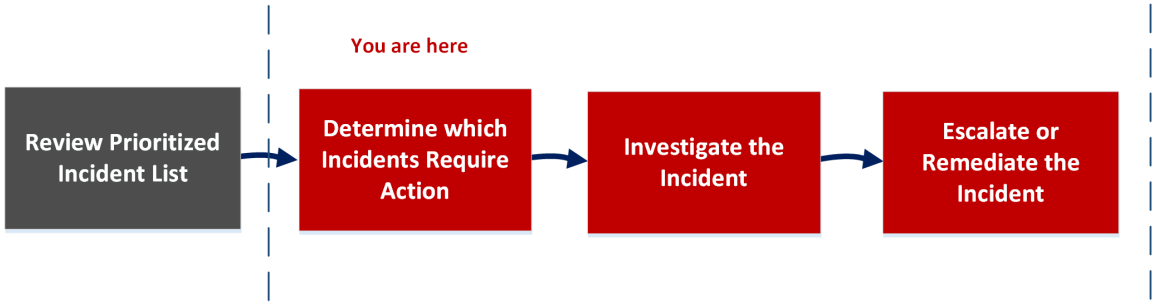
Toolbar Actions

This table lists the toolbar actions available in the Incidents List view.

Option	Description
	Enables you to open the Filters panel so that you can specify the incidents that you would like to see in the Incidents List.
	Closes the panel.
Change Priority button	Allows you to change the Priority of one or more selected incidents in the Incidents List.
Change Status button	Allows you to change the Status of one or more selected incidents.
Change Assignee button	Allows you to change the Assignee of one or more selected incidents.
Delete button	Allows you to delete the selected incidents if you have the appropriate permissions, such as an Administrator or Data Privacy Officer.

Option	Description
Retention Usage button	Allows an analyst to fetch all the stats of all the configured services and the percentage used by the pinned cache directories.

Incident Details View



In the Incident Details view (Respond > Incidents > click an ID or NAME hyperlink in the Incidents List), you can view and access extensive incident details. The Incident Details view contains multiple panels that provide the following benefits:

- **Overview**: View an incident summary and update the incident.
- **Indicators**: View the indicators (alerts) involved in the incident, the events within those alerts, and available enrichment information. You can also access Event Analysis details for some events and perform event reconnaissance.
- **Related Indicators**: View indicators (alerts) that are related to the incident and add them to the incident if they are not associated with an incident.
